2. Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.
3. When the seat is properly positioned the width of the intake seat must be 1.75 - 2.36 mm (0.0689 - 0.0928 in.) and the exhaust seat must be 1.71 - 2.32 mm (0.0673 - 0.0911 in.).
4. Check the valve spring (6) installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 40.74 mm (1.6039 in.).
5. The valve seat and valve face must maintain a face angle of 44.5 - 45 ° angle.

## REMOVAL

**NOTE: The cylinder heads must be removed in order to perform this procedure.**

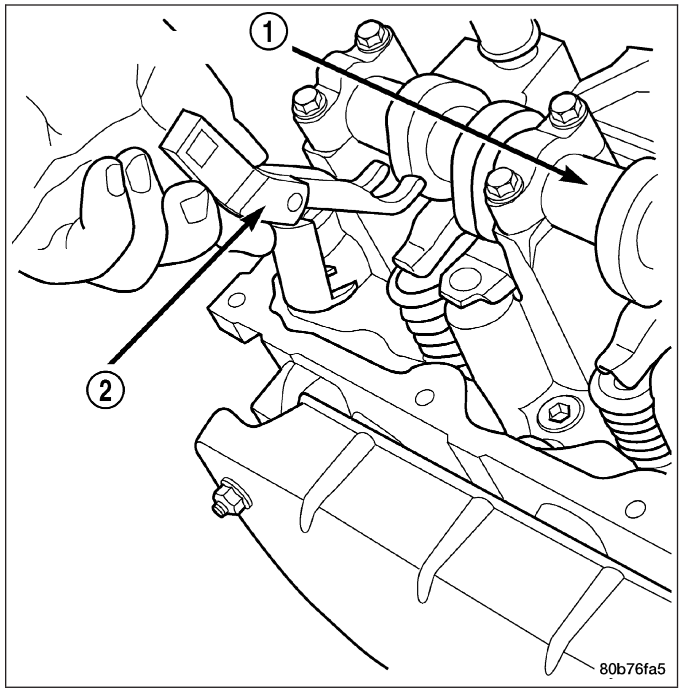
1. Remove rocker arms and lash adjusters (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
2. Remove the camshaft bearing caps and the camshaft.

**NOTE: All valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.**

3. Using Special Tool C-3422–B or C-3422–C Valve Spring Compressor and Special tool 8519 Adapter, compress the valve spring.

**NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.**

4. Remove the two spring retainer lock halves.



**NOTE: the valve spring is under tension use care when releasing the valve spring compressor.**

5. Remove the valve spring compressor.
6. Remove the spring retainer, and the spring.

**NOTE: Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.**

7. Remove the valve from the cylinder head.

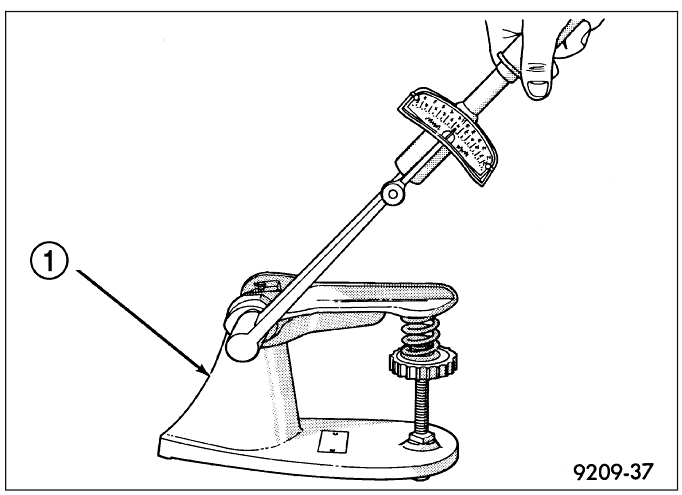
**NOTE: The valve stem seals are common between intake and exhaust.**

8. Remove the valve stem seal. Mark the valve for proper installation.

## TESTING VALVE SPRINGS

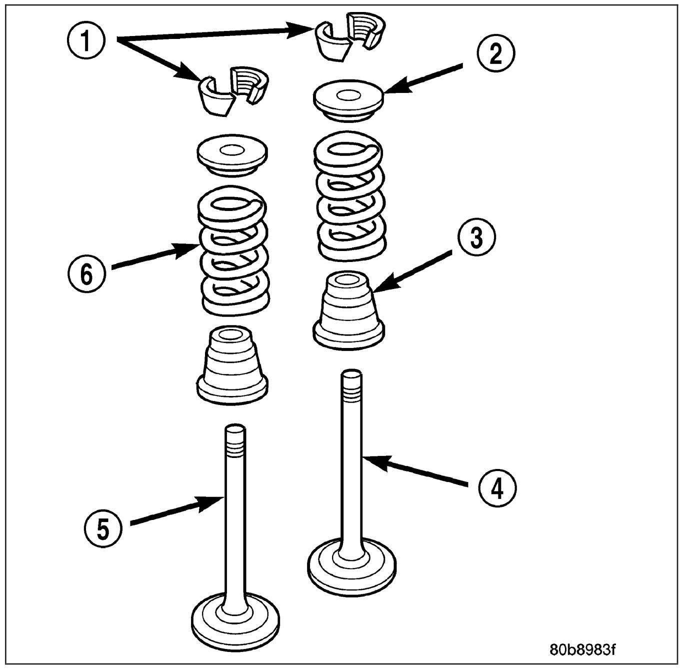
**NOTE: Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.**

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 (1) until surface is in line with the 40.12 mm (1.579 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until a Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Specifications Section to obtain specified height and allowable tensions. Replace any springs that do not meet specifications.

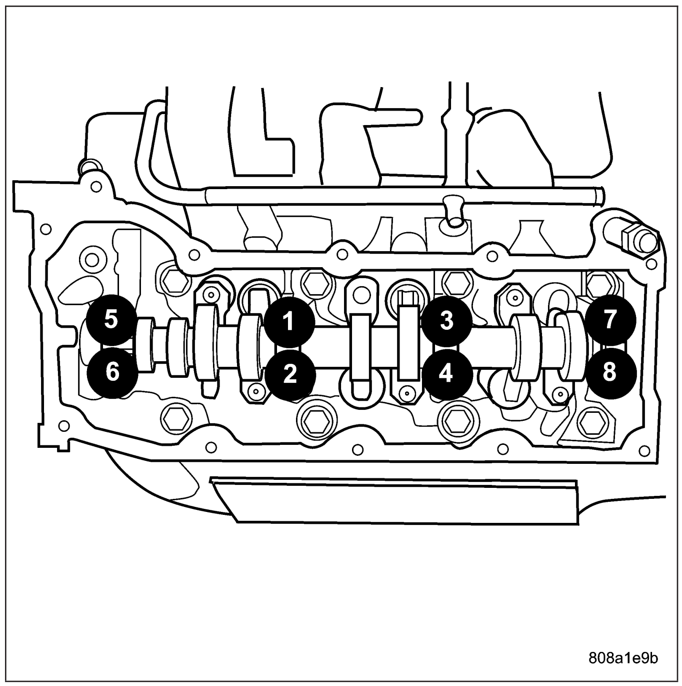


## INSTALLATION

1. coat the valve stem with clean engine oil and insert it into the cylinder head.
2. Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.
3. Install the spring and the spring retainer.
4. Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.
5. Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated.



6. lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing caps.
7. Install the camshaft bearing cap retaining bolts. Tighten the bolts 9-13 N·m (100 in. lbs.) in 1/2 turn increments in the sequence shown .
8. Position the hydraulic lash adjusters and rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ ROCKER ARM / ADJUSTER ASSY - INSTALLATION).



# ROCKER ARM - VALVE

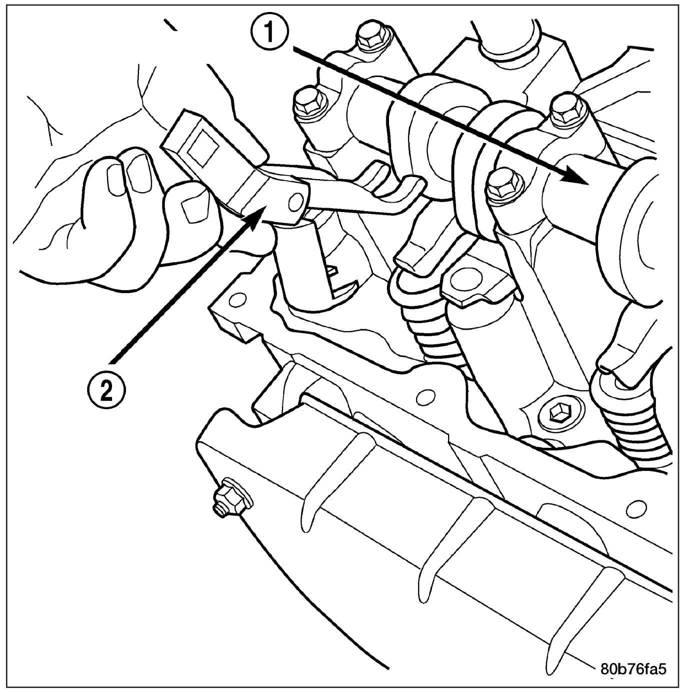
## DESCRIPTION

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 0.5 mm oil hole in the lash adjuster socket for roller and camshaft lubrication.

## REMOVAL

**NOTE: Disconnect the battery negative cable to prevent accidental starter engagement.**

1. Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
2. For rocker arm removal on cylinder No. 4, Rotate the crankshaft until cylinder No. 1 is at BDC intake stroke.
3. For rocker arm removal on cylinder No. 1, Rotate the crankshaft until cylinder No. 1 is at BDC combustion stroke.
4. For rocker arm removal on cylinders No. 3 and No. 5, Rotate the crankshaft until cylinder No. 1 is at TDC exhaust stroke.
5. For rocker arm removal on cylinders No. 2 and No. 6, Rotate the crankshaft until cylinder No. 1 is at TDC ignition stroke.
6. Using special tool 8516 Rocker Arm Remover (2) , press downward on the valve spring, remove rocker arm.

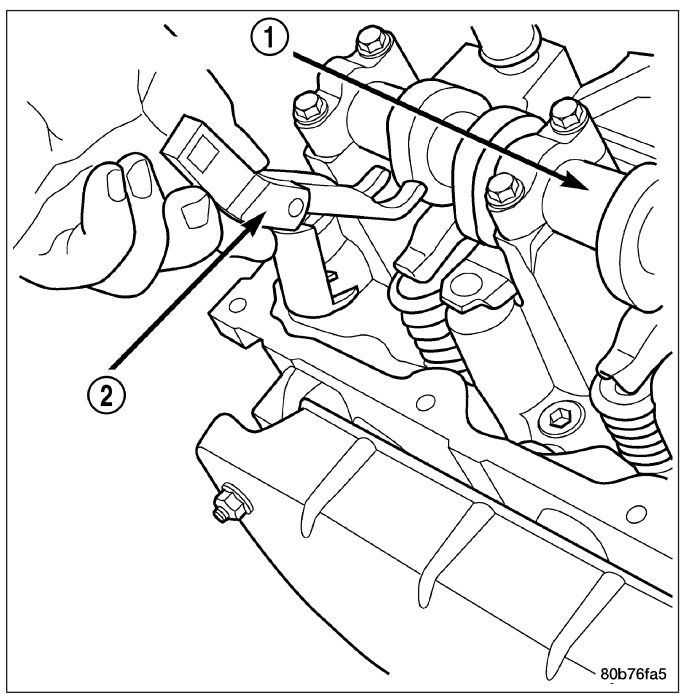


## INSTALLATION

**CAUTION: Make sure the rocker arms are installed with the concave pocket over the lash adjusters. Failure to do so may cause severe damage to the rocker arms and/or lash adjusters.**

**NOTE: Coat the rocker arms with clean engine oil prior to installation.**

1. For rocker arm installation on cylinders No. 4, Rotate the crankshaft until cylinder No. 1 is at BDC intake stroke.
2. For rocker arm installation on cylinder No. 1, Rotate the crankshaft until cylinder No. 1 is at BDC combustion stroke.
3. For rocker arm installation on cylinders No. 3 and No. 5, Rotate the crankshaft until cylinder No. 1 is at TDC exhaust stroke.
4. For rocker arm installation on cylinders No. 2 and No. 6, Rotate the crankshaft until cylinder No. 1 is at TDC ignition stroke.
5. Using special tool 8516 (2) press downward on the valve spring, install rocker arm.



6. Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

# SEALS - VALVE GUIDE

## DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

# SPRINGS - VALVE

## DESCRIPTION

The valve springs are made from high strength chrome silicon steel. There are different springs for intake and exhaust applications. The exhaust spring has an external damper. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

## REMOVAL

1. Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
2. Using Special Tool 8516 Valve Spring Compressor, remove the rocker arms and the hydraulic lash adjusters.
3. Remove the spark plug for the cylinder the valve spring and seal are to be removed from.
4. Apply shop air to the cylinder to hold the valves in place when the spring is removed.

**NOTE: All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.**

5. Using Special Tool 8387 Valve Spring Compressor, compress the valve spring.

**NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.**

6. Remove the two spring retainer lock halves.

**NOTE: the valve spring is under tension use care when releasing the valve spring compressor.**

7. Remove the valve spring compressor.

**NOTE: The valve springs are NOT common between intake and exhaust.**

8. Remove the spring retainer, and the spring.
9. Remove the valve stem seal.

**NOTE: The valve stem seals are common between intake and exhaust.**

## INSTALLATION

**NOTE: All six valve springs and seals are removed in the same manner; this procedure only covers one valve seal and valve spring.**

1. Apply shop air to the cylinder to hold the valves in place while the spring is installed.

**NOTE: The valve stem seals are common between intake and exhaust.**

2. Install the valve stem seal.

**NOTE: The valve springs are NOT common between intake and exhaust.**

3. Install the spring retainer, and the spring.
4. Using Special Tool 8387 Valve Spring Compressor, compress the valve spring.
5. Install the two spring retainer lock halves.

**NOTE: the valve spring is under tension use care when releasing the valve spring compressor.**

6. Remove the valve spring compressor.
7. Disconnect the shop air to the cylinder.
8. Install the spark plug for the cylinder the valve spring and seal was installed on.

9. Using Special Tool 8516 Valve Spring Compressor, install the rocker arms and the hydraulic lash adjusters.
10. Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

# BLOCK-ENGINE

## DESCRIPTION

The cylinder block is made of cast iron. The block is a closed deck design with the left bank forward. To provide high rigidity and improved NVH an enhanced compacted graphite bedplate is bolted to the block. The block design allows coolant flow between the cylinders bores, and an internal coolant bypass to a single poppet inlet thermostat is included in the cast aluminum front cover.

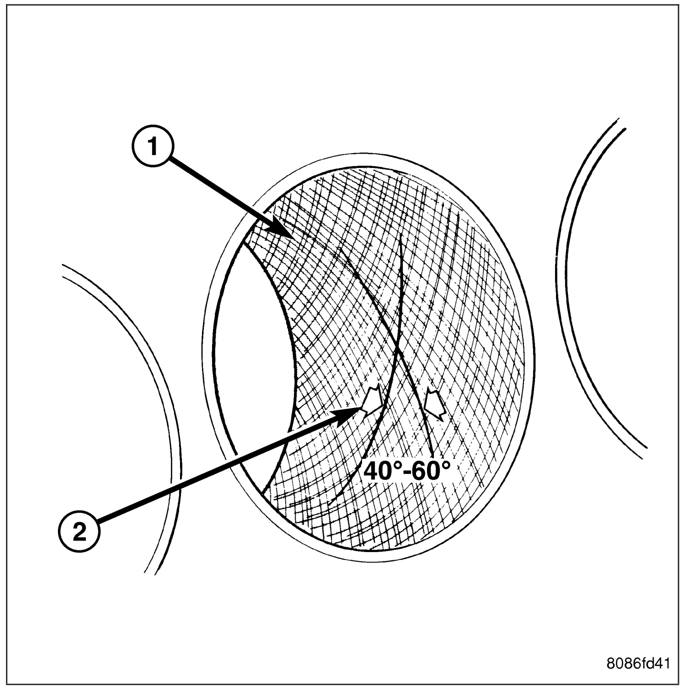
## STANDARD PROCEDURE - CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

1. Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

**CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.**

2. Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.



**CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.**

3. Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern (1). The hone marks should INTERSECT at 50° to 60° for proper seating of rings (2).
4. A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.
5. After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

## CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

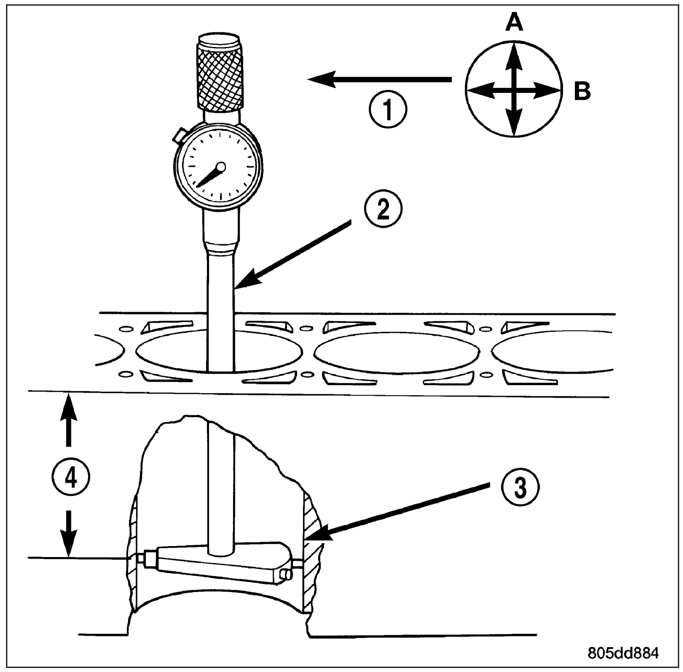
Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the plugs to 34 N·m (25 ft. lbs.) torque.

## INSPECTION

1. It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.
3. Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
4. Determine taper by subtracting the smaller diameter from the larger diameter.
5. Rotate measuring device 90° and repeat steps above.
6. Determine out-of-roundness by comparing the difference between each measurement.

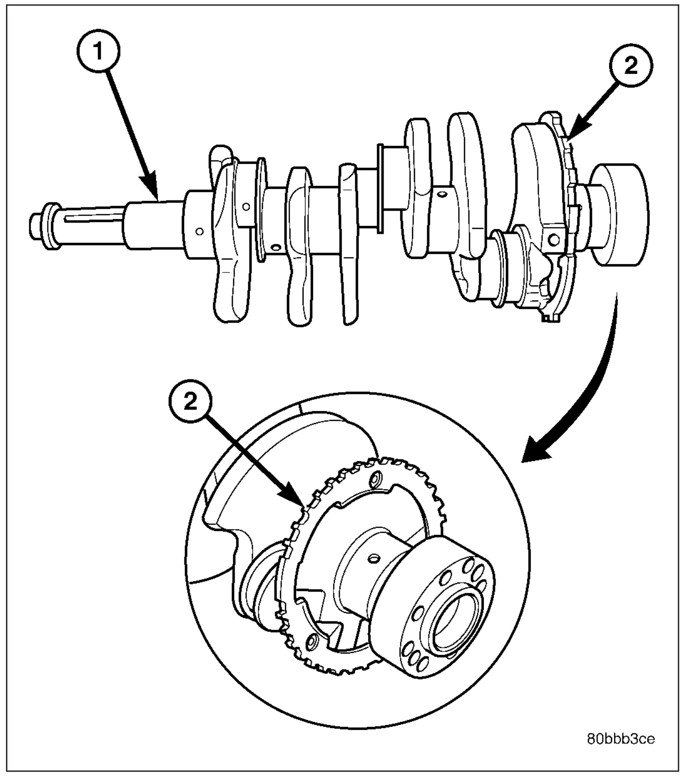


7. If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.015 mm (0.0006 inch), the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

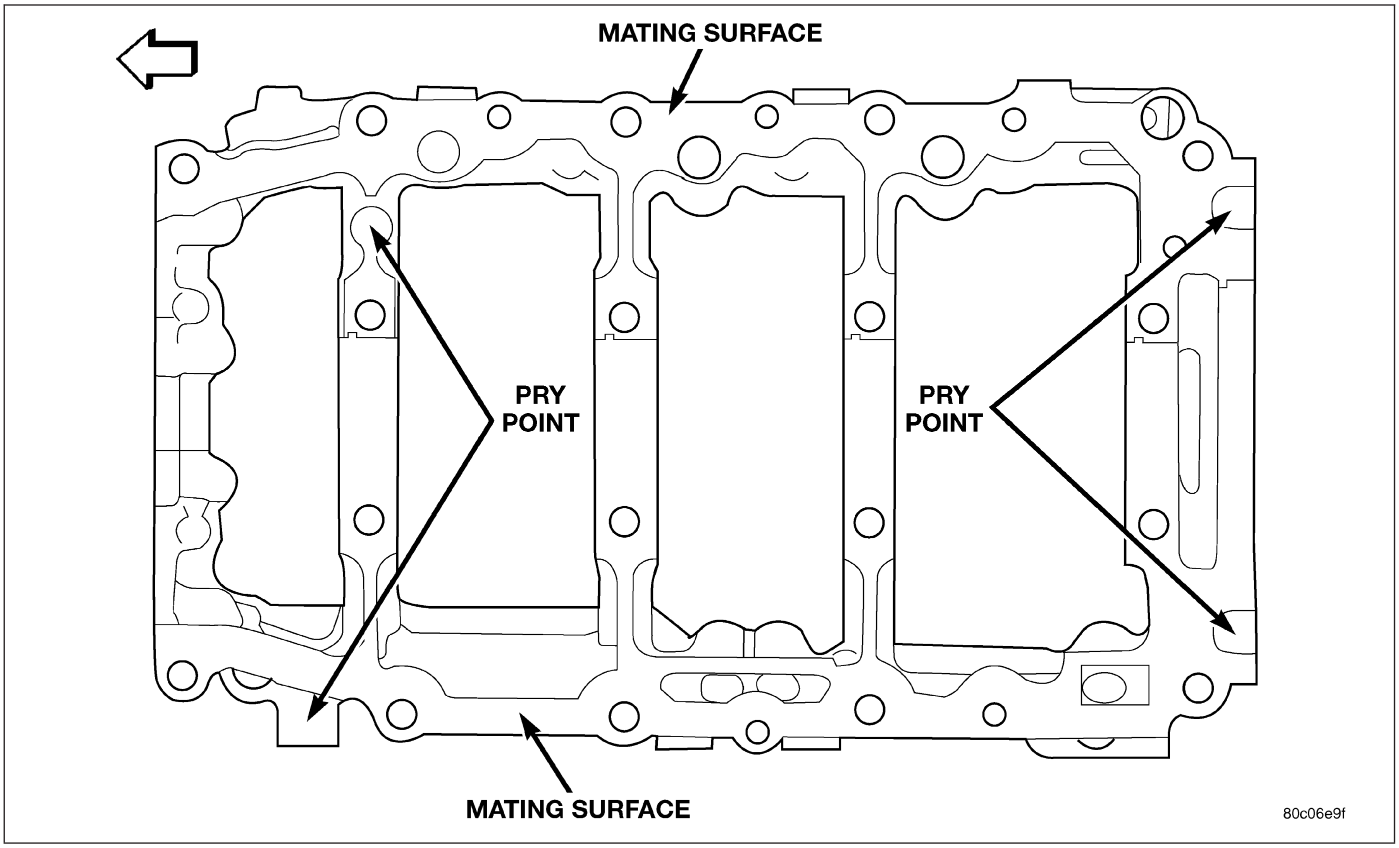
# CRANKSHAFT

## DESCRIPTION

The crankshaft is constructed of nodular cast iron. The crankshaft is a three throw split pin design with six counterweights for balancing purposes. The crankshaft is supported by four select fit main bearings with the number two serving as the thrust washer location. The main journals of the crankshaft are cross drilled to improve rod bearing lubrication. The number six counterweight has provisions for crankshaft position sensor target wheel mounting. The select fit main bearing markings are located on the rear side of the target wheel. The crankshaft oil seals are one piece design. The front oil seal is retained in the timing chain cover, and the rear seal is pressed in to a bore formed by the cylinder block and the bedplate assembly.



## REMOVAL



**NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.**

1. Remove the engine (Refer to 9 - ENGINE - REMOVAL).
2. Remove the engine oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

**CAUTION: DO NOT pry on the oil pan gasket when removing the oil pan, The oil pan gasket is mounted to the cylinder block in three locations and will remain attached to block when removing oil pan. Gasket can not be removed with oil pan.**

3. Remove the bedplate mounting bolts. Note the location of the two stud bolts for installation.
4. Remove the connecting rods from the crankshaft.

**CAUTION: The bedplate to cylinder block mating surface is a critical sealing surface. Do not pry on or damage this surface in anyway.**

**NOTE: The bedplate contains the lower main bearing halves. Use care when handling bedplate as not to drop or damage bearing halves. Installing main bearing halves in the wrong position will cause severe damage to the crankshaft.**

**NOTE: The bedplate has pry points cast into it. Use these points only. The pry points are shown below.**

5. Carefully pry on the pry points to loosen the bedplate then remove the bedplate.

**CAUTION: When removing the crankshaft, use care not to damage bearing surfaces on the crankshaft.**

6. Remove the crankshaft.
7. Remove the crankshaft tone wheel.

## INSPECTION

**NOTE: Thoroughly inspect the connecting rod bearing bores and main bearing bores for scoring, blueing or severe scratches. Further disassembly may be required.**

If connecting rod bearing bores show damage, the cylinder heads must be removed to service the piston and rod assemblies. If the bedplate or the cylinder block main bearing bores show damage the engine must be replaced.

1. If required, remove the main bearing halves from the cylinder block and bedplate.
2. Thoroughly clean the bedplate to cylinder block sealing surfaces and main bearing bores. Remove all oil and sealant residue.
3. Inspect the bedplate main bearing bores for cracks, scoring or severe blueing. If either condition exists the engine must be replaced.
4. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing. If either condition exist replace the thrust washers.
5. Inspect the oil pan gasket/windage tray for splits, tears or cracks in the gasket sealing surfaces. Replace gasket as necessary.

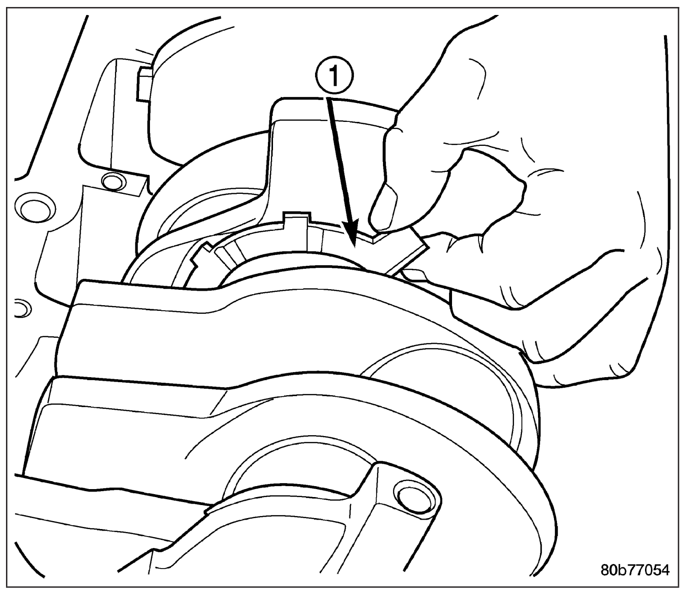
## INSTALLATION

**CAUTION: Main bearings are select fit. Refer to Crankshaft Main Bearings in this section for proper bearing selections.**

**CAUTION: When installing crankshaft, use care not to damage bearing surfaces on the crankshaft.**

**NOTE: Apply sealant to the tone wheel retaining screws prior to installation.**

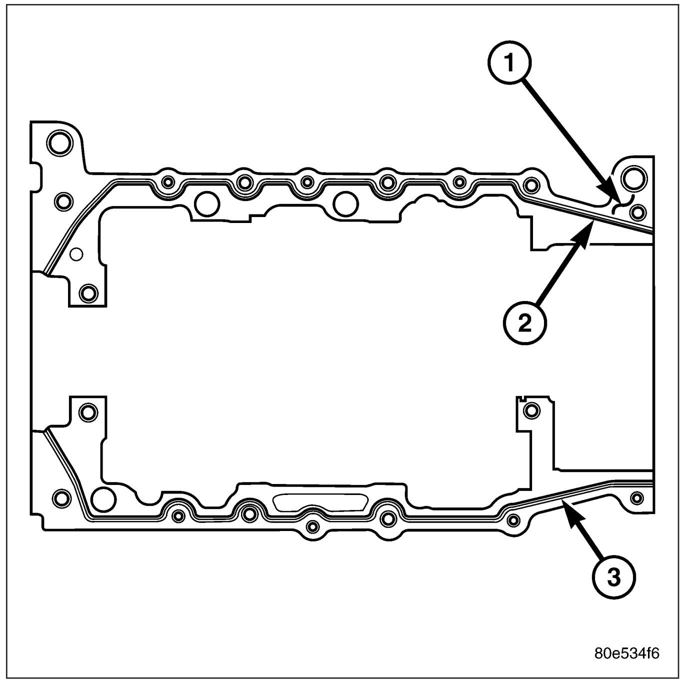
1. Lubricate upper main bearing halves with clean engine oil.
2. Install the crankshaft tone wheel. Torque the mounting screws to 15 N·m (11 ft. lbs.).
3. Position crankshaft in cylinder block.
4. Install the thrust washers (1).

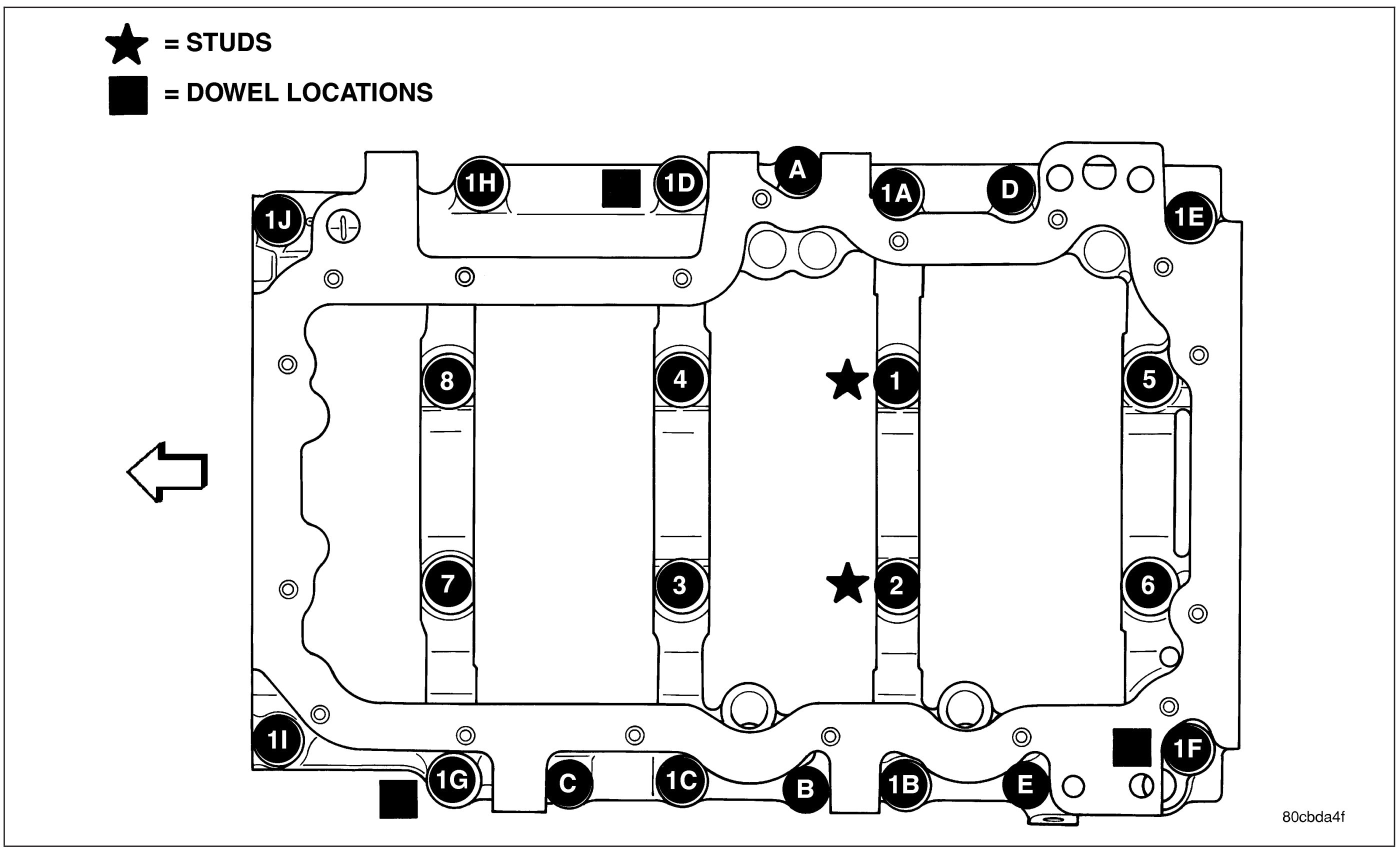


**CAUTION: The bedplate to cylinder block mating surface must be coated with Mopar® Engine RTV sealant prior to installation. Failure to do so will cause severe oil leaks.**

**NOTE: Make sure that the bedplate and cylinder block sealing surfaces are clean and free of oil or other contaminants. Contaminants on the sealing surfaces may cause main bearing distortion and/or oil leaks.**

5. Apply a 2.5mm (0.100 inch) bead of Mopar® Engine RTV sealant to the cylinder block-to-bedplate mating surface (2,3) as shown.





6. Coat the crankshaft main bearing journals with clean engine oil and position the bedplate onto the cylinder block.

**NOTE: Lubricate the bedplate retaining bolts with clean engine oil prior to installation.**

7. Install the bedplate retaining bolts, making sure to place the stud bolts in the correct location, Torque the bolts in the sequence shown.
   - Hand tighten bolts **1D,1G and 1F** until the bedplate contacts the block.
   - Tighten bolts **1A - 1J** to 54 N·m (40 ft. lbs.)
   - Tighten bolts **1 - 8** to 7 N·m (5 ft. lbs.)

- Turn bolts **1 - 8** an additional 90°.
- Tighten bolts **A - E** 27 N·m ( 20 ft. lbs.).

8. Measure crankshaft end play.
9. Install the connecting rods and measure side clearance (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).
10. Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
11. Install the engine (Refer to 9 - ENGINE - INSTALLATION).

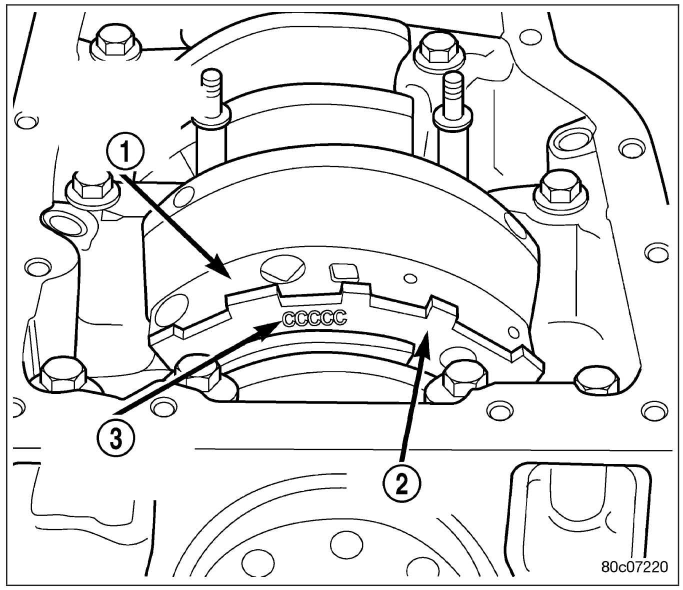
# BEARINGS-CRANKSHAFT MAIN

## STANDARD PROCEDURE

## MAIN BEARING FITTING

### SELECT FIT IDENTIFICATION

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the crankshaft position sensor target wheel (2) has grade identification marks stamped into it. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4. The crankshaft position sensor target wheel is mounted to the number 6 counter weight (1) on the crankshaft.



### INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

### MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Remove the crankshaft from the cylinder block (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - REMOVAL).

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008mm (0.0004 inch.) and maximum out of round is 0.005mm (0.002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

Install the crankshaft into the cylinder block (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - INSPECTION).

Check crankshaft end play.

### CRANKSHAFT MAIN BEARING SELECTION

| Crankshaft Marking | JOURNAL SIZE<br>SIZE mm (in.) | |
|---|---|---|
| ″R″ Size | 63.488 - 63.496 mm<br>(2.4995 - 2.4998 in.) | |
| ″S″ Size | 63.496 - 63.500 mm (2.4998 - 2.4999 in.) | |
| ″T″ Size | 63.500 - 63.504 mm (2.4999 - 2.501 in.) | |
| ″U″ Size | 63.504 - 63.512 mm (2.5001 - 2.5004 in.) | |
| Bearing size | | |
| Bearing Code | Size | Application |
| Upper Bearing | | |
| **A** | .2.443 - 2.447 mm<br>(.0961 - .0963 in.) | Use with crankshaft size ″R″ |
| **B** | 2.439 - 2.443 mm<br>(0.960 - .0961 in.) | Use with crankshaft ″S, T″ |
| **C** | 2.435 - 2.439 mm<br>(.0958 - .0960 in.) | Use with crankshaft ″U″ |

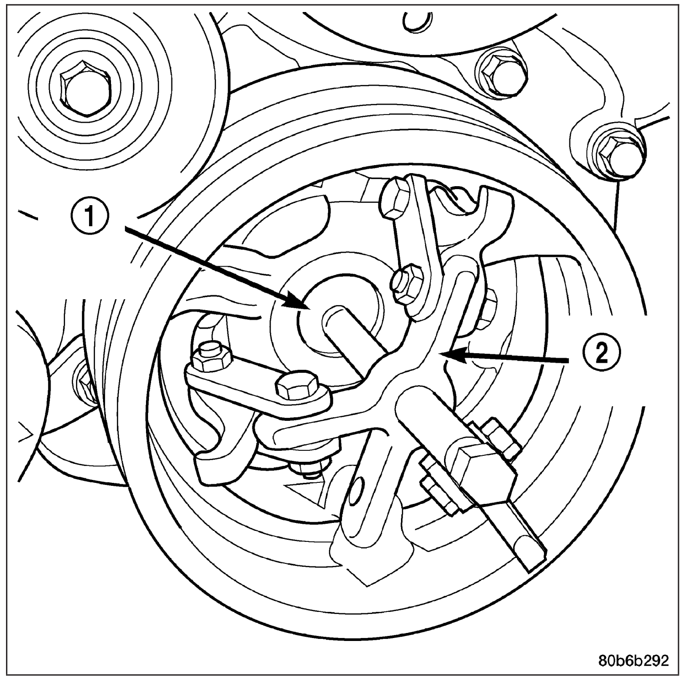
| ″4″ | 2.423 - 2.429 mm<br>(.0953 - .0956 in.) | Use with crankshaft ″T, U″ |
| Bearing Clearances | | |
| Main ″1, 4″ | | |
| Crankshaft ″R″ | .004 - .034 mm ( .00015 - .0013 in.) | |
| Crankshaft ″S″ | .004 - .030 mm ( .00015 - .0011 in.) | |
| Crankshaft ″T″ | .006 - .032 mm (.0002 - .0012 in.) | |
| Crankshaft ″U″ | .002 - .032 mm (.00007 -. 0012 in.) | |
| Main ″2, 3″ | | |
| Crankshaft ″R″ | .016 - .046 mm (.0006 - .0018 in.) | |
| Crankshaft ″S″ | .016 - .042 mm (.00062 - .016 in.) | |
| Crankshaft ″T″ | .018 - .044 mm (.0007 - .0017 in.) | |
| Crankshaft ″U″ | .014 - .044 mm (.0005 - .0017 in.) | |

1. Service main bearings are available in four grades. The chart identifies the four service grades available.

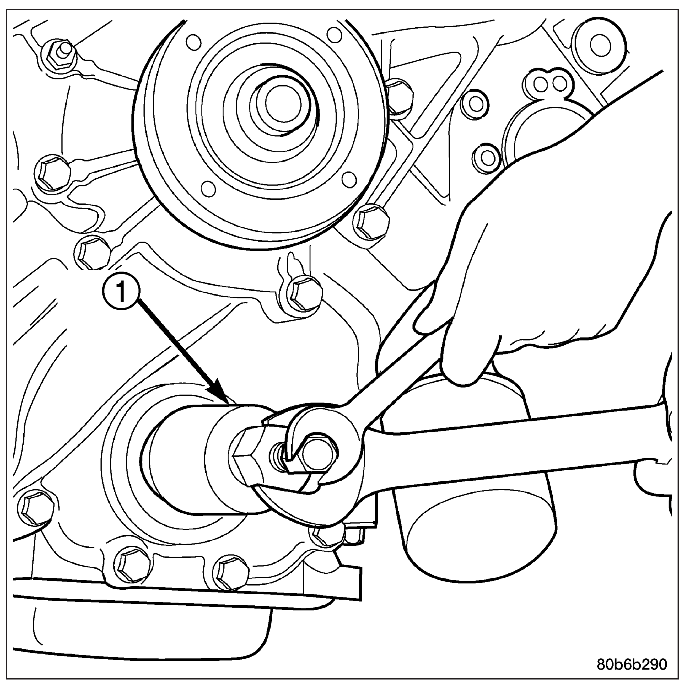
# SEAL-CRANKSHAFT OIL-FRONT

## REMOVAL

1. Disconnect negative cable from battery.
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Remove A/C compressor mounting fasteners and set aside.
4. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
5. Remove upper radiator hose.
6. Disconnect electrical connector for fan mounted inside radiator shroud.
7. Remove radiator shroud attaching fasteners.
8. Remove radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
9. Remove crankshaft damper bolt.
10. Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (2).

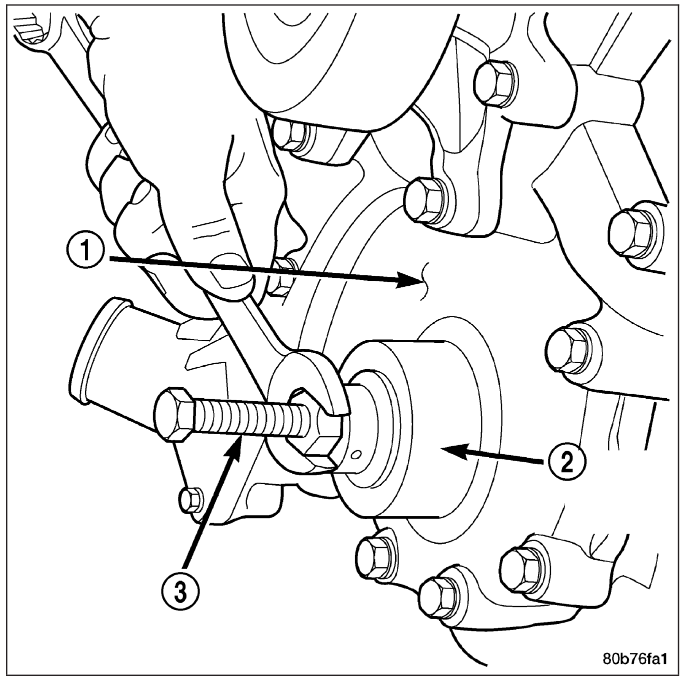


11. Using Special Tool 8511, remove crankshaft front seal (1) .



## INSTALLATION

**CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.**



1. Using Special Tool 8348 (2) and 8512 (3), install crankshaft front seal.
2. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
3. Install radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
4. Install upper radiator hose.
5. Install A/C compressor and tighten fasteners to 54 N·m (40 ft. lbs.).
6. Install accessory drive belt refer (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
7. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
8. Connect negative cable to battery.

# SEAL-CRANKSHAFT OIL-REAR

## DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
   a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
   b. Where leakage tends to run straight down, possible causes are a porous block, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See Engine, for proper repair procedures of these items.
4. If no leaks are detected, pressurized the crankcase as outlined in the section, Inspection (Engine oil Leaks in general)

**CAUTION: Do not exceed 20.6 kPa (3 psi).**

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.**

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), under the Oil Leak row, for components inspections on possible causes and corrections.
7. After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

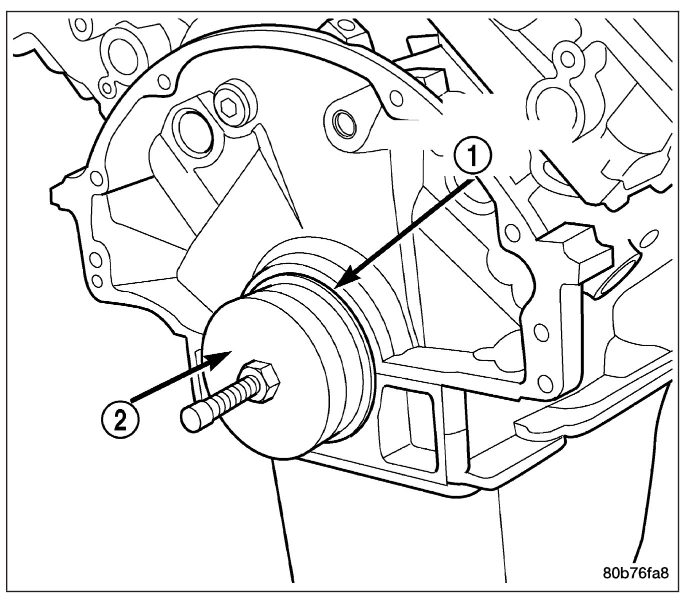
## REMOVAL

**NOTE: This procedure can be performed in vehicle.**

1. If being performed in vehicle, remove the transmission.
2. Remove the flexplate (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - REMOVAL).

**NOTE: The crankshaft oil seal CAN NOT be reused after removal.**

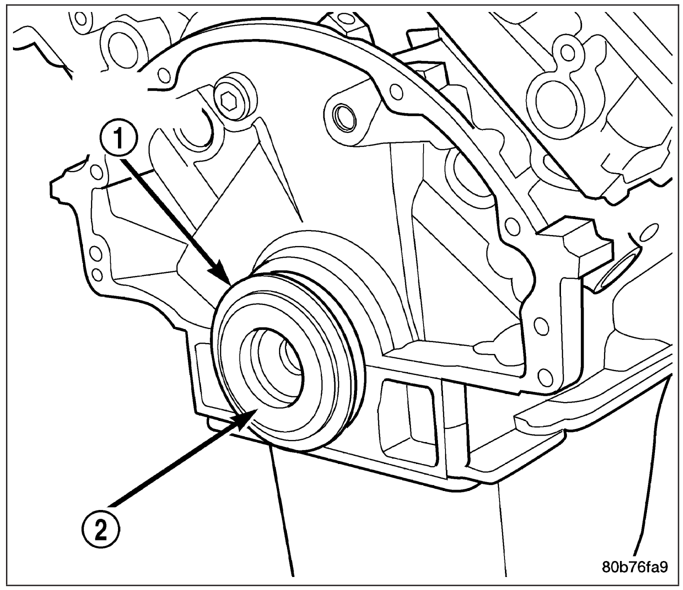
**NOTE: The crankshaft rear oil seal remover Special Tool 8506 must be installed deeply into the seal. Continue to tighten the removal tool into the seal until the tool can not be turned farther. Failure to install tool correctly the first time will cause tool to pull free of seal without removing seal from engine.**



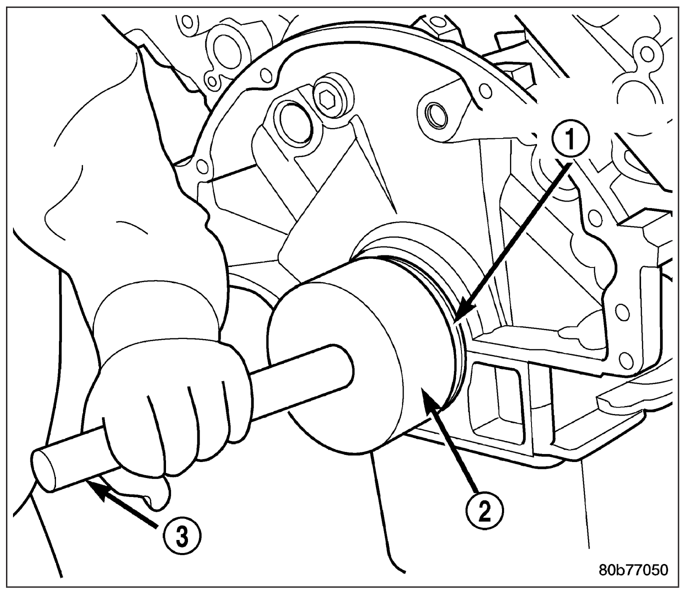
3. Using Special Tool 8506 (2), remove the crankshaft rear oil seal (1)

## INSTALLATION

1. Lubricate the crankshaft flange with engine oil.
2. Position the magnetic seal guide Special Tool 8349-2 onto the crankshaft rear face. Then position the crankshaft rear oil seal (1) onto the guide (2).



3. Using Special Tools 8349 Crankshaft Rear Oil Seal Installer (2) and C-4171 Driver Handle (3), with a hammer, tap the seal (1) into place. Continue to tap on the driver handle until the seal installer seats against the cylinder block crankshaft bore.
4. Install the flexplate.
5. Install the transmission.



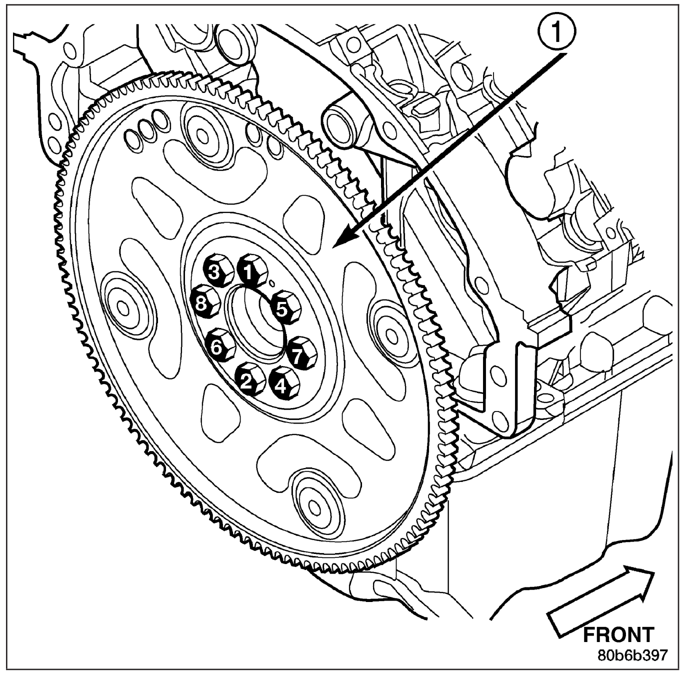
# PLATE-FLEX

## REMOVAL

1. Remove the transmission.
2. Remove the bolts and flexplate.

## INSTALLATION

1. Position the flexplate (1) onto the crankshaft and install the bolts hand tight.
2. Tighten the flexplate retaining bolts to 95 N·m (70 ft. lbs.) in the sequence shown.
3. Install the transmission.

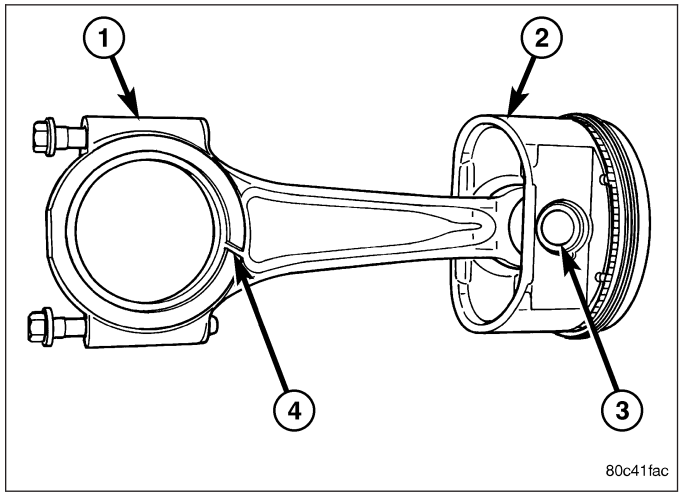


# ROD-PISTON AND CONNECTING

## DESCRIPTION

**CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.**

The pistons (2) are made of a high strength aluminum alloy. The connecting rods (1) are made of forged powdered metal, with a “fractured cap” design. A full floating piston pin is used to attach the piston to the connecting rod.



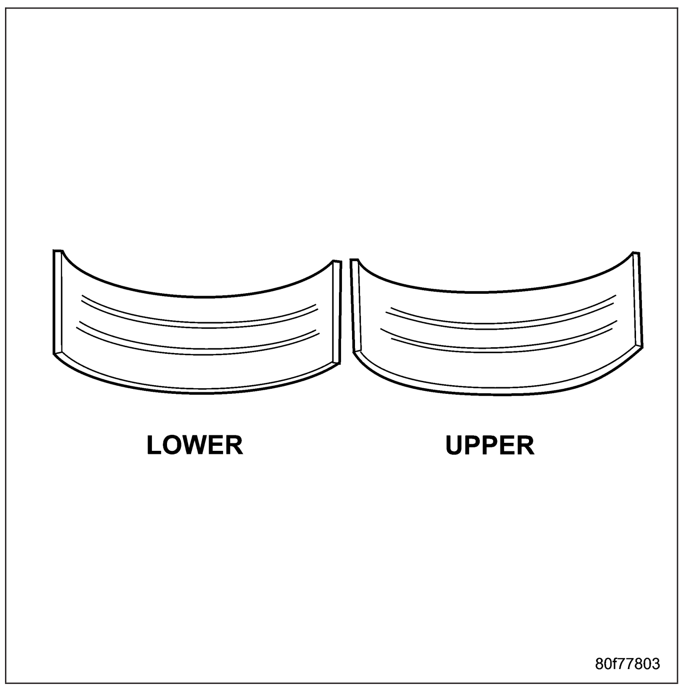
## STANDARD PROCEDURE

## CONNECTING ROD BEARING FITTING

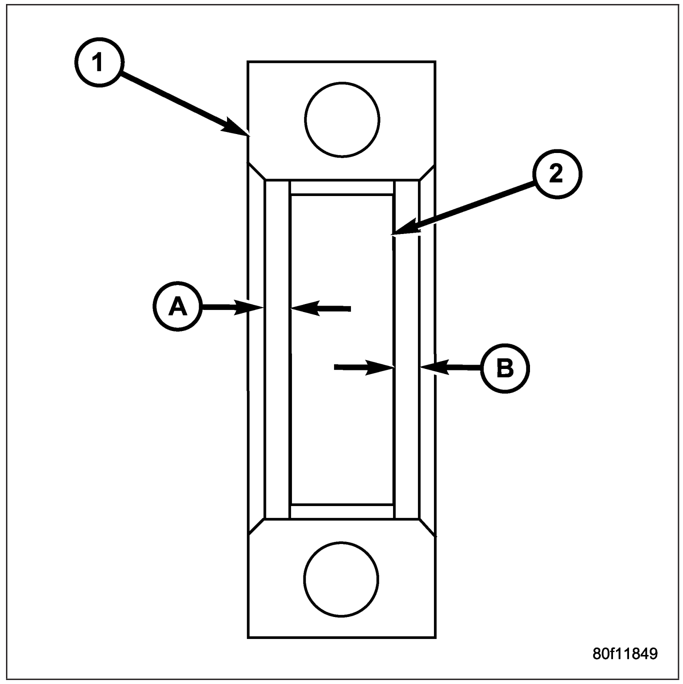
Inspect the connecting rod bearings for scoring. Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting. Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

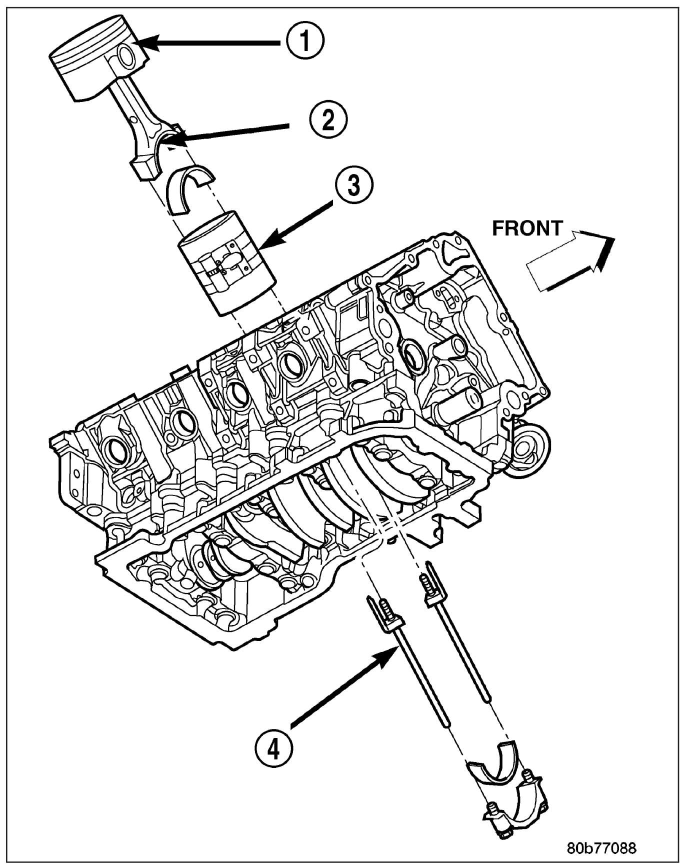
Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.



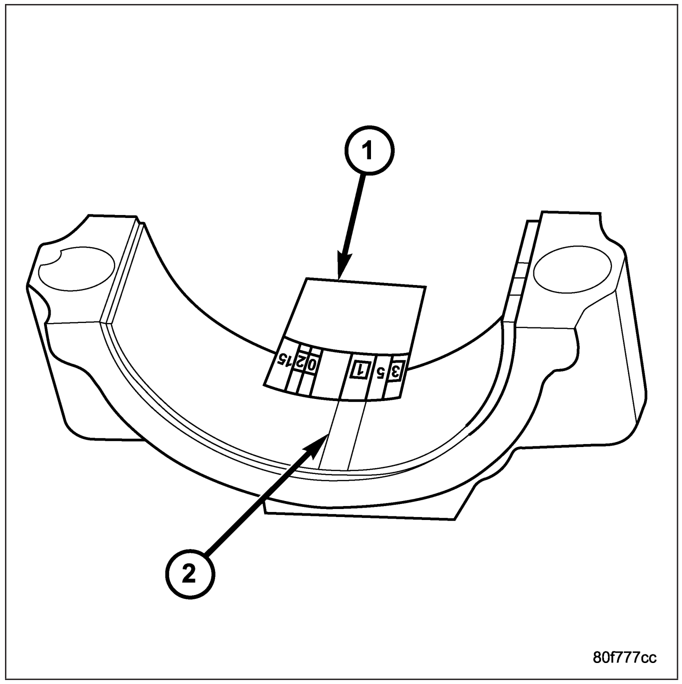
1. Wipe the oil from the connecting rod journal.
2. Lubricate the upper bearing insert and position in connecting rod. **Center bearing insert (2) in connecting rod (1)**



3. Use piston ring compressor (3) and Guide Pins Special Tool 8507 to install the rod and piston assemblies. The oil slinger slots in the rods must face front of the engine. The “F”'s near the piston wrist pin bore (1) should point to the front of the engine.



