# INTRODUCTION

## TABLE OF CONTENTS

# FASTENER IDENTIFICATION

## DESCRIPTION

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 9.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts.

**Bolt Markings and Torques - Metric**

| Bolt Markings | 8.8/8.9 | | 10.9 | | 12.9 | |
|---|---|---|---|---|---|---|
| Bolt Dia. | N·m | Ft. Lbs. | N·m | Ft. Lbs. | N·m | Ft. Lbs. |
| 6 | 12 | 105* | 14 | 120* | 16 | 12 |
| 8 | 25 | 250* | 32 | 23 | 38 | 28 |
| 10 | 54 | 40 | 60 | 45 | 74 | 55 |
| 12 | 95 | 70 | 108 | 80 | 135 | 100 |
| 14 | 155 | 115 | 175 | 130 | 216 | 160 |
| 16 | 243 | 180 | 324 | 210 | 324 | 240 |
| * Inch Lbs. | | | | | | |

**Bolt Markings and Torques - U. S. Customary**

| Bolt Markings | Grade 5 | | Grade 8 | |
|---|---|---|---|---|
| Bolt Dia. | N·m | Ft. Lbs | N·m | Ft. Lbs |
| 1/4 - 20 | 10 | 95* | 14 | 125* |
| 1/4 - 28 | 10 | 95* | 17 | 150* |
| 5/16 - 18 | 22 | 200* | 30 | 270* |
| 5/16 - 24 | 26 | 240* | 33 | 300* |
| 3/8 - 16 | 40 | 30 | 55 | 40 |

**HOW TO DETERMINE BOLT STRENGTH**

| | Mark | Class |
|---|---|---|
| Hexagon head bolt |  Bolt head No. 4 — 5 — 6 — 7 — 8 — 9 — 10 — 11 — | 4T 5T 6T 7T 8T 9T 10T 11T |
| |  No mark | 4T |
| Hexagon flange bolt w/washer hexagon bolt |  No mark | 4T |
| Hexagon head bolt |  Two protruding lines | 5T |
| Hexagon flange bolt w/washer hexagon bolt |  Two protruding lines | 6T |
| Hexagon head bolt |  Three protruding lines | 7T |
| Hexagon head bolt |  Four protruding lines | 8T |

| | Mark | Class |
|---|---|---|
| Stud bolt | No mark  | 4T |
| | Grooved  | 6T |
| Welded bolt |  | 4T |

# FASTENER USAGE

## DESCRIPTION

## FASTENER USAGE

**WARNING: Use of an incorrect fastener may result in component damage or personal injury.**

Fasteners and torque specifications references in this Service Manual are identified in metric and SAE format.

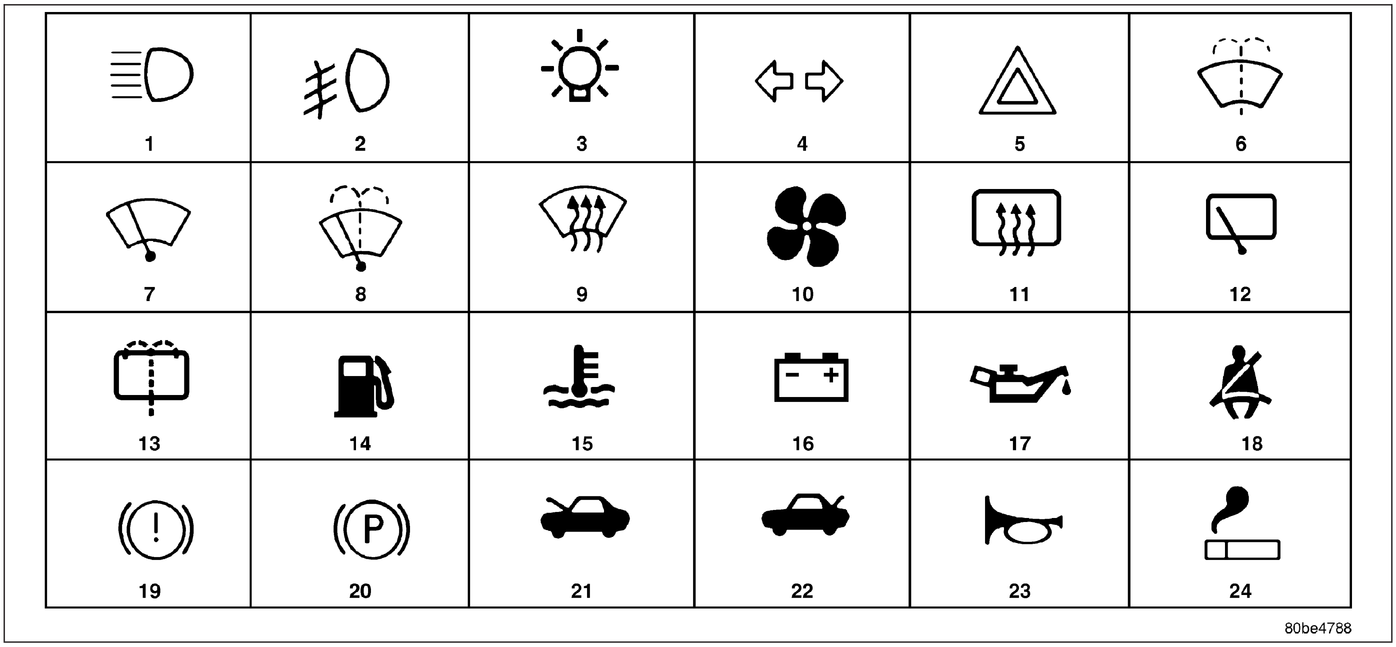
During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

## THREADED HOLE REPAIR

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

# INTERNATIONAL SYMBOLS

## DESCRIPTION



The graphic symbols illustrated in and the following International Control and Display Symbols Chart are used to identify various instrument controls. The symbols correspond to the controls and displays that are located on the instrument panel.

J901N-10

The metric system is based on quantities of one, ten, one hundred, one thousand and one million.

The following chart will assist in converting metric units to equivalent English and SAE units, or vise versa.

## CONVERSION FORMULAS AND EQUIVALENT VALUES

| MULTIPLY | BY | TO GET | MULTIPLY | BY | TO GET |
|---|---|---|---|---|---|
| in-lbs | x 0.11298 | = Newton Meters (N·m) | N·m | x 8.851 | = in-lbs |
| ft-lbs | x 1.3558 | = Newton Meters (N·m) | N·m | x 0.7376 | = ft-lbs |
| Inches Hg (60° F) | x 3.377 | = Kilopascals (kPa) | kPa | x 0.2961 | = Inches Hg |
| psi | x 6.895 | = Kilopascals (kPa) | kPa | x 0.145 | = psi |
| Inches | x 25.4 | = Millimeters (mm) | mm | x 0.03937 | = Inches |
| Feet | x 0.3048 | = Meters (M) | M | x 3.281 | = Feet |
| Yards | x 0.9144 | = Meters | M | x 1.0936 | = Yards |
| mph | x 1.6093 | = Kilometers/Hr. (Km/h) | Km/h | x 0.6214 | = mph |
| Feet/Sec | x 0.3048 | = Meters/Sec (M/S) | M/S | x 3.281 | = Feet/Sec |
| mph | x 0.4470 | = Meters/Sec (M/S) | M/S | x 2.237 | = mph |
| Kilometers/Hr. (Km/h) | x 0.27778 | = Meters/Sec (M/S) | M/S | x 3.600 | Kilometers/Hr. (Km/h) |

## COMMON METRIC EQUIVALENTS

| | |
|---|---|
| 1 inch = 25 Millimeters | 1 Cubic Inch = 16 Cubic Centimeters |
| 1 Foot = 0.3 Meter | 1 Cubic Foot = 0.03 Cubic Meter |
| 1 Yard = 0.9 Meter | 1 Cubic Yard = 0.8 Cubic Meter |
| 1 Mile = 1.6 Kilometers | |

Refer to the Metric Conversion Chart to convert torque values listed in metric Newton- meters (N·m). Also, use the chart to convert between millimeters (mm) and inches (in.).

Individual Torque Charts appear within many or the Groups. Refer to the Standard Torque Specifications Chart for torque references not listed in the individual torque charts.

# VEHICLE EMISSION CONTROL INFORMATION (VECI) LABEL

## DESCRIPTION

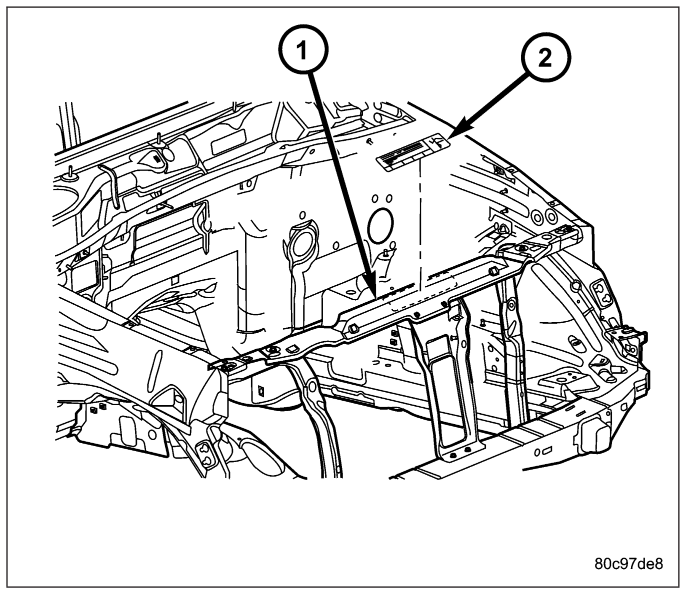
All models have a Vehicle Emission Control Information (VECI) Label. DaimlerChrysler permanently attaches the label in the engine compartment. The label cannot be removed without defacing label information and destroying label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

The label also contains an engine vacuum schematic. There are unique labels for vehicles built for sale in the state of California and the country of Canada. Canadian labels are written in both the English and French languages.

The VECI label contains the following:

- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap



# VEHICLE IDENTIFICATION NUMBER

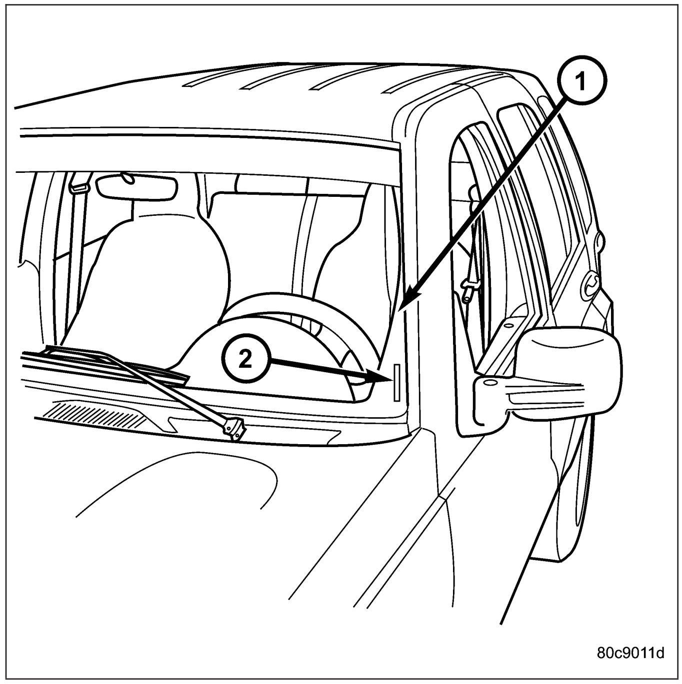
## DESCRIPTION

The Vehicle Identification Number (VIN) plate is located on the lower left A-pillar and is visible through the windshield. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the VIN decoding chart to determine the identification of a vehicle.

The Vehicle Identification Number is also imprinted on the:

- Vehicle Safety Certification Label.
- Frame rail.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.



**VEHICLE IDENTIFICATION NUMBER DECODING CHART**

| POSITION | INTERPRETATION | CODE = DESCRIPTION |
|---|---|---|
| 1 | Country of Origin | 1 = Manufactured by DaimlerChrysler Corporation |
| 2 | Make | J = Jeep |
| 3 | Vehicle Type | 4 = MPV W/O Side Airbags.<br>8 = MPV With Side Airbags. |

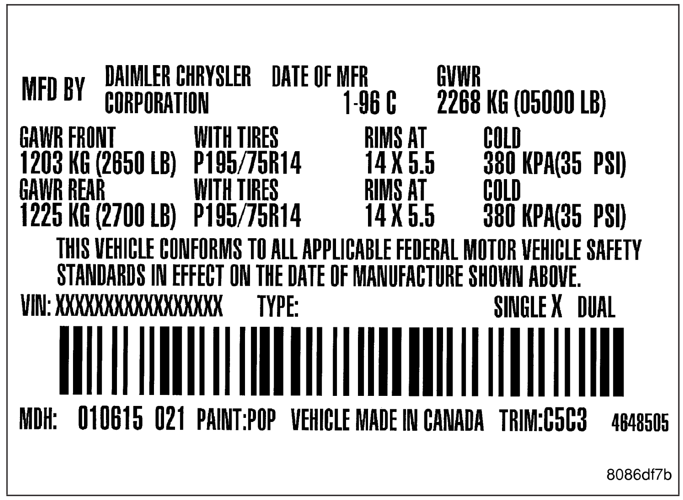
# VEHICLE CERTIFICATION LABEL

## DESCRIPTION

A vehicle certification label is attached to every DaimlerChrysler Corporation vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.



8086df7b

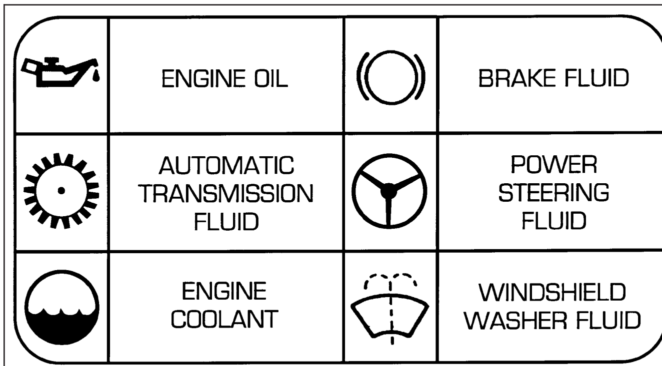
# LUBRICATION & MAINTENANCE

## TABLE OF CONTENTS

# INTERNATIONAL SYMBOLS

## DESCRIPTION

DaimlerChrysler Corporation uses international symbols to identify engine compartment lubricant and fluid inspection and fill locations.



8097ddbd

# PARTS & LUBRICANT RECOMMENDATION

## DESCRIPTION

## LUBRICANT RECOMMENDATIONS

### Chassis

| Component | Fluid, Lubricant, or Genuine Part |
|---|---|
| Steering Gear & Linkage, Ball Joints, Prop Shafts & Yokes, Wheel Bearings | Mopar® Multi-Purpose Lubricant NLGI Grade 2 EP, GC-LB |

### Body

| Component | Fluid, Lubricant, and Genuine Part |
|---|---|
| Hinges: | |
| Door & Hood | Mopar® Engine Oil |
| Swing Gate | Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB |
| Latches: Door, Hood/Safety Catch, Swing Gate | Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB |
| Seat Regulator & Track | Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB |
| Lock Cylinders | Mopar® Lock Cylinder Lube |

## FLUID TYPES

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a DaimlerChrysler Corporation vehicle.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)

## API QUALITY CLASSIFICATION

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by DaimlerChrysler Corporation.

9400-9

## GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

# FLUID TYPES

## DESCRIPTION

## ENGINE OIL

**WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.**

Only lubricants bearing designations defined by the following organization should be used.
- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Européens d’ Automobiles (European Automobile Manufacturers Association) (ACEA)

## API SERVICE GRADE CERTIFIED

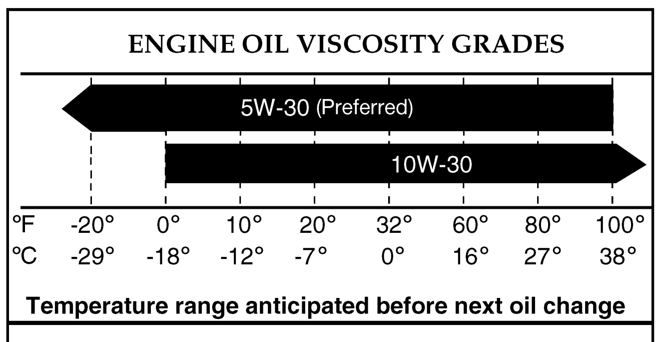
Use an engine oil that is API Certified. MOPAR® provides engine oils, that meet or exceed this requirement.

## SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation.

## ACEA Categories

For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.



80b89880

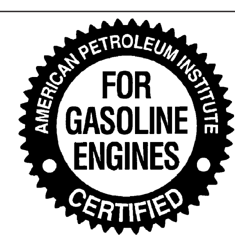
## ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

## CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). DaimlerChrysler only recommends API Certified engine oils. Use Mopar® engine oil or equivalent.



9400-9

## ENGINE OIL - DIESEL ENGINES

Only use synthetic engine oils meeting the API Categories SL/CF and Chrysler Material Standard MS-10725. Those engine oils not meeting the viscosity and API Quality and MS-10725 requirements should not be used.

### SAE VISCOSITY GRADE

The preferred engine oil is SAE 0W-40 Mobil® One Synthetic. If you can not locate SAE 0W-40 Mobil® One Synthetic, then SAE 5W-40 Mobil® One Synthetic would be acceptable.

## ENGINE OIL - DIESEL ENGINES - EXPORT

Use only Diesel Engine Oil meeting standard **MIL-2104C** or API Classification **CD or higher** or **CCML D4, D5**.

### SAE VISCOSITY GRADE

**CAUTION: Low viscosity oils must have the proper API quality or the CCMC G5 designation.**

To assure of properly formulated engine oils, it is recommended that SAE Grade 10W-40 engine oils that meet Chrysler material standard MS-6395, be used in accordance to ACEA B3, B4 specification. European Grade 10W-40 oils are also acceptable.

Oils of the SAE 5W-40 grade number are preferred when minimum temperatures consistently fall below -15° C (5° F).

## AXLE

**NOTE: DaimlerChrysler recommends using Mopar® lubricants or lubricants of equal quality.**

***FRONT AXLE***

- 186FIA (Model 30) - Mopar® Lubricant 80W-90

***REAR AXLE***

- 8 1/4 - Mopar® Gear Lubricant 75W-90 (Trailer Towing - Mopar® Synthentic Gear Lubricant 75W-140

**NOTE: Trac-lok® equipped axles require 118 ml (4 ounces) of Limited Slip Additive be added to the lubricant.**

## MANUAL TRANSMISSION

**NOTE: DaimlerChrysler recommends using Mopar® lubricants or lubricants of equal quality.**

- NSG370 - Mopar® Manual Transmission Lubricant MS-9224

## AUTOMATIC TRANSMISSION FLUID

**NOTE: Refer to Service Procedures in this group for fluid level checking procedures.**

Mopar® ATF +4, Automatic Transmission Fluid is the recommended fluid for DaimlerChrysler automatic transmissions.

**Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.**

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

### FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be**

**used.** The use of transmission “sealers” should also be avoided, since they may adversely affect the integrity of transmission seals.

## TRANSFER CASE - NV231

Recommended lubricant for the NV231 transfer case is Mopar® ATF +4, Automatic Transmission Fluid.

## TRANSFER CASE - NV241 GENII

Recommended lubricant for the NV2421 GENII transfer case is Mopar® ATF+4, Automatic Transmission Fluid.

## TRANSFER CASE - NV242

Recommended lubricant for the NV242 transfer case is Mopar® ATF+4, Automatic Transmission Fluid.

## ENGINE COOLANT

**WARNING: Antifreeze is an ethylene glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.**

**CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.**

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

**CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.**

## COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

**Pure Water-**Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

**100 percent Ethylene-Glycol-**The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

**50/50 Ethylene-Glycol and Water-**Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

**CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.**

**CAUTION: Do not use coolant additives that are claimed to improve engine cooling.**

## POWER STEERING FLUID

Mopar® ATF +4, Automatic Transmission Fluid is required in the power steering system. Substitute fluids can induce power steering system failure.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

## BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

**CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.**

**CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.**

## OPERATION - AUTOMATIC TRANSMISSION FLUID

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

# FLUID CAPACITIES

## SPECIFICATIONS - FLUID CAPACITIES

| DESCRIPTION | SPECIFICATION |

| FUEL TANK – Gasoline & Diesel | 19.5 U.S. Gallons (74L)* |
| ENGINE OIL | |
| 2.4L with Filter | 4.7L (5.0 qts.) |
| 3.7L with Filter | 4.7L (5.0 qts.) |
| 2.8L Diesel with Filter | 6.0L (6.3 qts.) |
| ENGINE COOLANT | |
| Cooling System - 2.4L | 9.5L (10.0 qts.) |
| Cooling System - 3.7L | 13.2L (14.0 qts.) |
| Cooling System-2.8L Diesel | 12.5 L (11.8 qts.) |
| POWER STEERING SYSTEM | |
| Power steering fluid capacities are dependent on engine/chassis options as well as steering gear/cooler options. Depending on type and size of internal cooler, length and inside diameter of cooler lines, or use of an auxiliary cooler, these capacities may vary. Refer to 19, Steering for proper fill and bleed procedures. | |
| AUTOMATIC TRANSMISSION | |
| Service Fill - 545RFE | 4.73L (10.0 pts) |
| O-haul Fill - 545RFE | 13.33L (28.0 pts) |
| Service Fill - 42RLE | 3.8L (8.0 pts) |
| O-haul Fill - 42RLE | 8.3L (17.6 pts) |
| Dry fill capacity depending on type and size of internal cooler, length and inside diameter of cooler lines, or use of an auxiliary cooler, these figures may vary. (Refer to 21 - TRANSMISSION/AUTOMATIC/FLUID - STANDARD PROCEDURE) | |
| TRANSFER CASE | |
| NV231 | 1.4L (2.95 pts.) |
| NV241 GENII | 2.0L (4.2 pts.) |
| NV242 | 1.6L (3.4 pts.) |
| MANUAL TRANSMISSION | |
| NSG370 (Approximate dry fill or fill to bottom edge of the fill plug hole.) | 1.5L (3.17 pts.) |
| FRONT AXLE | |
| 186 FIA (Model 30) | 1.24L (2.6 pts.) |
| REAR AXLE | |
| 8 1/4 | 2.08L (4.4 pts.)** |
| *Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure. | |
| ** When equipped with Trac-lok, include 118 ml (4.0 ounces) of Limited Slip Additive. | |

# MAINTENANCE SCHEDULES

## DESCRIPTION

## MAINTENANCE SCHEDULES - GASOLINE ENGINES

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule ″**B**″. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32°F (0°C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Trailer towing.
- Heavy loading.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.
- If equipped for and operated with E-85 (ethanol) fuel.

**NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow “Schedule B” of the “Maintenance Schedules” section of this manual.**

**NOTE: If ANY of these apply to you then flush and replace your engine coolant/anti-freeze every 102,000 miles (163 000 km) or 60 months, whichever comes first, and follow “Schedule B” of the “Maintenance Schedules” section of this manual.**

**NOTE: Most vehicles are operated under the conditions listed for Schedule “B.”**

Second is Schedule **“A”.** It is for vehicles that are not operated under any of the conditions listed under Schedule “B.”

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

***At Each Stop for Fuel***

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

***Once a Month***

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of the engine coolant/anti-freeze reservoir, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

***At Each Oil Change***

- Change the engine oil filter.
- Inspect the exhaust system.

- Inspect brake hoses.
- Check the engine coolant/anti-freeze level, hoses, and clamps.
- Inspect manual transmission fluid level — if equipped.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

## Schedule "B"

Follow schedule "B" if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 32°F (0°C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Trailer towing.
- Heavy loading.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.
- If equipped for and operated with E-85 (ethanol) fuel.

**NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow "Schedule B" of the "Maintenance Schedules" section of this manual.**

**NOTE: If ANY of these apply to you then flush and replace your engine coolant/anti-freeze every 102,000 miles (163 000 km) or 60 months, whichever comes first, and follow "Schedule B" of the "Maintenance Schedules" section of this manual.**

| Miles (Kilometers) | 108,000 (180 000) | 111,000 (185 000) | 114,000 (190 000) | 117,000 (195 000) | 120,000 (200 000) |
|---|---|---|---|---|---|
| Inspect the brake linings. | X | | | | X |
| Drain and refill the front and rear axle fluid‡ | | | | | X |
| Inspect the manual transmission fluid, add as necessary. | | | | | X |
| Drain and refill the automatic transmission fluid, replace main sump filter, and spin-on cooler return filter (if equipped).† | | | | | X |
| Inspect the drive belt and replace as needed. Not required if belt was previously replaced. | | | | | X |
| Drain and refill the transfer case fluid. | | | | | X |
| Flush and replace the engine coolant/anti-freeze at 120 months, if not replaced at 102,000 miles (170 000 km). | | | | | X |

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

† Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

◊ This maintenance is recommended by the manufacturer to the owner, but it is not required to maintain emissions warranty.

‡Off-highway operation, trailer towing, taxi, limousine, bus, snow plowing, or other types of commercial service or prolonged operation with heavy loading, especially in hot weather, require front and rear axle service indicated with a ‡ in Schedule "B". Perform these services if the vehicle is usually operated under these conditions.

## Schedule "A"

|---|---|---|---|
| Inspect the manual transmission fluid, add as necessary. | | | X |
| Drain and refill the transfer case fluid. | | | X |

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

◊ This maintenance is recommended by the manufacturer to the owner, but it is not required to maintain emissions warranty.

## MAINTENANCE SCHEDULES - DIESEL ENGINE

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule ″**B**″. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32°F (0°C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Trailer towing.
- Heavy loading.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

**NOTE: Most vehicles are operated under the conditions listed for Schedule “B.”**

Second is Schedule **“A”**. It is for vehicles that are not operated under any of the conditions listed under Schedule “B.”

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

### *At Each Stop for Fuel*

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

### *Once a Month*

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, clean and tighten the terminals as required.
- Check the fluid levels of engine coolant/anti-freeze deaeration bottle, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

### *At Each Oil Change*

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the engine coolant/anti-freeze level, hoses, and clamps.
- Inspect engine accessory drive belts. Replace as necessary.

- Inspect for the presence of water in the fuel filter/water separator unit.

***Tire Rotation***

- Rotate the tires every 6,250 miles (10 000 km).

## Schedule “B”

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 32°F (0°C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Trailer towing.
- Heavy loading.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

| **Miles (Kilometers)** | **6,250 (10 000)** | **12,500 (20 000)** | **18,750 (30 000)** | **25,000 (40 000)** | **31,250 (50 000)** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | | X | | X |
| **Replace the engine air filter element.** | | X | | X | |
| Inspect the boost pressure solenoid filter. Replace as necessary. | X | X | X | X | X |
| Replace the fuel filter/water separator unit. | | | | X | |
| Inspect the brake linings. | | X | | X | |
| Drain and refill the front and rear axle fluid. | | X | | X | |

| **Miles (Kilometers)** | **37,500 (60 000)** | **43,750 (70 000)** | **50,000 (80 000)** | **56,250 (90 000)** | **62,500 (100 000)** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | | X | | X | |
| **Replace the engine air filter element.** | X | | X | | X |
| Inspect the boost pressure solenoid filter. Replace as necessary. | X | X | X | X | X |
| Replace the boost pressure solenoid filter, if not previously replaced. | | | X | | |
| Replace the fuel filter/water separator unit. | | | X | | |
| Replace the engine accessory drive belt. | X | | | | |
| Inspect the brake linings. | X | | X | | X |
| Drain and refill the front and rear axle fluid. | X | | X | | X |
| Drain and refill the transfer case fluid. | | | | | X |
| Inspect the manual transmission fluid, add as necessary. | | | | | X |

| **Miles**<br>**(Kilometers)** | **37,500**<br>**(60 000)** | **43,750**<br>**(70 000)** | **50,000**<br>**(80 000)** | **56,250**<br>**(90 000)** | **62,500**<br>**(100 000)** |
|---|---|---|---|---|---|
| Drain and refill the automatic transmission fluid, replace sump filter, and spin-on cooler return filter (if equipped). ♢ | | | | | X |

| **Miles**<br>**(Kilometers)** | **68,750**<br>**(110 000)** | **75,000**<br>**(120 000)** | **81,250**<br>**(130 000)** | **87,500**<br>**(140 000)** | **93,750**<br>**(150 000)** | **100,000**<br>**(160 000)** |
|---|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | | X | | X | |
| **Replace the engine air filter element.** | | X | | X | | X |
| Inspect the boost pressure solenoid filter. Replace as necessary. | X | X | X | X | X | X |
| Replace the boost pressure solenoid filter, if not previously replaced. | | | | | | X |
| Replace the engine accessory drive belt.* | | X | | | | |
| Replace the engine timing belt and idler pulleys. | | | | | | X |
| Inspect the engine timing belt tensioner, replace if necessary.† | | | | | | X |
| Replace the fuel filter/water separator unit. | | X | | | | X |
| Flush and replace the engine coolant/anti-freeze. | | | | | | X |
| Inspect the brake linings. | | X | | X | | |
| Drain and refill the front and rear axle fluid. | | X | | X | | |

♢ Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

† The replacement of such component is requested if there is superficial wear, bearing clearance, or evident grease leak.

* This maintenance is not required if the belt was previously replaced.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

## Schedule "A"

| **Miles**<br>**(Kilometers)** | **12,500**<br>**(20 000)** | **25,000**<br>**(40 000)** | **37,500**<br>**(60 000)** | **50,000**<br>**(80 000)** |

| Inspect the brake linings. | | X | | X |
| Inspect the manual transmission fluid, add as necessary. | X | | | |

| **Miles (Kilometers)** | **12,500 (20 000)** | **25,000 (40 000)** | **37,500 (60 000)** | **50,000 (80 000)** |
|---|---|---|---|---|
| Inspect the transfer case fluid. | X | | | |

| **Miles (Kilometers)** | **62,500 (100 000)** | **75,000 (120 000)** | **87,500 (140 000)** | **100,000 (160 000)** |
|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | | X | |
| **Replace the engine air filter element.** | | X | | X |
| Inspect the boost pressure solenoid filter. Replace as necessary. | X | X | X | X |
| Replace the boost pressure solenoid filter, if not previously replaced. | | | | X |
| Replace the fuel filter/water separator unit. | | X | | X |
| Replace the engine timing belt, and idler pulleys. | | | | X |
| Inspect the engine timing belt tensioner, replace if necessary.† | | | | X |
| Flush and replace the engine coolant/anti-freeze. | X | | | |
| Replace the engine accessory drive belt. | X | | | |
| Inspect the brake linings. | | X | | X |
| Inspect the transmission fluid, add as necessary. | X | | | |
| Inspect the transfer case fluid. | X | | | |

† The replacement of such component is requested if there is superficial wear, bearing clearance, or evident grease leak.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

## MAINTENANCE SCHEDULES - GASOLINE ENGINES - EXPORT

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **“A”.** It is for vehicles that are not operated under any of the conditions listed under Schedule “B.”

Second is Schedule **″B″.** It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

Most vehicles are operated under the conditions listed for Schedule “B.”

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

### *At Each Stop for Fuel*

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

### *Once a Month*

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

### *At Each Oil Change*

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the coolant level, hoses, and clamps.
- Inspect manual transmission fluid level — if equipped.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

## Schedule “A”

| **Kilometers (Miles) [Months]** | **12 000 (7,500) [6]** | **24 000 (15,000) [12]** | **36 000 (22,500) [18]** | **48 000 (30,000) [24]** | **60 000 (37,500) [30]** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| Rotate the tires. | X | X | X | X | X |
| **Inspect the engine air filter element, replace if necessary.** | | | | X | |
| **Replace the spark plugs.** | | | | X | |
| Inspect the brake linings. | | | X | | |
| Inspect the transfer case fluid. | | | | X | |

| **Kilometers (Miles) [Months]** | **72 000 (45,000) [36]** | **84 000 (52,500) [42]** | **96 000 (60,000) [48]** | **108 000 (67,500) [54]** |

| **Inspect and replace the PCV valve, if necessary.** ♢ | | | | X |
| Inspect the brake linings. | | | X | |
| Inspect the drive belt and replace as needed. Not required if previously replaced. | | X | | X |
| Flush and replace the engine coolant if not done at 60 months. | X | | | |
| Drain the transfer case, and refill. | | | | X |

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

♢ This maintenance is recommended by the manufacturer to the owner, but it is not required to maintain emissions warranty.

## Schedule “B”

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

| **Kilometers (Miles)** | **5 000 (3,000)** | **10 000 (6,000)** | **14 000 (9,000)** | **19 000 (12,000)** | **24 000 (15,000)** |

| **Inspect the engine air filter element, replace if necessary.** | | | | | X |
| **Replace the spark plugs.** | | | | | X |
| **Inspect and replace the PCV valve, if necessary.** ♢ | | | | | X |
| Inspect the brake linings. | X | | | | X |
| Drain and refill the front and rear axle fluid‡ | | | | | X |
| Drain and refill the automatic transmission fluid, and replace main sump filter. | | | | | X |
| Inspect the drive belt and replace as needed. Not required if belt was previously replaced. | | | | | X |
| Drain and refill the transfer case fluid. | | | | | X |

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

♢ This maintenance is recommended by the manufacturer to the owner, but it is not required to maintain emissions warranty.

‡Off-highway operation, trailer towing, taxi, limousine, bus, snow plowing, or other types of commercial service or prolonged operation with heavy loading, especially in hot weather, require front and rear axle service indicated with a ‡ in Schedule "B". Perform these services if the vehicle is usually operated under these conditions.

## DESCRIPTION – DIESEL ENGINES – EXPORT SCHEDULES

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **"A"**. It is for vehicles that are not operated under any of the conditions listed under Schedule ″B″.

Second is Schedule **"B"**. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

Most vehicles are operated under the conditions listed for Schedule ″B″.

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

### *At Each Stop for Fuel*

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

*Once a Month*

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

*At Each Oil Change*

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the engine coolant/anti-freeze level, hoses, and clamps.
- Inspect engine accessory drive belts. Replace as necessary.
- Inspect for the presence of water in the fuel filter/water separator unit.

*Tire Rotation*

- Rotate the tires every 10 000 km (6,000 miles).

## Schedule "A"

| **Kilometers (Miles)** | **20 000 (12,500)** | **40 000 (25,000)** | **60 000 (37,500)** | **80 000 (50,000)** |
|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X |
| **Replace the engine air filter element.** | | X | | X |
| Replace the fuel filter/water separator unit. | | X | | X |
| Inspect the brake linings. | | X | | X |
| Inspect the transfer case fluid. | X | | | |

| **Kilometers (Miles)** | **100 000 (62,500)** | **120 000 (75,000)** | **140 000 (87,500)** | **160 000 (100,000)** |
|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X |
| **Replace the engine air filter element.** | | X | | X |
| Replace the fuel filter/water separator unit. | | X | | X |
| Replace the engine timing belt, and idler pulleys. | | | | X |
| Inspect the engine timing belt tensioner, replace if necessary. ◊ | | | | X |
| Flush and replace the engine coolant. | X | | | |
| Replace the engine accessory drive belt. | X | | | |
| Inspect the brake linings. | | X | | X |
| Inspect the transfer case fluid. | X | | | |

Inspection and service should also be performed anytime a malfunction is observed or suspected.

‡ Replace if there is superficial wear, bearing clearance, or evident grease leak.

**WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**

## Schedule “B”

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

| **Kilometers (Miles)** | **10 000 (6,250)** | **20 000 (12,500)** | **30 000 (18,750)** | **40 000 (25,000)** | **50 000 (31,250)** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X | X |
| **Replace the engine air filter element.** | | X | | X | |
| Replace the fuel filter/water separator unit. | | | | X | |
| Inspect the brake linings. | | X | | X | |
| Drain and refill the front and rear axle fluid. | | X | | X | |

| **Kilometers (Miles)** | **60 000 (37,500)** | **70 000 (43,750)** | **80 000 (50,000)** | **90 000 (56,250)** | **100 000 (62,500)** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X | X |
| **Replace the engine air filter element.** | X | | X | | X |
| Replace the fuel filter/water separator unit. | | | X | | |
| Replace the engine accessory drive belt. | X | | | | |
| Inspect the brake linings. | X | | X | | X |
| Drain and refill the front and rear axle fluid. | X | | X | | X |
| Drain and refill the transfer case fluid. | | | | | X |
| Drain and refill the automatic transmission fluid, and replace sump filter. ◊ | | | | | X |

| **Kilometers (Miles)** | **110 000 (68,750)** | **120 000 (75,000)** | **130 000 (81,250)** | **140 000 (87,500)** | **150 000 (93,750)** | **160 000 (100,000)** |
|---|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X | X | X |
| **Replace the engine air filter element.** | | X | | X | | X |
| Replace the engine accessory drive belt. | | X | | | | |
| Replace the engine timing belt and idler pulleys. | | | | | | X |
| Inspect the engine timing belt tensioner, replace if necessary.† | | | | | | X |
| Replace the fuel filter/water separator unit. | | X | | | | X |

| **Kilometers**<br><br>**(Miles)** | **110 000**<br><br>**(68,750)** | **120 000**<br><br>**(75,000)** | **130 000**<br><br>**(81,250)** | **140 000**<br><br>**(87,500)** | **150 000**<br><br>**(93,750)** | **160 000**<br><br>**(100,000)** |

| Drain and refill the front and rear axle fluid. | | X | | X | | |

◊ Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

† The replacement of such component is requested when there is superficial wear, bearing clearance, or evident grease leak.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

# FLUID FILL/CHECK LOCATIONS

## DESCRIPTION

The fluid check/fill point locations are located in each applicable service manual section.

# HOISTING

## STANDARD PROCEDURE - HOISTING RECOMMENDATIONS

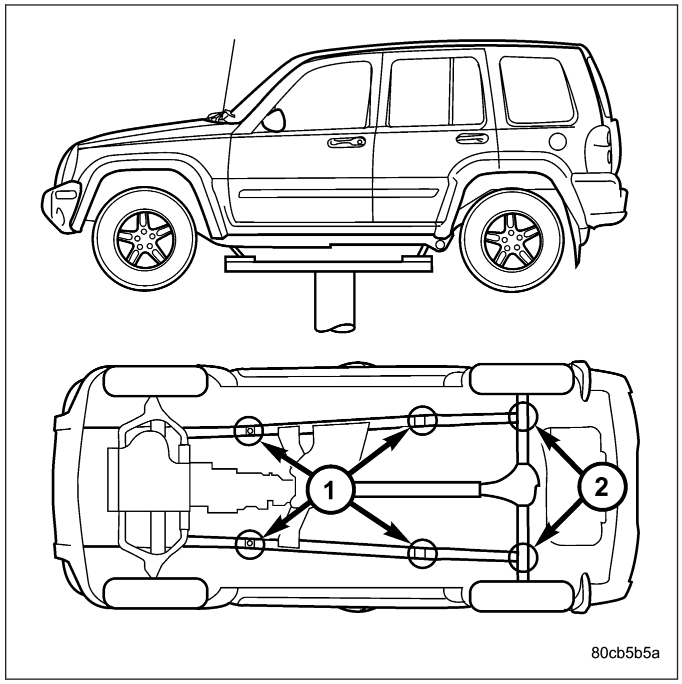
Refer to the Owner's Manual for emergency vehicle lifting procedures.

When properly positioned, a floor jack can be used to lift a Jeep vehicle. Support the vehicle in the raised position with jack stands at the front and rear ends of the frame rails.

**CAUTION: Do not attempt to lift a Jeep vehicle with a floor jack positioned under:**

- A body side sill.
- A steering linkage component.
- A drive shaft.
- The engine or transmission oil pan.
- The fuel tank.
- A front suspension arm.
- Transfer case.

**NOTE: Use the correct sub-frame rail or frame rail lifting locations only.**



## HOIST

Refer to the Owner's Manual for emergency vehicle lifting procedures.

A vehicle can be lifted with:

- A single-post, frame-contact hoist.
- A twin-post, chassis hoist.
- A ramp-type, drive-on hoist.

**NOTE: When a frame-contact type hoist is used, verify that the lifting pads are positioned properly.**

**WARNING: THE HOISTING AND JACK LIFTING POINTS PROVIDED ARE FOR A COMPLETE VEHICLE. WHEN A CHASSIS OR DRIVETRAIN COMPONENT IS REMOVED FROM A VEHICLE, THE CENTER OF GRAVITY IS ALTERED MAKING SOME HOISTING CONDITIONS UNSTABLE. PROPERLY SUPPORT OR SECURE VEHICLE TO HOISTING DEVICE WHEN THESE CONDITIONS EXIST.**

# JUMP STARTING

## STANDARD PROCEDURE - JUMP STARTING PROCEDURE

**WARNING: REVIEW ALL SAFETY PRECAUTIONS AND WARNINGS IN THE BATTERY SYSTEM SECTION OF THE SERVICE MANUAL. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE)**

- **DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT.**
- **IF EQUIPPED, DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS YELLOW OR BRIGHT COLOR.**
- **DO NOT JUMP START A VEHICLE WHEN THE BATTERY FLUID IS BELOW THE TOP OF LEAD PLATES.**
- **DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE.**
- **DO NOT USE OPEN FLAME NEAR BATTERY.**
- **REMOVE METALLIC JEWELRY WORN ON HANDS OR WRISTS TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.**
- **WHEN USING A HIGH OUTPUT BOOSTING DEVICE, DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS. REFER TO INSTRUCTIONS PROVIDED WITH DEVICE BEING USED.**
  **FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.**

**CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.**

### TO JUMP START A DISABLED VEHICLE:

1. Raise hood on disabled vehicle and visually inspect engine compartment for:
   - Generator drive belt condition and tension.
   - Fuel fumes or leakage, correct if necessary.
   - Frozen battery.
   - Yellow or bright color test indicator, if equipped.
   - Low battery fluid level.

**CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.**

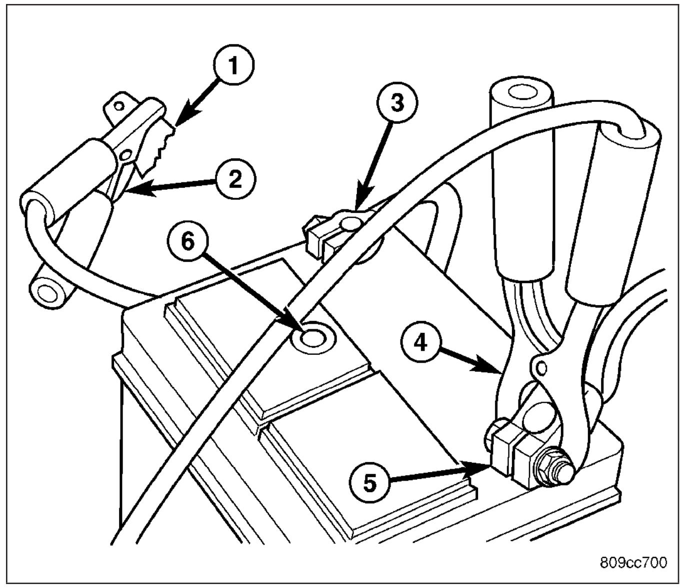
2. When using another vehicle as a booster source, turn off all accessories, place gear selector in park or neutral, set park brake or equivalent and operate engine at 1200 rpm.
3. On disabled vehicle, place gear selector in park or neutral and set park brake or equivalent. Turn OFF all accessories.
4. Connect jumper cables to booster battery. RED clamp to positive terminal (+). BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result . Review all warnings in this procedure.
5. On disabled vehicle, connect RED jumper cable clamp to battery positive (+) terminal. Connect BLACK jumper cable clamp to the engine as close to the ground cable connection as possible.

**CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.**

6. Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 min.), before cranking again.

## DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.
- When using a Booster vehicle, disconnect BLACK cable clamp from battery negative terminal. Disconnect RED cable clamp from battery positive terminal.
- Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

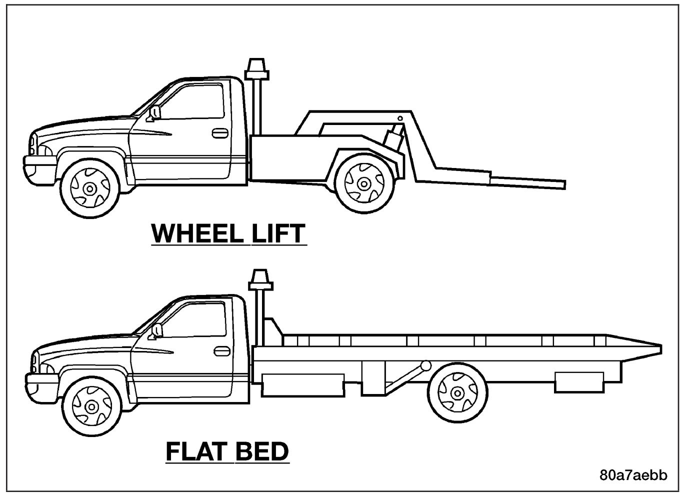


# TOWING

## STANDARD PROCEDURE - TOWING

A vehicle equipped with SAE approved wheel lift-type towing equipment can be used to tow Jeep vehicles. When towing a 4WD vehicle using a wheel-lift towing device, use tow dollies under the opposite end of the vehicle. A vehicle with flatbed device can also be used to transport a disabled vehicle.

### SAFETY PRECAUTIONS



**CAUTION: The following safety precautions must be observed when towing a vehicle:**

- Secure loose and protruding parts.
- Always use a safety chain system that is independent of the lifting and towing equipment.
- Do not allow towing equipment to contact the disabled vehicle's fuel tank.
- Do not allow anyone under the disabled vehicle while it is lifted by the towing device.
- Do not allow passengers to ride in a vehicle being towed.
- Always observe state and local laws regarding towing regulations.
- Do not tow a vehicle in a manner that could jeopardize the safety of the operator, pedestrians or other motorists.
- Do not attach tow chains, T-hooks, or J-hooks to a bumper, steering linkage, drive shafts or a non-reinforced frame hole.
- Do not tow a heavily loaded vehicle. Use a flatbed device to transport a loaded vehicle.

### TWO-WHEEL-DRIVE VEHICLE TOWING

DaimlerChrysler Corporation recommends that a vehicle be towed with the rear end lifted, whenever possible.

**WARNING: WHEN TOWING A DISABLED VEHICLE AND THE DRIVE WHEELS ARE SECURED IN A WHEEL LIFT OR TOW DOLLIES, ENSURE THE TRANSMISSION IS IN THE PARK POSITION (AUTOMATIC TRANSMISSION) OR A FORWARD DRIVE GEAR (MANUAL TRANSMISSION).**

**WARNING: ENSURE VEHICLE IS ON A LEVEL SURFACE OR THE WHEELS ARE BLOCKED TO PREVENT VEHICLE FROM ROLLING.**

### TWO WHEEL DRIVE TOWING-REAR END LIFTED

**CAUTION: Do not use steering column lock to secure steering wheel during towing operation.**

2WD vehicles can be towed with the front wheels on the surface for extended distances at speeds not exceeding 48 km/h (30 mph).

1. Attach wheel lift device to rear wheels.
2. Place the transmission in neutral.
3. Raise vehicle to towing position.
4. Attach safety chains. Route chains so not to interfere with tail pipe when vehicle is lifted.
5. Turn the ignition switch to the OFF position to unlock the steering wheel.

**CAUTION: Do not use steering column lock to secure steering wheel during towing operation.**

6. Secure steering wheel in straight ahead position with a clamp device designed for towing.
7. Place transmission in park.

## TWO WHEEL DRIVE TOWING-FRONT END LIFTED

**CAUTION: Many vehicles are equipped with air dams, spoilers, and/or ground effect panels. To avoid component damage, a wheel-lift towing vehicle or a flat-bed hauling vehicle is recommended.**

1. Attach wheel lift device to rear wheels.
2. Place the transmission in neutral.
3. Raise the rear of the vehicle off the ground and install tow dollies under rear wheels.
4. Attach wheel lift device to front wheels and raise vehicle to towing position.
5. Attach the safety chains.

**CAUTION: Do not use steering column lock to secure steering wheel during towing operation.**

6. Turn the ignition switch to the OFF position to unlock the steering wheel.
7. Secure steering wheel in straight ahead position with a clamp device designed for towing.
8. Place transmission in park.

## FOUR-WHEEL-DRIVE VEHICLE TOWING

DaimlerChrysler Corporation recommends that a 4WD vehicle be transported on a flat-bed device. A Wheel-lift device can be used provided **the trailing wheels are off the ground and positioned in tow dollies.**

**WARNING: WHEN TOWING A DISABLED VEHICLE AND THE DRIVE WHEELS ARE SECURED IN A WHEEL LIFT OR TOW DOLLIES, ENSURE THE TRANSMISSION IS IN THE PARK POSITION.**

**CAUTION: Many vehicles are equipped with air dams, spoilers, and/or ground effect panels. To avoid component damage, a wheel-lift towing vehicle or a flat-bed hauling vehicle is recommended.**

## FOUR WHEEL DRIVE TOWING—REAR END LIFTED

**WARNING: ENSURE VEHICLE IS ON A LEVEL SURFACE OR THE WHEELS ARE BLOCKED TO PREVENT VEHICLE FROM ROLLING.**

1. Attach wheel lift device to front wheels.
2. Place the transmission in neutral.
3. Raise the front of the vehicle off the ground and install tow dollies under front wheels.
4. Attach wheel lift device to rear wheels and raise vehicle to towing position.
5. Attach safety chains. Route chains so not to interfere with tail pipe when vehicle is lifted.
6. Turn the ignition switch to the OFF position to unlock the steering wheel.

**CAUTION: Do not use steering column lock to secure steering wheel during towing operation.**

7. Secure steering wheel in straight ahead position with a clamp device designed for towing.
8. Place transmission in park.

## FOUR WHEEL DRIVE TOWING—FRONT END LIFTED

**WARNING: ENSURE VEHICLE IS ON A LEVEL SURFACE OR THE WHEELS ARE BLOCKED TO PREVENT VEHICLE FROM ROLLING.**

1. Attach wheel lift device to rear wheels.
2. Place the transmission in neutral.
3. Raise the rear of the vehicle off the ground and install tow dollies under rear wheels.
4. Attach wheel lift device to front wheels and raise vehicle to towing position.
5. Attach the safety chains.

**CAUTION: Do not use steering column lock to secure steering wheel during towing operation.**

6. Turn the ignition switch to the OFF position to unlock the steering wheel.
7. Secure steering wheel in straight ahead position with a clamp device designed for towing.
8. Place transmission in park.

| IMPROPER TRACKING | Loose, worn or bent steering/ suspension components. | Inspect, tighten or replace components as necessary. |

# WHEEL ALIGNMENT

## TABLE OF CONTENTS

# WHEEL ALIGNMENT

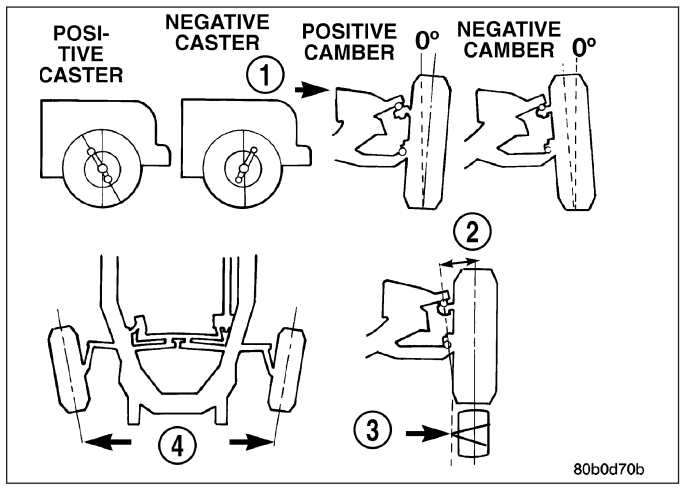
## DESCRIPTION

**NOTE: Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.**

Wheel alignment involves the correct positioning of the wheels in relation to the vehicle. The positioning is accomplished through suspension and steering linkage adjustments. An alignment is considered essential for efficient steering, good directional stability and to minimize tire wear. The most important measurements of an alignment are caster, camber and toe.

**CAUTION: Never attempt to modify suspension or steering components by heating or bending.**

**NOTE: Periodic lubrication of the front suspension/steering system components may be required. Rubber bushings must never be lubricated. Refer to Lubrication And Maintenance for the recommended maintenance schedule.**



## OPERATION

- **CASTER** is the forward or rearward tilt of the steering knuckle from vertical. Tilting the top of the knuckle forward provides negative caster. Tilting the top of the knuckle rearward provides positive caster. Positive caster promotes directional stability. This angle enables the front wheels to return to a straight ahead position after turns
- **CAMBER** is the inward or outward tilt of the wheel relative to the center of the vehicle. Tilting the top of the wheel inward provides negative camber. Tilting the top of the wheel outward provides positive camber. Incorrect camber will cause wear on the inside or outside edge of the tire
- **TOE** is the difference between the leading inside edges and trailing inside edges of the front tires. Wheel toe position out of specification cause's unstable steering, uneven tire wear and steering wheel off- center. The wheel toe position is the **final** front wheel alignment adjustment
- **THRUST ANGLE** is the angle of the rear axle relative to the centerline of the vehicle. Incorrect thrust angle can cause off-center steering and excessive tire wear. This angle is not adjustable, damaged component(s) must be replaced to correct the thrust angle

# STANDARD PROCEDURE

## STANDARD PROCEDURE - HEIGHT MEASUREMENT

### RIDE HEIGHT

**NOTE: The suspension is non-adjustable.**

The vehicle suspension height should be measured before performing wheel alignment procedure. Also when front suspension components have been replaced. This measure must be performed with the vehicle supporting it's own weight and taken on both sides of the vehicle.

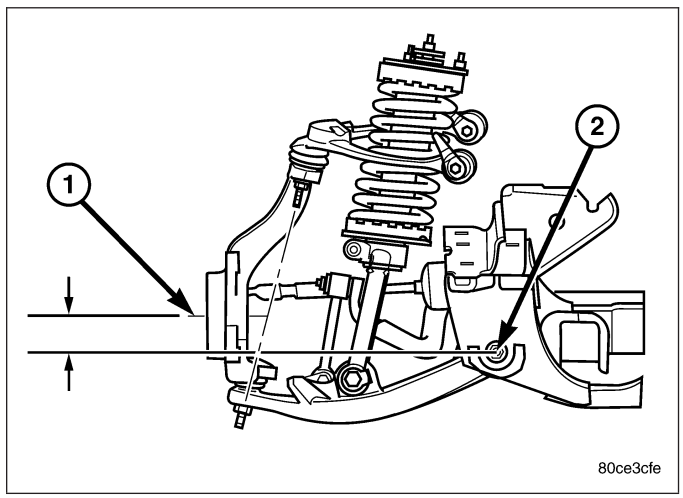
Front and rear ride heights are not adjustable. The spring selections at assembly determine ride height for acceptable appearance of the vehicle. Ride height dimensions assume full fluids (including fuel) and zero passengers. Refer to the table below for front ride height dimensions.

Vehicle ride height audits should be performed utilizing the following procedure:

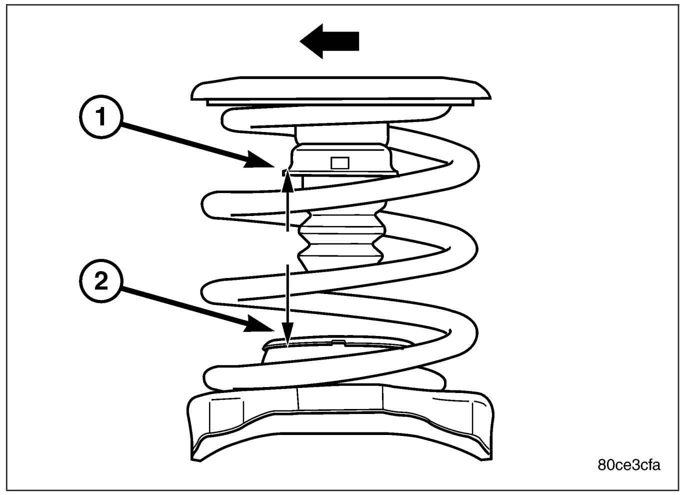
1. Drive the vehicle straight and forward on a non-tacky surface for a minimum of 20 feet to neutralize track width.
2. Bounce the front of the vehicle five times.
3. Measure and record the dimensions

FRONT RIDE HEIGHT Front ride height is defined by the relative vertical distance between the spindle center line and the rear pivot point of the front lower control arm to cradle attachment. The spindle center line is to be measured at the outer wheel face (point A). The rear pivot point is to be measured at the center of the cam/pivot bolt (point B) at its rearward most end (nut end).

REAR RIDE HEIGHT Rear ride height is defined by the relative vertical distance between the top of the lower spring seat strike surface and the bottom of the jounce cup (true metal to metal jounce travel). This is to be measured vertically inside the coil from the point intersecting the inboard edge and the for/aft center of



the jounce cup (point C) down to the strike surface (point D).



| Measurement | Target | Minimum | Maximum |
|---|---|---|---|
| Front Ride Height Distance AB | 66.5 mm Z=996.8 - 930.3 mm | 56.5 mm | 76.5 mm |
| Front Cross Ride Height Left - Right | 0.0 mm | -10.0 mm | 10.0 mm |
| Rear Ride Height Distance CD | 92.1 mm | 82.1 mm | 102.1 mm |
| Rear Cross Ride Height Left - Right | 0.0 mm | -10.0 mm | 10.0 mm |

## STANDARD PROCEDURE - CAMBER AND CASTER ADJUSTMENT

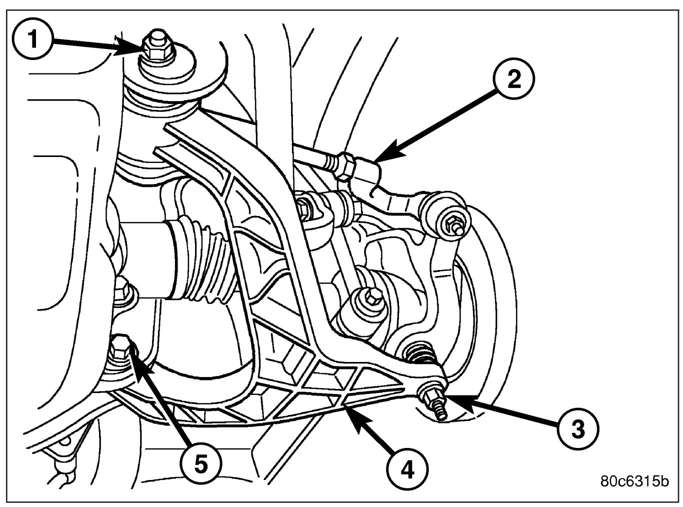
Camber and caster angle adjustments involve changing the position of the lower control arm cam bolts.

## STANDARD PROCEDURE - TOE ADJUSTMENT

4X4 SUSPENSION HEIGHT MESUREMENT MUST BE PERFORMED BEFORE AN ALIGNMENT.

The wheel toe position adjustment is the final adjustment.

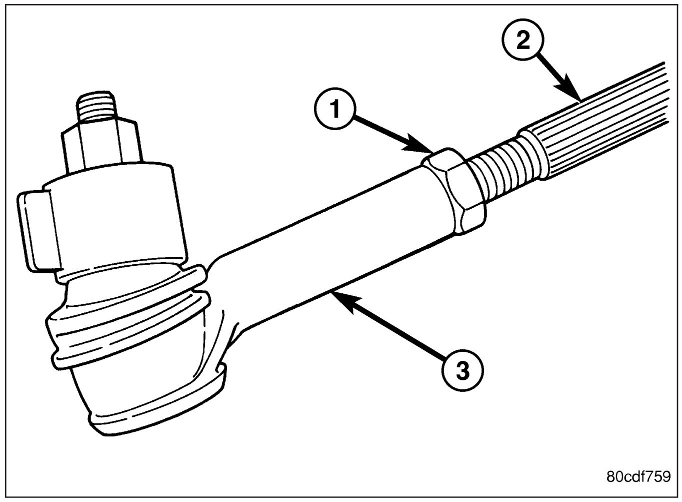
1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.
2. Loosen the tie rod jam nuts.



**NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.**

3. Adjust the wheel toe position by turning the tie rod as necessary.

4. Tighten the tie rod jam nut to 75 N·m (55 ft. lbs.).
5. Verify the specifications
6. Turn off engine.



## STANDARD PROCEDURE - CAMBER, CASTER AND TOE ADJUSTMENT

Camber and caster angle adjustments involve changing the position of the lower suspension arm cam bolts.

### CASTER

Moving the rear position of the cam bolt in or out, will change the caster angle significantly and camber angle only slightly. To maintain the camber angle while adjusting caster, move the rear of the cam bolt in or out. Then move the front of the cam bolt slightly in the opposite direction.

To increase positive caster angle, move the rear position of the cam bolt outward (from the engine). Move the front of cam bolt inward (toward the engine) slightly until the original camber angle is obtained.

### CAMBER

Move both of the cam bolts together in or out. This will change the camber angle significantly and caster angle slightly.

After adjustment is made tighten the cam bolt nuts to proper torque specification.

### TOE ADJUSTMENT

The wheel toe position adjustment is the final adjustment.

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.
2. Loosen the tie rod jam nuts.

**NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.**

3. Adjust the wheel toe position by turning the tie rod as necessary .
4. Tighten the tie rod jam nut to 75 N·m (55 ft. lbs.).
5. Verify the specifications
6. Turn off engine.

# SPECIFICATIONS

**NOTE: Suspension components with rubber/urethane bushings (2) should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.**

The front suspension is designed to allow each wheel to adapt to different road surfaces independently. The wheels are mounted to hub bearings on the steering knuckle spindles (5). The double-row hub bearings are sealed and lubricated for life. The steering knuckles turn (pivot) on ball joints integral to the outboard portion of the upper control arms and pressed into the lower steering knuckle. The ball joints are lubricated for life.

## WARNING

**WARNING: Suspension components with rubber bushings must be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort will be affected and cause premature bushing wear.**

# BUSHINGS

## REMOVAL

### STABILIZER BAR BUSHINGS

1. Raise vehicle on hoist.
2. Remove the stabilizer bushing clamps.
3. Remove the stabilizer bushings from the stabilizer bar.

### LOWER CONTROL ARM BUSHING

1. Remove the lower control arm (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).
2. Secure the control arm in a vise.

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

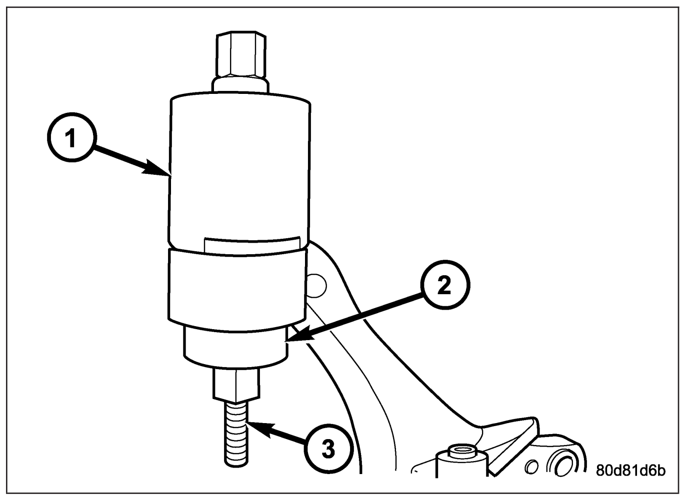
3. Press the bushing out using special tools 8858-5 (Receiver), 8858-6 (Driver) and 8839 with the threaded rod and the bearing as shown

### CLEVIS BRACKET BUSHING

1. Remove the clevis bracket from the shock (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - REMOVAL).

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

2. Press the bushing out using special tools 8858-1 (receiver), 8858-3 (driver) and 8839 with the threaded rod 8839 and the bearing as shown

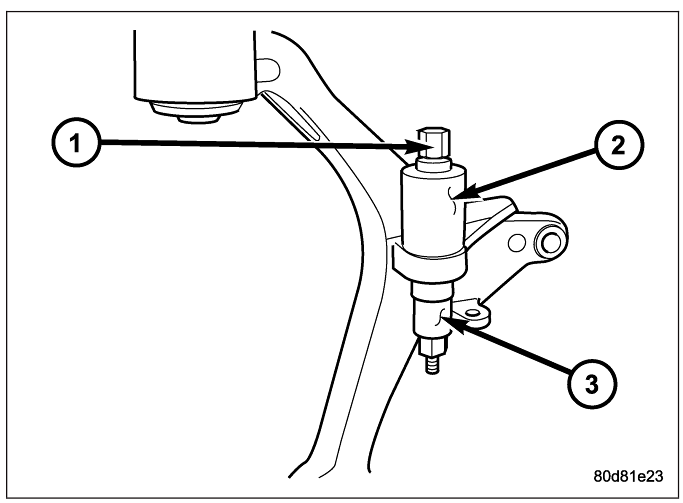


### UPPER CONTROL ARM BUSHINGS

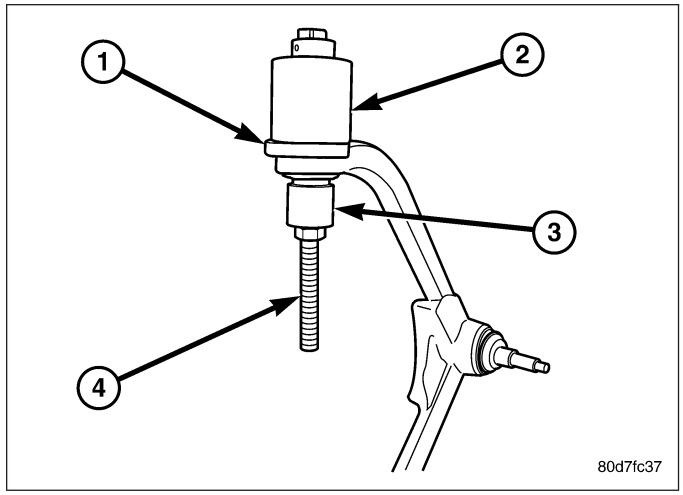
1. Remove the upper control arm (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - REMOVAL).
2. Secure the control arm in a vise.

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

3. Install bushing remover tools 8830-3 (Adapter), 8830-2 (Receiver) and 8830–4 (Driver) with the threaded rod 8838 and the bearing as shown



4. Press out the bushing.



## INSTALLATION

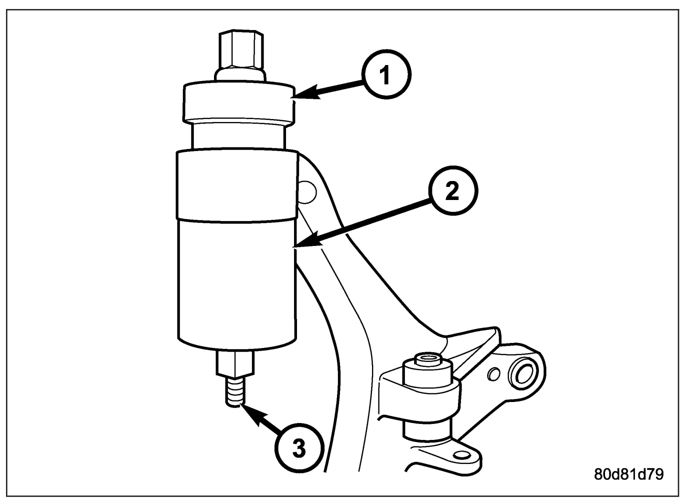
## STABILIZER BAR BUSHINGS

1. Install the stabilizer bushings to the stabilizer bar.
2. Install the stabilizer bushing clamps. Tighten the nuts to 149 N·m (110 ft.lbs.).
3. Lower the vehicle.

## LOWER CONTROL ARM BUSHING

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

1. Install the new lower control arm bushings into the lower control arm using tools 8858-5 (driver), 8858-6 (receiver) and the bearing with the threaded rod 8839 making sure to properly orient the bushing in the control.
2. Remove the control arm from the vise.
3. Install the lower control arm (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).
4. Reset the vehicle ride height (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
5. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

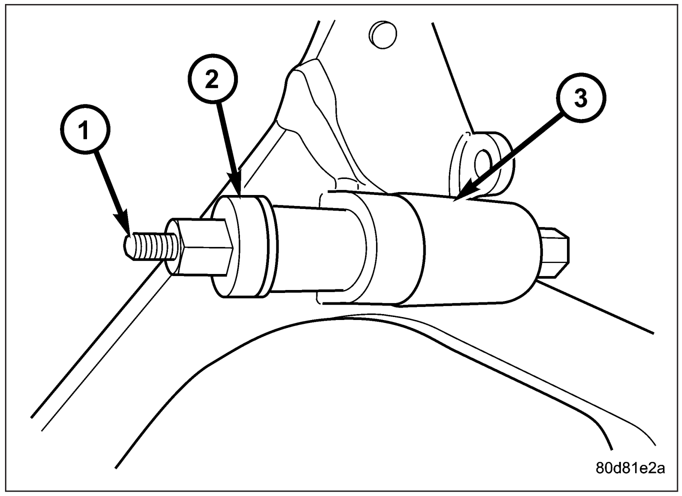


## CLEVIS BRACKET BUSHING

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

1. Install the new clevis bracket bushing into the lower control arm using tools 8858-2 (driver), 8858-1 (receiver) and the bearing with the threaded rod 8839 making sure to properly orient the bushing in the control.

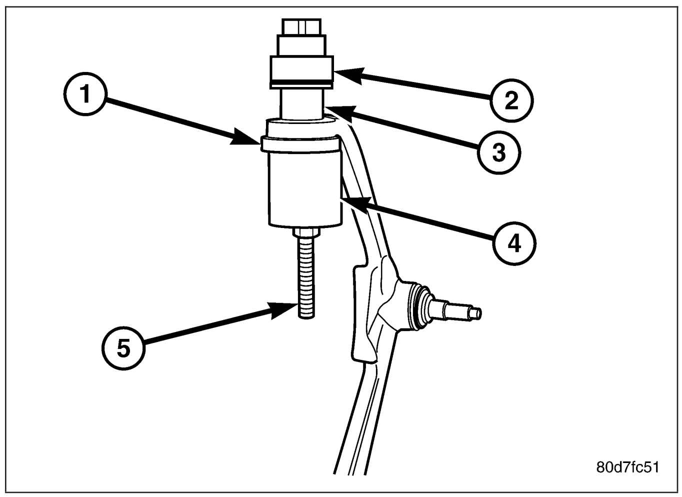
2. Install the clevis bracket (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - INSTALLATION).



## UPPER CONTROL ARM BUSHINGS

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

1. Install the new upper control arm bushings into the upper control arm using tools 8830-3 (Adapter), 8830-1 (Driver) and 8830-2 (Receiver) the bearing with the threaded rod 8838 making sure to properly orient the bushing in the control arm.
2. Remove the control arm from the vise.
3. Install the upper control arm (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - INSTALLATION).
4. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).



# HUB / BEARING

## REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

**CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.**

4. Remove the disc brake rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
5. Remove the wheel speed sensor (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - REMOVAL).
6. Remove the bracket securing the wheel speed sensor wire.
7. Remove the axle shaft nut. (if equipped with four wheel drive)
8. Remove the three mounting bolts for the hub/bearing assembly.
9. Remove the hub/bearing.

## INSTALLATION

1. Install the hub/bearing assembly to the vehicle.
2. Install the three mounting bolts for the hub/bearing. Tighten the bolt to 130 N·m (96 ft.lbs.).
3. Install the axle shaft nut. Tighten the nut to 135 N·m (100 ft.lbs.). (if equipped with four wheel drive)
4. Install the bracket to the wheel speed sensor wire.
5. Install the wheel speed sensor to the hub. Tighten the bolt to 13.5 N·m (10 ft.lbs.) (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - INSTALLATION).
6. Install the disc brake rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
7. Install the disc brake caliper adapter. Tighten the nut to 135 N·m (100 ft.lbs.) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
8. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

# KNUCKLE

## REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the caliper adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).

**CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.**

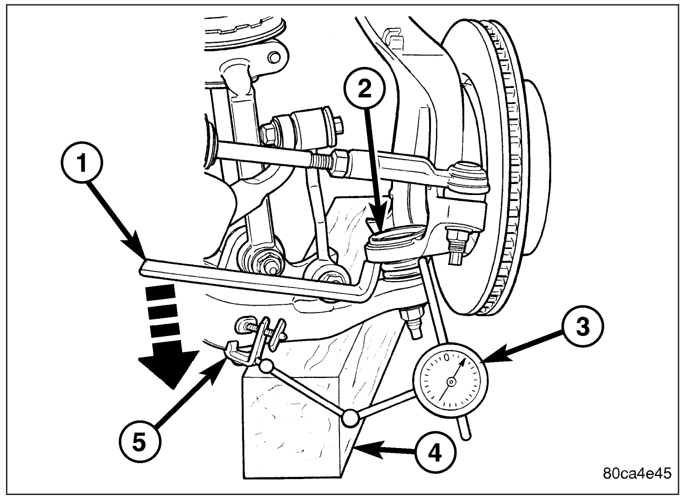
4. Remove the disc brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
5. Remove the wheel speed sensor. (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - REMOVAL).
6. Remove the axle shaft nut. (if equipped with four wheel drive)
7. Remove the hub/bearing. (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - REMOVAL).
8. Seperate the outer tie rod end from the steering knuckle. (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).
9. Remove the lower ball joint nut.
10. Seperate the lower ball joint from the suspension arm using tool C–4150A.
11. Remove the upper ball joint nut.
12. Seperate the upper ball joint from the knuckle using tool C–4150A.
13. Remove the knuckle from the vehicle.

## INSTALLATION

1. Install the knuckle to the vehicle.
2. Install the upper ball joint nut. Tighten the nut to 81 N·m (60 ft.lbs.).
3. Install the lower ball joint nut. Tighten the nut to 81 N·m (60 ft.lbs.).
4. Install the outer tie rod end to the steering knuckle. (Refer to 19 - STEERING/LINKAGE/TIE ROD END - INSTALLATION).
5. Install the hub/bearing. (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - INSTALLATION).
6. Install the axle shaft nut. Tighten the nut to 135 N·m (96 ft.lbs.).(if equipped with four wheel drive).
7. Install the wheel speed sensor. (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - INSTALLATION).
8. Install the disc brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
9. Install the caliper adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).
10. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
11. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

# LOWER BALL JOINT

## DIAGNOSIS AND TESTING - LOWER BALL JOINT



1. Raise the vehicle on a drive-on hoist.

**NOTE: If a drive-on hoist is not available, use wooden blocks with jack stands to support the lower control arm in the ball joint area. Place the jack stands appropriately and lower the hoist placing weight on the lower control arm. The lower control arms should now be supporting the vehicle weight.**

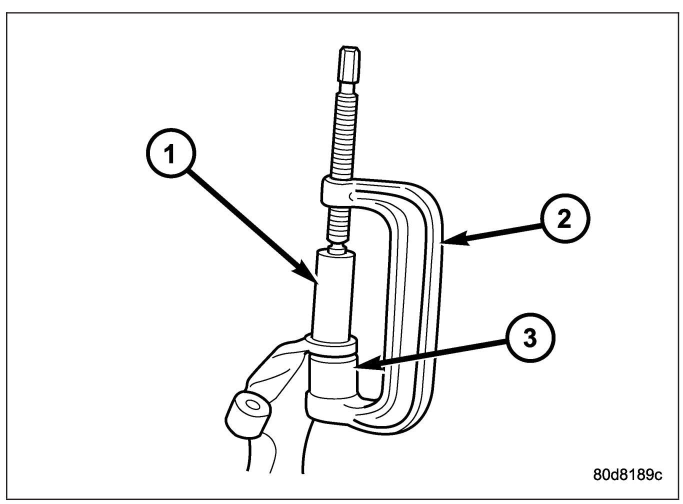
2. With the use of jack stands, lift the front end off the hoist and position wooden blocks (4) underneath both lower control arms supporting the vehicles weight.
3. Remove the tire and wheel assembly.
4. Attach a dial indicator (3) to the base of the lower control arm and align the dial indicator's contact point with the direction of the stud axis, touch the machined flat on the knuckle and zero the dial indicator.

**NOTE: Use care when applying the load to the knuckle, so the parts are not damaged using care not to tear the boot.**

5. From the front of the vehicle, insert a pry bar (1) to get it rested on the lower control arm and use lever principle to push the knuckle up until the arm of the dial indicator no longer moves.
6. Record the ball joint (2) movement on each side of the vehicle. The end play is acceptable with no more than 1.5mm of end play back to back.

## REMOVAL

1. Remove the tire and wheel assembly.
2. Remove the brake caliper and rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
3. Disconnect the tie rod from the steering knuckle (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).
4. Remove the steering knuckle (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL).
5. Move the halfshaft to the side and support the halfshaft out of the way (If Equipped).



**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

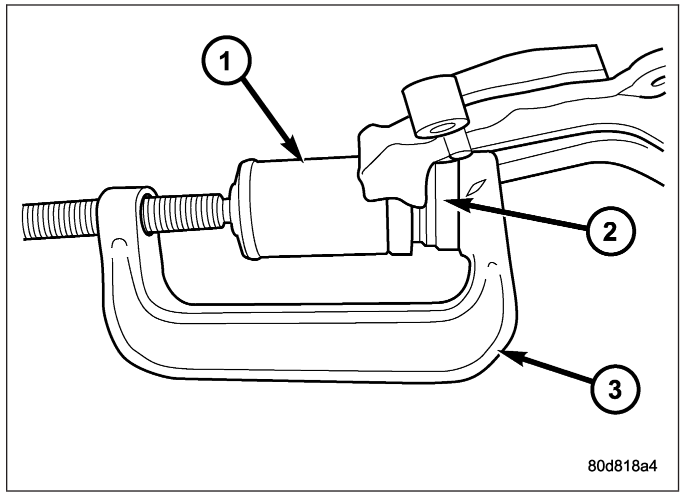
6. Secure the steering knuckle in a vise.
7. Remove the ball joint boot.
8. Press the ball joint from the steering knuckle using special tools C-4212–F (PRESS)(2), 8859-2 (RECEIVER)(3) and 8859-1 (DRIVER)(1).

## INSTALLATION

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

**NOTE: The plastic shipping cover must be in place over the ball joint boot while pressing the ball joint into the knuckle.**

1. Install the ball joint into the steering knuckle and press in using special tools C-4212–F (press)(3), 8859-3 (driver)(2) and 6761 (receiver)(1).

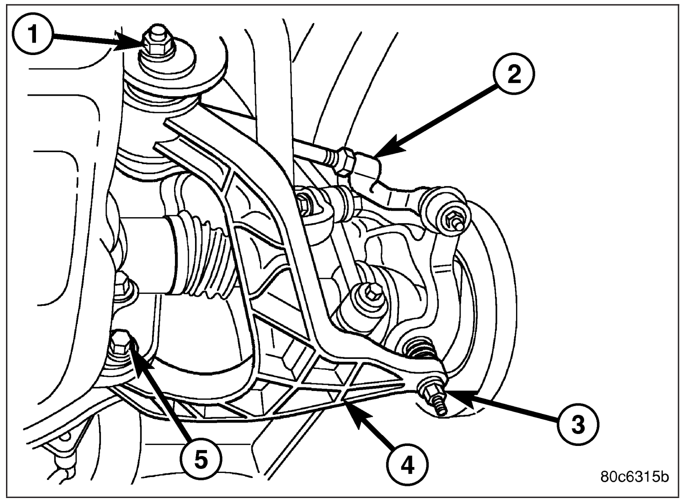


2. Remove the support for the halfshaft and install into position (If Equipped).
3. Install the steering knuckle (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - INSTALLATION).
4. Install the tie rod end into the steering knuckle (Refer to 19 - STEERING/LINKAGE/TIE ROD END - INSTALLATION).
5. Install and tighten the halfshaft nut to 136 N·m (100 ft. lbs.).
6. Install the brake caliper and rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
7. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
8. Check the vehicle ride height (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
9. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

# LOWER CONTROL ARM

## REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the lower clevis bracket bolt at the lower control arm (4).
4. Remove the stabilizer link bolt at the lower control arm (4).
5. Remove the lower ball joint nut (3).
6. Separate the lower ball joint from the lower control arm using tool C-4150A.

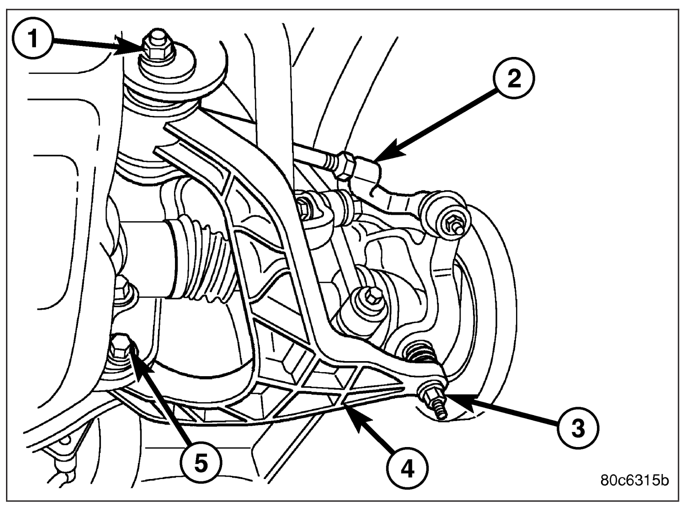


**NOTE: Marking the lower control arm pivot bolts front (1) and rear (5) will aid in the assembly procedure.**

7. Mark the lower control arm pivot bolts front (1) and rear (5).
8. Remove the front cam/pivot bolt (1).
9. Remove the rear cam/pivot bolt (5).
10. Remove the lower control arm (4) from the vehicle.

## INSTALLATION

1. Install the lower control arm (4) to the vehicle.
2. Install the rear cam/pivot bolt (5).
3. Install the front cam/pivot bolt (1).
4. Install the lower ball joint nut (3). Tighten the nut to 81 N·m (60 ft.lbs.)
5. Align the marks front and rear at the cam/pivot bolts and tighten the nuts. Tighten the nuts to 170 N·m (125 ft.lbs.)



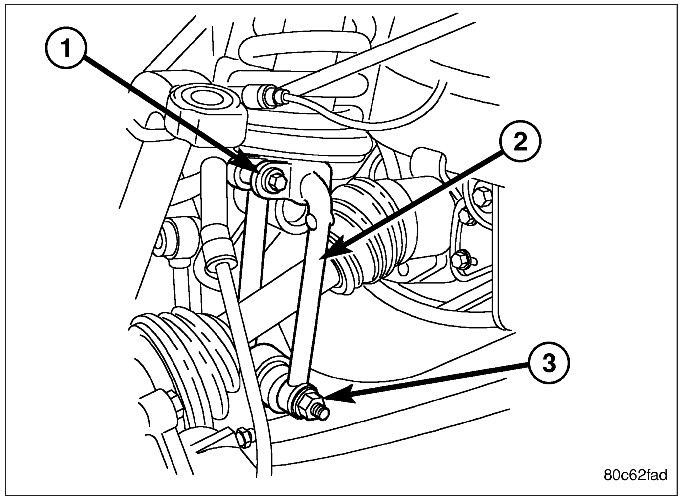
6. Install the stabilizer link bolt at the lower control arm. Tighten the nut to 136 N·m (100 ft.lbs.)
7. Install the lower clevis bracket bolt at the lower control arm. Tighten the nut to 150 N·m (110 ft.lbs.)
8. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
9. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

# SHOCK

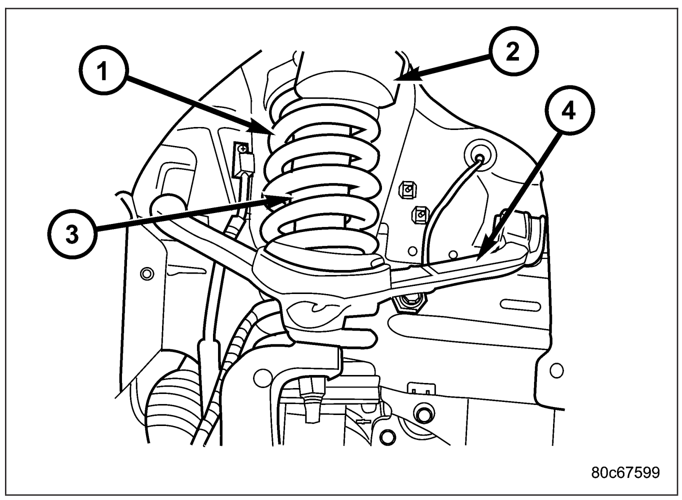
## REMOVAL

### LEFT SIDE

1. Disconnect the battery.
2. Remove the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).
3. Unclip the power center and move it to the side out of the way.
4. Remove the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).
5. Disconnect the battery temperature sensor from the battery tray.
6. Remove the four upper shock mounting nuts.
7. Raise and support the vehicle.
8. Remove the left tire and wheel assembly.
9. Remove the lower bolt (3) at the lower control arm securing the clevis bracket (2).
10. Remove the stabilizer link (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - REMOVAL).
11. Remove the lower ball joint nut.
12. Separate the lower ball joint from the lower control arm using remover C-4150A.
13. Rotate the lower control arm downward to allow access.
14. Remove the clevis bracket (2) at the shock.



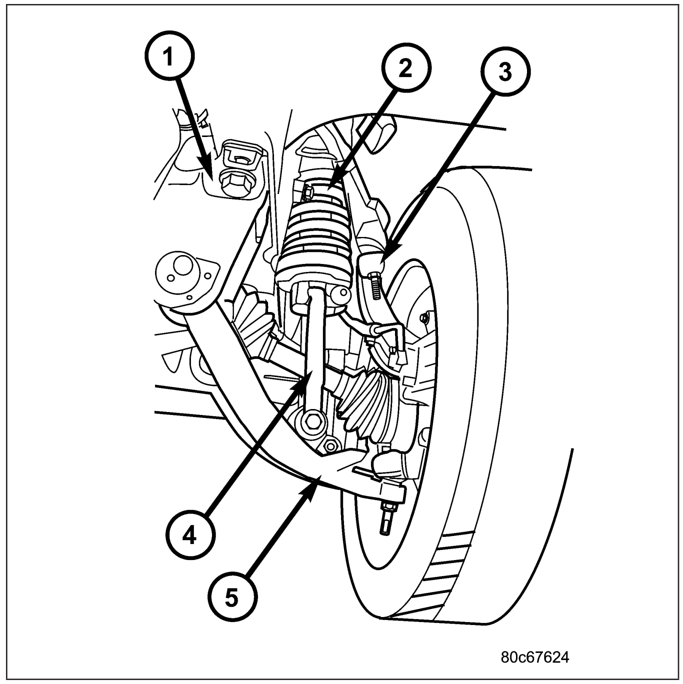
15. Remove the shock assembly (3) from the vehicle.
16. Remove the spring (1) from the shock (3) (if needed).



### RIGHT SIDE

1. Remove the air box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
2. Remove the two cruise control servo mounting nuts.
3. Remove the upper shock mounting nuts.
4. Raise and support the vehicle.
5. Remove the right side tire assembly.

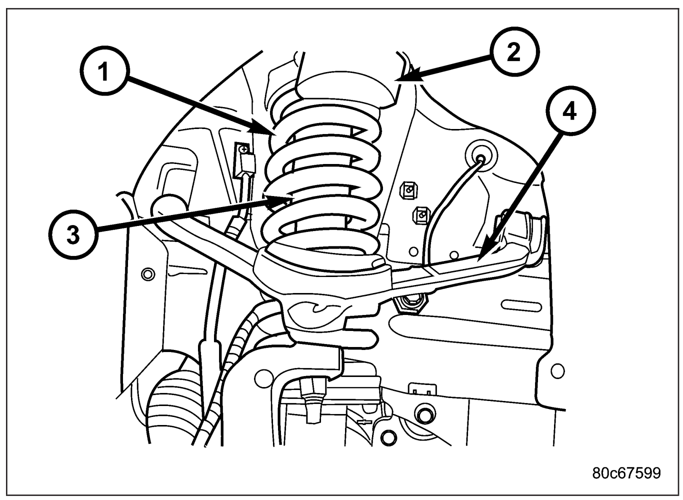
6. Remove the lower bolt at the lower control arm (5) securing the clevis bracket (4).
7. Remove the stabilizer link (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - REMOVAL).
8. Remove the lower ball joint nut.
9. Separate the lower ball joint from the lower control arm using remover C-4150A.
10. Rotate the lower control arm downward to allow access.
11. Remove the clevis bracket (4) at the shock (2).
12. Remove the shock assembly (2) from the vehicle.
13. Remove the spring from the shock (if needed). (Refer to 2 - SUSPENSION/FRONT/SPRING - REMOVAL).



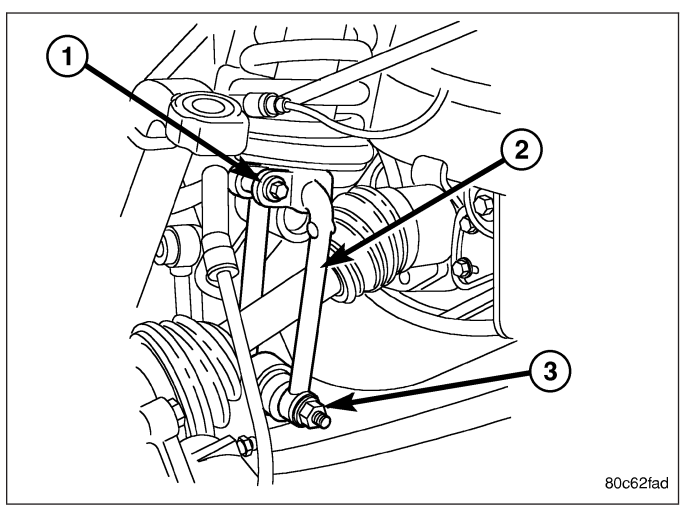
## INSTALLATION

## LEFT SIDE

1. Install the spring (1) to the shock (3) (if removed).
2. Install the shock assembly (3) to the vehicle.
3. Install the four upper shock mounting nuts. Tighten the nuts to 108 N·m (80 ft.lbs.).



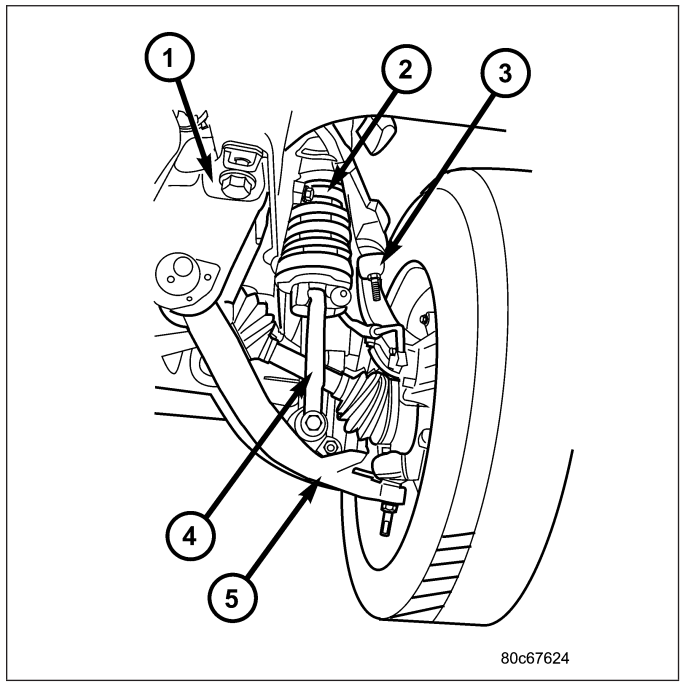
4. Install the clevis bracket (2) at the shock. (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - INSTALLATION). Tighten the bolt to 61N·m (45 ft.lbs.).
5. Raise the lower control into place and reconnect the lower ball joint nut. Tighten the nut to 81 N·m (60 ft.lbs.).
6. Install the clevis bracket (2) at the lower control arm. (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - INSTALLATION). Tighten the bolt to 150 N·m (110 ft.lbs.).



7. Install the lower stabilizer link at the lower control arm. Tighten the bolt to 136 N·m (100 ft.lbs.) (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - INSTALLATION).
8. Install the left tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
9. Lower the vehicle.
10. Reconnect the battery temperature sensor.
11. Install the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).
12. Install the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).
13. Reconnect the battery cables.

## RIGHT SIDE

1. Install the spring to the shock (if removed). (Refer to 2 - SUSPENSION/FRONT/SPRING - INSTALLATION).
2. Install the shock assembly to the vehicle.
3. Install the four upper shock mounting nuts. Tighten the nuts to 108 N·m (80 ft.lbs.).
4. Install the clevis bracket (4) at the shock (2). (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - INSTALLATION). Tighten the bolt to 61 N·m (45 ft.lbs.).
5. Raise the lower control into place and reconnect the lower ball joint nut. Tighten the nut to 81 N·m (60 ft.lbs.).
6. Install the clevis bracket (4) at the lower control arm (5). (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - INSTALLATION). Tighten the bolt to 150 N·m (110 ft.lbs.).
7. Install the lower stabilizer link at the lower control arm. Tighten the bolt to 136 N·m (100 ft.lbs.) (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - INSTALLATION).
8. Install the right tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

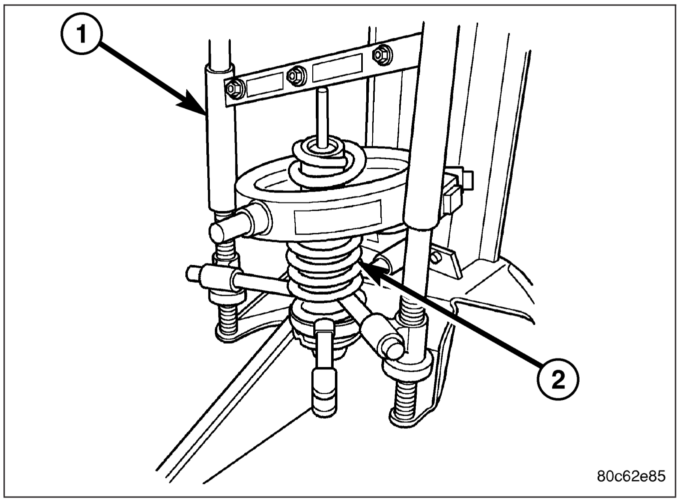


9. Lower the vehicle.
10. Install the cruise control servo mounting nuts.
11. Install the airbox (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).

# SPRING

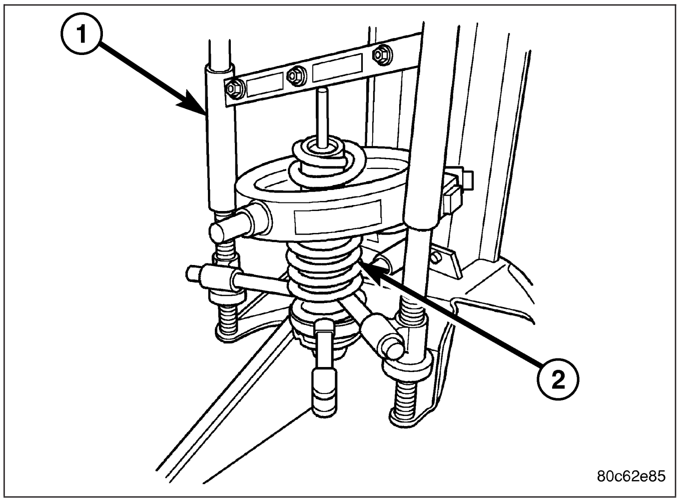
## REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the shock. Refer to the proper side shock removal procedure being worked on. (Refer to 2 - SUSPENSION/FRONT/SHOCK - REMOVAL).
4. Secure the shock assembly into a Pentastar® Service Equipment W-7200 Spring compressor (1).
5. Compress the spring (2).
6. Remove the shock mount nut.
7. Remove the shock from the spring compressor.
8. Transfer the necessary parts to the type of repair being done (Insulator, Spring, shock and mount).



## INSTALLATION

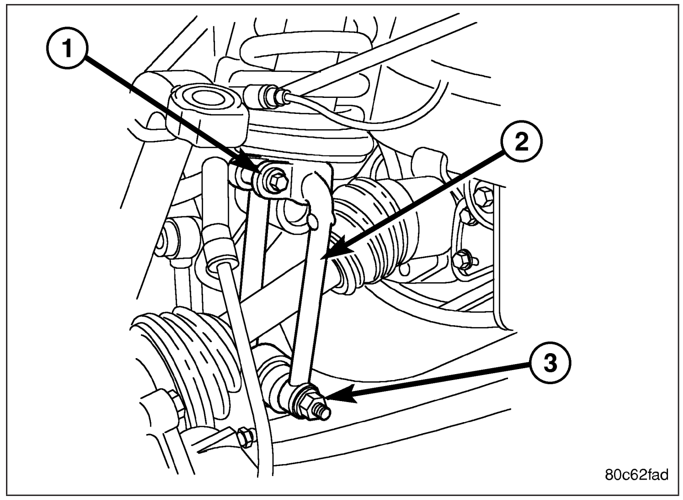
1. Install the shock to the spring (2) and spring compressor (1), After the transfer of the necessary parts to the type of repair being done (Insulator, Spring, shock and mount).
2. Install the shock mounting nut. Tighten the bolt to 41 N·m (30 ft.lbs.).
3. Loosen the compressed spring (2).
4. Remove the shock assembly from the spring compressor (1).
5. Install the shock to the vehicle. (Refer to 2 - SUSPENSION/FRONT/SHOCK - INSTALLATION).
6. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
7. Remove the support and lower the vehicle.



# CLEVIS BRACKET

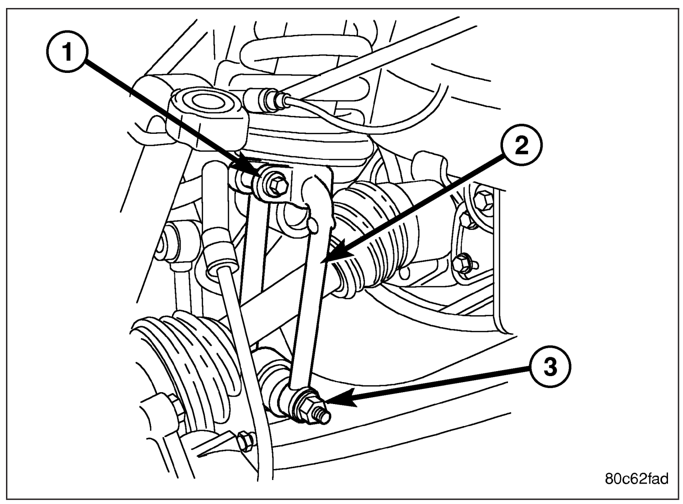
## REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the lower clevis bolt (3) at the lower control arm.
4. Remove the upper clevis bolt (1) at the shock.
5. Remove the lower stabilizer link bolt at the lower control arm.
6. Remove the lower ball joint nut.
7. Separate the lower ball joint from the lower control arm using remover C-4150A.
8. Swing the lower control arm downward to allow clearance to remove the clevis bracket (2).
9. Remove the clevis bracket (2) from the vehicle.



## INSTALLATION

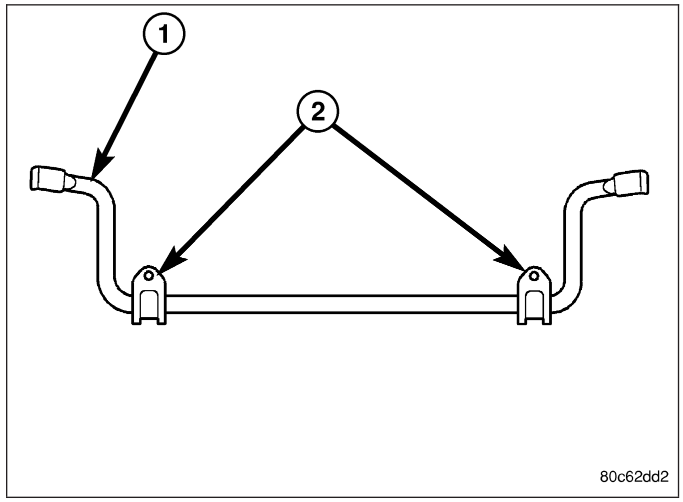
1. Install the clevis bracket (2) upper bolt (1) to the shock **Seat the clevis against the stop on the shock**. Tighten the bolt (1) to 61 N·m (45 ft.lbs.).
2. Raise the lower control arm to the lower ball joint.
3. Install the nut to the lower ball joint. Tighten the nut to 81 N·m (60 ft.lbs.).
4. Install the clevis bracket (2) lower bolt (3) to the lower control arm. Tighten the bolt (3) to 150 N·m (110 ft.lbs.).
5. Install the lower stabilizer link bolt at the lower control arm. Tighten the bolt to 115 N·m (85 ft.lbs.).
6. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
7. Lower the vehicle.



# STABILIZER BAR

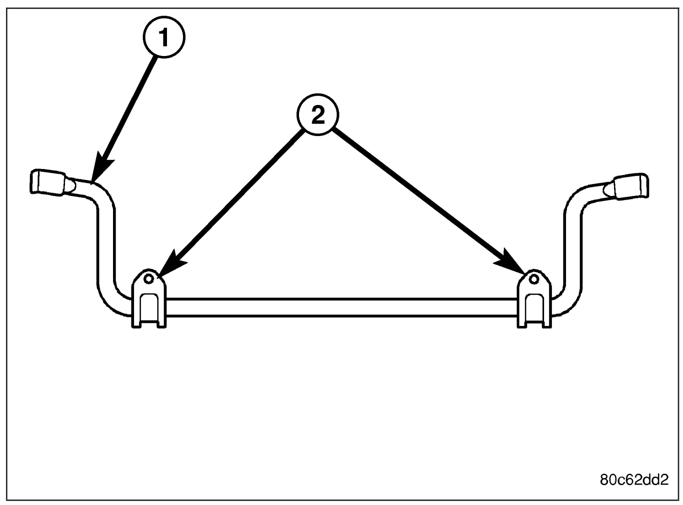
## REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the upper stabilizer link bolts at the stabilizer bar (1).
4. Remove the stabilizer bar bushing clamps (2) from the frame.
5. Remove the stabilizer bar (1) from the vehicle.



## INSTALLATION

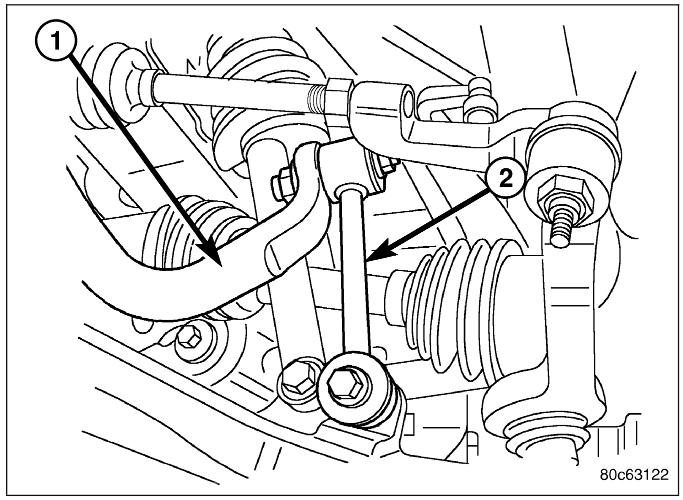
1. Install the stabilizer bar (1) to the vehicle.
2. Install the stabilizer bar bushing clamps (2). Tighten the nuts to 149 N·m (110 ft.lbs.).
3. Install the upper stabilizer link bolts and washer at the stabilizer bar (1). Tighten the bolt to 136 N·m (100 ft.lbs.).
4. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
5. Lower the vehicle.



# STABILIZER LINK

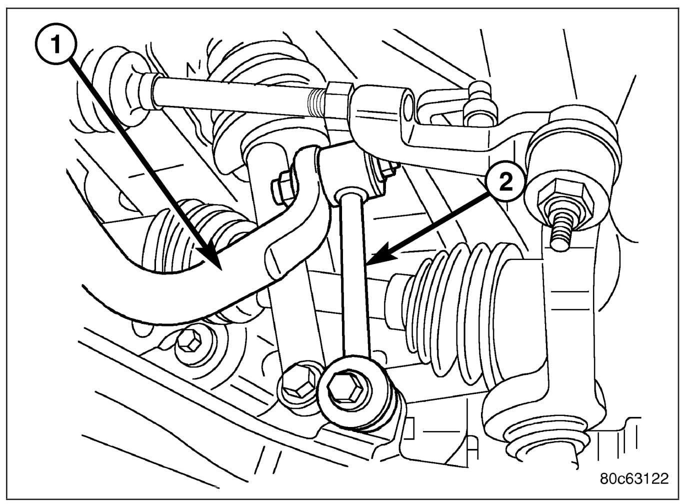
## REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the lower stabilizer link bolt (2) at the lower control arm.
4. Remove the upper stabilizer link bolt (2) at the stabilizer bar (1).
5. Remove the stabilizer link (2).



## INSTALLATION

1. Install the stabilizer link (2).
2. Install the upper stabilizer link bolt (2) and washer at the stabilizer bar. Tighten the bolt to 136 N·m (100 ft.lbs.).
3. Install the lower stabilizer link bolt (2) and washer at the lower control arm. Tighten the nut to 115 N·m (85 ft.lbs.).
4. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).



# UPPER CONTROL ARM

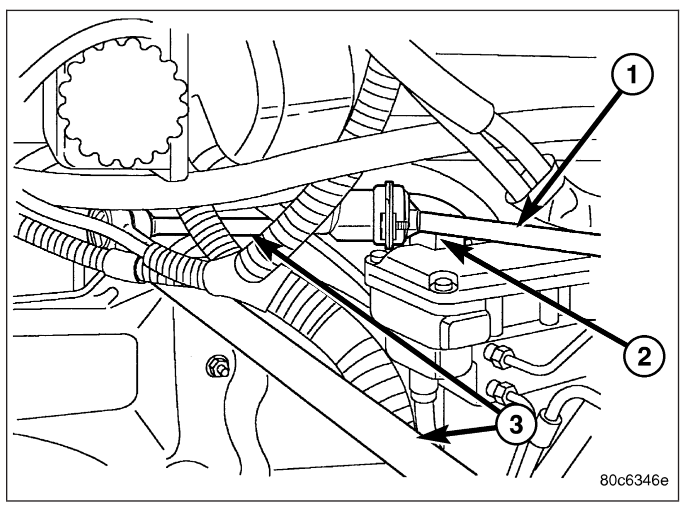
## REMOVAL

### RIGHT SIDE

1. Raise and support the vehicle.
2. Remove the right side tire and wheel assembly.
3. Remove the upper ball joint nut.
4. Separate the upper ball joint from the steering knuckle using remover C-4150A.
5. Lower the vehicle.
6. Remove the air box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
7. Remove the cruise control servo mounting nuts.
8. Remove the upper control arm rear bolt.
9. Remove the upper control arm front bolt.
10. Remove the upper control arm from the vehicle.

### LEFT SIDE

1. Raise and support the vehicle.
2. Remove the left side tire and wheel assembly.
3. Remove the upper ball joint nut.
4. Separate the upper ball joint from the steering knuckle using remover C-4150A.
5. Lower the vehicle.
6. Remove the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).
7. Unclip the power center and move it to the side out of the way.
8. Remove the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).
9. Disconnect the battery temperature sensor from the battery tray.
10. Remove the upper control arm rear bolt (2) by using a ratchet and extension (3) under the steering shaft (1) and positioned by the power steering reservoir.
11. Remove the upper control arm front bolt.
12. Remove the upper control arm from the vehicle.



## INSTALLATION

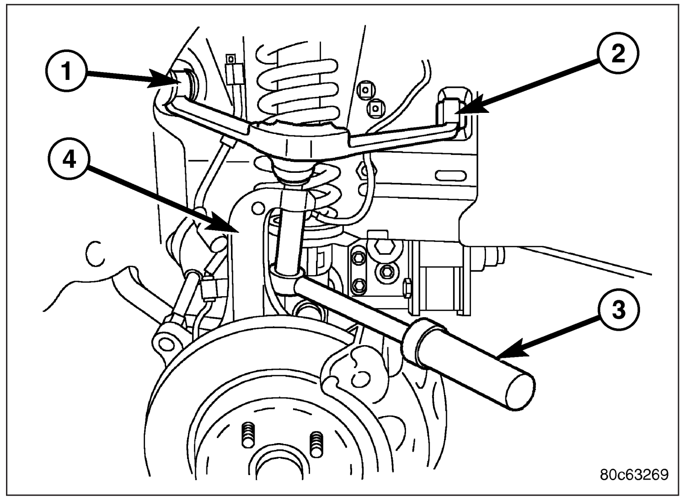
### RIGHT SIDE

1. Install the upper control arm to the vehicle.
2. Install the upper control arm front bolt. Tighten the bolt to 122 N·m (90 ft.lbs.).
3. Install the upper control arm rear bolt. Tighten the bolt to 122 N·m (90 ft.lbs.).
4. Install the cruise control servo mounting nuts.

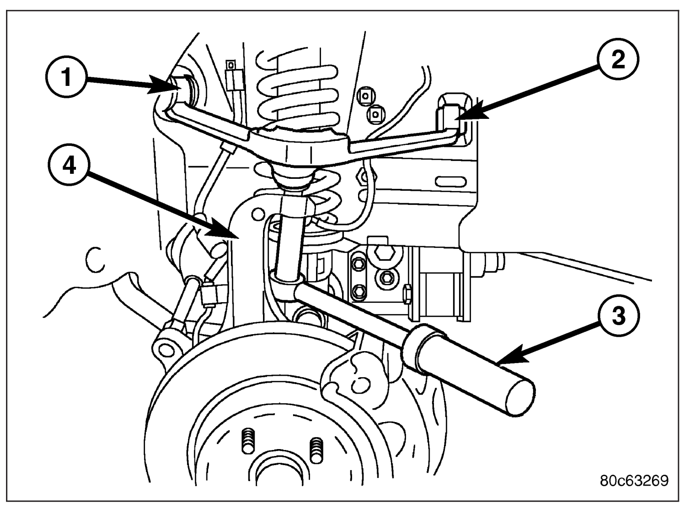
5. Install the air box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).
6. Install the upper ball joint nut. Tighten the nut to 81 N·m (60 ft.lbs.).
7. Install the right side tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
8. Lower the vehicle.
9. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

## LEFT SIDE

1. Install the upper control arm to the vehicle.
2. Install the upper control arm front bolt (1). Tighten the bolt to 122 N·m (90 ft.lbs.).
3. Install the upper control arm rear bolt (2). Tighten the bolt to 122 N·m (90 ft.lbs.).



4. Reconnect the battery temperature sensor to the battery tray.
5. Install the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).
6. Install the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).
7. Reclip and mount the power center.
8. Install the upper ball joint nut. Tighten the nut to 81 N·m (60 ft.lbs.).



9. Install the left side tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
10. Lower the vehicle.
11. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

# REAR

## TABLE OF CONTENTS

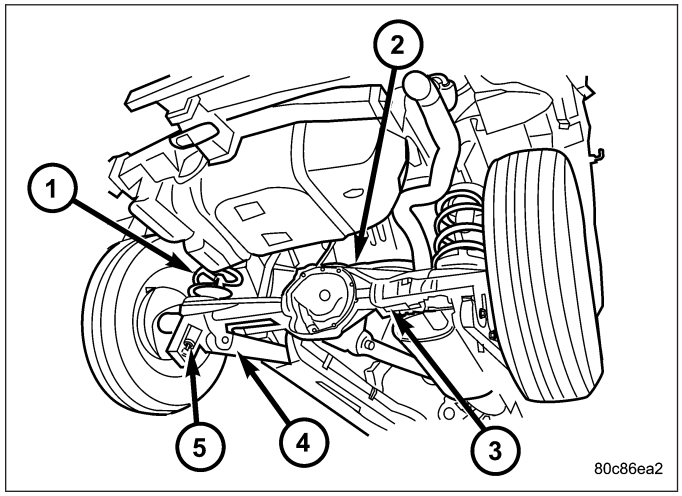
# REAR

## DESCRIPTION

**CAUTION: Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. This will maintain vehicle ride comfort and prevent premature bushing wear.**

The rear suspension is comprised of :

- Drive axle
- Shock absorbers (5)
- Coil springs (1)
- Lower suspension arms (4)
- Upper suspension arm (2)
- Stabilizer bar (3)



## WARNING

**WARNING: Suspension components with rubber bushings must be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort will be affected and cause premature bushing wear.**

## DIAGNOSIS AND TESTING - REAR SUSPENSION

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| VEHICLE INSTABILITY | 1. Loose or worn wheel bearings. | 1. Replace wheel bearings. |
| | 2. Loose, worn or bent suspension components. | 2. Inspect, tighten or replace components as necessary. |
| | 3. Tire pressure. | 3. Adjust tire pressure. |
| VEHICLE PULLS TO ONE SIDE | 1. Weak or broken spring. | 1. Replace spring. |
| | 2. Alignment. | 2. Align vehicle to specifications. |
| | 3.Tires. | 3. Replace tires. |
| | 4. Brakes. | 4. Repair as necessary. |
| KNOCKING, RATTLING OR SQUEAKING | 1. Worn shock bushings. | 1. Replace shock. |
| | 2. Loose shock mounting. | 2. Tighten to specifications. |
| | 3. Shock valve. | 3. Replace shock. |
| | 4. Loose upper ball joint. | 4. Replace ball joint. |
| | 5. Loose, worn or bent suspension components. | 5. Inspect, tighten or replace components as necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| IMPROPER TRACKING | 1. Loose, worn or bent suspension components.<br>2. Bent axle. | 1. Inspect, tighten or replace components as necessary.<br>2.Replace axle. |

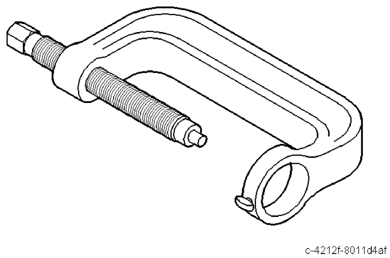
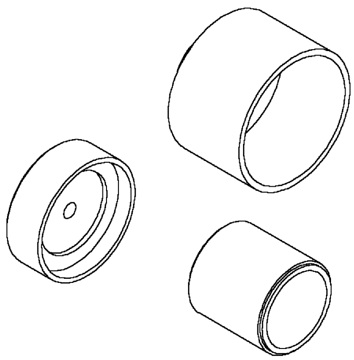
## SPECIAL TOOLS

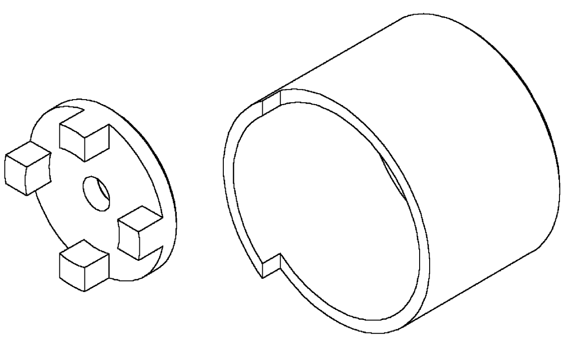
## REAR SUSPENSION



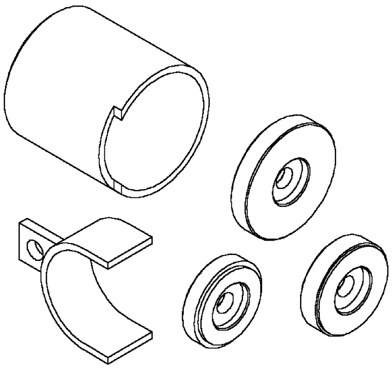
**BALL JOINT PRESS - C-4212F**



**REMOVER / INSTALLER REAR UPPER BALL JOINT - 8861**



**REMOVAL / INSTALLATION REAR UPPER CONTROL ARM BUSHINGS - 8860**



**REAR LOWER CONTROL ARM BUSHING REMOVER/INSTALLER - 8862**

# BUSHINGS

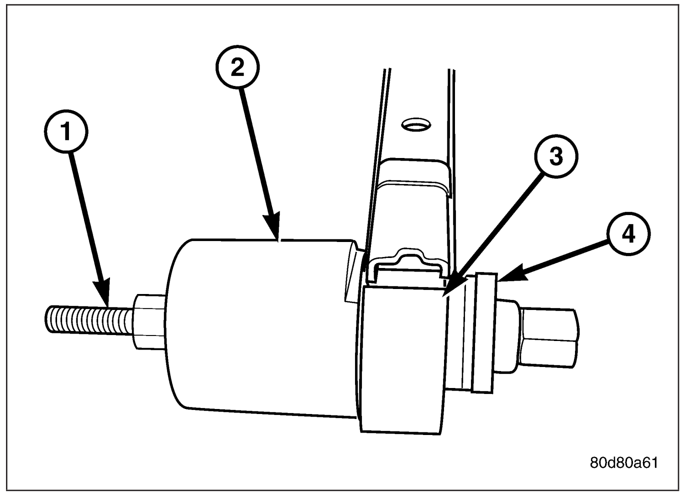
## REMOVAL

### LOWER SUSPENSION ARM BUSHING

1. Remove the lower suspension arm (Refer to 2 - SUSPENSION/REAR/LOWER CONTROL ARM - REMOVAL).
2. Secure the suspension arm in a vise.

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

3. Install special tools 8862-4 (receiver)(2), 8862-5 (spacer)(3) and 8862-1 or 8862- 2 (driver)(4) with the threaded rod 8839 (1) and the bearing as shown
4. Press out the bushing.

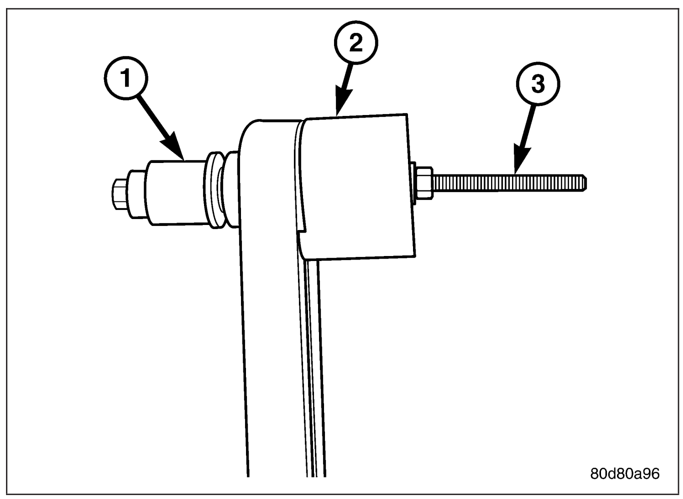


### UPPER SUSPENSION ARM BUSHING

1. Remove the upper suspension arm (Refer to 2 - SUSPENSION/REAR/UPPER CONTROL ARM - REMOVAL).
2. Secure the suspension arm in a vise.

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

3. Install special tools 8853-3 (driver)(1), 8860-1 (receiver)(2) and with the threaded rod 8838 (3) and the bearing as shown
4. Press out the bushing.

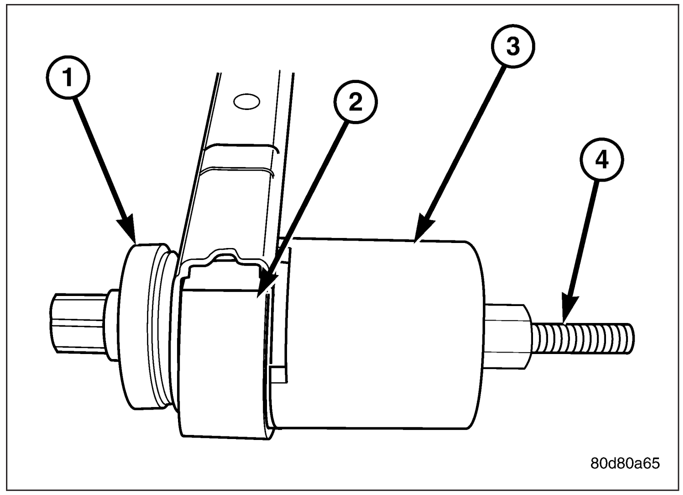


## INSTALLATION

### LOWER SUSPENSION ARM BUSHING

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

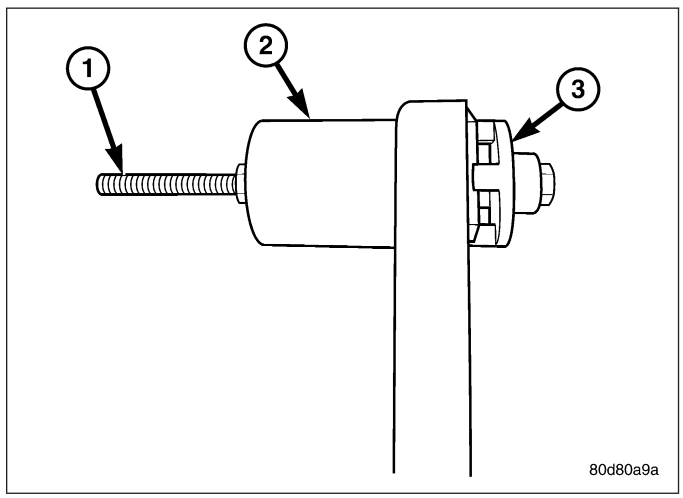
1. Install the new lower suspension arm bushings into the lower suspension arm using tools 8862-3 (driver)(1), 8862-4 (receiver)(3), 8862-5 (spacer)(2) and the bearing with the threaded rod 8839 (4) making sure to properly orient the bushing in the suspension arm.
2. Remove the suspension arm from the vise.
3. Install the lower suspension arm (Refer to 2 - SUSPENSION/REAR/LOWER CONTROL ARM - INSTALLATION).



## UPPER SUSPENSION ARM BUSHING

**NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.**

1. Install the new upper suspension arm bushings into the upper suspension arm using tools 8835-3 (receiver)(2), 8860-2 (driver)(3) and the bearing with the threaded rod 8838 (1) making sure to properly orient the bushing in the suspension arm.
2. Remove the suspension arm from the vise.
3. Install the upper suspension arm (Refer to 2 - SUSPENSION/REAR/UPPER CONTROL ARM - INSTALLATION).



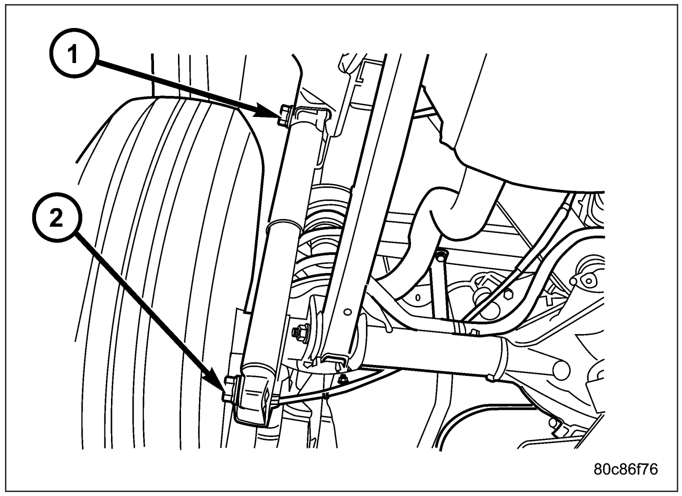
# SHOCK

## REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.

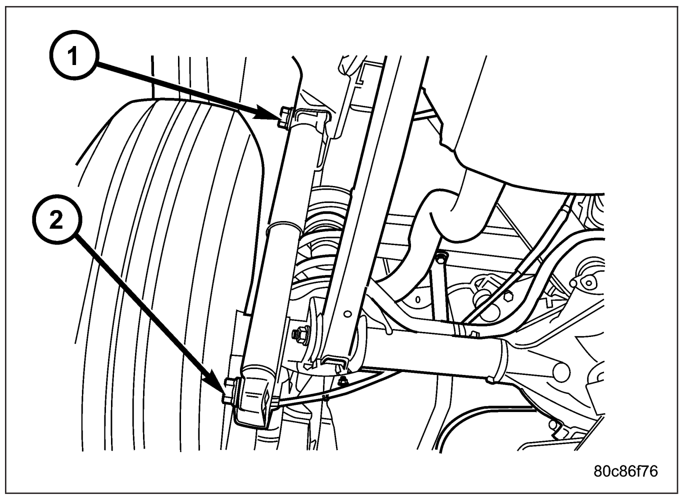
**CAUTION: Do not allow the axle to hang from the upper suspension arm ball joint.**

2. Remove the upper nut and bolt (1) from the frame bracket.
3. Remove the lower nut and bolt (2) from the axle bracket. Remove the shock absorber.



## INSTALLATION

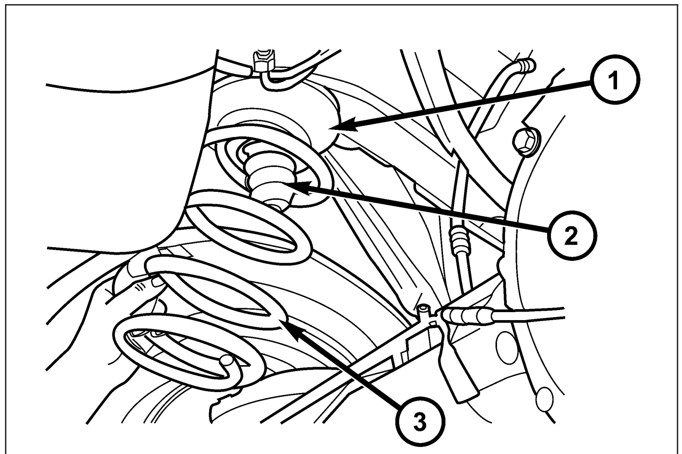
1. Install the shock absorber in the frame bracket and install the bolt and nut (1).
2. Install the shock absorber in the axle bracket and install the bolt and nut (2).
3. Remove the supports and lower the vehicle.
4. Tighten the upper mounting nuts (1) to 108 N·m (80 ft. lbs.). Tighten the lower mounting nuts (2) to 115 N·m (85 ft. lbs.).



# SPRING

## REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the shock absorber lower bolt from the axle bracket.
3. Lower the hydraulic jack and tilt the axle and remove the coil spring (3).
4. Remove and inspect the upper and lower spring isolators (1).



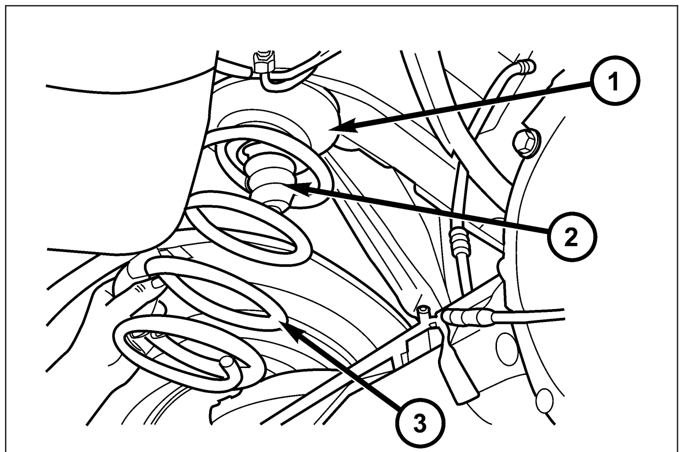
80c86f68

## INSTALLATION

1. Install the upper isolator (1).
2. Install the lower isolator.
3. Pull down on the axle and position the coil spring (3) in the lower isolator.

**CAUTION: Ensure the spring is positioned on the lower isolator.**

4. Raise the axle with the hydraulic jack.
5. Install the shock absorber to the axle bracket and tighten to 115 N·m (85 ft. lbs.).
6. Remove the supports and lower the vehicle.

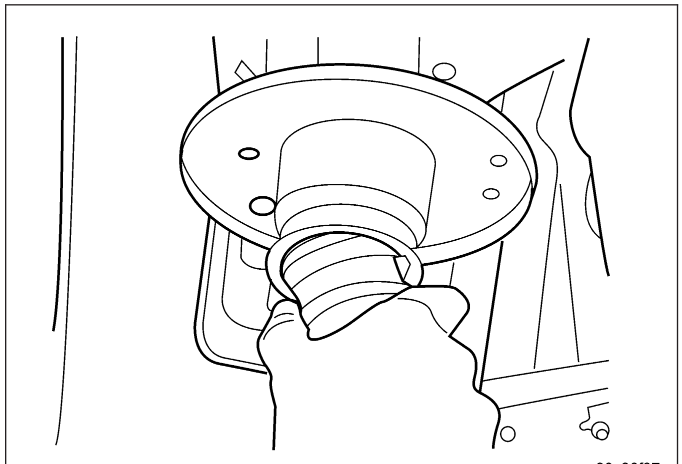


80c86f68

# JOUNCE BUMPER

## REMOVAL

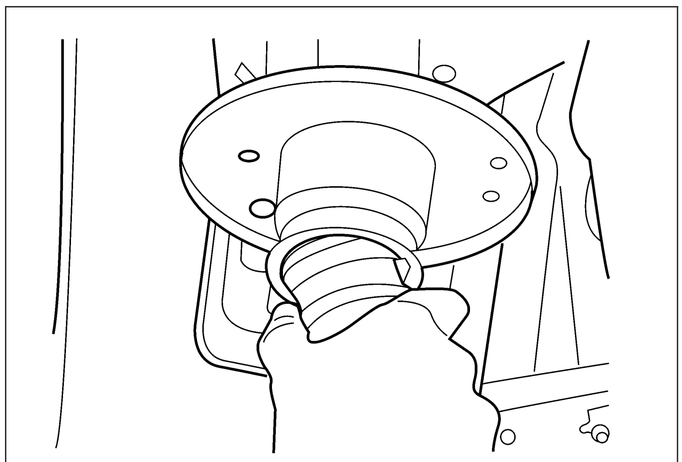
1. Remove the shock (Refer to 2 - SUSPENSION/REAR/SHOCK - REMOVAL).
2. Remove the coil spring (Refer to 2 - SUSPENSION/REAR/SPRING - REMOVAL).
3. Pull the jounce bumper downwards to remove.



80c86f37

## INSTALLATION

1. Install the jounce bumper into the mount by twisting the bumper into place.
2. Install the coil spring (Refer to 2 - SUSPENSION/REAR/SPRING - INSTALLATION).
3. Install the shock (Refer to 2 - SUSPENSION/REAR/SHOCK - INSTALLATION).

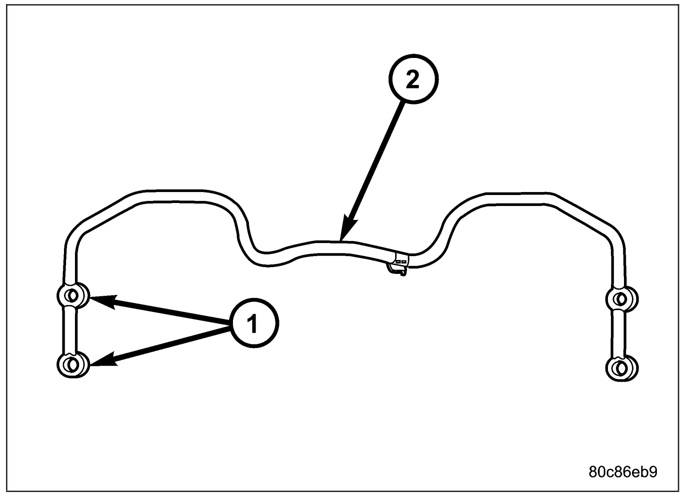


80c86f37

# STABILIZER BAR

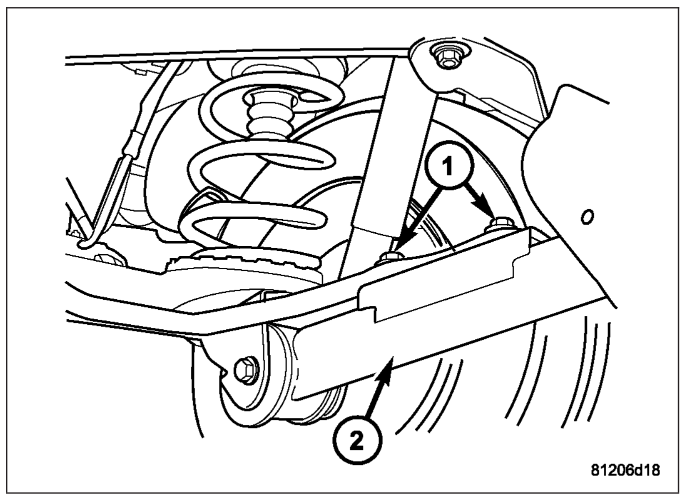
## REMOVAL

1. Raise and support the vehicle.
2. Remove the stabilizer bar bolts (1) from the lower suspension arm.
3. Remove the stabilizer bar (2).



## INSTALLATION

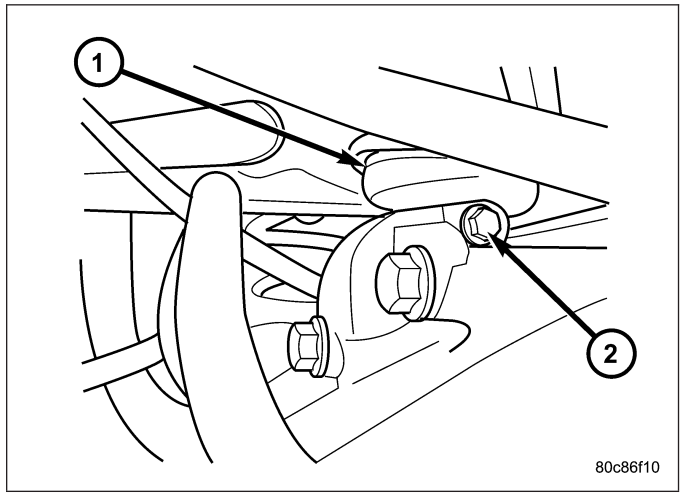
1. Position the stabilizer bar over the axle and install the bolts (1) to the lower suspension arm (2). Ensure the bar is centered with equal spacing on both sides. Tighten the bolts to 99 N·m (73 ft. lbs.).
2. Remove support and lower the vehicle.



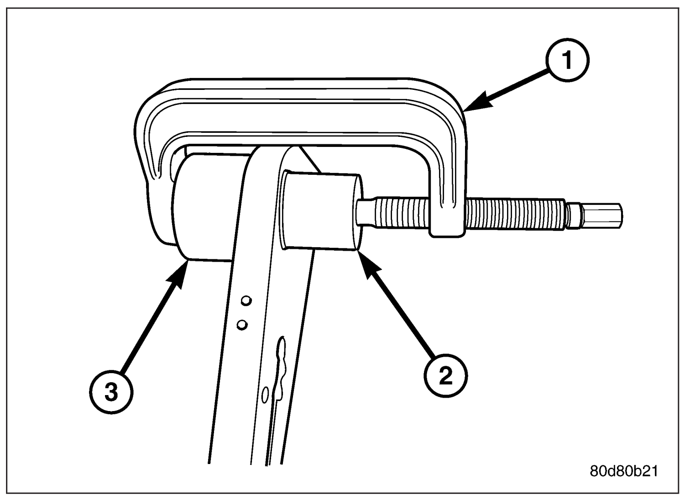
# UPPER BALL JOINT

## REMOVAL

1. Raise and support the vehicle.
2. Support the rear axle with a hydraulic jack.
3. Remove the ball joint pinch bolt (2) from the top of the axle.
4. Separate the ball joint (1) arm assembly from the differential housing by prying upwards.
5. Remove the upper suspension arm from the vehicle (Refer to 2 - SUSPENSION/REAR/UPPER CONTROL ARM - REMOVAL).
6. Secure the suspension arm in a vise.

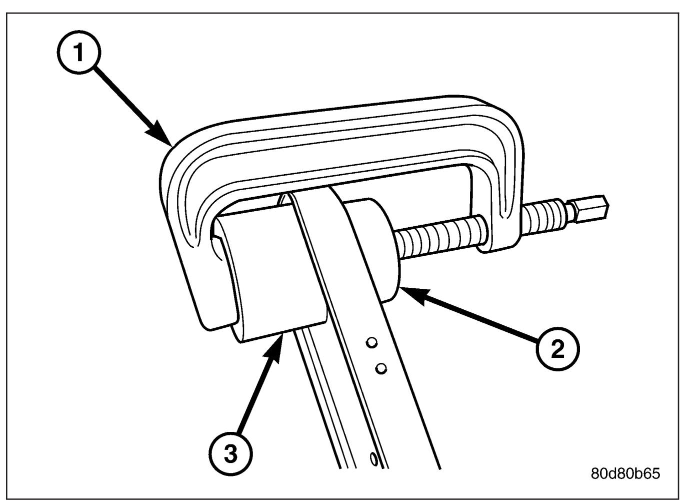


7. Install special tools C-4212F (press)(1) , 8861-3 (driver)(2) and 8861-2 (receiver)(3)
8. Press out the old ball joint.

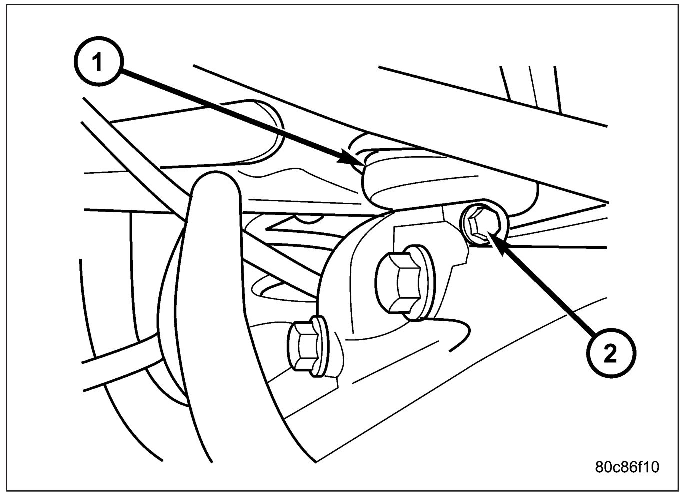


## INSTALLATION

1. Install special tools C-4212F (press)(1), 8861-1 (receiver)(2) and 8861-2 (driver)(3) with the ball joint in place.
2. Press the ball joint in the upper suspension arm.



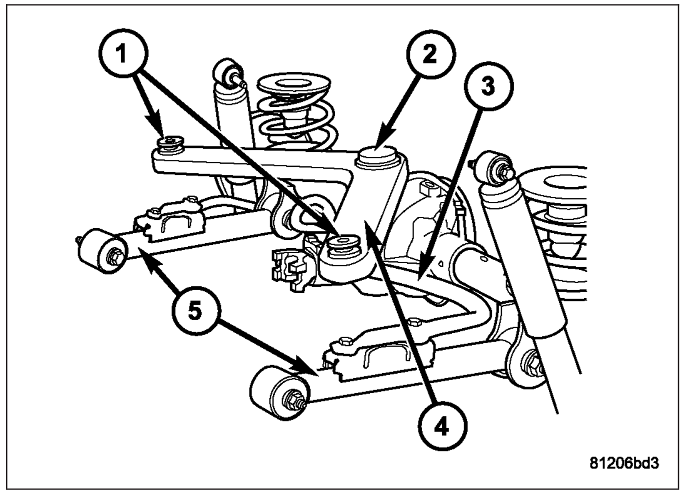
3. Remove the upper suspension arm from the vise.
4. Reinstall the upper suspension arm (Refer to 2 - SUSPENSION/REAR/UPPER CONTROL ARM - INSTALLATION).
5. Raise the rear axle with a hydraulic jack to align the ball joint (1) with the differential housing bracket.
6. Insert the ball joint (1) into the differential housing bracket.
7. Install the ball joint pinch bolt (2) and tighten to 95 N·m (70 ft. lbs.)..
8. Remove the supports and lower the vehicle.



# UPPER CONTROL ARM

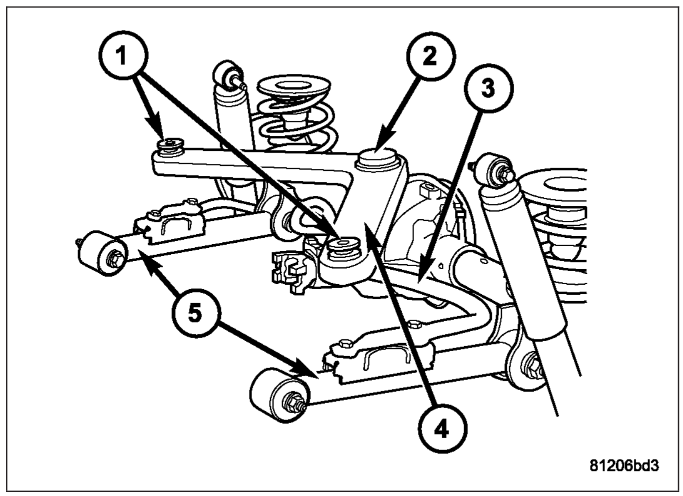
## DESCRIPTION - UPPER SUSPENSION ARM, BUSHINGS, AND BALL JOINT

The suspension arm uses vertical spool bushings to isolate road noise. The suspension arm is bolted through bushings (1) to cage nuts in the body and a ball joint (2) to the top of the differential housing.



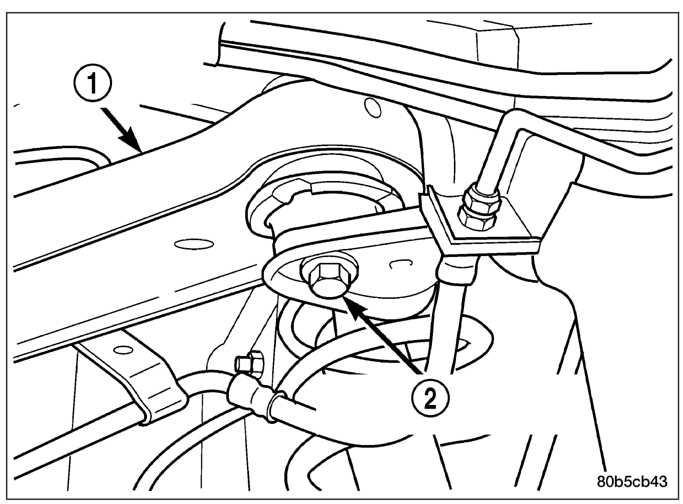
## OPERATION - UPPER SUSPENSION ARM, BUSHINGS, AND BALL JOINT

The upper suspension arm (4) provides fore/aft and lateral location of the rear axle. The suspension arm travel is limited through the use of jounce bumpers in compression and shock absorbers in rebound.

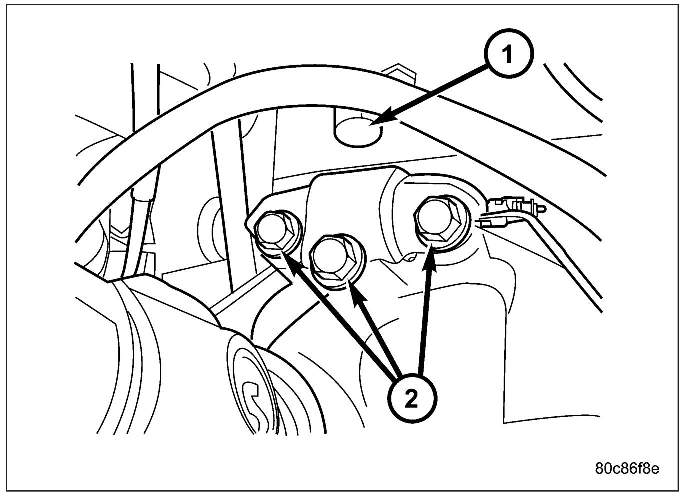


## REMOVAL

1. Raise and support the vehicle.
2. Support the rear axle with a hydraulic jack.
3. Remove the ball joint pinch bolt from the top of the differential housing bracket.
4. Remove partial nuts from the heat shield in order to lower the shield down enough to get the proper clearance to remove the right side bolt (2) from the body.
5. Remove the upper suspension arm mounting bolts (2) from the body and remove the arm (1).

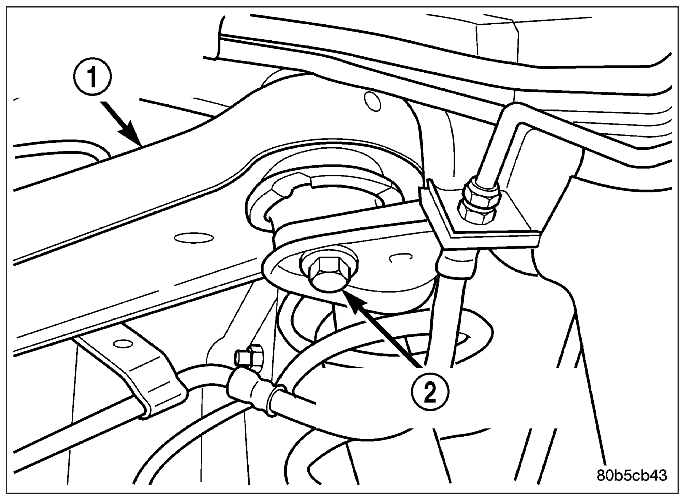


6. Remove the support bracket mounting bolts (2) if needed.

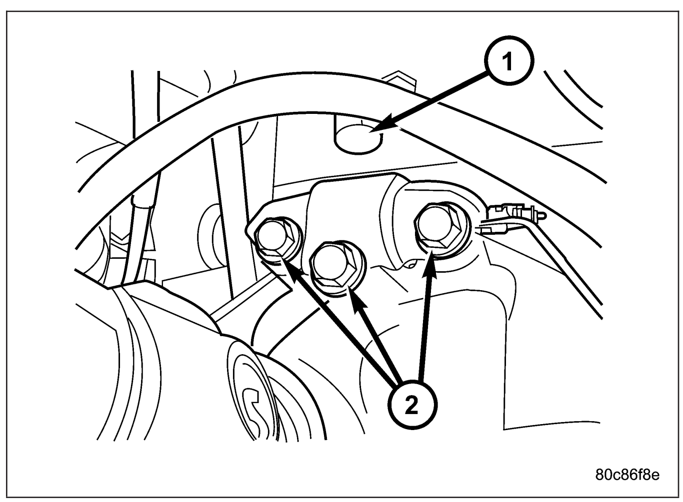


## INSTALLATION

1. Position the upper suspension arm (1) in the frame rail brackets.
2. Install the mounting bolts (2) and tighten to 100 N·m (74 ft. lbs.).



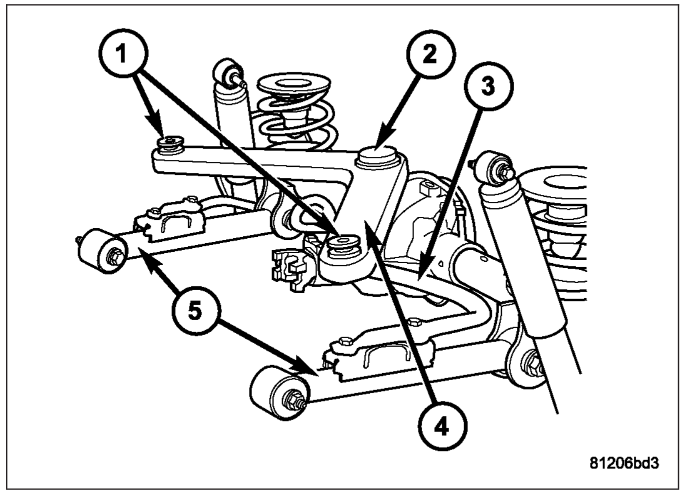
3. Retighten the heat shield back into place.
4. Install the support bracket and bolts (2) to the rear differential (if removed).
5. Pull the arm down on the differential housing bracket inserting the ball joint (1) into the support bracket (2) and install the pinch bolt and nut. Tighten the nut to 95 N·m (70 ft. lbs.).
6. Remove the supports and lower the vehicle.



# LOWER CONTROL ARM

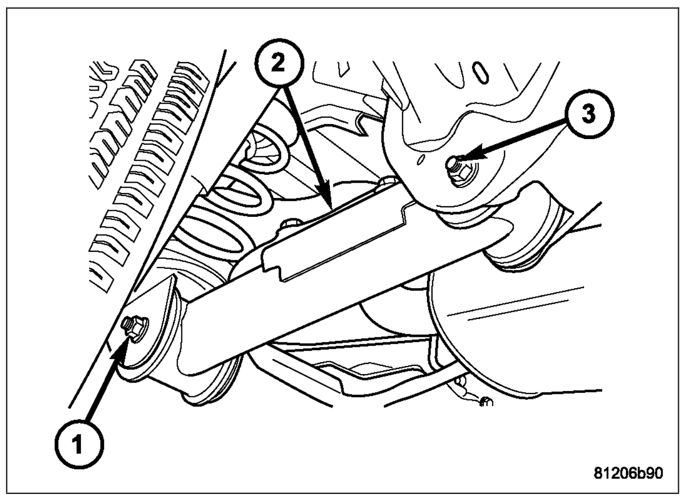
## DESCRIPTION

The lower suspension arms (5) are stamped steel and welded and use voided round bushings at the axle end and solid rubber at the body end of the arm.



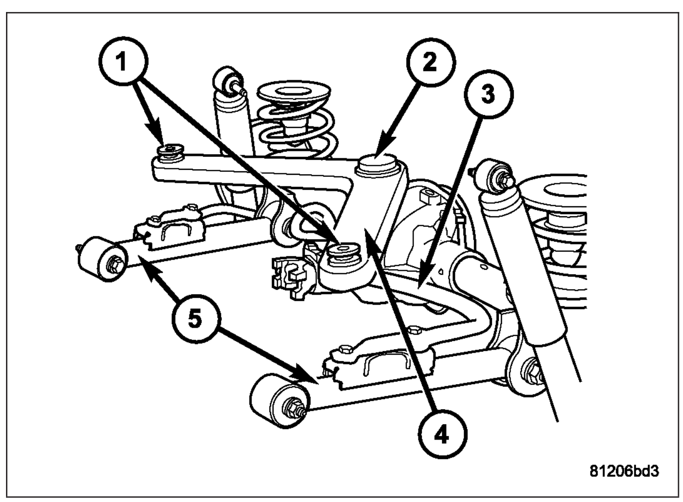
## OPERATION

The bushings provide isolation from the axle. The arms (2) mount to the unibody frame rail bracket (3) and the axle brackets (1). The arm (2) and bushings provide location and react to loads.



## REMOVAL

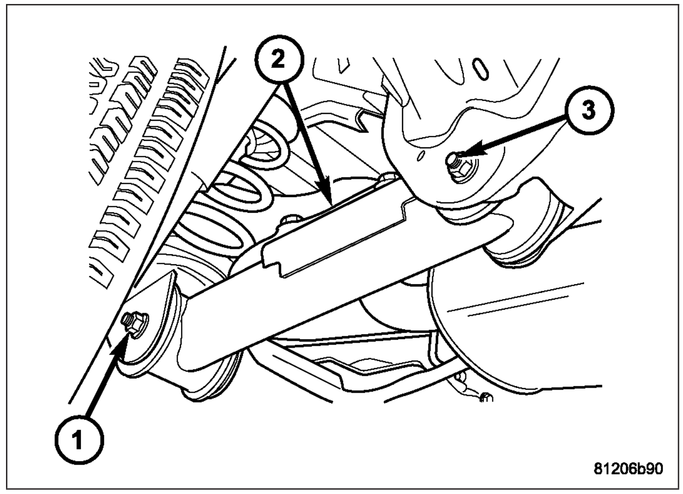
1. Raise the vehicle and support the rear axle.
2. Remove the stabilizer bar (3) retaining bolts from the suspension arm (5).



3. Remove the lower suspension arm nut and bolt (1) from the axle bracket (1).

**NOTE: When removing the right side suspension arm from the frame rail it will be necessary to pry the exhaust over slightly to allow enough clearance to remove the bolt.**

4. Remove the nut and bolt (3) from the frame rail (3) and remove the lower suspension arm (2).



## INSTALLATION

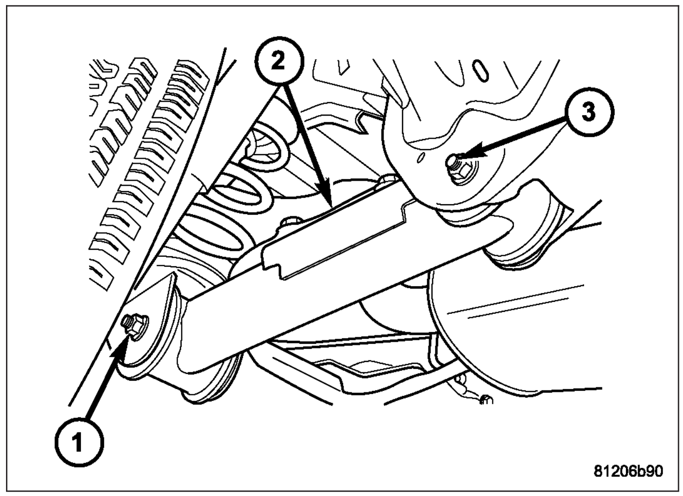
1. Position the lower suspension arm (2) in the axle bracket and frame rail bracket (3).

**NOTE: The end of the arm with the voided round bushing attaches to the axle bracket.**

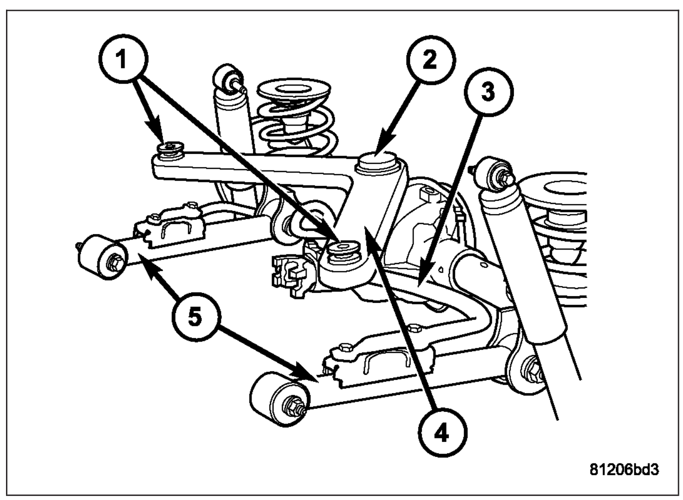
2. Install the axle bracket bolt (1) and nut finger tight.

**NOTE: When installing the right side suspension arm to the frame rail it will be necessary to pry the exhaust over slightly to allow enough clearance to install the bolt.**

3. Install the frame rail bracket bolt (3) and nut finger tight.



4. Install the stabilizer bar (3) retaining bolts to the suspension arm (5).
5. Remove the supports and lower the vehicle.
6. With the vehicle on the ground tighten the nut at the frame to 163 N·m (120 ft. lbs.). Tighten the nut at the axle bracket to 163 N·m (120 ft. lbs.).



# DIFFERENTIAL & DRIVELINE

## TABLE OF CONTENTS

# PROPELLER SHAFT

### TABLE OF CONTENTS

# PROPELLER SHAFT

## DIAGNOSIS AND TESTING

## PROPELLER SHAFT

### PROPELLER SHAFT VIBRATION

#### DRIVELINE VIBRATION

| Drive Condition | Possible Cause | Correction |
|---|---|---|
| Propeller Shaft Noise | 1. Undercoating or other foreign material on shaft. | 1. Clean exterior of shaft and wash with solvent. |
| | 2. Loose U-joint clamp screws. | 2. Install new clamps and screws and tighten to proper torque. |
| | 3. Loose or bent U-joint yoke or excessive runout. | 3. Install new yoke. |
| | 4. Incorrect driveline angularity. | 4. Measure and correct driveline angles. |
| | 5. Worn joint. | 5. Install new joint. |
| | 6. Propeller shaft damaged or out of balance. | 6. Installl new propeller shaft. |
| | 7. Broken rear spring. | 7. Install new rear spring. |
| | 8. Excessive runout or unbalanced condition. | 8. Re-index propeller shaft, test, and evaluate. |
| | 9. Excessive drive pinion gear shaft runout. | 9. Re-index propeller shaft and evaluate. |
| | 10. Excessive axle yoke deflection. | 10. Inspect and replace yoke if necessary. |
| | 11. Excessive transfer case runout. | 11. Inspect and repair as necessary. |
| U-Joint Noise | 1. Loose U-joint clamp screws. | 1. Install new clamps and screws and tighten to proper torque. |
| | 2. Lack of lubrication. | 2. Replace joints as necessary. |

Out-of-round tire or wheels that are out of balance, will cause a low frequency vibration.

Brake rotors that are unbalanced will cause a harsh, low frequency vibration.

Driveline vibration can be caused by loose or damaged engine mounts.

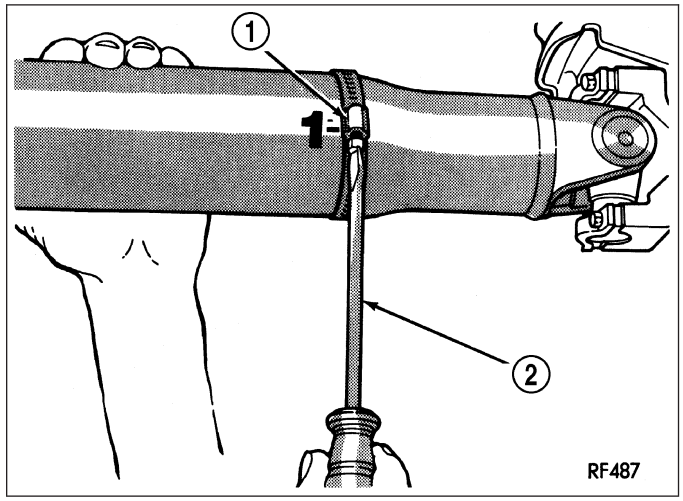
Propeller shaft vibration increases with vehicle speed. A vibration that occurs at a specific speed is not usually caused by a out of balance propeller shaft. Worn universal joints or an incorrect propeller shaft angle, can cause such a vibration.

## BALANCE

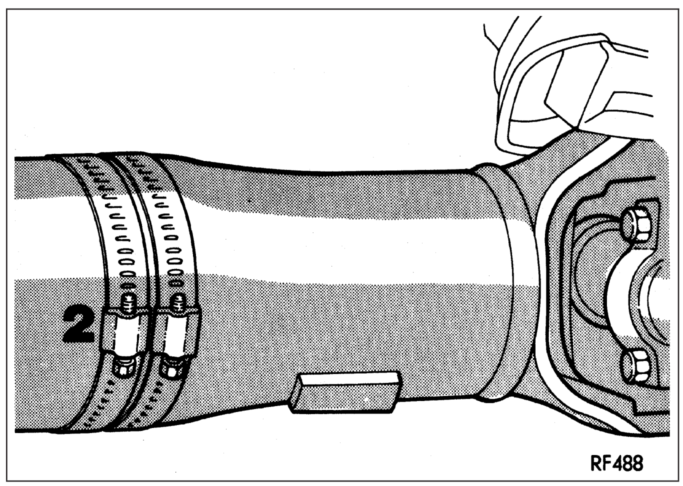
**NOTE: Indexing the propeller shaft 180° relative to the yoke may eliminate some vibrations.**

1. Raise the vehicle.
2. Clean all the foreign material from the propeller shaft and universal joints.
3. Inspect propeller shaft for missing balance weights, broken welds, and bent areas.

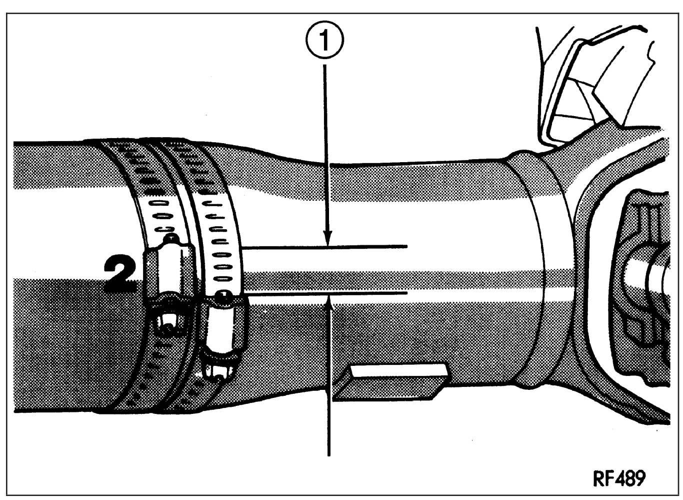
**NOTE: If the propeller shaft is bent, it must be replaced.**



4. Inspect universal joints for wear, properly installation and correct alignment with the shaft.
5. Remove wheels and tires and install wheel lug nuts to retain brake drums/rotors.
6. Mark and number the shaft six inches from the pinion yoke end at four positions 90 degrees apart.
7. Run and accelerate the vehicle until vibration occurs. Note the intensity and speed the vibration occurred. Stop the engine.
8. Position one screw clamp (1) on the propeller shaft with a screw driver (2).
9. Start the engine and check for vibration. If there is little or no change in vibration, move the clamp to the next positions. Repeat the vibration test. If there is no difference in vibration at the other positions, the source of the vibration may not be propeller shaft.
10. If vibration decreased, install a second clamp and repeat the test.



11. If the additional clamp causes an additional vibration, separate the clamps (1) (1/4 inch above and below the mark). Repeat the vibration test.
12. Increase distance between the clamps and repeat the test until the amount of vibration is at the lowest level. Bend the slack end of the clamps so the screws will not loosen.
13. If vibration remains unacceptable, repeat the procedure to the front end of the propeller shaft.
14. Install wheel and tires, and lower vehicle.



## RUNOUT

### RUNOUT SPECIFICATIONS

| | |
|---|---|
| Front of Shaft | 0.020 in. (0.50 mm) |
| Center of Shaft | 0.025 in. (0.63 mm) |
| Rear of Shaft | 0.020 in. (0.50 mm) |
| NOTE: Measure front/rear runout approximately 3 inches (76 mm) from the weld seam at each end of the shaft tube for tube lengths over 30 inches. For tube lengths under 30 inches, the maximum allowed runout is 0.020 in. (0.50 mm) for the full length of the tube. | |

1. Clean propeller shaft surface where the dial indicator will contact the shaft.
2. The dial indicator must be installed perpendicular to the shaft surface.
3. Measure runout at the center and ends of the shaft away from weld areas to ensure an accurate measurements.
4. Refer to Runout Specifications chart.
5. If propeller shaft runout is out of specification, remove propeller shaft. Index the shaft 180 degrees and measure shaft runout again.
6. If propeller shaft runout is now within specifications, mark the shaft and yokes for proper orientation.
7. If propeller shaft runout is not within specifications, check runout of the transmission/transfer case and axle. Correct as necessary and repeat propeller shaft runout measurement.
8. Replace propeller shaft if the runout still exceeds the limits.

## STANDARD PROCEDURE

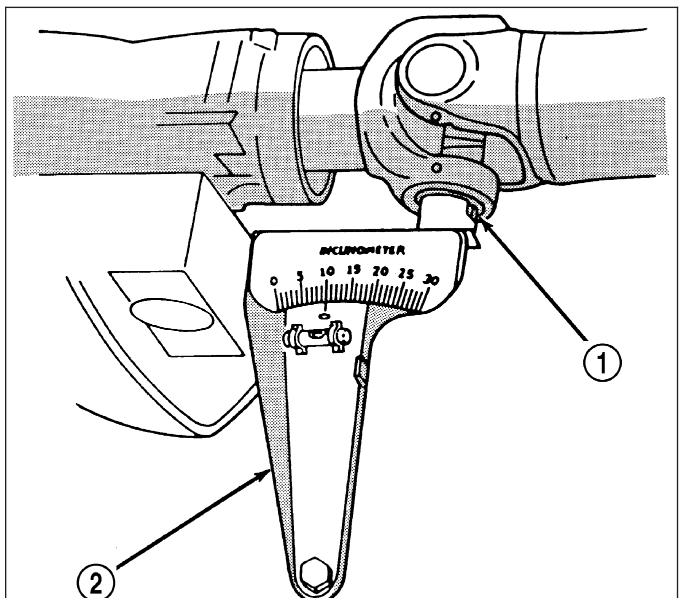
## PROPELLER SHAFT ANGLE

This procedure applies to the front and rear propeller shaft. To obtain front (output) angle on the C/V front propeller shaft, place Inclinometer 7663 on the machined ring of the pinion flange. To obtain propeller shaft angle measurement on the C/V front propeller shaft, place inclinometer on the propeller shaft tube.

1. Raise and support the vehicle at the axles as level as possible. Allow the wheels and propeller shaft to turn.
2. Remove universal joint snap rings if equipped, so inclinometer base sits flat.
3. Rotate shaft until transmission/transfer case output yoke bearing cap is facing downward.

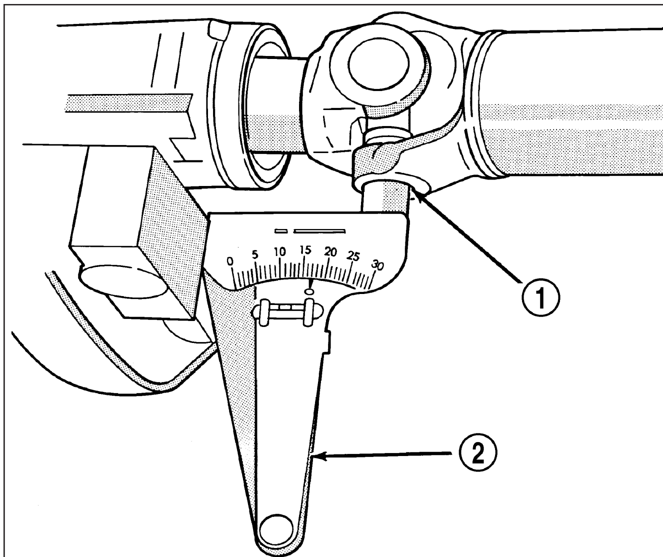
**NOTE: Always make measurements from front to rear and from the same side of the vehicle.**

4. Place inclinometer (2) on yoke bearing cap (1) or pinion flange ring parallel to the shaft. Center bubble in sight glass and record measurement. This measurement will give you the transmission or Output Yoke Angle (A).



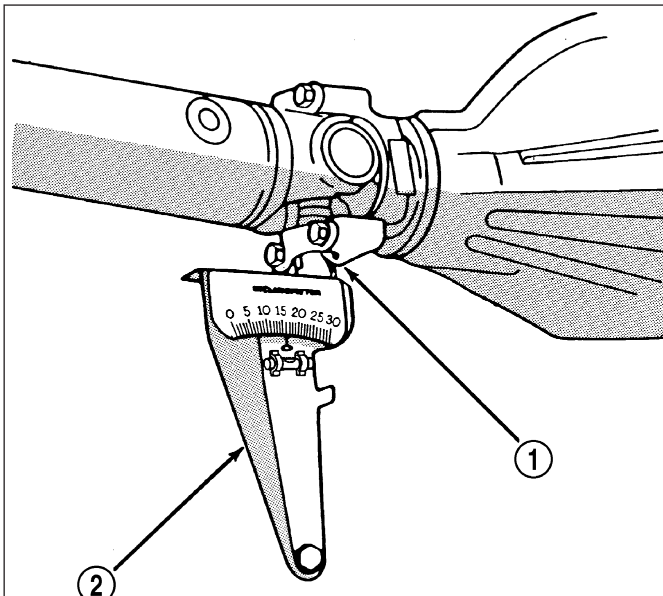
J9216-13

5. Rotate propeller shaft 90 degrees and place inclinometer (2) on yoke bearing cap (1) or propeller shaft tube on C/V propeller shaft, parallel to the shaft. Center bubble in sight glass and record measurement. This measurement can also be taken at the rear end of the shaft. This measurement will give you the propeller shaft angle (C)
6. Subtract smaller figure from larger (C minus A) to obtain transmission output operating angle.



J9216-9

7. Rotate propeller shaft 90 degrees and place inclinometer (2) on pinion yoke bearing cap (1) parallel to the shaft. Center bubble in sight glass and record measurement. This measurement will give you the pinion shaft or input yoke angle (B).
8. Subtract smaller figure from larger (C minus B) to obtain axle Input Operating Angle.



J9216-12

## RULES

Good cancellation of U-joint operating angles is within 1degree.

Operating angles less than 3 degrees.

Operating angles less than 10 degrees for double cardan U-joint.

At least 1/2 of one degree continuous operating (propeller shaft) angle.

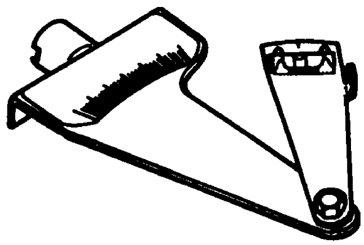
## SPECIFICATIONS

## PROPELLER SHAFT

### TORQUE SPECIFICATIONS

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Front Shaft - Companion Flange Bolts | 30 | 22 | - |
| Rear Shaft - Companion Flange Bolts | 115 | 85 | - |

## SPECIAL TOOLS



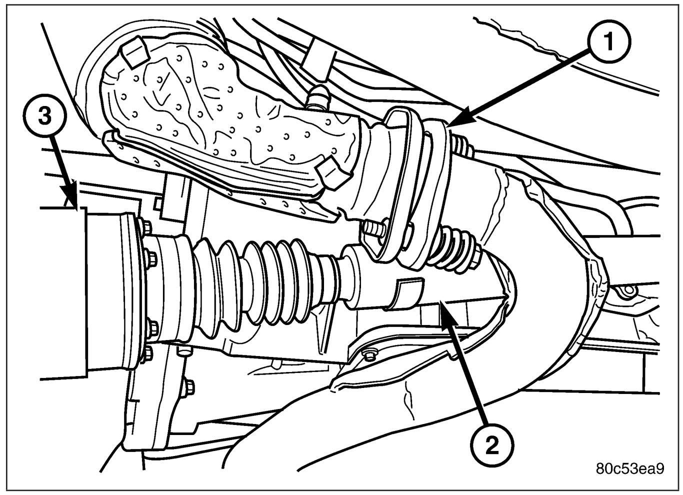
*INCLINOMETER 7663*

# SHAFT-PROPELLER FRONT

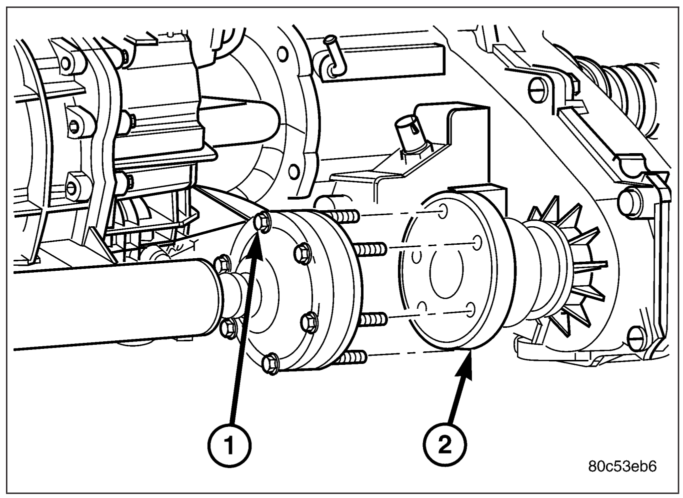
## REMOVAL

### REMOVAL – 2.8L DIESEL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove left side exhaust flange (1) bolts.
3. Mark companion flanges (3) and C/V joints at the front (2) and rear of the propeller shaft for installation reference.

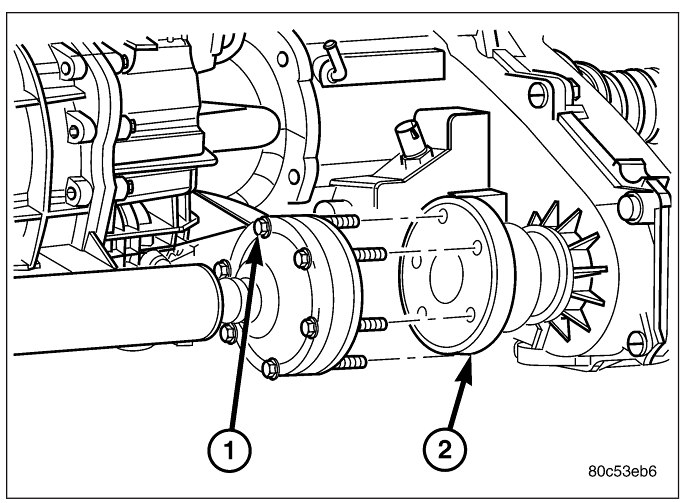


4. Remove bolts (1) from the front and rear C/V joints.
5. Push propeller shaft forward to clear transfer case companion flange (2).
6. Remove shaft from the front axle companion flange.
7. Pull down on the exhaust and tilt the front of the shaft down and pull shaft forward and remove from the vehicle.



### REMOVAL - 3.7L GAS ENGINE

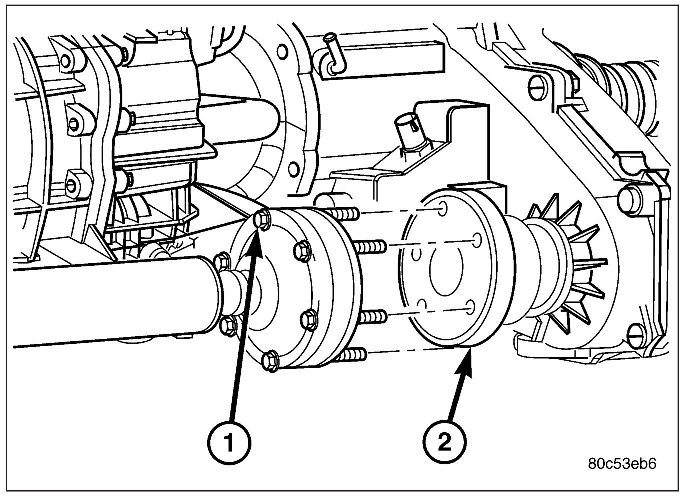
1. With vehicle in neutral, position vehicle on hoist.
2. Mark companion flanges and C/V joints at the front and rear of the propeller shaft for installation reference.
3. Remove bolts (1) from the front and rear C/V joints (2).
4. Push propeller shaft forward to clear transfer case companion flange.
5. Remove shaft from the front axle companion flange.
6. Tilt the front of the shaft down and pull shaft forward and remove from the vehicle.



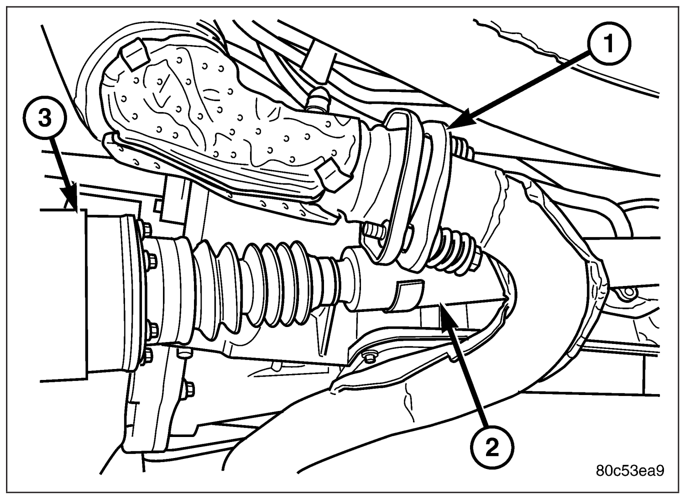
## INSTALLATION

## INSTALLATION – 2.8L DIESEL

1. Install propeller shaft between companion flanges.
2. Align marks on the companion flanges with the marks on the C/V joints.
3. Install front C/V joint bolts and tighten to 30 N·m (22 ft. lbs.).
4. Install rear C/V joint bolts (1) and tighten to 30 N·m (22 ft. lbs.).

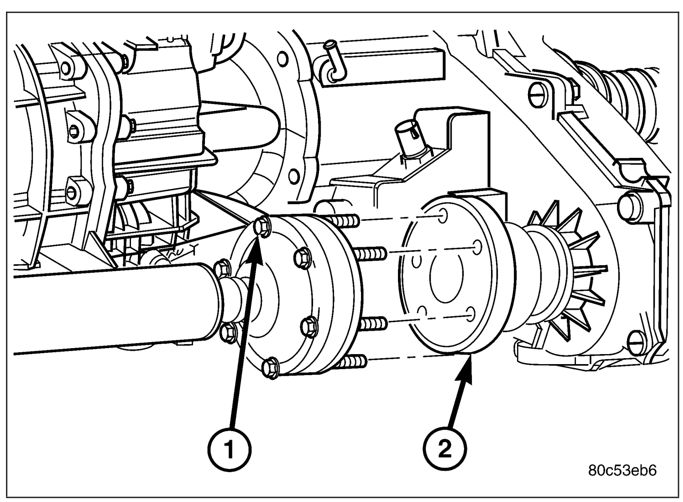


5. Install exhaust flange (1) and bolts.



## INSTALLATION - 3.7L GAS ENGINE

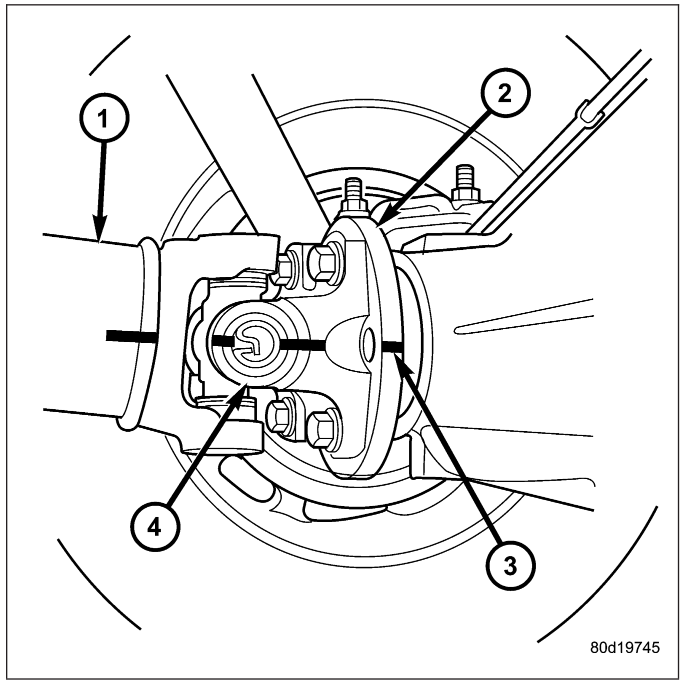
1. Install propeller shaft between companion flanges.
2. Align marks on the companion flanges with the marks on the C/V joints.
3. Install front C/V joint bolts and tighten to 30 N·m (22 ft. lbs.).
4. Install rear C/V joint bolts (1) and tighten to 30 N·m (22 ft. lbs.).



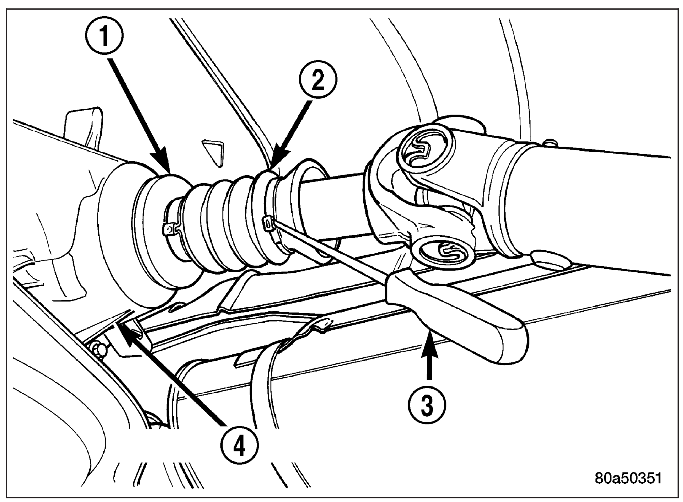
# SHAFT-PROPELLER REAR

## REMOVAL

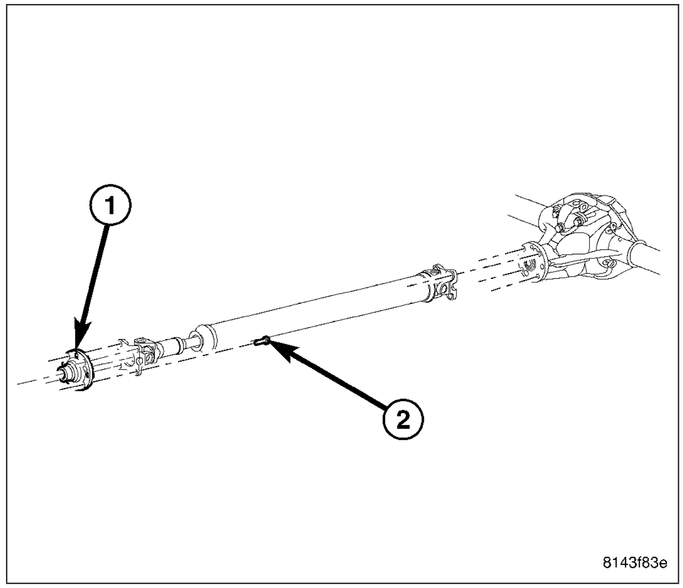
1. With vehicle in neutral, position vehicle on hoist.
2. Mark a reference line (3) across companion flanges (2) (4) and propeller shaft (1) for installation.



3. Pry open clamp holding the dust boot (2) to propeller shaft yoke, if equipped.

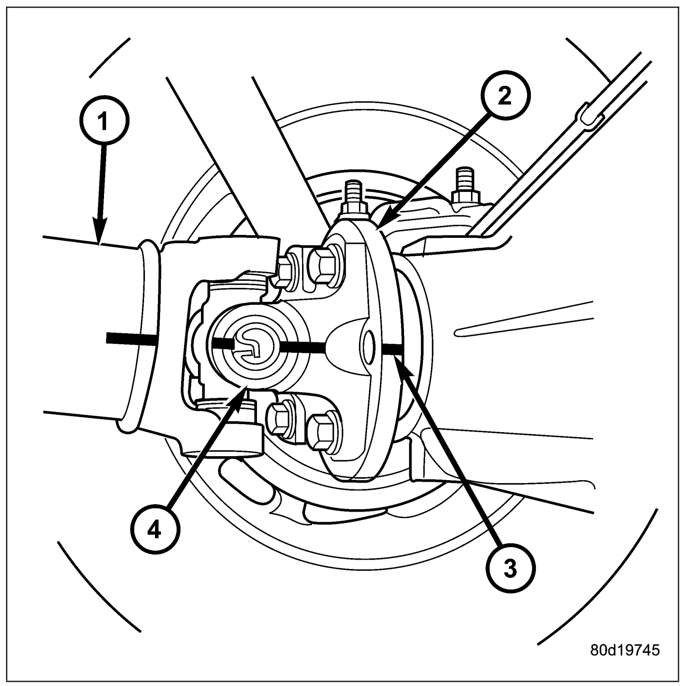


4. On 4x2 vehicles with manual transmission remover transmission companion flange (1) bolts (2).
5. Remove pinion companion flange bolts.
6. Remove propeller shaft.

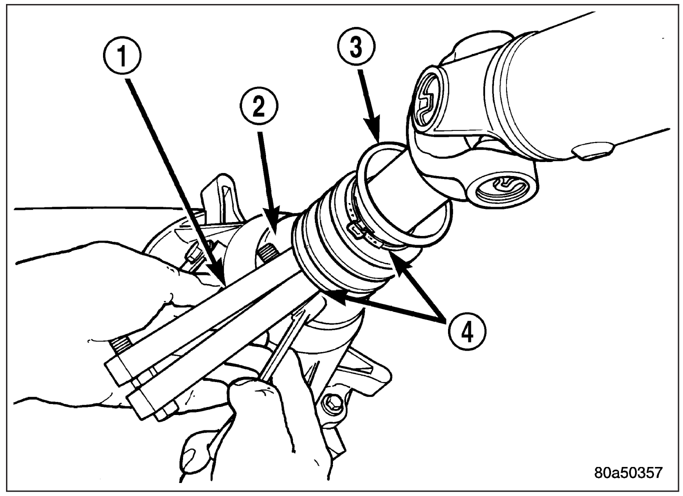


## INSTALLATION

1. Slide slip yoke on the transmission/transfer case output shaft. On 4x2 vehicles with a manual transmission install transmission flange bolts and tighten to 115 N·m (85 ft. lbs.).
2. Align reference marks (3) on companion flanges (2) (4) and propeller shaft (1).



3. Install companion flange bolts and tighten to 115 N·m (85 ft. lbs.).
4. Tighten dust boot (3) clamps (4) if equipped with clamp installer (1).

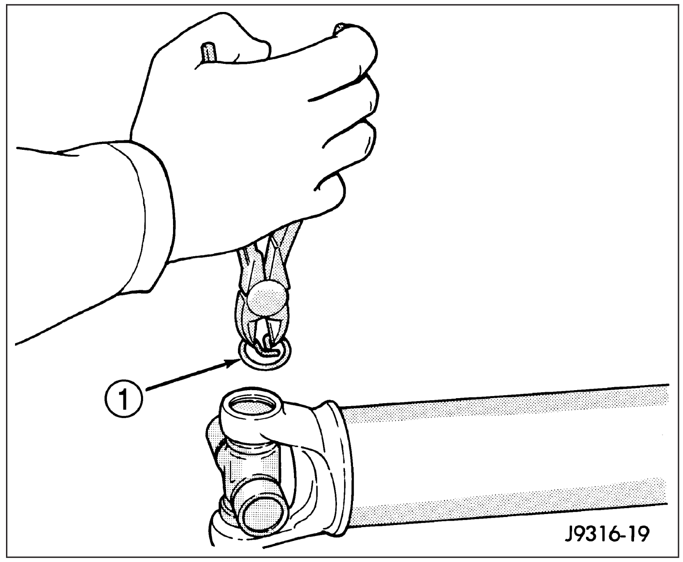


# UNIVERSAL JOINT-SINGLE CARDAN

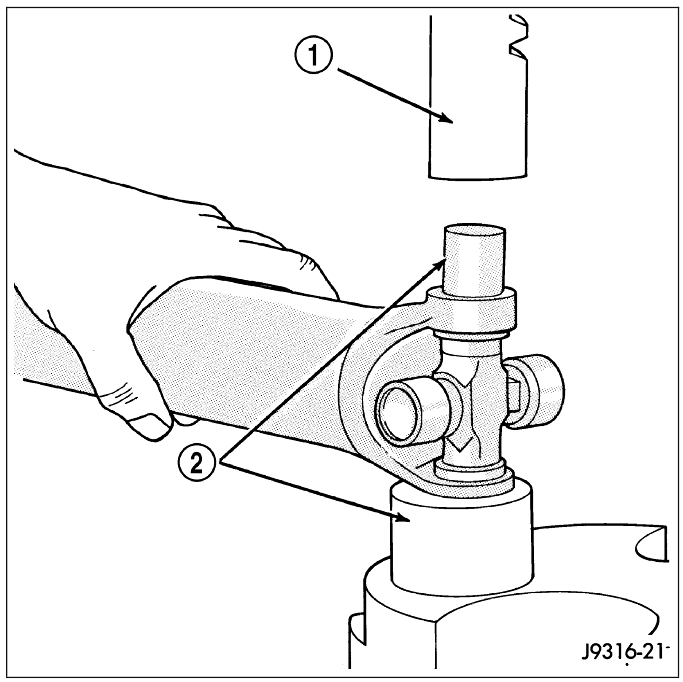
## DISASSEMBLY - WITH SNAP RINGS

**NOTE: This procedure describes a propeller shaft equipped with a cardan joint in the tube yoke. For propeller shafts equipped with a companion/slip yoke, repeat the steps to remove the remaining cardan joint.**

1. Tap outside of bearing cap with a drift to loosen snap ring.
2. Remove snap rings (1) from both sides of yoke.



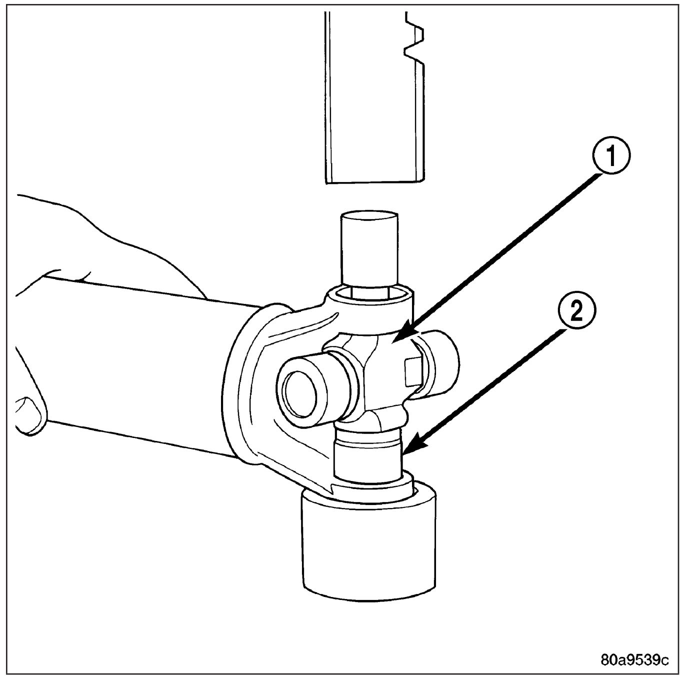
3. Position yoke with the grease fitting if equipped, pointing up.
4. Position a socket (2) with a inside diameter large enough to receive the bearing cap, beneath the yoke on a press.
5. Place another socket (2) with an outside diameter smaller than bearing cap on the upper bearing cap and press (1) the lower cap through the yoke.



**NOTE: If the bearing cap will not pull out of the yoke by hand after pressing, tap the yoke ear near the bearing cap to dislodge the cap.**

6. Pull bearing cap of the yoke.
7. Turn yoke over in the press and straighten the cross (1). Press the cross until the remaining bearing cap (2) can be removed.

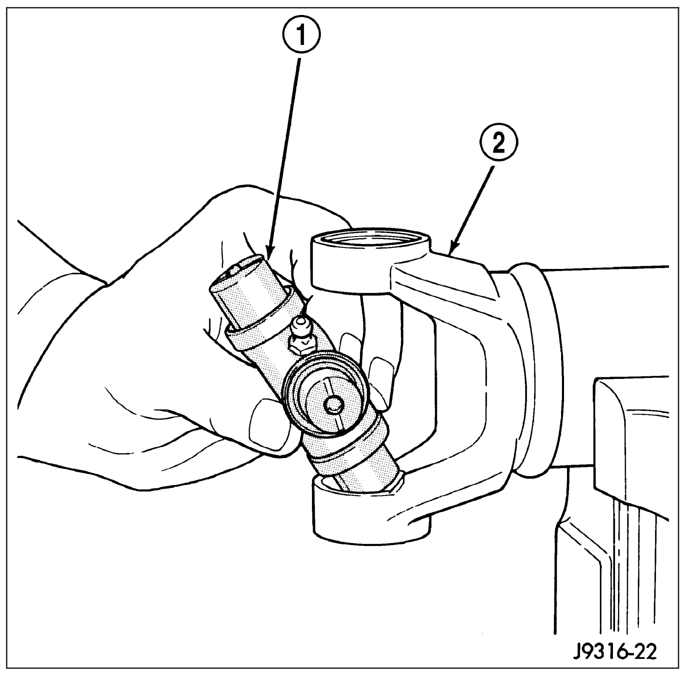
**CAUTION: If cross or bearing cap are not straight during removal, the bearing cap will score the walls of the yoke bore and damage can occur.**



## ASSEMBLY - WITH SNAP RINGS

**NOTE: This procedure describes a propeller shaft equipped a cardan joint in the tube yoke. For propeller shafts equipped with a companion/slip yoke, repeat the steps to remove the remaining cardan joint.**

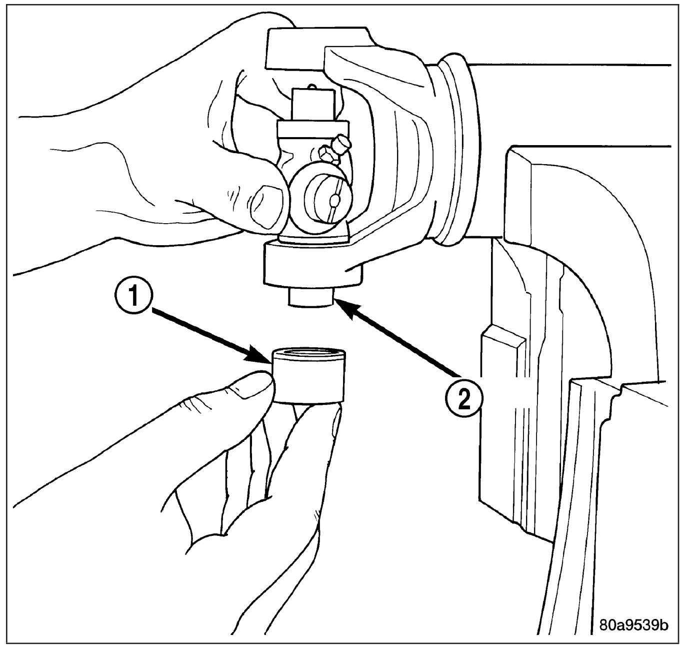
1. Apply (EP) N.L.G.I. Grade 1 or 2 grease to inside of yoke bores.
2. Position cross (1) in yoke (2) with lube fitting pointing up, if equipped.



3. Place a bearing cap (1) over the cross end (2) and align cap with yoke bore.
4. Press bearing cap into the yoke bore enough to clear snap ring groove.
5. Repeat Step 3 and Step 4 to install the opposite bearing cap.

**NOTE: If joint is stiff or binding, strike the yoke with a soft hammer to seat the needle bearings.**

6. Add grease to lube fitting, if equipped.



# HALF SHAFT

## TABLE OF CONTENTS

# HALF SHAFT

## CAUTION

**CAUTION:: Never grasp half shaft assembly by the boots. This may cause the boot to pucker or crease and reduce the service life of the boot.**
**Avoid over angulating or stroking the C/V joints when handling the half shaft.**
**Half shafts exposed to battery acid, transmission fluid, brake fluid, differential fluid or gasoline may cause the boots to deteriorate. Failure to follow these instruction will result in damage.**

## DIAGNOSIS AND TESTING

## HALF SHAFT

Check inboard and outboard C/V joint for leaking grease. This is a sign of boot or boot clamp damage.

### NOISE/VIBRATION IN TURNS

A clicking noise or vibration in turns could be caused by a damaged outer C/V or inner tripod joint seal boot or seal boot clamps. This will result in the loss/contamination of the joint grease, resulting in inadequate lubrication of the joint. Noise could also be caused by another component of the vehicle coming in contact with the half shafts.

### CLUNKING NOISE DURING ACCELERATION

This noise may be a damaged or worn C/V joint. A torn boot or loose/missing clamp on the inner/outer joint which has allowed the grease to be lost will damage the C/V joint.

### SHUDDER/VIBRATION DURING ACCELERATION

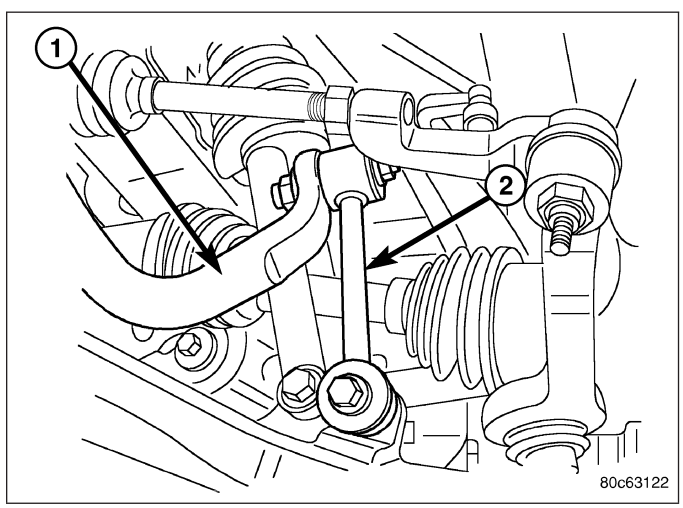
This could be a worn/damaged inner tripod joint or a sticking tripod joint. Improper wheel alignment may also cause a shudder or vibration.

### VIBRATION AT HIGHWAY SPEEDS

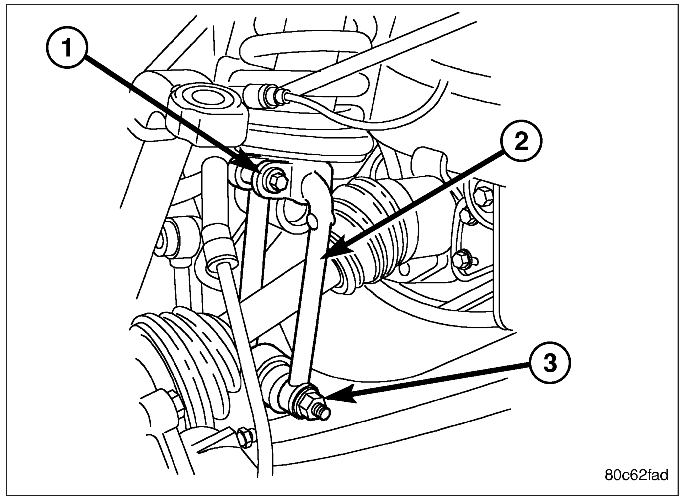
This problem could be a result of out of balance front tires or tire/wheel runout. Foreign material (mud, etc.) packed on the backside of the wheel(s) will also cause a vibration.

## REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove half shaft hub nut.
3. Remove stabilizer link (2) from stabilizer bar (1).

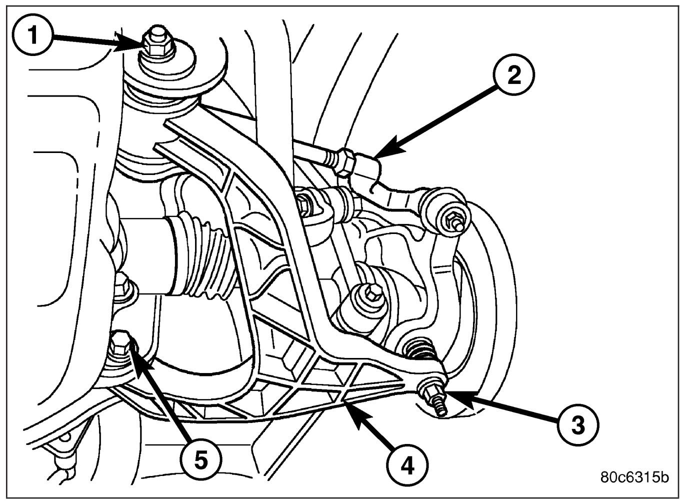


4. Remove clevis bracket (2) lower bolt (3).



5. Remover lower ball joint nut (3) and separate lower ball joint from the lower control arm (4).
6. Pull out on the steering knuckle and push the half shaft out of the knuckle.
7. With a pry bar remove the half shaft from the axle.

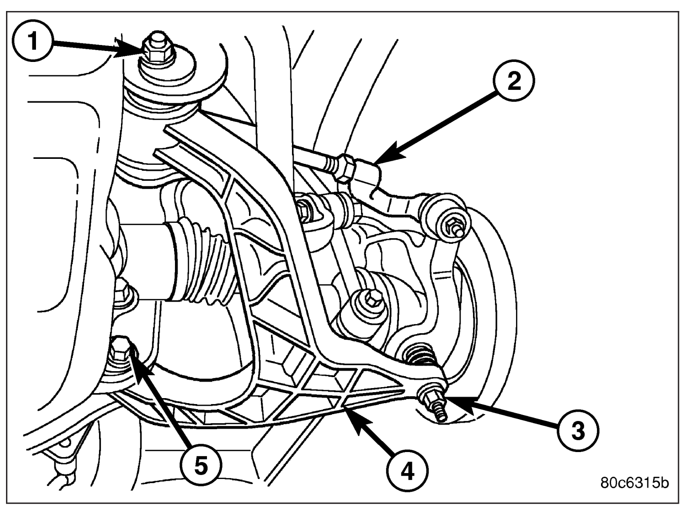
**NOTE: Right side half shaft has an axle shaft that may come out of the axle.**



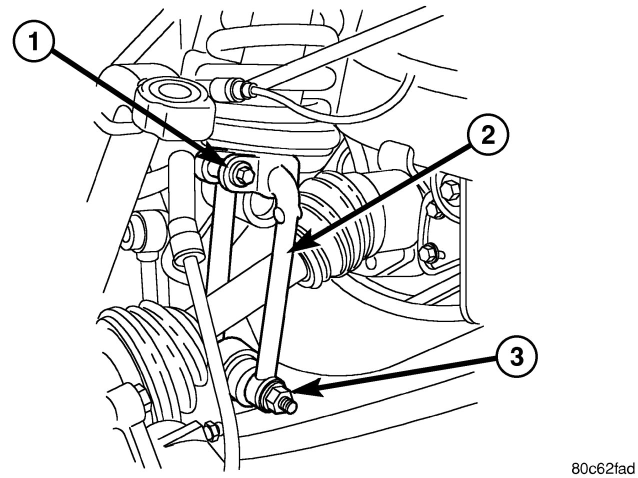
## INSTALLATION

**NOTE: Separate right half shaft from axle shaft in a vise if necessary and install axle shaft in the axle.**

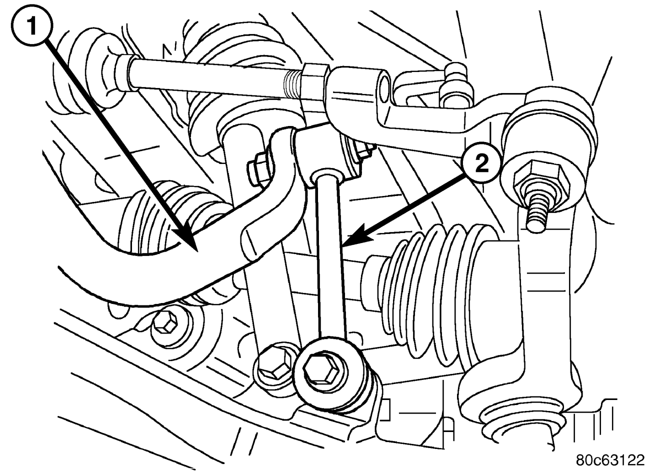
1. Apply a light coat of wheel bearing grease on the female splines of the inner C/V joint.
2. Install half shaft on the axle shaft spline and push firmly to engage the snap ring. Pull on the half shaft to verify snap has engaged.
3. Clean hub bearing bore and apply a light coat of wheel bearing grease.
4. Pull out on the steering knuckle and push the half shaft through the knuckle.
5. Install lower ball joint (3) into the lower control arm (4) and tighten pinch bolt.



6. Align clevis (2) with knuckle. Install and tighten lower clevis bolt (3) to specifications.



7. Install stabilizer bar link (2) on stabilizer bar (1).
8. Install half shaft hub nut and tighten to specifications.



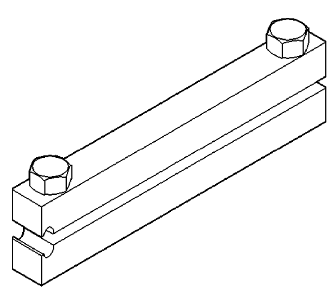
## SPECIFICATIONS

## HALF SHAFT

### TORQUE SPECIFICATIONS

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Half Shaft Nut | 136 | 100 | - |

## SPECIAL TOOLS



***INSTALLER C-4975A***

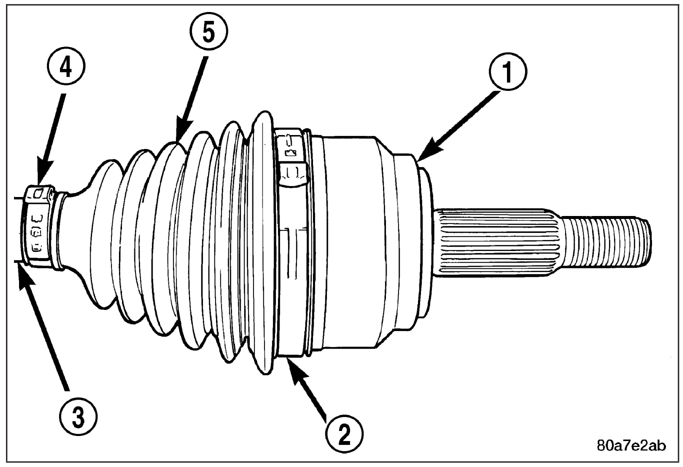
# JOINT/BOOT-C/V OUTER

## REMOVAL

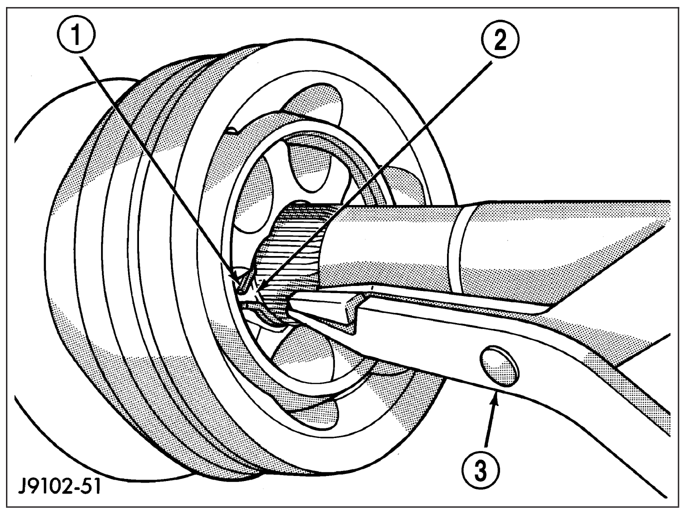
1. Place shaft in vise with soft jaws and support C/V joint.

**CAUTION: Do not damage C/V housing or half shaft.**

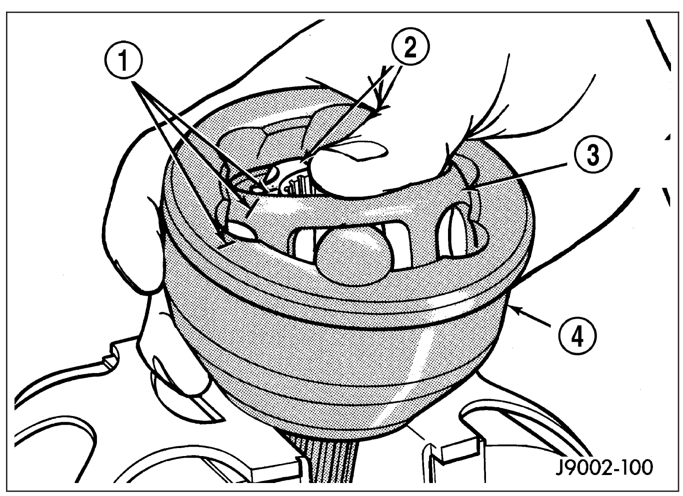
2. Remove clamps (2) (4) with a cut-off wheel or grinder.



3. Slide the boot down the shaft.
4. Remove lubricant to expose the C/V joint snap ring.
5. Spread snap ring (1) and slide the joint off the shaft.



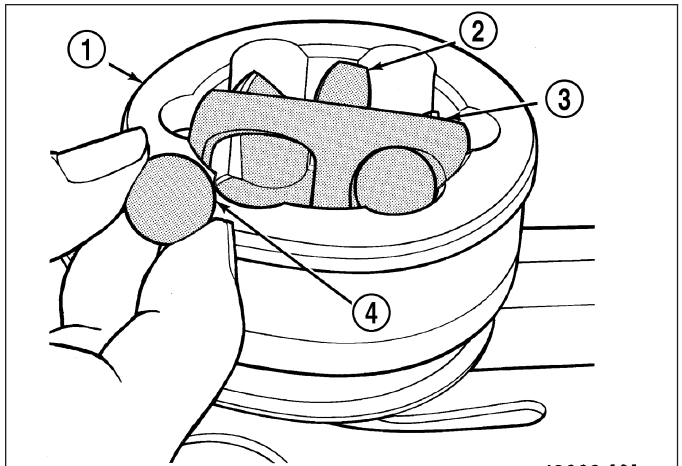
6. Slide boot off the shaft and discard old boot.
7. Mark alignment marks (1) on the inner race/hub (2), bearing cage (3) and housing with dabs of paint.



8. Clamp C/V joint in a vertical position in a soft jawed vise.
9. Press down one side of the bearing cage (3) to gain access to the ball at the opposite side.

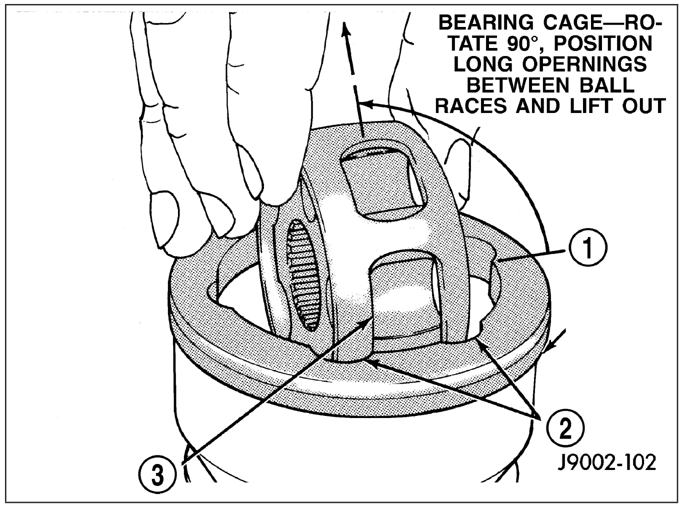
**NOTE: If joint is tight, use a hammer and brass drift to loosen the bearing hub. Do not contact the bearing cage with the drift.**

10. Remove ball (4) from the bearing cage (3).



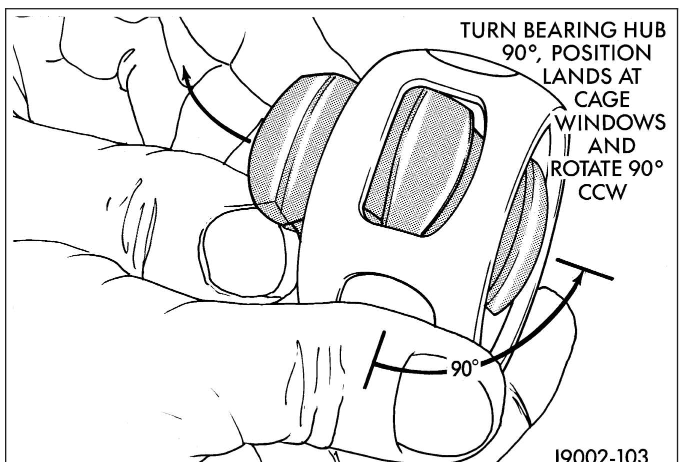
J9002-101

11. Repeat step above until all six balls are removed from the bearing cage.
12. Lift cage and inner race (2) upward and out from the housing (1).



J9002-102

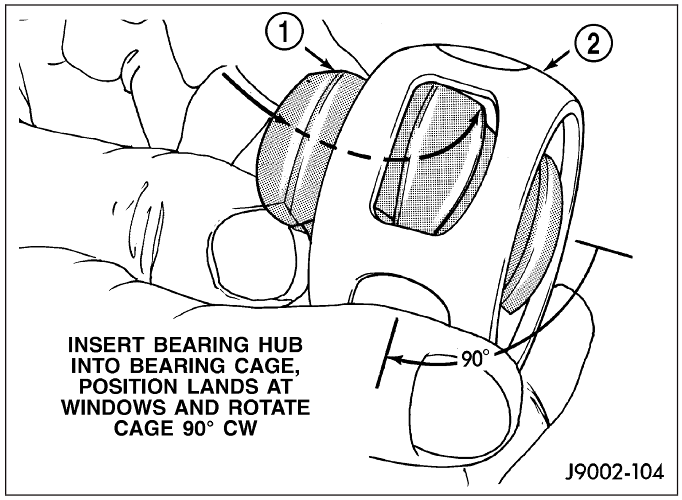
13. Turn inner race 90° in the cage and rotate the inner race/hub out of the cage.



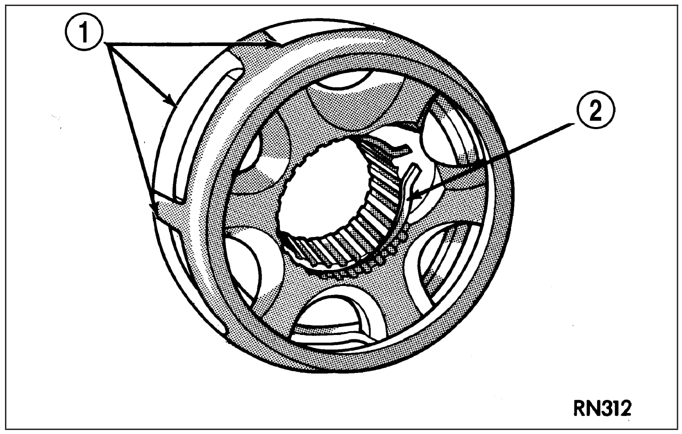
J9002-103

## INSTALLATION

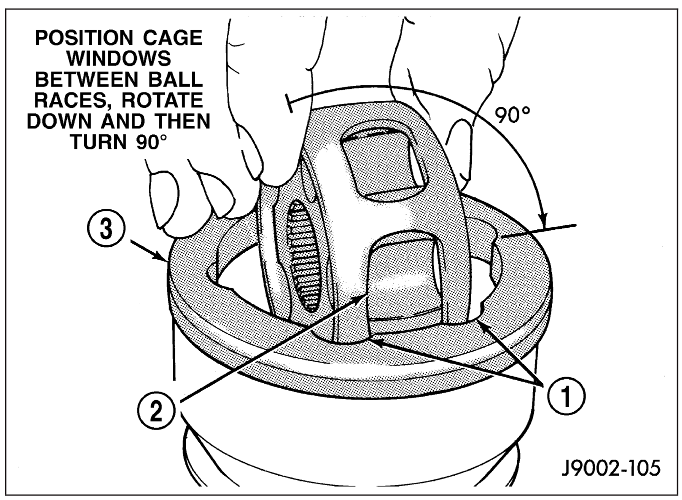
1. Apply a light coat of grease to the C/V joint components before assembling them.
2. Align inner race, cage and housing according to the alignment reference marks.
3. Insert inner race (1) into the cage (2) and rotate race into the cage.



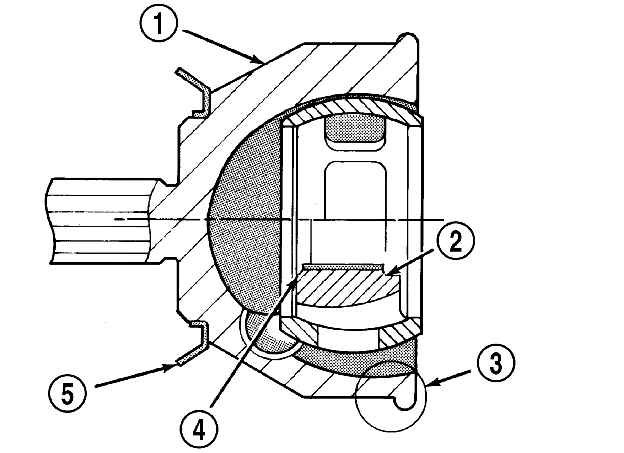
4. Rotate inner race/hub in the cage (1).



5. Insert cage into the housing (3).

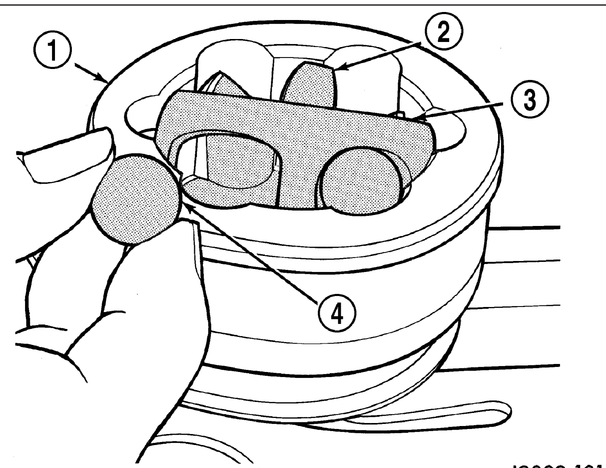


6. Rotate cage 90° into the housing (1).



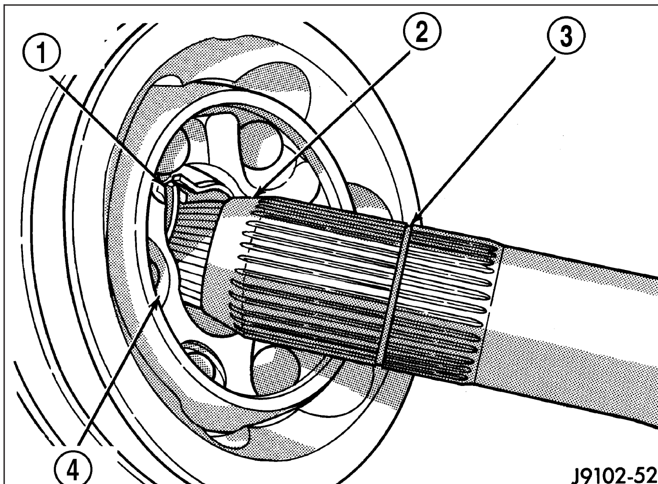
J9102-43

7. Apply lubricant included with replacement boot/joint to the ball races. Spread lubricant equally between all the races.
8. Tilt inner race/hub (2) and cage (3) and install the balls (4).



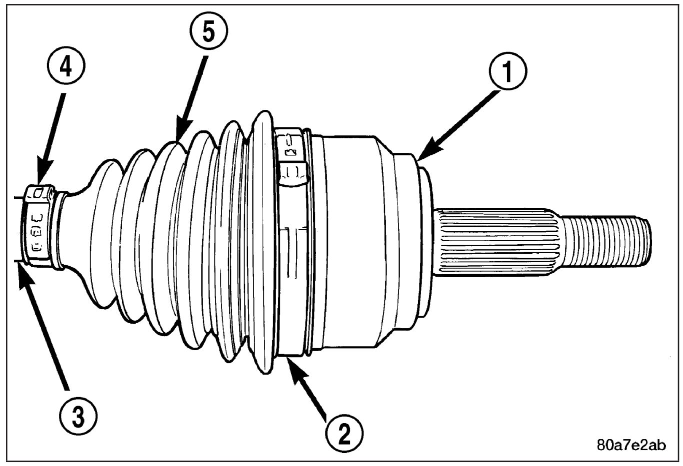
J9002-101

9. Place new clamps onto new boot and slide boot onto the shaft to it's original position.
10. Apply the rest of lubricant to the C/V joint and boot.
11. Push the joint onto the shaft until the snap ring (1) seats in the groove (3). Pull on the joint to verify the span ring has engaged.



J9102-52

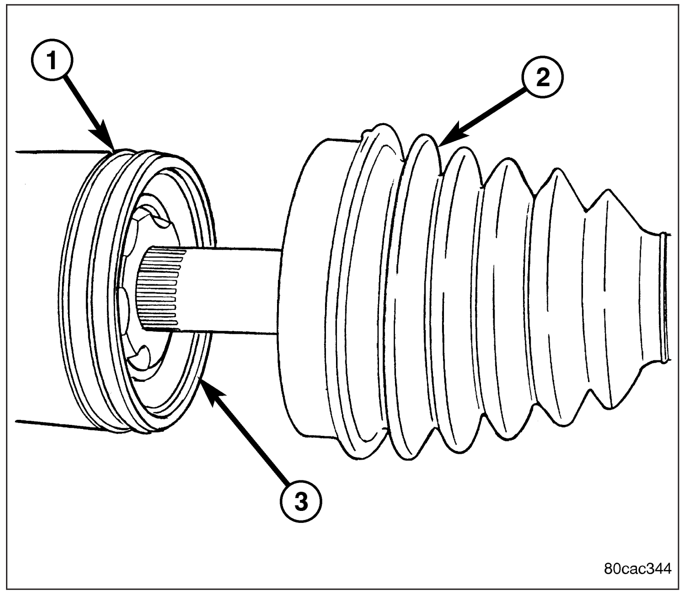
12. Position boot on the joint in it's original position. Ensure boot is not twisted and remove any excess air.
13. Secure both boot clamps (2) (4) with Clamp Installer C-4975A. Place tool on clamp bridge and tighten tool until the jaws of the tool are closed.



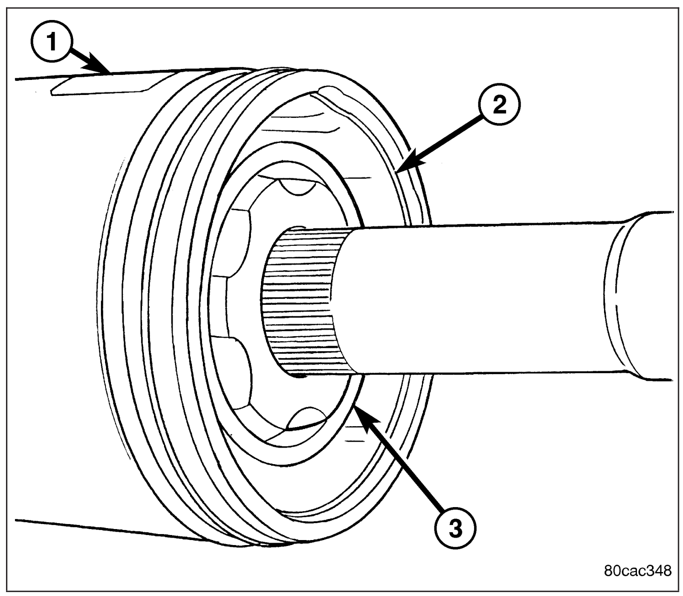
# JOINT/BOOT-C/V INNER

## REMOVAL

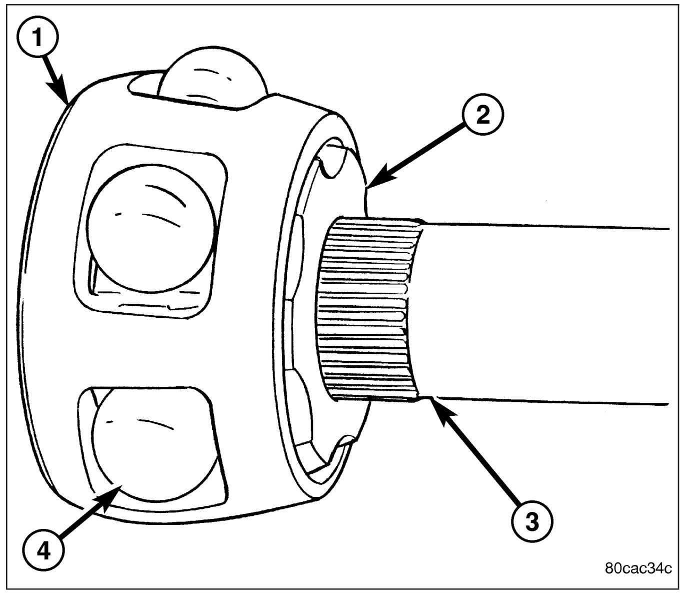
1. Clamp shaft in a vise (with soft jaws) and support C/V joint (1).
2. Remove clamps with a cut-off wheel or grinder.
3. Slide boot down (2) the shaft.



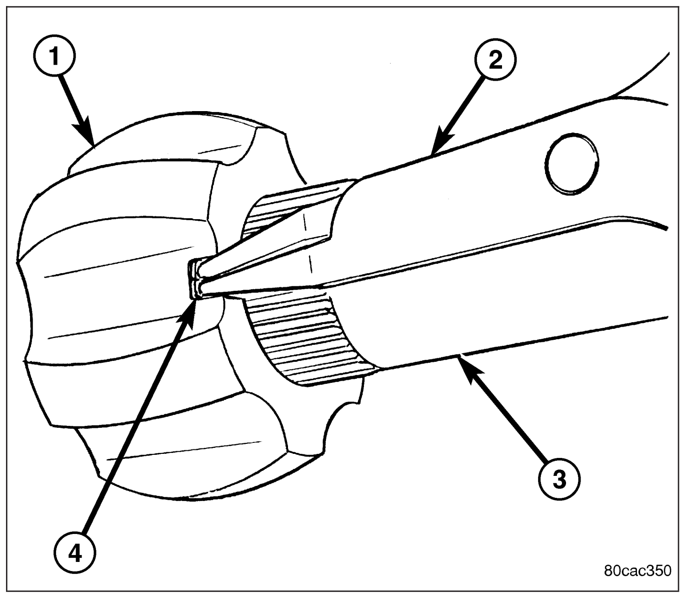
4. Remove lubricant from housing (1) to expose the C/V snap ring (2) and remove snap ring.



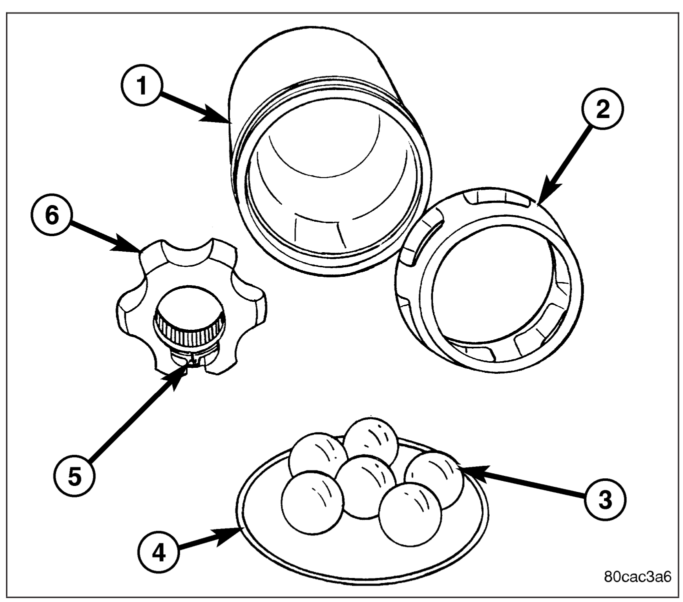
5. Remove bearings (4) from the cage (1).
6. Rotate cage (1) 30° and slide cage off the inner race (2) and down the shaft (3).



7. Remove spread inner race (1) snap ring (4) and remove race (1) from the shaft (3).
8. Remove boot from the shaft and discard.

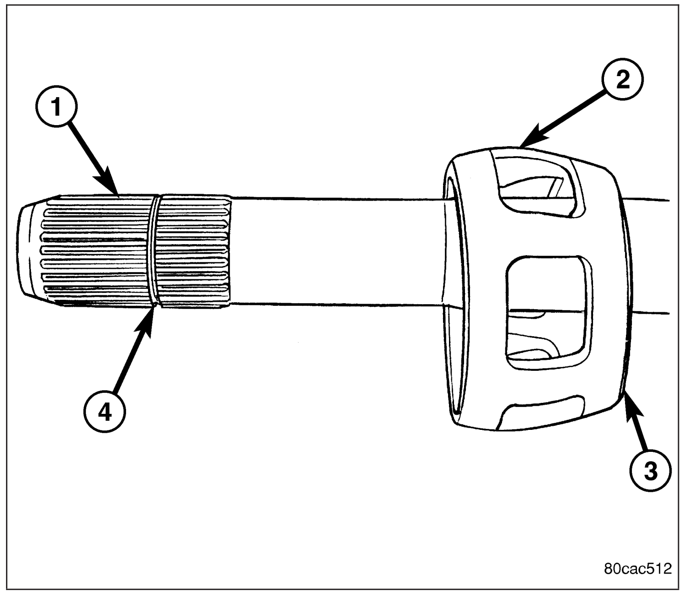


9. Clean and inspect housing (1), cage (2), bearings (3), housing snap-ring (4), inner race snap-ring (5) and inner race (6) for wear or damage.

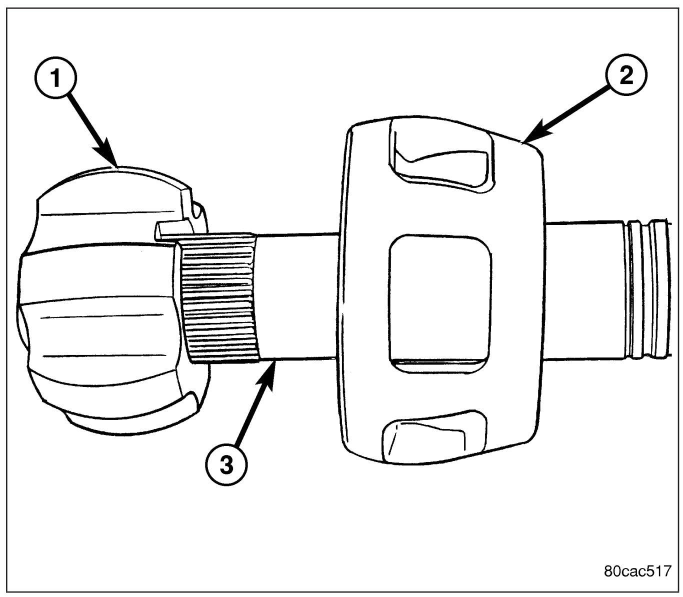


## INSTALLATION

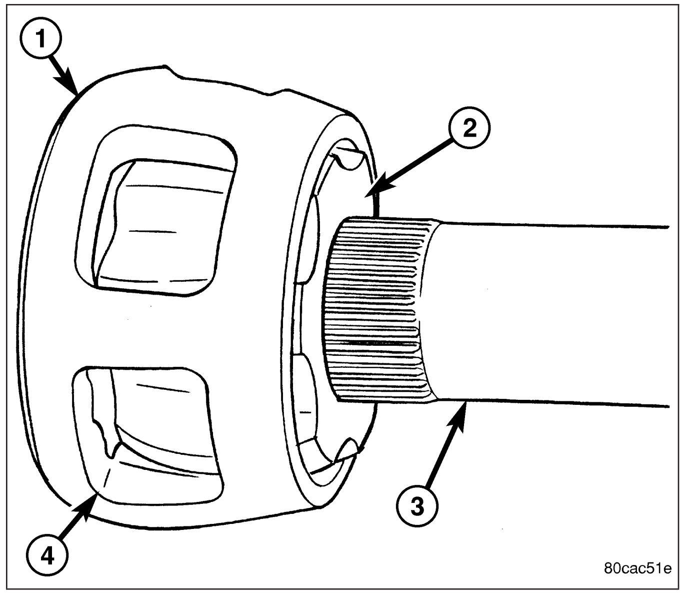
1. Apply a coat of grease supplied with the joint/boot to the C/V joint components before assembling them.
2. Place new clamps on the new boot and slide boot down the shaft.
3. Slide cage (2) onto the shaft (1) with the small diameter (3) end towards the boot.



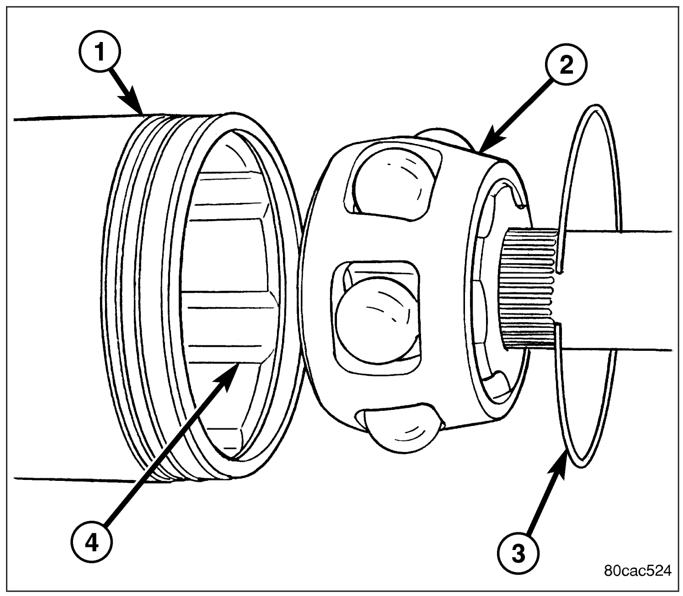
4. Install the inner race (1) onto the shaft (3). Pull on the race to verify snap ring has engaged.



5. Align cage (1) with the inner race (2) and slide over the race.
6. Turn the cage 30° to align the cage windows (4) with the race (2).



7. Apply grease to the inner race and bearings and install the bearings.
8. Apply grease to the housing bore (4) then install the bearing assembly (2) into the housing (1).
9. Install the housing snap ring (3) and verify it is seated in the groove.
10. Fill the housing and boot with the remaining grease.
11. Slide the boot onto the C/V housing into it's original position. Ensure boot is not twisted and remove any excess air.
12. Secure both boot clamps with Clamp Installer C-4975A. Place tool on clamp bridge and tighten tool until the jaws of the tool are closed.



# FRONT AXLE - 186FIA

## TABLE OF CONTENTS

# FRONT AXLE - 186FIA

## DIAGNOSIS AND TESTING

## FRONT AXLE - 186FIA

### GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side and pinions gears, usually do not cause noise during straight-ahead driving, when the gears are unloaded. The side gears are loaded during turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

### BEARING NOISE

Bearing noise can be either a whining or a growling sound.

**Pinion bearings** have a constant high pitch noise, because it rotates at a faster rate. This noise changes with vehicle speed. If noise is heard under a load, the rear pinion bearing is the source. If noise is heard during a coast, the front pinion bearing is the source.

**Differential bearings** usually produce a low pitch noise. The differential bearing noise is constant and varies only with vehicle speed.

**Axle shaft bearing** noise generally changes when the bearings are loaded. Turn vehicle sharply to the left and the right during a road test. This will load and unload the bearings and change the noise level. If axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

### LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joints/CV joint.
- Worn side-gear thrust washers.
- Worn pinion shaft bore.

### VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints/CV joint.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be an axle vibration. Also look at engine accessories, brackets and drive belts.

**NOTE: All driveline components should be examined before starting any repair.**

## DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear or the clutch engaged, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints/CV joint.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

To determined the source of a snap/clunk noise, raise vehicle on a hoist with the wheels free to rotate. Have a helper shift the transmission into gear and listen for the noise.

**DIAGNOSTIC CHART**

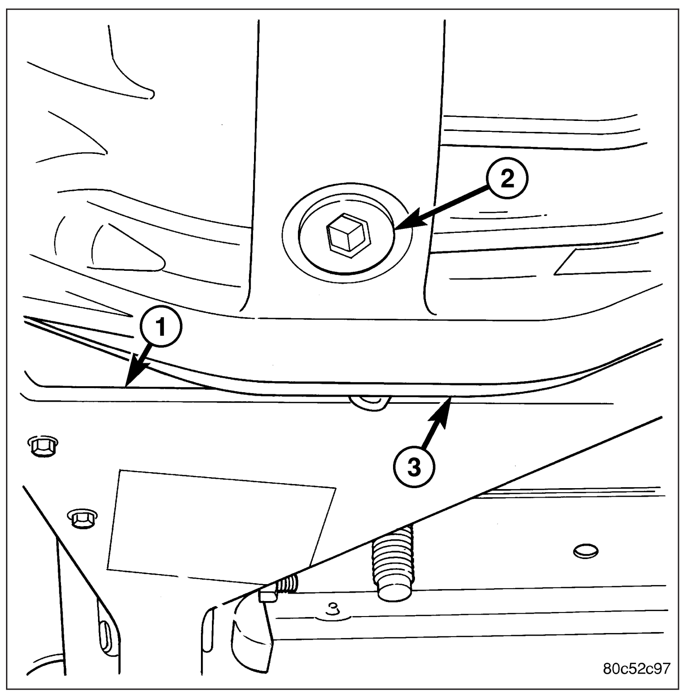
| Condition | Possible Causes | Correction |
|---|---|---|
| Wheel Noise | 1. Wheel loose. | 1. Tighten loose nuts. |
| | 2. Worn wheel bearing. | 2. Replace bearing. |
| Axle Shaft Noise | 1. Misaligned axle tube. | 1. Inspect axle tube alignment. Correct as necessary. |
| | 2. Bent or sprung axle shaft. | 2. Inspect and correct as necessary. |
| | 3. End-play in pinion bearings. | 3. Refer to pinion pre-load information and correct as necessary. |
| | 4. Excessive gear backlash between the ring gear and pinion. | 4. Check adjustment of the ring gear and pinion backlash. Correct as necessary. |
| | 5. Improper adjustment of pinion gear bearings. | 5. Adjust the pinion bearings pre-load. |
| | 6. Loose pinion yoke nut. | 6. Tighten the pinion yoke nut. |
| | 7. Scuffed gear tooth contact surfaces. | 7. Inspect and replace as necessary. |
| Axle Shaft Broke | 1. Misaligned axle tube. | 1. Replace the broken shaft after correcting tube mis-alignment. |
| | 2 Vehicle overloaded. | 2. Replace broken shaft and avoid excessive weight on vehicle. |
| | 3. Erratic clutch operation. | 3. Replace broken shaft and avoid or correct erratic clutch operation. |
| | 4. Grabbing clutch. | 4. Replace broken shaft and inspect and repair clutch as necessary. |

| Condition | Possible Causes | Correction |
|---|---|---|
| Differential Cracked | 1. Improper adjustment of the differential bearings. | 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. |
| | 2. Excessive ring gear backlash. | 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. |
| | 3. Vehicle overloaded. | 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. |
| | 4. Erratic clutch operation. | 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch. |
| Differential Gears Scored | 1. Insufficient lubrication. | 1. Replace scored gears. Fill differential with the correct fluid type and quantity. |
| | 2. Improper grade of lubricant. | 2. Replace scored gears. Fill differential with the correct fluid type and quantity. |
| | 3. Excessive spinning of one wheel/tire. | 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary. |
| Loss Of Lubricant | 1. Lubricant level too high. | 1. Drain lubricant to the correct level. |
| | 2. Worn axle shaft seals. | 2. Replace seals. |
| | 3. Cracked differential housing. | 3. Repair as necessary. |
| | 4. Worn pinion seal. | 4. Replace seal. |
| | 5. Worn/scored yoke. | 5. Replace yoke and seal. |
| | 6. Axle cover not properly sealed. | 6. Remove, clean and seal cover. |
| Axle Overheating | 1. Lubricant level low. | 1. Fill differential to correct level. |
| | 2. Improper grade of lubricant. | 2. Fill differential with the correct fluid type and quantity. |
| | 3. Bearing pre-loads too high. | 3. Adjust bearing pre-loads. |
| | 4. Insufficient ring gear backlash. | 4. Adjust ring gear backlash. |
| Gear Teeth Broke | 1. Overloading. | 1. Replace gears. Examine other gears and bearings for possible damage. |
| | 2. Erratic clutch operation. | 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. |
| | 3. Ice-spotted pavement. | 3. Replace gears and examine remaining parts for damage. |
| | 4. Improper adjustments. | 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct. |

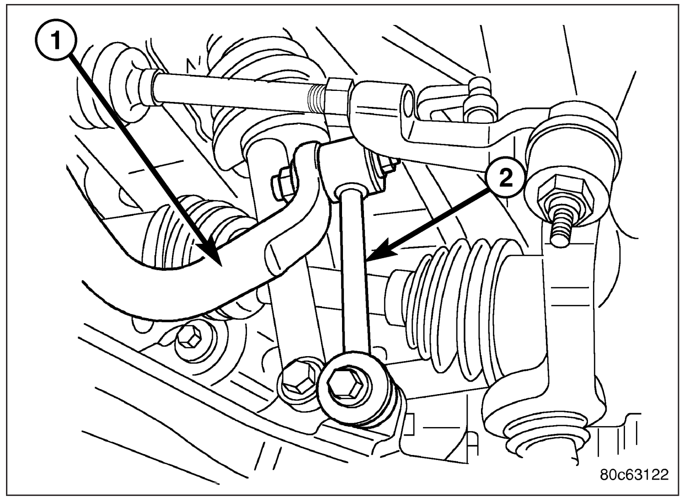
| Condition | Possible Causes | Correction |
|---|---|---|
| Axle Noise | 1. Insufficient lubricant. | 1. Fill differential with the correct fluid type and quantity. |
| | 2. Improper ring gear and pinion adjustment. | 2. Check ring gear and pinion contact pattern. |
| | 3. Unmatched ring gear and pinion. | 3. Replace gears with a matched ring gear and pinion. |
| | 4. Worn teeth on ring gear or pinion. | 4. Replace ring gear and pinion. |
| | 5. Loose pinion bearings. | 5. Adjust pinion bearing pre-load. |
| | 6. Loose differential bearings. | 6. Adjust differential bearing pre-load. |
| | 7. Ring gear run-out. | 7. Measure ring gear run-out. Replace components as necessary. |
| | 8. Loose differential bearing cap bolts. | 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. |
| | 9. Housing not machined properly. | 9. Replace housing. |

## REMOVAL

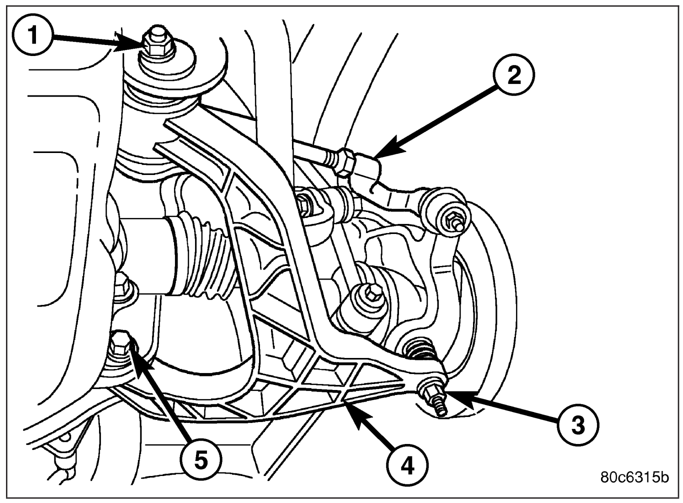
1. With vehicle in neutral, position vehicle on hoist.
2. Remove skid plate.
3. Remove differential housing (3) drain plug (2) and drain fluid.



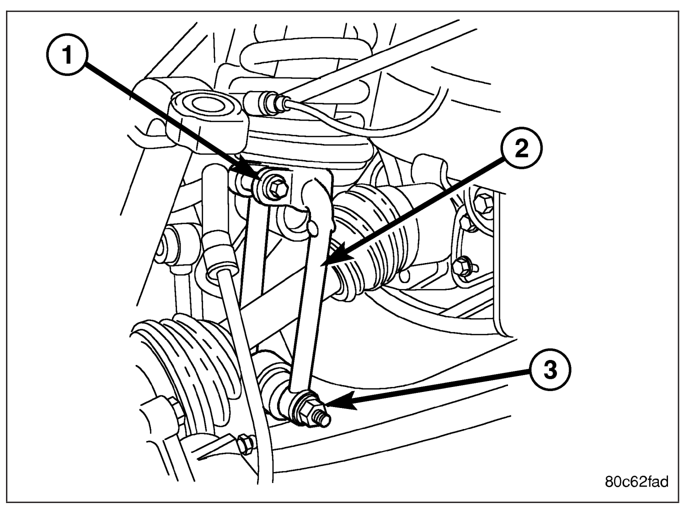
4. Mark front propeller shaft and pinion flange. Remove propeller shaft from pinion flange.
5. Remove half shaft hub nuts.
6. Remove stabilizer bar (1) links (2) from the lower control arms.



7. Remove tie rod end (2) nuts and separate ends from the knuckles.
8. Remove lower ball joint nuts (3) and separate ball joints from the lower control arms (4).



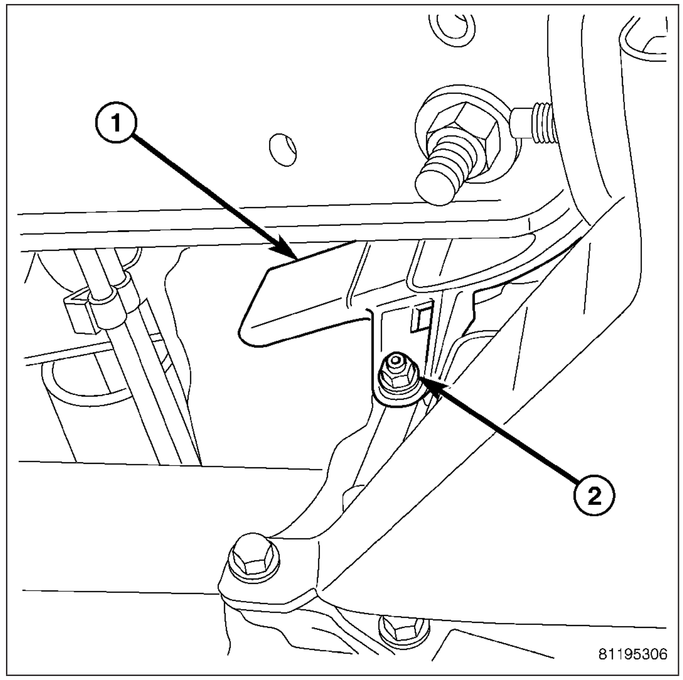
9. Remove shock clevis (2) lower bolts (3).
10. Pull out on the steering knuckles and push the half shaft out of the knuckles.



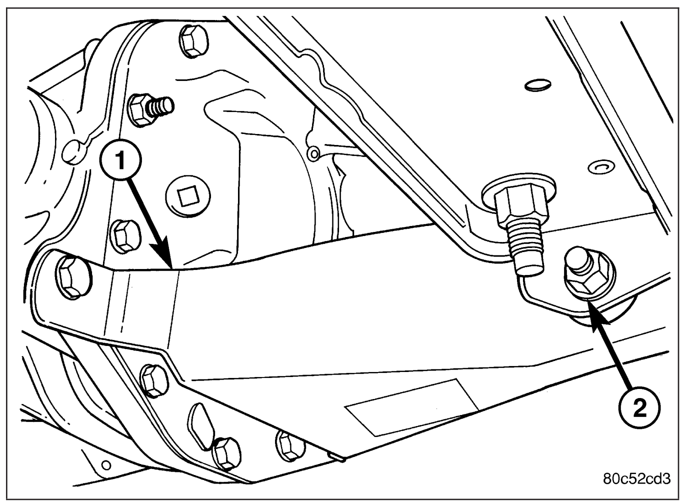
11. With a pry bar remove the half shafts from the axle.

**NOTE: Right half shaft has a splined axle that may come out with the half shaft.**

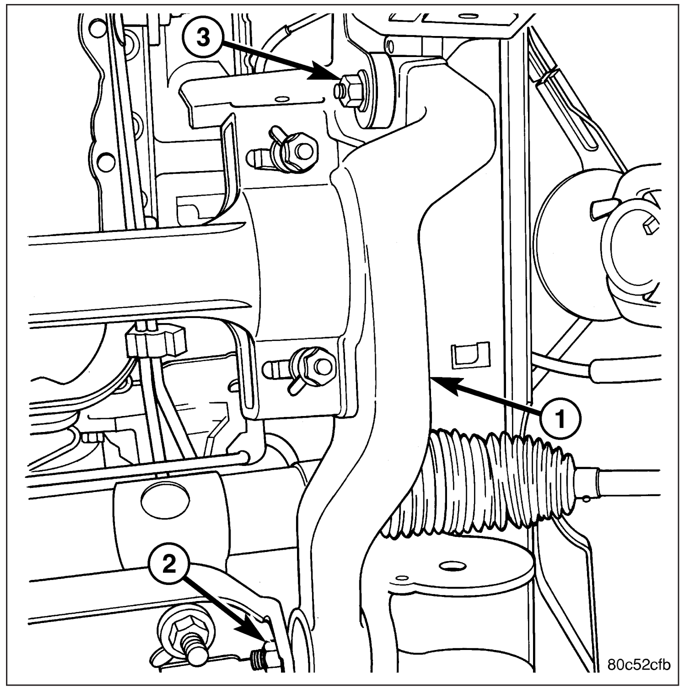
12. Remove differential vent hose from cover and remove drain trough (1) nut (2).



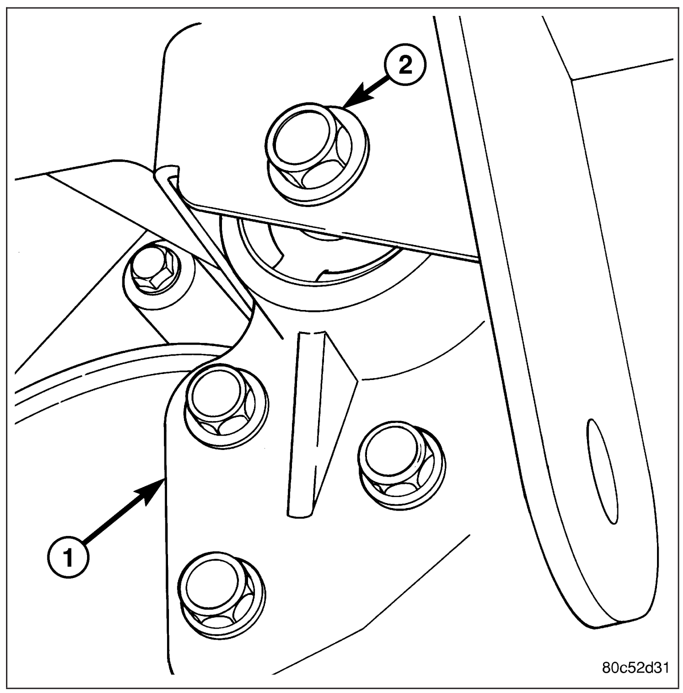
13. Support axle with a lift/jack.
14. Remove bolts from left front axle bracket (1) and cradle bracket bolt.
15. Remove oil filter drip tray.



16. Mark and remove right control arm cam bolt.
17. Remove front bolt (2) and rear bolt (3) from right axle bracket (1) frame mounts.



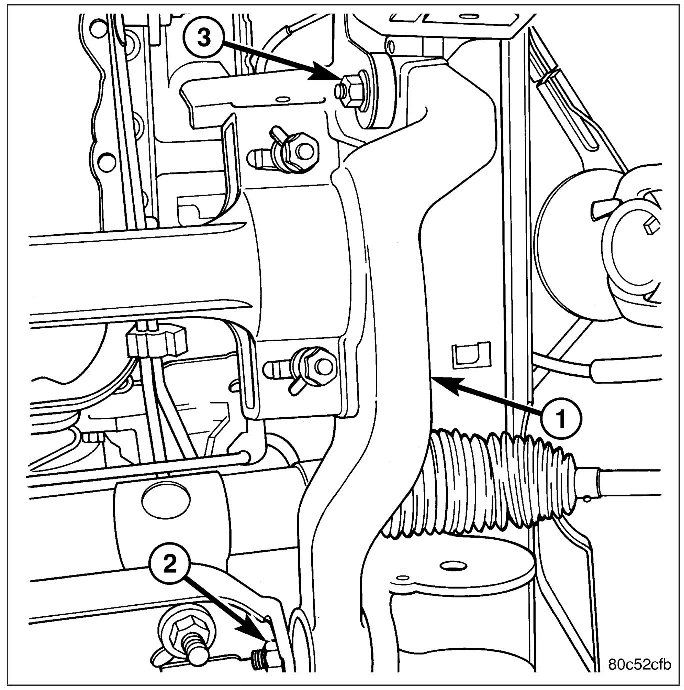
18. Remove bolt (2) from left rear axle bracket (1) frame mount.
19. Lower axle and from vehicle.



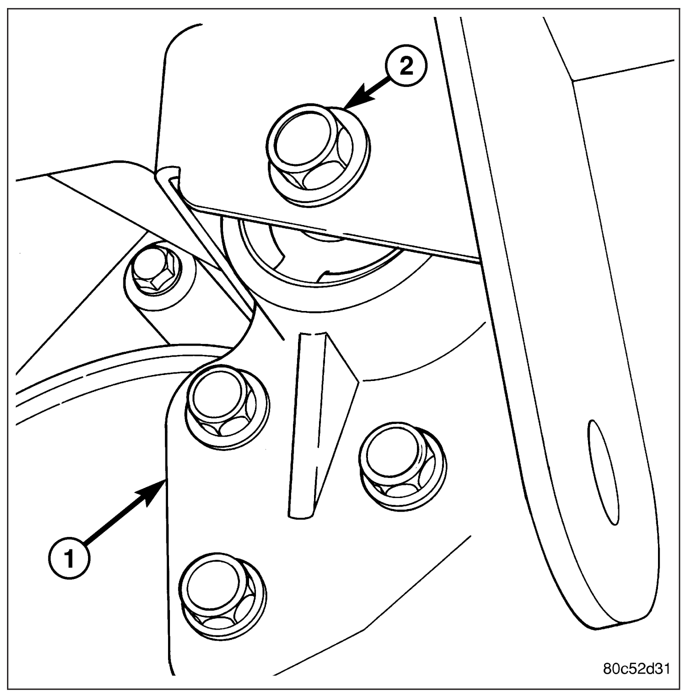
## INSTALLATION

**NOTE: Separate right axle shaft from the half shaft if necessary and install axle shaft in the axle.**

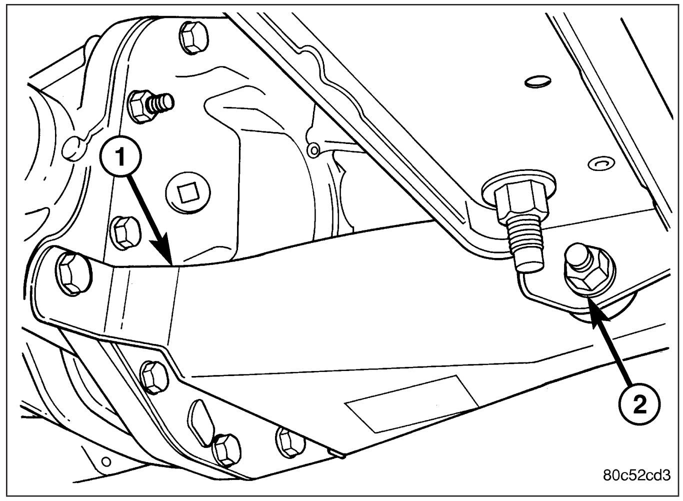
1. Install right bracket (1) to axle and tighten to 88 N·m (65 ft. lbs.).



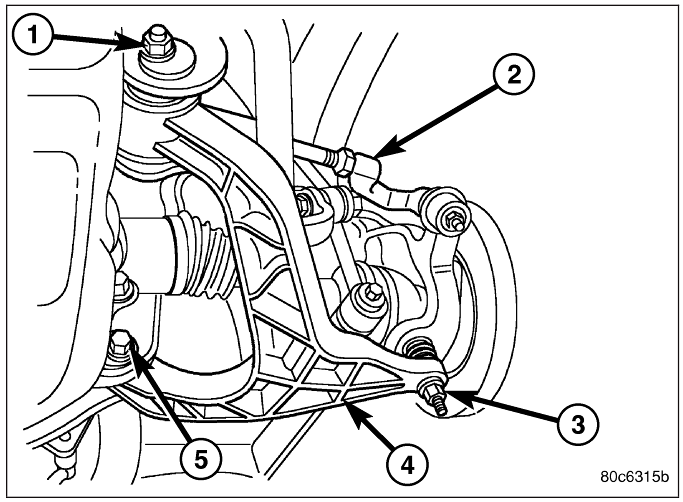
2. Install left rear bracket (1) to axle and tighten to 61 N·m (45 ft. lbs.).



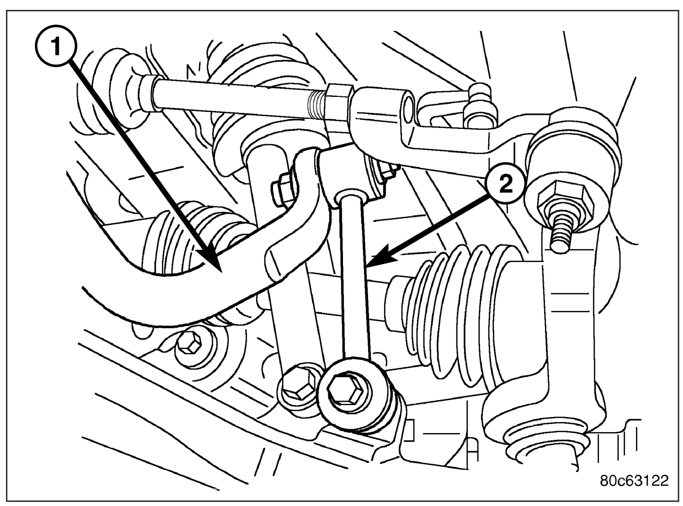
3. Install left front bracket (1) to axle and tighten to 61 N·m (45 ft. lbs.).
4. Raise axle up and align brackets with frame mounts.
5. Install frame mount bolts and tighten to 88 N·m (65 ft. lbs.).



6. Install half shafts.
7. Install right front control arm cam bolt (1) with marks aligned.
8. Install lower ball joint into lower control arms (4) and tighten nuts (3).
9. Align clevis with knuckles and install clevis bolts.



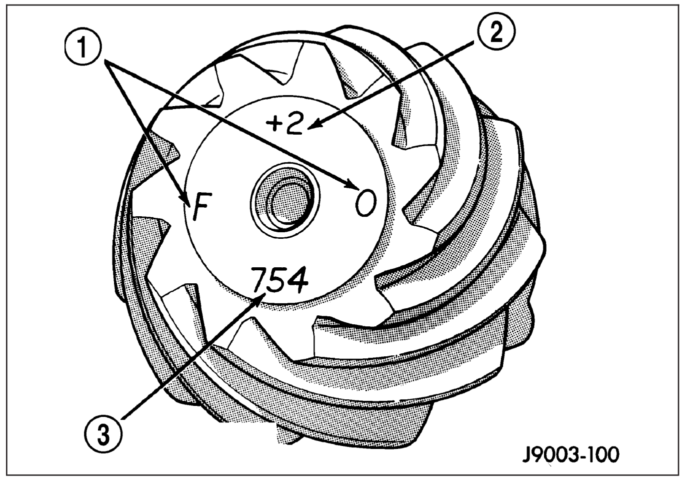
10. Install stabilizer bar (1) links (2) to lower control arms and install bolts.
11. Install oil filter trough.
12. Install new half shaft hub nuts and tighten to 136 N·m (100 ft. lbs.).
13. Install propeller shaft.
14. Install axle vent hose.
15. Fill differential with gear lubricant.
16. Install skid plate.
17. Tighten clevis and stabilizer links bolts to specifications.
18. Check vehicle alignment.



## ADJUSTMENTS

## PINION DEPTH-BEARING PRELOAD-GEAR BACKLASH

Ring and pinion gears are supplied as matched sets. Gear match numbers (3) for the ring and pinion gear are etched onto each gear. A plus (+) number, minus (–) number or zero (0) is etched into the face of the pinion gear (2). This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0).



Compensation for pinion depth variance is achieved with a select shim/oil slinger. The shims are placed between the rear pinion bearing and the pinion gear head.

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim/oil slinger to compensate for the difference in the depth variances. The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

**Pinion Gear Depth Variance Chart**: Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

**PINION GEAR DEPTH VARIANCE**

| Original Pinion Gear Depth Variance | Replacement Pinion Gear Depth Variance | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | −4 | −3 | −2 | −1 | 0 | +1 | +2 | +3 | +4 |
| **+4** | +0.008 | +0.007 | +0.006 | +0.005 | +0.004 | +0.003 | +0.002 | +0.001 | 0 |
| **+3** | +0.007 | +0.006 | +0.005 | +0.004 | +0.003 | +0.002 | +0.001 | 0 | −0.001 |
| **+2** | +0.006 | +0.005 | +0.004 | +0.003 | +0.002 | +0.001 | 0 | −0.001 | −0.002 |
| **+1** | +0.005 | +0.004 | +0.003 | +0.002 | +0.001 | 0 | −0.001 | −0.002 | −0.003 |

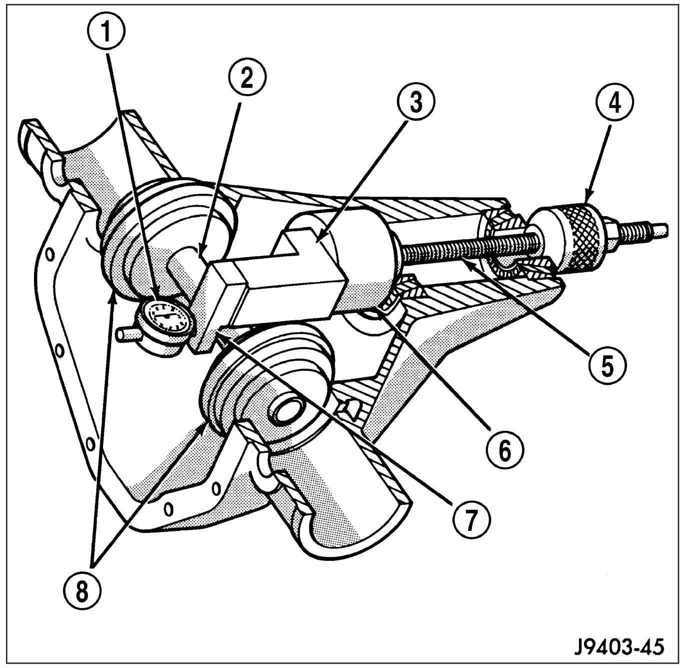
| **−3** | +0.001 | 0 | −0.001 | −0.002 | −0.003 | −0.004 | −0.005 | −0.006 | −0.007 |
| **−4** | 0 | −0.001 | −0.002 | −0.003 | −0.004 | −0.005 | −0.006 | −0.007 | −0.008 |

## PINION DEPTH MEASUREMENT

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339 (1).

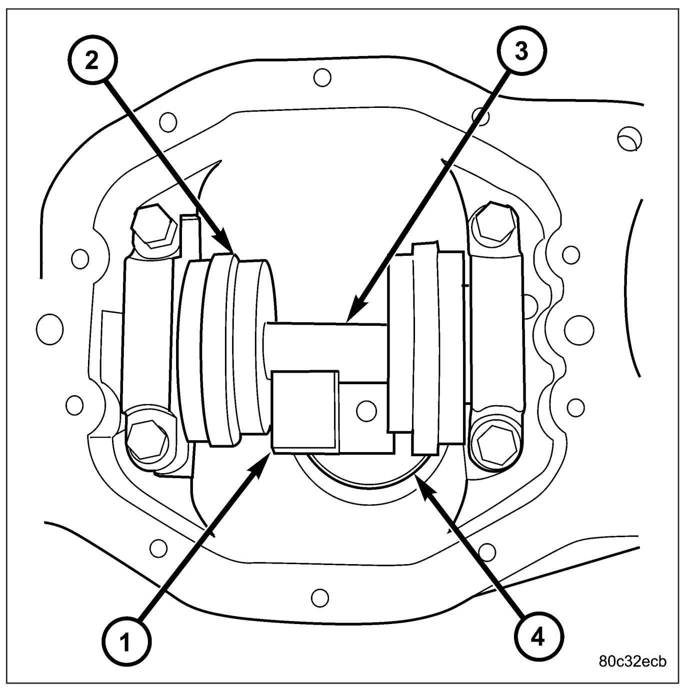
1. Assemble Pinion Height Block 6739 (3), Pinion Block 8804 (6) and rear pinion bearing onto Screw 6741(5).
2. Insert height gauge components into the housing through pinion bearing cups.
3. Install front pinion bearing and Cone-nut 6740 (4) onto the screw. Tighten Cone-Nut until Torque To Rotate screw is 1.7 N·m (15 in. lbs.).



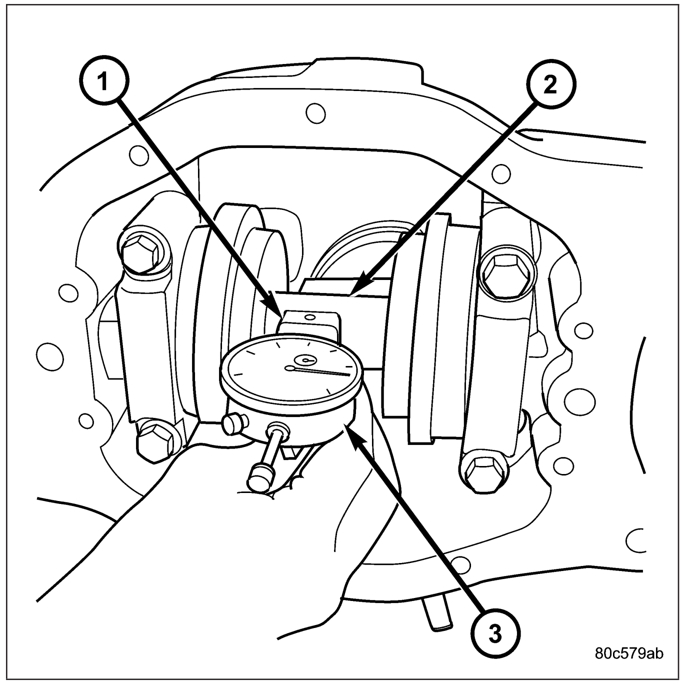
4. Position Arbor Disc 6732 (2) and Arbor D-115-3 (3) into the housing bearing cradles. Install differential bearing caps on Arbor Discs and tighten bolts to 41 N·m (30 ft. lbs.).

**NOTE: Arbor Discs 6732 has different step diameters to fit other axles. Choose proper step for axle being serviced.**

5. Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.

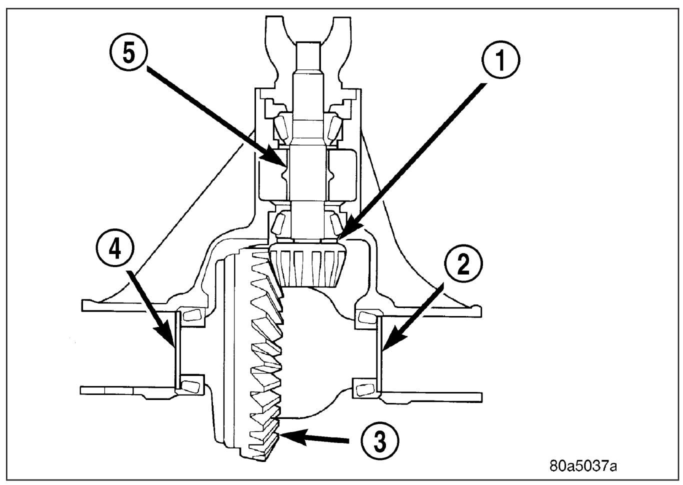


6. Position Scooter Block (1) with Dial Indicator (3) flush on the pinion height block. Hold the scooter block and zero the dial indicator.
7. Slowly slide the scooter block across the pinion height block over to the arbor (2). Move the scooter block till the dial indicator probe crests the arbor (2) and record the highest reading.
8. Select a shim/oil slinger equal to the dial indicator reading plus the pinion depth variance number etched in the face of the pinion. For example, if the depth variance is –2, add +0.002 in. to the dial indicator reading.



## DIFFERENTIAL SIDE BEARING PRELOAD AND GEAR BACKLASH

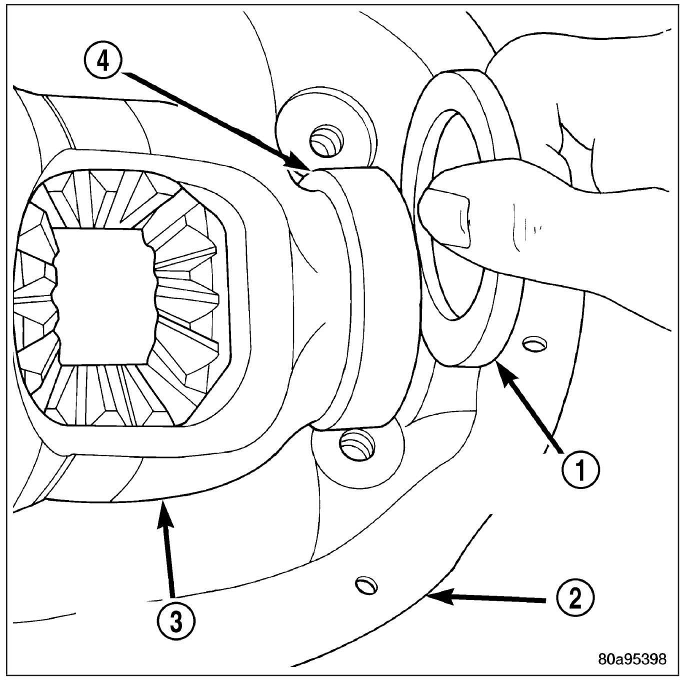
Differential bearing preload and gear backlash is achieved with selective shims (2) (4) located between the differential bearing cups and differential housing. The proper shim thickness can be determined using slip-fit Dummy Bearings D-348 in place of the differential side bearings and a Dial Indicator C-3339. Before measuring differential bearing preload and gear backlash, measure pinion gear depth and prepare pinion for installation. Pinion gear depth is essential to establishing gear backlash and tooth contact patterns. After measuring shim thickness to take up differential side play, install pinion and measure gear backlash shim thickness. Overall shim thickness is the dial indicator reading and preload specification added together. The gear backlash measurement determines the shim thickness used on the ring gear side of the differential case. Subtract gear backlash shim thickness from overall shim thickness to determine shim thickness for pinion gear side of the differential. Differential shim measurements are performed with spreader W-129-B removed.



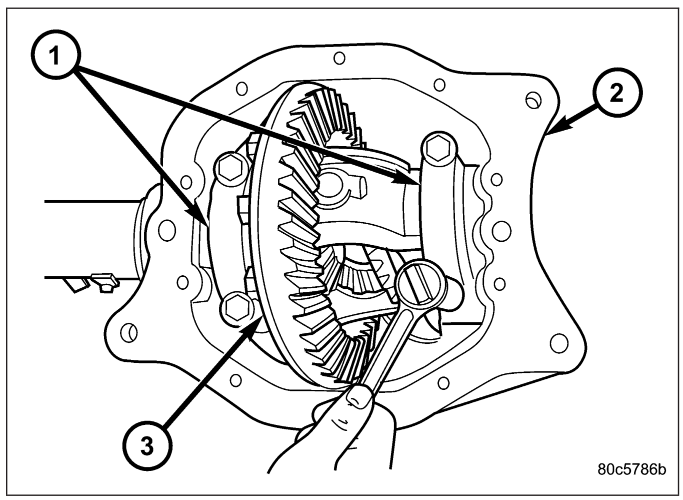
## PRELOAD SHIM SELECTION

**NOTE: It is difficult to salvage the differential side bearings during the removal procedure. Install replacement bearings if necessary.**

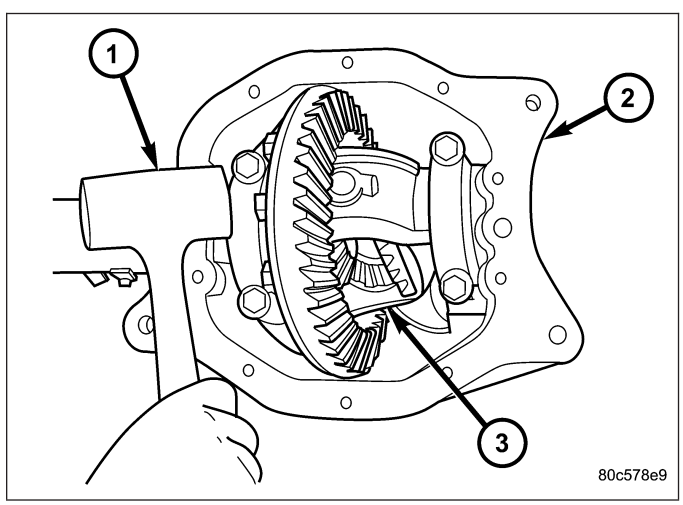
1. Remove differential side bearings from differential case.
2. Install ring gear on differential case and tighten bolts to specification.
3. Install Dummy Bearings D-348 (4) on differential case (3).
4. Install differential case in the housing.
5. Record the thickness of Dummy Shims 8107 (1). Insert the shims between the dummy bearings and the differential housing (2).



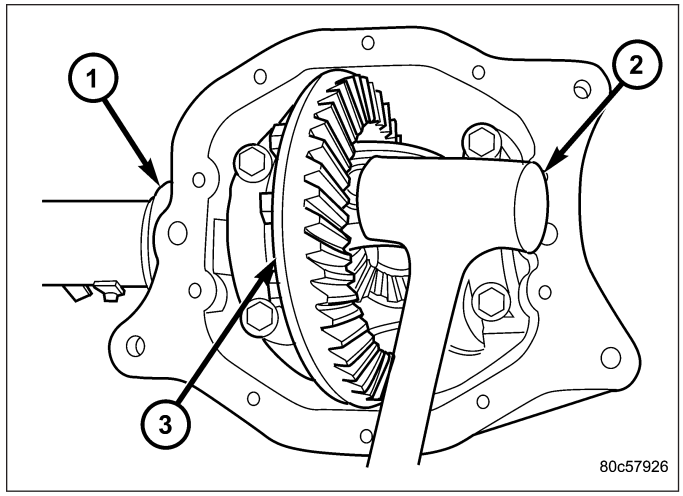
6. Install the bearing caps (1) in their correct positions and snug the bolts (3).



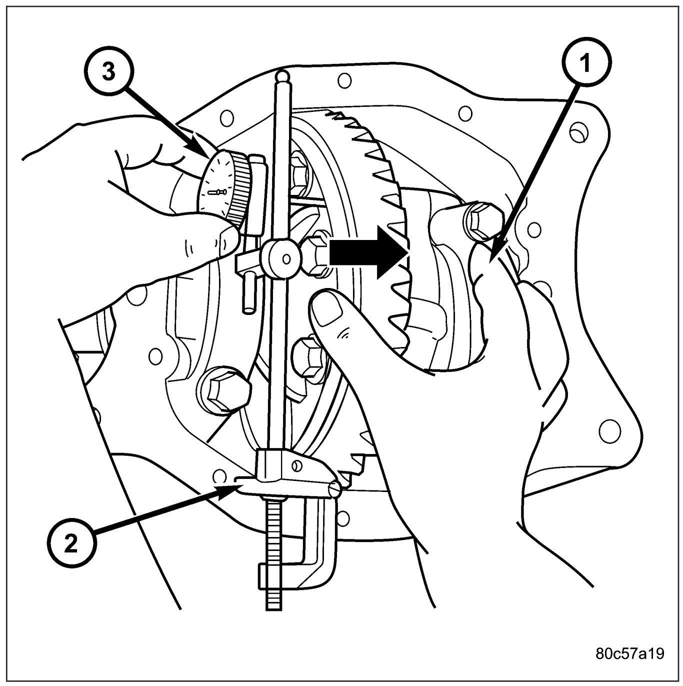
7. With a dead-blow hammer (1), seat differential dummy bearing to pinion side of the housing (2).



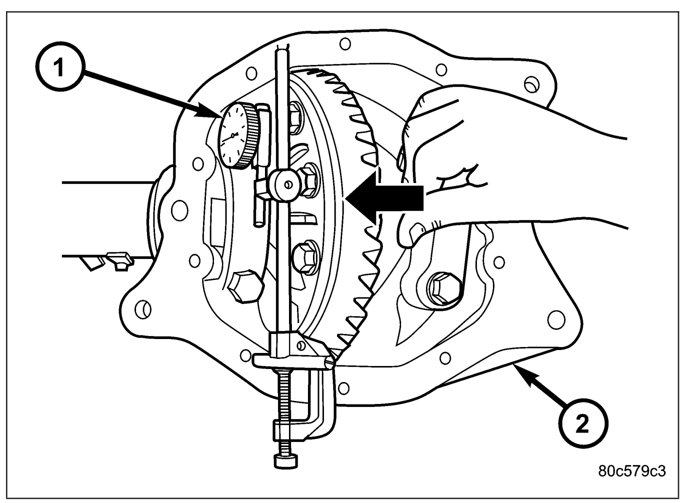
8. With a dead-blow hammer (2), seat differential dummy bearing to the ring gear (3) side of the housing (1).



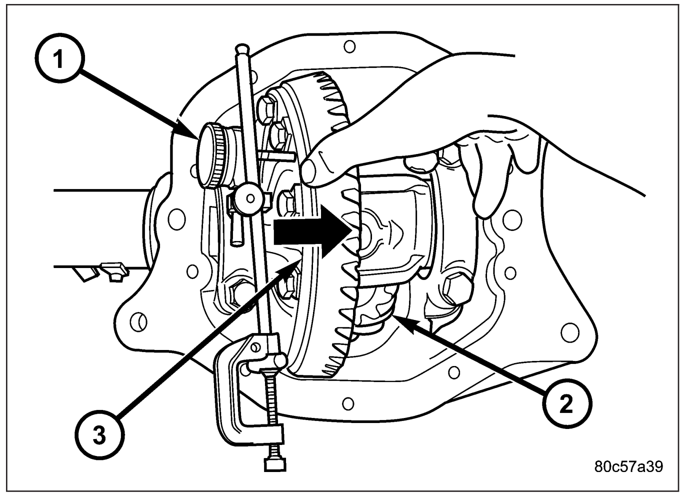
9. Thread Pilot Stud C-3288-B (2) into rear cover bolt hole below ring gear.
10. Attach a Dial Indicator C-3339 (3) to the Pilot Stud. Position the dial indicator plunger on flat surface between the ring gear bolts.
11. Push and hold differential case to pinion gear side (1) of the housing and zero dial indicator.



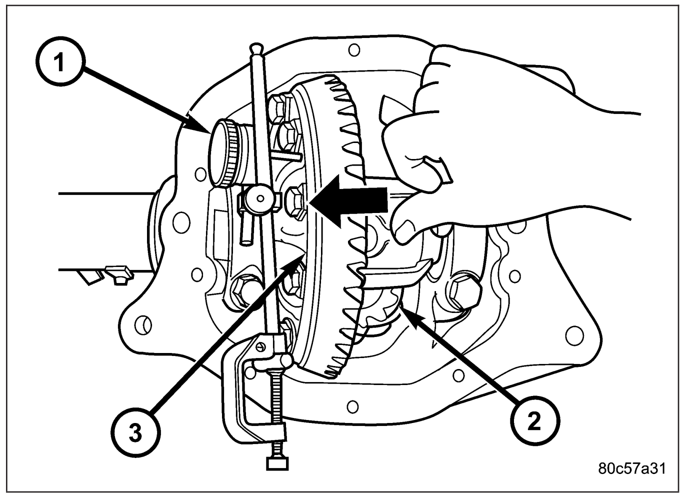
12. Push and hold differential case to ring gear side of the housing (2) and record dial indicator (1) reading.
13. Add 0.152 mm (0.006 in.) to the zero end play total. This new total represents the thickness of shims to compress or preload the new bearings when the differential is installed.
14. Rotate dial indicator out of the way on the pilot stud.
15. Remove differential case and dummy bearings from the housing.
16. Install the pinion gear in the housing. Install the pinion yoke and establish the correct pinion rotating torque.
17. Install differential case and Dummy Bearings D-348 in the housing.
18. Install a single dummy shim in the ring gear side. Install bearing caps and tighten bolts snug.



19. Seat ring gear side dummy bearing.
20. Position the dial indicator (1) plunger on a flat surface between the ring gear (3) bolt heads.
21. Push and hold differential case toward pinion gear (2) and zero dial indicator.



22. Push and hold differential case to ring gear side (3) of the housing and record dial indicator (1) reading. Add dummy shim thickness to this reading. This will be the total shim thickness to achieve zero backlash.
23. Subtract 0.076 mm (0.003 in.) from the dial indicator reading to compensate for backlash between ring and pinion gears. This total is the thickness shim required to achieve proper backlash.
24. Subtract the backlash shim thickness from the total preload shim thickness. The remainder is the shim thickness required on the pinion side of the axle housing.
25. Rotate dial indicator out of the way on pilot stud.
26. Remove differential case and dummy bearings from the housing.



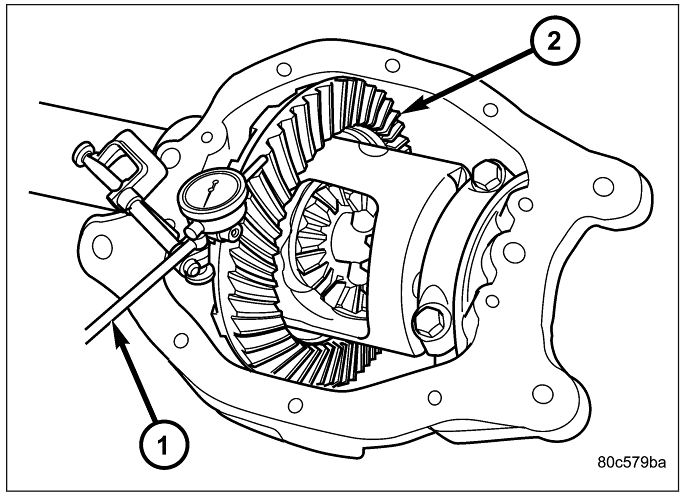
27. Install side bearings and cups on differential case.
28. Install spreader W-129-B with Adapter Set 6987 on the housing and spread axle opening enough to receive differential case.

**CAUTION: Never spread the differential housing over 0.34 mm (0.013 in.). If the housing is over-spread, it could be distorted or damaged.**

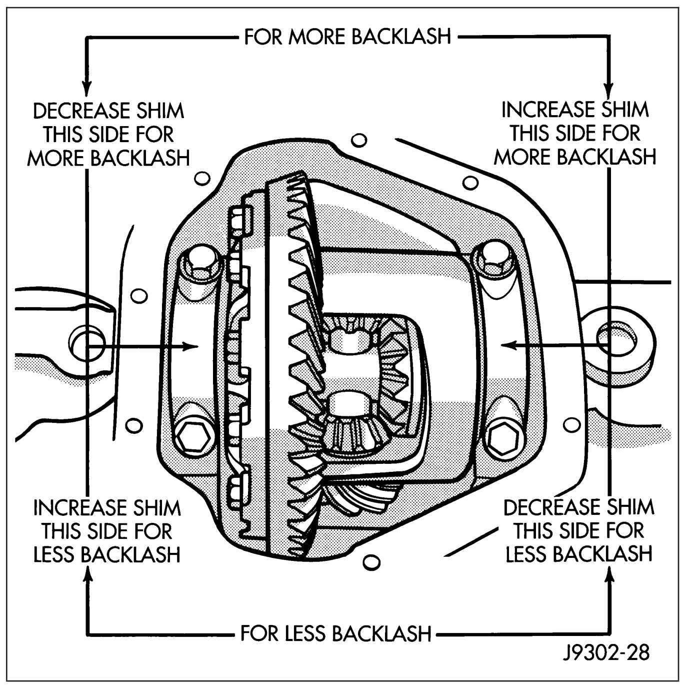
29. Place the bearing preload shims in the axle housing, against the axle tubes.
30. Install differential case into the housing.
31. Remove spreader from the housing.

## GEAR BACKLASH

1. Rotate the differential case several times to seat the side bearings.
2. Position the indicator plunger (1) against a ring gear tooth (2).
3. Push and hold ring gear upward while not allowing the pinion gear to rotate.
4. Zero dial indicator face to pointer.
5. Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm (0.005 in.) and 0.20 mm (0.008 in.). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the housing to the other.
6. Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.



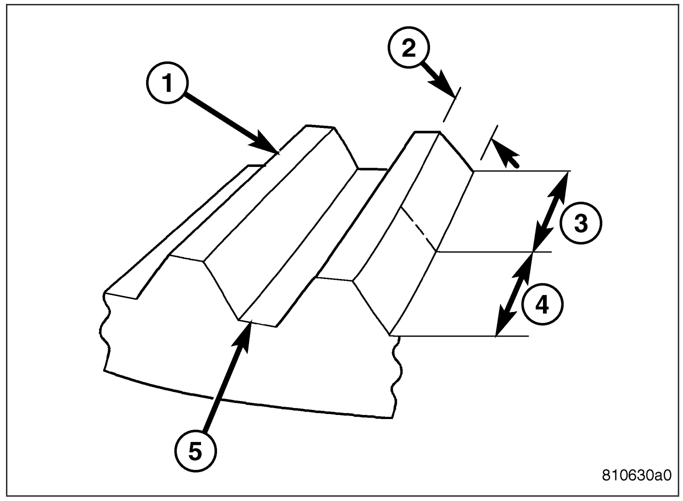
After the proper backlash is achieved, perform Gear Contact Pattern Analysis procedure.



## GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

The TOP LAND (1) of the gear tooth is the top surface of the tooth. The PROFILE (2) of the gear tooth is the depth of the tooth. The TOE (3) of the gear is the portion of the tooth surface at the end towards the center. The HEEL (4) of the gear is the portion of the tooth at the outer-end. The ROOT (5) of the gear tooth is the lowest portion of the tooth.



| DRIVE SIDE HEEL TOE | CONDITION | COAST SIDE TOE HEEL | CONDITION | ACTION REQUIRED |
|---|---|---|---|---|
|  | **Desirable pattern.** The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth. |  | **Desirable pattern.** The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth. | None |
|  | **Top heel contact** |  | **Top toe contact** | Backlash correct. Thicker pinion position shim required. |
|  | **Root toe contact** |  | **Root heel contact** | Backlash correct. Thinner pinion position shim required. |
|  | **Top heel contact** |  | **Top heel contact** | Pinion position shim correct. Decrease backlash. |
|  | **Root toe contact** |  | **Root toe contact** | Pinion position shim correct. Increase backlash. |

8106312d

**NOTE: If the PROFILE across the tooth is the same it is a 3 Axis cut gear. If the PROFILE across the tooth is tapered it is a 2 Axis cut gear.**

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

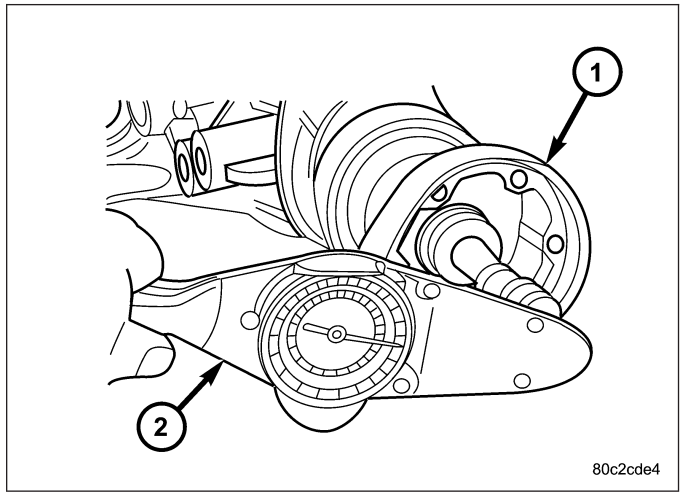
The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary.

## DIFFERENTIAL BEARING PRELOAD CHECK

The final check on the differential assembly before installing the axles, is torque to rotate pinion (1) and differential combined with an inch pound torque wrench (2). This will verify the correct differential bearing preload.

Torque to rotate the differential and pinion is the torque to rotate the pinion plus:

- Gear Ratio 3.55 - 0.48-0.78 N·m (4.2-6.9 in. lbs.)
- Gear Ratio 3.73 - 0.45-0.75 N·m (3.9-6.6 in. lbs.)



# SPECIFICATIONS

## FRONT AXLE - 186FIA

### AXLE SPECIFICATIONS

| DESCRIPTION | SPECIFICATION |
|---|---|
| Axle Ratio | 3.55, 3.73 |
| Ring Gear Diameter | 186 mm (7.33 in.) |
| Ring Gear Backlash | 0.12-0.20 mm (0.005-0.008 in.) |
| Pinion Bearing Preload | 1.69-2.82 N·m (15-25 in. lbs.) |
| Differential Bearing Preload Added To Pinion Torque To Rotate | |
| | |
| Gear Ratio 3.55 | 0.48-0.78 N·m (4.2-6.9 in. lbs.) |
| Gear Ratio 3.73 | 0.45-0.75 N·m (3.9-6.6 in. lbs.) |
| Gear Ratio 4.10 | 0.41-0.69 N·m (3.6-6.0 in. lbs.) |

### TORQUE SPECIFICATIONS

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Ring Gear Bolts | 108 | 80 | - |
| Differential Bearing Cap Bolts | 54-68 | 39-50 | - |
| Drain Trough bolt | 12 | - | 110 |
| Differential Cover Bolts | 19-26 | 14-19 | - |

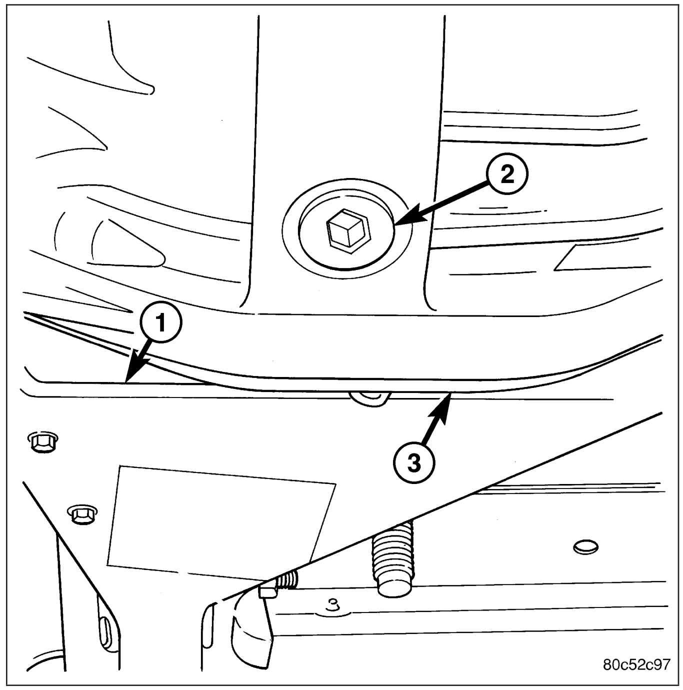
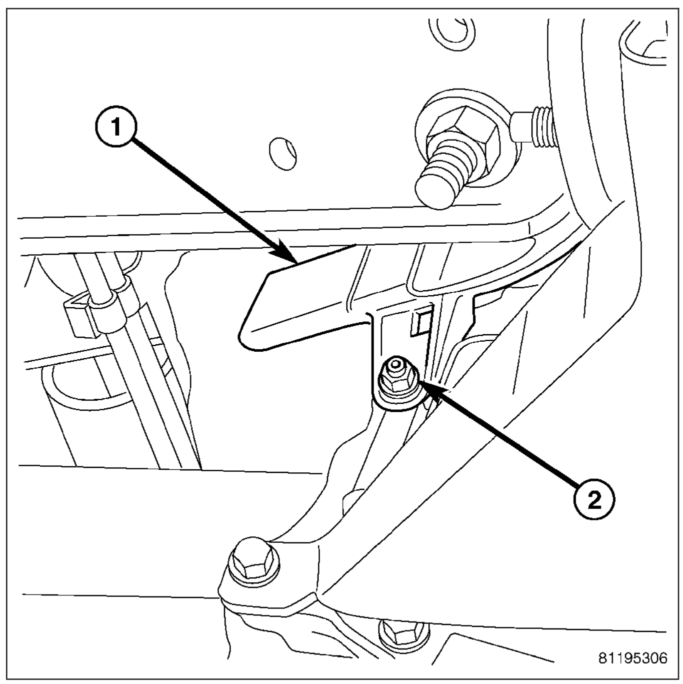
# COVER-DIFFERENTIAL

## REMOVAL

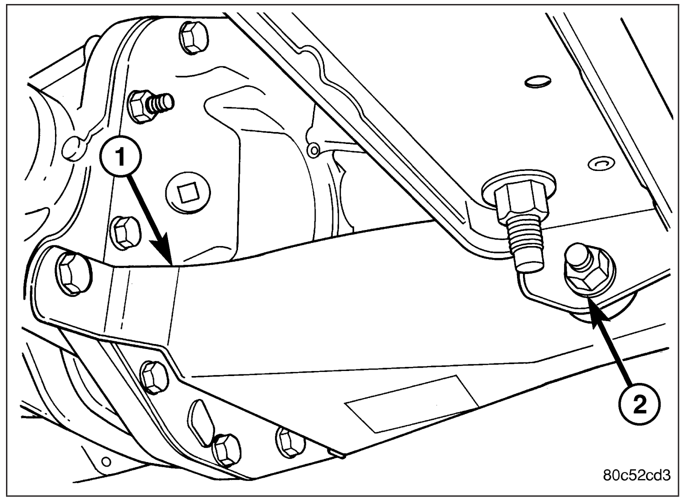
1. With vehicle in neutral, position vehicle on hoist.
2. Remove skid plate.
3. Remove drain plug (2) from housing (3) and drain fluid.



4. Remove oil trough (1) bolt from axle bracket.
5. Remove oil trough nut (2) from differential cover.

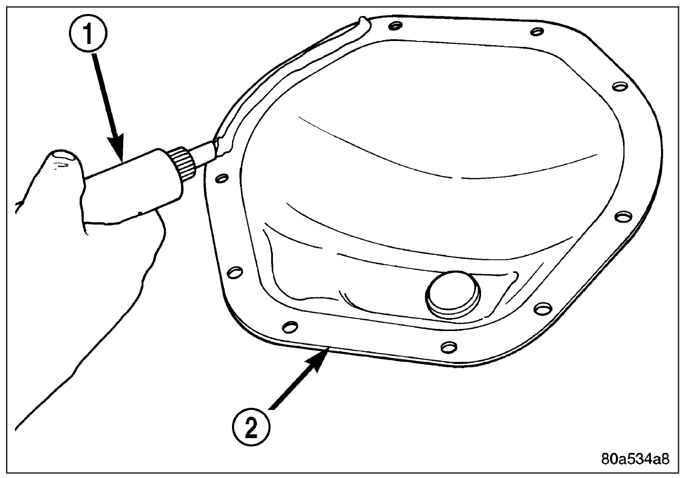


6. Loosen left front axle bracket bolt (2) at cradle.
7. Remove left front axle bracket (1) bolts from the axle and let bracket hang forward of the axle.
8. Remove vent hose from cover and remove oil trough.
9. Remove differential cover bolts and remove cover.



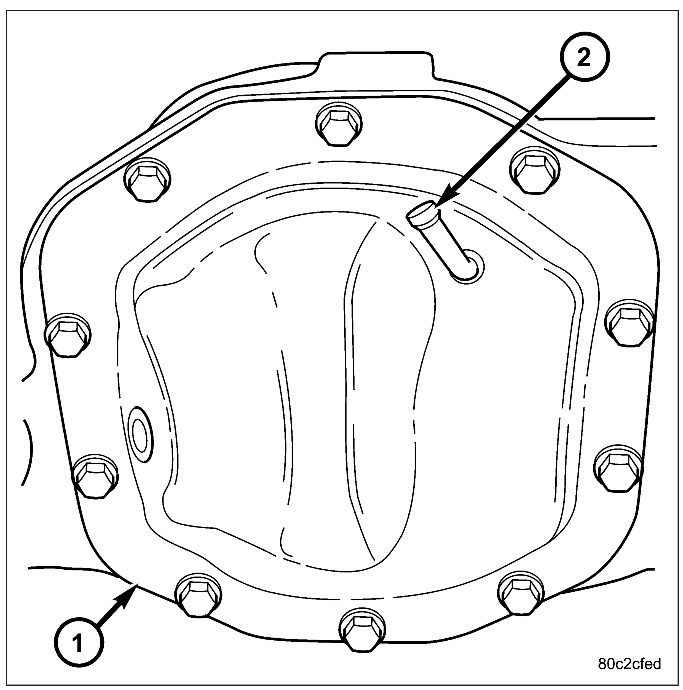
## INSTALLATION

1. Clean cover and mating surface.
2. Apply a bead of Mopar Axle RTV sealant (1) or equivalent to the differential cover (2).



**CAUTION: If cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to follow these instructions will result in a leak.**

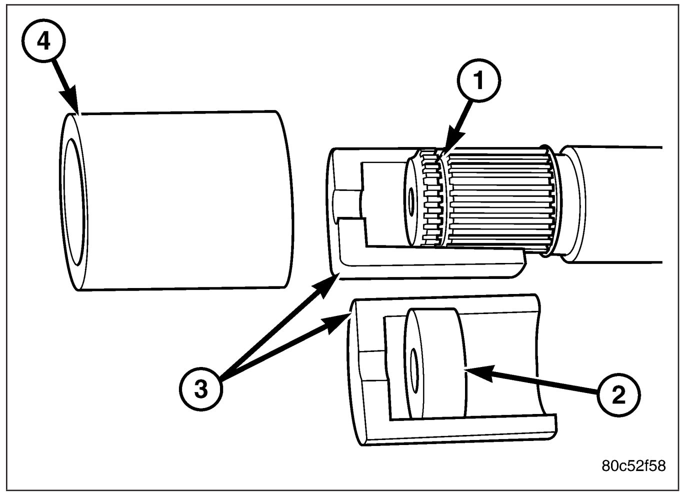
3. Install differential housing cover (1) and tighten bolts in a criss-cross pattern to 19-26 N·m (14-19 ft. lbs.).
4. Install drain trough and tighten nut to 23 N·m (200 in. lbs.).
5. Install vent hose (2) on differential cover with new clamp.
6. Install axle bracket to axle and tighten to 61 N·m (45 ft. lbs.).
7. Install drain trough bolt to axle bracket and tighten to 12 N·m (110 in. lbs.).
8. Tighten left front axle bracket cradle nut to 61 N·m (45 ft. lbs.).
9. Install skid plate.



# SHAFT-AXLE

## REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove right half shaft from vehicle.
3. Remove snap ring and o-ring from axle shaft.
4. Assemble Remover 8420A blocks (3) with hammer threads (2) on snap ring groove (1) on the shaft. Slide collar (4) over blocks and thread slid hammer into remover and remove shaft.
5. Slide axle shaft out of the axle tube.

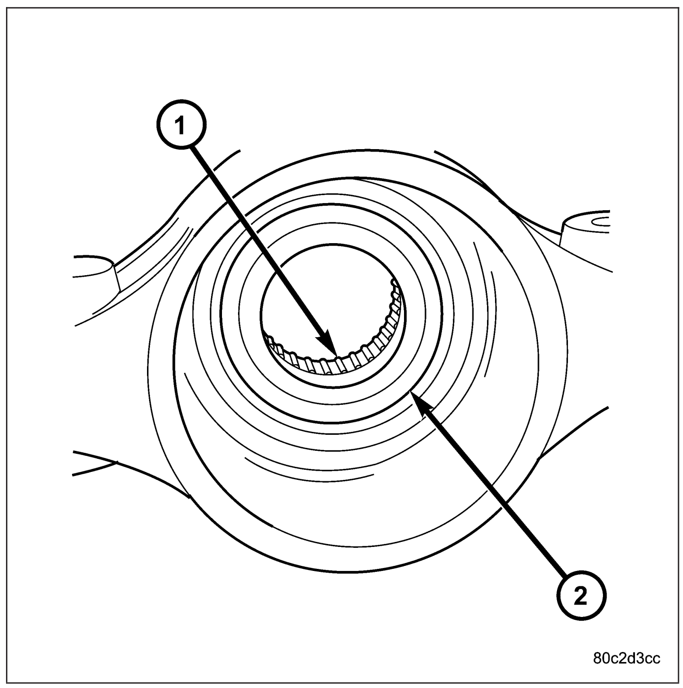


## INSTALLATION

1. Lubricate bearing (1) bore and seal (2) lip with gear lubricant. Insert axle shaft through seal, bearing and engage it into side gear splines.

**NOTE: Use care to prevent shaft splines from damaging axle shaft seal.**

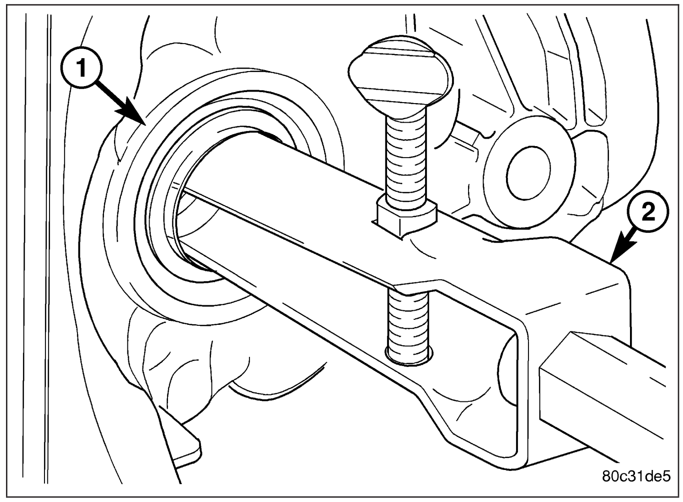
2. Install half shaft snap-ring and o-ring.
3. Push the axle shaft until the axle shaft snap-ring passes through the side gear.
4. Install right half shaft.
5. Check differential fluid level.



# SEAL-AXLE SHAFT

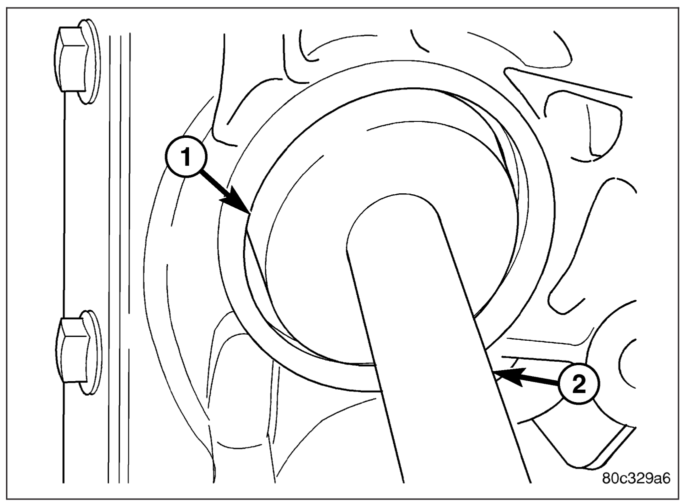
## REMOVAL

1. Remove half shaft.
2. Remove axle shaft for right side seal removal.
3. Remove shaft seal (1) with Remover 7794-A (2) and a slide hammer.



## INSTALLATION

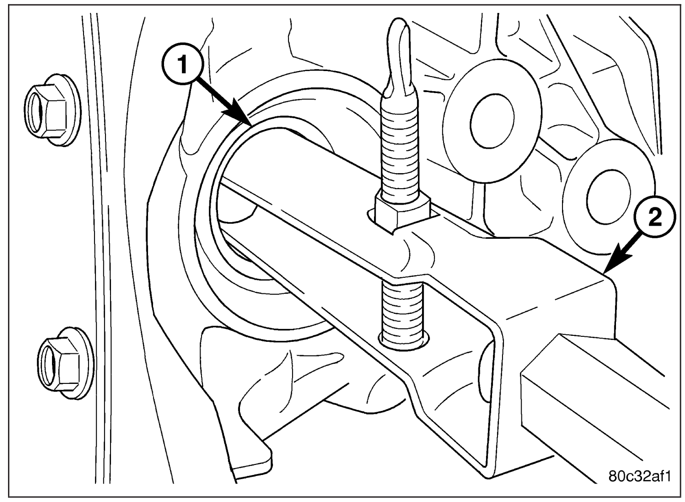
1. Apply a light coat of lubricant on the lip of the shaft seal.
2. Install **new** shaft seal with Installer 8806 (2) and Handle C-4171(1).
3. Install right axle shaft if removed.
4. Install half shaft.



# BEARING-AXLE

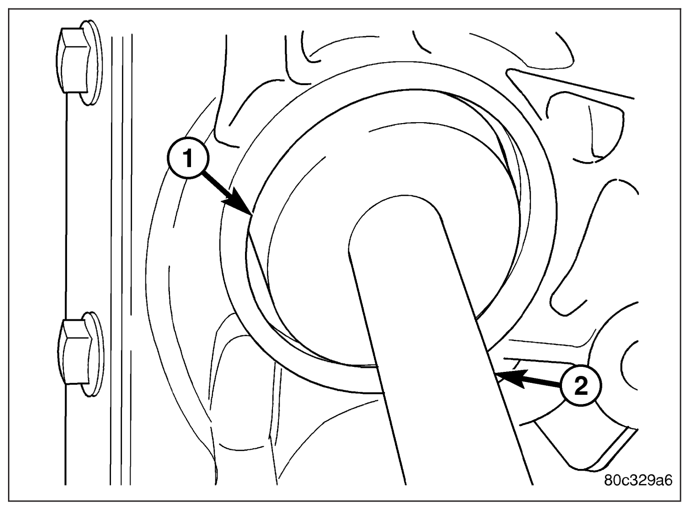
## REMOVAL

1. Remove half shaft.
2. Remove axle shaft for right side seal removal.
3. Remove shaft seal with Remover 7794-A and a slide hammer.
4. Remove shaft bearing (1) with Remover 7794-A (2) and a slide hammer.



## INSTALLATION

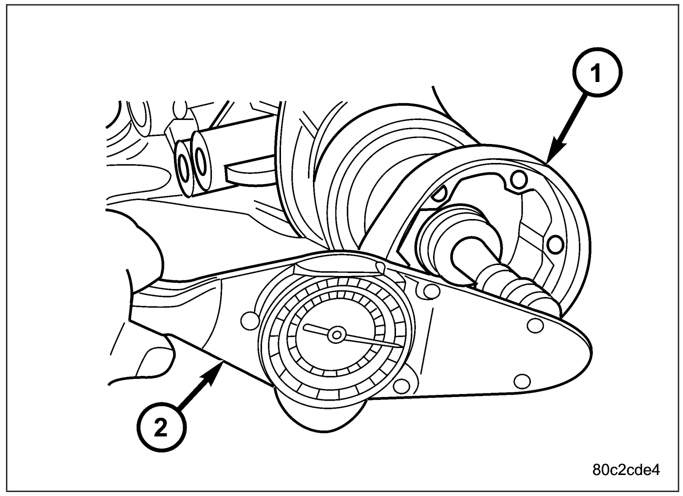
1. Install **new** shaft bearing with Installer 8805 and Handle C-4171.
2. Apply a light coat of lubricant on the lip of the shaft seal.
3. Install **new** shaft seal with Installer 8806 (1) and Handle C-4171 (2).
4. Install right axle shaft if removed.
5. Install half shaft.



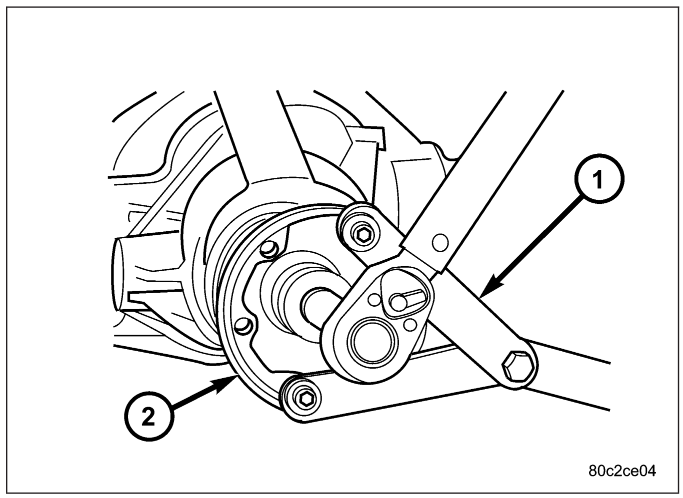
# SEAL-PINION

## REMOVAL

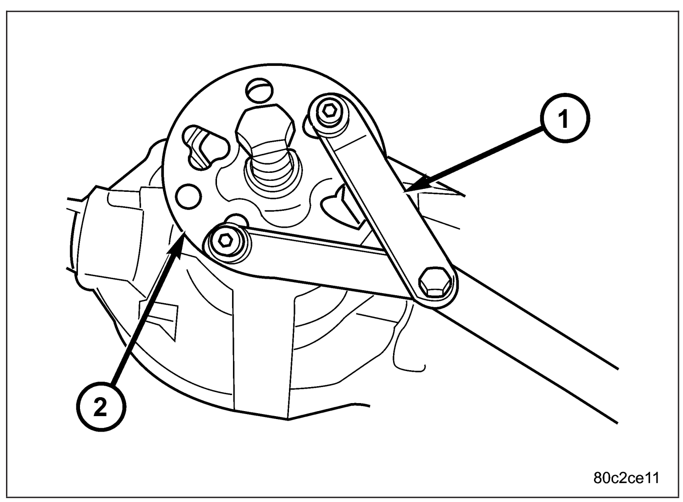
1. With vehicle in neutral, position vehicle on hoist.
2. Remove brake calipers and rotors.
3. Remove propeller shaft.
4. Rotate pinion gear a minimum of ten times and verify the pinion rotates smoothly.
5. Record torque to rotate the pinion gear (1) with a inch pound torque wrench (2).



6. Using a short piece of pipe and Spanner Wrench 6958 (1) to hold the pinion companion flange (2) and remove the pinion nut.

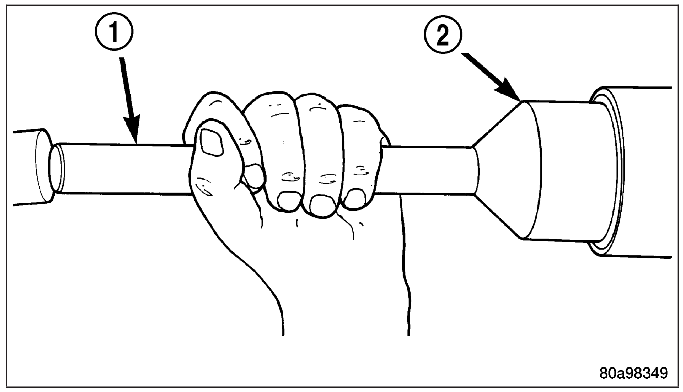


7. Remove pinion companion flange with Puller C-452 (2) and Spanner Wrench 6958 (1).
8. Pry pinion seal out with a seal pick.



## INSTALLATION

1. Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Installer 8681(2).

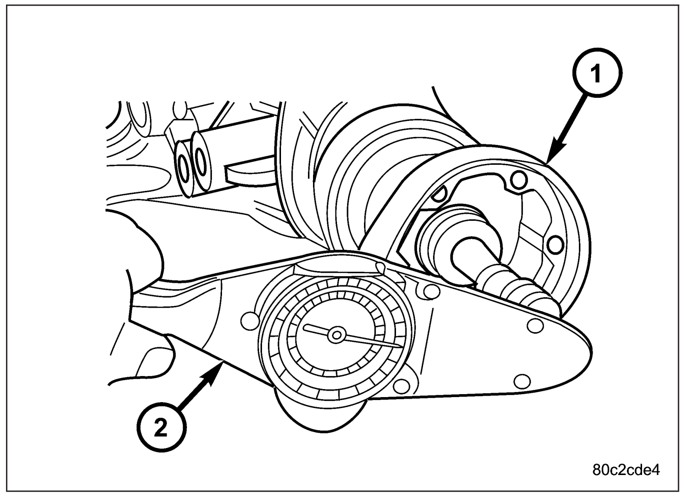


2. Install pinion companion flange on the pinion gear with Installer W-162-D, Cup 8109 and Wrench 6958.

**CAUTION: Do not exceed the minimum tightening torque 217 N·m (160 ft. lbs.) while installing pinion nut at this point. Failure to follow these instructions will result in damage.**

3. Install a **new** nut on the pinion gear. **Tighten the nut only enough to remove the shaft end play.**

**CAUTION: Never loosen pinion nut to decrease pinion rotating torque and never exceed specified preload torque. Failure to follow these instructions will result in damage.**



4. Rotate pinion a minimum of ten time and verify pinion rotates smoothly. Rotate the pinion shaft (1) with an inch pound torque wrench (2). Rotating torque should be equal to the reading recorded during removal plus 0.56 N·m (5 in. lbs.).
5. If rotating torque is low, use Spanner Wrench 6958 to hold the pinion companion flange and tighten the pinion nut in 6.8 N·m (5 ft. lbs.) increments until proper rotating torque is achieved.

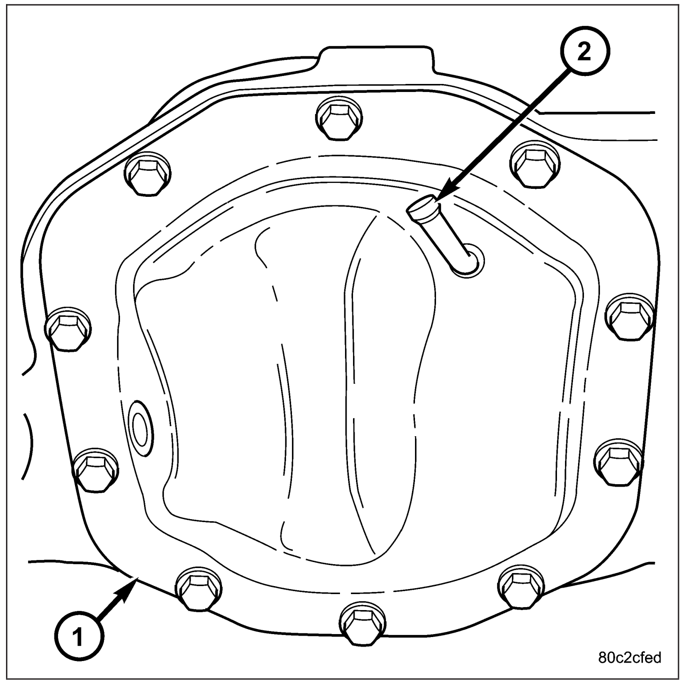
**CAUTION: If maximum tightening torque is reached prior to reaching the required rotating torque, the collapsible spacer may have been damaged. Failure to follow these instructions will result in damage.**

6. Install propeller shaft.
7. Fill differential with gear lubricant.

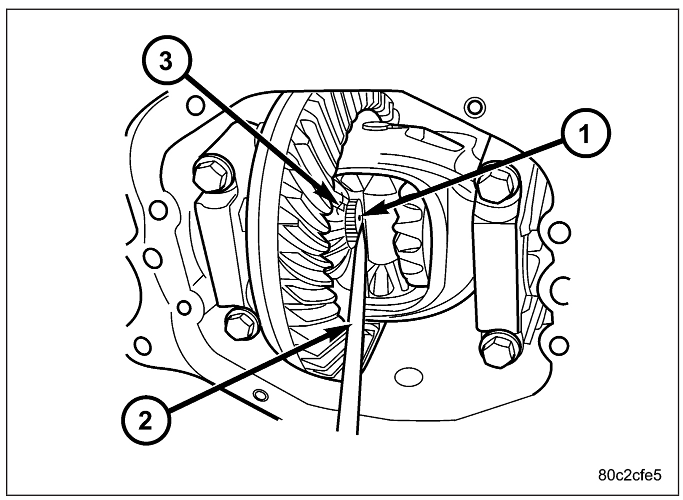
# DIFFERENTIAL

## REMOVAL

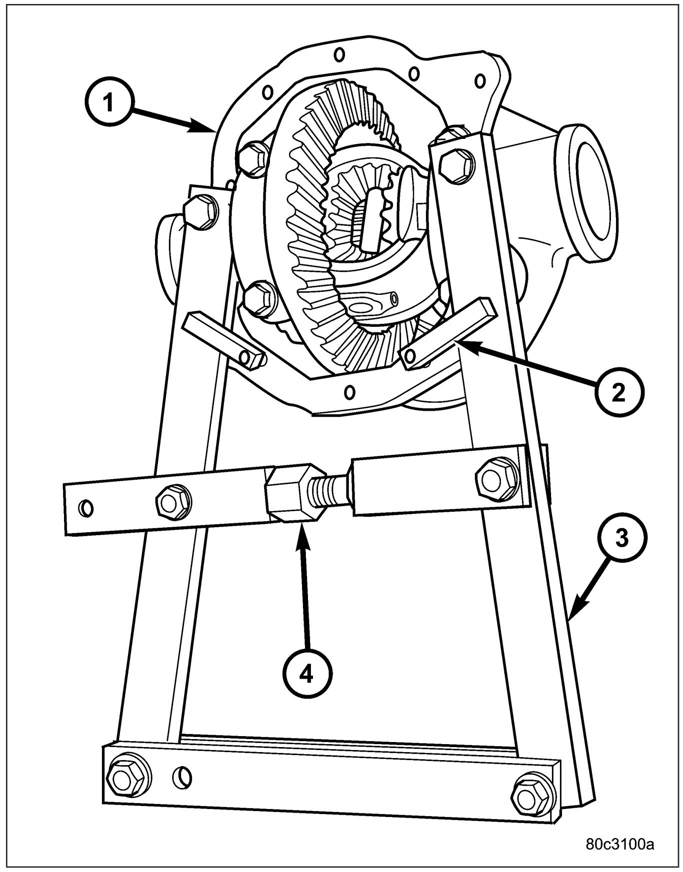
1. Remove differential housing cover (1).



2. Push right axle shaft (1) out of side gear (3) with a screw driver (2) and remove shaft.



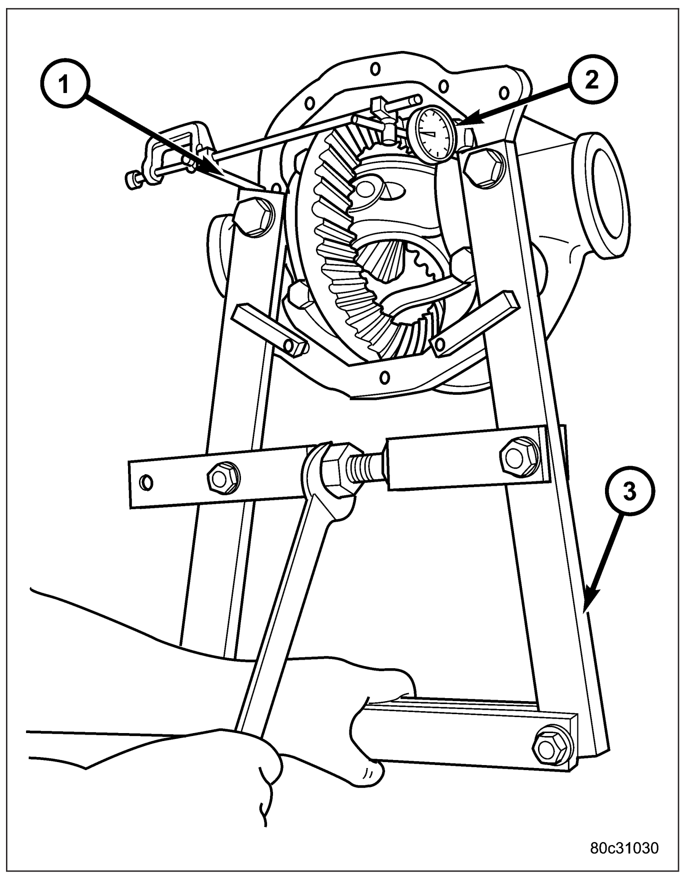
3. Mark differential bearing caps for installation reference.
4. Loosen bearing cap bolts.
5. Position Spreader W-129-B (3) onto differential locating holes and install the safety hold-down clamps (2). Tighten spreader turnbuckle (4) finger-tight.



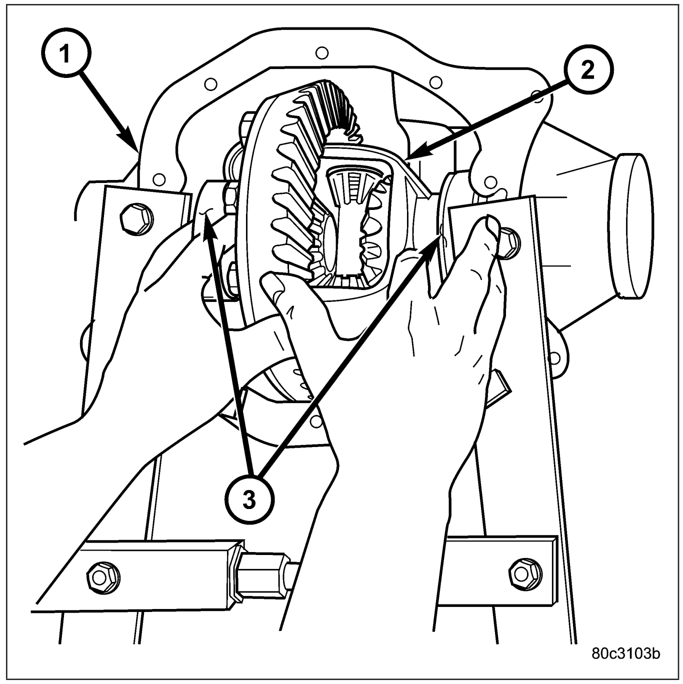
6. Install a Pilot Stud C-3288-B (1) at the left side of the differential housing. Attach Dial Indicator C-3339 (2) to pilot stud. Load indicator plunger against the opposite side of the housing and zero the indicator.
7. Spread differential case while measuring the distance with the dial indicator.

**CAUTION: Never spread the differential housing over 0.34 mm (0.013 in). Failure to heed caution may result in damage.**

8. Remove dial indicator.

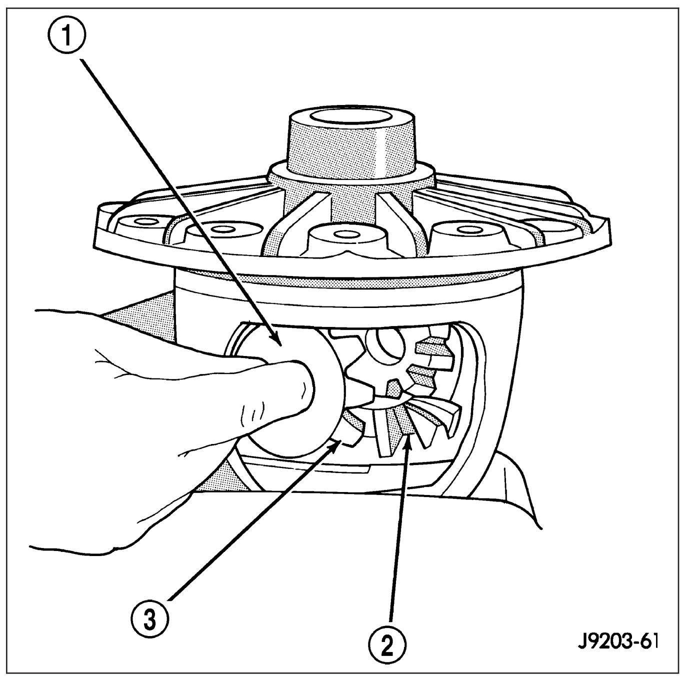


9. Hold differential case (2) and remove bearing caps.
10. Remove differential from the housing (1).
11. Tag differential bearing (3) cups and shims to indicate location.
12. Remove spreader from housing.



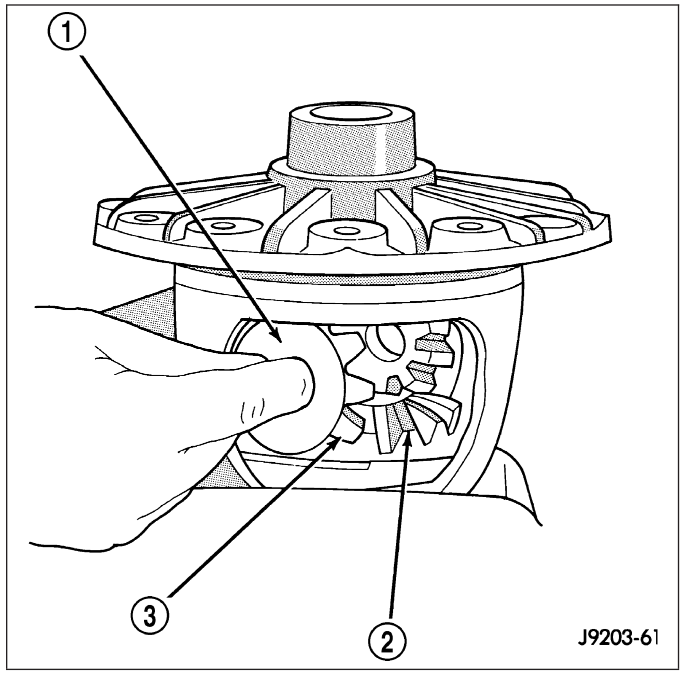
## DISASSEMBLY

1. Remove ring gear.
2. Remove roll-pin holding mate shaft in housing.
3. Remove pinion gear mate shaft.
4. Rotate differential side gears (2) and remove pinion gears (3) and thrust washers (1).
5. Remove differential side gears and thrust washers.

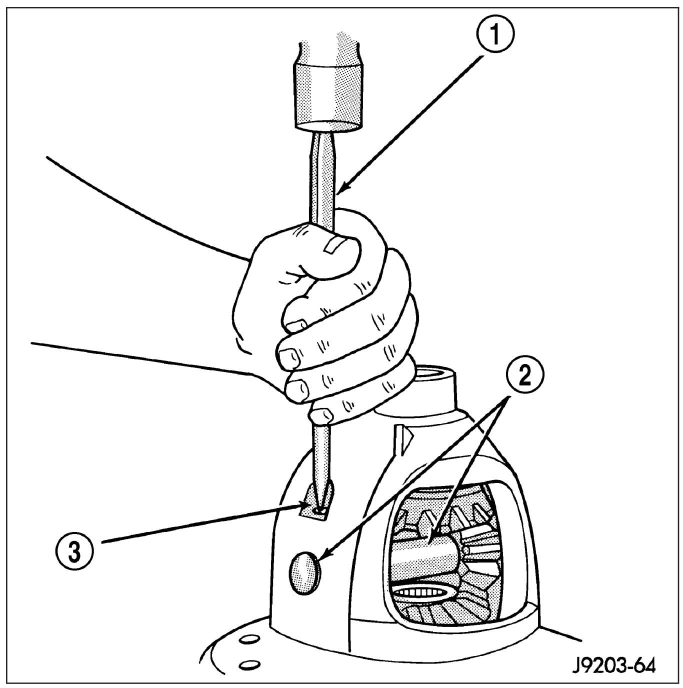


## ASSEMBLY

1. Install differential side gears (2) and thrust washers.
2. Install pinion mate gears (3) and thrust washers (1).
3. Install pinion gear mate shaft.



4. Align hole in the pinion gear mate shaft (2) with the hole in the differential case.
5. Install the roll-pin (3) in the differential case with a hammer and punch (1). Peen the edge of the roll-pin hole in the differential case in two places 180° apart.
6. Lubricate all differential components with hypoid gear lubricant.
7. Install ring gear.



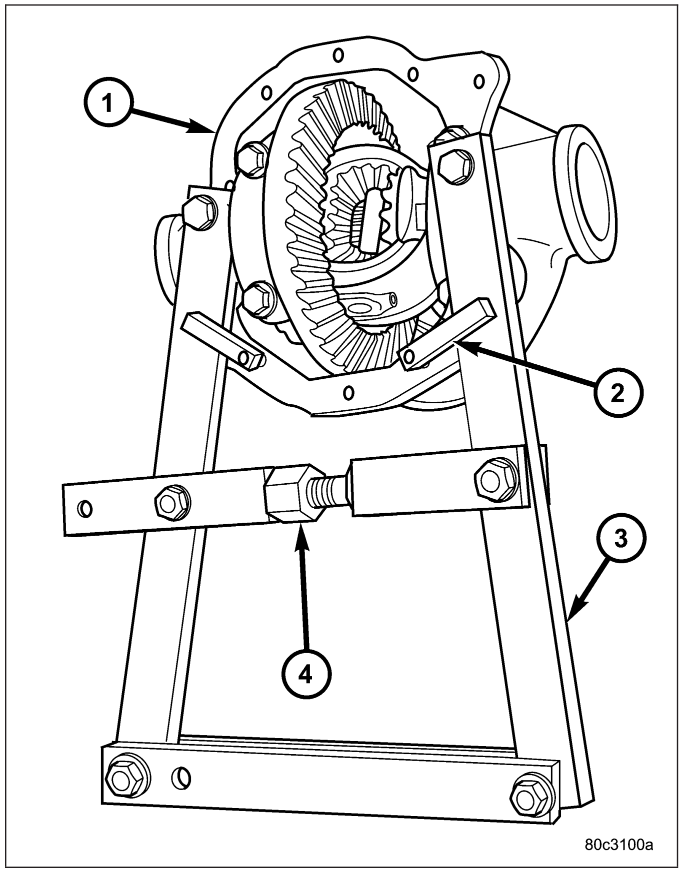
## INSTALLATION

**NOTE: If differential bearings or differential case are replaced, Refer to adjustments fore Differential Bearing Preload and Gear Backlash procedures.**

1. Position Spreader W-129-B on differential location holes and install safety hold-down clamps. Tighten spreader turnbuckle finger-tight.
2. Install Pilot Stud C-3288-B to the left side of the differential housing. Attach Dial Indicator C-3339 to pilot stud. Load indicator plunger against the opposite side of the housing and zero the indicator.
3. Spread housing while measuring the distance with the dial indicator.

**CAUTION: Never spread the differential housing over 0.34 mm (0.013 in). Failure to follow these instructions will damage the housing.**

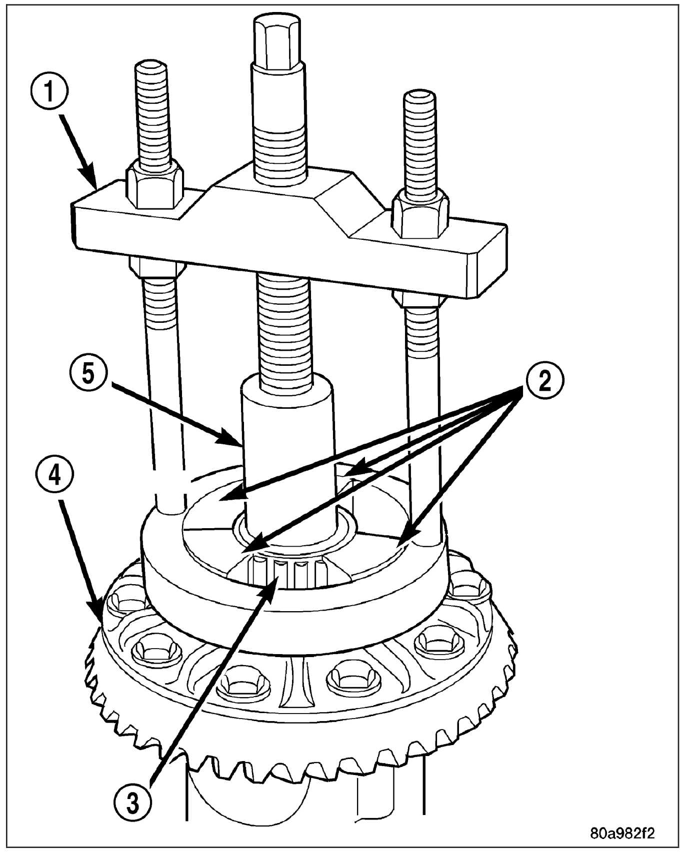
4. Remove dial indicator.
5. Install differential case in the housing. Tap differential case to seat bearings cups and preload shims in housing.
6. Install bearing caps and loosely install bolts.
7. Loosen turnbuckle (4) remove safety clamp (2) and remove spreader (3).
8. Tighten bearing cap bolts in a criss-cross pattern to 54-68 N·m (39-50 ft. lbs.).
9. Install right axle shaft.
10. Install differential housing cover.



# BEARING-DIFFERENTIAL CASE

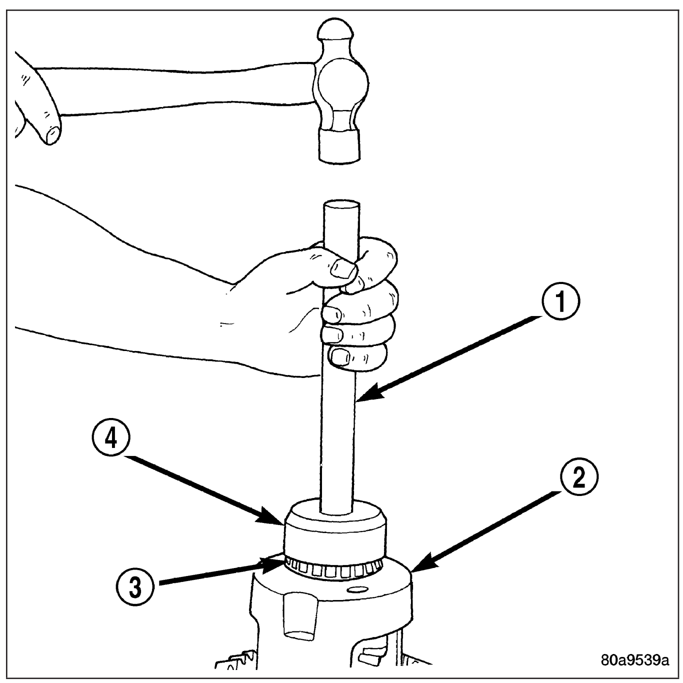
## REMOVAL

1. Remove differential from the housing.
2. Remove bearings (3) from the differential case (4) with Puller/Press C-293-PA (1), Adapters C-293-39 (2) and Plug SP-3289 (5).



## INSTALLATION

1. Install differential case (2) bearings (3) with Installer C-3716-A (4) and Handle C-4171(1).
2. Install differential into the housing.

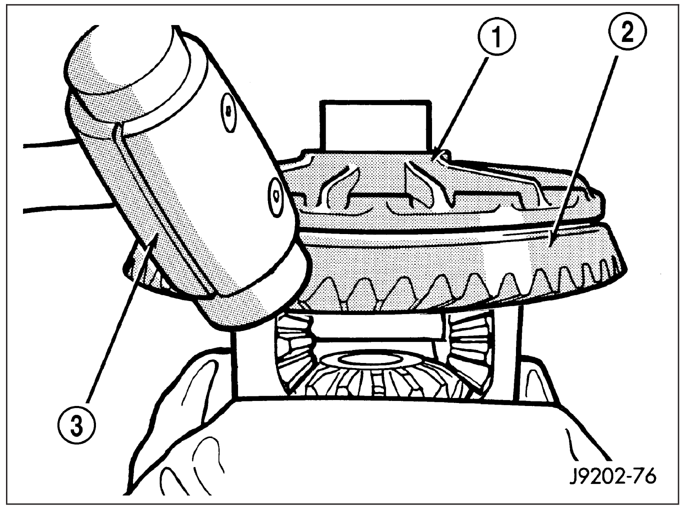


# GEAR-PINION/RING

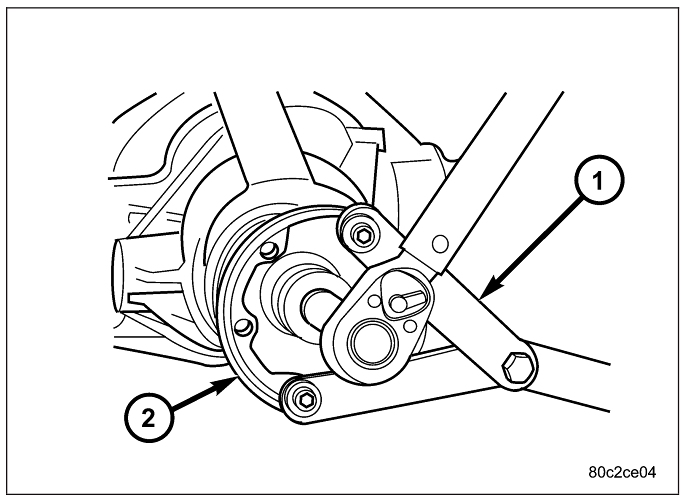
## REMOVAL

**NOTE: The ring gear and pinion are serviced as a matched set. Never replace ring gear without replacing the matched pinion gear.**

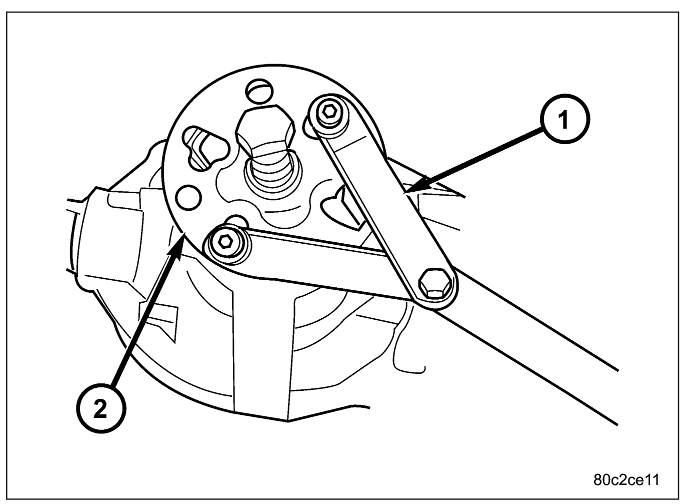
1. Remove differential from axle housing.
2. Place differential case (1) in a vise with soft jaws.
3. Remove bolts holding ring gear to differential case.
4. Driver ring gear (2) off the differential case (1) with a dead-blow hammer (3).



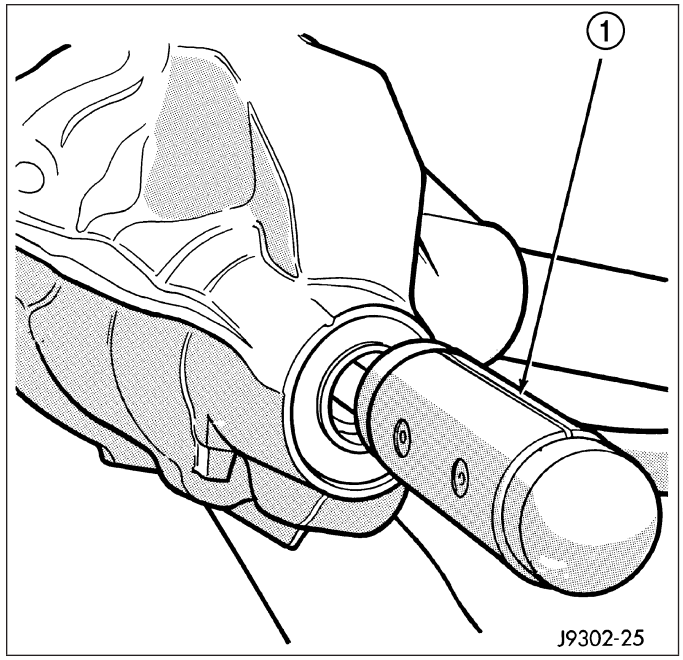
5. With Spanner Wrench 6958 (1) and a short length of 1 in. pipe, hold pinion companion flange (2) and remove pinion nut.



6. Remove pinion companion flange from pinion shaft with Spanner Wrench 6958 (1) and Puller C-452 (2).

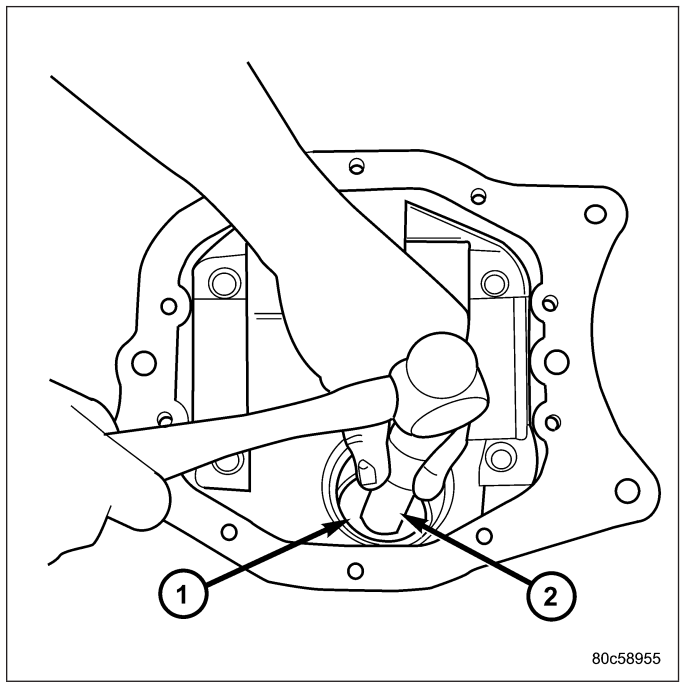


7. Remove pinion gear from housing with dead-blow hammer (1).

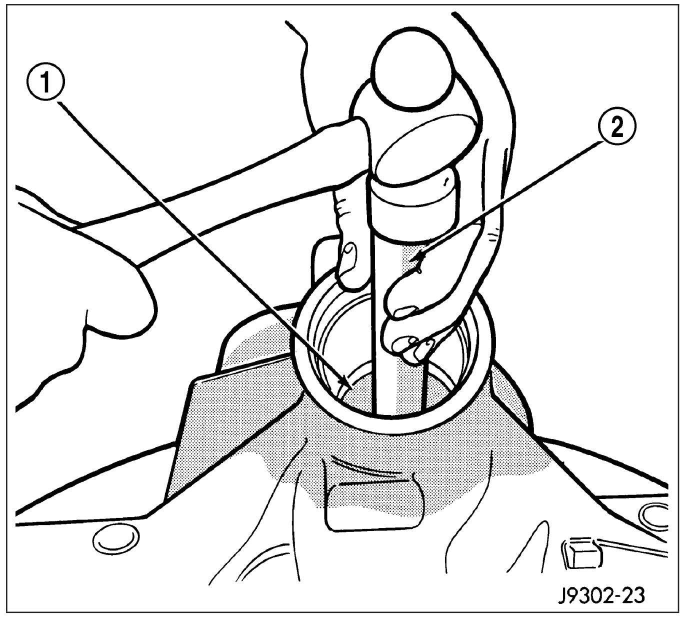


.

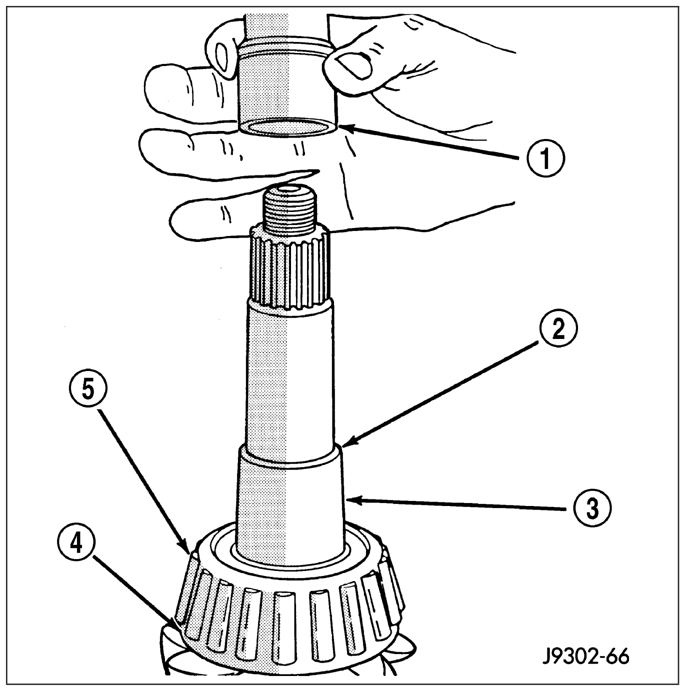
8. Remove front pinion bearing cup, bearing, oil slinger and pinion seal with Remover D-149 (1) and Handle C-4171 (2).



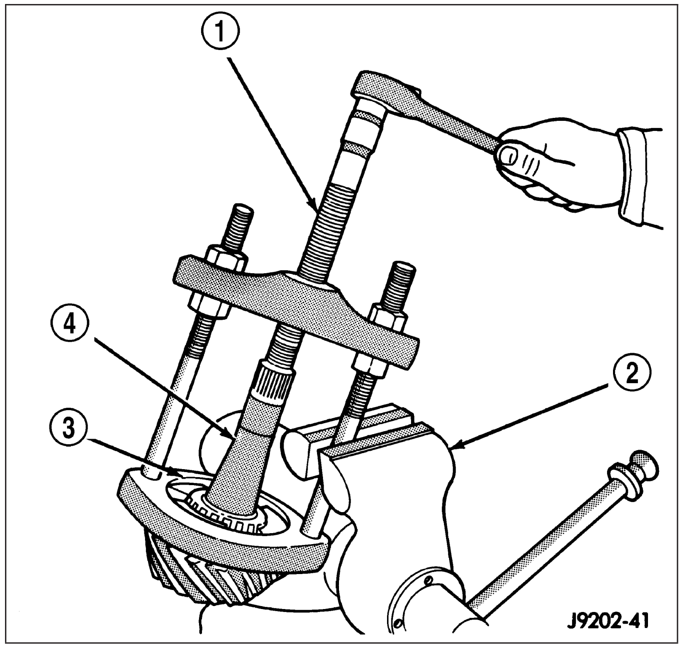
9. Remove rear pinion bearing cup with Remover C-4307 (1) and Handle C-4171 (2).



10. Remove collapsible spacer (1) from pinion gear (3).



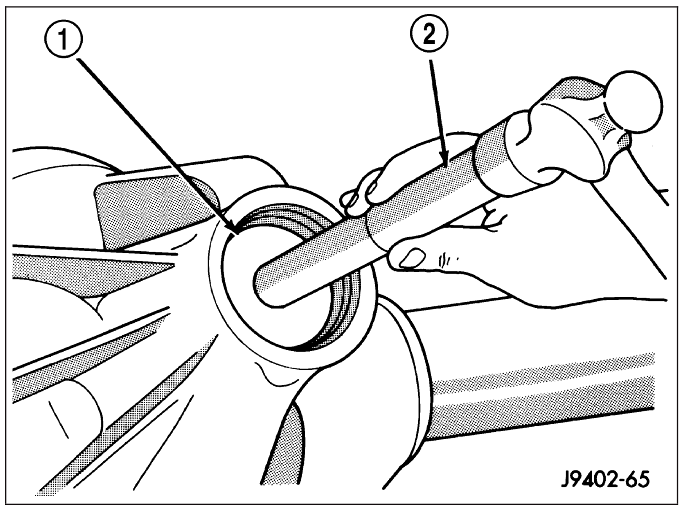
11. Remove rear pinion bearing from the pinion (4) with Puller/Press C-293-PA (1) and Adapters C-293-42 (3). Remove oil slinger/pinion depth shim from the pinion shaft and record thickness.



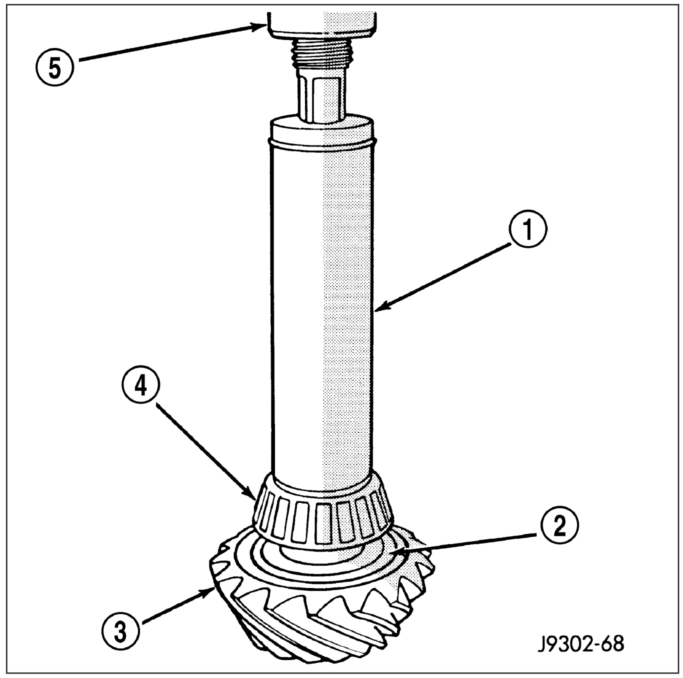
## INSTALLATION

**NOTE: Pinion depth shims are located under the rear pinion bearing. If ring and pinion gears are reused, the pinion oil slinger/depth shim should not require replacement. Refer to Adjustments (Pinion Gear Depth) to select the proper thickness shim before installing pinion gear.**

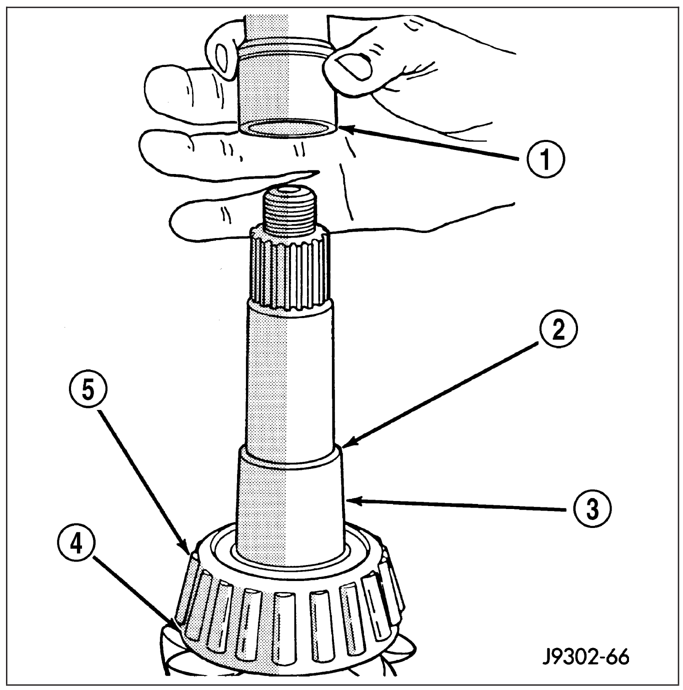
1. Install front pinion bearing, and oil slinger if equipped.
2. Apply a light coating of gear lubricant on the lip of pinion seal and install seal with Installer 8681.
3. Apply Mopar Door Ease or equivalent lubricant to outside surface of pinion bearing cups.
4. Install rear bearing cup with Installer C-4308 and Handle C-4171.
5. Install front bearing cup with Installer D-146 (1) and Handle C-4171 (1).



6. Install oil slinger/depth shim (2) and rear pinion bearing (4) on pinion shaft (3) with Installer 6448A (1) and a press (1).



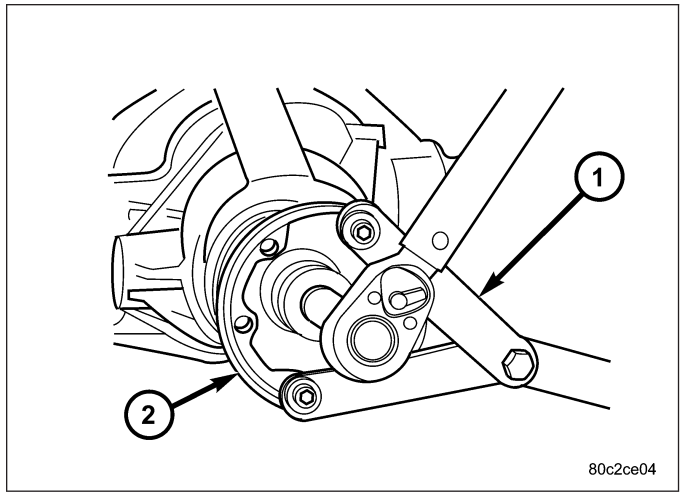
7. Install a **new** collapsible spacer (1) on pinion shaft (3) and install pinion into the housing.
8. Install pinion companion flange, with Installer W-162-D, Cup 8109 and Spanner Wrench 6958.



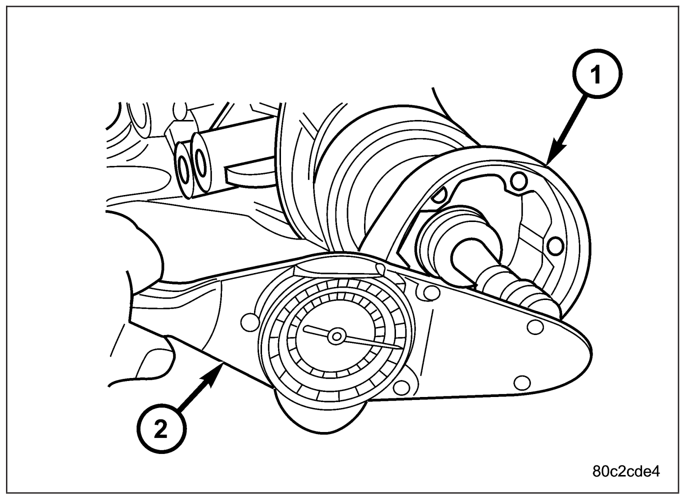
9. Install pinion a **new** nut onto the pinion gear and tighten the nut to 217 N·m (160 ft. lbs.). **Do not over-tighten.**

**CAUTION: Never loosen pinion gear nut to decrease pinion rotating torque and never exceed specified preload torque. Failure to follow these instructions will result in damage.**

10. Use Spanner Wrench 6958 (1), a length of 1 in. pipe and a torque wrench set at 678 N·m (500 ft. lbs.) and crush collapsible spacer until bearing end play is taken up.



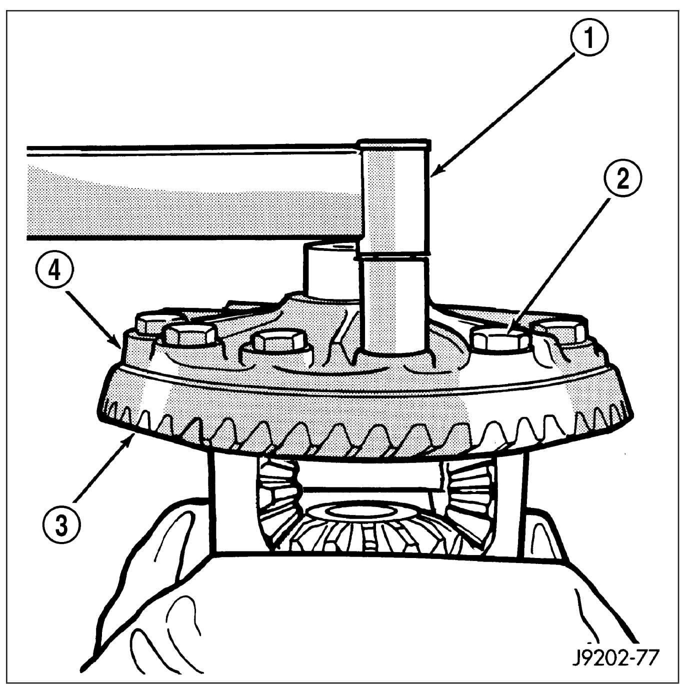
11. Slowly tighten the nut in 6.8 N·m (5 ft. lbs.) increments until the required rotating torque is achieved. Measure rotating torque frequently to avoid over crushing the collapsible spacer.
12. Rotate the pinion a minimum of ten times. Verify pinion (1) rotates smoothly and check rotating torque with an inch pound torque wrench (2). Pinion gear rotating torque is:
    - Original Bearings: 1 to 2.25 N·m (10 to 20 in. lbs.).
    - New Bearings: 1.69 to 2.82 N·m (15 to 25 in. lbs.).



13. Invert differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.
14. Invert differential case (4) in the vise. Install **new** ring gear (3) bolts (2) and alternately tighten to 108 N·m (80 ft. lbs.).

**CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions will result in damage.**

15. Install differential in housing and verify differential bearing preload, gear mesh and contact pattern.



# REAR AXLE - 8 1/4

## TABLE OF CONTENTS

# REAR AXLE - 8 1/4

## DIAGNOSIS AND TESTING

## REAR AXLE - 8 1/4

### GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side and pinions gears, usually do not cause noise during straight-ahead driving, when the gears are unloaded. The side gears are loaded during turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

### BEARING NOISE

Bearing noise can be either a whining or a growling sound.

**Pinion bearings** have a constant high pitch noise, because it rotates at a faster rate. This noise changes with vehicle speed. If noise is heard under a load, the rear pinion bearing is the source. If noise is heard during a coast, the front pinion bearing is the source.

**Differential bearings** usually produce a low pitch noise. The differential bearing noise is constant and varies only with vehicle speed.