4. Install the lower bearing insert in the bearing cap. **Center bearing insert in connecting rod.**. The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.
5. Install bearing cap and connecting rod on the journal and tighten bolts to 27 N·m (20 ft. lbs.) plus a 90° turn. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.
6. Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (2). Refer to Engine Specifications for the proper clearance. **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**



7. If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

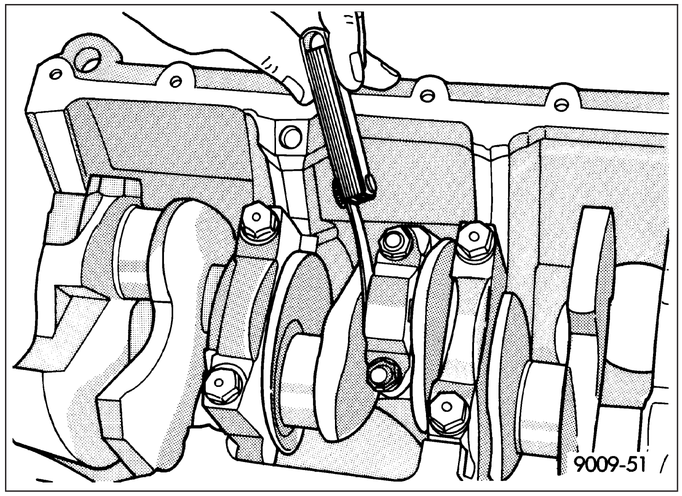
| Bearing Mark | SIZE | USED WITH JOURNAL SIZE |
|---|---|---|
| **.025 US** | .025 mm<br>(.001 in.) | 57.883-57.867 mm<br>(2.2788-2.2783 in.) |
| **Std.** | STANDARD | 57.908-57.892 mm<br>(2.2798-2.2792 in.) |
| **.250 US** | .250 mm<br>(.010 in.) | 57.658-57.646 mm<br>(2.2700-2.2695 in.) |

8. If bearing-to-journal clearance exceeds the specification, determin which services bearing set to use the bearing sizes are as follows:

**CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.**

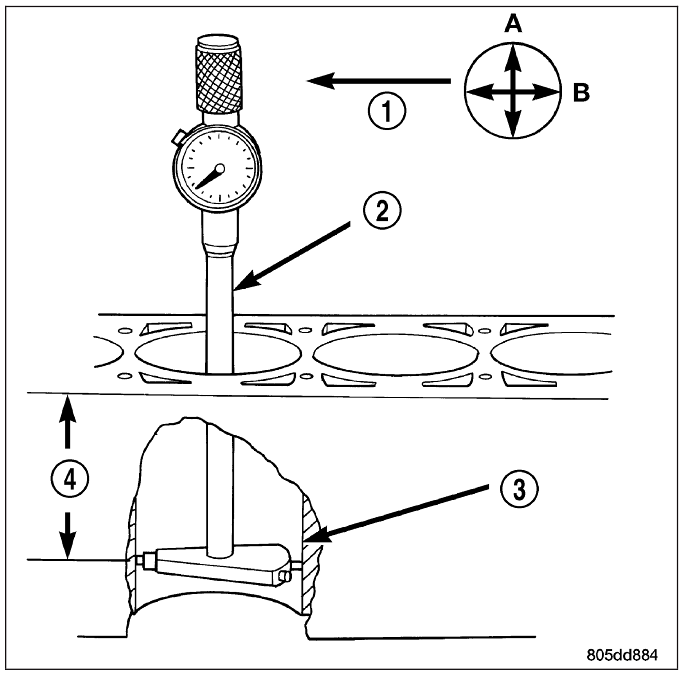
9. Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.
10. Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 27 N·m (20 ft. lbs.) plus a 90° turn.

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange. Refer to Engine Specifications for the proper clearance. Replace the connecting rod if the side clearance is not within specification.

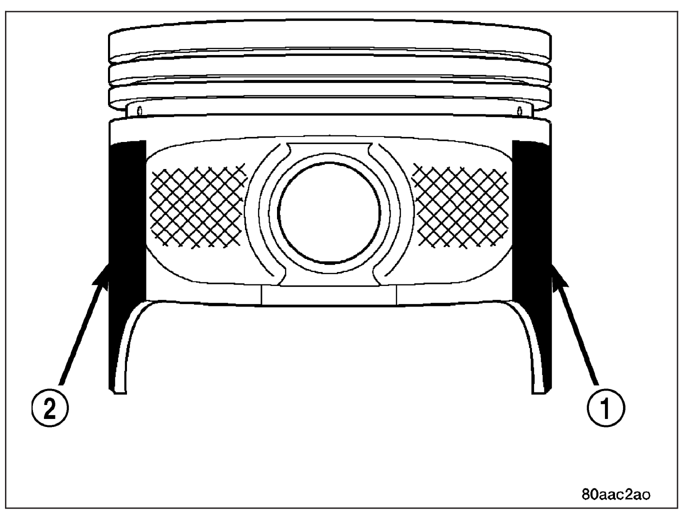


## STANDARD PROCEDURE - PISTON FITTING

1. To correctly select the proper size piston, a cylinder bore gauge (2), capable of reading in 0.003 mm ( .0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore (3) at a point 38.0 mm (1.5 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B.



3. The coated pistons (1,2) will be serviced with the piston pin and connecting rod pre-assembled.
4. The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston (1,2) will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.
5. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.



## REMOVAL

1. Disconnect negative cable from battery.
2. Remove the following components:
   - Oil pan and gasket/windage tray (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
   - Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
   - Timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
   - Cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
3. If necessary, remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation.** Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so the each connecting rod is centered in cylinder bore.

**CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur**

**NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.**

4. Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

**CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.**

5. Remove connecting rod cap. Install Special Tool 8507 Connecting Rod Guides into the connecting rod being removed. Remove piston from cylinder bore. Repeat this procedure for each piston being removed.

**CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur**

6. Immediately after piston and connecting rod removal, install bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.

## CLEANING

**CAUTION: DO NOT use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.**

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

**CAUTION: DO NOT remove the piston pin from the piston and connecting rod assembly.**

## INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

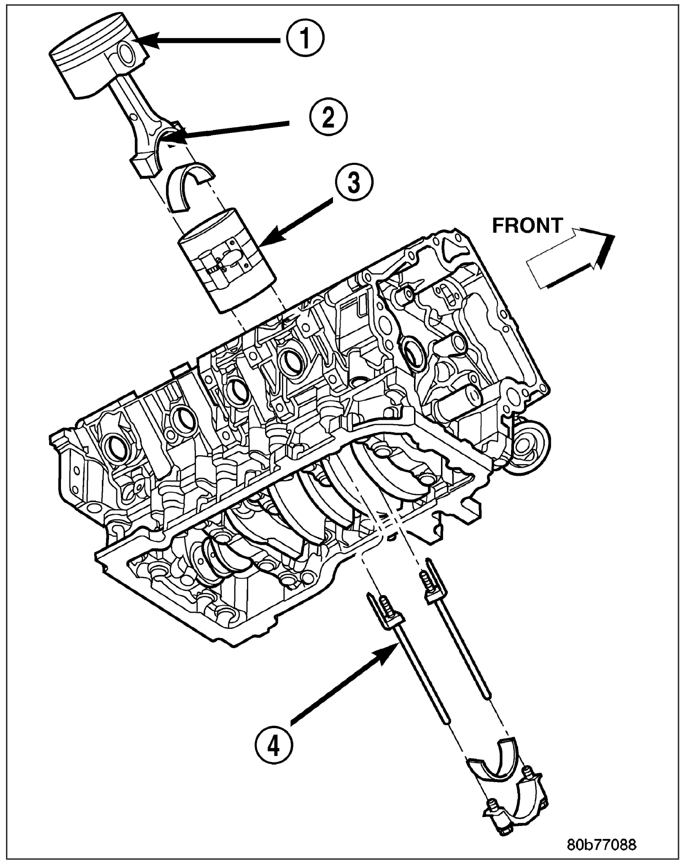
Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

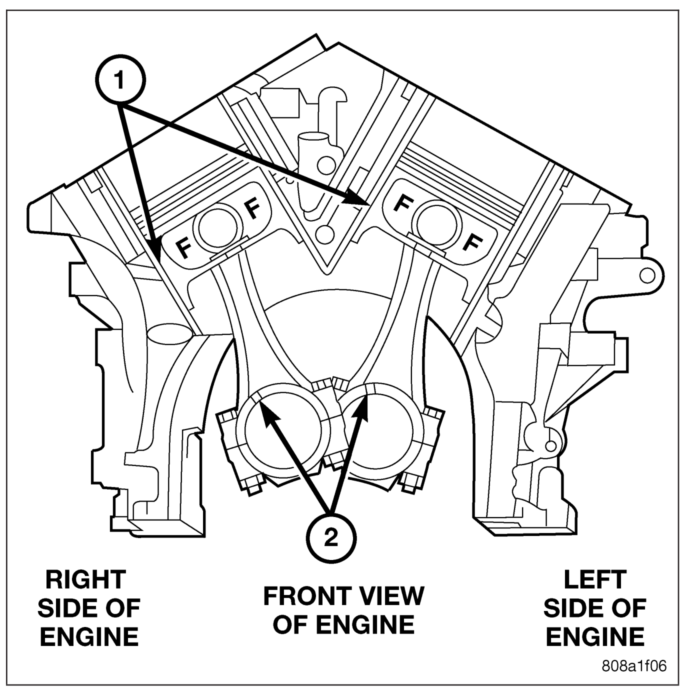
## INSTALLATION

1. Before installing piston and connecting rod assemblies into the bore, install the piston rings.
2. Immerse the piston head and rings in clean engine oil. Position a ring compressor over the piston and rings. Tighten ring compressor. **Ensure position of rings do not change during this operation.**
3. Position bearing onto connecting rod. Ensure that tabs in bearing shell aligns with slots in connecting rod. Verify that parting line of bearing is aligned with parting line of connecting rod.
4. Lubricate bearing surface with clean engine oil.
5. Install Special Tool 8507 Connecting Rod Guides (4) into connecting rod bolt threads.



6. The pistons are marked on the piston pin bore surface with an raised “F” indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks. The connecting rod oil slinger slot (2) faces the front of the engine.
7. Wipe cylinder bore clean and lubricate with engine oil.
8. Rotate crankshaft until connecting rod journal is on the center of cylinder bore. Insert rod and piston into cylinder bore and carefully position connecting rod guides over crankshaft journal.
9. Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

**CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.**



10. Lubricate rod bolts and bearing surfaces with engine oil. Install connecting rod cap and bearing. Tighten bolts to 27 N·m (20 ft. lbs.) plus 90°.
11. Install the following components:
- Cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
- Timing chain and cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

- Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- Oil pan and gasket/windage tray. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

12. Fill crankcase with proper engine oil to correct level.
13. Connect negative cable to battery.

# RINGS-PISTON

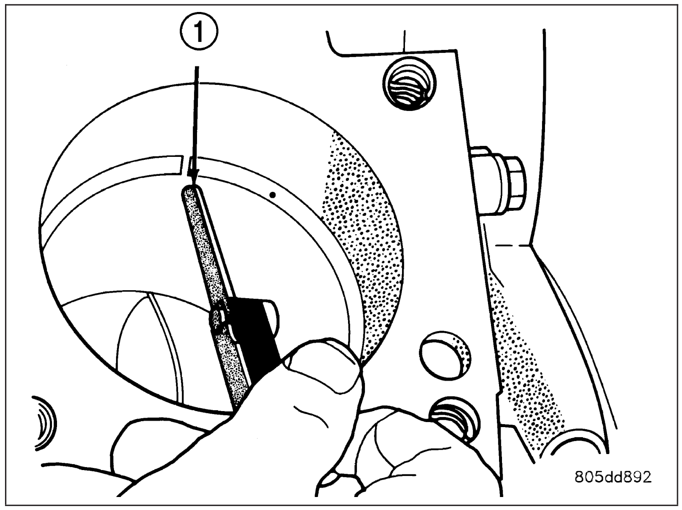
## STANDARD PROCEDURE - PISTON RING FITTING

Before reinstalling used rings or installing new rings, the ring clearances must be checked.

1. Wipe the cylinder bore clean.
2. Insert the ring in the cylinder bore.

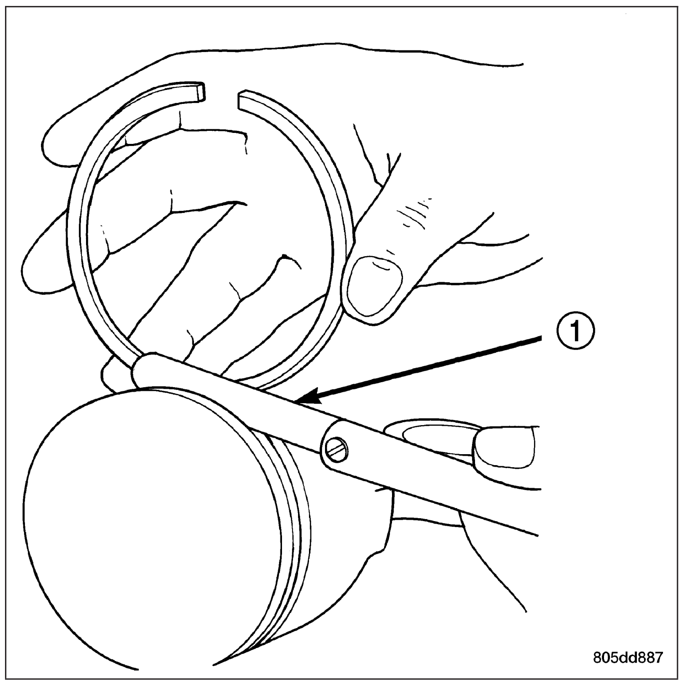
**NOTE: The ring gap measurement must be made with the ring positioned at least 12mm (0.50 inch.) from bottom of cylinder bore.**

3. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.
4. Using a feeler gauge (1) check the ring end gap. Replace any rings not within specification.



### PISTON RING SIDE CLEARANCE

**NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.**



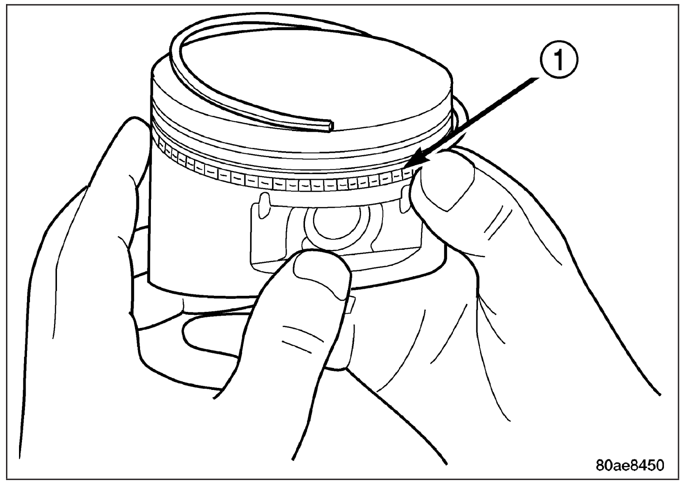
5. Measure the ring side clearance as shown make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.
6. Rotate the ring around the piston, the ring must rotate in the groove with out binding.

### PISTON RING SPECIFICATION CHART

| Ring Position | Groove Clearance | Maximum Clearance |
|---|---|---|
| Upper Ring | .051-.094 mm<br>(0.0020-.0037 in.) | 0.11 mm<br>(0.004 in.) |
| Intermediate Ring | 0.04-0.08 mm<br>(0.0016-0.0031 in.) | 0.10 mm<br>(0.004 in.) |
| Oil Control Ring | .019-.229 mm | .25 mm |

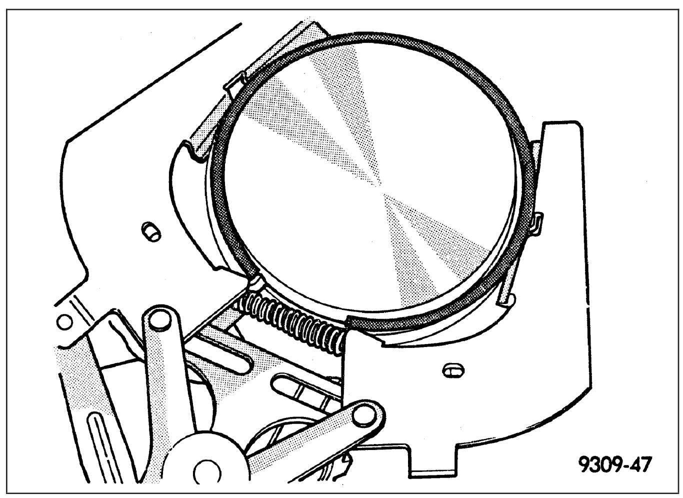
| Ring Position | Groove Clearance | Maximum Clearance |
|---|---|---|
| (Steel Rails) | (.0007-.0090 in.) | (0.010 in.) |
| **Ring Position** | **Ring Gap** | **Wear Limit** |
| Upper Ring | 0.20-0.36 mm<br>(0.0079-0.0142 in.) | 0.43 mm<br>(0.0017 in.) |
| Intermediate Ring | 0.37-0.63 mm<br>(0.0146-0.0249 in.) | 0.74 mm<br>(0.029 in.) |
| Oil Control Ring<br>(Steel Rail) | 0.025-0.76 mm<br>(0.0099- 0.03 in.) | 1.55 mm<br>(0.061 in.) |

7. The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

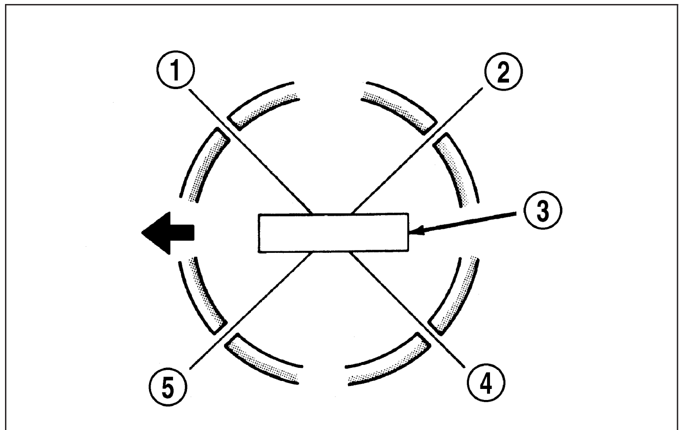


**NOTE: Piston rings are installed in the following order:**
- **Oil ring expander.**
- **Upper oil ring side rail.**
- **Lower oil ring side rail.**
- **No. 2 Intermediate piston ring.**
- **No. 1 Upper piston ring.**

8. Install the oil ring expander.
9. Install upper side rail (1) by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.
10. Install No. 2 intermediate piston ring using a piston ring installer.
11. Install No. 1 upper piston ring using a piston ring installer.



12. Position piston ring end gaps as shown. It is important that expander ring gap (5) is at least 45° from the side rail gaps, but not on the piston pin center or on the thrust direction.



RR09B48

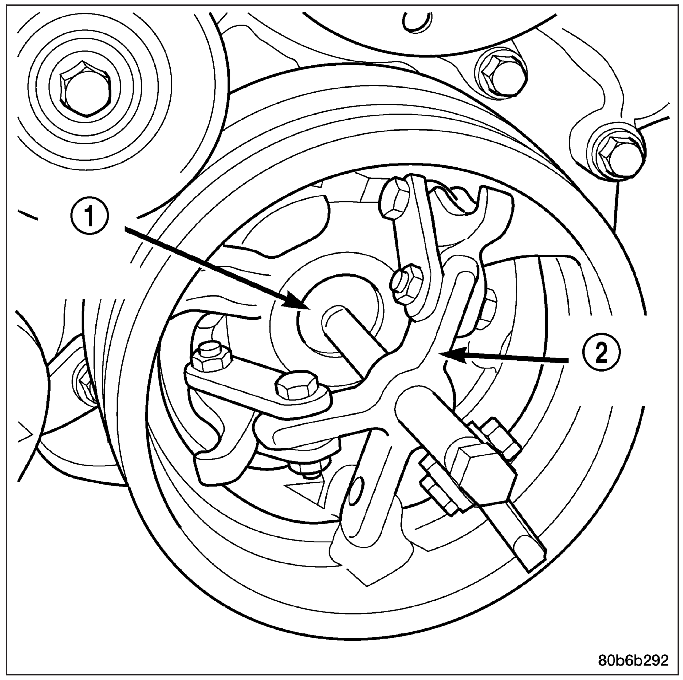
# DAMPER-CRANKSHAFT

## REMOVAL

1. Disconnect negative cable from battery.
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

**NOTE: Transmission cooler line snaps into shroud lower right hand corner.**

3. Remove crankshaft damper bolt.
4. Remove damper using Special Tools 8513 Insert (1) and 1026 Three Jaw Puller (2).

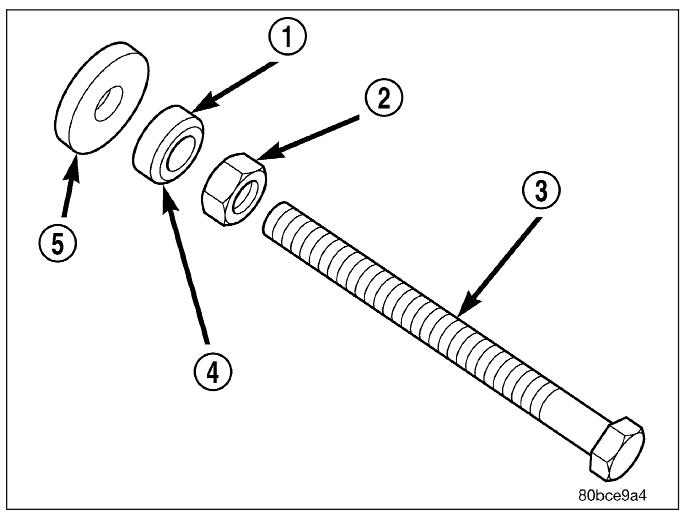


## INSTALLATION

**CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.**

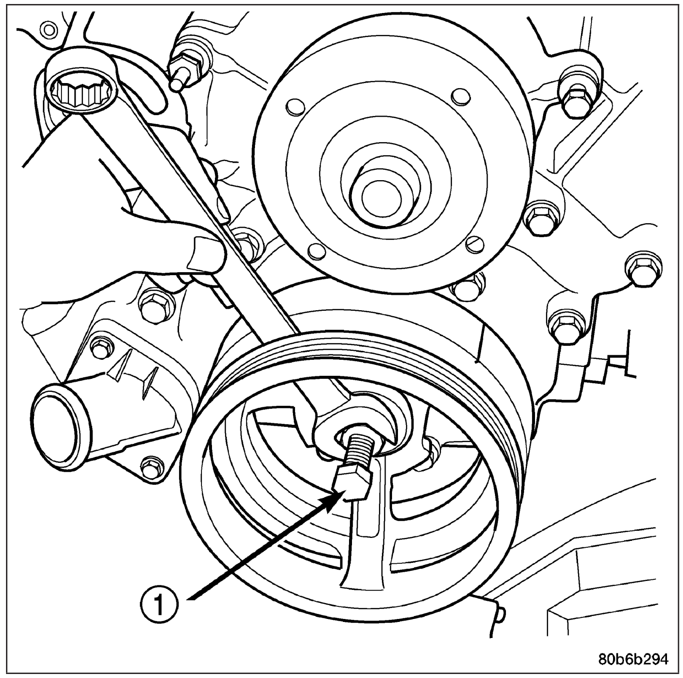
1. Align crankshaft damper slot with key in crankshaft. Slide damper onto crankshaft slightly.

**CAUTION: Special Tool 8512A, is assembled in a specific sequence. Failure to assemble this tool in this sequence can result in tool failure and severe damage to either the tool or the crankshaft.**



2. Assemble Special Tool 8512–A as follows, The nut is threaded onto the shaft first. Then the roller bearing (1) is placed onto the threaded rod (3) (The hardened bearing surface of the bearing **MUST** face the nut). Then the hardened washer slides onto the threaded rod. Once assembled coat the threaded rod's threads with Mopar® Nickel Anti-Seize or (Loctite No. 771).

3. Using Special Tool 8512A (1), press damper onto crankshaft.
4. Install then tighten crankshaft damper bolt to 175 N·m (130 ft. lbs.).
5. Install accessory drive belt (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
6. Connect negative cable to battery.



# COVER-STRUCTURAL

## DESCRIPTION

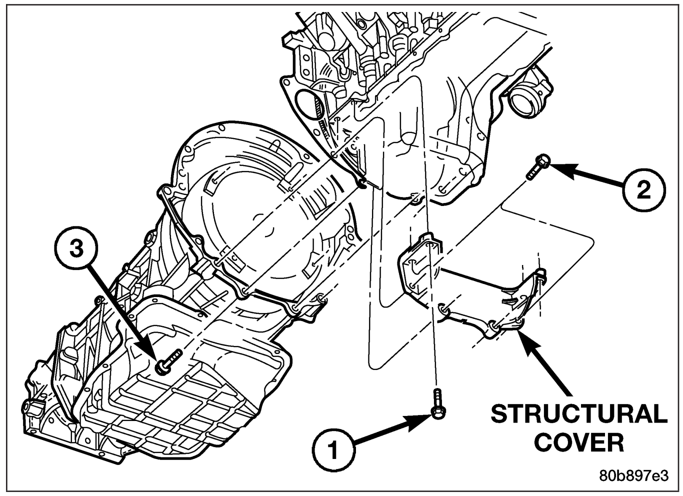
The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine bedplate.

## OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration.

## REMOVAL

1. Raise vehicle on hoist.
2. Remove the bolts (1) retaining structural cover.
3. Remove the structural cover.

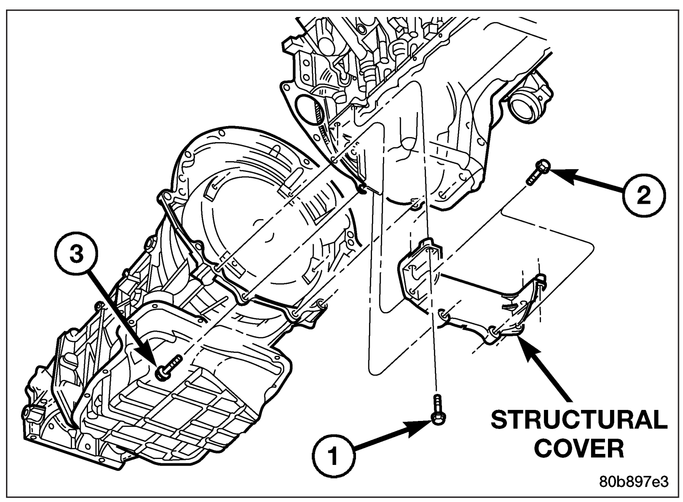


## INSTALLATION

**CAUTION: The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover.**

1. Position the structural cover in the vehicle.
2. Install all bolts (1) retaining the cover-to-engine. DO NOT tighten the bolts at this time.
3. Install the cover-to-transmission bolts. Do NOT tighten at this time.

**CAUTION: The structural cover must be held tightly against both the engine and the transmission bell housing during tightening sequence. Failure to do so may cause damage to the cover.**



4. Starting with the two rear cover-to-engine bolts, tighten bolts (1) to 54 N·m (40 ft. lbs.), then tighten bolts (2) and (3) to 54 N·m ( 40 ft. lbs.) in the sequence shown.

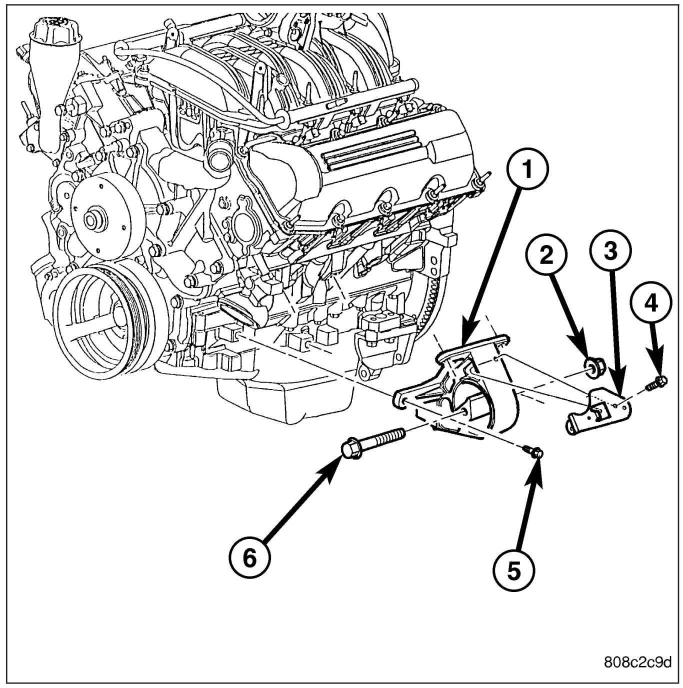
# MOUNT-FRONT

## REMOVAL

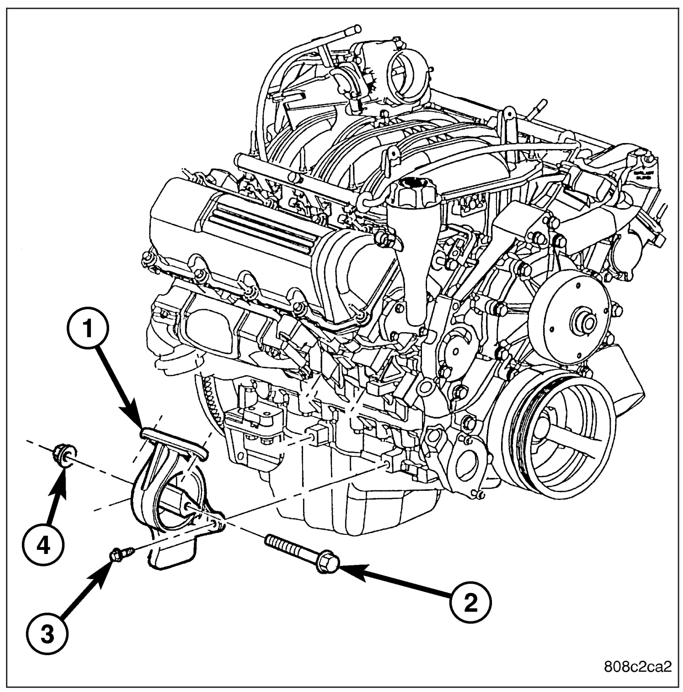
1. Disconnect the negative cable from the battery.

**CAUTION: Remove the fan blade, fan clutch and fan shroud before raising engine. Failure to do so may cause damage to the fan blade, fan clutch and fan shroud.**

2. Remove the fan blade, fan clutch and fan shroud. Refer to COOLING SYSTEM for procedure.
3. Remove the engine oil filter.
4. Support the engine with a suitable jack and a block of wood across the full width of the engine oil pan.
5. Remove the four cylinder block-to-insulator mount bolts (5) and the nut from the engine insulator mount through bolt.



6. Using the jack, raise the engine high enough to remove the engine insulator mount thru bolt (2) and the insulator mount and.



## INSTALLATION

1. Position the insulator mount and install the insulator mount through bolt.
2. Lower the engine until the cylinder block-to-insulator mount bolts can be installed.
3. Remove the jack and block of wood.
4. Torque the cylinder block-to-insulator mount bolts to 61 N·m ( 45 ft. lbs.).
5. Install and torque the through bolt retaining nut to 61 N·m (45 ft. lbs.).
6. Install the fan blade, fan clutch and fan shroud.

# MOUNT-REAR

## REMOVAL

**NOTE: A resilient rubber cushion supports the transmission at the rear between the transmission extension housing and the rear support crossmember or skid plate.**

1. Disconnect negative cable from battery.
2. Raise the vehicle and support the transmission.
3. Remove the nuts holding the support cushion to the crossmember. Remove the crossmember.

### MANUAL TRANSMISSION

a. Remove the support cushion nuts and remove the cushion.

b. Remove the transmission support bracket bolts and remove the bracket from the transmission.

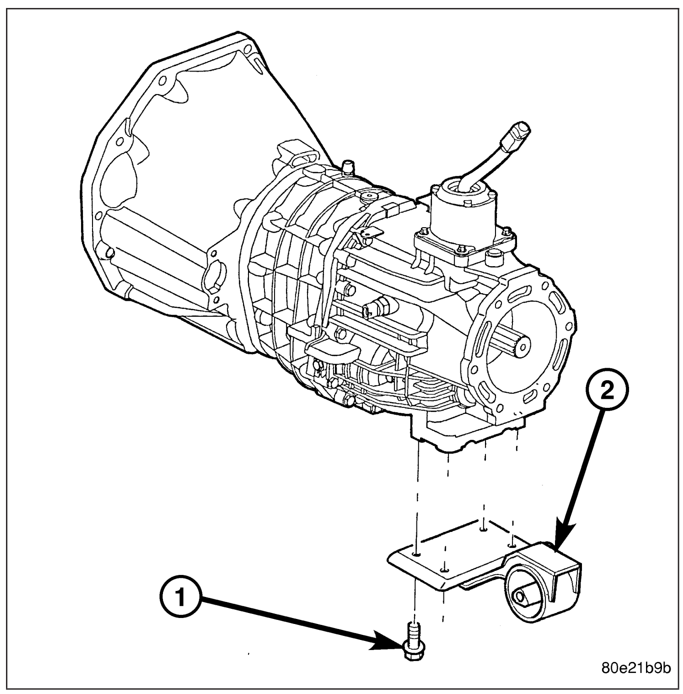
### AUTOMATIC TRANSMISSION

a. Remove the support cushion bolts and remove the cushion and the support bracket from the transmission (4WD) or from the adaptor bracket (2WD).

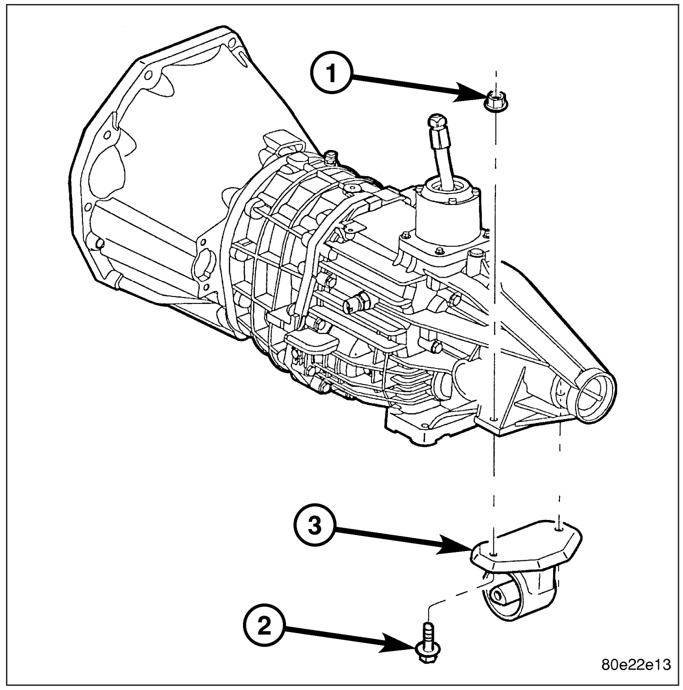
b. On 2WD vehicles, remove the bolts holding the transmission support adaptor bracket to the transmission. Remove the adaptor bracket.

## INSTALLATION

### MANUAL TRANSMISSION:

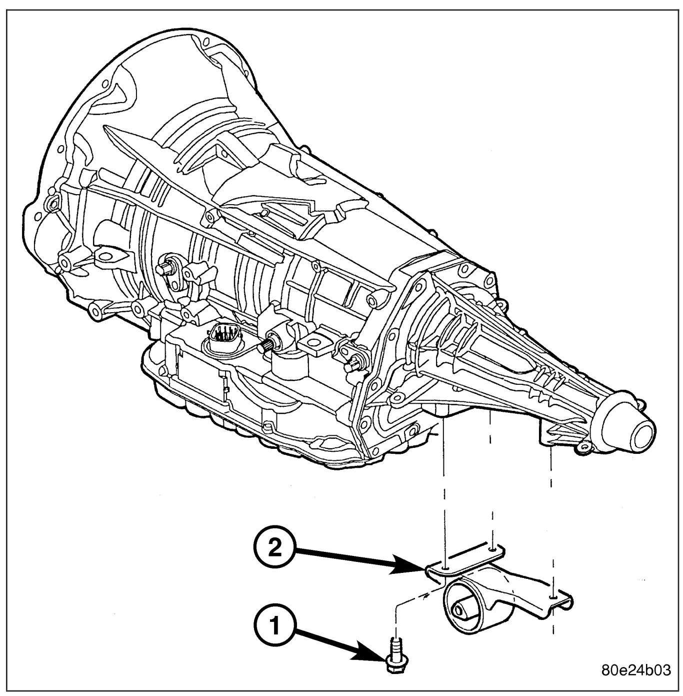


1. Install the transmission mount (1) to the transmissionor. Install the bolts (2) and tighten.

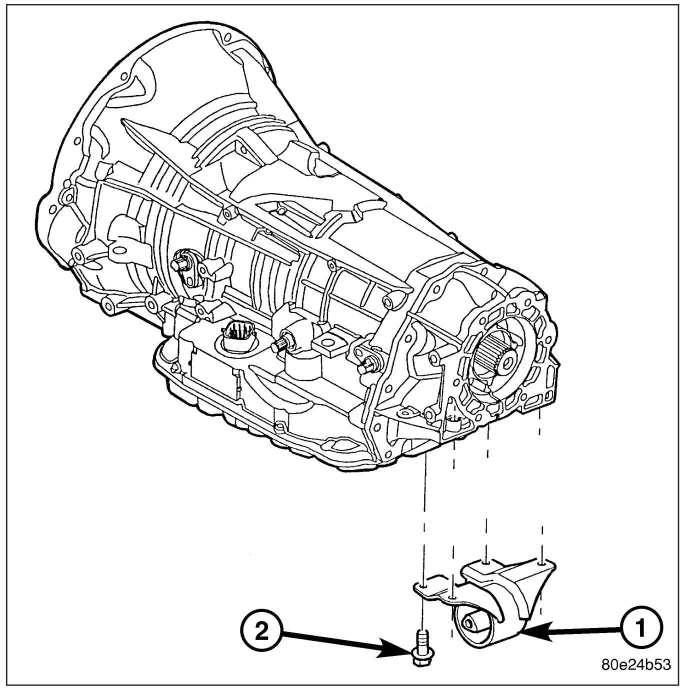


2. Position the crossmember in the vehicle. Install the crossmember to mount through bolt and nut.
3. Install crossmember-to-sill bolts and tighten to 41 N·m (30 ft. lbs.) torque.
4. Remove the transmission support.
5. Lower the vehicle.
6. Connect negative cable to battery.

## AUTOMATIC TRANSMISSION:



1. Install the transmission mount to transmission and. Install the bolts.
2. Position the crossmember in the vehicle. Install the crossmember to mount through bolt and nut.
3. Remove the transmission support.
4. Lower the vehicle.
5. Connect negative cable to battery.



# LUBRICATION

## DESCRIPTION

The lubrication system is a full flow filtration pressure feed type.

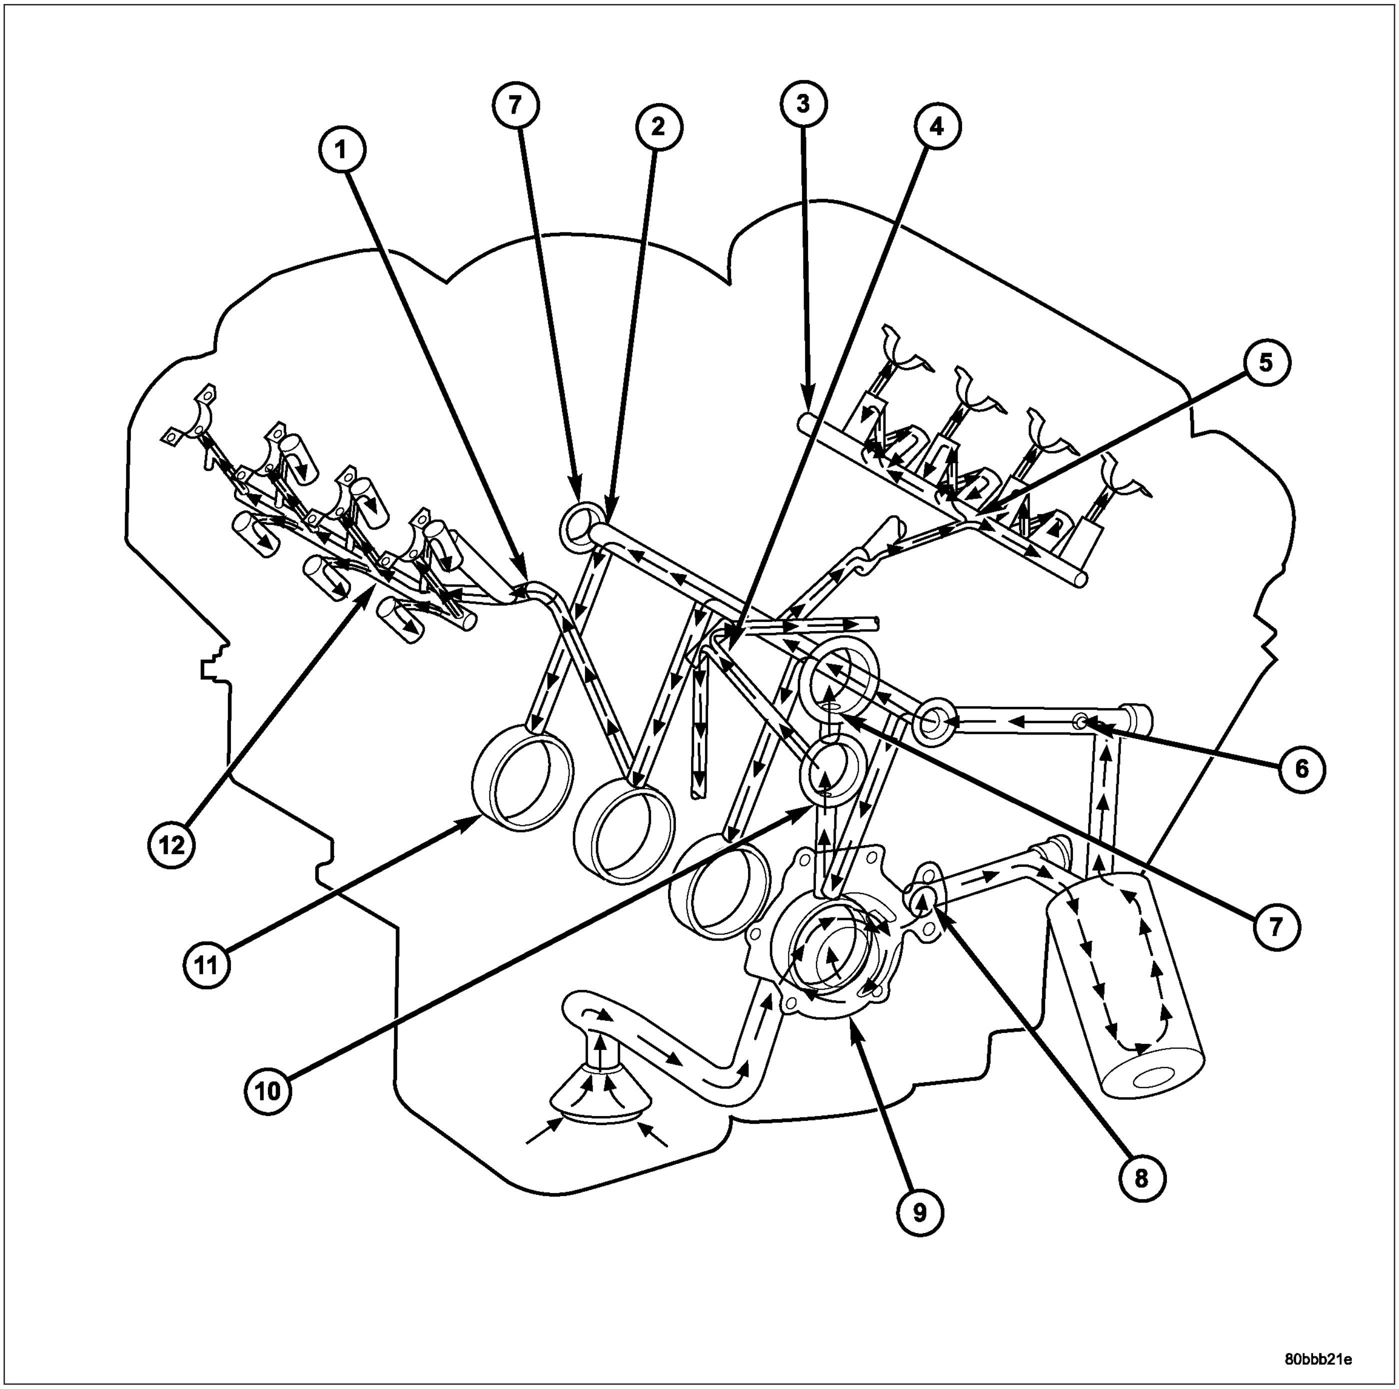
## OPERATION

**Engine Lubrication Flow Chart - Block: Table 1**

| FROM | TO |
|---|---|
| Oil Pickup Tube | Oil Pump |
| Oil Pump | Oil Filter |
| Oil Filter | Block Main Oil Gallery |
| Block Main Oil Gallery | 1. Crankshaft Main Journal<br>2. Left Cylinder Head*<br>3. Right Cylinder Head*<br>4. Counterbalance Shaft Rear Journal |
| Crankshaft Main Journals | Crankshaft Rod Journals |
| Crankshaft Number One Main Journal | 1. Front Timing Chain Idler Shaft<br>2. Counterbalance Shaft - Front Journal<br>3. Both Secondary Chain Tensioners |
| Left Cylinder Head | Refer to Engine Lubrication Flow Chart - Cylinder Heads: Table 2 |
| Right Cylinder Head | Refer to Engine Lubrication Flow Chart - Cylinder Heads: Table 2 |
| * The cylinder head gaskets have an oil restricter to control oil flow to the cylinder heads | |

**Engine Lubrication Flow Chart - Cylinder Heads: Table 2**

| FROM | TO |
|---|---|
| Cylinder Head Oil Port (in bolt hole) | Diagonal Cross Drilling to Main Oil Gallery |
| Main Oil Gallery (drilled through head from rear to front) | 1. Base of Camshaft Towers<br>2. Lash Adjuster Towers |
| Base of Camshaft Towers | Vertical Drilling Through Tower to Camshaft Bearings** |
| Lash Adjuster Towers | Diagonal Drillings to Hydraulic Lash Adjuster Pockets |
| ** The number three camshaft bearing journal feeds oil into the hollow camshaft tubes. Oil is routed to the intake lobes, which have oil passages drilled into them to lubricate the rocker arms. | |



Oil from the oil pan is pumped by a gerotor type oil pump (9) directly mounted to the crankshaft nose. Oil pressure is controlled by a relief valve mounted inside the oil pump housing.

The camshaft exhaust valve lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Due to the orientation of the rocker arm, the camshaft intake lobes are not lubed in the same manner as the exhaust lobes. The intake lobes are lubed through internal passages in the camshaft. Oil flows through a bore in the No. 3 camshaft bearing bore, and as the camshaft turns, a hole in the camshaft aligns with the hole in the camshaft bore allowing engine oil to enter the camshaft tube. The oil then exits through 1.6mm (0.063 in.) holes drilled into the intake lobes, lubricating the lobes and the rocker arms.

# DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.**If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method.

### Air Leak Detection Test Method

1. Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.
2. Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.
3. Attach an air hose with pressure gauge and regulator to the dipstick tube.

**CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.**

4. Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
5. If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.
6. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose.
7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

## INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
   a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
   b. Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

**CAUTION: Do not exceed 20.6 kPa (3 psi).**

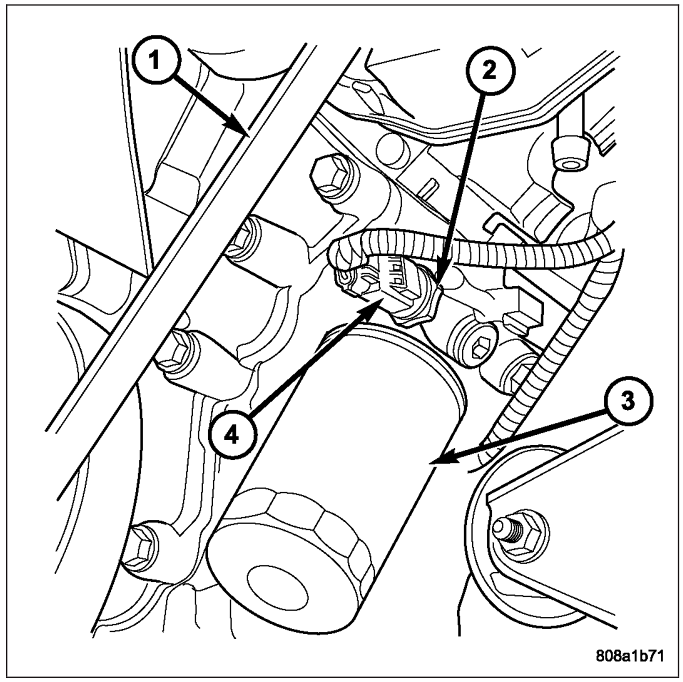
5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.**

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

## DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

1. Remove oil pressure sending unit (2) and install gauge assembly C-3292.
2. Run engine until thermostat opens.
3. Oil Pressure:
   - Curb Idle - 25 kPa (4 psi) minimum
   - 3000 rpm - 170 - 758 kPa (25 - 110 psi)
4. If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.



## DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
   a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
   b. Where leakage tends to run straight down, possible causes are a porous block, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See Engine, for proper repair procedures of these items.
4. If no leaks are detected, pressurized the crankcase as outlined in the section, Inspection (Engine oil Leaks in general)

**CAUTION: Do not exceed 20.6 kPa (3 psi).**

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.**

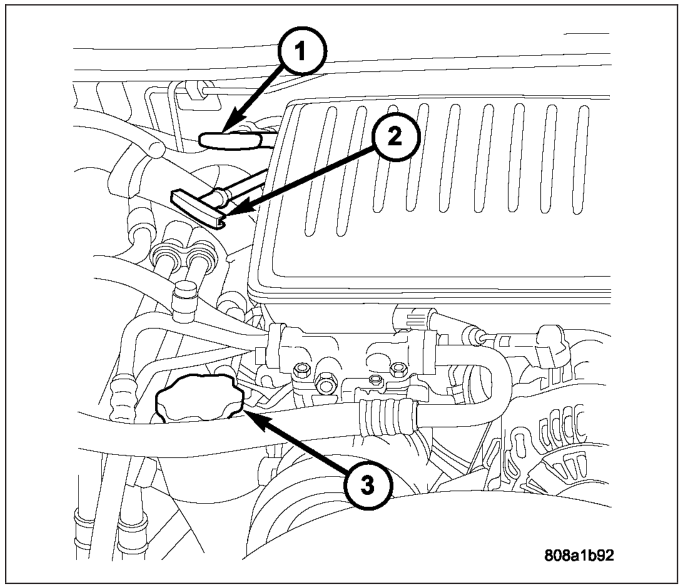
6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), under the Oil Leak row, for components inspections on possible causes and corrections.

7. After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

# OIL

## STANDARD PROCEDURE - ENGINE OIL SERVICE

The engine oil level indicator (1) is located at the right rear of the engine on the 3.7L/4.7L engines.



## CRANKCASE OIL LEVEL INSPECTION

**CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.**

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

1. Position vehicle on level surface.
2. With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
3. Wipe dipstick clean.
4. Install dipstick and verify it is seated in the tube.
5. Remove dipstick, with handle held above the tip, take oil level reading.
6. Add oil only if level is below the ADD mark on dipstick.

## ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

1. Position the vehicle on a level surface and turn engine off.
2. Hoist and support vehicle on safety stands.
3. Remove oil fill cap.
4. Place a suitable drain pan under crankcase drain.
5. Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
6. Install drain plug in crankcase.
7. Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.
8. Install oil fill cap.
9. Start engine and inspect for leaks.

10. Stop engine and inspect oil level.

**NOTE:**
**Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.**

# FILTER-ENGINE OIL

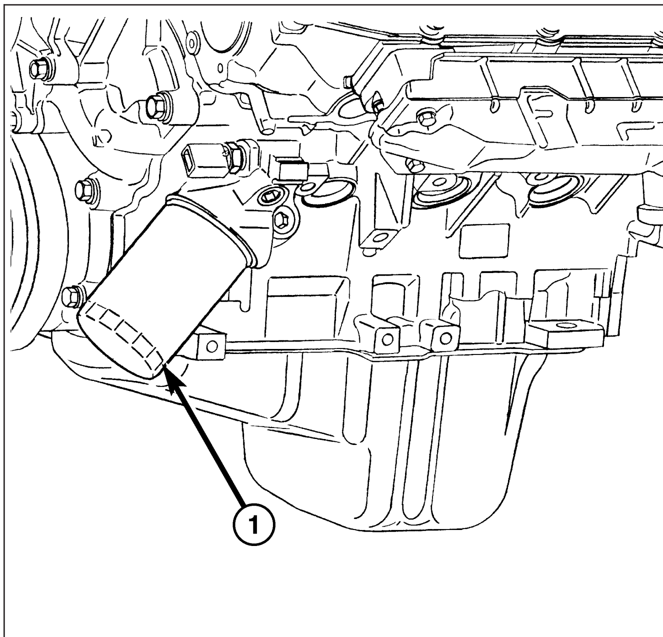
## REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

1. Position a drain pan under the oil filter (1).
2. Using a suitable oil filter wrench loosen filter.
3. Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss.
4. When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

**NOTE: Make sure filter gasket was removed with filter.**

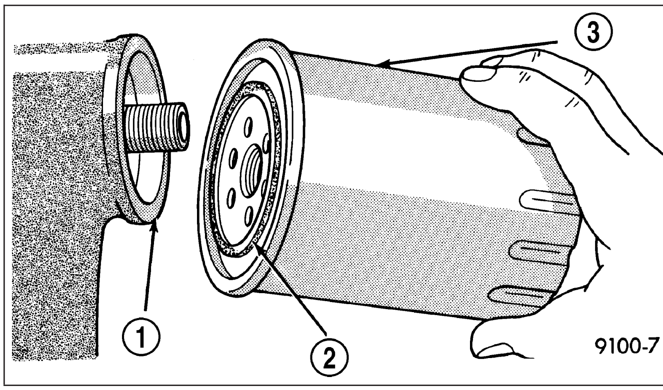
5. With a wiping cloth, clean the gasket sealing surface of oil and grime.



808a1b94

## INSTALLATION

1. Lightly lubricate oil filter gasket (2) with engine oil.
2. Thread filter (3) onto adapter nipple. When gasket makes contact with sealing surface, hand tighten filter one full turn, do not over tighten.
3. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

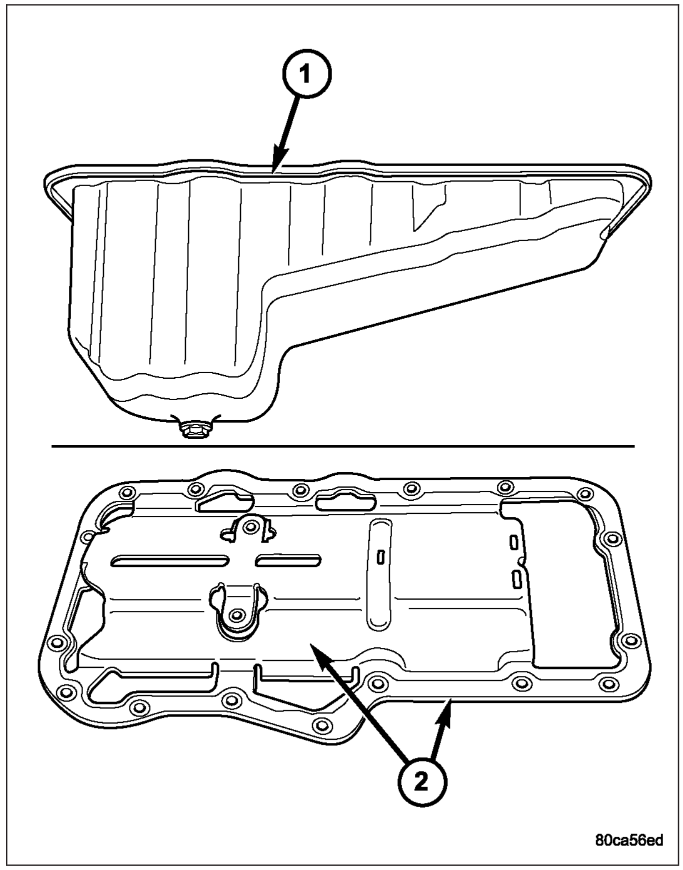


9100-7

# PAN-ENGINE OIL

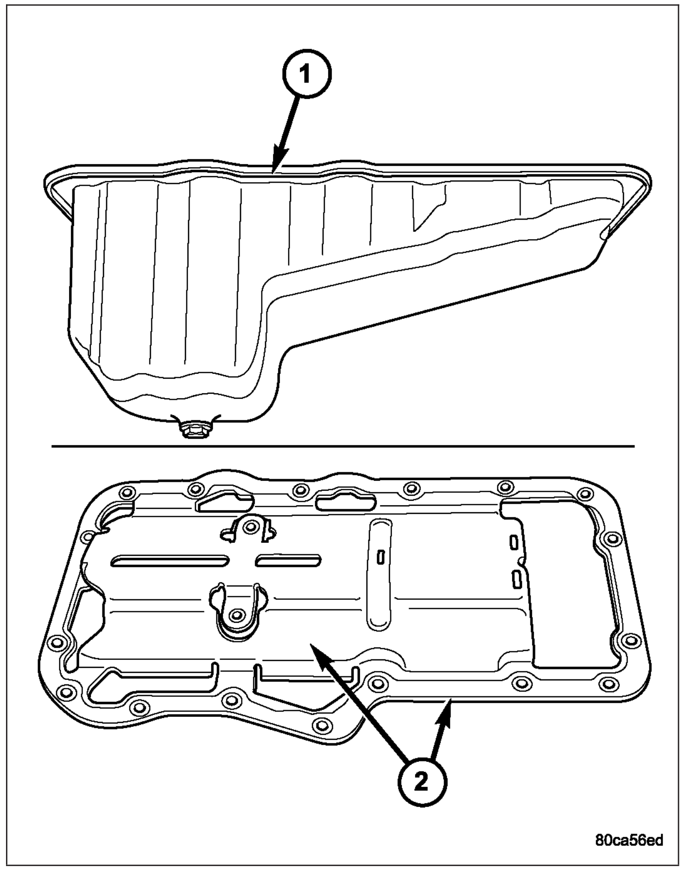
## DESCRIPTION

The engine oil pan (1)is made of laminated steel and has a single plane sealing surface. The sandwich style oil pan gasket has an integrated windage tray (2) and steel carrier. The sealing area of the gasket is molded with rubber and is designed to be reused as long as the gasket is not cut, torn or ripped.



## REMOVAL

## REMOVAL



1. Disconnect and isolate negative battery cable.
2. Install engine support fixture.
3. Raise and support vehicle.
4. Remove front wheel assemblies.
5. Remove skid plate (if equipped). (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL)
6. Drain engine oil.
7. Mark adjustment cam position of front lower control arm bolts.
8. Remove front lower control arm bolts. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL)
9. Disconnect LH tie rod. (Refer to 19 - STEERING/ LINKAGE/TIE ROD END - REMOVAL)
10. Disconnect LH lower ball joint (Refer to 2 - SUSPENSION/FRONT/LOWER BALL JOINT - REMOVAL)
11. Disconnect LH strut clevis (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - REMOVAL)
12. Remove LH front axle (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)
13. Remove front axle brace bolts.
14. Remove front prop shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/ PROPELLER SHAFT - REMOVAL)
15. Drain front axle.
16. Using a transmission jack, support front axle.
17. Remove axle bracket bolts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - REMOVAL)
18. With RH axle still in place, remove front differential.
19. Remove transmission oil cooler line bracket.
20. Remove engine to transmission stiffening bracket.
21. Position Special Tool 8534 on fender lip and align the slots in the brackets with the fender mounting holes.
22. Secure brackets to the fender using four M6 X 1.0 X 25 MM flanged cap screws.
23. Tighten the thumbscrews to secure the sleeves to the support tube.
24. Secure the support tube in an upright position.
25. Assemble the flat washer, thrust bearing, hook and T handle.
26. Using the M10 X 1.75 mm flanged nut supplied with the support fixture, secure the chain to the front engine lifting stud.
27. Loosen engine mounts.
28. Remove oil pan bolts.
29. Seperate oil pan (1) from engine.
30. Move oil pan to one side, remove oils sump bolt and windage tray bolts,

**NOTE: Do not pry on oil pan or oil pan gasket. Gasket is integral to engine windage tray and does not come out with oil pan.**

31. Move the oil pan and windage tray (2) toward front of vehicle and remove from vehicle.

## REMOVAL - 4x4

1. Disconnect Battery.
2. Install Engine Support Fixture, special Tool 8534.
3. Raise and support vehicle.
4. Remove front wheel and tire assemblies.
5. Remove skid plate (if equipped).
6. Drain engine oil.
7. Remove engine to transmission structural cover, (if equipped).
8. Remove transmission oil cooler line bracket.
9. Remove the front axle assembly from the vehicle (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - REMOVAL).
10. Loosen both engine mount through bolts.
11. Lower the vehicle.

**NOTE: It is not necessary to remove the viscous fan , or fan shroud, for oil pan removal.**

12. Raise the engine using Engine Support Fixture, special Tool 8534, until the viscous fan almost touches the fan shroud.
13. Raise the vehicle.
14. Remove the oil pan bolts.
15. Separate the oil pan from the engine.
16. Remove the (2) nuts and (1) bolt holding the oil pump pick-up tube, and windage tray in place.

**NOTE: It will be necessary to move the oil pan from side to side to gain access to these fasteners.**

17. Drop the oil pump pick-up tube into the oil pan, and remove the oil pan, pick-up tube, and the windage tray, as an assembly, from the front of the vehicle.

## CLEANING

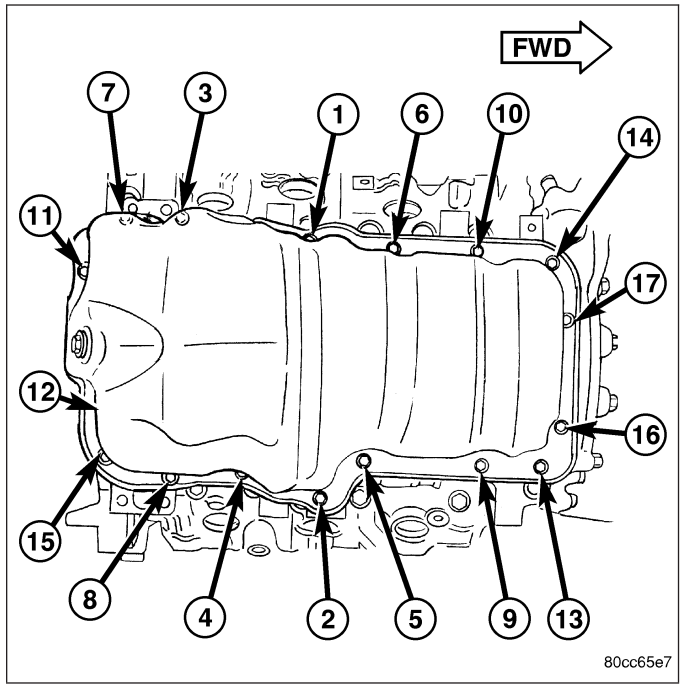
1. Clean oil pan in solvent and wipe dry with a clean cloth.
2. Clean the oil pan gasket surface. **DO NOT** use a grinder wheel or other abrasive tool to clean sealing surface.
3. Clean oil screen and tube thoroughly in clean solvent.

## INSPECTION

1. Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.
2. Inspect the oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

## INSTALLATION

## INSTALLATION



1. Clean the oil pan gasket mating surface of the bed-plate and oil pan.
2. Clean the oil pan and block gasket mating surfaces.
3. Inspect integrated oil pan gasket, and replace as necessary.
4. Drop the oil pump pick-up tube into the oil pan, and install the oil pan, pick-up tube, and the windage tray, as an assembly, from the front of the vehicle.
5. Install the windage tray, then the oil pump pick-up tube, and the (2) nuts and (1) bolt holding the oil pump pick-up tube, in place.

**NOTE: It will be necessary to move the oil pan from side to side to gain access to these fasteners.**

6. Torque the pick-up tube fasteners.
1. Install the oil pan.
2. Install and torque the oil pan bolts..
3. Install the engine to transmission structural cover, (if equipped).
4. Lower engine, and remove Special Tool 8534.
5. Lower the vehicle.
6. Lower the engine using Engine Support Fixture, special Tool # 8534.
7. Remove the Engine Support Fixture, special Tool # 8534.
8. Raise the vehicle.
9. Tighten both engine mount through bolts.
10. Install the transmission oil cooler line bracket.
11. Lower the vehicle.
12. Refill engine oil.
13. Reconnect battery.
14. Start engine and check for leaks.

## INSTALLATION - 4x4

1. Inspect oil pan gasket for defects, and replace if necessary.
2. Clean the oil pan and block gasket mating surfaces.
3. Drop the oil pump pick-up tube into the oil pan, and install the oil pan, pick-up tube, and the windage tray, as an assembly, from the front of the vehicle.
4. Install the windage tray, then the oil pump pick-up tube, and the (2) nuts and (1) bolt holding the oil pump pick-up tube, in place.

**NOTE: It will be necessary to move the oil pan from side to side to gain access to these fasteners.**

5. Torque the pick-up tube fasteners.
6. Install the oil pan.
7. Install and torque the oil pan bolts.
8. Install the engine to transmission structural cover, (if equipped).
9. Lower the vehicle.

10. Lower the engine using Engine Support Fixture, special Tool # 8534.
11. Remove the Engine Support Fixture, special Tool # 8534.
12. Raise the vehicle.
13. Tighten both engine mount through bolts.
14. Install the transmission oil cooler line bracket.
15. Install the front axle assembly to the vehicle (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - INSTALLATION).
16. Install the skid plate (if equipped).
17. Install the front wheel and tire assemblies.
18. Lower the vehicle.
19. Refill engine oil.
20. Reconnect battery.
21. Start engine, and check for leaks.

# SWITCH-OIL PRESSURE

## DESCRIPTION

The 1 wire, solid-state engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

## OPERATION

The oil pressure sensor uses three circuits. They are:

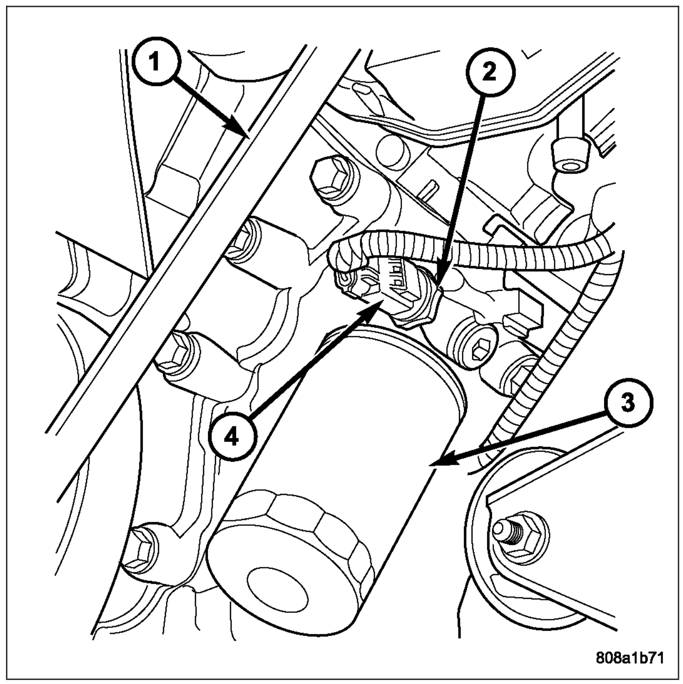
- A 5 volt power supply from the Powertrain Control Module (PCM)
- A sensor ground through the PCM's sensor return
- A signal to the PCM relating to engine oil pressure

The oil pressure sensor has a 3 wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor. Meaning different pressures relate to different output voltages.

A 5 volt supply is sent to the sensor from the PCM to power up the sensor. The sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on either a CCD or PCI bus circuit (depending on vehicle line) to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

## REMOVAL

1. Disconnect the negative cable from the battery.
2. Raise vehicle on hoist.
3. Remove front splash shield.
4. Disconnect oil pressure sender wire (4).
5. Remove the pressure sender (2).



## INSTALLATION

1. Install oil pressure sender.
2. Connect oil pressure sender wire.
3. Install front splash shield.
4. Lower vehicle.
5. Connect the negative battery cable.

# PUMP-ENGINE OIL

## REMOVAL

1. Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
3. Remove the timing chains and tensioners (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
4. Remove the four bolts, primary timing chain tensioner and the oil pump.

## DISASSEMBLY

1. Remove oil pump cover screws and lift off cover plate.
2. Remove pump inner and outer rotors.

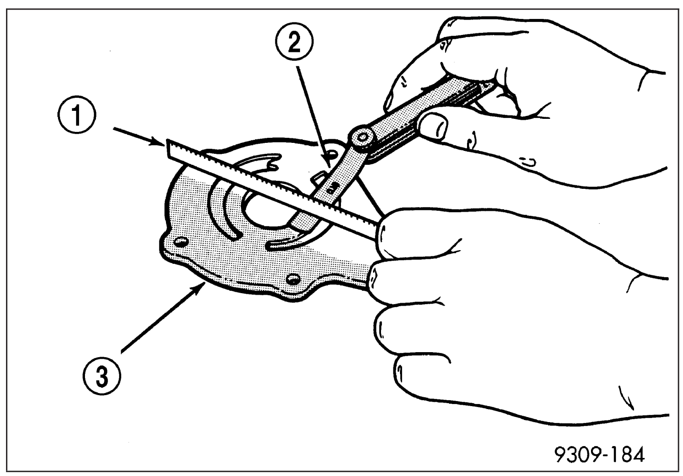
**NOTE: Once the oil pressure relief valve, cup plug, and pin are removed, the pump assembly must be replaced.**

3. If it is necessary to remove the pressure relief valve, drive the roll pin from pump housing and remove cup plug, spring and valve.

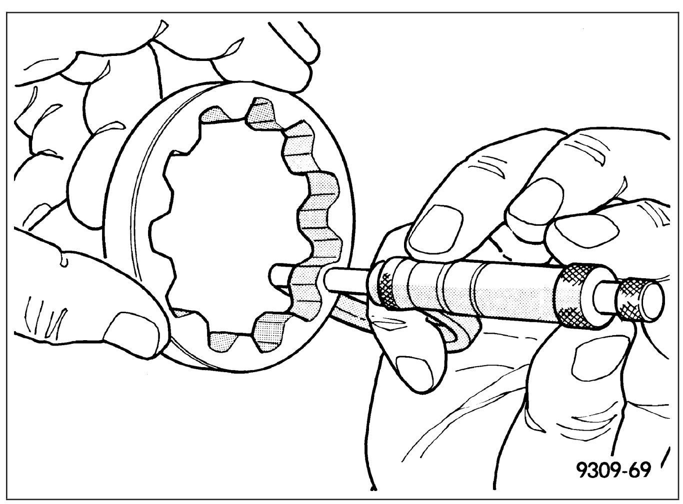
## INSPECTION

**CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.**

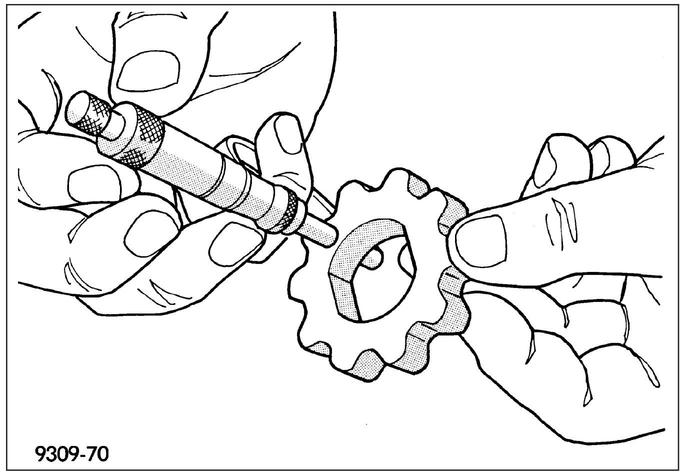
1. Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.
2. Lay a straight edge across the pump cover surface (3). If a 0.025 mm (0.001 in.) feeler gauge (2) can be inserted between the cover and the straight edge the oil pump assembly should be replaced.



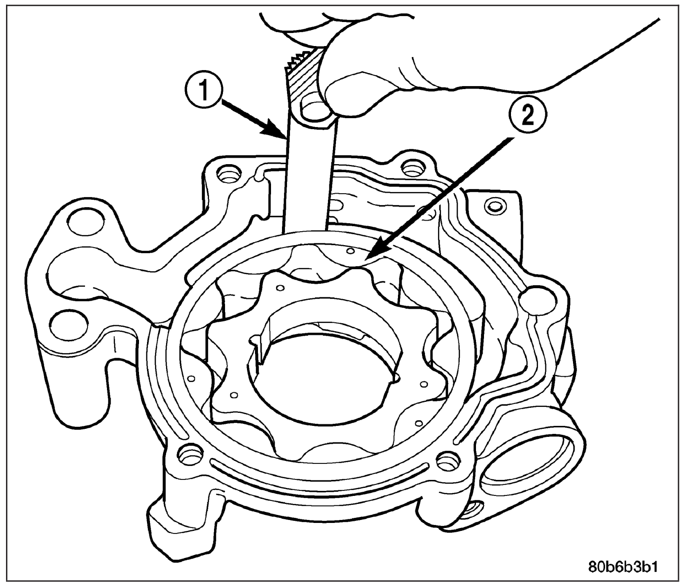
3. Measure the thickness of the outer rotor. If the outer rotor thickness measures at 12.005 mm (0.472 in.) or less the oil pump assembly must be replaced.
4. Measure the diameter of the outer rotor. If the outer rotor diameter measures at 85.925 mm (3.382 in.) or less the oil pump assembly must be replaced.



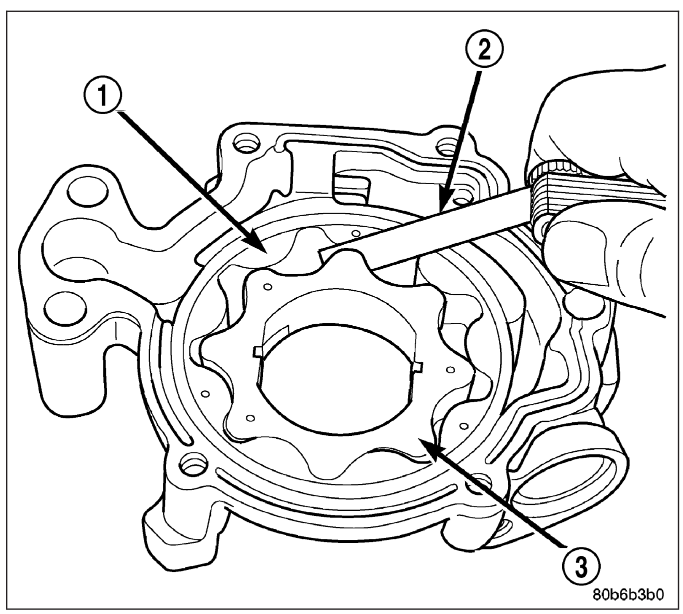
5. Measure the thickness of the inner rotor. If the inner rotor thickness measures at 12.005 mm (0.472 in.) or less then the oil pump assembly must be replaced.



6. Slide outer rotor (2) into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor and the body. If the measurement is 0.235mm (0.009 in.) or more the oil pump assembly must be replaced.

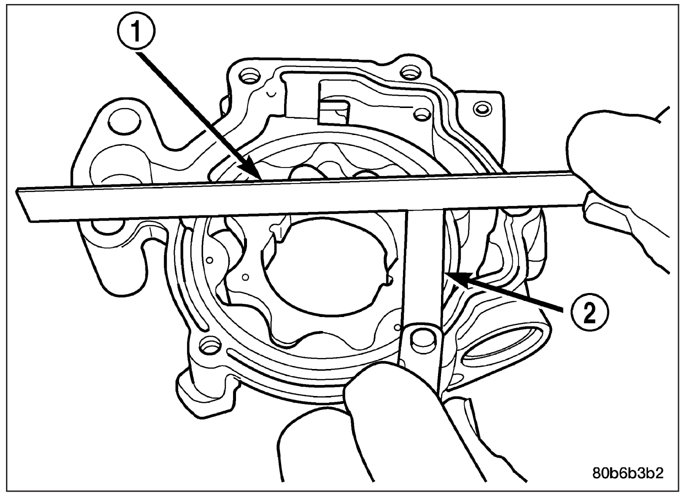


7. Install the inner rotor into the oil pump body. Measure the clearance between the inner (3) and outer (1) rotors. If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.



8. Place a straight edge (1) across the body of the oil pump (between the bolt holes), if a feeler gauge (2) of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced.

**NOTE: The 3.7L/4.7L Oil pump is released as an assembly. There are no DaimlerChrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.**

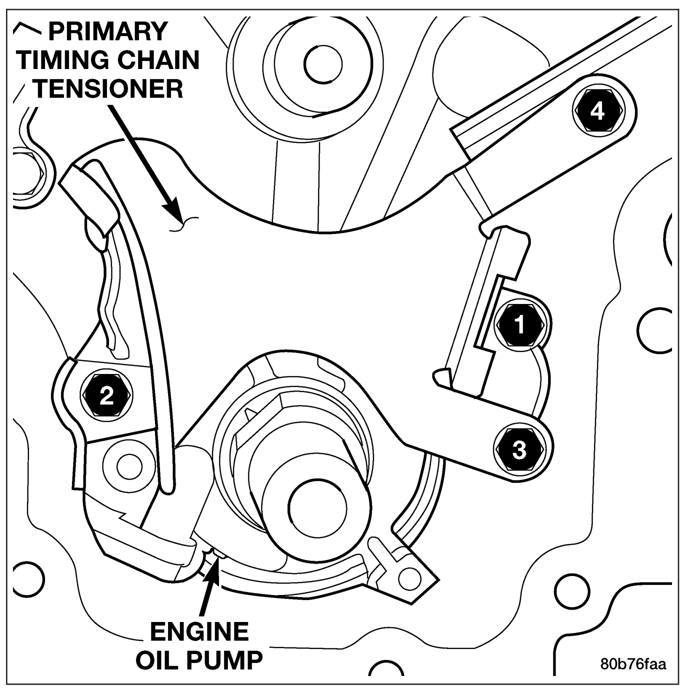


## ASSEMBLY

1. Wash all parts in a suitable solvent and inspect carefully for damage or wear.
2. Install inner and outer rotors
3. Install oil pump cover plate and install cover bolts and tighten them to 12 N·m (105 in. lbs.).
4. Prime oil pump before installation by filling rotor cavity with engine oil.
5. If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other causes for oil pressure loss.

## INSTALLATION

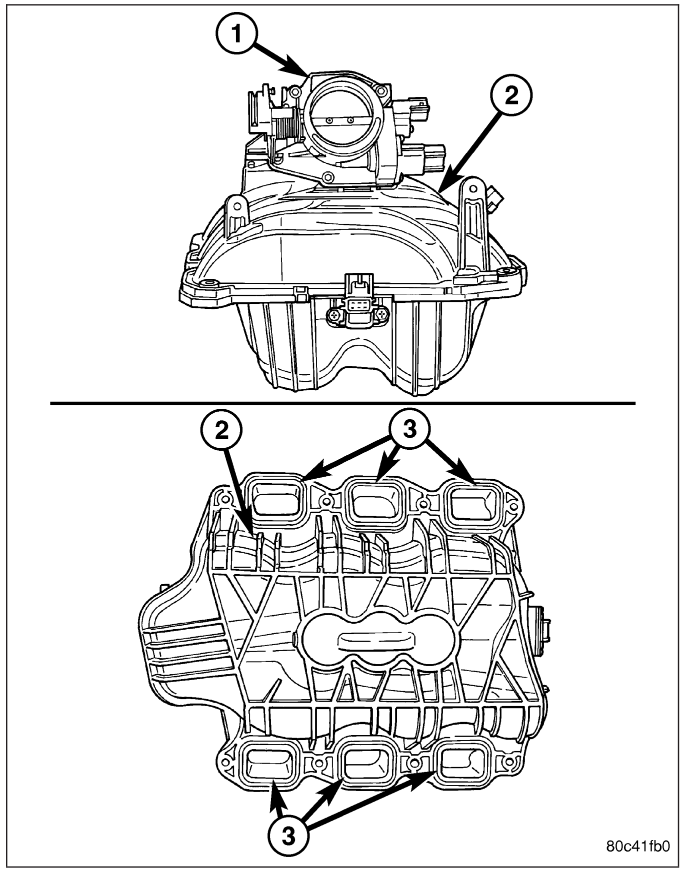
1. Position the oil pump onto the crankshaft and install two oil pump retaining bolts.
2. Position the primary timing chain tensioner and install the two retaining bolts.
3. Tighten the oil pump and primary timing chain tensioner retaining bolts to 28 N·m (250 in. lbs.) in the sequence shown.
4. Install the secondary timing chain tensioners and timing chains (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
5. Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
6. Install the pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).



# MANIFOLD-INTAKE

## DESCRIPTION

The intake manifold (2) is made of a composite material and features 300 mm (11.811 in.) long runners which maximizes low end torque. The intake manifold uses single plane sealing which consist of six individual press in place port gaskets to prevent leaks. The throttle body attaches directly to the intake manifold. Eight studs and two bolts are used to fasten the intake to the head.



## DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.**

1. Start the engine.
2. Spray a small stream of water (spray bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

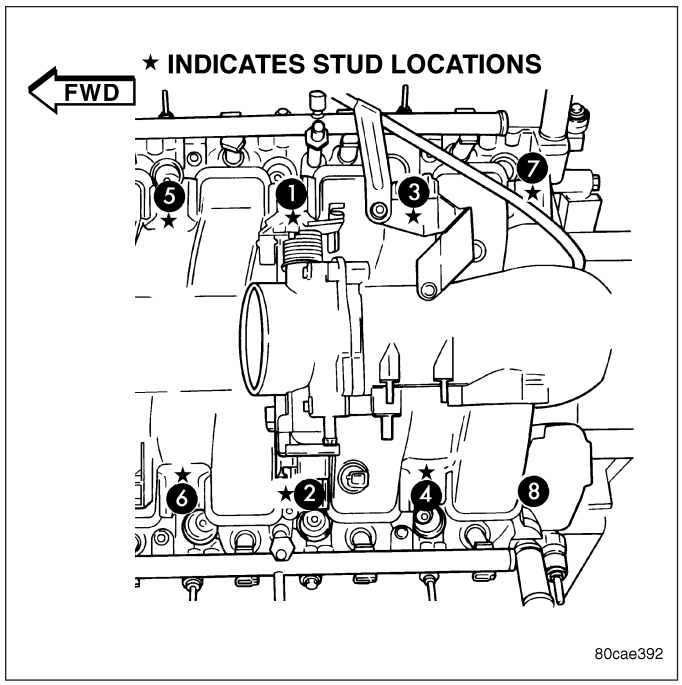
## REMOVAL

1. Disconnect negative cable from battery.
2. Remove resonator assembly and air inlet hose.
3. Disconnect throttle and speed control cables.
4. Disconnect electrical connectors for the following components: Refer to FUEL SYSTEM for component locations.
   - Manifold Absolute Pressure (MAP) Sensor
   - Intake Air Temperature (IAT) Sensor
   - Throttle Position (TPS) Sensor
   - Coolant Temperature (CTS) Sensor
   - Idle Air Control (IAC) Motor

5. Disconnect vapor purge hose, brake booster hose, speed control servo hose, positive crankcase ventilation (PCV) hose.
6. Disconnect generator electrical connections.
7. Disconnect air conditioning compressor electrical connections.
8. Disconnect left and right radio suppressor straps.
9. Disconnect and remove ignition coil towers.
10. Remove top oil dipstick tube retaining bolt and ground strap.
11. Bleed fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
12. Remove fuel rail.
13. Remove throttle body assembly and mounting bracket.
14. Drain cooling system below coolant temperature level (Refer to 7 - COOLING - STANDARD PROCEDURE).
15. Remove the heater hoses from the engine front cover and the heater core.
16. Unclip and remove heater hoses and tubes from intake manifold.
17. Remove coolant temperature sensor (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT TEMP SENSOR - REMOVAL).
18. Remove intake manifold retaining fasteners in reverse order of tightening sequence.
19. Remove intake manifold.

## INSTALLATION

1. Install intake manifold gaskets.
2. Install intake manifold.
3. Install intake manifold retaining bolts and tighten in sequence shown in to 12 N·m (105 in. lbs.).
4. Install left and right radio suppressor straps.
5. Install throttle body assembly.
6. Connect throttle cable and speed control cable to throttle body.
7. Install fuel rail.



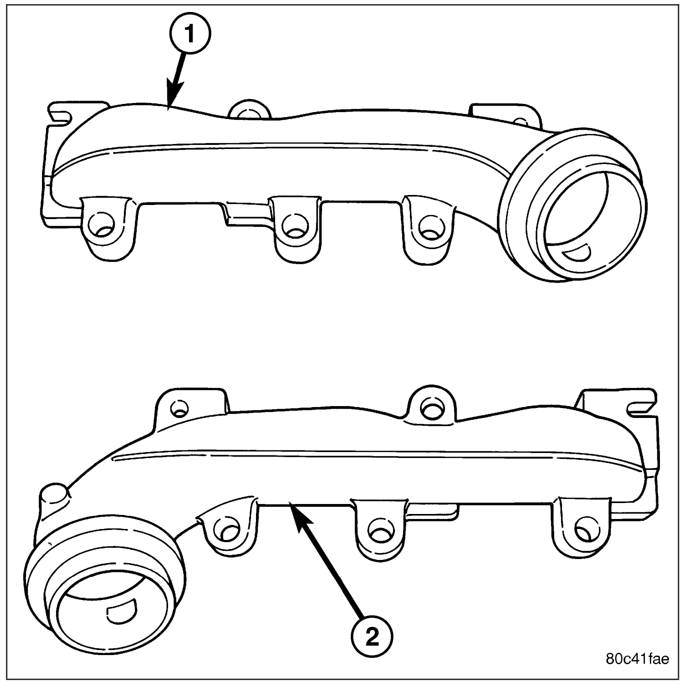
8. Install ignition coil towers.
9. Position and install heater hoses and tubes onto intake manifold.
10. Install the heater hoses to the heater core and engine front cover.
11. Connect electrical connectors for the following components:
   - Manifold Absolute Pressure (MAP) Sensor
   - Intake Air Temperature (IAT) Sensor
   - Throttle Position (TPS) Sensor
   - Coolant Temperature (CTS) Sensor
   - Idle Air Control (IAC) Motor
   - Ignition coil towers
   - Fuel injectors

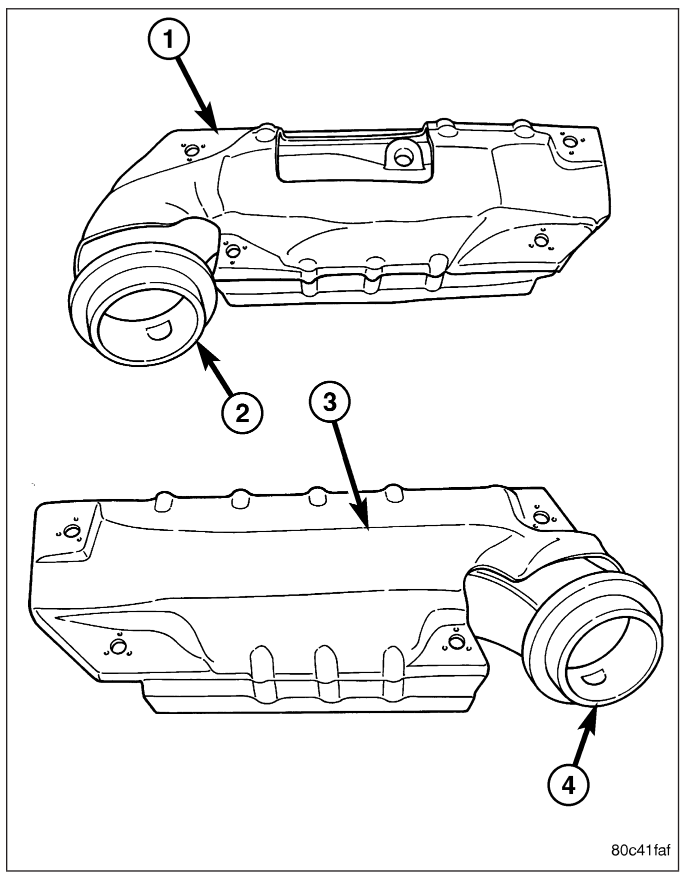
12. Install top oil dipstick tube retaining bolt and ground strap.
13. Connect generator electrical connections.
14. Connect Vapor purge hose, Brake booster hose, Speed control servo hose, Positive crankcase ventilation (PCV) hose.
15. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
16. Install resonator assembly and air inlet hose.
17. Connect negative cable to battery.

# MANIFOLD-EXHAUST

## DESCRIPTION

The exhaust manifolds (1,2) are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield (3) for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold.

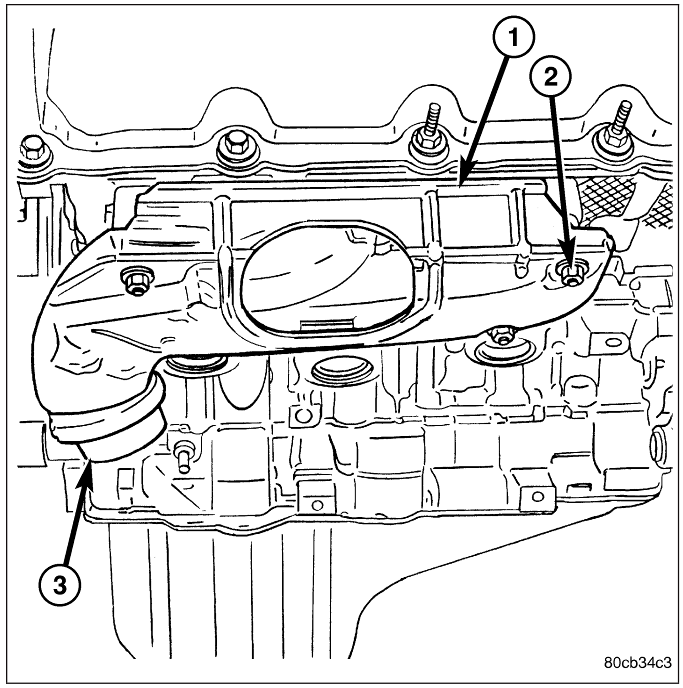




## REMOVAL

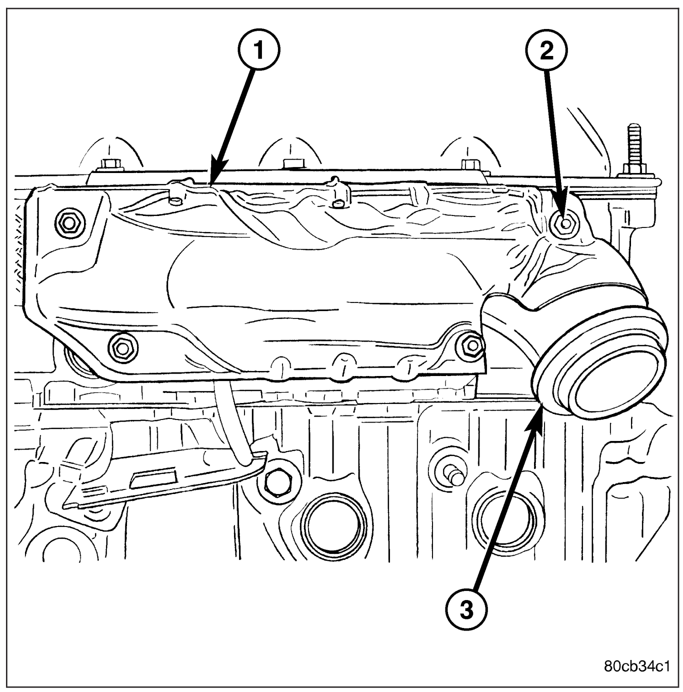
### RIGHT EXHAUST MANIFOLD

1. Disconnect the negative cable from the battery.
2. Raise and support the vehicle.
3. Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
4. Lower the vehicle.
5. Remove the exhaust heat shield (1).
6. Remove bolts, nuts and washers attaching manifold to cylinder head.
7. Remove manifold and gasket from the cylinder head.



### LEFT EXHAUST MANIFOLD

1. Disconnect the negative cable from the battery.
2. Raise and support the vehicle.
3. Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
4. Lower the vehicle.
5. Remove the exhaust heat shields (1).
6. Remove bolts, nuts and washers attaching manifold to cylinder head.
7. Remove manifold and gasket from the cylinder head.



## INSTALLATION

### RIGHT EXHAUST MANIFOLD

**CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.**

1. Position the engine exhaust manifold and gasket on the two studs located on the cylinder head. Install conical washers and nuts on these studs.
2. Install remaining conical washers. Starting at the center arm and working outward, tighten the bolts and nuts to 25 N·m (18 ft. lbs.) torque.
3. Install the exhaust heat shields.
4. Raise and support the vehicle.

**CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.**

5. Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

## LEFT EXHAUST MANIFOLD

**CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.**

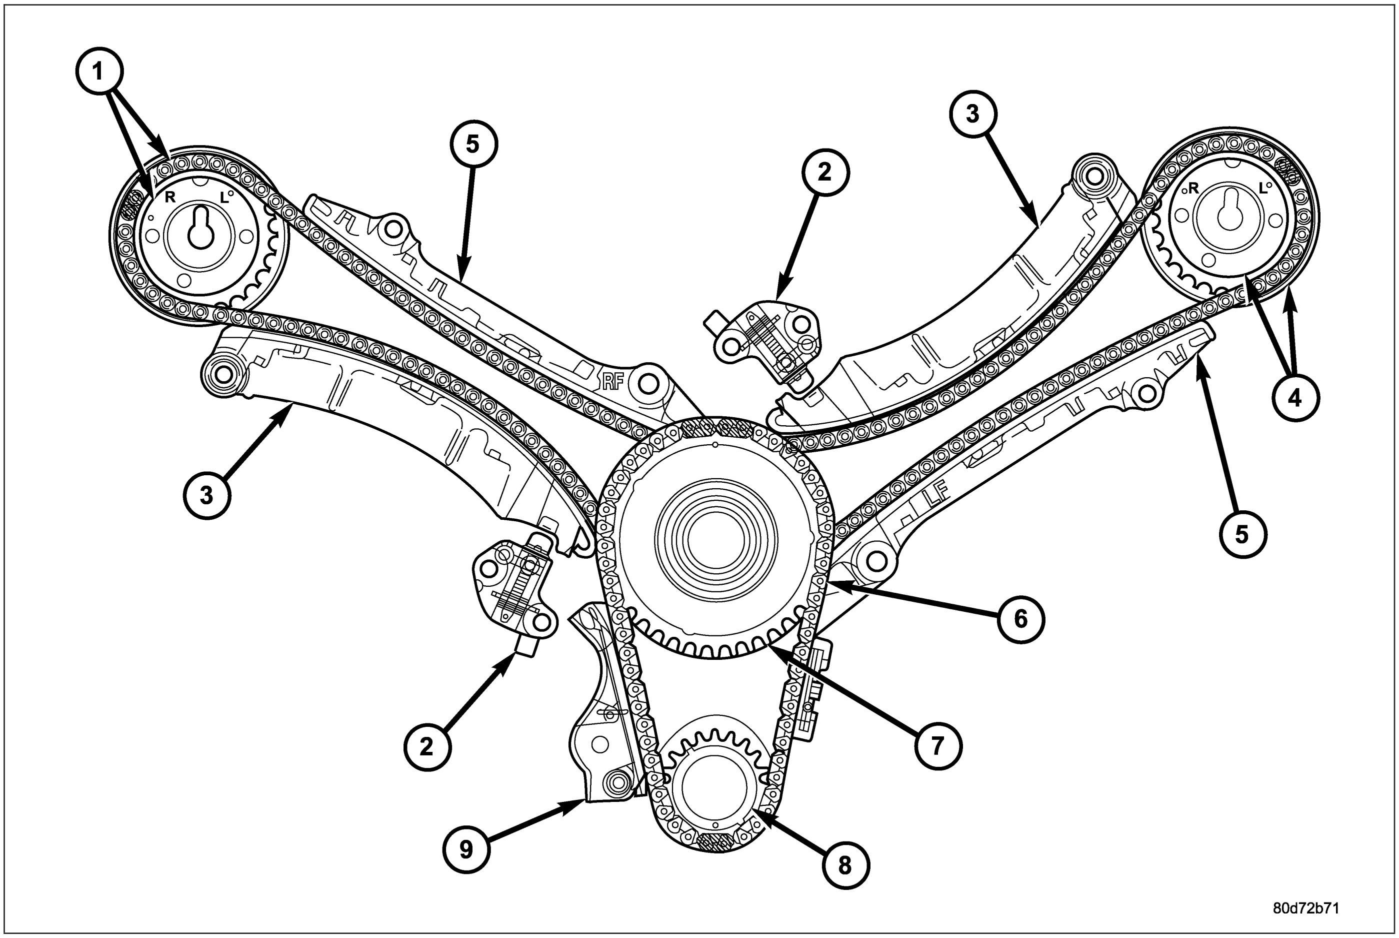
1. Position the engine exhaust manifold and gasket on the two studs located on the cylinder head. Install conical washers and nuts on these studs.
2. Install remaining conical washers. Starting at the center arm and working outward, tighten the bolts and nuts to 25 N·m (18 ft. lbs.) torque.
3. Install the exhaust heat shields.
4. Raise and support the vehicle.

**CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.**

5. Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

# VALVE TIMING

## DESCRIPTION



The timing drive system has been designed to provide quiet performance and reliability to support a **non-free wheeling** engine. Specifically the intake valves are non-free wheeling and can be easily damaged with forceful engine rotation if camshaft-to-crankshaft timing is incorrect. The timing drive system consists of a primary chain (6), two secondary timing chain drives (1,4) and a counterbalance shaft drive.

## OPERATION

The primary timing chain is a single inverted tooth chain type. The primary chain drives the large 50 tooth idler sprocket directly from a 25 tooth crankshaft sprocket. Primary chain motion is controlled by a pivoting leaf spring tensioner arm and a fixed guide. The arm and the guide both use nylon plastic wear faces for low friction and long wear. The primary chain receives oil splash lubrication from the secondary chain drive and designed oil pump leakage. The idler sprocket assembly connects the primary chain drive, secondary chain drives, and the counterbalance shaft. The idler sprocket assembly consists of two integral 26 tooth sprockets a 50 tooth sprocket and a helical gear that is press-fit to the assembly. The spline joint for the 50 tooth sprocket is a non serviceable press fit anti rattle type. A spiral ring is installed on the outboard side of the 50 tooth sprocket to prevent spline disengagement. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is a light press-fit into the cylinder block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the two bushings used in the idler sprocket assembly.

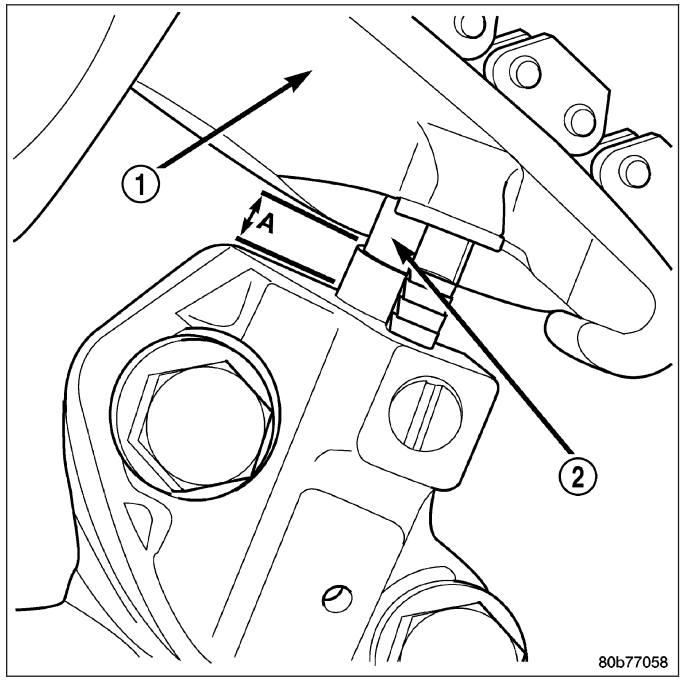
There are two secondary drive chains, both are roller type, one to drive the camshaft in each SOHC cylinder head. There are no shaft speed changes in the secondary chain drive system. Each secondary chain drives a 26 tooth cam sprocket directly from the 26 tooth sprocket on the idler sprocket assembly. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The hydraulic tensioners for the secondary chain systems are fed pressurized oil from oil reservoir pockets in the block. Each tensioner incorporates a controlled leak path through a device known as a vent disc located in the nose of the piston to manage chain loads. Each tensioner also has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The secondary timing chains receive lubrication from a small orifice in the tensioners. This orifice is protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

## STANDARD PROCEDURE

## MEASURING TIMING CHAIN WEAR

**NOTE: This procedure must be performed with the timing chain cover removed.**

1. Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
2. To determine if the secondary timing chains are worn, rotate the engine clockwise until maximum tensioner piston (2) extension is obtained. Measure the distance between the secondary timing chain tensioner housing and the step ledge on the piston. The measurement at point (A) must be less than 15mm (.5906 inches).
3. If the measurement exceeds the specification the secondary timing chains are worn and require replacement (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).



## SERVICE PROCEDURE - TIMING VERIFICATION

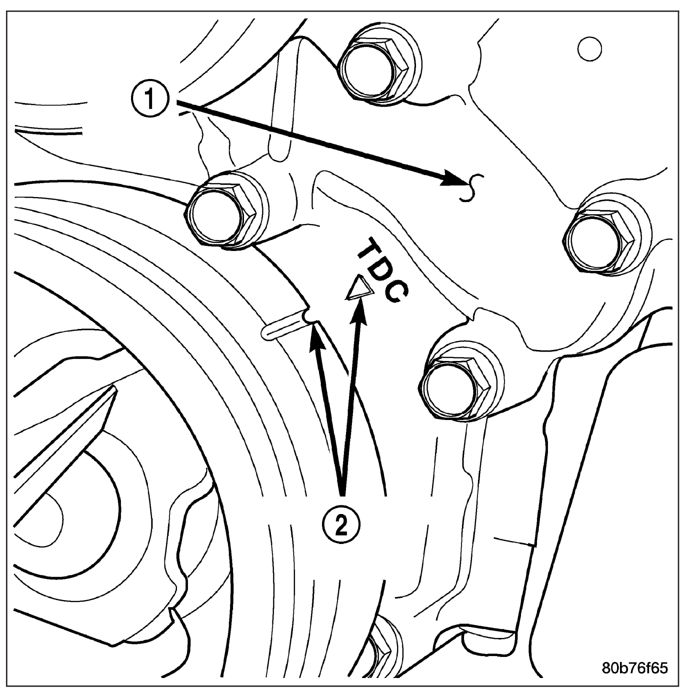
**CAUTION: The 3.7L is a non free-wheeling design engine. Therefore, correct engine timing is critical.**

**NOTE: Components referred to as left hand or right hand are as viewed from the drivers position inside the vehicle.**

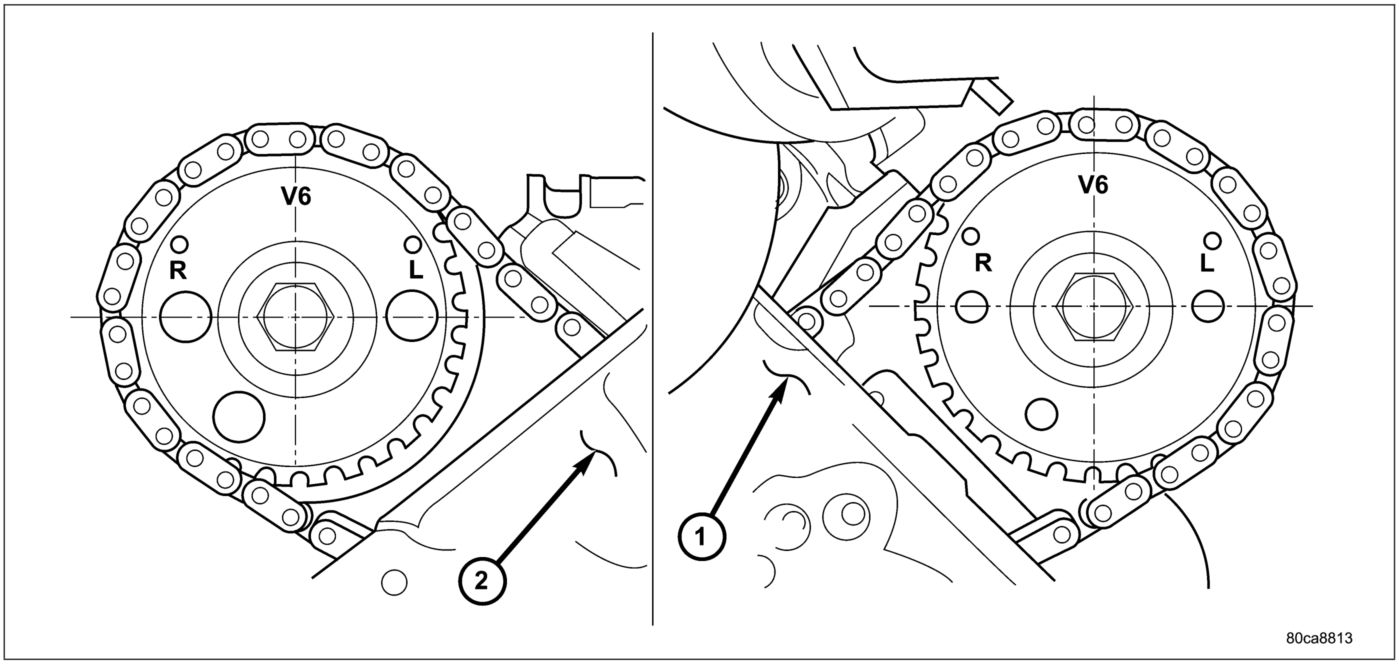
**NOTE: The blue link plates on the chains and the dots on the camshaft drive sprockets may not line up during the timing verification procedure. The blue link plates are lined up with the sprocket dots only when re-timing the complete timing drive. Once the timing drive is rotated blue link-to-dot alignment is no longer valid.**

Engine base timing can be verified by the following procedure:

1. Remove the cylinder head covers. Refer to the procedure in this section.



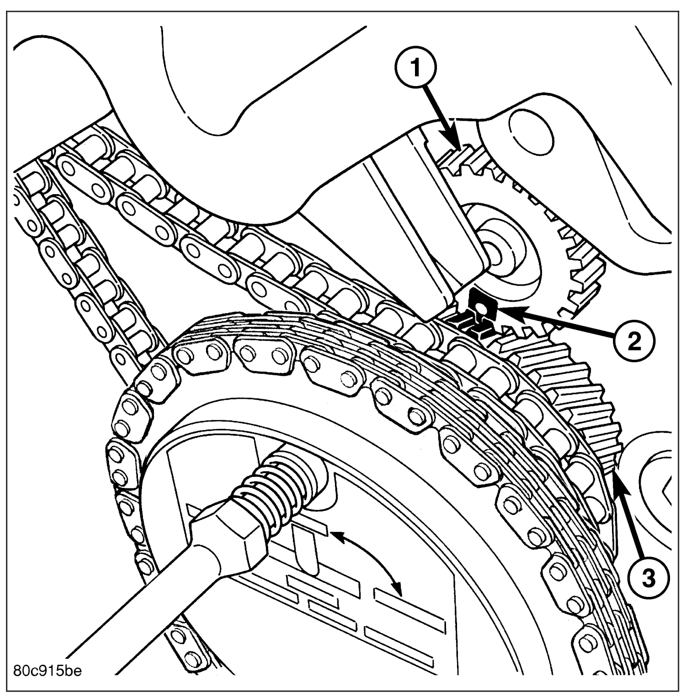
2. Using a mirror, locate the TDC arrow on the front cover. Rotate the crankshaft until the mark on the crankshaft damper (2) is aligned with the TDC arrow on the front cover (2). The engine is now at TDC.



3. Note the location of the V6 mark stamped into the camshaft drive gears (1,2). If the V6 mark on each camshaft drive gear is at the twelve o'clock position, the engine is at TDC on the exhaust stroke. If the V6 mark on each gear is at the six o'clock position, the engine is at TDC on the compression stroke.
4. If both of the camshaft drive gears are off in the same or opposite directions, the primary chain or both secondary chains are at fault. Refer to Timing Chain and Sprockets procedure in this section.
5. If only one of the camshaft drive gears is off and the other is correct, the problem is confined to one secondary chain. Refer to Single camshaft timing, in this procedure.
6. If both camshaft drive gear V6 marks are at the twelve o'clock or the six o'clock position the engine base timing is correct. Reinstall the cylinder head covers.

## COUNTER BALANCE SHAFT TIMING

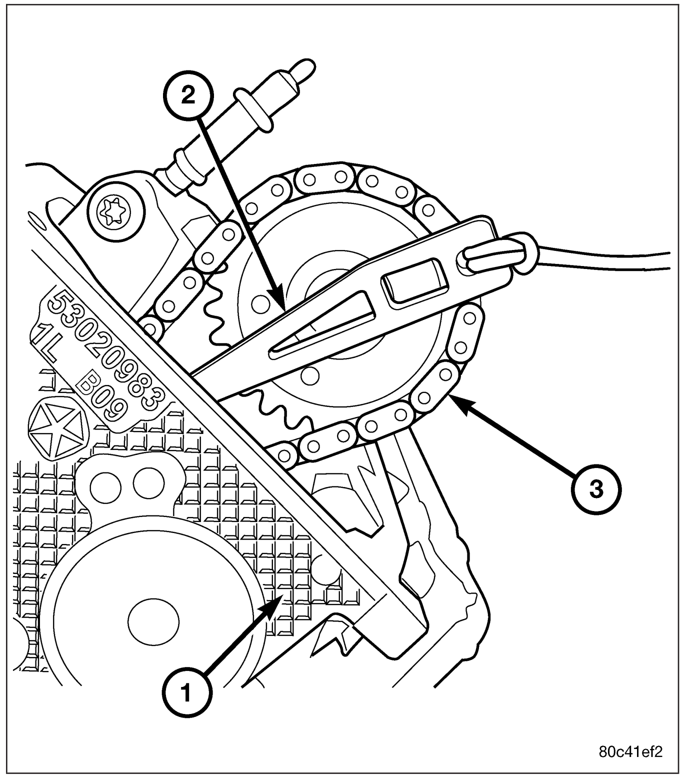
1. Ensure that the engine is at TDC with both camshaft sprocket V6 marks in the 12 o'clock position.
2. Look down the left cylinder head chain cavity. The timing dot (2) on the counter balance shaft drive gear should be in the 6 o'clock position.



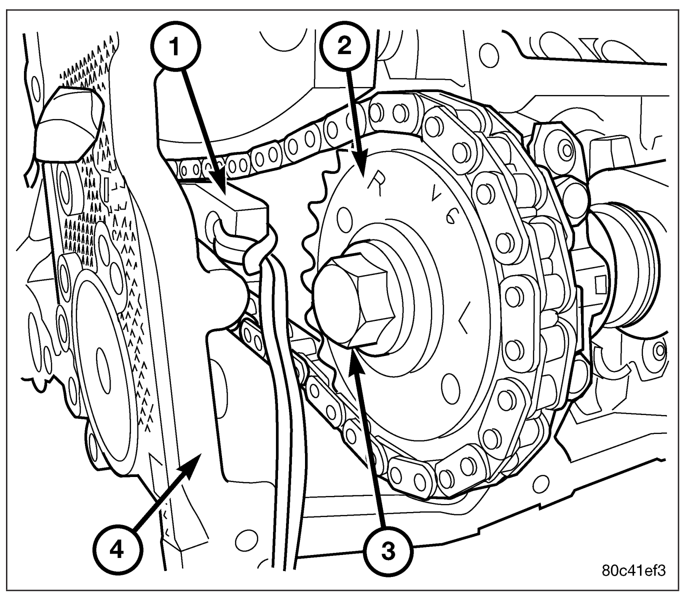
## TIMING - SINGLE CAMSHAFT

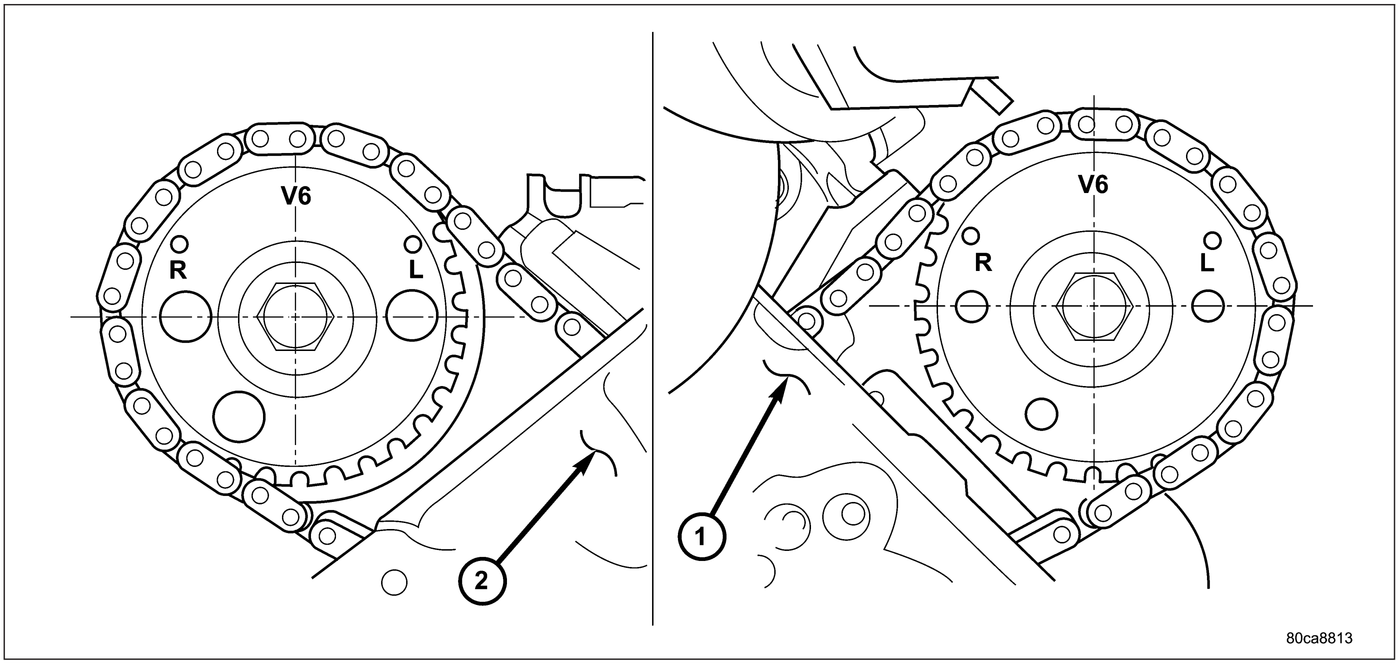
**NOTE: to adjust the timing on one camshaft, preform the following procedure.**

1. Using Chain Tensioner Wedge, Special Tool 8379 (2), stabilize the secondary chain drive. For reference purposes, mark the chain-to-sprocket position.



2. Remove the camshaft drive gear retaining bolt (3).
3. Carefully remove the camshaft drive gear from the camshaft.





4. Re-index the camshaft drive gear in the chain until the V6 mark is at the same position as the V6 mark on the opposite camshaft drive gear (1,2).
5. Using Special Tool 8428 Camshaft Wrench, rotate the camshaft until the alignment dowel on the camshaft is aligned with the slot in the camshaft drive gear.

**CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torqueing of bolt resulting in bolt failure.**

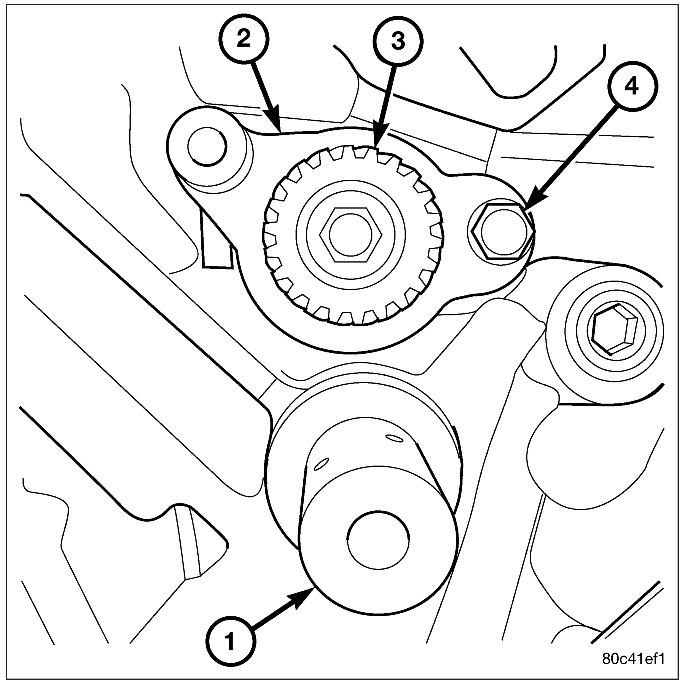
6. Position the camshaft drive gear onto the camshaft, remove oil from bolt then install the retaining bolt. Using Special Tools, Spanner Wrench 6958 with Adapter Pins 8346 and a suitable torque wrench, Tighten retaining bolt to 122 N·m (90 ft. Lbs.).
7. Remove Special Tool 8379.
8. Rotate the crankshaft two full revolutions, then verify that the camshaft drive gear V6 marks are in fact aligned.
9. Install the cylinder head covers. Refer to Cylinder Head Cover in this section.

# SHAFT-BALANCE

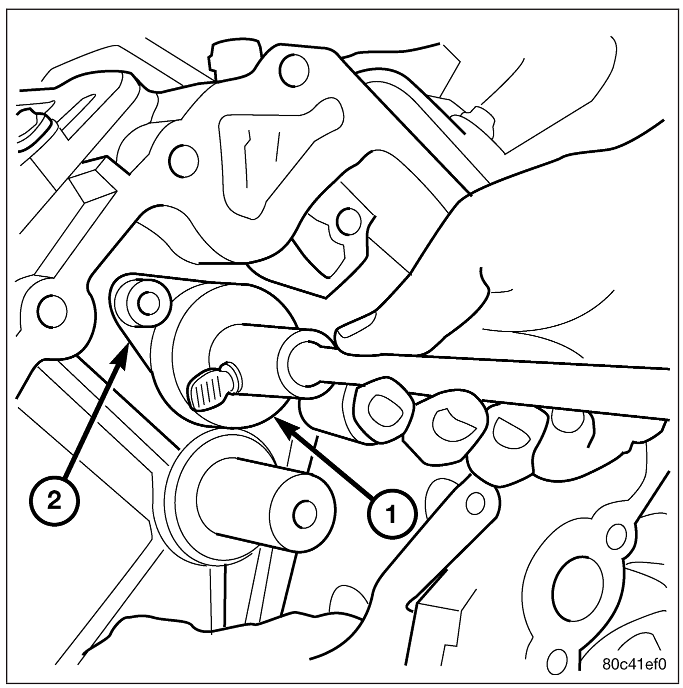
## REMOVAL

1. Remove the primary and secondary timing chains. Refer to TIMING CHAIN and SPROCKET.

**NOTE: The balance shaft and gear are serviced as an assembly. Do not attempt to remove the gear from the balance shaft.Remove the retaining bolt (4) from the counterbalance shaft thrust plate (2).**



2. Using Special Tool 8641 Counterbalance shaft remover/installer tool (1), remove the counterbalance shaft from the engine .