**Axle shaft bearing** noise generally changes when the bearings are loaded. Turn vehicle sharply to the left and the right during a road test. This will load and unload the bearings and change the noise level. If axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

### LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joints/CV joint.
- Worn side-gear thrust washers.
- Worn pinion shaft bore.

### VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints/CV joint.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be an axle vibration. Also look at engine accessories, brackets and drive belts.

**NOTE: All driveline components should be examined before starting any repair.**

## DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear or the clutch engaged, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints/CV joint.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

To determined the source of a snap/clunk noise, raise vehicle on a hoist with the wheels free to rotate. Have a helper shift the transmission into gear and listen for the noise.

### DIAGNOSTIC CHART

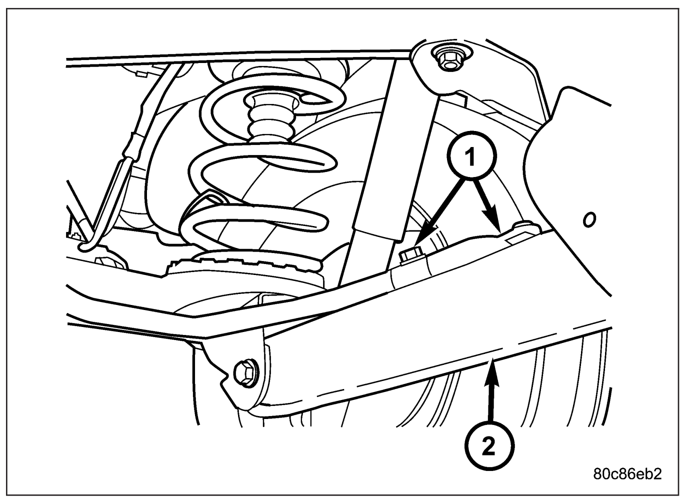
| Condition | Possible Causes | Correction |
|---|---|---|
| Wheel Noise | 1. Wheel loose. | 1. Tighten loose nuts. |
| | 2. Worn wheel bearing. | 2. Replace bearing. |
| Axle Shaft Noise | 1. Misaligned axle tube. | 1. Inspect axle tube alignment. Correct as necessary. |
| | 2. Bent or sprung axle shaft. | 2. Inspect and correct as necessary. |
| Axle Shaft Broke | 1. Misaligned axle tube. | 1. Replace the broken shaft after correcting tube mis-alignment. |
| | 2 Vehicle overloaded. | 2. Replace broken shaft and avoid excessive weight on vehicle. |
| | 3. Erratic clutch operation. | 3. Replace broken shaft and avoid or correct erratic clutch operation. |
| | 4. Grabbing clutch. | 4. Replace broken shaft and inspect and repair clutch as necessary. |
| Differential Cracked | 1. Improper adjustment of the differential bearings. | 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. |
| | 2. Excessive ring gear backlash. | 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. |
| | 3. Vehicle overloaded. | 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. |
| | 4. Erratic clutch operation. | 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch. |

| Condition | Possible Causes | Correction |
|---|---|---|
| Differential Gears Scored | 1. Insufficient lubrication. | 1. Replace scored gears. Fill differential with the correct fluid type and quantity. |
| | 2. Improper grade of lubricant. | 2. Replace scored gears. Fill differential with the correct fluid type and quantity. |
| | 3. Excessive spinning of one wheel/tire. | 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary. |
| Loss Of Lubricant | 1. Lubricant level too high. | 1. Drain lubricant to the correct level. |
| | 2. Worn axle shaft seals. | 2. Replace seals. |
| | 3. Cracked differential housing. | 3. Repair as necessary. |
| | 4. Worn pinion seal. | 4. Replace seal. |
| | 5. Worn/scored yoke. | 5. Replace yoke and seal. |
| | 6. Axle cover not properly sealed. | 6. Remove, clean and seal cover. |
| Axle Overheating | 1. Lubricant level low. | 1. Fill differential to correct level. |
| | 2. Improper grade of lubricant. | 2. Fill differential with the correct fluid type and quantity. |
| | 3. Bearing pre-loads too high. | 3. Adjust bearing pre-loads. |
| | 4. Insufficient ring gear backlash. | 4. Adjust ring gear backlash. |
| Gear Teeth Broke | 1. Overloading. | 1. Replace gears. Examine other gears and bearings for possible damage. |
| | 2. Erratic clutch operation. | 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. |
| | 3. Ice-spotted pavement. | 3. Replace gears and examine remaining parts for damage. |
| | 4. Improper adjustments. | 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct. |

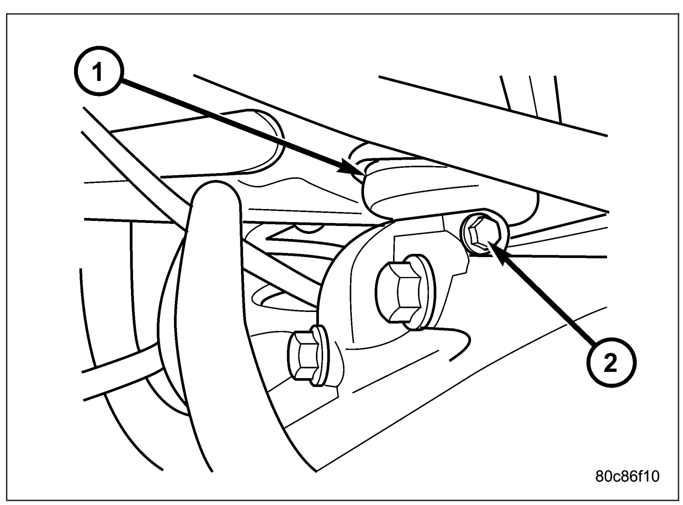
| Condition | Possible Causes | Correction |
|---|---|---|
| Axle Noise | 1. Insufficient lubricant. | 1. Fill differential with the correct fluid type and quantity. |
| | 2. Improper ring gear and pinion adjustment. | 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth. |
| | 3. Unmatched ring gear and pinion. | 3. Replace gears with a matched ring gear and pinion. |
| | 4. Worn teeth on ring gear or pinion. | 4. Replace ring gear and pinion. |
| | 5. Loose pinion bearings. | 5. Adjust pinion bearing pre-load. |
| | 6. Loose differential bearings. | 6. Adjust differential bearing pre-load. |
| | 7. Ring gear run-out. | 7. Measure ring gear run-out. Replace components as necessary. |
| | 8. Loose differential bearing cap bolts. | 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. |
| | 9. Housing not machined properly. | 9. Replace housing. |

## REMOVAL

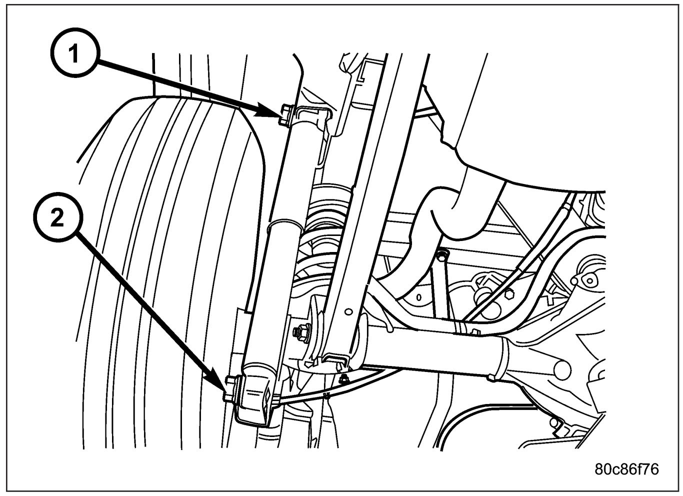
1. With vehicle in neutral, position vehicle on hoist.
2. Position a lift/jack under the axle and secure axle to device.
3. Mark propeller shaft and pinion yoke for installation reference.
4. Remove propeller shaft and suspend under the vehicle.
5. Remove brake components.
6. Remove vent hose from the axle shaft tube.
7. Remove the stabilizer bar bolts (1) from lower control arm (2).



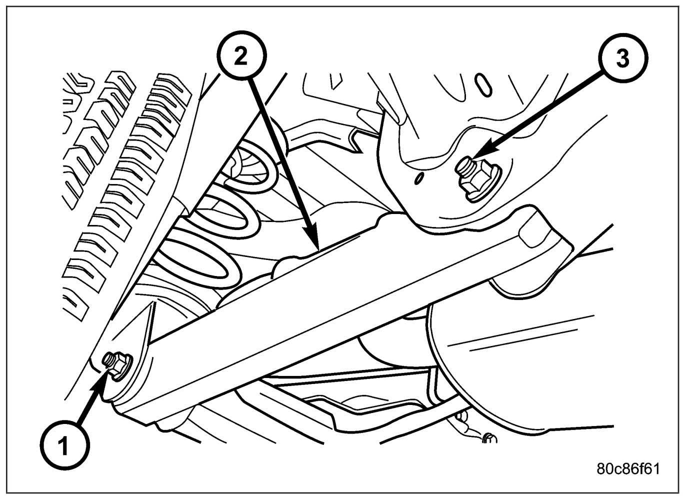
8. Remove upper control arm ball joint (1) pinch bolt (2) from bracket.



9. Remove shock absorbers from axle brackets (2).



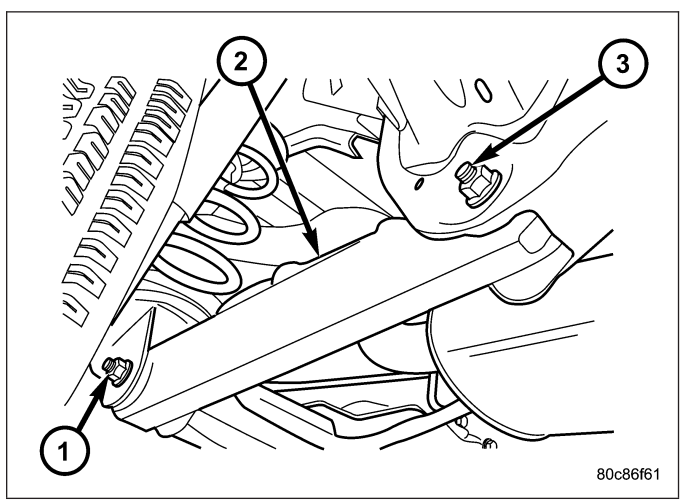
10. Loosen all lower control arms (2) mounting bolts.
11. Lower axle enough to remove coil springs and spring insulators.
12. Remove lower control arm bolts from the axle brackets (1).
13. Lower and remove the axle.



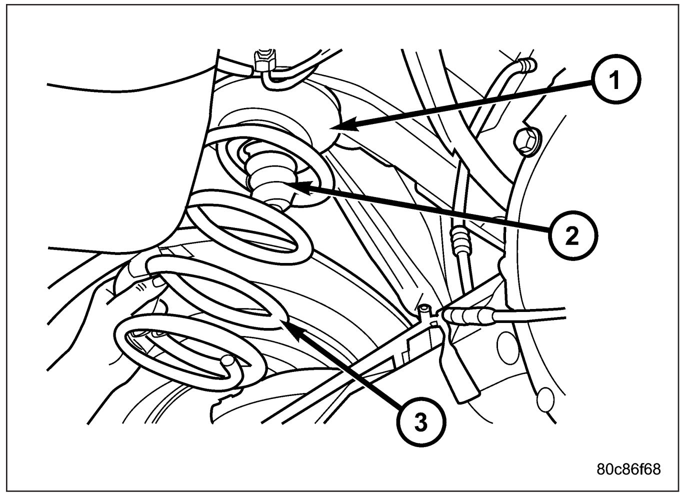
## INSTALLATION

**CAUTION: The weight of the vehicle must be supported by the springs before the lower control arms are tightened. This must be done to maintain vehicle ride height and prevent premature bushing failure.**

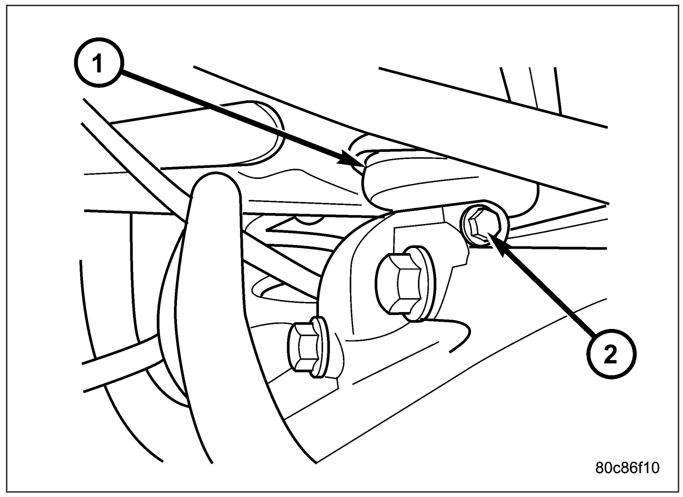
1. Raise the axle under the vehicle.
2. Install lower control arms (2) onto the axle brackets (1) and loosely install the mounting bolts.



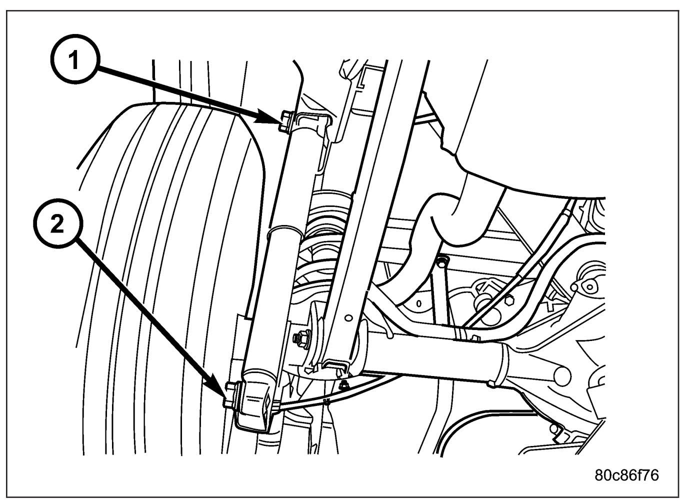
3. Install coil spring isolators (1) and springs (3).
4. Raise axle up until springs are seated.



5. Install upper control arm ball joint (1) into axle bracket and tighten pinch bolt (2) to torque specification.



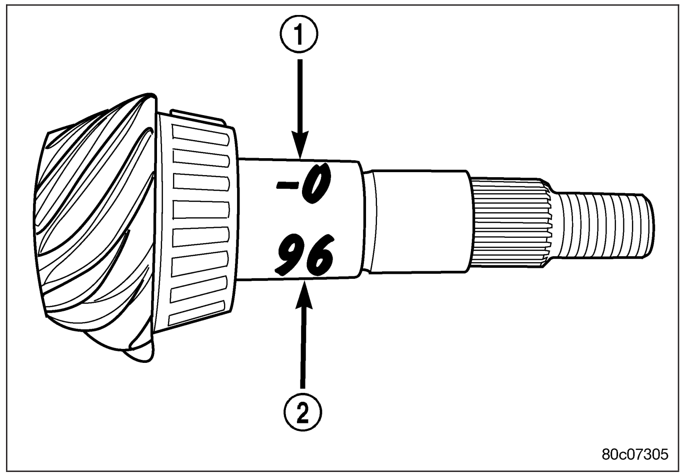
6. Install shock absorbers and tighten bolts (2) to torque specification.
7. Install stabilizer bar and tighten nuts to torque specification.
8. Install brake components.
9. Install axle vent hose.
10. Install propeller shaft with reference marks.
11. Install the wheels and tires.
12. Remove lifting device from axle and lower the vehicle.
13. Tighten the lower control arm bolts to torque specification.



# ADJUSTMENTS

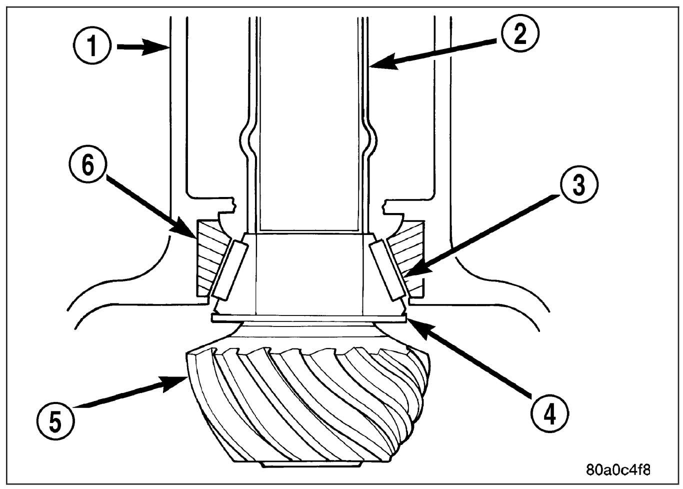
## PINION DEPTH-BEARING PRELOAD-GEAR BACKLASH

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus (+) number, minus (–) number or zero (0) along with the gear set sequence number (2) (01 to 99) is on each gear. This first number (1) the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion marked with a (0). The next two numbers are the sequence number of the gear set. The standard depth provides the best teeth contact pattern.



Compensation for pinion depth variance is achieved with select shims (4). The shims are placed behind the rear pinion bearing.

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim/oil slinger to compensate for the difference in the depth variances. The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.



**Pinion Gear Depth Variance Chart**: Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

**PINION GEAR DEPTH VARIANCE**

| Original Pinion Gear Depth Variance | Replacement Pinion Gear Depth Variance | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | −4 | −3 | −2 | −1 | 0 | +1 | +2 | +3 | +4 |
| **+4** | +0.008 | +0.007 | +0.006 | +0.005 | +0.004 | +0.003 | +0.002 | +0.001 | 0 |
| **+3** | +0.007 | +0.006 | +0.005 | +0.004 | +0.003 | +0.002 | +0.001 | 0 | −0.001 |
| **+2** | +0.006 | +0.005 | +0.004 | +0.003 | +0.002 | +0.001 | 0 | −0.001 | −0.002 |
| **+1** | +0.005 | +0.004 | +0.003 | +0.002 | +0.001 | 0 | −0.001 | −0.002 | −0.003 |
| **0** | +0.004 | +0.003 | +0.002 | +0.001 | 0 | −0.001 | −0.002 | −0.003 | −0.004 |

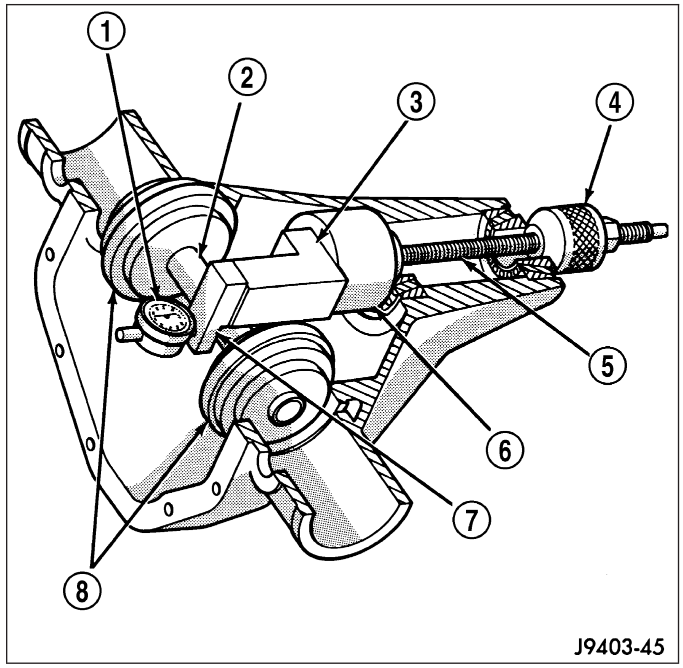
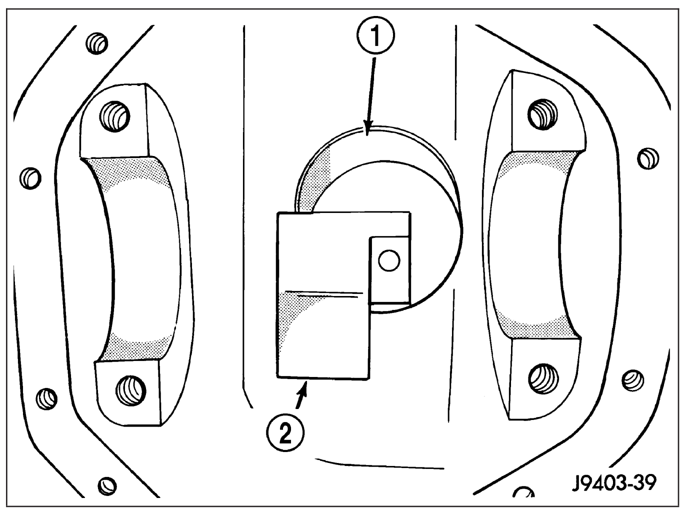
| **−4** | 0 | −0.001 | −0.002 | −0.003 | −0.004 | −0.005 | −0.006 | −0.007 | −0.008 |

## PINION DEPTH MEASUREMENT

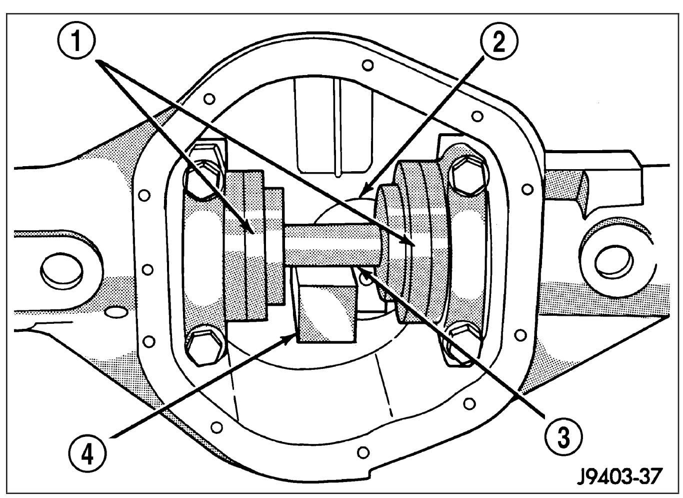
Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339 (1).



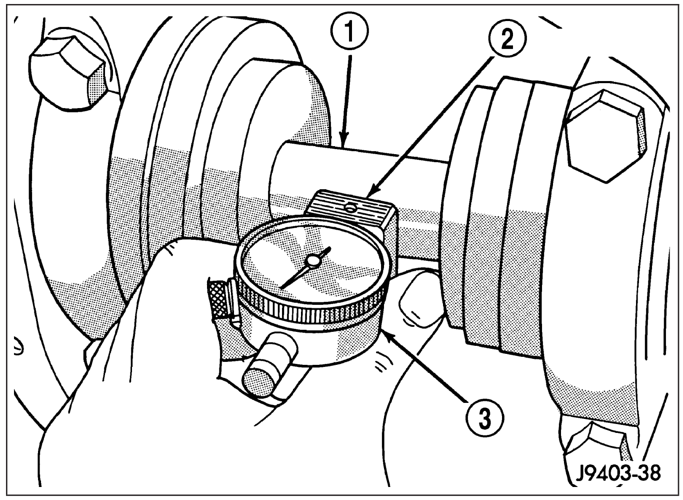
1. Assemble Pinion Height Block 6739 (2), Pinion Block 8540 (1) and rear pinion bearing onto Screw 6741.
2. Insert assembled height gauge components, rear bearing and screw into housing through pinion bearing cups.



3. Install front pinion bearing and Cone-Nut 6740 on the screw. Tighten Cone-Nut until Torque To Rotate screw is 1.7 N·m (15 in. lbs.).
4. Place Arbor Disc 8541 (1) on Arbor D-115-3 (3) in position in the housing side bearing cradles. Install differential bearing caps on arbor discs and tighten cap bolts to 41 N·m (30 ft. lbs.).



5. Assemble Dial Indicator C-3339 (3) into Scooter Block D-115-2 (2) and secure set screw.
6. Place Scooter Block/Dial Indicator in position in axle housing so dial probe and scooter block are flush against the rearward surface of the pinion height block. Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.
7. Slowly slide the dial indicator probe over the edge of the pinion height block.
8. Slide the dial indicator probe across the gap between the pinion height block and the arbor bar (1) with the scooter block against the pinion height block. When dial probe contacts the arbor bar, the dial pointer will turn clockwise. Continue moving the dial probe to the crest of the arbor bar and record the highest reading. If the dial indicator can not achieve a zero reading, the rear bearing cup or the pinion depth gauge set is not installed correctly.

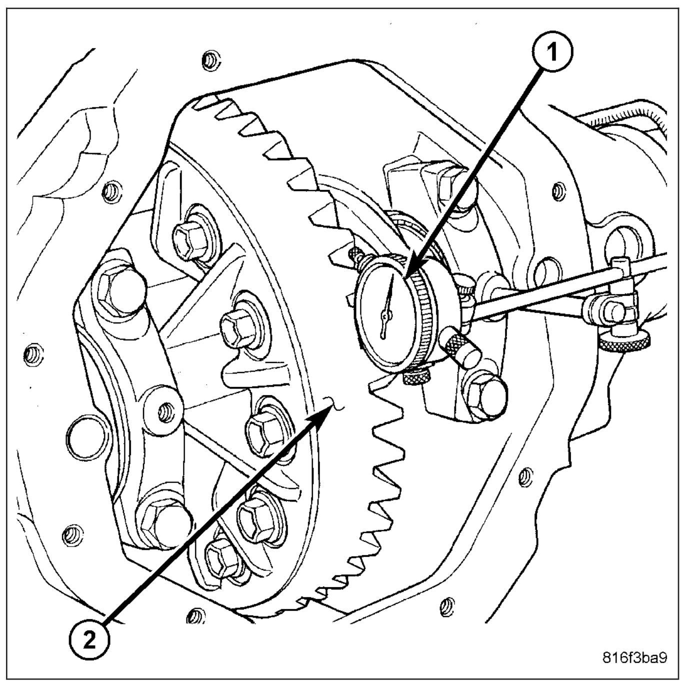


9. Select a shim equal to the dial indicator reading, plus the drive pinion gear depth variance number marked on the shaft of the pinion. For example, if the depth variance is –2, add +0.002 in. to the dial indicator reading. Then subtract 0.041 mm (0.0016 in.) from the total measurement. This will be the correct shim selection for the pinion height.

## DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

The following must be considered when adjusting bearing preload and gear backlash :

- The maximum ring gear (2) backlash variation is 0.076 mm (0.003 in.).
- Mark the gears so the same teeth are meshed during all backlash measurements.
- Maintain the torque while adjusting the bearing preload and ring gear backlash.
- Excessive adjuster torque will introduce a high bearing load and cause premature bearing failure. Insufficient adjuster torque can result in excessive differential case free-play and ring gear noise.
- Insufficient adjuster torque will not support the ring gear correctly and can cause excessive differential case free-play and ring gear noise.



**NOTE: The differential bearing cups will not always immediately follow the threaded adjusters as they are moved during adjustment. To ensure accurate bearing cup responses to the adjustments:**

- **Maintain the gear teeth engaged (meshed) as marked.**
- **The bearings must be seated by rapidly rotating the pinion gear a half turn back and forth.**
- **Do this five to ten times each time the threaded adjusters are adjusted.**

1. Use Adjuster C-4164 to adjust each threaded adjuster inward until the differential bearing free-play is eliminated. Allow some ring gear backlash, approximately 0.25 mm (0.01 in.) between the ring and pinion gear. Seat the bearing cups with the procedure described above.
2. Install dial indicator (1) and position the plunger against the drive side of a ring gear tooth (2). Measure the backlash at 4 positions (90 degrees apart) around the ring gear. Locate and mark the area of minimum backlash.

3. Rotate the ring gear to the position of the least backlash. Mark the gear so that all future backlash measurements will be taken with the same gear teeth meshed.
4. Loosen the right-side, tighten the left-side threaded adjuster. Obtain backlash of 0.076 to 0.102 mm (0.003 to 0.004 in.) with each adjuster tightened to 14 N·m (10 ft. lbs.). Seat the bearing cups with the procedure described above.
5. Tighten the differential bearing cap bolts to 95 N·m (70 ft. lbs.).
6. Tighten the right-side threaded adjuster to 102 N·m (75 ft. lbs.). Seat the bearing cups with the procedure described above. Continue to tighten the right-side adjuster and seat bearing cups until the torque remains constant at 102 N·m (75 ft. lbs.)
7. Measure the ring gear backlash. The range of backlash is 0.12 to 0.20 mm (0.005 to 0.008 in.).
8. Continue increasing the torque at the right-side threaded adjuster until the specified backlash is obtained.

**NOTE: The left-side threaded adjuster torque should have approximately 102 N·m (75 ft. lbs.). If the torque is considerably less, the complete adjustment procedure must be repeated.**

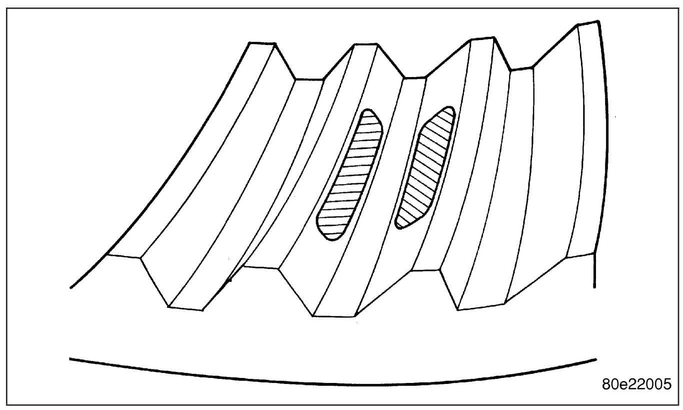
9. Tighten the left-side threaded adjuster until 102 N·m (75 ft. lbs.) torque is indicated. Seat the bearing rollers with the procedure described above. Do this until the torque remains constant.
10. Install the threaded adjuster locks and tighten the lock screws to 10 N·m (90 in. lbs.).

After the proper backlash is achieved, perform the Gear Contact procedure.

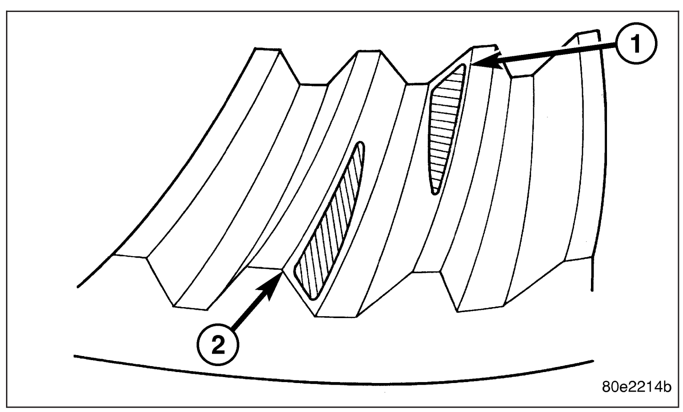
## GEAR CONTACT PATTERN

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.
3. Verify bearing cap bolts are torque specification.
4. Apply parking brakes lightly to create at 14 N·m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

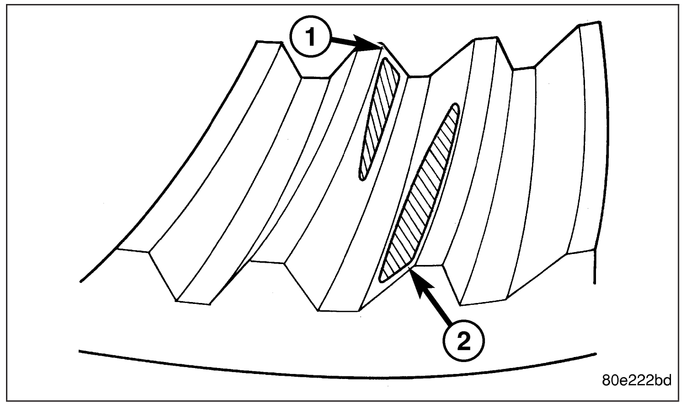
Gear contact pattern is correct. Backlash and pinion depth is correct.



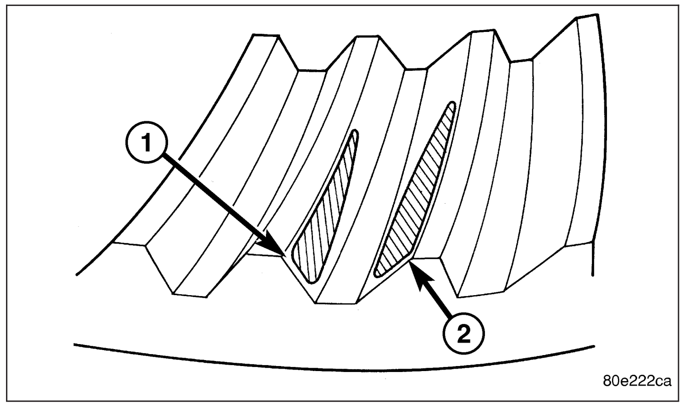
Ring gear is too far away from the pinion gear, coast side toe (1) drive side heel (2). Decrease backlash by moving ring closer to the pinion gear using the adjusters.



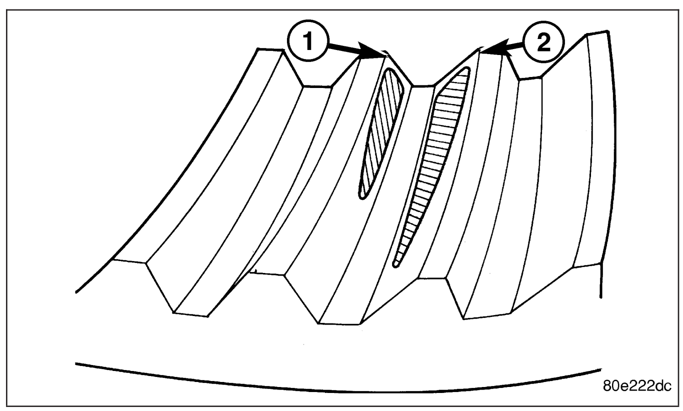
Ring gear is too close to the pinion gear, drive side toe (1) coast side heel (2). Increase backlash by moving ring away from the pinion gear using the adjusters.



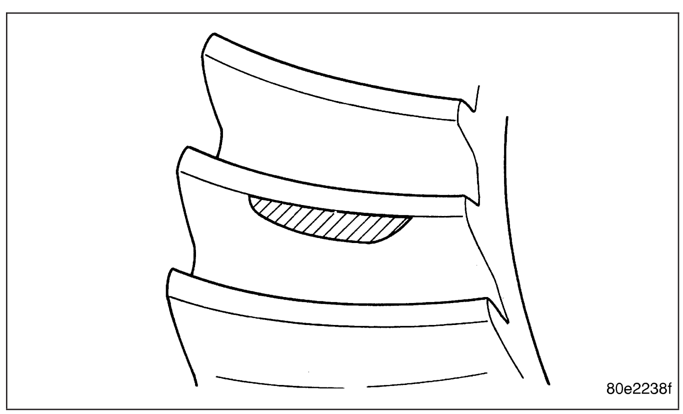
Ring gear is too far away from the pinion gear, drive side heel (1) coast side heel (2). Decrease backlash by moving ring gear closer to the pinion gear using the adjusters.



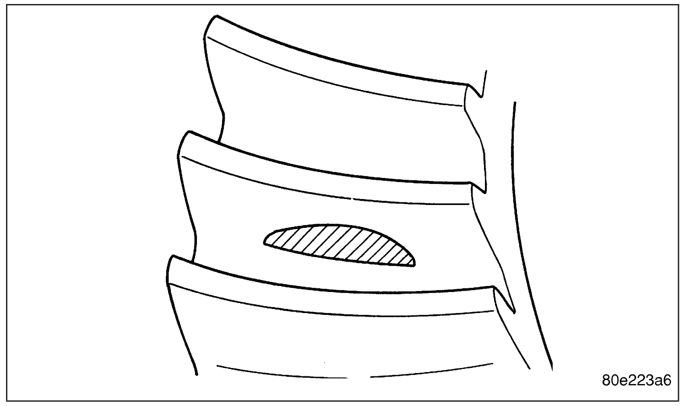
Ring gear is too close to the pinion gear, drive side toe (1) coast side toe (2). Increase backlash by moving ring gear away from the pinion gear using the adjusters.



Pinion gear is set too low. Increase pinion gear height, by increasing pinion depth shim thickness.



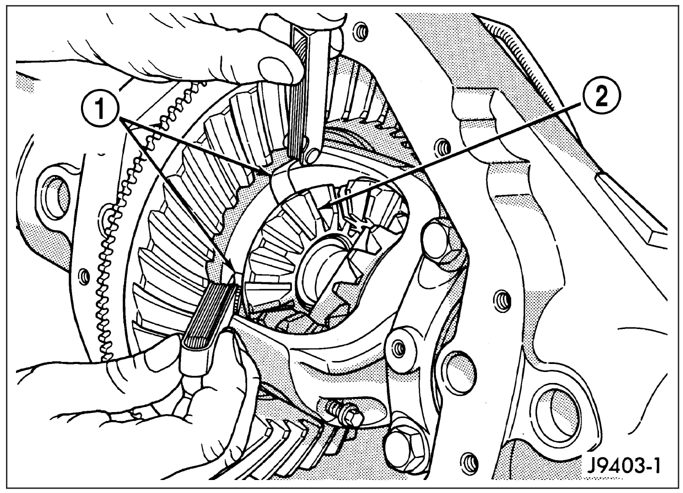
Pinion gear is set too high. Decrease pinion height by decreasing the pinion depth shim thickness.



## SIDE GEAR CLEARANCE

When measuring side gear clearance, check each gear independently. If it necessary to replace a side gear, replace both gears as a matched set.

1. Install axle shafts and C-locks and pinion mate shaft.
2. Measure each side gear clearance. Insert a matched pair of feeler gauge (1) blades between the side gear (2) and differential housing on opposite sides of the hub.



| | |
|---|---|
| SIDE GEAR CLEARANCE | 0.007 |
| THRUST WASHER THICKNESS | + 0.033 |
| TOTAL | 0.040 |
| | 0.040 |
| REPLACEMENT WASHER THICKNESS | − 0.037 |
| NEW SIDE GEAR CLEARANCE | 0.003 |

J9203-31

3. If side gear clearances is no more than 0.005 inch. Determine if the axle shaft is contacting the pinion mate shaft. **Do not remove the feeler gauges, inspect the axle shaft with the feeler gauge inserted behind the side gear.** If the end of the axle shaft is not contacting the pinion mate shaft, the side gear clearance is acceptable.
4. If clearance is more than 0.005 inch (axle shaft not contacting mate shaft), record the side gear clearance. Remove the thrust washer and measure its thickness with a micrometer. Add the washer thickness to the recorded side gear clearance. The sum of gear clearance and washer thickness will determine required thickness of replacement thrust washer.

In some cases, the end of the axle shaft will move and contact the mate shaft when the feeler gauge is inserted. The C-lock is preventing the side gear from sliding on the axle shaft.

5. If there is no side gear clearance, remove the C-lock from the axle shaft. Use a micrometer to measure the thrust washer thickness. Record the thickness and re-install the thrust washer. Assemble the differential case without the C-lock installed and re-measure the side gear clearance.
6. Compare both clearance measurements. If the difference is less than 0.3 mm (0.012 in.) add clearance recorded when the C-lock was installed to thrust washer thickness measured. The sum will determine the required thickness of the replacement thrust washer.
7. If clearance is 0.3 mm (0.012 in.) or greater, both side gears must be replaced (matched set) and the clearance measurements repeated.
8. If clearance (above) continues to be 0.3 mm (0.012 in.) or greater, the case must be replaced.

# SPECIFICATIONS - 8 1/4

## AXLE SPECIFICATIONS

| DESCRIPTION | SPECIFICATION |
|---|---|
| Axle Ratio | 3.55, 3.73 |
| Differential Case Flange Runout | 0.076 mm (0.003 in.) |
| Differential Case Clearance | 0.12 mm (0.005 in.) |
| Ring Gear Diameter | 213 mm (8.25 in.) |
| Ring Gear Backlash | 0.12-0.20 mm (0.005-0.008 in.) |
| Ring Gear Runout | 0.12 mm (0.005 in.) |
| Pinion Bearing Preload - Original Bearings | 1-2 N·m (10-20 in. lbs.) |
| Pinion Bearing Preload - New Bearings | 1-3.4 N·m (10-30 in. lbs.) |

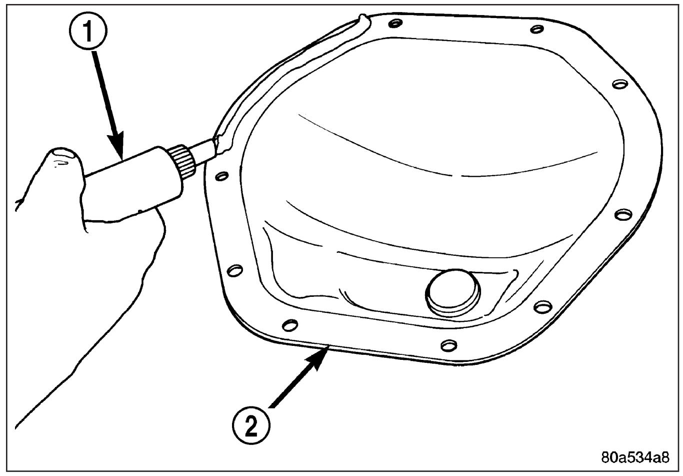
# COVER-DIFFERENTIAL

## REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove drain plug.
3. Remove cover bolts.
4. Remove cover and drain lubricant.

## INSTALLATION

1. Apply a bead of orange Mopar™ Axle RTV sealant (1) or equivalent to the housing cover (2).



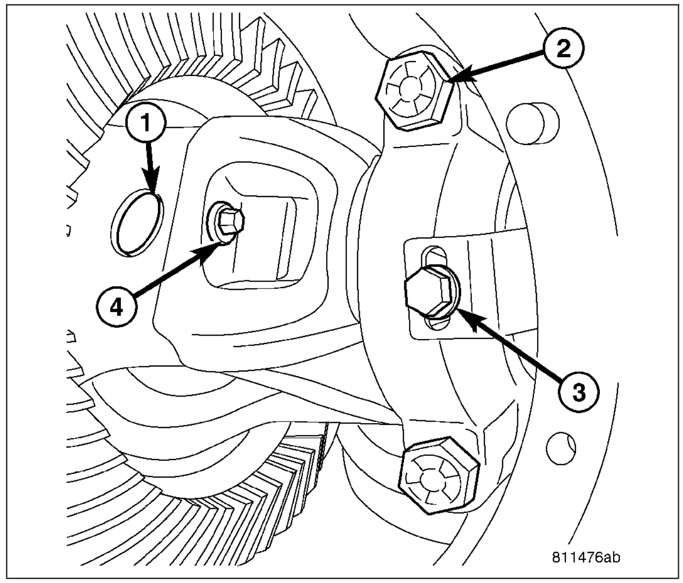
**CAUTION: If cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to follow these instructions will cause a leak.**

2. Install cover and identification tag. Tighten cover bolts in a criss-cross pattern to 41 N·m (30 ft. lbs.).
3. Fill differential to specifications.
4. Install fill plug.

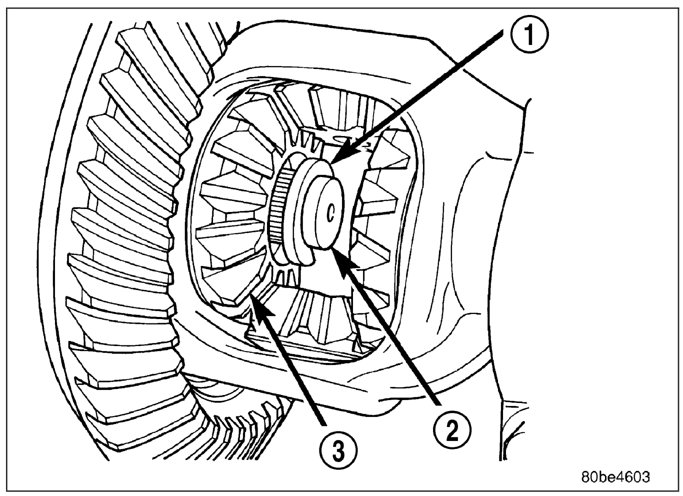
# SHAFT-AXLE

## REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove rear brake components.
3. Remove wheel speed sensor.
4. Remove differential housing cover and drain lubricant.
5. Rotate differential case so pinion mate shaft (1) lock screw (4) is accessible. Remove lock screw and pinion mate shaft from differential case.

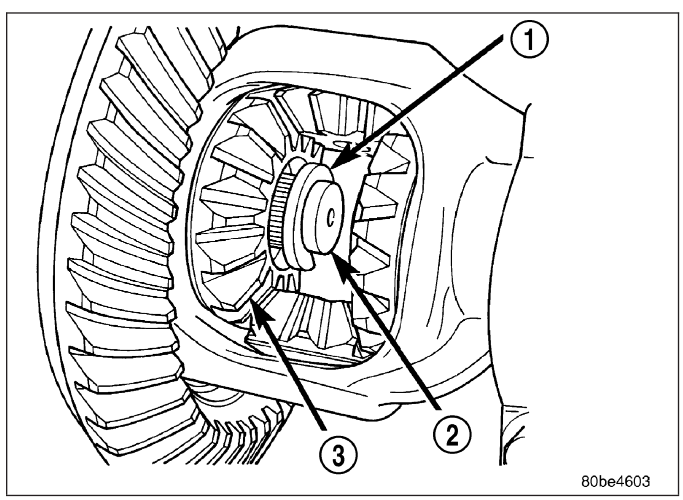


6. Push axle shaft inward and remove axle shaft C-lock (1) from the axle shaft (2).
7. Remove axle shaft from side gear (3) and axle tube.

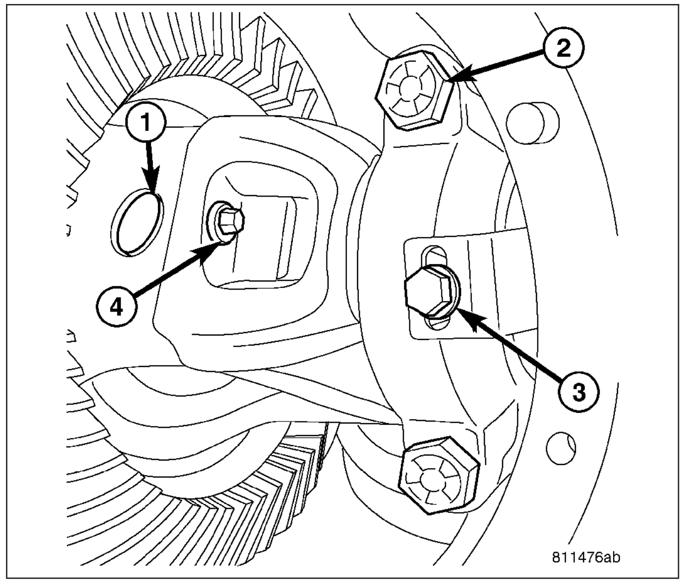


## INSTALLATION

1. Lubricate bearing bore and seal lip with gear lubricant.
2. Install axle shaft (2) through seal, bearing and engage into side gear (3) splines.
3. Install C-lock (1) in axle shaft end, then push axle shaft outward to seat C-lock in side gear.



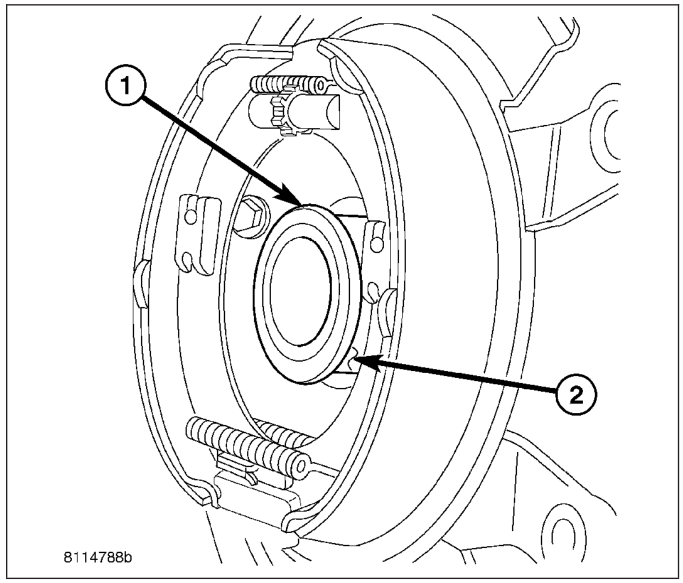
4. Install pinion mate shaft (1) into differential case and through thrust washers and differential pinions.
5. Align hole in shaft with hole in the differential case and install lock screw (4) with Loctite® on the threads. Tighten lock screw to 11 N·m (8 ft. lbs.).
6. Install differential cover.
7. Install wheel speed sensor.
8. Install rear brake components.



# SEAL-AXLE SHAFT

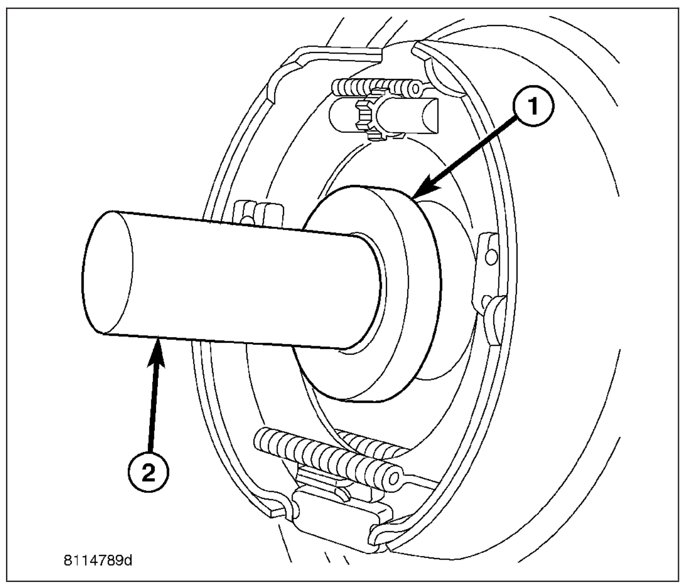
## REMOVAL

1. Remove axle shaft.
2. Remove axle shaft seal (1) from axle tube (2) with a seal pick.



## INSTALLATION

1. Remove any old sealer/burrs from axle tube.
2. Coat **new** seal lip with axle lubricant and install seal with Installer C-4198 (1) and Handle C-4171 (1).
3. Install axle shaft.

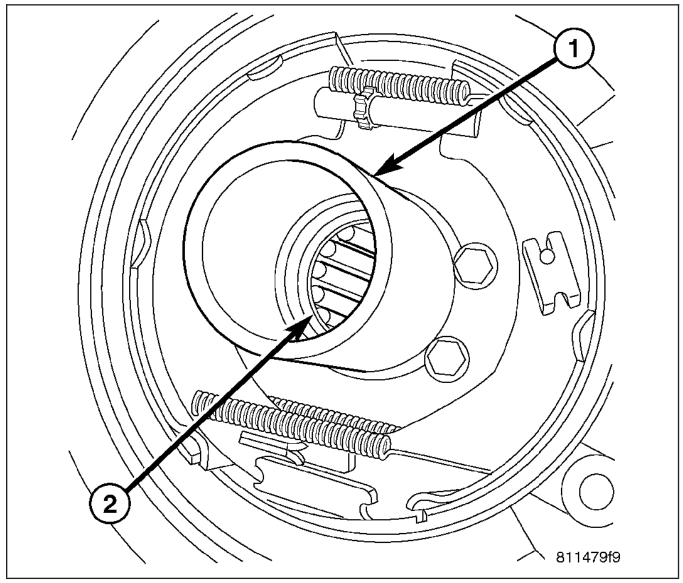


# BEARING-AXLE

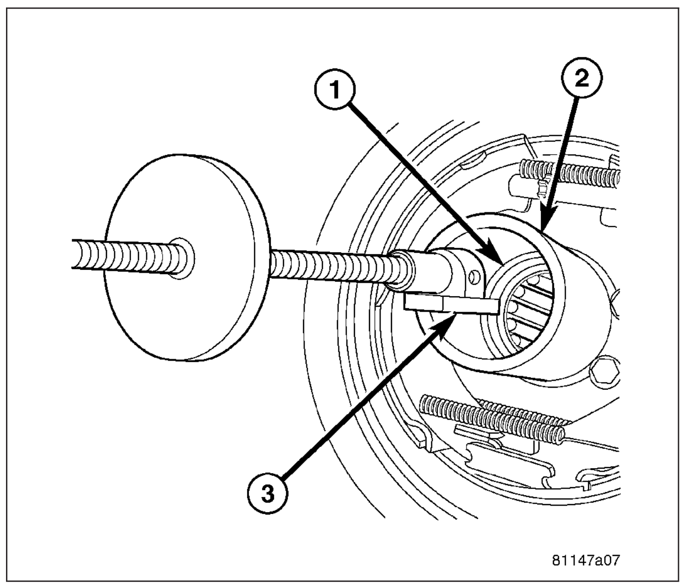
## REMOVAL

**NOTE: Remove bearing with Bearing Remover 6310 and Foot 6310-9.**

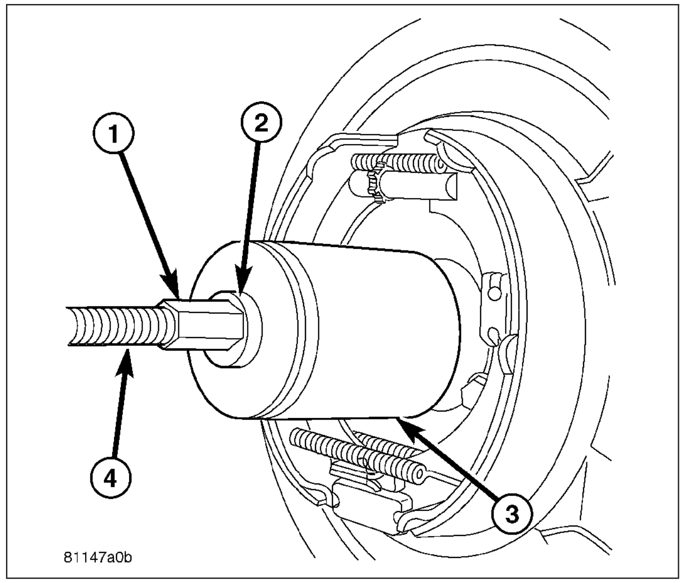
1. Remove axle shaft.
2. Remove axle seal with seal pick.
3. Position bearing (2) receiver (1) on axle tube.



4. Insert bearing remover Foot 6310-9 (3) through receiver (2) and bearing (1).



5. Tighten remove nut (1) on the shaft (4) to pull bearing into the receiver (3).

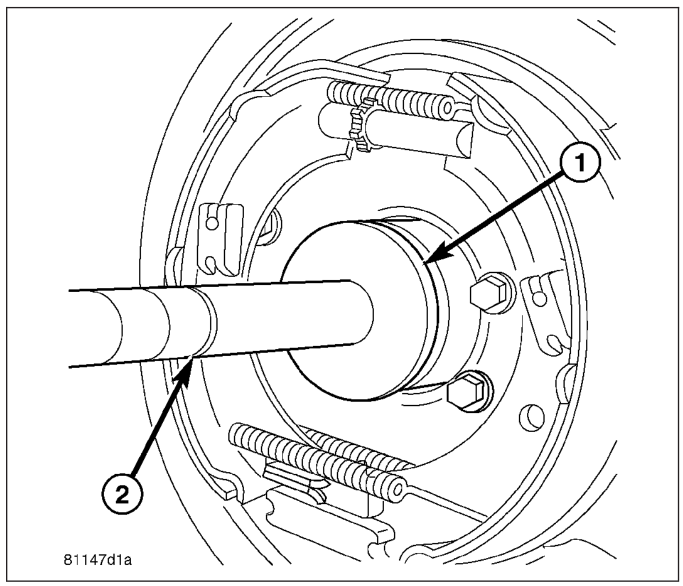


## INSTALLATION

1. Remove any old sealer/burrs from axle tube.
2. Install axle shaft bearing with Installer C-4198 (1) and Handle C-4171 (2). Drive bearing in until tool contacts the axle tube.

**NOTE: Bearing is installed with the bearing part number against installer.**

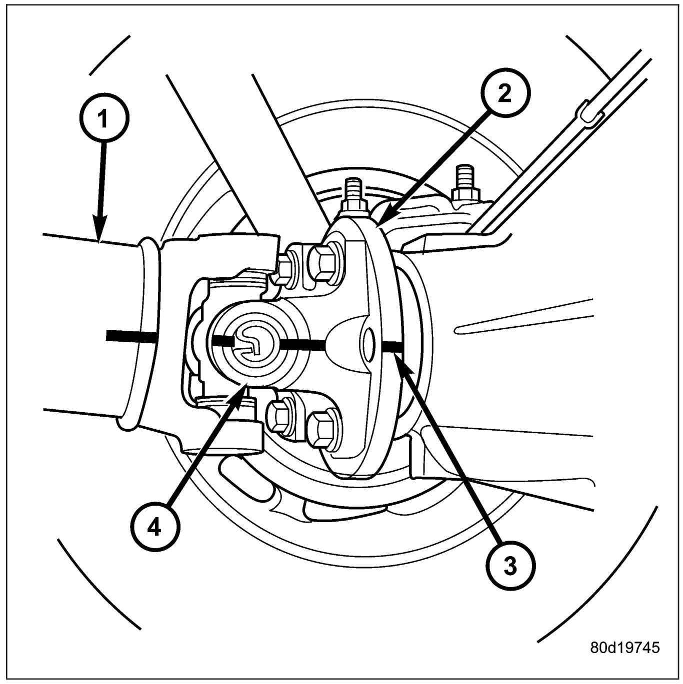
3. Coat **new** axle seal lip with axle lubricant. Install seal with Installer C-4198 and Handle C-4171.
4. Install axle shaft.



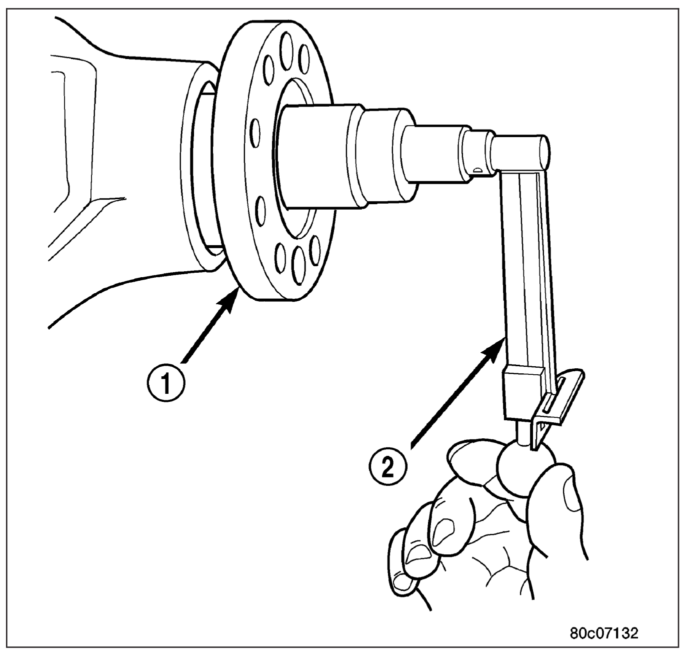
# SEAL-PINION

## REMOVAL

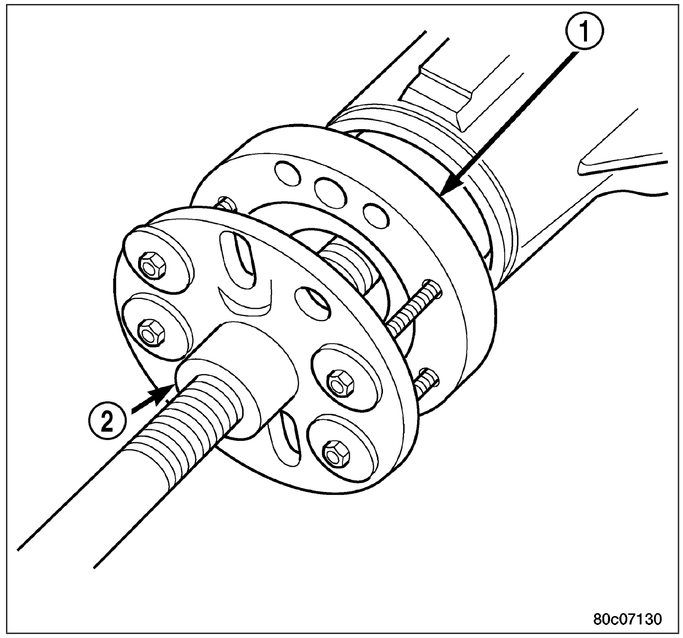
1. With vehicle in neutral, position vehicle on hoist.
2. Mark a reference line (3) across the axle companion flange (2) and propeller shaft flange yoke (4).
3. Remove companion flange bolts and remove propeller shaft
4. Remove wheel and tire assemblies.
5. Remove brake calipers and rotors to prevent any drag.



6. Rotate companion flange three or four times and verify flange rotates smoothly.
7. Measure rotating torque of the pinion (1) with a inch pound torque wrench (2) and record reading for installation reference.
8. Install bolts into two of the threaded holes in the companion flange 180 degrees apart.
9. Position Holder 6719A against the companion flange and install a bolt and washer into one of the remaining threaded holes. Tighten the bolts so the Holder 6719A is held to the flange.
10. Remove the pinion nut and washer.

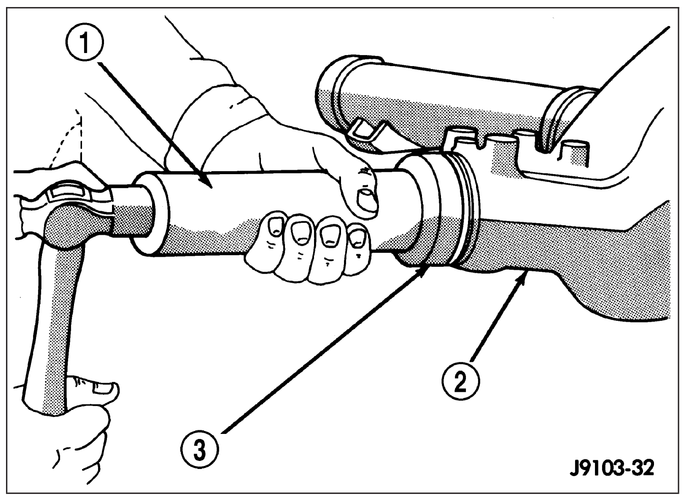


11. Remove companion flange (1) with Puller C-452 (2).
12. Remove pinion seal with a seal puller.



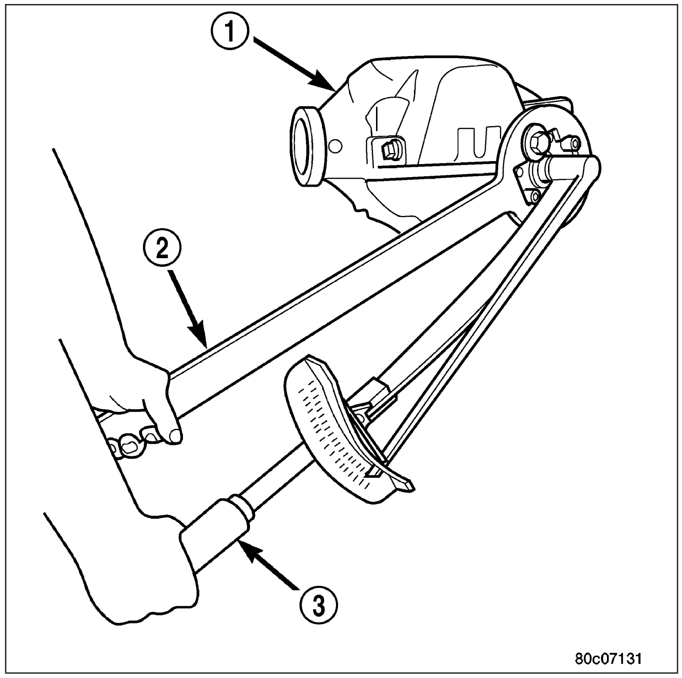
## INSTALLATION

1. Apply a light coating of gear lubricant on the lip of pinion seal.
2. Install **new** pinion seal with Installer C-4076-B (3) and Handle C-4735 (1).

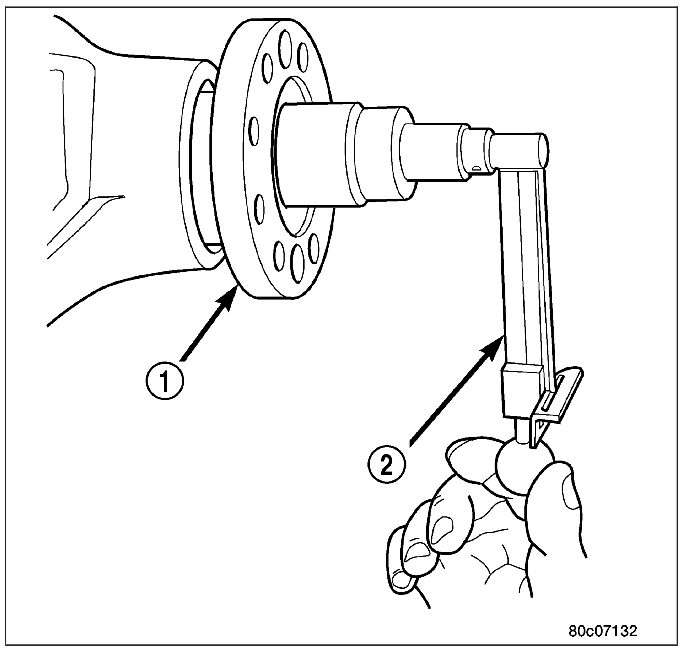


3. Install companion flange on the end of the shaft with the reference marks aligned.
4. Install bolts into two of the threaded holes in the companion flange 180 degrees apart.
5. Position Holder 6719A (2) against the companion flange and install a bolt and washer into one of the remaining threaded holes. Tighten the bolts so Holder 6719A is held to the flange.
6. Install companion flange on pinion shaft with Installer C-3718 and Holder 6719A.
7. Install the pinion washer and a **new** pinion nut. The convex side of the washer must face outward.

**CAUTION: Do not exceed the minimum tightening torque when installing the companion flange retaining nut at this point. Failure to heed caution may result in damage.**



8. Hold companion flange with Holder 6719A (2) and with a torque wrench (3) tighten pinion nut to 285 N·m (210 ft. lbs.). Rotate pinion several revolutions to ensure the bearing rollers are seated.
9. Rotate pinion (1) with an inch pound torque wrench (2). Rotating torque should be equal to the reading recorded during removal plus an additional 0.56 N·m (5 in. lbs.).



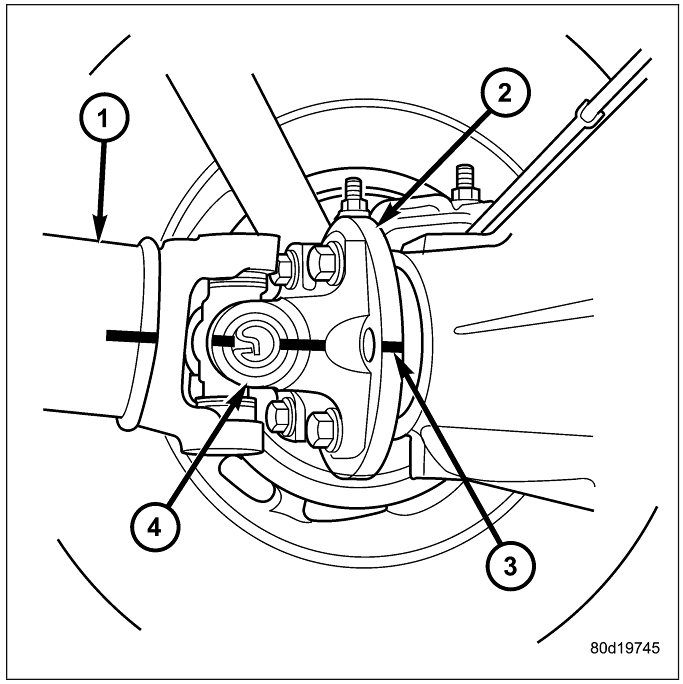
**CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. Failure to follow these instructions will result in damage.**

10. If rotating torque is low use Holder 6719A to hold the companion flange and tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until proper rotating torque is achieved.

**NOTE: The seal replacement is unacceptable if final pinion nut torque is less than 285 N·m (210 ft. lbs.).**

**NOTE: The bearing rotating torque should be constant during a complete revolution of the pinion. If the rotating torque varies, this indicates a binding condition.**

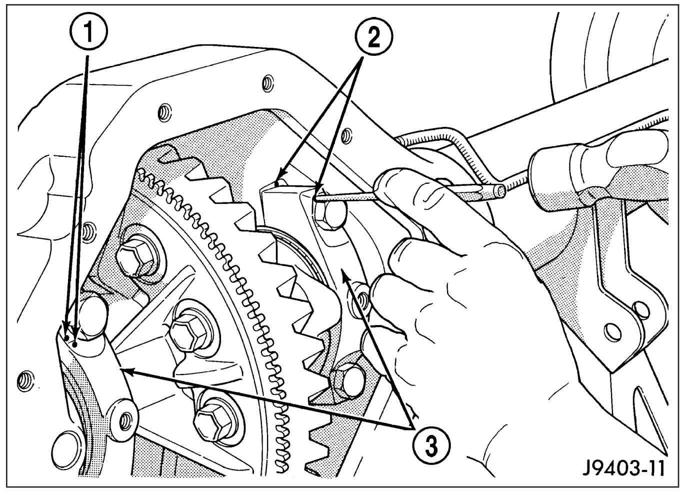
11. Install propeller shaft (1) with installation reference marks (3) aligned.
12. Install rear brake components.



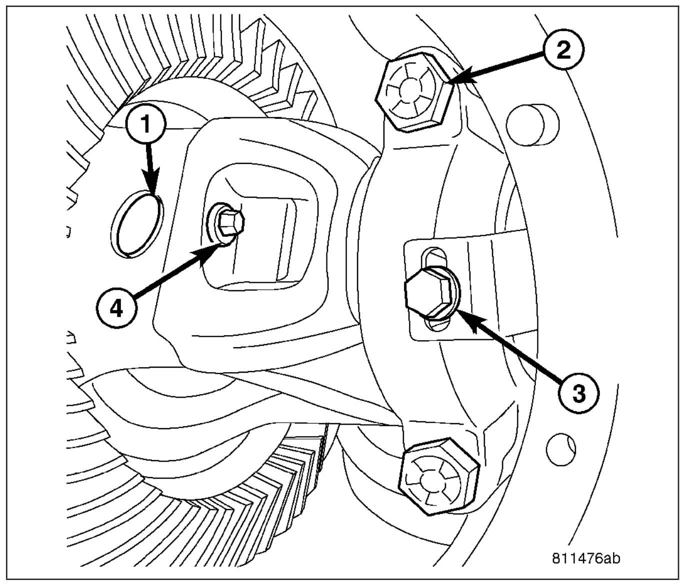
# DIFFERENTIAL

## REMOVAL

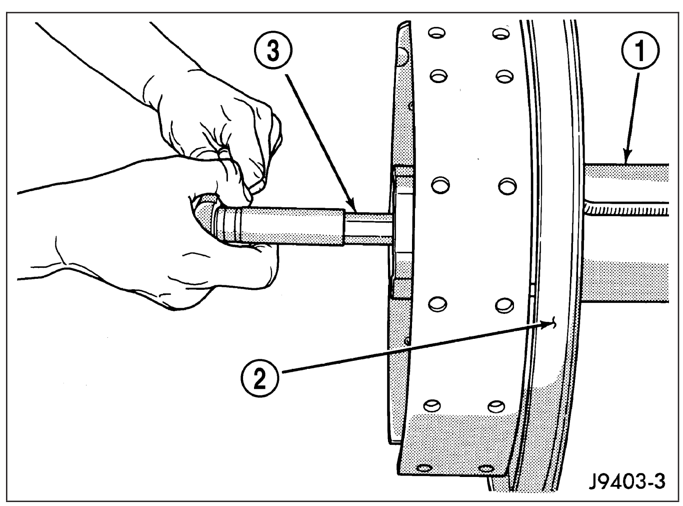
1. Remove differential fill plug.
2. Remove differential cover and drain lubricant.
3. Remove axle shaft C-locks and axle shafts.
4. Remove ABS sensor from housing.
5. Mark (1) (2) differential housing and bearing caps (3) for installation reference.



6. Remove bearing adjuster lock bolt (3) from bearing caps.
7. Loosen differential bearing cap bolts (2).

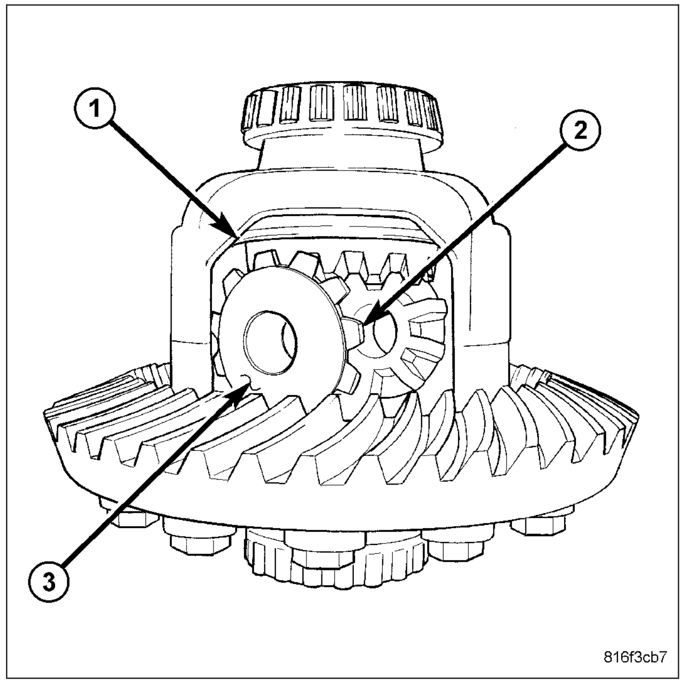


8. Loosen differential bearing adjusters through the axle tubes (1) with Adjuster C-4164 (3).
9. Hold differential case while removing bearing caps and adjusters.
10. Remove differential case and tag differential bearing cups and adjusters to indicate location.
11. Clean housing cavity with flushing oil, light engine oil or a lint free cloth.

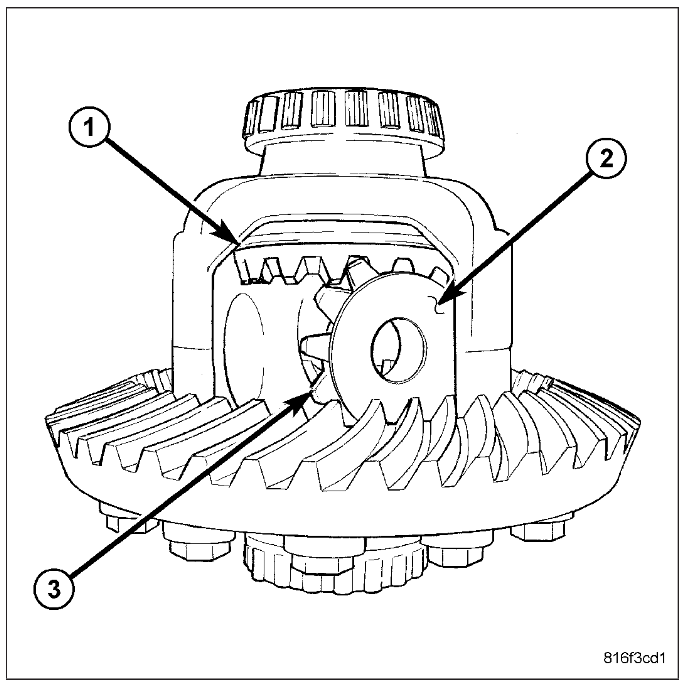


## DISASSEMBLY

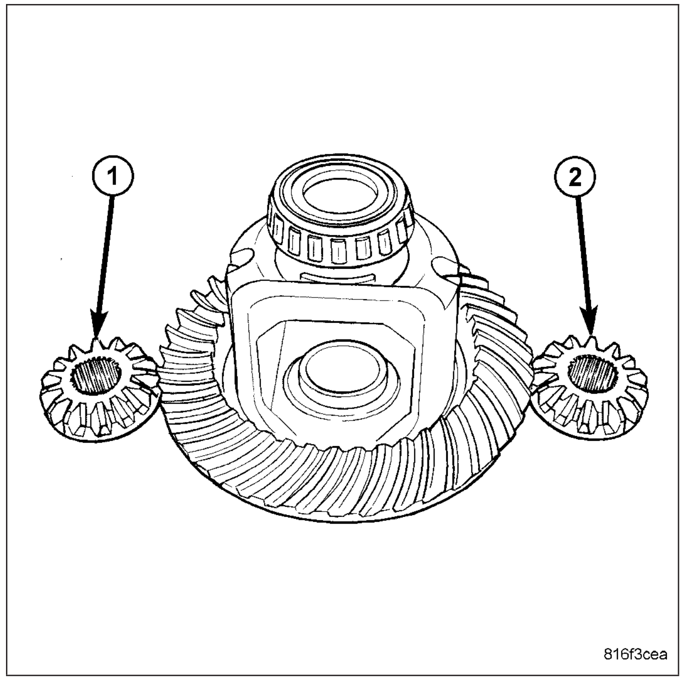
1. Rotate one pinion gear (2) with thrust washer (3) to the differential window (1) and remove gear and thrust washer.



2. Rotate remaining pinion gear (3) with thrust washer (2) to the differential window (1) and remove gear and washer.



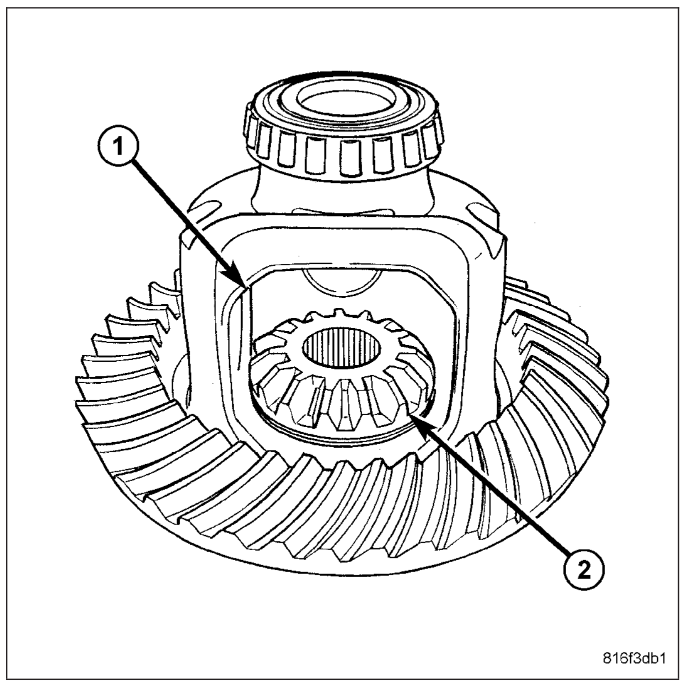
3. Remove differential side gears (1) (2) and thrust washers.



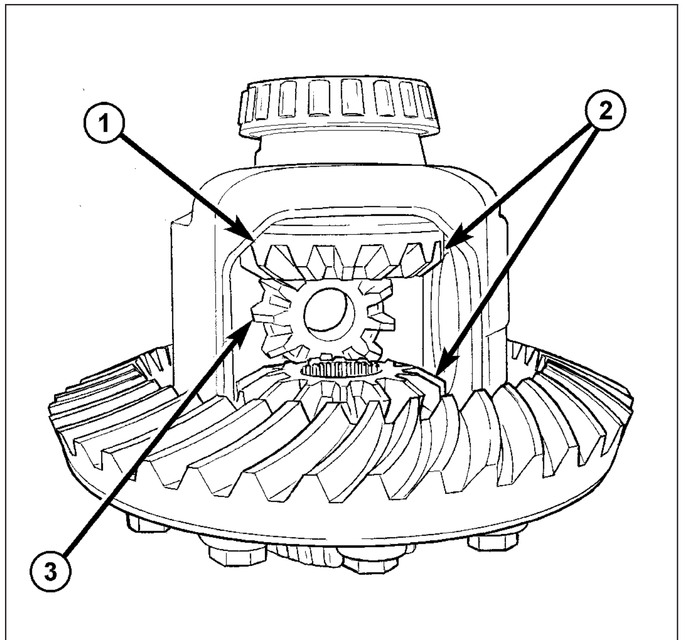
## ASSEMBLY

**NOTE: If same gears and thrust washers are being used, install them into their original locations.**

1. Lubricate all differential components with axle lubricant.
2. Install differential side gears (2) and thrust washers through differential window (1).

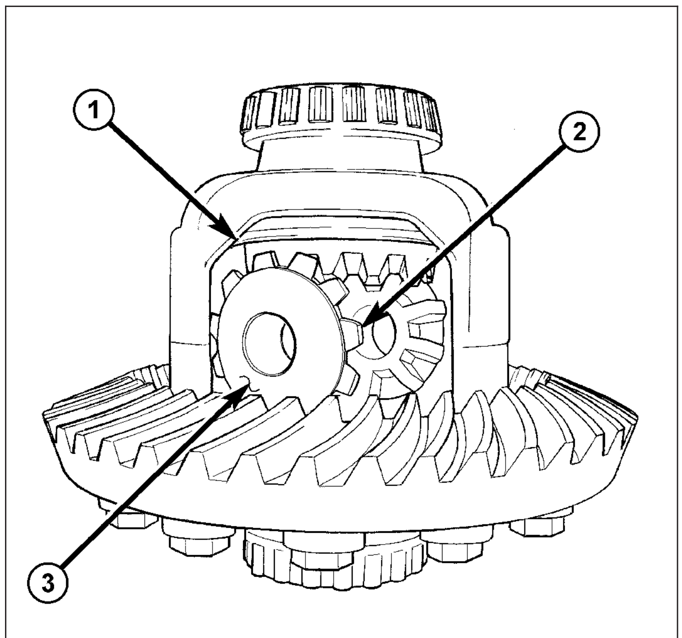


3. Install first pinion gear (3) with thrust washer into differential window (1) and side gears (2). Rotate pinion gear into the case.



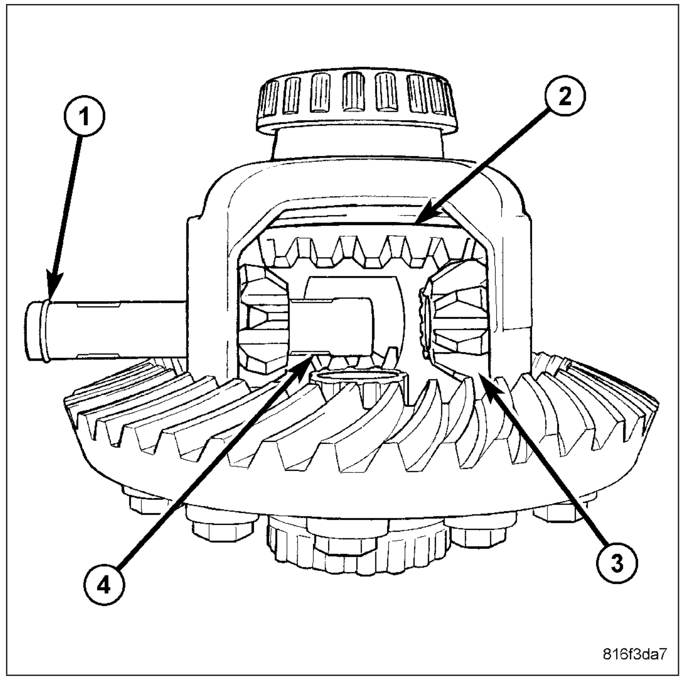
816f3e23

4. Install remaining pinion gear (2) and thrust washer (3). Rotate gears to align hole in the pinion gears with hole in the differential case.



816f3cb7

5. Slide pinion shaft (1) into the case and through the pinion gears (3) to align the gears.

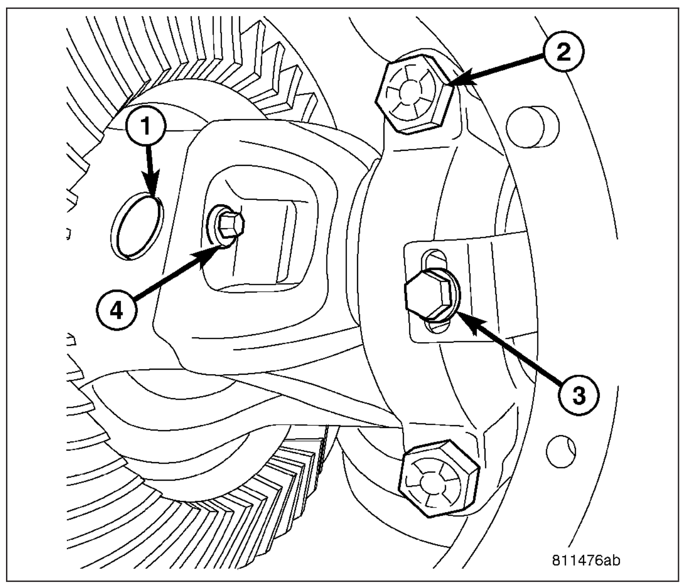


## INSTALLATION

1. Apply a coat of hypoid gear lubricant to differential bearings, bearing cups and threaded adjusters.

**NOTE: Grease can be used to keep the adjusters in position.**

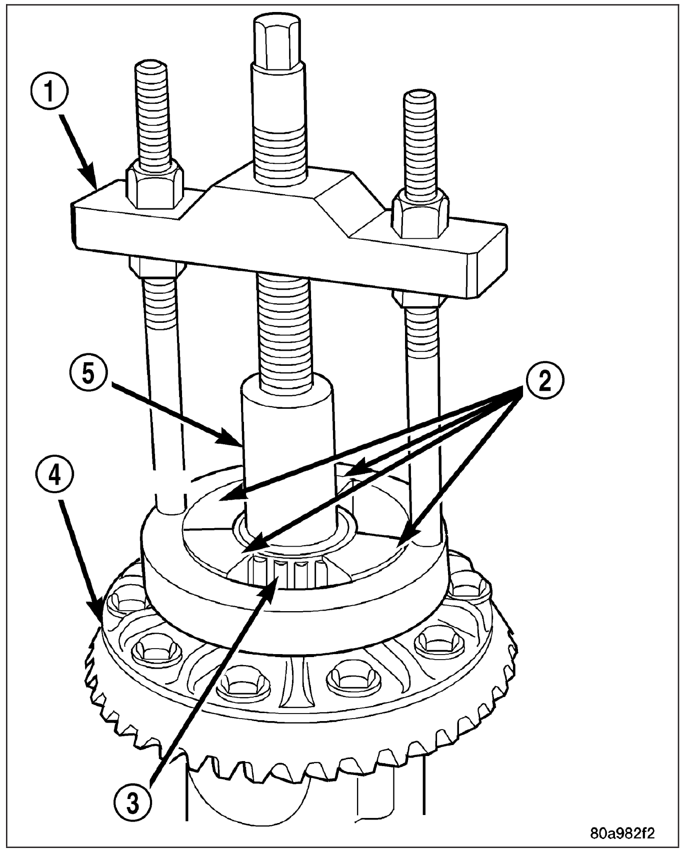
2. Install differential assembly into the housing.
3. Install differential bearing caps in their original locations.
4. Install bearing cap bolts (2) and tighten upper bolts to 14 N·m (10 ft. lbs.). Tighten lower bolts finger-tight until bolt head is seated.
5. Perform differential bearing preload and adjustment procedure.
6. Tighten bearing cap bolts in a criss-cross pattern to 95 N·m (70 ft. lbs.).
7. Install adjuster locks (3) on bearing caps and tighten to 10 N·m (90 in. lbs.).
8. Install axle shafts.
9. Install differential cover.



# BEARING-DIFFERENTIAL CASE

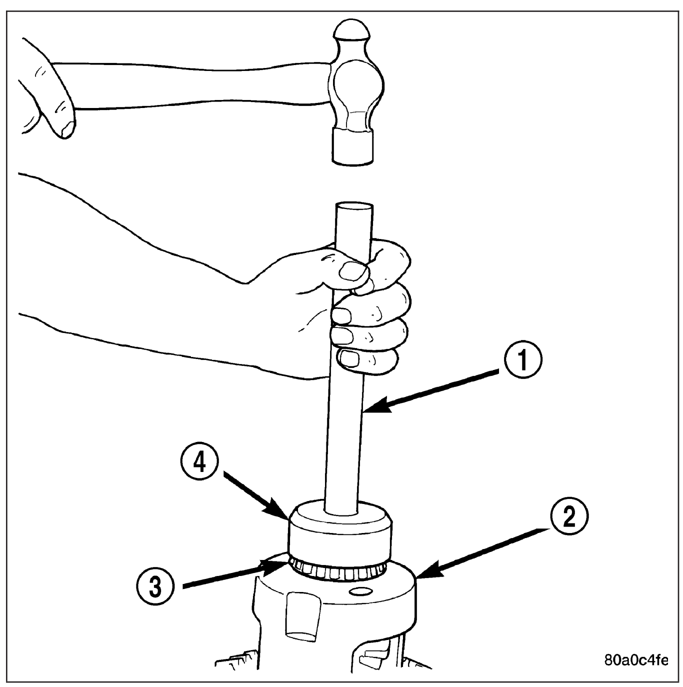
## REMOVAL

1. Remove differential case from axle.
2. Remove differential bearings (3) from the case with Puller/Press C-293-PA (1) and Adapters C-293-48 (2) and Plug SP-3289 (5).



## INSTALLATION

1. Install differential (2) bearings (3) with Installer C-4340 (4) and Handle C-4171(1).
2. Install differential case in axle.

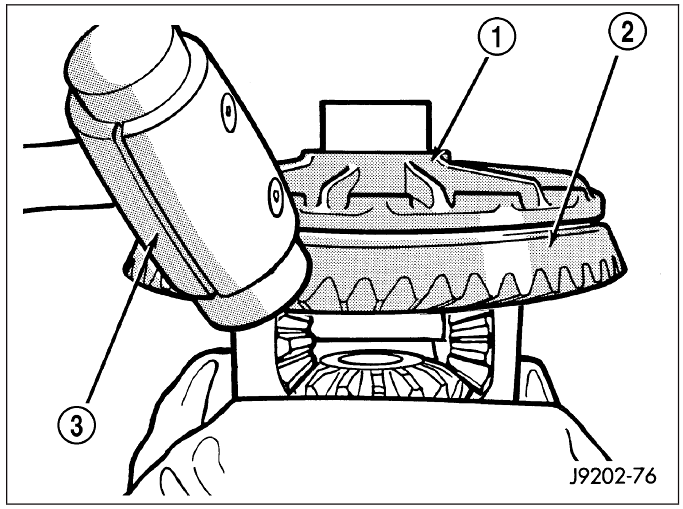


# GEAR-PINION/RING

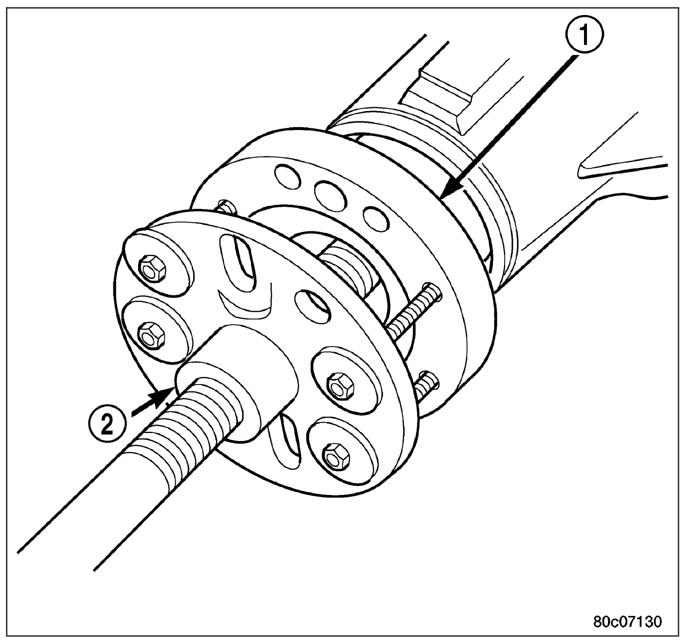
## REMOVAL

**NOTE: The ring and pinion gears are serviced in a matched set. Never replace one gear without replacing the other matched gear.**

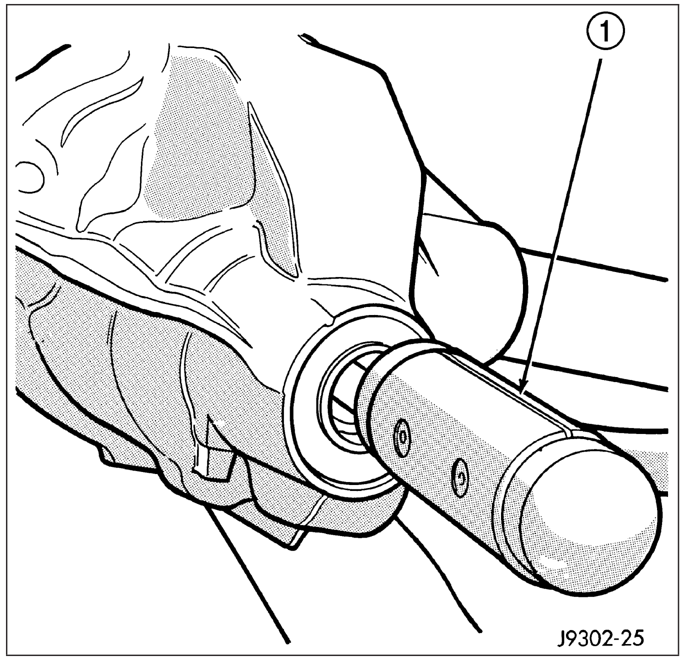
1. Remove differential from axle housing.
2. Place differential case (1) in a vise with soft metal jaw.
3. Remove bolts holding ring gear (2) to differential case.
4. Drive ring gear from differential case with a dead-blow hammer (3).



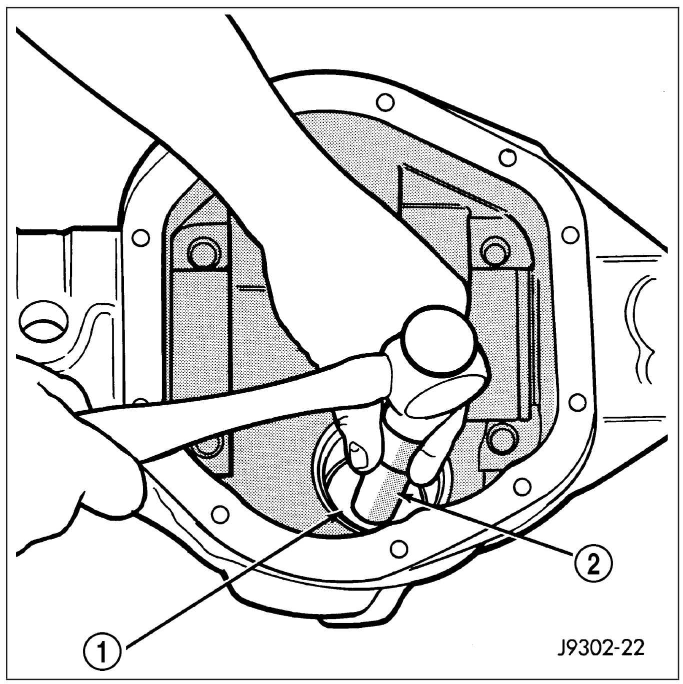
5. Hold flange (1) with Holder 6719A and remove flange nut and washer.
6. Remove flange (1) from pinion shaft with Puller C-452 (2).



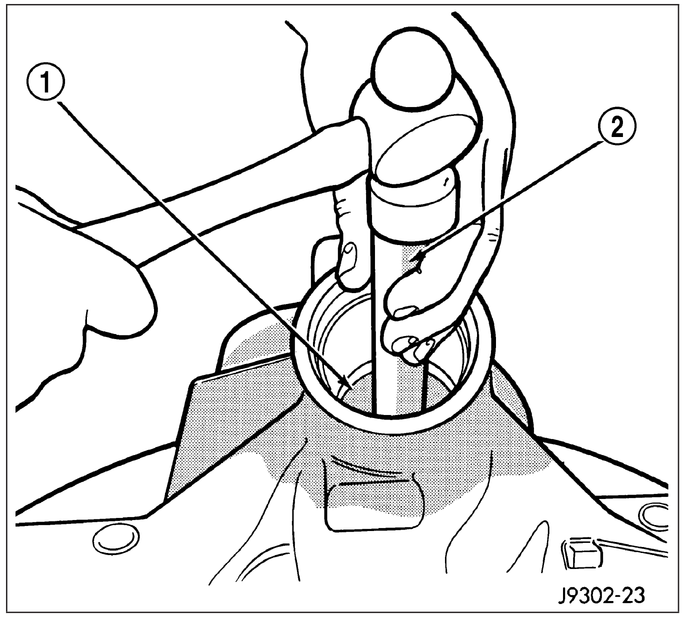
7. Remove pinion from the housing with dead-blow hammer (1).
8. Remove pinion shaft seal with a seal pick.
9. Remove oil slinger, if equipped, and front pinion bearing.



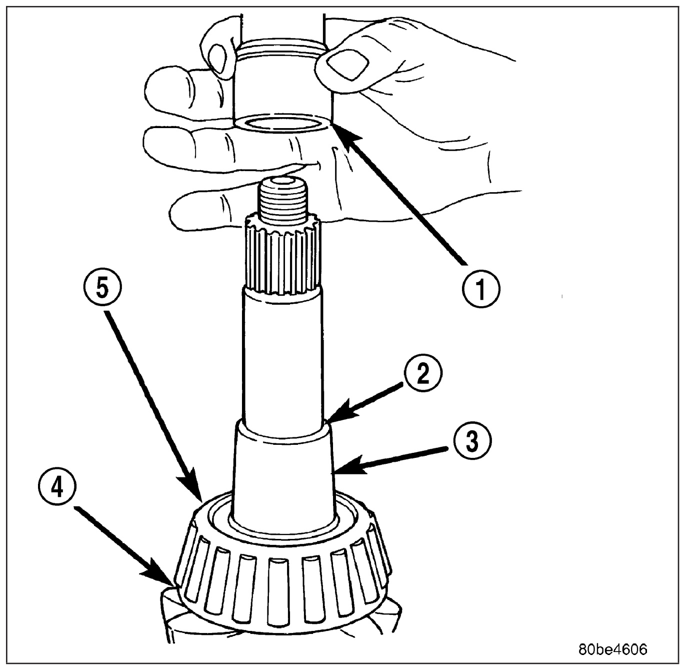
10. Remove front pinion bearing cup with Remover C-4345 (1) and Handle C-4171 (2).



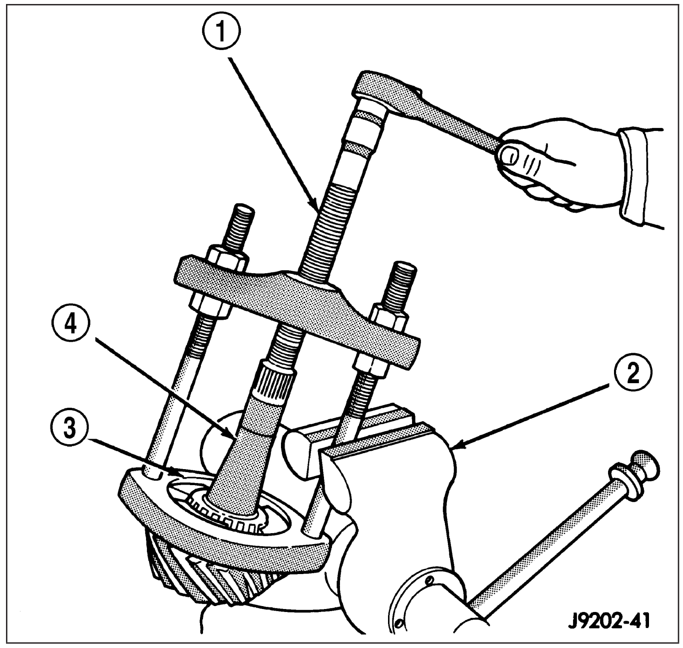
11. Remove rear bearing cup with Remover C-4307 (1) and Handle C-4171 (2).



12. Remove collapsible spacer (1) from pinion (3).



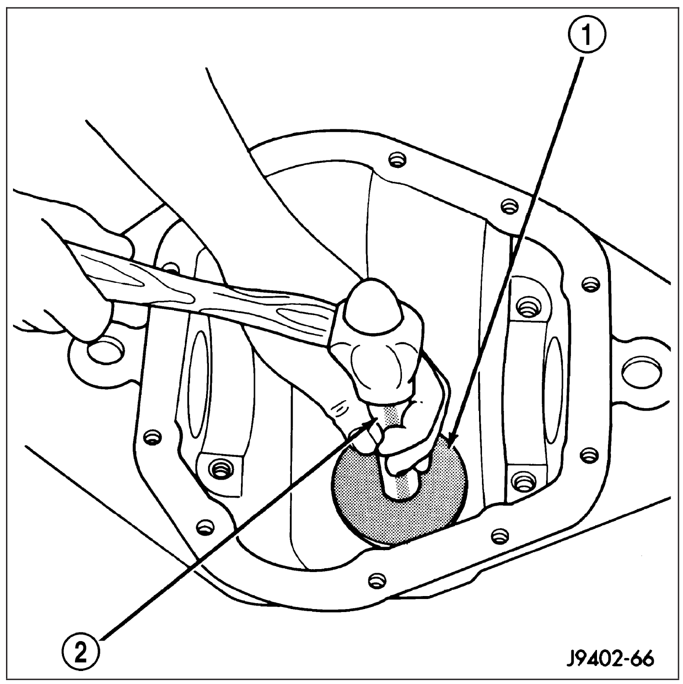
13. Remove rear pinion bearing with Puller/Press C-293-PA (1) and Adapters C-293-47 (3).
14. Remove depth shims from the pinion shaft and record the shims thickness.



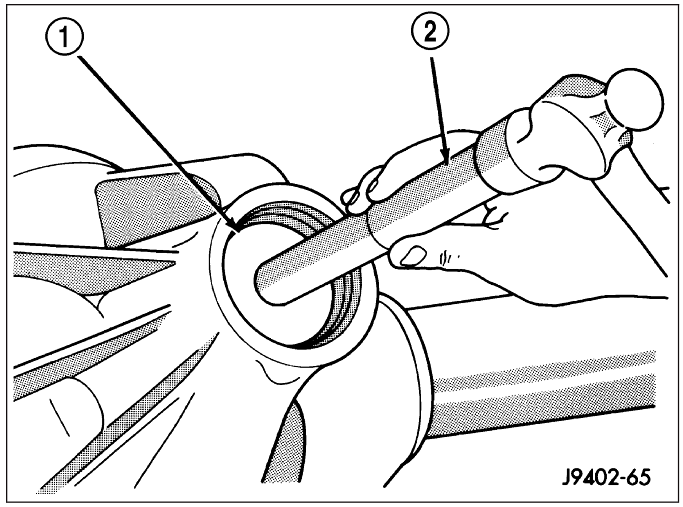
## INSTALLATION

**NOTE: A pinion depth shim/oil baffle is located under the rear pinion bearing. If ring and pinion gears are reused, the original pinion depth shim/oil baffle can be used. Refer to Adjustments (Pinion Gear Depth) to select the proper shim thickness if ring and pinion gear are replaced.**

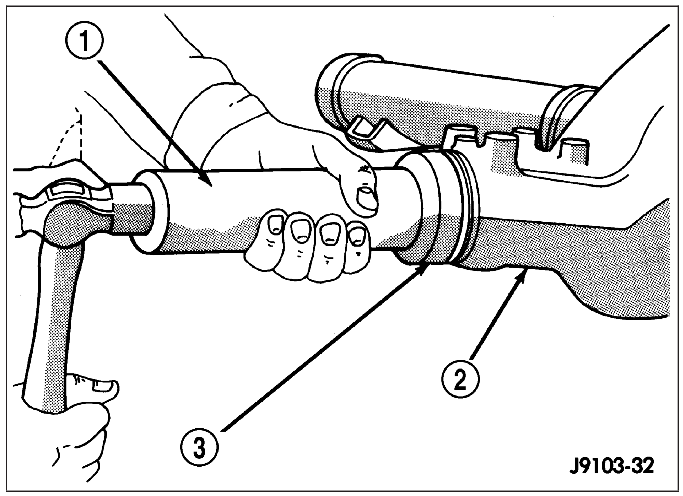
1. Install rear pinion bearing cup with Installer C-4308 (1) and Handle C-4171 (2).



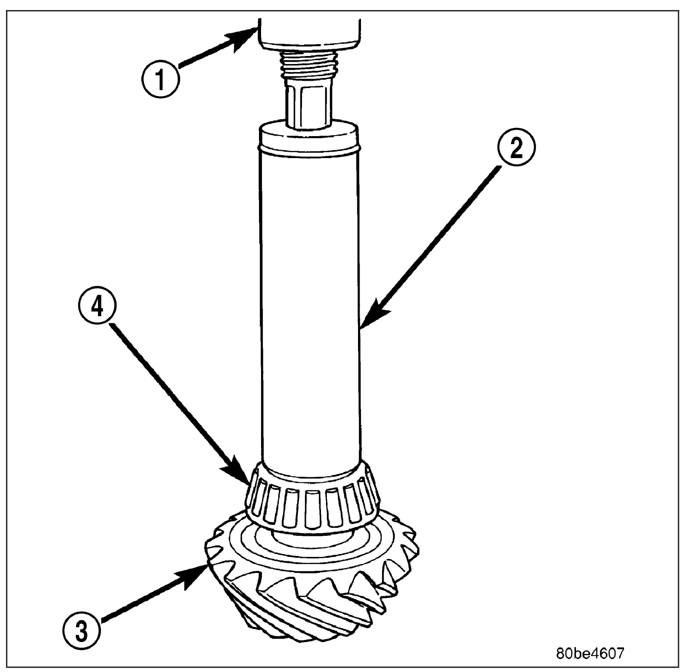
2. Install front pinion bearing cup with Installer D-130 (1) and Handle C-4171 (2).



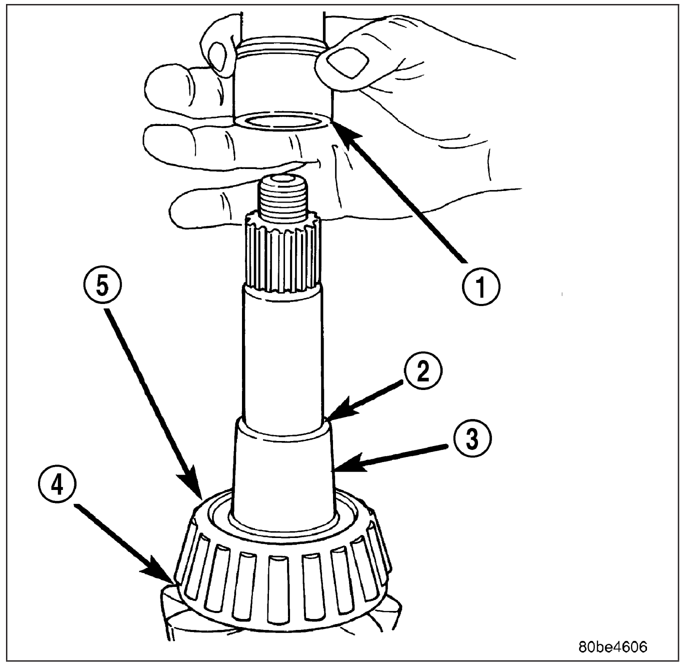
3. Install pinion front bearing and oil slinger, if equipped.
4. Apply a light coating of gear lubricant on the lip of pinion seal and install seal with Installer C-4076-B (3) and Handle C-4735 (1).



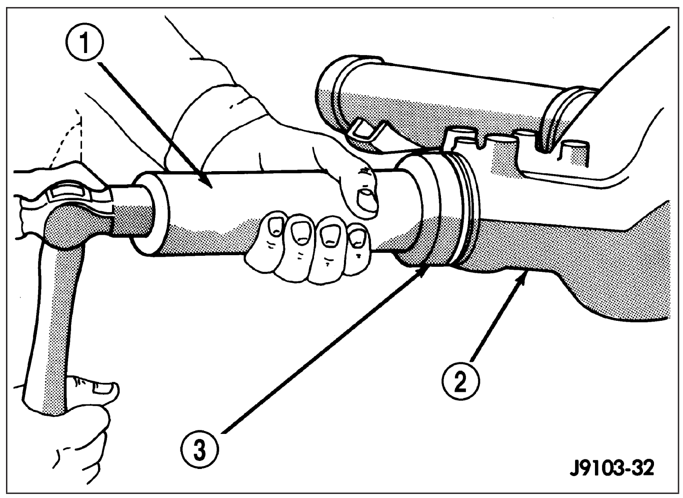
5. Place pinion depth shim on the pinion.
6. Install rear bearing (4) on pinion gear (3) and slinger if equipped, with Installer 6448A (2) and a press (1).



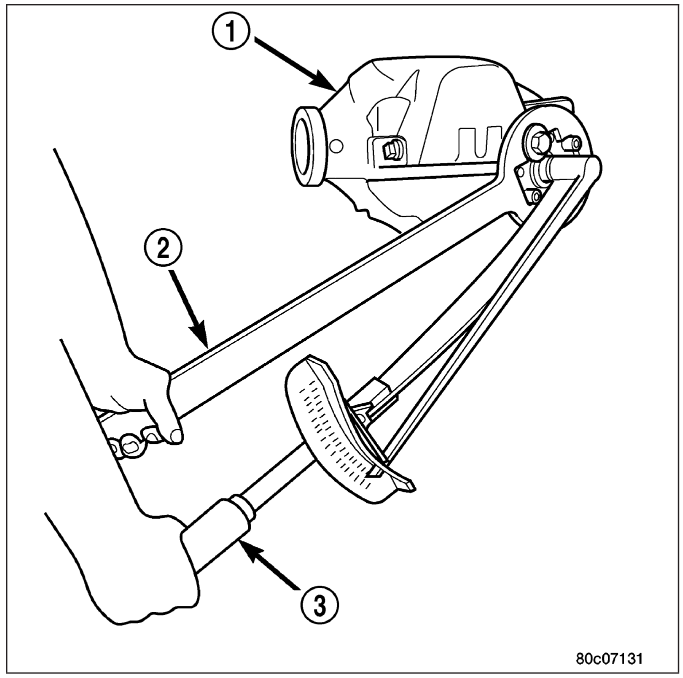
7. Install a **new** collapsible spacer (1) on pinion shaft (3) and install pinion in housing.



8. Install new pinion seal with Installer C-4076-B (3) and Handle C-4735 (1).

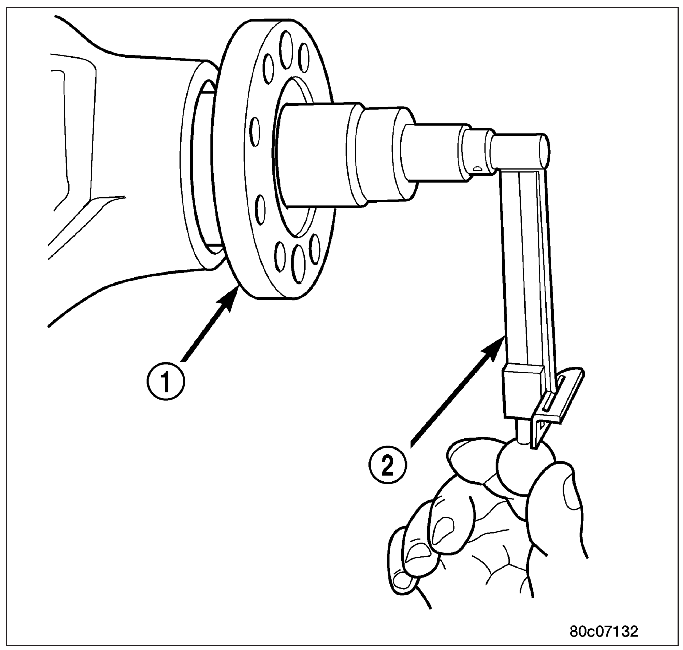


9. Install companion flange with Installer C-3718 and Holder 6719A.
10. Install flange washer and a new nut on the pinion. The convex side of the washer must face outward.
11. Holding flange with Holder 6719A (2) and tighten nut with torque wrench (3) to 285 N·m (210 ft. lbs.).



**CAUTION: Never loosen pinion nut to decrease pinion rotating torque and never exceed specified preload torque. Failure to heed caution may result in damage.**

12. Hold flange with Holder 6719A and slowly tighten the nut in 6.8 N·m (5 ft. lbs.) increments until the desired Torque To Rotating is achieved. Measure rotating torque frequently to avoid over crushing the spacer.
13. Check pinion (1) Torque To Rotating with an inch pound torque wrench (2). The pinion Torque To Rotating is:
   - Original Bearings: 1 to 2 N·m (10 to 20 in. lbs.).
   - New Bearings: 1 to 5 N·m (10 to 30 in. lbs.).



14. Install ring gear (3) on differential case (4) and start two ring gear bolts (2).
15. Invert differential case in the vise.
16. Install **new** ring gear bolts and alternately tighten to 102 N·m (75 ft. lbs.).

**CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions will result in damage.**

17. Install differential in axle housing and verify gear mesh refer to Adjustments (Gear Contact Pattern).

### ENGINE

| Component | Fluid, Lubricant, or Genuine Part |
|---|---|
| Engine Coolant | Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology) |
| Engine Oil (3.7L Engines) | Use API Certified SAE 5W-30 Engine Oil, meeting the requirements of DaimlerChrysler Material Standard MS-6395. |
| Engine Oil (2.8L Diesel Engines) | Use SAE 0W-40 Synthetic Engine Oil that meets API Categories SL/CF, and the requirements of DaimlerChrysler Material Standard MS-10725. If SAE 0W-40 is not available, SAE 5W-40 Synthetic Engine Oil is acceptable. |
| Oil Filter (3.7L Engine) | Mopar® Oil Filter (P/N 4781452AA or 4781452BB) |
| Oil Filter (2.8L Diesel Engine) | Mopar® Oil Filter (P/N 05072720AA) |
| Spark Plugs | Refer to the Vehicle Emission Control Information label in the engine compartment. |
| Fuel Selection (Gasoline Engines Only) | 87 Octane (89 Octane should be used for trailer towing purposes - 3.7L Only). |

### ENGINE - EXPORT

| Component | Fluid, Lubricant, or Genuine Part |
|---|---|
| Engine Coolant | Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology) |
| Engine Oil - Gasoline (Non ACEA Categories) | For best performance and maximum protection under all types of operating conditions, the manufacture only recommends engine oils that are API certified and meet the requirements of DaimlerChrysler Material Standard MS-6395. Use Mopar or an equivalent oil meeting the specification MS-6395. These Certified Oils exhibit the American Petroleum Institute (API) Engine Oil Certification Symbol on the front of the oil container. This symbol means that the oil has been tested, certified, and licensed by the American Petroleum Institute (API) to meet the oil standards required by the manufacturers. The manufacturer only recommends API Certified engine oils that meet the requirements of DaimlerChrysler Material Standard MS-6395. |
| Engine Oil - Gasoline (ACEA Categories) | For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A3/B3, A3/B4 or A5/B5. |
| Engine Oil - Diesel | Use only Diesel Engine Oils confirming to API (American Petroleum Institute) Quality CH-3 or CH-4. For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A3/B3 or A3/B4. |
| Oil Filter (3.7L Engine) | Mopar® Oil Filter (P/N 04781452AA or 04781452BB) |
| Oil Filter (2.8L Diesel Engine) | Mopar® Oil Filter (P/N 05072720AA) |
| Spark Plugs | Refer to the Vehicle Emission Control Information label in the engine compartment. |
| Fuel Selection (Gasoline Engines) | 91 Octane |

## Chassis

| Component | Fluid, Lubricant, or Genuine Part |
|---|---|
| Automatic Transmission | Mopar® ATF+4 Automatic Transmission Fluid |
| Manual Transmission | Mopar® Manual Transmission Lubricant or equivalent (meeting the requirements of DaimlerChrysler Material Standard MS-9224) |
| Transfer Case | Mopar® ATF+4 Automatic Transmission Fluid |
| Axle Differential (Front) | Mopar® Gear & Axle Lubricant (SAE 80W-90) or equivalent. |
| Axle Differential (Rear) | Mopar® Synthetic Gear Lubricant (SAE 75W-90) or equivalent. For trailer towing, the lubricant should be replaced with Mopar® Synthetic Gear & Axle Lubricant (SAE 75W-140) or equivalent.<br>Models equipped with Trac-Lok™ require a limited-slip additive. |
| Brake Master Cylinder | Mopar® DOT 3 Brake Fluid, SAE J1703 should be used. If DOT 3, SAE J1703 brake fluid is not available, then DOT 4 is acceptable. Use only recommended brake fluids. |
| Power Steering Reservoir | Mopar® ATF+4 Automatic Transmission Fluid |

## CHASSIS - EXPORT

| Component | Fluid, Lubricant, or Genuine Part |
|---|---|
| Automatic Transmission | Mopar® ATF+4 Automatic Transmission Fluid |
| Manual Transmission | Mopar® Manual Transmission Lubricant (P/N 04874464). |
| Transfer Case | Mopar® ATF+4 Automatic Transmission Fluid. |
| Axle Differential (front-rear) | Mopar® SAE 75W-140 (API GL5) Synthetic Gear Lubricant or equivalent. The 8.25 Corporate Rear Axle should use a SAE 75W-90 Gear Lubricant. For trailer towing, the lubricant should be replaced with SAE 75W-140 Synthetic Gear Lubricant.<br>Models equipped with Trac-Lok™ require a friction modifier additive. |
| Brake Master Cylinder | Mopar® Brake Fluid DOT 3 Motor Vehicle. If Mopar® brake fluid conforming to SAE J1703 standards is not available, then DOT 4 or DOT 4+ brake fluid is acceptable. |
| Power Steering Reservoir | Mopar® ATF+4 Automatic Transmission Fluid |
| Ball Joints, Prop Shafts, U-Joints, Yokes, & Wheel Bearings | Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB |

## CAPACITIES

| DESCRIPTION | U.S. | Metric |
|---|---|---|
| **Fuel (Approximate)** | 20.5 Gallons | 78 Liters |
| **Engine Oil with Filter** | | |
| 3.7 Liter Engines (SAE 5W-30, API Certified Engine Oil) | 5 Qts | 4.7 Liters |
| 2.8 Liter Diesel Engine (SAE 0W-40 Synthetic Engine Oil) | 6.4 Qts | 6.1 Liters |
| **Cooling System *** | | |
| 3.7 Liter Engine (Mopar® Antifreeze/Coolant 5 Year/100,000 Mile Formula) | 14 Qts | 13.2 Liters |
| 2.8 Liter Diesel Engine (Mopar® Antifreeze/Coolant 5 Year/ 100,000 Mile Formula) | 13 Qts | 12.5 Liters |
| * Includes heater and coolant recovery bottle filled to MAX level. | | |

# FUSE LOCATIONS & TYPES

## SPECIFICATIONS

## FUSE PANEL

### Interior Fuses

The fuse panel is on the left side of the instrument panel. A label is attached to the fuse panel cover to identify each fuse for ease of replacement.

| Cavity | Fuse | Description |
|---|---|---|
| 1 | 15 Amp<br>Blue | Horn Relay, Power Sunroof Relay, Power Window Relay |
| 2 | 10 Amp<br>Red | Rear Fog Lights (Export Only) |
| 3 | 20 Amp<br>Yellow | Cigar Lighter |
| 4 | 10 Amp<br>Red | Headlight Low Beam Right |
| 5 | 10 Amp<br>Red | Headlight Low Beam Left |
| 6 | 20 Amp<br>Yellow | Body Control Module/Power Door Locks |
| 7 | 10 Amp<br>Red | Left Park Light/Left Tail Lamp/License Plate Lamp |
| 8 | Spare | |
| 9 | 10 Amp<br>Red | Right Park Light/RightTail Lamp/License Plate Lamp/Cluster |
| 10 | Spare | |
| 11 | 15 Amp<br>Blue | Flasher |
| 12 | 15 Amp<br>Blue | Stop Lights |
| 13 | 10 Amp<br>Red | Body Control Module/CMTC/Cluster/Pass. Airbag On,Off Indicator, Auto Daylight Mirror/Light Bar Switch (Renegade Only) |
| 14 | 10 Amp<br>Red | PDC Fuel Pump/AC Clutch, Starter Relay/Engine Controller/ Transmission Controller (Diesel Only) |
| 15 | Spare | |
| 16 | 20 Amp<br>Yellow | Power Outlet (Rear) |
| 17 | 15 Amp<br>Blue | Rear Wiper |
| 18 | 20 Amp<br>Yellow | Radio Choke & Relay |
| 19 | 20 Amp<br>Yellow | Frt Fog Lights/Trailer Tow Stop and Turn Lights |
| 20 | Spare | |
| 21 | 10 Amp<br>Red | Radio |

| Cavity | Fuse | Description |
|---|---|---|
| 22 | 20 Amp<br>Yellow | Power Sunroof Relay/Antenna Module (Export Only) |
| 23 | Spare | |
| 24 | 10 Amp<br>Red | PDC Blower Motor |
| 25 | 10 Amp<br>Red | Heated Seat Switches/HVAC Control Head/Trailer Tow Battery Charge |
| 26 | 10 Amp<br>Red | Headlight High Beam Right |
| 27 | 10 Amp<br>Red | Headlight High Beam Left |
| 28 | Spare | |
| 29 | 10 Amp<br>Red | Heated Mirrors/Rear Window Defroster Indicator |
| 30 | 15 Amp<br>Blue | Heated Seat Module |
| 31 | Spare | |
| 32 | 10 Amp<br>Red | Wiper Switch/Front and Rear Wipers |
| 33 | 10 Amp<br>Red | SKIM Module/Data Link Connector |
| 34 | 15 Amp<br>Blue | Body Control Module/Cluster/Interior Lights, Hands Free Module/Radio/CMTC/ITM Module & Siren (Export Only) |
| 35 | Spare | |
| 36 | 10 Amp<br>Red | Airbag Control Module/Occupation Classification Module (Right Front Seat) |
| 37 | 10 Amp<br>Red | Airbag Control Module |
| 38 | 10 Amp<br>Red | ABS Controller/Shifter Assembly |
| 39 | 10 Amp<br>Red | Hazard Flasher (Turn Signals)/Backup Lamp Switch (Manual Transmission Only)/Transmission Range Switch (Automatic Transmission Only) |

## Underhood Fuses (Power Distribution Center)

Your vehicle is equipped with an electrical power distribution center located in the engine compartment near the battery. This power center houses plug-in “Cartridge” fuses which replace in-line fusible links. The power center also contains “Mini” fuses and plug-in full and micro ISO relays. A label inside the latching cover of the center identifies each component for ease of replacement, if necessary. “Cartridge” fuses and relays can be obtained from your authorized dealer.

# MAINTENANCE SCHEDULES

## DESCRIPTION

## MAINTENANCE SCHEDULES - GASOLINE ENGINES

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule ″**B**″. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32°F (0°C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Trailer towing.
- Heavy loading.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.
- If equipped for and operated with E-85 (ethanol) fuel.

**NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow "Schedule B" of the "Maintenance Schedules" section of this manual.**

**NOTE: If ANY of these apply to you then flush and replace your engine coolant/anti-freeze every 102,000 miles (163 000 km) or 60 months, whichever comes first, and follow "Schedule B" of the "Maintenance Schedules" section of this manual.**

**NOTE: Most vehicles are operated under the conditions listed for Schedule "B."**

Second is Schedule **"A".** It is for vehicles that are not operated under any of the conditions listed under Schedule "B."

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

***At Each Stop for Fuel***

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

***Once a Month***

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of the engine coolant/anti-freeze reservoir, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

***At Each Oil Change***

- Change the engine oil filter.
- Inspect the exhaust system.

- Inspect brake hoses.
- Check the engine coolant/anti-freeze level, hoses, and clamps.
- Inspect manual transmission fluid level — if equipped.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

## Schedule “B”

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 32°F (0°C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Trailer towing.
- Heavy loading.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.
- If equipped for and operated with E-85 (ethanol) fuel.

**NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow “Schedule B” of the “Maintenance Schedules” section of this manual.**

**NOTE: If ANY of these apply to you then flush and replace your engine coolant/anti-freeze every 102,000 miles (163 000 km) or 60 months, whichever comes first, and follow “Schedule B” of the “Maintenance Schedules” section of this manual.**

|---|---|---|---|---|---|
| Inspect the brake linings. | X | | | | X |
| Drain and refill the front and rear axle fluid‡ | | | | | X |
| Inspect the manual transmission fluid, add as necessary. | | | | | X |
| Drain and refill the automatic transmission fluid, replace main sump filter, and spin-on cooler return filter (if equipped).† | | | | | X |
| Inspect the drive belt and replace as needed. Not required if belt was previously replaced. | | | | | X |
| Drain and refill the transfer case fluid. | | | | | X |
| Flush and replace the engine coolant/anti-freeze at 120 months, if not replaced at 102,000 miles (170 000 km). | | | | | X |

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

† Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

◊ This maintenance is recommended by the manufacturer to the owner, but it is not required to maintain emissions warranty.

‡Off-highway operation, trailer towing, taxi, limousine, bus, snow plowing, or other types of commercial service or prolonged operation with heavy loading, especially in hot weather, require front and rear axle service indicated with a ‡ in Schedule "B". Perform these services if the vehicle is usually operated under these conditions.

## Schedule "A"

| Miles (Kilometers) [Months] | 6,000 (10 000) [6] | 12,000 (20 000) [12] | 18,000 (30 000) [18] | 24,000 (40 000) [24] | 30,000 (50 000) [30] |

|---|---|---|---|
| Inspect the manual transmission fluid, add as necessary. | | | X |
| Drain and refill the transfer case fluid. | | | X |

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

◊ This maintenance is recommended by the manufacturer to the owner, but it is not required to maintain emissions warranty.

## MAINTENANCE SCHEDULES - DIESEL ENGINE

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule ″**B**″. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32°F (0°C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Trailer towing.
- Heavy loading.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

**NOTE: Most vehicles are operated under the conditions listed for Schedule "B."**

Second is Schedule **"A"**. It is for vehicles that are not operated under any of the conditions listed under Schedule "B."

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

### *At Each Stop for Fuel*

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

### *Once a Month*

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, clean and tighten the terminals as required.
- Check the fluid levels of engine coolant/anti-freeze deaeration bottle, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

### *At Each Oil Change*

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the engine coolant/anti-freeze level, hoses, and clamps.
- Inspect engine accessory drive belts. Replace as necessary.

- Inspect for the presence of water in the fuel filter/water separator unit.

***Tire Rotation***

- Rotate the tires every 6,250 miles (10 000 km).

## Schedule “B”

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 32°F (0°C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C).
- Trailer towing.
- Heavy loading.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

| **Miles (Kilometers)** | **6,250 (10 000)** | **12,500 (20 000)** | **18,750 (30 000)** | **25,000 (40 000)** | **31,250 (50 000)** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | | X | | X |
| **Replace the engine air filter element.** | | X | | X | |
| Inspect the boost pressure solenoid filter. Replace as necessary. | X | X | X | X | X |
| Replace the fuel filter/water separator unit. | | | | X | |
| Inspect the brake linings. | | X | | X | |
| Drain and refill the front and rear axle fluid. | | X | | X | |

| **Miles (Kilometers)** | **37,500 (60 000)** | **43,750 (70 000)** | **50,000 (80 000)** | **56,250 (90 000)** | **62,500 (100 000)** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | | X | | X | |
| **Replace the engine air filter element.** | X | | X | | X |
| Inspect the boost pressure solenoid filter. Replace as necessary. | X | X | X | X | X |
| Replace the boost pressure solenoid filter, if not previously replaced. | | | X | | |
| Replace the fuel filter/water separator unit. | | | X | | |
| Replace the engine accessory drive belt. | X | | | | |
| Inspect the brake linings. | X | | X | | X |
| Drain and refill the front and rear axle fluid. | X | | X | | X |
| Drain and refill the transfer case fluid. | | | | | X |
| Inspect the manual transmission fluid, add as necessary. | | | | | X |

| **Miles** **(Kilometers)** | **37,500 (60 000)** | **43,750 (70 000)** | **50,000 (80 000)** | **56,250 (90 000)** | **62,500 (100 000)** |
|---|---|---|---|---|---|
| Drain and refill the automatic transmission fluid, replace sump filter, and spin-on cooler return filter (if equipped). ♢ | | | | | X |

| **Miles** **(Kilometers)** | **68,750 (110 000)** | **75,000 (120 000)** | **81,250 (130 000)** | **87,500 (140 000)** | **93,750 (150 000)** | **100,000 (160 000)** |
|---|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | | X | | X | |
| **Replace the engine air filter element.** | | X | | X | | X |
| Inspect the boost pressure solenoid filter. Replace as necessary. | X | X | X | X | X | X |
| Replace the boost pressure solenoid filter, if not previously replaced. | | | | | | X |
| Replace the engine accessory drive belt.* | | X | | | | |
| Replace the engine timing belt and idler pulleys. | | | | | | X |
| Inspect the engine timing belt tensioner, replace if necessary.† | | | | | | X |
| Replace the fuel filter/water separator unit. | | X | | | | X |
| Flush and replace the engine coolant/anti-freeze. | | | | | | X |
| Inspect the brake linings. | | X | | X | | |
| Drain and refill the front and rear axle fluid. | | X | | X | | |

♢ Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

† The replacement of such component is requested if there is superficial wear, bearing clearance, or evident grease leak.

* This maintenance is not required if the belt was previously replaced.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

## Schedule "A"

| **Miles** **(Kilometers)** | **12,500 (20 000)** | **25,000 (40 000)** | **37,500 (60 000)** | **50,000 (80 000)** |
|---|---|---|---|---|

| Replace the engine accessory drive belt. | X | | | |
| Inspect the brake linings. | | X | | X |
| Inspect the transmission fluid, add as necessary. | X | | | |
| Inspect the transfer case fluid. | X | | | |

† The replacement of such component is requested if there is superficial wear, bearing clearance, or evident grease leak.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

## MAINTENANCE SCHEDULES - GASOLINE ENGINES - EXPORT

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **"A".** It is for vehicles that are not operated under any of the conditions listed under Schedule "B."

Second is Schedule **″B″.** It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

Most vehicles are operated under the conditions listed for Schedule "B."

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

***At Each Stop for Fuel***

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

***Once a Month***

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

***At Each Oil Change***

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the coolant level, hoses, and clamps.
- Inspect manual transmission fluid level — if equipped.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

## Schedule “A”

| **Kilometers (Miles) [Months]** | **12 000 (7,500) [6]** | **24 000 (15,000) [12]** | **36 000 (22,500) [18]** | **48 000 (30,000) [24]** | **60 000 (37,500) [30]** |

| Drain and refill the front and rear axle fluid‡ | | | | | X |
| Drain and refill the automatic transmission fluid, and replace main sump filter. | | | | | X |
| Inspect the drive belt and replace as needed. Not required if belt was previously replaced. | | | | | X |
| Drain and refill the transfer case fluid. | | | | | X |

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

◊ This maintenance is recommended by the manufacturer to the owner, but it is not required to maintain emissions warranty.

‡Off-highway operation, trailer towing, taxi, limousine, bus, snow plowing, or other types of commercial service or prolonged operation with heavy loading, especially in hot weather, require front and rear axle service indicated with a ‡ in Schedule “B”. Perform these services if the vehicle is usually operated under these conditions.

## DESCRIPTION – DIESEL ENGINES – EXPORT SCHEDULES

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **“A”**. It is for vehicles that are not operated under any of the conditions listed under Schedule ″B″.

Second is Schedule **“B”**. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

Most vehicles are operated under the conditions listed for Schedule ″B″.

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

### *At Each Stop for Fuel*

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

***Once a Month***

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

***At Each Oil Change***

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the engine coolant/anti-freeze level, hoses, and clamps.
- Inspect engine accessory drive belts. Replace as necessary.
- Inspect for the presence of water in the fuel filter/water separator unit.

***Tire Rotation***

- Rotate the tires every 10 000 km (6,000 miles).

## Schedule "A"

| **Kilometers**<br>**(Miles)** | **20 000**<br>**(12,500)** | **40 000**<br>**(25,000)** | **60 000**<br>**(37,500)** | **80 000**<br>**(50,000)** |
|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X |
| **Replace the engine air filter element.** | | X | | X |
| Replace the fuel filter/water separator unit. | | X | | X |
| Inspect the brake linings. | | X | | X |
| Inspect the transfer case fluid. | X | | | |

| **Kilometers**<br>**(Miles)** | **100 000**<br>**(62,500)** | **120 000**<br>**(75,000)** | **140 000**<br>**(87,500)** | **160 000**<br>**(100,000)** |
|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X |
| **Replace the engine air filter element.** | | X | | X |
| Replace the fuel filter/water separator unit. | | X | | X |
| Replace the engine timing belt, and idler pulleys. | | | | X |
| Inspect the engine timing belt tensioner, replace if necessary. ◊ | | | | X |
| Flush and replace the engine coolant. | X | | | |
| Replace the engine accessory drive belt. | X | | | |
| Inspect the brake linings. | | X | | X |
| Inspect the transfer case fluid. | X | | | |

Inspection and service should also be performed anytime a malfunction is observed or suspected.

‡ Replace if there is superficial wear, bearing clearance, or evident grease leak.

**WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**

## Schedule "B"

Follow schedule "B" if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0°C (32°F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32°C (90°F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert driving.

| **Kilometers (Miles)** | **10 000 (6,250)** | **20 000 (12,500)** | **30 000 (18,750)** | **40 000 (25,000)** | **50 000 (31,250)** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X | X |
| **Replace the engine air filter element.** | | X | | X | |
| Replace the fuel filter/water separator unit. | | | | X | |
| Inspect the brake linings. | | X | | X | |
| Drain and refill the front and rear axle fluid. | | X | | X | |

| **Kilometers (Miles)** | **60 000 (37,500)** | **70 000 (43,750)** | **80 000 (50,000)** | **90 000 (56,250)** | **100 000 (62,500)** |
|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X | X |
| **Replace the engine air filter element.** | X | | X | | X |
| Replace the fuel filter/water separator unit. | | | X | | |
| Replace the engine accessory drive belt. | X | | | | |
| Inspect the brake linings. | X | | X | | X |
| Drain and refill the front and rear axle fluid. | X | | X | | X |
| Drain and refill the transfer case fluid. | | | | | X |
| Drain and refill the automatic transmission fluid, and replace sump filter. ◊ | | | | | X |

| **Kilometers (Miles)** | **110 000 (68,750)** | **120 000 (75,000)** | **130 000 (81,250)** | **140 000 (87,500)** | **150 000 (93,750)** | **160 000 (100,000)** |
|---|---|---|---|---|---|---|
| Change the engine oil and engine oil filter. | X | X | X | X | X | X |
| **Inspect the engine air filter element. Replace as necessary.** | X | X | X | X | X | X |
| **Replace the engine air filter element.** | | X | | X | | X |
| Replace the engine accessory drive belt. | | X | | | | |
| Replace the engine timing belt and idler pulleys. | | | | | | X |
| Inspect the engine timing belt tensioner, replace if necessary.† | | | | | | X |
| Replace the fuel filter/water separator unit. | | X | | | | X |

| **Kilometers** <br> **(Miles)** | **110 000** <br> **(68,750)** | **120 000** <br> **(75,000)** | **130 000** <br> **(81,250)** | **140 000** <br> **(87,500)** | **150 000** <br> **(93,750)** | **160 000** <br> **(100,000)** |
|---|---|---|---|---|---|---|
| Flush and replace the engine coolant/anti-freeze. | | | | | | X |
| Inspect the brake linings. | | X | | X | | |
| Drain and refill the front and rear axle fluid. | | X | | X | | |

◊ Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

† The replacement of such component is requested when there is superficial wear, bearing clearance, or evident grease leak.

Inspection and service should be performed anytime a malfunction is observed or suspected. Retain all receipts.

# REPLACEMENT BULBS

## SPECIFICATIONS

## REPLACEMENT LIGHT BULBS - INTERIOR

### SPECIFICATIONS

| LIGHT BULBS — Interior | Bulb Number |
|---|---|
| A/C Heater | Not Serviceable |
| Ashtray Receiver Light | 161 |
| Climate Control (Manual A/C) | 74 |
| Front Reading | 192 |
| Rear Cargo Light | 214–2 |
| Lighted Vanity Mirror * | P/N 6501966 |
| Underpanel Courtesy Lights | 906 |
| Instrument Cluster (General Illumination) | 103 |
| Telltale/Hazard Light | 74 |

* Available only from authorized dealers.

## REPLACEMENT LIGHT BULBS - EXTERIOR

### SPECIFICATIONS

| LIGHT BULBS — Exterior | Bulb Number |
|---|---|
| Backup Lights | 3157 P27/7W |
| Center High-Mounted Stoplight | 921/W16W |
| Fog Lights (Sport/Limited Only) | 9145 |
| Fog Lights (Renegade) | H3 |
| Front Park/Turn Lights | 3157 P27/7W |
| Front Side Marker | 168 |
| Headlights | 9007QL |
| Headlights - EXPORT | H4 |
| Rear License Plate Light | 168 |
| Rear Stop/Tail Lights | 3157 P27/7W |
| Rear Stop/Tail/Fog Lights - EXPORT | 3157 P27/7W |
| Rear Turn Signal Lights (2) | 3757 APY27/7W |

**NOTE: Numbers refer to commercial bulb types that can be purchased from your authorized dealer.**

If a bulb needs to be replaced, visit your authorized dealer.

# TRAILER TOWING

## SPECIFICATIONS

## TRAILER TOWING

In this section you will find safety tips and information on limits to the type of towing you can reasonably do with your vehicle. Before towing a trailer carefully review this information to tow your load as efficiently and safely as possible.

### Common Towing Definitions

The following trailer towing related definitions will assist you in understanding the following information:

**Gross Vehicle Weight Rating (GVWR)**

The GVWR is the total allowable weight of your vehicle. This includes driver, passengers, cargo and tongue weight. The total load must be limited so that you do not exceed the GVWR.

**Gross Trailer Weight (GTW)**

The gross trailer weight (GTW) is the weight of the trailer plus the weight of all cargo, consumables and equipment (permanent or temporary) loaded in or on the trailer in its ″loaded and ready for operation″ condition. The recommended way to measure GTW is to put your fully loaded trailer on a vehicle scale. The entire weight of the trailer must be supported by the scale.

**Gross Axle Weight Rating (GAWR)**

The GAWR is the maximum capacity of the front and rear axles. Distribute the load over the front and rear axles evenly. Make sure that you do not exceed either front or rear GAWR.

**WARNING:**
**It is important that you do not exceed the maximum front or rear GAWR. A dangerous driving condition can result if either rating is exceeded. You could lose control of the vehicle and have an accident.**

**Tongue Weight (TW)**

The downward force exerted on the hitch ball by the trailer. In most cases it should not be less than 10% or more than 15% of the trailer load. You must consider this as part of the load on your vehicle.

**Frontal Area**

The maximum height and maximum width of the front of a trailer.

**Trailer Sway Control**

The trailer sway control is a telescoping link that can be installed between the hitch receiver and the trailer tongue that typically provides adjustable friction associated with the telescoping motion to dampen any unwanted trailer swaying motions while traveling.

**Weight-Carrying Hitch**

A weight-carrying hitch supports the trailer tongue weight, just as if it were luggage located at a hitch ball or some other connecting point of the vehicle. These kind of hitches are the most popular on the market today and they're commonly used to tow small- and medium-sized trailers.

**Weight-Distributing Hitch**

A weight-distributing hitch includes a receiver attached to the tow vehicle, plus a removable hitch head and spring bar assembly that fits into the receiver opening and hook up brackets that connect the spring bars to the trailer frame.

## Trailer Hitch Classification

Your vehicle may be factory equipped for safe towing of trailers weighing over 2,000 lbs (907 kg) with the optional Trailer Tow Prep Package. See your dealer for package content.

The following chart provides the industry standard for the maximum trailer weight a given trailer hitch class can tow and should be used to assist you in selecting the correct trailer hitch for your intended towing condition. Refer to the Trailer Towing Weights (Maximum Trailer Weight Ratings) chart for the Max. GTW towable for your given drivetrain.

| Trailer Hitch Classification | |
|---|---|
| **Class** | **Max. GTW (Gross Trailer Wt.)** |
| Class I - Light Duty | 2,000 lbs (907 kg) |
| Class II - Medium Duty | 3,500 lbs (1587 kg) |
| Class III - Heavy Duty | 5,000 lbs (2268 kg) |
| Class IV - Extra Heavy Duty | 10,000 lbs (4540 kg) |

All trailer hitches should be professionally installed on your vehicle.

## Trailer Towing Weights (Maximum Trailer Weight Ratings)

The following chart provides the maximum trailer weight ratings towable for your given drivetrain.

| Engine/ Transmission | Model | GVWR (Gross Vehicle Wt. Rating) | GCWR (Gross Combined Wt. Rating) | Frontal Area | Max. GTW (Gross Trailer Wt.) | Max. Tongue Wt. (See Note 1) |
|---|---|---|---|---|---|---|
| 3.7L/6-Speed Manual | 4x2 | 5,350 lbs (2 427 kg) | 8,500 lbs (3 855 kg) | 40 ft2 | 3,500 lbs (1 587 kg) | 350 lbs (159 kg) |
| 3.7L/6-Speed Manual | 4x4 | 5,600 lbs (2 540 kg) | 8,750 lbs (3 969 kg) | 40 ft2 | 3,500 lbs (1 587 kg) | 350 lbs (159 kg) |
| 3.7L/ Automatic | 4x2 | 5,350 lbs (2 427 kg) | 7,150 lbs (3 243 kg) | 32 ft2 | 2,000 lbs (907 kg) | 200 lbs (91 kg) |
| 3.7L/ Automatic | 4x4 | 5,600 lbs (2 540 kg) | 7,400 lbs ( 3 356 kg) | 32 ft2 | 2,000 lbs (907 kg) | 200 lbs (91 kg) |
| 3.7L/ Automatic w/ Cooler | 4x2 | 5,350 lbs (2 427 kg) | 9,850 lbs (4 468 kg) | 60 ft2 | 5,000 lbs (2 268 kg) | 500 lbs (227 kg) |
| 3.7L/ Automatic w/Cooler | 4x4 | 5,600 lbs (2 540 kg) | 10,100 lbs (4 581 kg) | 60 ft2 | 5,000 lbs (2 268 kg) | 500 lbs (227 kg) |
| 2.8L Diesel/ Automatic | 4x4 | 5,650 lbs (2 563 kg) | 10,150 lbs (4 604 kg) | 60 ft2 | 5,000 lbs (2 268 kg) | 500 lbs (227 kg) |
| Refer to local laws for maximum trailer towing speeds. | | | | | | |

**NOTE: The trailer tongue weight must be considered as part of the combined weight of occupants and cargo, and should never exceed the weight referenced on the Tire and Loading Information placard.**

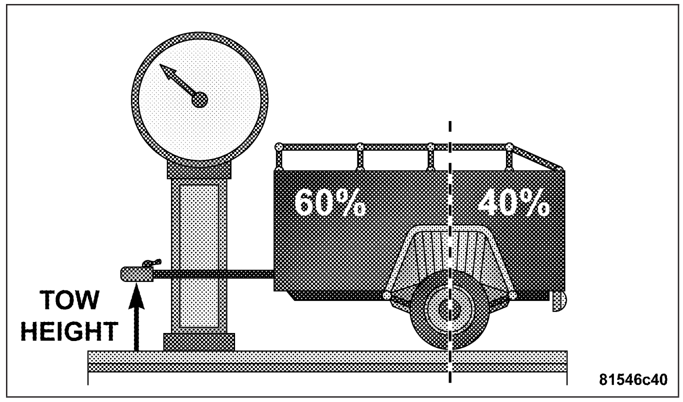
## Trailer and Tongue Weight

Always load a trailer with 60% to 65% of the weight in the front of the trailer. This places 10% to 15% of the Gross Trailer Weight (GTW) on the tow hitch of your vehicle. Loads balanced over the wheels or heavier in the rear can cause the trailer to sway **severely** side to side which will cause loss of control of the vehicle and trailer. Failure to load trailers heavier in front is the cause of many trailer accidents.

Never exceed the maximum tongue weight stamped on your bumper or trailer hitch.

Consider the following items when computing the weight on the rear axle of the vehicle:

- The tongue weight of the trailer.
- The weight of any other type of cargo or equipment put in or on your vehicle.
- The weight of the driver and all passengers.



**NOTE: Remember that everything put into or on the trailer adds to the load on your vehicle. Also, additional factory-installed options, or dealer-installed options, must be considered as part of the total load on your vehicle. Refer to the Tire and Loading Information placard in the Tire Safety Information Section of this manual for the maximum combined weight of occupants and cargo for your vehicle.**

**Trailer sway control and a weight distributing (load equalizing) hitch are recommended for Tongue Weights (TW) above 150 lbs (68 kg) and required for Tongue Weights above 300 lbs (136 kg).**

## Towing Requirements

To promote proper break-in of your new vehicle drivetrain components the following guidelines are recommended:

**CAUTION:**
- **Avoid towing a trailer for the first 500 miles (805 km) of vehicle operation. Doing so may damage your vehicle.**
- **During the first 500 miles (805 km) of trailer towing, limit your speed to 50 mph (80 km/h).**

When towing a trailer, never exceed the GAWR, or GCWR, ratings.

**WARNING:**
**Improper towing can lead to an injury accident. Follow these guidelines to make your trailer towing as safe as possible:**
**Make certain that the load is secured in the trailer and will not shift during travel. When trailering cargo that is not fully secured, dynamic load shifts can occur that may be difficult for the driver to control. You could lose control of your vehicle and have an accident.**

- When hauling cargo or towing a trailer, do not overload your vehicle or trailer. Overloading can cause a loss of control, poor performance or damage to brakes, axle, engine, transmission, steering, suspension, chassis structure or tires.
- Safety chains must always be used between your vehicle and trailer. Always connect the chains to the frame or hook retainers of the vehicle hitch. Cross the chains under the trailer tongue and allow enough slack for turning corners.
- Vehicles with trailers should not be parked on a grade. When parking, apply the parking brake on the tow vehicle. Put the tow vehicle automatic transmission in P for Park. Always, block or ″chock″ the trailer wheels.
- GCWR must not be exceeded.
- **Total weight must be distributed between the tow vehicle and the trailer such that the following four ratings are not exceeded:**
  - GVWR
  - GTW
  - GAWR
  - Tongue weight rating for the trailer hitch utilized (This requirement may limit the ability to always achieve the 10% to 15% range of tongue weight as a percentage of total trailer weight).

**Towing Requirements — Tires**

− Do not attempt to tow a trailer while using a compact spare tire.
− Proper tire inflation pressures are essential to the safe and satisfactory operation of your vehicle.
− Also, check the trailer tires for proper tire inflation pressures before trailer usage.

− Check for signs of tire wear or visible tire damage before towing a trailer. Refer to the (Refer to 22 - TIRES/WHEELS/TIRES - DESCRIPTION) section of this manual on Tread Wear Indicators for the proper inspection procedure.

− When replacing tires refer to (Refer to 22 - TIRES/WHEELS/TIRES - DESCRIPTION) section of this manual on Replacement Tires for proper tire replacement procedures. Replacing tires with a higher load carrying capacity will not increase the vehicle's GVWR and GAWR limits.

**Towing Requirements — Trailer Brakes**

− Do **not** interconnect the hydraulic brake system or vacuum system of your vehicle with that of the trailer. This could cause inadequate braking and possible personal injury.

− An electronically actuated trailer brake controller is required when towing a trailer with electronically actuated brakes. When towing a trailer equipped with a hydraulic surge actuated brake system, an electronic brake controller is not required.

− Trailer brakes are recommended for trailers over 1,000 lbs (454 kg) and required for trailers in excess of 2,000 lbs (907 kg).

**CAUTION:**
**If the trailer weighs more than 1,000 lbs (454 kg) loaded, it should have its own brakes and they should be of adequate capacity. Failure to do this could lead to accelerated brake lining wear, higher brake pedal effort, and longer stopping distances.**

**WARNING:**
**Do not connect trailer brakes to your vehicle's hydraulic brake lines. It can overload your brake system and cause it to fail. You might not have brakes when you need them and could have an accident.**
**Towing any trailer will increase your stopping distance. When towing you should allow for additional space between your vehicle and the vehicle in front of you. Failure to do so could result in an accident.**

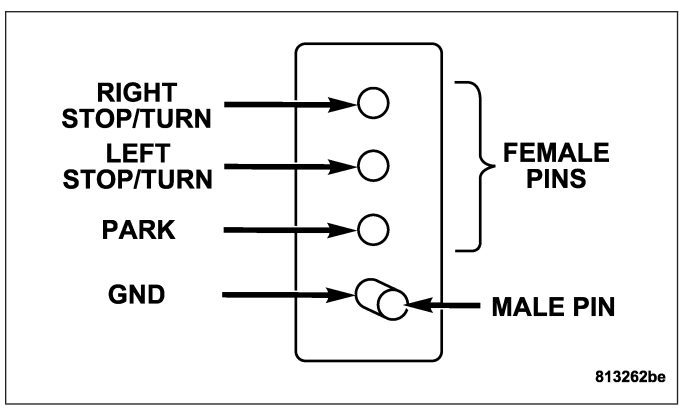
## Towing Requirements — Trailer Lights & Wiring

Whenever you pull a trailer, regardless of the trailer size, stop lights and turn signals on the trailer are required for motoring safety.

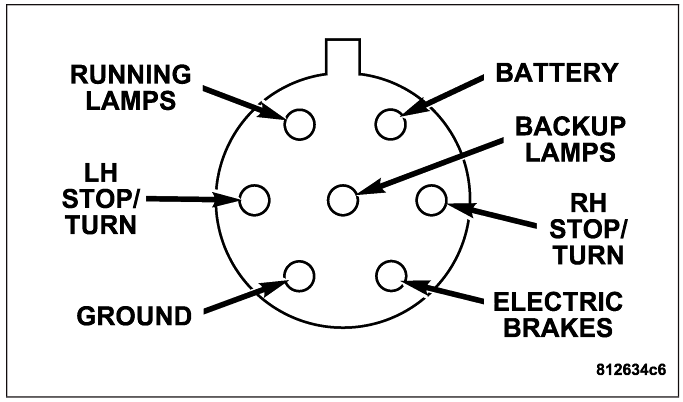
The Trailer Tow Package may include a 4 and 7 pin wiring harness. Use a factory approved trailer harness and connector.

**NOTE: Do not cut or splice wiring into the vehicles wiring harness.**

The electrical connections are all complete to the vehicle but you must mate the harness to a trailer connector. Refer to the following illustrations.



## Towing Tips



Before setting out on a trip, practice turning, stopping and backing the trailer in an area away from heavy traffic.

### Towing Tips — Automatic Transmission

The “D” range can be selected when towing. However, if frequent shifting occurs while in this range, the “3” range should be selected.Using the “3” range while operating the vehicle under heavy operating conditions will improve performance and extend transmission life by reducing excessive shifting and heat build up. This action will also provide better engine braking.

The automatic transmission fluid and filter should be changed if you REGULARLY tow a trailer for more than 45 minutes of continuous operation. See Schedule “B” in section 8 of this manual for transmission fluid change intervals.

**NOTE: Check the automatic transmission fluid level before towing.**

### Towing Tips — Electronic Speed Control (If Equipped)

− Don’t use in hilly terrain or with heavy loads.

− When using the speed control, if you experience speed drops greater than 10 mph (16 km/h), disengage until you can get back to cruising speed.

− Use speed control in flat terrain and with light loads to maximize fuel efficiency.

### Towing Tips — Autostick (If Equipped)

− For vehicles equipped with Autostick. By using the Autostick modes, and selecting a specific gear range, frequent shifting can be avoided. The highest gear range should be selected that allows for adequate performance. For example, choose “4” if the desired speed can be maintained. Choose “3” or “2” if needed to maintain the desired speed.

− Extended driving at high RPM should be avoided to prevent excess heat generation. A reduction in vehicle speed may be required to avoid extended driving at high RPM. Return to a higher gear range or vehicle speed when road conditions and RPM level allows.

### Towing Tips — Cooling System

To reduce potential for engine and transmission overheating, take the following actions:

- City Driving - When stopped for short periods of time, put transmission in neutral and increase engine idle speed.
- Highway Driving - Reduce speed.
- Air Conditioning - Turn off temporarily.
- refer to Cooling System Operating information in the Maintenance section of this manual for more information.

# BRAKES

## TABLE OF CONTENTS

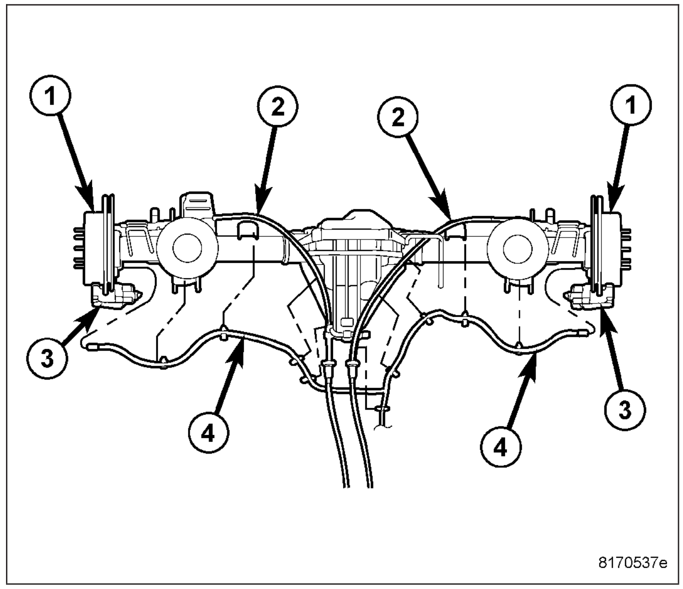
## BRAKES - BASE - SERVICE INFORMATION

### TABLE OF CONTENTS

# BRAKES - BASE - SERVICE INFORMATION

## DESCRIPTION

ESP and Power assist four wheel disc brakes are standard equipment. Disc brake components consist of single piston calipers and ventilated rotors. Rear disc brakes use a drum in hat design for the parking brake which is activated by brake shoes pressing against the inside of the drum in hat rotor (1).



The parking brake mechanism is lever and cable operated. The cables (2) are attached to equalizers on the rear disc brake support plate which moves the park brake shoes firmly against the drum in hat rotor. The parking brakes are operated by a hand lever.

The vehicle is equipped with ESP (Electronic Stability Program). There are four wheel speed sensors, one sensor at each wheel to monitor input.

A dual diaphragm vacuum power brake booster is used for all applications. All models have an aluminum master cylinder with plastic reservoir.

Factory brake lining on all models consists of an organic base material combined with metallic particles. The original equipment linings do not contain asbestos.

## WARNING

**WARNING: Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from aftermarket linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not clean brake parts with compressed air or by dry brushing. Use a vacuum cleaner specifically designed for the removal of asbestos fibers from brake components. If a suitable vacuum cleaner is not available, cleaning should be done with a water dampened cloth. Do not sand, or grind brake lining unless equipment used is designed to contain the dust residue. Dispose of all residue containing asbestos fibers in sealed bags or containers to minimize exposure to yourself and others. Follow practices prescribed by the occupational safety and health administration and the environmental protection agency for the handling, processing, and disposition of dust or debris that may contain asbestos fibers.**

**CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean the system components. These fluids damage rubber cups and seals. Use only fresh brake fluid or Mopar brake cleaner to clean or flush brake system components. These are the only cleaning materials recommended. If system contamination is suspected, check the fluid for dirt, discoloration, or separation into distinct layers. Also check the reservoir cap seal for distortion. Drain and flush the system with new brake fluid if contamination is suspected.**

**CAUTION: Use Mopar brake fluid, or an equivalent quality fluid meeting SAE/DOT standards J1703 and DOT 3. Brake fluid must be clean and free of contaminants. Use fresh fluid from sealed containers only to ensure proper antilock component operation.**

**CAUTION: Use Mopar multi-mileage or high temperature grease to lubricate caliper slide surfaces, drum brake pivot pins, and shoe contact points on the backing plates. Use multi-mileage grease or GE 661 or Dow 111 silicone grease on caliper slide pins to ensure proper operation.**

## DIAGNOSIS AND TESTING - BASE BRAKE SYSTEM

Base brake components consist of the brake shoes, calipers, rotors, brake lines, master cylinder, booster, and parking brake components.

Brake diagnosis involves determining if the problem is related to a mechanical, hydraulic, or vacuum operated component.

The first diagnosis step is the preliminary check.

## PRELIMINARY BRAKE CHECK

1. Check condition of tires and wheels. Damaged wheels and worn, damaged, or underinflated tires can cause pull, shudder, vibration, and a condition similar to grab.
2. If complaint was based on noise when braking, check suspension components. Jounce front and rear of vehicle and listen for noise that might be caused by loose, worn or damaged suspension or steering components.
3. Inspect brake fluid level and condition. Note that the brake reservoir fluid level will decrease in proportion to normal lining wear. **Also note that brake fluid tends to darken over time. This is normal and should not be mistaken for contamination.**
    a. If fluid level is abnormally low, look for evidence of leaks at calipers, brake lines, and master cylinder.
    b. If fluid appears contaminated, drain out a sample to examine. System will have to be flushed if fluid is separated into layers, or contains a substance other than brake fluid. The system seals and cups will also have to be replaced after flushing. Use clean brake fluid to flush the system.
4. Check parking brake operation. Verify free movement and full release of cables and hand lever. Also note if vehicle was being operated with parking brake partially applied.
5. Check brake pedal operation. Verify that pedal does not bind and has adequate free play. If pedal lacks free play, check pedal and power booster for being loose or for bind condition. Do not road test until condition is corrected.
6. Check booster vacuum check valve and hose.
7. If components checked appear OK, road test the vehicle.

## ROAD TESTING

1. If complaint involved low brake pedal, pump pedal and note if it comes back up to normal height.
2. Check brake pedal response with transmission in Neutral and engine running. Pedal should remain firm under constant foot pressure.
3. During road test, make normal and firm brake stops in 25-40 mph range. Note faulty brake operation such as low pedal, hard pedal, fade, pedal pulsation, pull, grab, drag, noise, etc.
4. Attempt to stop the vehicle with the parking brake only and note grab, drag, noise, etc.

### PEDAL FALLS AWAY

A brake pedal that falls away under steady foot pressure is generally the result of a system leak. The leak point could be at a brake line, fitting, hose, or caliper. If leakage is severe, fluid will be evident at or around the leaking component.

Internal leakage (seal by-pass) in the master cylinder caused by worn or damaged piston cups, may also be the problem cause.

An internal leak in the ABS or junction block may also be the problem with no physical evidence.

### LOW PEDAL

If a low pedal is experienced, pump the pedal several times. If the pedal comes back up worn linings or rotors are the most likely causes. The proper course of action is to inspect and replace all worn components.

### SPONGY PEDAL

A spongy pedal is most often caused by air in the system. However, substandard brake lines and hoses can also cause a spongy pedal. The proper course of action is to bleed the system, and replace substandard quality brake hoses if suspected.

### HARD PEDAL OR HIGH PEDAL EFFORT

A hard pedal or high pedal effort may be due to lining that is water soaked, contaminated, glazed, or badly worn. The power booster or check valve could also be faulty.

### PEDAL PULSATION

Pedal pulsation is caused by components that are loose, or beyond tolerance limits.

The primary cause of pulsation are disc brake rotors with excessive lateral runout or thickness variation. Other causes are loose wheel bearings or calipers and worn, damaged tires.

**NOTE: Some pedal pulsation may be felt during ABS activation.**

### BRAKE DRAG

Brake drag occurs when the lining is in constant contact with the rotor or drum. Drag can occur at one wheel, all wheels, fronts only, or rears only.

Drag is a product of incomplete brake shoe release. Drag can be minor or severe enough to overheat the linings, rotors and drums.

Minor drag will usually cause slight surface charring of the lining. It can also generate hard spots in rotors and drums from the overheat-cool down process. In most cases, the rotors, drums, wheels and tires are quite warm to the touch after the vehicle is stopped.

Severe drag can char the brake lining all the way through. It can also distort and score rotors and drums to the point of replacement. The wheels, tires and brake components will be extremely hot. In severe cases, the lining may generate smoke as it chars from overheating.

Common causes of brake drag are:

- Seized or improperly adjusted parking brake cables.
- Loose/worn wheel bearing.
- Seized caliper piston.
- Caliper binding on corroded bushings or rusted slide surfaces.
- Loose caliper mounting.
- Drum parking brake shoes binding on worn/damaged support plates.
- Mis-assembled components.
- Long booster output rod.

If brake drag occurs at all wheels, the problem may be related to a blocked master cylinder return port, or faulty power booster (binds-does not release).

### BRAKE FADE

Brake fade is usually a product of overheating caused by brake drag. However, brake overheating and resulting fade can also be caused by riding the brake pedal, making repeated high deceleration stops in a short time span, or constant braking on steep mountain roads. Refer to the Brake Drag information in this section for causes.

### BRAKE PULL

Front brake pull condition could result from:

- Contaminated lining in one caliper
- Seized caliper piston
- Binding caliper
- Loose caliper
- Rusty caliper slide surfaces
- Improper brake shoes
- Damaged rotor

A worn, damaged wheel bearing or suspension component are further causes of pull. A damaged front tire (bruised, ply separation) can also cause pull.

A common and frequently misdiagnosed pull condition is where direction of pull changes after a few stops. The cause is a combination of brake drag followed by fade at one of the brake units.

As the dragging brake overheats, efficiency is so reduced that fade occurs. Since the opposite brake unit is still functioning normally, its braking effect is magnified. This causes pull to switch direction in favor of the normally functioning brake unit.

An additional point when diagnosing a change in pull condition concerns brake cool down. Remember that pull will return to the original direction, if the dragging brake unit is allowed to cool down (and is not seriously damaged).

### REAR BRAKE GRAB OR PULL

Rear grab or pull is usually caused by improperly adjusted or seized parking brake cables, contaminated lining, bent or binding shoes and support plates, or improperly assembled components. This is particularly true when only one rear wheel is involved. However, when both rear wheels are affected, the master cylinder or proportioning valve could be at fault.

### BRAKES DO NOT HOLD AFTER DRIVING THROUGH DEEP WATER PUDDLES

This condition is generally caused by water soaked lining. If the lining is only wet, it can be dried by driving with the brakes very lightly applied for a mile or two. However, if the lining is both soaked and dirt contaminated, cleaning and/or replacement will be necessary.

### BRAKE LINING CONTAMINATION

Brake lining contamination is mostly a product of leaking calipers, worn seals, driving through deep water puddles, or lining that has become covered with grease and grit during repair. Contaminated lining should be replaced to avoid further brake problems.

### WHEEL AND TIRE PROBLEMS

Some conditions attributed to brake components may actually be caused by a wheel or tire problem.

A damaged wheel can cause shudder, vibration and pull. A worn or damaged tire can also cause pull.

Severely worn tires with very little tread left can produce a grab-like condition as the tire loses and recovers traction. Flat-spotted tires can cause vibration and generate shudder during brake operation. A tire with internal damage such as a severe bruise, cut, or ply separation can cause pull and vibration.

## BRAKE NOISES

Some brake noise is common with some disc brakes during the first few stops after a vehicle has been parked overnight or stored. This is primarily due to the formation of trace corrosion (light rust) on metal surfaces. This light corrosion is typically cleared from the metal surfaces after a few brake applications causing the noise to subside.

### BRAKE SQUEAK/SQUEAL

Brake squeak or squeal may be due to linings that are wet or contaminated with brake fluid, grease, or oil. Glazed linings and rotors with hard spots can also contribute to squeak. Dirt and foreign material embedded in the brake lining will also cause squeak/squeal.

A very loud squeak or squeal is frequently a sign of severely worn brake lining. If the lining has worn through to the brake shoes in spots, metal-to-metal contact occurs. If the condition is allowed to continue, rotors and drums can become so scored that replacement is necessary.

### BRAKE CHATTER

Brake chatter is usually caused by loose or worn components, or glazed/burnt lining. Rotors with hard spots can also contribute to chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

### THUMP/CLUNK NOISE

Thumping or clunk noises during braking are frequently **not** caused by brake components. In many cases, such noises are caused by loose or damaged steering, suspension, or engine components. However, calipers that bind on the slide surfaces can generate a thump or clunk noise.

## STANDARD PROCEDURE

### PRESSURE BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Do not pump the brake pedal at any time while bleeding. Air in the system will be compressed into small bubbles that are distributed throughout the hydraulic system. This will make additional bleeding operations necessary.

Do not allow the master cylinder to run out of fluid during bleed operations. An empty cylinder will allow additional air to be drawn into the system. Check the cylinder fluid level frequently and add fluid as needed.

Bleed only one brake component at a time in the following sequence:

- Master Cylinder
- Junction Block
- Right Rear Wheel
- Left Rear Wheel
- Right Front Wheel
- Left Front Wheel

Follow the manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 15-20 psi is sufficient for bleeding.

Fill the bleeder tank with recommended fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system. Use adapter provided with the equipment or Adapter 6921.

### MANUAL BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Do not pump the brake pedal at any time while bleeding. Air in the system will be compressed into small bubbles that are distributed throughout the hydraulic system. This will make additional bleeding operations necessary.

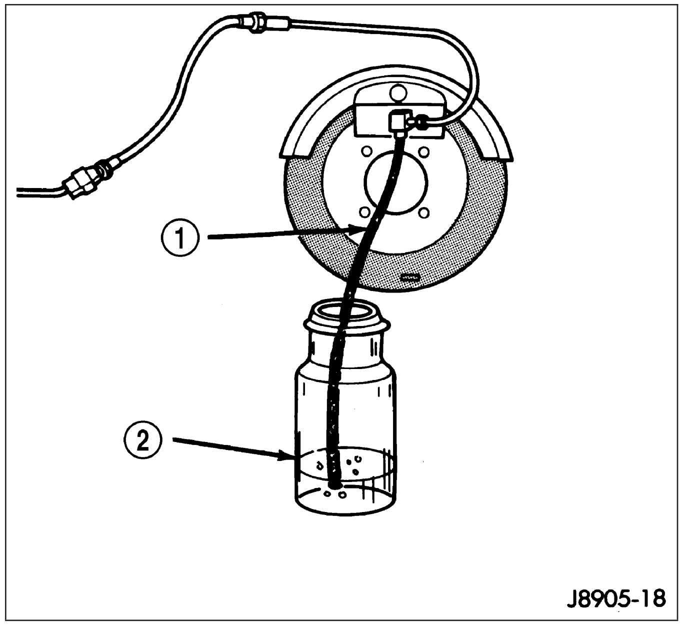
Do not allow the master cylinder to run out of fluid during bleed operations. An empty cylinder will allow additional air to be drawn into the system. Check the cylinder fluid level frequently and add fluid as needed.

Bleed only one brake component at a time in the following sequence:

- Master Cylinder
- Junction Block
- Right Rear Wheel
- Left Rear Wheel
- Right Front Wheel
- Left Front Wheel

1. Remove reservoir filler caps and fill reservoir.
2. If calipers were overhauled, open all caliper bleed screws. Then close each bleed screw as fluid starts to drip from it. Top off master cylinder reservoir once more before proceeding.

3. Attach one end of bleed hose to bleed screw and insert opposite end in glass container partially filled with brake fluid. Be sure end of bleed hose is immersed in fluid.
4. Open up bleeder, then have a helper press down the brake pedal. Once the pedal is down close the bleeder. Repeat bleeding until fluid stream is clear and free of bubbles. Then move to the next wheel.



## SPECIFICATIONS

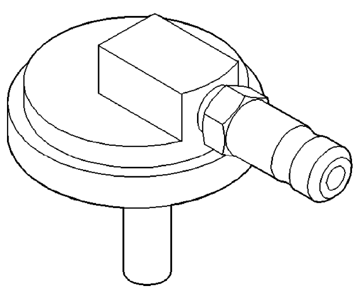
*Handle C-4171*



*Adapter Pressure Bleeder 6921*

# BRAKE LINES

## DESCRIPTION

Flexible rubber hose is used at both front and rear brakes and at the rear axle junction block. Double walled steel tubing is used to connect the master cylinder to the major hydraulic braking components and then to the flexible rubber hoses. Double inverted style and ISO style flares are used on the brake lines.

## DIAGNOSIS AND TESTING - BRAKE LINE AND HOSES

Flexible rubber hose is used at both front and rear brakes and at the rear axle junction block. Inspect the hoses whenever the brake system is serviced, at every engine oil change, or whenever the vehicle is in for service.

Inspect the hoses for surface cracking, scuffing, or worn spots. Replace any brake hose immediately if the fabric casing of the hose is exposed due to cracks or abrasions.

Also check brake hose installation. Faulty installation can result in kinked, twisted hoses, or contact with the wheels and tires or other chassis components. All of these conditions can lead to scuffing, cracking and eventual failure.

The steel brake lines should be inspected periodically for evidence of corrosion, twists, kinks, leaks, or other damage. Heavily corroded lines will eventually rust through causing leaks. In any case, corroded or damaged brake lines should be replaced.

Factory replacement brake lines and hoses are recommended to ensure quality, correct length and superior fatigue life. Care should be taken to make sure that brake line and hose mating surfaces are clean and free from nicks and burrs. Also remember that right and left brake hoses are not interchangeable.

Use new copper seal washers at all caliper connections. Be sure brake line connections are properly made (not cross threaded) and tightened to recommended torque.

## STANDARD PROCEDURE

## DOUBLE INVERTED FLARING

A pre-formed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

Special bending tools are needed to avoid kinking or twisting of metal brake tubes. Special flaring tools are needed to make a double inverted flare or ISO flare.

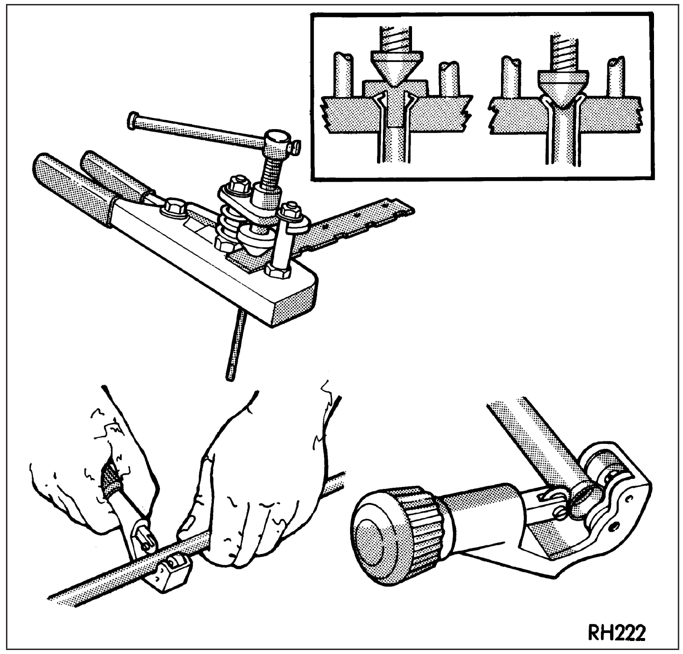
1. Cut off damaged tube with Tubing Cutter.
2. Ream cut edges of tubing to ensure proper flare.
3. Install replacement tube nut on the tube.
4. Insert tube in flaring tool.
5. Place gauge form over the end of the tube.
6. Push tubing through flaring tool jaws until tube contacts recessed notch in gauge that matches tube diameter.
7. Tighten the tool bar on the tube
8. Insert plug on gauge in the tube. Then swing compression disc over gauge and center tapered flaring screw in recess of compression disc.
9. Tighten tool handle until plug gauge is squarely seated on jaws of flaring tool. This will start the inverted flare.
10. Remove the plug gauge and complete the inverted flare.

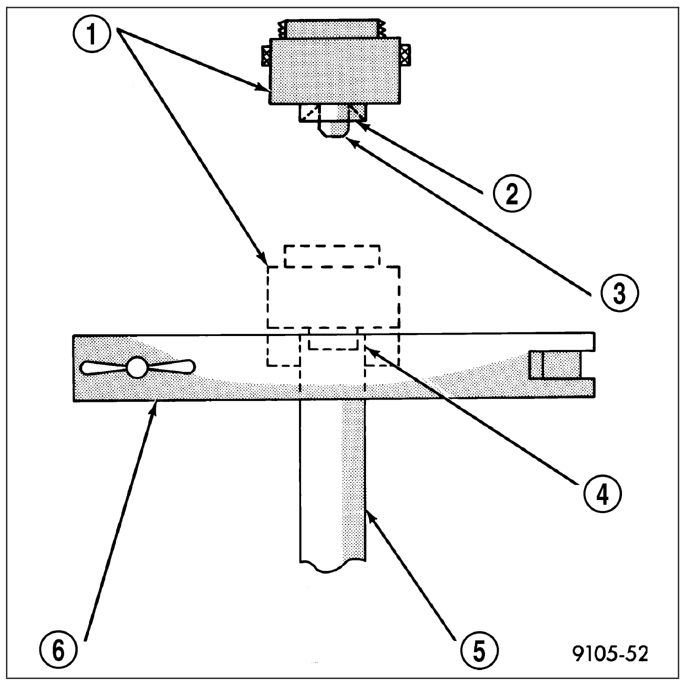
## ISO FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

To make a ISO flare use a Flaring Tool kit.

1. Cut off damaged tube with Tubing Cutter.
2. Remove any burrs from the inside of the tube.
3. Install tube nut on the tube.
4. Position the tube in the flaring tool flush with the top of the tool bar. Then tighten the tool bar on the tube.
5. Install the correct size adaptor on the flaring tool yoke screw.
6. Lubricate the adaptor.
7. Align the adaptor and yoke screw over the tube.
8. Turn the yoke screw in until the adaptor is squarely seated on the tool bar.

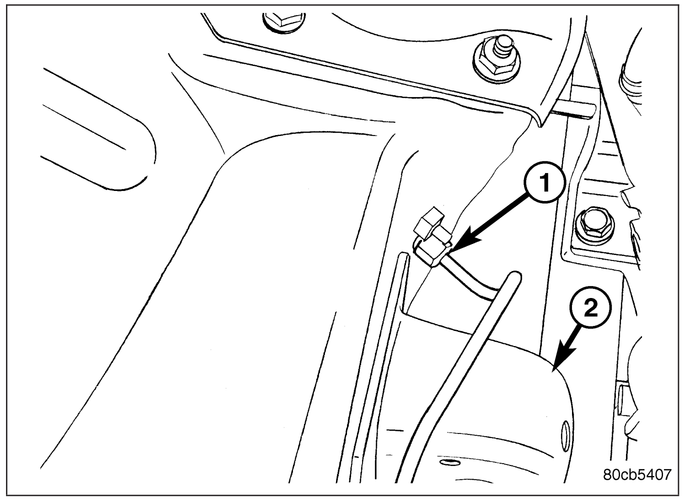




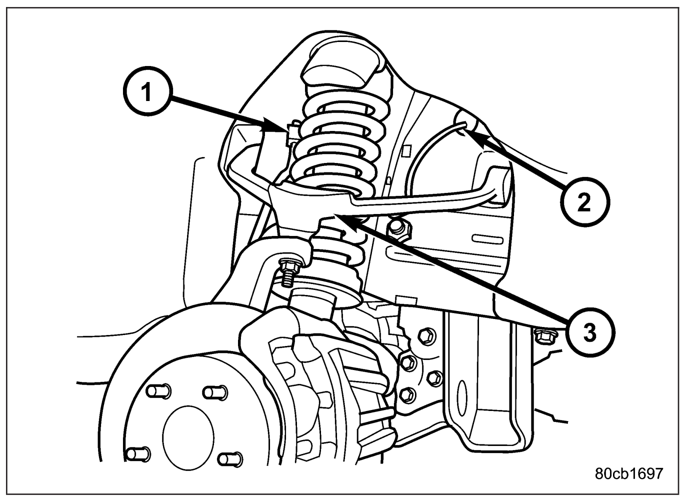
# REMOVAL

## FRONT BRAKE CALIPER HOSE

1. Install prop rod on the brake pedal to keep pressure on the brake system.
2. Remove the brake line (1) from the brake hose inside the engine compartment by the front control arm bolt (2).
3. Raise and support vehicle.

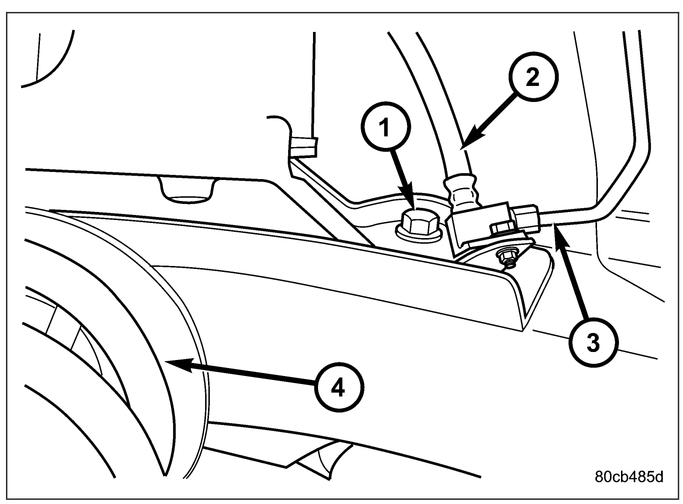


4. Remove the brake hose banjo bolt at the caliper.
5. Remove the mounting bolt for the top of the brake hose (1) at the vehicle.
6. Remove the hose.

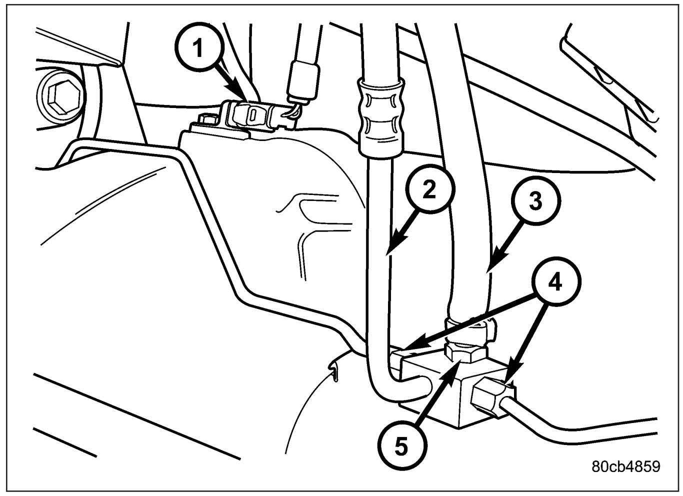


## REAR BRAKE HOSE

1. Install prop rod on the brake pedal to keep pressure on the brake system.
2. Raise and support the vehicle.
3. Remove the brake line (3) from the hose (2) at the body.
4. Remove the brake hose mounting bolt (1) at the top of the hose located at the body.



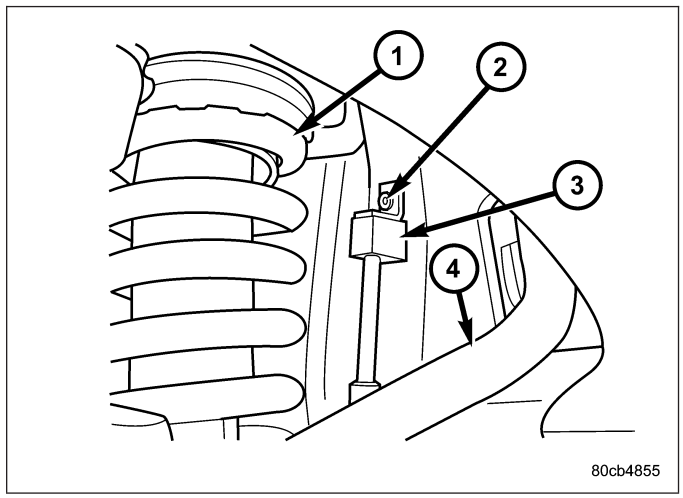
5. Remove the vent tube (3).
6. Remove the two brake lines (4) at the bottom of the hose located at the axle.
7. Remove the mounting bolt (5) for the brake hose (2) at the axle.
8. Remove the hose (2).



## INSTALLATION

## FRONT BRAKE CALIPER HOSE

1. Install the hose (3).
2. Install the mounting bolt (2) for the top of the brake hose (3) at the vehicle.
3. Install the brake hose banjo bolt at the caliper.
4. Lower the vehicle and remove the support.
5. Install the brake line to the brake hose inside the engine compartment by the front control arm bolt (4).
6. Remove the prop rod from the brake pedal.
7. Bleed the brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## REAR BRAKE HOSE

1. Install the hose.
2. Install the mounting bolt for the brake hose at the axle.
3. Install the two brake lines at the bottom of the hose located at the axle.
4. Install the vent tube.
5. Install the brake hose mounting bolt at the top of the hose located at the body.
6. Install the brake line to the hose at the body.
7. Lower the vehicle and remove the support.
8. Remove the prop rod.
9. Bleed the brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).

# BRAKE PADS / SHOES

## REMOVAL

### FRONT

1. Raise and support the vehicle.
2. Remove the front wheel and tire assembly.
3. Drain a small amount of fluid from the master cylinder brake reservoir with a **clean** suction gun.
4. Bottom the caliper pistons into the caliper by prying the caliper over.
5. Remove the caliper mounting bolts.
6. Remove the disc brake caliper from the mount.

**CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.**

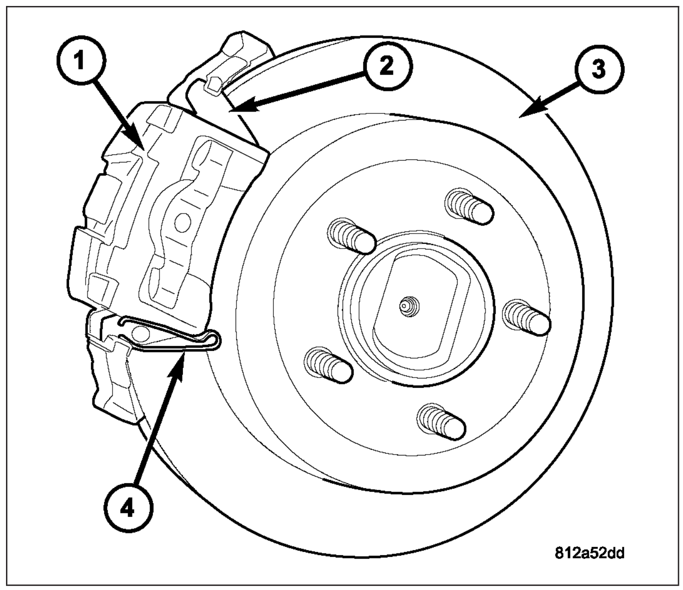
7. Remove the inboard and outboard pads.

### REAR

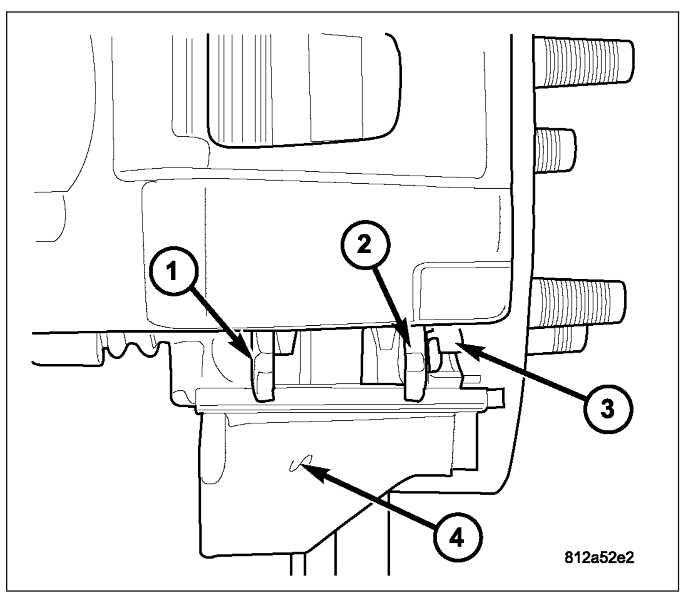
1. Raise and support vehicle.
2. Remove the wheel and tire assemblies.
3. Compress the caliper (1).
4. Remove the caliper slide pin bolts, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

**NOTE: Do not allow brake hose to support caliper assembly.**

5. Remove the caliper by tilting the top up and off the caliper adapter.



6. Support and hang the caliper.
7. Remove the inboard brake pad (1) from the caliper.
8. Remove the outboard brake pad (2) from the caliper.



## INSTALLATION

### FRONT

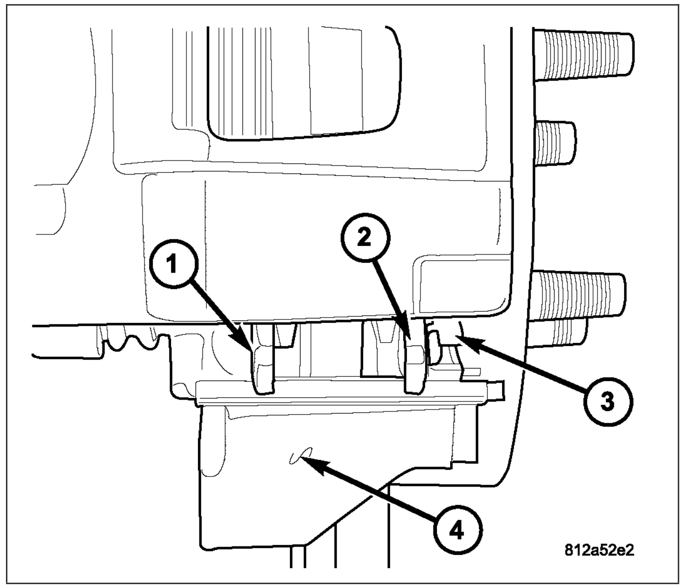
1. Install the inboard and outboard pads.
2. Install the caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
3. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

### REAR

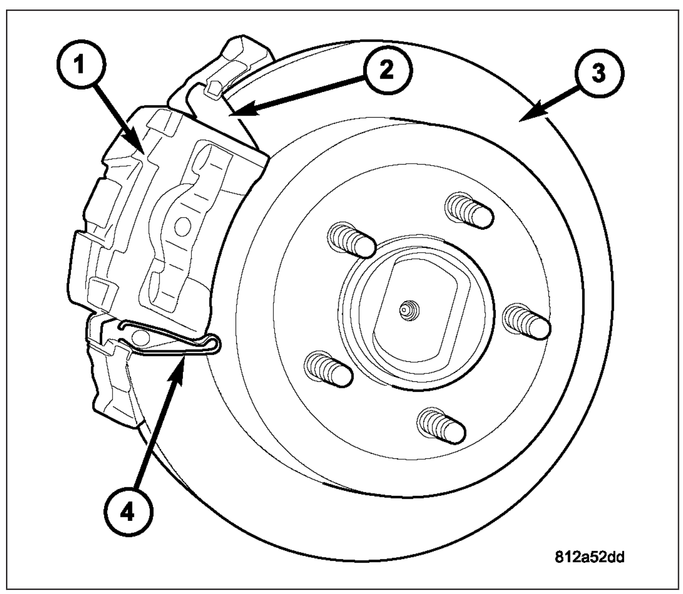
1. Place an old brake shoe between a C-clamp and caliper piston. Bottom piston in the caliper bore with C-clamp.
2. Clean caliper mounting adapter (4) and anti-rattle spring guide (3).
3. Lubricate anti-rattle spring guides (3) with Mopar brake grease.
4. Install anti-rattle spring guides (3).

**NOTE: Anti-rattle spring guides (3) are not interchangeable.**

5. Install inboard brake pad (1) to the caliper.
6. Install outboard brake pad (2) to the caliper.
7. Tilt the top of the caliper over rotor and under adapter. Then push the bottom of the caliper down onto the adapter (4).



8. Install caliper (1) to the rotor and then install the caliper slide pin bolts, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
9. Install wheel and tire assemblies and lower vehicle, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
10. Apply brakes several times to seat caliper pistons and brake shoes and obtain firm pedal.
11. Top off master cylinder fluid level.



# DISC BRAKE CALIPERS

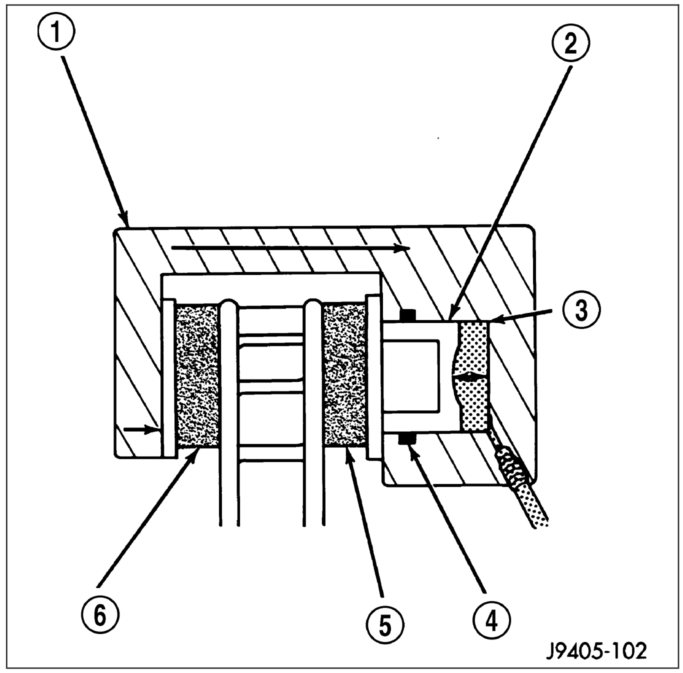
## DESCRIPTION

The calipers are a single piston type. The calipers are free to slide laterally, this allows continuous compensation for lining wear.

## OPERATION

When the brakes are applied fluid pressure is exerted against the caliper piston. The fluid pressure is exerted equally and in all directions. This means pressure exerted against the caliper piston and within the caliper bore will be equal.

Fluid pressure applied to the piston is transmitted directly to the inboard brake shoe. This forces the shoe lining against the inner surface of the disc brake rotor. At the same time, fluid pressure within the piston bore forces the caliper to slide inward on the mounting bolts. This action brings the outboard brake shoe lining into contact with the outer surface of the disc brake rotor.



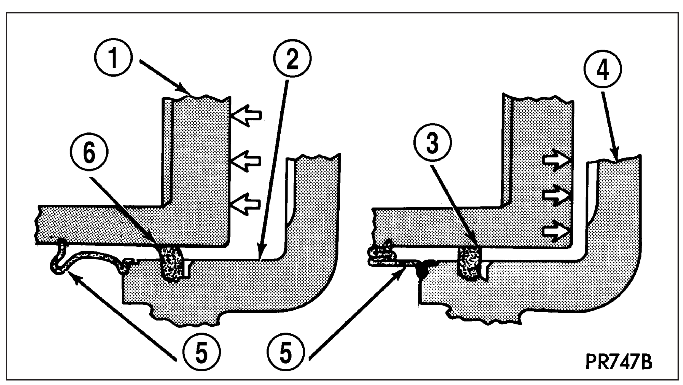
In summary, fluid pressure acting simultaneously on both piston and caliper, produces a strong clamping action. When sufficient force is applied, friction will attempt to stop the rotors from turning and bring the vehicle to a stop.

Application and release of the brake pedal generates only a very slight movement of the caliper and piston. Upon release of the pedal, the caliper and piston return to a rest position. The brake shoes do not retract an appreciable distance from the rotor. In fact, clearance is usually at, or close to zero. The reasons for this are to keep road debris from getting between the rotor and lining and in wiping the rotor surface clear each revolution.

The caliper piston seal controls the amount of piston extension needed to compensate for normal lining wear.

During brake application, the seal is deflected outward by fluid pressure and piston movement. When the brakes (and fluid pressure) are released, the seal relaxes and retracts the piston.

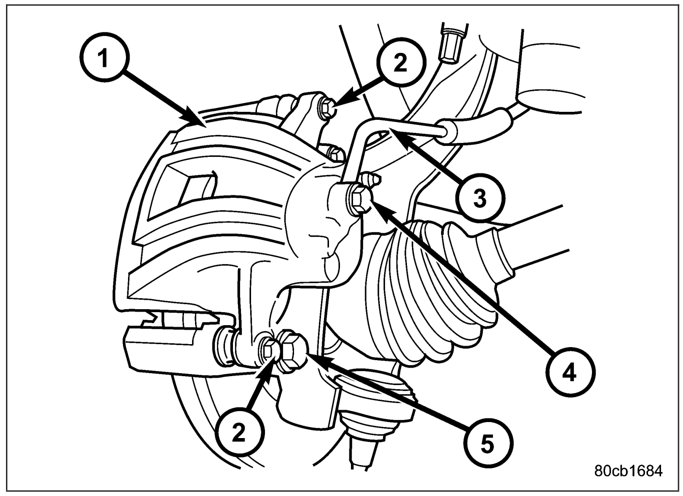
The amount of piston retraction is determined by the amount of seal deflection. Generally the amount is just enough to maintain contact between the piston and inboard brake shoe.



## REMOVAL

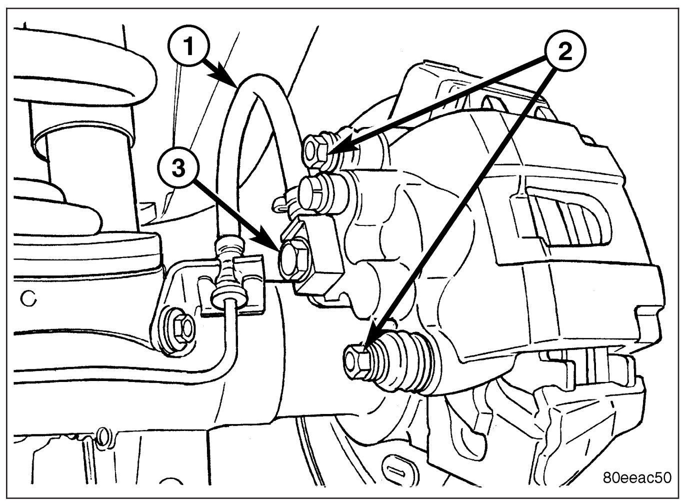
### FRONT

1. Install prop rod on the brake pedal to keep pressure on the brake system.
2. Raise and support vehicle.
3. Remove front wheel and tire assembly.
4. Remove the brake hose banjo bolt (4) if replacing caliper.
5. Remove the caliper mounting slide pin bolts (2).
6. Remove the caliper (1) from vehicle.



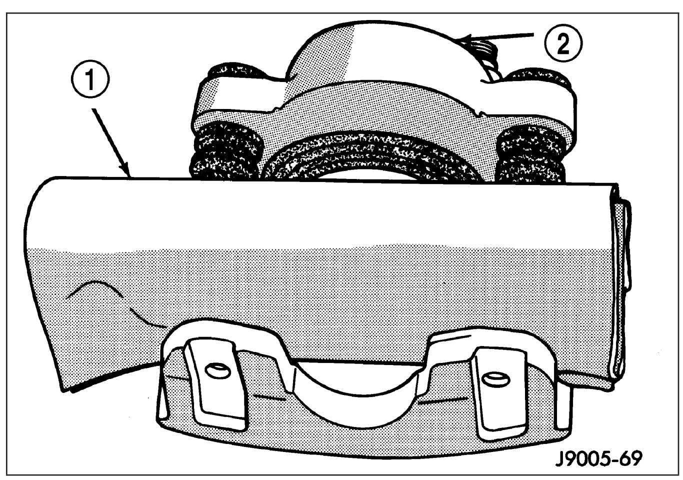
### REAR

1. Install prop rod on the brake pedal to keep pressure on the brake system.
2. Raise and support vehicle.
3. Remove the wheel and tire assembly.
4. Remove the brake hose banjo bolt (3) if replacing caliper.
5. Remove the caliper mounting slide pin bolts (2).
6. Remove the caliper from vehicle.



## DISASSEMBLY

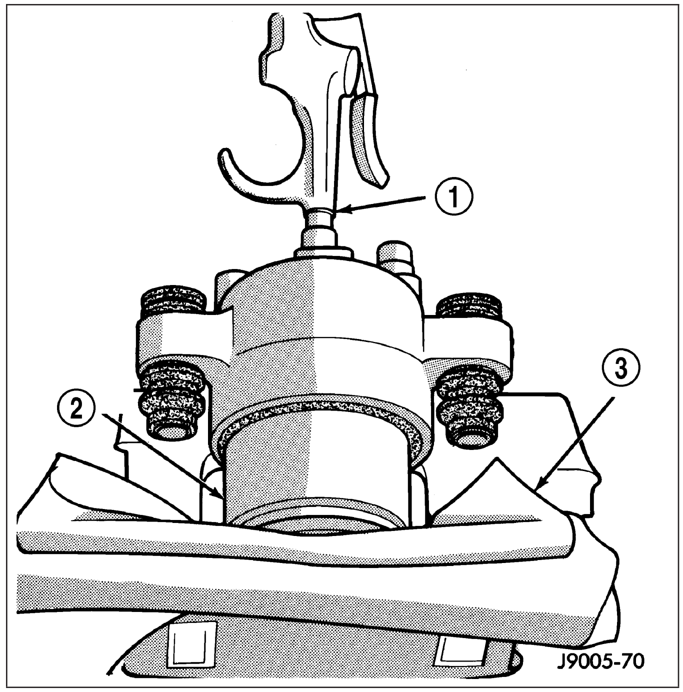
1. Remove brake shoes from caliper.
2. Drain brake fluid out of caliper.
3. Take a piece of wood and pad it with one-inch thickness of shop towels (1). Place this piece in the outboard shoe side of the caliper in front of the piston. This will cushion and protect caliper piston during removal.



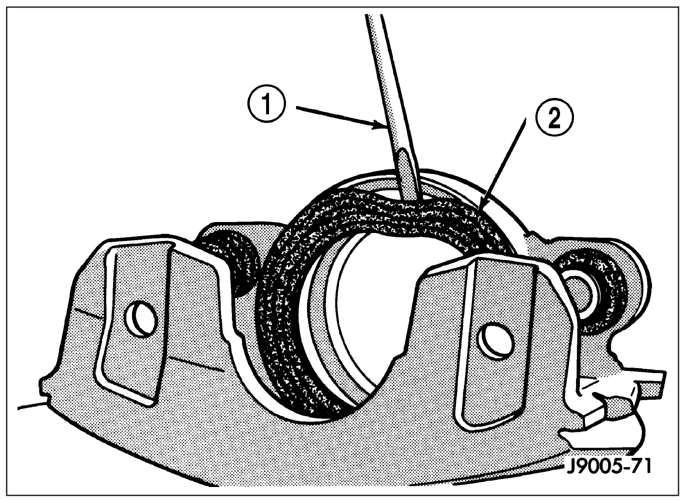
4. Remove caliper piston (2) with **short bursts** of low pressure compressed air. Direct air through fluid inlet port and ease piston out of bore.

**CAUTION: Do not blow the piston out of the bore with sustained air pressure. This could result in a cracked piston. Use only enough air pressure to ease the piston out.**

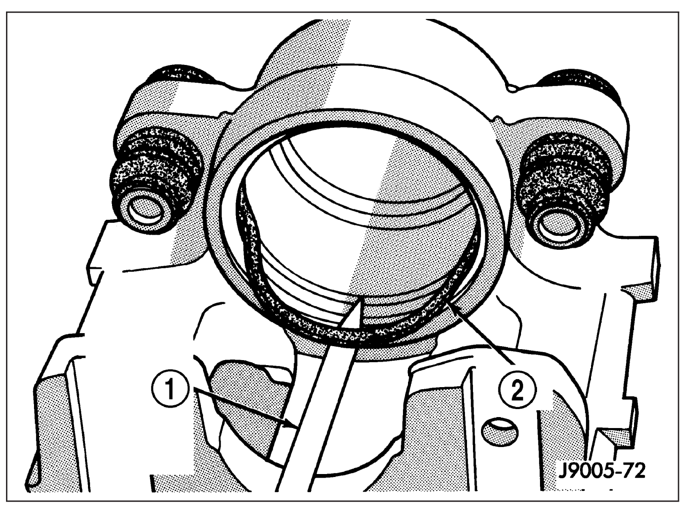
**WARNING: Never attempt to catch the piston as it leaves the bore. This may result in personal injury.**



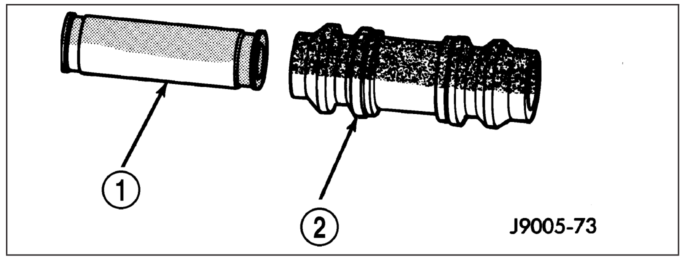
5. Remove caliper piston dust boot with suitable pry tool (1).



6. Remove caliper piston seal with wood or plastic tool (1). Do not use metal tools as they will scratch piston bore.



7. Remove caliper mounting bolt bushings (1) and boots (2).



## CLEANING

Clean the caliper components with clean brake fluid or brake clean only. Wipe the caliper and piston dry with lint free towels or use low pressure compressed air.

**CAUTION: Do not use gasoline, kerosene, thinner, or similar solvents. These products may leave a residue that could damage the piston and seal.**

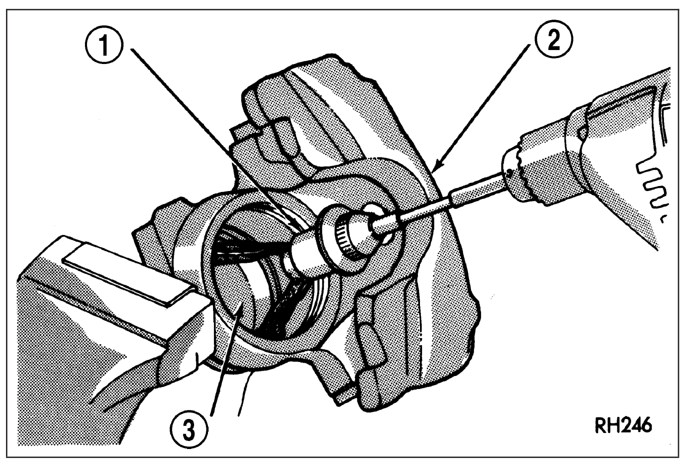
## INSPECTION

The piston is made from a phenolic resin (plastic material) and should be smooth and clean.

The piston must be replaced if cracked or scored. Do not attempt to restore a scored piston surface by sanding or polishing.

**CAUTION: If the caliper piston is replaced, install the same type of piston in the caliper. Never interchange phenolic resin and steel caliper pistons. The pistons, seals, seal grooves, caliper bore and piston tolerances are different.**

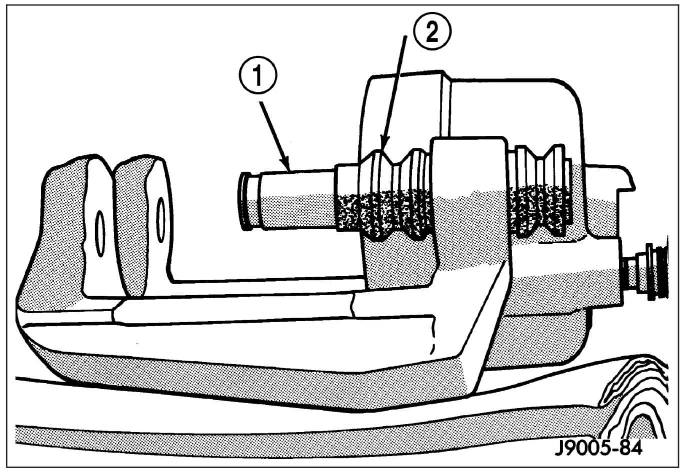
The bore can be **lightly** polished with a brake hone to remove very minor surface imperfections. The caliper should be replaced if the bore is severely corroded, rusted, scored, or if polishing would increase bore diameter more than 0.025 mm (0.001 inch).



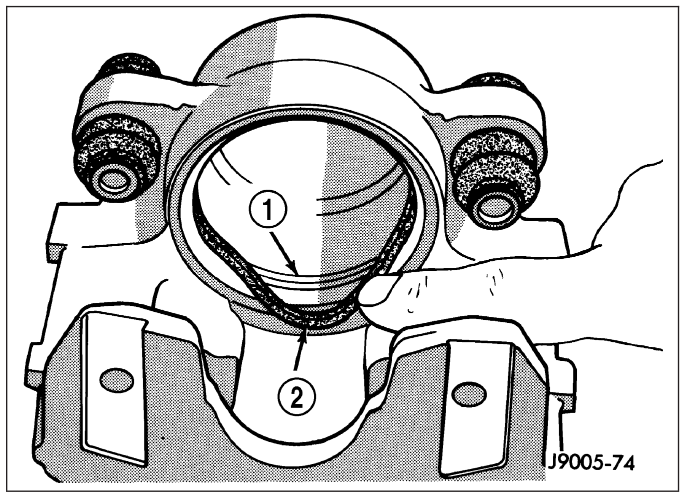
## ASSEMBLY

**CAUTION: Dirt, oil, and solvents can damage caliper seals. Insure assembly area is clean and dry.**

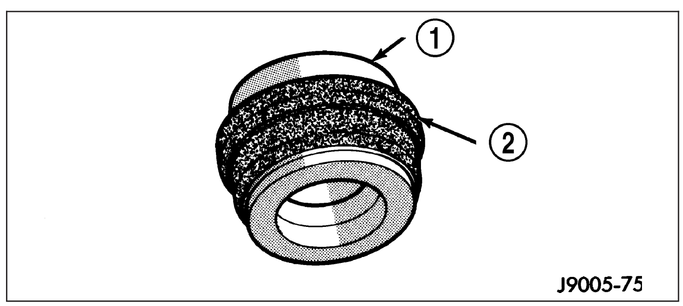
1. Lubricate caliper piston bore, new piston seal and piston with clean brake fluid.
2. Lubricate caliper bushings and interior of bushing boots with silicone grease.
3. Install bushing boots (2) in caliper, then insert bushing into boot and push bushing (1) into place.



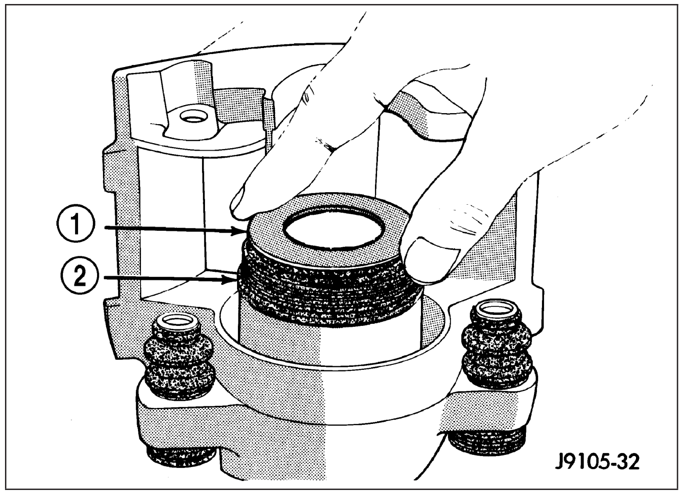
4. Install new piston seal into seal groove (1) with finger.



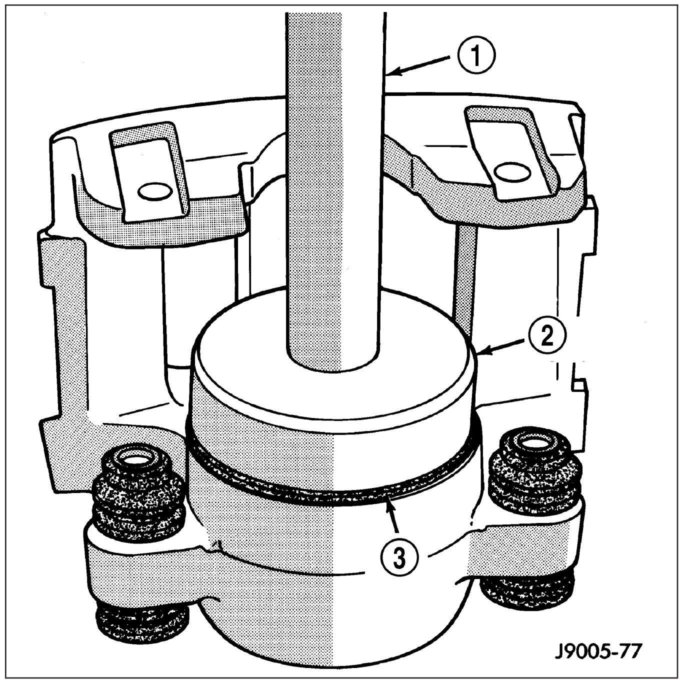
5. Install new dust boot on caliper piston and seat boot in piston groove (1).



6. Press piston (1) into caliper bore by hand, use a turn and push motion to work piston into seal.
7. Press caliper piston to bottom of bore.



8. Seat dust boot (3) in caliper with Installer Tool C-4842 (2) and Tool Handle C-4171 (1).
9. Replace caliper bleed screw if removed.



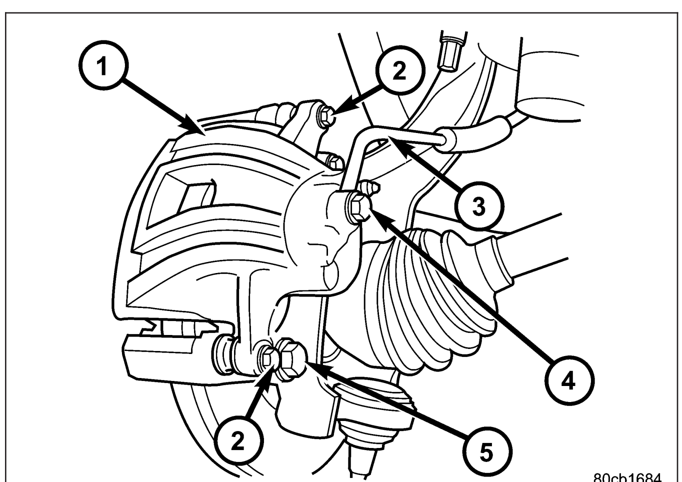
## INSTALLATION

## FRONT

1. Install caliper (1) to the caliper adapter.
2. Coat the caliper mounting slide pin bolts (2) with silicone grease. Begin with the bolt closet to the bleeder screws (top), Then install and tighten the bolts to 15 N·m (11 ft. lbs.).
3. Install the brake hose banjo bolt (4) if removed.

**CAUTION: Verify brake hose is not twisted or kinked before tightening fitting bolt.**

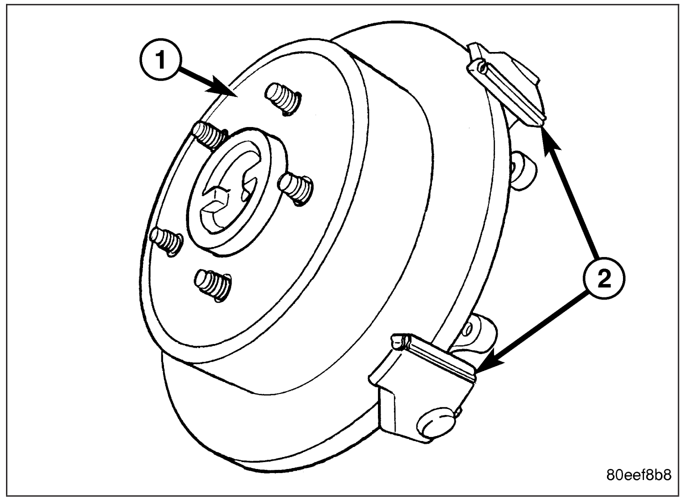
4. Install the brake hose (3) to the caliper (1) with **new seal washers** and tighten fitting bolt to 31 N·m (23 ft. lbs.).



5. Remove the prop rod from the vehicle.
6. Bleed the base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
7. Install the wheel and tire assemblies (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
8. Remove the supports and lower the vehicle.
9. Verify a firm pedal before moving the vehicle.

## REAR

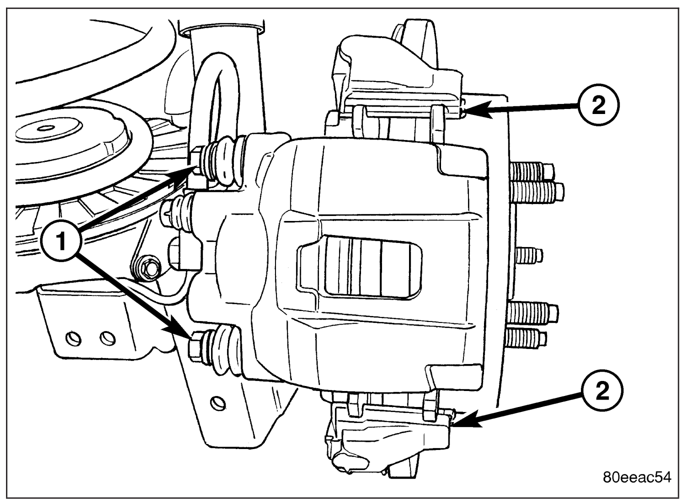
1. Install the brake pads if removed.
2. Lubricate ant-rattle clips (2) for the disc brake pads.



3. Install caliper to the caliper adapter.
4. Coat the caliper mounting slide pin bolts (1) with silicone grease. Then install and tighten the bolts to 15 N·m (11 ft. lbs.).
5. Install the brake hose banjo bolt if removed.

**CAUTION: Verify brake hose is not twisted or kinked before tightening fitting bolt.**

6. Install the brake hose to the caliper with **new seal washers** and tighten fitting bolt to 31 N·m (23 ft. lbs.).



7. Remove the prop rod from the vehicle.
8. Bleed the base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
9. Install the wheel and tire assemblies (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
10. Remove the supports and lower the vehicle.
11. Verify a firm pedal before moving the vehicle.

# DISC BRAKE CALIPER ADAPTER

## REMOVAL

1. Raise and support the vehicle.
2. Remove the front wheel and tire assembly.
3. Drain a small amount of fluid from master cylinder brake reservoir with a **clean** suction gun.
4. Bottom the caliper pistons into the caliper by prying the caliper over.
5. Remove the caliper mounting bolts.
6. Remove the disc brake caliper from the mount.

**CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.**

7. Remove the inboard and outboard brake pads. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL).
8. Remove the caliper adapter mounting bolts .

## INSTALLATION

1. Install the caliper adapter mounting bolts. Tighten the mounting bolts to 135 N·m (100 ft.lbs).
2. Install the inboard and outboard pads. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).
3. Install the caliper mounting bolts.
4. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

# ROTORS

## DIAGNOSIS AND TESTING

## DISC BRAKE ROTOR

The rotor braking surfaces should not be refinished unless necessary.

Light surface rust and scale can be removed with a lathe equipped with dual sanding discs. The rotor surfaces can be restored by machining in a disc brake lathe if surface scoring and wear are light.

Replace the rotor under the following conditions:

- severely scored
- tapered
- hard spots
- cracked
- below minimum thickness

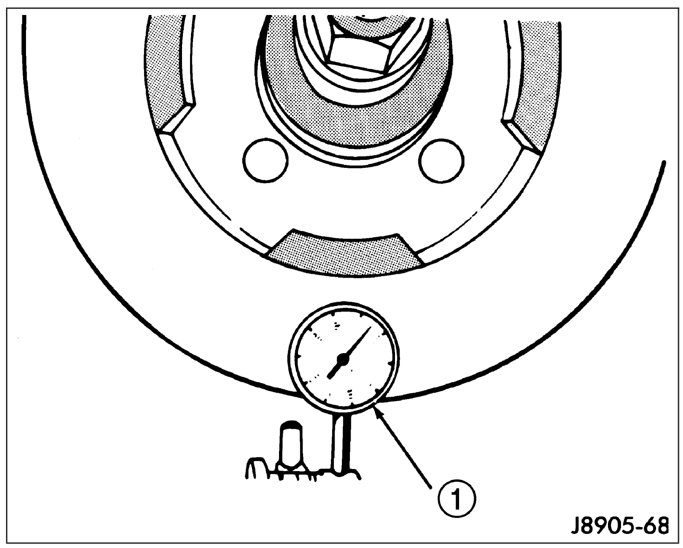
### ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if worn below minimum thickness, or if machining would reduce thickness below the allowable minimum.

Rotor minimum thickness is usually specified on the rotor hub. The specification is either stamped or cast into the hub surface.

### ROTOR RUNOUT

Check rotor lateral runout with dial indicator C-3339 (1). Excessive lateral runout will cause brake pedal pulsation and rapid, uneven wear of the brake shoes. Position the dial indicator plunger approximately 25.4 mm (1 in.) inward from the rotor edge. The dial indicator should be positioned in the center of the rotor surface. Maximum allowable rotor runout is 0.102 mm (0.004 in.).



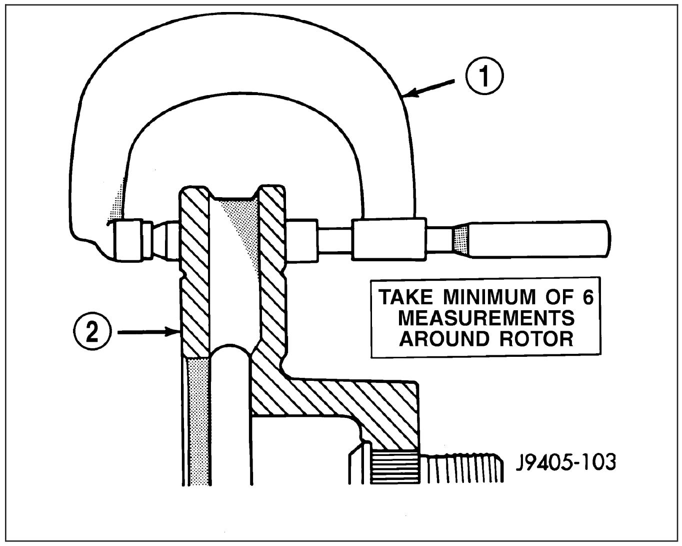
## ROTOR THICKNESS VARIATION

Variations in rotor thickness will cause pedal pulsation, noise and shudder.

Measure rotor thickness at 6 to 12 points around the rotor face.

Position the micrometer (1) approximately 25.4 mm (1 in.) from the rotor (2) outer circumference for each measurement.

Thickness should not **vary** by more than 0.013 mm (0.0005 in.) from point-to-point on the rotor. Machine or replace the rotor if necessary.



## BRAKE DRUM IN HAT ROTOR

The maximum allowable diameter of the drum braking surface is indicated on the drum outer edge. Always replace the drum if machining would cause drum diameter to exceed the size limit indicated on the drum in hat.

### BRAKE DRUM RUNOUT

Measure drum diameter and runout with an accurate gauge. The most accurate method of measurement involves mounting the drum in a brake lathe and checking variation and runout with a dial indicator.

Machine the drum if runout or variation exceed values. Replace the drum in hat rotor if machining causes the drum in hat rotor to exceed the maximum allowable diameter.

## STANDARD PROCEDURE

## DISC BRAKE ROTOR

The disc brake rotor can be machined if scored or worn. The lathe must machine both sides of the rotor simultaneously with dual cutter heads. The rotor mounting surface must be clean before placing on the lathe. Equipment capable of machining only one side at a time may produce a tapered rotor. A hub mounted on-vehicle lathe is recommended. This type of lathe trues the rotor to the vehicles hub/bearing.

**CAUTION: Brake rotors that do not meet minimum thickness specifications before or after machining must be replaced.**

## BRAKE DRUM IN HAT ROTOR MACHINING

The brake drum in hat rotor can be machined on a drum lathe when necessary. Initial machining cuts should be limited to 0.12 - 0.20 mm (0.005 - 0.008 in.) at a time as heavier feed rates can produce taper and surface variation. Final finish cuts of 0.025 to 0.038 mm (0.001 to 0.0015 in.) are recommended and will generally provide the best surface finish.

Be sure the drum in hat rotor is securely mounted in the lathe before machining operations. A damper strap should always be used around the drum to reduce vibration and avoid chatter marks.

The maximum allowable diameter of the drum braking surface is stamped or cast into the drum in hat rotor.

**CAUTION: Replace the drum in hat rotor if machining will cause the drum to exceed the maximum allowable diameter.**

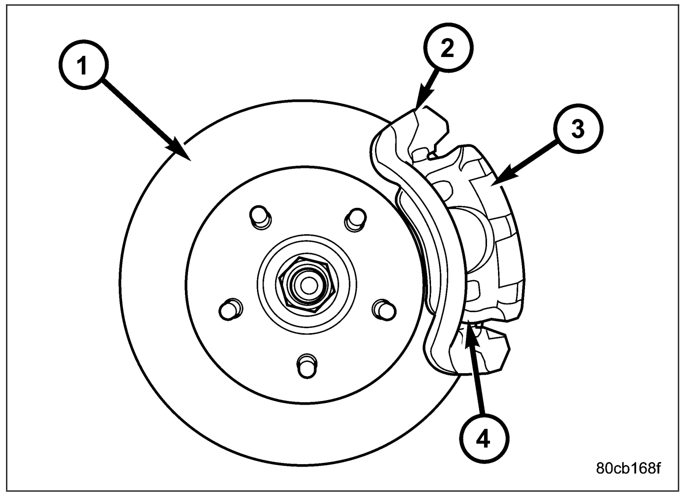
## REMOVAL

### FRONT

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.

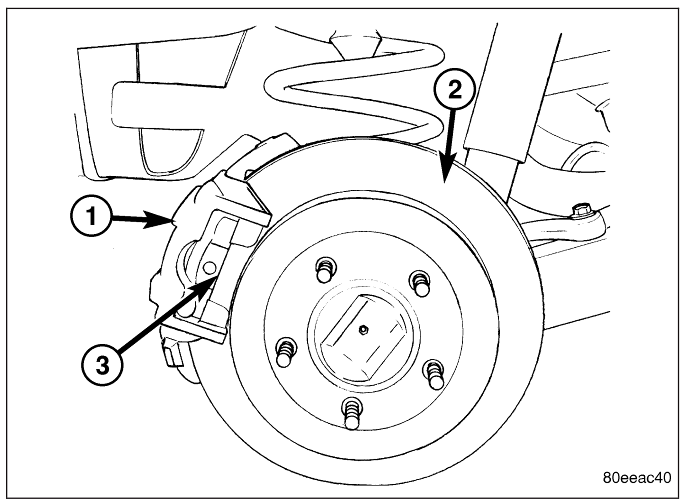
**CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.**

3. Remove the caliper adapter (2). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).
4. Remove the disc brake rotor (1).



### REAR

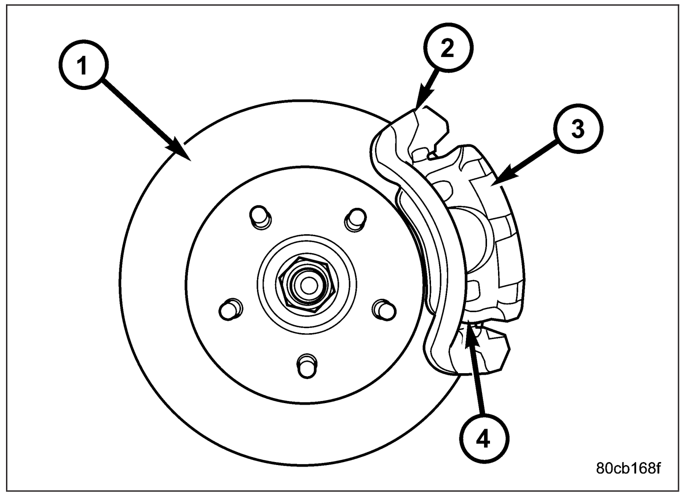
1. Raise and support the vehicle
2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper (1) and pads (3), (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the retianing clips and rotor assembly.



## INSTALLATION

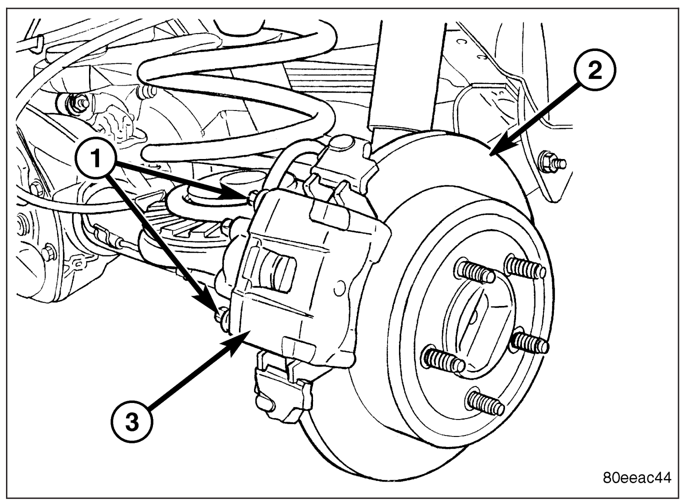
### FRONT

1. Install the disc brake rotor (1) to the hub.
2. Install the caliper mounting adapter (2). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).
3. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).



### REAR

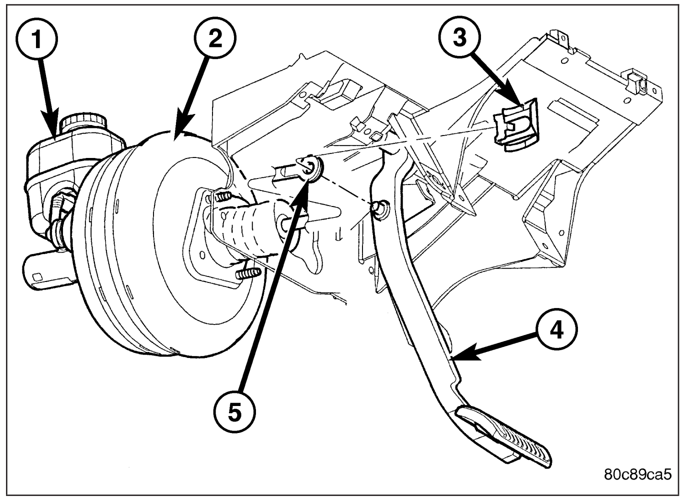
1. Install the rotor (2) to the axleshaft.
2. Install the disc brake caliper (3) and pads , (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
3. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
4. Lower the vehicle.



# PEDAL

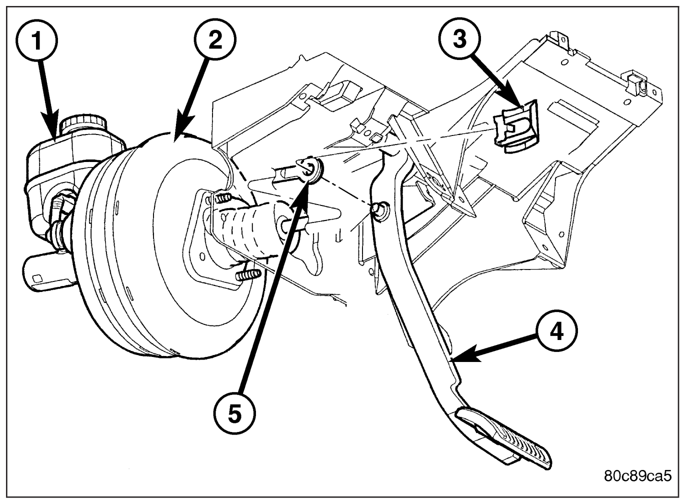
## DESCRIPTION

A suspended-type brake pedal (4) is used, the pedal pivots on a shaft mounted in the steering column support bracket. The bracket is attached to the dash panel. The unit is serviced as an assembly, except for the pedal pad.



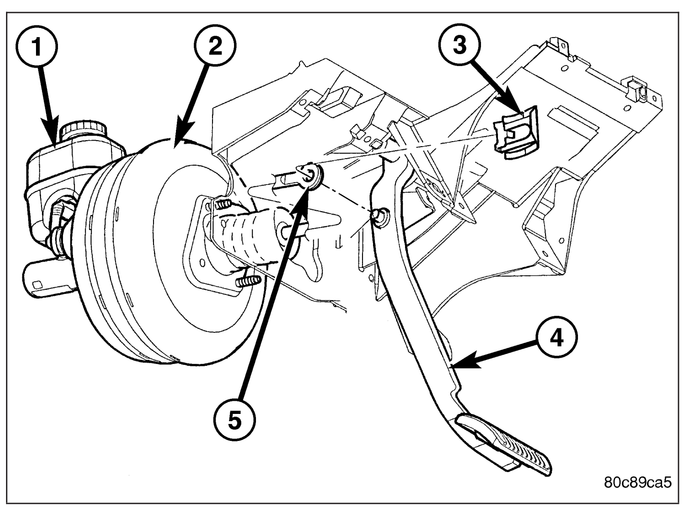
## OPERATION

The brake pedal (4) is attached to the booster push rod (5). When the pedal is depressed, the primary booster push rod (5) is depressed which move the booster secondary rod. The booster secondary rod depress the master cylinder piston (1).



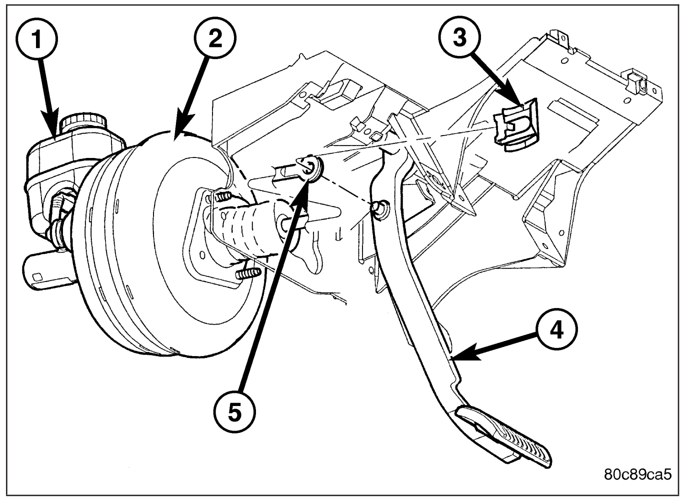
## REMOVAL

1. Remove the knee blocker under the steering column, (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).
2. Remove the retainer clip securing the booster push rod (5) to pedal (4).
3. Remove the brake lamp switch, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL).
4. Remove the nuts securing the pedal to the column bracket.
5. Remove the pedal from the vehicle.



## INSTALLATION

1. Install the pedal (4) into the vehicle.
2. Install the nuts securing the pedal to the column bracket.
3. Tighten the nuts to 22.6 N·m (200 in. lbs.).
4. Lubricate the brake pedal pin and bushings with Mopar multi-mileage grease.
5. Install the booster push rod (5) on the pedal pin and install a new retainer clip.
6. Install the brake lamp switch, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION).
7. Install the knee blocker, (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION).



# POWER BRAKE BOOSTER

## DESCRIPTION

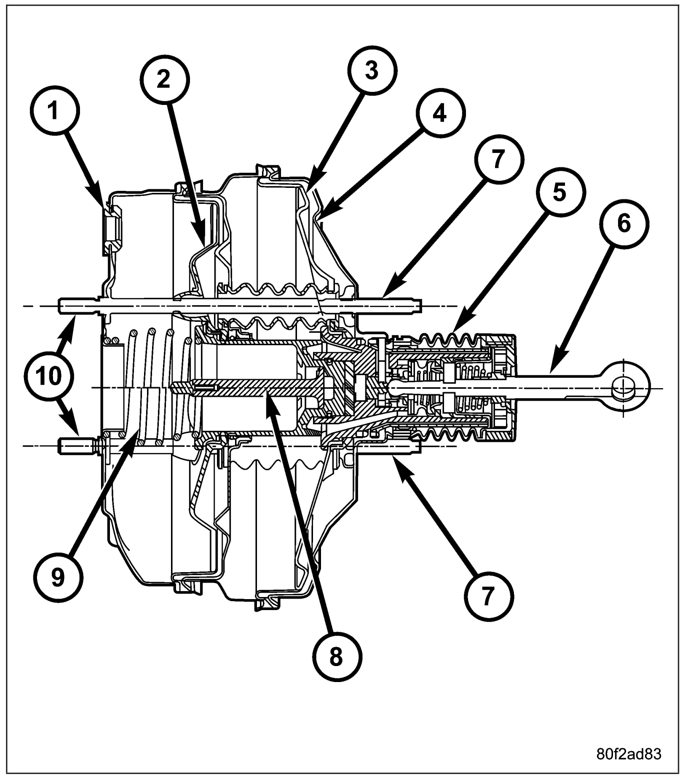
The booster assembly consists of a housing divided into separate chambers by two internal diaphragms. The outer edge of each diaphragm is attached to the booster housing. The diaphragms are connected to the booster primary push rod.

Two push rods are used in the booster. The primary push rod connects the booster to the brake pedal. The secondary push rod connects the booster to the master cylinder to stroke the cylinder pistons.

The booster assembly is of the tie-bar design. This means the structural support of the assembly is through the tie-bars, whose ends protrude through the booster shell. One end is the master cylinder mounting stud and the other end is the booster mounting stud. The booster assembly (with properly functioning check valve installed) may not have a good vacuum seal unless the booster is installed on the dash panel mounting bracket with master cylinder and booster mounting nuts properly torqued.

## OPERATION

The atmospheric inlet valve is opened and closed by the primary push rod (6). Booster vacuum supply is through a hose attached to an intake manifold fitting at one end and to the booster check valve (1) at the other. The vacuum check valve (1) in the booster housing (4) is a one-way device that prevents vacuum leak back.



Power assist is generated by utilizing the pressure differential between normal atmospheric pressure and a vacuum. The vacuum needed for booster operation is taken directly from the engine intake manifold. The entry point for atmospheric pressure is through a filter and inlet valve at the rear of the housing.

The chamber areas forward of the booster diaphragms are exposed to vacuum from the intake manifold. The chamber areas to the rear of the diaphragms, are exposed to normal atmospheric pressure of 101.3 kilopascals (14.7 pounds/square in.).

Brake pedal application causes the primary push rod to open the atmospheric inlet valve. This exposes the area behind the diaphragms to atmospheric pressure. The resulting pressure differential provides the extra apply force for power assist.

The booster check valve, check valve grommet and booster seals are serviceable.

## DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start engine and check booster vacuum hose connections. A hissing noise indicates vacuum leak. Correct any vacuum leak before proceeding, also ensure booster mounting nuts are torqued correctly.
2. Stop engine and shift transmission into Neutral.
3. Pump brake pedal until all vacuum reserve in booster is depleted.
4. Press and hold brake pedal under light foot pressure. The pedal should hold firm, if the pedal falls away master cylinder is faulty (internal leakage).
5. Start engine and note pedal action. It should fall away slightly under light foot pressure then hold firm. If no pedal action is discernible, power booster, vacuum supply, or vacuum check valve is faulty. Proceed to the POWER BOOSTER VACUUM TEST.
6. If the POWER BOOSTER VACUUM TEST passes, rebuild booster vacuum reserve as follows: Release brake pedal. Increase engine speed to 1500 rpm, close the throttle and immediately turn off ignition to stop engine.

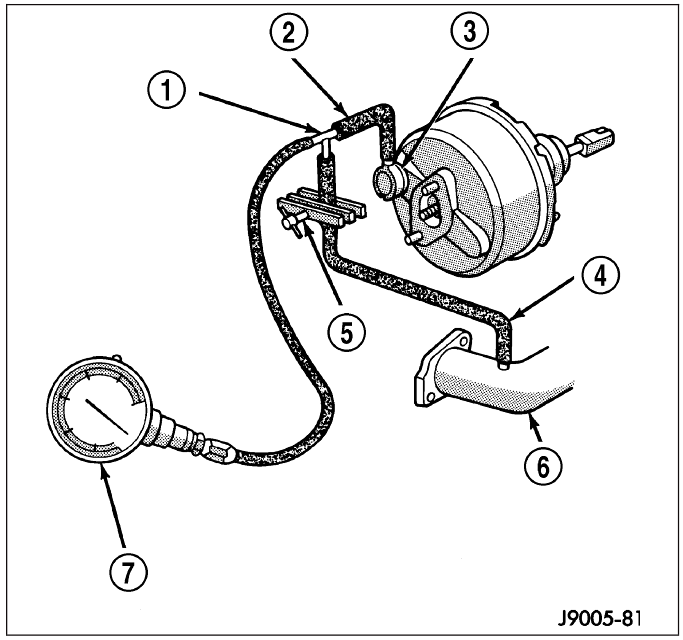
7. Wait a minimum of 90 seconds and try brake action again. Booster should provide two or more vacuum assisted pedal applications. If vacuum assist is not provided, booster is faulty.

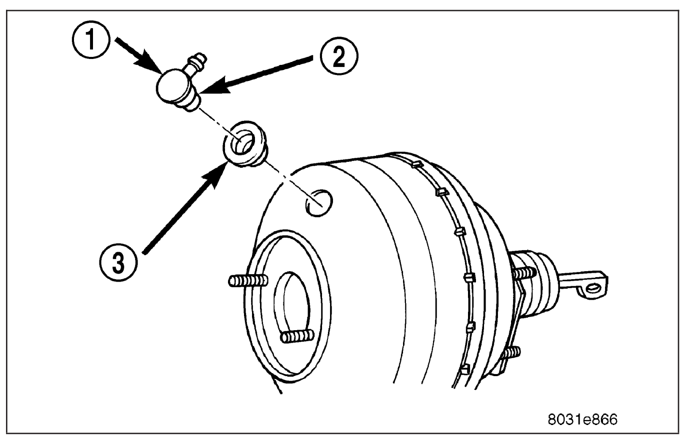
## POWER BOOSTER VACUUM TEST

1. Connect vacuum gauge to booster check valve with short length of hose and T-fitting.
2. Start and run engine at curb idle speed for one minute.
3. Observe the vacuum supply. If vacuum supply is not adequate, repair vacuum supply.
4. Clamp hose shut between vacuum source and check valve.
5. Stop engine and observe vacuum gauge.
6. If vacuum drops more than one inch Hg (33 millibars) within 15 seconds, booster diaphragm or check valve is faulty.

## POWER BOOSTER CHECK VALVE TEST

1. Disconnect vacuum hose from check valve.
2. Remove check valve and valve seal from booster.
3. Use a hand operated vacuum pump for test.
4. Apply 15-20 inches vacuum at large end of check valve.
5. Vacuum should hold steady. If gauge on pump indicates vacuum loss, check valve is faulty and should be replaced.



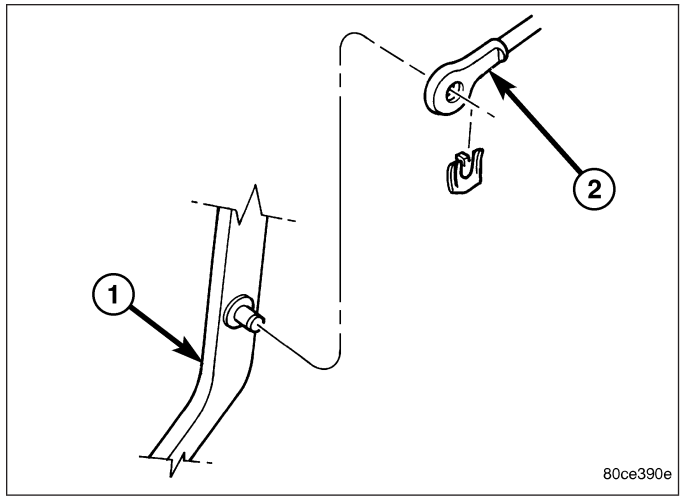


## REMOVAL

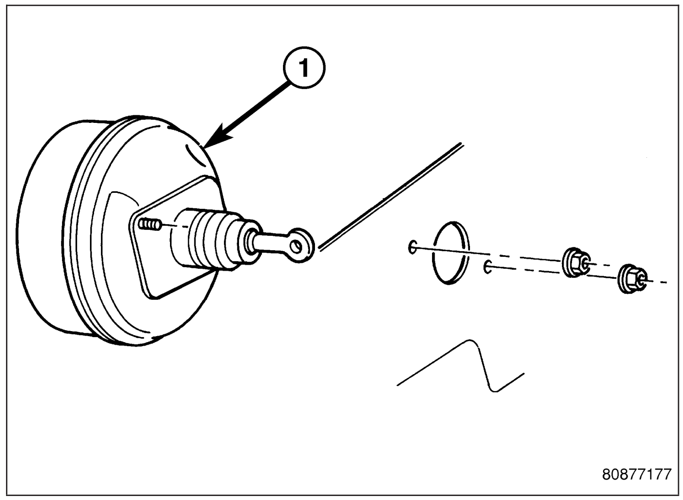
## LEFT HAND DRIVE (LHD)

1. Disconnect the wire to the fluid level switch at the bottom of the reservoir.
2. Remove the master cylinder (Refer to 5 - BRAKES/ HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL).
3. Disconnect vacuum hoses from booster check valve.
4. Remove the brake lines from the master cylinder and the HCU (abs vehicles only) or the junction block for clearance.
5. Disconnect the HCU from the mounts and move to the side for clearance of the booster.
6. Remove knee blocker under the steering column, (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).

7. Remove the brake light switch and discard, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL)
8. Remove retaining clip that secures booster push rod (2) to brake pedal (1).



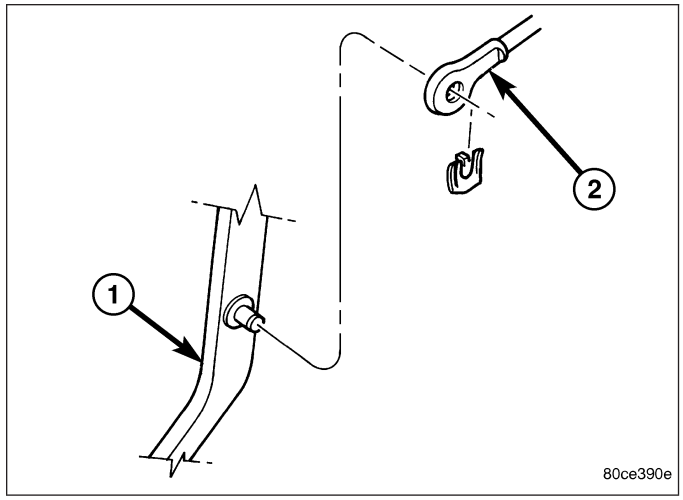
9. Remove nuts attaching booster (1) to the dash panel.
10. In engine compartment, slide booster studs out of dash panel, tilt booster upward, and remove booster from engine compartment.



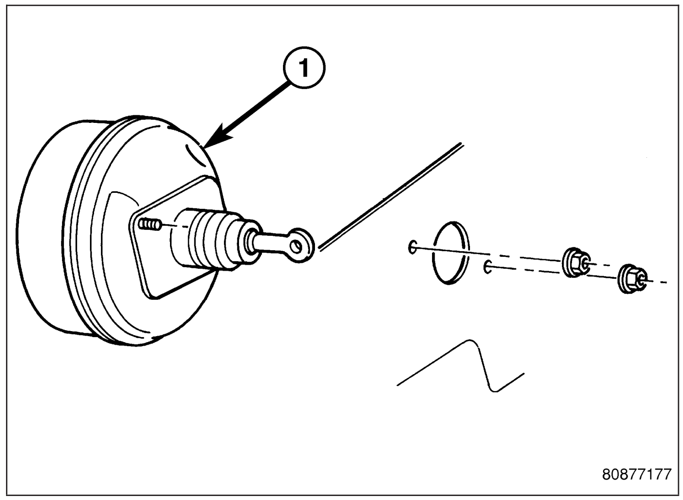
## RIGHT HAND DRIVE (RHD)

1. Remove the air box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
2. Relocate the cruise control servo to gain access to the booster for removal.
3. Remove the brake lines from the master cylinder.
4. Remove the master cylinder (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL).
5. Disconnect vacuum hose from booster check valve.
6. Remove knee blocker under the steering column, (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).

7. Remove the brake light switch and discard, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL)
8. Remove retaining clip that secures booster push rod (2) to brake pedal (1).



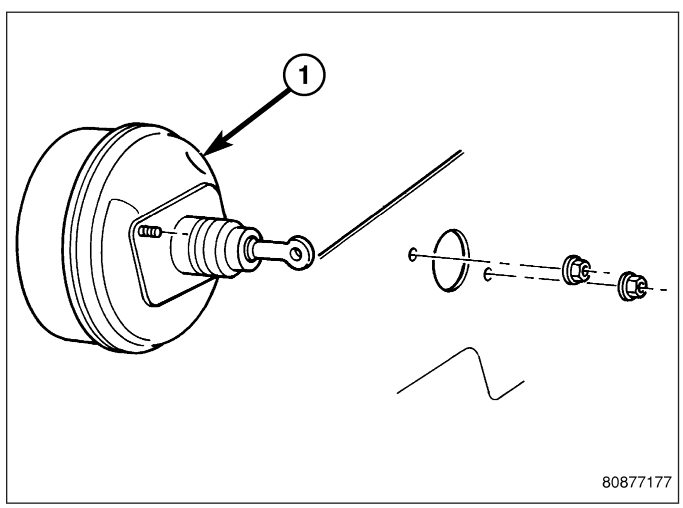
9. Remove nuts attaching booster (1) to the dash panel.
10. In engine compartment, slide booster studs out of dash panel, tilt booster upward, and remove booster from engine compartment.



## INSTALLATION

## LEFT HAND DRIVE (LHD)

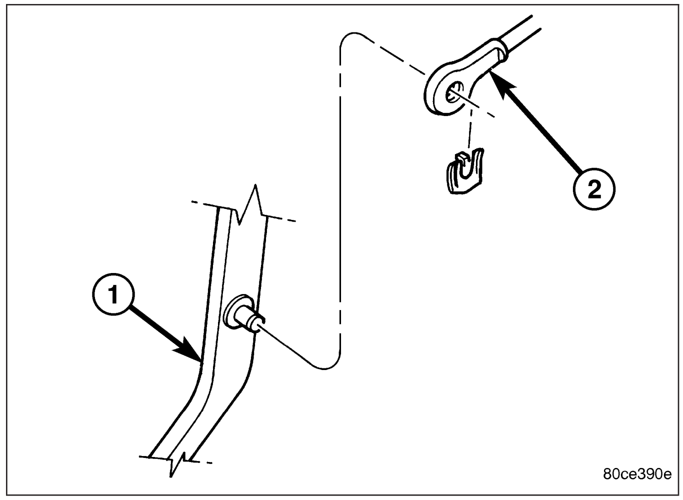
1. Align and position booster (1) on the dash panel.
2. Install booster mounting nuts. Tighten nuts just enough to hold booster in place.



3. Slide booster push rod (2) onto the brake pedal (1). Then secure push rod to pedal pin with retaining clip.

**NOTE: Lubricate the pedal pin with Mopar multi-mileage grease before installation.**

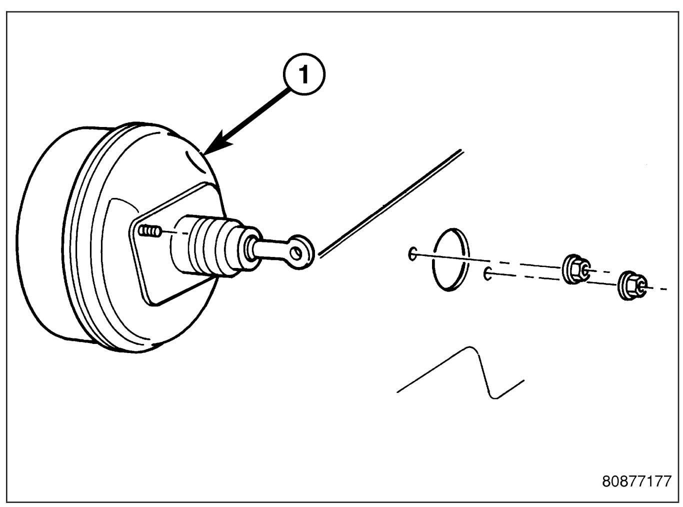
4. Tighten booster mounting nuts to 25 N·m (220 in. lbs.).



5. Install a new brake lamp switch and reconnect the electrical connector.
6. Install the knee blocker, (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION).
7. If original master cylinder is being installed, check condition of seal at rear of master cylinder. Replace seal if cut, or torn.
8. Clean cylinder mounting surface of brake booster. Use shop towel wetted with brake cleaner for this purpose. Dirt, grease, or similar materials will prevent proper cylinder seating and could result in vacuum leak.
9. Align and install master cylinder on the booster studs. Install mounting nuts and tighten to 25 N·m (220 in. lbs.).
10. Connect vacuum hose to booster check valve.
11. Remount the HCU. Tighten bracket mounting nuts to 14 N·m (125 in. lbs.).
12. Connect and secure the brake lines to HCU or junction block and master cylinder. Start all brake line fittings by hand to avoid cross threading.
13. Connect the wire to fluid level switch at the bottom of the reservoir.
14. Fill and bleed base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).
15. Verify proper brake operation before moving vehicle.

## RIGHT HAND DRIVE (RHD)

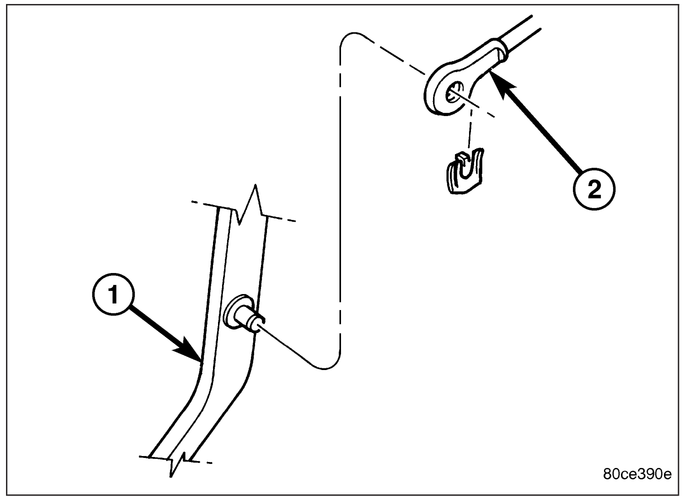
1. Align and position booster (1) on the dash panel.
2. Install booster mounting nuts. Tighten nuts just enough to hold booster in place.



3. Slide booster push rod (2) onto the brake pedal (1). Then secure push rod (2) to pedal pin with retaining clip.

**NOTE: Lubricate the pedal pin with Mopar multi-mileage grease before installation.**

4. Tighten booster mounting nuts to 39 N·m (29 ft. lbs.).
5. Install a new brake lamp switch and reconnect the electrical connector.



6. Install the knee blocker, (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION).
7. If original master cylinder is being installed, check condition of seal at rear of master cylinder. Replace seal if cut, or torn.
8. Clean cylinder mounting surface of brake booster. Use shop towel wetted with brake cleaner for this purpose. Dirt, grease, or similar materials will prevent proper cylinder seating and could result in vacuum leak.
9. Align and install master cylinder on the booster studs. Install mounting nuts and tighten to 17.5 N·m (155 in. lbs.).
10. Connect vacuum hose to booster check valve.
11. Remount the cruise control servo to the original location. Tighten bracket mounting nuts to 17.5 N·m (155 in. lbs.).
12. Connect and secure the brake lines to HCU and master cylinder. Start all brake line fittings by hand to avoid cross threading.
13. Connect the wire to fluid reservoir.
14. Install the air box.
15. Fill and bleed base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).
16. Verify proper brake operation before moving vehicle.

# MASTER CYLINDER

## DESCRIPTION

The master cylinder has a removable nylon reservoir. The cylinder body is made of aluminum and contains a primary and secondary piston assembly. The cylinder body including the piston assemblies are not serviceable. If diagnosis indicates an internal problem with the cylinder body, it must be replaced as an assembly. The reservoir and grommets are the only replaceable parts on the master cylinder.

## OPERATION

The master cylinder bore contains a primary and secondary piston. The primary piston supplies hydraulic pressure to the front brakes. The secondary piston supplies hydraulic pressure to the rear brakes. The master cylinder reservoir stores reserve brake fluid for the hydraulic brake circuits.

## DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start engine and check booster vacuum hose connections. A hissing noise indicates vacuum leak. Correct any vacuum leak before proceeding, also ensure booster mounting nuts are torqued correctly.
2. Stop engine and shift transmission into Neutral.
3. Pump brake pedal until all vacuum reserve in booster is depleted.
4. Press and hold brake pedal under light foot pressure. The pedal should hold firm, if the pedal falls away master cylinder is faulty (internal leakage).
5. Start engine and note pedal action. It should fall away slightly under light foot pressure then hold firm. If no pedal action is discernible, power booster, vacuum supply, or vacuum check valve is faulty. Proceed to the POWER BOOSTER VACUUM TEST.
6. If the POWER BOOSTER VACUUM TEST passes, rebuild booster vacuum reserve as follows: Release brake pedal. Increase engine speed to 1500 rpm, close the throttle and immediately turn off ignition to stop engine.
7. Wait a minimum of 90 seconds and try brake action again. Booster should provide two or more vacuum assisted pedal applications. If vacuum assist is not provided, booster is faulty.

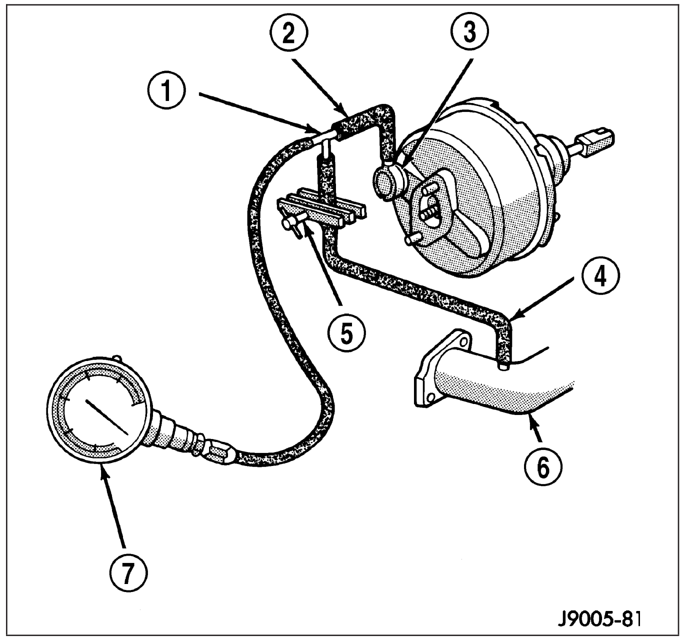
### POWER BOOSTER VACUUM TEST

1. Connect vacuum gauge to booster check valve with short length of hose and T-fitting.
2. Start and run engine at curb idle speed for one minute.
3. Observe the vacuum supply. If vacuum supply is not adequate, repair vacuum supply.
4. Clamp hose shut between vacuum source and check valve.
5. Stop engine and observe vacuum gauge.

6. If vacuum drops more than one inch Hg (33 millibars) within 15 seconds, booster diaphragm or check valve is faulty.

## POWER BOOSTER CHECK VALVE TEST

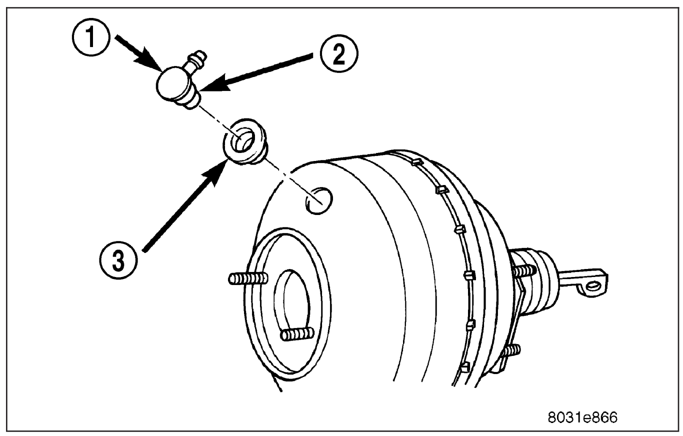
1. Disconnect vacuum hose from check valve.
2. Remove check valve and valve seal from booster.
3. Use a hand operated vacuum pump for test.
4. Apply 15-20 inches vacuum at large end of check valve.
5. Vacuum should hold steady. If gauge on pump indicates vacuum loss, check valve is faulty and should be replaced.

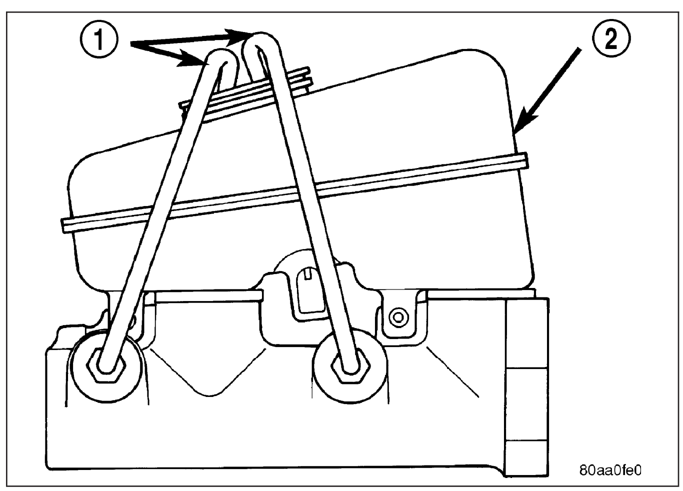


## STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

A new master cylinder should be bled before installation on the vehicle. Required bleeding tools include bleed tubes and a wood dowel to stroke the pistons. Bleed tubes can be fabricated from brake line.

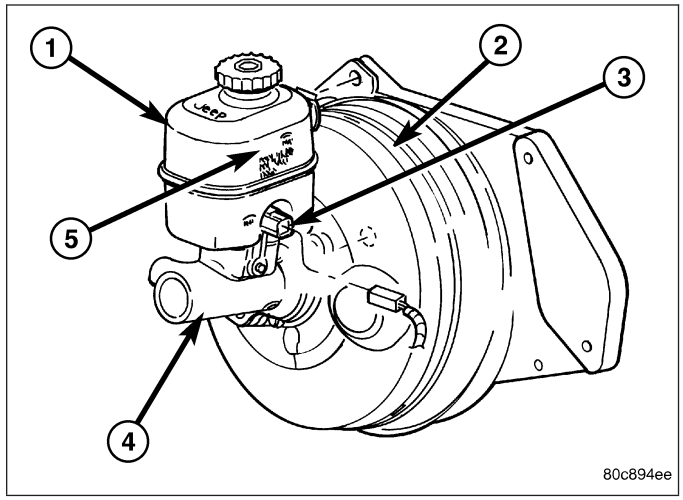
1. Mount master cylinder in vise.
2. Attach bleed tubes to cylinder outlet ports. Then position each tube end into reservoir.
3. Fill reservoir with fresh brake fluid.
4. Press cylinder pistons inward with wood dowel. Then release pistons and allow them to return under spring pressure. Continue bleeding operations until air bubbles are no longer visible in fluid.





## REMOVAL

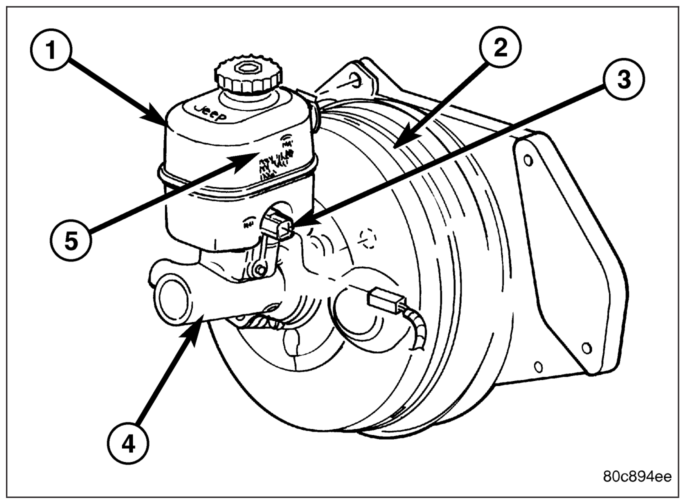
1. Siphon and drain the fluid from the reservoir (1).
2. Remove the brake lines at the master cylinder (4).
3. Disconnect the fluid level electrical connector (3) from the reservoir (1).
4. Remove mounting nuts from the master cylinder (4).
5. Remove master cylinder (4).
6. Remove cylinder cover and drain the rest of the fluid.
7. If master cylinder reservoir requires service, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID RESERVOIR - REMOVAL).



## INSTALLATION

**NOTE: If master cylinder is replaced, bleed cylinder before installation.**

1. Clean cylinder mounting surface of brake booster (2).
2. Install master cylinder (4) onto brake booster studs.
3. Install mounting nuts and tighten to 25 N·m (220 in. lbs.).
4. Connect the brake lines to the master cylinder and tighten to 20 N·m (180 in. lbs.).
5. Connect fluid level electrical connector (3) to the reservoir (1).
6. Fill and bleed base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).



# FLUID

## DESCRIPTION

## BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

**CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.**

**CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.**

## DIAGNOSIS AND TESTING

## BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

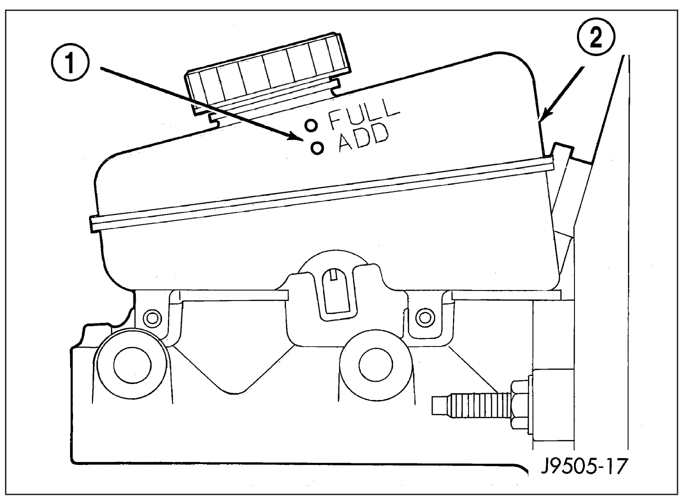
To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brakes hydraulic unit and all hydraulic fluid hoses.

## STANDARD PROCEDURE - MASTER CYLINDER FLUID LEVEL

Always clean the master cylinder reservoir and cap before adding fluid. This will prevent dirt from falling in the reservoir and contaminating the brake fluid.

The reservoir has a ADD and a FULL mark on the side fill to the FULL mark.



# FLUID RESERVOIR

## REMOVAL

1. Install prop rod on brake pedal to keep pressure on the brake system.
2. Remove reservoir cap and siphon fluid into drain container.
3. Remove the electrical connector from the fluid level switch in the reservoir.
4. Remove the reservoir mounting bolt.
5. Remove the reservoir from the master cylinder by pulling upwards.
6. Remove old grommets from cylinder body.

## INSTALLATION

1. Fill and bleed master cylinder on bench before installation in vehicle.

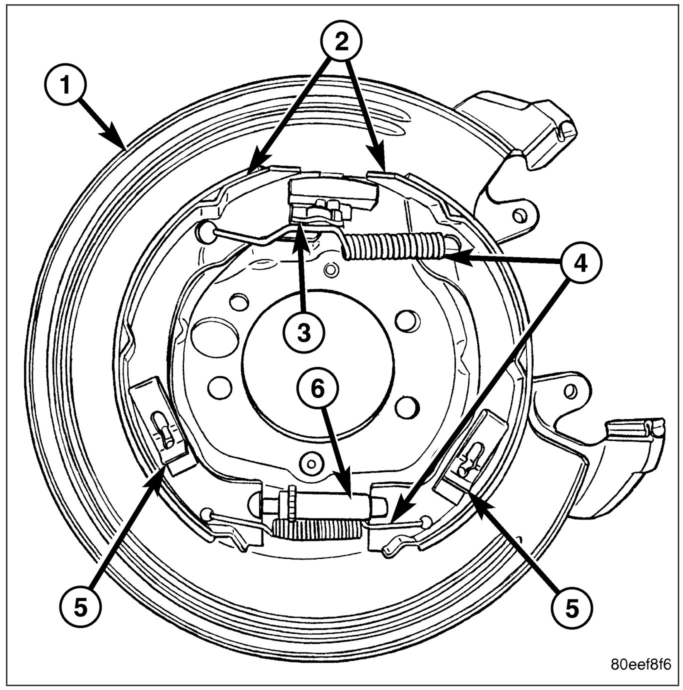
**CAUTION: Do not use any type of tool to install the grommets. Tools may cut, or tear the grommets creating a leak problem after installation. Install the grommets using finger pressure only.**

2. Lubricate new grommets with clean brake fluid and Install new grommets in cylinder body. Use finger pressure to install and seat grommets.
3. Start reservoir in grommets. Then rock reservoir back and forth while pressing downward to seat it in grommets.
4. Install the mounting bolt for the reservoir to the master cylinder.
5. Reconnect the electrical connector to the fluid reservoir level switch.
6. Remove the prop rod from the vehicle.
7. Fill and bleed base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).

# SUPPORT PLATE

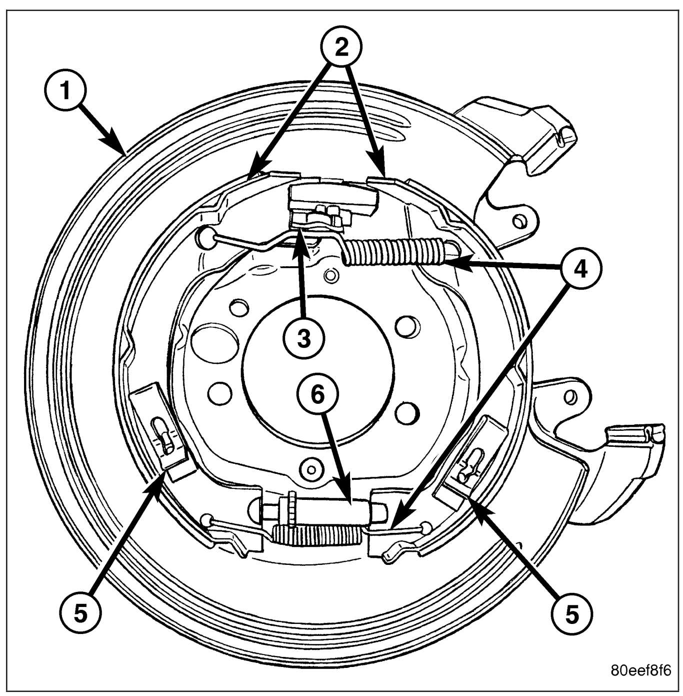
## REMOVAL

1. Remove wheel and tire assembly.
2. Remove the disc brake caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
3. Remove the rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
4. Remove the axle shaft , (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - AXLE SHAFTS - REMOVAL).
5. Remove the park brake shoes (2) , (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - REMOVAL).
6. Remove the parking brake cable from the brake lever.
7. Remove the bolts attaching the support plate (1) to the axle and remove the support plate (1).

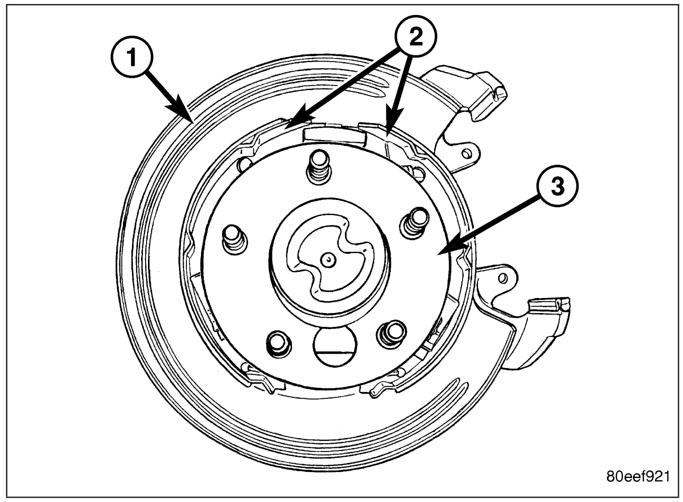


## INSTALLATION

1. Install support plate on axle flange. Tighten attaching bolts to 115 N·m (85 ft. lbs.).
2. Install the park brake shoes (2) , (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION).
3. Install parking brake cable in the brake lever.



4. Install axle shaft (3), (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - AXLE SHAFTS - INSTALLATION).



5. Adjust brake shoes to drum with brake gauge (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).
6. Install the rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
7. Install the caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
8. Install the wheel and tire assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

# PARKING BRAKE

## DESCRIPTION

The parking brake is a hand lever and cable operated system used to apply the rear brakes.

## OPERATION

A hand operated lever in the passenger compartment is the main application device. The front cable is connected between the hand lever and the rear cables with an equalizer.

The rear cables are connected to the actuating lever on each primary brake shoe. The levers are attached to the brake shoes by a pin either pressed into, or welded to the lever. A clip is used to secure the pin in the brake shoe. The pin allows each lever to pivot independently of the brake shoe.

To apply the parking brakes, the hand lever is pulled upward. This pulls the rear brake shoe actuating levers forward, by means of a tensioner and cables. As the actuating lever is pulled forward, the parking brake strut (which is connected to both shoes), exerts a linear force against the secondary brake shoe. This action presses the secondary shoe into contact with the drum. Once the secondary shoe contacts the drum, force is exerted through the strut. This force is transferred through the strut to the primary brake shoe causing it to pivot into the drum as well.

A gear type ratcheting mechanism is used to hold the lever in an applied position. Parking brake release is accomplished by the hand lever release button.

A parking brake switch is mounted on the parking brake lever and is actuated by movement of the lever. The switch, which is in circuit with the red warning light in the dash, will illuminate the warning light whenever the parking brakes are applied.

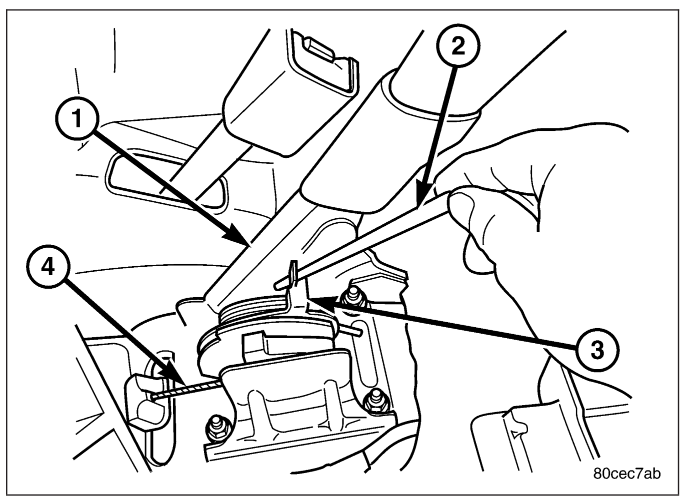
Parking brake is self-adjusting when the lever is pulled. The cable tensioner, once adjusted at the factory, should not need further adjustment under normal circumstances.

## ADJUSTMENTS

## LOCK OUT

**NOTE: The parking brake is self-adjusting, it can not be adjusted.**

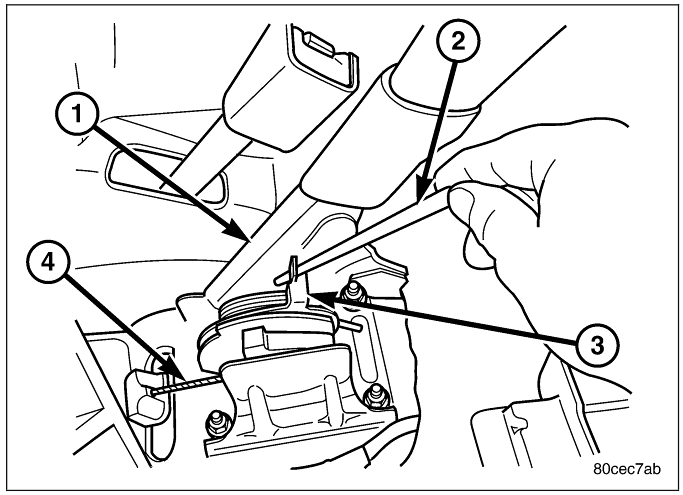
1. Remove the center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
2. Pull up on the spring until the tab on the lever passes the tab on the cable guide (3) and install a punch (2) in the hole on the side then release.
3. The park brake system is now locked out to perform necessary repairs.



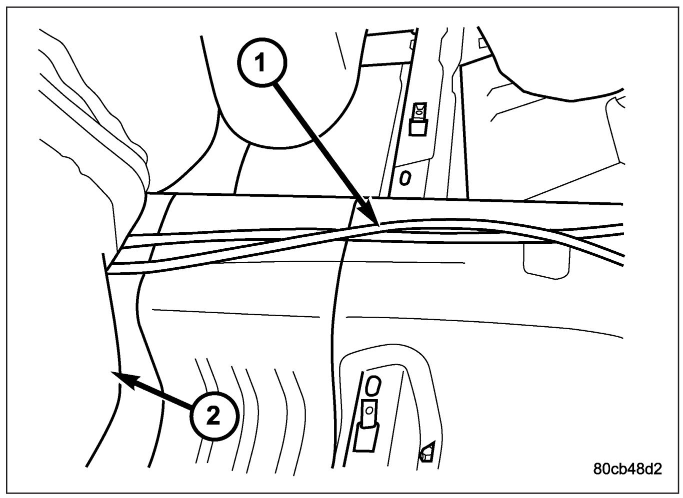
# CABLES

## REMOVAL

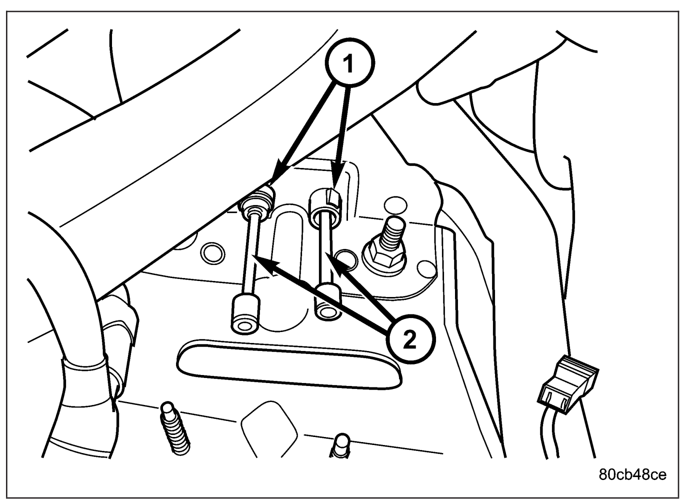
1. Lock out the parking brake cables (Refer to 5 - BRAKES/PARKING BRAKE - ADJUSTMENTS).



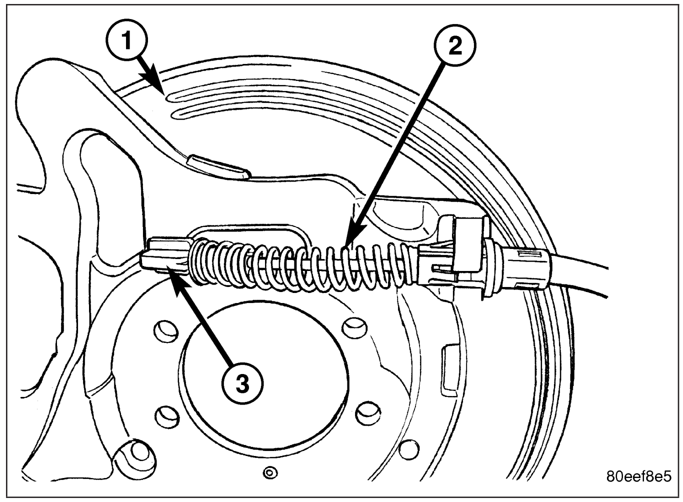
2. Remove the rear seat (Refer to 23 - BODY/SEATS/ SEAT - REMOVAL).
3. Pull the carpet forward far enough in the rear to gain access to the two parking brake cables thru the floor.
4. Disconnect the two cables (1) from the front mount.



5. Push the cables (2) thru the floor with the grommets.
6. Remove the cable from the axle bracket with a proper sized box end wrench over the tangs (1).

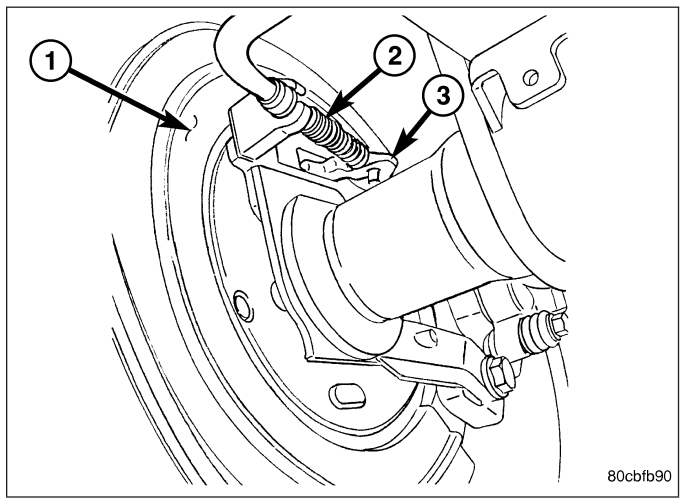


7. Remove the brake cable (2) from the brake lever (3).

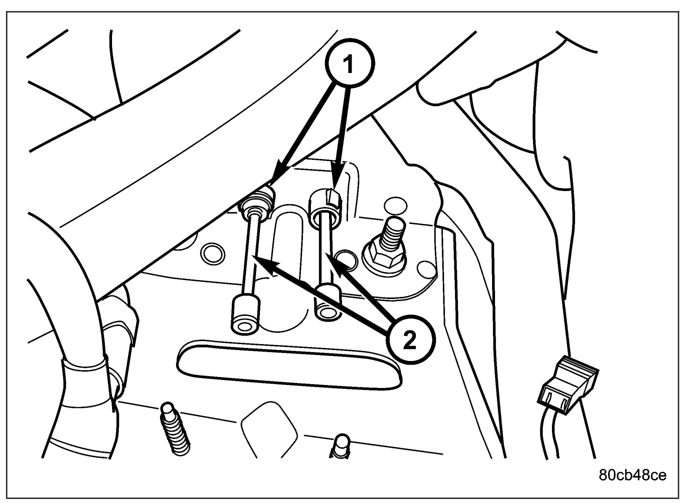


## INSTALLATION

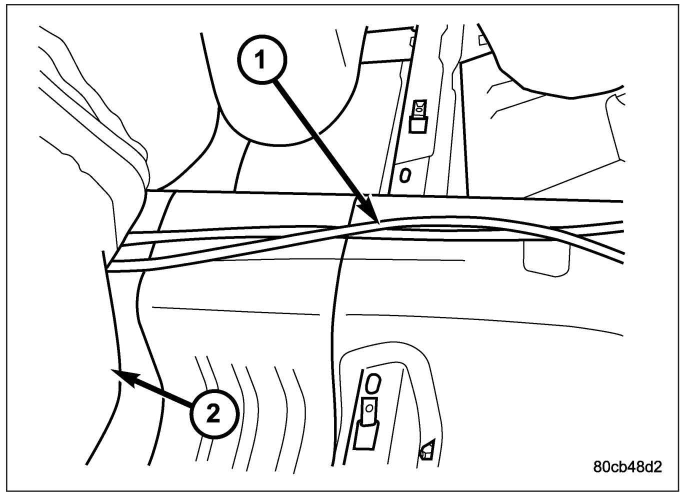
1. Install the cables (2) into the axle bracket.
2. Reconnect the cable to the park brake lever (3).



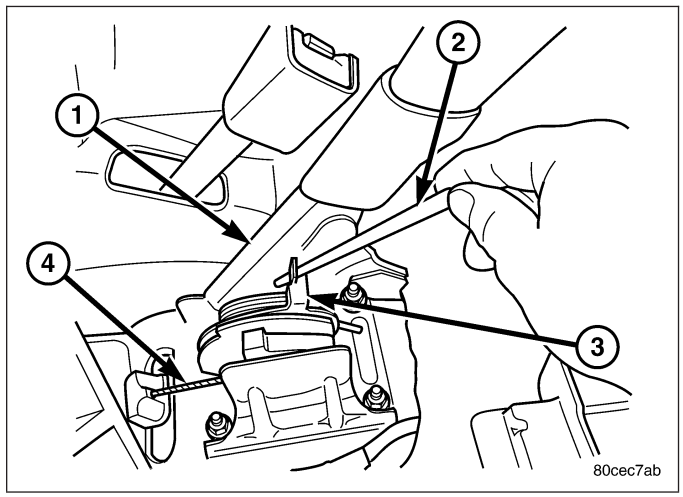
3. Push the cables (2) thru the floor and seat the tangs (1).



4. Reconnect the two cables (1) to the front mount.
5. Lay the carpet (2) back down in the rear.
6. Install the rear seat (Refer to 23 - BODY/SEATS/ SEAT - INSTALLATION).



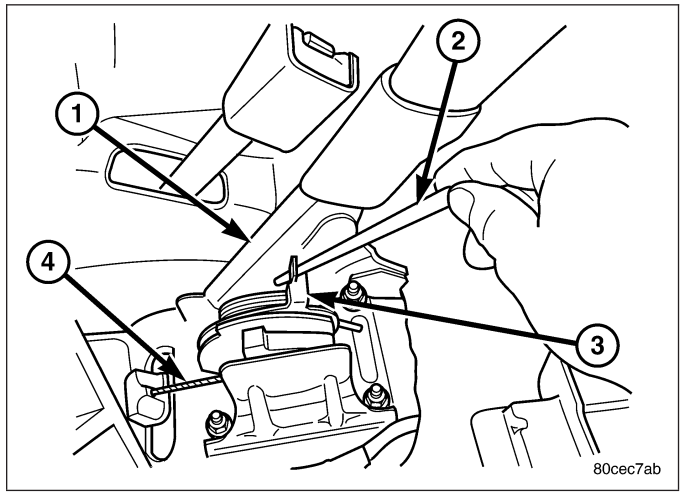
7. Remove the lock out device (2) on the lever (1).
8. Adjust the park brake shoes (Refer to 5 - BRAKES/ PARKING BRAKE/SHOES - ADJUSTMENTS).
9. Test the parking brake.



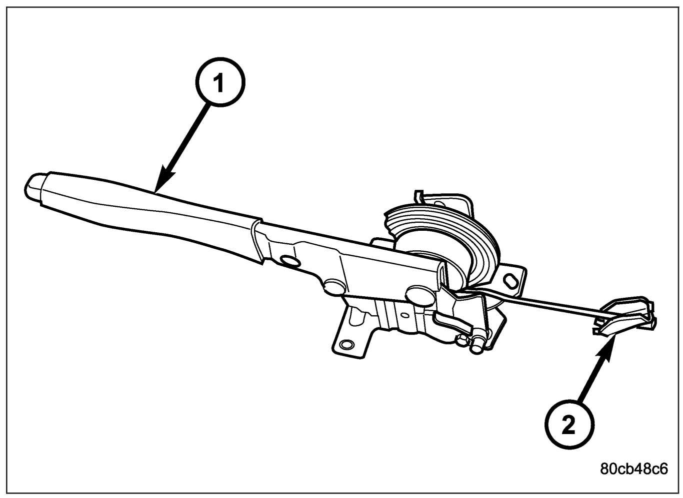
# LEVER

## REMOVAL

1. Remove the center floor console, (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
2. Lock out the parking brakes (Refer to 5 - BRAKES/ PARKING BRAKE - ADJUSTMENTS).

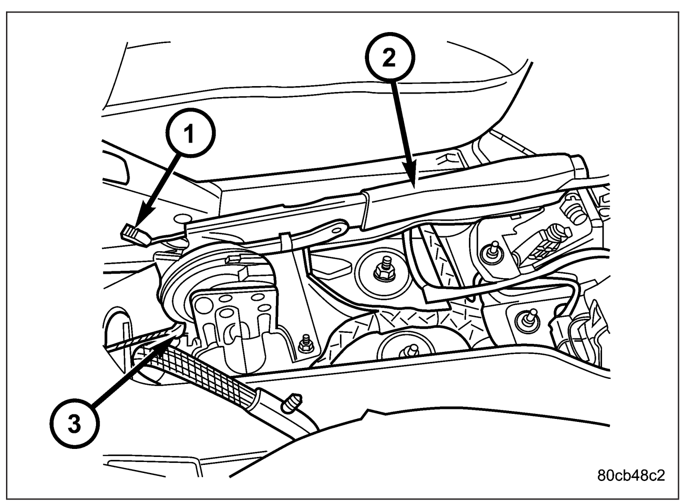


3. Disengage the front cables from the equalizer (2).
4. Disconnect the parking brake lamp switch wire.
5. Remove the parking brake lever assembly (1) mounting bolts.
6. Remove the lever assembly (1).



## INSTALLATION

1. Install the parking brake lever assembly (2).
2. Install the parking brake lever assembly (2) to the mounting bolts and tighten.
3. Engage the front cables (3) to the equalizer.
4. Reconnect the parking brake lamp switch wire.
5. If installing a new parking brake lever remove the pin that comes on the lever when shipped.
6. If you are reinstalling the original park brake lever remove the lock out device at this time.
7. Test the parking brake lever.

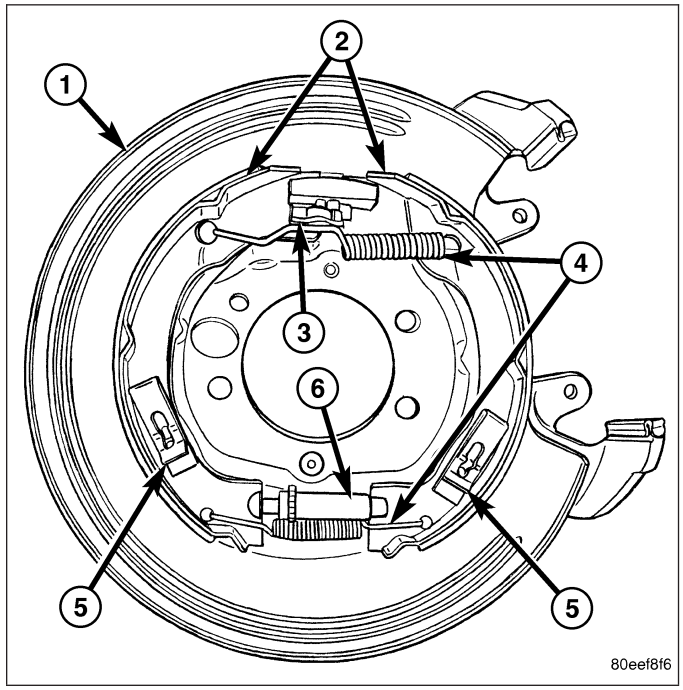


8. Install the center floor console, (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

# SHOES

## DESCRIPTION

Drum in hat park brakes are dual shoe, internal expanding units with an automatic self adjusting mechanism.

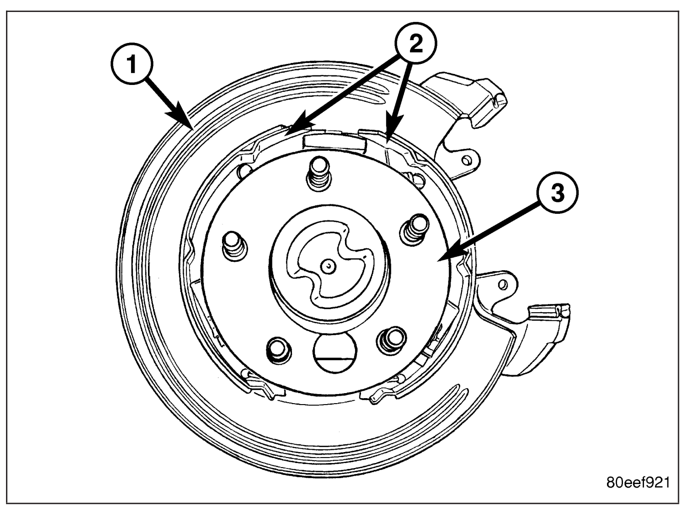


## OPERATION

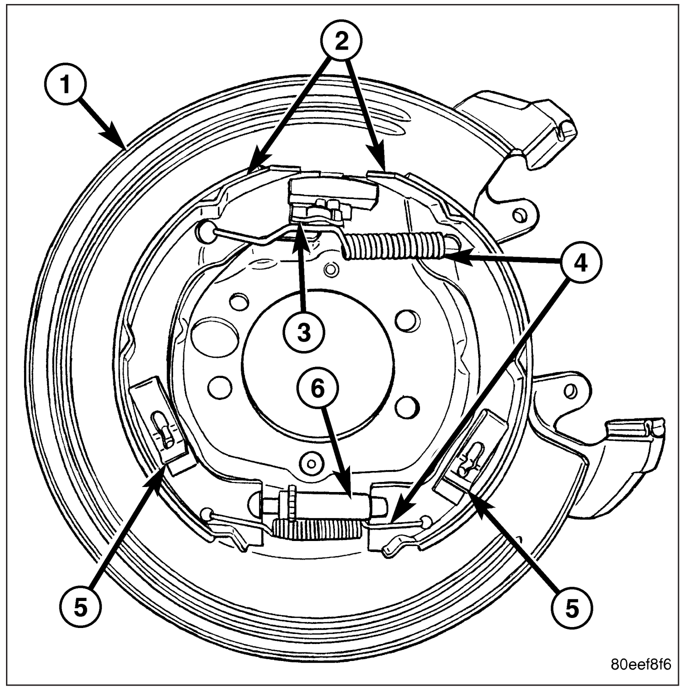
When the parking brake pedal is depressed the brake cable pulls the brake shoes outward against the brake drum. When the brake pedal is released the return springs attached to the brake shoes pull the shoes back to there original position.

## REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the disc brake rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).



5. Disassemble the rear park brake shoes (2).



## CLEANING - REAR DRUM IN HAT BRAKE

Clean the individual brake components, including the support plate exterior, with a water dampened cloth or with brake cleaner. Do not use any other cleaning agents. Remove light rust and scale from the brake shoe contact pads on the support plate with fine sandpaper.

## INSPECTION - REAR DRUM IN HAT BRAKE

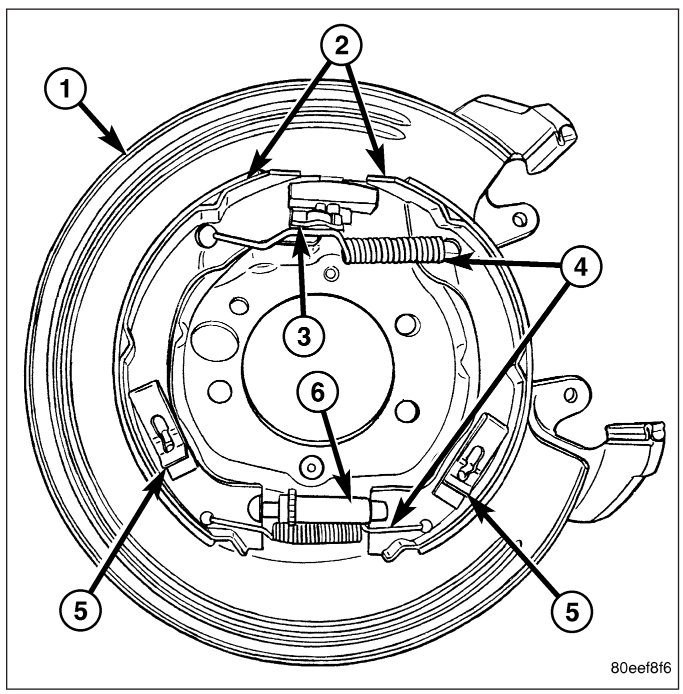
As a general rule, riveted brake shoes should be replaced when worn to within 0.78 mm (1/32 in.) of the rivet heads. Bonded lining should be replaced when worn to a thickness of 1.6 mm (1/16 in.).

Examine the lining contact pattern to determine if the shoes are bent or the drum is tapered. The lining should exhibit contact across its entire width. Shoes exhibiting contact only on one side should be replaced and the drum checked for runout or taper.

Inspect the adjuster screw assembly (6). Replace the assembly if the star wheel or threads are damaged, or the components are severely rusted or corroded.

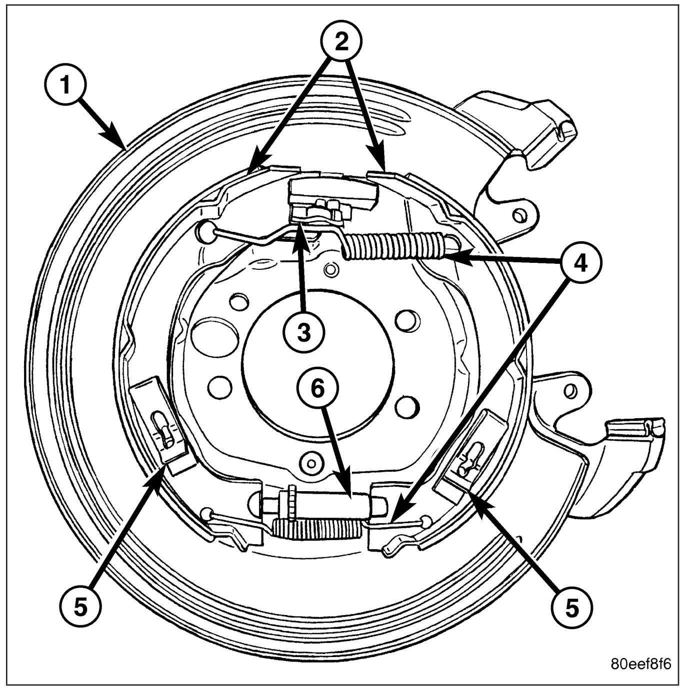
Discard the brake springs (4) and retainer components if worn, distorted or collapsed. Also replace the springs if a brake drag condition had occurred. Overheating will distort and weaken the springs.

Inspect the brake shoe contact pads on the support plate (1), replace the support plate (1) if any of the pads are worn or rusted through. Also replace the plate if it is bent or distorted.

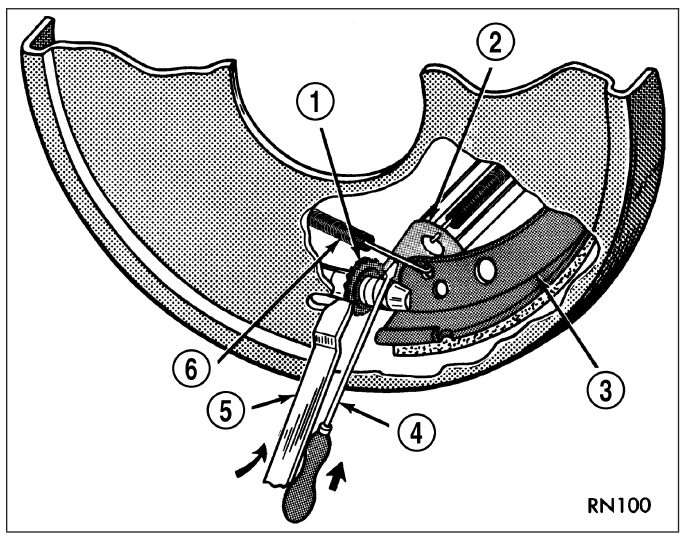


## INSTALLATION

**NOTE: On a new vehicle or after parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake lever.**



1. Reassemble the rear park brake shoes (2).
2. Adjust the rear brake shoes (1) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).
3. Install the disc brake rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
4. Install the disc brake caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).



5. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
6. Lower the vehicle.

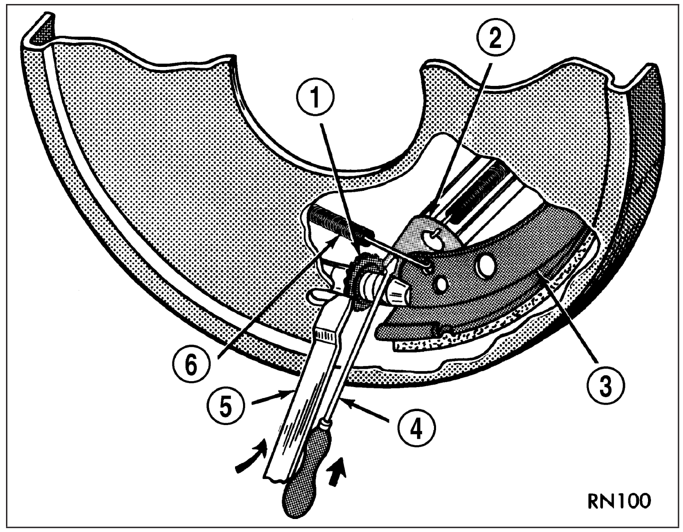
## ADJUSTMENTS

## REAR DRUM IN HAT PARK BRAKE (ROTOR INSTALLED) USING ADJUSTING TOOL

Adjustment can be made with a standard brake gauge or with adjusting tool. Adjustment is performed with the complete brake assembly installed on the backing plate.

1. Be sure parking brake lever is fully released.
2. Raise vehicle so rear wheels can be rotated freely.
3. Remove plug from each access hole in brake support plates.
4. Loosen parking brake cable adjustment nut until there is slack in front cable.
5. Insert adjusting tool through support plate access hole and engage tool in teeth of adjusting screw star wheel.

6. Rotate adjuster screw star wheel (move tool handle upward) until slight drag can be felt when wheel is rotated.
7. Push and hold adjuster lever away from star wheel with thin screwdriver.
8. Back off adjuster screw star wheel until brake drag is eliminated.
9. Repeat adjustment at opposite wheel. Be sure adjustment is equal at both wheels.
10. Install support plate access hole plugs.
11. Adjust parking brake cable and lower vehicle.
12. Apply park brake hand lever and make sure park brakes hold the vehicle staionary.
13. Release park brake hand lever.



## REAR DRUM IN HAT PARK BRAKE (ROTOR REMOVED)

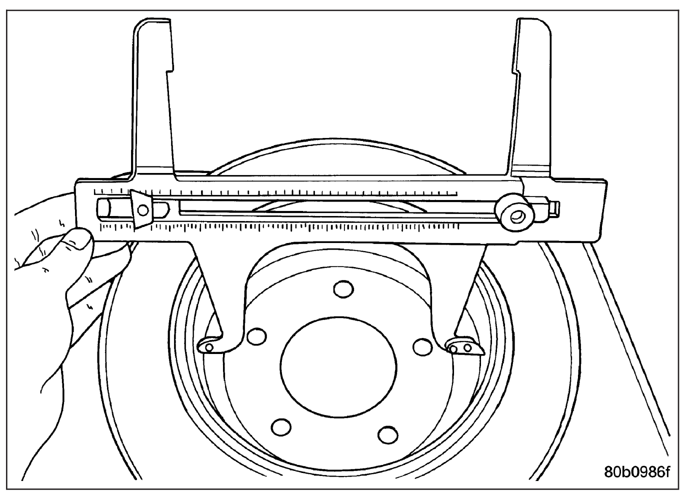
Under normal circumstances, the only time adjustment is required is when the shoes are replaced, removed for access to other parts, or when one or both rotors are replaced.

Adjustment can be made with a standard brake gauge or with adjusting tool. Adjustment is performed with the complete brake assembly installed on the backing plate.

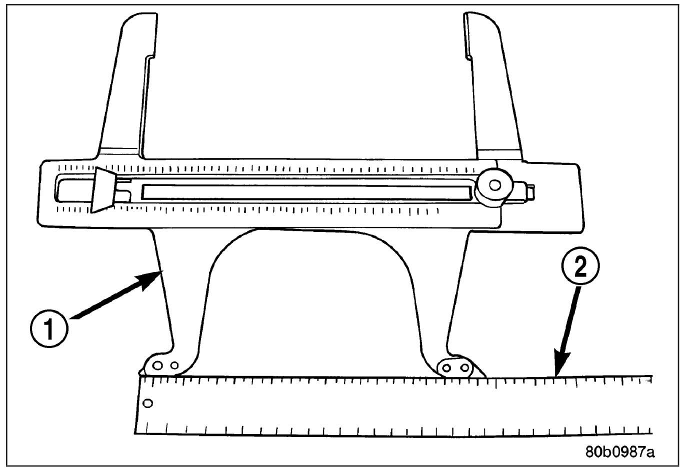
**CAUTION: Before adjusting the park brake shoes be sure that the park brake pedal is in the fully released position. If park brake pedal is not in the fully released position, the park brake shoes can not be accurately adjusted.**

1. Raise vehicle.
2. Remove tire and wheel.
3. Remove disc brake caliper from caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove rotor from the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

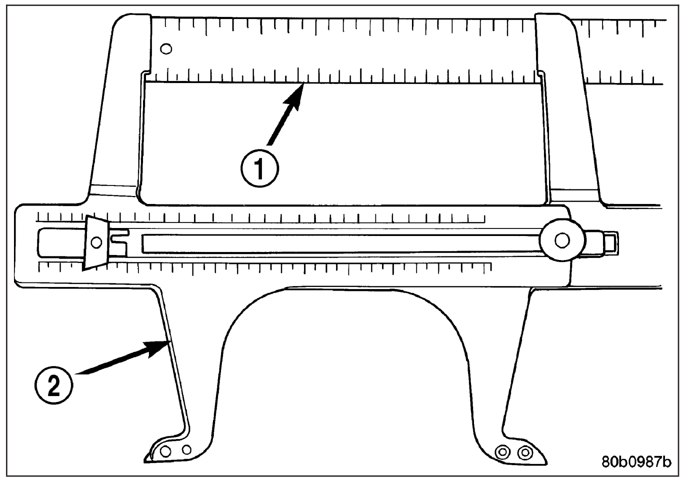
**NOTE: When measuring the brake drum diameter, the diameter should be measured in the center of the area in which the park brake shoes contact the surface of the brake drum.**



5. Using Brake Shoe Gauge, Special Tool C-3919 (1), or equivalent, **accurately** measure the inside diameter of the park brake drum portion of the rotor.
6. Using a ruler (2) that reads in 64th of an inch, accurately read the measurement of the inside diameter of the park brake drum from the special tool.



7. Reduce the inside diameter measurement of the brake drum that was taken using Special Tool C-3919 (2) by 1/64 of an inch. Reset Gauge, Brake Shoe, Special Tool C-3919 (2) or the equivalent used, so that the outside measurement jaws are set to the reduced measurement.
8. Place Gauge, Brake Shoe, Special Tool C-3919 (2) , or equivalent over the park brake shoes. The special tool must be located diagonally across at the top of one shoe and bottom of opposite shoe (widest point) of the park brake shoes.
9. Using the star wheel adjuster, adjust the park brake shoes until the lining on the park brake shoes just touches the jaws on the special tool.
10. Repeat step 8 above and measure shoes in both directions.



11. Install brake rotor on the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
12. Rotate rotor to verify that the park brake shoes are not dragging on the brake drum. If park brake shoes are dragging, remove rotor and back off star wheel adjuster one notch and recheck for brake shoe drag against drum. Continue with the previous step until brake shoes are not dragging on brake drum.
13. Install disc brake caliper on caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
14. Install wheel and tire.
15. Tighten the wheel mounting nuts in the proper sequence until all nuts are torqued to half the specified torque. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).
16. Lower vehicle.

**CAUTION: Before moving vehicle, pump brake pedal several times to ensure the vehicle has a firm enough pedal to stop the vehicle.**

**NOTE: After parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake hand lever.**

17. Road test the vehicle to ensure proper function of the vehicle's brake system.

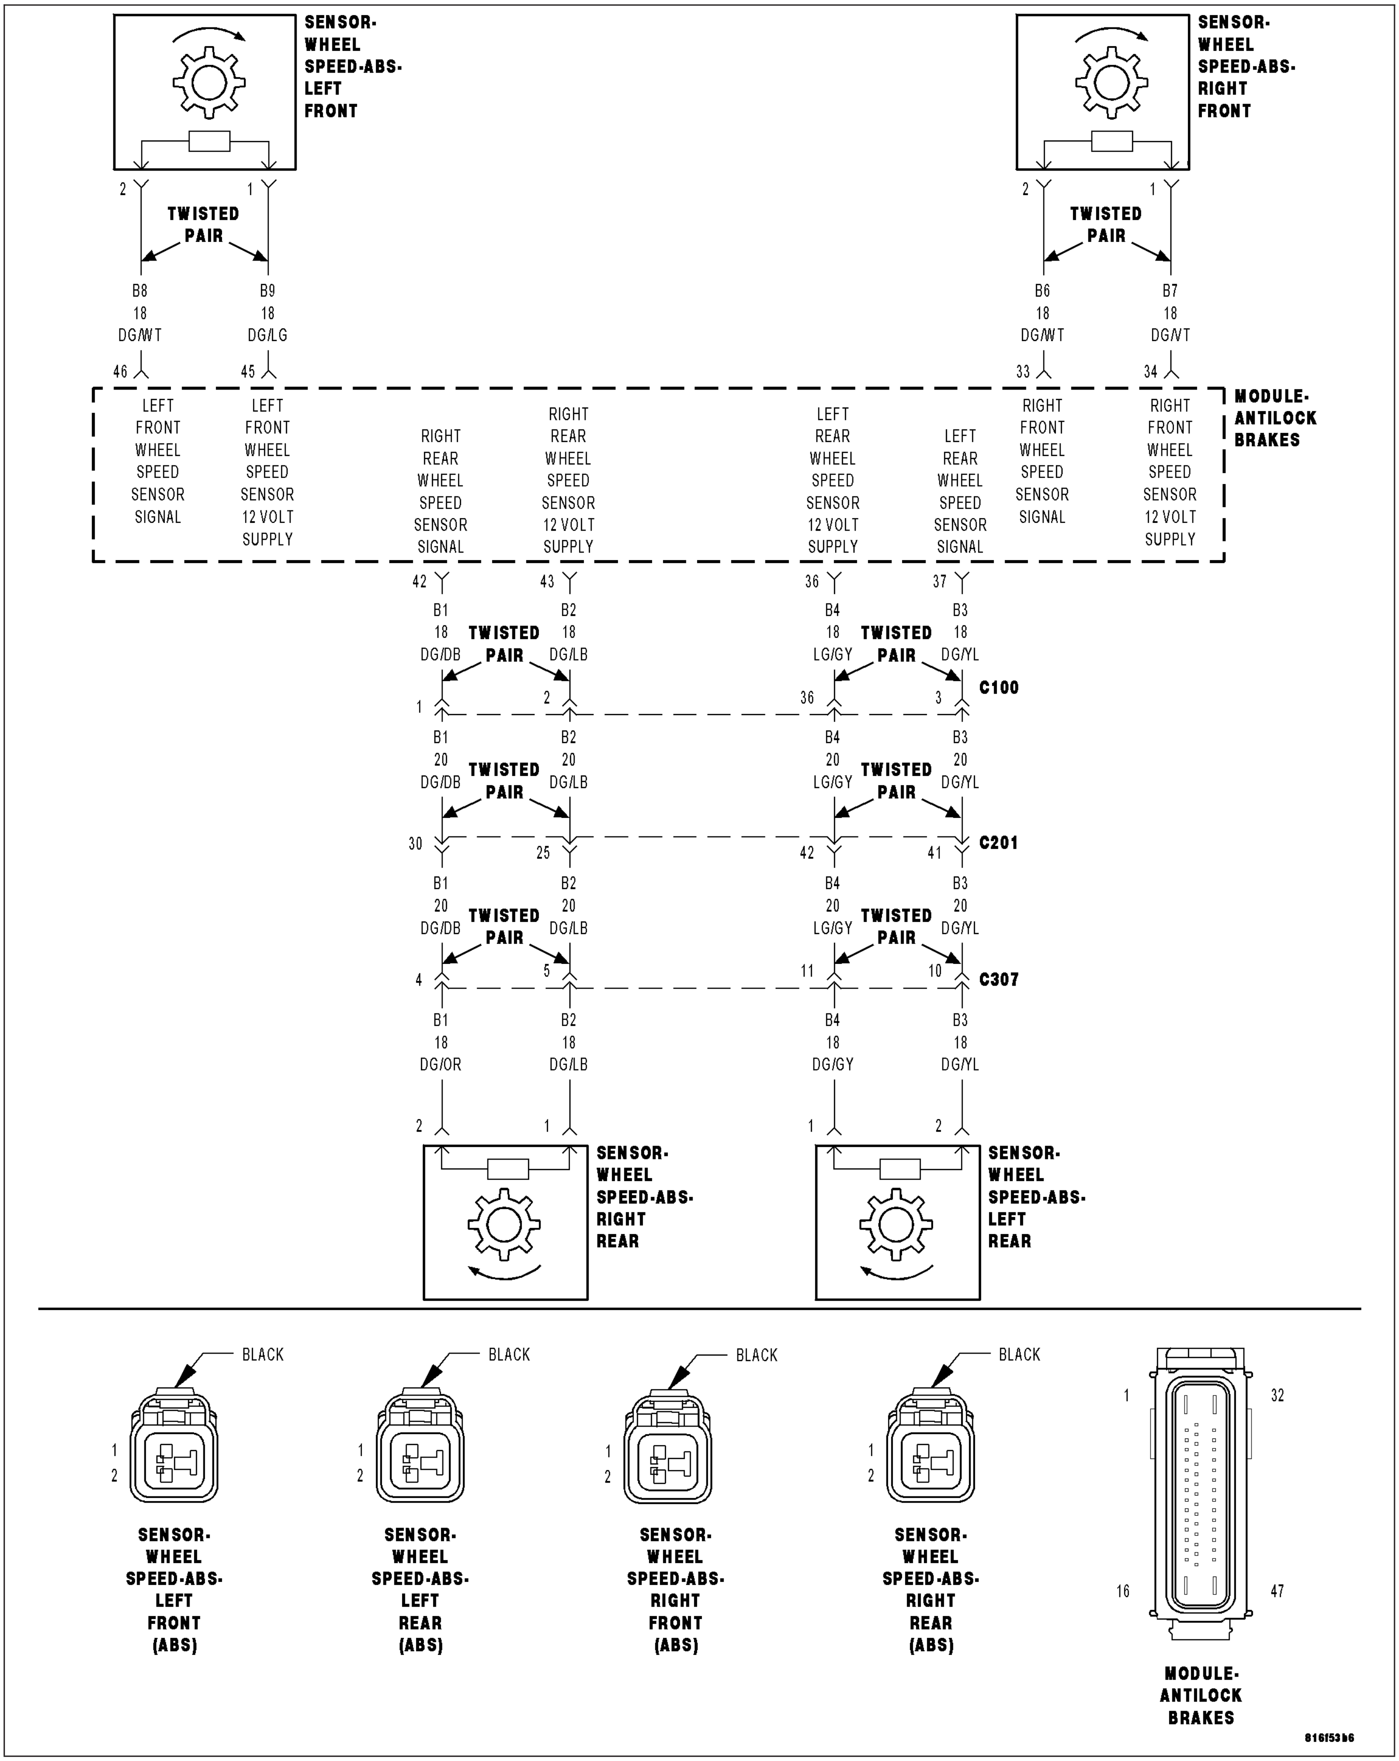
# BRAKES - ABS ELECTRICAL DIAGNOSTICS

## TABLE OF CONTENTS

# BRAKES - ABS ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (B9) LEFT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN |
| (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN |
| (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO (B9) LEFT FRONT WSS 12 VOLT SUPPLY CIRCUIT |
| LEFT FRONT WSS |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK FOR DTC C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.**

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

**Is the Left Front WSS or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK (B9) LEFT FRONT WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Left Front WSS harness connector.

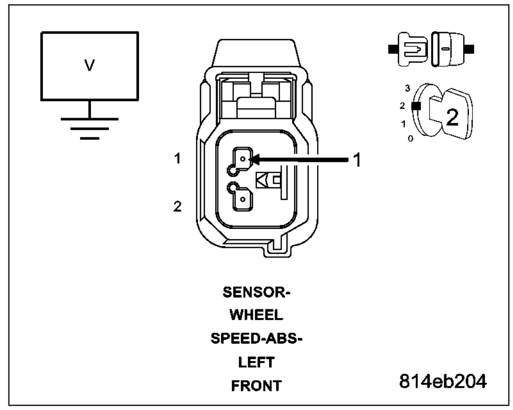
Turn the ignition on.

Measure the voltage of the (B9) Left Front WSS 12 Volt Supply circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Go To 6

**No** >> Go To 4



## 4. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

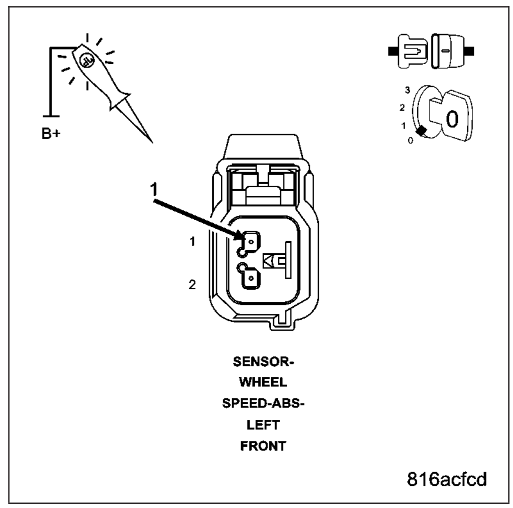
Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B9) Left Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5



## 5. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT OPEN

Connect a jumper wire between ground and the (B9) Left Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.

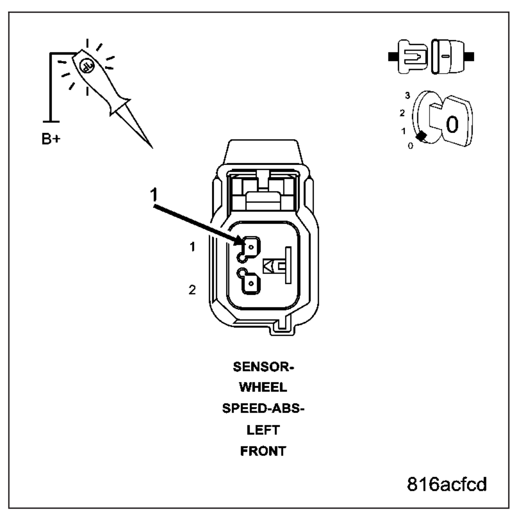
**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

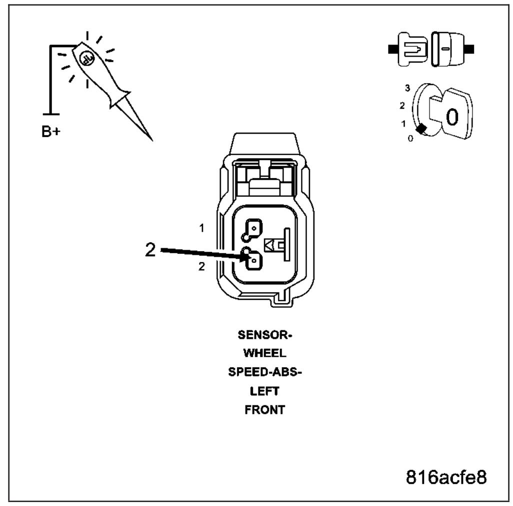
**No** >> Repair the (B9) Left Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## 6. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.



**Does the test light illuminate brightly?**

**Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to ground.

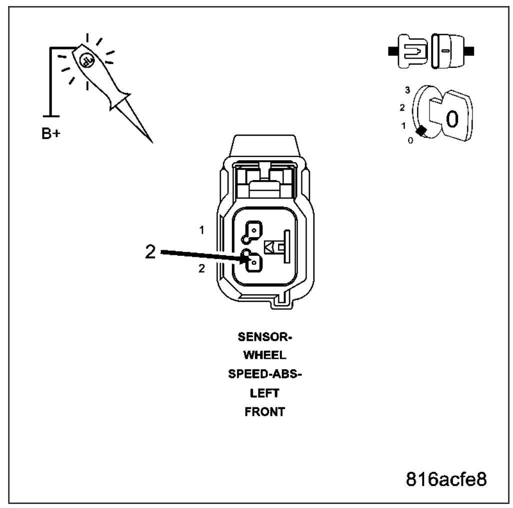
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN

Connect a jumper wire between ground and the (B8) Left Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 8

**No** >> Repair the (B8) Left Front WSS Signal circuit for an open.

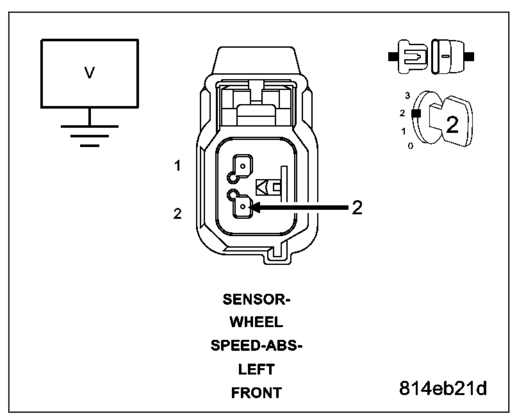
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 8. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B8) Left Front WSS Signal circuit and ground.



**Is the voltage above one volt?**

**Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to voltage.

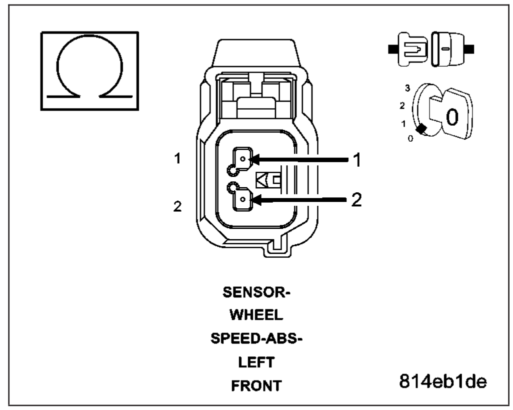
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 9

## 9. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TOGETHER

Turn the ignition off.

Measure the resistance between the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit.



**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 10

**No** >> Repair the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit for a short together.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 10. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front WSS Signal is intermittently missing a vehicle speed above 40 kph (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

| Possible Causes |
|---|
| LEFT FRONT WSS LOOSE — B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE |
| LEFT FRONT TONE WHEEL DAMAGE |
| LEFT FRONT WHEEL BEARING DAMAGE |
| IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES |
| LEFT FRONT WSS |
| ANTI-LOCK BRAKE MODULE |

### Diagnostic Test

#### 1. CHECK FOR DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**

**NOTE: If DTC C100A Left Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

#### 2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

**NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.**

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Is the Left Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?**

**Yes** >> Go To 3

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

**Is the Left Front Tire improperly inflated or mismatched tires on vehicle?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals**

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector

Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

**Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK LEFT FRONT TONE WHEEL FOR DAMAGE

Inspect the Left Front Tone Wheel for damage, missing teeth, cracks, or looseness.

**NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

**Is the Left Front Tone Wheel damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. CHECK LEFT FRONT WHEEL BEARING FOR DAMAGE

Inspect the Left Front wheel bearing for excessive runout or clearance.

**NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.**

**Is the Left Front Wheel Bearing Damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front WSS reading is different from the readings received from the other WSS's at a vehicle speed above 40 kph (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

| Possible Causes |
|---|
| LEFT FRONT WSS LOOSE — B8, B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE |
| IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES |
| LEFT FRONT TONE WHEEL/BEARING DAMAGE |
| LEFT FRONT WSS |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. CHECK FOR DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 2

### 2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

**NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.**

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Is the Left Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?**

**Yes** >> Go To 3

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## 3. CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

**Is the Left Front Tire improperly inflated or mismatched tires on vehicle?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8, B9 CIRCUITS/TERMINALS FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals**

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector

Inspect the Left Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

**Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK LEFT FRONT TONE WHEEL FOR DAMAGE

Inspect the Left Front Tone Wheel for damage, missing teeth, cracks, or looseness.

**NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

**Is the Left Front Tone Wheel damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

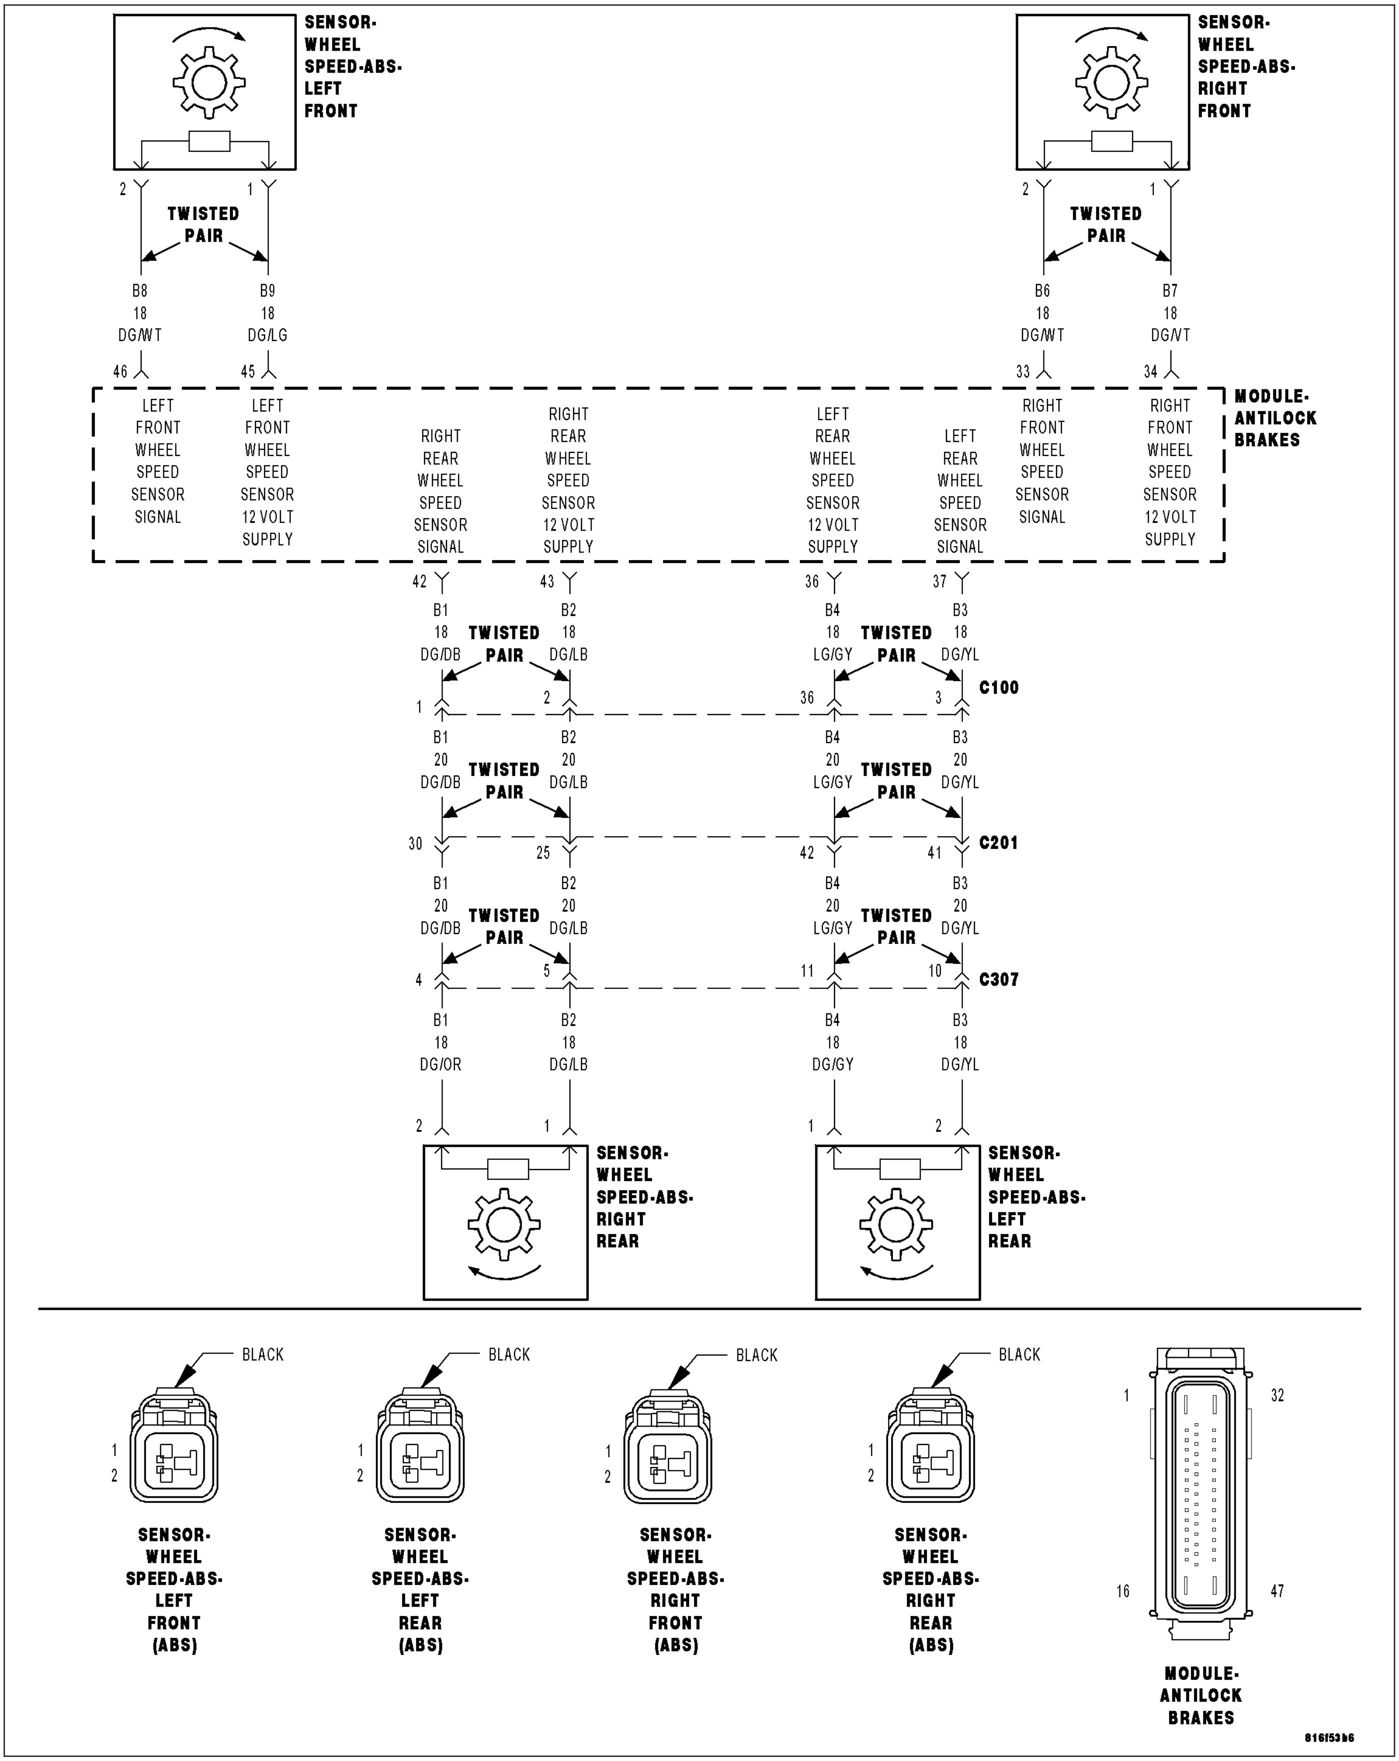
**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN |
| (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN |
| (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT |
| RIGHT FRONT WSS |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK FOR DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.**
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.

**Is the Right Front WSS or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Right Front WSS harness connector.

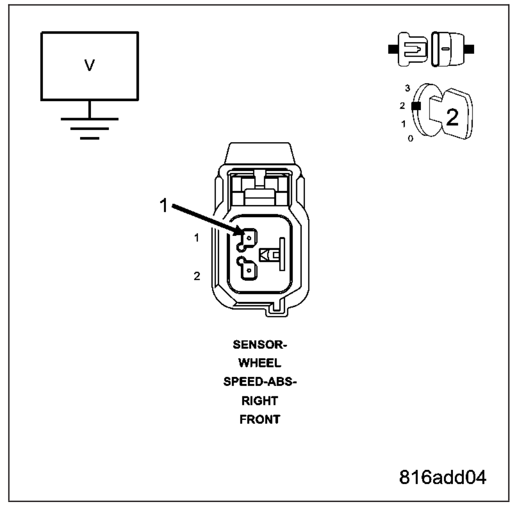
Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS 12 Volt Supply circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Go To 6

**No** >> Go To 4



## 4. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

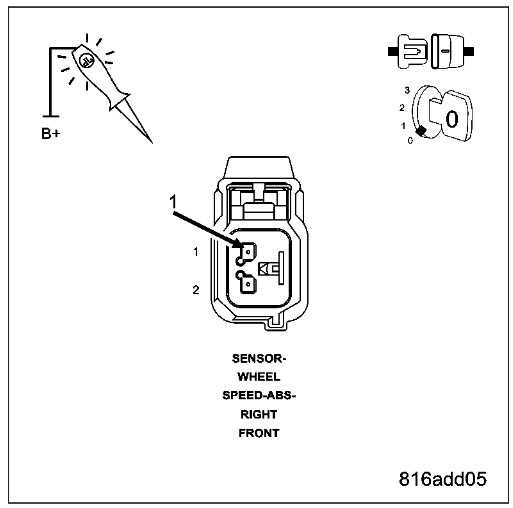
Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5



## 5. CHECK (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B7) Right Front WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.

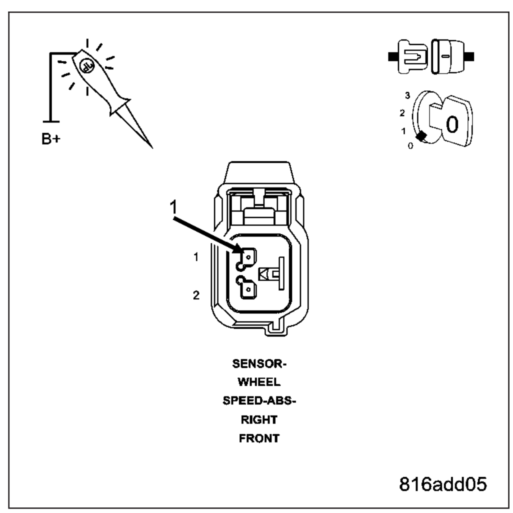
**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

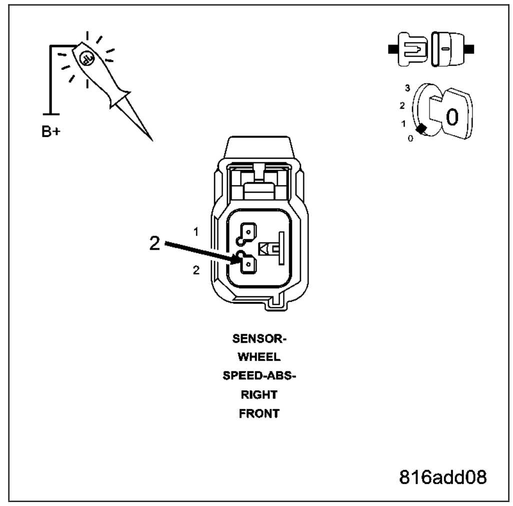
**No** >> Repair the (B7) Right Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## 6. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.



**Does the test light illuminate brightly?**

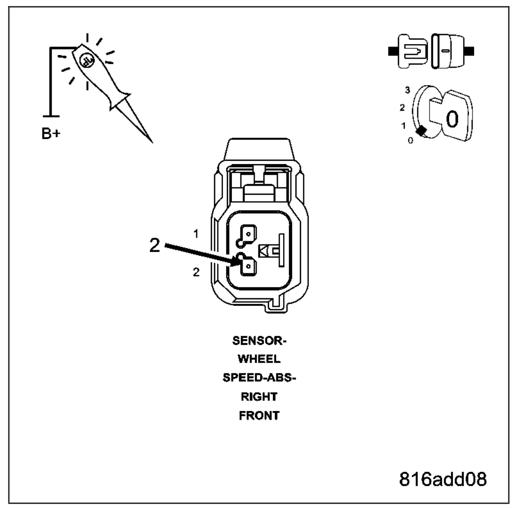
**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN

Connect a jumper wire between ground and the (B6) Right Front WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 8

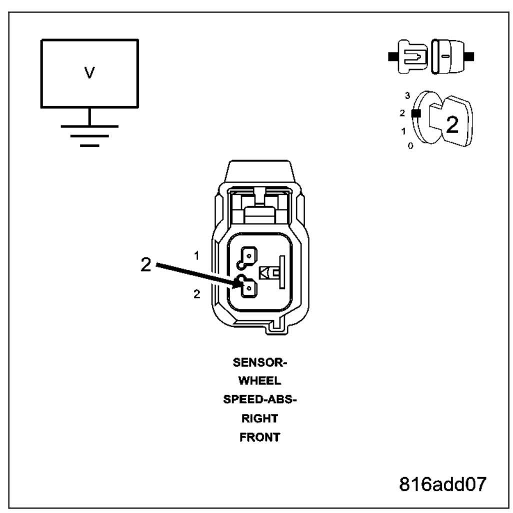
**No** >> Repair the (B6) Right Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 8. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR AN SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B6) Right Front WSS Signal circuit and ground.



**Is the voltage above one volt?**

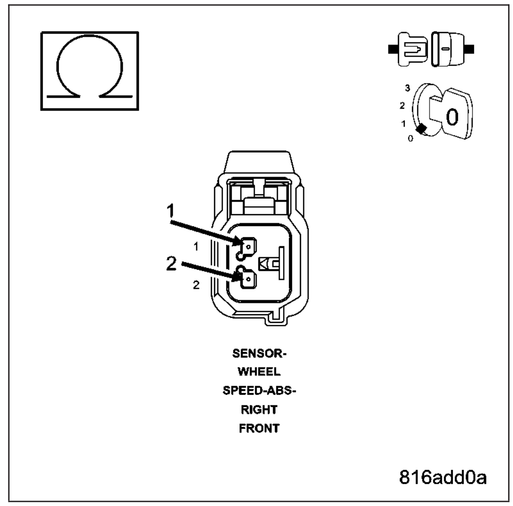
**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 9

## 9. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS 12 VOLT SUPPLY CIRCUIT SHORTED TOGETHER

Turn the ignition off.

Measure the resistance between the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit.



**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 10

**No** >> Repair the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit for a short together.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 10. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Front WSS Signal is intermittently missing a vehicle speed above 25mph (40 kph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

| Possible Causes |
|---|
| RIGHT FRONT WSS LOOSE — B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE |
| RIGHT FRONT TONE WHEEL DAMAGE |
| RIGHT FRONT WHEEL BEARING DAMAGE |
| IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES |
| RIGHT FRONT WSS |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. CHECK FOR DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**

**NOTE: If DTC C1015–Right Front Wheel Speed Sensor Circuit is present it must be repaired before continuing.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

**NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.**

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Is the Right Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?**

**Yes** >> Go To 3

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

**Is the Right Front Tire improperly inflated or mismatched tires on vehicle?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals**

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector

Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

**Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK RIGHT FRONT TONE WHEEL FOR DAMAGE

Inspect the Right Front Tone Wheel for damage, missing teeth, cracks, or looseness.

**NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

**Is the Right Front Tone Wheel damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. CHECK RIGHT FRONT WHEEL BEARING FOR DAMAGE

Inspect the Right Front wheel bearing for excessive runout or clearance.

**NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.**

**Is the Right Front Wheel Bearing Damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Front WSS reading is different from the readings received from the other WSS's at a vehicle speed above 40 kph (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

| Possible Causes |
|---|
| RIGHT FRONT WSS LOOSE — B6, B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE |
| IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES |
| RIGHT FRONT TONE WHEEL/BEARING DAMAGE |
| RIGHT FRONT WSS |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. CHECK FOR DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 2

### 2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

**NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.**
Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Is the Right Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?**

**Yes** >> Go To 3

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## 3. CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Front Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

**Is the Right Front Tire improperly inflated or mismatched tires on vehicle?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6, B7 CIRCUITS/TERMINALS FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals**

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector

Inspect the Right Front WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

**Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK RIGHT FRONT TONE WHEEL FOR DAMAGE

Inspect the Right Front Tone Wheel for damage, missing teeth, cracks, or looseness.

**NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

**Is the Right Front Tone Wheel damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

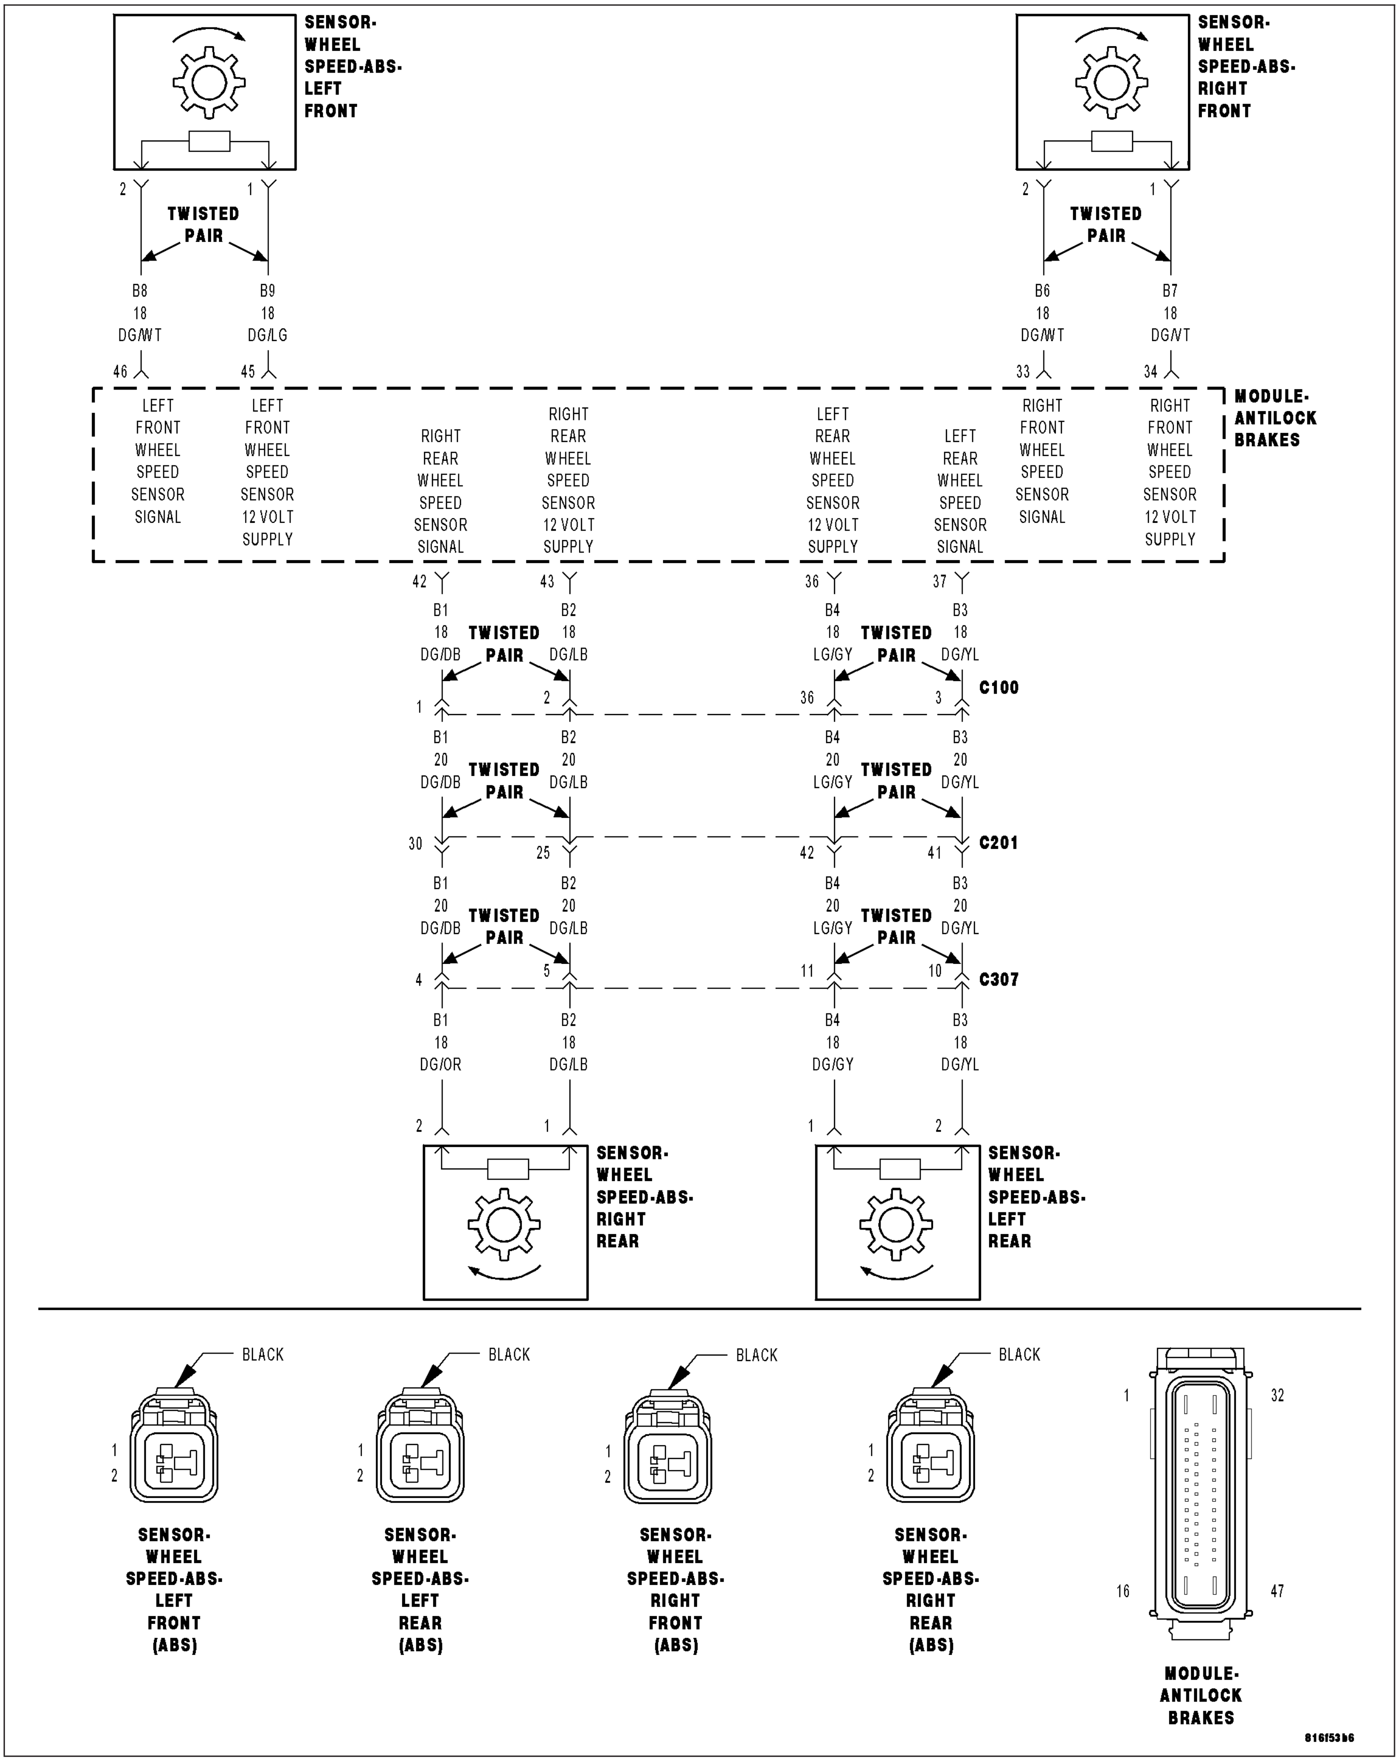
**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

| Possible Causes |
| --- |
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN |
| (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN |
| (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT |
| LEFT REAR WSS |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK FOR DTC C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.**
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

**Is the Left Rear WSS or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Left Rear WSS harness connector.

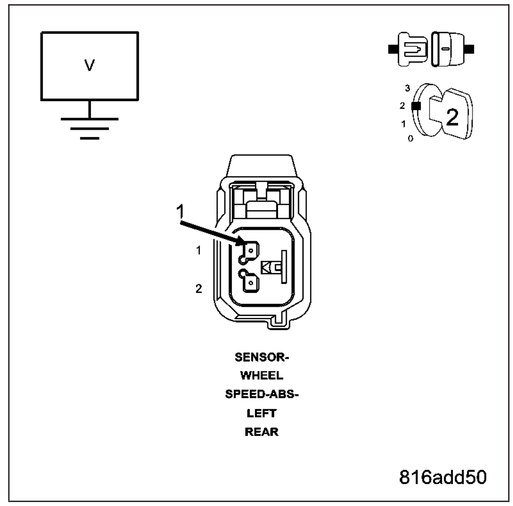
Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS 12 Volt Supply circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Go To 6

**No** >> Go To 4



## 4. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

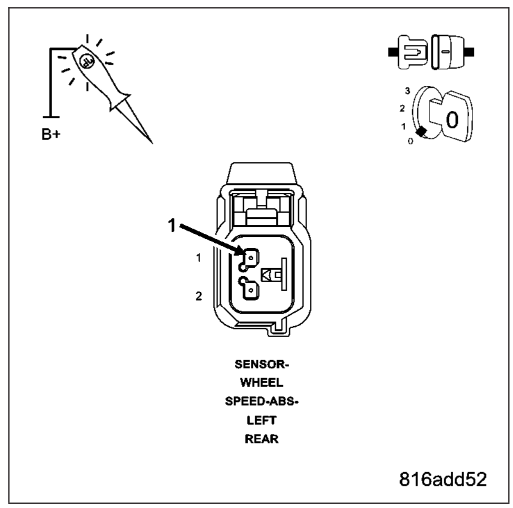
Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B4) Left Rear WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5



## 5. CHECK (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B4) Left Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.

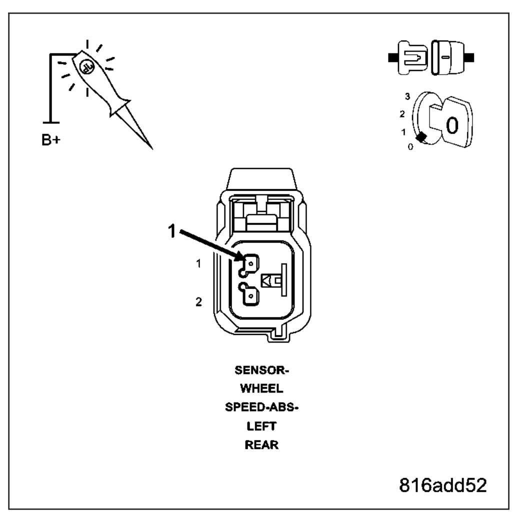
**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

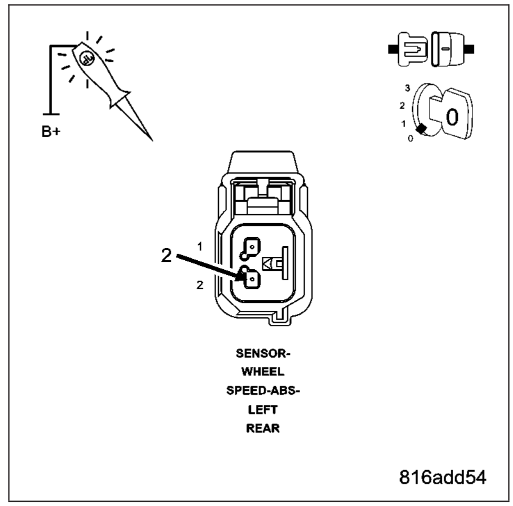
**No** >> Repair the (B4) Left Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## 6. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.



**Does the test light illuminate brightly?**

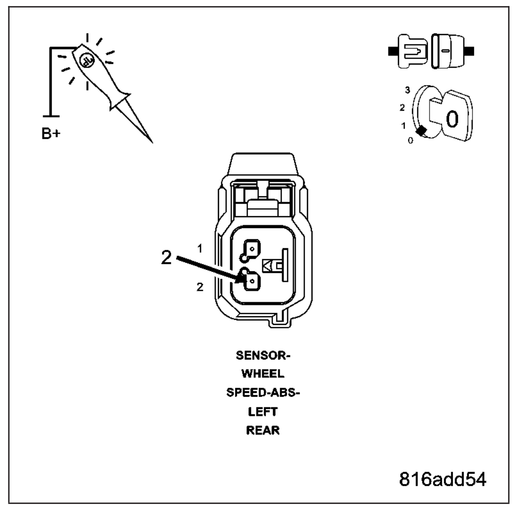
**Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B3) Left Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 8

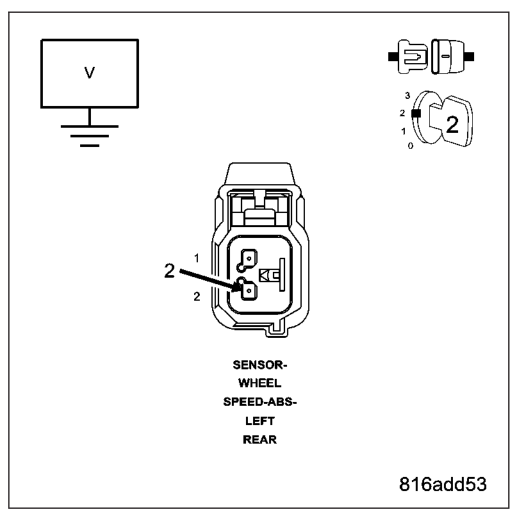
**No** >> Repair the (B3) Left Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 8. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B3) Left Rear WSS Signal circuit and ground.



**Is the voltage above one volt?**

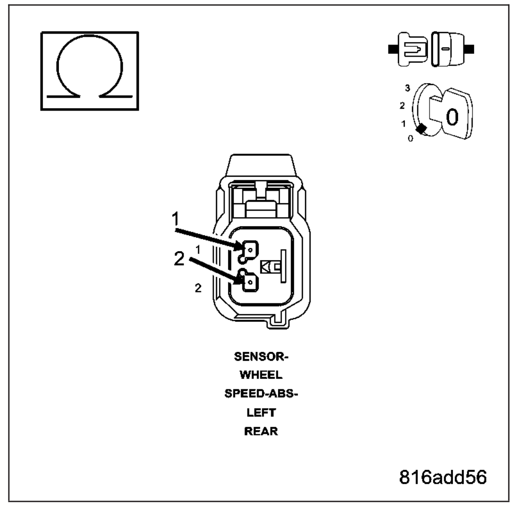
**Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 9

## 9. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TOGETHER

Turn the ignition off.

Measure the resistance between the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit.



**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 10

**No** >> Repair the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit for a short together.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 10. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**
Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Rear WSS Signal is intermittently missing a vehicle speed above 25mph (40 kph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

| Possible Causes |
|---|
| LEFT REAR WSS AIR GAP |
| LEFT REAR WSS LOOSE — B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE |
| LEFT REAR TONE WHEEL DAMAGE |
| LEFT REAR WHEEL BEARING DAMAGE |
| IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES |
| LEFT REAR WSS |
| ANTI-LOCK BRAKE MODULE |

### Diagnostic Test

#### 1. CHECK FOR DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

#### 2. CHECK LEFT REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Left Rear WSS air gap.

**NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.**

**Is the Left Rear WSS air gap within specifications?**

**Yes** >> Go To 3

**No** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 3. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

**NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.**
Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Is the Left Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?**

**Yes** >> Go To 4

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 4. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

**Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK LEFT REAR WSS LOOSENESS, INSPECT B4, B5 CIRCUITS/TERMINALS FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals**
Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector

Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

**Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

**NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

**Is the Left Rear Tone Wheel damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. CHECK LEFT REAR WHEEL BEARING FOR DAMAGE

Inspect the Left Rear wheel bearing for excessive runout or clearance.

**NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.**

**Is the Left Rear Wheel Bearing Damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 8

## 8. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Rear WSS reading is different from the readings received from the other WSS's at a vehicle speed above 40 kph (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

| Possible Causes |
| --- |
| LEFT REAR WSS LOOSE — B3, B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE |
| IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES |
| LEFT REAR WSS AIR GAP |
| LEFT REAR TONE WHEEL DAMAGE |
| LEFT REAR WSS |
| ANTI-LOCK BRAKE MODULE |

### Diagnostic Test

#### 1. CHECK FOR DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 2

#### 2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

**NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.**
Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Is the Left Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?**

**Yes** >> Go To 3

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## 3. CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Left Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

**Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK LEFT REAR WSS LOOSENESS, INSPECT B3, B4 CIRCUITS/TERMINALS FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals**

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector

Inspect the Left Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

**Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK LEFT REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Left Rear WSS air gap.

**NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.**

**Is the Left Rear WSS air gap within specifications?**

**Yes** >> Go To 6

**No** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

**NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

**Is the Left Rear Tone Wheel damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

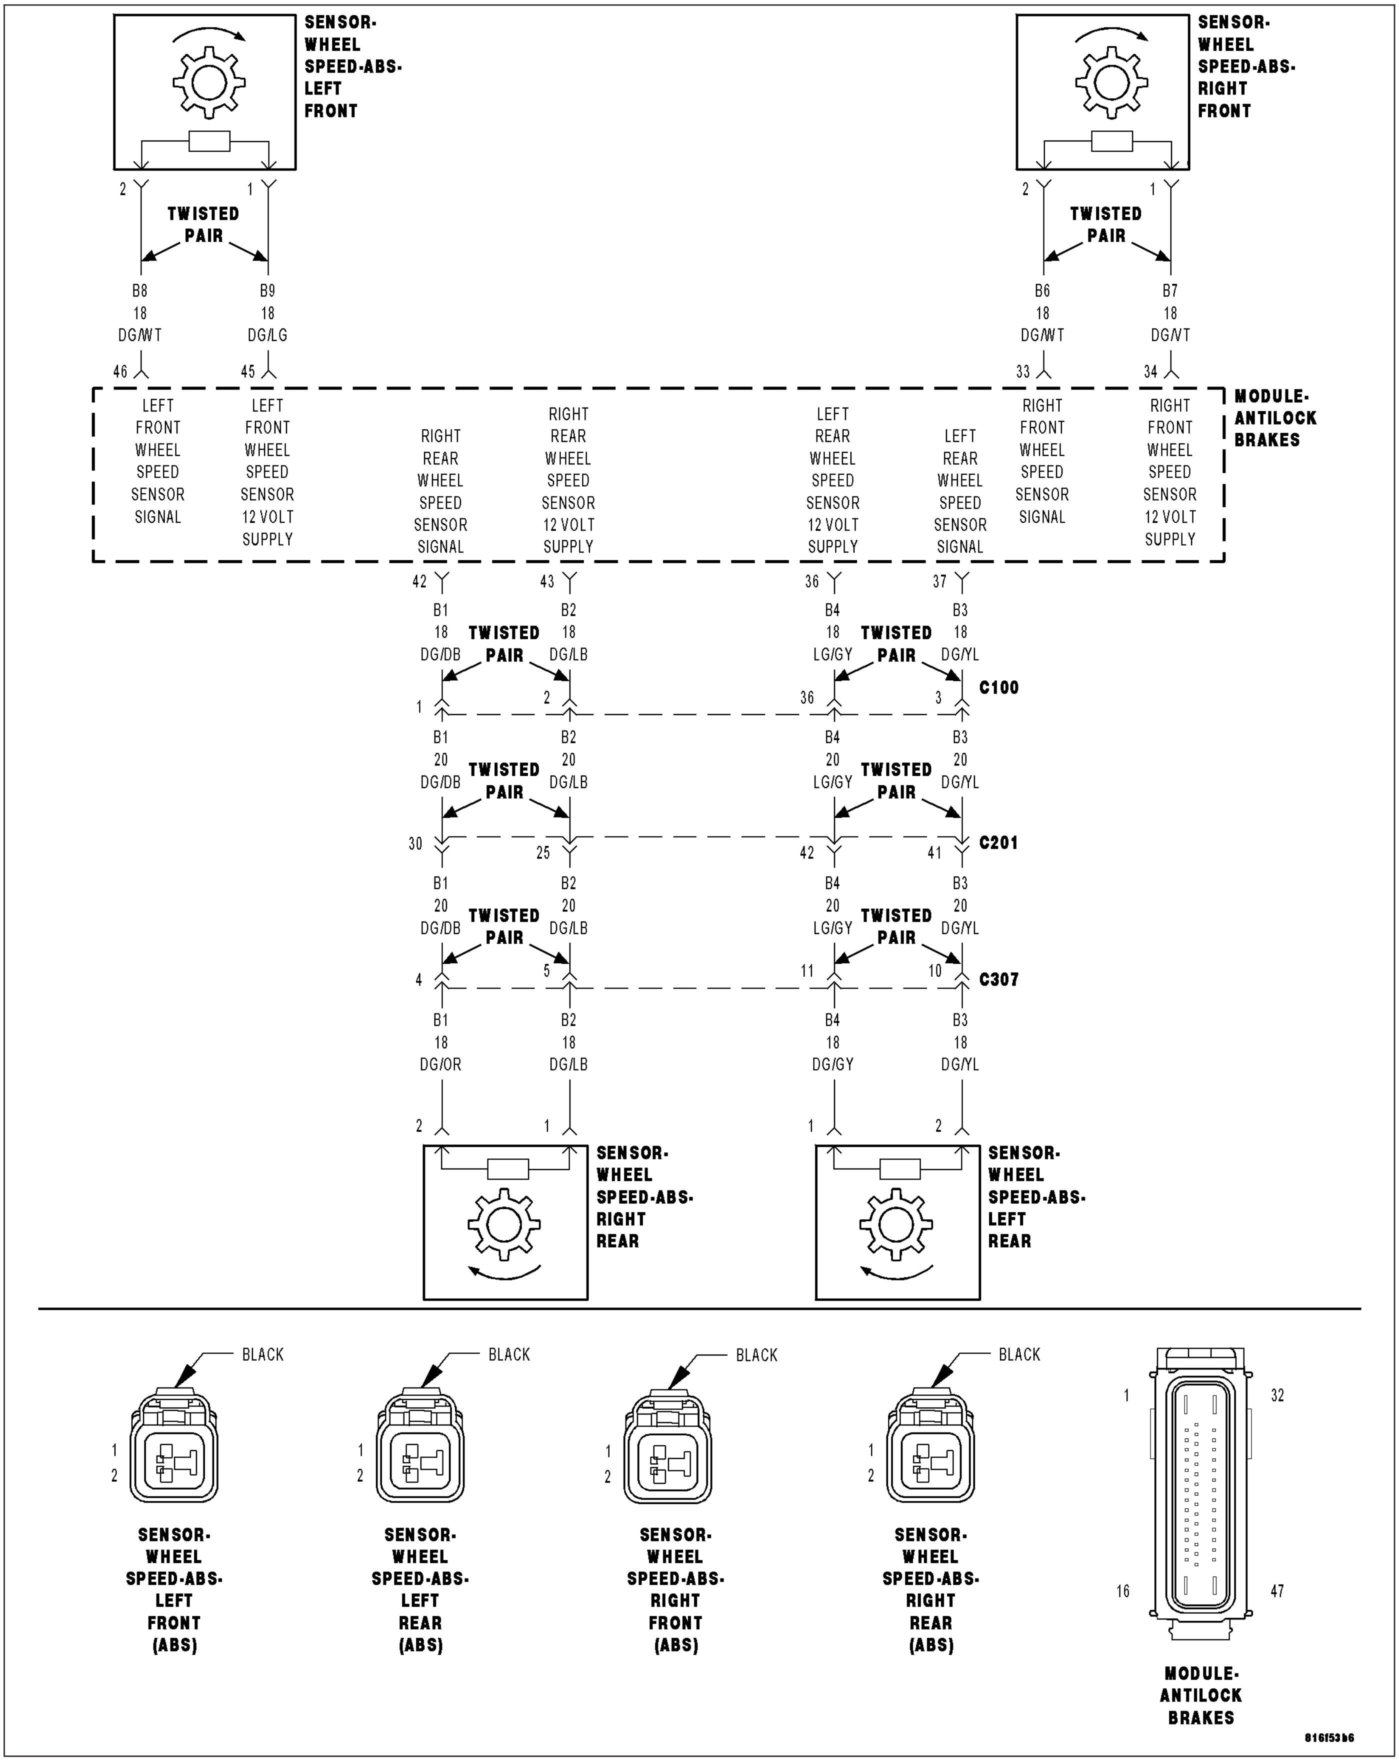
**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

| Possible Causes |
| --- |
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN |
| (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN |
| (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT |
| RIGHT REAR WSS |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK FOR DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.**

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

**Is the Right Rear WSS or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

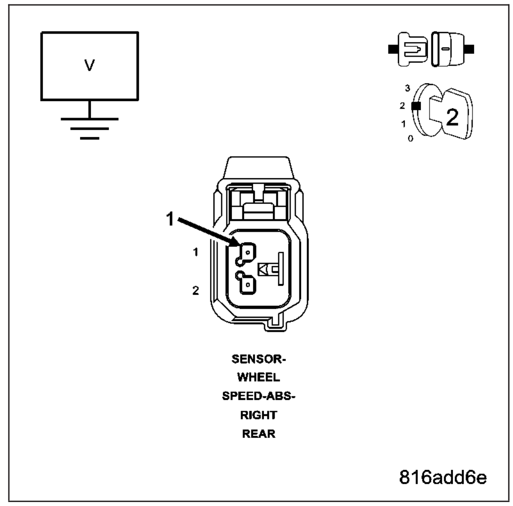
**No** >> Go To 3

## 3. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT VOLTAGE

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS 12 Volt Supply circuit.



**Is the voltage above 10.0 volts?**

**Yes** >> Go To 6

**No** >> Go To 4

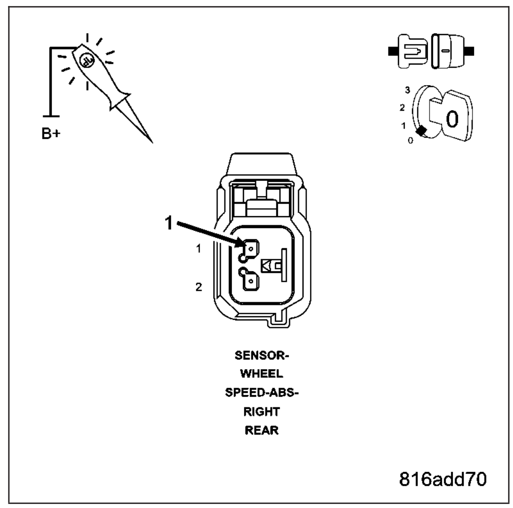
## 4. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.



**Does the test light illuminate brightly?**

**Yes** >> Repair the (B2) Right Rear WSS Supply circuit for a short to ground.

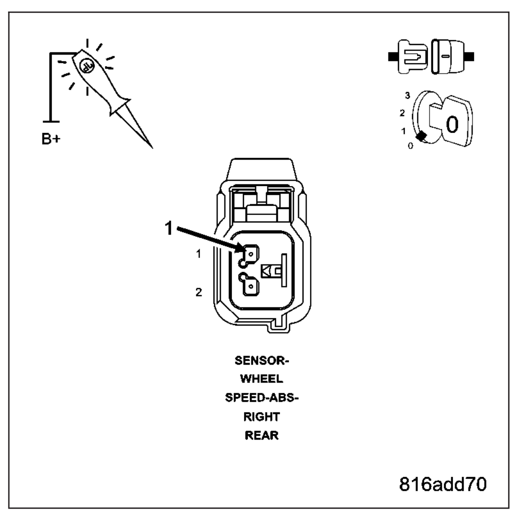
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B2) Right Rear WSS Supply circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.



**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

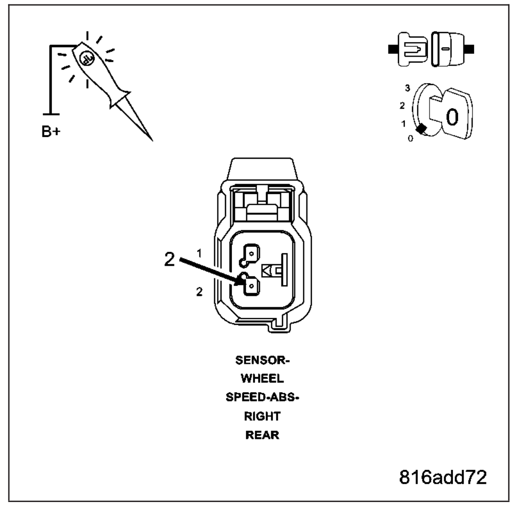
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair the (B2) Right Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.



**Does the test light illuminate brightly?**

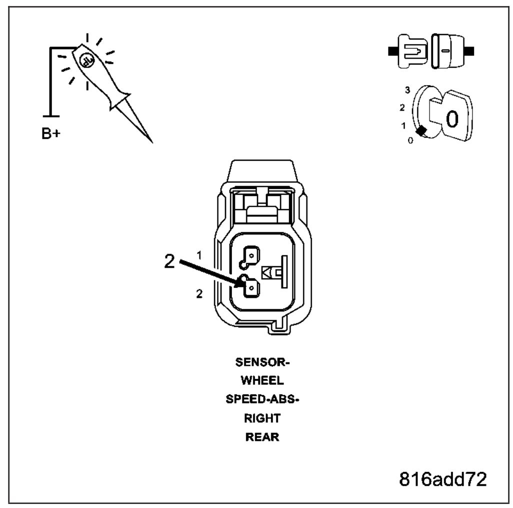
**Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between ground and the (B1) Right Rear WSS Signal circuit in the Anti-Lock Brakes Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 8

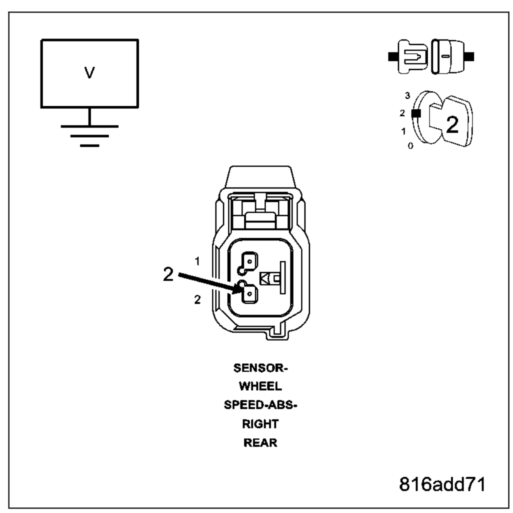
**No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 8. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Remove all jumper wires.

Measure the voltage between the (B1) Right Rear WSS Signal circuit and ground.



**Is the voltage above one volt?**

**Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 9

## 9. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO (B2) RIGHT REAR WSS 12 VOLT SUPPLY CIRCUIT

Turn the ignition off.

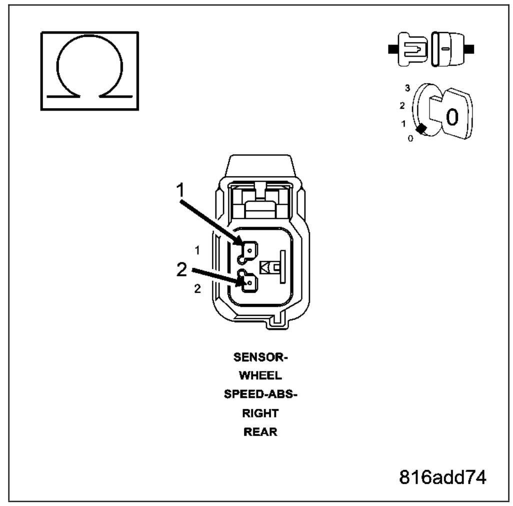
Measure the resistance between the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 10

**No** >> Repair the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit for a short together.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## 10. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear WSS Signal is intermittently missing a vehicle speed above 25mph (40 kph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

| Possible Causes |
|---|
| RIGHT REAR WSS AIR GAP |
| RIGHT REAR WSS LOOSE — B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE |
| RIGHT REAR TONE WHEEL DAMAGE |
| RIGHT REAR WHEEL BEARING DAMAGE |
| IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES |
| RIGHT REAR WSS |
| ANTI-LOCK BRAKE MODULE |

### Diagnostic Test

#### 1. CHECK FOR DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

#### 2. CHECK RIGHT REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Right Rear WSS air gap.

**NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.**

**Is the Right Rear WSS air gap within specifications?**

**Yes** >> Go To 3

**No** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 3. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

**NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.**

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Is the Right Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?**

**Yes** >> Go To 4

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 4. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

**Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals**

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector

Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

**Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. CHECK RIGHT REAR TONE WHEEL FOR DAMAGE

Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

**NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

**Is the Right Rear Tone Wheel damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. CHECK RIGHT REAR WHEEL BEARING FOR DAMAGE

Inspect the Right Rear wheel bearing for excessive runout or clearance.

**NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.**

**Is the Right Rear Wheel Bearing Damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 8

## 8. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear WSS reading is different from the readings received from the other WSS's at a vehicle speed above 40 kph (25 mph). The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

| Possible Causes |
| --- |
| RIGHT REAR WSS LOOSE — B1, B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE |
| IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES |
| RIGHT REAR WSS AIR GAP |
| RIGHT REAR TONE WHEEL DAMAGE |
| RIGHT REAR WSS |
| ANTI-LOCK BRAKE MODULE |

### Diagnostic Test

#### 1. CHECK FOR DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, record and erase DTCs.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 2

#### 2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

**NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.**
Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Is the Right Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?**

**Yes** >> Go To 3

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## 3. CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES

Turn the ignition off.

Check and adjust the Right Rear Tire pressure.

Check and adjust all other tire pressures.

Inspect for mismatched tires on vehicle.

**Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1, B2 CIRCUITS/TERMINALS FOR DAMAGE

**NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals**

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector

Inspect the Right Rear WSS for looseness, excessive corrosion and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

**Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK RIGHT REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Right Rear WSS air gap.

**NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.**

**Is the Right Rear WSS air gap within specifications?**

**Yes** >> Go To 6

**No** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK RIGHT REAR TONE WHEEL FOR DAMAGE

Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

**NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.**

**Is the Right Rear Tone Wheel damaged?**

**Yes** >> Repair as necessary
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read ABS DTCs.

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1041-LEFT FRONT TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

| Possible Causes |
|---|
| LEFT FRONT TONE WHEEL/BEARING DAMAGE |
| DIRTY TONE WHEEL/SENSOR |

### Diagnostic Test

#### 1. CHECK FOR A DTC C1041-LEFT FRONT TONE WHEEL PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

**WARNING: To avoid personal injury or death, check brake capability is available before road testing.**
Test drive the vehicle in a straight line to 40 Km/h (25 mph).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**Does the scan tool display: C1041-LEFT FRONT TONE WHEEL PERFORMANCE?**

**Yes** >> Replace the Left Front Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

| Possible Causes |
|---|
| RIGHT FRONT TONE WHEEL/BEARING DAMAGE |
| DIRTY TONE WHEEL/SENSOR |

### Diagnostic Test

#### 1. CHECK FOR A DTC C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

**CAUTION: Ensure brake capability is available before road testing.**
Test drive the vehicle in a straight line to 40 km/h (25 mph).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**Does the scan tool display: C1042-RIGHT FRONT TONE WHEEL PERFORMANCE?**

**Yes** >> Replace the Right Front Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## C1043-LEFT REAR TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

| Possible Causes |
|---|
| LEFT REAR TONE WHEEL/BEARING DAMAGE |
| DIRTY TONE WHEEL/SENSOR |

## Diagnostic Test

### 1. CHECK FOR A DTC C1043-LEFT REAR TONE WHEEL PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

**CAUTION: Ensure brake capability is available before road testing.**
Test drive the vehicle in a straight line to 40 km/h (25 mph).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**Does the scan tool display: C1043-LEFT REAR TONE WHEEL PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK THE LEFT REAR TONE WHEEL FOR DAMAGE

**NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.**
Check the Left Rear Tone Wheel for damage.

Check the Left Rear Tone Wheel for dirt.

**Was the tone wheel dirty?**

**Yes** >> Clean tone wheel and sensor. Clear codes and retest.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Left Rear Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1044-RIGHT REAR TONE WHEEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

| Possible Causes |
| --- |
| RIGHT REAR TONE WHEEL/BEARING DAMAGE |
| DIRTY TONE WHEEL/SENSOR |

## Diagnostic Test

### 1. CHECK FOR A DTC C1044-RIGHT REAR TONE WHEEL PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

**CAUTION: Ensure brake capability is available before road testing.**

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read DTCs.

**Does the scan tool display: C1044-RIGHT REAR TONE WHEEL PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK THE RIGHT REAR TONE WHEEL FOR DAMAGE

**NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.**

Check the Right Rear Tone Wheel for damage.

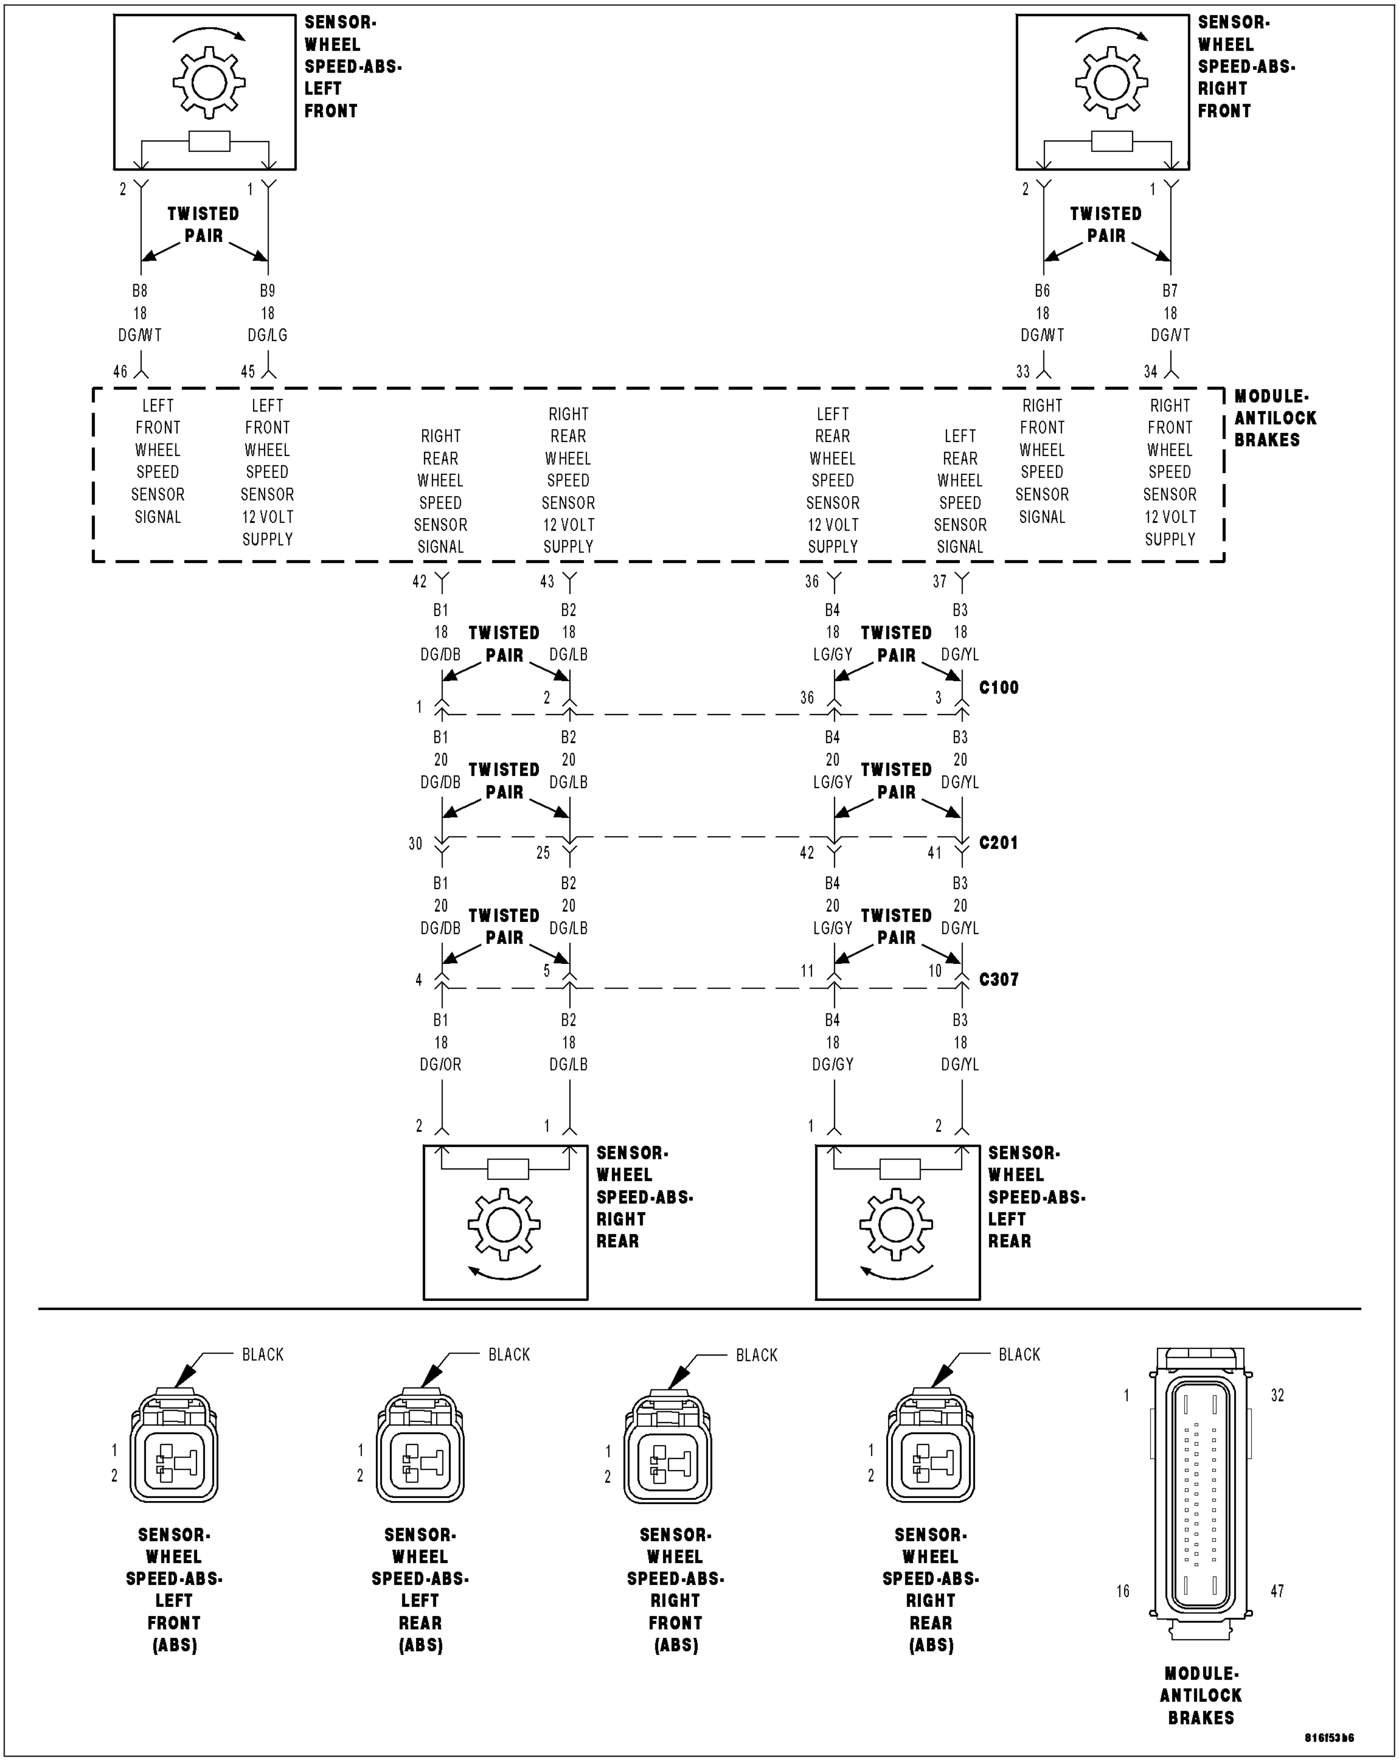
Check the Right Rear Tone Wheel for dirt.

**Was the tone wheel dirty?**

**Yes** >> Clean tone wheel and sensor. Clear codes and retest.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Right Rear Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1046–LEFT FRONT WHEEL PRESSURE PHASE MONITORING



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During active ABS control.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

| Possible Causes |
| --- |
| LEFT FRONT TONE WHEEL/BEARING DAMAGED |
| WHEEL SPEED SIGNALS SWAPPED |
| LEFT FRONT WSS |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. COMPARE WHEEL SPEED SENSOR SIGNALS

**WARNING: Ensure brake capability is available before road testing.**

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Does the Left Front WSS speed differ from the other WSS speeds by 8 Km/h (5 m.p.h.) or show NO speed?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

### 3. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. LEFT FRONT WHEEL SPEED SENSOR

Replace the Left Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**
Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read ABS DTCs.

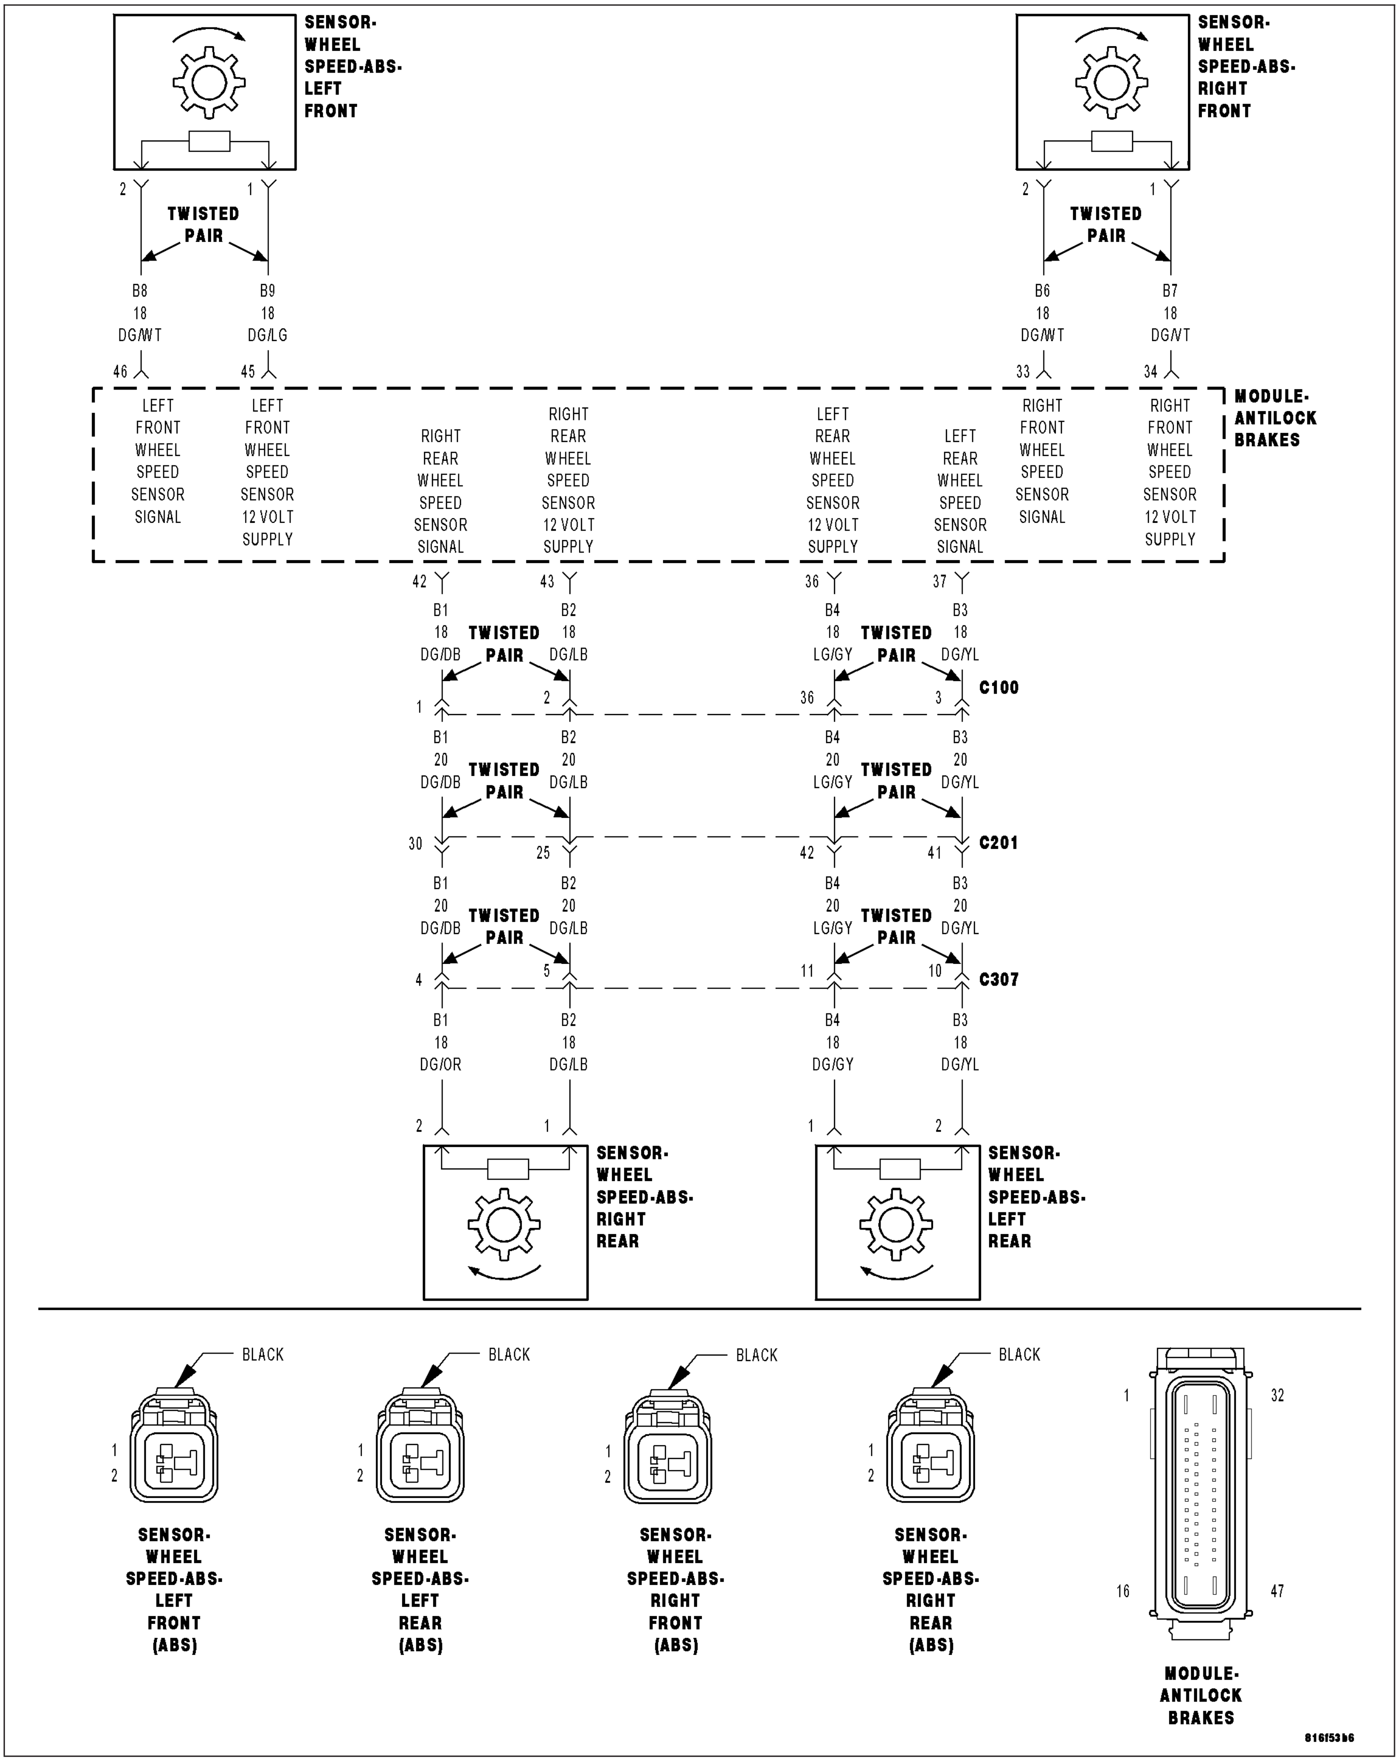
**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1046–LEFT FRONT WHEEL PRESSURE PHASE MONITORING reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1047–RIGHT FRONT WHEEL PRESSURE PHASE MONITORING



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During active ABS control.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

| Possible Causes |
| --- |
| RIGHT FRONT TONE WHEEL DAMAGED |
| WHEEL SPEED SIGNALS SWAPPED |
| RIGHT FRONT WSS |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. COMPARE WHEEL SPEED SENSOR SIGNALS

**WARNING: Ensure brake capability is available before road testing.**

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Does the Right Front WSS speed differ from the other WSS speeds by 8 Km/h (5 m.p.h.) or show NO speed?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

### 3. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. RIGHT FRONT WHEEL SPEED SENSOR

Replace the Right Front Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**
Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read ABS DTCs.

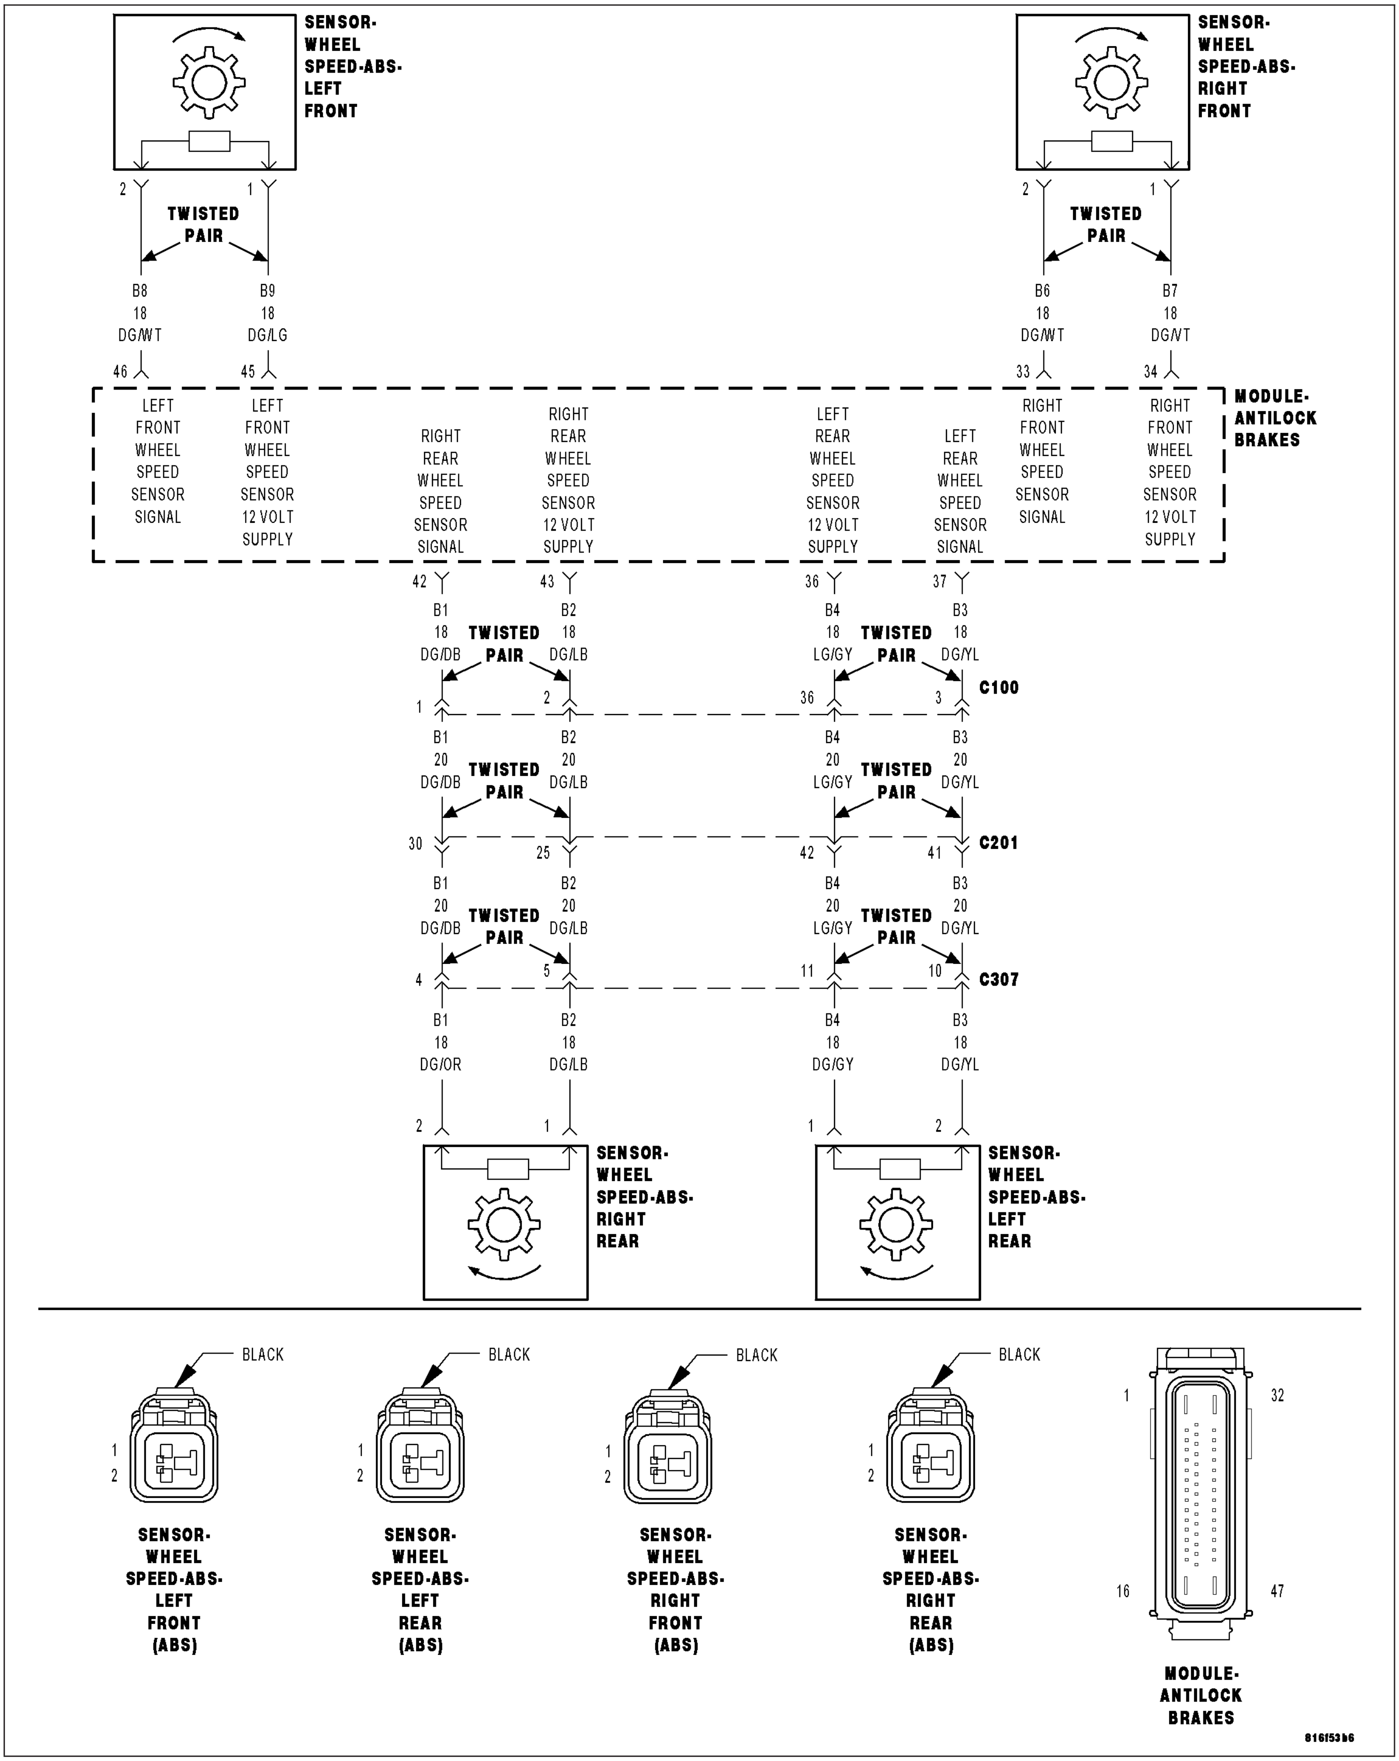
**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1047–RIGHT FRONT WHEEL PRESSURE PHASE MONITORING reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1048–LEFT REAR WHEEL PRESSURE PHASE MONITORING



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During active ABS control.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

| Possible Causes |
| --- |
| LEFT REAR TONE WHEEL/WHEEL BEARING |
| WHEEL SPEED SIGNALS SWAPPED |
| LEFT REAR WSS |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. COMPARE WHEEL SPEED SENSOR SIGNALS

**WARNING: Ensure brake capability is available before road testing.**

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Does the Left Rear WSS speed differ from the other WSS speeds by 8 Km/h (5 m.p.h.) or show NO speed?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

### 3. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. LEFT REAR WHEEL SPEED SENSOR

Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**
Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read ABS DTCs.

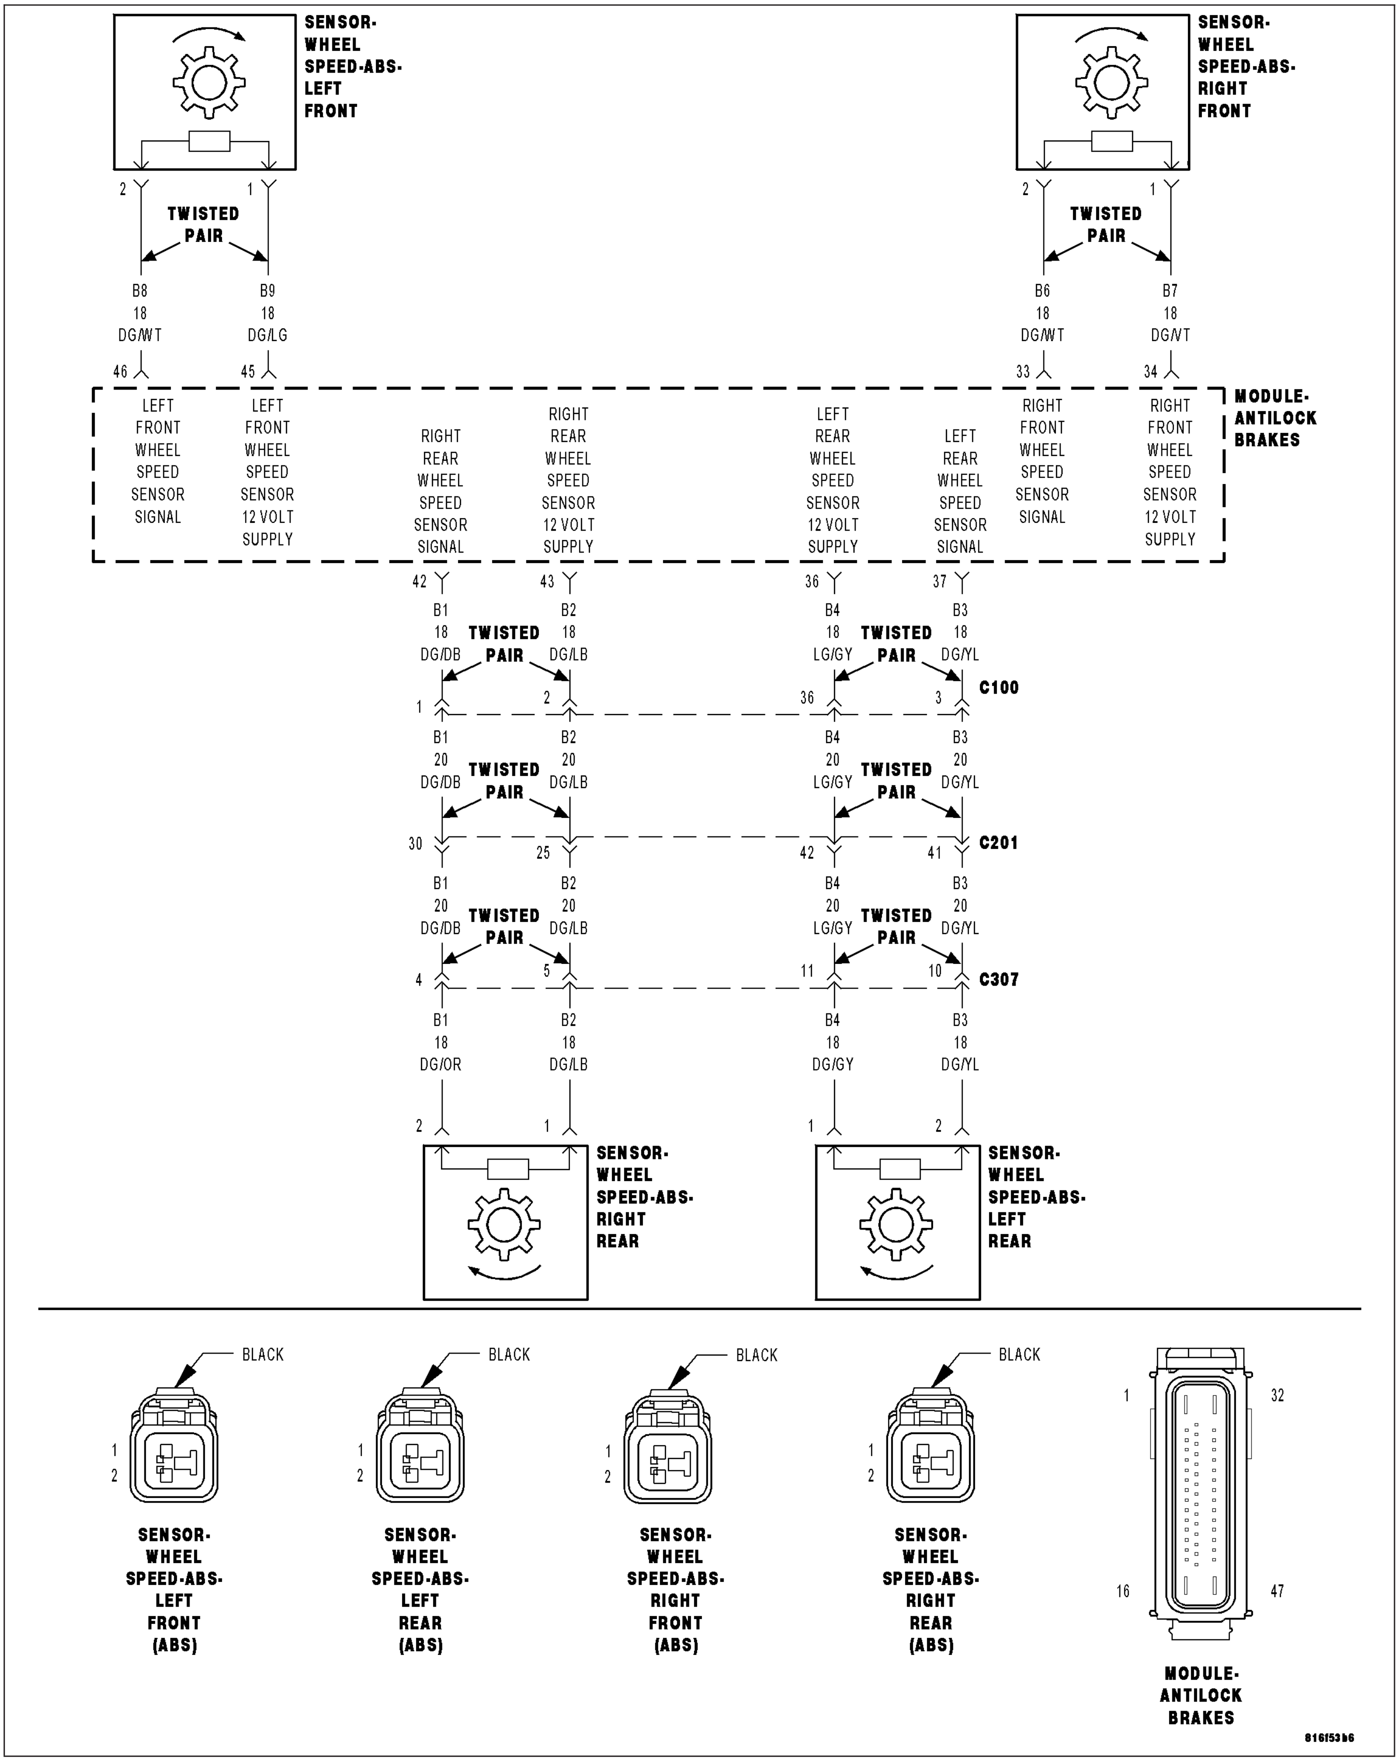
**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1048–LEFT REAR WHEEL PRESSURE PHASE MONITORING reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1049–RIGHT REAR WHEEL PRESSURE PHASE MONITORING



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During active ABS control.
- **Set Condition:**
  When the Anti-Lock Brakes Module detects a pressure reduction phase and the following pressure hold phase is too long.

| Possible Causes |
|---|
| RIGHT REAR TONE WHEEL DAMAGED |
| WHEEL SPEED SIGNALS SWAPPED |
| RIGHT REAR WSS |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. COMPARE WHEEL SPEED SENSOR SIGNALS

**WARNING: Ensure brake capability is available before road testing.**

With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

**Does the Right Rear WSS speed from the other WSS speeds by 8 Km/h (5 m.p.h.) or show NO speed?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT TONE WHEEL/BEARING

Turn the ignition off.

Visually inspect the tone wheel and bearing for damage.

- Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

### 3. CHECK WHEEL SPEED SENSOR WIRING

Check the Anti-Lock Brakes Module and Wheel Speed Sensors harness connectors for incorrectly wired connectors.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. RIGHT REAR WHEEL SPEED SENSOR

Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**
Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read ABS DTCs.

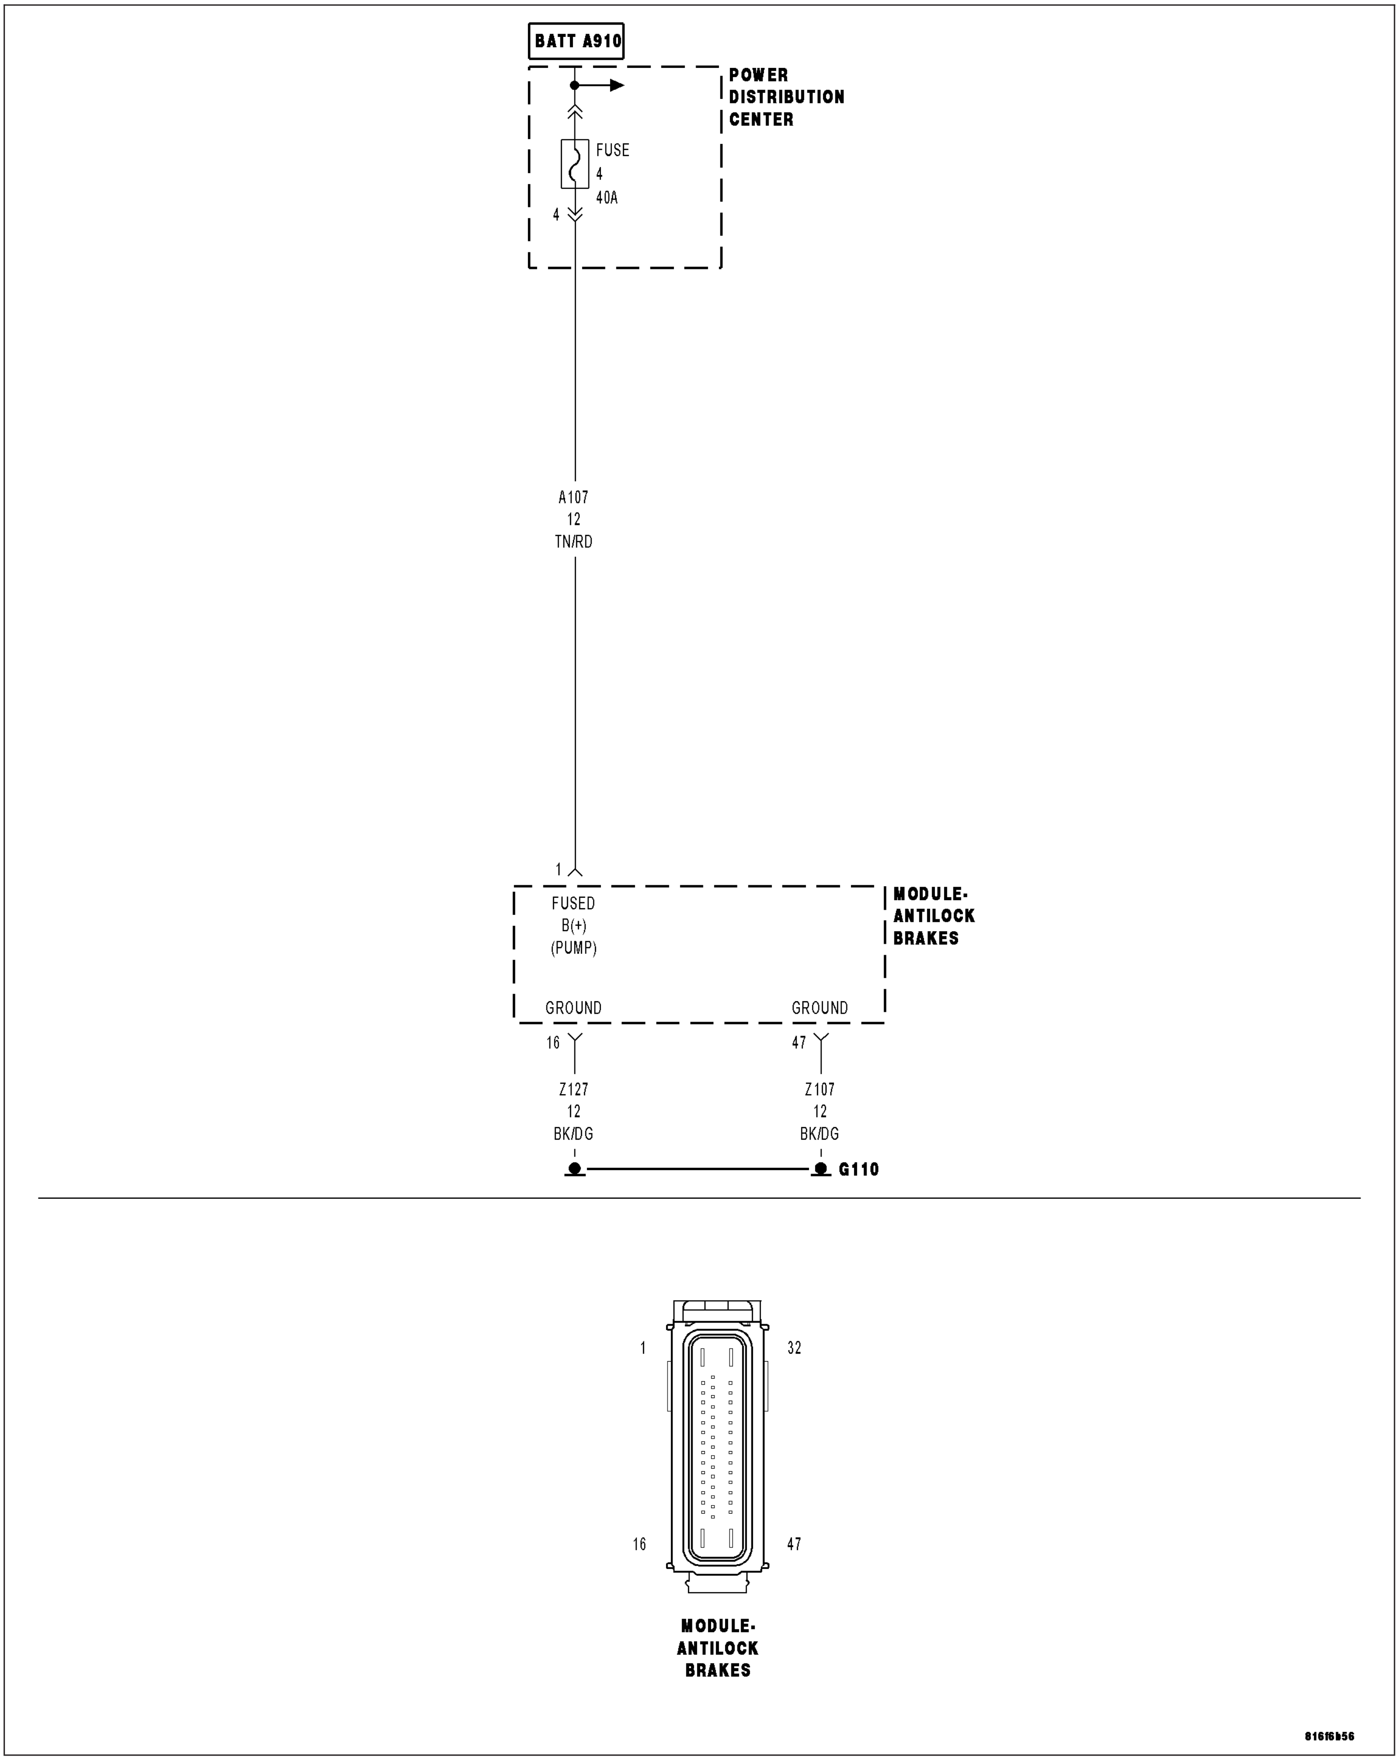
**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Did DTC C1049–RIGHT REAR WHEEL PRESSURE PHASE MONITORING reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C1073–ABS PUMP MOTOR CONTROL CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the ABS Pump Motor is activated.
- **Set Condition:**
  The Anti-Lock Brake Module detects low pump motor feedback voltage with actuation of the pump motor relay.

| Possible Causes |
|---|
| BLOWN PUMP FUSE |
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| HIGH RESISTANCE IN B+ CIRCUITS |
| HIGH RESISTANCE IN GROUND CIRCUITS |
| INTEGRATED CONTROL UNIT |

## Diagnostic Test

### 1. CHECK FOR A DTC C1073-ABS PUMP MOTOR CONTROL CIRCUIT

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**

With the scan tool, read DTCs

**NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.**

**Does the scan tool display: C1073-ABS PUMP MOTOR CONTROL CIRCUIT?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK THE ABS PUMP MOTOR FUSED B+ FOR AN OPEN

Turn the ignition off.

Remove and visually inspect the ABS Pump Motor B+ fuse.

**Is the ABS Pump Motor B+ fuse open?**

**Yes** >> Go To 4

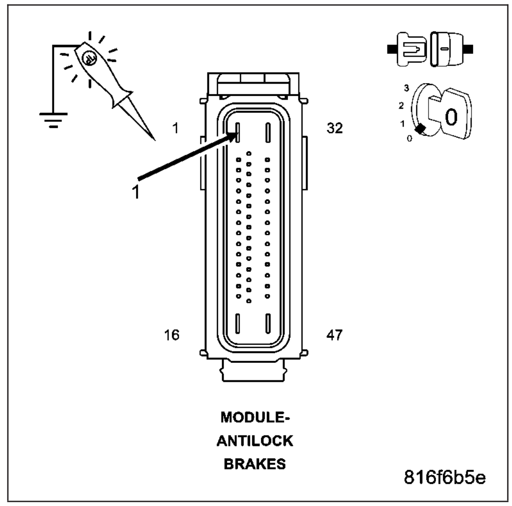
**No** >> Go To 6

## 4. CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12–volt test light connected to 12–volts, probe the (A107) Fused B+ circuit.



**Does the test light illuminate brightly?**

**Yes** >> Repair the (A107) Fused B(+) circuit for a short to ground. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK THE (A107) FUSED B(+) CIRCUIT

Turn the ignition off.

Visually inspect the (A107) Fused B(+) circuit in the wiring harness.

Look for any signs of intermittent short to ground.

**Is the wiring harness OK?**

**Yes** >> Go To 6

**No** >> Repair the (A107) Fused B(+) circuit for a short to ground. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK THE VOLTAGE ON THE (A107) FUSED B(+) CIRCUIT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

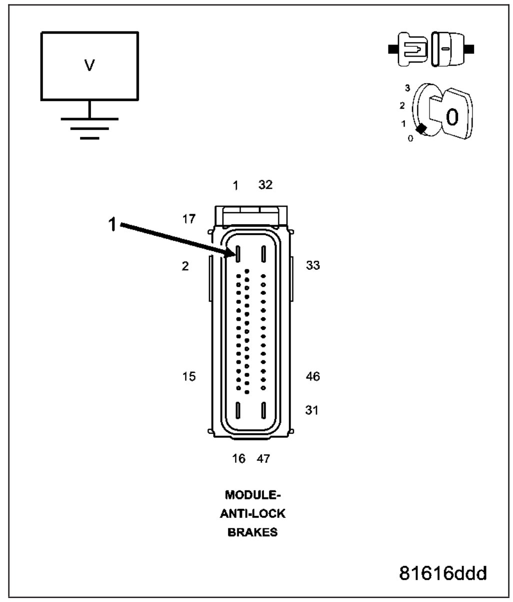
Measure the voltage of the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 7

**No** >> Repair the (A107) Fused B(+) circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## 7. CHECK THE (Z107) GROUND CIRCUITS FOR AN OPEN

Measure the resistance of the (Z107) Ground circuits between the Anti-Lock Brake Module harness connector and ground

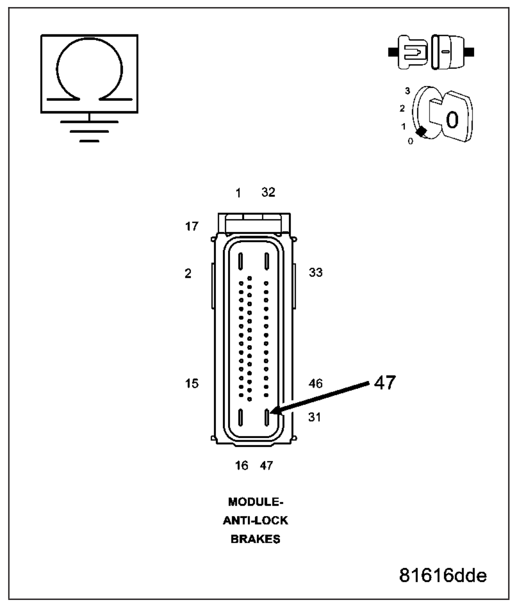
**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the ICU per service information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair the high resistance in the affected circuit.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## C1078–TIRE REVOLUTIONS RANGE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  A comparison between the tire circumference value contained in the EEPROM and the tire circumference value received on the CAN bus. Programmed value for tire size is not within acceptable range.

| Possible Causes |
|---|
| INCORRECT VALUE PROGRAMMED INTO ECM |
| ENGINE CONTROL MODULE |

## Diagnostic Test

### 1. INCORRECT VALUE PROGRAMMED INTO FCM

| TIRE SIZE | BODY STYLE | ENGINE SIZE | SALES CODE | TIRE CIRCUMFERENCE (DEC) |
|---|---|---|---|---|
| P225/75R 16 WRANGLER ST | KJ | ALL | TR7 | |
| P235/70R 16 WRANGLER SR-A | KJ | ALL | TSN | |
| P235/70R 16 WRANGLER SR-A | KJ | ALL | TSZ | |
| P235/65R 17 EAGLE RSA | KJ | ALL | TX7 | |
| P235/65R 17 WRANGLER HP | KJ | ALL | TUP | |

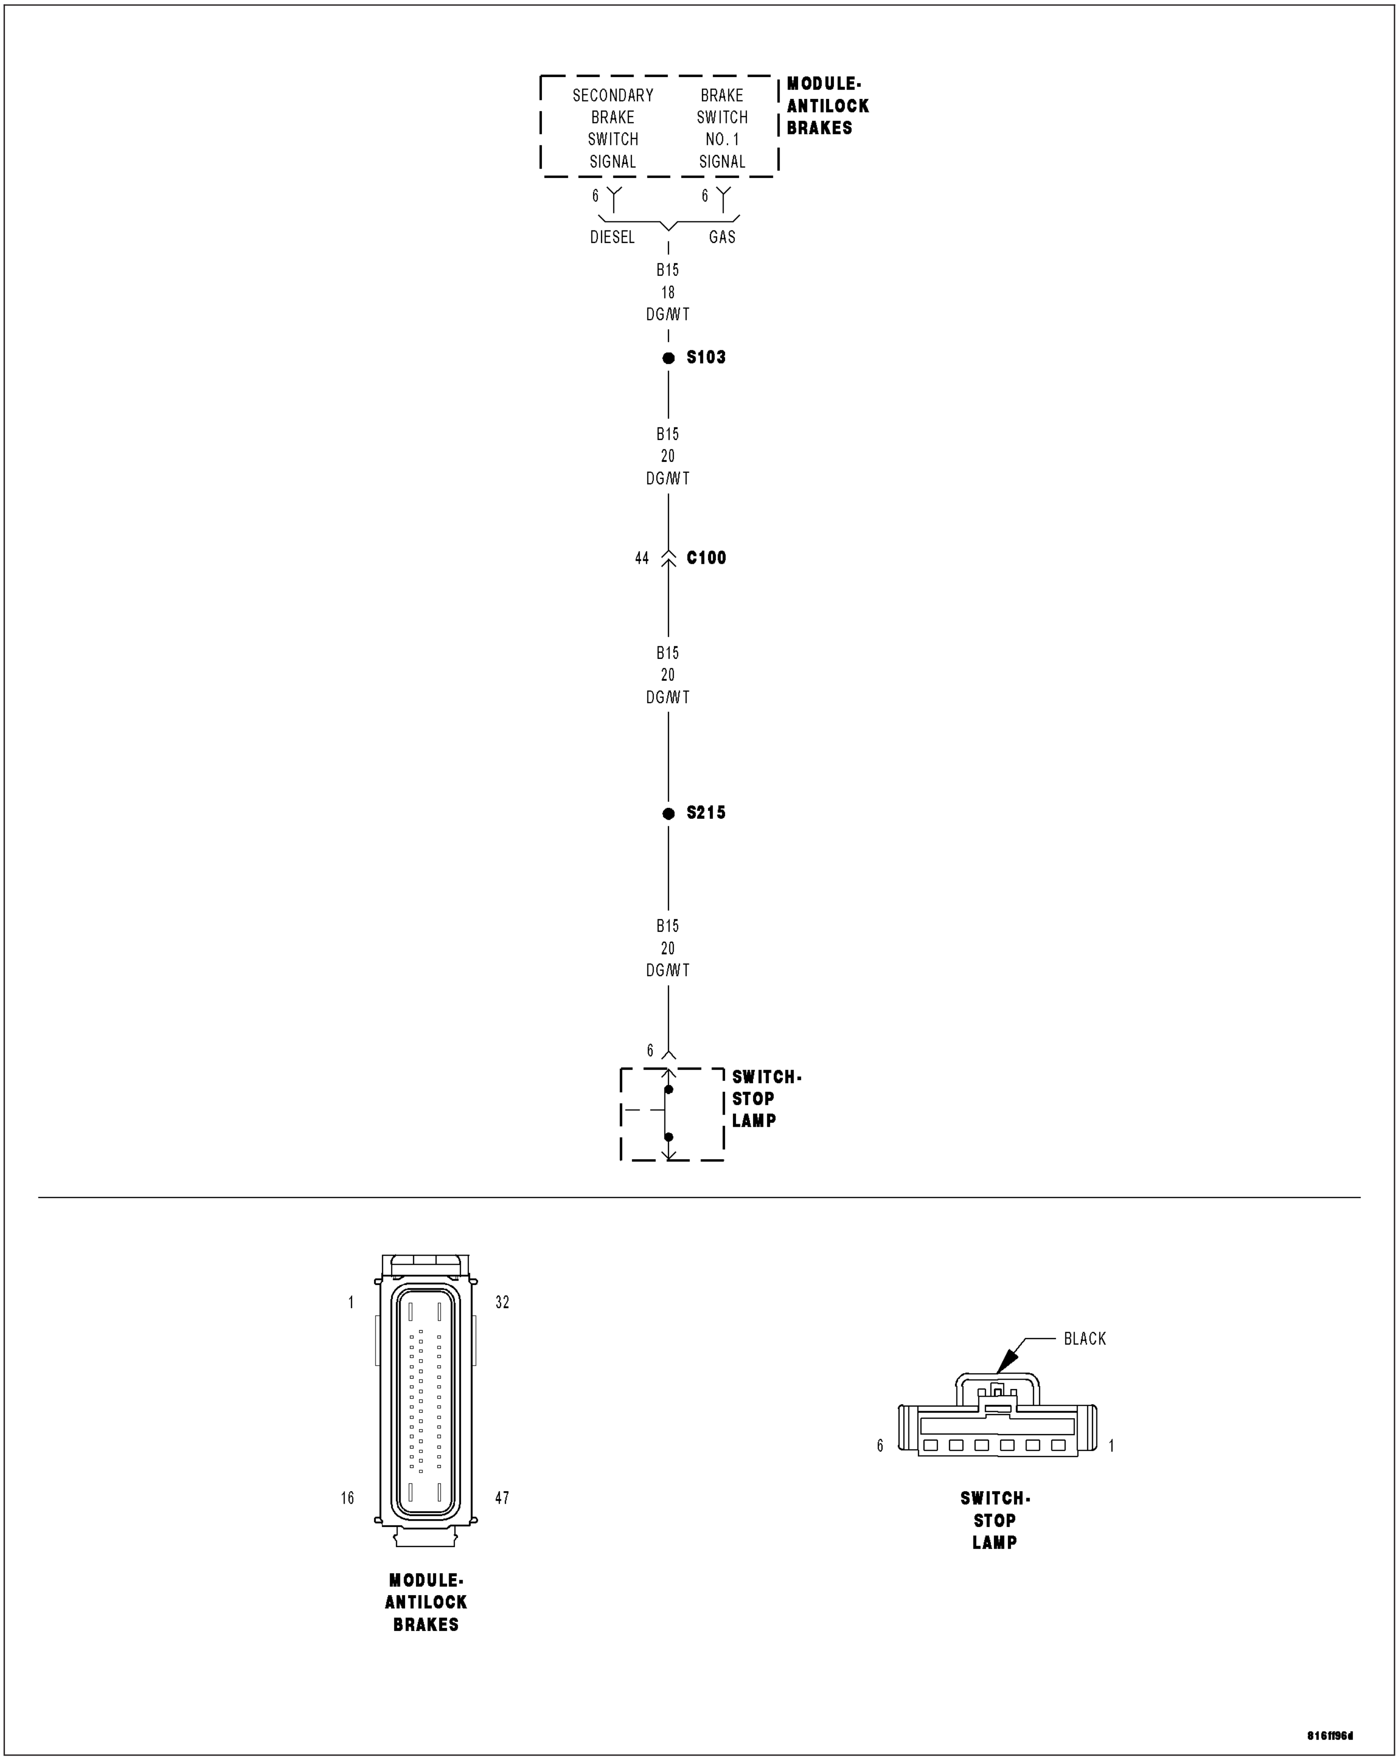
Verify the correct Tire/wheel information is programmed in the FCM.

**Is the correct value programmed in the FCM according to the chart?**

**Yes** >> Test complete.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Program the correct Tire/Wheel information in the FCM.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C107C–BRAKE PEDAL SWITCH 1/2 STUCK



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on, but not during first run.
  Or, with low supply voltage.
  Or, if a Pressure Sensor fault is active.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a mismatch between the Brake Test Signal (BTS) from the Pressure Sensor and the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas).

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| STOP LAMP RELATED DTCs OR SYMPTOMS PRESENT |
| MISADJUSTED PEDAL SWITCH |
| PRESSURE SENSOR OR VOLTAGE RELATED DTCs PRESENT |
| (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) OPEN |
| (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) SHORT TO GROUND |
| STOP LAMP SWITCH |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Diagnose and repair all Pressure Sensor and Voltage related DTCs and all Stop Lamp related DTCs and symptoms before diagnosing this DTC.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

Press and release the brake pedal several times.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) FUNCTION WHILE DEPRESSING & RELEASING THE BRAKE PEDAL

Disconnect the Anti-Lock Brakes Module harness connector.

Turn the ignition on.

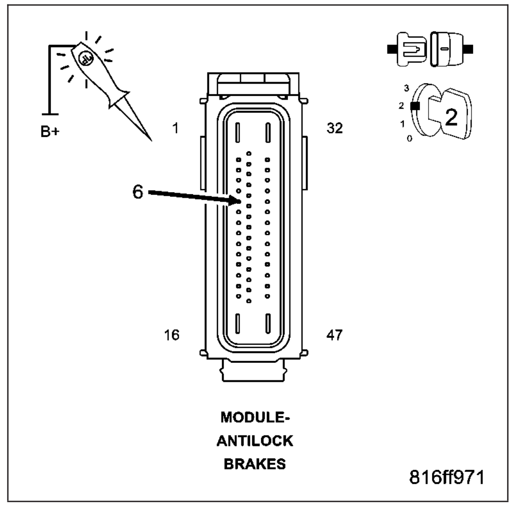
Using a 12-volt test light connected to 12 volts, probe the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) in the Anti-Lock Brakes Module harness connector.

Depress and release the brake pedal.

**Does the test light illumination toggle from off to on?**

**Yes** >> Go To 7

**No** >> Go To 4



816ff971

## 4. CHECK (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) FOR AN OPEN

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

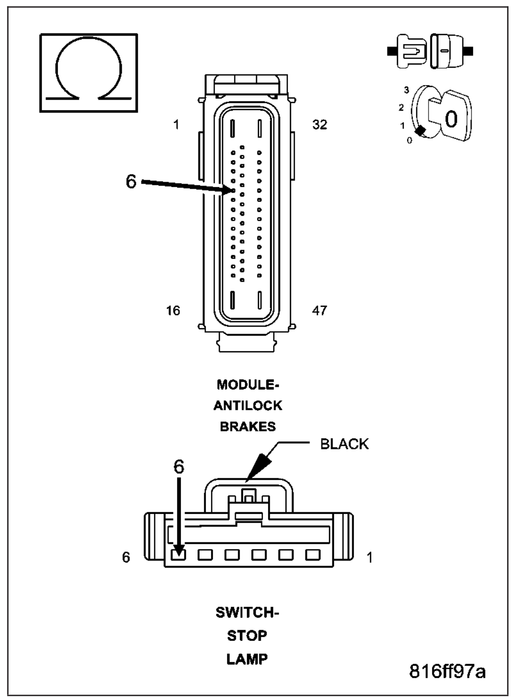
Measure the resistance of the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) between the Anti-Lock Brakes Module harness connector and the Stop Lamp Switch harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



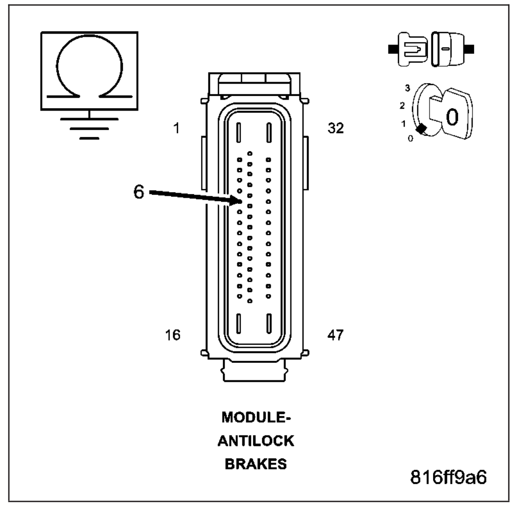
816ff97a

## 5. CHECK (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Measure the resistance of the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) between ground and the Anti-Lock Brakes Module harness connector.



**Is the resistance below 10k ohms?**

**Yes** >> Repair the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. CHECK (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) FOR A OPEN GROUND Measure the resistance on the (Z940) Ground circuit and ground in the Stop Lamp Switch harness connector.

**Is the resistance below 5 ohms?**

**Yes** >> Replace the Stop Lamp Switch in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair the open in the (Z940) Ground circuit.

## 7. CHECK BRAKE PEDAL ADJUSTMENT

- Reconnect the Stop Lamp Switch harness connector.

Using a 12-volt test light connected to 12 volts, backprobe the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) in the Stop Lamp Switch harness connector.

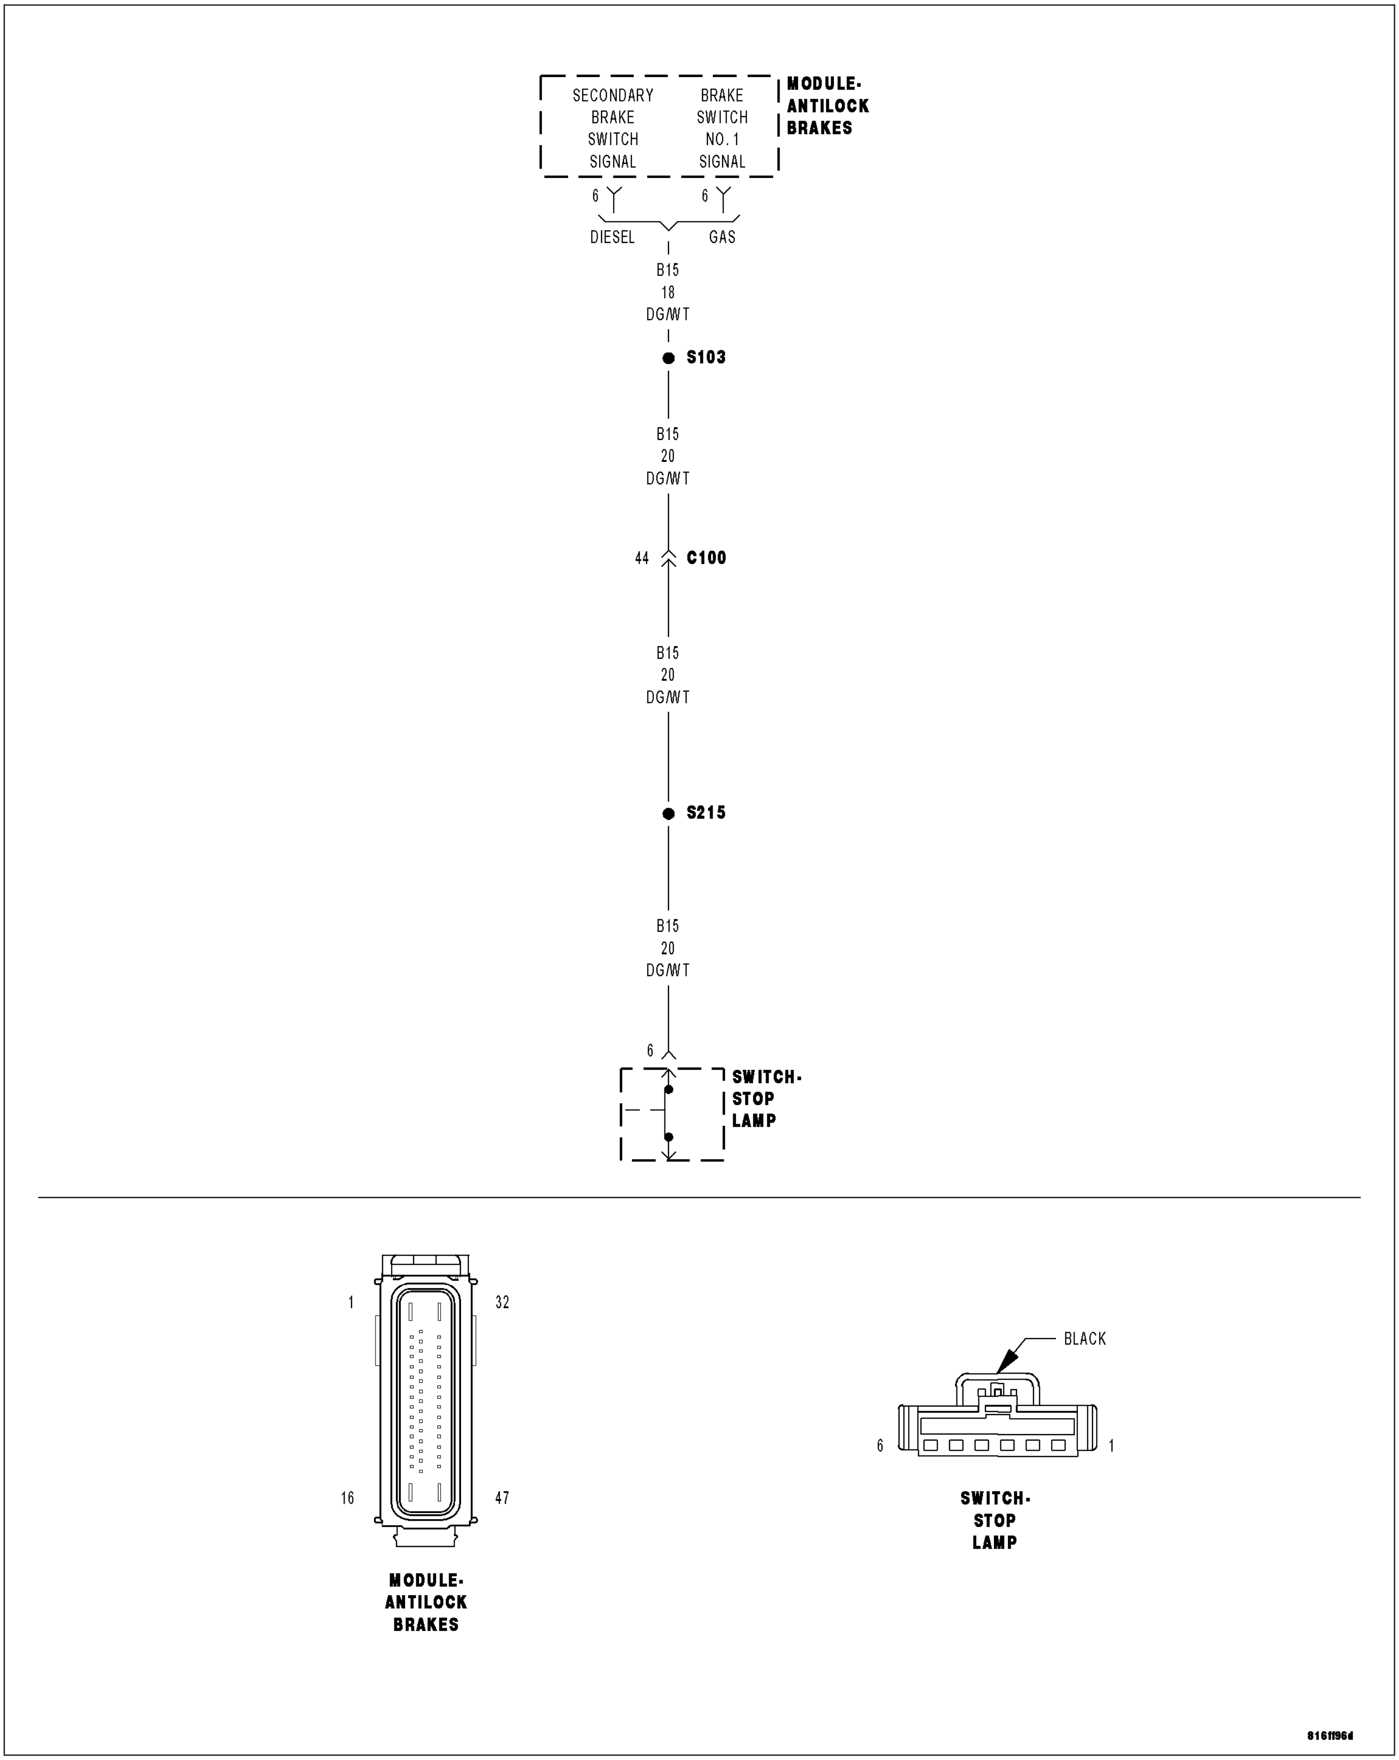
Depress and release the brake pedal.

**Does the test light illumination toggle from off to on within 4–5 mm of brake pedal travel?**

**Yes** >> Replace the Anti-Lock Bakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Stop Lamp Switch in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C107D–BRAKE PEDAL SWITCH 1/2 CORRELATION



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the vehicle is driven.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects an implausible signal from the Stop Lamp Switch.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| STOP LAMP RELATED DTCs OR SYMPTOMS PRESENT (F942 CIRCUIT/FUSE OPEN) |
| MISADJUSTED PEDAL SWITCH |
| (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) SHORTED TO GROUND |
| (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) OPEN |
| STOP LAMP SWITCH |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Diagnose and repair all Pressure Sensor and Voltage related DTCs and all Stop Lamp related DTCs and symptoms before diagnosing this DTC.**

Turn the ignition on.

With the scan tool, read ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase DTCs.

Cycle the ignition switch.

**WARNING: Ensure brake capability is available before road testing.**

Test drive the vehicle as follows: Drive for more than 6 minutes at a speed greater than 40 km/h (25 m.p.h.) and accelerate to a speed greater than 40 km/h (25 m.p.h.) and then decelerate to a speed lower than 3 km/h (2 m.p.h.) five consecutive times.

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) FUNCTION WHILE DEPRESSING & RELEASING THE BRAKE PEDAL

Disconnect the Anti-Lock Brakes Module harness connector.

Turn the ignition on.

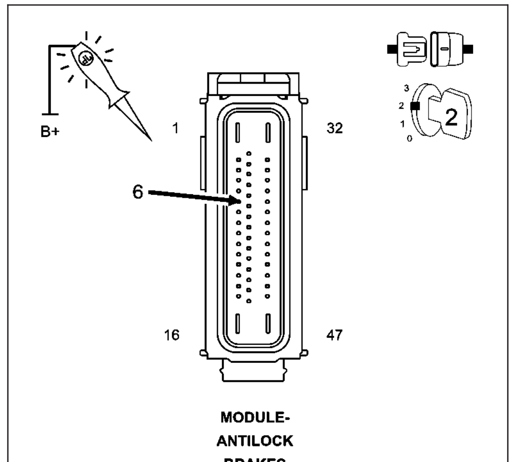
Using a 12-volt test light connected to 12 volts, backprobe the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) in the Anti-Lock Brakes Module harness connector.

Depress and release the brake pedal.

**Does the test light illumination toggle from off to on?**

**Yes** >> Go To 7

**No** >> Go To 4



816ff971

## 4. CHECK (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

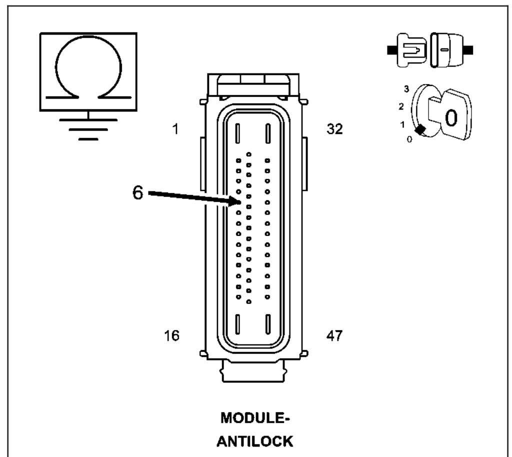
Measure the resistance of the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) between ground and the Anti-Lock Brakes Module harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

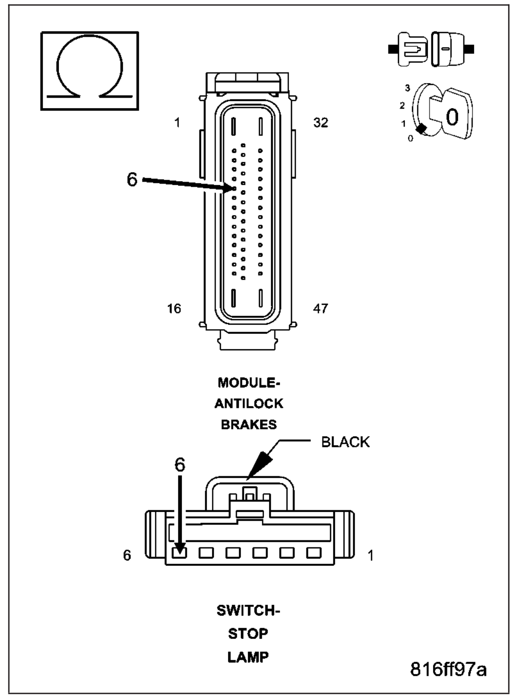
**No** >> Go To 5



816ff9a6

## 5. CHECK (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) FOR AN OPEN

Measure the resistance of the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) between the Anti-Lock Brakes Module harness connector and the Stop Lamp Switch harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK (B15) SECONDARY BRAKE SWITCH SIGNAL CIRCUIT (DIESEL) OR (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT (GAS) FOR A OPEN GROUND Measure the resistance on the (Z904) Ground circuit and ground in the Stop Lamp Switch harness connector.

**Is the resistance below 5 ohms?**

**Yes** >> Replace the Stop Lamp Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair the open in the (Z904) Ground circuit.

## 7. CHECK BRAKE PEDAL ADJUSTMENT

- Reconnect the Stop Lamp Switch harness connector.

Using a 12-volt test light connected to 12 volts, backprobe the (B15) Secondary Brake Switch Signal circuit (Diesel) or the (B15) Brake Switch No. 1 Signal circuit (Gas) in the Stop Lamp Switch harness connector.

Depress and release the brake pedal.

**Does the test light illumination toggle from off to on within 4–5 mm of brake pedal travel?**

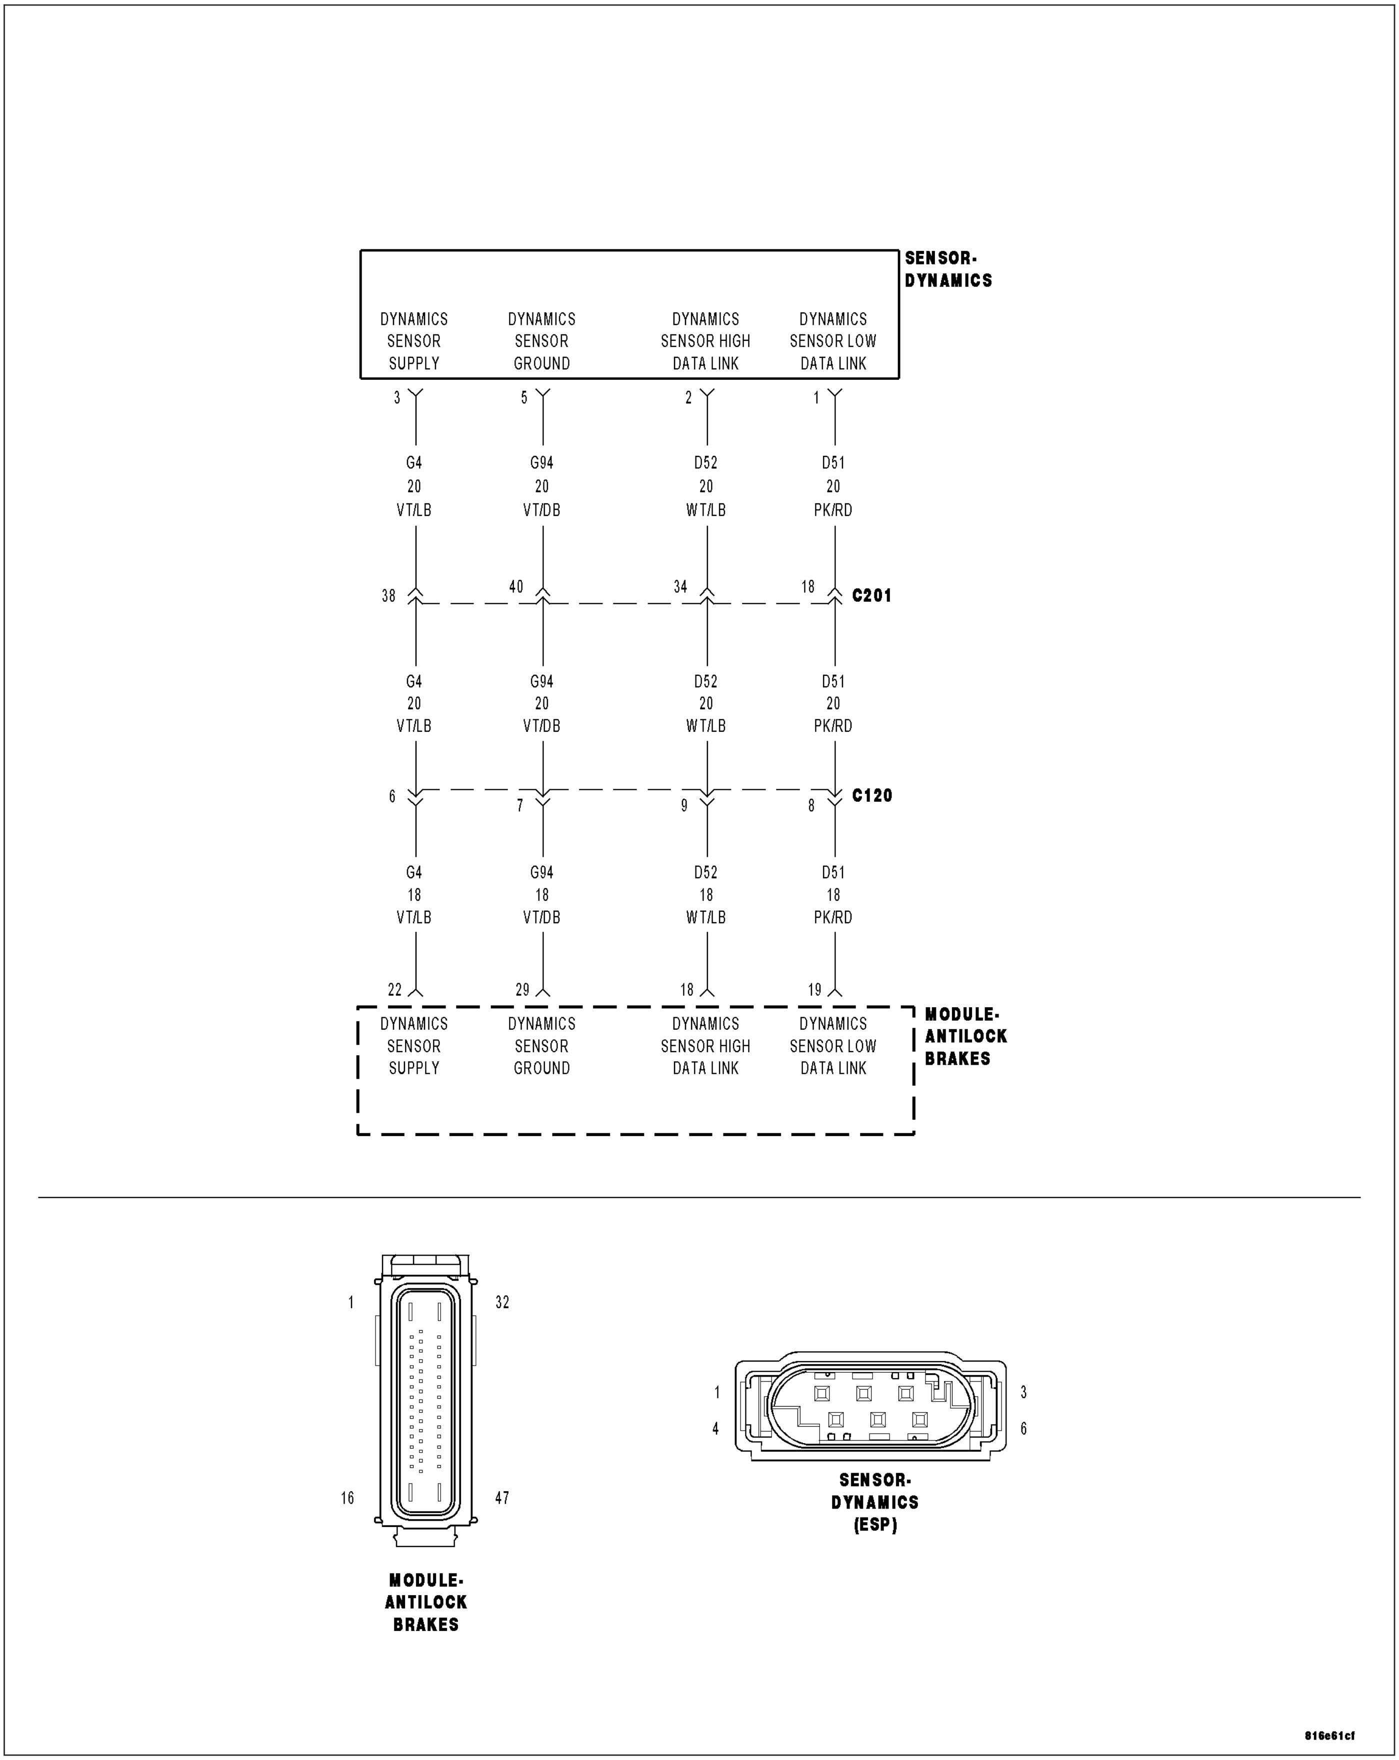
**Yes** >> Replace the Anti-Lock Bakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Stop Lamp Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1210–G SENSOR INPUT CIRCUIT PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Once per loop, but not during active test function of acceleration sensor if the sensor voltage is out of range.
- **Set Condition:**
  Longitudinal acceleration sensor signal is out of range.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (G4) DYNAMICS SENSOR SUPPLY HIGH RESISTANCE |
| (G94) GROUND CIRCUIT HIGH RESISTANCE |
| DYNAMICS SENSOR INSTALLATION |
| DYNAMICS SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC C1210–G SENSOR INPUT CIRCUIT PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

**Does the scan tool display: C1210–G SENSOR INPUT CIRCUIT PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check the Steering Angle Sensor installation.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. (G4) DYNAMICS SENSOR SUPPLY HIGH RESISTANCE

Turn the ignition off.
Disconnect the Dynamics Sensor harness connector.
Turn the ignition on.
Measure the voltage of the (G4) Dynamics Sensor Supply circuit at the Dynamics Sensor harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Repair the (G4) Dynamics Sensor Supply circuit for high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 4. (G94) GROUND CIRCUIT HIGH RESISTANCE

Turn the ignition off.
Measure the resistance between the (G94) Ground circuit and ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (G94) Ground circuit for high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 5. CHECK THE DYNAMICS SENSOR INSTALLATION

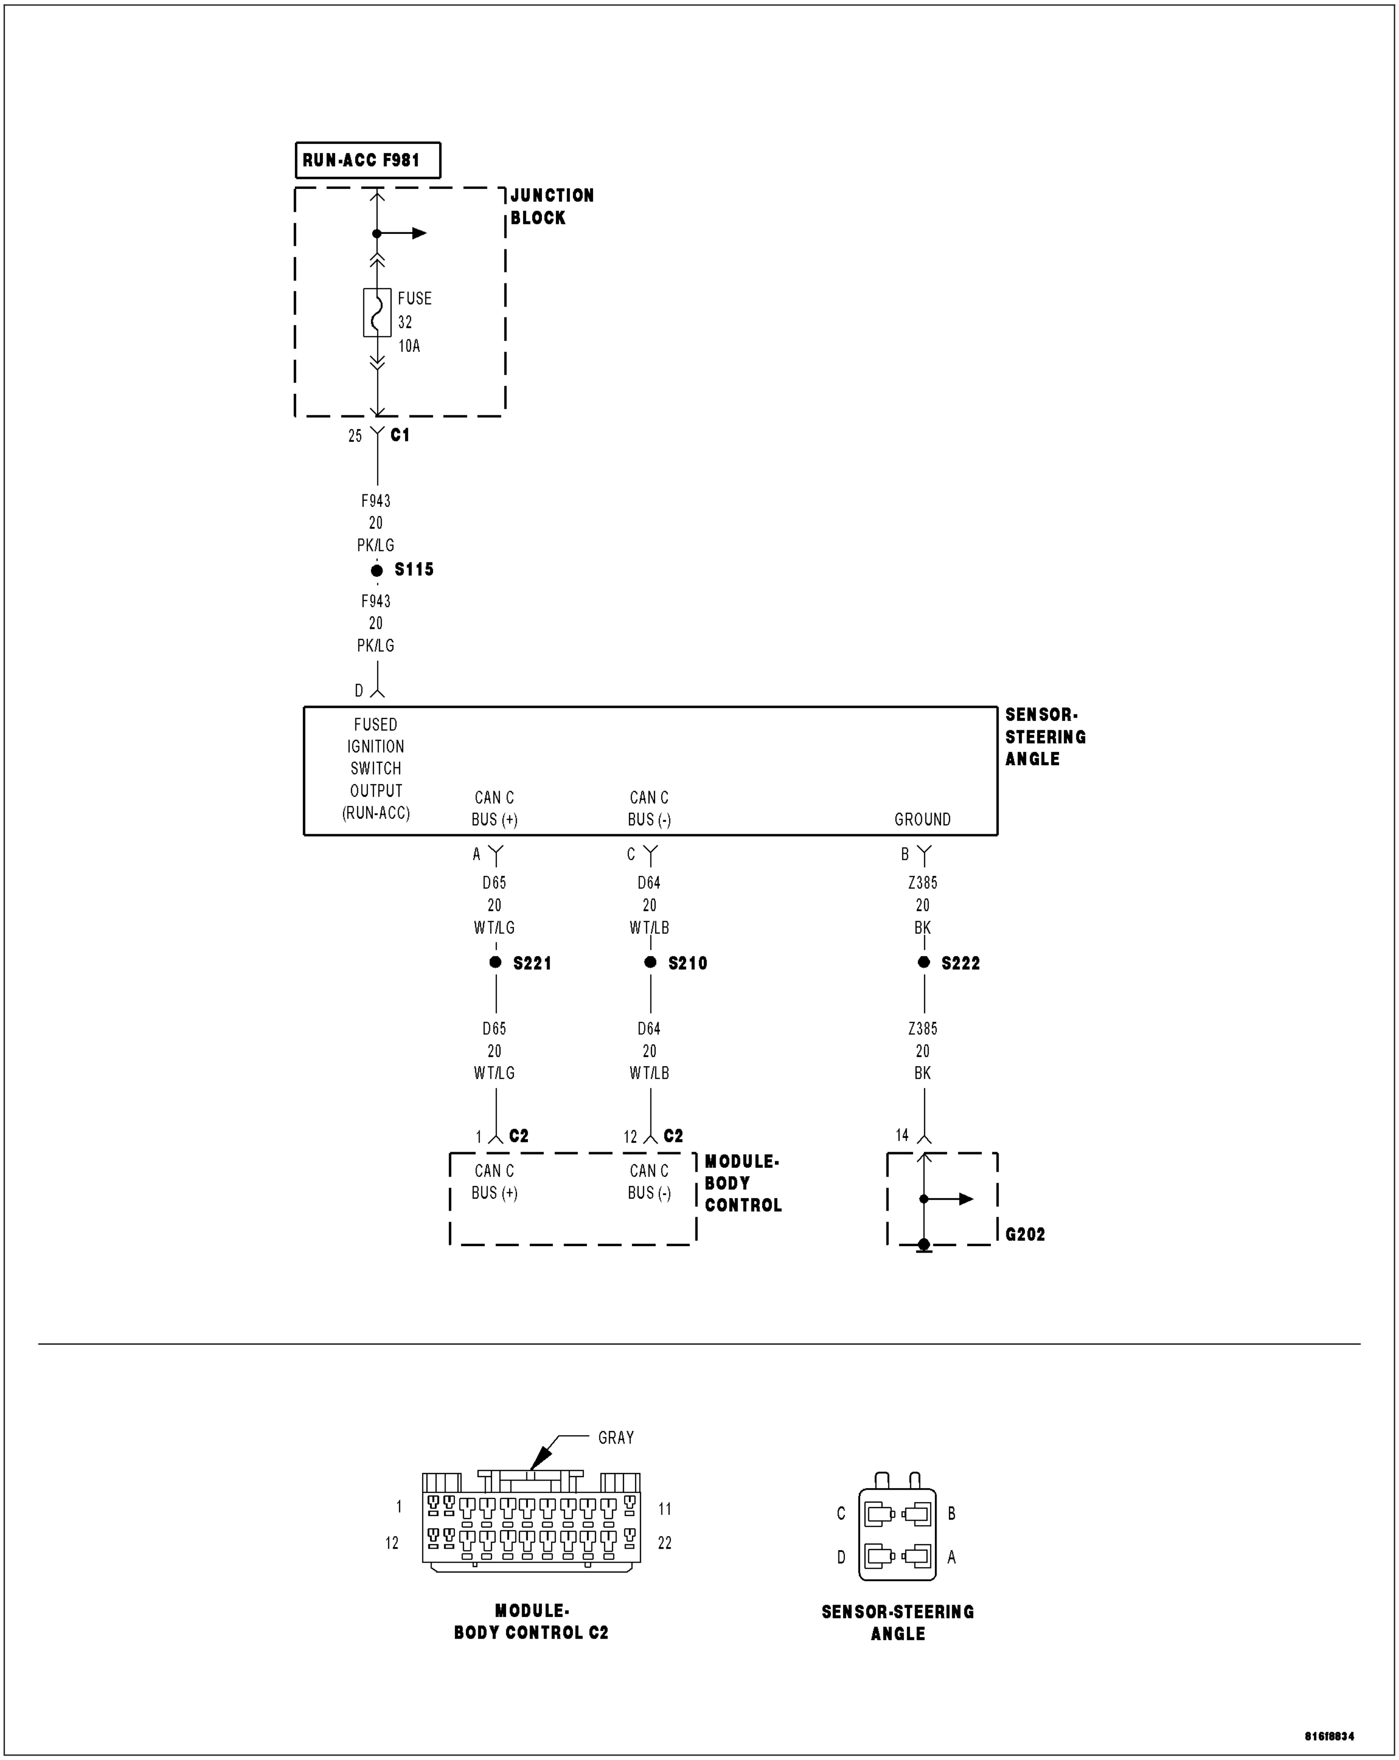
**NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**
Turn the ignition off.
Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.
Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1219–STEERING ANGLE SENSOR ERRATIC PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brake Module detects that the calculated steering wheel angle exceeds what is physically possible.

| Possible Causes |
| --- |
| VEHICLE DAMAGE |
| STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE |
| STEERING ANGLE SENSOR LOOSE |
| STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION) |
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (F943) FUSED IGNITION SWITCH OUTPUT (RUN-ACC) CIRCUIT HIGH RESISTANCE |
| (Z385) GROUND CIRCUIT HIGH RESISTANCE |
| STEERING ANGLE SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: Ensure brake capability is available before road testing.**
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Center the steering wheel.

With the scan tool, read the Steering Angle Sensor Position.

**Is the Steering Angle Sensor Position within ±15°?**

**Yes** >> Go To 3

**No** >> Go To 8

## 3. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

**NOTE: If possible, check vehicle repair history for collision damage.**

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems.

Inspect the steering column and intermediate shaft for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK STEERING ANGLE SENSOR INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.**

Verify that the Steering Angle Sensor are properly installed.

**Is the Steering Angle Sensor properly installed?**

**Yes** >> Go To 5

**No** >> Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 5. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: A low voltage condition at the Steering Angle Sensor will cause this DTC to set.**

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

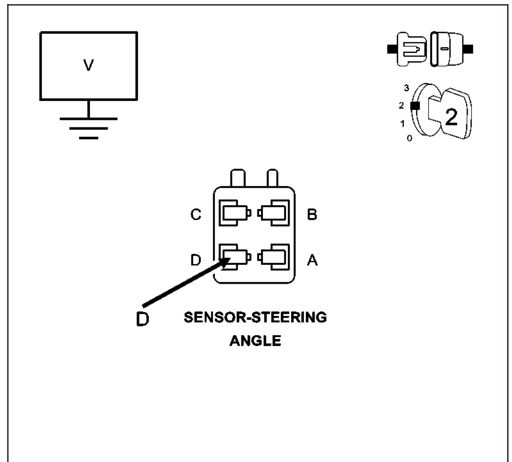
**No** >> Go To 6

## 6. CHECK (F943) FUSED IGNITION SWITCH OUTPUT (RUN-ACC) CIRCUIT FOR HIGH RESISTANCE

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (F943) Fused Ignition Switch Output (Run-ACC) circuit.



816f8838

**Is the voltage above 11.0 volts?**

**Yes** >> Go To 7

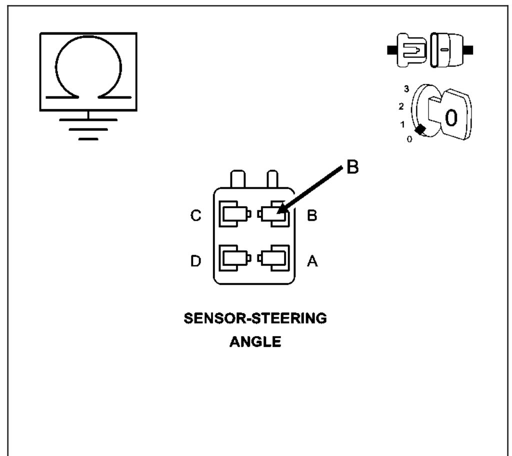
**No** >> Repair the (F943) Fused Ignition Switch Output (Run-ACC) circuit for high resistance.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 7. CHECK (Z385) GROUND CIRCUIT FOR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (Z385) Ground circuit between ground and the Steering Angle Sensor harness connector.



816f8840

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair the (Z385) Ground circuit for high resistance.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 8. CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL

With the scan tool, read the Steering Angle Sensor Position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor Position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

**Did the steering angle change accordingly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C121A–STEERING ANGLE SENSOR NOT INITIALIZED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  This DTC may set with DTC C1231–DRIVE TEST: STEERING ANGLE SENSOR due to cycling of ignition several times or entering and exiting diagnostics several times.

Refer to **C1231–DRIVE TEST: STEERING ANGLE SENSOR** in this Section for the diagnostic test procedure.

## C121C-TORQUE REQUEST SIGNAL DENIED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Powertrain Control Module indicates, for an extended period of time, that engine management relevant for Automatic Yaw Control/Traction Control System control can not be accomplished.

| Possible Causes |
| --- |
| ANTI-LOCK BRAKE MODULE |
| POWERTRAIN CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC C121C-TORQUE REQUEST SIGNAL DENIED

**NOTE: This DTC must be active for the results of this test to be valid and this DTC may set while driving under severe load conditions.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

Start Engine.

With the scan tool, read and record DTCs.

**Does the scan tool display: C121C-TORQUE REQUEST SIGNAL DENIED?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK THE POWERTRAIN DTCS

With the scan tool, read and record Powertrain DTCs.

**Were any Powertrain related DTCs found?**

**Yes** >> Repair the Powertrain System in accordance with the Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

### 3. ESP TORQUE REQUEST SIGNAL

Engine started.

With the scan tool, read the Allow ESP Torque Request status bit.

**Was the Allow ESP Torque Request showing NOT set?**

**Yes** >> Replace the Powertrain Module in accordance with the Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C121D–BRAKE PRESSURE SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

| Possible Causes |
|---|
| ANTI-LOCK BRAKE MODULE |
| INTEGRATED CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

**Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. RECHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

**Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?**

**Yes** >> Replace the ICU in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test complete

## C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

| Possible Causes |
| --- |
| ANTI-LOCK BRAKE MODULE |
| INTEGRATED CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

**Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. RECHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTCs.

**Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?**

**Yes** >> Replace the ICU in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test complete

## C1221-BRAKE PRESSURE SENSOR/ACCEL PEDAL POSITION SENSOR CORRELATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor output signal is not plausible.

| Possible Causes |
|---|
| AIR IN BRAKE SYSTEM / WORN MECHANICAL COMPONENTS |
| BRAKE SWITCH SIGNAL OPEN |
| BRAKE PRESSURE SENSOR |
| INTEGRATED CONTROL MODULE |

### Diagnostic Test

#### 1. CHECK FOR A DTC C1221-BRAKE PRESSURE SENSOR/ACCEL PEDAL POSITION SENSOR CORRELATION

Turn the ignition on.
With the scan tool, read and record DTCs.
With the scan tool, read and record Freeze Frame information.
With the scan tool, erase DTCs.
Start the engine.
Depress and release the brake pedal.
With the scan tool, read and record DTCs.

**Does the scan tool display: C1221-BRAKE PRESSURE SENSOR/ACCEL PEDAL POSITION SENSOR CORRELATION?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

#### 2. CHECK BRAKE SWITCH

With the scan tool look at the Brake Switch Signal.
Apply the brakes on and off while checking for a Brake Switch Signal change.

**Did the Brake Switch Signal change?**

**Yes** >> Go To 3

**No** >> Repair as needed.

#### 3. CHECK BRAKE PRESSURE SENSOR

With the scan tool look at Pressure Sensor Signal and the Brake Switch Signal.
With the brakes not applied the Pressure Sensor should read ± 15 bar.
Apply the brakes the Pressure Sensor should read above 15 bar.

**Did Brake Pressure Sensor increase above 15 bar?**

**Yes** >> Replace the Integrated Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK FOR AIR IN BRAKE SYSTEM

**NOTE: Before continuing the brake system must be bled to verify there is no air in the brake system.**

Turn ignition off.

Bleed brake system.

Check worn mechanical components.

**Was there any air in the brake system or worn mechanical components?**

**Yes** >> Repair as needed.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Integrated Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1231-DRIVE TEST: STEERING ANGLE SENSOR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects implausible Steering Angle Sensor data.

| Possible Causes |
|---|
| STEERING ANGLE SENSOR INSTALLATION |
| STEERING ANGLE SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC C1231–DRIVE TEST: STEERING ANGLE SENSOR

**NOTE: This DTC must be active for the results of this test to be valid.**

**NOTE: If any of the following DTCs are present they must be repaired before continuing.**

DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE

DTC C121A-STEERING ANGLE SENSOR NOT INITIALIZED

DTC C123F-STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

DTC C1240-STEERING ANGLE SENSOR ANGLE OVERTRAVEL PERFORMANCE

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine.

With the scan tool, read and record DTCs.

**Does the scan tool display: C1231–DRIVE TEST: STEERING ANGLE SENSOR?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the Steering Angle Sensor is active on the bus.

**Is the Steering Angle Sensor active on the bus?**

**Yes** >> Go To 3

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

## 3. CHECK STEERING ANGLE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle.

**Is the Steering Angle reading within ±15 degrees?**

**Yes** >> Go To 4

**No** >> Go To 5

## 4. CHECK STEERING ANGLE CHANGE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle.

Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

**Did the steering angle change accordingly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 5. CHECK STEERING ANGLE SENSOR INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.**

Turn the ignition off.

Verify that the Steering Angle Sensor is properly installed. Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION.

**Is the Steering Angle Sensor properly installed?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1232–DRIVE TEST: PRESSURE SENSOR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  If the Pressure Sensor fails to activate.

| Possible Causes |
|---|
| HYDRAULIC / BRAKE SYSTEM COMPONENT INSTALLATION |
| INTEGRATED CONTROL UNIT |
| PRESSURE SENSOR (HYDRAULIC CONTROL UNIT) |

## Diagnostic Test

### 1. CHECK FOR A DTC C1232–DRIVE TEST: PRESSURE SENSOR

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine.

With the scan tool, read and record DTCs.

**Does the scan tool display: C1232–DRIVE TEST: PRESSURE SENSOR?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.

Verify that the brake system components are installed and functioning properly.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Clean contacts in HCU first if problem reoccurs replace the Integrated Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects implausible Dynamics Sensor data.

| Possible Causes |
| --- |
| DYNAMICS SENSOR INSTALLATION |
| DYNAMICS SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

Perform ECU initialization with drive test. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Start the engine.

With the scan tool, read and record DTCs.

**Does the scan tool display: C1234–DRIVE TEST: SENSOR CLUSTER INSTALLATION?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK THE DYNAMICS SENSOR INSTALLATION

**NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1238-DRIVE TEST: UNSUCCESSFUL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During the Drive Test.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a fault with the Steering Angle Sensor, the Pressure Sensor, or the Dynamics Sensor.

| Possible Causes |
|---|
| STEERING ANGLE SENSOR |
| PRESSURE SENSOR |
| DYNAMICS SENSOR |
| ANTI-LOCK BRAKES MODULE |

### Diagnostic Test

1. **DIAGNOSE & REPAIR ALL DTCs**

**Repair**

Diagnose and repair all DTCs.

## C1239–EMISSIONS ROLLS TEST ACTIVE

For a complete wiring diagram **Refer to Section 8W**.

### Theory of Operation

The functional effects are that the output signal for all wheel speeds mimic the wheel with the highest wheel speed.

This DTC sets when the Emissions Rolls Test is active.

Close out the Emissions Rolls Test though the FCM.

## C123A–ESP SYSTEM SENSORS CALIBRATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Once per ignition cycle.
- **Set Condition:**
  If the calculated checksum does not match the stored checksum.

| Possible Causes |
|---|
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. INITIALIZE ANTI-LOCK BRAKES MODULE

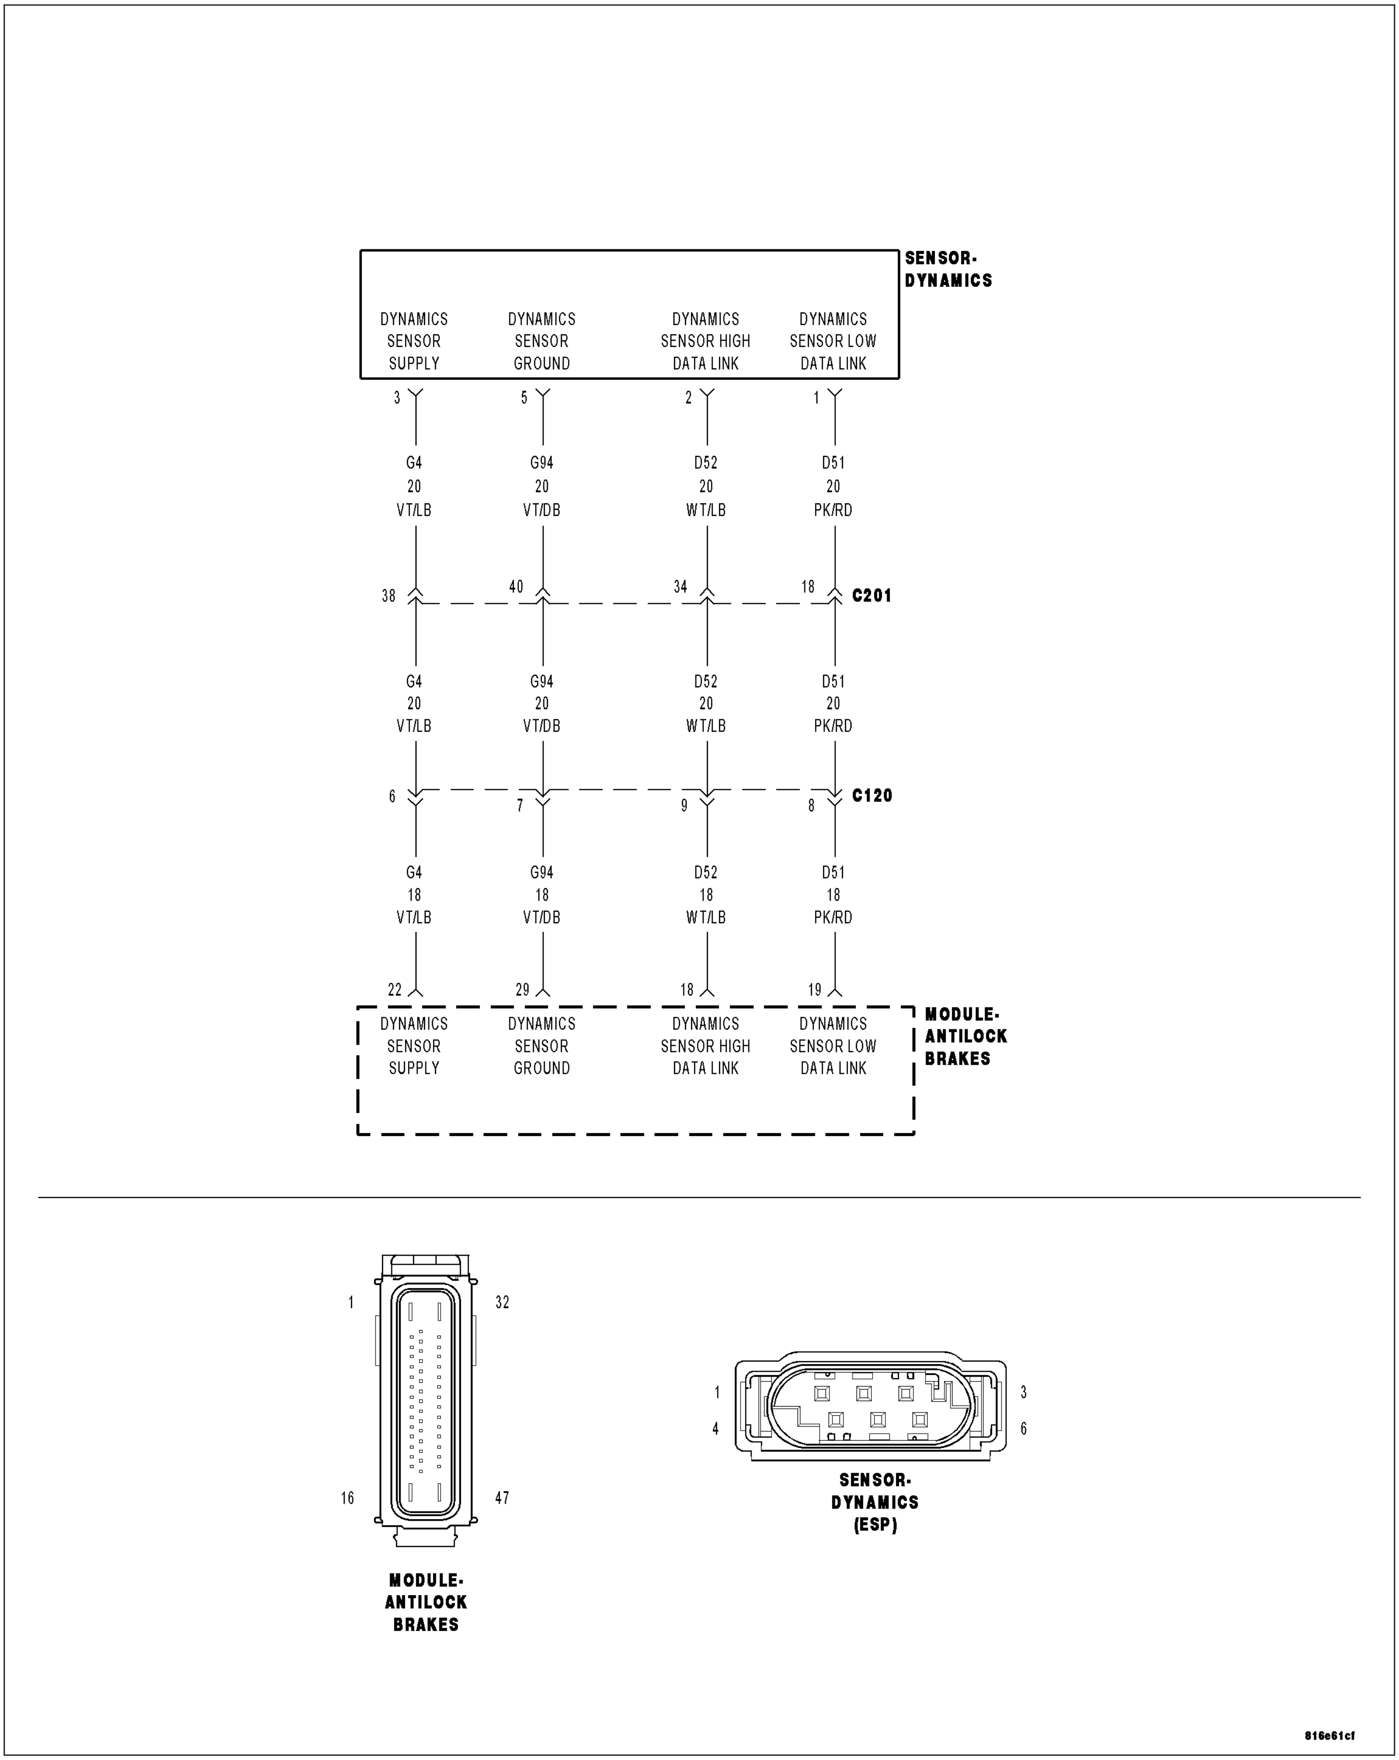
Initialize ECU refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**Does this DTC reset?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test complete.

## C123B–ESP SYSTEM CONTROL TOO LONG



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates ESP control lasting longer the 15 seconds.

| Possible Causes |
|---|
| HYDRAULIC/BRAKE ISSUE |
| DYNAMICS SENSOR |
| INTEGRATED CONTROL MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: If other DTC's are set they must be repaired before continuing. This DTC must be active for the results of this test to be valid and this DTC may set while driving under excessive driving conditions.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: Ensure brake capability is available before road testing.**

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK HYDRAULIC SYSTEM & BRAKE SYSTEM COMPONENT INSTALLATION & FUNCTION

Verify that the Anti-Lock Brakes Module and Hydraulic Control Unit are properly installed.

Verify that the hydraulic system is properly filled and bled.

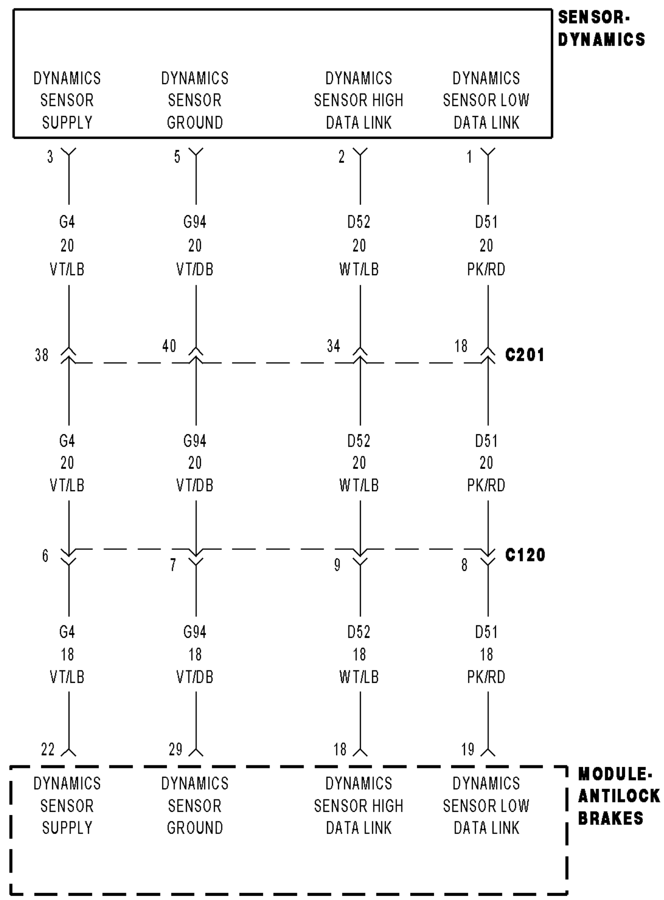
Verify that the brake system components are installed and functioning properly.

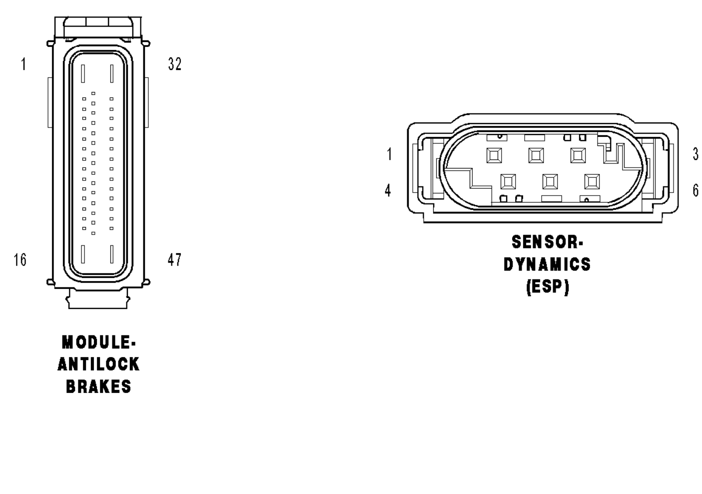
**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C123C–DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE





For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With vehicle speed above 11 km/h (7 m.p.h.), but not if the sensor signal is invalid.
  Or, during skidding.
  Or, when driving in reverse.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects implausible Dynamics Sensor values.

| Possible Causes |
| --- |
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| DYNAMICS SENSOR INSTALLATION |
| DYNAMICS SENSOR |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: If present, diagnose and repair DTC C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115–DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before diagnosing this DTC.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: Ensure brake capability is available before road testing.**

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK THE DYNAMICS SENSOR INSTALLATION

**NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.
Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C123F–STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on, but not if a checksum failure of the stored offset values is detected.
  Or, a CAN time-out failure is detected.
  Or, a failure is detected by the Steering Angle Sensor.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that either the calculated steering wheel angle offset or the steering wheel angle signal measured output is out of range.

| Possible Causes |
|---|
| VEHICLE DAMAGE |
| STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE |
| STEERING WHEEL ALIGNMENT |
| STEERING ANGLE SENSOR LOOSE |
| STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION) |
| STEERING ANGLE SENSOR |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

**NOTE: If present, diagnose and repair DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE, C121A-STEERING ANGLE SENSOR NOT INITIALIZED, or C1240-STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE before diagnosing this DTC.**

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: To avoid personal injury or death, check brake capability is available before road testing.**

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

**NOTE: If possible, check vehicle repair history for collision damage.**

Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK STEERING ANGLE SENSOR OUTPUT

Start the engine.

Turn the steering wheel so wheels point in a straight ahead position.

With the scan tool, read the Steering Angle Sensor position.

**Is the Steering Angle Sensor Position within ± 15° degrees?**

**Yes** >> Go To 5

**No** >> Go To 4

## 4. CHECK STEERING ANGLE SENSOR INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.**

Verify that the Steering Angle Sensor are properly installed.

**Is the Steering Angle Sensor properly installed?**

**Yes** >> Go To 5

**No** >> Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 5. RE-INITIALIZE THE ESP MODULE

Perform ECU initialization with drive test to clear offsets. Refer to Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**Is DTC C123F–STEERING ANGLE SENSOR COMPARATIVE PERFORMANCE still active?**

**Yes** >> Go To 6

**No** >> Sensor was probably loose or calibrated with wheels not centered to vehicle. Test complete.
Perform the ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK STEERING ANGLE SENSOR OUTPUT WHILE ROTATING THE STEERING WHEEL

With the scan tool, read the Steering Angle Sensor position while rotating the steering wheel to the right and then to the left. The Steering Angle Sensor position should decrease when rotating the steering wheel to the right and increase when rotating the steering wheel to the left.

**Did the steering angle change accordingly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.
Perform the ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1240–STEERING ANGLE SENSOR OVERTRAVEL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on, but not if a CAN time out failure is detected.
  Or, if a fault is detected by the Steering Angle Sensor.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the absolute value of the measured steering wheel angle is greater than 720 degrees.

| Possible Causes |
|---|
| VEHICLE DAMAGE |
| STEERING COLUMN / INTERMEDIATE SHAFT DAMAGE |
| STEERING WHEEL ALIGNMENT |
| STEERING ANGLE SENSOR LOOSE |
| STEERING ANGLE SENSOR IMPROPERLY INSTALLED (WRONG MOUNTING POSITION) |
| STEERING ANGLE SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. PERFORM TEST DRIVE & VERIFY DTC IS STILL ACTIVE

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: To avoid personal injury or death, check brake capability is available before road testing.**
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT VEHICLE, STEERING COLUMN, & INTERMEDIATE SHAFT FOR DAMAGE

**NOTE: If possible, check vehicle repair history for collision damage.**
Turn the ignition off.

Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

Inspect the steering column and intermediate shaft for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK STEERING ANGLE CHANGE

Turn steering wheel so wheels point in a straight ahead position.

With scan tool check steering angle if reading travels to 720 degrees whiling rotating wheel from lock to lock.

**NOTE: Sensor damage can occur if wheel is turned over 720 degrees.**

Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

**Did the steering angle change accordingly and display less the 720 degrees from lock to lock?**

**Yes** >> Go To 4

**No** >> Replace the Steering Angle Sensor in accordance with the Service Information and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 4. CHECK STEERING ANGLE SENSOR INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: Proper Steering Angle Sensor installation is crucial for proper operation.**

Verify that the Steering Angle Sensor are properly installed. Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION.

**Is the Steering Angle Sensor properly installed?**

**Yes** >> Replace the Steering Angle Sensor and clear offsets by initializing ECU with wheels pointing straight ahead, in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair as necessary and clear offsets by initializing ECU with wheels pointing straight ahead.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1242–G SENSOR INPUT SIGNAL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 m.p.h.) for the first time, but not if the sensor voltage is out of range,
  Or, during diagnostic mode.
  Or, if the monitoring was inhibited by a corresponding diagnostics command.
  Or, if the vehicle speed has exceeded 20 km/h (12.4 m.p.h.) during the actual ignition cycle.
  Or, if at least one over spinning wheel is detected.
  Or, if one of the control functions is active.
- **Set Condition:**
  If the measured acceleration signal is higher than 0.8 g and longer than the specified detection time.

| Possible Causes |
|---|
| DYNAMICS SENSOR INSTALLATION |
| DYNAMICS SENSOR OR ANTI-LOCK BRAKE MODULE |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: To avoid personal injury or death, check brake capability is available before road testing.**
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK THE DYNAMICS SENSOR INSTALLATION

**NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**
Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >>

**NOTE: Vehicles without a Dynamics Sensor replace Anti-Lock Brake Module.**
**Replace the Dynamics Sensor or Anti-Lock Brake Module in accordance with the Service Information.**
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C1243–G SENSOR NOT INITIALIZED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Once after ignition on.
- **Set Condition:**
  If the stored zero point calibration value of the longitudinal acceleration sensor is invalid.

| Possible Causes |
| --- |
| DYNAMICS SENSOR NOT CALIBRATED |
| DYNAMICS SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. PERFORM ECU INITIALIZATION

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: To avoid personal injury or death, check brake capability is available before road testing.**
Perform ECU initialization with drive test refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**NOTE: The ECU Initialization process must include driving the vehicle into a 90° turn.**
Park the vehicle.

>> Go To 2

### 2. VERIFY IF DTC IS STILL ACTIVE

Cycle the ignition switch.

**WARNING: To avoid personal injury or death, check brake capability is available before road testing.**
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >>

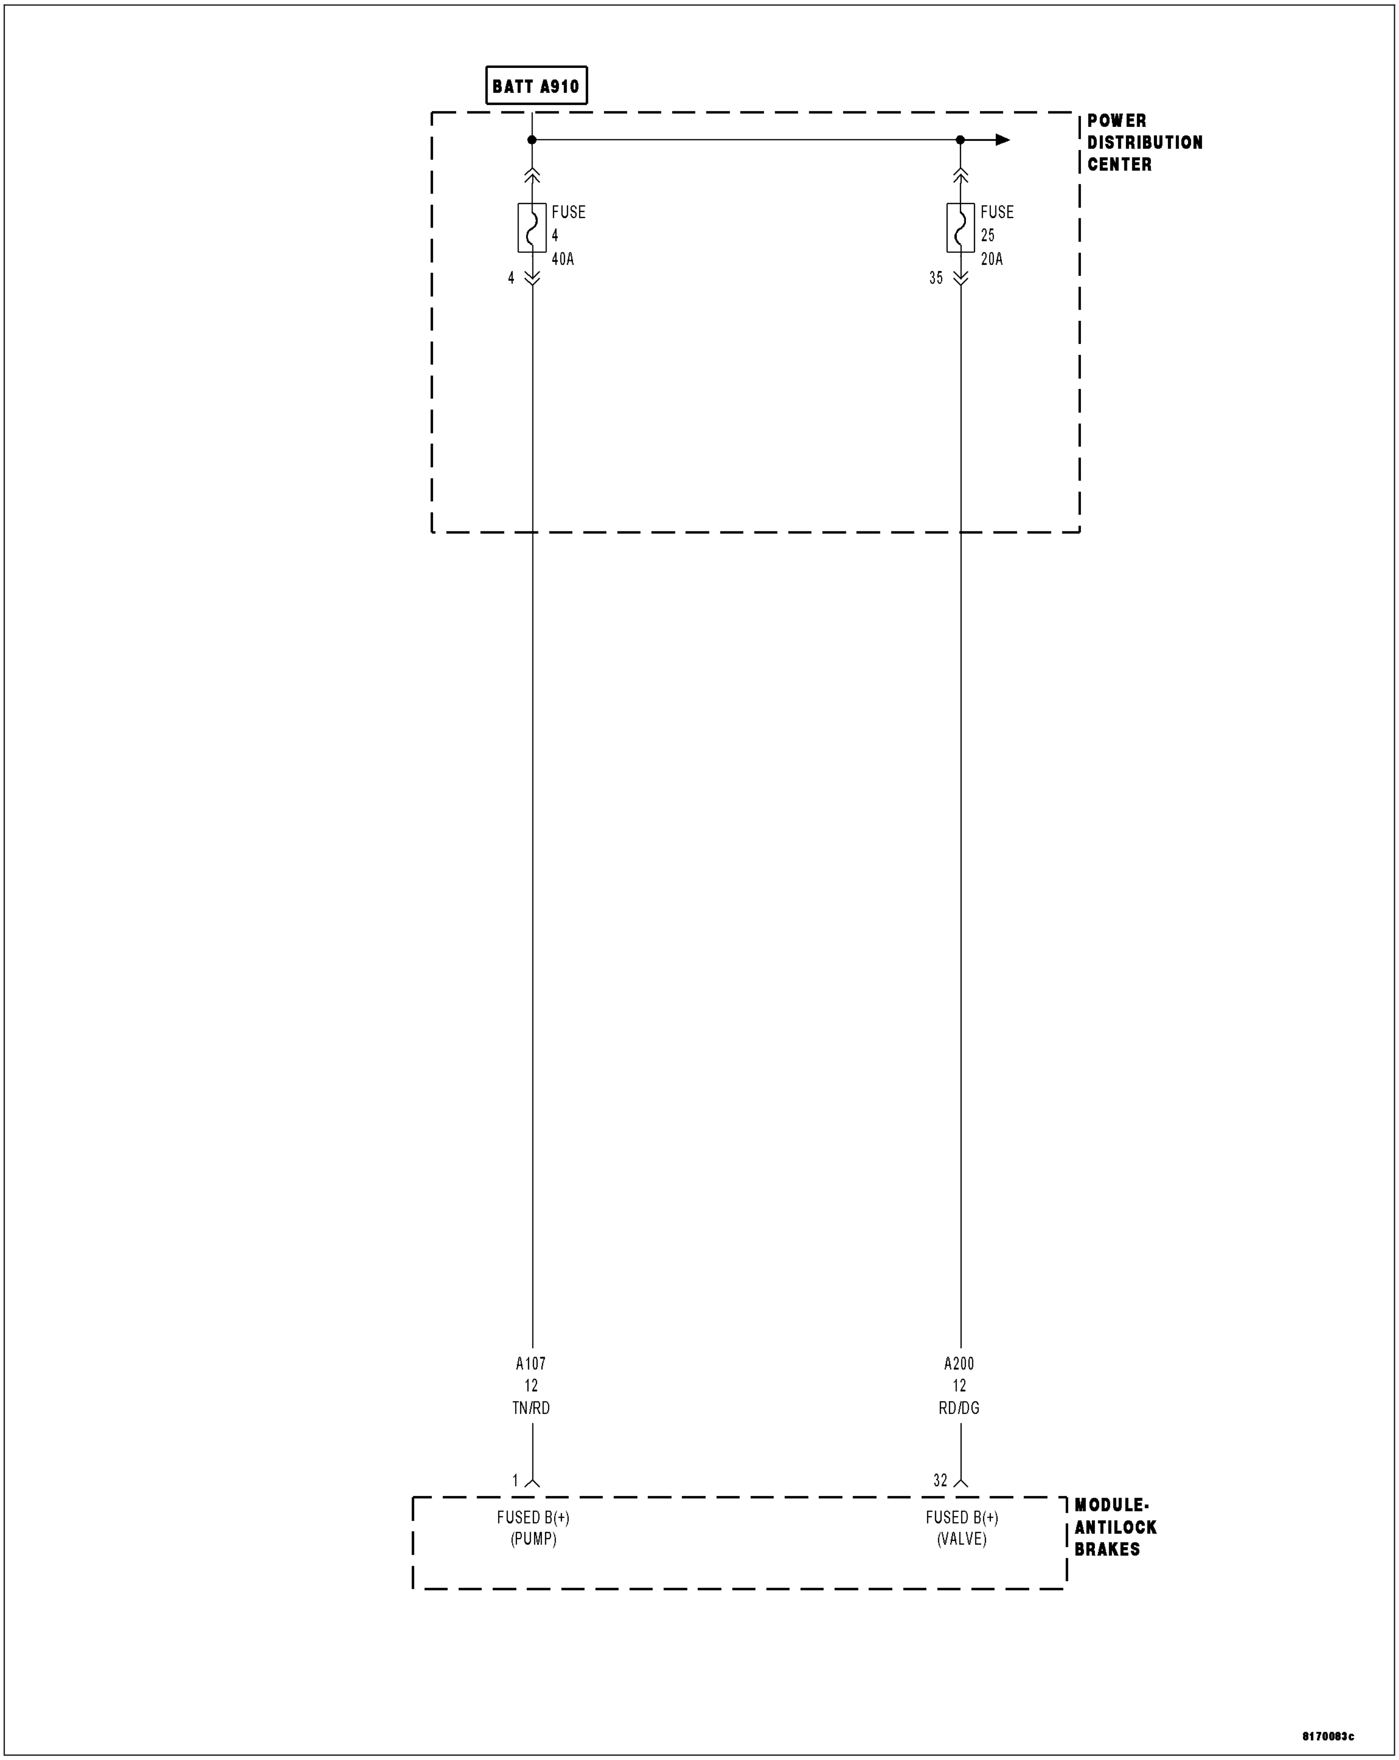
**NOTE: Vehicles without a Dynamics Sensor replace Anti-Lock Brake Module.**
**Replace the Dynamics Sensor or Anti-Lock Brake Module in accordance with the Service Information.**

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## C2100–BATTERY VOLTAGE LOW



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects system voltage is below 9.5 volts.

| Possible Causes |
| --- |
| ECM OR PCM DTCs PRESENT |
| VEHICLE BATTERY / CHARGING SYSTEM |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. DTC'S IN THE PCM

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs from the PCM.

With the scan tool, read and record Freeze Fame information.

With the scan tool, erase DTCs.

Start the engine.

With the scan tool, read and record DTCs.

With the scan tool read DTCs from the PCM.

**Are any charging system codes present?**

**Yes** >> Repair the charging system DTC in the PCM.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 2

### 2. CHARGING SYSTEM FAILURE

Start the engine.

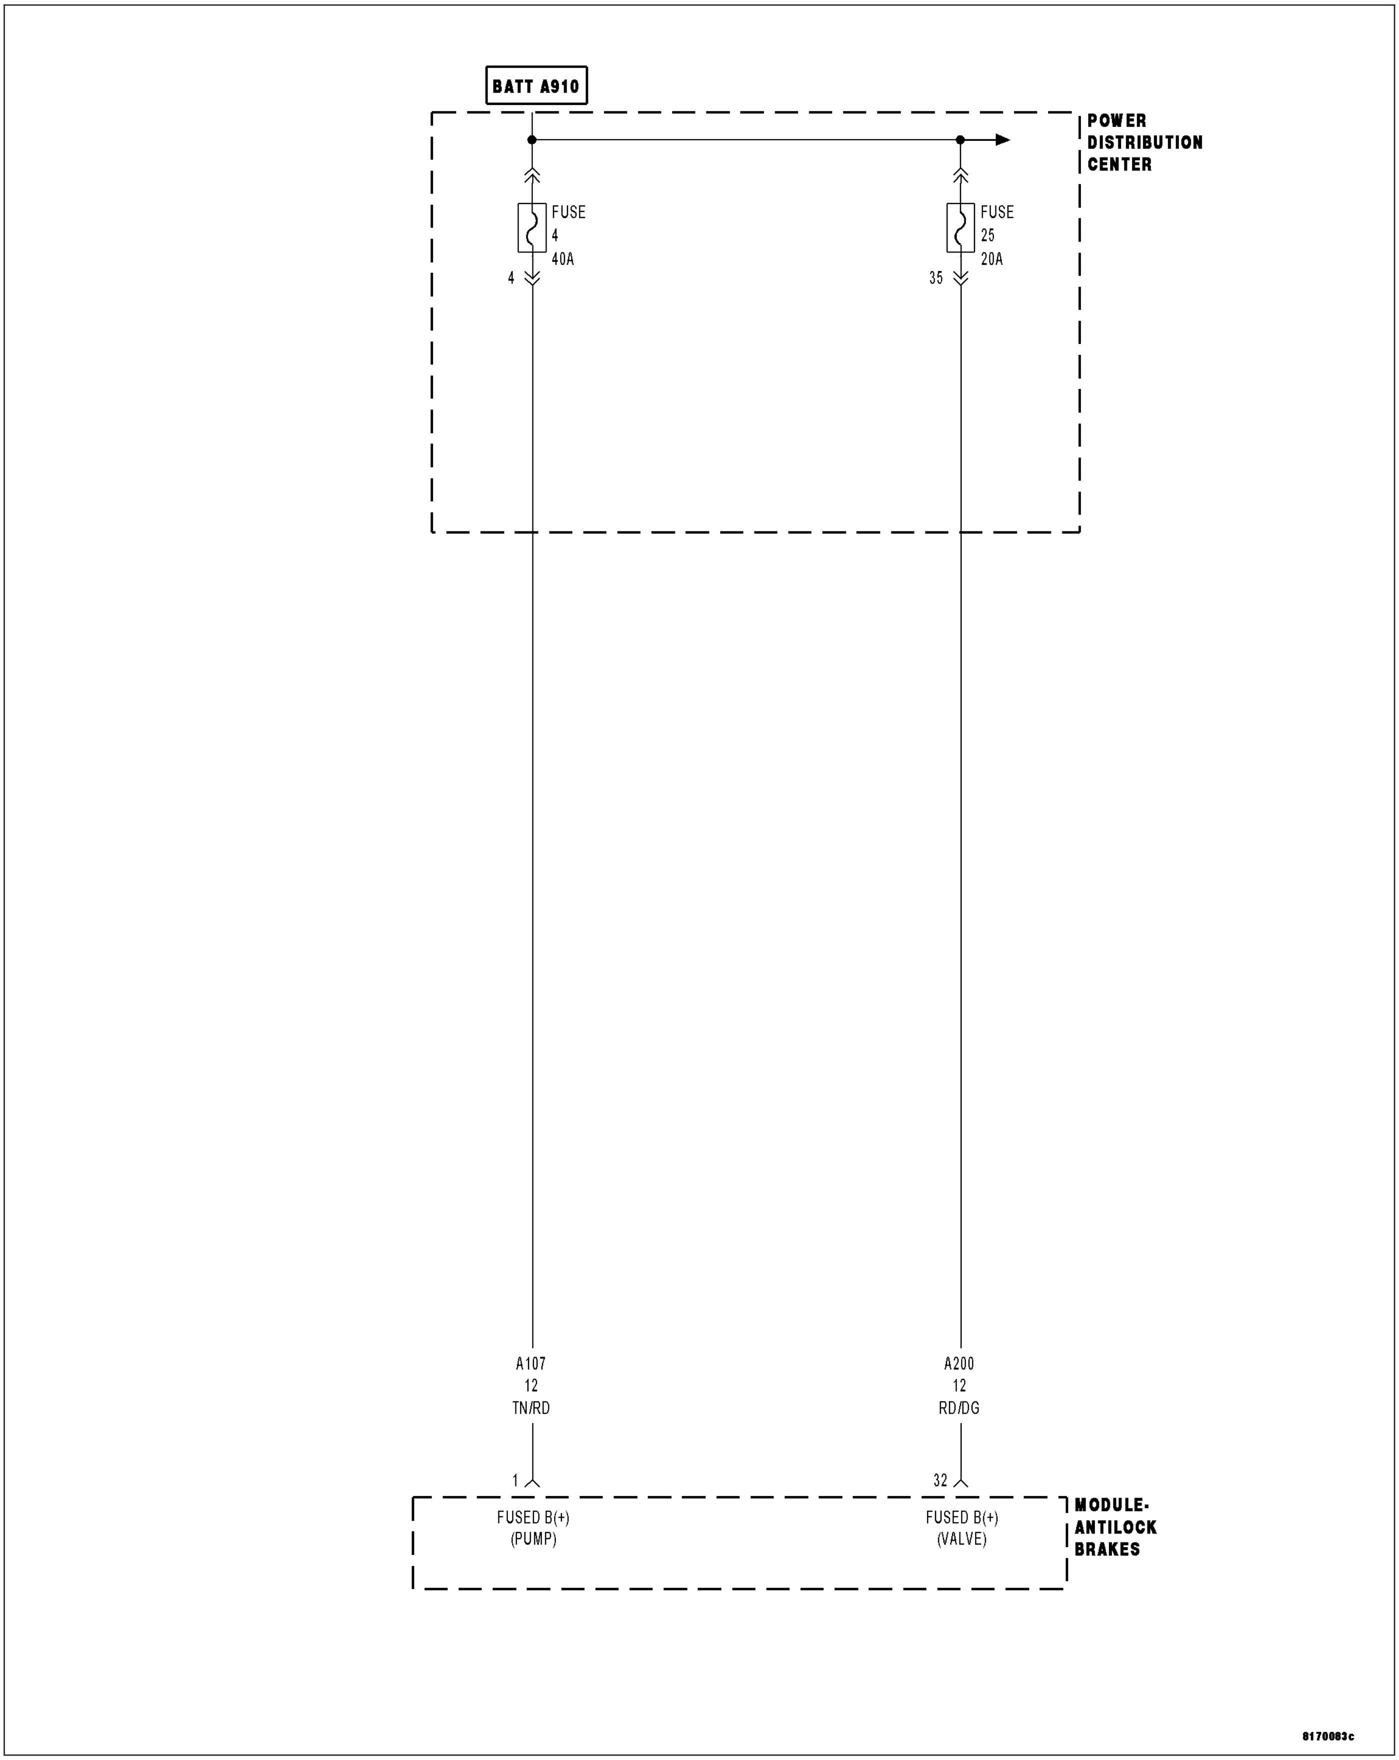
Connect voltmeter to vehicle battery.

**Is the vehicle battery voltage under 10 volts?**

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

**Yes** >> Repair the charging system per service information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C2101–BATTERY VOLTAGE HIGH



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects system voltage is above 17 volts.

| Possible Causes |
|---|
| ECM/PCM DTCs PRESENT |
| VEHICLE BATTERY / CHARGING SYSTEM |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1.

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read and record DTCs from the ECM/PCM.

With the scan tool, read and record Freeze Fame information.

With the scan tool, erase DTC's.

Start the engine.

With the scan tool, read and record DTCs.

With the scan tool read DTCs from the PCM.

**Are any charging system codes present?**

**Yes** >> Repair the charging system DTC in the ECM/PCM.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

**No** >> Go To 2

### 2. CHARGING SYSTEM FAILURE

Start the engine.

Connect voltmeter to vehicle battery.

**Is the vehicle battery voltage over 16.8 volts?**

**No** >> Go To 3

**Yes** >> Repair the charging system per service information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

### 3. CHARGING POWER SUPPLY VOLTAGE

With a scan tool read Power Supply Voltage.

**Is Power Supply Voltage over 16.8 volts?**

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C2111–SENSOR SUPPLY 1 VOLTAGE CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the supply voltage for external analog sensors is out of range.

| Possible Causes |
|---|
| ANTI-LOCK BRAKES MODULE |
| PRESSURE SENSOR (HYDRAULIC CONTROL UNIT) |

## Diagnostic Test

### 1. REPLACE ANTI-LOCK BRAKES MODULE & VERIFY IF DTC IS STILL ACTIVE

Turn the ignition off.

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Turn the ignition on.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Replace the Hydraulic Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## C2112–SENSOR SUPPLY 1 VOLTAGE CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the supply voltage for external analog sensors is out of range.

| Possible Causes |
|---|
| ANTI-LOCK BRAKES MODULE |
| PRESSURE SENSOR (HYDRAULIC CONTROL UNIT) |

## Diagnostic Test

### 1. REPLACE ANTI-LOCK BRAKES MODULE & VERIFY IF DTC IS STILL ACTIVE

Turn the ignition off.

Replace the Anti-Lock Brakes Module in accordance with the Service Information. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Turn the ignition on.

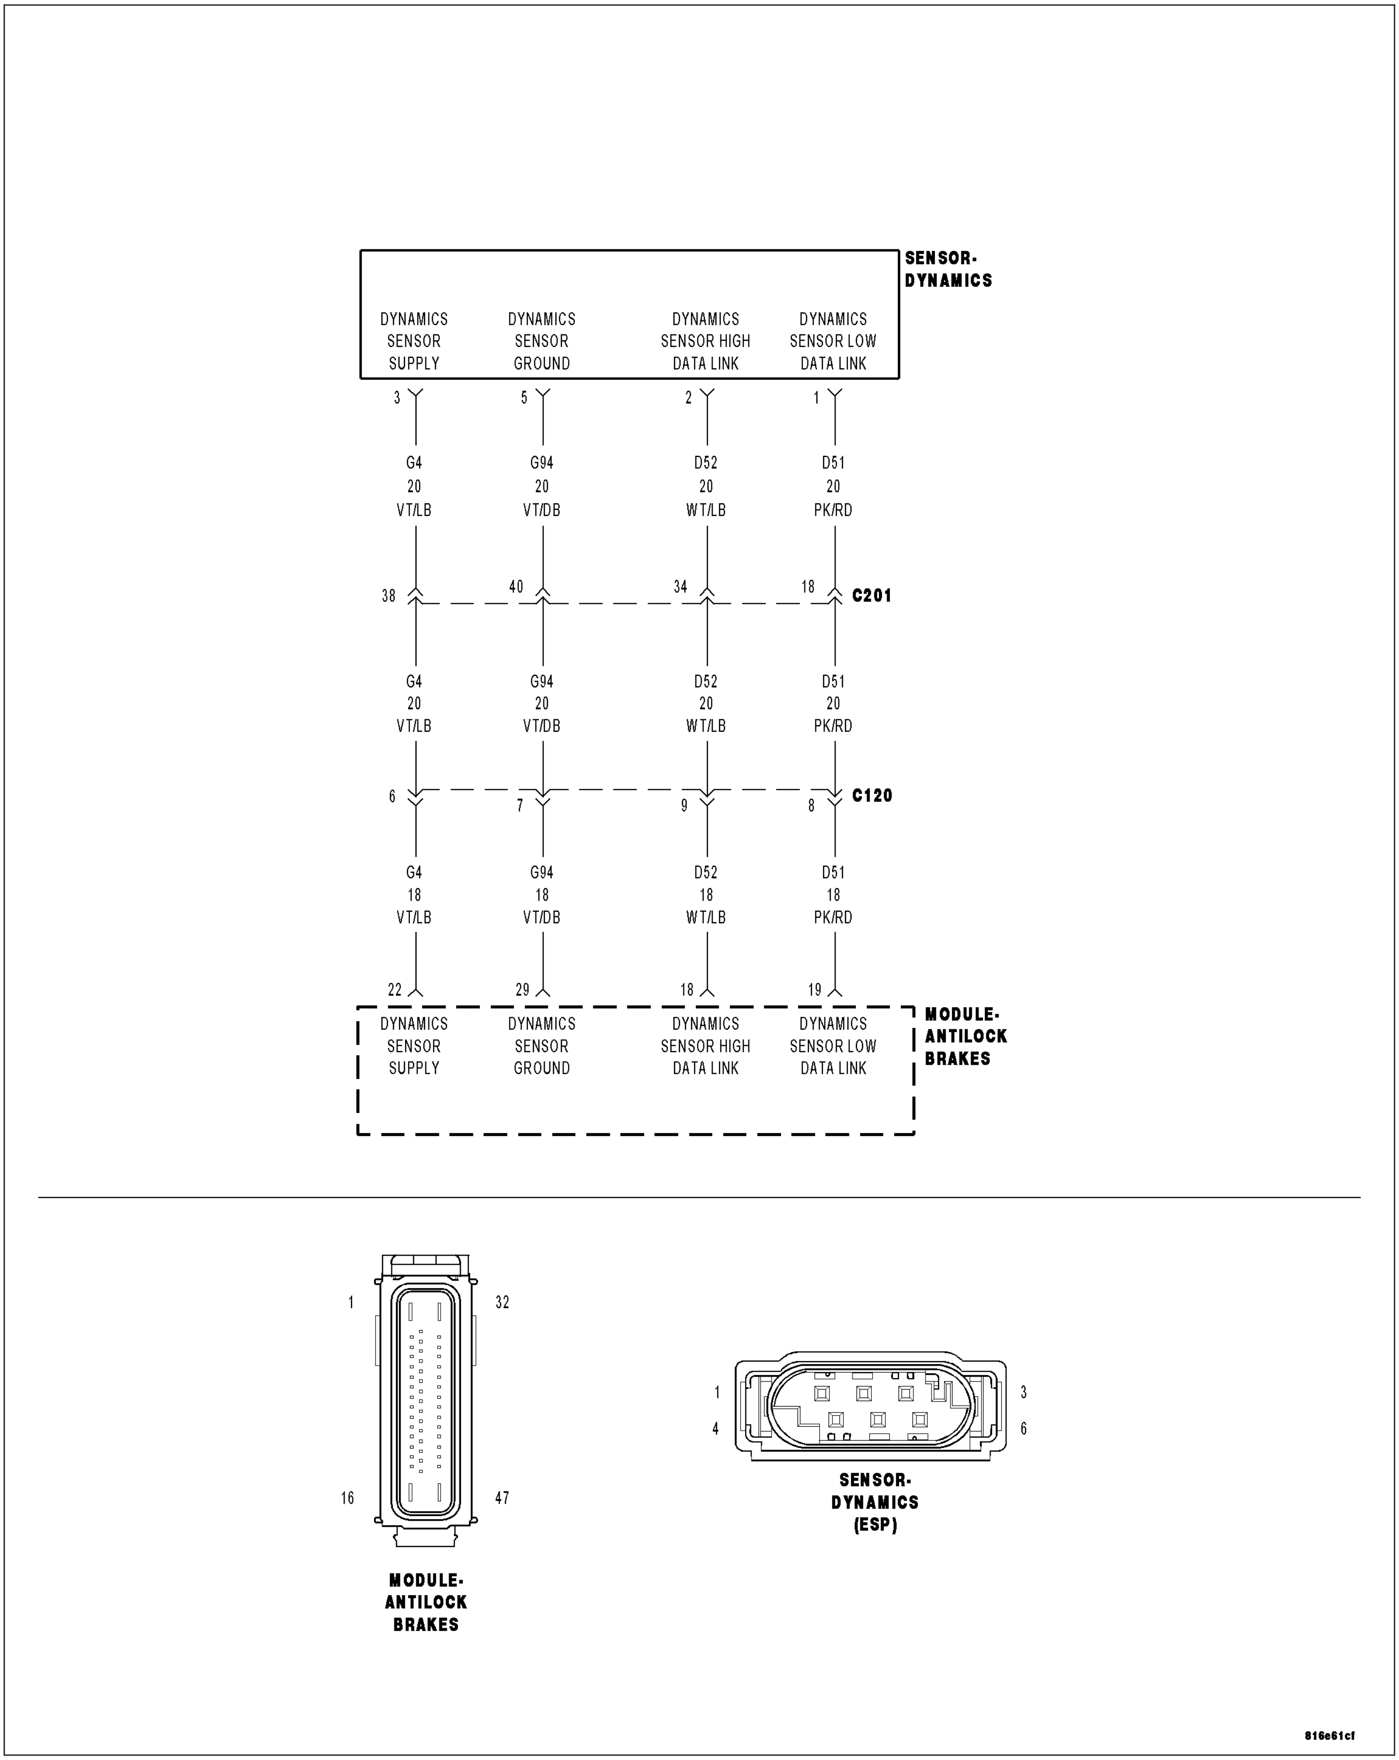
With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Replace the Hydraulic Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Dynamics Sensor status changes from initialized to not initialized due to low voltage on the (G4) Dynamics Sensor Supply circuit.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (G4) DYNAMICS SENSOR SUPPLY CIRCUIT HIGH RESISTANCE |
| (G94) DYNAMICS SENSOR GROUND CIRCUIT HIGH RESISTANCE |
| (G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO OTHER ABS CIRCUITS |
| DYNAMICS SENSOR |
| ANTI-LOCK BRAKES MODULE |

## 1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## 2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

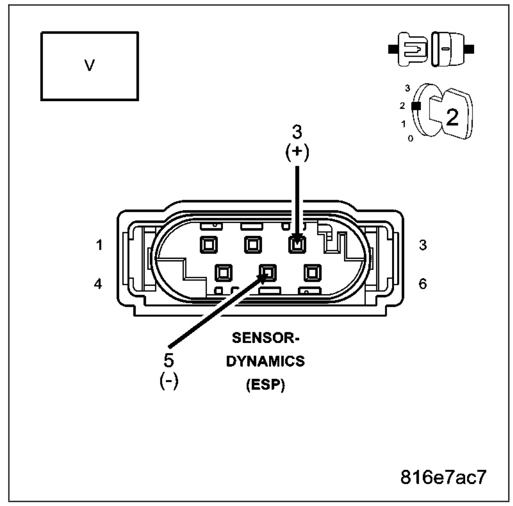
**No** >> Go To 3

## 3. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT & (G94) DYNAMICS SENSOR GROUND CIRCUIT FUNCTION

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage between the (G4) Dynamics Sensor Supply Circuit and the (G94) Dynamics Sensor Ground Circuit.



**Is the voltage above 4.5 volts?**

**Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

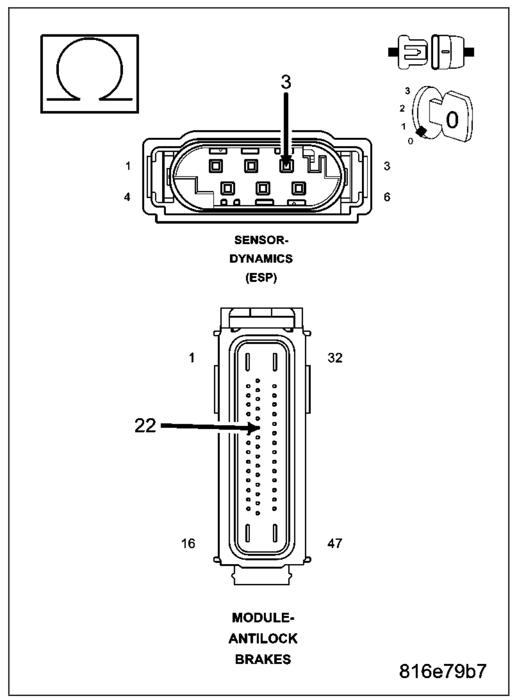
**No** >> Go To 4

## 4. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Anti-Lock Brakes Module harness connector.

Measure the resistance of the (G4) Dynamics Sensor Supply circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (G4) Dynamics Sensor Supply circuit for high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 5. CHECK (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

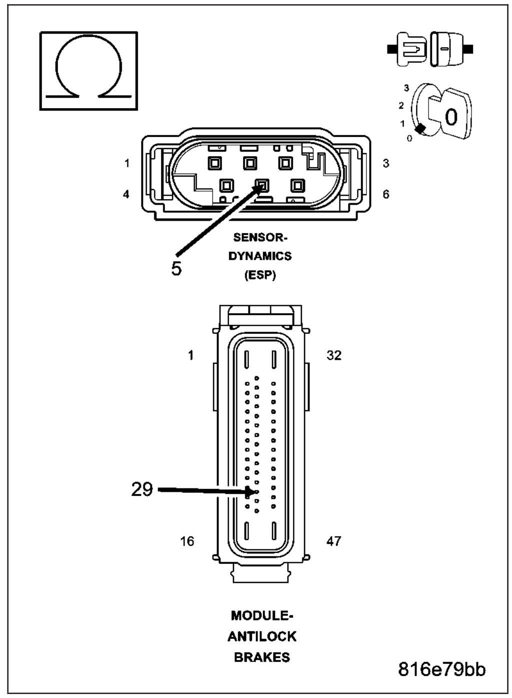
Measure the resistance of the (G94) Dynamics Sensor Ground circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (G94) Dynamics Sensor Ground circuit for high resistance.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## 6. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR A SHORT TO OTHER ABS CIRCUITS

Measure the resistance between the (G4) Dynamics Sensor Supply circuit and the B46, B15, D21, D65, D64, Z127, D52, D51, G94, B6, B7, B4. B3, B1, B2, B9, B8, and Z107 circuit in the Anti-Lock Brakes Module harness connector.

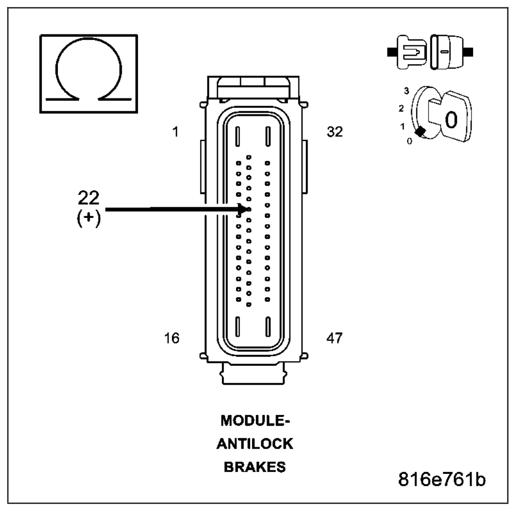
**Is the resistance below 10k ohms on any of the circuits?**

**Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (G4) Dynamics Sensor Supply circuit.

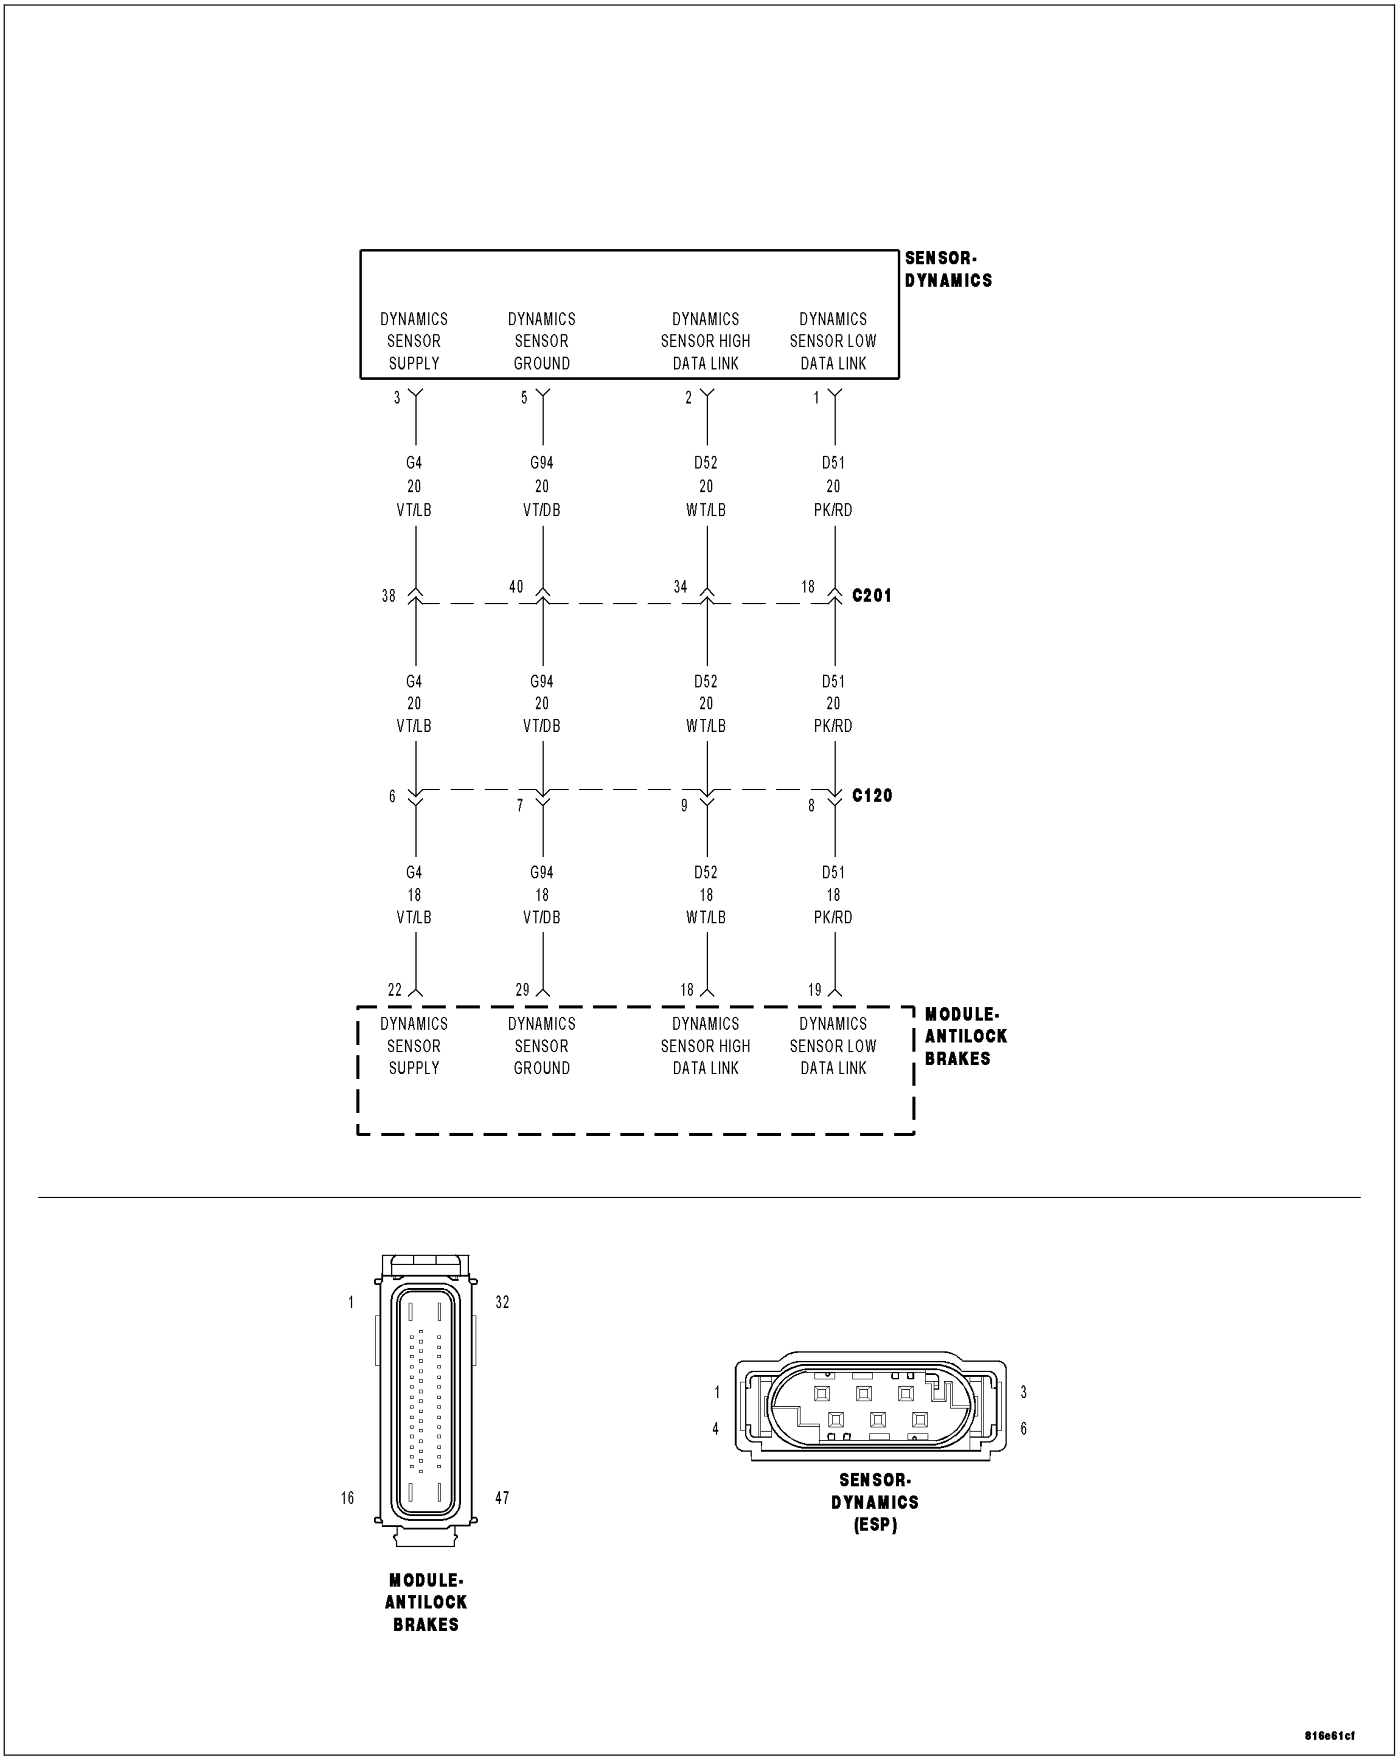
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



## C2115–DYNAMICS SENSOR SUPPLY VOLTAGE HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Upon ignition on, prior to switching the (G4) Dynamics Sensor Supply circuit power on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects voltage on the (G4) Dynamics Sensor Supply circuit when the circuit's power is turned off.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE |
| ANTI-LOCK BRAKES MODULE |

## 1. VERIFY DTC IS ACTIVE

Turn the ignition on.
With the scan tool, read and record ABS DTCs.
With the scan tool, read and record Environmental Data (EV Data).
With the scan tool, erase ABS DTCs.
Cycle the ignition switch.
With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## 2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.
Check all related wiring for pinched, chafed, pierced, and partially broken wires.
Check all related connectors for broken, bent, pushed out, and corroded terminals.

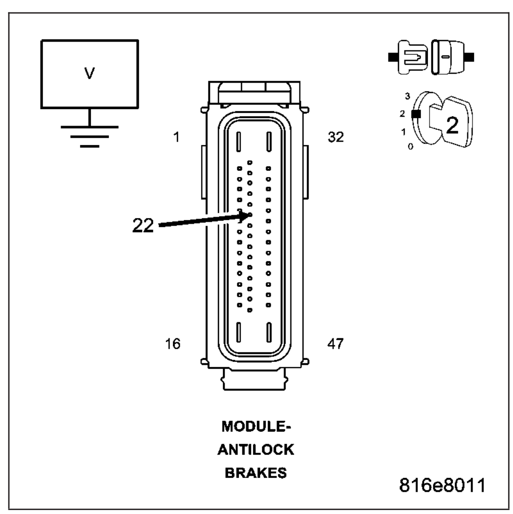
**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK (G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.
Turn the ignition on.
Measure the voltage of the (G4) Dynamics Sensor Supply Circuit.

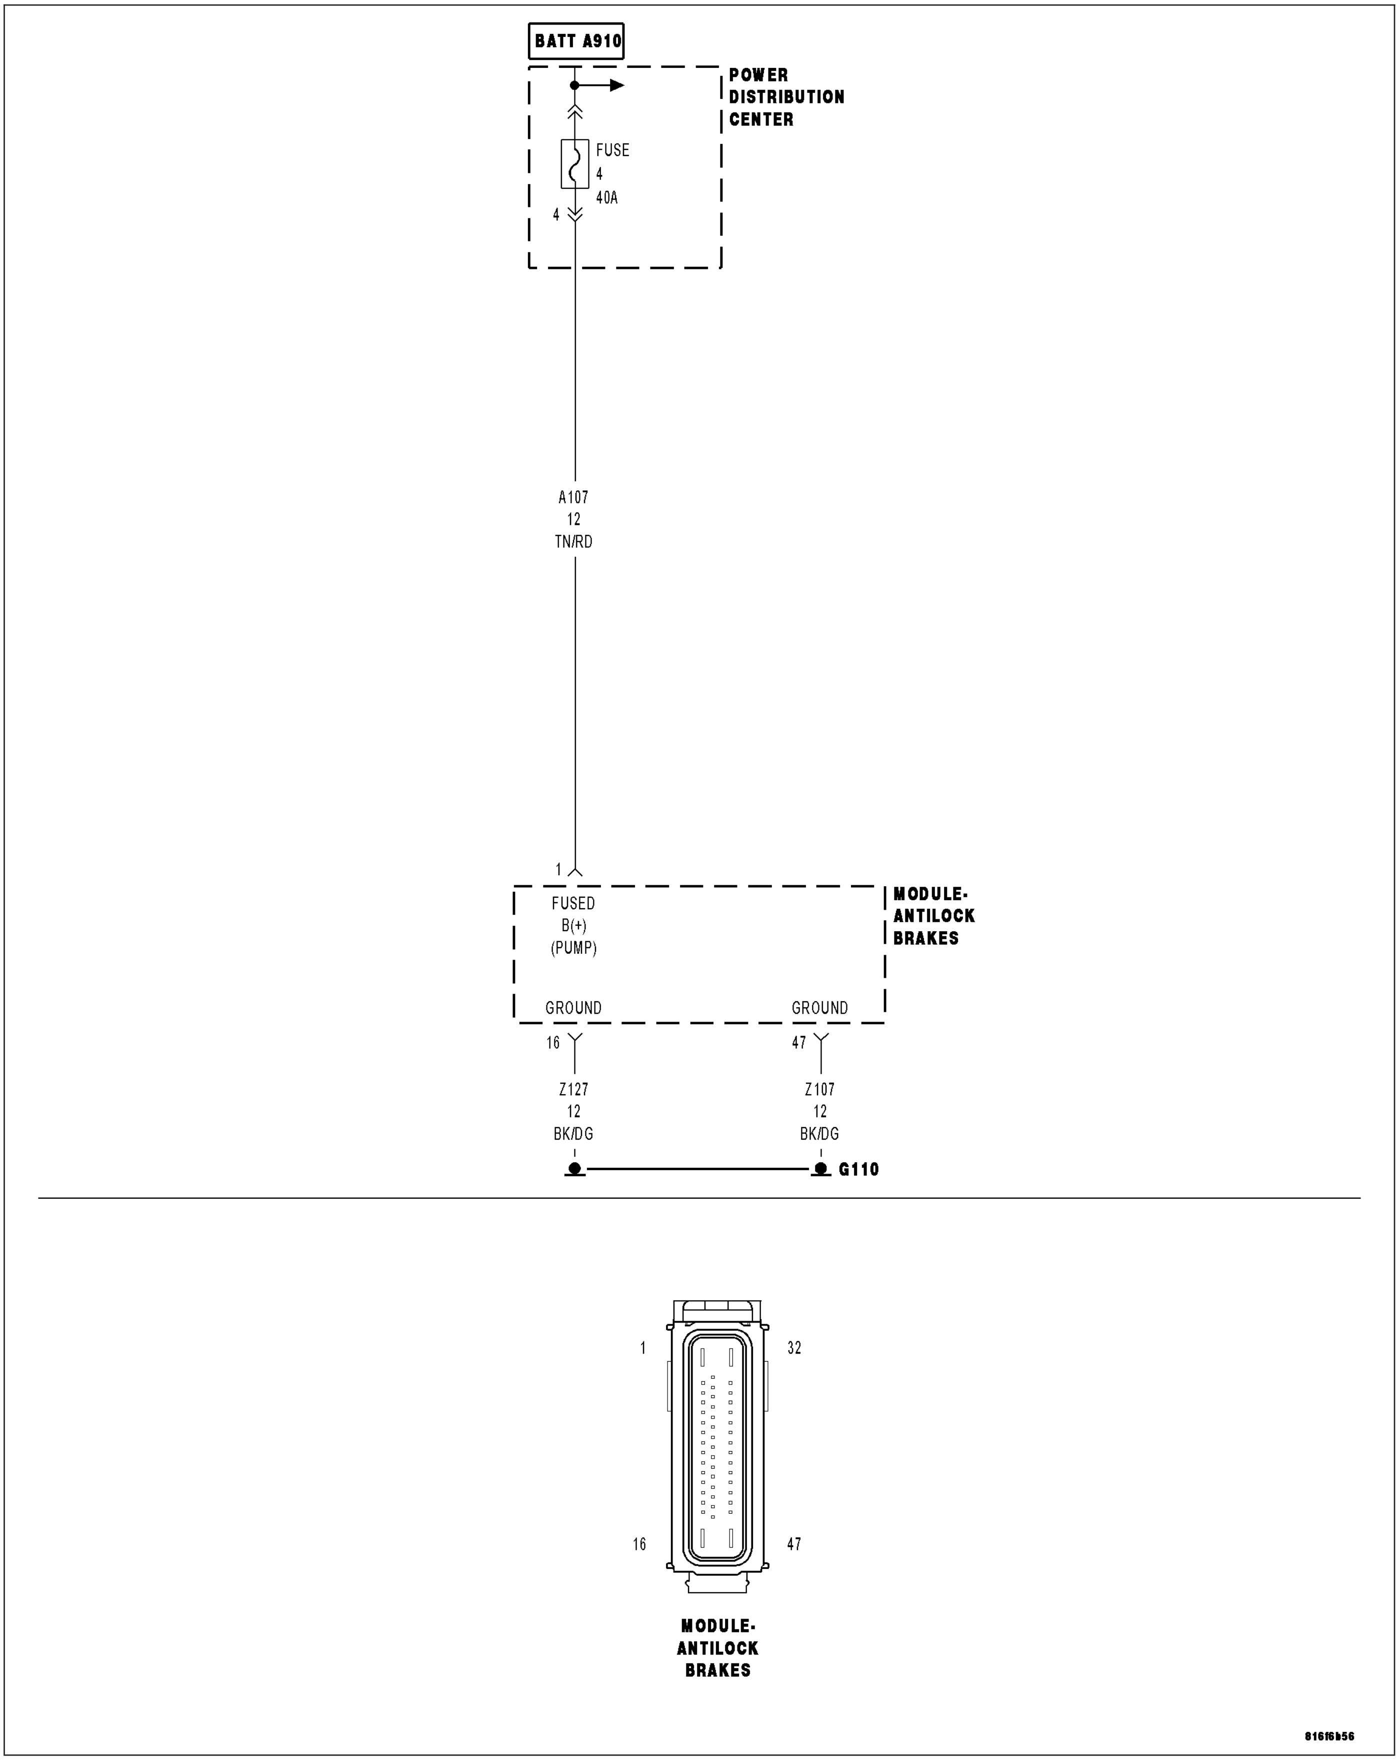


**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (G4) Dynamics Sensor Supply Circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and the ABS Pump Motor deactivated, but not if supply voltage faults are detected. Or, if the control is switched off.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects either a low voltage condition when the ABS Pump Motor is activated or deactivated or a high voltage condition when the ABS Pump Motor is deactivated.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| ABS PUMP MOTOR FUSE OPEN |
| (A107) FUSED B(+) CIRCUIT SHORTED TO GROUND, OPEN, OR HIGH RESISTANCE |
| (Z127) GROUND CIRCUIT OPEN, OR HIGH RESISTANCE |
| ANTI-LOCK BRAKES MODULE |
| PUMP MOTOR (HYDRAULIC CONTROL UNIT) |

## Diagnostic Test

### 1. CHECK FOR A DTC C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

Road test the vehicle over 40 km/h (25 m.p.h.).

**NOTE: Vehicle must be driven above 40 km/h (25 m.p.h.) for set conditions to be meet.**
With the scan tool, read DTCs.

**Does the scan tool display: C2116–ABS PUMP MOTOR SUPPLY LOW VOLTAGE?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) Diagnostic Test

### 2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Turn the ignition off.

Visually inspect the Anti-Lock Brakes Module harness connector and wiring harness for damage.

Check all related wiring for pinched, chafed, pierced, and partially broken wires.

Check all related connectors for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK ABS PUMP MOTOR FUSE

Remove and visually inspect the ABS Pump Motor fuse.

**Is the fuse open?**

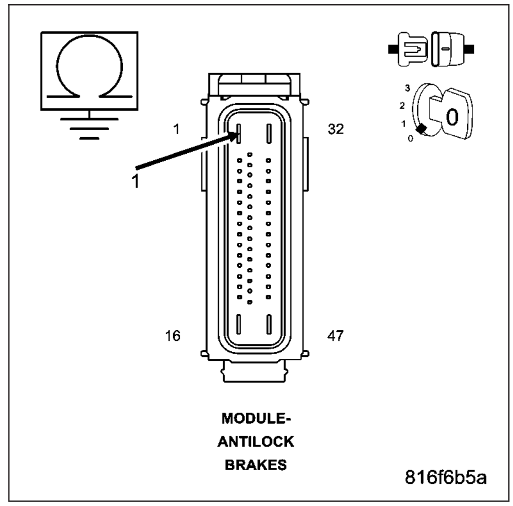
**Yes** >> Go To 4

**No** >> Go To 5

## 4. CHECK (A107) FUSED B(+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Anti-Lock Brakes Module harness connector.

Measure the resistance of the (A107) Fused B(+) circuit between ground and the Anti-Lock Brakes Module harness connector.



**Is the resistance below 10k ohms?**

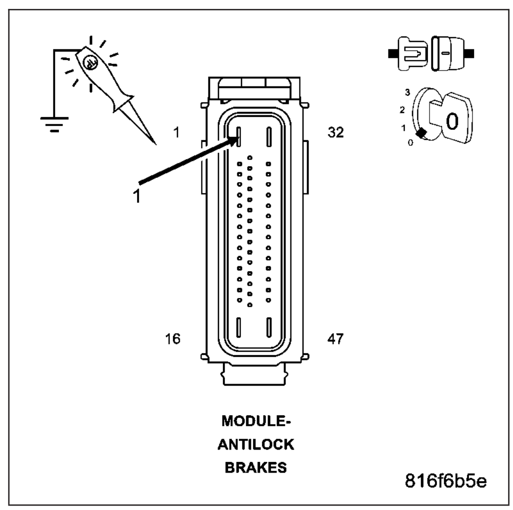
**Yes** >> Repair the (A107) Fused B(+) circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK (A107) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Replace the ABS Pump Motor fuse.

Using a 12-volt test light connected to ground, probe the (A107) Fused B(+) circuit.



**NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

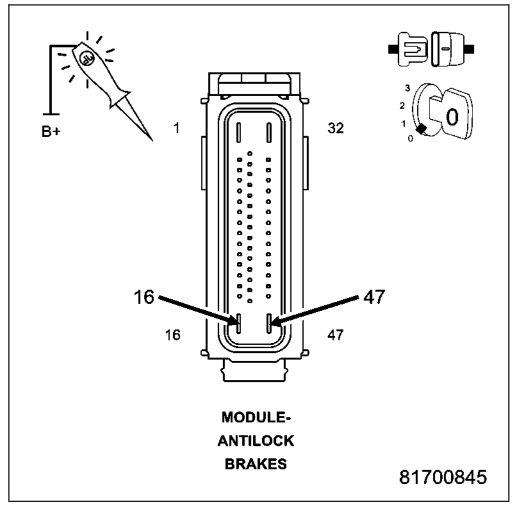
**No** >> Repair the (A107) Fused B(+) circuit for an open or high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK (Z127) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Using a 12-volt test light connected to 12 volts, probe the (Z127) Ground circuit.

**NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly on both circuits?**



**Yes** >> Go To 7

**No** >> Repair (Z127) circuit for an open or high resistance.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 7. REPLACE ANTI-LOCK BRAKES MODULE & VERIFY IF DTC IS STILL ACTIVE

Replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Turn the ignition on.

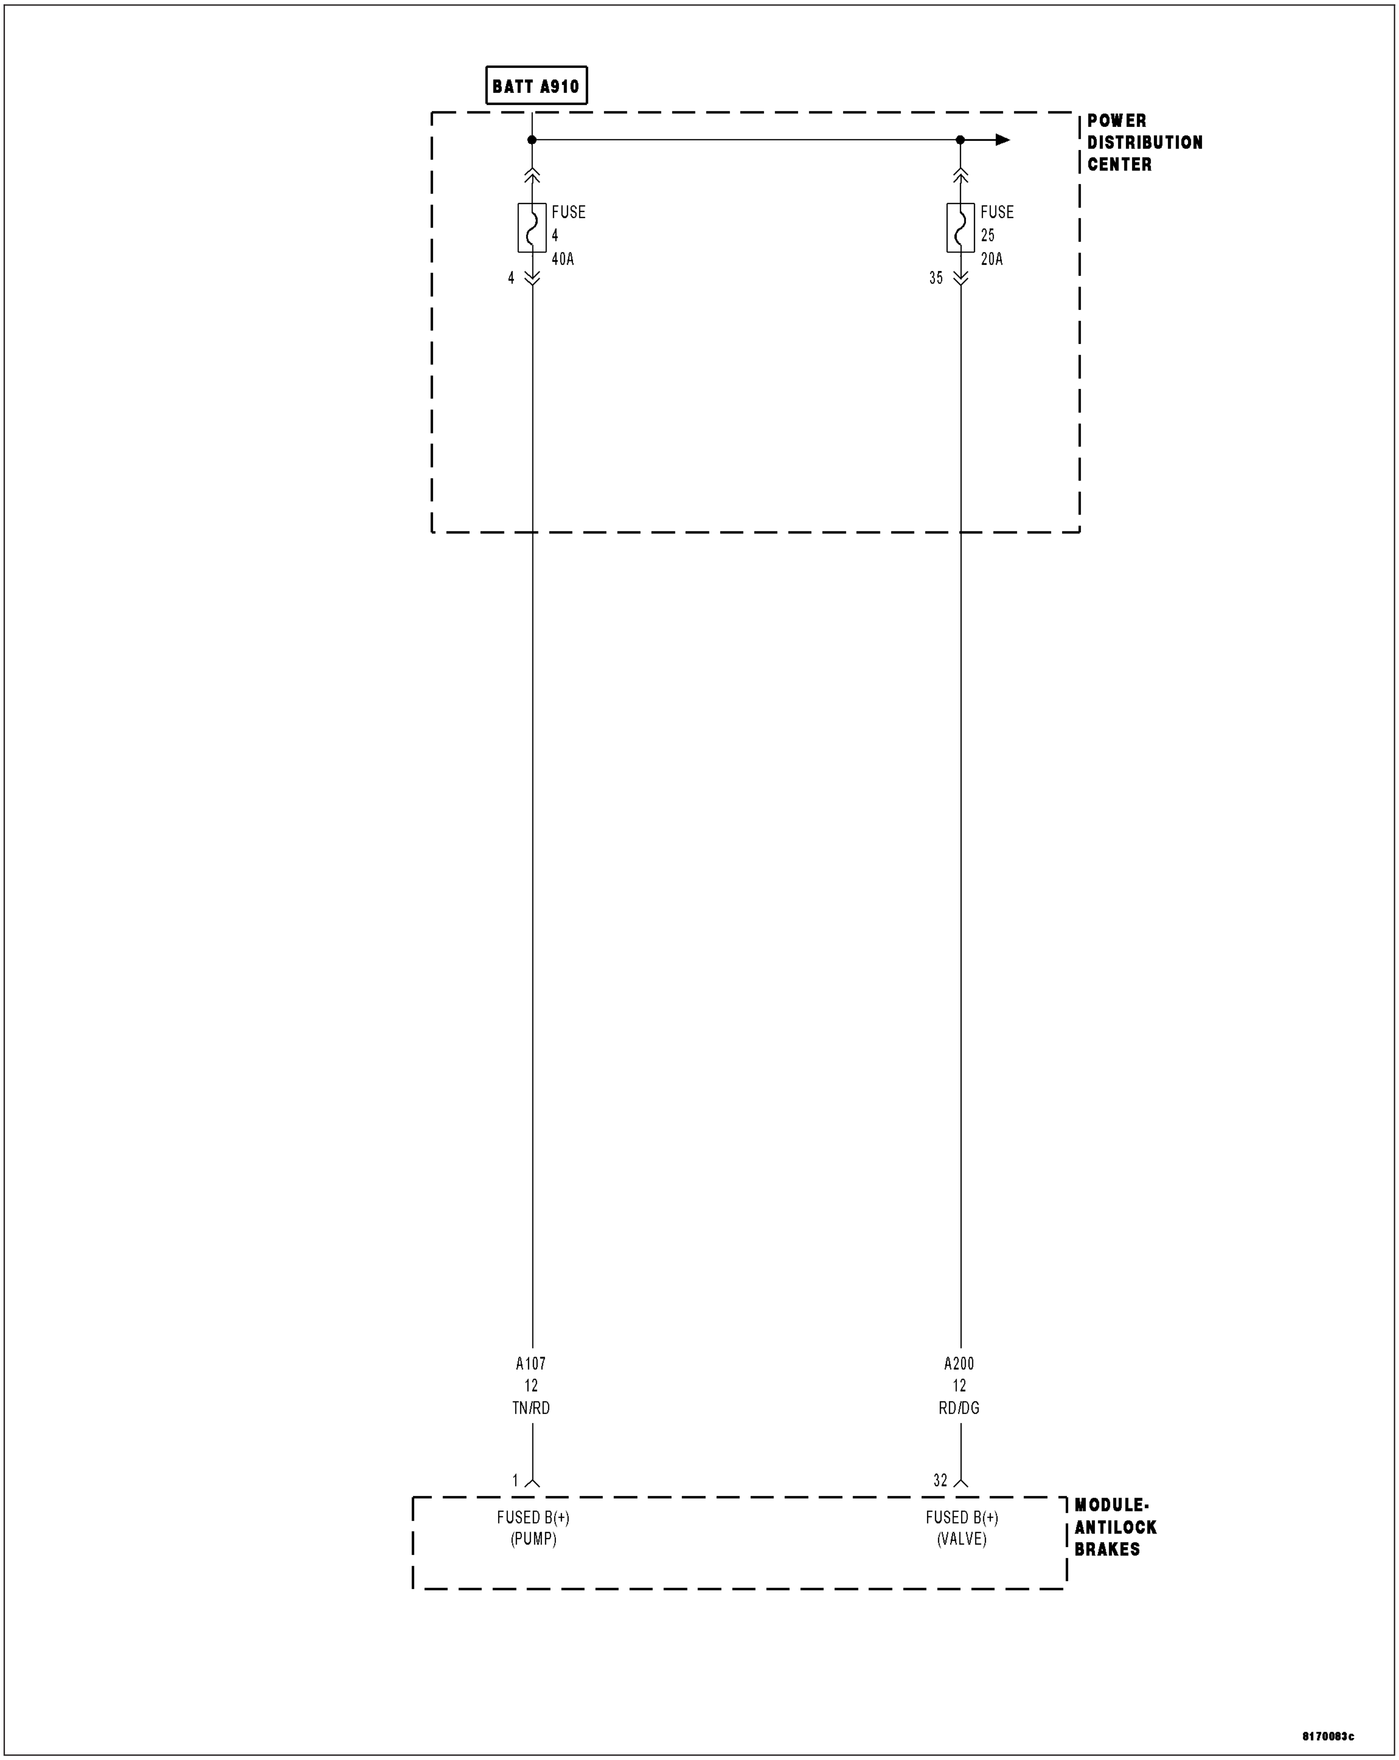
With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Replace the Hydraulic Control Unit in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## C2200–ANTI-LOCK BRAKE MODULE INTERNAL



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on. The Anti-Lock Brake Module monitors its internal microprocessors for correct operation.
- **Set Condition:**
  If the Anti-lock brake module detects an internal fault, the DTC is set.

| Possible Causes |
|---|
| ABM - INTERNAL FAULT |

## Diagnostic Test

### 1. ABM INTERNAL FAILURE DTC PRESENT

Turn the ignition on.
With the scan tool, read DTCs.
With the scan tool, erase DTCs.
Turn the ignition off.
Turn the ignition on.
With the scan tool, read DTCs.

**Does the scan tool display ANTI-LOCK BRAKE MODULE INTERNAL FAILURE?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## C2202-ORIGINAL VIN MISMATCH/MISSING

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module fails the diagnostic test.

| Possible Causes |
|---|
| ANTI-LOCK BRAKE MODULE |

### 1. ANTI-LOCK BRAKE MODULE CONFIGURATION

The Anti-lock Brake Module hardware check has determined that module configuration does not match vehicle configuration. Verify that the correct module part number is installed in the vehicle.

Turn the ignition on.

With the Scan Tool, verify that the VIN stored in the controller matches the vehicle VIN.

With the Scan Tool, select Clear Stored DTCs.

Cycle the ignition off, then on.

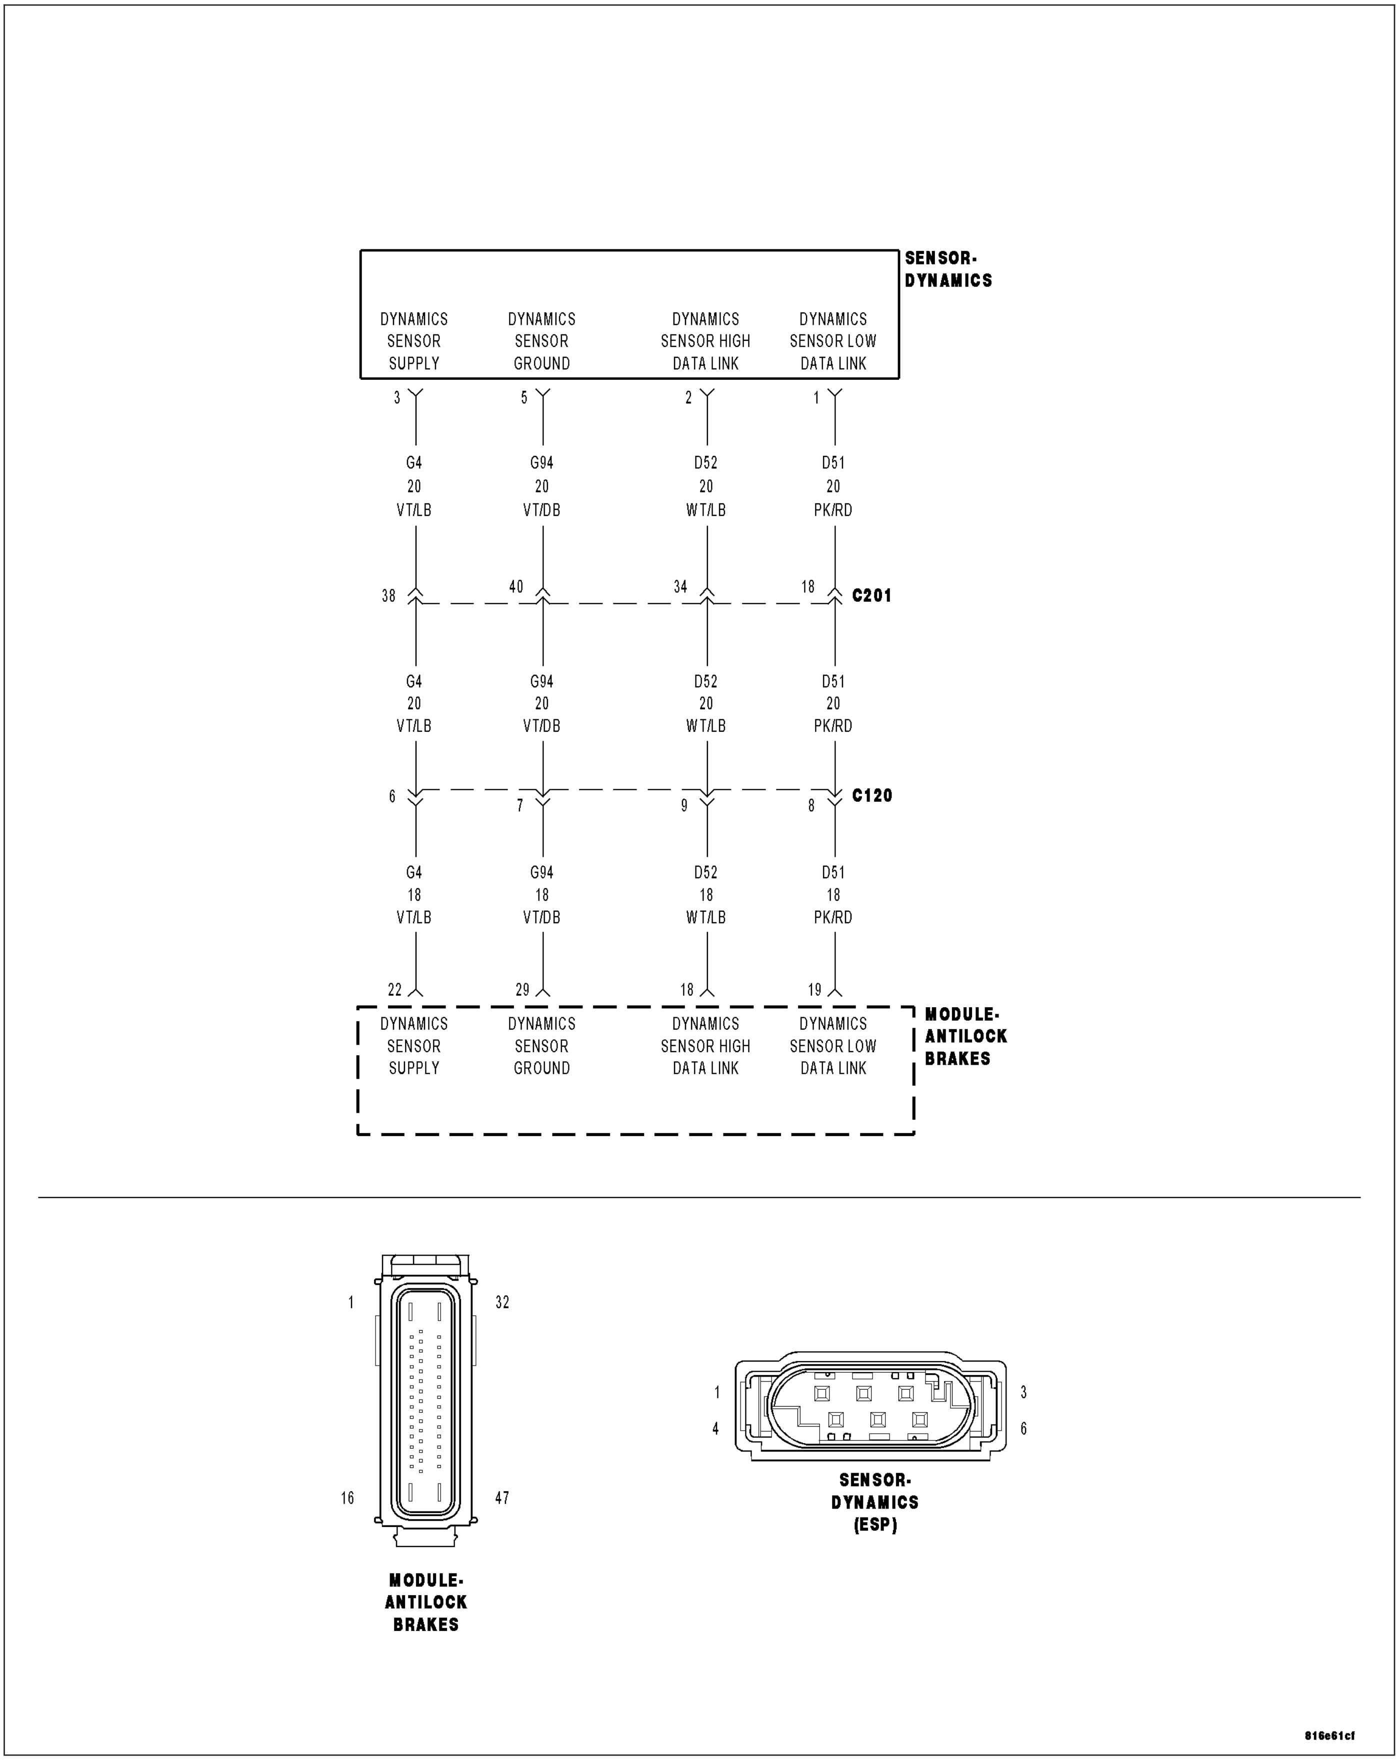
With the Scan Tool, select View DTCs.

**Does this DTC reset?**

**Yes** >> Replace the Anti-lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test complete.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C2204–DYNAMICS SENSOR INTERNAL



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously, with ignition on, until vehicle speed exceeds 20 km/h (12.4 m.p.h.) for the first time, but not if the sensor voltage is out of range.
  Or, during diagnostic mode.
  Or, if the monitoring was inhibited by a corresponding diagnostics command.
  Or, if the vehicle speed has exceeded 20 km/h (12.4 m.p.h.) during the actual ignition cycle.
  Or, if at least one over spinning wheel is detected.
  Or, if one of the control functions is active.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the Lateral Sensor signal is out of range.

| Possible Causes |
|---|
| DYNAMICS SENSOR INSTALLATION |
| DYNAMICS SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: Ensure brake capability is available before road testing.**
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/hr (6 and 12 m.p.h.).

Park the vehicle.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK THE DYNAMICS SENSOR INSTALLATION

**NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**
Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

### 3. CHECK DYNAMICS SENSOR OUTPUT

**CAUTION: All previously removed connectors must be connected before test driving the vehicle.**
Connect all previously disconnected components and connectors.

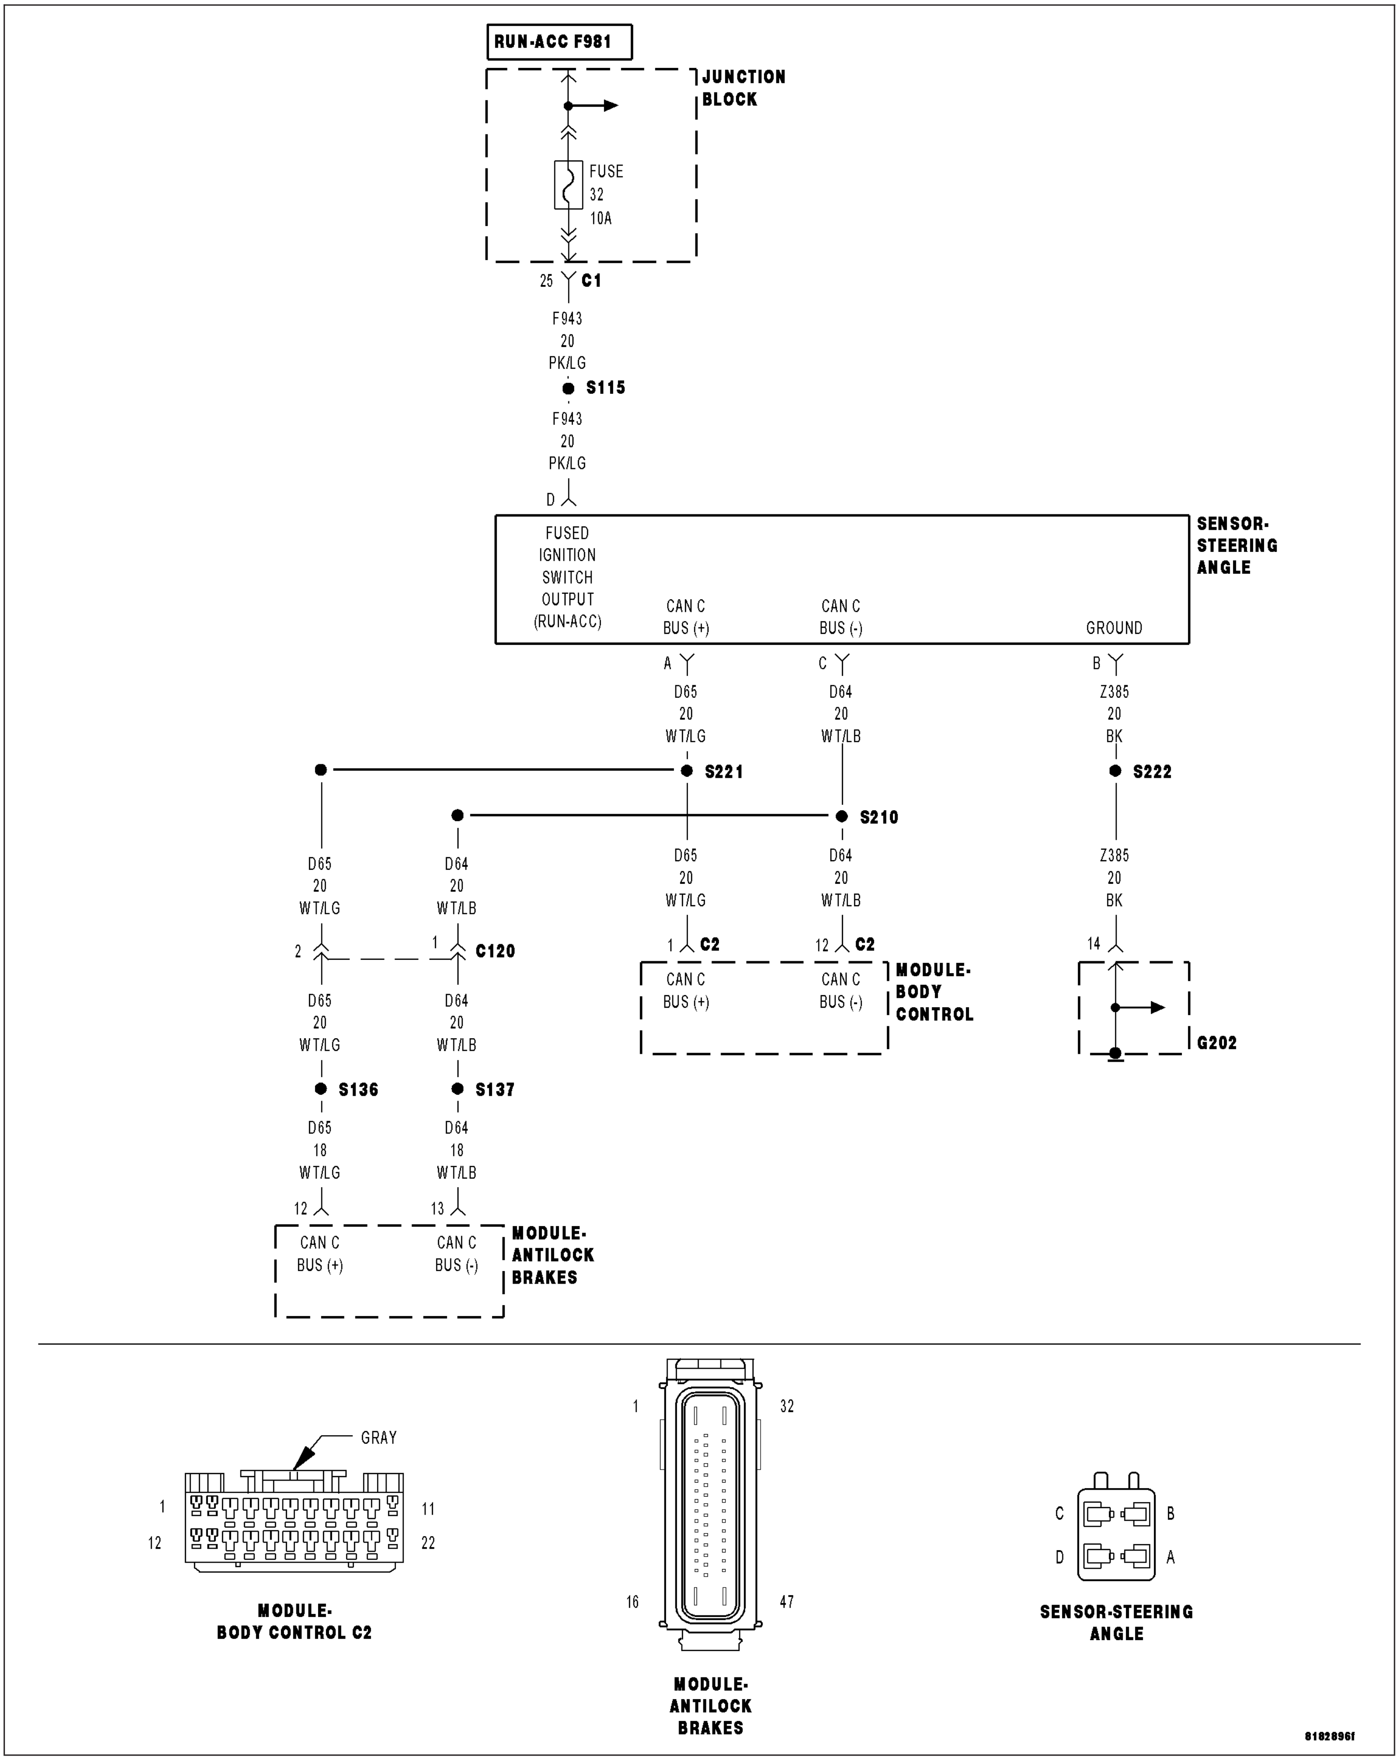
**WARNING: Ensure brake capability is available before road testing.**
Monitor Dynamics Sensor operation while an assistant drives the vehicle.

**Is Lateral Sensor output between 0.02 G to 0.16 G and Yaw Sensor output between 1.30° to 5.70°**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## C2205–STEERING ANGLE SENSOR INTERNAL



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on, but not if supply voltage faults are detected.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects that the Steering Angle Sensor is either not calibrated, or not initialized, or its status changes from initialized to not initialized, or if the sensor sends an internal failure message.

| Possible Causes |
|---|
| STEERING ANGLE SENSOR NOT INITIALIZED |
| STEERING ANGLE SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC C2205-STEERING ANGLE SENSOR INTERNAL

**NOTE: This DTC must be active for the results of this test to be valid.**
Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

**WARNING: Ensure brake capability is available before road testing.**
Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

With the scan tool, read and record DTCs.

**Does the scan tool display: C2205-STEERING ANGLE SENSOR INTERNAL?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. STEERING ANGLE SENSOR

Replace the Steering Angle Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**CAUTION: Ensure brake capability is available before road testing.**
Road test the vehicle over 25 km/h (6 and 15 m.p.h).

**NOTE: Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.). for set conditions to be meet.**
With the scan tool, read ABS DTCs.

**Did DTC C2205-STEERING ANGLE SENSOR INTERNAL reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## C2206–VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects the signal from the gateway module relevant for vehicle characteristic is missing or does not match for a period greater than the specified fault duration.

| Possible Causes |
|---|
| TIPM / PCM NOT CONFIGURED CORRECTLY |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC C2206-VEHICLE CONFIGURATION MISMATCH

**NOTE: This DTC must be active for the results of this test to be valid.**

**NOTE: This DTC will be active when a new module is installed until initialization is performed.**

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Perform ECU initialization with drive test on ABM. Refer to ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs.

**Does the scan tool display: C2206-VEHICLE CONFIGURATION MISMATCH?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. VERIFY THAT THE TIPM/PCM IS CONFIGURED CORRECTLY

Turn the ignition on.

Check the following data to verify the TIPM/PCM is configured correctly. Engine Displacement (PCM), XWD 4x2, 4x4, all Wheel Drive, (TIPM), Axle ratio (TIPM), Vehicle Line (TIPM), Brake type 0= ABS 1=ESP (TIPM).

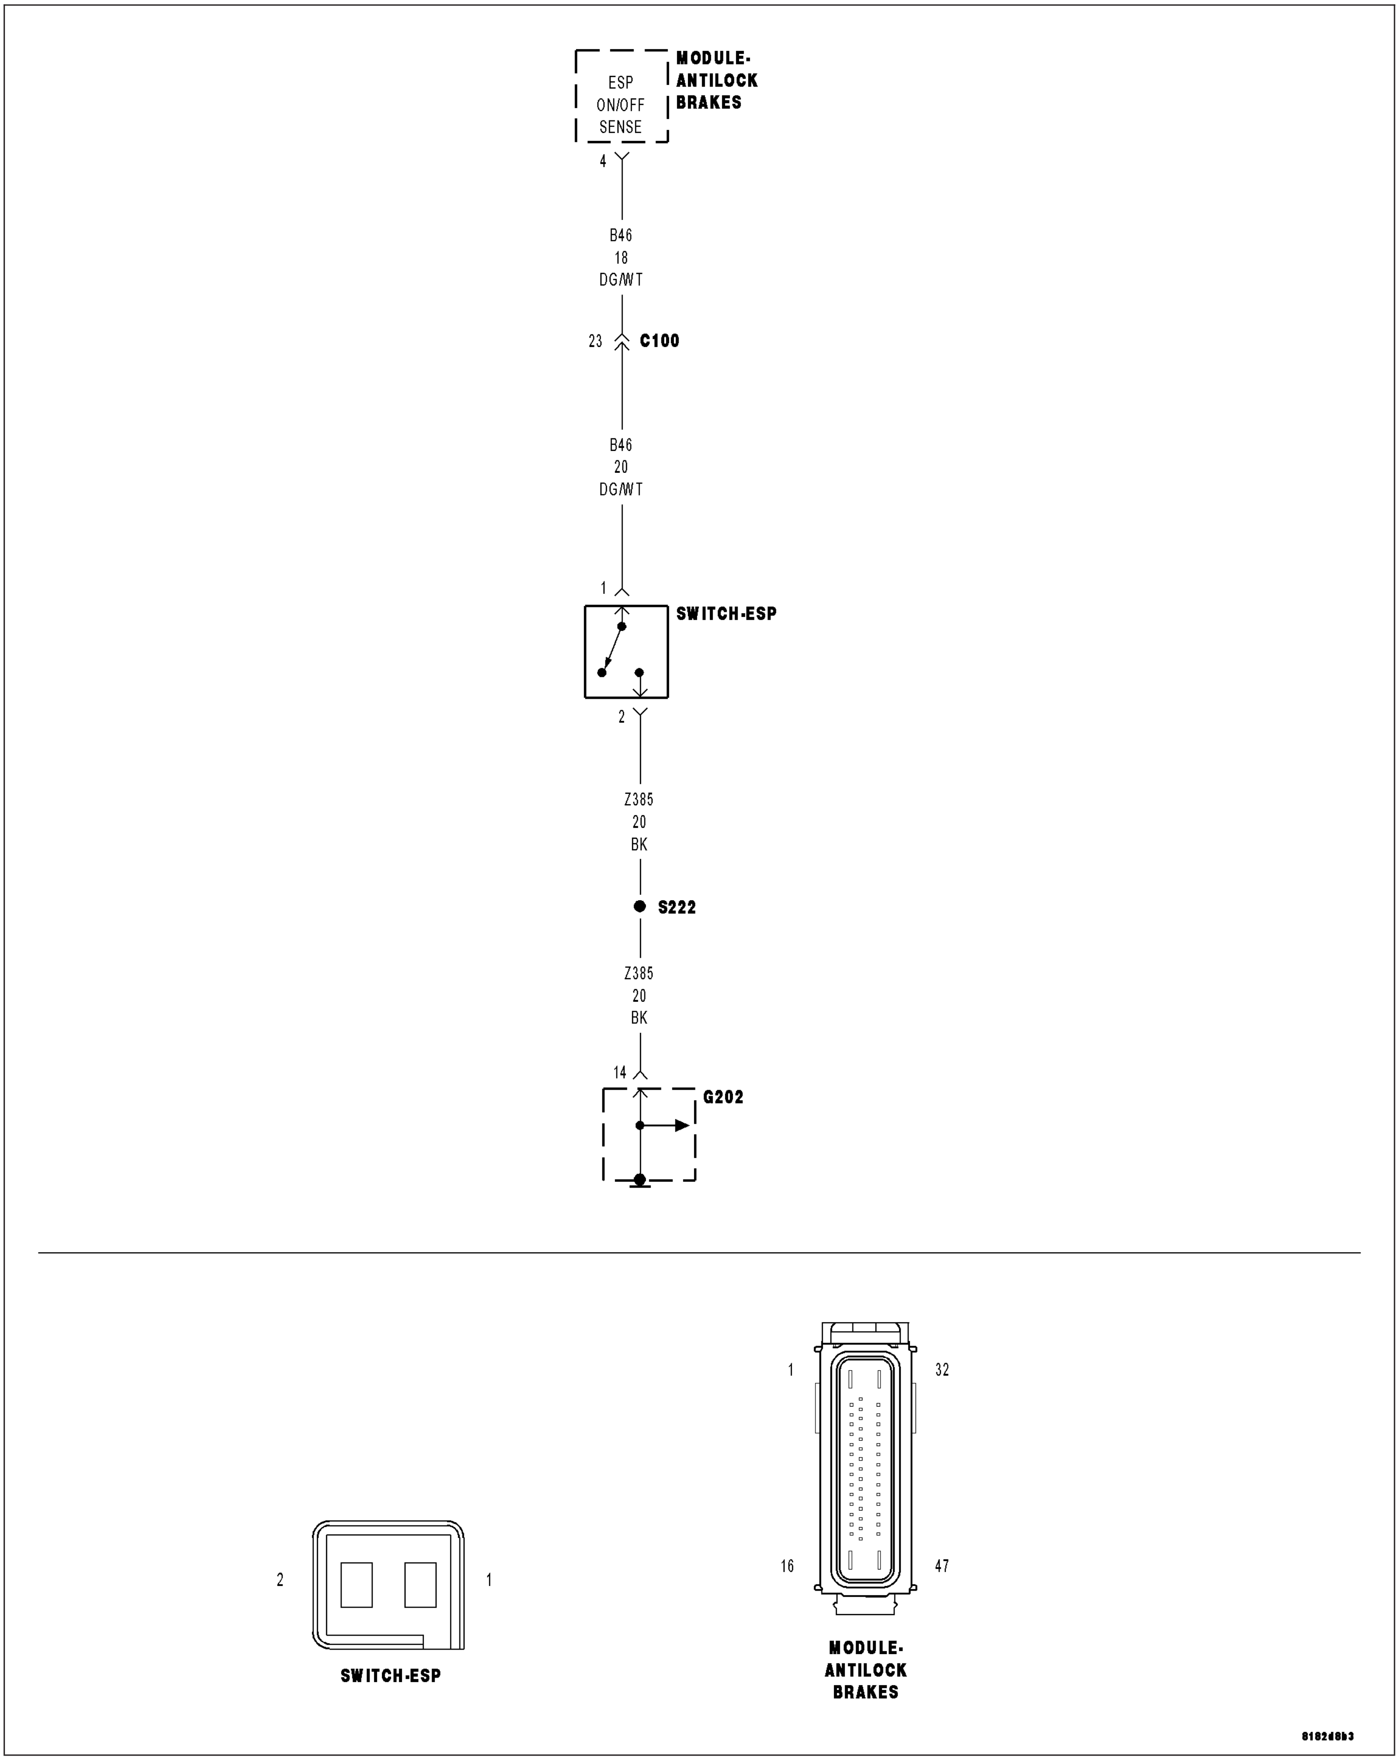
**NOTE: The DTC will be active when a new controller is installed until initialization is performed.**

**Was the TIPM/PCM configured correctly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Reprogram the appropriate module.
Perform ABS or PCM VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## ESP/TCS SWITCH CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module indicates that the ESP/TCS Switch is low for 30 seconds.

| Possible Causes |
|---|
| STUCK CLOSED ESP/TCS SWITCH |
| (Z385) GROUND CIRCUIT OPEN |
| (B46) ESP/TCS CONTROL SWITCH SENSE CIRCUIT SHORTED TO GROUND |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. ESP/TCS SWITCH CIRCUIT

**NOTE: If any other DTCs are present they must be repaired before continuing.**

Turn the ignition on.

Turn the ESP/TCS switch on then off.

Check for car icon on solid in cluster and pressing ESP/TCS switch does not change state.

With the scan tool, read the switch state for the ESP/TCS switch with NO pressure on the brake, read and record DTCs.

**Does the scan tool display switch state indicating pressed?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

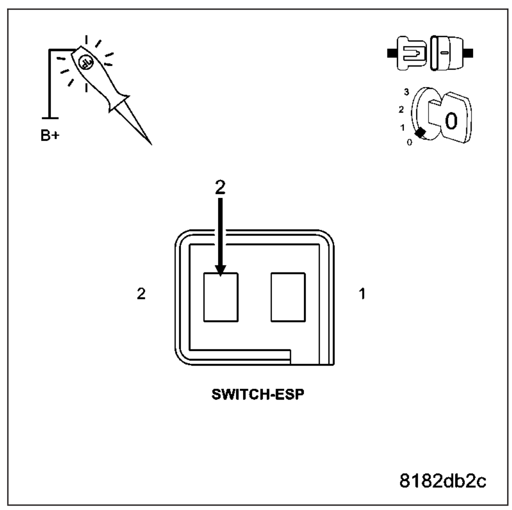
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

### 2. (Z385) OPEN CIRCUIT

Turn the ignition off.

Disconnect the ESP/TCS switch.

Using a 12–volt test light connected to 12–volts, check the (Z385) ground circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 3

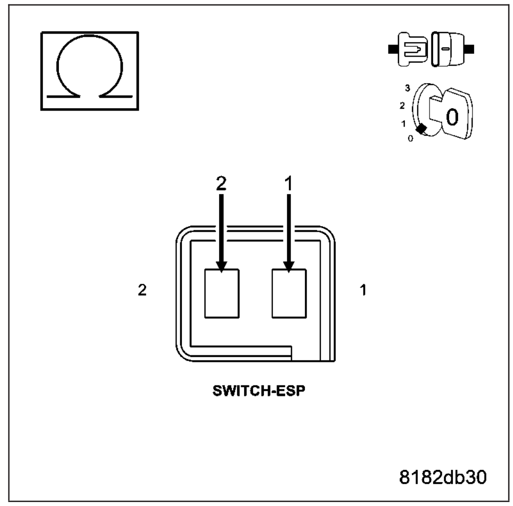
**No** >> Repair (Z385) ground circuit for an open circuit or high resistance.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 3. CHECK FOR A STUCK ESP/TCS SWITCH

Turn the ignition off.

Measure the internal resistance of the ESP/TCS Switch between the (B46) ESP/TCS control circuit and (Z385) Ground circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the ESP/TCS Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

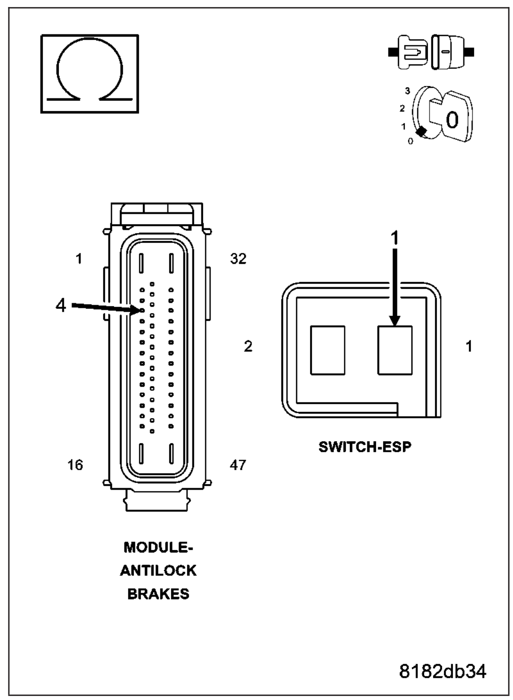
## 4. ESP/TCS CONTROL CIRCUIT

Turn the ignition off.

Disconnect the ESP/TCS Switch.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance of the (B46) ESP/TCS control circuit to ground.



**Is the resistance below 5.0 ohms?**

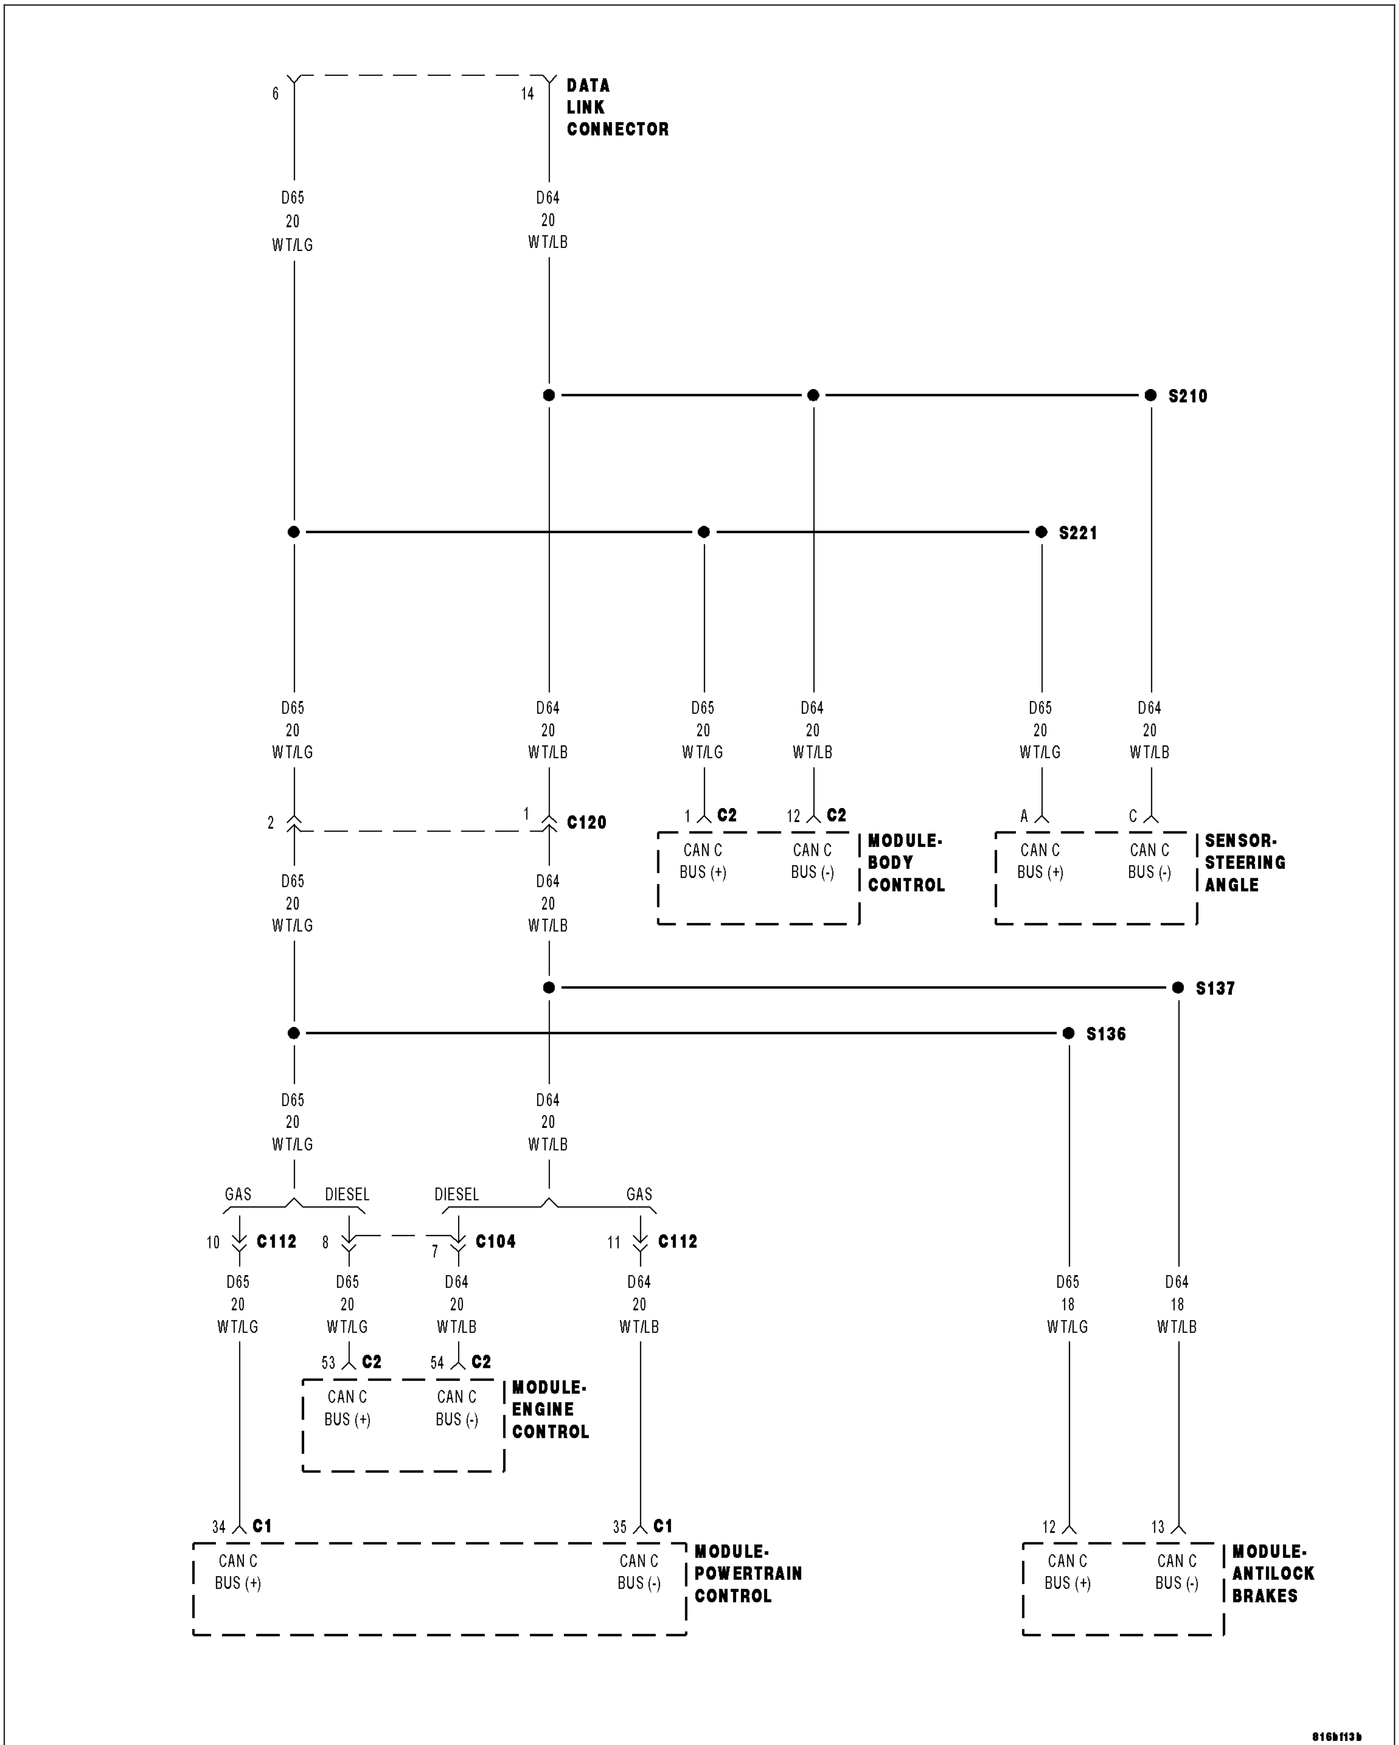
**Yes** >> Repair the (B46) ESP/TCS control circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U0002–CAN C BUS OFF PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  A module detects a short in either CAN C Bus circuit.

Perform the CAN C Bus Communication Failure diagnostic test procedure. **(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)**.

## U0100–LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the Anti-Lock Brakes Module fails to receive bus messages from the ECM or PCM for approximately 500 ms.

| Possible Causes |
| --- |
| DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| ECM OR PCM POWER AND GROUND |
| ECM OR PCM |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**
Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs related to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

**No** >> Go To 3

## 3. VERIFY THAT THE ECM OR PCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the ECM or PCM is active on the bus.

**Is the ECM or PCM active on the bus?**

**Yes** >> Go To 4

**No** >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

## 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs “Logged Against” the ECM or PCM?**

**Yes** >> Replace/update the ECM or PCM in accordance with the service information.
Perform POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)..
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Anti-Lock Brakes Module in accordance with the service information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U0101–LOST COMMUNICATION WITH TCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the Anti-Lock Brakes Module fails to receive bus messages from the TCM for approximately 500 ms.

| Possible Causes |
| --- |
| DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| TCM POWER AND GROUND |
| PCM DTCs PRESENT |
| TCM |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Verify the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

**NOTE: If present, diagnose and repair DTC U0002–CAN C BUS OFF PERFORMANCE, DTC U0146–LOST COMMUNICATION WITH CENTRAL GATEWAY, or DTC U1502–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM FCM / BCM before diagnosing this DTC.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the Stored Lost Communication test procedure. Refer to the table of contents in this section. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs related to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

**No** >> Go To 3

## 3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the TCM is active on the bus.

**Is the TCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs “Logged Against” the TCM?**

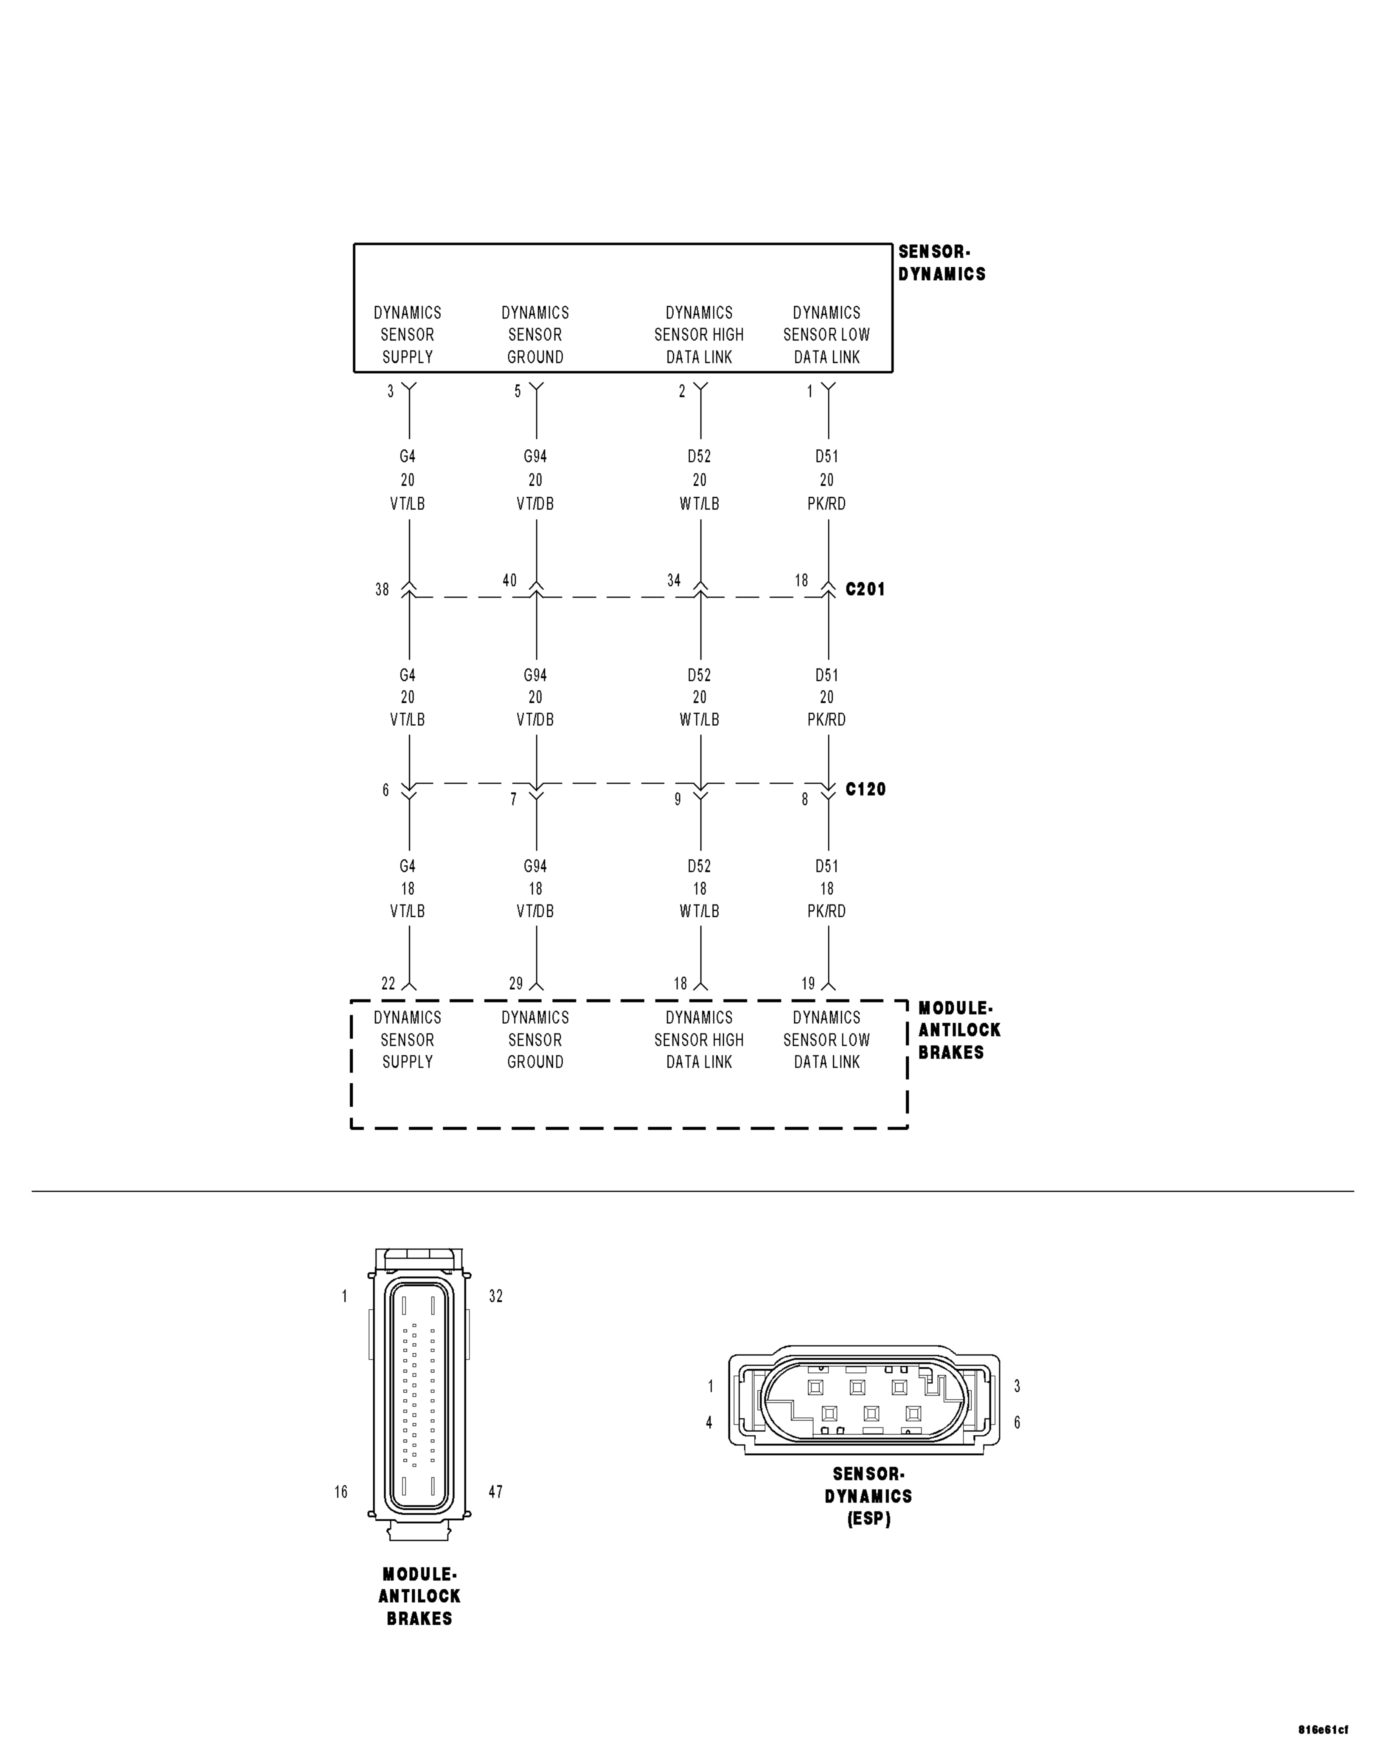
**Yes** >> Replace/update the TCM in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace the Anti-Lock Brakes Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## U0125–LOST COMMUNICATION WITH DYNAMICS SENSOR



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module fails to receive bus messages from the Dynamics Sensor.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN |
| (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, SHORTED TO VOLTAGE, OR OPEN |
| DYNAMICS SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: If present, diagnose and repair DTC C2114–DYNAMICS SENSOR SUPPLY VOLTAGE LOW or DTC C2115–DYNAMICS SENSOR SUPPLY VOLTAGE HIGH before proceeding.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

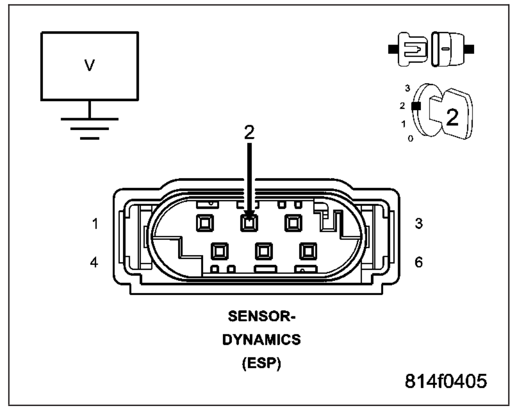
## 3. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D52) Dynamics Sensor High Data Link circuit.



**Is there any voltage present?**

**Yes** >> Repair the (D52) Dynamics Sensor High Data Link circuit for a short to voltage.

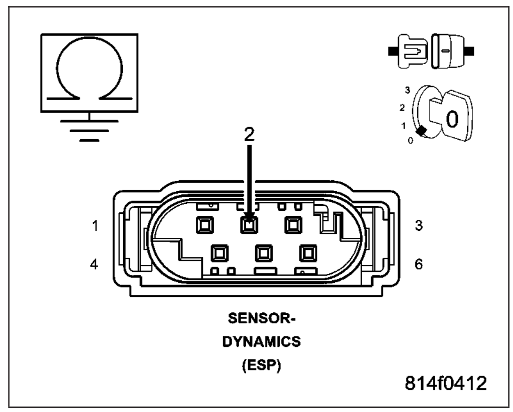
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D52) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.



**Is the resistance below 5.0 ohms?**

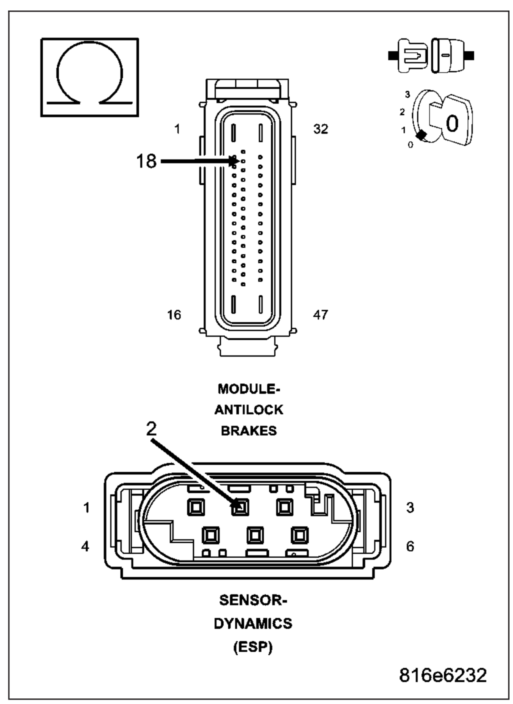
**Yes** >> Repair the (D52) Dynamics Sensor High Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D52) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

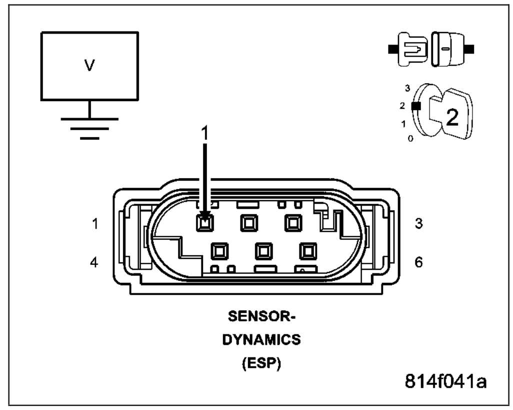
**No** >> Repair the (D52) Dynamics Sensor High Data Link circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D51) Dynamics Sensor Low Data Link circuit.



**Is there any voltage present?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for a short to voltage.

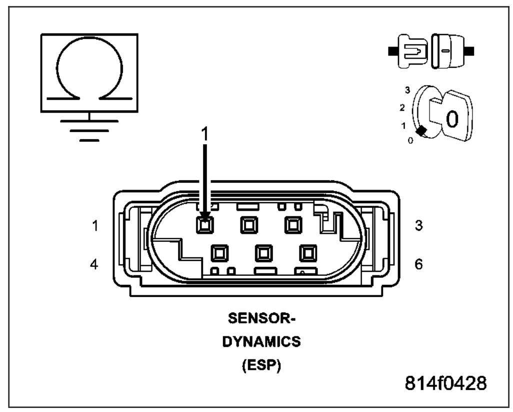
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D51) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.



**Is the resistance below 5.0 ohms?**

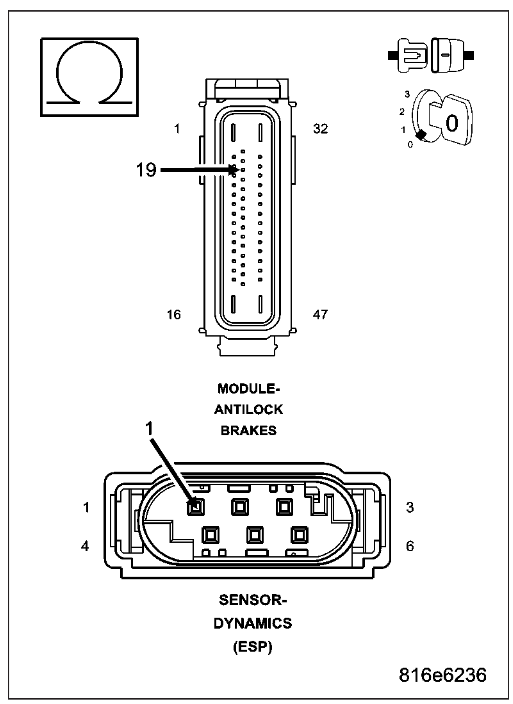
**Yes** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 8

## 8. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D51) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U0126–LOST COMMUNICATION WITH STEERING ANGLE SENSOR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the Anti-Lock Brakes Module fails to receive bus messages from the Steering Angle Sensor for approximately 500 ms.

| Possible Causes |
| --- |
| DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| STEERING ANGLE SENSOR POWER AND GROUND |
| STEERING ANGLE SENSOR |
| ANTI-LOCK BRAKES MODULE |

### Diagnostic Test

#### 1. VERIFY DTC IS ACTIVE

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**
Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

#### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs related to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the Steering Angle Sensor is active on the bus.

**Is the Steering Angle Sensor active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs "Logged Against" the STEERING ANGLE SENSOR?**

**Yes** >> Replace/update the Steering Angle Sensor in accordance with the service information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Anti-Lock Brakes Module in accordance with the service information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U0146–LOST COMMUNICATION WITH CENTRAL GATEWAY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the Anti-Lock Brakes Module either fails to receive bus messages from the Engine Control Module (ECM) for approximately 500 ms, or it receives invalid messages from the ECM, or it detects messages from the ECM are of improper data length.

| Possible Causes |
|---|
| DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| ECM POWER AND GROUND |
| ECM |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs related to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. VERIFY THAT THE ECM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the ECM is active on the bus.

**Is the ECM active on the bus?**

**Yes** >> Go To 4

**No** >> .Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs "Logged Against" the ECM?**

**Yes** >> Replace/update the ECM in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Anti-Lock Brakes Module in accordance with the service information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U0401–IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.
- **Set Condition:**
  When the Anti-Lock Brake Module detects an incorrect CAN message from the Engine Control Module (ECM).

| Possible Causes |
|---|
| ABM CAN BUS DTCS |
| ENGINE DTCS |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. CHECK FOR DTC U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read DTCs.

**Does the scan tool display: U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?**

**Yes** >> Go To 2

**No** >> Perform the ABS Intermittent Condition diagnostic procedure in this Section.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING). Diagnostic Test

### 2. CHECK IF FCM CAN BUS DTCs ARE PRESENT

With the scan tool, read FCM DTCs.

**Are there any FCM CAN BUS DTCs present?**

**Yes** >> Refer to the appropriate diagnostic. (Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

### 3. CHECK IF ENGINE DTCs ARE PRESENT

With the scan tool, read Engine DTCs.

**Are there any Engine DTCs present?**

**Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U0429–IMPLAUSIBLE DATA RECEIVED FROM SCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With ignition on, but not if low voltage is detected.
  Or, if a CAN Bus off event is detected.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects either the sequence or integrity of the Steering Angle Sensor messages is invalid.

| Possible Causes |
|---|
| CAN C BUS CIRCUIT(S) SHORTED |
| LOAD TOO HIGH ON CAN C BUS |
| STEERING ANGLE SENSOR DTCs PRESENT |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. CHECK IF COMMUNICATION RELATED DTCs ARE PRESENT

Turn the ignition on.

With the scan tool, read ABS DTCs.

**Are any Communication related DTCs present?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of symptoms.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 2

### 2. CHECK IF OTHER STEERING ANGLE SENSOR RELATED DTCs ARE PRESENT

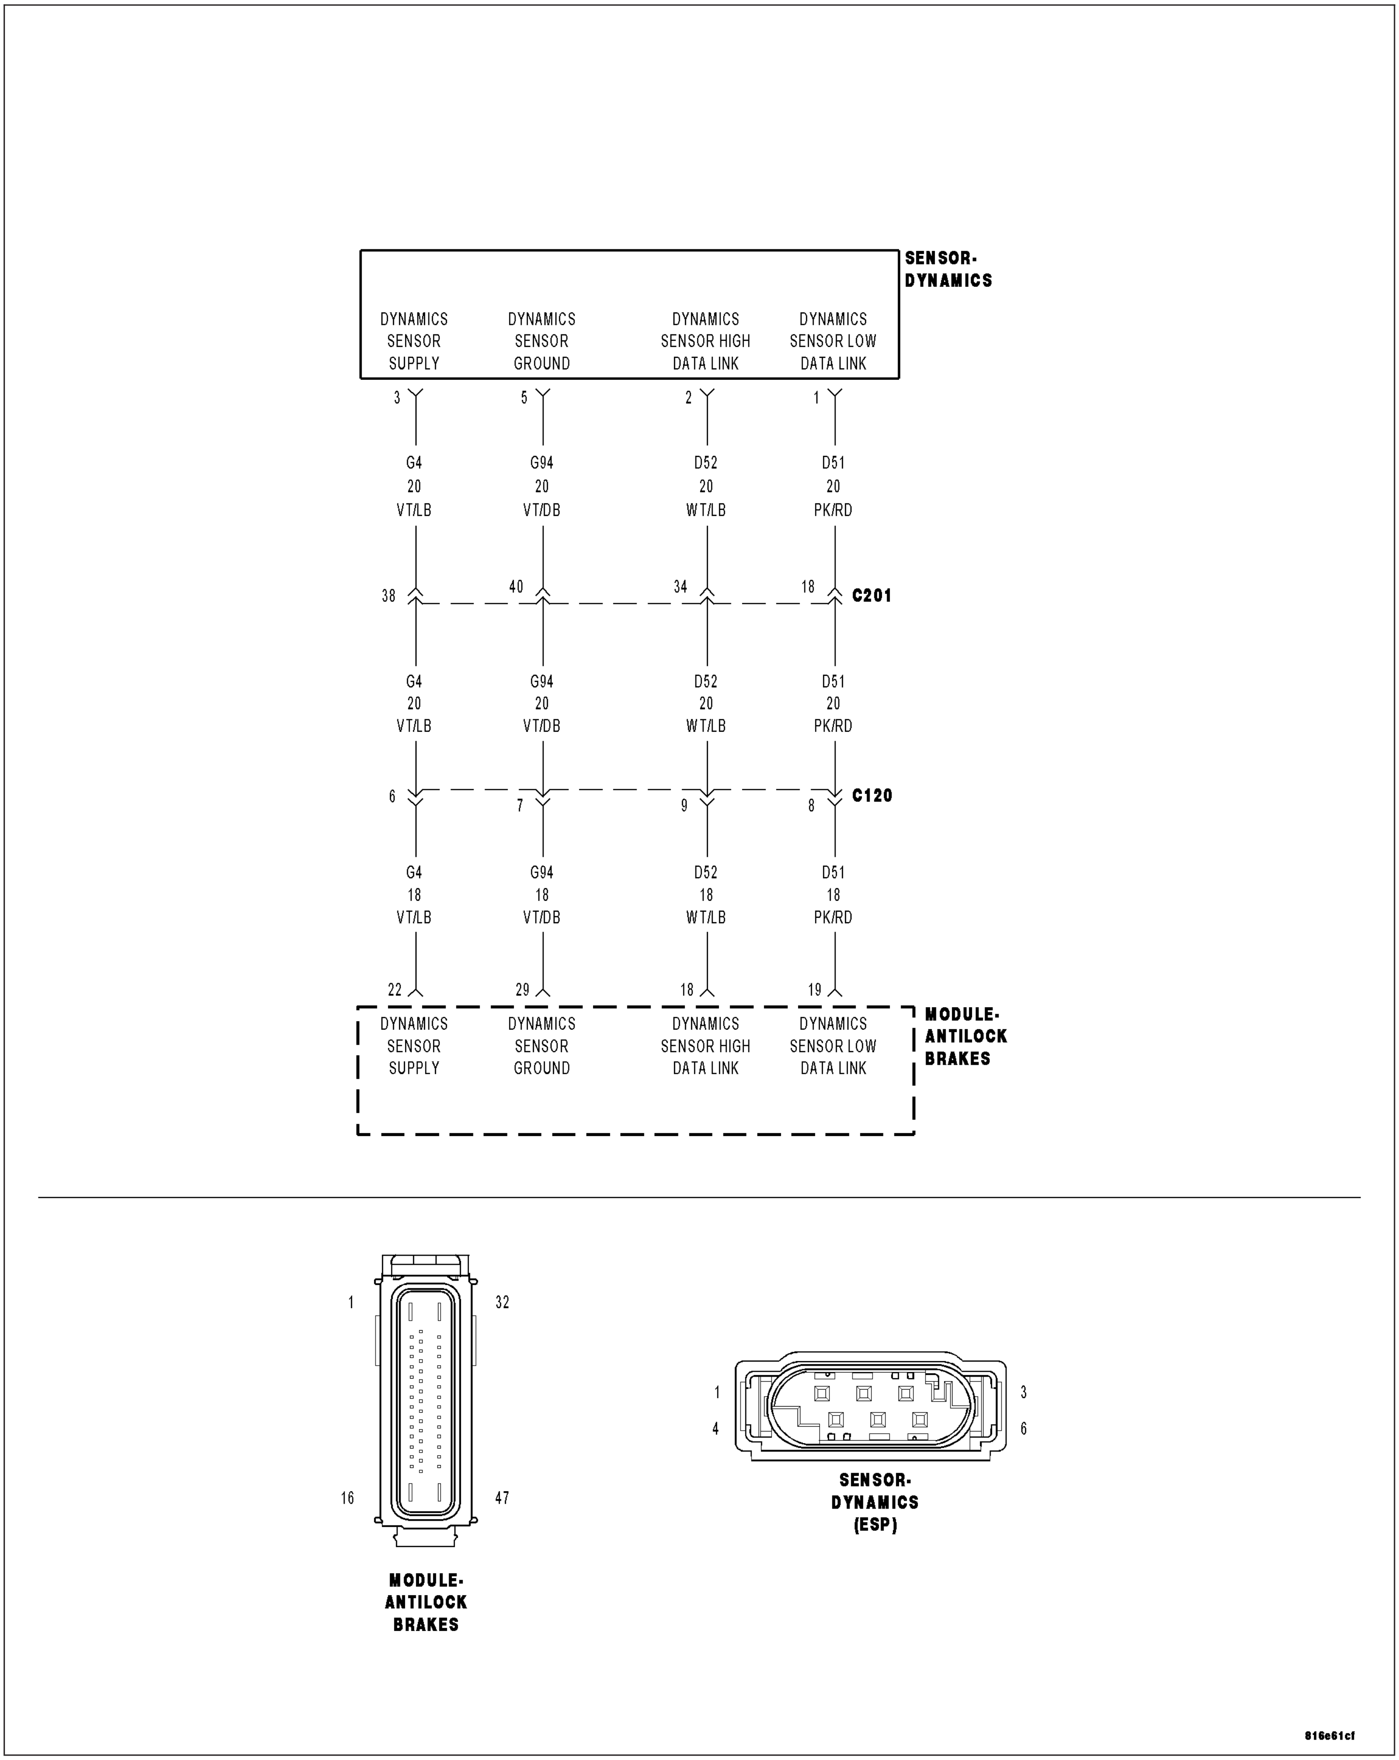
With the scan tool, read ABS DTCs.

**Are any other STEERING ANGLE SENSOR DTCs present?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of symptoms.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Steering Angle Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U1003–ESP CAN C BUS PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects too many CAN Bus off events on the Dynamics Sensor Data Link circuits.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN |
| (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN |
| DYNAMICS SENSOR |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

Turn the ignition on.
With the scan tool, read and record ABS DTCs.
With the scan tool, read and record Environmental Data (EV Data).
With the scan tool, erase ABS DTCs.
Cycle the ignition switch.
With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

### 2. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.
Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

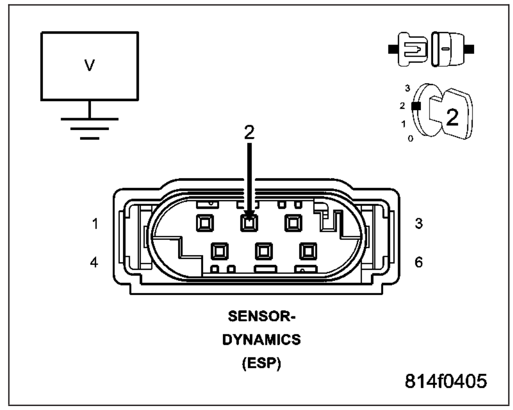
## 3. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D52) Dynamics Sensor High Data Link circuit.



**Is there any voltage present?**

**Yes** >> Repair the (D52) Dynamics Sensor High Data Link circuit for a short to voltage.

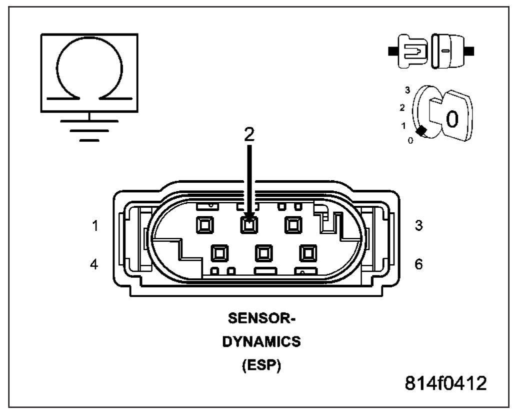
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D52) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.



**Is the resistance below 5.0 ohms?**

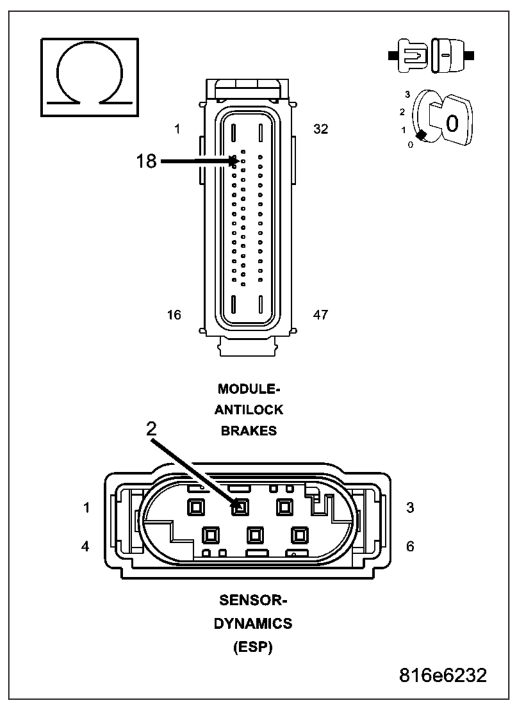
**Yes** >> Repair the (D52) Dynamics Sensor High Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D52) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

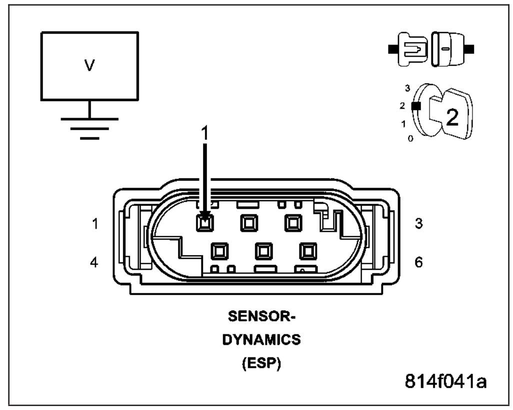
**No** >> Repair the (D52) Dynamics Sensor High Data Link circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 6. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D51) Dynamics Sensor Low Data Link circuit.



**Is there any voltage present?**

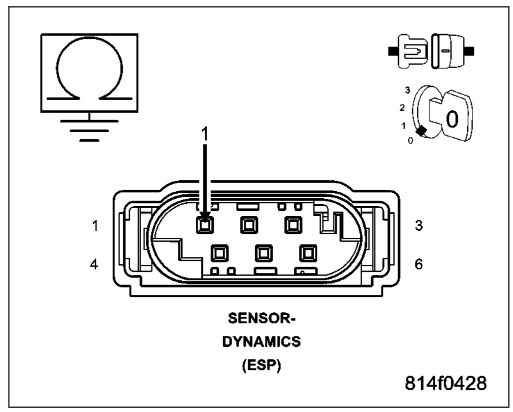
**Yes** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 7

## 7. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D51) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.



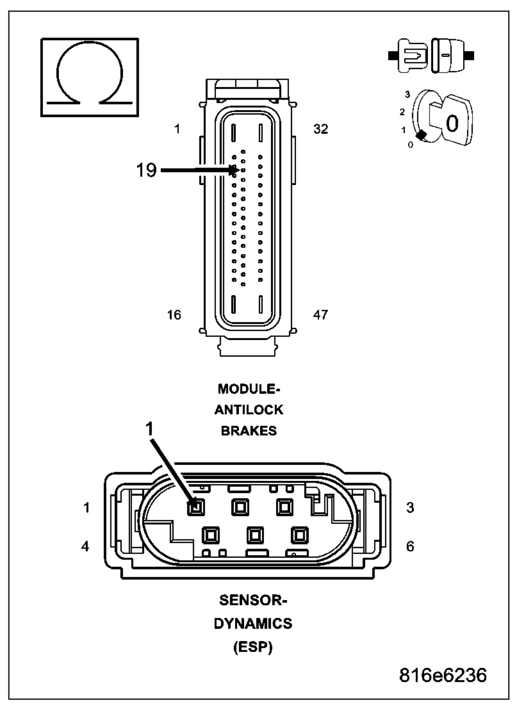
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 8

## 8. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D51) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 9

**No** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 9. REPLACE DYNAMICS SENSOR & VERIFY IF DTC IS STILL ACTIVE

Replace the Dynamics Sensor in accordance with the Service Information. Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

Turn the ignition on.

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

**WARNING: Ensure brake capability is available before road testing.**

Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).

Park the vehicle.

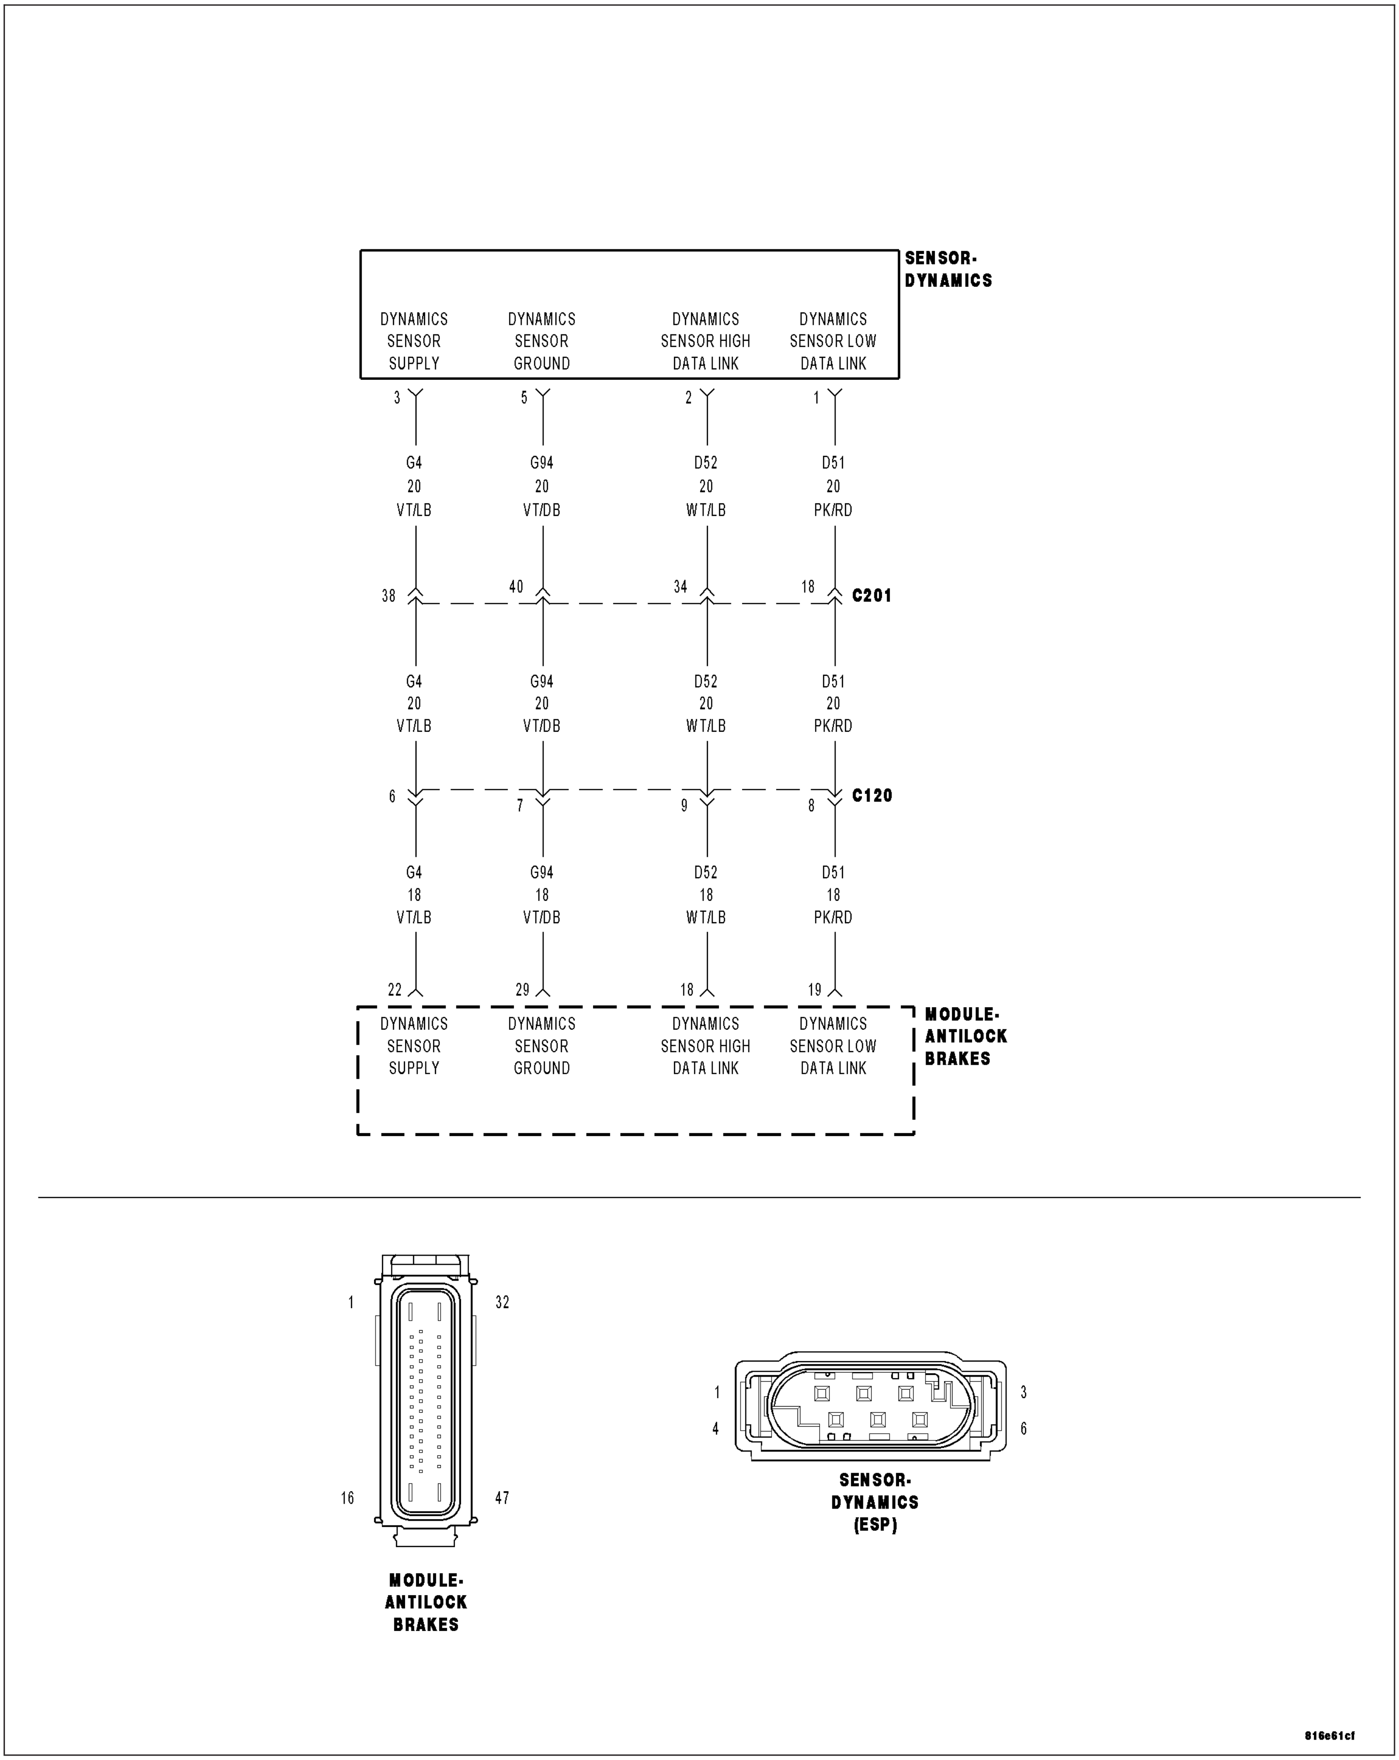
With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U1104–CAN C BUS CRC PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects an invalid CAN message from the Dynamics Sensor.

| Possible Causes |
| --- |
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN |
| (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN |
| DYNAMICS SENSOR INSTALLATION |
| DYNAMICS SENSOR |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

### 2. CHECK THE DYNAMICS SENSOR INSTALLATION

**NOTE: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**

Turn the ignition off.

Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.

Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

### 3. INSPECT RELATED WIRING HARNESS, TERMINALS, & CONNECTORS

Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

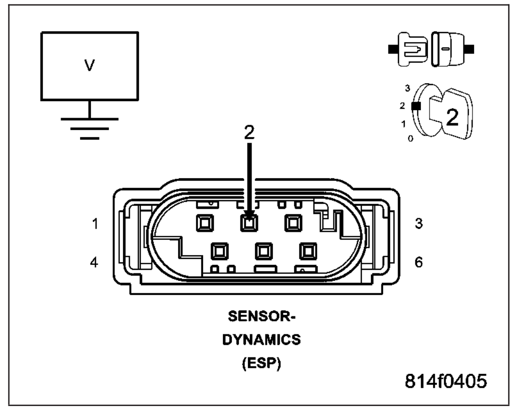
**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE



Disconnect the Anti-Lock Brakes Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (D52) Dynamics Sensor High Data Link circuit.

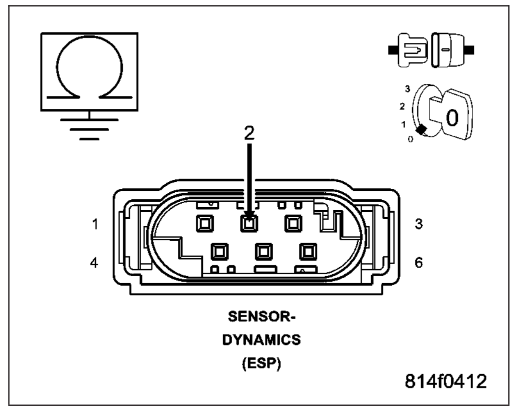
**Is there any voltage present?**

**Yes** >> Repair the (D52) Dynamics Sensor High Data Link circuit for a short to voltage.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND



Turn the ignition off.

Measure the resistance of the (D52) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.

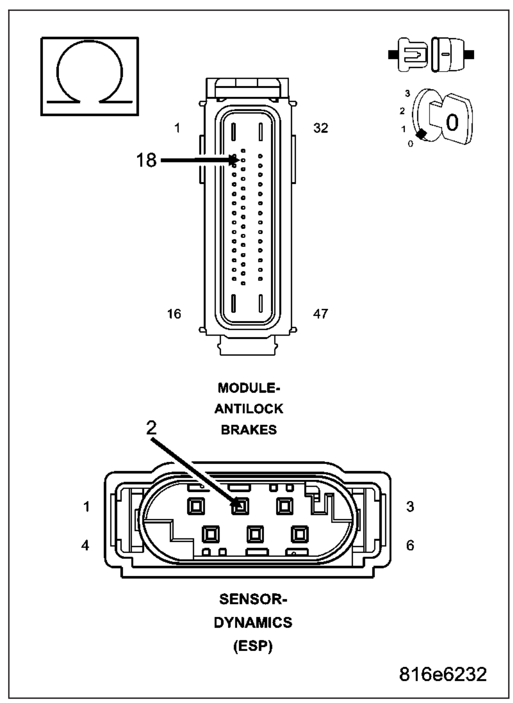
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (D52) Dynamics Sensor High Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. CHECK THE (D52) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN



Measure the resistance of the (D52) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

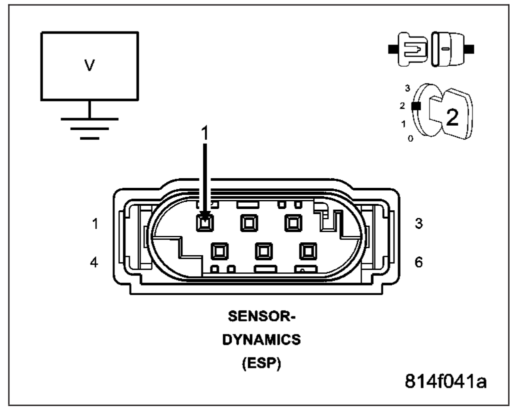
**No** >> Repair the (D52) Dynamics Sensor High Data Link circuit for an open.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## 7. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D51) Dynamics Sensor Low Data Link circuit.



**Is there any voltage present?**

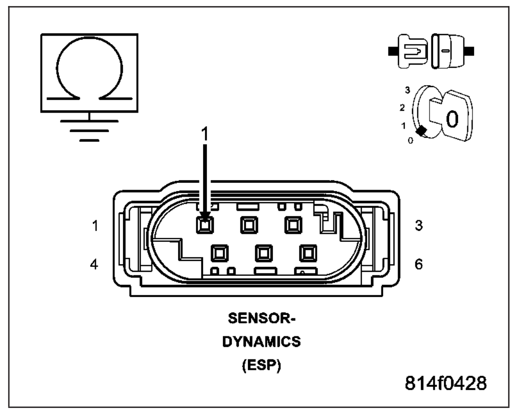
**Yes** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for a short to voltage.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 8

## 8. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance of the (D51) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.



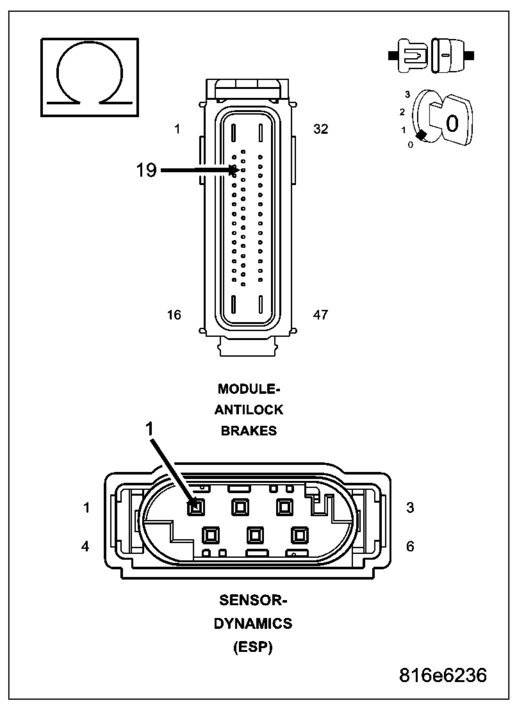
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for a short to ground.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 9

## 9. CHECK THE (D51) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D51) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-Lock Brakes Module harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Repair the (D51) Dynamics Sensor Low Data Link circuit for an open.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U140E–IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Once per ignition cycle, but not during cranking.
  Or, if low supply voltage faults are detected.
- **Set Condition:**
  If the Anti-Lock Brakes Module either fails to receive vehicle configuration data from the Engine Control Module (ECM) or Powertrain Control Module (PCM) or Body Control Module (BCM) or the configuration data it receives from the ECM or PCM or BCM is invalid

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| ECM OR PCM DTCs PRESENT |
| ECM OR PCM NOT PROGRAMMED OR PROGRAMMED WITH INCORRECT VIN |
| BCM NOT PROGRAMMED OR PROGRAMMED WITH INCORRECT INFORMATION |
| ECM, PCM OR BCM |
| ANTI-LOCK BRAKES MODULE |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: This DTC must be active for the results of this test to be valid. If DTC C2206-VEHICLE CONFIGURATION MISMATCH is present it must be repaired before continuing.**

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs related to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

**No** >> Go To 3

## 3. CHECK IF BCM DTCs ARE PRESENT

With the scan tool, read BCM DTCs.

**Are any DTCs present?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. VERIFY BCM IS CONFIGURED CORRECTLY

With the scan tool, verify that the BCM part number and configuration is correct for the vehicle.

**Is the correct BCM installed in the vehicle?**

**No** >> Replace and program the BCM in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**Yes** >> Go To 5

## 5. CHECK IF ECM OR PCM DTCs ARE PRESENT

With the scan tool, read ECM or PCM DTCs.

**Are any DTCs present?**

**Yes** >> Diagnose and repair the DTC(s). Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 6

## 6. VERIFY CORRECT ECM OR PCM IS INSTALLED IN THE VEHICLE

With the scan tool, verify that the ECM or PCM part number is correct for the vehicle.

**Is the correct ECM or PCM installed in the vehicle?**

**No** >> Replace and program the ECM or PCM in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**Yes** >> Go To 7

## 7. VERIFY ECM OR PCM IS PROGRAMMED WITH CORRECT VIN

With the scan tool, verify that the ECM or PCM is programmed with the correct VIN.

**Is the ECM or PCM programmed with the correct VIN?**

**No** >> Using the scan tool, perform PCM Replaced to update the VIN in the PCM.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**Yes** >> Go To 8

## 8. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs “Logged Against” the ECM or PCM?**

**Yes** >> Replace/update the ECM or PCM in accordance with the service information.
Perform POWERTRAIN VERIFICATION TEST. Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U1501–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM ECM/PCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously, with ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects bus messages from the Engine Control Module (ECM) or Powertrain Control Module (PCM) are of improper data length.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| ECM OR PCM DTCs PRESENT |
| ECM OR PCM |
| ANTI-LOCK BRAKES MODULE |

### Diagnostic Test

#### 1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

#### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs related to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

**No** >> Go To 3

## 3. CHECK IF ECM OR PCM DTCs ARE PRESENT

With the scan tool, read ECM or PCM DTCs.

**Are any DTCs present?**

**Yes** >> Diagnose and repair the DTC(s). Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs "Logged Against" the ECM or PCM?**

**Yes** >> Replace/update the ECM or PCM in accordance with the service information.
Perform POWERTRAIN VERIFICATION TEST. Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U1502–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously, with ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects bus messages from the Transmission Control Module (TCM) are of improper data length.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| TCM DTCs PRESENT |
| TCM |
| ANTI-LOCK BRAKES MODULE |

### Diagnostic Test

#### 1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, read and record ABS DTCs.

With the scan tool, read and record Environmental Data (EV Data).

With the scan tool, erase ABS DTCs.

Cycle the ignition switch.

With the scan tool, read ABS DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

#### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs related to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

**No** >> Go To 3

## 3. CHECK IF TCM DTCs ARE PRESENT

With the scan tool, read TCM DTCs.

**Are any TCM DTCs present?**

**Yes** >> Diagnose and repair the DTC(s).

Perform TRANSMISSION VERIFICATION TEST - VER 1.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Using the schematics as a guide, check the Anti-Lock Brakes Module pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace the Anti-Lock Brakes Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

## U1503–IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM FCM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects an incorrect CAN message from the Front Control Module (FCM).

| Possible Causes |
| --- |
| FCM CAN BUS DTCS |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. CHECK IF FCM CAN BUS DTCs ARE PRESENT

With the scan tool, read FCM DTCs.

**Are there any FCM CAN BUS DTCs present?**

**Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

# U1504-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM STEERING ANGLE SENSOR

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on.
- **Set Condition:**
  When the Anti-Lock Brake Module detects an incorrect CAN message from the Steering Angle Sensor.

| Possible Causes |
| --- |
| FCM CAN BUS DTCS |
| STEERING ANGLE SENSOR |
| ANTI-LOCK BRAKE MODULE |

## Diagnostic Test

### 1. CHECK FOR A DTC U1504-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM STEERING ANGLE SENSOR

**NOTE: Diagnose and repair any Steering Angle Sensor DTCs in the Steering Column Module, any communication DTCs in the SCM, FCM or PCM and any system under voltage or over voltage DTCs before continuing with this test.**

**NOTE: This DTC must be active for the results of this test to be valid.**

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

With the scan tool, read DTCs.

**Does the scan tool display: U1504-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM STEERING ANGLE SENSOR?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Refer to the ABS-INTERMITTENT CONDITION TEST. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

### 2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring. Look for the data to change other than as expected or for the DTC to reset.

Refer to any Technical Service Bulletins that apply.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. STEERING ANGLE SENSOR

Replace the Steering Angle Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**Did DTC U1504-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM STEERING ANGLE SENSOR reset?**

**Yes** >> Replace the Anti-Lock Brakes Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## ABS INTERMITTENT CONDITION

For a complete wiring diagram **Refer to Section 8W**.

### Diagnostic Test

#### 1. PERFORM ABS INTERMITTENT CONDITION TEST

**NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.**

**WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.**

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Wiggle the wires while checking for shorts and open circuits.

Perform a voltage drop test on the related circuits between the suspected faulty component and the Anti-Lock Brake Module.

Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits

For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.

Use the scan tool to perform a System Test if one applies to failing component.

A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

**Were any problems found during the above inspections?**

**Yes** >> Perform the necessary repairs.
Perform ABS VERIFICATION TEST. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

**No** >> Test Complete.

## STANDARD PROCEDURE

## ABS VERIFICATION TEST

### 1. ABS VERIFICATION TEST

**WARNING: To avoid personal injury or death, check brake capability is available before road testing.**

**NOTE: If the ABM (Anti-Lock Brake Module), SAS (Steering Angle Sensor), Dynamics Sensor was replaced, it must be initialized using the scan tool. If not initialized, the ABS indicator will flash continuously with no DTCs. To initialize the ABM and clear offsets have wheels pointing straight ahead and follow the directions on the scan tool. The drive test requires a 90° turn. If the Dynamics Sensor was replaced, test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/hr (6 and 15 m.p.h.).**

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Verify all accessories are turned off and the battery is fully charged.
4. Verify that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes from All modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was indicating the failure.
5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTCs from all modules.
6. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.

**NOTE: For Sensor Signal and Pump Motor faults, the ABM must sense all 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicator.**

7. If there are no DTCs present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several anti-lock braking stops.
8. Again, with the scan tool read DTCs. If any DTCs are present, refer to the Table of Contents in the applicable Section for the diagnostic test procedure and troubleshoot the new or recurring symptom.
9. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

**Are any DTCs present or is the original concern still present?**

**Yes** >> Repair is not complete, refer to appropriate symptom.

**No** >> Repair is complete.

# BRAKES - ABS SERVICE INFORMATION

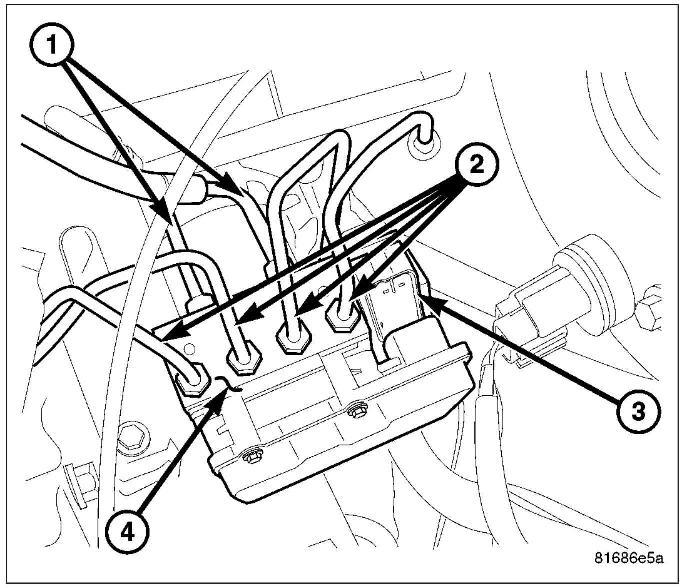
## TABLE OF CONTENTS

# BRAKES - ABS SERVICE INFORMATION

## DESCRIPTION

## ANTILOCK BRAKE SYSTEM WITH TRACTION CONTROL

This vehicle uses the Continental Teves MK25e electronic brake control system. The system includes ABS (Anti-lock Brake System), EVBP (Electronic Variable Brake Proportioning), TCS (Traction Control System), BAS (Brake Assist System), ERM (Electronic Roll Mitigation) and ESP (Electronic Stability Program). All six systems work together to enhance vehicle stability and control in various driving conditions and are commonly referred to as ESP. ESP is standard



The electronic brake control system uses the following components to operate:

- Integrated Control Unit (ICU) – The ICU is a combination of the Electronic Brake Controller (EBC) and the Hydraulic Control Unit (HCU) (4)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)
- Dynamics Sensor – The Dynamics Sensor includes a yaw rate sensor, (The Dynamics Sensor is located under the center console near the center of the vehicle).
- lateral accelerometer and, on 4x4 vehicles with a low range transfer case (245 T-Case), a longitudinal accelerometer.
- Steering Angle Sensor (SAS) – The SAS is part of the clock spring assembly in the steering column.
- Brake Pressure Sensor – The brake pressure sensor is located in the HCU and is not serviceable separate from the HCU.

## ALL-SPEED TRACTION CONTROL

The TCS is an all-speed traction control system that functions up to the maximum allowed vehicle speed. TCS enhances vehicle stability and mobility by reducing wheel spin when accelerating on slippery surfaces. TCS controls wheel spin by applying the brakes and/or reducing engine power.

## ANTILOCK BRAKE SYSTEM (ABS)

The purpose of the antilock brake system (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking

## ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use EVBP to balance front-to-rear braking. The EVBP is used in place of a rear brake proportioning valve. The EVBP system controls the slip of the rear wheels during braking at low to moderate deceleration, up until the point where ABS control is necessary. The brake pressure at the rear wheels is controlled by using the inlet and outlet valves located in the hydraulic control unit (HCU).

EVBP activation should not be perceptible by the customer because there is no pump motor noise and almost no brake pedal feedback.

## ELECTRONIC STABILITY PROGRAM

The ESP system enhances directional control and stability of the vehicle under various driving conditions. ESP corrects for over/under steering of the vehicle by applying the brake of the appropriate wheel to assist in counteracting the over/under steer condition. Engine power may also be reduced to help the vehicle maintain the desired path. ESP uses sensors in the vehicle to determine the vehicle path intended by the driver and compares it to the actual path of the vehicle. When the actual path does not match the intended path, ESP applies the brake of the appropriate wheel to assist in counteracting the oversteer or understeer condition

- Oversteer – when the vehicle is turning more than appropriate for the steering wheel position.
- Understeer – when the vehicle is turning less than appropriate for the steering wheel position.

The “ESP/TCS Indicator Light” located in the instrument cluster, starts to flash as soon as the tires lose traction and the ESP system becomes active. The “ESP/TCS Indicator Light” also flashes when TCS is active.

## BRAKE ASSIST SYSTEM (BAS)

The BAS is designed to optimize the vehicle’s braking capability during emergency braking maneuvers. The system detects an emergency braking situation by sensing the rate and amount of brake application and then applies optimum pressure to the brakes. This can help reduce braking distances. The BAS complements the antilock brake system (ABS). Applying the brakes very quickly results in the best BAS assistance.

## ELECTRONIC ROLL MITIGATION (ERM)

This system anticipates the potential for wheel lift by monitoring the driver’s steering wheel input and the speed of the vehicle. When ERM determines that the rate of change of the steering wheel angle and vehicles speed are sufficient to potentially cause wheel lift, it applies the appropriate brake and may reduce engine power to lessen the chance that wheel lift will occur. ERM will only intervene during very severe or evasive driving maneuvers.

ERM can only reduce the chance of wheel lift occurring during severe or evasive driving maneuvers. It can not prevent wheel lift due to other factors such as road conditions, leaving the roadway or striking objects or other vehicles.

## OPERATION

## ANTILOCK BRAKE SYSTEM WITH TRACTION CONTROL

### ABS

There are a few performance characteristics of the MK25E Antilock Brake System that may at first seem abnormal, but in fact are normal. These characteristics are described below.

#### NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

#### ABS BRAKING

ABS operation is available at all vehicle speeds above 3–5 mph. If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation, although for vehicle stability, both rear wheel solenoids receive the same electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the integrated control unit (ICU) regulates hydraulic pressure at all 4 of the vehicle’s wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

### NOISE AN BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3–4 mph. There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

### TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25–30 percent. This means that the wheel rolling velocity is 25–30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

### START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12–25 mph (20–40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

### PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no fault codes are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel bearing housings where wheel speed sensors mount; and loose wheel speed sensor mounting bolts.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

## ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing “all-speed” traction control.

With AWD, where front-wheel slip can occur, the degree of throttle intervention is relatively less than with rear-wheel drive. The difference in speed capability and the degree of throttle intervention between rear-wheel drive and all-wheel drive is due to the fact that non-driven front wheels on a rear-wheel drive vehicle give the system an accurate vehicle speed reference on which to base responses. With AWD, the possibility that the front wheels may also be slipping makes appropriate corrective action more difficult to determine, thus limiting the effective speed range. Offsetting this is the fact that loss of traction is less likely with AWD because torque is transmitted through all four wheels to begin with. In actual driving situations on snow or ice, the rear-wheel drive and AWD systems respond in essentially the same way up to the 45 mph (72 km/h) limit of the AWD system.

When severe wheel slippage is detected (as on snow-covered roads), the Winter Mode feature of All-Speed Traction Control causes the transmission to up-shift to higher gears at lower speeds than normal. Once a slippery launch condition is detected, the transmission will remain in Winter Mode for a minimum of three minutes. After that, if the road is providing normal traction, the system returns to providing normal up-shifts.

## ANTILOCK BRAKE SYSTEM (ABS)

There are a few performance characteristics of the MK25e anti-lock brake system that may, at first, seem abnormal but in fact are normal. These characteristics are described below.

### NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a front/rear split master cylinder and conventional vacuum assist.

### ABS BRAKING

ABS operation is available at all vehicle speeds above 3-5 mph. If a wheel locking tendency is detected during brake application, the brake system enters ABS mode. During ABS braking, hydraulic pressure in the four wheel circuit is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electronic solenoids to allow brake pressure to be modulated at each wheel individually. For vehicle stability reasons, both rear wheel solenoids receive the same electrical signal input during ABS. Wheel lock-up may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the integrated control unit (ICU) regulates hydraulic brake pressure at all four of the vehicle’s wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at each wheel is the same and does not exceed the pressure appropriate for the wheel with the highest slip in order to maintain vehicle stability.

## ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched ON so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the outlet valve and draining through the inlet valve check valve. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

## ELECTRONIC STABILITY PROGRAM

To determine whether the car is responding properly to cornering commands, ESP uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESP operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESP system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

## DIAGNOSIS AND TESTING - ANTILOCK BRAKING SYSTEM

The ABS brake system performs several self-tests every time the ignition switch is turned on and the vehicle is driven. The ABM monitors the systems input and output circuits to verify the system is operating correctly. If the on board diagnostic system senses that a circuit is malfunctioning the system will set a trouble code in its memory.

**NOTE: An audible noise may be heard during the self-test. This noise should be considered normal.**

**NOTE: The scan tool is used to diagnose the ABS system. For additional information refer to the Electrical, Electronic Control Modules section.**

## STANDARD PROCEDURE - ABS BRAKE BLEEDING

ABS system bleeding requires conventional bleeding methods plus use of the DRB scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids. A second base brake bleeding procedure is then required to remove any air remaining in the system.

1. Perform base brake bleeding, (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
2. Connect scan tool to the Data Link Connector.
3. Select ANTILOCK BRAKES, followed by MISCELLANEOUS, then ABS BRAKES. Follow the instructions displayed. When scan tool displays TEST COMPLETE, disconnect scan tool and proceed.
4. Perform base brake bleeding a second time, (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
5. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.

## SPECIFICATIONS

### TORQUE SPECIFICATIONS

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Hydraulic Control Unit Mounting Nuts (HCU) | 14.1 | — | 125 |
| Hydraulic Control Unit Brake Lines (HCU) | 20.3 | — | 180 |
| Antilock Brake Module Mounting Screws (ABM) | 1.8 | — | 16 |
| Wheel Speed Sensors Front Mounting Bolt | 13.5 | — | 120 |
| Wheel Speed Sensor Rear Mounting Bolt | 9 | — | 80 |
| Dynamics Sensor Nuts | 9 | — | 80 |

# ELECTRICAL

## DESCRIPTION

A wheel speed sensor is used at each wheel. The front sensors are mounted to the steering knuckles. The rear sensors are mounted at the outboard end of the axle. Tone wheels are mounted to the outboard ends of the front and rear axle shafts. The gear type tone wheel serves as the trigger mechanism for each sensor.

## OPERATION

The sensors convert wheel speed into a small digital signal. The ABM sends 12 volts to the sensors. The sensor has an internal magneto resistance bridge that alters the voltage and amperage of the signal circuit. This voltage and amperage is changed by magnetic induction when the toothed tone wheel passes the wheel speed sensor. This digital signal is sent to the ABM. The ABM measures the voltage and amperage of the digital signal for each wheel.

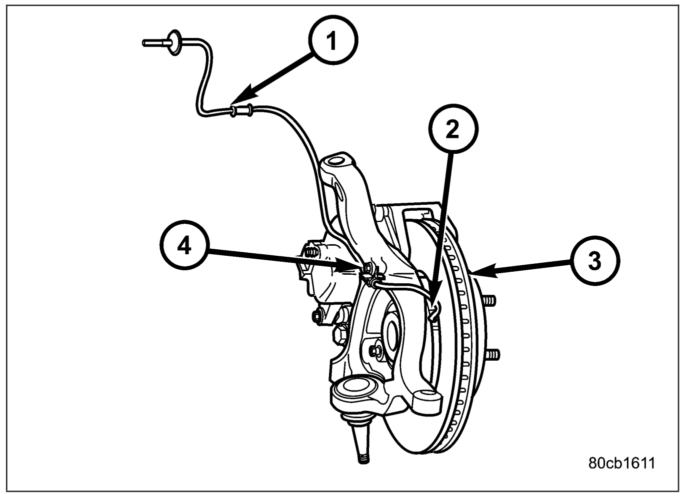
# SENSOR-WHEEL SPEED-FRONT

## REMOVAL

1. Disconnect the front wheel speed sensor wire connector that is located on the inboard side of the respective wheel house.
2. Raise and support the vehicle.
3. Remove the tire and wheel assembly.
4. Remove the caliper adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).

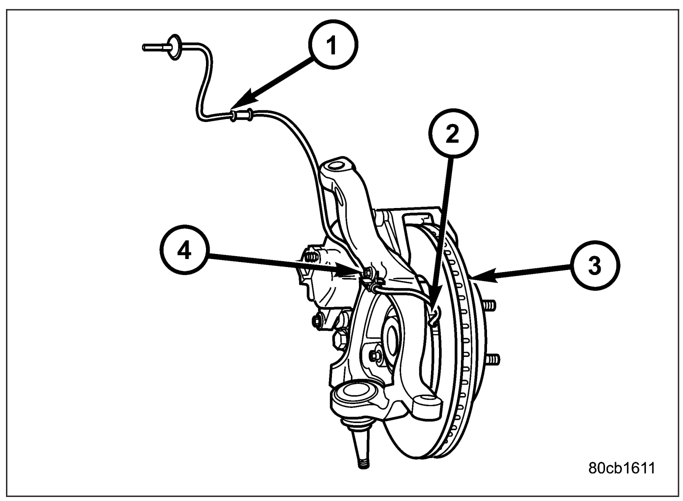
**CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose with result. Provide a suitable support to hang the caliper securely.**

5. Remove the disc brake rotor (3). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
6. Remove the wheel speed sensor mounting bolt to the hub.
7. Remove the wheel speed sensor wire from the hub/bearing.
8. Remove the wheel speed sensor wire hold down (4) from the knuckle.
9. Remove the wheel speed sensor wire (1) thru the wheel well.
10. Remove the wheel speed sensor (2) from the vehicle.



## INSTALLATION

1. Install the wheel speed sensor (2) to the vehicle.
2. Install the wheel speed sensor wire (1) thru the wheel well.
3. Install the wheel speed sensor wire (1) to the hub/bearing.
4. Install the wheel speed sensor wire hold down (4) to the knuckle.
5. Install the wheel speed sensor mounting bolt to the hub. Tighten the mounting bolt to 13.5 N·m (120 in. lbs.).
6. Install the disc brake rotor (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

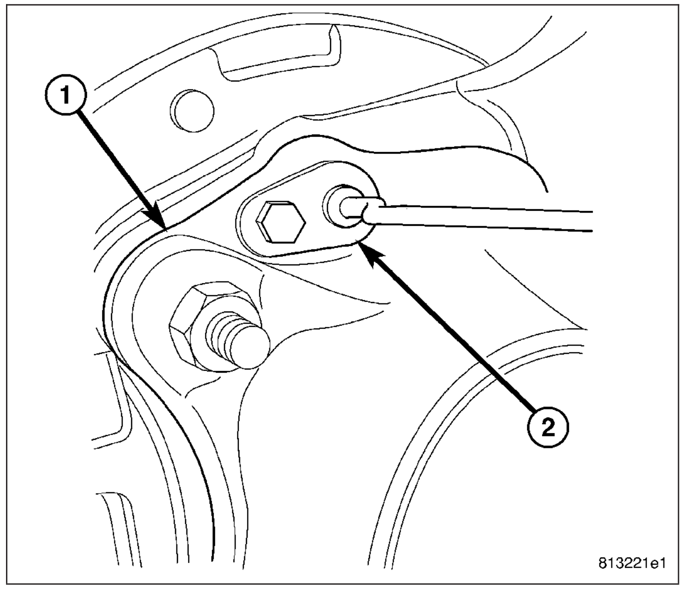


7. Install the disc brake caliper adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).
8. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
9. Reconnect the front wheel speed sensor wire connector to the inboard side of the wheel house being worked on.

# SENSOR- WHEEL SPEED-REAR

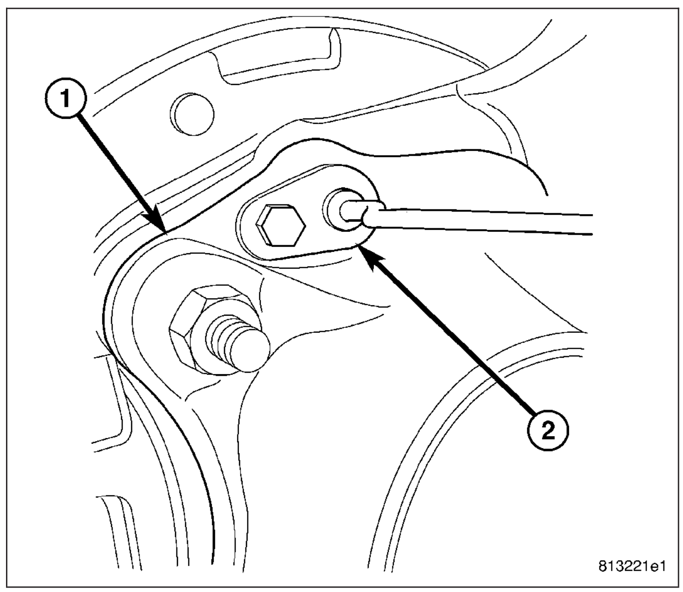
## REMOVAL

1. Raise and support the vehicle.
2. Remove the wheel speed sensor mounting bolt (2) from the rear support plate (1).
3. Remove the wheel speed sensor from the support plate (1).
4. Disconnect the wheel speed sensor electrical connector.



## INSTALLATION

1. Insert the wheel speed sensor (2) through the support plate (1).
2. Tighten the wheel speed sensor bolt (2) to 12-14 N·m (106-124 in. lbs.).
3. Secure the wheel speed sensor wire to the routing clips. Verify that the sensor wire is secure and clear of the rotating components.
4. Reconnect the wheel speed sensor electrical connector.
5. Lower the vehicle.

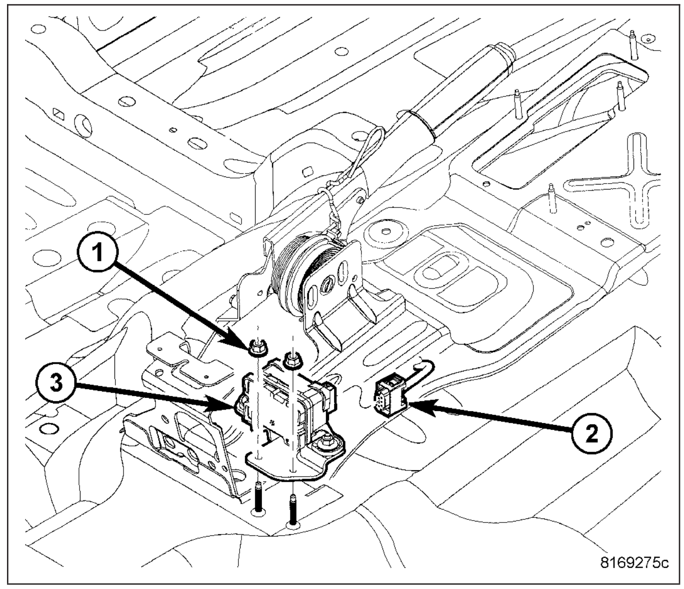


# SENSOR-DYNAMICS

## DESCRIPTION

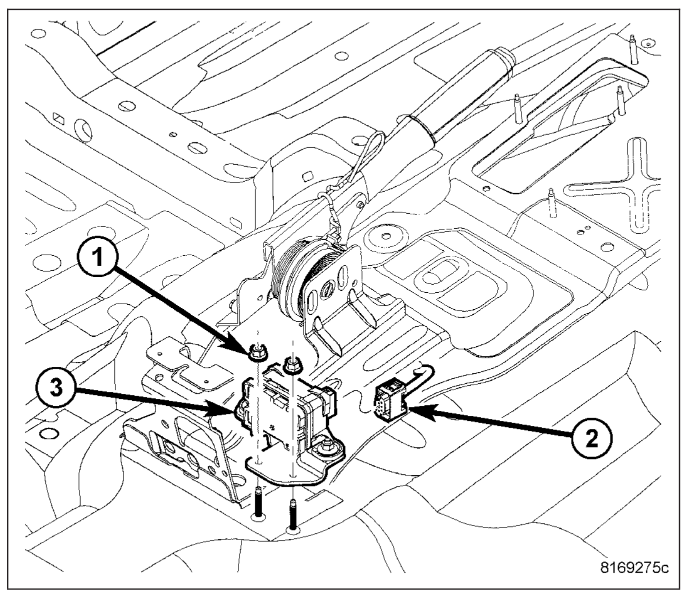
The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor (3). The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor (3) must be replaced when necessary.



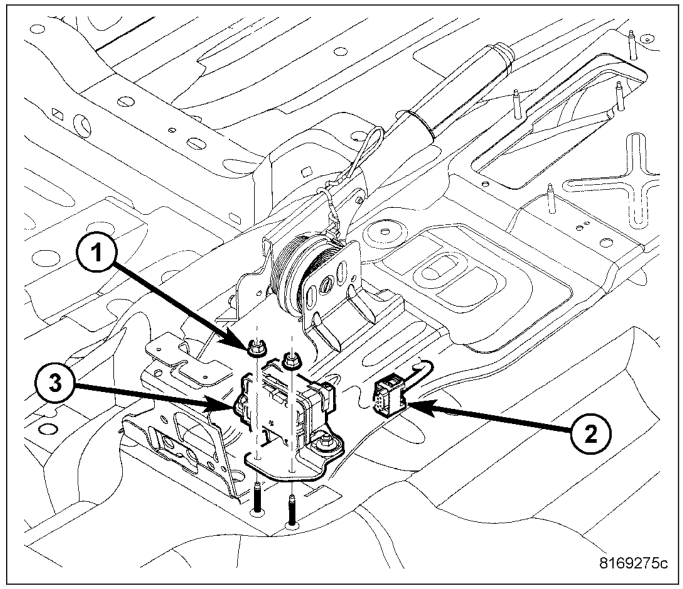
## REMOVAL

1. Remove the center console (Refer to 23 - BODY/ INTERIOR/FLOOR CONSOLE - REMOVAL).
2. Disconnect electrical connector (2) from the dynamics sensor (3).
3. Remove the two nuts (1) securing the sensor to the floor.
4. Remove the sensor (3).



## INSTALLATION

1. Install the dynamics sensor (3) to the vehicle.
2. Install the electrical connector (2) making sure that the connector is fully seated into the sensor (3)
3. Install the two retaining nuts (1) and tighten to 9 N·m (80 in. lbs.).
4. Install the floor console.



# SENSOR-STEERING ANGLE

## DESCRIPTION

**NOTE: Steering angle sensor is part of the airbag clockspring and is not serviced separately from the clock-spring.**

Under transient cornering conditions the lateral acceleration sensor does not measure the true sway force on the car. In order to compensate for this the system uses the driver's steering command (Steering angle sensor) and vehicle speed to estimate the true sway force. This signal is matched with the lateral acceleration sensor signal to ensure a significantly-reduced transient sway of the vehicle body.

## REMOVAL

**NOTE: Steering angle sensor is part of the airbag clockspring and is not serviced separately from the clock-spring.**

1. For removal of the steering angle sensor (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

## INSTALLATION

**NOTE: Steering angle sensor is part of the airbag clockspring and is not serviced separately from the clock-spring.**

1. For installation of the steering angle sensor (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

# HCU (HYDRAULIC CONTROL UNIT)

## DESCRIPTION

The HCU consists of a valve body, pump motor, and wire harness.

## OPERATION

Accumulators in the valve body store extra fluid released to the system for ABS mode operation. The pump provides the fluid volume needed and is operated by a DC type motor. The motor is controlled by the ABM.

The valves modulate brake pressure during antilock braking and are controlled by the ABM.

The HCU provides three channel pressure control to the front and rear brakes. One channel controls the rear wheel brakes in tandem. The two remaining channels control the front wheel brakes individually.

During antilock braking, the solenoid valves are opened and closed as needed. The valves are not static. They are cycled rapidly and continuously to modulate pressure and control wheel slip and deceleration.

During normal braking, the HCU solenoid valves and pump are not activated. The master cylinder and power booster operate the same as a vehicle without an ABS brake system.

During antilock braking, solenoid valve pressure modulation occurs in three stages, pressure increase, pressure hold, and pressure decrease. The valves are all contained in the valve body portion of the HCU.

### PRESSURE DECREASE

The outlet valve is opened and the inlet valve is closed during the pressure decrease cycle.

A pressure decrease cycle is initiated when speed sensor signals indicate high wheel slip at one or more wheels. At this point, the ABM closes the inlet then opens the outlet valve, which also opens the return circuit to the accumulators. Fluid pressure is allowed to bleed off (decrease) as needed to prevent wheel lock.

Once the period of high wheel slip has ended, the ABM closes the outlet valve and begins a pressure increase or hold cycle as needed.

### PRESSURE HOLD

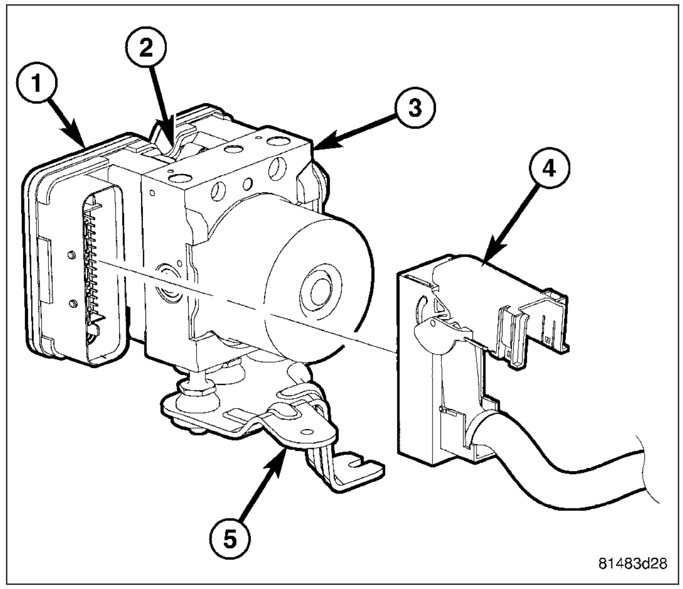
Both solenoid valves are closed in the pressure hold cycle. Fluid apply pressure in the control channel is maintained at a constant rate. The ABM maintains the hold cycle until sensor inputs indicate a pressure change is necessary.

### PRESSURE INCREASE

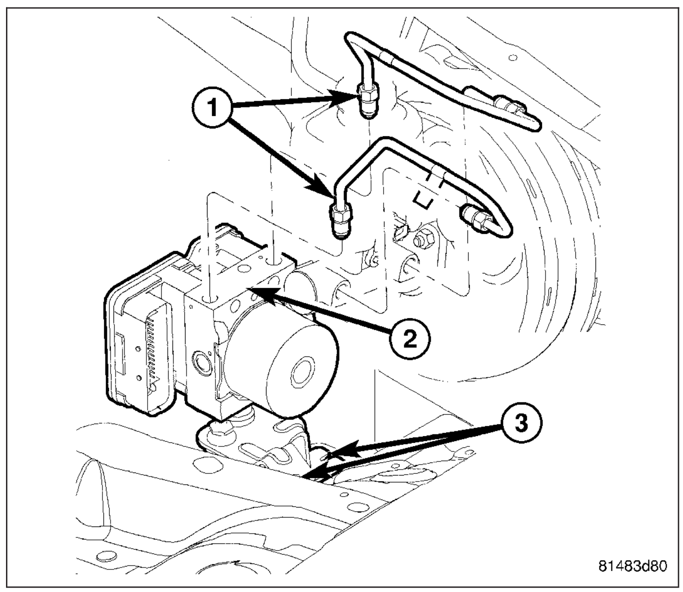
The inlet valve is open and the outlet valve is closed during the pressure increase cycle. The pressure increase cycle is used to counteract unequal wheel speeds. This cycle controls re-application of fluid apply pressure due to changing road surfaces or wheel speed.

## REMOVAL

1. Install prop rod on the brake pedal to keep pressure on the brake system.
2. Remove negative battery cable from the battery.
3. Pull up on the ABM harness connector release (4) and remove connector.

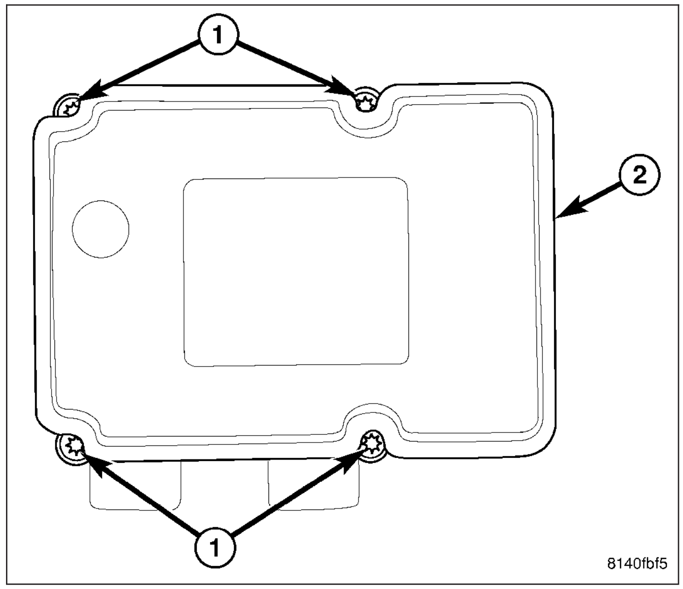


4. Remove brake lines (1) from the ABM (2).
5. Remove ABM (2) mounting nuts (3) and remove ABM(2).

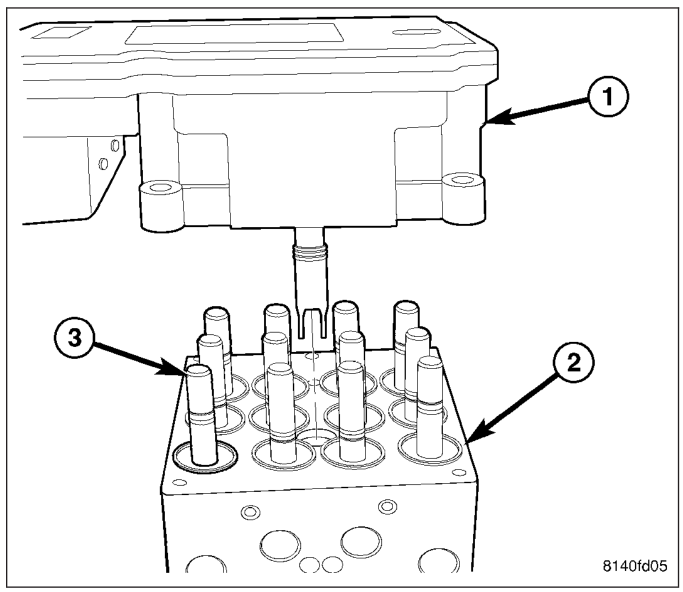


## DISASSEMBLY

1. Remove the four screws (1) attaching the ABM module to the HCU (2).



2. Separate the ABM module (1) from the HCU (2).

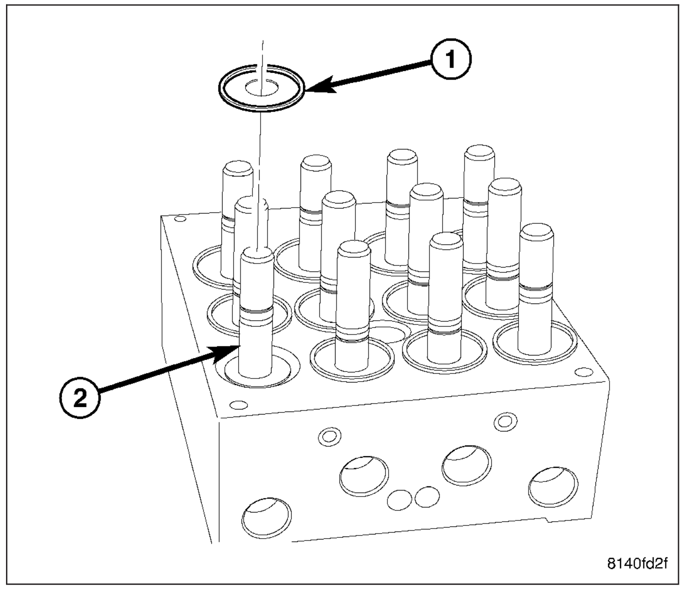


## ASSEMBLY

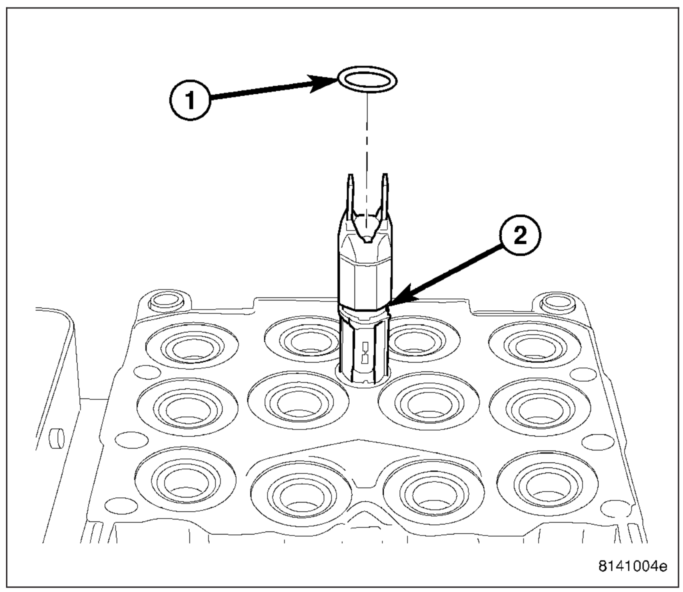
1. Clean any debris off the mating surfaces of the HCU and ABM module.

**CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.**

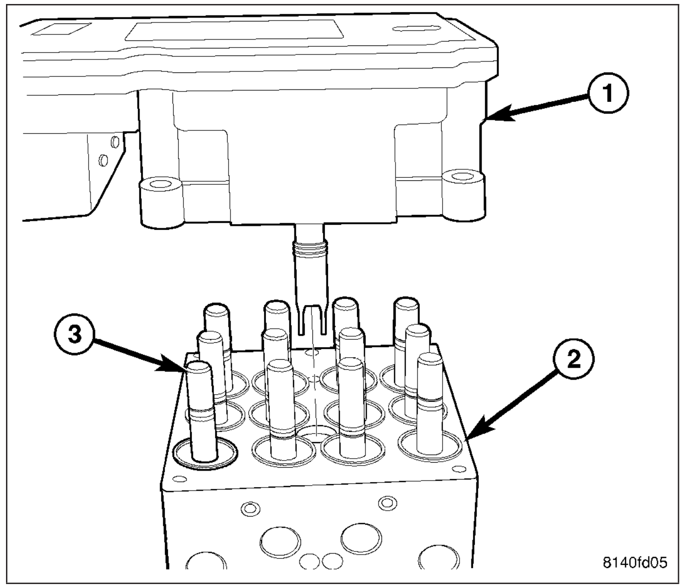
2. If the seals on the components are not new, they must be replaced. Each of the solenoid valve stem seals (1) must be replaced **do not reuse solenoid valve stem seals**.



3. The pump/motor connector O-ring (1) should also be replaced if not new



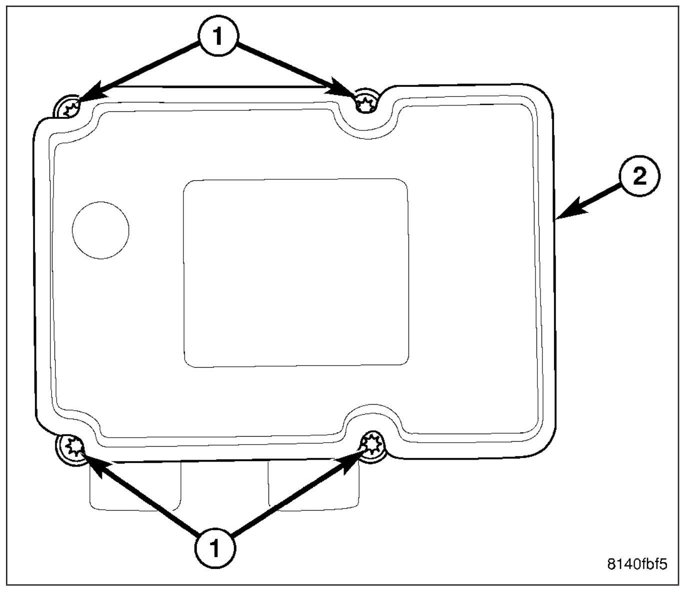
4. Align components and install the ABM module on the HCU.
5. Install the four screws attaching the ABM module to the HCU. Tighten the mounting screws to 2 N·m (17 in. lbs.) torque.
6. If the mounting bracket needs to be installed, install the mounting pins in the HCU as necessary and tighten to 11 N·m (97 in. lbs.) torque. Insert the mounting pins into the grommets mounted in the bracket, then install the single mounting bolt. Tighten the mounting bolt to 11 N·m (97 in. lbs.) torque.
7. Install the HCU in the vehicle (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - INSTALLATION).

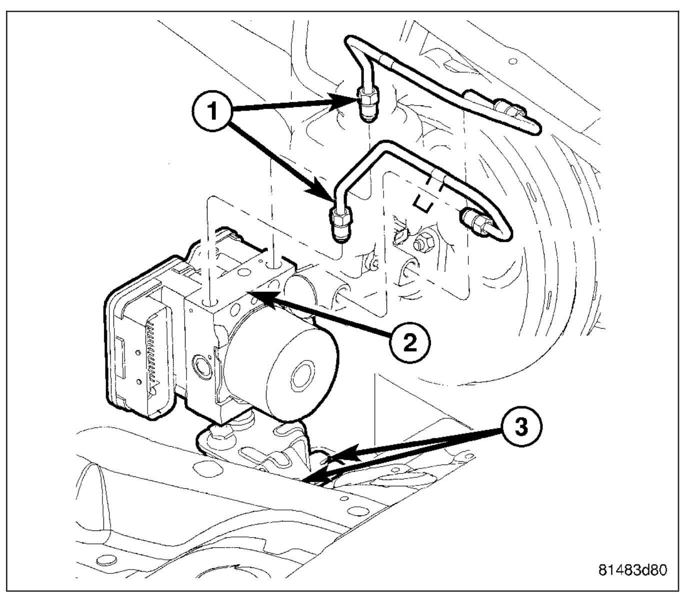


## INSTALLATION

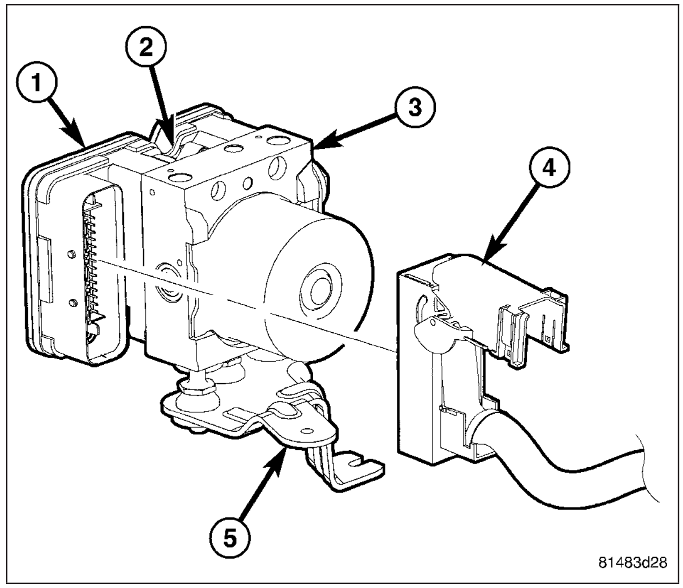
**NOTE: If the ABM module is being replaced with a new ABM module it must be reprogrammed with the use of a scan tool.**

1. Install ABM (2) on the mounting studs (3).
2. Install mounting nuts. Tighten to 14.1 N·m (125 in. lbs.).
3. Install brake lines (1) to the ABM (2) and tighten to 20 N·m (180 in. lbs.) .





4. Install wiring harness connector (4) to the ABM (3) and push down on the release to secure the connector.
5. Install negative battery cable to the battery.
6. Bleed ABS brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).



# CLUTCH

## TABLE OF CONTENTS

# CLUTCH

## WARNING

**WARNING: Exercise care when servicing clutch components. Factory installed clutch discs do not contain asbestos fibers. Dust and dirt on clutch parts may contain asbestos fibers from aftermarket components. Breathing excessive concentrations of these fibers can cause serious bodily harm. Wear a respirator during service and never clean clutch components with compressed air or with a dry brush. Either clean the components with water dampened rags or use a vacuum cleaner specifically designed to remove asbestos fibers and dust. Do not create dust by sanding a clutch discs. Replace the disc if the friction material is damaged. Dispose of all dust and dirt containing asbestos fibers in sealed bags or containers. This will minimize exposure to yourself and to others. Follow all recommended safety practices prescribed by the occupational safety and health administration (OSHA) and the environmental safety agency (EPA), for the handling and disposal of products containing asbestos. Failure to follow these instructions may result in personal injury or death.**

## DIAGNOSIS AND TESTING

## CLUTCH

Drive the vehicle at normal speeds. Shift the transmission through all gear ranges and observe clutch action. If the clutch chatters, grabs, slips or does not release properly, remove and inspect the clutch components. If the problem is noise or hard shifting, further diagnosis may be needed as the transmission or another driveline component may be at fault.

**NOTE: Vehicles equipped with a Dual Mass Flywheel may produce a rattle when the engine is shut off. This noise is considered normal.**

### CLUTCH CONTAMINATION

Fluid contamination is a frequent cause of clutch malfunctions. Oil, water or clutch fluid on the clutch disc and pressure plate surfaces will cause chatter, slip and grab. Inspect components for oil, hydraulic fluid or water/road splash contamination.

Oil contamination indicates a leak at either the rear main seal or transmission input shaft. Clutch fluid leaks are usually from damaged slave cylinder push rod seals. Heat buildup caused by slippage between the pressure plate, disc and flywheel can bake the oil residue onto the components. The glaze-like residue ranges in color from amber to black.

Road splash contamination is dirt/water entering the clutch housing due to loose bolts, housing cracks. Driving through deep water puddles can force water/road splash into the housing through such openings.

### IMPROPER RELEASE OR CLUTCH ENGAGEMENT

Clutch release or engagement problems are caused by wear or damage clutch components. A visual inspection of the release components will usually reveal the problem part.

Release problems can result in hard shifting and noise. Look for leaks at the clutch cylinders and interconnecting line and loose slave cylinder bolts. Also worn/loose release fork, pivot stud, clutch disc, pressure plate or release bearing.

Engagement problems can result in slip, chatter/shudder and noisy operation. The causes may be clutch disc contamination, wear, distortion or flywheel damage. Visually inspect to determine the actual cause of the problem.

### CLUTCH MISALIGNMENT

Clutch components must be in proper alignment with the crankshaft and transmission input shaft. Misalignment caused by excessive runout or warpage of any clutch component will cause grab, chatter and improper clutch release.

## PRESSURE PLATE AND DISC RUNOUT

Check the clutch disc before installation. Axial (face) runout of a **new** disc should not exceed 0.50 mm (0.020 in.). Measure runout about 6 mm (1/4 in.) from the outer edge of the disc facing. Obtain another disc if runout is excessive.

Check condition of the clutch before installation. A warped cover or diaphragm spring will cause grab and incomplete release or engagement. Be careful when handling the cover and disc. Impact can distort the cover, diaphragm spring, release fingers and the hub of the clutch disc.

Use an alignment tool when positioning the disc on the flywheel. The tool prevents accidental misalignment which could result in cover distortion and disc damage.

A frequent cause of clutch cover distortion (and consequent misalignment) is improper bolt tightening.

## FLYWHEEL RUNOUT

Check flywheel runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm (0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator. Mount the indicator on a stud installed in place of one of the flywheel bolts.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening
- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Flywheel machining is not recommended. The flywheel clutch surface is machined to a unique contour and machining will negate this feature. Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with surface grinding equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended.** Replace the flywheel if scoring is severe and deeper than 0.076 mm (0.003 in.). Excessive stock removal can result in flywheel cracking or warpage after installation; it can also weaken the flywheel and interfere with proper clutch release.

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar Lock And Seal or equivalent. Tighten flywheel bolts to specified torque only. Overtightening can distort the flywheel hub causing runout.

## DIAGNOSIS CHART

The diagnosis charts Diagnosis Chart describe common clutch problems, causes and correction. Conditions, causes and corrective action are outlined in the indicated columns.

**Diagnosis Chart**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| Disc facing worn out | 1. Normal wear. | 1. Replace cover and disc. |
| | 2. Driver frequently rides (slips) the clutch. Results in rapid overheating and wear. | 2. Replace cover and disc. |
| | 3. Insufficient clutch cover diaphragm spring tension. | 3. Replace cover and disc. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| Clutch disc facing contaminated with oil, grease, or clutch fluid. | 1. Leak at rear main engine seal or transmission input shaft seal. | 1. Replace appropriate seal. |
| | 2. Excessive amount of grease applied to the input shaft splines. | 2. Remove grease and apply the correct amount of grease. |
| | 3. Road splash, water entering housing. | 3. Replace clutch disc. Clean clutch cover and reuse if in good condition. |
| | 4. Slave cylinder leaking. | 4. Replace hydraulic clutch linkage. |
| Clutch is running partially disengaged. | 1. Release bearing sticking or binding and does not return to the normal running position. | 1. Verify failure. Replace the release bearing and transmission front bearing retainer as necessary. |
| Flywheel below minimum thickness specification. | 1. Improper flywheel machining. Flywheel has excessive taper or excessive material removal. | 1. Replace flywheel. |
| Clutch disc, cover and/or diaphragm spring warped or distorted. | 1. Rough handling. Impact bent cover, spring, or disc. | 1. Replace disc or cover as necessary. |
| | 2. Improper bolt tightening procedure. | 2. Tighten clutch cover using proper procedure. |
| Facing on flywheel side of disc torn, gouged, or worn. | 1. Flywheel surface scored or nicked. | 1. Correct surface condition if possible. Replace flywheel and disc as necessary. |
| | 2. Clutch disc sticking or binding on transmission input shaft. | 2. Lubricate splines with high temperature grease. |
| Clutch disc facing burnt. Flywheel and cover pressure plate surfaces heavily glazed. | 1. Frequent operation under high loads or hard acceleration conditions. | 1. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause. |
| | 2. Driver frequently rides (slips) clutch. Results in rapid wear and overheating of disc and cover. | 2. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause. |
| Clutch disc binds on input shaft splines. | 1. Clutch disc hub splines damaged during installation. | 1. Clean, smooth, and lubricate hub splines if possible. Replace disc if necessary. |
| | 2. Input shaft splines rough, damaged, or corroded. | 2. Clean, smooth, and lubricate shaft splines if possible. Replace input shaft if necessary. |
| Clutch disc rusted to flywheel and/or pressure plate. | 1. Clutch not used for and extended period of time (e.g. long term vehicle storage). | 1. Sand rusted surfaces with 180 grit sanding paper. Replace clutch cover and flywheel if necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| Pilot bearing seized, loose, or rollers are worn. | 1. Bearing cocked during installation. | 1. Install and lubricate a new bearing. |
| | 2. Bearing defective. | 2. Install and lubricate a new bearing. |
| | 3. Bearing not lubricated. | 3. Install and lubricate a new bearing. |
| | 4. Clutch misalignment. | 4. Inspect clutch and correct as necessary. Install and lubricate a new bearing. |
| Clutch will not disengage properly. | 1. Low clutch fluid level. | 1. Replace hydraulic linkage assembly. |
| | 2. Clutch cover loose. | 2. Follow proper bolt tightening procedure. |
| | 3. Clutch disc bent or distorted. | 3. Replace clutch disc. |
| | 4. Clutch cover diaphragm spring bent or warped. | 4. Replace clutch cover. |
| | 5. Clutch disc installed backwards. | 5. Remove and install clutch disc correctly. |
| | 6. Release fork bent or fork pivot loose or damaged. | 6. Replace fork or pivot as necessary. |
| | 7. Clutch master or slave cylinder failure. | 7. Replace hydraulic linkage assembly. |
| Clutch pedal squeak. | 1. Pivot pin loose. | 1. Tighten pivot pin if possible. Replace clutch pedal if necessary. |
| | 2. Master cylinder bushing not lubricated. | 2. Lubricate master cylinder bushing. |
| | 3. Pedal bushings worn out or cracked. | 3. Replace and lubricate bushings. |
| Clutch master or slave cylinder plunger dragging or binding | 1. Master or slave cylinder components worn or corroded. | 1. Replace clutch hydraulic linkage assembly. |
| Release bearing is noisy. | 1. Release bearing defective or damaged. | 1. Replace release bearing. |
| Contact surface of release bearing damaged. | 1. Clutch cover incorrect or release fingers bent or distorted. | 1. Replace clutch cover and release bearing. |
| | 2. Release bearing defective or damaged. | 2. Replace the release bearing. |
| | 3. Release bearing misaligned. | 3. Check and correct runout of clutch components. Check front bearing sleeve for damage/ alignment. Repair as necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
| --- | --- | --- |
| Partial engagement of clutch disc. One side of disc is worn and the other side is glazed and lightly worn. | 1. Clutch pressure plate position incorrect. | 1. Replace clutch disc and cover. |
| | 2. Clutch cover, spring, or release fingers bent or distorted. | 2. Replace clutch disc and cover. |
| | 3. Clutch disc damaged or distorted. | 3. Replace clutch disc. |
| | 4. Clutch misalignment. | 4. Check alignment and runout of flywheel, disc, pressure plate, and clutch housing. Correct as necessary. |

# SPECIFICATIONS

## CLUTCH

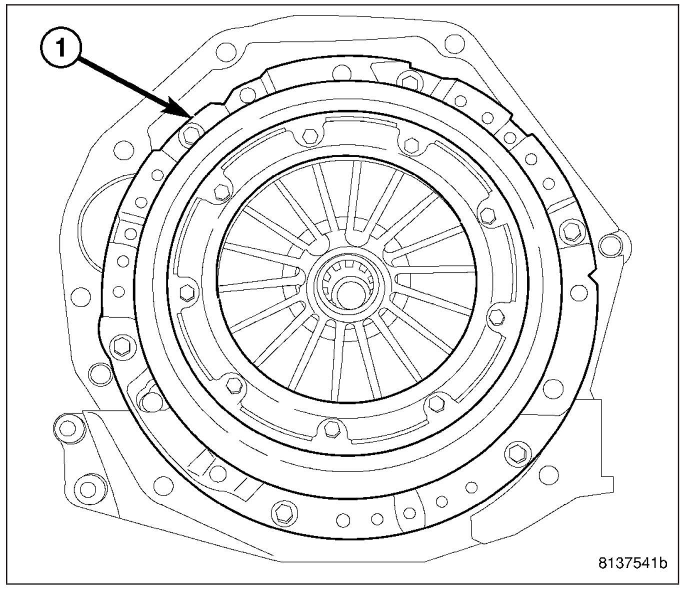
### TORQUE SPECIFICATIONS

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
| --- | --- | --- | --- |
| Pressure Plate Bolts - 3.7L | 50 | 37 | - |
| Pressure Plate Bolts - 2.5L Diesel | 54 | 40 | - |
| Clutch Cylinder Bolts | 23 | - | 200 |
| Flywheel Bolts - 3.7L | 81 | 60 | - |
| Flywheel Bolts - 2.5L Diesel | 45 | 33 | - |
| Master Cylinder Nuts | 38 | 28 | - |
| Slave Cylinder Nuts | 23 | 17 | - |
| Pedal Bracket Nuts | 39 | 29 | - |

# DISC-CLUTCH

## REMOVAL

1. Remove transmission.
2. Mark position of pressure plate (1) on flywheel with paint or a scriber for assembly reference, if clutch is not being replaced.
3. Loosen pressure plate bolts evenly and in rotation to relieve spring tension and avoid warping the plate.
4. Remove pressure plate bolts and pressure plate and disc.



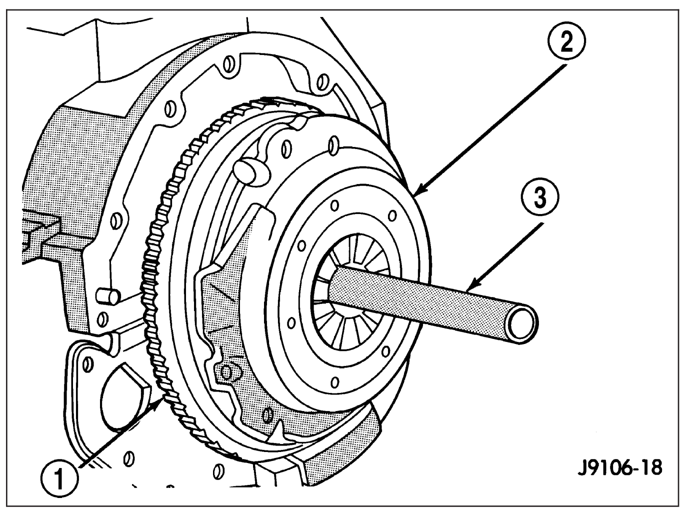
## INSTALLATION

## GAS ENGINES

1. Lightly scuff sand flywheel face with 180 grit emery cloth, then clean with a wax and grease remover.
2. Lubricate pilot bearing with Mopar high temperature bearing grease or equivalent.
3. Check runout and operation of **new** clutch disc.

**NOTE: Disc must slide freely on transmission input shaft splines.**

4. With the disc on the input shaft, check face runout with dial indicator. Check runout at disc hub 6 mm (1/4 in.) from outer edge of facing. Obtain another clutch disc if runout exceed 0.5 mm (0.020 in.).
5. Position clutch disc on flywheel with side marked flywheel against the flywheel.



**NOTE: If not marked, the flat side of disc hub goes towards the flywheel.**

6. Insert clutch alignment tool (3) through the clutch disc and into the pilot bearing.
7. Position clutch pressure plate (2) over disc and on the flywheel (1).
8. Install pressure plate bolts finger tight.

**CAUTION: Use only the factory bolts to mount the pressure plate. The bolts must be the correct size. If bolts are too short, there isn't enough thread engagement, if too long bolts interfere with the Dual Mass Flywheel.**

9. Tighten pressure plate bolts evenly and in rotation a few threads at a time.

**CAUTION: The bolts must be tightened evenly and to specified torque. Failure to follow these instructions will distort the pressure plate.**

10. Tighten pressure plate bolts 50 N·m (37 ft. lbs.).
11. Apply light coat of Mopar high temperature bearing grease or equivalent to clutch disc hub and splines of transmission input shaft.

**CAUTION: Do not over lubricate shaft splines. This will result in grease contamination of disc.**

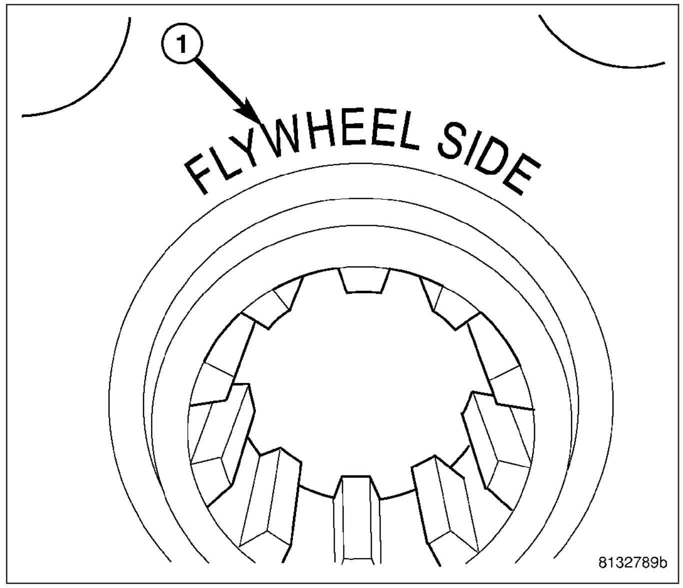
12. Install transmission.

## DIESEL ENGINE

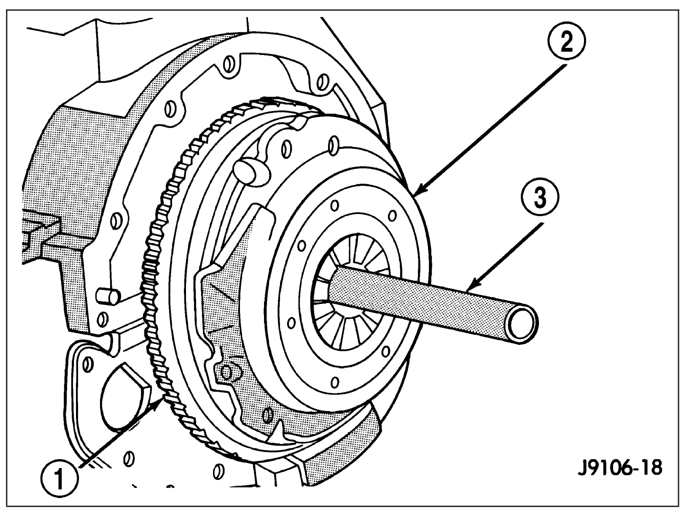
1. Lightly scuff sand flywheel face with 180 grit emery cloth, then clean with a wax and grease remover.
2. Lubricate pilot bearing with Mopar high temperature bearing grease or equivalent.
3. Check runout and operation of **new** clutch disc.

**NOTE: Disc must slide freely on transmission input shaft splines.**

4. With the disc on the input shaft, check face runout with dial indicator. Check runout at disc hub 6 mm (1/4 in.) from outer edge of facing. Obtain another clutch disc if runout exceed 0.5 mm (0.020 in.).
5. Position clutch disc on flywheel with side marked flywheel side (1) against the flywheel. If not marked, the flat side of disc hub goes towards the flywheel.



6. Insert clutch alignment tool (3) through the clutch disc and into the pilot bearing.
7. Position clutch pressure plate (2) over disc and on the flywheel (1).



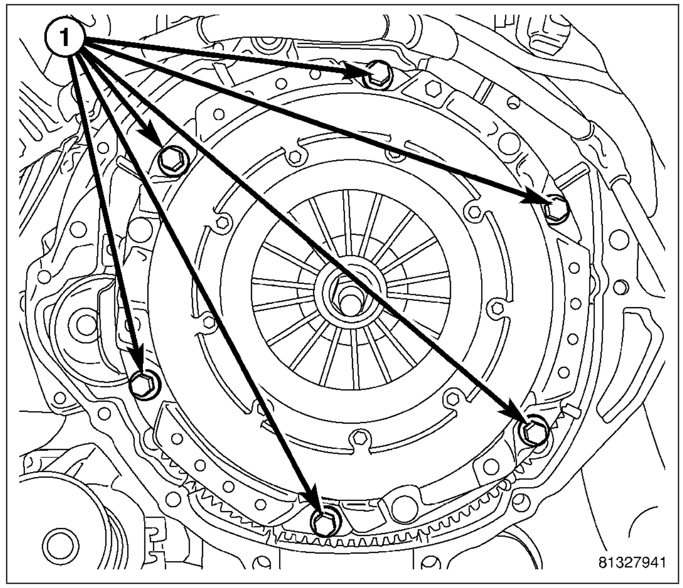
8. Install pressure plate bolts (1) finger tight.
9. Tighten pressure plate bolts evenly and in rotation a few threads at a time.

**CAUTION: The bolts must be tightened evenly and to specified torque. Failure to follow these instruction will distort the pressure plate.**

10. Tighten pressure plate bolts to 54 N·m (40 ft. lbs.).
11. Apply light coat of Mopar® high temperature bearing grease or equivalent to clutch disc hub and splines of transmission input shaft.

**CAUTION: Do not over lubricate shaft splines. Failure to follow these instruction will contamination of disc.**

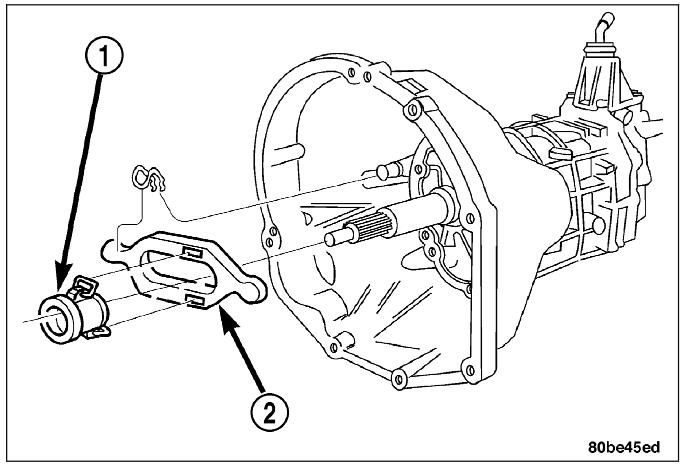
12. Install transmission.



# BEARING-CLUTCH RELEASE

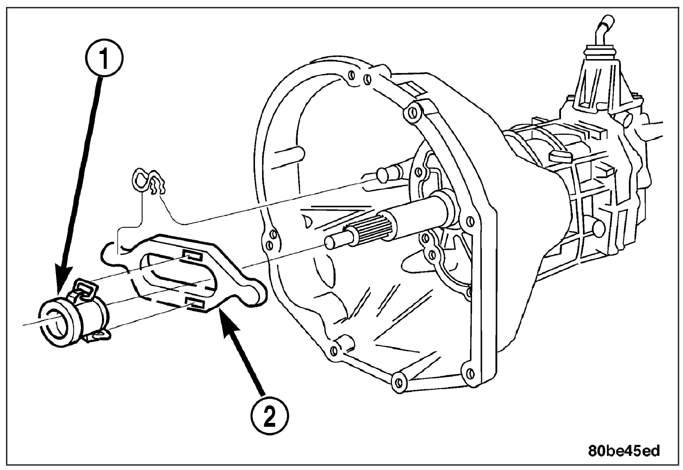
## REMOVAL

1. Remove transmission.
2. Disconnect release bearing (1) from release fork (2) and remove the bearing.
3. Inspect bearing slide surface of transmission front bearing retainer. Replace retainer if slide surface is scored, worn, or cracked.
4. Inspect release fork and fork pivot. Be sure pivot is secure and in good condition. Be sure fork is not distorted or worn. Replace release fork retainer spring if bent or damaged.



## INSTALLATION

1. Lubricate crankshaft pilot bearing with Mopar™ high temperature bearing grease or equivalent. Apply grease to end of long shank, small diameter flat blade screwdriver. Then insert tool through clutch disc hub to reach bearing.
2. Lubricate input shaft splines, bearing retainer slide surface, fork pivot and release fork pivot surface.
3. Install new release bearing (1) and secured to release fork (2).
4. Install transmission.

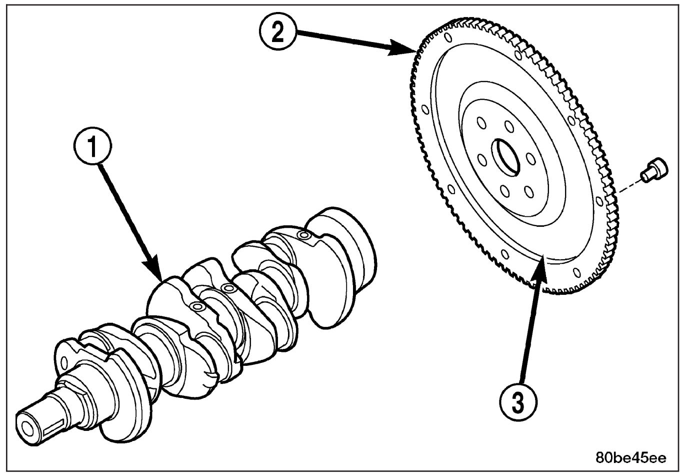


# FLYWHEEL

## DESCRIPTION

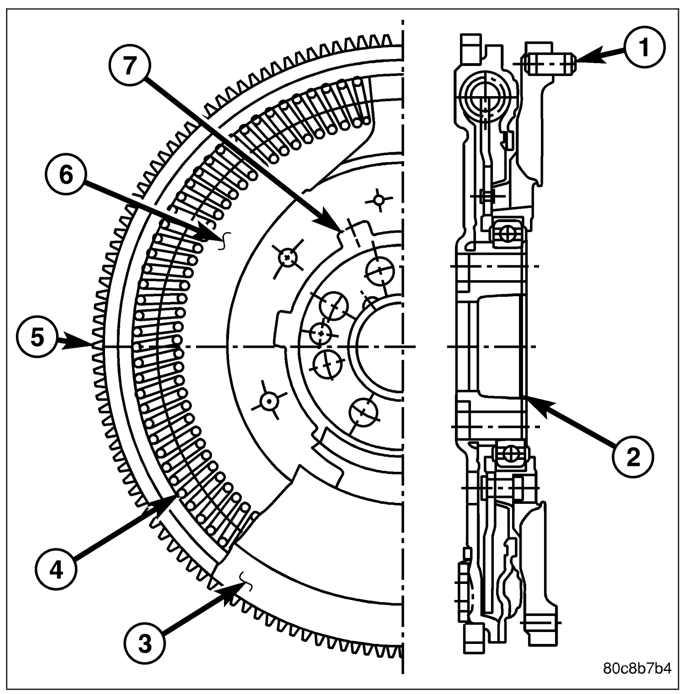
### STANDARD FLYWHEEL

The standard flywheel is used on the 3.7L engine. The flywheel (3) is a heavy plate bolted to the rear of the crankshaft (1). The flywheel incorporates the ring gear (2) around the outer circumference to mesh with the starter to permit engine cranking. The rear face of the flywheel serves as the driving member to the clutch disc.



### DUAL MASS FLYWHEEL

The Dual Mass Flywheel is used on the 2.8L Diesel. The flywheel incorporates the ring gear (5) around the outer circumference to mesh with the starter to permit engine cranking. The primary flywheel (6) side is bolted to the crankshaft. The secondary flywheel (3) side serves as the driving member to the clutch disc. Internal springs (4) between the flywheels are use to dampen energy. The Dual Mass Flywheel is serviced as an assembly only and should never be taken apart.



## DIAGNOSIS AND TESTING

## FLYWHEEL

Check flywheel runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm (0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator. Mount the indicator on a stud installed in place of one of the flywheel bolts.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening

- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Flywheel machining is not recommended. The flywheel clutch surface is machined to a unique contour and machining will negate this feature. Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with surface grinding equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended.** Replace the flywheel if scoring is severe and deeper than 0.076 mm (0.003 in.). Excessive stock removal can result in flywheel cracking or warpage after installation; it can also weaken the flywheel and interfere with proper clutch release.

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar Lock And Seal or equivalent. Tighten flywheel bolts to specified torque only. Overtightening can distort the flywheel hub causing runout.

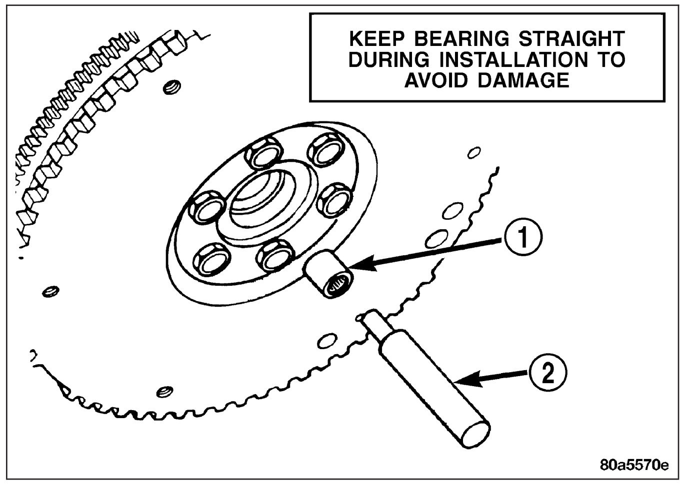
# BEARING-PILOT

## REMOVAL

1. Remove transmission.
2. Remove pressure plate and clutch disc.
3. Remove pilot bearing with an internal (blind hole) puller.

## INSTALLATION

1. Lubricate new bearing with Mopar high temperature bearing grease or equivalent.
2. Start new pilot bearing (1) into crankshaft by hand. Then seat bearing with clutch alignment tool (2).
3. Install clutch disc and pressure plate.
4. Install transmission.

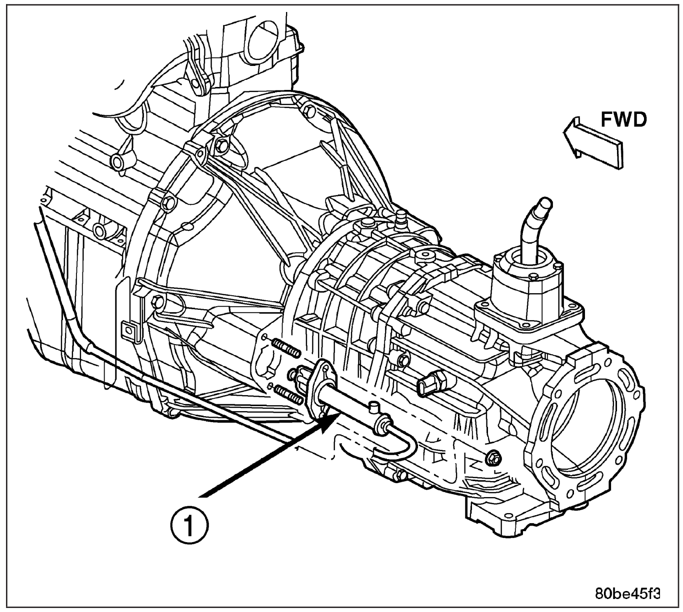


# LINKAGE

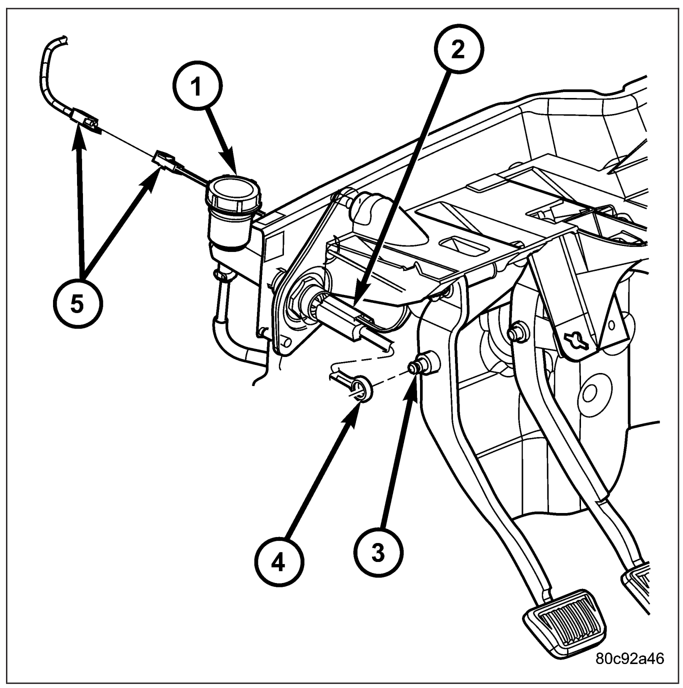
## REMOVAL

**NOTE: The clutch master cylinder, slave cylinder and connecting line are serviced as an assembly only. The linkage components cannot be overhauled or serviced separately. The cylinders and connecting line are sealed units.**

1. With vehicle in neutral, position vehicle on hoist.
2. Remove slave cylinder (1) from clutch housing.
3. Disengage clutch fluid line from body clips, if applicable.
4. Lower vehicle.

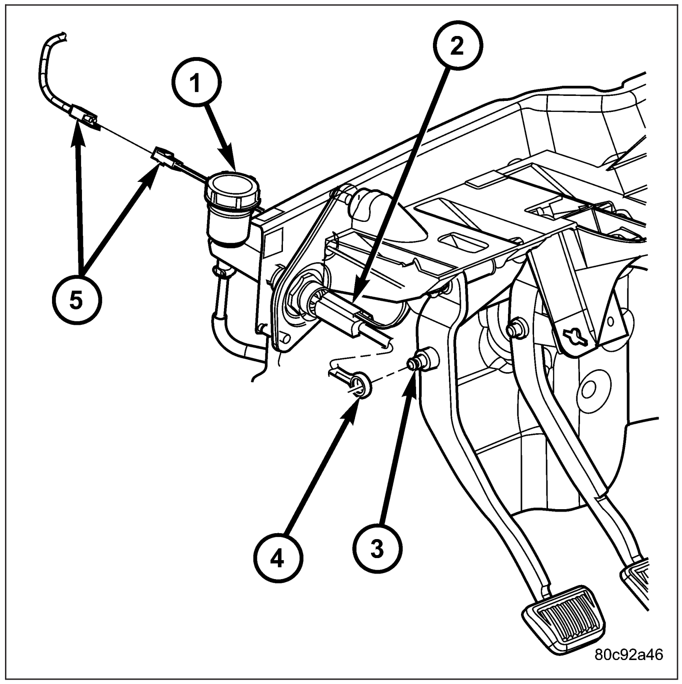


5. Tighten clutch master cylinder (1) reservoir cap to avoid spilling fluid.
6. Remove clutch master cylinder attaching nuts.
7. Disengage clutch master cylinder actuator (4) from pivot pin (3) on pedal arm.
8. Disconnect clutch interlock safety switch wires (5).
9. Remove clutch hydraulic linkage through engine compartment.



## INSTALLATION

**NOTE: The clutch master cylinder, slave cylinder and connecting line are serviced as an assembly only. The linkage components cannot be overhauled or serviced separately. The cylinders and connecting line are sealed units.**



1. Tighten master cylinder reservoir cap to avoid spills.
2. Position clutch linkage components in vehicle. Work connecting line and slave cylinder downward past engine and adjacent to clutch housing.
3. Position clutch master cylinder (1) on dash panel.
4. Attach clutch master cylinder actuator (4) to pivot pin (3) on clutch pedal.
5. Install clutch master cylinder nuts and tighten to 38 N·m (28 ft. lbs.).
6. Raise vehicle.
7. Insert slave cylinder push rod through clutch housing opening and securely engaged into release lever.
8. Install slave cylinder nuts and tighten to 23 N·m (17 ft. lbs.).
9. Secure clutch fluid line in body and transmission clips.
10. Connect clutch interlock safety switch wires (5).

# CYLINDER-MASTER

## INSPECTION

The clutch fluid reservoir, master cylinder, slave cylinder and fluid lines are pre-filled with fluid at the factory during assembly operations.

The hydraulic system should not require additional fluid under normal circumstances. **The reservoir fluid level will actually increase as normal clutch wear occurs. Avoid overfilling or removing fluid from the reservoir.**

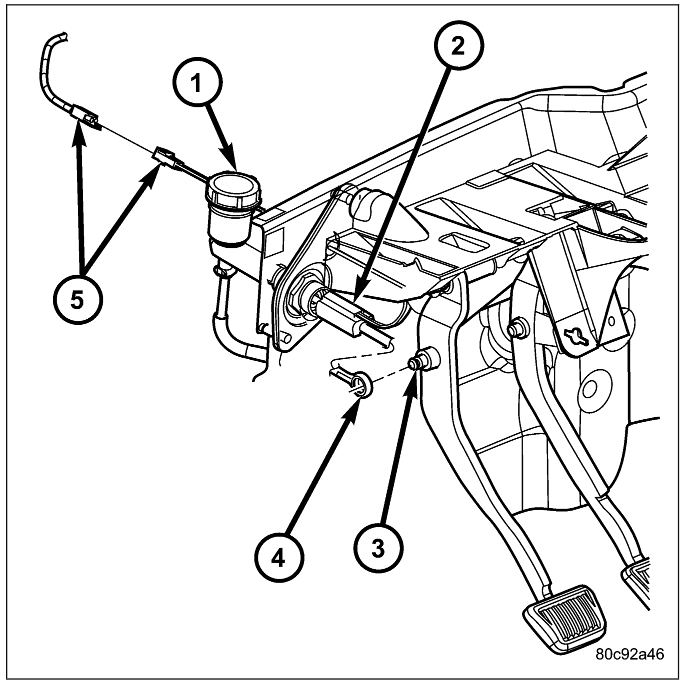
Clutch fluid level is checked at the master cylinder reservoir. An indicator ring is provided on the outside of the reservoir. With the cap and diaphragm removed, fluid level should not be above indicator ring.

To avoid contaminating the hydraulic fluid during inspection, wipe reservoir and cover clean before removing the cap.

# PEDAL-CLUTCH

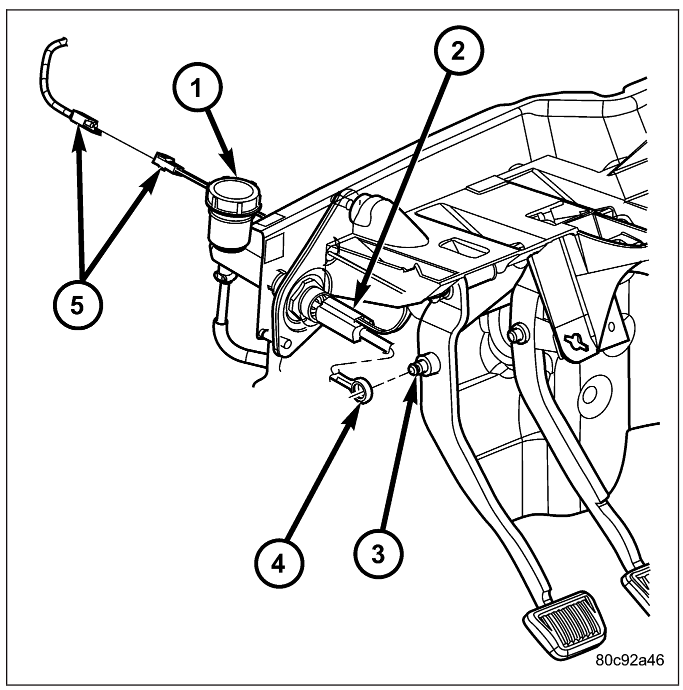
## REMOVAL

1. Remove steering column lower cover and knee blocker for access.
2. Disconnect clutch pedal position switch wires.
3. Disengage bushing lock tabs attaching clutch master cylinder actuator (4) to pedal pivot (3).
4. Remove nuts attaching pedal and bracket to dash panel and upper cowl support.
5. Separate pedal assemble from vehicle.



## INSTALLATION

1. Place clutch pedal and bracket over studs on dash panel and cowl support.
2. Install pedal and bracket to dash panel nuts and tighten to 39 N·m (29 ft. lbs.).
3. Install actuator (4) on brake pedal pivot (3).
4. Connect clutch pedal position switch wires (5).



# RELAY-CLUTCH SWITCH OVERRIDE

## DESCRIPTION

The clutch pedal position switch override relay is located in the Power Distribution Center (PDC). Refer to PDC cover label for location within PDC.

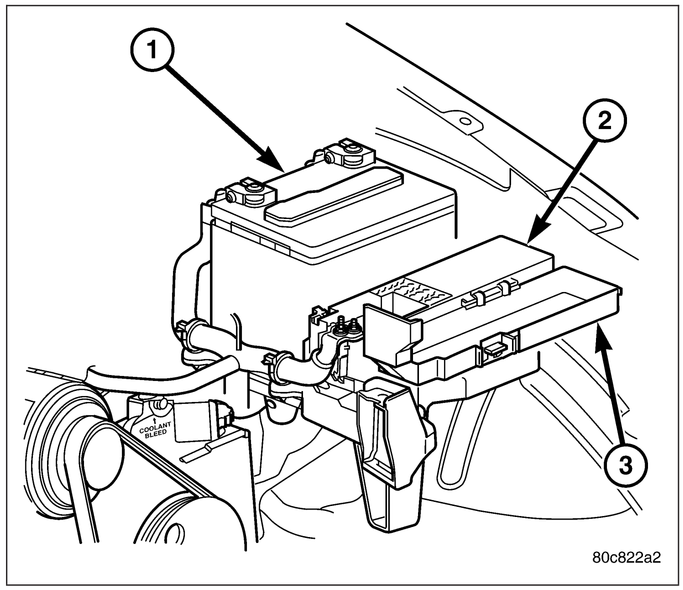
## OPERATION

The clutch pedal position switch override relay, inhibits operation of the clutch pedal position switch when the vehicle transfer case is in the four wheel drive low-range position. This enables the starter motor to operate without depressing the clutch pedal, for off-road applications. If Diagnostic Trouble Codes (DTC's) for the override relay or transfer case switch are stored, override relay will be inhibited.

## REMOVAL

**NOTE: Refer to label on PDC cover for relay location.**

1. Remove PDC (2) cover (3).
2. Remove relay from PDC.
3. Check relay and PDC terminals for:
   - Damage or corrosion
   - Pin height (all terminals should be same height)



## INSTALLATION

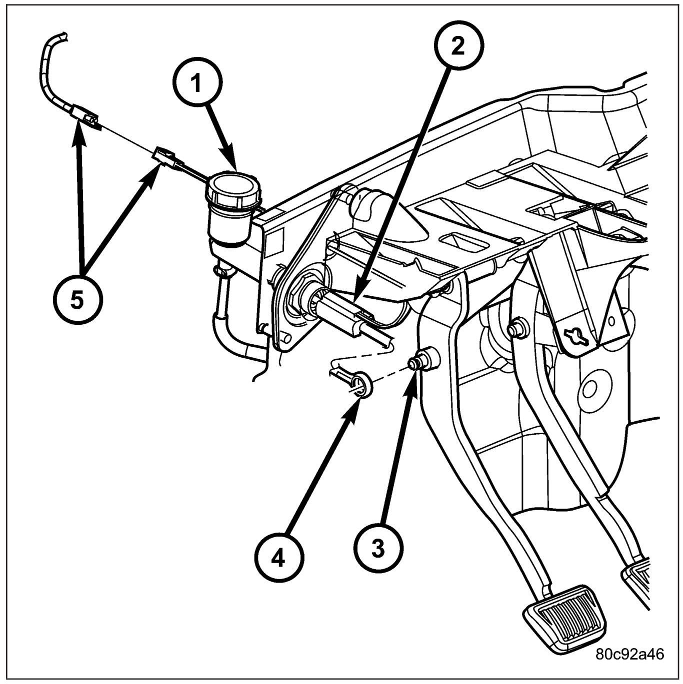
1. Install relay in PDC.
2. Install PDV cover.
3. Verify operation of relay.

# SWITCH-CLUTCH PEDAL POSITION

## DESCRIPTION

The clutch pedal position switch (2) is located under the instrument panel, attached to the clutch master cylinder (1) push rod. The wiring harness connection for the switch is in the engine compartment.

The clutch pedal position switch override relay is located in the Power Distribution Center (PDC). Refer to PDC cover label for location within PDC.



## OPERATION

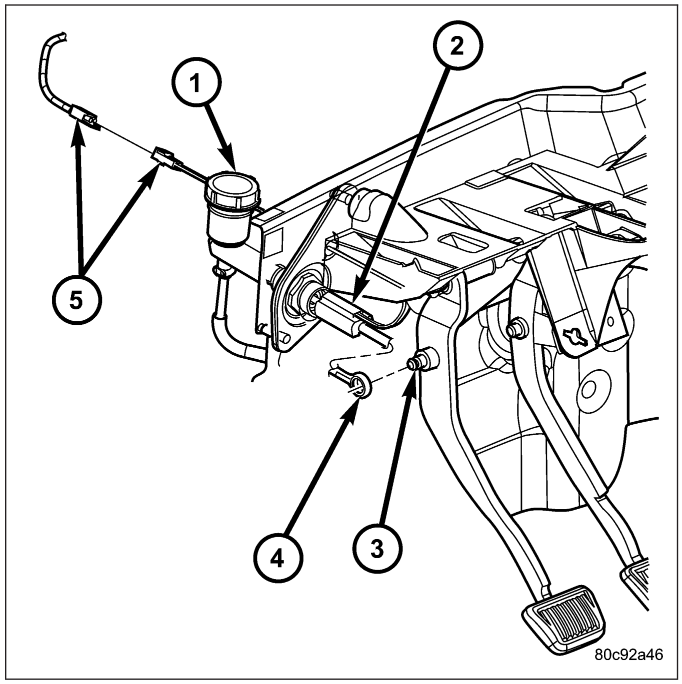
The clutch pedal position switch is used to prevent starter motor engagement unless the clutch pedal is depressed. An input from this switch is also used to either shut down/prevent operation of the speed control system when the clutch pedal is depressed.

**Four Wheel Drive Feature:** The clutch pedal position switch override relay, inhibits operation of the position switch when the vehicle transfer case is in the four wheel drive low-range position. This enables the starter motor to operate without depressing the clutch pedal, for off-road applications. If Diagnostic Trouble Codes (DTC's) for the override relay or transfer case switch are stored, override relay will be inhibited.

## DIAGNOSIS AND TESTING

## CLUTCH PEDAL POSITION SWITCH

1. Disconnect switch 2-wire connector (5) in engine compartment.
2. Check switch continuity with an ohmmeter while operating clutch pedal.
   - Pedal Depressed - Continuity
   - Pedal Released - No Continuity
3. If continuity is not present or always present, replace clutch master cylinder. Switch is not serviced separately.



# COOLING

## TABLE OF CONTENTS

# COOLING

## DESCRIPTION

### 3.7L ENGINE

The cooling system consists of the following items:

- 2 Speed electric cooling fan - Standard.
- 2 Speed electric cooling fan and mechanical engine fan with viscous clutch - Heavy duty cooling only
- Radiator
- Thermostat
- Combined coolant pressure bottle/overflow system with pressure cap
- Combination A/C/transmission oil cooler (if equipped with an automatic transmission)
- Coolant
- Water pump
- Hoses and hose clamps

### 2.8L DIESEL ENGINE

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

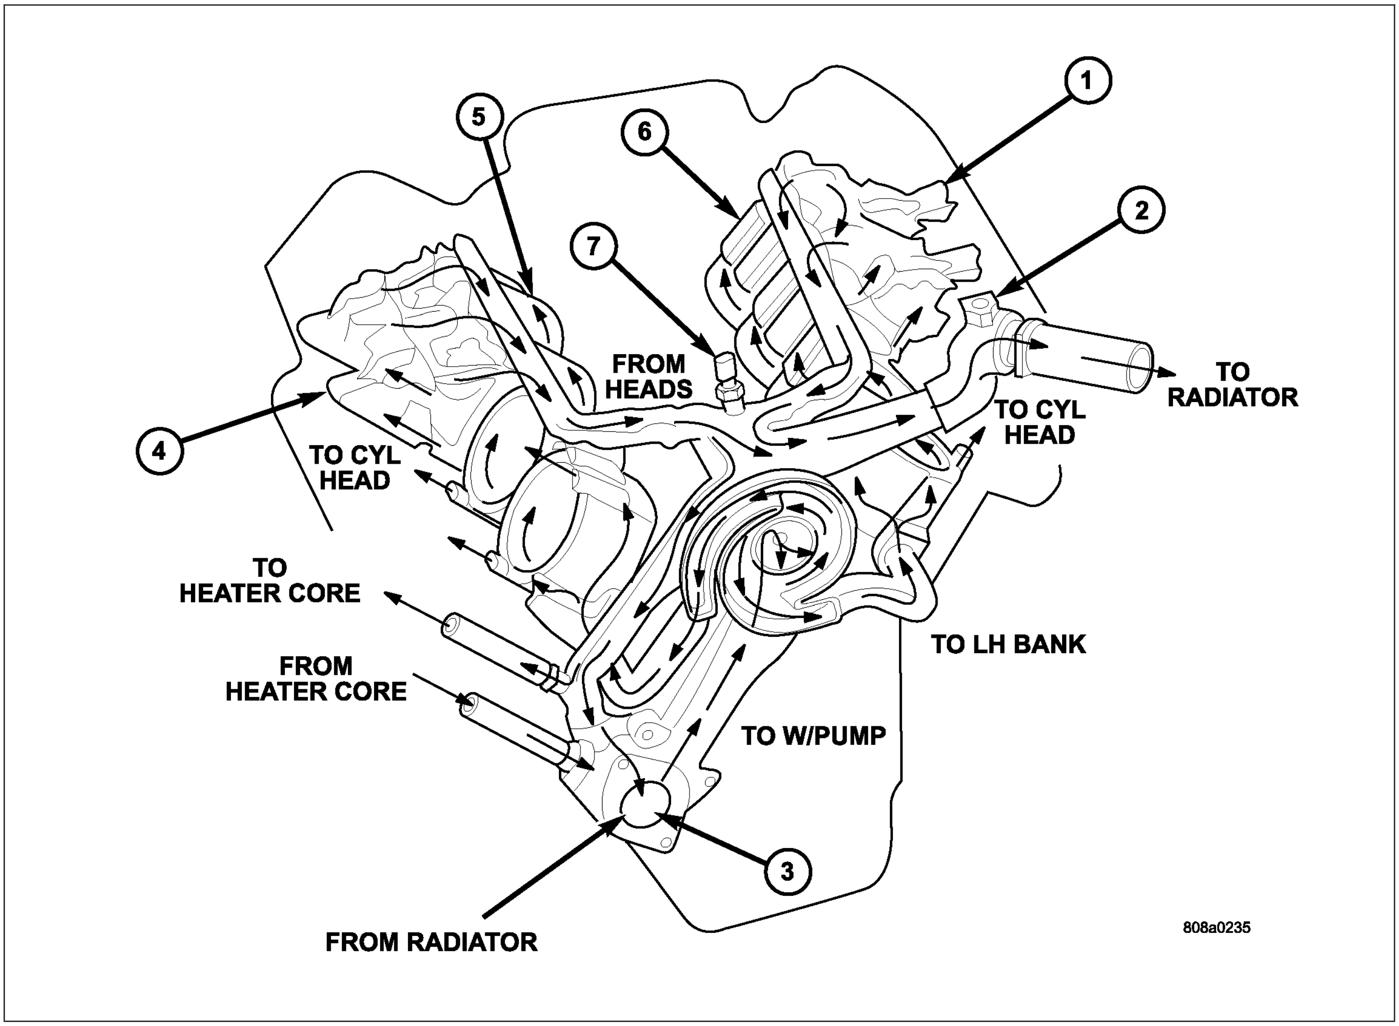
The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted, pressurized coolant tank using a pressure/vent cap is used.

#### COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Charge Air Cooler
- 2 Speed Electric Cooling Fan with an engine driven fan with viscous clutch
- A aluminum-core radiator with plastic side tanks
- A separate pressurized coolant tank
- Combined coolant pressure bottle with pressure cap plus an overflow system
- Fan shroud
- Thermostat
- Coolant
- Low coolant warning lamp
- Coolant temperature gauge
- Water pump
- Hoses and hose clamps

## COOLING SYSTEM ROUTING - 3.7L ENGINE



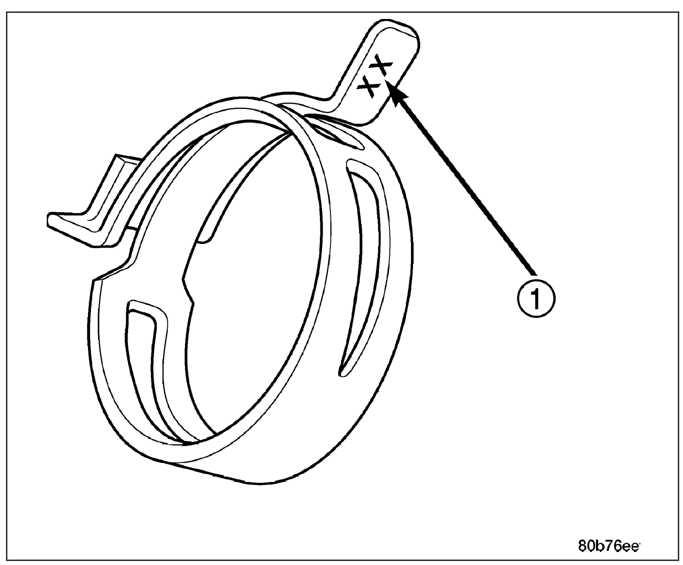
For cooling system routing refer to.

## HOSE CLAMPS

The cooling system utilizes spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp.

**WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL NUMBER 6094. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.**

**CAUTION: A number or letter is stamped into the tongue (1) of constant tension clamps. If replacement is necessary, use only a original equipment clamp with matching number or letter.**



# OPERATION

## COOLING SYSTEM

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

## HOSE CLAMPS

The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, only use constant tension clamp pliers designed to compress the hose clamp.

# DIAGNOSIS AND TESTING

## ON-BOARD DIAGNOSTICS (OBD)

### COOLING SYSTEM RELATED DIAGNOSTICS

The powertrain control module (PCM) has been programmed to monitor certain cooling system components:

- If the engine has remained cool for too long a period, such as with a stuck open thermostat, a Diagnostic Trouble Code (DTC) can be set.
- If an open or shorted condition has developed in the relay circuit controlling the electric radiator fan, a Diagnostic Trouble Code (DTC) can be set.

If the problem is sensed in a monitored circuit often enough to indicate an actual problem, a DTC is stored. The DTC will be stored in the PCM memory for eventual display to the service technician. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

### ACCESSING DIAGNOSTIC TROUBLE CODES

To read DTC's and to obtain cooling system data (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

### ERASING TROUBLE CODES

After the problem has been repaired, use the DRB scan tool to erase a DTC. Refer to the appropriate Powertrain Diagnostic Procedures service information for operation of the DRB scan tool.

## PRELIMINARY CHECKS

### ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- PROLONGED IDLE
- VERY HIGH AMBIENT TEMPERATURE
- SLIGHT TAIL WIND AT IDLE
- SLOW TRAFFIC
- TRAFFIC JAMS
- HIGH SPEED
- STEEP GRADES

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.

1. TRAILER TOWING:

Consult Trailer Towing section of owner's manual. Do not exceed limits.

2. RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may affect cooling system. This may be:

- Engine adjustments (incorrect timing)

- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump, or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

**NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to following Cooling System Diagnosis charts.**

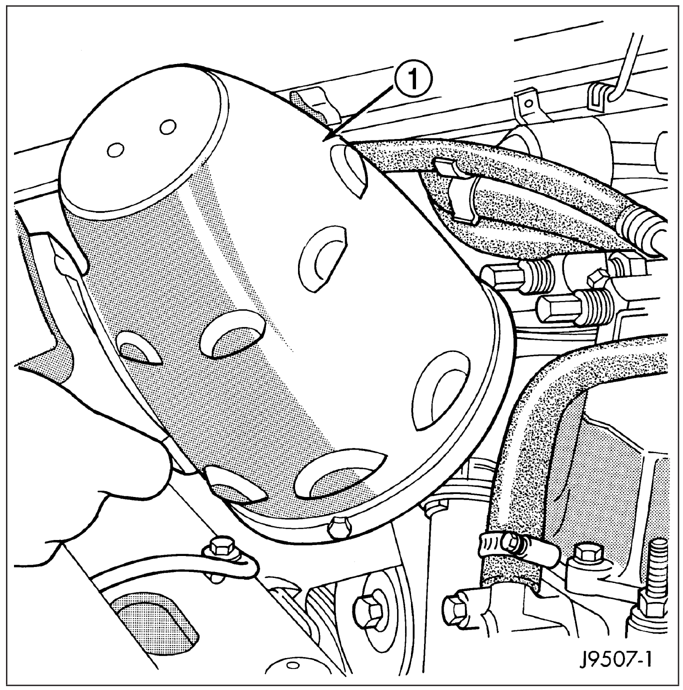
These charts are to be used as a quick-reference only. Refer to the group text for information.

## COOLING SYSTEM LEAKS

### ULTRAVIOLET LIGHT METHOD

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause additive to glow a bright green color.

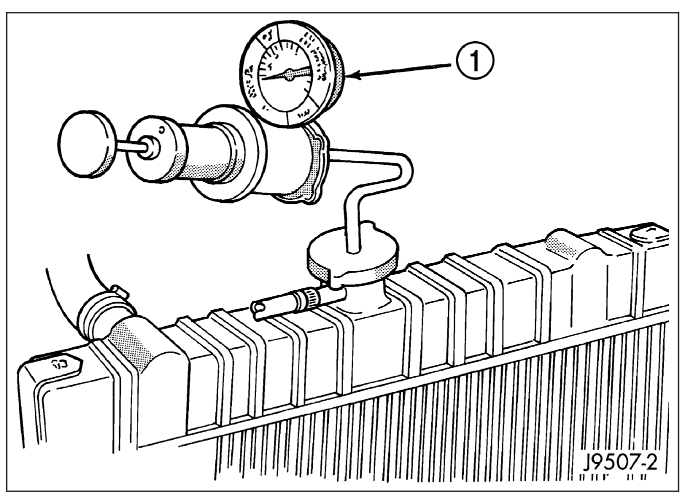
The black light (1) can be used in conjunction with a pressure tester to determine if any external leaks exist.



### PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if cause of coolant loss is not located during the warm engine examination.

**WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING.**



Carefully remove radiator pressure cap from pressure bottle and check coolant level. Push down on cap to disengage it from stop tabs. Wipe inside of filler neck and examine lower inside sealing seat for nicks, cracks, paint, and dirt. Inspect radiator-to- reserve/ overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on outside of filler neck. If cams are damaged, seating of pressure cap valve and tester seal will be affected.

Attach pressure tester (7700 or an equivalent) to radiator filler neck.

Operate tester pump (1) to apply 110 kPa (16 psi) pressure to system. If hoses enlarge excessively or bulges while testing, replace as necessary. Observe gauge pointer and determine condition of cooling system according to following criteria:

**Holds Steady:** If pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test.

**Drops Slowly:** Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

**Drops Quickly:** Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

## INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect transmission dipstick for water globules and transmission fluid cooler for leakage.

**WARNING: WITH RADIATOR PRESSURE TESTER TOOL INSTALLED ON RADIATOR, DO NOT ALLOW PRESSURE TO EXCEED 124 KPA (18 PSI). PRESSURE WILL BUILD UP QUICKLY IF A COMBUSTION LEAK IS PRESENT. TO RELEASE PRESSURE, ROCK TESTER FROM SIDE TO SIDE. WHEN REMOVING TESTER, DO NOT TURN TESTER MORE THAN 1/2 TURN IF SYSTEM IS UNDER PRESSURE.**

Operate engine without pressure cap on radiator until thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders to isolate compression leak.

If the needle on dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

## COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

**WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAINCOCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.**

Drain sufficient coolant to allow thermostat removal. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL). Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of top of thermostat housing.

**CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.**

Start engine and accelerate rapidly three times, to approximately 3000 rpm while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

## COOLING SYSTEM DIAGNOSIS CHART - GAS ENGINE

### COOLING SYSTEM DIAGNOSIS CHART

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| TEMPERATURE GAUGE READS LOW | 1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat? | 1. Refer to for On-Board Diagnostics and DTC information. Replace thermostat if necessary. |
| | 2. Is the temperature sending unit connected? | 2. Check the temperature sensor connector. (Refer to 7 - COOLING/ ENGINE/ENGINE COOLANT TEMP SENSOR - DESCRIPTION). Repair connector if necessary. |
| | 3. Is the temperature gauge operating OK? | 3. Check gauge operation. Repair as necessary. |
| | 4. Coolant level low in cold ambient temperatures accompanied with poor heater performance. | 4. Check coolant level in the coolant pressure bottle and the radiator. Inspect system for leaks. Repair leaks as necessary. |
| | 5. Improper operation of internal heater doors or heater controls. | 5. Inspect heater and repair as necessary. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING) |
| | 6. Electric fan functioning when not required. | 6. Inspect electric fan for proper operation. Refer to Electric Cooling Fan in this section. Refer to group 8W for electric cooling fan and relay circuit schematic data. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| TEMPERATURE GAUGE READS HIGH OR THE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM. | 1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions. | 1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair. |
| | 2. Is the temperature gauge reading correctly? | 2. Check gauge. (Refer to Group 8J - INSTRUMENT CLUSTER). Repair as necessary. |
| | 3. Is the temperature warning illuminating unnecessarily? | 3. Check warning lamp operation. (Refer to Group 8J - INSTRUMENT CLUSTER). Repair as necessary. |
| | 4. Coolant low in coolant pressure bottle and radiator? | 4. Check for coolant leaks and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). |
| | 5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6. | 5. Tighten cap. |
| | 6. Poor seals at the radiator cap. | 6. (a) Check condition of cap and cap seals. (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING).<br>(b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator. |
| | 7. Coolant not flowing through system. | 7. (a) Check condition of pressure bottle cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING).<br>(b) Check condition of radiator vent nipple. If neck is damaged, replace radiator.<br>(c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary.<br>(d) Check pressure bottle/overflow tank and tanks hoses for blockage. Repair as necessary. |
| | 8. Incorrect coolant concentration | 8. Check coolant. (Refer to 7 - COOLING/ENGINE/COOLANT - DESCRIPTION) for correct coolant/water mixture ratio. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 9. Fan installed backwards on viscous drive. | 9. Mount fan on drive correctly. |
| | 10. Radiator or A/C condenser fins are dirty or clogged. | 10. Remove insects and debris. (Refer to 7 - COOLING/ENGINE/ RADIATOR - CLEANING). |
| | 11. Radiator core is corroded or plugged. | 11. Have radiator re-cored or replaced. |
| | 12. Fuel or ignition system problems. | 12. Refer to FUEL and /or IGNITION CONTROL for diagnosis. |
| | 13. Dragging brakes. | 13. Check and correct as necessary. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) for correct procedures. |
| | 14. Bug screen or cardboard is being used, reducing airflow. | 14. Remove bug screen or cardboard. |
| | 15. Thermostat partially or completely shut. | 15. Check thermostat operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING). |
| | 16. Viscous fan drive not operating properly. | 16. Check fan drive operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - DIAGNOSIS AND TESTING). |
| | 17. Cylinder head gasket leaking. | 17. Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). For repair, (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL). |
| | 18. Heater core leaking. | 18. Check heater core for leaks. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ HEATER CORE - REMOVAL). Repair as necessary. |
| | 19. Electric fan not functioning. | 19. Inspect electric fan for proper operation (Refer to 7 - COOLING/ ENGINE/RADIATOR FAN - DESCRIPTION). |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC) | 1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly. | 1. A normal condition. No correction is necessary. |
| | 2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit. | 2. Check operation of gauge and repair if necessary (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). |
| | 3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running) | 3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven. |
| | 4. Gauge reading high after re-starting a warmed up (hot) engine. | 4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation. |
| | 5. Coolant level low in cooling system (air will build up in the cooling system causing the thermostat to open late). | 5. Check and correct coolant leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). |
| | 6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late. | 6. (a) Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). (b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary. |
| | 7. Water pump impeller loose on shaft. | 7. Check water pump and replace as necessary. (Refer to 7 - COOLING/ENGINE/WATER PUMP - DIAGNOSIS AND TESTING). |
| | 8. Loose accessory drive belt. (water pump slipping) | 8. (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). Check and correct as necessary. |
| | 9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late. | 9. Locate leak and repair as necessary. |
| PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/ OVERFLOW TANK | 1. Pressure relief valve in pressure bottle cap is defective. | 1. Check condition of radiator cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace cap as necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT | 1. Coolant leaks in radiator, cooling system hoses, water pump or engine. | 1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). |
| DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH | 1. Engine overheating. | 1. Check reason for overheating and repair as necessary. |
| | 2. Freeze point of coolant not correct. Mixture is too rich or too lean. | 2. Check coolant concentration. (Refer to 7 - COOLING/ENGINE/ COOLANT - DESCRIPTION) and adjust ratio as required. |
| HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING | 1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system. | 1. (a) Radiator cap relief valve stuck. (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace if necessary. |
| | | (b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary. |
| | | (c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary. |
| | | (d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary. |
| NOISY VISCOUS FAN/DRIVE | 1. Fan blades loose. | 1. Replace fan blade assembly. (Refer to 7 - COOLING/ENGINE/ RADIATOR FAN - REMOVAL) |
| | 2. Fan blades striking a surrounding object. | 2. Locate point of fan blade contact and repair as necessary. |
| | 3. Air obstructions at radiator or air conditioning condenser. | 3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser. |
| | 4. Thermal viscous fan drive has defective bearing. | 4. Replace fan drive. Bearing is not serviceable. (Refer to 7 - COOLING/ ENGINE/RADIATOR FAN - REMOVAL). |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| INADEQUATE HEATER PERFORMANCE. THERMOSTAT FAILED IN OPEN POSITION | 1. Has a Diagnostic trouble Code (DTC) been set? | 1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for correct procedures and replace thermostat if necessary. |
| | 2. Coolant level low | 2. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). |
| | 3. Obstructions in heater hose/ fittings | 3. Remove heater hoses at both ends and check for obstructions. |
| | 4. Heater hose kinked | 4. Locate kinked area and repair as necessary. |
| | 5. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation. | 5. (Refer to 7 - COOLING/ENGINE/ WATER PUMP - DIAGNOSIS AND TESTING). If a slipping belt is detected, (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - REMOVAL). If heater core obstruction is detected, (Refer to 7 - COOLING - STANDARD PROCEDURE) for cooling system reverse flushing. |
| STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILLE AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE | 1. During wet weather, moisture (snow, ice or rain condensation) on the radiator or condenser will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator or condenser, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away. | 1. Occasional steam emitting from this area is normal. No repair is necessary. |
| COOLANT COLOR | 1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant. | 1. (Refer to 7 - COOLING/ENGINE/ COOLANT - DESCRIPTION) for coolant concentration information. Adjust coolant mixture as necessary. |
| COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE | 1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures. | 1. A normal condition. No repair is necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| FAN RUNS ALL THE TIME | 1. Fan control sensors inoperative. | 1. Check for DTC s. Verify sensor readings. |
| | 2. Fan control solenoid stuck ″on″. | 2. Check fan operation speeds. Refer to fan speed operation table. |
| | 3. Fan control solenoid harness damaged. | 3. Check for DTC 1499. Repair as required. |
| | 4. Transmission temperature too high. | 4. Check for transmission over temp. DTC. |
| | 5. Engine coolant temperature too high. | 5. (a) Check coolant level. Correct level as required. |
| | | (b) Thermostat stuck. Replace thermostat. |
| | | (c) Water pump failed. Replace water pump. |
| | | (d) Coolant flow restricted. Clean radiator. |
| | | (e) Air flow over radiator obstructed. Remove obstruction. |

## COOLING SYSTEM DIAGNOSIS CHART - DIESEL ENGINE

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

1. PROLONGED IDLE, VERY HIGH AMBIENT TEMPERATURE, SLIGHT TAIL WIND AT IDLE, SLOW TRAFFIC, TRAFFIC JAMS, HIGH SPEED OR STEEP GRADES.
   - Idle with A/C off when temperature gauge is at end of normal range.
2. TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

3. RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt
- Brakes (possibly dragging)
- Changed parts (incorrect water pump)
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

**NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to following Cooling System Diagnosis charts.**

These charts are to be used as a quick-reference only.

**COOLING SYSTEM DIAGNOSIS-DIESEL ENGINE**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| TEMPERATURE GAUGE READS LOW | 1. Diesel engines, due to their inherent efficiency are slower to warm up than gasoline powered engines, and will operate at lower temperatures when the vehicle is unloaded. | 1. The low gauge reading may be normal. Refer to thermostats in the manual text for information. See Thermostat Diagnosis-Diesel Engine. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 2. Is the temperature gauge connected to the temperature gauge coolant sensor on the engine? | 2. Check the engine temperature sensor connector in the engine compartment. |
| | 3. Is the temperature gauge operating OK? | 3. Check gauge operation. Repair as necessary. |
| | 4. Coolant level low in cold ambient temperatures accompanied with poor heater performance. | 4. Check coolant level in the coolant tank. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant section for WARNINGS and precautions before removing the pressure cap. |
| | 5. Improper operation of internal heater doors or heater controls. | 5. Inspect heater and repair as necessary. Refer to Heating and Air Conditioning for procedures. |
| TEMPERATURE GAUGE READS HIGH. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM COOLING SYSTEM | 1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperature and the air conditioning is on. Higher altitudes could aggravate these conditions. | 1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to normal range, determine the cause for the overheating and repair. |
| | 2. Temperature gauge reading incorrectly. | 2. Check gauge. Refer to I/P group. |
| | 3. Coolant low in coolant tank and radiator. | 3. Check for coolant leaks and repair as necessary. |
| | 4. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. | 4. Tighten cap. |
| | 5. Poor seals at pressure/vent cap. | 5. (a) Check condition of cap and cap seals. (b) Check condition of coolant tank filler neck. Make sure it does not leak pressure. |
| | 6. Freeze point of antifreeze not correct. Mixture may be too rich. | 6. Check antifreeze. Adjust antifreeze-to-water ratio as required. |
| | 7. Coolant not flowing through system. | 7. Check for coolant flow in coolant tank with engine warm and thermostat open. Coolant should be observed flowing through the tank. If flow is not observed, determine reason for lack of flow and repair as necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 8. Radiator or A/C condenser fins are dirty or clogged. | 8. Clean debris from radiator or A/C condenser |
| | 9. Radiator core is corroded or plugged. | 9. Have radiator re-cored or replaced. |
| | 10. Aftermarket A/C installed without proper A/C condenser. | 10. Install proper A/C condenser. |
| | 11. Dragging Brakes. | 11. Check and correct as necessary. |
| | 12. Non-factory bug screen is being used reducing air flow. | 12. Only a factory screen should be used. |
| | 13. Thermostat partially or completely shut. This is more prevalent on high mileage vehicles. | 13. Check thermostat and replace if necessary. |
| | 14. Cylinder head gasket leaking. | 14. Check cylinder head gasket for leaks. |
| | 15. Heater core leaking. | 15. Check heater core for leaks. Repair as necessary. |
| TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC) | 1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly. Fluctuation is also influenced by loads, outside temperature and extended idle time with diesel engines. | 1. A normal condition. No correction is necessary. |
| | 2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit. | 2. Check operation of gauge and repair as necessary. |
| | 3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running). | 3. A normal condition. No correction needed. Gauge should return to normal range after vehicle is driven. |
| | 4. Gauge reading high after starting a warm-up (hot) engine. | 4. A normal condition. No correction needed. Gauge should return to normal after a few minutes of engine operation. |
| | 5. Coolant level low in the coolant tank (air will build up in the cooling system causing the thermostat to open late). | 5. Check and correct coolant leaks. |
| | 6. Cylinder head gasket leaking allowing exhaust gases to enter the cooling system causing the thermostat to open late. | 6. (a) Check for cylinder head gasket leaks with a commercially available leak tester. (b) Check for coolant in engine oil. Inspect for white steam emitting from exhaust system. Repair as necessary. |
| | 7. Water pump impeller loose on shaft. | 7. Check water pump and replace as necessary. |
| | 8. Loose accessory drive belt (water pump slipping). | 8. Check and correct as necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
| --- | --- | --- |
| | 9. Air leak on the suction side of the water pump allowing air to build up in the cooling system causing the thermostat to open late. | 9. Locate leak and repair as necessary. |
| PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT TANK | 1. Pressure relief valve in pressure/vent cap is defective. | 1. Check condition of pressure/vent cap and cap seals. |
| | 2. Head gasket leak or cracked cylinder head. | 2. Repair as necessary. |
| COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE IS READING HIGH OR HOT | 1. Coolant leaks in radiator, cooling system hoses, water pump, or engine. | 1. Pressure test cooling system and repair as necessary. |
| HOSE OR HOSES COLLAPSE WHEN ENGINE IS COOLING | 1. Vacuum created in cooling system on engine cool-down is not being relieved through pressure/vent cap. | 1. Cap relief valve stuck. Replace if necessary. |
| NOISY FAN | 1. Cooling fan blades loose. | 1. Replace cooling fan assembly. |
| | 2. Cooling fan blades striking a surrounding object. | 2. Locate point of fan blade contact and repair as necessary. |
| | 3. Air obstructions at radiator or A/C condenser. | 3. Remove obstructions or clean debris from radiator or A/C condenser. |
| INADEQUATE AIR CONDITIONER PERFORMANCE (COOLING SYSTEM SUSPECTED) | 1. Radiator and/or A/C condenser is restricted, obstructed or dirty (insects, leaves, etc.) | 1. Remove restriction or clean debris from radiator or A/C condenser. |
| | 2. Engine is overheating (heat may be transferred from radiator to A/C condenser. High underhood temperatures due to engine overheating may also transfer heat to A/C condenser). | 2. Correct overheating condition. |
| | 3. The cooling system is equipped with air seals at the radiator and/or A/C condenser. If these seals are missing or damaged, not enough air flow will be pulled through the radiator and A/C condenser. | 3. Check for missing or damaged air seals. Repair as necessary. |
| | 4. Is the cooling fan operating correctly? | 4. Refer to Cooling Fan in this group for diagnosis. Repair as necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| INADEQUATE HEATER PERFORMANCE. MAY BE ACCOMPANIED BY LOW GAUGE READING | 1. Diesel engines, due to their inherent efficiency are slower to warm up than gasoline powered engines, and will operate at lower temperatures when the vehicle is unloaded. | 1. The lower gauge reading may be normal. |
| | 2. Coolant level low. | 2. Pressure test cooling system. Repair leaks as necessary. |
| | 3. Obstruction in heater hose fitting at engine. | 3. Remove heater hoses and check for obstructions. Repair as necessary. |
| | 4. Heater hose kinked. | 4. Locate kinked area. Repair as necessary. |
| | 5. Water pump is not pumping water to heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot the water pump may not be operating correctly. The accessory drive belt may also be slipping causing poor water pump operation. | 5. Refer to water pumps in this group. Repair as necessary. If a slipping belt is detected, refer to Engine Accessory Drive Belts in this group. Repair as necessary. |
| HEAT ODOR | 1. Various heat shields are used at certain drive line components. One or more of these shields may be missing. | 1. Locate missing shields. Repair or replace as necessary. |
| | 2. Is temperature gauge reading above the normal range? | 2. Refer to the previous Temperature Gauge Reads High in these Diagnostic Charts. Repair as necessary. |
| | 3. Has undercoating been applied to any unnecessary components? | 3. Clean undercoating as necessary. |
| STEAM IS COMING FROM FRONT OF VEHICLE NEAR GRILLE AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE | 1. During wet weather, moisture (snow, ice, or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or air flow to blow it away. | 1. Occasional steam emitting from this area is normal. No repair is necessary. |
| COOLANT ODOR | 1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant. | 1. Refer to Coolant in this group for antifreeze tests. Adjust antifreeze-to-water ratio as necessary. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
| --- | --- | --- |
| COOLANT LEVEL CHANGES IN COOLANT TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE | 1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the HOT and COLD marks at normal engine operating temperature, the level should return to within that range after operation at elevated temperatures. | 1. This a normal condition. No repair necessary. |

## COOLING SYSTEM FLOW CHECK - DIESEL ENGINE

To determine whether coolant is flowing through the cooling system, use the following procedures:

1. If engine is cold, idle engine until normal operating temperature is reached. Then feel the upper radiator hose. If it is hot, coolant is circulating.

**WARNING: DO NOT REMOVE THE COOLING SYSTEM PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

2. Remove pressure/vent cap when engine is cold, idle engine until thermostat opens, you should observe coolant flow while looking down in the coolant recovery pressure container. Once flow is detected install the pressure/vent cap.

## COOLING SYSTEM AERATION

Low coolant level in a cross flow radiator will equalize in both tanks with engine off. With engine running and at operating temperature, the high pressure inlet tank runs full and the low pressure outlet tank drops, resulting in cooling system aeration. Aeration will draw air into the water pump resulting in the following:

- High reading shown on the temperature gauge.
- Loss of coolant flow through the heater core.
- Corrosion in the cooling system.
- Water pump seal may run dry, increasing the risk of premature seal failure.
- Combustion gas leaks into the coolant can also cause aeration.

## STANDARD PROCEDURE

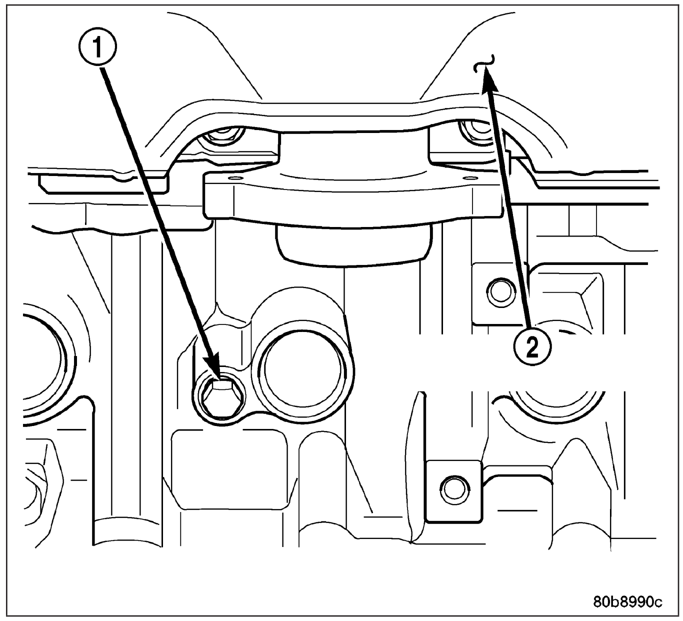
## DRAINING COOLING SYSTEM

**WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS (1) OR LOOSEN THE RADIATOR DRAINCOCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.**

1. DO NOT remove radiator cap first. With engine cold, raise vehicle on a hoist and locate radiator draincock.

**NOTE: Radiator draincock is located on the left/ lower side of radiator facing to rear of vehicle.**

2. Attach one end of a hose to the draincock. Put the other end into a clean container. Open draincock and drain coolant from radiator. This will empty the coolant reserve/overflow tank. The coolant does not have to be removed from the tank unless the system is being refilled with a fresh mixture. When tank is empty, remove radiator cap and continue draining cooling system.



## REFILLING COOLING SYSTEM

1. Tighten the radiator draincock and the cylinder block drain plug(s) (if removed).

**CAUTION: Failure to purge air from the cooling system can result in an overheating condition and severe engine damage.**

2. Fill cooling system with the antifreeze mixture (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). Fill pressure bottle to service line and install cap.

**NOTE: The engine cooling system will push any remaining air into the coolant bottle within about an hour of normal driving. As a result, a drop in coolant level in the pressure bottle may occur. If the engine cooling system overheats and pushes coolant into the overflow side of the coolant bottle, this coolant will be sucked back into the cooling system ONLY IF THE PRESSURE CAP IS LEFT ON THE BOTTLE. Removing the pressure cap breaks the vacuum path between the two bottle sections and the coolant will not return to cooling system.**

3. With heater control unit in the HEAT position, operate engine with pressure bottle cap in place.
4. Add coolant to pressure bottle as necessary. **Only add coolant to the pressure bottle when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.**

**NOTE: The coolant bottle has two chambers. Coolant will normally only be in the outboard (larger) of the two. The inboard chamber is only to recover coolant in the event of an overheat or after a recent service fill. The inboard chamber should normally be empty. If there is coolant in the overflow side of the coolant bottle (after several warm/cold cycles of the engine) and coolant level is above cold full when cold, disconnect the end of the overflow hose at the fill neck and lower it into a clean container. Allow coolant to drain into the container until emptied. Reconnect overflow hose to fill neck.**

## COOLING SYSTEM - REVERSE FLUSHING

**CAUTION: The cooling system normally operates at 97-110 kPa (14-16 psi) pressure. Exceeding this pressure may damage the radiator or hoses.**

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

## CHEMICAL CLEANING

If visual inspection indicates the formation of sludge or scaly deposits, use a radiator cleaner (Mopar ® Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid the flushing operation.

**CAUTION: Be sure instructions on the container are followed.**

## REVERSE FLUSHING RADIATOR

Disconnect the radiator hoses from the radiator fittings. Attach a section of radiator hose to the radiator bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

**CAUTION: The cooling system normally operates at 97-110 kPa (14 -16 psi) pressure. Exceeding this pressure may damage the radiator or hoses.**

Allow the radiator to fill with water. When radiator is filled, apply air in short blasts allowing radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. For more information, refer to operating instructions supplied with flushing equipment. Have radiator cleaned more extensively by a radiator repair shop.

## REVERSE FLUSHING ENGINE

Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE). Remove the thermostat housing and thermostat. Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump. Attach a lead away hose to the water pump inlet fitting.

**CAUTION: Be sure that the heater control valve is closed (heat off). This is done to prevent coolant flow with scale and other deposits from entering the heater core.**

Connect the water supply hose and air supply hose to the flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose. For more information, refer to operating instructions supplied with flushing equipment.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL). Install the thermostat and housing with a replacement gasket (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION). Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture (Refer to 7 - COOLING - STANDARD PROCEDURE).

# INSPECTION

After performing a cleaning/flush procedure, inspect all hoses, clamps and connections for deterioration and leaks. Inspect radiator and heater core for leaks.

# SPECIFICATIONS

## FILL VOLUMES

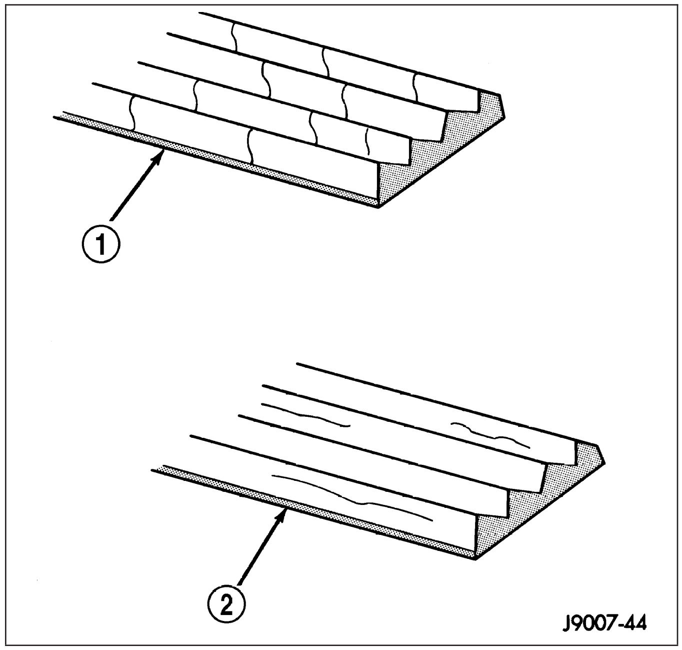
## DIAGNOSIS AND TESTING - SERPENTINE DRIVE BELT DIAGNOSIS

When diagnosing serpentine drive belts, small cracks (1) that run across ribbed surface of belt from rib to rib, are considered normal. These are not a reason to replace belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace belt if it has excessive wear, frayed cords or severe glazing.



**SERPENTINE DRIVE BELT DIAGNOSIS CHART**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| RIB CHUNKING (ONE OR MORE RIBS HAS SEPARATED FROM BELT BODY) | 1. Foreign objects imbedded in pulley grooves. | 1. Remove foreign objects from pulley grooves. Replace belt. |
| | 2. Installation damage. | 2. Replace belt. |
| RIB OR BELT WEAR | 1. Pulley(s) misaligned. | 1. Align pulley(s). |
| | 2. Abrasive environment. | 2. Clean pulley(s). Replace belt if necessary. |
| | 3. Rusted pulley(s). | 3. Clean rust from pulley(s). |
| | 4. Sharp or jagged pulley groove tips. | 4. Replace pulley. |
| | 5. Rubber deteriorated. | 5. Replace belt. |
| LONGITUDINAL BELT CRACKING (CRACKS BETWEEN TWO RIBS) | 1. Belt has mistracked from pulley groove. | 1. Replace belt. |
| | 2. Pulley groove tip has worn away rubber to tensile member. | 2. Replace belt. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
| --- | --- | --- |
| BELT SLIPS | 1. Belt slipping because of insufficient tension. | 1. Replace automatic belt tensioner. |
| | 2. Belt routed incorrectly. | 2. Verify belt routing. |
| | 3. Incorrect belt. | 3. Replace belt. |
| | 4. Belt or pulley subjected to substance (belt dressing, oil ethylene glycol) that has reduced friction. | 4. Replace belt and clean pulleys. |
| | 5. Driven component bearing failure. | 5. Replace faulty component bearing. |
| | 6. Belt glazed and hardened from heat and excessive slippage. | 6. Replace belt. |
| "GROOVE JUMPING" (BELT DOES NOT MAINTAIN CORRECT POSITION ON PULLEY) | 1. Belt tension either too high or too low. | 1. Replace automatic belt tensioner. |
| | 2. Belt routed incorrectly. | 2. Verify belt routing. |
| | 3. Incorrect belt. | 3. Replace belt. |
| | 4. Pulley(s) not within design tolerance. | 4. Replace pulley(s). |
| | 5. Foreign object(s) in grooves. | 5. Remove foreign objects from grooves. |
| | 6. Pulley misalignment. | 6. Check and replace. |
| | 7. Belt cord line is broken. | 7. Replace belt. |
| BELT BROKEN (NOTE: IDENTIFY AND CORRECT PROBLEM BEFORE NEW BELT IS INSTALLED) | 1. Excessive tension. | 1. Replace belt and automatic belt tensioner. |
| | 2. Incorrect belt. | 2. Replace belt. |
| | 3. Tensile member damaged during belt installation. | 3. Replace belt. |
| | 4. Severe misalignment. | 4. Check and replace. |
| | 5. Bracket, pulley, or bearing failure. | 5. Replace defective component and belt. |
| NOISE (OBJECTIONABLE SQUEAL, SQUEAK, OR RUMBLE IS HEARD OR FELT WHILE DRIVE BELT IS IN OPERATION) | 1. Belt slippage. | 1. Replace belt or automatic belt tensioner. |
| | 2. Bearing noise. | 2. Locate and repair. |
| | 3. Belt misalignment. | 3. Replace belt. |
| | 4. Belt-to-pulley mismatch. | 4. Install correct belt. |

Refer to SERPENTINE DRIVE BELT DIAGNOSIS CHART for further belt diagnosis.

# BELT TENSIONERS

## DESCRIPTION

The automatic belt tensioner is a spring loaded arm and pulley assembly. The tensioner assembly is designed to apply constant pressure on the accessory drive belt to maintain proper belt tension.

## OPERATION

**WARNING: THE AUTOMATIC BELT TENSIONER ASSEMBLY IS SPRING LOADED. DO NOT ATTEMPT TO DISASSEMBLE THE TENSIONER ASSEMBLY.**

The automatic belt tensioner maintains correct belt tension using a coiled spring within the tensioner housing. The spring applies pressure to the tensioner arm pressing the arm into the belt, tensioning the belt.

If a new belt is being installed, the arrow must be within approximately 3 mm (1/8 in.) of indexing mark. Belt is considered new if it has been used 15 minutes or less. If this specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)
- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory
- Belt incorrectly routed.

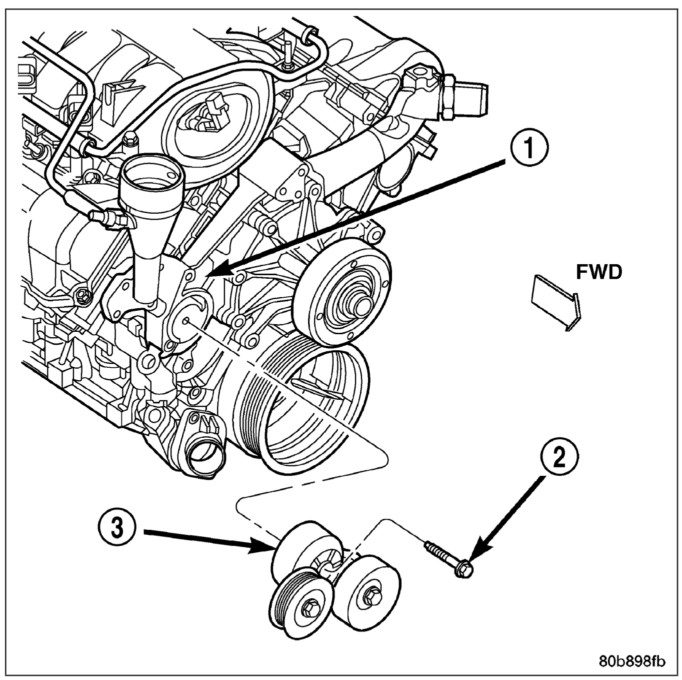
## REMOVAL

## 3.7L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove tensioner assembly (3) from engine front cover.

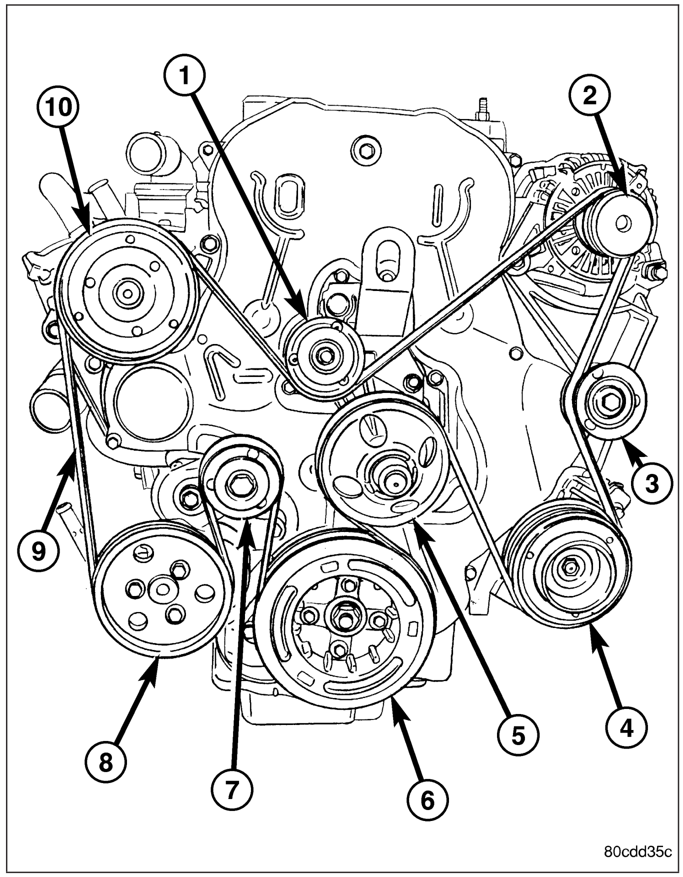
**WARNING: BECAUSE OF HIGH SPRING TENSION, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY (EXCEPT FOR PULLEY ON TENSIONER).**

3. Remove pulley bolt. Remove pulley from tensioner.

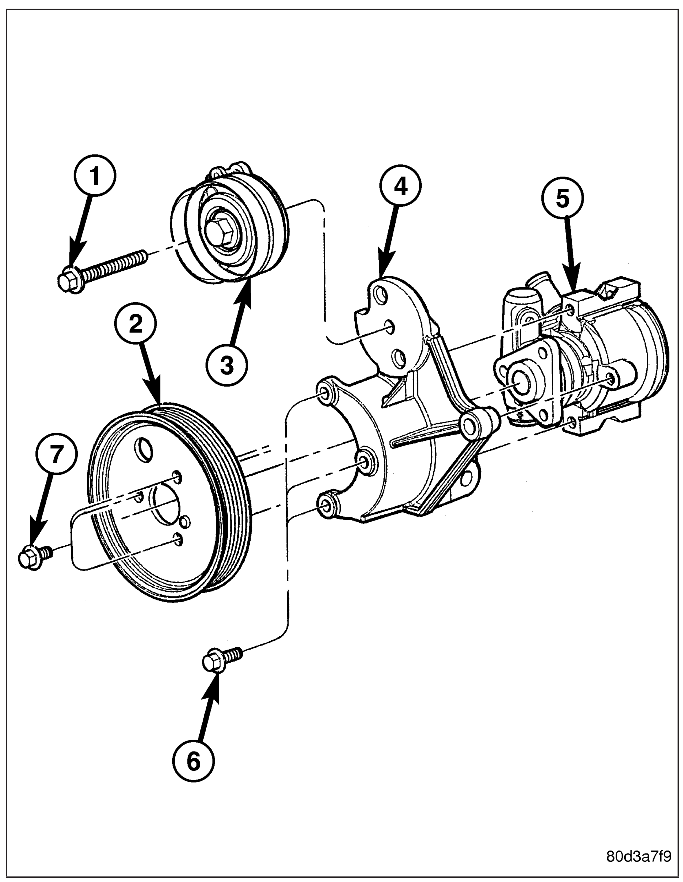


## 2.8L DIESEL

1. Disconnect negative battery cable.
2. Remove accessory drive belt (9) (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).



3. Remove belt tensioner retaining bolt and remove tensioner (3) from bracket (4).



## INSTALLATION

### 3.7L ENGINE

1. Install pulley and pulley bolt to tensioner. Tighten bolt to 61 N·m (45 ft. lbs.) torque.
2. An indexing slot is located on back of tensioner. Align this slot to the head of the bolt on the front cover. Install the mounting bolt. Tighten bolt to 41 N·m (30 ft. lbs.).
3. Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
4. Check belt indexing marks (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

### 2.8L DIESEL

1. Install belt tensioner on bracket. Torque retaining bolt to 47 N·m.
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Connect negative battery cable.

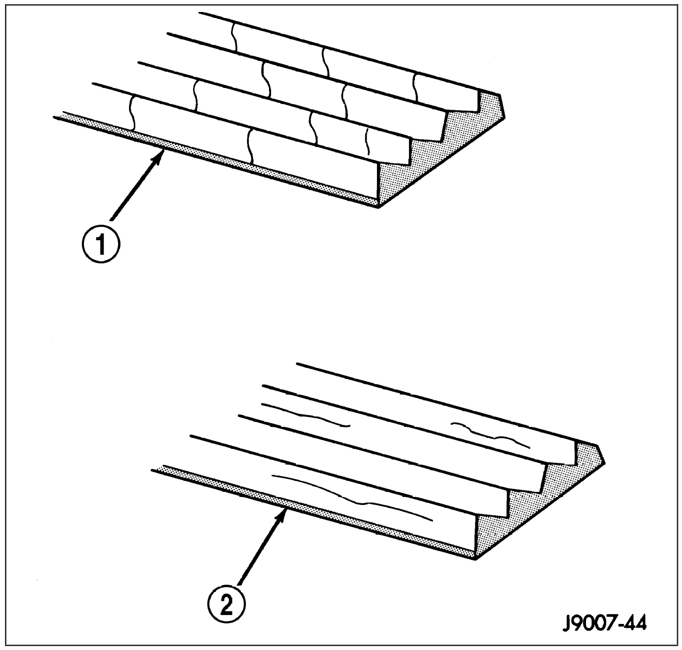
# DRIVE BELTS

## DIAGNOSIS AND TESTING - ACCESSORY DRIVE BELT

### VISUAL DIAGNOSIS

When diagnosing serpentine accessory drive belts, small cracks (1) that run across the ribbed surface of the belt from rib to rib , are considered normal. These are not a reason to replace the belt. However, cracks running along a rib (2) (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords or severe glazing.

Refer to ACCESSORY DRIVE BELT DIAGNOSIS CHART for further belt diagnosis.



### NOISE DIAGNOSIS

#### ACCESSORY DRIVE BELT DIAGNOSIS CHART

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|

| CONDITION | POSSIBLE CAUSES | CORRECTION |
| --- | --- | --- |
| LONGITUDAL BELT CRACKING. | 1. Belt has mistracked from pulley groove. | 1. Replace belt. |
| | 2. Pulley groove tip has worn away rubber to tensile member. | 2. Replace belt. |
| ″GROOVE JUMPING″ (Belt does not maintain correct position on pulley). | 1. Incorrect belt tension. | 1. Inspect/Replace tensioner if necessary. |
| | 2. Pulley(s) not within design tolerance. | 2. Replace pulley(s). |
| | 3. Foreign object(s) in grooves. | 3. Remove foreign objects from grooves. |
| | 4. Pulley misalignment. | 4. Align component. |
| | 5. Belt cordline is broken. | 5. Replace belt. |
| BELT BROKEN (Note: Identify and correct problem before new belt is installed). | 1. Incorrect belt tension. | 1. Replace Inspect/Replace tensioner if necessary. |
| | 2. Tensile member damaged during belt installation. | 2. Replace belt. |
| | 3. Severe misalignment. | 3. Align pulley(s). |
| | 4. Bracket, pulley, or bearing failure. | 4. Replace defective component and belt. |
| NOISE (Objectionable squeal, squeak, or rumble is heard or felt while drive belt is in operation). | 1. Incorrect belt tension. | 1. Inspect/Replace tensioner if necessary. |
| | 2. Bearing noise. | 2. Locate and repair. |
| | 3. Belt misalignment. | 3. Align belt/pulley(s). |
| | 4. Belt to pulley mismatch. | 4. Install correct belt. |
| | 5. Driven component induced vibration. | 5. Locate defective driven component and repair. |
| TENSION SHEETING FABRIC FAILURE (Woven fabric on outside circumference of belt has cracked or separated from body of belt). | 1. Tension sheeting contacting stationary object. | 1. Correct rubbing condition. |
| | 2. Excessive heat causing woven fabric to age. | 2. Replace belt. |
| | 3. Tension sheeting splice has fractured. | 3. Replace belt. |
| CORD EDGE FAILURE (Tensile member exposed at edges of belt or separated from belt body). | 1. Incorrect belt tension. | 1. Inspect/Replace tensioner if necessary. |
| | 2. Belt contacting stationary object. | 2. Replace belt. |
| | 3. Pulley(s) out of tolerance. | 3. Replace pulley. |
| | 4. Insufficient adhesion between tensile member and rubber matrix. | 4. Replace belt. |

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

## REMOVAL

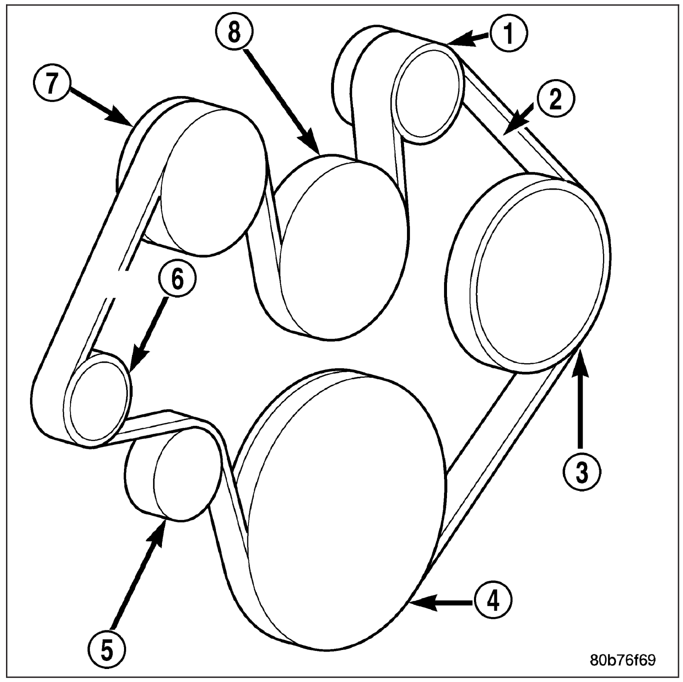
### 3.7L ENGINE

**NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.**

**CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVERE DAMAGE MAY OCCUR TO THE TENSIONER.**

Belt tension is not adjustable. Belt adjustment is maintained by an automatic spring loaded belt tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner (6) until it contacts its stop. Remove belt, then slowly rotate the tensioner into the freearm position.



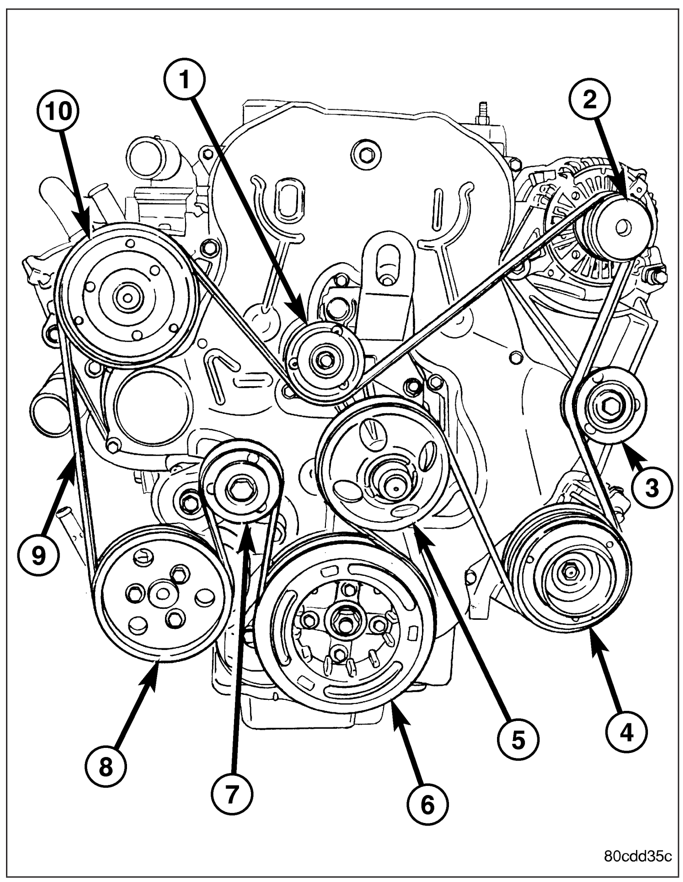
### 2.8L DIESEL

**NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.**

**CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVERE DAMAGE MAY OCCUR TO THE TENSIONER.**

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring loaded) belt tensioner.

1. Disconnect negative battery cable.
2. Rotate belt tensioner until it contacts its stop. Remove belt (9), then slowly rotate the tensioner into the freearm position.



## INSTALLATION

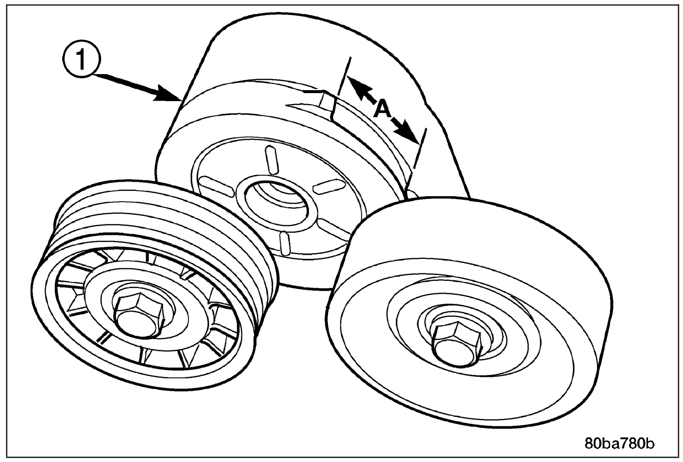
## 3.7L ENGINE

**NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.**

Belt tension is not adjustable. Belt adjustment is maintained by an automatic spring loaded belt tensioner.

1. Check condition of all pulleys.

**CAUTION: When installing the serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.**



2. Install new belt. Route the belt around all pulleys except the idler pulley. Rotate the tensioner arm (1) until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.
3. With the drive belt installed, inspect the belt wear indicator. On 3.7L Engines the gap between the tang and the housing stop (measurement A) must not exceed 24 mm (0.94 inches).

## 2.8L DIESEL

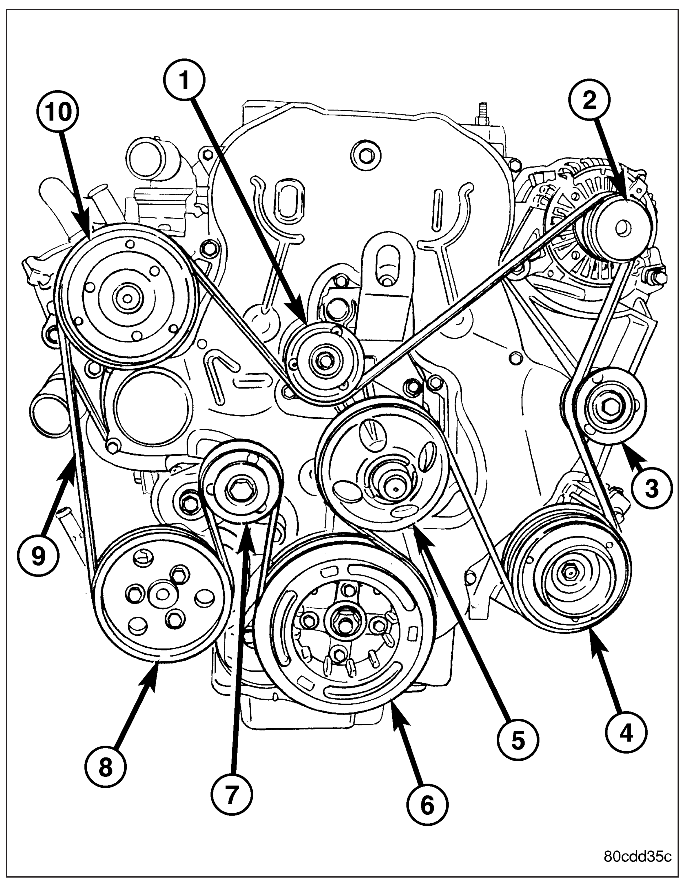
**NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.**

Belt tension is not adjustable. Belt adjustment is maintained by an automatic spring loaded belt tensioner.

1. Check condition of all pulleys.

**CAUTION: When installing the serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.**

2. Install new belt (9). Route the belt around all pulleys except the idler pulley. Rotate the tensioner arm until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.

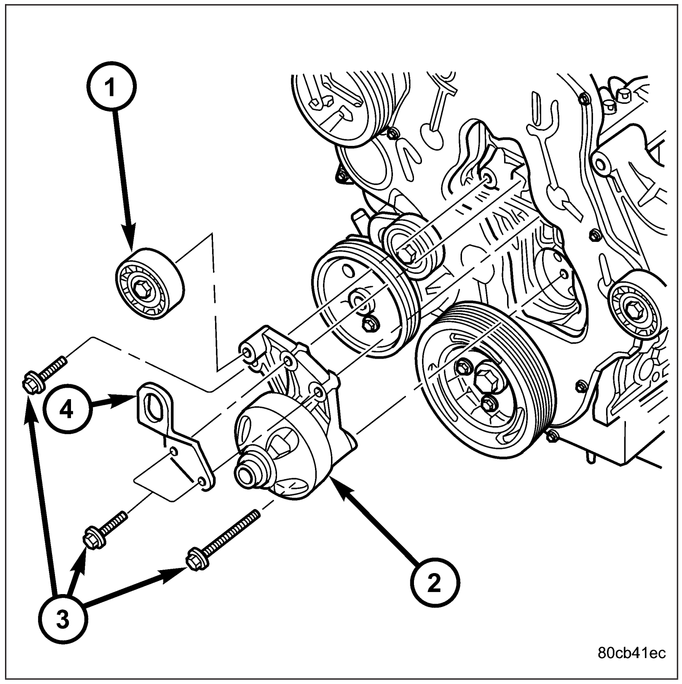


# IDLER PULLEY

## REMOVAL

**CAUTION: The retaining bolts on the idler pulleys are left hand thread.**

1. Disconnect negative battery cable.
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Remove idler pulley (1) retaining bolts and pulleys.



## INSTALLATION

## 2.8L DIESEL

1. Install idler pulleys and retaining bolts. Torque bolts to 53 N·m.
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Connect negative battery cable.

# ENGINE

## TABLE OF CONTENTS

# COOLANT

## DESCRIPTION

## HOAT COOLANT

**WARNING: Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.**

**CAUTION: Use of Propylene-Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.**

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/ fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

**CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.**

## COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

**Pure Water-** Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

**100 percent Ethylene-Glycol -** The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

**50/50 Ethylene-Glycol and Water -** Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

**CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.**

### COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

**CAUTION: Do not use coolant additives that are claimed to improve engine cooling.**

## ENGINE COOLANT

### ETHYLENE-GLYCOL MIXTURES

**CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.**

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The recommended mixture of 50/50 ethylene-glycol and water will provide protection against freezing to -37° C (-35° F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7° C (-90° F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149° C (300° F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at 22° C (-8° F ).

### PROPYLENE-GLYCOL MIXTURES

It's overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32° C (-26° F). 5° C higher than ethylene-glycol's freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125° C (257° F ) at 96.5 kPa (14 psi), compared to 128° C (263° F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up on a cooling system designed for ethylene-glycol. Propylene glycol also has poorer heat transfer characteristics than ethylene glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/ethylene-glycol Mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene glycol.

## OPERATION

Coolant flows through the engine block absorbing the heat from the engine, then flows to the radiator where the cooling fins in the radiator transfers the heat from the coolant to the atmosphere. During cold weather the ethylene-glycol or propylene-glycol coolant prevents water present in the cooling system from freezing within temperatures indicated by mixture ratio of coolant to water.

# COOLANT RECOVERY CONTAINER

## DESCRIPTION

### COOLANT RECOVERY PRESSURE SYSTEM - 3.7L/2.8L DIESEL

This system works on the principal of a closed and deaerated system using thermally generated pressure. The expansion and contraction of the coolant in the pressurized closed system keeps it free of trapped air. It provides:

- A pressurized surge tank volume for expansion and contraction.
- A non-pressurized overflow volume to capture excess coolant expansion and allow for it's return to the pressurized system.
- A pressurized cap on the pressure bottle rather than the radiator. This facilitates deaeration of the system.
- Reserve coolant is included in the pressurized volume to account for minor leaks and evaporation or boiling losses.
- Provides a warning light for low coolant level.

### COOLANT RECOVERY NON-PRESSURE SYSTEM - 2.4L

This system works on the principal of a closed and completely deaerated system using thermally generated pressure. The bottle acts as a reserve coolant source to keep air out of the system but must have a specified minimum amount of coolant in the bottle at all times. The expansion and contraction of the coolant in the pressurized closed coolant loop allows the reserve bottle to accept and give up excess fluid via a hose from the radiator neck. It provides:

- A non-pressurized reserve coolant tank volume for expansion and contraction of coolant.
- A pressurized cap on the radiator. This keeps the main loop of the cooling system at an elevated operating pressure and prevents coolant boiling at lower temperatures. It is the highest point in the 2.4L.
- Reserve coolant is included in the non-pressurized tank in enough quantity to account for minor leaks and evaporation or boiling losses, and to keep the return line back to the radiator full at all times. Failure to do so could allow air to be sucked back into the radiator as the engine and engine coolant cool down and the coolant volume contracts.

# COOLANT RECOVERY PRESSURE CONTAINER

## DESCRIPTION

This system works along with the radiator pressure cap. This is done by using thermal expansion and contraction of the coolant to keep the coolant free of trapped air. It provides:

- A volume for coolant expansion and contraction.
- A convenient and safe method for checking/adjusting coolant level at atmospheric pressure. This is done without removing the radiator pressure cap.
- Some reserve coolant to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Coolant will then be drawn from the coolant tank and returned to a proper level in the radiator.

The coolant reservoir/overflow system has a radiator mounted pressurized cap, an overflow tube, and a plastic coolant reservoir/overflow tank, mounted to the right side of the cowl. It is mounted to the cowl with two nuts on top, and a slide bracket on the bottom.

## OPERATION

## COOLANT RECOVERY PRESSURE SYSTEM - 3.7L/2.8L DIESEL

As the engine warms, the coolant in the closed system expands. The pressurized bottle accepts the expanding fluid. Then, when the thermostat opens and a high demand for coolant is placed on the system, the pressurized surge tank side of the bottle can supply the temporary additional volume of coolant demanded by the system. Once the water pump catches up with the flow demand, the tank returns to equilibrium. A separate compartment in the bottle accepts the overflow coolant which is then drawn back into the primary side of the bottle when the engine and coolant cool down

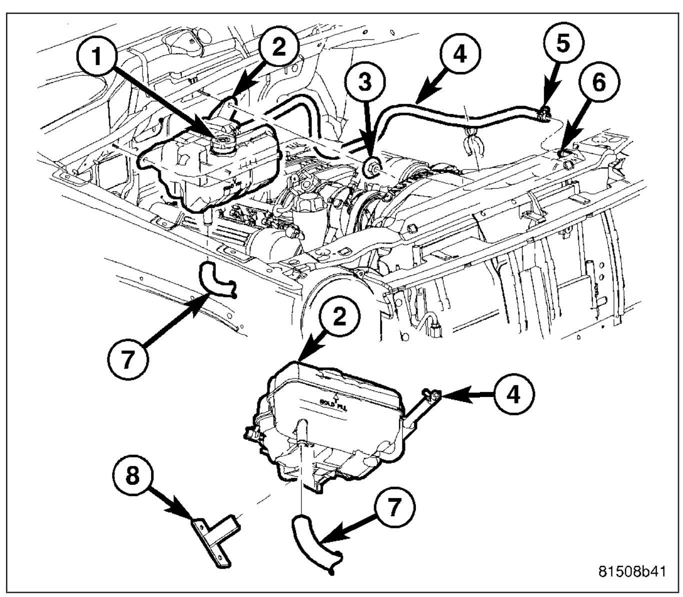
The advantage of the pressurized system is that any excess air in the cooling system is routed to the top of the bottle via a vent hose at the thermostat housing to the bottle. This air accumulates at the top of the pressurized volume in the bottle (the highest point in the system) and is forced out of the system through the pressure cap. This keeps the system properly deaerated and maintains pressure in the cooling system to prevent water pump cavitation

The diesel bottle has an additional vent line back to the radiator that is immersed in the coolant bath at the bottle. This also ensures air at the radiator is routed back to bottle for expulsion and that a constant head of liquid is present at the radiator.

## REMOVAL

## PRESSURE SYSTEM - 3.7L/2.8L DIESEL

1. Remove pressure cap from bottle.
2. Siphon coolant from pressure bottle (2) into a contaminant free container.
3. Disconnect coolant bottle to radiator hose at coolant bottle.
4. Disconnect lower hose at coolant bottle.
5. Remove mounting nuts.
6. Remove coolant bottle from bracket.



# INSTALLATION

## PRESSURE SYSTEM - 3.7L/2.8L DIESEL

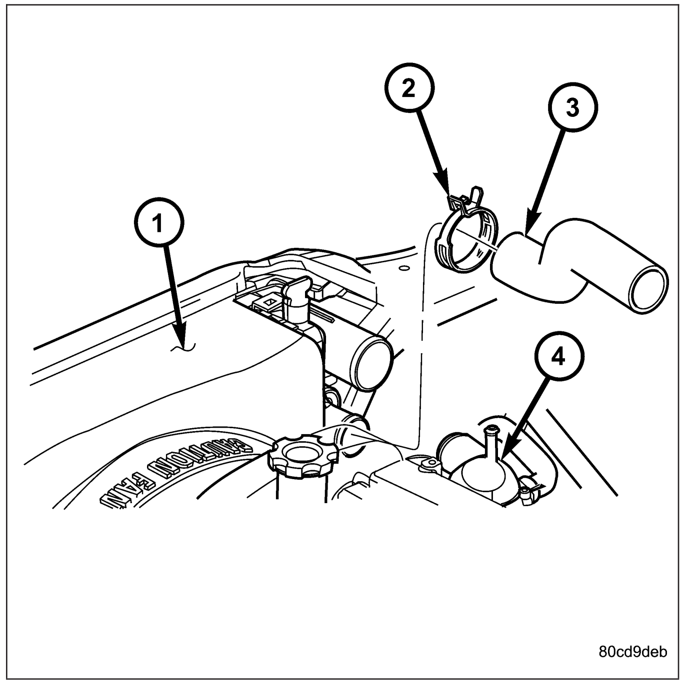
1. Position pressure bottle on mounting bracket.
2. Install mounting nuts. Tighten nuts to 8.5 N·m (75 in. lbs.).
3. Install lower hose at coolant bottle.
4. Install radiator to coolant bottle hose at coolant bottle.
5. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

# COOLANT SYSTEM HOSES-2.8L DIESEL

## REMOVAL

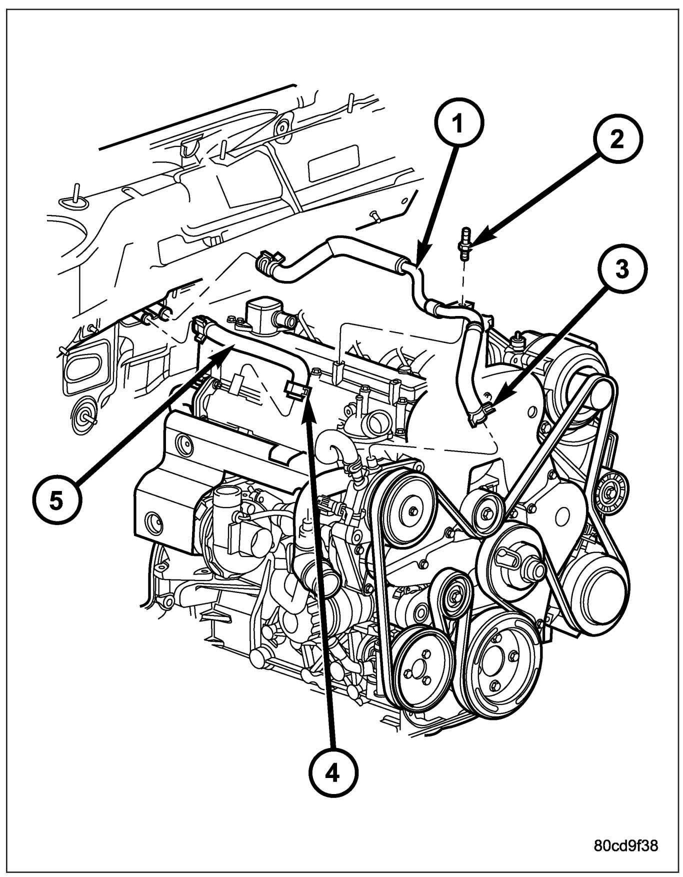
### UPPER RADIATOR HOSE - 2.8L DIESEL

1. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
2. Disconnect upper radiator hose (3) from thermostat housing.
3. Disconnect upper radiator hose from radiator and remove from vehicle.



### HEATER CORE HOSES - 2.8L DIESEL

1. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
2. Remove engine cover from engine (Refer to 9 - ENGINE COVER - REMOVAL).
3. Disconnect heater core supply line at heater core and viscous heater. Remove hose from vehicle.
4. Disconnect heater core return line (5) from heater core and EGR cooler. Remove hose from vehicle.



## INSTALLATION

### UPPER RADIATOR HOSE - 2.8L DIESEL

1. Install upper radiator hose on radiator and thermostat housing.
2. Reposition hose clamps in proper position.
3. Refill cooling system to proper level (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

### HEATER CORE HOSES - 2.8L DIESEL

1. Connect heater core supply hose to heater core and viscous heater. Position hose clamps into proper position.
2. Connect heater core return hose to heater core and EGR cooler. Position hose clamps into proper position.
3. Install engine cover to engine (Refer to 9 - ENGINE COVER - INSTALLATION).
4. Refill cooling system to proper level (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

# ENGINE BLOCK HEATER

## DESCRIPTION

The block heater is operated by ordinary house current (110 Volt A.C.) through a power cord and connector located in the engine compartment. The heater is mounted in a core hole (in place of a core hole plug) in the engine block, with the heating element immersed in coolant.

**CAUTION: The power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds and become damaged.**

## OPERATION

The block heater element is submerged in the cooling system's coolant. When electrical power (110 volt A.C.) is applied to the element, it creates heat. This heat is transferred to the engine coolant. This provides easier engine starting and faster warm-up when vehicle is operated in areas having extremely low temperatures.

## REMOVAL - 3.7L

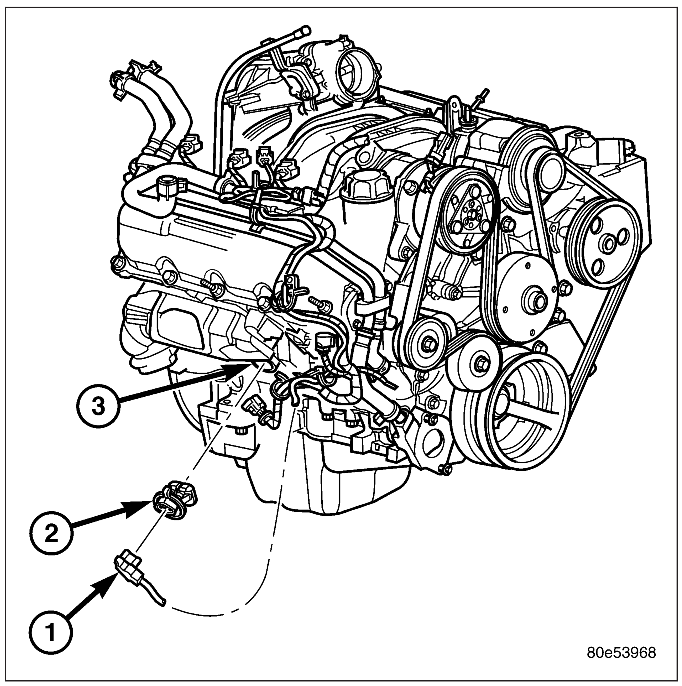
1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Raise vehicle on hoist.
3. Detach power cord plug from heater.
4. Loosen screw in center of heater. Remove heater assembly.

## INSTALLATION - 3.7L

1. Thoroughly clean core hole and heater seat.
2. Insert heater assembly (2) with element loop positioned **upward** .
3. With heater seated, tighten center screw securely to assure a positive seal.

**CAUTION: To prevent damage, the power cord must be secured in it's retaining clips, and not positioned so it could contact linkages or exhaust manifold.**

4. Connect power cord to heater.
5. Lower vehicle.
6. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).



# ENGINE COOLANT TEMPERATURE SENSOR

## DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to sense engine coolant temperature. The sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

## OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- for engine coolant temperature gauge operation through CCD or PCI (J1850) communications
- Injector pulse-width
- Spark-advance curves
- ASD relay shut-down times
- Idle Air Control (IAC) motor key-on steps
- Pulse-width prime-shot during cranking
- O2 sensor closed loop times
- Purge solenoid on/off times
- EGR solenoid on/off times (if equipped)
- Leak Detection Pump operation (if equipped)
- Radiator fan relay on/off times (if equipped)
- Target idle speed

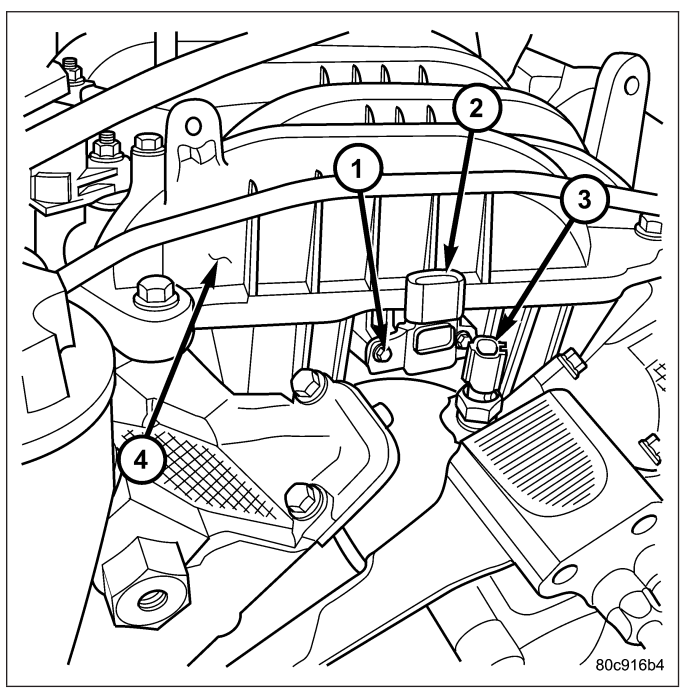
## REMOVAL

## 3.7L ENGINE

The Engine Coolant Temperature (ECT) sensor (3) is installed into a water jacket at front of intake manifold near rear of generator.

**WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.**

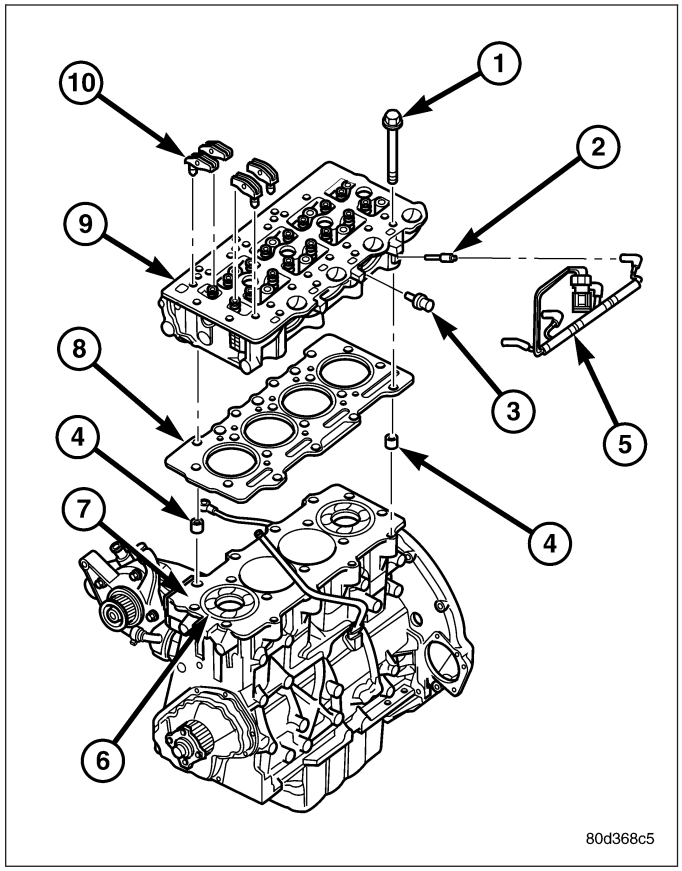
1. Partially drain cooling system.
2. Disconnect electrical connector from sensor.
3. Remove sensor from intake manifold.



## 2.8L DIESEL ENGINE

**WARNING: DO NOT REMOVE OR LOOSEN THE COOLANT PRESSURE/VENT CAP, CYLINDER BLOCK DRAIN PLUGS, OR THE DRAINCOCK WHEN THE SYSTEM IS HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.**

1. Disconnect negative battery cable.
2. Drain the cooling system. (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE)
3. Disconnect coolant temperature sensor electrical connector.
4. Remove coolant temperature sensor (3) from cylinder head.



## INSTALLATION

## 3.7L ENGINE

1. Apply thread sealant to sensor threads.
2. Install sensor to engine.
3. Tighten coolant temperature sensor to 11 N·m (8 ft. lbs.) torque.
4. Replace any lost engine coolant.

## 2.8L DIESEL ENGINE

1. Install coolant temperature sensor in thermostat housing.
2. Connect coolant temperature sensor electrical connector.
3. Refill cooling system. (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE)
4. Connect negative battery cable.

# ENGINE COOLANT THERMOSTAT

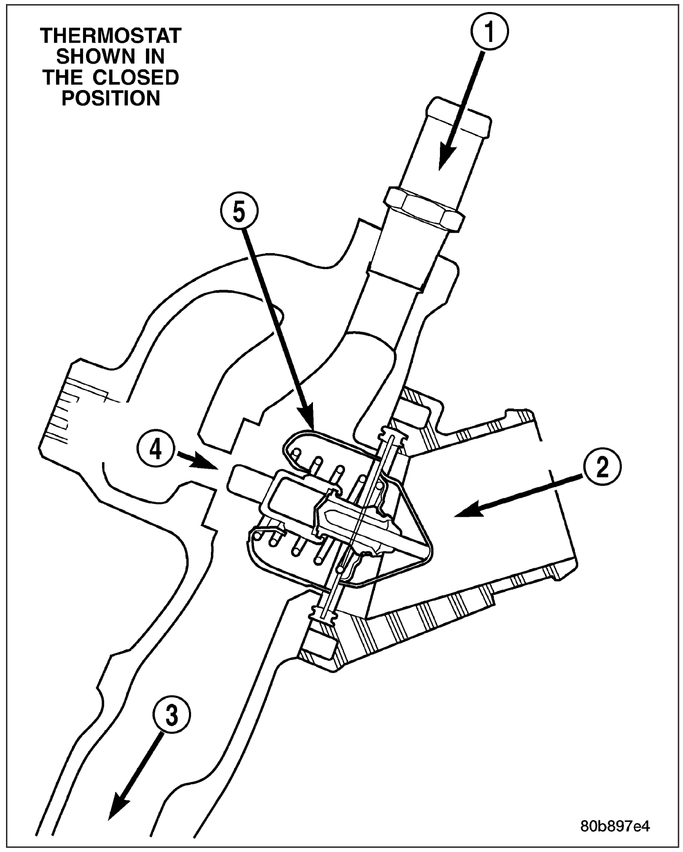
## DESCRIPTION

## DESCRIPTION - 3.7L ENGINE

**CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.**

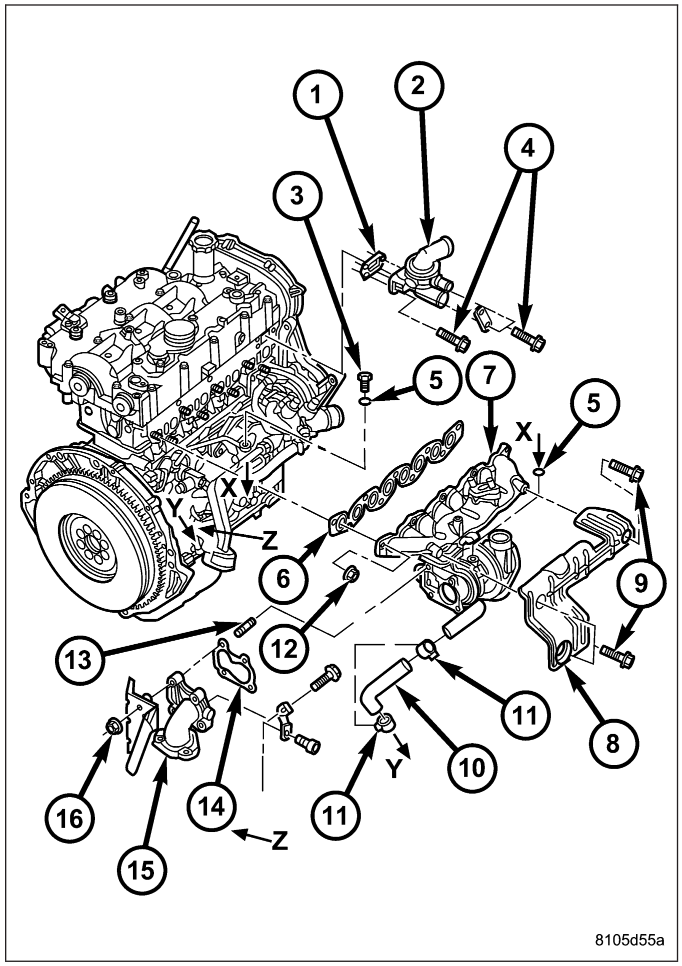
A pellet-type thermostat (5) controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator. On all engines the thermostat is closed below 195°F (90°C). Above this temperature, coolant is allowed to flow to the radiator. This provides quick engine warm up and overall temperature control. On the 3.7L engine the thermostat is designed to block the flow of the coolant bypass journal by 50% instead of completely blocking the flow. This design controls coolant temperature more accurately.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.



## DESCRIPTION

A pellet-type thermostat (2) controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator.



## OPERATION

The thermostat starts to open at 80°C (176°F). Above this temperature, coolant is allowed to flow to the radiator. This provides quicker engine warmup and overall temperature control.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.

## DIAGNOSIS AND TESTING - THERMOSTAT

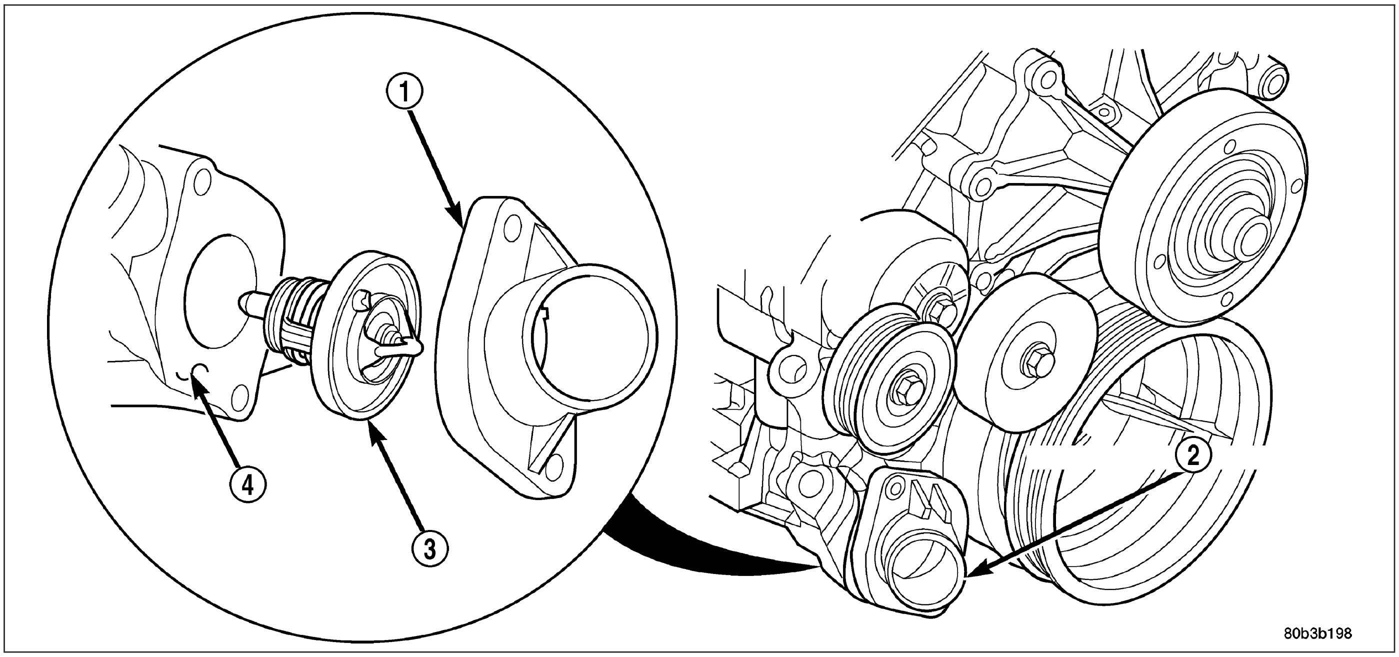
### ON-BOARD DIAGNOSTICS

All models are equipped with On-Board Diagnostics for certain cooling system components. If the powertrain control module (PCM) detects low engine coolant temperature, it will record a Diagnostic Trouble Code (DTC). For other DTC numbers, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

The DTC can also be accessed through the DRB scan tool.

## REMOVAL

## 3.7L ENGINE



**WARNING: DO NOT LOOSEN RADIATOR DRAINCOCK WITH SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN OCCUR.**

Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

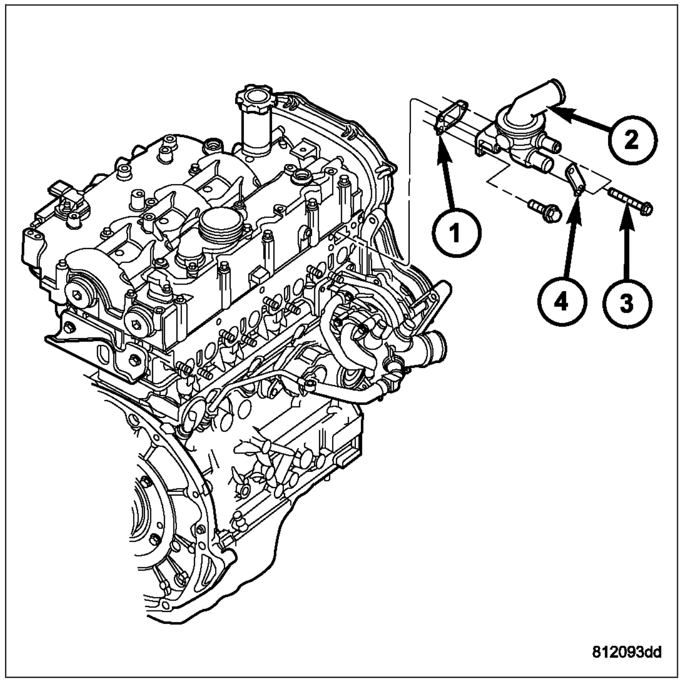
If thermostat (3) is being replaced, be sure that replacement is specified thermostat for vehicle model and engine type.

1. Disconnect negative battery cable at battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Raise vehicle on hoist.
4. Remove splash shield.
5. Remove lower radiator hose clamp and lower radiator hose at thermostat housing.
6. Remove thermostat housing mounting bolts, thermostat housing and thermostat.

## 2.8L DIESEL ENGINE

**NOTE: The thermostat is not serviced separately. The thermostat and housing must be replaced as an assembly.**

1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
3. Partially drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
4. Disconnect upper radiator hose and bypass hoses at thermostat housing (2).
5. Remove thermostat housing retaining bolts, support bracket (2.8L) and housing from cylinder head, discard gasket.



## INSTALLATION

## 3.7L ENGINE

1. Clean mating areas of timing chain cover and thermostat housing.
2. Install thermostat (spring side down) into recessed machined groove on housing assembly. Make sure rubber seal locating tab is positioned in the corresponding notch in the housing.
3. Position thermostat housing on timing chain cover.
4. Install two housing-to-timing chain cover bolts. Tighten bolts to 12 N·m (105 in. lbs.) torque.
5. Install lower radiator hose on thermostat housing.
6. Install splash shield.
7. Lower vehicle.
8. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
9. Connect negative battery cable to battery.
10. Start and warm the engine. Check for leaks.

## 2.8L DIESEL ENGINE

1. Clean old gasket material from cylinder head and thermostat housing.
2. Install thermostat housing with gasket and support bracket (2.8 L) to cylinder head. Torque bolts to 27 N·m.
3. Connect coolant bypass hose and upper radiator hose to thermostat housing.
4. Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
5. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
6. Connect negative battery cable.

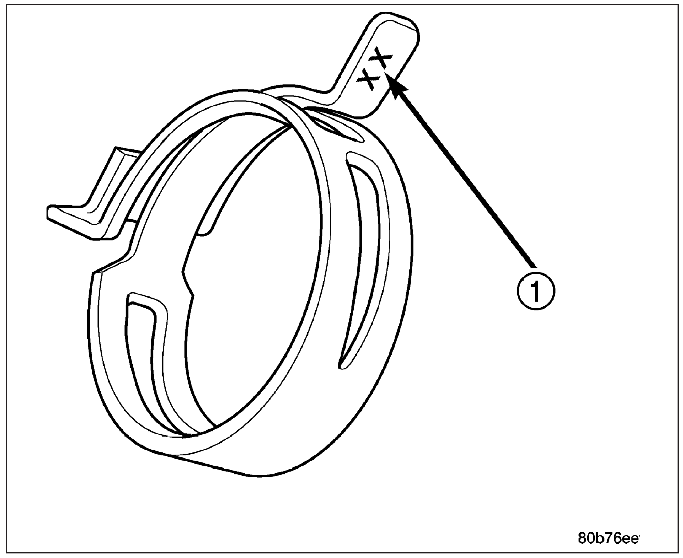
# HOSE CLAMPS

## DESCRIPTION - HOSE CLAMPS

The cooling system utilizes spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp.

**WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL NUMBER 6094.. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.**

**CAUTION: A number or letter is stamped into the tongue (1) of constant tension clamps. If replacement is necessary, use only a original equipment clamp with matching number or letter.**



## OPERATION - HOSE CLAMPS

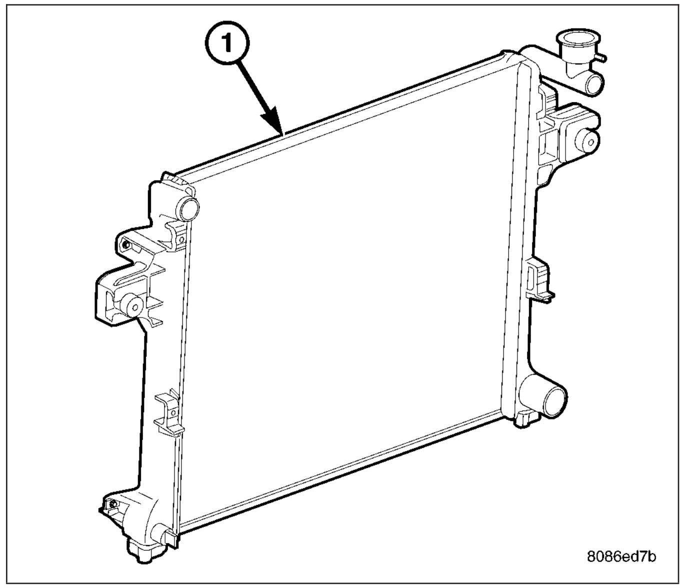
The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, only use constant tension clamp pliers designed to compress the hose clamp.

# RADIATOR

## DESCRIPTION

All vehicles are equipped with a cross flow type radiator (1) with plastic side tanks.

Plastic tanks, while stronger than brass, are subject to damage by impact, such as from tools or wrenches. Handle radiator with care.

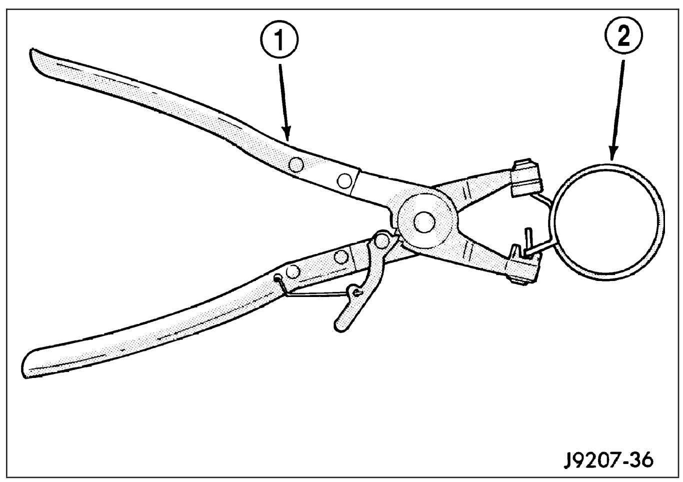


## REMOVAL

## 3.7L/2.8L DIESEL ENGINES

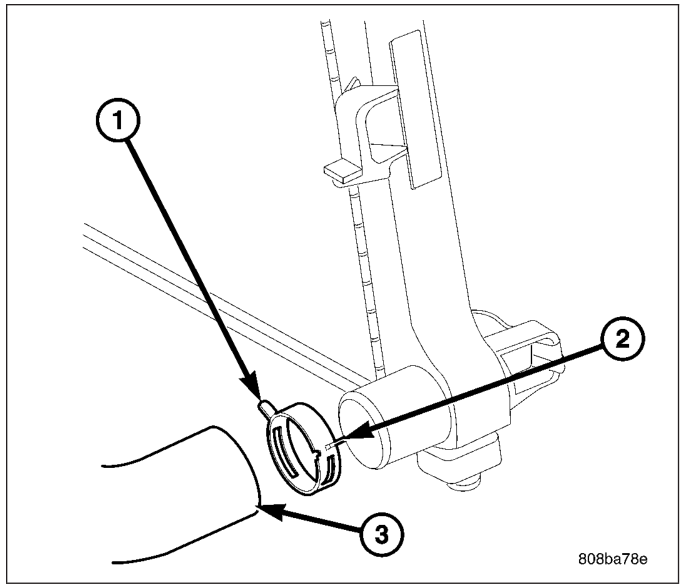
**WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR. REFER TO COOLING SYSTEM DRAINING.**

Do not waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

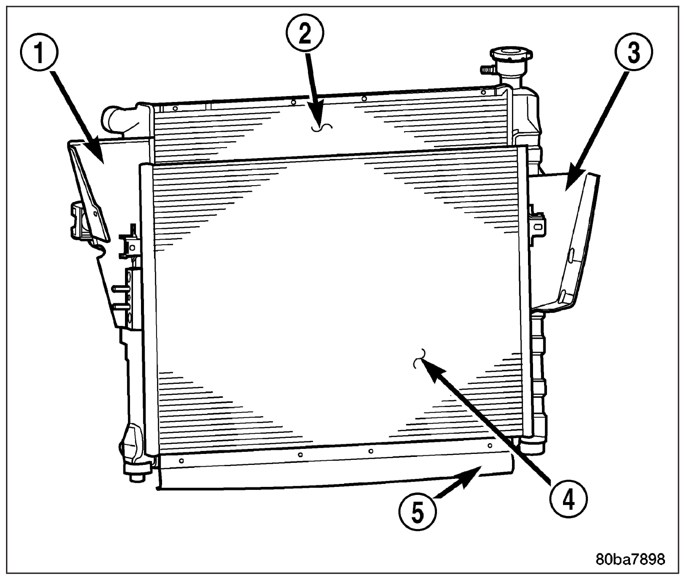


**WARNING: CONSTANT TENSION HOSE CLAMPS (2) ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL NUMBER 6094. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.**

**CAUTION: A number or letter is stamped (2) into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with matching number or letter.**



**CAUTION: When removing the radiator or A/C condenser for any reason, note the location of all radiator-to-body and radiator-to-A/C condenser rubber air seals. These are used at the top, bottom and sides of the radiator and A/C condenser. To prevent overheating, these seals must be installed to their original positions.**



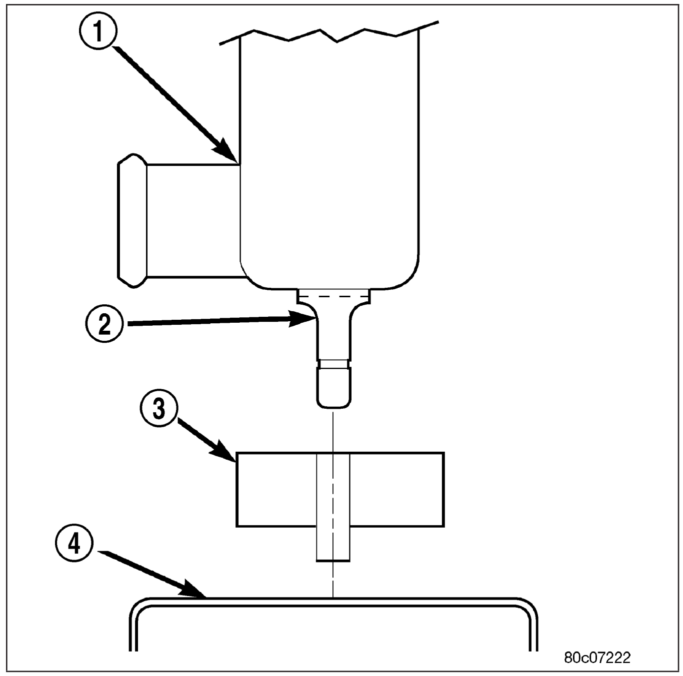
1. Disconnect the negative battery cable at battery.
2. Drain coolant from radiator (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove the front grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
4. Remove the cooling fan from the engine, if equipped.
5. Remove the two radiator mounting bolts.
6. Disconnect the connector for the electric fan.
7. Disconnect the power steering cooler line from cooler.
8. Disconnect the radiator upper and lower hoses.
9. Disconnect the overflow hose from radiator (2).

10. The lower part of radiator is equipped with two alignment dowel pins (2) . They are located on the bottom of radiator tank and fit into rubber grommets. These rubber grommets are pressed into the radiator lower crossmember.

**WARNING: THE AIR CONDITIONING SYSTEM (IF EQUIPPED) IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE OFF. REFER TO REFRIGERANT WARNINGS IN, HEATING AND AIR CONDITIONING BEFORE HANDLING ANY AIR CONDITIONING COMPONENT.**

**NOTE: The radiator and radiator cooling fan can be removed as an assembly. It is not necessary to remove the cooling fan before removing or installing the radiator.**

11. Gently lift up and remove radiator from vehicle. Be careful not to scrape the radiator fins against any other component. Also be careful not to disturb the air conditioning condenser (if equipped).



## CLEANING

Clean radiator fins With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

## INSPECTION

The radiator cooling fins should be checked for damage or deterioration. Inspect cooling fins to make sure they are not bent or crushed, these areas result in reduced heat exchange causing the cooling system to operate at higher temperatures. Inspect the plastic end tanks for cracks, damage or leaks.

Inspect the radiator neck for damage or distortion.

## INSTALLATION

## 3.7L/2.8L DIESEL ENGINES

**CAUTION: Before installing the radiator or A/C condenser, be sure the radiator-to-body and radiator-to-A/C condenser rubber air seals are properly fastened to their original positions. These are used at the top, bottom and sides of the radiator and A/C condenser. To prevent overheating, these seals must be installed to their original positions.**

1. Gently lower the radiator and fan shroud into the vehicle. Guide the two radiator alignment dowels into the rubber grommets located in lower radiator crossmember.
2. Connect the radiator upper and lower hoses and hose clamps to radiator.

**CAUTION: The tangs on the hose clamps must be positioned straight down.**

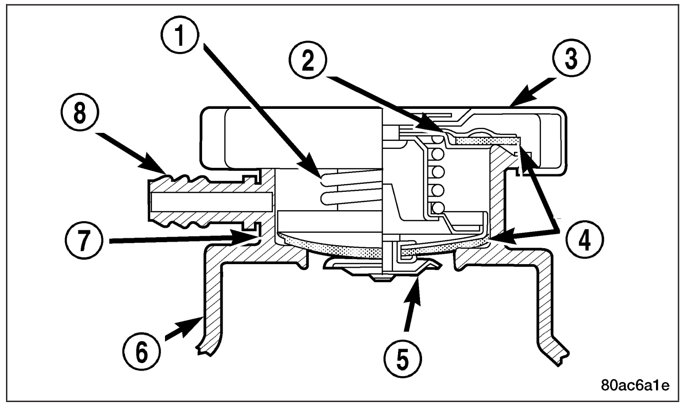
3. Install coolant reserve/overflow tank hose at radiator.
4. Install both radiator mounting bolts.
5. Reconnect the electric cooling fan.
6. Install the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
7. Reinstall the cooling fan to the engine.
8. Rotate the fan blades (by hand) and check for interference at fan shroud.
9. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

10. Connect battery cable at battery.
11. Start and warm engine. Check for leaks.

# RADIATOR PRESSURE CAP

## DESCRIPTION

The cooling system cap is located on the coolant pressure bottle for 3.7L/2.8L Diesel engine and the radiator for the 2.4L engine. The cap construction includes; stainless steel swivel top, rubber seals and retainer, main spring (1), and a spring loaded valve.



## OPERATION

The pressure cap allows the cooling system to operate at higher than atmospheric pressure which raises the coolant boiling point, thus allowing increased radiator cooling capacity. The pressure cap releases pressure at some point within a range of 110 kPa ± 14 kPa (16 psi ± 2 psi).

A spring-loaded vent valve in the center of the cap allows the system to pressurize and depressurize without creating a vacuum. If the valve is stuck open, coolant will escape to the overflow hose. There is also a gasket in the cap to seal to the top of the filler neck.

**CAUTION: Use only the pressure cap specified for this vehicle. Use of other pressure caps can lead to coolant loss and overheating.**

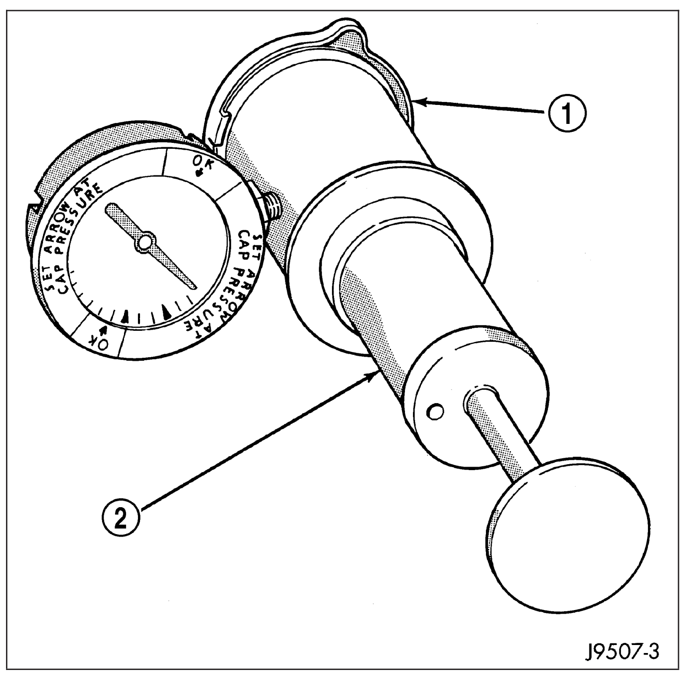
## DIAGNOSIS AND TESTING

## RADIATOR PRESSURE CAP - GAS ENGINES

Remove cap (1) from pressure bottle or radiator as appropriate. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install the cap on pressure tester (tool 7700 or an equivalent).

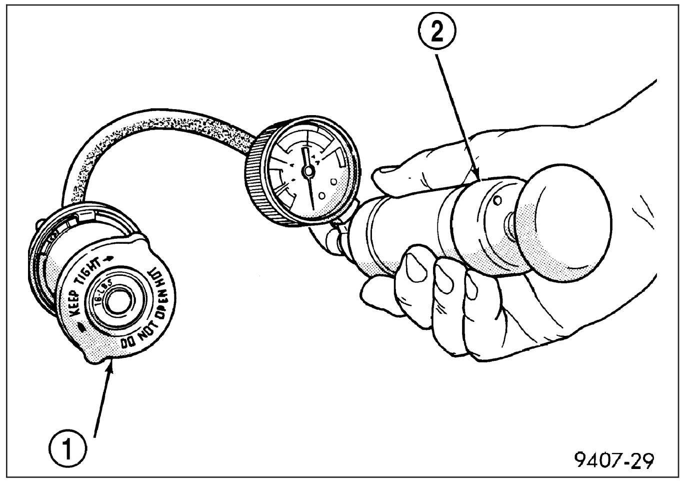
Operate the tester pump (2) and observe the gauge pointer at its highest point. The cap release pressure should be 124 to 145 kPa (18 to 21 psi). The cap is satisfactory when the pressure holds steady. It is also good if it holds pressure within the 124 to 145 kPa (18 to 21 psi) range for 30 seconds or more. If the pointer drops quickly, replace the cap.

**CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.**



## RADIATOR PRESSURE CAP - 3.7L/2.8L DIESEL

Dip the pressure cap (1) in water. Clean any deposits off the vent valve or its seat and apply cap to end of the Pressure Cap Test Adaptor that is included with the Cooling System Tester 7700. Working the plunger, bring the pressure to 104 kPa (15 psi) on the gauge. If the pressure cap fails to hold pressure of at least 97 kPa (14 psi), replace the pressure cap.

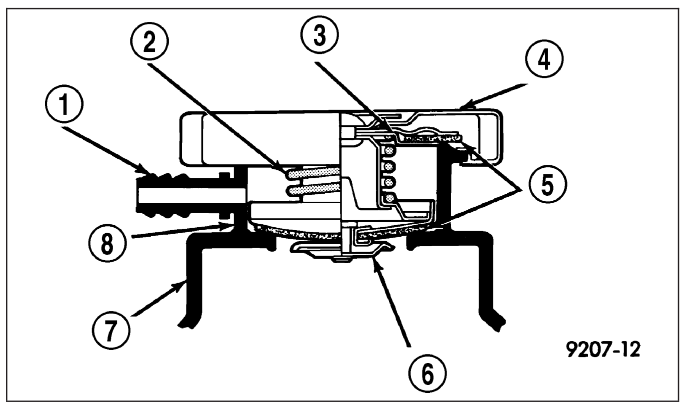


**CAUTION: The Cooling System Tester Tool is very sensitive to small air leaks that will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to the tool. Turn tool upside down and recheck pressure cap to confirm that cap is bad.**

If the pressure cap tests properly while positioned on Cooling System Tester (2) , but will not hold pressure or vacuum when positioned on the filler neck. Inspect the filler neck and cap top gasket for irregularities that may prevent the cap from sealing properly.

## PRESSURE RELIEF TEST - 3.7L/2.8L DIESEL

The pressure cap upper gasket (seal) pressure relief can be checked by removing the overflow hose at the radiator filler neck nipple. Attach the Radiator Pressure Tool to the filler neck nipple (1) and pump air into the radiator. Pressure cap upper gasket should relieve at 69-124 kPa (10-18 psi) and hold pressure at 55 kPa (8 psi) minimum.



**WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE RADIATOR PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, THE RADIATOR CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT OR UNDER PRESSURE.**

There is no need to remove the radiator cap at any time **except** for the following purposes:

1. Check and adjust coolant freeze point.
2. Refill system with new coolant.
3. Conducting service procedures.
4. Checking for vacuum leaks.

**WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT 15 MINUTES BEFORE REMOVING CAP. THEN PLACE A SHOP TOWEL OVER THE CAP AND WITHOUT PUSHING DOWN ROTATE COUNTERCLOCKWISE TO THE FIRST STOP. ALLOW FLUIDS TO ESCAPE THROUGH THE OVERFLOW TUBE AND WHEN THE SYSTEM STOPS PUSHING COOLANT AND STEAM INTO THE CRS TANK AND PRESSURE DROPS PUSH DOWN AND REMOVE THE CAP COMPLETELY. SQUEEZING THE RADIATOR INLET HOSE WITH A SHOP TOWEL (TO CHECK PRESSURE) BEFORE AND AFTER TURNING TO THE FIRST STOP IS RECOMMENDED.**

## CLEANING

Clean the radiator pressure cap using a mild soap and water only.

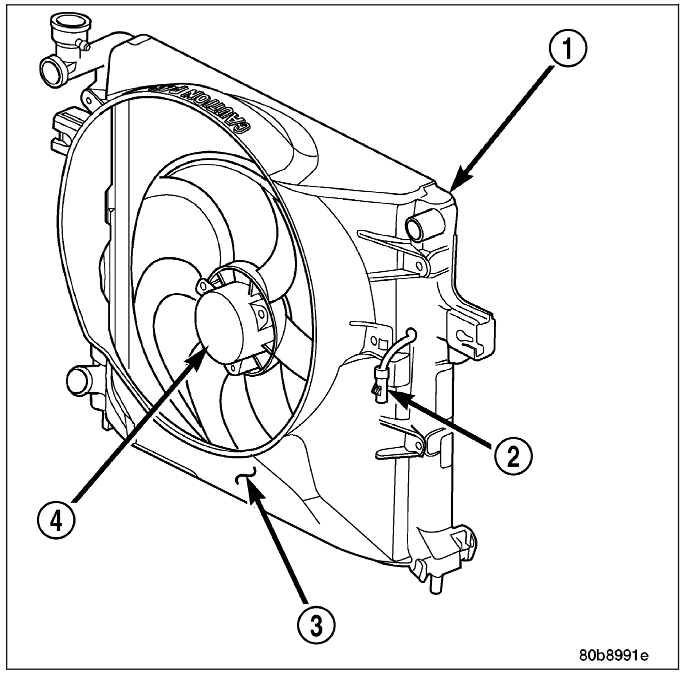
## INSPECTION

Visually inspect the pressure valve gasket on the cap. Replace cap if the gasket is swollen, torn or worn. Inspect the area around radiator filler neck for white deposits that indicate a leaking cap.

# RADIATOR FAN - ELECTRIC

## DESCRIPTION

The fan (4) is electrically controlled by the powertrain control module (PCM) through the fan control relays. The relays are located in the power distribution center (PDC) in the engine compartment.



## OPERATION

The electric radiator cooling fan is controlled by the Powertrain Control Module (PCM) through the radiator cooling fan relays. The PCM regulates fan operation based on input from the engine coolant temperature sensor, battery temperature sensor,air conditioning select switch and vehicle speed.

The fan is not energized during engine cranking regardless of the electrical input from the temperature sensors and air conditioning switch. However, if engine operation conditions warrant fan engagement, the fan will run once engine starts.

**On vehicles NOT equipped with AC:** The relay is energized when the coolant temperature is above 80° C (176° F), or battery temperature sensor above –12° C (10° F). It will then de-energize when coolant temperature drops below 82° C (180° F), or battery temperature sensor below –9° C (16° F).

**Vehicles Equipped with AC:** In addition to using coolant temperature and battery temperature sensor to control cooling fan operation, the cooling fan will also be engaged when the ,air conditioning system is activated. The relay is also energized when air conditioning is selected and coolant temperature is above 95° C (203° F), or , air conditioning is selected and battery temperature sensor is above 41° C (106° F). It will then de-energize when air conditioning is selected and coolant temperature is below 92° C (198° F), or air conditioning is selected and battery temperature is below 38° C (100° F).

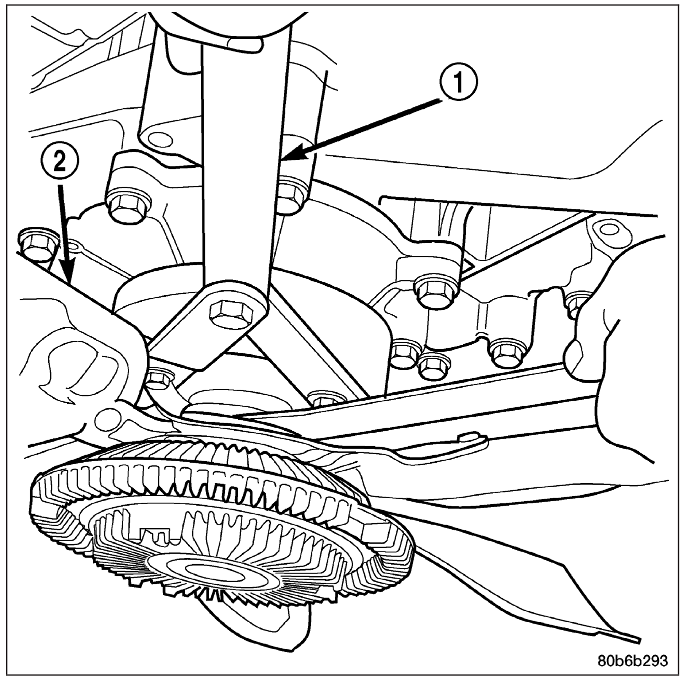
## REMOVAL

## 3.7L ENGINE

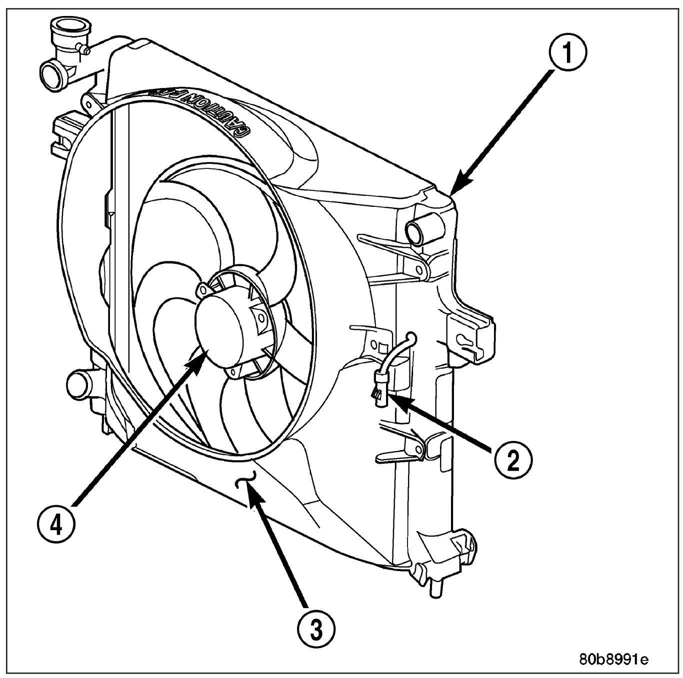
If the fan blade is bent, warped, cracked or damaged in any way, it must be replaced **only** with a replacement fan blade. **Do not attempt to repair a damaged fan blade.**

**NOTE: For 3.7L Heavy Duty/Max Cool/Trailer Tow cooling package, the viscous fan cannot be removed separate from the shroud. Both fan and shroud must be removed together.**

1. Disconnect battery negative cable.
2. Using special tool 6958 spanner wrench and 8346 adapters, remove the viscous fan from the water pump.



3. Gently lay fan into shroud.
4. Disconnect the electrical connector (2) for the electric fan, then disconnect connector from shroud.
5. Remove the two fan shroud mounting bolts connecting the fan shroud to the radiator.
6. Remove the shroud and fan from the vehicle.



## INSTALLATION

## 3.7L ENGINE

**NOTE: For 3.7L Heavy Duty/Max Cool/Trailer Tow cooling package, the viscous fan cannot be installed separate from the shroud. Both fan and shroud must be installed together.**

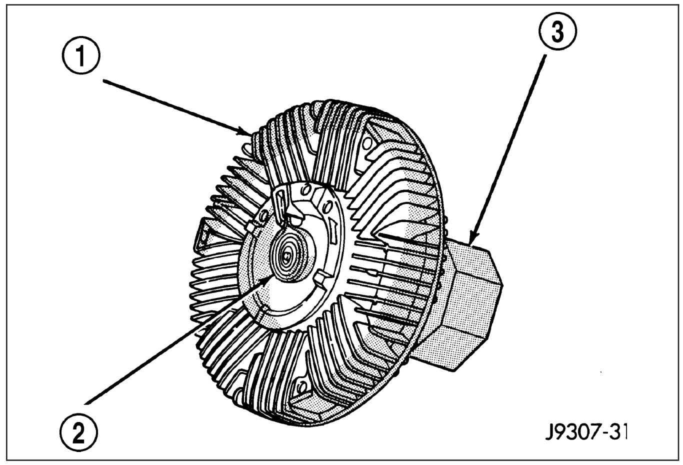
1. Gently lay viscous fan into shroud.
2. Install fan shroud assembly into the vehicle. Tighten fan shroud to radiator bolts to (5.5 N·m (50 in. lbs.).

3. Using special tool 6958 spanner wrench and 8346 adapters, install the viscous fan on the water pump.
4. Connect fan motor wire connector to harness connector, and attach connector to shroud.
5. Connect battery negative cable.
6. Start engine and check fan operation.

# RADIATOR - FAN - VISCOUS

## DESCRIPTION

**CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.**



The thermal viscous fan drive (1) is a silicone-fluid-filled coupling used to connect the fan blades to the water pump shaft. The coupling allows the fan to be driven in a normal manner. This is done at low engine speeds while limiting the top speed of the fan to a predetermined maximum level at higher engine speeds.

On the 3.7L engine, an electric fan is standard and the viscous fan is added on for trailer tow packages only.

On the 2.8L diesel engine, the viscous is standard.

## OPERATION

A thermostatic bimetallic spring coil is located on the front face of the viscous fan drive unit. This spring coil reacts to the temperature of the radiator discharge air. It engages the viscous fan drive for higher fan speed if the air temperature from the radiator rises above a certain point. Until additional engine cooling is necessary, **the fan will remain at a reduced rpm regardless of engine speed. Normally less than 800 rpm.**

Only when sufficient heat is present, will the viscous fan drive engage. This is when the air flowing through the radiator core causes a reaction to the bimetallic coil. It then increases fan speed to provide the necessary additional engine cooling.

Once the engine has cooled, the radiator discharge temperature will drop. The bimetallic coil again reacts and the fan speed is reduced to the previous disengaged speed.

## DIAGNOSIS AND TESTING

## VISCOUS FAN DRIVE

If the fan assembly free-wheels without drag (the fan blades will revolve more than five turns when spun by hand), replace the fan drive. This spin test must be performed when the engine is cool.

For the following test, the cooling system must be in good condition. It also will ensure against excessively high coolant temperature.

**WARNING: BE SURE THAT THERE IS ADEQUATE FAN BLADE CLEARANCE BEFORE DRILLING.**

1. Drill a 3.18-mm (1/8-in) diameter hole in the top center of the fan shroud.
2. Obtain a dial thermometer with an 8 inch stem (or equivalent). It should have a range of -18° to 105°C (0° to 220° F). Insert thermometer through the hole in the shroud. Be sure that there is adequate clearance from the fan blades.
3. Connect a tachometer and an engine ignition timing light (timing light is to be used as a strobe light).
4. Block the air flow through the radiator. Secure a sheet of plastic in front of the radiator (or air conditioner condenser). Use tape at the top to secure the plastic and be sure that the air flow is blocked.
5. Be sure that the air conditioner (if equipped) is turned off.

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.**

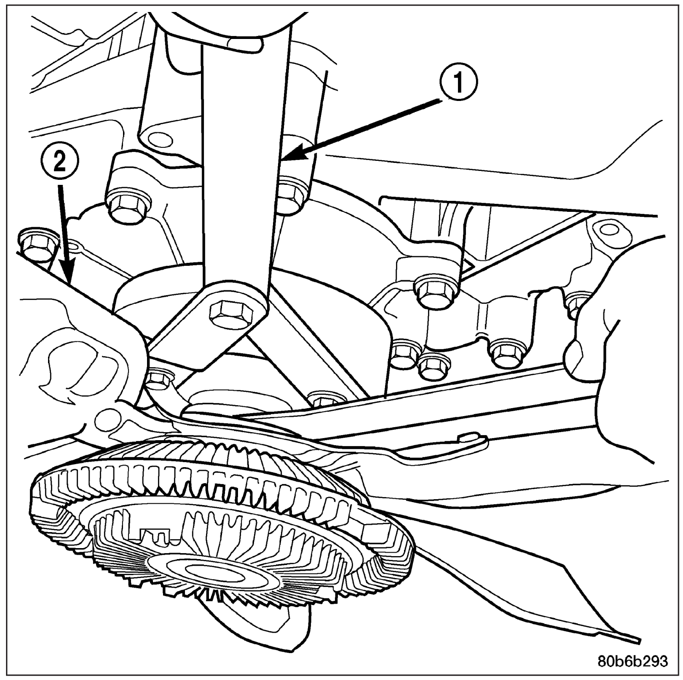
6. Start the engine and operate at 2400 rpm. Within ten minutes the air temperature (indicated on the dial thermometer) should be up to 93° C (200° F). Fan drive **engagement** should have started to occur at between 91° to 96° C (195° to 205° F). Engagement is distinguishable by a definite **increase** in fan flow noise (roaring). The timing light also will indicate an increase in the speed of the fan.
7. When the air temperature reaches 93° C (200° F), remove the plastic sheet. Fan drive **disengagement** should have started to occur at between 62° to 85° C (145° to 185° F). A definite **decrease** of fan flow noise (roaring) should be noticed. If not, replace the defective viscous fan drive unit.

## REMOVAL

## 3.7L ENGINE

1. Disconnect negative battery cable from battery.

**NOTE: The thermal viscous fan drive/fan blade assembly is attached (threaded) to water pump hub shaft.**



2. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Remove fan blade/viscous fan drive assembly from water pump using special tool 6958 spanner wrench and 8346 adapters(1) , by turning mounting nut counterclockwise as viewed from front. Threads on viscous fan drive (2) are **RIGHT HAND.**
4. Do not attempt to remove fan/viscous fan drive assembly from vehicle at this time.
5. Do not unbolt fan blade assembly from viscous fan drive at this time.
6. Remove fan shroud to radiator bolts.
7. Remove fan shroud and fan blade/viscous fan drive assembly as a complete unit from vehicle.
8. After removing fan blade/viscous fan drive assembly, **do not** place viscous fan drive in horizontal position. If stored horizontally, silicone fluid in the viscous fan drive could drain into its bearing assembly and contaminate lubricant.

**CAUTION: Do not remove water pump pulley-to-water pump bolts. This pulley is under belt tension.**

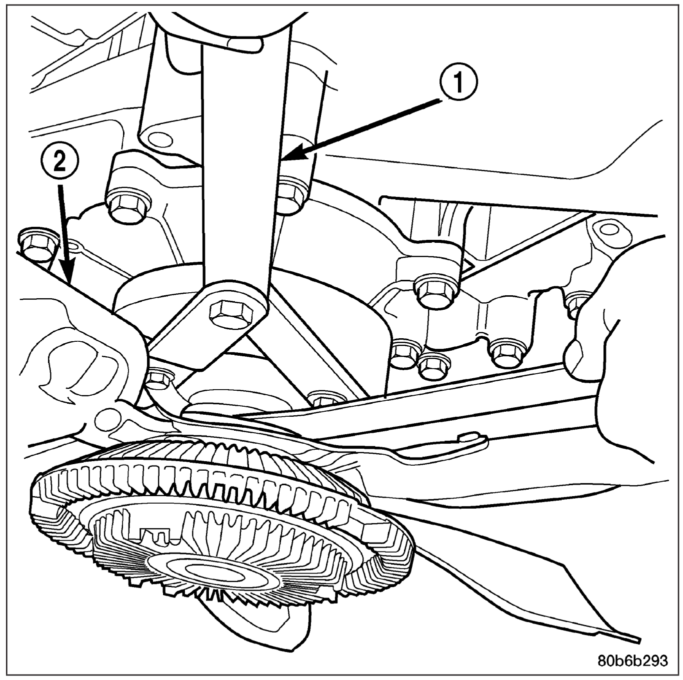
9. Remove four bolts securing fan blade assembly to viscous fan drive.

## 2.8L DIESEL

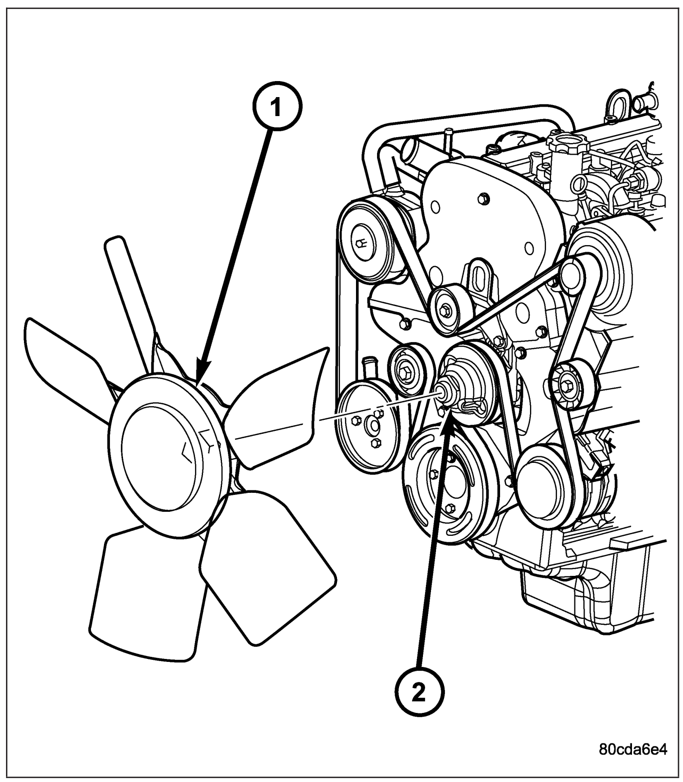
1. Disconnect negative battery cable.

**NOTE: The thermal viscous fan drive/fan blade assembly is attached (threaded) to fan support.**

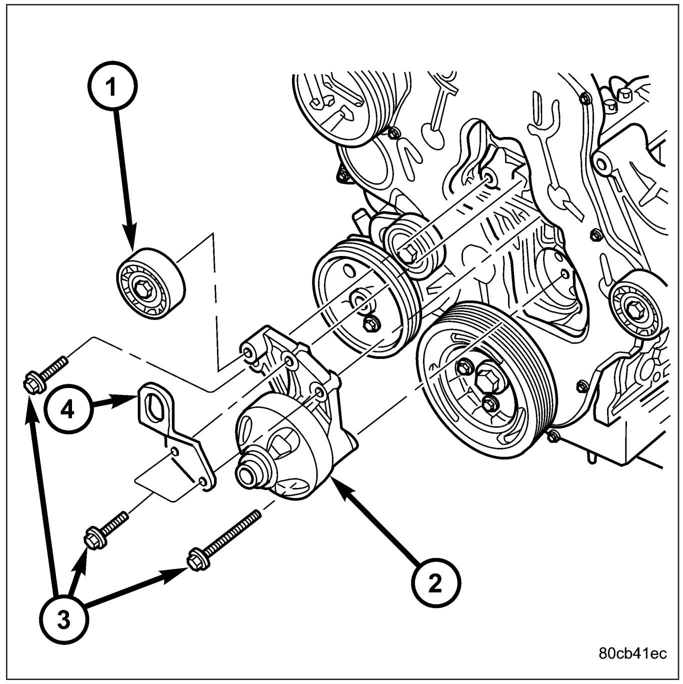
2. Remove fan blade/viscous fan drive assembly from water pump using special tool 6958 spanner wrench, by turning mounting nut counterclockwise as viewed from front. Threads on viscous fan drive are **RIGHT HAND.**



3. Do not attempt to remove fan/fan drive viscous clutch assembly (1) from vehicle at this time.
4. Do not unbolt fan blade assembly from fan drive viscous clutch at this time.



5. Remove fan shroud to radiator bolts.
6. Remove fan shroud and fan blade/fan drive viscous clutch assembly as a complete unit from vehicle.
7. After removing fan blade/fan drive viscous clutch assembly, **do not** place viscous clutch in horizontal position. If stored horizontally, silicone fluid in the fan drive viscous clutch could drain into its bearing assembly and contaminate lubricant.
8. Remove four bolts securing fan blade assembly to fan drive viscous clutch.
9. Remove cooling fan support (2) from engine block.



## CLEANING

Clean the fan blades using a mild soap and water. Do not use an abrasive to clean the blades.

## INSPECTION

**WARNING: DO NOT ATTEMPT TO BEND OR STRAIGHTEN FAN BLADES IF FAN IS NOT WITHIN SPECIFICATIONS.**

**CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.**

1. Remove fan blade assembly from viscous fan drive unit (four bolts).
2. Lay fan on a flat surface with leading edge facing down. With tip of blade touching flat surface, replace fan if clearance between opposite blade and surface is greater than 2.0 mm (.090 inch). Rocking motion of opposite blades should not exceed 2.0 mm (.090 inch). Test all blades in this manner.
3. Inspect fan assembly for cracks, bends, loose rivets or broken welds. Replace fan if any damage is found.

## INSTALLATION

## 3.7L ENGINE

1. Assemble fan blade to viscous fan drive. Tighten mounting bolts to 23.7 N·m (210 in. lbs.) torque.

**NOTE: The viscous fan and fan shroud must be installed as an assembly.**

2. Gently lay viscous fan into fan shroud.
3. Install the fan shroud to radiator mounting bolts. Tighten bolts to 9 N·m (80 in·lbs).
4. Thread the fan and fan drive onto the water pump pulley, and tighten nut using special tool 6958 spanner wrench and 8346 adapters.
5. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

**CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) for correct belt routing.**

## 2.8L DIESEL

1. Assemble fan blade to viscous fan drive. Tighten mounting bolts to 23.7 N·m (210 in. lbs.) torque.

**NOTE: The viscous fan and fan shroud must be installed as an assembly.**

2. Gently lay fan and viscous drive into fan shroud.
3. Install the fan shroud to radiator mounting bolt. Tighten bolts to 9 N·m (80 in. lbs.) torque..
4. Thread the fan and viscous drive onto the fan support and tighten nut using special tool 6958 spanner wrench.
5. Install cooling fan support to engine block. Torque bolts to 149 N·m.(110 ft. lbs.).
6. Install fan drive viscous clutch and fan assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
7. Connect negative battery cable.

# WATER PUMP

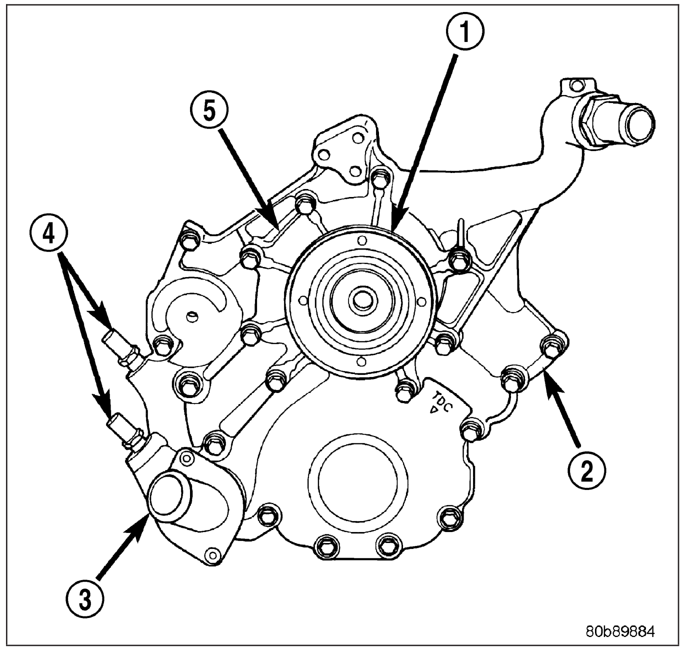
## DESCRIPTION

### 3.7L ENGINE

A centrifugal water pump (5) circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core. The pump is driven from the engine crankshaft by a single serpentine drive belt.

The water pump impeller is pressed onto the rear of a shaft that rotates in bearings pressed into the housing. The housing has two small holes to allow seepage to escape. The water pump seals are lubricated by the antifreeze in the coolant mixture. No additional lubrication is necessary.

Both heater hoses are connected to fittings on the timing chain front cover. The water pump is also mounted directly to the timing chain cover and is equipped with a non serviceable integral pulley.



### 2.8L DIESEL ENGINE

The water pump on the 2.8L CRD diesel has a die cast aluminum housing. It bolts to a aluminum housing which attaches to the engine block.

## DESCRIPTION - WATER PUMP BYPASS - 3.7L

The 3.7L engine uses an internal water/coolant bypass system. The design uses galleries in the timing chain cover to circulate coolant during engine warm-up preventing the coolant from flowing through the radiator. The thermostat uses a stub shaft located at the rear of the thermostat to control flow through the bypass gallery.

## OPERATION

### 2.8L DIESEL ENGINE

The water pump is used to circulate coolant through the cooling system. The coolant is pumped through the engine block, cylinder head, heater core, EGR cooler, viscous heater, and radiator.

### 3.7L ENGINES

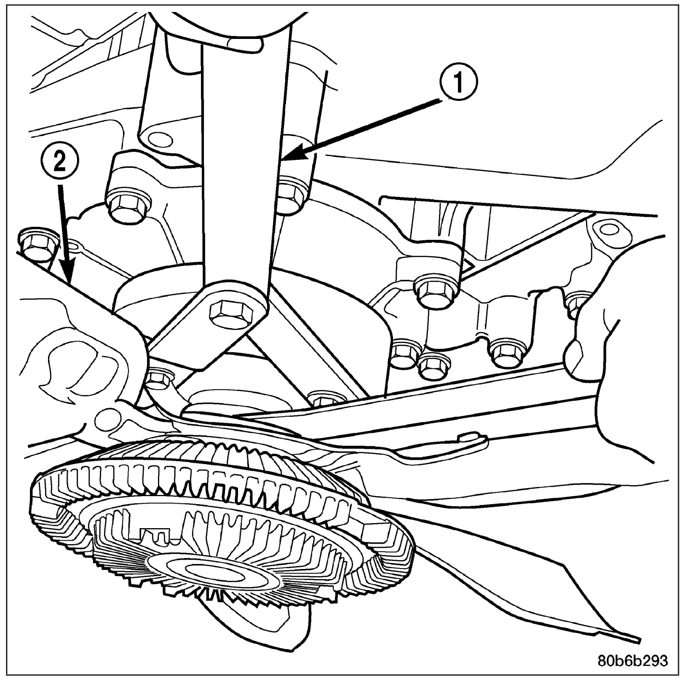
A centrifugal water pump circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core, this coolant absorbs the heat generated when the engine is running. The pump is driven by the engine crankshaft via a drive belt.

## REMOVAL

## 3.7L

The water pump on 3.7L engines is bolted directly to the engine timing chain case cover.

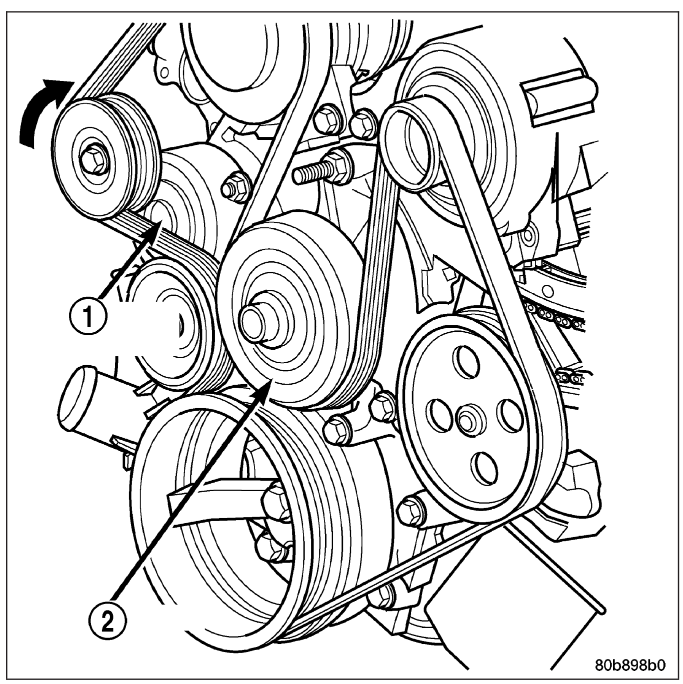
1. Disconnect negative battery cable from battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove fan/viscous fan drive assembly from water pump (2) (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL). Do not attempt to remove fan/viscous fan drive assembly from vehicle at this time.



**WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL NUMBER 6094. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.**

**CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with matching number or letter.**

4. If water pump is being replaced, do not unbolt fan blade assembly from thermal viscous fan drive.
5. Remove two fan shroud-to-radiator screws. Disconnect the coolant overflow hose.
6. Remove upper fan shroud and fan blade/viscous fan drive assembly from vehicle.
7. After removing fan blade/viscous fan drive assembly, **do not** place thermal viscous fan drive in horizontal position. If stored horizontally, silicone fluid in viscous fan drive could drain into its bearing assembly and contaminate lubricant.
8. Remove accessory drive belt (1) (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
9. Remove lower radiator hose clamp and remove lower hose at water pump.
10. Remove seven water pump mounting bolts and one stud bolt.

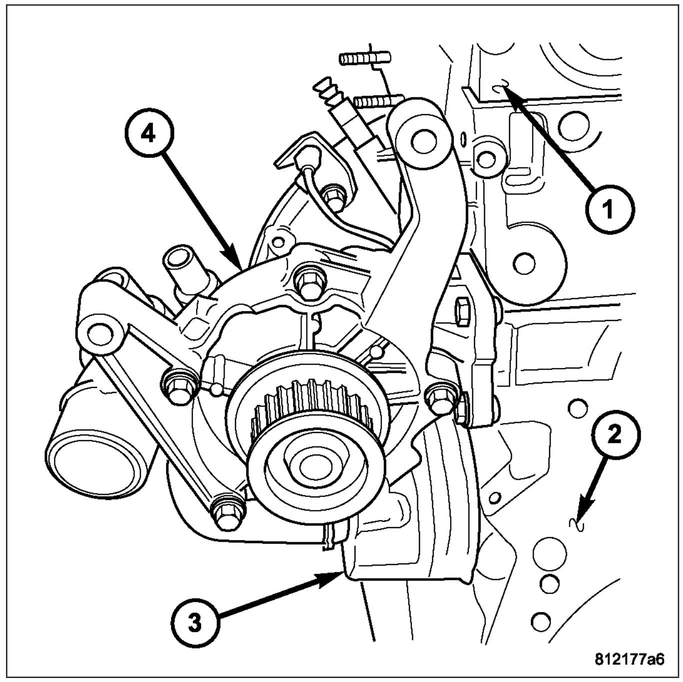


**CAUTION: Do not pry water pump at timing chain case/cover. The machined surfaces may be damaged resulting in leaks.**

11. Remove water pump and gasket. Discard gasket.

## 2.8L DIESEL ENGINE

1. Disconnect negative battery cable.
2. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
3. Remove timing belt inner and outer covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
4. Remove water pump retaining bolts and pump (4) .



## CLEANING

Clean the gasket mating surface. Use caution not to damage the gasket sealing surface.

## INSPECTION

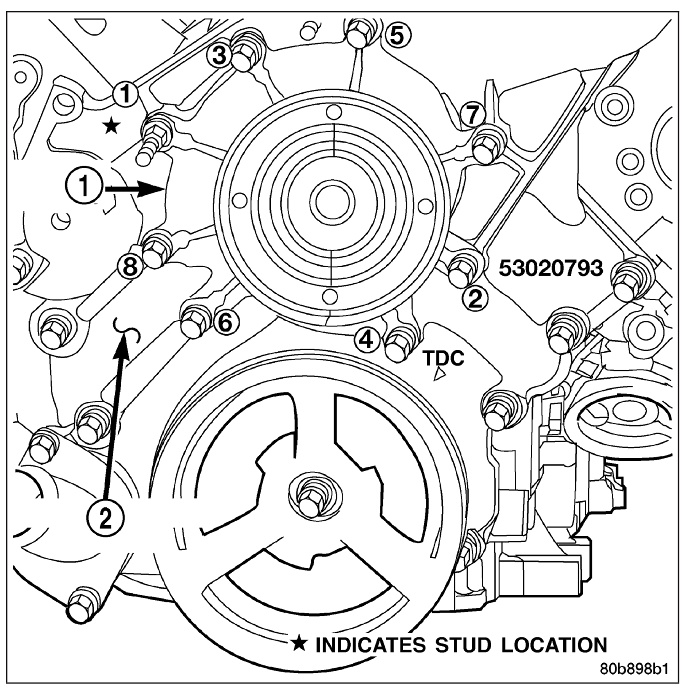
Inspect the water pump assembly for cracks in the housing, Water leaks from shaft seal, Loose or rough turning bearing or Impeller rubbing either the pump body or timing chain case/cover.

## INSTALLATION

## 3.7L ENGINE

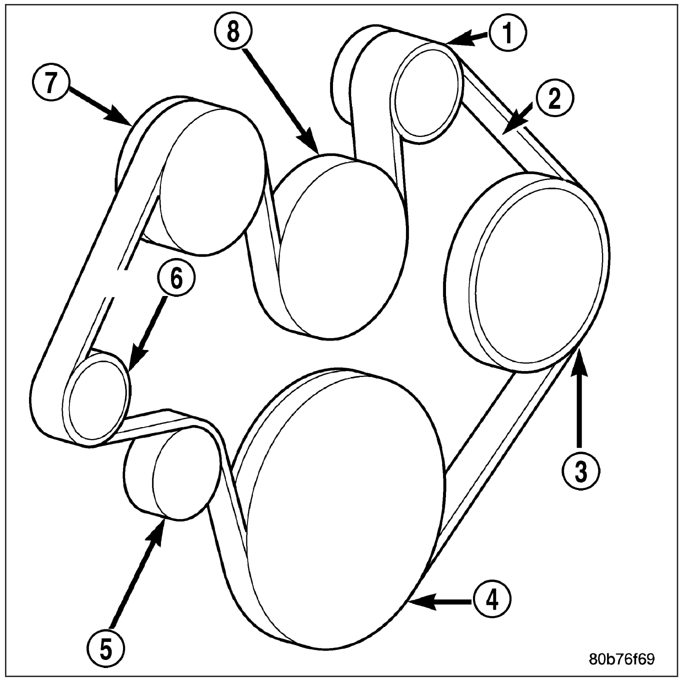
The water pump (1) on 3.7L engines is bolted directly to the engine timing chain case cover (2).

1. Clean gasket mating surfaces.
2. Using a new gasket, position water pump and install mounting bolts as shown.. Tighten water pump mounting bolts to 54 N·m (40 ft. lbs.) torque.
3. Spin water pump to be sure that pump impeller does not rub against timing chain case/cover.
4. Connect radiator lower hose to water pump.



5. Relax tension from belt tensioner (6). Install drive belt (2) (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

**CAUTION: When installing the serpentine accessory drive belt, belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction. Refer to for correct belt routing. Or, refer to the Belt Routing Label located in the engine compartment. The correct belt with correct length must be used.**



6. Position upper fan shroud and fan blade/viscous fan drive assembly.
7. Be sure the upper and lower portions of the fan shroud are firmly connected. All air must flow through the radiator.
8. Install two fan shroud-to-radiator screws.
9. Be sure of at least 25 mm (1.0 inches) between tips of fan blades and fan shroud.
10. Install fan blade/viscous fan drive assembly to water pump shaft (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
11. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
12. Connect negative battery cable.
13. Start and warm the engine. Check for leaks.

## 2.8L DIESEL ENGINE

1. Clean mating surfaces of water pump housing and engine block as necessary.
2. Place new o-ring in groove in water pump housing. Install water pump and retaining bolts. Torque bolts to 24 N·m.
3. Install both inner and outer timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
4. Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
5. Connect negative battery cable.

# TRANSMISSION

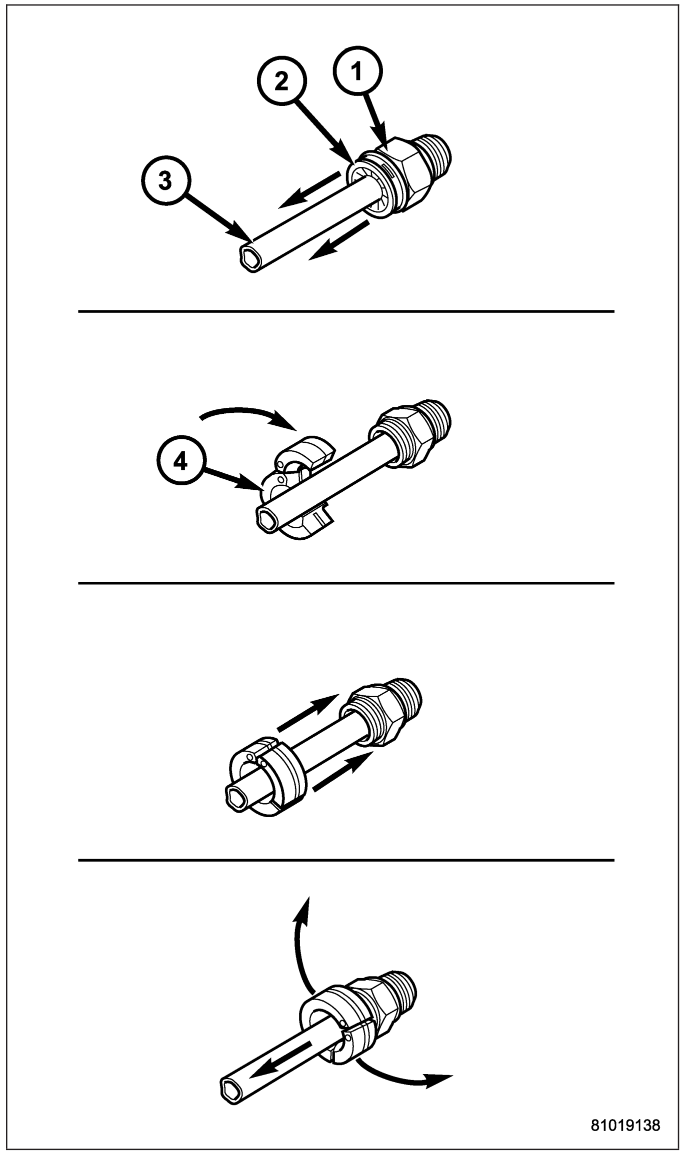
## TABLE OF CONTENTS

# TRANSMISSION

## STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING DISASSEMBLY/ASSEMBLY

### DISCONNECT

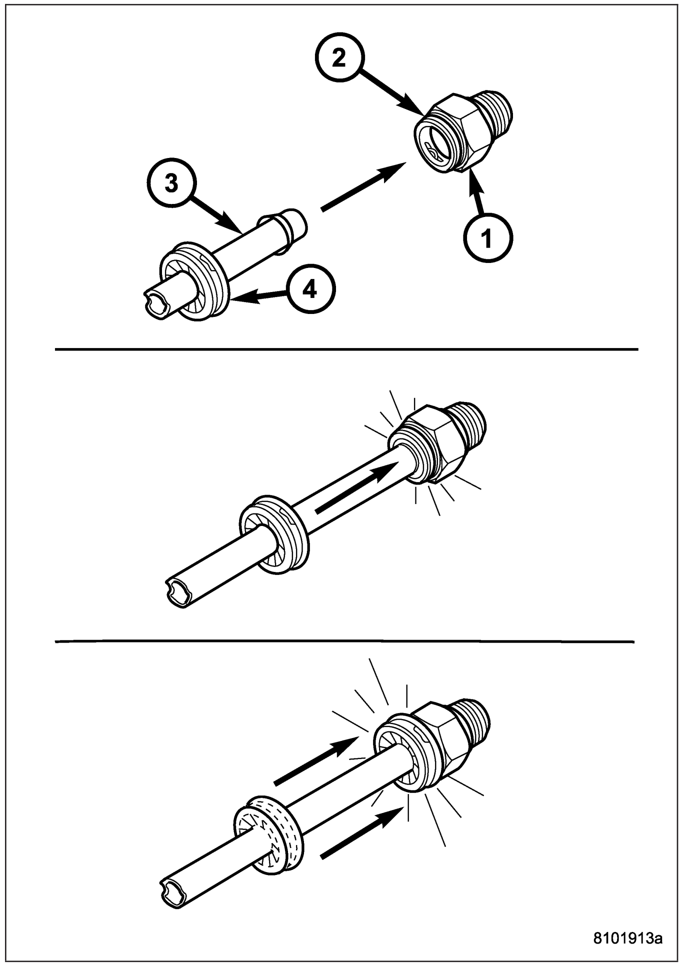
1. Remove dust cap by pulling it straight back off of quick connect fitting (1).
2. Place disconnect tool Release Tool 8875A (4) onto transmission cooler line with the fingers of the tool facing the quick connect fitting.
3. Slide disconnect tool down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect fitting.
4. Rotate the disconnect tool 60° to expand the retaining clip.
5. While holding the disconnect tool against the quick connect fitting, pull back on the transmission cooler line to remove.



## CONNECT

1. Align transmission cooler line (3) with quick connect fitting while pushing straight into the fitting.
2. Push in on transmission cooler line until a “click” is heard or felt.
3. Slide dust cap (4) down the transmission cooler line and snap it over the quick connect fitting until it is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

**NOTE: If dust cap will not snap into place, repeat assembly step #2.**



# TRANS COOLER

## DESCRIPTION

The automatic transmission cooler is located in the front of the condenser and behind the front fascia. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The transmission oil cooler for the 2.8L Diesel with automatic transmission integrated into the A/C condenser.

The Transmission oil cooler assembly is equipped with quick connect fitting for the transmission oil cooler lines.

## REMOVAL

1. Remove electric cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
2. Position cooling fan out of the way.
3. Using Tool 8875A, disconnect transmission cooler tube from the transmission cooler (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE).
4. Remove the transmission cooler mounting bolts.
5. Remove transmission cooler from vehicle.

## INSTALLATION

1. Position transmission cooler in vehicle.
2. Install transmission mounting bolts. Tighten to 14 N·m (123 in. lbs.)
3. Install transmission cooler lines into cooler (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE).
4. Install electric cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

# AUDIO/VIDEO

## TABLE OF CONTENTS

# AUDIO/VIDEO - ELECTRICAL DIAGNOSTICS

## TABLE OF CONTENTS

# AUDIO/VIDEO - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## ALL OUTPUTS SHORT - BASE AUDIO SYSTEM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition in RUN and IOD fuse installed.
- **Set Condition:**
  The radio has sensed a short on the output for more than 10 seconds.

| Possible Causes |
| --- |
| LEFT I/P SPEAKER |
| LEFT FRONT DOOR SPEAKER |
| RIGHT I/P SPEAKER |
| RIGHT FRONT DOOR SPEAKER |
| LEFT REAR SPEAKER |
| RIGHT REAR SPEAKER |
| (+) CIRCUIT SHORTED TO GROUND |
| SPEAKER SECTION OF RADIO |
| (-) CIRCUIT SHORTED TO GROUND |
| SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER |

### Diagnostic Test

#### 1. DETERMINE FAULT

Turn the ignition on.
Turn the Radio on.
With the Scan Tool, erase the audio DTC's.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool , read the audio DTC's.

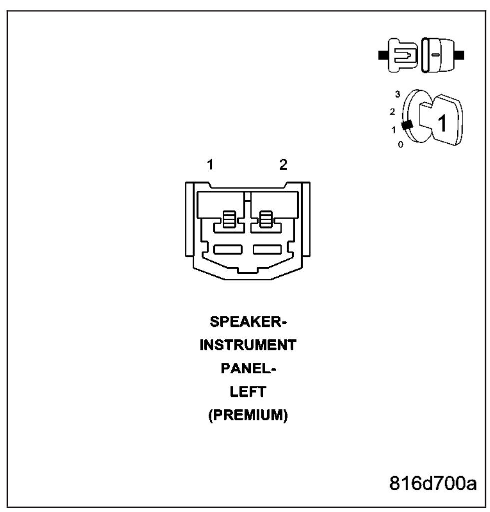
**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 2

**No** >> Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short.
Perform BODY VERIFICATION TEST - VER 1.

#### 2. LEFT I/P SPEAKER

Turn the ignition off.
Disconnect the Left I/P Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool , erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.



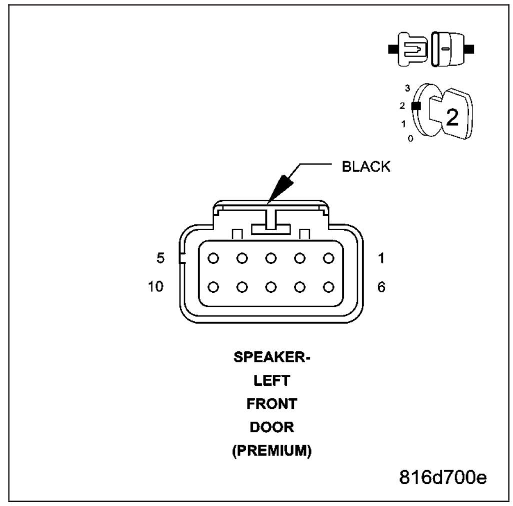
**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 3

**No** >> Replace the Left I/P Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 3. LEFT FRONT DOOR SPEAKER

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool , erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool , read DTC's.



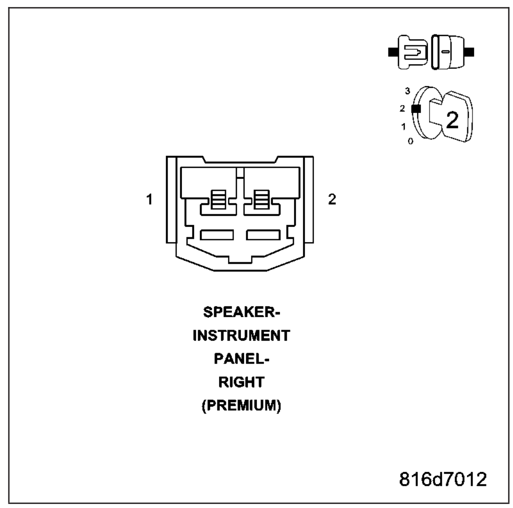
**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 4

**No** >> Replace the Left Front Door Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 4. RIGHT I/P SPEAKER

Turn the ignition off.
Disconnect the Right I/P Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool , erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.



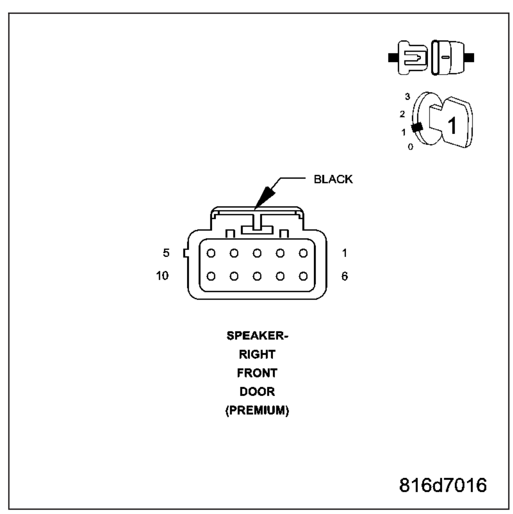
**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 5

**No** >> Replace the Right I/P Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 5. RIGHT FRONT DOOR SPEAKER

Turn the ignition off.
Disconnect the Right Front Door Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool , erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.

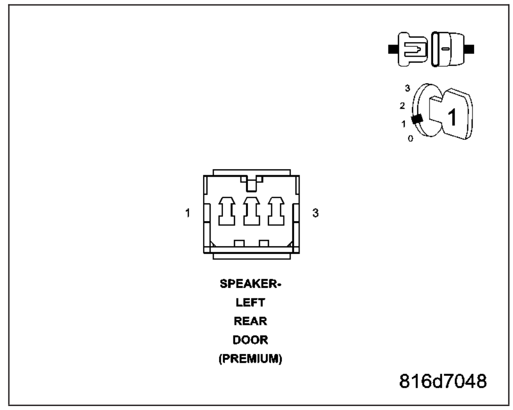


**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 6

**No** >> Replace the Right Front Door Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 6. LEFT REAR SPEAKER



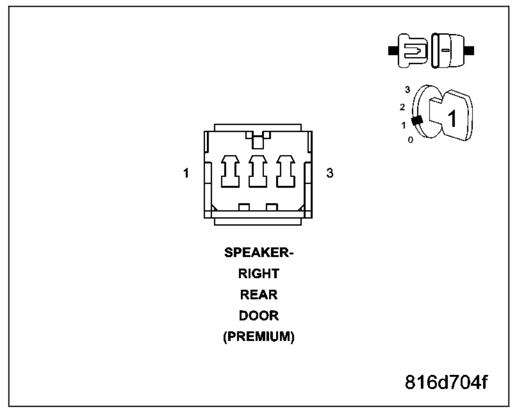
Turn the ignition off.
Disconnect the Left Rear Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool , erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.

**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 7

**No** >> Replace the Left Rear Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 7. RIGHT REAR SPEAKER



Turn the ignition off.
Disconnect the Right Rear Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.

**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 8

**No** >> Replace the Right Rear Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 8. (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Left I/P Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Right I/P Speaker harness connector.
Disconnect the Left Rear Speaker harness connector.
Disconnect the Right Rear Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between ground and each speaker (+) circuit.

**Is the resistance below 1000.0 (1K) ohms?**

**Yes** >> Repair the speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 9

## 9. (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Left I/P Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Right I/P Speaker harness connector.
Disconnect the Left Rear Speaker harness connector.
Disconnect the Right Rear Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between ground and each speaker (-) circuit.

**Is the resistance below 1000.0 (1K) ohms?**

**Yes** >> Repair the speaker (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 10

## 10. SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Left I/P Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Right I/P Speaker harness connector.
Disconnect the Left Rear Speaker harness connector.
Disconnect the Right Rear Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between each speaker (+) circuit and each speaker (-) circuit.

**Is the resistance below 1000.0 (1K) ohms for any of the measurements?**

**Yes** >> Repair the shorted together speaker circuits.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 11

## 11. SPEAKER SECTION OF RADIO

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

## ALL OUTPUTS SHORT - PREMIUM AUDIO SYSTEM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition in RUN and IOD fuse installed.
- **Set Condition:**
  The radio has sensed a short on the output for more than 10 seconds.

| Possible Causes |
|---|
| LEFT FRONT DOOR SPEAKER |
| RIGHT FRONT DOOR SPEAKER |
| (+) CIRCUIT SHORTED TO GROUND |
| (-) CIRCUIT SHORTED TO GROUND |
| SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER |
| SPEAKER SECTION OF RADIO |

## Diagnostic Test

### 1. DETERMINE FAULT

Turn the ignition on.
Turn the Radio on.
With the Scan Tool , erase the audio DTC's.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool , read the audio DTC's.

**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 2

**No** >> Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short.
Perform BODY VERIFICATION TEST - VER 1.

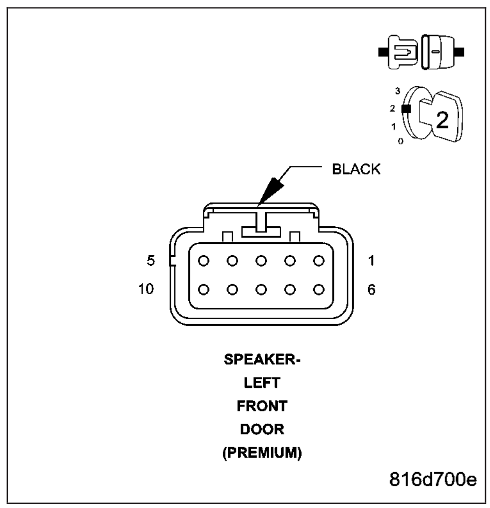
### 2. LEFT FRONT DOOR SPEAKER

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool , erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool , read DTC's.

**Does the Scan Tool display ALL OUTPUTS SHORT?**

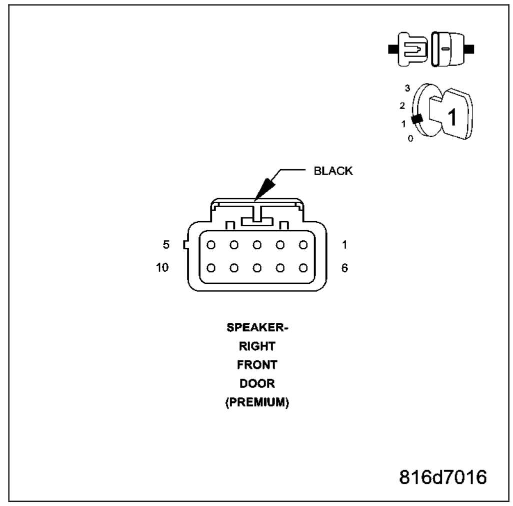
**Yes** >> Go To 3

**No** >> Replace the Left Front Door Speaker.
Perform BODY VERIFICATION TEST - VER 1.



## 3. RIGHT FRONT DOOR SPEAKER

Turn the ignition off.
Disconnect the Right Front Door Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool , erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool , read DTC's.



**Does the Scan Tool display ALL OUTPUTS SHORT?**

**Yes** >> Go To 4

**No** >> Replace the Right Front Door Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 4. (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between ground and each speaker (+) circuit.

**Is the resistance below 1000.0 (1K) ohms?**

**Yes** >> Repair the speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between ground and each speaker (-) circuit.

**Is the resistance below 1000.0 (1K) ohms?**

**Yes** >> Repair the speaker (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between each speaker (+) circuit and each speaker (-) circuit.

**Is the resistance below 1000.0 (1K) ohms for any of the measurements?**

**Yes** >> Repair the shorted together speaker circuits.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 7

## 7. SPEAKER SECTION OF RADIO

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

## CASSETTE PLAYER INOP

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition and radio turned on.
- **Set Condition:**
  The code will set if the radio detects a internal cassette failure.

| Possible Causes |
|---|
| INTERNAL FAILURE |

## Diagnostic Test

### 1. INTERNAL FAILURE

**NOTE: If a DTC is set, erase the DTC and attempt to reset the DTC. If DTC resets, follow this test.**
This is an internal radio failure.

**View repair**

**Repair**

Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

## CD CHANGER MECHANICAL FAILURE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition and CD Changer turned on.
- **Set Condition:**
  The code will set if the CD Changer detects a mechanical failure.

| Possible Causes |
|---|
| INTERNAL FAILURE |

## Diagnostic Test

### 1. INTERNAL FAILURE

**NOTE: Erase DTC and attempt to reset. If DTC resets, follow this test.**
This is an internal CD Changer failure.

**View repair**

**Repair**

Replace the CD Changer.
Perform BODY VERIFICATION TEST - VER 1.

## CD CHANGER READ FAILURE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition and CD Changer turned on.
- **Set Condition:**
  The code will set if a CD that is not formatted as a music CD is installed in the CD Changer.

| Possible Causes |
|---|
| CD CHANGER READ FAILURE |

## Diagnostic Test

### 1. CD CHANGER READ FAILURE

Replace the problem CD with a good, clean, unscratched, music CD.

Turn the radio on and select the good CD.

With the Scan Tool , read DTC's.

**Does the Scan Tool display CD CHANGER READ FAILURE?**

**Yes** >> Replace the CD Changer.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## CD CHANGER TEMPERATURE HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition and CD Changer turned on.
- **Set Condition:**
  The code will set if the temperature inside the CD Changer is above +65° C (+145° F).

| Possible Causes |
|---|
| HIGH TEMPERATURE FAILURE |

## Diagnostic Test

### 1. HIGH TEMPERATURE

With the Scan Tool, erase the audio DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The CD Changer will operate between -23° C and 65° C (-10° F and +145° F).

With the Scan Tool, read DTC's.

**Does the Scan Tool display CD CHANGER TEMPERATURE HIGH?**

**Yes** >> Replace the CD Changer.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## CD PLAY FAILURE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition and the radio CD player turned on.
- **Set Condition:**
  The code will set if a CD that is not formatted as a music CD or is scratched, dirty so the radio can not play the CD.

| Possible Causes |
|---|
| CD PLAY FAILURE |

## Diagnostic Test

### 1. CD PLAY FAILURE

Replace the problem CD with a good, clean, unscratched, music CD.

Turn the radio CD player on.

With the Scan Tool, read DTC's.

**Does the Scan Tool display CD PLAY FAILURE?**

**Yes** >> Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## CD READ FAILURE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition and the radio CD player turned on.
- **Set Condition:**
  The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

| Possible Causes |
|---|
| CD READ FAILURE |

## Diagnostic Test

### 1. CD READ FAILURE

Replace the problem CD with a good, clean, unscratched, music CD.

Turn the radio CD player on.

With the Scan Tool, read DTC's.

**Does the Scan Tool display CD READ FAILURE?**

**Yes** >> Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## CD TEMPERATURE HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition and the radio CD player turned on.
- **Set Condition:**
  The code will set if the temperature inside the radio CD player is above +70° C (+156° F).

| Possible Causes |
|---|
| HIGH TEMPERATURE FAILURE |

## Diagnostic Test

### 1. HIGH TEMPERATURE

With the ScanTool, erase the audio DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The radio CD player will operate between -23° C and 70° C (-10° F and +156° F).

With the Scan Tool, read DTC's.

**Does the Scan Tool display CD TEMPERATURE HIGH?**

**Yes** >> Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## LOW VOLTAGE LEVEL

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the radio on.
- **Set Condition:**
  The radio detects lower than normal voltage.

| Possible Causes |
| --- |
| CHECK CHARGING SYSTEM |
| CHECK VOLTAGE LEVEL AT RADIO |
| RADIO |

### Diagnostic Test

#### 1. CHECK CHARGING SYSTEM

Check the charging system in accordance with the service information.

**Is the charging system operating properly?**

**Yes** >> Go To 2

**No** >> Refer to the appropriate service information and repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

#### 2. CHECK VOLTAGE LEVEL AT RADIO

Turn the ignition off.
Disconnect the Radio harness connector.
Start the engine.
Measure the voltage of each Fused B+ circuit and the Fused Ignition Switch Output circuit.

**Is the voltage above or approximately 14 volts for each measurement?**

**Yes** >> Go To 3

**No** >> Repair the circuit for high resistance.
Perform BODY VERIFICATION TEST - VER 1.

#### 3. RADIO

**NOTE: Reconnect all previously disconnected components.**
Turn the ignition and Radio on.
With the Scan Tool, erase the audio DTC’s.
Start the engine.
With the Scan Tool, read the audio DTC’s.

**Did this DTC reset?**

**Yes** >> Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## NO ANTENNA CONNECTION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the radio in seek up/down mode.
- **Set Condition:**
  With the radio in seek mode for two minutes and the radio does not detect an antenna connection or does not receive a radio station signal.

| Possible Causes |
|---|
| BAD ANTENNA CONNECTION |
| TEST ANTENNA |
| RADIO |

## Diagnostic Test

### 1. BAD ANTENNA CONNECTION

Turn the ignition off.

Disconnect the Radio Antenna connector.

Inspect the Radio Antenna connection.

**Was the Antenna connection clean and tight?**

**Yes** >> Go To 2

**No** >> Repair Antenna connection as needed.
Perform BODY VERIFICATION TEST - VER 1.

### 2. TEST ANTENNA

Refer to the Audio System in the service information and test the Antenna in accordance with the service procedure.

**Is the Antenna ok?**

**Yes** >> Go To 3

**No** >> Repair or replace the Antenna assembly as necessary.
Perform BODY VERIFICATION TEST - VER 1.

### 3. RADIO

**NOTE: Reconnect all previously disconnected components.**
Turn the ignition and Radio on.

**NOTE: Move vehicle outside approximately 30ft from any structure.**
With the Scan Tool, erase the audio DTC's, put the radio in seek up and seek down mode for approximately 2 minutes before proceeding.

With the Scan Tool, read the audio DTC's.

**Did this DTC reset?**

**Yes** >> Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Test Complete.

# *POOR SOUND QUALITY

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| CHECK AUDIO DTCS |
| CHECK SELECTED RADIO EQ CURVE |
| SET THE RADIO EQ CURVE |
| VERIFY SOUND PERFORMANCE |

## Diagnostic Test

### 1. CHECK AUDIO DTCS

Turn the ignition on.

With the Scan Tool, check for any audio related DTC's.

**Are any Audio related DTCs set?**

**Yes** >> Refer to the Audio category for the related symptom(s).
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 2

### 2. CHECK SELECTED RADIO EQ CURVE

Turn the ignition on.

With the Scan Tool, enter body, body computer then miscellaneous.

Check the radio EQ curve setting and follow the instructions on the Scan Tool.

**Is the radio EQ curve correct for the audio combination the vehicle is equipped with?**

**Yes** >> Refer to the service information for problems related to poor sound quality and perform the appropriate checks.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. SET THE RADIO EQ CURVE

Turn the ignition on.

With the Scan Tool, enter body, body computer then miscellaneous.

Set the radio EQ curve. Follow the instructions on the Scan Tool.

Cycle the ignition switch from off to on.

Check the radio EQ curve setting.

**Is the radio EQ curve correct for the audio combination the vehicle is equipped with?**

**Yes** >> Refer to the service information for problems related to poor sound quality and perform the appropriate checks.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

## POWER AMP SHUTDOWN - BASE AUDIO SYSTEM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition in RUN and IOD fuse installed.
- **Set Condition:**
  The radio has sensed a short on the output for more than 10 seconds.

| Possible Causes |
|---|
| LEFT I/P SPEAKER |
| LEFT FRONT DOOR SPEAKER |
| RIGHT I/P SPEAKER |
| RIGHT FRONT DOOR SPEAKER |
| LEFT REAR SPEAKER |
| RIGHT REAR SPEAKER |
| (+) CIRCUIT SHORTED TO GROUND |
| SPEAKER SECTION OF RADIO |
| (-) CIRCUIT SHORTED TO GROUND |
| SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER |

### Diagnostic Test

#### 1. DETERMINE FAULT

Turn the ignition on.
Turn the Radio on.
With the Scan Tool, erase the audio DTC's.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read the audio DTC's.

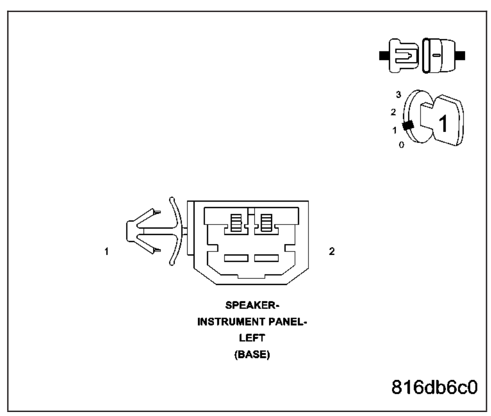
**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 2

**No** >> Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short.
Perform BODY VERIFICATION TEST - VER 1.

#### 2. LEFT I/P SPEAKER

Turn the ignition off.
Disconnect the Left I/P Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.



**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 3

**No** >> Replace the Left I/P Speaker.
Perform BODY VERIFICATION TEST - VER 1.

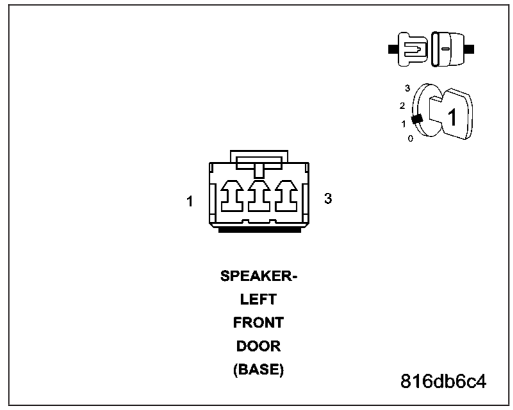
## 3. LEFT FRONT DOOR SPEAKER

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.

**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 4

**No** >> Replace the Left Front Door Speaker.
Perform BODY VERIFICATION TEST - VER 1.



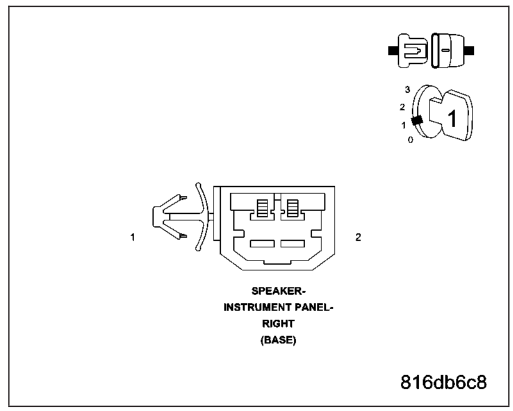
## 4. RIGHT I/P SPEAKER

Turn the ignition off.
Disconnect the Right I/P Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.

**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 5

**No** >> Replace the Right I/P Speaker.
Perform BODY VERIFICATION TEST - VER 1.



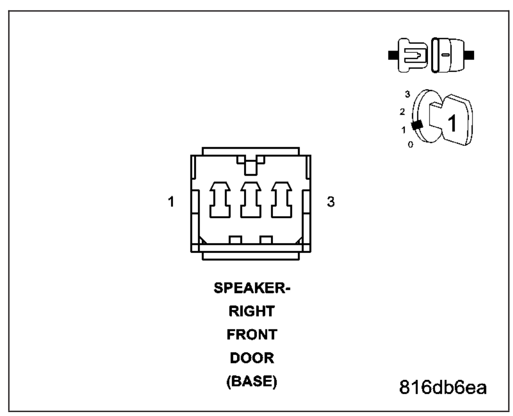
## 5. RIGHT FRONT DOOR SPEAKER

Turn the ignition off.
Disconnect the Right Front Door Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.

**Does the Scan Tool display POWER AMP SHUTDOWN?**

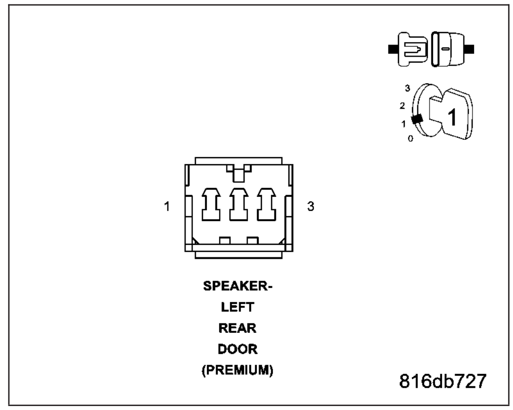
**Yes** >> Go To 6

**No** >> Replace the Right Front Door Speaker.
Perform BODY VERIFICATION TEST - VER 1.



## 6. LEFT REAR SPEAKER

Turn the ignition off.
Disconnect the Left Rear Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.



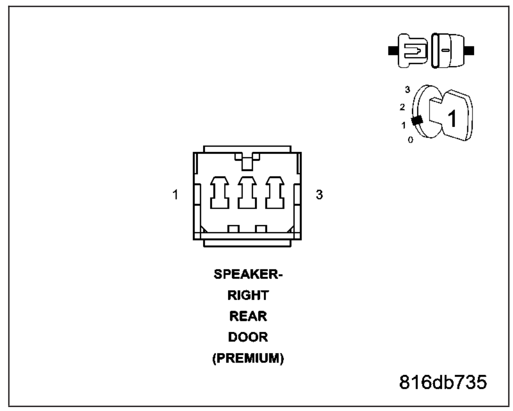
**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 7

**No** >> Replace the Left Rear Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 7. RIGHT REAR SPEAKER

Turn the ignition off.
Disconnect the Right Rear Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.



**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 8

**No** >> Replace the Right Rear Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 8. (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Left I/P Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Right I/P Speaker harness connector.
Disconnect the Left Rear Speaker harness connector.
Disconnect the Right Rear Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between ground and each speaker (+) circuit.

**Is the resistance below 1000.0 (1K) ohms?**

**Yes** >> Repair the speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 9

## 9. (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Left I/P Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Right I/P Speaker harness connector.
Disconnect the Left Rear Speaker harness connector.
Disconnect the Right Rear Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between ground and each speaker (-) circuit.

**Is the resistance below 1000.0 (1K) ohms?**

**Yes** >> Repair the speaker (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 10

## 10. SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Left I/P Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Right I/P Speaker harness connector.
Disconnect the Left Rear Speaker harness connector.
Disconnect the Right Rear Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between each speaker (+) circuit and each speaker (-) circuit.

**Is the resistance below 1000.0 (1K) ohms for any of the measurements?**

**Yes** >> Repair the shorted together speaker circuits.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 11

## 11. SPEAKER SECTION OF RADIO

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

## POWER AMP SHUTDOWN - PREMIUM AUDIO SYSTEM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition in RUN and IOD fuse installed.
- **Set Condition:**
  The radio has sensed a short on the output for more than 10 seconds.

| Possible Causes |
| --- |
| LEFT FRONT DOOR SPEAKER |
| RIGHT FRONT DOOR SPEAKER |
| (+) CIRCUIT SHORTED TO GROUND |
| (-) CIRCUIT SHORTED TO GROUND |
| (+) & (-) CIRCUITS SHORTED TOGETHER |
| RADIO |

## Diagnostic Test

### 1. DETERMINE FAULT

Turn the ignition on.
Turn the Radio on.
With the Scan Tool, erase the audio DTC's.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read the audio DTC's.

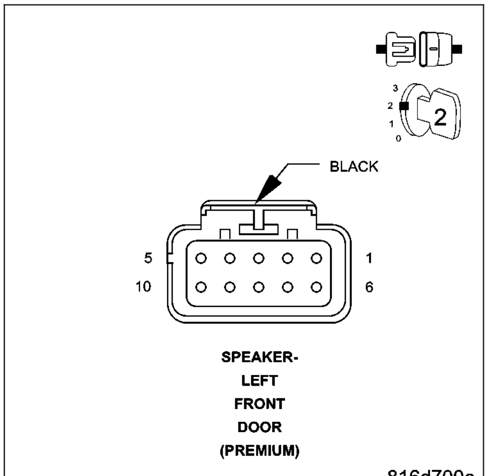
**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 2

**No** >> Refer to the wiring diagrams located in the service information to help isolate a possible intermittent short.
Perform BODY VERIFICATION TEST - VER 1.

### 2. LEFT FRONT DOOR SPEAKER

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.



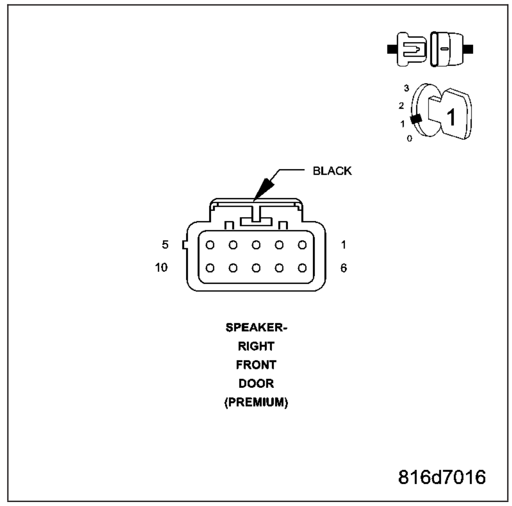
816d700e

**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 3

**No** >> Replace the Left Front Door Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 3. RIGHT FRONT DOOR SPEAKER



Turn the ignition off.
Disconnect the Right Front Door Speaker harness connector.
Turn the ignition on.
Turn the radio on.
With the Scan Tool, erase the audio DTCs.
Cycle the ignition switch from off to on and wait 10 seconds.
With the Scan Tool, read DTC's.

**Does the Scan Tool display POWER AMP SHUTDOWN?**

**Yes** >> Go To 4

**No** >> Replace the Right Front Door Speaker.
Perform BODY VERIFICATION TEST - VER 1.

## 4. (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between ground and each speaker (+) circuit.

**Is the resistance below 1000.0 (1K) ohms?**

**Yes** >> Repair the speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between ground and each speaker (-) circuit.

**Is the resistance below 1000.0 (1K) ohms?**

**Yes** >> Repair the speaker (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. SPEAKER (+) & (-) CIRCUITS SHORTED TOGETHER

Turn the ignition off.
Disconnect the Left Front Door Speaker harness connector.
Disconnect the Right Front Door Speaker harness connector.
Disconnect the Radio C1 harness connector.
Measure the resistance between each speaker (+) circuit and each speaker (-) circuit.

**Is the resistance below 1000.0 (1K) ohms for any of the measurements?**

**Yes** >> Repair the shorted together speaker circuits.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 7

## 7. SPEAKER SECTION OF RADIO

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Radio.
Perform BODY VERIFICATION TEST - VER 1.

## *REMOTE RADIO SWITCHES INOPERATIVE (IF EQUIPPED)

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| ATTEMPT TO COMMUNICATE WITH THE RADIO |
| CHECK OPERATION OF SWITCHES |
| LEFT REMOTE RADIO SWITCH SHORTED TO GROUND |
| RIGHT REMOTE RADIO SWITCH SHORTED TO GROUND |
| RADIO CONTROL MUX CIRCUIT SHORTED TO GROUND AT THE SWITCH |
| RADIO CONTROL MUX CKT SHORTED TO THE RADIO CONTROL MUX RETURN CKT AT THE SWITCH |
| CLOCKSPRING SHORTED TO GROUND |
| RADIO CONTROL MUX CIRCUIT SHORTED TO GROUND |
| RADIO CONTROL MUX CKT SHORTED TO THE RADIO CONTROL MUX RETURN CKT |
| BODY CONTROL MODULE - INTERNAL SHORT |
| CLOCKSPRING OPEN |
| OPEN RADIO CONTROL MUX RETURN CIRCUIT |
| OPEN RADIO CONTROL MUX CIRCUIT |
| BODY CONTROL MODULE - OPEN INTERNALLY |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE RADIO

Turn the ignition on.

With the Scan Tool, attempt to communicate with the Radio.

**Was the Scan Tool able to communicate with the Radio?**

**Yes** >> Go To 2

**No** >> Refer to the communication category and perform the appropriate symptom.
Perform BODY VERIFICATION TEST - VER 1.

### 2. CHECK OPERATION OF SWITCHES

Turn the ignition on.

Turn the Radio on.

Operate all the remote radio switch functions.

**Is only one function or one switch not operating properly?**

**Yes** >> Repair the Radio Control MUX circuit or the Radio Control MUX Return circuit for an open between the inoperative switch and the clockspring. If OK, replace the remote radio switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE REMOTE RADIO CONTROL SWITCH VOLTAGE

Turn the ignition on.

With the Scan Tool, enter Body Computer then Sensors and monitor the Radio Control SW voltage.

**Is the voltage above 3.8 volts?**

**Yes** >> Go To 4

**No** >> Go To 8

## 4. CLOCKSPRING OPEN

Turn the ignition on.

Turn the Radio on.

Disconnect the Clockspring C1 harness connector.

Connect a jumper wire between the Radio Control MUX circuit and the Radio Control MUX Return circuit.

**Did the radio change stations?**

**Yes** >> Repair the Radio Control MUX circuit or the Radio Control MUX Return circuit for an open between the clockspring and the splice to the switches. If OK, replace the Clockspring.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. OPEN RADIO CONTROL MUX RETURN CIRCUIT

Turn the ignition off.

Disconnect the Clockspring C1 harness connector.

Disconnect the BCM C2 harness connector.

Measure the resistance of the Radio Control MUX Return circuit between the BCM C2 connector and the Clockspring C1 connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the Radio Control MUX Return circuit for an open between the clockspring and the BCM.
Perform BODY VERIFICATION TEST - VER 1.

## 6. OPEN RADIO CONTROL MUX CIRCUIT

Turn the ignition off.

Disconnect the Clockspring C1 harness connector.

Disconnect the BCM C2 harness connector.

Measure the resistance of the Radio Control MUX circuit between the BCM C2 connector and the Clockspring C1 connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the Radio Control MUX circuit for an open between the clockspring and the BCM.
Perform BODY VERIFICATION TEST - VER 1.

## 7. BODY CONTROL MODULE - OPEN INTERNALLY

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Body Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

## 8. LEFT REMOTE RADIO SWITCH SHORTED TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait 2 minutes before proceeding.**

**CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidently deployed.**

Remove the Driver Airbag Module.

Disconnect the Left Remote Radio Switch harness connector.

Turn the ignition on, reconnect the battery.

With the Scan Tool, enter Body Computer then Sensors and monitor the Radio Control SW voltage.

**Is the voltage above 3.8 volts?**

**Yes** >> Replace the Left Remote Radio Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 9

## 9. RIGHT REMOTE RADIO SWITCH SHORTED TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait 2 minutes before proceeding.**

**CAUTION: Do not place an intact undeployed airbag module face down on a hard surface, the airbag module will propel into the air if accidently deployed.**

Remove the Driver Airbag Module.

Disconnect the Right Remote Radio Switch harness connector.

Turn the ignition on, reconnect the battery.

With the Scan Tool, enter Body Computer then Sensors and monitor the Radio Control SW voltage.

**Is the voltage above 3.8 volts?**

**Yes** >> Replace the Right Remote Radio Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 10

## 10. CHECK THE CLOCKSPRING

Turn the ignition off.

Disconnect the Clockspring C3 harness connector.

Turn the ignition on.

With the Scan Tool, enter Body Computer then Sensors and monitor the Radio Control SW voltage.

**Is the voltage above 3.8 volts?**

**Yes** >> Go To 11

**No** >> Go To 12

## 11. RADIO CONTROL MUX CIRCUIT SHORTED TO GROUND AT THE SWITCH

Turn the ignition off.

Disconnect the Clockspring C3 harness connector.

**NOTE: Ensure both remote radio switches are disconnected.**

Measure the resistance between ground and the Radio Control MUX circuit at the clockspring C3 harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Radio Control MUX circuit for a short to ground between the clockspring and the remote radio switches.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Radio Control MUX circuit for a short to the Radio Control MUX Return circuit between the clockspring and the remote radio switches.
Perform BODY VERIFICATION TEST - VER 1.

## 12. CLOCKSPRING SHORTED TO GROUND

Turn the ignition off.

Disconnect the Clockspring C1 harness connector.

Turn the ignition on.

With the Scan Tool, enter Body Computer then Sensors and monitor the Radio Control SW voltage.

**Is the voltage above 3.8 volts?**

**Yes** >> Replace the Clockspring in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 13

## 13. RADIO CONTROL MUX CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Clockspring C1 harness connector.

Disconnect the BCM C2 harness connector.

Measure the resistance between ground and the Radio Control MUX circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Radio Control MUX circuit for a short to ground between the clockspring and the BCM.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 14

## 14. RADIO CONTROL MUX CKT SHORTED TO THE RADIO CONTROL MUX RETURN CKT

Turn the ignition off.

Disconnect the Clockspring C1 harness connector.

Disconnect the BCM C2 harness connector.

Measure the resistance between the Radio Control MUX circuit and the Radio Control MUX Return circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Radio Control MUX circuit for a short to the Radio Control MUX Return circuit between the clockspring and the BCM.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

# AUDIO/VIDEO

## TABLE OF CONTENTS

# AUDIO/VIDEO

## DESCRIPTION

Several combinations of radio receivers and speaker systems are offered on this model. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the RUN or ACCESSORY positions.

The audio system includes the following components:

- Amplifier choke and relay (with premium speaker system only)
- Antenna
- Compact disc changer (if equipped)
- Power amplifier mounted to each front door speaker (with premium speaker system only)
- Radio noise suppression components
- Radio receiver
- Remote radio switches (if equipped)
- Speakers

Certain functions and features of the audio system rely upon resources shared with other electronic modules in the vehicle over the Programmable Communication Interface (PCI) bus network. The data bus network allows the sharing of sensor information. For diagnosis of these electronic modules or of the data bus network, the use of a scan tool and the proper Diagnostic Procedures information is recommended.

## OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The audio system components operate on battery current received through a fuse in the Junction Block (JB) on a fused ignition switch output (run-acc) circuit so that the system will only operate when the ignition switch is in the Run or Accessory positions.

On vehicles that are equipped with the optional remote radio switches, the Body Control Module (BCM) receives hard wired resistor multiplexed inputs from the remote radio switches. The programming in the BCM allows it to process those inputs and send the proper messages to the radio receiver over the Programmable Communication Interface (PCI) bus network to control the radio volume up or down, station seek up or down, preset station advance, and mode advance functions.

Refer to the owner's manual for more information on the features, use and operation of each of the available audio systems.

## DIAGNOSIS AND TESTING - AUDIO

**Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic information.**

**Refer to the appropriate wiring information.**

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

**AUDIO SYSTEM DIAGNOSIS TABLE**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO AUDIO | 1. Fuse faulty. | 1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Junction Block (JB). Replace fuses, if required. |
| | 2. Radio connector faulty. | 2. Check for loose or corroded radio connector. Repair, if required. |
| | 3. Wiring faulty. | 3. Check for shorted or open wires. Repair wiring, if required. |
| | 4. Radio ground faulty. | 4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required. |
| | 5. Radio faulty. | 5. Refer to appropriate Diagnostic Service Manual. |
| | 6. Speakers faulty. | 6. Replace speaker as necessary. |
| | 7. Choke and relay faulty | 7. Replace choke and relay as necessary. |
| NO RADIO DISPLAY | 1. Fuse faulty. | 1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Junction Block (JB). Replace fuses, if required. |
| | 2. Radio connector faulty. | 2. Check for loose or corroded radio connector. Repair, if required. |
| | 3. Wiring faulty. | 3. Check for battery voltage at radio connector. Repair wiring, if required. |
| | 4. Radio ground faulty. | 4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required. |
| | 5. Radio faulty. | 5. Refer to appropriate Diagnostic Service Manual. |
| CLOCK WILL NOT KEEP SET TIME | 1. Fuse faulty. | 1. Check Ignition-Off Draw (IOD) fuse in the Junction Block (JB). Replace fuse, if required. |
| | 2. Radio connector faulty. | 2. Check for loose or corroded radio connector. Repair, if required. |
| | 3. Wiring faulty. | 3. Check for battery voltage at radio connector. Repair wiring, if required. |
| | 4. Radio ground faulty. | 4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required. |
| | 5. Radio faulty. | 5. Refer to appropriate Diagnostic Service Manual. |
| POOR RADIO RECEPTION | 1. Antenna faulty. | 1. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - DIAGNOSIS AND TESTING). |
| | 2. Radio ground faulty. | 2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required. |
| | 3. Radio noise suppression faulty. | 3. Repair or replace ground strap as necessary. |
| | 4. Radio faulty. | 4. Refer to appropriate Diagnostic Service Manual. |
| SOUND DISTORTION ( VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING) | 1. Door trim panel loose or missing fasteners. | 1. Inspect door trim panel and correct as necessary. Replace any missing fasteners. |

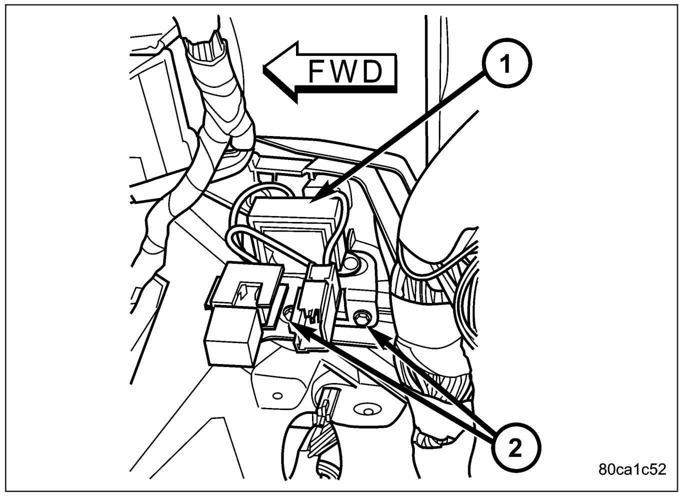
| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 2. Water shield loose or misaligned. | 2. Inspect water shield and adjust as required. |
| | 3. Items placed in door trim panel map pockets vibrating or moving from side to side. | 3. Remove items from door trim panel. Ensure that vibration is no longer present. |
| NO/POOR TAPE OPERATION | 1. Faulty tape. | 1. Insert known good tape and test operation. |
| | 2. Foreign objects behind tape door. | 2. Remove foreign objects and test operation. |
| | 3. Dirty cassette tape head. | 3. Clean head with Mopar Cassette Head Cleaner. |
| | 4. Faulty tape deck. | 4. Exchange or replace radio, if required. |
| NO COMPACT DISC OPERATION | 1. Faulty CD. | 1. Insert known good CD and test operation. |
| | 2. Foreign material on CD. | 2. Clean CD and test operation. |
| | 3. Condensation on CD or optics. | 3. Allow temperature of vehicle interior to stabilize and test operation. |
| | 4. Faulty CD player. | 4. Refer to appropriate Diagnostic Service Manual. |

# AMPLIFIER CHOKE AND RELAY

## DESCRIPTION

Vehicles equipped with the premium speaker package have a amplifier choke and relay (1). The amplifier choke and relay is mounted to the lower instrument panel above the pedals and towards the instrument panel center stack.

The amplifier choke and relay should be checked if there is no sound output from the speakers. The amplifier choke and relay can not be repaired or adjusted and, if faulty or damaged, the unit must be replaced.



## OPERATION

The amplifier choke and relay is used to control the supply of fused battery current to the front door speaker-mounted dual amplifiers. The speaker relay is energized by a fused 12 volt output from the radio receiver whenever the radio is turned on. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

## DIAGNOSIS AND TESTING - AMPLIFIER CHOKE AND RELAY

**Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic information.**

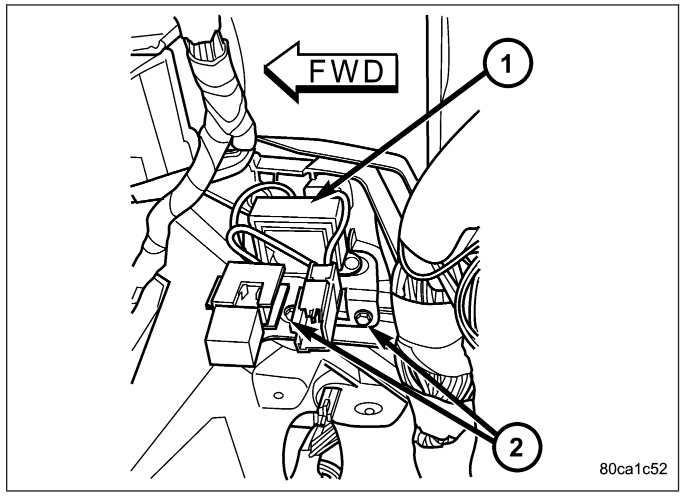
The amplifier choke and relay is used to switch power to the individual speaker amplifiers used with the premium speaker package. The amplifier choke and relay is serviced only as a unit. If all of the speakers are inoperative the amplifier choke and relay should be inspected. Before replacement, make the following inspections of the amplifier choke and relay circuits. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, replace the faulty fuse.
2. Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the battery as required.
3. Disconnect the instrument panel wire harness connector from the amplifier choke and relay. Check for battery voltage at the fused B(+) circuit cavity of the instrument panel wire harness connector for the amplifier choke and relay. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.
4. Probe the ground circuit cavity of the instrument panel wire harness connector for the amplifier choke and relay. Check for continuity to a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open ground circuit to ground as required.
5. Turn the ignition switch to the RUN position and turn the radio ON. Check for battery voltage at the radio 12-volt output circuit cavity of the instrument panel wire harness connector for the amplifier choke and relay. If OK, go to Step 6. If not OK, repair the open radio 12-volt output circuit to the radio as required.
6. Turn the radio and ignition switches to the OFF position. Reconnect the instrument panel wire harness connector to the amplifier choke and relay. Check for battery voltage at the amplified speaker (+) circuit cavity of the instrument panel wire harness connector for the amplifier choke and relay. There should be zero volts. Turn the ignition and radio switches to the ON position. There should now be battery voltage. If OK, repair the open amplified

speaker (+) circuits to the speaker-mounted amplifiers as required. If not OK, replace the faulty amplifier choke and relay.

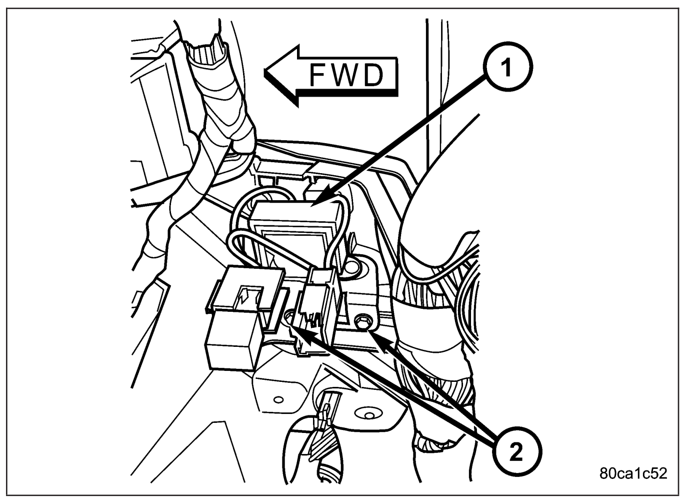
## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove knee blocker cover and knee blocker.
3. Disconnect the electrical harness connector from the amplifier choke and relay (1).
4. Remove mounting fasteners and amplifier choke and relay.



## INSTALLATION

1. Install the amplifier choke and relay (1).
2. Install and tighten the mounting fasteners.
3. Connect the electrical harness connector.
4. Install knee blocker cover and knee blocker.
5. Connect the battery negative cable.



# ANTENNA BODY & CABLE

## DESCRIPTION

### DOMESTIC

The antenna body and cable is secured below the fender panel by the antenna cap nut through a mounting hole in the side of the right front fender. The primary coaxial antenna cable is then routed beneath the fender sheet metal and through a entry hole in the right cowl side panel into the interior of the vehicle. Inside the vehicle, the primary coaxial cable is connected to a secondary instrument panel antenna coaxial cable with an in-line connector that is located behind the right kick panel. The instrument panel antenna cable is then routed behind the instrument panel to the back of the radio.

### EXPORT

The primary coaxial antenna cable is routed behind the A-pillar trim, up the right side of the roof panel above the headliner. Inside the vehicle, the primary coaxial cable is connected to a secondary instrument panel antenna coaxial cable with an in-line connector that is located behind the A-pillar trim at one end. At the other end, the cable is connected to the antenna module. The instrument panel antenna cable is then routed behind the instrument panel to the back of the radio.

## OPERATION

The antenna body and cable connects the antenna mast (domestic) or quarter glass integral antenna (export) to the radio. The radio antenna is an electromagnetic circuit component used to capture radio frequency signals that are broadcast by local commercial radio stations in both the Amplitude Modulating (AM) and Frequency Modulating (FM) frequency ranges. These electromagnetic radio frequency signals induce small electrical modulations into the antenna as they move past the mast. The antenna body transfers the weak electromagnetic radio waves induced into the antenna into the center conductor of the flexible primary antenna coaxial cable. The braided outer shield of the antenna coaxial cable is grounded through both the antenna body and the radio chassis, effectively shielding the radio waves as they are conducted to the radio. The radio then tunes and amplifies the weak radio signals into stronger electrical signals in order to operate the audio system speakers.

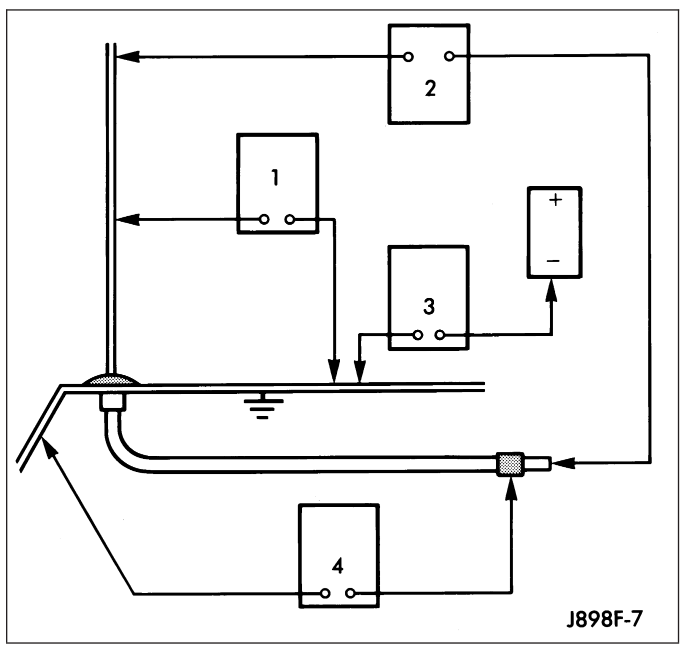
## DIAGNOSIS AND TESTING - ANTENNA BODY AND CABLE

The following four tests are used to diagnose the antenna with an ohmmeter:

- **Test 1** - Mast to ground test
- **Test 2** - Tip-of-mast to tip-of-conductor test
- **Test 3** - Body ground to battery ground test
- **Test 4** - Body ground to antenna coaxial cable shield test.

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

The ohmmeter test lead connections for each test are shown in the illustration.



**NOTE: This model has a two-piece antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate an antenna cable problem. First, test the primary antenna cable (integral to the antenna body and cable) from the coaxial cable connector behind the right side kick panel to the antenna body. Then, test the secondary antenna cable (instrument panel antenna cable) from the coaxial cable connector behind the right side kick panel to the coaxial cable connector at the radio.**

## TEST 1

Test 1 determines if the antenna mast is insulated from ground. Proceed as follows:

1. Disconnect and isolate the antenna coaxial cable connector behind the right side kick panel.
2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to known ground. Check the ohmmeter reading for continuity.
3. There should be no continuity. If OK, go to Test 2. If not OK, replace the faulty antenna body and cable.

## TEST 2

Test 2 checks the antenna conductor components for an open circuit. This test should be performed first on the entire antenna circuit, from the antenna mast to the center conductor of the coaxial cable connector at the radio. If an open circuit is detected, each of the three antenna conductor components (antenna mast, antenna body and cable, instrument panel antenna cable) should be isolated and tested individually to locate the exact component that is the source of the open circuit. To begin this test, proceed as follows:

1. Disconnect the instrument panel antenna cable coaxial connector from the back of the radio.
2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to the center conductor pin of the instrument panel antenna cable coaxial connector for the radio. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register only a fraction of an ohm resistance. High or infinite resistance indicates a damaged or open antenna conductor. If OK, go to Test 3. If not OK, isolate and test each of the individual antenna conductor components. Replace only the faulty antenna conductor component.

## TEST 3

Test 3 checks the condition of the vehicle body ground connection. To begin this test, proceed as follows:

1. This test must be performed with the battery positive cable disconnected from the battery. Disconnect and isolate both battery cables, negative cable first.
2. Reconnect the battery negative cable.
3. Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the battery negative terminal post. Check the ohmmeter reading for continuity.
4. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the battery negative terminal and the vehicle body. If OK, go to Test 4. If not OK, check the battery negative cable connection to the vehicle body and the radio noise suppression ground strap connections to the engine and the vehicle body for being loose or corroded. Clean or tighten these connections as required.

## TEST 4

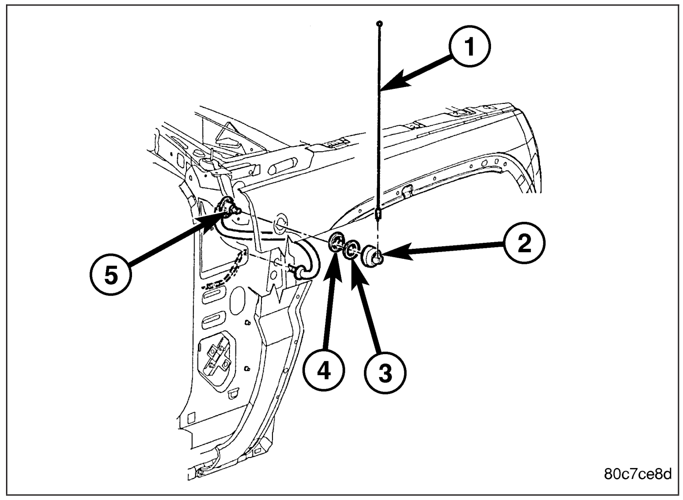
Test 4 checks the condition of the connection between the antenna coaxial cable shield and the vehicle body ground as follows:

1. Disconnect and isolate the antenna coaxial cable connector behind the right side kick panel.
2. Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the outer crimp on the antenna coaxial cable connector. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the antenna body and the vehicle body or between the antenna body and the antenna coaxial cable shield. If not OK, clean the antenna body to fender mating surfaces and tighten the antenna cap nut to specifications.
4. Check the resistance again with an ohmmeter. If the resistance is still more then one ohm, replace the faulty antenna body and cable.

## REMOVAL

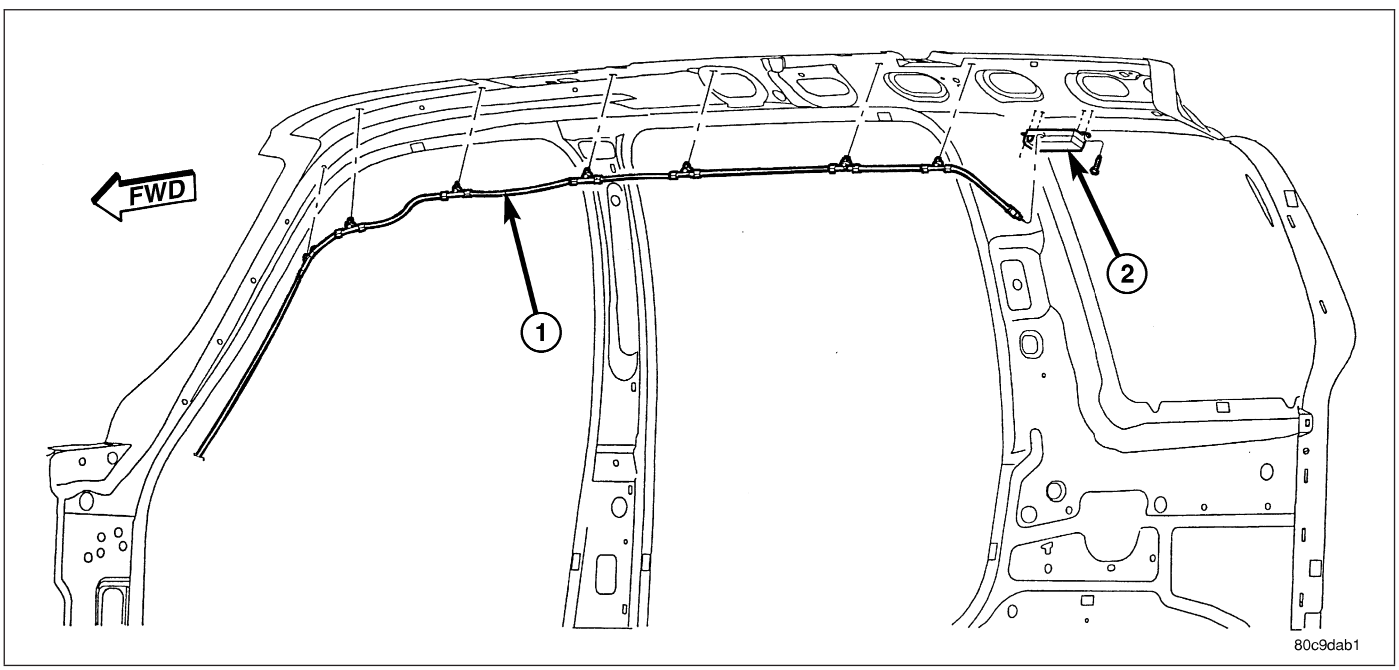
### DOMESTIC

1. Disconnect and isolate the battery negative cable.
2. Remove the antenna mast (1).
3. Remove cover (2).
4. Remove mounting nut (3).
5. Remove bezel adapter.
6. Remove right kick panel trim.
7. Disconnect antenna body and cable from the instrument panel cable. Attach a wire or string (approximately 2 feet in length) to the cable to aid in installation of the new cable.
8. Remove the upper fender mounting bolts. Loosen the two fender mounting bolts located near the upper door hinge (Refer to 23 - BODY/EXTERIOR/FRONT FENDER - REMOVAL).
9. Carefully pull fender out to access the antenna body and cable. Pull cable up through the opening with wire attached.



### EXPORT

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**



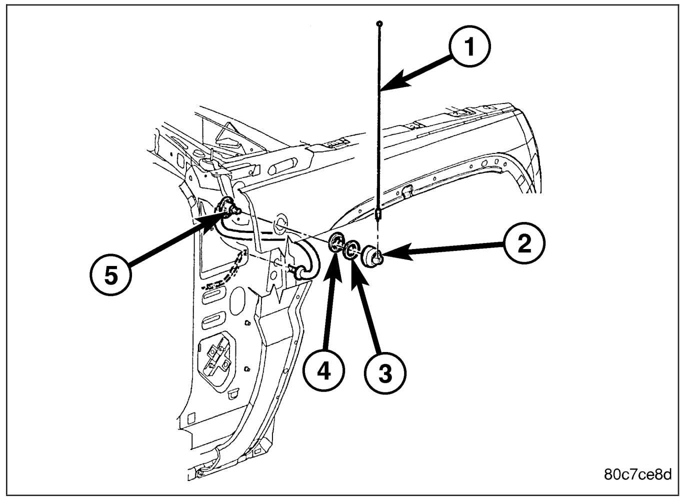
1. Disconnect and isolate the battery negative cable.
2. Remove the assist handles on the right side of the headliner (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL).
3. Remove the right side visor (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).
4. Remove the A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
5. Lower headliner as necessary to access antenna cable (1).

6. Disconnect antenna cable from antenna module (2).
7. Remove antenna cable from roof panel by pulling on retaining clips.
8. Disconnect antenna cable from instrument panel antenna cable by disconnecting the antenna connector.

## INSTALLATION

### DOMESTIC

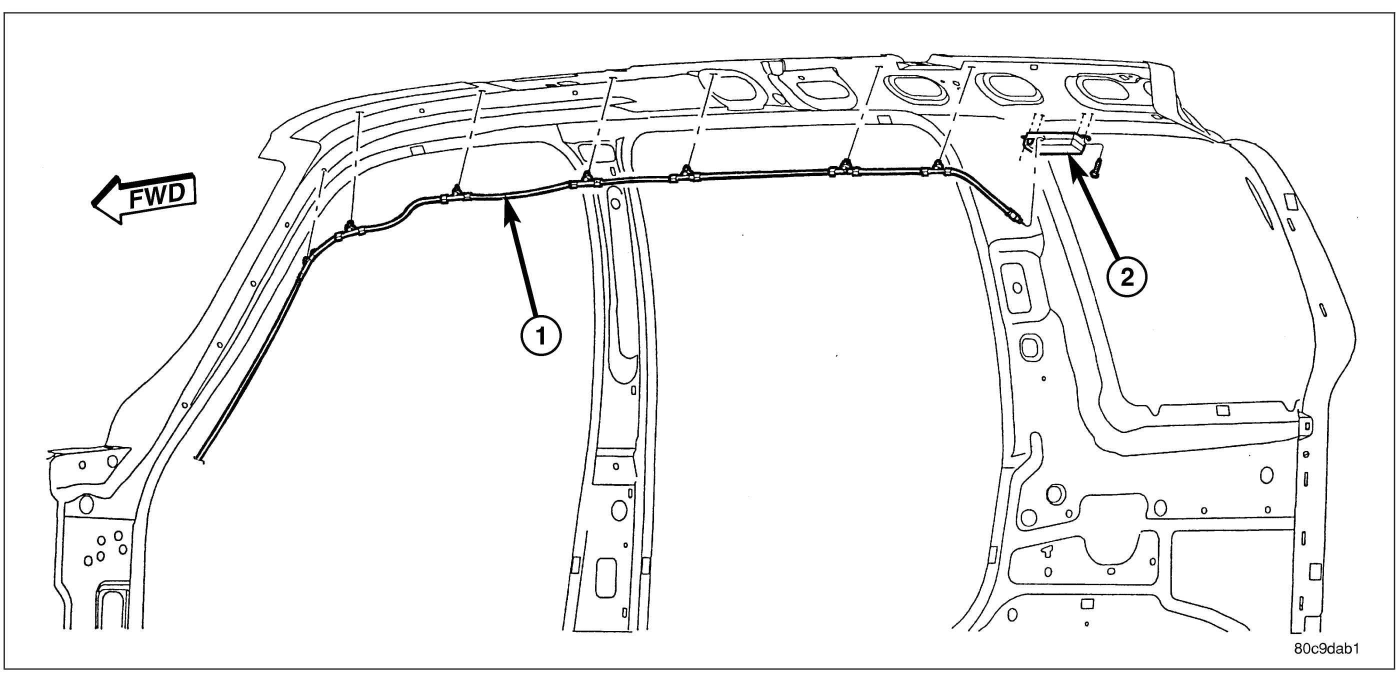
1. Attached wire to new cable. Pull fender out and insert cable into opening.
2. Pull cable through hole in kick panel area using the attached wire.
3. Connect antenna body cable to the instrument panel cable (5).
4. Install right kick panel trim.
5. Install bezel adapter.
6. Install mounting nut.
7. Install cover.
8. Install antenna mast. Tighten to 50 N·m (37 ft. lbs.). **Ensure that the antenna mast is fully seated on antenna base and that there is no gap between the mast and base.**
9. Tighten fender mounting bolts near door hinge area.



10. Install and tighten the upper fender mounting bolts (Refer to 23 - BODY/EXTERIOR/FRONT FENDER - INSTALLATION).
11. Connect the battery negative cable.

### EXPORT

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

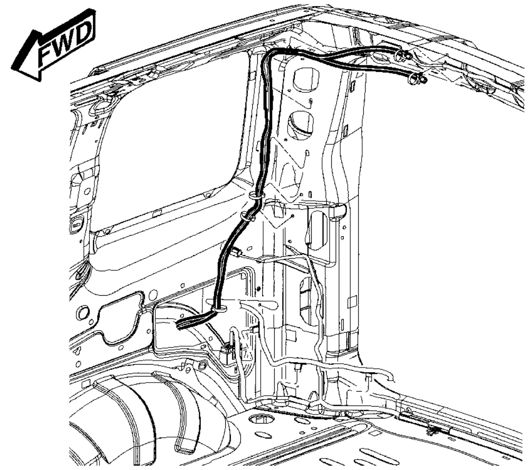


1. Connect antenna cable (1) to the instrument panel antenna cable.
2. Install antenna cable to the roof panel by pressing retaining clips into position.
3. Connect antenna cable to the antenna module (2).
4. Raise headliner into position.
5. Install A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).
6. Install the right side sunvisor (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).
7. Install the assist handles (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - INSTALLATION).
8. Connect the battery negative cable.

# ANTENNA CABLE - SATELLITE RADIO

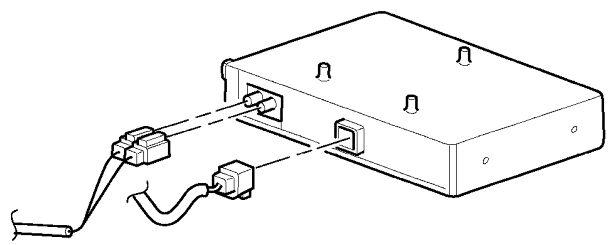
## REMOVAL

1. Disconnect and isolate the battery cable.
2. Remove headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - REMOVAL).
3. Disconnect antenna cable from antenna.
4. Remove antenna cable retainers from C-pillar and roof panel.



8147d222

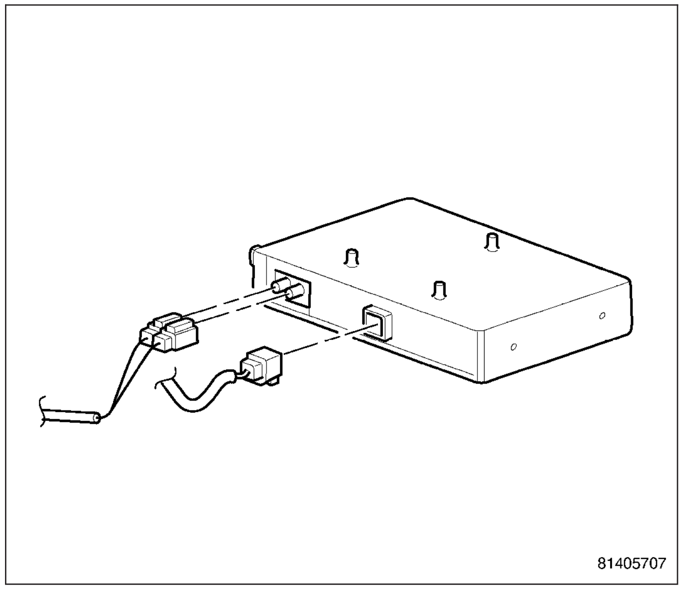
5. Disconnect antenna cable from satellite receiver.



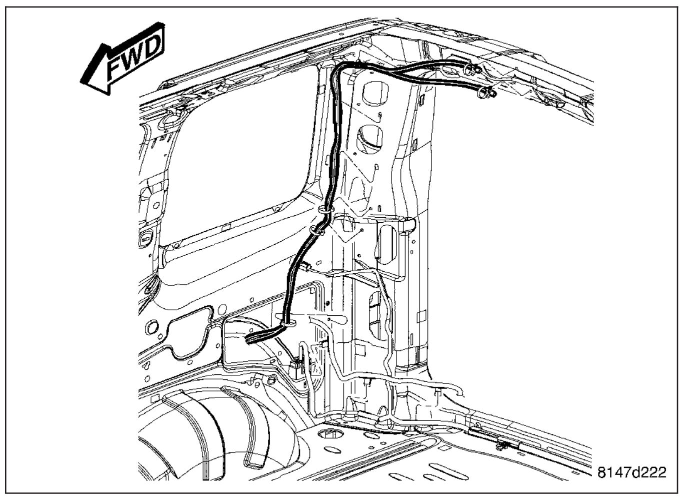
81405707

## INSTALLATION

1. Connect antenna cable to satellite receiver.



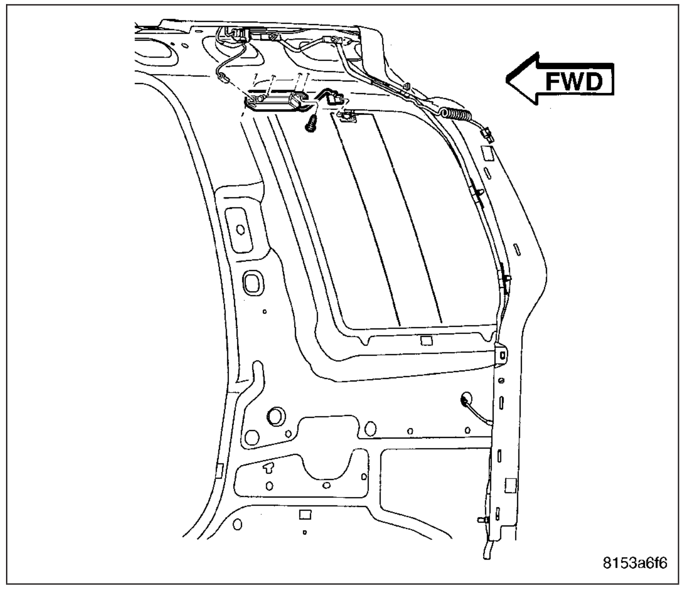
2. Install antenna cable retainers to C-pillar and roof panel.
3. Connect antenna cable to satellite antenna.
4. Install headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - INSTALLATION).
5. Connect battery negative cable.



# ANTENNA MODULE

## DESCRIPTION

The antenna module is an electromagnetic circuit component designed to capture and enhance radio frequency signals in both the AM and FM broadcast bands. The antenna module is mounted to the right rear roof rail under the headliner. The modules mounting brackets also double as the ground circuit. The module has an electrical connector that connects to the integral radio antenna, located on the right rear quarter glass. There is also an electrical connector for battery voltage and a coax cable connector.



## OPERATION

The antenna module receives both AM and FM radio signals supplied by the side window integral radio antenna system and selectively amplifies them. The amplified signal is then sent through the body length coax cable to the radio input.

## DIAGNOSIS AND TESTING

## ANTENNA MODULE

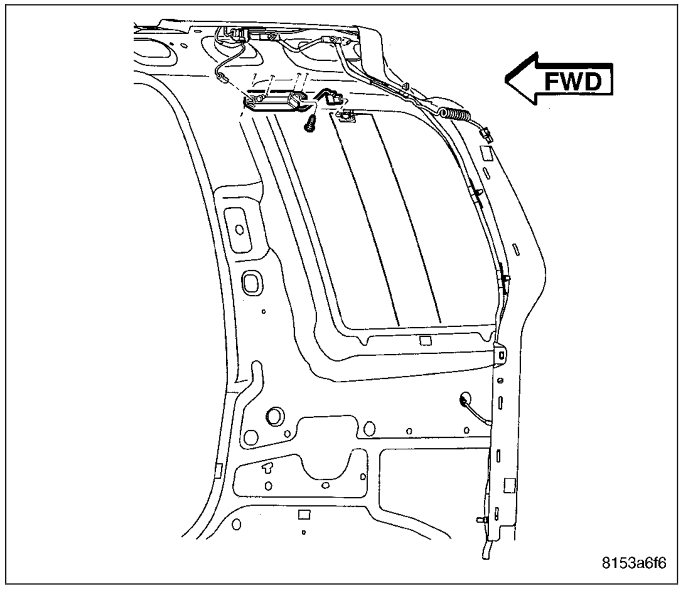
### ANTENNA MODULE DIAGNOSIS TABLE

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO AM RECEPTION, WEAK FM RECEPTION | 1. Antenna module to antenna connector open or disconnected. | 1. Repair open, reconnect antenna module connector to glass mounted antenna. |
| | 2. Coax open or disconnected. | 2. Repair open, reconnect coax. |
| | 3. No battery power at antenna module. | 3. Check fuse, if okay, repair open in battery voltage circuit. |
| NO AM OR FM RECEPTION | 1. Coax disconnected at radio. | 1. Reconnect coax. |
| | 2. Coax shorted to ground. | 2. Repair or Replace coax |
| WEAK OR NO AM/FM RECEPTION | 1. Antenna Module faulty. | 1. Substitute known good module. If reception improves, Antenna Module was faulty. |

## REMOVAL

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

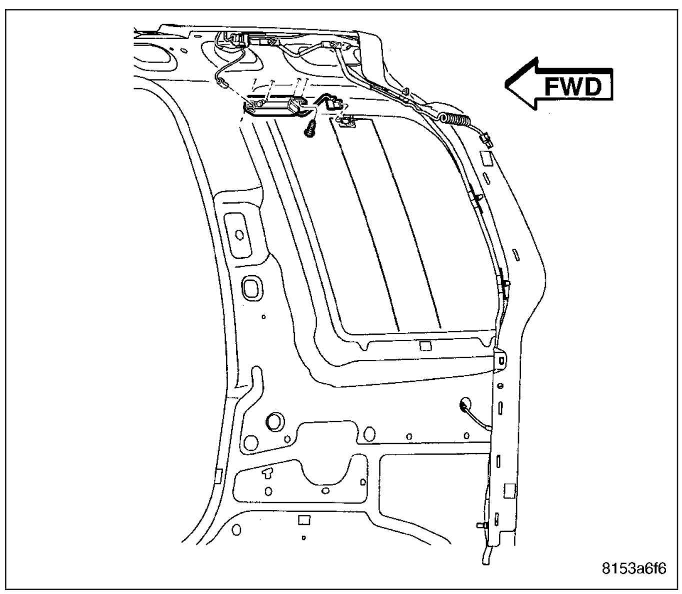
1. Disconnect and isolate the battery negative cable.
2. Remove the headliner as necessary to access antenna module.
3. Disconnect the electrical harness connector from the antenna module.
4. Disconnect the antenna module connector from the integral antenna.
5. Remove the mounting fasteners from the antenna module.
6. Disconnect the coax lead from the antenna module.



## INSTALLATION

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

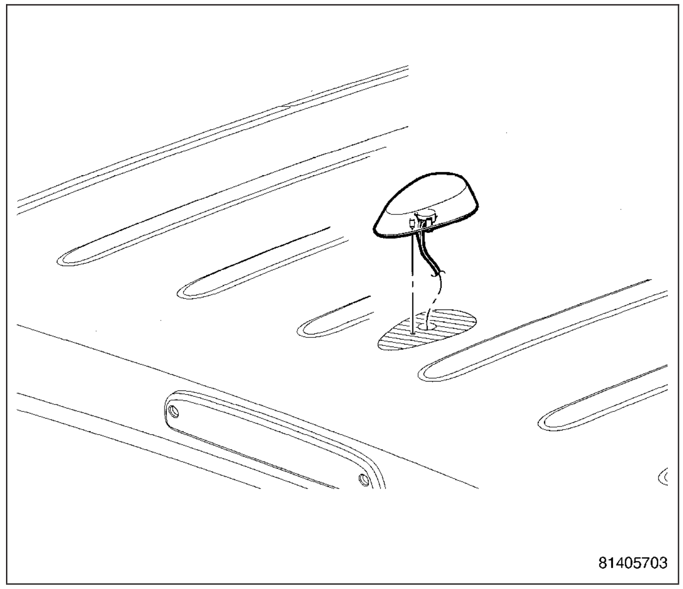
1. Plug coax into antenna module.
2. Position antenna module. Install and tighten mounting fasteners.
3. Connect antenna module lead to the integral antenna.
4. Connect battery power supply lead to antenna module.
5. Install headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
6. Connect battery negative cable.



# ANTENNA-SATELLITE RADIO

## DESCRIPTION

The satellite radio antenna is secured by a threaded fastener and two retainers which protrude through a hole in the roof panel. Two antenna cables from the antenna are connected to the satellite receiver.

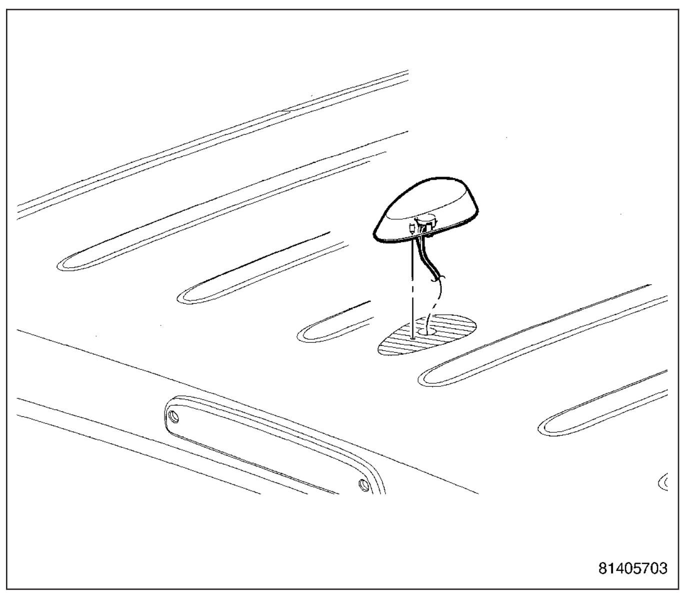


## OPERATION

The satellite radio antenna receives signals from orbiting satellites and sends these signals to the satellite receiver module. The satellite radio antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

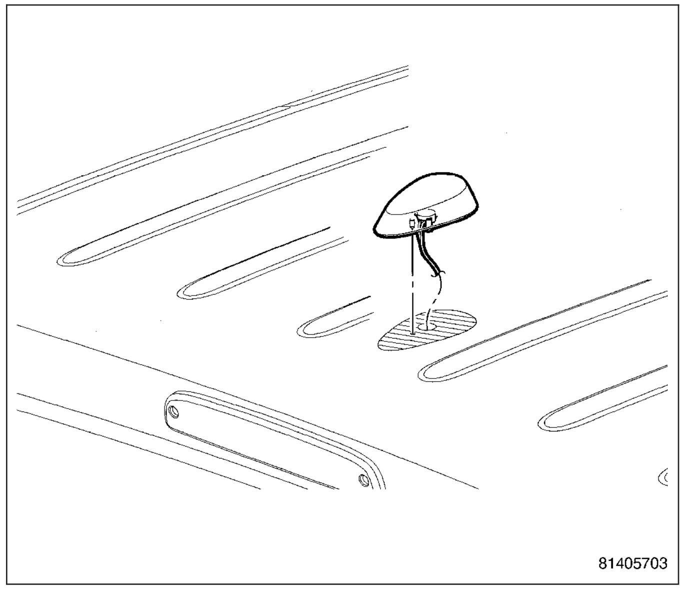
## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. Disconnect the antenna cables from the antenna.
4. Remove the retaining fastener.
5. From inside the vehicle, and using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up the one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.



## INSTALLATION

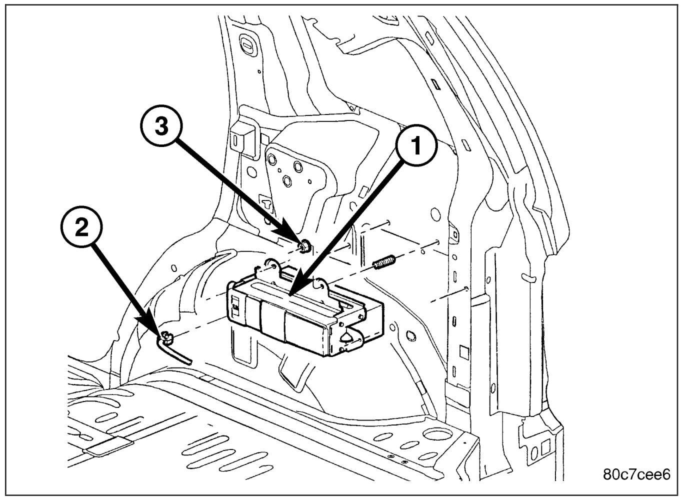
1. Insert wire harness through hole in roof panel. Press antenna into position until both retainers snap into place.
2. Install and tighten the retaining fasteners.
3. Connect antenna cable connectors to antenna.
4. Install headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - INSTALLATION).
5. Connect battery negative cable.



# CD CHANGER

## DESCRIPTION

The CD changer (if equipped) is mounted in the cargo area of the passenger compartment on the right rear quarter panel.

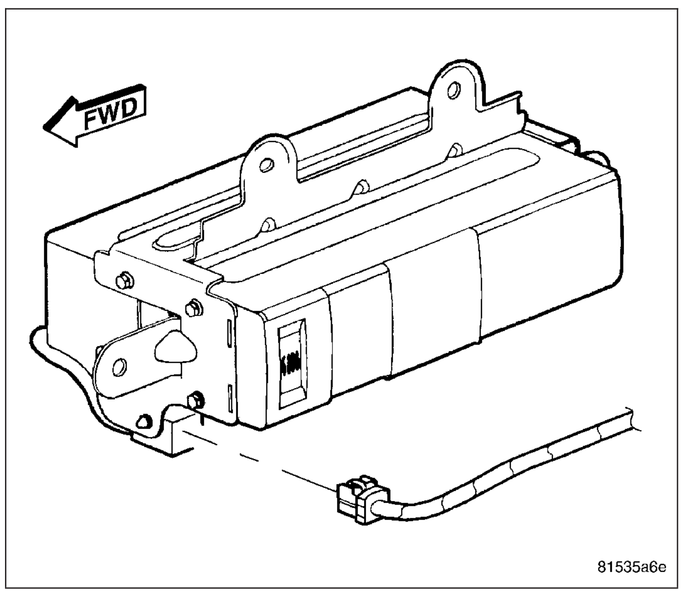


## OPERATION

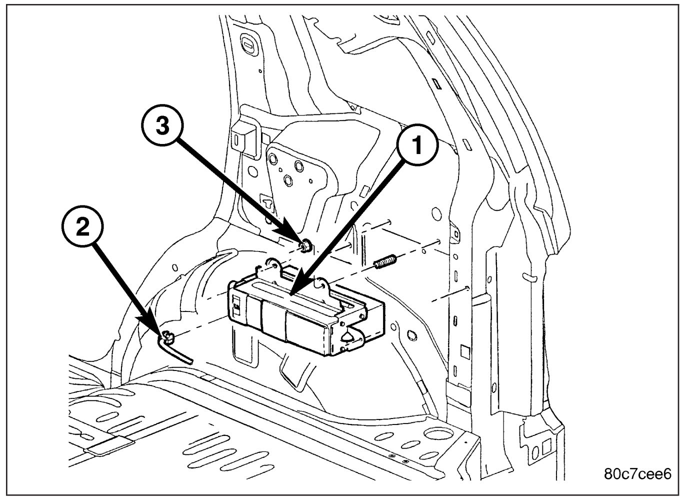
The CD changer will only operate when the ignition switch is in the On or Accessory positions, and the radio is turned on. The six-CD magazine may be ejected with the ignition in the Off position.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the right rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).
3. Disconnect the electrical wire harness connector.

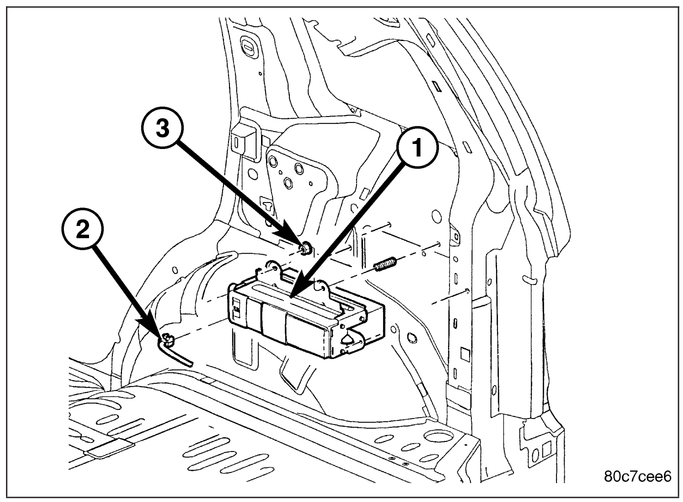


4. Remove the mounting fasteners.
5. Remove the CD Changer (1) from the vehicle.

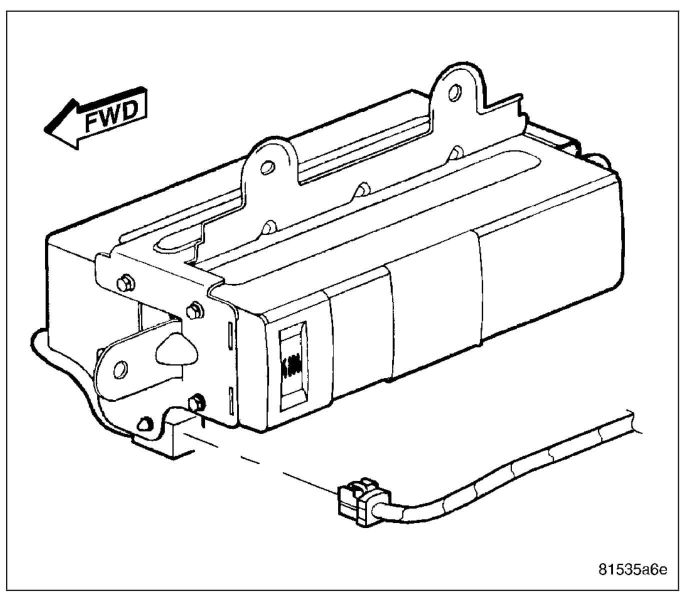


## INSTALLATION

1. Install the CD Changer to the vehicle.
2. Install and tighten the mounting fasteners.



3. Connect the wire harness connector.
4. Install the right rear quarter trim panel (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).
5. Connect the battery negative cable.



# INSTRUMENT PANEL ANTENNA CABLE

## REMOVAL

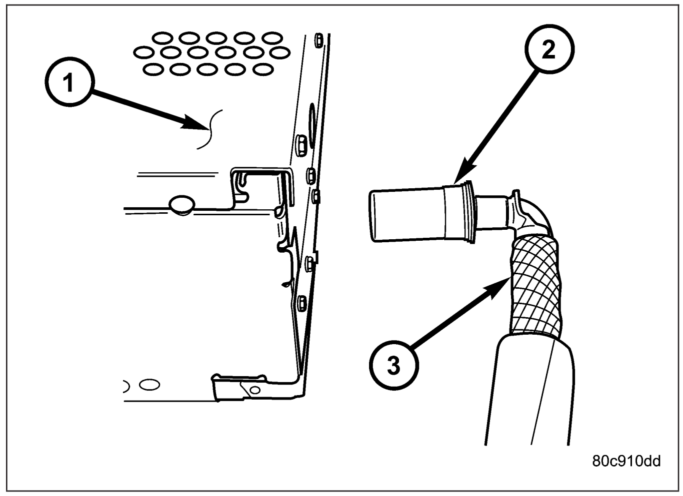
### DOMESTIC

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

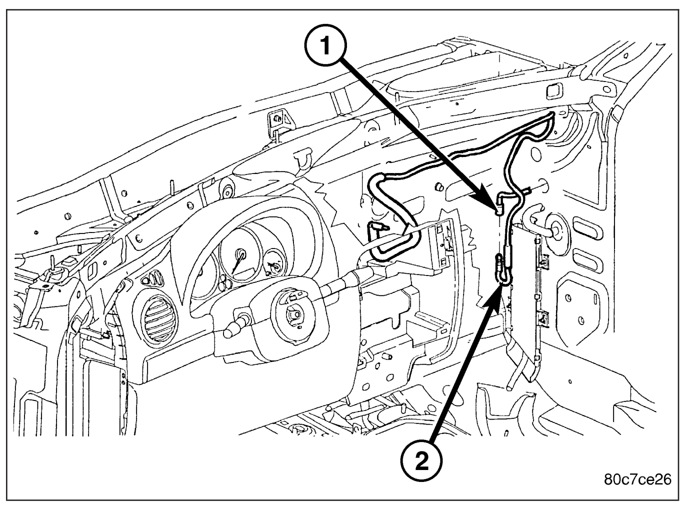
1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

**CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.**

3. Disconnect the antenna cable from radio by pulling the locking antenna connector (2) away from radio.



4. Disengage each of the retainers that secure the cable to the instrument panel.
5. Remove the cable (1) from the instrument panel.



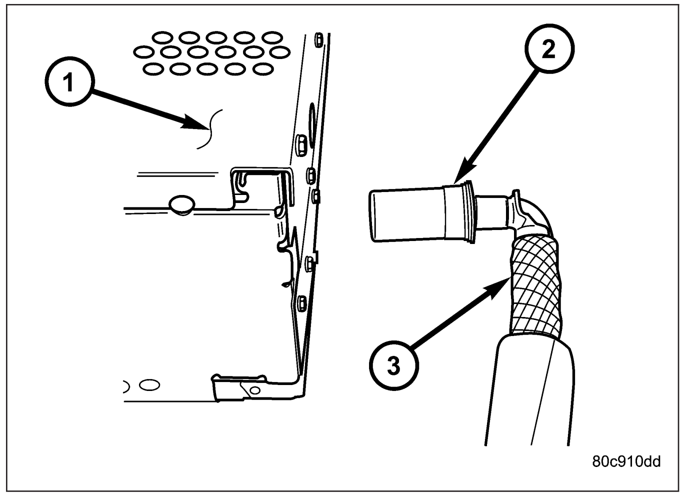
### EXPORT

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

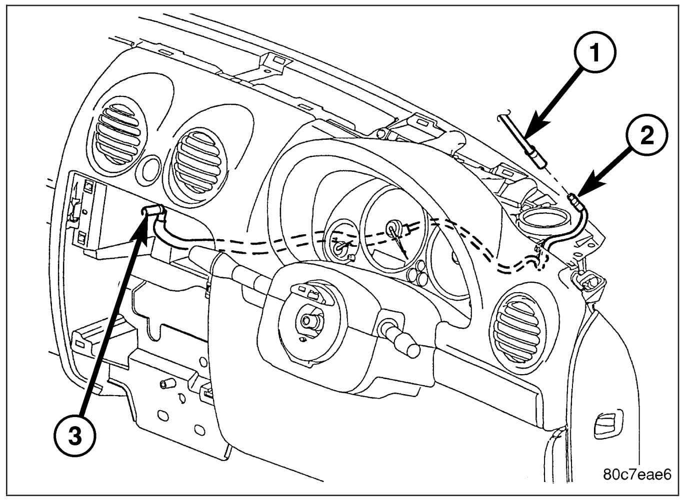
**CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.**

3. Disconnect antenna cable from radio by pulling on the locking antenna connector (2)



.

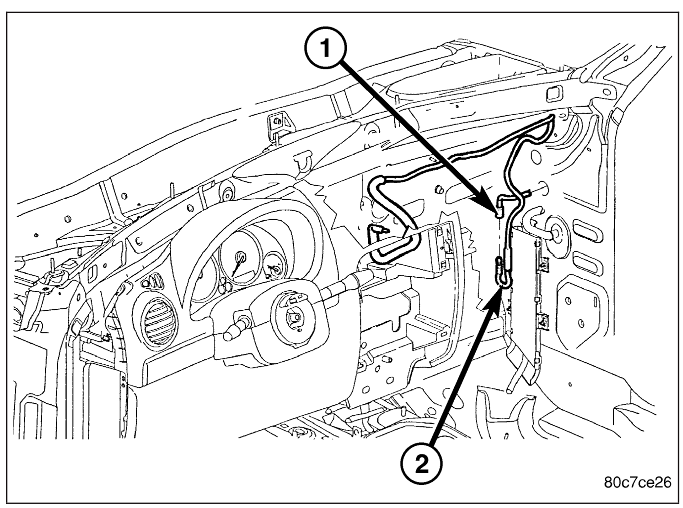
4. Disengage each of the retainers that secure the cable (2) to the instrument panel.



## INSTALLATION

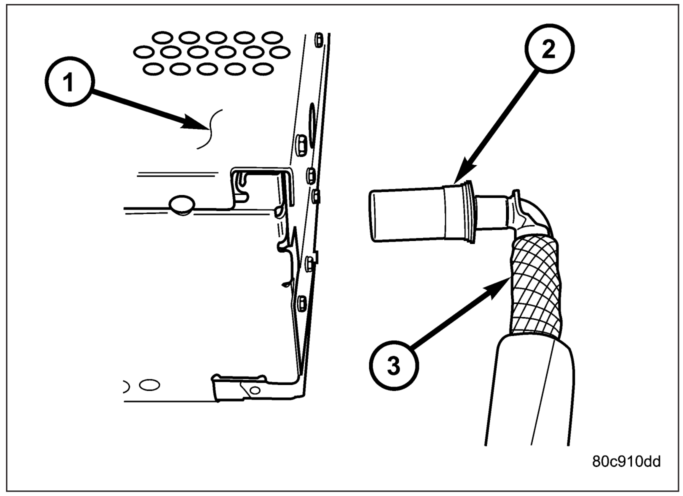
### DOMESTIC

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental air-bag deployment and possible personal injury.**



1. Position the instrument panel antenna cable onto the instrument panel.
2. Engage each of the retainers that secure the cable to the back side of the instrument panel.

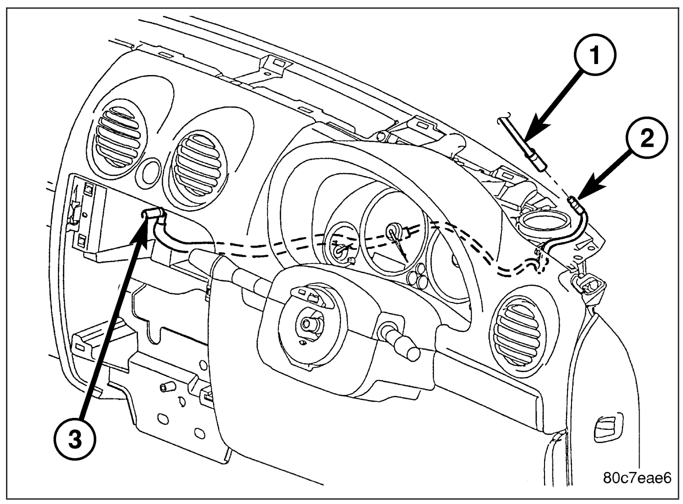
3. Connect cable to radio.
4. Install instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
5. Connect the battery negative cable.



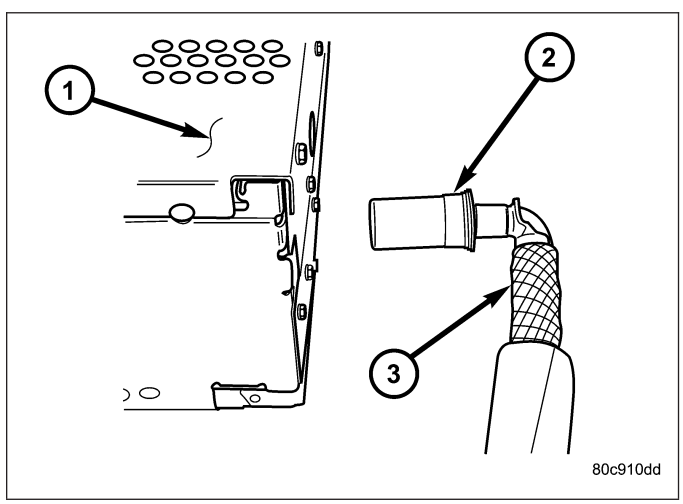
## EXPORT

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

1. Position the instrument panel antenna cable onto the instrument panel.
2. Engage each of the retainers that secure the cable (2) to the back side of the instrument panel.



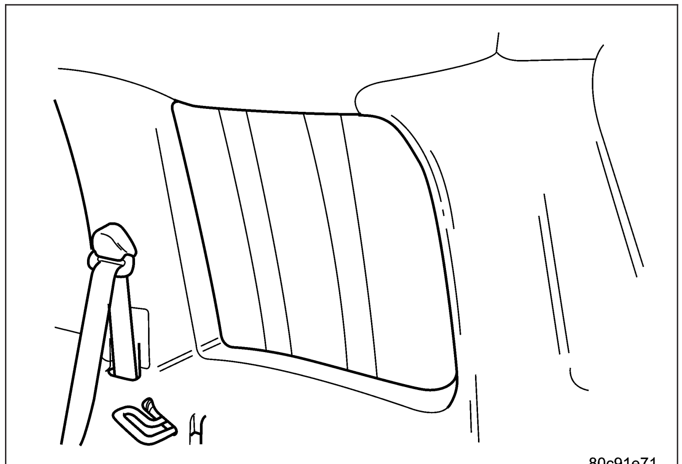
3. Connect cable to radio.
4. Install instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
5. Connect the battery negative cable.



# QUARTER GLASS INTEGRAL ANTENNA

## DESCRIPTION

The integral radio antenna element is bonded to the right rear quarter glass and is replaced with the glass assembly only.



80c91e71

## OPERATION

The integral antenna receives radio frequencies and sends them to the antenna module for amplification.

## DIAGNOSIS AND TESTING - QUARTER GLASS INTEGRAL ANTENNA

The antenna grid pattern connects to the terminal tab for both AM and FM.

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. To detect breaks in the integral antenna elements, the following procedure is required:

1. Disconnect the antenna module connector from the antenna terminals on the glass.
2. Using an ohmmeter, place a lead on one of the terminals and check each end of the grid pattern connected to this terminal for continuity. If continuity is not present, move one lead through the grid in progression starting at the terminal with the other lead on the terminal until continuity is lost. A break in the antenna grid can be repaired using a Mopar Rear Window Defogger Repair Kit (Part Number 4267922) or equivalent (Refer to 8 - ELECTRICAL/HEATED GLASS - STANDARD PROCEDURE).

# RADIO

## DESCRIPTION

### RADIO

Available radios include:

- AM/FM/cassette with CD changer control feature (RBB sales code)
- AM/FM/cassette/CD/ with CD changer control feature (RAZ sales code)
- AM/FM/CD with CD changer control feature (RBK sales code)
- AM/FM/ 6 CD in-dash changer (RBQ sales code)
- AM/FM/cassette/CD with CD changer control feature (RAD, RBT or RBY sales code) - export only
- AM/FM/CD (REK sales code) - export only
- AM/FM/DVD with GPS navigation (RB1 sales code)
- AM/FM/DVD with GPS navigation (RB3 sales code) - export only

All radio receivers can communicate on the Programmable Communications Interface (PCI) data bus network.

### COUNTRY CODE AND CABIN EQ SETTING - REK RADIO ONLY

The REK radio may require the country code and cabin EQ setting to be set if not programmed correctly.

**If battery power is lost to radio, the anti-theft code must be entered before radio will operate.**

If the region the vehicle will be driven in uses 10 kHz spacing on the AM band (i.e. 950, 960 etc.), set the Country Code to "USA". If the region uses 9 kHz spacing, has LW and MW Bands, and uses RDS (i.e. AF, PTY, TA, etc.), set the radio for "EUR". If neither of the previous settings apply, and the vehicle is not being driven in Japan, set the radio to "ROW". Vehicles driven in Japan should have the radio set to "JPN". The following chart list selected country codes and radio broadcast standards.

To enter the country code and EQ setting, use a scan tool.

**COUNTRY CODE SELECTION CHART**

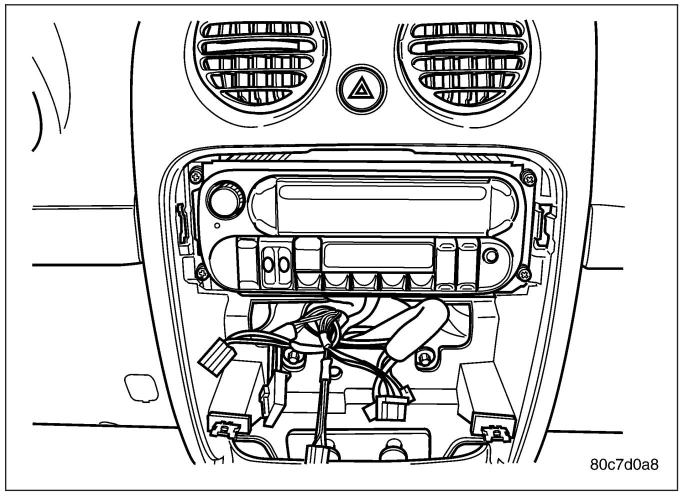
## OPERATION

The radio receiver operates on ignition switched battery current that is available only when the ignition switch is in the On or Accessory positions. The electronic digital clock function of the radio operates on fused battery current supplied through the IOD fuse, regardless of the ignition switch position.

For complete circuit diagrams, refer to the appropriate wiring information.

## REMOVAL

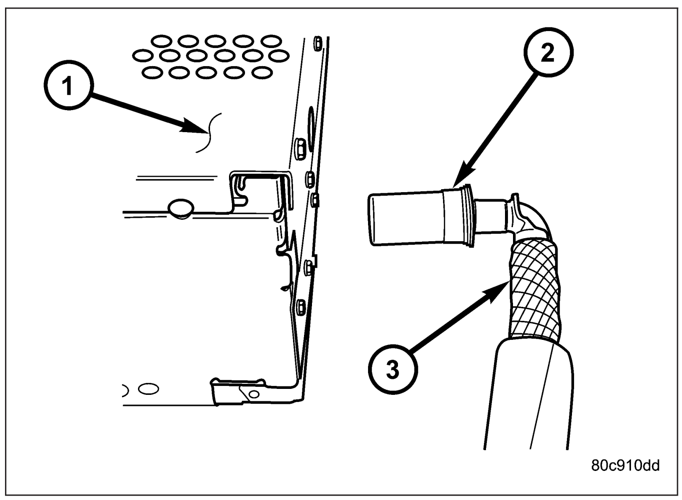
1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center trim panel.
3. Remove the radio mounting fasteners.



80c7d0a8

**CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.**

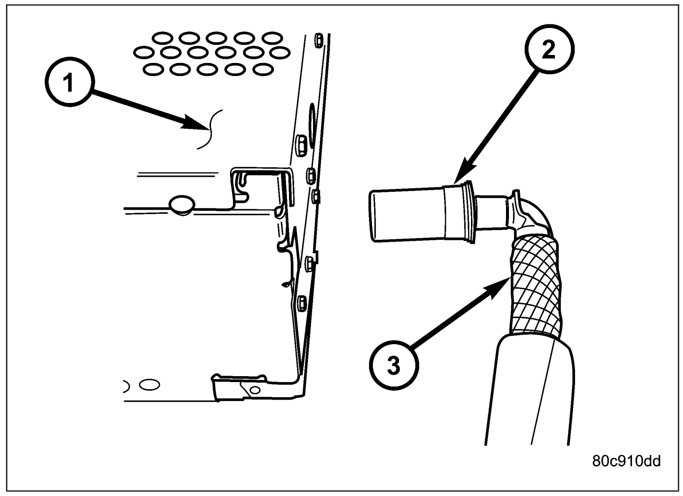
4. Disconnect the antenna cable by pulling the locking antenna connector (2) away from the radio.
5. Disconnect the electrical harness connector(s).
6. Remove radio from instrument panel.



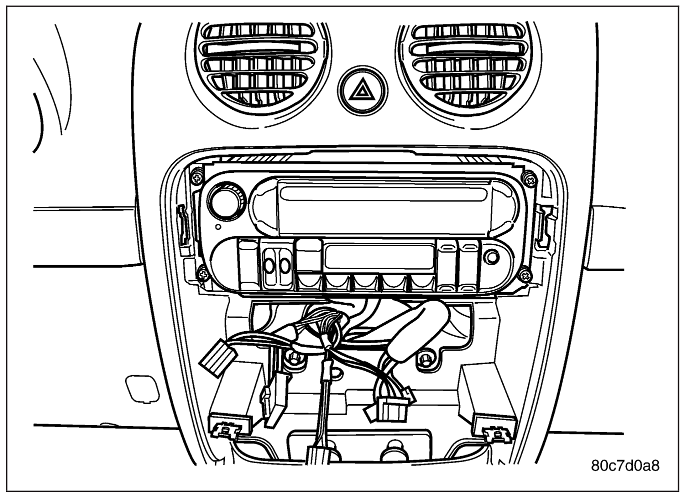
80c910dd

## INSTALLATION

1. Connect the wire harness connector(s).
2. Connect the antenna cable.



3. Install the radio to the instrument panel.
4. Install and tighten the radio mounting fasteners.
5. Install the instrument panel center trim panel.
6. Connect the battery negative cable.



# RADIO NOISE SUPPRESSION COMPONENTS

## DESCRIPTION

Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of “buzzing,” “hissing,” “popping,” “clicking,” “crackling,” and/or “whirring” sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with factory-installed radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the factory-installed radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Engine-to-body ground strap -** This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the engine cylinder head(s). The other is secured to the plenum.
- **Resistor-type spark plugs -** This type of spark plug has an internal resistor connected in series between the spark plug terminal and the center electrode to help reduce the production of electromagnetic radiation that can result in radio noise.

## OPERATION

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

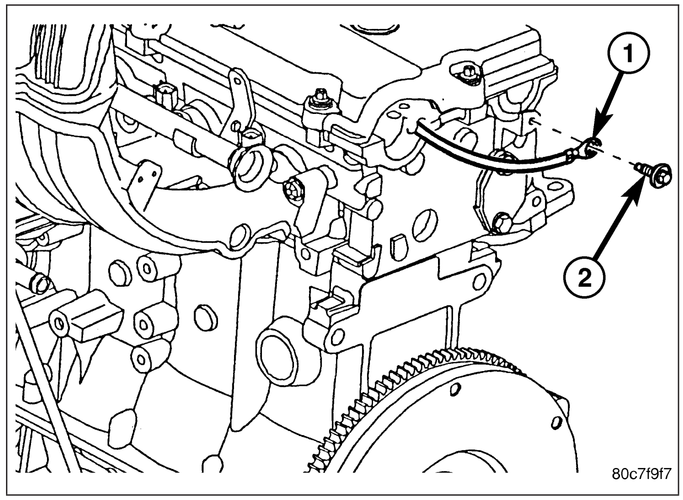
The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

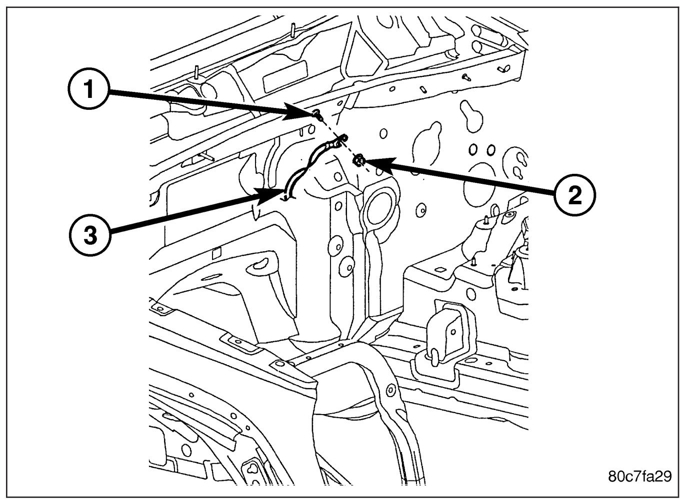
## REMOVAL

### 2.4L ENGINE

1. Disconnect and isolate the battery negative cable.
2. Remove the retaining bolt (2) from the engine cylinder head.

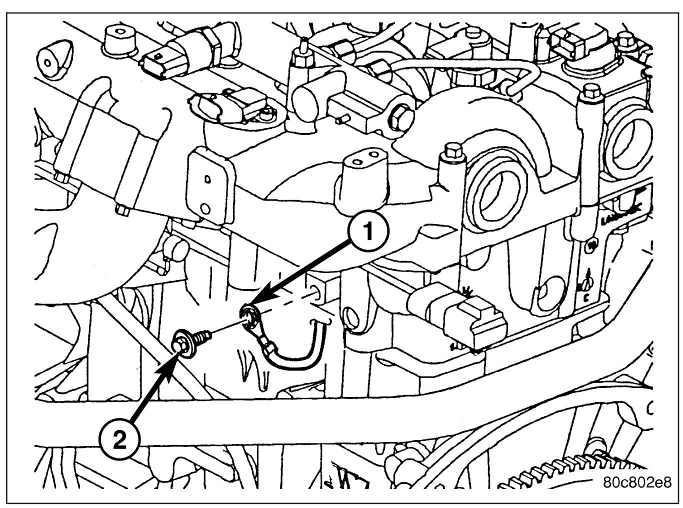


3. Remove the retaining nut (2) from the plenum.

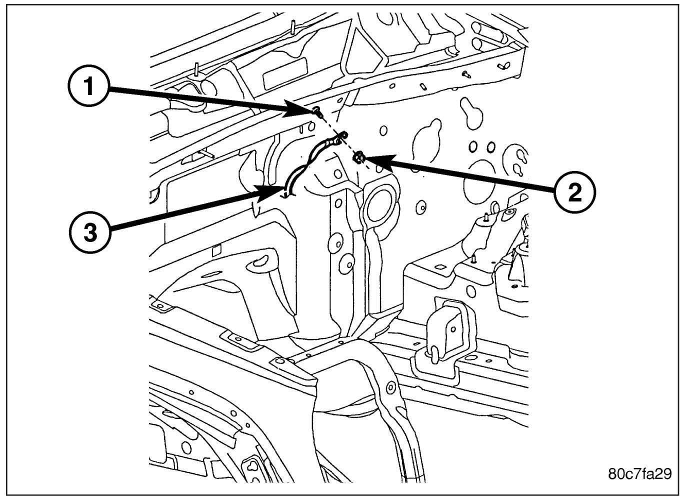


### 2.5L ENGINE

1. Disconnect and isolate the battery negative cable.
2. Remove the retaining bolt (2) from the engine cylinder head.

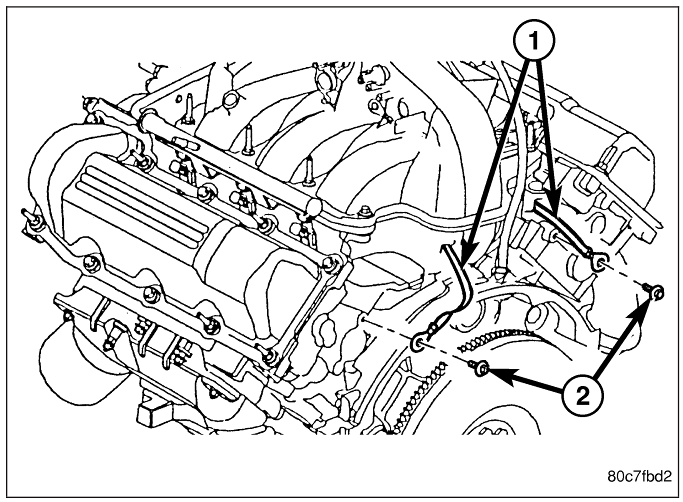


3. Remove the retaining nut (2) from the plenum.

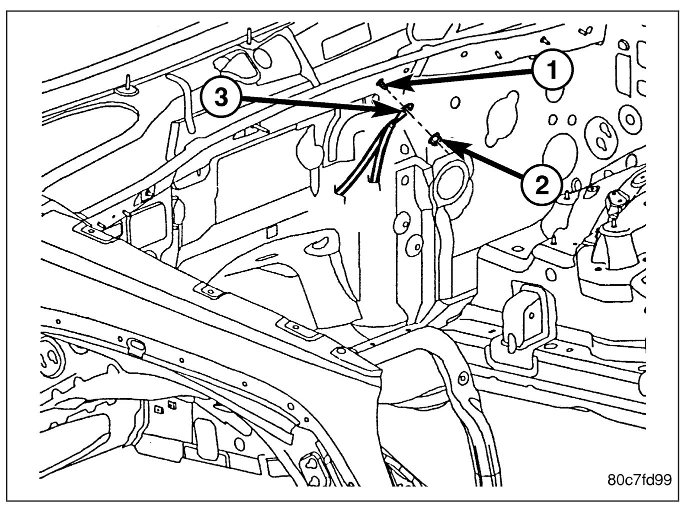


## 3.7L ENGINE

1. Disconnect and isolate the battery negative cable.
2. Remove the retaining bolts (2) from the engine cylinder heads.



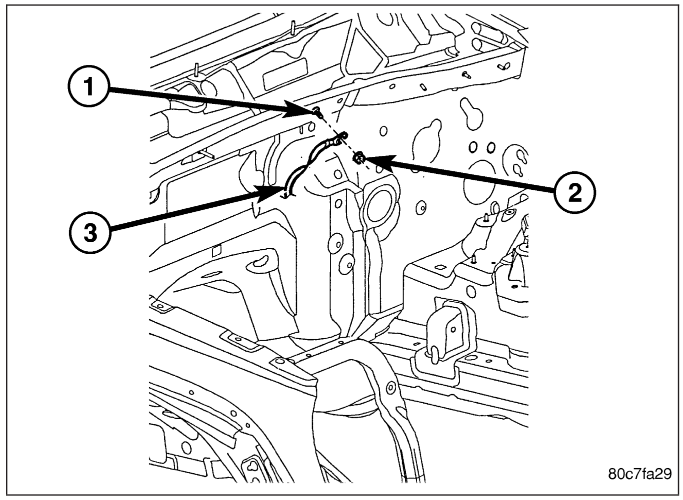
3. Remove the retaining nut (2) from the plenum.



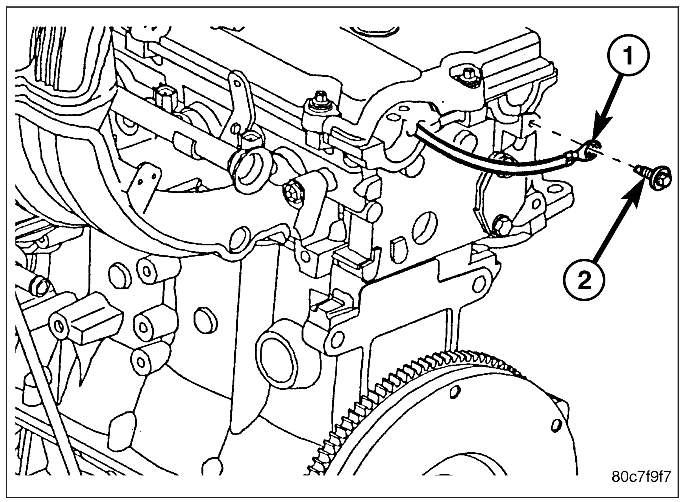
## INSTALLATION

### 2.4L ENGINE

1. Install the retaining nut and ground strap to the plenum.

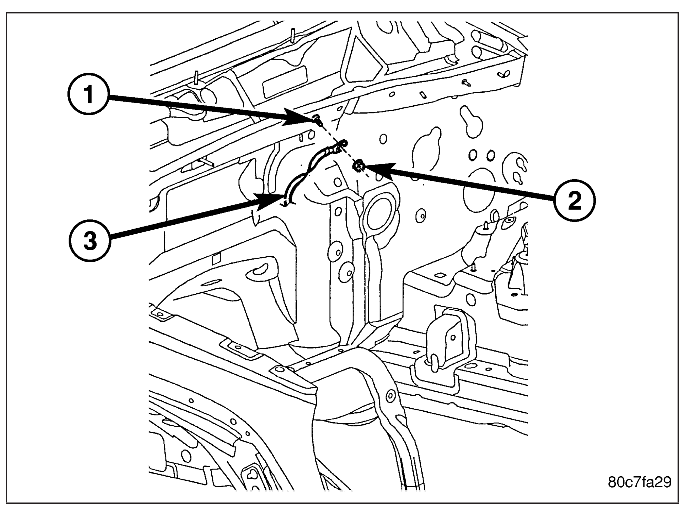


2. Install the retaining bolt and ground strap to the engine cylinder head.
3. Connect the battery negative cable.

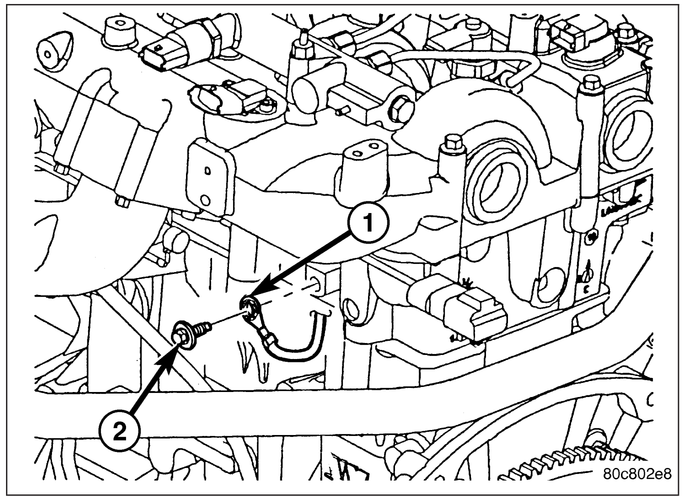


### 2.5L ENGINE

1. Install the retaining nut and ground strap to the plenum.

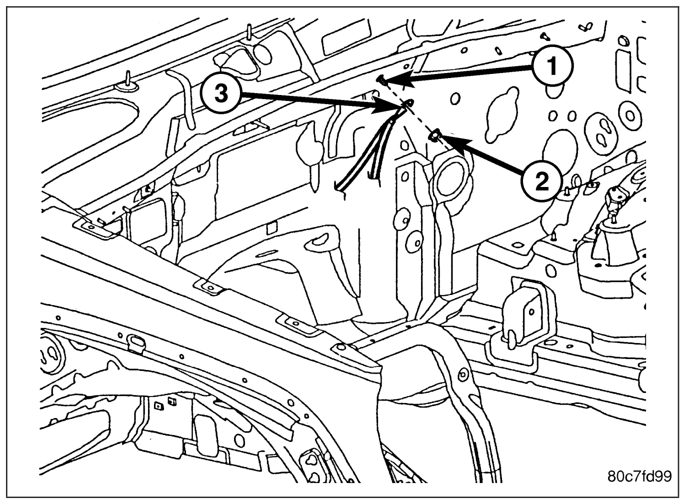


2. Install the retaining bolt and ground strap to the engine cylinder head.
3. Connect the battery negative cable.

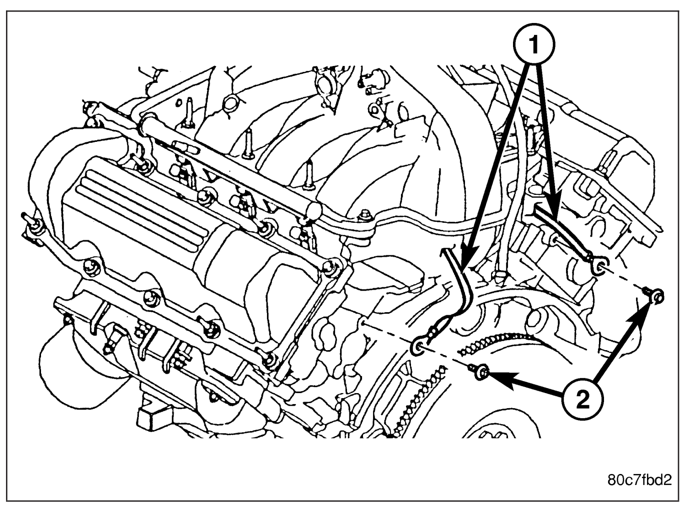


### 3.7L ENGINE

1. Install the retaining nut and ground strap to the plenum.



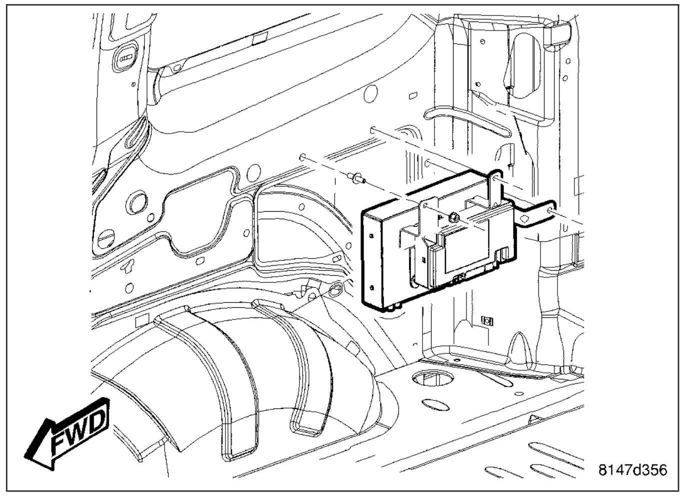
2. Install the retaining bolts and ground strap to the engine cylinder heads.
3. Connect the battery negative cable.



# RECEIVER-SATELLITE

## DESCRIPTION

The satellite receiver is located behind the right rear quarter trim.

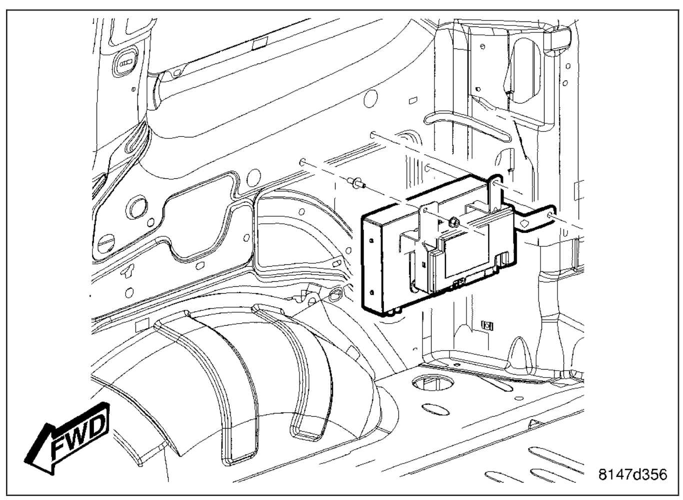


## OPERATION

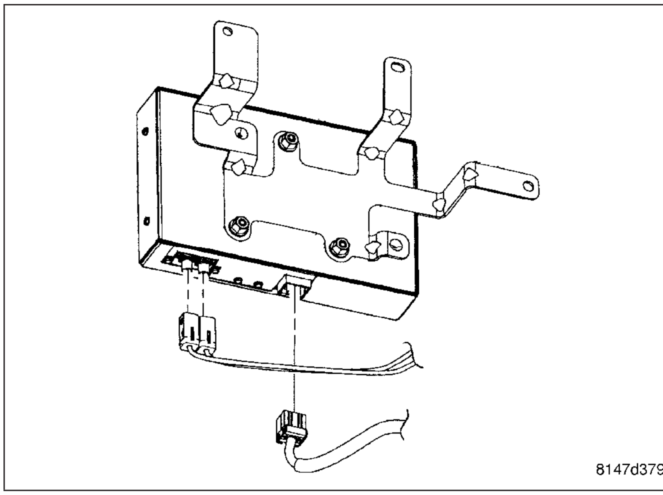
The satellite receiver module receives signals from the roof mounted antenna and processes this information before it is sent to the radio. The module operates on both battery feed circuits and CAN bus messages. It will operate with the ignition key in the run or accessory position only.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the right quarter trim panel (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).
3. Remove mounting fasteners.

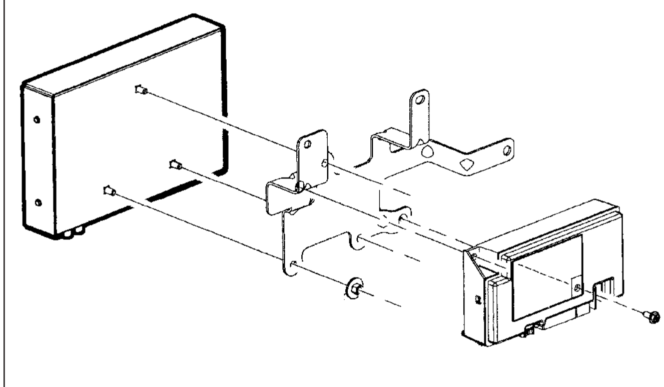


4. Disconnect electrical harness connector.



8147d379

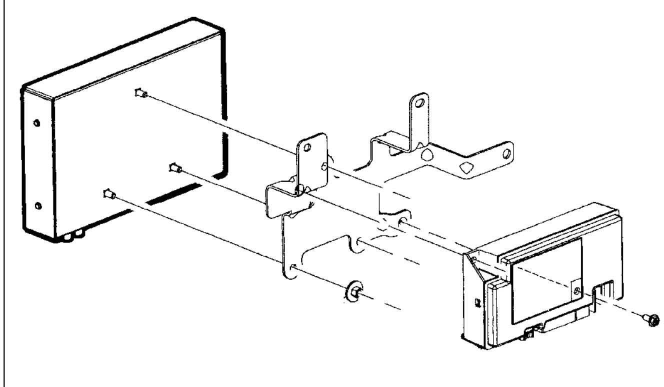
5. Remove the hands free module from the mounting bracket.
6. Remove the satellite module mounting fasteners.



8147d394

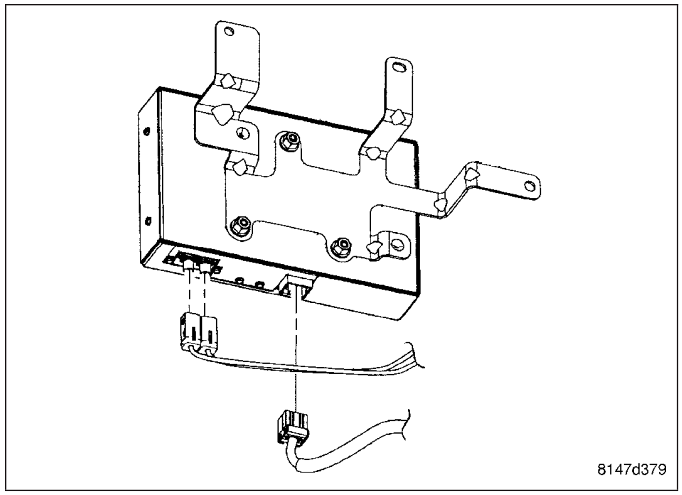
## INSTALLATION

1. Position satellite module to bracket.
2. Install and tighten mounting fasteners.
3. Position hands free module to bracket.
4. Install and tighten mounting fasteners.



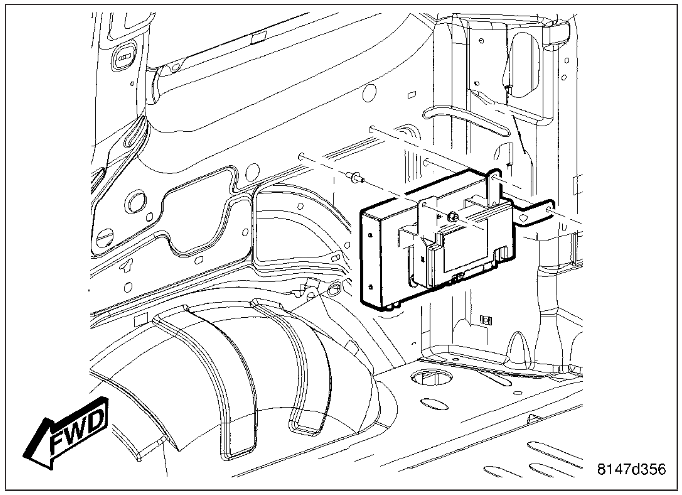
8147d394

5. Connect electrical harness connectors and antenna cables.



8147d379

6. Position bracket assembly to quarter panel.
7. Install and tighten mounting fasteners.
8. Install quarter trim panel.
9. Connect battery negative cable.

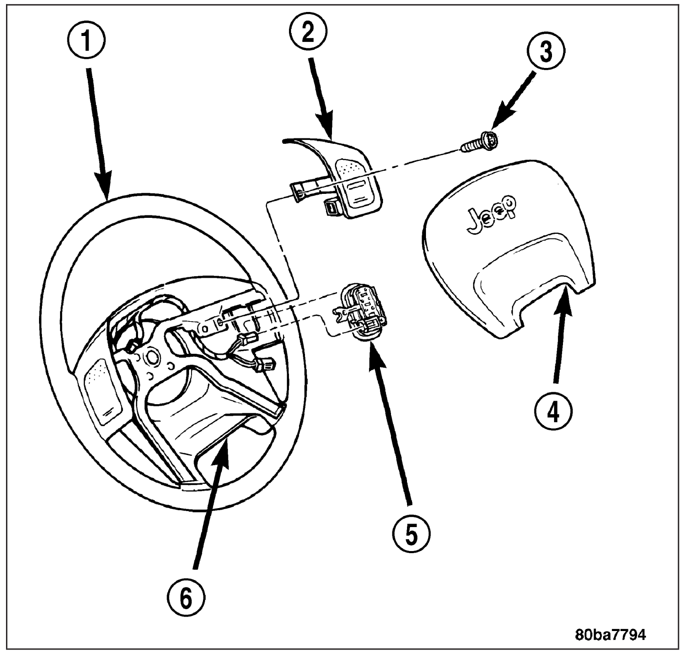


8147d356

# REMOTE SWITCHES

## DESCRIPTION

Two rocker-type switches (2) (if equipped) are mounted on the back (instrument panel side) of the steering wheel spokes. The switch on the left spoke is the seek switch and has seek up, seek down, and preset station advance functions. The switch on the right spoke is the volume control switch and has volume up, and volume down functions. The switch on the right spoke also includes a “mode” control that allows the driver to sequentially select AM radio, FM radio, cassette player, CD player or CD changer (if equipped).



## OPERATION

The six switches in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the Body Control Module (BCM) through the clockspring. The BCM sends a five volt reference signal to both switch units on one circuit, and senses the status of all of the switches by reading the voltage drop on a second circuit.

When the BCM senses an input (voltage drop) from any one of the remote radio switches, it sends the proper switch status messages on the Programmable Communication Interface (PCI) data bus network to the radio receiver. The electronic circuitry within the radio receiver is programmed to respond to these remote radio switch status messages by adjusting the radio settings as requested. For diagnosis of the BCM or the PCI data bus, the use of a scan tool and the proper Diagnostic Procedures manual are recommended.

## DIAGNOSIS AND TESTING - REMOTE SWITCHES

**Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic information.**

For complete circuit diagrams, refer to the appropriate wiring information.

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

1. Disconnect and isolate the battery negative cable. Remove the remote radio switch(es) from the steering wheel (Refer to 8 - ELECTRICAL/AUDIO/REMOTE SWITCHES - REMOVAL).
2. Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch Test chart. If the remote radio switch resistances check OK, go to Step 3. If not OK, replace the faulty switch.

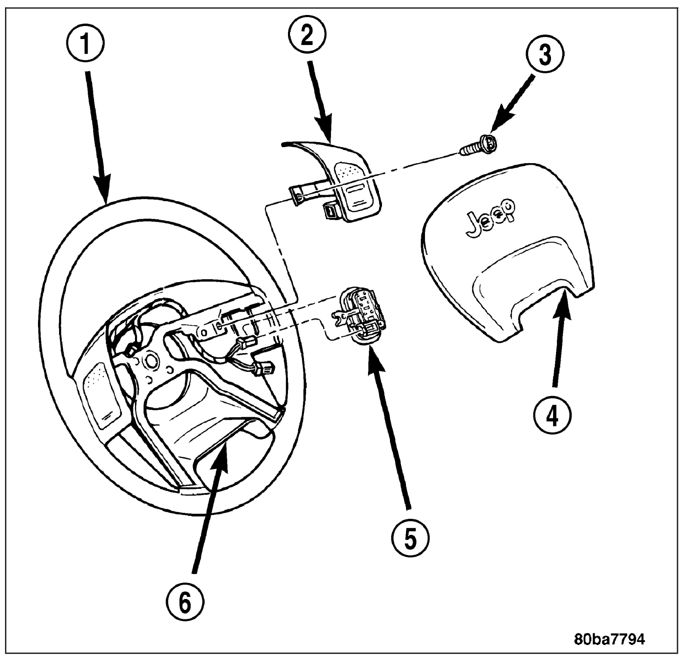
**REMOTE RADIO SWITCH TEST TABLE**

| Switch | Switch Position | Resistance |
|---|---|---|
| Right (White) | Volume Up | 1.210 Kilohms ± 1% |
| Right (White) | Volume Down | 3.010 Kilohms ± 1% |
| Right (White) | Mode Advance | 0.0511 Kilohms ± 1% |
| Left (Black) | Seek Up | 0.261 Kilohms ± 1% |
| Left (Black) | Seek Down | 0.681 Kilohms ± 1% |
| Left (Black) | Pre-Set Station Advance | 0.162 Kilohms ± 1% |

3. Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for 5 volts at the radio control mux circuit cavities of the steering wheel wire harness connectors for both remote radio switches. If OK, go to Step 4. If not OK, repair the open or shorted radio control mux circuit to the Body Control Module (BCM) as required.
4. Disconnect and isolate the battery negative cable. Disconnect the 22-way instrument panel wire harness connector from the BCM. Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted remote radio switch ground circuit to the BCM as required.
5. Check for continuity between the remote radio switch ground circuit cavities of the steering wheel wire harness connectors for both remote radio switches and the 22-way instrument panel wire harness connector for the BCM. There should be continuity. If OK, refer to the proper Diagnostic Procedures manual to test the BCM and the PCI data bus. If not OK, repair the open remote radio switch ground circuit as required.

## REMOVAL

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

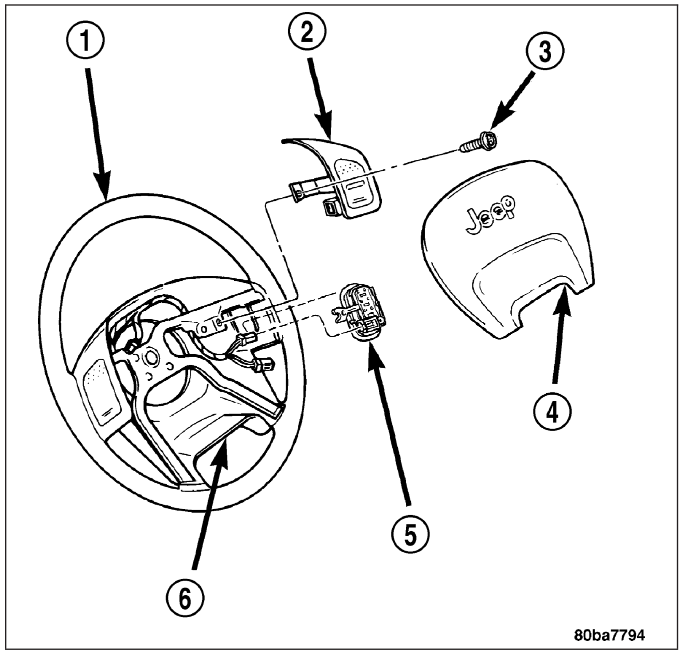


1. Disconnect and isolate the battery negative cable.
2. Remove the driver side airbag from the vehicle (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. Remove the speed control switches.
4. Unplug the wire harness connector from the remote radio switch (5).
5. Depress the tabs on each side of each switch and push the switch through the rear steering wheel cover.

## INSTALLATION

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

1. Install remote radio switch to the steering wheel.
2. Connect the wire harness to the remote radio switch.
3. Install the speed control switches.
4. Install the driver side airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
5. Connect the battery negative cable.



# SPEAKER

## DESCRIPTION

### STANDARD

The standard equipment speaker system includes speakers in six locations. One 6.4 centimeter (2.50 inch) diameter speaker is installed on each end of the instrument panel top pad. One 16.5 centimeter (6.5 inch) full-range speaker is located in each front door. There is also one full-range 16.5 centimeter (6.5 inch) diameter full-range speaker located in each rear door.

### PREMIUM

The optional premium speaker system features six Premium model speakers in six locations. Each of the standard speakers is replaced with Premium model speakers. One 6.4 centimeter (2.50 inch) diameter speaker is installed on each end of the instrument panel top pad. One 16.5 centimeter (6.5 inch) Premium woofer is located in each front door. There is also one full-range 16.5 centimeter (6.5 inch) diameter Premium full-range speaker located in each rear door. The premium speaker system also includes a power amplifier mounted to each front door speaker. The total available power of the premium speaker system is about 160 watts.

## OPERATION

Two wires connected to each speaker, one feed circuit (+) and one return circuit (–), allow the audio output signal electrical current to flow through the voice coil. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

## DIAGNOSIS AND TESTING - SPEAKER

**Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic information.**

Refer to the appropriate wiring information.

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

**CAUTION: The speaker output of the radio is a “floating ground” system. Do not allow any speaker lead to short to ground, as damage to the radio may result.**

**NOTE: If poor sound quality is noted in the audio system, check the Cabin Equalization curve programmed in the BCM. Make sure a base speaker system has the Base Cabin Equalization Curve programmed to the vehicle. If the vehicle has a premium speaker system, make sure the Premium Cabin Equalization Curve is programmed to the vehicle**

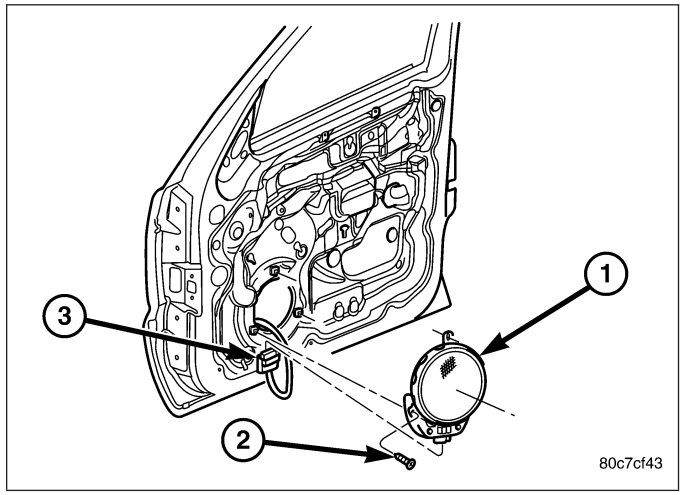
1. If all speakers are inoperative, check the fuses in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 3.
3. Turn the radio receiver OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with an amplifier, remove the radio receiver. If vehicle is equipped with an amplifier. disconnect wire harness connector at output side of amplifier. Go to Step 4.
4. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the radio receiver wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted speaker feed (+) and/or return (-) circuits(s) to the speaker as required.

5. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuits(s) as required.

## REMOVAL

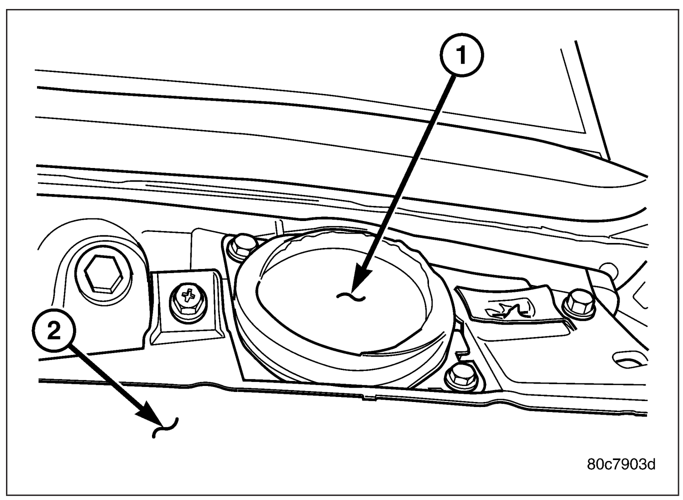
### FRONT DOOR

1. Disconnect and isolate the battery negative cable.
2. Remove the front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Remove the speaker mounting fasteners.
4. Remove the speaker (1) from the door and disconnect the wire harness connector.



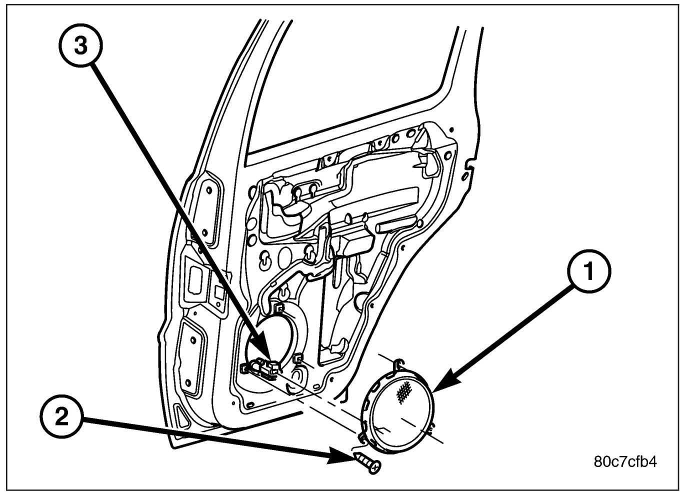
### INSTRUMENT PANEL

1. Disconnect and isolate the battery negative cable.
2. Remove the A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
3. Remove instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
4. Remove speaker mounting fasteners.
5. Remove speaker (1) and disconnect the wire harness connector.



## REAR DOOR

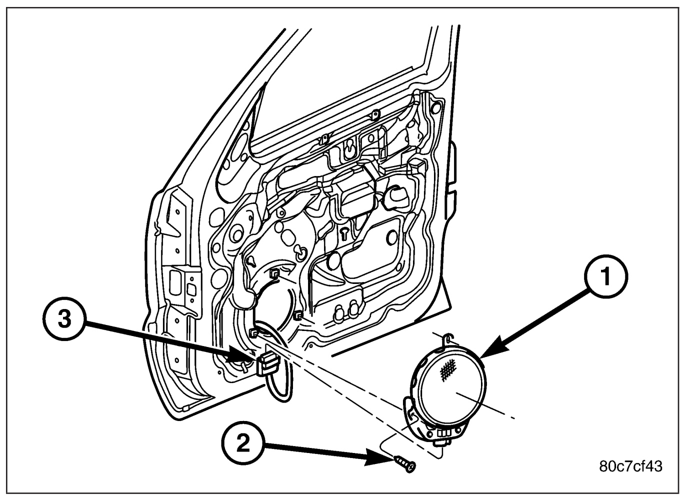
1. Disconnect and isolate the battery negative cable.
2. Remove the rear door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
3. Remove the speaker mounting fasteners.
4. Remove the speaker (1) from the door and disconnect the wire harness connector (3).



## INSTALLATION

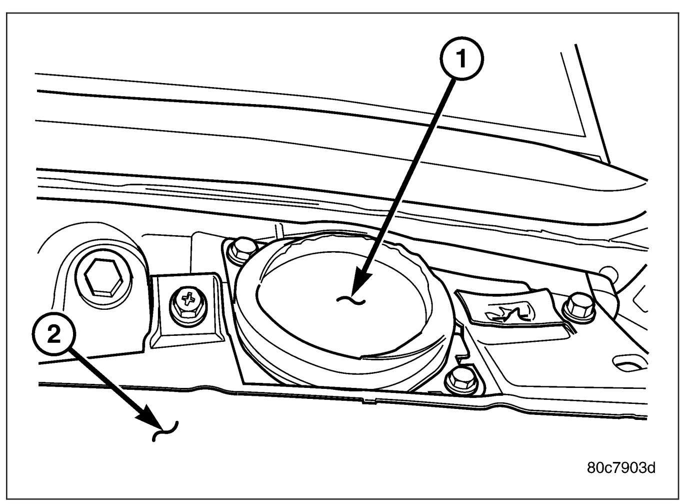
### FRONT DOOR

1. Connect the wire harness connector and install the speaker to the door.
2. Install the speaker mounting screws. Tighten to 2 N·m (20 in. lbs.).
3. Install the front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
4. Connect the battery negative cable.



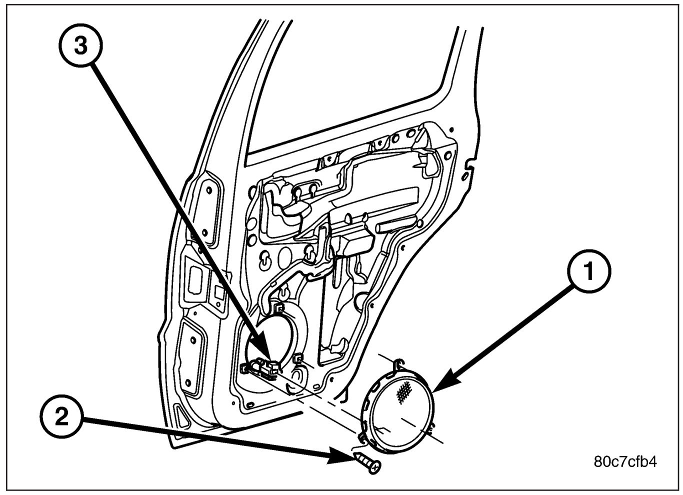
### INSTRUMENT PANEL

1. Connect wire harness connector and install speaker.
2. Install speaker mounting screws. Tighten to 2 N·m (20 in. lbs.).
3. Install instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).
4. Install the A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).
5. Connect the battery negative cable.



## REAR DOOR

1. Connect the wire harness connector and install the speaker to the door.
2. Install the speaker mounting screws. Tighten to 2 N·m (20 in. lbs.).
3. Install the rear door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).
4. Connect the battery negative cable.



# CHIME/BUZZER

## TABLE OF CONTENTS

## CHIME/BUZZER - ELECTRICAL DIAGNOSTICS

### TABLE OF CONTENTS

# CHIME/BUZZER - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## *CHIME INOPERATIVE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. TEST CHIME OPERATION WITH THE SCAN TOOL

Turn the ignition on.

With the scan tool, actuate the Chime.

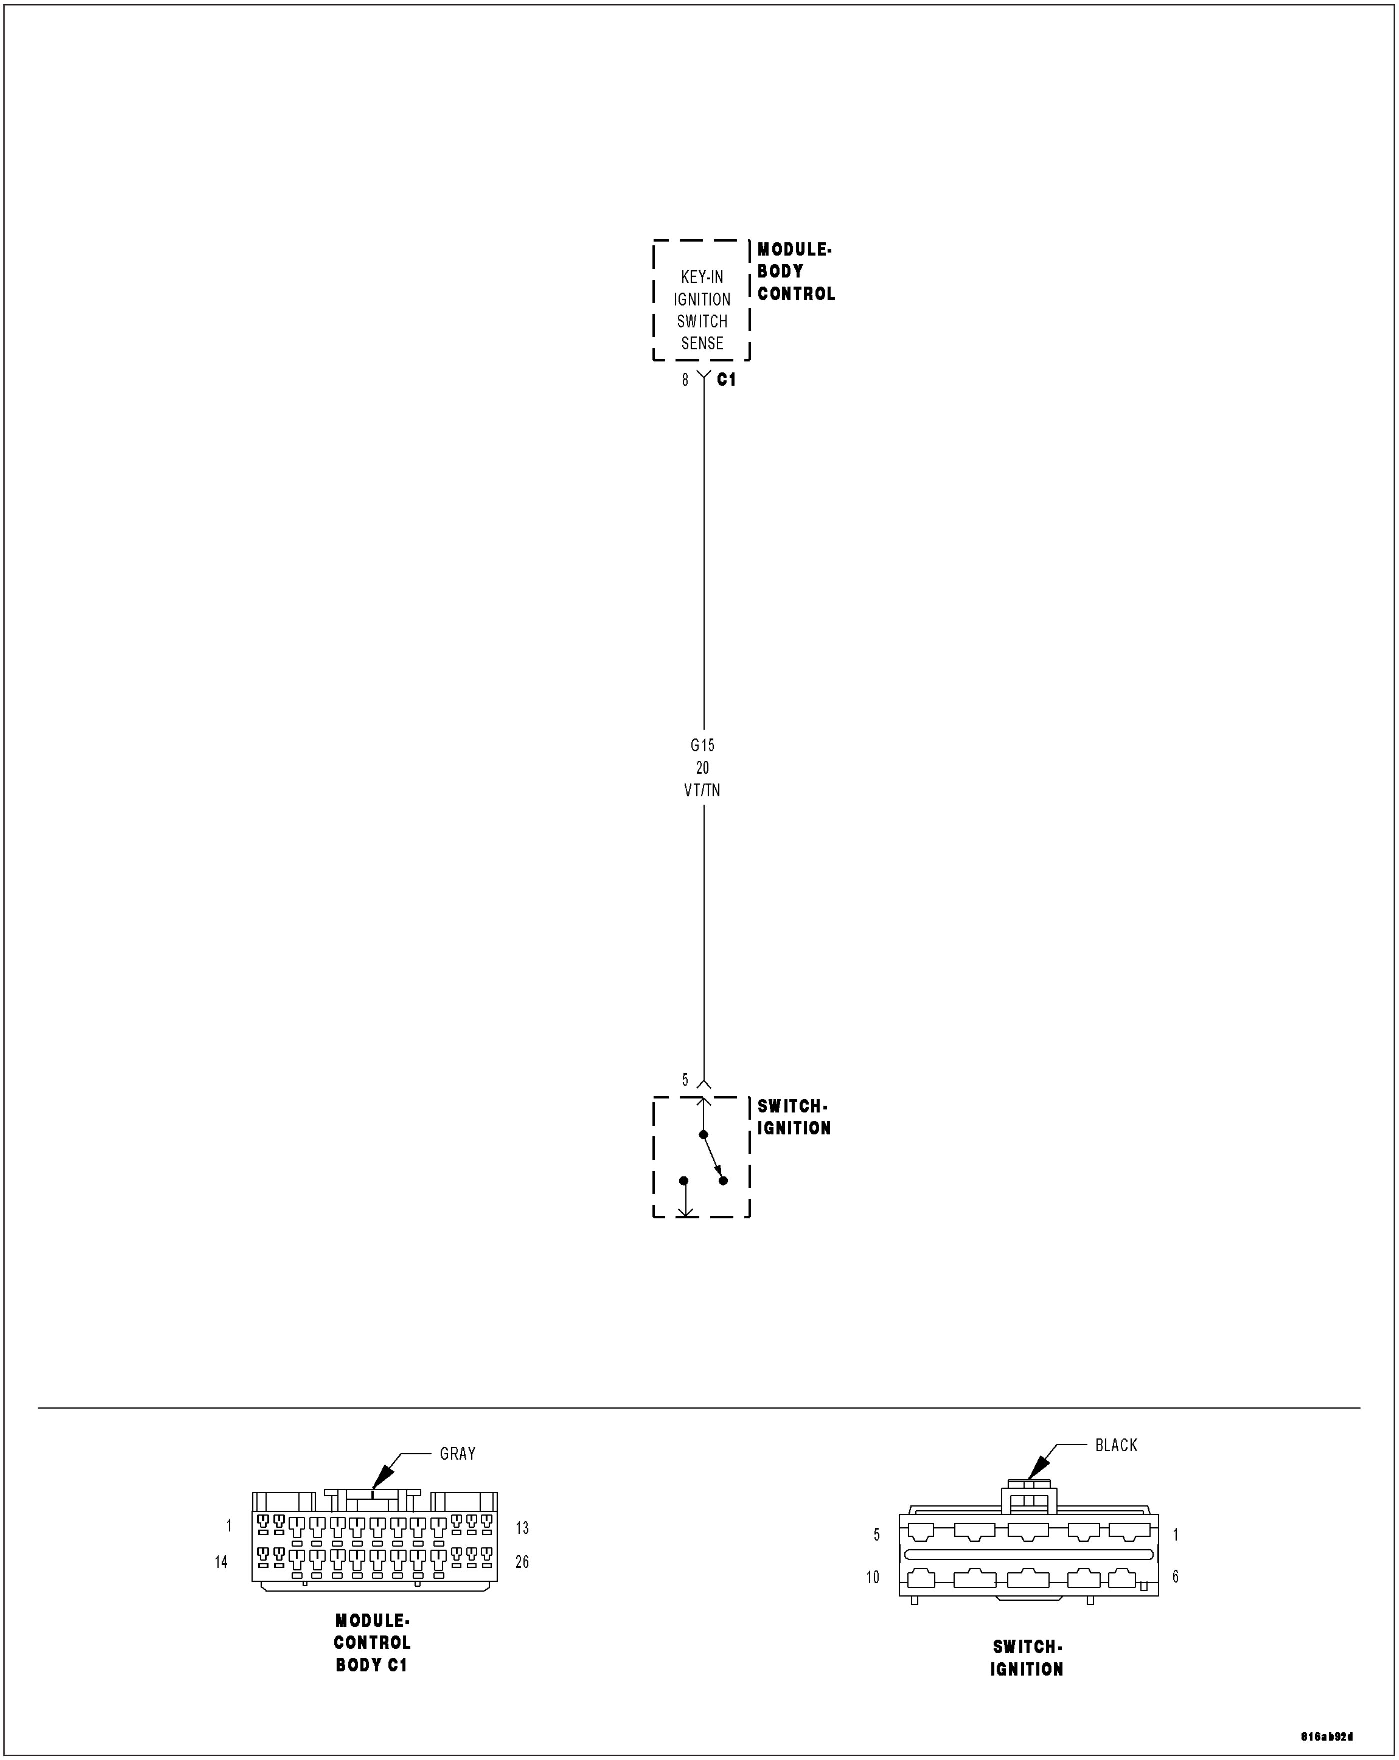
**Does the Chime sound?**

**Yes** >> Refer to the Table of Contents in this Section for related symptoms.

**No** >> Replace the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

# *CHIME SOUNDS WITH DRIVER DOOR OPEN & KEY REMOVED



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| (G15) KEY-IN IGNITION SWITCH SENSE CIRCUIT SHORTED TO GROUND |
| IGNITION LOCK CYLINDER |
| IGNITION SWITCH |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. CHECK THE KEY IN IGNITION STATUS WITH THE KEY REMOVED

**NOTE: Ensure the exterior lamps turn on and off properly and are off before continuing this test.**

Turn the ignition on.

With the scan tool in BCM, select Input Output.

Remove the key from the ignition switch.

With the scan tool, read the Key In Ignition status.

**Does the scan tool display: Key Not In Ignition?**

**Yes** >> Refer to the Service Information for other possible causes.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 2

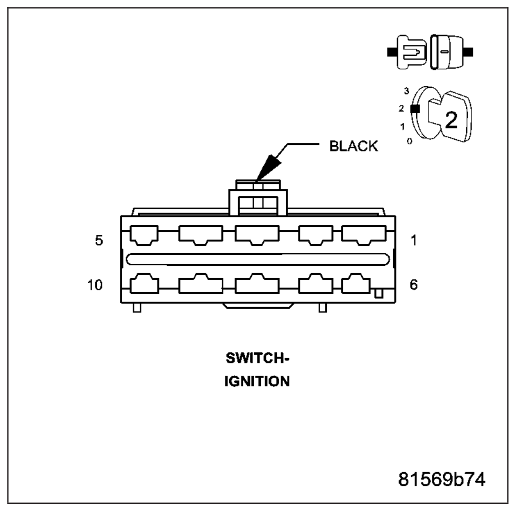
### 2. CHECK FOR A SHORTED IGNITION LOCK CYLINDER / IGNITION SWITCH

Disconnect the Ignition Switch harness connector.

**Does the chime turn off?**

**Yes** >> Inspect the Ignition Lock Cylinder for damage and repair as necessary. If OK, replace the Ignition Switch in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

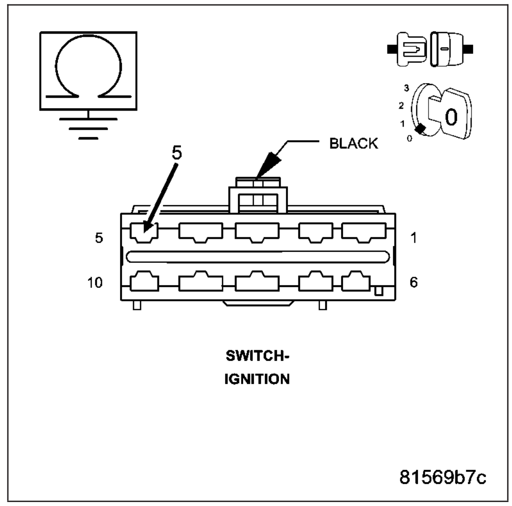
**No** >> Go To 3



## 3. CHECK THE (G15) KEY-IN IGNITION SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Disconnect the BCM C1 harness connector.

Measure the resistance of the (G15) Key-In Ignition Switch Sense circuit between ground and the Ignition Switch harness connector.



**Is the resistance below 100.0 ohms?**

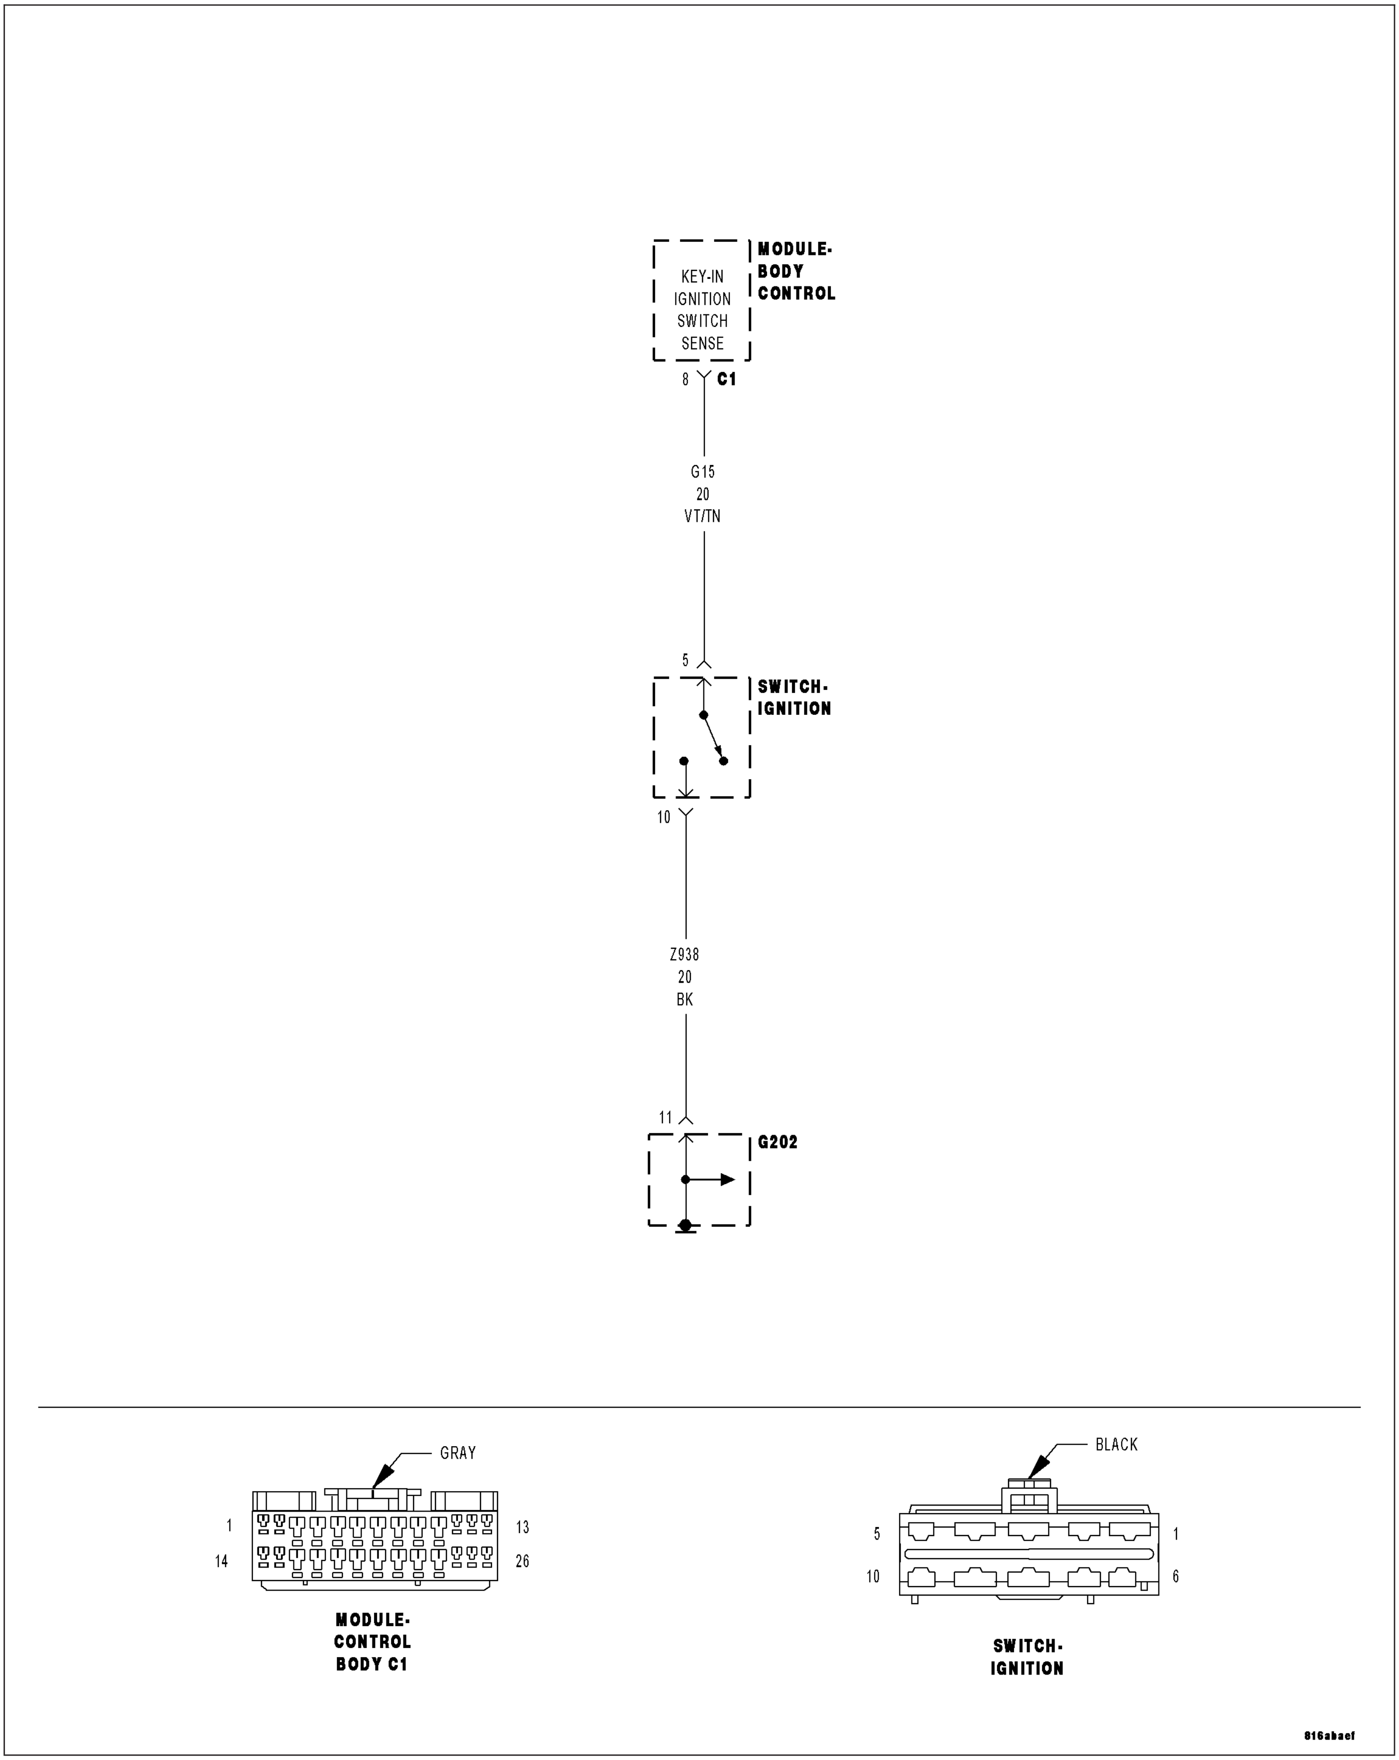
**Yes** >> Repair the (G15) Key-In Ignition Switch Sense circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## *CHIME INOPERATIVE WITH KEY IN IGNITION & DRIVER DOOR OPEN



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| BODY CONTROL MODULE (BCM) DTC(S) PRESENT |
| (Z938) GROUND CIRCUIT OPEN |
| (G15) KEY-IN IGNITION SWITCH SENSE CIRCUIT OPEN |
| IGNITION SWITCH OPEN |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. CHECK FOR DTCs IN THE BODY CONTROL MODULE (BCM)

**NOTE: The driver door ajar switch must be operational for the result of this test to be valid.**

Turn the ignition on.

With the scan tool, read BCM DTCs.

**Does the scan tool display any Cluster Wake Up Output or Communication DTCs?**

**Yes** >> Refer to the Table of Contents in (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING) or in (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the applicable diagnostic procedures.

**No** >> Go To 2

### 2. CHECK THE KEY IN IGNITION STATUS WITH THE SCAN TOOL

With the scan tool in BCM, select Input Output.

With the scan tool, read the Key In Ignition Status.

**Does the scan tool display: Key In Ignition?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 3

### 3. CHECK FOR AN OPEN IGNITION SWITCH

Back probe the Ignition Switch harness connector with a jumper wire between the (G15) Key-In Ignition Switch Sense circuit and the (Z938) Ground circuit.

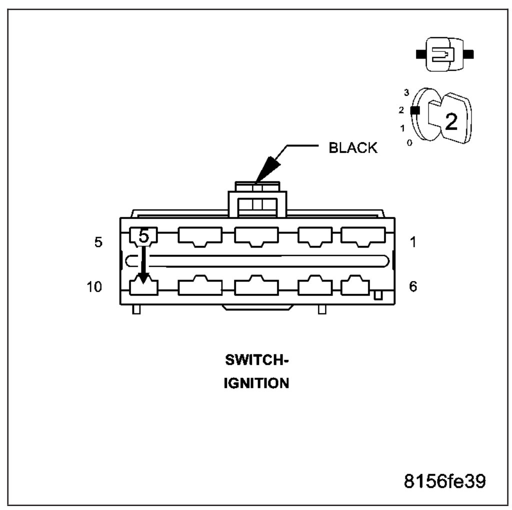
With the scan tool, read the Key In Ignition Status.

**Does the scan tool display: Key In Ignition?**

**Yes** >> Replace the Ignition Switch in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4



## 4. CHECK THE (Z938) GROUND CIRCUIT FOR AN OPEN

Turn the ignition off.

Remove the jumper wire.

Disconnect the Ignition Switch harness connector.

Turn all lights off.

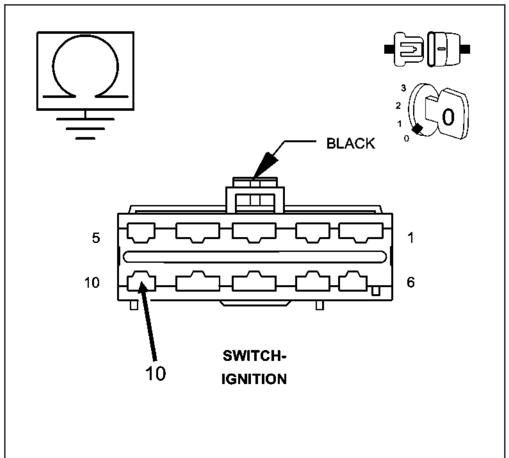
Measure the resistance of the (Z938) Ground circuit between ground and the Ignition Switch harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (Z938) Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



8156fe52

## 5. CHECK THE (G15) KEY-IN IGNITION SWITCH SENSE CIRCUIT FOR AN OPEN

Disconnect the BCM C1 harness connector.

Measure the resistance of the (G15) Key-In Ignition Switch Sense circuit between the Ignition Switch harness connector and the BCM C1 harness connector.

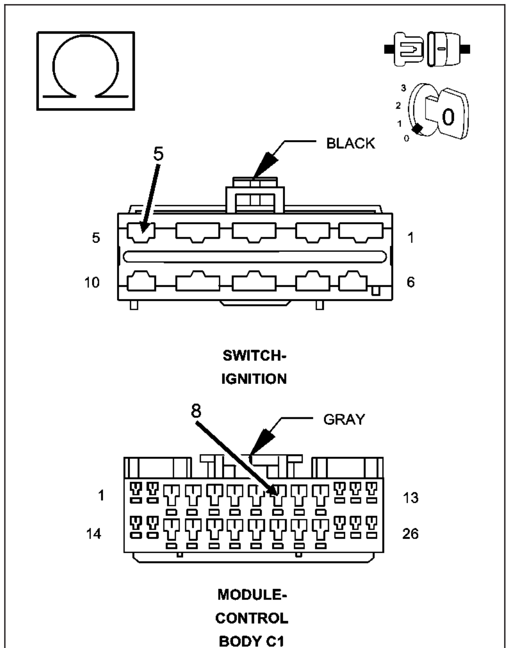
**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (G15) Key-In Ignition Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



8156fea1

## *VEHICLE SPEED WARNING CHIME PROBLEM

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| INCORRECT COUNTRY CODE PROGRAMMED IN BODY CONTROL MODULE (BCM) |
| BODY CONTROL MODULE (BCM) |

### 1. VERIFY THE BCM IS PROGRAMMED WITH THE CORRECT COUNTRY CODE

**NOTE: The high speed warning chime is for Gulf Coast Countries only.**

Turn the ignition on.

With the scan tool in BCM, select Miscellaneous.

With the scan tool, read the country code setting.

**Is the country code incorrect?**

**Yes** >> Reprogram with the correct country code.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace and program the BCM in accordance with the Service Information.

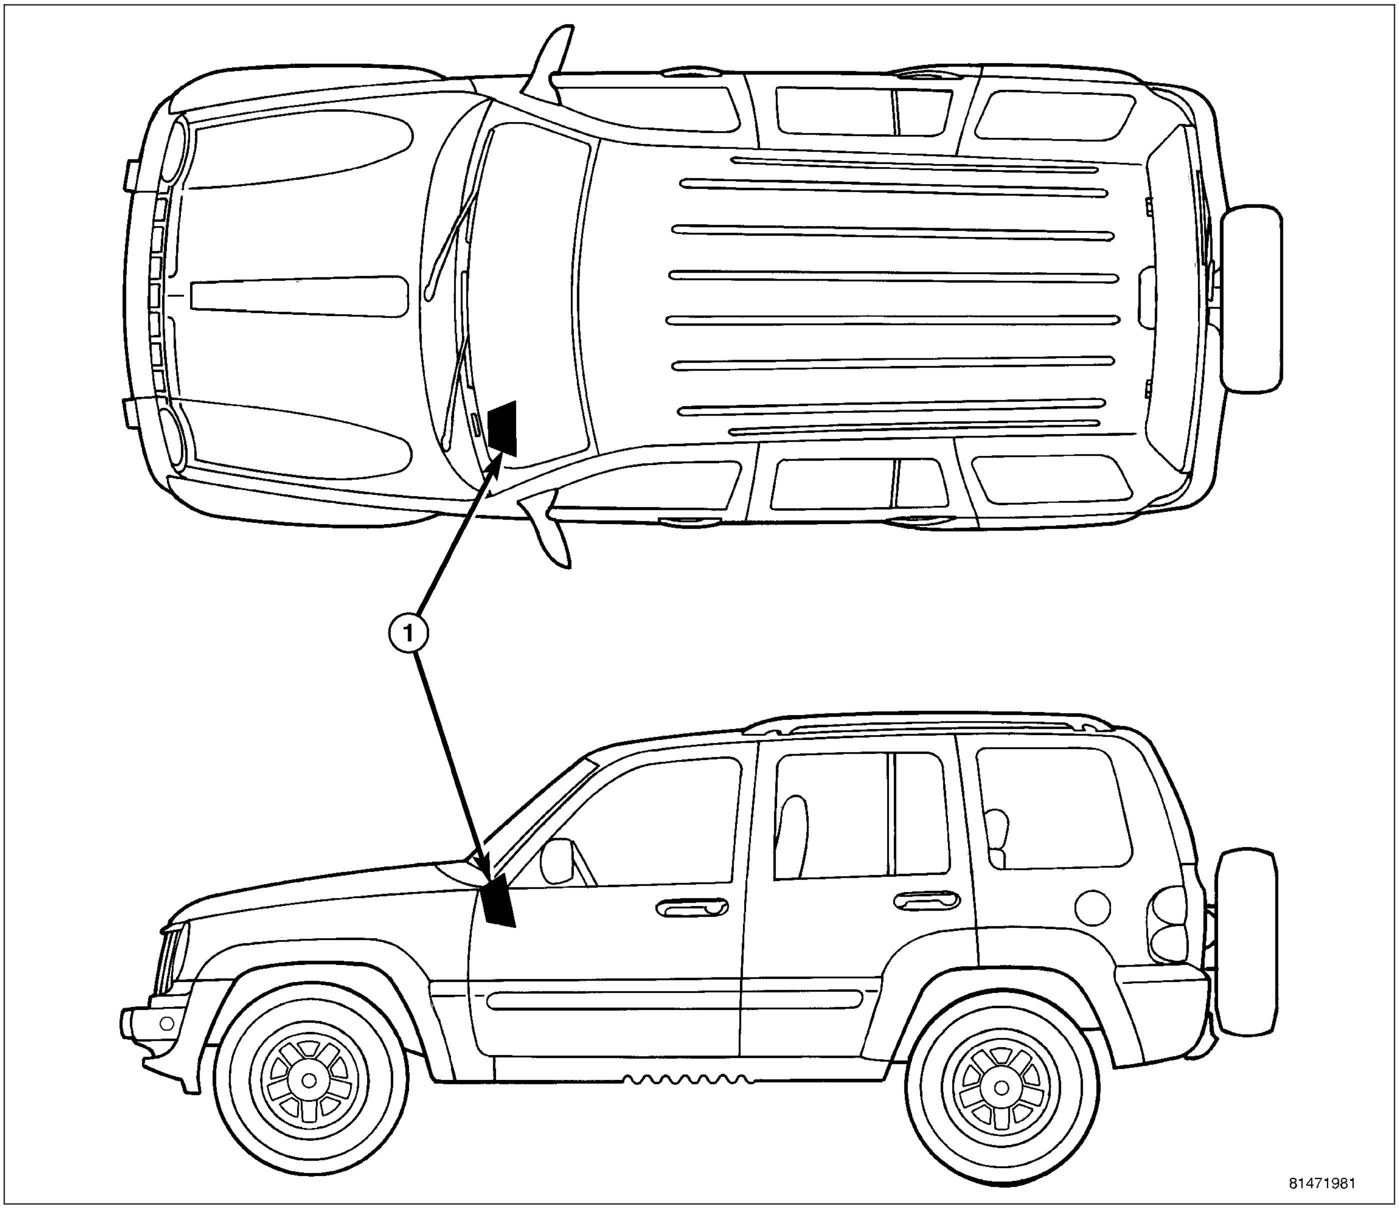
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

# CHIME WARNING SYSTEM

## TABLE OF CONTENTS

# CHIME WARNING SYSTEM

## DESCRIPTION



A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer that is soldered onto the electronic circuit board inside of the ElectroMechanical Instrument Cluster (EMIC) (1) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants.

The EMIC electromechanical transducer generates both beep tones and chime tones. The microprocessor-based EMIC utilizes electronic chime request messages received from other modules in the vehicle over the Programmable Communications Interface (PCI) data bus along with hard wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the EMIC allow it to control the audible outputs that are produced through its on-board transducer.

The EMIC is capable of producing the following audible outputs:

- **Fixed Duration Beep** - A short, sharp, single tactile “beep” tone that is about 150 milliseconds in duration.
- **EVIC Warning Chime** - Two sets of three “beep” tones indicate a warning is being displayed by the Electronic Vehicle Information Center (EVIC) in the overhead console.
- **Single Chime Tone** - A single “bong-like” chime tone.

- **Slow Rate Repetitive Chime** - Repeated chime tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated chime tones that are issued at a fast rate of about 180 chimes per minute.

Hard wired circuitry connects the EMIC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC chime warning system circuits and components cannot be adjusted or repaired. If the EMIC circuitry or the on-board transducer are damaged or faulty, the EMIC unit must be replaced.

## OPERATION

The chime warning system operates on battery voltage received through a fuse in the Junction Block (JB) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the On position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **ABS Indicator Warning** - On vehicles equipped with an optional Antilock Brake System (ABS), the Electro-Mechanical Instrument Cluster (EMIC) transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the Programmable Communications Interface (PCI) data bus from the Controller Antilock Brake (CAB) requesting “Antilock Brake System (ABS)” indicator illumination. This warning will only occur following completion of the “ABS” indicator bulb test, and will only occur once during any ignition cycle.
- **Airbag Indicator Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the PCI data bus from the Airbag Control Module (ACM) requesting “Airbag” indicator illumination. This warning will only occur following completion of the “Airbag” indicator bulb test, and will only occur once during any ignition cycle.
- **Charging System Indicator Warning** - Each time the ignition switch is turned to the On position, the EMIC transducer will generate a single chime the first time an electronic message is received over the PCI data bus from the Powertrain Control Module (PCM) requesting charging system indicator illumination. This warning indicates that a failure condition has been monitored affecting the operation of the charging system related components or circuits.
- **Compass Mini-Trip Computer Global Reset** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the PCI data bus from the optional Compass Mini-Trip Computer (CMTC) requesting that the CMTC elapsed time, average fuel economy, and/or trip odometer data has been reset. The CMTC monitors hard wired inputs from the U.S./Metric and Reset button switches, and electronic messages received from the Body Control Module (BCM) to determine the proper reset messages to send to the EMIC.
- **Door Ajar Warning** - On vehicles without an optional Electronic Vehicle Information Center (EVIC), the EMIC transducer will generate one short chime for each of three display sequences when the ignition switch is in the On position and electronic messages are received over the PCI data bus from the Body Control Module (BCM) indicating that the status of any door ajar input has changed and indicating that the vehicle is moving.
- **Electronic Throttle Control Indicator Warning** - On vehicles equipped with an optional diesel engine, the EMIC transducer will generate a single chime the first time an electronic message is received over the PCI data bus from the PCM requesting Electronic Throttle Control (ETC) indicator illumination, either solid or flashing. This chime will only occur once during any ignition cycle.
- **Engine Coolant Temperature High Warning** - Each time the ignition switch is turned to the On position, the EMIC transducer will generate chime tones the first time an electronic message is received over the PCI data bus from the PCM indicating that the engine coolant temperature is too high. This chime will sound for five consecutive tones unless an electronic message is received from the PCM indicating that the engine coolant

temperature is not too high, or the ignition switch is turned to the Off position before the five tones have completed.

- **Electronic Stability Program/Brake Assist System Fault Warning** - The EMIC transducer will generate one short chime each time the Electronic Stability Program (ESP)/Brake Assist System (BAS) indicator is illuminated in the instrument cluster. This warning indicates a failure condition has been monitored affecting the operation of the ESP/BAS related components or circuits. This warning will only occur following completion of the “ESP/BAS” indicator bulb test, and will only occur once during any ignition cycle.
- **Electronic Vehicle Information Center Warning** - On vehicles equipped with an optional EVIC, the EMIC transducer will generate chimes when an electronic message is received over the PCI data bus from the EVIC indicating that the EVIC is displaying certain warnings.
- **Fasten Seat Belt Indicator Warning** - The EMIC transducer will generate repetitive chimes at a slow rate each time a hard wired input is received from a seat belt switch indicating that the driver side or passenger side front seat belt is not fastened with the ignition switch in the On position. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled, and will sound five chimes at a slow rate (one each time the lamp turns on during flashing). (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/SEAT BELT INDICATOR - OPERATION).
- **Gas Cap Warning** - On domestic vehicles equipped with a gasoline engine, the EMIC transducer will generate one short chime each time an electronic message is received over the PCI data bus from the PCM indicating that there is a gross leak in the vapor recovery system. This chime will only occur once during any ignition cycle.
- **Gate Ajar Warning** - On vehicles without an optional EVIC, the EMIC transducer will generate one short chime for each of three display sequences when the ignition switch is in the On position, and electronic messages are received over the PCI data bus from the BCM indicating that the status of the tailgate ajar input has changed from closed to not closed and indicating that the vehicle is moving.
- **Glass Ajar Warning** - On vehicles without an optional EVIC, the EMIC transducer will generate one short chime for each of two display sequences when the ignition switch is in the On position, and electronic messages are received over the PCI data bus from the BCM indicating that the status of the rear flip-up glass ajar input has changed from closed to not closed and indicating that the vehicle is moving.
- **Head/Park/Fog Lamps-On Warning** - The EMIC transducer will generate repetitive chimes at a fast rate when the ignition switch is in any position except On, and electronic messages are received over the PCI data bus from the BCM indicating that the exterior lamps are On and that the driver side front door is open. The chimes will continue to sound until the exterior lamps are turned Off, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Key-In-Ignition Warning** - The EMIC transducer will generate repetitive chimes at a fast rate when the ignition switch is in any position except On, and electronic messages are received over the PCI data bus from the BCM indicating that the key is in the ignition lock cylinder and that the driver side front door open. These chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Low Coolant Warning** - On vehicles equipped with an optional diesel engine, the EMIC transducer will generate a single chime when the ignition switch is first turned to the On position and a hard wired input from the engine coolant level sensor to the EMIC indicates that the coolant level is low for more than about one-quarter second. Any time after the ignition switch is first turned to the On position, the EMIC uses internal programming to check the status of the engine coolant level sensor inputs about once every second, then adjusts an internal counter up or down based upon the status of this input. When the counter accumulates thirty inputs indicating that the coolant level is low, a single chime is sounded. This strategy is intended to reduce the effect that coolant sloshing within the coolant reservoir can have on reliable chime warning operation. This chime will only occur once during any ignition cycle.
- **Low Fuel Warning** - Each time the ignition switch is turned to the On position, the EMIC transducer will generate a single chime the first time an electronic message is received over the PCI data bus from the PCM requesting “Low Fuel” indicator illumination. The chime will only occur a second time during the same ignition cycle if another electronic message has been received from the PCM indicating that there is an increase in the fuel level equal to about 3 liters (0.8 gallon), then a subsequent electronic message from the PCM requests “Low Fuel” indicator illumination. This strategy combined with filtering performed by the internal programming of the PCM on the fuel tank sending unit input is intended to reduce the possibility of fuel sloshing within the fuel tank causing multiple low fuel warning chimes during a given ignition cycle. The EMIC will also respond with the low fuel warning chime when electronic fuel level messages are received from the PCM indicating that

the hard wired input to the PCM from the fuel tank sending unit is an open circuit (greater than full), or a short circuit (less than empty).