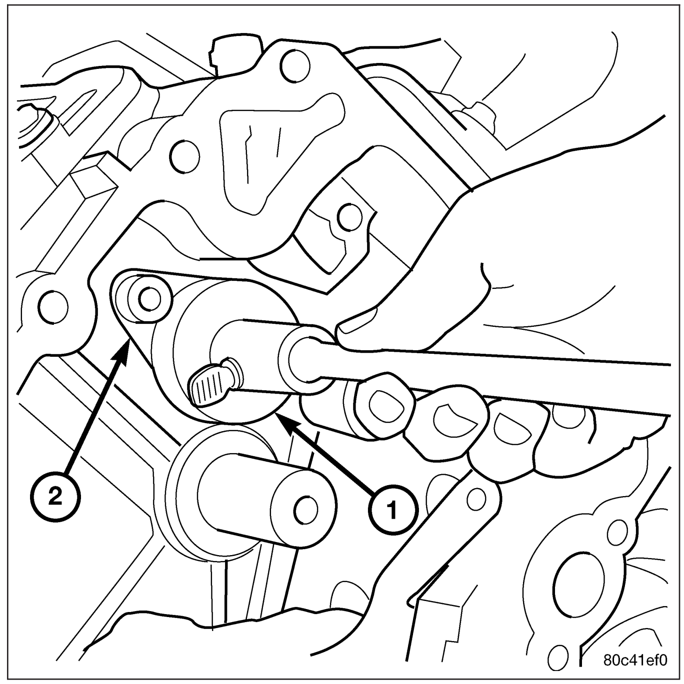
## INSTALLATION

**NOTE: The balance shaft and gear are serviced as an assembly. Do not attempt to remove the gear from the balance shaft.**

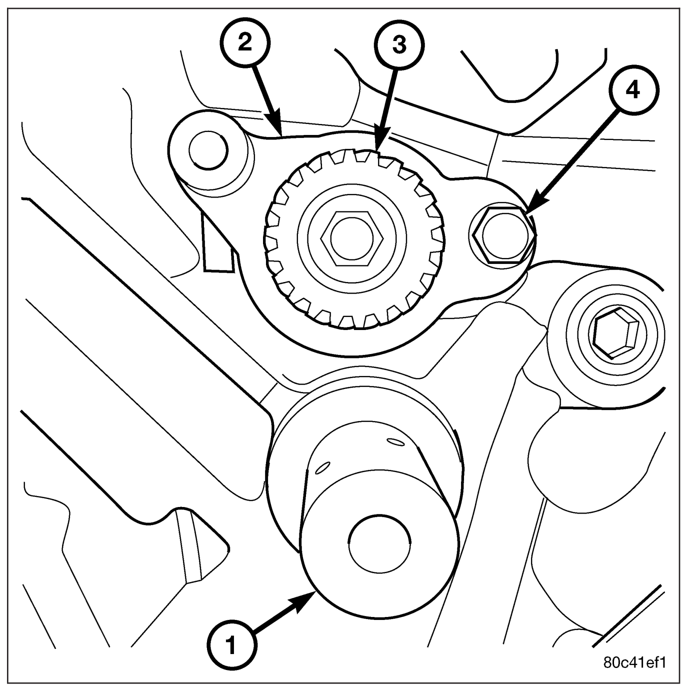
1. Coat counterbalance shaft bearing journals with clean engine oil.

**NOTE: The balance shaft is heavy, and care should be used when installing shaft, so bearings are not damaged.**

2. Using Special Tool 8641 Counterbalance shaft remover/installer tool (1), carefully install counterbalance shaft into engine.



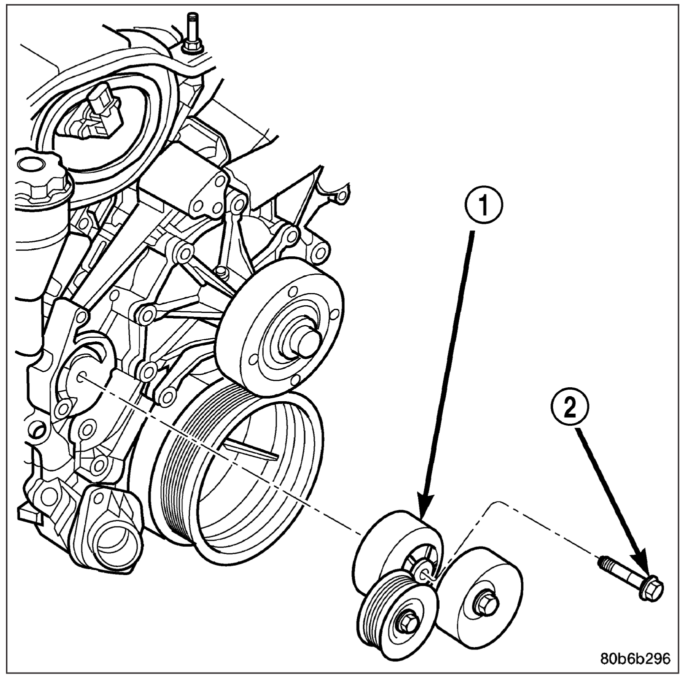
3. Install Counterbalance shaft thrust plate retaining bolt (4) finger tight.Do not tighten bolt at this time.
4. Position the right side of the thrust plate with the right chain guide bolt, install bolt finger tight.
5. Torque the thrust plate retaining bolt (4) to 28 N·m (250 in. lbs.).
6. Remove the chain guide bolt so that guide can be installed.



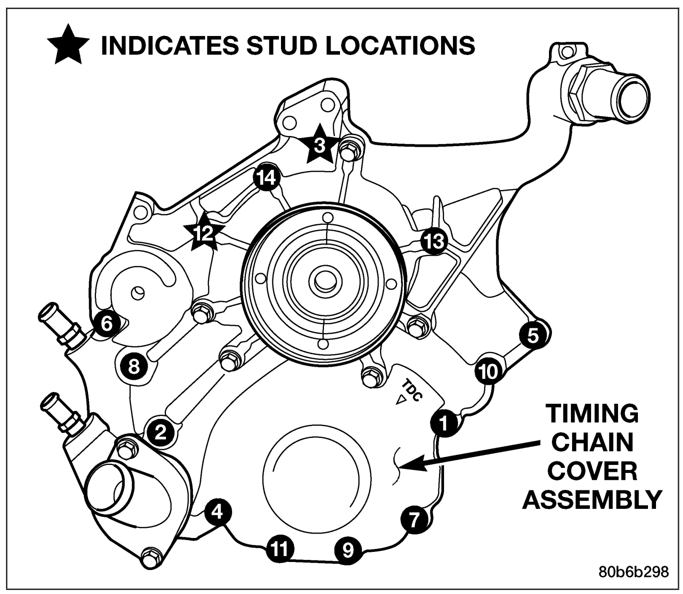
# COVER-TIMING

## REMOVAL

1. Disconnect the battery negative cable.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove electric cooling fan and fan shroud assembly.
4. Remove fan and fan drive assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
5. Disconnect both heater hoses at timing cover.
6. Disconnect lower radiator hose at engine.
7. Remove accessory drive belt tensioner assembly (1).



8. Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
9. Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
10. Remove A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).



**CAUTION: The 3.7L engine uses an anerobic sealer instead of a gasket to seal the front cover to the engine block, from the factory. For service, Mopar® Grey Engine RTV sealant must be substituted.**

**NOTE: It is not necessary to remove the water pump for timing cover removal.**

11. Remove the bolts holding the timing cover to engine block..
12. Remove the timing cover.

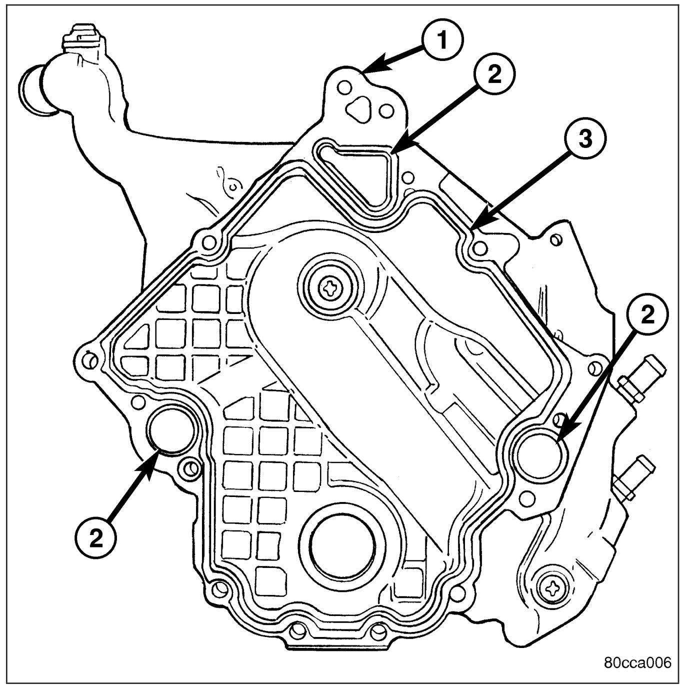
## INSTALLATION

**CAUTION: Do not use oil based liquids to clean timing cover or block surfaces. Use only rubbing alcohol, along with plastic or wooden scrapers. Use no wire brushes or abrasive wheels or metal scrapers, or damage to surfaces could result.**

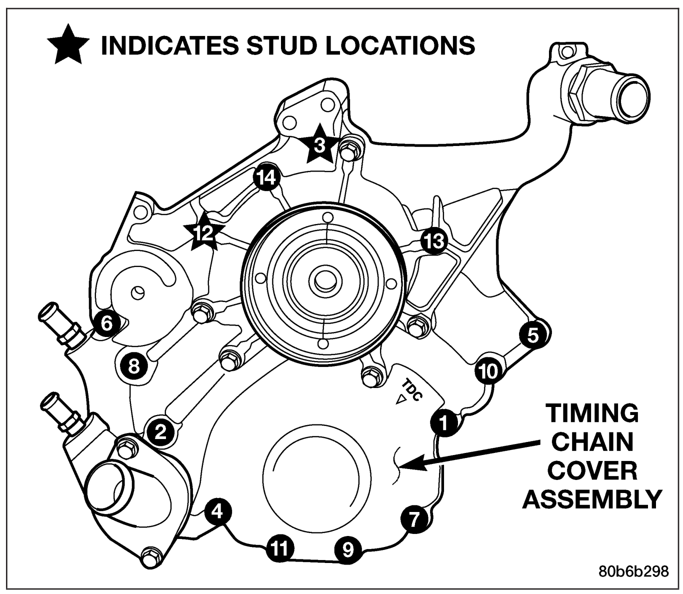
1. Clean timing chain cover and block surface using rubbing alcohol.

**CAUTION: The 3.7L uses a special anerobic sealer instead of a gasket to seal the timing cover to the engine block, from the factory. For service repairs, Mopar® Grey Engine RTV must be used as a substitute.**

2. Inspect the water passage o-rings for any damage, and replace as necessary.
3. Apply Mopar® Grey Engine RTV sealer (3) to the front cover following the path below, using a 3 to 4mm thick bead.



4. Install cover. Tighten flange head fasteners in sequence shown to 58 N·m (43 ft. lbs.).
5. Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
6. Install the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).
7. Install the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
8. Install accessory drive belt tensioner assembly (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - INSTALLATION).
9. Install radiator upper and lower hoses.
10. Install both heater hoses.
11. Install electric fan shroud and viscous fan drive assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
12. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
13. Connect the battery negative cable.



# SHAFT-IDLER

## REMOVAL

1. Remove the primary and secondary timing chains and sprockets. Refer to procedure in this section.

**NOTE: To remove the idler shaft, it is necessary to tap threads into the shaft, to install the removal tool.**

2. Using a 12 mm X 1.75 tap, cut threads in the idler shaft center bore.
3. Cover the radiator core with a suitable cover.

**CAUTION: Use care when removing the idler shaft, Do not strike the radiator cooling fins with the slide hammer.**

4. Using Special Tool 8517 Slide Hammer, remove the idler shaft.

## INSTALLATION

1. Thoroughly clean the idler shaft bore.
2. Position the idler shaft in the bore.

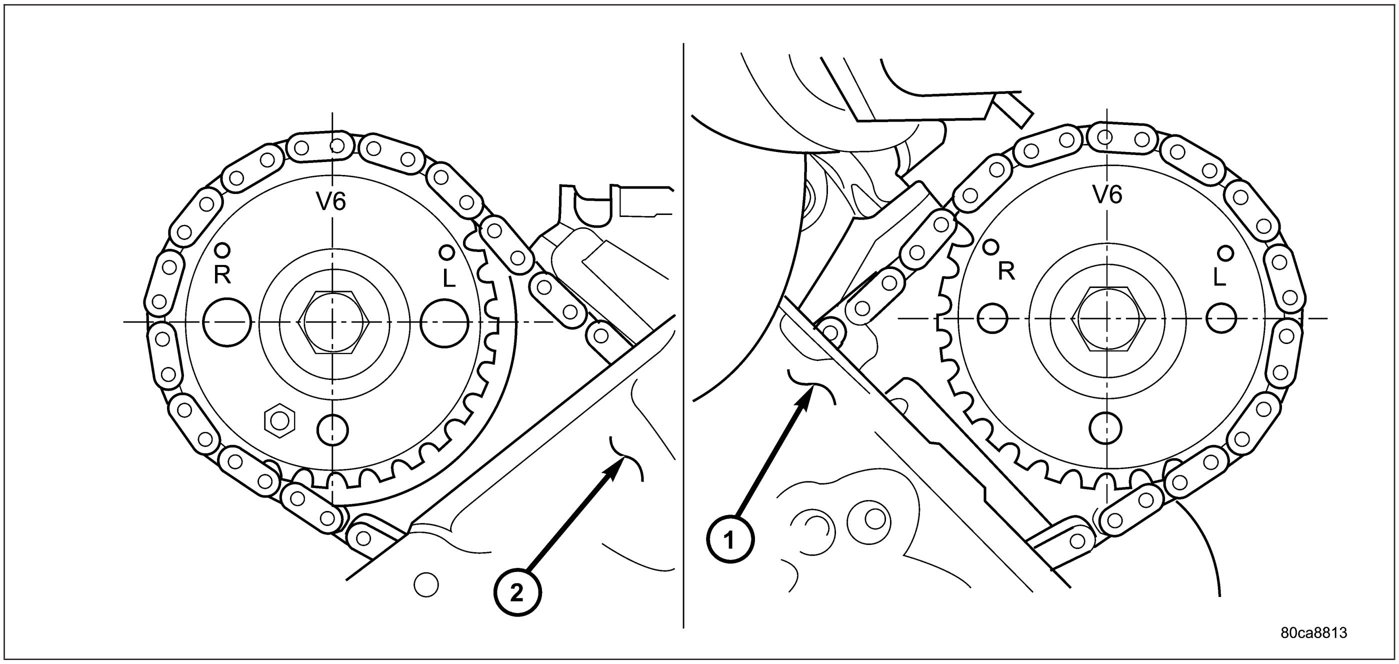
**NOTE: The two lubrication holes in the idler shaft do not require any special alignment.**

**NOTE: Before using the retaining bolt to install the idler shaft, coat the threads and the pilot on the idler shaft, with clean engine oil.**

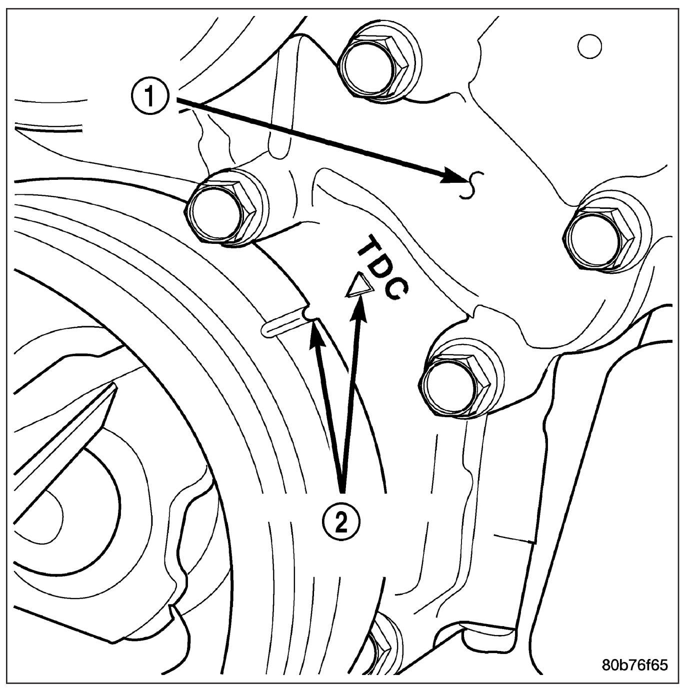
3. Using the primary idler sprocket retaining bolt and washer, carefully draw the idler shaft into the bore until fully seated.
4. Coat the idler shaft with clean engine oil.
5. Install the timing chains and sprockets. Refer to procedure in this section.

# CHAIN AND SPROCKETS-TIMING

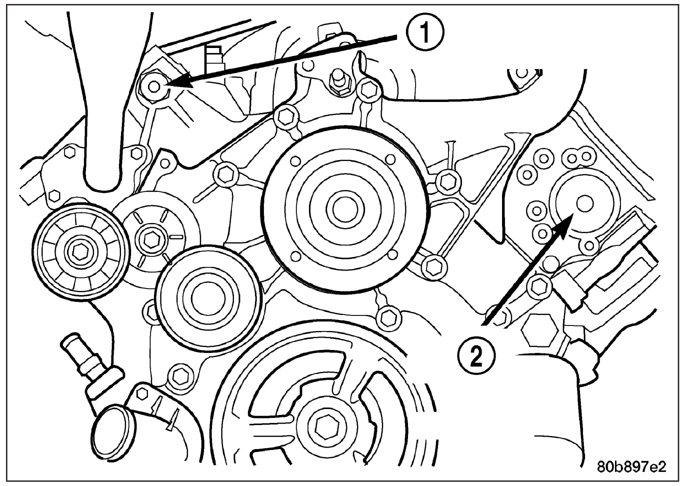
## REMOVAL



1. Disconnect negative cable from battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove right and left cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
4. Remove radiator fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
5. Rotate engine until timing mark on crankshaft damper (2) aligns with TDC mark on timing chain cover (2) and the camshaft sprocket "V6" marks are at the 12 o'clock position (No. 1 TDC exhaust stroke).



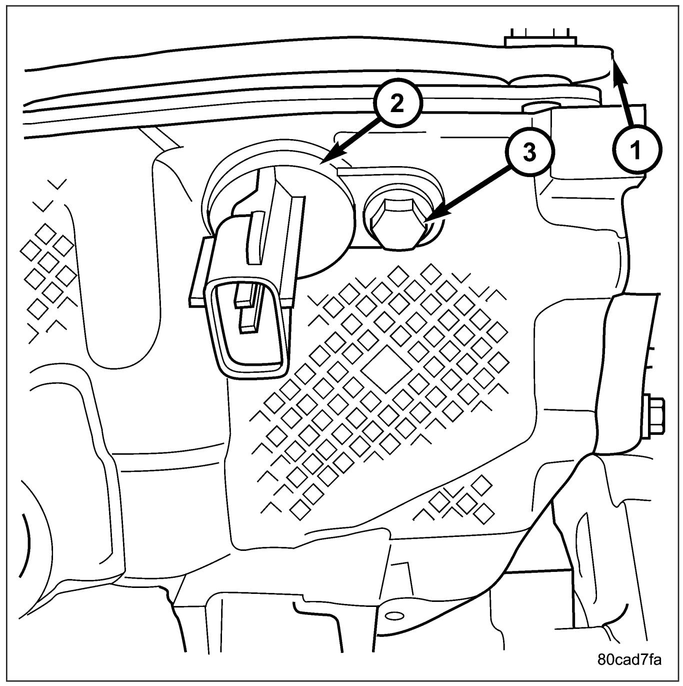
6. Remove power steering pump (Refer to 19 - STEERING/PUMP - REMOVAL).
7. Remove access plug from left and right cylinder heads for access to chain guide fasteners.
8. Remove the oil fill housing to gain access to the right side tensioner arm fastener.
9. Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) and timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).



10. Collapse and pin primary chain tensioner.

**CAUTION: Plate behind left secondary chain tensioner could fall into oil pan. Therefore, cover pan opening.**

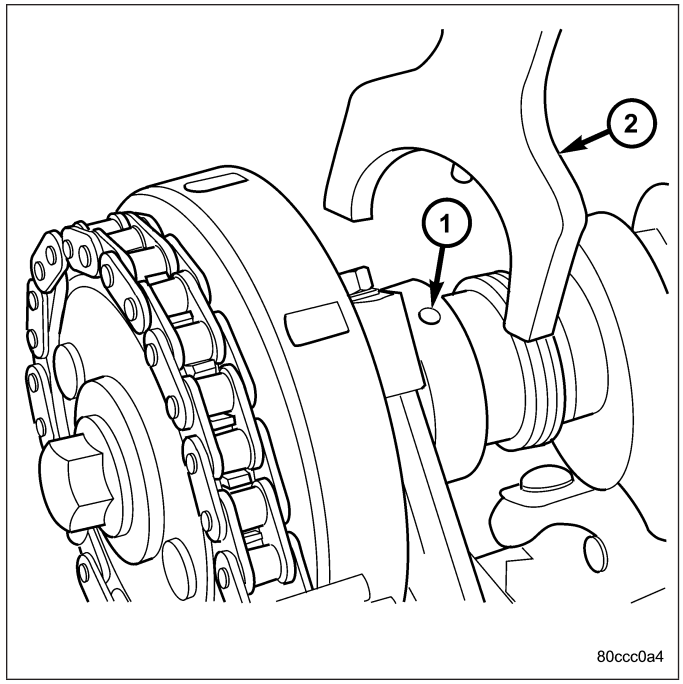
11. Remove secondary chain tensioners.
12. Remove camshaft position sensor (2).



**CAUTION: Care should be taken not to damage camshaft target wheel. Do not hold target wheel while loosening or tightening camshaft sprocket. Do not place the target wheel near a magnetic source of any kind. A damaged or magnetized target wheel could cause a vehicle no start condition.**

**CAUTION: Do not forcefully rotate the camshafts or crankshaft independently of each other. Damaging intake valve to piston contact will occur. Ensure negative battery cable is disconnected to guard against accidental starter engagement.**

13. Remove left and right camshaft sprocket bolts.
14. While holding the left camshaft steel tube with Special Tool 8428 Camshaft Wrench (2), remove the left camshaft sprocket. Slowly rotate the camshaft approximately 5 degrees clockwise to a neutral position.
15. While holding the right camshaft steel tube with Special Tool 8428 Camshaft Wrench (2), remove the right camshaft sprocket.



16. Remove idler sprocket assembly bolt.
17. Slide the idler sprocket assembly and crank sprocket forward simultaneously to remove the primary and secondary chains.
18. Remove both pivoting tensioner arms and chain guides.
19. Remove primary chain tensioner.

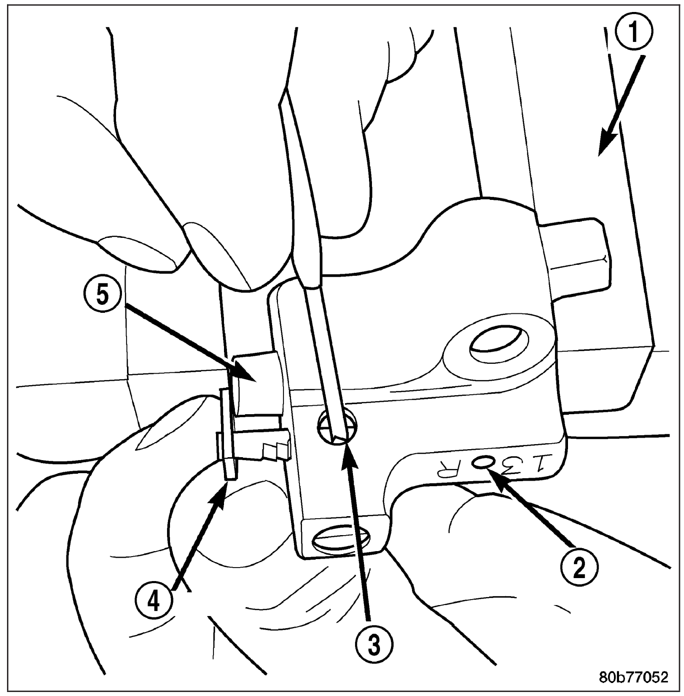
## INSPECTION

Inspect the following components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Idler sprocket assembly spline joint. The joint should be tight with no backlash or axial movement.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep. If plastic face is severely grooved or melted, the tensioner lube jet may be clogged. The tensioner should be replaced.
- Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner tensioner arm and chain should be replaced.
- Primary chain tensioner plastic faces. Replace as required.

## INSTALLATION

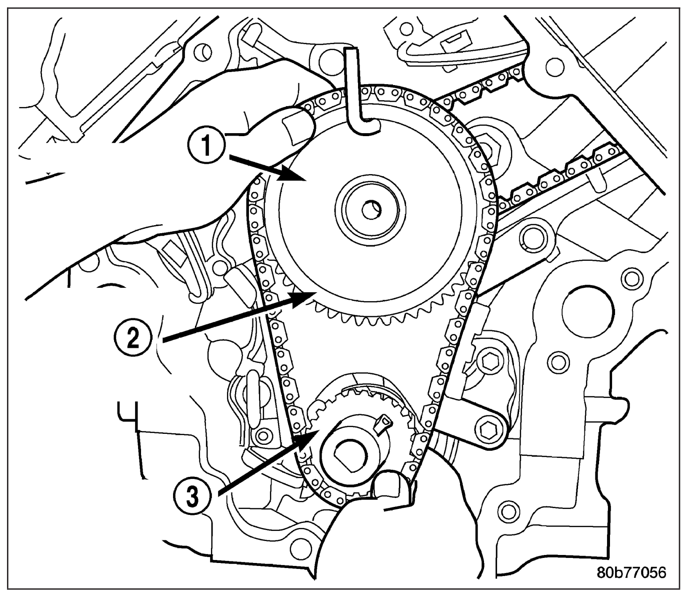
1. Using a vise, lightly compress the secondary chain tensioner piston (5) until the piston step is flush with the tensioner body. Using a pin or suitable tool, release ratchet pawl by pulling pawl back against spring force through access hole on side of tensioner. While continuing to hold pawl back, Push ratchet device to approximately 2 mm from the tensioner body. Install Special Tool 8514 lock pin (3) into hole on front of tensioner. Slowly open vise (1) to transfer piston spring force to lock pin.
2. Position primary chain tensioner over oil pump and insert bolts into lower two holes on tensioner bracket. Tighten bolts to 28 N·m (250 in. lbs.).



3. Install right side chain tensioner arm. Install Torx® bolt. Tighten Torx® bolt to 28 N·m (250 in. lbs.).

**CAUTION: The silver bolts retain the guides to the cylinder heads and the black bolts retain the guides to the engine block.**

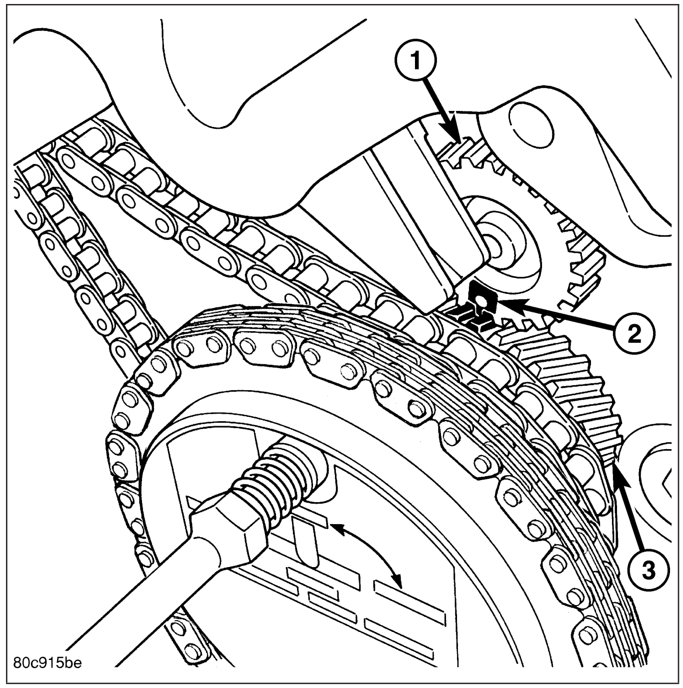
4. Install the left side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).
5. Install left side chain tensioner arm, and Torx® bolt. Tighten Torx® bolt to 28 N·m (250 in. lbs.).
6. Install the right side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).
7. Install both secondary chains onto the idler sprocket. Align two plated links on the secondary chains to be visible through the two lower openings on the idler sprocket (4 o'clock and 8 o'clock). Once the secondary timing chains are installed, position special tool 8429 (1) to hold chains in place for installation.

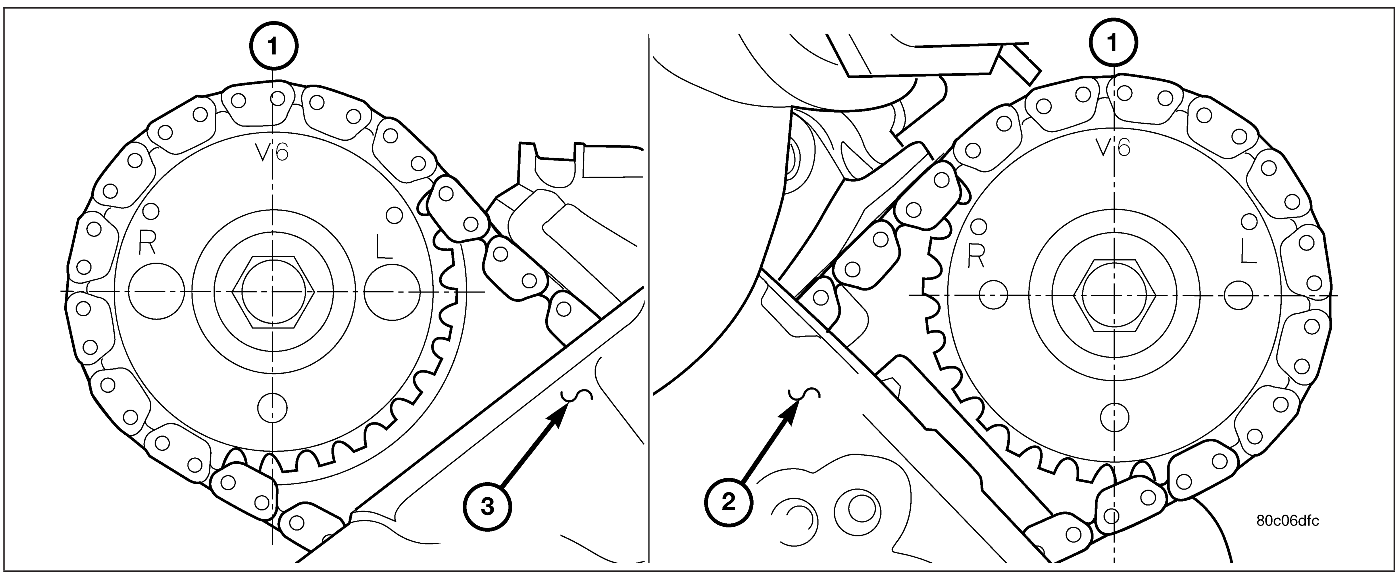


8. Align primary chain double plated links with the timing mark at 12 o'clock on the idler sprocket. Align the primary chain single plated link with the timing mark at 6 o'clock on the crankshaft sprocket.
9. Lubricate idler shaft and bushings with clean engine oil.

**NOTE: The idler sprocket must be timed to the counterbalance shaft drive gear before the idler sprocket is fully seated.**

10. Install all chains, crankshaft sprocket, and idler sprocket as an assembly. After guiding both secondary chains through the block and cylinder head openings, affix chains with a elastic strap or equivalent. This will maintain tension on chains to aid in installation. Align the timing mark (2) on the idler sprocket gear (3) to the timing mark on the counterbalance shaft drive gear (1), then seat idler sprocket fully. Before installing idler sprocket bolt, lubricate washer with oil, and tighten idler sprocket assembly retaining bolt to 34 N·m (25 ft. lbs.).





**NOTE: It will be necessary to slightly rotate camshafts for sprocket installation.**

11. Align left camshaft sprocket “L” dot to plated link on chain.
12. Align right camshaft sprocket “R” dot to plated link on chain.

**CAUTION: Remove excess oil from the camshaft sprocket bolt. Failure to do so can result in over-torque of bolt resulting in bolt failure.**

13. Remove Special Tool 8429, then attach both sprockets to camshafts. Remove excess oil from bolts, then Install sprocket bolts, but do not tighten at this time.
14. Verify that all plated links are aligned with the marks on all sprockets and the “V6” marks on camshaft sprockets are at the 12 o’clock position.

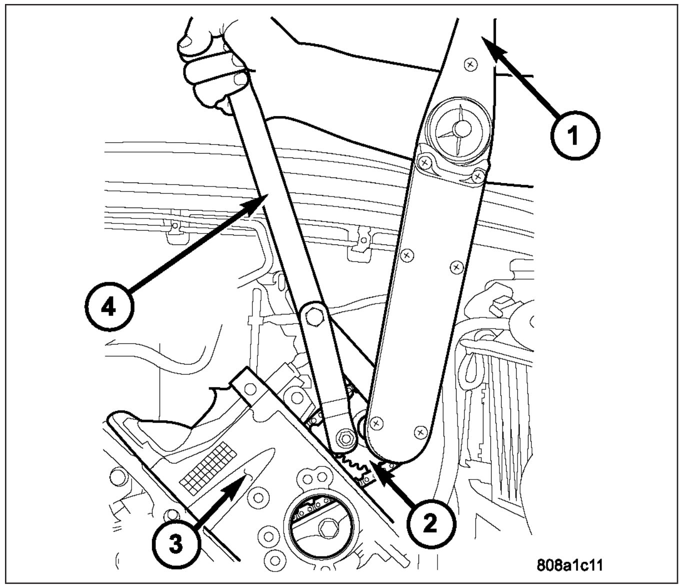
**CAUTION: Ensure the plate between the left secondary chain tensioner and block is correctly installed.**

15. Install both secondary chain tensioners. Tighten bolts to 28 N·m (250 in. lbs.).

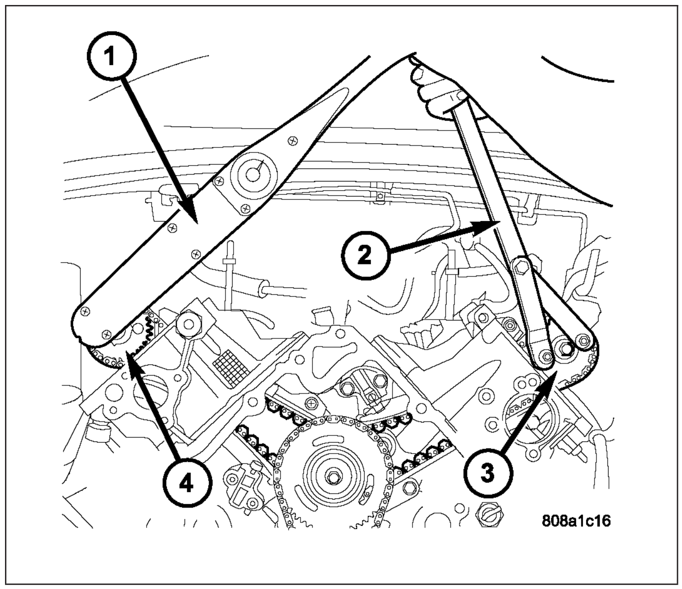
**NOTE: Left and right secondary chain tensioners are not common.**

16. Remove all 3 locking pins from tensioners.

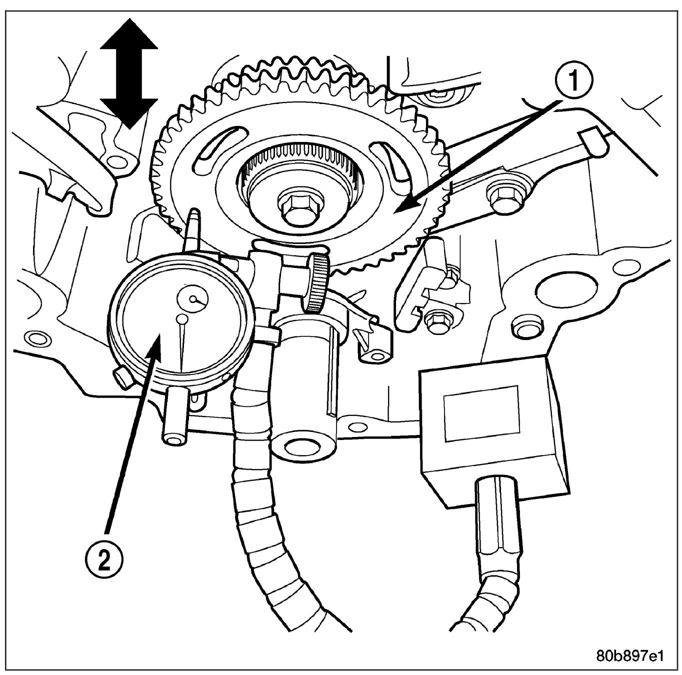
**CAUTION: After pulling locking pins out of each tensioner, DO NOT manually extend the tensioner(s) ratchet. Doing so will over tension the chains, resulting in noise and/or high timing chain loads.**



17. Using Special Tool 6958, Spanner with Adaptor Pins 8346, (4) tighten left and right camshaft sprocket bolts to 122 N·m (90 ft. lbs.).
18. Rotate engine two full revolutions. Verify timing marks are at the follow locations:
    - primary chain idler sprocket dot is at 12 o'clock
    - primary chain crankshaft sprocket dot is at 6 o'clock
    - secondary chain camshaft sprockets "V6" marks are at 12 o'clock
    - counterbalancer shaft drive gear dot is aligned to the idler sprocket gear dot
19. Lubricate all three chains with engine oil.

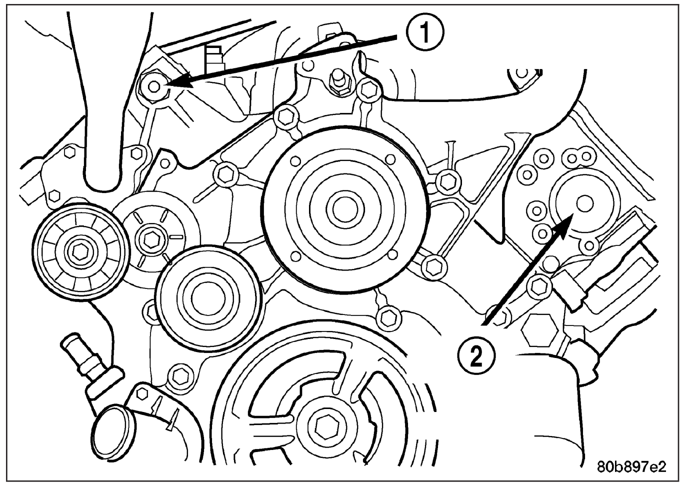


20. After installing all chains, it is recommended that the idler gear end play be checked. The end play must be within 0.10 -0.25 mm (0.004 - 0.010 in.). If not within specification, the idler gear must be replaced.
21. Install timing chain cover and crankshaft damper. Refer to procedures.
22. Install cylinder head covers (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).



**NOTE: Before installing threaded plug in right cylinder head, the plug must be coated with sealant to prevent leaks.**

23. Coat the large threaded access plug with **Mopar® Thread Sealant with Teflon**, then install into the right cylinder head (1) and tighten to 81 N·m (60 ft. lbs.) .
24. Install the oil fill housing.
25. Install access plug in left cylinder head (2).
26. Install power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).
27. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
28. Connect negative cable to battery.



# ENGINE - 2.8L DIESEL

## TABLE OF CONTENTS

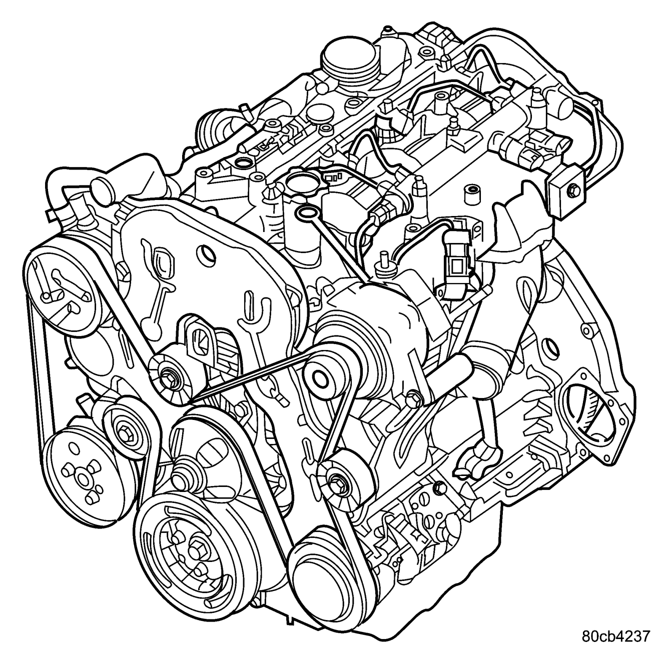
# ENGINE - 2.8L DIESEL

## DESCRIPTION

### 2.8L COMMON RAIL DIESEL ENGINE

The 2.8L (2776cc) four-cylinder “common rail” direct injection engine is an in-line overhead valve design. The engine utilize a cast iron cylinder block with a closed lower structure and tunnel housing for the crankshaft. The engine has a one piece aluminum cylinder head with four valves per cylinder and dual overhead cam shafts. The 2.8L is turbocharged, intercooled and also equipped with a EGR cooler..

The identification stamp for the 2.8L is located on the left side of the engine block, above the starter. The engine code label is located on the front timing cover and is the same as the engine I.D. and serial number. There is also a fuel system label on the front timing cover used for fuel system identification during ECM programming.



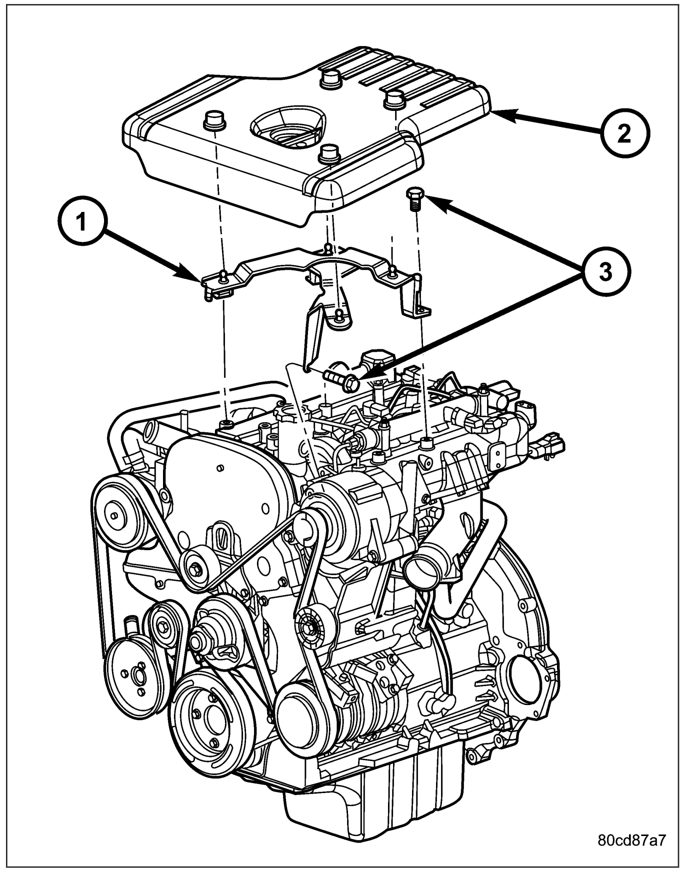
80cb4237

| DESCRIPTION | SPECIFICATION |
|---|---|
| Displacement 2.8L | 2.8L (2776cc) |
| Bore | 94.00 mm |
| Stroke | 100.00 mm |
| Compression Ratio | 17.5:1 |
| Vacuum at Idle | 700 mm/Hg (27.5 In/Hg) |
| Belt Tension | Automatic Belt Tensioner |
| Thermostat Opening | 80°C ± 2°C |
| Generator Rating | Denso 12V-95A |
| Cooling System Capacity | 13.8 Liters W/O Auxiliary Heater<br>16.6 Liters With Auxiliary Heater |
| Engine Oil Capacity | 6.0L (6.3 Qt.) W/Filter Change |
| Timing System | Belt Driven DOHC Overhead Camshafts |
| Air Intake | Dry Filter With Turbocharger and Charge Air Cooler |
| Fuel Supply | Gear - Style Pump Incorporated In The High Pressure Pump |
| Fuel System | Direct Fuel Injection Common Rail System |
| Combustion Cycle | 4 Stroke |
| Cylinder Compression Difference Between Cylinders | 5 Bar (72.5 psi.) |
| Cooling System | Water Cooling |
| Injection Pump | CP3 2nd. Generation Common Rail System |
| Lubrication | Pressure Lubricated By Rotary Pump |

| DESCRIPTION | SPECIFICATION |
|---|---|
| Minimum Oil Pressure (Warm) | 0.7 Bar (10 psi.) at Idle<br>2 Bar (29 psi) at 3800 rpm |
| Engine Rotation | Clockwise Viewed From Front Cover |

## ENGINE COVER

The insulated engine cover (2) is made of plastic and used cosmetically to cover the top of the engine and greatly reduce engine noise.



## REMOVAL

## ENGINE - 2.8L DIESEL

**NOTE: The export manual transmissions must be removed from the vehicle before removing the engine.**

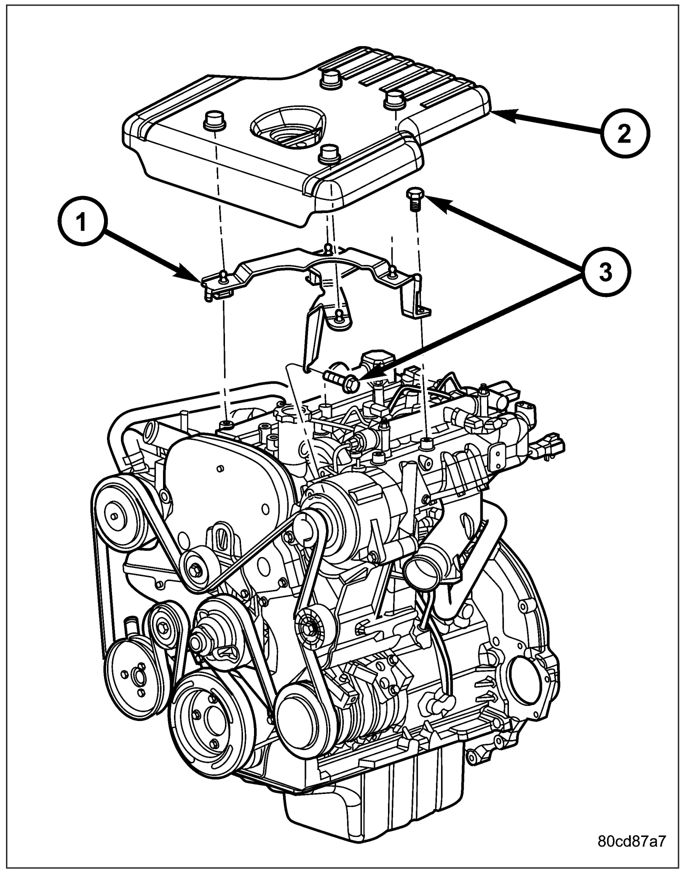
1. Disconnect negative battery cable.
2. Disconnect under hood lamp from the hood assembly.
3. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
4. Remove engine cover (Refer to 9 - ENGINE - REMOVAL).
5. Remove air cleaner assembly from the engine bay.
6. Recover refrigerant from A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
7. Disconnect high side refrigerant line from the upper radiator support bracket.
8. Remove upper radiator support bracket retaining bolts and remove the support bracket.
9. Remove front grille and head lamp panel.
10. Remove from fascia.
11. Remove high side refrigerant line retaining nut and remove the line from the condenser assembly. Position the line out of the way.

12. Remove cooling fan and fan drive viscous clutch assembly.
13. Remove fan shroud retaining bolts and remove fan assembly and shroud together.
14. Disconnect charge air cooler hoses from charge air cooler.
15. Disconnect engine coolant hoses from engine assembly.
16. Disconnect coolant reservoir hose from radiator.
17. Remove low side refrigerant line retaining nut and remove line from the condenser assembly. Position the line out of the way.
18. Remove condenser assembly retaining bolts and remove condenser from the vehicle.
19. Remove power steering cooler retaining bolts and unclip air deflectors from both sides of the radiator (cooling module) assembly.
20. Remove cooling module assembly.
21. Remove charge air cooler hose from the intake manifold.
22. Remove high side refrigerant line from A/C compressor and remove high side line from the engine bay.
23. Remove coolant reservoir retaining nuts and clips retaining electrical harness, position reservoir aside to allow access to remaining hoses.
24. Disconnect remaining hoses from coolant reservoir and remove reservoir.
25. Remove accessory drive belt from the engine (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
26. Accessing bolts through the pump pulley, remove power steering pump retaining bolts and position pump aside with lines still attached.
27. Remove engine cover mounting bracket retaining bolts and remove the bracket from the top of the engine.
28. Disconnect heater core inlet and outlet hoses from the heater core.
29. Remove generator from engine (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL). This will provide access to the wires beneath it.
30. Remove low side refrigerant line retaining nuts from accumulator and compressor and remove from engine bay.
31. Trace engine wiring and disconnect electrical connectors and tie straps one at a time until all wiring is disconnected from the engine assembly. When all the engine electrical harness is disconnected position the harness aside.
32. Remove coolant elbow retaining bolts from rear of the water pump.
33. Disconnect coolant hoses leading from the coolant elbow and remove coolant elbow from engine.
34. Remove oil cooler adapter.
35. Raise and support the vehicle.
36. Remove oil filter and adaptor assembly.
37. Remove starter motor from engine (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
38. Remove chassis ground wire above starter mounting location on the engine block.
39. Support the transmission with a jackstand.
40. Remove the flex plate access cover.
41. Remove the flex plate fasteners.
42. Remove transmission cross member fasteners.
43. Lower the transmission.
44. Remove the upper transmission to engine fasteners.
45. Raise the transmission.
46. Install the transmission cross member fasteners.
47. Remove the transmission jack.
48. Remove exhaust inlet pipe retaining bolts and disconnect exhaust pipe from turbocharger.
49. Remove transmission to engine retaining bolts.
50. Separate transmission cooler line(s) from retainer.
51. Connect a suitable lifting device to engine assembly.
52. Remove right side engine mount retaining nut.

53. Lower vehicle.
54. Remove left side engine mount retaining nut.
55. Remove exhaust manifold rear heat shield.
56. Disconnect the fuel supply and return lines.
57. Remove crankshaft sensor heat shield.
58. Disconnect crankshaft position sensor, located on the right rear of the engine.
59. Remove the oil separator from the cylinder head cover/intake manifold.
60. Disconnect oil pressure sensor. Make certain everything is disconnected from the engine assembly.
61. Place a floor jack under the transmission to support the transmission.
62. With engine and transmission supported by a lifting device separate the engine from the transmission.
63. Lift the engine assembly out of the engine bay.

## ENGINE COVER

1. Remove oil fill cap.
2. Carefully lift engine cover (2) from corners to remove from mounting bracket (1)..



## INSTALLATION

## ENGINE - 2.8L DIESEL

1. Install engine assembly and align with the transmission.

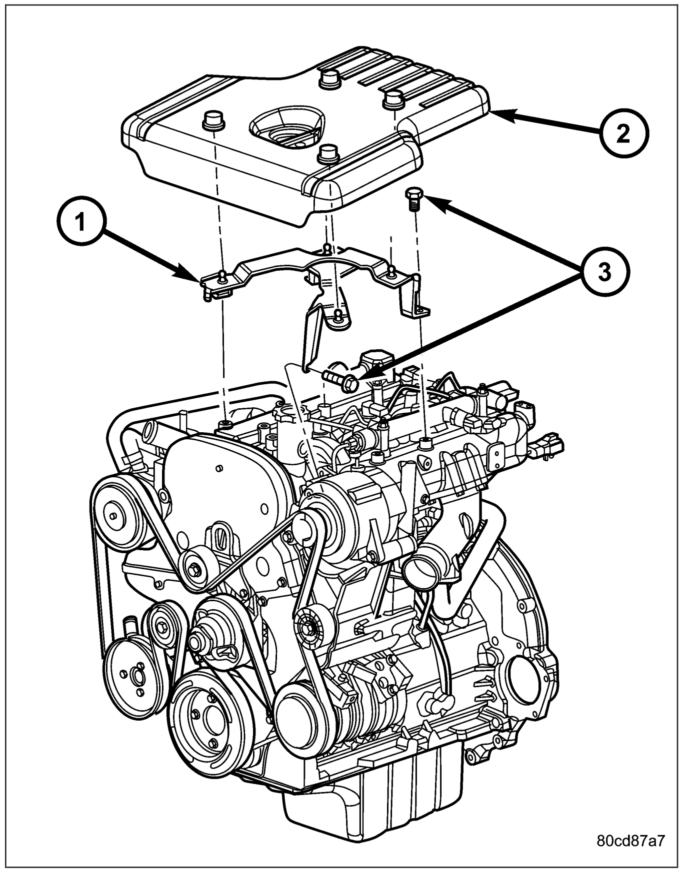
**NOTE: For vehicle equipped with a manual transmission, Install the transmission.**

2. Raise and support the vehicle.
3. Install accessable engine to transmission housing bolts. tighten bolts to 68 N·m (50 ft. lbs.).
4. Connect oil pressure sensor, located between the engine block and the turbocharger.
5. Connect crankshaft position sensor, located on the right rear of the engine.
6. Install right side engine mount on the engine block.

7. Disconnect lifting device from the engine assembly.
8. Raise and support the vehicle.
9. Install all transmission to engine retaining bolts.
10. Install exhaust inlet pipe and retaining bolts.
11. Install chassis ground wire above starter mounting location on the engine block.
12. Install starter motor on the engine.
13. Install oil filter and cooler assembly.
14. Lower vehicle.
15. Install oil cooler adapter.
16. Install coolant elbow and retaining bolts and connect the hoses leading from it.
17. Trace engine wiring and connect electrical connectors and tie straps one at a time until all wiring is connected on engine assembly.
18. Install low side refrigerant line.
19. Install generator on the engine (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
20. Connect heater core inlet and outlet hoses at heater core.
21. Connect four large electrical connectors near rear of the right front fenderwell.
22. Install engine cover mounting bracket and retaining bolts.
23. Accessing bolts through the pump pulley, install the power steering pump and retaining bolts.
24. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
25. Install coolant reservoir and connect hoses.
26. Install coolant reservoir retaining nuts.
27. Install high side refrigerant line on compressor.
28. Install charge air cooler hose on intake manifold.
29. Install cooling module assembly in the engine bay.
30. Install power steering cooler and retaining bolts and clip the air deflectors on both sides of the radiator (cooling module) assembly.
31. Install condenser assembly and retaining bolts.
32. Install low side refrigerant line and retaining nut.
33. Connect coolant reservoir hose on radiator.
34. Connect engine coolant hoses on engine.
35. Connect charge air cooler hoses on charge air cooler.
36. Install fan shroud with cooling fan assembly inside the shroud and install the shroud retaining bolts.
37. Connect cooling fan and fan drive viscous clutch assembly to fan support.
38. Install high side refrigerant line and retaining nut.
39. Install upper radiator support bracket and retaining bolts.
40. Connect high side refrigerant line on the upper radiator support bracket.
41. Charge refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
42. Install air filter assembly.
43. Install engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
44. Install engine oil fill cap.
45. Fill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
46. With assistance from another person, install hood assembly on the vehicle.
47. Connect under hood lamp on the hood assembly.
48. Connect negative battery cable.

## ENGINE COVER

1. Align engine cover (2) with mounting bracket (1). Push down firmly on all four corners of engine cover to snap in place.
2. Install oil fill cap.



## SPECIFICATIONS

## ENGINE SPECIFICATIONS

### GENERAL DESCRIPTION

| DESCRIPTION | SPECIFICATION |
|---|---|
| Engine Type | R2816K5A |
| Weight | 270Kg (595 lbs.) dry |
| Number of Cylinders | 4 |
| Bore | 94 mm |
| Stroke | 100 mm |
| Displacement | 2776cc |
| Injection Order | 1-3-4-2 |

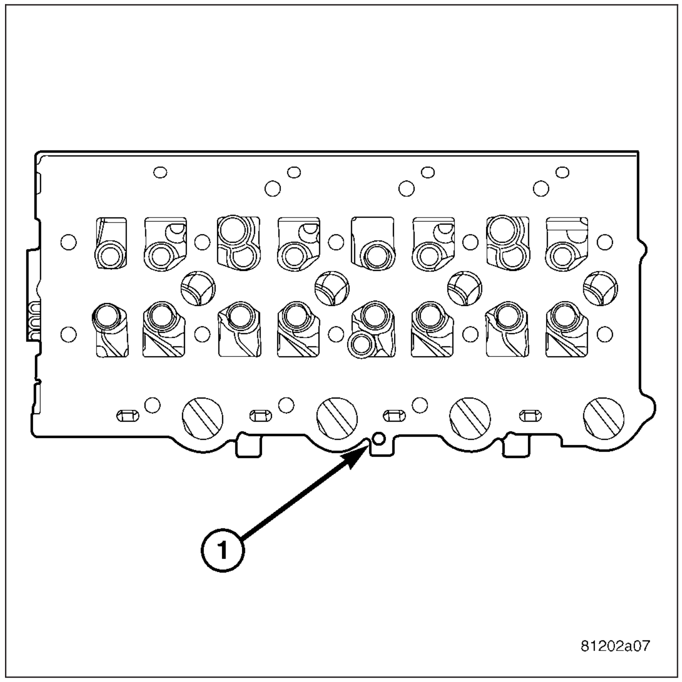
# HEAD-CYLINDER

## DESCRIPTION

The 2.8L aluminum, overhead valve cylinder head (1) has different dimensions for the intake air and a bias relief port. The cylinder head itself is not resurfacable. The cylinder head uses a selectable Multi-layered Steel gasket that is available in three sizes.



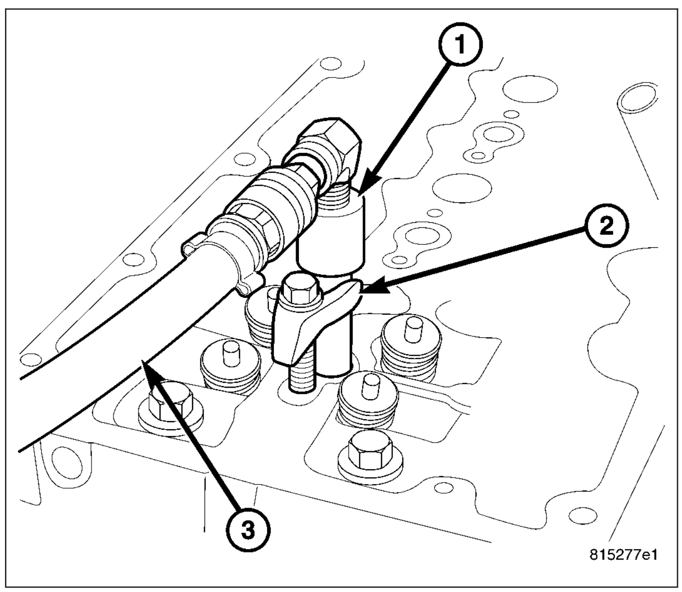
## STANDARD PROCEDURE

## VALVE SEALS - IN VEHICLE

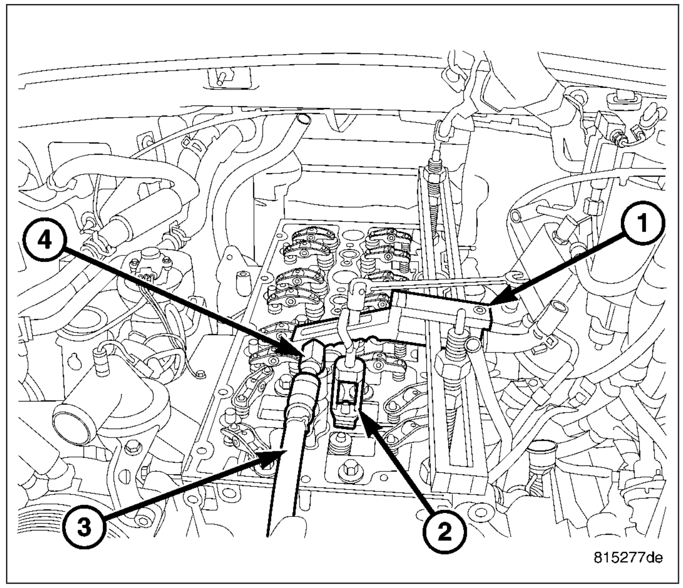
1. Disconnect the negative battery cable.
2. Remove the intake manifold/cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

**NOTE: Rocker arms and lifters must be kept in order of removal and stored in the up right position.**

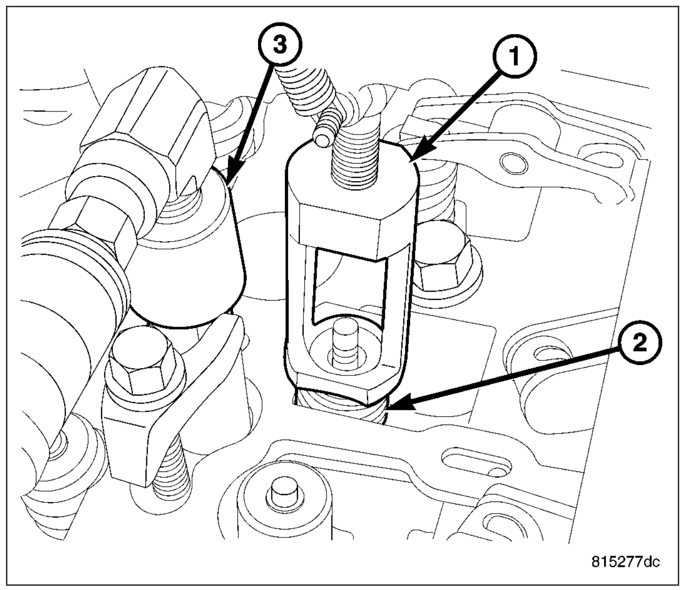
3. Position the rocker arms aside. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
4. Install special tool VM.1072A, compression tester adaptor , into the injector hole and retain with an injector hold down (2) bolt.



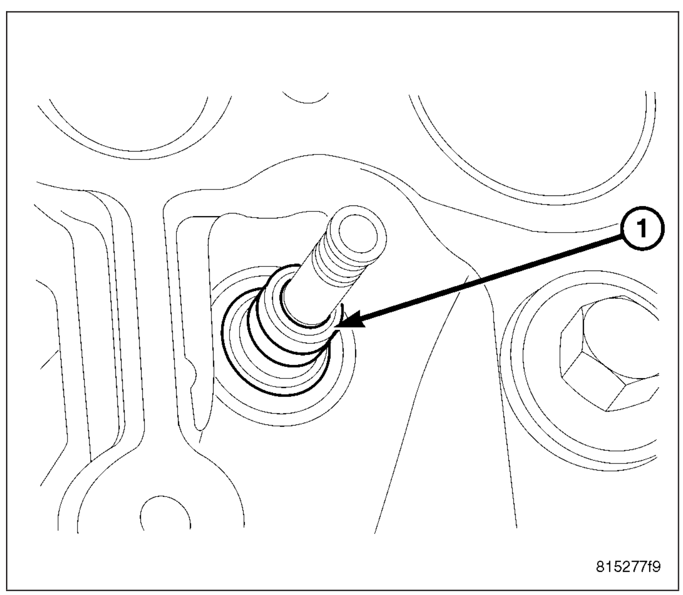
5. Prepare special tool MD998772A (1) for usage by inverting the tool to cylinder head holding screws so that the thread size matches the cylinder head.
6. Install special tool MD998772A (1) onto cylinder head and using adaptor MD998772A-15 (2), place the adaptor over the valve spring.
7. Connect a regulated air supply (3) to VM.1072A (4), and pressurize the cylinder.
8. Place shop towels around the working area of the cylinder head to prevent valve locks from accidently entering the engine.



9. Using adaptor MD998772A-15 (1), collapse the valve spring (2) and remove the locks.
10. Remove the valve spring (2) assembly.



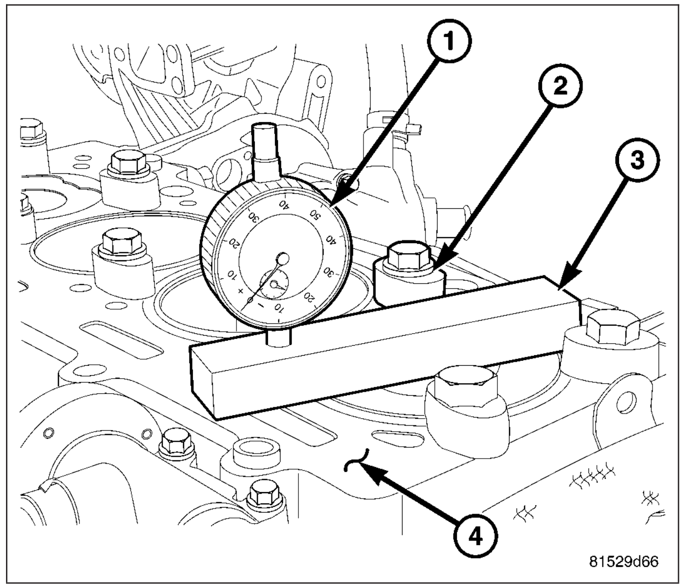
11. Remove the valve seal.
12. Repeat this procedure for all cylinders.



## STANDARD PROCEDURE - MEASURING PISTON PROTRUSION

**CAUTION: DO NOT Rotate the engine with the cylinder head off without first installing the cylinder liner retainers VM.1076. Failure to do so may result in the cylinder liner moving and a false piston protrusion reading. A false piston protrusion reading may result in a wrong cylinder head gasket selection.**

1. Use special tool VM.1010 dial indicator (1) with special tool VM.1013 (3).
2. Bring the piston of cylinder number 1 exactly to top dead center.
3. Lay the straight edge special tool VM.1013 (3) across the cylinder sleeve and zero the dial indicator (1) on the cylinder block surface (4).



4. Lay the straight edge special tool VM.1010 across the cylinder sleeve, setup the dial indicator on the piston crown (above the center of the piston pin) 5mm (1/8 in.) from the edge of the piston and note the measurement.

**NOTE: Install the cylinder liner retainers VM.1076 before rotating the engine.**

5. Repeat the procedure with the rest of the cylinders.
6. Establish the thickness of the steel gasket by averaging the four piston protrusion readings.

| Piston Clearance (mm) | 0.71-0.81 |

## VALVE SERVICE

This procedure is done with the engine cylinder head removed from the block.

### DISASSEMBLY

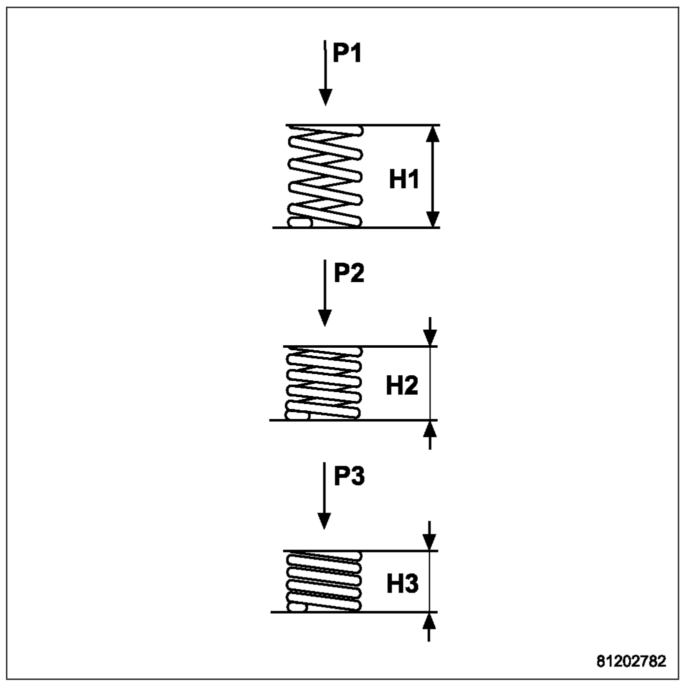
1. Remove the engine cylinder head from the cylinder block (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
2. Use Valve Spring Compressor Tool and compress each valve spring.
3. Remove the valve locks, retainers, and springs.
4. Use a smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.
5. Remove the valves, and place them in a rack in the same order as removed.

### VALVE CLEANING

1. Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.
2. Clean all residue and gasket material from the engine cylinder head machined gasket surface.

### INSPECTION

1. Inspect for cracks in the combustion chambers and valve ports.
2. Inspect for cracks on the exhaust seat.
3. Inspect for cracks in the gasket surface at each coolant passage.
4. Inspect valves for burned, cracked or warped heads.
5. Inspect for scuffed or bent valve stems.
6. Replace valves displaying any damage.
7. Check valve spring height.

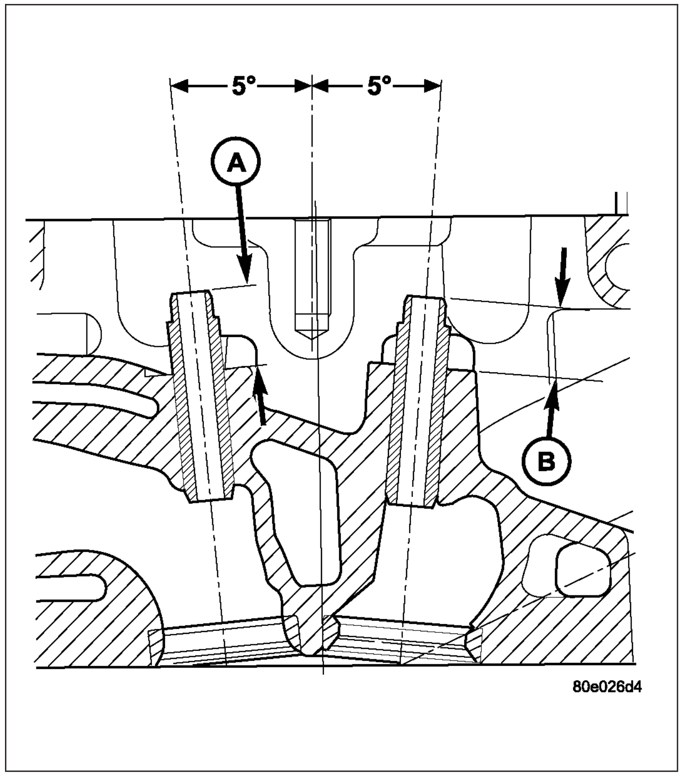


### VALVE SEAT REFACING

1. Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.
2. Use tapered stones to obtain the specified seat width when required.

## VALVE GUIDES

1. Valve Guides height requirement.
2. Measurement A : 16.50 - 17.00 mm. Measurment B : 14.50 - 15.00 mm.



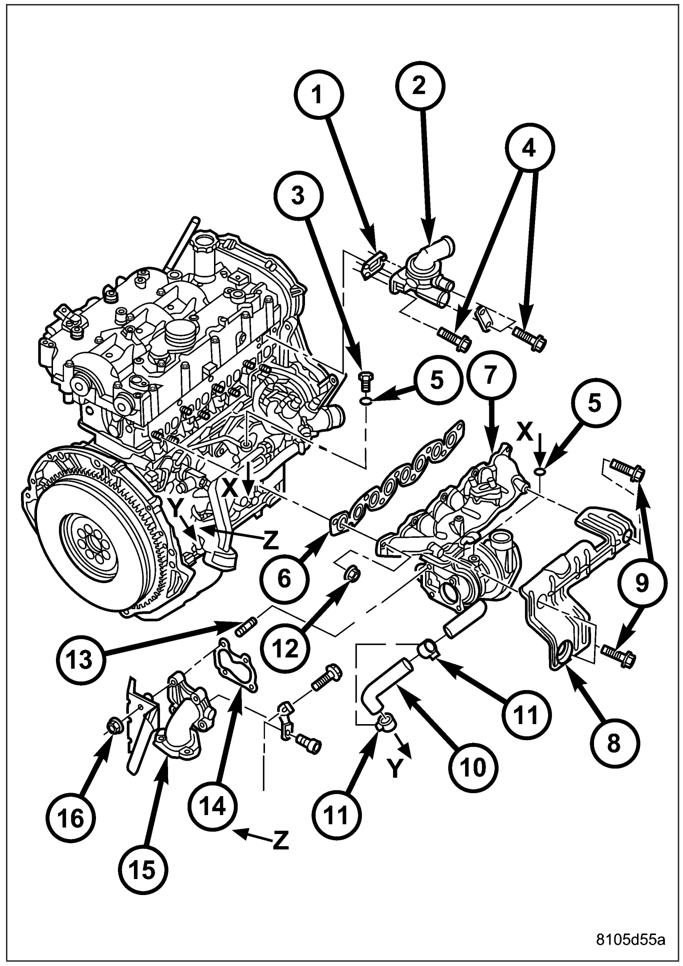
## VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT

1. Measure and record internal diameter of valve guides. Valve guide internal diameter is 6.0 to 6.012 mm (0.2362 to 0.2366 in.).
2. Measure valve stems and record diameters. Intake valve stem diameter 5.952 to 5.97 mm (0.2343 to 0.2350 in). Exhaust valve stem diameter 5.942 to 5.96 mm (0.2339 to 0.2346 in).
3. Subtract diameter of valve stem from internal diameter of its respective valve guide to obtain valve stem clearance in valve guide. Clearance of inlet valve stem in valve guide is 0.03 to 0.06 mm (.0011 to .0023 in). Clearance of exhaust valve stem in valve guide is 0.04 to 0.07 mm (.0015 to .0027 in).
4. If valve stem clearance in valve guide exceeds tolerances, new valve guides must be installed.

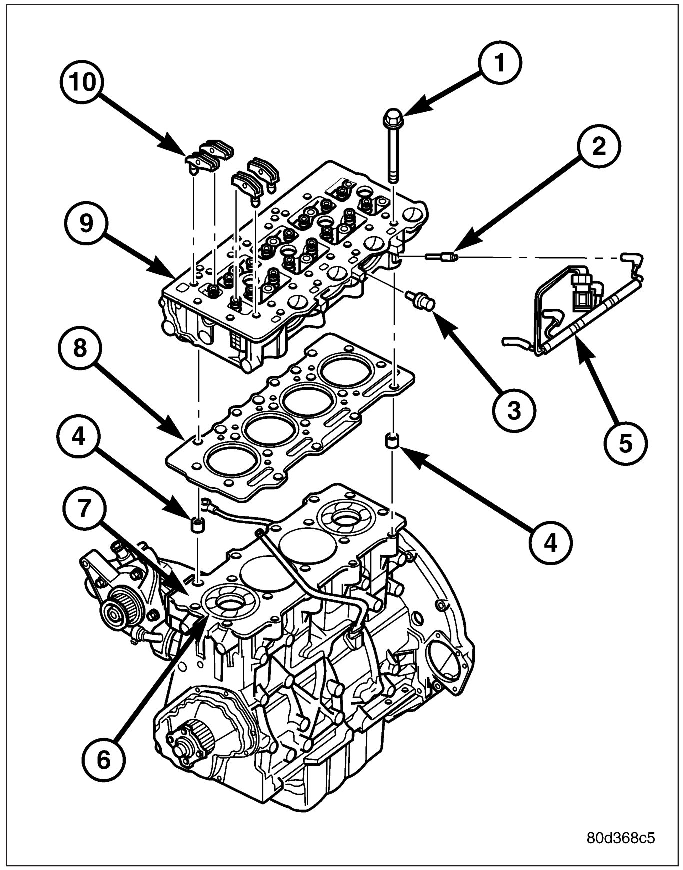
## REMOVAL

1. Disconnect negative battery cable.
2. Remove engine cover and bracket (Refer to 9 - ENGINE COVER - REMOVAL).
3. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
4. Remove radiator core support.
5. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
6. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
7. Remove accessory drive belt tensioner and both idler pulleys, **Idler pulley bolts are L.H. thread.** (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL).
8. Remove power steering pump pulley.
9. Remove front engine lift bracket.
10. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
11. Remove generator and support bracketing (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
12. Remove viscous heater.
13. Remove vibration damper.

14. Remove throttle cable assembly and set aside.
15. Disconnect main engine wiring harness connectors from right inner wheel housing.
16. Disconnect main engine wiring harness ancillary components and set harness aside.
17. Remove air cleaner housing.
18. Disconnect EGR cooler assembly water inlet pipe.
19. Remove EGR cooler from exhaust manifold (2.8L) Disconnect coolant pipe (2.5L). (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE COOLER - REMOVAL).
20. Remove exhaust manifold heat shield.



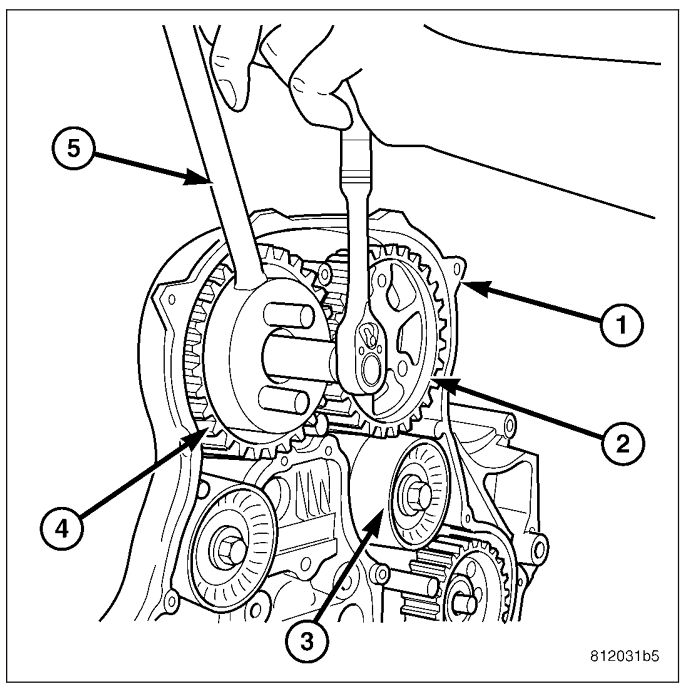
21. Remove turbocharger heat shield retaining bolt and position shield aside.
22. Remove turbocharger oil feed line from turbocharger.
23. Raise and support vehicle.
24. Disconnect exhaust stabilizer bracket at lower exhaust manifold.
25. Disconnect exhaust system bracket at transmission crossmember.
26. Lower the vehicle and remove the exhaust manifold retaining nuts.
27. Slide the exhaust manifold and turbocharger off of exhaust manifold studs .
28. Remove coolant hoses at thermostat housing.
29. Disconnect fuel return hose from fuel injectors and set aside (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).
30. Remove fuel injector pressure lines (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).
31. Disconnect fuel pump high pressure line at fuel rail (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).
32. Disconnect oil dip stick tube from intake manifold.
33. Disconnect brake booster line bracket from intake manifold and set aside.



34. Remove fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).

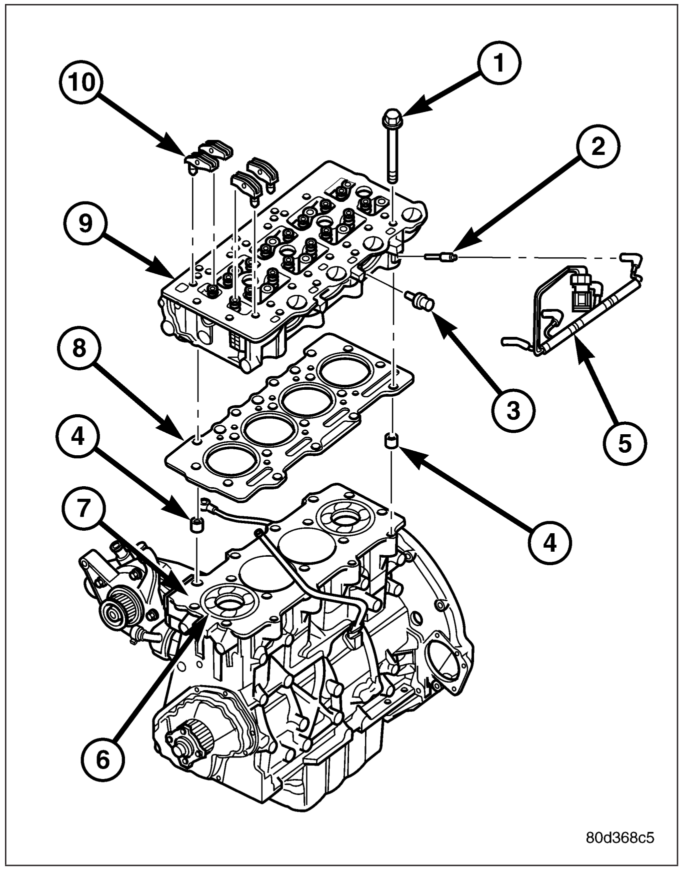
**CAUTION: Before removing the cylinder head cover/intake manifold or timing belt the engine must put at 90° after TDC. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)**

35. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
36. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
37. Using VM.1055, remove both camshaft gears.



38. Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
39. Remove cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

40. Remove rocker arm and lifter assemblies from cylinder head. **Be sure to keep in same order as removed.**
41. Remove cylinder head cover/intake manifold gasket from cylinder head.
42. Disconnect glow plug and engine coolant temperature electrical connectors.
43. Remove turbocharger outlet to charge air cooler hose.
44. Remove cylinder head bolts.
45. Remove cylinder head assembly from engine block.



## CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.

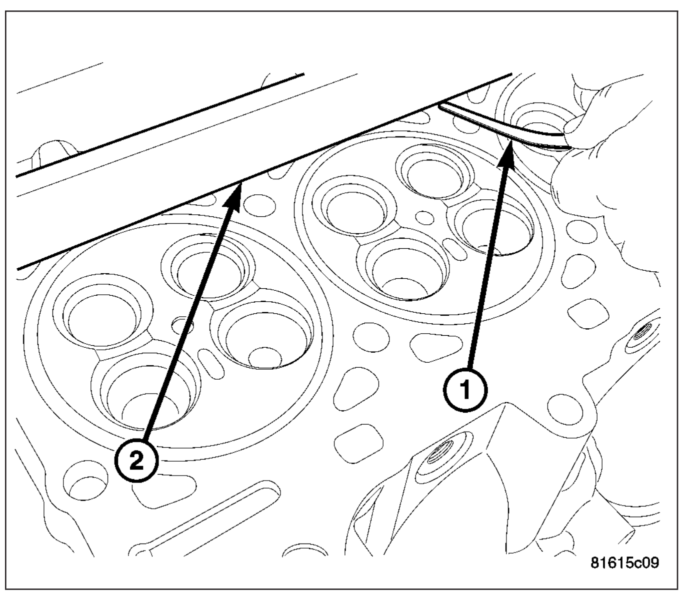
Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

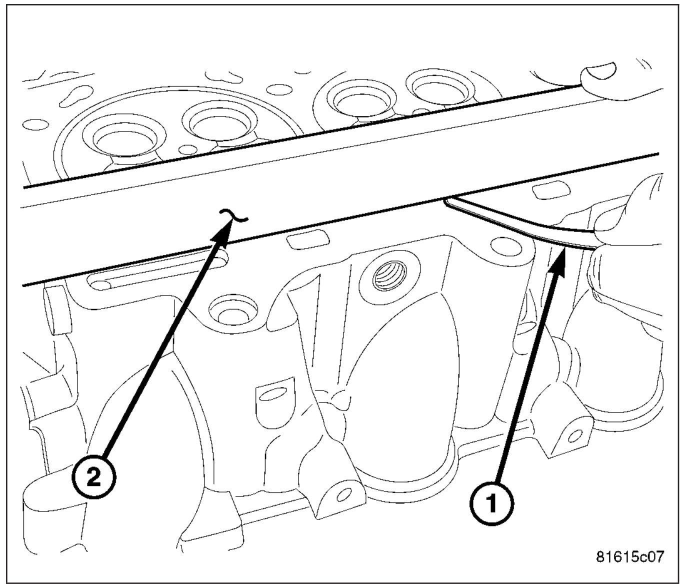
## INSPECTION

**CAUTION: The cylinder head surface and straight edge must be absolutely clean before the flatness measurement is taken. DO NOT check flatness across the combustion chamber area or on the marks left by the gasket stopper.**

Use a cleaned straight edge (2) and feeler (1) gauge to check the flatness. Lie the straight edge (2) parallel across the cooling ports. Measure before each combustion chamber toward the outer edge of the cylinder head, above and below each combustion chamber, between each combustion chamber, top and bottom , on the cylinder head and block mating surfaces. The **maximum** allowed warpage is 0.1mm (0.004 in.).



The minimum cylinder head thickness is 89.95mm (3.541 in.).



## INSTALLATION

**CAUTION: Piston protrusion must be measured to determine cylinder head gasket thickness if one or more cylinder liners have been replaced (Refer to 9 - ENGINE/CYLINDER HEAD - STANDARD PROCEDURE).**

**NOTE: If cylinder liner(s) have not been removed, the same thickness head gasket that was removed can be used.**

1. Clean and inspect gasket mating surfaces.
2. Position correct head gasket on engine block.
3. Place cylinder head on engine block.

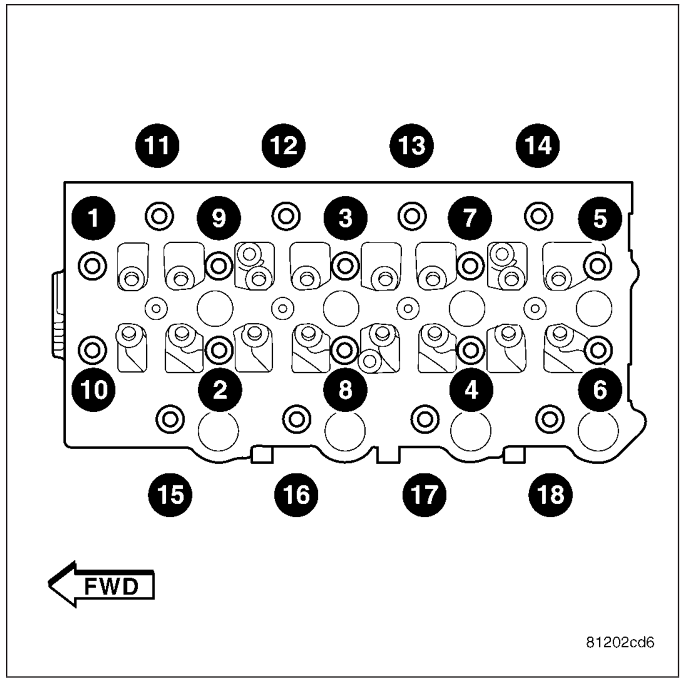
**CAUTION: New cylinder head bolts must be used. Do Not lubricate new cylinder head bolts. They already are coated with an anti scuff treatment.**

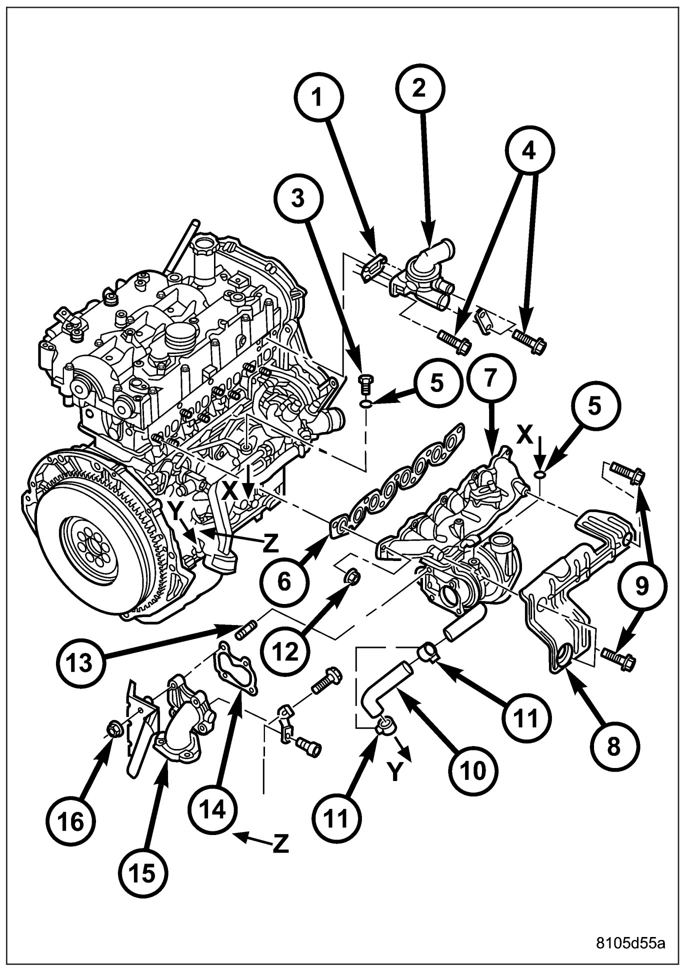
4. Tighten cylinder head bolts following procedure below.

### Cylinder Head Bolt Torquing Procedure

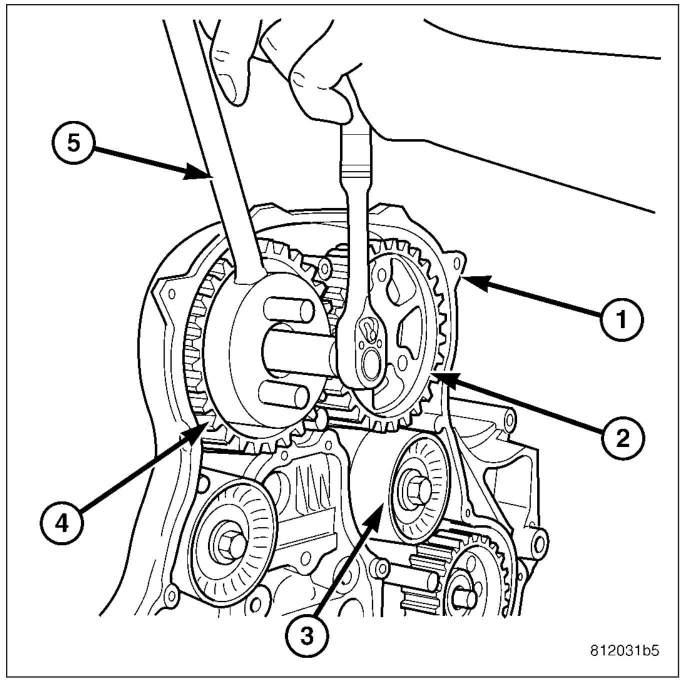
1. Tighten all cylinder head bolts starting from the center bolts, following the cylinder head scheme and the following sequence: 3-2-1-10-9-8-7-6-5-4-11-12-13-14-15-16-17-18.
2. Without loosening any bolts, starting from the center bolts, tighten each bolt an additional 75° in the following sequence: 10-9-8-7-6-5-4-3-2-1.
3. Tighten the lateral cylinder head bolts an additional 50° in the following sequence: 11-12-13-14-15-16-17-18.
4. Finally tighten all bolts an additional 75° in the following sequence: 10-9-8-7-6-5-4-3-2-1-11-12-13-14-15-16-17-18..

5. Slide exhaust manifold and turbocharger on exhaust manifold studs.
6. Install exhaust manifold retaining nuts. Tighten the nuts to 36 N·m. in a cross sequence beginning in the middle and working outward, then perform the tightening sequence to the exhaust manifold nuts again.
7. Install exhaust manifold heat shield. Torque bolts to 24.5N·m.
8. Install turbocharger outlet to charge air cooler pipe.
9. Install upper radiator hose.
10. Connect glow plug and coolant temperature sensor electrical connectors.
11. Install new cylinder head cover/intake manifold gasket.
12. Install rocker arm and lifter assemblies.**Be sure to put rocker arm and lifter assemblies in same location as removed.**
13. Install cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
14. Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
15. Using VM.1055, install both camshaft gears and tighten bolts finger tight.
16. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
17. Using VM.1055, torque cam gear retaining bolts to 108 N·m..





18. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
19. **Remove crankshaft and both camshaft locking pins at this time** (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
20. Install fuel injectors (Refer to 14 - FUEL SYSTEM/ FUEL INJECTION/FUEL INJECTOR - INSTALLATION).
21. Install brake booster line bracket to intake manifold.
22. Install oil dip stick tube to intake manifold.
23. Connect fuel pump high pressure line to fuel rail.
24. Install fuel injector pressure lines.
25. Connect fuel return hose to fuel injectors.
26. Connect engine coolant hoses to thermostat housing.
27. Raise vehicle.
28. Reconnect exhaust system bracket at transmission crossmember.



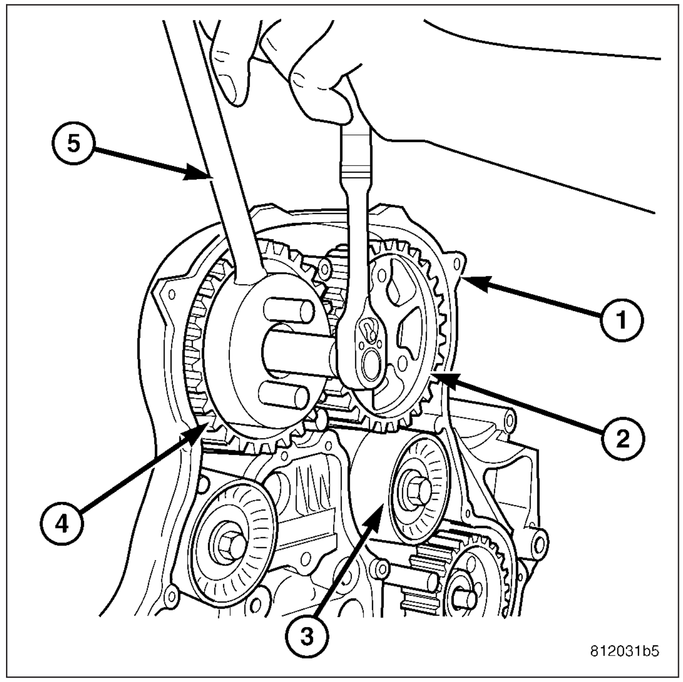
29. Connect exhaust stabilizer bracket to lower exhaust manifold.
30. Install turbocharger oil feed line to turbocharger.
31. Lower vehicle.
32. Install turbocharger heat shield.
33. Install exhaust manifold heat shield.
34. Install EGR cooler assembly and connect engine coolant hoses.
35. Install air cleaner housing.
36. Install main engine wiring harness and connect all ancillary electrical components.
37. Install throttle cable assembly.
38. Install viscous heater.
39. Install vibration damper.
40. Install generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
41. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
42. Install front engine lift bracket.
43. Install power steering pump pulley.
44. Install accessory drive belt tensioner and both idler pulleys. **Idler pulley retaining bolts are L. H. Thread.**
45. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
46. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
47. Install upper radiator core support.
48. Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
49. Install engine cover and bracket (Refer to 9 - ENGINE COVER - INSTALLATION).
50. Connect negative battery cable.
51. Start engine and inspect for leaks (Refer to 14 - FUEL SYSTEM - WARNING).

# SEAL(S)-CAMSHAFT OIL

## REMOVAL

1. Disconnect negative battery cable.
2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
5. Remove vibration damper.
6. Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

**WARNING: Before removing the timing belt the engine must rotated to 90° after TDC and special tool VM.1080 installed. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).**



7. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
8. Using VM.1055, remove both camshaft gears (2) and (4).
9. Remove both camshaft oil seals using special tool VM.1058.

## INSTALLATION

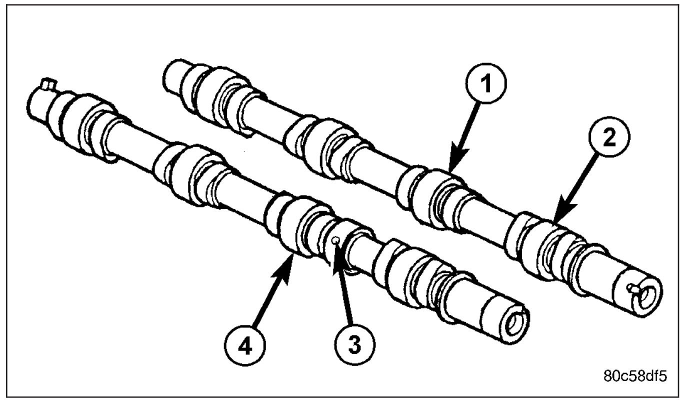
**CAUTION: Special tool VM.1080 must be removed from the flex plate after the repair is complete.**

1. Install new camshaft oil seal using VM.1057.
2. Install camshaft sprockets and tighten retaining bolts finger tight.
3. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
4. Torque camshaft sprockets to 108 N·m using VM.1085 to hold sprockets.
5. Install outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
6. Install vibration damper.
7. Remove special tool V.M1080 from the engine block access hole.
8. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
9. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
10. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
11. Connect negative battery cable.

# CAMSHAFT(S)

## DESCRIPTION

The camshafts (1) and (2) are made of gray cast iron with eight machined lobes and four bearing journals. Each camshaft has an alignment hole (2) and (3) toward the front of the camshaft that is used during base engine timing procedures (Refer to 9 - ENGINE/ VALVE TIMING - STANDARD PROCEDURE).

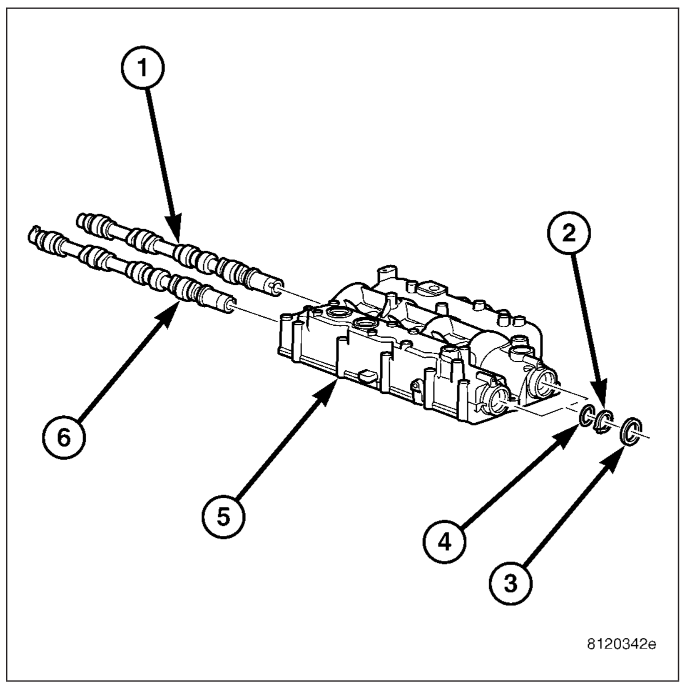


## OPERATION

When the camshaft rotates the lobes actuate the hydraulic lifters and rocker arms, forcing downward on the rocker arms which opens the valves.

## REMOVAL - CAMSHAFTS

1. Disconnect negative battery cable.
2. Remove engine cover and bracket (Refer to 9 - ENGINE - REMOVAL).
3. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
4. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
5. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
6. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
7. Rotate the engine to 90 degrees ATDC and install special tool VM.1089. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
8. Remove vibration damper (Refer to 9 - ENGINE/ ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
9. Remove generator (Refer to 8 - ELECTRICAL/ CHARGING/GENERATOR - REMOVAL).



**CAUTION: Before removing the cylinder head cover/intake manifold (5) or timing belt the engine must rotated to the 90° ATDC, or the 3 O'clock position and special tool VM.1089 installed in the 90 degree ATDC alignment hole. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)**

10. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
11. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

12. Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
13. Remove cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
14. With cylinder head cover/intake manifold on work bench, remove plugs at rear of cylinder head cover/intake manifold.
15. Remove camshaft oil seals.
16. Remove snap ring (2) and thrust washer (4) from camshaft.
17. Slide camshaft through access hole at rear of cylinder head cover/intake manifold (5).

## INSTALLATION - CAMSHAFTS

1. Lubricate camshafts with Mopar® Engine Oil Supplement, or equivalent.
2. Carefully install camshafts into access holes in rear of cylinder head cover/intake manifold.
3. Install thrust washer, snap ring, and camshaft oil seal.

### CHECKING CAMSHAFT ENDPLAY

1. After camshafts are properly installed in cylinder head cover check end play of camshafts with a dial indicator. The end play should be between 0.10 mm - 0.55 mm.

**NOTE: If the camshaft endplay is not within specification, measure thickness of the camshaft spacer. Camshaft spacer thickness should be 2.8 ± .02mm.**

4. Measure the camshaft end play with a dial indicator. The end play should be between 0.10 mm-0.55 mm.
5. Install access hole plugs and gaskets at rear of cylinder head cover/intake manifold. Torque plugs to 80N·m.(59 ft. lbs.).
6. Install cylinder head cover/intake manifold on engine block (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
7. Align the camshafts and install camshaft alignment pins, VM1052 and VM1053 into the camshaft cover.
8. Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

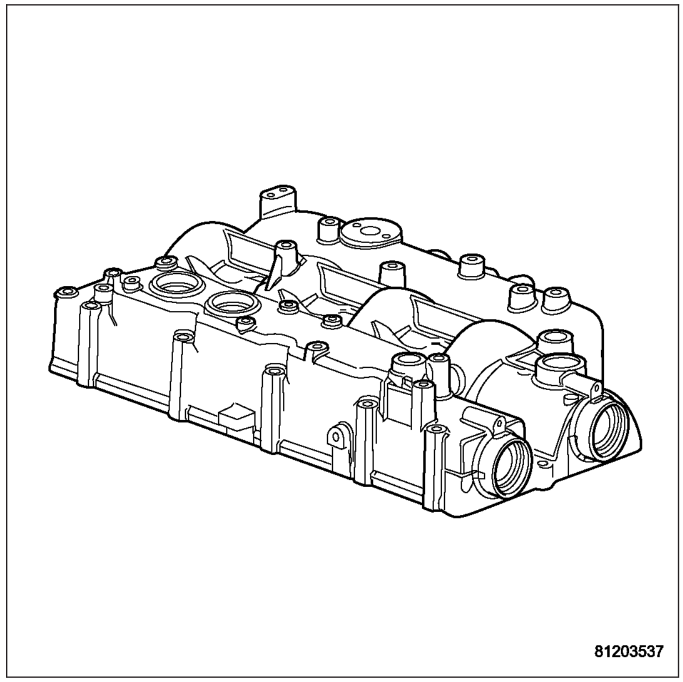
**NOTE: Crankshaft must be rotated to the 90 degree ATDC, or the 3 O'clock position (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).**

9. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
10. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
11. Install generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
12. Install vibration damper.
13. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
14. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
15. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
16. Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
17. Connect negative battery cable.

# COVER-CYLINDER HEAD

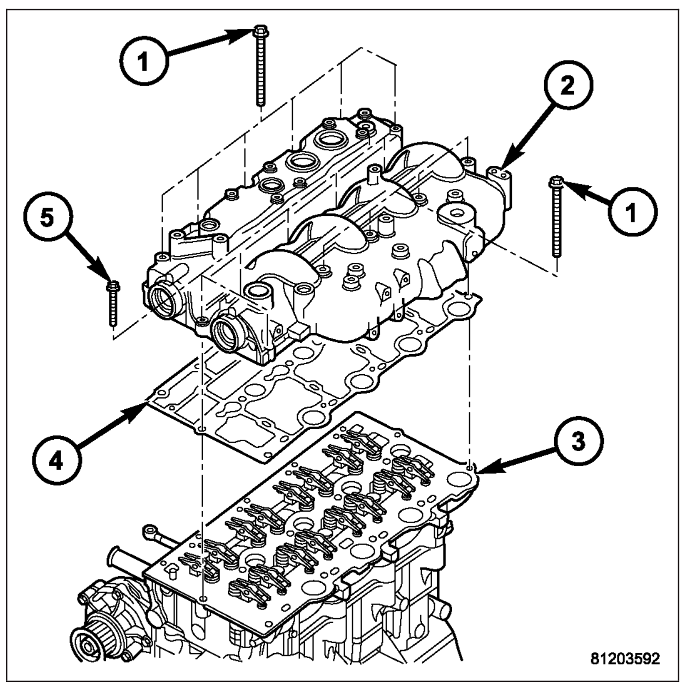
## DESCRIPTION

The cylinder head cover and the intake manifold on this engine are made of cast aluminum. The cylinder head cover also incorporates a oil drain back hole for the crankcase ventilation (CCV) system..



## REMOVAL

**CAUTION: Before removing the cylinder head cover/intake manifold (2) the witness mark on the crankshaft hub must rotated to the 3 O'clock position or, 90° after TDC to assure proper alignment of the camshafts and the crankshaft. Failure to do so could result in valve and/or piston damage during reassembly.**



1. Disconnect negative battery cable.
2. Remove engine cover and bracket (Refer to 9 - ENGINE - REMOVAL).
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
5. Evacuate the air conditioning.
6. Disconnect the coolant recovery hose at the radiator.
7. Remove the charge air inlet hose at the coolant module.
8. Remove the upper radiator hose at the radiator.
9. Separate the A/C hoses from the cooling fan shroud.
10. Remove cooling fan and fan drive viscous drive assembly, along with the fan shroud (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
11. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
12. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

13. Disconnect the EGR cooler pipe behind the inner timing cover.
14. Remove generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL), and generator rear support bracket.
15. Remove the accessory drive belt Idler pulleys **L.H.Thread.**
16. Remove the drive belt tensioner.
17. Remove the power steering pump pulley.
18. Remove the vibration damper.

**CAUTION: Before removing the cylinder head cover/intake manifold (2) the witness mark on the crankshaft hub must rotated to the 3 O'clock position or, 90° after TDC to assure proper alignment of the camshafts and the crankshaft. Failure to do so could result in valve and/or piston damage during reassembly.**

19. Rotate the crankshaft hub to 90° after TDC (3 O'clock position).
20. Remove heater hose pipe fasteners.

**NOTE: It may be necessary to rotate the camshaft gear bolt slightly to gain proper camshaft alignment pin seating against the intake manifold. Alignment pins must seat flush against the intake manifold.**

21. Install the intake camshaft locking pin VM.1052 and exhaust camshaft locking pin VM.1053 (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
22. Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
23. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
24. Install special tool VM.1085 and remove camshaft gears.
25. Remove timing belt idler pulleys **L.H.Thread.**
26. Remove inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
27. Disconnect coolant temperature sensor, camshaft position sensor, boost pressure/intake air temperature sensor, fuel injectors, fuel temperature sensor, fuel rail solenoid, and EGR air flow electrical connectors.
28. Disconnect the main engine harness connectors at the right inner fender well and position the harness over the left side of the engine and aside.
29. Disconnect the brake booster vacuum pipe from the EGR air control valve.
30. Disconnect the EGR cooler pipe from the EGR air control valve.
31. Separate the main engine harness from the bracket on the EGR air control valve.
32. Remove the EGR tube from the underside of the EGR air control valve.
33. Separate the block heater wiring harness from the oil level indicator tube.
34. Remove the oil level indicator tube from the EGR air control valve.
35. Remove fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).
36. Remove fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - REMOVAL).
37. Disconnect oil separator outlet hose at separator.
38. Remove the oil separator from the intake manifold/cylinder head cover (2).
39. Disconnect the return fuel junction block from the intake manifold/cylinder head cover (2).
40. Remove cylinder head cover/intake manifold retaining bolts.
41. Lift cylinder head cover/intake manifold (2) from cylinder head (3).

**NOTE: When removing rocker arm and lifter assemblies, Always keep lifters in an upright position and in the order that they were removed from the cylinder head (3).**

42. Remove rocker arm and lifter assemblies from cylinder head (3).
43. Remove cylinder head cover/intake manifold gasket (4) from cylinder head (3).

## INSTALLATION

1. Clean and inspect sealing surfaces.
2. Install new gasket on cylinder head.

**NOTE: Add a small amount of grease to the top of each valve to assist with rocket arm positioning.**

3. Install rocker arm and lifter assemblies in cylinder head. **Be sure to put rocker arm and lifter assemblies in same location as removed.**

**CAUTION: Care must be taken when installing the cylinder head cover/intake manifold. Do not knock the rocker arms off of the valves when installing the cover.**

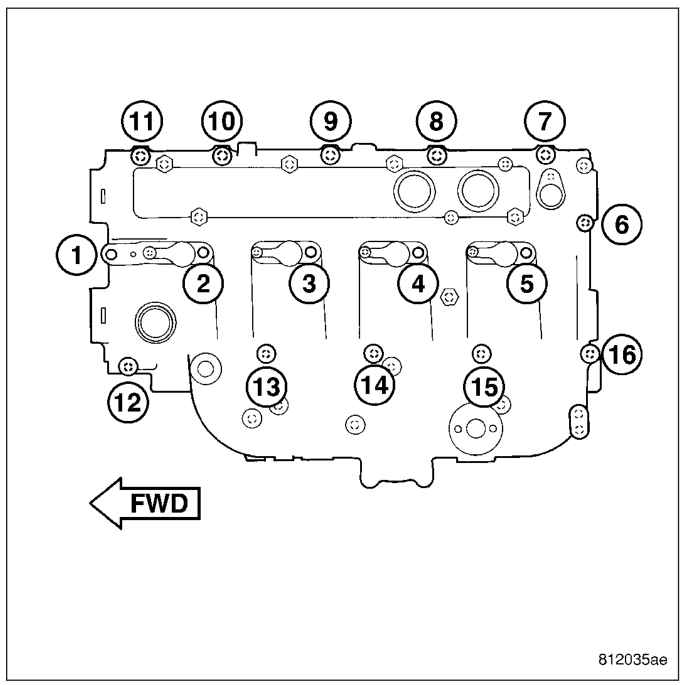
4. Install cylinder head cover/intake manifold.

**NOTE: Be sure to lubricate cylinder head cover/intake manifold retaining bolts with engine oil before assembly. If new bolts are being installed, DO NOT lubricate before assembly.**

5. Install two cylinder head cover/intake manifold retaining bolts and tighten finger tight.
6. Remove alignment studs and install remaining retaining bolts. Tighten retaining bolts finger tight.
7. Torque cylinder head cover/intake manifold retaining bolts following procedure below.

## CYLINDER HEAD COVER/INTAKE MANIFOLD TIGHTENING PROCEDURE

- Alternate between bolts #11 and #16 to seat cylinder head cover/intake manifold on cylinder head. Torque bolts to 7 N·m.
- Torque all cylinder head cover/intake manifold retaining bolts to 25 N·m in numerical order starting with #1 and ending with #16.



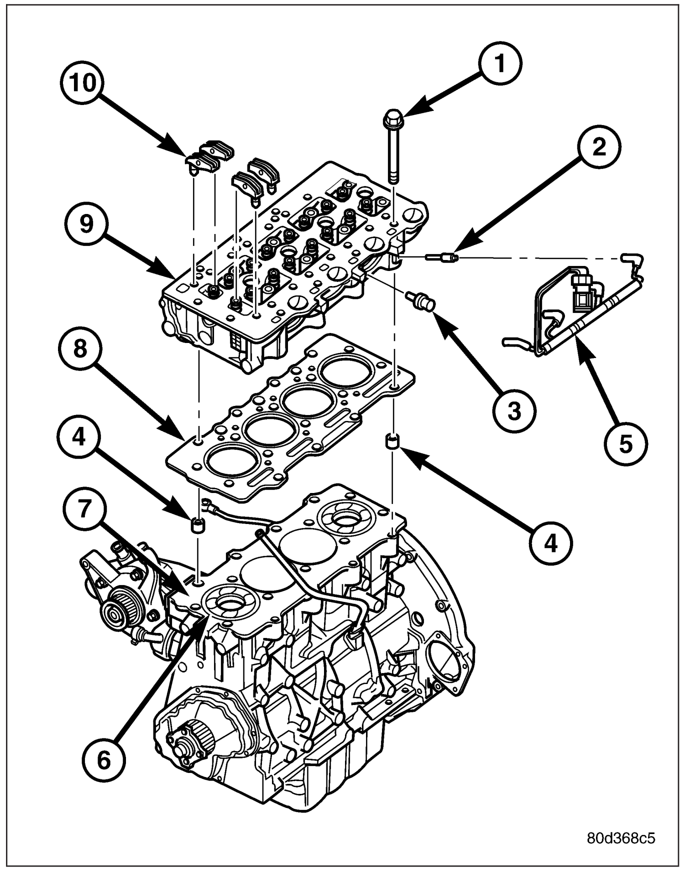
8. Connect EGR tube at intake manifold inlet tube. Torque clamp to 10.8 N·m.
9. Install turbo inlet tube retaining bolt at intake manifold. Torque bolt to 27.5 N·m.
10. Connect oil separator outlet hose at separator.
11. Install oil level indicator tube retaining bolt at intake manifold inlet. Torque bolt to 10 N·m.(88 in. lbs.).
12. Install brake booster vacuum tube retaining bolt at intake manifold inlet. Torque bolt to 10 N·m.(88 in. lbs.).
13. Install power steering pump reservoir in bracket.
14. Install fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION).
15. Install fuel injectors and fuel injector supply lines (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).
16. Connect camshaft position sensor, boost pressure/intake air temperature sensor, EGR solenoid, and fuel pressure sensor electrical connectors.
17. Install inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
18. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
19. Install outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
20. Remove crankshaft VM.1089 and both camshaft locking pins (VM.1052,VM1053) (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).

21. Install vibration damper.
22. Install generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
23. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
24. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
25. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
26. Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
27. Install engine cover and bracket (Refer to 9 - ENGINE - INSTALLATION).
28. Connect negative battery cable.

# ARMS-ROCKER

## DESCRIPTION

The rocker arms (10) are made of stamped steel and serviced as an assembly along with the lifter. The rocker arm (10) also has a fracture point. This fracture point is designed to prevent engine failure if the engine is not timed properly or the timing belt breaks suddenly..

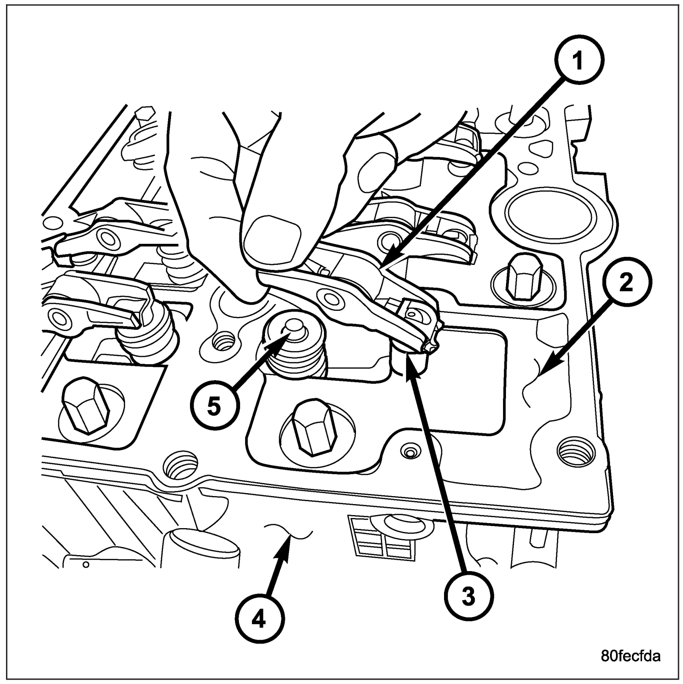


## OPERATION

The rocker arms are used as a link between the camshaft and valves. As the camshaft rotates, the lobes of the camshafts apply downward pressure on the rocker arms. This pressure is then transmitted to the valves which causes the valves to open.

## REMOVAL

**CAUTION: Before removing the cylinder head cover/intake manifold (2) the engine must rotated to 90° after TDC to assure proper alignment of the engine timing components. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)**



1. Disconnect negative battery cable.
2. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
3. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Remove the vibration damper.
6. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
7. Remove the power steering pump pulley.
8. Rotate the crankshaft to 90 degrees ATDC (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
9. Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
10. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
11. Remove inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
12. Remove cylinder head cover/intake manifold (2) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

**NOTE: Lifters must be kept in order of removal and stored in the up right position.**

13. Remove rocker arms (1) and lifters (3).

## INSTALLATION

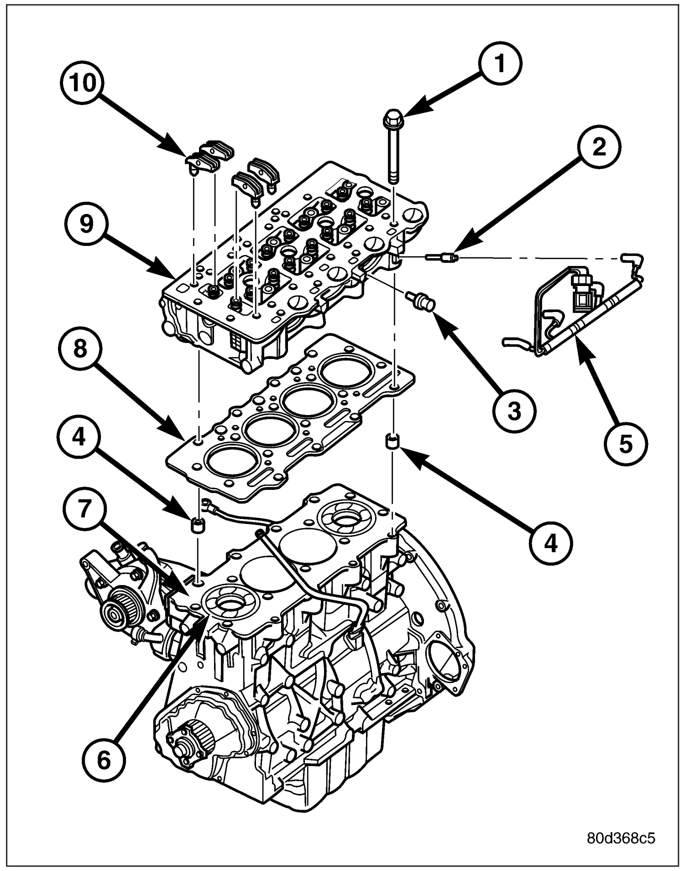
1. Clean and inspect gasket sealing surfaces.
2. Install new gasket on cylinder head.
3. Lubricate lifter ball end of lifter(s), valve(s), and rocker arm roller(s) with Mopar® Engine Oil Supplement or equivlalent.
4. Connect rocker arm(s) to lifter and reposition on valve(s).
5. Install cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
6. Install inner timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
7. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
8. Install outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
9. Install vibration damper.
10. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

11. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
12. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
13. Refill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
14. Connect negative battery cable.

# LIFTERS-HYDRAULIC

## DESCRIPTION

Valve lash is controlled by hydraulic tappets located inside the cylinder head (9), in tappet bores below the camshafts.



## REMOVAL

1. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).