- **Low Oil Pressure Indicator Warning** - Each time the ignition switch is turned to the On position, the EMIC transducer will generate a single chime the first time three sequential sets of electronic messages are received over the PCI data bus from the PCM indicating that the engine oil pressure is too low with the engine running.
- **Low Wash Warning** - On vehicles without an optional EVIC, the EMIC transducer will generate one short chime for each of two display sequences when the ignition switch is turned to the On position and a hard wired input from the washer fluid level switch to the EMIC indicates the washer fluid is low for more than about one-quarter second. Any time after the ignition switch is first turned to the On position, the EMIC uses internal programming to check the status of the washer fluid level switch inputs about once every second, then adjusts an internal counter up or down based upon the status of this input. When the counter accumulates thirty inputs indicating that the washer fluid level is low, a single chime is sounded. This strategy is intended to reduce the effect that fluid sloshing within the washer reservoir can have on reliable chime warning operation. This warning will only occur once during any ignition cycle.
- **Overspeed Warning** - The EMIC transducer will generate repetitive chimes at a slow rate when the ignition switch is in the On position, and an electronic message is received over the PCI data bus from the PCM indicating that the vehicle speed is over a pre-programmed speed value. These chimes will continue to sound until the vehicle speed messages are below the pre-programmed speed value, or until the ignition switch is turned to the Off position, whichever occurs first. This feature is only enabled on vehicles that have a BCM that has been configured for sale in a Middle East Gulf Coast Country (GCC).
- **No Airbag Indicator Message Warning** - The EMIC transducer will generate one short chime and turn on the “Airbag” indicator when the ignition switch is in the On position, and a PCI data bus “Airbag” indicator on or off message is not received from the ACM for six consecutive seconds.
- **No Antilock Brake Indicator Message Warning** - The EMIC transducer will generate one short chime and turn on the “ABS” indicator when the ignition switch is in the On position, and a PCI data bus “ABS” indicator on or off message is not received from the CAB for six consecutive seconds.
- **No Fuel Level Message Warning** - The EMIC transducer will generate one short chime and turn on the “Low Fuel” indicator when the ignition switch is in the On position, and a PCI data bus fuel level message is not received from the PCM for twelve consecutive seconds.
- **Remote Keyless Entry Transmitter Programming** - On vehicles so equipped, the EMIC transducer will generate a single short chime when an electronic message is received over the PCI data bus from the BCM indicating that a Remote Keyless Entry (RKE) transmitter has been successfully programmed by the customer into the RKE module memory.
- **Sentry Key “Customer Learn” Mode Announcement** - On vehicles so equipped, the EMIC transducer will generate one short chime to confirm that an electronic “Customer Learn” message has been received over PCI data bus to indicate that the Sentry Key REmote Entry Module (SKREEM) is prepared for programming additional sentry key transponders. This chime feature is only active on vehicles equipped with the optional Sentry Key system, and sold in a market where “Customer Learn” programming is an allowed feature.
- **Service Traction Control System Warning** - On vehicles so equipped, the EMIC transducer will generate one short chime to confirm that an electronic “Service Traction Control System” message has been received over PCI data bus from the Controller Antilock Brake (CAB) to indicate that the traction control system requires service. This warning will only occur once during any ignition cycle.
- **Tire Pressure Monitor Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the PCI data bus from the Sentry Key REmote Entry Module (SKREEM) requesting the TPM indicator be turned on for a monitored low tire pressure condition. This warning will only occur once per monitored low tire during any ignition cycle.
- **Tire Pressure Monitor Fault Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the PCI data bus from the Sentry Key REmote Entry Module (SKREEM) requesting the TPM indicator be flashed on and off for a detected TPM sensor or system fault. This warning will only occur once during any ignition cycle.
- **Turn Signal On Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for a distance of about 3.2 kilometers (about two miles). The chime will continue until the turn signal input becomes inactive, until the hazard warning system is turned On, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Water-In-Fuel Indicator Warning** - On vehicles equipped with a diesel engine, each time the ignition switch is turned to the On position, the EMIC transducer will generate a single chime the first time an electronic mes-

sage is received over the PCI data bus from the PCM requesting “Water-in-Fuel” indicator illumination. This warning will only occur once during any ignition cycle.

The EMIC provides chime service for all available features in the chime warning system. The EMIC relies upon its internal programming, numerous hard wired inputs, and electronic message inputs received from other modules over the PCI data bus to provide the chime warning system features. The internal programming of the EMIC determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired chime warning system inputs to the EMIC, as well as other hard wired circuits for this system may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the PCI data bus, or the electronic messages received by the EMIC from other modules. The most reliable, efficient, and accurate means to diagnose the EMIC, the PCI data bus, or the electronic message inputs used for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## DIAGNOSIS AND TESTING

## CHIME WARNING SYSTEM

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired chime warning system inputs to the ElectroMechanical Instrument Cluster (EMIC), as well as other hard wired circuits for this system may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the Programmable Communications Interface (PCI) data bus, or the electronic message inputs used by the EMIC to provide chime warning system service. The most reliable, efficient, and accurate means to diagnose the EMIC, the PCI data bus, and the electronic message inputs for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

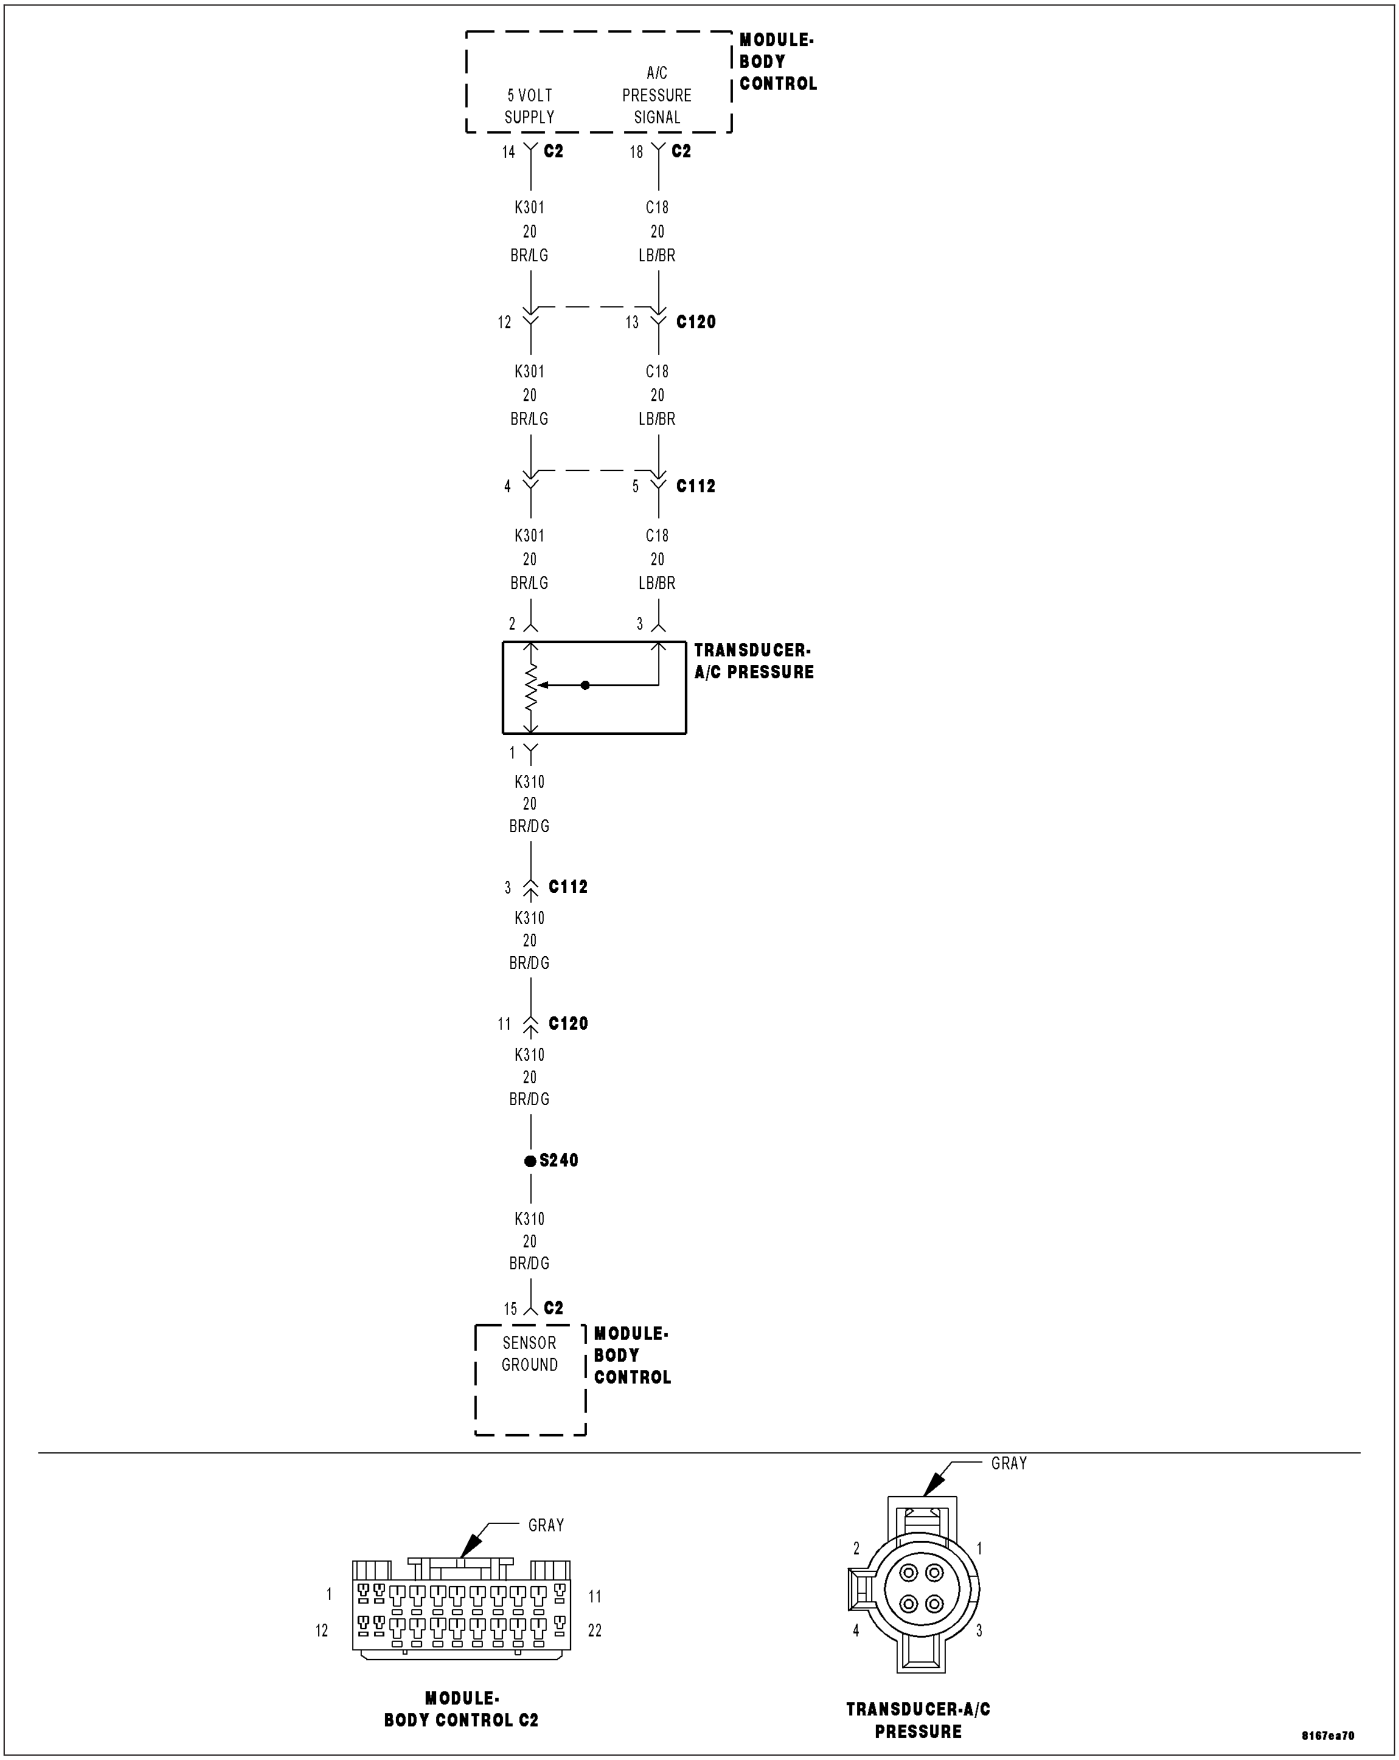
### TABLE OF CONTENTS

# ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTIC

## DIAGNOSIS AND TESTING

## A/C PRESSURE SENSOR HIGH (BCM)



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Body Control Module (BCM) will set this DTC if voltage goes above 4.92 volts for more than 5 seconds on the (C18) A/C Pressure Sensor Signal circuit.

| Possible Causes |
|---|
| (C18) A/C PRESSURE SIGNAL CIRCUIT SHORTED TO VOLTAGE |
| (C18) A/C PRESSURE SIGNAL CIRCUIT SHORTED TO THE (K301) 5-VOLT SUPPLY CIRCUIT |
| (C18) A/C PRESSURE SIGNAL CIRCUIT OPEN |
| (K310) SENSOR GROUND CIRCUIT OPEN |
| A/C PRESSURE TRANSDUCER |
| BCM |

## Diagnostic Test

### 1. CHECK THE A/C PRESSURE TRANSDUCER VOLTAGE

**NOTE: Verify that the A/C Refrigerant System is properly charged before proceeding.**
Start the engine.
With the scan tool, read the A/C Pressure Transducer voltage.

**Is the voltage above 4.6 volts?**

**Yes** >> Go To 2

**No** >> Go To 7

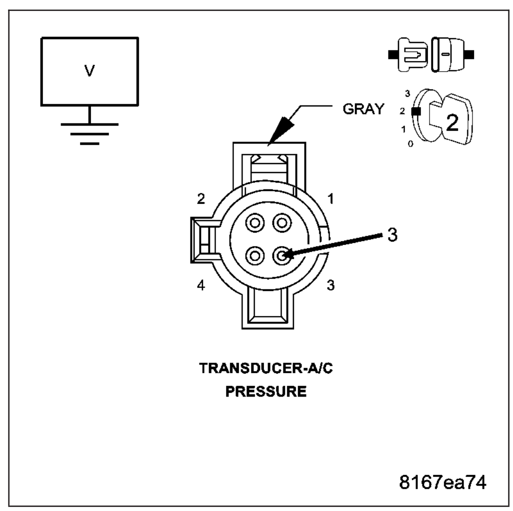
### 2. CHECK THE (C18) A/C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
Disconnect the A/C Pressure Transducer harness connector.
Turn the ignition on.
Measure the voltage of the (C18) A/C Pressure Signal circuit.

**Is the voltage above 5.2 volts?**

**Yes** >> Repair the (C18) A/C Pressure Signal circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 3

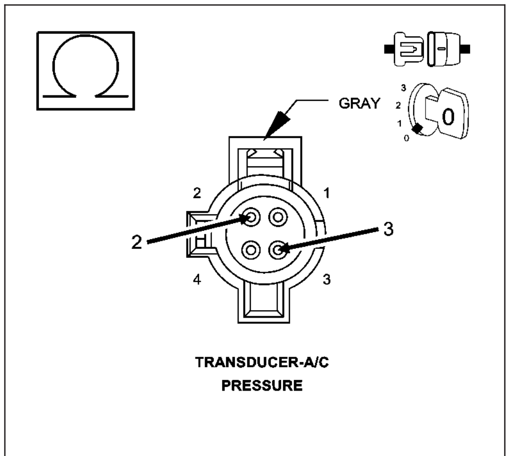


## 3. CHECK THE (C18) A/C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO THE (K301) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the BCM C2 harness connector.

Measure the resistance between the (C18) A/C Pressure Signal circuit and the (K301) 5-Volt Supply circuit in the A/C Pressure Transducer harness connector.



8167ea78

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C18) A/C Pressure Signal circuit for a short to the (K301) 5-Volt Supply circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

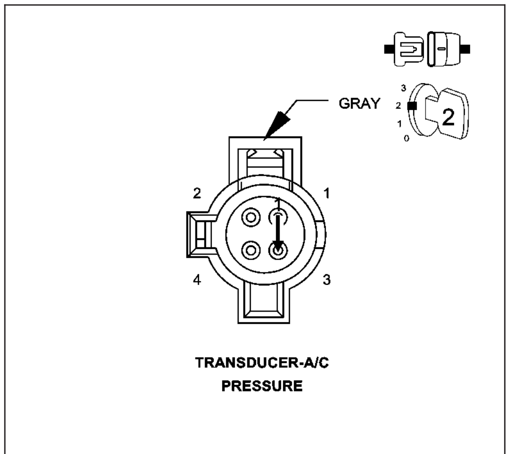
## 4. CHECK THE (C18) A/C PRESSURE SIGNAL CIRCUIT & THE (K310) SENSOR GROUND CIRCUIT FUNCTION

Reconnect the BCM C2 harness connector.

Connect a jumper wire between the (C18) A/C Pressure Signal circuit and the (K310) Sensor Ground circuit.

Turn the ignition on.

With the scan tool, read the A/C Pressure Transducer voltage.



8167ea7c

**Is the voltage below 1.0 volt?**

**Yes** >> Replace the A/C Pressure Transducer in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 5

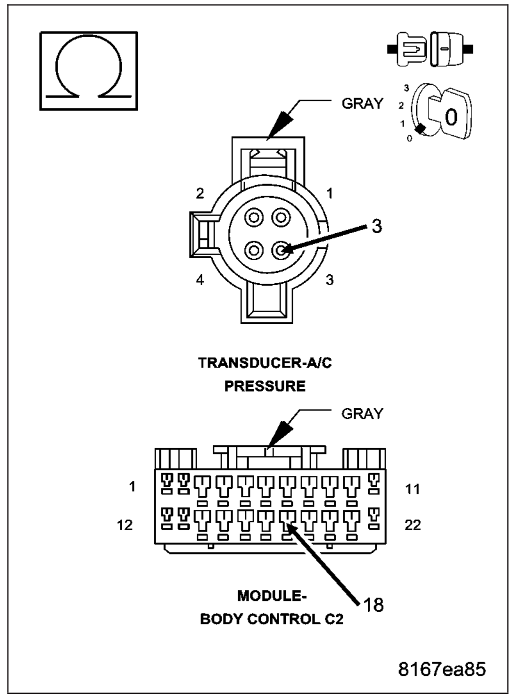
## 5. CHECK THE (C18) A/C PRESSURE SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off.

Remove the jumper wire from the A/C Pressure Transducer harness connector.

Disconnect the BCM C2 harness connector.

Measure the resistance of the (C18) A/C Pressure Signal circuit between the A/C Pressure Transducer harness connector and the BCM C2 harness connector.



**Is the resistance below 5.0 ohms?**

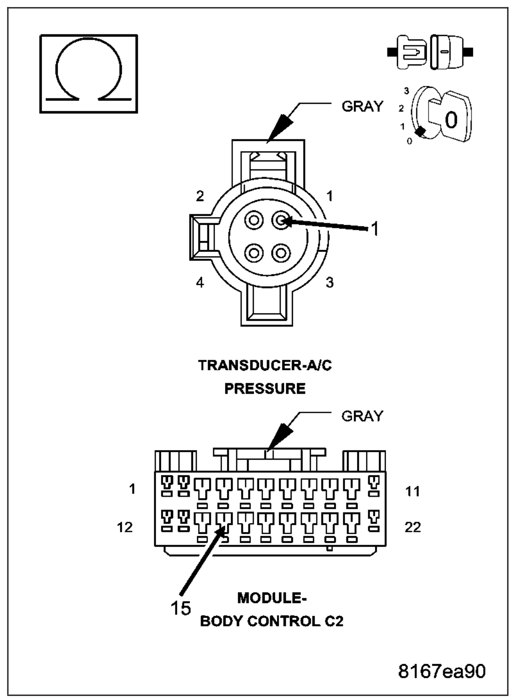
**Yes** >> Go To 6

**No** >> Repair the (C18) A/C Pressure Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 6. CHECK THE (K310) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (K310) Sensor Ground circuit between the A/C Pressure Transducer harness connector and the BCM C2 harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (K310) Sensor Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 7. TEST FOR INTERMITTENT CONDITION

**NOTE: The condition that set this DTC is not present at this time. The following may help in identifying the cause of the intermittent condition.**

Check the Technical Service Bulletins (TSBs) for related concerns.

Turn the ignition on.

Using the scan tool, erase the BCM DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Monitor the scan tool for DTCs while wiggling the related wiring harness.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Perform a voltage drop test on the related circuits between the component and the BCM.

If numerous DTCs were set, use the wiring diagram/schematic to check for common ground and supply circuits.

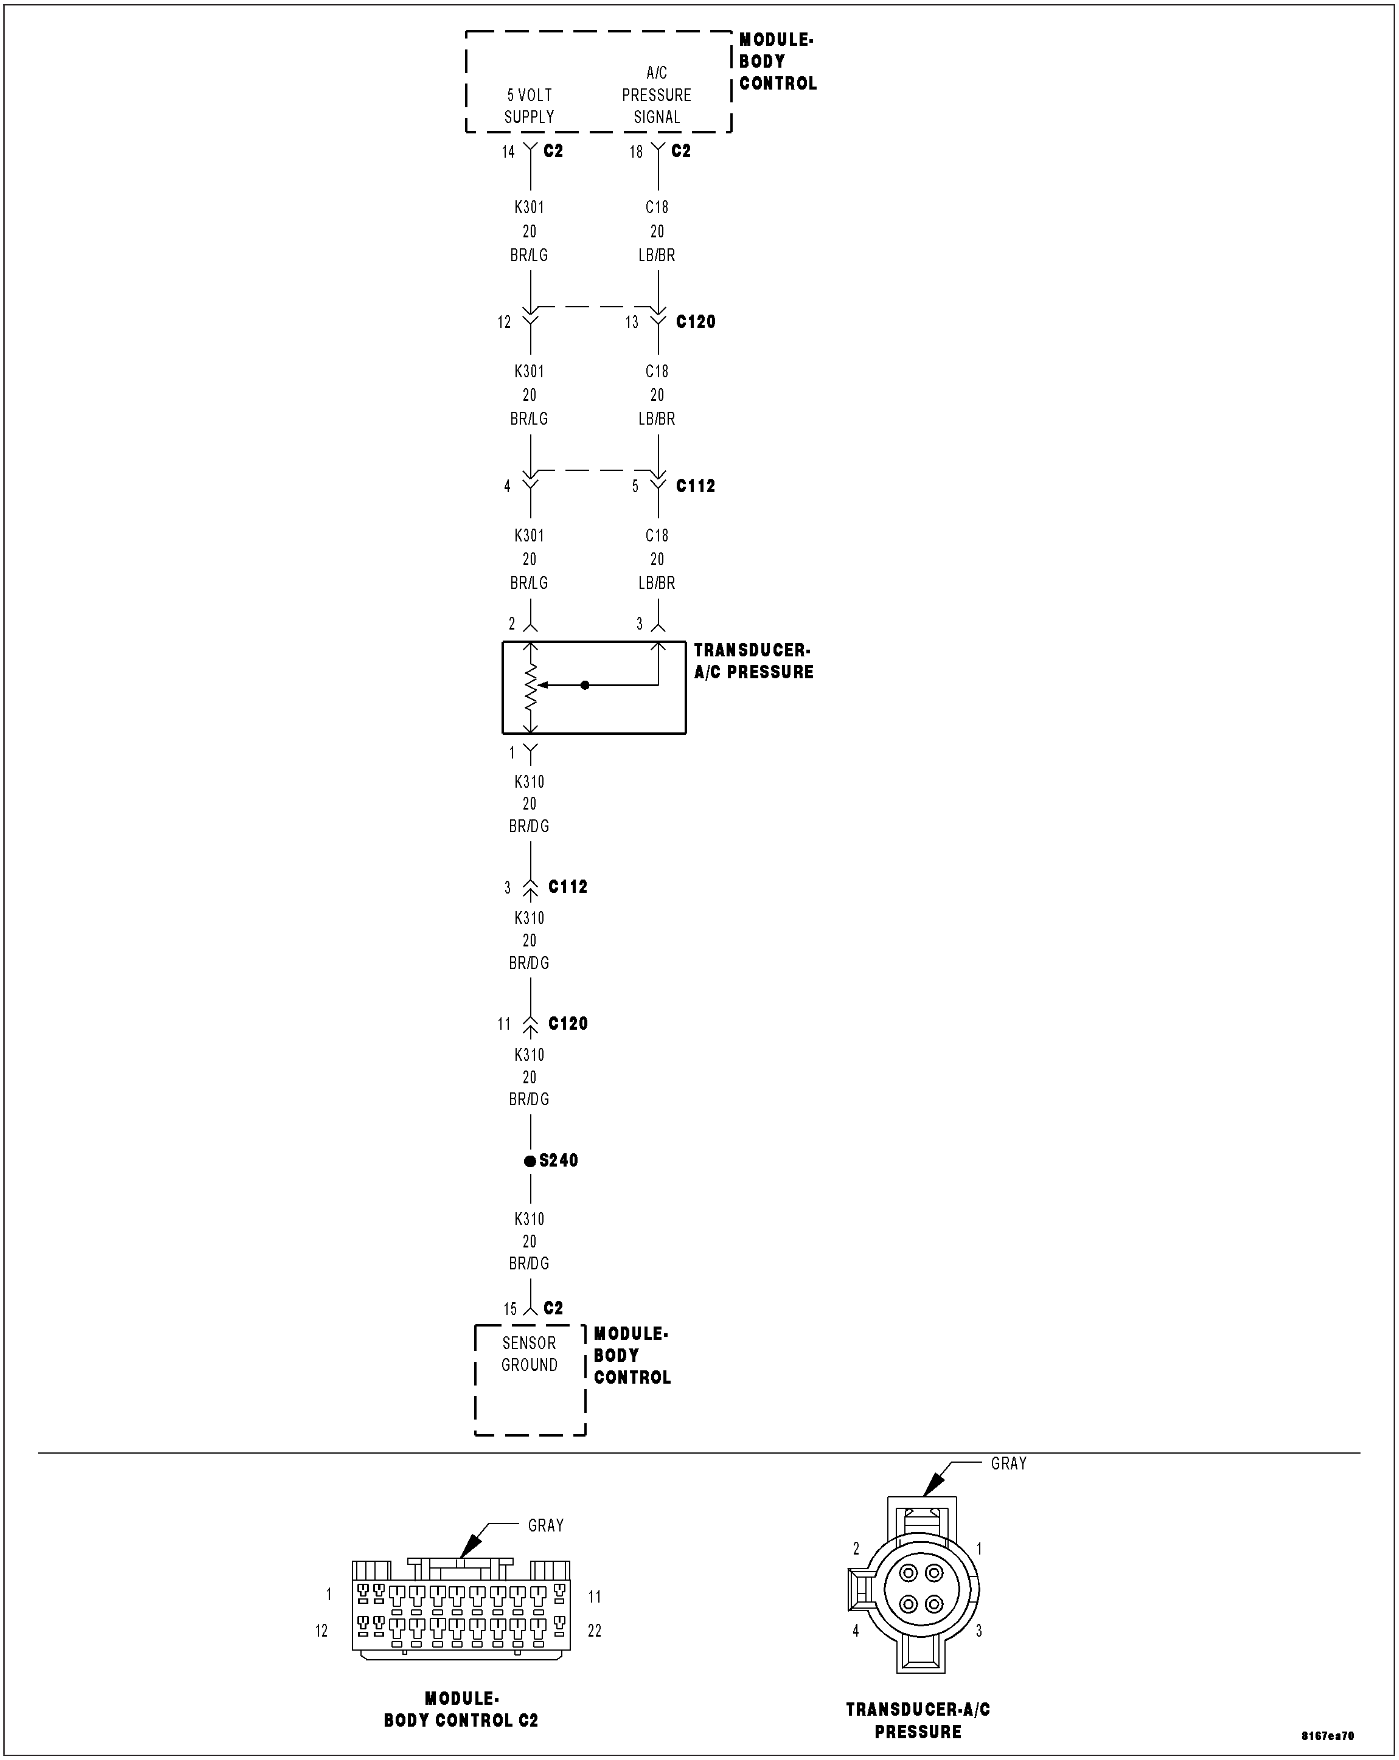
**Were any problems found?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test Complete.

## A/C PRESSURE SENSOR LOW (BCM)



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Body Control Module (BCM) will set this DTC if voltage drops below 0.137 volts for more than 5 seconds on the (C18) A/C Pressure Sensor Signal circuit.

| Possible Causes |
| --- |
| (C18) A/C PRESSURE SIGNAL CIRCUIT SHORTED TO GROUND |
| (C18) A/C PRESSURE SIGNAL CIRCUIT SHORTED TO THE (K310) SENSOR GROUND CIRCUIT |
| (K301) 5-VOLT SUPPLY CIRCUIT OPEN |
| (K301) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND |
| (K301) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K310) SENSOR GROUND CIRCUIT |
| A/C PRESSURE TRANSDUCER |
| BCM |

## Diagnostic Test

### 1. CHECK THE A/C PRESSURE TRANSDUCER VOLTAGE

**NOTE: Verify that the A/C Refrigerant System is properly charged before proceeding.**
Start the engine.
With the scan tool, read the A/C Pressure Transducer voltage.

**Is the voltage below 0.5 volts?**

**Yes** >> Go To 2

**No** >> Go To 9

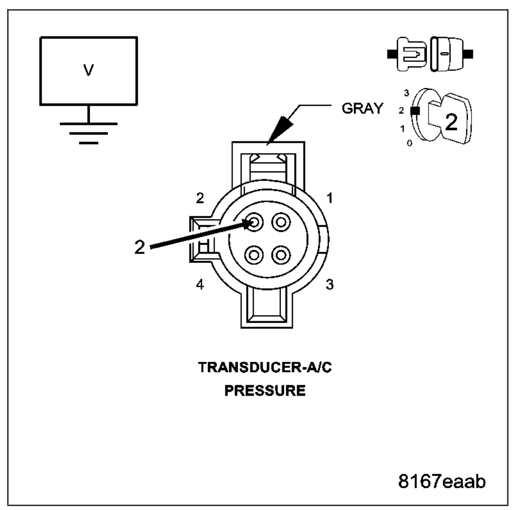
### 2. CHECK THE (K301) 5-VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.
Disconnect the A/C Pressure Transducer harness connector.
Turn the ignition on.
Measure the voltage of the (K301) 5-Volt Supply circuit.

**Is the voltage above 4.5 volts?**

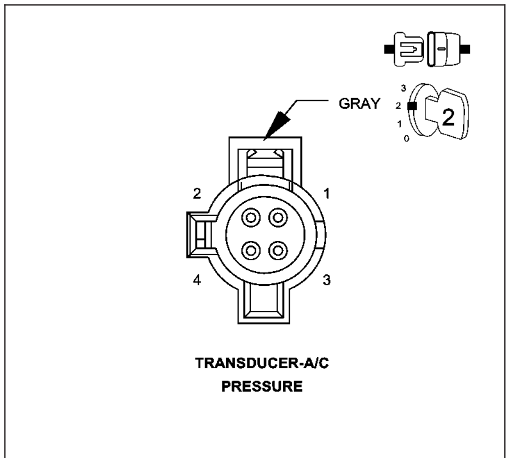
**Yes** >> Go To 3

**No** >> Go To 6



## 3. CHECK THE A/C PRESSURE TRANSDUCER VOLTAGE WITH THE TRANSDUCER DISCONNECTED

With the scan tool, read the A/C Pressure Transducer voltage.



8167eaaf

**Is the voltage above 0.5 of a volt?**

**Yes** >> Replace the A/C Pressure Transducer in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

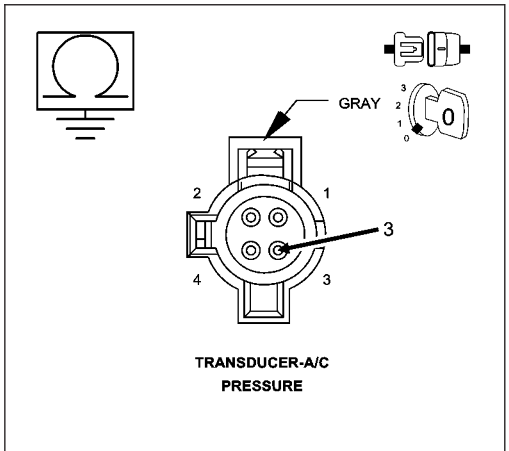
**No** >> Go To 4

## 4. CHECK THE (C18) A/C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the BCM C2 harness connector.

Measure the resistance between ground and the (C18) A/C Pressure Signal circuit at the A/C Pressure Transducer harness connector.



8167eab3

**Is the resistance below 10k ohms?**

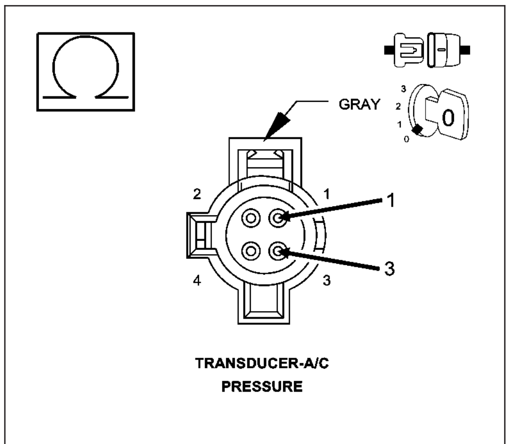
**Yes** >> Repair the (C18) A/C Pressure Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK THE (C18) A/C PRESSURE SIGNAL CIRCUIT FOR A SHORT TO THE (K310) SENSOR GROUND CIRCUIT

Measure the resistance between the (C18) A/C Pressure Signal circuit and the (K310) Sensor Ground circuit at the A/C Pressure Transducer harness connector.



8167eab7

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C18) A/C Pressure Signal circuit for a short to the (K310) Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 6. CHECK THE (K301) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off.

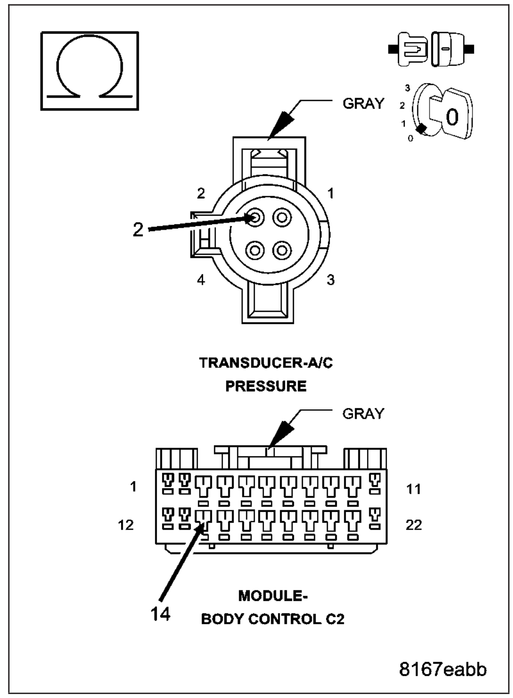
Disconnect the BCM C2 harness connector.

Measure the resistance of the (K301) 5-Volt Supply circuit between the A/C Pressure Transducer harness connector and the BCM C2 harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (K301) 5-Volt Supply circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



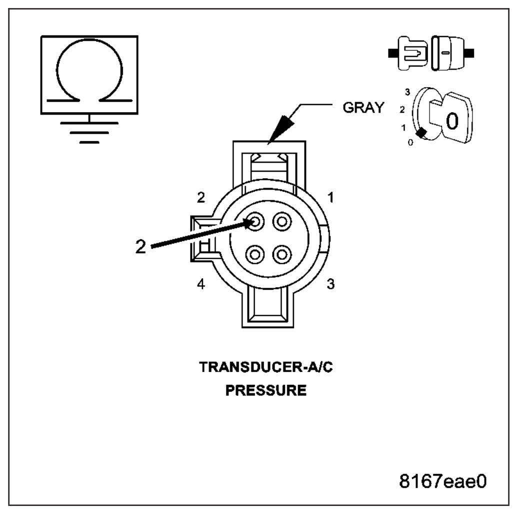
## 7. CHECK THE (K301) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (K301) 5-Volt Supply circuit at the A/C Pressure Transducer harness connector.

**Is the resistance below 10k ohms?**

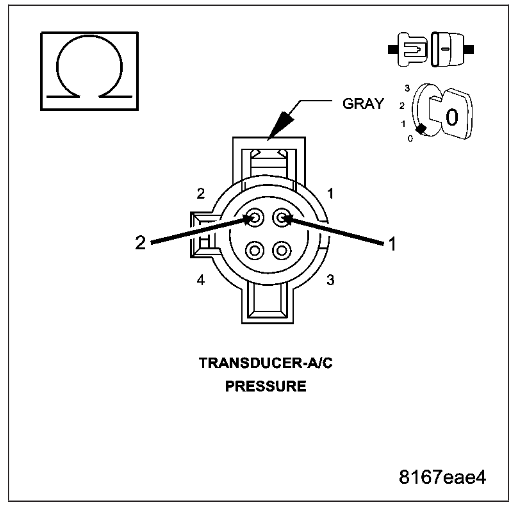
**Yes** >> Repair the (K301) 5-Volt Supply circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 8



## 8. CHECK THE (K301) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO FOR A SHORT TO THE (K310) SENSOR GROUND CIRCUIT

Measure the resistance between the (K301) 5-Volt Supply circuit and the (K310) Sensor Ground circuit at the A/C Pressure Transducer harness connector.



**Is the resistance below 10k ohms?**

**Yes** >> Repair the (K301) 5-Volt Supply circuit for a short to the (K310) Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 9. TEST FOR INTERMITTENT CONDITION

**NOTE: The condition that set this DTC is not present at this time. The following may help in identifying the cause of the intermittent condition.**

Check the Technical Service Bulletins (TSBs) for related concerns.

Turn the ignition on.

Using the scan tool, erase the BCM DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Monitor the scan tool for DTCs while wiggling the related wiring harness.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Perform a voltage drop test on the related circuits between the component and the BCM.

If numerous DTCs were set, use the wiring diagram/schematic to check for common ground and supply circuits.

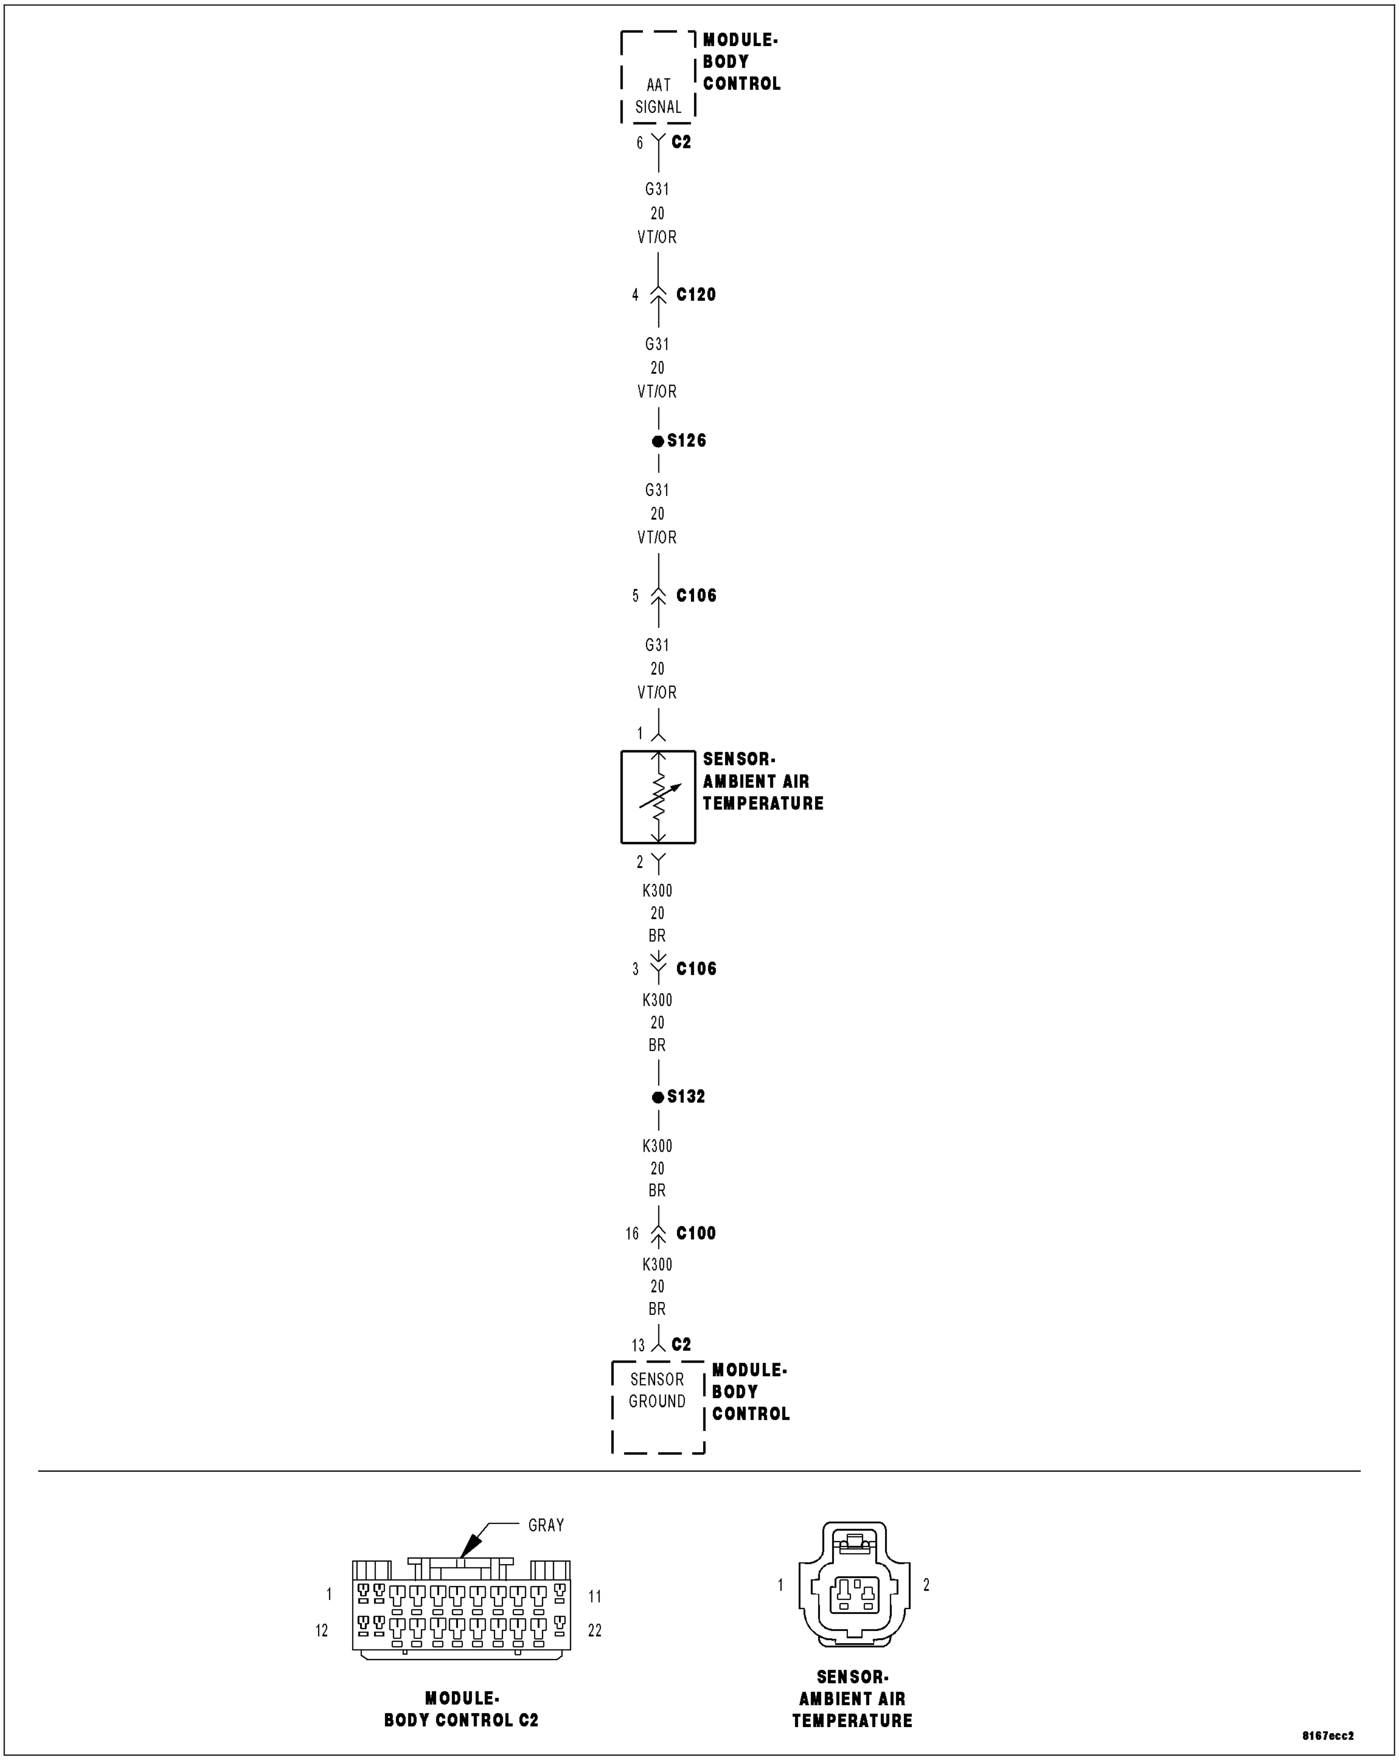
**Were any problems found?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test Complete.

## AMBIENT TEMPERATURE HIGH (BCM)



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Body Control Module (BCM) will set this DTC if voltage goes above 4.7 volts for more than 5 seconds on the (G31) Ambient Temperature Sensor Signal circuit.

| Possible Causes |
|---|
| (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE |
| (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN |
| (K300) SENSOR GROUND CIRCUIT OPEN |
| AMBIENT TEMPERATURE SENSOR |
| BCM |

## Diagnostic Test

### 1. CHECK THE AMBIENT TEMPERATURE SENSOR VOLTAGE

Turn the ignition on.

With the scan tool, read the Ambient Temperature Sensor voltage.

**Is the voltage above 4.5 volts?**

**Yes** >> Go To 2

**No** >> Go To 7

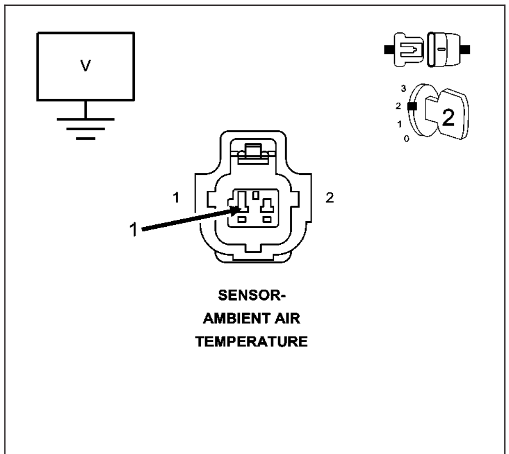
### 2. CHECK THE (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Ambient Temperature Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (G31) Ambient Temperature Sensor Signal circuit.



8167eccc

**Is the voltage above 5.2 volts?**

**Yes** >> Go To 3

**No** >> Go To 4

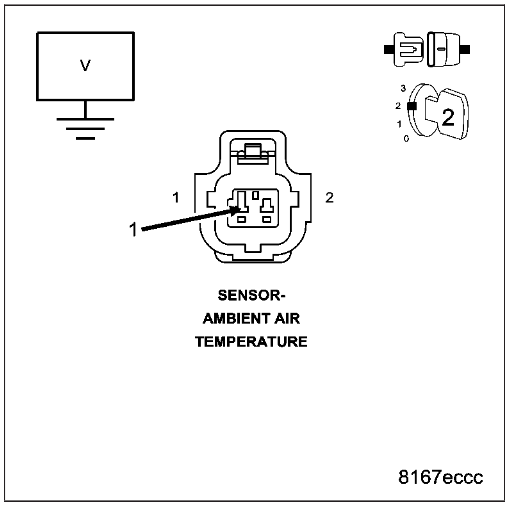
## 3. CHECK THE (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the BCM C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G31) Ambient Temperature Sensor Signal circuit.



**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (G31) Ambient Temperature Sensor Signal circuit for a short to voltage.

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

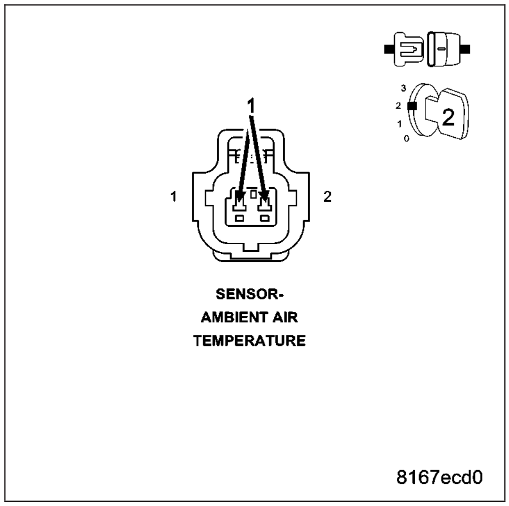
## 4. CHECK THE (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT & THE (K300) SENSOR GROUND CIRCUIT FUNCTION

Turn the ignition off.

Connect a jumper wire between the (G31) Ambient Temperature Sensor Signal circuit and the (K300) Sensor Ground circuit.

Turn the ignition on.

With the scan tool, read the Ambient Temperature Sensor voltage.



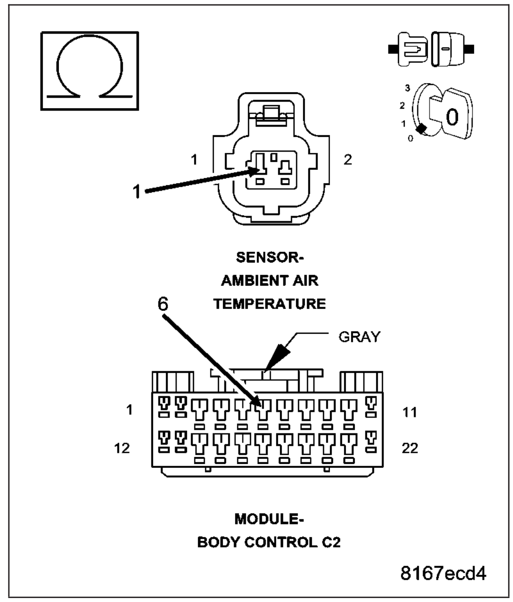
**Is the voltage below 1.0 volt?**

**Yes** >> Replace the Ambient Temperature Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK THE (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN



Turn the ignition off.

Remove the jumper wire from the Ambient Temperature Sensor harness connector.

Disconnect the BCM C2 harness connector.

Measure the resistance of the (G31) Ambient Temperature Sensor Signal circuit between the Ambient Temperature Sensor harness connector and the BCM C2 harness connector.

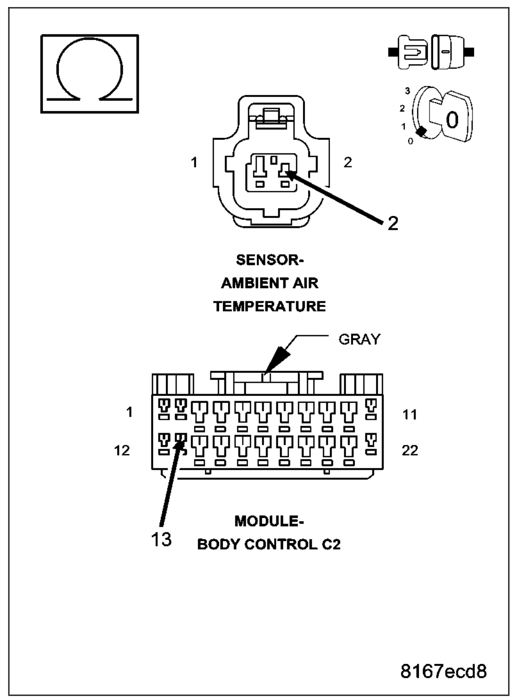
**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (G31) Ambient Temperature Sensor Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 6. CHECK THE (K300) SENSOR GROUND CIRCUIT FOR AN OPEN



Measure the resistance of the (K300) Sensor Ground circuit between the Ambient Temperature Sensor harness connector and the BCM C2 harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (K300) Sensor Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 7. TEST FOR INTERMITTENT CONDITION

**NOTE: The condition that set this DTC is not present at this time. The following may help in identifying the cause of the intermittent condition.**

Check the Technical Service Bulletins (TSBs) for related concerns.

Turn the ignition on.

Using the scan tool, erase BCM DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Monitor the scan tool for DTCs while wiggling the related wiring harness.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Perform a voltage drop test on the related circuits between the component and the BCM.

If numerous DTCs were set, use the wiring diagram/schematic to check for common ground and supply circuits.

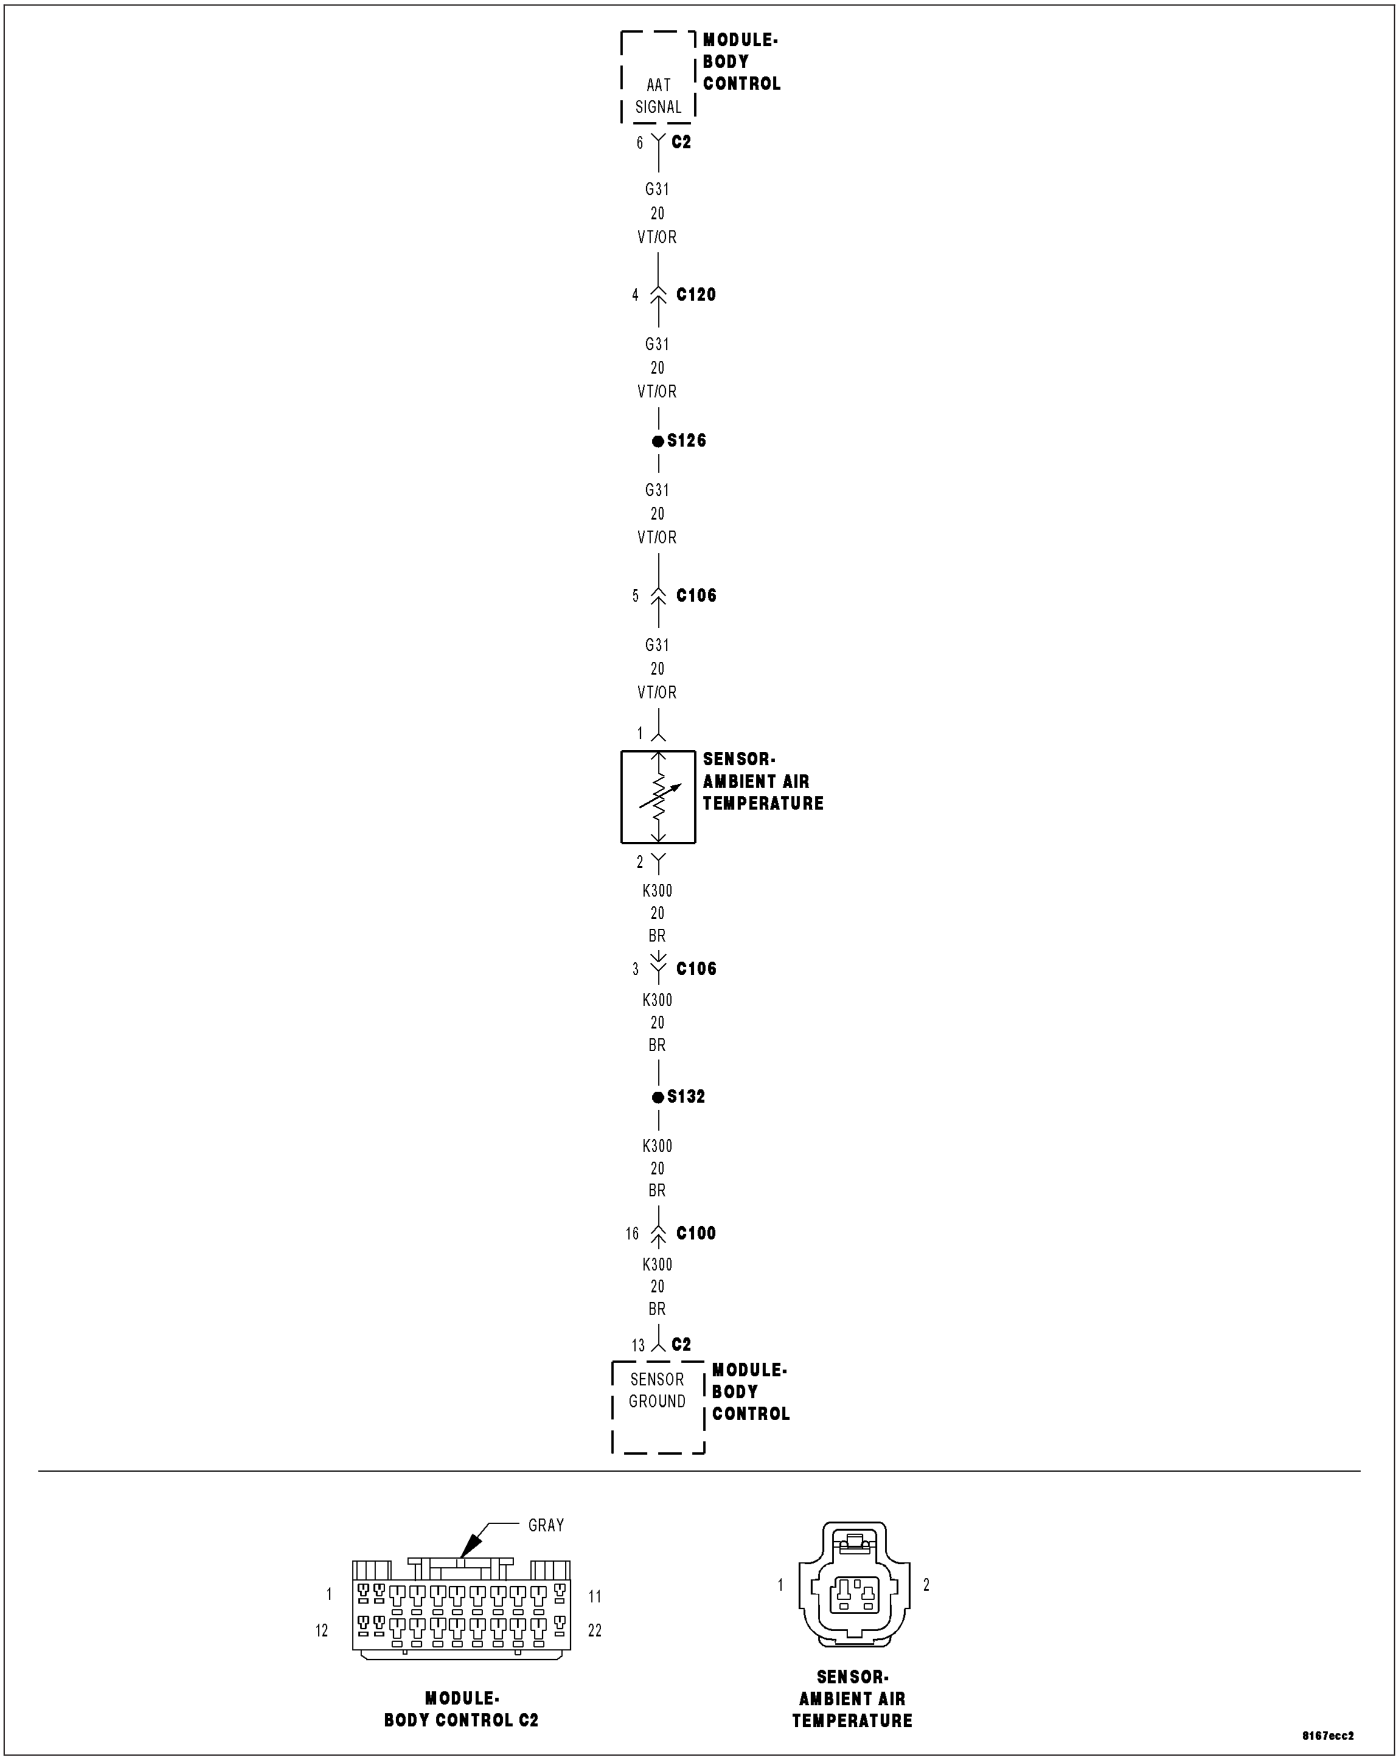
**Were any problems found?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test Complete.

## AMBIENT TEMPERATURE LOW (BCM)



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Body Control Module (BCM) will set this DTC if voltage drops below 0.195 volts for more than 5 seconds on the (G31) Ambient Temperature Sensor Signal circuit.

| **Possible Causes** |
|---|
| (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND |
| (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT |
| AMBIENT TEMPERATURE SENSOR |
| BCM |

## Diagnostic Test

### 1. CHECK THE AMBIENT TEMPERATURE SENSOR VOLTAGE

Turn the ignition on.

With the scan tool, read the Ambient Temperature Sensor voltage.

**Is the voltage below 0.5 volts?**

**Yes** >> Go To 2

**No** >> Go To 5

### 2. CHECK THE AMBIENT TEMPERATURE SENSOR VOLTAGE WITH THE SENSOR DISCONNECTED

Turn the ignition off.

Disconnect the Ambient Temperature Sensor harness connector.

Turn the ignition on.

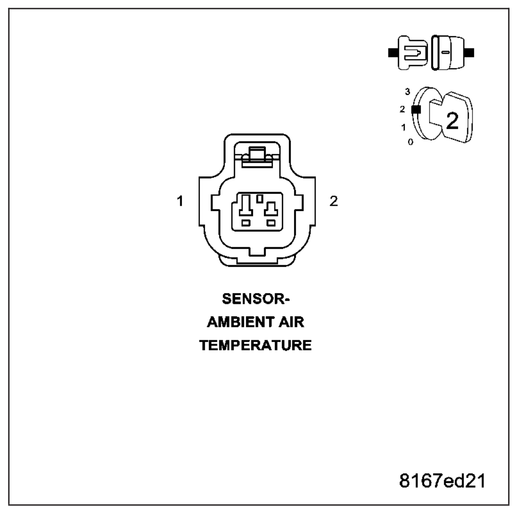
With the scan tool, read the Ambient Temperature Sensor voltage.

**Is the voltage above 4.6 volts?**

**Yes** >> Replace the Ambient Temperature Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 3

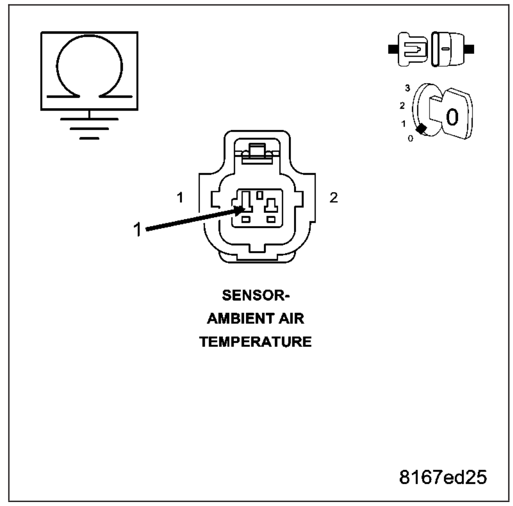


## 3. CHECK THE (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the BCM C2 harness connector.

Measure the resistance between ground and the (G31) Ambient Temperature Sensor Signal circuit at the Ambient Temperature Sensor harness connector.



**Is the resistance below 10k ohms?**

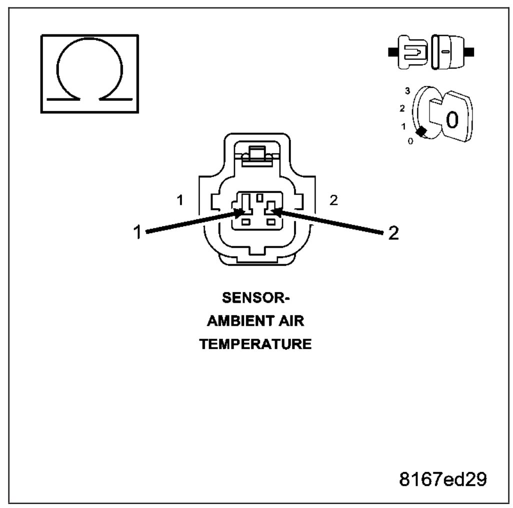
**Yes** >> Repair the (G31) Ambient Temperature Sensor Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK THE (G31) AMBIENT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (K300) SENSOR GROUND CIRCUIT

Measure the resistance between the (G31) Ambient Temperature Sensor Signal circuit and the (K300) Sensor Ground circuit at the Ambient Temperature Sensor harness connector.



**Is the resistance below 10k ohms?**

**Yes** >> Repair the (G31) Ambient Temperature Sensor Signal circuit for a short to the (K300) Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. TEST FOR INTERMITTENT CONDITION

**NOTE: The condition that set this DTC is not present at this time. The following may help in identifying the cause of the intermittent condition.**

Check the Technical Service Bulletins (TSBs) for related concerns.

Turn the ignition on.

Using the scan tool, erase BCM DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Monitor the scan tool for DTCs while wiggling the related wiring harness.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Perform a voltage drop test on the related circuits between the component and the BCM.

If numerous DTCs were set, use the wiring diagram/schematic to check for common ground and supply circuits.

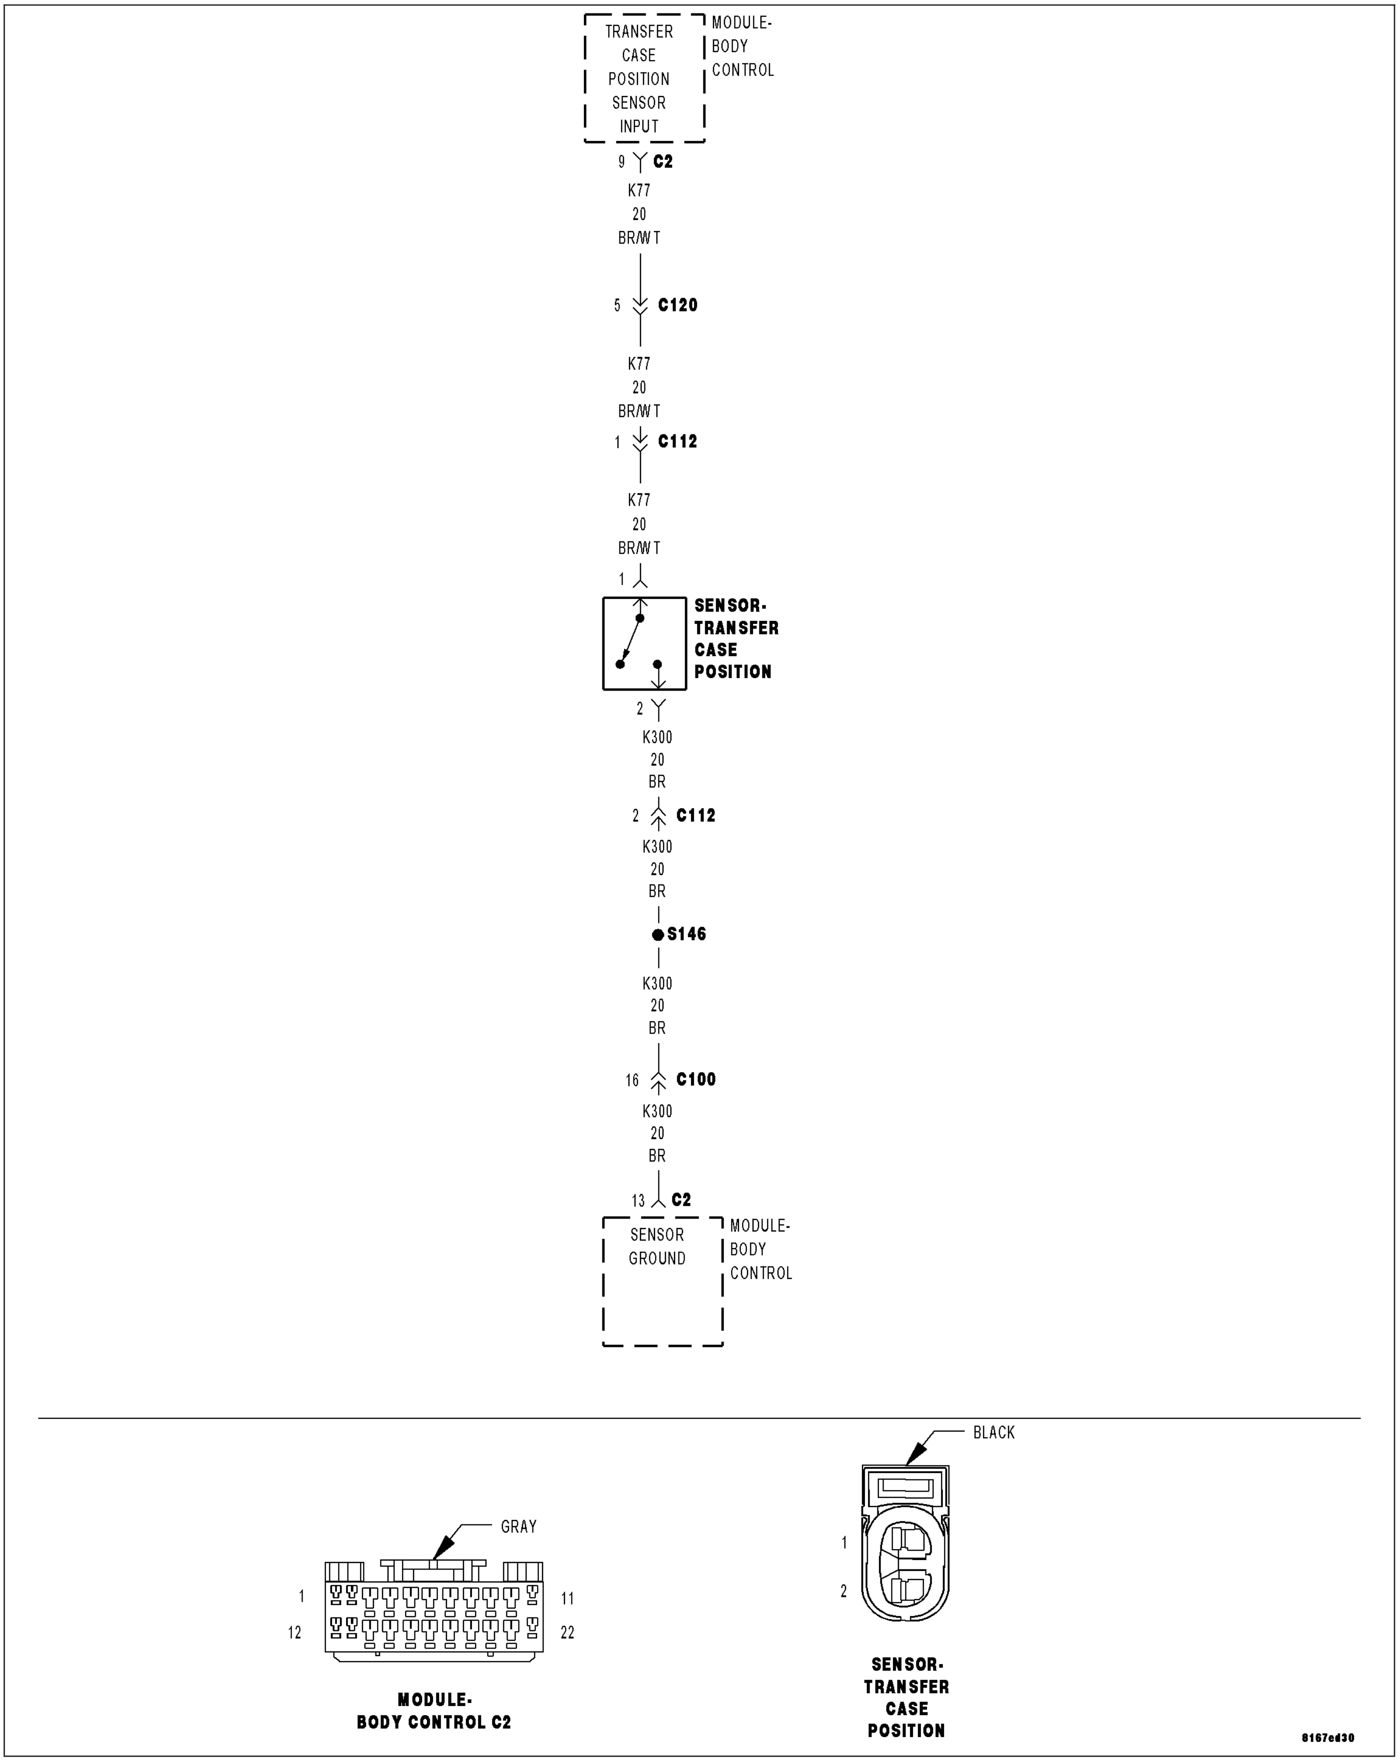
**Were any problems found?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test Complete.

## T-CASE SWITCH HIGH (BCM)



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Body Control Module (BCM) will set this DTC if voltage goes above 4.8 volts for more than 5 seconds on the (K77) Transfer Case Position Sensor Input circuit.

| Possible Causes |
|---|
| (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT SHORTED TO VOLTAGE |
| (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT OPEN |
| (K300) SENSOR GROUND CIRCUIT OPEN |
| TRANSFER CASE POSITION SENSOR |
| BCM |

## Diagnostic Test

### 1. CHECK THE TRANSFER CASE POSITION SENSOR INPUT VOLTAGE

Turn the ignition on.

With the scan tool, read the Transfer Case Position Sensor Input voltage.

**Is the voltage above 4.5 volts?**

**Yes** >> Go To 2

**No** >> Go To 7

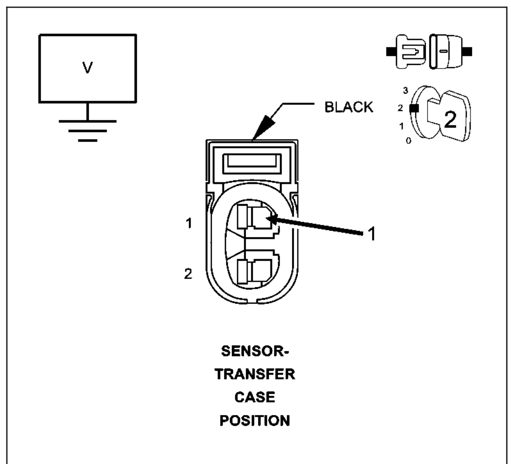
### 2. CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Transfer Case Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K77) Transfer Case Position Sensor Input circuit.



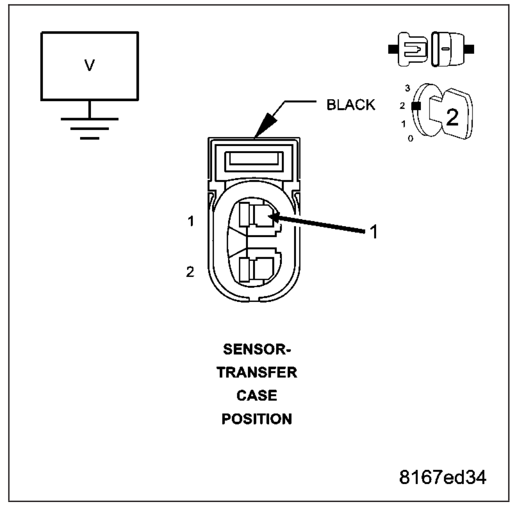
8167ed34

**Is the voltage above 5.2 volts?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT FOR A SHORT TO VOLTAGE



Turn the ignition off.

Disconnect the BCM C2 harness connector.

Turn the ignition on.

Measure the voltage of the (K77) Transfer Case Position Sensor Input circuit at the Transfer Position Sensor harness connector.

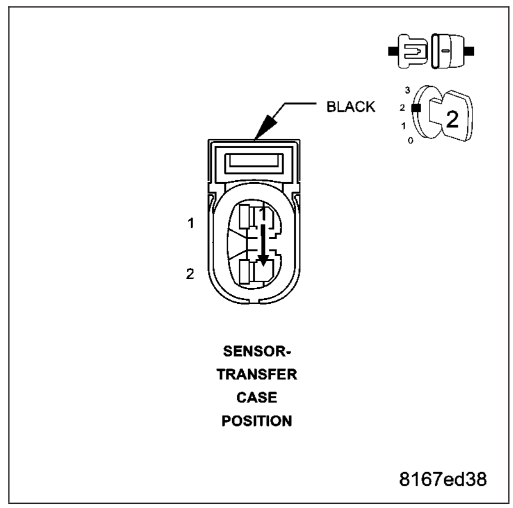
**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (K77) Transfer Case Position Sensor Input circuit for a short to voltage.

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT & THE (K300) SENSOR GROUND CIRCUIT FUNCTION



Turn the ignition off.

Connect a jumper wire between the (K77) Transfer Case Position Sensor Input circuit and the (K300) Sensor Ground circuit.

Turn the ignition on.

With the scan tool, read the Transfer Case Position Sensor Input voltage.

**Is the voltage below 1.0 volt?**

**Yes** >> Replace the Transfer Case Position Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 5

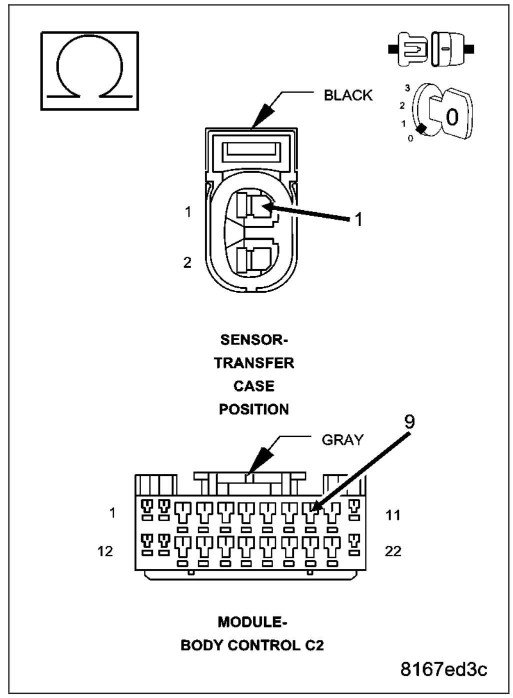
## 5. CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT FOR AN OPEN

Turn the ignition off.

Remove the jumper wire from the Transfer Case Position Sensor harness connector.

Disconnect the BCM C2 harness connector.

Measure the resistance of the (K77) Transfer Case Position Sensor Input circuit between the Transfer Case Position Sensor harness connector and the BCM C2 harness connector.



**Is the resistance below 5.0 ohms?**

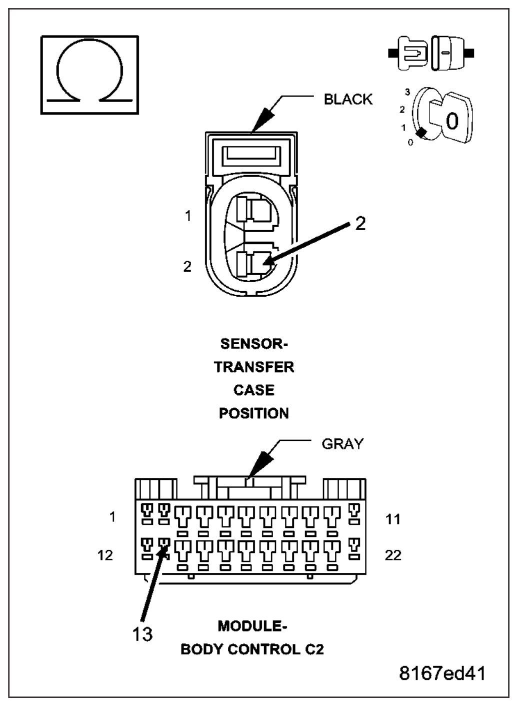
**Yes** >> Go To 6

**No** >> Repair the (K77) Transfer Case Position Sensor Input circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 6. CHECK THE (K300) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (K300) Sensor Ground circuit between the Transfer Case Position Sensor harness connector and the BCM C2 harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (K300) Sensor Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 7. TEST FOR INTERMITTENT CONDITION

**NOTE: The condition that set this DTC is not present at this time. The following may help in identifying the cause of the intermittent condition.**

Check the Technical Service Bulletins (TSBs) for related concerns.

Turn the ignition on.

Using the scan tool, erase BCM DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Monitor the scan tool for DTCs while wiggling the related wiring harness.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Perform a voltage drop test on the related circuits between the component and the BCM.

If numerous DTCs were set, use the wiring diagram/schematic to check for common ground and supply circuits.

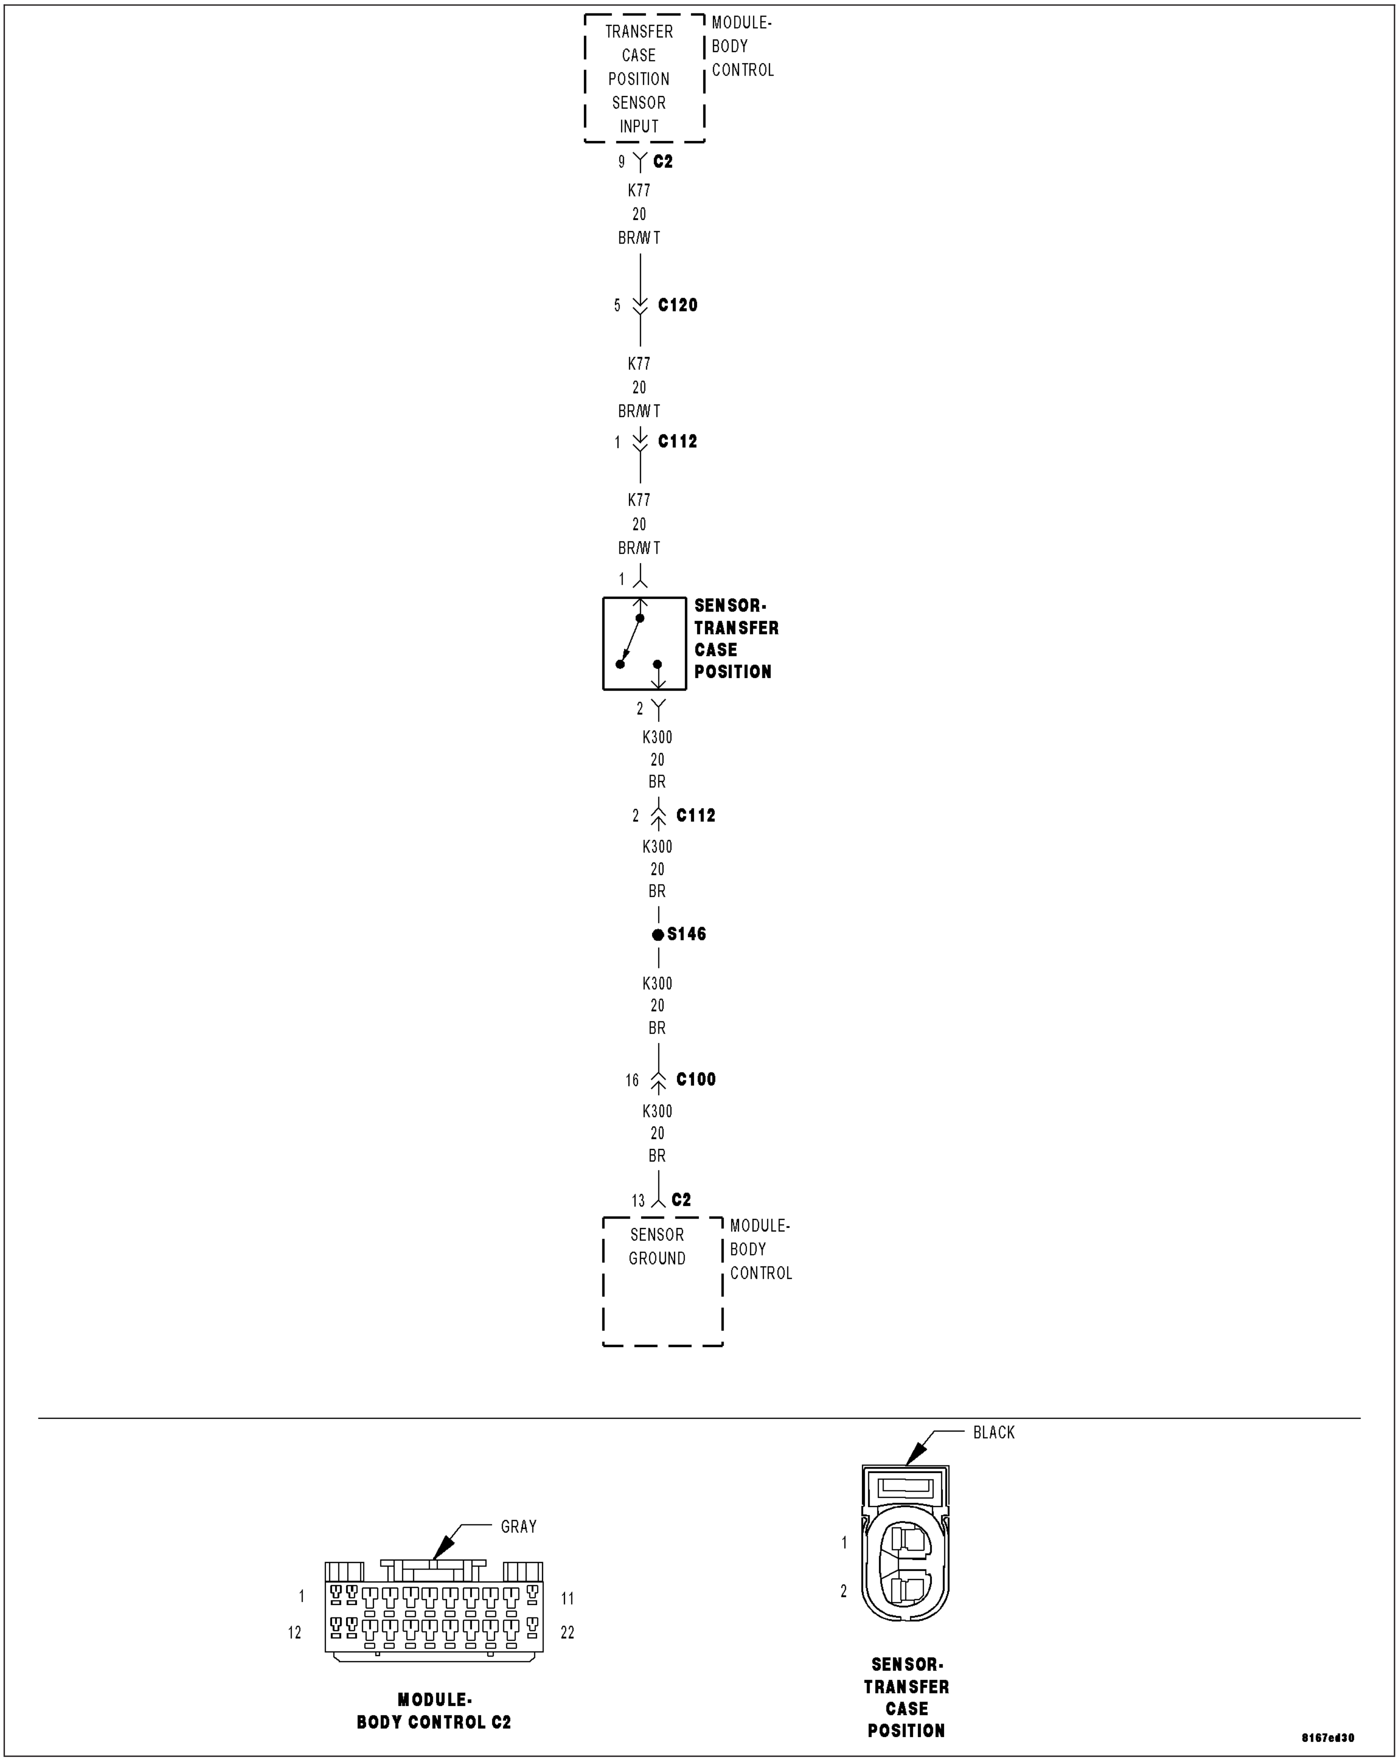
**Were any problems found?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test Complete.

## T-CASE SWITCH LOW (BCM)



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Body Control Module (BCM) will set this DTC if voltage drops below 0.155 volts for more than 5 seconds on the (K77) Transfer Case Position Sensor Input circuit.

| Possible Causes |
|---|
| (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT SHORTED TO GROUND |
| (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT |
| TRANSFER CASE POSITION SENSOR |
| BCM |

## Diagnostic Test

### 1. CHECK THE TRANSFER CASE POSITION SENSOR INPUT VOLTAGE

Turn the ignition on.

With the scan tool, read the Transfer Case Position Sensor Input voltage.

**Is the voltage below 0.5 volts?**

**Yes** >> Go To 2

**No** >> Go To 5

### 2. CHECK THE TRANSFER CASE POSITION SENSOR INPUT VOLTAGE WITH THE SENSOR DISCONNECTED

Turn the ignition off.

Disconnect the Transfer Case Position Sensor harness connector.

Turn the ignition on.

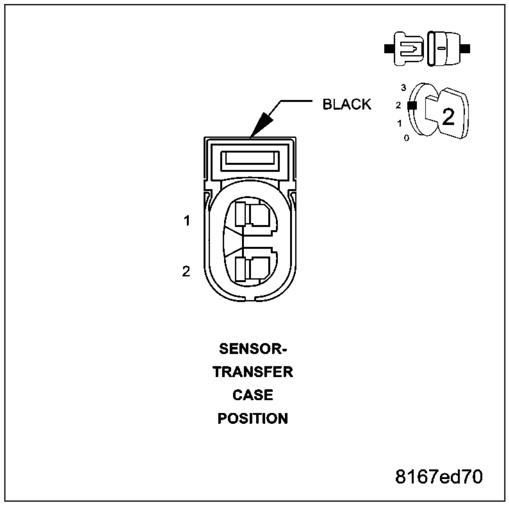
With the scan tool, read the Transfer Case Position Sensor voltage.

**Is the voltage above 4.6 volts?**

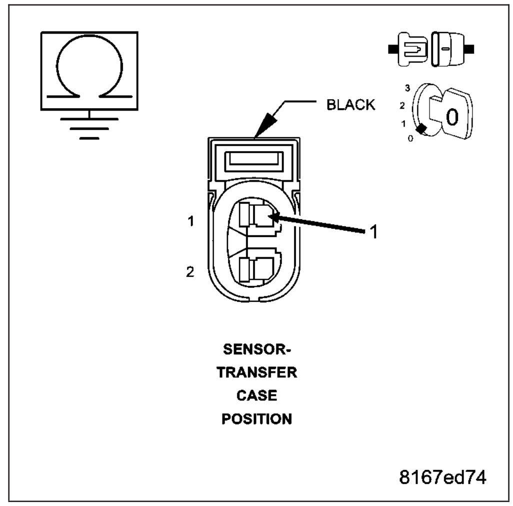
**Yes** >> Replace the Transfer Case Position Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 3



## 3. CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT FOR A SHORT TO GROUND



Turn the ignition off.

Disconnect the BCM C2 harness connector.

Measure the resistance between ground and the (K77) Transfer Case Position Sensor Input circuit at the Transfer Case Position Sensor harness connector.

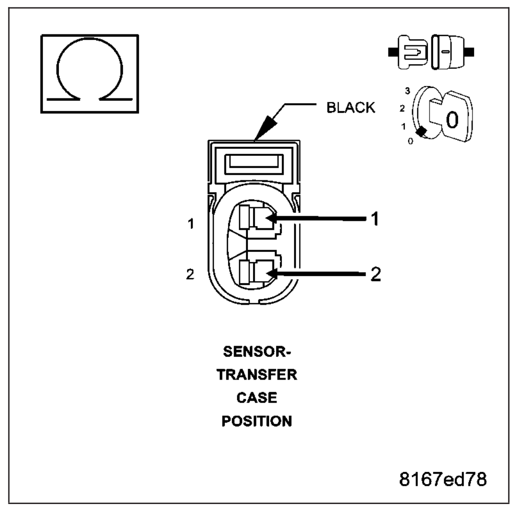
**Is the resistance below 10k ohms?**

**Yes** >> Repair the (K77) Transfer Case Position Sensor Input circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK THE (K77) TRANSFER CASE POSITION SENSOR INPUT CIRCUIT FOR A SHORT TO THE (K300) SENSOR GROUND CIRCUIT



Measure the resistance between the (K77) Transfer Case Position Sensor Input circuit and the (K300) Sensor Ground circuit at the Transfer Case Position Sensor harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (K77) Transfer Case Position Sensor Input circuit for a short to the (K300) Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. TEST FOR INTERMITTENT CONDITION

**NOTE: The condition that set this DTC is not present at this time. The following may help in identifying the cause of the intermittent condition.**

Check the Technical Service Bulletins (TSBs) for related concerns.

Turn the ignition on.

Using the scan tool, erase BCM DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Monitor the scan tool for DTCs while wiggling the related wiring harness.

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Perform a voltage drop test on the related circuits between the component and the BCM.

If numerous DTCs were set, use the wiring diagram/schematic to check for common ground and supply circuits.

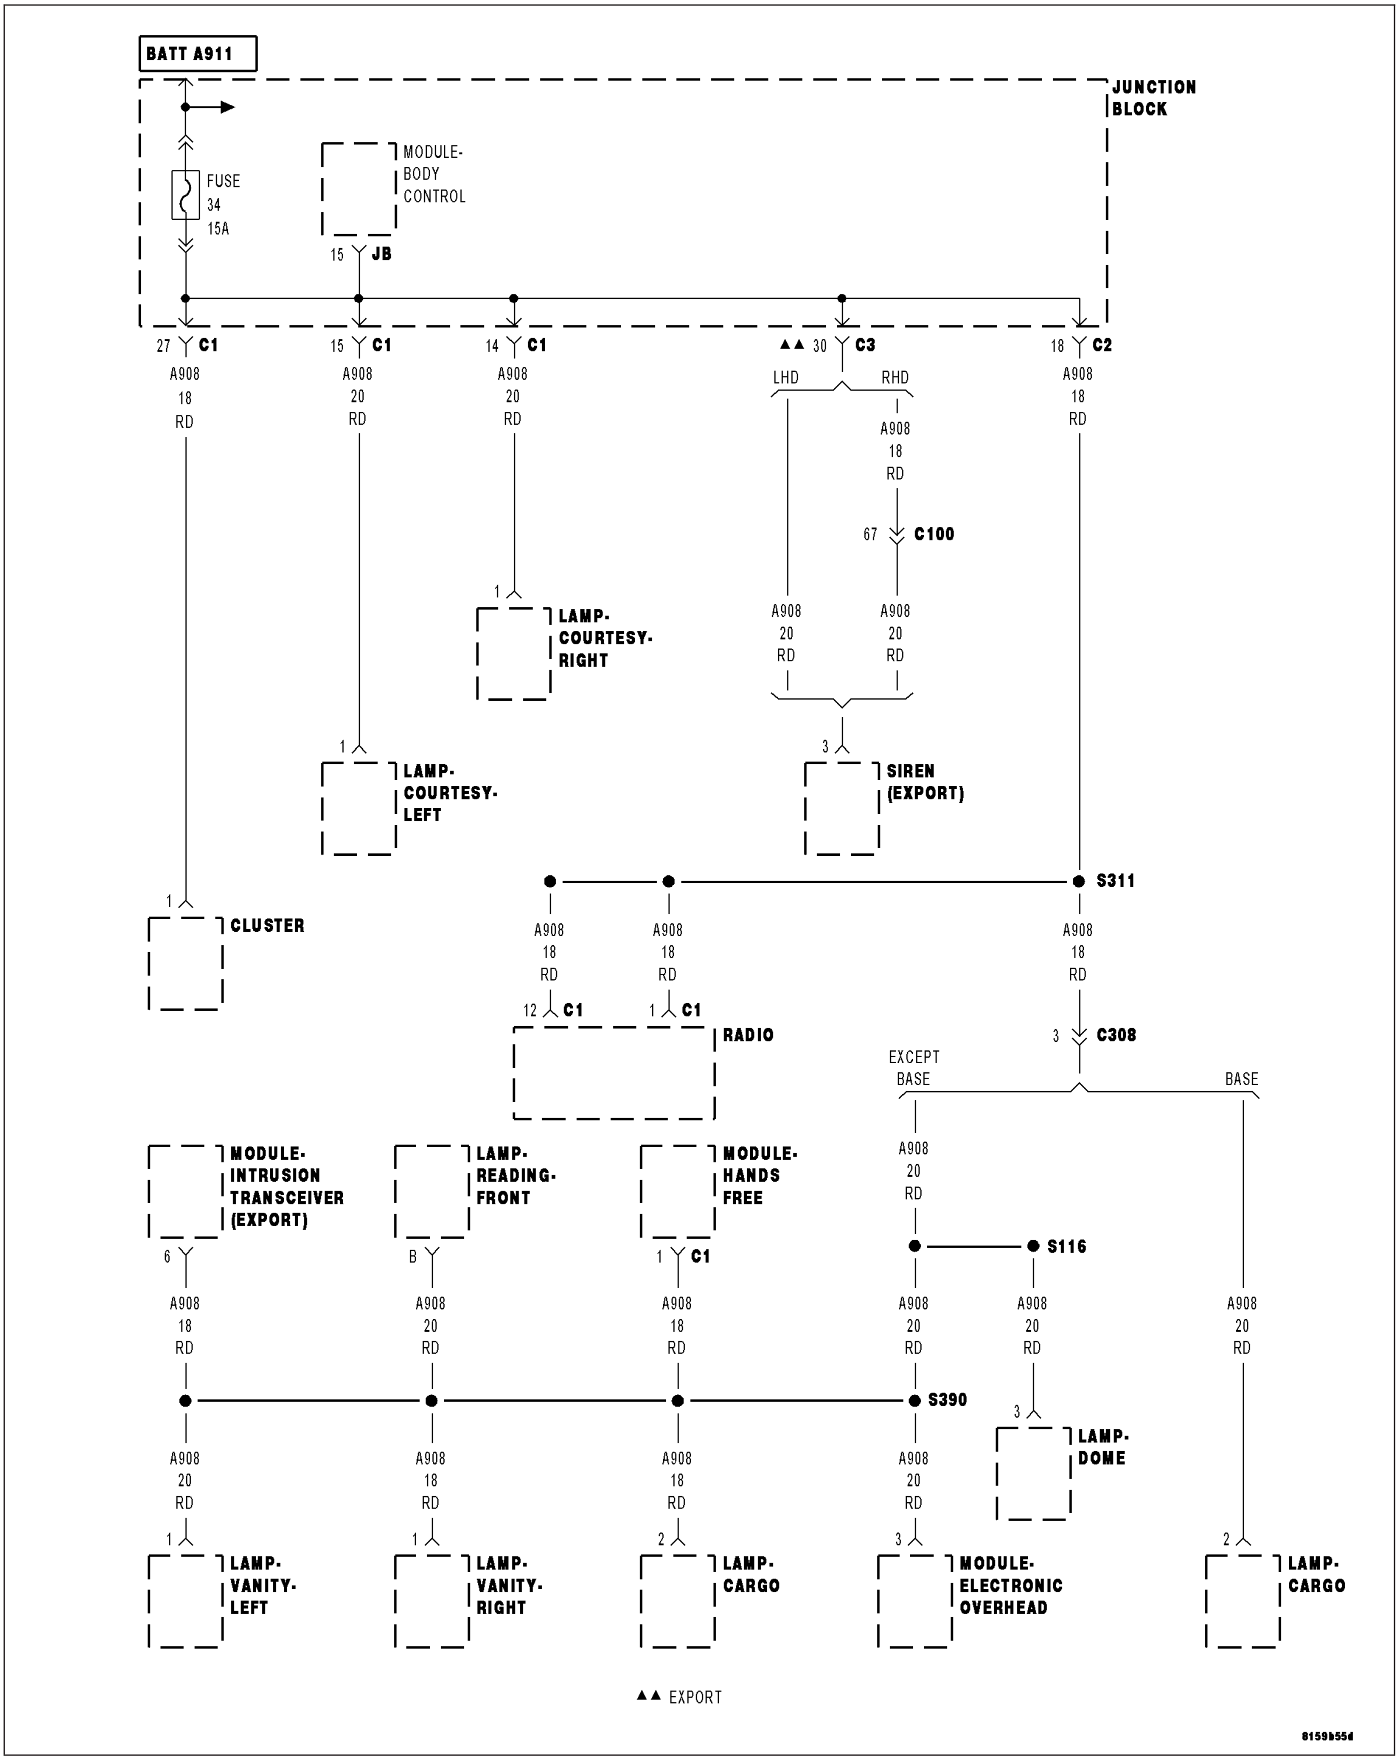
**Were any problems found?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test Complete.

## BATTERY IOD DISCONNECT AT BCM



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The BCM detects a no or low voltage condition on the IOD circuit.

| Possible Causes |
|---|
| OPEN FUSES |
| JUNCTION BLOCK |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR AN ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the BCM DTC's.

Turn the ignition off then turn the ignition on and wait approximately 1 minute.

With the scan tool, read the BCM DTC's.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. CHECK FUSES

Turn the ignition off.

Inspect the Junction Block and the PDC fuses.

**Are any fuses open?**

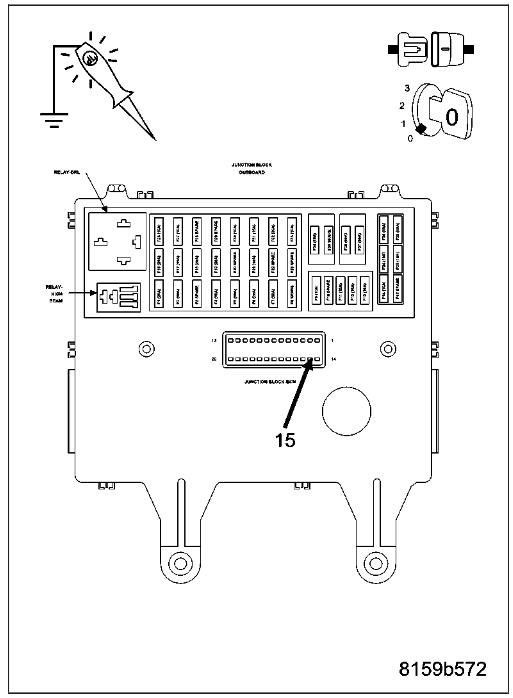
**Yes** >> Replace Fuse(s) as necessary. Use the wiring diagrams to help isolate a possible short circuit condition.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. CHECK THE (A908) FUSED B+ CIRCUIT FOR AN OPEN

Remove the BCM from the Junction Block.

Using a 12-volt test light connected to ground, probe the (A908) Fused B+ circuit (cavity 15).



**Is the test light illuminated?**

**Yes** >> Replace the Body Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (A908) Fused B+ circuit for an open. If ok, replace the Junction Block in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## EEPROM CHECKSUM FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  When the EEPROM memory checksum is determined to be incorrect.

| Possible Causes |
| --- |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the BCM DTC's.

Turn the ignition off then turn the ignition on and wait approximately 1 minute.

With the scan tool, read the BCM DTC's.

**Did this DTC reset?**

**Yes** >> Replace the Body Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test Complete.

## FLASH CHECKSUM FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  When the flash checksum is determined to be incorrect.

| Possible Causes |
| --- |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the BCM DTC's.

Turn the ignition off then turn the ignition on and wait approximately 1 minute.

With the scan tool, read the BCM DTC's.

**Did this DTC reset?**

**Yes** >> Replace the Body Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test Complete.

## ITM MESSAGES NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The BCM does not receive any messages from the Intrusion Transceiver Module (ITM) for at least 30 seconds.

| Possible Causes |
|---|
| (D25) PCI BUS CIRCUIT OPEN |
| INTRUSION TRANSCEIVER MODULE POWER AND GROUND |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE INTRUSION TRANSCEIVER MODULE (ITM)

Turn the ignition on.

With the scan tool attempt to communicate with the ITM.

**Was the scan tool able to I/D or communicate with the ITM?**

**Yes** >> Go To 2

**No** >> Refer to the table of contents and perform the related symptom.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 2. BODY CONTROL MODULE

With the scan tool, erase the BCM DTC's.

Turn the ignition on and wait approximately 1 minute.

With the scan tool, read the BCM DTC's.

**Did this DTC reset?**

**Yes** >> Replace the Body Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## LOST COMMUNICATION WITH ITM, NO IFR RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The BCM does not receive any messages from the Intrusion Transceiver Module (ITM) for at least 30 seconds.

| Possible Causes |
|---|
| (D25) PCI BUS CIRCUIT OPEN |
| INTRUSION TRANSCEIVER MODULE POWER AND GROUND |
| BODY CONTROL MODULE |

### Diagnostic Test

#### 1. ATTEMPT TO COMMUNICATE WITH THE INTRUSION TRANSCEIVER MODULE (ITM)

Turn the ignition on.

With the scan tool attempt to communicate with the ITM.

**Was the scan tool able to I/D or communicate with the ITM?**

**Yes** >> Go To 2

**No** >> Refer to the table of contents and perform the related symptom.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

#### 2. BODY CONTROL MODULE

With the scan tool, erase the BCM DTC’s.

Turn the ignition on and wait approximately 1 minute.

With the scan tool, read the BCM DTC’s.

**Did this DTC reset?**

**Yes** >> Replace the Body Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## PCM/ECM MESSAGES NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The BCM does not receive any messages from the PCM/ECM for at least 30 seconds.

| Possible Causes |
|---|
| PCM/ECM POWER AND GROUND |
| CAN C BUS CIRCUIT FAULT |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE PCM/ECM

Turn the ignition on.

With the scan tool attempt to communicate with the PCM/ECM.

**Was the scan tool able to I/D or communicate with the PCM/ECM?**

**Yes** >> Go To 2

**No** >> Refer to the table of contents and perform the related symptom.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 2. BODY CONTROL MODULE

With the scan tool, erase the BCM DTC's.

Turn the ignition on and wait approximately 1 minute.

With the scan tool, read the BCM DTC's.

**Did this DTC reset?**

**Yes** >> Ensure the CAN C Bus circuits are not open at the BCM, if ok then replace the Body Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## VIN MSG NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Body Control Module (BCM) either fails to receive a VIN message within 1 second or the VIN message contains signal not available (SNA) information.

| Possible Causes |
|---|
| WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE |
| DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| ECM OR PCM DTCs PRESENT |
| ECM OR PCM |
| BCM |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, record an erase BCM DTCs.

Cycle the ignition switch.

With the scan tool, read BCM DTCs.

**Does this DTC reset?**

**Yes** >> Go To 2

**No** >> Using the schematics as a guide, check the BCM and the ECM or PCM pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs related to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in the applicable Section.

**No** >> Go To 3

### 3. CHECK IF ECM OR PCM DTCs ARE PRESENT

With the scan tool, read ECM or PCM DTCs.

**Are any DTCs present?**

**Yes** >> Diagnose and repair the DTC(s). Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs “Logged Against” the ECM or PCM?**

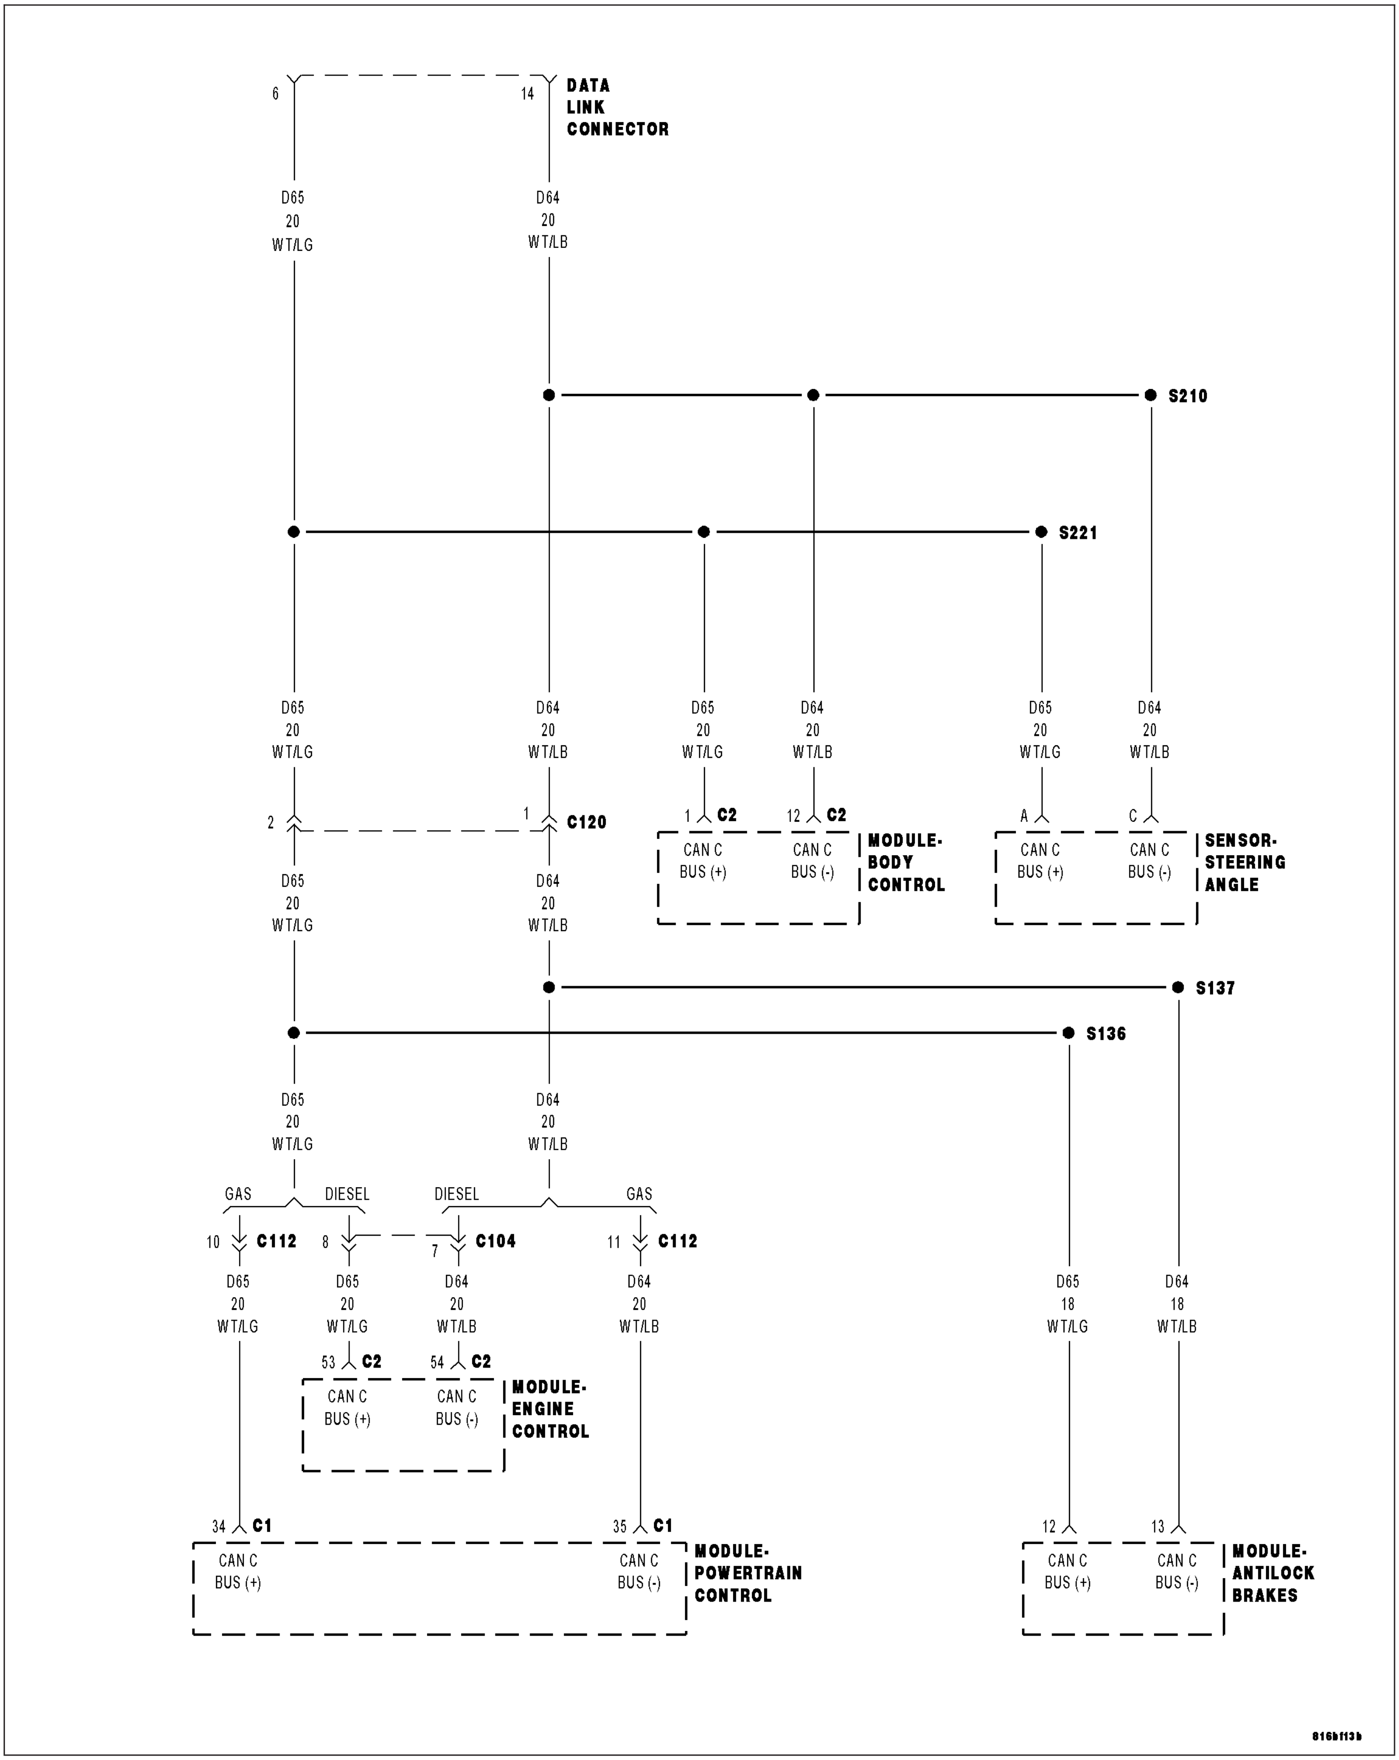
**Yes** >> Replace/update the ECM or PCM in accordance with the service information.

Perform POWERTRAIN VERIFICATION TEST. Refer to 9 - ENGINE - DIAGNOSIS AND TESTING.

**No** >> Using the schematics as a guide, check the BCM pins, terminals, and connectors for corrosion, damage, and terminal push out. Pay particular attention to all Communication circuits. If no problems are found, replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## U0001-CAN C BUS CIRCUIT

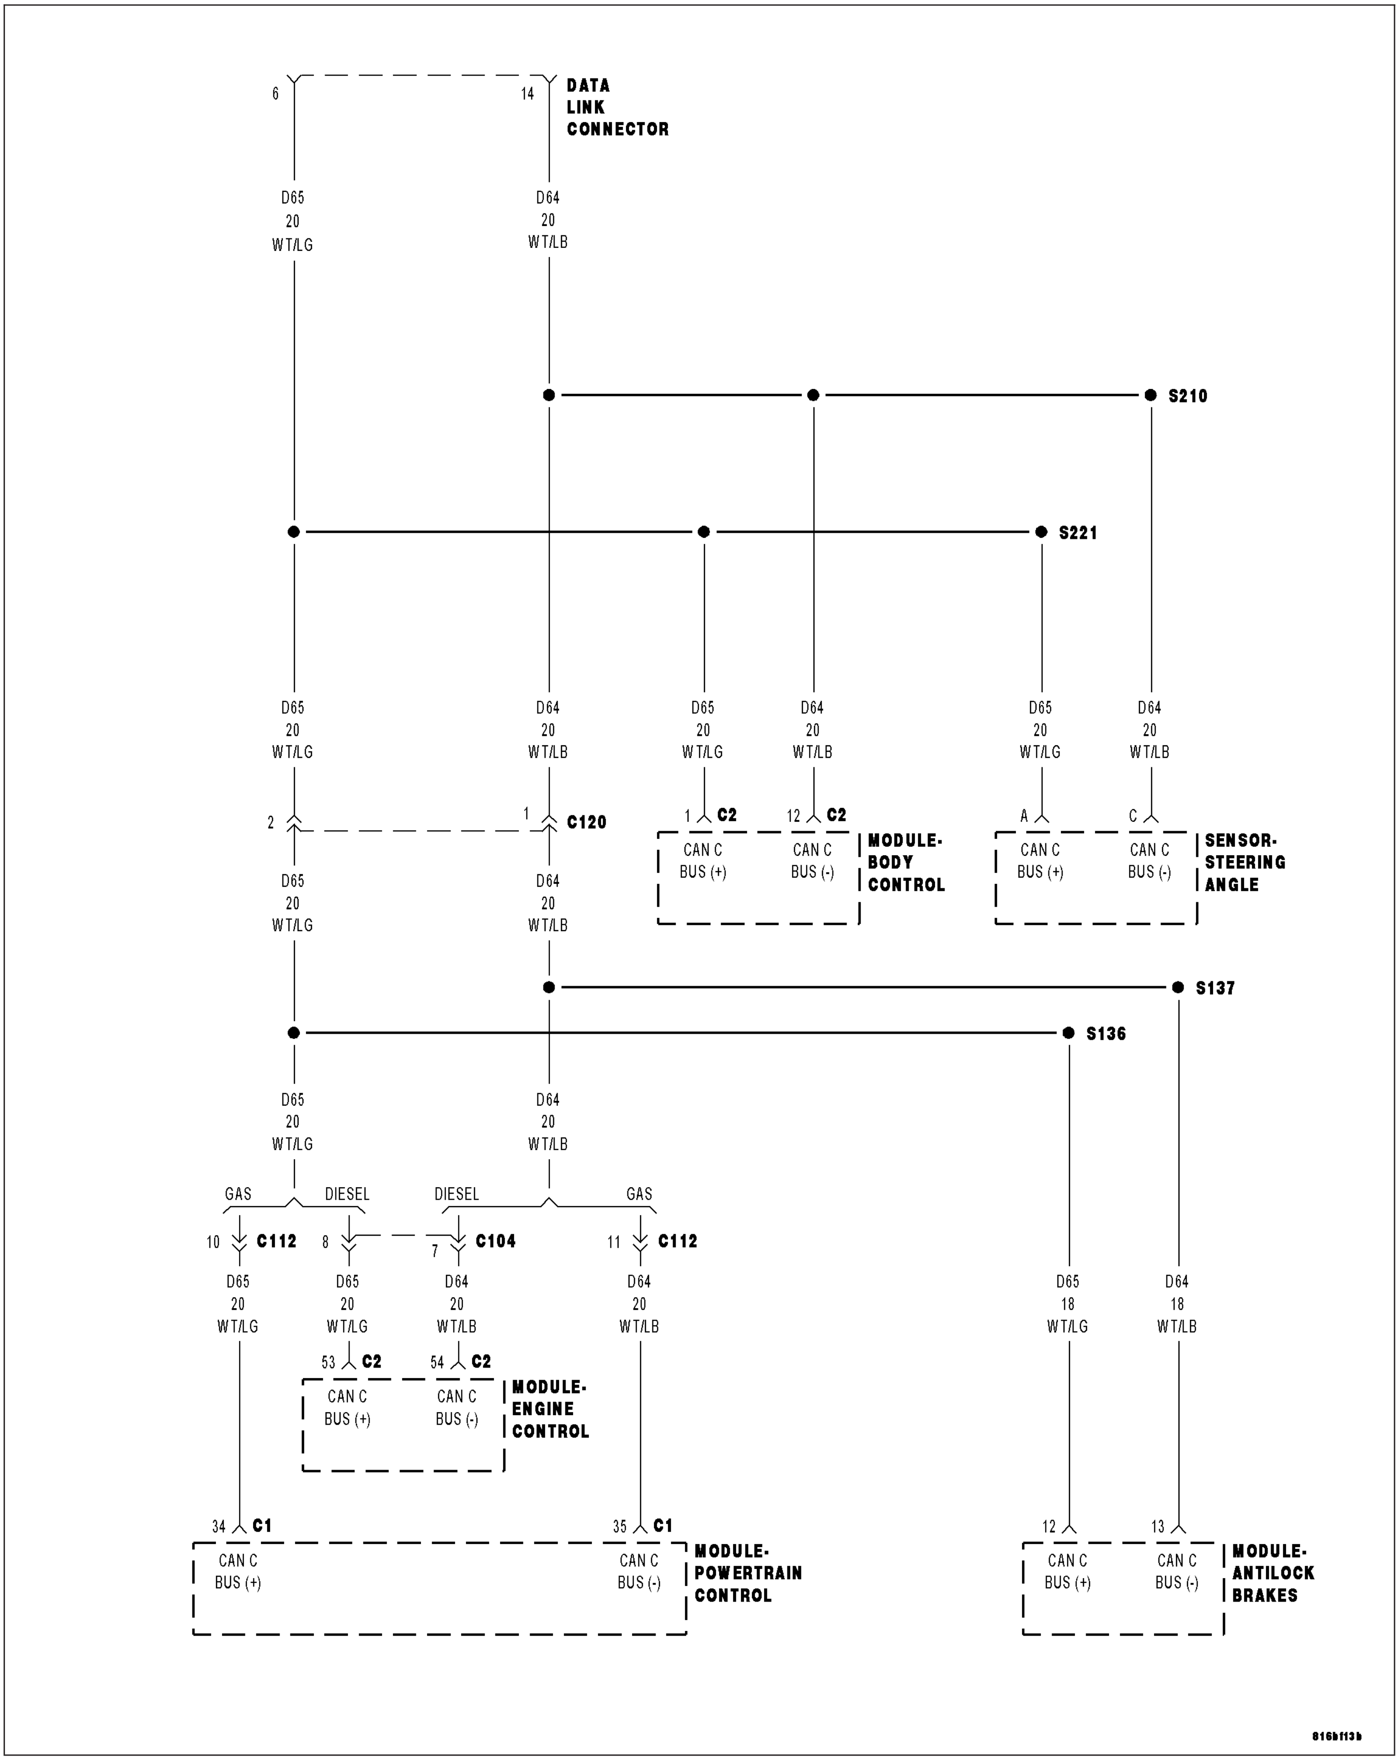


For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  A module detects a short in either CAN C Bus circuit.

Perform the CAN C Bus Communication Failure diagnostic test procedure. **(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)**.

## U0002–CAN C BUS OFF PERFORMANCE

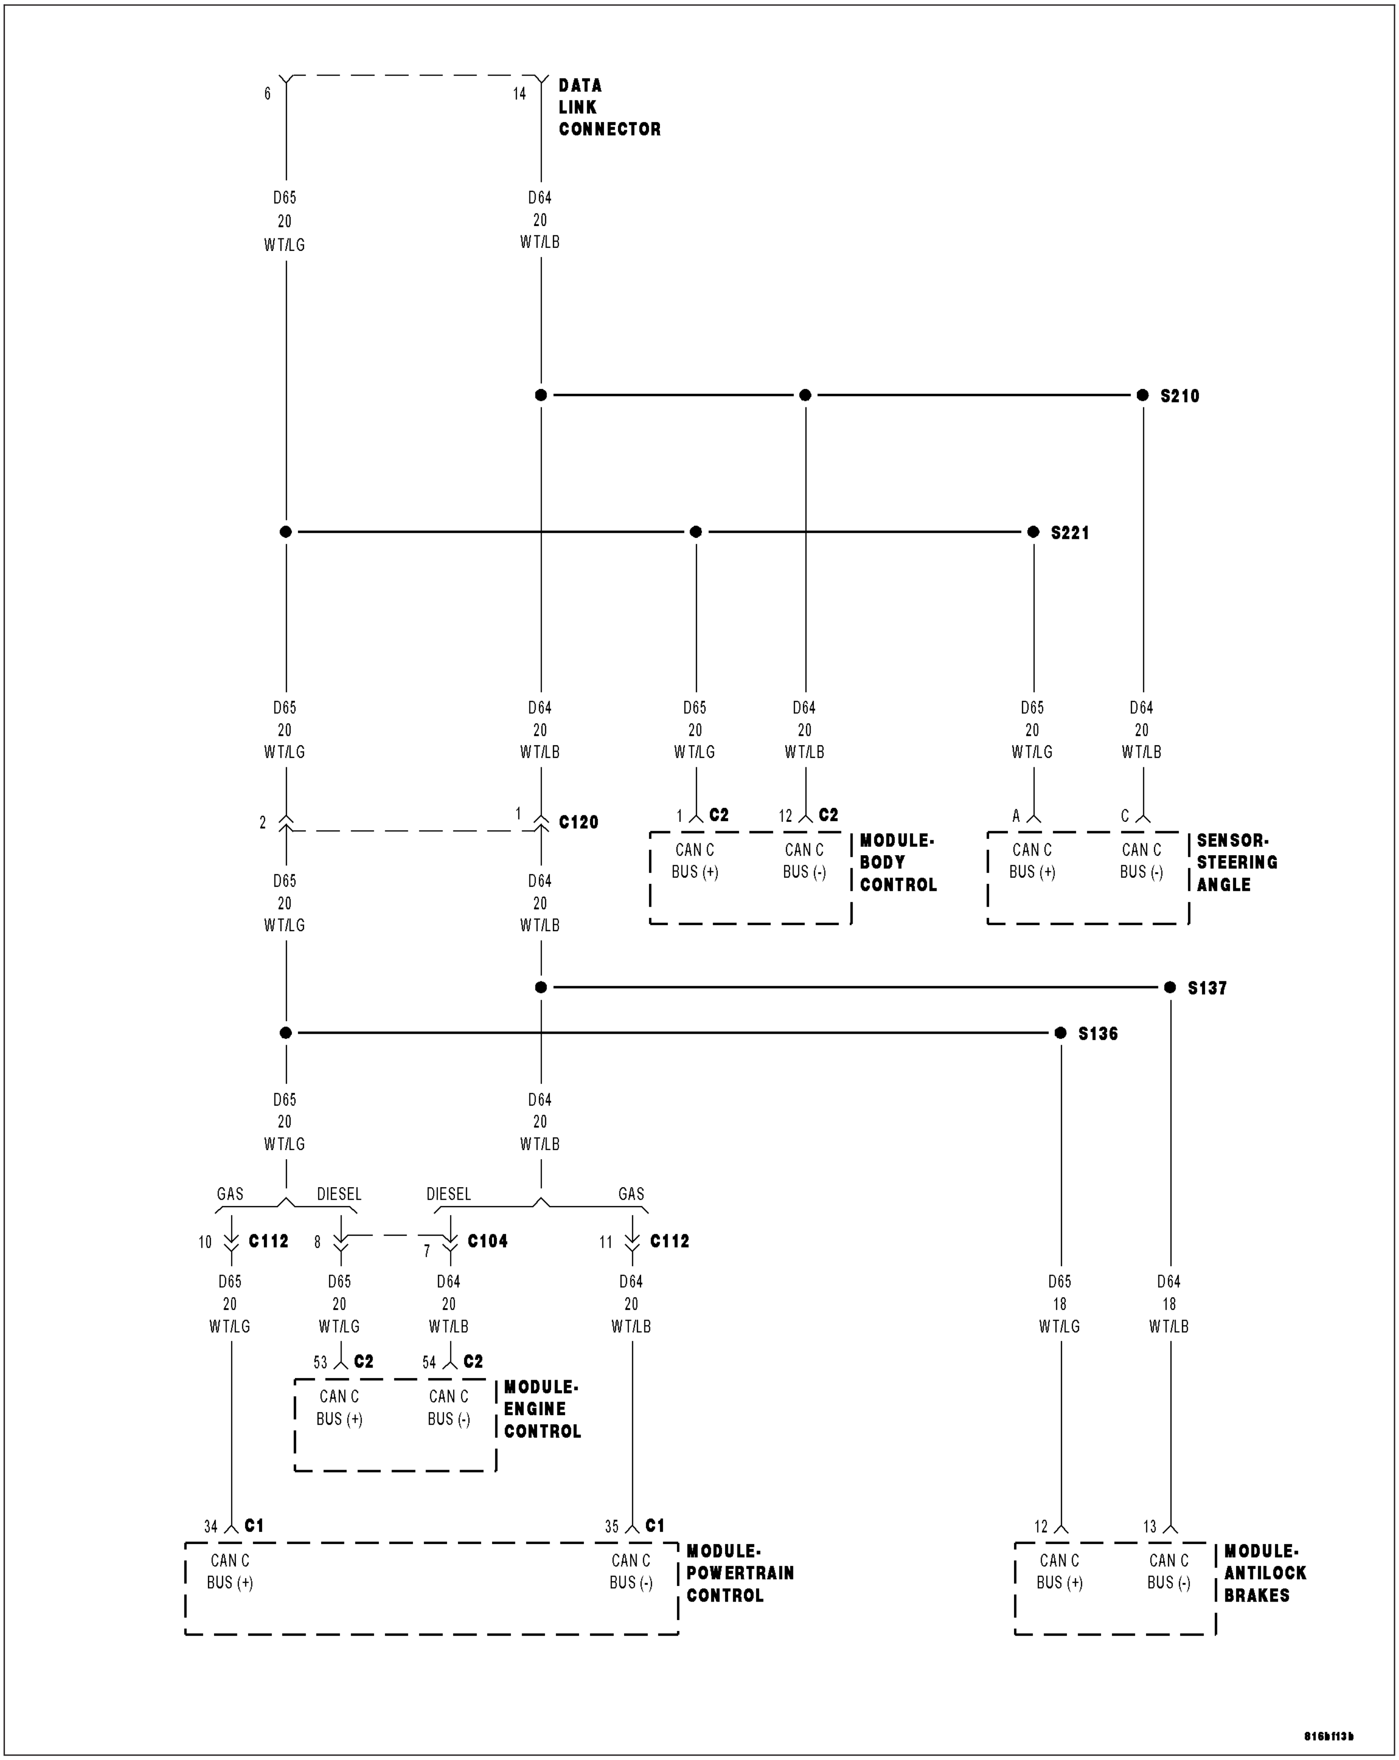


For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  A module detects a short in either CAN C Bus circuit.

Perform the CAN C Bus Communication Failure diagnostic test procedure. **(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)**.

## U0100-LOST COMMUNICATION WITH ECM/PCM



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  Bus messages not received from the ECM/PCM for approximately 500ms.

| Possible Causes |
|---|
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| ECM/PCM |
| ECM/PCM POWER AND GROUND |
| MODULE THAT SET THIS DTC |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**
Turn the ignition on.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

**No** >> Go To 3

### 3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the ECM/PCM is active on the bus.

**Is the ECM/PCM active on the bus?**

**Yes** >> Go To 4

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

## 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

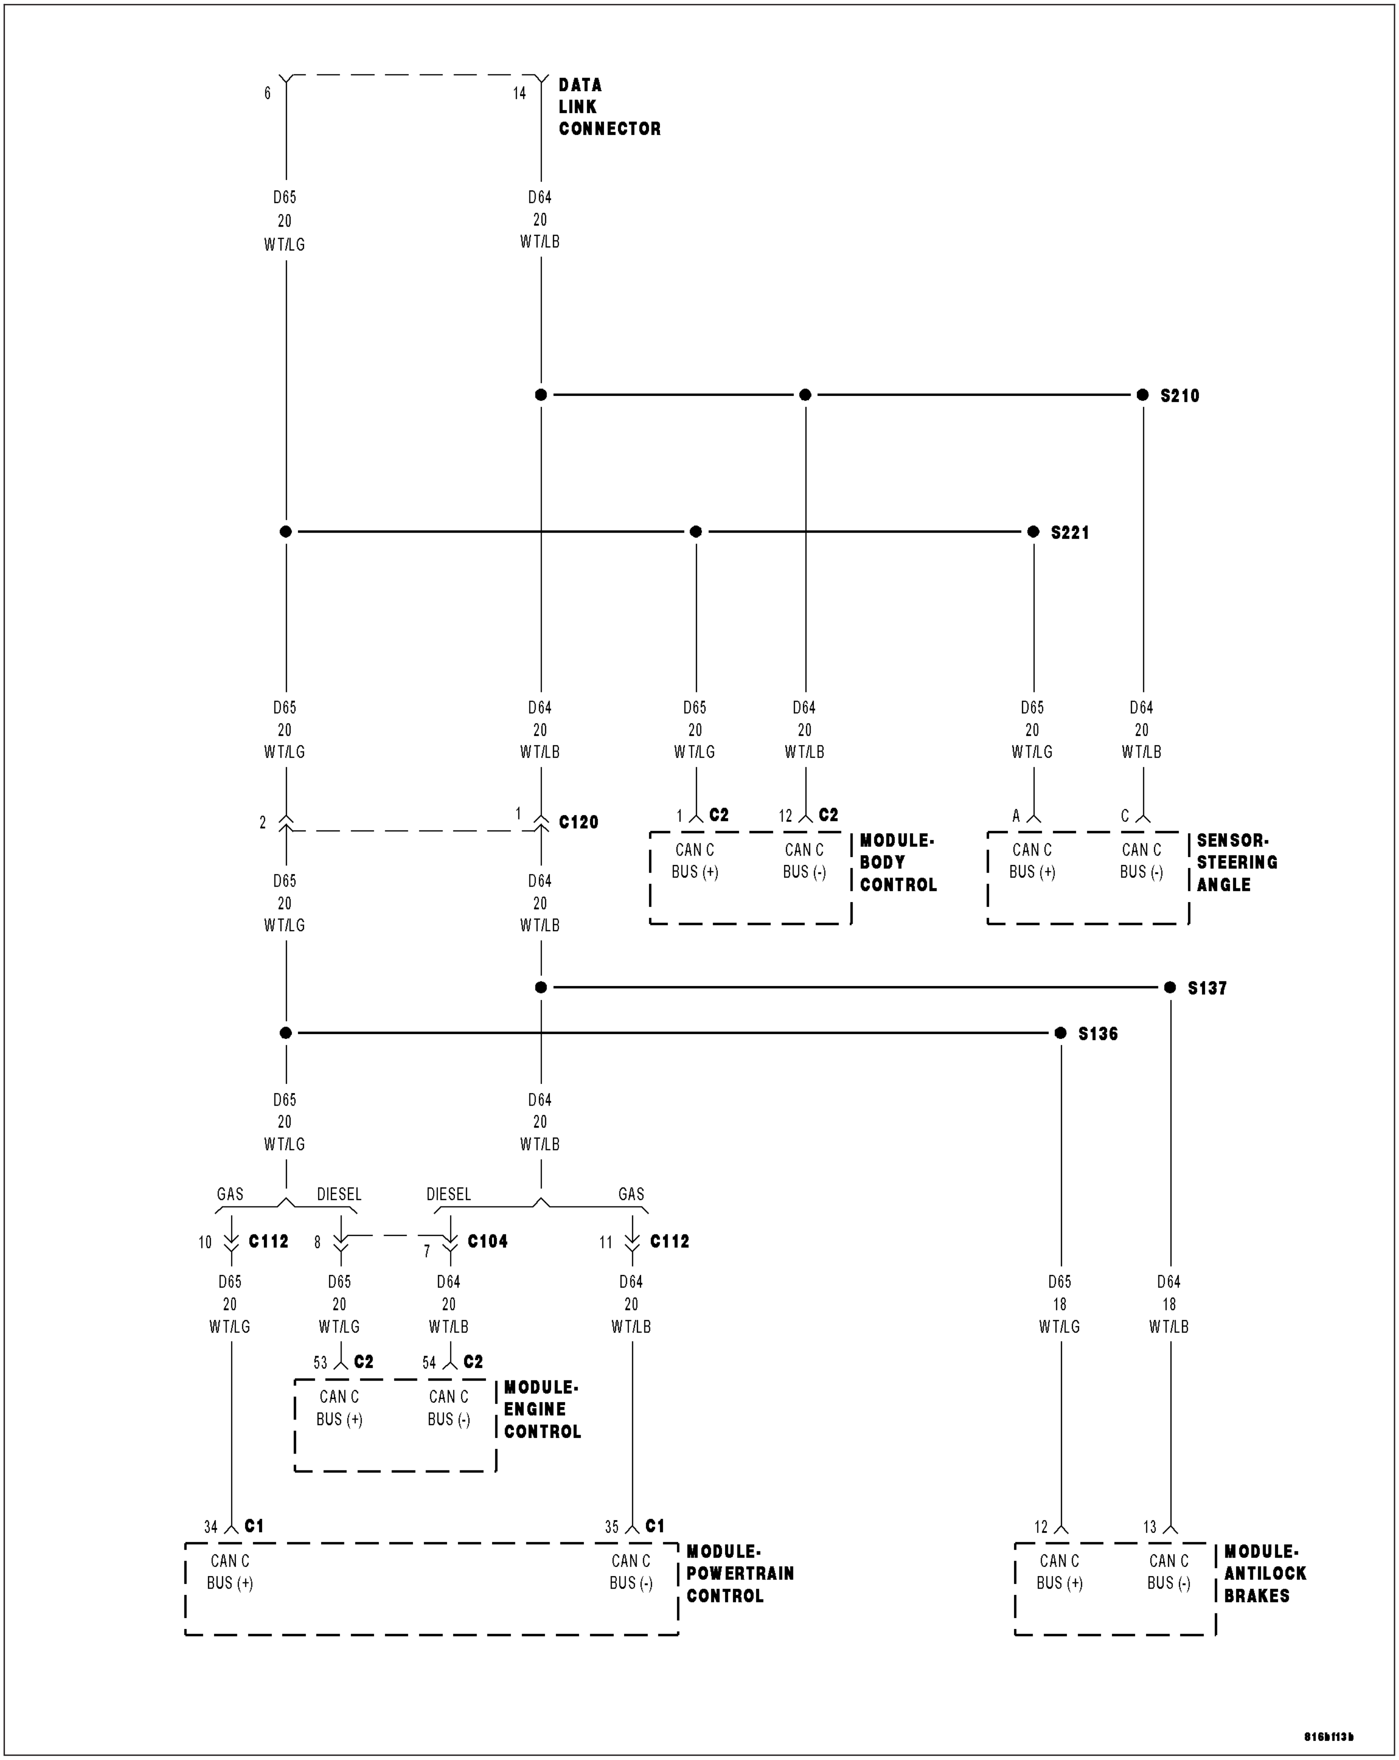
With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs “Logged Against” the ECM/PCM?**

**Yes** >> Replace/update the ECM/PCM in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  Bus messages not received from the Antilock Brake Module for approximately 500ms.

| Possible Causes |
|---|
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| ANTILOCK BRAKE MODULE |
| ANTILOCK BRAKE MODULE POWER AND GROUND |
| MODULE THAT SET THIS DTC |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**
Turn the ignition on.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

**No** >> Go To 3

### 3. VERIFY THAT THE ABS MODULE IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the ABS is active on the bus.

**Is the ABS active on the bus?**

**Yes** >> Go To 4

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

### 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs “Logged Against” the ABS?**

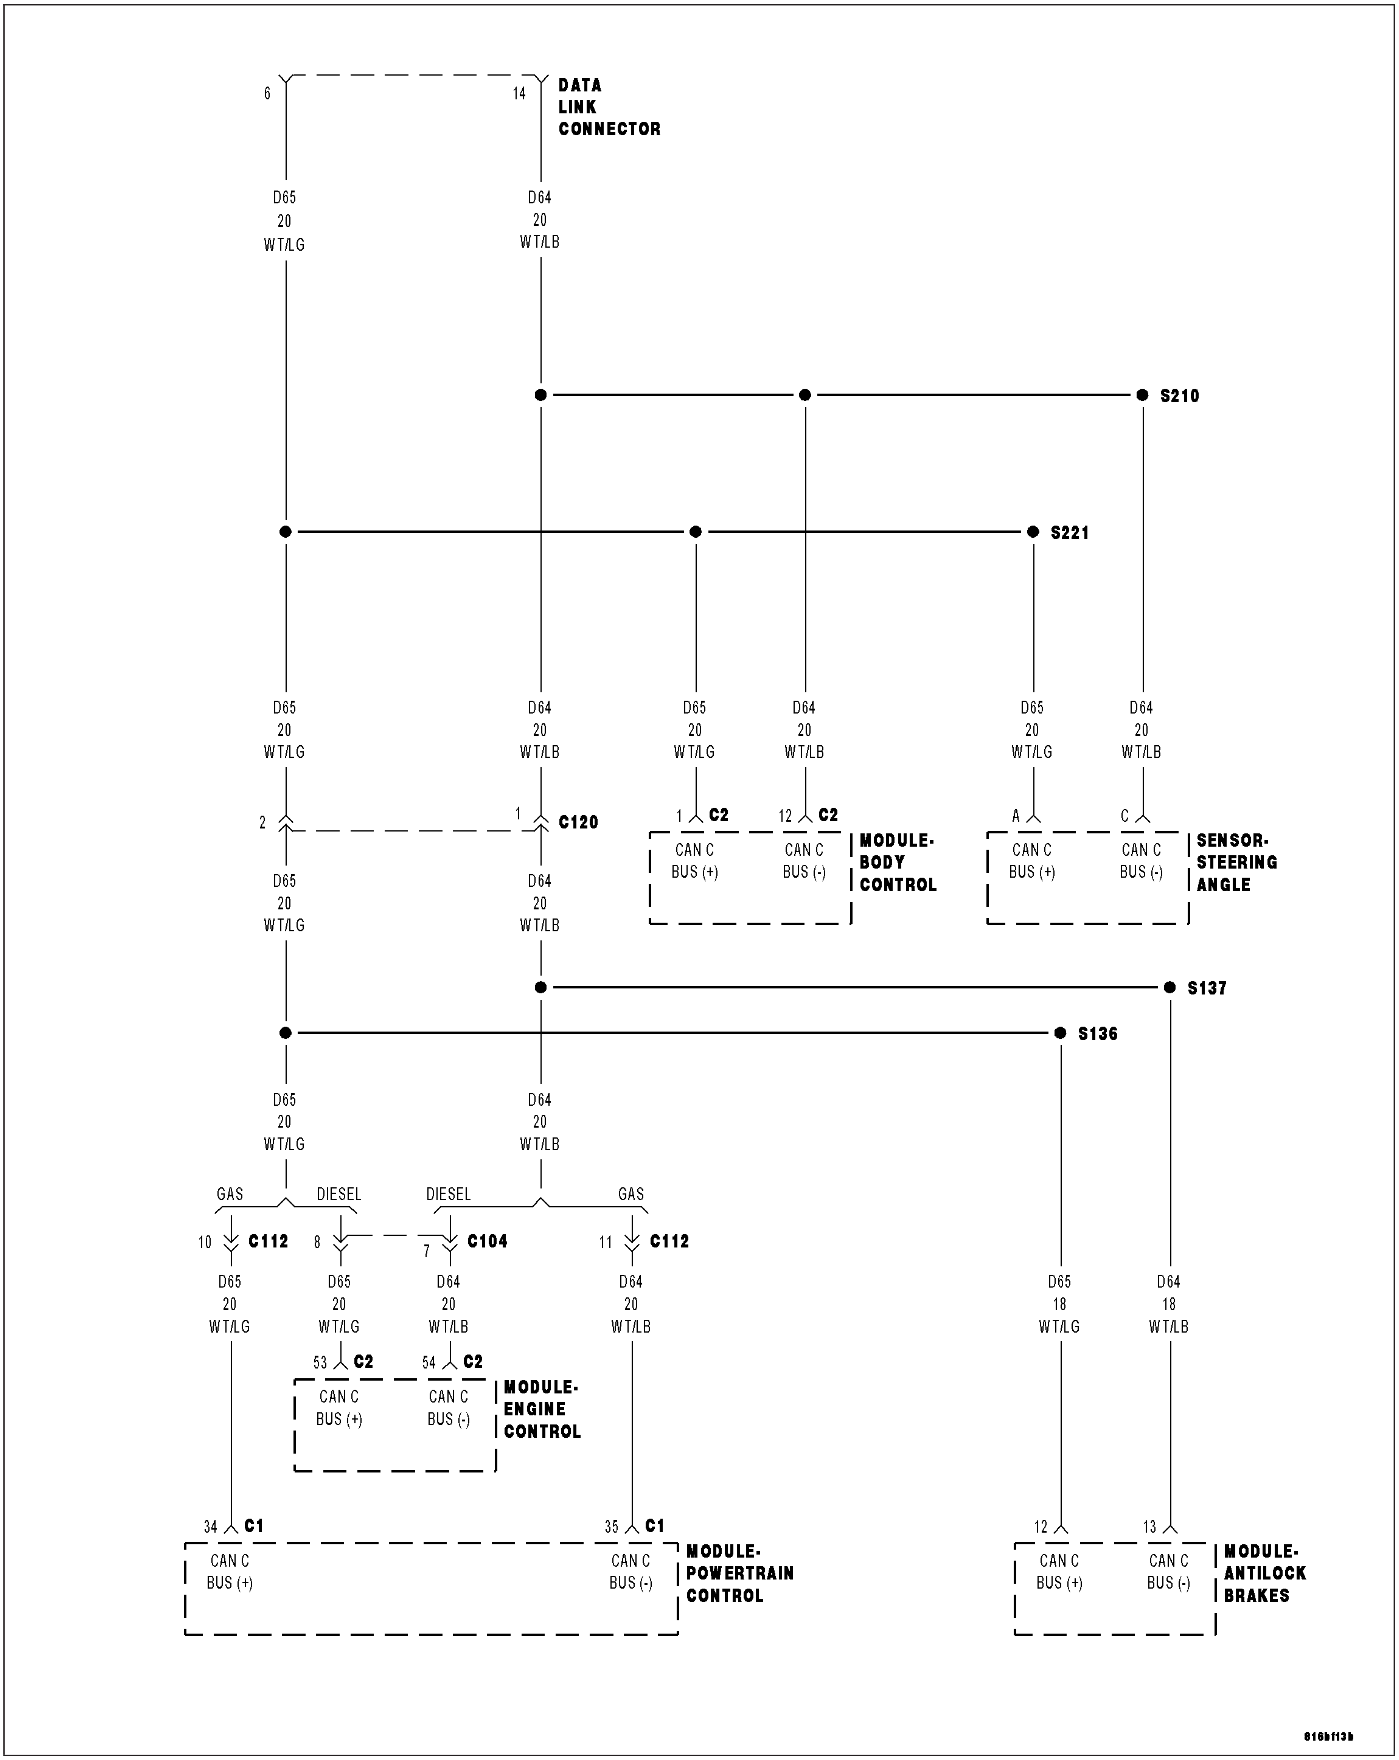
**Yes** >> Replace/update the Antilock Brake Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace/update the module that set this DTC in accordance with the service information

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR (SAS)



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  Bus messages not received from the SAS (steering angle sensor) for approximately 500ms.

| Possible Causes |
|---|
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| STEERING ANGLE SENSOR |
| STEERING ANGLE SENSOR POWER AND GROUND |
| MODULE THAT SET THIS DTC |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**
Turn the ignition on.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

**No** >> Go To 3

### 3. VERIFY THAT THE SAS IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the SAS is active on the bus.

**Is the SAS active on the bus?**

**Yes** >> Go To 4

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

## 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs "Logged Against" the SAS?**

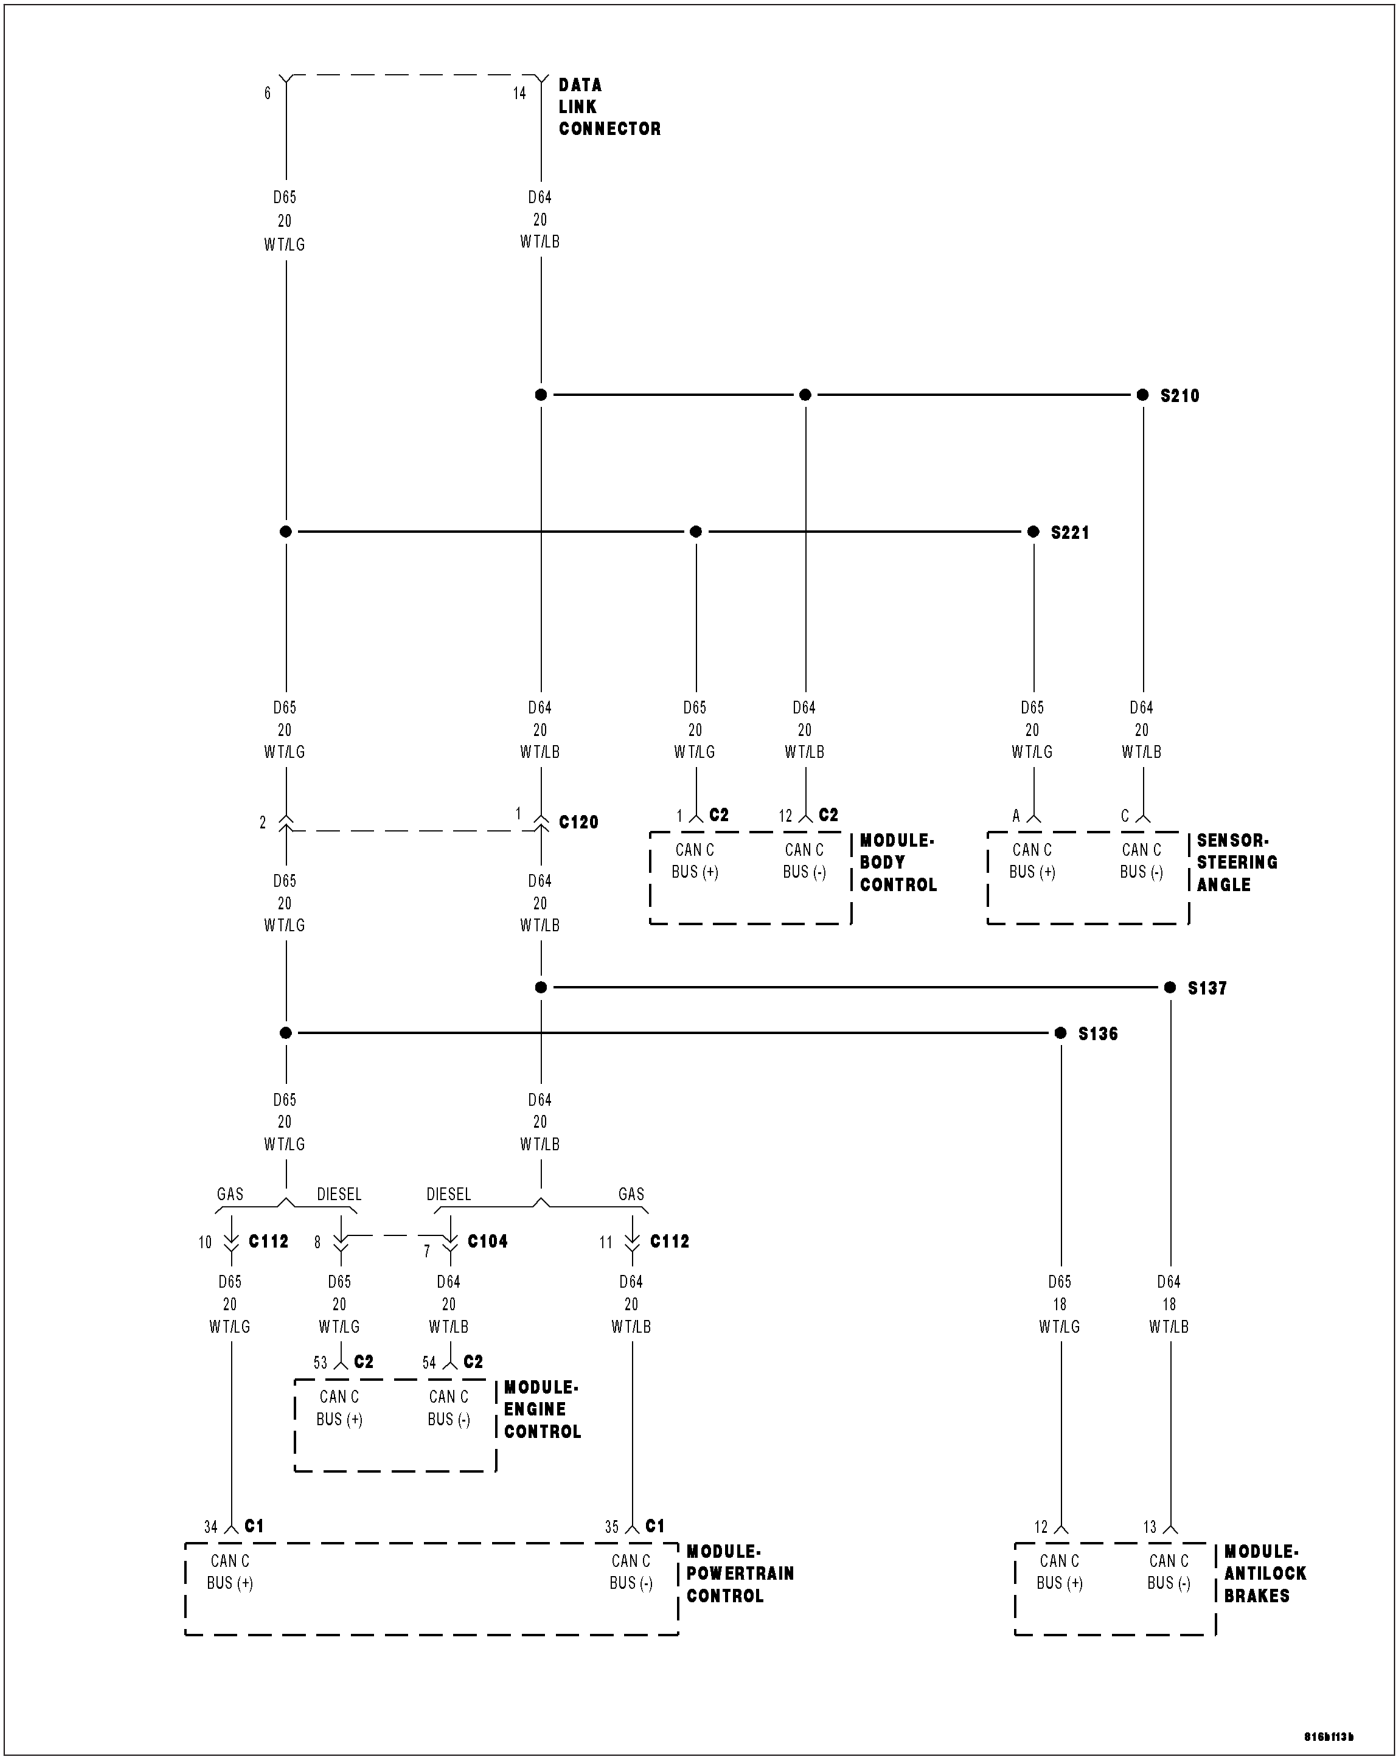
**Yes** >> Replace/update the Steering Angle Sensor (internal to the clockspring) in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace/update the module that set this DTC in accordance with the service information

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## U110A-LOST COMMUNICATION WITH SCCM - CAN C (STEERING ANGLE SENSOR)



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
    - With the ignition on
    - Battery voltage between 10 and 16 volts
    - IOD fuse installed
- **Set Condition:**
  Bus messages not received from the SAS (steering angle sensor) for approximately 500ms.

| Possible Causes |
| --- |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| STEERING ANGLE SENSOR |
| STEERING ANGLE SENSOR POWER AND GROUND |
| MODULE THAT SET THIS DTC |

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**
Turn the ignition on.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Perform the Stored Lost Communication test procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all CAN C Bus modules.

**NOTE: Check for CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.**

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

**No** >> Go To 3

### 3. VERIFY THAT THE SAS IS ACTIVE ON THE BUS

With the scan tool, select ECU View.

Verify that the SAS is active on the bus.

**Is the SAS active on the bus?**

**Yes** >> Go To 4

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

### 4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network View and select Advanced.

**Is there more than one module with active DTCs “Logged Against” the SAS?**

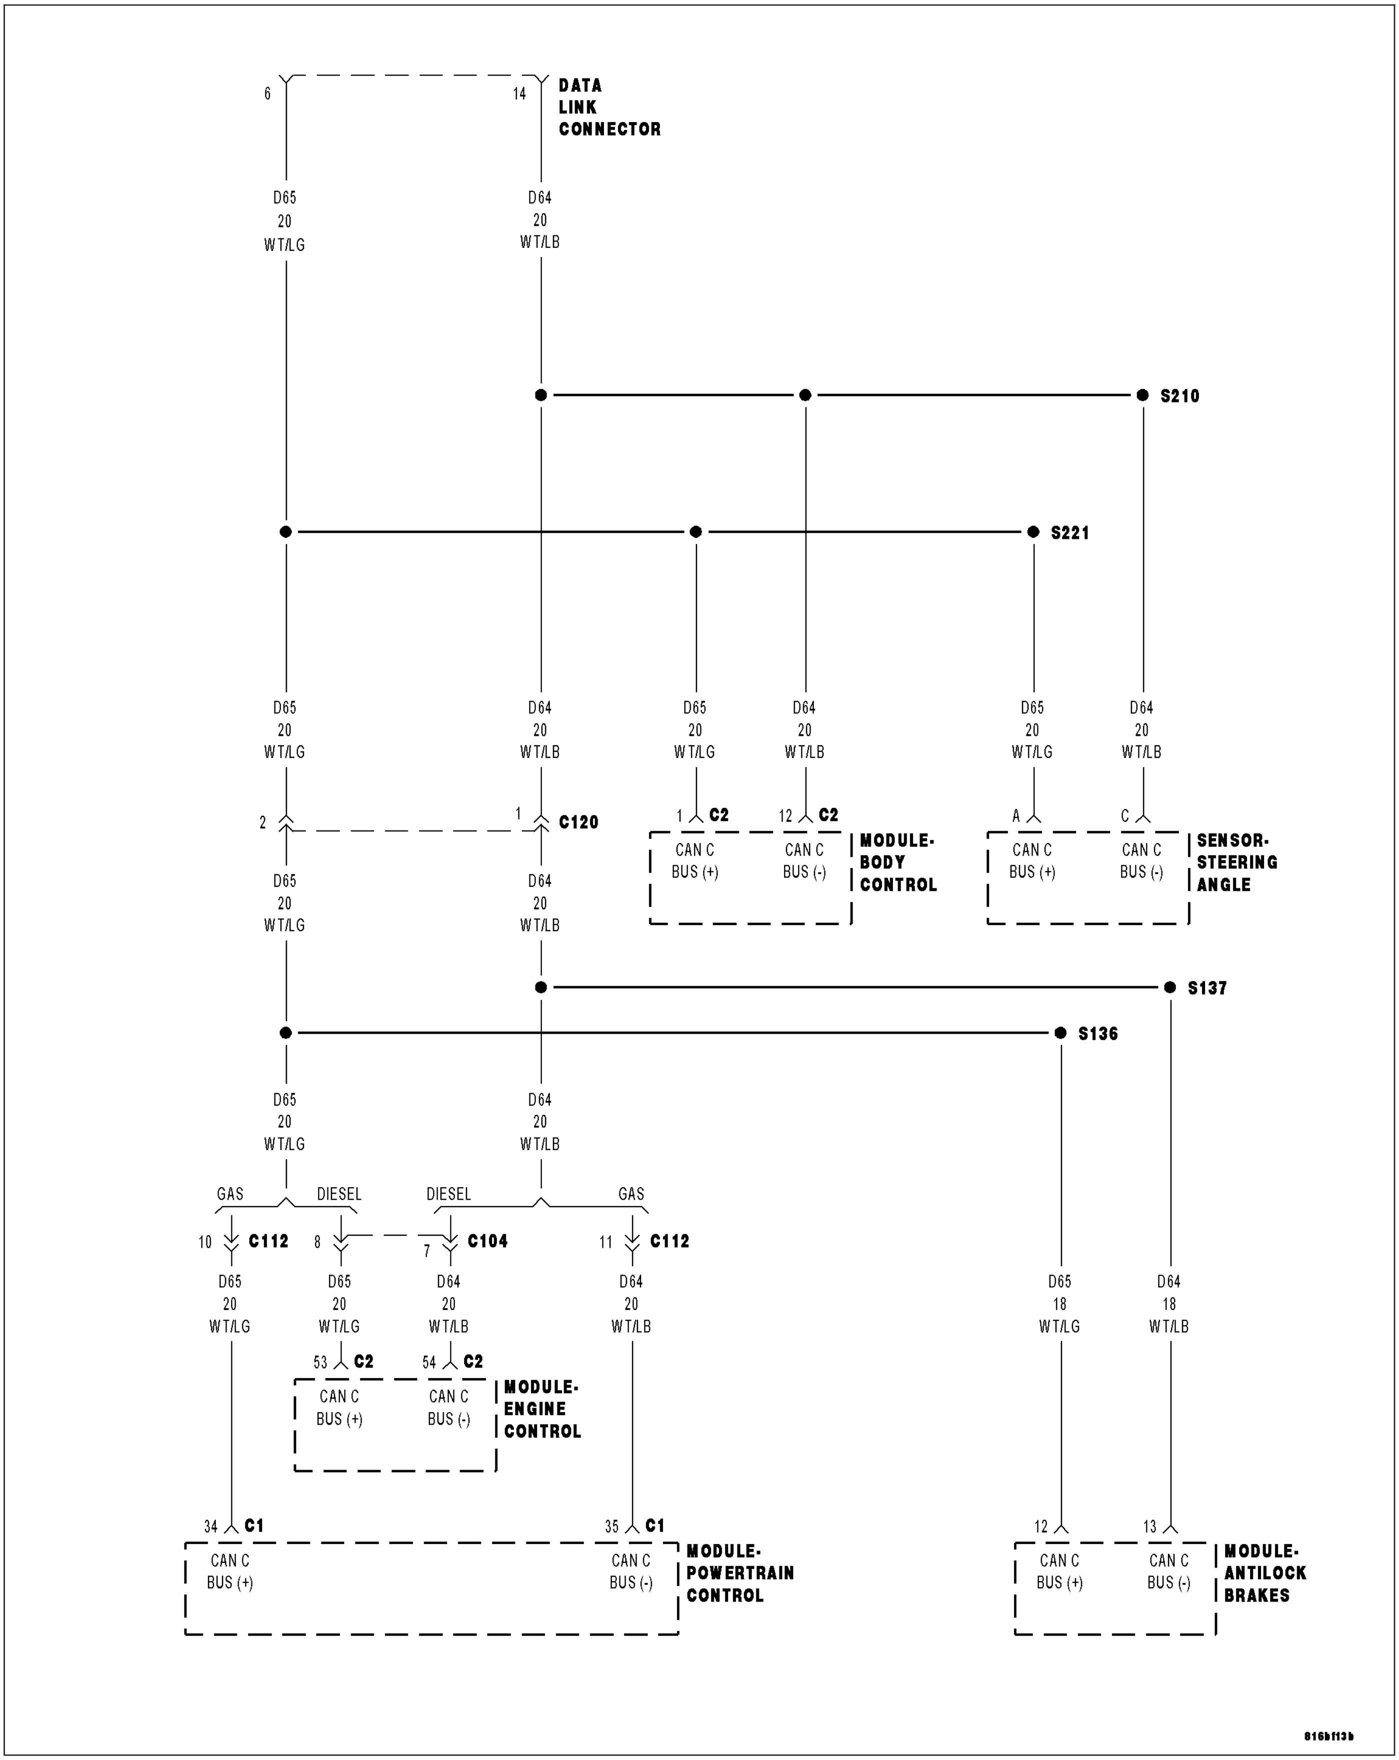
**Yes** >> Replace/update the Steering Angle Sensor (internal to the clockspring) in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace/update the module that set this DTC in accordance with the service information

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *STORED LOST COMMUNICATION DTCS



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
    - With the ignition on
    - Battery voltage between 10 and 16 volts
    - IOD fuse installed
- **Set Condition:**
  Bus messages not received from for approximately 500ms.

| Possible Causes |
|---|
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES |
| POWER OR GROUND FROM THE REPORTING MODULE |
| MODULE THAT SET THIS DTC |
| PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT) |
| LOW BATTERY/JUMP START CONDITION |
| IOD FUSE WAS REMOVED DURING SHIPPING |
| CHECK FOR RELATED TSBS |

## Diagnostic Test

### 1. VERIFY DTC IS STORED

**NOTE: Stored faults may indicate a customer perceived intermittent condition.**

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

Turn the ignition on.

With the scan tool, read stored DTCs.

**Is this DTC stored?**

**Yes** >> Go To 2

**No** >> Diagnose the active DTC. Refer to the table of contents for a list of the symptoms.

### 2. CHECK THE ENVIRONMENTAL DATA

With the scan tool, read the loss of communication environmental data.

**Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are their any stored CAN C hardware electrical, battery, ignition voltage, VIN missing/mismatch DTCs present which match environmental data?**

**Yes** >> These DTCs may have been the result of other service procedures performed. Clear DTCs.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. VERIFY INTERMITTENT LOST COMMUNICATION DTC-WIRING CONCERNS

With the scan tool, select Network View and select Advanced.

**Is there more than one ECU with stored DTCs “Logged Against” the module and one or more lost communication DTCs stored in the offending module?**

**Yes** >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

**No** >> Go To 4

## 4. VERIFY INTERMITTENT LOST COMMUNICATION DTC-OFFENDING MODULE

With the scan tool, select Network View and select Advanced.

**Is there more than one ECU with stored DTCs “Logged Against” the module and NO lost communication DTCs stored in the offending module?**

**Yes** >> Check for a TSB related to this offending module.

**No** >> Go To 5

## 5. VERIFY INTERMITTENT LOST COMMUNICATION DTC-REPORTING MODULE

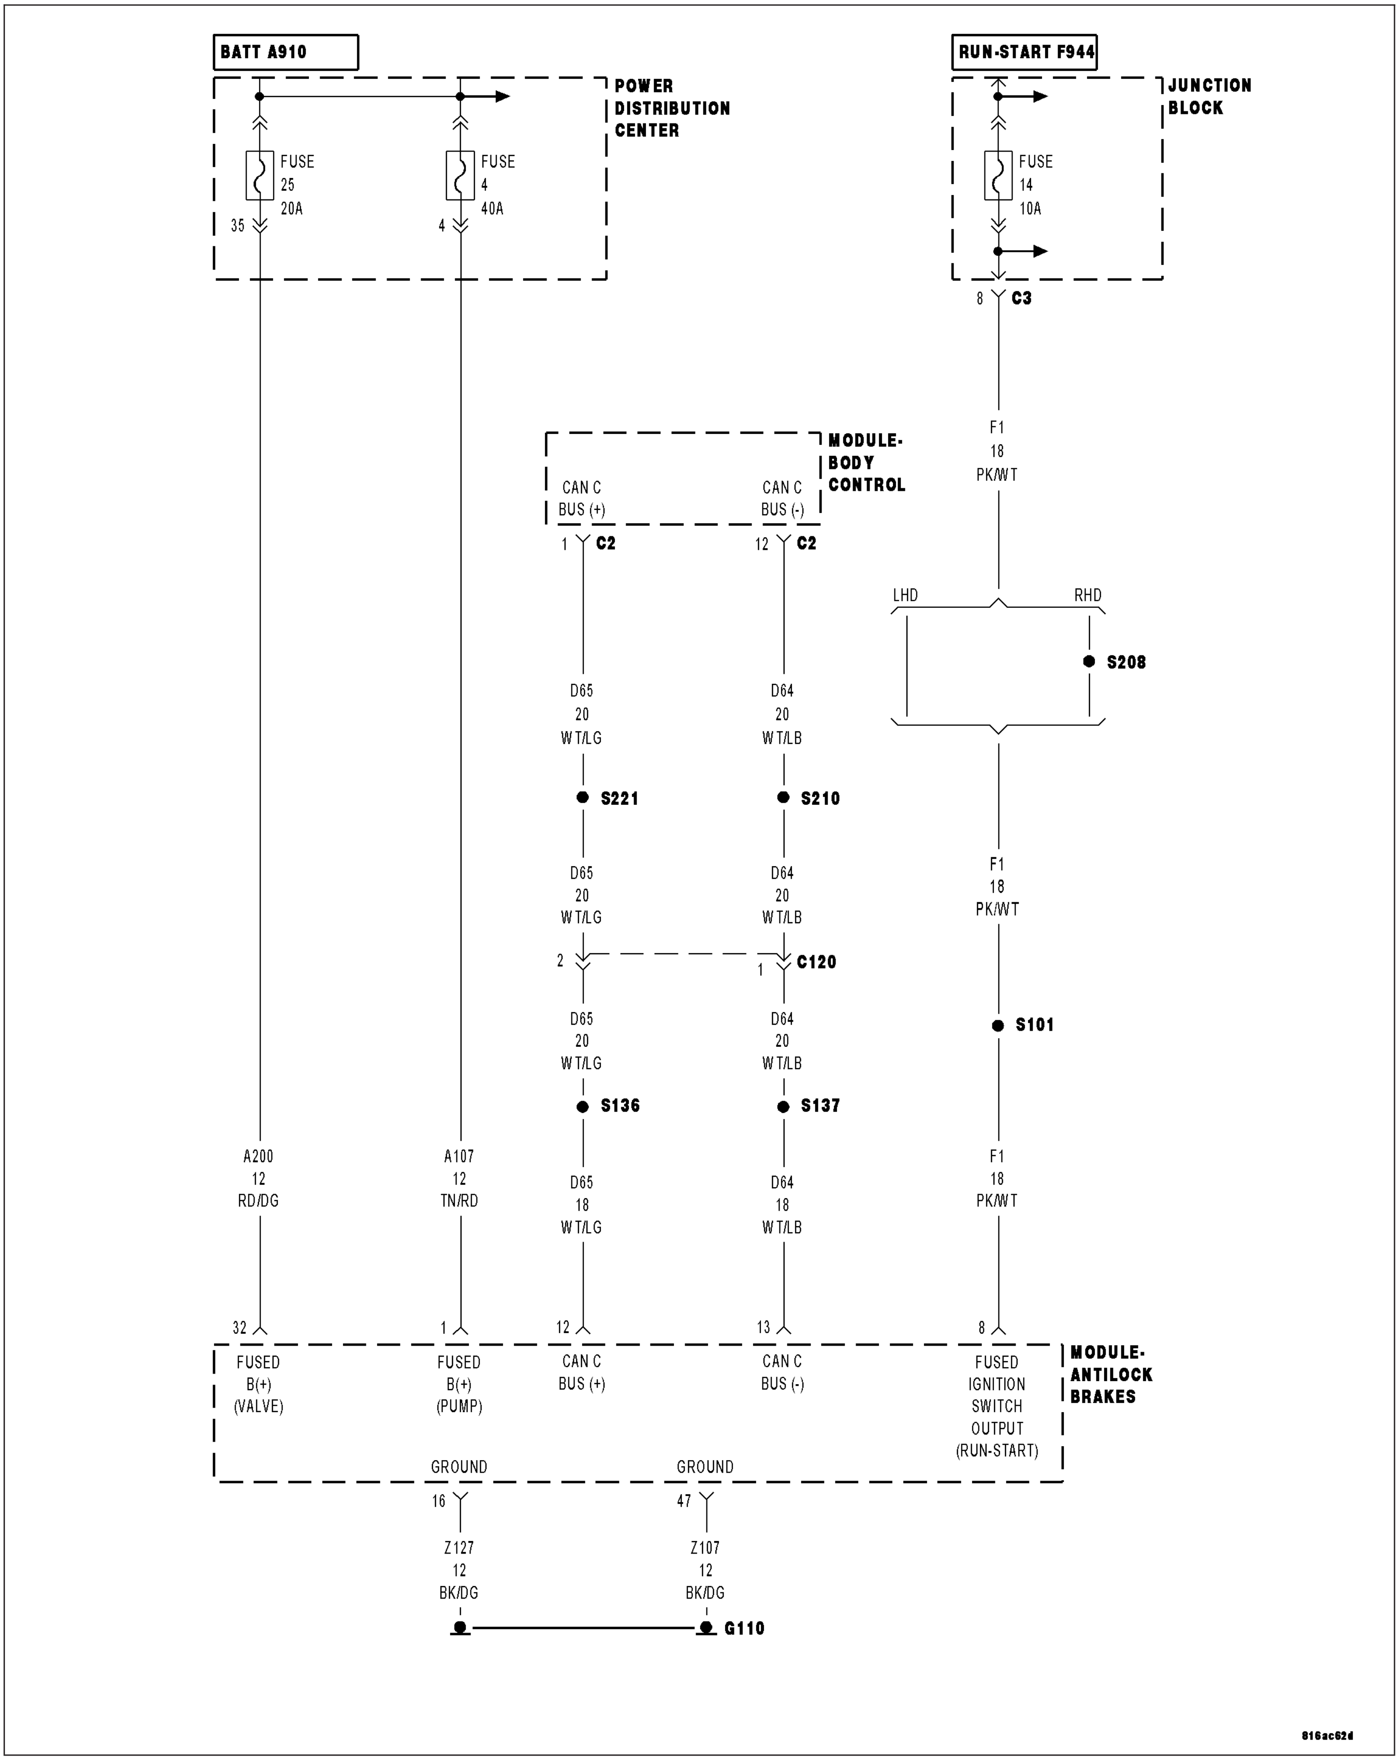
With the scan tool, select Network View and select Advanced.

**Is there ONLY ONE ECU with stored DTCs “Logged Against” the module?**

**Yes** >> Check for a TSB related to the module that set this DTC.

**No** >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

## *NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE)



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (A107) (A200) FUSED B(+) CIRCUIT OPEN OR SHORTED |
| (Z107) (Z127) GROUND CIRCUIT OPEN |
| (F1) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED |
| (D65) CAN C BUS (+) CIRCUIT OPEN |
| (D64) CAN C BUS (-) CIRCUIT OPEN |
| ANTILOCK BRAKE MODULE |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

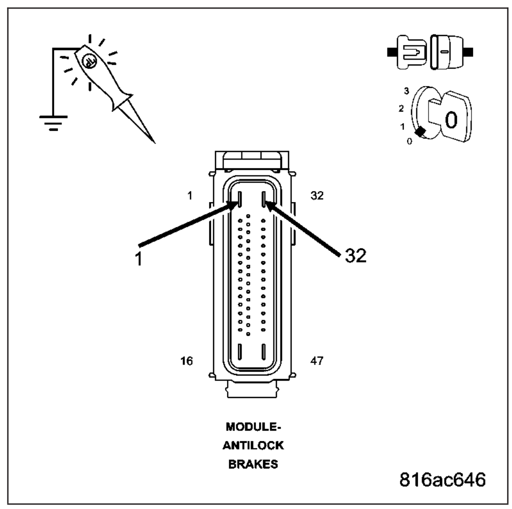
**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (A107) (A200) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Using a 12-volt test light connected to ground, check each (A107) and (A200) Fused B(+) circuit.



**Does the test light illuminate brightly for each circuit?**

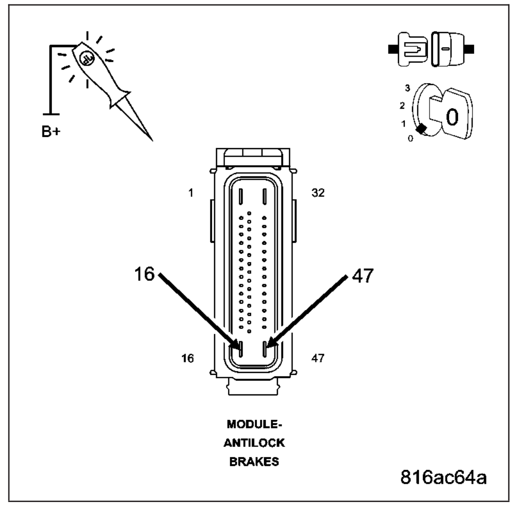
**Yes** >> Go To 3

**No** >> Repair the (A107) or (A200) Fused B(+) circuit for an open or short.

Perform ABS VERIFICATION TEST - VER 1.

## 3. (Z107) (Z127) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z107) and (Z127) ground circuit.



**Does the test light illuminate brightly for each circuit?**

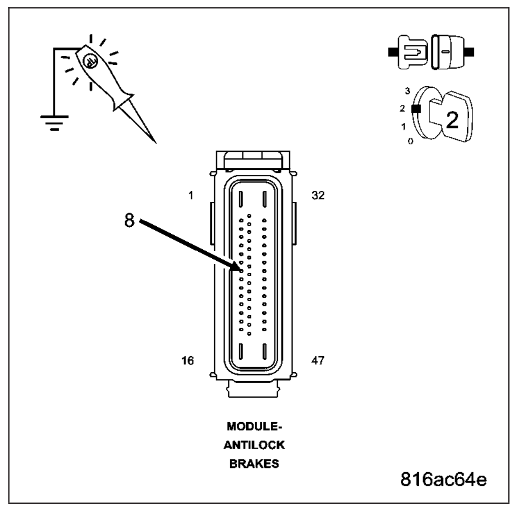
**Yes** >> Go To 4

**No** >> Repair the (Z107) or (Z127) ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

## 4. (F1) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F1) Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F1) Fused Ignition Switch Output circuit for an open or short.
Perform ABS VERIFICATION TEST - VER 1.

## 5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

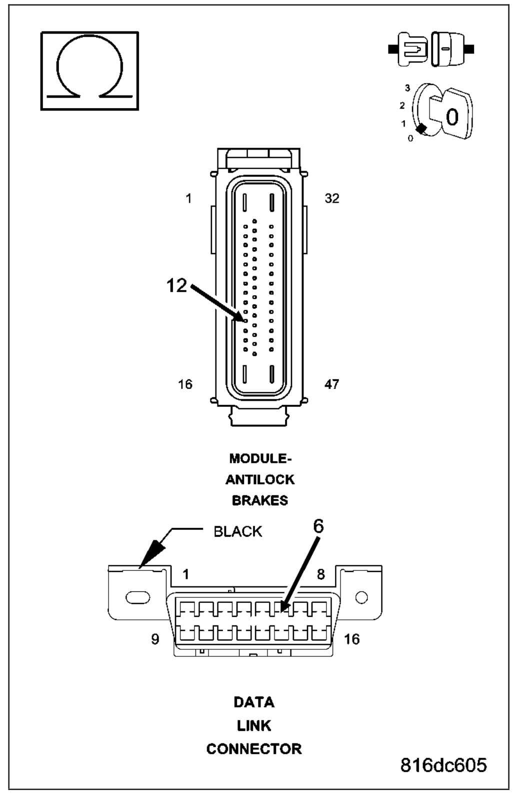
Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the DLC connector and the Antilock Brake Module connector.

**Is resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (D65) CAN C Bus (+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.



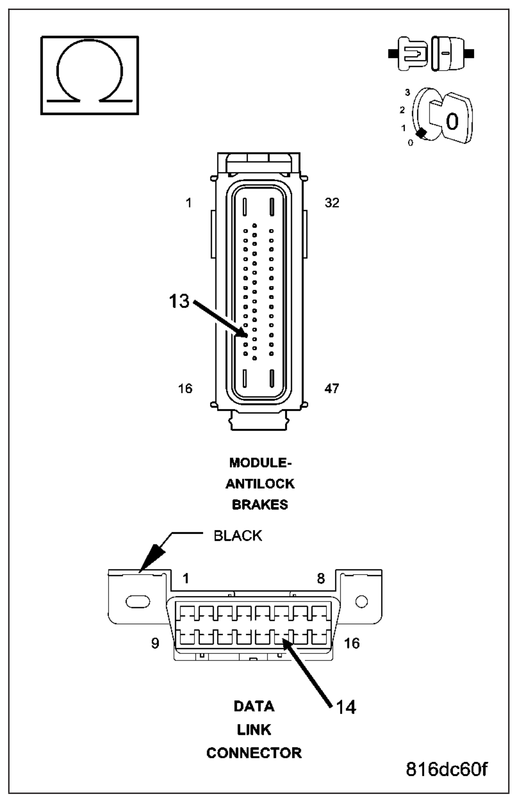
## 6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the DLC connector and the Antilock Brake Module connector.

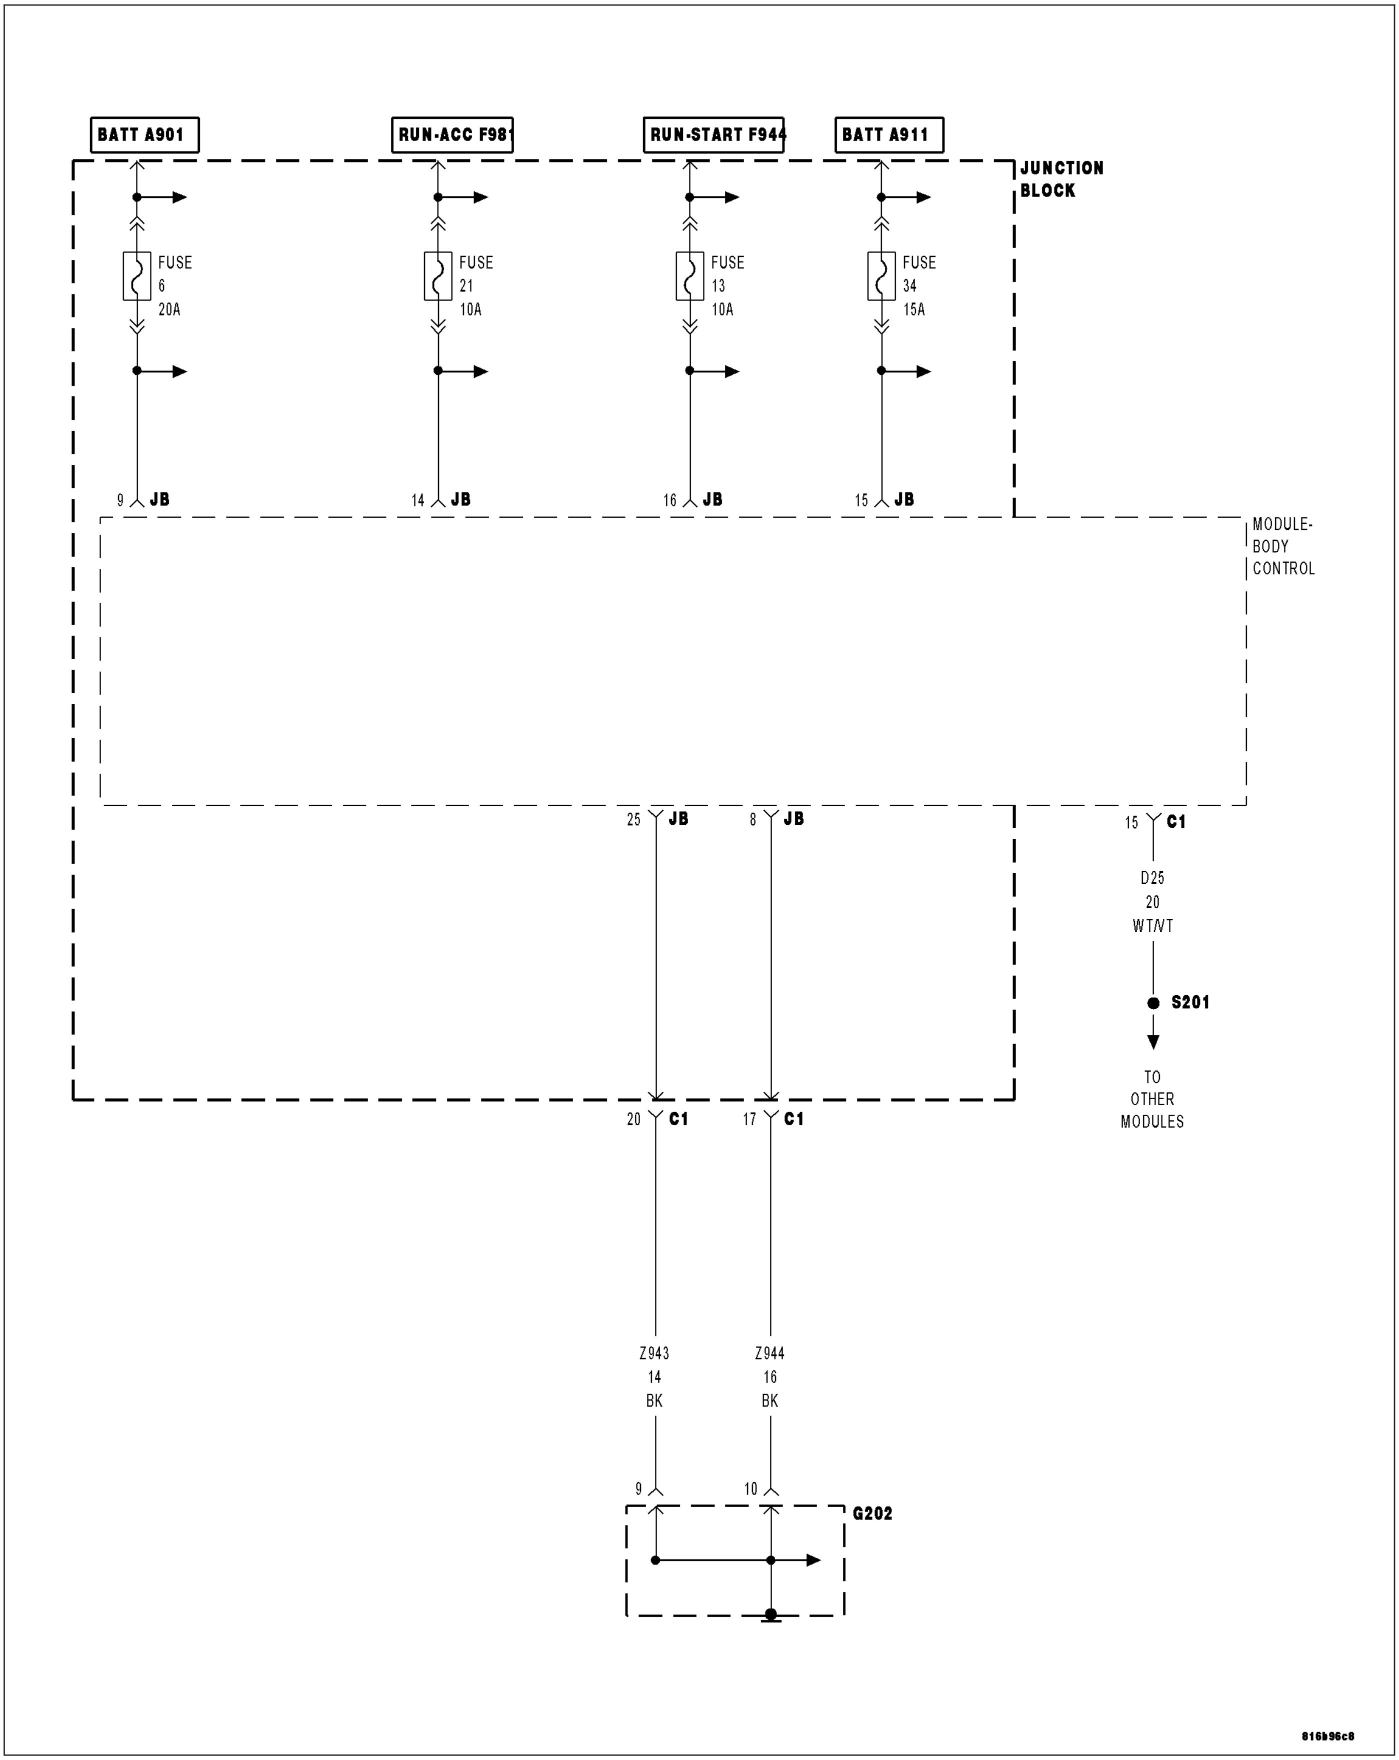
**Is resistance below 5.0 ohms?**

**Yes** >> Replace the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.



## *NO RESPONSE FROM BODY CONTROL MODULE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (Z943) (Z944) GROUND CIRCUIT OPEN |
| (A213) (A908) FUSED B(+) CIRCUIT OPEN |
| (F98) (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. PCI BUS COMMUNICATION AND TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**
With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (Z943) (Z944) GROUND CIRCUIT OPEN

Turn the ignition off.

Remove the Body Control Module from the Junction Block.

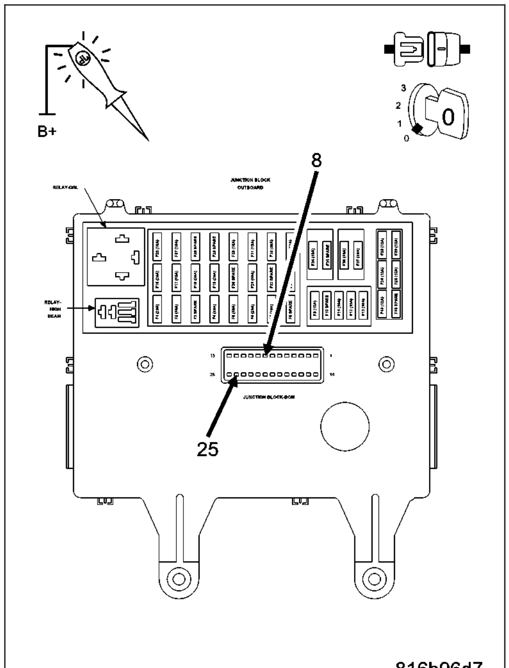
Using a 12-volt test light connected to 12-volts, probe each (Z943) and (Z944) ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 3

**No** >> Repair the appropriate ground circuit for an open between the Junction Block and the common grounding point. If OK, replace the Junction Block in accordance with the service information.

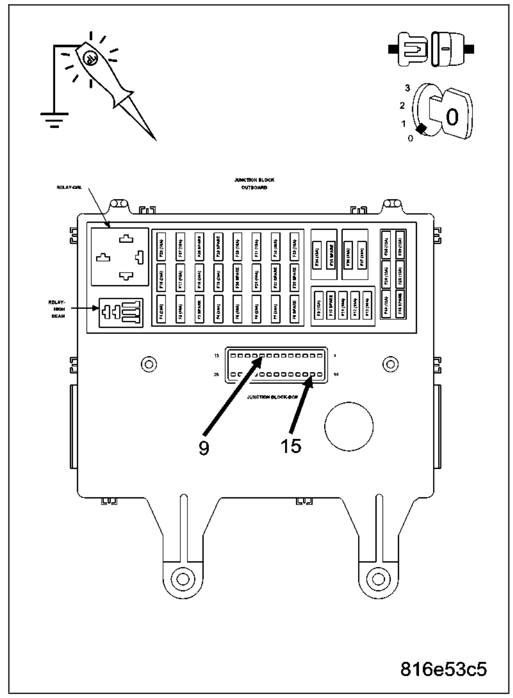
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



816b96d7

## 3. (A213) (A908) FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, probe the (A213) and (A908) Fused B(+) circuit.



**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 4

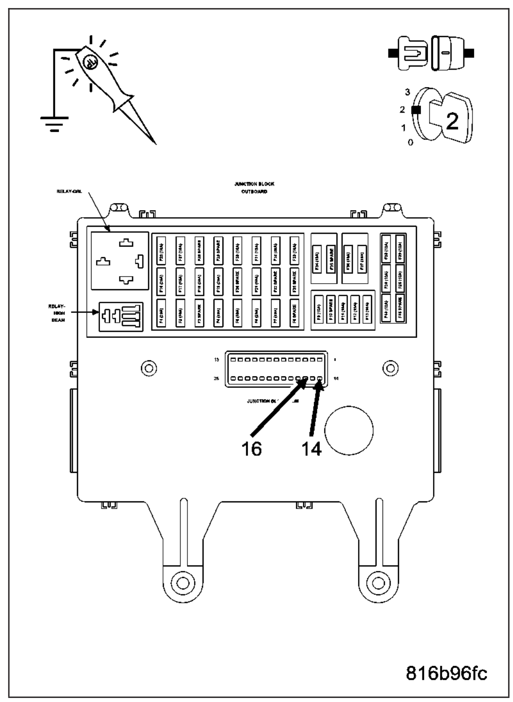
**No** >> Check all Junction Block and PDC fuses. If OK, replace the Junction Block in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. (F98) (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (F98) and (F942) Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Check all Junction Block and PDC fuses. If OK, replace the Junction Block in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

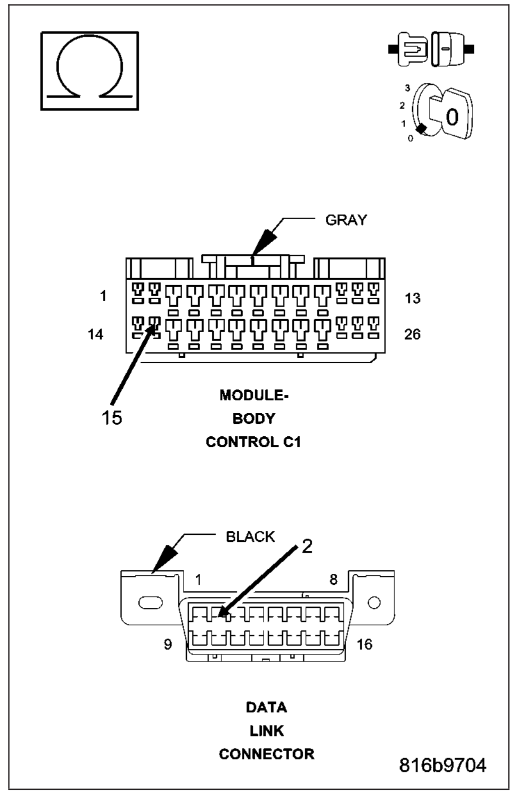
## 5. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the scan tool from the DLC connector.

Disconnect the Body Control Module C1 harness connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the Body Control Module connector.



**Is the resistance below 5.0 ohms?**

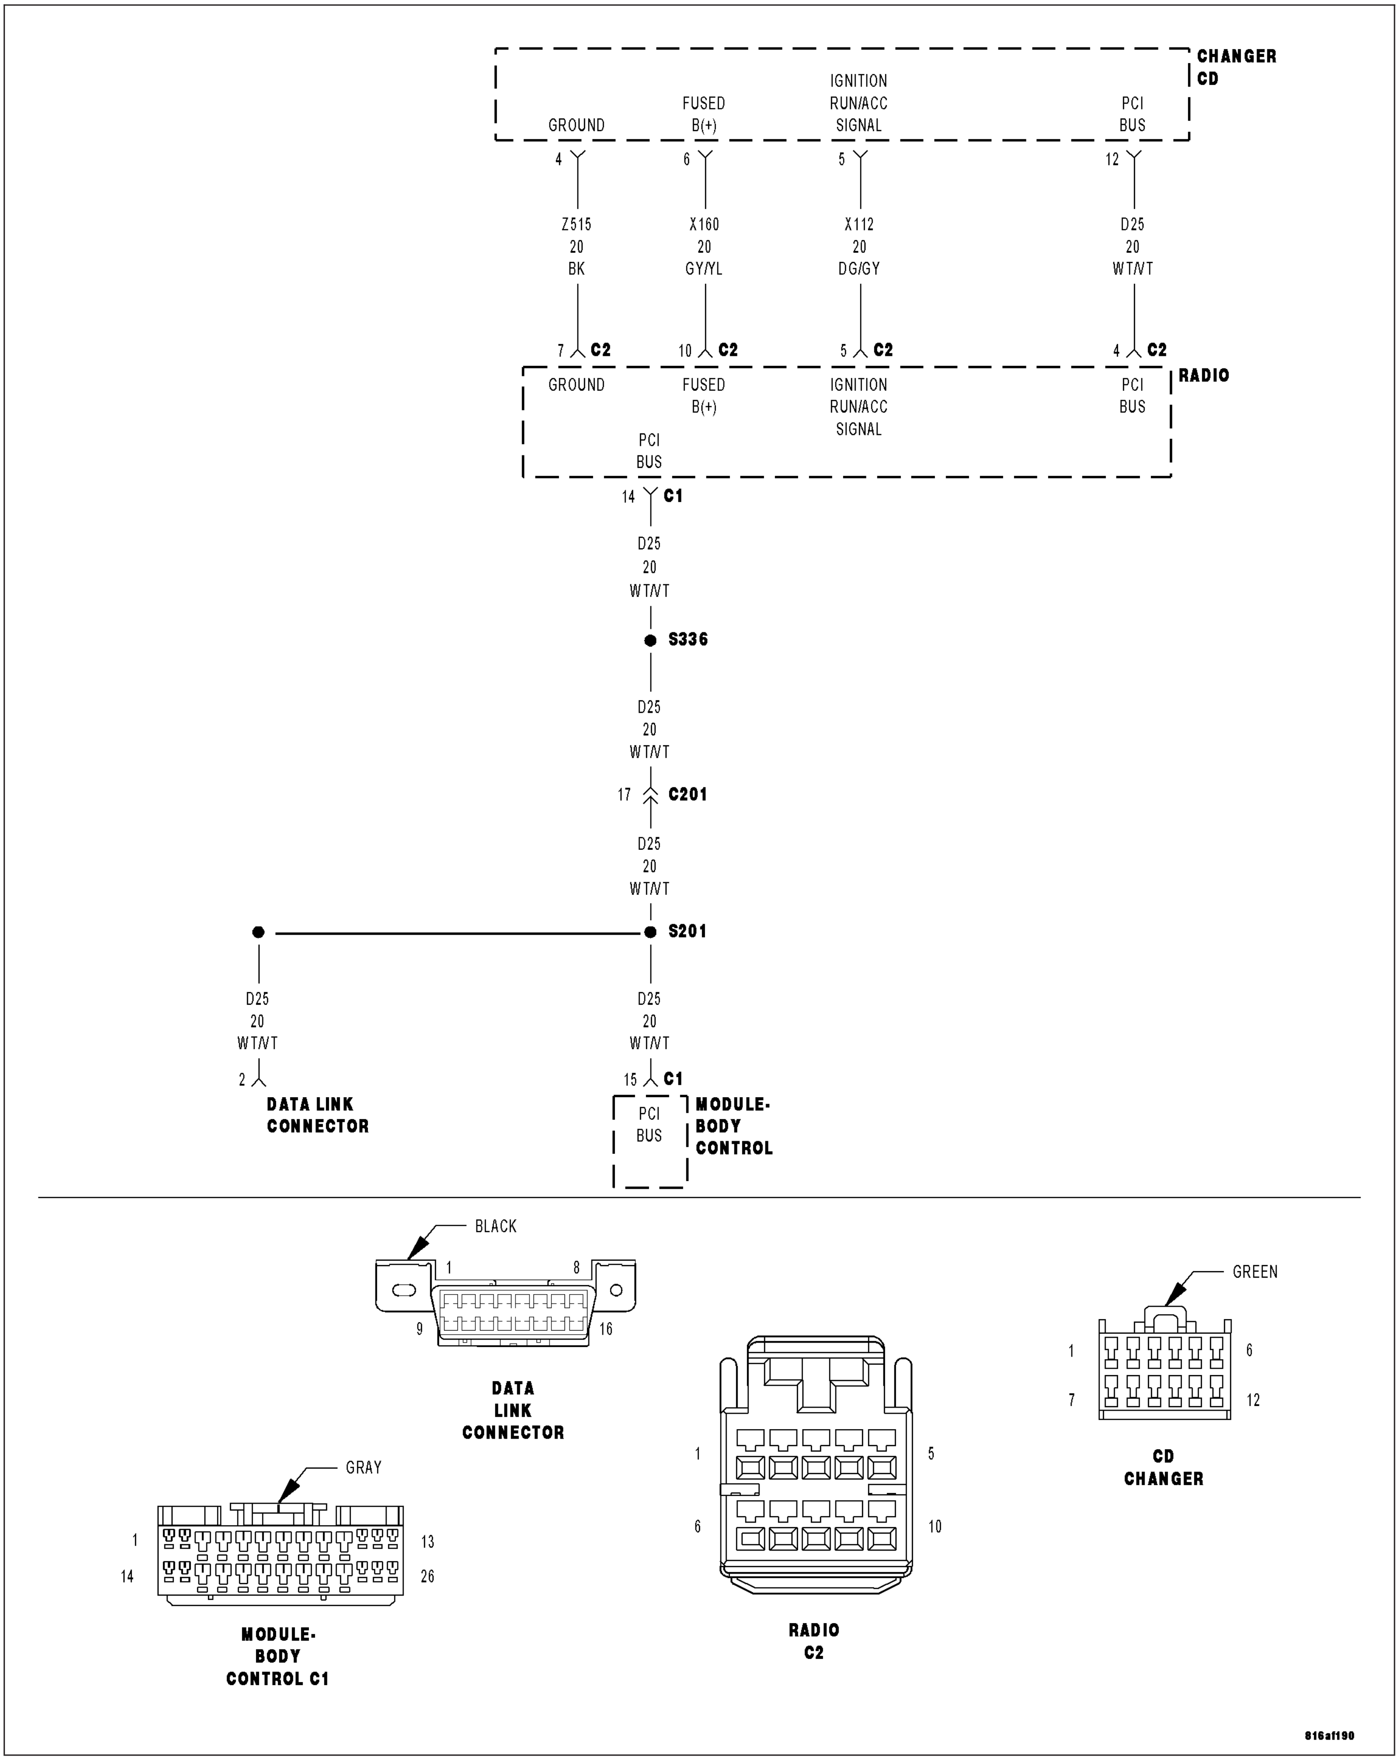
**Yes** >> Replace the Body Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (D25) PCI Bus circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## *NO RESPONSE FROM CD CHANGER



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (Z515) GROUND CIRCUIT OPEN |
| (X160) FUSED B(+) CIRCUIT OPEN |
| (X112) IGNITION RUN/ACC SIGNAL CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| RADIO |
| CD CHANGER |

## Diagnostic Test

### 1. ESTABLISH COMMUNICATION WITH RADIO ON PCI BUS

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool communicate with the radio?**

**Yes** >> Go To 2

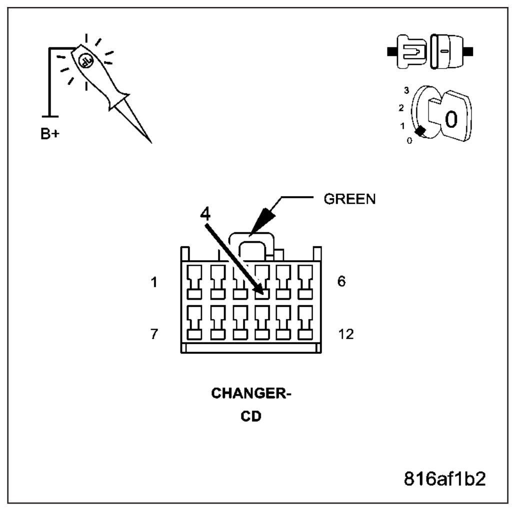
**No** >> Perform the appropriate no response test. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

### 2. (Z515) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the CD Changer harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Z515) ground circuit.



**Does the test light illuminate brightly?**

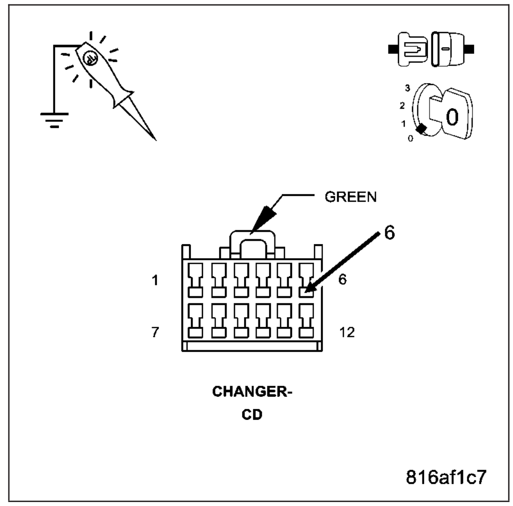
**Yes** >> Go To 3

**No** >> Repair the (Z515) Ground circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (X160) FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, probe the (X160) Fused B(+) circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 4

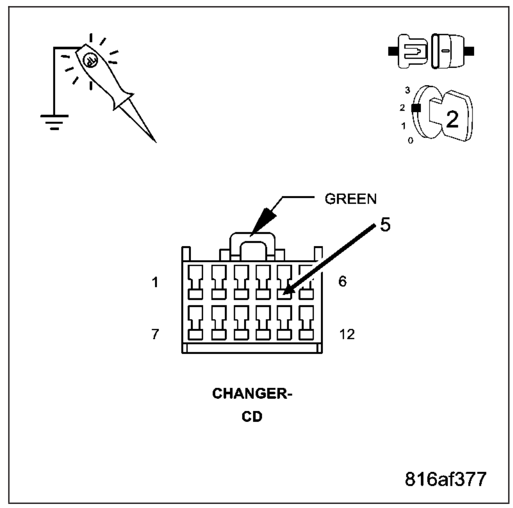
**No** >> Repair the (X160) Fused B(+) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. (X112) IGNITION RUN/ACC SIGNAL CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (X112) Ignition Run/Acc Signal circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 5

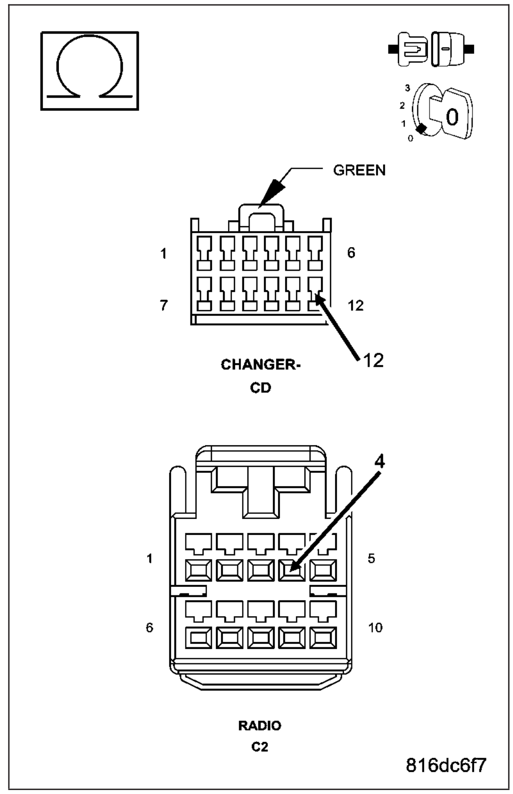
**No** >> Repair the (X112) Ignition Run/Acc Signal circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (D25) PCI Bus circuit between the Radio C2 harness connector and the CD Changer connector.



**Is the resistance below 5.0 ohms?**

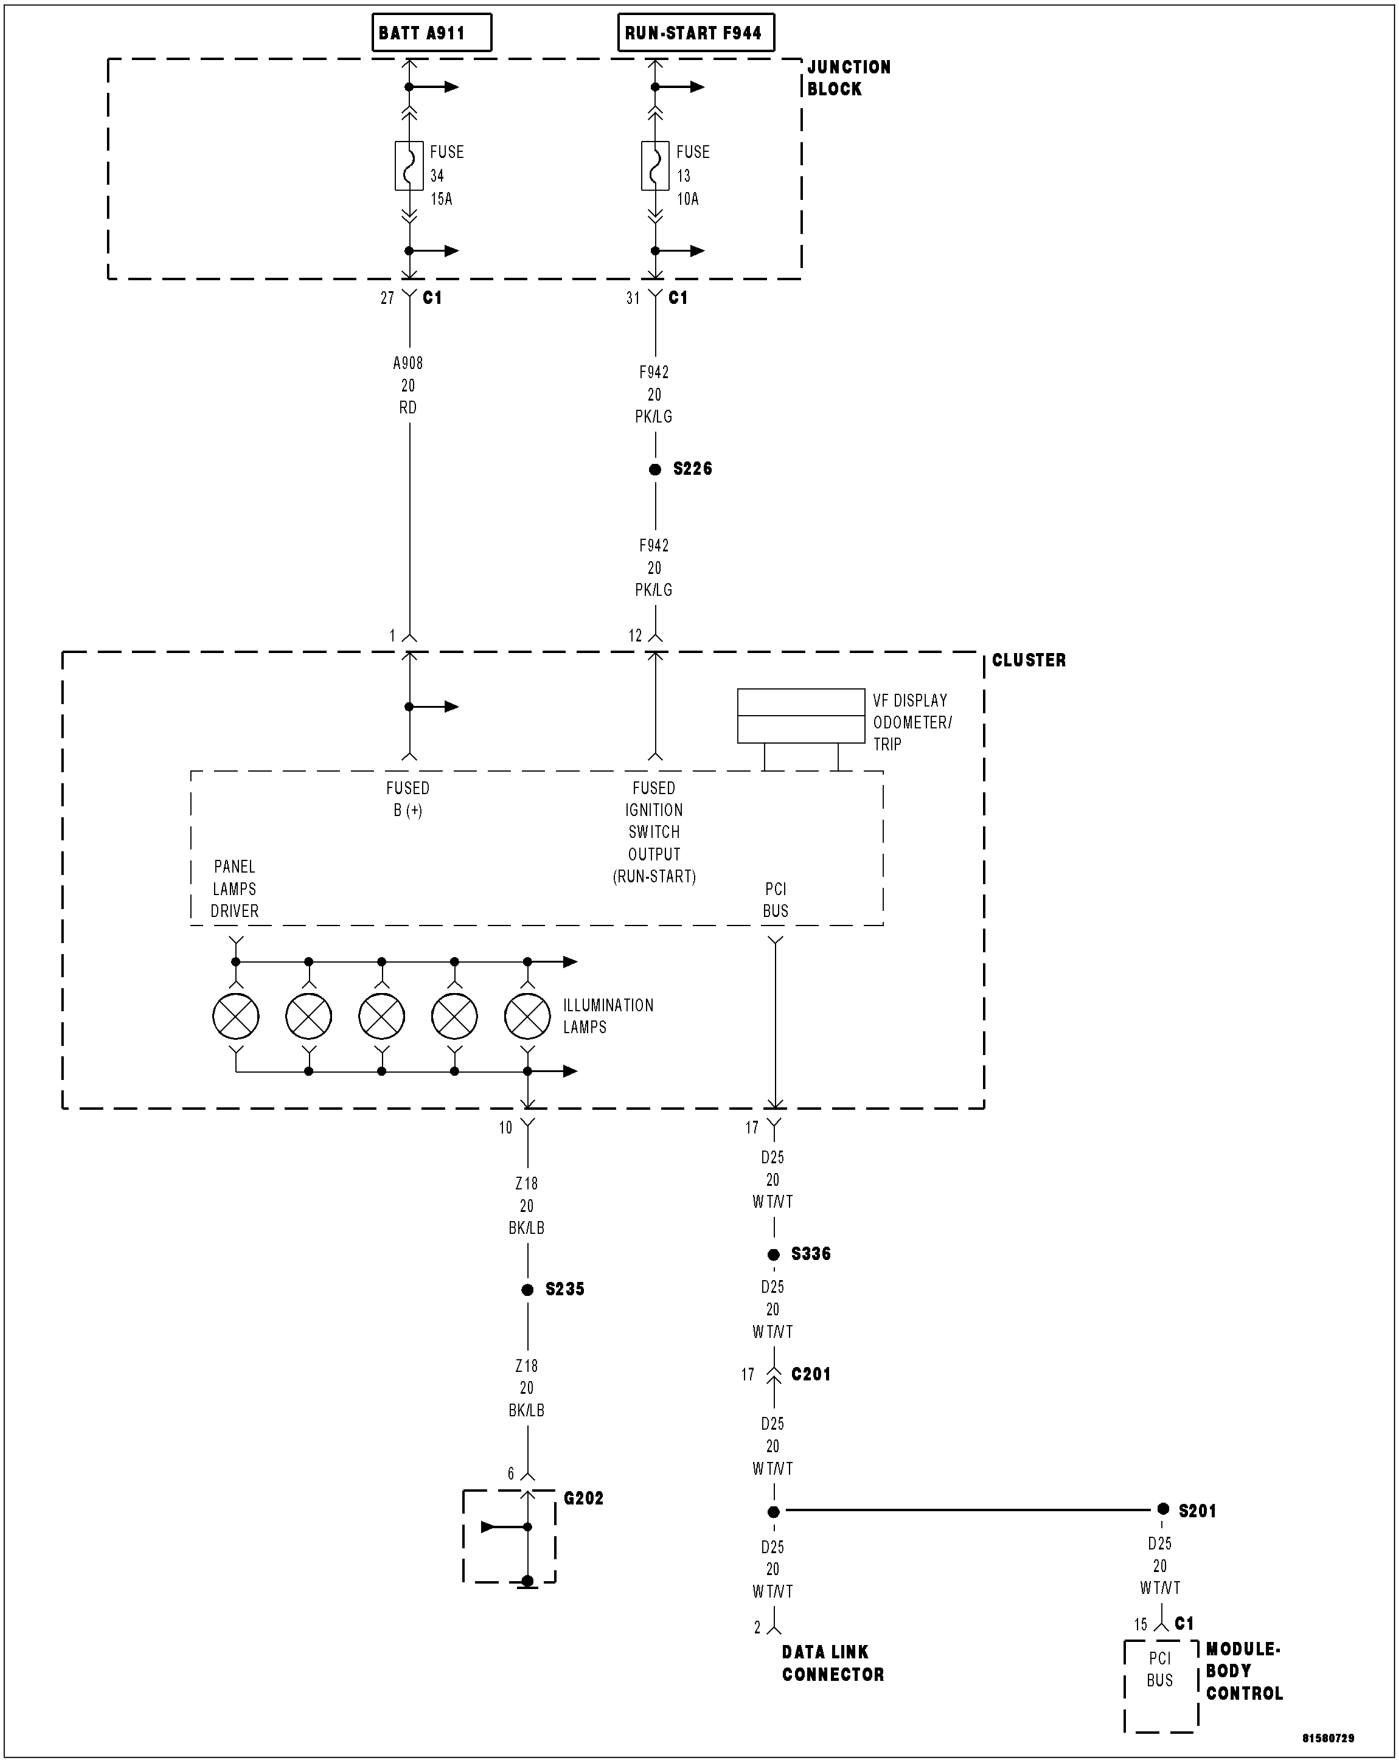
**Yes** >> Replace the CD Changer in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (D25) PCI Bus circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

# *NO RESPONSE FROM CLUSTER



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| (Z18) GROUND CIRCUIT OPEN |
| (A908) FUSED B(+) CIRCUIT OPEN |
| (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| CLUSTER |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

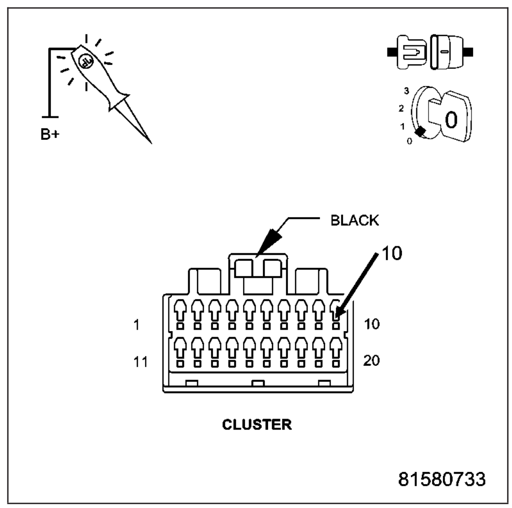
**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (Z18) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Cluster harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Z18) ground circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (Z18) Ground circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (A908) FUSED B(+) CIRCUIT OPEN

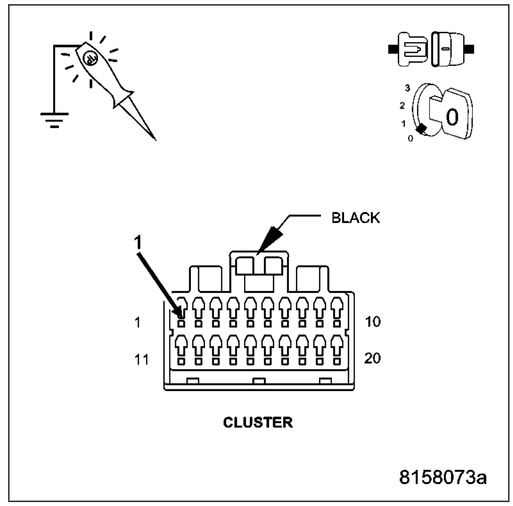
Using a 12-volt test light connected to ground, probe the (A908) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (A908) Fused B(+) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 4. (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition on.

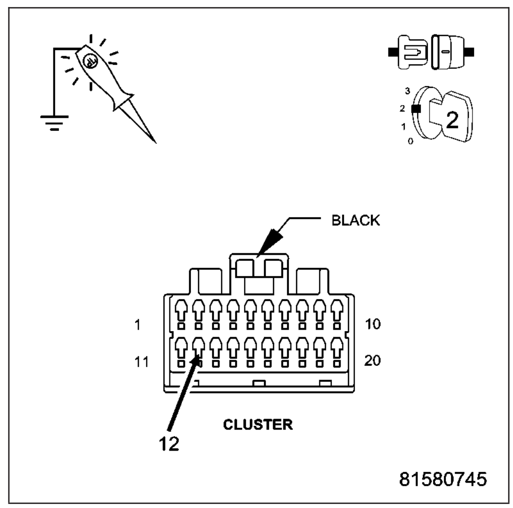
Using a 12-volt test light connected to ground, probe the (F942) Fused Ignition Switch Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F942) Fused Ignition Switch Output circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

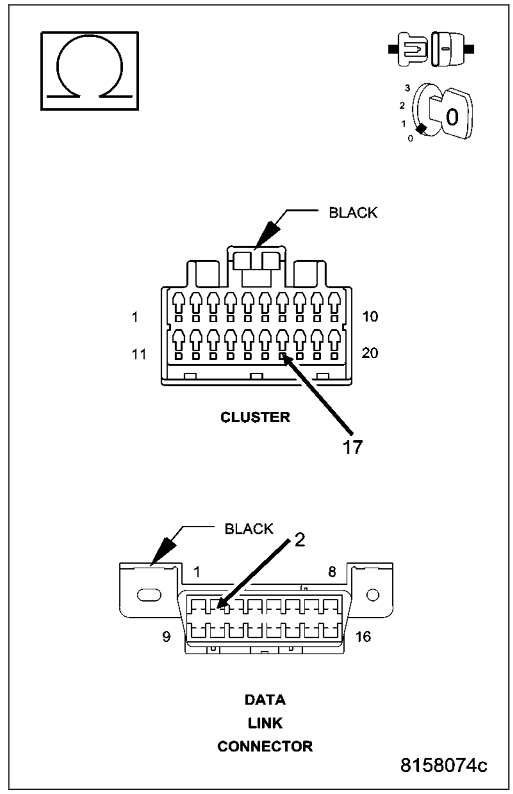


## 5. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the cluster connector.



**Is the resistance below 5.0 ohms?**

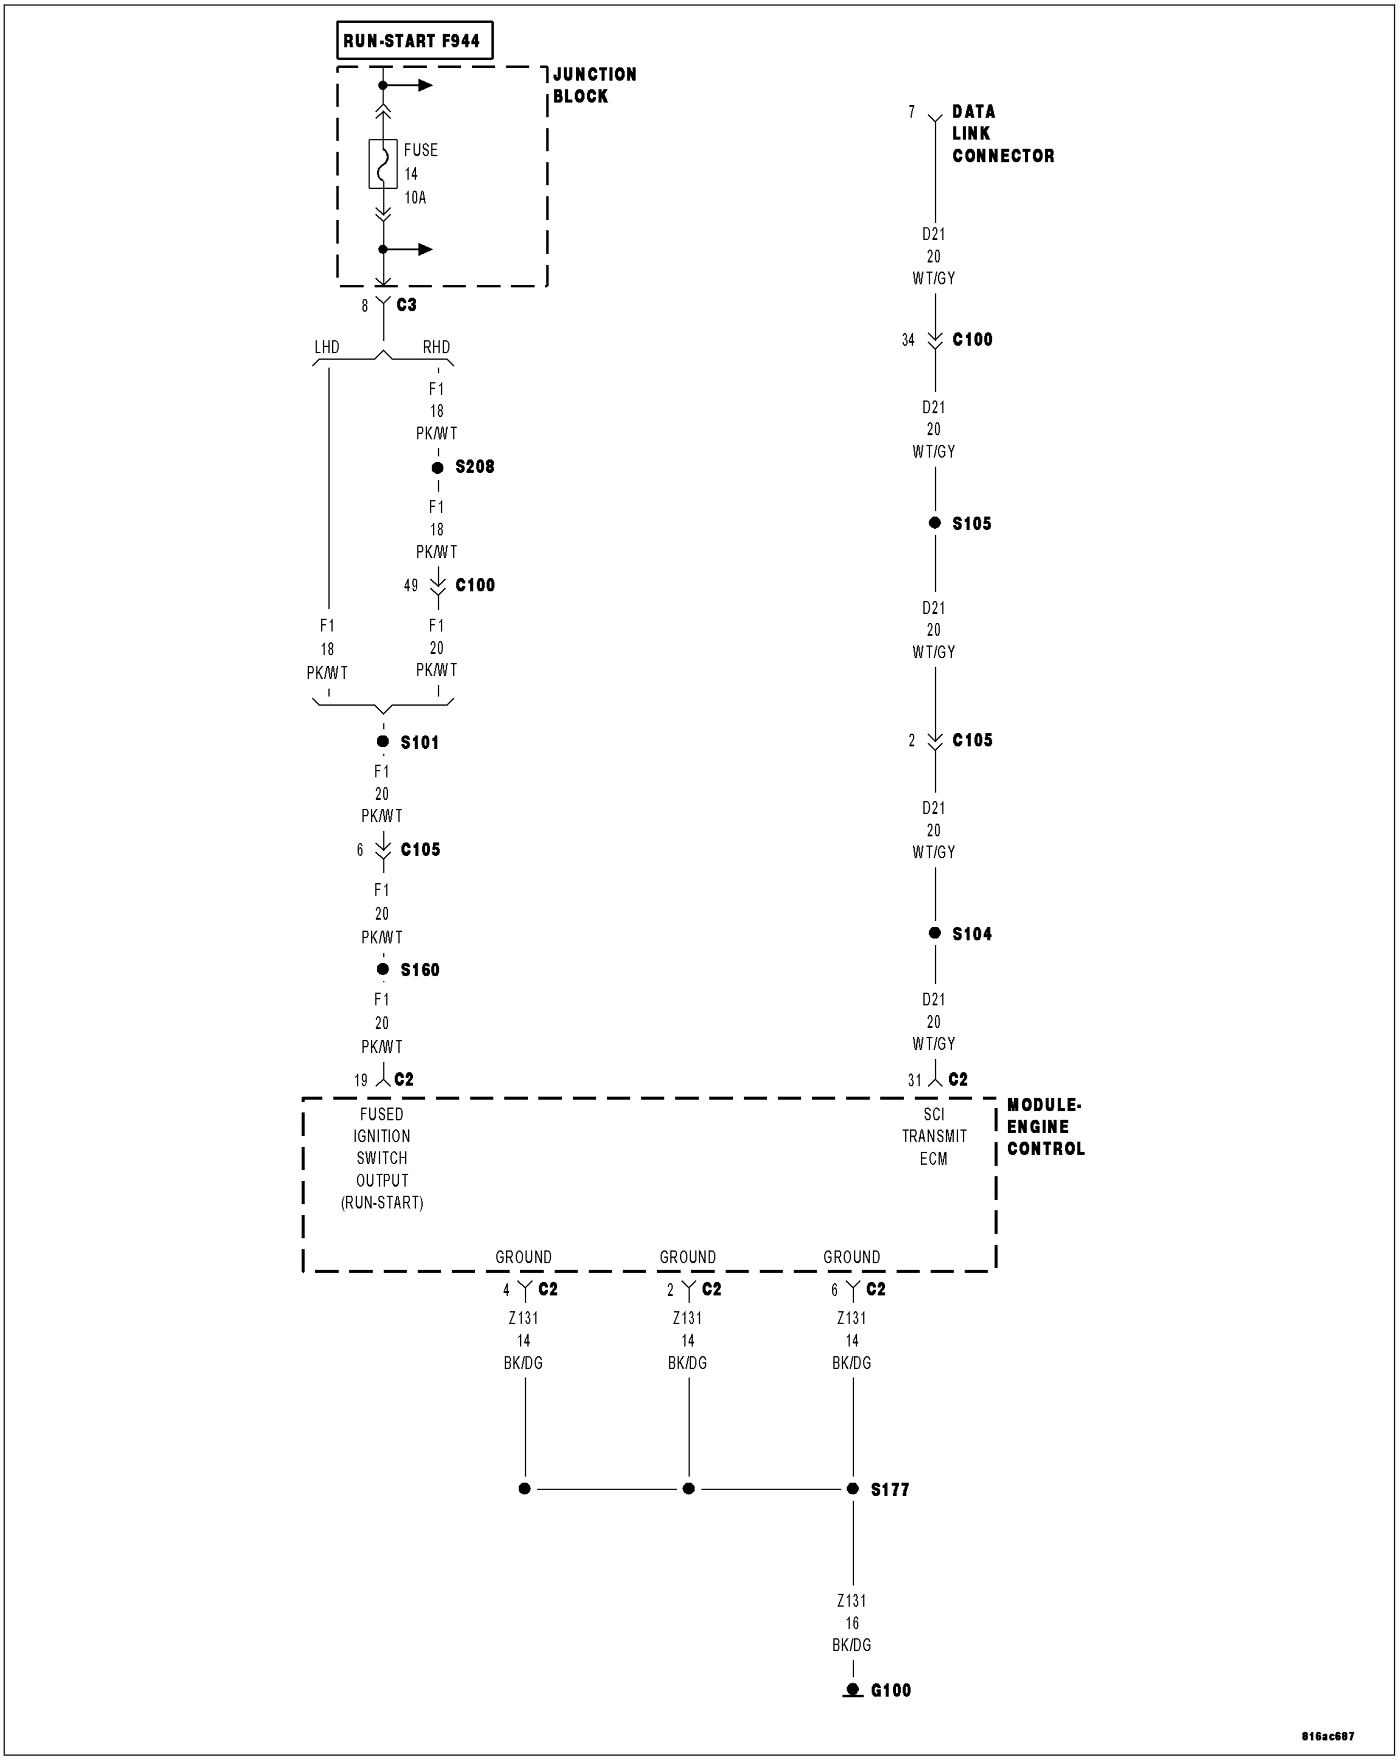
**Yes** >> Replace the Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (D25) PCI Bus circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## *NO RESPONSE FROM ECM (ENGINE CONTROL MODULE) - DIESEL



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| ENGINE CONTROL MODULE POWER AND GROUND |
| (D21) SCI TRANSMIT CIRCUIT SHORTED TO VOLTAGE |
| (D21) SCI TRANSMIT CIRCUIT SHORTED TO GROUND |
| (D21) SCI TRANSMIT CIRCUIT OPEN |
| TRANSMISSION CONTROL MODULE |
| ANTILOCK BRAKE MODULE |
| ENGINE CONTROL MODULE |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**
With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. CHECK ECM POWER AND GROUND

Check the ECM power and ground circuits. Refer to 9 - ENGINE ELECTRICAL DIAGNOSTICS - DIESEL for the diagnostic test procedure.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform the ECM VERIFICATION TEST.

**No** >> Go To 3

## 3. (D21) SCI CIRCUIT SHORTED TO GROUND AT ECM

Turn the ignition off.

Disconnect the scan tool from the DLC connector.

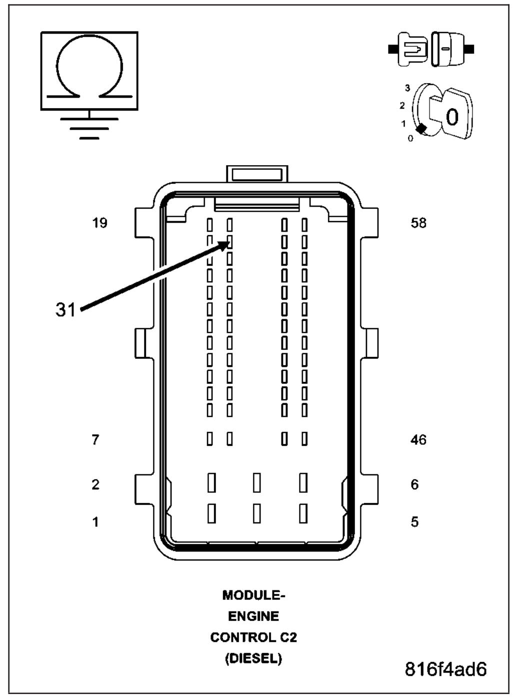
Disconnect the ECM C2 harness connector.

Measure the resistance between ground and the (D21) SCI Transmit circuit at the ECM harness connector.

**Is resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Go To 6



## 4. (D21) SCI CIRCUIT SHORTED TO GROUND AT TCM

Disconnect the TCM harness connector.

Measure the resistance between ground and the (D21) SCI Transmit circuit at the TCM harness connector.

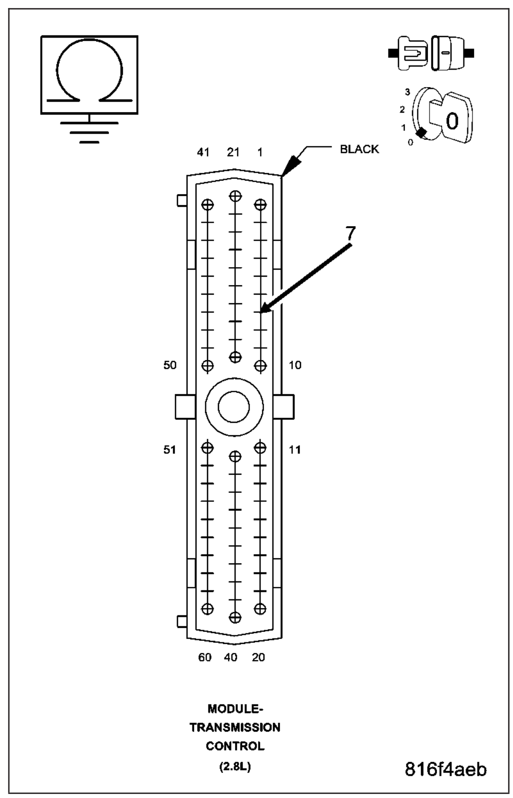
**NOTE: If the vehicle is not equipped with a TCM, answer yes to the question.**

**Is resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Replace the Transmission Control Module in accordance with the service information.

Perform the BODY VERIFICATION TEST–VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 5. (D21) SCI CIRCUIT SHORTED TO GROUND AT ABS MODULE

Disconnect the ABS module harness connector.

Measure the resistance between ground and the (D21) SCI Transmit circuit at the ABS module harness connector.

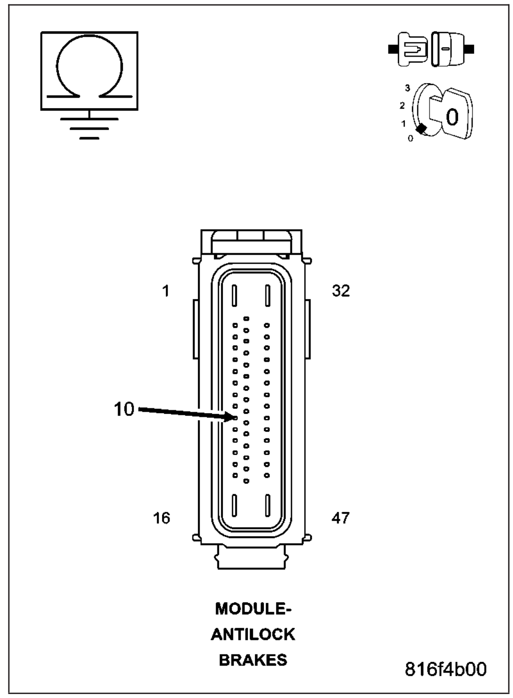
**Is resistance below 5.0 ohms?**

**Yes** >> Repair the (D21) SCI Transmit circuit for a short to ground.

Perform the BODY VERIFICATION TEST–VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Antilock Brake System Module in accordance with the service information.

Perform the BODY VERIFICATION TEST–VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 6. (D21) SCI CIRCUIT SHORTED TO VOLTAGE AT THE DLC

Turn the ignition on.

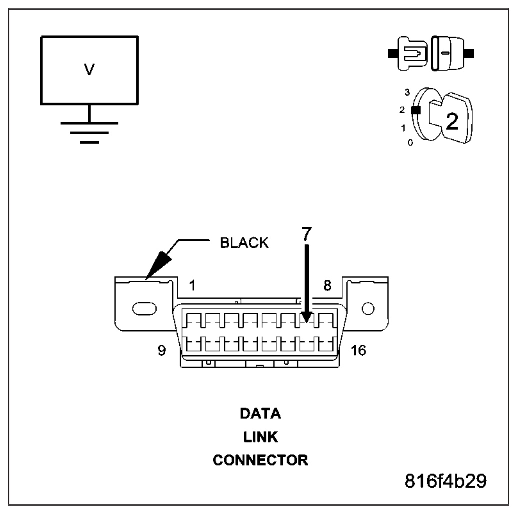
Measure the voltage of the (D21) SCI Transmit circuit at the DLC connector.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (D21) SCI Transmit circuit for a short to voltage.

Perform the BODY VERIFICATION TEST–VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 7



## 7. (D21) SCI CIRCUIT OPEN AT THE DLC

Turn the ignition off.

Measure the resistance of the (D21) SCI Transmit circuit between the ECM connector and the DLC connector.

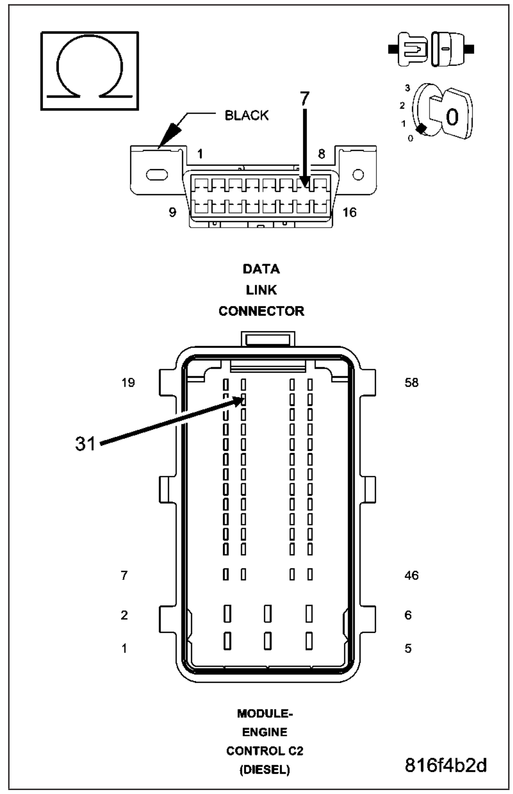
**Is resistance below 5.0 ohms?**

**Yes** >> Replace the Engine Control Module in accordance with the service information.

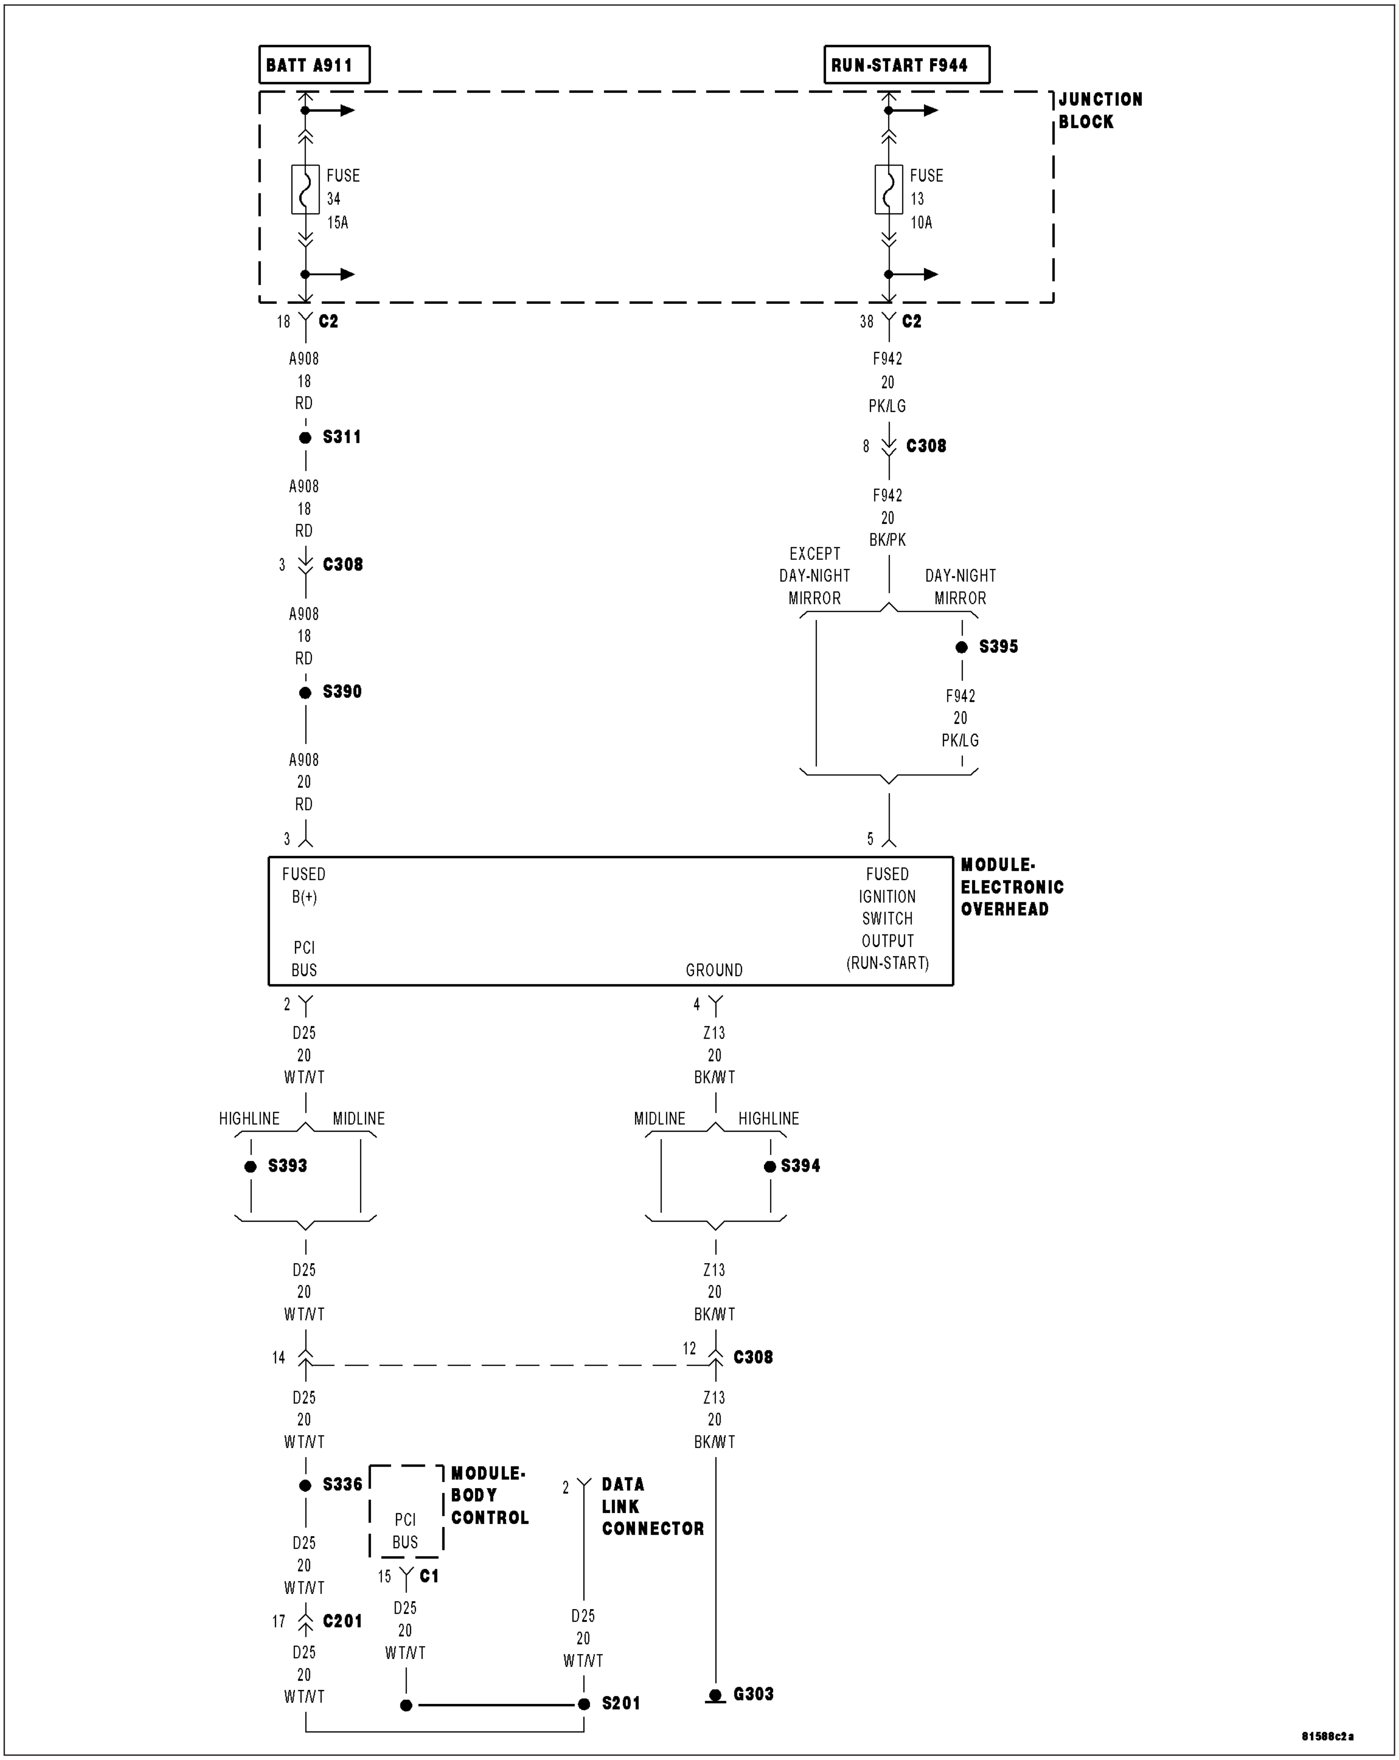
Perform the ECM VERIFICATION TEST.

**No** >> Repair the (D21) SCI Transmit circuit for an open.

Perform the BODY VERIFICATION TEST–VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## *NO RESPONSE FROM EOM (ELECTRONIC OVERHEAD MODULE)



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| (Z13) GROUND CIRCUIT OPEN |
| (A908) FUSED B(+) CIRCUIT OPEN |
| (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| ELECTRONIC OVERHEAD MODULE |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

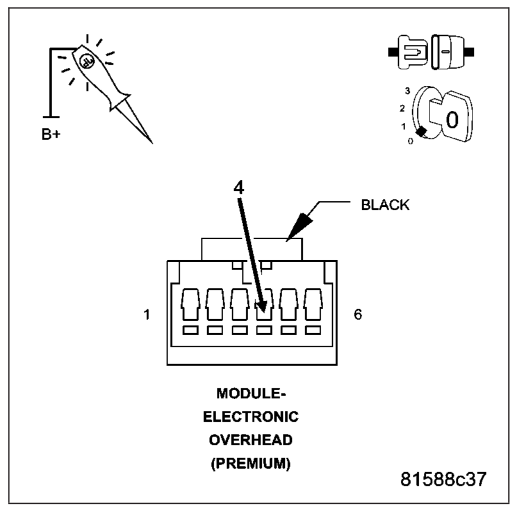
**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (Z13) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Electronic Overhead Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Z13) ground circuit.



**Does the test light illuminate brightly?**

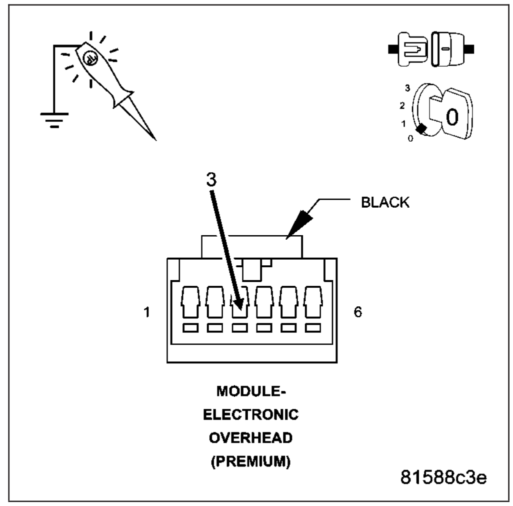
**Yes** >> Go To 3

**No** >> Repair the (Z13) Ground circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (A908) FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, probe the (A908) Fused B(+) circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 4

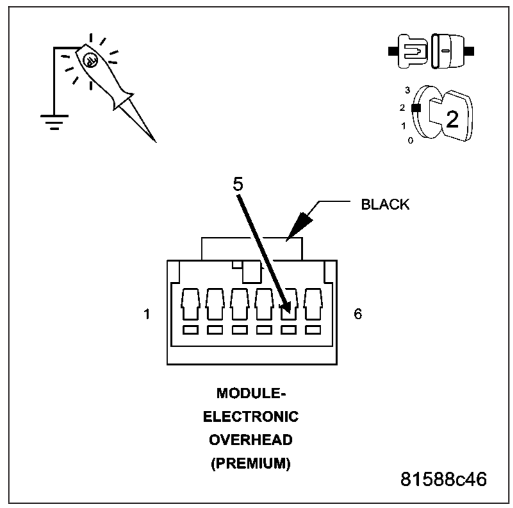
**No** >> Repair the (A908) Fused B(+) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (F942) Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F942) Fused Ignition Switch Output circuit for an open.

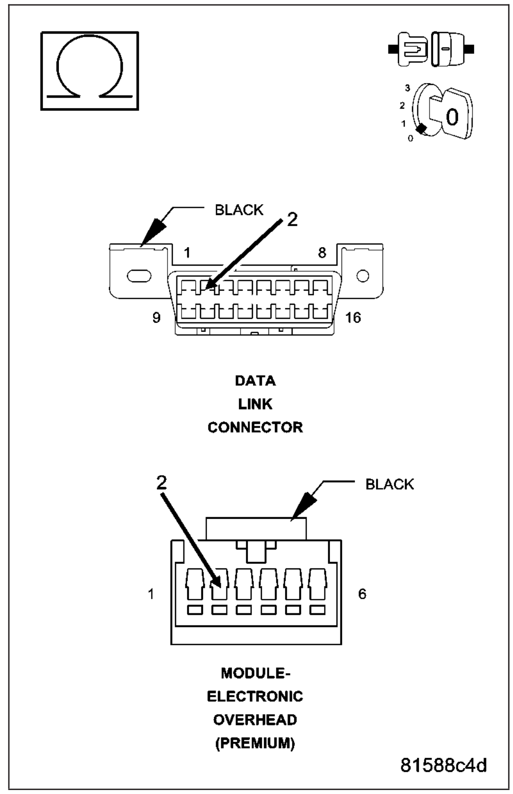
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the Electronic Overhead Module connector.



**Is the resistance below 5.0 ohms?**

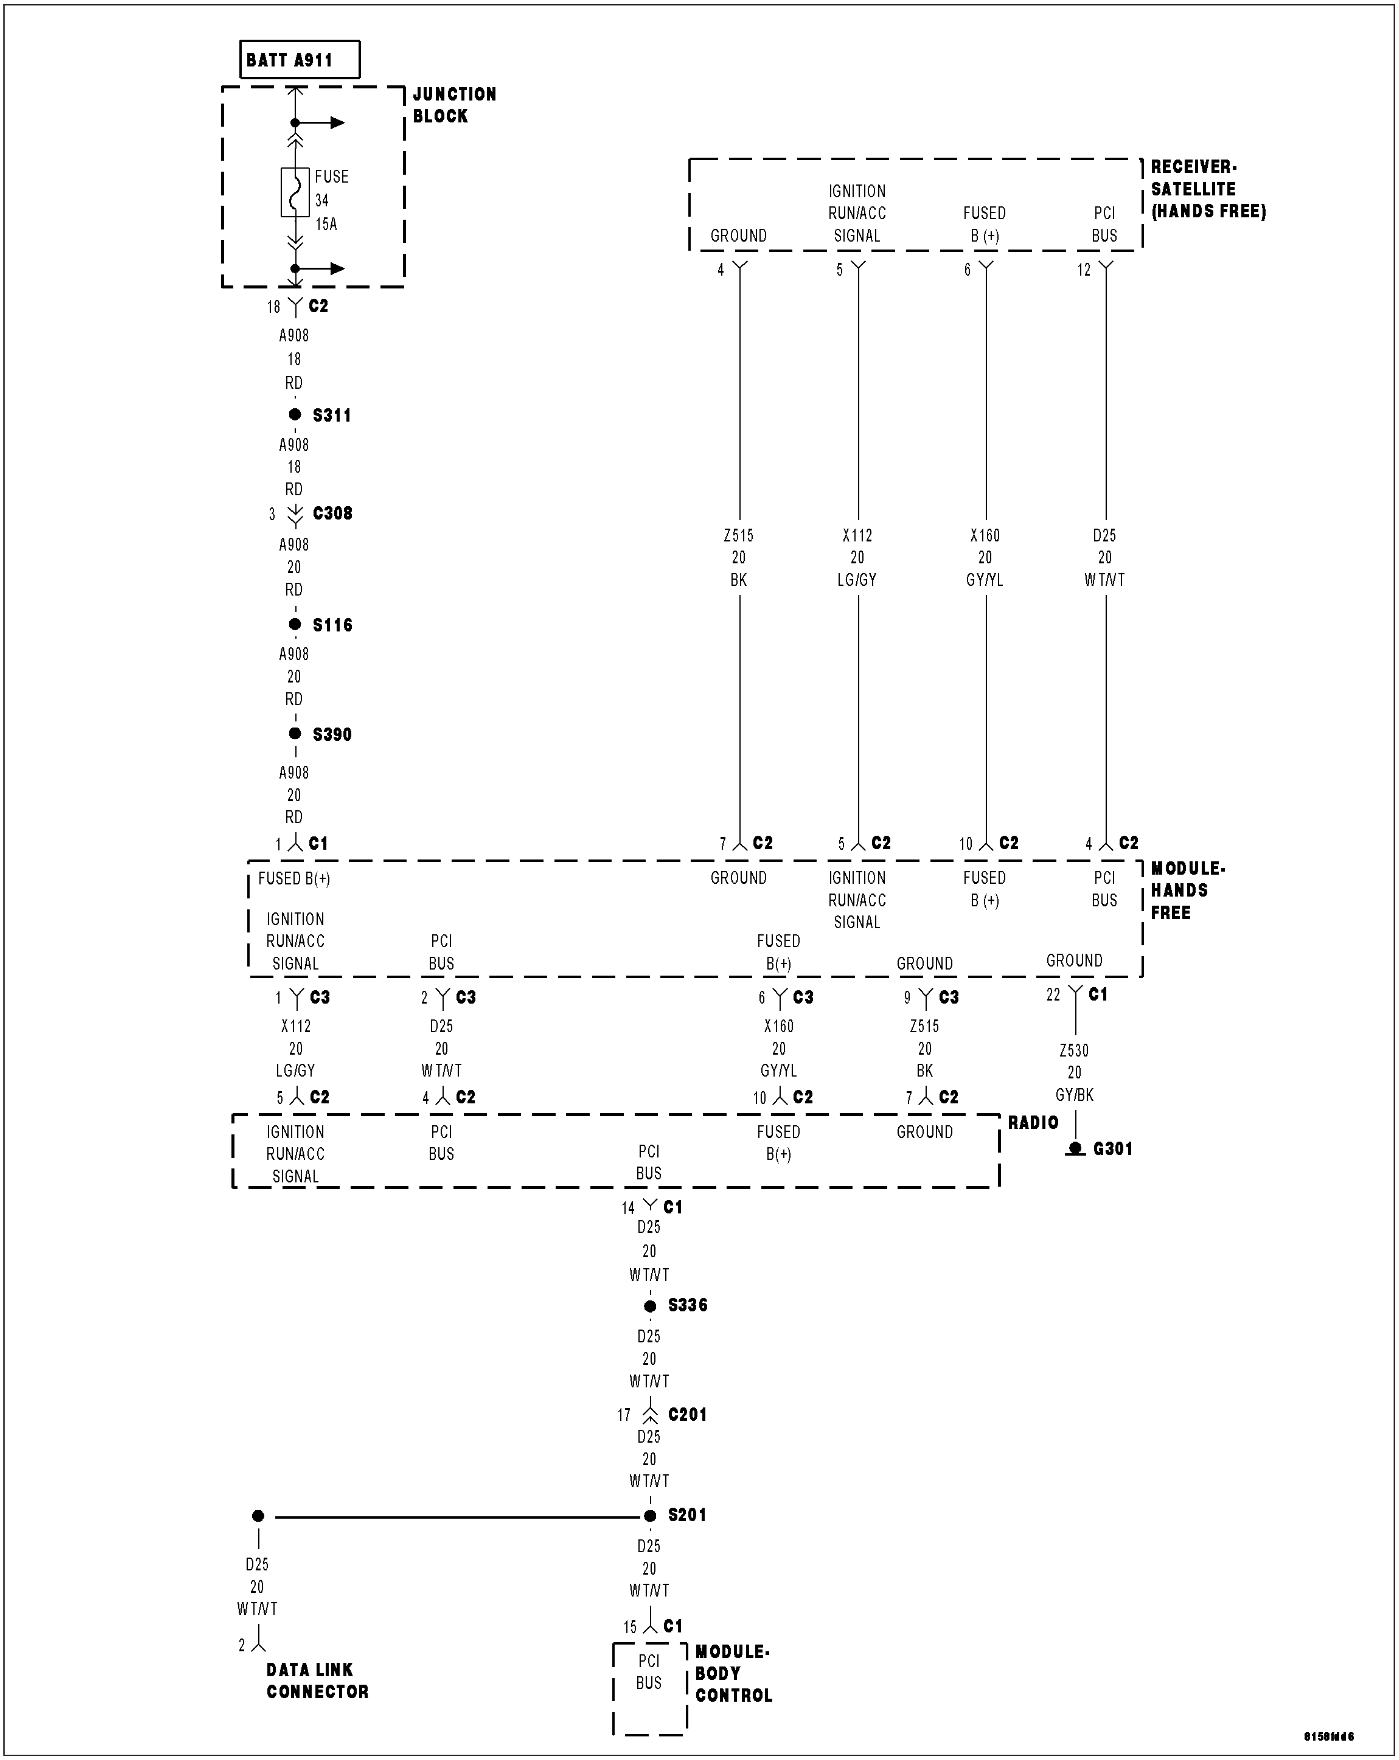
**Yes** >> Replace the Electronic Overhead Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (D25) PCI Bus circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## *NO RESPONSE FROM HANDS FREE MODULE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| (Z530) GROUND CIRCUIT OPEN |
| (A908) FUSED B(+) CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| RADIO |
| HANDS FREE MODULE (HFM) |

## Diagnostic Test

### 1. ESTABLISH COMMUNICATION WITH RADIO ON PCI BUS

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**
With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool communicate with the radio?**

**Yes** >> Go To 2

**No** >> Perform the appropriate no response test. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

### 2. (Z530) GROUND CIRCUIT OPEN

Turn the ignition off.

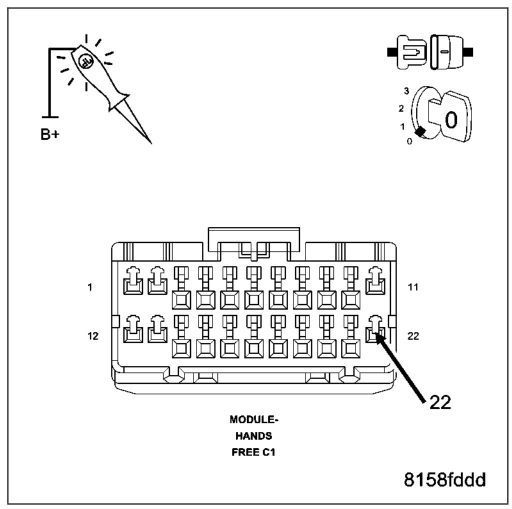
Disconnect the Hands Free Module C1 harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Z530) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (Z530) Ground circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



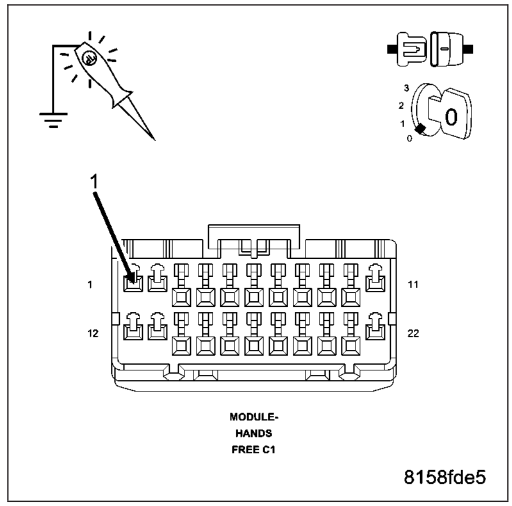
## 3. (A908) FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, probe the (A908) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (A908) Fused B(+) circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 4. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module C3 harness connector.

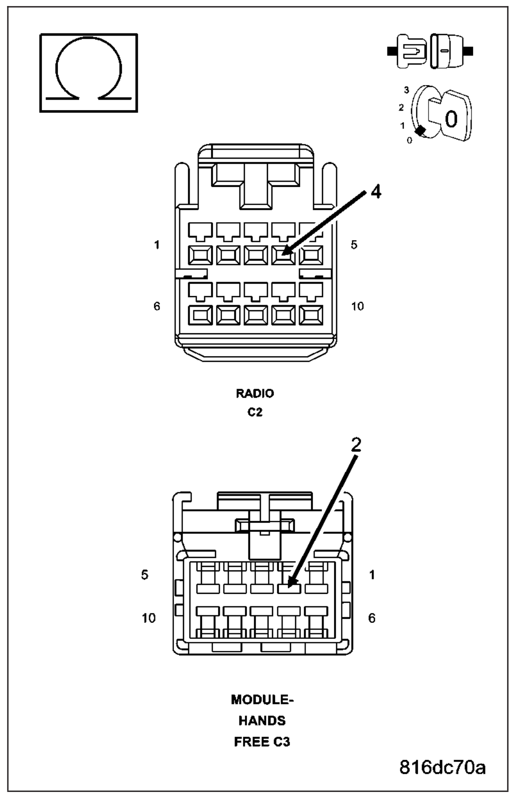
Disconnect the Radio C2 harness connector.

Measure the resistance of the (D25) PCI Bus circuit between the Radio C2 harness connector and the Hands Free Module connector.

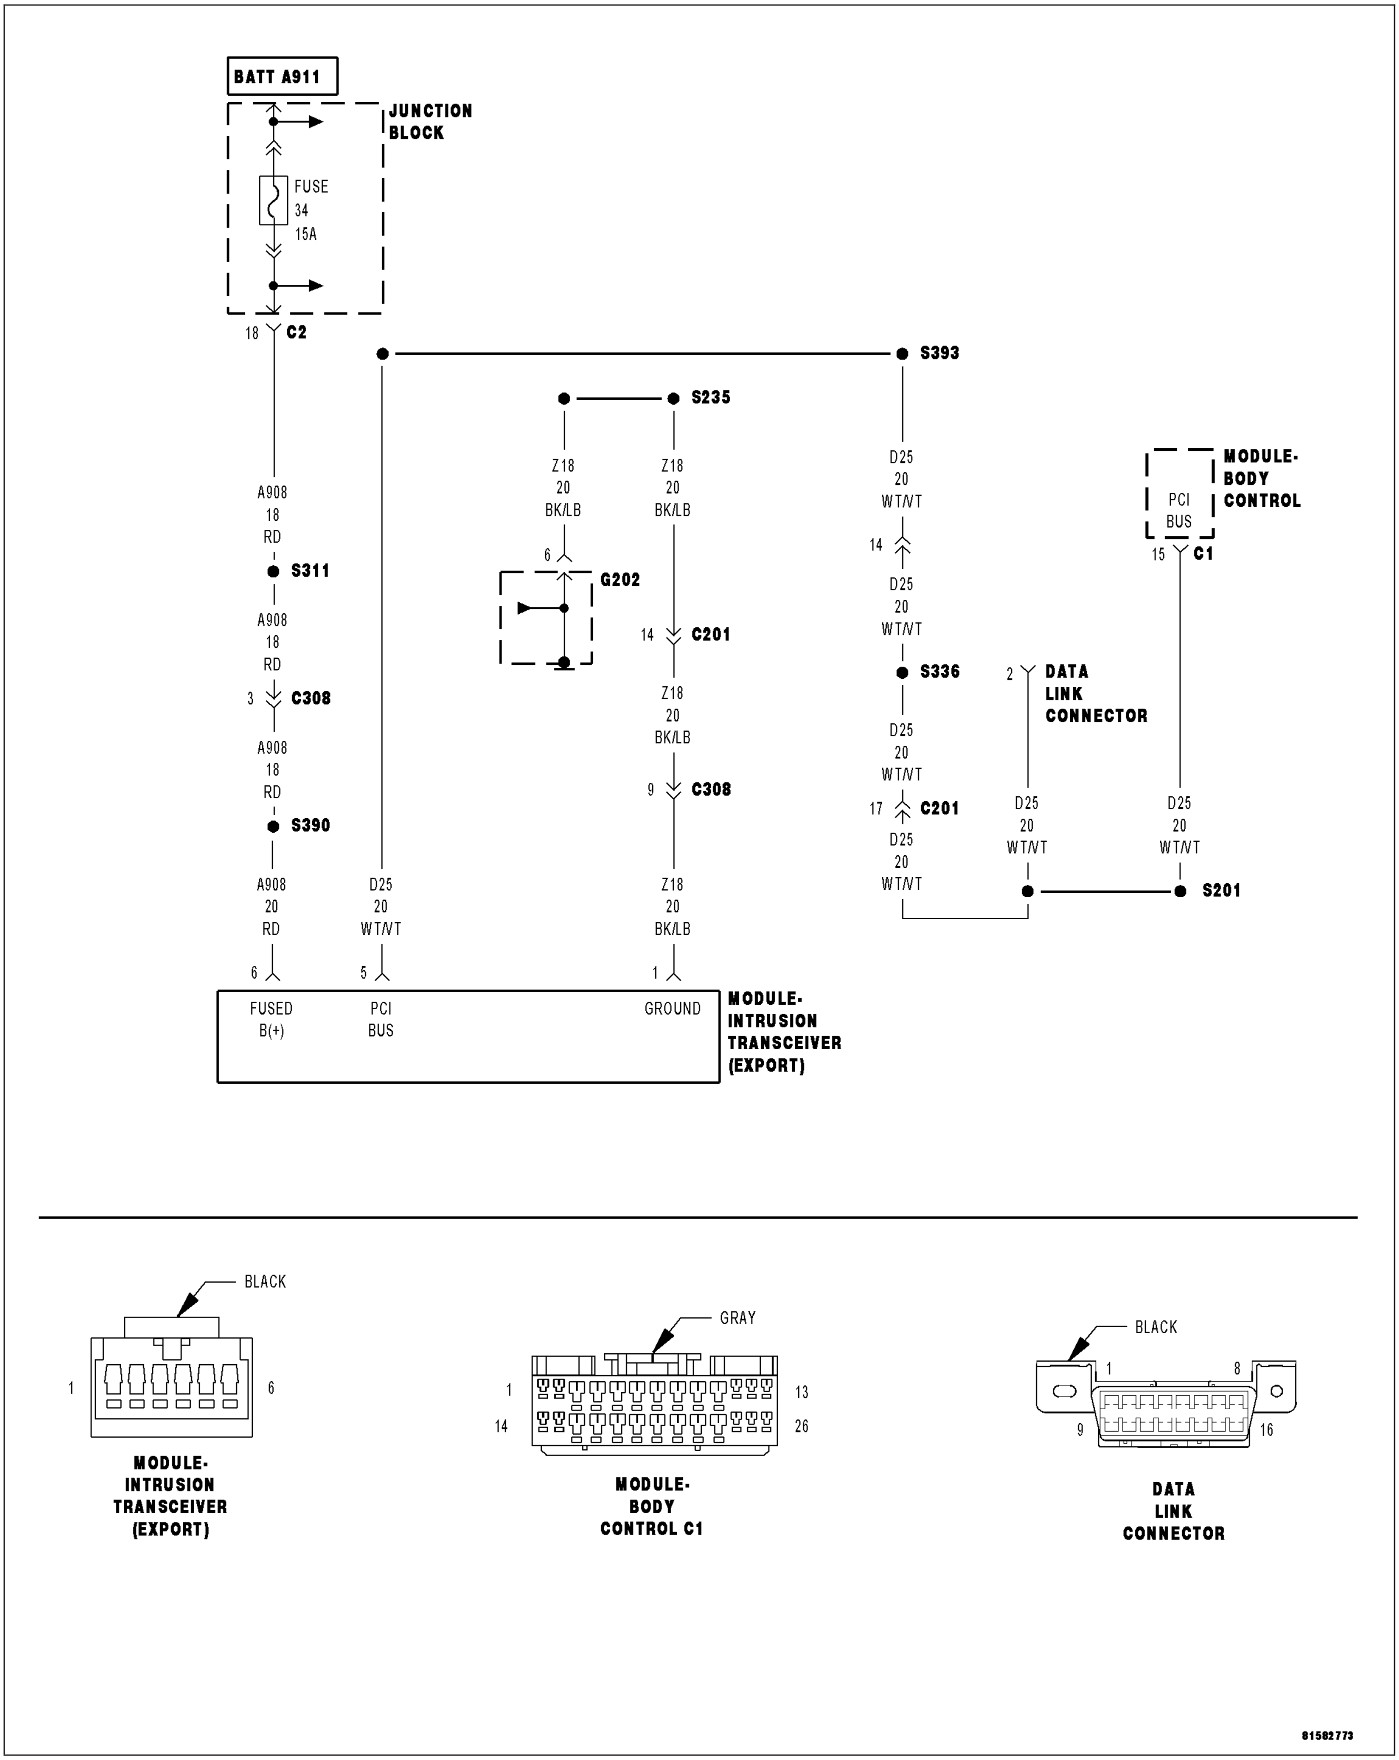
**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Hands Free Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (D25) PCI Bus circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



# *NO RESPONSE FROM INTRUSION TRANSCEIVER MODULE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| (Z18) GROUND CIRCUIT OPEN |
| (A908) FUSED B(+) CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| INTRUSION TRANSCEIVER MODULE |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

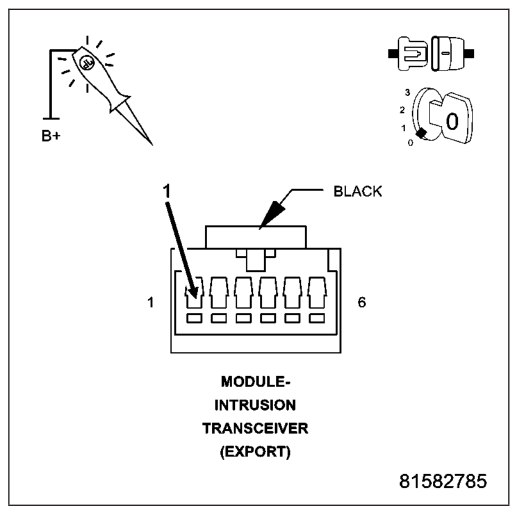
**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (Z18) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Intrusion Transceiver Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Z18) ground circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (Z18) Ground circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (A908) FUSED B(+) CIRCUIT OPEN

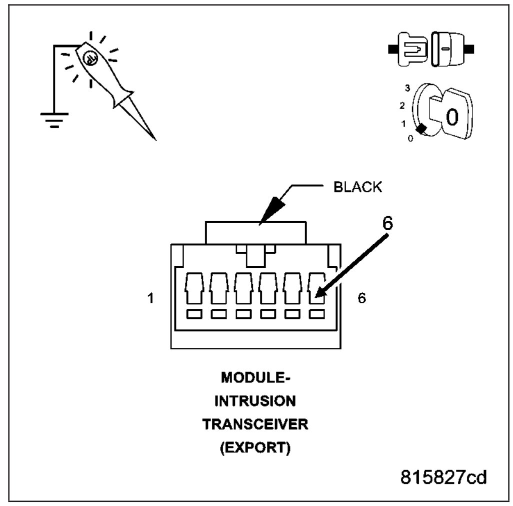
Using a 12-volt test light connected to ground, probe the (A908) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (A908) Fused B(+) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 4. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the Intrusion Transceiver Module connector.

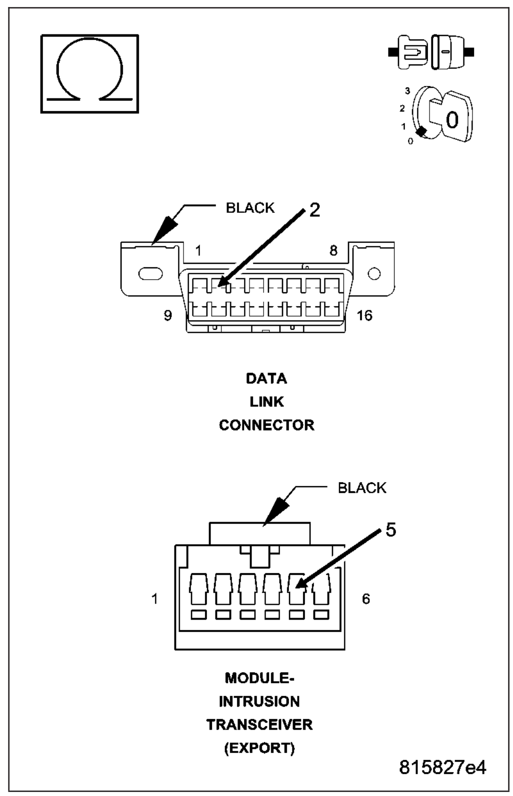
**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Intrusion Transceiver Module in accordance with the service information.

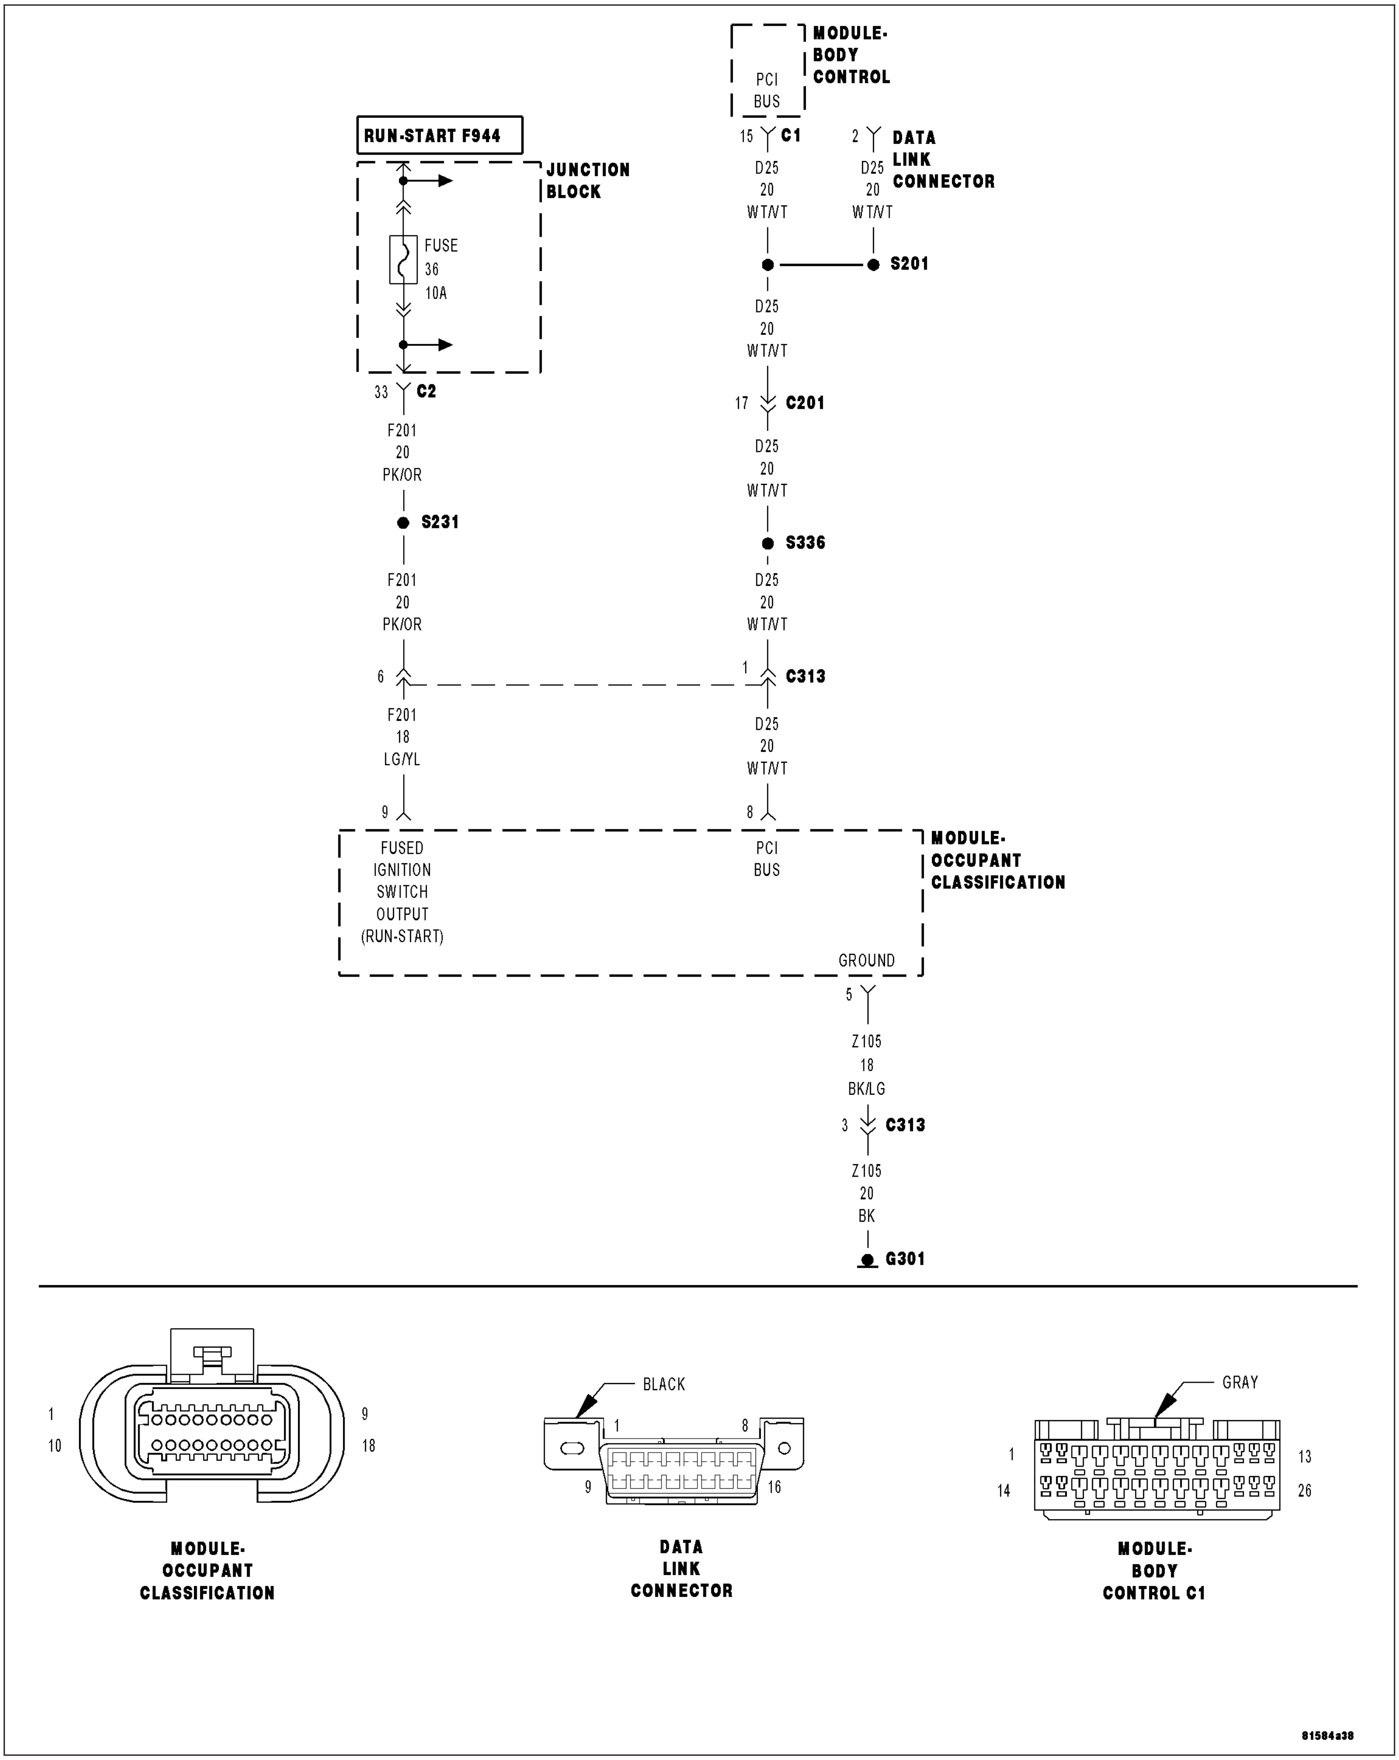
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (D25) PCI Bus circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## *NO RESPONSE FROM OCCUPANT CLASSIFICATION MODULE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (F201) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| (Z105) GROUND CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| OCCUPANT CLASSIFICATION MODULE |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

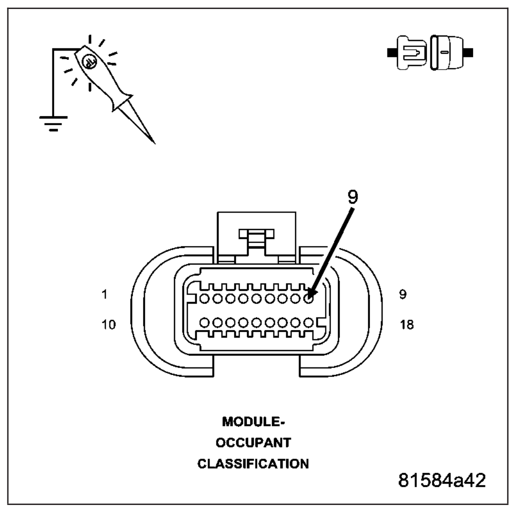
### 2. (F201) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Occupant Classification Module harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Using a 12-volt test light connected to ground, probe the (F201) Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (F201) Fused Ignition Switch Output circuit for an open.

Perform the AIRBAG VERIFICATION TEST – VER 1.

## 3. (Z105) GROUND CIRCUIT OPEN

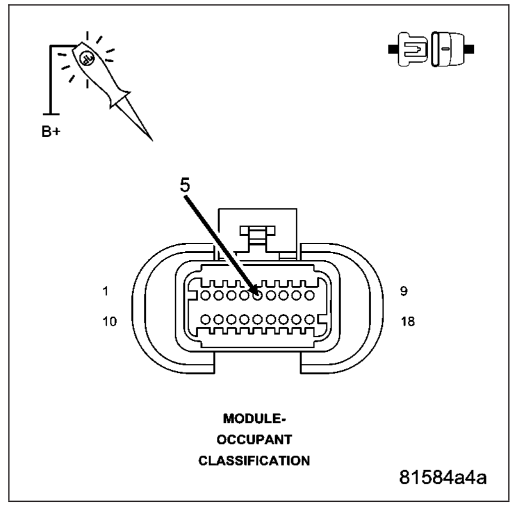
Turn the ignition off.

Using a 12-volt test light connected to 12-volts, probe the (Z105) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z105) Ground circuit for an open.
Perform the AIRBAG VERIFICATION TEST – VER 1.



## 4. (D25) PCI BUS CIRCUIT OPEN

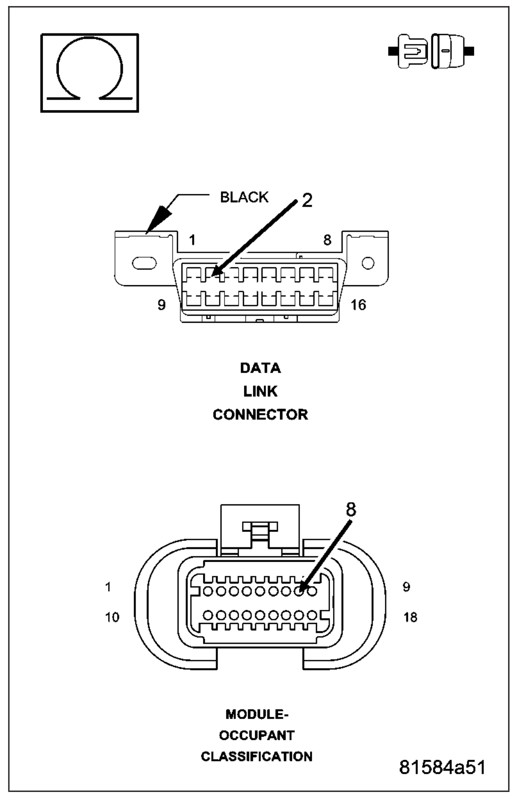
Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the Occupant Classification Module connector.

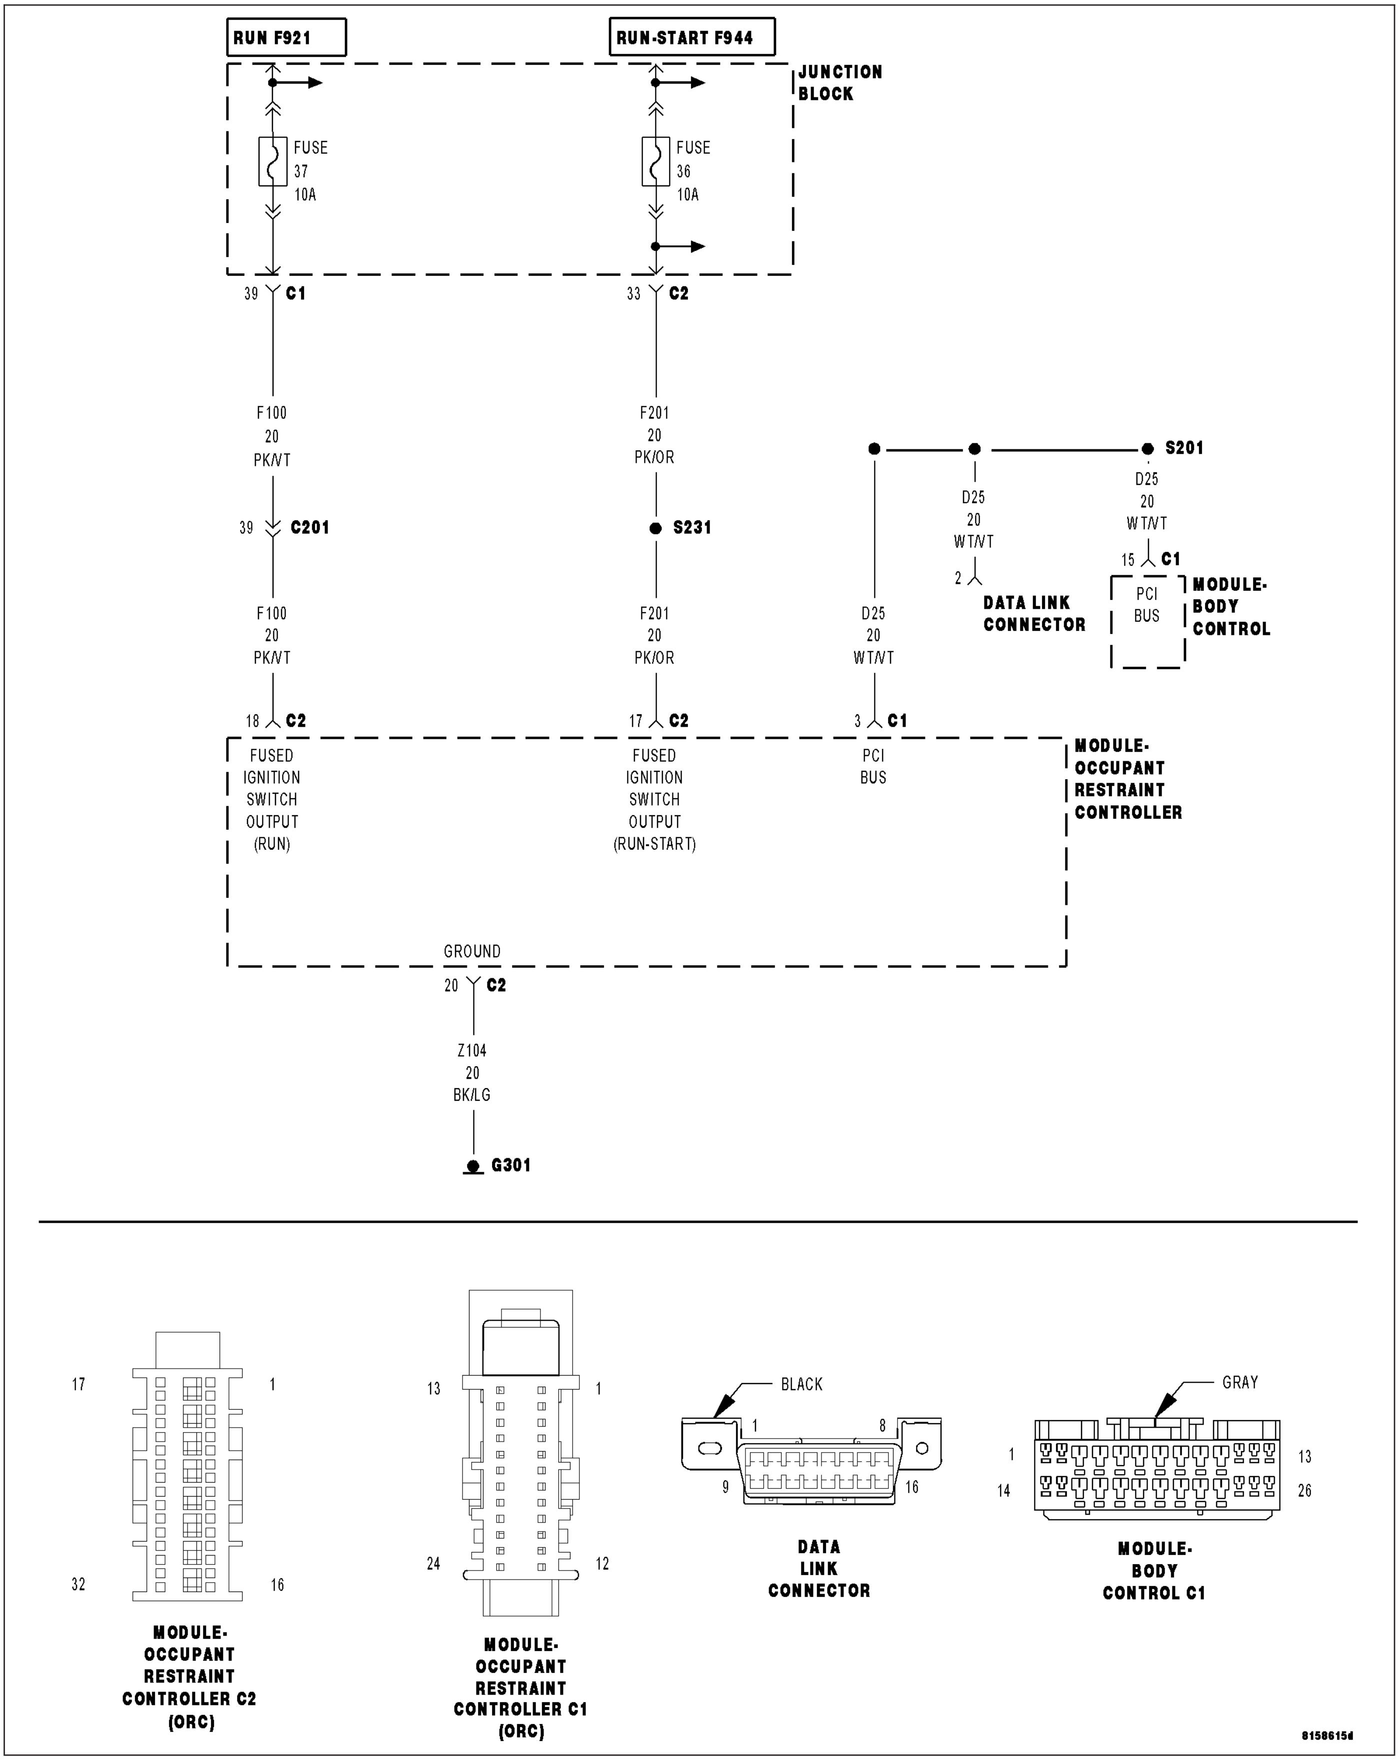
**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Occupant Classification Module in accordance with the service information.
Perform the AIRBAG VERIFICATION TEST – VER 1.

**No** >> Repair the (D25) PCI Bus circuit for an open.
Perform the AIRBAG VERIFICATION TEST – VER 1.



## *NO RESPONSE FROM OCCUPANT RESTRAINT CONTROLLER



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN |
| (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN |
| (Z104) GROUND CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| OCCUPANT RESTRAINT CONTROLLER |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. CHECKING FOR VOLTAGE AT THE ORC

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Occupant Restraint Controller C1 and C2 harness connectors.

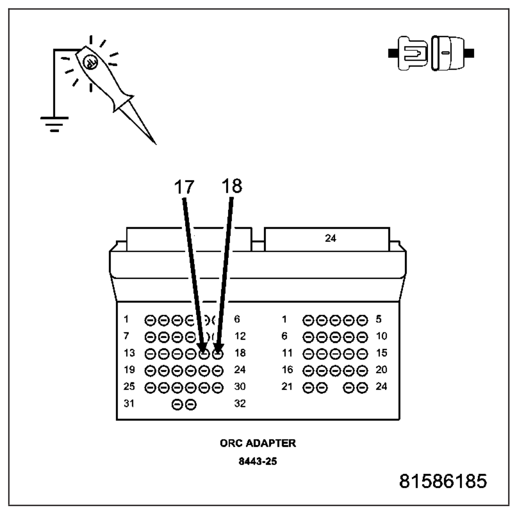
Connect the appropriate Load Tool ORC Adapter to the ORC connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Using a 12-volt test light connected to ground, probe the (F100) Fused Ignition Switch Output (run) circuit and the (F201) Fused Ignition Switch Output (run-start) circuit.

**NOTE: One open circuit will not cause a NO RESPONSE condition.**

**Did the test light illuminate brightly on both circuits?**



**Yes** >> Go To 3

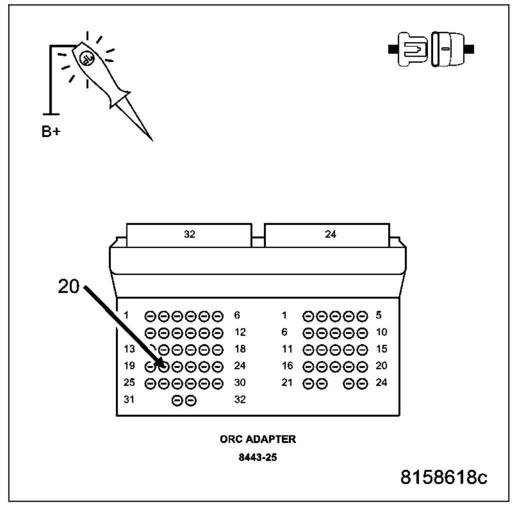
**No** >> Repair the (F100) Fused Ignition Switch Output (run) or the (F201) Fused Ignition Switch Output (run-start) circuit for an open.

Perform the AIRBAG VERIFICATION TEST – VER 1.

## 3. (Z104) GROUND CIRCUIT OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, probe the (Z104) ground circuit.



**Did the test light illuminate brightly?**

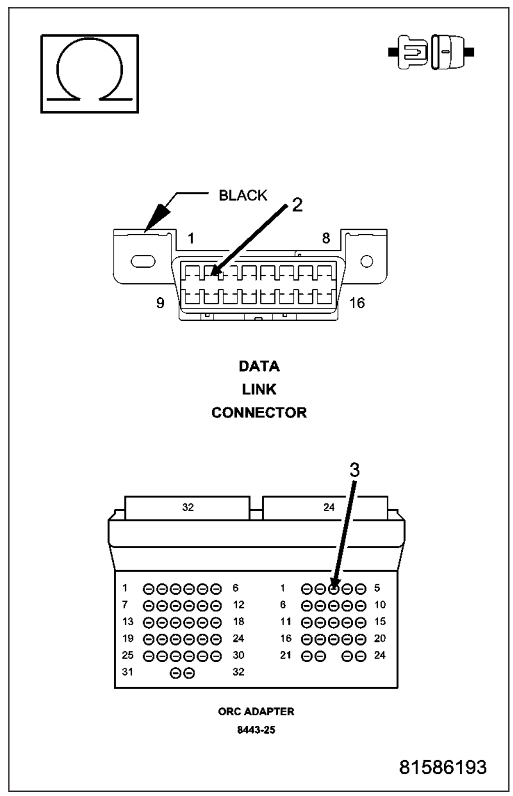
**Yes** >> Go To 4

**No** >> Repair the (Z104) Ground circuit for an open.
Perform the AIRBAG VERIFICATION TEST – VER 1.

## 4. (D25) PCI BUS CIRCUIT OPEN

Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the Occupant Restraint Controller C1 harness connector.

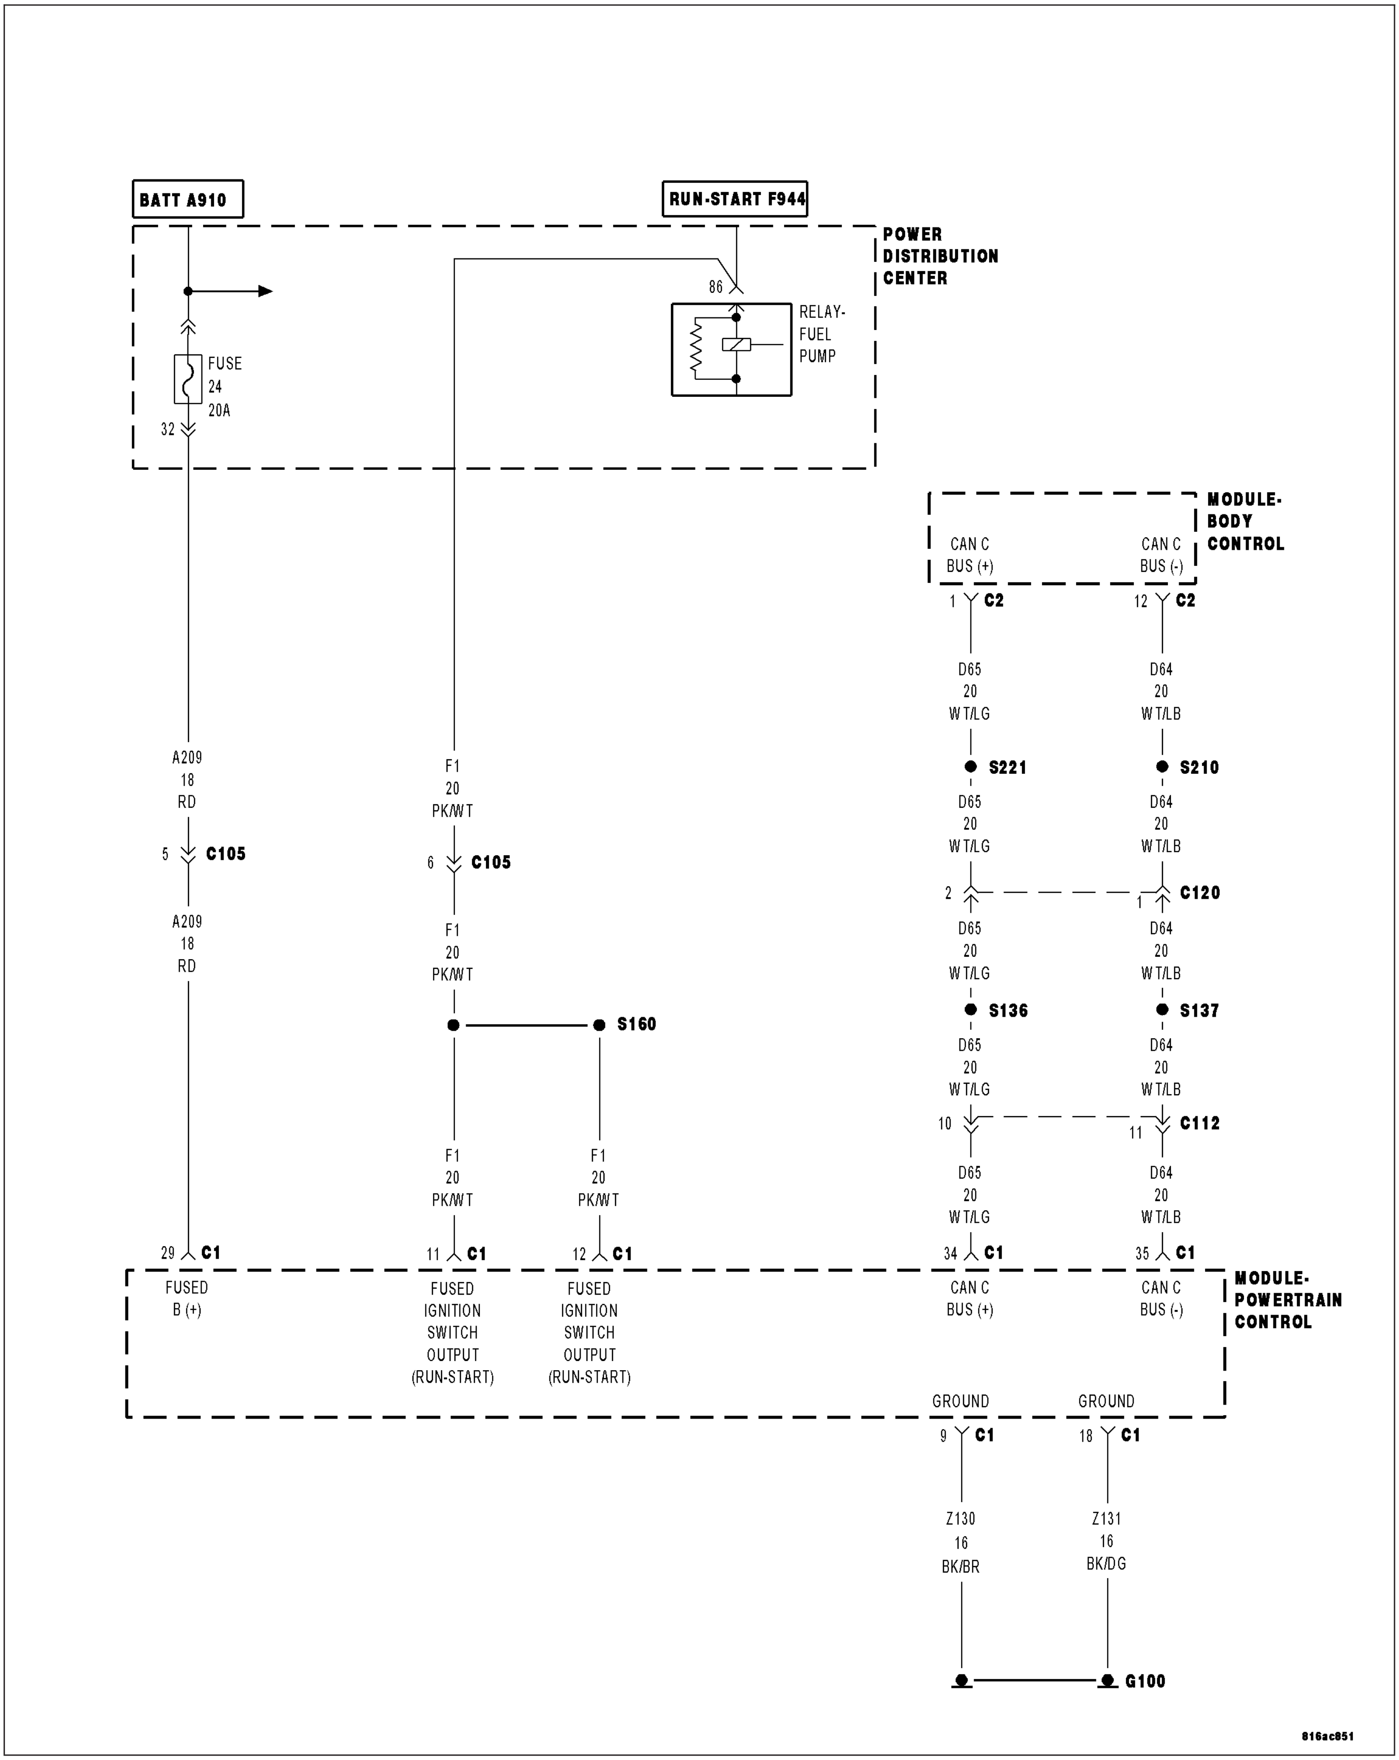


**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Occupant Restraint Controller Module in accordance with the service information.
Perform the AIRBAG VERIFICATION TEST – VER 1.

**No** >> Repair the (D25) PCI Bus circuit for an open.
Perform the AIRBAG VERIFICATION TEST – VER 1.

## *NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) (NGC)



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (A209) FUSED B(+) CIRCUIT OPEN OR SHORTED |
| (Z130) (Z131) GROUND CIRCUIT OPEN |
| (F1) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED |
| (D65) CAN C BUS (+) CIRCUIT OPEN |
| (D64) CAN C BUS (-) CIRCUIT OPEN |
| POWERTRAIN CONTROL MODULE |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**
With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (A209) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

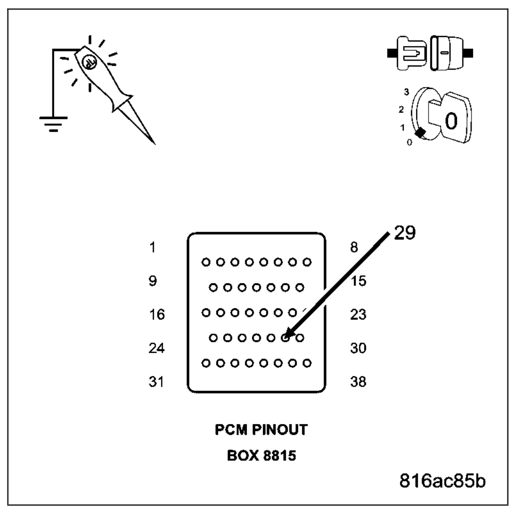
Disconnect the PCM C1 harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**
Using a 12-volt test light connected to ground, check the (A209) Fused B(+) circuit.

**Does the test light illuminate brightly?**

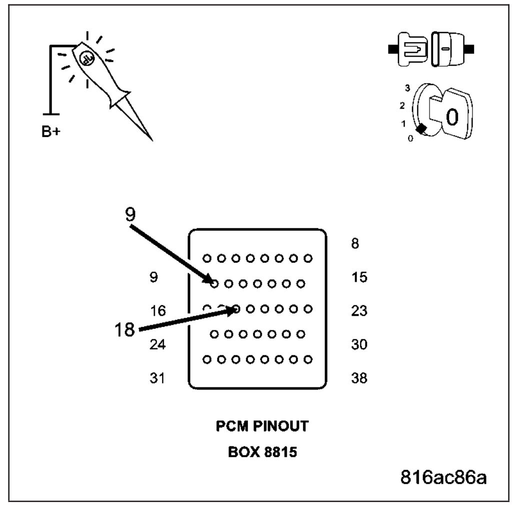
**Yes** >> Go To 3

**No** >> Repair the (A209) Fused B(+) circuit for an open or short.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.



## 3. (Z130) (Z131) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z130) and (Z131) ground circuit.



**Does the test light illuminate brightly for each circuit?**

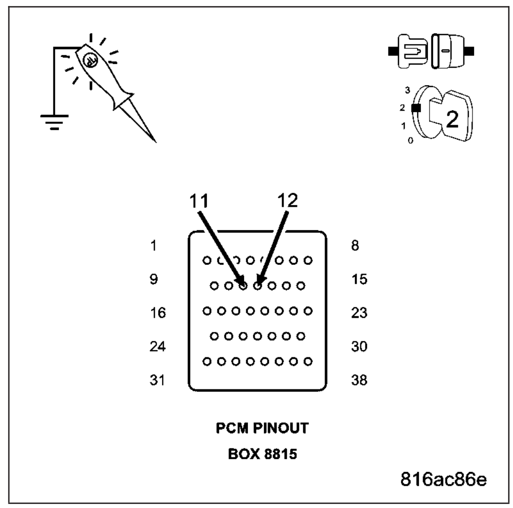
**Yes** >> Go To 4

**No** >> Repair the ground circuit for an open.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

## 4. (F1) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F1) Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 5

**No** >> Repair the (F1) Fused Ignition Switch Output circuit for an open or short.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

## 5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the scan tool from the DLC.

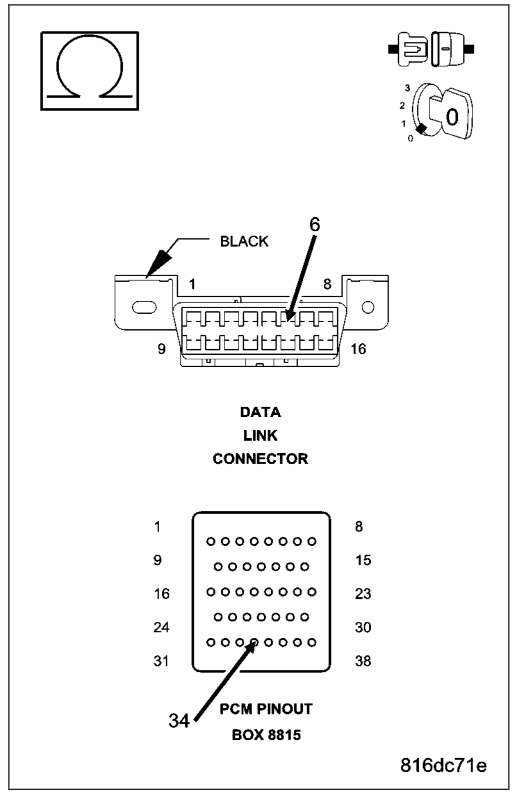
Measure the resistance of the (D65) CAN C Bus (+) circuit between the DLC connector and the appropriate terminal of the special tool #8815.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (D65) CAN C Bus (+) circuit for an open.

Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.



## 6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the DLC connector and the appropriate terminal of the special tool #8815.

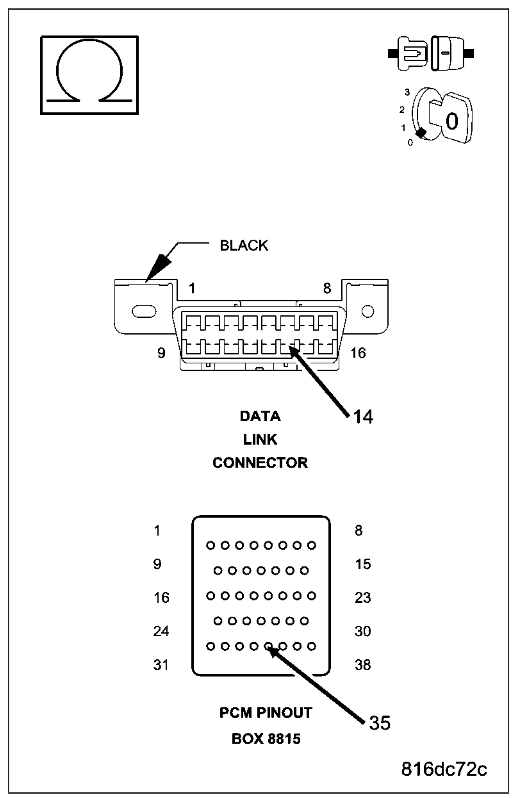
**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and program the Powertrain Control Module in accordance with the service information.

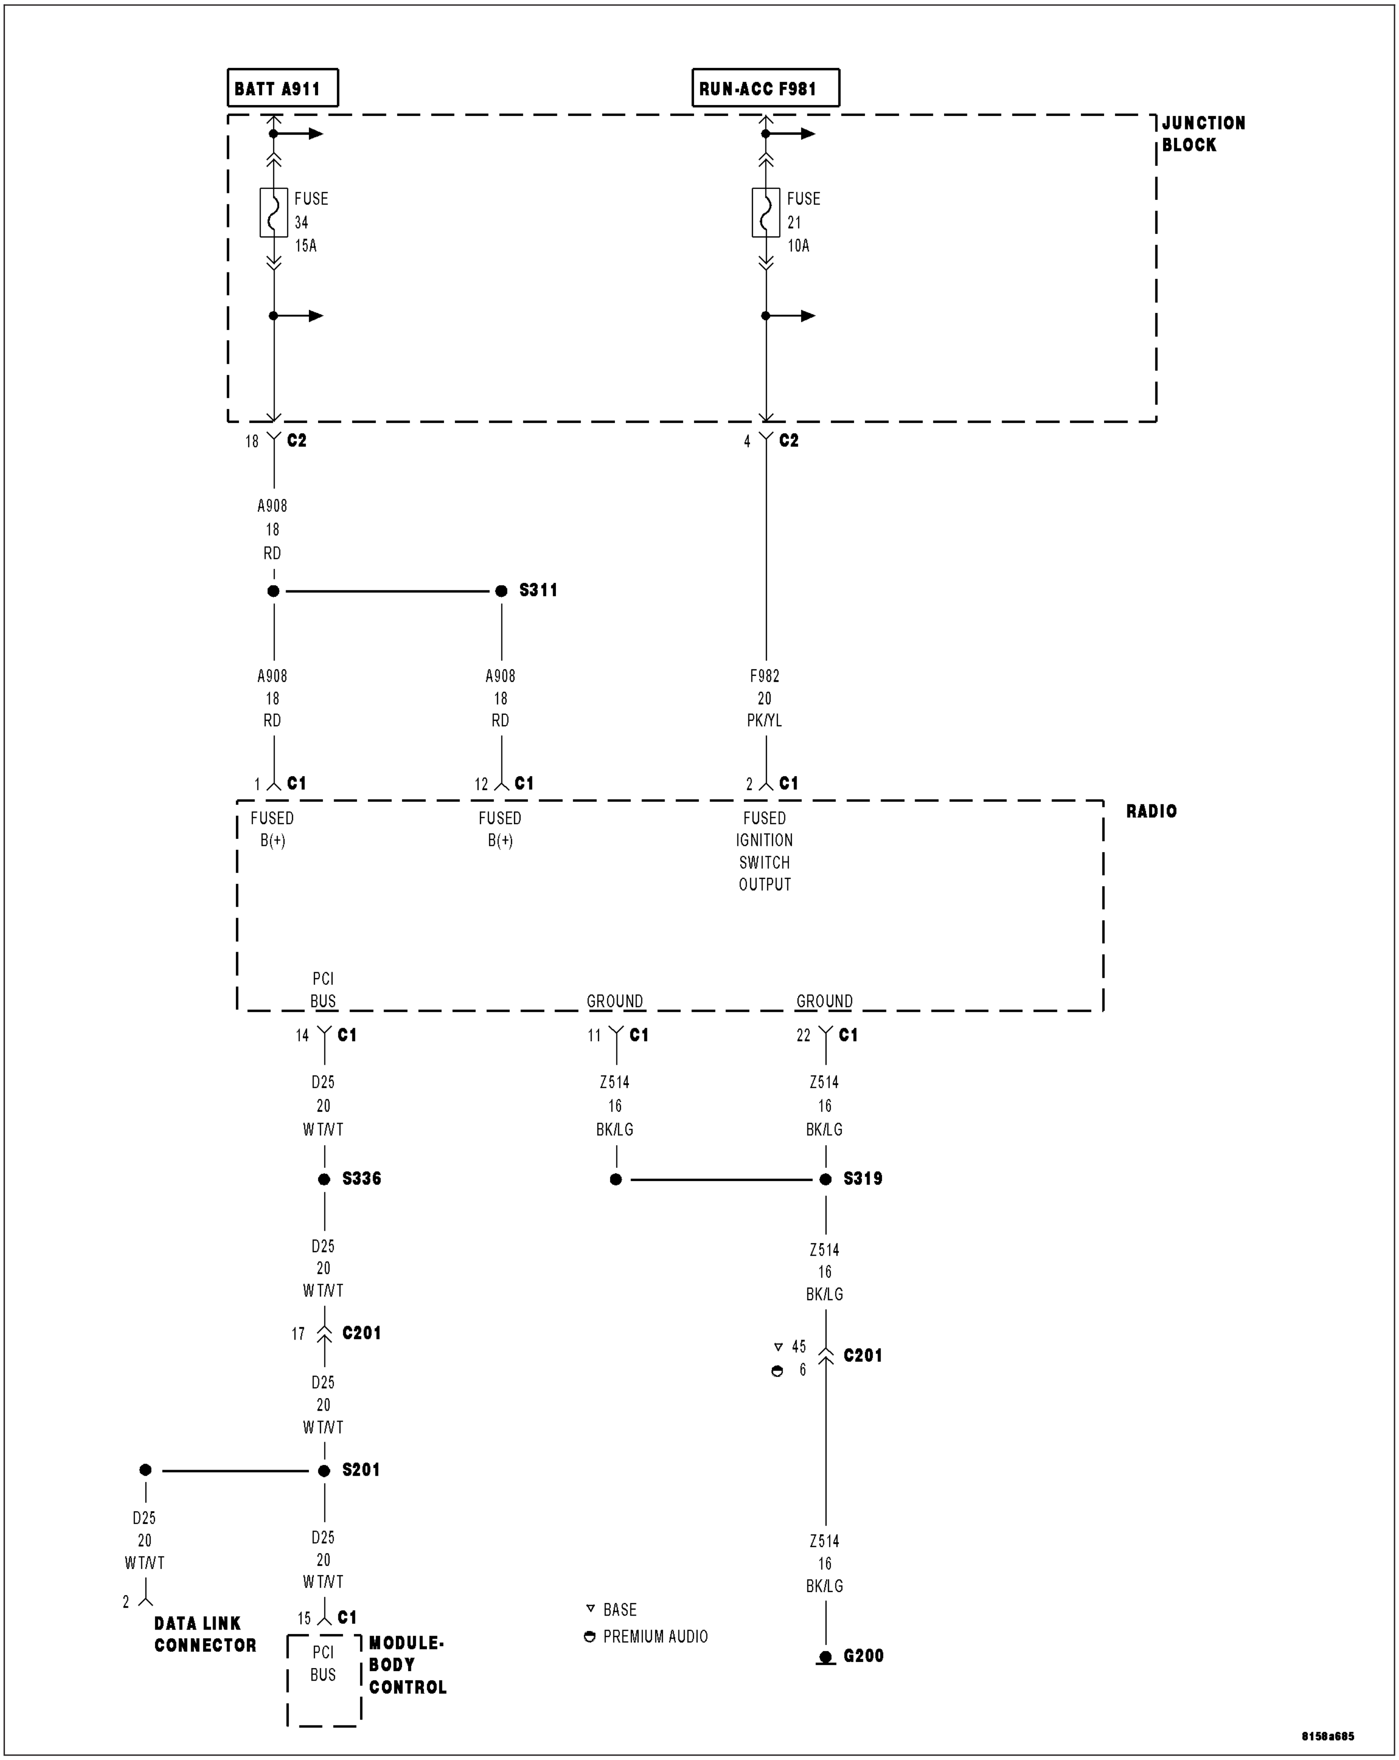
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

**No** >> Repair the (D64) CAN C Bus (-) circuit for an open.

Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.



## *NO RESPONSE FROM RADIO



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (Z514) GROUND CIRCUIT OPEN |
| (A908) FUSED B(+) CIRCUIT OPEN |
| (F982) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| RADIO |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

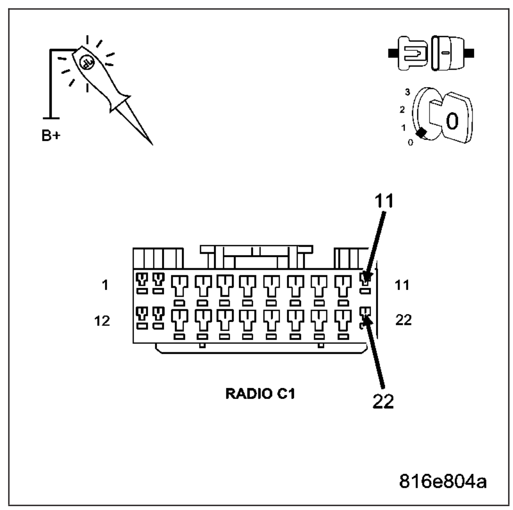
**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (Z514) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Using a 12-volt test light connected to 12-volts, probe each (Z514) ground circuit.



**Does the test light illuminate brightly for each circuit?**

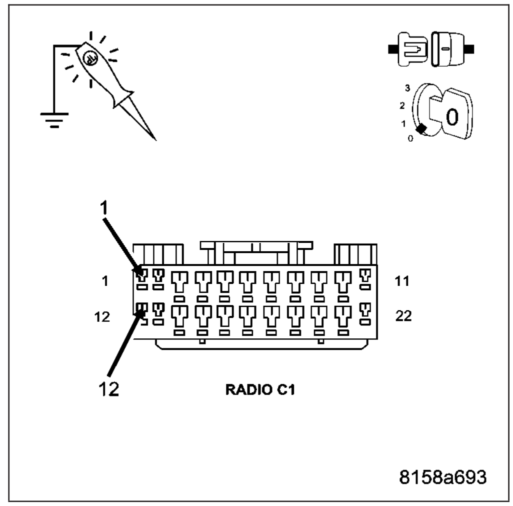
**Yes** >> Go To 3

**No** >> Repair the (Z514) Ground circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (A908) FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, probe each (A908) Fused B(+) circuit.



**Does the test light illuminate brightly for each circuit?**

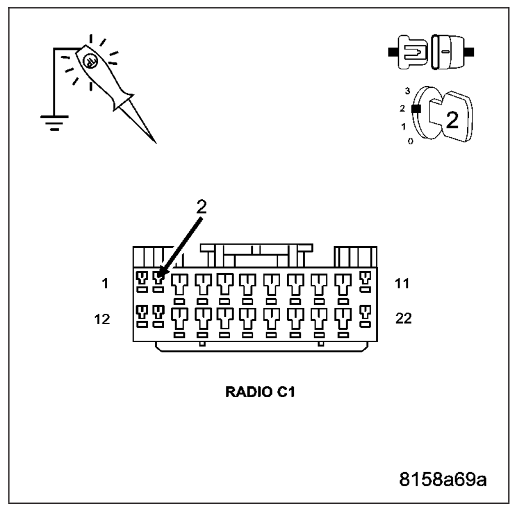
**Yes** >> Go To 4

**No** >> Repair the (A908) Fused B(+) circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. (F982) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (F982) Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F982) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

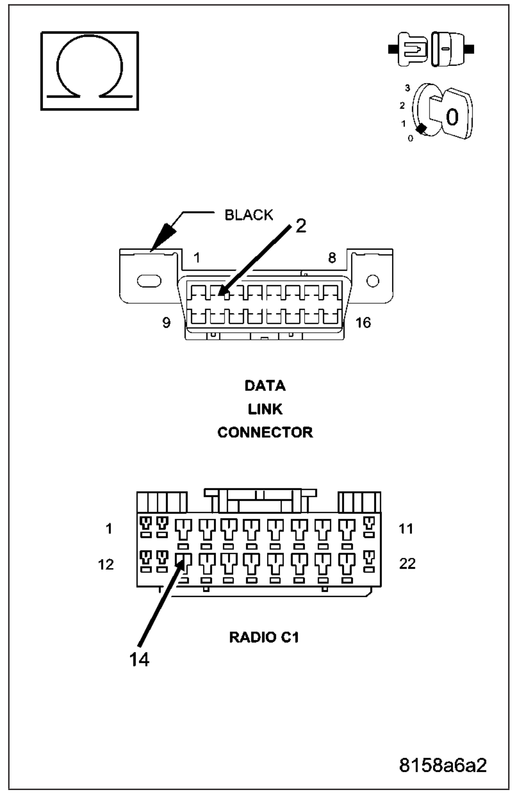
## 5. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the Radio C1 connector.

**Is the resistance below 5.0 ohms?**



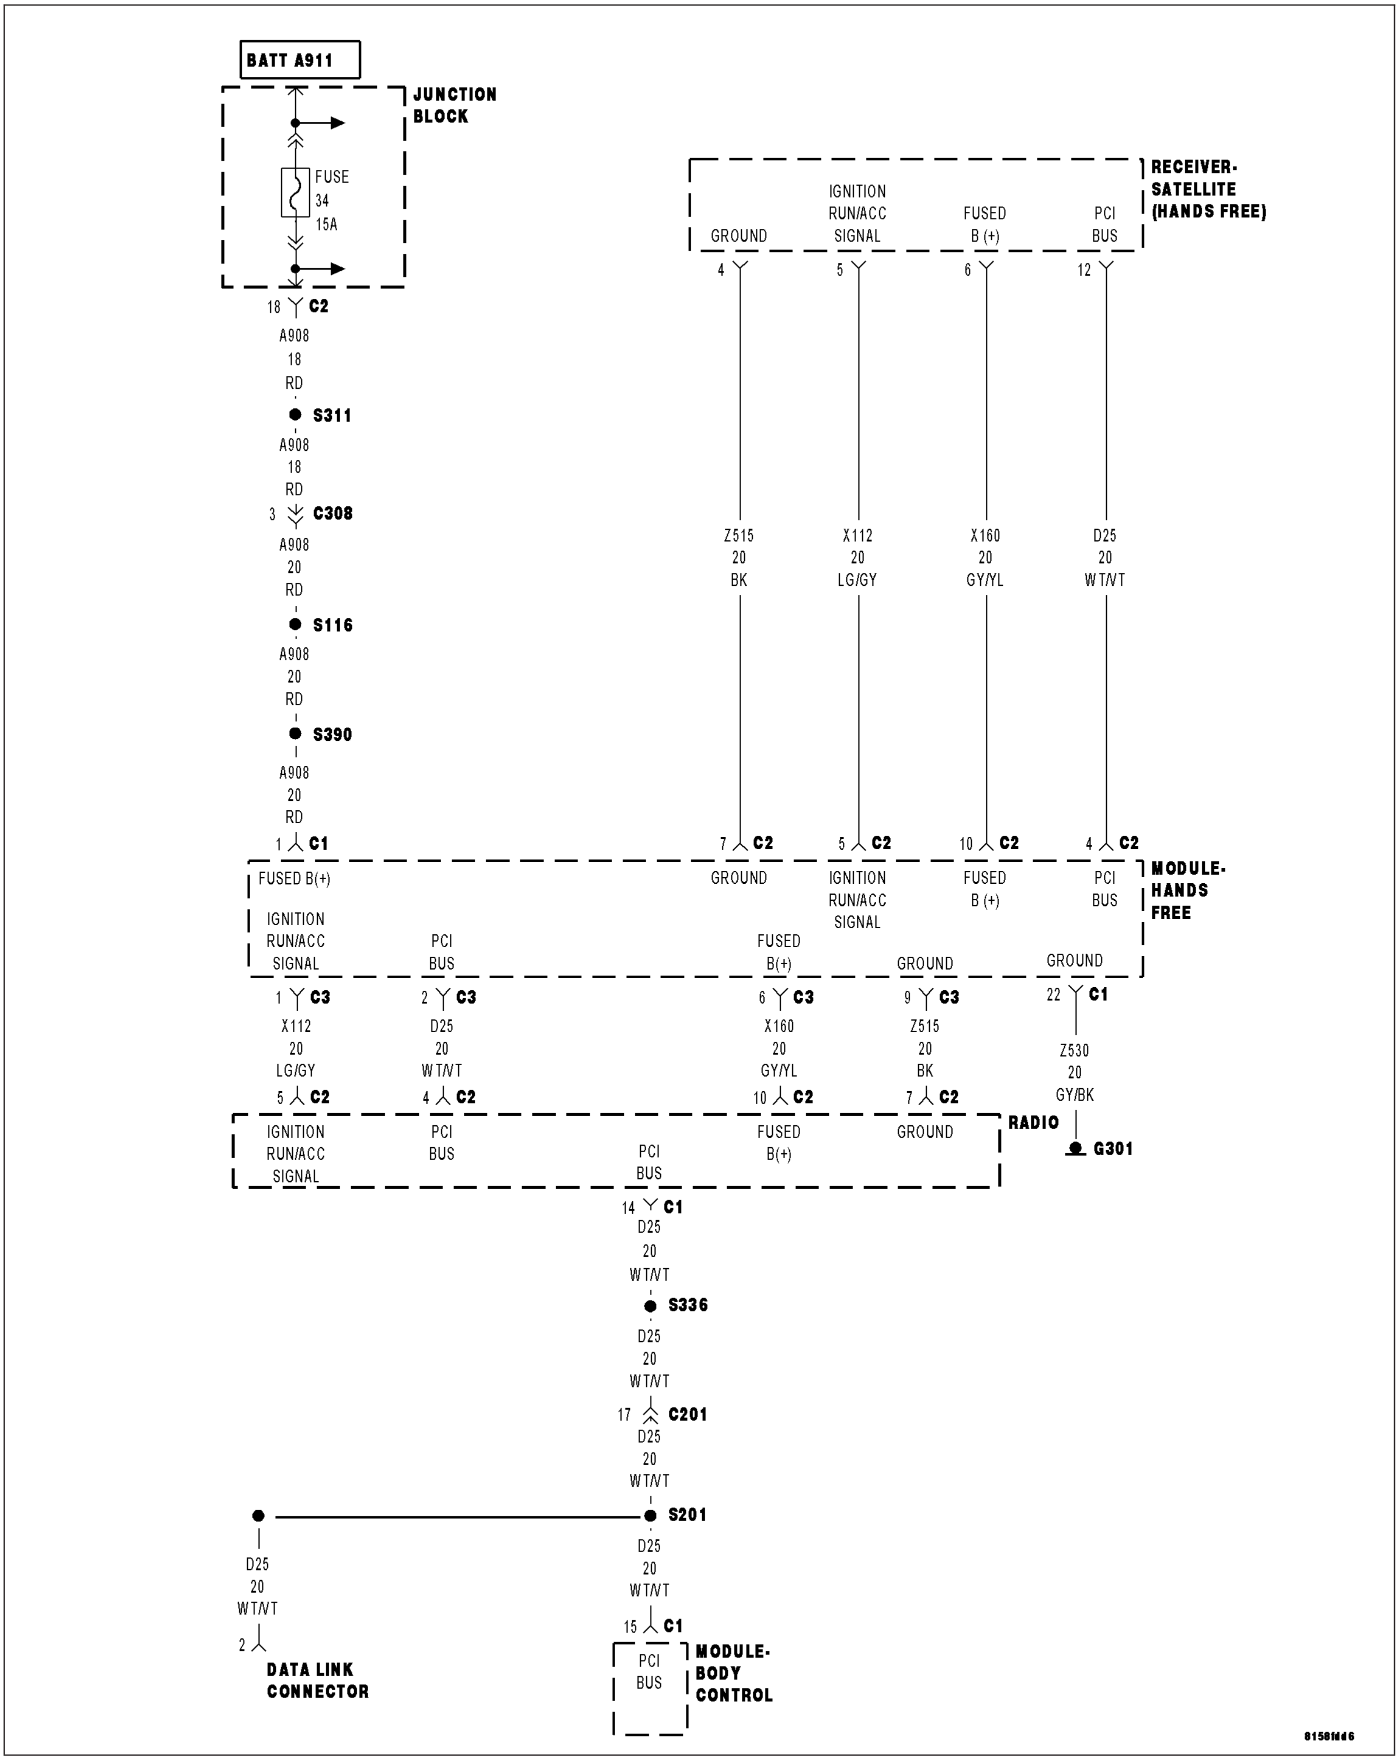
**Yes** >> Replace the Radio in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (D25) PCI Bus circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

# *NO RESPONSE FROM SATELLITE RECEIVER (SDAR)



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (Z515) GROUND CIRCUIT OPEN |
| (X160) FUSED B(+) CIRCUIT OPEN |
| (X112) IGNITION RUN/ACC SIGNAL CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| RADIO |
| HANDS FREE MODULE |
| SATELLITE RECEIVER |

## Diagnostic Test

### 1. ESTABLISH COMMUNICATION WITH RADIO AND HANDS FREE MODULE (IF EQUIPPED) ON PCI BUS

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**
With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool communicate with the Radio and Hands Free Module?**

**Yes** >> Go To 2

**No** >> Perform the appropriate no response test. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

### 2. VISUALLY INSPECT THE RADIO AND SATELLITE RECEIVER CONNECTORS

Turn the ignition off.

Disconnect the Radio C2 harness connector.

Disconnect the Satellite Receiver harness connector.

Visually inspect the connectors for damage and pushed out pins.

**NOTE: If the vehicle is equipped with a Hands Free Phone module, check the connectors. This device is a pass through for the satellite receiver circuits.**

**Was any damage found?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

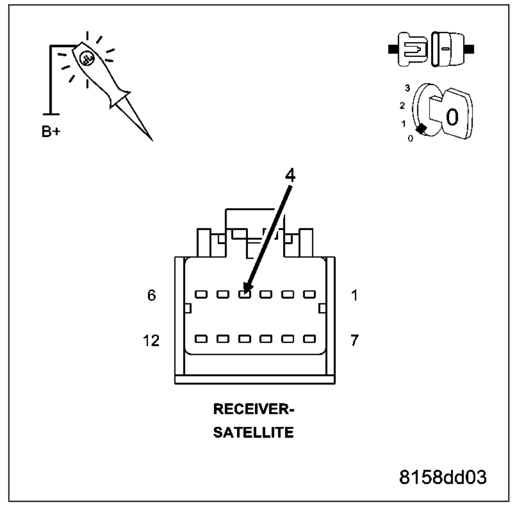
**No** >> Go To 3

## 3. (Z515) GROUND CIRCUIT OPEN

Reconnect the Radio C2 harness connector.

**NOTE: If the vehicle is equipped with a Hands Free Phone module, check the connectors. This device is a pass through for the satellite receiver circuits.**

Using a 12-volt test light connected to 12-volts, probe the (Z515) ground circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z515) Ground circuit for an open.

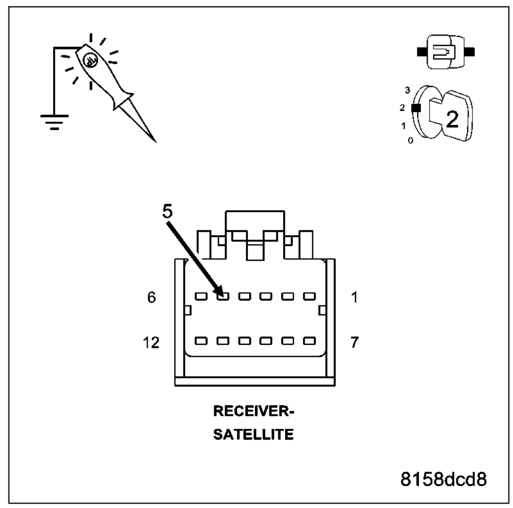
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. (X112) IGNITION RUN/ACC SIGNAL CIRCUIT OPEN

**NOTE: If the vehicle is equipped with a Hands Free Phone module, check the connectors. This device is a pass through for the satellite receiver circuits.**

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (X112) Ignition Run/Acc Signal circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 5

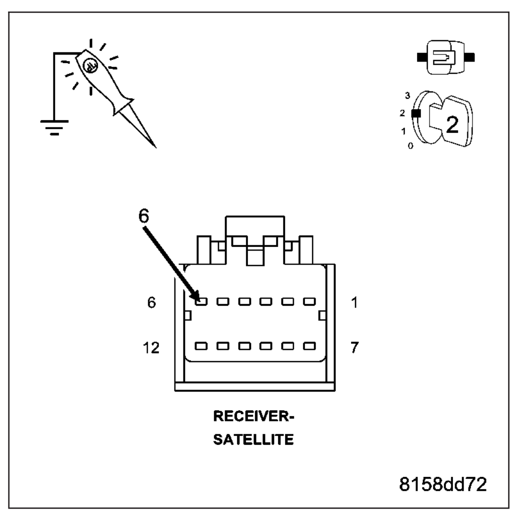
**No** >> Repair the (X112) Ignition Run/Acc Signal circuit for an open. If ok, replace the Radio.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. (X160) FUSED B(+) CIRCUIT OPEN

**NOTE: If the vehicle is equipped with a Hands Free Phone module, check the connectors. This device is a pass through for the satellite receiver circuits.**

Using a 12-volt test light connected to ground, probe the (X160) Fused B(+) circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (X160) Fused B(+) circuit for an open. If ok, replace the Radio.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

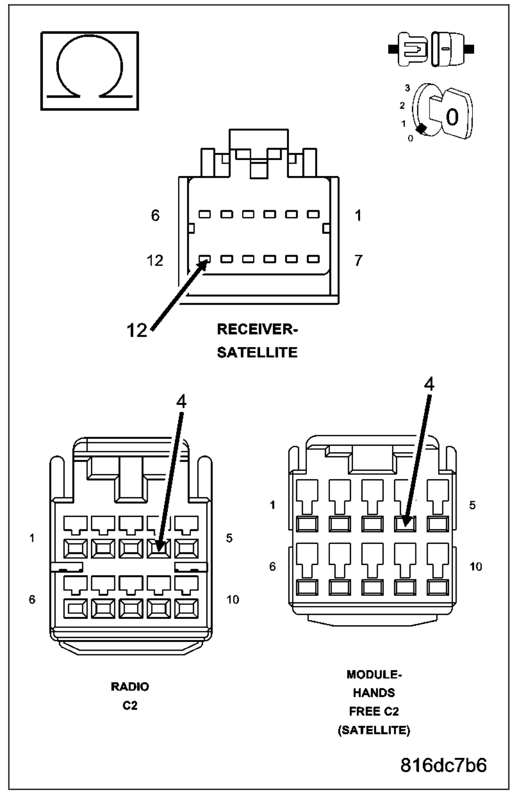
## 6. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the Radio C2 harness connector.

**NOTE: If equipped disconnect the HFM C2 harness connector.**

Measure the resistance of the (D25) PCI Bus circuit between either the Radio C2 harness connector (or if equipped the HFM C2 harness connector) and the Satellite Receiver harness connector.



**Is the resistance below 5.0 ohms?**

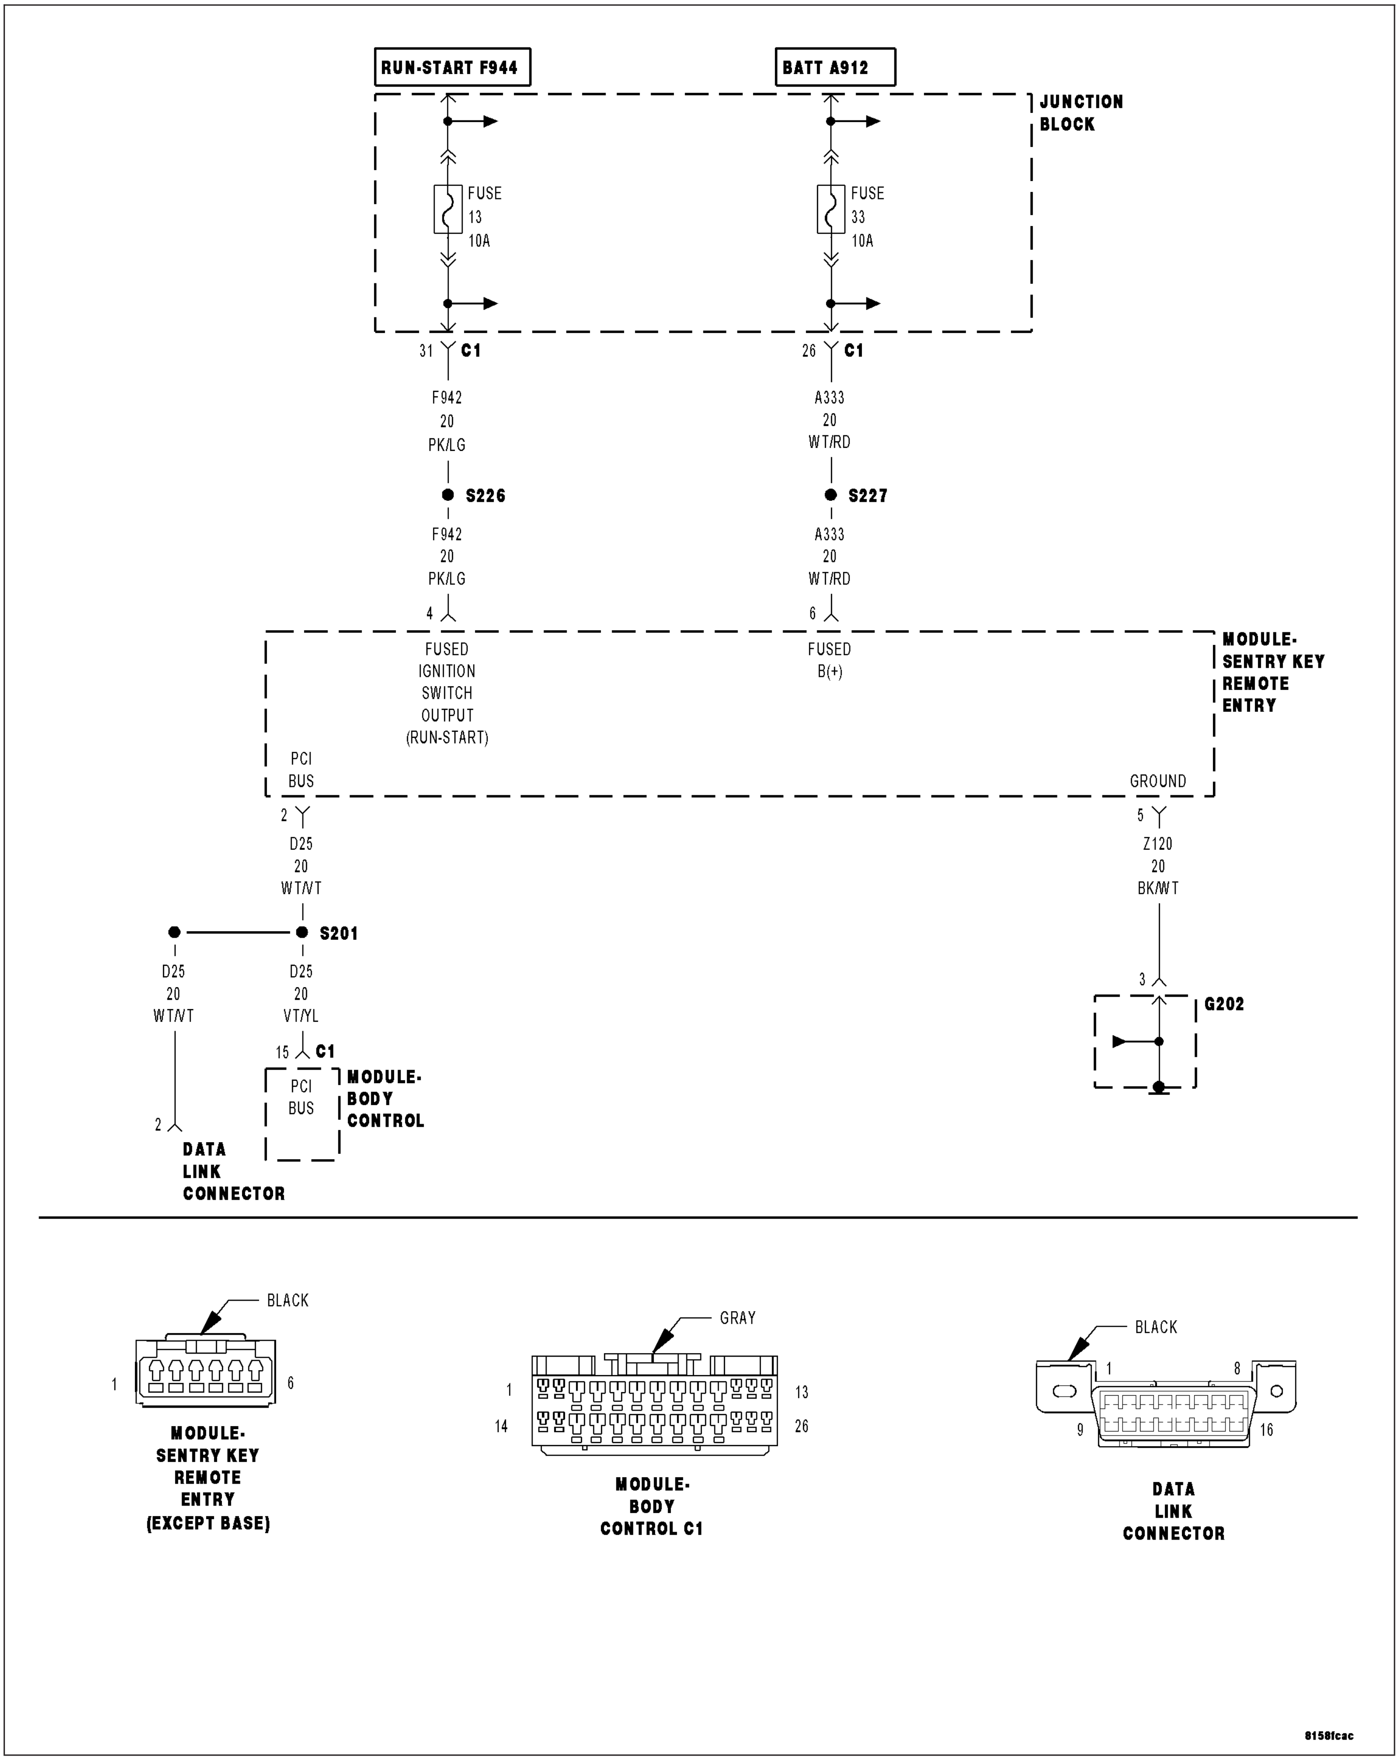
**Yes** >> Replace the Satellite Receiver in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (D25) PCI Bus circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## *NO RESPONSE FROM SENTRY KEY REMOTE ENTRY MODULE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (Z120) GROUND CIRCUIT OPEN |
| (A333) FUSED B(+) CIRCUIT OPEN |
| (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| (D25) PCI BUS CIRCUIT OPEN |
| SENTRY KEY REMOTE ENTRY MODULE (SKREEM) |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**
With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

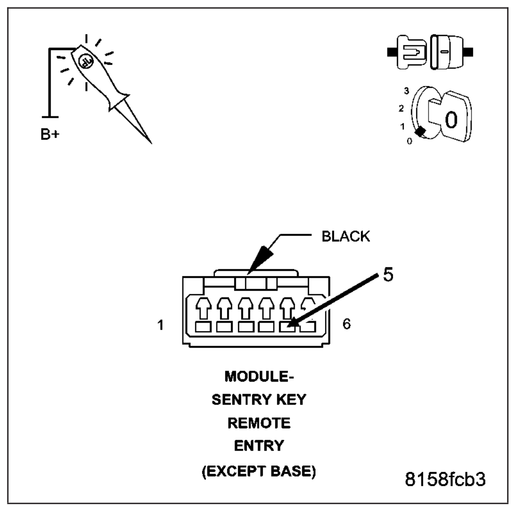
**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (Z120) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Sentry Key Remote Entry Module (SKREEM) harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Z120) ground circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (Z120) Ground circuit for an open.
Perform SKIS VERIFICATION TEST.

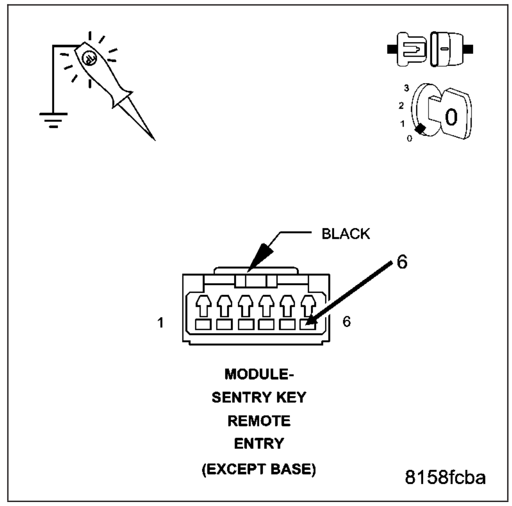
## 3. (A333) FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, probe the (A333) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (A333) Fused B(+) circuit for an open.
Perform SKIS VERIFICATION TEST.



## 4. (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

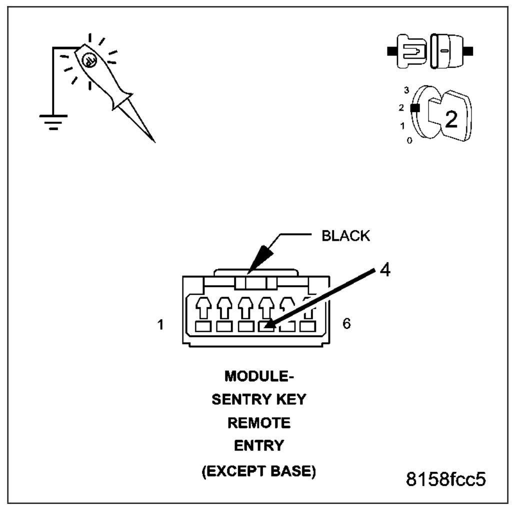
Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (F942) Fused Ignition Switch Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F942) Fused Ignition Switch Output circuit for an open.
Perform SKIS VERIFICATION TEST.

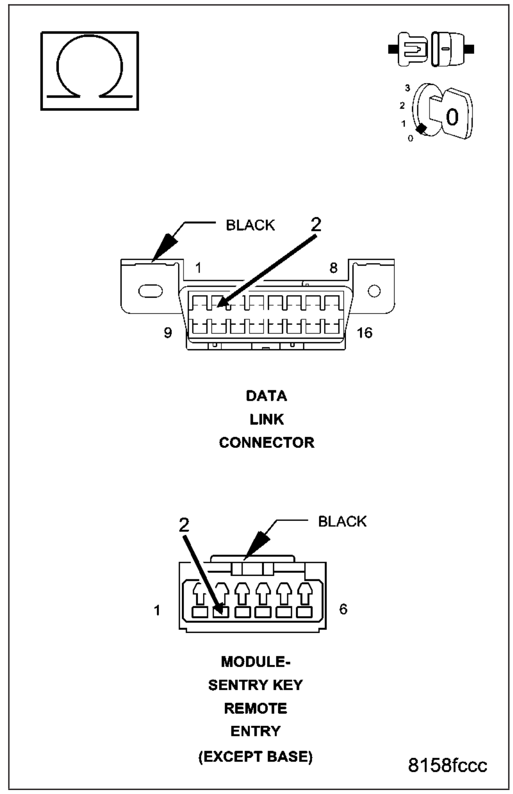


## 5. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the Sentry Key Remote Entry Module (SKREEM) harness connector.

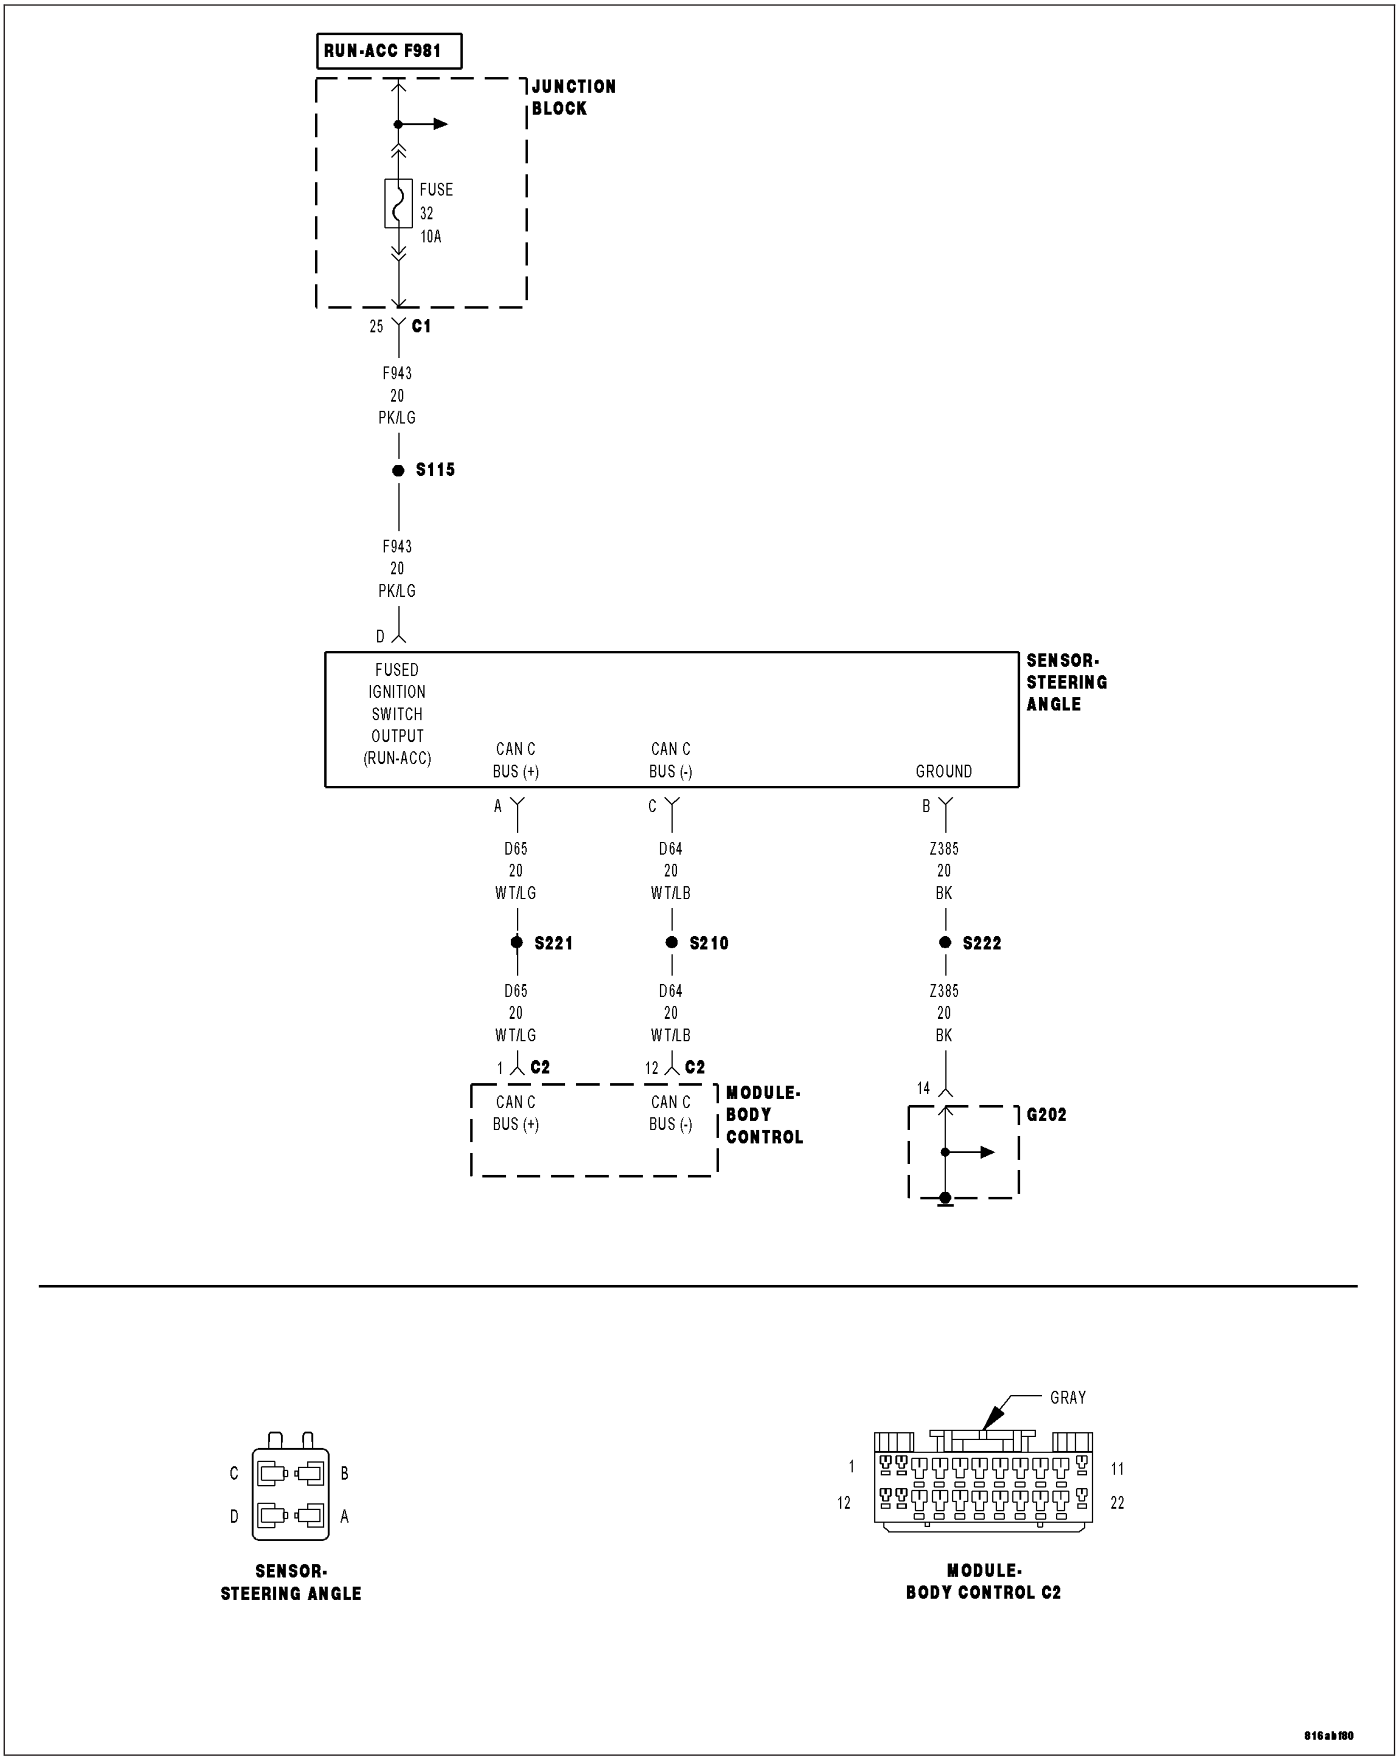


**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Sentry Key Remote Entry Module (SKREEM) in accordance with the service information.
Perform SKIS VERIFICATION TEST.

**No** >> Repair the (D25) PCI Bus circuit for an open.
Perform SKIS VERIFICATION TEST.

## *NO RESPONSE FROM THE STEERING ANGLE SENSOR (SAS)



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (F943) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED |
| (Z385) GROUND CIRCUIT OPEN |
| (D65) CAN C BUS (+) CIRCUIT OPEN |
| (D64) CAN C BUS (-) CIRCUIT OPEN |
| STEERING ANGLE SENSOR |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the sensor?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

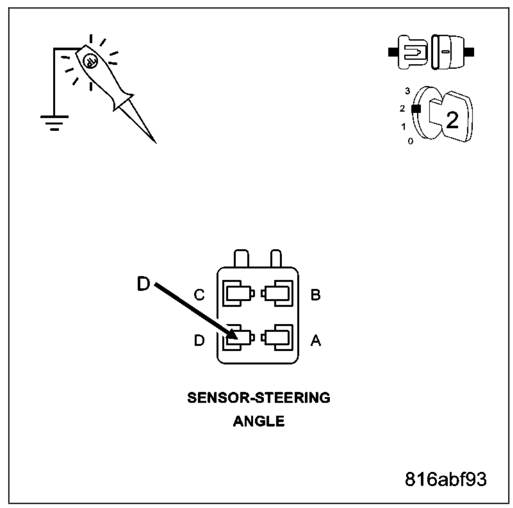
### 2. (F943) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Steering Angle Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F943) Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (F943) Fused Ignition Switch Output circuit for an open or short.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 3. (Z385) GROUND CIRCUIT OPEN

Turn the ignition off.

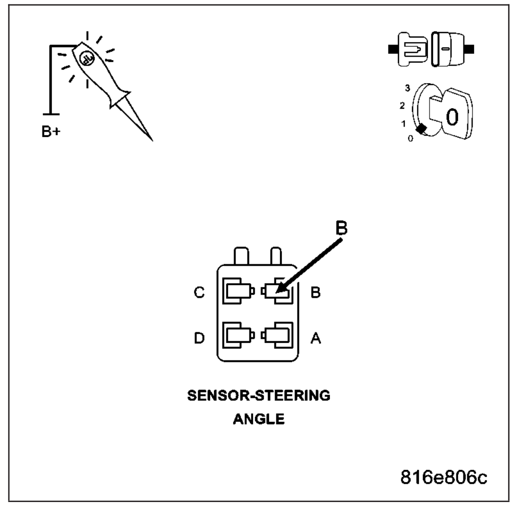
Using a 12-volt test light connected to 12-volts, check the (Z385) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z385) ground circuit for an open.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 4. (D65) CAN C BUS (+) CIRCUIT OPEN

Disconnect the scan tool from the DLC connector.

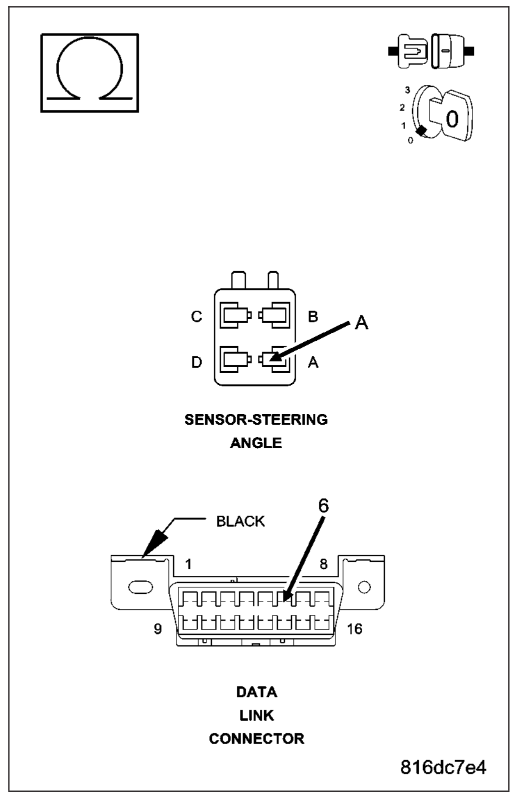
Measure the resistance of the (D65) CAN C Bus (+) circuit between the DLC connector and the Steering Angle Sensor connector.

**Is resistance below 5.0 ohms?**

**Yes** >> Go To 5

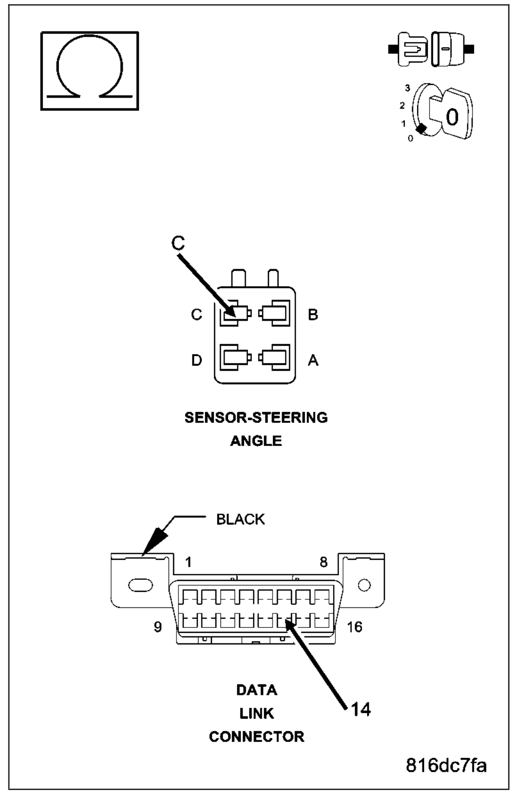
**No** >> Repair the (D65) CAN C Bus (+) circuit for an open.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 5. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the DLC connector and the Steering Angle Sensor connector.



**Is resistance below 5.0 ohms?**

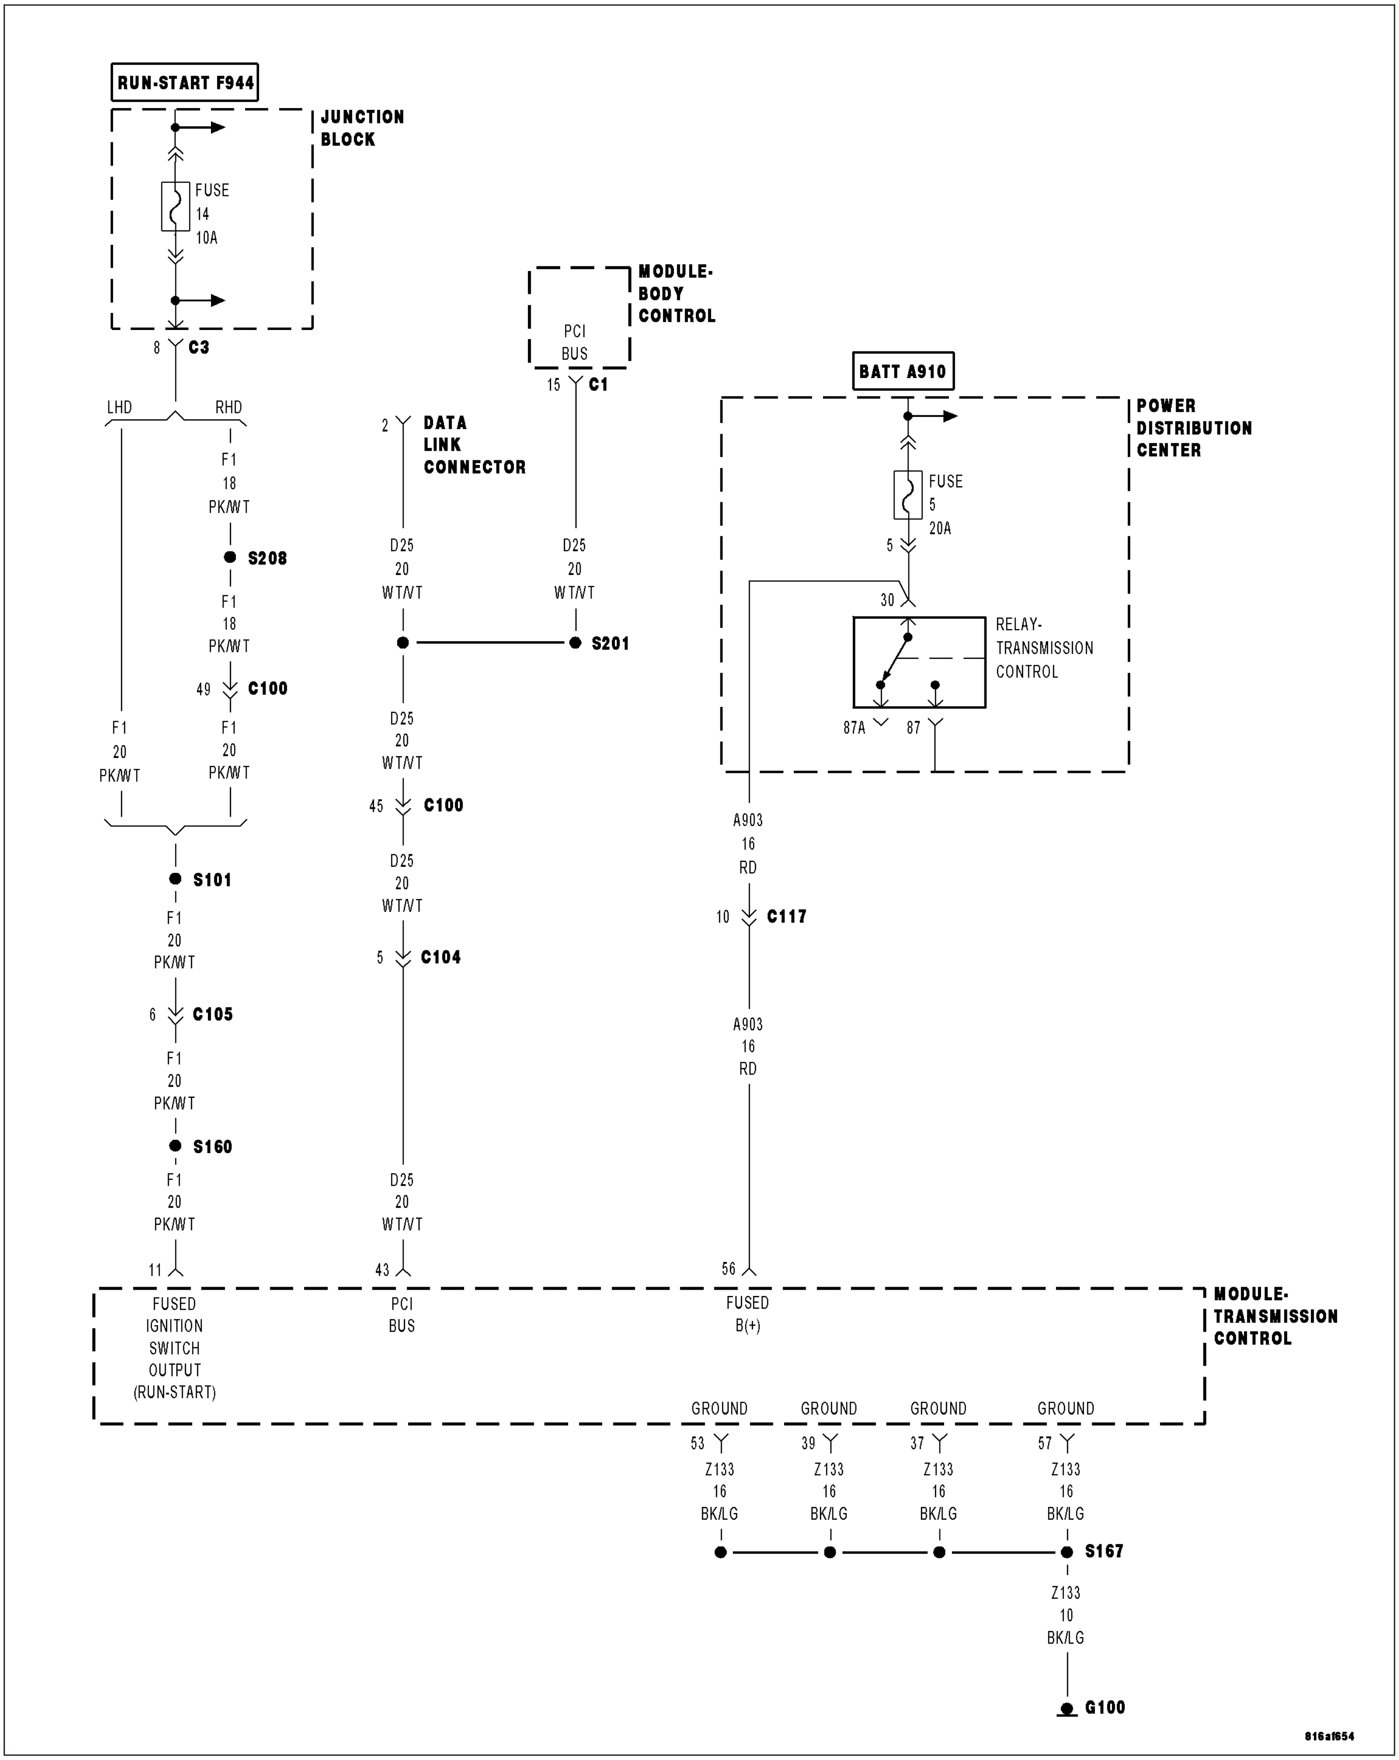
**Yes** >> Replace the Steering Angle Sensor in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (D64) CAN C Bus (-) circuit for an open.

Perform the BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *NO RESPONSE FROM TCM (TRANSMISSION CONTROL MODULE) (2.8L)



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (A903) FUSED B(+) CIRCUIT OPEN OR SHORTED |
| (Z133) GROUND CIRCUIT OPEN |
| (F1) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED |
| (D25) PCI BUS CIRCUIT OPEN |
| TRANSMISSION CONTROL MODULE |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

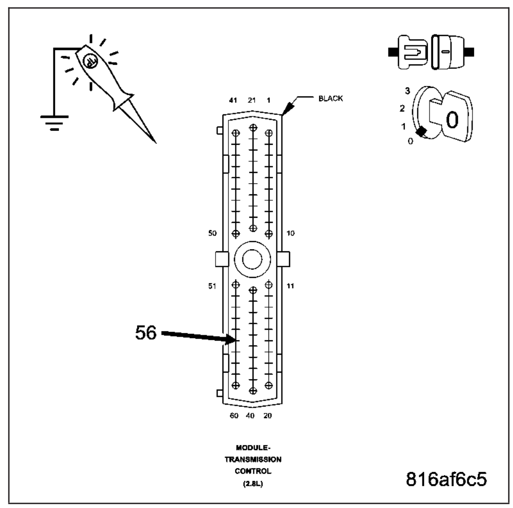
**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (A903) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the TCM harness connector.

Using a 12-volt test light connected to ground, check the (A903) Fused B(+) circuit.



**Does the test light illuminate brightly?**

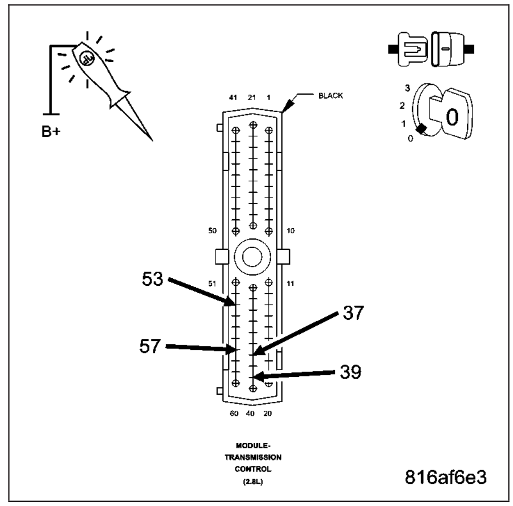
**Yes** >> Go To 3

**No** >> Repair the (A903) Fused B(+) circuit for an open or short.

Perform the appropriate POWERTRAIN VERIFICATION TEST.

## 3. (Z133) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z133) ground circuit.



**Does the test light illuminate brightly for each circuit?**

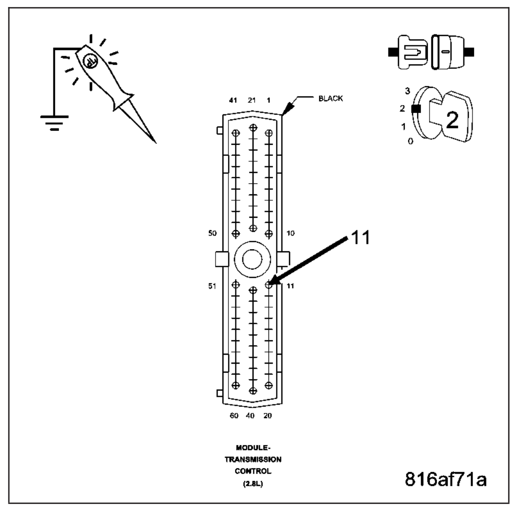
**Yes** >> Go To 4

**No** >> Repair the (Z133) ground circuit for an open.
Perform the appropriate POWERTRAIN VERIFICATION TEST.

## 4. (F1) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F1) Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 5

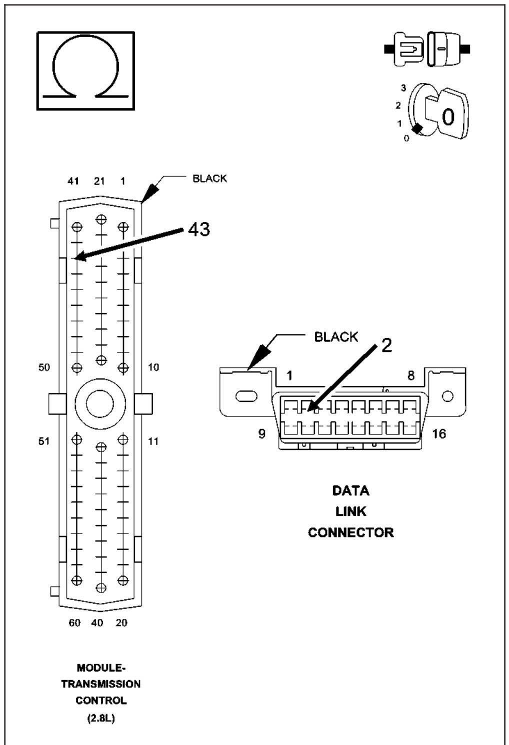
**No** >> Repair the (F1) Fused Ignition Switch Output circuit for an open or short.
Perform the appropriate POWERTRAIN VERIFICATION TEST.

## 5. (D25) PCI BUS CIRCUIT OPEN

Turn the ignition off.

Disconnect the scan tool from the DLC connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the TCM connector.



816af738

**Is the resistance below 5.0 ohms?**

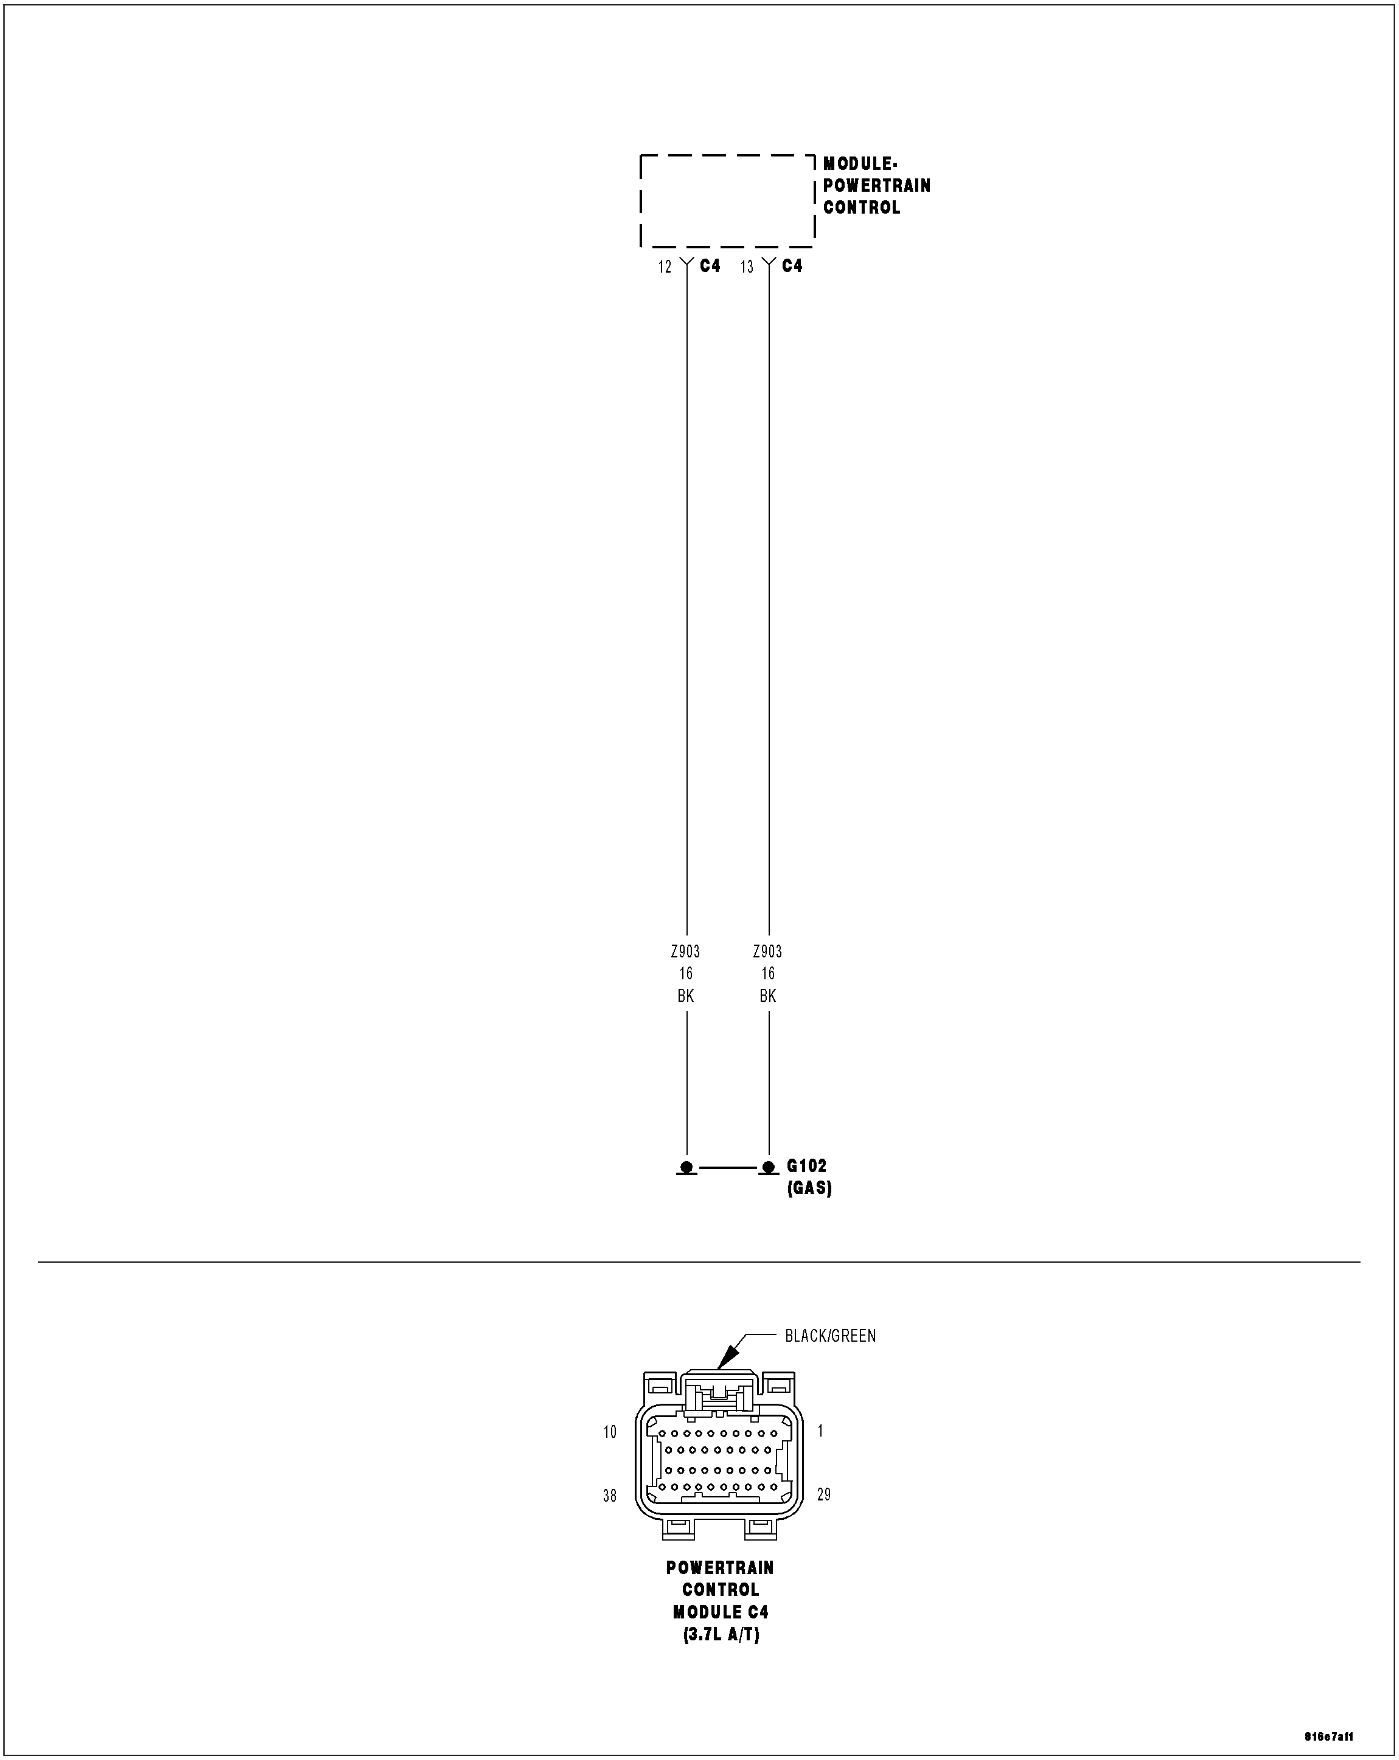
**Yes** >> Replace the Transmission Control Module in accordance with the service information.

Perform the appropriate POWERTRAIN VERIFICATION TEST.

**No** >> Repair the (D25) PCI Bus circuit for an open.

Perform the appropriate POWERTRAIN VERIFICATION TEST.

## *NO RESPONSE FROM TCM (POWERTRAIN CONTROL MODULE) - NGC



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (A209) B(+) CIRCUIT OPEN OR SHORTED |
| (Z903) GROUND CIRCUIT OPEN |
| (F1) FUSED IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED |
| (D65) CAN C BUS (+) CIRCUIT OPEN |
| (D64) CAN C BUS (-) CIRCUIT OPEN |
| POWERTRAIN CONTROL MODULE |

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**

With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

### 2. ATTEMPT TO COMMUNICATE WITH THE PCM

With the scan tool in ECU view, observe the status of the PCM.

**Does the scan tool display a red X next to the PCM?**

**Yes** >> Refer to the No Response From PCM test procedure. Refer to the table of contents in this section.

**No** >> Go To 3

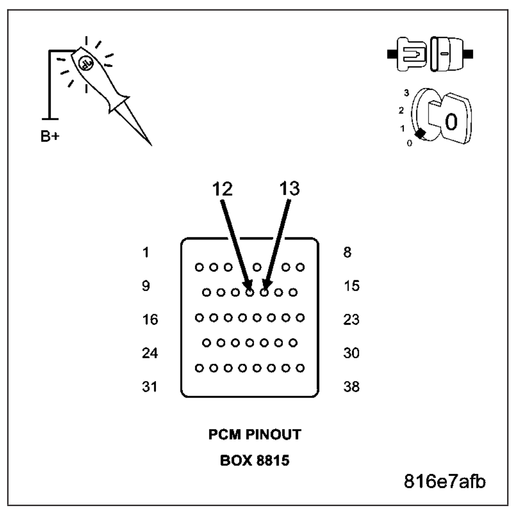
### 3. (Z903) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the PCM C4 harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Using a 12-volt test light connected to 12-volts, check the (Z903) ground circuit.

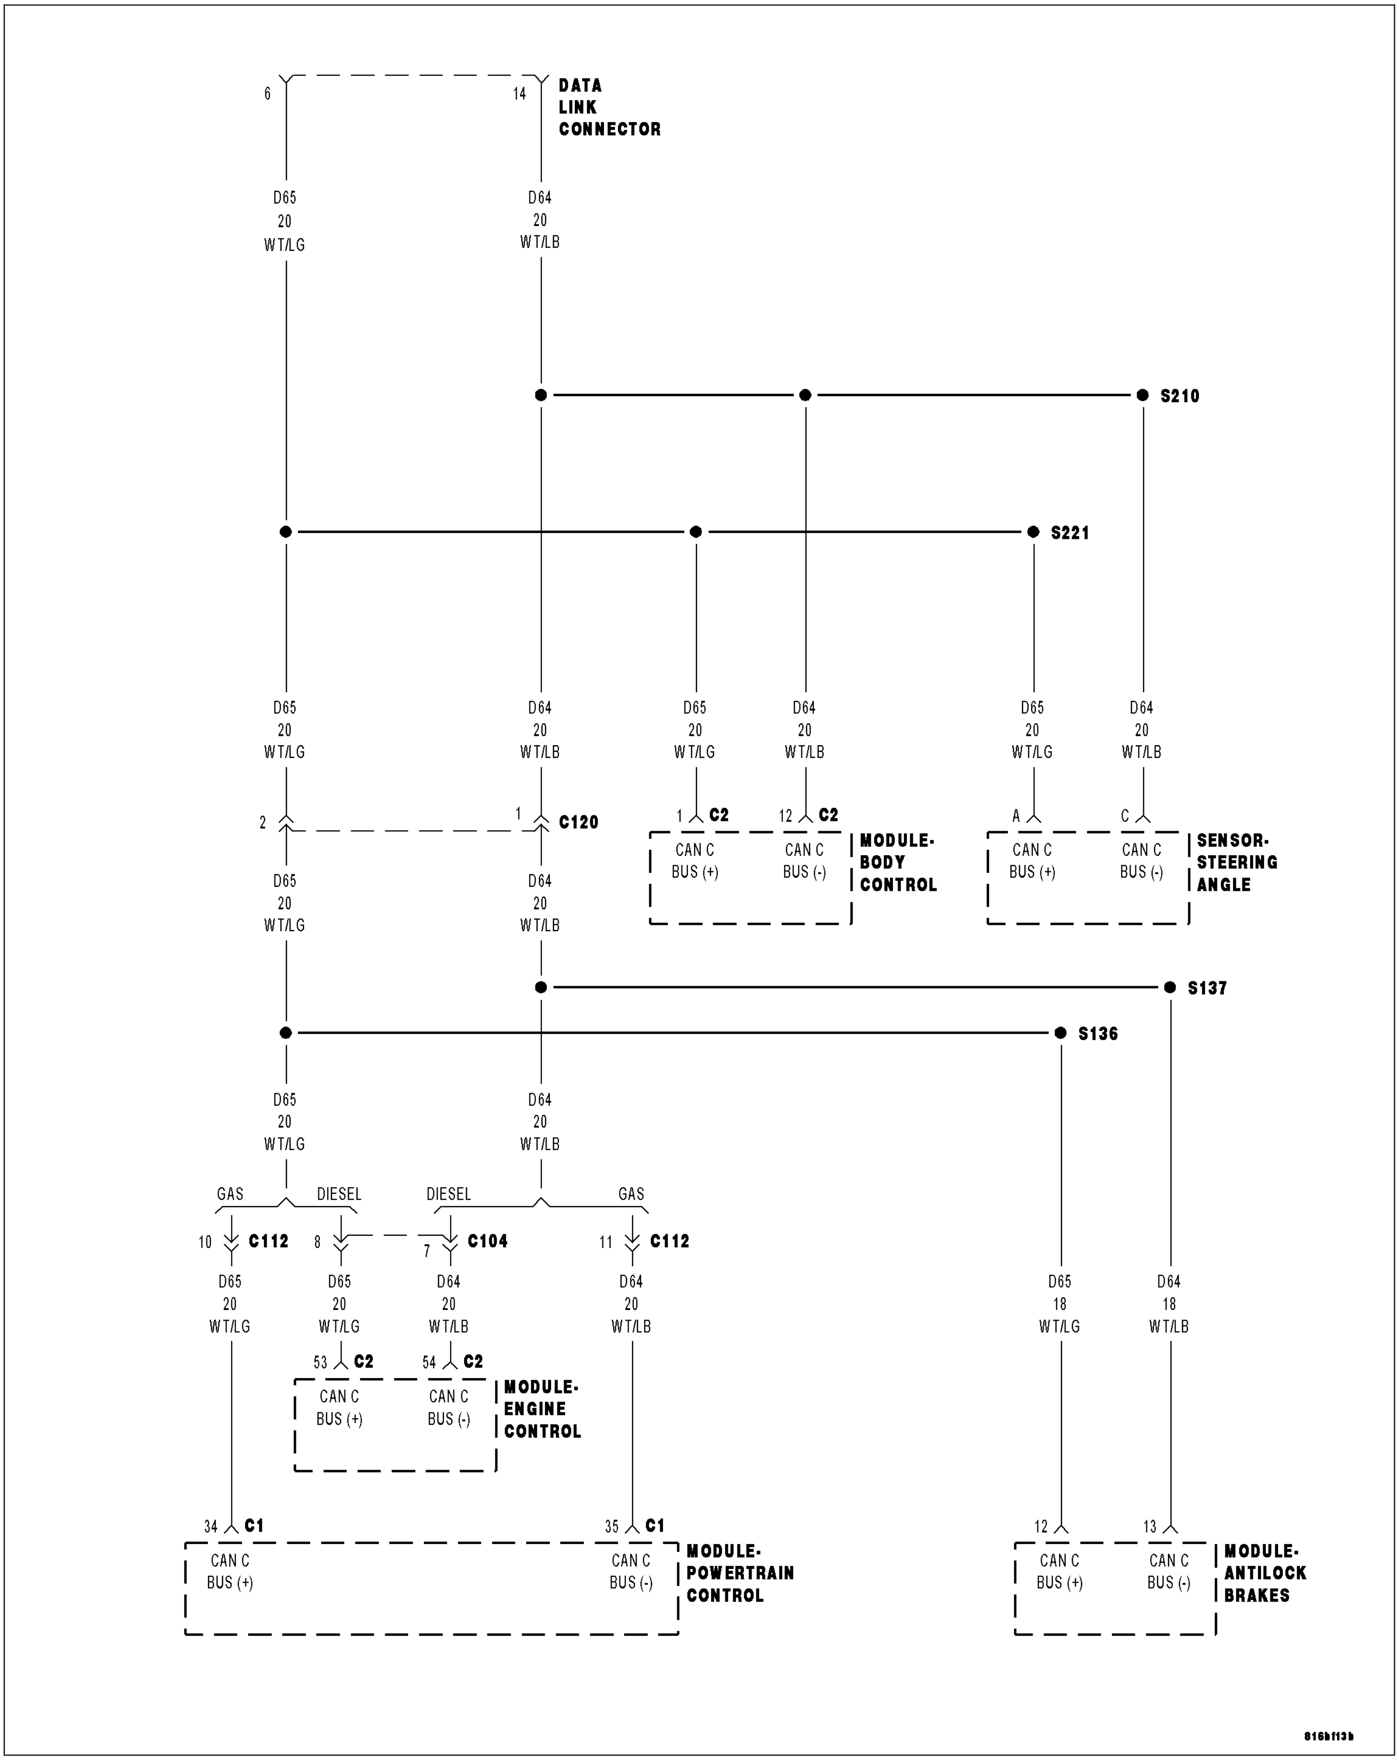


**Does the test light illuminate brightly?**

**Yes** >> Replace and program the Powertrain Control Module in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

**No** >> Repair the (Z903) ground circuit for an open.
Perform the appropriate VERIFICATION TEST.

## *CAN C BUS COMMUNICATION FAILURE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The scan tool cannot communicate with ANY module on the CAN C Bus circuit.

| Possible Causes |
|---|
| (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE |
| (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE |
| (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND |
| (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND |
| (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT |
| ANTILOCK BRAKE MODULE |
| POWERTRAIN CONTROL MODULE (PCM or ECM) |
| STEERING ANGLE SENSOR |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. VERIFY CAN C BUS COMMUNICATION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**
With the scan tool select ECU View.

**NOTE: A red X will be next to the module that is not communicating or not installed on the vehicle, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool communicate with any module on the CAN C Bus circuit?**

**Yes** >> The conditions that caused this symptom are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**No** >> Go To 2

### 2. CHECK THE D65 CAN C (+) AND (D64) CAN C (-) CIRCUITS FOR A SHORT TO VOLTAGE

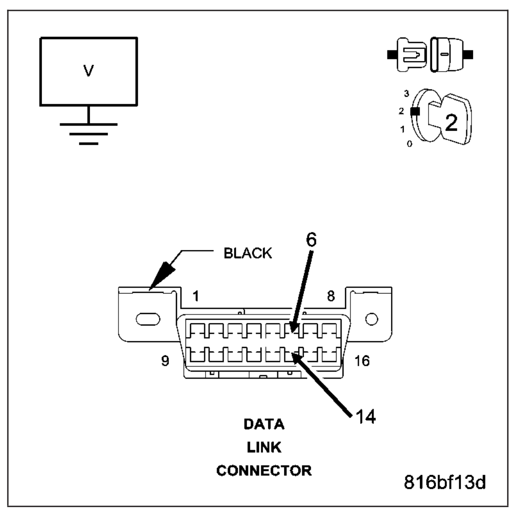
Turn the ignition on.

Measure the voltage of the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit at the DLC.

**Is the voltage steadily above 4.0 volts?**

**Yes** >> Go To 3

**No** >> Go To 4



## 3. (D65) CAN C BUS (+) CIRCUIT OR (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

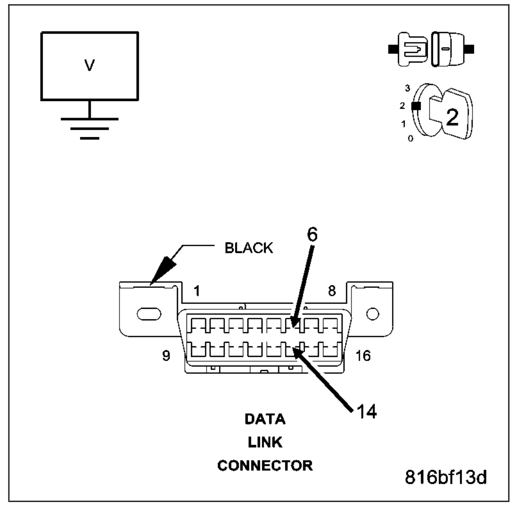
Disconnect the scan tool from the DLC.

**NOTE: Perform the following steps for each module on the CAN C Bus Circuit.**

Measure the voltage between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit and ground at the DLC.

Disconnect a module, turn the ignition on and check if the module that was disconnected was causing the short to voltage internally.

While monitoring the voltmeter, disconnect each module on the CAN C Bus Circuit one at a time.



**Is there any voltage present with all modules disconnected?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit or (D64) CAN C Bus (-) circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

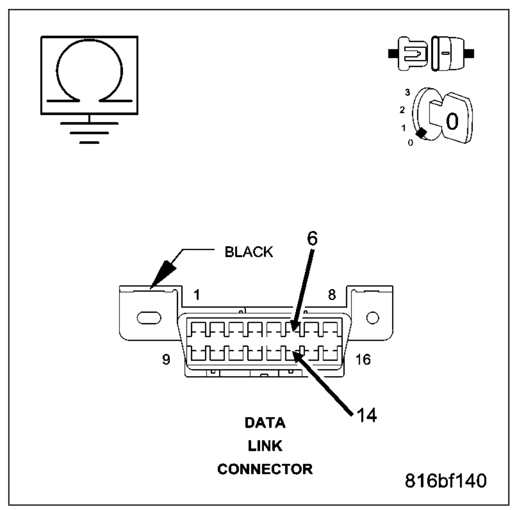
**No** >> Replace the module in accordance with the service information that when disconnected eliminated the short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 4. CHECK THE (D65) CAN C BUS (+) CIRCUIT AND THE (D64) CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between the (D65) CAN C Bus (+) circuit and ground and the (D64) CAN C Bus (-) circuit and ground at the DLC.



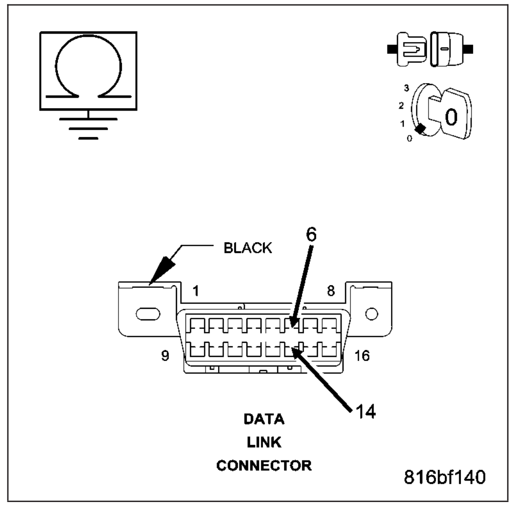
**Is the resistance below 5.0 ohms on either circuit?**

**Yes** >> Go To 5

**No** >> Go To 6

## 5. (D65) CAN C BUS (+) CIRCUIT OR (D64) CAN C (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.



**NOTE: Perform the following steps for each module on the CAN C Bus Circuit.**

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit and ground at the DLC.

Disconnect a module, check if the module that was disconnected was causing the short to ground internally.

While monitoring the ohmmeter, disconnect each module on the CAN C Bus Circuit one at a time.

**Is the resistance below 5.0 ohms with all modules disconnected?**

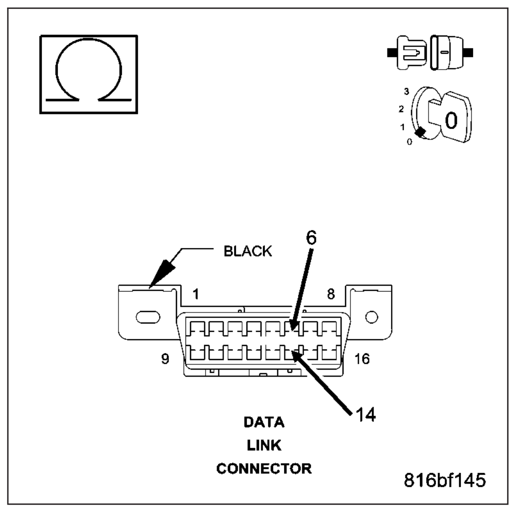
**Yes** >> Repair the (D65) CAN C Bus (+) circuit or (D64) CAN C Bus (-) circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the module in accordance with the service information that when disconnected eliminated the short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 6. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT



**NOTE: Perform the following steps for each module on the CAN C Bus Circuit.**

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit at the DLC.

Disconnect a module, check if the module that was disconnected was causing the short internally.

While monitoring the ohmmeter, disconnect each module on the CAN C Bus Circuit one at a time.

**Is the resistance below 5.0 ohms with all modules disconnected?**

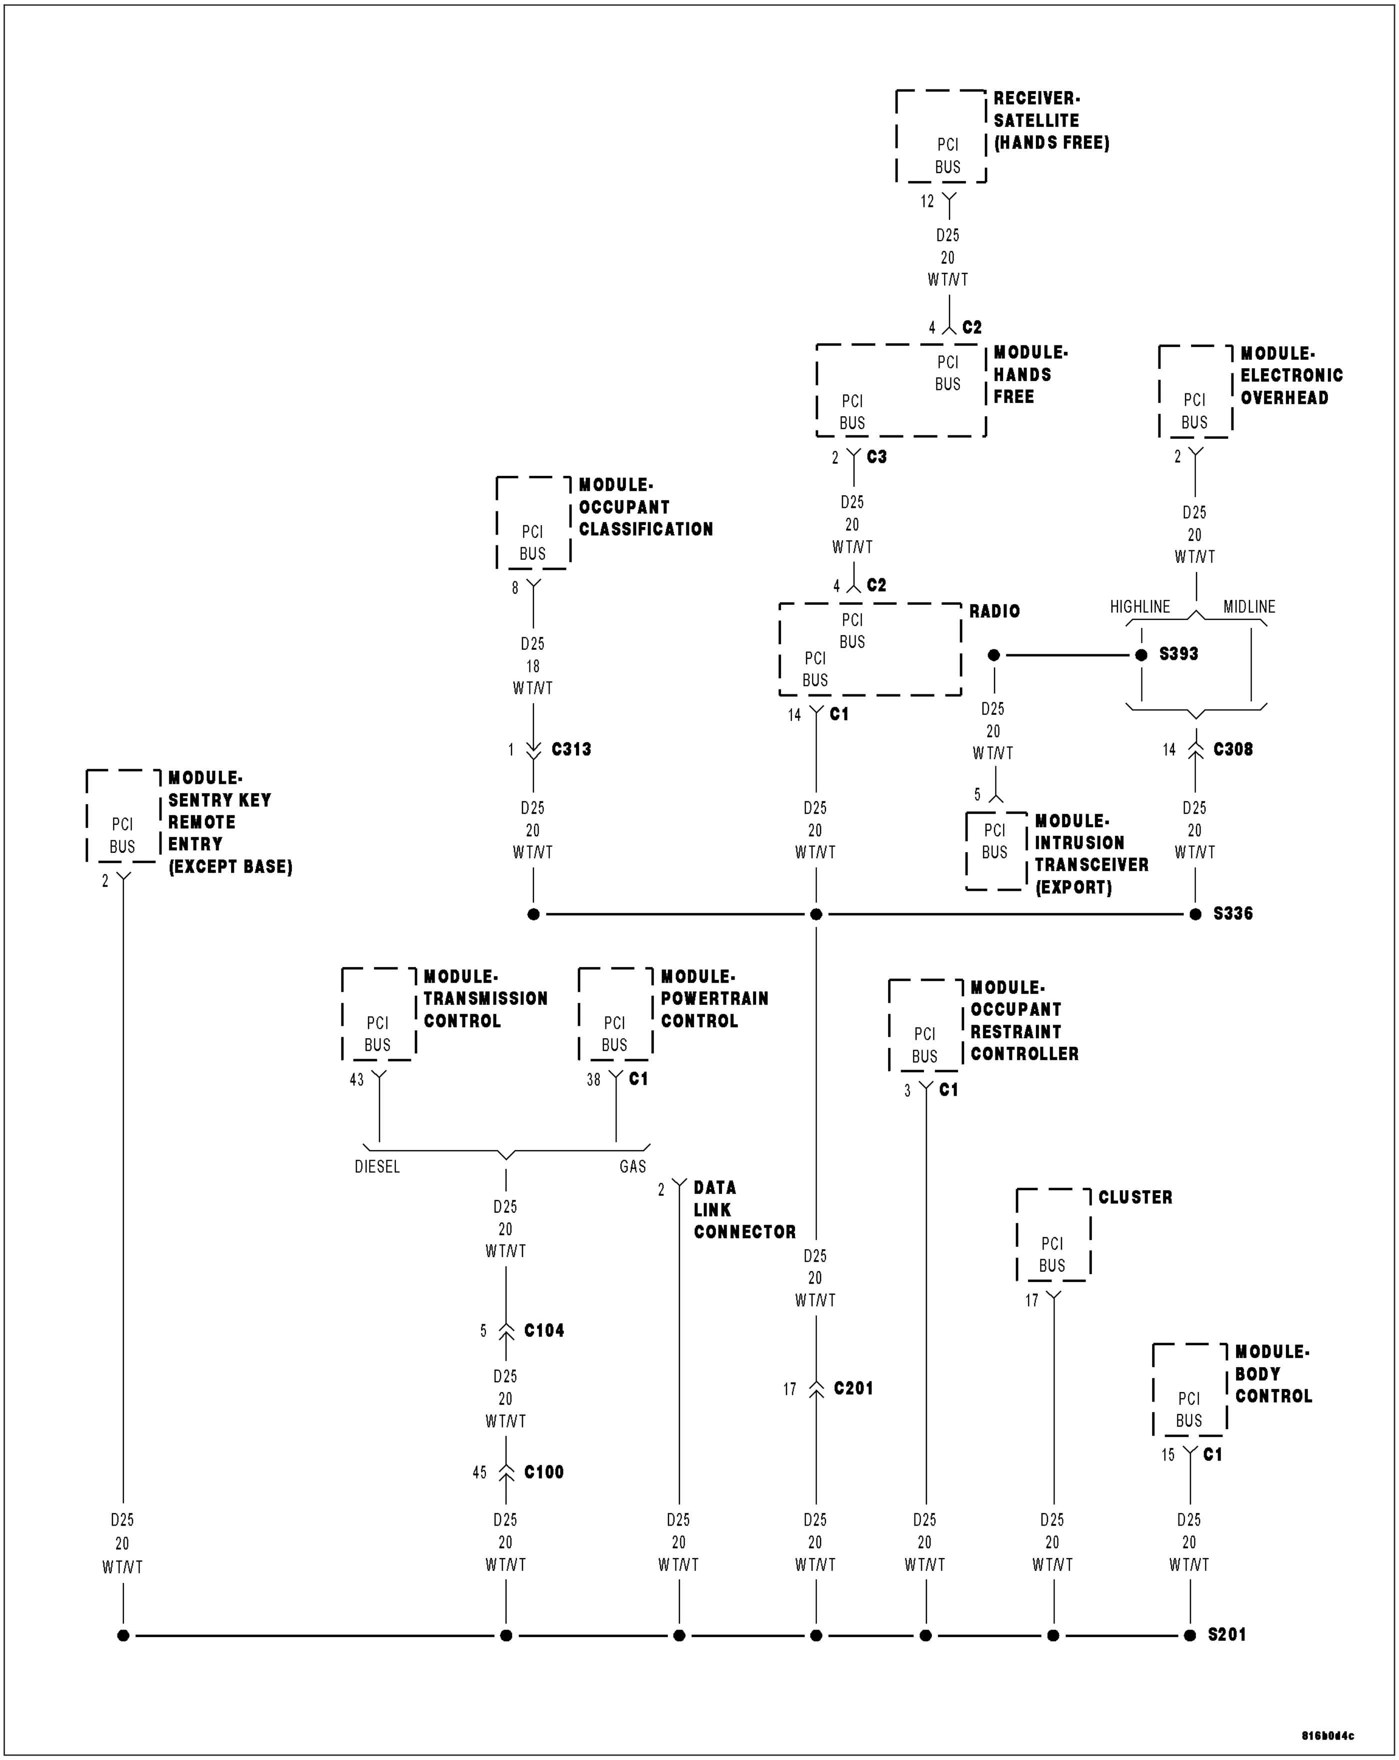
**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the module in accordance with the service information that when disconnected eliminated the short.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *PCI BUS COMMUNICATION FAILURE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (D25) PCI BUS CIRCUIT OPEN AT DATA LINK CONNECTOR (DLC) |
| (D25) PCI BUS CIRCUIT SHORTED TO GROUND |
| (D25) PCI BUS CIRCUIT SHORTED TO VOLTAGE |
| ANY PCI BUS MODULE INTERNALLY SHORTED TO GROUND |
| ANY PCI BUS MODULE INTERNALLY SHORTED TO VOLTAGE |

## Diagnostic Test

### 1. PCI BUS COMMUNICATION AND TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.**
With the scan tool, select ECU view.

**NOTE: A red X will be next to the module that is not communicating or not installed on the vehicle, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**

**Does the scan tool communicate with any module on the PCI Bus network?**

**Yes** >> The conditions that caused this symptom are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**No** >> Go To 2

### 2. (D25) PCI BUS CIRCUIT OPEN AT THE DLC

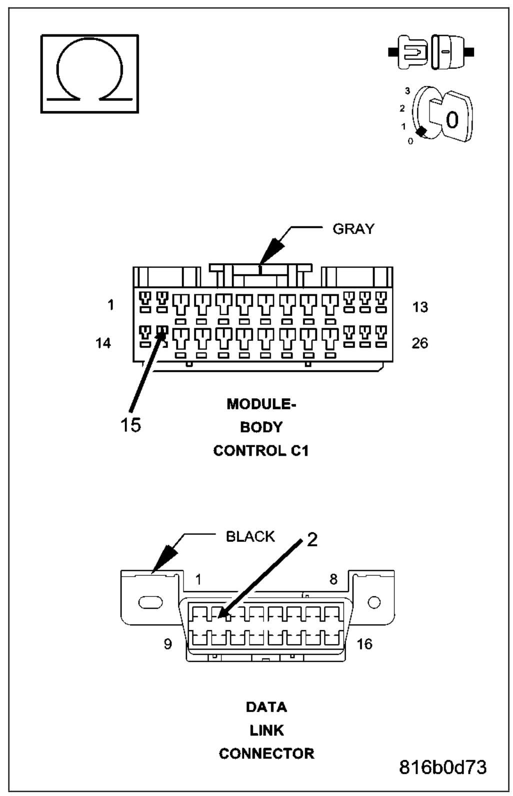
**NOTE: If the PCI Bus circuit is open between the BCM and the DLC the scan tool will be unable to identify the vehicle. Perform the test below to determine if the open condition exists causing the scan tool error.**
Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the scan tool from the DLC.

Disconnect the BCM C1 harness connector.

Measure the resistance of the (D25) PCI Bus circuit between the DLC and the BCM harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (D25) PCI Bus circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. CHECK THE (D25) PCI BUS CIRCUIT FOR A SHORT TO VOLTAGE

**NOTE: Reconnect the BCM harness connector and the negative battery cable.**

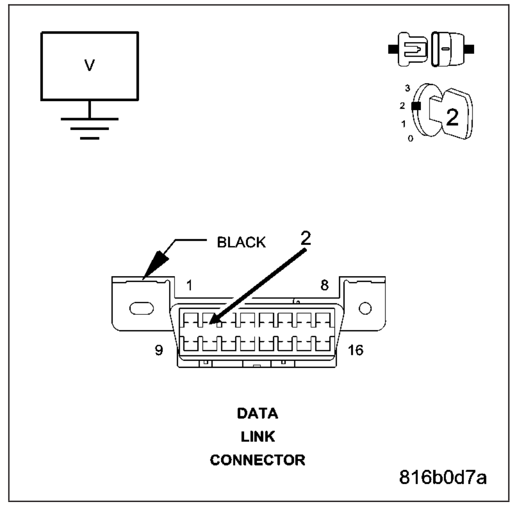
Turn the ignition on.

Measure the voltage of the (D25) PCI Bus circuit at the DLC.

**Is the voltage steadily above 7.0 volts?**

**Yes** >> Go To 4

**No** >> Go To 5



## 4. (D25) PCI BUS CIRCUIT SHORTED TO VOLTAGE

**NOTE: If the PCI Bus circuit is shorted to voltage the scan tool will be unable to identify the vehicle. Perform the test below, make the repairs as indicated. Re-attempt communication with the scan tool.**

Turn the ignition off.

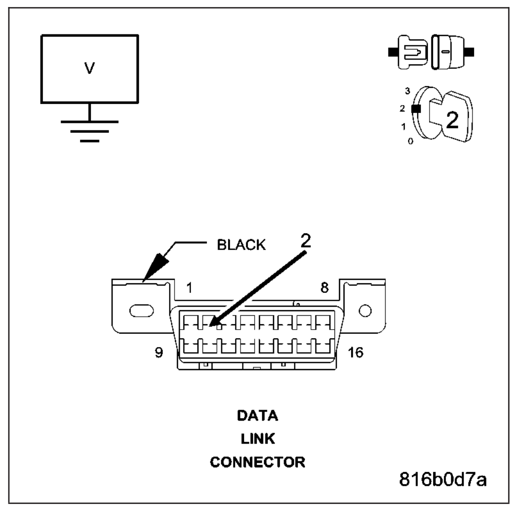
Using a voltmeter, connect one end to the (D25) PCI Bus circuit at the DLC and the other end to ground.

**NOTE: For each module on the PCI Bus perform the following steps.**

Turn the ignition off, wait one minute before disconnecting a module, turn the ignition on and check if the module disconnected was causing the short to voltage internally.

While monitoring the voltmeter, disconnect each module the vehicle is equipped with one at a time.

**Is the voltage steadily above 7.0 volts with all the modules disconnected?**



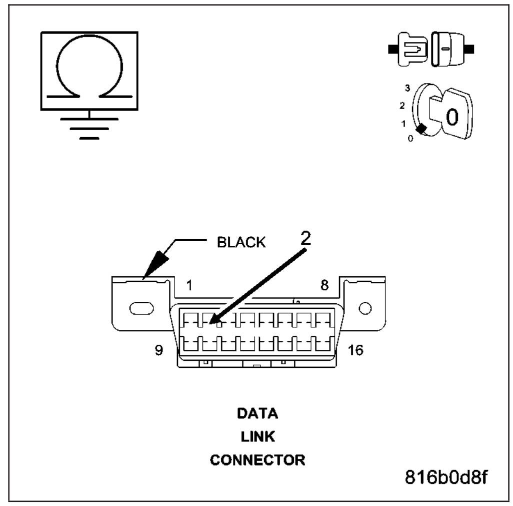
**Yes** >> Repair the (D25) PCI Bus circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace the module that when disconnected eliminated the short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. (D25) PCI BUS CIRCUIT SHORTED TO GROUND



**NOTE: If the PCI Bus circuit is shorted to ground the scan tool will be unable to identify the vehicle. Perform the test below, make the repairs as indicated. When the repair is complete unplug the IOD fuse, wait 30 seconds, and plug the fuse back in. This will re-initialize the BCM. Re-attempt communication with the scan tool.**

Turn the ignition off.

Using a ohmmeter, connect one end to the (D25) PCI Bus circuit at the DLC and the other end to ground.

While monitoring the ohmmeter, disconnect each module the vehicle is equipped with one at a time.

**NOTE: Total bus resistance to ground thru all of the modules is typically between 350 to 1000 ohms. The more modules on the PCI Bus, the lower the total resistance will be.**

**Is the resistance below 150.0 ohms with all the modules disconnected?**

**Yes** >> Repair the (D25) PCI Bus circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace the module that when disconnected the short to ground was eliminated.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## STANDARD PROCEDURE

# BODY VERIFICATION TEST – VER 1

## Diagnostic Test

### 1. Perform Body Verification Test

**NOTE: If the SKREEM, PCM or ECM was replaced, refer to the Service Information for proper programming procedures.**

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. If the Instrument Cluster was replaced, use the scan tool to insure the proper warning indicators are configured.
3. If the Body Control Module was replaced, turn the ignition on for 15 seconds (to learn the VIN). If the vehicle is equipped with VTSS, use the scan tool and enable VTSS.
4. Program tire size, country code, radio EQ setting and RKE transmitters (if the SKREEM was replaced) and all options as necessary.
5. (Export only) If the Intrusion Transceiver Module (ITM) was replaced, use the scan tool to enable ITM and program Interior Type.
6. (Export only) If the Siren was replaced, perform the scan tool Siren Replacement procedure.
7. Ensure that all accessories are turned off.
8. Ensure that the battery is fully charged.
9. Turn the ignition on.
10. With the scan tool, record and erase DTCs from all modules.
11. If any other electronic control module was replaced, select the applicable module from the scan tool menu and press “Misc. Functions”. If the module has programmable features, program as necessary.
12. Turn the ignition off, wait 10 seconds, and then turn the ignition on.
13. Operate all functions of the system that caused the original concern.
14. With the scan tool, check for DTCs in all modules.

**Are DTCs present in any of the modules or is the original condition still present?**

**Yes** >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

**No** >> The repair is complete.

# ELECTRONIC CONTROL MODULES

## TABLE OF CONTENTS

# ELECTRONIC CONTROL MODULES

## STANDARD PROCEDURE

## PCM/SKREEM PROGRAMMING

**NOTE: Before replacing the Powertrain Control Module (PCM), be certain to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM driver/control circuit failures are caused by internal component failures (i.e. relays and solenoids) and shorted circuits (i.e. pull-ups, drivers, and switched circuits). These failures are difficult to detect when a double fault has occurred and only one Diagnostic Trouble Code (DTC) has been set.**

When a Powertrain Control Module (PCM) and the Sentry Key REmote Entry Module (SKREEM) on vehicles equipped with the Sentry Key Immobilizer System (SKIS) are replaced at the same time, perform the following steps in order:

1. Program the new PCM.
2. Program the new SKREEM (also sometimes referred to as the Wireless Control Module or WCM).
3. Replace all ignition keys and program them into the new SKREEM/WCM.

### PROGRAMMING THE PCM/SKREEM

The SKIS Secret Key is an ID code that is unique to each SKREEM/WCM. This code is programmed and stored in the SKREEM/WCM, the PCM, and each ignition key transponder chip. When the PCM or SKREEM/WCM is replaced, it is necessary to program the Secret Key into the new module using a diagnostic scan tool. Follow the programming steps outlined in the diagnostic scan tool for “PCM Replaced” or “WCM Replaced” under “Miscellaneous Functions” for the “WCM/Wireless Control Module” menu item as appropriate.

**NOTE: Be certain to enter the correct country code for the SKREEM/WCM. If the incorrect country code is programmed into the SKREEM, it cannot be changed and the SKREEM must be replaced.**

**NOTE: If the PCM and the SKREEM/WCM are replaced at the same time, all vehicle ignition keys will need to be replaced and new keys programmed into the new SKREEM/WCM.**

**NOTE: Programming the PCM or SKREEM is done using a diagnostic scan tool and a PIN to enter secure access mode. If three attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. (Ensure all accessories are turned OFF. Also monitor the battery state and connect a battery charger if necessary).**

### PROGRAMMING IGNITION KEYS TO THE SKREEM

Each ignition key transponder also has a unique ID code that is assigned at the time the key is manufactured. When a key is programmed into the SKREEM/WCM, the transponder ID code is learned by the module and the transponder acquires the unique Secret Key ID code from the SKREEM/WCM. To program ignition keys into the SKREEM/WCM, follow the programming steps outlined in the diagnostic scan tool for “Program Ignition Keys or Key FOBs” under “Miscellaneous Functions” for the “WCM/Wireless Control Module” menu item.

**NOTE: A maximum of eight keys can be learned to each SKREEM. Once a key is learned to a SKREEM, that key has acquired the Secret Key for that SKREEM and cannot be transferred to any other SKREEM or vehicle.**

If ignition key programming is unsuccessful, the scan tool will display one of the following error messages:

- **Programming Not Attempted** - The scan tool attempts to read the programmed key status and there are no keys programmed into SKREEM memory.
- **Programming Key Failed (Possible Used Key From Wrong Vehicle)** - SKREEM is unable to program an ignition key transponder due to one of the following:
  - The ignition key transponder is faulty.

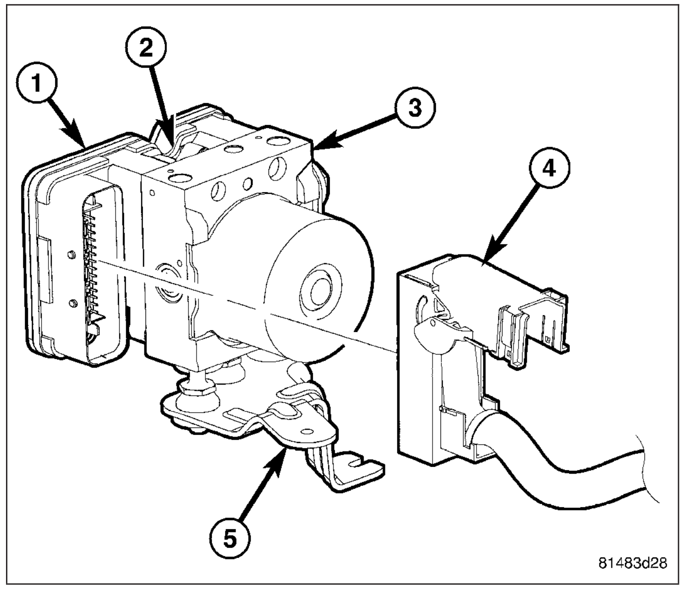
- The ignition key transponder is or has been already programmed to another vehicle.

- **8 Keys Already Learned, Programming Not Done** - The SKREEM transponder ID memory is full.
- **Learned Key In Ignition** - The ID for the ignition key transponder currently in the ignition lock cylinder is already programmed into SKREEM memory.

# MODULE-ANTILOCK BRAKE

## DESCRIPTION

The Antilock Brake Module (ABM) (1) is mounted to the Hydraulic Control Unit (HCU) (3) and operates the ABS system.

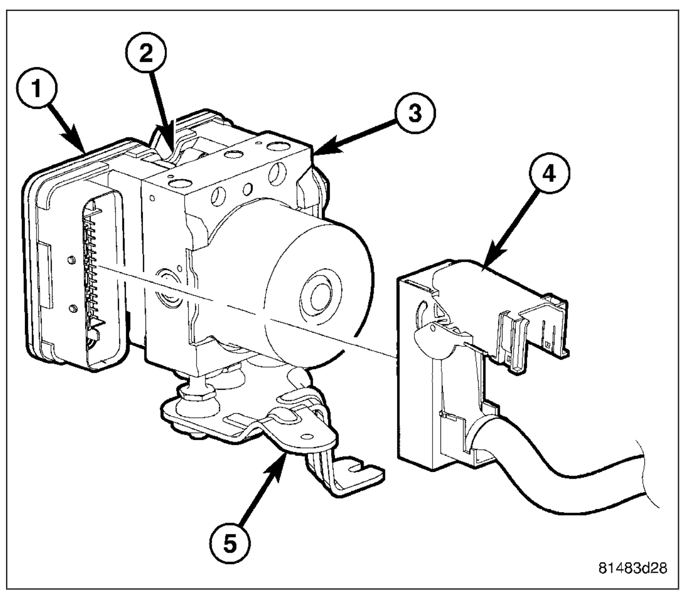


## OPERATION

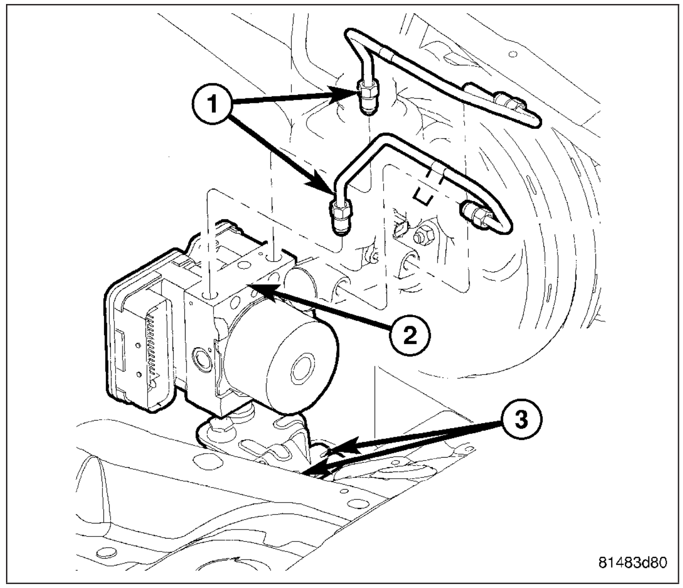
The ABM voltage source is through the ignition switch in the RUN position. The ABM contains dual microprocessors. A logic block in each microprocessor receives identical sensor signals. These signals are processed and compared simultaneously. The ABM contains a self check program that illuminates the ABS warning light when a system fault is detected. Faults are stored in a diagnostic program memory and are accessible with the scan tool. ABS faults remain in memory until cleared, or until after the vehicle is started approximately 50 times. Stored faults are **not** erased if the battery is disconnected.

## REMOVAL

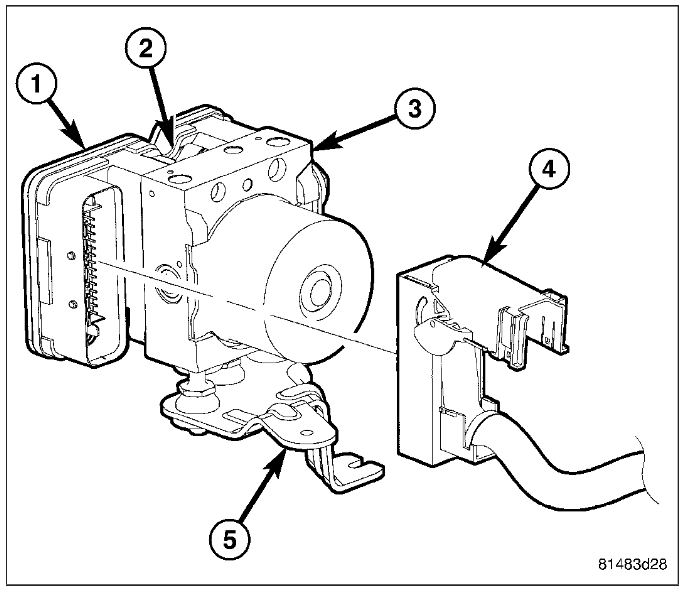
1. Remove the negative battery cable from the battery.
2. Pull up on the ABM harness connector (4) release and remove connector.
3. Remove the pump connector from the ABM.



4. Remove the brake lines (1) from the ABM (2).
5. Remove the ABM (2) mounting nuts (3).
6. Remove the ABM unit from the vehicle.



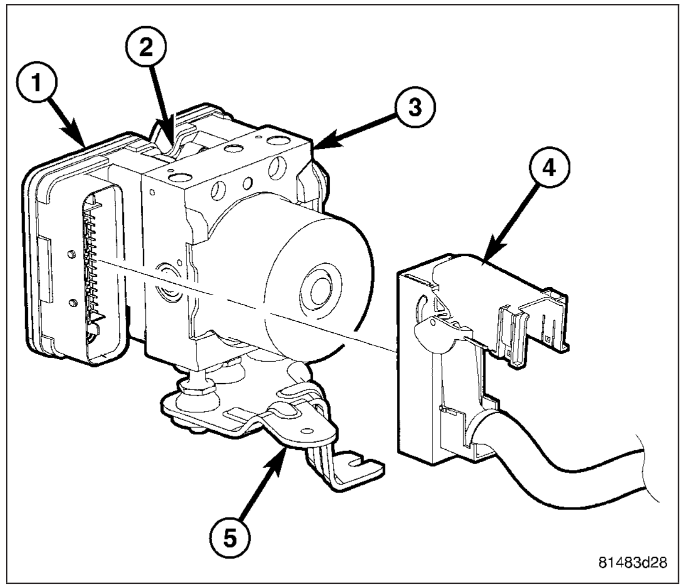
7. Remove the ABM module (1) mounting screws (2) from the ABM unit (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - DISASSEMBLY).



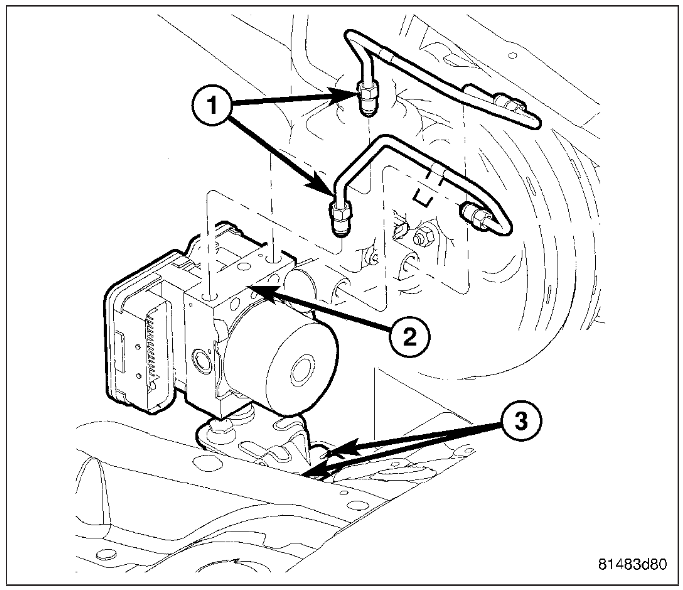
## INSTALLATION

**NOTE: If the ABM module (1) is being replaced with a new ABM module it must be reprogrammed with the use of a scan tool.**

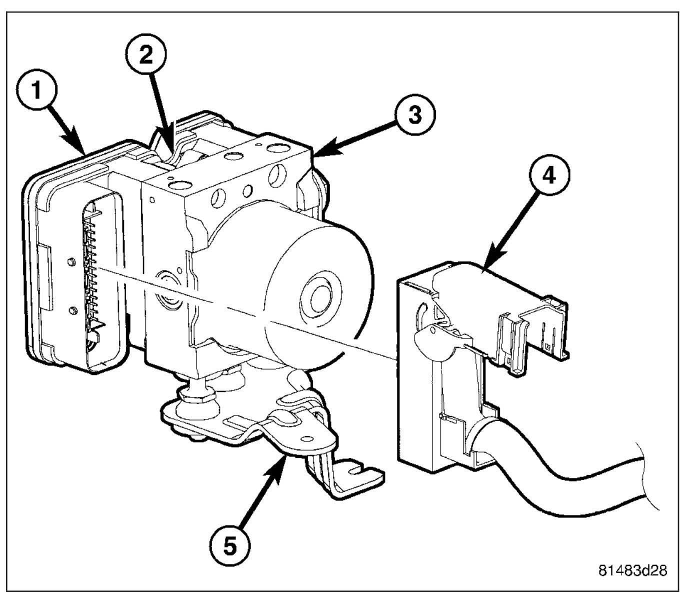
1. Install ABM module (1) to the ABM unit (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - ASSEMBLY).
2. Install mounting screws (2). Tighten to 2 N·m (16 in. lbs.).



3. Install the ABM unit (2) to the vehicle.
4. Install the ABM mounting bracket nuts (3) and tighten to 14 N·m (125 in. lbs.).
5. Install brake lines (1) to the ABM unit (2) and tighten to 20 N·m (180 in. lbs.).



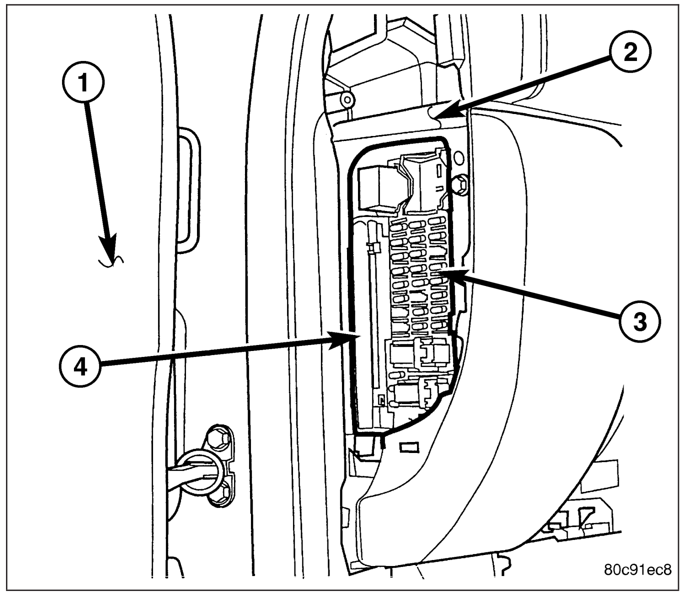
6. Install the wiring harness connector (4) to the ABM unit and push down on the release to secure the connector.
7. Install negative battery cable to the battery.
8. Bleed ABS brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).



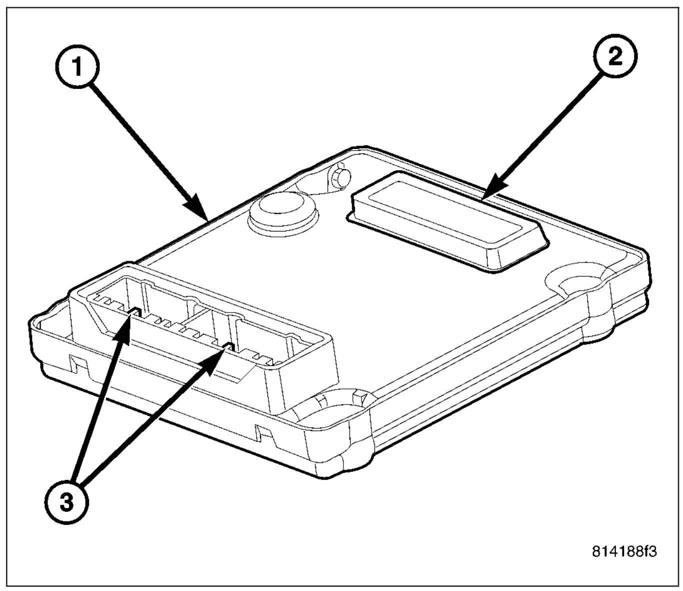
# BODY CONTROL MODULE

## DESCRIPTION

A Body Control Module (BCM) (4) is concealed behind the driver side end of the instrument panel (2) in the passenger compartment, where it is secured to the fuse panel side of the Junction Block (JB) (3) with four screws. The JB is the interface between the body, the instrument panel, and the headlamp and dash wire harnesses. The JB also contains the fuses and relays used for the interior electrical system of the vehicle.



The BCM (1) is enclosed in a molded plastic housing with two integral external connectors (3) that connect it to the vehicle electrical system through two take outs with connectors from the instrument panel wire harness. The BCM also has an integral interface connector (2) that joins it through a connector receptacle that is integral to the JB housing to the circuitry within the JB. This connector is referred to as the JB-BCM connector. The combined BCM and JB are sometimes referred to as the Junction Block Module (JBM).



The BCM utilizes integrated circuitry and information carried on the Programmable Communications Interface (PCI) data bus along with many hard wired inputs to monitor numerous sensor and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the BCM allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the PCI data bus.

Vehicles equipped with the optional Electronic Stability Program (ESP) have a hybrid bus network. The hybrid network includes some electronic nodes that communicate using a Controller Area Network (CAN-C) protocol, in addition to nodes communicating on the PCI data bus. The BCM in vehicles with a hybrid bus is also equipped to serve as the Central GateWay and may be referred to as the BCMCGW. The central gateway allows communication between nodes on the two bus networks by translating messages between them.

The electronic functions and features that the BCM supports or controls include the following:

- **A/C Select Switch Status** - The BCM monitors an input from, and transmits the status of the A/C switch in the heater-A/C control.

- **Audio System Cabin Equalization** - The BCM stores the cabin equalization curves for numerous optional speaker architectures for use by the radio. The equalization curve information allows the radio to optimize sound output for the unique combination of cabin and speaker architecture found within the vehicle. The BCM provides this information when requested by the radio over the PCI data bus.
- **Cargo Lamp Disable** - The BCM monitors an input from the cargo lamp switch to provide an interior lighting disable feature.
- **Chimes** - The chime tone transducer is located on the ElectroMechanical Instrument Cluster (EMIC) circuit board, but the EMIC goes to sleep with the ignition switch in the Off position. The BCM provides a wake-up output to the EMIC based upon inputs from the key-in ignition switch or the exterior lighting switch, then sends electronic chime request messages to the EMIC for the headlamps-on warning and key-in ignition warning.
- **Door Lock Inhibit** - The BCM monitors the key-in ignition switch and the driver side front door ajar switch to provide a door lock inhibit feature.
- **Electronic Pinion Factor** - On vehicles without the optional Antilock Brake System (ABS) the BCM provides a source voltage to the rear wheel speed sensor and monitors a returned vehicle speed signal input. The BCM is able to use the vehicle speed signal input to accurately calculate vehicle speed and distance information by applying an electronic pinion factor. This factor is based upon either a pre-programmed tire size or a Tire Revolutions per Mile (TIRE REV/MILE) value that compensates for multiple optional axle ratios and tire diameters. The correct electronic pinion factor **must** be programmed into the BCM using a diagnostic scan tool in order for the vehicle speed and distance information to be accurate. The BCM then transmits the correct vehicle speed information over the PCI data bus for use by the EMIC for control of the speedometer and odometer.
- **Enhanced Accident Response Support** - The BCM monitors an input from the Airbag Control Module (ACM) and, five seconds after a front or side airbag deployment will unlock all doors by activating the power unlock output if the power lock switch input remains inactive for two seconds. The BCM also turns on the interior lighting after an airbag deployment event, five seconds after the vehicle speed is zero. The interior lighting remains illuminated until the ignition switch is turned to the Off position, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.
- **Exterior Lamp Load Shedding** - The BCM provides a battery saver feature which will automatically turn off exterior lamps that remain on after a timed interval.
- **Exterior Lamp Status** - The BCM monitors the status of the park lamp, low beam, high beam or Daytime Running Lamp (DRL - Canada only), front fog lamp (optional), and rear fog lamp (in required markets only) relays.
- **Exterior Lighting Control** - The BCM provides exterior lamp control for standard head and park lamps, as well as Daytime Running Lamps (DRL - Canada only), front fog lamps (optional), and rear fog lamps (in required markets only). This includes support for features including optical horn (also known as flash-to-pass) and headlamp time delay.
- **Flip-Up Glass Control** - The BCM monitors inputs from the tailgate cylinder lock switch, the tailgate handle switch, the Remote Keyless Entry (RKE) system and the rear wiper switch to provide control for the rear flip-up glass actuator.
- **Fog Lamp Control** - The BCM provides fog lamp control for front fog lamps (optional), and rear fog lamps (in required markets only).
- **Front Wiper System Status** - The BCM monitors the status of the front wiper motor park switch.
- **Fuel Economy and Distance to Empty Calculations** - The BCM calculates and transmits the fuel ECOnomy (ECO) and Distance To Empty (DTE) data.
- **Headlamp Time Delay** - The BCM provides a headlamp time delay feature with the ignition switch in the Off position.
- **Heated Rear Glass Control** - The BCM provides control and timer functions for the heated rear glass feature and transmits the system status.
- **Ignition On/Off Timer** - The BCM monitors and transmits the elapsed ignition On timer data and monitors the ignition Off time.
- **Ignition Switch Position Status** - The BCM monitors and transmits the status of the ignition switch.
- **Instrument Panel Dimming** - The BCM monitors and transmits the selected illumination intensity level of the panel lamps dimmer switch.
- **Interior Lamp Load Shedding** - The BCM provides a battery saver feature which will automatically turn off all interior lamps that remain on after a timed interval.

- **Interior Lighting Control** - The BCM monitors inputs from the interior lighting switch, the door ajar switches, the flip-up glass ajar switch, the tailgate ajar switch, the cargo lamp switch, the reading lamp switches, and the RKE system to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-off and courtesy illumination defeat features.
- **Intermittent Wipe and Front Wiper System Control** - The BCM monitors inputs from the front wiper and washer switch and the front wiper motor park switch to provide front wiper system control through the wiper on/off and high/low relays. This includes support for adjustable intermittent wipe, mist wipe (also known as pulse wipe), and wipe-after-wash features.
- **Key-In-Ignition Switch Status** - The BCM monitors and transmits the status of the key-in-ignition switch.
- **Panic Mode** - The BCM provides support for the RKE system panic mode feature.
- **Parade Mode** - The BCM provides a parade mode (also known as funeral mode) that allows the interior Vacuum Fluorescent Displays (VFD) to be illuminated at full intensity while driving in daylight with the exterior lamps On.
- **Power Locks -** The BCM monitors inputs from the power lock switches and the RKE system to provide control of the power lock motors through outputs to the lock, unlock, and driver unlock relays. This includes support for rolling door locks (also known as automatic door locks) and a door lock inhibit mode.
- **Programmable Features** - The BCM provides support for several standard and optional programmable features, including: rolling door locks, headlamp time delay interval, RKE driver-door-only or unlock-all-doors, RKE optical chirp, and RKE audible chirp.
- **Remote Keyless Entry** - The BCM provides support for the RKE system features, including support for the RKE Lock, Unlock (with optional driver-door-only unlock, and unlock-all-doors), rear flip-up glass control, Panic, audible chirp, optical chirp, and illuminated entry modes.
- **Rolling Door Locks** - The BCM provides support for the power lock system rolling door locks feature (also known as automatic door locks).
- **Tailgate and Flip-Up Glass Ajar Status -** The BCM monitors and transmits the status of the tailgate and rear flip-up glass ajar switches.
- **Remote Radio Switch Interface** - The BCM monitors and transmits the status of the optional remote radio switches.
- **Self-Diagnostics** - The BCM provides support for diagnostics through communication with a diagnostic scan tool over the PCI data bus network. Each analog and digital input can be verified, and each output can be actuated through the use of this diagnostic protocol. The BCM also stores Diagnostic Trouble Codes (DTCs) to assist in the troubleshooting of this unit.
- **Vacuum Fluorescent Display Synchronization** - The BCM transmits panel lamp intensity data which allows modules with Vacuum Fluorescent Displays (VFD) to coordinate their illumination intensity.
- **Vehicle Theft Security System** - The BCM monitors inputs from the door ajar switches, the tailgate ajar switch, the flip-up glass ajar switch, the hood ajar switch (in required markets only), and the RKE system to control the features of the optional Vehicle Theft Security System (VTSS).

Hard wired circuitry connects the BCM to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the BCM through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

Many of the electronic features in the vehicle controlled or supported by the BCM are programmable using a customer programming procedure or a diagnostic scan tool. In addition, the BCM software is Flash compatible, which means it can be reprogrammed using Flash reprogramming procedures. However, if any of the BCM hardware is damaged or faulty, the entire BCM unit must be replaced.

## OPERATION

The microprocessor-based Body Control Module (BCM) monitors many hard wired switch and sensor inputs as well as those resources it shares with other electronic modules in the vehicle through its communication over the Programmable Communications Interface (PCI) data bus or the hybrid bus network. The internal programming and all of these inputs allow the BCM microprocessor to determine the tasks it needs to perform and their priorities, as well as both the standard and optional features that it should provide. The BCM programming then performs those tasks and provides those features through both PCI data bus or hybrid bus communication with other electronic modules and through hard wired outputs through a number of driver circuits, relays, and actuators. These outputs allow the BCM the ability to control numerous accessory systems in the vehicle.

The BCM operates on battery and ignition voltage inputs received through several fuses in the Junction Block (JB) on a non-switched fused B(+) circuit, through another fuse in the JB on a fused ignition switch output (run-start) circuit, and through a third fuse in the JB on a fused ignition switch output (run-acc) circuit. This arrangement allows the BCM to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the On, Start, and/or Accessory positions. All of the battery voltage circuits are connected to the BCM through the JB/BCM connector.

The BCM receives ground through five separate circuits. Three of these circuits are connected to the BCM through a connector of the instrument panel wire harness on three separate ground circuits, while the other two circuits are connected to the BCM through the JB/BCM connector. Each of these circuits receives a path to ground through the instrument panel wire harness with an eyelet terminal connector that is secured by a nut to a ground stud on the driver side instrument panel end bracket near the JB.

The BCM monitors its own internal circuitry as well as many of its input and output circuits, and will store a Diagnostic Trouble Code (DTC) in electronic memory for any failure it detects. These DTCs can be retrieved and diagnosed using a diagnostic scan tool. Refer to the appropriate diagnostic information.

## INPUT AND OUTPUT CIRCUITS

### HARD WIRED INPUTS

The hard wired inputs to the BCM include the following:

- **A/C on/off control**
- **BCM flash enable**
- **Door lock switch mux**
- **Driver door ajar switch sense**
- **Flip-up glass ajar switch sense**
- **Flip-up glass release switch sense**
- **Front fog lamp switch sense**
- **Front wiper park switch sense**
- **Front wiper switch mux**
- **Fused B(+)**
- **Fused ignition switch output (run-acc)**
- **Fused ignition switch output (run-start)**
- **Headlamp switch mux**
- **High beam switch sense**
- **Hood ajar switch sense - with VTSS - in markets where required only**
- **Key-in ignition switch sense**
- **Left rear door ajar switch sense**
- **Lightbar switch sense - Renegade with light bar only**
- **Panel lamps dimmer switch mux**
- **Passenger front door ajar switch sense**
- **Radio control mux - with remote radio switches only**
- **Rear courtesy lamp control**
- **Rear window defogger control**
- **Rear wiper intermittent driver**
- **Rear wiper on driver**

- **RHD input - connected to ground on right-hand drive models only**
- **Right rear door ajar switch sense**
- **Tailgate ajar switch sense**
- **Washer pump driver**
- **Vehicle speed signal**

Refer to the appropriate wiring information for additional details.

### HARD WIRED OUTPUTS

The hard wired outputs of the BCM include the following:

- **Accessory delay relay control - power sunroof only**
- **Courtesy lamp driver**
- **Courtesy lamp load shed**
- **Door lock relay control**
- **Door unlock relay control**
- **Driver door unlock relay control**
- **Flip-up glass release motor driver**
- **Front fog lamp relay control**
- **Front wiper high/low relay control**
- **Front wiper on/off relay control**
- **Fused B(+) - lock, unlock and driver unlock relay feed**
- **Hazard lamp control**
- **High beam relay control**
- **Horn relay control**
- **Instrument cluster wake up signal**
- **Low beam relay control**
- **Park lamp relay control**
- **Rear fog lamp relay control - with rear fog lamps in markets where required only**
- **Rear window defogger relay control**
- **Tailgate lock driver**
- **Tailgate unlock driver**
- **Vehicle speed output**
- **Vehicle speed sensor supply - except with Antilock Brake System (ABS)**
- **VTSS indicator driver - with VTSS only**

Refer to the appropriate wiring information for additional details.

### GROUNDS

The BCM receives ground through five separate circuits, and also supplies a clean ground path to several switches through the following hard wired circuits:

- **Door lock switch ground**
- **Multi-function switch ground**
- **Radio control mux return**
- **Tailgate switch ground**

Refer to the appropriate wiring information for additional details.

### COMMUNICATION

The BCM has the following communication circuits:

- **PCI bus**
- **CAN-C High bus - with ESP only**
- **CAN-C Low bus - with ESP only**

Refer to the appropriate wiring information for additional details.

## DIAGNOSIS AND TESTING

## BODY CONTROL MODULE

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired inputs to and outputs from the Body Control Module (BCM), as well as other hard wired circuits for this module may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

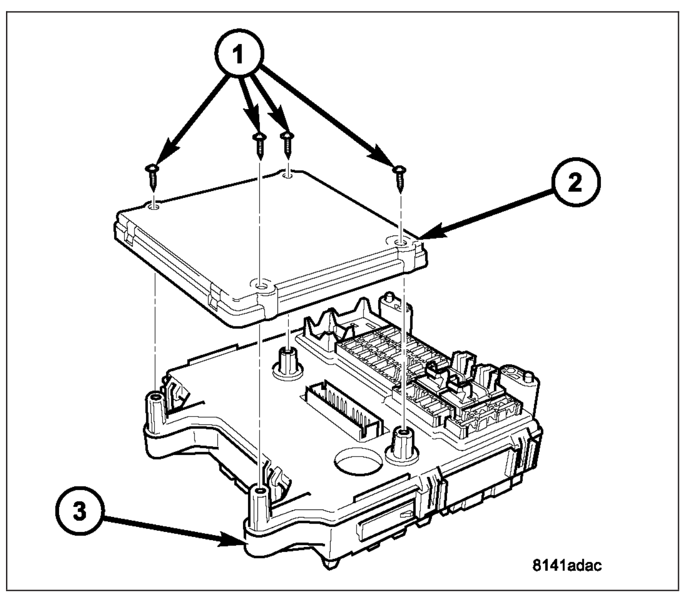
However, conventional diagnostic methods may not prove conclusive in the diagnosis of the BCM, the Programmable Communications Interface (PCI) data bus, or the electronic messages received and transmitted by the BCM over the PCI data bus. The most reliable, efficient, and accurate means to diagnose the BCM, the PCI data bus and the electronic message inputs to and outputs from this module requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: Before replacing a Body Control Module (BCM), use a diagnostic scan tool to retrieve the current settings for the many BCM programmable features including electronic pinion factor (tire size), cabin equalization curve (audio system architecture), country code and Remote Keyless Entry (RKE) system preferences. These settings MUST be programmed into the replacement BCM using the diagnostic scan tool before returning the vehicle to service. A new BCM is shipped in default mode that may prevent proper speedometer indications and the availability of numerous electronic features until it has been properly programmed. Refer to the appropriate diagnostic information.**

1. Disconnect and isolate the battery negative cable.
2. Remove the Junction Block Module (JBM) (3) from the instrument panel end bracket on the driver side of the vehicle. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - REMOVAL).
3. Remove the four screws (1) that secure the Body Control Module (BCM) (2) to the Junction Block (JB).
4. Remove the BCM from the JB.



## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: Before replacing a Body Control Module (BCM), use a diagnostic scan tool to retrieve the current settings for the many BCM programmable features including electronic pinion factor (tire size), cabin equalization curve (audio system architecture), country code and Remote Keyless Entry (RKE) system preferences. These settings MUST be programmed into the replacement BCM using the diagnostic scan tool before returning the vehicle to service. A new BCM is shipped in default mode that may prevent proper speedometer indications and the availability of numerous electronic features until it has been properly programmed. Refer to the appropriate diagnostic information.**

1. Position the Body Control Module (BCM) (2) to the Junction Block (JB) (3) and reconnect them at the JB/BCM interface connector.
2. Install and tighten the four screws (1) that secure the BCM to the JB. Tighten the screws to 2 N·m (20 in. lbs.).
3. Reinstall the Junction Block Module (JBM) onto the instrument panel end bracket. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - INSTALLATION).
4. Reconnect the battery negative cable.

# COMMUNICATION

## DESCRIPTION

The primary on-board communication network between microprocessor-based electronic control modules in this model is the DaimlerChrysler Programmable Communication Interface (PCI) data bus system. However, some modules in the vehicle use the Controller Area Network (CAN-C) data bus system in combination with the PCI bus to form a hybrid bus system. A data bus network minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one module (also referred to as a node). Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data. Each node ignores the messages on the bus that it cannot use.

The hybrid bus system has a central gateway or hub integral to a Body Control Module/Central GateWay (BCM-CGW) that is connected to both buses. The gateway physically and electrically isolates the buses from each other and coordinates the bi-directional transfer of messages between them. The BCM is located on the Junction Block (JB), which is located on the driver side instrument panel end bracket in the passenger compartment of the vehicle.

The PCI bus is a single-wire multiplex system, while the CAN-C bus is a two-wire multiplex system. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. Depending upon the optional equipment in the vehicle, the PCI bus is used for communication between most all body interior nodes, while the CAN-C bus is used exclusively by certain powertrain and chassis nodes in vehicles equipped with the hybrid bus.

In addition, certain vehicles may also be equipped with a Serial Controller Interface (SCI) or a K-Line serial link bus to provide direct diagnostic access between a diagnostic scan tool connected to the industry-standard 16-way Data Link Connector (DLC) located below the driver side instrument panel and certain powertrain nodes. The Bus Connections table identifies those nodes in this vehicle with more than one possible bus connection configuration. Those nodes that are not listed in the table are all connected to and accessed through the PCI bus.

| ***K-LINE | The K-Line bus may also referred to as the Serial Controller Interface (SCI) bus in some diagnostic information. | | | | | | |

## OPERATION

The hybrid bus network allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the low speed Programmable Communications Interface (PCI) bus or on the high speed Controller Area Network (CAN-C) bus, the message structure and layout is similar, which allows the Body Control Module Central GateWay (sometimes referred to as the BCMCGW) to process and transfer messages between the buses. The BCMCGW also stores a Diagnostic Trouble Code (DTC) for certain bus network faults.

All modules (also referred to as nodes) transmit and receive messages over one of these two buses, either the single-wire PCI bus or the two-wire CAN-C bus. Data exchange between nodes is achieved by serial transmission of encoded data messages. Each node can both send and receive serial data simultaneously. Bus messages are carried over the data bus in the form of Variable Pulse Width Modulated (VPWM) signals which, when the high and low voltage pulses are strung together, form a message. Each node uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time.

The voltage network used to transmit messages requires biasing and termination. Each module on the bus network provides its own biasing and termination. Each node terminates the bus through a terminating resistor and a terminating capacitor. There are two types of nodes on the bus. The dominant node terminates the bus through a 1 KW resistor and a 3300 pF capacitor, typically resulting in about a 3300 ohm termination resistance. However, this resistance value may vary somewhat by application. The BCM (or BCMCGW) is the only dominant node in this network. A non-dominant (or recessive) node terminates the bus through an 11 KW resistor and a 330 pF capacitor, typically resulting in about a 10800 ohm termination resistance.

## PROGRAMMABLE COMMUNICATIONS INTERFACE DATA BUS

The PCI (or J1850) data bus communication protocol exceeds the Society of Automotive Engineers (SAE) J1850 Standard for Class B Multiplexing. The PCI data bus speed is an average 10.4 Kilobits per second (Kbps).

## CONTROLLER AREA NETWORK DATA BUS

The communication protocol being used for the CAN-C data bus is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b. The CAN-C is the faster of the two primary buses in the hybrid bus system providing near real-time communication (500 Kbps).

The CAN-C bus nodes are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (–) wire. Refer to the CAN-C bus voltage table.

| CAN-C Bus Voltages (Normal Operation) | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| **Bus Circuit** | **Sleep** | **Recessive (Bus Idle)** | **Dominant (Bus Active)** | **CAN-L Short to Ground** | **CAN-H Short to Ground** | **CAN-L Short to Battery** | **CAN-H Short to Battery** | **CAN-H Short to CAN-L** |

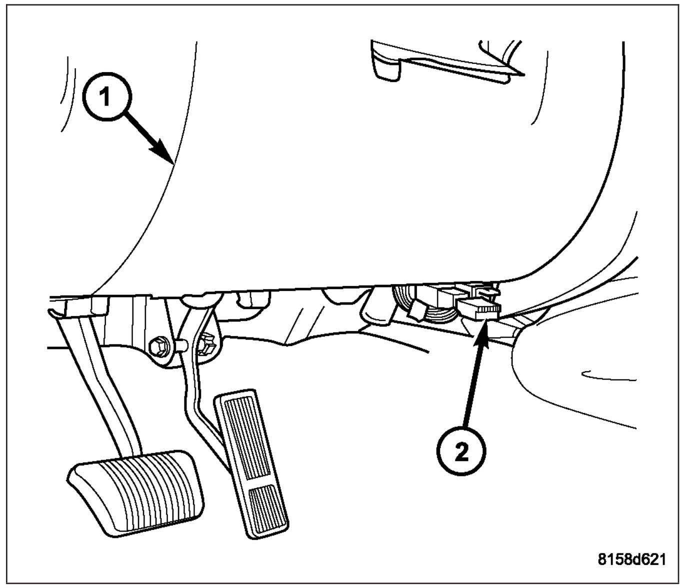
| All measurements taken between node ground and CAN terminal with a standard DVOM. | | | | | | | | |
| DVOM will display average network voltage. | | | | | | | | |
| Total resistance of CAN-C network can also be measured (60 ohms). | | | | | | | | |

The CAN-C bus network is awake only when the ignition switch is in the On or Start positions. However, an individual node on the CAN bus may still be awake with the ignition switch in the Accessory or Unlock positions. This is because the integrated circuitry of an individual node may be capable of processing certain sensor inputs and outputs without the need to utilize network resources.

# DATA LINK CONNECTOR

## DESCRIPTION

The Data Link Connector (DLC) (2) is a 16-way molded plastic connector insulator on a dedicated take out of the instrument panel wire harness. This connector is located at the lower edge of the instrument panel, inboard of the steering column. The connector insulator is retained by two screws through two integral mounting tabs to the lower instrument panel reinforcement, just below the lower edge of the instrument panel steering column opening cover (1).



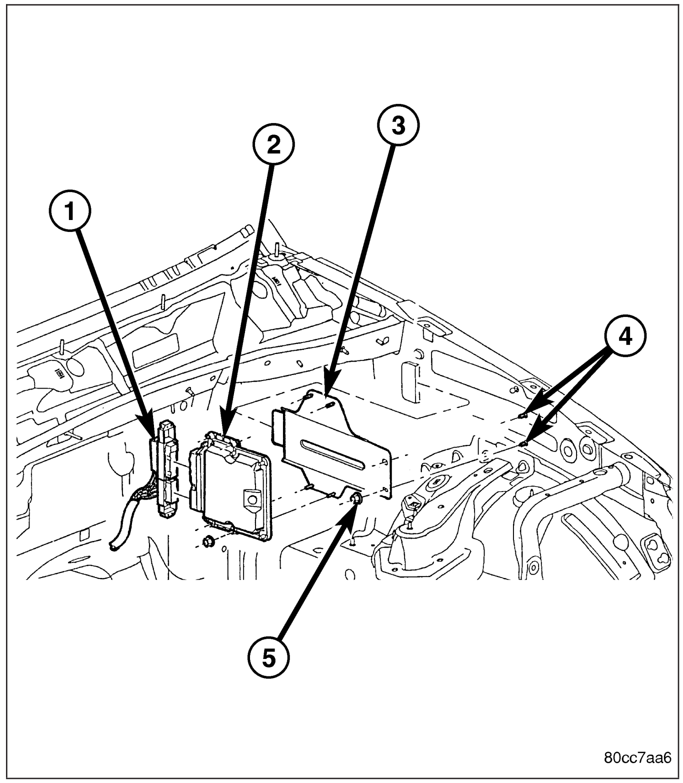
## OPERATION

The Data Link Connector (DLC) is an industry-standard 16-way connector that permits the connection of a diagnostic scan tool to the hybrid data bus network for interfacing with, configuring, and retrieving Diagnostic Trouble Code (DTC) data from the electronic modules that reside on the network within the vehicle.

# MODULE-DIESEL ENGINE CONTROL

## DESCRIPTION

The Engine Control Module (ECM) (2) is located in the left side of engine compartment attached to the left inner fender behind the battery. The ECM also incorporates the barometric pressure sensor in it's housing.



## OPERATION

The ECM has been programmed to monitor different circuits of the diesel fuel injection system. This monitoring is called on-board diagnostics. Certain criteria must be met for a diagnostic trouble code to be entered into the ECM memory. The criteria may be a range of engine rpm, engine temperature, time or other input signals to the ECM. If all of the criteria for monitoring a system or circuit are met, and a problem is sensed, then a DTC will be stored in the ECM memory. It is possible that a DTC for a monitored circuit may not be entered into the ECM memory, even though a malfunction has occurred. This may happen when the monitoring criteria have not been met. The ECM compares input signal voltages from each input device with specifications (the established high and low limits of the input range) that are programmed into it for that device. If the input voltage is not within the specifications and other trouble code criteria are met, a DTC will be stored in the ECM memory.

## ECM OPERATING MODES

As input signals to the ECM change, the ECM adjusts its response to the output devices. For example, the ECM must calculate a different fuel quantity and fuel timing for engine idle condition than it would for a wide open throttle condition. There are several different modes of operation that determine how the ECM responds to the various input signals.

**Ignition Switch On (Engine Off)**

When the ignition is turned on, the ECM activates the glow plug relay for a time period that is determined by engine coolant temperature, atmospheric temperature and battery voltage.

**Engine Start-Up Mode**

The ECM uses the engine temperature sensor and the crankshaft position sensor (engine speed) inputs to determine fuel injection quantity.

### Normal Driving Modes

Engine idle, warm-up, acceleration, deceleration and wide open throttle modes are controlled based on all of the sensor inputs to the ECM. The ECM uses these sensor inputs to adjust fuel quantity and fuel injector timing.

### Limp-In Mode

If there is a fault detected with the accelerator pedal position sensor, the ECM will set the engine speed at 1100 rpm.

### Overspeed Detection Mode

If the ECM detects engine rpm that exceeds 5200 rpm, the ECM will set a DTC in memory and illuminate the MIL until the DTC is cleared.

### After-Run Mode

The ECM transfers RAM information to ROM and performs an Input/Output state check.

## MONITORED CIRCUITS

The ECM is able to monitor and identify most driveability related trouble conditions. Some circuits are directly monitored through ECM feedback circuitry. In addition, the ECM monitors the voltage state of some circuits and compares those states with expected values. Other systems are monitored indirectly when the ECM conducts a rationality test to identify problems. Although most subsytems of the engine control module are either directly or indirectly monitored, there may be occasions when diagnostic trouble codes are not immediately identified. For a trouble code to set, a specific set of conditions must occur and unless these conditions occur, a DTC will not set.

## DIAGNOSTIC TROUBLE CODES

Each Diagnostic Trouble Code (DTC) is diagnosed by following a specific procedure. The diagnostic test procedure contains step-by-step instruction for determining the cause of the DTC as well as no trouble code problems. Refer to the appropriate Diesel Powertrain Diagnostic Manual for more information.

### HARD CODE

A DTC that comes back within one cycle of the ignition key is a hard code. This means that the problem is current every time the ECM/SKIM checks that circuit or function. Procedures in this manual verify if the DTC is a hard code at the beginning of each test. When the fault is not a hard code, an intermittent test must be performed. NOTE: If the scan tool displays faults for multiple components (i.e. ECT, VSS, IAT sensors) identify and check the shared circuits for possible problems before continuing (i.e. sensor grounds or 5-volt supply circuits). Refer to the appropriate schematic to identify shared circuits. Refer to the appropriate Diesel Powertrain Diagnostic Manual for more information.

### INTERMITTENT CODE

A DTC that is not current every time the ECM/SKIM checks the circuit or function is an intermittent code. Most intermittent DTCs are caused by wiring or connector problems. Problems that come and go like this are the most difficult to diagnose; they must be looked for under specific conditions that cause them. **NOTE: Electromagnetic (radio) interference can cause an intermittent system malfunction.** This interference can interrupt communication between the ignition key transponder and the SKIM. The following checks may assist you in identifying a possible intermittent problem:

- Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, loose fitting or corroded terminals.
- Visually inspect the related wire harness. Look for chafed, pierced or partially broken wire.
- Refer to hotlines or technical service bulletins that may apply.

Refer to the appropriate Diesel Powertrain Diagnostic Manual for more information.

**ECM DIAGNOSTIC TROUBLE CODES**

**IMPORTANT NOTE:** Before replacing the ECM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most ECM driver/control circuit failures are caused by internal failures to components (i.e. relays and solenoids) and shorted circuits (i.e. sensor pull-ups, drivers and ground circuits). These faults are difficult to detect when a double fault has occurred and only one DTC has set. If the scan tool displays faults for multiple components (i.e. VSS, ECT, Batt Temp, etc.) identify and check the shared circuits for possible problems before continuing (i.e. sensor grounds or 5-volt supply circuits). Refer to the appropriate wiring diagrams to identify shared circuits. Refer to the appropriate Diesel Powertrain Diagnostic Manual for more information.

## STANDARD PROCEDURE - PCM/ECM/SKIM PROGRAMMING - DIESEL

**NOTE: Before replacing the PCM/ECM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM/ECM driver/control circuit failures are caused by internal component failures (i.e. relay and solenoids) and shorted circuits (i.e. pull-ups, drivers and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has set.**

### PCM/SKIM PROGRAMMING

When a PCM (JTEC) and the SKIM are replaced at the same time perform the following steps in order:

1. Program the new PCM (JTEC).
2. Program the new SKIM.
3. Replace all ignition keys and program them to the new SKIM.

### ECM/SKIM PROGRAMMING

When an ECM (Bosch) and the SKIM are replaced at the same time perform the following steps in order:

1. Program the new SKIM.
2. Program the new ECM (Bosch).

### PROGRAMMING THE ECM (Bosch)

1. To program the VIN, connect the scan tool and turn the ignition on.
2. Select Engine from the main menu. The scan tool will require the VIN to be entered before continuing.
3. Select ENTER to update the VIN. The scan tool will display the updated VIN.
4. If the engine is equipped with air conditioning, the ECM A/C function must be enabled. Enable the ECM A/C function as follows:
   - Using the scan tool, select ENGINE, MISCELLANEOUS, then ENABLE/DISABLE A/C
   - Push 1 to enable A/C. The scan tool screen should display A/C Activated.

### PROGRAMMING THE PCM (JTEC)

The SKIS Secret Key is an ID code that is unique to each SKIM. This code is programmed and stored in the SKIM, PCM and transponder chip (ignition keys). When replacing the PCM it is necessary to program the secret key into the new PCM using the scan tool. Perform the following steps to program the secret key into the PCM.

1. Turn the ignition switch on (transmission in park/neutral).
2. Use the scan tool and select THEFT ALARM, SKIM then MISCELLANEOUS.
3. Select PCM REPLACED (GAS ENGINE).
4. Enter secured access mode by entering the vehicle four-digit PIN.
5. Select ENTER to update PCM VIN.

**NOTE: If three attempts are made to enter secure access mode using an incorrect PIN, secured access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. (Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary).**

6. Press ENTER to transfer the secret key (the SKIM will send the secret key to the PCM).
7. Press Page Back to get to the Select System menu and select ENGINE, JTEC (diesel only), MISCELLANEOUS, and SRI MEMORY CHECK.
8. The scan tool will ask, Is odometer reading between XX and XX? Select the YES or NO button on the scan tool. If NO is selected, the scan tool will read, Enter Odometer Reading<From I.P. odometer>. Enter the odometer reading from the Instrument Panel and press ENTER.

## PROGRAMMING THE SKIM

1. Turn the ignition switch on (transmission in park/neutral).
2. Use the scan tool and select THEFT ALARM, SKIM then MISCELLANEOUS.
3. Select PCM REPLACED (GAS ENGINE).
4. Program the vehicle four-digit PIN into SKIM.
5. Select COUNTRY CODE and enter the correct country.

**NOTE: Be sure to enter the correct country code. If the incorrect country code is programmed into SKIM, the SKIM must be replaced.**

6. Select YES to update VIN (the SKIM will learn the VIN from the PCM).
7. Press ENTER to transfer the secret key (the PCM will send the secret key to the SKIM).
8. Program ignition keys to SKIM.

**NOTE: If the PCM and the SKIM are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new SKIM.**

## PROGRAMMING IGNITION KEYS TO THE SKIM

1. Turn the ignition switch on (transmission in park/neutral).
2. Use the scan tool and select THEFT ALARM, SKIM then MISCELLANEOUS.
3. Select PROGRAM IGNITION KEY'S.
4. Enter secured access mode by entering the vehicle four-digit PIN.

**NOTE: A maximum of eight keys can be learned to each SKIM. Once a key is learned to a SKIM it (the key) cannot be transferred to another vehicle.**

If ignition key programming is unsuccessful, the scan tool will display one of the following messages:

Programming Not Attempted - The scan tool attempts to read the programmed key status and there are no keys programmed into SKIM memory.

Programming Key Failed (Possible Used Key From Wrong Vehicle) - SKIM is unable to program key due to one of the following:

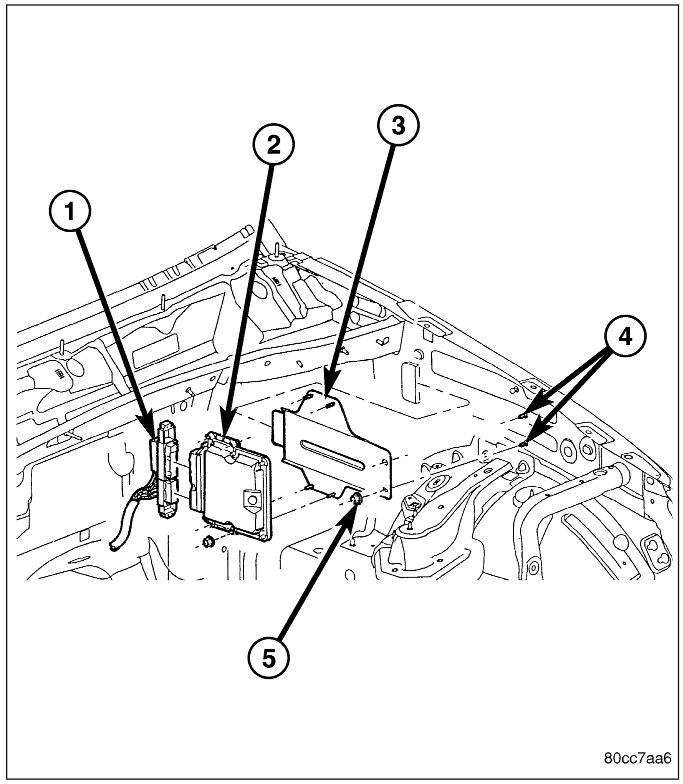
- faulty ignition key transponder
- ignition key is programmed to another vehicle.
- 8 Keys Already Learned, Programming Not Done - SKIM transponder ID memory is full.

5. Obtain ignition keys to be programmed from customer (8 keys maximum).
6. Using the scan tool, erase all ignition keys by selecting MISCELLANEOUS and ERASE ALL CURRENT IGN. KEYS.
7. Program all ignition keys.

Learned Key In Ignition - Ignition key transponder ID is currently programmed in SKIM memory.

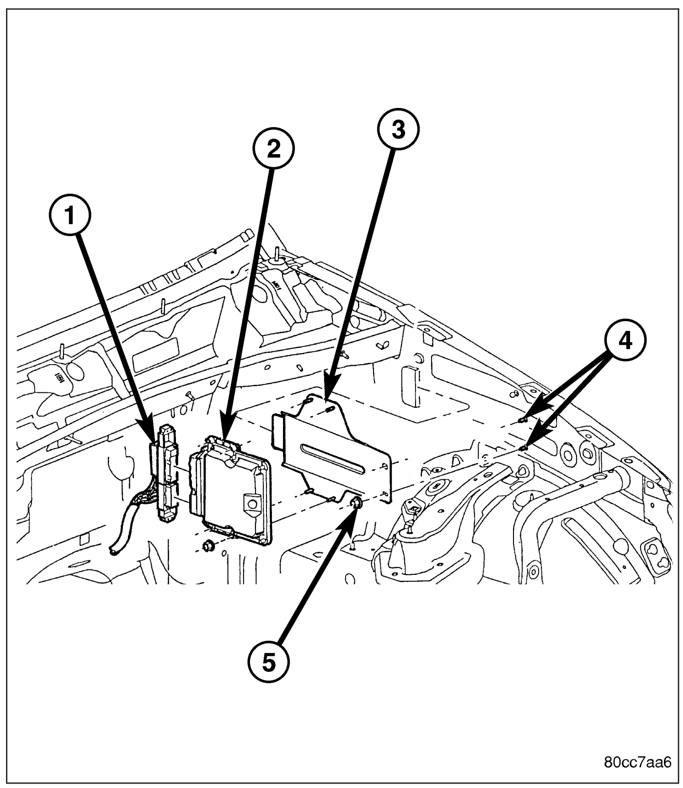
## REMOVAL

1. Disconnect negative battery cable.
2. Disconnect ECM electrical connectors (1).
3. Remove ECM bracket (3) to inner fender retaining nuts (5).
4. Remove ECM (2) and bracket assembly from vehicle.
5. Separate ECM from bracket.



## INSTALLATION

1. Install ECM (2) on bracket (3).
2. Position ECM and bracket assembly in vehicle.
3. Install ECM bracket to inner fender retaining nuts (5).
4. Connect ECM electrical connectors (1).
5. Connect negative battery cable.

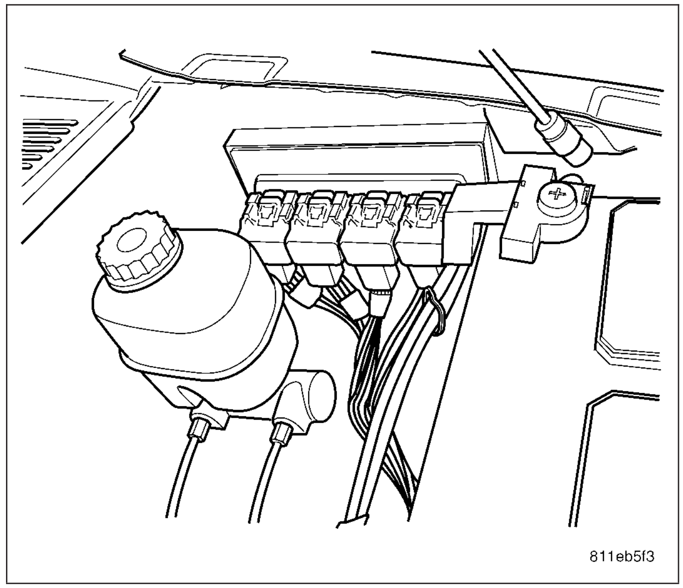


# MODULE-POWERTRAIN CONTROL

## DESCRIPTION

### PCM

The Powertrain Control Module (PCM) is located in the engine compartment.



## MODES OF OPERATION

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices. For example, the PCM must calculate different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT).

The PCM will operate in two different modes: **Open Loop and Closed Loop**.

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O2S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O2S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O2S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide Open Throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

## IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM pre-positions the Idle Air Control (IAC) motor.
- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle Position Sensor (TPS) is monitored.
- The Auto ShutDown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O2S sensor heater element is energized via the ASD or O2S heater relay. The O2S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

## ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Battery voltage
- Engine Coolant Temperature (ECT) sensor
- CranKshaft Position (CKP) sensor
- Intake manifold Air Temperature (IAT) sensor
- Manifold Absolute Pressure (MAP) sensor
- Throttle Position Sensor (TPS)
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within three seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

## ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Battery voltage
- Engine Coolant Temperature (ECT) sensor
- CranKshaft Position (CKP) sensor
- Intake manifold Air Temperature (IAT) sensor
- Manifold Absolute Pressure (MAP) sensor
- Throttle Position Sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM adjusts engine idle speed through the IAC motor and adjusts ignition timing.
- The PCM operates the A/C compressor clutch through the A/C compressor clutch relay. This is done if A/C has been selected by the vehicle operator and specified pressures are met at the high and low–pressure A/C switches. Refer to Heating and Air Conditioning for additional information.

- When engine has reached operating temperature, the PCM will begin monitoring O2S sensor input. The system will then leave the warm-up mode and go into closed loop operation.

## IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine Coolant Temperature (ECT) sensor
- CranKshaft Position (CKP) sensor
- Intake manifold Air Temperature (IAT) sensor
- Manifold Absolute Pressure (MAP) sensor
- Throttle Position Sensor (TPS)
- Camshaft position sensor signal
- Battery voltage
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the IAC motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the A/C compressor clutch relay. This is done if A/C has been selected by the vehicle operator and specified pressures are met at the high and low–pressure A/C switches. Refer to Heating and Air Conditioning for additional information.

## CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine Coolant Temperature (ECT) sensor
- CranKshaft Position (CKP) sensor
- Intake manifold Air Temperature (IAT) sensor
- Manifold Absolute Pressure (MAP) sensor
- Throttle Position Sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal -auto. trans. only)
- Oxygen (O2S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio. It also adjusts engine idle speed through the IAC motor.
- The PCM adjusts ignition timing by turning the ground path to the coil(s) on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

## ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

## DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine Coolant Temperature (ECT) sensor
- CranKshaft Position (CKP) sensor
- Intake manifold Air Temperature (IAT) sensor
- Manifold Absolute Pressure (MAP) sensor
- Throttle Position Sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Vehicle speed

If the vehicle is under hard deceleration with the proper rpm and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

Based on the above inputs, the PCM will adjust engine idle speed through the IAC motor.

The PCM adjusts ignition timing by turning the ground path to the coil on and off.

## WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Engine Coolant Temperature (ECT) sensor
- CranKshaft Position (CKP) sensor
- Intake manifold Air Temperature (IAT) sensor
- Manifold Absolute Pressure (MAP) sensor
- Throttle Position Sensor (TPS)
- Camshaft position sensor signal

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.
- The PCM adjusts ignition timing by turning the ground path to the coil(s) on and off.

## IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

# 5 VOLT SUPPLIES

Two different Powertrain Control Module (PCM) five volt supply circuits are used; primary and secondary.

# IGNITION CIRCUIT SENSE

This circuit ties the ignition switch to the Powertrain Control Module (PCM).

## POWER GROUNDS

The Powertrain Control Module (PCM) has two main grounds. Both of these grounds are referred to as power grounds. All of the high-current, noisy, electrical devices are connected to these grounds as well as all of the sensor returns. The sensor return comes into the sensor return circuit, passes through noise suppression, and is then connected to the power ground.

The power ground is used to control ground circuits for the following PCM loads:

- Generator field winding
- Fuel injectors
- Ignition coil(s)
- Certain relays/solenoids
- Certain sensors

## SENSOR RETURN

The Sensor Return circuits are internal to the Powertrain Control Module (PCM).

Sensor Return provides a low–noise ground reference for all engine control system sensors. Refer to Power Grounds for more information.

## OPERATION

## PCM

The PCM operates the fuel system. The PCM is a pre-programmed, triple microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine rpm, manifold absolute pressure, engine coolant temperature, throttle position, transmission gear selection (automatic transmission), vehicle speed, power steering pump pressure, and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

**NOTE: PCM Inputs:**

- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- A/C pressure transducer
- Auto shutdown (ASD) sense
- Battery temperature
- Battery voltage
- Brake switch
- J1850 bus (+) circuits
- J1850 bus (-) circuits
- Camshaft position sensor signal
- Crankshaft position sensor
- Data link connection for scan tool
- Engine coolant temperature sensor

- Fuel level (through J1850 circuitry)
- Generator (battery voltage) output
- Ignition circuit sense (ignition switch in on/off/crank/run position)
- Intake manifold air temperature sensor
- Knock sensors (2 on 3.7L engine)
- Leak detection pump (switch) sense (if equipped)
- Manifold absolute pressure (MAP) sensor
- Oil pressure
- Oxygen sensors
- Park/neutral switch (automatic transmission only)
- Power ground
- Power steering pressure switch
- Sensor return
- Signal ground
- Speed control multiplexed single wire input
- Throttle position sensor
- Transfer case switch (4WD range position)
- Vehicle speed sensor

**NOTE: PCM Outputs:**

- A/C clutch relay
- Auto shutdown (ASD) relay
- J1850 bus (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
- Clutch pedal position switch override relay
- Data link connection for scan tool
- EGR valve control solenoid (if equipped)
- EVAP canister purge solenoid
- Five volt sensor supply (primary)
- Five volt sensor supply (secondary)
- Fuel injectors
- Fuel pump relay
- Generator field driver (-)
- Generator field driver (+)
- Idle air control (IAC) motor
- Ignition coil(s)
- Leak detection pump (if equipped)
- Malfunction indicator lamp (Check engine lamp). Driven through J1850 circuits.
- Oxygen sensor heater relays
- Oxygen sensors (pulse width modulated)
- Radiator cooling fan relay (pulse width modulated)
- Speed control vacuum solenoid
- Speed control vent solenoid
- Tachometer (if equipped). Driven through J1850 circuits.
- Transmission convertor clutch circuit. Driven through J1850 circuits.

## 5 VOLT SUPPLIES

Primary 5 volt supply:

- supplies the required 5 volt power source to the Crankshaft Position (CKP) sensor.
- supplies the required 5 volt power source to the Camshaft Position (CMP) sensor.
- supplies a reference voltage for the Manifold Absolute Pressure (MAP) sensor.

- supplies a reference voltage for the Throttle Position Sensor (TPS).

Secondary 5 volt supply:

- supplies the required 5 volt power source to the oil pressure sensor.
- supplies the required 5 volt power source for the Vehicle Speed Sensor (VSS) (if equipped).
- supplies the 5 volt power source to the transmission pressure sensor (certain automatic transmissions).

## IGNITION CIRCUIT SENSE

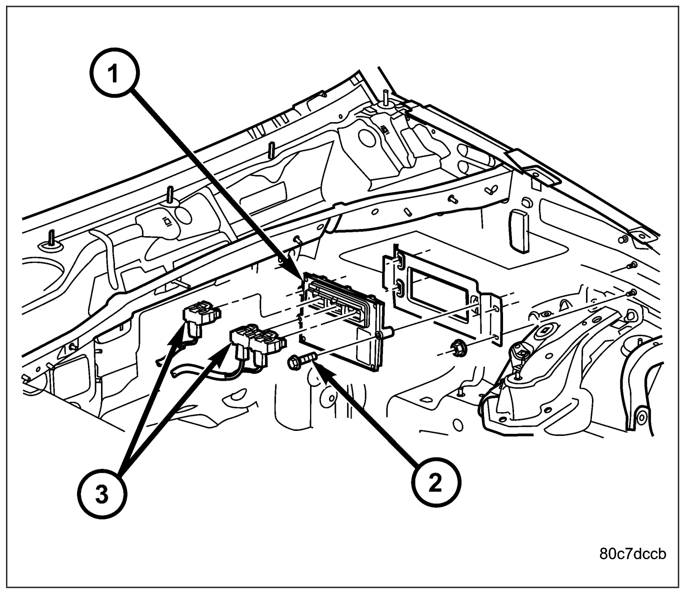
The ignition circuit sense input tells the PCM the ignition switch has energized the ignition circuit.

Battery voltage is also supplied to the PCM through the ignition switch when the ignition is in the RUN or START position. This is referred to as the ″ignition sense″ circuit and is used to ″wake up″ the PCM. Voltage on the ignition input can be as low as 6 volts and the PCM will still function. Voltage is supplied to this circuit to power the PCM's 8-volt regulator and to allow the PCM to perform fuel, ignition and emissions control functions.

## REMOVAL

**Use the scan tool to reprogram the new powertrain control module (PCM) with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a diagnostic trouble code (DTC) may be set.**

The PCM (1) is located in the engine compartment near the battery.



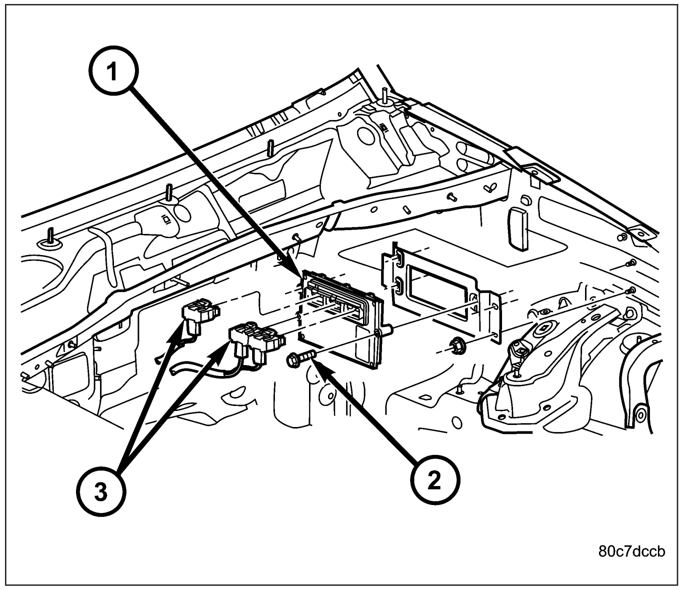
To avoid possible voltage spike damage to the PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

1. Disconnect negative battery cable at battery.
2. Remove cover over electrical connectors. Cover snaps onto PCM.
3. **NGC Modules :** Carefully unplug the four 38-way connectors from PCM. **JTEC Modules :** Carefully unplug the three 32–way connectors from PCM.
4. Remove three PCM mounting bolts (2) and remove PCM from vehicle.

## INSTALLATION

**Use the scan tool to reprogram the new powertrain control module (PCM) with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a diagnostic trouble code (DTC) may be set.**

1. Install PCM (1) and three mounting bolts (2) to vehicle.
2. Tighten bolts. Refer to torque specifications.
3. Check pin connectors in the PCM and its connectors for corrosion or damage. Also, the pin heights in connectors should all be same. Repair as necessary before installing connectors.
4. **NGC Modules :** Carefully install the four 38-way connectors into PCM. **JTEC Modules :** Carefully install the three 32–way connectors into PCM.
5. Install cover over electrical connectors. Cover snaps onto PCM.
6. Install battery cable.
7. Use the scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage.

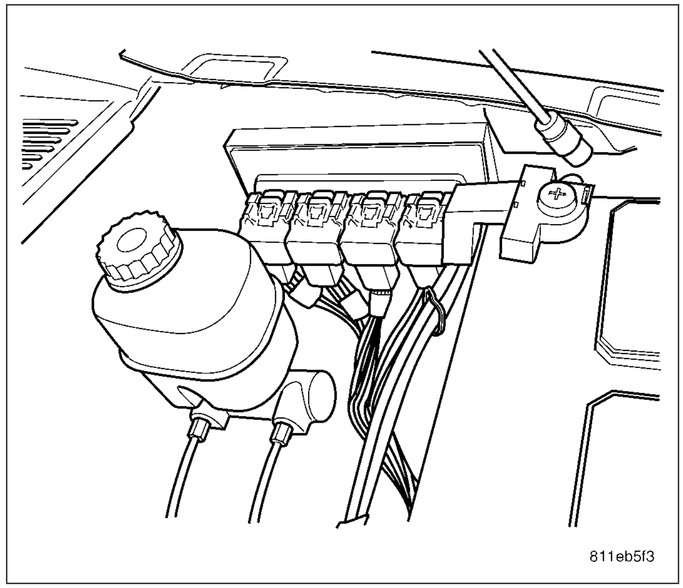


# MODULE-TRANSMISSION CONTRO

## DESCRIPTION

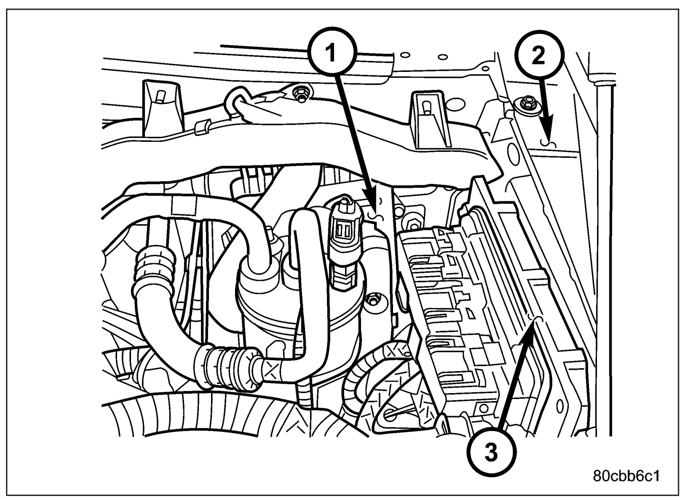
### TRANSMISSION CONTROL MODULE - GASOLINE ENGINES

The Transmission Control Module (TCM) is a sub-module within the Powertrain Control Module (PCM). The PCM is located on the left inner fender.



### TRANSMISSION CONTROL MODULE - DIESEL ENGINE

The Transmission Control Module (TCM) (3) is located in the engine compartment on the left (driver) side and is mounted to the dash panel.



## OPERATION

### TRANSMISSION CONTROL MODULE - GASOLINE ENGINES

The TCM is the controlling unit for all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hard-wired to, and used specifically by the TCM. Indirect inputs originate from other components/modules, and are shared with the TCM via the PCI bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition "ON" voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor

- CranKshaft Position sensor (CKP)
- Transmission Range Sensor (TRS)
- Pressure Switches (L/R, 2/4, OD)
- Transmission Temperature Sensor (TTS) (Integral to TRS)
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Speed Control ON/OFF Switch
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Brake Switch Status
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids (L/R, 2/4, OD and UD)
- Vehicle Speed (to PCM)
- Torque Reduction Request (to PCM)

Some examples of TCM **indirect outputs** are:

- Transmission Temperature (to PCM)
- PRNDL Position (to BCM)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indices (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with scan tool)

**NOTE: If the TCM has been replaced, the “Quick Learn Procedure” must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

## CLUTCH VOLUME INDEX (CVI)

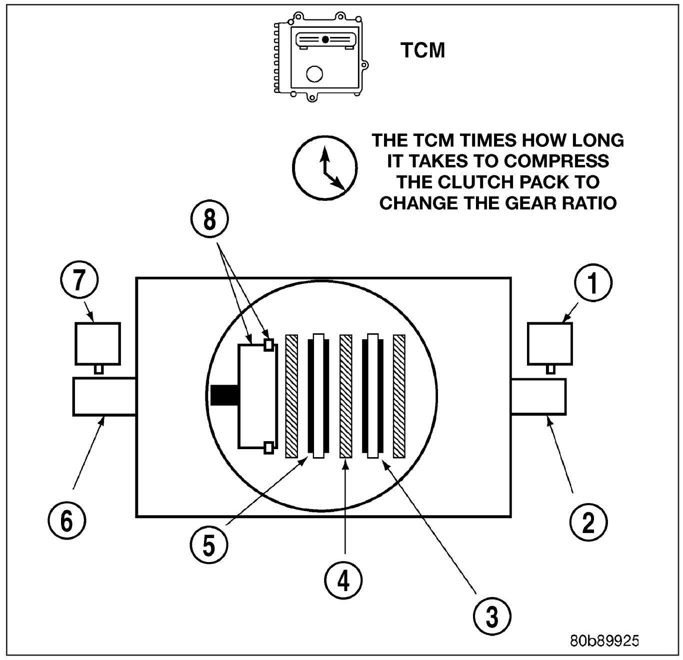
An important function of the TCM is to monitor Clutch Volume Index (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur.

Gear ratios can be determined by using the scan tool and reading the Input/Output Speed Sensor values in the “Monitors” display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.



The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly (broken return springs, out of position snap rings, excessive clutch pack clearance, improper assembly, etc.) can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

| CLUTCH VOLUMES | | | | |
|---|---|---|---|---|
| Clutch | When Updated | | | Proper Clutch Volume |
| | Shift Sequence | Oil Temperature | Throttle Angle | |
| L/R | 2-1 or 3-1 coast downshift | > 21° C (70° F) | < 5° | 35 to 83 |
| 2/4 | 1-2 shift | > 43° C (110° F) | 5 - 54° | 20 to 77 |
| OD | 2-3 shift | | | 48 to 150 |
| UD | 4-3 or 4-2 shift | | > 5° | 24 to 70 |

## SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following table 42RLE Shift Schedule to determine the appropriate operation expected, depending on driving conditions.

**42RLE Shift Schedule**

| Schedule | Condition | Expected Operation |
|---|---|---|
| **Extreme Cold** | Oil temperature at start-up below -27° C (-16° F) | Park, Reverse, Neutral and 2nd gear only (prevents shifting which may fail a clutch with frequent shifts) |

| Schedule | Condition | Expected Operation |
|---|---|---|
| **Cold** | Oil temperature at start-up above -25° C (-12° F) and below 2° C (36° F) | - Delayed 2-3 upshift (approximately 22-31 mph)<br>- Delayed 3-4 upshift (45-53 mph)<br>- Early 4-3 coastdown shift (approximately 30 mph)<br>- Early 3-2 coastdown shift (approximately 17 mph)<br>- High speed 4-2, 3-2, 2-1 kickdown shifts are prevented<br>- No EMCC |
| **Warm** | Oil temperature at start-up above 2° C (36° F) and below 27° C (80° F) | - Normal operation (upshift, kickdowns, and coastdowns)<br>- No EMCC |
| **Hot** | Oil temperature at start-up above 27° C (80° F) | - Normal operation (upshift, kickdowns, and coastdowns)<br>- Full EMCC, no PEMCC except to engage FEMCC (except at closed throttle at speeds above 70-83 mph) |
| **Overheat** | Oil temperature above 115° C (240° F) or engine coolant temperature above 118° C (244° F) | - Delayed 2-3 upshift (25-32 mph)<br>- Delayed 3-4 upshift (41-48 mph)<br>- 3rd gear FEMCC from 30-48 mph<br>- 3rd gear PEMCC from 27-31 mph |
| **Super Overheat** | Oil temperature above 127° C (260° F) | - All ″Overheat″ shift schedule features apply<br>- 2nd gear PEMCC above 22 mph<br>- Above 22 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made |

## TRANSMISSION CONTROL MODULE - DIESEL ENGINE

The Transmission Control Module (TCM) controls all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hard wired to, and used specifically by the TCM. Indirect inputs are shared with the TCM via the vehicle communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition “ON” voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor
- Crankshaft Position Sensor
- Transmission Range Sensor
- Pressure Switches
- Transmission Temperature Sensor
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor
- Line Pressure Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids
- Torque Reduction Request

Some examples of TCM **indirect outputs** are:

- Transmission Temperature (to PCM)
- PRNDL Position (to cluster/CCN)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indexes (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with scan tool)

**NOTE: If the TCM has been replaced, the "Quick Learn Procedure" must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

## BATTERY FEED

A fused, direct battery feed to the TCM is used for continuous power. This battery voltage is necessary to retain memory in the TCM. When the battery (B+) is disconnected, this memory is lost. When the battery (B+) is restored, this memory loss is detected by the TCM and a Diagnostic Trouble Code (DTC) is set.

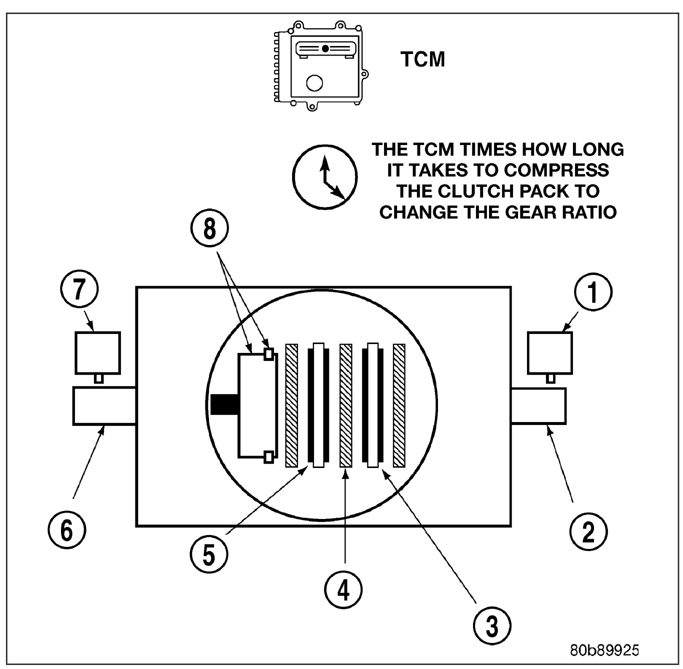
## CLUTCH VOLUME INDEXES (CVI)

An important function of the TCM is to monitor Clutch Volume Indexes (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur.

Gear ratios can be determined by using the Scan Tool and reading the Input/Output Speed Sensor values in the "Monitors" display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.



For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

| CLUTCH VOLUMES | | |
|---|---|---|
| **Clutch** | **When Updated** | **Proper Clutch Volume** |
| L/R | 2-1 or 3-1 downshift | 45 to 134 |
| 2C | 3-2 kickdown shift | 25 to 85 |
| OD | 2-3 upshift | 30 to 100 |
| 4C | 3-4 upshift | 30 to 85 |
| UD | 4-3 kickdown shift | 30 to 100 |

## SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following chart to determine the appropriate operation expected, depending on driving conditions.

| Schedule | Condition | Expected Operation |
|---|---|---|
| **Extreme Cold** | Oil temperature below -27° C (16° F) | -Park, Reverse, Neutral and 1st and 3rd gear only in D position, 2nd gear only in Manual 2 or L<br>-No EMCC |
| **Super Cold** | Oil temperature between -24° C (-12° F) and -12° C (10° F) | - Delayed 2-3 upshift<br>- Delayed 3-4 upshift<br>- Early 4-3 coastdown shift<br>- High speed 4-2, 3-2, 2-1 kickdown shifts are prevented<br>-Shifts at high throttle openings willl be early.<br>- No EMCC |
| **Cold** | Oil temperature between -12° C (10° F) and 2° C (36° F) | -Shift schedule is the same as Super Cold except that the 2-3 upshifts are not delayed. |
| **Warm** | Oil temperature between 4° C (40° F) and 27° C (80° F) | - Normal operation (upshift, kickdowns, and coastdowns)<br>- No EMCC |

| Schedule | Condition | Expected Operation |
|---|---|---|
| **Hot** | Oil temperature between 27° C (80° F) and 115° C (240° F) | - Normal operation (upshift, kickdowns, and coastdowns)<br><br>- Normal EMCC operation |
| **Overheat** | Oil temperature above 115° C (240° F) or engine coolant temperature above 118° C (244° F) | - Delayed 2-3 upshift<br>- Delayed 3-4 upshift<br>- 3rd gear FEMCC from 30-48 mph<br>- 3rd gear PEMCC above 35 mph<br>- Above 25 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made |

## STANDARD PROCEDURE

## TCM QUICK LEARN

The quick learn procedure requires the use of the scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Solenoid Pack Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 rpm
- The throttle angle (TPS) must be less than three degrees
- The shift lever position must stay in PARK until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.
- The calculated oil temperature must be above 16° C (60° F) and below 93° C (200° F).

## DRIVE LEARN

When a transmission is repaired and a Quick Learn procedure has been performed on the Transmission Control Module (TCM), the following Drive Learn procedure can be performed to fine tune any shifts which are particularly objectionable.

**NOTE: It is not necessary to perform the complete Drive Learn procedure every time the TCM is Quick Learned. Perform only the portions which target the objectionable shift.**

### LEARN A SMOOTH 1ST NEUTRAL TO DRIVE SHIFT

Perform this procedure only if the complaint is for a delayed or harsh shift the first time the transmission is put into gear after the vehicle is allowed to set with the engine not running for at least 10 minutes. Use the following steps to have the TCM learn the 1st N-D UD CVI.

**NOTE: The transmission oil temperature must be between 27-43° C (80-110° F).**

1. Start the engine only when the engine and ignition have been off for at least ten (10) minutes.

2. With the vehicle at a stop and the service brake applied, record the 1st N-D UD CVI while performing a Neutral to Drive shift. The 1st N-D UD CVI accounts for air entrapment in the UD clutch that may occur after the engine has been off for a period of time.
3. Repeat Step 1 and Step 2 until the recorded 1st N-D UD CVI value stabilizes.

**NOTE: It is important that this procedure be performed when the transmission temperature is between 27-43° C (80-110° F). If this procedure takes too long to complete fully for the allowed transmission oil temperature, the vehicle may be returned to the customer with an explanation that the shift will improve daily during normal vehicle usage. The TCM also learns at higher oil temperatures, but these values (line pressure correction values) are not available for viewing on the scan tool.**

## LEARN A SMOOTH NEUTRAL TO DRIVE GARAGE SHIFT

Perform this procedure if the complaint is for a delayed or harsh shift when the transmission is put into gear after the vehicle has had its first shift. Use the following steps to have the TCM learn the Norm N-D UD CVI.

**NOTE: The transmission oil temperature must be between 27-43° C (80-110° F) to learn the UD CVI. Additional learning occurs at temperatures as low as -18° C (0° F) and as high as 93° C (200° F). This procedure may be performed at any temperature that experiences poor shift quality. Although the UD CVI may not change, shift quality should improve.**

1. Start the vehicle engine and shift to drive.
2. Move the vehicle forward to a speed of at least 16 km/h (10 MPH) and come to a stop. This ensures no air is present in the UD hydraulic circuit.
3. Perform repeated N-D shifts at a stop while pausing in Neutral for at least 2-3 seconds and monitor Norm N-D UD CVI volume until the value stabilizes. The value will change during the N-D shift. This is normal since the UD value is different for the N-D shift then the normal value shown which is used for 4-3 coastdown and kickdowns. Perform repeated shifts in this temperature range until the Norm N-D UD CVI value stabilizes and the N-D shifts become smooth.

## LEARN THE 1ST 2-3 SHIFT AFTER A RESTART OR SHIFT TO REVERSE

Use the following steps to have the TCM learn the 1st 2-3 shift OD CVI.

**NOTE: The transmission oil temperature must be above 27° C (80° F).**

1. With the vehicle engine running, select reverse gear for over 2 seconds.
2. Shift the transmission to Drive and accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform a 2-3 shift while noting the 1st 2-3 OD CVI.
3. Repeat Step 1 and Step 2 until the 1st 2-3 upshift becomes smooth and the 1st 2-3 OD CVI stabilizes.

## LEARN A SMOOTH 2-3 AND 3-4 UPSHIFT

**NOTE: The transmission oil temperature must be above 43° C (110° F).**

Use the following steps to have the TCM learn the OD and 4C CVI's.

1. Accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform multiple 1-2, 2-3, and 3-4 upshifts. The 2nd 2-3 shift following a restart or shift to reverse will be shown during the shift as a value between the 1st 2-3 OD CVI and the normal OD CVI. Updates to the normal OD CVI will occur after the 2nd shift into 3rd gear, following a restart or shift to reverse.
2. Repeat Step 1 until the 2-3 and 3-4 shifts become smooth and the OD and 4C CVI become stable.

## LEARN A SMOOTH 4-3 COASTDOWN AND PART THROTTLE 4-3 KICKDOWN

**NOTE: The transmission oil temperature must be above 43° C (110° F).**

Use the following steps to have the TCM learn the UD shift volume.

1. At a vehicle speed between 64-97 km/h (40-60 mph), perform repeated 4-3 kickdown shifts.

2. Repeat Step 1 until the UD volume becomes somewhat stable and the shift becomes smooth.

## LEARN A SMOOTH 1-2 UPSHIFT AND 3-2 KICKDOWN

Use the following steps to have the TCM learn the 2C shift volume.

**NOTE: The transmission oil temperature must be above 43° C (110° F).**

1. With a vehicle speed below 48 km/h (30 mph) and the transmission in 3rd gear, perform multiple 3-2 kickdowns.
2. Repeat Step 1 until the 3-2 kickdowns become smooth and the 2C CVI becomes stable.

## LEARN A SMOOTH MANUAL 2-1 PULLDOWN SHIFT AS WELL AS A NEUTRAL TO REVERSE SHIFT

**NOTE: The transmission oil temperature must be above 43° C (110° F).**

Use the following steps to have the TCM learn the LR volume.

1. With the vehicle speed around 40-48 km/h (25-30 mph) in Manual 2nd, perform manual pulldowns to Low or 1st gear at closed throttle.
2. Repeat Step 1 until the LR CVI becomes stable and the manual 2-1 becomes smooth.

## LEARN A SMOOTH NEUTRAL TO REVERSE SHIFT

**NOTE: The transmission oil temperature must be above 43° C (110° F).**

1. With the vehicle at a stop, perform Neutral to Reverse shifts until the shift is smooth. An unlearned Neutral to Reverse shift may be harsh or exhibit a double bump.
2. If any of the shifts are still not smooth after the clutch volume stabilizes, an internal transmission problem may be present.

## LEARN A SMOOTH 4-5 UPSHIFT

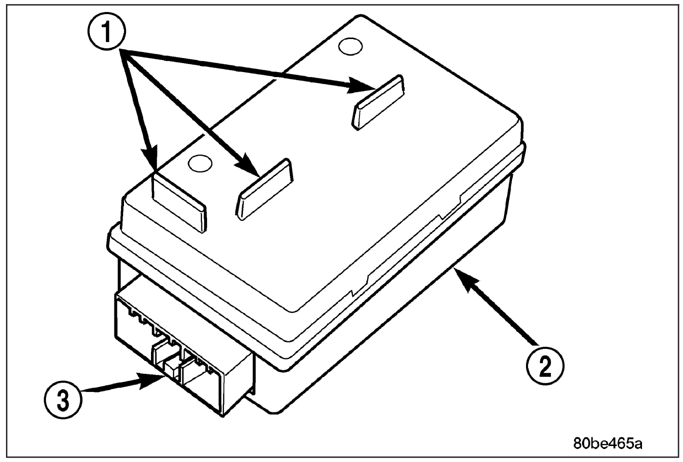
**NOTE: The transmission oil temperature must be above 43° C (110° F).**

Use the following steps to have the TCM learn the Alt 2C CVI.

1. Accelerate the vehicle through 88 km/h (55 mph) at a steady 10-15 degree throttle opening and perform multiple 4-5 upshifts.
2. Repeat Step 1 until the 4-5 shift become smooth and the Alt 2C CVI become stable. There is a separate 2C volume used and learned for 4-5 shifts, 2CA. It is independent of the 2C CVI learned on 3-2 kickdowns.

# HEATED SEAT MODULE

## DESCRIPTION



The heated seat module (2) is also known as the Seat Heat Interface Module. The heated seat module (2) is located under the left front seat cushion, where it is secured to a mounting bracket via two push-pin retainers. The heated seat module has a single connector receptacle (3) that allows the module to be connected to all of the required inputs and outputs through the seat wire harness.

The heated seat module (2) is an electronic microprocessor controlled device designed and programmed to use inputs from the heated seat relay, the two heated seat switches and the two heated seat sensors to operate and control the heated seat elements in both front seats and the two heated seat indicator lamp Light-Emitting Diodes (LEDs) in each heated seat switch. The heated seat module is also programmed to perform self-diagnosis of certain heated seat system functions and provide feedback of that diagnosis through the heated seat switch indicator lamps.

The heated seat module (2) cannot be repaired. If the heated seat module is damaged or faulty, the entire module must be replaced.

## OPERATION

The heated seat module operates on fused battery current received from a fuse in the junction block. The module is grounded at all times. Inputs to the module include a resistor multiplexed heated seat switch request circuit for each of the two heated seat switches and the heated seat sensor inputs from the seat cushions of each front seat. In response to those inputs, the heated seat module controls battery current to the heated seat elements and sensors, and controls the ground for the heated seat switch indicator lamps (LED's).

When a heated seat switch (Driver or Passenger) is depressed a signal is received by the heated seat module, the module energizes the proper indicator LED (Low or High) in the switch by grounding the indicator lamp circuit to indicate that the heated seat system is operating. At the same time, the heated seat module energizes the selected heated seat sensor circuit and the sensor provides the module with an input indicating the surface temperature of the selected seat cushion.

The Low heat set point is about 36° C (96.8° F), and the High heat set point is about 42° C (107.6° F). If the seat cushion surface temperature input is below the temperature set point for the selected temperature setting, the heated seat module energizes an N-channel Field Effect Transistor (N-FET) within the module which energizes the heated seat elements in the selected seat cushion and back. When the sensor input to the module indicates the correct temperature set point has been achieved, the module de-energizes the N-FET which de-energizes the heated seat elements. The heated seat module will continue to cycle the N-FET as needed to maintain the selected temperature set point.

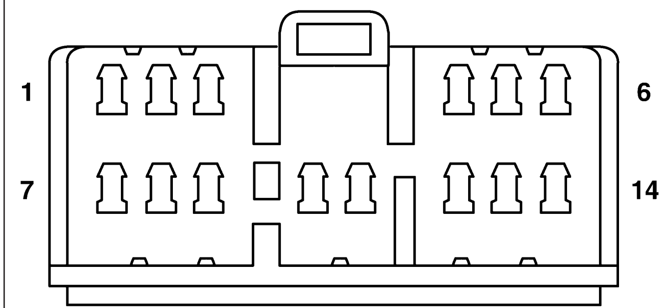
If the heated seat module detects a heated seat sensor value input that is out of range or a shorted or open heated seat element circuit, it will notify the vehicle operator or the repair technician of this condition by flashing the High and/or Low indicator lamps in the affected heated seat switch. Refer to **Diagnosis and Testing Heated Seat System** in Heated Systems for flashing LED diagnosis and testing procedures. Refer to **Diagnosis and Testing Heated Seat Module** in this section for heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

## DIAGNOSIS AND TESTING - HEATED SEAT MODULE

If a heated seat fails to heat and one or both of the indicator lamps on a heated seat switch flash, refer to **Heated Seat System Diagnosis and Testing** in Heated Systems for flashing LED failure identification. Refer to **Wiring Diagrams** in for complete heated seat system wiring diagrams.

1. Remove the heated seat module from its mounting location (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/MEMORY HEATED SEAT/ MIRROR MODULE - REMOVAL).

**NOTE: Any resistance values (ohms Ω) given in the following text are supplied using the automatic range generated by a fluke® automotive meter. If another type of measuring device is used the values generated may not be the same as the results shown here, or may have to be converted to the range used here.**



80cb4c88

## RIGHT SEAT HEATER INOPERATIVE

1. If a heated seat heats but one or both indicator lamps (LED's) on the heated seat switch fail to illuminate, check the driver circuit with the inoperative LED for a short to ground. If OK, replace the heated seat switch. If NOT OK repair the short to ground as required and than replace the heated seat switch.

**NOTE: If the right seat cushion is already warm the following step will not prove conclusive.**

2. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #3 for battery voltage when the right heated seat switch is turned "ON", voltage should be present, If OK go to Step 3 If NOT OK, test the right heated seat switch (Refer to 8 - ELECTRICAL/HEATED SEATS/PASSENGER HEATED SEAT SWITCH - DIAGNOSIS AND TESTING). If the switch tests OK, check for continuity between the switch and control module on the MUX circuit, If OK replace the heated seat control module. If NOT OK, repair the open or shorted MUX circuit as required.

**NOTE: Be certain the battery is fully charged before testing. Failure to do so can result in incorrect readings.**

3. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #10 for battery voltage, while observing the voltmeter depress the right heated seat switch **low** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 4. If NOT OK check for continuity between the switch and control module on the low heat driver circuit, If OK replace the heated seat control module.
4. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #11 for battery voltage, while observing the voltmeter depress the right heated seat switch **high** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 5. If NOT OK check for continuity between the switch and control module on the high heat driver circuit, If OK replace the heated seat control module.
5. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #2 for approx. 5v, voltage should be present, If OK go to Step 6. If NOT OK replace the heated seat control module.
6. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #7 for a range in voltage from 1.72v (warm seat) – 3.0v (cold seat). It should be within this range, If OK replace the heated seat module. If NOT OK test the Heated Seat Sensor. If NOT OK, replace the right heated seat element and sensor assembly. If the heated seat sensor tests OK, check for continuity between the right heated seat cushion connector and control module connector on the 5v supply circuit, If NOT OK, repair the open or shorted 5v supply

circuit as required. If OK check for continuity between the right heated seat cushion connector and control module connector on the temperature sensor input circuit. If NOT OK, repair the open or shorted temperature sensor input circuit as required. If OK replace the heated seat control module.

## LEFT SEAT HEATER INOPERATIVE

1. If a heated seat heats but one or both indicator lamps (LED's) on the heated seat switch fail to illuminate, check the driver circuit with the inoperative LED for a short to ground. If OK, replace the heated seat switch. If NOT OK repair the short to ground as required and than replace the heated seat switch.

**NOTE: If the left seat cushion is already warm the following step will not prove conclusive.**

2. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #5 for battery voltage when the left heated seat switch is turned "ON", voltage should be present, If OK go to Step 3 If NOT OK, test the left heated seat switch (Refer to 8 - ELECTRICAL/HEATED SEATS/DRIVER HEATED SEAT SWITCH - DIAGNOSIS AND TESTING). If the switch tests OK, check for continuity between the switch and control module on the MUX circuit, If OK replace the heated seat control module. If NOT OK, repair the open or shorted MUX circuit as required.
3. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #12 for battery voltage, while observing the voltmeter depress the left heated seat switch **low** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 4. If NOT OK check for continuity between the switch and control module on the low heat driver circuit, If OK replace the heated seat control module.
4. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #14 for battery voltage, while observing the voltmeter depress the left heated seat switch **high** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 5. If NOT OK check for continuity between the switch and control module on the high heat driver circuit, If OK replace the heated seat control module.
5. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #2 for approx. 5v, 5 voltage should be present, If OK go to Step 6. If NOT OK replace the heated seat control module.
6. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #8 for a range in voltage from 1.72v (warm seat) – 3.0v (cold seat). It should be within this range, If OK replace the heated seat control module. If NOT OK, test the Heated Seat Sensor. If NOT OK, replace the left heated seat element and sensor assembly. If the heated seat sensor tests OK, check for continuity between the left heated seat cushion connector and control module connector on the 5v supply circuit, If NOT OK, repair the open or shorted 5v supply circuit as required. If OK check for continuity between the left heated seat cushion connector and control module connector on the temperature sensor input circuit. If NOT OK, repair the open or shorted temperature sensor input circuit as required. If OK replace the heated seat control module.

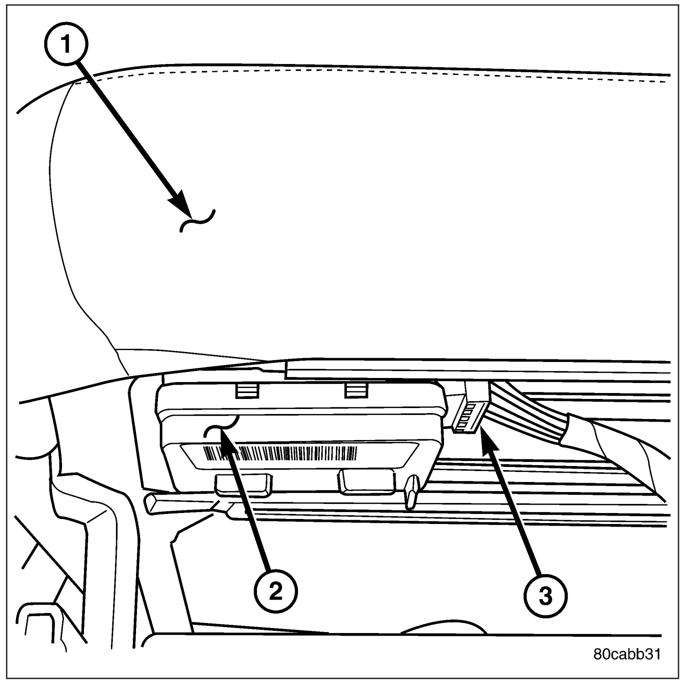
## BOTH SEATS INOPERATIVE

If both seats (driver and passenger) fail to heat and the indicator lamps on the heated seat switches for both seats fail to operate, test the heated seat fuses in the junction block. If the heated seat fuses check OK, go to Step 1.

1. Back-probe the heated seat module wire harness connector, do not disconnect. Check for continuity between the ground circuit cavity #13 of the heated seat module connector and a good ground. If OK go to Step 2. If NOT OK, repair the open or shorted ground circuit as required.
2. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #4 and #6 for battery voltage, voltage should be present, If OK go to Step 3. If NOT OK repair the open or shorted fused B(+) circuit as required.
3. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #2 for approx. 5v, voltage should be present, replace the heated seat control module with a known good module and verify system operation.

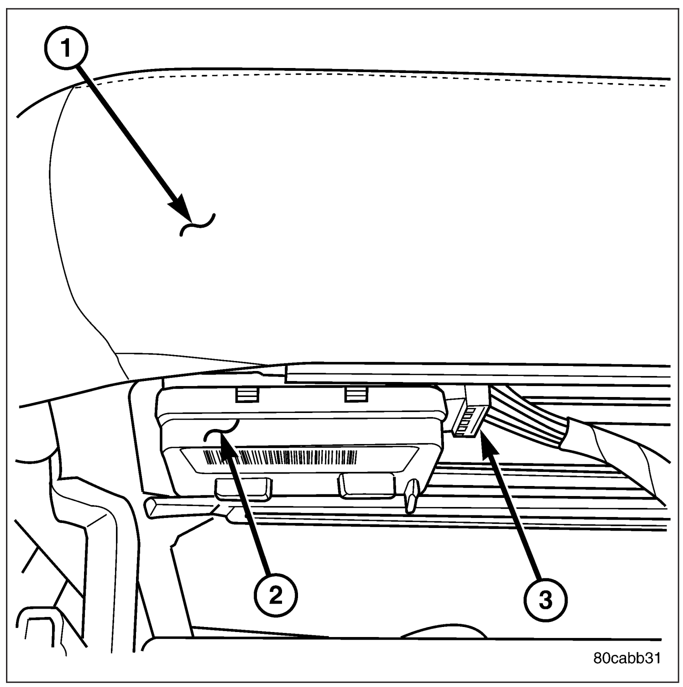
## REMOVAL

1. Working under the front seat cushion (1), remove the heated seat module (2) from its mounting bracket by gently prying the module off of the two mounting pushpins.
2. Disconnect the seat wire harness connector (3) from the connector receptacle on the side of the heated seat module (2).
3. Remove the heated seat module from the vehicle.



## INSTALLATION

1. Connect the seat wire harness connector (3) to the connector receptacle on the side of the heated seat module (2).
2. Install the heated seat module (2) on its mounting bracket under the front seat (1).
3. Verify heated seat system operation.



# ENGINE SYSTEMS

## TABLE OF CONTENTS

# BATTERY SYSTEM

## TABLE OF CONTENTS

# BATTERY SYSTEM

## DESCRIPTION

A single 12-volt battery is standard factory-installed equipment on this model. All of the components of the battery system are located within the engine compartment of the vehicle. The battery system for this vehicle covers the following related components, which are covered in further detail later in this section of the service manual:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the battery terminal posts to the vehicle electrical system.
- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray in the engine compartment.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules and jump starting procedure, see the owner's manual in the vehicle glove box. Optionally, refer to the Lubrication and Maintenance section of this manual for the recommended battery maintenance schedules and for the proper battery jump starting procedure. While battery charging can be considered a maintenance procedure, the battery charging procedure and related information are located later in this section of the service manual. This was done because the battery must be fully-charged before any battery system diagnosis or testing procedures can be performed.

## OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

## DIAGNOSIS AND TESTING

## BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. Refer to Charging System for the proper charging system on-board diagnostic test procedures.

### MICRO 420 BATTERY TESTER

The Micro 420 automotive battery tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro 420 battery tester.

| BATTERY SYSTEM DIAGNOSIS | | |
|---|---|---|
| CONDITION | POSSIBLE CAUSES | CORRECTION |
| THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE. | 1. The electrical system ignition-off draw is excessive. | 1. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the excessive ignition-off draw, as required. |
| | 2. The charging system is faulty. | 2. Determine if the charging system is performing to specifications. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required. |
| | 3. The battery is discharged. | 3. Determine the battery state-of-charge using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Charge the faulty battery, as required. |
| | 4. The battery terminal connections are loose or corroded. | 4. Refer to Battery Cables for the proper battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required. |
| | 5. The battery has an incorrect size or rating for this vehicle. | 5. Refer to Battery System Specifications for the proper size and rating. Replace an incorrect battery, as required. |
| | 6. The battery is faulty. | 6. Determine the battery cranking capacity using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Replace the faulty battery, as required. |
| | 7. The starting system is faulty. | 7. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required. |
| | 8. The battery is physically damaged. | 8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required. |

| BATTERY SYSTEM DIAGNOSIS | | |
|---|---|---|
| CONDITION | POSSIBLE CAUSES | CORRECTION |
| THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED. | 1. The battery has an incorrect size or rating for this vehicle. | 1. Refer to Battery System Specifications for the proper specifications. Replace an incorrect battery, as required. |
| | 2. The battery terminal connections are loose or corroded. | 2. Refer to Battery Cable for the proper cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required. |
| | 3. The electrical system ignition-off draw is excessive. | 3. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the faulty electrical system, as required. |
| | 4. The battery is faulty. | 4. Test the battery using the Micro 420 battery tester. Refer to Standard Procedures for additional test procedures. Replace the faulty battery, as required. |
| | 5. The starting system is faulty. | 5. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required. |
| | 6. The charging system is faulty. | 6. Determine if the charging system is performing to specifications. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required. |
| | 7. Electrical loads exceed the output of the charging system. | 7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads. |
| | 8. Slow driving or prolonged idling with high-amperage draw systems in use. | 8. Advise the vehicle operator, as required. |
| THE BATTERY WILL NOT ACCEPT A CHARGE. | 1. The battery is faulty. | 1. Test the battery using the Micro 420 battery tester. Charge or replace the faulty battery, as required. |

## ABNORMAL BATTERY DISCHARGING

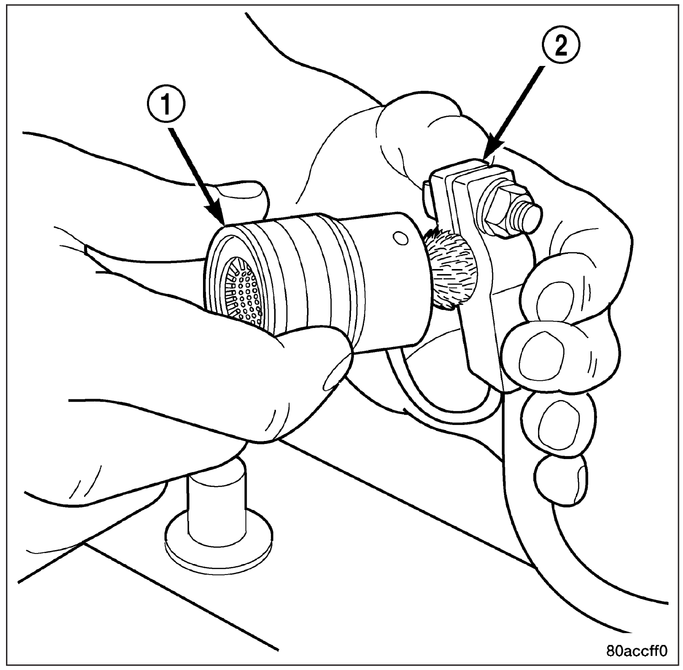
Any of the following conditions can result in abnormal battery discharging:

1. A faulty or incorrect charging system component. Refer to Charging System for additional charging system diagnosis and testing procedures.
2. A faulty or incorrect battery. Use Micro 420 battery tester and refer to Battery System for additional battery diagnosis and testing procedures.
3. A faulty circuit or component causing excessive ignition-off draw.
4. Electrical loads that exceed the output of the charging system. This can be due to equipment installed after manufacture, or repeated short trip use.
5. A faulty or incorrect starting system component. Refer to Starting System for the proper starting system diagnosis and testing procedures.
6. Corroded or loose battery posts and/or terminal clamps.
7. Slow driving speeds (heavy traffic conditions) or prolonged idling, with high-amperage draw systems in use.

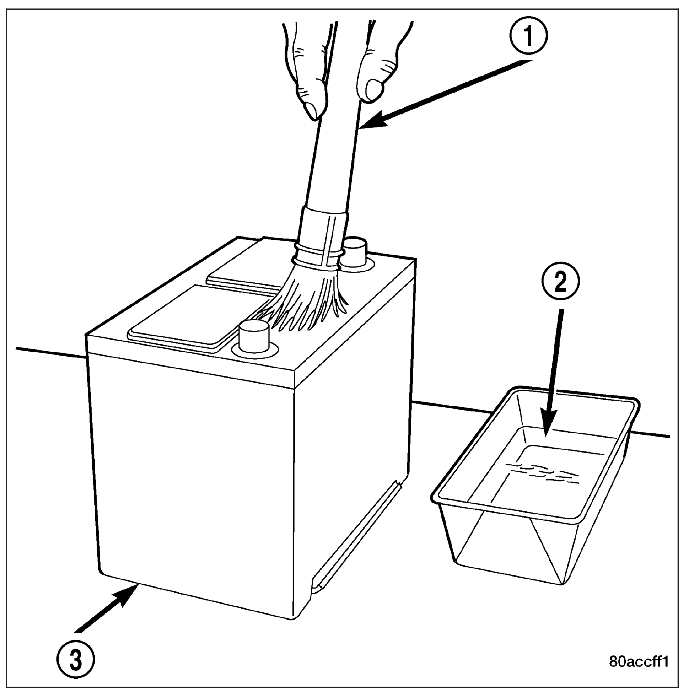
## CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

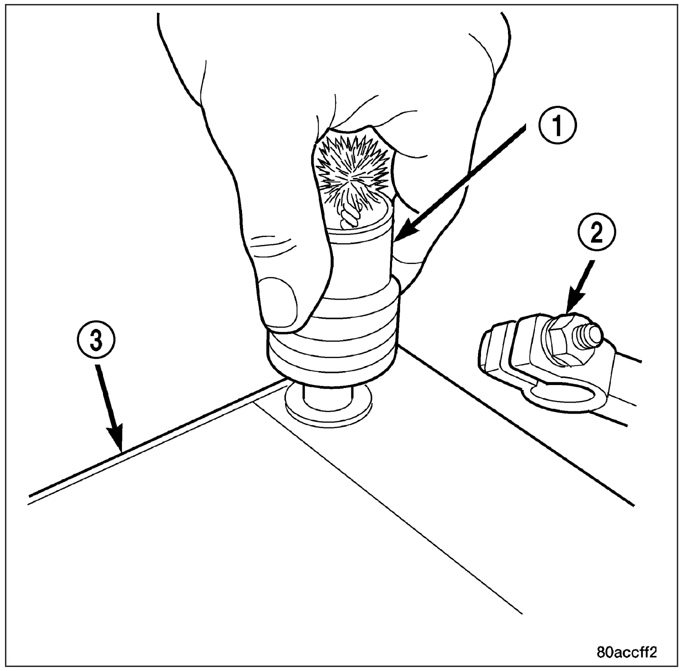
1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.
2. Clean the battery tray and battery hold down hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.



3. If the removed battery is to be reinstalled, clean the outside of the battery (3) case and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, refer to Battery System Specifications for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.
4. If the vehicle is so equipped, clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.



5. Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner (1) , and a sodium bicarbonate (baking soda) and warm water cleaning solution.



## INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the Owner's Manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
4. Inspect the battery thermal guard for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.
5. Inspect the battery built-in test indicator sight glass for an indication of the battery condition. If the battery is discharged, charge as required. Refer to Standard Procedures for the proper battery built-in indicator test procedures. Also refer to Standard Procedures for the proper battery charging procedures.

## SPECIFICATIONS

## BATTERY

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery

fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.

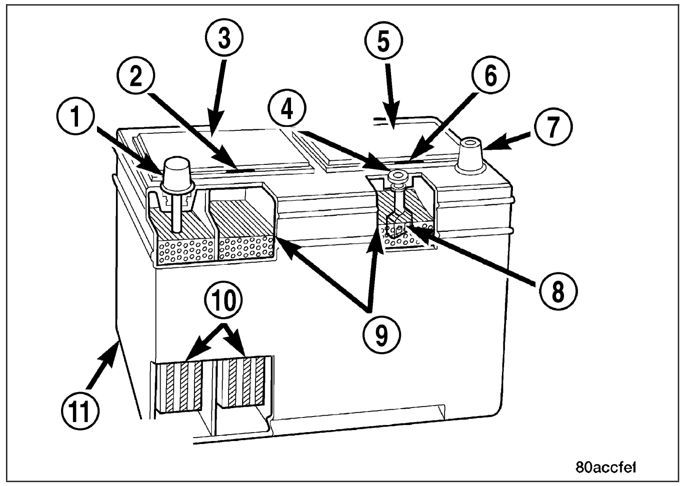
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.
- **Load Test Amperage** - The Load Test Amperage rating specifies the current (in amperes) that a battery should be tested at with the battery load test equipment. This value should always be 50 percent of the CCA. For example: the CCA for this battery is 600amps, the Load Test Amperage is 50 percent of that or 300 amps.

| BATTERY CLASSIFICATIONS & RATINGS | | | | | |
|---|---|---|---|---|---|
| Part Number | BCI Group Size Classification | Cold Cranking Amperage | Reserve Capacity | Ampere - Hours | Load Test Amperage |
| 04609365AD | 34 | 600 | 120 | 66 | 300 |

# BATTERY

## DESCRIPTION

### CONVENTIONAL BATTERY - GASOLINE ENGINES



A conventional large capacity, low-maintenance storage battery (11) is standard factory-installed equipment on models equipped with a gasoline engine. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper specifications of the factory-installed batteries available on this model. Male post type terminals (1) and (7) made of a soft lead material protrude from the top of the molded plastic battery case to provide the means for connecting the battery to the vehicle electrical system. The battery positive terminal post (1) is physically larger in diameter than the negative terminal post (7) to ensure proper battery connection. The letters **POS** and **NEG** are also molded into the top of the battery case adjacent to their respective positive and negative terminal posts for identification confirmation. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - DESCRIPTION) for more information on the battery cables that connect the battery to the vehicle electrical system.

The battery is made up of six individual cells that are connected in series. Each cell contains positively charged plate groups (10) that are connected with lead straps to the positive terminal post, and negatively charged plate groups (10) that are connected with lead straps to the negative terminal post. Each plate consists of a stiff mesh framework or grid coated with lead dioxide (positive plate) or sponge lead (negative plate). Insulators or plate separators made of a non-conductive material are inserted between the positive and negative plates to prevent them from contacting or shorting against one another. These dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

### SPIRAL PLATE BATTERY - DIESEL ENGINE

**WARNING: Never exceed 14.4 volts when charging a spiral plate battery. Personal injury and/or battery damage may result.**

Vehicles equipped with a diesel engine utilize a spiral wound plate designed battery with recombination technology. This is a maintenance-free battery that is capable of delivering more power than a conventional battery. This additional power is required by a diesel engine during cold cranking.

Spiral plate technology takes the elements of traditional batteries - lead and sulfuric acid - to the next level. By tightly winding layers of spiral grids and acid-permeated vitreous separators into cells, the manufacturer has developed a battery with more power and service life than conventional batteries the same size. The spiral plate battery is completely, permanently sealed. Through gas recombination, hydrogen and oxygen within the battery are captured during normal charging and reunited to form the water within the electrolyte, eliminating the need to add distilled water. Therefore, these batteries have non-removable battery vent caps. Water **cannot** be added to this battery.

The acid inside an spiral plate battery is bound within the vitreous separators, ending the threat of acid leaks. This feature allows the battery to be installed in any position anywhere in the vehicle.

Spiral plate technology is the process by which the plates holding the active material in the battery are wound tightly in coils instead of hanging flat, like conventional batteries. This design has a lower internal resistance and also increases the active material surface area.

Due to the maintenance-free design, distilled water cannot be added to this battery. Therefore, if more than 14.4 volts are used during the spiral plate battery charging process, water vapor can be exhausted through the pressure-sensitive battery vents and lost for good. This can permanently damage the spiral plate battery. Never exceed 14.4 volts when charging a spiral plate battery. Personal injury and/or battery damage may result.

Batteries are used to store electrical energy potential in a chemical form. When an electrical load is applied to the battery terminals, an electrochemical reaction occurs within the battery. This reaction causes the battery to discharge electrical current.

## OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

## DIAGNOSIS AND TESTING

## BATTERY

The battery must be completely charged and the top, posts and terminal clamps should be properly cleaned and inspected before diagnostic procedures are performed. Refer to Battery System Cleaning for the proper cleaning procedures, and Battery System Inspection for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

**WARNING: If the battery shows signs of freezing, leaking or loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.**

**WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.**

**WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.**

**WARNING: If the battery is equipped with removable cell caps, be certain that each of the cell caps are in place and tight before the battery is returned to service. Personal injury and/or vehicle damage may result from loose or missing cell caps.**

The condition of a battery is determined by two criteria:

1. **State-Of-Charge** - This can be determined by checking the battery voltage (open-circuit voltage test).
2. **Cranking Capacity** - This can be determined by performing a battery load test, which measures the ability of the battery to supply high-amperage current.

First, determine the battery state-of-charge using the Micro 420 battery tester. Perform the open-circuit voltage test to determine the state-of-charge. Refer to open-circuit voltage test in the Standard Procedures section of this group.

Second, determine the battery cranking capacity by performing a load test. The battery must be charged before proceeding with a load test if:

- Micro 420 tester indicates battery charging is required.
- The battery open-circuit voltage is less than 12.4 volts.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is faulty and must be replaced.

**NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.**

A battery is fully-charged when:

- Micro 420 tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.4 volts or greater.

## STANDARD PROCEDURE

## CONVENTIONAL BATTERY CHARGING

**CAUTION: Vehicles equipped with a diesel engine utilize a unique spiral plate battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the spiral plate battery charging procedure could result in damage to the battery or personal injury. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - SPIRAL PLATE BATTERY CHARGING) for the appropriate procedure.**

Battery charging can be performed fast or slow, it terms of time. **Slow** battery charging is the best means of restoring a battery to full potential. Fast battery charging should only be performed when absolutely necessary due to time restraints. A battery is fully-charged when:

- Micro 420 tester indicates the battery is OK.
- Open-circuit voltage of the battery is 12.65 volts or above.

**WARNING: Never exceed twenty amperes when charging a cold (-1° c [30° f] or lower) battery. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.**

**CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.**

**CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.**

**CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.**

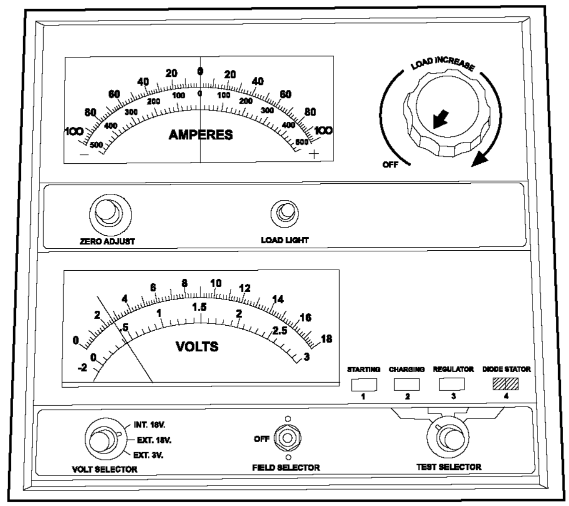
Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

After the battery has been charged to 12.4 volts or greater, perform a load test to determine the battery cranking capacity. Refer to Standard Procedures for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

## CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.



80863de9

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.
3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

**CHARGE RATE TABLE**

| Voltage | Hours |
|---|---|
| 16.0 volts maximum | up to 4 hours |
| 14.0 to 15.9 volts | up to 8 hours |
| 13.9 volts or less | up to 16 hours |

## CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

**BATTERY CHARGING TIME TABLE**

| Charging Amperage | 5 Amps | 10 Amps | 20 Amps |
|---|---|---|---|
| Open Circuit Voltage | Hours Charging @ 21° C (70° F) | | |
| 12.25 to 12.49 | 6 hours | 3 hours | 1.5 hours |
| 12.00 to 12.24 | 10 hours | 5 hours | 2.5 hours |
| 10.00 to 11.99 | 14 hours | 7 hours | 3.5 hours |
| Below 10.00 | 18 hours | 9 hours | 4.5 hours |

## SPIRAL PLATE BATTERY CHARGING

Vehicles equipped with a diesel engine utilize a unique spiral plate battery. This battery has a maximum charging voltage that must not be exceeded in order to restore the battery to its full potential, failure to use the following spiral plate battery charging procedure could result in damage to the battery or personal injury.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 battery tester indicates battery is OK.
- Open-circuit voltage of the battery is 12.65 volts or above.
- Battery passes Load Test multiple times.

**WARNING: If the battery shows signs of freezing, leaking, loose posts or low electrolyte level, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.**

**WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.**

**WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.**

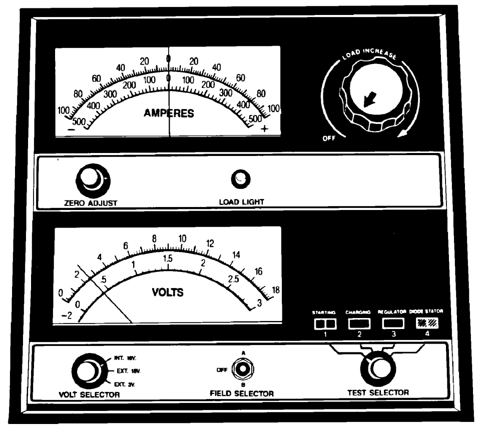
**CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Charge the battery directly at the battery terminals. Do not exceed 14.4 volts while charging a battery.**

**CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.**

After the battery has been charged to 12.6 volts or greater, perform a load test to determine the battery cranking capacity. Refer to Battery Diagnosis and Testing for the proper battery test procedures. If the battery will endure a load test, return the battery to service. If the battery will not pass a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

## CHARGING A COMPLETELY DISCHARGED BATTERY – SPIRAL PLATE BATTERY



898A-12

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. Refer to Battery Removal and Installation for access instructions. If the reading is below ten volts, the battery charging current will be low. It could take several hours before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.
3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

**SPIRAL-PLATE BATTERY CHARGE RATE TABLE**

| Voltage | Minutes |
|---|---|
| 14.4 volts maximum | up to 10 minutes |
| 13.0 to 14 volts | up to 20 minutes |
| 12.9 volts or less | up to 30 minutes |

## CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature -** A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies eight amperes will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

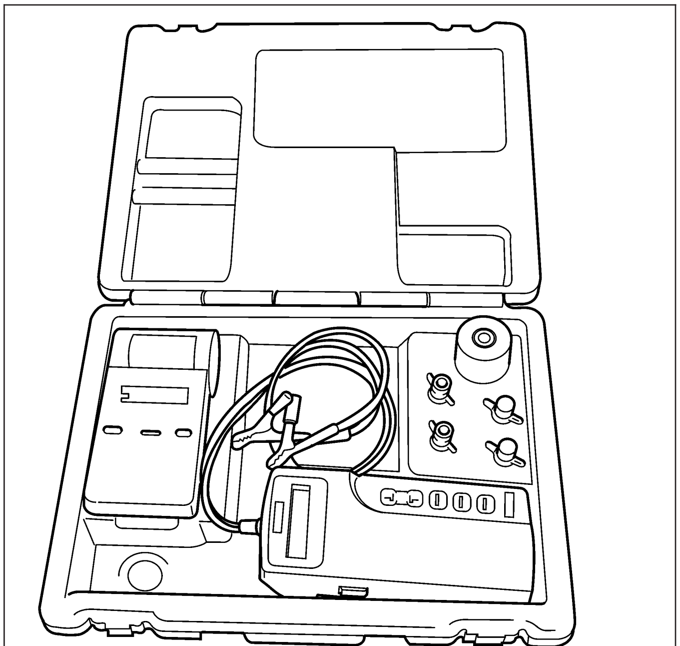
The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

**SPIRAL-PLATE BATTERY CHARGING TIME TABLE**

| Charging Amperage | 5 Amps | 8 Amps |
|---|---|---|
| Open Circuit Voltage | Hours Charging @ 21° C (70° F) | |
| 12.25 to 12.49 | 6 hours | 3 hours |
| 12.00 to 12.24 | 10 hours | 5 hours |
| 10.00 to 11.99 | 14 hours | 7 hours |
| Below 10.00 | 18 hours | 9 hours |

## USING MICRO 420 BATTERY TESTER

Always use the Micro 420 instruction manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:



80c91c8d

**WARNING: Always wear appropriate eye protection and use extreme caution when working with batteries.**

## BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. **The preferred test position is at the battery terminal**. If the battery is not accessible, you may test using both the positive and negative jumper posts. Select TESTING AT JUMPER POST when connecting to that location.
3. Connect the tester to the battery or jumper posts, the red clamp to positive (+) and the black clamp to negative (–).
4. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
5. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

**CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.**

6. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

| BATTERY TEST RESULTS | |
|---|---|
| GOOD BATTERY | Return to service |
| GOOD - RECHARGE | Fully charge battery and return to service |
| CHARGE & RETEST | Fully charge battery and retest battery |
| REPLACE BATTERY | Replace the battery and retest complete system |
| BAD-CELL REPLACE | Replace the battery and retest complete system |

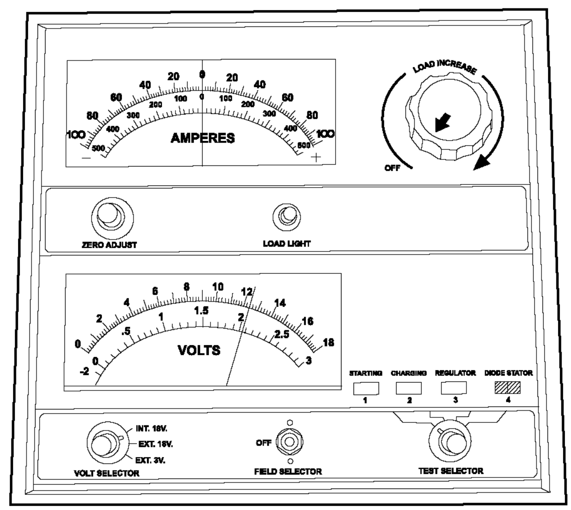
**NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.**

## OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery.

Before proceeding with this test, completely charge the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage.



80863dd0

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be tested to reveal its cranking capacity (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

| OPEN CIRCUIT VOLTAGE TABLE | |
|---|---|
| Open Circuit Voltage | Charge Percentage |
| 11.7 volts or less | 0% |
| 12.0 volts | 25% |
| 12.2 volts | 50% |
| 12.4 volts | 75% |
| 12.6 volts or more | 100% |

## IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Power Distribution Center (PDC). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes. See the Electronic Module Ignition-Off Draw Table for more information.

| ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE | | | |
|---|---|---|---|
| Module | Time Out? (If Yes, Interval And Wake-Up Input) | IOD | IOD After Time Out |
| Radio | No | 1 to 3 milliamperes | N/A |
| Audio Power Amplifier | No | up to 1 milliampere | N/A |
| Body Control Module (BCM) | No | 4.75 milliamperes (max.) | N/A |
| Powertrain Control Module (PCM) | No | 0.95 milliampere | N/A |
| ElectroMechanical Instrument Cluster (EMIC) | No | 0.44 milliampere | N/A |
| Combination Flasher | No | 0.08 milliampere | N/A |
| Automatic Transmission Controller (EATX) | Yes, 20 minutes | 120 milliampere | 0.70 ma |

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Disconnect the battery negative cable.
4. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.
5. After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Power Distribution Center (PDC) and then in the Junction Block (JB), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information in this service manual for complete PDC and JB fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage

reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, refer to Charging System for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

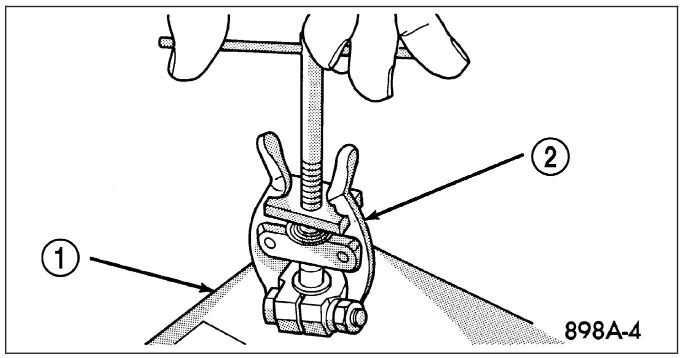
**CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.**

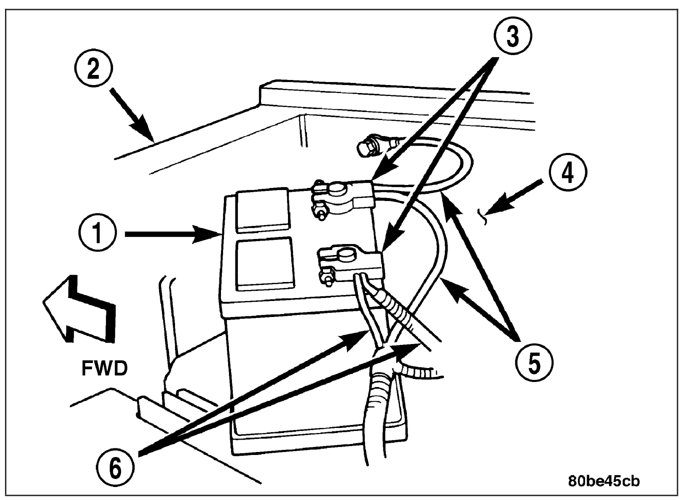
6. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

## REMOVAL

**WARNING: Wear a suitable pair of rubber gloves (not the household type) when removing a battery by hand. Safety glasses should also be worn. If the battery is cracked or leaking, the electrolyte can burn the skin and eyes.**

**NOTE: The use of a battery terminal puller (2) may be necessary if the cable clamps will not separate from the battery posts.**

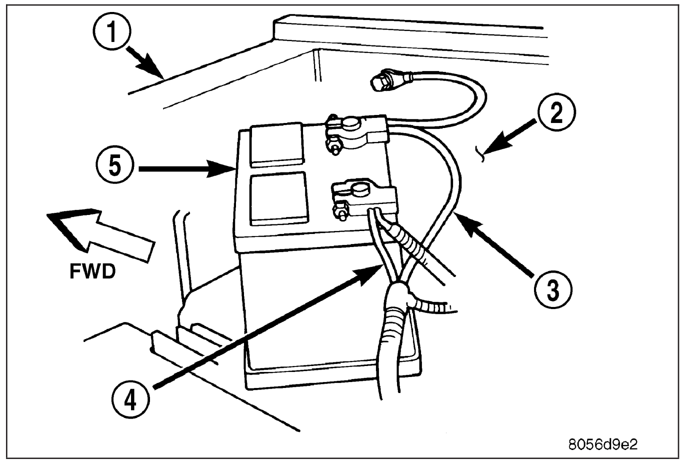




1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Loosen the battery negative cable (5) terminal clamp pinch-bolt hex nut.
3. Disconnect the battery negative cable (5) terminal clamp from the battery negative terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.
4. Loosen the battery positive cable (6) terminal clamp pinch-bolt hex nut.
5. Disconnect the battery positive cable (6) terminal clamp from the battery positive terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.
6. Remove the battery holddowns from the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY HOLDDOWN - REMOVAL) for the proper battery holddown removal procedures.
7. Remove the battery and the battery thermal guard (if equipped) from the battery tray as a unit.
8. If equipped, remove the battery thermal guard from the battery case.

## INSTALLATION

1. Clean and inspect all of the battery system components. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) and (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper procedures.
2. If equipped, install the battery thermal guard onto the battery case (5).
3. Position the battery (5) onto the battery trayt. Ensure that the battery positive and negative terminal posts are correctly positioned. The battery cable terminal clamps must reach the correct battery terminal post without stretching the cables.
4. Reinstall the battery holddowns onto the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY HOLDDOWN - INSTALLATION) for the proper installation procedure.



**CAUTION: Be certain that the battery cable terminal clamps are connected to the correct battery terminal posts. Reversed battery polarity may damage electrical components of the vehicle.**

5. Clean the battery cable terminal clamps and the battery terminal posts. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) for cleaning procedure.
6. Reconnect the battery positive cable (4) terminal clamp to the battery positive terminal post. Tighten the terminal clamp pinch-bolt hex nut to 8.5 N·m (75 in. lbs.).
7. Reconnect the battery negative cable (3) terminal clamp to the battery negative terminal post. Tighten the terminal clamp pinch-bolt hex nut to 8.5 N·m (75 in. lbs.).
8. Apply a thin coating of petroleum jelly or chassis grease to the exposed surfaces of the battery cable terminal clamps and the battery terminal posts.
9. Obtain an appropriate scan tool and check the PCM for any stored battery disconnect trouble codes. Clear codes if required.

# BATTERY HOLDDOWN

## DESCRIPTION

The battery holddown hardware includes a plastic holddown bracket and retaining bolt. The battery holddown bracket meshes with the battery tray to secure the battery to the battery tray.

When installing a battery into the battery tray, it is important that the holddown hardware is properly installed and that the fastener is tightened to the proper specifications. Improper holddown fastener tightness, whether too loose or too tight, can result in damage to the battery, the vehicle, or both. Refer to Battery Holddown for the proper installation procedure, including the proper holddown fastener torque specifications.

## OPERATION

The battery holddown secures the battery in the battery tray. This holddown is designed to prevent battery movement during the most extreme vehicle operation conditions. Periodic removal and lubrication of the battery holddown hardware is recommended to prevent hardware seizure at a later date.

**CAUTION: Never operate a vehicle without a battery holddown device properly installed. Damage to the vehicle, components and battery could result.**

## REMOVAL

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Loosen the battery negative cable terminal clamp pinch-bolt hex nut.
3. Disconnect the battery negative cable terminal clamp from the battery negative terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.
4. Remove the battery hold down bracket retaining bolt from the threaded insert in the battery tray assembly.

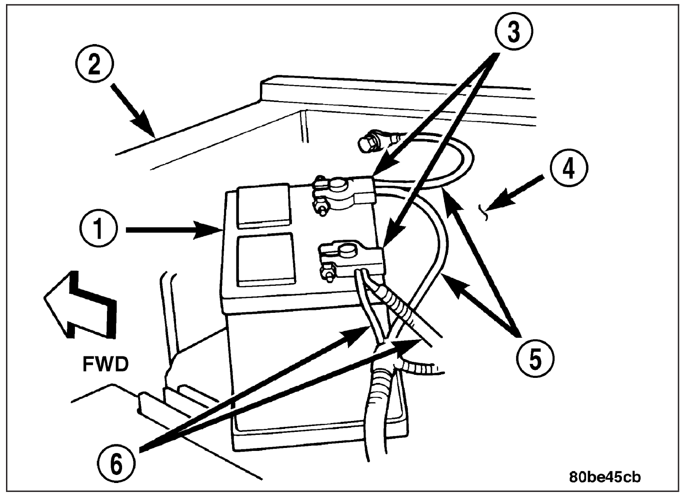
## INSTALLATION

1. Clean and inspect the battery hold down hardware. Refer to Battery Cleaning for the proper battery system component cleaning procedures, and Battery Inspection for the proper battery system component inspection procedures.
2. Position the battery hold down bracket onto the battery tray.
3. Install and tighten the battery hold down bracket retaining bolt. Tighten the bolt to 4 N·m (35 in. lbs.).
4. Reconnect the battery negative cable terminal clamp to the battery negative terminal post. Tighten the terminal clamp pinch-bolt hex nut to 8.4 N·m (75 in. lbs.).

# BATTERY CABLES

## DESCRIPTION

The battery cables (5) and (6) are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a clamping type female battery terminal (3) made of soft lead that is die cast onto one end of the battery cable wire. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a black insulating jacket and a smaller female battery terminal clamp.



The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some models. Refer to the appropriate wiring information in this service manual for the location of the proper battery cable wire harness diagrams. The wiring information also includes proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

## OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

The battery positive cable terminal clamp is die cast onto the ends of two wires. One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal studs of the Power Distribution Center (PDC), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp is also die cast onto the ends of two wires. One wire has an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a stud on the left side of the engine cylinder block. The other wire has an eyelet terminal that connects the battery negative cable to the vehicle body through a ground stud on the left wheel house, near the battery.

## DIAGNOSIS AND TESTING

## BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

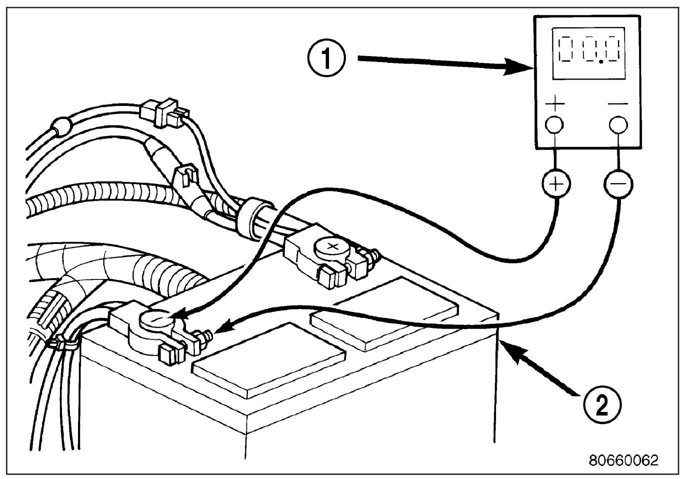
When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

## VOLTAGE DROP TEST

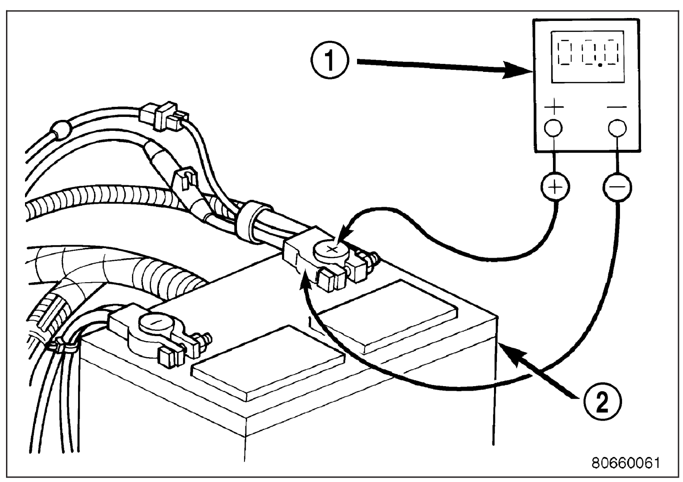
The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and load tested. Refer to Standard Procedures for the proper battery charging and load test procedures.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay is located in the Power Distribution Center (PDC), in the engine compartment. See the fuse and relay layout label affixed to the underside of the PDC cover for ASD relay identification and location.

1. Connect the positive lead of the voltmeter (1) to the battery (2) negative terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

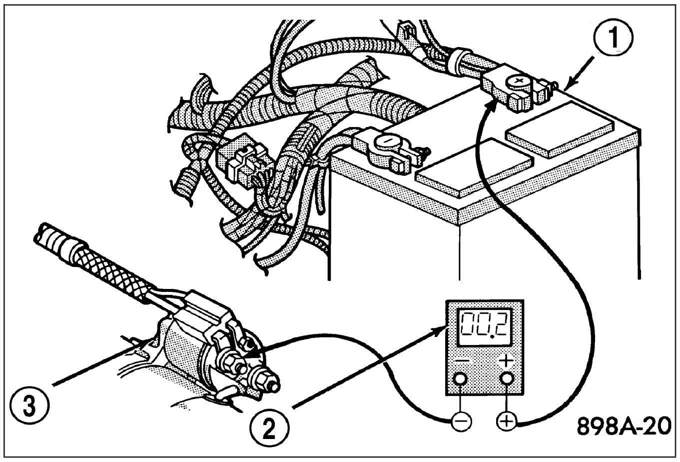


2. Connect the positive lead of the voltmeter (1) to the battery (2) positive terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor

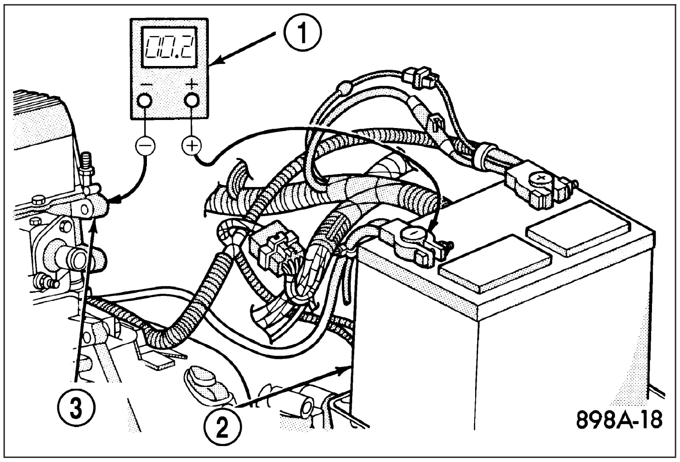


connection between the battery positive cable terminal clamp and the battery positive terminal post.

3. Connect the voltmeter (2) to measure between the battery positive cable terminal clamp (1) and the starter solenoid B(+) terminal stud (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.



4. Connect the voltmeter (1) to measure between the battery (2) negative cable terminal clamp and a good clean ground on the engine block (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.



## REMOVAL

The battery cables on this model may include portions of wiring circuits for the generator and other components on the vehicle. If battery cable replacement is required, it will be necessary to extract the cables out of the engine wire harness assembly. Use care not to damage the other wires and circuits which are also packaged into the engine wire harness assembly.

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Disconnect and isolate the negative battery cable terminal.
3. Remove the tape from the engine wire harness assembly, to access the desired battery cable.
4. One at a time, trace and disconnect the battery cable retaining fasteners and routing clips until the desired cable is free from the vehicle.
5. Feed the battery cable out of the vehicle.

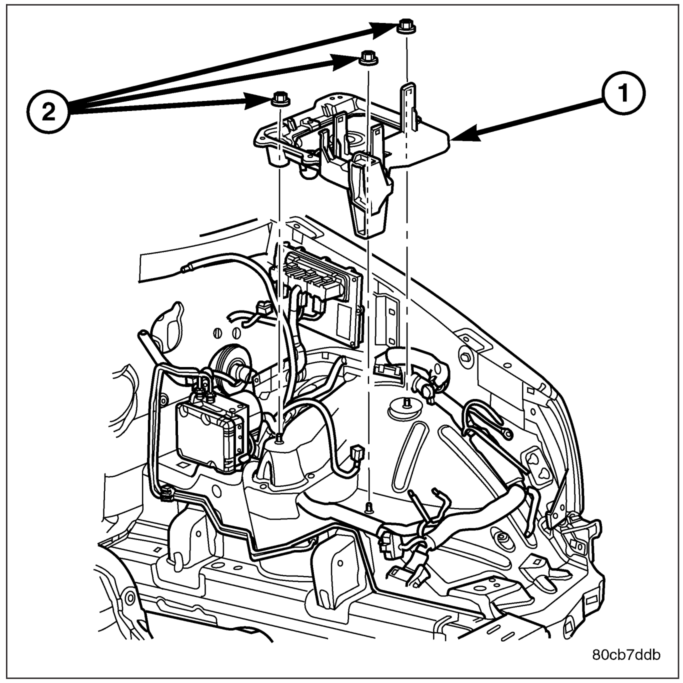
## INSTALLATION

1. Position the battery cable in the vehicle.
2. One at a time, trace and install the battery cable retaining fasteners and routing clips until the desired cable is properly installed in the engine wire harness assembly.
3. Install the tape on the engine wire harness assembly.
4. Connect the negative battery cable terminal.

# BATTERY TRAY

## DESCRIPTION

The battery is placed in a molded plastic tray (1) located in the left front corner of the engine compartment. The battery hold down hardware is contained within the battery tray. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY HOLDDOWN - DESCRIPTION) for more information on hold down hardware.

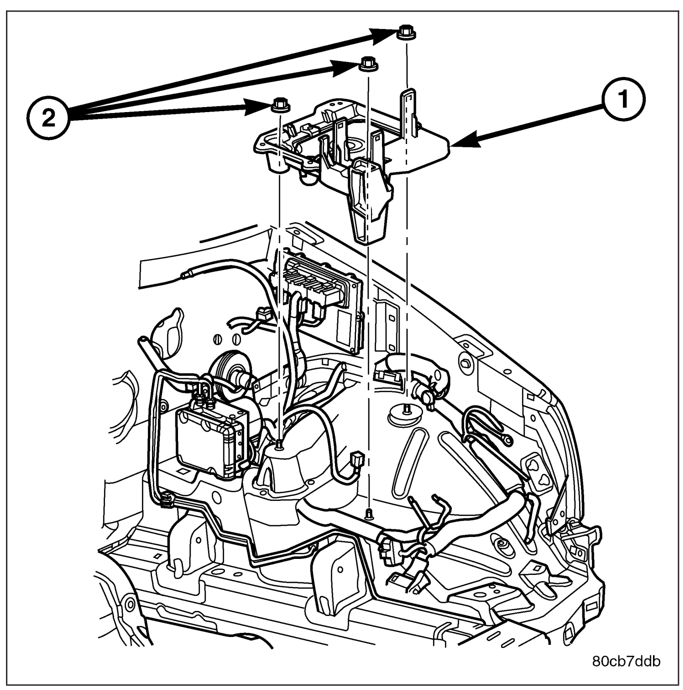


## OPERATION

The battery tray provides a secure mounting location and supports the battery. On some vehicles, the battery tray also provides the anchor point/s for the battery holddown hardware. The battery tray and the battery holddown hardware combine to secure and stabilize the battery in the engine compartment, which prevents battery movement during vehicle operation. Unrestrained battery movement during vehicle operation could result in damage to the vehicle, the battery, or both.

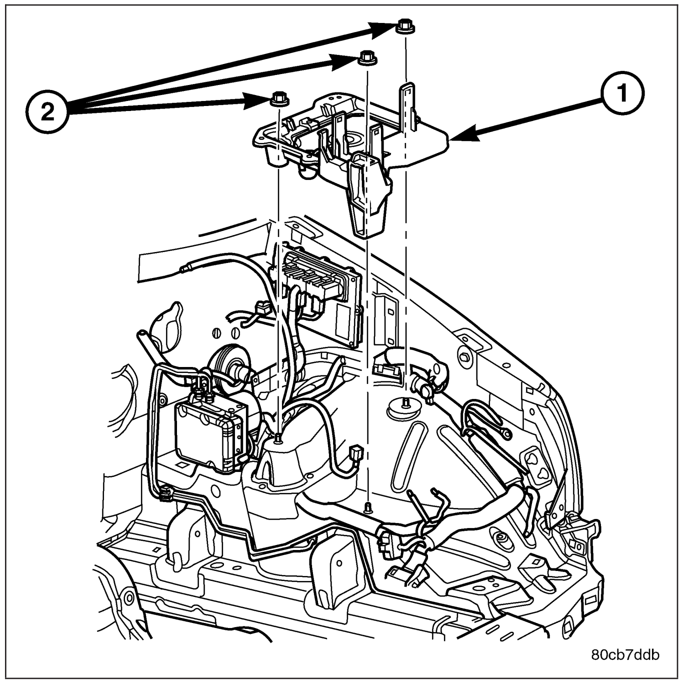
## REMOVAL

1. Remove the battery from the battery tray (1) (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).
2. Unlatch and remove the PDC from the battery tray (1).
3. Remove the three nuts (2) that secure the battery tray (1) to the weld studs on the front extension of the left front wheelhouse inner panel.
4. Remove the battery tray (1) from the vehicle.



## INSTALLATION

1. Clean and inspect the battery tray (1). (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING).
2. Position the battery tray (1) onto the weld studs on the front extension of the left front wheelhouse inner panel.
3. Install the three nuts (2) that secure the battery tray (1) to the weld studs on the front extension of the left front wheelhouse inner panel. Tighten the nuts to 7 N·m (65 in. lbs.).
4. Install the PDC on the battery tray.
5. Install the battery onto the battery tray. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).



# CHARGING SYSTEM

## TABLE OF CONTENTS

# CHARGING SYSTEM

## DESCRIPTION

The charging system consists of:

- Generator
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch
- Battery (refer to 8, Battery for information)
- Battery temperature sensor
- Generator Lamp (if equipped)
- Check Gauges Lamp (if equipped)
- Wiring harness and connections (refer to 8, Wiring for information)

## OPERATION

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. When the ASD relay is on, voltage is supplied to the ASD relay sense circuit at the PCM. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

A battery temperature sensor, located in the battery tray housing, is used to sense battery temperature. This temperature data, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. This is done by cycling the ground path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects. Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage,** engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as reminder to check the three gauges. The signal to activate the lamp is sent via the CCD bus circuits. The lamp is located on the instrument panel. Refer to 8, Instrument Cluster for additional information.

## DIAGNOSIS AND TESTING - CHARGING SYSTEM

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp (if equipped) is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test in 8, Battery for more information.

### INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the DRB® scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to 8, Battery for procedures.
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications.
5. Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications in 7, Cooling System.
6. Inspect automatic belt tensioner (if equipped). Refer to 7, Cooling System for information.
7. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

## SPECIFICATIONS

### TORQUE - EXCEPT DIESEL

| DESCRIPTION | N-m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|

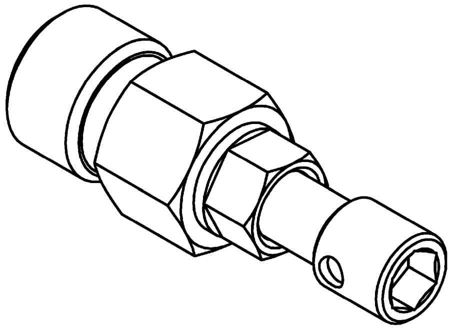
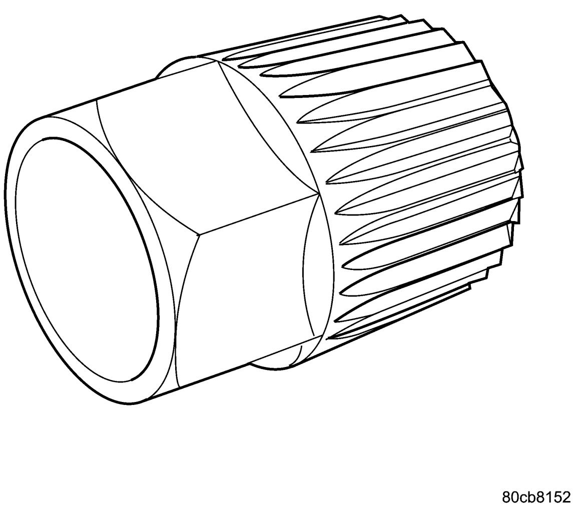
## SPECIAL TOOLS



GENERATOR DECOUPLER TOOL #8433



GENERATOR DECOUPLER TOOL #8823

# SENSOR - BATTERY TEMPERATURE

## DESCRIPTION

The Battery Temperature Sensor (BTS) is attached to the battery tray located under the battery.

## OPERATION

The BTS is used to determine the battery temperature and control battery charging rate. This temperature data, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. System voltage will be higher at colder temperatures and is gradually reduced at warmer temperatures.

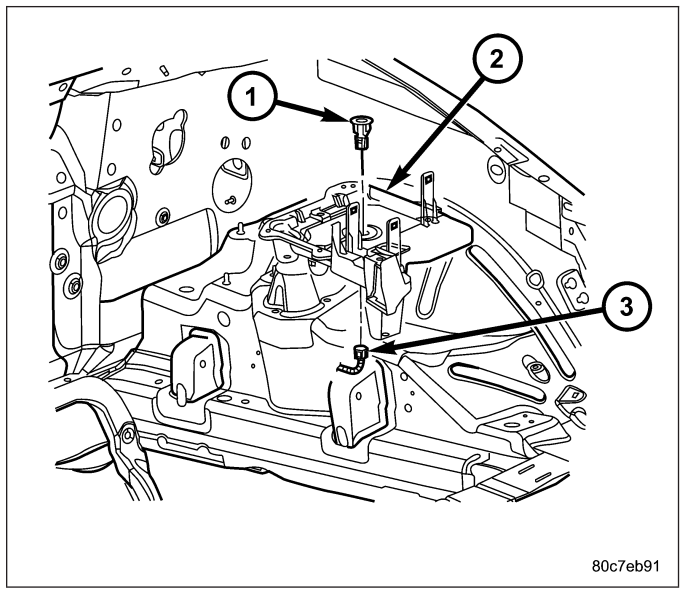
The PCM sends 5 volts to the sensor and is grounded through the sensor return line. As temperature increases, resistance in the sensor decreases and the detection voltage at the PCM increases.

The BTS is also used for OBD II diagnostics. Certain faults and OBD II monitors are either enabled or disabled, depending upon BTS input (for example, disable purge and enable Leak Detection Pump (LDP) and O2 sensor heater tests). Most OBD II monitors are disabled below 20° F (-7° C).

## REMOVAL

The battery temperature sensor (1) is located under the vehicle battery and is attached to a mounting hole on battery tray.

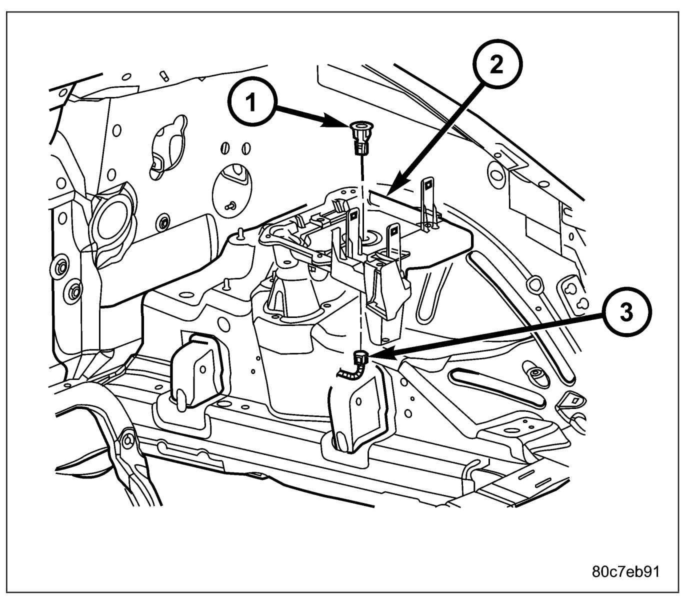
1. Remove battery. Refer to 8, Battery for procedures.
2. Disconnect sensor pigtail harness from engine wire harness electrical connector.
3. Pry sensor straight up from battery tray mounting hole.



## INSTALLATION

The battery temperature sensor (1) is located under vehicle battery and is attached to a mounting hole on battery tray.

1. Feed pigtail harness through hole in top of battery tray and press sensor into top of battery tray.
2. Connect pigtail harness.
3. Install battery. Refer to 8, Battery for procedures.



# GENERATOR

## DESCRIPTION

The generator is belt-driven by the engine using a serpentine type drive belt. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced.

## OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicle electrical system through the generator battery terminal.

Although the generators appear the same externally, different generators with different output ratings are used on this vehicle. Be certain that the replacement generator has the same output rating and part number as the original unit. Refer to Specifications and see Generator Ratings for amperage ratings and part numbers.

Noise emitting from the generator may be caused by: worn, loose or defective bearings; a loose or defective drive pulley; incorrect, worn, damaged or misadjusted fan drive belt; loose mounting bolts; a misaligned drive pulley or a defective stator or diode.

## REMOVAL

## REMOVAL - GAS

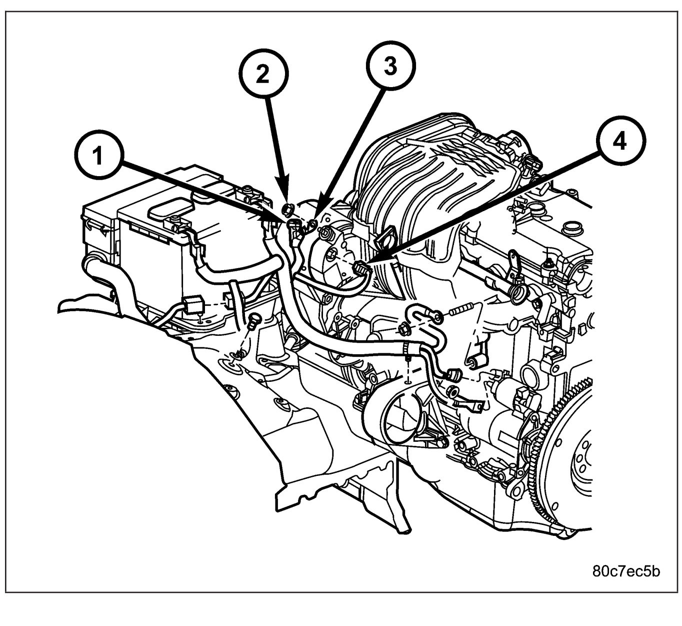
**CAUTION: Disconnect negative cable from battery before removing battery output wire from generator. Failure to do so can result in injury.**

1. Disconnect and isolate negative battery cable at battery.

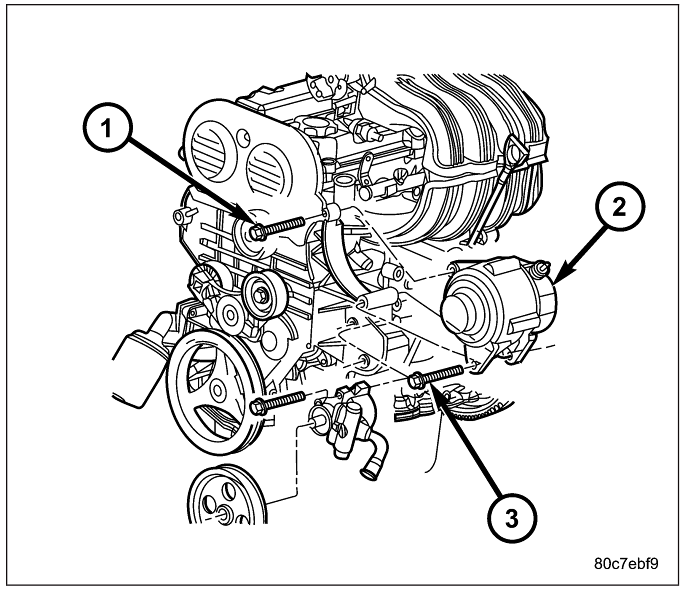
**CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.**

**CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in Cooling System.**

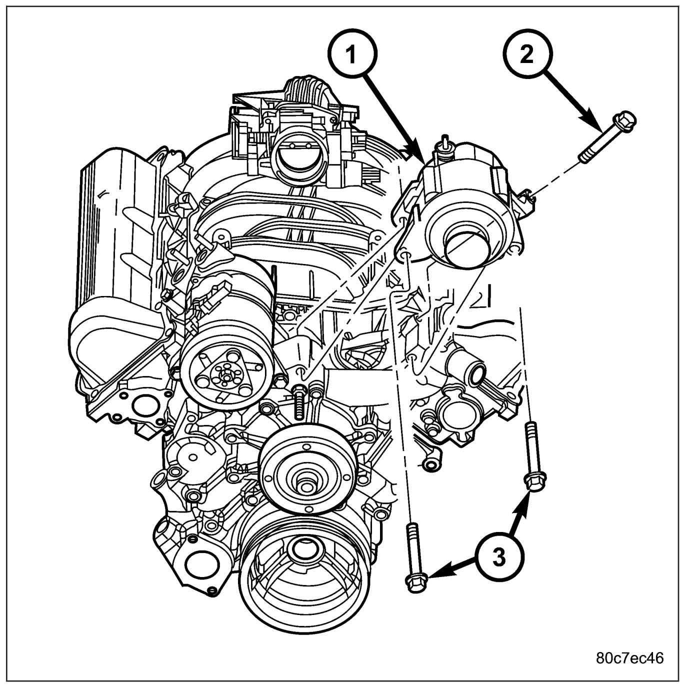
2. Remove generator drive belt. Refer to 7, Cooling System for procedures.
3. Unsnap plastic protective cover (1) from B+ mounting stud.
4. Remove B+ terminal mounting nut (2) at top of generator.
5. Disconnect field wire electrical connector (4) at rear of generator by pushing on connector tab.



6. 2.4L Engine: Remove 2 generator mounting bolts (1) and (2).



7. 3.7L Engine: Remove 1 vertical generator mounting bolt (2) and two horizontal mounting bolts (3).
8. Remove generator from vehicle.



## REMOVAL- DIESEL

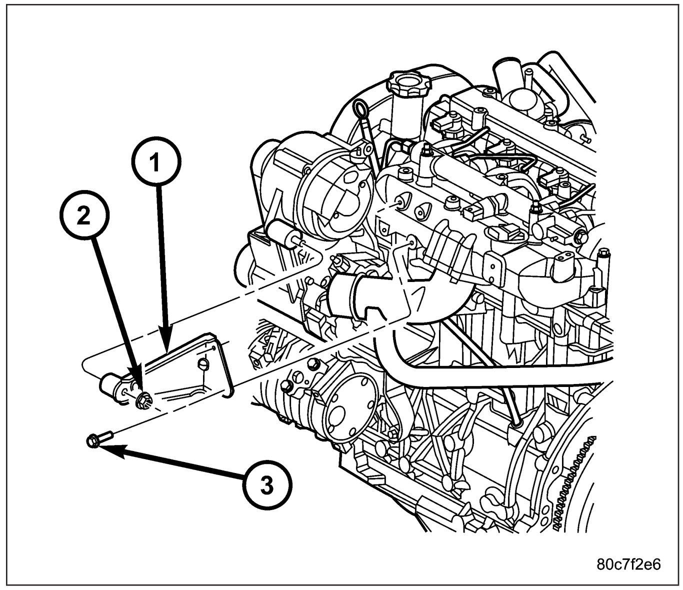
**CAUTION: Disconnect negative cable from battery before removing battery output wire from generator. Failure to do so can result in injury.**

**CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.**

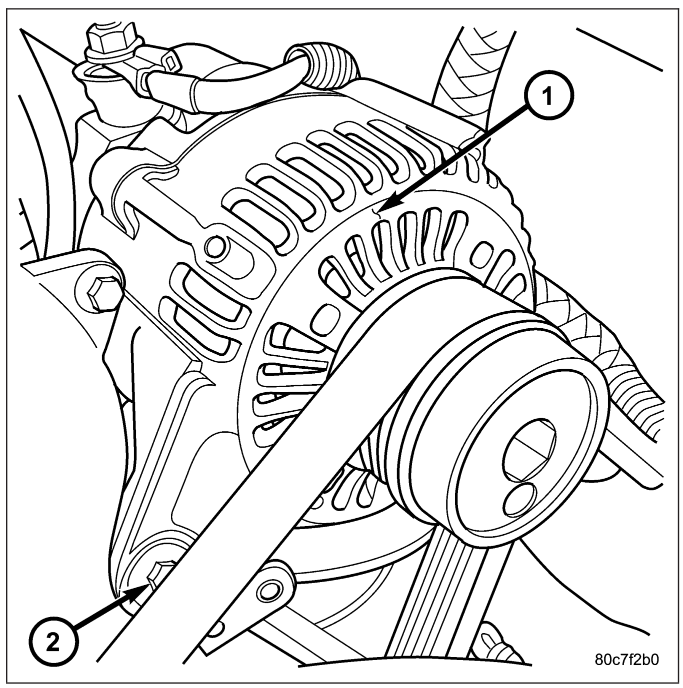
**CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in Cooling System.**

1. Disconnect and isolate negative battery cable.
2. Remove engine oil fill cap and engine oil dipstick.
3. Remove plastic decorative engine cover. Cover snaps onto engine.

4. Remove generator drive belt. Refer to Cooling System for procedure.
5. Remove protective plastic cover from B+ stud at top of generator.
6. Remove nut securing battery output cable to B+ terminal at top of generator.
7. Unplug field terminal connector at rear of generator.
8. Loosen support bracket bolts (3) and nut (2).



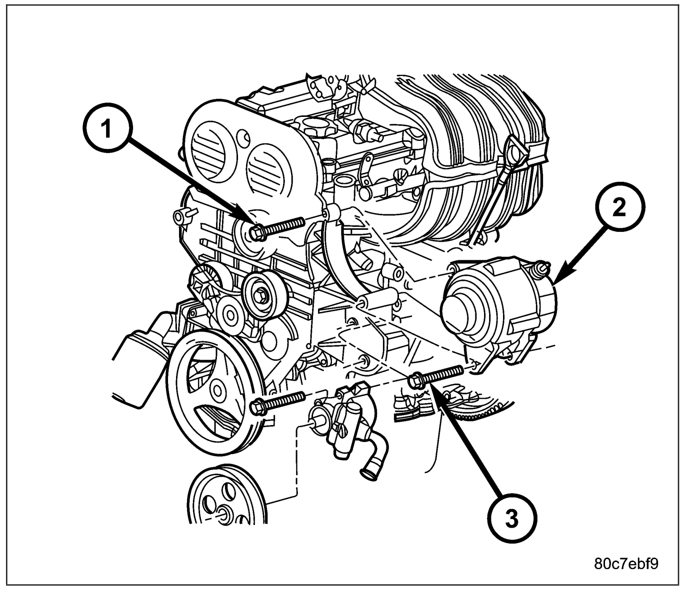
9. Remove two generator mounting bolts (2).
10. Remove generator from vehicle.



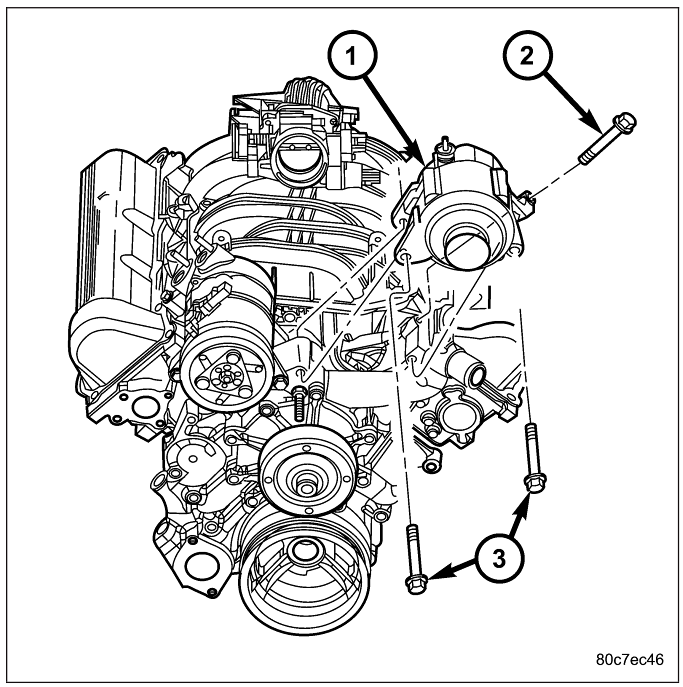
# INSTALLATION

## INSTALLATION - GAS

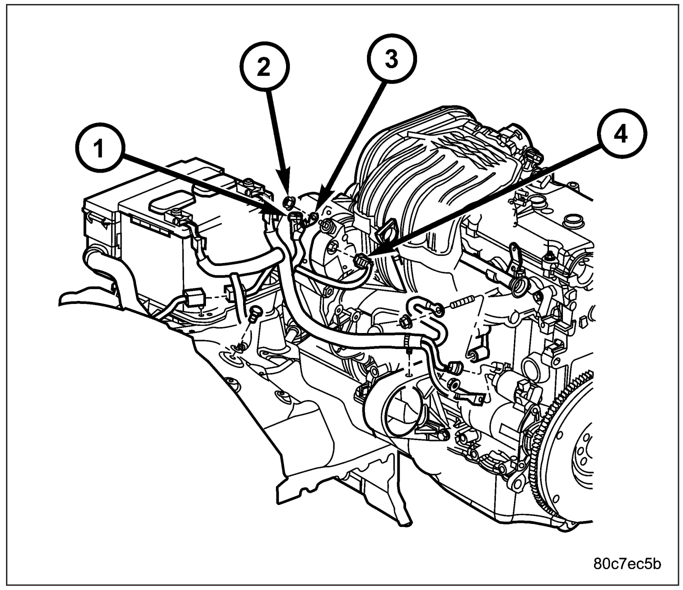
1. 2.4L Engine: Position generator to engine and install two mounting bolts (1) and (2) and tighten to 57 N·m (42 ft. lbs.)



2. 3.7L Engine: Position generator to engine and install three mounting bolts (2) and (3). Tighten 2 horizontal mounting bolts to specified torque. Tighten 1 vertical mounting bolt and tighten to 40 N·m (29 ft. lbs.)



3. Snap field wire connector (4) into rear of generator.
4. Install B+ terminal (3) and nut (2) to generator mounting stud and tighten to 13 N·m (115 in. lbs.)
5. Snap plastic protective cover (1) to B+ terminal.



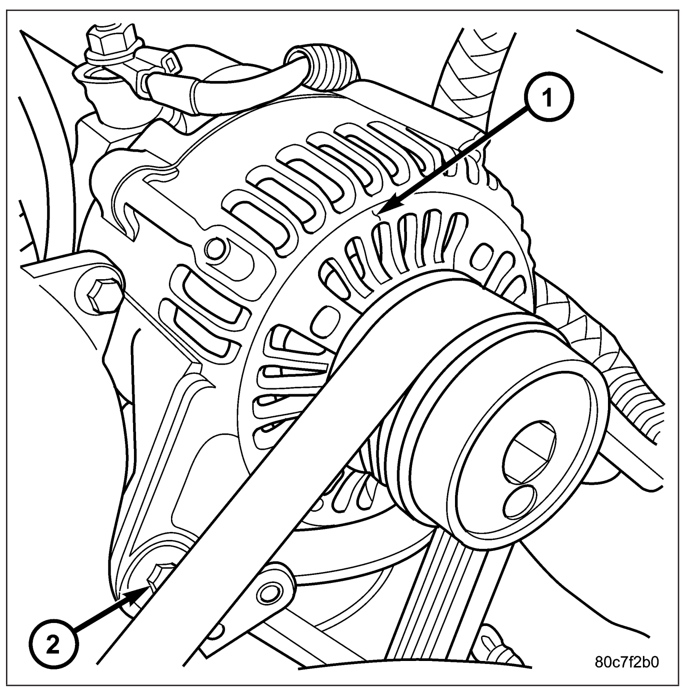
**CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.**

**CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to over-heat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in 7, Cooling System.**

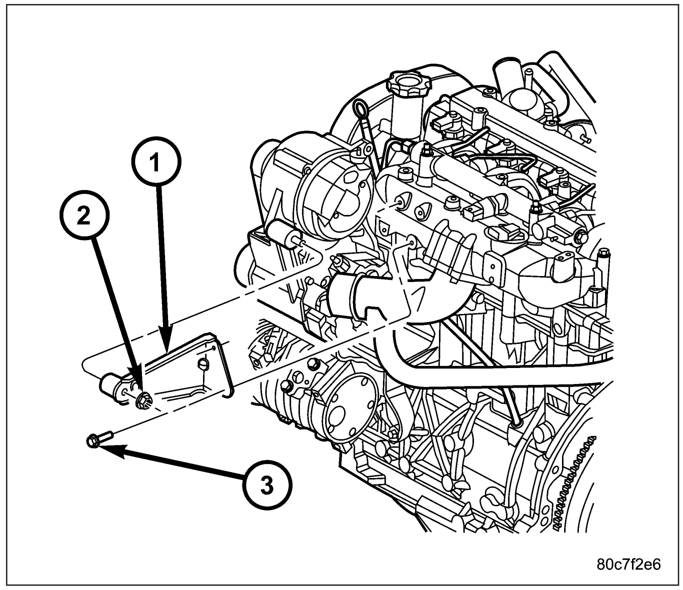
6. Install drive belt Refer to 7, Cooling System for belt routing, belt adjustment and bolt tightening procedures.
7. Install negative battery cable to battery.

## INSTALLATION - DIESEL

1. Position generator (1) to engine.
2. Install generator mounting bolts/nuts (2) and tighten to 54 N·m (42 ft. lbs.).



3. Tighten support bracket bolts (3) and nut (2).
4. Connect field terminal connector at rear of generator.
5. Install battery output cable and nut to B+ terminal at top of generator and tighten to 13 N·m (115 in. lbs.)
6. Install protective plastic cover to B+ stud at top of generator.



**CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.**

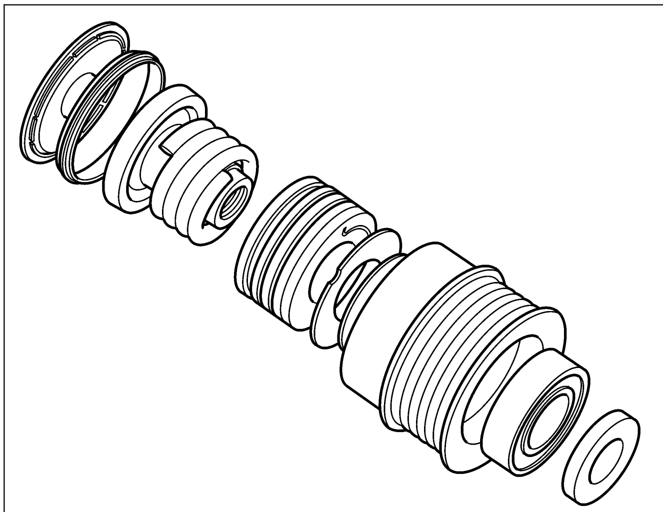
**CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in Cooling System.**

7. Install generator drive belt. Refer to Cooling System for procedure.
8. Install engine oil fill cap and engine oil dipstick.
9. Install plastic decorative engine cover. Cover snaps onto engine.
10. Connect negative battery cable.
11. Check charging system for proper operation.

# PULLEY - GENERATOR DECOUPLER

## DESCRIPTION

**The generator decoupler is used only with certain engines.** The decoupler is used in place of the standard generator drive pulley.



80a9349e

## OPERATION

**The generator decoupler is used only with certain engines.** The decoupler is a one-way clutch designed to help reduce belt tension fluctuation, vibration, reduce fatigue loads, improve belt life, reduce hubloads on components, and reduce noise. Dry operation is used (no grease or lubricants). The decoupler is not temperature sensitive and also has a low sensitivity to electrical load. The decoupler is a non-serviceable item and is to be replaced as an assembly.

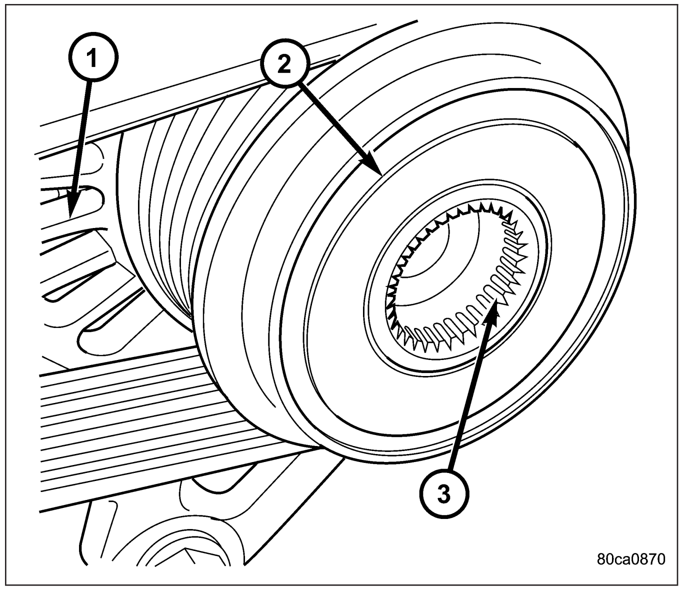
## DIAGNOSIS AND TESTING - GENERATOR DECOUPLER

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| Does not drive generator (generator not charging) | Internal failure | Replace decoupler |
| Noise coming from decoupler | Internal failure | Replace decoupler |

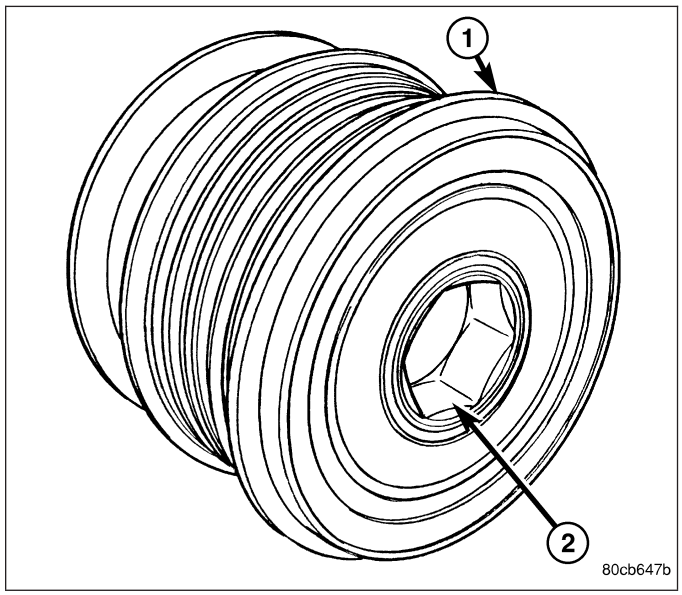
## REMOVAL

**The generator decoupler is used only with certain engines.**

Two different type generator decoupler pulleys are used. One can be identified by the use of machined splines (3).



The other decoupler is equipped with a hex opening (2) and will not use splines.

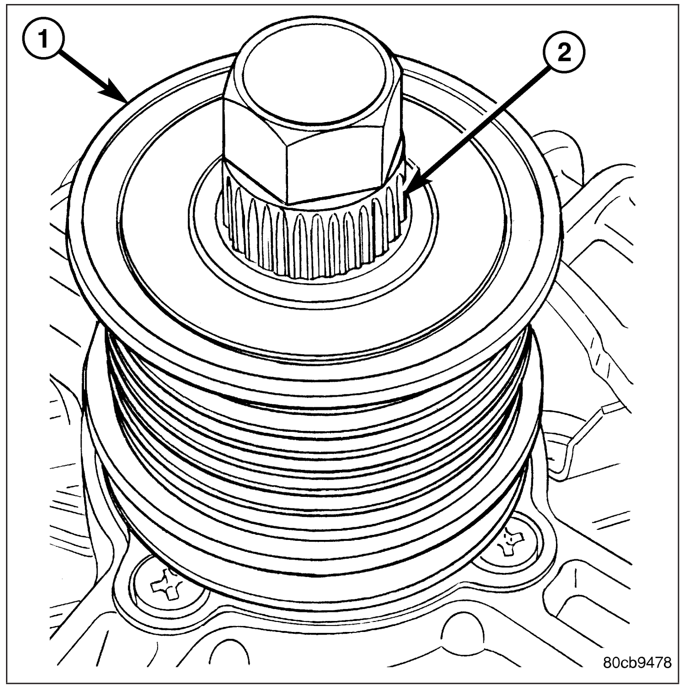


Different special tools are required to service each different decoupler. Refer to following procedure.

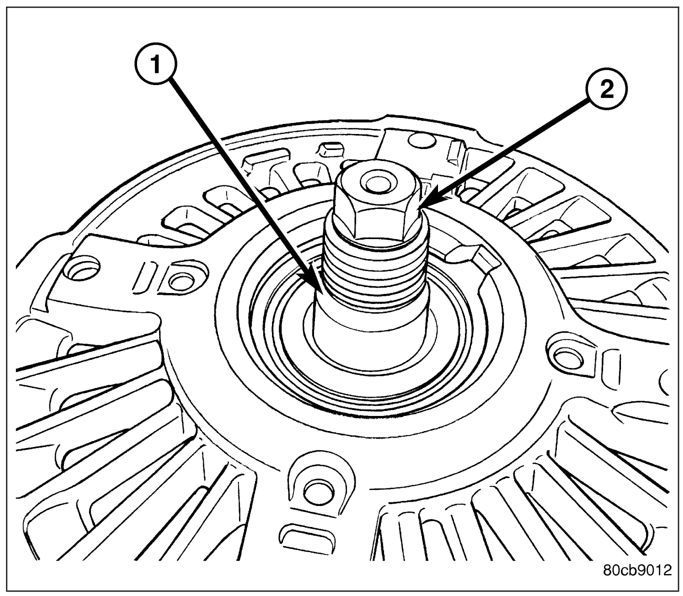
**INA Decoupler**

1. Disconnect negative battery cable.
2. Remove generator and accessory drive belt. Refer to Generator Removal.

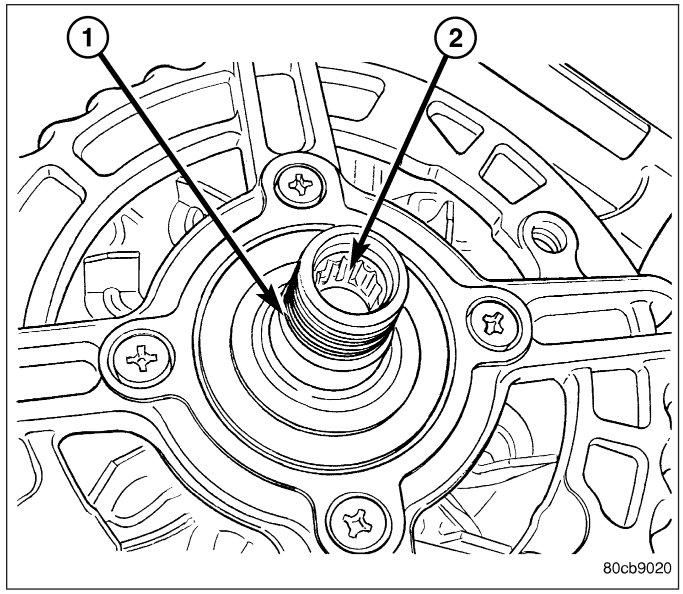
3. Position Special Tool #8823 (VM.1048) (2) into decoupler (1).



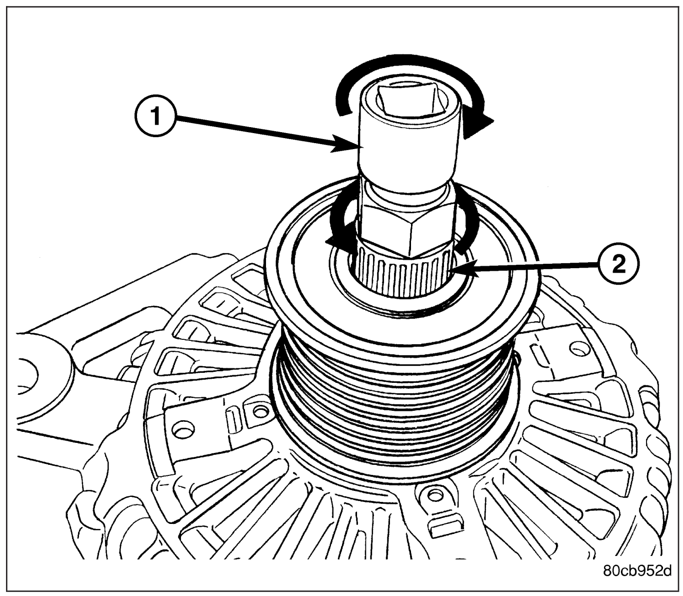
4. Determine if end of generator shaft is hex shaped (2).......................



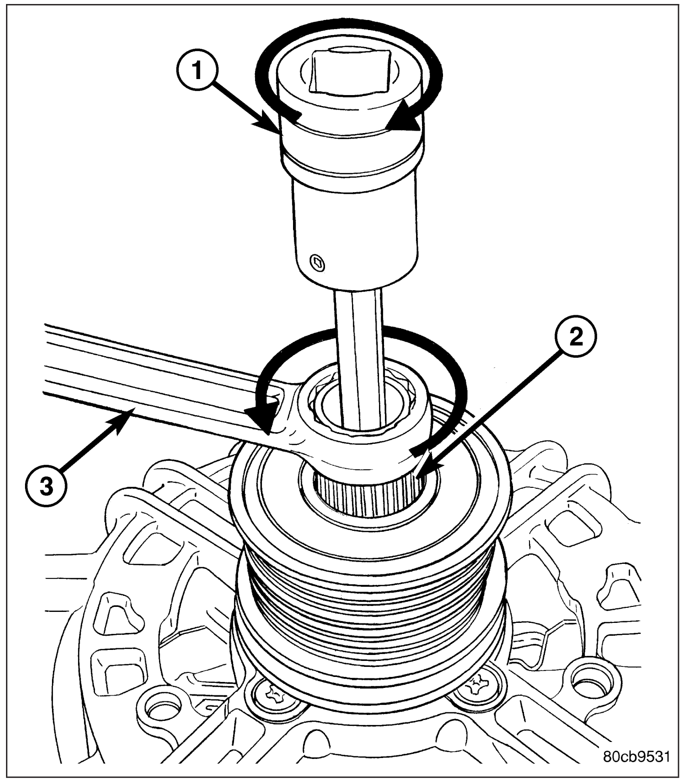
5. ............ or is splined (2).



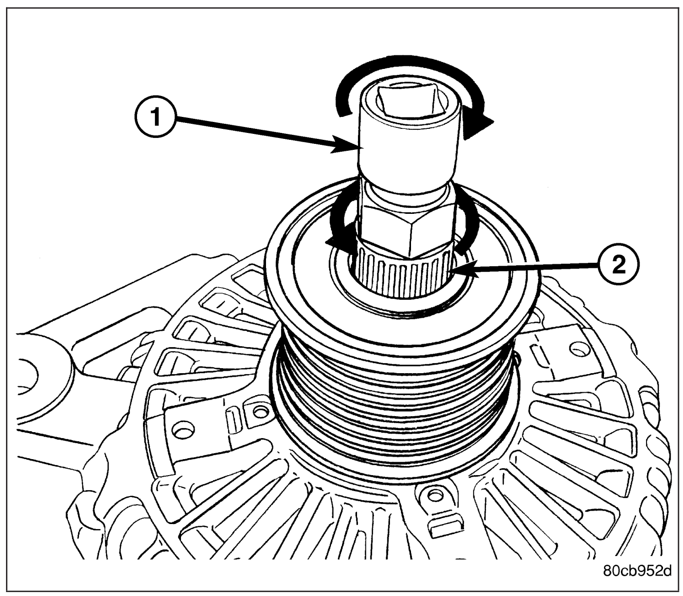
6. If hex is used, insert a 10MM deep socket (1) into tool #8823 (VM.1048).



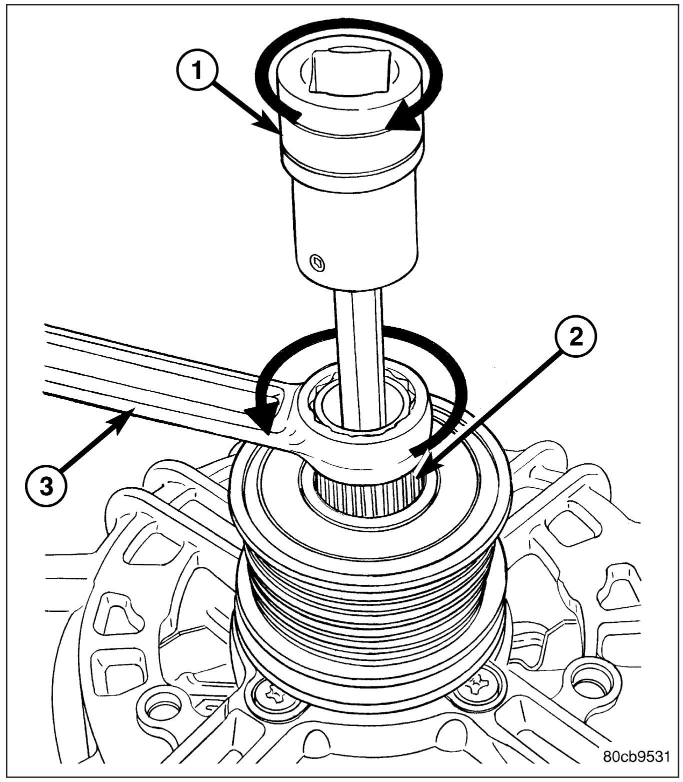
7. If splined, insert a 5/16” 6-point hex driver (1), or a 10MM 12-point triple square driver into tool #8823 (VM.1048).



8. The generator shaft uses conventional right-hand threads to attach decoupler. To break decoupler loose from generator threads, rotate end of tool (1) clockwise or...........,

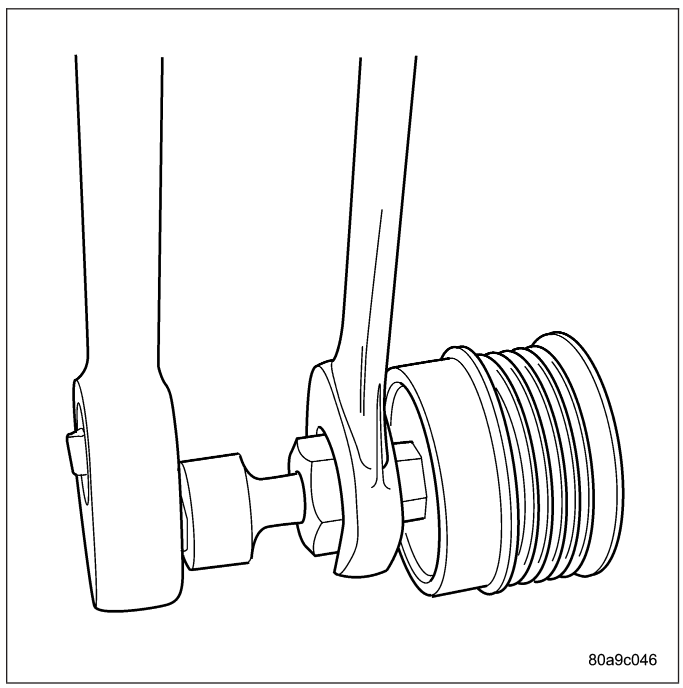


9. rotate end of tool (1) clockwise.
10. After breaking loose with tool, unthread decoupler by hand from generator.

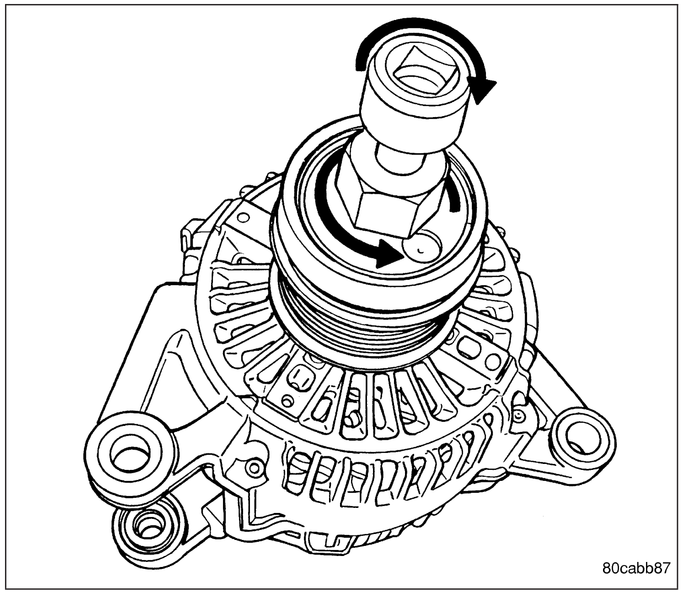


**Litens Decoupler**

1. Disconnect negative battery cable.
2. Remove generator and accessory drive belt. Refer to Generator Removal.
3. Position Special Tool #8433 into decoupler. Align to hex end of generator shaft.



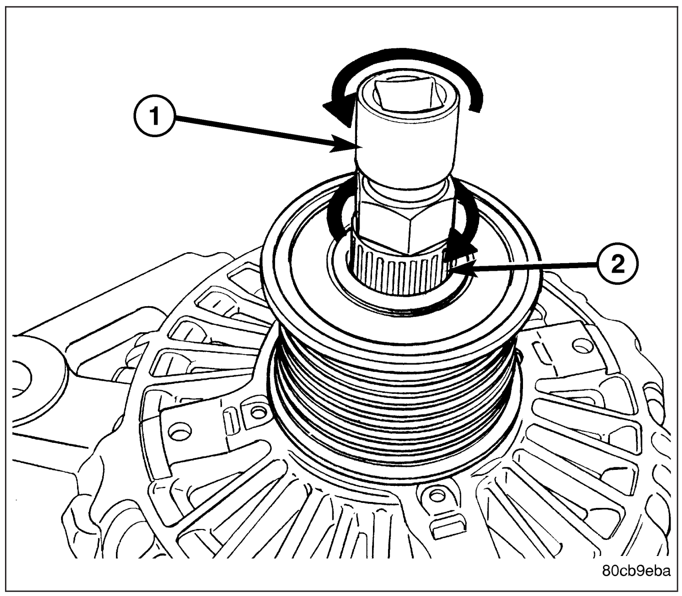
4. The generator shaft uses conventional right-hand threads to attach decoupler. To break decoupler loose from generator threads, rotate end of tool clockwise.
5. After breaking loose with tool, unthread decoupler by hand from generator.



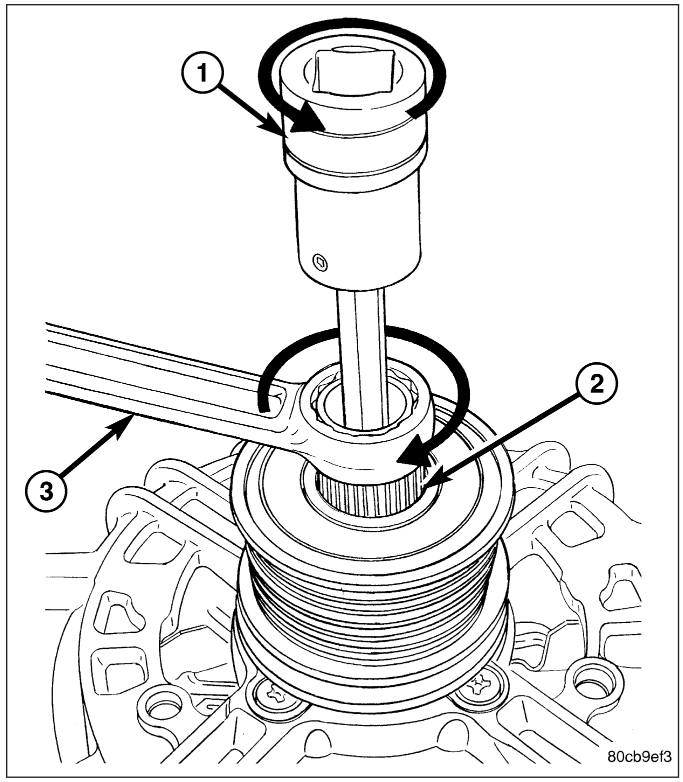
## INSTALLATION

### INA Decoupler

1. Thread decoupler pulley onto generator shaft by hand (right-hand threads).
2. Position Special Tool #8823 (VM.1048) into decoupler.
3. Determine if end of generator shaft is hex shaped or is splined. If hex is used, insert a 10MM deep socket (1) into tool #8823 (VM.1048) or..............



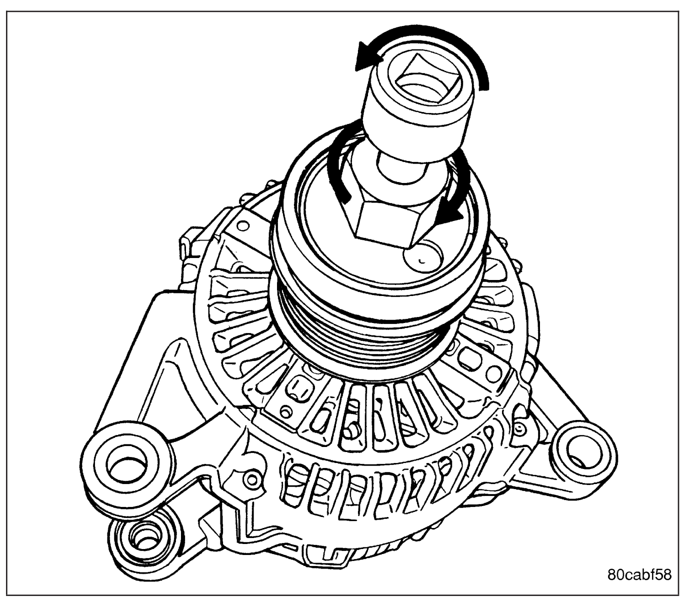
4. ............if splined, insert a 5/16” 6-point hex driver (1), or a 10MM 12-point triple square driver into tool #8823 (VM.1048).



5. **Do not use an adjustable, ratcheting “click type” torque wrench. Most “click type” wrenches will only allow torque to be applied in a clockwise rotation. Use a dial-type or beam-type wrench.** Tighten in counterclockwise rotation and tighten to 110 N·m (81 ft. lbs.).
6. Install accessory drive belt, and generator. Refer to Generator Installation.
7. Connect negative battery cable.

**Litens Decoupler**

1. Thread decoupler pulley onto generator shaft by hand (right-hand threads).
2. Position Special Tool 8433 into decoupler. Align tool to hex end of generator shaft.
3. **Do not use an adjustable, ratcheting “click type” torque wrench. Most “click type” wrenches will only allow torque to be applied in a clockwise rotation. Use a dial-type or beam-type wrench.** Tighten in counterclockwise rotation and tighten to 110 N·m (81 ft. lbs.).



4. Install accessory drive belt, and generator. Refer to Generator Installation.
5. Connect negative battery cable.

# REGULATOR - VOLTAGE

## DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

## OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the Powertrain Control Module (PCM). This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and battery temperature (refer to Battery Temperature Sensor for more information). It then determines a target charging voltage. If sensed battery voltage is 0.5 volts or lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is 0.5 volts above target voltage. A circuit in the PCM cycles the ground side of the generator field up to 100 times per second (100Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output. Also refer to Charging Operation for additional information.

# STARTING SYSTEM

## TABLE OF CONTENTS

# STARTING SYSTEM

## DESCRIPTION

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC).

## OPERATION

The starting system components form two separate circuits. A high-amperage feed circuit that feeds the starter motor between 150 and 350 amperes (700 amperes - diesel engine), and a low-amperage control circuit that operates on less than 20 amperes. The high-amperage feed circuit components include the battery, the battery cables, the contact disc portion of the starter solenoid, and the starter motor. The low-amperage control circuit components include the ignition switch, the clutch pedal position switch (manual transmission), the park/neutral position switch (automatic transmission), the starter relay, the electromagnetic windings of the starter solenoid, and the connecting wire harness components.

If the vehicle is equipped with a manual transmission, it has a clutch pedal position switch installed in series between the ignition switch and the coil battery terminal of the starter relay. This normally open switch prevents the starter relay from being energized when the ignition switch is turned to the momentary Start position, unless the clutch pedal is depressed. This feature prevents starter motor operation while the clutch disc and the flywheel are engaged. The starter relay coil ground terminal is always grounded on vehicles with a manual transmission.

If the vehicle is equipped with an automatic transmission, battery voltage is supplied through the low-amperage control circuit to the coil battery terminal of the starter relay when the ignition switch is turned to the momentary Start position. The park/neutral position switch is installed in series between the starter relay coil ground terminal and ground. This normally open switch prevents the starter relay from being energized and the starter motor from operating unless the automatic transmission gear selector is in the Neutral or Park positions.

When the starter relay coil is energized, the normally open relay contacts close. The relay contacts connect the relay common feed terminal to the relay normally open terminal. The closed relay contacts energize the starter solenoid coil windings.

The energized solenoid pull-in coil pulls in the solenoid plunger. The solenoid plunger pulls the shift lever in the starter motor. This engages the starter overrunning clutch and pinion gear with the starter ring gear on the manual transmission flywheel or on the automatic transmission torque converter or torque converter drive plate.

As the solenoid plunger reaches the end of its travel, the solenoid contact disc completes the high-amperage starter feed circuit and energizes the solenoid plunger hold-in coil. Current now flows between the solenoid battery terminal and the starter motor, energizing the starter.

Once the engine starts, the overrunning clutch protects the starter motor from damage by allowing the starter pinion gear to spin faster than the pinion shaft. When the driver releases the ignition switch to the On position, the starter relay coil is de-energized. This causes the relay contacts to open. When the relay contacts open, the starter solenoid plunger hold-in coil is de-energized.

When the solenoid plunger hold-in coil is de-energized, the solenoid plunger return spring returns the plunger to its relaxed position. This causes the contact disc to open the starter feed circuit, and the shift lever to disengage the overrunning clutch and pinion gear from the starter ring gear.

## DIAGNOSIS AND TESTING - STARTING SYSTEM

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these 3 systems must perform within specifications.

| Starting System Diagnosis | | |
|---|---|---|
| CONDITION | POSSIBLE CAUSE | CORRECTION |
| STARTER FAILS TO OPERATE. | 1. Battery discharged or faulty. | 1. Refer to Battery. Charge or replace battery, if required. |
| | 2. Starting circuit wiring faulty. | 2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits, if required. |
| | 3. Starter relay faulty. | 3. Refer to Starter Relay in Diagnosis and Testing. Replace starter relay if required. |
| | 4. Ignition switch faulty. | 4. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required. |
| | 5. Clutch pedal position switch faulty. | 5. Refer to Clutch Pedal Position Switch. |
| | 6. Park/Neutral position switch faulty or misadjusted. | 6. Refer to Park/Neutral Position Switch. Replace park/neutral position switch if required. |
| | 7. Starter solenoid faulty. | 7. Refer to Starter Motor. Replace starter motor assembly if required. |
| | 8. Starter motor faulty. | 8. If all other starting system components and circuits test OK, replace starter motor. |
| STARTER ENGAGES, FAILS TO TURN ENGINE. | 1. Battery discharged or faulty. | 1. Refer to Battery. Charge or replace battery if required. |
| | 2. Starting circuit wiring faulty. | 2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits if required. |
| | 3. Starter motor faulty. | 3. If all other starting system components and circuits test OK, replace starter motor assembly. |
| | 4. Engine seized. | 4. Refer to Engine Diagnosis in the Diagnosis and Testing section of 9, Engine. |
| STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS. | 1. Starter ring gear faulty. | 1. Refer to Starter Motor Removal and Installation. Remove starter motor to inspect starter ring gear. Replace starter ring gear if required. |
| | 2. Starter motor faulty. | 2. If all other starting system components and circuits test OK, replace starter motor assembly. |
| STARTER DOES NOT DISENGAGE. | 1. Starter motor improperly installed. | 1. Refer to Starter Motor Removal and Installation. Tighten starter mounting hardware to correct torque specifications. |
| | 2. Starter relay faulty. | 2. Refer to Starter Relay Diagnosis and Testing. Replace starter relay if required. |
| | 3. Ignition switch faulty. | 3. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required. |
| | 4. Starter motor faulty. | 4. If all other starting system components and circuits test OK, replace starter motor. |

### INSPECTION

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. Before removing any unit from starting system for repair or diagnosis, perform the following inspections:

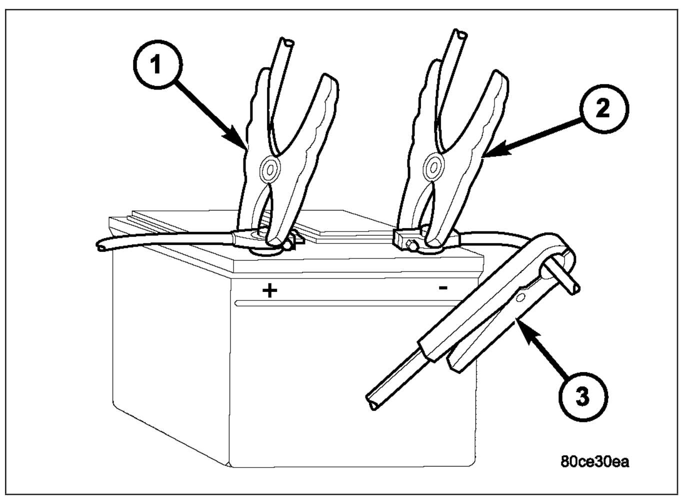
**WARNING: On vehicles equipped with airbags, refer to 8, passive restraint systems, before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

- **Battery** - Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. Refer to **Battery** in 8, Battery. **Note: If equipped with diesel engine, a dual battery system may be used, and both batteries must be inspected.**
- **Ignition Switch** - Visually inspect ignition switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Ignition Switch and Key Lock Cylinder.**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Clutch Pedal Position Switch** in 6, Clutch.
- **Park/Neutral Position Switch** - If equipped with automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Starter Relay** - Visually inspect starter relay for indications of physical damage and loose or corroded wire harness connections.
- **Starter Motor** - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to 8, Wiring Diagrams.

## TESTING

### COLD CRANKING TEST

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. The battery must be fully-charged and load-tested before proceeding. Refer to **Battery** in Battery.



1. Connect volt-ampere tester to battery terminals (1), (2) and (3). See instructions provided by manufacturer of volt-ampere tester being used. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, tester should be connected to battery on left side of vehicle only. Also, tester current reading must be taken from positive battery cable lead that connects to starter motor.**
2. Fully engage parking brake.
3. If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
4. Verify that all lamps and accessories are turned off.
5. To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

**WARNING: If equipped with diesel engine, attempt to start engine a few times before proceeding with following step.**

6. Rotate and hold ignition switch in Start position. Note cranking voltage and current (amperage) draw readings shown on volt-ampere tester.
   a. If voltage reads below 9.6 volts, refer to **Starter Motor** in Diagnosis and Testing. If starter motor is OK, refer to **Engine Diagnosis** in 9, Engine for further testing of engine. If starter motor is not OK, replace faulty starter motor.
   b. If voltage reads above 9.6 volts and current (amperage) draw reads below specifications, refer to **Feed Circuit Test** in this section.
   c. If voltage reads 12.5 volts or greater and starter motor does not turn, refer to **Control Circuit Testing** in this section.
   d. If voltage reads 12.5 volts or greater and starter motor turns very slowly, refer to **Feed Circuit Test** in this section.

**NOTE: A cold engine will increase starter current (amperage) draw reading, and reduce battery voltage reading.**

### FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in high-amperage feed circuit. For complete starter wiring circuit diagrams, refer 8, Wiring Diagrams.

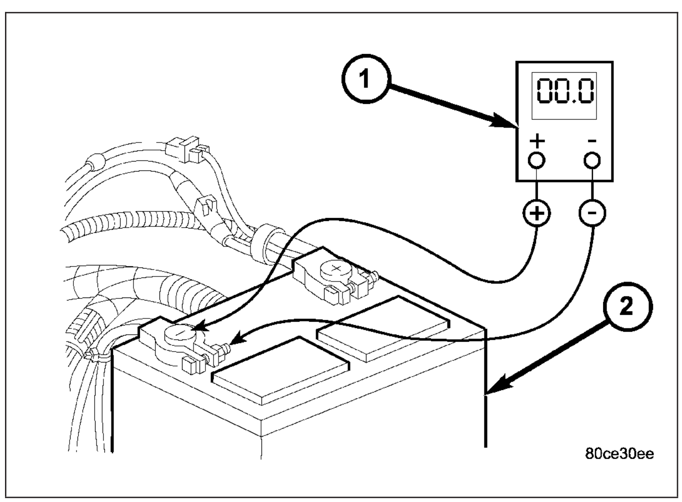
When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which voltmeter probes are attached.

**Example:** When testing resistance of positive battery cable, touch voltmeter leads to positive battery cable clamp and cable connector at starter solenoid. If you probe positive battery terminal post and cable connector at starter solenoid, you are reading combined voltage drop in positive battery cable clamp-to-terminal post connection and positive battery cable.

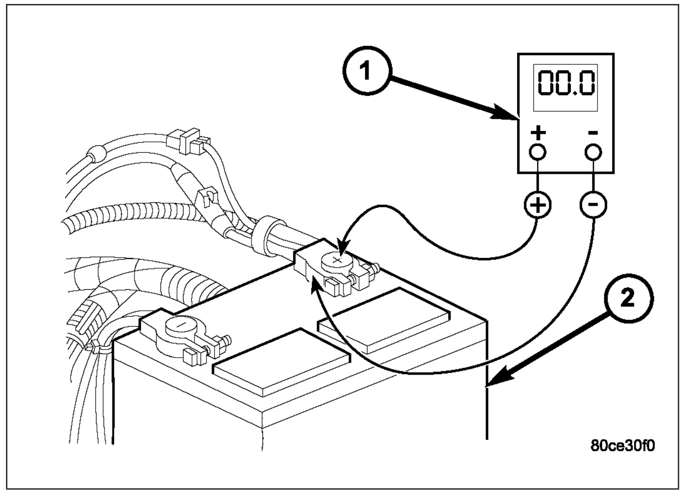
The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing tests, be certain that following procedures are accomplished:

- Battery is fully-charged and load-tested. Refer to **Battery** in 8, Battery.
- Fully engage parking brake.
- If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
- Verify that all lamps and accessories are turned off.
- To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

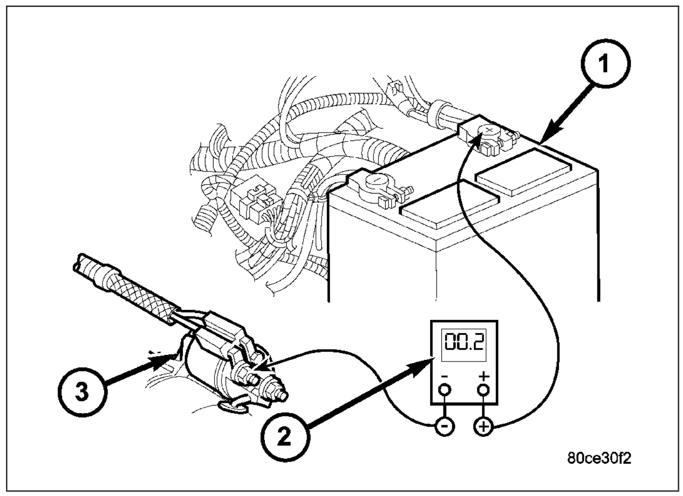
1. Connect positive lead of voltmeter (1) to negative battery cable terminal post. Connect negative lead of voltmeter to negative battery cable clamp. Rotate and hold ignition switch in Start position. Observe voltmeter (1). If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, procedure must be performed twice, once for each battery.**



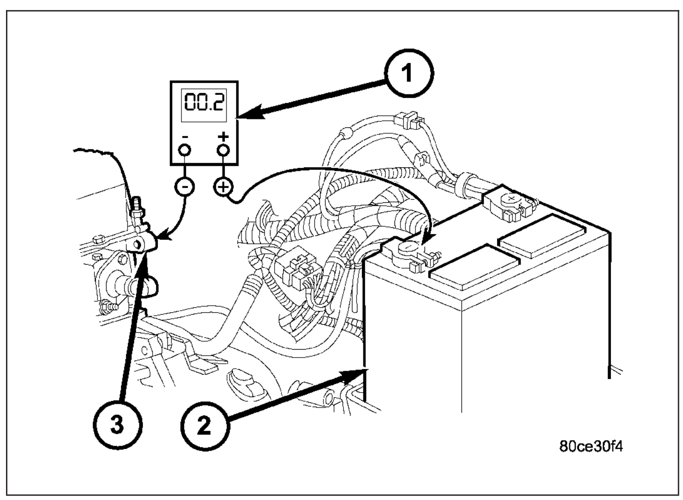
2. Connect positive lead of voltmeter (1) to positive battery terminal post. Connect negative lead of voltmeter to battery positive cable clamp. Rotate and hold ignition switch in Start position. Observe voltmeter (1). If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**



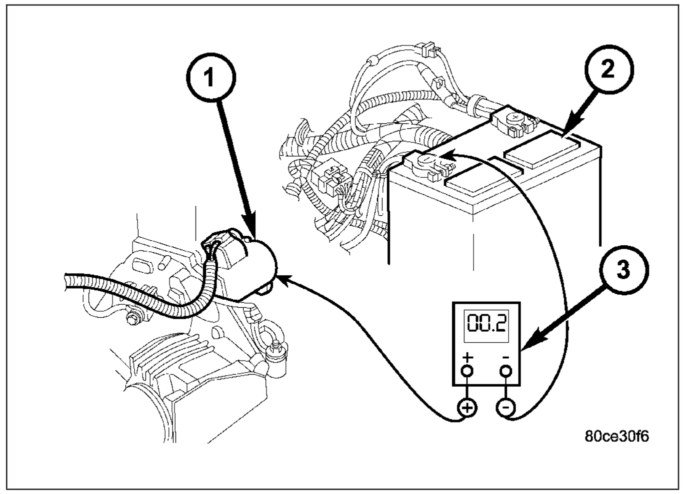
3. Connect voltmeter (2) to measure between battery positive terminal post and starter solenoid battery terminal stud (3). Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cable connection at solenoid. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**



4. Connect voltmeter (1) to measure between negative battery terminal post and a good clean ground on engine block (3). Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten negative battery cable attachment on engine block. Repeat test. If reading is still above 0.2 volt, replace faulty negative battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**



5. Connect positive lead of voltmeter (3) to starter housing (1). Connect negative lead of voltmeter to negative battery terminal post. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, correct poor starter to engine block ground contact. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**



6. If equipped with dual battery system (certain diesel equipped models), connect positive lead of voltmeter to positive battery cable clamp on battery located on left side of vehicle. Connect negative lead of voltmeter to positive battery terminal post on battery located on right side of vehicle. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cables at both batteries. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

If resistance tests detect no feed circuit problems, refer to **Starter Motor** in the Diagnosis and Testing.

### CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

- **Starter Relay** - Refer to **Starter Relay** Diagnosis and Testing.
- **Starter Solenoid** - Refer to **Starter Motor** Diagnosis and Testing.
- **Ignition Switch** - Refer to **Ignition Switch and Key Lock Cylinder**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, refer to **Clutch Pedal Position Switch** in 6, Clutch.
- **Park/Neutral Position Switch** - If equipped with automatic transmission, refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Wire harnesses and connections** - Refer to 8, Wiring Diagrams.

## INSPECTION - STARTING SYSTEM

The following starting system components should be carefully inspected whenever any starting system problem is encountered.

**WARNING: On vehicles equipped with airbags, disable airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate battery negative (ground) cable, then wait two minutes for airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable airbag system. Failure to take proper precautions could result in accidental airbag deployment and possible personal injury.**

### *Battery*

- Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery, if required. Refer to **Battery** for battery cleaning and inspection procedures.

### *Ignition Switch*

- Visually inspect ignition switch for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Wiring Diagrams**. Refer to **Ignition Switch and Key Lock Cylinder** for ignition switch service procedures.

***Clutch Pedal Position Switch***

- If vehicle is equipped with a manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Clutch Hydraulic Linkage** for clutch pedal position switch service procedures.

***Park/Neutral Position Switch***

- If vehicle is equipped with an automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Park/Neutral Position Switch** for park/neutral position switch service procedures.

***Starter Relay***

- Visually inspect starter relay for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Starter Relay** for starter relay service procedures.

***Starter Motor***

- Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. If problem being diagnosed involves improper starter engagement, disengagement or noise complaints, starter motor should be removed. With starter motor removed, inspect starter pinion and ring gears for damaged or missing teeth. Replace faulty components as required. Refer to **Starter Motor** for removal/installation procedures.

***Starter Solenoid***

- Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections. Clean corroded connections as required. Refer to **Starter Motor** for starter solenoid service procedures.

***Wiring***

- Visually inspect starting system wire harnesses for indications of physical damage. Repair or replace any faulty wiring, as required. Refer to **Wiring Diagrams** for repair or connector and terminal service procedures.

## SPECIFICATIONS

### TORQUE - GAS

| DESCRIPTION | N-m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Starter Solenoid Battery Cable Nut | 11 | - | 100 |

| Starter Mounting Bolts | 27 | 20 | - |

## STARTER MOTOR - GAS POWERED

| Starter Motor and Solenoid | |
|---|---|
| Engine Application | 2.4L / 3.7L |
| Power Rating | 1.4 Kilowatt (1.9 Horsepower) |
| Voltage | 12 Volts |
| ** Number of Permanent Magnets | 6 |
| Number of Brushes | 4 |
| Drive Type | Planetary Gear Reduction |
| Free Running Test Voltage | 11.2 Volts |
| Free Running Test Maximum Amperage Draw | 90 Amperes |
| Free Running Test Minimum Speed | 2400 rpm |
| Solenoid Closing Maximum Voltage Required | 7.8 Volts |
| * Cranking Amperage Draw Test | 160 Amperes |
| | |
| *Test at operating temperature. Cold engine, tight (new) engine, or heavy oil will increase starter amperage draw. | |
| **The starter is equipped with permanent magnets. Never strike the starter case to attempt to loosen a sticking/ stuck armature as permanent magnets may crack or break. | |

## TORQUE - DIESEL

| ITEM | SPECIFICATION |
|---|---|
| ENGINE | TURBO DIESEL |
| RATED VOLTAGE | 12 VOLTS |
| NUMBER OF FIELDS | 4 |
| NUMBER OF POLES | 4 |
| NUMBER OF BRUSHES | 4 |
| DRIVE TYPE | GEAR REDUCTION |
| FREE RUNNING TEST VOLTAGE | 11.5 VOLTS |
| FREE RUNNING TEST MAXIMUM AMPERAGE DRAW | 160 AMPS |
| FREE RUNNING TEST MINIMUM SPEED | 5500 RPM |
| SOLENOID CLOSING MAXIMUM VOLTAGE | 7.8 VOLTS |
| MAXIMUM CRANKING AMPERAGE DRAW | * 500 AMPS |

* A COLD OR NEW ENGINE WILL INCREASE STARTER AMPERAGE DRAW. THE USE OF HEAVY WEIGHT ENGINE OIL WILL ALSO INCREASE STARTER AMPERAGE DRAW.

# STARTER MOTOR

## DIAGNOSIS AND TESTING - STARTER MOTOR

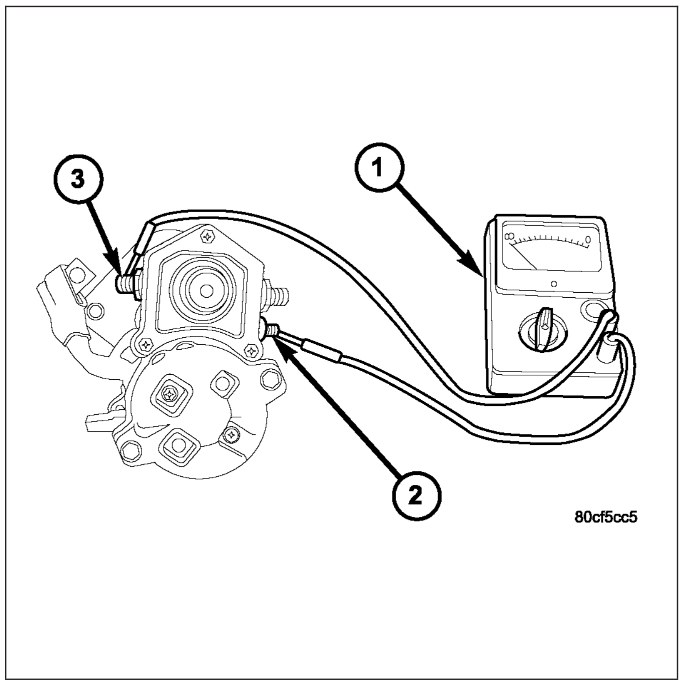
Correct starter motor operation can be confirmed by performing the following free running bench test. This test can only be performed with starter motor removed from vehicle. Refer to Specifications for starter motor specifications.

1. Remove starter motor from vehicle. Refer to Starter Motor Removal and Installation.
2. Mount starter motor securely in a soft-jawed bench vise. The vise jaws should be clamped on the mounting flange of starter motor. Never clamp on starter motor by field frame.
3. Connect a suitable volt-ampere tester and a 12-volt battery to starter motor in series, and set ammeter to 100 ampere scale. See instructions provided by manufacturer of volt-ampere tester being used.
4. Install jumper wire from solenoid terminal to solenoid battery terminal. The starter motor should operate. If starter motor fails to operate, replace faulty starter motor assembly.
5. Adjust carbon pile load of tester to obtain free running test voltage. Refer to Specifications for starter motor free running test voltage specifications.
6. Note reading on ammeter and compare reading to free running test maximum amperage draw. Refer to Specifications for starter motor free running test maximum amperage draw specifications.
7. If ammeter reading exceeds maximum amperage draw specification, replace faulty starter motor assembly.

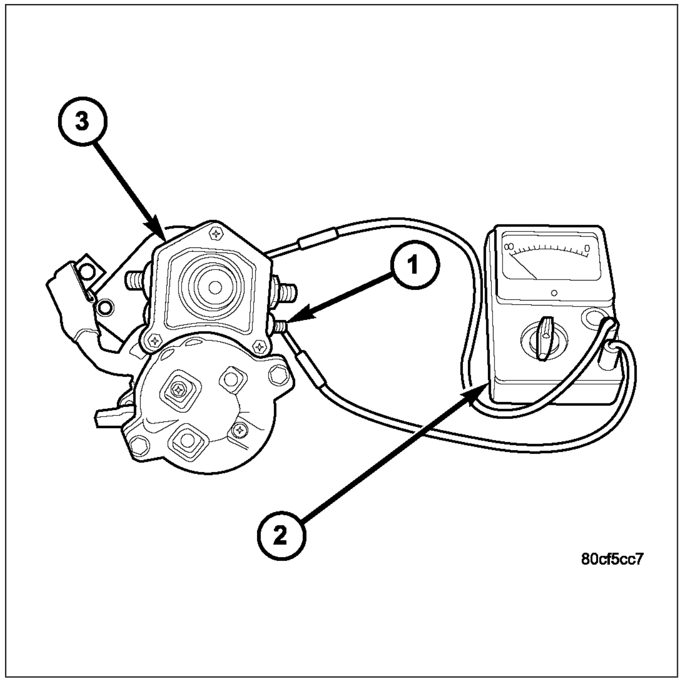
### STARTER SOLENOID

This test can only be performed with starter motor removed from vehicle.

1. Remove starter motor from vehicle. Refer to Starter Motor Removal and Installation.
2. Disconnect wire from solenoid field coil terminal.
3. Check for continuity between solenoid terminal (3) and solenoid field coil terminal (2) with a continuity tester (1). There should be continuity. If OK, go to Step 4. If not OK, replace faulty starter motor assembly.



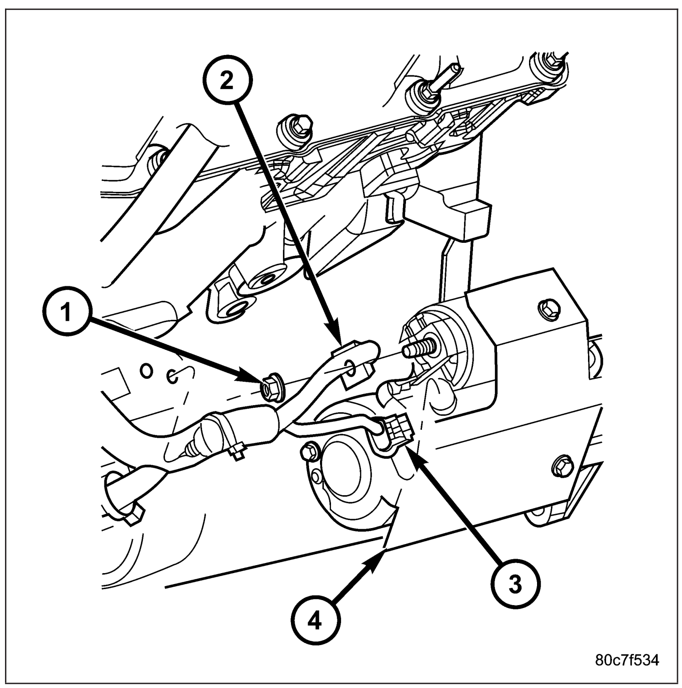
4. Check for continuity between solenoid terminal (1) and solenoid case. There should be continuity. If not OK, replace faulty starter motor assembly.



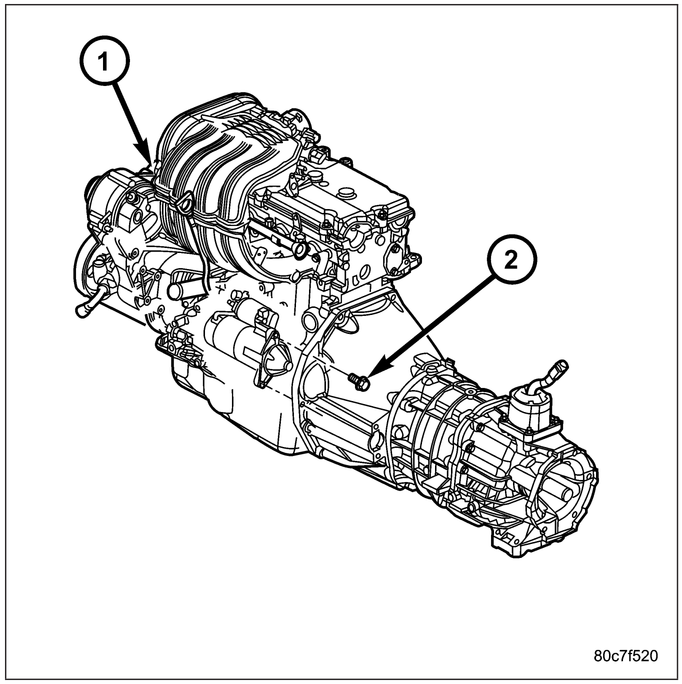
## REMOVAL

### 2.4L

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Remove solenoid wire connector (3) from solenoid terminal.
4. Remove battery cable eyelet (2) from stud on starter solenoid.

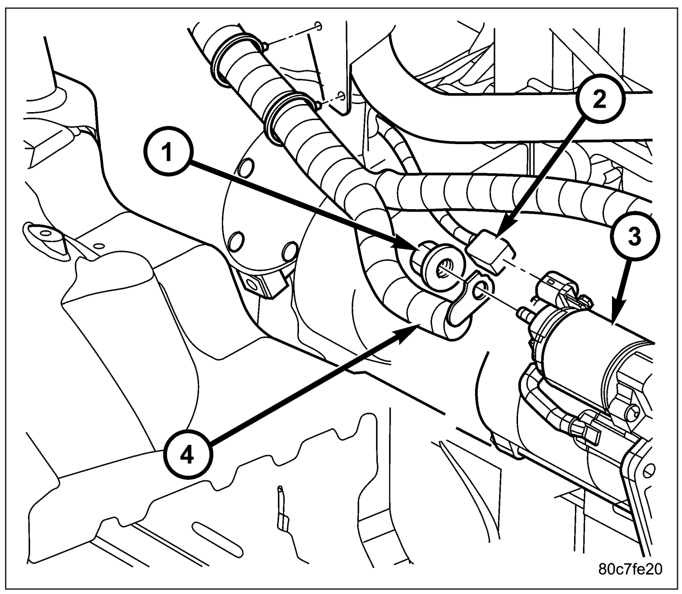


5. Remove two starter mounting bolts (2) and remove starter from vehicle.

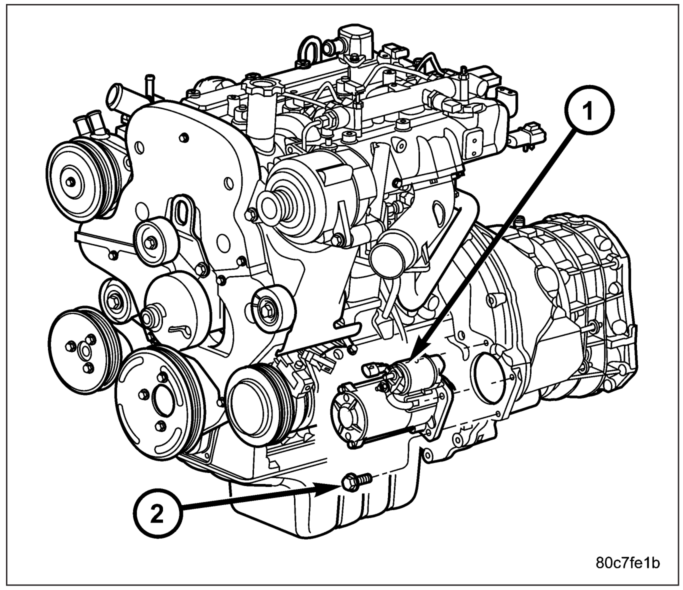


## 2.8L - DIESEL

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Disconnect solenoid wire connector (2) from solenoid terminal.
4. Remove battery cable eyelet (4) from stud on starter solenoid.

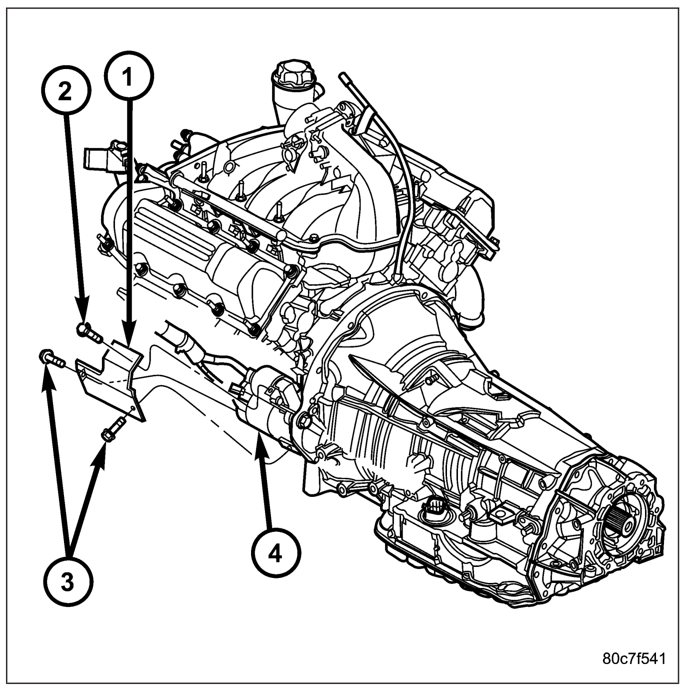


5. Remove three starter mounting bolts (2).
6. Remove starter (1) from transmission bellhousing.

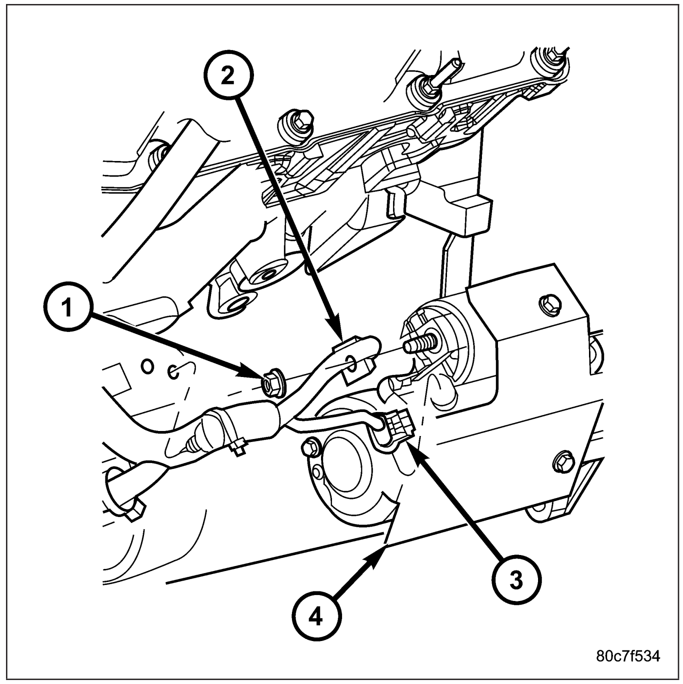


### 3.7L

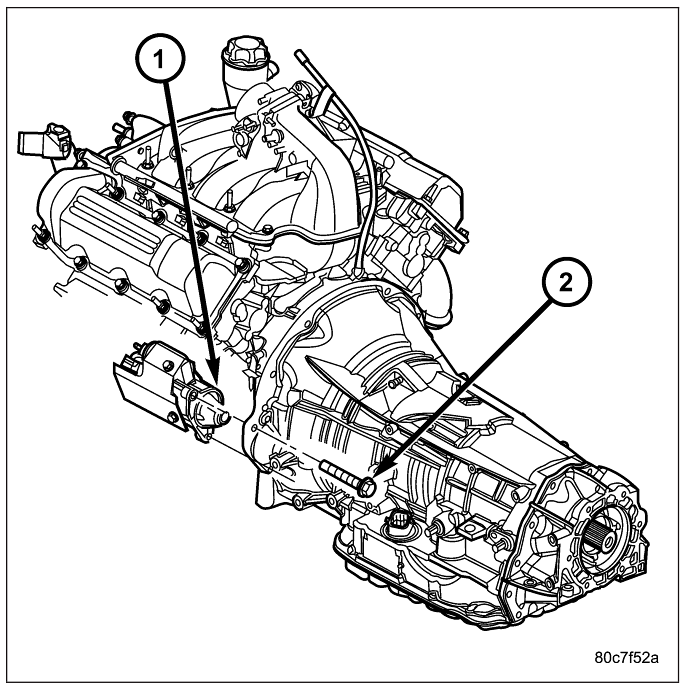
1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Remove 2 flange bolts securing left exhaust downpipe to crossover pipe. Lower pipe slightly to allow front propeller shaft removal.
4. Remove front propeller shaft.
5. Remove two starter heat shield bolts (3) at side of starter.
6. Remove starter heat shield nut at front of starter.
7. Remove starter heat shield.



8. Remove solenoid wire connector (3) from solenoid terminal.
9. Remove battery cable eyelet (2) from stud on starter solenoid.



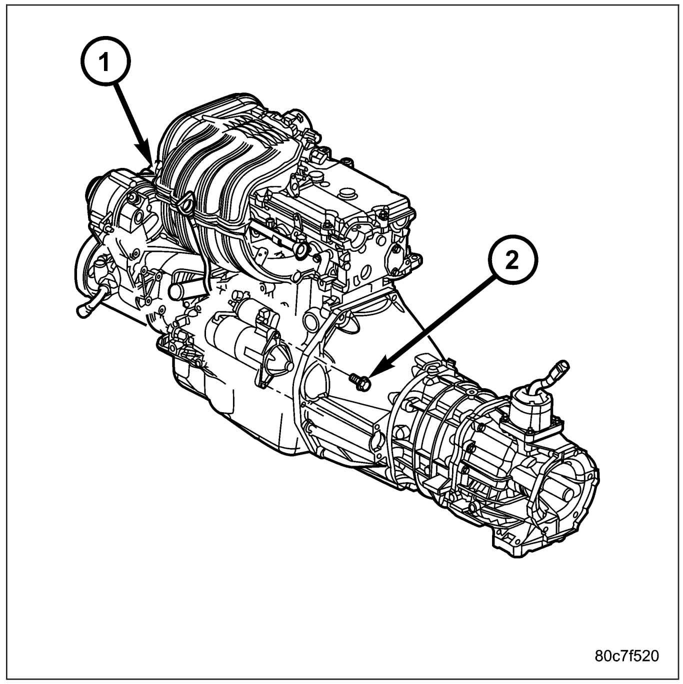
10. Remove two starter mounting bolts (2).
11. Position front of starter to face rear of vehicle. Rotate starter until solenoid position is located below starter.
12. Remove starter from vehicle by passing it between exhaust pipe and transmission bellhousing.



## INSTALLATION

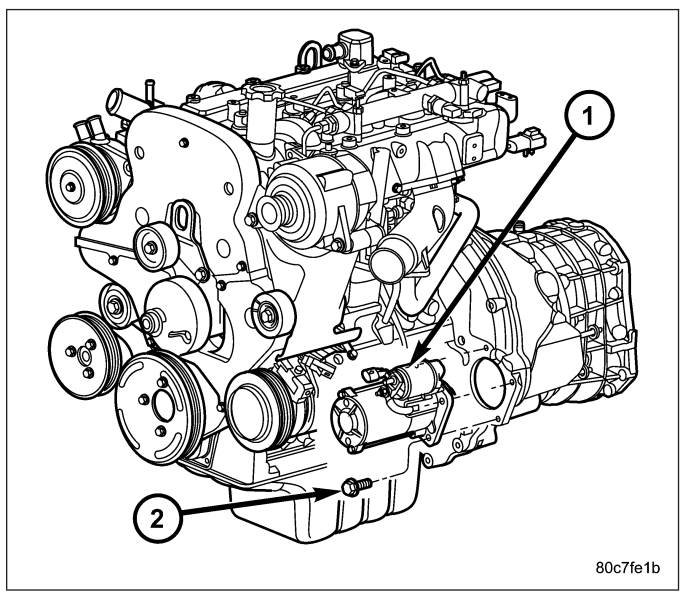
### 2.4L

1. Position starter into bellhousing and install two bolts (2) and tighten to 54 N·m (40 ft. lbs.).
2. Install battery cable and nut to stud on starter solenoid and tighten to 11 N·m (100 in. lbs.).
3. Install solenoid wire connector to solenoid terminal.
4. Lower vehicle.
5. Connect negative battery cable.

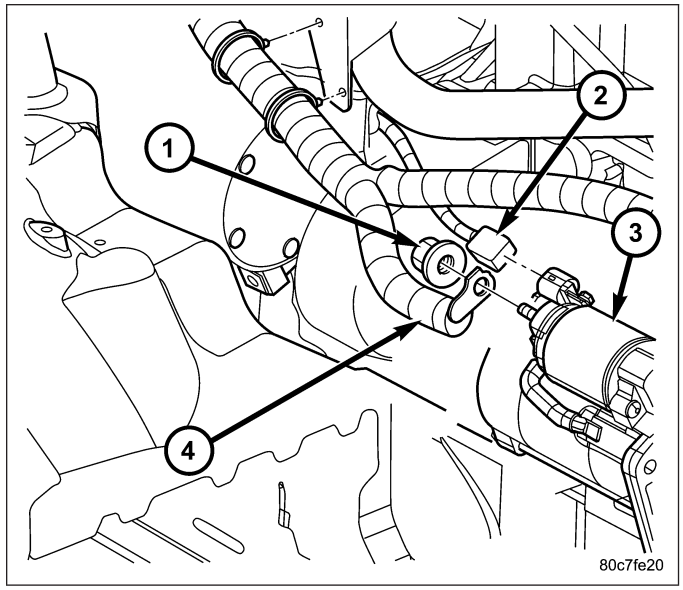


### 2.8L - DIESEL

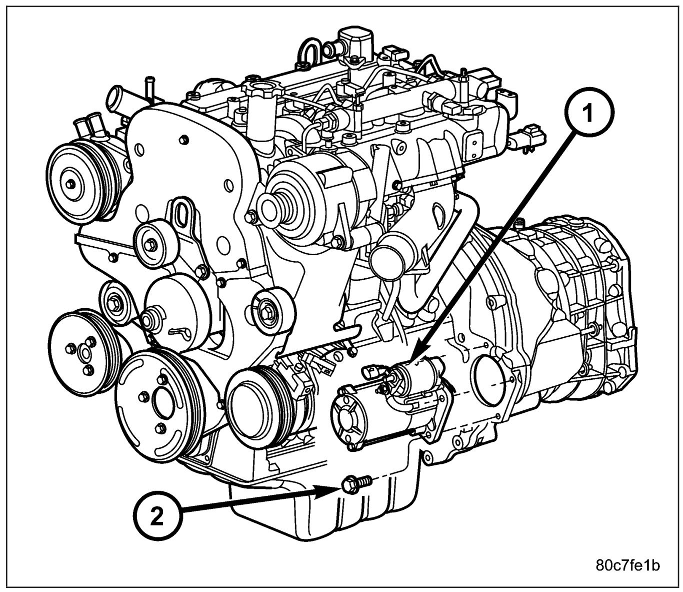
1. Position starter motor (1) to transmission housing.



2. Connect battery cable solenoid terminal wire harness connector (2) to connector receptacle on starter solenoid. Always support starter motor during this process. Do not let starter motor hang from wire harness.
3. Install battery cable eyelet terminal (4) onto solenoid B (+) terminal stud.
4. Install nut (1) securing battery cable eyelet terminal to starter solenoid B (+) terminal stud and tighten to 11 N·m (100 in. lbs.).



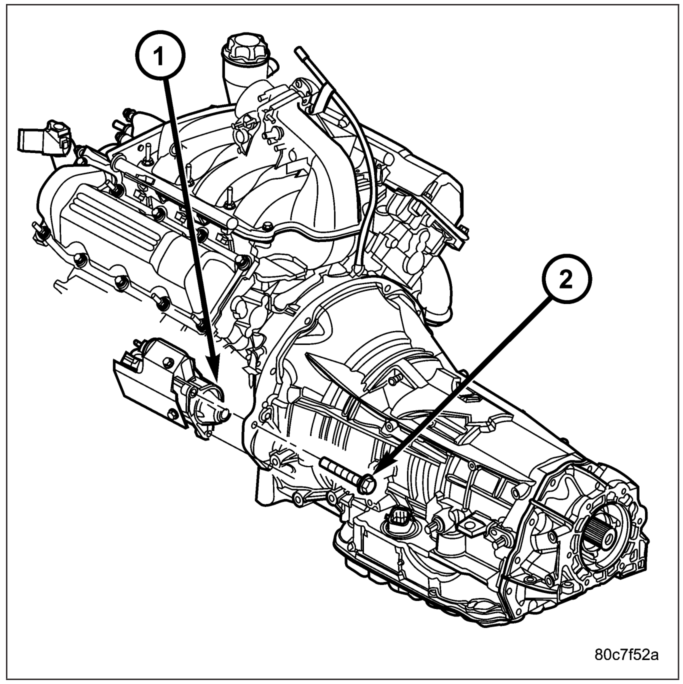
5. Position starter motor and install three bolts (2). Tighten 3 bolts in this sequence: top bolt, bottom bolt, middle bolt to 27 N·m (20 ft. lbs.).
6. Lower vehicle.
7. Connect negative battery cable.



## 3.7L

1. Position front of starter towards rear of vehicle with solenoid position rotated until it is located below starter. Install starter by passing it between exhaust pipe and transmission bellhousing.

2. Position starter into bellhousing and install two bolts (2) and tighten to 54 N·m (40 ft. lbs.).
3. Install battery cable and nut to stud on starter solenoid and tighten to 11 N·m (100 in. lbs.).
4. Install solenoid wire connector to solenoid terminal.
5. Position starter heat shield and install nut at front of starter.
6. Install 2 starter heat shield bolts at side of starter.
7. Install front propeller shaft.
8. Install 2 flange bolts securing left exhaust downpipe to crossover pipe.
9. Lower vehicle.
10. Connect negative battery cable.



# RELAY - STARTER MOTOR

## DESCRIPTION

The starter relay is an electromechanical device that switches battery current to the pull-in coil of the starter solenoid when ignition switch is turned to Start position. The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. See PDC cover for relay identification and location.

The starter relay is a International Standards Organization (ISO) relay. Relays conforming to ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The starter relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

## OPERATION

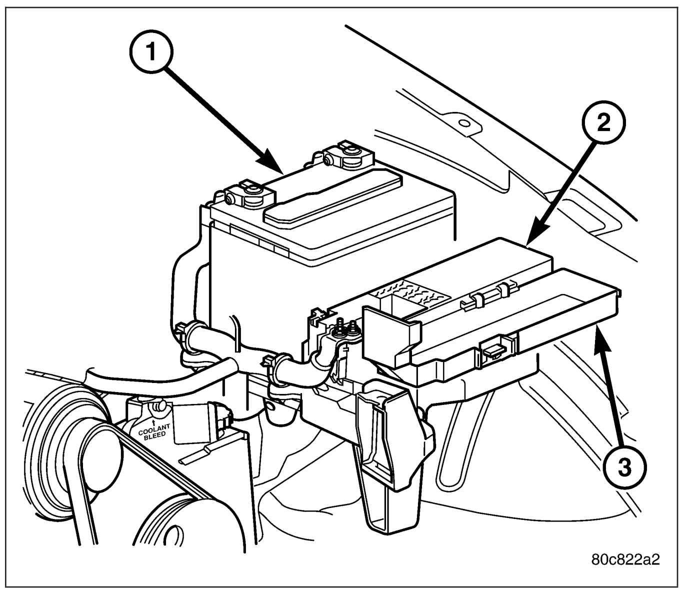
The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When electromagnetic coil is energized, it draws the movable contact away from normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When electromagnetic coil is de-energized, spring pressure returns movable contact to normally closed position. The resistor or diode is connected in parallel with electromagnetic coil within relay, and helps to dissipate voltage spikes produced when coil is de-energized.

## REMOVAL

The starter relay is located in the Power Distribution Center (PDC) (2). Refer to label on PDC cover for relay location.

1. Remove PDC cover (3).
2. Remove relay from PDC.
3. Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
4. Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.



## INSTALLATION

1. Refer to Power Distribution Center (PDC) cover for starter relay location.
2. Install relay to PDC.
3. Install cover to PDC.

| CODE ACTIVE |
| REAR DEFOGGER RELAY SHORTED |
| JUNCTION BLOCK - REAR DEFOGGER RELAY CONTROL CIRCUIT SHORT TO VOLTAGE |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

Turn the ignition on.

With the scan tool, erase DTCs.

Attempt to operate the Rear Window Defogger.

With the scan tool, read DTCs.

**Does the scan tool display REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT SHORT TO VOLTAGE?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

### 2. RELAY SHORTED

Remove the Rear Window Defogger Relay from the Junction Block.

Install a substitute relay in place of the Rear Window Defogger Relay.

With the scan tool, erase DTCs.

Attempt to operate the Rear Window Defogger.

With the scan tool, read DTCs.

**Does the scan tool display REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT SHORT TO VOLTAGE?**

**Yes** >> Go To 3

**No** >> Replace the original relay.
Perform BODY VERIFICATION TEST - VER 1.

## 3. JUNCTION BLOCK - REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

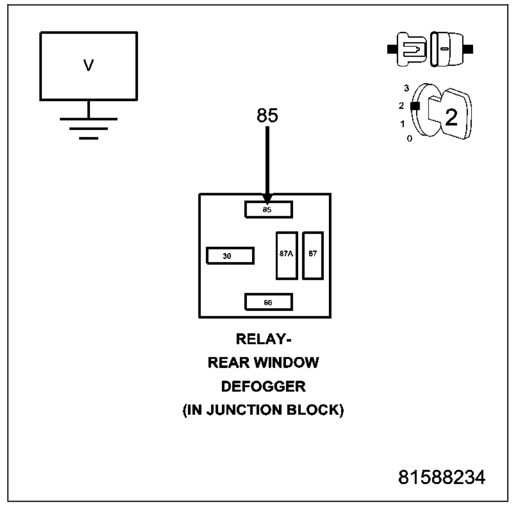
Remove the Rear Window Defogger Relay from the Junction Block.

Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block connectors are reconnected at this time.**

Turn the ignition on.

Measure the voltage of the Rear Window Defogger Relay Control circuit in the relay connector of the Junction Block.

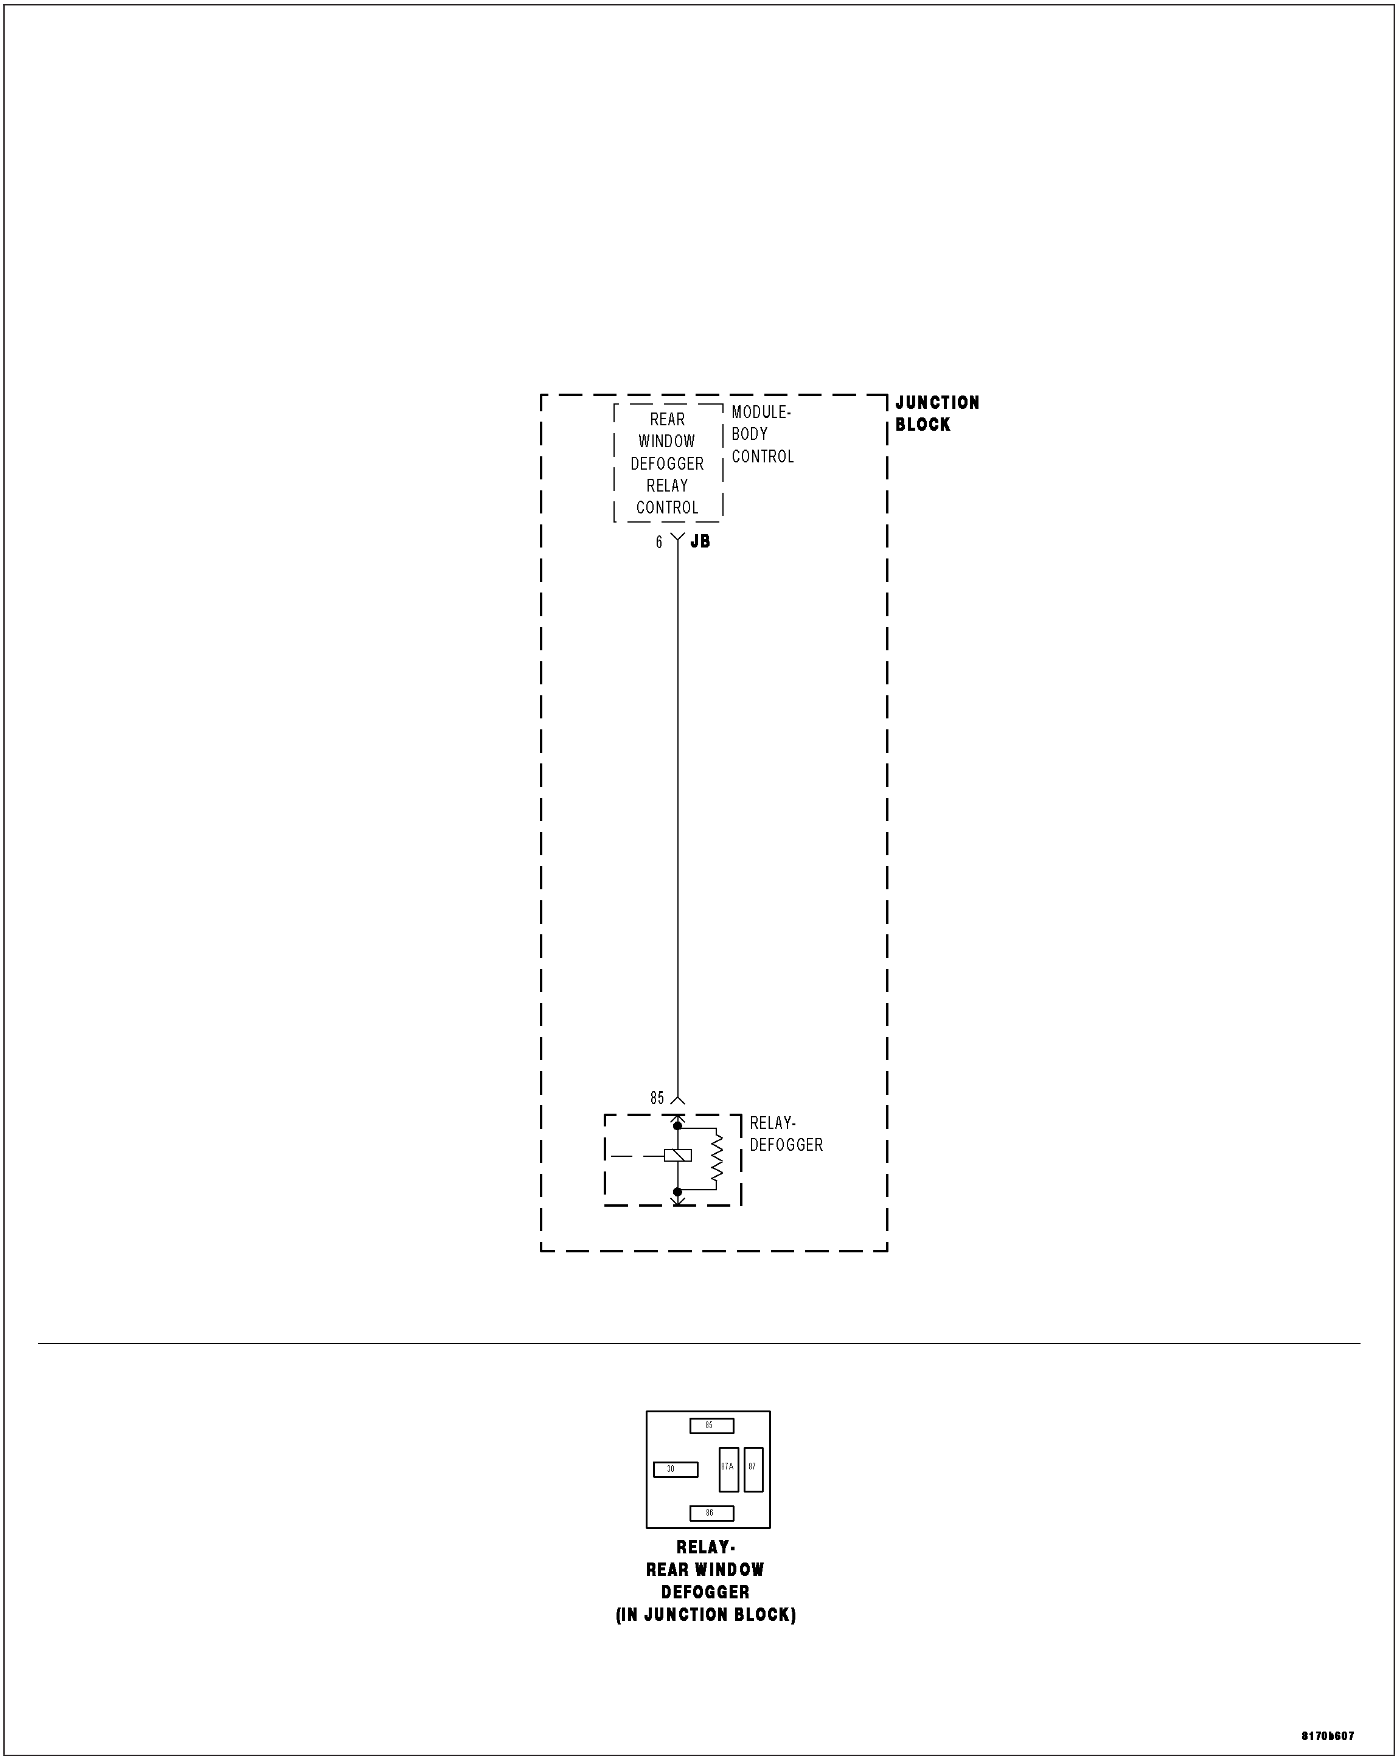


**Is there any voltage present?**

**Yes** >> Replace the Junction Block.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## REAR DEFOGGER RELAY CONTROL CIRCUIT OPEN/SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

## Diagnostic Test

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the BCM detects no voltage on the Rear Window Defogger Control circuit due to an open or short to ground.

| Possible Causes |
|---|
| JUNCTION BLOCK FUSE 39 |
| CODE ACTIVE |
| RELAY OPEN OR SHORTED |
| JUNCTION BLOCK - REAR WINDOW DEFOGGER RELAY CONTROL SHORT TO GROUND |
| FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| JUNCTION BLOCK - REAR WINDOW DEFOGGER RELAY CONTROL OPEN |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

Turn the ignition on.

With the scan tool, erase DTCs.

Attempt to operate the Rear Window Defogger.

With the scan tool, read DTCs.

**Does the scan tool display REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT OPEN/SHORT TO GROUND?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary. Ensure the relay is completely plugged in.
Perform BODY VERIFICATION TEST - VER 1.

### 2. JUNCTION BLOCK FUSE 39

Check Junction Block fuse 39.

**Is the fuse open.**

**Yes** >> Check for a short to ground and replace the Junction Block fuse.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition on.

Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output circuit at Fuse 39.

The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the open Fused Ignition Switch Output circuit as necessary.
Perform BODY VERIFICATION TEST - VER 1.

## 4. RELAY OPEN OR SHORTED

Remove the Rear Window Defogger Relay from the Junction Block.

Install fuse if previously removed.

Install a substitute relay in place of the Rear Window Defogger Relay.

With the scan tool, erase DTCs.

Attempt to operate the Rear Window Defogger.

With the scan tool, read DTCs.

**Does the scan tool display REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT OPEN/SHORT TO GROUND?**

**Yes** >> Go To 5

**No** >> Replace the original relay.
Perform BODY VERIFICATION TEST - VER 1.

## 5. JUNCTION BLOCK - REAR WINDOW DEFOGGER RELAY CONTROL SHORT TO GROUND

Turn the ignition off.

Remove the Rear Window Defogger Relay from the Junction Block.

Remove the Body Control Module from the Junction Block.

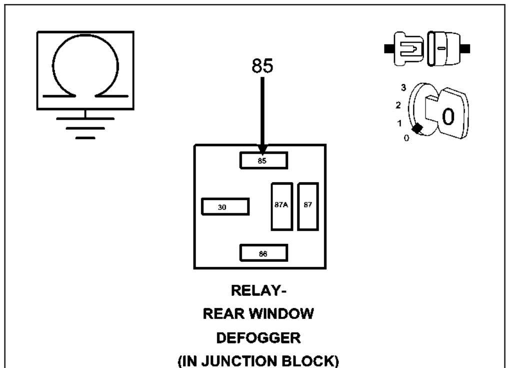
**NOTE: Ensure the Junction Block connectors are reconnected at this time.**

Measure the resistance between ground and the Rear Window Defogger Relay Control circuit in the relay connector of the Junction Block.

**Is the resistance below 100.0 ohms?**

**Yes** >> Replace the Junction Block.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 6



8170b668

## 6. JUNCTION BLOCK - REAR WINDOW DEFOGGER RELAY CONTROL OPEN

Turn the ignition off.

Remove the Rear Window Defogger Relay from the Junction Block.

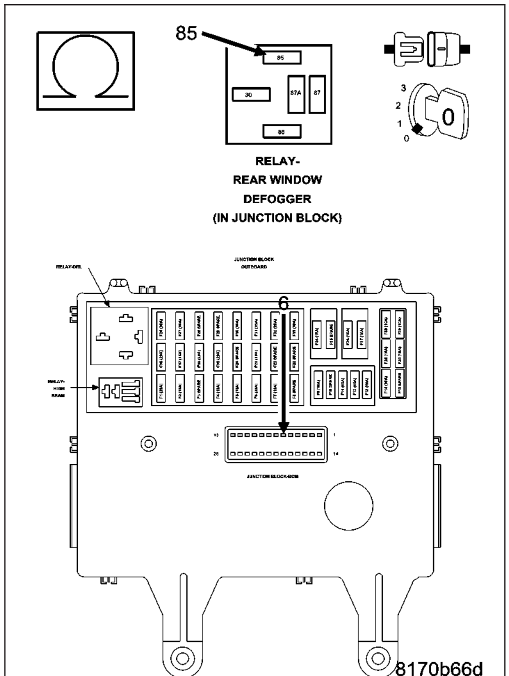
Remove the Body Control Module from the Junction Block.

Measure the resistance of the Rear Window Defogger Relay Control circuit between the Relay connector and the Junction Block - BCM connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 7

**No** >> Replace the Junction Block.
Perform BODY VERIFICATION TEST - VER 1.



8170b66d

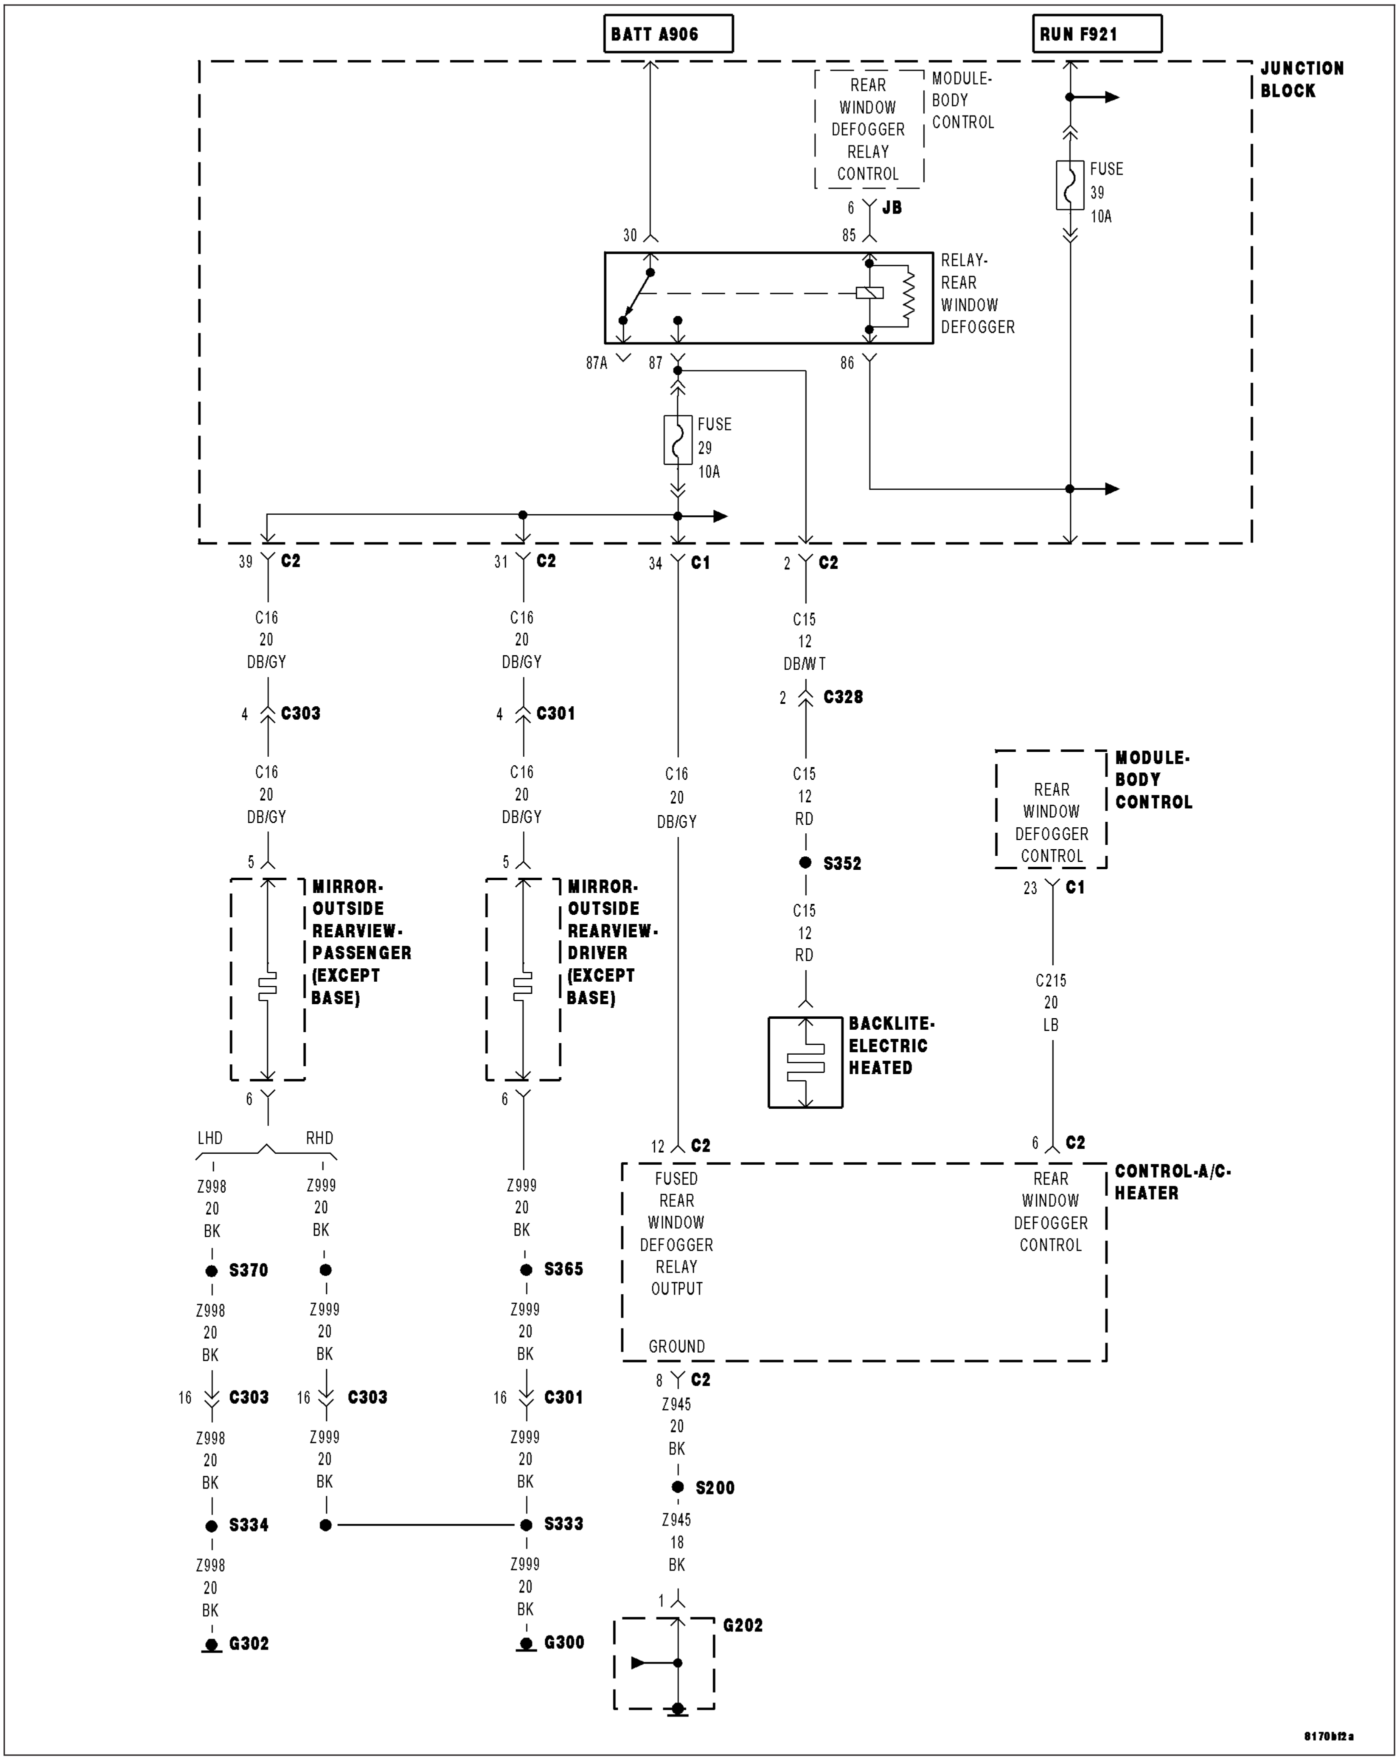
## 7. BODY CONTROL MODULE

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## *REAR WINDOW DEFOGGER INOPERATIVE



For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| JUNCTION BLOCK FUSE 29 |
| PDC FUSE 19 |
| REAR DEFOGGER RELAY DTC'S |
| REAR WINDOW DEFOGGER RELAY OUTPUT CIRCUIT OPEN |
| REAR WINDOW DEFOGGER RELAY |
| REAR WINDOW DEFOGGER GRID OPEN |
| FUSED B(+) CKT OPEN AT RELAY |
| A/C-HEATER CONTROL |
| OPEN GROUND CIRCUIT |
| FUSED REAR WINDOW DEFOGGER RELAY OUTPUT CIRCUIT OPEN |
| REAR WINDOW DEFOGGER CONTROL OPEN |
| BODY CONTROL MODULE |
| A/C-HEATER CONTROL LED |

## Diagnostic Test

### 1. REAR DEFOGGER RELAY DTC'S

With the scan tool, read the Body Control Module DTC's.

**Are there any Rear Defogger Relay DTC's present?**

**Yes** >> Refer to the symptom list for problems related to Rear Defogger Relay DTC's.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 2

### 2. REAR DEFOGGER SWITCH OPERATION

Toggle the Rear Defogger switch and observe the indicator.

**Does the indicator toggle on and off when the switch is pressed?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. REAR DEFOGGER GRID OPEN

Turn the ignition on.

Turn the Rear Window Defogger on.

Measure the voltage between the Rear Window Defogger Relay Output circuit at the defogger grid on the rear window to ground.

**Is the voltage above 12.0 volts?**

**Yes** >> Repair the open in the Rear Window Defogger Grid or the Grid Ground circuit.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Rear Window Defogger Relay Output circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

## 4. SCAN TOOL ON/OFF STATE

With the scan tool, Rear Defogger Switch state.

Cycle the Rear Defogger On/Off button and observe the scan tool.

**Did the scan tool display change?**

**Yes** >> Go To 5

**No** >> Go To 10

## 5. PDC FUSE 19

Check the Power Distribution Center fuse 19.

**Is the fuse open?**

**Yes** >> Check for a short to ground and replace the PDC fuse.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. JUNCTION BLOCK FUSE 29

Check Junction Block fuse 29.

**Is the fuse open?**

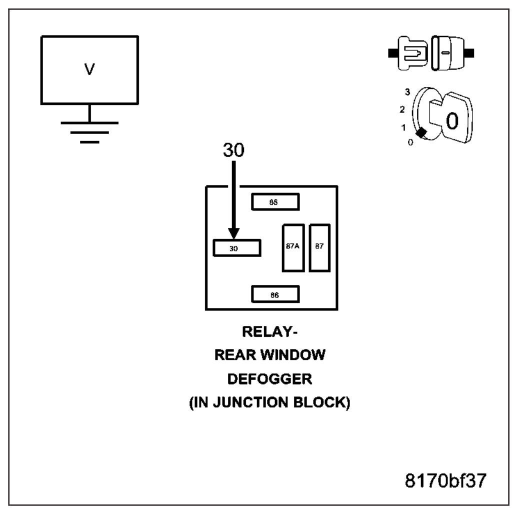
**Yes** >> Check for a short to ground and replace the Junction Block fuse.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 7

## 7. FUSED B(+) CKT OPEN

Remove the Rear Window Defogger Relay from the Junction Block.

Measure the voltage of the Fused B(+) circuit in the Rear Window Defogger Relay connector.



**Is the voltage above 10.0 volts?**

**Yes** >> Go To 8

**No** >> Repair the open Fused B(+) circuit from PDC fuse 19.
Perform BODY VERIFICATION TEST - VER 1.

## 8. SUBSTITUTE RELAY

Remove the Rear Window Defogger Relay from the Junction Block.

Install a known good relay in the Rear Window Defogger Relay connector.

Turn the ignition on.

Toggle the Rear Window Defogger switch and observe the indicator.

**Does the Rear Window Defogger indicator illuminate?**

**Yes** >> Replace the original Rear Window Defogger Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 9

## 9. A/C HEATER CONTROL LED

Gain access to the A/C Heater Control C2 connector.

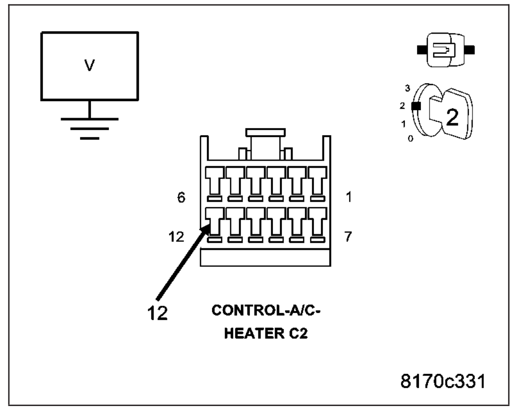
Toggle the Rear Window Defogger switch in the next step.

While back probing, measure the voltage of the Fused Rear Window Defogger Relay Output circuit.

**Is there any voltage present?**

**Yes** >> Replace the A/C-Heater Control.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Fused Rear Window Defogger Relay Output circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



## 10. GROUND WIRE

Turn the ignition off.

Disconnect the A/C-Heater Control C2 connector.

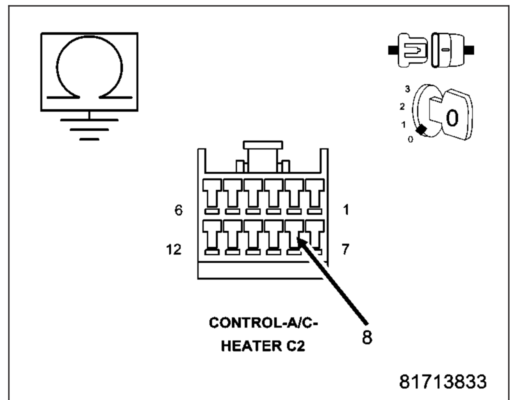
Turn of all interior lights.

Measure the resistance of the Ground circuit in the C2 connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 11

**No** >> Repair the ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



## 11. A/C HEATER CONTROL

Turn the ignition off.

Disconnect the A/C-Heater Control C2 connector.

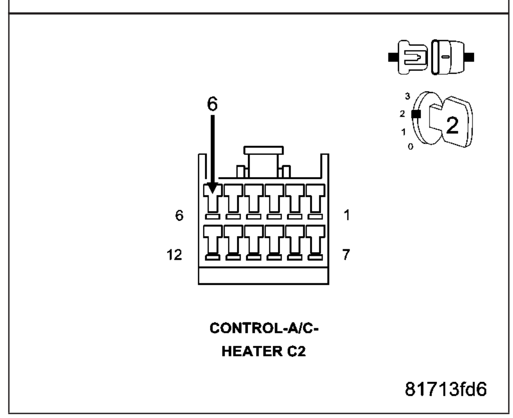
With the scan tool, read the Rear Defogger Switch state.

Connect a jumper wire between Rear Window Defogger Control and ground.

**Did the scan tool display change?**

**Yes** >> Replace the A/C-Heater Control.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 12



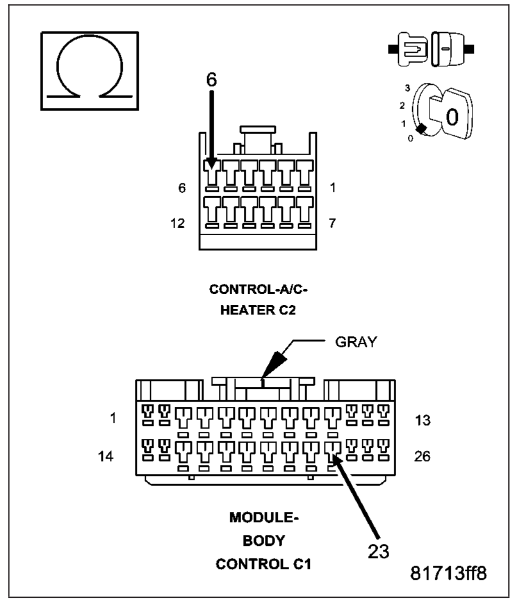
## 12. REAR WINDOW DEFOGGER CONTROL OPEN

Turn the ignition off.

Disconnect the A/C-Heater Control C2 connector.

Disconnect the Body Control Module C1 connector.

Measure the resistance of the Rear Window Defogger Control circuit between the A/C- Heater Control C2 connector and the Body Control Module C1 connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and program the Body Control Module in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Rear Window Defogger Control circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.

# HEATED GLASS - SERVICE INFORMATION

## TABLE OF CONTENTS

# HEATED GLASS - SERVICE INFORMATION

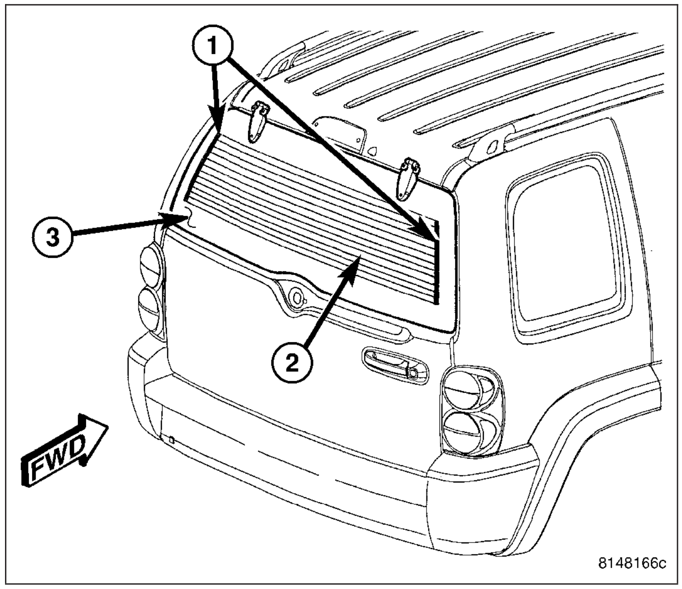
## DESCRIPTION

**CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.**

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned On or Off by a switch in the A/C-heater control located at the center of the instrument panel and by a timing circuit integral to the body control module (BCM).

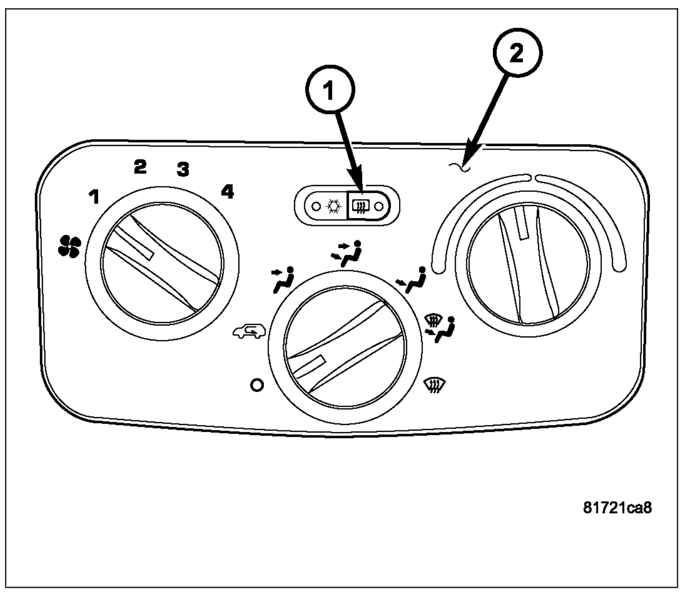
Circuit protection is provided by two cartridge fuses. The fuse located in the junction block (JB) is for the control circuit and the fuse located in the power distribution center (PDC) is for the heated grid circuit.



## OPERATION

The electric backlight (EBL) system is controlled by a momentary switch (1) located in the A/C-heater control (2) In the instrument panel. When the rear window defogger switch is pressed to the On position, the body control module (BCM) energizes the rear window defogger (EBL) relay, which then directs fused battery current through the relay and to the rear defogger grid lines and the heated side view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

An amber indicator in the rear window defogger switch will illuminate to indicate when the EBL system is turned on. The BCM contains the EBL system control circuitry including the timer logic.



**NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.**

The EBL system will automatically turn off after a programmed time interval of about 10 minutes as long as the ignition switch is the Run position. After the initial time interval has expired, if the rear window defogger switch is turned on again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than Run or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent (Refer to 8 - ELECTRICAL/

HEATED GLASS/REAR WINDOW DEFOGGER GRID - STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR).

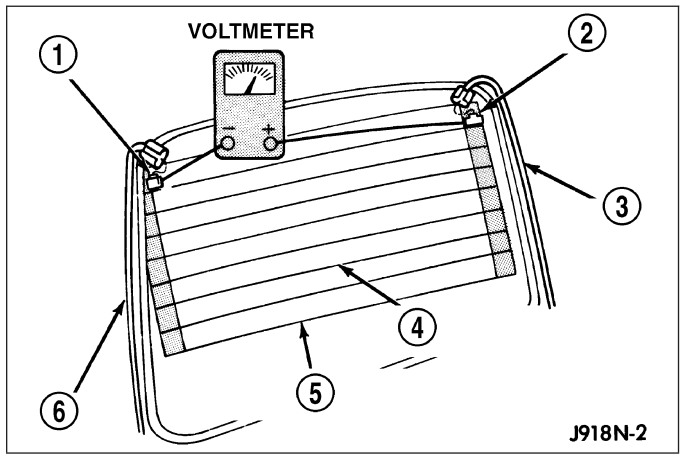
## DIAGNOSIS AND TESTING

## ELECTRIC BACKLIGHT (EBL) SYSTEM

**NOTE: Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear glass heating grid lines.**

**NOTE: For circuit descriptions and diagrams of the rear window defogger (EBL) system, refer to 8W - WIRING DIAGRAM INFORMATION.**

Operation of the electric backlight (EBL) system can be confirmed by the following:



1. Use a DRBIII® scan tool and check for diagnostic trouble codes (DTCs) related to the body control module (BCM). If no DTCs are found, go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2
2. Turn the ignition switch to the Run position. Set the rear window defogger switch in the On position. The rear window defogger operation can be checked by feeling the surfaces of the rear window glass or outside rear view mirror glass. A distinct difference in temperature between the grid lines (5) and the adjacent clear glass or the mirror glass should be detected within three to four minutes of operation.
3. If a temperature difference is not detected, use a 12-volt DC voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
   - Confirm the ignition switch is in the Run position.
   - Confirm the rear window defogger switch is in the On position.
   - Confirm the EBL feed wire (3) is connected to the heating grid positive terminal and that there is continuity between the EBL relay and the heating grid.
   - Confirm the EBL ground wire (6) is connected to the heating grid negative terminal and that there is continuity to ground.
   - Check the EBL relay and fuse located in the junction block (JB) in the passenger compartment. The relay and fuse must be tight in the receptacles and all electrical connections must be secure.
   - Check the fuse in the power distribution center (PDC) located in the engine compartment. The fuse must be tight in the receptacle and all electrical connections must be secure.
4. If broken defogger grid lines or bus bars are suspected, use a 12-volt DC voltmeter and contact terminal A with the negative lead and each rear glass heating grid line at its mid-point C (4) with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s) (Refer to 8 - ELECTRICAL/HEATED GLASS/GRID-REAR WINDOW DEFOGGER - STANDARD PROCEDURE).
5. If the EBL system still does not operate, replace the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).
6. If the EBL system operation has been verified but the rear window defogger indicator does not illuminate, replace the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).

# GRID-REAR WINDOW DEFOGGER

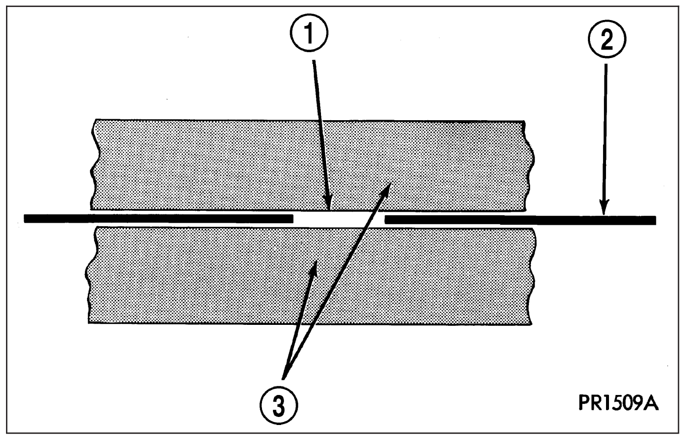
## STANDARD PROCEDURE

## GRID LINE AND TERMINAL REPAIR

**WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow the warnings could result in possible personal injury or death.**

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. For grid line repairs, mask the area to be repaired with masking tape or use a template.
5. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).



6. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
7. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
8. Carefully remove the masking tape or template.

**CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.**

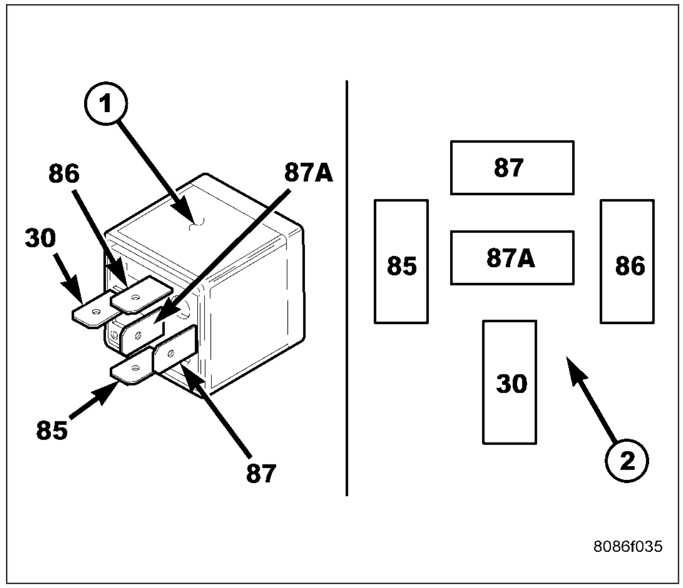
9. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
10. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
11. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

# RELAY-REAR WINDOW DEFOGGER

## DESCRIPTION

The rear window defogger (EBL) relay (1) is an International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The EBL relay is a electromechanical device that switches battery current through a fuse in the power distribution center (PDC) to the rear window defogger grid and to the outside mirror heating grids, when equipped. The EBL relay is energized when the relay coil is provided a ground path by the control circuitry within the body control module (BCM).

The EBL relay is located in the junction block (JB) in the passenger compartment.



## OPERATION

The ISO-standard rear window defogger (EBL) relay is an electromechanical switch that uses a low current input controlled by the body control module (BCM) to control the high current output to the rear window defogger grid lines The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the rear window defogger grid lines.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The EBL relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relay and for complete rear window defogger (EBL) wiring diagrams.

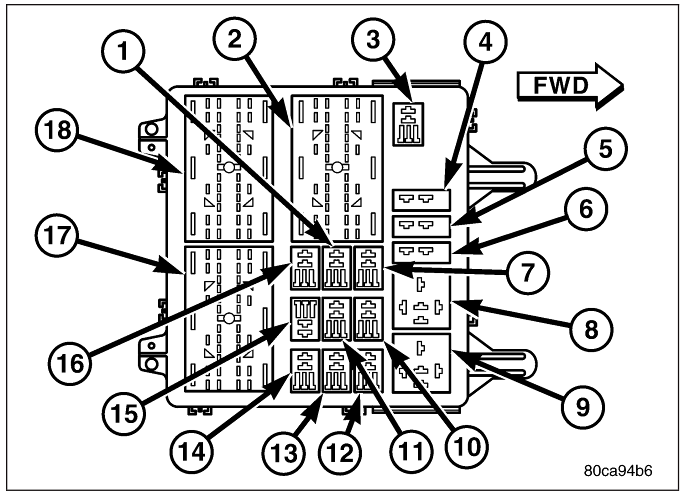
## REMOVAL

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.**

1. Disconnect and isolate the negative battery cable.
2. Remove the cover from the junction block (JB) located in the passenger compartment.

**NOTE: Refer to the fuse and relay layout map on the inside of the JB cover for EBL relay location.**

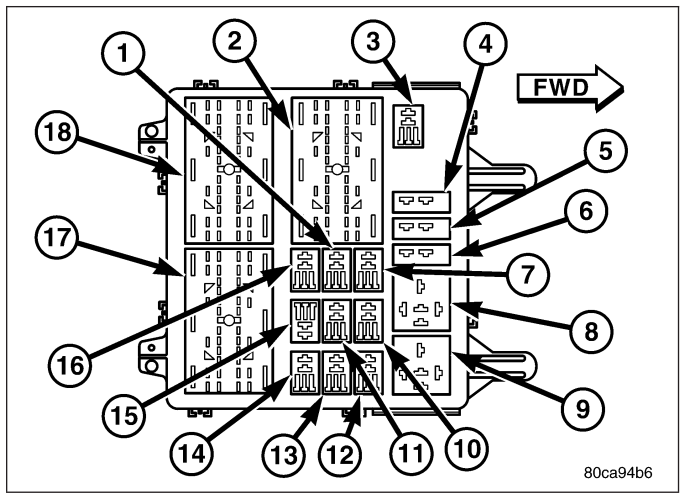
3. Remove the EBL relay (8) from the JB.



## INSTALLATION

**NOTE: Refer to the fuse and relay layout map on the inside of the junction block (JB) cover for EBL relay location.**

1. Position the EBL relay (8) into the proper receptacle of the JB.
2. Align the EBL relay terminals with the terminal cavities in the JB receptacle and push down firmly on the relay until the terminals are fully seated.
3. Install the cover onto the JB.
4. Reconnect the negative battery cable.

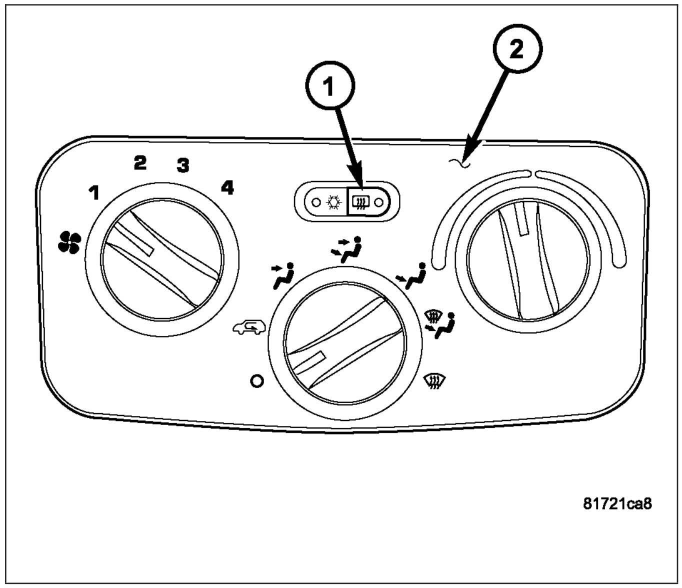


# SWITCH-REAR WINDOW DEFOGGER

## DESCRIPTION

The rear window defogger switch (1) is integrated into the A/C-heater control (2) located in the instrument panel. When the rear window defogger switch is activated, the A/C-heater control requests the body control module (BCM) to operate the rear window defogger (EBL) relay.

When the EBL relay is activated, current is directed to the rear defogger grid lines and the heated side view mirrors (if equipped). The grid lines heat the glass to help clear the surface of fog or frost.



## OPERATION

An LED indicator will illuminate when the rear window defogger switch is activated. When the switch is activated, it energizes the timing circuit integral to the body control module (BCM), which then activates the rear window defogger (EBL) relay. The EBL relay controls the current flow to the grids of the rear window defogger and when equipped, the heated side view mirrors.

**NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.**

The EBL system will automatically turn off after a programmed time interval of about 10 minutes as long as the ignition switch is the Run position. After the initial time interval has expired, if the rear window defogger switch is turned on again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than Run or by manually pressing the rear window defogger switch a second time.

The rear window defogger switch and the rear window defogger LED indicator cannot be repaired and, if faulty or damaged, the A/C-heater control must be replaced (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).

## DIAGNOSIS AND TESTING

## REAR WINDOW DEFOGGER SWITCH

The rear window defogger switch and timer circuit may be tested in the vehicle with or without the DRB III® scan tool.

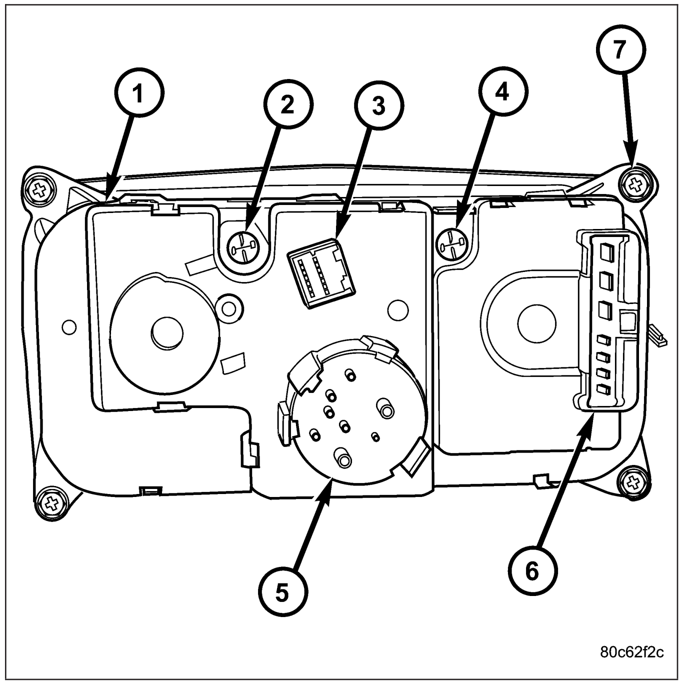
### TESTING WITH SCAN TOOL

Using a DRB III® scan tool, refer to the proper Body Diagnostic Procedures Manual.

**TESTING WITHOUT SCAN TOOL**

**NOTE: For circuit descriptions and diagrams of the rear window defogger (EBL) system, refer to 8W - WIRING DIAGRAM INFORMATION.**

1. Remove the A/C-heater control from the instrument panel (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).
2. Using a ohmmeter, check for continuity between the ground circuit cavity of the defogger switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit as required.
3. Check for continuity between the ground circuit terminal and the rear window defogger relay output terminal (3) on the back of the A/C-heater control. There should be momentary continuity as the defogger switch is pressed, and then no continuity. If OK, (Refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING). If not OK, replace the faulty A/C-heater control.



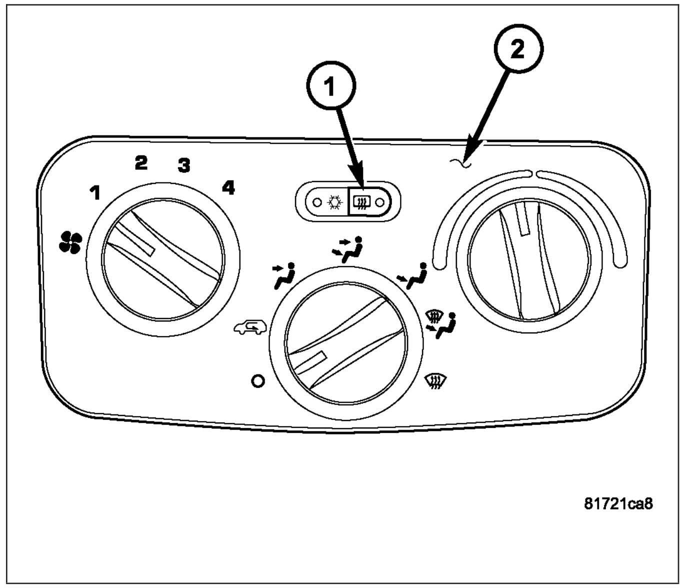
# HEATED MIRRORS - SERVICE INFORMATION

## TABLE OF CONTENTS

# HEATED MIRRORS - SERVICE INFORMATION

## DESCRIPTION

The optional heated mirror system is controlled by the momentary rear window defogger switch (1) which is integral to the A/C-heater control (2). An amber indicator lamp in the switch will illuminate to indicate when the rear window defogger (EBL) system is turned on.



The heated mirror system only operates in concert with the EBL system, and will automatically turn off after a programmed time interval of about 10 minutes as long as the ignition switch is the Run position. After the initial time interval has expired, if the rear window defogger switch is turned on again during the same ignition cycle, the heated mirror system will automatically turn off after about 5 minutes. The heated mirror system will also turn off if the ignition switch is turned to any position other than Run or by manually pressing the rear window defogger switch a second time.

## OPERATION

When the rear window defogger switch is pressed, the rear window defogger (EBL) system becomes activated and an electric heater grid located behind the glass of each of the outside rear view mirrors is energized. When energized, each of these heater grids produce heat to help clear the outside rear view mirrors of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, (refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING) in this group. If only one of the outside mirror heating grids is inoperative, (refer to 8 - ELECTRICAL/POWER MIRRORS - DIAGNOSIS AND TESTING).

The heating grid behind each outside mirror glass cannot be repaired and, if faulty or damaged, the mirror glass must be replaced (refer to 23 - BODY/EXTERIOR/GLASS-OUTSIDE REARVIEW MIRROR - REMOVAL).

# HEATED SEAT SYSTEM-SERVICE INFO

## TABLE OF CONTENTS

# HEATED SEAT SYSTEM-SERVICE INFO

## DESCRIPTION

Individually controlled electrically heated front seats are available on models that are also equipped with the optional leather trim package. Vehicles with this option can be visually identified by the two separate heated seat switches mounted on the outboard seat cushion side shields. The heated seat system allows the front seat driver and passenger to select from two different levels of supplemental electrical seat heating, or no seat heating to suit their individual comfort requirements. The heated seat system for this vehicle includes the following major components:

- **Heated Seat Switches** - Two heated seat switches are used per vehicle, including two Light-Emitting Diode (LED) indicator lamps and an incandescent back lighting bulb for each switch. One switch for the driver and one for the passenger front seats. The switches are mounted on the outboard seat cushion side shields.
- **Heated Seat Module** - also referred to as the Seat Heat Interface Module (SHIM), this module contains the solid state electronic control and diagnostic logic circuitry for the heated seat system. One heated seat module is used per vehicle and is mounted under the left front seat cushion. Refer to the Electronic Control Modules section of the service manual for heated seat module information.
- **Heated Seat Elements** - Four heated seat elements are used per vehicle, one for each front seat back and one for each front seat cushion. The elements are integral to the individual front seat and seat back cushions and cannot be removed from the cushions, once installed at the factory.
- **Heated Seat Sensors** - Two heated seat sensors are used per vehicle, one for each front seat. The sensors are integral to the individual front seat heating elements.

Following are general descriptions of the major components in the heated seat system. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the heated seat system. Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

## OPERATION

The heated seat module receives fused battery current through fuse No.29 in the Junction Block (JB) when the ignition switch is in the "ON" position. The heated seat switches receive battery current through fuse No.25 in the Junction Block also, when the ignition switch is in the "ON" position. The heated seat module shares a common ground circuit with each of the heated seat elements. The heated seat elements will only operate when the surface temperature of the seat cushion is below the designed temperature set points of the system.

The heated seat system will also be turned off automatically whenever the ignition switch is turned to any position except On. If the ignition switch is turned to the Off position while a heated seat is turned ON, the heated seat will remain Off after the ignition switch is turned back "ON" until a heated seat switch is depressed again.

The heated seat module monitors inputs from the heated seat sensors and the heated seat switches. In response to these inputs the heated seat module uses its internal programming to control outputs to the heated seat elements in both front seats and to control the heated seat LED indicator lamps located in both of the heated seat switches. The heated seat module is also programmed to provide self-diagnostic capability. When the module detects certain failures within the heated seat system, it will provide a visual indication of the failure by flashing the indicator lamps in the affected heated seat switch. The heated seat module will automatically turn off the heated seat elements if it detects a short or open in the heated seat element circuit or a heated seat sensor value that is out of range.

## DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

### HEATED SEAT SYSTEM SELF-DIAGNOSIS

The heated seat system is capable of performing some self-diagnostics. The following table depicts the various monitored failures which will be reported to the vehicle operator or technician by flashing the individual heated seat switch Light Emitting Diode (LED) indicator lamps. Refer to the Heated Seat System Self-Diagnosis table for failure identification. The driver side heated seat switch indicator lamps will flash if a failure occurs in the driver side heated seat, and the passenger side heated seat switch indicator lamps will flash for a passenger side heated seat failure. If a monitored heated seat system failure occurs, the switch indicator lamps will flash at a pulse rate of about one-half second on, followed by about one-half second off for a duration of about one minute after the switch for the faulty heated seat is depressed in either the Low or High direction. This process will repeat every time the faulty heated seat switch is actuated until the problem has been corrected.

| Heated Seat System Self-Diagnosis | | |
|---|---|---|
| Monitored Failure | Switch High Indicator Lamp | Switch Low Indicator Lamp |
| Heated Seat Element Shorted | Flashing | Flashing |
| Heated Seat Element Open | Flashing | Off |
| Heated Seat Sensor Value Out of Range | Off | Flashing |

If the heated seat system failure is identified by flashing heated seat switch indicator lamps, go to the appropriate diagnosis and testing procedure in this section and confirm the condition, using the step by step procedure. If the monitored failure is confirmed, replace the component. If the monitored failure is not confirmed, replace the heated seat module with a known good unit and retest the system.

## HEATED SEAT SYSTEM TESTING

Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams. Before testing the individual components in the heated seat system, perform the following preliminary checks:

- If a single indicator lamp for one heated seat switch does not operate and the heated seat elements do heat, refer to **Diagnosis and Testing the Heated Seat Switch** in this section for the location of heated seat switch diagnosis and testing procedures.
- If both indicator lamps for a heated seat switch operate, but the heated seat elements do not heat, refer to **Diagnosis and Testing the Heated Seat Module** in Electronic Control Modules for the location of heated seat module diagnosis and testing procedures.
- If an indicator lamp on either heated seat switch remains illuminated after the heated seat has been turned Off, refer to **Diagnosis and Testing the Heated Seat Module** in Electronic Control Modules for the location of heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

# HEATED SEAT SWITCH

## DESCRIPTION

The heated seat switches are located on the outboard cushion side shield of the driver and passenger front seats. The two, three-position rocker type switches provide a resistor multiplexed signal to the Heated Seat Module through separate hard wired circuits. Each switch has an Off, Low and High setting. Each switch contains two light emitting diodes (LED), one for each High and Low setting to let the occupant know that the seat heater system is on.