## INSPECTION

Clean each lifter assembly in cleaning solvent to remove all varnish and sludge deposits. Inspect for indications of scuffing on the side and base of each lifter body.

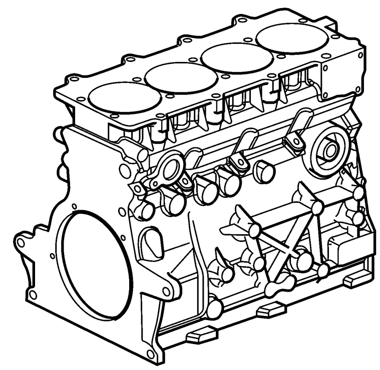
## INSTALLATION

1. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

# BLOCK-ENGINE

## DESCRIPTION

The 2.8L CRD Diesel engine uses a cast iron engine block with wet cast iron cylinder liners. The cylinder block has increased stiffness that reduces structural flexing and a fractured connecting rod cap design that can not distort connecting rod cap fit.

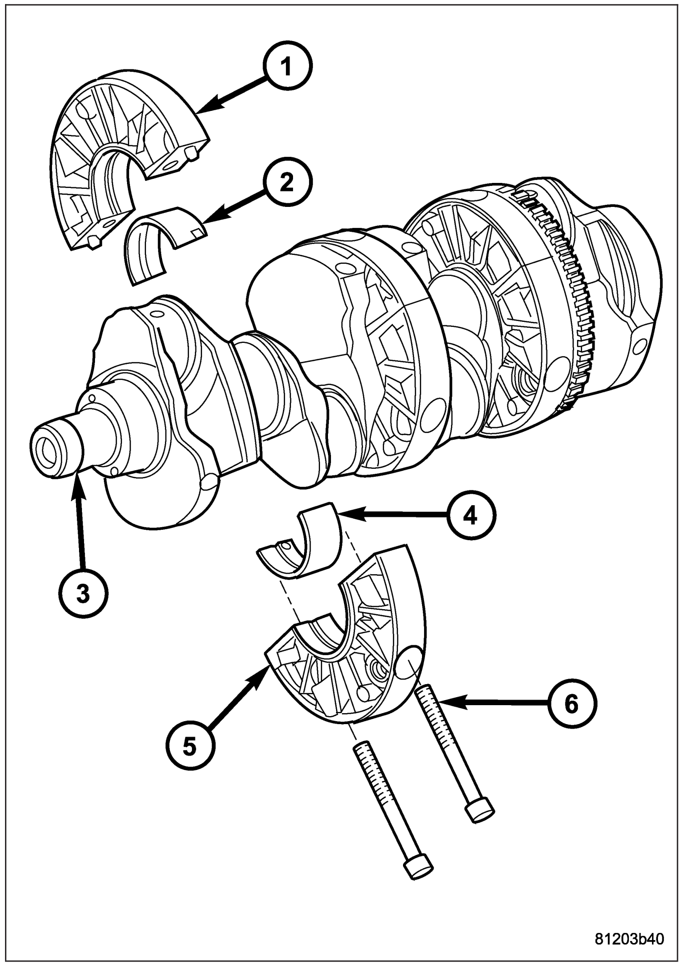


80c6aef8

# CRANKSHAFT

## DESCRIPTION

The crankshaft for the 2.8L is a forged steel type design with five main bearing journals. The crankshaft is located at the bottom of the engine block and is held in place with three main bearing supports

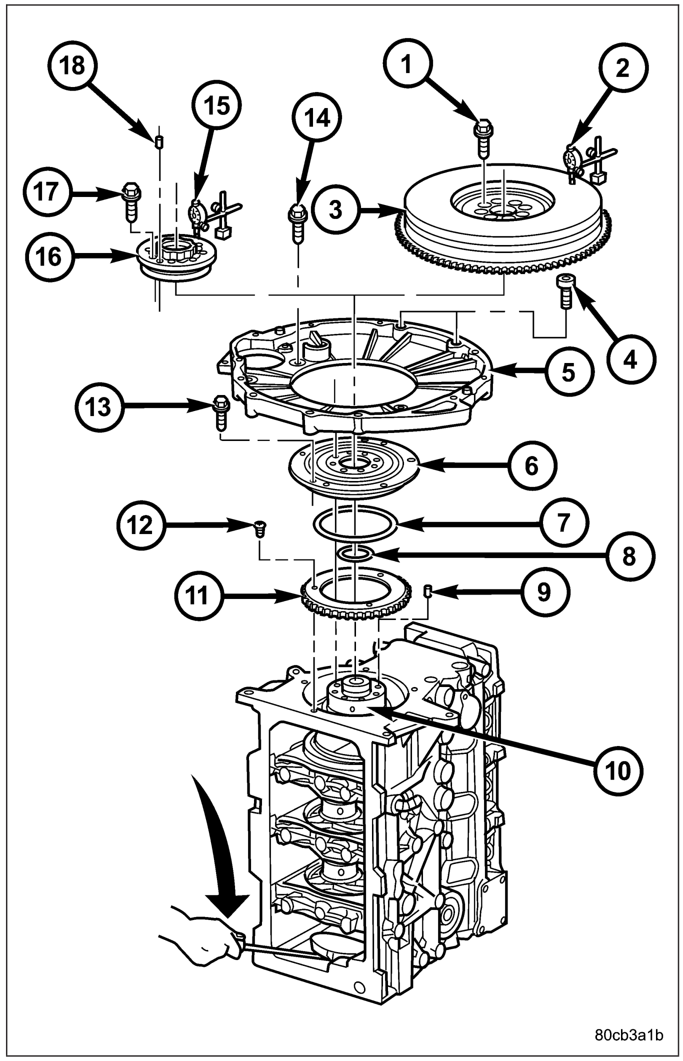


## OPERATION

The crankshaft transfers force generated by combustion within the cylinder bores to the flexplate.

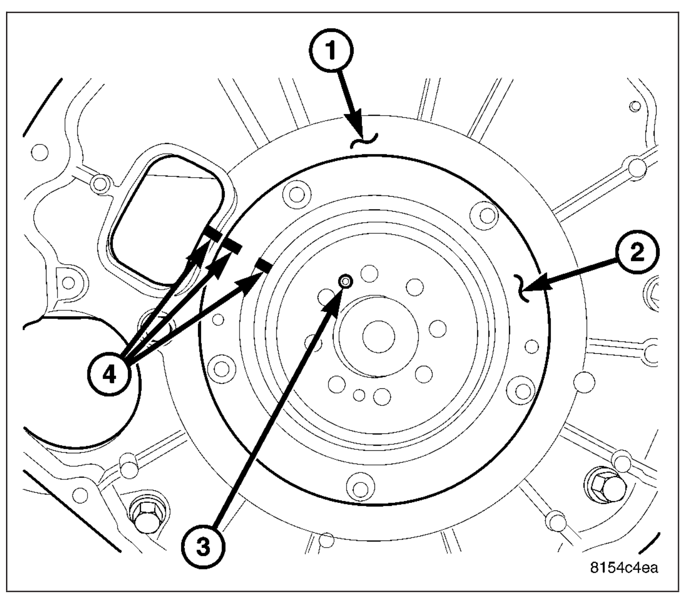
## STANDARD PROCEDURE - CHECKING CRANKSHAFT END PLAY

1. Mount a dial indicator to a stationary point at rear of engine. Locate the probe perpendicular against the flywheel.
2. Move the crankshaft (10) all the way to the front of its travel.
3. Zero the dial indicator (2).
4. Move the crankshaft (10) all the way to the rear and read dial indicator (2). For crankshaft end play clearances (Refer to 9 - ENGINE - SPECIFICATIONS).



## REMOVAL - CRANKSHAFT

**NOTE: The crankshaft is removed from the rear of the engine. Make sure to use an appropriate engine stand.**



1. Remove engine from vehicle (Refer to 9 - ENGINE - REMOVAL).
2. Mount engine on an engine stand.
3. Drain engine oil and remove oil filter.
4. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
5. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
6. Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
7. Remove cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

8. Remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
9. Remove flex plate.

**NOTE: Paint marking or scribing will assist in properly assembling and aligning oil passage ports in the crankshaft supports and engine block.**

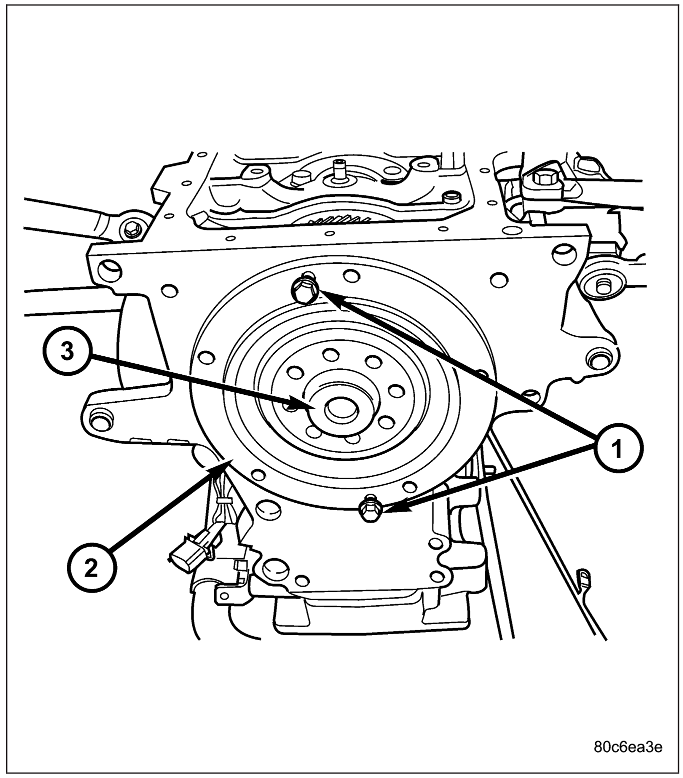
10. Paint mark or scribe (4) the relation of the rear main bearing support (2) and adaptor plate (1).

**NOTE: One of the crankshaft position sensor heat shield fasteners will have to be removed to free the adaptor plate (1) for removal.**

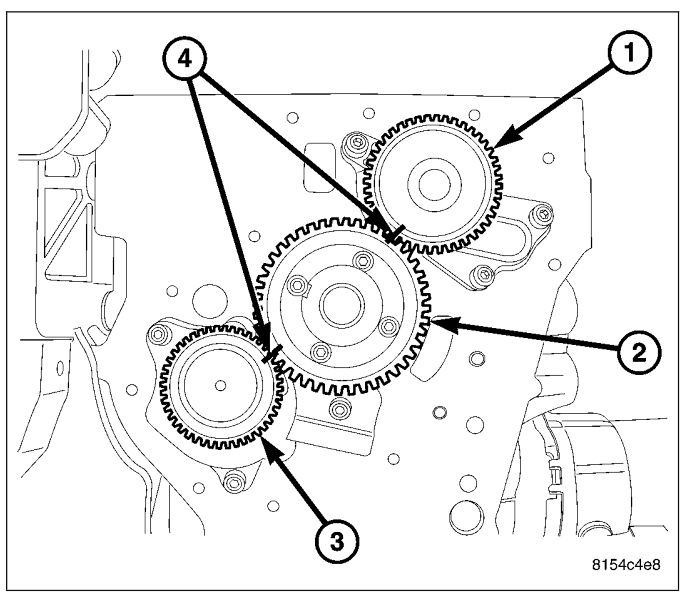
11. Remove rear main bearing support (2) and adapter plate (1) retaining bolts and remove adapter plate (1).
12. Paint mark or scribe (4) the rear main bearing support (2) to engine block relation once the adaptor plate (1) is removed.

**NOTE: Keep the rear main bearing support (2) and rear crankshaft seal together as an assembly (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - DESCRIPTION).**

13. Remove rear main bearing support (2) by threading two retaining bolts (1) in holes provided. Tighten bolts (1) equally to push main bearing support (2) out of block.

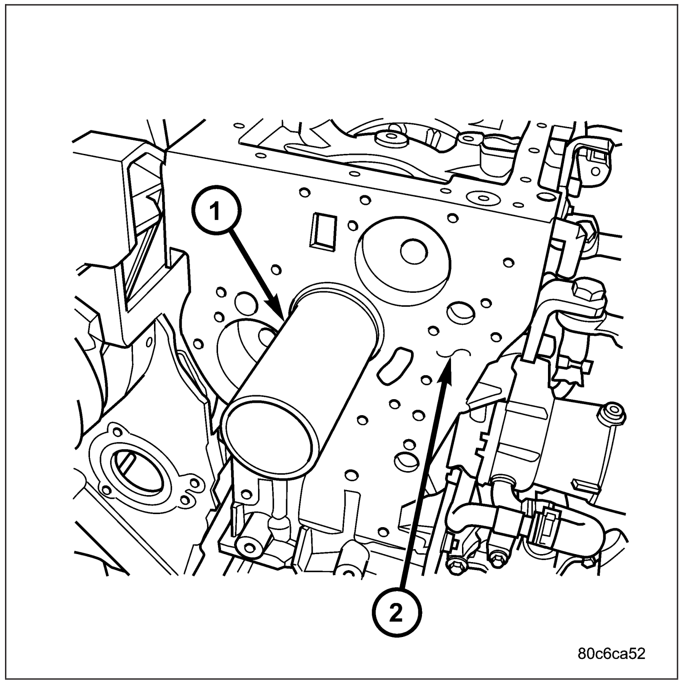


14. Remove front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL).
15. Paint mark or scribe the crankshaft gear to vacuum pump and oil pump drive gears (1).



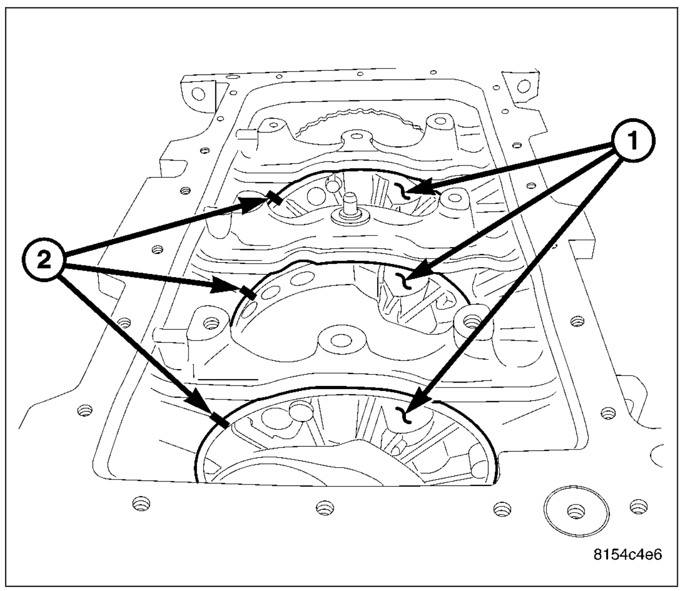
16. Remove crankshaft gear (2).

17. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
18. Remove oil pump pickup tube (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
19. Remove balance shaft assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - REMOVAL).
20. Remove oil jets (Refer to 9 - ENGINE/LUBRICATION/OIL JET - REMOVAL).
21. Remove piston and connecting rod assemblies (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - REMOVAL).
22. Slide special tool VM.1069 on the front of the crankshaft.

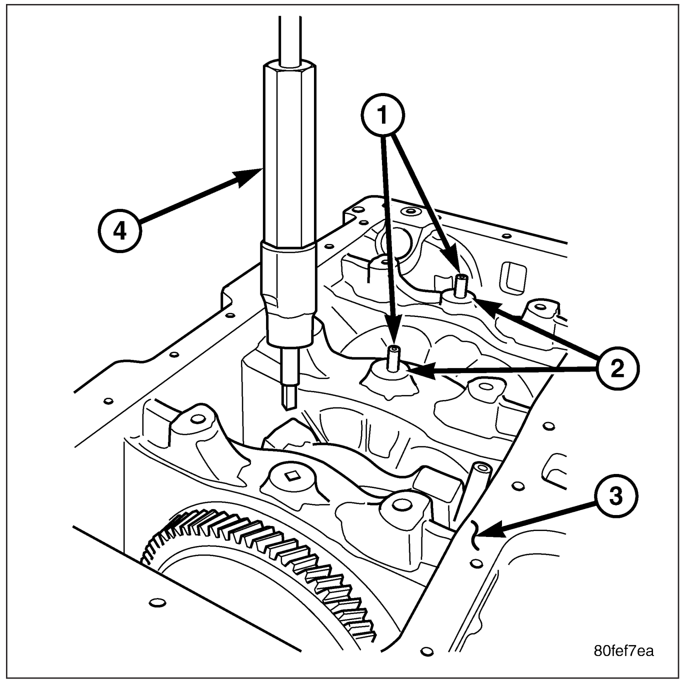


**CAUTION: Failure to properly identify and align each crankshaft support (1) will result in improperly aligned engine oil passages which will lead to engine failure.**

23. Paint mark or scribe (2) each crankshaft support (1) to engine block relation.



24. Using special tool VM.1054 (4), remove crankshaft support retainers (1) and o-rings (2), discard o-rings (2)..
25. Paint mark or scribe the relation between the crankshaft sensor tone ring and the crankshaft and remove the tone ring.
26. While holding crankshaft guide VM 1069, carefully guide crankshaft out of the rear of engine block (3).



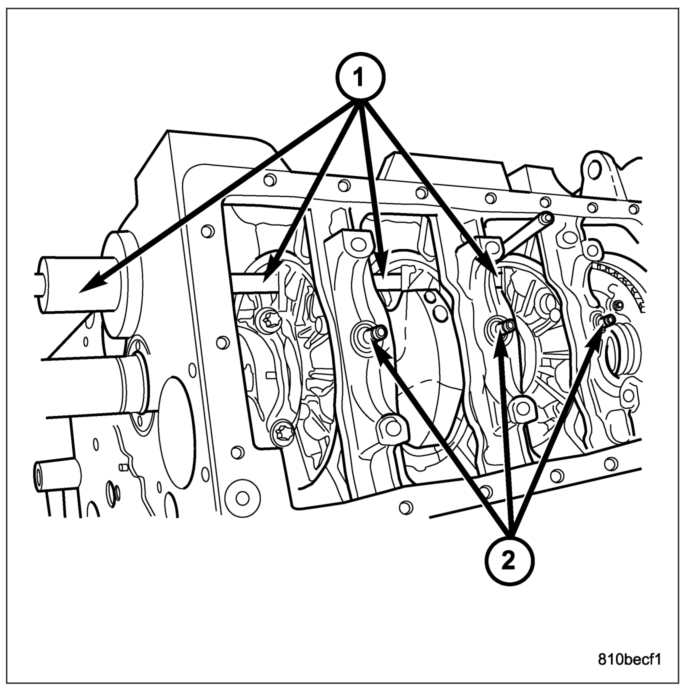
## INSTALLATION

**CAUTION: IT IS CRITICAL THAT BOTH HALVES OF THE CRANKSHAFT SUPPORT ARE ALIGNED PROPERLY WITH THE ENGINE TO SUPPORT ENGINE OIL MANAGEMENT.**

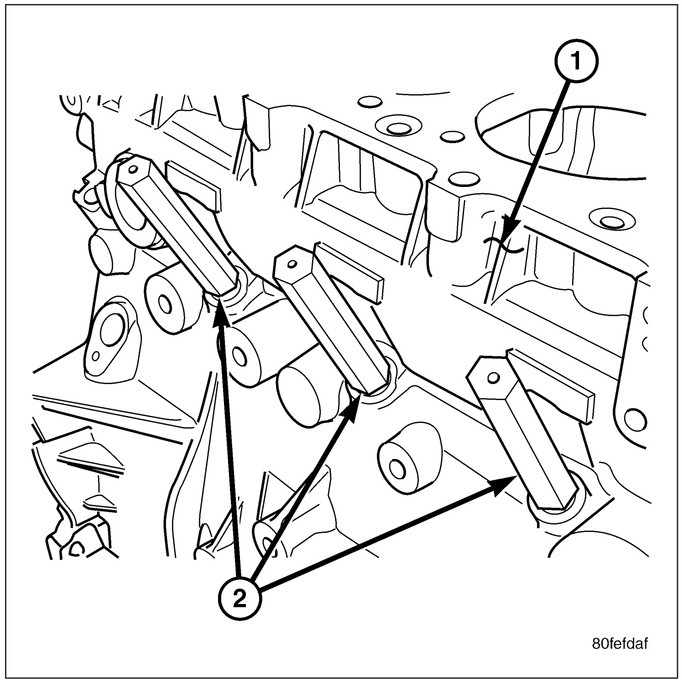
1. Install crankshaft in engine block.

**NOTE: There are two identical holes in the crankshaft support. Care must be taken to insert the special tool into the correct one..**

2. Insert crankshaft support alignment dowel into the vacuum pump access hole, through the proper crankshaft support holes then slide the tool guide flush against the engine block and retain with a vacuum pump retaining bolt.
3. Install crankshaft support retainers.



4. Remove special tool VM.1069 from crankshaft.
5. Remove special tool VM. 9095 from engine block.
6. Install crankshaft sprocket.
7. Install front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).
8. Install rear main bearing support in engine block (1). **Be sure to align oil hole in rear main bearing support with the lubrication port in the block.**
9. Install adapter plate and retaining bolts. Torque bolts to 27.5N·m.
10. Install flex plate.
11. Install piston and connecting rod assemblies (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSTALLATION).
12. Install oil jets (Refer to 9 - ENGINE/LUBRICATION/OIL JET - INSTALLATION).
13. Install balance shaft assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - INSTALLATION).



14. Install oil pump pickup tube (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
15. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
16. Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
17. Install cylinder head cover/intake manifold (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
18. Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
19. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
20. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
21. Install engine in vehicle.
22. Fill engine oil with proper oil to correct level.

# BEARINGS-CRANKSHAFT MAIN

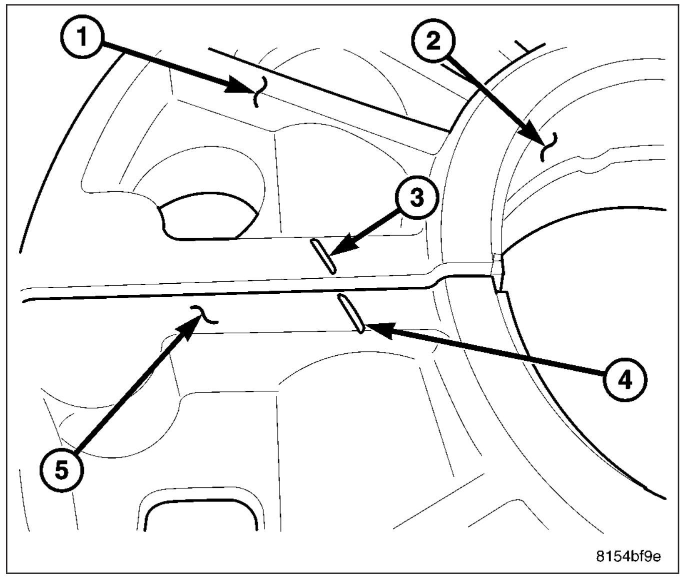
## REMOVAL

**NOTE: The crankshaft support halves can be identified by aligning the witness marks scribed on the face, located between the halves. These witness marks must face towards the front of the engine when installing the crankshaft and support assembly.**

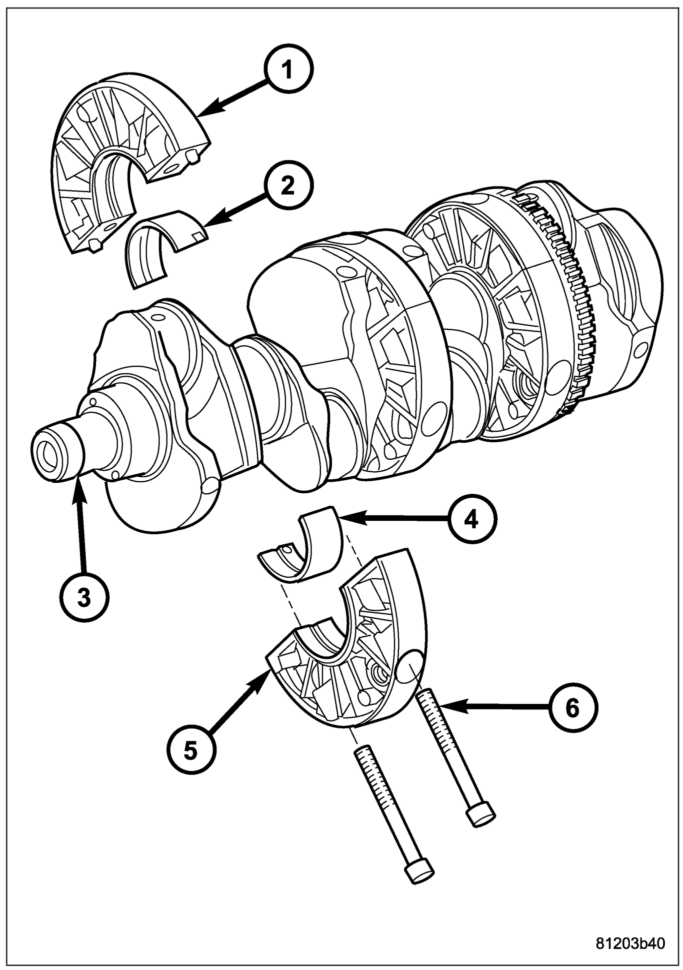
The engine must be removed from vehicle and completely disassembled to replace the front main bearing.

### CRANKSHAFT MAIN BEARINGS

1. With crankshaft assembly removed from engine.
2. Identify the crankshaft support witness marks.

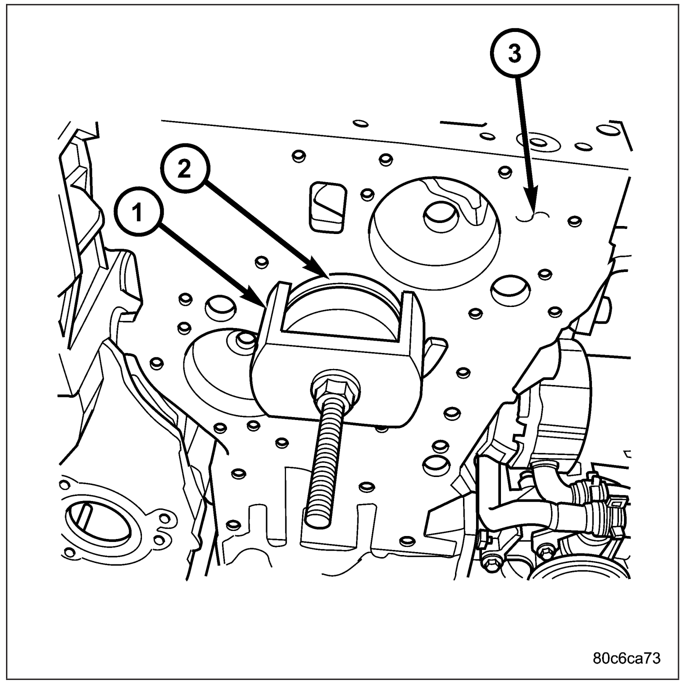


3. Remove crankshaft supports from crankshaft and remove bearing halves from supports.



### CRANKSHAFT FRONT MAIN BEARING

1. Using special tool VM.1073 push front main bearing out of front of engine block.



## INSTALLATION

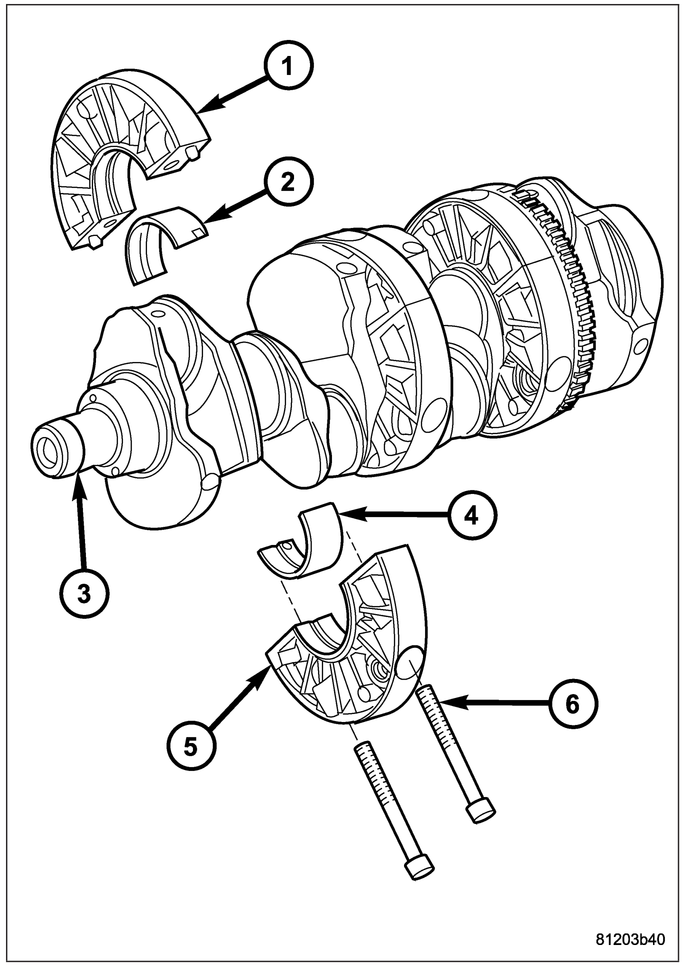
### CRANKSHAFT MAIN BEARINGS

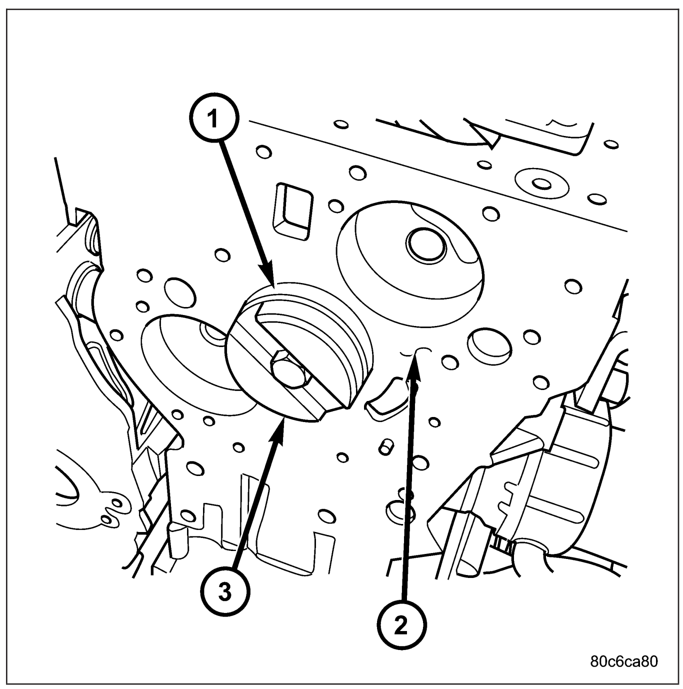
**NOTE: Identify the correct crankshaft by noting the groove on the front of the 2.8L crankshaft.**

1. Install bearing halves in crankshaft supports.
2. Lubricate crankshaft and main bearings with clean engine oil.
3. Install crankshaft supports on crankshaft. Torque bolts to 44.1N·m.

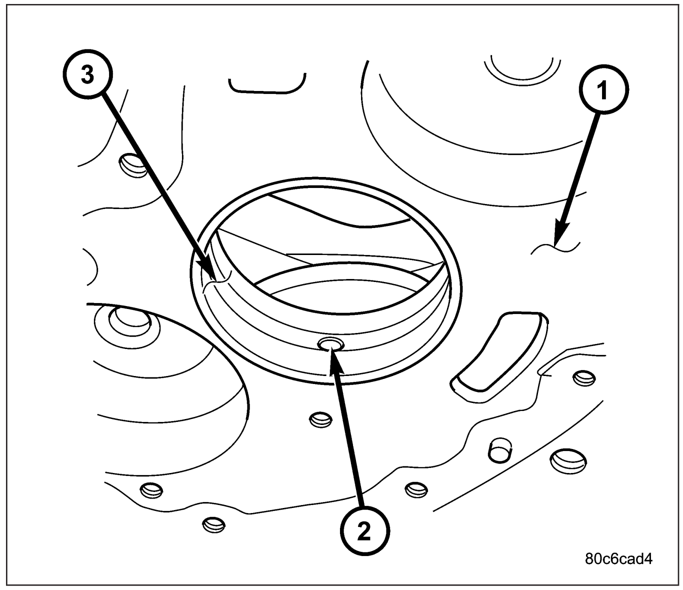
## FRONT CRANKSHAFT MAIN BEARING

1. Using special tool VM.1073, push front crankshaft main bearing in engine block.
2. Be sure oil hole in bearing lines up with oil gallery in engine block.





3. Reassemble engine and install in vehicle.



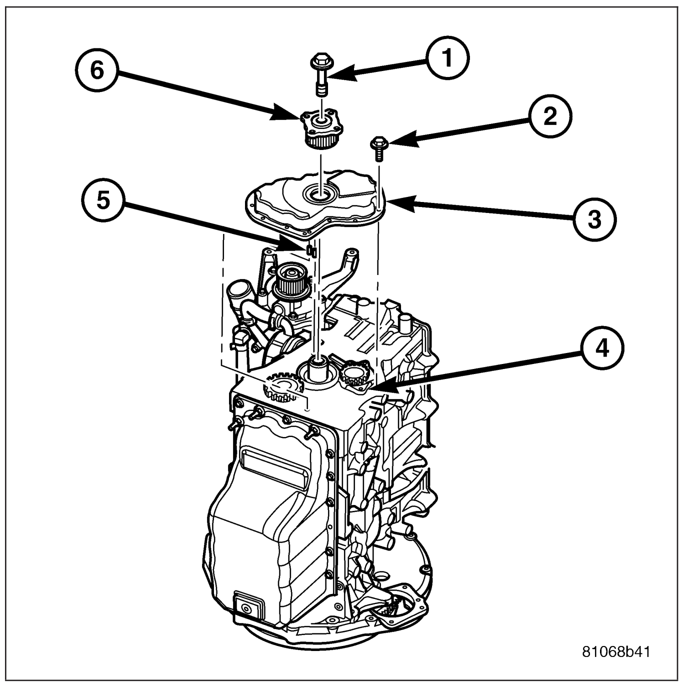
# SEAL-CRANKSHAFT OIL - FRONT

## REMOVAL

1. Disconnect negative battery cable.
2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
5. Remove vibration damper/crankshaft pulley (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
6. Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
7. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
8. Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

**NOTE: Crankshaft hub retaining bolt has left hand thread.**

9. Remove crankshaft hub.
10. Remove front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL) .
11. With cover on work bench, pry out old seal.



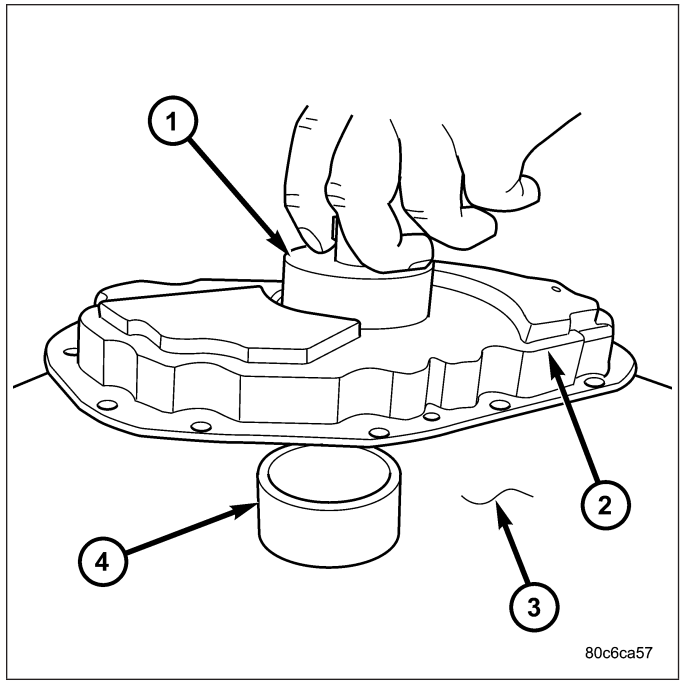
## INSTALLATION

**CAUTION: Do Not use a hammer to install the crankshaft oil seal.**

**NOTE: To prevent potential oil leaks, DO NOT touch the front crankshaft inner seal. Always handle the seal from the outer diameter.**

1. Clean engine block and front engine cover sealing surfaces.
2. Install crankshaft oil seal on VM.1061.
3. Place sleeve for VM.1061 on pressbench as shown.

4. Position VM.1061 and press in new seal into front engine cover.
5. Install front engine cover on engine (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).
6. Install crankshaft hub and retaining bolt. Torque bolt to 304N·m.
7. Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
8. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
9. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
10. Install vibration damper/crankshaft pulley (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
11. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

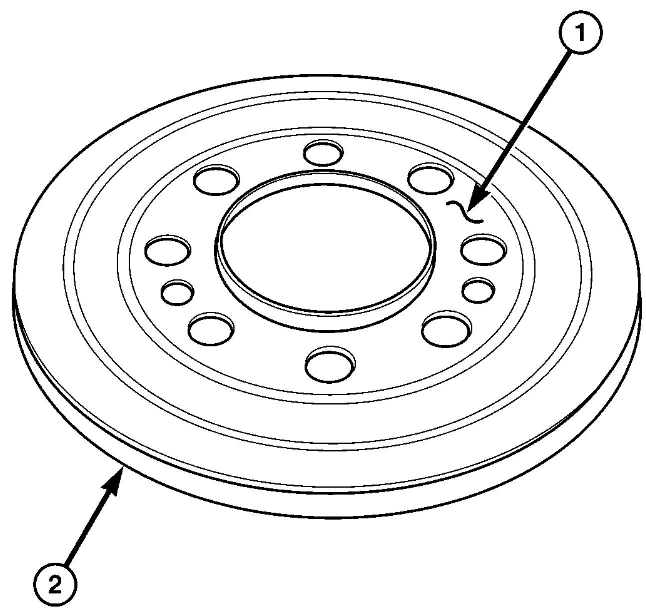


12. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
13. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
14. Connect negative battery cable.

# SEAL-CRANKSHAFT OIL - REAR

## DESCRIPTION

The rear crankshaft seal consists of two parts that reside in a third part, the rear support assembly. The rear seal is inserted into the rear cup. These pieces should be assembled WITH OUT removing one from the other. The rear support assembly, once assembled, should not be separated as well, to reduced possibility of damage to the internal rear seal lip.

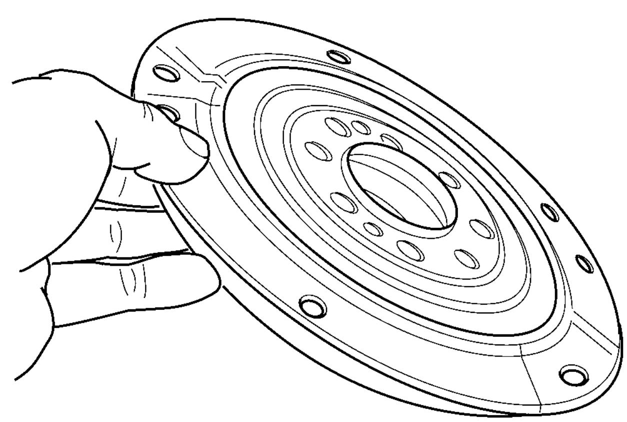


8120baaf

## REMOVAL

This must be done with either the engine or transmission removed from vehicle.

1. Remove flywheel assembly.
2. Paint mark or scribe a witness mark on the engine block to be used for alignment purposes during assembly.
3. Pry out old crankshaft oil seal.



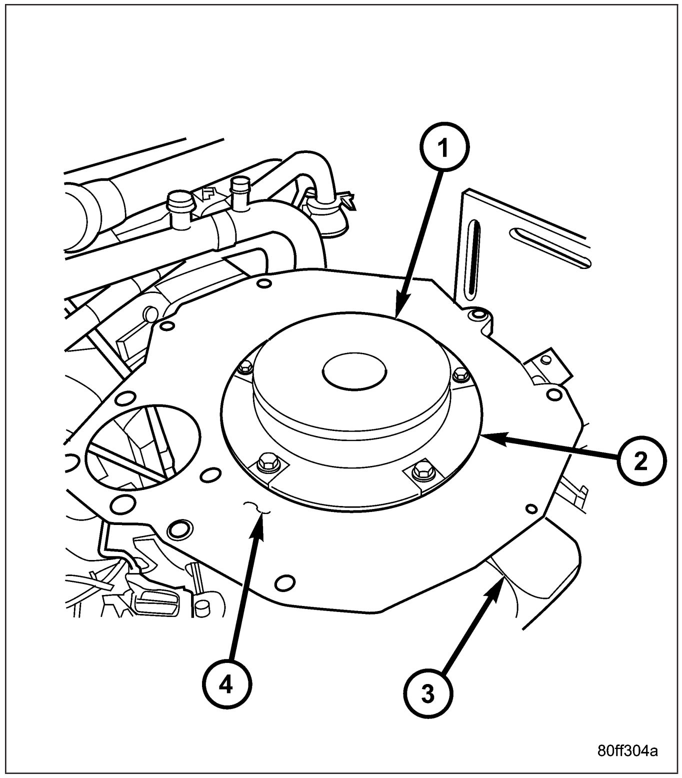
8120baae

## INSTALLATION

**CAUTION: To prevent potential oil leaks, DO NOT touch or separate the rear crankshaft inner seal from the seal cup. When replacing the rear crankshaft carrier, DO NOT touch or separate the seal cup from the rear oil seal. Always handle the components as an assembly and from their outer diameter.**

1. Using special tool VM.1050, install rear crankshaft oil seal in rear main bearing support.

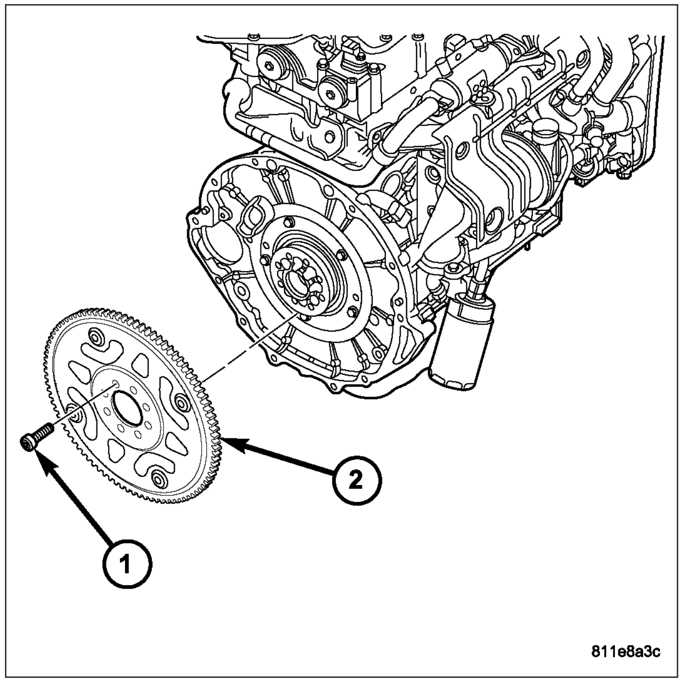
2. Install engine or transmission in vehicle.



# FLEX PLATE-2.8L

## REMOVAL

1. Remove the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - REMOVAL), (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - REMOVAL).
2. Paint mark the flex plate hub to flex plate relation.
3. Remove the 40 mm flex plate bolts (1) and flex plate (2).
4. Inspect flex plate (2) for damage.



## INSTALLATION

**NOTE: Do Not lubracate new bolts as they are already coated with an anti-scuff treatment.Align the flex plate to hub paint marks, where applicable.**

1. Install the flex plate hub and hand tighten the fasteners.
2. Tighten each flex plate hub fastener to 50 N·m (37 lbs. ft.) in a clockwise cross sequence.
3. At this point, loosen one flex plate adaptor fastener, and with a torque wrench and angle gauge, tighten the fastener to 25 N·m (19 lbs. ft.), plus 60 degrees.
4. Perform the above procedure for the remaining flex plate adaptor bolts in a clockwise cross sequence.
5. Install the flex plate locating pin.
6. Install the flex plate to the hub and install the fasteners. Tighten the flex plate fasteners in a cross sequence to 44 N·m (32.5 ft. lbs.).
7. Install the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION), (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - INSTALLATION).

# LINERS-CYLINDER

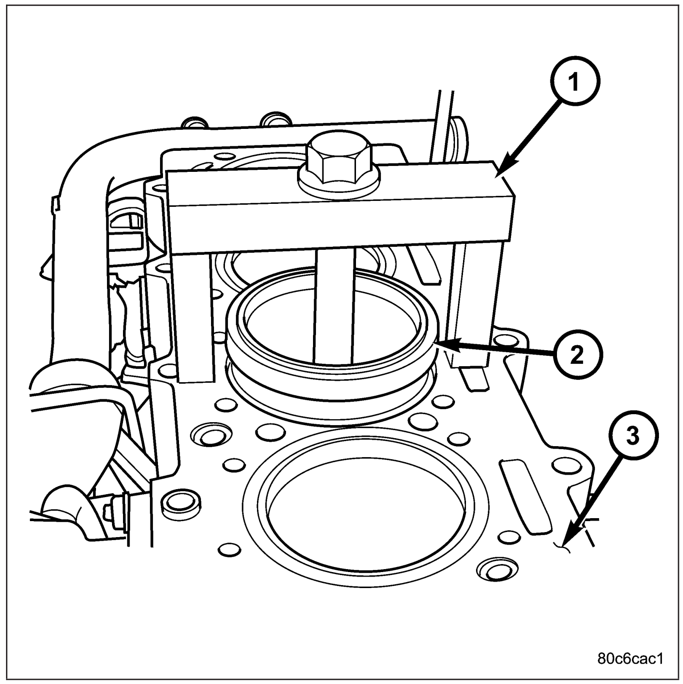
## DESCRIPTION

Each cylinder wall liner used on this engine is of the wet design. Coolant is in direct contact with the liner. Three O-rings are used to seal the liner to the engine block. The top O-rings (black) are water seals and the lower (brown) seal is an oil seal. The applicable metal shim is used for cylinder liner protrusion. If the liner is to be reused, match mark the liner and block. Anytime that the liners are removed, replace the O-rings and the shim. If one or more liners have been replaced the liner protrusion must be measured to determine the proper head gasket selection. If the liners are not removed, used the same thickness head gasket that was removed.

## REMOVAL

**CAUTION: To prevent damage to the oil jets, remove the oil jets before removing the pistons or liners.**

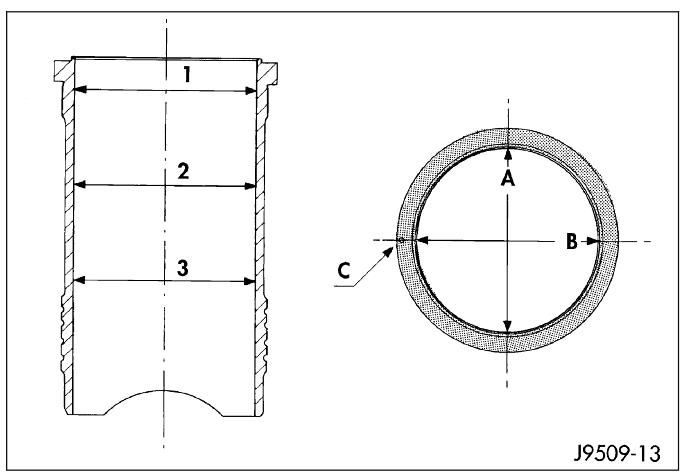
1. Remove engine from vehicle.
2. With engine completely disassembled, use special tool VM.1001 (1) to remove cylinder liner (2).
3. Tighten bolt on VM.1001 (1) to remove cylinder liner (2) from engine block (3).
4. Remove shim(s) from cylinder liner (2) or cylinder block recess. Keep shim(s) with each cylinder liner (2) until cylinder liner (2) protrusion measurement.



## INSPECTION

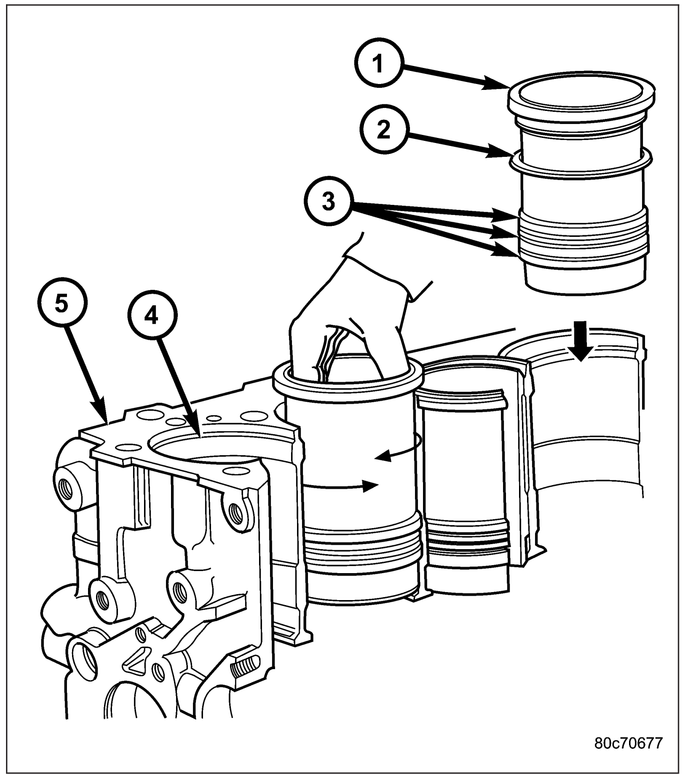
The cylinder walls should be checked for out-of-round and taper with a dial bore gauge. The cylinder bore out-of-round is 0.100 mm (.0039 in.) maximum and cylinder bore taper is 0.100 mm (.0039 in.) maximum. If the cylinder walls are badly scuffed or scored, new liners should be installed and honed, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B. Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from the bottom bore.



## INSTALLATION

**CAUTION: Cleanliness can not be over emphasized enough when cleaning the cylinder liner (1) to engine block (5) mating surfaces. Failure to do so will result in the wrong protrusion reading. Only one shim (2) per sleeve fitting. DO NOT stack or re-use shims (2).**



**NOTE: When installing cylinder liners (1) for protrusion measurement, remove all O-rings (3) and discard original shim (2).**

1. Carefully clean cylinder liner (1) and engine block (5), and degrease the engine block deck where it comes into contact with the cylinder liners (1). Install the cylinder liners in the engine block (5) as shown, rotating them back and forth by 45° in order to guarantee correct positioning.

**NOTE: All Measurements Must Be Taken On the High Pressure Pump Side.**

2. Measure the cylinder liner (1)) recess relative to block deck with dial indicator VM.1013 mounted on a special tool VM.1010 A.. Zero dial gauge on block deck.

**NOTE: The cylinder liner (1) reading will actually be a negative number.**

3. Move dial gauge to cylinder liner (1) edge record reading on dial gauge. The reading should be negative.
4. Remove cylinder liner (1) and special tools.
5. Then select the correct shim (2) thickness to give proper protrusion (0.00 - 0.05 mm).

**NOTE: The O-rings (3) are used toward the bottom of the cylinder liner (1). Each cylinder liner (1) has three O-rings (3) that prevent coolant and engine oil from mixing. The brown (bottom) O-ring (3) is an oil seal and the two black (top) O-rings (3) are water seals.**

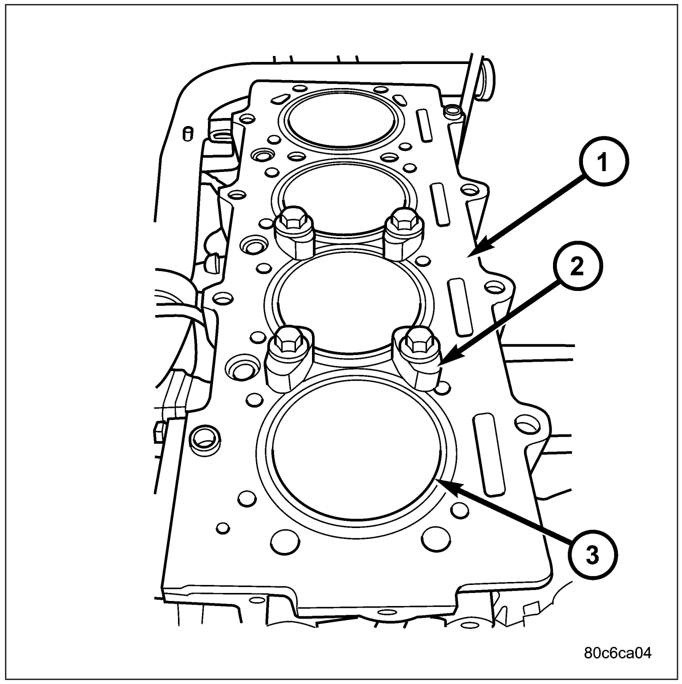
6. Fit the proper shim (2), and the O-rings (3), onto the cylinder liner (1).
7. Lubricate the lower cylinder liner (1) location in the engine block (5).

**CAUTION: When installing special tool VM.1076, make sure the tool does not rotate when tightening and damage the cylinder liner (1). DO NOT rotate the engine with out special tool VM.1076 in position.**

8. Fit the cylinder liners in the crankcase making sure that the shim (2) is positioned correctly in the seat. Lock the cylinder liners (1) in position using special tool (VM.1076) and bolts tightened to 50 N·m (37 ft.lbs.).

**NOTE: After measuring cylinder liner (1) protrusion again, piston protrusion must be measured to prevent the wrong cylinder head gasket selection.**

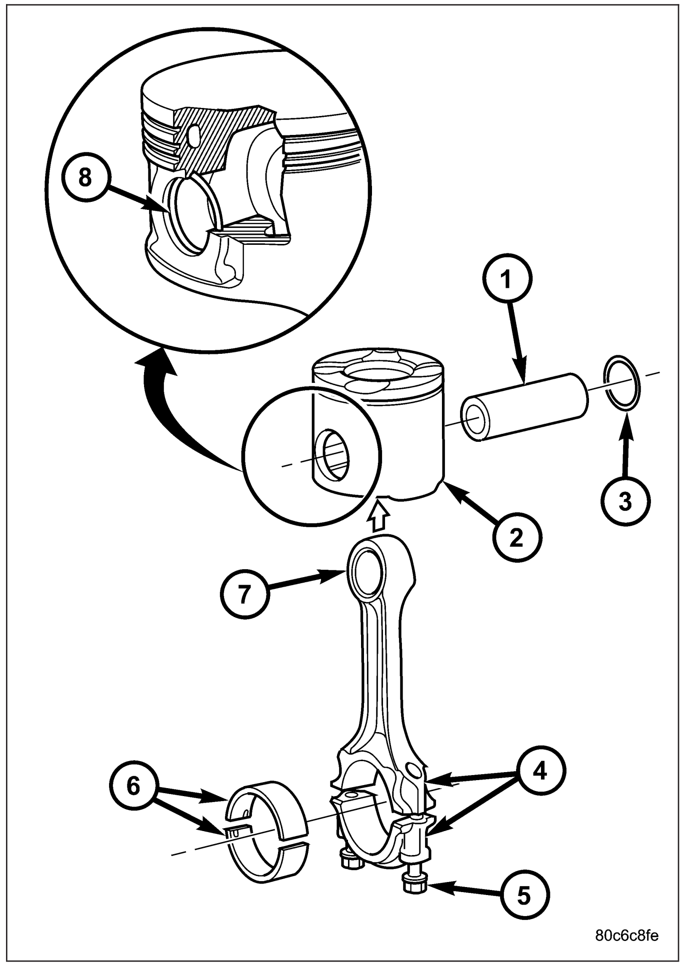
9. Measure cylinder liner (1) protrusion again. It should be 0.00 - 0.05 mm.
10. Reassemble engine.
11. Install engine in vehicle.



# ROD-PISTON AND CONNECTING

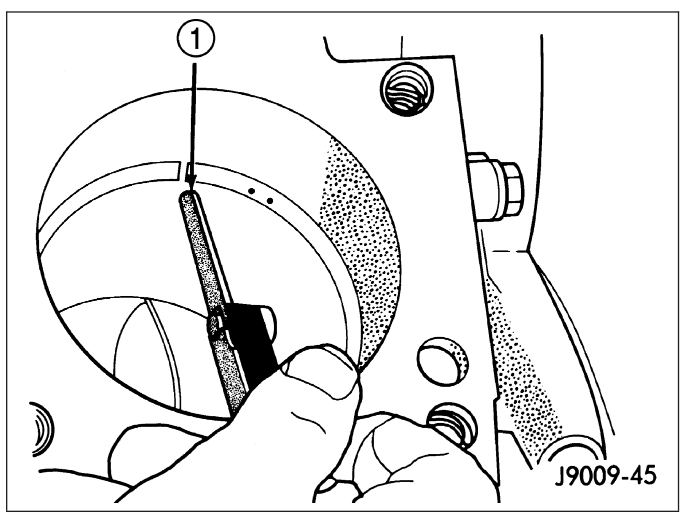
## DESCRIPTION

The pistons (2) are of a free floating design. Oil jets in the engine block lubricate and cool the piston and piston pin (1) assembly. The connecting rods (7) have a pressed in place wrist pin bushing which is lubricated by the oil jets. Connecting rod (7) and bearing caps have cracked mating surfaces and are not interchangeable..

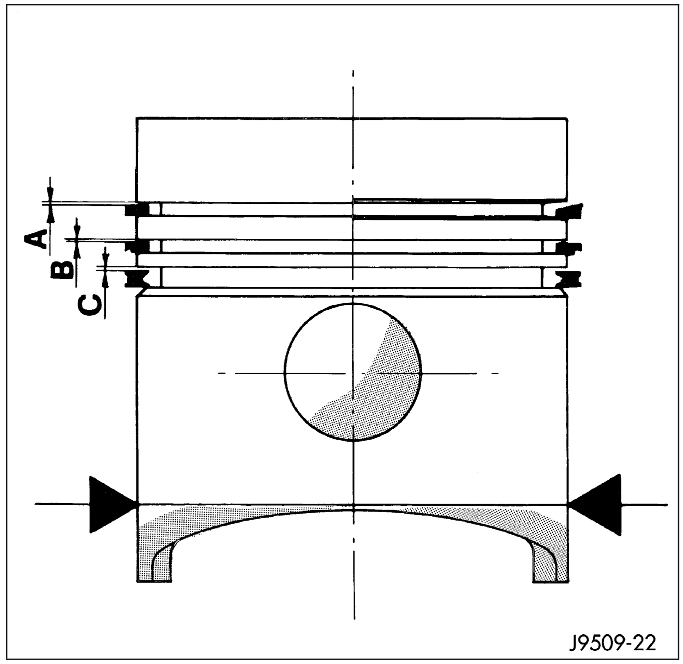


## STANDARD PROCEDURE - PISTON RING FITTING

1. Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 in.) from bottom of cylinder bore. Check gap with feeler gauge. Top compression ring gap .30 to .45mm (.0118 to .0177 in.). Second compression ring gap .30 to .45mm (.0118 to .0177 in.). Oil control ring gap .25 to .50mm (.0098 to .0196 in.).
2. If ring gaps exceed dimension given, new rings or cylinder liners must be fitted. Keep piston rings in piston sets.



3. Check piston ring to groove clearance. Top compression ring gap .080 to .130mm (.0031 to .0051 in.). Second compression ring gap .070 to .110mm (.0027 to .0043 in.). Oil control ring gap .040 to .080mm (.0015 to .0031 in.).



## REMOVAL

**NOTE: Both the connecting rod and the connecting rod cap are paint marked to aid during assembly. Paint marks disappear after time. If the rod and the cap are not marked with paint, paint mark or scribe them before disassembly.**

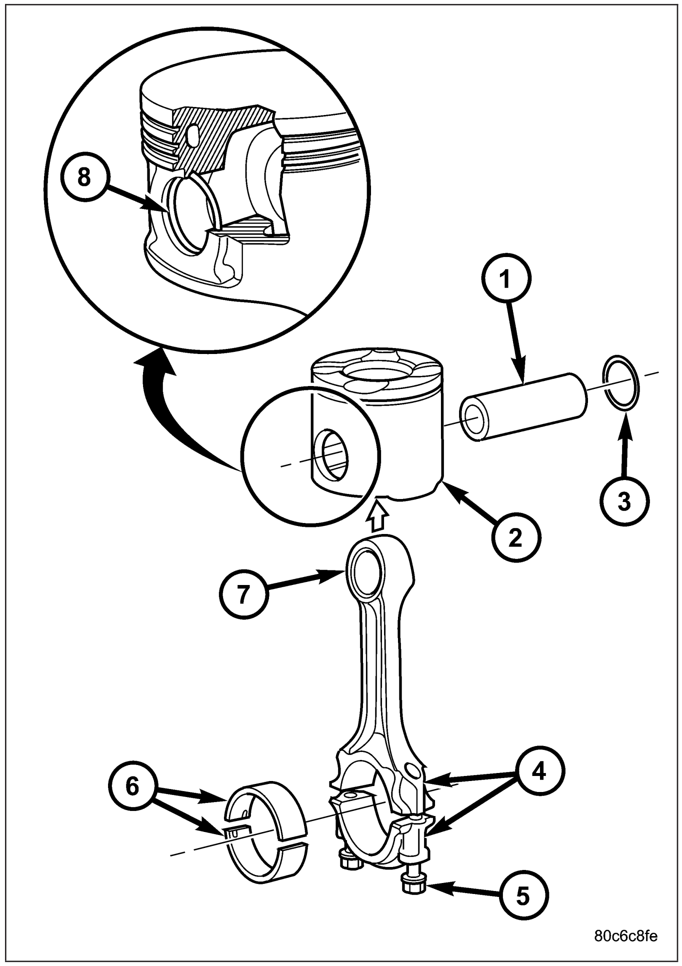
1. Disconnect negative battery cable.
2. Remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
3. Raise vehicle on hoist.
4. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
5. Remove oil pump pickup tube. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
6. Remove balance shaft assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - REMOVAL).
7. Remove top ridge of cylinder bores with a ridge reamer before removing pistons from cylinder block. **Be sure to keep top of pistons covered during this operation.**
8. Piston and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

**NOTE: Be careful not to nick or scratch crankshaft journals**

9. After removal, install bearing cap on the mating rod and mark pistons with matching cylinder number when removed from engine block.

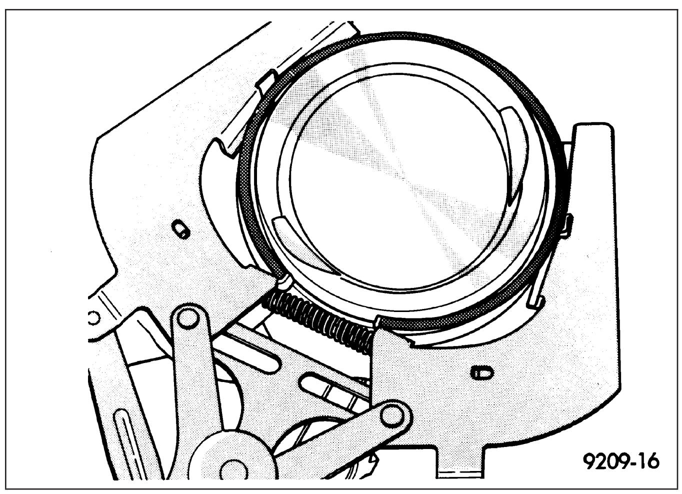
## PISTON PIN - REMOVAL

1. Secure connecting rods (7) in a soft jawed vice.
2. Remove 2 snap rings (8) securing piston pin (1).
3. Push piston pin (1) out of piston (2) and connecting rod (7).



## PISTON RING - REMOVAL

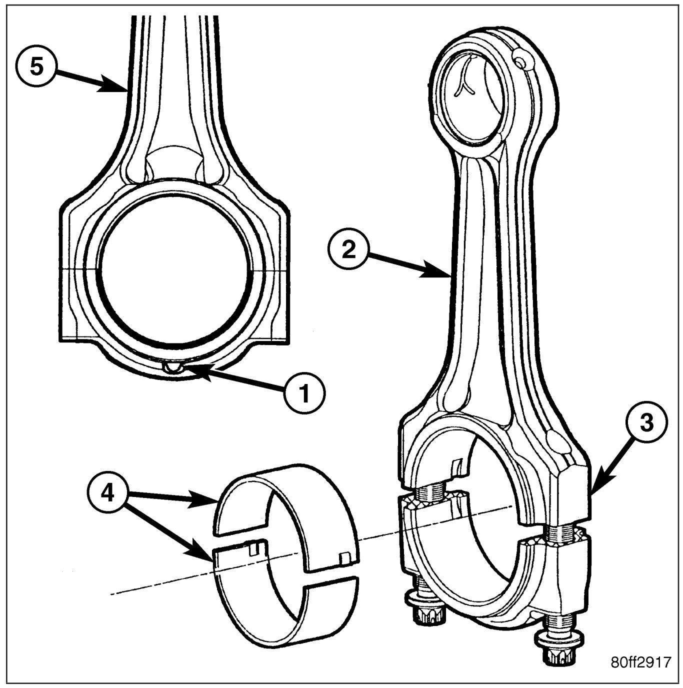
1. ID mark on face of top and second piston rings must point toward piston crown.
2. Using a suitable ring expander, remove top and second piston rings.
3. Remove upper oil ring side rail, lower oil ring side rail and then the oil expander from piston.
4. Carefully clean carbon from piston crowns, skirts and ring grooves ensuring the 4 oil holes in the oil control ring groove are clear.



## INSPECTION

### PISTONS

1. Piston Diameter: Size: 91.912-91.928mm (3.6185-3.6192 in.) Maximum wear limit .05mm (.0019 in.).
2. Check piston pin bores in piston for roundness. Make 3 checks at 120° intervals. Maximum out of roundness .05mm (.0019in.).
3. The piston diameter should be measured approximately 15 mm (.590 in.) up from the base.
4. Skirt wear should not exceed 0.1 mm (.00039 in.).
5. The clearance between the cylinder liner and piston should not exceed 0.065-0.083 mm (.0025-.0032 in.).



### CONNECTING RODS

**CAUTION: Connecting rod bolts must be replaced when disassembled. When assembling the connecting rod (2), be sure that the connecting rod pawl (1) on each of the connecting rod caps is facing the rear (fly wheel) side of the engine.**

**NOTE: Do Not lubricate the new connecting rod bolts. They are already coated with a anti scuff treatment.**

1. Assemble connecting rod bearings (4) and bearing caps to their respective connecting rods (2) ensuring that the serrations on the cap and reference marks are aligned.
2. Tighten connecting cap bolts to 10 N·m (88 in. lbs.).
3. Without loosening connecting rod bolts, tighten all bolts to 30N·m (22 ft.lbs.).
4. Using a torque angle gauge, tighten each bolt an additional 40°.
5. Recheck all bolt tightening with a torque wrench set to 88N·m (65 ft.lbs.).
6. Check and record internal diameter of crank end of connecting rod (2).

**CAUTION: When changing connecting rods (2), DO NOT use a stamp to mark the cylinder location. Identify the connecting rods (2) and caps location using a paint marker. All four must have the same weight and the same number. Replacement connecting rods (2) will only be supplied in sets of four.**

Connecting rods (2) are supplied in sets of four since they all must be of the same weight category. Max allowable weight difference is 5 gr.

### PISTON PINS

1. Measure the diameter of piston pin in the center and both ends.For specification, (Refer to 9 - ENGINE - SPECIFICATIONS), (Refer to 9 - ENGINE - SPECIFICATIONS).

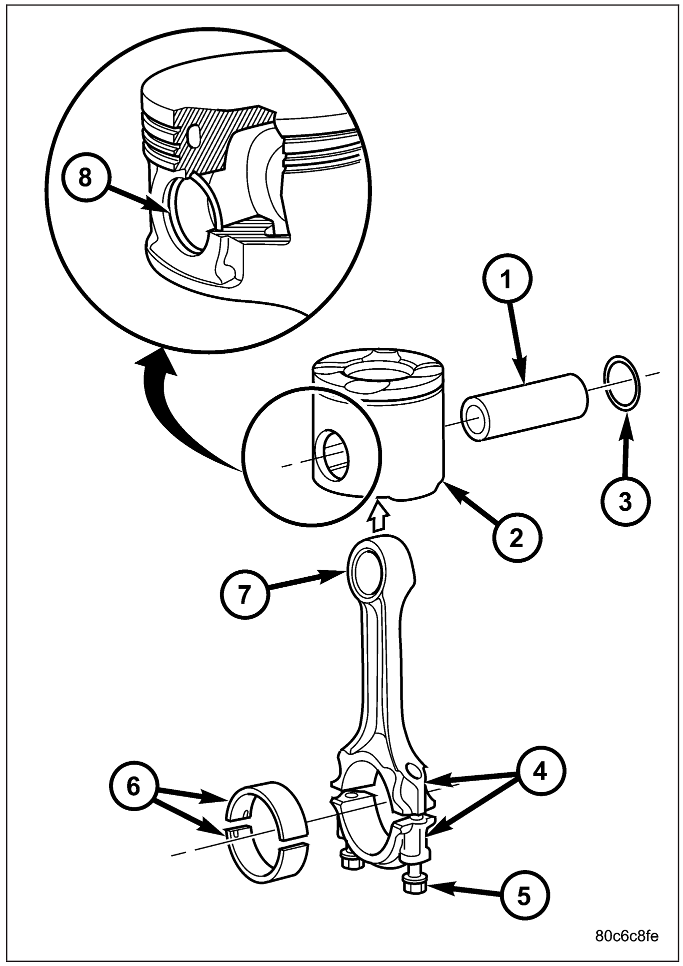
## INSTALLATION

### PISTON PIN INSTALLATION

1. Secure connecting rod (7) in soft jawed vice.
2. Lubricate piston pin (1) and piston (2) with clean engine oil.
3. Position piston (2) on connecting rod (7).

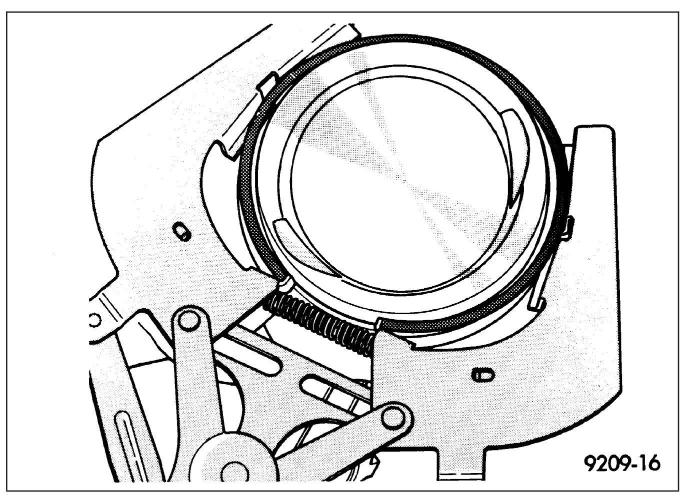
**CAUTION: Ensure arrow on piston crown and the bearing cap numbers on the connecting rod are on the opposite side.**

4. Install piston pin (1).
5. Install snap ring (3) in piston (2) to retain piston pin (1).
6. Remove connecting rod (7) from vice.

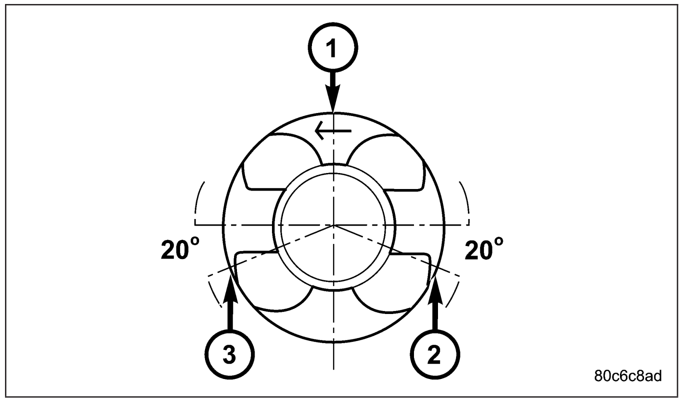


### PISTON RINGS - INSTALLATION

1. Install rings on the pistons using a suitable ring expander.



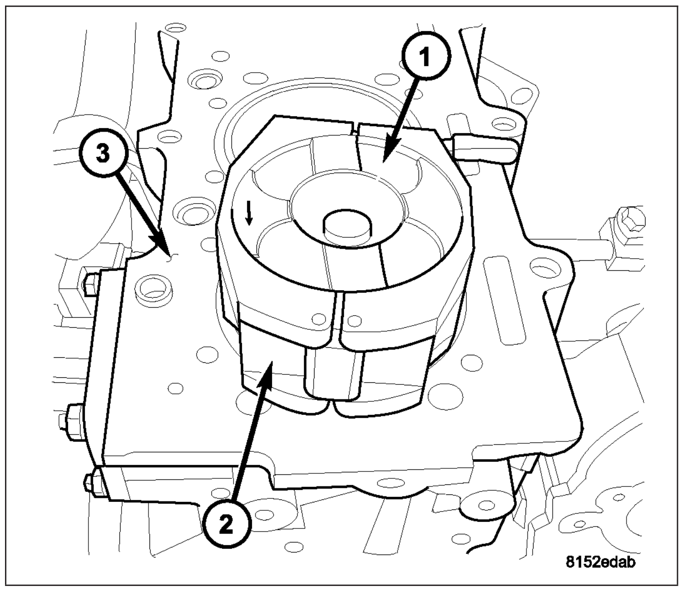
2. Top compression ring is tapered and chromium plated. The second ring is of the scraper type and must be installed with scraping edge facing bottom of the piston. The third is an oil control ring. Ring gaps must be positioned, before inserting piston into the liners, as follows.
3. Top ring gap must be positioned at the #3 position (looking at the piston crown from above).
4. Second piston ring gap should be positioned at the #1 position.
5. Oil control ring gap should be positioned at the #2 position.



6. When assembling pistons check that components are installed in the same position as before disassembly, determined by the numbers stamped on the crown of individual pistons. Engine cylinders are numbered starting from gear train end of the engine. **Face arrow on top of piston toward front of engine**. Therefore, the numbers stamped on connecting rod big end should face toward the injection pump side of engine. To insert piston into cylinder use a ring compressor as shown in.

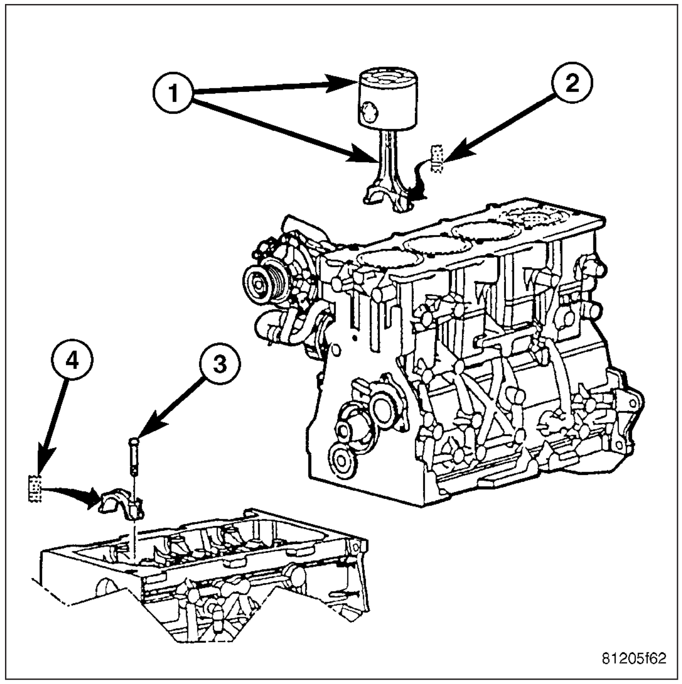
## INSTALLATION

1. Before installing pistons, and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.
2. Before installing the ring compressor, make sure the oil ring expander ends are butted together.
3. Immerse the piston head and rings in clean engine oil, slide the piston ring compressor, over the piston and tighten. **Ensure position of rings does not change during this operation**.
4. Face arrow on piston towards front of engine.



**CAUTION: Care must be taken not to nick crankshaft journal when installing pistons.**

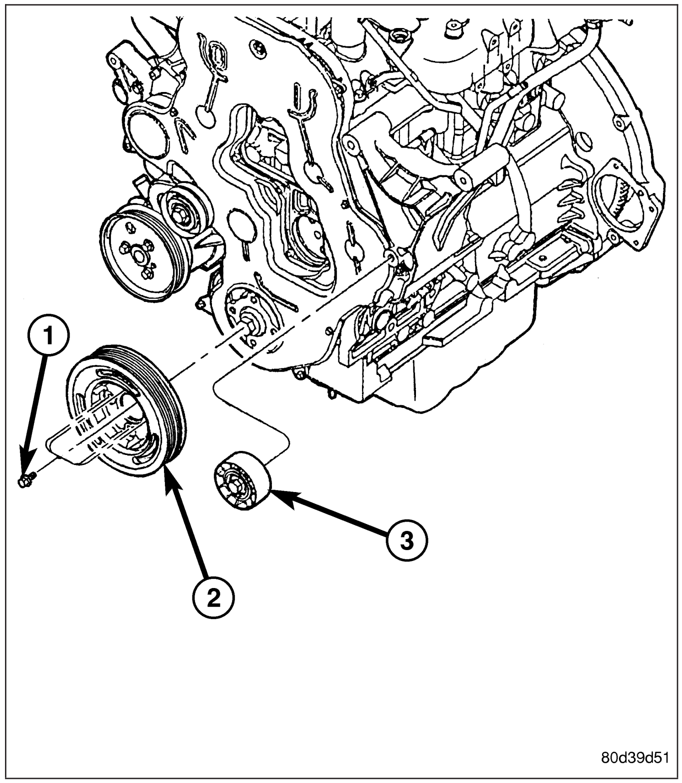
5. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.
6. Guide the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.
7. Install connecting rod caps. Install rod bolts and torque to 10N·m (88 lbs. in.). Torque bolts the next stage to 30N·m (22 ft.lb.) plus 60°. Then with a torque wrench set at torque to 88N·m (65 ft.lb), make a tightening check.
8. Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
9. Install balance shaft assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - INSTALLATION).
10. Install oil pump pickup tube (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
11. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
12. Connect negative battery cable.



# DAMPER-VIBRATION

## REMOVAL

1. Disconnect negative battery cable.
2. Remove viscous cooling fan and shrowd (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove vibration damper retaining bolts (1) and damper (2(.



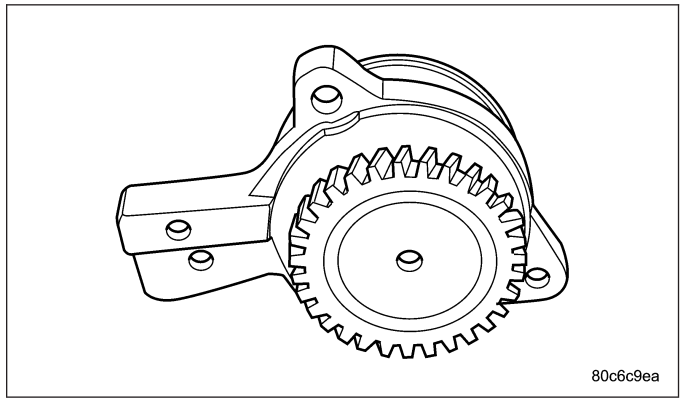
## INSTALLATION

1. Install vibration damper and retaining bolts. Torque bolts to 32.4N·m. (24 ft.lbs.).
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Install viscous fan and fan shrowd (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
4. Connect negative battery cable.

# PUMP-INTERNAL VACUUM

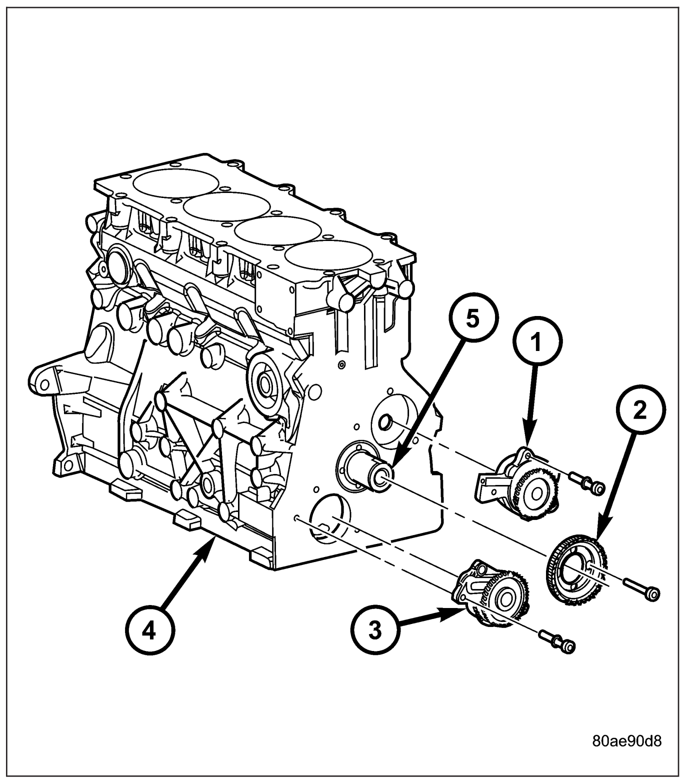
## DESCRIPTION

The diesel engine uses a internal vacuum pump. This vacuum pump is mounted in the front of the engine block under the engine front cover. The vacuum pump is driven by a sprocket on the crankshaft.



## REMOVAL

1. Disconnect negative battery cable.
2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
5. Remove vibration damper/crankshaft pulley (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
6. Rotate the engine to 90 degrees ATDC and install alignment pin VM.1089 (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
7. Remove outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).



**CAUTION: Before removing the cylinder head cover/intake manifold or timing belt the engine must rotated to the 90° ATDC and special tool VM.1089 alignment pin installed. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)**

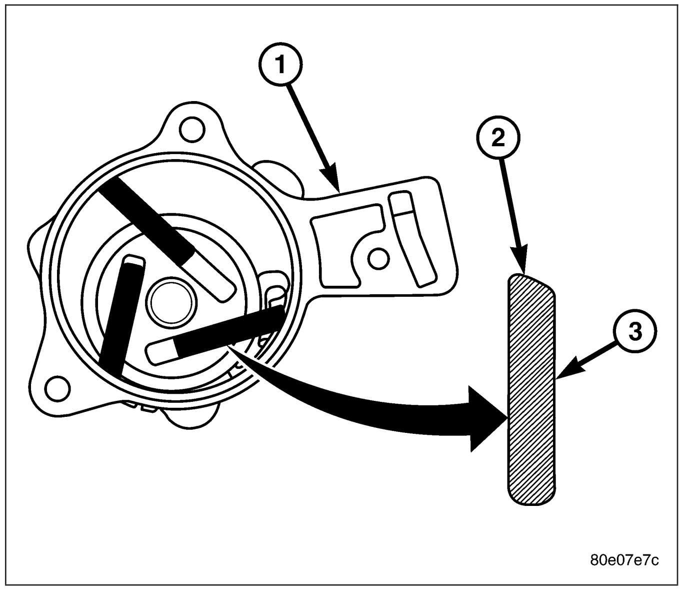
8. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
9. Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

**NOTE: Crankshaft hub has LHD thread.**

10. Remove crankshaft hub.
11. Remove front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL).
12. Remove crankshaft sprocket.
13. Remove vacuum pump.

## INSTALLATION

**NOTE: Verify the 3 blades on the vacuum pump are in place and correctly assembled. The tapered edge should be on the outer side. Make sure the pump rotates before installation.**



1. Lubricate vacuum pump components and install in engine block. Torque bolts to 10.8N·m.
2. Install crankshaft sprocket. Torque bolts to 10.8N·m.
3. Install front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).
4. Install front crankshaft hub. Torque bolt to 304N·m.
5. Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
6. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
7. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
8. Remove special tool VM.1080 from the engine block 90 degree ATDC alignment hole.
9. Install vibration damper/crankshaft pulley (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
10. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
11. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
12. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
13. Connect negative battery cable.

# COVER-ENGINE - FRONT

## DESCRIPTION

The front engine cover on this engine is a stamped steel cover which covers the oil pump and vacuum pump.

## REMOVAL

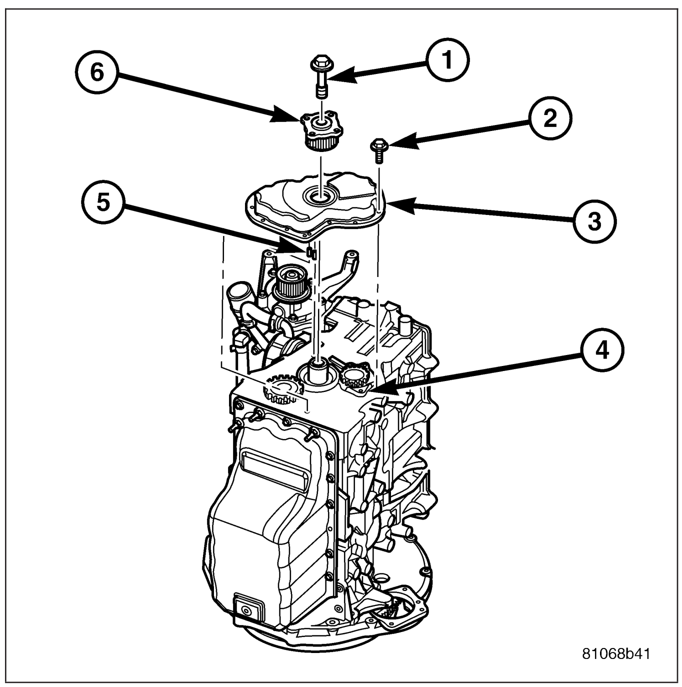
1. Disconnect negative battery cable.
2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
5. Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
6. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

**CAUTION: Before removing the cylinder head cover/intake manifold or timing belt the engine must aligned at 90° ATDC and special tool VM.1089 installed. Failure to do so could result in valve and/or piston damage during reassembly. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)**

7. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
8. Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

**NOTE: Crankshaft hub has left hand thread.**

9. Remove crankshaft hub.
10. Remove front engine cover.



## INSTALLATION

1. Clean engine block and front engine cover sealing surfaces.
2. Apply a continous 3mm bead of Silicone Sealer to cover, install within 10 minutes. Torque bolts to 11.8N·m..
3. Install crankshaft hub. Torque bolt to 304N·m.

4. Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
5. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
6. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)
7. Remove 90 degree ATDC alignment pin VM.1080.
8. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
9. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
10. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
11. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
12. Connect negative battery cable.

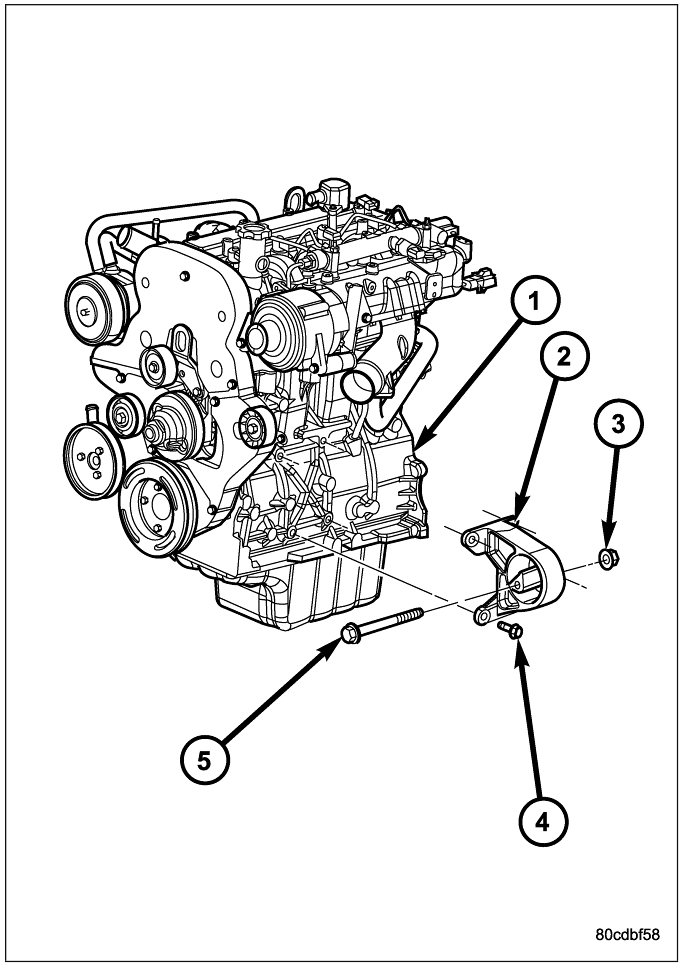
# MOUNT-LEFT ENGINE

## REMOVAL

1. Disconnect the negative battery cable.
2. Remove the cooling fan and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
3. Raise and support the vehicle.
4. Loosen both engine mount through bolts.

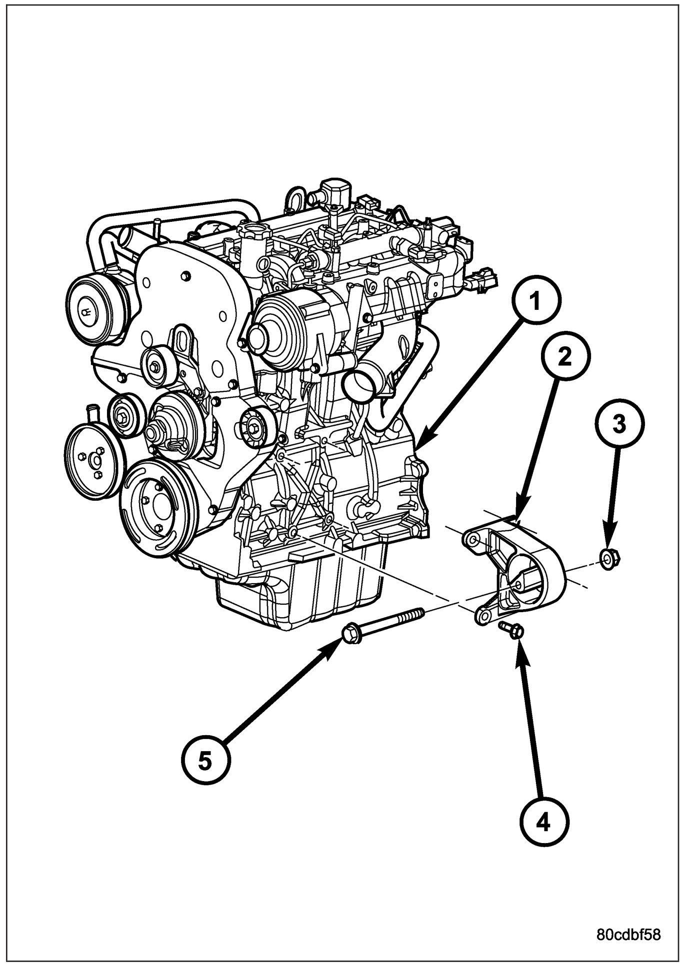
**NOTE: Care must be taken not to damage any wiring above the transmission when raising the engine.**

5. Using a suitable jack, raise and support the engine.
6. Remove the engine mount retaining bolts and remove the mount.



## INSTALLATION

1. Position the engine mount and hand tighten the retaining bolts.
2. Lower the engine mount and through bolts into the engine mount support.
3. Lower the vehicle.
4. Install the left upper engine mount bolt.Tighten bolt to 54 N·m (40 lbs. ft.).
5. Raise and support the vehicle.
6. Tighten remaining mount to engine bolts to 54 N·m (40 lbs. ft.).
7. Tighten engine mount through bolts to 54 N·m (40 lbs. ft.).
8. Lower the vehicle.
9. Install the cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
10. Connect the negative battery cable.



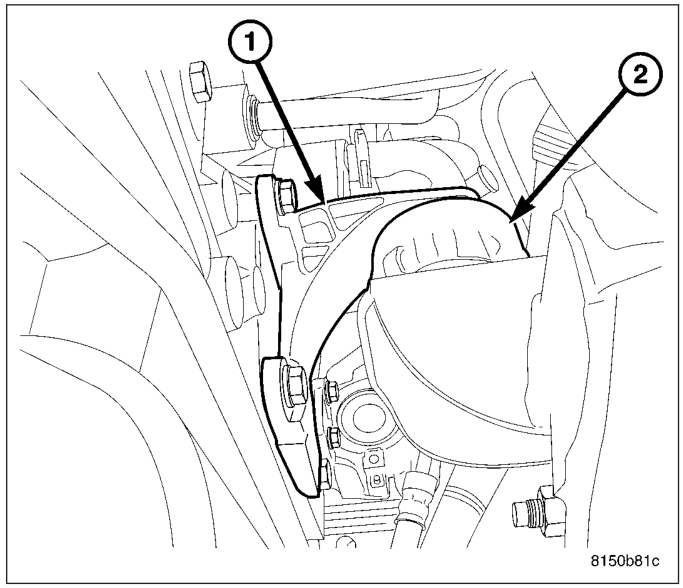
# RIGHT ENGINE MOUNT

## REMOVAL

1. Disconnect the negative battery cable.
2. Remove the cooling fan and shroud.
3. Loosen the upper engine mount fastener at the engine mount bracket.
4. Raise and support the vehicle.
5. Loosen the lower engine mount fastener.

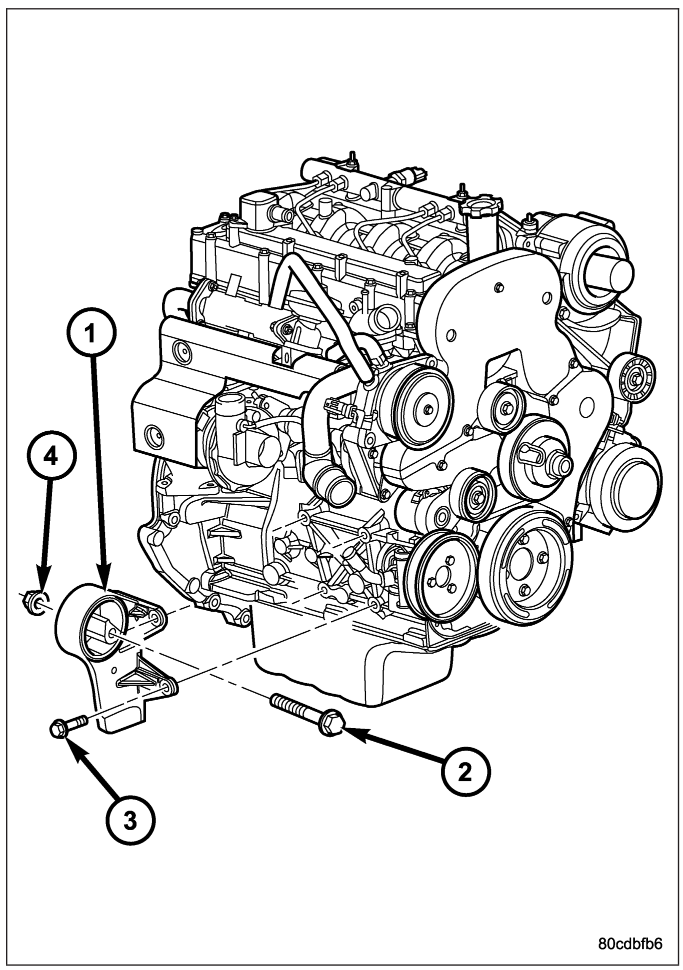
**NOTE: Care must be taken not to damage the wiring harnesses above the transmission when lifting the engine.**

6. Using a suitable jack, raise and support the engine
7. Remove the engine mount bolts and engine mount



## INSTALLATION

1. Position the engine mount and install the engine mount bolts. Tighten bolts to 54 N·m (40 lbs. ft.).
2. Lower the engine.
3. Tighten the engine mount through bolts to 54 N·m (40 lbs. ft.).
4. Lower the vehicle.
5. Install the cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
6. Connect the negative battery cable.



# OIL

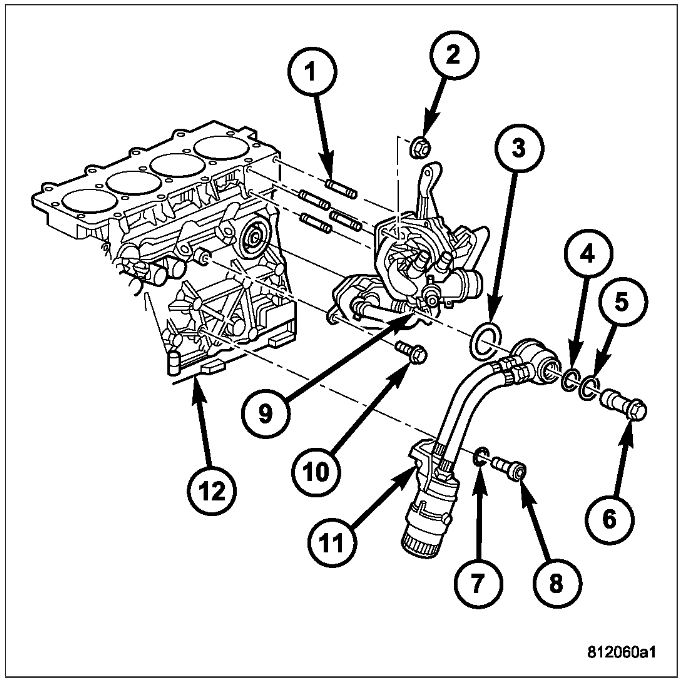
## DESCRIPTION

Refer to the Lube and Maintenance section for oil specifications (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

# ADAPTER-OIL FILTER

## DESCRIPTION

An oil filter adapter is used on this vehicle to relocate the oil filter for easier access when servicing .

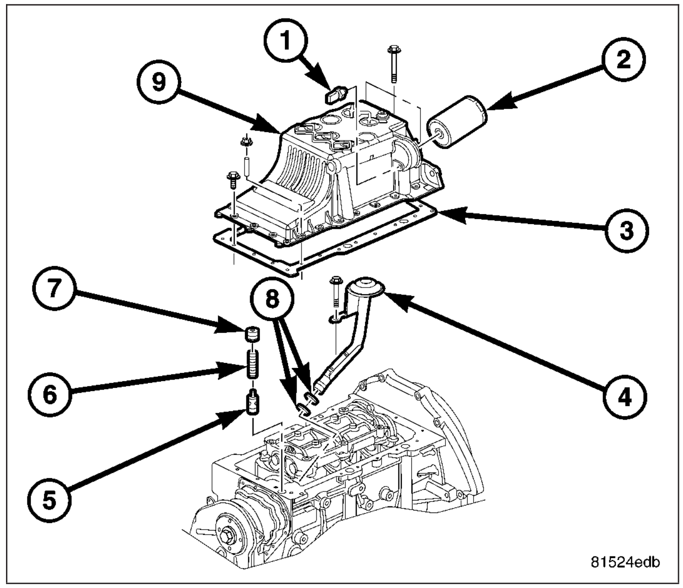


# PAN-OIL

## REMOVAL

1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE - REMOVAL).

**NOTE: When installing engine support fixture, care must be taken not to damage the hood ajar switch mounted to the right inner fender.**



3. Install engine support fixture, special tool #8534.
4. Raise vehicle on hoist.
5. Remove both front wheel and tire assemblies.
6. Remove front skid plate (if equipped).
7. Drain engine oil.
8. Disconnect the front drive shaft from the front drive axle,
9. Loosen both engine mount through bolts.
10. Lower vehicle.
11. Raise engine using support fixture, special tool #8534, until the viscous fan almost touches the fan shroud.
12. Raise vehicle on hoist.
13. Support the front cradle assembly with a suitable lifting devise.
14. Mark the front cradle to under body position to assure proper alignment during assembly.
15. Remove both inner rail cradle alignment bolts in the front wheel housing.
16. Loosen both power steering gear retaining bolts, leave the retaining nuts on the bolts.
17. Loosen power steering lines from cradle.
18. Remove both lower front strut bolts.
19. Loosen both front cradle mounting bolts.
20. Loosen both rear cradle mounting bolts.
21. Disconnect the oil sending unit harness connector.
22. Remove all oil pan retaining bolts, separate the oil level indicator tube from the pan and lower oil pan.
23. Lower front cradle using the suitable lifting devise until enough clearance is obtained to remove the oil pan.

## INSTALLATION

1. Clean oil pan and sealing surfaces. Inspect oil pan and engine block.
2. Install oil pan, gasket, oil pan retaining bolts, hand tight..
3. Push the oil pan against adaptor plate and tighten transmission to oil pan bolts first.
4. Tighten oil pan bolts to 11.8N·m (104 lbs.in.), beginning with the center bolts and then tighten the remaining bolts in a clockwise rotation. Retighten the center two bolts again after all bolts are tighten to specification.
5. Raise the front cradle using a suitable lifting devise and align the cradle with the underbody marks made during the removal procedure.
6. Torque the cradle mounting bolts to 122 N·m (90 lbs. ft.).
7. Torque the inner rail mounting bolts to 47 N·m (35 lbs. ft.).
8. Torque the steering gear mounting bolts to 162N·m (120 lbs. ft.).
9. Remove the cradle support devise and lower the vehicle.
10. Lower the engine using support fixture, special tool #8534, until the engine mount through bolts are seated in the cradle.
11. Raise the vehicle.

12. Torque engine mount through bolts to 88N·m (65 lbs. ft.).
13. Install front axle assembly (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - INSTALLATION).
14. Install front axle skid plate (if equipped) (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).
15. Install both front wheel and tire assemblies (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE) tighten to 115–155 N·m (85–115 lbs. ft.).

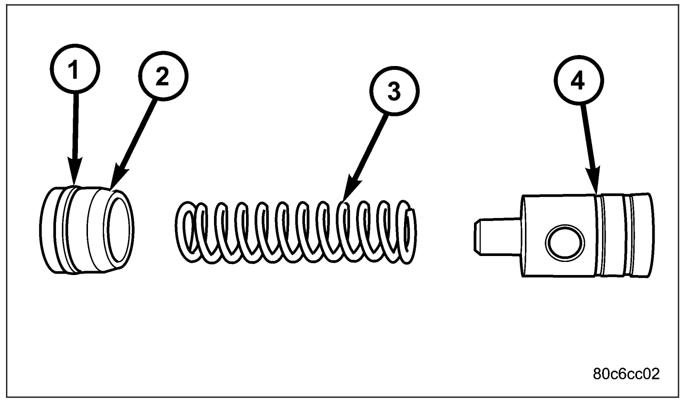
**NOTE: When removing engine support fixture, care must be taken not to damage the hood ajar switch mounted to the right inner fender well (if equipped).**

16. Lower the vehicle and remove the engine support fixture.
17. Refill engine to proper level with the correct viscosity engine oil.
18. Connect negative battery cable.
19. Start engine and inspect for leaks.
20. Install engine cover (Refer to 9 - ENGINE - INSTALLATION).
21. Perform complete front wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

# VALVE-OIL PRESSURE RELIEF

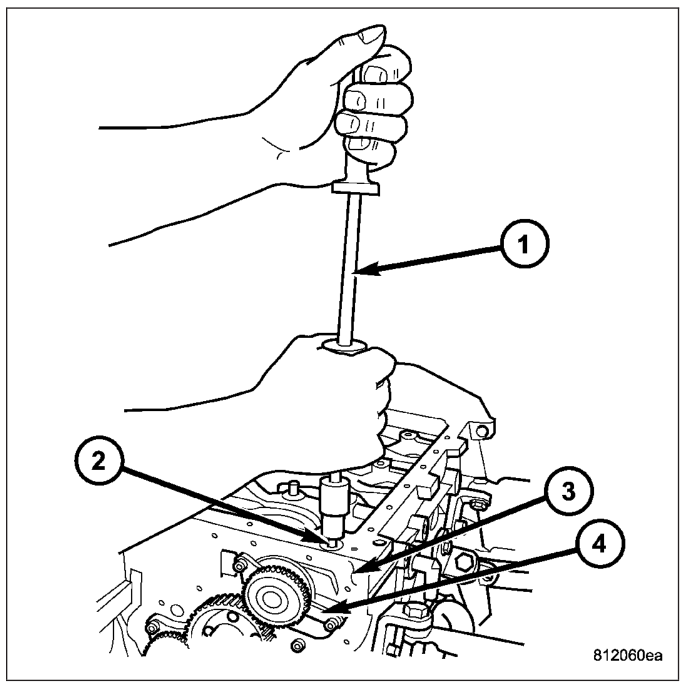
## DESCRIPTION

The oil pressure relief valve mounts in the front of the engine block and is used to control oil flow through the engines lubrication system.



## REMOVAL

1. Remove engine oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Using special tool VM.1054, remove oil pressure relief valve from engine block.

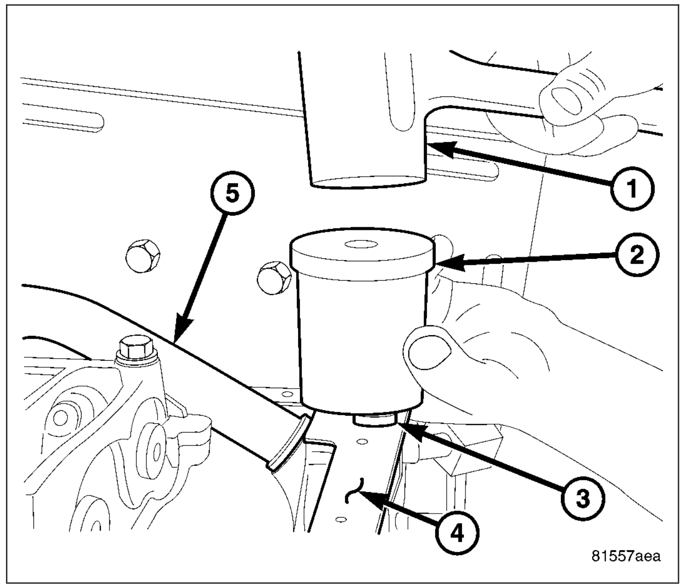


## INSTALLATION

1. Thoroughly clean all components and relief valve pocket in cylinder block.
2. Lubricate all oil pressure relief valve components with engine oil.
3. Install oil pressure relief valve plunger, spring, and cap.

**WARNING: DO NOT strike the oil pressure valve cap with a hammer**

**CAUTION: Care must be taken not to interfere with the engine front cover or the oil pick up tube when seating the oil relief valve cap. Failure to install the valve cap flush with the engine block surface correctly will result in low oil pressure and possible engine damage.**



4. Using a driver with a flat surface, carefully tap the oil pressure relief valve cap into place until the cap seats flush with engine block.
5. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

# UNIT-OIL PRESSURE SENDING

## DESCRIPTION

The oil pressure switch is located on the right side of the engine block. The switch screws into the engines main oil gallery.

## OPERATION

The oil pressure sending unit uses three circuits. They are:

- A signal circuit to the ECM.
- A sensor ground circuit through the ECM.
- A 5 volt reference circuit from the ECM.

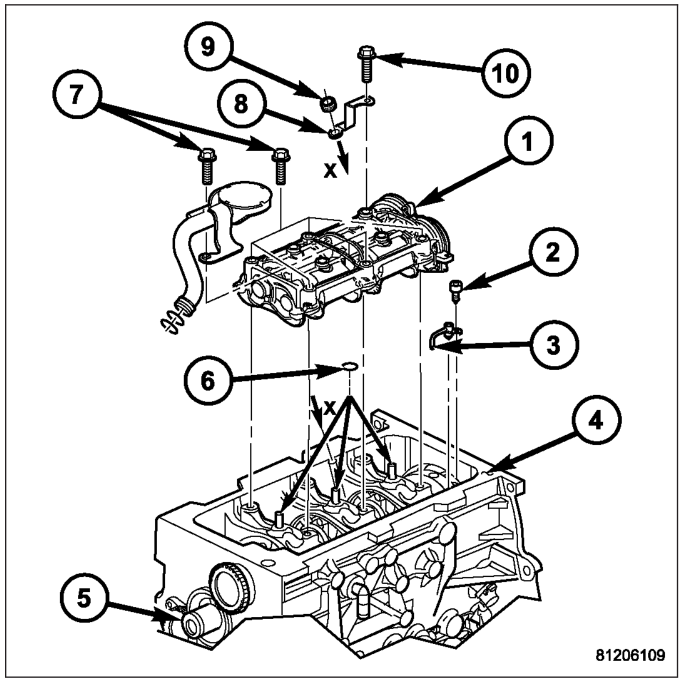
The oil pressure sending unit returns a voltage signal back to the ECM relating oil pressure. Ground for the sensor is supplied by the ECM.

# PUMP-OIL

## REMOVAL

## REMOVAL - OIL PUMP PICKUP TUBE

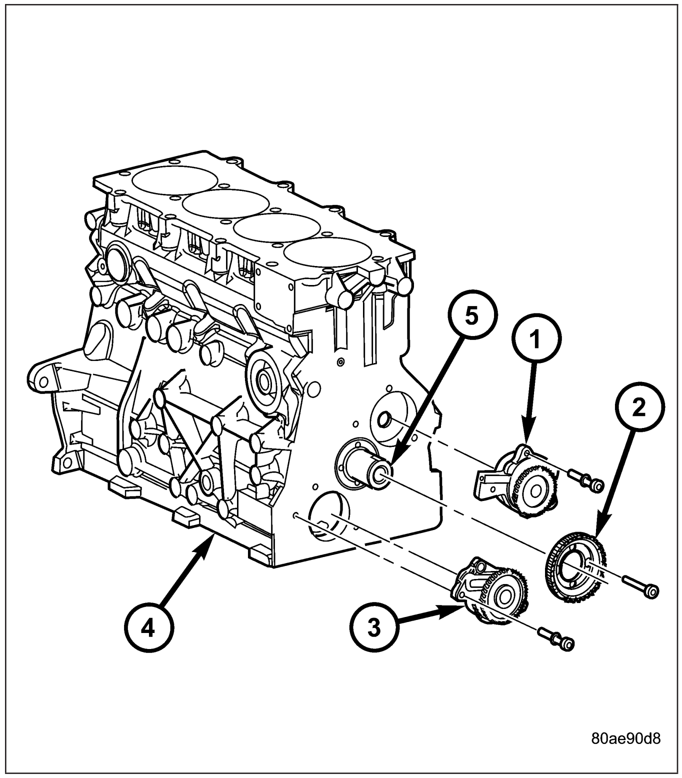
1. Disconnect negative battery cable.
2. Raise vehicle on hoist.
3. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
4. Remove oil pump pickup tube retaining bolt and pull pickup tube from engine block. Discard O-rings.



## REMOVAL - OIL PUMP

1. Disconnect negative battery cable.
2. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
5. Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
6. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
7. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
8. Remove timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
9. Remove front engine cover (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - REMOVAL).

10. Remove crankshaft sprocket.
11. Remove oil pump retaining bolts and remove pump from engine block.



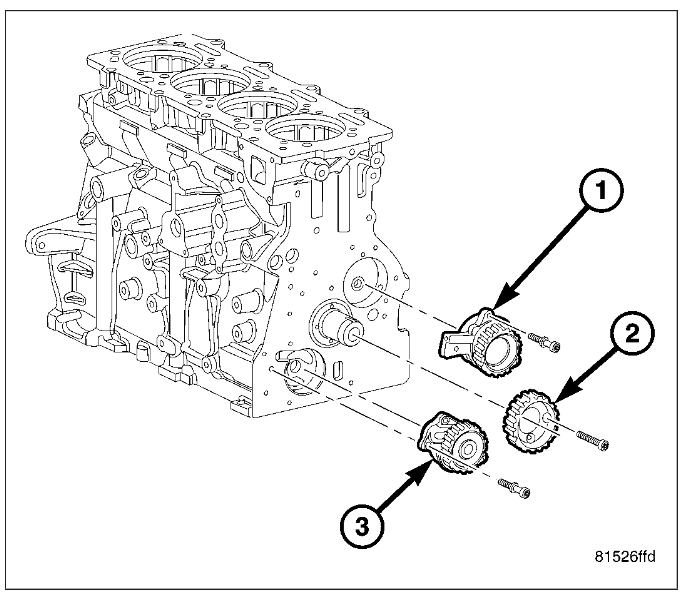
## INSTALLATION

## INSTALLATION - OIL PUMP PICKUP TUBE

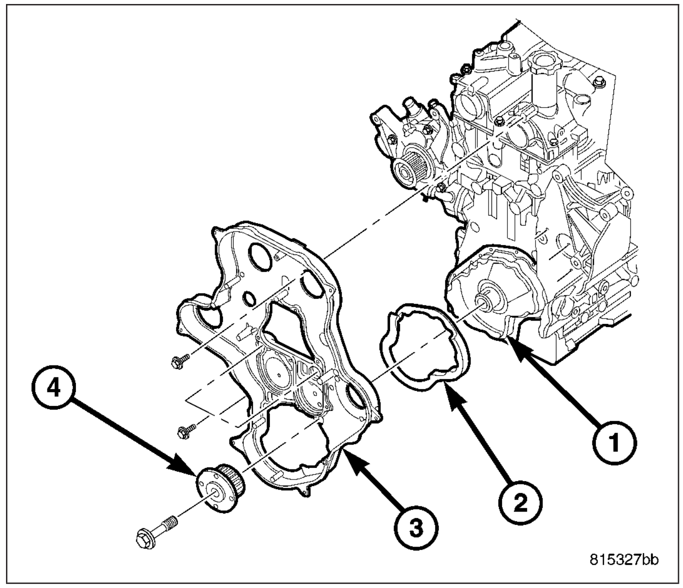
1. Lubricate o-ring on oil pump pickup tube with engine oil.
2. Install pickup tube in engine block and install retaining bolt. Torque bolt to 32.4N·m. (24 ft.lbs.)..
3. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
4. Refill engine oil to proper level.
5. Connect negative battery cable.

## INSTALLATION - OIL PUMP

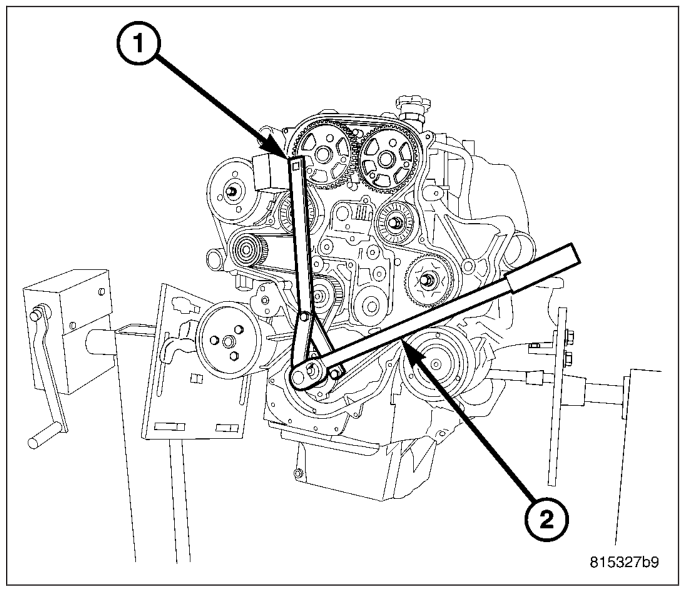
1. Lubricate oil pump rotor with engine oil.
2. Install oil pump in bore in engine block.
3. Install oil pump retaining bolts. Torque bolts to 10.8N·m. (96 in. lbs.).
4. Install crankshaft sprocket. Torque bolts to 10.8N·m. (96 in. lbs.).



5. Install front engine cover and seal (Refer to 9 - ENGINE/ENGINE BLOCK/ENGINE COVER - INSTALLATION).
6. Install timing belt inner cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
7. Install the lower timing belt gear and hand tighten fastener.



8. Connect special tool #6958 to the lower timing gear using the vibration damper bolts and tighten the timing gear fastener to 275N·m (203 ft. lbs).
9. Remove special tool #6958.
10. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
11. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
12. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
13. Install power steering pump pulley.
14. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
15. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

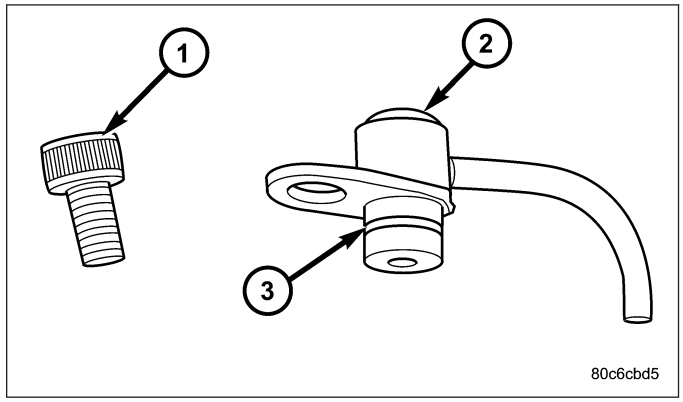


16. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
17. Remove the crankshaft and camshaft alignment pins.
18. Connect negative battery cable.

# JET-OIL

## DESCRIPTION

There are four oil jets installed in the engine block. These oil jets are used to cool and lubricate the piston assemblies.



## REMOVAL

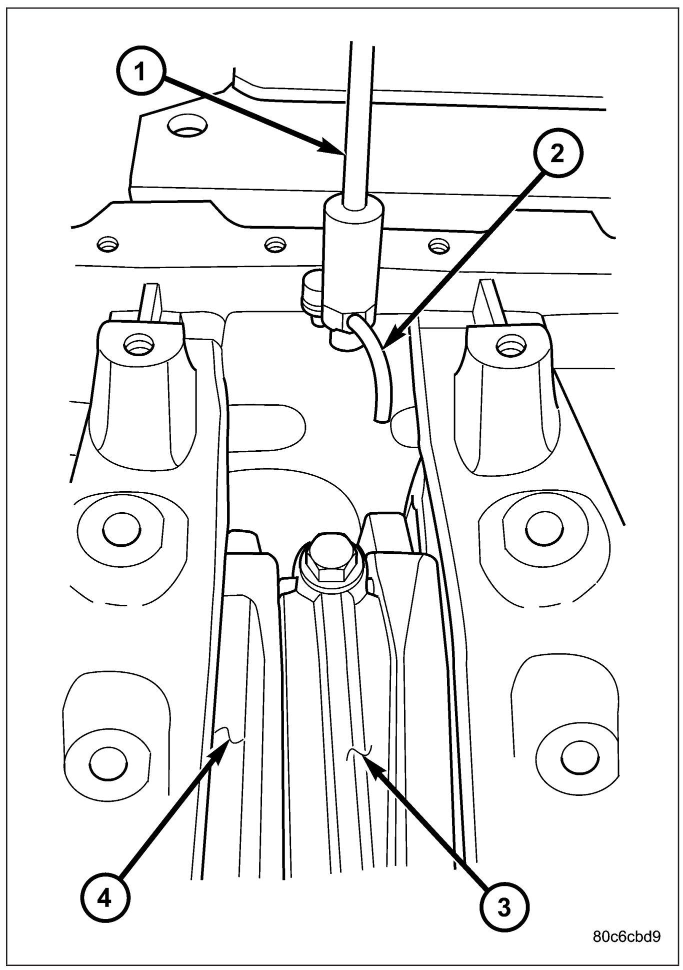
**CAUTION: Use caution when removing and installing oil jets. Damage to oil jet nozzle could cause severe engine damage. Care must be taken not to damage the crankshaft tone ring when removing cylinder number four oil jet.**

**NOTE: Remove oil jets before removing piston, crankshaft liners.**

1. Disconnect negative battery cable.
2. Raise vehicle on hoist.
3. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

**NOTE: When removing oil jet from cylinder number four, care must be taken not to damage the crankshaft tone ring.**

4. Using special tool VM.1060 to hold oil jet. Remove oil jet retaining bolt and remove oil jet from engine block.

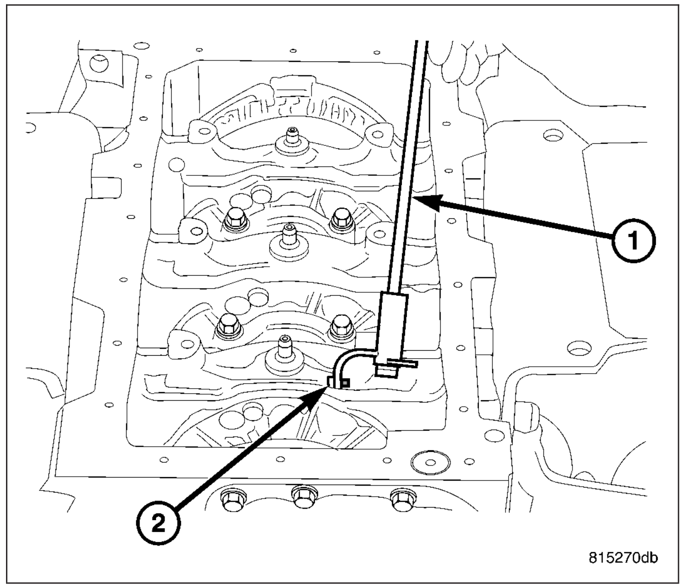


## INSTALLATION

**CAUTION: Use caution when removing and installing oil jets. Damage to oil jet nozzle could cause severe engine damage. Care must be taken not to damage the crankshaft tone ring when installing cylinder number four oil jet.**

**NOTE: Carefully install the oil jets After assembling the engine liners, crankshaft and pistons.**

1. Lubricate o-ring on oil jet.
2. Using special tool VM.1060, install oil jet in engine block
3. Install oil jet retaining bolt. Torque bolt to 10.8N·m.(96 in.lbs.).
4. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
5. Refill engine oil to proper level.
6. Connect negative battery cable.