The heated seat switches and their LED's cannot be repaired. If either switch is faulty or damaged the entire switch must be replaced.

## OPERATION

There are three positions that can be selected with each of the heated seat switches: Off, Low, and High. When the front of the switch rocker is fully depressed, the High position is selected and the high position LED indicator illuminates. When the rear of the switch rocker is fully depressed, the Low position is selected and the low position LED indicator illuminates. When the switch rocker is depressed a second time in either direction, Off is selected and both LED indicators are extinguished.

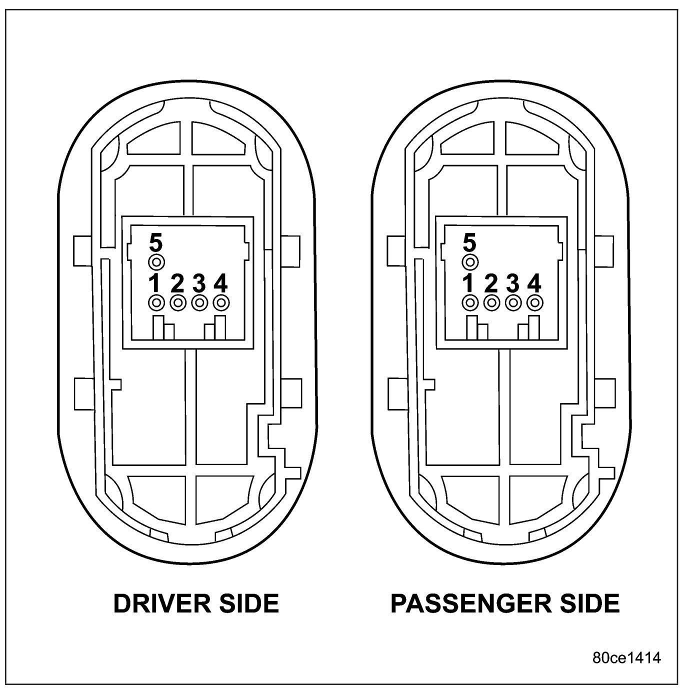
Both switches provide separate resistor multiplexed hard wire inputs to the Heated Seat Module to indicate the selected switch position. The heated seat module monitors the switch inputs and responds to the heated seat switch status messages by controlling the output to the seat heater elements of the selected seat. The Low heat position set point is about 36° C (97° F), and the High heat position set point is about 41° C (105° F).

## DIAGNOSIS AND TESTING

## HEATED SEAT SWITCH

If a heated seat fails to heat and one or both of the indicator lamps on a heated seat switch flash, refer to **Heated Seat System Diagnosis and Testing** in this section for flashing LED failure identification. Refer to **Wiring Diagrams** for complete heated seat system wiring diagrams.

1. If the problem being diagnosed involves a heated seat switch indicator lamp that remains illuminated after the heated seat has been turned Off, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/MEMORY HEATED SEAT/MIRROR MODULE - DIAGNOSIS AND TESTING) for heated seat module diagnosis and testing procedures. If not, go to Step 2
2. Remove the heated seat switch (Refer to 8 - ELECTRICAL/HEATED SEATS/DRIVER HEATED SEAT SWITCH - REMOVAL). Check for continuity between the ground circuit cavity No.5 of the heated seat switch connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open ground circuit as required.
3. Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output circuit cavity No.1 of the heated seat switch connector. If OK, go to Step 4. If not OK, repair the open fused ignition switch output circuit as required.



4. Check the continuity between pin No.1 and pin No.3 of the heated seat switch. If the readings do not correspond to those in the Heated Seat Switch Continuity table, replace the heated seat switch. If OK, and the heated seat system is still not operating properly (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/MEMORY HEATED SEAT/MIRROR MODULE - DIAGNOSIS AND TESTING) for heated seat module diagnosis and testing procedures.

**NOTE: Any resistance values (ohms Ω) given in the following text are supplied using the automatic range generated by a fluke® automotive meter. If another type of measuring device is used, the values generated may not be the same as the results shown here, or may have to be converted to the range used here.**

**TESTING HEATED SEAT SWITCH CONTINUITY**

| CONTINUITY BETWEEN | SWITCH POSITION | OHMS READING +/– 10% |
|---|---|---|
| PIN 1 AND 3 | OFF | 2.2 K (2200) OHMS |
| PIN 1 AND 3 | LO | .415 K (415) OHMS |
| PIN 1 AND 3 | HI | 33 OHMS |

## REMOVAL

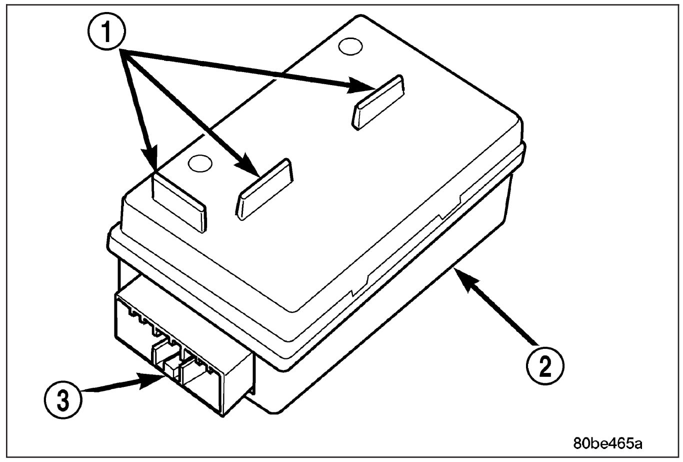
1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat cushion side shield (Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE COVERS - REMOVAL).
3. Disconnect the heated seat switch electrical connector. Depress the locking tab and pull straight apart.
4. Working from the underside of the switch, gently rock the switch back and forth out of its mounting location.

## INSTALLATION

1. Gently rock the switch back and forth in to its mounting location.
2. Connect the heated seat switch electrical connector.
3. Install the appropriate seat cushion side shield. Refer to the Body section of the service manual for the procedure.
4. Connect the negative battery cable.

# HEATED SEAT MODULE

## DESCRIPTION



The heated seat module (2) is also known as the Seat Heat Interface Module. The heated seat module (2) is located under the left front seat cushion, where it is secured to a mounting bracket via two push-pin retainers. The heated seat module has a single connector receptacle (3) that allows the module to be connected to all of the required inputs and outputs through the seat wire harness.

The heated seat module (2) is an electronic microprocessor controlled device designed and programmed to use inputs from the heated seat relay, the two heated seat switches and the two heated seat sensors to operate and control the heated seat elements in both front seats and the two heated seat indicator lamp Light-Emitting Diodes (LEDs) in each heated seat switch. The heated seat module is also programmed to perform self-diagnosis of certain heated seat system functions and provide feedback of that diagnosis through the heated seat switch indicator lamps.

The heated seat module (2) cannot be repaired. If the heated seat module is damaged or faulty, the entire module must be replaced.

## OPERATION

The heated seat module operates on fused battery current received from a fuse in the junction block. The module is grounded at all times. Inputs to the module include a resistor multiplexed heated seat switch request circuit for each of the two heated seat switches and the heated seat sensor inputs from the seat cushions of each front seat. In response to those inputs, the heated seat module controls battery current to the heated seat elements and sensors, and controls the ground for the heated seat switch indicator lamps (LED's).

When a heated seat switch (Driver or Passenger) is depressed a signal is received by the heated seat module, the module energizes the proper indicator LED (Low or High) in the switch by grounding the indicator lamp circuit to indicate that the heated seat system is operating. At the same time, the heated seat module energizes the selected heated seat sensor circuit and the sensor provides the module with an input indicating the surface temperature of the selected seat cushion.

The Low heat set point is about 36° C (96.8° F), and the High heat set point is about 42° C (107.6° F). If the seat cushion surface temperature input is below the temperature set point for the selected temperature setting, the heated seat module energizes an N-channel Field Effect Transistor (N-FET) within the module which energizes the heated seat elements in the selected seat cushion and back. When the sensor input to the module indicates the correct temperature set point has been achieved, the module de-energizes the N-FET which de-energizes the heated seat elements. The heated seat module will continue to cycle the N-FET as needed to maintain the selected temperature set point.

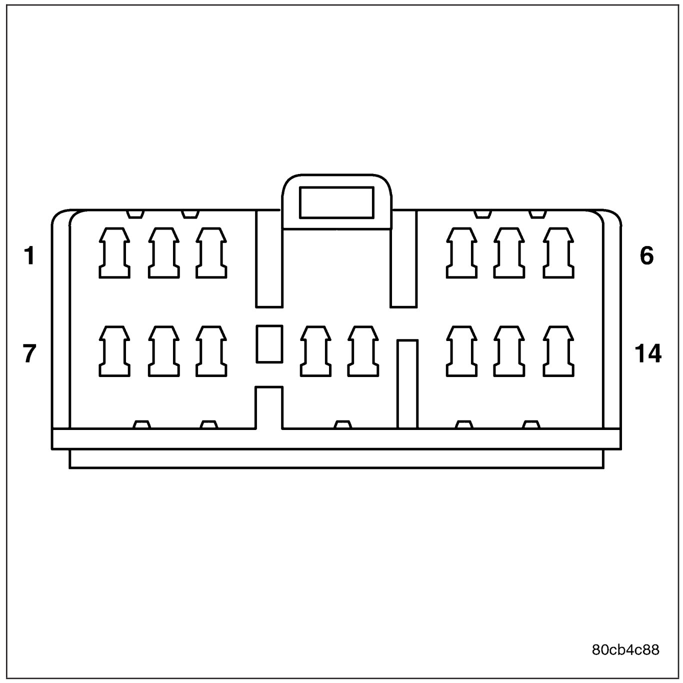
If the heated seat module detects a heated seat sensor value input that is out of range or a shorted or open heated seat element circuit, it will notify the vehicle operator or the repair technician of this condition by flashing the High and/or Low indicator lamps in the affected heated seat switch. Refer to **Diagnosis and Testing Heated Seat System** in Heated Systems for flashing LED diagnosis and testing procedures. Refer to **Diagnosis and Testing Heated Seat Module** in this section for heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

## DIAGNOSIS AND TESTING - HEATED SEAT MODULE

If a heated seat fails to heat and one or both of the indicator lamps on a heated seat switch flash, refer to **Heated Seat System Diagnosis and Testing** in Heated Systems for flashing LED failure identification. Refer to **Wiring Diagrams** in for complete heated seat system wiring diagrams.

1. Remove the heated seat module from its mounting location (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/MEMORY HEATED SEAT/ MIRROR MODULE - REMOVAL).

**NOTE: Any resistance values (ohms Ω) given in the following text are supplied using the automatic range generated by a fluke® automotive meter. If another type of measuring device is used the values generated may not be the same as the results shown here, or may have to be converted to the range used here.**



## RIGHT SEAT HEATER INOPERATIVE

1. If a heated seat heats but one or both indicator lamps (LED's) on the heated seat switch fail to illuminate, check the driver circuit with the inoperative LED for a short to ground. If OK, replace the heated seat switch. If NOT OK repair the short to ground as required and than replace the heated seat switch.

**NOTE: If the right seat cushion is already warm the following step will not prove conclusive.**

2. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #3 for battery voltage when the right heated seat switch is turned "ON", voltage should be present, If OK go to Step 3 If NOT OK, test the right heated seat switch (Refer to 8 - ELECTRICAL/HEATED SEATS/PASSENGER HEATED SEAT SWITCH - DIAGNOSIS AND TESTING). If the switch tests OK, check for continuity between the switch and control module on the MUX circuit, If OK replace the heated seat control module. If NOT OK, repair the open or shorted MUX circuit as required.

**NOTE: Be certain the battery is fully charged before testing. Failure to do so can result in incorrect readings.**

3. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #10 for battery voltage, while observing the voltmeter depress the right heated seat switch **low** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 4. If NOT OK check for continuity between the switch and control module on the low heat driver circuit, If OK replace the heated seat control module.
4. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #11 for battery voltage, while observing the voltmeter depress the right heated seat switch **high** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 5. If NOT OK check for continuity between the switch and control module on the high heat driver circuit, If OK replace the heated seat control module.
5. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #2 for approx. 5v, voltage should be present, If OK go to Step 6. If NOT OK replace the heated seat control module.
6. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #7 for a range in voltage from 1.72v (warm seat) – 3.0v (cold seat). It should be within this range, If OK replace the heated seat module. If NOT OK test the Heated Seat Sensor. If NOT OK, replace the right heated seat element and sensor assembly. If the heated seat sensor tests OK, check for continuity between the right heated seat cushion connector and control module connector on the 5v supply circuit, If NOT OK, repair the open or shorted 5v supply

circuit as required. If OK check for continuity between the right heated seat cushion connector and control module connector on the temperature sensor input circuit. If NOT OK, repair the open or shorted temperature sensor input circuit as required. If OK replace the heated seat control module.

## LEFT SEAT HEATER INOPERATIVE

1. If a heated seat heats but one or both indicator lamps (LED's) on the heated seat switch fail to illuminate, check the driver circuit with the inoperative LED for a short to ground. If OK, replace the heated seat switch. If NOT OK repair the short to ground as required and than replace the heated seat switch.

**NOTE: If the left seat cushion is already warm the following step will not prove conclusive.**

2. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #5 for battery voltage when the left heated seat switch is turned "ON", voltage should be present, If OK go to Step 3 If NOT OK, test the left heated seat switch (Refer to 8 - ELECTRICAL/HEATED SEATS/DRIVER HEATED SEAT SWITCH - DIAGNOSIS AND TESTING). If the switch tests OK, check for continuity between the switch and control module on the MUX circuit, If OK replace the heated seat control module. If NOT OK, repair the open or shorted MUX circuit as required.
3. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #12 for battery voltage, while observing the voltmeter depress the left heated seat switch **low** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 4. If NOT OK check for continuity between the switch and control module on the low heat driver circuit, If OK replace the heated seat control module.
4. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #14 for battery voltage, while observing the voltmeter depress the left heated seat switch **high** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 5. If NOT OK check for continuity between the switch and control module on the high heat driver circuit, If OK replace the heated seat control module.
5. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #2 for approx. 5v, 5 voltage should be present, If OK go to Step 6. If NOT OK replace the heated seat control module.
6. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #8 for a range in voltage from 1.72v (warm seat) – 3.0v (cold seat). It should be within this range, If OK replace the heated seat control module. If NOT OK, test the Heated Seat Sensor. If NOT OK, replace the left heated seat element and sensor assembly. If the heated seat sensor tests OK, check for continuity between the left heated seat cushion connector and control module connector on the 5v supply circuit, If NOT OK, repair the open or shorted 5v supply circuit as required. If OK check for continuity between the left heated seat cushion connector and control module connector on the temperature sensor input circuit. If NOT OK, repair the open or shorted temperature sensor input circuit as required. If OK replace the heated seat control module.

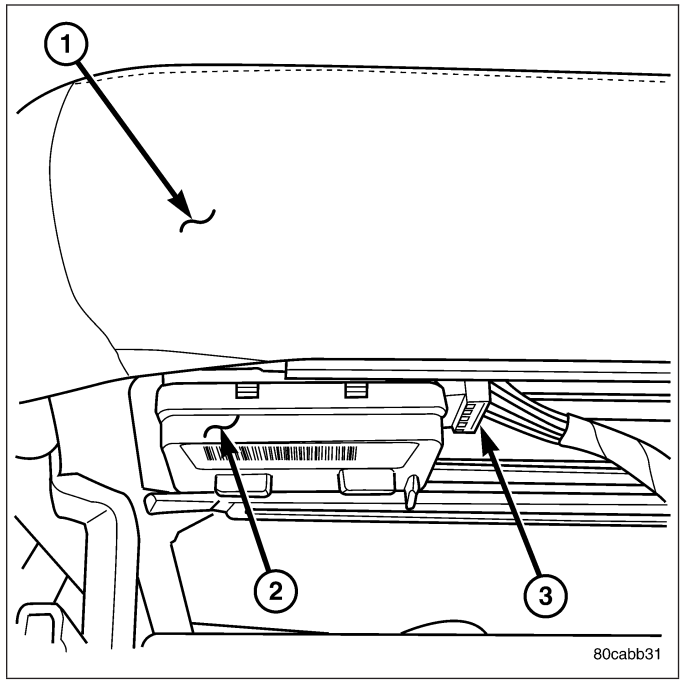
## BOTH SEATS INOPERATIVE

If both seats (driver and passenger) fail to heat and the indicator lamps on the heated seat switches for both seats fail to operate, test the heated seat fuses in the junction block. If the heated seat fuses check OK, go to Step 1.

1. Back-probe the heated seat module wire harness connector, do not disconnect. Check for continuity between the ground circuit cavity #13 of the heated seat module connector and a good ground. If OK go to Step 2. If NOT OK, repair the open or shorted ground circuit as required.
2. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #4 and #6 for battery voltage, voltage should be present, If OK go to Step 3. If NOT OK repair the open or shorted fused B(+) circuit as required.
3. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #2 for approx. 5v, voltage should be present, replace the heated seat control module with a known good module and verify system operation.

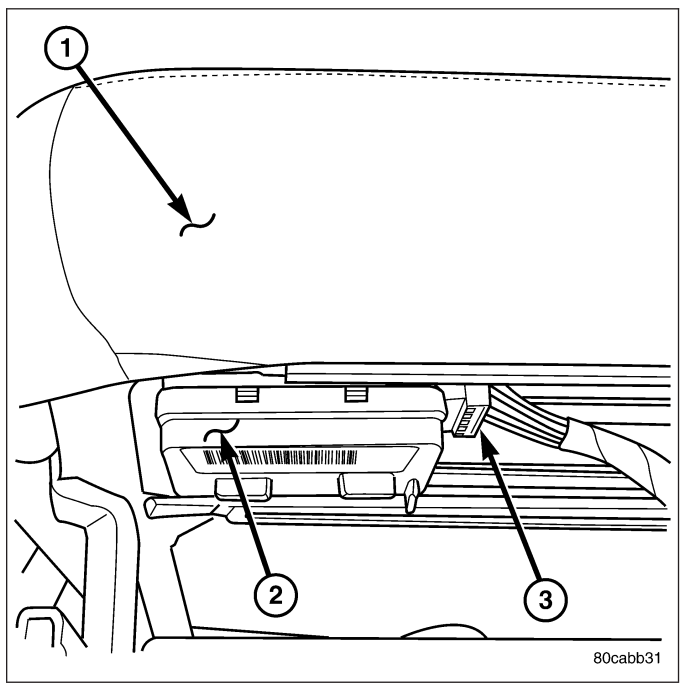
## REMOVAL

1. Working under the front seat cushion (1), remove the heated seat module (2) from its mounting bracket by gently prying the module off of the two mounting pushpins.
2. Disconnect the seat wire harness connector (3) from the connector receptacle on the side of the heated seat module (2).
3. Remove the heated seat module from the vehicle.



## INSTALLATION

1. Connect the seat wire harness connector (3) to the connector receptacle on the side of the heated seat module (2).
2. Install the heated seat module (2) on its mounting bracket under the front seat (1).
3. Verify heated seat system operation.



# HEATED SEAT ELEMENT

## DESCRIPTION

The heated seat system includes four seat heating elements. Two are located in each front seat, one for the seat cushion and the other for the seat back. All models use two resistor wire heating elements for each seat that are connected in series with the Heated Seat Module (HSM). The temperature sensor is a Negative Temperature Coefficient (NTC) thermistor. One temperature sensor is used for each seat, and it is located on the seat cushion heating element for all models.

The seat heating elements are permanently attached to the seat cushions. The heated seat elements and the temperature sensor cannot be adjusted or repaired and, if faulty or damaged, the seat cushions must be replaced. Refer to the Body section for the seat cushion service procedures.

## OPERATION

The heated seat elements resist the flow of electrical current. When battery current is passed through the elements, the energy lost by the resistance of the elements to the current flow is released in the form of heat. When the temperature of the seat cushion cover rises, the resistance of the sensor decreases. The Heated Seat Module supplies a five-volt current to one side of each sensor, and monitors the voltage drop through the sensor on a return circuit. The Heated Seat Module uses this temperature sensor input to monitor the temperature of the seat, and regulates the current flow to the seat heating elements accordingly.

## DIAGNOSIS AND TESTING - HEATED SEAT ELEMENT

### SEAT CUSHION ELEMENT

**NOTE: When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as siting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.**

1. Disconnect and isolate the battery negative cable. Disconnect the green heated seat cushion element wire harness connector from the power seat wire harness. The power seat wire harness connectors for the seat cushion heating elements are secured to a bracket located under the seat cushion frame. Refer to **Wiring** for connector pin information.
2. Check for continuity between the two heated seat element circuit cavities. There should be continuity. If OK, the elements within the seat assembly test OK, go to Step 3. If not OK, replace the faulty seat heating element and cushion assembly.
3. Test the seat wire harness between the heated seat module connector and the heated seat wire harness element connector for a shorted or open circuit. If OK, element is OK, proceed with testing the heated seat sensor and module. If not OK, repair the shorted or open seat wire harness as required.

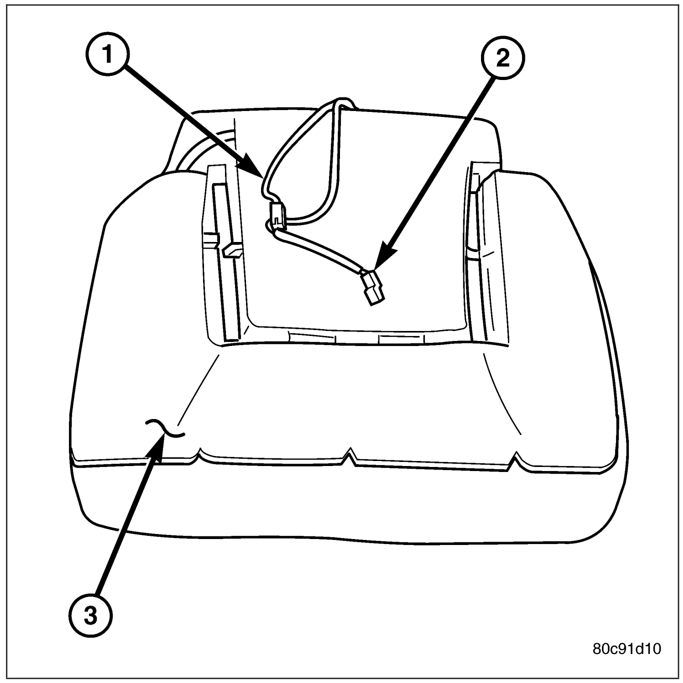
### SEAT BACK ELEMENT

1. Disconnect and isolate the battery negative cable. Disconnect the green heated seat back element wire harness connector from the power seat wire harness. The power seat wire harness connectors for the seat cushion heating elements are secured to a bracket located under the seat cushion frame. Refer to **Wiring** for connector pin information.
2. Check for continuity between the two heated seat element circuit cavities. There should be continuity. If OK, the elements within the seat assembly test OK, go to Step 3. If not OK, replace the faulty seat heating element and cushion assembly.
3. Test the seat wire harness between the heated seat module connector and the heated seat wire harness element connector for a shorted or open circuit. If OK, element is OK, proceed with testing the heated seat sensor and module. If not OK, repair the shorted or open seat wire harness as required.

## REMOVAL

**NOTE: Do not remove the factory installed heating elements (3) from the seat or seat back cushions. The original element is permanently attached and cannot be removed without permanent damage. The replacement heating element is designed to be applied directly on top of the inoperative factory installed heating element.**

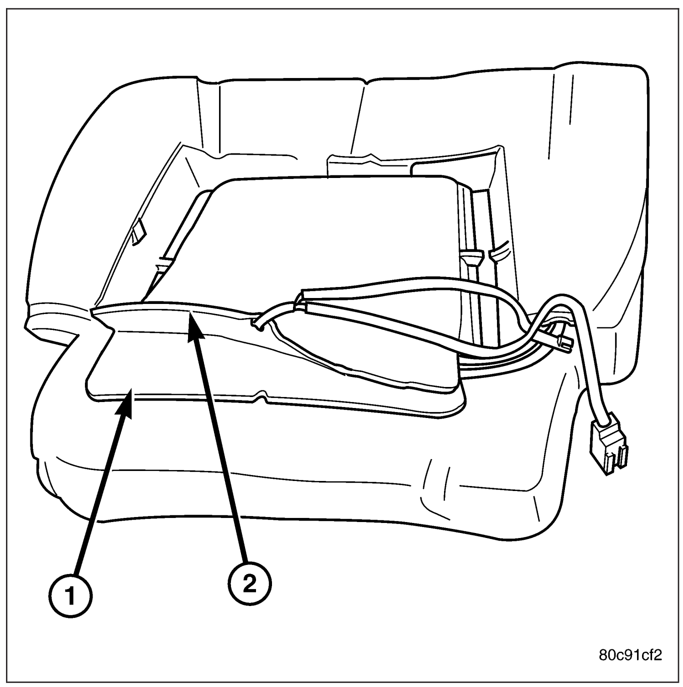
1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL) or seat back trim cover, (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - REMOVAL).
3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.



## INSTALLATION

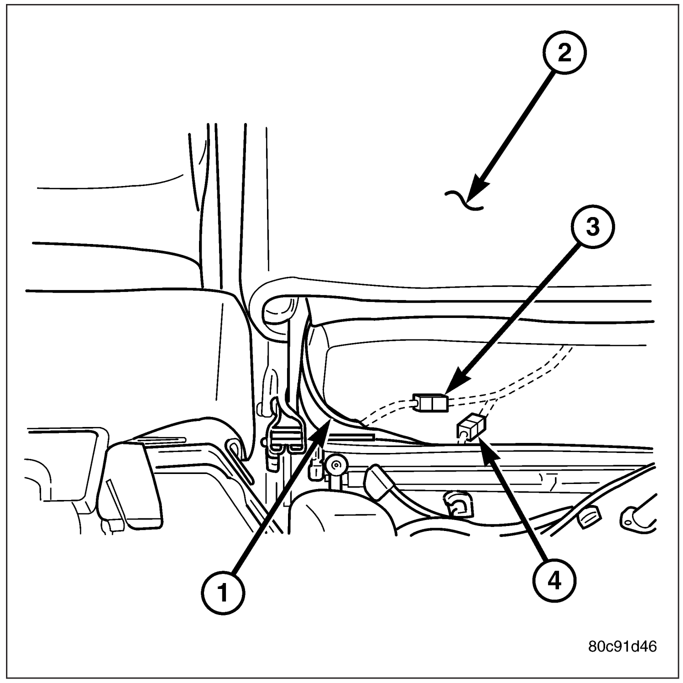
1. Peel off the adhesive backing on the back of the replacement heating element (2) and stick directly on top of the factory installed heating element (1).

**CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.**



2. Connect the new heating element electrical connectors (3&4).
3. Connect the battery negative cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION) or seat back trim cover, (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - INSTALLATION).

**NOTE: Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover.**



# HEATED SEAT SENSOR

## DESCRIPTION

The heated seat temperature sensor is a Negative Temperature Coefficient (NTC) thermistor. One temperature sensor is used for each seat. This temperature sensor is located in the seat cushion heating element on all models.

The heated seat temperature sensor cannot be repaired or adjusted and must be replaced if defective. The heated seat cushion element must be replaced if the temperature sensor is defective. Refer to the procedure in this section of the service manual.

## OPERATION

When the temperature of the seat cushion cover rises, the resistance of the sensor decreases. The heated seat module supplies five-volts to one side of each sensor, and monitors the voltage drop through the sensor on a return circuit. The heated seat module uses this temperature sensor input to monitor the temperature of the seat, and regulates the current flow to the seat heating elements accordingly.

## DIAGNOSIS AND TESTING - HEATED SEAT SENSOR

For complete circuit diagrams, refer to **WIRING**.

**NOTE: Any resistance values (ohms Ω) given in the following text are supplied using the automatic range generated by a fluke® automotive meter. If another type of measuring device is used the values generated may not be the same as the results shown here, or may have to be converted to the range used here.**

1. Position the driver seat in the full rearward position.
2. Unclip the heated seat module from the bottom of the drivers seat cushion pan.
3. Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity (No.7 for passenger, No.8 for driver seat) for a range in voltage from approx. 1.72 – 3.0 volts. It should be within this range, If OK check the heated seat element. If NOT OK, check for the proper 5 volt supply to the heated seat sensor, from the module. Refer to Wiring for specific information. If 5 volts is not being supplied to the sensor from the module, replace the heated seat module.
4. Test the seat wire harness between the heated seat module connector and the heated seat wire harness connector for shorted or open circuits. If OK, refer to **Diagnosis and Testing the Heated Seat Module** in Electronic Control Modules, for the proper heated seat module diagnosis and testing procedures. If not OK, repair the shorted or open heated seat wire harness as required.

## REMOVAL

1. For heated seat sensor replacement procedure (Refer to 8 - ELECTRICAL/HEATED SEATS/HEATED SEAT ELEMENT - REMOVAL).

# HORN

## TABLE OF CONTENTS

# HORN SYSTEM

## DESCRIPTION

The dual-note horn system features dual electromagnetic horn units. The horn system includes the following major components:

- **Horn** - The two horns are located below the Power Distribution Center (PDC).
- **Horn Relay** - The horn relay is located in the Junction Block (JB).
- **Horn Switch** - The horn switch is molded into the driver airbag assembly.

## OPERATION

The horn system operates on battery current received through fuse 3 in the Junction Block (JB). The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

## DIAGNOSIS AND TESTING - HORN SYSTEM

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the horn relay from the Junction Block (JB).

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

**HORN SYSTEM DIAGNOSIS TABLE**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| BOTH HORNS INOPERATIVE | 1. Faulty fuse. | 1. Check the fuse in the Junction Block (JB). Replace the fuse and repair the shorted circuit or component, if required. |
| | 2. Faulty horn relay. | 2. Refer to horn relay for the proper diagnosis and testing procedures. Replace the horn relay or repair the open horn relay circuit, if required. |
| | 3. Faulty horn switch. | 3. Refer to horn switch for the proper diagnosis and testing procedure. Replace the horn switch or repair the open horn switch circuit, if required. |
| | 4. Faulty horns. | 4. Refer to horn for the proper diagnosis and testing procedure. Replace the horns or repair the open horn circuit, if required. |
| ONE HORN INOPERATIVE | 1. Faulty horn. | 1. Refer to horn for the proper diagnosis and testing procedures. Replace the horn or repair the open horn circuit, if required. |
| HORN SOUNDS CONTINUOUSLY | 1. Faulty horn relay. | 1. Refer to horn relay for the proper diagnosis and testing procedure. Replace the horn relay or repair the shorted horn relay control circuit, if required. |
| | 2. Faulty horn switch. | 2. Refer to horn switch for the proper diagnosis and testing procedure. Replace the horn switch or repair the shorted horn switch circuit, if required. |

# HORN

## DIAGNOSIS AND TESTING - HORN

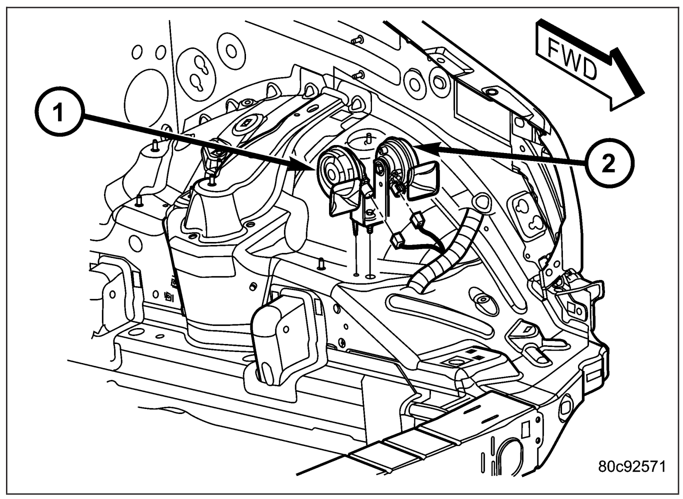
**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

Refer to the appropriate wiring information.

1. Disconnect the wire harness connector from the horn. Measure the resistance between the horn ground circuit cavity of the wire harness connector and a good ground. There should be no measurable resistance. If OK, go to Step 2. If not OK, replace wiring as necessary.
2. Check for battery voltage at the horn relay output circuit cavity of the wire harness connector for the horn. There should be zero volts. If OK, go to Step 3. If not OK, check horn relay.
3. Depress the horn switch. There should now be battery voltage at the horn relay output circuit cavity of the wire harness connector for the horn. If OK, but the horn does not sound, replace the faulty horn. If not OK, check horn relay and horn relay circuit.

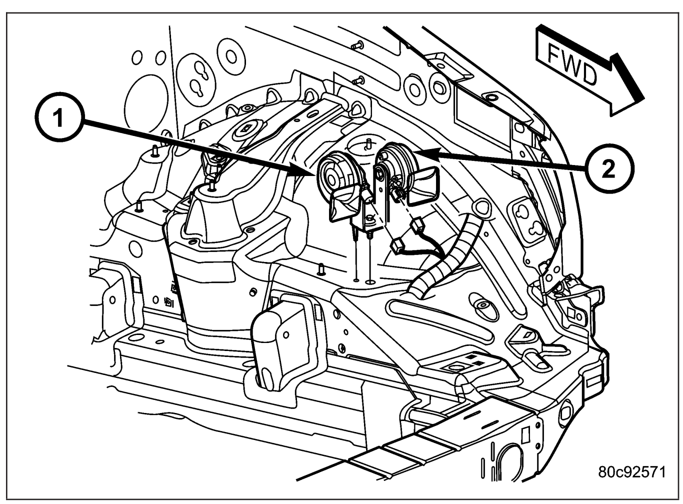
## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Disconnect the electrical harness connector from the horns.
3. Remove the mounting bolt.
4. Remove the horns (1) and (2).



## INSTALLATION

1. Install the horns (1) and (2).
2. Install the mounting bolt. Tighten bolt to 25 N·m (19 lb. ft.).
3. Connect the electrical harness connector to the horns
4. Connect the battery negative cable.



# HORN SWITCH

## DESCRIPTION

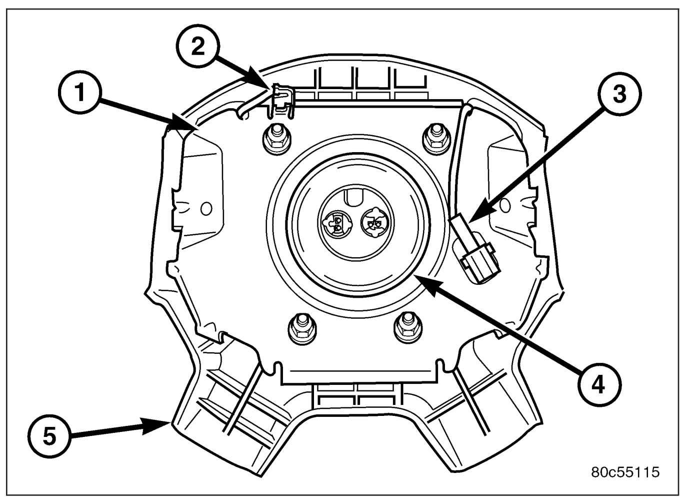
The horn switch is molded into the driver airbag. The horn switch can not be serviced separately. For service procedures, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

## DIAGNOSIS AND TESTING - HORN SWITCH

For complete circuit diagrams, refer to the appropriate wiring information.

**WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

1. Disconnect and isolate the battery negative cable.
2. Remove the steering column opening cover.
3. Check for continuity between the metal steering column jacket and a good ground. There should be continuity. If OK, go to Step 4. If not OK, (Refer to 19 - STEERING/COLUMN - INSTALLATION) for proper installation of the steering column.
4. Remove the driver side airbag module from the steering wheel (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL). Disconnect the horn switch wire harness connectors from the driver side airbag module.
5. Remove the horn relay from the Junction Block (JB). Check for continuity between the steering column half of the horn switch feed wire (3) harness connector and a good ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted horn relay control circuit to the horn relay in the Junction Block as required.



6. Check for continuity between the steering column half of the horn switch feed wire harness connector and the horn relay control circuit cavity for the horn relay in the Junction Block. There should be continuity. If OK, go to Step 7. If not OK, repair the open horn relay control circuit to the horn relay in the Junction Block as required.
7. Check for continuity between the horn switch feed wire and the horn switch ground wire (2) on the driver side airbag module. There should be no continuity. If OK, go to Step 8. If not OK, replace the faulty horn switch.
8. Depress the center of the driver side airbag module trim cover (5) and check for continuity between the horn switch feed wire and the horn switch ground wire on the driver side airbag module. There should now be continuity. If not OK, replace the faulty horn switch (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

# IGNITION CONTROL

## TABLE OF CONTENTS

# IGNITION SYSTEMS

## DESCRIPTION

The ignition system consists of:

- Spark Plugs
- Ignition Coil(s)
- Powertrain Control Module (PCM)
- Crankshaft Position Sensor
- 2 Knock Sensors (3.7L only)
- Camshaft Position Sensor
- The MAP, TPS, IAC and ECT also have an effect on the control of the ignition system.

## OPERATION

The 3.7L engine uses a separate ignition coil for each cylinder. The one-piece coil bolts directly to the cylinder head. Rubber boots seal the secondary terminal ends of the coils to the top of all 6 spark plugs. A separate electrical connector is used for each coil.

Because of coil design, spark plug cables (secondary cables) are not used. A distributor is not used.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

The Auto Shutdown (ASD) relay provides battery voltage to each ignition coil. The Powertrain Control Module (PCM) provides a ground contact (circuit) for energizing each coil. When the PCM breaks the contact, the energy in the coil primary transfers to the secondary causing a spark. The PCM will de-energize the ASD relay if it does not receive inputs from either the crankshaft or camshaft position sensors.

## SPECIFICATIONS

## IGNITION TIMING

Ignition timing is not adjustable on any engine.

## ENGINE FIRING ORDER - 3.7L V-6

The engine firing order is: 1 - 6 - 5 - 4 - 3 - 2

## IGNITION COIL RESISTANCE - 3.7L V-6

| PRIMARY RESISTANCE 21-27°C (70-80°F) | SECONDARY RESISTANCE 21-27°C (70-80°F) |
|---|---|
| 0.6 - 0.9 Ohms | 6,000 - 9,000 Ohms |

## SPARK PLUGS

| ENGINE | PLUG TYPE | ELECTRODE GAP |
|---|---|---|
| 3.7L | ZFR6F - 11G (NGK #) | 1.1 mm (0.042 in.) |

## TORQUE

| DESCRIPTION | N-m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Camshaft Position Sensor - 3.7L | 12 | - | 106 |
| Crankshaft Position Sensor Nut/Bolt - 3.7L | 23 | 21 | 205 |
| * Knock Sensor Bolt - 3.7L | * 20 | * 15 | |
| Ignition Coil Mounting Nuts - 3.7L | 8 | - | 70 |
| Ignition Coil Capacitor Nuts - 3.7L | 8 | - | 70 |
| Spark Plugs - 3.7L | 27 | 20 | - |
| Do not apply any sealant, thread-locker or adhesive to bolts. Poor sensor performance may result. | | | |
| * Torque critical tapered design. Do not exceed 15 ft. lbs. | | | |

# RELAY-AUTO SHUT DOWN

## DESCRIPTION - PCM OUTPUT

The 5-pin, 12-volt, Automatic Shutdown (ASD) relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

## OPERATION

## ASD SENSE - PCM INPUT

A 12-volt signal at this input indicates to the PCM that the ASD has been activated. The relay is used to connect the oxygen sensor heater elements, oxygen sensor heater relay, ignition coil and fuel injectors to the positive side of the 12-volt power supply.

This input is used only to sense that the ASD relay is energized. If the Powertrain Control Module (PCM) does not see 12-volts at this input when the ASD should be activated, it will set a Diagnostic Trouble Code (DTC).

## ASD SENSE- PCM OUTPUT

The ASD relay supplies battery voltage (12+ volts) to the fuel injectors and ignition coil(s). With certain emissions packages it also supplies 12-volts to the oxygen sensor heating elements and the oxygen sensor heater relay.

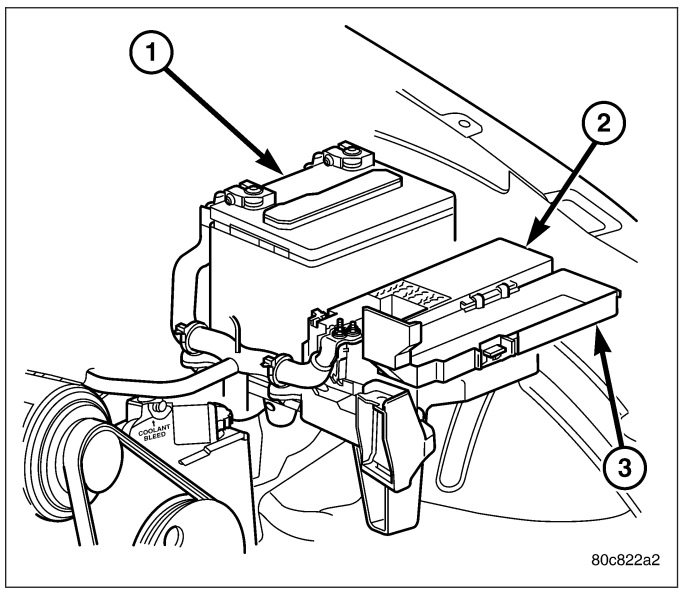
The ground circuit for the coil within the ASD relay is controlled by the Powertrain Control Module (PCM). The PCM operates the ASD relay by switching its ground circuit on and off.

The ASD relay will be shut-down, meaning the 12-volt power supply to the ASD relay will be de-activated by the PCM if the ignition key is left in the ON position. This is if the engine has not been running for approximately 1.8 seconds.

## REMOVAL

The ASD relay is located in the Power Distribution Center (PDC) (2). Refer to label on PDC cover for relay location.

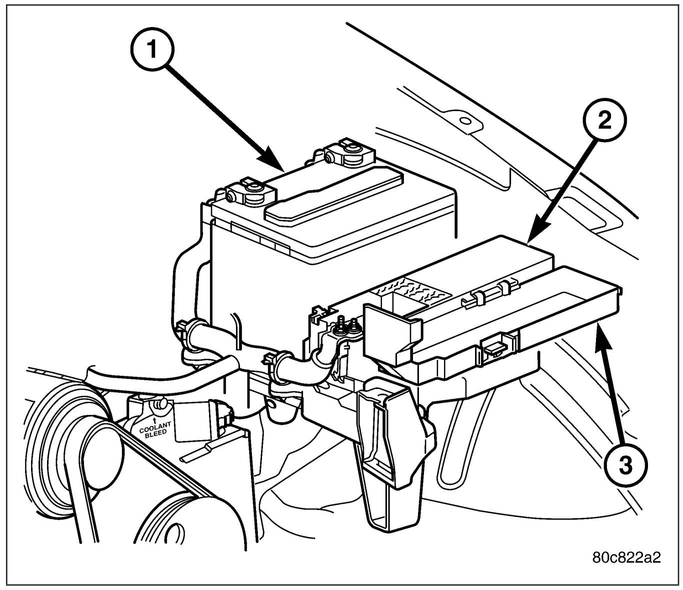
1. Remove PDC cover.
2. Remove relay from PDC.
3. Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
4. Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.



## INSTALLATION

The ASD relay is located in the Power Distribution Center (PDC) (2). Refer to label on PDC cover for relay location.

1. Install relay to PDC.
2. Install cover (3) to PDC.

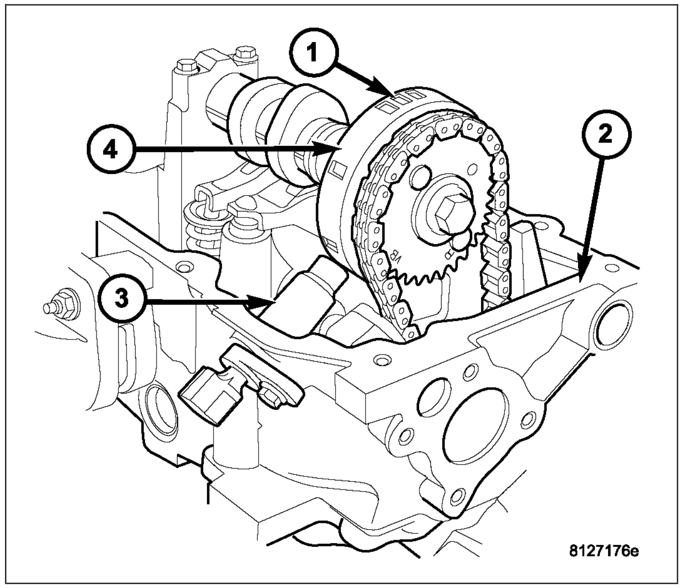


# SENSOR-CAMSHAFT POSITION

## DESCRIPTION

### 3.7L

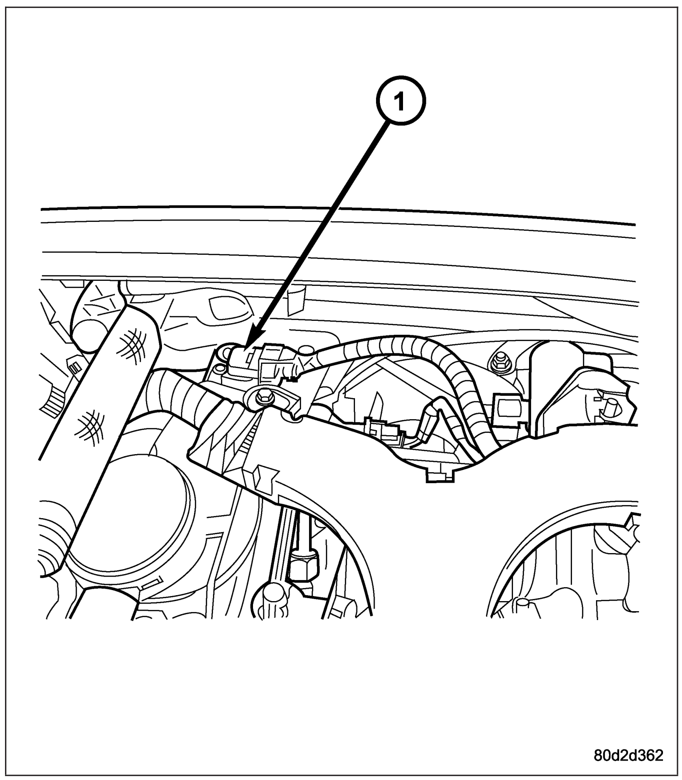
The Camshaft Position Sensor (CMP) (3) is bolted to the right-front side of the right cylinder head (2).



### 2.8L TURBODIESEL

The camshaft position (CMP) (1) sensor is mounted in the top of cylinder head cover/intake manifold at the rear of the engine.

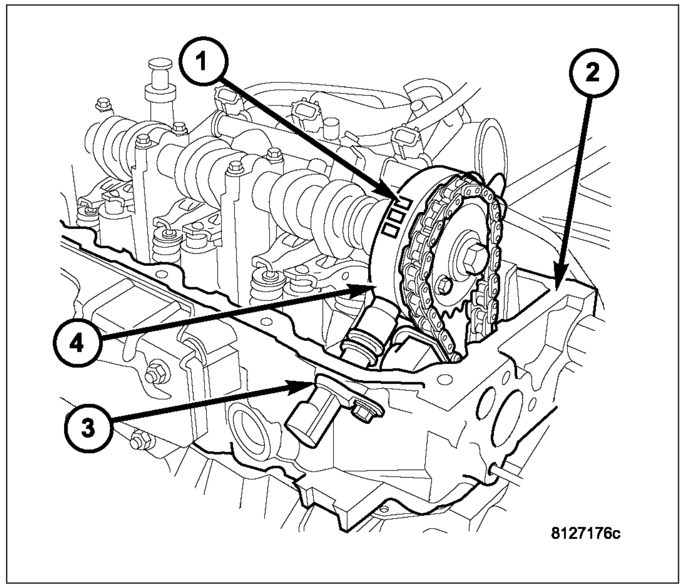
The CMP sensor (1) is a hall effect device that detects a notch on the rear of the exhaust camshaft that allows the ECM to determine the position of cylinder number one. The engine will continue to run if the signal is lost, but will not restart after the vehicle is shut off.



## OPERATION

### 3.7L

The Camshaft Position Sensor (CMP) sensor on the 3.7L (3) contains a hall effect device referred to as a sync signal generator. A rotating target wheel (tonewheel) (4) for the CMP is located at the front of the camshaft for the right cylinder head (2). This sync signal generator detects notches (1) located on a tonewheel. As the tonewheel rotates, the notches pass through the sync signal generator. The signal from the CMP sensor is used in conjunction with the Crankshaft Position Sensor (CKP) to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders.

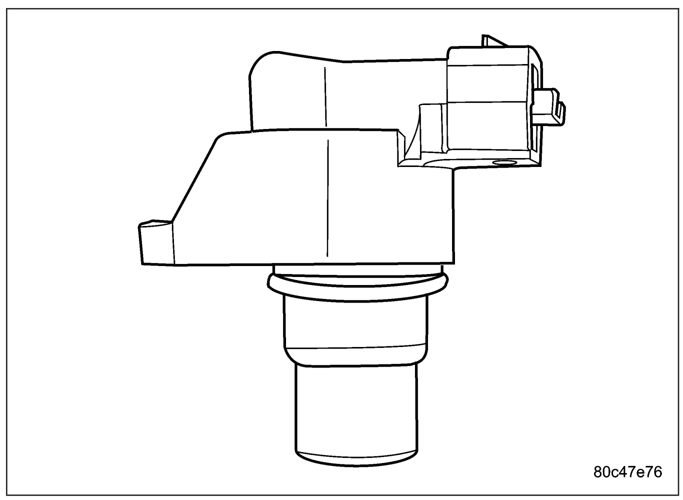


When the leading edge of the tonewheel notch enters the tip of the CMP, the interruption of magnetic field causes the voltage to switch high, resulting in a sync signal of approximately 5 volts.

When the trailing edge of the tonewheel notch leaves the tip of the CMP, the change of the magnetic field causes the sync signal voltage to switch low to 0 volts.

### 2.8L TURBODIESEL

The camshaft position (CMP) sensor is a hall effect switch. A tooth made of a ferromagnetic material is attached to the camshaft. When this tooth passes the CMP sensor an electronic signal is created. This signal is then sent to the engine control module (ECM). This signal is used by the ECM to determine TDC and which cylinder has just entered its compression phase.

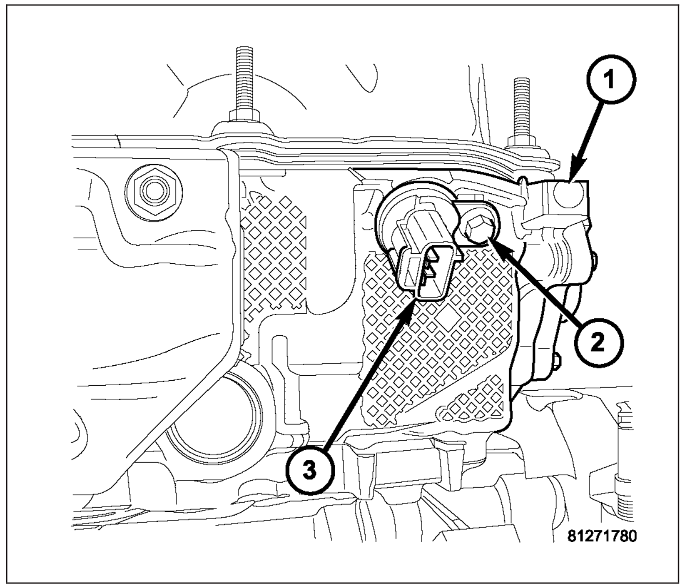


## REMOVAL

### 3.7L

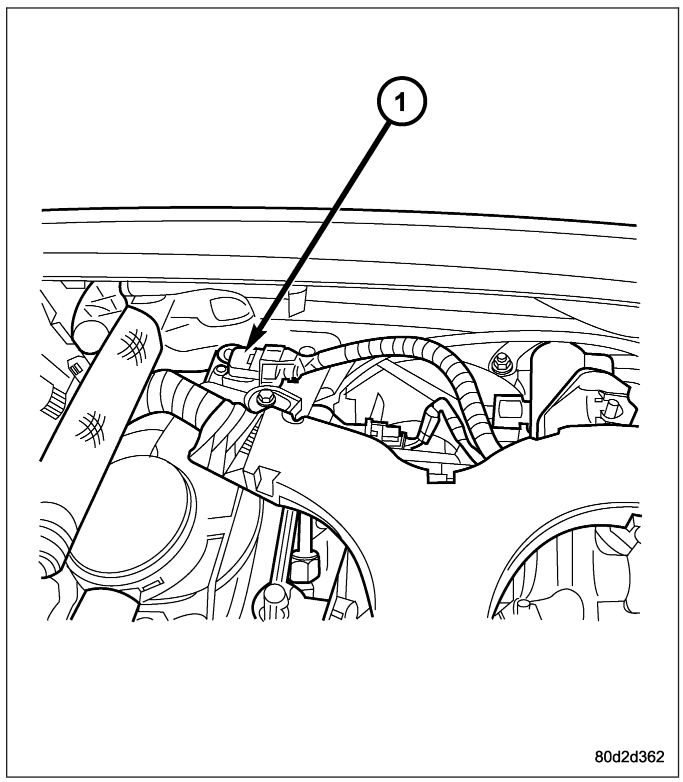
The Camshaft Position Sensor (CMP) (3) is bolted to the front/top of the right cylinder head (1).

1. Disconnect electrical connector at CMP sensor.
2. Remove sensor mounting bolt (2).
3. Carefully twist sensor from cylinder head.
4. Check condition of sensor O-ring.



### 2.8L TURBODIESEL

1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
3. Disconnect CMP sensor electrical connector.
4. Remove CMP sensor (1) retaining bolt and remove sensor from cylinder head cover/intake manifold.



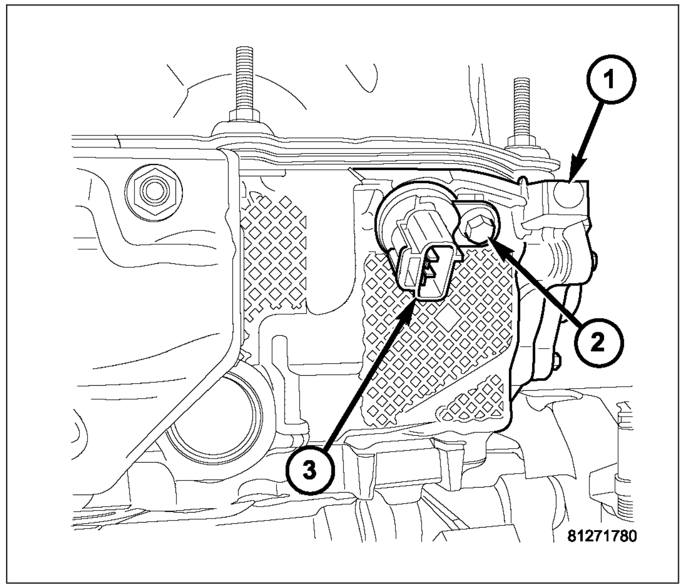
## INSTALLATION

### 3.7L

1. Clean out machined hole in cylinder head.
2. Apply a small amount of engine oil to sensor O-ring.
3. Install sensor (3) into cylinder head (1) with a slight rocking and twisting action.

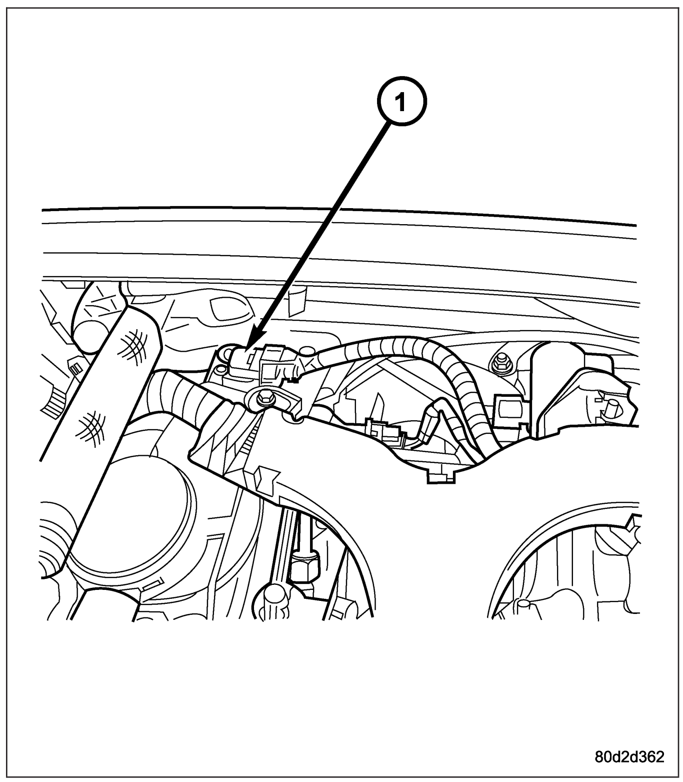
**CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder head. If sensor is not flush, damage to sensor mounting tang may result.**

4. Install mounting bolt (2) and tighten to 12 N·m (106 in. lbs.).
5. Connect electrical connector to sensor.



### 2.8L TURBODIESEL

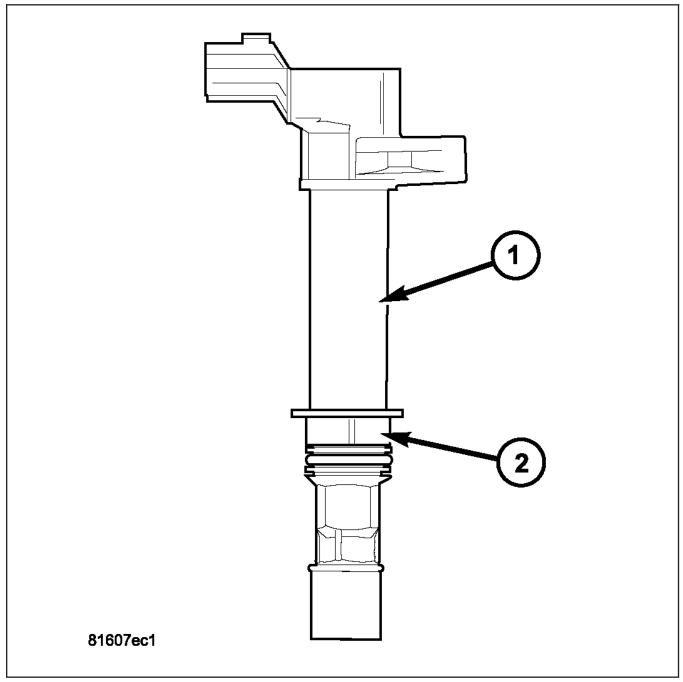
1. Lubricate O-ring on new CMP sensor (1) and install in cylinder head cover/intake manifold.
2. Install retaining bolts. Torque to 11 N·m (105 in. lbs.).
3. Connect sensor electrical connector.
4. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
5. Connect negative battery cable.



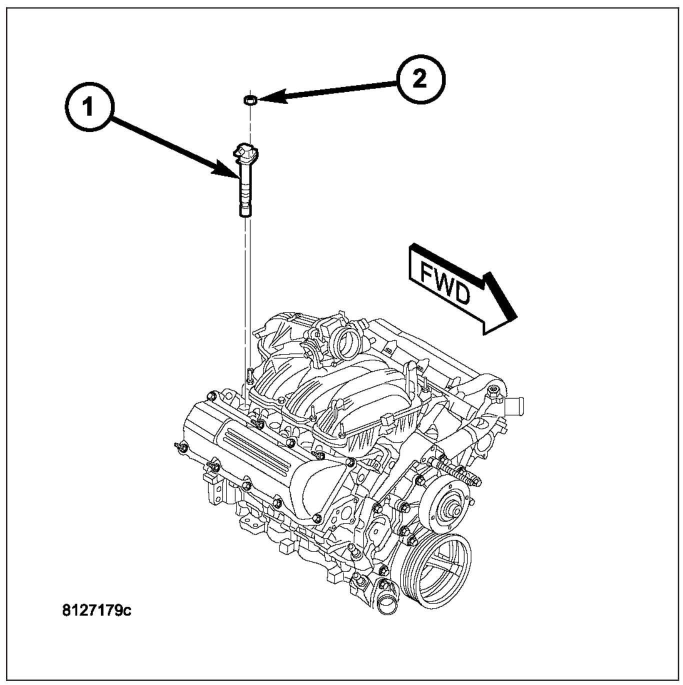
# COIL-IGNITION

## DESCRIPTION

The 3.7L uses 6 dedicated, and individually fired coil (1) for each spark plug.



Each coil (1) is mounted directly into the cylinder head and onto the top of each spark plug.



## OPERATION

Battery voltage is supplied to the 6 individual ignition coils from the ASD relay. The Powertrain Control Module (PCM) opens and closes each ignition coil ground circuit at a determined time for ignition coil operation.

**Base ignition timing is not adjustable.** By controlling the coil ground circuit, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

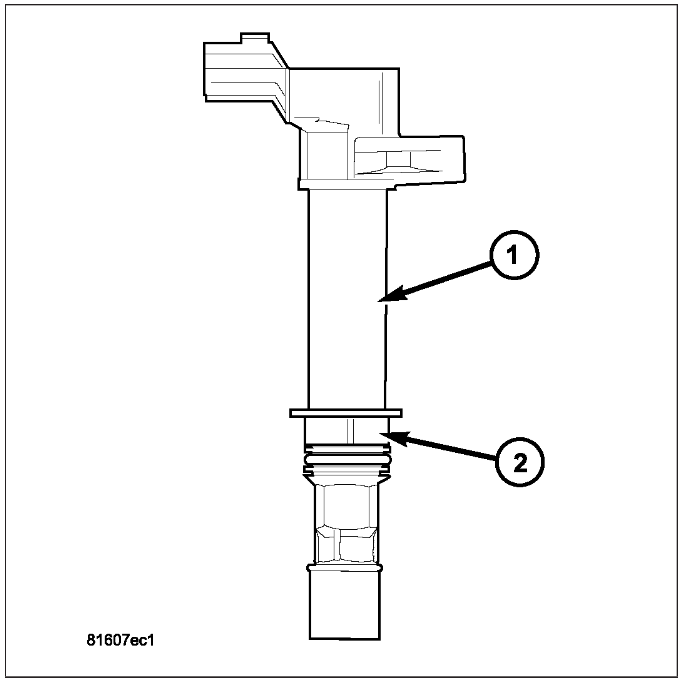
The ignition coil is not oil filled. The windings are embedded in an epoxy compound. This provides heat and vibration resistance that allows the ignition coil to be mounted on the engine.

Because of coil design, spark plug cables (secondary cables) are not used.

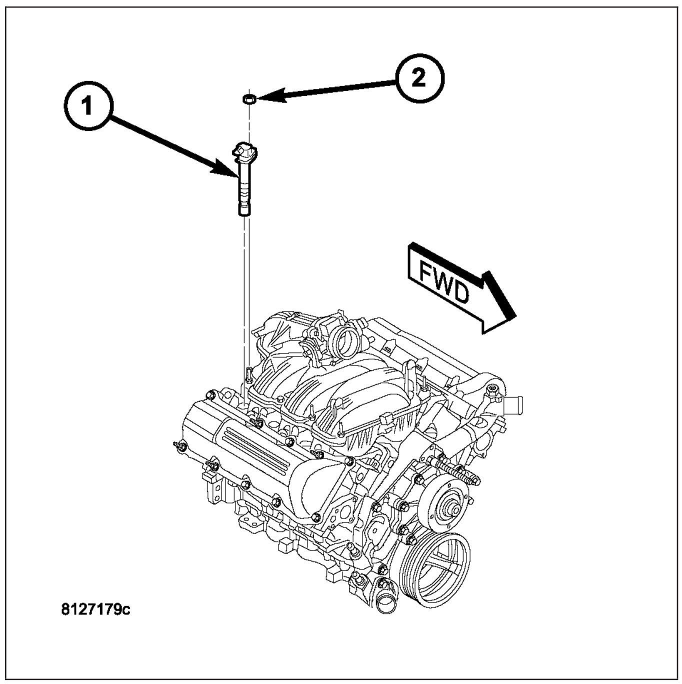
## REMOVAL

An individual ignition coil (1) is used for each spark plug. The coil fits into machined holes in the cylinder head. A mounting stud/nut secures each coil to the top of the intake manifold. The bottom of the coil is equipped with a rubber boot to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug. These rubber boots and springs are a permanent part of the coil and are not serviced separately. An o-ring (2) is used to seal the coil at the opening into the cylinder head.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.
2. Disconnect electrical connector from coil by pushing downward on release lock on top of connector and pull connector from coil.
3. Clean area at base of coil with compressed air before removal.

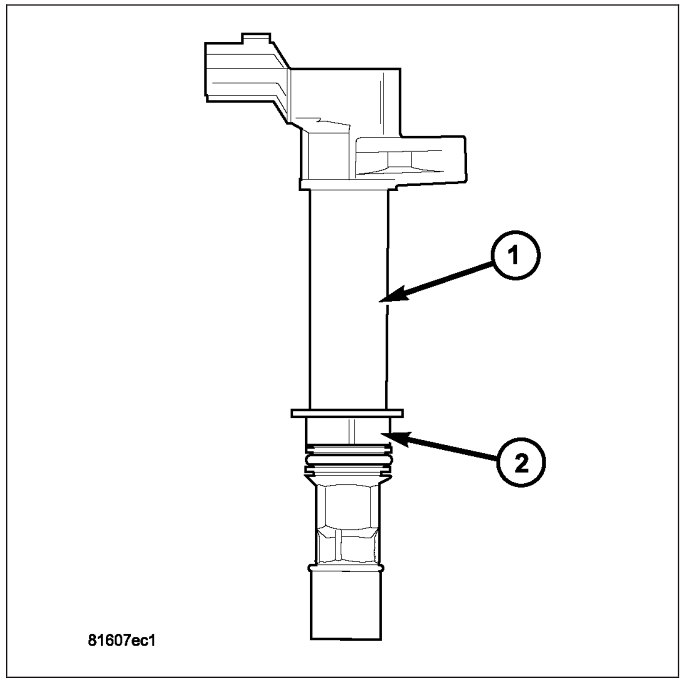


4. Remove coil mounting nut (2) from mounting stud.
5. Carefully pull up coil from cylinder head opening with a slight twisting action.
6. Remove coil from vehicle.

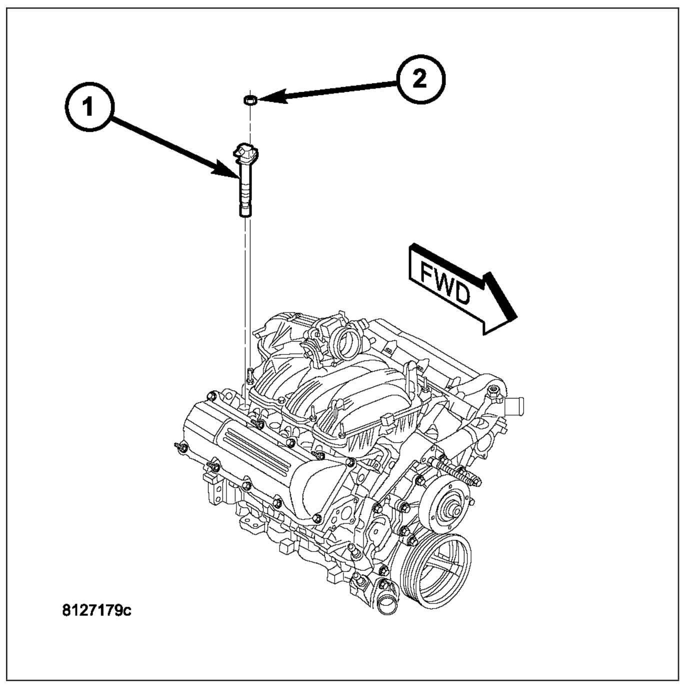


## INSTALLATION

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Check condition of coil O-ring (2) and replace as necessary. To aid in coil installation, apply silicone to coil O-ring (2).



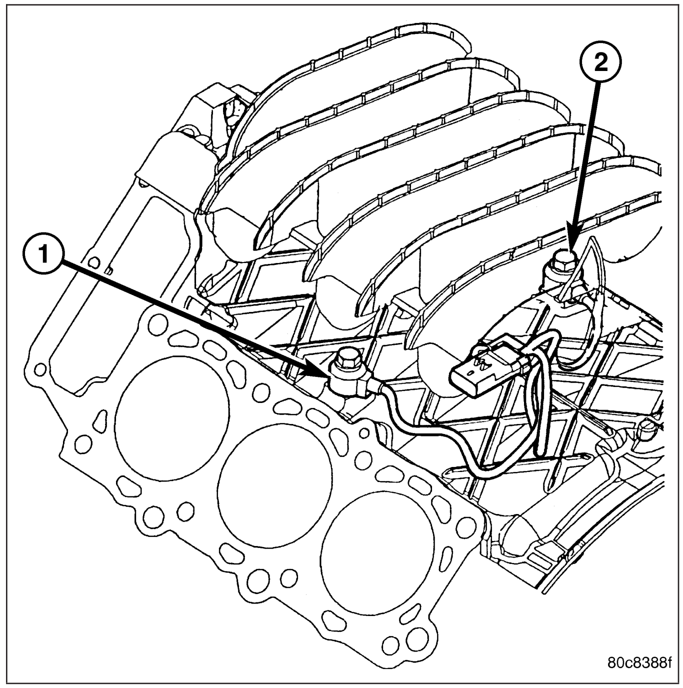
3. Position ignition coil (1) into cylinder head opening and push onto spark plug. Do this while guiding coil base over mounting stud.
4. Install coil mounting stud nut (2). Tighten to 8 N·m (70 in. lbs).
5. Connect electrical connector to coil by snapping into position.
6. If necessary, install throttle body air tube.



# SENSOR-KNOCK

## DESCRIPTION

The two knock sensors (1) and (2) are bolted into the cylinder block under the intake manifold.



## OPERATION

Two knock sensors are used on the 3.7L V-6 engine; one for each cylinder bank. When the knock sensor detects a knock in one of the cylinders on the corresponding bank, it sends an input signal to the Powertrain Control Module (PCM). In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric material which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives the knock sensor voltage signal as an input. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except at Wide Open Throttle (WOT). The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

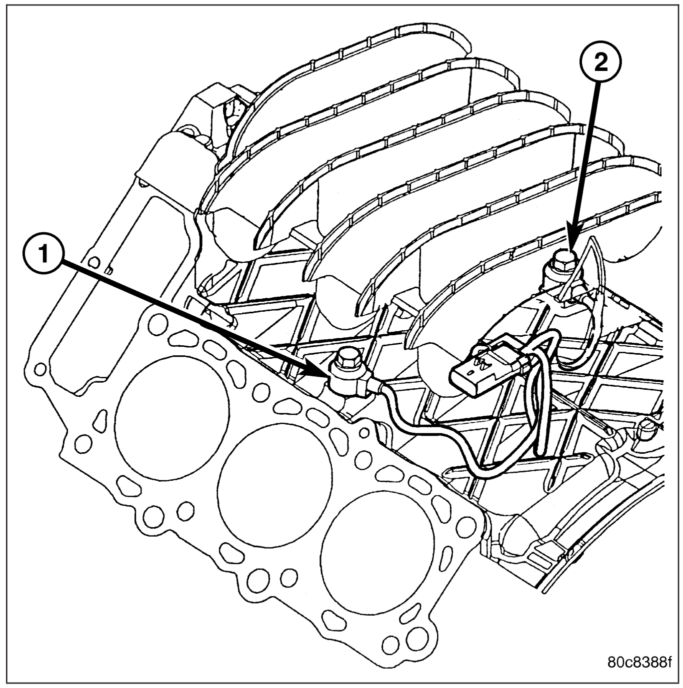
**NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors.**

## REMOVAL

The two knock sensors (1) are bolted into the cylinder block under the intake manifold.

**NOTE: The left sensor is identified by an identification tag (LEFT). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.**

1. Disconnect knock sensor dual pigtail harness from engine wiring harness. This connection is made near rear of engine.
2. Remove intake manifold (Refer to 9 - ENGINE/ MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Remove sensor mounting bolts (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensors (1) from engine.



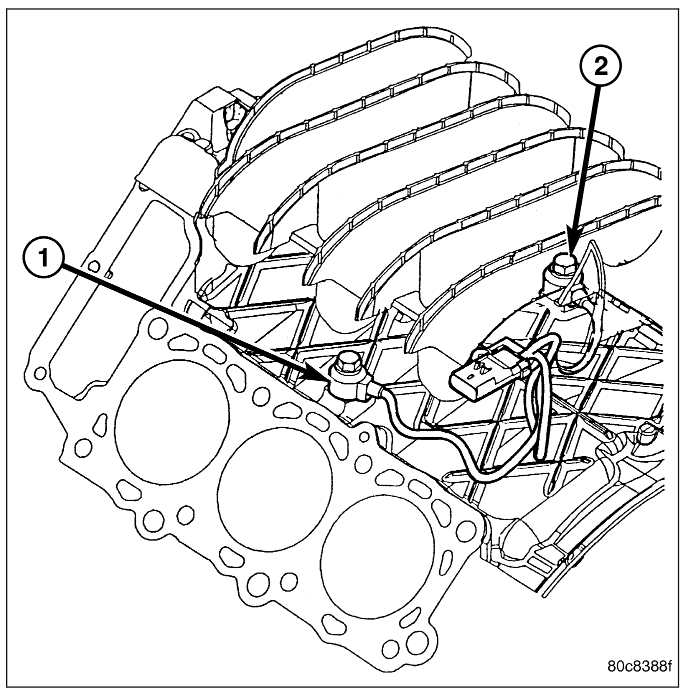
## INSTALLATION

**NOTE: The left sensor is identified by an identification tag (LEFT). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.**

1. Thoroughly clean knock sensor mounting holes.
2. Install sensors (1) into cylinder block.

**NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque for the knock senor bolt is relatively light for an 8 mm bolt.**

**NOTE: Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.**



3. Install and tighten mounting bolts (2). Tighten to 20 N·m (176 in. lbs.).
4. Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
5. Connect knock sensor wiring harness to engine harness (4) at rear of intake manifold.

# PLUG-SPARK

## DESCRIPTION

Resistor type spark plugs are used.

Spark plug resistance values range from 6,000 to 20,000 ohms (when checked with at least a 1000 volt spark plug tester). **Do not use an ohmmeter to check the resistance values of the spark plugs. Inaccurate readings will result.**

## OPERATION

To prevent possible pre-ignition and/or mechanical engine damage, the correct type/heat range/number spark plug must be used.

Always use the recommended torque when tightening spark plugs. This is especially true when plugs are equipped with tapered seats. Incorrect torque can distort the spark plug and change plug gap. It can also pull the plug threads and do possible damage to both the spark plug and the cylinder head.

Remove the spark plugs and examine them for burned electrodes and fouled, cracked or broken porcelain insulators. Keep plugs arranged in the order in which they were removed from the engine. A single plug displaying an abnormal condition indicates that a problem exists in the corresponding cylinder. Replace spark plugs at the intervals recommended in the Lubrication and Maintenance section.

Spark plugs that have low mileage may be cleaned and reused if not otherwise defective, carbon or oil fouled. Also refer to Spark Plug Conditions.

**CAUTION: Never use a motorized wire wheel brush to clean the spark plugs. Metallic deposits will remain on the spark plug insulator and will cause plug misfire.**

## REMOVAL

Each individual spark plug is located under each ignition coil. Each individual ignition coil must be removed to gain access to each spark plug (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - REMOVAL).

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil, spray compressed air around coil base at cylinder head.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert. Also check condition of ignition coil o-ring and replace as necessary.
5. Inspect spark plug condition.

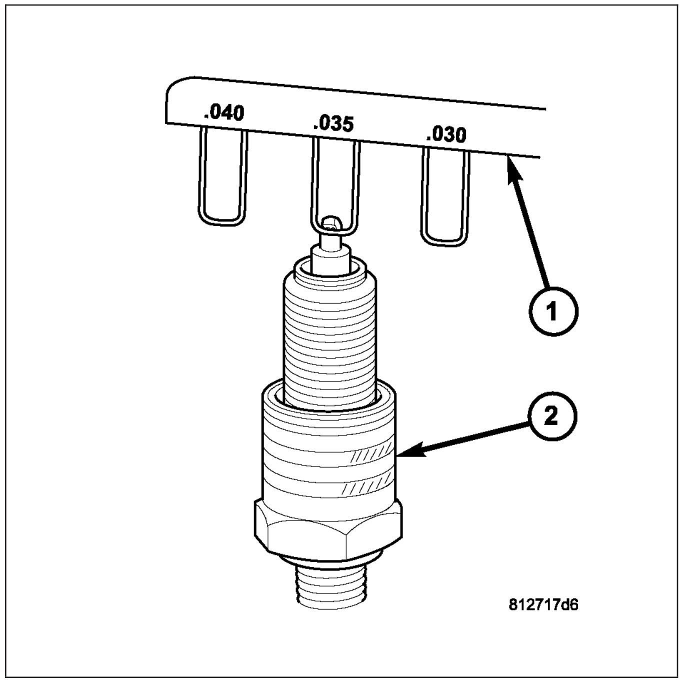
## CLEANING

## CLEANING AND ADJUSTMENT

The plugs may be cleaned using commercially available spark plug cleaning equipment. After cleaning, file center electrode flat with a small point file or jewelers file before adjusting gap.

**CAUTION: Never use a motorized wire wheel brush to clean spark plugs. Metallic deposits will remain on spark plug insulator and will cause plug misfire.**

Adjust spark plug gap with a gap gauging tool (1).



## INSTALLATION

Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

Always tighten spark plugs to the specified torque. Over tightening can cause distortion resulting in a change in the spark plug gap or a cracked porcelain insulator.

1. Start the spark plug into the cylinder head by hand to avoid cross threading.
2. Tighten spark plugs to 27 N·m (20 ft. lbs.).
3. Before installing ignition coil(s), check condition of coil o-ring and replace as necessary. To aid in coil installation, apply silicone to coil O-ring.
4. Install ignition coil(s) (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - INSTALLATION).

# SWITCH-IGNITION

## DESCRIPTION

The electrical ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

## DIAGNOSIS AND TESTING - IGNITION SWITCH

### ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, Refer to the appropriate section for the component.

### MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

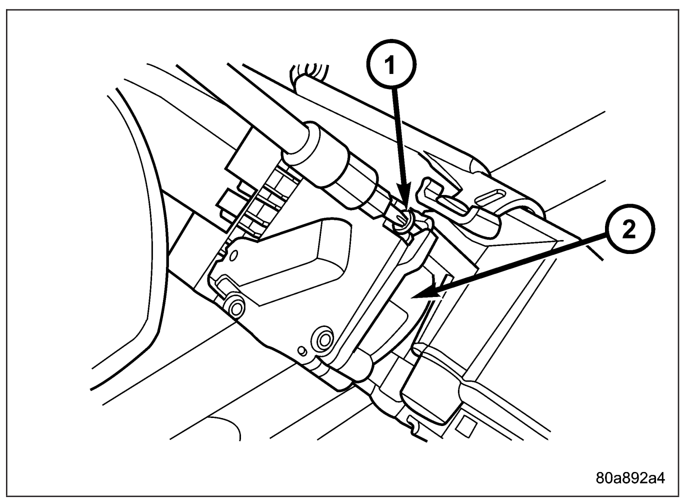
**Vehicles equipped with an automatic transmission and a floor mounted shifter:** a cable is used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock system is used to lock the transmission shifter in the PARK position when the key cylinder is rotated to any position. If the ignition key is difficult to rotate to or from any position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 30RH/GEAR SHIFT CABLE - ADJUSTMENTS). The interlock system within the steering column is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

**Vehicles equipped with a manual transmission and a floor mounted shifter:** on certain models, a button is located on the steering column behind the ignition key cylinder. The button must be manually depressed to allow rotation of the ignition key cylinder to any position. If it is difficult to rotate the key to any position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

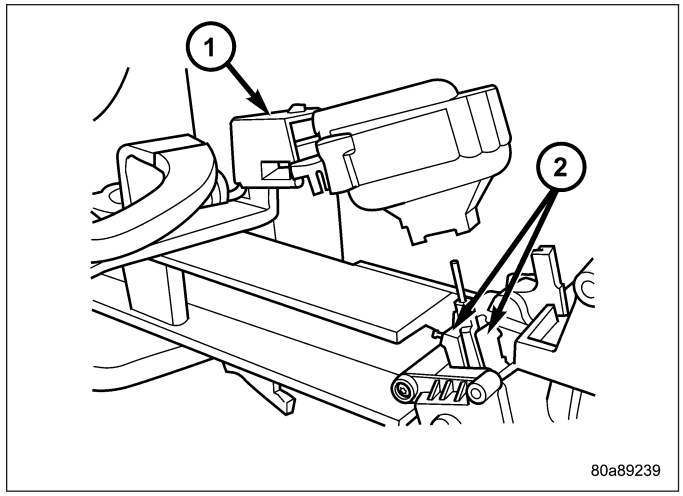
## REMOVAL

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

1. Remove lower steering column cover screws and remove cover.
2. Remove lock cylinder. (Refer to 19 - STEERING/COLUMN/KEY/LOCK CYLINDER - REMOVAL).
3. Remove the multi-function switch.
4. Disconnect the electrical connector at the rear of the ignition switch.
5. Remove the ignition switch mounting screw (1). Use tamper proof torx bit to remove the screw (1).



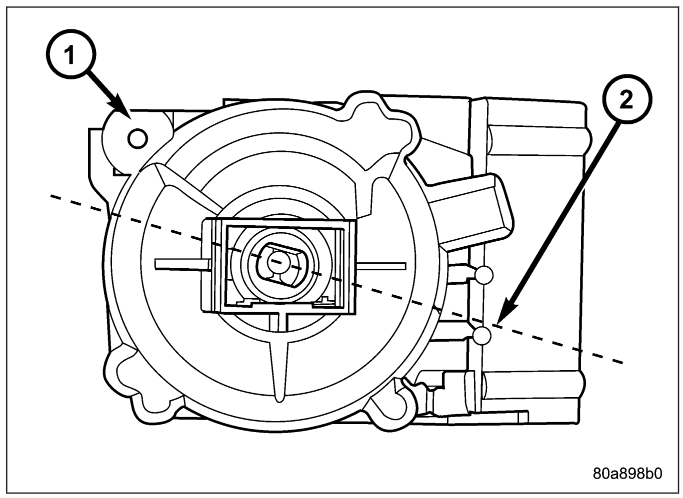
6. Pull the ignition switch (1) straight out to remove from the locking tabs (2).



## INSTALLATION

The ignition key must be in the key cylinder for cylinder installation. The key cylinder must be aligned with the ignition switch for installation.

1. Before installing ignition switch (1), rotate the slot in the switch to the ON position (2).
2. Connect the electrical connector to rear of ignition switch (1). Make sure that locking tab is fully seated into wiring connector.
3. Position the switch to the column and install tamper proof screw. Tighten screw to 2 N·m (17 in. lbs.).
4. Install the lock cylinder (Refer to 19 - STEERING/COLUMN/KEY/LOCK CYLINDER - INSTALLATION).
5. Test the operation of the lock cylinder for smooth rotating.



6. Install the multi-function switch.
7. Install steering column lower cover.

# SWITCH-KEY-IN IGNITION

## DESCRIPTION

The key-in ignition switch is integral to the ignition switch, which is mounted on the left side of the steering column, opposite the ignition cylinder. It closes a path to ground for the instrument cluster chime warning circuitry when the ignition key is inserted in the ignition lock cylinder and the driver door jamb switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition cylinder.

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced. (Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - REMOVAL).

## DIAGNOSIS AND TESTING - KEY-IN IGNITION SWITCH

For circuit descriptions and diagrams, Refer to the appropriate sections on the individual components.

**WARNING: On vehicles equipped with airbags, refer to electrical - passive restraint systems before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

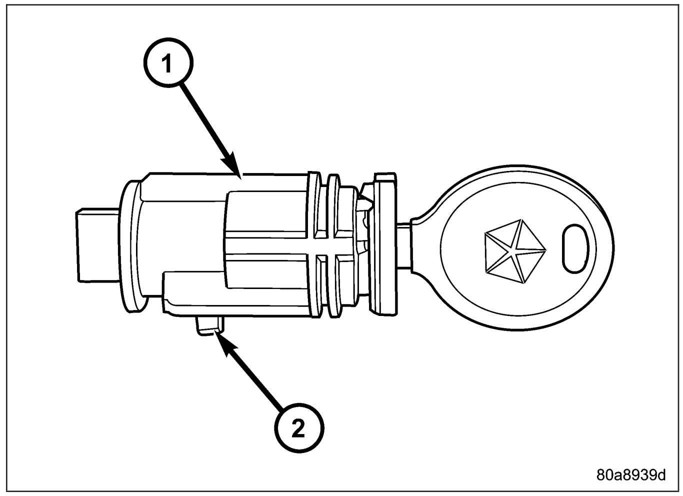
1. Disconnect and isolate the battery negative cable. Remove the steering column shrouds. Unplug the key-in ignition switch wire harness connector from the ignition switch.
2. Check for continuity between the key-in switch sense circuit and the left front door jamb switch sense circuit terminals of the key-in ignition switch. There should be continuity with the key in the ignition cylinder, and no continuity with the key removed from the ignition cylinder. If OK, go to Step 3. If not OK, replace the faulty ignition switch assembly.
3. Check for continuity between the left front door jamb switch sense circuit cavity of the key-in ignition switch wire harness connector and a good ground. There should be continuity with the driver door open, and no continuity with the driver door closed. If OK, see the diagnosis for Instrument Cluster in this group. If not OK, repair the circuit to the driver door jamb switch as required.

# CYLINDER-KEY/LOCK

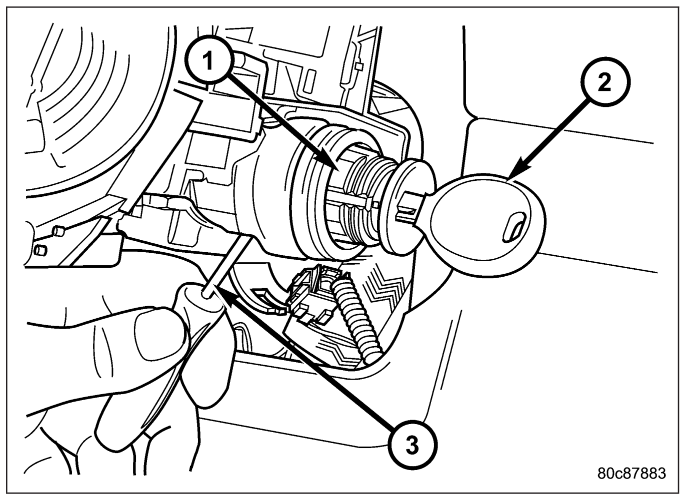
## REMOVAL

The ignition key must be in the key cylinder (1) for cylinder removal. The key cylinder must be removed first before removing ignition switch.

1. If equipped with an automatic transmission, place shifter in PARK position.
2. Remove the lower shroud cover.
3. Remove the remote keyless entry (R.K.E.) module.
4. Remove the halo ring around the cylinder.
5. Rotate key to ON position.
6. A release tang (2) is located on bottom of key cylinder (1).



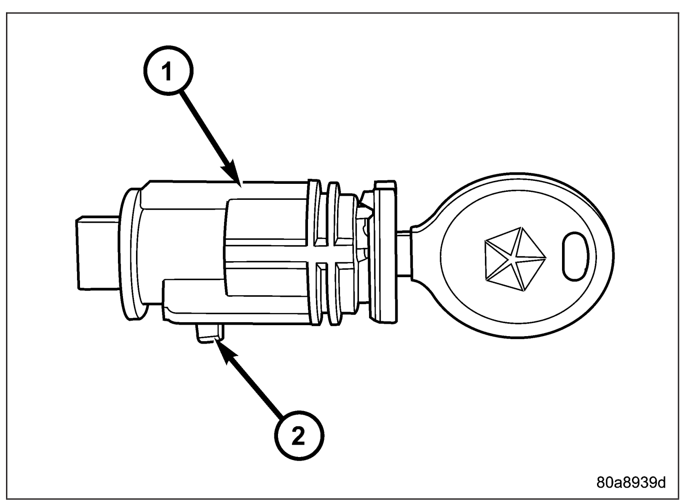
7. Position a small screwdriver or pin punch (3) into tang access hole on bottom of steering column.
8. Push the pin punch (3) up while pulling key cylinder (1) from steering column.



## INSTALLATION

The ignition key must be in the key cylinder (1) for cylinder installation.

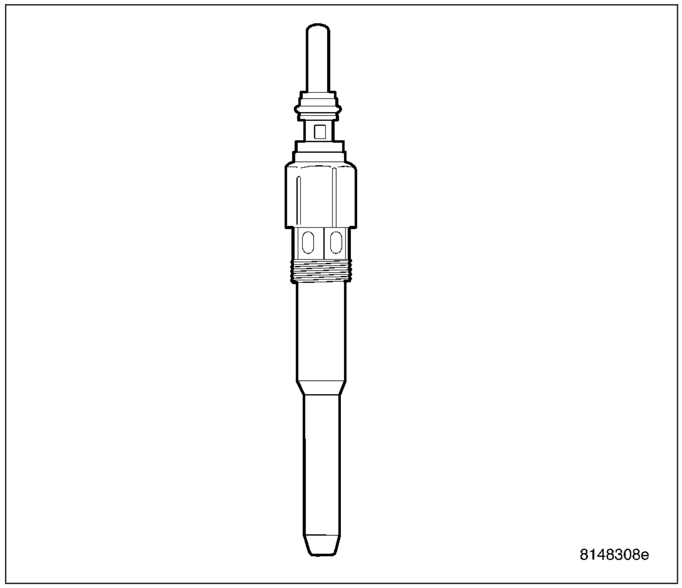
1. Install the key cylinder (1) into the housing using care to align the end of the key cylinder with the ignition switch.
2. Push the key cylinder (1) in until it clicks .
3. Rotate the key to the insert position.
4. install the halo ring around the key cylinder housing.
5. Install the R.K.E. module.
6. Install the lower shroud cover.



# PLUG-GLOW

## DESCRIPTION

**CAUTION: The glow plug system is a 7 volt system. The glow plugs DO NOT tolerate any over voltage. Full battery voltage will destroy the glow plug immediately. DO NOT test the glow plugs with a 12V source as damage will occur to the glow plug.**



**CAUTION:**

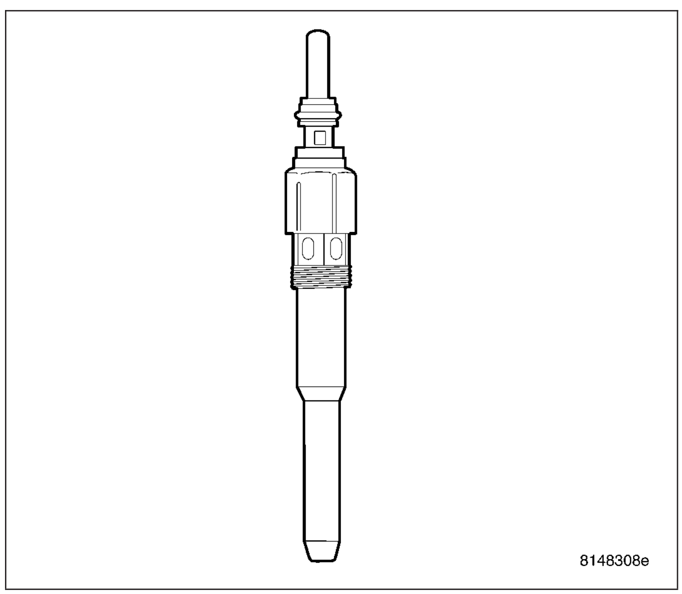
- **Never bend, bump or knock the ceramic glow plugs.**
- **Ceramic glow plugs must not be handled loose in a container. Store, handle, and transport them only in original boxes.**
- **If there is any doubt about the proper condition of a glow plug, do not use it anymore.**
- **Do not clean the glow plugs with abrasive or aggressive media.**
- **Avoid dipping the glow plug into fluids.**
- **Read Diagnostic Trouble Codes (DTCs). If a glow plug problem is indicated, do not start the engine.**

**CAUTION: Disregarding these instructions may cause severe engine damage.**

Glow plugs are used to help start a cold or cool engine. The glow plugs will heat up and glow to heat the combustion chamber of each cylinder. An individual glow plug is used for each cylinder. Each glow plug is threaded into the left side of the cylinder head below the cylinder head cover/intake manifold.

## OPERATION

**CAUTION: The glow plug system is a 7 volt system. DO NOT test the glow plugs with a 12 V source as damage will occur to the glow plug(s).**



The Engine Control Module (ECM) monitors various engine sensors. When the ignition key is turned to the ON position, the ECM sends a signal to the glow plug module to turn on, and cycle, the glow plugs for a predetermined amount of time, plus illuminate the glow plug light in the instrument panel. Once activated, the element inside of the ceramic core of the glow plug begins to glow. Each glow plug draws approximately 5 amps, for a total system amperage of 20 amps at 22° C (72° F) ambient temperature. If there is a fault with the glow plug system, the ECM will store a fault code.

## DIAGNOSIS AND TESTING - GLOW PLUGS

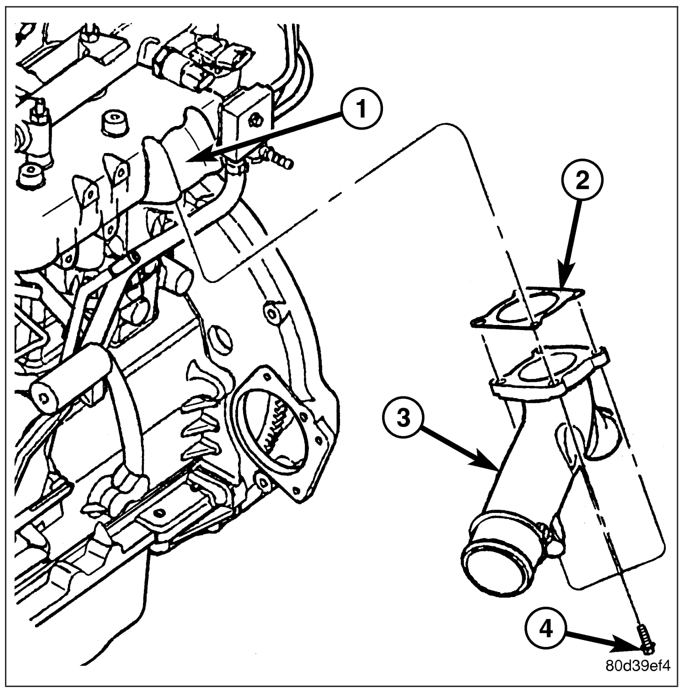
**CAUTION: DO NOT start the engine before the glow system test correctly.**

1. Measure the electrical resistance of the glow plug in the installed condition, resistance should be less than 0.8Ω. The ground contact must be as close as possible to the glow plug contact to avoid introducing errors in the measurement.
2. If the resistance is out of tolerance, remove the glow plug and check it again separately.
3. Use the actuator test function for the glow plug module and glow plug lamp. The design and function of the glow plug module tests each glow plug to check the complete glow system.
4. If MIL is OFF and OBD has not recognized a malfunction of the glow system, testing is finished and the engine can be started.
5. If MIL is still ON, check the electrical connectors of glow plugs and power up the glow plugs again.

## REMOVAL

**CAUTION:**
- **If necessary, remove hindering components to ease access.**
- **Do not bend, knock, or drop the glow plugs while handling (any mechanical impact may damage the glow plug).**
- **First loosen the glow plug with a wrench then screw it out by hand or with assistance of a flexible tool (e.g. with a rubber hose).**
- **Compare the removed glow plug with a new one. If there are missing parts of the ceramic heating element, remove all fragments from the combustion chamber before you start the engine. CYLINDER HEAD WILL NEED TO BE REMOVED**

1. Disconnect negative battery cable.
2. To access the glow plug for cylinder number one, no additional components need to be removed.
3. To remove the glow plug for cylinder number two, remove the rear generator bracket.
4. To remove the glow plug for cylinder number three, remove the EGR pipe from the intake elbow and remove the intake elbow.
5. To remove the glow plug for cylinder number four, relocate the fuel filter assembly.
6. Disconnect glow plug electrical connectors.
7. Remove glow plugs from cylinder head.



## INSTALLATION

**CAUTION:**

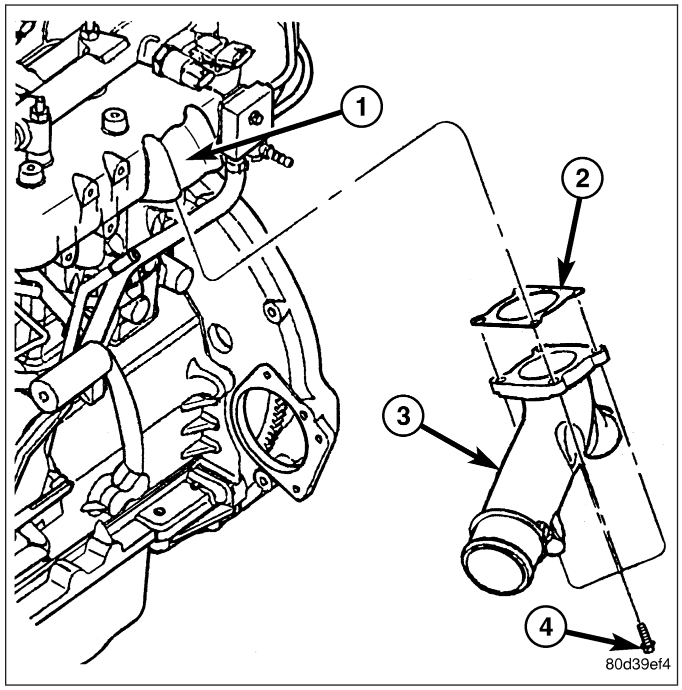
- **Before a new glow plug is installed, make sure that the thread of glow plug and glow plug bore in the cylinder head is dry, clean, and oil/grease-free**
- **Check the resistance of the glow plug with an appropriate multi-meter, resistance should be less than 0.8Ω.**
- **Tighten the glow plug by hand or means of a flexible tool (e.g. rubber hose) as far as possible and finish tightening with a correctly set torque wrench.**
- **Strictly observe the required tightening torque.**
- **Do not bend, knock, or drop the glow plug while installing.**

**CAUTION: If a fragment of the ceramic heater of the glow plug has fallen into the combustion chamber, the cylinder head MUST be removed.**

1. Install glow plugs all the way into cylinder head, hand tight, until the thread stops.

**CAUTION: Strictly observe the required tightening torque. If tightening torque was to high, remove and replace the glow plug.**

2. Tighten glow plugs to 12.5 N·m (110 in. lbs.).
3. Connect glow plug electrical connectors.
4. Install any components that were removed for access.
5. Connect negative battery cable.
6. Test the glow plug system for proper operation before starting the engine. (Refer to 8 - ELECTRICAL/IGNITION CONTROL/GLOW PLUG - DIAGNOSIS AND TESTING)

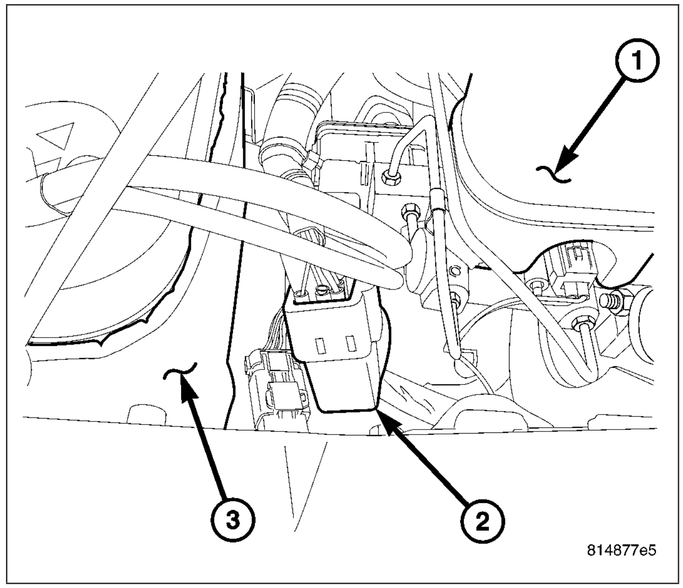


# MODULE-GLOW PLUG

## DESCRIPTION

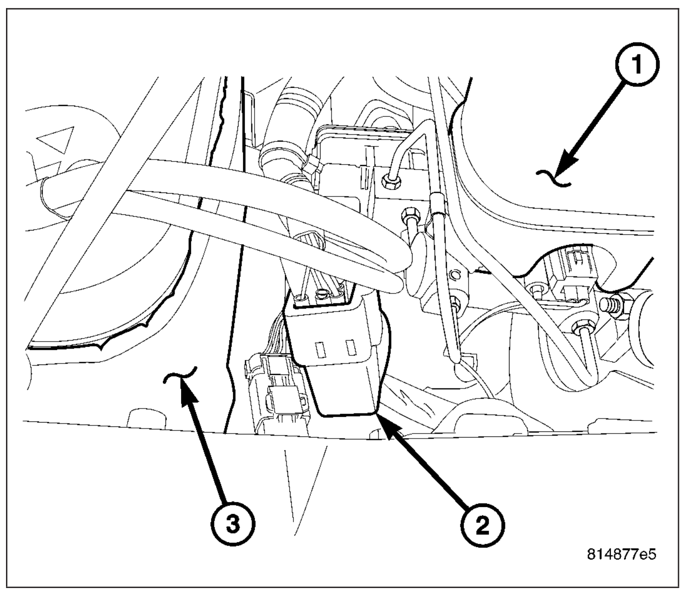
**CAUTION: The glow plug system is a 7 volt system. DO NOT ATTEMPT to test the glow plug system with a 12V power source or damage will occur.**

The glow plug module (2) is mounted to the inner fender between the battery and the master cylinder (1) in the engine compartment. For an explanation of the glow plug system operation (Refer to 8 - ELECTRICAL/IGNITION CONTROL/GLOW PLUG RELAY - OPERATION).



## OPERATION

**CAUTION: The glow plug system is a 7 volt system. DO NOT ATTEMPT to test the glow plug system with a 12V power source or damage will occur.**



When the ignition (key) switch is placed in the ON position, a signal is sent from the sensors to the ECM relaying current engine coolant temperature and ambient air temperature.

After receiving this signal, the ECM will determine if, when and for how long of a period the glow plugs should be activated. This is done before, during and after the engine is started. Whenever the glow plug module (2) is activated, it will control the 7 volt high amperage circuit for the operation of the four glow plugs.

The Glow Plug lamp is tied to this circuit. Lamp operation is also controlled by the ECM.

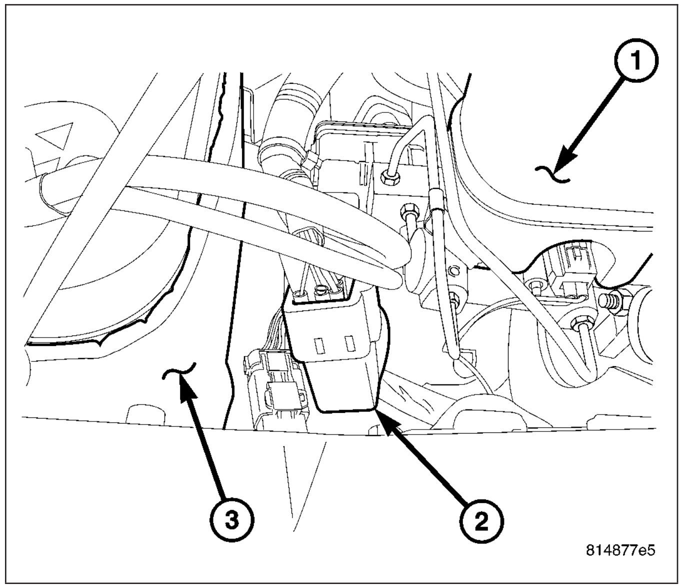
With a cold engine, the glow plug module and glow plugs may be activated for a maximum time of 200 seconds. Refer to the following Glow Plug Control chart for a temperature/time comparison of the glow plug relay operation.

In this chart, Pre-Heat and Post-Heat times are mentioned. Pre-Heat is the amount of time the glow plug control circuit is activated when the ignition (key) is switched ON, without the engine running. Post-Heat is the amount of time the glow plug control circuit is activated after the engine is operated. The Glow Plug lamp will not be activated during the post-heat cycle.

| Engine Coolant Temperature ″Key ON″ | Wait-To Start Lamp ″ON″ (Seconds) | Pre-Heat Cycle (Glow Plugs On Seconds) | Post-Heat Cycle (Seconds) |
|---|---|---|---|
| -30C | 10 SEC. | 35 SEC. | 200 SEC. |
| -10C | 10 SEC. | 23 SEC. | 180 SEC. |
| +10C | 1 SEC. | 21 SEC. | 160 SEC. |
| +30C | 1 SEC. | 20 SEC. | 140 SEC. |
| +40C | 1 SEC. | 19 SEC. | 70 SEC. |
| +70C | 1 SEC. | 16 SEC. | 20 SEC. |

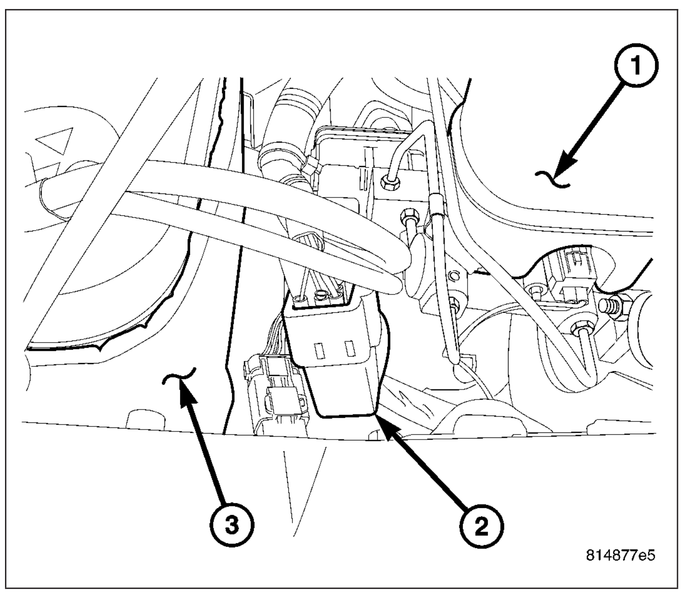
## REMOVAL

1. Disconnect the negative battery cable.
2. Disconnect the glow plug wiring harness connector.
3. Remove the module (2) from the inner wheel well.



## INSTALLATION

1. Connect the glow plug wiring harness connector.
2. Secure the relay onto the inner fender well.
3. Connect the negative battery cable.



# CAPACITOR-IGNITION COIL

## DESCRIPTION

One coil capacitor is used. It is located in the engine compartment and attached (clipped) to a wiring trough near the brake power booster.

## OPERATION

The coil capacitor(s) help dampen the amount of conducted electrical noise to the camshaft position sensor, crankshaft position sensor, and throttle position sensor. This noise is generated on the 12V supply wire to the ignition coils and fuel injectors.

## REMOVAL

The coil capacitor is located in the engine compartment and is attached (clipped) to a wiring harness trough near the brake power booster (graphic not available).

1. Unclip capacitor from wiring harness trough.
2. Disconnect electrical connector at capacitor.

## INSTALLATION

1. Connect electrical connector to coil capacitor.
2. Position capacitor into v-clip on wiring harness trough.

# INSTRUMENT CLUSTER

## TABLE OF CONTENTS

## INSTRUMENT CLUSTER - ELECTRICAL DIAGNOSTICS

### TABLE OF CONTENTS

# INSTRUMENT CLUSTER - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## ABS LAMP CIRCUIT SHORT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects Indicator short/open fault during internal self test.

| Possible Causes |
| --- |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## ABS LAMP OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects Indicator short/open fault during internal self test.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## BRAKE LAMP CIRCUIT SHORT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects Indicator short/open fault during internal self test.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## BRAKE LAMP OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects Indicator short/open fault during internal self test.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## MIL LAMP CIRCUIT SHORT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects Indicator short/open fault during internal self test.

| Possible Causes |
| --- |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## MIL LAMP OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects Indicator short/open fault during internal self test.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## SEATBELT LAMP CIRCUIT SHORT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects Indicator short/open fault during internal self test.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## SEATBELT LAMP OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects Indicator short/open fault during internal self test.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

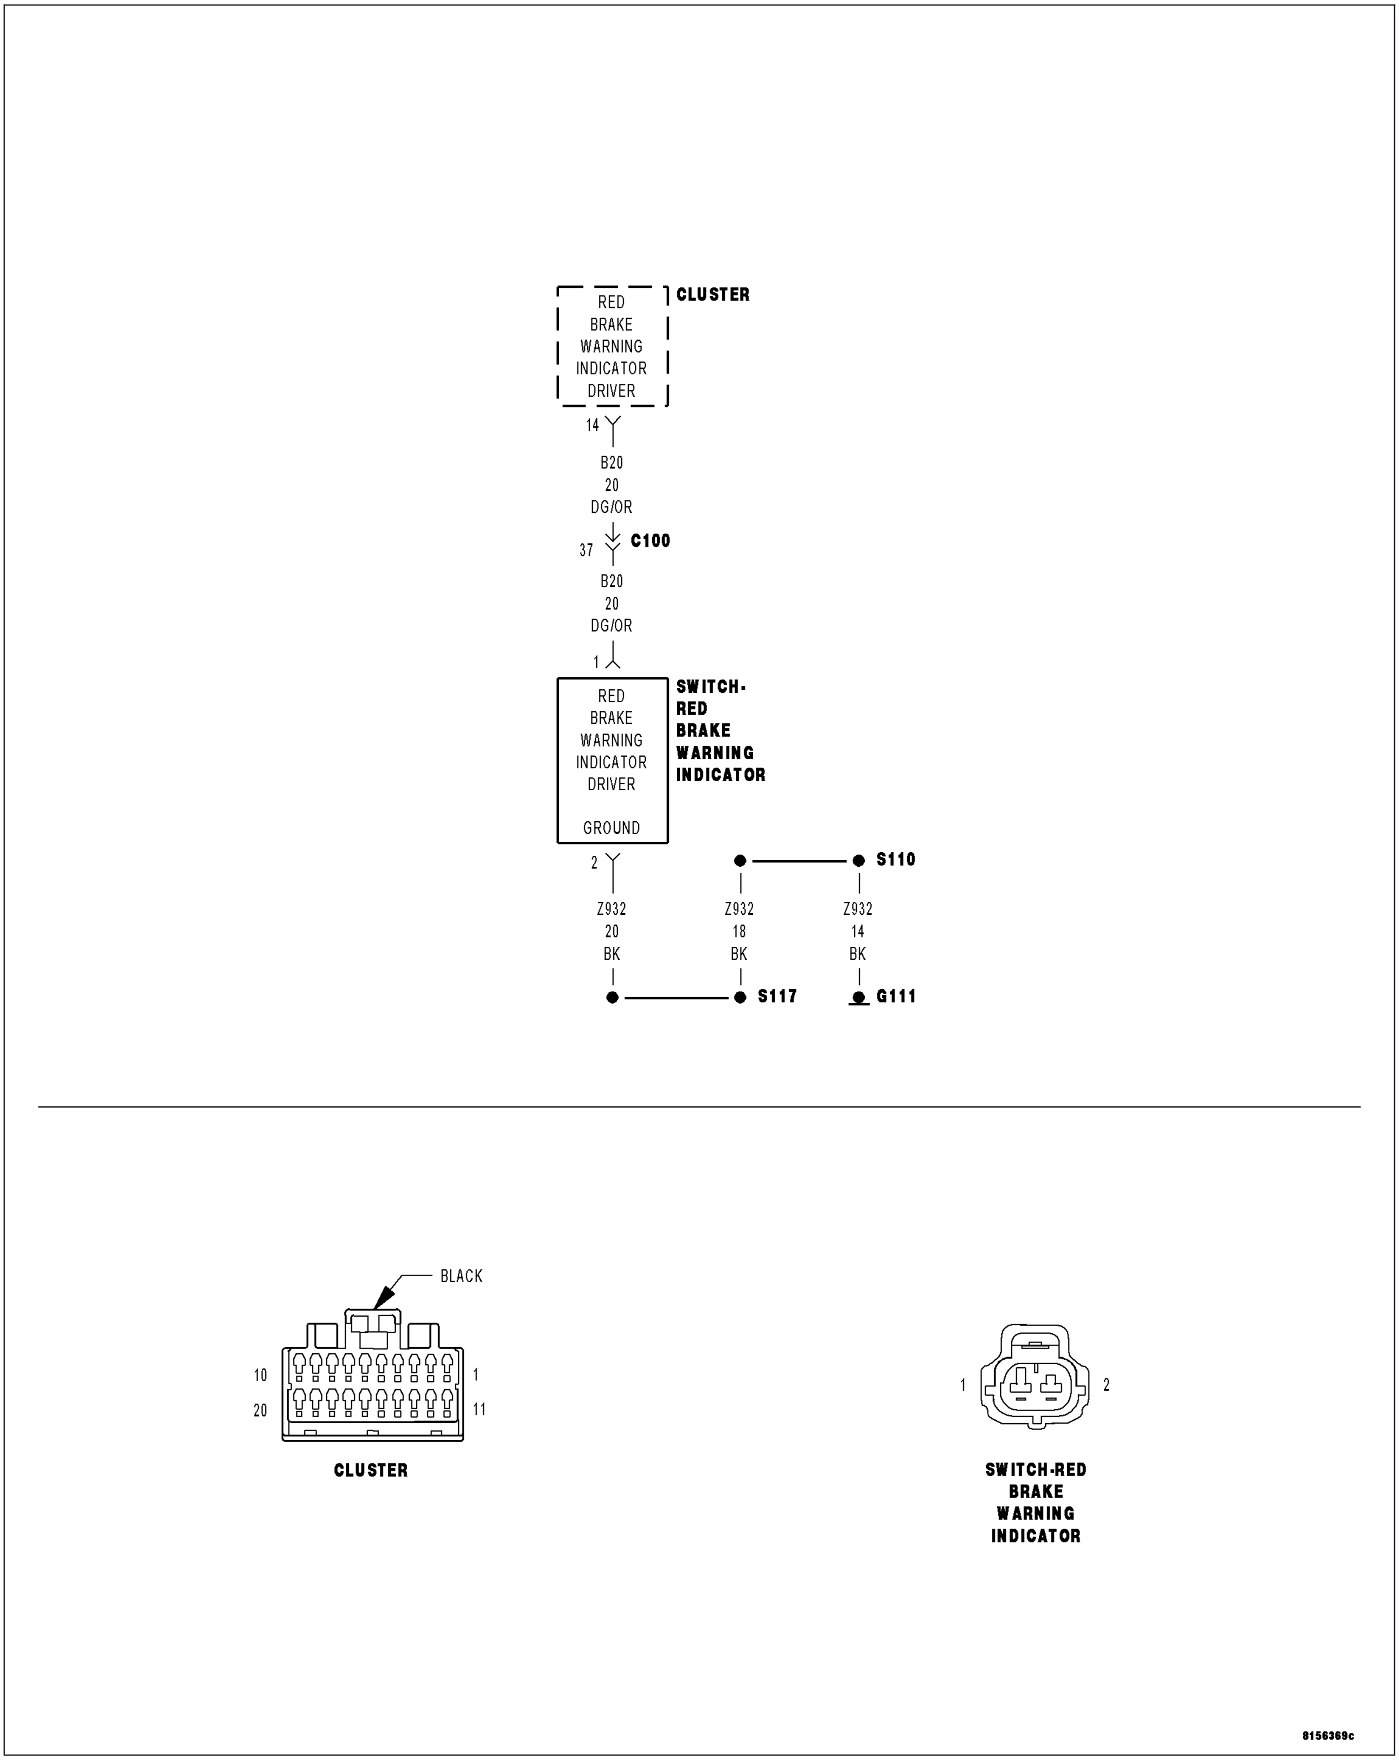
With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## BRAKE FLUID SWITCH CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The cluster performs open circuit detection on the Brake Fluid Level (Red Brake Warning Indicator Driver) switch and the sense circuit. Fault sets if an open circuit is detected. When this fault is detected the cluster will illuminate the Brake warning indicator.

| Possible Causes |
|---|
| INTERMITTENT CONDITION |
| BRAKE FLUID LEVEL SWITCH |
| (Z932) BRAKE FLUID LEVEL SWITCH GROUND CIRCUIT |
| (B20) RED BRAKE WARNING INDICATOR DRIVER CIRCUIT |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

**NOTE: Ensure that the Brake Fluid Level Switch harness connector is properly connected.**

With the scan tool, erase DTCs.

Cycle the ignition and wait approximately 15 seconds.

With the scan tool, read DTCs.

**Does the scan tool display: BRAKE FLUID SWITCH CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connectors.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. BRAKE FLUID LEVEL SWITCH

Turn the ignition off.

Disconnect the Brake Fluid Level Switch harness connector.

Check connectors - Clean/repair as necessary.

Measure the internal resistance of the Brake Fluid Level (Red Brake Warning Indicator Driver) Switch.

**Is the resistance above 1.1k (1,100) ohms?**

**Yes** >> Replace the Brake Fluid Level (Red Brake Warning Indicator Driver) Switch in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

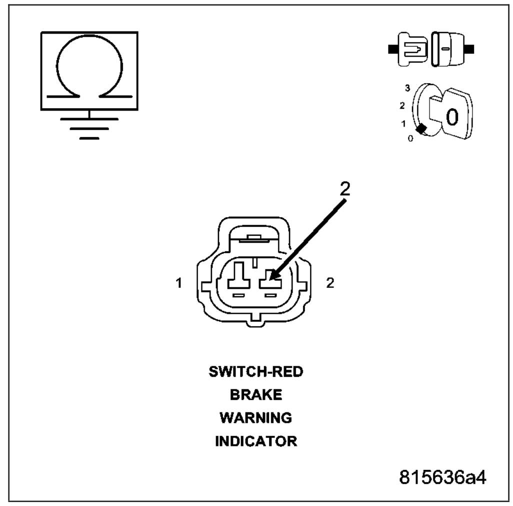
## 3. (Z932) BRAKE FLUID LEVEL SWITCH GROUND CIRCUIT

Turn the ignition off.

Disconnect the Brake Fluid Level Switch harness connector.

Check connectors - Clean/repair as necessary.

Measure the resistance between ground and the (Z932) Brake Fluid Level Switch Ground circuit.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (Z932) Brake Fluid Level (Red Brake Warning Indicator Driver) Switch Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

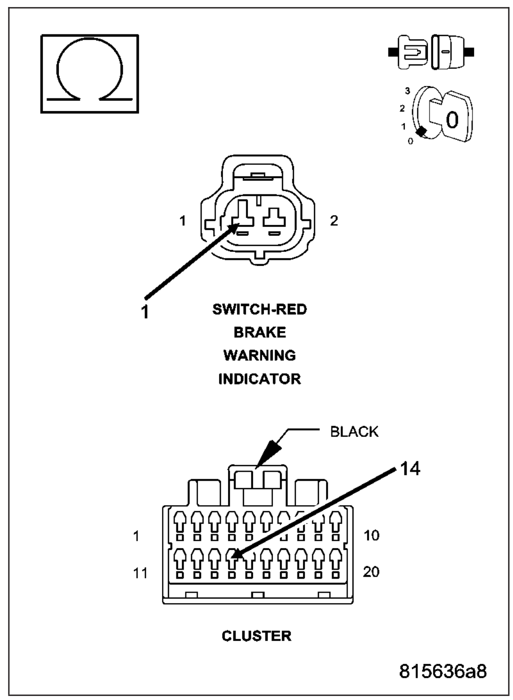
## 4. (B20) RED BRAKE WARNING INDICATOR DRIVER CIRCUIT OPEN

Turn the ignition off.

Disconnect the Brake Fluid Level Switch harness connector.

Disconnect the Instrument Cluster harness connector.

Measure the resistance of the (B20) Red Brake Warning Indicator Driver circuit.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (B20) Red Brake Warning Indicator Driver circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## CLUSTER BUS TRANSMIT SHUTDOWN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects loss of internal bus transmission for 4 seconds.

| Possible Causes |
| --- |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Cycle the ignition and wait approximately 1 minute.

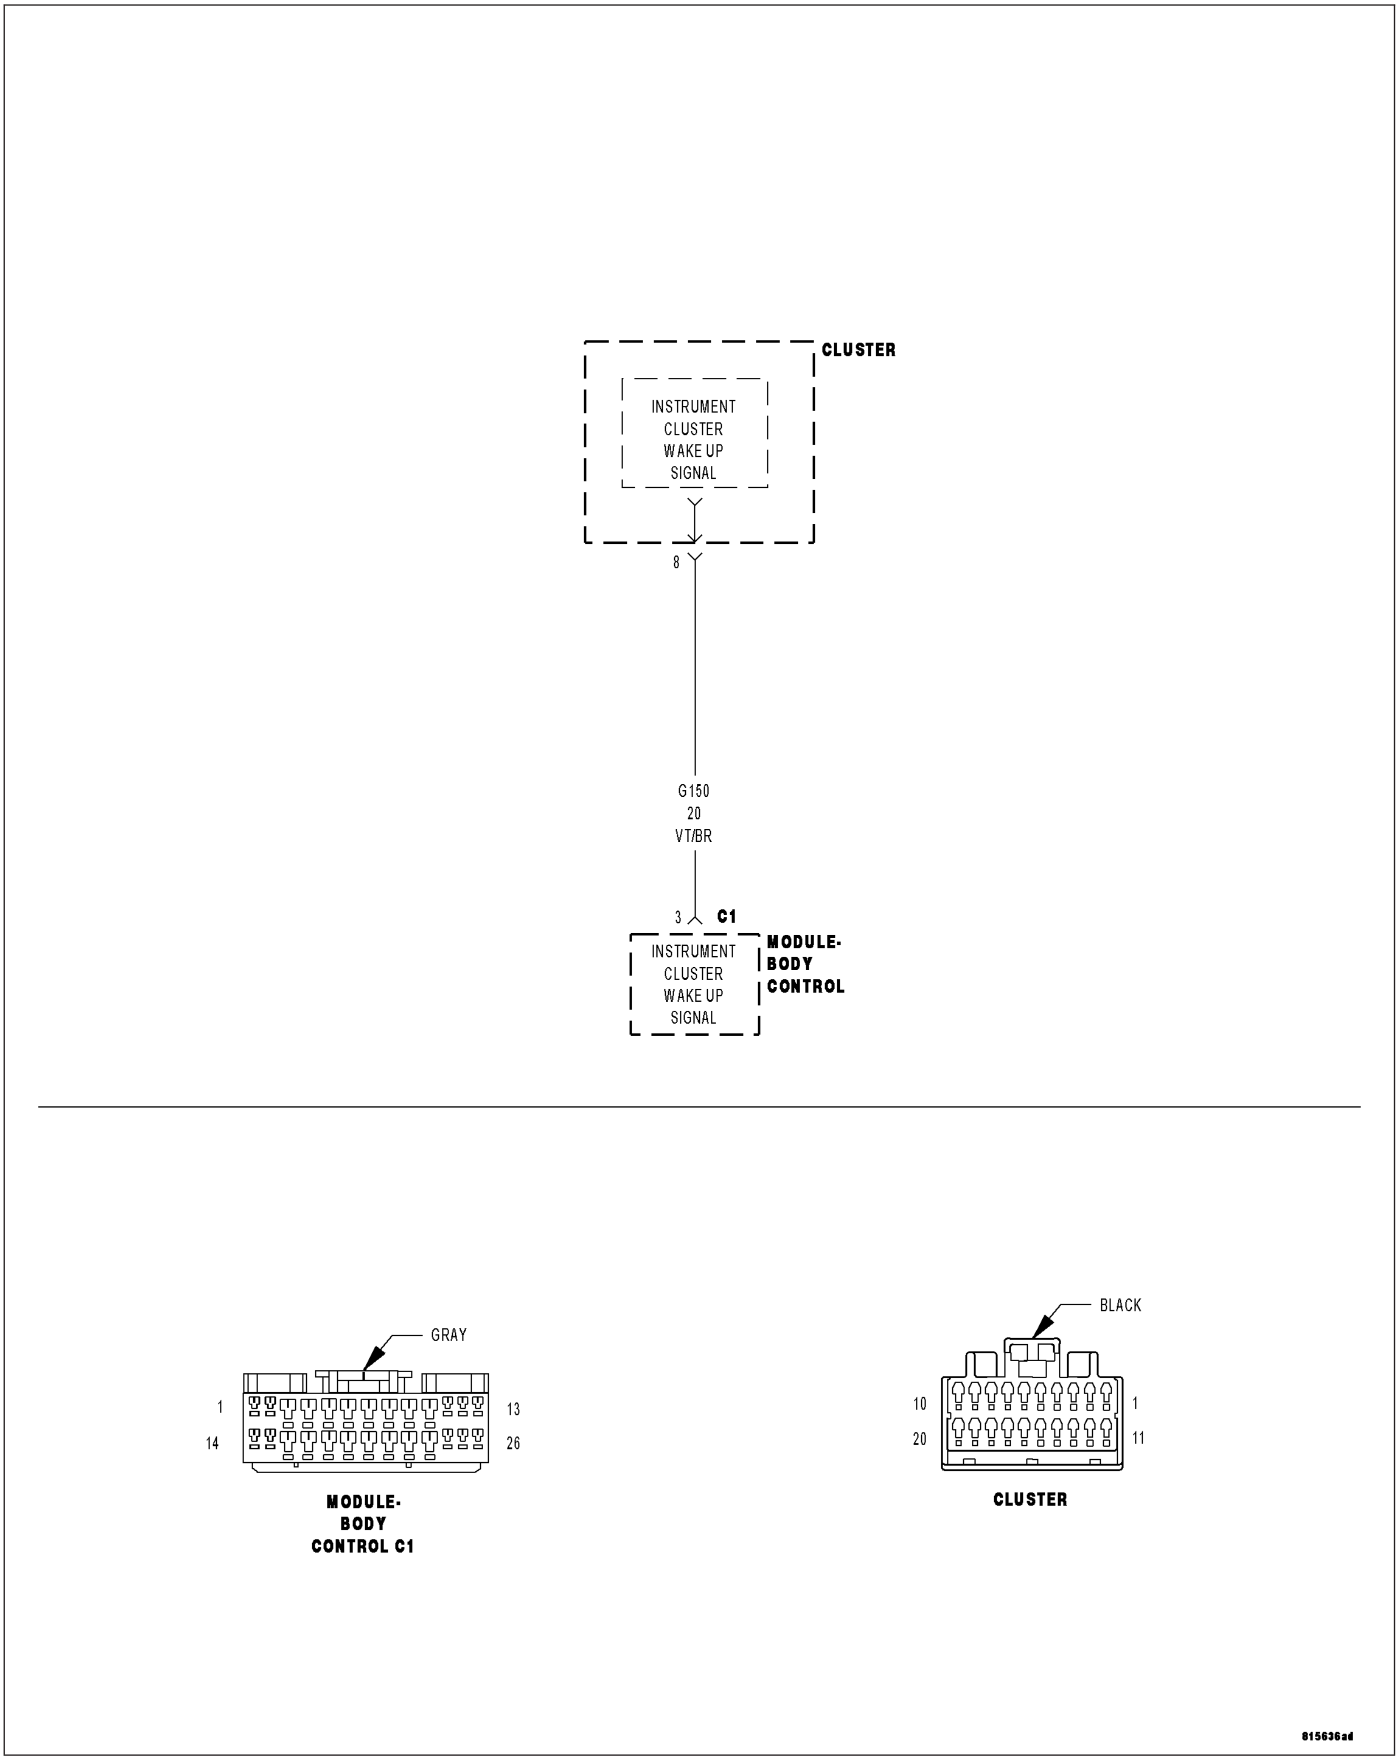
With the scan tool, read DTCs.

**Did this DTC reset?**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## CLUSTER WAKE UP OUTPUT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the OFF position.
- **Set Condition:**
  When the BCM receives an input from the driver door switch or an input from exterior lamp control switch. Symptoms will include: No fast chime with key in ignition or Park Lamps on and driver door open. No VF odometer display when door open. No cluster, high beam indicator, front or rear fog lamp indicator illumination.

| Possible Causes |
| --- |
| (G150) INSTRUMENT CLUSTER WAKE UP SIGNAL CIRCUIT SHORT TO VOLTAGE |
| INTERMITTENT CONDITION |
| BODY CONTROL MODULE |
| INSTRUMENT CLUSTER |

## Diagnostic Test

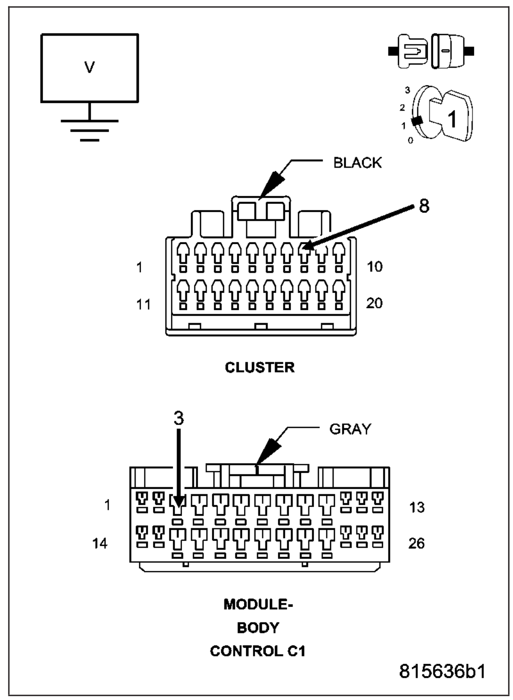
### 1. (G150) INSTRUMENT CLUSTER WAKE UP SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the BCM C1 harness connector.

Disconnect the Instrument Cluster harness connector.

Measure the voltage between the (G150) Instrument Cluster Wake Up Signal circuit and ground.



**Is there any voltage present?**

**Yes** >> Repair the (G150) Instrument Cluster Wake Up Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

## 2. BODY CONTROL MODULE

Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

Ensure that the BCM C1 harness connector is connected.

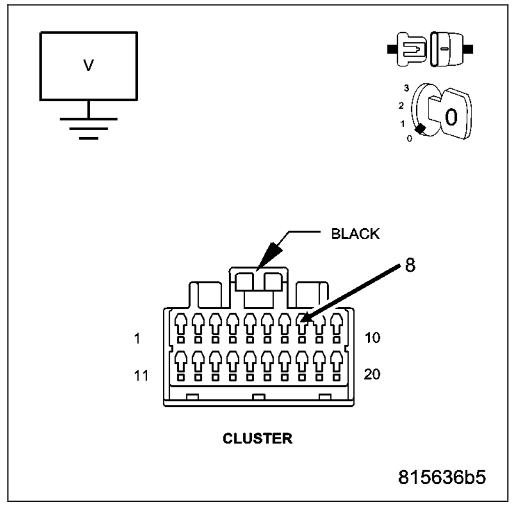
Measure the voltage between the (G150) Cluster Wake Up circuit and ground.

**Is there any voltage present?**

**Yes** >> Replace and program the Body Control Module in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



## 3. INSTRUMENT CLUSTER

Turn the ignition off.

Ensure that the Instrument Cluster and BCM C1 harness connectors are connected.

Turn the ignition on.

With the scan tool, read DTCs.

**Did this DTC reset?**

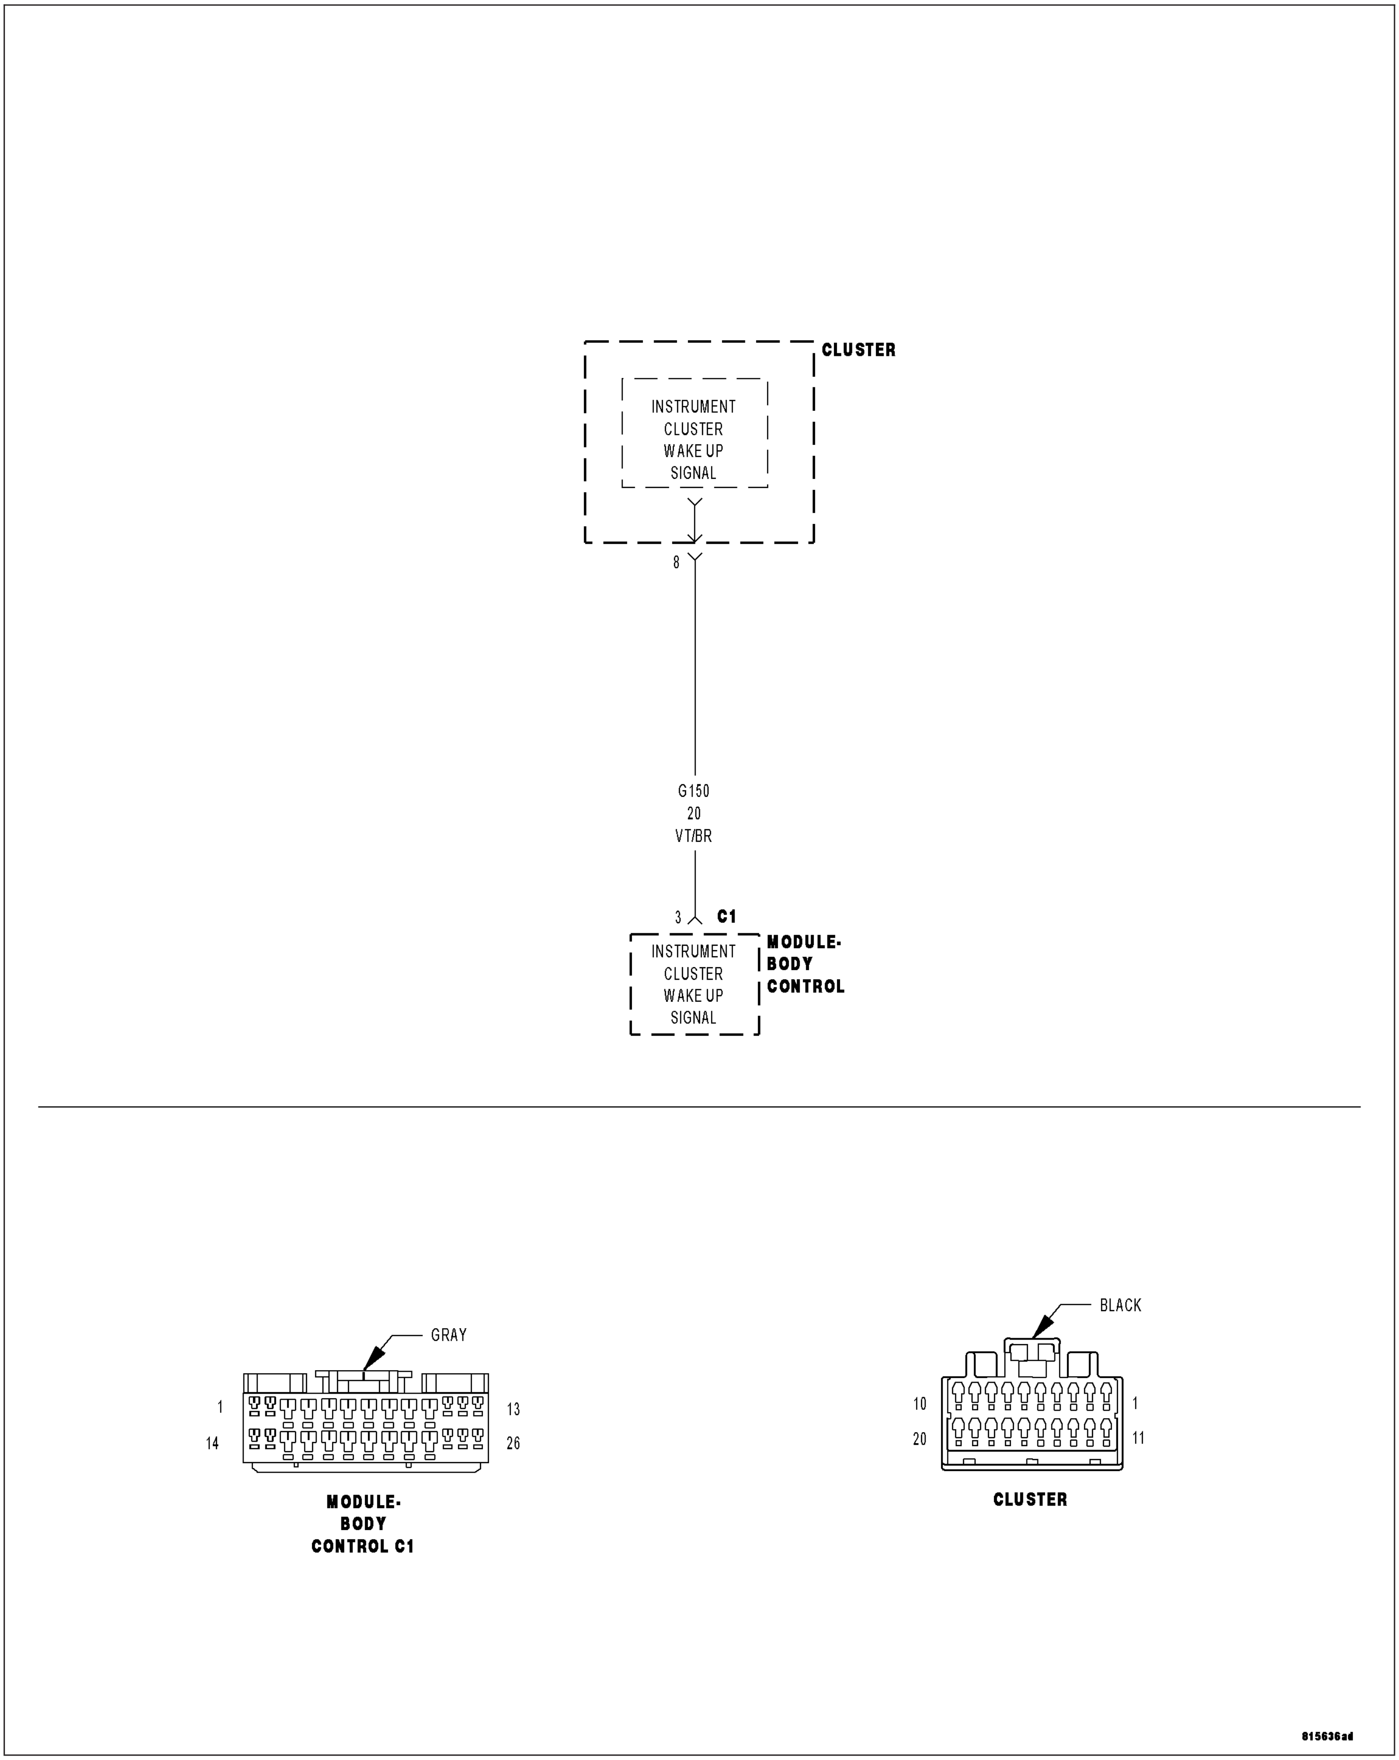
**Yes** >> Replace and configure the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> The condition is not present at this time. Monitor scan tool DTCs while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## CLUSTER WAKE UP OUTPUT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the OFF position.
- **Set Condition:**
  When the BCM receives an input from the driver door switch or an input from exterior lamp control switch. Symptoms will include: No fast chime with key in ignition or Park Lamps on and driver door open. No VF odometer display when door open. No cluster, high beam indicator, front or rear fog lamp indicator illumination.

| Possible Causes |
|---|
| (A908) FUSED B(+) CIRCUIT OPEN |
| (G150) INSTRUMENT CLUSTER WAKE UP SIGNAL CIRCUIT OPEN |
| INTERMITTENT CONDITION |
| (G150) INSTRUMENT CLUSTER WAKE UP SIGNAL CIRCUIT SHORT TO GROUND |
| BODY CONTROL MODULE |
| INSTRUMENT CLUSTER |

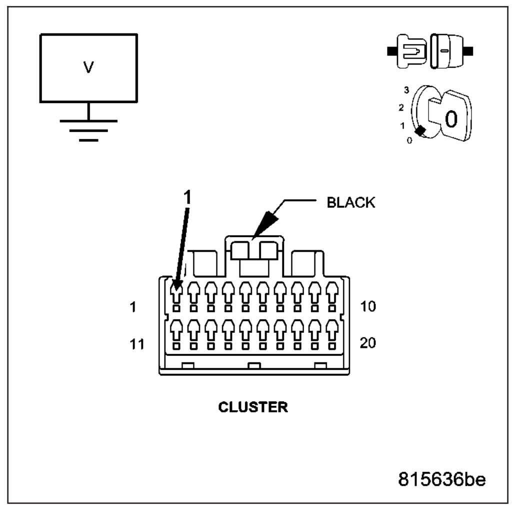
## Diagnostic Test

### 1. (A908) FUSED B(+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

Measure the voltage between the (A908) Fused B(+) circuit and ground.

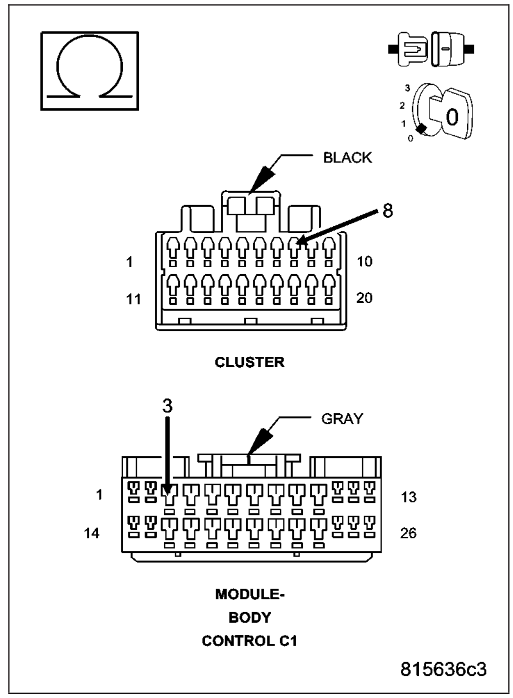


**Is the voltage above 10.5 volts?**

**Yes** >> Go To 2

**No** >> Repair the (A908) Fused B(+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 2. (G150) INSTRUMENT CLUSTER WAKE UP SIGNAL CIRCUIT OPEN



Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

Disconnect the BCM C1 harness connector.

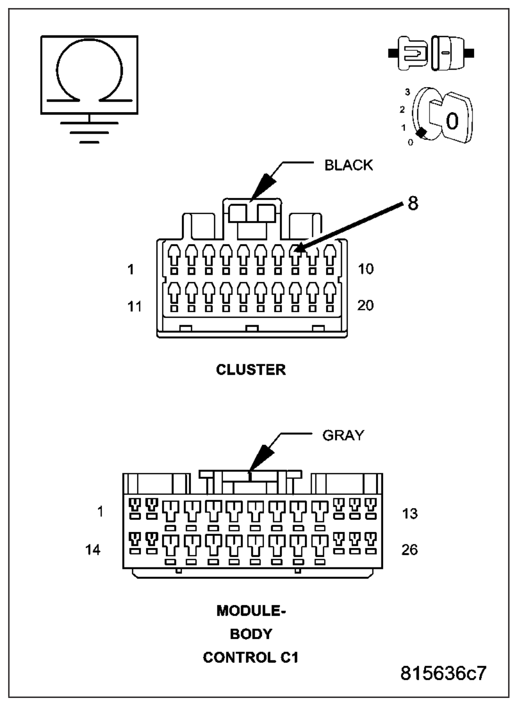
Measure the resistance of the (G150) Instrument Cluster Wake Up Signal circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (G150) Instrument Cluster Wake Up Signal circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. (G150) CLUSTER WAKE UP CIRCUIT SHORT TO GROUND



Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

Disconnect the BCM C1 harness connector.

Measure the resistance between ground and the (G150) Cluster Wake Up circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (G150) Instrument Cluster Wake Up Signal circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. BODY CONTROL MODULE

Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

Ensure that the BCM C1 harness connector is connected.

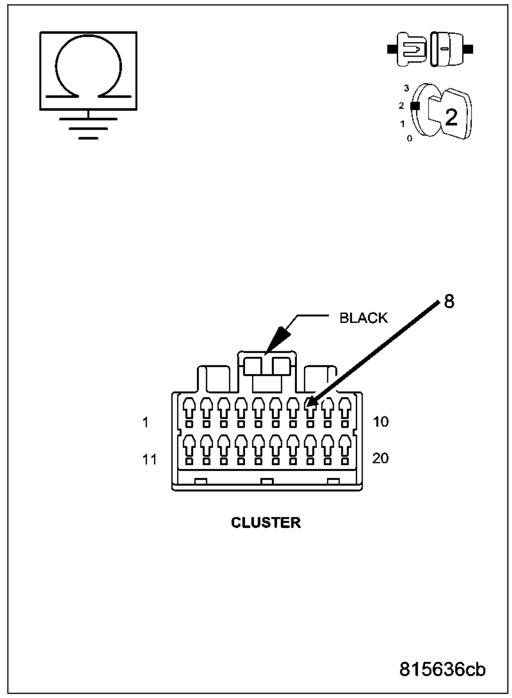
Install a DVOM between the Cluster Wake Up circuit of the Instrument Cluster harness connector and ground.

Set the DVOM to read resistance.

Turn the ignition on.

With the scan tool, select Body Control Module, then Actuators.

Observe the DVOM while using the scan tool to actuate the Cluster Wake Up ″on.″



**Did the DVOM indicate a brief (2 second) continuity to ground?**

**Yes** >> Go To 5

**No** >> Replace and program the Body Control Module in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 5. INSTRUMENT CLUSTER

Turn the ignition off.

Ensure that the Instrument Cluster and BCM C1 harness connectors are connected.

Open the driver door or actuate the High Beam Headlamps with the key off.

With the scan tool, read DTCs.

**Did this DTC reset?**

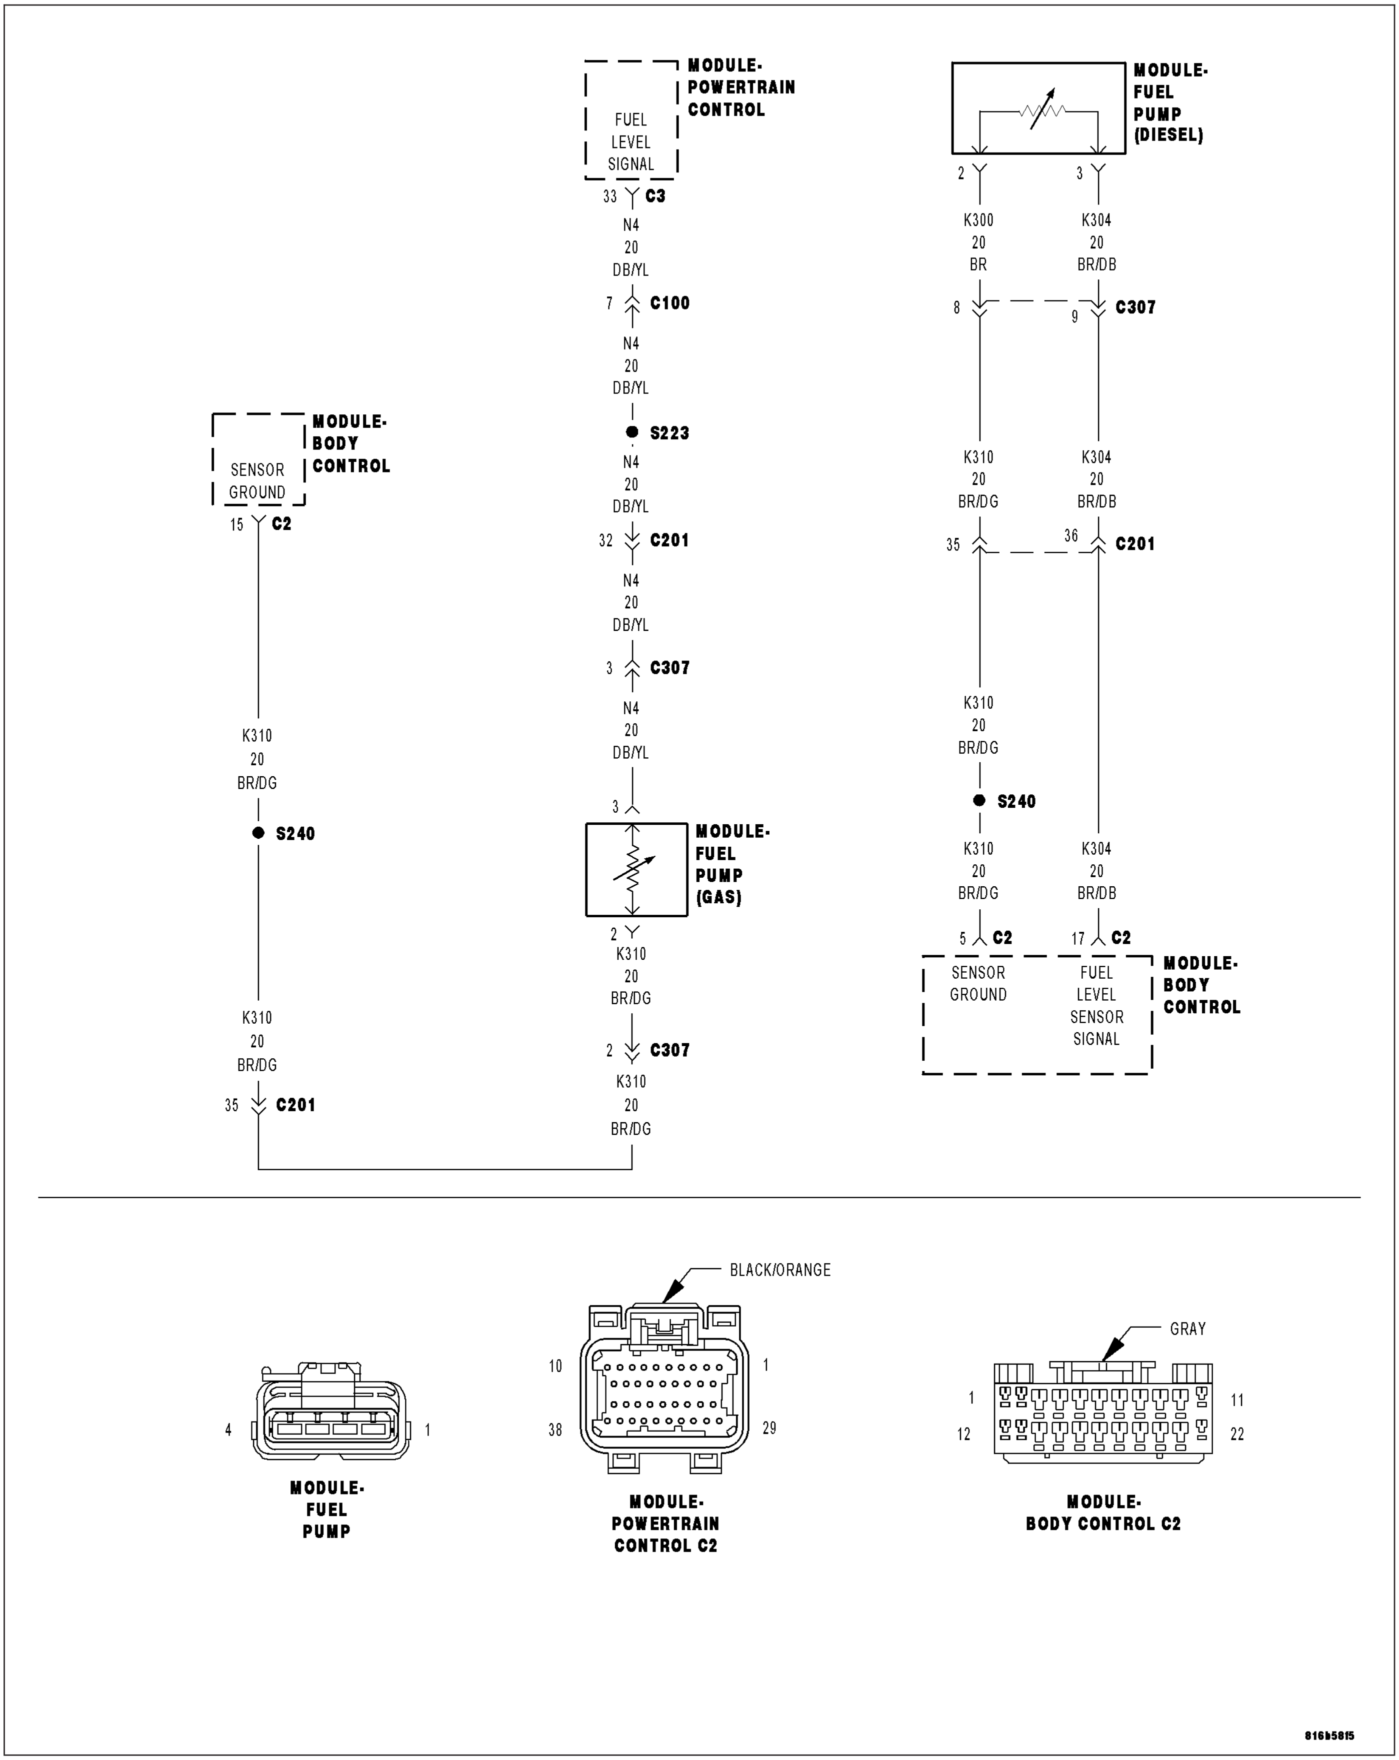
**Yes** >> Replace and configure the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> The condition is not present at this time. Monitor scan tool DTCs while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## FUEL SENSOR FAULTED LOW (BCM)



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition on and battery voltage above 10.4 volts.
- **Set Condition:**
  The fuel level sensor signal voltage goes below 0.0196 of a volt for more than 90 seconds.

| Possible Causes |
| --- |
| FUEL LEVEL SENSOR VOLTAGE BELOW 0.0196 OF A VOLT |
| FUEL LEVEL SENSOR |
| (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO GROUND |
| (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT |
| PCM |

## Diagnostic Test

### 1. FUEL LEVEL SENSOR VOLTS BELOW 0.0196 VOLT

Ignition on, engine not running.
With the scan tool, read DTCs and record the related Freeze Frame data.
With the scan tool, read the Fuel Level Sensor voltage.

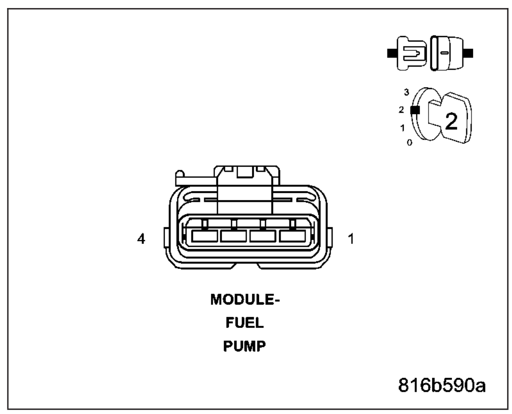
**Is the Fuel Level Sensor voltage below 0.0196 of a volt?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Symptom (Diagnostic Procedure).
Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. FUEL LEVEL SENSOR

Turn the ignition off.
Disconnect the Fuel Pump Module harness connector.
Ignition on, engine not running.
With the scan tool, read the Fuel Level Sensor voltage.



**Did the Fuel Level Sensor voltage change from below 0.4 of a volt to above 4.0 volts?**

**Yes** >> Replace the Fuel Level Sensor in accordance with the Service Information.
Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

### 3. DETERMINE VEHICLE ENGINE TYPE

**What type of engine is the vehicle equipped with?**

**Gas** >> Go To 4

**Gas (ESP)**
Go To 7

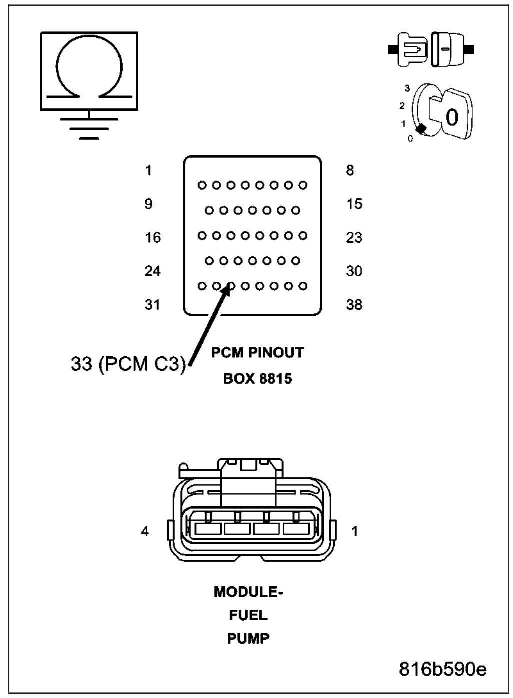
**Diesel**
Go To 10

## 4. (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 and C3 PCM harness connectors.

Measure the resistance between ground and the (N4) Fuel Level Signal circuit at the Fuel Level Sensor harness connector.



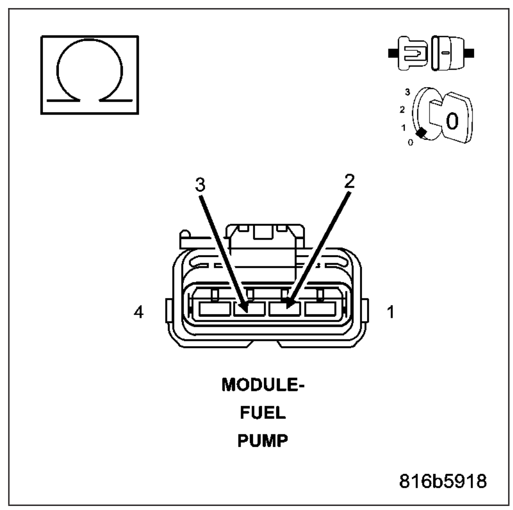
**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (N4) Fuel Level Signal circuit.
Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND

Measure the resistance between the (N4) Fuel Level Signal circuit and the (K900) Sensor ground circuit at the Fuel Pump Module harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short between the (K900) Sensor ground and the (N4) Fuel Level Signal circuit.
Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Powertrain Control Module per Service Information.

Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 7. (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the BCM C2 harness connectors.

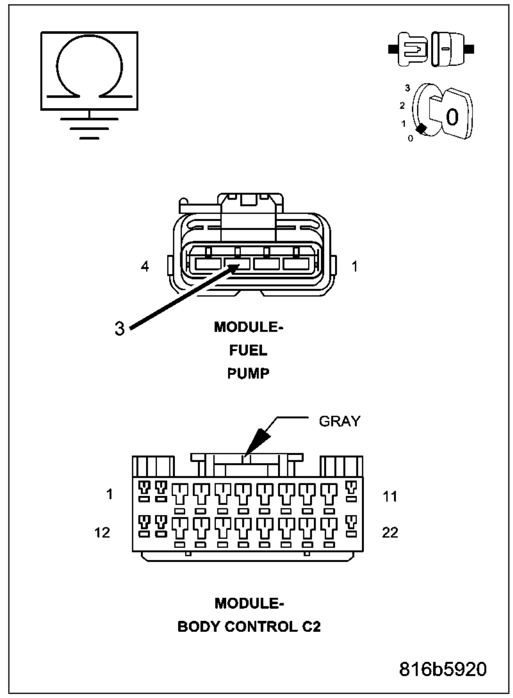
Measure the resistance between ground and the (N4) Fuel Level Signal circuit at the Fuel Level Sensor harness connector.

**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (N4) Fuel Level Signal circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 8



## 8. (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO THE (K310) SENSOR GROUND

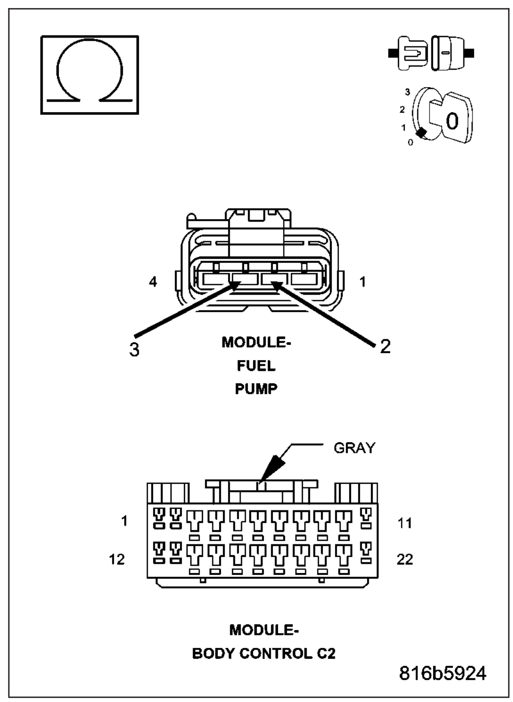
Measure the resistance between the (N4) Fuel Level Signal circuit and the (K310) Sensor ground circuit at the Fuel Pump Module harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short between the (K310) Sensor ground and the (N4) Fuel Level Signal circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 9



## 9. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Body Control Module per Service Information.

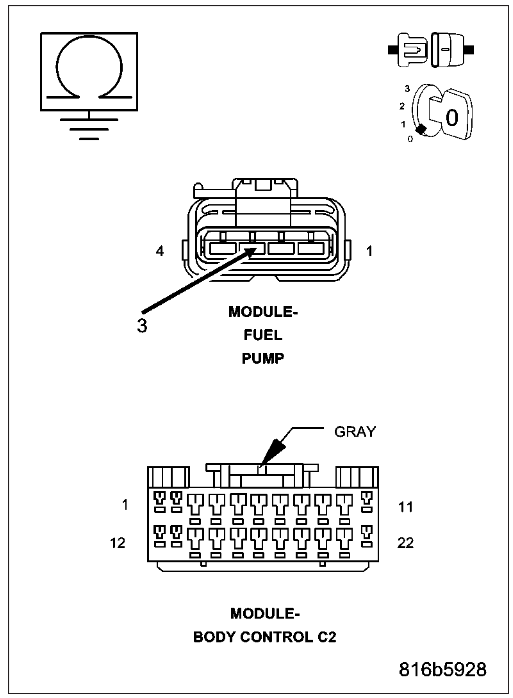
Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 10. (K304) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the BCM C2 harness connectors.

Measure the resistance between ground and the (K304) Fuel Level Signal circuit at the Fuel Level Sensor harness connector.



**Is the resistance below 100 ohms?**

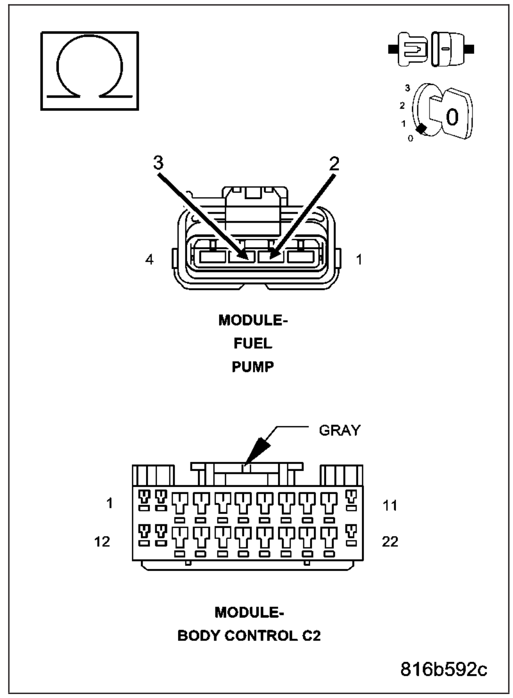
**Yes** >> Repair the short to ground in the (K304) Fuel Level Signal circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 11

## 11. (K304) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND

Measure the resistance between the (K304) Fuel Level Signal circuit and the (K300) Sensor ground circuit at the Fuel Pump Module harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short between the (K300) Sensor ground and the (N304) Fuel Level Signal circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 12

## 12. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

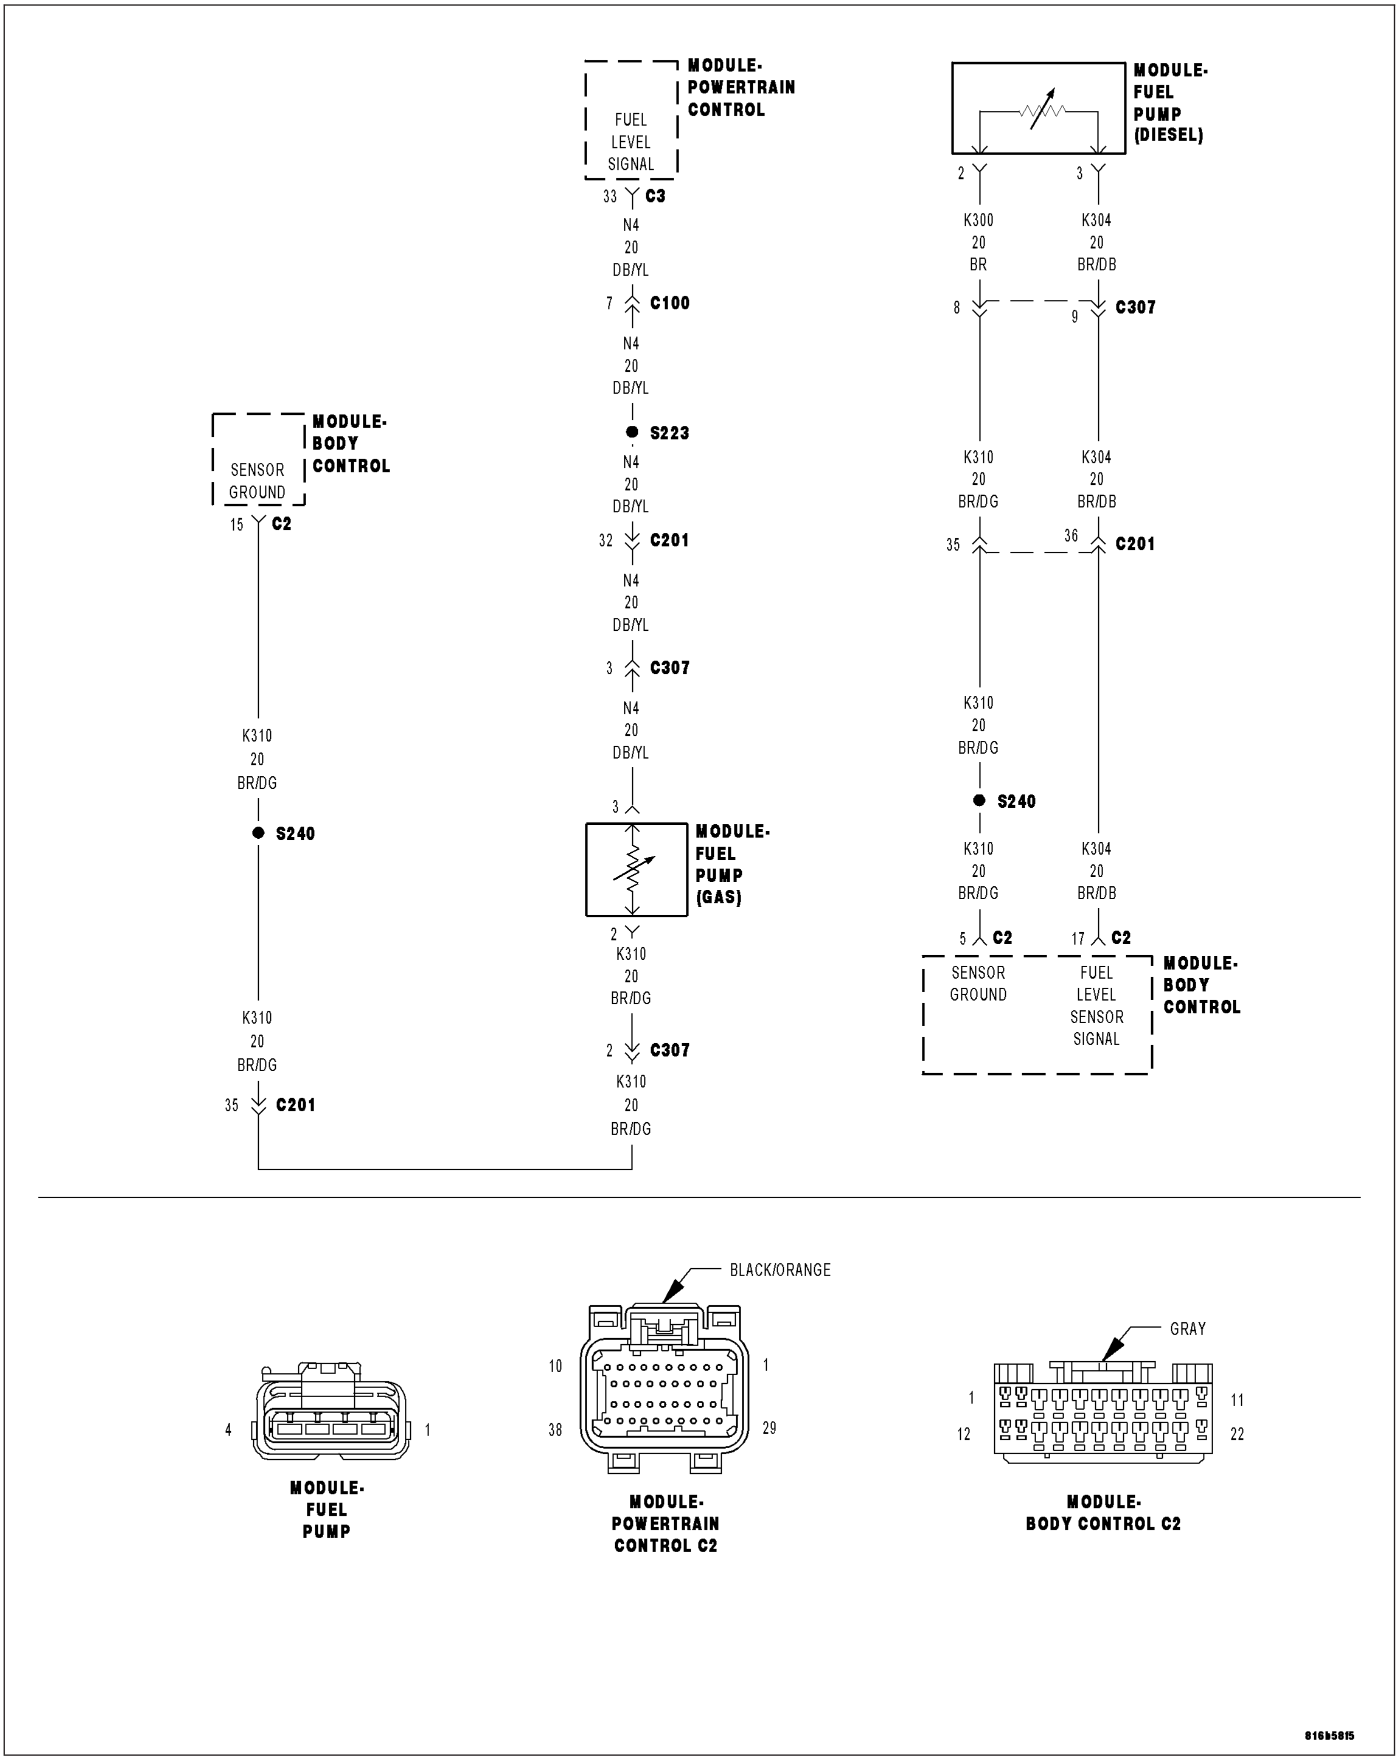
**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Powertrain Control Module per Service Information.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## FUEL SENSOR FAULTED HIGH (BCM)



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition on and battery voltage above 10.4 volts.
- **Set Condition:**
  The fuel level sensor signal voltage at the PCM goes above 4.9 volts for more than 90 seconds.

| Possible Causes |
|---|
| FUEL LEVEL SENSOR VOLTAGE ABOVE 4.9 VOLTS |
| FUEL LEVEL SENSOR |
| (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| (N4) FUEL LEVEL SIGNAL CIRCUIT OPEN |
| (K900) SENSOR GROUND CIRCUIT OPEN |
| PCM |

## Diagnostic Test

### 1. FUEL LEVEL SENSOR VOLTAGE ABOVE 4.9 VOLTS

Ignition on, engine not running.

With the scan tool, read the Fuel Level Sensor voltage.

**Is the Fuel Level Sensor voltage above 4.9 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Symptom (Diagnostic Procedure).
Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. FUEL LEVEL SENSOR

Turn the ignition off.

Disconnect the Fuel Pump Module electrical harness connector.

Connect a jumper wire between the (N4) Fuel Level Signal circuit and the (K900) Sensor ground circuit at the Fuel Pump Module harness connector.

Ignition on, engine not running.

With the scan tool, read the Fuel Level Sensor voltage.

**NOTE: Remove the jumper wire before continuing.**

**Did the Fuel Level Sensor voltage change from above 4.8 volts to below 0.4 of a volt?**

**Yes** >> Replace the Fuel Level Sensor.
Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

### 3. DETERMINE VEHICLE ENGINE TYPE

**What type of engine is the vehicle equipped with?**

**Gas** >> Go To 4

**Gas (ESP)**
Go To 8

**Diesel**
Go To 12

## 4. (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO VOLTAGE

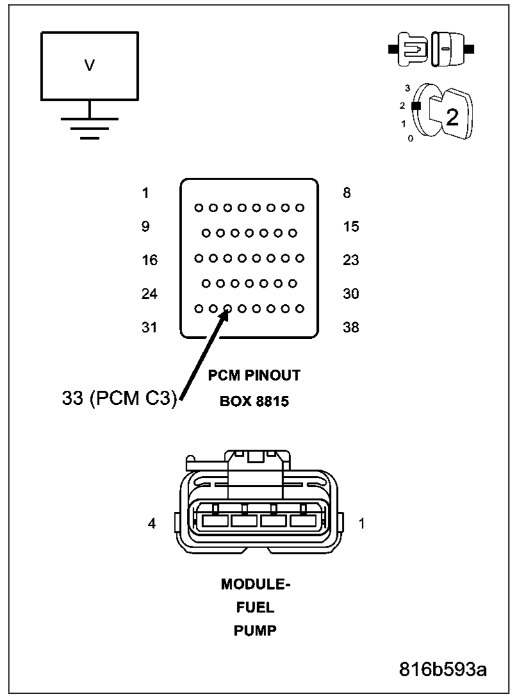
Turn the ignition off.

Disconnect the C2 and C3 PCM harness connectors.

**WARNING: When the engine is operating, do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing.**

Ignition on, engine not running.

Measure the voltage on the (N4) Fuel Level Signal circuit at the Fuel Pump Module harness connector.



**Is the voltage above 5.3 volts?**

**Yes** >> Repair the short to voltage in the (N4) Fuel Level Signal circuit.

Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

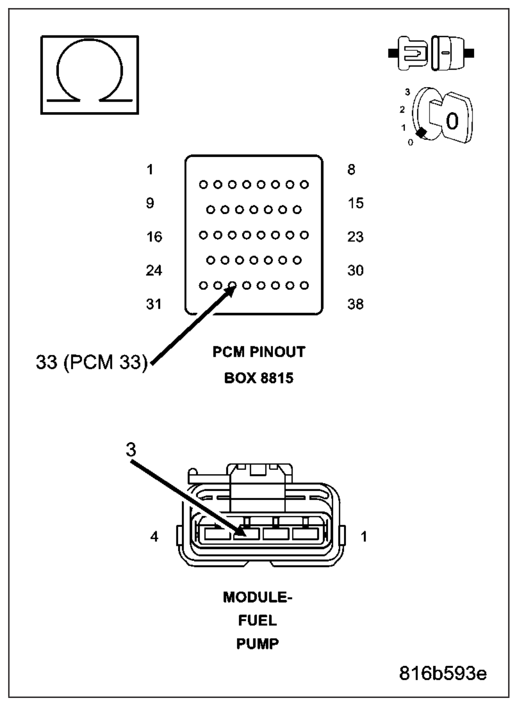
**No** >> Go To 5

## 5. (N4) FUEL LEVEL SIGNAL CIRCUIT OPEN

Turn the ignition off.

**CAUTION: Do not probe the pcm harness connectors. Probing the pcm harness connectors will damage the pcm terminals resulting in poor terminal to pin connection. Install miller special tool #8815 to perform diagnosis.**

Measure the resistance of the (N4) Fuel Level Signal circuit from the Fuel Pump Module harness connector to the appropriate terminal in Miller Special Tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

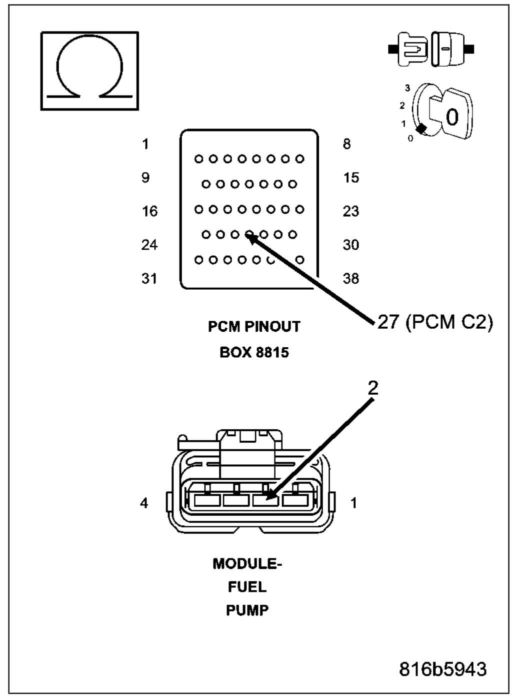
**No** >> Repair the open in the (N4) Fuel Level Signal circuit.

Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 6. (K900) SENSOR GROUND CIRCUIT OPEN

**CAUTION: Do not probe the pcm harness connectors. Probing the pcm harness connectors will damage the pcm terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K900) Sensor ground circuit from the Fuel Pump Module harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the open in the (K900) Sensor ground circuit.
Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 7. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Powertrain Control Module per Service Information.

Perform POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 8. (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED BATTERY TO VOLTAGE

Turn the ignition off.

Disconnect the BCM C2 harness connectors.

Ignition on, engine not running.

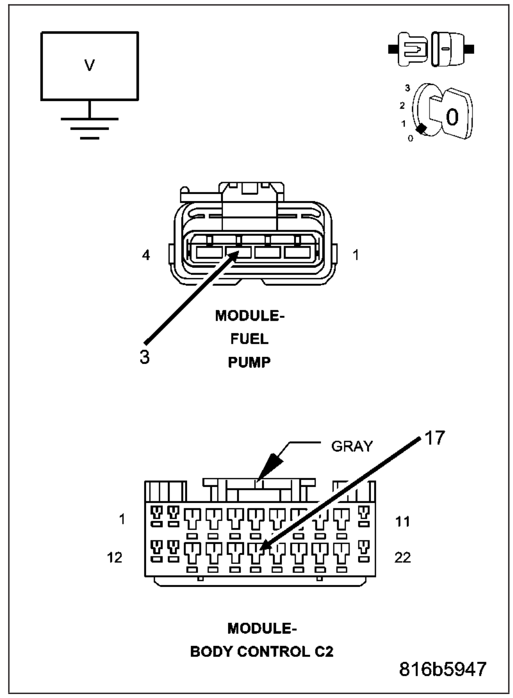
Measure the voltage on the (N4) Fuel Level Signal circuit at the Fuel Pump Module harness connector.

**Is the voltage above 5.3 volts?**

**Yes** >> Repair the short to voltage in the (N4) Fuel Level Signal circuit.

Perform BODY VERIFICATION TEST VER -1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 9



## 9. (N4) FUEL LEVEL SIGNAL CIRCUIT OPEN

Turn the ignition off.

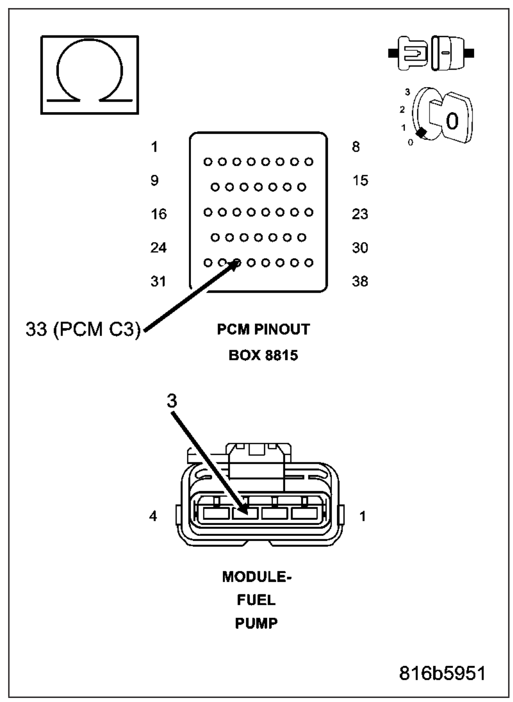
Measure the resistance of the (N4) Fuel Level Signal circuit from the Fuel Pump Module harness connector to the appropriate terminal in Miller Special Tool #8815.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 10

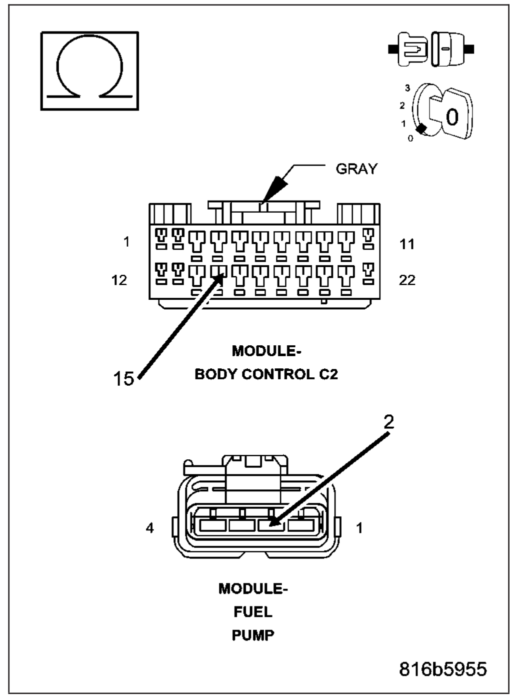
**No** >> Repair the open in the (N4) Fuel Level Signal circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 10. (K310) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (K310) Sensor ground circuit from the Fuel Pump Module harness connector to the appropriate terminal of Miller Special Tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 11

**No** >> Repair the open in the (K310) Sensor ground circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 11. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

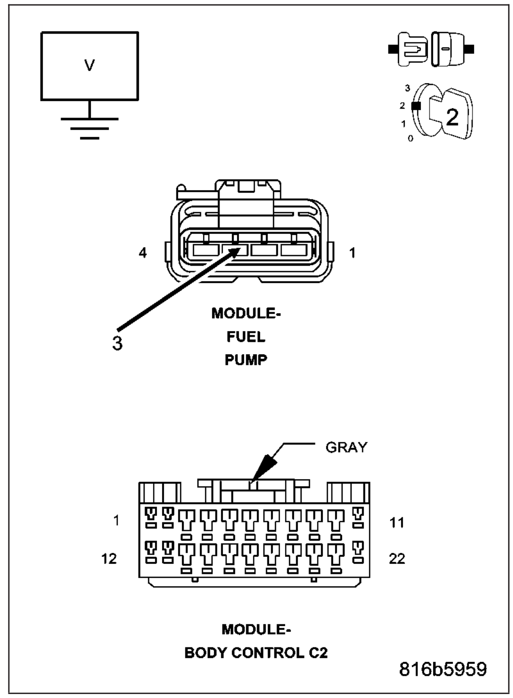
**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Body Control Module per Service Information.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 12. (N4) FUEL LEVEL SIGNAL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the BCM C2 harness connectors.

Ignition on, engine not running.

Measure the voltage on the (N4) Fuel Level Signal circuit at the Fuel Pump Module harness connector.

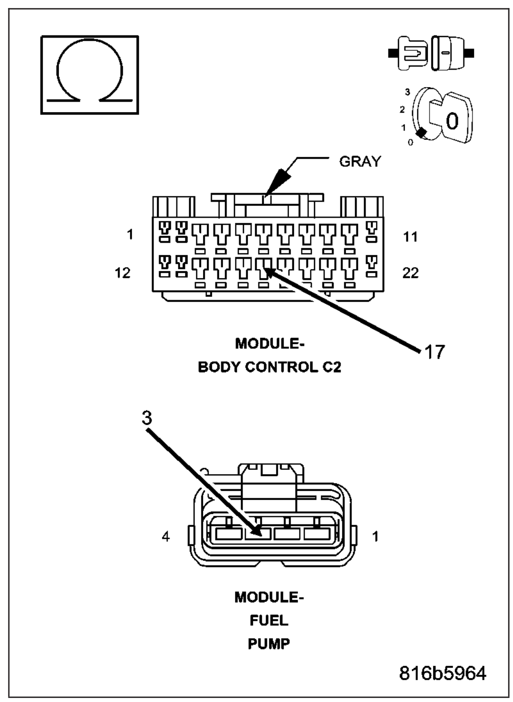
**Is the voltage above 5.3 volts?**

**Yes** >> Repair the short to voltage in the (N4) Fuel Level Signal circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. (K304) FUEL LEVEL SIGNAL CIRCUIT OPEN



Turn the ignition off.

Measure the resistance of the (K304) Fuel Level Signal circuit from the Fuel Pump Module harness connector to the appropriate terminal in Miller Special Tool #8815.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 14

**No** >> Repair the open in the (K304) Fuel Level Signal circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 14. (K300) SENSOR GROUND CIRCUIT OPEN

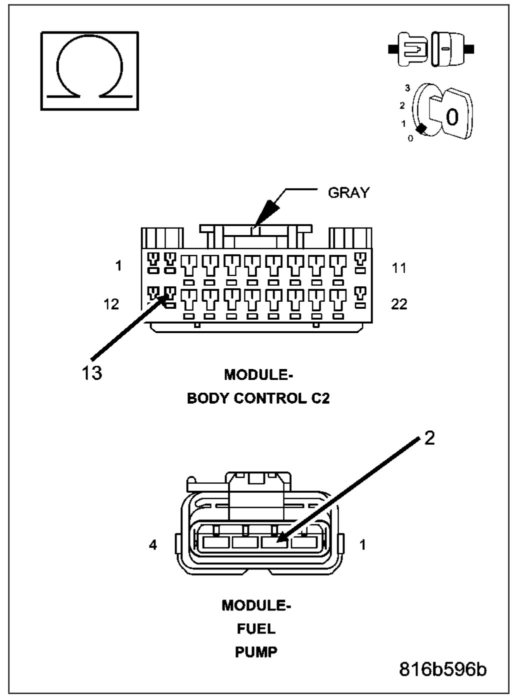
Measure the resistance of the (K300) Sensor ground circuit from the Fuel Pump Module harness connector to the appropriate terminal of Miller Special Tool #8815.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 15

**No** >> Repair the open in the (K300) Sensor ground circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 15. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Body Control Module per Service Information.

Perform BODY VERIFICATION TEST VER - 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## INTERNAL MODULE FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The instrument cluster detects an internal failure.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

With the scan tool, read DTCs.

**When this code is set, the Instrument Cluster must be replaced.**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## NO ABS BUS MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects no ABS bus messages for 6 continuous seconds. The cluster will illuminate the ABS warning indicator.

| Possible Causes |
|---|
| NO RESPONSE - PCI BUS - CAB MODULE |
| INTERMITTENT CONDITION |

## Diagnostic Test

### 1. NO RESPONSE - PCI BUS - CAB MODULE

Turn the ignition on.

With the scan tool, attempt to communicate with the CAB module.

**Was the scan tool able to I/D or communicate with the CAB module?**

**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to the COMMUNICATION category for the related symptom(s). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## NO BCM BUS MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects no BCM bus message for 6 seconds.

| Possible Causes |
|---|
| NO RESPONSE - PCI BUS - BCM |
| INTERMITTENT CONDITION |

## Diagnostic Test

### 1. NO RESPONSE - PCI BUS - BCM

Turn the ignition on.

With the scan tool, attempt to communicate with the BCM.

**Was the scan tool able to I/D or communicate with the BCM?**

**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to the COMMUNICATION category for the related symptom(s).

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## NO EVIC/TPM BUS MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects no EVIC/TPM bus messages for 6 seconds.

| Possible Causes |
|---|
| NO RESPONSE - EVIC/TPM |
| INTERMITTENT CONDITION |

## Diagnostic Test

### 1. NO RESPONSE - EVIC/TPM

Turn the ignition on.

With the scan tool, attempt to communicate with the EVIC/TPM.

**Was the scan tool able to I/D or communicate with the EVIC/TPM?**

**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to the COMMUNICATION category for the related symptom(s).

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## NO ORC BUS MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects no ORC bus message for 6 seconds. The cluster will illuminate the Airbag warning indicator.

| Possible Causes |
|---|
| NO RESPONSE - PCI BUS - ORC |
| INTERMITTENT CONDITION |

### Diagnostic Test

#### 1. NO RESPONSE - PCI BUS - ORC

Turn the ignition on.

With the scan tool, attempt to communicate with the ACM.

**Was the scan tool able to I/D or communicate with the ACM?**

**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to the COMMUNICATION category for the related symptom(s).

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## NO PCI BUS MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects no PCI Bus messages for 4 continuous seconds. The VF will display ″no bus.″ The cluster will illuminate the ABS, Fuel, Airbag, and MIL warning indicators. All gauge needles will default to the lowest indication.

| Possible Causes |
|---|
| NO RESPONSE - PCI BUS |
| INTERMITTENT CONDITION |
| NO RESPONSE - PCI BUS - INSTRUMENT CLUSTER |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. NO RESPONSE - PCI BUS

Turn the ignition on.

**NOTE: When the Instrument Cluster detects no PCI Bus, the VF will display ″no bus″.**
With the scan tool, attempt to communicate with other modules on the PCI Bus.

**Was the scan tool able to communicate with other modules?**

**Yes** >> Go To 2

**No** >> Refer to the COMMUNICATION category for the related symptom(s).
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. NO RESPONSE - PCI BUS - INSTRUMENT CLUSTER

Turn the ignition on.

With the scan tool, select System Monitors, then J1850 Module Scan.

**Does the scan tool display MIC PRESENT on the BUS?**

**Yes** >> Go To 3

**No** >> Refer to symptom ″No Response from Instrument Cluster in the Communication″ category.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 3. INSTRUMENT CLUSTER

With the scan tool, erase DTCs.

Cycle the ignition and wait approximately 1 minute.

With the scan tool, read DTCs.

**Did this DTC reset?**

**Yes** >> Replace the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## NO PCM BUS MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects no PCM bus message for 20 seconds. The cluster will illuminate the MIL indicator.

| Possible Causes |
|---|
| NO RESPONSE - PCI BUS - PCM |
| INTERMITTENT CONDITION |

## Diagnostic Test

### 1. NO RESPONSE - PCI BUS - PCM

Turn the ignition on.

With the scan tool, attempt to communicate with the PCM.

**Was the scan tool able to I/D or communicate with the PCM?**

**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to the COMMUNICATION category for the related symptom(s).

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## NO SKIM BUS MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run/Start position.
- **Set Condition:**
  The Instrument Cluster detects no SKIM bus message for 20 seconds.

| Possible Causes |
|---|
| NO RESPONSE - PCI BUS - SKIM |
| INTERMITTENT CONDITION |

## Diagnostic Test

### 1. NO RESPONSE - PCI BUS - SKIM

Turn the ignition on.

**NOTE: Ensure that the vehicle is equipped with the SKIM feature before proceeding with this test.**
With the scan tool, attempt to communicate with the SKIM module.

**Was the scan tool able to I/D or communicate with the SKIM module?**

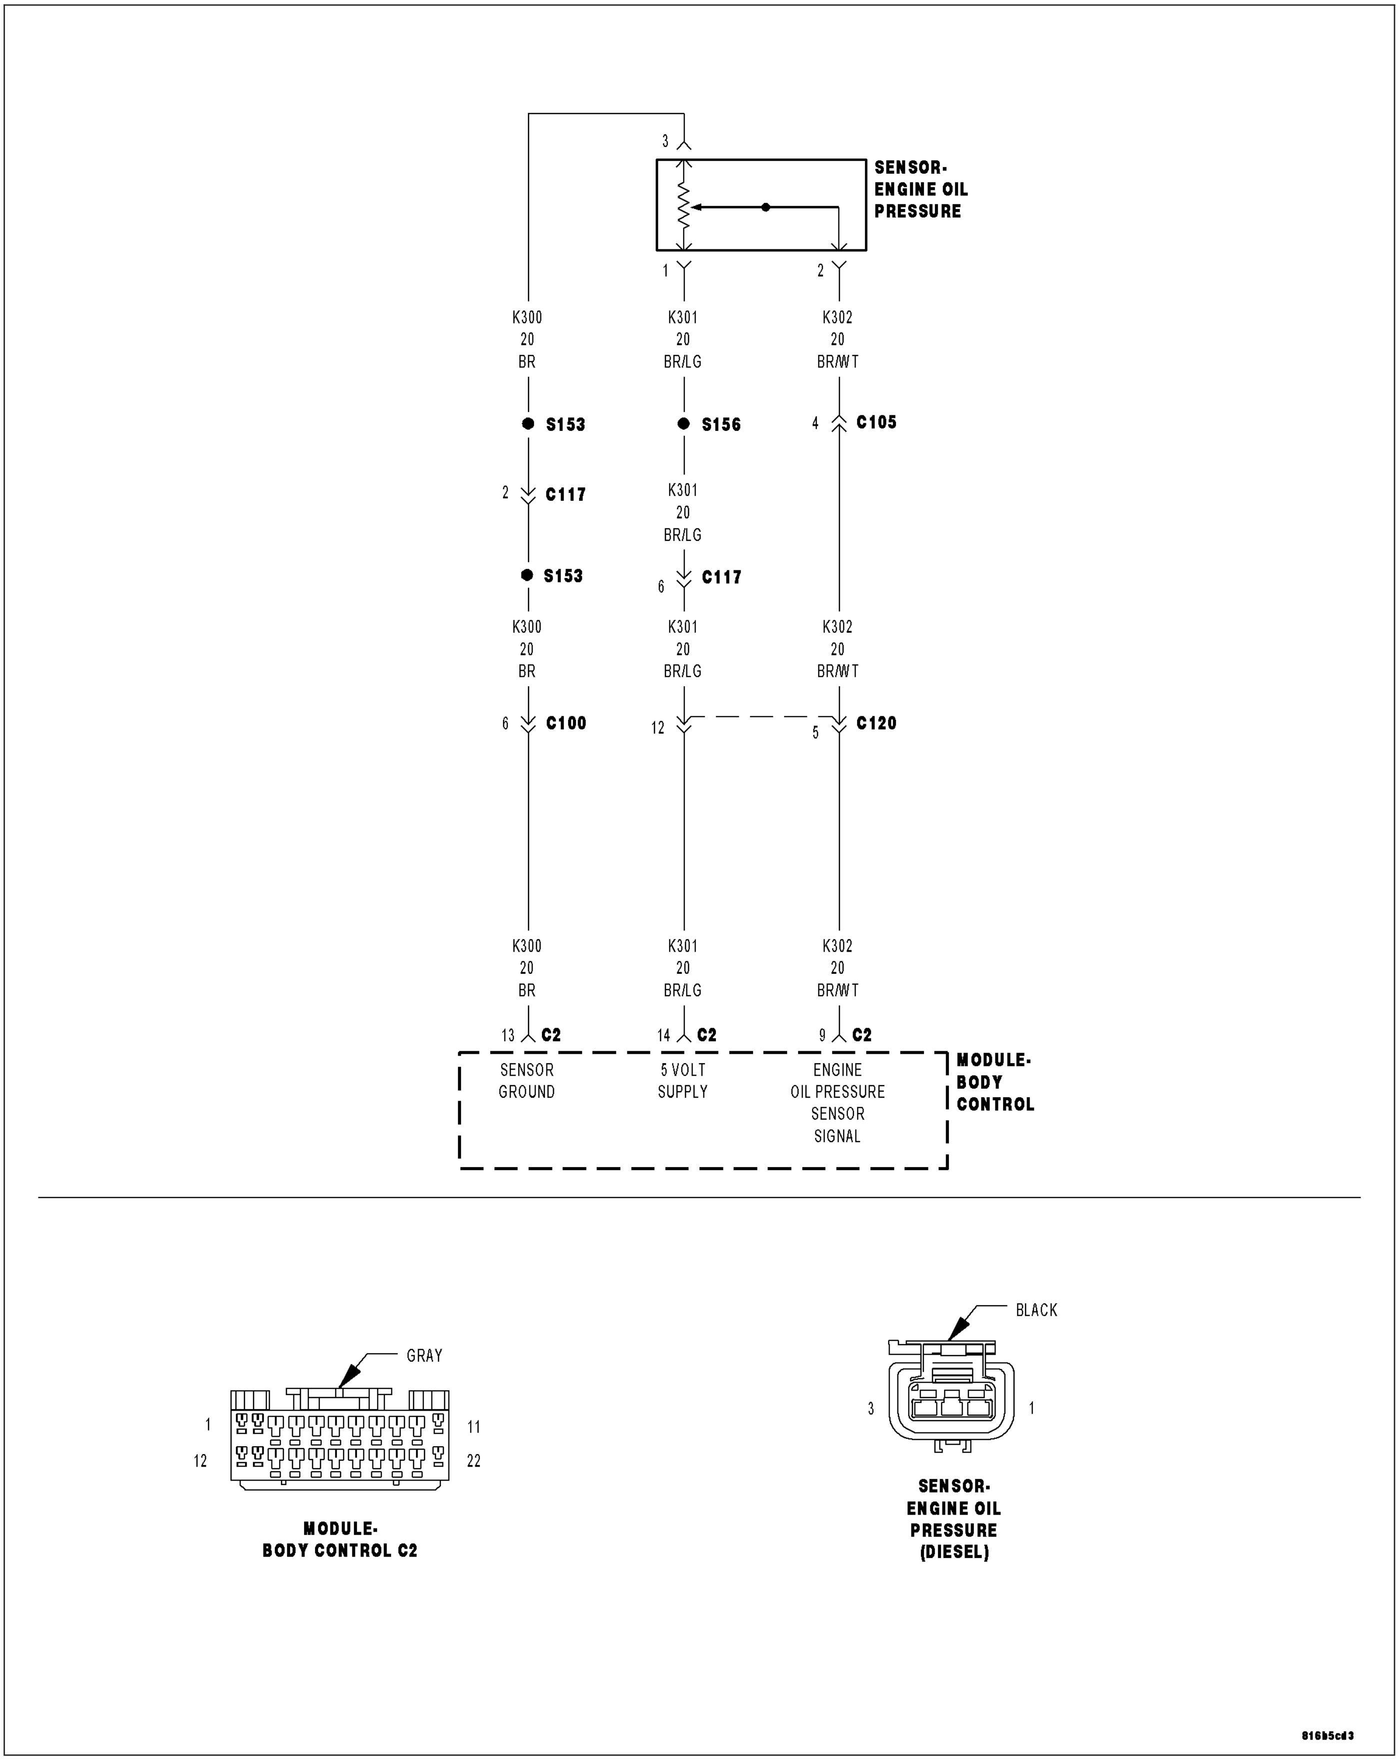
**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to the COMMUNICATION category for the related symptom(s).

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## OIL PRESSURE SENSOR FAULTED HIGH



For a complete wiring diagram **Refer to Section 8W**.

## Diagnostic Test

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Oil Pressure Sensor voltage high.

| Possible Causes |
|---|
| (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT OPEN |
| (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT OPEN |
| (K300) SENSOR GROUND CIRCUIT OPEN |
| OIL PRESSURE SENSOR |
| POWERTRAIN CONTROL MODULE (PCM) |

## Diagnostic Test

### 1. OIL PRESSURE SENSOR VOLTAGE ABOVE 4.92 VOLTS

Start the engine.

With a scan tool, read the Oil Pressure Sensor voltage.

**Is the voltage above 4.92 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. OIL PRESSURE SENSOR

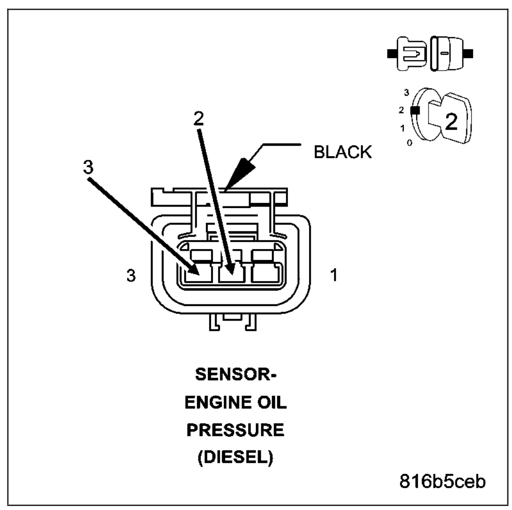
Turn the ignition off.

Disconnect the Oil Pressure Sensor harness connector.

Connect a jumper wire between the (K302) Oil Pressure Sensor Signal circuit and the (K300) Sensor ground circuit in the Sensor harness connector.

Ignition on, engine not running.

With a scan tool, monitor the Oil Pressure Sensor voltage.



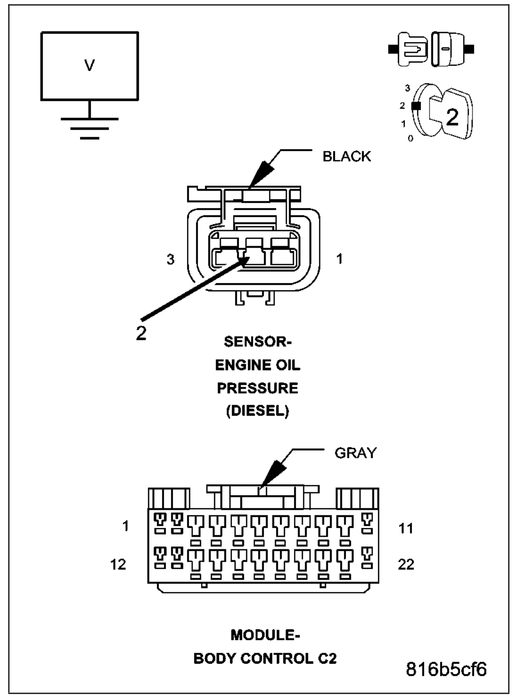
**Is the voltage below 1.0 volt with the jumper wire installed?**

**Yes** >> Replace the Oil Pressure Sensor.
Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

**NOTE: Remove the jumper wire before continuing.**

## 3. (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE



Turn the ignition off.

Disconnect the BCM C2 harness connector.

Ignition on, engine not running.

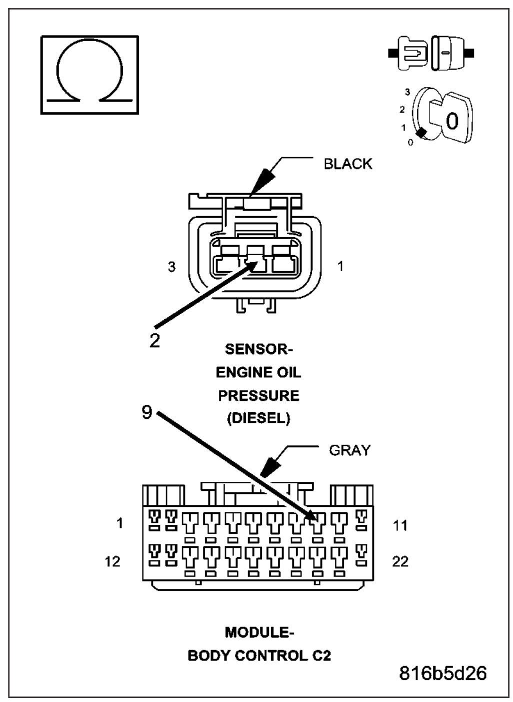
Measure the voltage on the (K302) Oil Pressure Sensor Signal circuit in the Oil Pressure Sensor harness connector.

**Is the voltage above 5.2 volts?**

**Yes** >> Repair the short to battery voltage in the (K302) Oil Pressure Sensor Signal circuit.
Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT OPEN



Turn the ignition off.

Measure the resistance of the (K302) Oil Pressure Sensor Signal circuit.

**Is the resistance below 5.0 ohms?**

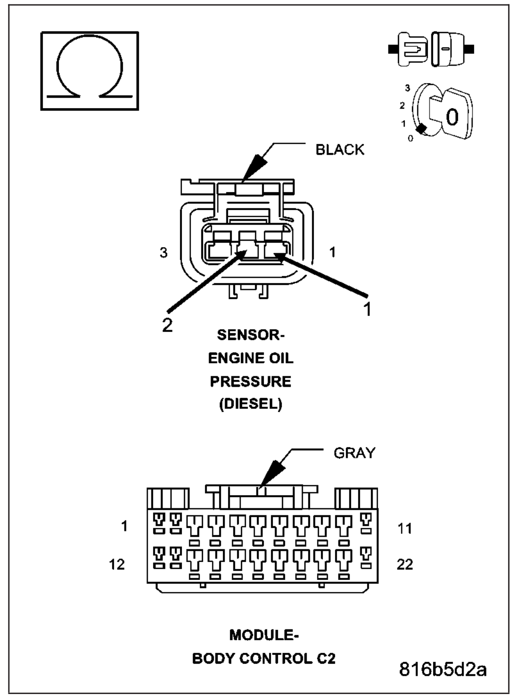
**Yes** >> Go To 5

**No** >> Repair the open in the (K302) Oil Pressure Sensor Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 5. (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K301) 5–VOLT SUPPLY CIRCUIT

Disconnect the BCM C2 harness connector.

Measure the resistance between the (K302) Oil Pressure Sensor Signal circuit and the (K301) 5-volt Supply circuit in the Oil Pressure Sensor harness connector.



**Is the resistance below 100 ohms?**

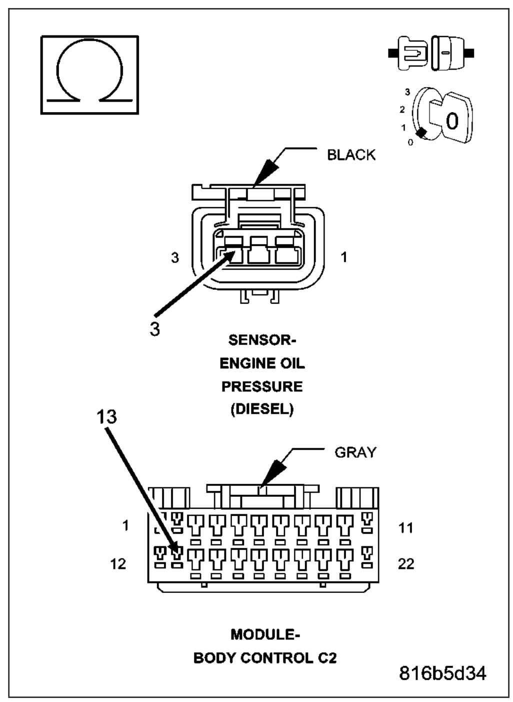
**Yes** >> Repair the short between the (K301) 5-volt Supply circuit and the (K302) Oil Pressure Sensor Signal circuit.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (K300) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (K300) Sensor ground circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the open in the (K300) Sensor ground circuit.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 7. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

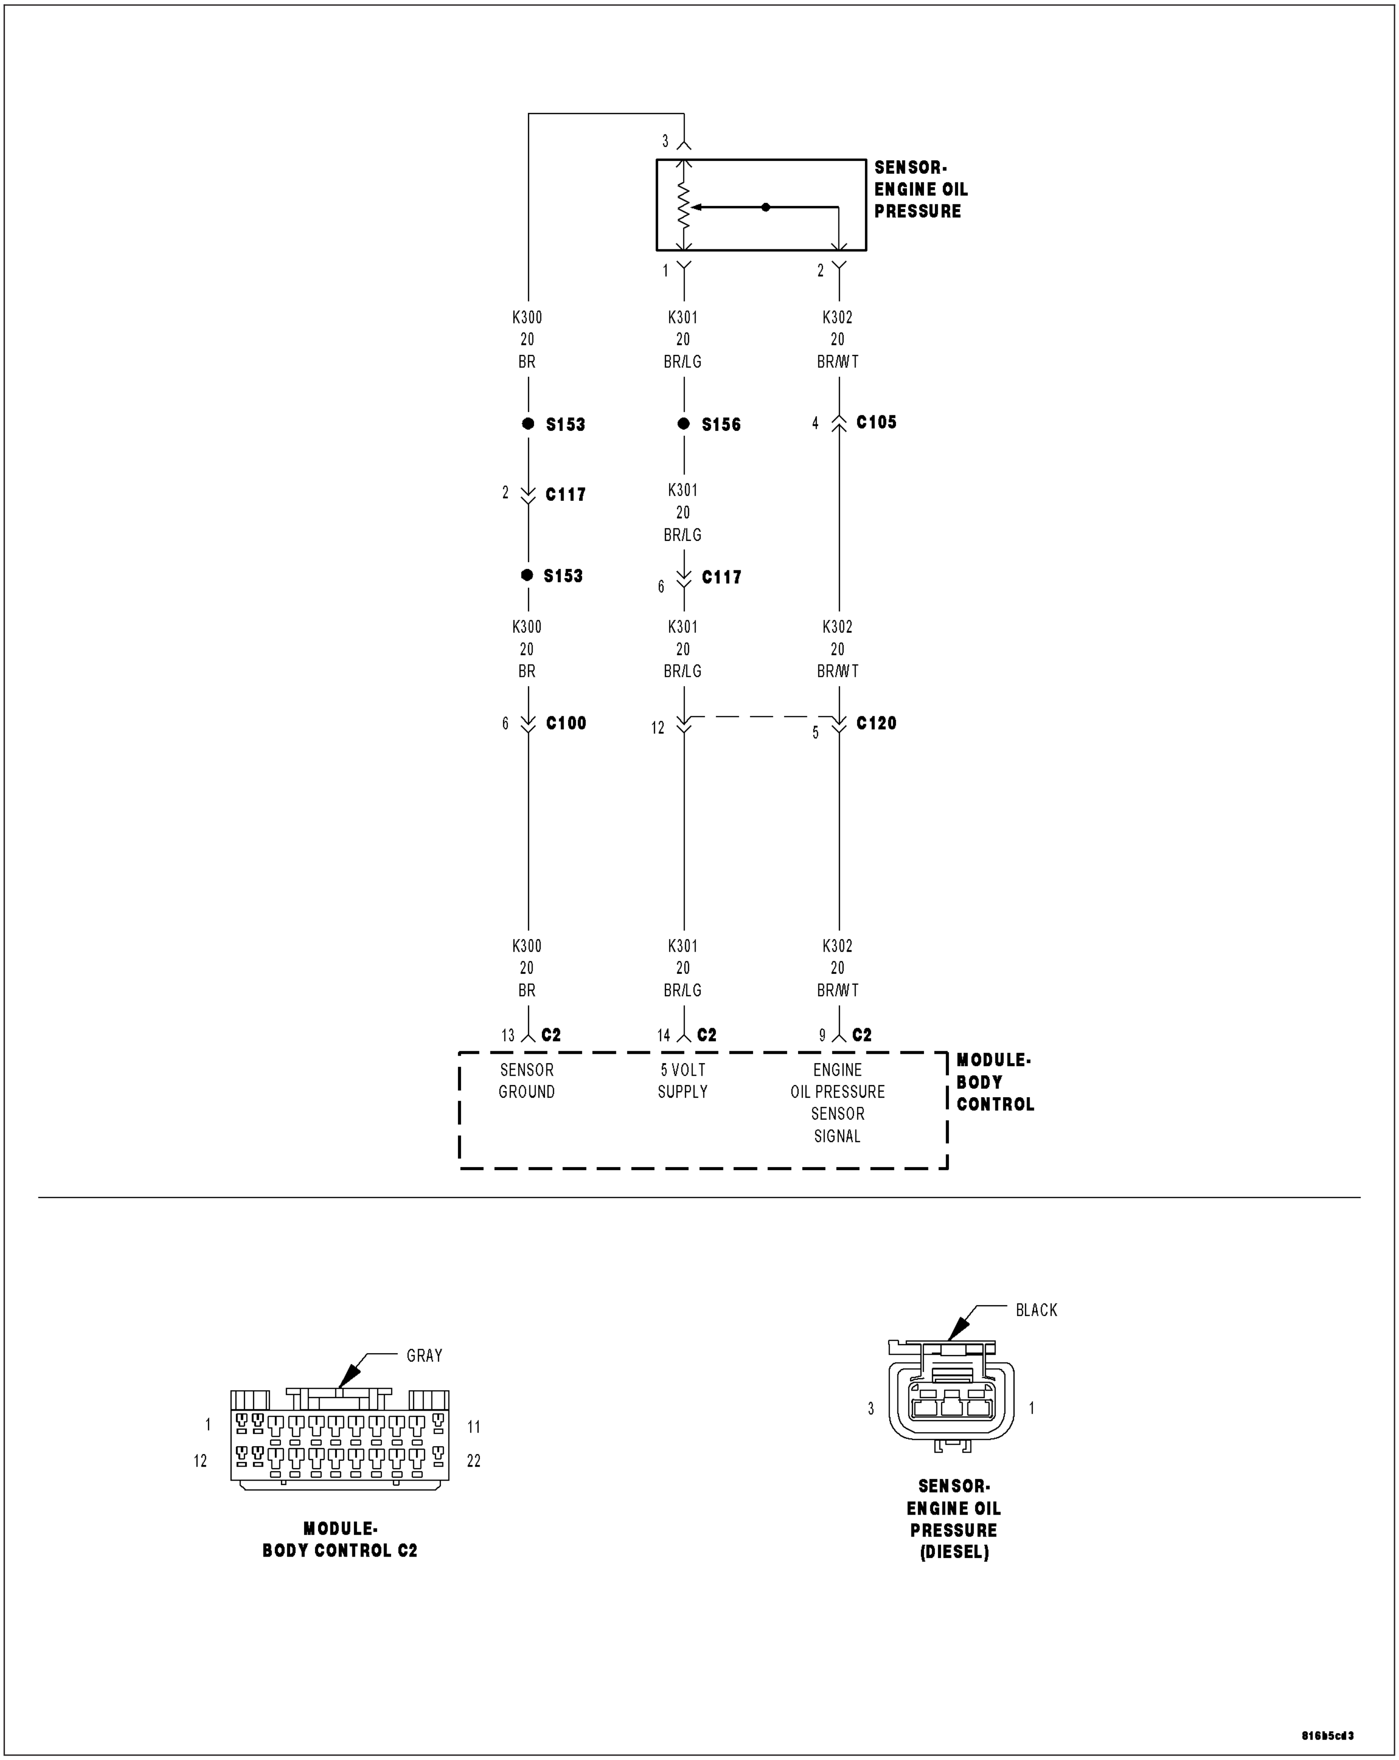
**Yes** >> Repair as necessary.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## OIL PRESSURE SENSOR FAULTED LOW (BCM)



For a complete wiring diagram **Refer to Section 8W**.

## Diagnostic Test

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Oil Pressure Sensor voltage low.

| Possible Causes |
|---|
| (K301) 5-VOLT SUPPLY CIRCUIT |
| (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND |
| (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT |
| (K301) 5-VOLT SUPPLY CIRCUIT OPEN |
| (K301) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND |
| OIL PRESSURE SENSOR |
| BCM |

## Diagnostic Test

### 1. OIL SENSOR VOLTAGE BELOW 0.08 OF A VOLT

Ignition on, engine not running.

With a scan tool, read the MAP Sensor voltage.

**Is the voltage below 0.08 of a volt?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

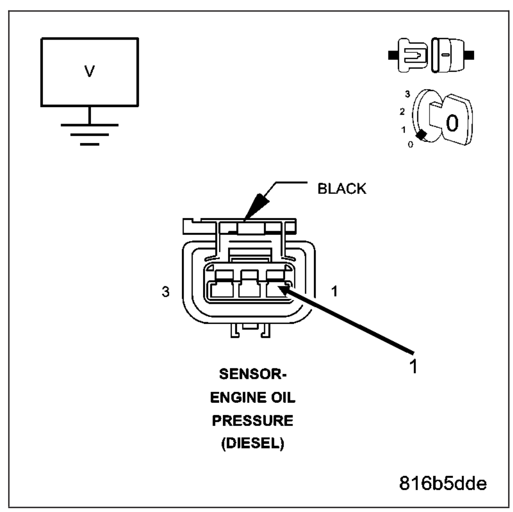
### 2. (K301) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Oil Pressure Sensor harness connector.

Ignition on, engine not running.

Measure the voltage on the (K301) 5-volt Supply circuit in the Oil Pressure Sensor harness connector.



**Is the voltage between 4.5 to 5.2 volts?**

**Yes** >> Go To 3

**No** >> Go To 6

## 3. OIL PRESSURE SENSOR

With a scan tool, monitor the Oil Pressure Sensor voltage with the Sensor harness connector disconnected.

**Is the voltage above 4.5 volts?**

**Yes** >> Replace the Oil Pressure Sensor.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

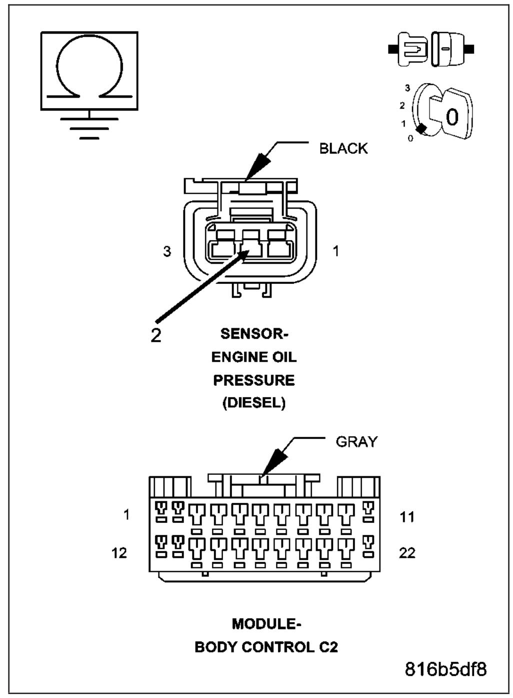
**No** >> Go To 4

## 4. (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the BCM C2 harness connector.

Measure the resistance between ground and the (K302) Oil Pressure Sensor Signal circuit in the Oil Pressure Sensor harness connector.



**Is the resistance below 100 ohms?**

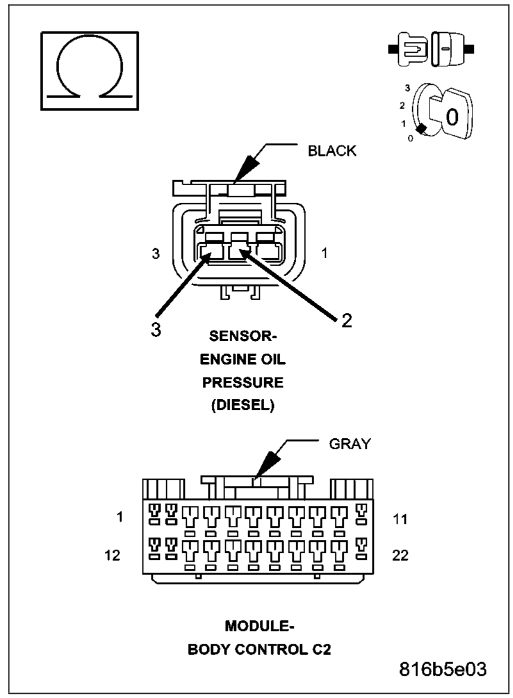
**Yes** >> Repair the short to ground in the (K302) Oil Pressure Sensor Signal circuit.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (K302) OIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT

Measure the resistance between the (K302) Oil Pressure Sensor Signal circuit and the (K300) Sensor ground circuit in the Oil Pressure Sensor harness connector.



**Is the resistance below 100 ohms?**

**Yes** >> Repair the short between the (K302) Oil Pressure Sensor Signal circuit and the (K300) Sensor ground circuit.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

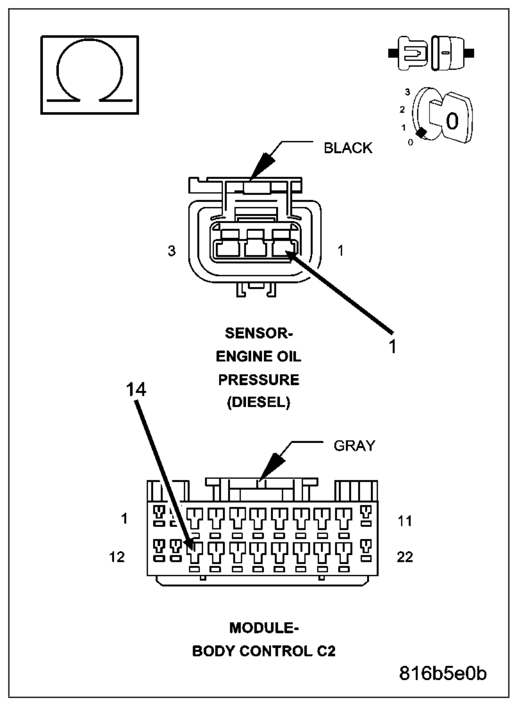
**No** >> Go To 6

## 6. (K301) 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.

Disconnect the BCM C2 harness connector.

Measure the resistance of the (K301) 5-volt Supply circuit.



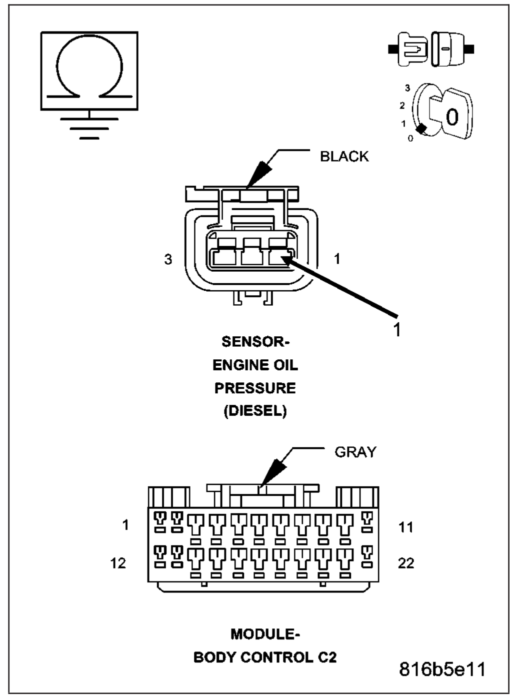
**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the open in the (K301) 5-volt Supply circuit.

Perform the BODY VERIFICATION TEST VER. 1 (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 7. (K301) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K301) 5-volt Supply circuit in the Oil Pressure Sensor harness connector.

**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (K301) 5-volt Supply circuit.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and program the BODY Control Module per Service Information.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## TIRE SIZE NOT PROGRAMMED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the battery is connected.
- **Set Condition:**
  Tire size is not programmed to a valid size. The default condition for a new BCM is un-programmed. The BCM must be programmed with a valid tire size or the speedometer will default to Zero and this code will set.

| Possible Causes |
|---|
| PROGRAM TIRE SIZE |

## Diagnostic Test

### 1. PROGRAM TIRE SIZE

With the scan toolin Body Computer, select Miscellaneous, then select Program Tire Size.

Program the appropriate tire size.

With the scan tool, erase DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, read DTCs.

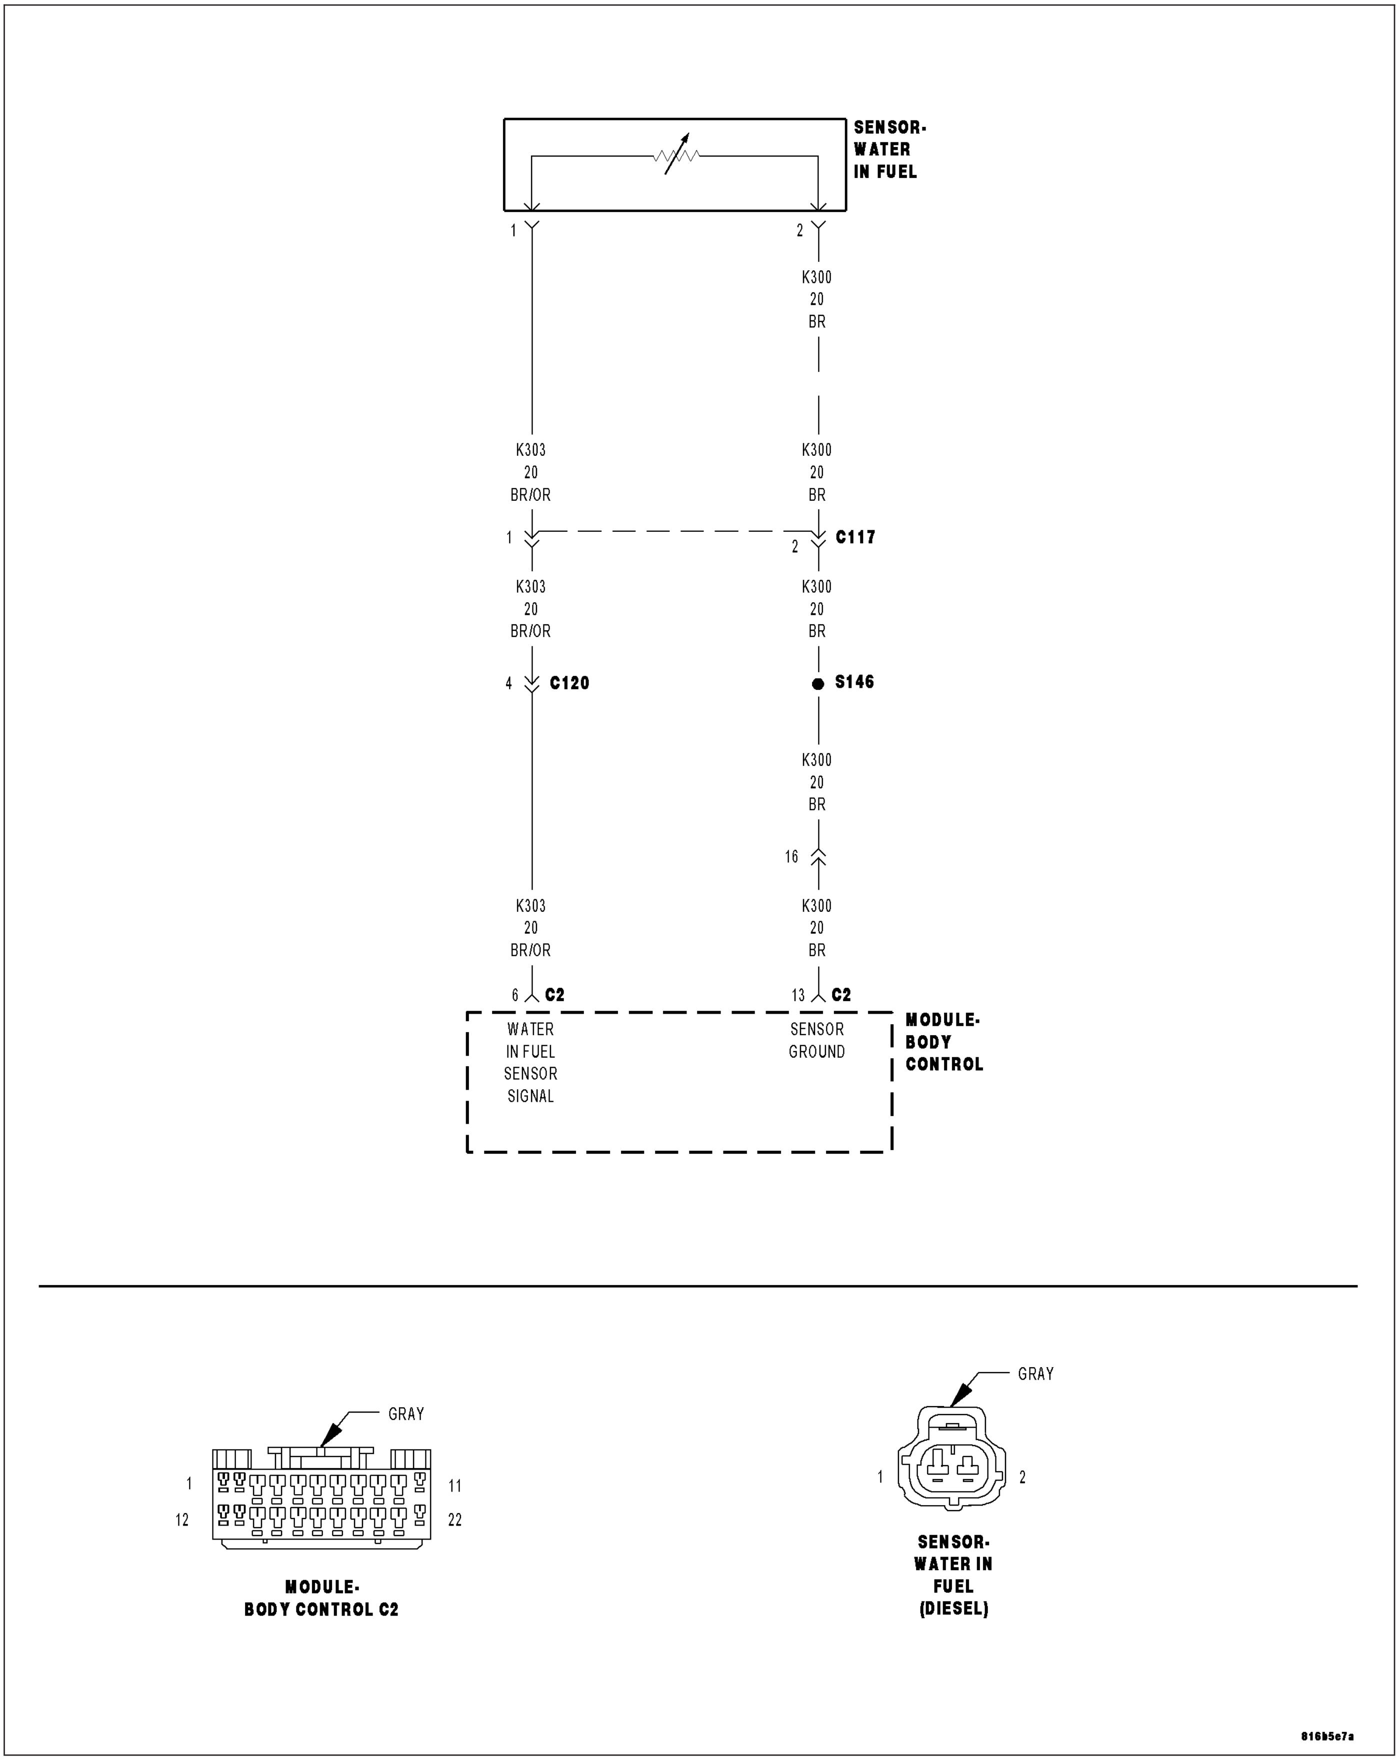
**Did this DTC reset?**

**Yes** >> Replace and program the Body Control Module in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## WATER IN FUEL SENSOR FAULTED HIGH (BCM)



For a complete wiring diagram **Refer to Section 8W**.

## Diagnostic Test

- **When Monitored:**
  With the Ignition on.
- **Set Condition:**
  The BCM detects a High condition on the Water In Fuel Sensor Signal Circuit.

| **Possible Causes** |
|---|
| (K303) WATER IN FUEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE |
| (K303) WATER IN FUEL SENSOR SIGNAL CIRCUIT OPEN |
| (K300) SENSOR GROUND CIRCUIT OPEN |
| BCM |
| WATER IN FUEL SENSOR |

## Diagnostic Test

### 1. WATER IN FUEL SENSOR

Turn the ignition off.

Disconnect the Water In Fuel Sensor harness connector.

Connect a jumper wire between the (K303) and (K300) circuits at the Water In Fuel Sensor harness connector.

Turn the ignition on.

**NOTE: Check connectors - Clean/repair as necessary.**

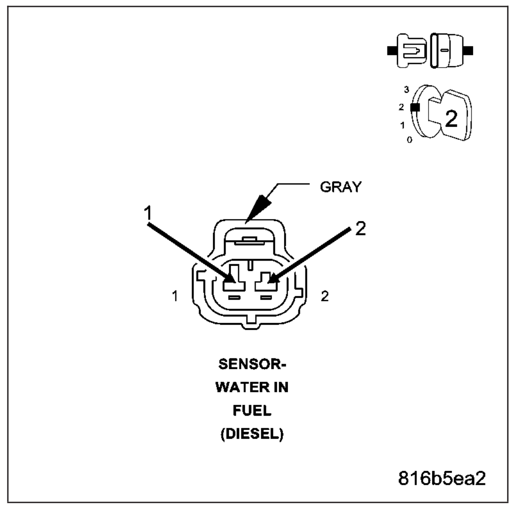
With the scan tool, check DTCs.

**Does the scan tool display: WATER IN FUEL SENSOR FAULTED HIGH?**

**Yes** >> Replace the Water In Fuel Sensor.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2



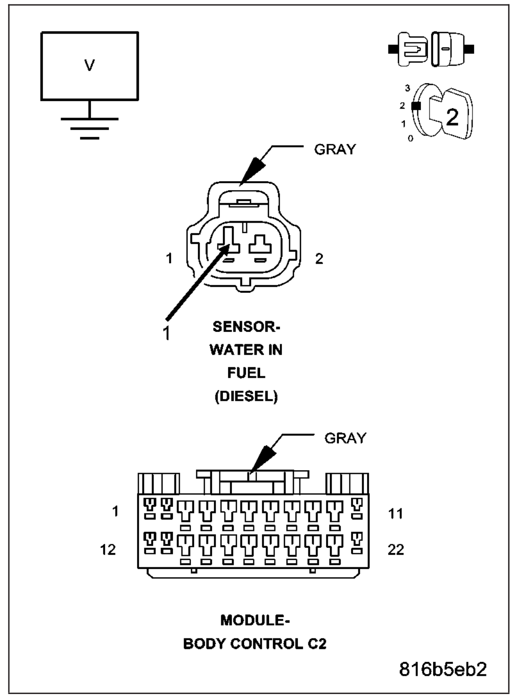
## 2. (K303) WATER IN FUEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the BCM C2 harness connectors.

Ignition on, engine not running.

Measure the voltage on the (K303) Water In Fuel Sensor Signal circuit.



**Is the voltage above 5.3 volts?**

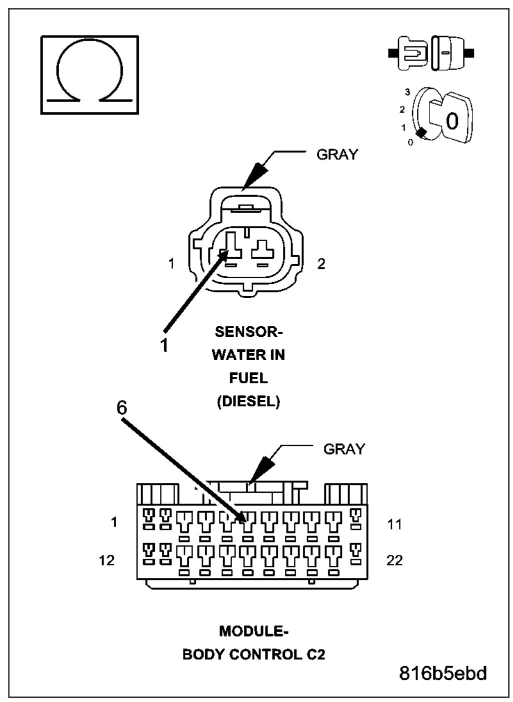
**Yes** >> Repair the short to voltage in the (K303) Water In Fuel Sensor Signal circuit.
Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. (K303) WATER IN FUEL SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (K303) Water In Fuel Sensor Signal circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the open in the (K303) Water In Fuel Sensor Signal circuit.
Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 4. (K300) SENSOR GROUND CIRCUIT OPEN

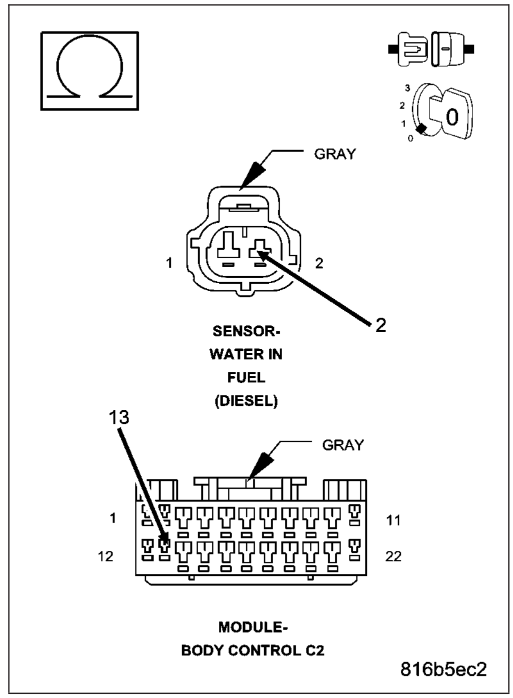
Measure the resistance of the (K300) Sensor ground circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the open in the (K300) Sensor ground circuit.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 5. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

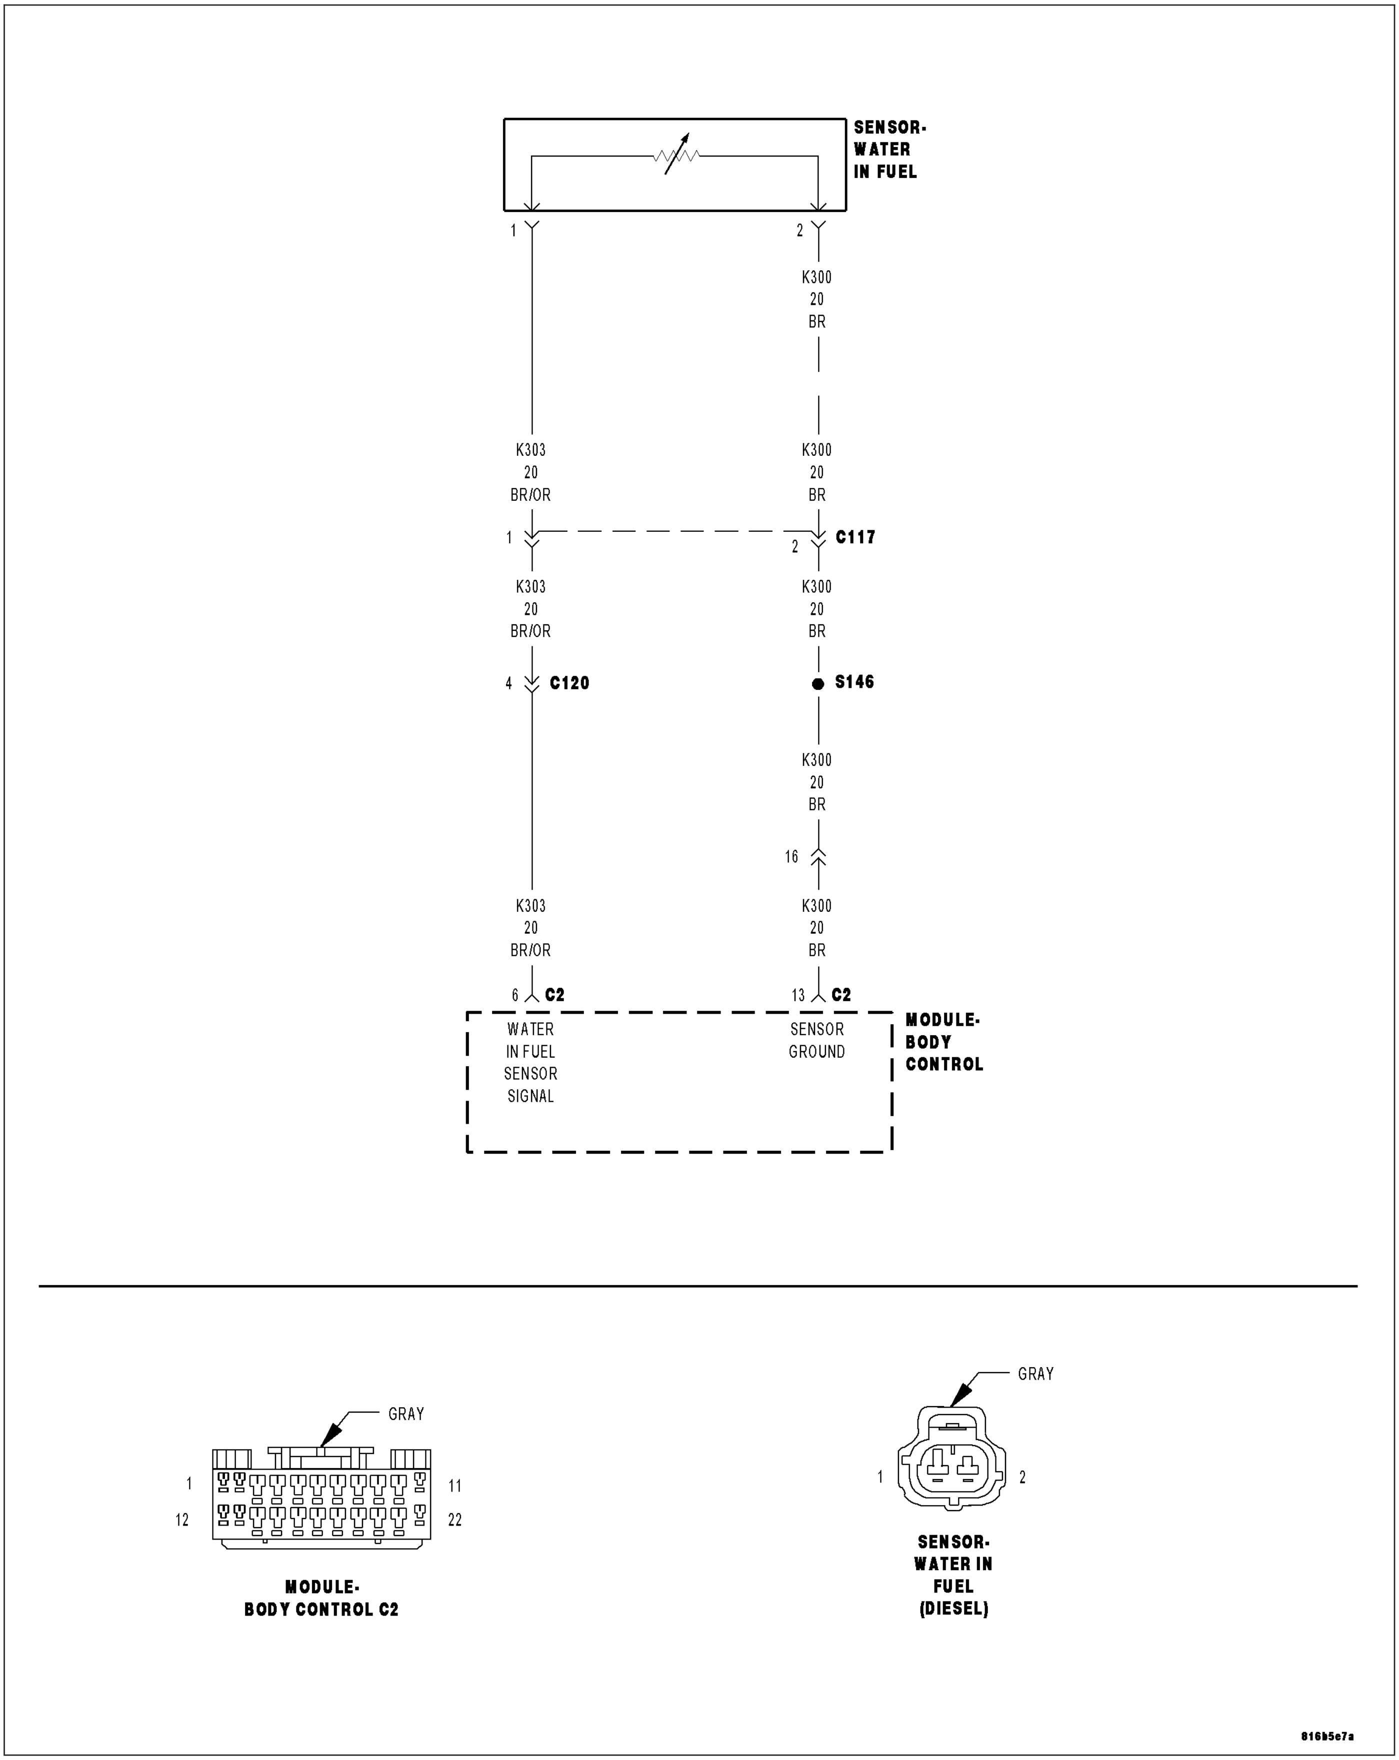
**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Powertrain Control Module per Service Information.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## WATER IN FUEL SENSOR FAULTED LOW (BCM)



For a complete wiring diagram **Refer to Section 8W**.

## Diagnostic Test

- **When Monitored:**
  With the Ignition on.
- **Set Condition:**
  The BCM detects a Low condition on the Water In Fuel Sensor Signal Circuit.

| Possible Causes |
| --- |
| (K303) WATER IN FUEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND |
| (K303) WATER IN FUEL SENSOR SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT |
| WATER IN FUEL SENSOR |
| BCM |

## Diagnostic Test

### 1. WATER IN FUEL SENSOR

Turn the ignition off.

Disconnect the Water in fuel sensor harness connector.

Turn the ignition on.

**NOTE: Check connectors - Clean/repair as necessary.**

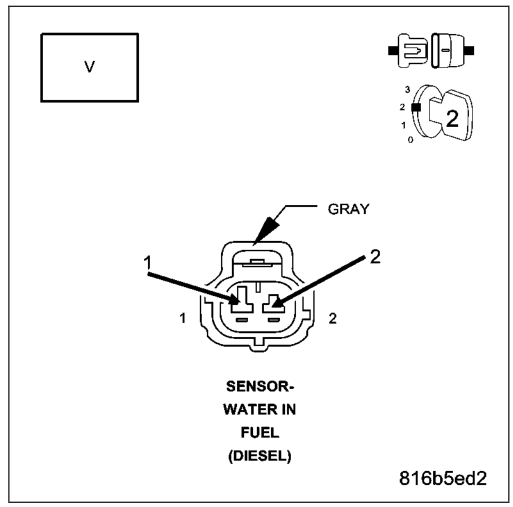
Measure the voltage between the signal circuit and return circuit of the WIF sensor harness connector.

**Is the voltage between 4.5 and 5.5 volts?**

**Yes** >> Replace the Water in fuel sensor.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

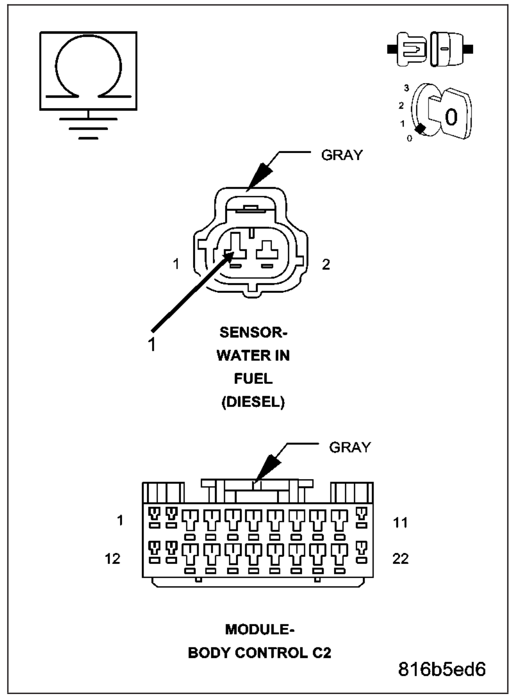


## 2. (K303) WATER IN FUEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Disconnect the BCM C2 connector.

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between ground and the (K303) Water In Fuel Sensor Signal circuit.



**Is the resistance less than 10 ohms?**

**Yes** >> Repair the (K303) Water In Fuel Sensor Signal circuit for a short ground.
Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

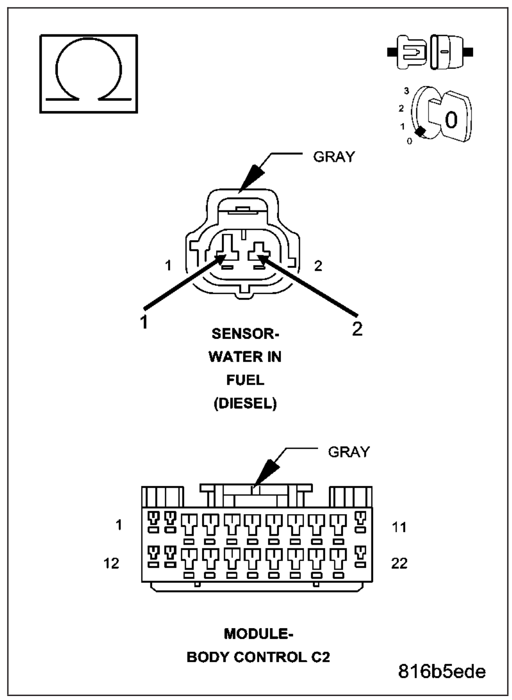
**No** >> Go To 3

## 3. (K303) WATER IN FUEL SENSOR SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT

Disconnect the BCM C2 connector.

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between the (K303) Water In Fuel Sensor Signal circuit and the (K300) Sensor Ground circuit.



**Is the resistance less than 10 ohms?**

**Yes** >> Repair the (K303) Water In Fuel Sensor Signal circuit for a short to the (K300) Sensor Ground circuit.
Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Body Control Module per Service Information.

Perform BODY VERIFICATION TEST VER - 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

# *4WD INDICATOR INACCURATE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| 4WD MODE SENSOR DTC PRESENT |
| INTERMITTENT CONDITION |
| TRANSFER CASE POSITION SENSOR |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. 4WD MODE SENSOR DTC PRESENT

**NOTE: With the scan tool, ensure that the Instrument Cluster is configured for the correct transfer case before proceeding with this test.**
With the scan tool, read DTCs.

**Does the scan tool display any 4WD Mode Sensor DTCs?**

**Yes** >> Refer to the DRIVEABILITY category and perform the appropriate symptom.

**No** >> Go To 2

### 2. INSTRUMENT CLUSTER

Perform the Instrument Cluster Self Test.

Depress and hold the Trip Odometer reset button while turning the ignition from the off to the on position.

**Did the 4WD indicator in question illuminate?**

**Yes** >> Go To 3

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 3. TRANSFER CASE POSITION SENSOR

Turn the ignition on.

With the scan tool in Sensors, read the T-Case Position while moving the transfer case shift lever through all of the positions.

The scan tool should display the following values:

4WD Lo: 0.96 - 1.35 volts

Neutral: 2.39 - 2.76 volts

Full Time: 3.2 - 3.5 volts

Part Time: 3.7 - 4.0 volts

2WD: 4.17 - 4.45 volts

**Is the Transfer Case Position voltage within the specified ranges?**

**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

**No** >> Replace the Transfer Case Position Sensor in accordance with the Service Information.
Perform POWERTRAIN VERIFICATION TEST VER - 2. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

## *4WD INDICATOR INACCURATE - DIESEL ONLY

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| 4WD MODE SENSOR DTC PRESENT |
| INTERMITTENT CONDITION |
| TRANSFER CASE POSITION SENSOR |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. 4WD MODE SENSOR DTC PRESENT

**NOTE: With the scan tool, ensure that the Instrument Cluster is configured for the correct transfer case before proceeding with this test.**
With the scan tool, read DTCs.

**Does the scan tool display any 4WD Mode Sensor DTCs?**

**Yes** >> Refer to the DRIVEABILITY category and perform the appropriate symptom.

**No** >> Go To 2

### 2. INSTRUMENT CLUSTER

Perform the Instrument Cluster Self Test.

Depress and hold the Trip Odometer reset button while turning the ignition from the off to the on position.

**Did the 4WD indicator in question illuminate?**

**Yes** >> Go To 3

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 3. TRANSFER CASE POSITION SENSOR

Turn the ignition on.

With the scan tool in Sensors, read the T-Case Position while moving the transfer case shift lever through all of the positions.

The scan tool should display the following values:

4WD Lo: 0.15 - 0.40 volts

Neutral: 0.68 - 0.98 volts

Full Time: 1.23 - 1.56 volts

Part Time: 1.78 - 2.12 volts

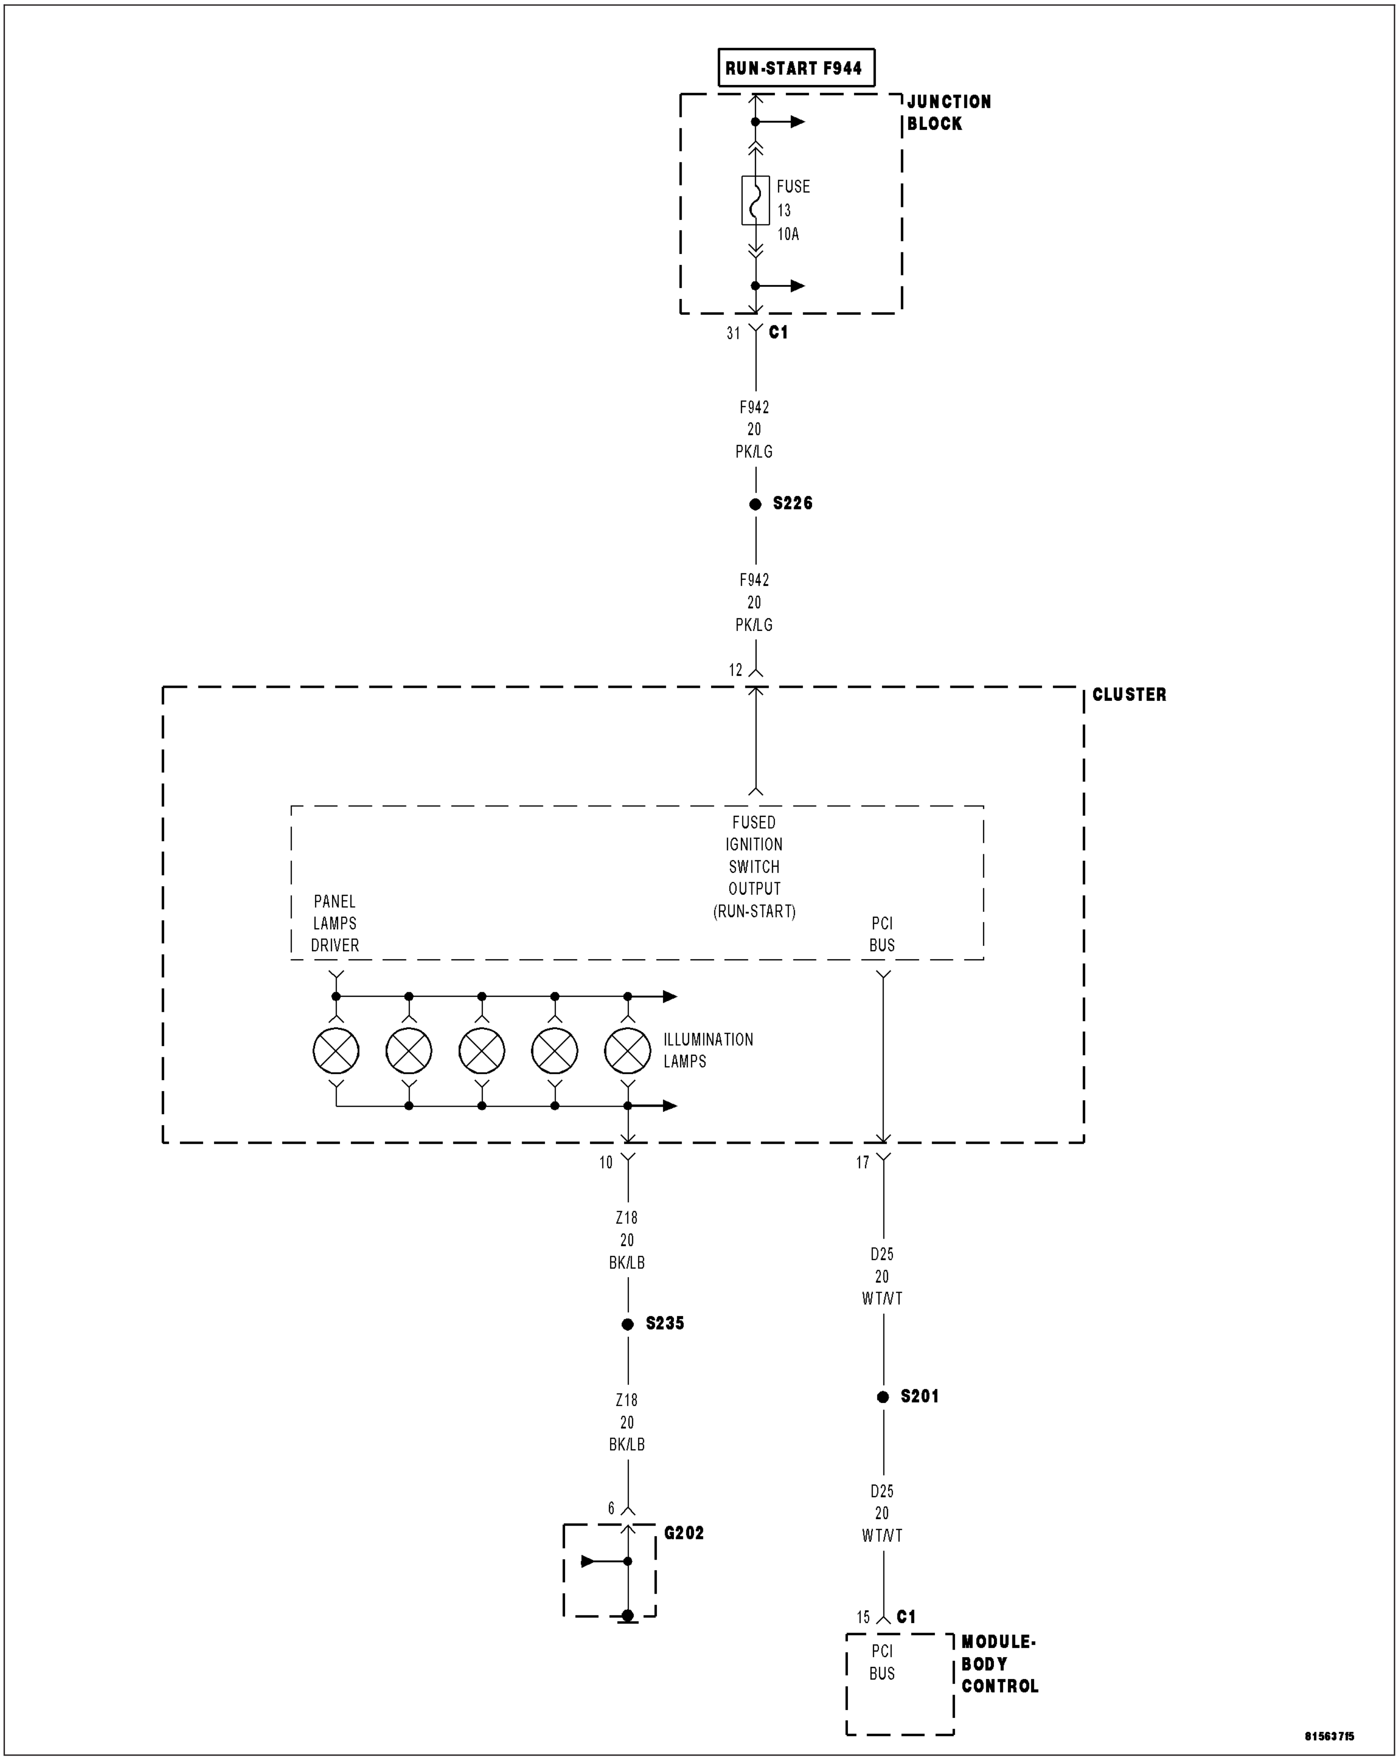
2WD: 2.43 - 2.77 volts

**Is the Transfer Case Position voltage within the specified ranges?**

**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

**No** >> Replace the Transfer Case Position Sensor in accordance with the Service Information.
Perform POWERTRAIN VERIFICATION TEST VER - 2. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

## *ALL GAUGES INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| NO RESPONSE - PCI BUS |
| NO RESPONSE - PCI BUS - POWERTRAIN CONTROL MODULE |
| NO RESPONSE - PCI BUS - INSTRUMENT CLUSTER |
| (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORT TO GROUND |
| (Z18) INSTRUMENT CLUSTER GROUND CIRCUIT OPEN |
| (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. NO RESPONSE - PCI BUS

Turn the ignition on.

With the scan tool, select System Monitors, then J1850 Module Scan.

**Does the scan tool display: MIC PRESENT on the BUS?**

**Yes** >> Go To 2

**No** >> Refer to the COMMUNICATION category and perform the appropriate symptom.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. NO RESPONSE - PCI BUS - POWERTRAIN CONTROL MODULE

Turn the ignition on.

With the scan tool, select Body, MIC, SYSTEM TESTS, PCM Monitor.

**Does the scan tool display: PCM INACTIVE on the BUS?**

**Yes** >> Refer to the symptom list for problems related to *NO RESPONSE FROM THE POWERTRAIN CONTROL MODULE.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

### 3. NO RESPONSE - PCI BUS - INSTRUMENT CLUSTER

Turn the ignition on.

With the scan tool, select Body, MIC, MODULE DISPLAY.

**Does the scan tool display: NO RESPONSE from MIC?**

**Yes** >> Refer to the symptom list for problems related to *NO RESPONSE FROM THE INSTRUMENT CLUSTER.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORT TO GROUND

Turn the ignition off.

Inspect the #13 Fuse in the Junction Block.

If the fuse is open, replace with proper rated fuse.

Turn the ignition on for one minute.

Turn the ignition off.

Inspect the #13 Fuse in the Junction Block.

**Is the fuse open?**

**Yes** >> Repair the (F942) Fused Ignition Switch Output circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

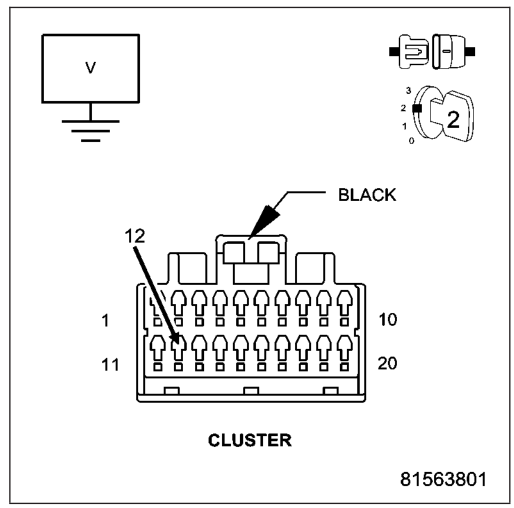
Turn the ignition on.

Measure the voltage between the (F942) Fused Ignition Switch Output circuit and ground.

**Is the voltage above 10.5 volts?**

**Yes** >> Go To 6

**No** >> Repair the (F942) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 6. (Z18) INSTRUMENT CLUSTER GROUND CIRCUIT OPEN

Turn the ignition off.

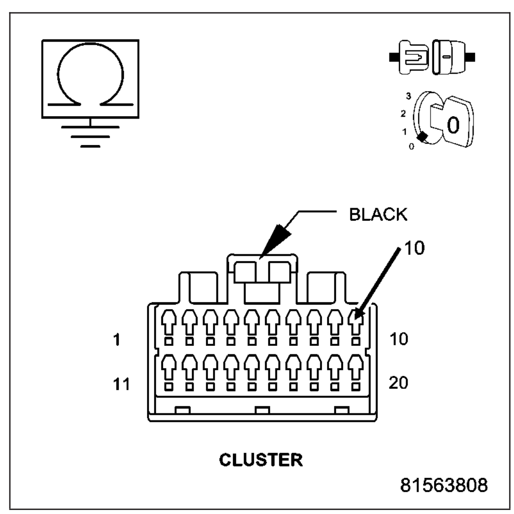
Disconnect the Instrument Cluster harness connector.

Measure the resistance between ground and the (Z18) Instrument Cluster Ground circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair (Z18) the Instrument Cluster Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## *ANY PCI BUS INDICATOR INOPERATIVE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| INDICATOR MESSAGE NOT RECEIVED |
| NO RESPONSE - INSTRUMENT CLUSTER |
| NO RESPONSE - PCI BUS |
| NO RESPONSE - PCI BUS - POWERTRAIN CONTROL MODULE |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. NO RESPONSE - INSTRUMENT CLUSTER

Turn the ignition on.

With the scan tool, select System Monitors, then J1850 Module Scan.

**Does the scan tool display: MIC PRESENT on the BUS?**

**Yes** >> Go To 2

**No** >> Refer to the COMMUNICATION category and perform the appropriate symptom.

### 2. NO RESPONSE - INSTRUMENT CLUSTER

Turn the ignition on.

With the scan tool, select MIC, then MODULE DISPLAY.

**Does the scan tool display: NO RESPONSE from MIC?**

**Yes** >> Refer to the symptom list for problems related to *NO RESPONSE FROM THE INSTRUMENT CLUSTER.

**No** >> Go To 3

### 3. NO RESPONSE - PCI BUS

Turn the ignition on.

With the scan tool, select Body, MIC, MONITORS, PCI BUS MONITORS.

**Does the scan tool display: PCM INACTIVE on the BUS?**

**Yes** >> Refer to the symptom list for problems related to *NO RESPONSE FROM THE POWERTRAIN CONTROL MODULE.

**No** >> Go To 4

### 4. INDICATOR MESSAGE NOT RECEIVED

**NOTE: Diagnose and repair any PCM or BCM DTCs before proceeding with this test.**

Perform the Instrument Cluster Self Test.

Depress and hold the Trip Odometer button while turning the ignition from the off to the on position.

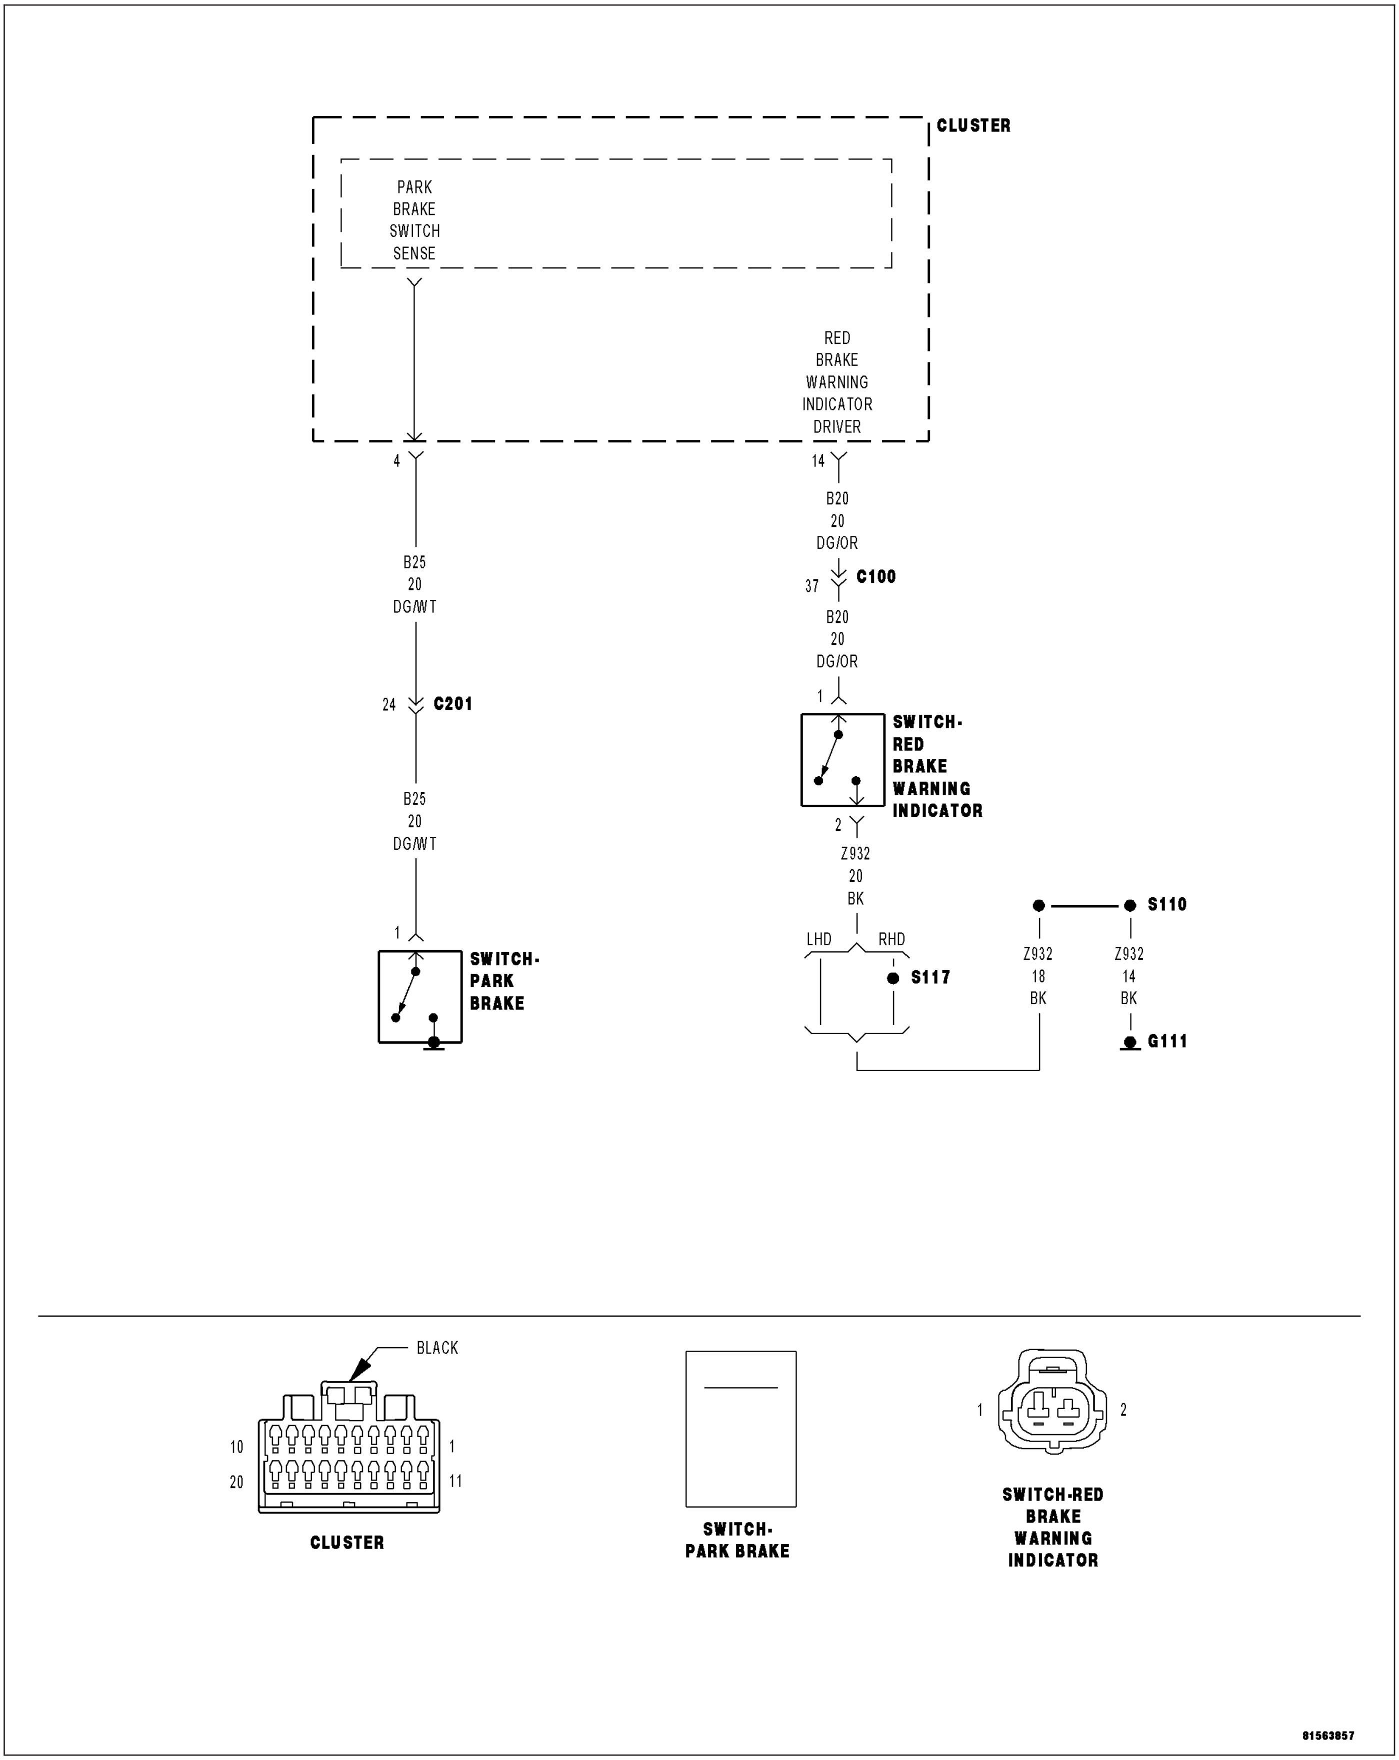
Observe the indicator in question.

**Did the indicator illuminate?**

**Yes** >> Refer to the appropriate Service Information category to diagnose the related system.

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *BRAKE INDICATOR ALWAYS ON



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| BRAKE FLUID LEVEL SWITCH CIRCUIT DTC PRESENT |
| BRAKE FLUID LEVEL SWITCH |
| (B20) RED BRAKE WARNING INDICATOR DRIVER CIRCUIT SHORT TO GROUND |
| PARK BRAKE SWITCH |
| (B25) PARK BRAKE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. BRAKE FLUID SWITCH CIRCUIT DTC PRESENT

**NOTE: Ensure that the Brake Fluid Level is properly filled and the Brake Fluid Level Switch harness connector is properly connected.**

With the scan tool, erase DTCs.

Cycle the ignition and wait approximately 15 seconds.

With the scan tool, read DTCs.

**Does the scan tool display: BRAKE FLUID LEVEL SWITCH CIRCUIT OPEN?**

**Yes** >> Refer to symptom list for problems related to ″BRAKE FLUID LEVEL SWITCH CIRCUIT OPEN″.

**No** >> Go To 2

### 2. BRAKE FLUID LEVEL SWITCH

Turn the ignition off.

Disconnect the Brake Fluid Level Switch harness connector.

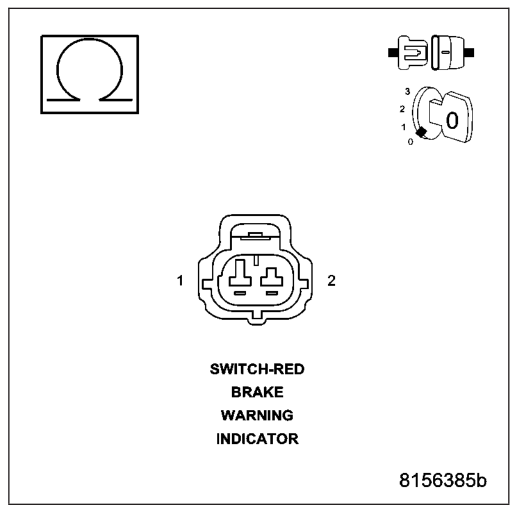
Measure the resistance of the Brake Fluid Level Switch.

**Is the resistance below 900 ohms?**

**Yes** >> Replace the Brake Fluid Level Switch in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



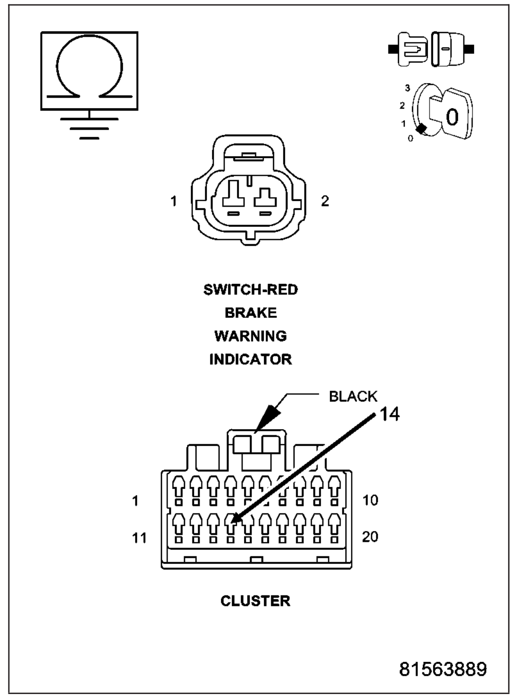
## 3. (B20) RED BRAKE WARNING INDICATOR DRIVER CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Brake Fluid Level Switch harness connector.

Disconnect the Instrument Cluster harness connector.

Measure the resistance between ground and the (B20) Red Brake Warning Indicator Driver circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (B20) Red Brake Warning Indicator Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. PARK BRAKE SWITCH

**NOTE: Ensure that the Brake Fluid Level Switch and Instrument Cluster harness connectors are properly connected.**

Disconnect the Park Brake Switch harness connector.

With the scan tool in Inputs/Outputs, read the Park Brake Switch state.

**Does the scan tool display: Open?**

**Yes** >> Replace the Park Brake Switch in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 5

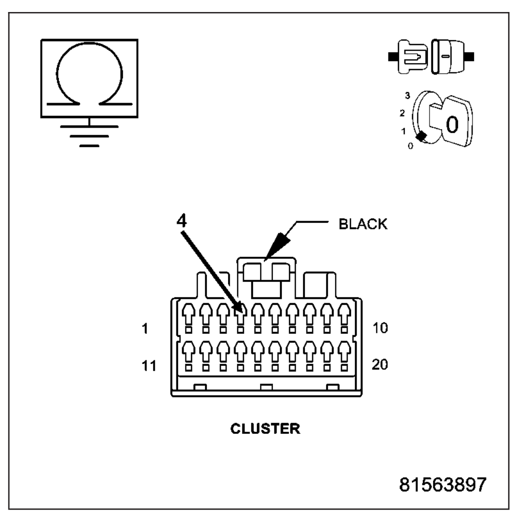
## 5. (B25) PARK BRAKE SWITCH SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Park Brake Switch harness connector.

Disconnect the Instrument Cluster harness connector.

Measure the resistance between ground and the (B25) Park Brake Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

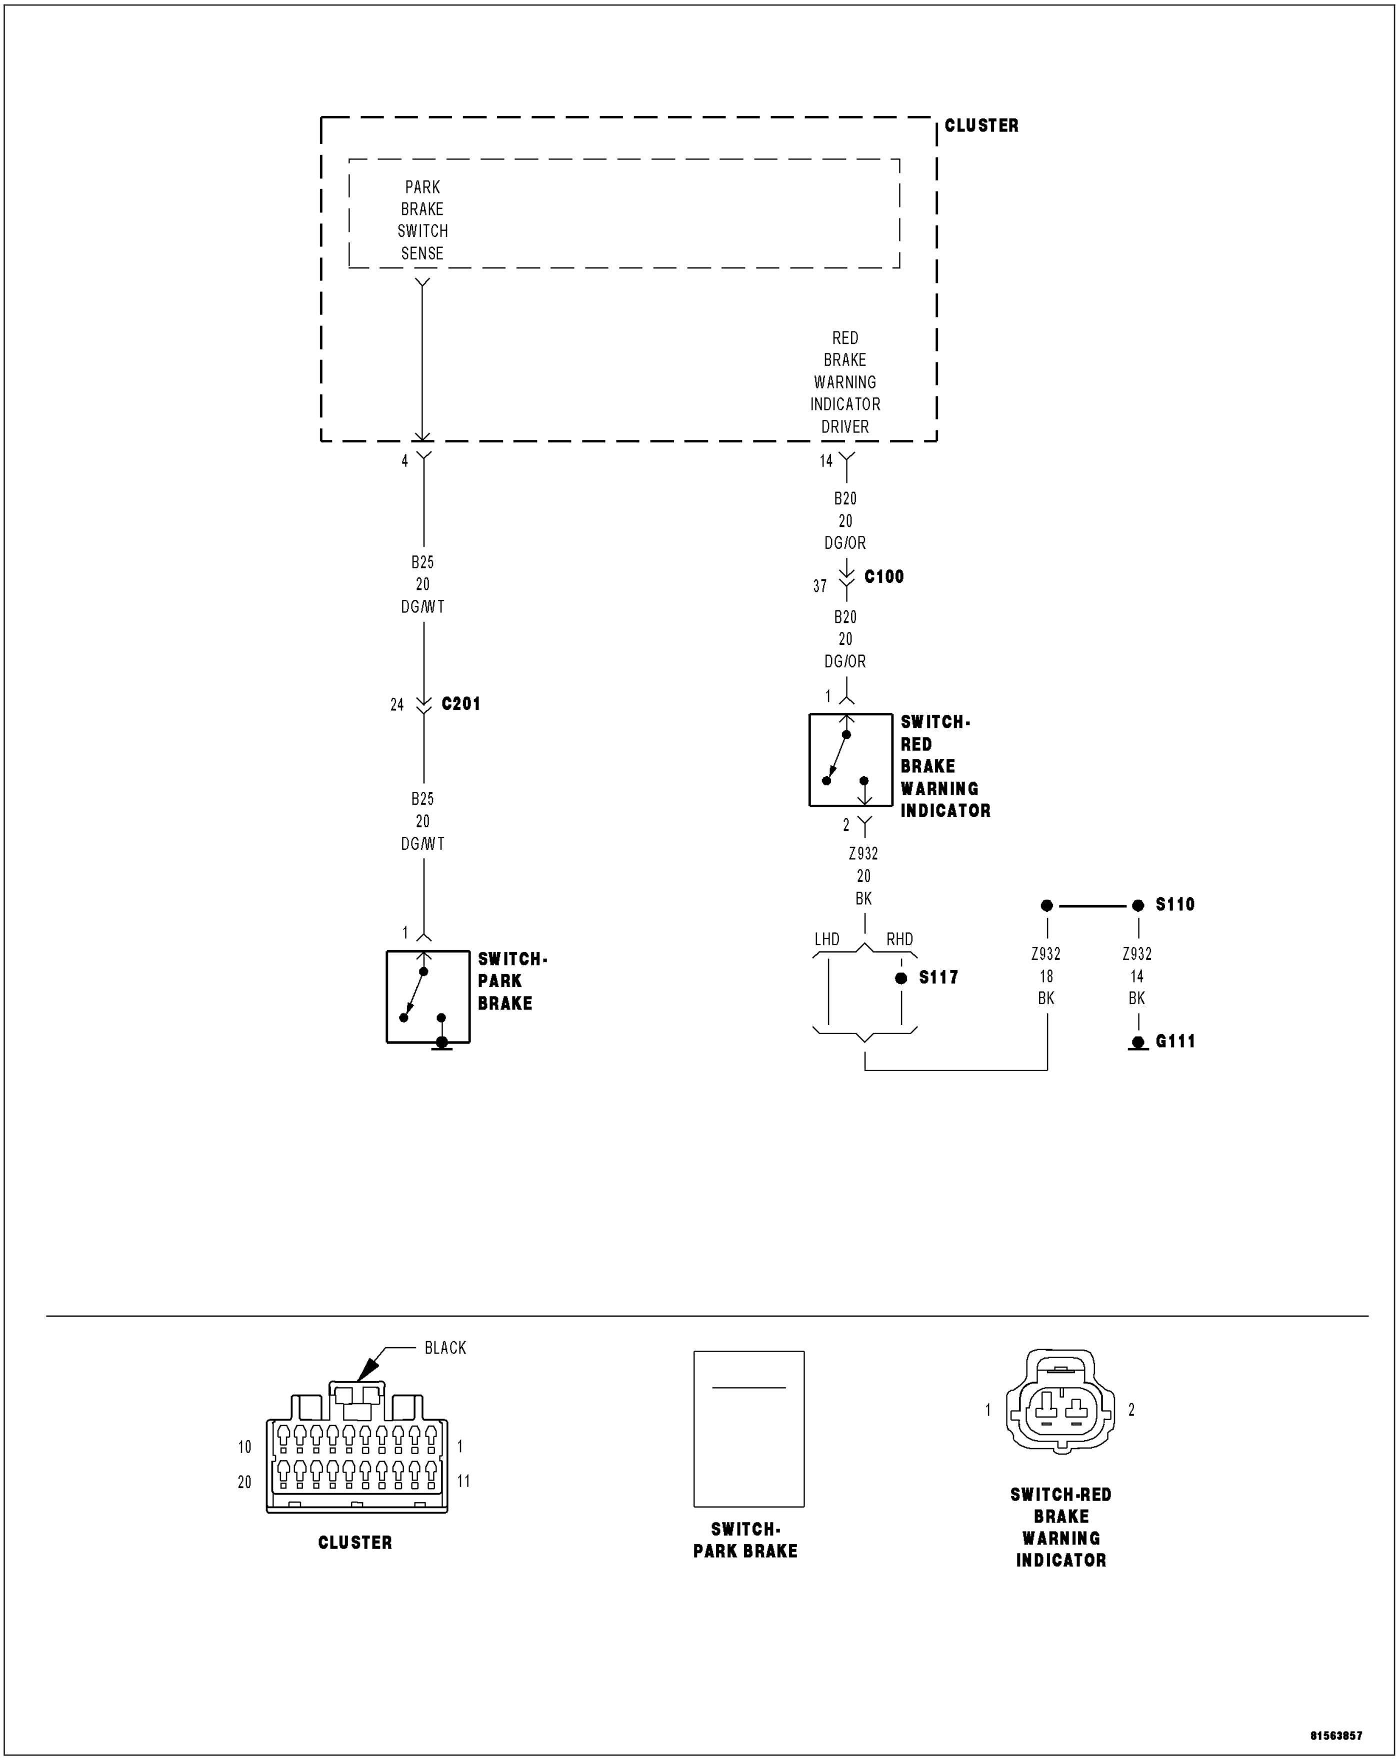
**Yes** >> Repair the (B25) Park Brake Switch Sense circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *BRAKE INDICATOR INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**.

## Diagnostic Test

| Possible Causes |
|---|
| BRAKE FLUID LEVEL SWITCH |
| PARK BRAKE SWITCH |
| (B25) PARK BRAKE SWITCH SENSE CIRCUIT OPEN |
| INSTRUMENT CLUSTER |

### 1. BRAKE FLUID LEVEL SWITCH

**Is the BRAKE indicator only inoperative with the Park Brake engaged?**

**Yes** >> Go To 2

**No** >> Replace the Brake Fluid Level Switch in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. PARK BRAKE SWITCH

Disconnect the Park Brake Switch harness connector.
Connect a jumper wire between the Park Brake Switch Sense circuit and ground.
Turn the ignition on.
Observe the BRAKE indicator.

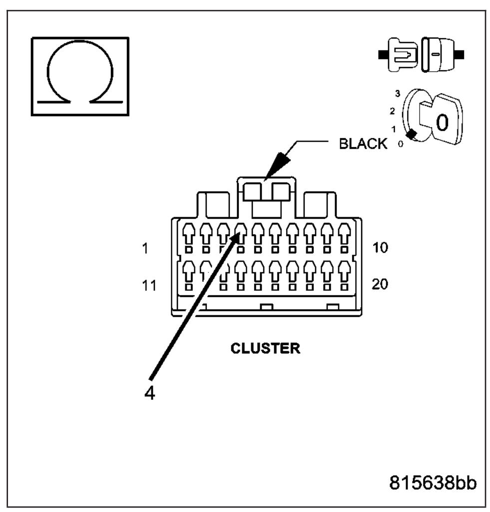
**Did the BRAKE indicator illuminate?**

**Yes** >> Replace the Park Brake Switch in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

### 3. (B25) PARK BRAKE SWITCH SENSE CIRCUIT OPEN

Turn the ignition off.
Disconnect the Park Brake Switch harness connector.
Disconnect the Instrument Cluster harness connector.
Measure the resistance of the (B25) Park Brake Switch Sense circuit.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (B25) Park Brake Switch Sense circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *FUEL GAUGE INACCURATE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| FUEL LEVEL SENSOR DTC PRESENT |
| INTERMITTENT CONDITION |
| FUEL LEVEL SENSOR |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. FUEL LEVEL SENSOR DTC PRESENT

**NOTE: Diagnose and repair any PCM Fuel Level DTCs before proceeding with this test.**
With the scan tool, read DTCs.

**Does the scan tool display any Fuel Level Sensor DTCs?**

**Yes** >> Refer to symptom list for problems related to Fuel Level Sensor DTCs.

**No** >> Go To 2

### 2. INSTRUMENT CLUSTER

Perform the Instrument Cluster Self Test.

Depress and hold the Trip Odometer reset button while turning the ignition on.

**NOTE: The Instrument Cluster Self Test can also be performed using the scan tool.**
Observe the Fuel Gauge calibration points during the Self Test.

The Fuel Gauge indicator needle should pause at the following positions:

Off: Empty Stop below ″E″

Calibration Point 1: ″1/4″

Calibration Point 2: ″1/2″

Calibration Point 3: ″F″

Calibration Point 4: ″3/4″

Calibration Point 5: ″1/2″

Calibration Point 6: ″1/4″

Calibration Point 7: ″E″

**Did the Fuel Gauge needle pause at the correct calibration points?**

**Yes** >> Go To 3

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 3. FUEL LEVEL SENSOR

With the scan tool, select Body, MIC, then Monitors.

Read the Fuel Tank Level Volts.

Compare the Fuel Tank Level Volts displayed by the scan tool to the Fuel Gauge using the following values:

4.3 - 3.19 Volts (Approximately 220 - 200 Ohms of Fuel Sensor Resistance) = ″E″

2.56 Volts (Approximately 160 Ohms of Fuel Sensor Resistance) = ″1/4″

1.91 Volts (Approximately 120 Ohms of Fuel Sensor Resistance) = ″1/2″

1.27 Volts (Approximately 80 Ohms of Fuel Sensor Resistance) = ″3/4″

0.319 - .646 Volts (Approximately 20 - 40 Ohms of Fuel Sensor Resistance) = ″F″

**NOTE: Fuel Tank Level Voltage should be within +/- 0.2 volts.**

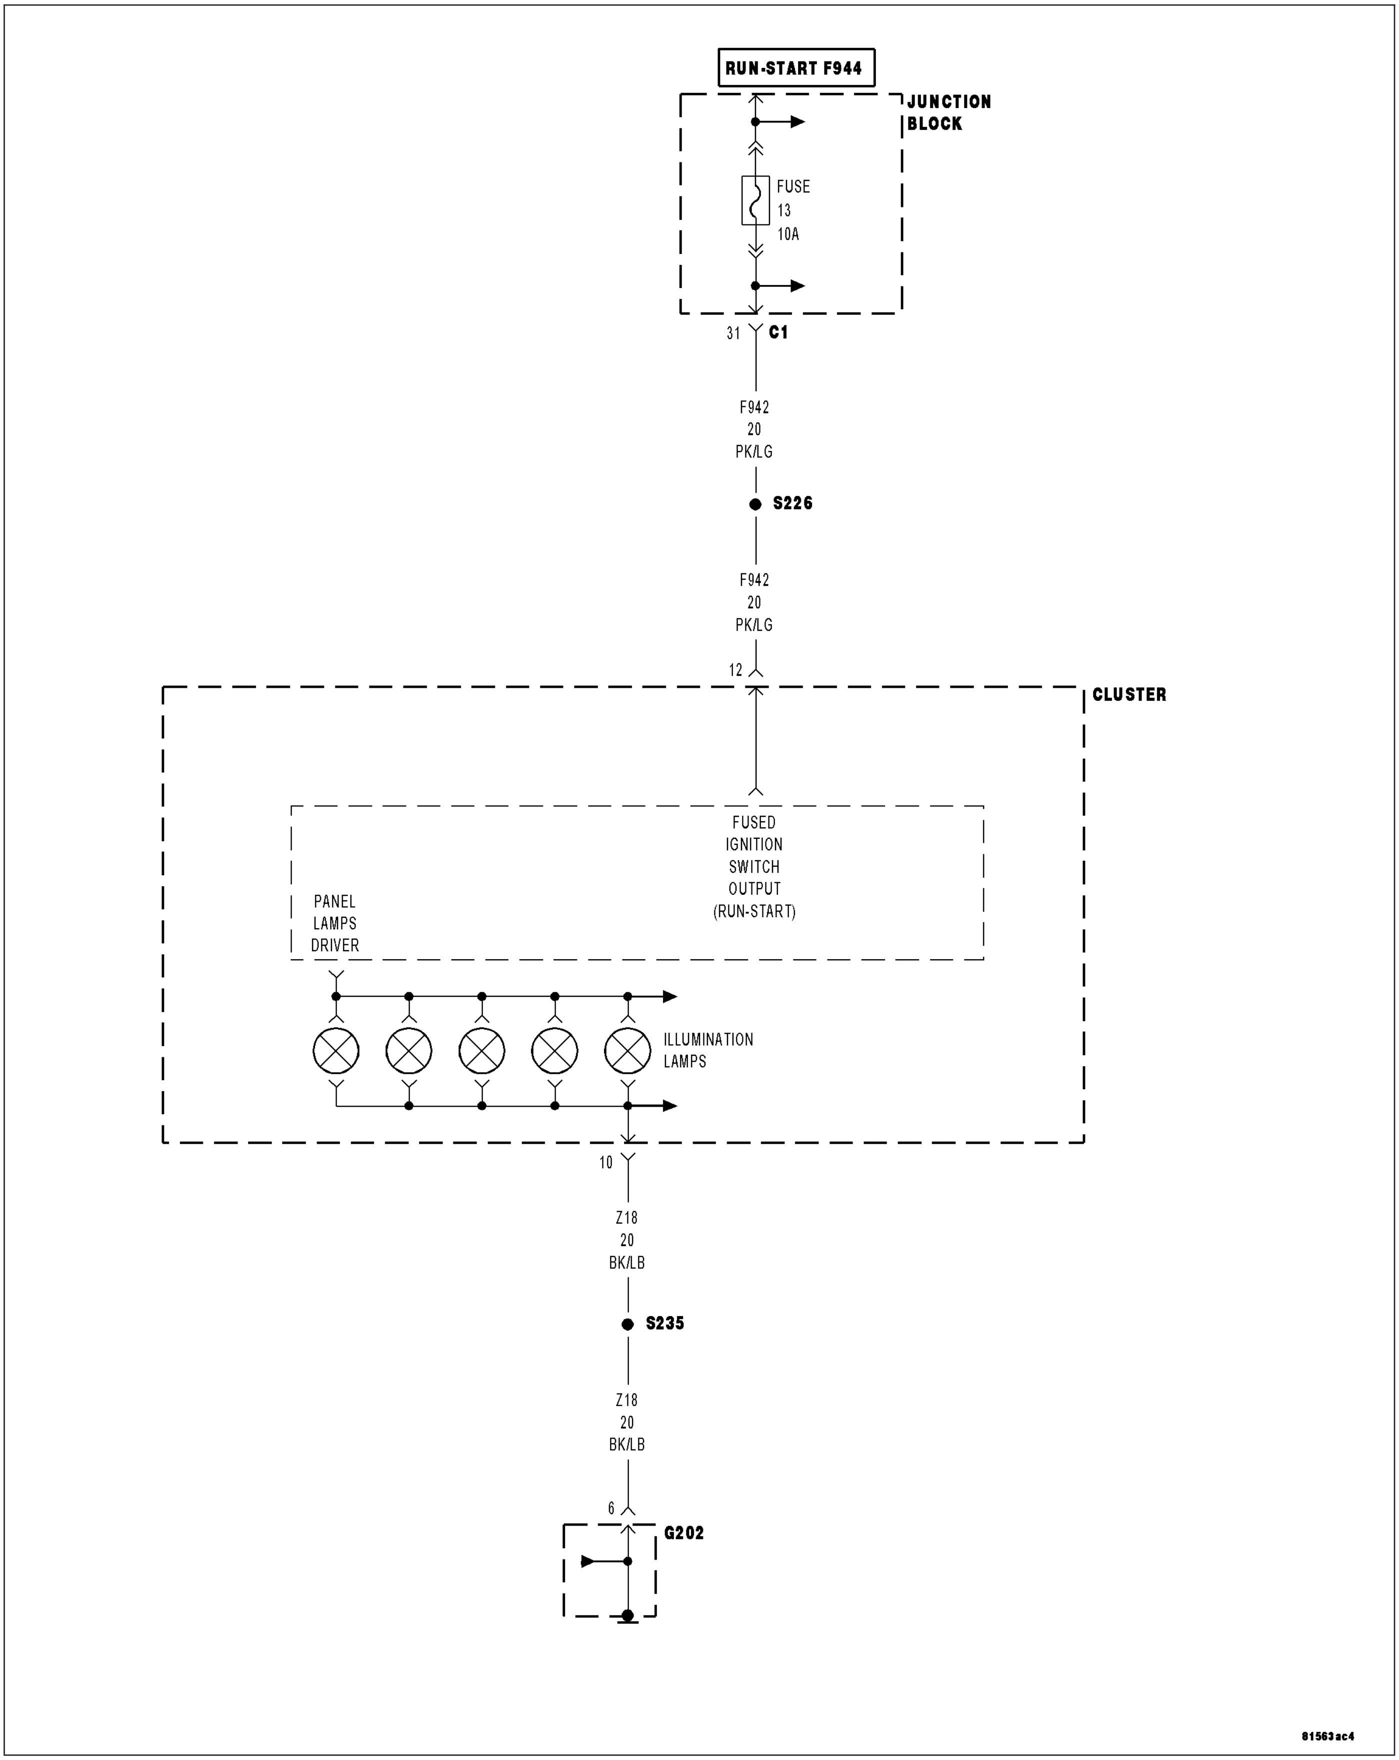
**Is the displayed Fuel Tank Level voltage correct?**

**Yes** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector termianls.

**No** >> Replace the Fuel Level Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *INSTRUMENT CLUSTER INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORT TO GROUND |
| (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| (Z18) INSTRUMENT CLUSTER GROUND CIRCUIT OPEN |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORT TO GROUND

Turn the ignition off.
Remove and inspect the #13 Fuse in the Junction Block.
If the fuse is open, replace with proper rated fuse.
Turn the ignition on for 1 minute.
Turn the ignition off.
Remove and inspect the #13 Fuse in the Junction Block.

**Is the fuse open?**

**Yes** >> Repair the (F942) Fused Ignition Switch Output circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 2

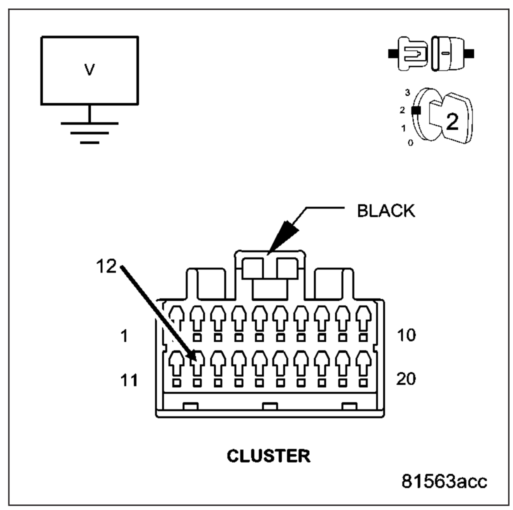
### 2. (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition off.
Disconnect the Instrument Cluster harness connector.
Turn the ignition on.
Measure the voltage between (F942) Fused Ignition Switch Output circuit and ground.

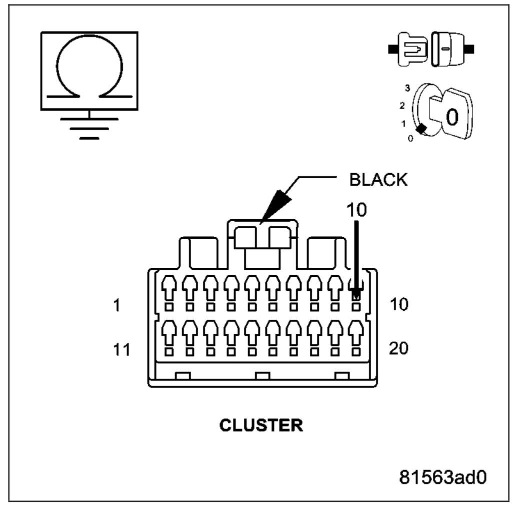
**Is the voltage above 10.5 volts?**

**Yes** >> Go To 3

**No** >> Repair the (F942) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



## 3. (Z18) INSTRUMENT CLUSTER GROUND CIRCUIT OPEN



Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

Measure the resistance between ground and the (Z18) Instrument Cluster Ground circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and configure the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (Z18) Instrument Cluster Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.

## *LOW COOLANT INDICATOR ALWAYS ON - DIESEL ONLY

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| LOW COOLANT LEVEL SWITCH |
| (G18) LOW COOLANT FLUID LEVEL SENSE CIRCUIT SHORT TO GROUND |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. LOW COOLANT LEVEL SWITCH

**NOTE: Ensure that the coolant is filled to the proper level before proceeding with this test.**

Disconnect the Low Coolant Level Switch harness connector.

With the scan tool in Inputs/Outputs, read the Low Coolant Switch state.

**Does the scan tool display: Closed?**

**Yes** >> Go To 2

**No** >> Replace the Low Coolant Switch in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. (G18) LOW COOLANT FLUID LEVEL SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Low Coolant Level Switch harness connector.

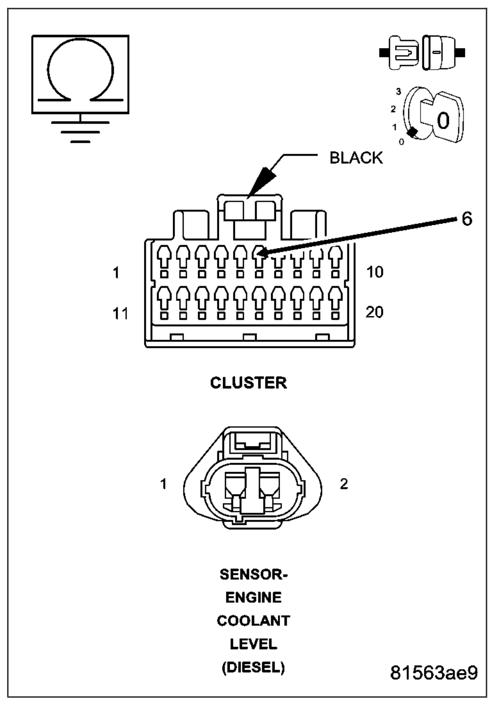
Disconnect the Instrument Cluster harness connector.

Measure the resistance between ground and the (G18) Low Coolant Fluid Level Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (G18) Low Coolant Fluid Level Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## *LOW COOLANT INDICATOR INOPERATIVE - DIESEL ONLY

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| LOW COOLANT SWITCH |
| (G18) LOW COOLANT FLUID LEVEL SENSE CIRCUIT OPEN |
| (Z939 )LOW COOLANT SWITCH GROUND CIRCUIT OPEN |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. LOW COOLANT SWITCH

**NOTE: Perform the Instrument Cluster Self Test before proceeding with this test. If the Indicator does not illuminate, replace the Cluster.**

Turn the ignition off.

Disconnect the Low Coolant Switch harness connector.

Connect a jumper wire between cavity 1 and cavity 2.

Turn the ignition on and wait approximately 1 minute.

With the scan tool in Inputs/Outputs, read the Low Coolant Switch state.

**Does the scan tool display: Closed?**

**Yes** >> Replace the Low Coolant Switch in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. (Z939) LOW COOLANT SWITCH GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Low Coolant Switch harness connector.

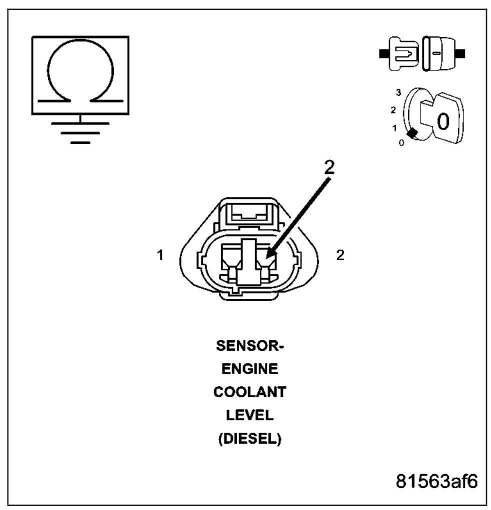
Measure the resistance between ground and the (Z939) Low Coolant Switch Ground circuit.

**Is the resistance above 5.0 ohms?**

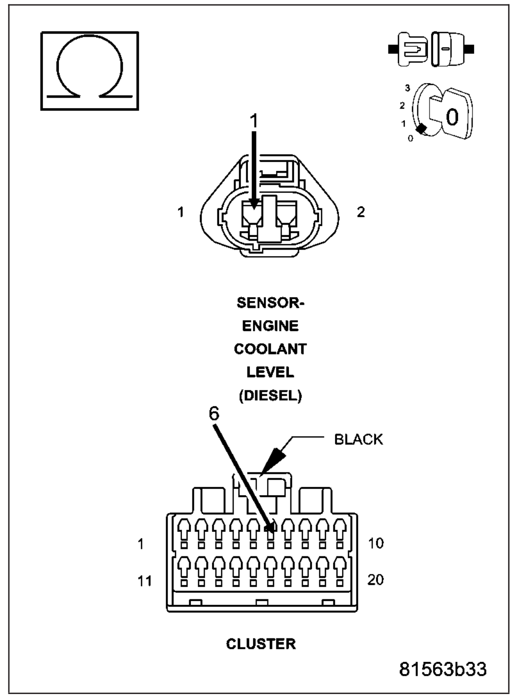
**Yes** >> Repair the (Z939) Low Coolant Switch Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



## 3. (G18) LOW COOLANT FLUID LEVEL SENSE CIRCUIT OPEN



Turn the ignition off.

Disconnect the Low Coolant Switch harness connector.

Disconnect the Instrument Cluster harness connector.

Measure the resistance of the (G18) Low Coolant Fluid Level Sense circuit.

**Is the resistance above 5.0 ohms?**

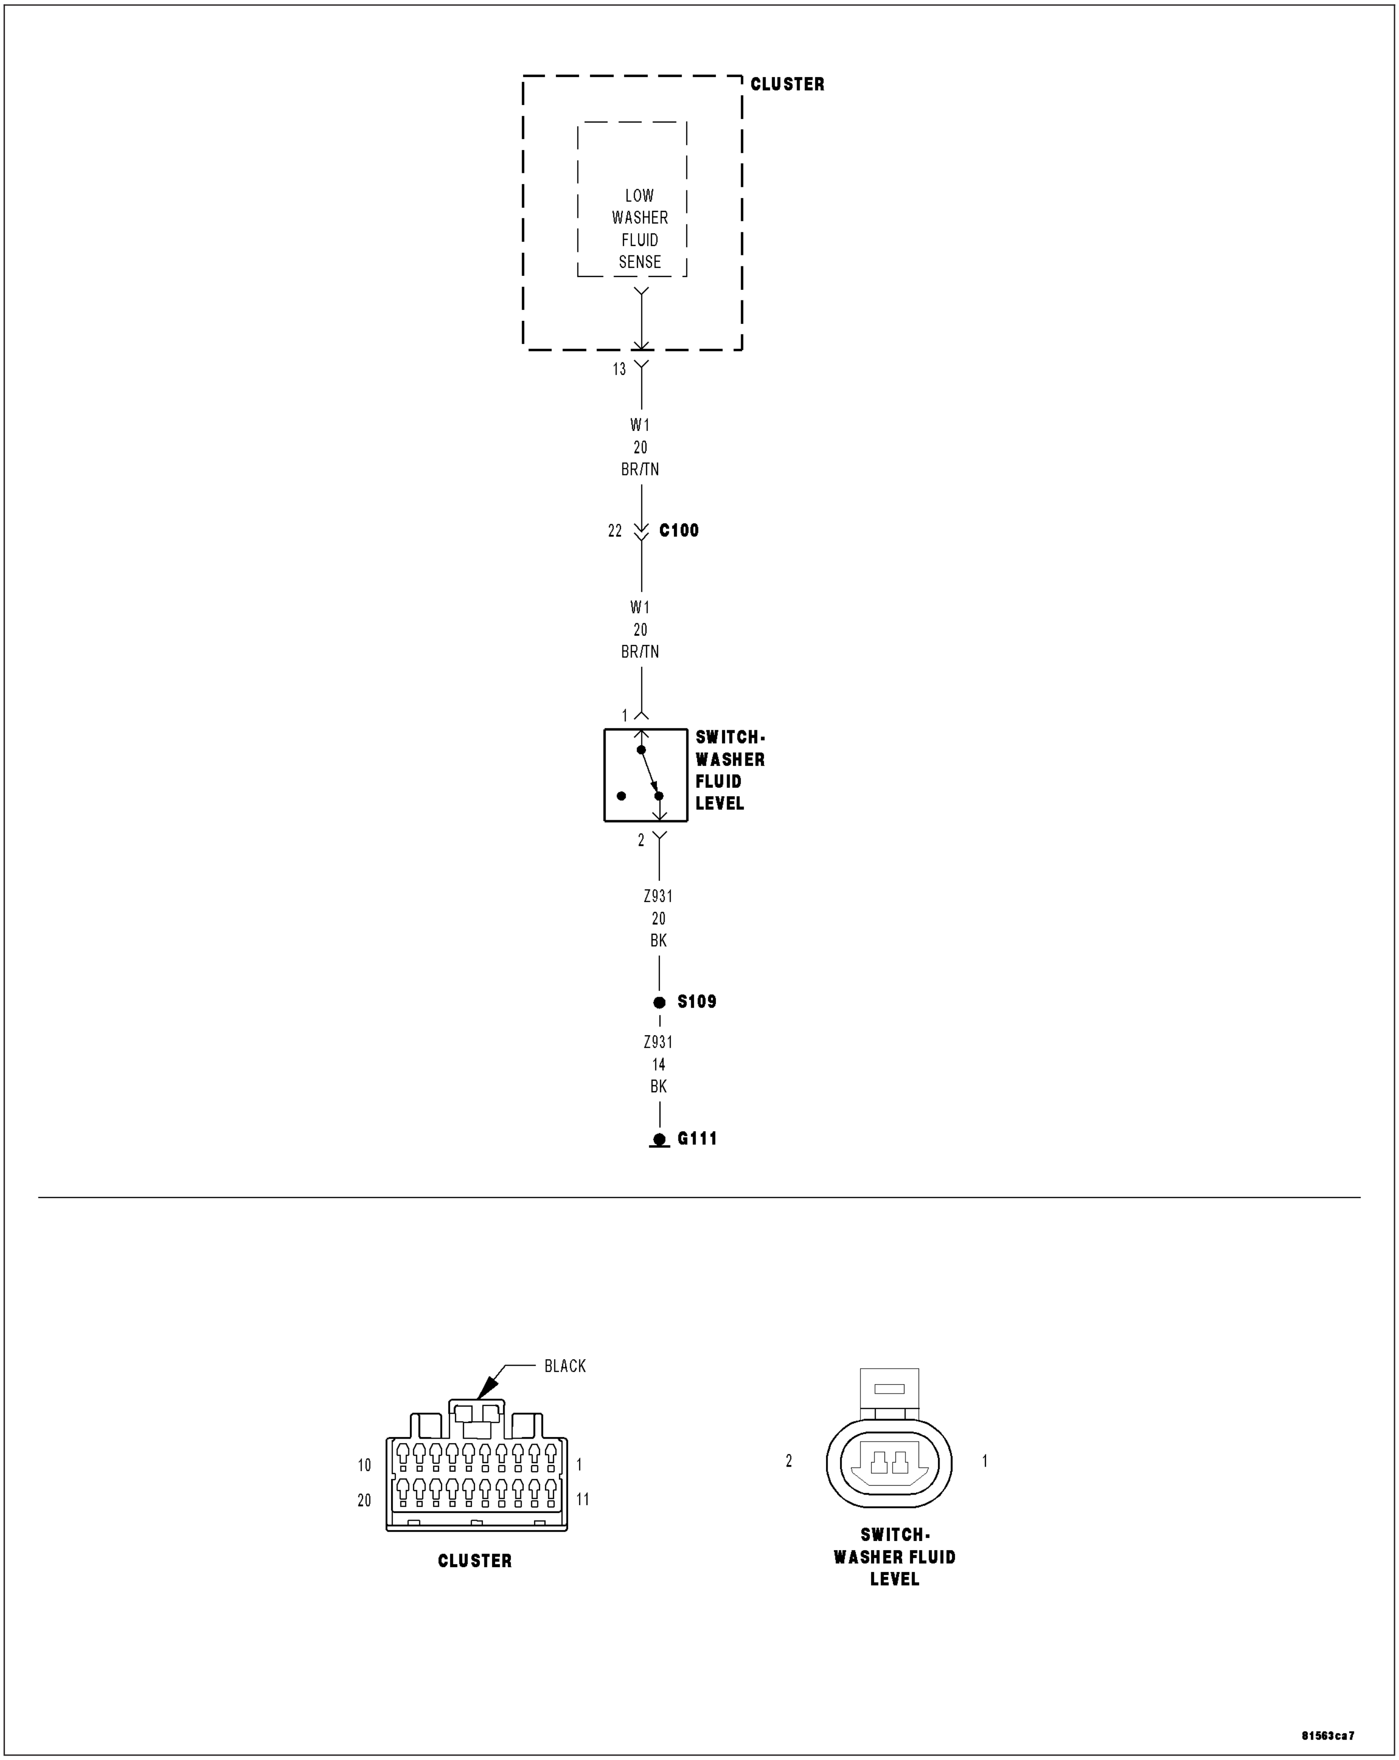
**Yes** >> Repair the (G18) Low Coolant Fluid Level Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *LOW WASH MESSAGE NOT OPERATING PROPERLY



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| WASHER FLUID LEVEL SWITCH ALWAYS CLOSED |
| (W1) LOW WASHER FLUID SENSE CIRCUIT OPEN |
| (W1) LOW WASHER FLUID SENSE CIRCUIT SHORT TO GROUND |
| WASHER FLUID LEVEL SWITCH ALWAYS OPEN |
| (Z931) WASHER FLUID LEVEL SWITCH GROUND CIRCUIT OPEN |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. FAULT DESCRIPTION

**NOTE: Ensure that the Washer Fluid reservoir is filled and the Fluid Level Switch connector is properly connected before proceeding with this test.**

Turn the ignition on and wait approximately 1 minute.

**Is the LOWASH message always displayed?**

**Yes** >> Go To 2

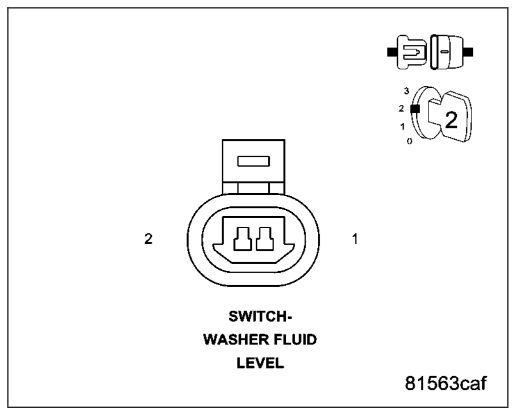
**No** >> Go To 3

### 2. WASHER FLUID LEVEL SWITCH ALWAYS CLOSED

Turn the ignition off.

Disconnect the Washer Fluid Level Switch harness connector.

Turn the ignition on and wait approximately 1 minute.



**Does the VF display: LOWASH?**

**Yes** >> Repair the Low Washer Fluid Sense circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Washer Fluid Level Switch in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

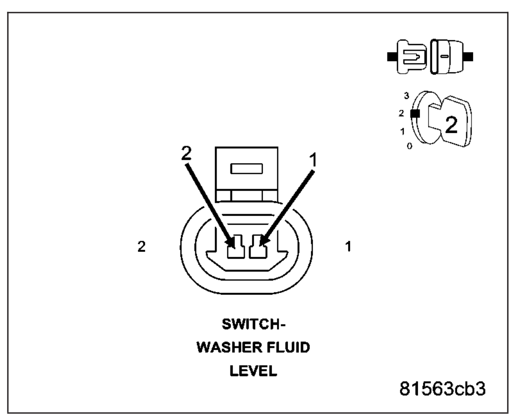
### 3. WASHER FLUID LEVEL SWITCH ALWAYS OPEN

Turn the ignition off.

Disconnect the Washer Fluid Level Switch harness connector.

Connect a jumper wire between cavity 1 and cavity 2.

Turn the ignition on and wait approximately 1 minute.



**Does the VF display: LOWASH?**

**Yes** >> Replace the Washer Fluid Level Switch in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

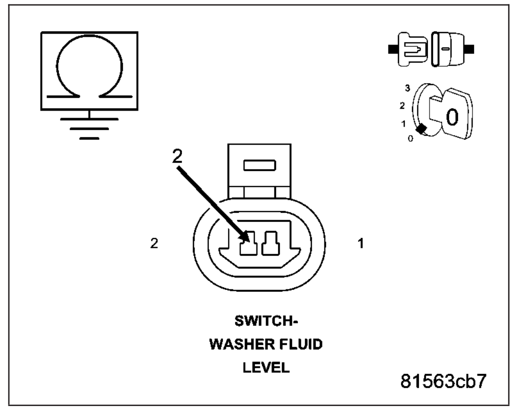
**No** >> Go To 4

## 4. WASHER FLUID LEVEL SWITCH

Turn the ignition off.

Disconnect the Washer Fluid Level Switch harness connector.

Measure the resistance between ground and the (Z931) Washer Fluid Level Switch Ground circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the Washer Fluid Level Switch Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

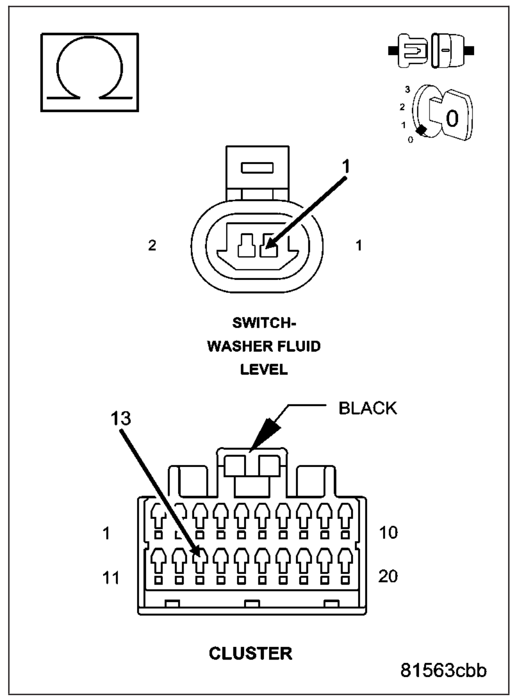
## 5. (W1) LOW WASHER FLUID SENSE CIRCUIT OPEN

Turn the ignition off.

Disconnect the Washer Fluid Level Switch harness connector.

Disconnect the Instrument Cluster harness connector.

Measure the resistance of the (W1) Low Washer Fluid Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace and configure the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (W1) Low Washer Fluid Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *ONE GAUGE INOPERATIVE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| POWERTRAIN CONTROL MODULE DTCS |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. POWERTRAIN CONTROL MODULE

Turn the ignition on.

With the scan tool, read DTCs.

**Does the scan tool display any PCM DTCs?**

**Yes** >> Refer to the DRIVEABILITY category and perform the appropriate symptom.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. INSTRUMENT CLUSTER

Turn the ignition off.

Perform the Instrument Cluster Self Test.

**NOTE: The Self Test can be initiated manually by depressing and holding the Trip Reset button while turning the ignition on, or by using the scan tool.**

Observe the gauge in question while the Instrument Cluster performs the Self Test.

The gauges should position at the following calibrations points:

Speedometer MPH: 0, 30, 60, 90, 120, 90, 60, 30, 0

Speedometer kPH: 0, 60, 120, 180, 240, 180, 120, 60, 0

Tachometer Gas: 0, 1000, 3000, 5000, 7000, 5000, 3000, 1000, 0

Tachometer Diesel: 0, 1000, 3000, 5000, 3000, 1000, 0

Fuel: 1/4, 1/2, 3/4, F, 3/4, 1/2, 1/4, E

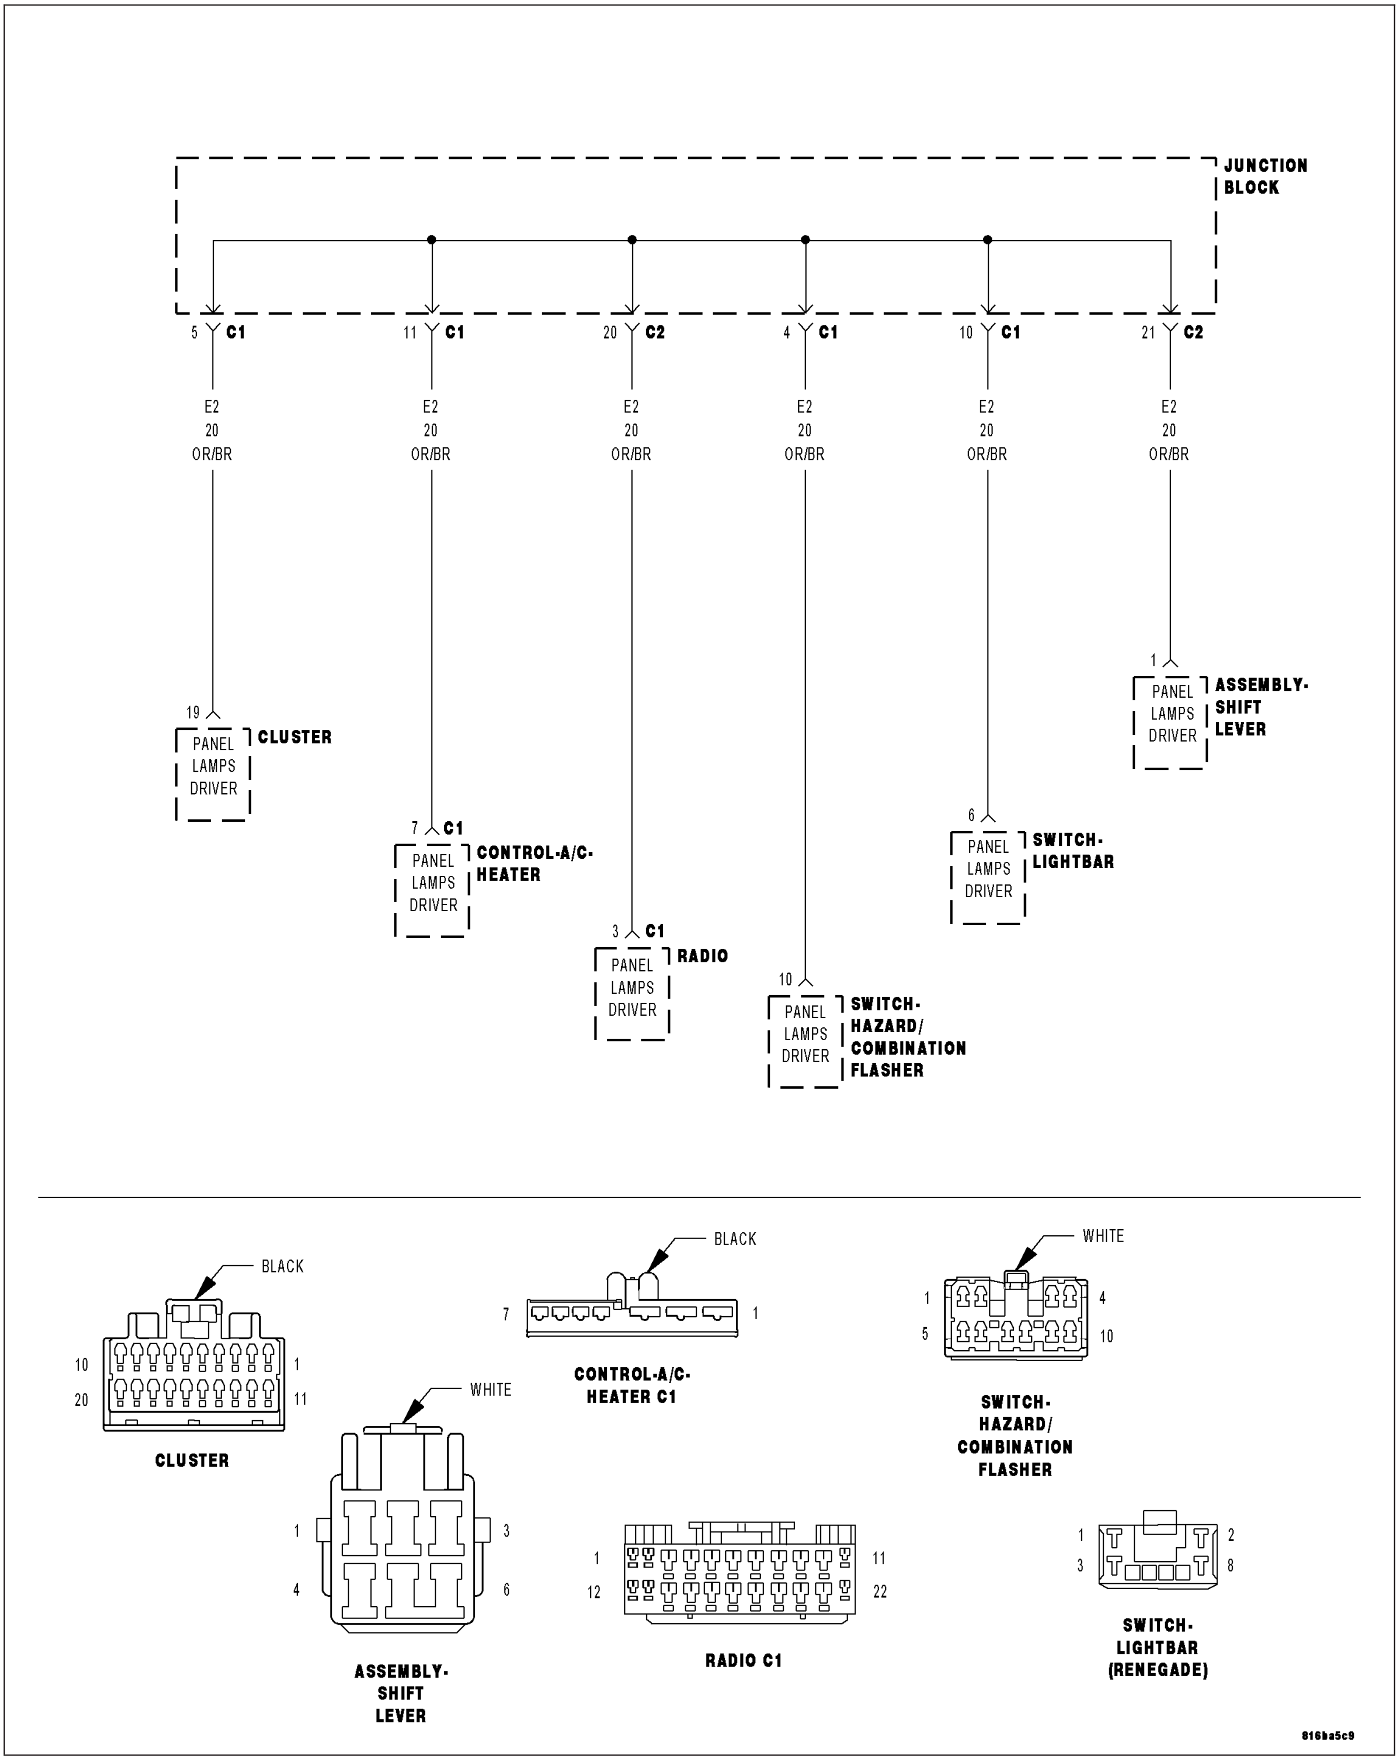
Coolant: Lo, 1/4, 1/2, 3/4, HI, 3/4, 1/2, 1/4, Lo

**Did the gauge in question operate properly?**

**Yes** >> Test Complete.

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *PANEL DIMMING INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| PANEL ILLUMINATION DTC PRESENT |
| ILLUMINATION BULB(S) |
| (L78) FUSED PARK LAMP RELAY OUTPUT CIRCUIT SHORT TO GROUND |
| (L78) FUSED PARK LAMP RELAY OUTPUT CIRCUIT OPEN |
| (E2) PANEL LAMPS DRIVER CIRCUIT SHORT TO VOLTAGE |
| ILLUMINATED COMPONENT INTERNALLY SHORTED |
| (E2) PANEL LAMPS DRIVER CIRCUIT SHORT TO GROUND |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. PANEL ILLUMINATION DTC PRESENT

Turn the ignition on.

With the scan tool, read DTCs.

**Does the scan tool display any MIC or BCM DTCs?**

**Yes** >> Refer to symptom list for problems related to BCM or Instrument Cluster DTCs

**No** >> Go To 2

### 2. ILLUMINATION BULB(S)

Turn the ignition on.

Turn the Park Lamps on and adjust the dimming switch to maximum brightness.

**Are all of the Instrument Cluster illumination bulbs inoperative?**

**Yes** >> Go To 3

**No** >> Replace the Illumination Bulb(s) as necessary in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 3. FUSED PARK LAMP RELAY OUTPUT CIRCUIT SHORT TO GROUND

Turn the ignition off.

Remove and inspect the #9 Fuse in the Junction Block.

If the fuse is open, replace with proper rated fuse.

Turn the Park Lamps on for 1 minute.

Turn the ignition off.

Remove and inspect the #9 Fuse in the Junction Block.

**Is the #9 Fuse in the Junction Block open?**

**Yes** >> Using the wiring diagram/schematic as a guide, repair the Fused Park Lamp Relay Output circuit for a short to ground (between the Junction Block and the Instrument Cluster).

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

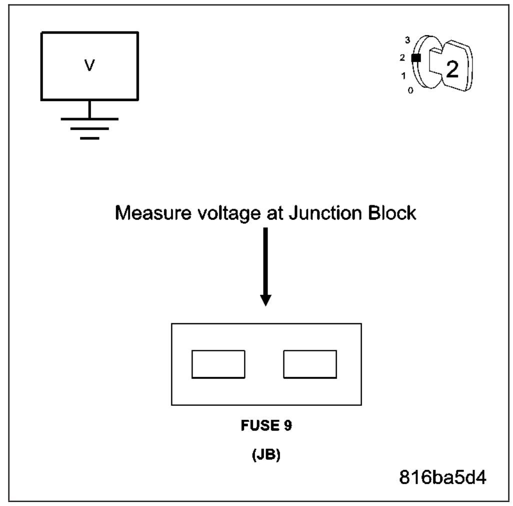
**No** >> Go To 4

## 4. PARK LAMP RELAY OUTPUT CIRCUIT OPEN

Turn the ignition on.

Turn the Park Lamps on.

Measure the voltage between the #9 Fuse in the Junction Block and ground.



**Is the voltage above 10.5 volts?**

**Yes** >> Go To 5

**No** >> Repair the Junction Block in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 5. (L78) FUSED PARK LAMP RELAY OUTPUT CIRCUIT OPEN

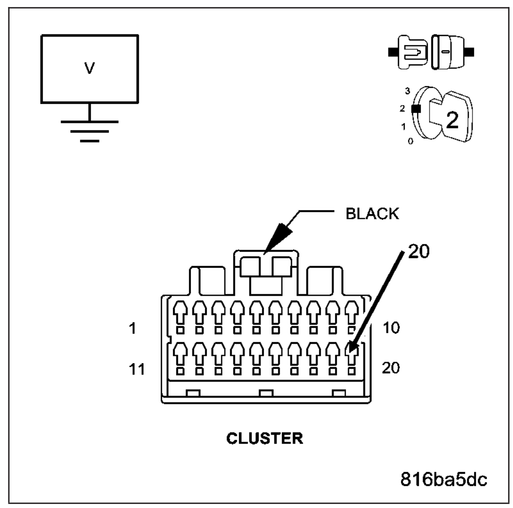
Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

Turn the ignition on.

Turn the Park Lamps on.

Measure the voltage between the (L78) Fused Park Lamp Relay Output circuit and ground.



**Is the voltage above 10.5 volts?**

**Yes** >> Go To 6

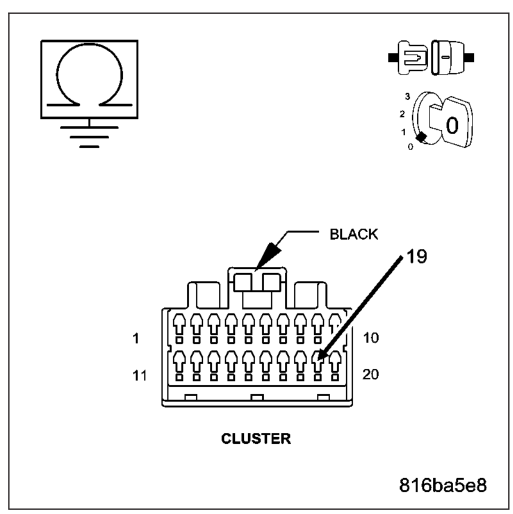
**No** >> Repair the (L78) Fused Park Lamp Relay Output circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 6. (E2) PANEL LAMPS DRIVER CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Measure the voltage between the (E2) Panel Lamps Driver circuit and ground.



**Is there any voltage present?**

**Yes** >> Repair the (E2) Panel Lamps Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. ILLUMINATED COMPONENT INTERNALLY SHORTED

Turn the ignition off.

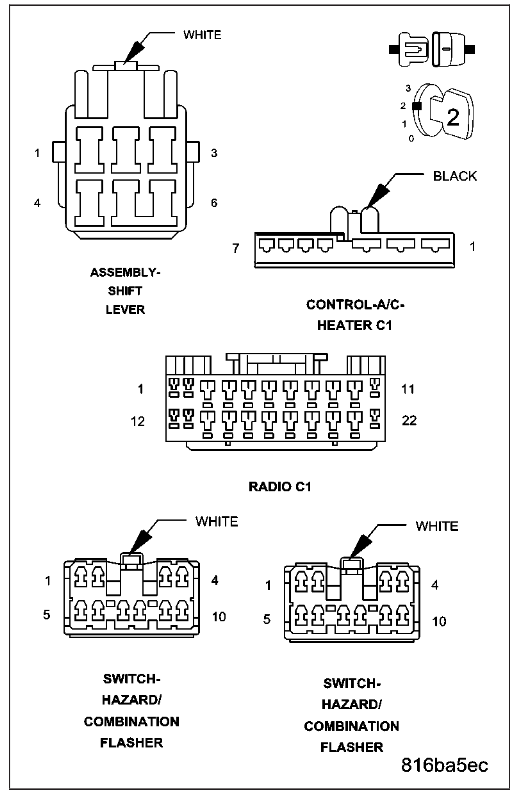
Ensure that the Instrument Cluster harness connector is connected.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors to all of the illuminated components.

Turn the ignition on.

Turn the Park Lamps on.

While disconnecting components, inspect for Instrument Cluster illumination.



**Does the Instrument Cluster illumination operate after disconnecting any component?**

**Yes** >> Replace the illuminated component as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 8

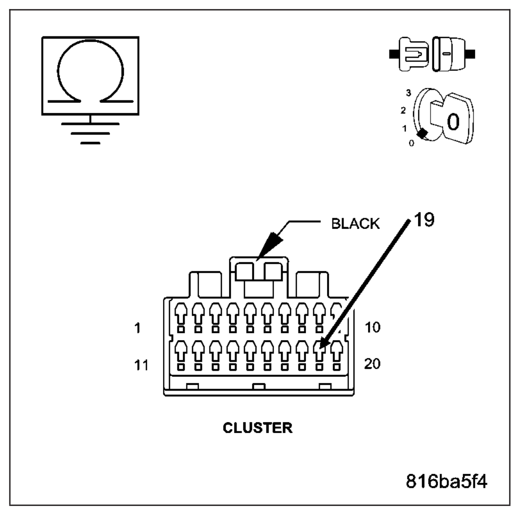
## 8. (E2) PANEL LAMPS DRIVER CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster harness connector.

Using the wiring diagram/schematic as a guide, ensure that all illuminated components are disconnected.

Measure the resistance between ground and the (E2) Panel Lamps Driver circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (E2) Panel Lamps Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *SEAT BELT INDICATOR ALWAYS ON

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| ACM DTC PRESENT |
| INSTRUMENT CLUSTER |

## Diagnostic Test

### 1. ACM DTC PRESENT

Turn the ignition on.

Ensure that the seat belt buckles are not damaged and are buckled.

With the scan tool select MIC, in Inputs/Outputs, read the Seatbelt Lamp state.

**Does the scan tool display: ON?**

**Yes** >> Refer to Seat Belt symptom(s) in the Airbag category.

**No** >> Replace and configure the Instrument Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

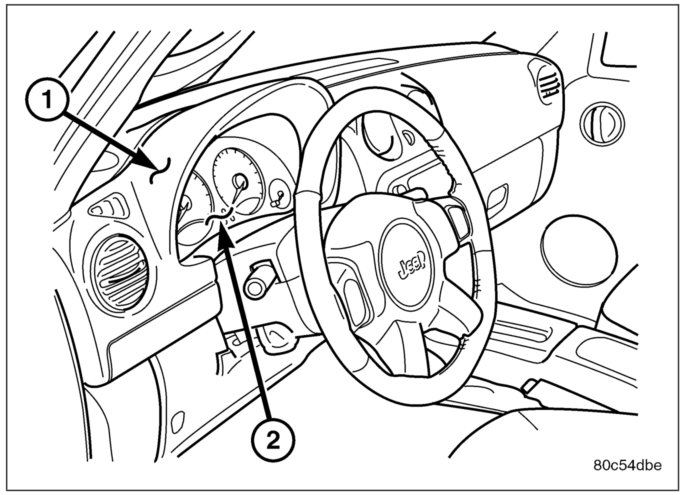
# INSTRUMENT CLUSTER

## TABLE OF CONTENTS

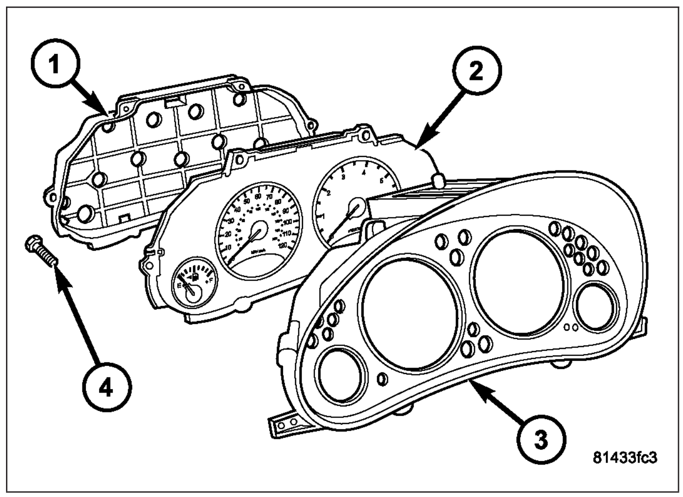
# INSTRUMENT CLUSTER

## DESCRIPTION

The instrument cluster (2) for this vehicle is an ElectroMechanical Instrument Cluster (EMIC) that is located in the instrument panel (1) above the steering column opening, directly in front of the driver. The remainder of the EMIC, including the mounts and the electrical connections, are concealed within the instrument panel behind the cluster bezel. Besides analog gauges and indicators, the EMIC module incorporates a blue-green digital Vacuum Fluorescent Display (VFD) unit for displaying odometer/trip odometer information, some warning or reminder indications and certain diagnostic information.



The EMIC gauges and indicators are visible through a dedicated opening in the cluster bezel on the instrument panel and are protected by a clear plastic cluster lens that is integral to a cluster lens, hood and mask unit (3). Just behind the cluster lens is the cluster hood and an integral cluster mask, which are constructed of molded black plastic. Two cluster masks are used; a base black version is used on base vehicles, while a premium black version features a chrome trim ring around the perimeter of each gauge opening and is used on premium vehicles.



The cluster hood serves as a visor and shields the face of the cluster from ambient light and reflections to reduce glare, while the cluster mask serves to separate and define the individual gauges and indicators of the EMIC. A black plastic odometer/trip odometer switch button protrudes through dedicated holes in the cluster mask and the cluster lens near the lower edge of the cluster just to the right of the tachometer. The molded plastic EMIC lens, hood and mask unit has three integral mounting tabs, one on each of the lower outboard corners of the unit and one on the upper surface of the hood near the center. These mounting tabs are used to secure the EMIC to the molded plastic instrument panel cluster carrier with two screws at the top, and one screw at each outboard tab.

The rear of the cluster housing (2) and the EMIC electronic circuitry are protected by a molded plastic rear cover (1), which is secured to the cluster lens, hood and mask unit with six screws (4). The rear cover includes clearance holes for service access to each of the nine incandescent bulb and bulb holder units installed on the cluster circuit board for general illumination lighting and for the cluster connector receptacle. The single connector receptacle on the back of the cluster electronic circuit board connects the EMIC to the vehicle electrical system through a single dedicated take out and connector of the instrument panel wire harness.

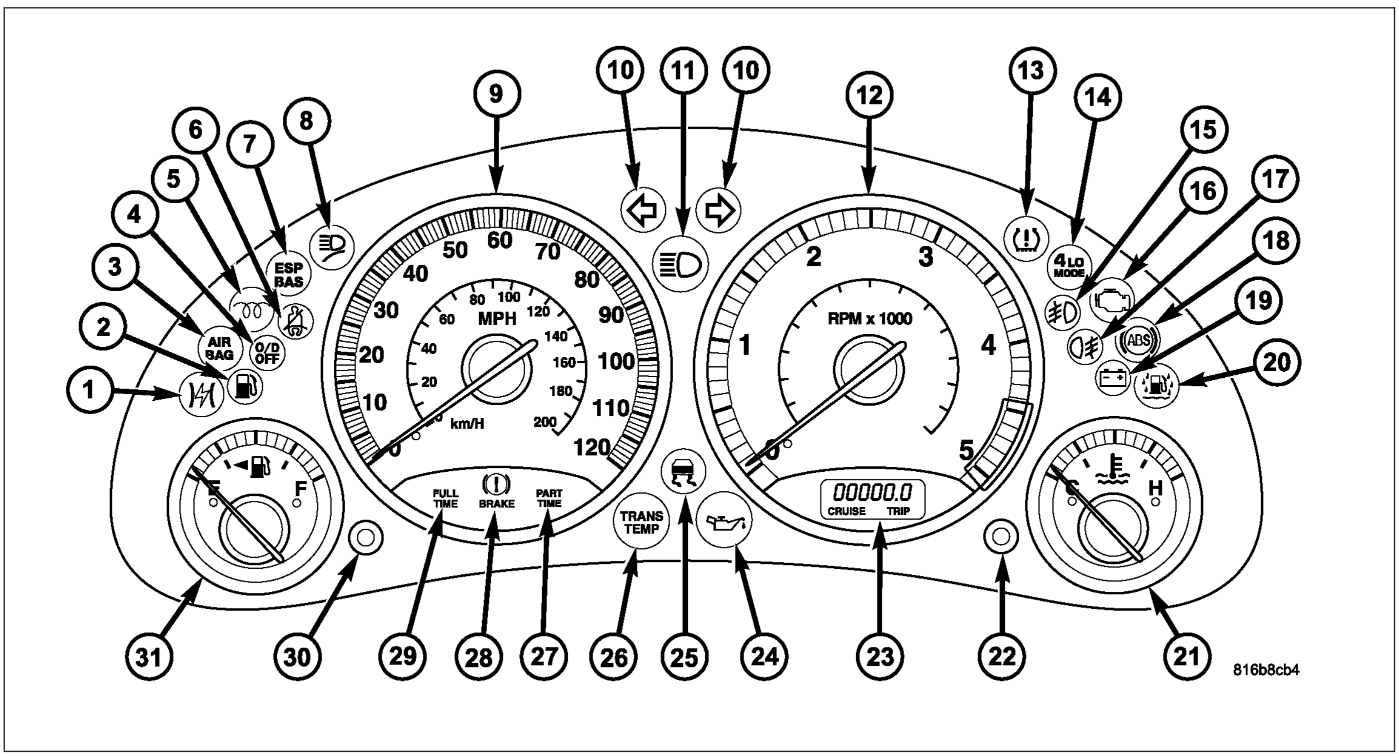
Sandwiched between the rear cover and the lens, hood and mask unit is the cluster housing. The molded plastic cluster housing serves as the carrier for the cluster circuit board and circuitry, the cluster connector receptacle, the gauges, a Light Emitting Diode (LED) for each cluster indicator, the VFD unit, an audible tone transducer, the cluster overlay, the gauge pointers, the odometer/trip odometer switch and the switch button.

Behind the cluster lens, hood, and mask unit on the face of the cluster housing is the cluster overlay. The cluster overlay is a laminated plastic unit. The dark, visible, outer surface of the overlay is marked with all of the gauge dial faces and graduations, but this layer is also translucent. The darkness of this outer layer prevents the cluster from appearing cluttered or busy by concealing the cluster indicators that are not illuminated, while the translucence of this layer allows those indicators and icons that are illuminated to be readily visible. The underlying layer of the overlay is opaque and allows light from the various indicators and the incandescent illumination lamps behind it to be visible through the outer layer of the overlay only through predetermined stencil-like cutouts. A rectangular opening in the overlay at the base of the tachometer dial face has a smoked clear lens through which the illuminated VFD unit can be viewed.

Numerous versions of the EMIC module are offered on this vehicle, in both base and premium trim. These versions accommodate all of the variations of optional equipment and regulatory requirements for the various markets in which the vehicle will be offered. The microprocessor-based EMIC utilizes integrated circuitry and information carried on the Programmable Communication Interface (PCI) data bus along with several hard wired analog and multiplexed inputs to monitor sensors and switches throughout the vehicle. In response to those inputs, the internal circuitry and programming of the EMIC allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the PCI data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION - PCI BUS).

Besides typical instrument cluster gauge and indicator support, the electronic functions and features that the EMIC supports or controls include the following:

- **Audible Warnings** - The EMIC electronic circuit board is equipped with an audible tone transducer and programming that allows it to provide various audible alerts to the vehicle operator, including chime tones and beep tones. (Refer to 8 - ELECTRICAL/CHIME WARNING SYSTEM - DESCRIPTION).
- **Panel Lamps Dimming Control** - The EMIC provides a hard wired 12-volt Pulse-Width Modulated (PWM) output that synchronizes the dimming level of all panel lamps dimmer controlled lamps with that of the cluster illumination lighting.



The EMIC houses four analog gauges, one odometer/trip odometer VFD unit and has provisions for up to twenty-five indicators. Some of the EMIC indicators are automatically configured when the EMIC is connected to the vehicle electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each EMIC may have provisions for indicators to support every available option, the configurable indicators will not be functional in a vehicle that does not have the equipment that an indicator supports.

The EMIC includes the following analog gauges:

- **Engine Temperature Gauge (21)**
- **Fuel Gauge (31)**
- **Speedometer (9)**

- **Tachometer (12)**

The EMIC includes the following VFD display units:

- **Odometer Display (23)** - Includes ajar indicators (without Electronic Vehicle Information Center (EVIC) only), cruise indicator, gas cap indicator (with gasoline engines only), low coolant indicator (with diesel engine only), odometer, trip odometer, washer fluid indicator (without EVIC only).
- **Odometer/Trip Odometer Switch Button (22)**

The EMIC includes provisions for the following indicators:

- **Airbag Indicator (3)**
- **Ajar Indicators** - textual messages in odometer VFD (23) for doors, tailgate and rear flip-up glass.
- **Antilock Brake System (ABS) Indicator (18)**
- **Brake Indicator (28)**
- **Charging Indicator (19)**
- **Coolant Low Indicator (w/Diesel Engine only)** - textual message in odometer VFD (23).
- **Cruise Indicator** - in odometer VFD (23).
- **Electronic Stability Program (ESP)/Brake Assist System (BAS) Indicator (7)**
- **Electronic Throttle Control (ETC) Indicator (1)** - with diesel engine only.
- **Four-Wheel Drive Full Time Indicator (29)** - with Selec-Trac transfer case only.
- **Four-Wheel Drive Low Mode Indicator (14)** - with four-wheel drive only.
- **Four-Wheel Drive Part Time Indicator (27)** - with four-wheel drive only.
- **Front Fog Lamp Indicator (15)** - with front fog lamps only.
- **Gas Cap Indicator** - with gasoline engine only in odometer VFD (23).
- **High Beam Indicator (11)**
- **Light Bar Lamp Indicator (8)** - with light bar lamps only.
- **Low Fuel Indicator (2)**
- **Low Oil Pressure Indicator (24)**
- **Malfunction Indicator Lamp (MIL) (16)**
- **Overdrive Off Indicator (4)** - with automatic transmission only.
- **Rear Fog Lamp Indicator (17)** - with rear fog lamps only.
- **Seatbelt Indicator (6)**
- **Security Indicator (30)**
- **Tire Pressure Monitor Indicator (13)**
- **Traction Control/Electronic Stability Program (ESP) Indicator (25)**
- **Transmission Overtemp Indicator (26)** - with automatic transmission only.
- **Turn Signal (Right and Left) Indicators (10)**
- **Wait-To-Start Indicator (5)** - with diesel engine only.
- **Washer Fluid Indicator** - textual message in odometer VFD (23).
- **Water-In-Fuel Indicator (20)** - with diesel engine only.

Each indicator in the EMIC, except the Cruise indicator located within the odometer/trip odometer VFD unit, is illuminated by a dedicated Light Emitting Diode (LED) that is soldered onto the EMIC electronic circuit board. The LED units are not available for service replacement and, if damaged or ineffective, the entire EMIC must be replaced. Cluster illumination is accomplished by dimmable incandescent back lighting, which illuminates the gauges for visibility when the exterior lighting is turned on. Each of the incandescent bulbs is secured by an integral bulb holder to the electronic circuit board from the back of the cluster housing.

Hard wired circuitry connects the EMIC to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC module for this vehicle is serviced only as a complete unit. The EMIC module cannot be adjusted or repaired. If a gauge, an LED indicator, the VFD unit, the electronic circuit board, the circuit board hardware, the cluster overlay, or the EMIC housing are damaged or ineffective, the entire EMIC module must be replaced. The cluster lens, hood and mask unit and the incandescent general illumination lamp bulbs with holders are available for individual service replacement.

## OPERATION

The ElectroMechanical Instrument Cluster (EMIC) is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the EMIC provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The EMIC is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service.

The microprocessor-based EMIC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Programmable Communication Interface (PCI) data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

The EMIC microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microprocessor can sound a chime through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The EMIC may also produce audible warnings for other electronic modules in the vehicle based upon electronic tone request messages received over the PCI data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The EMIC circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the EMIC to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the On or Start positions. The EMIC receives a ground input from the Body Control Module (BCM) as a wake-up signal in order to provide the ignition-off features. The EMIC circuitry is grounded through a ground circuit and take out of the instrument panel wire harness with an eyelet terminal connector that is secured by a nut to a ground stud located on the left instrument panel end bracket.

The EMIC also has a self-diagnostic actuator test capability, which will test each of the PCI bus message-controlled functions of the cluster by lighting the appropriate indicators (except the airbag indicator), positioning the gauge needles at several predetermined calibration points across the gauge faces, and stepping the display of the odometer Vacuum-Fluorescent Display (VFD) unit sequentially from all ones through all nines. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

### GAUGES

All gauges receive battery current through the EMIC circuitry when the ignition switch is in the On or Start positions. With the ignition switch in the Off position battery current is not supplied to any gauges, and the EMIC circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the On or Start positions.

All of the EMIC gauges are air core magnetic units. Two fixed electromagnetic coils are located within each gauge. These coils are wrapped at right angles to each other around a movable permanent magnet. The movable magnet is suspended within the coils on one end of a pivot shaft, while the gauge needle is attached to the other end of the shaft. One of the coils has a fixed current flowing through it to maintain a constant magnetic field strength. Current flow through the second coil changes, which causes changes in its magnetic field strength. The current flowing through the second coil is changed by the EMIC circuitry in response to messages received over the PCI data bus. The gauge needle moves as the movable permanent magnet aligns itself to the changing magnetic fields created around it by the electromagnets.

The gauges are diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the PCI data bus and the electronic data bus message inputs to the EMIC that control each gauge require the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for each gauge may be found elsewhere in this service information.

### VACUUM-FLUORESCENT DISPLAY

The Vacuum-Fluorescent Display (VFD) unit is soldered to the EMIC electronic circuit board. With the ignition switch in the Off or Accessory positions, the odometer display is activated when the driver door is opened (Rental Car mode) and is deactivated when the driver door is closed. Otherwise, the display unit is active when the ignition switch is in the On or Start positions, and inactive when the ignition switch is in the Off or Accessory positions.

The illumination intensity of the VFD unit is controlled by the EMIC circuitry based upon electronic dimming level messages received from the BCM over the PCI data bus, and is synchronized with the illumination intensity of other VFD units in the vehicle. The BCM provides dimming level messages based upon internal programming and inputs it receives from the circuitry of the multi-function switch on the steering column based upon the settings of the control knob and control ring on the left (lighting) control stalk that have been selected by the vehicle operator.

The EMIC VFD unit has several display capabilities including odometer, trip odometer, some warning or reminder indications, and various diagnostic information when certain fault conditions exist. On models equipped with the optional Electronic Vehicle Information Center (EVIC), most of the odometer VFD unit warning and reminder indications are suppressed so as not to duplicate indications that are provided by the EVIC. The odometer VFD warning and reminder messages include:

- **“door”** - indicating a door is ajar (on vehicles without the optional EVIC only).
- **“gascap”** - indicating that the fuel tank filler cap is loose or that there is a gross leak in the fuel vapor recovery system (on vehicles with a gasoline engine only).
- **“gate”** - indicating the tailgate is ajar (on vehicles without the optional EVIC only).
- **“glass”** - indicating the tailgate glass is ajar (on vehicles without the optional EVIC only).
- **“locool”** - indicating the engine coolant level is low (on vehicles with an optional diesel engine only).
- **“lowash”** - indicating that the washer fluid level is low (on vehicles without the optional EVIC only).
- **“no bus”** - indicating there is no PCI data bus communication detected.

An odometer/trip odometer switch on the EMIC circuit board is used to control some of the display modes. This switch is actuated manually by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just right of the tachometer. Actuating this switch momentarily with the ignition switch in the On position will toggle the VFD between the odometer and trip odometer modes. Depressing the switch button for about two seconds while the VFD is in the trip odometer mode will reset the trip odometer value to zero. The VFD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button.

Holding this switch depressed while turning the ignition switch from the Off position to the On position will initiate the EMIC self-diagnostic actuator test. The VFD will also display the cluster software version level near the completion of the EMIC self-diagnostic actuator test. Refer to the instrument cluster diagnosis and testing service information for additional details on this cluster function. The EMIC microprocessor remembers which display mode is active when the ignition switch is turned to the Off position, and returns the VFD display to that mode when the ignition switch is turned On again.

The VFD unit is diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the PCI data bus and the electronic data bus message inputs to the EMIC that control some of the VFD functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer, the trip odometer, and the various warning and reminder indicator functions of the VFD unit may be found elsewhere in this service information.

### INDICATORS

Indicators are located in various positions within the EMIC and are all connected to the EMIC electronic circuit board. Some indicators operate based upon hard wired inputs to the EMIC, but most are controlled by PCI data bus messages from other electronic modules in the vehicle. Some are controlled by a combination of hard wired inputs, electronic messaging and EMIC programming. If the EMIC loses PCI data bus communication, the EMIC circuitry will automatically turn on the Malfunction Indicator Lamp (MIL) until PCI data bus communication is restored.

The various EMIC indicators are controlled by different strategies; some receive fused ignition switch output from the EMIC circuitry and have a switched ground, others are grounded through the EMIC circuitry and have a switched battery feed, while still others are completely controlled by the EMIC microprocessor based upon various hard wired and electronic message inputs. Some indicators are illuminated at a fixed intensity, while the illumination intensity of others is synchronized with that of the EMIC general illumination lighting.

In addition, certain indicators in this instrument cluster are automatically configured or self-configured. This feature allows the configurable indicators to be enabled by the EMIC circuitry for compatibility with certain optional equipment. The ABS indicator, airbag indicator, and Tire Pressure Monitor (TPM) indicator are automatically configured by PCI data bus messages received by the EMIC from the CAB, ACM or EVIC after the EMIC is installed in the vehicle. Once these configuration settings are learned by the EMIC, a diagnostic scan tool must be used to remove these settings from the EMIC non-volatile memory. The automatically configured or self-configured indicators remain latent in each EMIC at all times and will be active only when the EMIC receives the appropriate PCI message inputs for the optional system or equipment.

The hard wired indicator inputs are diagnosed using conventional diagnostic methods. However, the EMIC circuitry and PCI bus message controlled indicators are diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the PCI data bus and the electronic message inputs to the EMIC that control an indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific details of the operation for each indicator may be found elsewhere in this service information.

### CLUSTER ILLUMINATION

The EMIC has several illumination lamps that provide cluster back lighting whenever the exterior lighting is turned On. The illumination intensity of these lamps is adjusted when the interior lighting control ring on the left control stalk of the multi-function switch is rotated (down to dim, up to brighten) to one of six available minor detent positions. The Body Control Module (BCM) monitors a resistor multiplexed input from the multi-function switch on a panel lamps dimmer switch mux circuit. In response to that input, the BCM provides a control output to energize the park lamp relay and transmits an electronic dimming level message to the EMIC over the Programmable Communications Interface (PCI) data bus based upon internal programming.

The EMIC receives the electronic dimming level message from the BCM, and a battery current input from the energized park lamp relay on the hard wired fused park lamp relay output. Based upon the dimming level message, the EMIC then converts the battery current input to the appropriate 12-volt Pulse Width Modulated (PWM) output. This PWM output is used to illuminate the cluster illumination lamps and the VFD unit on the EMIC circuit board, and provides a PWM output on the hard wired fused panel lamps dimmer switch signal circuit to control and synchronize the illumination intensity of other incandescent illumination lamps in the vehicle. The cluster illumination lamps are grounded at all times.

The BCM also transmits electronic dimming level messages over the PCI data bus to other electronic modules in the vehicle to control and synchronize the illumination intensity of their VFD units to that of the EMIC VFD unit. In addition, the control ring on the left (lighting) control stalk of the multi-function switch has a Parade Mode position to provide a parade or funeral mode. The BCM monitors the request for this mode from the multi-function switch, then transmits an electronic dimming level message to illuminate all VFD units in the vehicle at full (daytime) intensity for easier visibility when driving in daylight with the exterior lighting turned On.

The hard wired multi-function switch and panel lamps dimmer inputs to and outputs from the EMIC may be diagnosed using conventional diagnostic methods. However, proper testing of the PWM output of the EMIC and the electronic dimming level messages sent by the BCM over the PCI data bus requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## INPUT AND OUTPUT CIRCUITS

### HARD WIRED INPUTS

The hard wired inputs to the EMIC include the following:

- **BCM Wake Up Input**
- **Driver Side Front Seat Belt Switch Sense**
- **Fused B(+) - Ignition-Off Draw**
- **Fused Ignition Switch Output (Run-Start)**
- **Fused Park Lamp Relay Output**
- **Left Turn Signal**
- **Low Coolant Fluid Level Sense - with Diesel Engine**
- **Low Washer Fluid Sense**
- **Park Brake Switch Sense**
- **Passenger Side Front Seat Belt Switch Sense**

- **Red Brake Warning Indicator Driver**
- **Right Turn Signal**
- **VTSS Indicator Driver**

Refer to the appropriate wiring information for additional details.

#### HARD WIRED OUTPUTS

The hard wired outputs of the EMIC include the following:

- **Fused Panel Lamps Dimmer Switch Signal**

Refer to the appropriate wiring information for additional details.

#### GROUNDS

The EMIC receives a ground path through the following hard wired circuits:

- **Power Ground**

Refer to the appropriate wiring information for additional details.

#### COMMUNICATION

The EMIC has provisions for the following communication circuits:

- **PCI Data Bus**

Refer to the appropriate wiring information for additional details.

## DIAGNOSIS AND TESTING

## INSTRUMENT CLUSTER

If the instrument cluster general illumination lighting is inoperative, refer to CLUSTER ILLUMINATION DIAGNOSIS .

If all of the instrument cluster gauges and indicators are inoperative, be certain to check the instrument cluster fused B(+) fuse and the instrument cluster fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard wired gauge or indicator is inoperative, refer to the diagnosis and testing service information for that specific gauge or indicator. If an individual Programmable Communications Interface (PCI) data bus message-controlled gauge or indicator is inoperative, perform the Actuator Test as follows:

### ACTUATOR TEST

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. If the instrument cluster has been replaced, certain indicators in this instrument cluster will be automatically configured when the cluster is connected to the electrical system of the vehicle. This feature allows those indicators to be activated for compatibility with certain optional equipment. Some other indicators may require manual intervention to obtain proper configuration for the equipment in the specific vehicle. If the problem being diagnosed involves erroneous illumination of the ABS indicator, the airbag indicator, the Electronic Throttle Control (ETC) indicator, the Part Time indicator, the Full Time indicator or the Tire Pressure Monitor indicator when the vehicle does not have the appropriate equipment, a diagnostic scan tool must be used to manually enable or disable the correct indicator(s). Refer to the appropriate diagnostic information.**

The instrument cluster actuator test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges, the PCI data bus message controlled indicators, and the chime tone transducer are capable of operating as designed. During the actuator test the instrument cluster circuitry will sound the audible tone transducer, position each of the gauge needles at various calibration points, illuminate each of the segments in the Vacuum-Fluorescent Display (VFD) unit, and turn all of the PCI data bus message-controlled indicators on and off again.

Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the PCI data bus, the Powertrain Control Module (PCM), the Airbag Control Module (ACM), the Body Control Module (BCM), the Electronic Vehicle Information Center (EVIC), the Sentry Key REmote Entry Module (SKREEM), or the inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the Off position.
2. Depress the odometer/trip odometer switch button.
3. While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the On position, but do not start the engine.
4. Release the odometer/trip odometer switch button.
5. The instrument cluster will automatically begin the actuator test sequence, as follows:
    a. The cluster will turn on, then off again each of the PCI data bus message controlled indicators to confirm the functionality of the indicator and the cluster control circuitry:
    b. The cluster will sweep the needles for each of the gauges to several calibration points in sequence to confirm the functionality of the gauge and the cluster control circuitry:
    c. The cluster will sequentially step the odometer/trip odometer VFD unit display from all ones (111111) through all nines (999999) to confirm the functionality of all VFD unit segments and their control circuitry, then display the software version number.
    d. The cluster will generate five (5) chime tones to confirm the functionality of the audible tone transducer and the control circuitry.
6. The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test, if the ignition switch is turned to the Off position during the test, or if an engine rpm message indicating that the engine is running is received from the PCM over the PCI data bus during the test.
7. Go back to Step 1 to repeat the test, if required.

## CLUSTER ILLUMINATION DIAGNOSIS

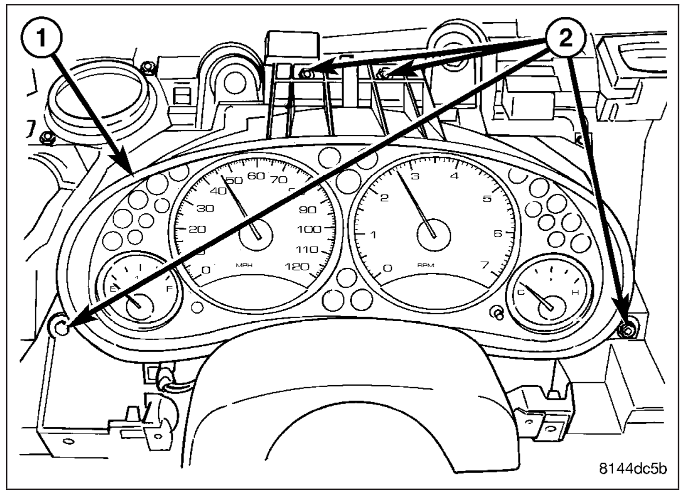
**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

If the problem being diagnosed is a single inoperative illumination lamp, be certain that the bulb and bulb holder unit are properly installed in the instrument cluster electronic circuit board. If no installation problems are found, replace the faulty bulb and bulb holder unit. If all of the cluster illumination lamps are inoperative, the most reliable, efficient, and accurate means to diagnose the cluster illumination function of the instrument cluster requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the battery negative cable.
2. Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
3. Remove the four screws (2) that secure the instrument cluster (1) to the instrument panel structural support.
4. Pull the instrument cluster rearward far enough to access and disconnect the instrument panel wire harness connector from the connector receptacle on the back of the cluster housing.
5. Remove the instrument cluster from the instrument panel.



## DISASSEMBLY

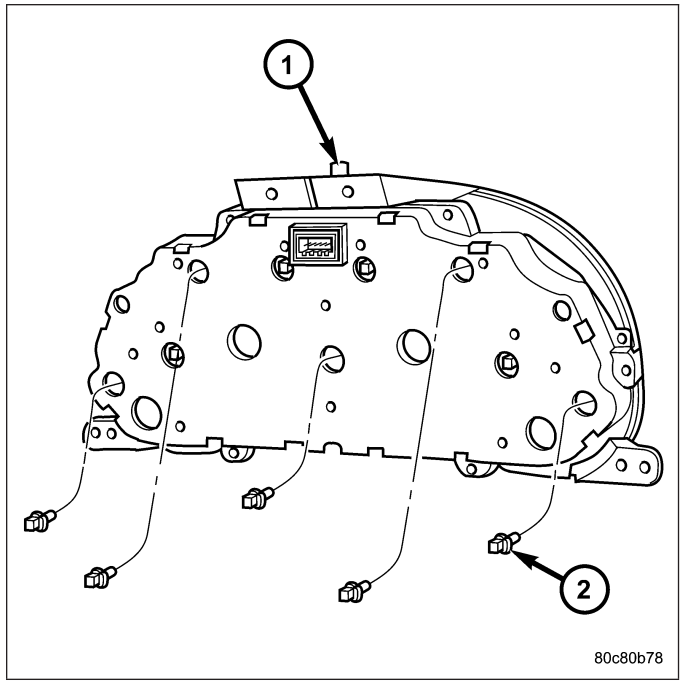
**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The incandescent instrument cluster illumination lamp bulbs (including the integral bulb holders), and the cluster lens, hood and mask unit are the only components of the instrument cluster used in this vehicle that are serviced separately. Following are the procedures for disassembling these components from the instrument cluster.**

## CLUSTER BULB

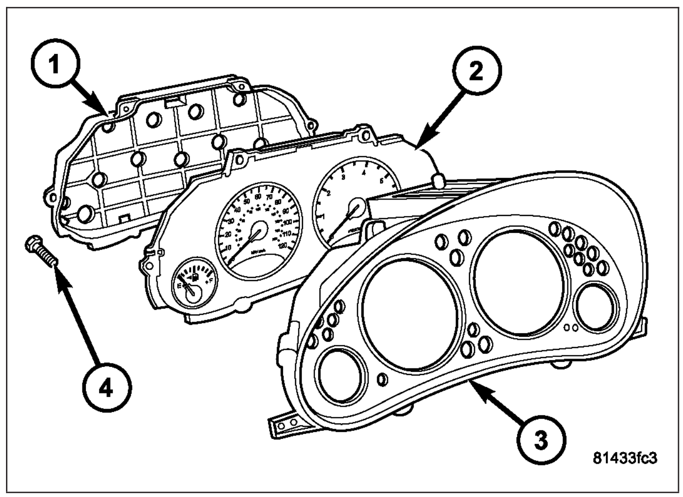
**NOTE: This procedure applies to each of the incandescent cluster illumination lamp and bulb holder units.**

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument cluster (1) from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
3. Rotate the bulb holder (2) counterclockwise about sixty degrees on the instrument cluster circuit board.
4. Pull the bulb and bulb holder straight out of the circuit board.



## CLUSTER LENS, HOOD, AND MASK

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
3. From the back of the instrument cluster, remove the six screws (4) that secure the rear cover (1) and the lens, hood, and mask unit (3) to the cluster housing (2).
4. Remove the lens, hood, and mask unit from the face of the instrument cluster.



## ASSEMBLY

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

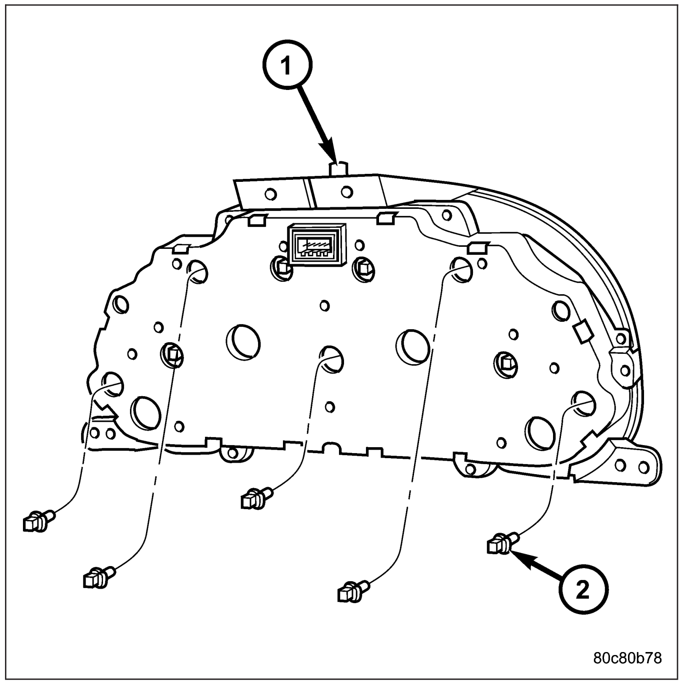
**NOTE: The incandescent instrument cluster illumination lamp bulbs (including the integral bulb holders), and the cluster lens, hood and mask unit are the only components of the instrument cluster used in this vehicle that are serviced separately. Following are the procedures for disassembling these components from the instrument cluster.**

## CLUSTER BULB

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the instrument cluster, the electronic circuit board and/or the gauges.**

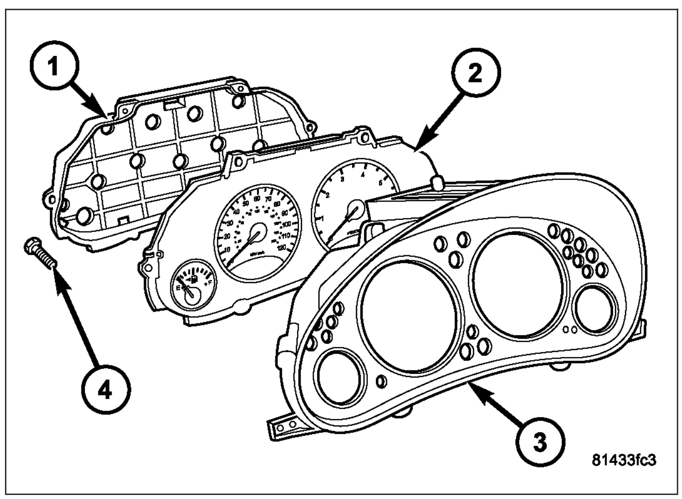
**NOTE: This procedure applies to each of the incandescent cluster illumination lamp and bulb holder units.**

1. Align the bulb holder and bulb (2) with the keyed opening in the circuit board of the instrument cluster (1).
2. Insert the bulb holder and bulb straight into the circuit board until the bulb holder is firmly seated.
3. Rotate the bulb holder clockwise about thirty degrees on the circuit board to lock it into place.
4. Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
5. Reconnect the battery negative cable.



## CLUSTER LENS, HOOD, AND MASK

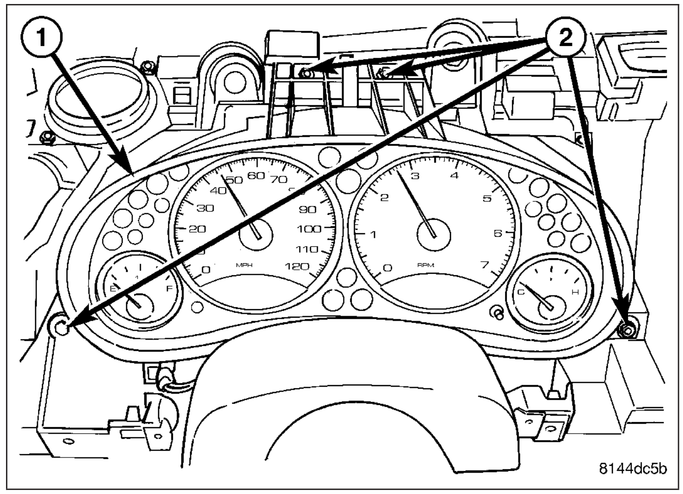
1. Position the cluster lens, hood, and mask unit (3) over the face of the instrument cluster (2). Be certain that the odometer/trip odometer switch button is inserted through the proper clearance holes in the mask and the lens.
2. From the back of the instrument cluster, install and tighten the six screws (4) that secure the rear cover (1) and the lens, hood, and mask unit to the cluster housing. Tighten the screws to 1 N·m (10 in. lbs.).
3. Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
4. Reconnect the battery negative cable.



## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Position the instrument cluster (1) close enough to the instrument panel to reconnect the instrument panel wire harness connector to the connector receptacle on the back of the cluster housing.
2. Position the instrument cluster into the instrument panel.
3. Install and tighten the four screws (2) that secure the instrument cluster to the instrument panel. Tighten the screws to 2 N·m (17 in. lbs.).
4. Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ CLUSTER BEZEL - INSTALLATION).
5. Reconnect the battery negative cable.



**NOTE: If the instrument cluster has been replaced, certain indicators in this instrument cluster will be automatically configured when the cluster is connected to the electrical system of the vehicle. This feature allows those indicators to be activated for compatibility with certain optional equipment. Some other indicators may require manual intervention to obtain proper configuration for the equipment in the specific vehicle. If a problem is noted involving erroneous illumination of the ABS indicator, the airbag indicator, the electronic throttle control indicator, the Part Time indicator or the Full Time indicator when the vehicle does not have the appropriate equipment, a diagnostic scan tool must be used to manually enable or disable the correct indicator(s). Refer to the appropriate diagnostic information.**

# ABS INDICATOR

## DESCRIPTION

An Antilock Brake System (ABS) indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional ABS, this indicator is electronically disabled. This indicator is located above the engine temperature gauge and to the right of the tachometer in the cluster overlay.

The ABS indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Failure of Anti-lock Braking System” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ABS indicator is serviced as a unit with the instrument cluster.

## OPERATION

The ABS indicator gives an indication to the vehicle operator when the ABS system is faulty or inoperative. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Programmable Communications Interface (PCI) data bus.

The ABS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the ABS indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the ABS indicator is illuminated by the instrument cluster for about three seconds as a bulb test.
- **ABS Lamp-On Message** - Each time the cluster receives a lamp-on message from the CAB, the ABS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster receives no lamp-on or lamp-off messages from the CAB for six consecutive seconds, the ABS indicator is illuminated. The indicator remains illuminated until the cluster receives a valid message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the ABS indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.
- **ABS Diagnostic Test** - The ABS indicator is blinked on and off by lamp-on and lamp-off messages from the CAB during the performance of the ABS diagnostic tests.

The CAB continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a system malfunction and/or that the ABS system has become inoperative. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the cluster ABS indicator circuit, the cluster sends a message notifying the CAB of the condition, then the instrument cluster and the CAB will each store a DTC.

For proper diagnosis of the antilock brake system, the CAB, the PCI data bus, or the electronic message inputs to the instrument cluster that control the ABS indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# AIRBAG INDICATOR

## DESCRIPTION

An airbag indicator is standard equipment on all instrument clusters. However, the instrument cluster is programmed to automatically enable this indicator only on vehicles equipped with the airbag system, which is not available in some markets. The indicator is located above the fuel gauge and to the left of the speedometer in the instrument cluster overlay.

The airbag indicator consists of a stencil-like cutout of the text “AIR BAG” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “AIR BAG” text to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The airbag indicator is serviced as a unit with the instrument cluster.

## OPERATION

The airbag indicator gives an indication to the vehicle operator when the airbag system is faulty or inoperative. The airbag indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Airbag Control Module (ACM) over the Programmable Communications Interface (PCI) data bus.

The airbag indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the airbag indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the airbag indicator is illuminated for about six seconds. The entire bulb test is a function of the ACM.
- **ACM Lamp-On Message** - Each time the cluster receives a lamp-on message from the ACM, the airbag indicator will be illuminated. The indicator remains illuminated for about 12 seconds or until the cluster receives a lamp-off message from the ACM, whichever is longer.
- **Communication Error** - If the cluster receives no airbag messages for six consecutive seconds, the airbag indicator is illuminated. The indicator remains illuminated until the cluster receives a single lamp-off message from the ACM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the airbag indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the airbag indicator is a function of the instrument cluster.

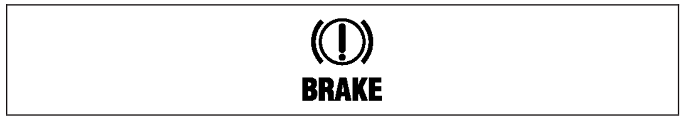
The ACM continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ACM then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the ACM sends a lamp-on message after the bulb test, it indicates that the ACM has detected a system malfunction and/or that the airbags and seat belt tensioners may not deploy when required, or may deploy when not required. The ACM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the cluster airbag indicator circuit, the cluster sends a message notifying the ACM of the condition, then the instrument cluster and the ACM will each store a DTC.

For proper diagnosis of the airbag system, the ACM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the airbag indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# BRAKE/PARK BRAKE INDICATOR

## DESCRIPTION

A brake indicator is standard equipment on all instrument clusters. This indicator is located near the lower edge of the speedometer gauge dial face in the instrument cluster overlay.



The brake indicator consists of stencil-like cutout of the text “BRAKE” and the International Control and Display Symbol icon for “Brake Failure” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the text and icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The brake indicator is serviced as a unit with the instrument cluster.

## OPERATION

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, when there are certain brake hydraulic system malfunctions as indicated by a low brake hydraulic fluid level condition, or when the brake fluid level switch is disconnected. On models equipped with an optional Antilock Brake System (ABS), the brake indicator can also give an indication when certain faults are detected in the ABS. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Programmable Communications Interface (PCI) data bus (ABS only), and hard wired inputs from the park brake switch and the brake fluid level switch.

The brake indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the brake indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the brake indicator is illuminated by the instrument cluster for about three seconds as a bulb test.
- **Brake Lamp-On Message** - Each time the cluster receives a lamp-on message from the CAB, the brake indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Park Brake Switch Input** - Each time the cluster detects ground on the park brake switch sense circuit (park brake switch closed = park brake applied or not fully released) while the ignition switch is in the On position, the brake indicator is illuminated. The indicator remains illuminated until the park brake switch sense input to the cluster is an open circuit (park brake switch open = park brake fully released), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Brake Fluid Level Switch Input** - Each time the cluster detects ground on the red brake warning indicator driver circuit (brake fluid level switch closed = brake hydraulic system fluid level low) while the ignition switch is in the On position, the brake indicator is illuminated. The indicator remains illuminated until the status of the red brake warning indicator driver input to the cluster is off (brake fluid level switch off = brake hydraulic system fluid level is not low), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Brake Fluid Level Switch Input Fault** - The brake fluid level switch also features a 1 kilohm diagnostic resistor connected in parallel between the switch input and output to provide the cluster with verification that the red brake warning indicator driver circuit is not open. If the cluster does not see a proper input on the red brake warning indicator driver circuit while the ignition switch is in the On position, it will turn on the brake indicator. The indicator remains illuminated until the red brake warning indicator driver circuit fault is resolved, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the brake indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The park brake switch on the park brake lever mechanism provides a hard wired ground input to the instrument cluster circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released.

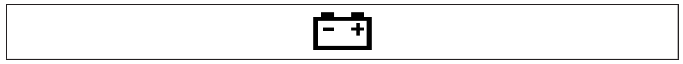
The brake fluid level switch on the brake master cylinder reservoir provides a hard wired ground input to the instrument cluster circuitry through the red brake warning indicator driver circuit whenever the fluid level in the reservoir becomes low. On models equipped with the optional ABS system, the CAB continually monitors the ABS system circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a system malfunction and/or that the ABS system has become inoperative. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects.

For further diagnosis of the brake indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The park brake switch input to the instrument cluster may be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information. For proper diagnosis of the brake fluid level switch, the ABS, the CAB, the PCI data bus, or the electronic message inputs to the instrument cluster that control the brake indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# CHARGING INDICATOR

## DESCRIPTION

A charging indicator is standard equipment on all instrument clusters. This indicator is located above the engine temperature gauge and to the right of the tachometer on the instrument cluster overlay.



The charging indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Battery Charging Condition" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The charging indicator is serviced as a unit with the instrument cluster.

## OPERATION

The charging indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The charging indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the charging indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the charging indicator is illuminated by the instrument cluster for about three seconds as a bulb test.
- **Voltage Low Message** - Each time the cluster receives a message from the PCM indicating the electrical system voltage is low (less than about nine volts is a charge fail condition), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the electrical system voltage is normal (greater than about 12.0 volts, but less than 16.0 volts), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Voltage High Message** - Each time the cluster receives a message from the PCM indicating a electrical system voltage is high (greater than about 16.0 volts), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the electrical system voltage is normal (less than about 15.5 volts, but greater than 9.0 volts), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the charging indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the electrical system voltage to control the generator output. The PCM then sends the proper system voltage messages to the instrument cluster. If the instrument cluster turns on the charging indicator after the bulb test, it may indicate that the charging system requires service. For further diagnosis of the charging indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the charging system, the PCI data bus, or the electronic message inputs to the instrument cluster that control the charging indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# COOLANT LOW INDICATOR

## DESCRIPTION

A coolant low indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional diesel engine this indicator is electronically disabled. The coolant low indication appears within the cluster Vacuum Fluorescent Display (VFD) unit.

The coolant low indicator consists of a textual “LoCooL” message which appears in place of the odometer information in the VFD. The VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated. The textual message appears in the same blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

The coolant low indicator is serviced as a unit with the VFD in the instrument cluster.

## OPERATION

The coolant low indicator gives an indication to the vehicle operator when the diesel engine coolant level is low. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and a hard wired input received by the cluster from the engine coolant level switch.

The coolant low indicator function of the cluster Vacuum Fluorescent Display (VFD) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the VFD coolant low indication will always be off when the ignition switch is in any position except On or Start. The instrument cluster will turn on the coolant low indicator for the following reasons:

- **Engine Coolant Level Switch Input** - Each time the cluster detects a low resistance or ground on the low coolant fluid level sense circuit (engine coolant level switch closed = engine coolant level low) while the ignition switch is in the On position, the cluster applies an algorithm to ensure that the input is correct and not the result of coolant sloshing in the coolant reservoir. The cluster tests the status of the circuit about seven milliseconds after ignition On, and about once every second thereafter, then uses an internal counter to count up or down. When the counter accumulates 30 ground inputs on the circuit, the coolant low indicator will be illuminated. If the ignition switch is in the On position and the vehicle is not moving when the coolant level switch input is received, the VFD will repeatedly and sequentially cycle the coolant low indication in two second intervals with the odometer/trip odometer information and any other active warnings including: door ajar, gate ajar, glass ajar, and low washer fluid. If the vehicle is moving, or once the cluster of a non-moving vehicle receives an electronic vehicle speed message from the Powertrain Control Module (PCM) indicating a speed greater than zero, the warning sequence will consist of three complete display cycles with an audible single chime tone accompanying each cycle, then revert to only the visual coolant low indication and odometer/trip odometer display cycling until the low coolant fluid level sense input to the cluster is not closed or low resistance (engine coolant level switch not closed or low resistance = engine coolant level full), or until the ignition switch is turned to the Off position, whichever occurs first. The VFD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button on the front of the cluster.
- **Engine Coolant Level Switch Input Fault** - The engine coolant level switch also features a 3.3 kilohm diagnostic resistor connected in parallel between the switch input and output to provide the cluster with verification that the low coolant fluid level sense circuit is not open or shorted. If the cluster does not see a proper input on the low coolant fluid level sense circuit, it will suspend coolant low indicator operation. The indicator operation remains suspended until the low coolant fluid level sense circuit fault is resolved.

The engine coolant level switch on the coolant bottle provides a hard wired ground input to the instrument cluster circuitry through the low coolant fluid level sense circuit whenever the level of the coolant in the bottle is low. For further diagnosis of the coolant low indicator or the instrument cluster circuitry that controls the VFD, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the engine coolant level switch input to the instrument cluster that controls the coolant low indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# CRUISE INDICATOR

## DESCRIPTION

**CRUISE**

A cruise indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional speed control system, this indicator is electronically disabled. This indicator is located within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit.

The cruise indicator consists of the text “CRUISE” in the lower portion of the odometer VFD unit. The odometer VFD is soldered onto the instrument cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated. The “CRUISE” text appears in a blue-green color and at the same lighting level as the odometer/trip odometer information when it is illuminated by the instrument cluster electronic circuit board.

The cruise indicator is serviced as a unit with the VFD unit in the instrument cluster.

## OPERATION

The cruise indicator gives an indication to the vehicle operator when the speed control system is turned On, regardless of whether the speed control is engaged. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The cruise indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The indicator only illuminates when it is switched to ground by the instrument cluster logic circuit. The instrument cluster will turn on the cruise indicator for the following reasons:

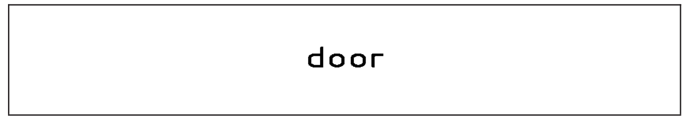
- **Cruise Lamp-On Message** - Each time the cluster receives a cruise lamp-on message from the PCM indicating the speed control system has been turned On, the cruise indicator is illuminated. The indicator remains illuminated until the cluster receives a cruise lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the cruise indicator will be turned on, then off again during the VFD portion of the test in order to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the speed control switches to determine the appropriate outputs to the speed control servo. The PCM then sends the proper cruise indicator lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the cruise indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the speed control system, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the cruise indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# DOOR AJAR INDICATOR

## DESCRIPTION



A door ajar indicator is standard equipment on all instrument clusters. This indicator is located within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit. However, on models equipped with the optional Electronic Vehicle Information Center (EVIC) the door ajar indicator in the odometer VFD is electronically suppressed so as not to duplicate indications that are provided by the EVIC.

The door ajar indicator consists of the text “door”, which appears in place of the odometer/trip odometer information in the odometer VFD unit. The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated. The “door” text appears in the same blue-green color and at the same lighting level as the odometer/trip odometer information when it is illuminated by the instrument cluster electronic circuit board.

The door ajar indicator is serviced as a unit with the VFD unit in the instrument cluster.

## OPERATION

The door ajar indicator gives an indication to the vehicle operator that one or more of the passenger compartment doors may be open or not completely latched. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received by the cluster from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus.

The door ajar indicator function of the Vacuum Fluorescent Display (VFD) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the VFD door ajar indication will always be off when the ignition switch is in any position except On or Start. The instrument cluster will turn on the door ajar indicator for the following reasons:

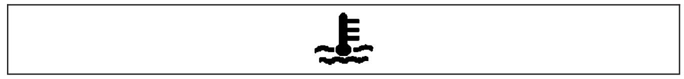
- **Door Ajar Lamp-On Message** - Each time the cluster receives a door ajar lamp-on message from the BCM indicating that a door is open or not completely latched, the door ajar indicator will be illuminated. If the ignition switch is in the On position and the vehicle is not moving when the door ajar lamp-on message is received, the VFD will repeatedly and sequentially cycle the door ajar indication in two second intervals with the odometer/trip odometer information and any other active warnings including: gate ajar, glass ajar, and low washer fluid. If the vehicle is moving, or once the cluster of a non-moving vehicle receives an electronic vehicle speed message from the Powertrain Control Module (PCM) indicating a speed greater than zero, the warning sequence will consist of three complete display cycles with an audible single chime tone accompanying each cycle, then revert to only the visual door ajar indication and odometer/trip odometer display cycling until the door ajar switch is cycled. The door ajar indicator will also be extinguished when the cluster receives a door ajar lamp-off message from the BCM, if the ignition switch is turned to the Off position, whichever occurs first. The VFD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button on the front of the cluster.

The BCM continually monitors the door ajar switches to determine the status of the doors. The BCM then sends the proper door ajar lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the door ajar indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the door ajar switches and circuits, the BCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the door ajar indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# ENGINE TEMPERATURE GAUGE

## DESCRIPTION



An engine coolant temperature gauge is standard equipment on all instrument clusters. This gauge is located in the lower right corner of the instrument cluster, to the right of the tachometer. The gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from “C” (or Cold) to “H” (or Hot) for all engines. An International Control and Display Symbol icon for “Engine Coolant Temperature” is located on the cluster overlay, in the center of the gauge directly above the hub of the gauge needle.

The engine coolant temperature gauge text and graphics are white against a black field, while the major and minor scale increments are black against a silver field, except for a pair of red zone increments at the far right (Hot) end of the gauge scale. All text, graphics and increments are clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white text and graphics and the major black increments appear blue-green, while the major red increments still appear red. The minor increments are not illuminated. The red gauge needle is internally illuminated.

Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The engine coolant temperature gauge is serviced as a unit with the instrument cluster.

## OPERATION

The engine coolant temperature gauge gives an indication to the vehicle operator of the engine coolant temperature. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The engine coolant temperature gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is within the normal operating range [up to about 124° C (255° F) for gasoline engines, or about 110° C (230° F) for diesel engines], the gauge needle is moved to the actual relative temperature position on the gauge scale.
- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is high [above about 127° C (260° F) for gasoline engines, or 112° C (233° F) for diesel engines], the gauge needle is moved into the center of the red warning zone on the gauge scale.
- **Engine Temperature Critical Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is critical [above about 132° C (269° F) for gasoline engines, or 115° C (239° F) for diesel engines], the gauge needle is moved to the high end of the red warning zone on the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine coolant temperature gauge needle will be swept to several gauge calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the instrument cluster. For further diagnosis of the engine coolant temperature gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster moves the engine coolant temperature gauge needle to indicate a high or critical engine temperature, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant temperature sensor, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the engine coolant temperature gauge, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# ELECTRONIC STABILITY PROGRAM/BRAKE ASSIST SYSTEM INDICATOR

## DESCRIPTION

An ESP/BAS indicator is standard equipment on all instrument clusters. This indicator is located above the fuel gauge and to the left of the speedometer on the cluster overlay.

The ESP/BAS indicator consists of a stencil-like cutout of the text “ESP BAS” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “ESP BAS” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ESP/BAS indicator is serviced as a unit with the instrument cluster.

## OPERATION

The ESP/BAS indicator gives an indication to the vehicle operator when a fault has been detected in the Electronic Stability Program (ESP)/Brake Assist System (BAS). This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Programmable Communications Interface (PCI) data bus.

The ESP/BAS indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The indicator only illuminates when it is switched to ground by the instrument cluster circuitry. The instrument cluster will turn on the ESP/BAS indicator for the following reasons:

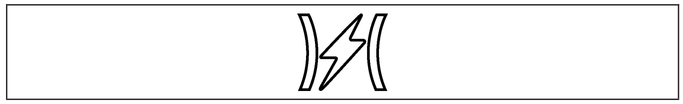
- **Bulb Test** - Each time the ignition switch is turned to the On position the ESP/BAS indicator is illuminated for about four seconds as a bulb test.
- **ESP/BAS Lamp-On Message** - Each time the cluster receives an ESP/BAS lamp-on message from the CAB indicating that a fault has been detected in an ESP/BAS system circuit or component, the ESP/BAS indicator will be illuminated. The indicator remains illuminated until the fault is corrected and the cluster receives an ESP/BAS lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the ESP/BAS indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The CAB continually monitors the ESP/BAS system components and circuits to determine the condition of the system. The CAB then sends the proper ESP/BAS lamp-on and lamp-off messages to the instrument cluster. For proper diagnosis of the ESP/BAS system, the CAB, the PCI data bus, or the electronic message inputs to the instrument cluster that control the ESP/BAS indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# ETC INDICATOR

## DESCRIPTION

An Electronic Throttle Control (ETC) indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional diesel engine, this indicator is electronically disabled. This indicator is located above the fuel gauge and to the left of the speedometer on the cluster overlay.



The ETC indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Electronic Throttle Control" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The ETC indicator is serviced as a unit with the instrument cluster.

## OPERATION

The Electronic Throttle Control (ETC) indicator gives an indication to the vehicle operator when the ETC system is faulty or inoperative. The ETC indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The ETC indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the ETC indicator for the following reasons:

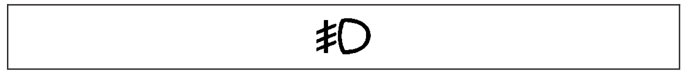
- **Bulb Test** - Each time the ignition switch is turned to the On position the ETC indicator is illuminated for about 15 seconds. The entire bulb test is a function of the PCM.
- **ETC Lamp-On Message** - Each time the cluster receives a lamp-on message from the PCM, the ETC indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or continues to flash for about 12 seconds or until the cluster receives a lamp-off message from the PCM, whichever is longer. If the indicator is illuminated solid with the engine running the vehicle will usually remain drivable. If the indicator is flashing with the engine running the vehicle may require towing. A flashing indicator means the ETC system requires immediate service.
- **Communication Error** - If the cluster receives no lamp-on or lamp-off message from the PCM for 20 consecutive seconds, the Malfunction Indicator Lamp (MIL) is illuminated by the instrument cluster. The MIL remains controlled and illuminated by the cluster until a valid ETC indicator lamp-on or lamp-off message is received from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the ETC indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the ETC indicator is a function of the PCM.

The PCM continually monitors the ETC system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the PCM sends a lamp-on message after the bulb test, it indicates that the PCM has detected an ETC system malfunction and/or that the ETC system is inoperative. The PCM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ETC indicator fails to illuminate due to an open or short in the cluster ETC indicator circuit, the cluster sends a message notifying the PCM of the condition, then the instrument cluster and the PCM will each store a DTC.

For proper diagnosis of the ETC system, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the ETC indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# FRONT FOG LAMP INDICATOR

## DESCRIPTION



A front fog lamp indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional front fog lamps, this indicator is electronically disabled. This indicator is located above the engine temperature gauge and to the right of the tachometer on the cluster overlay.

The front fog lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Front Fog Light” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in green through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the front fog lamp indicator is dimmable, which is adjusted along with the cluster illumination lighting using the panel lamps dimmer control ring on the left control stalk of the multi-function switch.

The front fog lamp indicator is serviced as a unit with the instrument cluster.

## OPERATION

The front fog lamp indicator gives an indication to the vehicle operator whenever the front fog lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus.

The front fog lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the front fog lamp indicator for the following reasons:

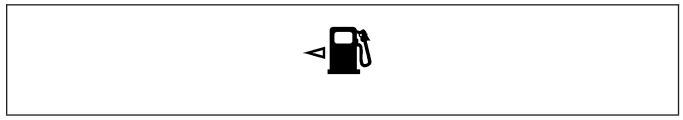
- **Front Fog Lamp-On Message** - Each time the cluster receives a front fog lamp-on message from the BCM indicating the front fog lamps are turned On, the front fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a front fog lamp-off message from the BCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the front fog lamp indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The BCM continually monitors the exterior lighting (multi-function) switch to determine the appropriate outputs to the front fog lamp relay. The BCM then sends the proper front fog lamp indicator lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the front fog lamp indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the front fog lamp system, the BCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the front fog lamp indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# FUEL GAUGE

## DESCRIPTION



A fuel gauge is standard equipment on all instrument clusters. This gauge is located in the lower left corner of the instrument cluster, to the left of the speedometer. This gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from “E” (or Empty) to “F” (or Full). An International Control and Display Symbol icon for “Fuel” is located on the cluster overlay, directly above the hub of the gauge needle. An arrowhead pointed to the left side of the vehicle is imprinted on the cluster overlay next to the “Fuel” icon in the fuel gauge to provide the driver with a reminder as to the location of the fuel filler access.

The fuel gauge text and graphics are white against a black field, while the major and minor scale increments are black against a silver field, except for a pair of red zone increments at the far left (Empty) end of the gauge scale. All text, graphics and increments are clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white text and graphics and the major black increments appear blue-green, while the major red increments still appear red. The minor increments are not illuminated. The red gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board.

The fuel gauge is serviced as a unit with the instrument cluster.

## OPERATION

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The fuel gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Percent Tank Full Message -** Each time the cluster receives a message from the PCM indicating the percent tank full, the cluster moves the gauge needle to the proper relative position on the gauge scale. The PCM applies an algorithm to the input from the fuel tank sending unit to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs to the PCM.
- **Less Than 15 Percent Tank Full Message -** Each time the cluster receives messages from the PCM indicating the percent tank full is less than 15, the gauge needle is moved to below the one-eighth position (red zone) on the gauge scale and the low fuel indicator is illuminated. The low fuel indicator remains illuminated until the cluster receives messages from the PCM indicating that the percent tank full is greater than 15 (one-eighth), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Less Than Empty Percent Tank Full Message -** Each time the cluster receives a message from the PCM indicating the percent tank full is less than empty, the gauge needle is moved to the far left (low) end of the gauge scale and the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sending unit input to the PCM is a short circuit.
- **More Than Full Percent Tank Full Message -** Each time the cluster receives a message from the PCM indicating the percent tank full is more than full, the gauge needle is moved to the far left (low) end of the gauge scale and the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sending unit input to the PCM is an open circuit.
- **Actuator Test -** Each time the cluster is put through the actuator test, the fuel gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the fuel tank sending unit input to determine the level of fuel in the fuel tank. The PCM then applies an algorithm to the input and sends the proper percent tank full messages to the instrument cluster. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the fuel tank sending unit, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the fuel gauge, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# GAS CAP INDICATOR

## DESCRIPTION

A gas cap indicator is standard equipment on all instrument clusters. However, on vehicles equipped with the optional diesel engine, this indicator is electronically disabled. The gas cap indication appears within the odometer Vacuum Fluorescent Display (VFD) unit.

The gas cap indicator consists of a textual **GASCAP** message which appears in place of the odometer information in the display. The odometer VFD is soldered onto the cluster electronic circuit board, and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated. The gas cap textual message appears in the same blue-green color and at the same lighting level as the odometer information when it is illuminated by the instrument cluster electronic circuit board.

The gas cap indicator is serviced as a unit with the VFD in the instrument cluster.

## OPERATION

The gas cap indicator gives an indication to the vehicle operator when there is a gross leak detected in the on-board fuel vapor recovery system. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received over the Programmable Communications Interface (PCI) data bus from the Powertrain Control Module (PCM).

The gas cap indicator function of the odometer Vacuum Fluorescent Display (VFD) unit is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the VFD gas cap indication will always be off when the ignition switch is in any position except On or Start. The instrument cluster will turn on the gas cap indicator for the following reasons:

- **Gas Cap Indicator Request Message** - Each time the cluster receives a gas cap indicator request message from the PCM indicating there is a gross leak in the vapor recovery system, the gas cap indicator will be illuminated. If the ignition switch is in the On position and the vehicle is not moving when the gas cap indicator request message is received, the VFD will repeatedly and sequentially cycle the gas cap indication in two second intervals with the odometer/trip odometer information and any other active warnings including: door ajar, gate ajar, glass ajar, and low washer fluid. If the vehicle is moving, or once the cluster of a non-moving vehicle receives an electronic vehicle speed message from the Powertrain Control Module (PCM) indicating a speed greater than zero, the warning sequence will consist of three complete display cycles with an audible single chime tone accompanying each cycle, then revert to only the visual gas cap indication and odometer/trip odometer display cycling until the cluster receives a message indicating there is no gross leak in the vapor recovery system, or until the ignition switch is turned to the Off position, whichever occurs first. The VFD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button on the front of the cluster.

The PCM continually monitors the on board vapor recovery system to determine whether there are air leaks in the system. The PCM then sends the proper gas cap indicator messages to the instrument cluster. For proper diagnosis of the on board vapor recovery system, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the gas cap indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# GATE AJAR INDICATOR

## DESCRIPTION

A gate ajar indicator is standard equipment on all instrument clusters. This indicator is located within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit. However, on models equipped with the optional Electronic Vehicle Information Center (EVIC) the gate ajar indicator in the odometer VFD is electronically suppressed so as not to duplicate indications that are provided by the EVIC.

The gate ajar indicator consists of the text “GATE”, which appears in place of the odometer/trip odometer information in the odometer VFD unit. The odometer VFD is soldered onto the cluster electronic circuit board and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated. The “GATE” text appears in the same blue-green color and at the same lighting level as the odometer/trip odometer information when it is illuminated by the instrument cluster electronic circuit board.

The gate ajar indicator is serviced as a unit with the VFD unit in the instrument cluster.

## OPERATION

The gate ajar indicator gives an indication to the vehicle operator that the rear tailgate may be open or not completely latched. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received by the cluster from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus.

The gate ajar indicator function of the Vacuum Fluorescent Display (VFD) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the VFD gate ajar indication will always be off when the ignition switch is in any position except On or Start. The instrument cluster will turn on the gate ajar indicator for the following reasons:

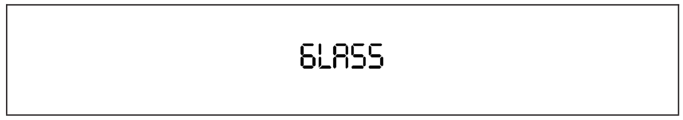
- **Gate Ajar Lamp-On Message** - Each time the cluster receives a gate ajar lamp-on message from the BCM indicating that the rear tailgate is open or not completely latched, the gate ajar indicator will be illuminated. If the ignition switch is in the On position and the vehicle is not moving when the gate ajar lamp-on message is received, the VFD will repeatedly and sequentially cycle the gate ajar indication in two second intervals with the odometer/trip odometer information and any other active warnings including: door ajar, glass ajar, and low washer fluid. If the vehicle is moving, or once the cluster of a non-moving vehicle receives an electronic vehicle speed message from the Powertrain Control Module (PCM) indicating a speed greater than zero, the warning sequence will consist of three complete display cycles with an audible single chime tone accompanying each cycle, then revert to only the visual gate ajar indication and odometer/trip odometer display cycling until the tailgate ajar switch is cycled. The gate ajar indicator will also be extinguished when the cluster receives a gate ajar lamp-off message from the BCM, or if the ignition switch is turned to the Off position, whichever occurs first. The VFD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button on the front of the cluster.

The BCM continually monitors the tailgate ajar switch to determine the status of the rear tailgate. The BCM then sends the proper gate ajar lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the gate ajar indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the tailgate ajar switch and circuit, the BCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the gate ajar indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# GLASS AJAR INDICATOR

## DESCRIPTION



A glass ajar indicator is standard equipment on all instrument clusters. This indicator is located within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit. However, on models equipped with the optional Electronic Vehicle Information Center (EVIC) the glass ajar indicator in the odometer VFD is electronically suppressed so as not to duplicate indications that are provided by the EVIC.

The glass ajar indicator consists of the text "GLASS", which appears in place of the odometer/trip odometer information in the odometer VFD unit. The odometer VFD is soldered onto the cluster electronic circuit board and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated. The "GLASS" text appears in the same blue-green color and at the same lighting level as the odometer/trip odometer information when it is illuminated by the instrument cluster electronic circuit board.

The glass ajar indicator is serviced as a unit with the VFD unit in the instrument cluster.

## OPERATION

The glass ajar indicator gives an indication to the vehicle operator that the rear flip-up glass may be open or not completely latched. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received by the cluster from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus.

The glass ajar indicator function of the Vacuum Fluorescent Display (VFD) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the VFD glass ajar indication will always be off when the ignition switch is in any position except On or Start. The instrument cluster will turn on the glass ajar indicator for the following reasons:

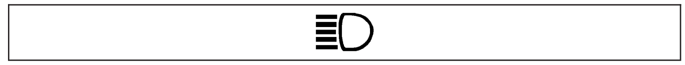
- **Glass Ajar Lamp-On Message** - Each time the cluster receives a glass ajar lamp-on message from the BCM indicating that the rear flip-up glass is open or not completely latched, the glass ajar indicator will be illuminated. If the ignition switch is in the On position and the vehicle is not moving when the glass ajar lamp-on message is received, the VFD will repeatedly and sequentially cycle its glass ajar indication in two second intervals with the odometer/trip odometer information and any other active warnings including: door ajar, gate ajar, and low washer fluid. If the vehicle is moving, or once the cluster of a non-moving vehicle receives an electronic vehicle speed message from the Powertrain Control Module (PCM) indicating a speed greater than zero, the warning sequence will consist of three complete display cycles with an audible single chime tone accompanying each of the first two cycles, then revert to only the visual glass ajar indication and odometer/trip odometer display cycling until the glass ajar switch is cycled. The glass ajar indicator will also be extinguished when the cluster receives a glass ajar lamp-off message from the BCM, or if the ignition switch is turned to the Off position, whichever occurs first. The VFD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button on the front of the cluster.

The BCM continually monitors the flip-up glass ajar switch to determine the status of the rear flip-up glass. The BCM then sends the proper glass ajar lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the glass ajar indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the glass ajar switch and circuit, the BCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the glass ajar indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# HIGH BEAM INDICATOR

## DESCRIPTION



A high beam indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the cluster overlay, between the tachometer and the speedometer.

The high beam indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "High Beam" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A blue Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in blue through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The high beam indicator is serviced as a unit with the instrument cluster.

## OPERATION

The high beam indicator gives an indication to the vehicle operator whenever the headlamp high beams are illuminated. In certain markets where required, the high beam indicator also gives an indication when the optional light bar lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus.

The high beam indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the high beam indicator for the following reasons:

- **High Beam Headlamps-On Message** - Each time the cluster receives a high beam headlamps-on electronic message from the BCM the high beam indicator will be illuminated. The high beam indicator remains illuminated until the cluster receives a high beam headlamps-off message from the BCM.
- **Light Bar Lamps-On Message** - This function of the high beam indicator applies only to vehicles equipped with the optional light bar lamps and manufactured for certain markets where it is required. Each time the cluster receives a light bar lamps-on message from the BCM the high beam indicator will be illuminated. The high beam indicator remains illuminated until the cluster receives a light bar lamps-off message from the BCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the high beam indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The BCM continually monitors the exterior lighting (multi-function) switch and the optional light bar lamp switch to determine the appropriate outputs to the headlamp low beam, headlamp high beam, and light bar lamp relays. The BCM then sends the proper high beam indicator and light bar lamp indicator messages to the instrument cluster. For further diagnosis of the high beam indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the headlamp system, the light bar lamp system, the BCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the high beam indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# LIGHT BAR LAMP INDICATOR

## DESCRIPTION

A light bar lamp indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional roof-mounted light bar, this indicator is electronically disabled. The light bar lamp indicator is located above the fuel gauge and to the left of the speedometer in the cluster overlay.

The light bar lamp indicator consists of a stencil-like cutout of an icon in the opaque layer of the instrument cluster overlay. This icon is similar in appearance to the International Control and Display Symbol icon for “High Beam”, but has an additional curved line beneath it to represent the forward roofline of the vehicle. The dark outer layer of the overlay prevents the indicator from being clearly visible when the it is not illuminated. An amber or blue Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber or blue through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The color of the LED used is determined by the requirements of the market for which the vehicle is manufactured.

When the exterior lighting is turned On, the illumination intensity of the light bar lamp indicator is dimmable, which is adjusted along with the cluster illumination lighting using the panel lamps dimmer control ring on the left control stalk of the multi-function switch.

The light bar lamp indicator is serviced as a unit with the instrument cluster.

## OPERATION

The light bar lamp indicator gives an indication to the vehicle operator whenever the light bar lamps are illuminated. In certain markets where required, the high beam indicator also gives an indication when the optional light bar lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus.

The light bar lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the light bar lamp indicator for the following reasons:

- **Light Bar Lamps-On Message** - Each time the cluster receives a light bar lamps-on message from the BCM, the light bar lamp indicator will be illuminated. The light bar lamp indicator remains illuminated until the cluster receives a light bar lamps-off message from the BCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the light bar lamp indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The BCM continually monitors the light bar lamp switch to determine the appropriate outputs to the light bar lamp relay. The BCM then sends the proper light bar lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the light bar lamp indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the light bar lamp system, the BCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the light bar lamp indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# LOW FUEL INDICATOR

## DESCRIPTION

A low fuel indicator is standard equipment on all instrument clusters. The low fuel indicator is located above the fuel gauge and to the left of the speedometer in the cluster overlay.

The low fuel indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Fuel” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The low fuel indicator is serviced as a unit with the instrument cluster.

## OPERATION

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The low fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the low fuel indicator for the following reasons:

- **Bulb Test -** Each time the ignition switch is turned to the On position the low fuel indicator is illuminated for about three seconds as a bulb test.
- **Less Than 15 Percent Tank Full Message** - Each time the cluster receives messages from the PCM indicating that the percent tank full is less than 15, the low fuel indicator is illuminated. The indicator remains illuminated until the cluster receives messages from the PCM indicating that the percent tank full has increased to greater than 15. The PCM applies an algorithm to the input from the fuel tank sending unit to dampen the illumination of the low fuel indicator against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs to the PCM.
- **Less Than Empty Percent Tank Full Message -** Each time the cluster receives a message from the PCM indicating the percent tank full is less than empty, the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sending unit input to the PCM is a short circuit.
- **More Than Full Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full is more than full, the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sending unit input to the PCM is an open circuit.
- **Communication Error** - If the cluster fails to receive a percent tank full message for more than about 12 seconds, the cluster control circuitry will illuminate the low fuel indicator until a new percent tank full message is received, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test -** Each time the cluster is put through the actuator test, the low fuel indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the fuel tank sending unit input to determine the level of fuel in the fuel tank. The PCM then applies an algorithm to the input and sends the proper percent tank full messages to the instrument cluster. For further diagnosis of the low fuel indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the fuel tank sending unit, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the low fuel indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# LOW OIL PRESSURE INDICATOR

## DESCRIPTION

A low oil pressure indicator is standard equipment on all instrument clusters. This indicator is located near the lower edge of the cluster overlay, between the tachometer and the speedometer.

The low oil pressure indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Engine Oil” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The low oil pressure indicator is serviced as a unit with the instrument cluster.

## OPERATION

The low oil pressure indicator gives an indication to the vehicle operator when the engine oil pressure reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The low oil pressure indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the low oil pressure indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the low oil pressure indicator is illuminated as a bulb test. The indicator will remain illuminated until the engine is started (engine speed is greater than 450 rpm), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Engine Oil Pressure Low Message** - Once the engine has been started (engine speed is greater than 450 rpm), each time the cluster receives three consecutive messages from the PCM indicating that the engine oil pressure is about 4 kPa or lower (about 0.6 psi or lower), the low oil pressure indicator is illuminated. The indicator remains illuminated until the cluster receives a single message from the PCM indicating that the engine oil pressure is about 76 kPa or higher (about 11 psi or higher), or until the ignition switch is turned to the Off position, whichever occurs first. Once the cluster monitors an engine speed of greater than 450 rpm, the cluster logic will ignore engine speed in determining low oil pressure indicator operation for the remainder of the current ignition cycle.
- **Actuator Test** - Each time the cluster is put through the actuator test, the low oil pressure indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

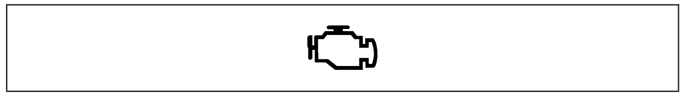
The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper engine oil pressure messages to the instrument cluster. If the instrument cluster turns on the indicator after the bulb test, it may indicate that the engine or the engine oiling system requires service. For further diagnosis of the low oil pressure indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the engine oil pressure sensor, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the low oil pressure indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# MALFUNCTION INDICATOR LAMP (MIL)

## DESCRIPTION

A Malfunction Indicator Lamp (MIL) is standard equipment on all instrument clusters. This indicator is located above the coolant temperature gauge and to the right of the tachometer in the cluster overlay.



The MIL consists of a stencil-like cutout of the International Control and Display Symbol icon for “Engine” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The MIL is serviced as a unit with the instrument cluster.

## OPERATION

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the Powertrain Control Module (PCM) has recorded a Diagnostic Trouble Code (DTC) for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Programmable Communications Interface (PCI) data bus.

The MIL Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the MIL for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the indicator is illuminated for about seven seconds as a bulb test.
- **MIL Lamp-On Message** - Each time the cluster receives a MIL lamp-on message from the PCM, the indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the PCM message. For some DTC’s, if a problem does not recur, the PCM will send a lamp-off message automatically. Other DTC’s may require that a fault be repaired and the PCM be reset before a lamp-off message will be sent. For more information on the PCM and the DTC set and reset parameters, (Refer to 25 - EMISSIONS CONTROL - OPERATION).
- **Communication Error** - If the cluster receives no messages from the PCM for twenty consecutive seconds, the MIL is illuminated by the instrument cluster to indicate a loss of bus communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the MIL will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the instrument cluster turns on the MIL after the bulb test, it may indicate that a malfunction has occurred or that the fuel and emissions systems require service. For further diagnosis of the MIL or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the fuel and emissions systems, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the MIL, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# ODOMETER

## DESCRIPTION

An odometer and trip odometer are standard equipment in all instrument clusters. The odometer and trip odometer information are displayed in a common electronic, blue-green Vacuum Fluorescent Display (VFD) unit. The VFD unit is soldered onto the cluster electronic circuit board and is visible through a window with a smoked clear lens located in the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents it from being clearly visible when it is not illuminated.

The odometer and trip odometer information are not displayed simultaneously. The trip odometer reset switch on the instrument cluster circuit board toggles the display between odometer and trip odometer modes by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just right of the odometer VFD. When the trip odometer information is displayed, the word “TRIP” is also illuminated near the bottom of the VFD in a blue-green color and at the same lighting level as the trip odometer information.

The odometer and trip odometer distance information is stored in the instrument cluster memory. This information can be increased when the proper inputs are provided to the instrument cluster, but the information cannot be decreased. The odometer can display values up to 864,004 kilometers (536,870 miles). The odometer latches at these values, and will not roll over to zero. The trip odometer can display values up to 9,999.9 kilometers (9,999.9 miles) before it rolls over to zero.

The odometer display does not have a decimal point and will not show values less than a full unit (kilometer or mile), while the trip odometer display does have a decimal point and will show tenths of a unit (kilometer or mile). The unit of measure for the odometer and trip odometer is selected at the time that it is manufactured, and cannot be changed. If the instrument cluster has a kilometers-per-hour primary speedometer scale, the odometer/trip odometer registers kilometers; and if the cluster features a miles-per-hour primary speedometer scale, the odometer/trip odometer registers miles.

The odometer/trip odometer has a “Rental Car” mode, which will illuminate the odometer information in the VFD whenever the driver side front door is opened with the ignition switch in the Off or Accessory positions. During daylight hours (exterior lamps are Off) the VFD is illuminated at full brightness for clear visibility. At night (exterior lamps are On) the VFD lighting level is adjusted with the other cluster illumination lamps using the panel lamps dimmer control ring on the left control stalk of the multi-function switch. However, a “Parade” mode position of the panel lamps dimmer control ring allows the VFD to be illuminated at full brightness if the exterior lamps are turned On during daylight hours.

The odometer/trip odometer VFD unit, the trip odometer switch, and the trip odometer switch button are serviced as a unit with the instrument cluster.

## OPERATION

The odometer and trip odometer give an indication to the vehicle operator of the distance the vehicle has traveled. This indicator is controlled by the instrument cluster circuitry based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The odometer and trip odometer information is displayed by the instrument cluster Vacuum Fluorescent Display (VFD) unit. The VFD will display the odometer information whenever the driver side front door is opened with the ignition switch in the Off or Accessory positions, and will display the last previously selected odometer or trip odometer information when the ignition switch is turned to the On or Start positions. The instrument cluster circuitry controls the VFD and provides the following features:

- **Odometer/Trip Odometer Display Toggling** - Actuating the trip odometer reset switch button momentarily with the VFD illuminated will toggle the display between the odometer and trip odometer information. Each time the VFD is illuminated with the ignition switch in the On or Start positions, the display will automatically return to the last mode previously selected (odometer or trip odometer). The VFD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button.
- **Trip Odometer Reset** - When the trip odometer reset switch button is pressed and held for longer than about two seconds with the ignition switch in the On or Start positions, the trip odometer will be reset to 0.0 kilome-

ters (miles). The VFD unit must be displaying the trip odometer information in order for the trip odometer information to be reset.

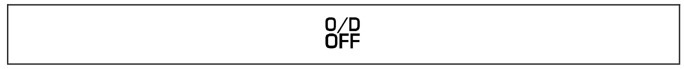
- **Communication Error** - If the cluster fails to receive a distance message during normal operation, it will hold and display the last data received until the ignition switch is turned to the Off position. If the cluster does not receive a distance message within one second after the ignition switch is turned to the On position, it will display the last distance message stored in the cluster memory. If the cluster is unable to display distance information due to an error internal to the cluster, the VFD will display "error".
- **Actuator Test** - Each time the cluster is put through the actuator test, the VFD will step sequentially through a display of "111111" through "999999", then display the cluster software version number to confirm the functionality of each of the VFD unit segments and the cluster control circuitry.

The PCM continually monitors the vehicle speed pulse information received from the Body Control Module (BCM), then sends the proper distance messages to the instrument cluster. For further diagnosis of the odometer/trip odometer or the instrument cluster circuitry that controls these functions, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the vehicle speed sensor, the BCM, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the odometer/trip odometer, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# OVERDRIVE OFF INDICATOR

## DESCRIPTION



An overdrive off indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional overdrive automatic transmission, this indicator is electronically disabled. This indicator is located above the fuel gauge and to the left of the speedometer in the cluster overlay.

The overdrive off indicator consists of a stencil-like cutout of the text “O/D OFF” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the text from being clearly visible when the indicator is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “O/D OFF” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the overdrive off indicator is dimmable, which is adjusted along with the cluster illumination lighting using the panel lamps dimmer control ring on the left control stalk of the multi-function switch.

The overdrive off indicator is serviced as a unit with the instrument cluster.

## OPERATION

The overdrive off indicator gives an indication to the vehicle operator when the Off position of the overdrive off switch has been selected, disabling the electronically controlled overdrive feature of the automatic transmission. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The overdrive off indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the overdrive off indicator for the following reasons:

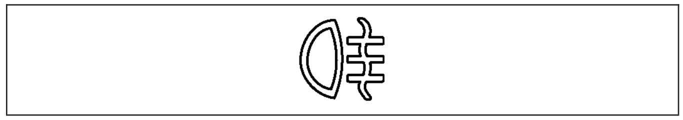
- **Overdrive Off Lamp-On Message** - Each time the cluster receives an overdrive off lamp-on message from the PCM the overdrive off indicator will be illuminated. The indicator remains illuminated until the cluster receives an overdrive off lamp-off message from the PCM, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the overdrive off indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the overdrive off switch to determine the appropriate outputs to the automatic transmission. The PCM then sends the proper overdrive off lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the overdrive off indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the overdrive control system, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the overdrive off indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# REAR FOG LAMP INDICATOR

## DESCRIPTION



A rear fog lamp indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional rear fog lamps, which are available only in certain markets where they are required, this indicator is electronically disabled. This indicator is located above the coolant temperature gauge and to the right of the tachometer in the cluster overlay.

The rear fog lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Rear Fog Light” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the rear fog lamp indicator is dimmable, which is adjusted along with the cluster illumination lighting using the panel lamps dimmer control ring on the left control stalk of the multi-function switch.

The rear fog lamp indicator is serviced as a unit with the instrument cluster.

## OPERATION

The rear fog lamp indicator gives an indication to the vehicle operator whenever the rear fog lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus.

The rear fog lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the rear fog lamp indicator for the following reasons:

- **Rear Fog Lamp-On Message** - Each time the cluster receives a rear fog lamp-on message from the BCM the rear fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a rear fog lamp-off message from the BCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the rear fog lamp indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The BCM continually monitors the exterior lighting (multi-function) switch to determine the appropriate outputs to the rear fog lamp relay. The BCM then sends the proper rear fog lamp indicator lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the rear fog lamp indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the rear fog lamp system, the BCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the rear fog lamp indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# SEATBELT INDICATOR

## DESCRIPTION

A seatbelt indicator is standard equipment on all instrument clusters. This indicator is located above the fuel gauge and to the left of the speedometer in the cluster overlay.

The seatbelt indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Seat Belt" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The seatbelt indicator is serviced as a unit with the instrument cluster.

## OPERATION

The seatbelt indicator gives an indication to the vehicle operator of the status of the driver and passenger side front seat belts. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming. On models equipped with airbags the indicator is also controlled by electronic messages received by the cluster from the Airbag Control Module (ACM) over the Programmable Communications Interface (PCI) data bus.

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or "beltminder" feature that is enabled when the vehicle is shipped from the factory. This beltminder feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

The seatbelt indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the seatbelt indicator for the following reasons:

- **Seatbelt Reminder Function** - Each time the cluster receives a battery current input on the fused ignition switch output (run-start) circuit, the indicator will be illuminated as a seatbelt reminder for about seven seconds, or until the ignition switch is turned to the Off position, whichever occurs first. This reminder function will occur regardless of the status of the seat belt switch inputs received by the cluster from the driver and passenger side front seat belts.
- **Seat Belt Switch Input - Beltminder Active** - Following the seatbelt reminder function on models equipped with the Occupant Classification System (OCS), each time the cluster receives an input from the driver or passenger side front seat belt switch indicating that a front seat belt is not fastened with the ignition switch in the Start or On positions, the indicator will be illuminated. The passenger side front seat belt switch input must be accompanied by electronic messages received from the Airbag Control Module (ACM) over the Programmable Communications Interface (PCI) data bus indicating that the passenger side front seat is occupied. On models not equipped with the OCS, the cluster responds only to the driver side seat belt switch input. In addition, if the front seat belt remains unbuckled about sixty seconds after the conclusion of the seatbelt reminder function with the vehicle speed greater than about 13 kilometers-per-hour (8 miles-per-hour), the seatbelt indicator will begin to cycle between flashing on and off for five seconds, then lighting solid for three seconds. The seatbelt indicator will continue to cycle between flashing and solid illumination for 12 complete cycles, until the cluster receives no front seat belt switch input, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Seat Belt Switch Input - Beltminder Inactive** - Following the seatbelt reminder function on models equipped with the OCS, each time the cluster receives an input from the driver or passenger side front seat belt switch indicating that a front seat belt is not fastened with the ignition switch in the Start or On positions, the indicator will be illuminated. The passenger side front seat belt switch input must be accompanied by electronic messages received from the ACM over the PCI data bus indicating that the passenger side front seat is occupied. On models not equipped with the OCS, the cluster responds only to the driver side seat belt switch input. The seatbelt indicator remains illuminated until the cluster receives no seat belt switch input, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the seatbelt indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The cluster continually monitors the status of the front seat belt switch inputs and electronic messages from the ACM to determine the appropriate seatbelt indicator operation. For further diagnosis of the seatbelt indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the seatbelt switches, the ACM, the OCS, the PCI data bus, or the electronic message inputs to the instrument cluster that control the seatbelt indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

## STANDARD PROCEDURE

## ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or “beltminder” feature that is enabled when the vehicle is shipped from the factory. This beltminder feature provides extended and modified visual seatbelt indicator and audible chime warning responses to an unbuckled driver side front seat belt. The beltminder feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool.

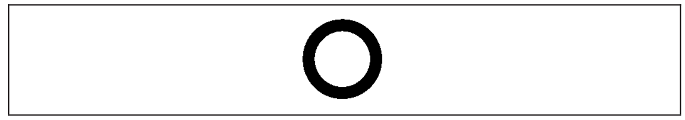
### CUSTOMER PROGRAMMING SEQUENCE

**NOTE: The following sequence of events must occur within sixty (60) seconds of the ignition switch being placed in the On position in order for the programming to be completed successfully.**

1. With all doors closed and the ignition switch in any position except On or Start, buckle the driver side front seat belt.
2. Turn the ignition switch to the On position and wait for the seatbelt indicator reminder function to conclude (about seven seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.
4. Turn the ignition switch to any position except On or Start to toggle the beltminder feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

# SECURITY INDICATOR

## DESCRIPTION



A security indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional Vehicle Theft Alarm (VTA) or the optional Sentry Key Immobilizer System (SKIS), this indicator is electronically disabled. This indicator is located near the lower edge of the cluster overlay below the speedometer and to the right of the fuel gauge.

The security indicator consists of a small round cutout in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The security indicator is serviced as a unit with the instrument cluster.

## OPERATION

The security indicator gives an indication to the vehicle operator when the Vehicle Theft Alarm (VTA) is arming or is armed. This indicator is controlled on the instrument cluster circuit board by a hard wired input to the cluster from the Body Control Module (BCM) on the VTSS indicator driver circuit.

On models equipped with the Sentry Key Immobilizer System (SKIS), the security indicator also gives an indication to the vehicle operator of the status of the SKIS. The SKIS function of this indicator is controlled by the BCM based upon BCM programming and electronic messages received by the BCM from the Sentry Key REmote Entry Module (SKREEM) over the Programmable Communications Interface (PCI) data bus.

The security indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through a fused B(+) circuit at all times. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the BCM. The BCM will turn on the security indicator for the following reasons:

- **Bulb Test** - Only on vehicles equipped with the SKIS, each time the ignition switch is turned to the On position the SKREEM sends an electronic message to the BCM to illuminate the security indicator for about three seconds as a bulb test. The entire bulb test is a function of the SKREEM.
- **VTA Indication** - During the sixteen second VTA pre-arming function, the BCM will flash the security indicator on and off repeatedly at a steady, fast rate to indicate that the VTA is in the process of arming. Following successful VTA arming, the BCM flashes the security indicator on and off continuously at a slower rate to indicate that the VTA is armed. The security indicator continues flashing at the slower rate until the VTA is disarmed.
- **SKIS Lamp-On Message** - Each time the BCM receives a SKIS lamp-on message from the SKREEM, the security indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the SKREEM message. The indicator remains illuminated solid or continues to flash until the BCM receives a SKIS lamp-off message from the SKREEM, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - Only on vehicles equipped with the SKIS, if the BCM receives no SKIS lamp-on or lamp-off messages from the SKREEM for twenty consecutive seconds, the security indicator is illuminated by the BCM. The indicator remains controlled and illuminated by the BCM until a valid SKIS lamp-on or lamp-off message is received from the SKREEM.
- **Actuator Test** - Only on vehicles equipped with the SKIS, each time the instrument cluster is put through the actuator test, the security indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the indicator control circuitry.

The BCM circuitry controls the security indicator through the VTSS indicator driver circuit whenever the ignition switch is in the Off position and the VTA is arming, armed, or triggered. On vehicles equipped with the SKIS, the SKREEM performs a self-test each time the ignition switch is turned to the On position to decide whether the SKIS is in good operating condition and whether a valid key is present in the ignition lock cylinder. The SKREEM then sends the proper lamp-on or lamp-off messages to the BCM. If the BCM flashes the security indicator upon ignition On, or turns on the security indicator solid after the bulb test, it indicates that a SKIS malfunction has occurred or that the SKIS is inoperative.

The VTSS indicator driver circuit between the BCM and the instrument cluster can be diagnosed using conventional diagnostic tools and methods. However, for proper diagnosis of the VTA, the SKIS, the SKREEM, the BCM, the PCI data bus, or the electronic message and hard wired inputs to the BCM that control the security indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# SHIFT INDICATOR (TRANSFER CASE)

## DESCRIPTION

### PART TIME INDICATOR

A part time indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional four-wheel drive system, this indicator is electronically disabled. This indicator is located near the lower edge of the speedometer gauge dial face on the cluster overlay.

The part time indicator consists of a stencil-like cutout of the text “PART TIME” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “PART TIME” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the part time indicator is dimmable, which is adjusted along with the cluster illumination lighting using the panel lamps dimmer control ring on the left control stalk of the multi-function switch.

The part time indicator is serviced as a unit with the instrument cluster.

### FULL TIME INDICATOR

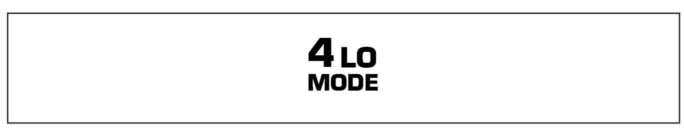
A full time indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional Selec-Trac four-wheel drive system, this indicator is electronically disabled. This indicator is located near the lower edge of the speedometer gauge dial face in the cluster overlay.

The full time indicator consists of a stencil-like cutout of the text “FULL TIME” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green Light Emitting Diode (LED) behind the cutout in the opaque layer of the cluster overlay causes the “FULL TIME” text to appear in green through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the full time indicator is dimmable, which is adjusted along with the cluster illumination lighting using the panel lamps dimmer control ring on the left control stalk of the multi-function switch.

The full time indicator is serviced as a unit with the instrument cluster.

### FOUR LOW MODE INDICATOR



A four low mode indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional four-wheel drive system, this indicator is electronically disabled. This indicator is located above the coolant temperature gauge and to the right of the tachometer in the cluster overlay.

The four low mode indicator consists of a stencil-like cutout of the words “4 LO MODE” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “4 LO MODE” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the four low mode indicator is dimmable, which is adjusted along with the cluster illumination lighting using the panel lamps dimmer control ring on the left control stalk of the multi-function switch.

The four low mode indicator is serviced as a unit with the instrument cluster.

## OPERATION

## PART TIME INDICATOR

The part time indicator gives an indication to the vehicle operator whenever a part time operating mode of the four-wheel drive transfer case is selected. On vehicles equipped with the Command-Trac four-wheel drive system, the part time indicator lights when the transfer case is engaged in the “4H” or “4L” positions. On vehicles equipped with the Selec-Trac four-wheel drive system, the part time indicator lights when the transfer case is engaged in the “4 X 4 Part Time” position. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The instrument cluster must be electronically configured for the type of transfer case in the vehicle using a diagnostic scan tool in order to provide proper operation of the part time indicator. The part time indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the part time indicator for the following reasons:

- **Part Time Lamp-On Message** - Each time the cluster receives a part time lamp-on message from the PCM indicating that a part time position of the four-wheel drive transfer case has been selected, the part time indicator will be illuminated. The indicator remains illuminated until the cluster receives a part time lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the part time indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the transfer case switch to determine the driveline operating mode. The PCM then sends the proper part time lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the part time indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the transfer case switch, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the part time indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

## FULL TIME INDICATOR

The full time indicator gives an indication to the vehicle operator whenever a full time operating mode of the four-wheel drive transfer case is selected. On vehicles equipped with the Selec-Trac four-wheel drive system, the full time indicator lights when the transfer case is engaged in the “4 X 4 Full Time” position. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The instrument cluster must be electronically configured for the type of transfer case in the vehicle using a diagnostic scan tool in order to provide proper operation of the full time indicator. The full time indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the full time indicator for the following reasons:

- **Full Time Lamp-On Message** - Each time the cluster receives a full time lamp-on message from the PCM indicating that a full time position of the four-wheel drive transfer case has been selected, the full time indicator will be illuminated. The indicator remains illuminated until the cluster receives a full time lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the full time indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the transfer case switch to determine the driveline operating mode. The PCM then sends the proper full time lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the full time indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the transfer case switch, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the full time indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

## FOUR LOW MODE INDICATOR

The four low mode indicator gives an indication to the vehicle operator that a “Low” operating mode of the four-wheel drive transfer case is selected. On vehicles equipped with the Command-Trac four-wheel drive system, the four low mode indicator lights when the transfer case is engaged in the “4L” position. On vehicles equipped with the Selec-Trac four-wheel drive system, the four low mode indicator lights when the transfer case is engaged in the “4 Lo” position.

This indicator is controlled by a transistor on the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus. The instrument cluster must be electronically configured for the type of transfer case in the vehicle using a diagnostic scan tool in order to provide proper operation of the four low mode indicator.

The four low mode indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the four low mode indicator for the following reasons:

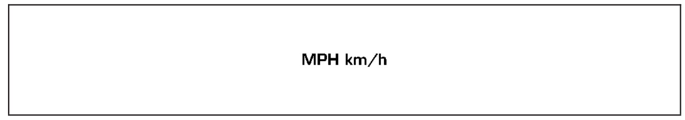
- **Four Low Mode Lamp-On Message** - Each time the cluster receives a four low mode lamp-on message from the PCM indicating that a low range position of the four-wheel drive transfer case has been selected, the four low mode indicator will be illuminated. The indicator remains illuminated until the cluster receives a four low mode lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the four low mode indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the transfer case switch to determine the driveline operating mode. The PCM then sends the proper four low mode lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the four low mode indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the transfer case switch, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the four low mode indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# SPEEDOMETER

## DESCRIPTION



A speedometer is standard equipment on all instrument clusters. The speedometer is located next to the tachometer, just to the left of center in the instrument cluster. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry, and a fixed 255 degree primary scale on the gauge dial face that reads left-to-right either from “0” to “120” mph, or from “0” to “240” km/h, depending upon the market for which the vehicle is manufactured.

Most versions also have a secondary inner scale on the gauge dial face that provides the equivalent opposite measurement units from the primary scale. Text appearing on the cluster overlay just above the hub of the speedometer needle abbreviates the unit of measure for the primary scale (i.e.: MPH or km/h), while the text for the unit of measure for the secondary scale (i.e.: MPH or km/h) is located adjacent to the low end of that scale.

The speedometer primary scale text is white against a black field, while the major and minor primary scale increments are black against a silver field. If equipped, the secondary scale text and increments are light gray against a black field. All text and increments are clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, all primary scale text and major increments appear blue-green. The primary scale minor increments and the secondary scale are not illuminated. The red gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board.

The speedometer is serviced as a unit with the instrument cluster.

## OPERATION

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The speedometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

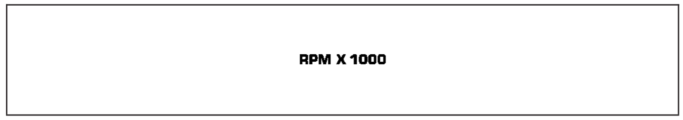
- **Vehicle Speed Message** - Each time the cluster receives a vehicle speed message from the PCM it will calculate the correct vehicle speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new vehicle speed message and reposition the gauge pointer accordingly about every 86 milliseconds. The gauge needle will continually be repositioned at the relative vehicle speed position on the gauge scale until the until the vehicle stops moving, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a speedometer message, it will hold the gauge needle at the last indication for about six seconds, or until the ignition switch is turned to the Off position, whichever occurs first. After six seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the speedometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the vehicle speed information received from the Body Control Module (BCM) to determine the vehicle road speed. The PCM then sends the proper vehicle speed messages to the instrument cluster. For further diagnosis of the speedometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the BCM, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the speedometer, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# TACHOMETER

## DESCRIPTION



A tachometer is standard equipment on all instrument clusters. The tachometer is located next to the speedometer, just to the right of center in the instrument cluster. The tachometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 255 degree scale on the gauge dial face that reads left-to-right from “0” to “7” for gasoline engines. On vehicles with a diesel engine, the scale reads from “0” to “5”. The text “RPM X 1000” imprinted on the cluster overlay directly above the hub of the tachometer needle identifies that each number on the tachometer scale is to be multiplied by 1000 rpm.

The tachometer text is white against a black field, while the major and minor scale increments are black against a silver field. A light gray inner secondary scale provides a balanced appearance between the tachometer and speedometer, but is purely cosmetic. All text and increments are clearly visible within the instrument cluster in daylight. The gasoline engine tachometer has red increments designating the engine red line beginning at 5800 rpm, while the red increments for the diesel engine tachometer begin at 4000 rpm. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, all text and major increments appear blue-green, while the red major increments still appear red. The minor increments and the secondary scale are not illuminated. The red gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board.

The tachometer is serviced as a unit with the instrument cluster.

## OPERATION

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The tachometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Speed Message -** Each time the cluster receives an engine speed message from the PCM it will calculate the correct engine speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new engine speed message and reposition the gauge pointer accordingly about every 86 milliseconds. The gauge needle will continually be repositioned at the relative engine speed position on the gauge scale until the engine stops running, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error -** If the cluster fails to receive an engine speed message, it will hold the gauge needle at the last indication for about six seconds, or until the ignition switch is turned to the Off position, whichever occurs first. After six seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test -** Each time the cluster is put through the actuator test, the tachometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

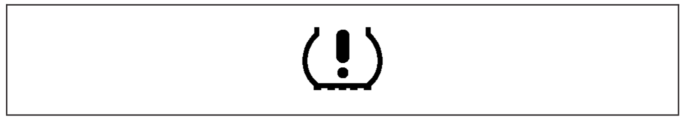
The PCM continually monitors the crankshaft position sensor to determine the engine speed. The PCM then sends the proper engine speed messages to the instrument cluster. For further diagnosis of the tachometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the crankshaft position sensor, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the tachometer, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# TIRE PRESSURE MONITOR INDICATOR

## DESCRIPTION

A Tire Pressure Monitor (TPM) indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional TPM, this indicator is electronically disabled. This indicator is located above the coolant temperature gauge and to the right of the tachometer in the cluster overlay.



The TPM indicator consists of a stencil-like cutout of an icon that represents a cross-section of a tire with a centered exclamation point in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The TPM indicator is serviced as a unit with the instrument cluster.

## OPERATION

The Tire Pressure Monitor (TPM) indicator gives an indication to the vehicle operator of the status of the TPM system. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Sentry Key REmote Entry Module (SKREEM) over the Programmable Communications Interface (PCI) data bus.

The TPM indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provide a path to ground by the instrument cluster transistor. The instrument cluster will turn on the TPM indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position, the SKREEM sends a TPM lamp-on message to the cluster to illuminate the TPM indicator for about three seconds as a bulb test.
- **TPM Lamp-On Message** - Each time the cluster receives a TPM lamp-on message from the SKREEM, the TPM indicator will be illuminated. The indicator remains illuminated until the cluster receives a TPM lamp-off message from the SKREEM or until the ignition switch is turned to the Off position, whichever occurs first.
- **TPM Fault Message** - Each time the cluster receives a TPM fault message from the SKREEM, the TPM indicator will be flashed on and off for 60 seconds indicating a sensor or system fault. The cluster then waits for 10 minutes and begins to flash the indicator again. This behavior repeats until the cluster receives a valid message from the SKREEM indicating there is no sensor or system fault or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster receives no TPM lamp-on or lamp-off messages from the SKREEM for six consecutive seconds, the TPM indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid TPM lamp-on or lamp-off message is received from the SKREEM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the TPM indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

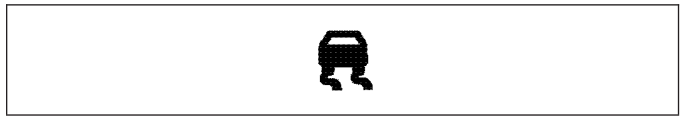
The SKREEM performs a self-test each time the ignition switch is turned to the On position to decide whether the TPM system is in good operating condition and whether the tire inflation pressures are too high or too low. The SKREEM then sends the proper TPM lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the TPM indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the TPM indicator after the bulb test, it indicates that the inflation pressure of a tire is too low or that a malfunction has occurred and the TPM system is inoperative.

For proper diagnosis of the SKREEM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the TPM indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# TRACTION CONTROL INDICATOR

## DESCRIPTION

A traction control indicator is standard equipment on all instrument clusters. This indicator is located near the lower edge of the cluster overlay, between the tachometer and the speedometer.



The traction control indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for "Stability - Anti-Spin" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The traction control indicator is serviced as a unit with the instrument cluster.

## OPERATION

The traction control indicator gives an indication to the vehicle operator when the Electronic Stability Program (ESP)/Traction Control System (TCS) has been activated or deactivated. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Programmable Communications Interface (PCI) data bus.

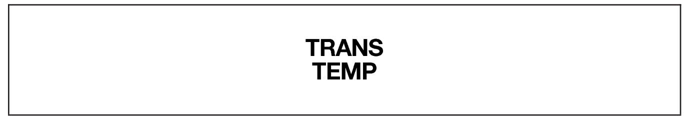
The traction control indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The indicator only illuminates when it is switched to ground by the instrument cluster circuitry. The instrument cluster will turn on the traction control indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the traction control indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **Traction Control Lamp-On Message** - Each time the cluster receives a traction control lamp-on message from the CAB indicating that the ESP/TCS has been activated or deactivated, the traction control indicator will be illuminated. The indicator can be flashed on and off (activated), or illuminated solid (deactivated), as dictated by the CAB message. The indicator remains illuminated solid or continues to flash until the cluster receives a traction control lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Service Traction Control System Message** - Each time the cluster receives a service traction control system message from the CAB indicating that a ESP/TCS fault has been detected, the traction control indicator will be illuminated solid and a single chime tone is sounded. The indicator remains illuminated solid until the fault is corrected and the cluster receives a traction control lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the traction control indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The CAB continually monitors the traction control switch to determine the proper outputs to the components of the Antilock Brake System (ABS). The CAB then sends the proper traction control lamp-on and lamp-off messages to the instrument cluster. For proper diagnosis of the traction control switch, the ABS, the CAB, the PCI data bus, or the electronic message inputs to the instrument cluster that control the traction control indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# TRANS TEMP INDICATOR

## DESCRIPTION



A transmission over-temperature indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with an optional automatic transmission, this indicator is electronically disabled. This indicator is located near the lower edge of the cluster overlay, between the tachometer and the speedometer.

The transmission over-temperature indicator consists of a stencil-like cutout of the text “TRANS TEMP” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “TRANS TEMP” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The transmission over-temperature indicator is serviced as a unit with the instrument cluster.

## OPERATION

The transmission over-temperature indicator gives an indication to the vehicle operator when the transmission fluid temperature is excessive, which may lead to accelerated transmission component wear or failure. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The transmission over-temperature indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the transmission over-temperature indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the transmission over-temperature indicator is illuminated for about three seconds as a bulb test.
- **Trans Over-Temp Lamp-On Message** - Each time the cluster receives a trans over-temp lamp-on message from the PCM indicating that the transmission fluid temperature is 135° C (275° F) or higher, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a trans over-temp lamp-off message from the PCM, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the transmission over-temperature indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

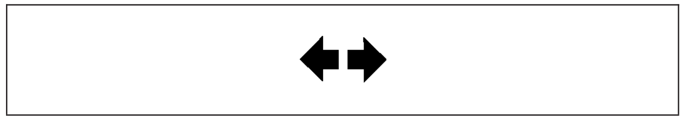
The PCM continually monitors the transmission temperature sensor to determine the transmission operating condition. The PCM then sends the proper transmission temperature messages to the instrument cluster. If the instrument cluster turns on the transmission over-temperature indicator due to a high transmission oil temperature condition, it may indicate that the transmission and/or the transmission cooling system are being overloaded or that they require service. For further diagnosis of the transmission over-temperature indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the transmission temperature sensor, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the transmission over-temperature indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# TURN SIGNAL INDICATOR

## DESCRIPTION

Two turn signal indicators, one right and one left, are standard equipment on all instrument clusters. These indicators are located near the upper edge of the cluster overlay, between the speedometer and the tachometer.



Each turn signal indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Turn Warning” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents these icons from being clearly visible when they are not illuminated. A green Light-Emitting Diode (LED) behind each cutout in the opaque layer of the cluster overlay causes the icon to appear in green through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The turn signal indicators are serviced as a unit with the instrument cluster.

## OPERATION

The turn signal indicators give an indication to the vehicle operator that the turn signals (left or right indicator flashing) or hazard warning signals (both left and right indicators flashing) have been selected and are operating. These indicators are controlled by two individual hard wired inputs from the combination flasher circuitry within the hazard switch to the instrument cluster electronic circuit board.

Each turn signal indicator Light Emitting Diode (LED) is grounded on the instrument cluster electronic circuit board at all times. Therefore, these indicators can be illuminated regardless of the ignition switch position. Each LED will only illuminate when it is provided battery current by the combination flasher circuitry of the hazard switch. The turn signal indicators are connected in parallel with the other turn signal circuits. This arrangement allows the turn signal indicators to remain functional, regardless of the condition of the other circuits in the turn signal and hazard warning systems.

The combination flasher outputs of the hazard switch to the instrument cluster turn signal indicator inputs can be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information. For further diagnosis or more information on the combination flasher and hazard switch operation, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HAZARD SWITCH - DESCRIPTION).

# WAIT-TO-START INDICATOR

## DESCRIPTION

A wait-to-start indicator is only found in the instrument clusters of vehicles equipped with an optional diesel engine. This indicator is located above the fuel gauge and to the left of the speedometer in the cluster overlay.

The wait-to-start indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Diesel Preheat” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The wait-to-start indicator is serviced as a unit with the instrument cluster.

## OPERATION

The wait-to-start indicator gives an indication to the vehicle operator when the diesel engine glow plugs are energized in their pre-heat operating mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The wait-to-start indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the wait-to-start indicator for the following reasons:

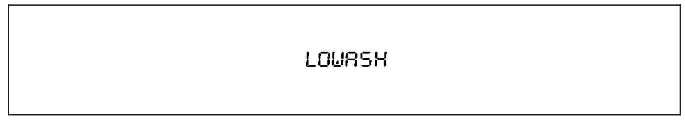
- **Wait-To-Start Lamp-On Message** - Each time the cluster receives a wait-to-start lamp-on message from the PCM indicating that the glow plugs are heating and are too cool for efficient and reliable engine starting, the wait-to-start indicator will be illuminated. The indicator remains illuminated until the cluster receives a wait-to-start lamp-off message or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the wait-to-start indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the ambient air temperature and the glow plug pre-heater circuits to determine how long the glow plugs should be energized in their pre-heat operating mode. The PCM then sends the proper wait-to-start lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the wait-to-start indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the glow plug pre-heater control circuits, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the wait-to-start indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# WASHER FLUID INDICATOR

## DESCRIPTION



A washer fluid indicator is standard equipment on all instrument clusters. This indicator is located within the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit. However, on models equipped with the optional Electronic Vehicle Information Center (EVIC) the washer fluid indicator in the odometer VFD is electronically suppressed so as not to duplicate indications that are provided by the EVIC.

The washer fluid indicator consists of the text "LOWASH", which appears in place of the odometer/trip odometer information in the odometer VFD unit. The odometer VFD is soldered onto the cluster electronic circuit board and is visible through a window with a smoked clear lens located on the lower edge of the tachometer gauge dial face of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated. The "LOWASH" text appears in the same blue-green color and at the same lighting level as the odometer/trip odometer information when it is illuminated by the instrument cluster electronic circuit board.

The washer fluid indicator is serviced as a unit with the instrument cluster.

## OPERATION

The washer fluid indicator gives an indication to the vehicle operator that the fluid level in the washer reservoir is low. This indicator is controlled by the instrument cluster logic circuit based upon cluster programming and a hard wired input received by the cluster from the washer fluid level switch mounted on the washer reservoir.

The washer fluid indicator function of the Vacuum Fluorescent Display (VFD) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the VFD washer fluid indication will always be off when the ignition switch is in any position except On or Start. The instrument cluster will turn on the washer fluid indicator for the following reasons:

- **Washer Fluid Level Switch Input -** Each time the cluster detects ground on the low washer fluid sense circuit (washer fluid level switch closed = washer fluid level low) the cluster applies an algorithm to ensure that the input is correct and not the result of fluid sloshing in the washer reservoir. The cluster tests the status of the circuit about seven milliseconds after the ignition switch is turned to the On position, and about once every second thereafter, then uses an internal counter to count up or down. When the counter accumulates 30 ground inputs on the circuit, the washer fluid indicator will be illuminated. If the vehicle is not moving when the washer fluid level switch input counter reaches 30, the VFD will repeatedly and sequentially cycle its low washer fluid indication in two second intervals with the odometer/trip odometer information and any other active warnings including: door ajar, gate ajar, and glass ajar. If the vehicle is moving, or once the cluster of a non-moving vehicle receives an electronic vehicle speed message from the Powertrain Control Module (PCM) indicating a speed greater than zero, the warning sequence will consist of 15 complete display cycles with an audible single chime tone accompanying each of the first two cycles, then revert to only the odometer/trip odometer display. Once the washer fluid indicator warning has completed, the washer fluid indicator is extinguished and will not repeat until the ignition switch is cycled. The VFD can be reverted to the odometer display and any currently displayed textual messages suspended by momentarily depressing and releasing the odometer/trip odometer reset switch button on the front of the cluster.

The instrument cluster continually monitors the washer fluid level switch in the washer reservoir to determine the status of the washer fluid level. For further diagnosis of the washer fluid indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

The washer fluid level switch and circuits can be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information. The washer fluid level switch also features a 3.3 kilohm diagnostic resistor connected in parallel between the switch input and output to provide the cluster with verification that the low washer fluid sense circuit is not open or shorted. This input can be monitored using a diagnostic scan tool. Refer to the appropriate diagnostic information.

# WATER-IN-FUEL INDICATOR

## DESCRIPTION

A water-in-fuel indicator is only found in the instrument clusters of vehicles equipped with an optional diesel engine. This indicator is located above the coolant temperature gauge and to the right of the tachometer in the cluster overlay.

The water-in-fuel indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Water In Fuel” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

The water-in-fuel indicator is serviced as a unit with the instrument cluster.

## OPERATION

The water-in-fuel indicator gives an indication to the vehicle operator when there is excessive water in the fuel system. This indicator is controlled by a transistor on the instrument cluster electronic circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus.

The water-in-fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the water-in-fuel indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the water-in-fuel indicator is illuminated for about three seconds as a bulb test.
- **Water-In-Fuel Lamp-On Message** - Each time the cluster receives a water-in-fuel lamp-on message from the PCM indicating there is excessive water in the diesel fuel system, the water-in-fuel indicator will be illuminated. The indicator remains illuminated until the cluster receives a water-in-fuel lamp-off message, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the water-in-fuel indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the water-in-fuel sensor to determine whether there is excessive water in the diesel fuel. The PCM then sends the proper water-in-fuel lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the water-in-fuel indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the water-in-fuel-sensor, the PCM, the PCI data bus, or the electronic message inputs to the instrument cluster that control the water-in-fuel indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# LAMPS

## TABLE OF CONTENTS

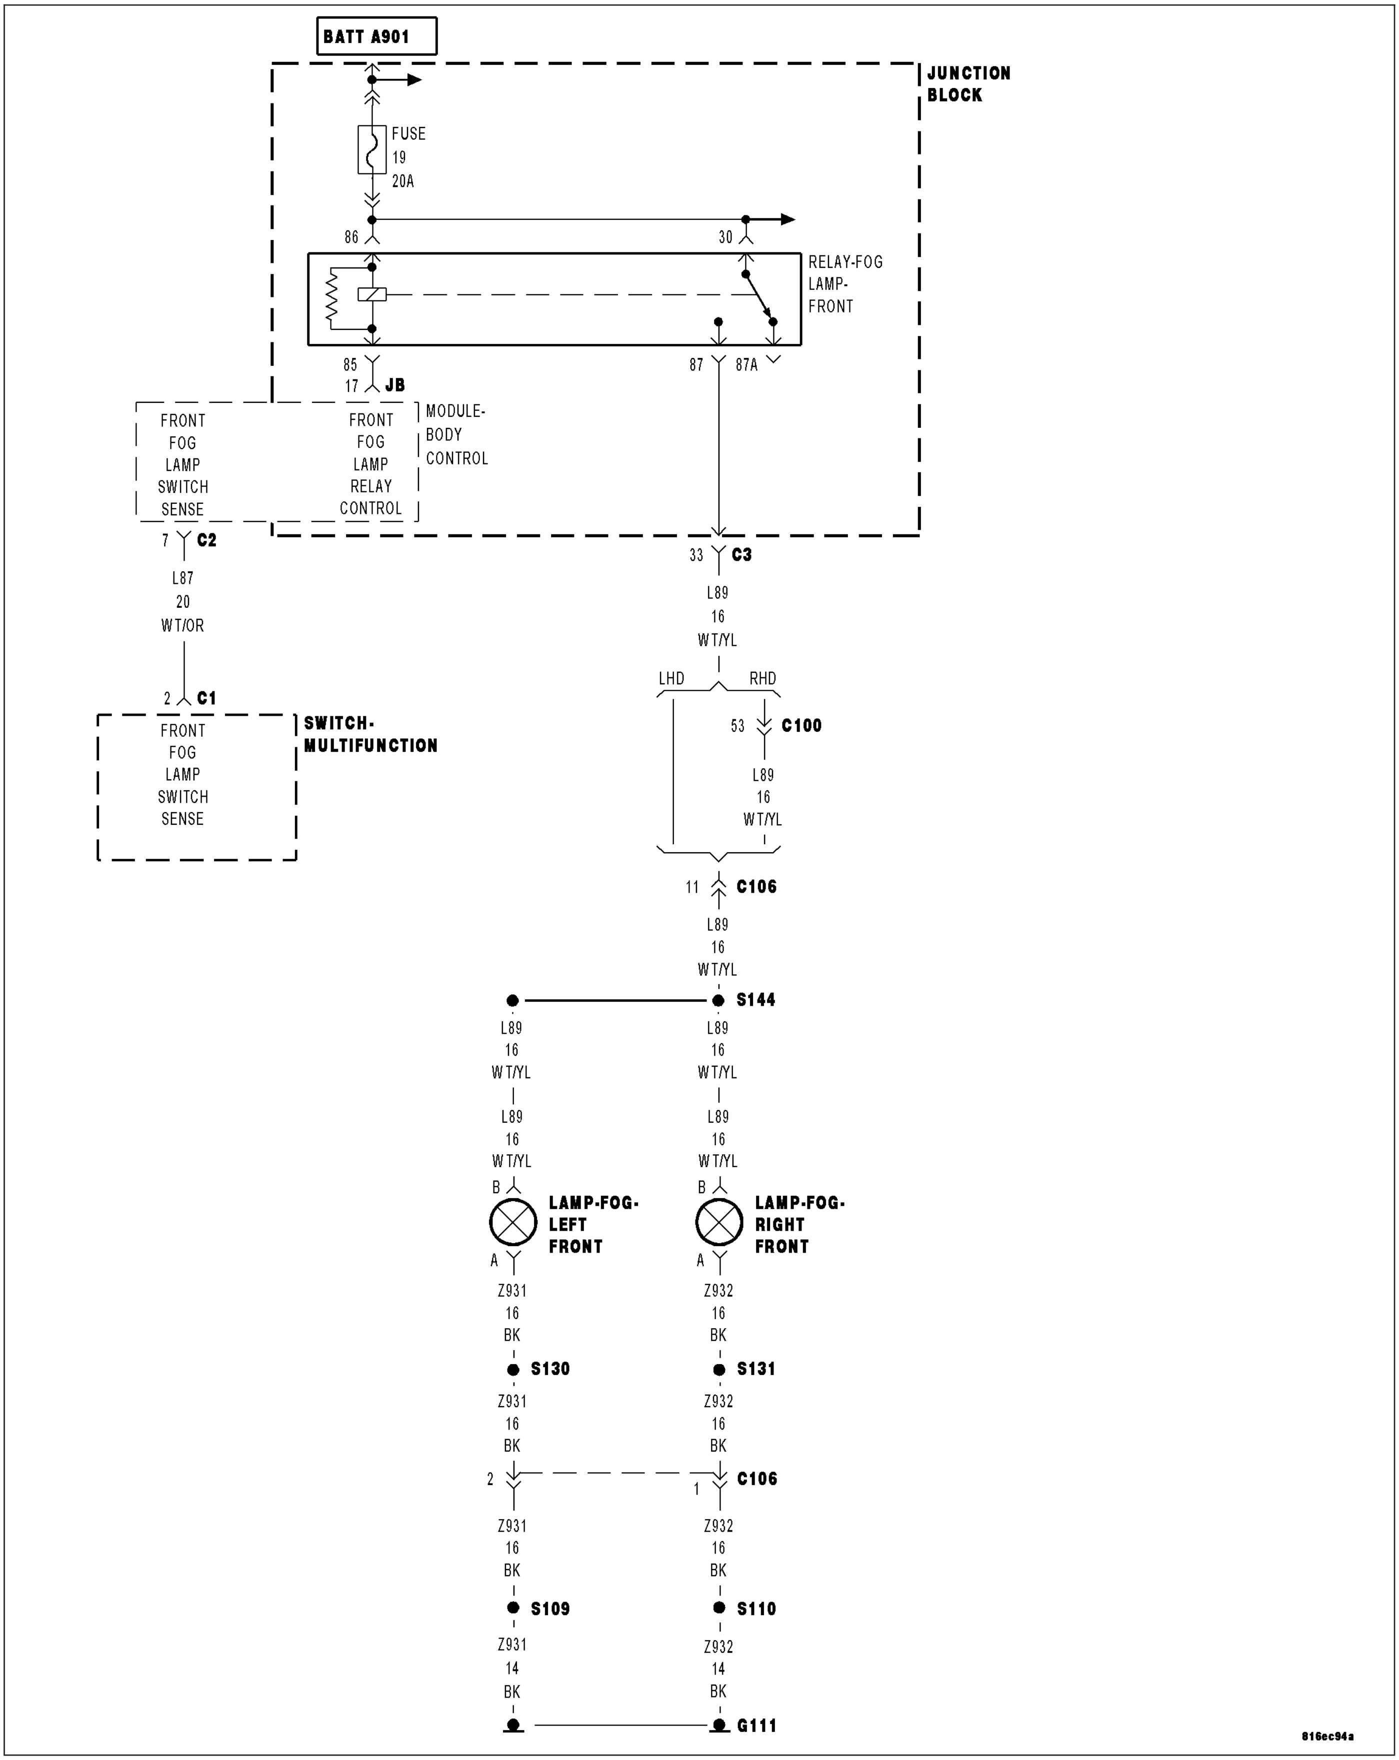
## LAMPS/LIGHTING - EXTERIOR - ELECTRICAL DIAGNOSTICS

### TABLE OF CONTENTS

# LAMPS/LIGHTING - EXTERIOR - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## FRONT FOG RELAY CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  BCM detects battery on the Front Fog Relay when it is attempting to turn on the Front Fog Lamps for more than 5 seconds. The BCM learns that the Front Fog Options exists on a vehicle when it detects a ground on the Front Fog Switch Input circuit.

| Possible Causes |
|---|
| MISSING RELAY |
| OPEN FUSE |
| FOG LAMP RELAY |
| BODY CONTROL MODULE |
| FOG LAMP RELAY CONTROL CIRCUIT OPEN |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all BCM DTC's.

Turn the Fog Lamps on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: FRONT FOG RELAY CKT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MISSING RELAY

Turn the ignition off.

Check the Junction Block to make certain the Fog Lamp Relay is present.

**Is the Fog Lamp Relay present?**

**Yes** >> Go To 3

**No** >> Replace the missing Fog Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

### 3. OPEN FUSE

Turn the ignition off.

Check Junction Block fuse 19.

**Is the fuse open?**

**Yes** >> Replace the open fuse.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. FOG LAMP RELAY

Turn the ignition off.
Install a known good relay in place of the fog lamp relay.
Turn the Fog Lamps On.

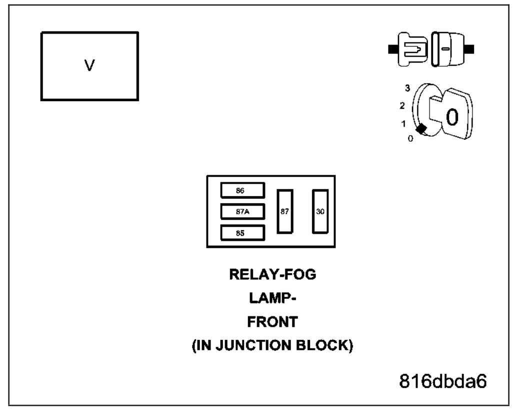
**Do the Fog Lamps operate normally?**

**Yes** >> Replace the Fog Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. BODY CONTROL MODULE

Turn the ignition off.
Remove the Fog Lamp Relay.
Measure the voltage of the Fused B+ circuit of the fog lamp relay.

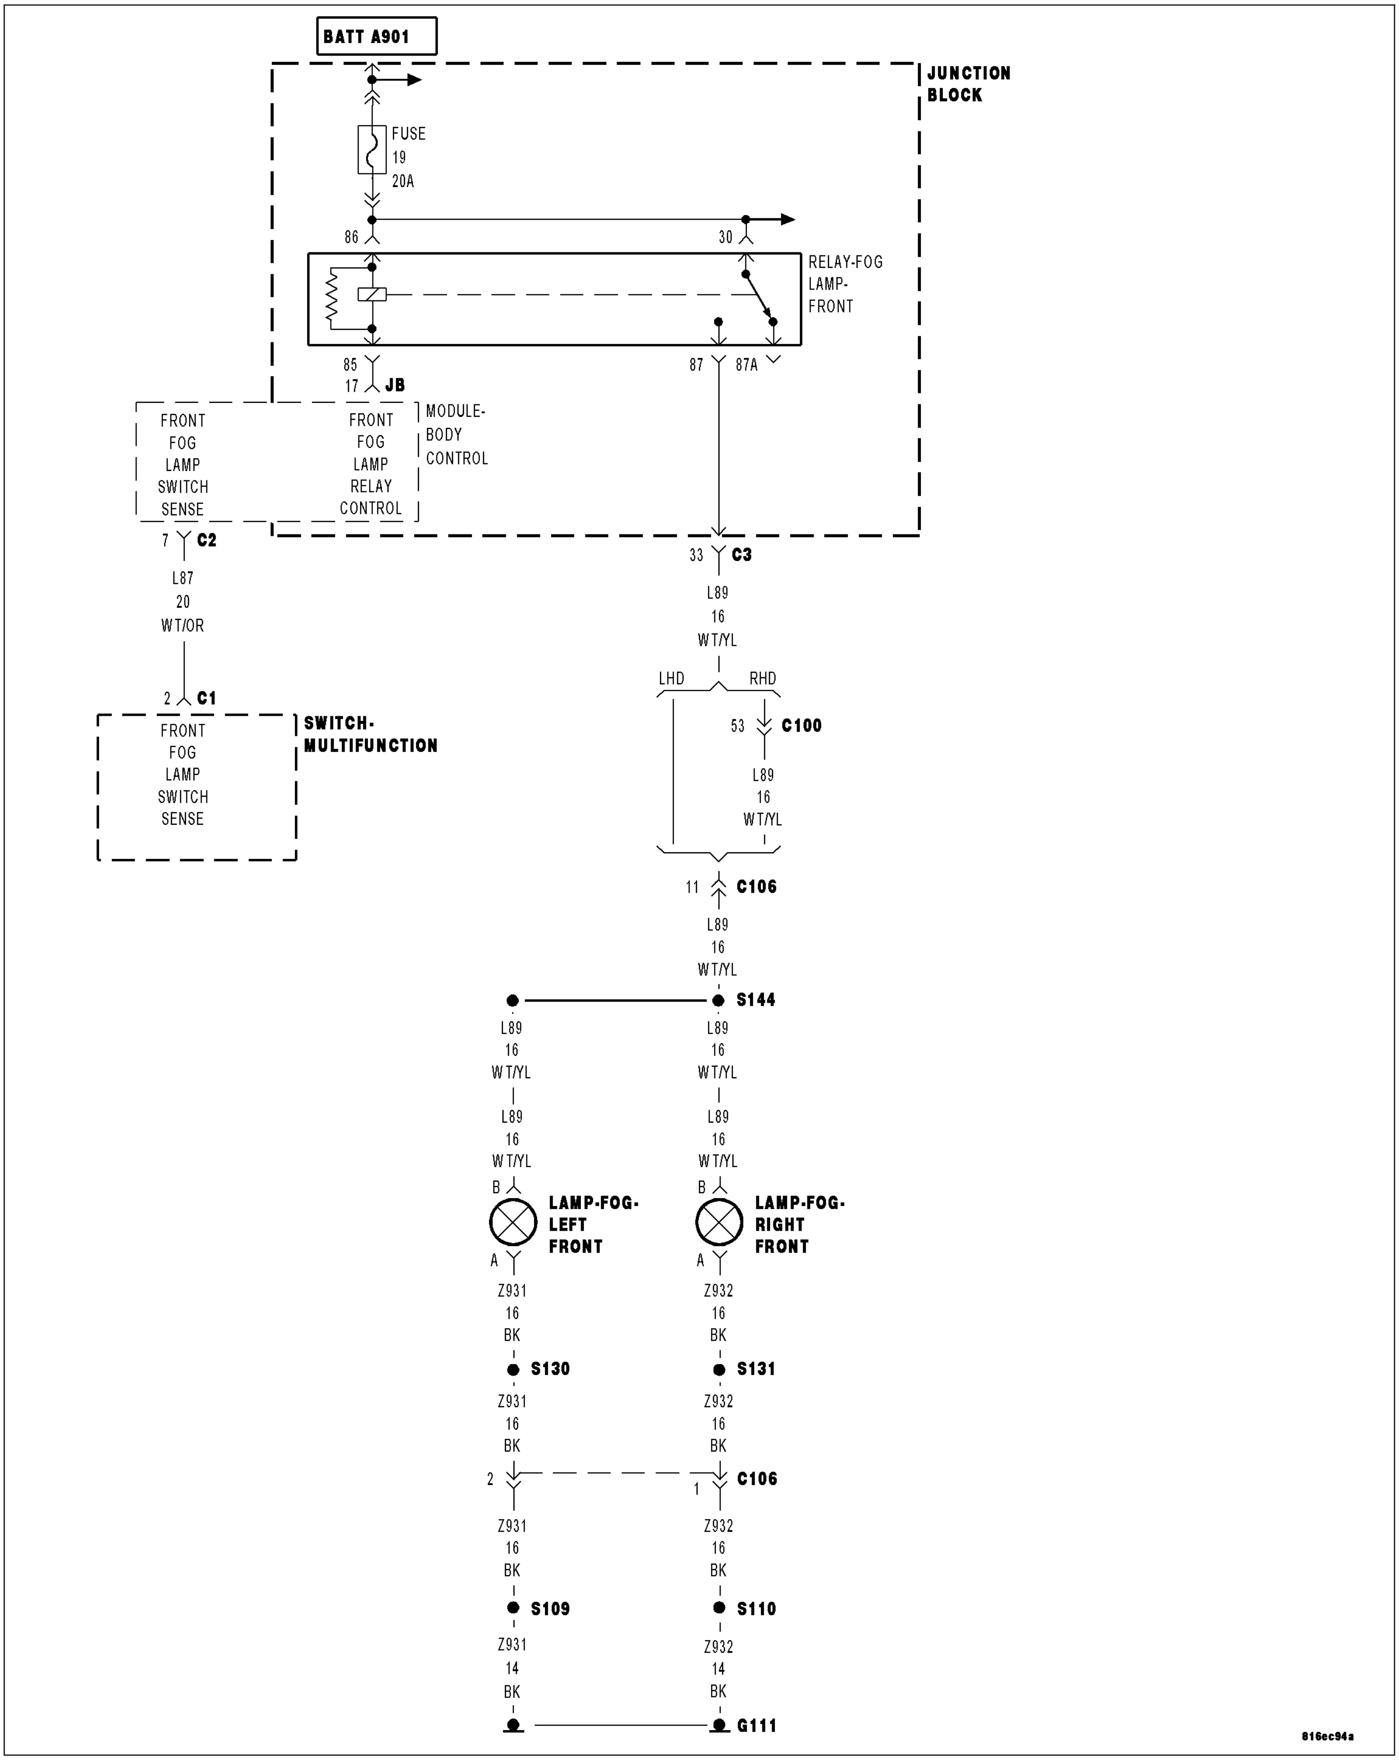


**Is the voltage above 10 volts?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Fog Lamp Relay Control Circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

## FRONT FOG RELAY CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  BCM detects a low (ground) on the Front Fog Relay even though it is not attempting to turn on the Front Fog Lamps for more than 5 seconds.

| Possible Causes |
| --- |
| FRONT FOG RELAY SHORT TO GROUND |
| FRONT FOG RELAY |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all BCM DTC's.

Turn the Fog Lamps on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: FRONT FOG RELAY CKT LOW?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor Scan Tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.

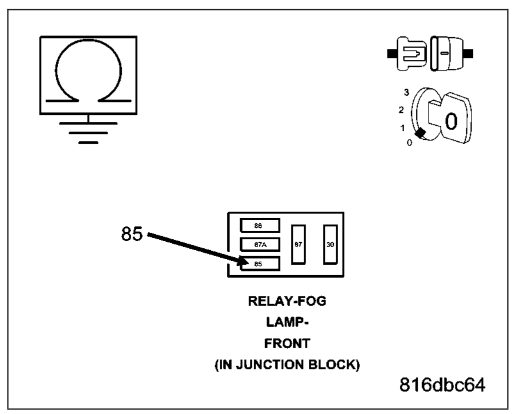
Perform BODY VERIFICATION TEST - VER 1.

### 2. FRONT FOG RELAY SHORT TO GROUND

Turn the ignition off.

Disconnect the Front Fog Relay.

Measure the resistance between ground and the Front Fog Relay Control circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Front Fog Relay Control circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

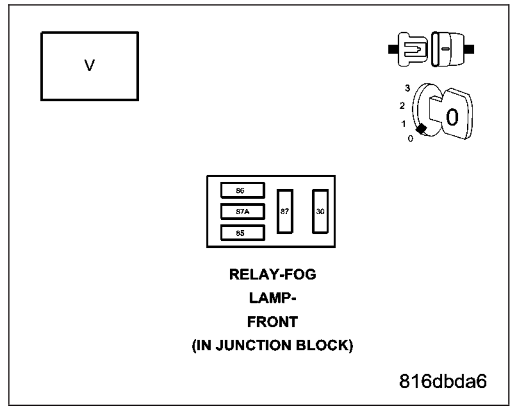
**No** >> Go To 3

## 3. FRONT FOG RELAY

Turn the ignition off.

Disconnect the Front Fog Relay harness connector.

Measure the voltage of the Front Fog Relay harness connector coil side feed circuit to ground.



**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Fog Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## HEADLAMP SWITCH INPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The BCM detects a voltage greater than 4.75 V on the Headlamp Switch Input for more than 5 seconds.

| Possible Causes |
| --- |
| HEADLAMP SWITCH OPEN |
| HEADLAMP SWITCH MUX CIRCUIT OPEN |
| HEADLAMP SWITCH RETURN CIRCUIT OPEN |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, erase all BCM DTC's.

Turn the headlamps to the ON position.

With the Scan Tool, read DTCs.

**Does the Scan Tool display: HEADLAMP SWITCH INPUT CKT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor Scan Tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. HEADLAMP SWITCH OPEN

Turn the ignition off.

Disconnect the Multifunction Switch harness connector.

Connect a jumper wire between the Headlamp Switch MUX circuit and the Headlamp Switch Return circuit in the Multifunction Switch harness connector.

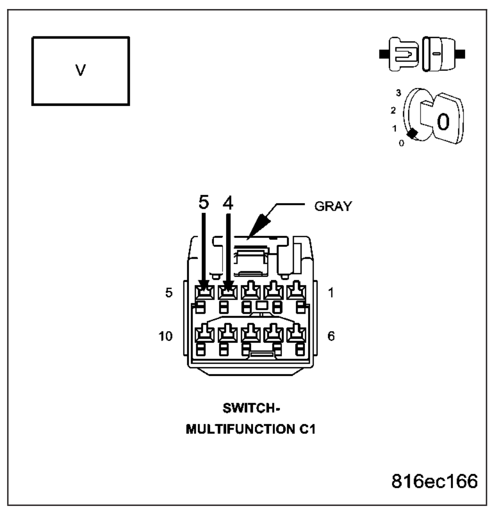
Turn the ignition on.

With the Scan Tool, select Body, Body Controller and read: Headlamp Switch volts.

**Does the Scan Tool display Headlamp Switch voltage below 0.5 volts?**

**Yes** >> Replace the Headlamp Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3



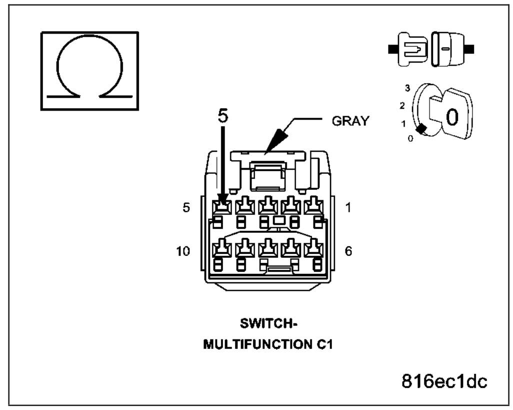
## 3. HEADLAMP SWITCH MUX CIRCUIT OPEN

Turn the ignition off.

Disconnect the Body Control Module harness connector.

Disconnect the Multifunction Switch harness connector.

Measure resistance of the Headlamp Switch MUX circuit from the Body Control Module connector to the Multifunction Switch harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Headlamp Switch MUX circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

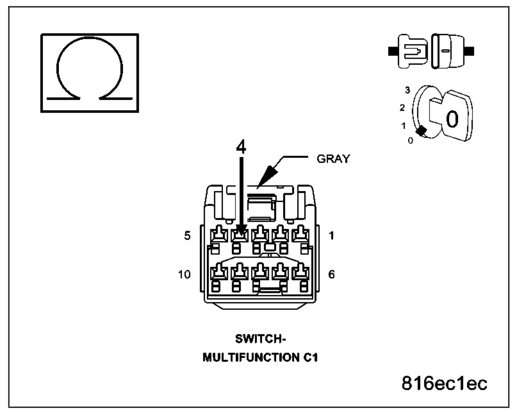
## 4. HEADLAMP SWITCH RETURN CIRCUIT OPEN

Turn the ignition off.

Disconnect the Body Control Module harness connector.

Disconnect the Multifunction Switch C1 harness connector.

Measure resistance of the Headlamp Switch Return circuit from the Body Control Module connector to the Multifunction Switch harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Headlamp Switch Return circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

# HEADLAMP SWITCH INPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  BCM detects a voltage less than 0.25 volts on the Headlamp Switch Input for more than 5 seconds.

| Possible Causes |
|---|
| HEADLAMP SWITCH SHORTED |
| HEADLAMP SWITCH MUX CIRCUIT SHORT TO RETURN CIRCUIT |
| HEADLAMP SWITCH MUX CIRCUIT SHORT TO GROUND |
| HEADLAMP SWITCH RETURN CIRCUIT SHORT TO GROUND |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all BCM DTC's.

Turn the headlamps to the ON position.

With the Scan Tool, read DTCs.

**Does the Scan Tool display: HEADLAMP SWITCH INPUT CKT LOW?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor Scan Tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1.

### 2. HEADLAMP SWITCH SHORTED

Turn the ignition off.

Disconnect the Multifunction Switch harness connector.

Turn the ignition on.

With the Scan Tool, select Body, Body Control Module and read: Headlamp Switch voltage.

**Does the Scan Tool display Headlamp Switch voltage above 4.8 volts?**

**Yes** >> Replace the Multifunction Switch.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. HEADLAMP SWITCH MUX CIRCUIT SHORT TO MUX RETURN CIRCUIT

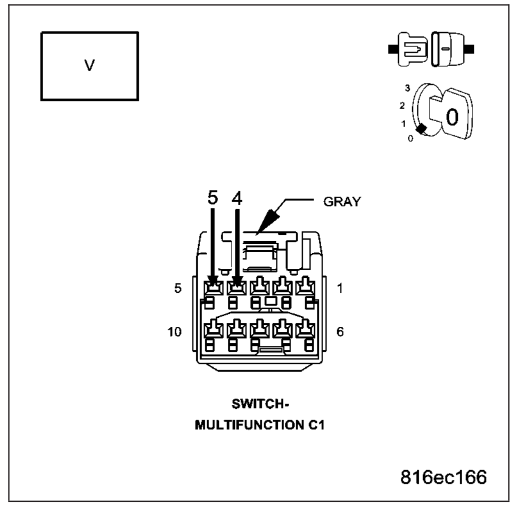
Turn the ignition off.

Disconnect the Body Control Module harness connector.

Disconnect the Multifunction Switch harness connector.

Measure resistance between the Headlamp Switch Return circuit and the Headlamp Switch MUX circuit.

**Is the resistance below 5.0 ohms?**



**Yes** >> Repair the Headlamp Switch MUX circuit for a short to the Headlamp Switch Return circuit.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. HEADLAMP SWITCH MUX CIRCUIT SHORT TO GROUND

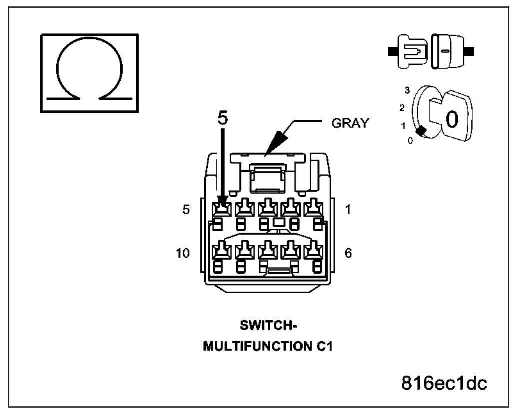
Turn the ignition off.

Disconnect the Body Control Module harness connector.

Disconnect the Multifunction Switch harness connector.

Measure resistance between ground and the Headlamp Switch MUX circuit.

**Is the resistance above 5.0 ohms?**



**Yes** >> Repair the Headlamp Switch MUX Circuit for a short to ground condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. HEADLAMP SWITCH RETURN CIRCUIT SHORT TO GROUND

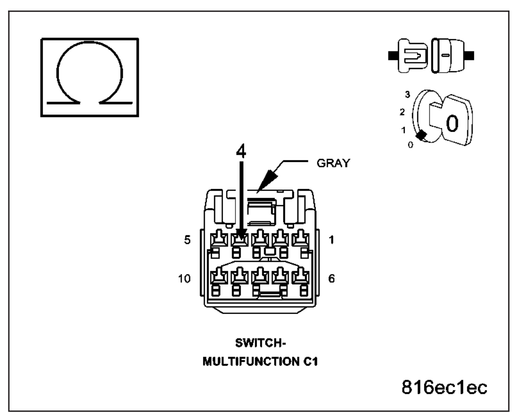
Turn the ignition off.

Disconnect the Body Control Module harness connector.

Disconnect the Multifunction Switch harness connector.

Measure resistance between ground and the Headlamp Switch Return circuit.

**Is the resistance below 5.0 ohms?**



**Yes** >> Repair the Headlamp Switch Return Circuit for a short to ground condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## HIGH BEAM RELAY CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  BCM detects battery on the High Beam Relay when it is attempting to turn on the High Beams for more than 5 seconds.

| Possible Causes |
|---|
| MISSING RELAY |
| OPEN FUSE |
| HIGH BEAM RELAY |
| MULTIFUNCTION SWITCH |
| HIGH BEAM SWITCH SENSE CIRCUIT OPEN |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all BCM DTC's.

Turn the High Beams on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: HIGH BEAM RELAY CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MISSING RELAY

Turn the ignition off.

Check the Junction Block to make certain the High Beam Relay is present.

**Is the High Beam Relay present?**

**Yes** >> Go To 3

**No** >> Replace the missing High Beam Relay.
Perform BODY VERIFICATION TEST - VER 1.

### 3. OPEN FUSE

Turn the ignition off.

Check the Junction Block High Beam fuses 26 and 27.

**Are any of the fuses open?**

**Yes** >> Replace the open fuse.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. HIGH BEAM RELAY

Turn the ignition off.

Install a known good relay in place of the High Beam Relay.

Turn the High Beams On.

**Do the High Beams operate normally?**

**Yes** >> Replace the High Beam Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

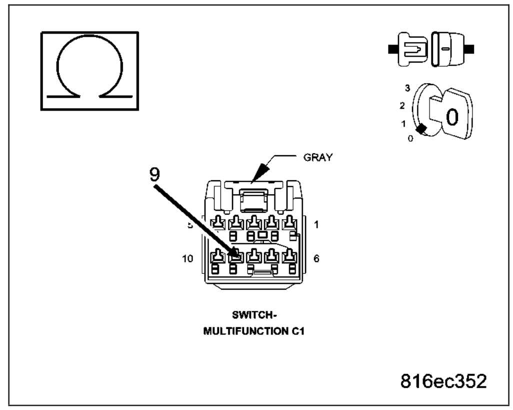
## 5. MULTIFUNCTION SWITCH

Turn the ignition off.

Disconnect the Multifunction Switch harness connector C1.

Disconnect the BCM C2 connector.

Measure the resistance of the High Beam Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Multifunction Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the High Beam Switch Sense circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

## *LOW BEAM HEADLAMPS INOPERATIVE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Possible Causes
- **Set Condition:**
  Possible Causes

| Possible Causes |
|---|
| LOW BEAM RELAY |
| OPEN FUSED B+ CIRCUIT |
| LOW BEAM RELAY CONTROL CIRCUIT |
| LOW BEAM RELAY |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the Low Beams on.

**Do the Low Beam Headlamps operate properly?**

**Yes** >> The condition is not present at this time. Monitor Scan Tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 2

### 2. LOW BEAM RELAY

Remove the Low Beam Relay from the Junction Block.

Install a known good relay in place of the Low Beam Relay.

With the Scan Tool, actuate the Low Beam Relay.

**Do the Headlamps flash while actuating the Low Beam Relay?**

**Yes** >> Replace the Low Beam Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. OPEN FUSED B(+) CIRCUIT

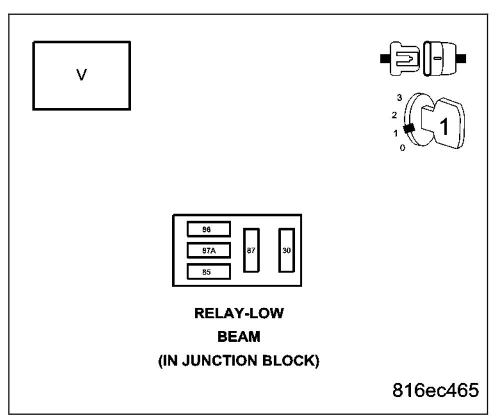
Remove the Low Beam Relay from the Junction Block.

Measure the voltage of the Fused B(+) circuit at the Low Beam Relay connector.

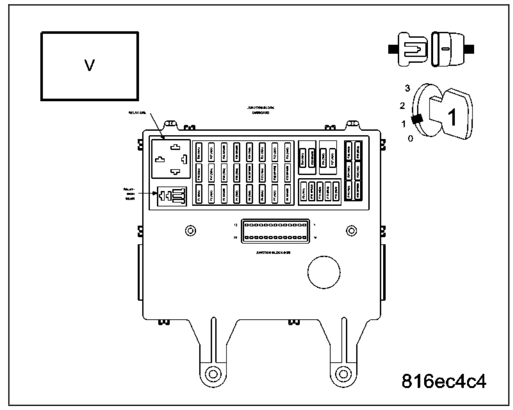
**Is the voltage above 10.0 volts?**

**Yes** >> Go To 4

**No** >> Repair the open fused B+ circuit.
Perform BODY VERIFICATION TEST - VER 1.



## 4. LOW BEAM RELAY CONTROL CIRCUIT



Remove the BCM from the junction block.

Connect a jumper wire between the Fused B(+) circuit and the Low Beam Relay Control circuit at the Low Beam Relay connector.

Measure the voltage of the Low Beam Relay Control circuit to the BCM Junction Block connector.

**Is the voltage above 10.0 volts?**

**Yes** >> Go To 5

**No** >> Repair the Low Beam Relay Control circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

## 5. LOW BEAM HEADLAMP RELAY

Disconnect the jumper wire.

Reinstall the Low Beam Relay in the Junction Block.

Remove the BCM from the junction block.

Measure the voltage of the Low Beam Relay Control circuit to the BCM internal connector.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Low Beam Relay.
Perform BODY VERIFICATION TEST - VER 1.

## LOW BEAM RELAY CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With ignition on
- **Set Condition:**
  BCM detects battery on the Low Beam Relay when it is attempting to turn on the Low Beams for more than 5 seconds.

| Possible Causes |
|---|
| MISSING RELAY |
| OPEN FUSE |
| LOW BEAM RELAY |
| BODY CONTROL MODULE |
| FUSED LOW BEAM RELAY OUTPUT CIRCUIT OPEN |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Low Beams on.

With the scan tool, read the DTC information.

**Does the scan tool read: LOW BEAM RELAY CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MISSING RELAY

Turn the ignition off.

Check the Junction Block to make certain the Low Beam Relay is present.

**Is the Low Beam Relay present?**

**Yes** >> Go To 3

**No** >> Replace the missing Low Beam Relay.
Perform BODY VERIFICATION TEST - VER 1.

### 3. OPEN FUSE

Turn the ignition off.

Check the Junction Block Low Beam fuses 4 and 5.

**Are any of the fuses open?**

**Yes** >> Replace the open fuse.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. LOW BEAM RELAY

Turn the ignition off.
Install a known good relay in place of the Low Beam Relay.
Turn the Low Beams On.

**Do the Low Beams operate normally?**

**Yes** >> Replace the Low Beam Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. BODY CONTROL MODULE

Turn the ignition off
Remove the Low Beam Relay.
Measure the voltage of the Fused B+ circuit of the Low Beam Relay.

**Is the voltage above 10 volts?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Fused Low Beam Relay Output circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

## LOW BEAM RELAY CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  BCM detects a low (ground) on the Low Beam Relay even though it is not attempting to turn on the Low Beams for more than 5 seconds.

| Possible Causes |
|---|
| LOW BEAM RELAY SHORT TO GROUND |
| LOW BEAM RELAY |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Low Beams on.

With the scan tool, read the DTC information.

**Does the scan tool read: LOW BEAM RELAY CKT LOW?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor DRBIII parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. LOW BEAM RELAY SHORT TO GROUND

Turn the ignition off.

Disconnect the Low Beam Relay.

Measure the resistance between ground and the Low Beam Relay Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Low Beam Relay Control circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. LOW BEAM RELAY

Turn the ignition off.

Disconnect the Low Beam Relay harness connector.

Measure the voltage of the Low Beam Relay harness connector coil side feed circuit to ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Low Beam Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## PARK LAMP RELAY CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  BCM detects battery on the Park Lamp Relay when it is attempting to turn on the Park Lamps for more than 5 seconds.

| Possible Causes |
|---|
| MISSING RELAY |
| OPEN FUSE |
| PARK LAMP RELAY |
| BODY CONTROL MODULE |
| FUSED PARK LAMP RELAY OUTPUT CIRCUIT OPEN |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Park Lamps on.

With the scan tool, read the DTC information.

**Does the scan tool read: PARK LAMP RELAY CKT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MISSING RELAY

Turn the ignition off.

Check the Junction Block to make certain the Park Lamp Relay is present.

**Is the Park Lamp Relay present?**

**Yes** >> Go To 3

**No** >> Replace the missing Park Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

### 3. OPEN FUSE

Turn the ignition off.

Check the Junction Block Park Lamp fuses 23 and 9.

**Are any of the fuses open?**

**Yes** >> Replace the open fuse.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. PARK LAMP RELAY

Turn the ignition off.
Install a known good relay in place of the Park Lamp Relay.
Turn the Park Lamps On.

**Do the Park Lamps operate normally?**

**Yes** >> Replace the Park Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. BODY CONTROL MODULE

Turn the ignition off.
Remove the Park Lamp Relay.
Measure the voltage of the Fused B+ circuit of the Park Lamp Relay.

**Is the voltage above 10 volts?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Fused Park Lamp Relay Output circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

## PARK LAMP RELAY CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  BCM detects a low (ground) on the Park Lamp Relay even though it is not attempting to turn on the Park Lamps for more than 5 seconds.

| Possible Causes |
| --- |
| PARK LAMP RELAY SHORT TO GROUND |
| PARK LAMP RELAY |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC’s.

Turn the Park Lamps on.

With the scan tool, read the DTC information.

**Does the scan tool read: PARK LAMP RELAY CKT LOW?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. PARK LAMP RELAY SHORT TO GROUND

Turn the ignition off.

Disconnect the Park Lamp Relay.

Measure the resistance between ground and the Park Lamp Relay Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Park lamp Relay Control circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. PARK LAMP RELAY

Turn the ignition off.

Disconnect the Park Lamp Relay harness connector.

Measure the voltage of the Park Lamp Relay harness connector coil side feed circuit to ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Park Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## REAR FOG RELAY CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  BCM detects battery on the Rear Fog Relay when it is attempting to turn on the Front Fog Lamps for more than 5 seconds. The BCM is programmed per Country Code whether or not a vehicle is equipped with a Rear Fog Relay.

| Possible Causes |
|---|
| MISSING RELAY |
| OPEN FUSE |
| FOG LAMP RELAY |
| BODY CONTROL MODULE |
| FOG LAMP RELAY CONTROL CIRCUIT OPEN |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Fog Lamps on.

With the scan tool, read the DTC information.

**Does the scan tool read: REAR FOG RELAY CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MISSING RELAY

Turn the ignition off.

Check the Junction Block to make certain the Rear Fog Lamp Relay is present.

**Is the Rear Fog Lamp Relay present?**

**Yes** >> Go To 3

**No** >> Replace the missing Fog Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

### 3. OPEN FUSE

Turn the ignition off.

Check Junction Block fuse 2.

**Is the fuse open?**

**Yes** >> Replace the open fuse.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. FOG LAMP RELAY

Turn the ignition off.

Install a known good relay in place of the Rear Fog Lamp Relay.

Turn the Fog Lamps On.

**Do the Rear Fog Lamps operate normally?**

**Yes** >> Replace the Fog Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. BODY CONTROL MODULE

Turn the ignition off.

Remove the Fog Lamp Relay.

Measure the voltage of the Fused B+ circuit of the Fog Lamp Relay.

**Is the voltage above 10 volts?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Fog Lamp Relay Control Circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

## REAR FOG RELAY CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  BCM detects a low (ground) on the Fog Relay even though it is not attempting to turn on the Rear Fog Lamps for more than 5 seconds.

| Possible Causes |
|---|
| LOW BEAM RELAY |
| OPEN FUSED B+ CIRCUIT |
| LOW BEAM RELAY CONTROL CIRCUIT |
| LOW BEAM RELAY |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Fog Lamps on.

With the scan tool, read the DTC information.

**Does the scan tool read: Rear Fog Relay Circuit Low?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. REAR FOG RELAY SHORT TO GROUND

Turn the ignition off.

Disconnect the Rear Fog Relay.

Measure the resistance between ground and the Rear Fog Relay Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Rear Fog Relay Control circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. REAR FOG RELAY

Turn the ignition off.

Disconnect the Rear Fog Relay harness connector from the Junction Block.

Measure the voltage of the Rear Fog Relay harness connector coil side feed circuit to ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Rear Fog Lamp Relay.
Perform BODY VERIFICATION TEST - VER 1.

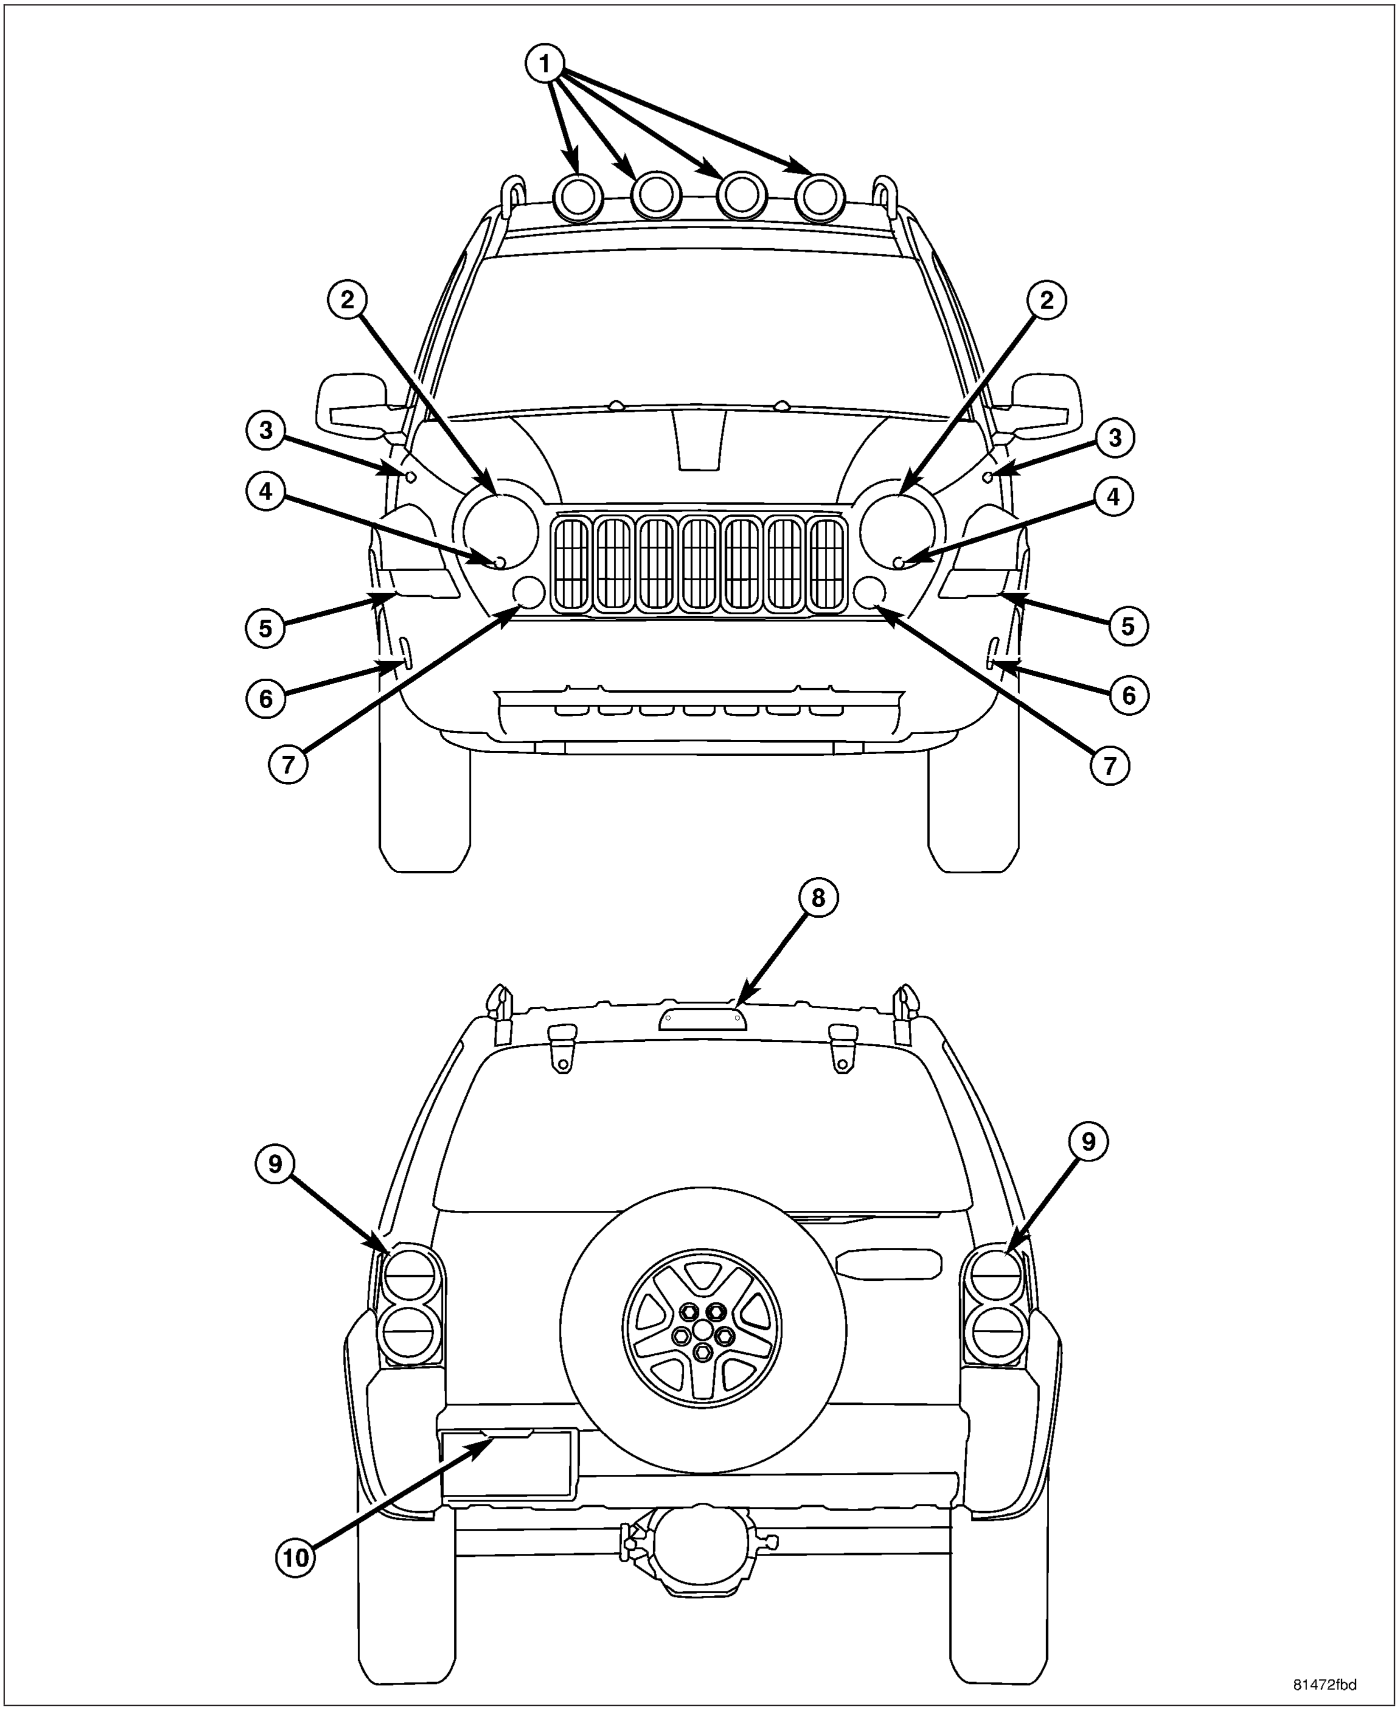
**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

# LAMPS/LIGHTING - EXTERIOR

## TABLE OF CONTENTS

# LAMPS/LIGHTING - EXTERIOR

## DESCRIPTION



The exterior lighting system for this vehicle includes the following exterior lamp units:

- **Center High Mounted Stop Lamp (8)** - A standard equipment Center High Mounted Stop Lamp (CHMSL) is centered on the rear edge of the roof panel above the flip-up glass opening at the rear of the vehicle.
- **Front Fog Lamps (7)** - Two optional front fog lamps are available on this vehicle, grille opening panel mounted fog lamp units with an adjustable reflector that are secured behind a dedicated opening on each side of the grille panel below and inboard of the headlamps; or, free standing fascia mounted lamps with an adjustable mounting bracket that are secured to the upper horizontal surface of the front fascia below and inboard of the headlamps.
- **Front Park Lamps (5)** - A standard equipment front park lamp unit is mounted high at each outboard end of the front fascia.
- **Front Position Lamps (4)** - A front position lamp is integral to each headlamp unit in certain markets where they are required.
- **Front Side Marker Lamps/Reflectors (6)** - A front side marker lamp unit is mounted low on each outward facing outboard end of the front fascia. In certain markets where the side repeater lamp is required, the bulb and socket is deleted from the front side marker lamp and only the lamp housing with its reflective lens is used.
- **Headlamps (2)** - Standard equipment round headlamp units with a fixed lens and an adjustable reflector are secured to the grille opening panel at each side of the front grille. In certain markets where required, a headlamp leveling actuator motor and/or a front position lamp is/are integral to each headlamp.
- **License Plate Lamps (10)** - Vehicles with a license plate tub integral to the left side of the rear fascia have a single rear license plate lamp unit mounted to the underside of the upper horizontal wall of the fascia tub formation. Vehicles with a license plate bracket secured to the spare tire carrier have two rear license plate lamps mounted to the underside of the upper horizontal wall of the tub formation in the bracket.
- **Light Bar Lamps (1)** - Vehicles equipped with this option have a light bar mounted to the roof panel just rearward of the upper windshield opening header. Depending upon the market the vehicle is manufactured for, the light bar incorporates either two or four individually adjustable, forward-facing, auxiliary lamp units.
- **Rear Lamp Units (9)** - A standard equipment rear lamp unit is mounted to the rear of each quarter panel on either side of the tailgate opening.
- **Side Repeater Lamps (3)** - A side repeater lamp is mounted to each front fender just behind the front wheel in certain markets where they are required.
- **Rear Reflectors** - In certain markets where they are required, two rectangular, red reflectors are located on the rear bumper fascia, one just inboard and below each rear lamp unit.

These exterior lighting lamp units and their controls are combined to provide the following exterior lighting features:

- **Auxiliary (Off-Road) Lamps** - On vehicles equipped with the light bar lamp option, the auxiliary (off-road) light bar lamps include the clear bulbs, reflectors and clear lenses of each of the two or four adjustable lamps integral to the light bar.
- **Backup Lamps** - The backup (or reverse) lamps include a clear bulb, reflector and clear lens that are integral to each rear lamp unit.
- **Brake Lamps** - The brake (or stop) lamps include the clear bulbs, reflectors and red lenses that are integral to each rear lamp unit and the CHMSL.
- **Daytime Running Lamps** - Vehicles manufactured for sale in Canada illuminate the high beam filament of each headlamp bulb at a reduced intensity to serve as the Daytime Running Lamps (DRL).
- **Front Fog Lamps** - Both optional front fog lamps include the bulb, reflector and lens of each adjustable front fog lamp unit.
- **Hazard Warning Lamps** - The hazard warning lamps include the bulbs, reflectors and lenses of each lamp in the right and left, front and rear turn signal circuits.
- **Headlamps** - The headlamps include a single, dual filament halogen bulb, an adjustable reflector and a clear lens integral to each headlamp unit.
- **Headlamp Leveling** - Headlamp leveling is available only in certain markets where it is required equipment. A headlamp leveling actuator motor on each headlamp unit and a headlamp leveling switch mounted on the instrument panel allow the vertical axis of the headlamp beam pattern to be adjusted by the vehicle operator from the interior of the vehicle to compensate for passenger or cargo load.
- **Optical Horn** - Also known as flash-to-pass, the beam selection function of the multi-function switch left (lighting) control stalk has a momentary intermediate position that allows the headlamp high beams to be flashed momentarily, without changing the headlamp beam selection.

- **Park Lamps** - The front park lamps include either the clear bulbs, the reflectors and the amber lenses of the front park lamp units or the clear position lamp bulb integral to each headlamp unit. Vehicles not equipped with repeater lamp units have front side marker lamps. The bulbs are removed from the front side marker lamps on vehicles with repeater lamps so that they serve only as reflectors. The rear park lamps include a clear bulb, a reflector and a red lens integral to each rear lamp unit as well as the clear bulb and lens of the license plate lamp unit or units.
- **Rear Fog Lamps** - Rear fog lamps are available only in certain markets where they are required equipment. The rear fog lamps include a clear bulb, a reflector and a red lens that are integral to each rear lamp unit.
- **Turn Signal Lamps** - The front turn signal lamps include a clear bulb, a reflector, and an amber lens that are integral to each front park lamp unit and the front side marker lamps. In certain markets where required, the repeater lamps on each front fender replace the front side marker lamps in the front turn signal circuits. The rear turn signal lamps include an amber bulb, a reflector and a clear lens that are integral to each rear lamp unit.

Other components of the exterior lighting system for this vehicle include:

- **Backup Lamp Switch** - Vehicles equipped with a manual transmission have a plunger-type backup lamp switch located on the transmission housing. A Transmission Range Sensor (TRS) integral to the solenoid pack on the valve body of the optional electronic automatic transmission performs the backup lamp switch function on vehicles that are so equipped.
- **Body Control Module** - The Body Control Module (BCM) is located on the Junction Block (JB) under the driver side outboard end of the instrument panel. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL MODULE - DESCRIPTION).
- **Brake Lamp Switch** - A plunger-type brake lamp switch is located on the steering column support bracket under the instrument panel and is actuated by the brake pedal arm when the brake pedal is depressed.
- **Combination Flasher** - An electronic combination turn signal and hazard warning flasher is integral to the hazard warning switch in the center of the instrument panel.
- **Daytime Running Lamp Relay** - Vehicles manufactured for sale in Canada use a solid state Daytime Running Lamps (DRL) relay installed in the Junction Block (JB) instead of the conventional high beam relay.
- **Front Fog Lamp Relay** - Vehicles equipped with the optional front fog lamps have a front fog lamp relay located in the Junction Block (JB).
- **Hazard Switch** - The hazard switch is located near the center of the instrument panel and includes the electronic combination flasher circuitry for the hazard warning system and the turn signal system.
- **Headlamp Leveling Motor** - A headlamp leveling actuator motor is located on the back of each headlamp housing of vehicles manufactured for certain markets where the headlamp leveling feature is required.
- **Headlamp Leveling Switch** - A thumbwheel actuated four-position headlamp leveling switch is mounted in the driver side instrument panel bezel of vehicles manufactured for certain markets where the headlamp leveling feature is required.
- **High Beam Relay** - A high beam relay is located in the Junction Block (JB) of all vehicles except those that are manufactured for sale in Canada. Canadian vehicles have a solid state Daytime Running Lamps (DRL) relay in the JB instead of the high beam relay.
- **Light Bar Lamp Switch** - A rocker actuated light bar lamp switch is mounted in the driver side instrument panel bezel of vehicles equipped with the optional light bar lamps.
- **Low Beam Relay** - A low beam relay is located in the Junction Block (JB) of all vehicles.
- **Multi-Function Switch** - The multi-function switch is located on the steering column, just below the steering wheel. The multi-function switch includes a left (lighting) control stalk and a right (wiper) control stalk. The left control stalk is dedicated to providing almost all of the driver controls for both the exterior and interior lighting systems.
- **Park Brake Switch** - A park brake switch is located on the park brake lever mechanism on the floor panel transmission tunnel between the two front seats.
- **Park Lamp Relay** - A park lamp relay is located in the Junction Block (JB) of all vehicles.
- **Rear Fog Lamp Relay** - Vehicles manufactured for certain markets where rear fog lamps are required equipment have a rear fog lamp relay located in the Junction Block (JB).
- **Trailer Tow Connector** - Vehicles equipped with a factory-installed trailer towing package have a heavy duty 7-way trailer tow connector installed in a bracket on the trailer hitch receiver.
- **Trailer Tow Relays** - Vehicles equipped with a factory-installed trailer towing package have a connector bank containing four relays located behind the right quarter trim panel. The four relays are used to supply fused

ignition switch output (run), brake lamps, right turn signal, and left turn signal outputs to a trailer through the trailer tow wiring and connectors. Refer to the appropriate wiring information.

- **Trailer Tow Wiring Adapter** - Vehicles equipped with a factory-installed trailer towing package have a wiring adapter provided that adapts the factory-installed heavy duty 7-way trailer tow connector to a conventional 4-way light duty connector.
- **Turn Signal Cancel Cam** - A turn signal cancel cam is integral to the clockspring of all vehicles.

Hard wired circuitry connects the exterior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the exterior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

## OPERATION

Following are paragraphs that briefly describe the operation of each of the major exterior lighting systems. The hard wired circuits and components of the exterior lighting systems may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the Body Control Module (BCM), the ElectroMechanical Instrument Cluster (EMIC), the Powertrain Control Module (PCM) or the Programmable Communications Interface (PCI) data bus. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the PCM, the PCI data bus or the electronic bus message inputs and outputs related to the various exterior lighting systems requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

### BACKUP LAMPS

The backup (or reverse) lamps have a path to ground at all times through a takeout and eyelet terminal of the rear lighting wire harness that is secured by a ground screw to the base of the right D-pillar behind the quarter trim panel. The backup lamps receive battery voltage from a fused ignition switch output (run) fuse on the back-up lamp feed circuit only when the backup lamp switch (manual transmission) or the Transmission Range Sensor (TRS - electronic automatic transmission) is closed by the gearshift mechanism within the transmission.

### BRAKE LAMPS

The brake (or stop) lamps have a path to ground at all times through the rear lighting harness and a takeout and eyelet terminal of the rear body wire harness that is secured by a ground screw at the base of the right D-pillar behind the quarter trim panel. The Center High Mounted Stop Lamp (CHMSL) has a path to ground at all times through a takeout and eyelet terminal of the rear body wire harness that is secured by a ground screw at the base of the driver side (left or right) D-pillar behind the quarter trim panel. The brake lamps and CHMSL receive battery voltage from a fuse in the Junction Block (JB) on the brake lamp switch output circuit when the brake lamp switch is closed by the brake pedal arm.

### DAYTIME RUNNING LAMPS

Vehicles manufactured for sale in Canada illuminate the high beam filament of both headlamp bulbs at a reduced intensity when the engine is running and the exterior lamps are turned off. This feature is enabled by the Body Control Module (BCM) and a solid state Daytime Running Lamps (DRL) relay, which is installed in the Junction Block (JB). The high beam relay is omitted from the JB on vehicles equipped with DRL.

When the BCM monitors an engine speed signal of greater than 450 rpm and the status of the exterior lighting switch input is Off, the BCM duty cycles the DRL relay to produce illumination of the headlamp high beam filaments at a reduced intensity. The BCM also provides normal headlamp high beam operation through the DRL relay on vehicles so equipped. When the DRL relay is energized, it provides battery voltage from a fused B(+) fuse in the JB to the headlamp high beam filament through the DRL relay output circuit.

### FRONT FOG LAMPS

Vehicles equipped with optional front fog lamps have a premium Body Control Module (BCM), a front fog lamp relay installed in the Junction Block (JB), and a front fog lamp switch integral to the left control stalk of the multi-function switch. The front fog lamps have a path to ground at all times through their connection to the front fascia wire harness from two take outs with eyelet terminals that are secured by ground screws to the left inner fender shield in the engine compartment.

The BCM controls front fog lamp operation by monitoring the exterior lighting switch input from the multi-function switch, then energizing or de-energizing the front fog lamp relay control coil. The BCM also sends the appropriate electronic message to the ElectroMechanical Instrument Cluster (EMIC) over the Programmable Communications Interface (PCI) data bus to control operation of the front fog lamp indicator.

When the front fog lamp relay is energized, it provides battery voltage from a fused B(+) fuse in the JB to the front fog lamps through the front fog lamp relay output circuit. The BCM provides a battery saver (load shedding) feature for the front fog lamps, which will turn these lamps off if they are left on for more than about eight minutes with the ignition switch in the Off position. In certain markets where required, the front fog lamps are also turned off by the BCM whenever the headlamp high beams are selected. Each front fog lamp includes an integral adjustment screw to be used for static aiming of the fog lamp beams.

## HAZARD WARNING LAMPS

With the hazard switch in the On position, the hazard warning system is activated causing the hazard switch button, the right and left turn signal indicators, and the right and left turn signal lamps to begin flashing on and off. When the hazard warning system is activated, the circuitry within the hazard switch and electronic combination flasher unit will repeatedly energize and de-energize two internal relays that switch battery voltage from a fused B(+) fuse in the Junction Block (JB) to the turn signal indicators and the turn signal lamps through the right and left turn signal circuits.

The flashing of the hazard switch button illumination lamp is performed internally by the hazard switch and combination flasher unit circuit board. The hazard warning lamps can also be energized by the Body Control Module (BCM) through a hazard lamp control circuit input to the hazard switch and combination flasher unit.

## HEADLAMPS

The headlamp system includes the Body Control Module (BCM), a low beam relay installed in the Junction Block (JB), a high beam relay installed in the JB (except Canada), a solid state Daytime Running Lamps (DRL) relay installed in the JB (Canada only), the exterior lighting switches integral to the left (lighting) control stalk of the multi-function switch, and the ElectroMechanical Instrument Cluster (EMIC). The headlamps have a path to ground at all times through the grille opening reinforcement wire harness and two take outs with eyelet terminals of the headlamp and dash wire harness that are secured by ground screws to the left inner fender shield in the engine compartment.

The BCM controls headlamp operation by monitoring the exterior lighting switch inputs from the multi-function switch, then energizing or de-energizing the low beam relay, the high beam relay or the solid state circuitry of the DRL relay. It also sends electronic messages to the EMIC over the Programmable Communications Interface (PCI) data bus to control operation of the high beam indicator. When each respective relay is energized, it provides battery voltage from a fuse in the Power Distribution Center (PDC) through a relay (low beam, high beam, or DRL) output circuit.

The BCM also provides a battery saver (load shedding) feature for the headlamps, which will turn these lamps off if they are left on for more than about eight minutes with the ignition switch in the Off position; and, a headlamp delay feature with optional delay intervals that can be programmed using a diagnostic scan tool. Each headlamp includes an integral reflector adjustment screw to be used for static aiming of the headlamp beams.

## HEADLAMP LEVELING

In certain markets where required, a headlamp leveling system is provided on the vehicle. The headlamp leveling system includes unique headlamp units equipped with a headlamp leveling actuator motor, and a rotary thumbwheel actuated headlamp leveling switch on the instrument panel. The headlamp leveling system allows the headlamp beams to be adjusted to one of four vertical positions to compensate for changes in inclination caused by the loading of the vehicle suspension.

The leveling motors are mechanically connected through an integral pushrod to the adjustable headlamp reflector. The headlamp leveling switch is a resistor multiplexed unit that provides one of four voltage outputs to the headlamp leveling motors. The headlamp leveling motors will move the headlamps to the selected position based upon the voltage input received from the switch. The headlamp leveling motors and switch have a path to ground at all times. The headlamp leveling components operate on battery voltage received through the fused park lamp relay output circuit so that the system will only operate when the exterior lighting is turned on.

## LIGHT BAR LAMPS

The optional light bar (auxiliary off-road) lamps system the Body Control Module (BCM), the light bar switch on the instrument panel, and the ElectroMechanical Instrument Cluster. For all North American markets, the light bar switch receives battery voltage on a fused ignition switch output (run-start) circuit, which enables the switch to energize the lamps whenever the ignition switch is in the On or Start positions. For markets outside of North America, the light bar switch receives battery voltage from the park lamp relay in the Junction Block (JB) on the park lamp relay output circuit, and monitors an input from the low beam driver output circuit of the low beam relay in the JB, which enables the switch to energize the light bar lamps only with the park lamps On and the low beam headlamps Off.

The light bar lamps have a path to ground at all times through a take out and eyelet terminal of the instrument panel wire harness that is secured by a nut to a ground stud on the left instrument panel end bracket (left-hand drive) or the center of the instrument panel support structure (right-hand drive). The light bar switch controls light bar lamp operation by providing battery voltage from a fused B(+) fuse in the Power Distribution Center (PDC) to the lamps on the lightbar switch output circuit. When the lightbar switch output circuit is energized, the light bar switch also provides an input to the BCM on the lightbar switch sense circuit. The BCM then provides the appropriate electronic messages to the EMIC over the Programmable Communications Interface (PCI) data bus to control operation of the light bar indicator, the high beam indicator, or both indicators as required by the market for which the vehicle was manufactured.

## PARK LAMPS

The park lamps system includes the Body Control Module (BCM), a park lamp relay installed in the Junction Block (JB), and the exterior lighting switch integral to the left (lighting) control stalk of the multi-function switch. The front park lamp and side marker lamp or, if equipped, the front position lamp bulbs each have a path to ground at all times through two take outs with eyelet terminals of the headlamp and dash wire harness that are secured by ground screws to the left inner fender shield in the engine compartment. The rear park and license plate lamps have a path to ground at all times through a take out and eyelet terminal of the rear body harness that is secured by a ground screw to the base of the right D-pillar behind the quarter trim panel.

The BCM controls park lamp operation by monitoring the exterior lighting switch input from the multi-function switch, then energizing or de-energizing the park lamp relay. When the park lamp relay is energized, it provides battery voltage from a fuse in the Power Distribution Center (PDC) through a park lamp relay output circuit to the appropriate lamp bulbs. On vehicles manufactured for North American markets only, the BCM also provides a battery saver (load shedding) feature for the park lamps, which will turn these lamps off if they are left on for more than about eight minutes with the ignition switch in the Off position.

## REAR FOG LAMPS

Rear fog lamps are installed on vehicles manufactured for certain markets where they are required. The rear fog lamp system includes a premium Body Control Module (BCM), a rear fog lamp relay installed in the Junction Block (JB), and a rear fog lamp switch integral to the left (lighting) control stalk of the multi-function switch. The rear fog lamps operate in concert with the front fog lamps. The rear fog lamps have a path to ground at all times through a take out and eyelet terminal of the rear body wire harness that is secured by a ground screw to the base of the right D-pillar behind the quarter trim panel.

The BCM controls rear fog lamp operation by monitoring the exterior lighting switch input from the multi-function switch, then energizing or de-energizing the rear fog lamp relay control coil and sending the appropriate electronic messages to the instrument cluster over the Programmable Communications Interface (PCI) data bus to control rear fog lamp indicator operation. When the rear fog lamp relay is energized, it provides battery voltage from a fused B(+) fuse in the JB to the rear fog lamps through the rear fog lamp relay output circuit. The BCM also provides a battery saver (load shedding) feature for the rear fog lamps, which will turn these lamps off if they are left on for more than about eight minutes with the ignition switch in the Off position.

## TRAILER TOW WIRING

In addition to the trailer tow wiring provisions, vehicles equipped with an optional trailer tow package include trailer tow relays installed in a bank of connectors concealed behind the quarter trim panel above the right rear wheel house. These relays isolate the trailer lighting from the vehicle lighting and are controlled by the normal outputs of the brake lamp switch, hazard warning switch/combination flasher unit, and the park lamp relay. When a trailer tow relay is energized, it provides battery voltage from a fused B(+) fuse to the trailer lamps through the trailer tow wiring to synchronize the illumination and flash rate of the trailer brake, park and turn signal lamps with those of the tow vehicle.

### TURN SIGNAL LAMPS

When the left control stalk of the multi-function switch is moved up (right turn) or down (left turn), the turn signal system is activated causing the selected right or left turn signal indicators and turn signal lamps to flash on and off. When the turn signal system is activated, the circuitry within the turn signal switch and the hazard switch/electronic combination flasher unit will repeatedly energize and de-energize one of two internal relays that switch battery voltage from a fused ignition switch output (run) fuse in the Junction Block (JB) to the appropriate turn signal indicator and turn signal lamps.

The ElectroMechanical Instrument Cluster (EMIC) chime tone transducer will generate an audible turn signal cancel warning each time the vehicle is driven for a distance of about 3.2 kilometers (about two miles) with a turn signal indicator flashing. The EMIC uses Programmable Communications Interface (PCI) data bus distance messages from the Powertrain Control Module (PCM) and a hard wired input from the turn signal switch circuitry or the multi-function switch to determine when to sound the turn signal cancel warning.

## WARNING

## WARNINGS - LAMPS/LIGHTING - EXTERIOR

**WARNING:: To avoid personal injury or death, eye protection should be used when servicing any glass components.**

**CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.**

**CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SPECIFICATIONS). In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.**

## DIAGNOSIS AND TESTING

## LAMPS/LIGHTING - EXTERIOR

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: When diagnosing the exterior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.**

**NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.**

The hard wired exterior lamp and lighting circuits may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the Body Control Module (BCM), the ElectroMechanical Instrument Cluster (EMIC), the Powertrain Control Module (PCM), the Programmable

Communications Interface (PCI) data bus, or the electronic message inputs used to provide exterior lamp and lighting service or many of the electronic features of the exterior lamp and lighting systems. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the PCM, the PCI data bus, and the electronic message inputs used for control of the exterior lamps and lighting system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## BACKUP LAMPS

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| BACKUP LAMP DOES NOT ILLUMINATE | 1. Inoperative or missing fuse. | 1. Test and replace backup lamp fuse as required. |
| | 2. Inoperative or missing bulb. | 2. Test and replace backup lamp bulb as required. |
| | 3. Inoperative ground circuit. | 3. Test and repair backup lamp ground circuit as required. |
| | 4. Inoperative supply circuit. | 4. Test and repair open back-up lamp supply circuit as required. |
| | 5. Inoperative switch. | 5. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) as required. |
| BACKUP LAMP DOES NOT EXTINGUISH | 1. Inoperative supply circuit. | 1. Test and repair shorted back-up lamp supply circuit as required. |
| | 2. Inoperative switch. | 2. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) as required. |

## BRAKE LAMPS

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| BRAKE LAMP DOES NOT ILLUMINATE | 1. Inoperative or missing fuse. | 1. Test and replace brake lamp fuse as required. |
| | 2. Inoperative or missing bulb. | 2. Test and replace brake lamp bulb as required. |
| | 3. Inoperative ground circuit. | 3. Test and repair brake lamp ground circuit as required. |
| | 4. Inoperative supply circuit. | 4. Test and repair open brake lamp switch output circuit as required. |
| | 5. Inoperative switch. | 5. Test and replace brake lamp switch as required. |
| BRAKE LAMP DOES NOT EXTINGUISH | 1. Inoperative supply circuit. | 1. Test and repair shorted brake lamp switch output circuit as required. |
| | 2. Inoperative switch. | 2. Test and replace brake lamp switch as required. |

## DAYTIME RUNNING LAMPS

**NOTE: Before performing the following tests, determine whether the headlamp low and high beams operate. If the headlamp high and low beams are also inoperative, diagnose and repair that problem before attempting to repair the Daytime Running Lamps.**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE | 1. High beam relay installed. | 1. Vehicles with DRL should have a solid state DRL relay, but no high beam relay. If vehicle has DRL relay installed, remove the high beam relay as required. |
| | 2. Inoperative or missing DRL relay. | 2. Replace DRL relay with a known good unit and check operation. Replace DRL relay as required. |
| | 3. Incorrect BCM programming. | 3. Use a diagnostic scan tool to check and program correct country code into BCM as required. |
| | 4. Inoperative BCM inputs or outputs. | 4. Use a diagnostic scan tool to test the BCM inputs or outputs. Refer to the appropriate diagnostic information. |

## FRONT FOG LAMPS

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| ONE FRONT FOG LAMP DOES NOT ILLUMINATE | 1. Inoperative or missing bulb. | 1. Test and replace front fog lamp bulb as required. |
| | 2. Inoperative ground circuit. | 2. Test and repair front fog lamp ground circuit as required. |
| | 3. Inoperative supply circuit. | 3. Test and repair open front fog lamp relay output circuit as required. |
| BOTH FRONT FOG LAMPS DO NOT ILLUMINATE | 1. Inoperative or missing fuse. | 1. Test and replace front fog lamp fuse as required. |
| | 2. Inoperative control circuit. | 2. Test and repair open front fog lamp relay control circuit as required. |
| | 3. Inoperative or missing relay. | 3. Test and replace front fog lamp relay as required. |
| | 4. Inoperative ground circuit. | 4. Test and repair front fog lamp ground circuit as required. |
| | 5. Inoperative supply circuit. | 5. Test and repair open front fog lamp relay output circuit as required. |
| | 6. Inoperative switch. | 6. Test and replace multi-function switch as required. |
| | 7. Inoperative BCM inputs or outputs. | 7. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| FRONT FOG LAMPS DO NOT EXTINGUISH | 1. Inoperative supply circuit. | 1. Test and repair shorted front fog lamp relay output circuit as required. |
| | 2. Inoperative control circuit. | 2. Test and repair shorted front fog lamp relay control circuit as required. |
| | 3. Inoperative relay. | 3. Test and replace front fog lamp relay as required. |
| | 4. Inoperative switch. | 4. Test and replace multi-function switch as required. |
| | 5. Inoperative BCM inputs or outputs. | 5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information. |

## HAZARD WARNING LAMPS

**NOTE: Before performing the following tests, confirm whether the left and right turn signals operate satisfactorily. If the turn signals are inoperative or operate improperly, diagnose and repair that problem before attempting to repair the Hazard Warning Lamps.**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| HAZARD WARNING LAMPS DO NOT FLASH | 1. Inoperative or missing fuse. | 1. Test and replace hazard warning fuse as required. |
| | 2. Inoperative ground circuit. | 2. Test and repair hazard switch ground circuit as required. |
| | 3. Inoperative supply circuit. | 3. Test and repair open hazard switch fused B(+) circuit as required. |
| | 4. Inoperative switch/flasher. | 4. Test and replace hazard switch/ combination flasher unit as required. |
| HAZARD WARNING LAMPS DO NOT STOP FLASHING | 1. Inoperative switch/flasher. | 1. Test and replace hazard switch/ combination flasher unit as required. |

## HEADLAMPS

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| ONE HEADLAMP DOES NOT ILLUMINATE | 1. Inoperative or missing fuse. | 1. Test and replace headlamp fuse as required. |
| | 2. Inoperative or missing bulb. | 2. Test and replace headlamp bulb as required. |
| | 3. Inoperative ground circuit. | 3. Test and repair open headlamp ground circuit as required. |
| | 4. Inoperative supply circuit. | 4. Test and repair open headlamp low beam, high beam, or DRL relay output circuit as required. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| BOTH LOW OR HIGH BEAM HEADLAMPS DO NOT ILLUMINATE | 1. Inoperative or missing relay. | 1. Test and replace low beam, high beam, or DRL relay as required. (Note: Vehicles with a DRL relay do not use a high beam relay. The DRL relay cannot be tested. Replace DRL relay with a known good unit and check operation. Replace DRL relay as required.) |
| | 2. Inoperative control circuit. | 2. Test and repair open low beam or high beam relay control circuit as required. |
| | 3. Inoperative switch. | 3. Test and replace multi-function switch as required. |
| | 4. Inoperative BCM inputs or outputs. | 4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information. |
| HEADLAMPS DO NOT EXTINGUISH | 1. Inoperative supply circuit. | 1. Test and repair shorted headlamp low beam, high beam, or DRL relay output circuit as required. |
| | 2. Inoperative control circuit. | 2. Test and repair shorted low beam or high beam relay control circuit as required. |
| | 3. Inoperative relay. | 3. Test and replace low beam, high beam, or DRL relay as required. (Note: Vehicles with a DRL relay do not use a high beam relay. The DRL relay cannot be tested. Replace DRL relay with a known good unit and check operation. Replace DRL relay as required.) |
| | 4. Inoperative switch. | 4. Test and replace multi-function switch as required. |
| | 5. Inoperative BCM inputs or outputs. | 5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information. |
| HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS | 1. Inoperative relay. | 1. Test and replace low beam, high beam, or DRL relay as required. (Note: Vehicles with a DRL relay do not use a high beam relay. The DRL relay cannot be tested. Replace DRL relay with a known good unit and check operation. Replace DRL relay as required.) |
| | 2. Inoperative switch. | 2. Test and replace multi-function switch as required. |
| | 3. Inoperative BCM inputs or outputs. | 3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information. |

## HEADLAMP LEVELING

**NOTE: Before performing the following tests, confirm whether the park lamps operate properly. If the park lamps are inoperative, diagnose and repair that problem before attempting to repair the Headlamp Leveling System.**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| ONE LEVELING MOTOR IS INOPERATIVE | 1. Inoperative ground circuit. | 1. Test and repair open leveling motor ground circuit as required. |
| | 2. Inoperative supply circuit. | 2. Test and repair open leveling motor feed circuit as required. |
| | 3. Inoperative signal circuit. | 3. Test and repair open headlamp adjust signal circuit as required. |
| | 4. Inoperative motor. | 4. Test and replace headlamp leveling motor as required. |
| BOTH LEVELING MOTORS ARE INOPERATIVE | 1. Inoperative switch ground circuit. | 1. Test and repair open leveling switch ground circuit as required. |
| | 2. Inoperative motor ground circuit. | 2. Test and repair open leveling motor ground circuit as required. |
| | 3. Inoperative switch supply circuit. | 3. Test and repair open leveling switch feed circuit as required. |
| | 4. Inoperative motor feed circuit. | 4. Test and repair open leveling motor feed circuit as required. |
| | 5. Inoperative signal circuit. | 5. Test and repair open or shorted leveling motor signal circuit as required. |
| | 6. Inoperative switch. | 6. Test and replace leveling switch as required. |
| | 7. Inoperative motors. | 7. Test and replace leveling motors as required. |

## LIGHT BAR LAMPS

**NOTE: Before performing the following tests on vehicles manufactured for markets outside of North America, confirm whether both the park lamps and the low beam headlamps operate satisfactorily. If the park lamps or low beam headlamps are inoperative or operate improperly, diagnose and repair that problem before attempting to repair the light bar lamps.**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| ONE LIGHT BAR LAMP DOES NOT ILLUMINATE | 1. Inoperative or missing bulb. | 1. Test and replace off road lamp bulb as required. |
| | 2. Inoperative ground circuit | 2. Test and repair open off road lamp ground circuit as required. |
| | 3. Inoperative supply circuit. | Test and repair open lightbar switch output circuit as required. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO LIGHT BAR LAMPS ILLUMINATE | 1. Inoperative or missing fuse. | 1. Test and replace light bar lamp fuse as required. |
| | 2. Inoperative switch feed circuit. | 2. Test and repair open fused B(+) circuit to light bar switch as required. |
| | 3. Inoperative ground circuit. | 3. Test and repair open off road lamp ground circuit as required. |
| | 4. Inoperative supply circuit. | 4. Test and repair open lightbar switch output circuit as required. |
| | 5. Inoperative switch ground circuit. | 5. Test and repair open light bar switch ground circuit as required. |
| | 6. Inoperative switch supply circuit. | 6. Test and repair open fused ignition switch output (run-start) circuit (North America) or park lamp relay output circuit (except North America) as required. |
| | 7 Inoperative switch. | 7. Test and replace light bar lamp switch as required. |
| LIGHT BAR LAMPS DO NOT EXTINGUISH | 1. Inoperative supply circuit. | 1. Test and repair shorted lightbar switch output circuit as required. |
| | 2. Inoperative switch. | 2. Test and replace light bar lamp switch as required. |
| INOPERATIVE OR INCORRECT LIGHT BAR INDICATIONS IN INSTRUMENT CLUSTER | 1. Inoperative switch sense circuit. | 1. Test and repair open/shorted lightbar switch sense circuit as required. |
| | 2. Incorrect BCM programming. | 2. Use a diagnostic scan tool to check and program correct country code into BCM as required. |
| | 3. Inoperative BCM inputs or outputs. | 3. Use a diagnostic scan tool to test the BCM inputs or outputs. Refer to the appropriate diagnostic information. |

## PARK LAMPS

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| ONE OR SEVERAL, BUT NOT ALL LAMPS IN PARK LAMP CIRCUIT DO NOT ILLUMINATE | 1. Inoperative or missing fuse. | 1. Test and replace park lamp fuse as required. |
| | 2. Inoperative or missing bulb. | 2. Test and replace park lamp bulb as required. |
| | 3. Inoperative ground circuit. | 3. Test and repair open park lamp ground circuit as required. |
| | 4. Inoperative supply circuit. | 4. Test and repair open park lamp relay output circuit as required. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO PARK LAMPS ILLUMINATE | 1. Inoperative or missing relay. | 1. Test and replace park lamp relay as required. |
| | 2. Inoperative control circuit. | 2. Test and repair open park lamp relay control circuit as required. |
| | 3. Inoperative switch. | 3. Test and replace multi-function switch as required. |
| | 4. Inoperative BCM inputs or outputs. | 4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information. |
| PARK LAMPS DO NOT EXTINGUISH | 1. Inoperative supply circuit. | 1. Test and repair shorted park lamp relay output circuit as required. |
| | 2. Inoperative control circuit. | 2. Test and repair shorted park lamp relay control circuit as required. |
| | 3. Inoperative relay. | 3. Test and replace park lamp relay as required. |
| | 4. Inoperative switch. | 4. Test and replace multi-function switch as required. |
| | 5. Inoperative BCM inputs or outputs. | 5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information. |

## REAR FOG LAMPS

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| ONE REAR FOG LAMP DOES NOT ILLUMINATE | 1. Inoperative or missing bulb. | 1. Test and replace rear fog lamp bulb as required. |
| | 2. Inoperative ground circuit. | 2. Test and repair open rear fog lamp ground circuit as required. |
| | 3. Inoperative supply circuit. | 3. Test and repair open rear fog lamp relay output circuit as required. |
| BOTH REAR FOG LAMPS DO NOT ILLUMINATE | 1. Inoperative or missing fuse. | 1. Test and replace rear fog lamp fuse as required. |
| | 2. Inoperative ground circuit. | 2. Test and repair open rear fog lamp ground circuit as required. |
| | 3. Inoperative supply circuit. | 3. Test and repair open rear fog lamp relay output circuit as required. |
| | 4. Inoperative control circuit. | 4. Test and repair open rear fog lamp relay control circuit as required. |
| | 5. Inoperative or missing relay. | 5. Test and replace rear fog lamp relay as required. |
| | 6. Inoperative switch. | 6. Test and replace multi-function switch as required. |
| | 7. Incorrect BCM programming. | 7. Use a diagnostic scan tool to check and program correct country code into BCM as required. |
| | 8. Inoperative BCM inputs or outputs. | 8. Use a diagnostic scan tool to test the BCM inputs or outputs. Refer to the appropriate diagnostic information. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| REAR FOG LAMPS DO NOT EXTINGUISH | 1. Inoperative supply circuit. | 1. Test and repair shorted rear fog lamp relay output circuit as required. |
| | 2. Inoperative control circuit. | 2. Test and repair shorted rear fog lamp relay control circuit as required. |
| | 3. Inoperative relay. | 3. Test and replace rear fog lamp relay as required. |
| | 4. Inoperative switch. | 4. Test and replace multi-function switch as required. |
| | 5. Inoperative BCM inputs or outputs. | 5. Use a diagnostic scan tool to test the BCM inputs or outputs. Refer to the appropriate diagnostic information. |

## TURN SIGNAL LAMPS

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| ONE TURN SIGNAL LAMP DOES NOT ILLUMINATE | 1. Inoperative or missing bulb. | 1. Test and replace turn signal bulb as required. |
| | 2. Inoperative ground circuit. | 2. Test and repair open ground circuit as required. |
| | 3. Inoperative supply circuit. | 3. Test and repair open right or left turn signal circuit as required. |
| ALL RIGHT SIDE AND/OR ALL LEFT SIDE TURN SIGNAL LAMPS DO NOT FLASH | 1. Inoperative sense circuit. | 1. Test and repair open right or left turn switch sense circuit as required. |
| | 2. Inoperative signal circuit. | 2. Test and repair open right or left turn signal circuit as required. |
| | 3. Inoperative switch. | 3. Test and replace multi-function switch as required. |
| | 4. Inoperative flasher. | 4. Replace hazard switch/combination flasher with a known good unit and check operation. Replace hazard switch/ combination flasher unit as required. |
| ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS FLASH TOO RAPIDLY (MORE THAN 100 FLASHES PER MINUTE) | 1. Inoperative or missing bulb. | 1. Test and replace turn signal bulb as required. |
| | 2. Inoperative ground circuit. | 2. Test and repair open ground circuit as required. |
| | 3. Inoperative signal circuit | 3. Test and repair open right or left turn signal circuit as required. |
| | 4. Inoperative flasher. | 4. Replace hazard switch/combination flasher with a known good unit and check operation. Replace hazard switch/ combination flasher unit as required. |

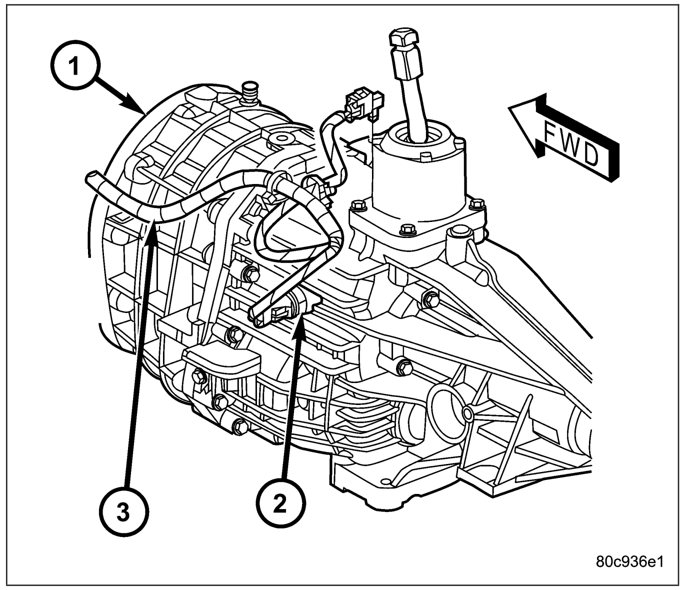
# BACKUP LAMP SWITCH

## DESCRIPTION

Vehicles equipped with a manual transmission (1) have a normally open, spring-loaded plunger type backup lamp switch (2). Vehicles with an optional electronic automatic transmission have a Transmission Range Sensor (TRS) that is used to perform several functions, including that of the backup lamp switch. The TRS is described in further detail elsewhere in this service information.



The backup lamp switch is located in a threaded hole on the side of the manual transmission housing. The switch has a threaded body and a hex formation near the plunger end of the switch. An integral connector receptacle at the end of the switch opposite the plunger connects the switch to the vehicle electrical system through a take out and connector of the engine wire harness (3). When installed, only the switch connector and the hex formation are visible on the outside of the transmission housing. The backup lamp switch cannot be adjusted or repaired and, if inoperative or damaged, the entire switch unit must be replaced.

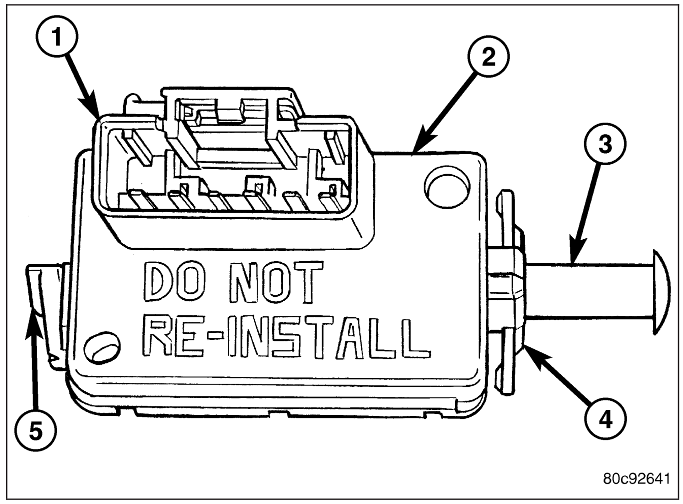
## OPERATION

The backup lamp switch controls the flow of battery voltage to the backup lamp bulbs through an output on the back-up lamp feed circuit. The switch plunger is mechanically actuated by the gearshift mechanism within the transmission, which will depress the switch plunger and close the switch contacts whenever the reverse gear has been selected. The switch receives battery voltage through a fuse in the Junction Block (JB) whenever the ignition switch is in the On position. The backup lamp switch and circuits can be tested using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

# BRAKE LAMP SWITCH

## DESCRIPTION

The brake lamp switch (2) is a three circuit, spring-loaded plunger actuated switch that is secured to the steering column support bracket under the instrument panel on the driver side of the vehicle. The molded plastic switch housing has an integral connector receptacle (1) containing six terminal pins and featuring a Connector Position Assurance (CPA) lock. The switch is connected to the vehicle electrical system through a dedicated take out of the instrument panel wire harness.



The switch plunger (3) extends through a mounting collar (4) on one end of the switch housing. The plunger has a one time telescoping self-adjustment feature that is activated after the switch is installed by moving an adjustment release lever (5) on the opposite end of the switch housing clockwise, until it locks into a position that is parallel to the connector receptacle.

An installed brake lamp switch cannot be readjusted or repaired. If the switch is damaged, inoperative, or removed from its mounting position for any reason, it must be replaced with a new unit.

## OPERATION

The brake lamp switch controls three independent circuits. These circuits are described as follows:

- **Brake Lamp Switch Circuit** - A normally open brake lamp switch circuit receives a battery voltage input, and supplies this battery voltage to the brake lamps and the Controller Antilock Brake (CAB) on a brake lamp switch output circuit only when the brake pedal is depressed (brake lamp switch plunger released).
- **Brake Lamp Switch Signal Circuit** - A normally closed brake lamp switch signal circuit receives a direct path to ground, and supplies this ground input to the Powertrain Control Module (PCM) on a brake lamp switch sense circuit only when the brake pedal is released (brake lamp switch plunger is depressed).
- **Speed Control Circuit** - A normally closed speed control circuit receives a battery voltage input from the Powertrain Control Module on a speed control supply circuit, and supplies this battery voltage to the speed control servo solenoids (dump, vacuum, and vent) on a speed control brake switch output circuit only when the speed control system is turned On and the brake pedal is released (brake lamp switch plunger is depressed).

The components of the self-adjusting brake switch plunger consist of a two-piece telescoping plunger, a split plunger locking collar, and a release wedge. The release lever has a shaft with a wedge that spreads the plunger locking collar to an open or released position. After the switch is installed and the brake pedal is released, the plunger telescopes to the correct adjustment position. When the release lever is moved to the release position, the wedge is disengaged from the locking collar causing the collar to apply a clamping pressure to the two plunger halves, fixing the plunger length.

The brake lamp switch can be diagnosed using conventional diagnostic tools and methods.

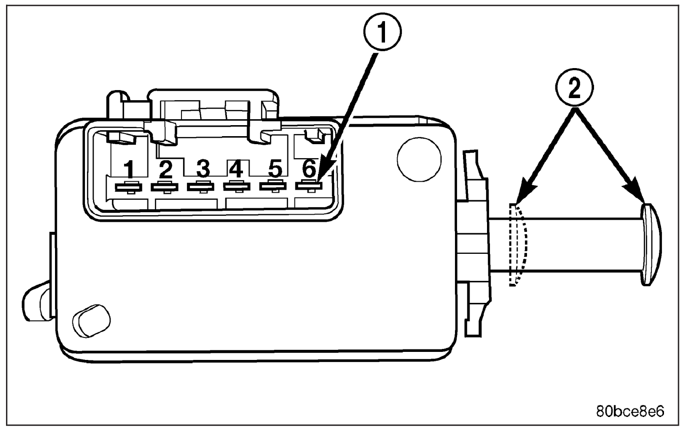
## DIAGNOSIS AND TESTING

## BRAKE LAMP SWITCH

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Do not remove the brake lamp switch from the mounting bracket. The self-adjusting switch plunger is a one time only feature. If the switch is removed from the mounting bracket, it MUST be replaced with a new switch.**

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the brake lamp switch.
3. Using an ohmmeter, perform the continuity tests at the terminal pins (1) in the brake lamp switch connector receptacle as shown in the Brake Lamp Switch Tests table.



| BRAKE LAMP SWITCH TESTS | |
|---|---|
| PLUNGER POSITION (2) | CONTINUITY BETWEEN (1) |
| Released (Extended) | Pins 1 and 2 |
| Compressed (Depressed) | Pins 3 and 4, 5 and 6 |

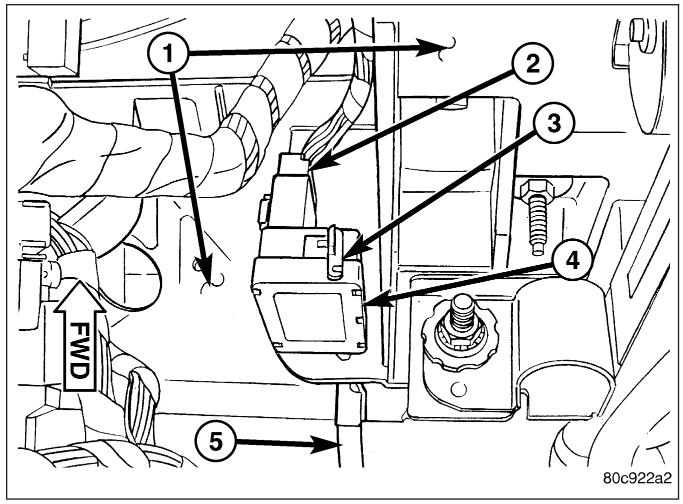
4. If the switch fails any of the continuity tests, replace the inoperative brake lamp switch as required.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: The brake lamp switch self-adjusting switch plunger is a one time only feature. If the switch is removed from the mounting bracket, it MUST be replaced with a new switch.**

1. Disconnect and isolate the battery negative cable.
2. Locate the brake lamp switch (4) near the support bracket (1) on the lower steering column.
3. Disconnect the wire harness connector (2) from the brake lamp switch.
4. Rotate the brake lamp switch housing counter-clockwise about 30 degrees to align the tabs on the switch locking collar with the keyed mounting hole in the switch mounting bracket.
5. Pull the switch straight back from the keyed hole to remove it from the bracket.
6. Discard the removed brake lamp switch.

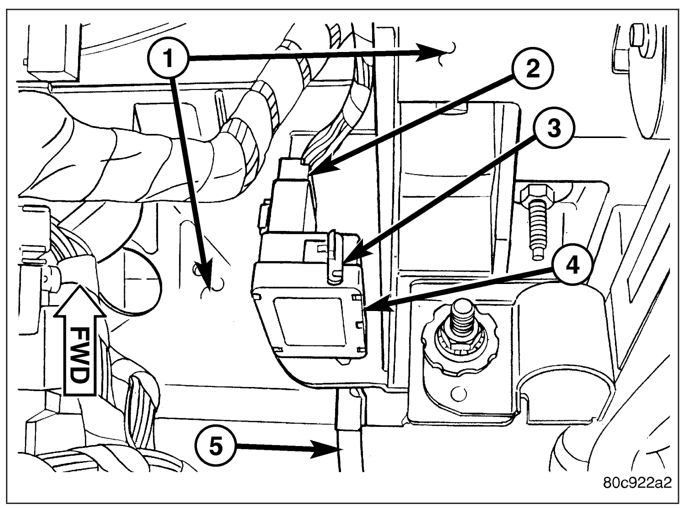


## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: The brake lamp switch self-adjusting switch plunger is a one time only feature. If the switch is removed from the mounting bracket, it MUST be replaced with a new switch.**

1. Depress and hold the brake pedal (5) in the depressed position.
2. Align the tabs on the brake lamp switch (4) locking collar with the keyed hole in the switch mounting bracket.
3. Insert the tabs on the brake lamp switch locking collar through the keyed hole in the switch mounting bracket until the switch housing is firmly seated against the bracket.
4. Rotate the switch clockwise about 30 degrees to engage the tabs on the locking collar with the switch mounting bracket.
5. Release the brake pedal.



**CAUTION: Do not release or pull up on the brake pedal before the switch plunger adjustment has been completed.**

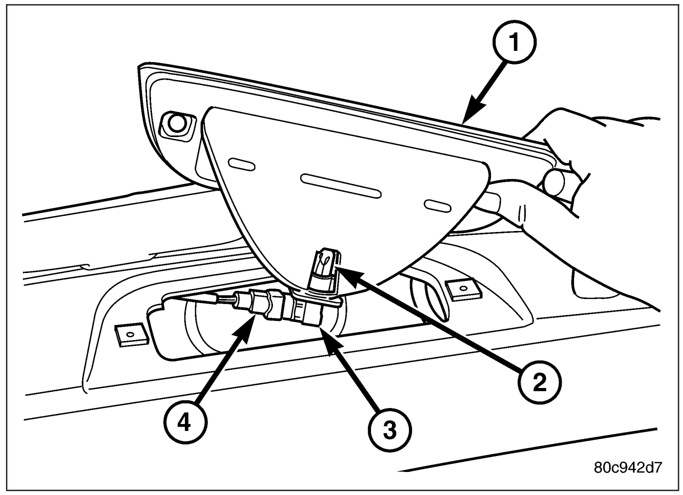
6. Release the brake pedal, but do not pull it upward.
7. Rotate the plunger adjustment release lever (3) clockwise until it locks into place. The lever should be parallel to the brake lamp switch connector receptacle. This action will set the switch plunger length to a final adjustment position and cannot be undone. If not performed properly the first time, a new brake lamp switch **must** be installed.
8. Reconnect the wire harness connector (2) to the brake lamp switch.
9. Reconnect the battery negative cable.

# LAMP-HIGH MOUNTED STOP

## REMOVAL

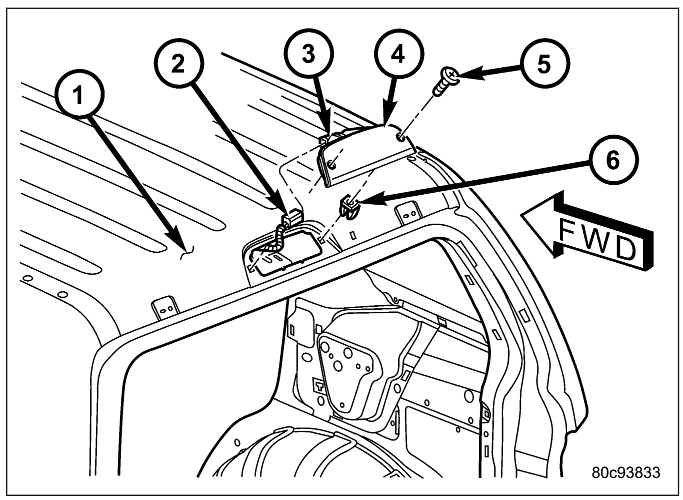
### BULB

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws that secure the Center High Mounted Stop Lamp (CHMSL) (1) to the roof panel.
3. Pull the CHMSL lens and housing away from the header panel far enough to access the lamp wiring (4) and bulb socket (3) on the back of the lamp.
4. Firmly grasp the socket on the back of the lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
5. Pull the socket and bulb (2) straight out from the keyed opening in the housing.
6. Pull the base of the bulb straight out of the socket.



### LAMP

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws (5) that secure the Center High Mounted Stop Lamp (CHMSL) (4) to the rear of the roof panel (1).
3. Pull the CHMSL away from the roof panel far enough to access and disconnect the wire harness connector (4) from the lamp socket (3).
4. Remove the CHMSL from the roof panel.

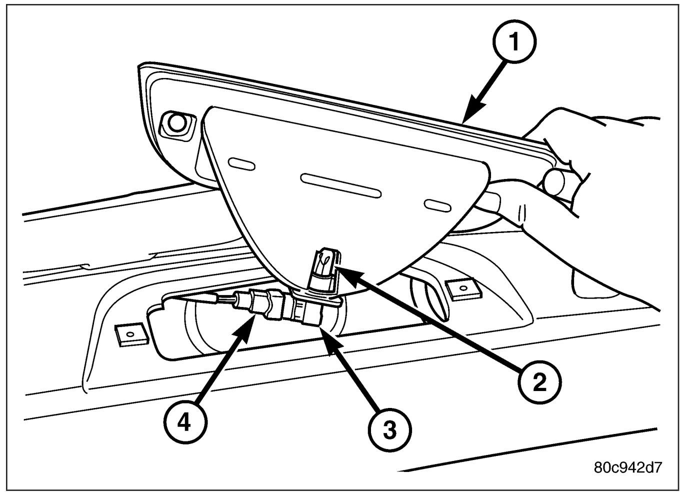


## INSTALLATION

### BULB

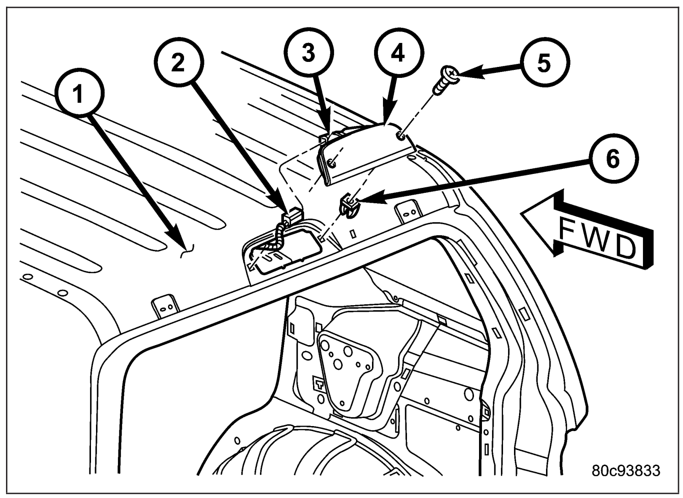
**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

1. Align the base of the bulb (2) with the socket (3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of CHMSL housing (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Position the CHMSL into the opening in the rear roof panel.
7. Install and tighten the two screws that secure the CHMSL to the roof panel. Tighten the screws to 2 N·m (21 in. lbs.).
8. Reconnect the battery negative cable.



## LAMP

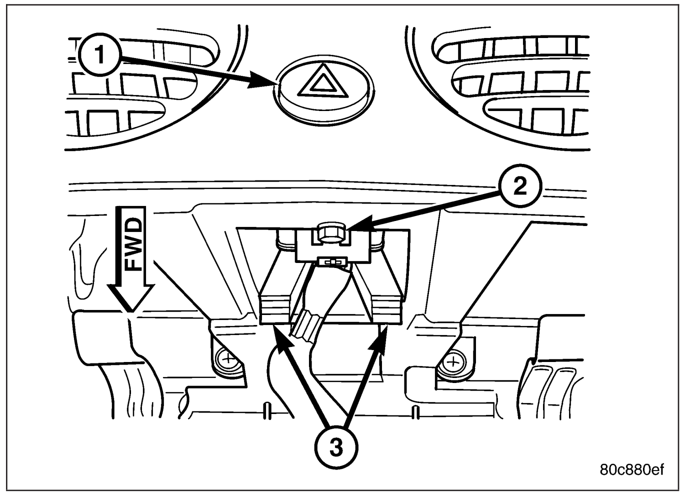
1. Check to be certain that the two plastic nuts (6) are properly positioned and in good condition on each side of the roof panel (1) opening for the Center High Mounted Stop Lamp (CHMSL) (4).
2. Position the CHMSL near the roof panel opening.
3. Reconnect the wire harness connector (2) to the CHMSL socket (3).
4. Install and tighten the two screws (5) that secure the CHMSL to the roof panel. Tighten the screws to 2 N·m (21 in. lbs.).
5. Reconnect the battery negative cable.



# COMBINATION FLASHER

## DESCRIPTION

The combination flasher is integral to the hazard switch unit located behind the hazard switch button (1) near the center of the instrument panel. The combination flasher is a smart relay that functions as both the turn signal system and the hazard warning system flasher. The combination flasher contains active electronic Integrated Circuitry (IC) elements.



This flasher is designed to handle the current flow requirements of the factory-installed lighting. If supplemental lighting is added to the turn signal lamp circuits, such as when towing a trailer with lights, the combination flasher will automatically try to compensate to keep the flash rate the same.

The combination flasher cannot be repaired or adjusted and, if inoperative or damaged, the hazard switch unit must be replaced.

## OPERATION

The combination flasher has the following inputs and outputs: fused B(+), fused ignition switch output, right turn signal sense, left turn signal sense, and one output each for the right and left turn signal circuits. The combination flasher also receives an internal input through the hazard switch and, on vehicles equipped with the optional Vehicle Theft Security System (VTSS), receives an input from the Body Control Module (BCM) in order to flash the turn signal lamps as an optical alert feature of that system.

Battery voltage is supplied to the flasher on a fused B(+) circuit so that the flasher can perform the hazard warning flasher function, regardless of the ignition switch position. The flasher also receives battery voltage on a separate fused ignition switch output (run-start) circuit to perform the turn signal flasher function.

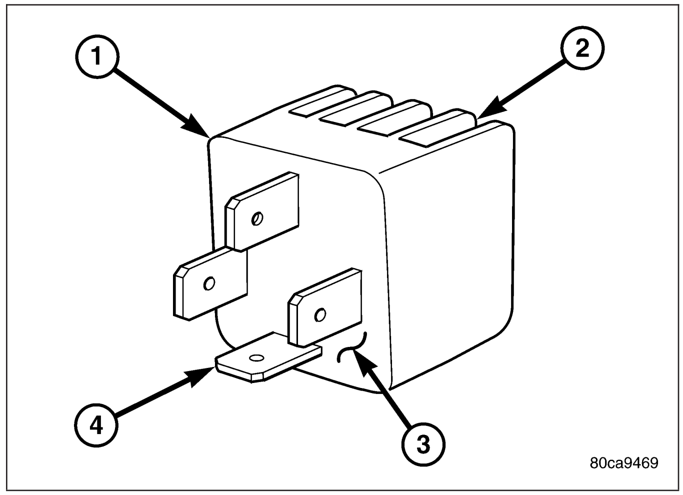
The Integrated Circuit (IC) within the combination flasher contains the logic that controls the flasher operation and the flash rate. The IC receives separate sense ground inputs from the multi-function switch for the right and left turn signals, and from the hazard switch contacts or the BCM for the hazard warning signals. A special design feature of the combination flasher allows it to ″sense″ that a turn signal circuit or bulb is not operating, and provide the driver an indication of the condition by flashing the remaining bulbs in the affected circuit at a higher rate (120 flashes-per-minute or higher).

Because of the active electronic elements within the combination flasher, it cannot be tested with conventional automotive electrical test equipment. If the combination flasher is believed to be faulty, test the turn signal and hazard warning systems before replacing the flasher. If no problems are found, replace the hazard warning switch with a known good unit to confirm system operation.

# DAYTIME RUNNING LAMP RELAY

## DESCRIPTION

The Daytime Running Lamp (DRL) relay (1) is a solid state relay that is used only on vehicles manufactured for sale in Canada. The DRL relay is installed in the Junction Block (JB) on the driver side outboard end of the instrument panel. Vehicles equipped with this relay **do not** have a headlamp high beam relay installed in the JB.



The DRL relay features a die cast aluminum housing that serves to contain the solid state circuitry of the relay as well as to perform as a heat sink (2). Potting material (3) fills the base of the housing to enclose and protect the circuitry.

Four male spade terminals (4) exit the base of the relay housing through the potting material to connect the relay to the vehicle electrical system. These terminals are laid out in a footprint that is similar to that of a conventional International Standards Organization (ISO) relay; however, a standard ISO relay must never be installed in place of the DRL relay.

The DRL relay cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced with a new unit.

## OPERATION

The Daytime Running Lamps (DRL) relay is a solid state relay that controls the flow of battery current to the high beam filaments of both headlamp bulbs based upon a duty cycle control input received from the Body Control Module (BCM) of vehicles equipped with the DRL feature. By cycling the DRL relay output, the BCM controls the illumination intensity of the high beam filaments. The DRL relay is connected to the vehicle electrical system through a receptacle in the Junction Block (JB). The inputs and outputs of the DRL relay include:

- **Battery Voltage Input** - The DRL relay receives battery voltage on a fused B(+) circuit from a fused B(+) fuse in the Power Distribution Center (PDC).
- **Ground Input** - The DRL relay receives a path to ground through a splice block with an eyelet terminal that is secured by a nut to a ground stud on the driver side instrument panel end bracket near the JB.
- **Control Input** - The DRL relay control input is received from the BCM and/or the momentary optical horn (flash-to-pass) output of the multi-function switch through a high beam relay control circuit.
- **Control Output** - The DRL relay supplies Pulse Width Modulated (PWM) battery voltage to the headlamp high beam filaments through the high beam relay output circuit.

Because of active electronic elements within the DRL relay, it cannot be diagnosed or tested using conventional diagnostic tools and procedures. If the DRL relay is believed to be inoperative, test and repair the headlamp system as necessary. If no problem is found in the headlamp system, replace the DRL relay with a known good unit to confirm system operation.

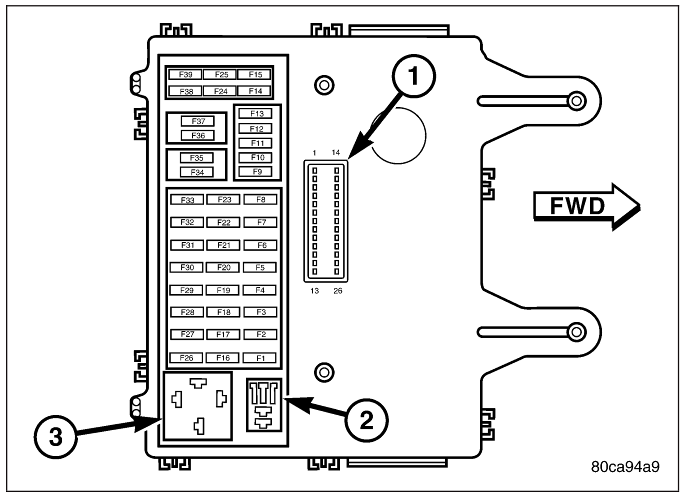
The DRL relay cannot be repaired and, if inoperative or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the DRL relay and for complete exterior lighting wiring diagrams.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The DRL relay is installed in the Junction Block (JB) on the driver side outboard end of the instrument panel. Vehicles equipped with this relay MUST NOT have a headlamp high beam relay installed in the JB. Also, although the terminals of the DRL relay are laid out in a footprint that is similar to that of a conventional International Standards Organization (ISO) relay, a standard ISO relay MUST NEVER be installed in the place of the DRL relay.**

1. Disconnect and isolate the battery negative cable.
2. Remove the trim from the driver side end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).
3. Remove the Daytime Running Lamp (DRL) relay (3) by grasping it firmly and pulling it straight out from the receptacle in the JB.

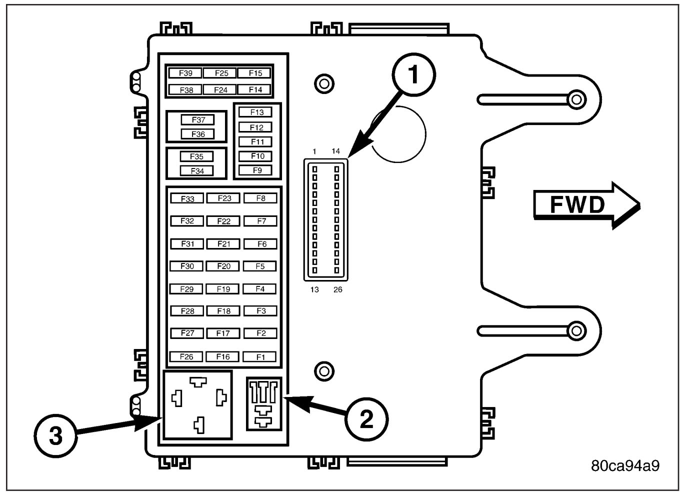


## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The DRL relay is installed in the Junction Block (JB) on the driver side outboard end of the instrument panel. Vehicles equipped with this relay MUST NOT have a headlamp high beam relay installed in the JB. Also, although the terminals of the DRL relay are laid out in a footprint that is similar to that of a conventional International Standards Organization (ISO) relay, a standard ISO relay MUST NEVER be installed in the place of the DRL relay.**

1. Position the Daytime Running Lamp (DRL) relay to the proper receptacle (3) in the JB. The adjacent receptacle (2) must NOT be populated by a headlamp high beam relay on a vehicle that is equipped with a DRL relay.
2. Align the DRL relay terminals with the cavities in the JB receptacle.
3. Push firmly and evenly on the top of the DRL relay until the relay base is fully seated in the JB receptacle.
4. Reinstall the trim onto the driver side outboard end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).
5. Reconnect the battery negative cable.

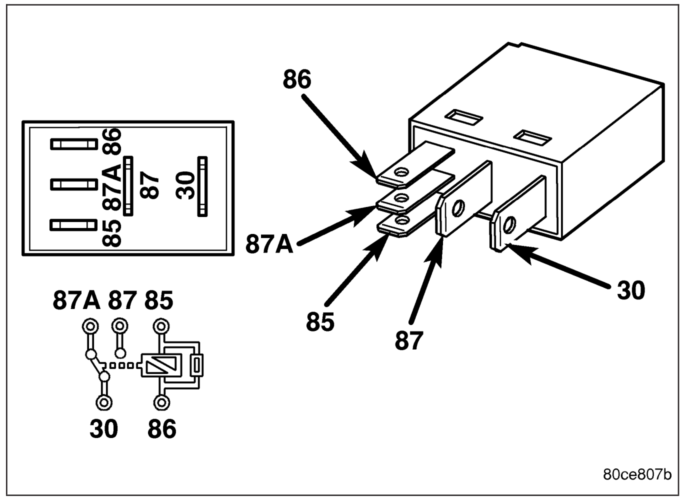


# FOG LAMP RELAY

## DESCRIPTION

### FRONT

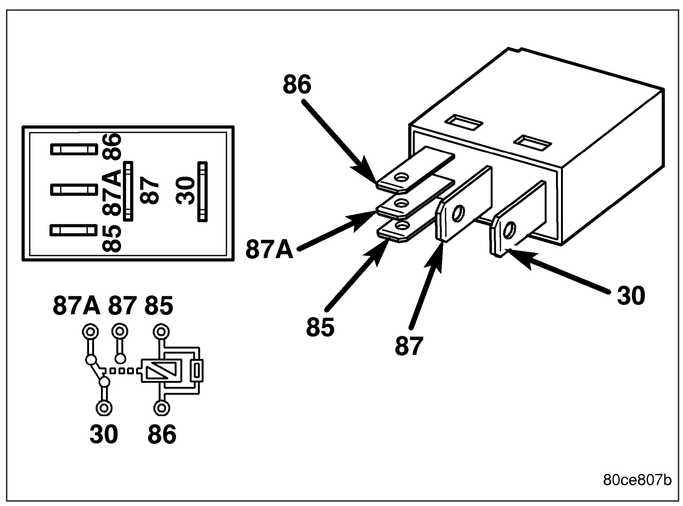
The front fog lamp relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male spade-type terminals that extend from the relay base plate.



The front fog lamp relay is located in the Junction Block (JB) on the driver side outboard end bracket of the instrument panel. Refer to Junction Block in the wiring section of this service information for specific relay cavity assignment information. The front fog lamp relay cannot be adjusted or repaired and, if inoperative or damaged, the unit must be replaced.

### REAR

The rear fog lamp relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male spade-type terminals that extend from the relay base plate.



The rear fog lamp relay is located in the Junction Block (JB) on the driver side outboard end bracket of the instrument panel. Refer to Junction Block in the wiring section of this service information for specific relay cavity assignment information. The rear fog lamp relay cannot be adjusted or repaired and, if inoperative or damaged, the unit must be replaced.

## OPERATION

### FRONT

The front fog lamp relay is an electromechanical switch that uses a low current input from the Body Control Module (BCM) to control a high current output to the front fog lamps. Within the relay are an electromagnetic coil, a movable contact and two fixed contact points. A resistor is connected in parallel with the coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the field of the relay coil collapses.

The movable common supply contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This field draws the movable contact point away from the normally closed contact, and holds it against the normally open contact. When the relay coil is de-energized, spring pressure returns the movable contact back against the normally closed contact.

The inputs and outputs of the front fog lamp relay include:

- **Common Supply Terminal (30)** - The common feed terminal is connected to a fused B(+) circuit at all times.
- **Coil Ground Terminal (85)** - The coil ground terminal is connected to a control output of the premium Body Control Module (BCM) through a front fog lamp relay control circuit. The BCM controls front fog lamp operation by controlling a ground path through this circuit.
- **Coil Battery Terminal (86)** - The coil battery terminal is connected to a fused B(+) circuit at all times.
- **Normally Open Terminal (87)** - The normally open terminal is connected to the front fog lamps through a front fog lamp relay output circuit and provides battery voltage to the front fog lamps whenever the relay is energized.
- **Normally Closed Terminal (87A)** - The normally closed terminal is not connected in this application, but will have battery voltage present whenever the relay is de-energized.

The front fog lamp relay can be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

### REAR

The rear fog lamp relay is an electromechanical switch that uses a low current input from the Body Control Module (BCM) to control a high current output to the rear fog lamps. Within the relay are an electromagnetic coil, a movable contact and two fixed contact points. A resistor is connected in parallel with the coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the field of the relay coil collapses.

The movable common supply contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This field draws the movable contact point away from the normally closed contact, and holds it against the normally open contact. When the relay coil is de-energized, spring pressure returns the movable contact back against the normally closed contact.

The inputs and outputs of the rear fog lamp relay include:

- **Common Supply Terminal (30)** - The common feed terminal is connected to a fused B(+) circuit at all times.
- **Coil Ground Terminal (85)** - The coil ground terminal is connected to a control output of the premium BCM through a rear fog lamp relay control circuit. The BCM controls rear fog lamp operation by controlling a ground path through this circuit.
- **Coil Battery Terminal (86)** - The coil battery terminal is connected to a fused B(+) circuit at all times.
- **Normally Open Terminal (87)** - The normally open terminal is connected to the rear fog lamps through a rear fog lamp relay output circuit and provides battery voltage to the rear fog lamps whenever the relay is energized.
- **Normally Closed Terminal (87A)** - The normally closed terminal is not connected in this application, but will have battery voltage present whenever the relay is de-energized.

The rear fog lamp relay can be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

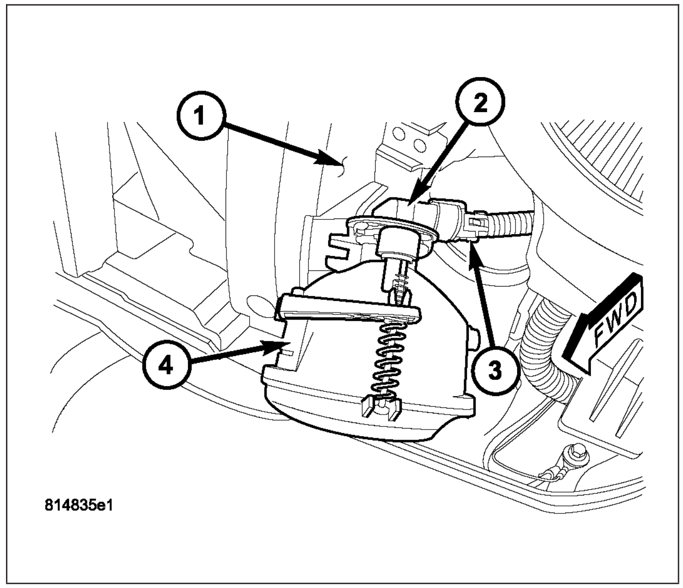
# FRONT FOG LAMP

## REMOVAL

## BULB - GRILLE MOUNTED

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

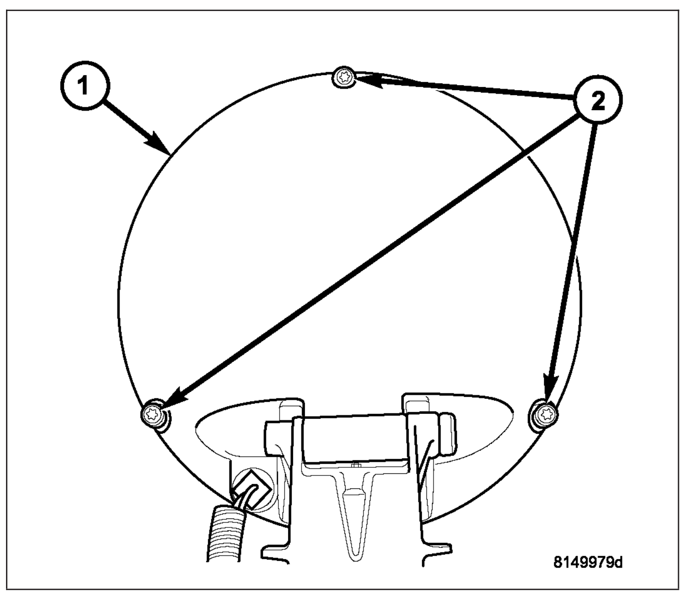
1. Disconnect and isolate the battery negative cable.
2. Remove the front fog lamp from the grille opening reinforcement (1), but do not disconnect the wire harness connector (3) from the socket (2) on the back of the lamp housing (4). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FRONT FOG LAMP - REMOVAL).
3. Firmly grasp the socket on the back of the housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.



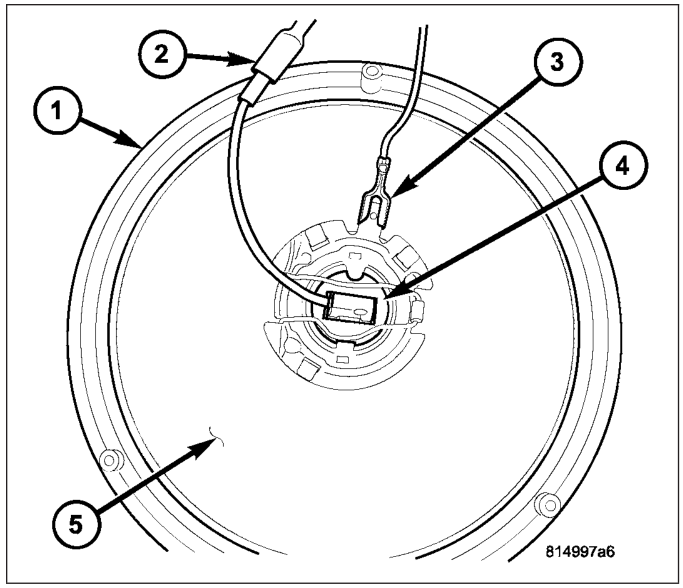
## BULB - FASCIA MOUNTED

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

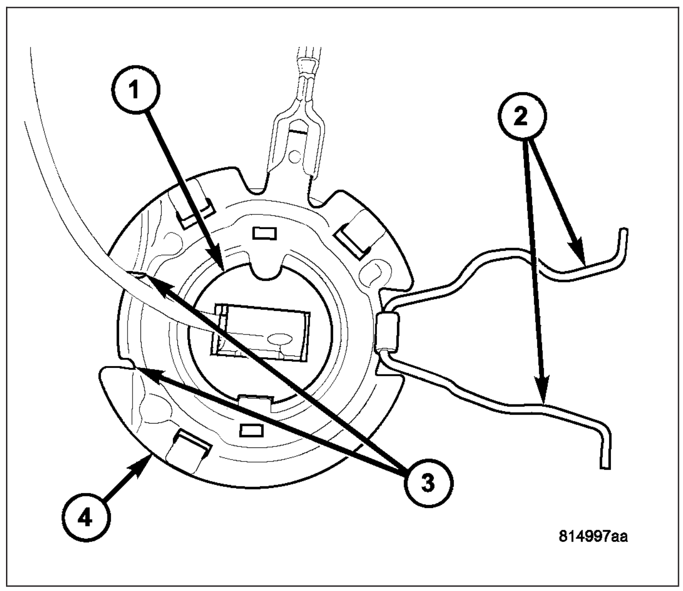
1. Disconnect and isolate the battery negative cable.
2. Remove the three screws (2) that secure the front fog lamp bezel and lens to the back of the lamp housing (1).



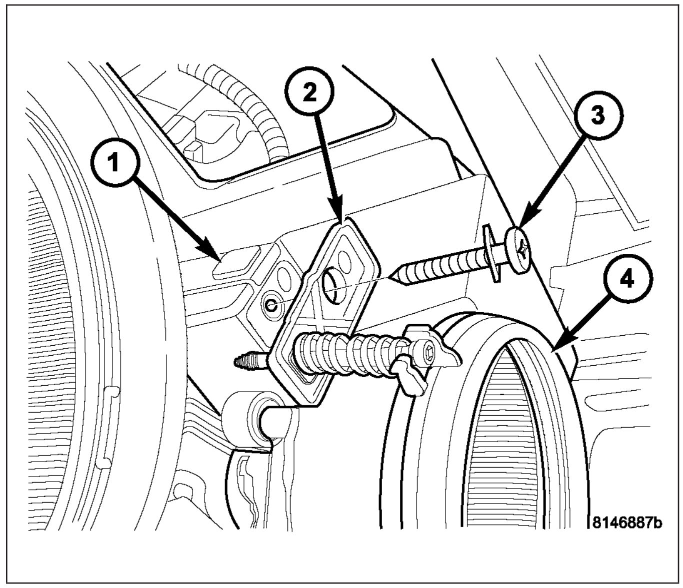
3. Pull the bezel (1) and lens away from the front of the lamp housing far enough to access and disconnect the fog lamp wiring connector from the bulb pigtail wire (2).



4. Pinch together the two hooked ends of the bulb retainer clip (2) and disengage them from the slots (3) in the mounting flange (4) on the back of the lens reflector.
5. Pivot the retainer clip up off of the bulb flange and out of the way.
6. Pull the bulb straight out of the mounting flange on the back of the lens reflector.

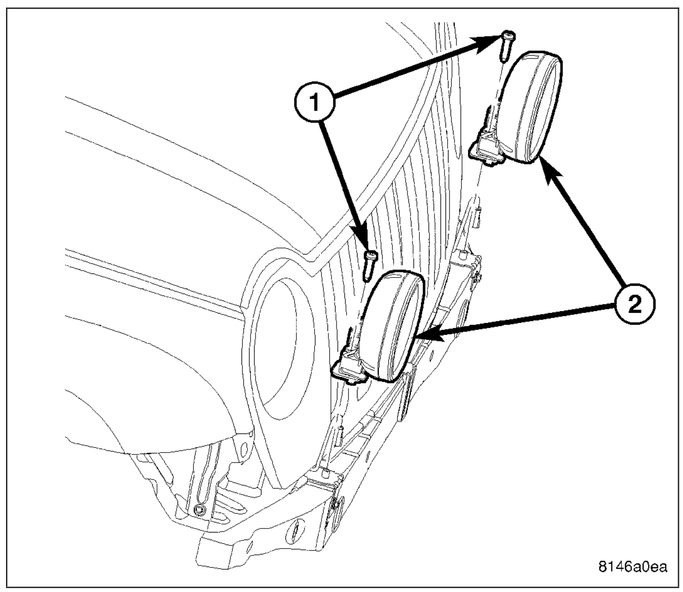


## LAMP - GRILLE MOUNTED



1. Disconnect and isolate the battery negative cable.
2. Remove the grille panel from the front of the grille opening reinforcement. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
3. Remove the screw (3) that secures the fog lamp adjuster bracket (2) to the grille opening reinforcement (1).
4. Insert a trim stick or another suitable wide flat-bladed tool, between either side of the lamp (4) and the side of the lamp seat in the grille opening reinforcement.
5. Carefully pry the pivot pin on either side of the lamp out of its receptacle in the stanchion within the seat of the reinforcement.
6. Pull the lamp out from the seat far enough to access and disconnect the wire harness connector from the bulb socket on the back of the lamp housing.
7. Remove the lamp from the vehicle.

## LAMP - FASCIA MOUNTED



1. Disconnect and isolate the battery negative cable.
2. Remove the grille panel from the front of the grille opening reinforcement. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
3. Disconnect the front fog lamp pigtail wire from the connector on the grille opening reinforcement.
4. Remove the screw (1) from the mounting bracket that secures the fog lamp (2) to the bracket on the top of the front bumper fascia.
5. Remove the lamp from the top of the fascia.

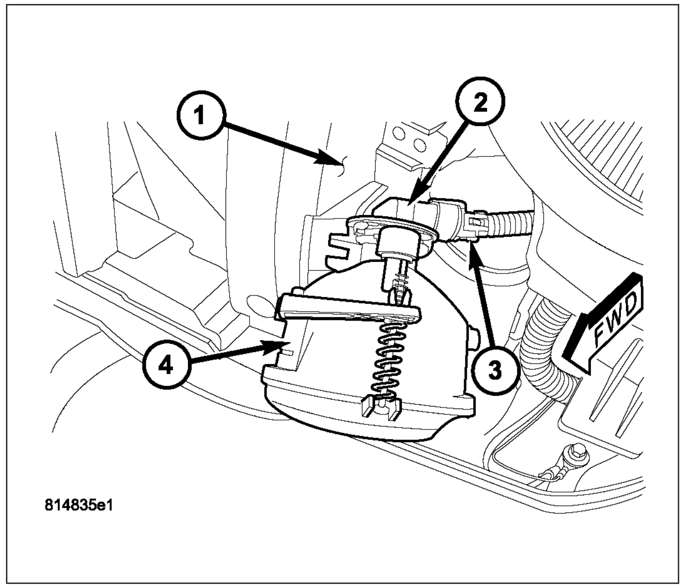
## INSTALLATION

## BULB - GRILLE MOUNTED

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

1. Align the base of the bulb with the front fog lamp socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the front fog lamp housing (4).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place. The socket connector receptacle (3) should be pointed horizontally.
6. Reinstall the fog lamp into the grille opening reinforcement (1). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FRONT FOG LAMP - INSTALLATION).
7. Reconnect the battery negative cable.

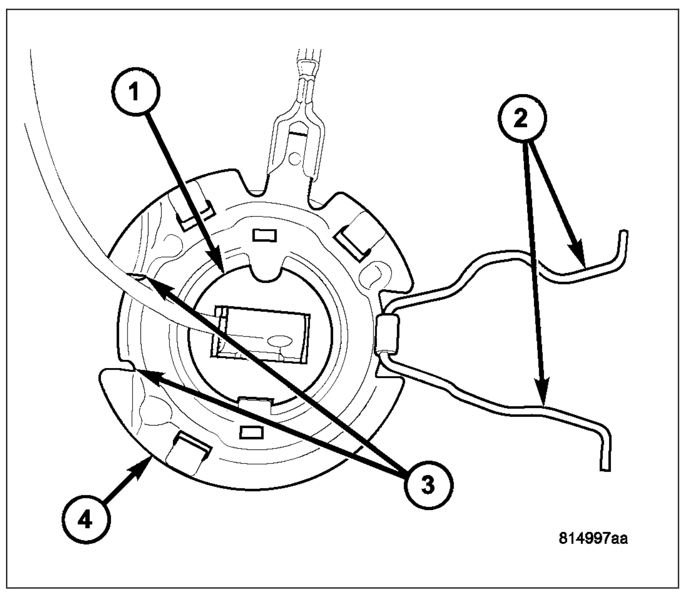


## BULB - FASCIA MOUNTED

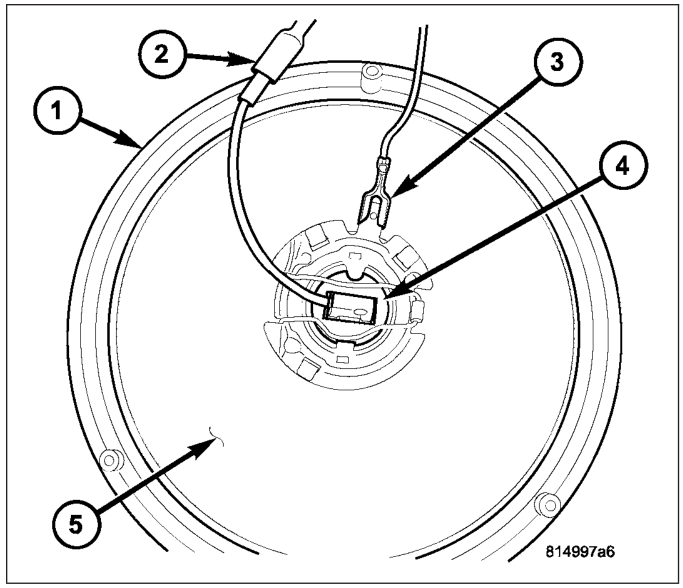
**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

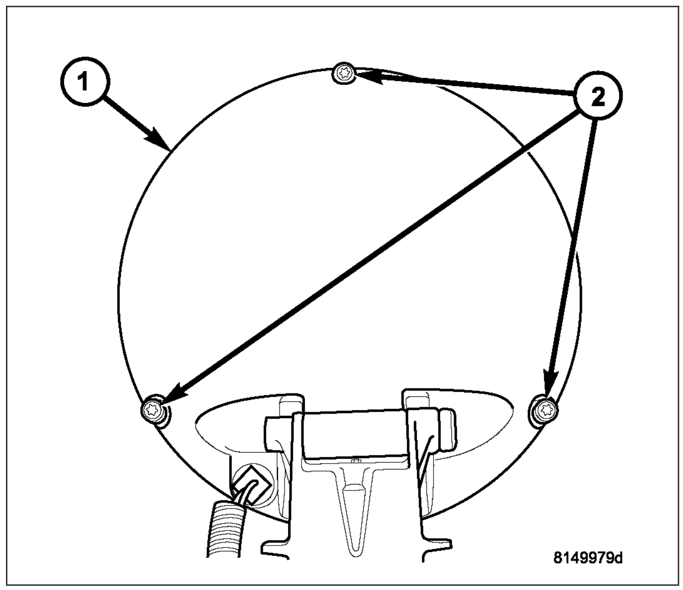
1. Align the fog lamp bulb flange (1) with the mounting flange (4) on the back of the lens reflector.
2. Insert the bulb straight into the opening in the mounting flange until the bulb flange is firmly seated.
3. Pivot the bulb retainer clip (2) up and over the bulb flange.
4. Pinch together the two hooked ends of the retainer clip and engage them into the slots (3) in the mounting flange to lock the bulb into place.



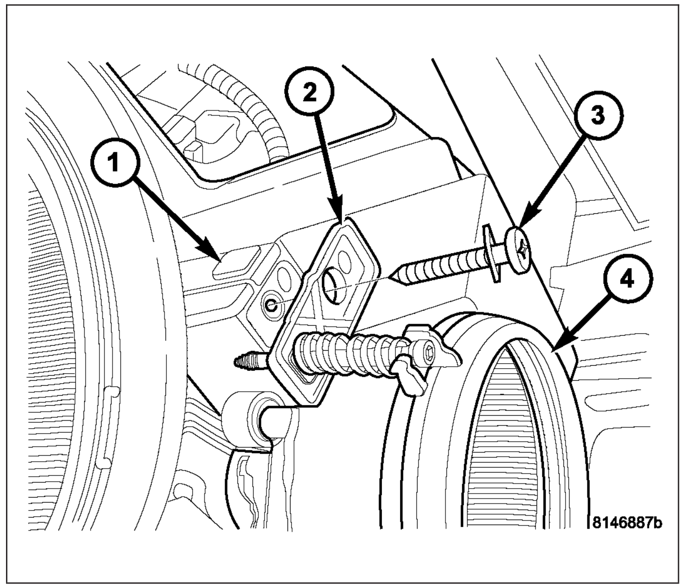
5. Reconnect the bulb pigtail wire to the fog lamp wiring connector (2).
6. Align and install the lens and bezel (1) into the front fog lamp housing. Be certain not to pinch the lamp wiring between the housing and the bezel.



7. Install and tighten the three screws (2) that secure the bezel and lens to the back of the lamp housing (1). Tighten the screws to 2 N·m (17 in. lbs.).
8. Reconnect the battery negative cable.

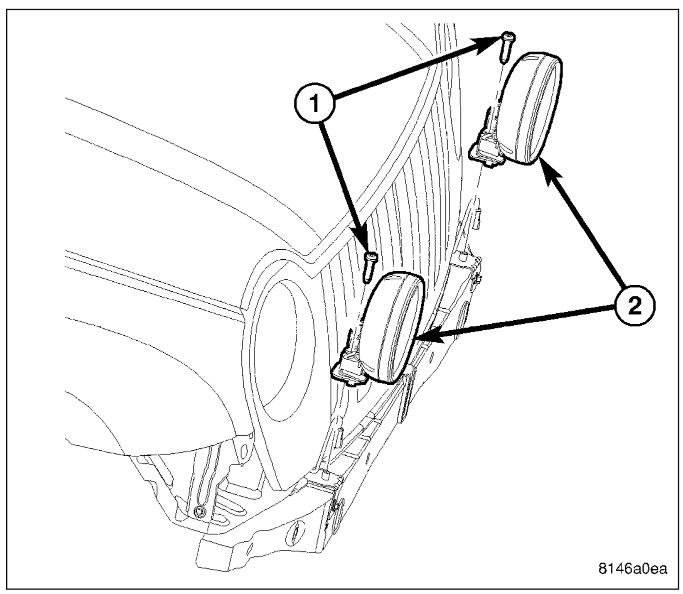


## LAMP - GRILLE MOUNTED



1. Position the front fog lamp (4) to the seat in the grille opening reinforcement (1).
2. Reconnect the wire harness connector to the bulb socket on the back of the lamp housing.
3. Engage the pivot pin on either side of the lamp into its receptacle in the stanchion within the lamp seat of the grille opening reinforcement.
4. Insert a trim stick or another suitable wide flat-bladed tool, between the opposite side of the lamp and the side of the lamp seat.
5. Carefully pry between the side of the lamp and the seat far enough for the loose pivot pin to be snapped into place within its stanchion.
6. Install and tighten the screw (3) that secures the fog lamp adjuster bracket (2) to the grille opening reinforcement. Tighten the screw to 3 N·m (30 in. lbs.).
7. Reinstall the grille panel onto the front of the grille opening reinforcement. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
8. Reconnect the battery negative cable.
9. Confirm proper front fog lamp alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FRONT FOG LAMP UNIT - ADJUSTMENTS).

## LAMP - FASCIA MOUNTED



1. Position the front fog lamp (2) to the bracket on the top of the front bumper fascia.
2. Install and tighten the screw (1) into the mounting bracket that secures the lamp to the fascia. Tighten the screw to 20 N·m (15 ft. lbs.).
3. Reconnect the lamp pigtail wire to the connector on the grille opening reinforcement.
4. Reinstall the grille panel onto the front of the grille opening reinforcement. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
5. Reconnect the battery negative cable.
6. Confirm proper front fog lamp alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FRONT FOG LAMP UNIT - ADJUSTMENTS).

## ADJUSTMENTS

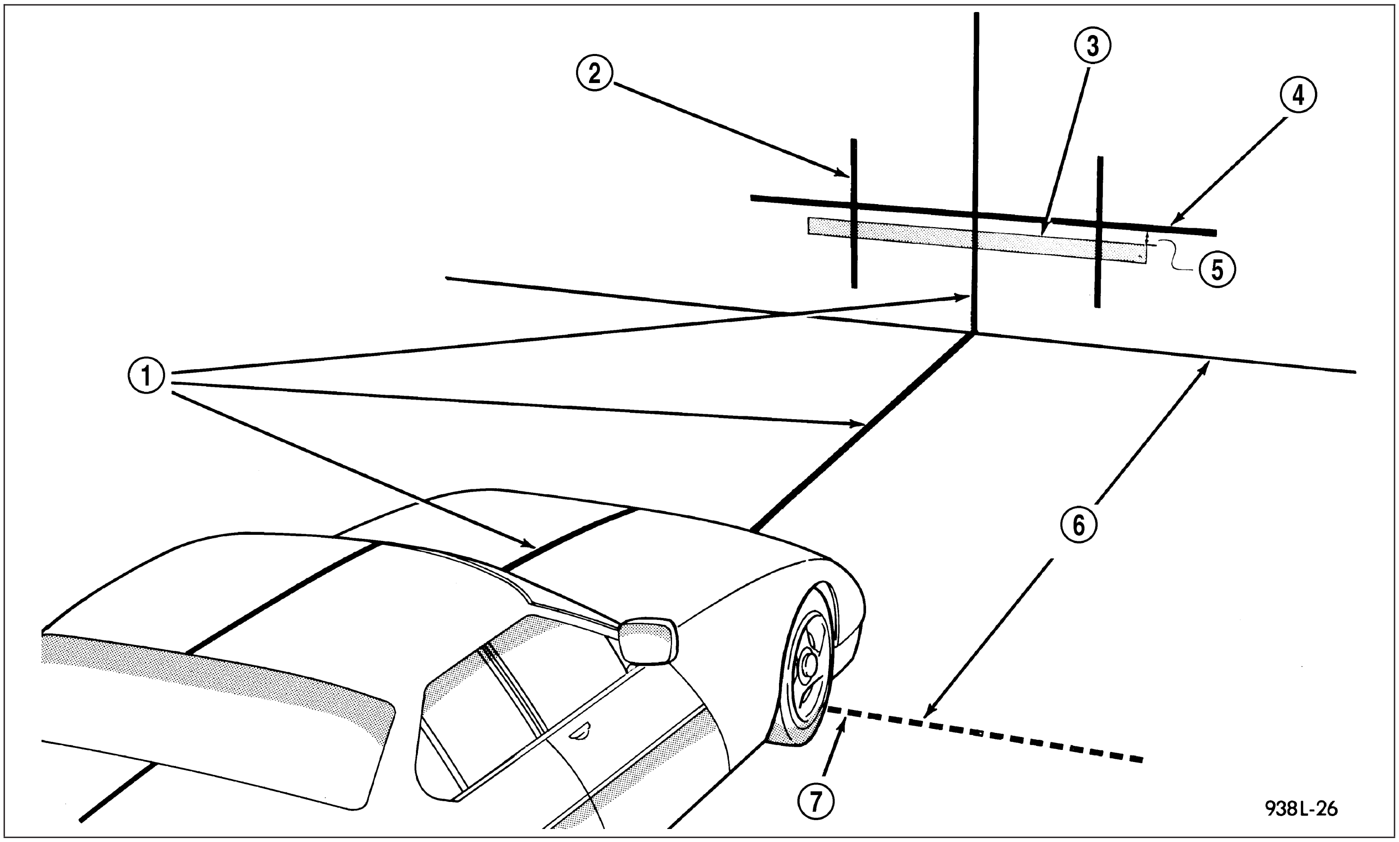
## FRONT FOG LAMP UNIT

### VEHICLE PREPARATION FOR FOG LAMP ALIGNMENT

1. Repair or replace any inoperative or damaged components that could hinder proper lamp alignment.
2. Verify proper tire inflation.
3. Clean the front fog lamp lenses.
4. Verify that the cargo area is not heavily loaded.

5. The fuel tank should be Full. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.

## FOG LAMP ALIGNMENT SCREEN PREPARATION



Prepare an alignment screen as illustrated.

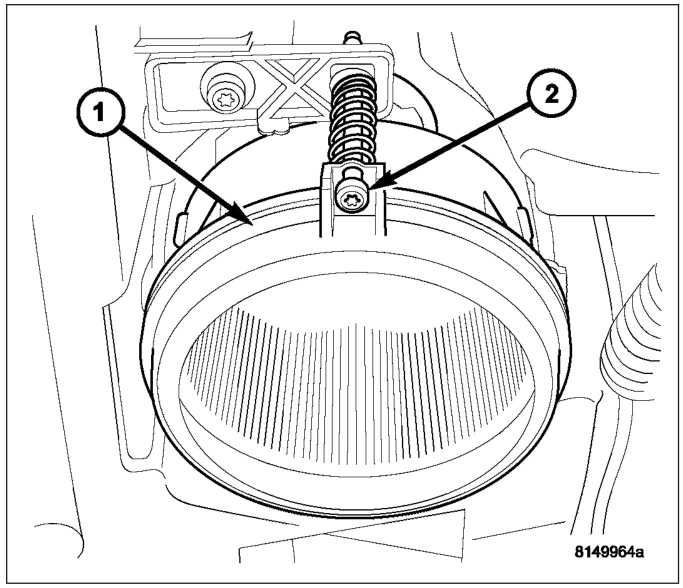
1. Position the vehicle on a level surface perpendicular to a flat wall 7.62 meters (25 feet) (6) away from the front of the front fog lamp lens (7). If necessary, tape a line on the floor 7.62 meters (25 feet) away from and parallel to the wall.
2. Measure up on the wall 1.27 meters (5 feet) from the floor and tape a vertical line on the alignment screen at the centerline of the vehicle (1). Sight along the centerline of the vehicle (from the rear of the vehicle forward) to verify the accuracy of the centerline placement.
3. Rock the vehicle from side-to-side three times to allow the suspension to stabilize, then jounce the front suspension three times by pushing downward on the front bumper and releasing. Measure the distance from the center of the front fog lamp lens to the floor. Transfer this measurement to the alignment screen and tape a horizontal line on the wall at this mark (4). This line will be used for up-and-down adjustment reference.
4. Measure the distance from the centerline of the vehicle to the center of each front fog lamp being aligned. Transfer these measurements to the alignment screen and tape a vertical line this distance to each side of the vehicle centerline (2). These lines will be used for left/right reference.

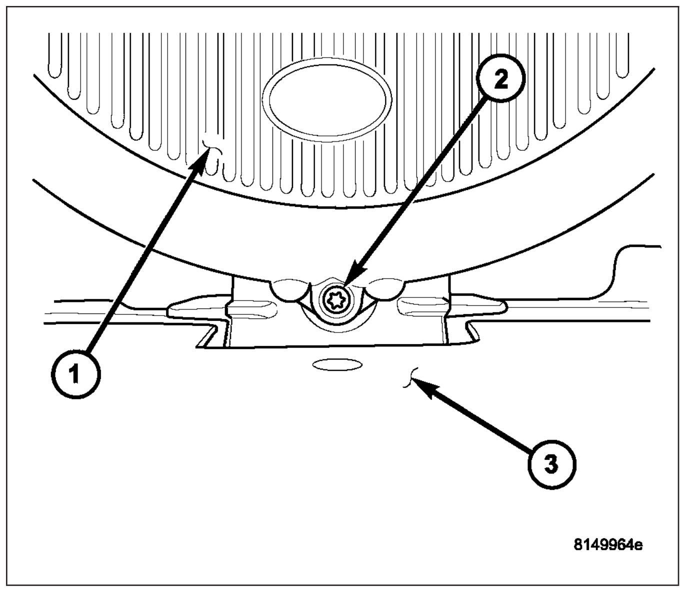
## FOG LAMP ADJUSTMENT

A properly aligned front fog lamp will project a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp.

**NOTE: On vehicles with grille-mounted fog lamps the grille must be removed to access the front fog lamp adjusting screws. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).**

1. Turn the front fog lamp (1) adjusting screws (2) to adjust the beam height as required.



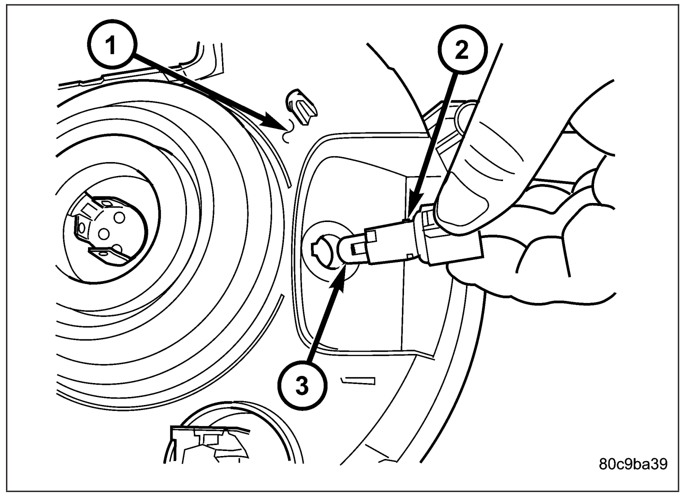


# FRONT POSITION LAMP

## REMOVAL - BULB

**NOTE: The front position lamps are integral to the headlamps on vehicles manufactured for certain markets where these lamps are required.**

1. Disconnect and isolate the battery negative cable.
2. Remove the headlamp from the front grille opening reinforcement. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).
3. Firmly grasp the front position lamp socket (2) near the bottom of the headlamp unit housing (1) and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb (3) straight out of the socket.

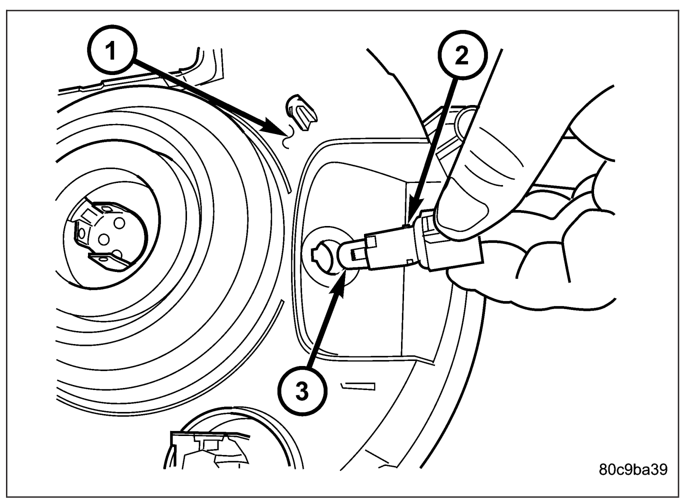


## INSTALLATION - BULB

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**NOTE: The front position lamps are integral to the headlamp units on vehicles manufactured for certain markets where these lamps are required.**

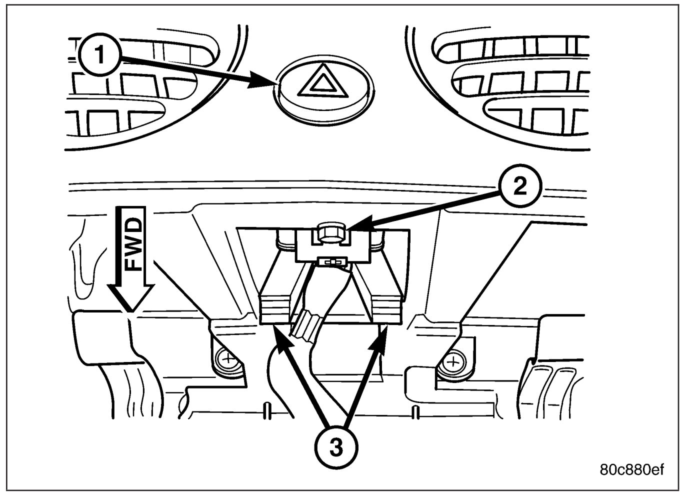
1. Align the base of the bulb (3) with the position lamp bulb socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the bottom of the headlamp housing (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the headlamp unit onto the grille opening reinforcement. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).
7. Reconnect the battery negative cable.
8. Confirm proper headlamp unit alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - ADJUSTMENTS).



# HAZARD SWITCH

## DESCRIPTION

The hazard switch is integral to the hazard switch module, which is secured near the center of instrument panel just above the radio. Only the hazard switch button (1) is visible through a dedicated, beveled, circular opening in the instrument panel between the two center panel outlets of the heat and air conditioning system. A red, stencil-like International Control and Display Symbol icon for "Hazard Warning" identifies the hazard switch button. The remainder of the hazard switch module is concealed behind the instrument panel.



All of the circuitry and components of the hazard switch module are contained within a molded black plastic housing. On the opposite end of the housing from the switch button is an integral connector receptacle and a stamped steel mounting bracket. The mounting bracket includes two latch feature tabs (3) that extend downward to support the back of the housing. These tabs engage the edge of the mounting hole provided for the switch in the instrument panel above the radio opening. The switch module housing also has an integral short, dowel-like alignment pin on each side just behind the switch button that is engaged in integral ramp formations in the instrument panel two align and support the face of the module. Finally, a single screw (2) through the top of the radio opening securely fastens the switch module to the instrument panel.

The switch module is connected to the vehicle electrical system through a single dedicated take out and connector of the instrument panel wire harness. Within the hazard switch module is the hazard switch circuitry, which includes a circuit board with both the hazard switch and the electronic combination flasher circuitry. The circuitry of the combination flasher performs both the hazard flasher and the turn signal flasher functions.

The hazard switch module cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced as a unit.

## OPERATION

The hazard switch button is slightly recessed in the instrument panel when the switch is in the Off position, and latches at a position that is flush with the outer surface of the instrument panel when in the On position. The hazard switch module circuit board includes miniature relays that produce audible clicking to emulate the sound of a conventional flasher whenever the turn signals or the hazard warning system are activated.

The hazard switch module receives battery voltage on a fused B(+) circuit from a fuse in the Junction Block (JB) at all times for operation of the hazard warning, and on a fused ignition switch output (run) circuit from another fuse in the JB whenever the ignition switch is in the On position for operation of the turn signals. The module receives a path to ground through a splice block secured by a nut to a ground stud on the driver side instrument panel end bracket near the JB.

Inputs to and outputs from the hazard switch module include:

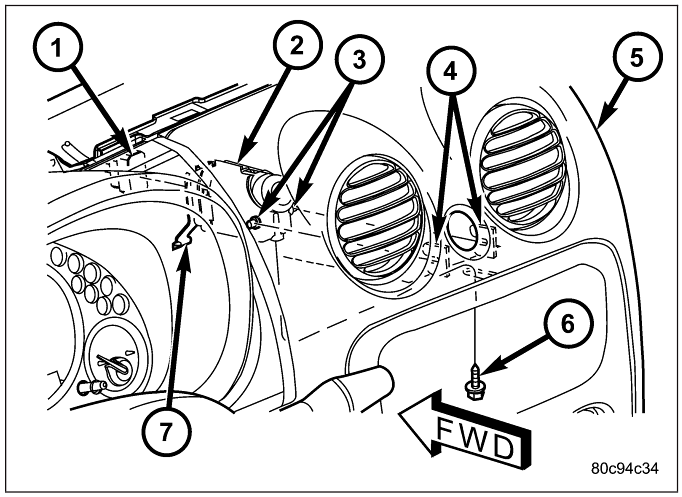
- **Panel Lamps Dimmer Input** - A non-serviceable incandescent bulb soldered onto the hazard switch module provides illumination of the switch button when the exterior lighting is turned On through the fused panel lamps dimmer switch signal circuit. This bulb flashes on and off at full intensity whenever the hazard switch button is activated, regardless of the status of the exterior lighting.
- **Hazard Switch Input** - The combination flasher receives an internal ground input from the hazard switch to request hazard flasher operation.
- **Multi-Function Switch Input** - The combination flasher receives separate ground inputs from the multi-function switch on right and left turn switch sense circuits to request turn signal flasher operation.
- **Body Control Module Input** - The Body Control Module (BCM) can request hazard flasher operation by providing a ground path to the combination flasher through a hazard lamp control circuit.

- **Turn Signal Output** - The combination flasher responds to the flasher inputs by energizing and de-energizing two miniature relays on the module circuit board. These relays control the switch output through the right and left turn signal circuits. One relay controls the right lamps, while the other controls the left.

Because of active electronic elements within the hazard switch module, it cannot be tested using conventional diagnostic tools or procedures. If a problem is noted with turn signal or hazard warning system operation, test and confirm the turn signal and hazard warning lighting circuits are in good condition before replacing the hazard switch module.

## REMOVAL

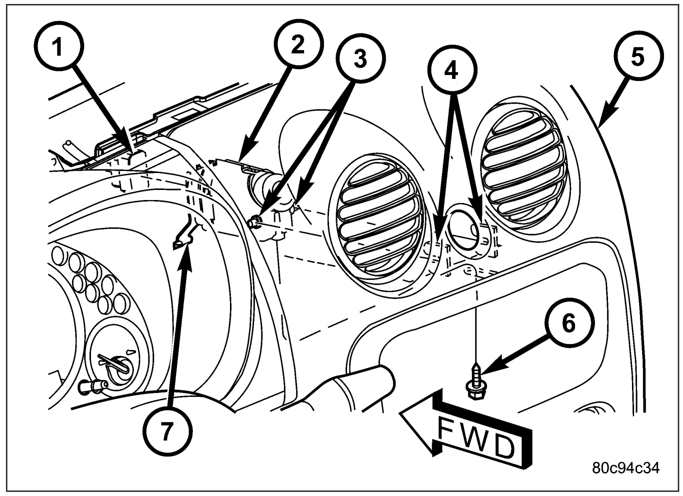
**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**



1. Disconnect and isolate the battery negative cable.
2. Remove the radio from the instrument panel. (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
3. Remove the screw (6) at the top of the instrument panel radio opening that secures the hazard switch (2) to the instrument panel (5).
4. Reach through the radio opening to access the two latch tabs (7) of the stamped metal hazard switch mounting bracket.
5. Pull rearward and downward on the latch tabs of the switch mounting bracket far enough to disengage them from the instrument panel trim.
6. Push the hazard switch button through the button opening far enough to disengage the alignment pins (3) on each side of the switch housing from the saddle-like ramp formations (4) on the back of the instrument panel trim.
7. Pull the switch down into the radio opening far enough to access and disconnect the instrument panel wire harness connector (1) from the back of the switch.
8. Remove the hazard switch through the instrument panel radio opening.

## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

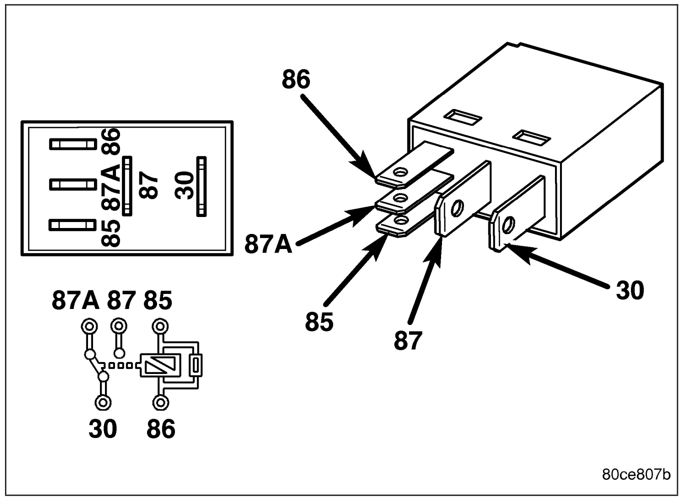


1. Position the hazard switch module (2) into the instrument panel (5) radio opening.
2. Reconnect the instrument panel wire harness connector (1) to the back of the switch housing.
3. Reach through the instrument panel radio opening to position the hazard switch for installation.
4. Guide the hazard switch button through the button opening of the instrument panel, which will engage the alignment pins (3) on each side of the switch housing into the saddle-like ramp formations (4) on the back of the instrument panel trim.
5. Press upward on the back of the hazard switch until the latch tabs (7) of the mounting bracket are both engaged with the instrument panel trim.
6. Install and tighten the screw (6) that secures the switch to the top of the instrument panel radio opening. Tighten the screw to 2 N·m (17 in. lbs.).
7. Reinstall the radio into the instrument panel. (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
8. Reconnect the battery negative cable.

# HEADLAMP HIGH BEAM RELAY

## DESCRIPTION

The headlamp high beam relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male spade-type terminals that extend from the relay base plate.



The headlamp high beam relay is located in the Junction Block (JB). This relay is omitted from vehicles manufactured for sale in Canada, which have a Daytime Running Lamp (DRL) solid state relay installed in the JB that also performs the high beam relay function.

The headlamp high beam relay cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced with a new unit.

## OPERATION

The headlamp high beam relay is an electromechanical switch that uses a low current input from the Body Control Module (BCM) to control a high current output to the headlamp high beam filaments. Within the relay are an electromagnetic coil, a movable contact and two fixed contact points. A resistor is connected in parallel with the coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the field of the relay coil collapses.

The movable common supply contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This field draws the movable contact point away from the normally closed contact, and holds it against the normally open contact. When the relay coil is de-energized, spring pressure returns the movable contact back against the normally closed contact.

The inputs and outputs of the headlamp high beam relay include:

- **Common Supply Terminal (30)** - The common feed terminal is connected to a fused B(+) circuit at all times.
- **Coil Ground Terminal (85)** - The common feed terminal is connected to a fused B(+) circuit at all times.
- **Coil Battery Terminal (86)** - The coil battery terminal is connected to a control output of the Body Control Module (BCM) and to the momentary optical horn (flash-to-pass) output of the multi-function switch through a high beam relay control circuit. The BCM and/or the multi-function switch controls headlamp high beam operation by controlling a ground path through this circuit.
- **Normally Open Terminal (87)** - The normally open terminal is connected to the headlamp high beam filaments through the high beam relay output circuit and provides battery voltage to the headlamp high beams whenever the relay is energized.
- **Normally Closed Terminal (87A)** - The normally closed terminal is not connected in this application, but will have battery voltage present whenever the relay is de-energized.

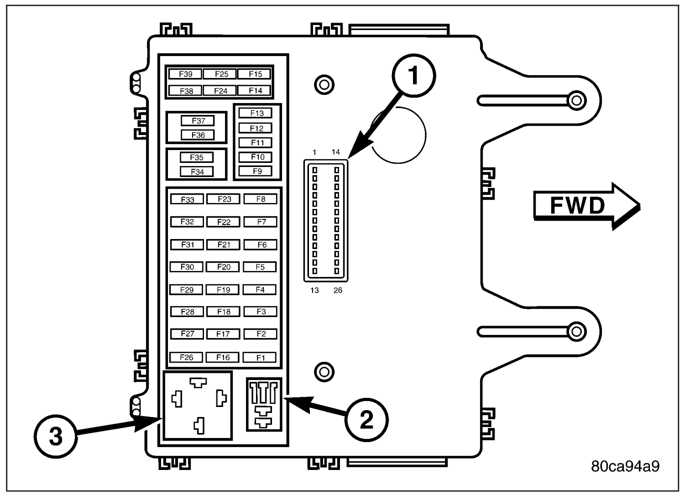
The headlamp high beam relay can be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The headlamp high beam relay is installed in the Junction Block (JB) on the driver side outboard end of the instrument panel. Vehicles equipped with a Daytime Running Lamps (DRL) relay MUST NOT have a headlamp high beam relay installed in the JB.**

1. Disconnect and isolate the battery negative cable.
2. Remove the trim from the driver side end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).
3. Remove the high beam relay by grasping it firmly and pulling it straight out from the receptacle (2) in the Junction Block (JB).

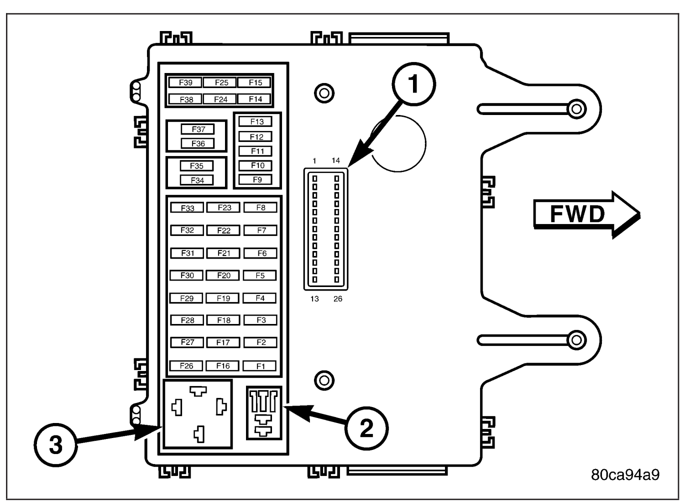


## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

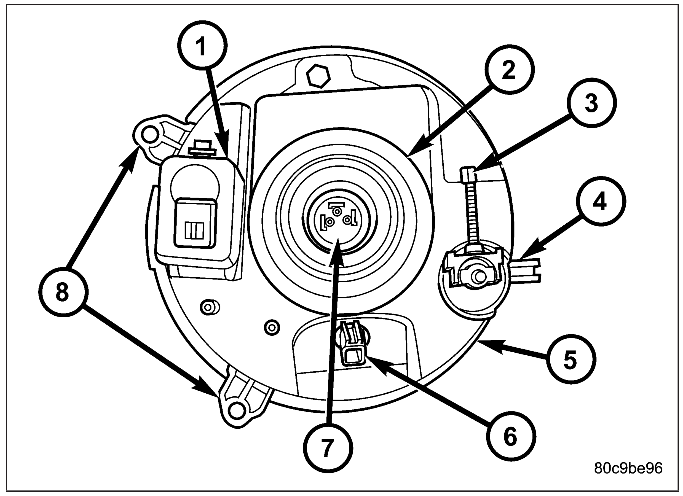
**NOTE: The headlamp high beam relay is installed in the Junction Block (JB) on the driver side outboard end of the instrument panel. Vehicles equipped with a Daytime Running Lamps (DRL) relay MUST NOT have a headlamp high beam relay installed in the JB.**

1. Position the headlamp high beam relay to the proper receptacle (2) in the Junction Block (JB).
2. Align the high beam relay terminals with the cavities in the JB receptacle.
3. Push firmly and evenly on the top of the high beam relay until the relay base is fully seated in the JB receptacle.
4. Reinstall the trim onto the driver side outboard end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).
5. Reconnect the battery negative cable.



# HEADLAMP LEVELING MOTOR

## DESCRIPTION



The headlamp leveling motor (1) is located on the rear inboard side of each headlamp unit (5) on vehicles equipped with the headlamp leveling system, which is available only in certain markets where required. The motor is encased within a molded plastic housing and is secured by an integral wedge-type mounting boss to a keyed flange on the back of the headlamp unit housing. A rubber seal around the circumference of the mounting boss seals the motor to the headlamp.

The outside of the motor housing features an integral molded connector on its rearward surface, a hex-headed adjusting screw extends from the top of the housing, and a plastic pushrod with a ball formation on its free end extends from the motor mounting boss. Within the motor housing is a 12-volt Direct Current (DC) servo motor, an electronic controller board that includes the motor logic circuits, and an integral screw-drive transmission. The headlamp leveling motor is connected to the vehicle electrical system through a dedicated take out and connector of the front fascia wire harness.

The headlamp leveling motor is serviced as a unit with the headlamp unit. The motor cannot be repaired and, if inoperative or damaged, the entire headlamp unit must be replaced.

## OPERATION

The controller board and logic circuitry of the headlamp leveling motor control motor operation based upon a voltage signal input received from the resistor multiplexed headlamp leveling switch on the instrument panel. When the motor is energized it will extend or retract the motor pushrod through the integral screw-drive transmission. The ball on the end of the pushrod is snapped into a socket on the back of the reflector within the headlamp unit housing, which will cause the reflector to move as the pushrod is extended or retracted, changing the angle at which the light is projected from the headlamps.

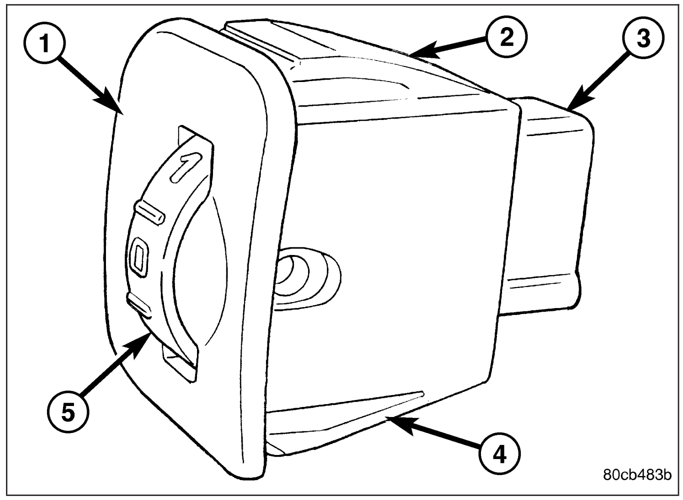
The headlamp leveling motors and switch have a path to ground at all times. The headlamp leveling components operate on battery voltage received through the fused park lamp relay output circuit so that the system will only operate when the exterior lighting is turned On.

Because of active electronic elements within the headlamp leveling motor, it cannot be tested using conventional diagnostic tools and procedures. If the headlamp leveling system is believed to be inoperative, the headlamp leveling circuits and the leveling switch must be tested before considering motor replacement.

# HEADLAMP LEVELING SWITCH

## DESCRIPTION

The headlamp leveling switch (1) is used only on vehicles manufactured for certain markets where the headlamp leveling system is required. The headlamp leveling switch is mounted in the driver side inboard trim bezel on the instrument panel. Only the switch bezel and thumbwheel (5) are visible on the outer surface of the instrument panel trim bezel. The black plastic switch thumbwheel is marked with white numbers “0,” “1,” “2,” and “3,” each of which indicates one of the four switch detent positions. Each higher number represents a lower aiming position of the headlamp beam relative to the road surface.



The black, molded plastic switch housing encloses the switch thumbwheel mechanism and the leveling switch circuitry including the switch contacts and a series resistor configuration. A connector receptacle (3) is integral to the back of the switch housing, while a single integral latch feature (2) on the top of the housing and two latch features (4) on the bottom of the housing secure the switch in the instrument panel trim bezel. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The headlamp leveling switch cannot be adjusted or repaired and, if inoperative or damaged, the unit must be replaced.

## OPERATION

The headlamp leveling switch receives battery voltage on a fused park lamp relay output circuit from a fuse in the Junction Block (JB) whenever the park lamps relay is energized (the park lamps are turned On). The switch receives a path to ground through a splice block in the instrument panel wire harness secured by a nut to a ground stud on the driver side instrument panel end bracket near the JB.

The only output from the switch is a voltage signal that it provides to the headlamp leveling motors on a headlamp adjust signal circuit. Each switch position selects a different tap on a series resistor within the switch to provide a different voltage signal to the leveling motors. The higher the switch position number, the higher the output voltage level.

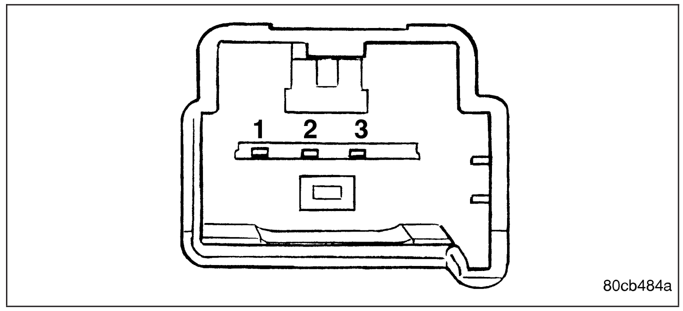
The headlamp leveling switch can be tested using conventional diagnostic tools and methods.

## DIAGNOSIS AND TESTING

## HEADLAMP LEVELING SWITCH

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the battery negative cable.
2. Disconnect the instrument panel wire harness connector from the headlamp leveling switch.
3. Using an ohmmeter, perform the resistance tests at the terminal pins in the headlamp leveling switch connector receptacle as shown in the Headlamp Leveling Switch Tests table.



| HEADLAMP LEVELING SWITCH TESTS | |
|---|---|
| SWITCH POSITION | RESISTANCE (OHMS) BETWEEN PINS 1 AND 3 |
| 0 | 0.5 ± 0.5 |
| 1 | 301 ± 1 |
| 2 | 595 ± 1 |
| 3 | 739 ± 1 |

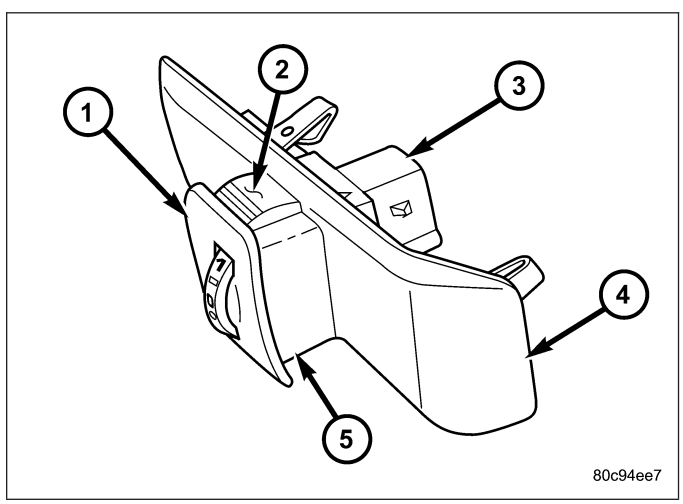
4. If the switch fails any of the resistance tests, replace the inoperative headlamp leveling switch as required.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: A headlamp leveling switch is used only on vehicles manufactured for certain markets where headlamp leveling is required.**

1. Disconnect and isolate the battery negative cable.
2. Remove the driver side inboard bezel (4) from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DRIVER SIDE BEZEL - REMOVAL).
3. Disconnect the instrument panel wire harness connector from the headlamp leveling switch connector receptacle (3).
4. From the back of the trim bezel, depress the two lower latch features (5) on the switch housing and rock the bottom of the switch out through the face of the bezel.



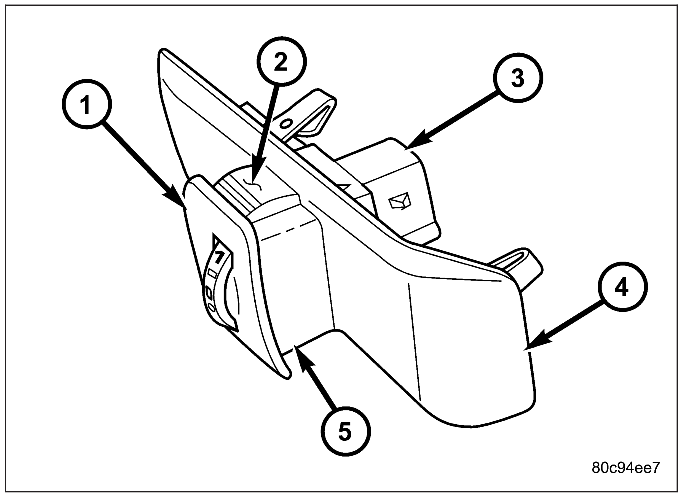
5. From the back of the trim bezel, depress the upper latch feature (2) on the switch housing and push the switch (1) out through the face of the bezel.

## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: A headlamp leveling switch is used only on vehicles manufactured for certain markets where headlamp leveling is required.**

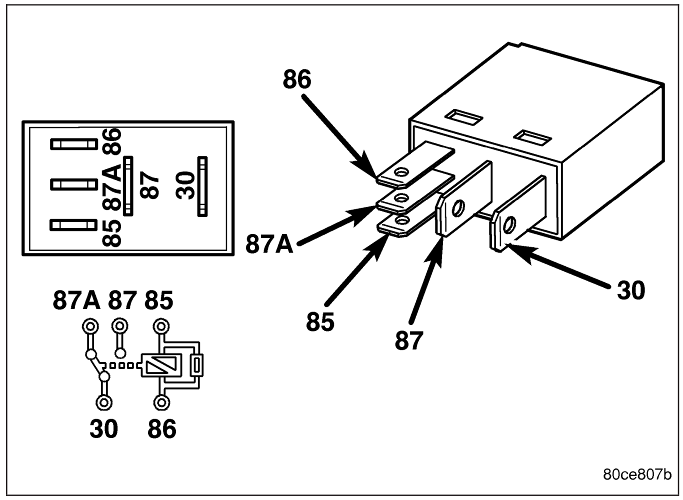
1. From the face of the driver side inboard bezel (4), align the headlamp leveling switch housing (1) to the mounting hole in the bezel.
2. Push the switch into the mounting hole until it is fully seated and each of the latch features (2 and 5) is fully engaged.
3. Position the switch and bezel unit to the instrument panel.
4. Reconnect the instrument panel wire harness connector to the switch connector receptacle (3).
5. Reinstall the trim bezel and switch unit onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DRIVER SIDE BEZEL - INSTALLATION).
6. Reconnect the battery negative cable.



# HEADLAMP LOW BEAM RELAY

## DESCRIPTION

The headlamp low beam relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male spade-type terminals that extend from the relay base plate.



The headlamp low beam relay is located in the Junction Block (JB) on the driver side instrument panel end bracket. The headlamp low beam relay cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced with a new unit.

## OPERATION

The headlamp low beam relay is an electromechanical switch that uses a low current input from the Body Control Module (BCM) to control a high current output to the headlamp low beam filaments. Within the relay are an electromagnetic coil, a movable contact and two fixed contact points. A resistor is connected in parallel with the coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the field of the relay coil collapses.

The movable common supply contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This field draws the movable contact point away from the normally closed contact, and holds it against the normally open contact. When the relay coil is de-energized, spring pressure returns the movable contact back against the normally closed contact.

The inputs and outputs of the headlamp low beam relay include:

- **Common Supply Terminal (30)** - The common feed terminal is connected to a fused B(+) circuit at all times.
- **Coil Ground Terminal (85)** - The common feed terminal is connected to a fused B(+) circuit at all times.
- **Coil Battery Terminal (86)** - The coil battery terminal is connected to a control output of the Body Control Module (BCM) through a low beam relay control circuit. The BCM controls headlamp low beam operation by controlling a ground path through this circuit.
- **Normally Open Terminal (87)** - The normally open terminal is connected to the headlamp low beam filaments through the low beam relay output circuit and provides battery voltage to the headlamp low beams whenever the relay is energized.
- **Normally Closed Terminal (87A)** - The normally closed terminal is not connected in this application, but will have battery voltage present whenever the relay is de-energized.

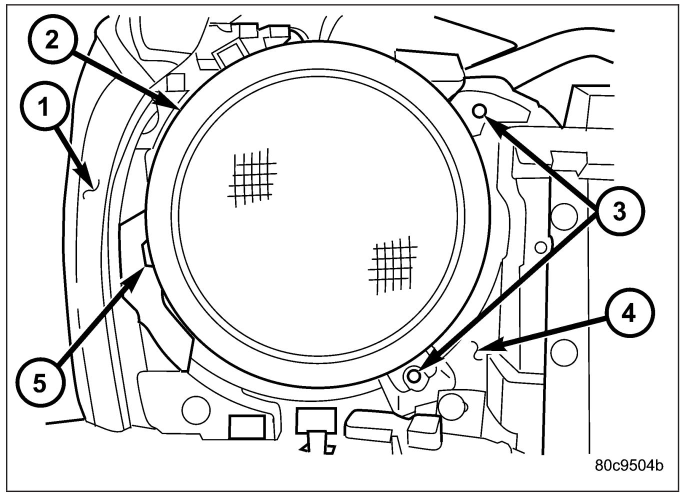
The headlamp low beam relay can be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

# HEADLAMP UNIT

## REMOVAL

## LAMP

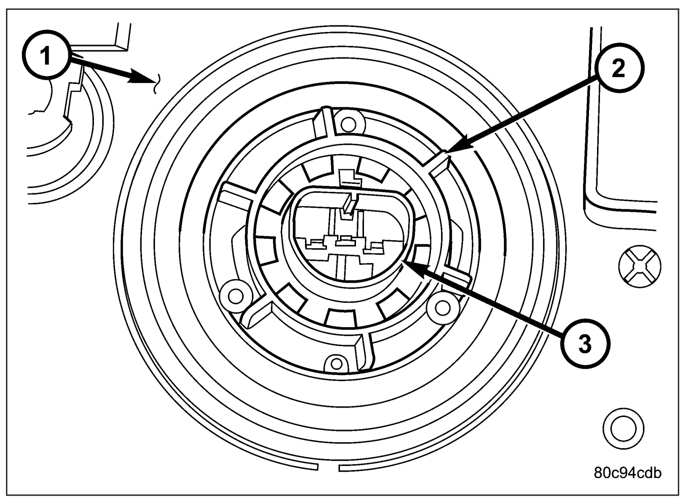
1. Disconnect and isolate the battery negative cable.
2. Remove the grille panel from the grille opening reinforcement. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
3. Remove the two screws that secure the mounting tabs (3) on the inboard side of the headlamp unit housing (2) to the grille opening reinforcement (4).
4. Pull the inboard side of the headlamp unit away from the grille opening reinforcement far enough to disengage the locator tab (5) on the outboard side of the unit from the engagement slot in the outboard edge of the reinforcement.
5. Pull the headlamp unit away from the grille opening reinforcement far enough to disconnect the wire harness connectors from the headlamp bulb socket (North America), the headlamp bulb base (Export), the front position lamp socket (if equipped), and the headlamp leveling motor (if equipped).
6. Remove the headlamp from the grille opening reinforcement.



## BULB - NORTH AMERICA

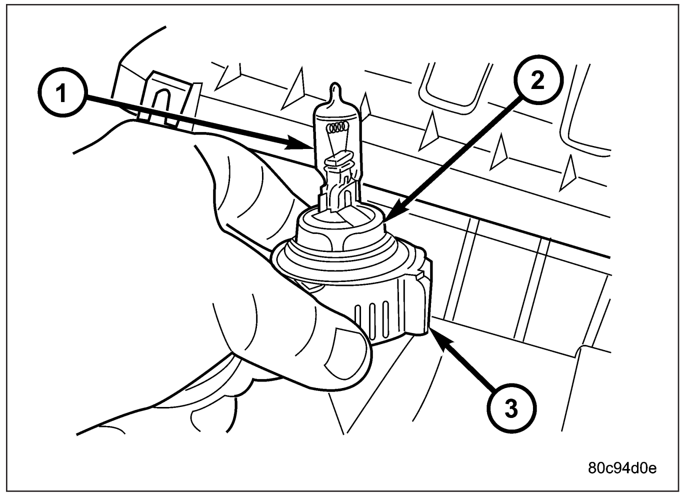
1. Disconnect and isolate the battery negative cable.
2. Reach behind the headlamp unit (1) from the engine compartment side of the upper radiator crossmember to access the headlamp bulb lock ring (2).
3. Firmly grasp the lock ring on the back of the headlamp unit housing.
4. Rotate the lock ring on the back of the headlamp housing counterclockwise about 30 degrees to unlock it.

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**



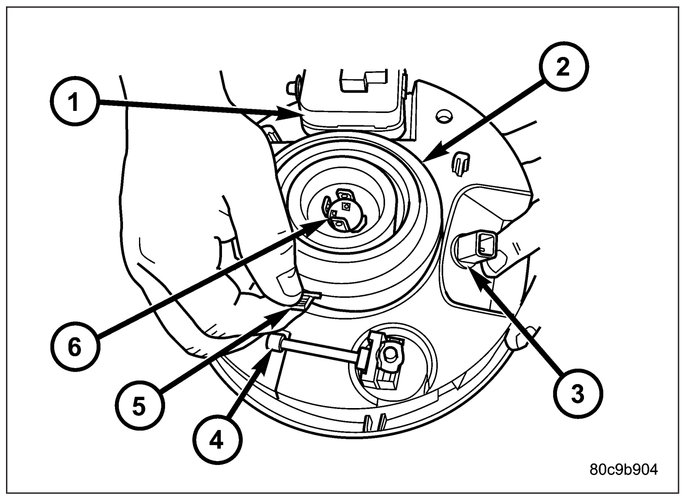
5. Pull the lock ring, socket, and bulb (3) straight out of the keyed opening in the headlamp housing and up from behind the upper radiator crossmember.

6. Disconnect the grille opening reinforcement wire harness connector from the headlamp bulb (1) socket connector (2) receptacle.
7. Remove the bulb and socket unit from the lock ring (3).

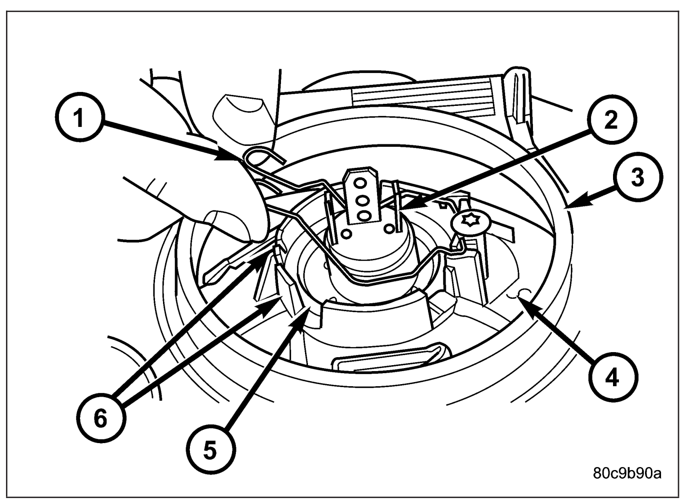


## BULB - EXPORT

1. Disconnect and isolate the battery negative cable.
2. Remove the headlamp unit from the grille opening reinforcement. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).
3. Firmly grasp the tab of the headlamp boot seal (2) on the back of the headlamp unit housing.
4. Pull the tab away from the back of the headlamp unit housing to remove the boot seal from the housing and the bulb base (6).

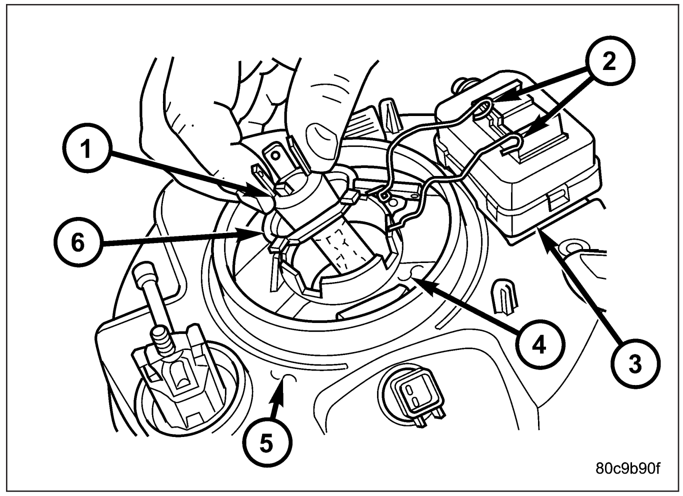


5. Pinch the two hooked ends of the wire headlamp bulb retainer clip (1) together and disengage them from the slots (6) in the flange of the reflector (4).
6. Pivot the headlamp bulb retainer clip up off of the bulb flange (5) and out of the way.



**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

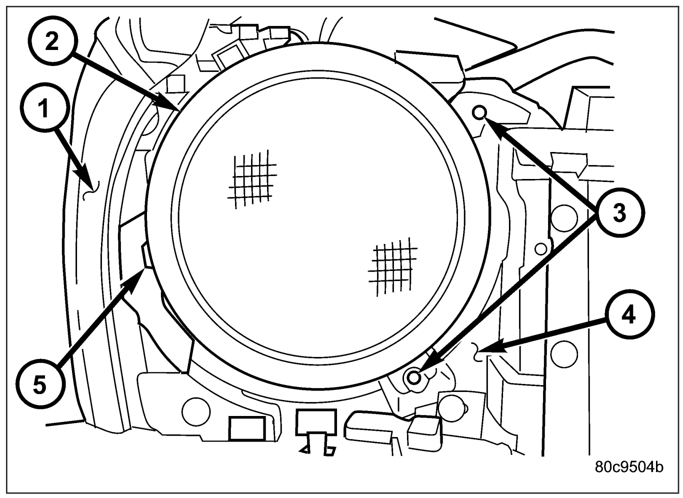
7. Pull the bulb (1) straight out of the keyed opening in the headlamp reflector (4).



## INSTALLATION

## LAMP

1. Position the headlamp unit (2) to the grille opening reinforcement (4).
2. Reconnect the wire harness connectors to the headlamp bulb socket (North America), the headlamp bulb base (Export), the front position lamp socket (if equipped), and the headlamp leveling motor (if equipped).
3. Engage the locator tab (5) on the outboard side of the headlamp unit into the engagement slot in the outboard edge of the grille opening reinforcement.
4. Align the two mounting tabs (3) on the inboard side of the headlamp unit housing to the mounting holes in the grille opening reinforcement.
5. Install and tighten the two screws that secure the mounting tabs on the inboard side of the headlamp housing to the grille opening reinforcement. Tighten the screws to 3 N·m (30 in. lbs.).



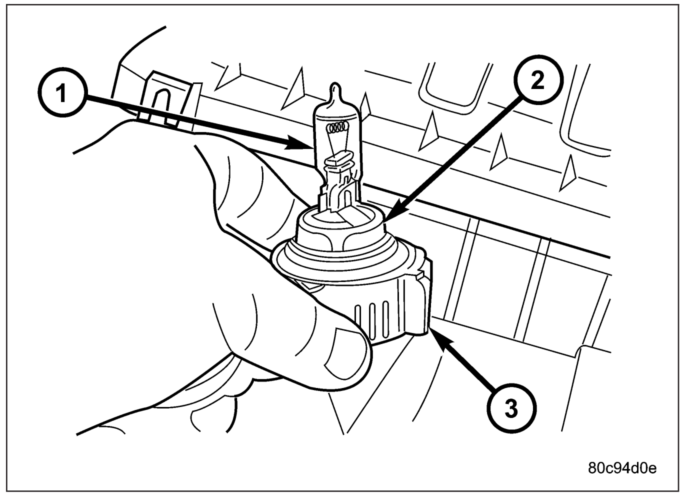
6. Reinstall the grille panel onto the grille opening reinforcement. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
7. Reconnect the battery negative cable.
8. Confirm proper headlamp unit alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - ADJUSTMENTS).

## BULB - NORTH AMERICA

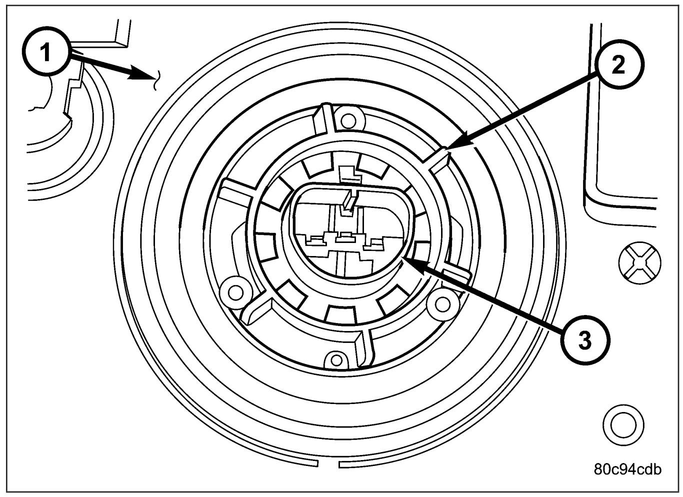
**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

1. Position the headlamp bulb (1) and socket (2) into the lock ring (3).
2. Reconnect the grille opening reinforcement wire harness connector to the headlamp bulb socket connector receptacle.



3. Position the lock ring (2), socket, and bulb (3) down behind the upper radiator crossmember and align them with the keyed opening on the back of the headlamp unit housing (1).
4. Push the socket and bulb unit straight into the headlamp housing until they are firmly seated.
5. Position the lock ring over the socket and engage it with the flange on the back of the headlamp housing.
6. Rotate the lock ring on the back of the headlamp housing clockwise about 30 degrees to lock it into place.
7. Reconnect the battery negative cable.

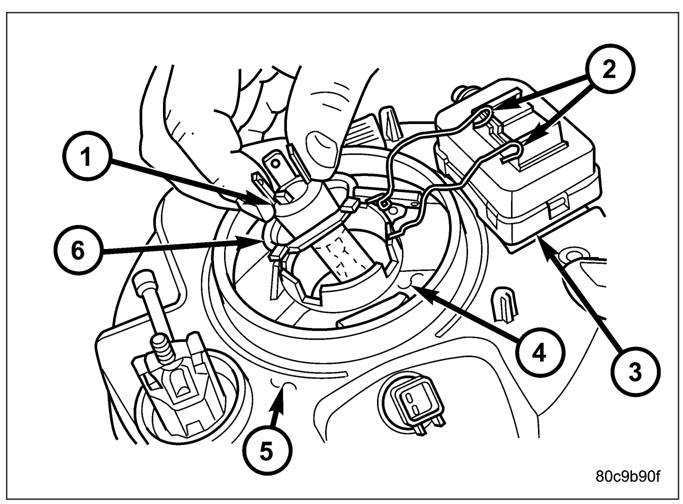


## BULB - EXPORT

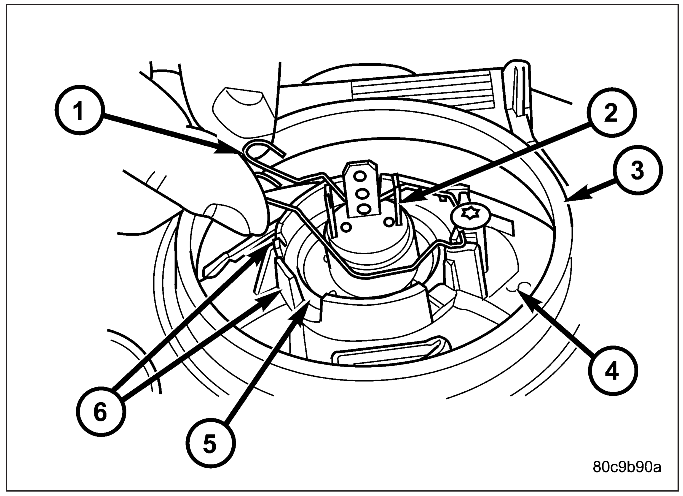
**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

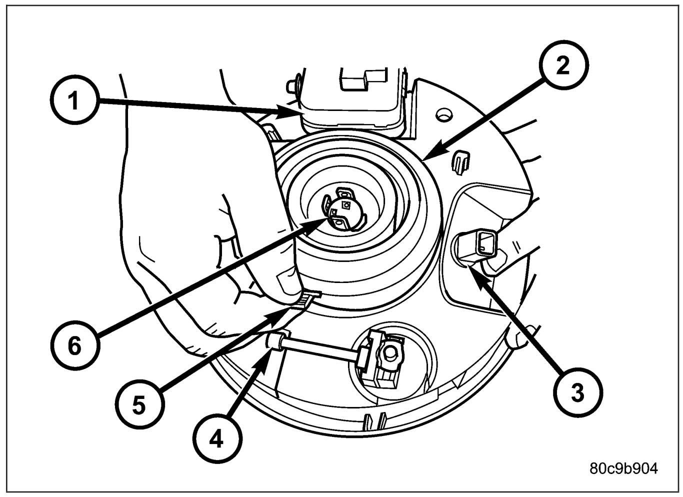
1. Position the bulb (1) into the keyed opening in the headlamp reflector (4).
2. Pivot the headlamp bulb retainer clip (2) back over the bulb flange (6).



3. Pinch the two hooked ends of the wire headlamp bulb retainer clip (1) together and engage them into the slots (6) in the flange of the reflector (4).



4. Position the center opening of the boot seal (2) over the base of the headlamp bulb (6) and pull it downward until the seal is fully engaged over the bulb base.
5. Position the outer circumference of the boot seal over the flange on the back of the headlamp unit housing and pull it downward until the seal is fully engaged over the flange.
6. Reinstall the headlamp unit onto the grille opening reinforcement. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).
7. Reconnect the battery negative cable.
8. Confirm proper headlamp unit alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - ADJUSTMENTS).



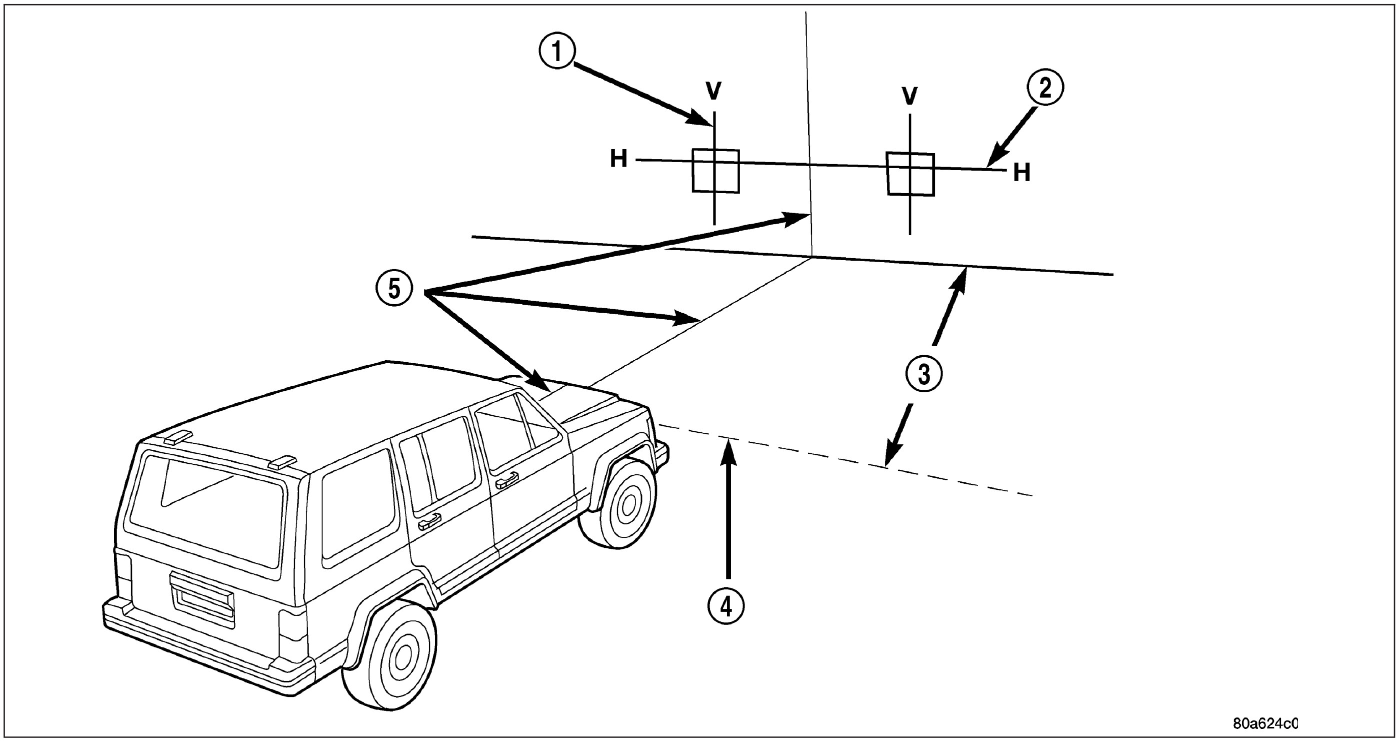
## ADJUSTMENTS

## HEADLAMP UNIT

### VEHICLE PREPARATION FOR HEADLAMP ALIGNMENT

1. Verify headlamp dimmer (multi-function) switch and high beam indicator operation.
2. If the vehicle is equipped with headlamp leveling, be certain that the headlamp leveling switch is in the “0” position.
3. Repair or replace any inoperative or damaged components that could hinder proper lamp alignment.
4. Verify proper tire inflation.
5. Clean headlamp lenses.
6. Verify that cargo area is not heavily loaded.
7. The fuel tank should be Full. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.

## HEADLAMP ALIGNMENT SCREEN PREPARATION



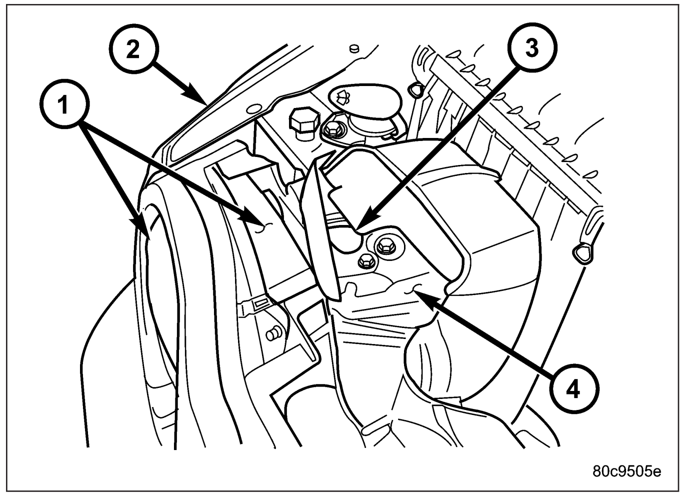
Prepare an alignment screen as illustrated.

1. Position the vehicle on a level surface perpendicular to a flat wall 7.62 meters (25 feet) away (3) from the front of the headlamp lens (4) for North American vehicles, or 10.0 meters (32.81 feet) away from the front of the headlamp lens (4) for Export vehicles. If necessary, tape a line on the floor at the appropriate distance away from and parallel to the wall.
2. Measure up on the wall 1.27 meters (5 feet) from the floor and tape a vertical line on the alignment screen at the centerline of the vehicle (5). Sight along the centerline of the vehicle (from the rear of the vehicle forward) to verify the accuracy of the centerline placement.
3. Rock the vehicle from side-to-side three times to allow the suspension to stabilize, then jounce the front suspension three times by pushing downward on the front bumper and releasing. Measure the distance from the center of the headlamp lens to the floor (2). Transfer this measurement to the alignment screen and tape a horizontal line on the wall at this mark. This line will be used for up-and-down adjustment reference.
4. Measure the distance from the centerline of the vehicle to the center of each headlamp being aligned. Transfer these measurements to the alignment screen and tape a vertical line this distance to each side of the vehicle centerline (1). These lines will be used for left/right reference.

## HEADLAMP ADJUSTMENT

**NOTE: A properly aligned headlamp will project a pattern on the alignment screen from just below horizontal to 75 millimeters (3 inches) below the headlamp centerline for vehicles in North America, or from just below horizontal to 125 millimeters (5 inches) below the headlamp horizontal centerline for vehicles in Export.**

1. Vehicles for all markets except Japan should have the headlamp low beams selected with the dimmer (multi-function) switch during the adjustment procedure. Vehicles for the Japanese market should have the headlamp high beams selected.
2. Cover the lens of the headlamp that is not being adjusted.
3. Turn the adjusting screw (3) until the top edge of the beam intensity pattern is positioned from just below horizontal to 75 millimeters (3 inches) below the headlamp horizontal centerline for vehicles in North America, or from just below horizontal to 125 millimeters (5 inches) below the headlamp horizontal centerline for Export vehicles.
4. Repeat the adjustment procedure for the opposite headlamp.

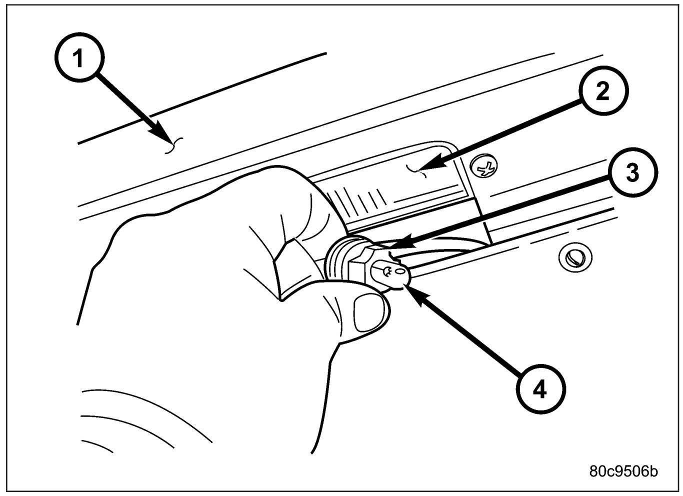


# LICENSE PLATE LAMP

## REMOVAL

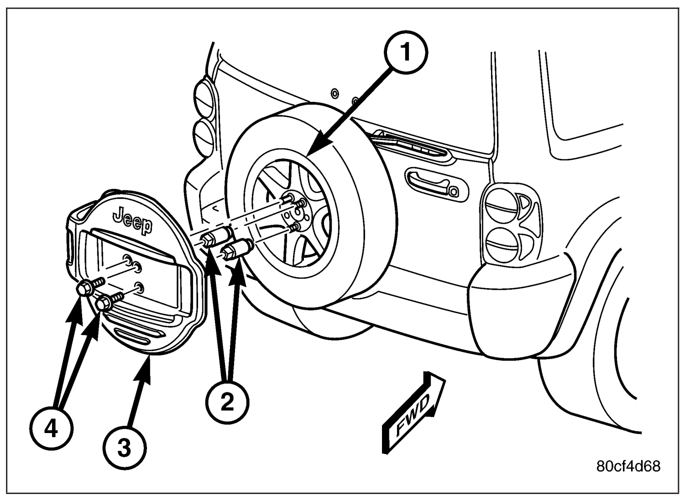
### BULB - NORTH AMERICA

1. Disconnect and isolate the battery negative cable.
2. Reach through the opening in the rear bumper fascia (1) between the license plate and the lamp (2) to access the socket (3) on the back of the license plate lamp unit housing.
3. Firmly grasp and pull the socket and bulb (4) straight out of the opening in the back of the license plate lamp housing.
4. Pull the bulb straight out of the socket.

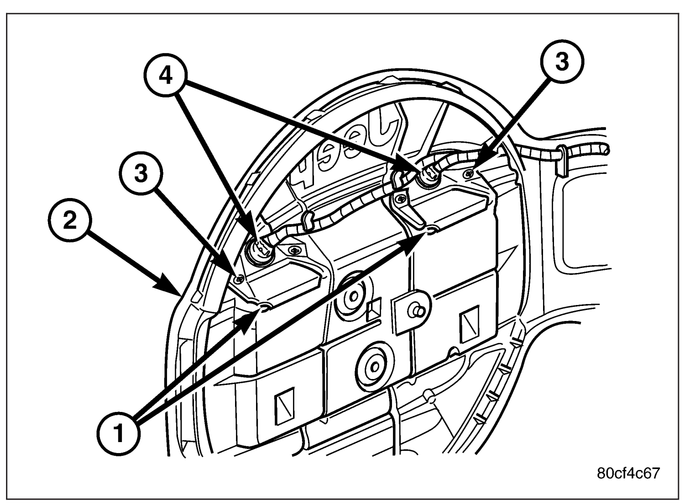


### BULB - EXPORT

1. Disconnect and isolate the battery negative cable.
2. Unsnap and lift up the bottom of the license mounting plate far enough to access and remove the two screws (4) that secure the license plate bracket (3) to the special lug nuts (2) on the spare tire (1).

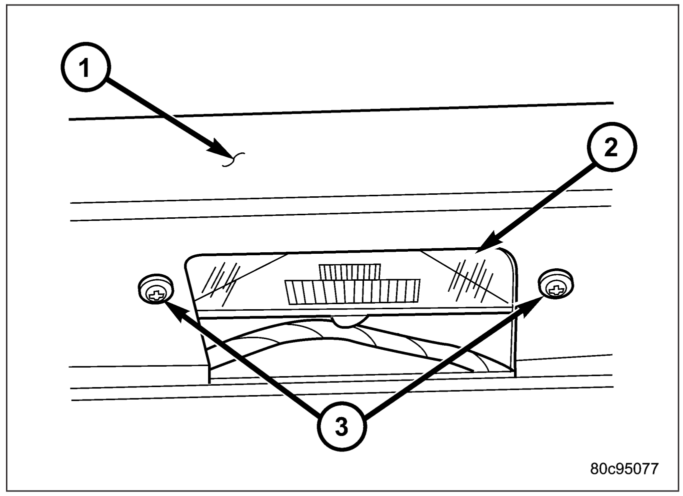


3. Swing the license plate bracket (2) away from the spare tire far enough to access the license plate lamp bulb sockets (4).
4. Firmly grasp the socket on the top of the license plate lamp unit housing for the bulb that is being removed.
5. Rotate the socket counterclockwise about 30 degrees to unlock it.
6. Pull the socket and bulb straight out from the keyed opening in the top of the lamp housing.
7. Pull the base of the bulb straight out of the socket.



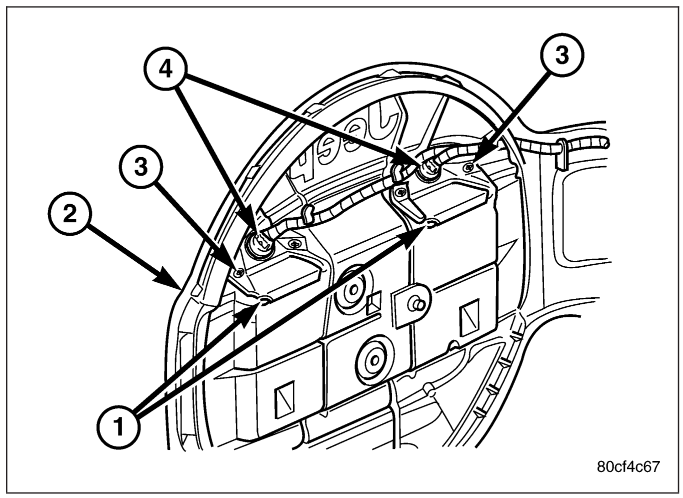
## LAMP - NORTH AMERICA

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws (3) that secure the license plate lamp unit (2) to the rear bumper fascia (1).
3. Lower the lamp from the mounting hole in the fascia far enough to access and disconnect the lamp pigtail wire connector.
4. Remove the license plate lamp unit from the vehicle.



## LAMP - EXPORT

1. Disconnect and isolate the battery negative cable.
2. Remove the bulb and socket (4) from the license plate lamp unit (1) that is being removed. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ LICENSE PLATE LAMP BULB - REMOVAL - EXPORT).
3. Remove the two screws (3) that secure the lamp unit to the back of the license plate bracket (2).
4. Remove the lamp unit from the back of the license plate bracket.

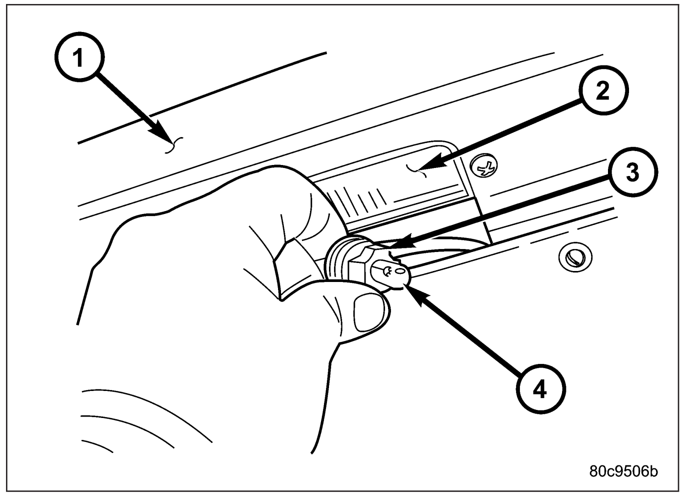


## INSTALLATION

## BULB - NORTH AMERICA

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

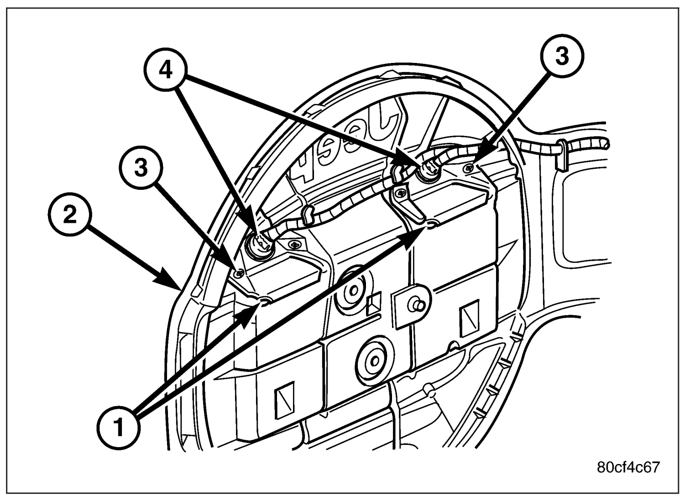
1. Align the base of the bulb (4) with the license plate lamp socket (3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Reach through the opening in the rear bumper fascia (1) between the license plate and the lamp (2) to align the socket and bulb with the opening on the back of the lamp housing.
4. Insert the socket and bulb straight into the housing until the socket is firmly seated.
5. Reconnect the battery negative cable.



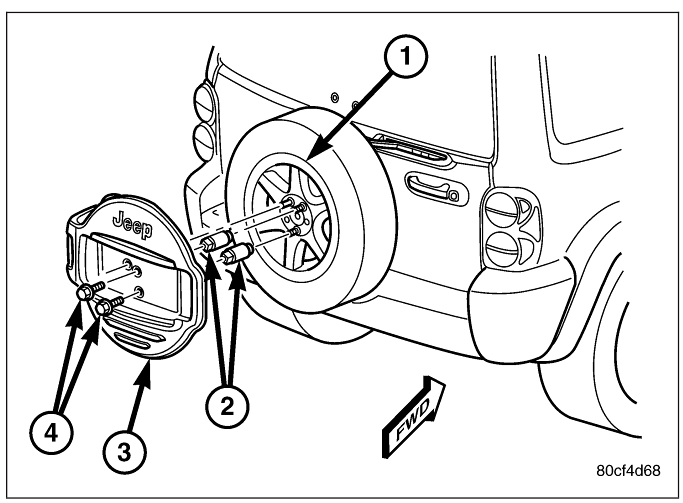
## BULB - EXPORT

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

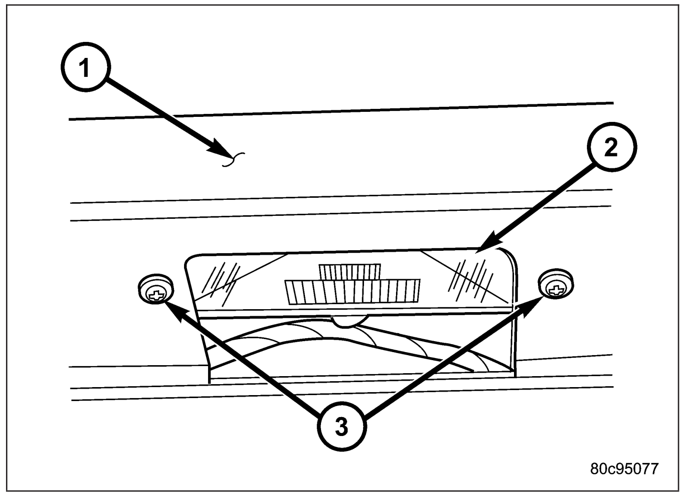
1. Align the base of the bulb with the license plate lamp socket (4).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the top of the license plate lamp unit (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.



6. Swing the license plate bracket (3) back against the spare tire (1).
7. Lift up the bottom of the license mounting plate far enough to install and tighten the two screws (4) that secure the license plate bracket to the special lug nuts (2) on the spare tire. Tighten the screws to 28 N·m (21 ft. lbs.).
8. Lower the bottom of the license mounting plate and snap it into place on the license plate bracket.
9. Reconnect the battery negative cable.

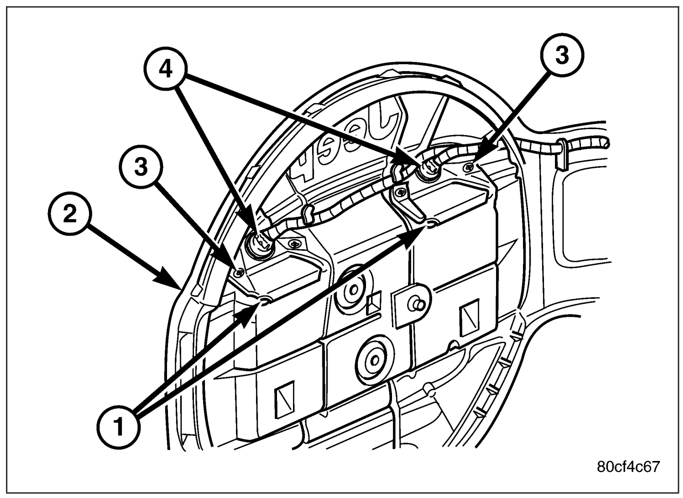


## LAMP - NORTH AMERICA



1. Position the license plate lamp unit (2) to the rear bumper fascia (1).
2. Reconnect the lamp socket pigtail wire connector.
3. Position the lamp unit into the mounting hole in the rear bumper fascia.
4. Install and tighten the two screws (3) that secure lamp unit to the fascia. Tighten the screws to 2 N·m (20 in. lbs.).
5. Reconnect the battery negative cable.

## LAMP - EXPORT



1. Position the license plate lamp unit (1) onto the back of the license plate bracket (2).
2. Install and tighten the two screws (3) that secure the lamp unit to the back of the license plate bracket. Tighten the screws to 2 N·m (20 in. lbs.).
3. Reinstall the bulb and socket (4) into the lamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LICENSE PLATE LAMP BULB - INSTALLATION - EXPORT).
4. Reconnect the battery negative cable.

# LAMP BAR

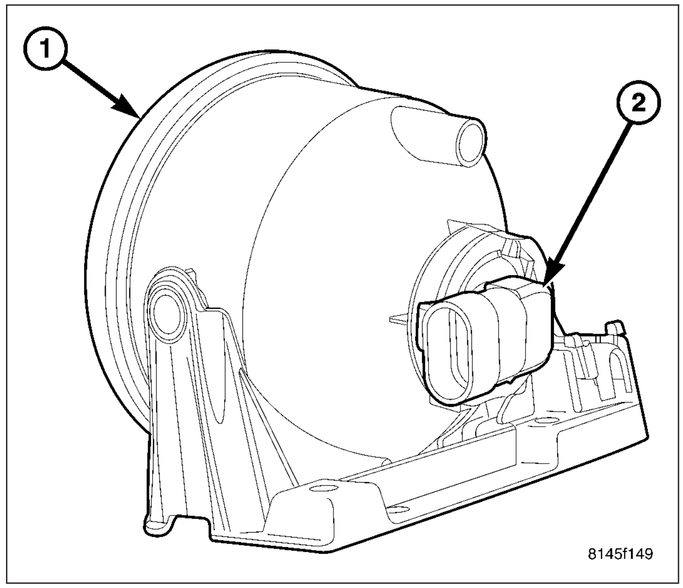
## REMOVAL

## BULB

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

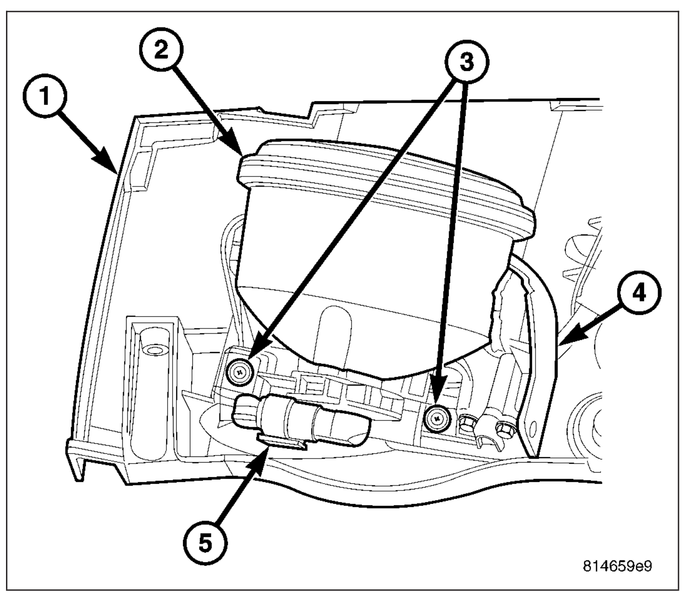
**NOTE: The optional light bar includes either two or four lamps, depending upon the requirements in the market for which the vehicle is manufactured. Each lamp contains a single bulb. The service procedures for each of these bulbs is the same.**

1. Disconnect and isolate the battery negative cable.
2. Remove the cover from the light bar lamps and reinforcement. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LIGHT BAR LAMP COVER - REMOVAL).
3. Disconnect the wire harness connector from the light bar lamp socket (2).
4. Firmly grasp the socket on the back of the lamp housing (1) and rotate it counterclockwise about 30 degrees to unlock it.
5. Pull the socket and bulb straight out from the keyed opening in the housing.
6. Pull the base of the bulb straight out of the socket.



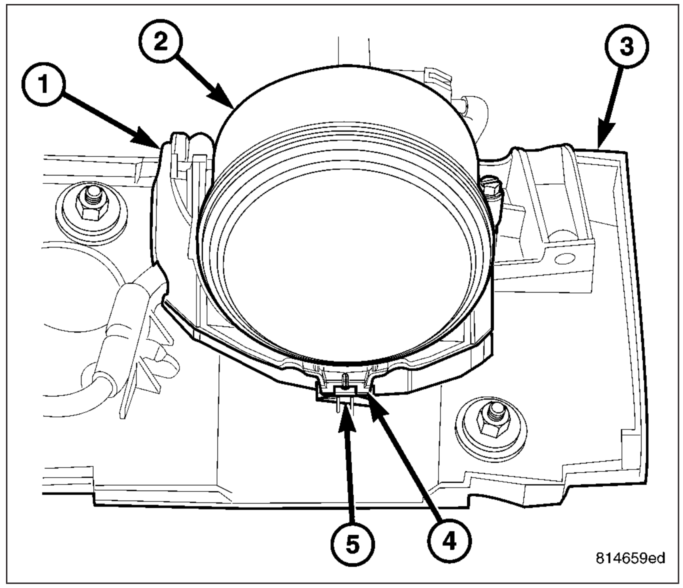
## LAMP

1. Disconnect and isolate the battery negative cable.
2. Remove the cover from the light bar lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LIGHT BAR LAMP COVER - REMOVAL).
3. Disconnect the light bar wire harness connector (5) from the socket on the back of the lamp (2).
4. Remove the two screws (3) that secure the rear of the lamp bracket (4) to the reinforcement (1).



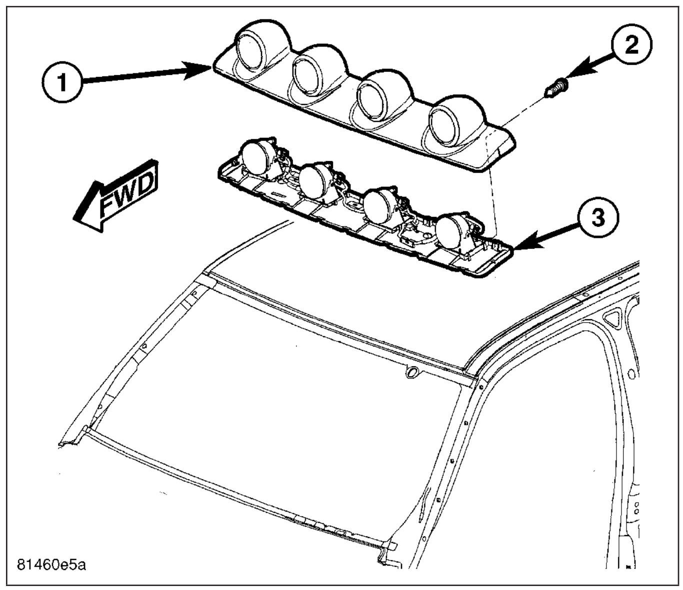
**NOTE: There is a hook on the forward edge of the lamp bracket secured under a tab that is integral to the reinforcement. The rear of the lamp must be lifted upward by the lamp socket/connector in order to disengage the hook from under the tab.**

5. Lift the lamp socket/connector on the rear of the lamp (2) upward far enough to disengage the hook (4) on the front edge of the lamp bracket (1) from under the integral tab (5) of the reinforcement (3).
6. Slide the lamp and bracket unit rearward and remove it from the reinforcement.



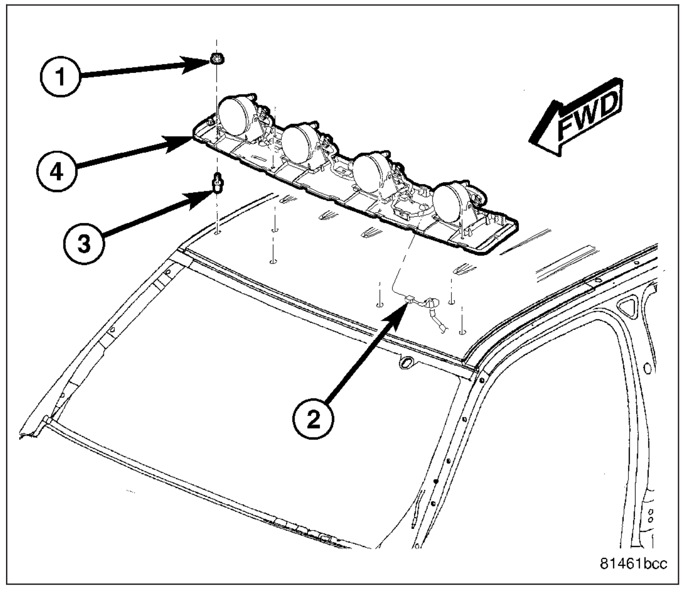
## COVER

1. Remove the four screws (2) that secure the cover (1) to the rear edge of the light bar reinforcement (3) on the roof panel.
2. Lift the rear edge of the cover upward and then slide it forward far enough to disengage the front edge of the cover from under the front edge of the light bar reinforcement.
3. Remove the light bar cover from the roof panel.



## REINFORCEMENT

1. Disconnect and isolate the battery negative cable.
2. Remove the cover from the light bar lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LIGHT BAR LAMP COVER - REMOVAL).
3. Disconnect the jumper harness connector (2) from the light bar reinforcement harness connector.
4. Remove the four nuts (1) that secure the reinforcement (4) to the rivet studs (3) on the roof panel.



**CAUTION: Four strips of double-faced adhesive tape serve to protect the roof panel and supplement the hard fasteners that secure the light bar reinforcement. Any residual tape and adhesive must be removed carefully to prevent damage to roof panel. Following removal, the roof panel and the bottom of the reinforcement must be thoroughly cleaned with isopropyl alcohol or another suitable solvent.**

5. While lifting the light bar reinforcement upward from the roof panel, carefully feed the jumper wire and connector through the clearance hole in the reinforcement.
6. Remove the reinforcement from the vehicle.

## INSTALLATION

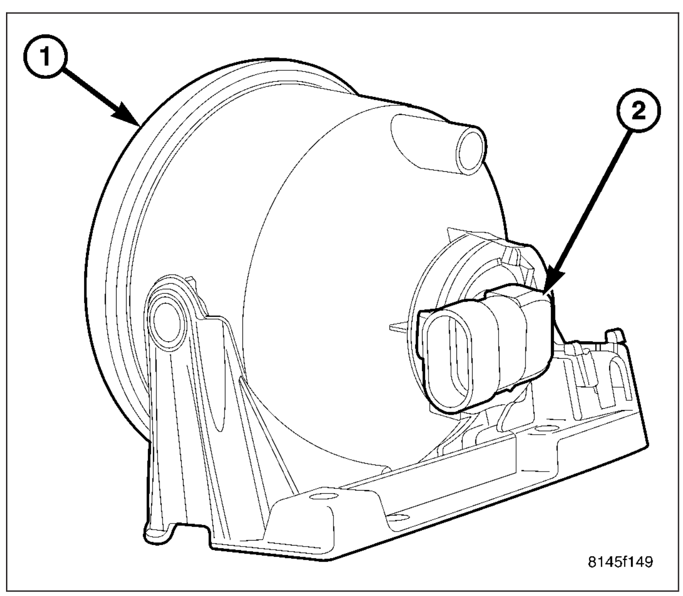
## BULB

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.**

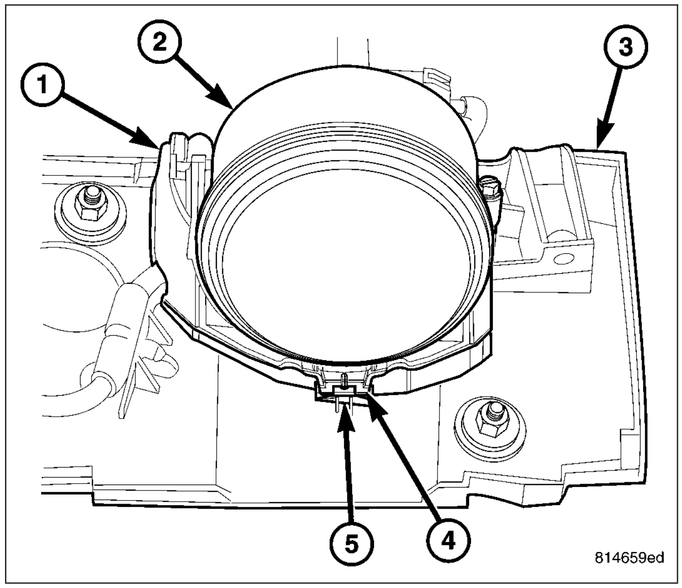
**NOTE: The optional light bar includes either two or four lamps, depending upon the requirements in the market for which the vehicle is manufactured. Each lamp contains a single bulb. The service procedures for each of these bulbs is the same.**

1. Align the base of the bulb with the light bar lamp socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the light bar lamp housing (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reconnect the wire harness connector to the socket.
7. Reinstall the cover over the light bar lamps and reinforcement. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LIGHT BAR LAMP COVER - INSTALLATION).
8. Reconnect the battery negative cable.



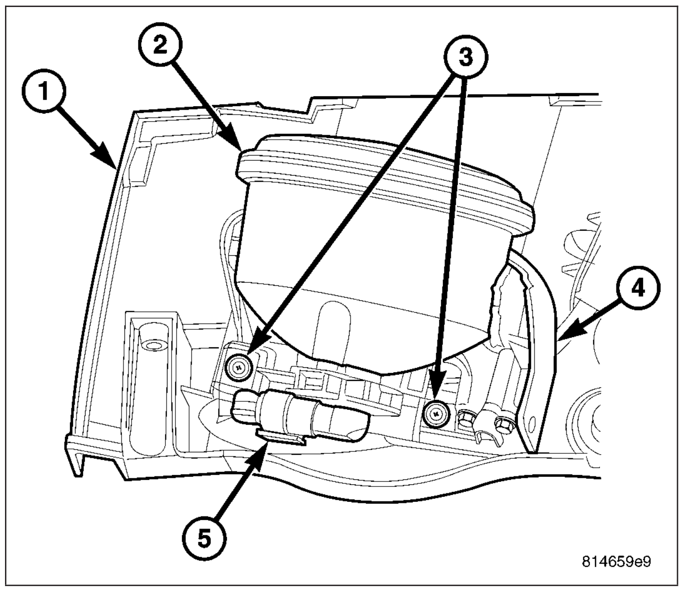
## LAMP

1. Position the lamp (2) and bracket (1) unit onto the light bar reinforcement (3).



**NOTE: There is a hook on the forward edge of the lamp bracket that must be secured under a tab that is integral to the reinforcement. The rear of the lamp must be lifted upward by the lamp socket/connector in order to engage the hook under the tab.**

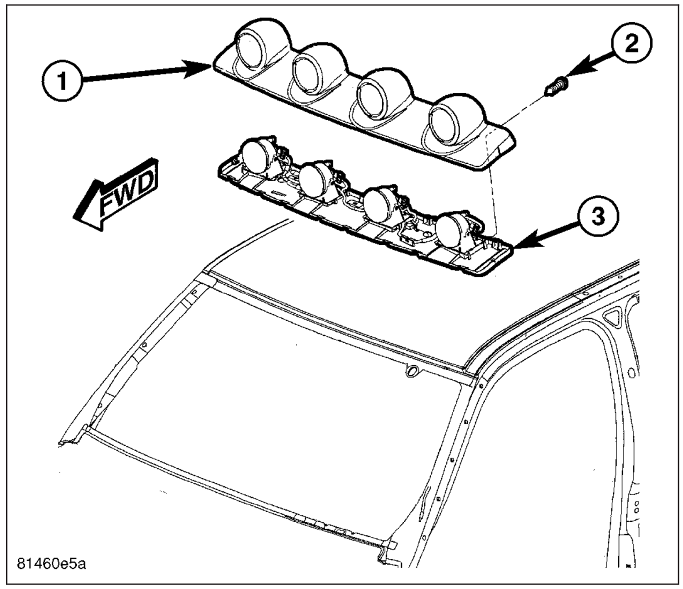
2. Lift the lamp socket/connector on the rear of the lamp upward far enough to engage the hook (4) on the front edge of the lamp bracket under the integral tab (5) of the reinforcement.
3. Slide the lamp and bracket forward and seat.



4. Install and tighten the two screws (3) that secure the rear of the lamp bracket (4) to the reinforcement (1). Tighten the screws to 2 N·m (17 in. lbs.).
5. Reconnect the light bar wire harness connector (5) to the socket on the back of the lamp (2).
6. Reconnect the battery negative cable.
7. Confirm proper lamp alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ LIGHT BAR LAMP - ADJUSTMENTS).
8. Reinstall the cover over the light bar lamps and reinforcement. (Refer to 8 - ELECTRICAL/LAMPS/ LIGHTING - EXTERIOR/LIGHT BAR LAMP COVER - INSTALLATION).

## COVER

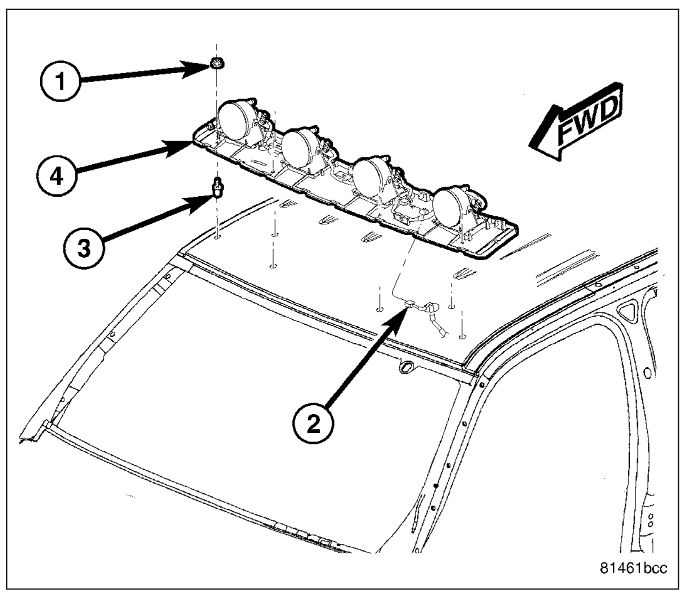
1. Position the front edge of the light bar cover (1) on the roof panel just ahead of the front edge of the light bar reinforcement (3).
2. Slide the cover rearward to engage the front edge of the cover under the forward edge of the reinforcement, then lower the rear edge of the cover into position.
3. Install and tighten the four screws (2) that secure the rear edge of the cover to the reinforcement. Tighten the screws to 2 N·m (17 in. lbs.).



## REINFORCEMENT

**CAUTION: Four strips of double-faced adhesive tape serve to protect the roof panel and supplement the hard fasteners that secure the light bar reinforcement. Any residual tape and adhesive must be removed carefully to prevent damage to roof panel. Following removal, the roof panel and the bottom of the reinforcement must be thoroughly cleaned with isopropyl alcohol or another suitable solvent. The mounting surfaces must be clean and dry before installation.**

1. Install four new strips of double-faced adhesive tape to the base of an existing reinforcement (4) being reinstalled.
2. Remove the release paper from the adhesive strips on the base of the new (4) or existing reinforcement.
3. With the aid of an assistant, carefully feed the jumper wire and connector (2) through the clearance hole in the reinforcement while positioning the unit over the rivet studs (3) on the roof panel.
4. Using hand pressure, press the reinforcement down firmly and evenly over each of the tape strips to be certain they are firmly secured to the roof panel.
5. Install and tighten the four nuts (1) that secure the reinforcement to the rivet studs on the roof panel. Tighten the nuts to 6 N·m (50 in. lbs.).
6. Reconnect the jumper harness connector to the light bar reinforcement harness connector.
7. Reconnect the battery negative cable.
8. Confirm proper lamp alignment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LIGHT BAR LAMP - ADJUSTMENTS).
9. Reinstall the cover over the light bar lamps and reinforcement. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LIGHT BAR LAMP COVER - INSTALLATION).



# ADJUSTMENTS

## LIGHT BAR LAMP

### VEHICLE PREPARATION FOR LIGHT BAR LAMP ALIGNMENT

1. Repair or replace any ineffective or damaged components that could hinder proper lamp alignment.
2. Verify proper tire inflation.
3. Clean light bar lamp lenses.
4. Verify that cargo area is not heavily loaded.
5. The fuel tank should be Full. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.

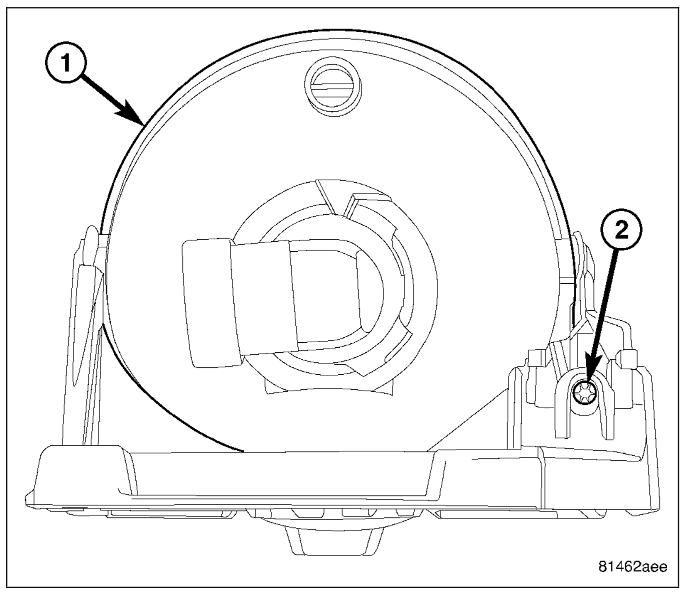
### LIGHT BAR LAMP ALIGNMENT SCREEN PREPARATION

1. Position the vehicle on a level surface perpendicular to a flat wall 7.62 meters (25 feet) away from the front of the headlamp lens. If necessary, tape a line on the floor at the appropriate distance away from and parallel to the wall.
2. Measure up on the wall 2.36 meters (93 inches) from the floor and tape a horizontal line on the alignment screen that is approximately as long as the vehicle is wide. This line will be used for the light bar lamp up-and-down (vertical) adjustment reference.

### LIGHT BAR LAMP ADJUSTMENT

**NOTE: Only the vertical aim of the light bar lamp beams is adjustable.**

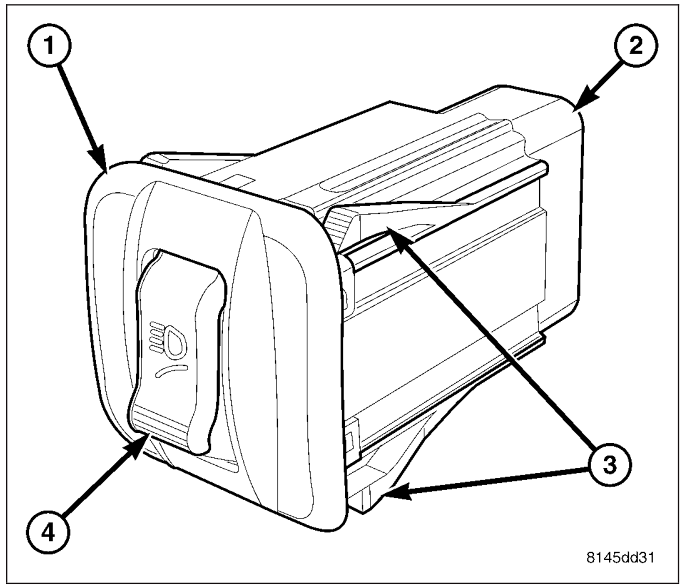
1. Rock the vehicle from side-to-side three times to allow the suspension to stabilize, then jounce the front suspension three times by pushing downward on the front bumper and releasing.
2. Turn the adjusting screw (2) on the back of the light bar lamp (1) until the beam intensity pattern is centered on the up-and-down (vertical) adjustment reference tape on the alignment screen.
3. Repeat the adjustment procedure for each lamp as required.



# LAMP BAR SWITCH

## DESCRIPTION

The light bar lamp switch (1) is used only on vehicles equipped with the optional light bar and off road lamps. The light bar lamp switch is mounted in the driver side outboard trim bezel on the instrument panel. Only the switch bezel and rocker (4) are visible on the outer surface of the instrument panel trim bezel. The black plastic switch rocker is marked with an icon that is similar in appearance to the International Control and Display Symbol icon for "High Beam", but has an additional curved line beneath it to represent the forward roofline of the vehicle. The icon is illuminated when the exterior lighting is turned On.



The black, molded plastic switch housing encloses the momentary switch rocker mechanism and the switch circuitry including an integral relay and active electronic elements. A connector receptacle (2) is integral to the back of the switch housing, while a two integral latch features (3) on the top and bottom of the housing secure the switch in the instrument panel trim bezel. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The light bar lamp switch cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

## OPERATION

In vehicles manufactured for North American markets, the light bar lamp switch operates on battery voltage received on a fused ignition switch output (run-start) circuit from a fuse in the Junction Block (JB) whenever the ignition switch is in the On or Start positions. In vehicles manufactured for export markets, the switch operates on battery voltage received from the park lamp relay in the JB on a park lamp relay output circuit whenever the park lamp relay is energized. The switch receives a path to ground through a splice block in the instrument panel wire harness secured by a nut to a ground stud on the driver side instrument panel end bracket near the JB.

The switch also receives battery voltage on a fused B(+) circuit that the relay within the switch controls to energize and de-energize the light bar lamps through an output on the lightbar switch output circuit. A panel lamps driver input is used to illuminate the icon on the switch rocker when the exterior lighting is turned On. In certain markets where it is required, the switch also receives a logic input on a low beam driver circuit, which allows the switch to disallow the light bar lamps from operating unless the park lamps are turned On and the low beam headlamps are turned Off.

Another output from the switch is a voltage signal that it provides to the Body Control Module (BCM) on a lightbar switch sense circuit. The BCM sends electronic messages over the Programmable Communications Interface (PCI) data bus to the instrument cluster based upon this input to control illumination of the light bar lamp indicator and/or the high beam indicator as required by the market for which the vehicle was manufactured.

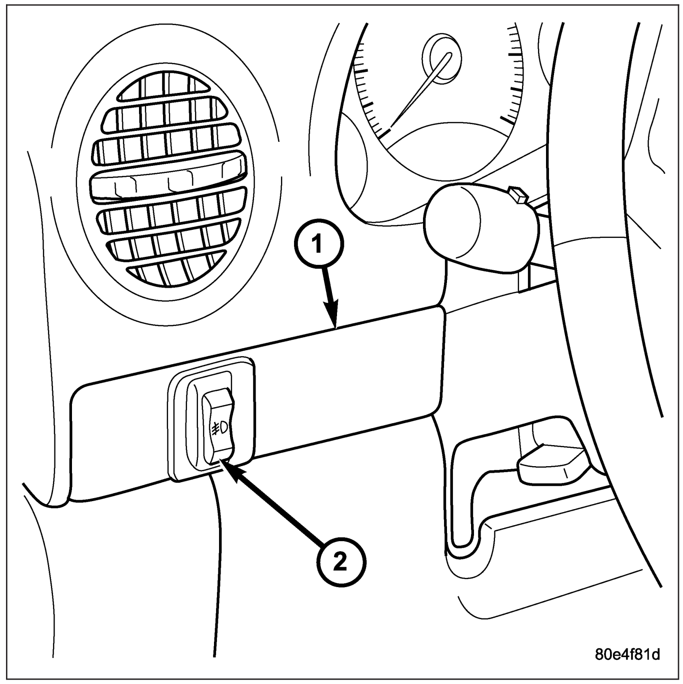
Because of active electronic elements within the light bar lamp switch, it cannot be tested using conventional diagnostic tools or procedures. If a problem is noted with the light bar lamp system operation, test and confirm the input and output circuits of the switch are in good condition before replacing the switch.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: A light bar lamp switch is used only on vehicles equipped with the optional light bar and auxiliary off-road lamps.**

1. Disconnect negative battery cable.
2. Remove the driver side outboard bezel (1) from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DRIVER SIDE BEZEL - REMOVAL).
3. Disconnect the instrument panel wire harness connector from the light bar lamp switch (2) connector receptacle.
4. From the back of the trim bezel, depress the two lower latch features on the switch housing and rock the bottom of the switch out through the face of the bezel.
5. From the back of the trim bezel, depress the two upper latch features on the switch housing and push the switch out through the face of the bezel.

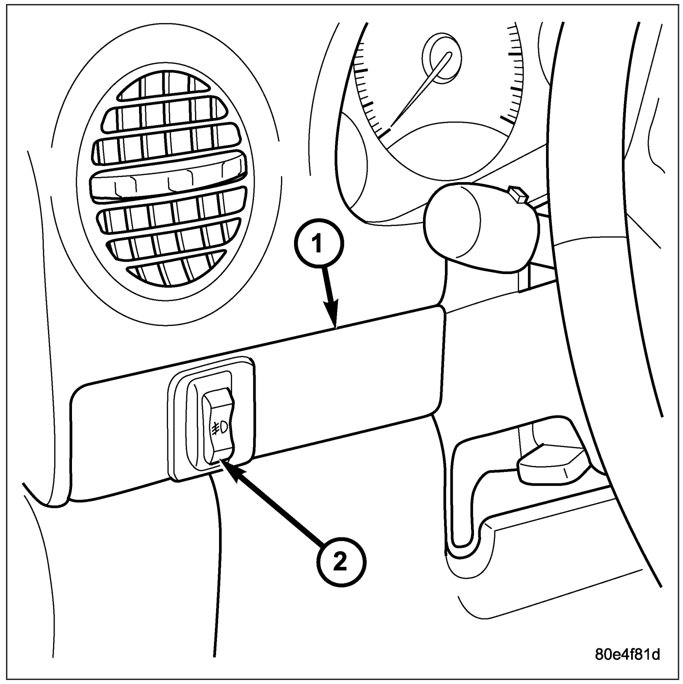


## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: A light bar lamp switch is used only on vehicles equipped with the optional light bar and auxiliary off-road lamps.**

1. From the face of the driver side outboard bezel (1), align the light bar lamp switch housing (2) to the mounting hole in the bezel.
2. Push the switch into the mounting hole until it is fully seated and each of the latch features is fully engaged.
3. Reconnect the instrument panel wire harness connector to the switch connector receptacle.
4. Reinstall the trim bezel and switch unit onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DRIVER SIDE BEZEL - INSTALLATION).
5. Reconnect the battery negative cable.



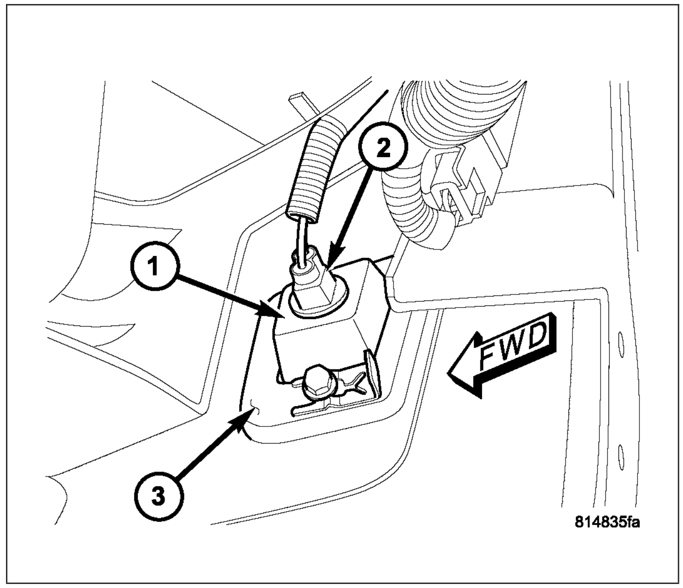
# MARKER LAMP

## REMOVAL

### BULB

**NOTE: The following procedure applies only to vehicles manufactured for the North American market. Vehicles manufactured for export markets do not have a bulb, socket or wiring provided to illuminate the front side marker lamp. The front side marker lamp housing and lens are present, but serve only as a reflector on export vehicles.**

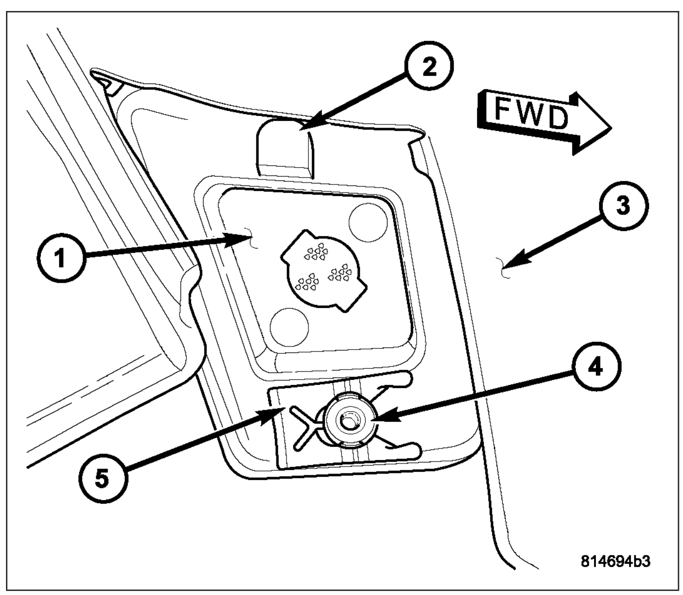
1. Turn the front wheels full lock toward the same side of the vehicle as the lamp being serviced.
2. Disconnect and isolate the battery negative cable.
3. Remove the four fasteners securing the front of the adjacent right or left front fender wheel liner to the lower edge of the front bumper fascia (3) and the outboard surface of the frame rail ahead of the front wheel.
4. Reach between the front of the wheel liner and the lower fascia to access the back of the front side marker lamp unit housing (1).
5. Firmly grasp the front side marker bulb socket (2) on the back of the lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
6. Pull the socket and bulb straight out from the keyed opening in the housing.
7. Pull the base of the bulb straight out of the socket.



### LAMP

**NOTE: Vehicles manufactured for export markets do not have a bulb, socket or wiring provided to illuminate the front side marker lamp. The front side marker lamp housing and lens are present, but serve only as a reflector on export vehicles.**

1. Turn the front wheels full lock toward the same side of the vehicle as the lamp being serviced.
2. Disconnect and isolate the battery negative cable.
3. Remove the four fasteners securing the front of the adjacent right or left front fender wheel liner to the lower edge of the front bumper fascia and the outboard surface of the frame rail ahead of the front wheel.
4. Reach between the front of the wheel liner and the lower fascia (3) to access the back of the front side marker lamp unit housing (1).
5. If the vehicle is so equipped, firmly grasp the front side marker bulb socket on the back of the lamp housing and rotate it counterclockwise about 30 degrees to unlock it.
6. If the vehicle is so equipped, pull the socket and bulb straight out from the keyed opening in the housing.



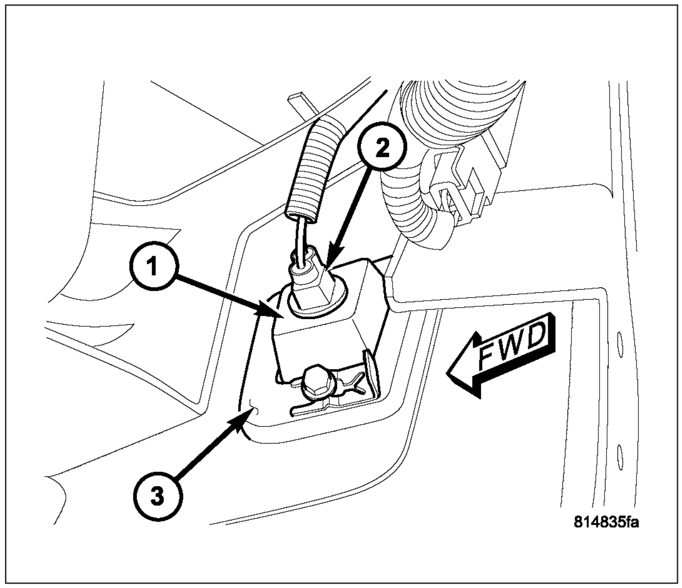
7. Slide the retaining clip (5) off of the pin (4) integral to the lower end of the lamp housing that secures the lamp to the fascia.
8. Push the lower end of the lamp out through the outside of the fascia far enough to disengage the tab (2) at the top of the lamp from the notch at the top of the lamp mounting hole.
9. Remove the lamp from the outside of the fascia.

## INSTALLATION

## BULB

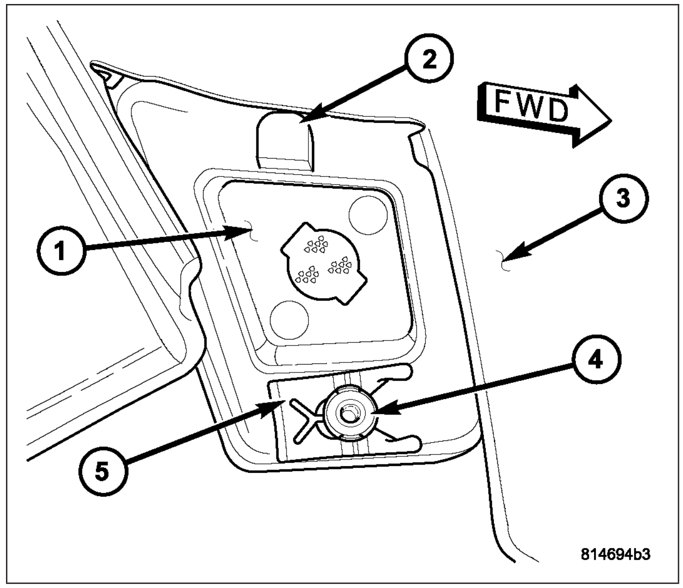
**NOTE: The following procedure applies only to vehicles manufactured for the North American market. Vehicles manufactured for export markets do not have a bulb, socket or wiring provided to illuminate the front side marker lamp. The front side marker lamp housing and lens are present, but serve only as a reflector on export vehicles.**

1. Align the base of the bulb with the front side marker bulb socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Reach between the front of the adjacent right or left front fender wheel liner and the lower bumper fascia (3) to access the back of the lamp housing (1).
4. Align the socket and bulb with the keyed opening on the back of the housing.
5. Insert the socket and bulb into the housing until the socket is firmly seated.
6. Rotate the socket clockwise about 30 degrees to lock it into place.
7. Reinstall the four fasteners securing the front of the wheel liner to the lower edge of the fascia and the outboard surface of the frame rail ahead of the front wheel.
8. Reconnect the battery negative cable.



## LAMP

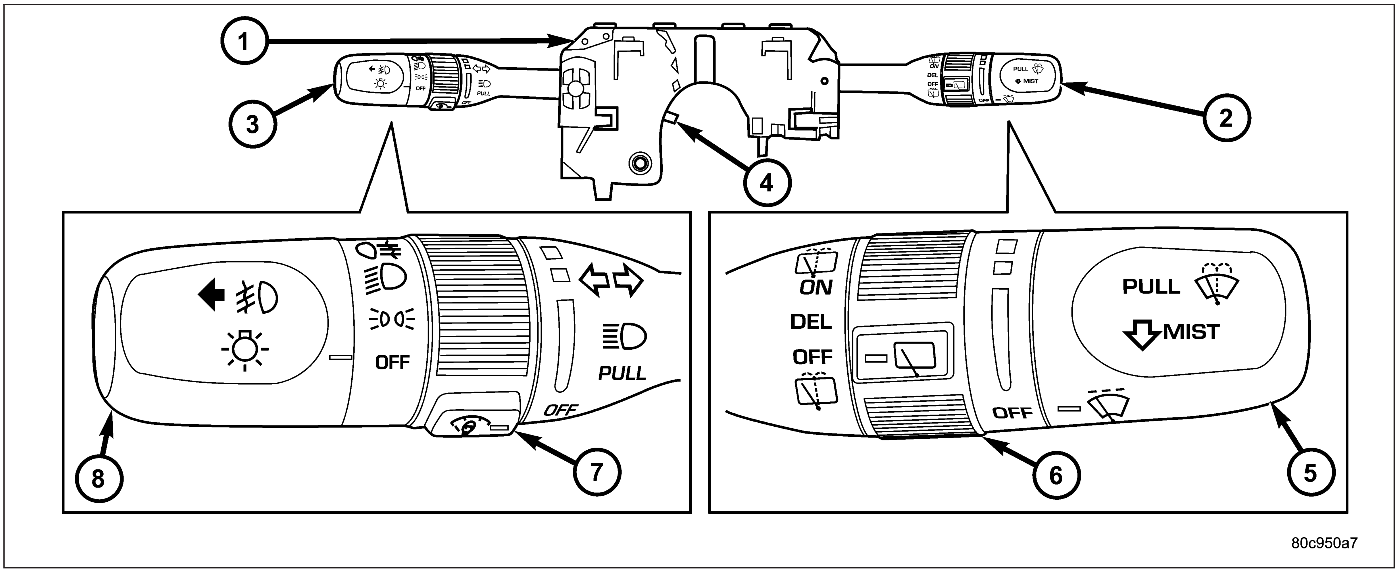
**NOTE: Vehicles manufactured for export markets do not have a bulb, socket or wiring provided to illuminate the front side marker lamp. The front side marker lamp housing and lens are present, but serve only as a reflector on export vehicles.**



1. Position the front side marker lamp unit (1) to the lamp mounting hole on the outside of the fascia.
2. Engage the tab (2) at the top of the lamp into the notch at the top of the mounting hole then push the pin (4) on the lower end of the lamp through the round hole at the base of the mounting hole.
3. Reach between the front of the adjacent right or left front fender wheel liner and the lower bumper fascia (3) to access the back of the lamp housing.
4. Slide the retaining clip (5) onto the pin on the lower end of the lamp housing to secure the lamp to the fascia.
5. If the vehicle is so equipped, align the socket and bulb with the keyed opening on the back of the housing.
6. If the vehicle is so equipped, insert the socket and bulb into the housing until the socket is firmly seated.
7. If the vehicle is so equipped, rotate the socket clockwise about 30 degrees to lock it into place.
8. Reinstall the four fasteners securing the front of the wheel liner to the lower edge of the fascia and the outboard surface of the frame rail ahead of the front wheel.
9. Reconnect the battery negative cable.

# MULTI-FUNCTION SWITCH

## DESCRIPTION



The multi-function switch (1) is located on the steering column, just below the steering wheel. The only visible components of the multi-function switch are the right (2) and left control stalks (3). One stalk extends through the steering column shrouds on each side of the steering column. The remainder of the switch including its mounting provisions, its electrical connection, and the turn signal cancel actuator (4) are concealed beneath the shrouds.

The switch housing and controls are constructed of molded black plastic. A saddle-like formation in the center of the lower switch housing straddles the steering column tube just below the column lock housing, and two locating posts integral to the lower surface of the switch housing engage two holes in the forward-facing side of the lock housing. Also several integral ledge-like locating tabs on the switch housing are supported and located by several mating points on the column lock housing. When the steering column shrouds are installed on the column, mounting tabs on the switch housing and the clockspring are clamped to the lock housing by the same two screws that secure the column shrouds to the column and each other.

There are several versions of the multi-function switch to support both optional equipment and regulatory equipment that is required only in certain markets. Each multi-function switch control stalk has both white nomenclature and International Control and Display Symbol graphics applied to it, which clearly identify its many functions. Each control stalk has a control knob (5 and 8) on its end with a flattened face to allow it to be easily rotated. On vehicles equipped with optional front fog lamps, the knob on the end of left control stalk can also be pulled outward to select those lamps.

Each control stalk also features a knurled control ring (6 and 7) located just below the control knob. The left control stalk is dedicated to providing driver controls for the interior and exterior lighting systems, while the right control stalk is dedicated to providing driver controls for the front and rear wiper systems.

Two integral connector receptacles on the multi-function switch housing connect the switch to the vehicle electrical system through two dedicated take outs and connectors of the instrument panel wire harness. The left connector receptacle contains nine terminal pins for the lighting control circuits of the switch, while the right connector receptacle contains six terminal pins for the wiper control circuits of the switch.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire switch must be replaced as a unit.

## LEFT CONTROL STALK

The left (lighting) control stalk of the multi-function switch supports the following functions and features:

- **Front Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional front fog lamps.
- **Headlamps** - The left multi-function switch control knob provides detent switching for the headlamps.
- **Headlamp Beam Selection** - The left multi-function switch control stalk provides detent switching for selection of the headlamp high or low beams.

- **Headlamp Optical Horn** - The left multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Interior Lamps Defeat** - The left multi-function switch control ring provides detent switching to defeat the illumination of all interior courtesy lamps when a door, the rear flip-up glass, or the tailgate are opened.
- **Interior Lamps On** - The left multi-function switch control ring provides detent switching to simultaneously illuminate all interior courtesy lamps.
- **Panel Lamps Dimming** - The left multi-function switch control ring provides simultaneous adjustable control of the illumination intensity of all instrument panel lighting at one of six available illumination intensity levels.
- **Parade Mode** - The left multi-function switch control ring provides detent switching for a parade mode that maximizes the illumination intensity of all instrument panel lighting for visibility when driving in daylight with the exterior lamps turned on.
- **Park Lamps** - The left multi-function switch control knob provides detent switching for the park lamps.