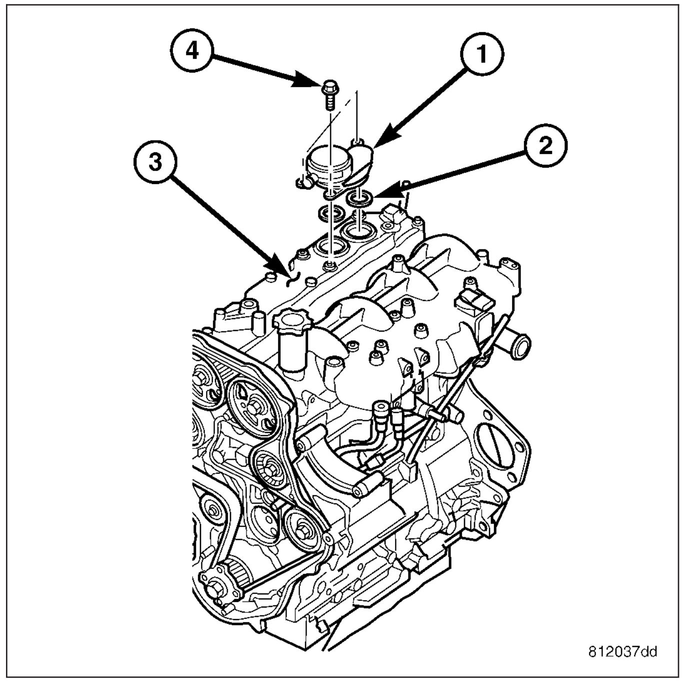
# SEPARATOR-OIL

## REMOVAL

1. Remove the engine cover.

**NOTE: Inspect the oil drain back access hole in the intake manifold/cylinder head cover to assure that it is free of obstruction.**

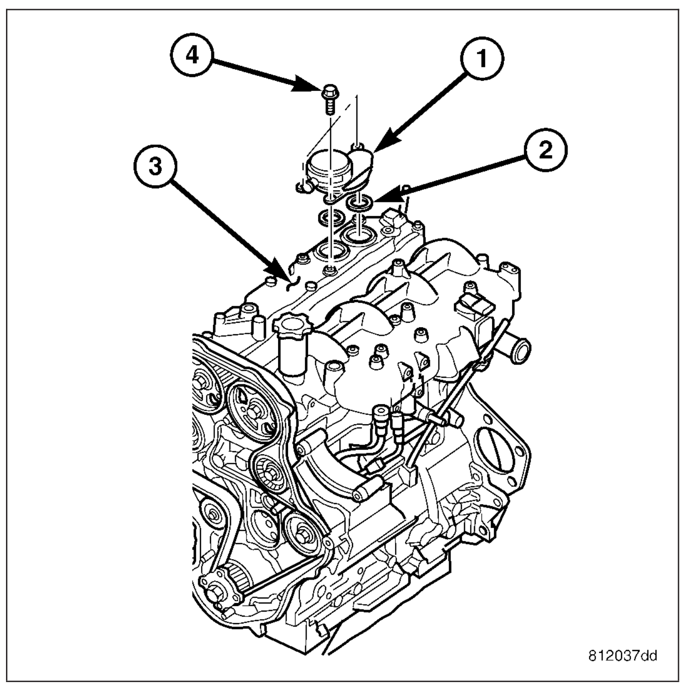
2. Remove the oil separator fasteners and oil separator.



## INSTALLATION

**NOTE: Inspect the oil drain back access hole in the intake manifold/cylinder head cover to assure that it is free of obstruction.**

1. Lubricate the oil separator o-rings with clean engine oil.
2. Carefully position and push down on the oil separator to seat.
3. Install the oil separator retaining fasteners. Tighten fasteners to 10.8 N·m (96 lbs. in.).



# MANIFOLD-INTAKE

## DESCRIPTION

(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - DESCRIPTION)

## REMOVAL

1. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

## INSTALLATION

1. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

# MANIFOLD-EXHAUST

## REMOVAL

1. (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - REMOVAL)

## INSTALLATION

1. (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSTALLATION)

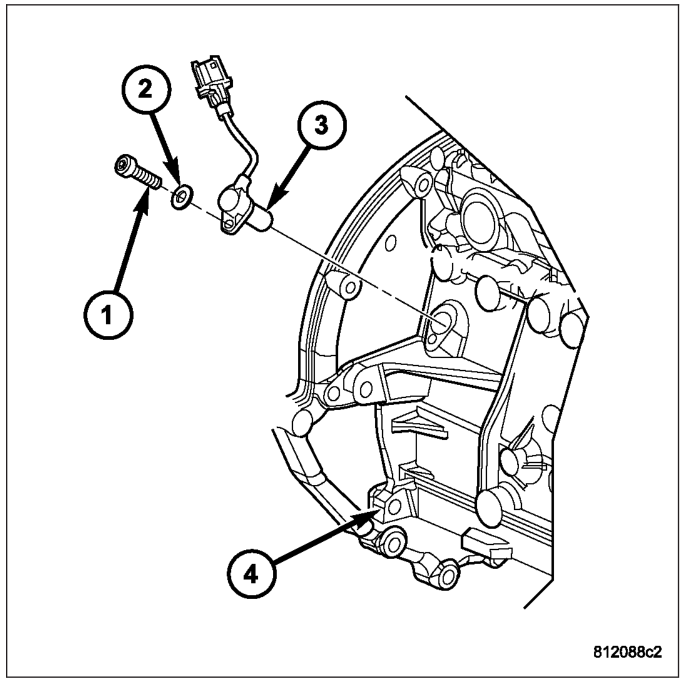
# TIMING-VALVE

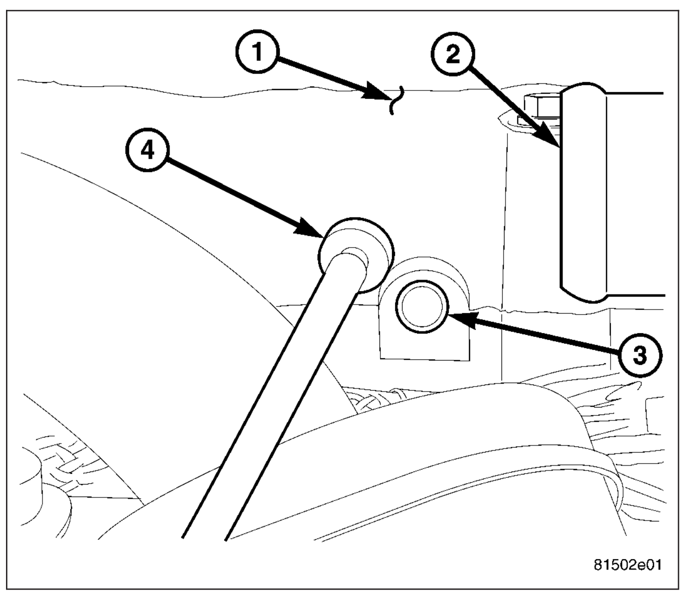
## STANDARD PROCEDURE - LOCKING ENGINE 90 DEGREES AFTER TDC

1. Disconnect negative battery cable.

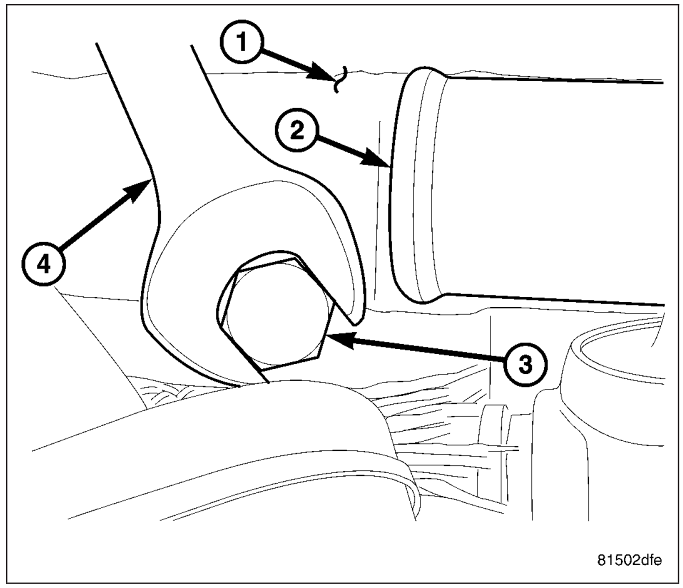
**NOTE: Rotate the engine by the front crankshaft bolt until the line next to the bolt in the front crankshaft hub reaches 12 oclock. Rotate the engine another 1/4 turn to the right, or the three oclock position. This will assist approximating the location of 90 degrees ATDC.**

2. Rotate engine by hand until special tool VM 1080 can be install through the engine access hole, locking the flex plate and preventing crankshaft movement. This locks the engine at 90° after TDC.
3. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
4. Remove EGR valve and EGR cooler to exhaust manifold retaining nuts.
5. Reposition EGR valve assembly out of way.
6. Remove plug in cylinder head cover/intake manifold.

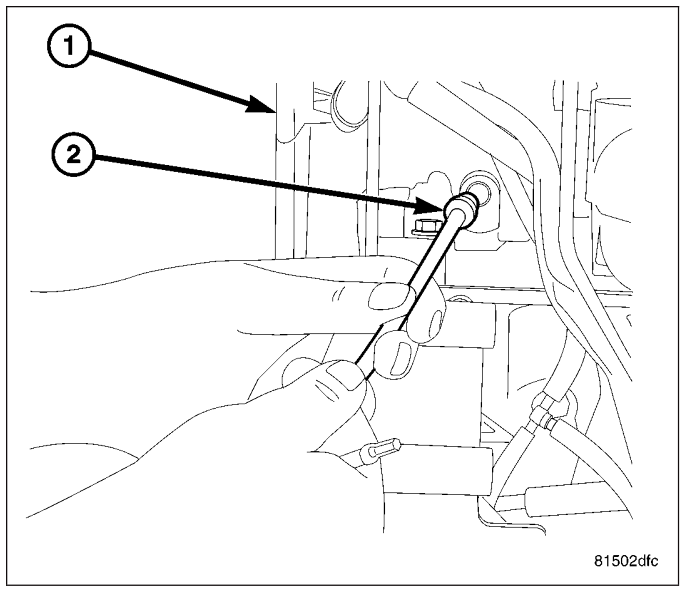


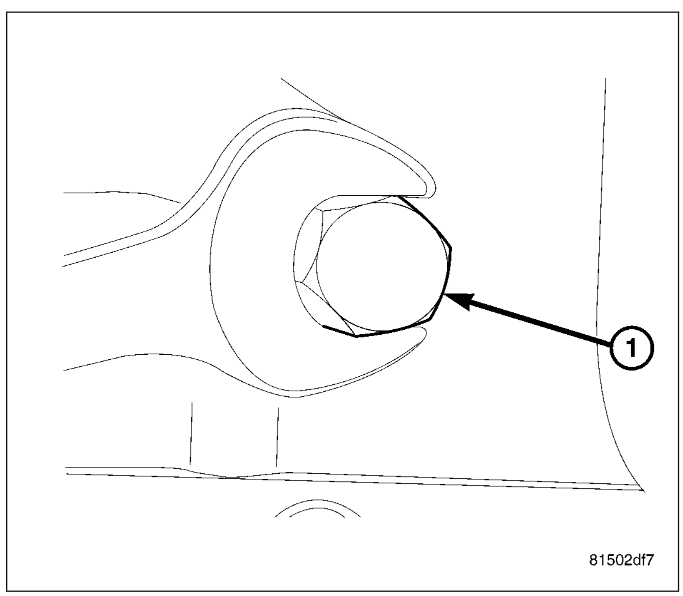


7. Insert VM.1053 to lock exhaust camshaft in position.
8. Remove generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
9. Remove plug in cylinder head cover/intake manifold.
10. Insert VM.1052 to lock intake camshaft in position.



11. At this point the timing belt can be removed for service.
12. After engine service is completed and timing belt reinstalled, remove both camshaft locking pins from cylinder head cover/intake manifold.
13. Install both camshaft access plugs.
14. Remove 90° after TDC engine locking pin.
15. Install generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
16. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
17. Connect negative battery cable.

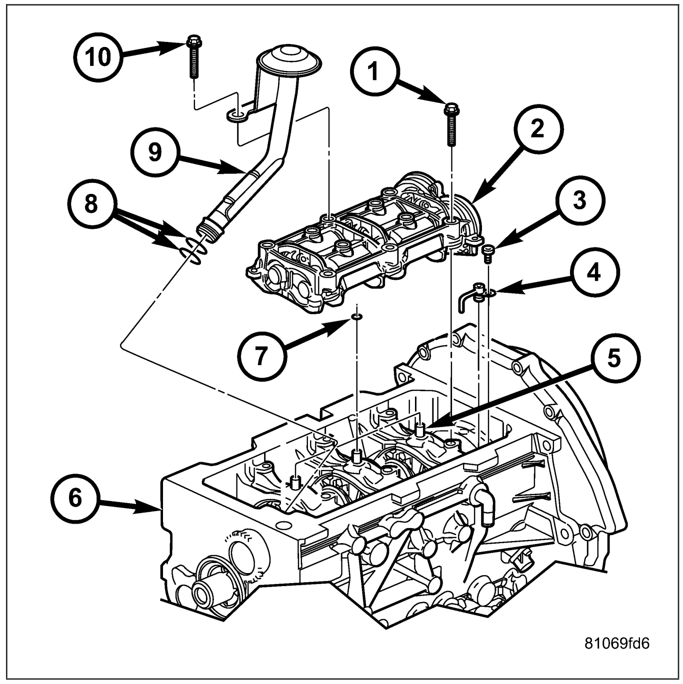




# SHAFT-BALANCE

## DESCRIPTION

The 2.8L Common Rail Diesel engine is equipped with two gear driven nodular cast iron balance shafts in a cast aluminum carrier. The balance shaft assembly is gear driven by the crankshaft and used to counteract engine vibration..

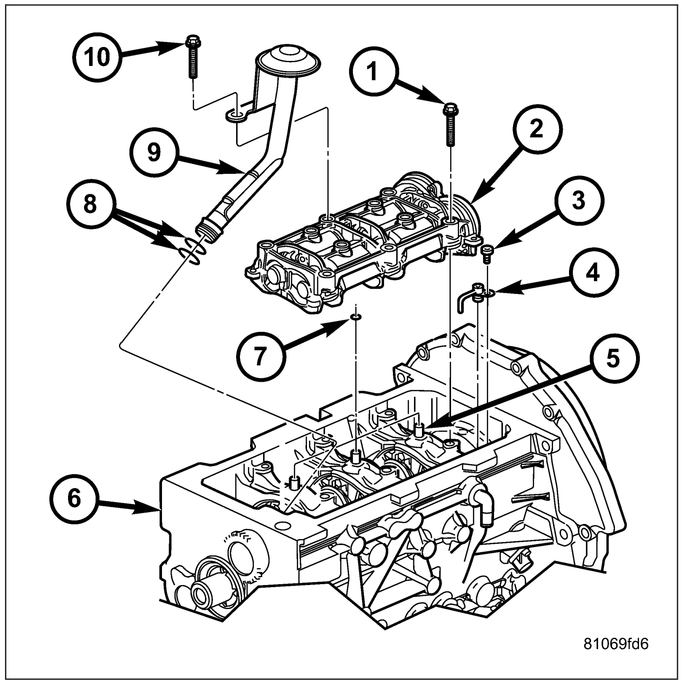


## OPERATION

The balance shaft assembly includes four balancers on two shafts. The balance shafts are connected by helical gears, and the assembly is timed with the engine. The dual-counter rotating shafts rotate at twice the engine speed and decrease second order vertical shaking forces caused by component movement. Balance shaft oiling is provided through oil passages in the crankshaft carriers.

## REMOVAL

1. Disconnect negative battery cable.
2. Raise vehicle on hoist.
3. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
4. Remove oil pump pickup tube (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
5. Remove balance shaft assembly and discard O-rings on the central carrier pins.



## INSTALLATION

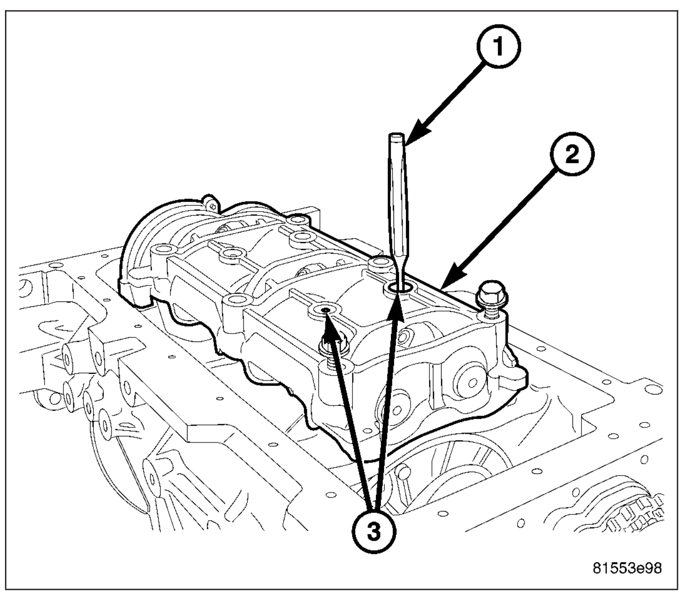
**CAUTION: Install new O-rings on the carrier pins and oil pick up tube before assembly.**

**NOTE: Before installation of the balance shaft assembly, the # 1 cylinder must be brought to TDC, or the 12 O'clock position. There is a line on the front of the crankshaft hub, next to the front crankshaft bolt, that may assist the alignment.**

1. Remove the vibration damper and roll engine over by hand until the witness line on the front of the crankshaft hub is at the 12 O'clock, or TDC position. Once the # 1 cylinder is brought to TDC, the balance shaft assembly can be installed.

**CAUTION: CARE MUST BE TAKEN DURING THE INSTALLATION OF THE DRIFT OR PUNCH. THE BACK SIDE OF THE COUNTER WEIGHTS ON THE BALANCE SHAFTS MUST BE IN THE UP POSITION BEFORE INSERTING THE TOOL INTO THE HOUSING.**

2. With balance shaft assembly on work bench. Insert a drift of a punch into balance shaft assembly alignment hole. This will ensure proper balance shaft to crankshaft timing after assembly.
3. Install the new crankshaft carrier pin O-rings, balance shaft assembly and retaining bolts. Torque bolts to 32.4N·m (24 ft. lbs.).



4. Install oil pump pickup tube with new seals (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
5. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

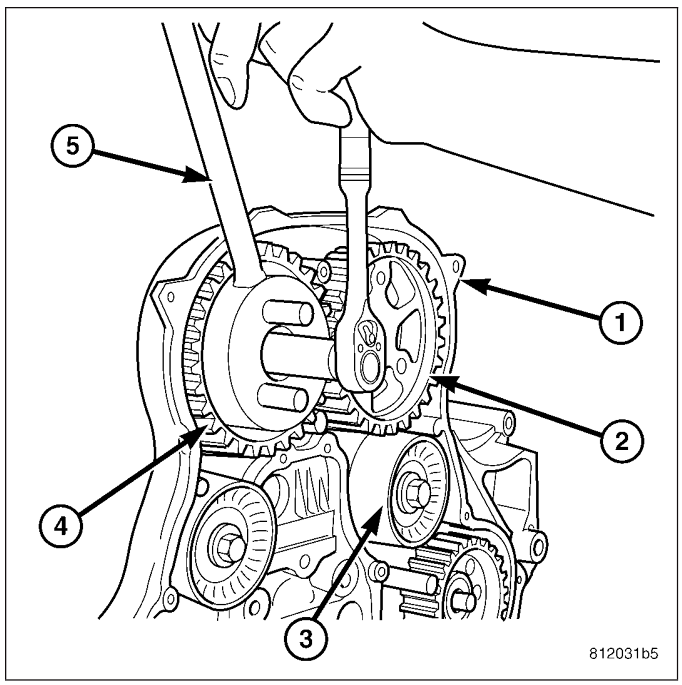
6. Refill engine oil to proper level.
7. Connect negative battery cable.

# COVER(S)-TIMING BELT AND CHAIN

## REMOVAL

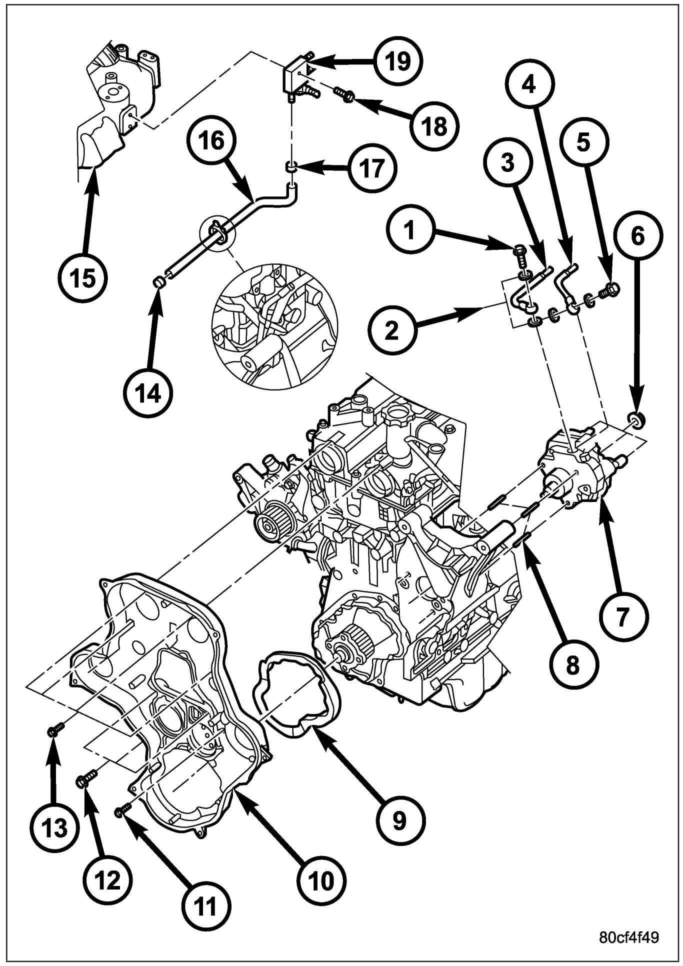
## REMOVAL - TIMING BELT INNER COVER

1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
3. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
6. Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
7. Rotate the engine to 90 degrees ATDC (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
8. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
9. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
10. Remove timing belt idler pulleys (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT IDLER PULLEY - REMOVAL).
11. Using special tool VM.1055, remove camshaft sprockets.
12. Remove timing belt tensioner (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - REMOVAL).
13. Remove injection pump sprocket (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - REMOVAL).
14. Remove timing belt inner cover retaining bolts and remove cover.



## REMOVAL - TIMING BELT OUTER COVER

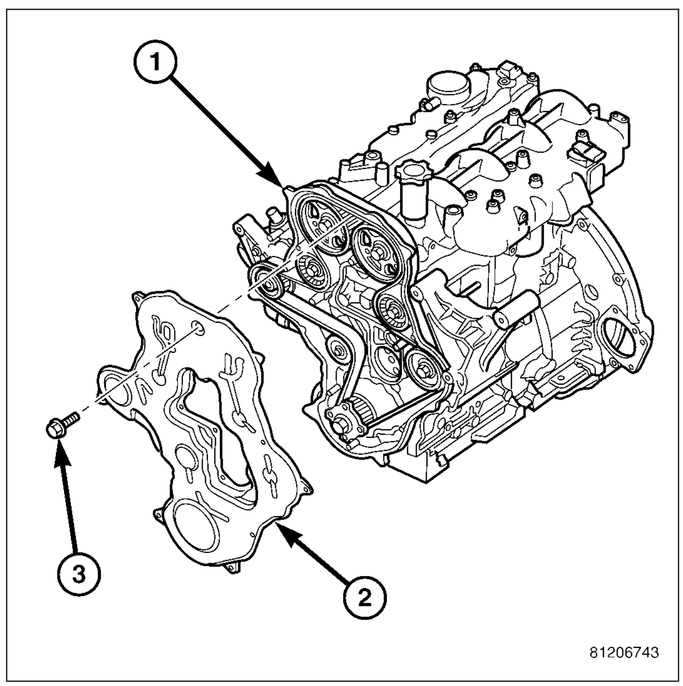
1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
3. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
6. Remove the power steering pump pulley.
7. Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
8. Remove timing belt outer cover retaining bolts and remove cover.



## INSTALLATION

## INSTALLATION - TIMING BELT INNER COVER

1. Install timing belt inner cover to engine front cover seal.
2. Install timing belt inner cover to cylinder head cover gaskets.
3. Install timing belt inner cover and retaining bolts. Torque 10mm bolts to 47.1N·m and 8mm bolts to 10.8N·m.
4. Install injection pump sprocket (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - INSTALLATION).
5. Install camshaft sprockets. Torque bolts to 108N·m..
6. Install timing belt idler pulleys (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT IDLER PULLEY - INSTALLATION).



7. Install timing belt and tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
8. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
9. Remove special tool VM.1080, 90 degree ATDC pin from the flex plate.

10. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
11. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
12. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
13. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
14. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
15. Connect negative battery cable.

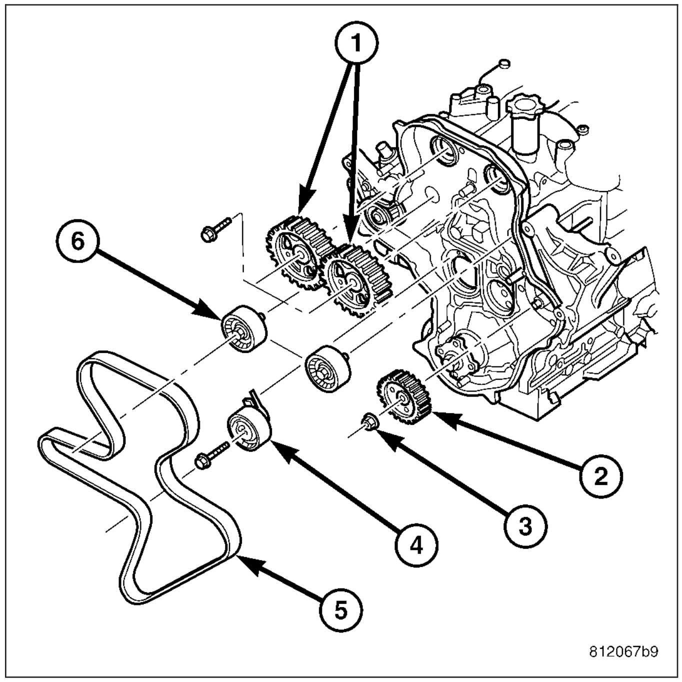
## INSTALLATION - TIMING BELT OUTER COVER

1. Install timing belt outer cover seal and cover. Torque 3mm bolts to 10.8N·m and 8mm bolts to 10.8N·m..
2. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
3. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
4. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
5. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
6. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
7. Connect negative battery cable.

# PULLEY-TIMING BELT IDLER

## REMOVAL

**CAUTION: Idler pulley retaining bolts are left hand thread.**



1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
3. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
6. Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
7. Rotate the engine to 90 degrees ATDC and install special tool VM.1089 (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).
8. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
9. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

**NOTE: Idler pulley retaining bolts are left hand thread.**

10. Remove timing belt idler pulleys.

## INSTALLATION

**NOTE: The idler pulley bolts are left hand thread.**

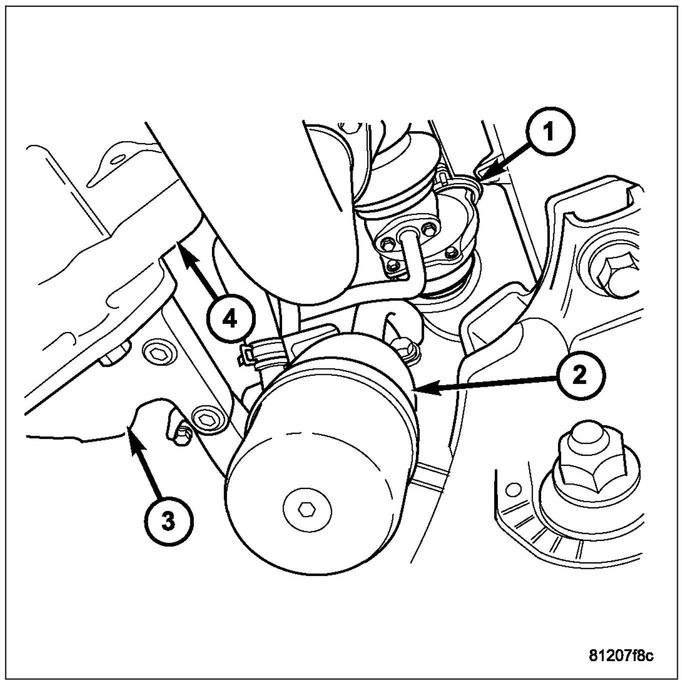
1. Install timing belt idler pulleys. Torque bolts to 47.1N·m..
2. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
3. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
4. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
5. Remove special tool VM.1080, 90 degree ATDC locating pin.
6. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
7. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
8. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
9. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
10. Connect negative battery cable.

# SPROCKET(S)-TIMING BELT AND CHAIN

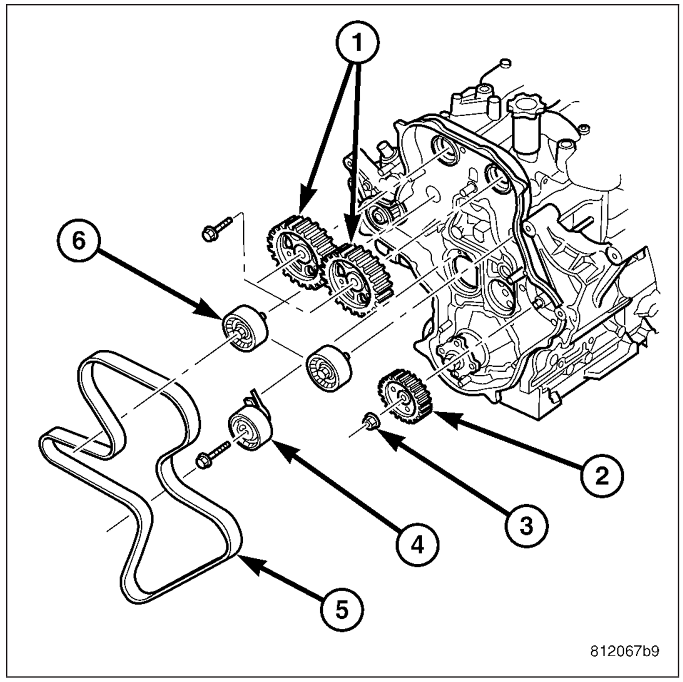
## REMOVAL

**CAUTION: BEFORE REMOVING THE TIMING BELT, THE ENGINE MUST BE PLACED AT 90° AFTER TDC. FAILURE TO DO SO MAY RESULT IN VALVE AND/OR PISTON DAMAGE DURING ASSEMBLY. (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE)**

1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
3. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
6. Bring piston #1 to TDC, turn crankshaft until notch on the crankshaft hub is at the 12 o'clock position.
7. Looking at the engine from the belt side, rotate the crankshaft 90° clockwise.
8. Install the 90° alignment pin into the crankcase threaded hole on the right side of the engine to lock the crankcase (make sure the crankshaft does not rotate).
9. Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
10. Paint mark the crankshaft hub and the oil pump cover (this will be useful during the timing check).
11. Remove the alternator.
12. Remove the intake and exhaust camshaft plugs from the camshaft cover, to introduce the camshaft timing pins VM.1052 Intake, and VM.1053 Exhaust (if the engine is timed correctly, the pins can be installed).
13. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
14. Loosen timing belt tensioner and remove timing belt.



15. Remove the intake and exhaust camshaft alignment pins, VM.1052 Intake, and VM.1053 Exhaust.
16. Loosen camshaft gears using special tool VM 1085 to retain the gears when removing bolts.
17. Use camshaft bolt to rotate the intake camshafts until the intake alignment hole lines up with the hole on the camshaft cover. Install alignment pin VM 1052 and tighten with a wrench (repeat the operation for the exhaust camshaft alignment using alignment pin VM 1053).



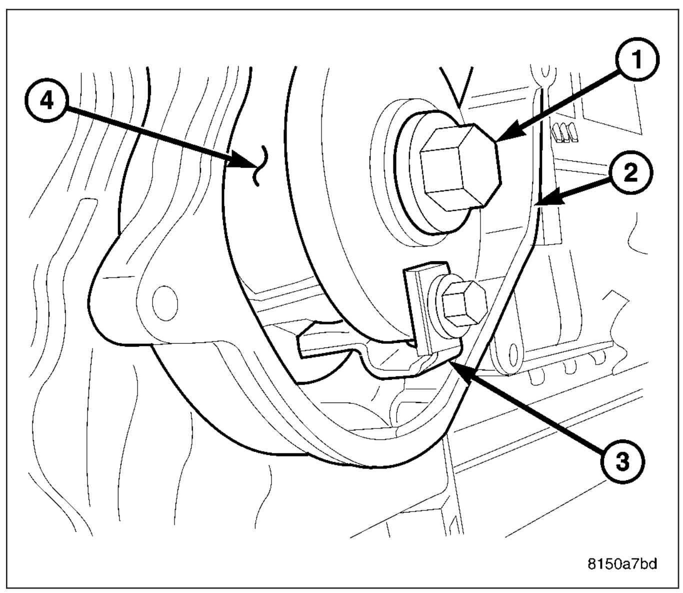
## INSTALLATION

**NOTE: There are marks on the high pressure pump gear and both camshaft gears. These ARE NOT alignment marks and should be disreguarded.**

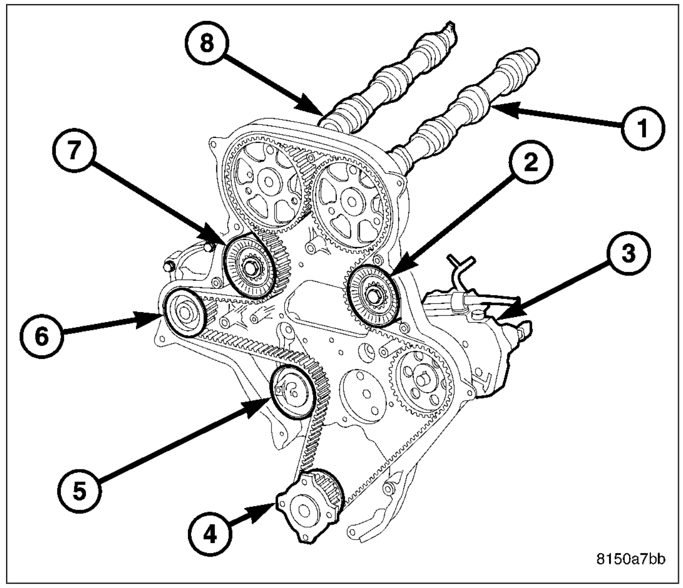
1. With both camshaft alignment pins still installed and the engine locked at 90° after TDC, verify that the camshaft gears are loose.

**NOTE: DO NOT remove the timing belt from the package until it's ready to be installed. DO NOT expose timing belt to oil, grease or water contamination. DO NOT crimp belt at a sharp angle. DO NOT clean belt, pulleys or tensioner with solvent. Check that pulleys and bearings are not seized or damage before installing belt.**

2. Install timing belt on crankshaft hub and fix it with special tool VM 1074.

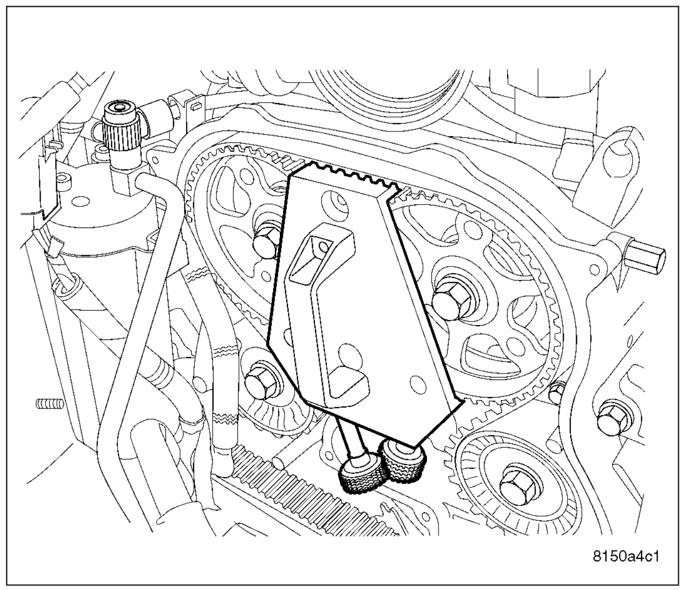


3. Route the belt around high pressure injection pump, idler pulley, intake camshaft gear, exhaust camshaft gear, idler pulley, and water pump gear.
4. Adjust the timing belt tensioner (turn it clockwise) using special tool VM.9660, lining up the center notch with the aluminum cover dowel pin. Tighten the retaining bolt to 28N·m. (Refer to 9 - ENGINE/ VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS).



5. Install special tool VM.1085 between camshaft gears and tighten thumb screws to engauge and retain the camshaft gears.
6. Tighten the camshaft gear bolts to 108 N·m (80 ft.lbs.) while holding the gears with special tool VM 1085.
7. Remove camshaft gear locking tool.
8. Remove intake and exhaust alignment pins.
9. Remove engine locking pin from engine block.
10. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

**WARNING: IF CAMSHAFT COVER WAS REMOVED WAIT 30 MINUTES BEFORE ROTATING CRANK-SHAFT.**



11. Rotate the engine clockwise 2 revolutions (looking at engine from the belt side).
12. Carefully line up the crankshaft hub painted mark with the oil pump cover mark.
13. Check that the intake and exhaust camshaft alignment pins can be installed.

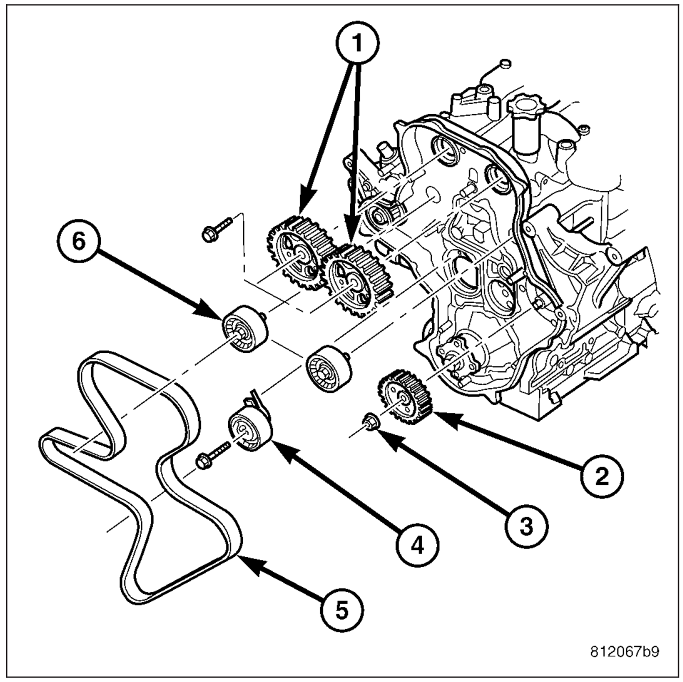
**WARNING: IF THE CAMSHAFT ALIGNMENT PINS CAN NOT BE INSTALLED AT THIS TIME, REPEAT THE PROCEDURE FROM THE BEGINNING.**

14. Install the camshaft access plugs.
15. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
16. Install the alternator.
17. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
18. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
19. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
20. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
21. Connect negative battery cable.

# TENSIONER AND PULLEY-TIMING BELT AND CHAIN

## REMOVAL

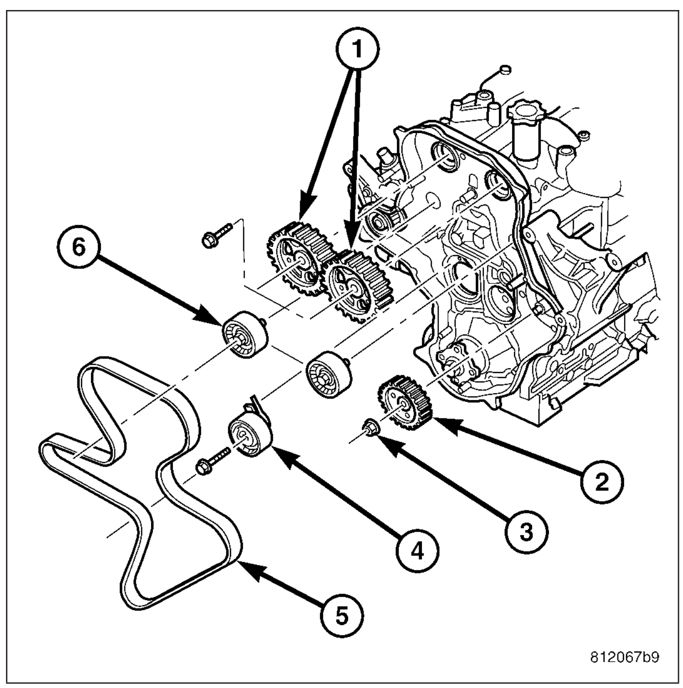
**NOTE: Before servicing the timing belt, the engine must be rotate to 90 degrees ATDC and alignment pin VM.1089 installed (Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).**



1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
3. Remove cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Remove cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
6. Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
7. Remove the power steering pump pulley.
8. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
9. Loosen and remove timing belt tensioner.

## INSTALLATION

**NOTE: DO NOT remove the timing belt from the package until it's ready to be installed. DO NOT expose timing belt to oil, grease or water contamination. DO NOT crimp belt at a sharp angle. DO NOT clean belt, pulleys or tensioner with solvent. Check that pulleys and bearings are not seized or damage before installing belt.**



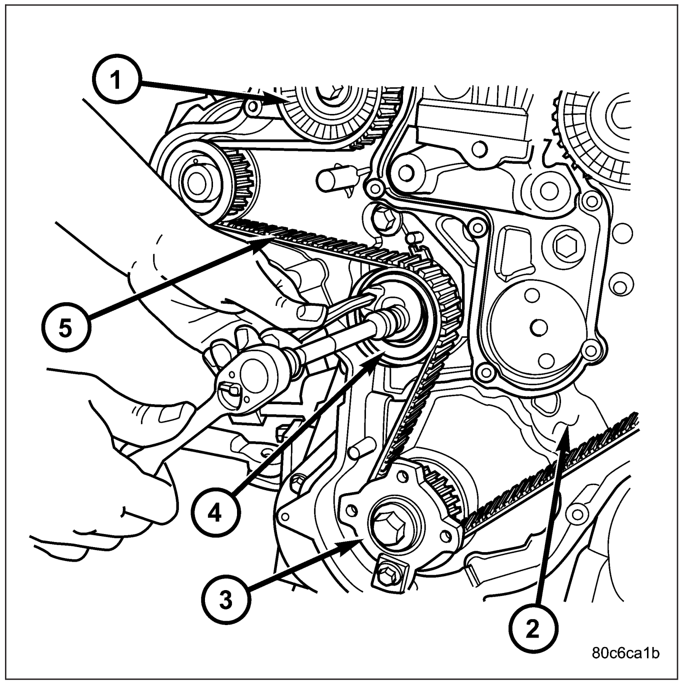
1. Install timing belt tensioner and retaining bolt.
2. Adjust timing belt tensioner (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS).
3. Install timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
4. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
5. Install the power steering pump pulley.
6. Install cooling fan support (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
7. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
8. Install cooling fan and fan drive viscous clutch assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).
9. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).

10. Connect negative battery cable.

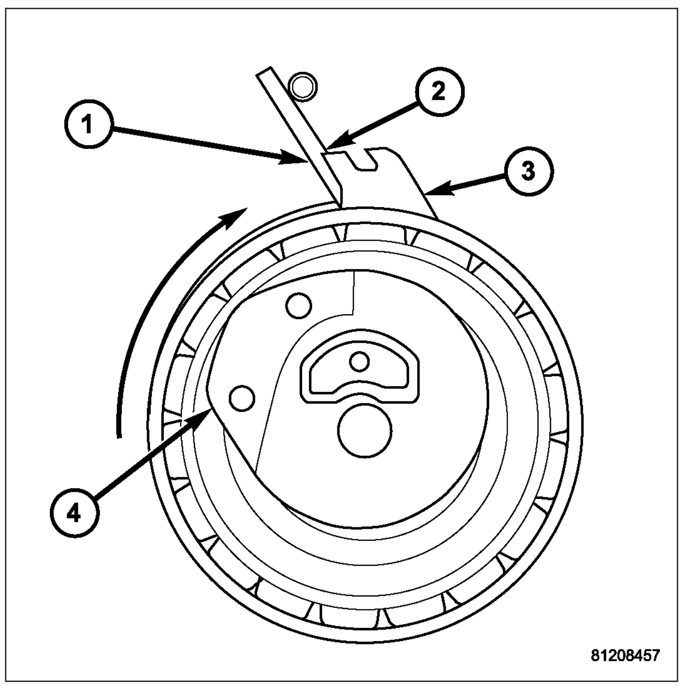
# ADJUSTMENTS

## ADJUSTMENT - TIMING BELT TENSIONER

1. With timing belt outer cover removed and timing belt installed.
2. Loosen timing belt tensioner.



3. Align timing belt tensioner using special tool 9660, with the alignment pointer as shown and torque timing belt tensioner retaining bolt to 34.7N·m.(26 ft. lbs.)..
4. Rotate engine 2 complete revolution and then recheck tensioner alignment. Readjust tensioner alignment as necessary.



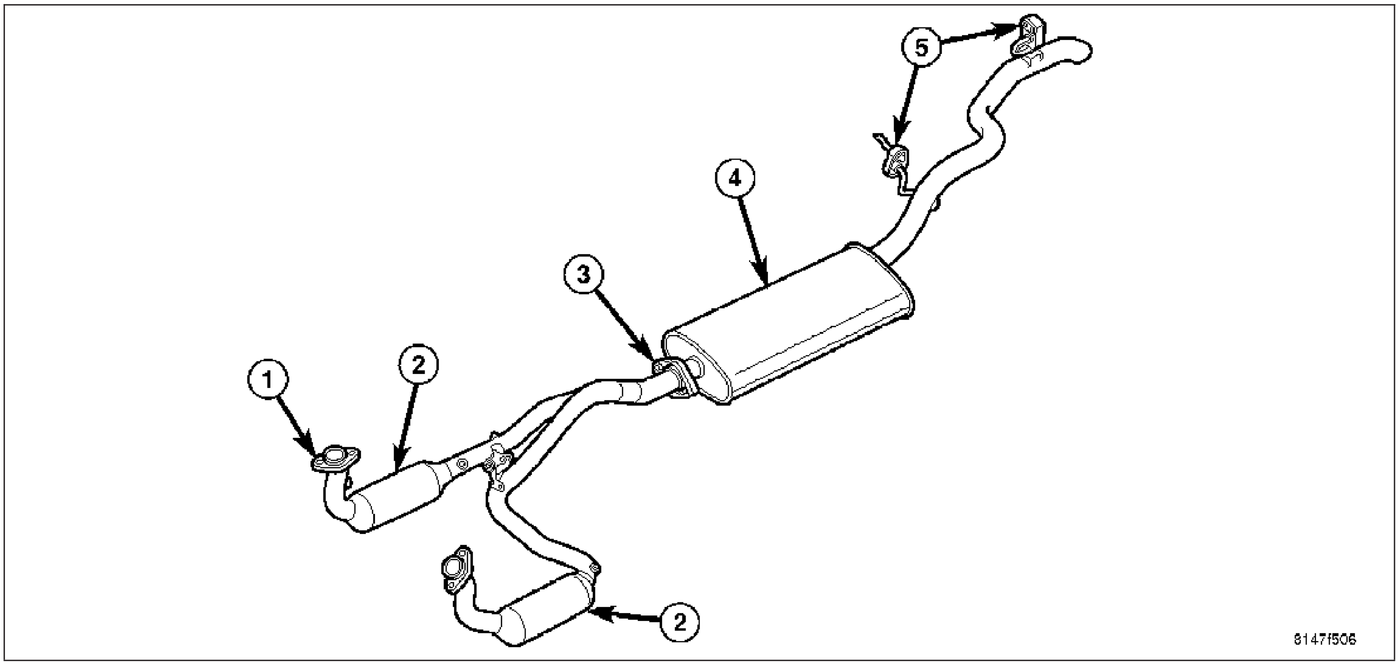
# EXHAUST SYSTEM

## TABLE OF CONTENTS

# EXHAUST SYSTEM AND TURBOCHARGER

## DESCRIPTION

## GAS ENGINES



The basic exhaust system consists of a exhaust pipe assembly with catalytic converters (2), muffler (4) and tailpipe assembly and heat shields.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. Minimum clearance between any exhaust component and the body or frame is 25 mm (1.0 in.). If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or equivalent). This will assure proper engine function and system alignment.

**CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.**

## 2.8L DIESEL

**CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.**

The diesel engine exhaust system consists of an engine exhaust manifold, turbocharger, EGR valve with intercooler, front exhaust pipe with catalytic converter, muffler and tailpipe assembly.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. The exhaust components should be kept a minimum of 25.4 mm (1.0 in.) away from the body and frame. If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - EXHAUST SYSTEM

### EXHAUST SYSTEM DIAGNOSIS CHART

| CONDITION | POSSIBLE CAUSE | CORRECTION |
|---|---|---|
| EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES | 1. Leaks at pipe joints. | 1. Tighten clamps/bolts to specified torque at leaking joints. |
| | 2. Rusted or blown out muffler. | 2. Replace muffler. Inspect exhaust system. |
| | 3. Broken or rusted out exhaust pipe. | 3. Replace exhaust pipe. |
| | 4. Exhaust pipe leaking at manifold flange. | 4. Tighten/replace flange attaching nuts/bolts. |
| | 5. Exhaust manifold cracked or broken. | 5. Replace exhaust manifold. |
| | 6. Leak between exhaust manifold and cylinder head. | 6. Tighten exhaust manifold to cylinder head bolts. |
| | 7. Catalytic converter rusted or blown out. | 7. Replace catalytic converter assy. |
| | 8. Restriction in exhaust system. | 8. Remove restriction, if possible. Replace restricted part if necessary. |
| CAUTION: When servicing and replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and/or sensor. | | |

## DIESEL ENGINE

**CAUTION: On high mileage vehicles it is normal to see some exhaust staining around the turbocharger control rod area. This is not a sign of turbocharger failure.**

### EXHAUST SYSTEM DIAGNOSIS CHART

| CONDITION | POSSIBLE CAUSE | CORRECTION |
|---|---|---|
| EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES | 1. Leaks at pipe joints. | 1. Tighten clamps/bolts at leaking joints. |
| | 2. Rusted or blown out muffler. | 2. Replace muffler. Inspect exhaust system. |
| | 3. Broken or rusted out exhaust pipe. | 3. Replace exhaust pipe. |
| | 4. Exhaust pipe leaking at manifold flange. | 4. Tighten/replace flange attaching nuts/bolts. |
| | 5. Exhaust manifold cracked or broken. | 5. Replace exhaust manifold. |
| | 6. Leak between exhaust manifold and cylinder head. | 6. Tighten exhaust manifold to cylinder head bolts. Replace gasket if necessary. |
| | 7. Turbocharger mounting flange cracked. | 7. Remove turbocharger and inspect. (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - REMOVAL). |
| | 8. Restriction in exhaust system. | 8. Remove restriction, if possible. Replace restricted part if necessary. |
| | 9. EGR pipe(s) leak | 9. Tighten bolts. Replace gasket. |
| | 10. EGR assembly leak | 10. Tighten bolts. Replace gaskets. |
| Drivability Concern - Turbo | 1. Vacuum hose disconnected | 1. Check connections, replace as necessary |
| | 2. Vacuum system leaks | 2. Inspect for damage. Check for leaks, replace as necessary |
| | 3. Boost pressure solenoid filter clogged | 3. Replace the filter. |

# CATALYTIC CONVERTER

## DESCRIPTION

**WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.**

**CAUTION: DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the converter.**

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

**Unleaded gasoline must be used to avoid contaminating the catalyst core.**

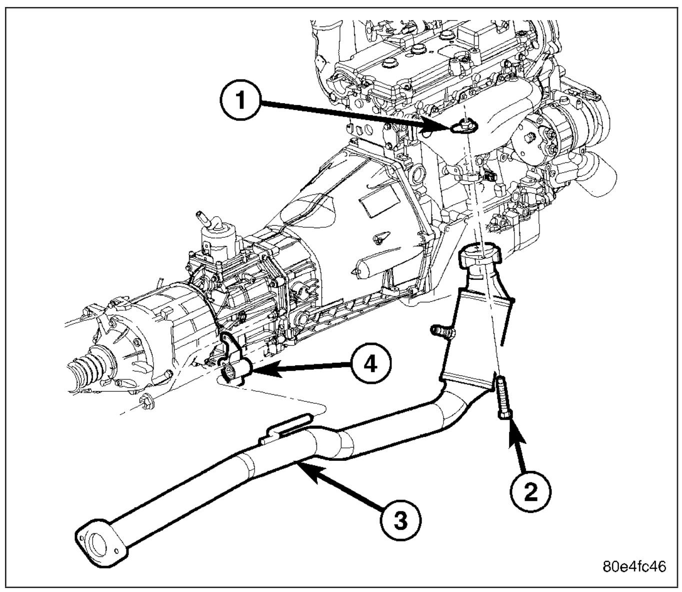
50 State emission vehicles incorporate two catalytic converters located after the exhaust manifolds and before the muffler.

## REMOVAL

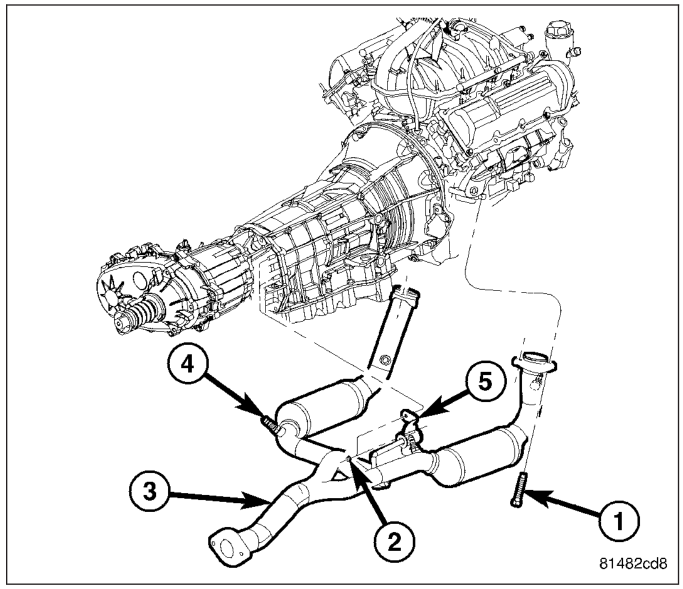
## 2.4L ENGINE

**WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.**

1. Raise and support the vehicle.
2. Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. Disconnect oxygen sensor electrical connector.
4. Remove the bolts from the front exhaust pipe/catalytic converter assembly to muffler flange.
5. Remove bolts and flanged nuts at the manifold.
6. Lower the catalyst assembly (3) and slide out of the mount at the transmission (if equipped).
7. Remove the front exhaust pipe/catalytic converter assembly from the vehicle.



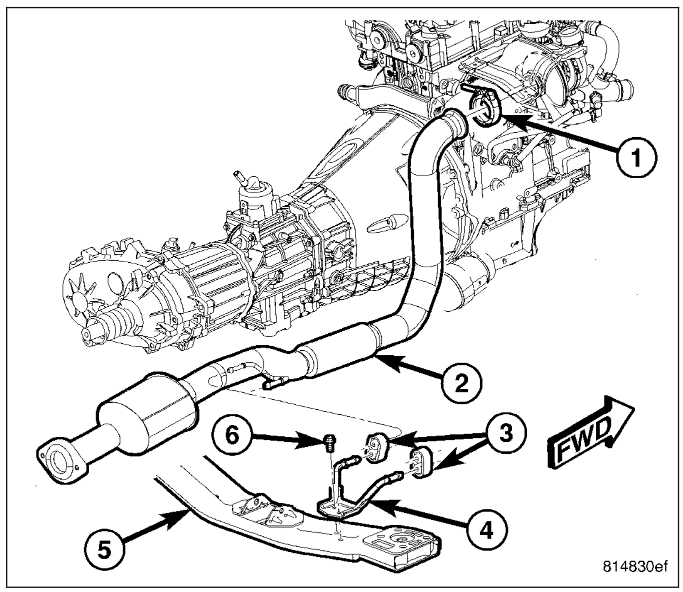
## 3.7L ENGINE



**WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.**

1. Raise and support the vehicle.
2. Saturate the bolts (1) and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. Disconnect oxygen sensor electrical connectors.
4. Remove the nuts from the front exhaust pipe and catalytic converter assembly to muffler flange.
5. Remove bolts (1) and flanged nuts at the manifold.
6. Lower the front exhaust pipe/catalytic converter assembly (3) and slide out of the mount at the transmission (if equipped).
7. Remove the front exhaust pipe/catalytic converter assembly from the vehicle.

## 2.8L DIESEL ENGINE



**WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.**

1. Raise and support the vehicle.
2. Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. Remove the nuts from the front exhaust pipe and catalytic converter to muffler flange.

**NOTE: The front exhaust pipe and catalytic converter to turbocharger clamp is not reusable. Always use a new clamp when reinstalling the catalytic converter.**

4. Remove the nut from the front exhaust pipe and catalytic converter to turbocharger clamp (1). Spread the clamp.
5. Lower the catalyst assembly (2) and slide out of the mount at the transmission (if equipped).
6. Remove the front exhaust pipe/catalytic converter assembly from the vehicle.
7. Discard the front exhaust pipe and catalytic converter to turbocharger clamp (1). Discard clamp.

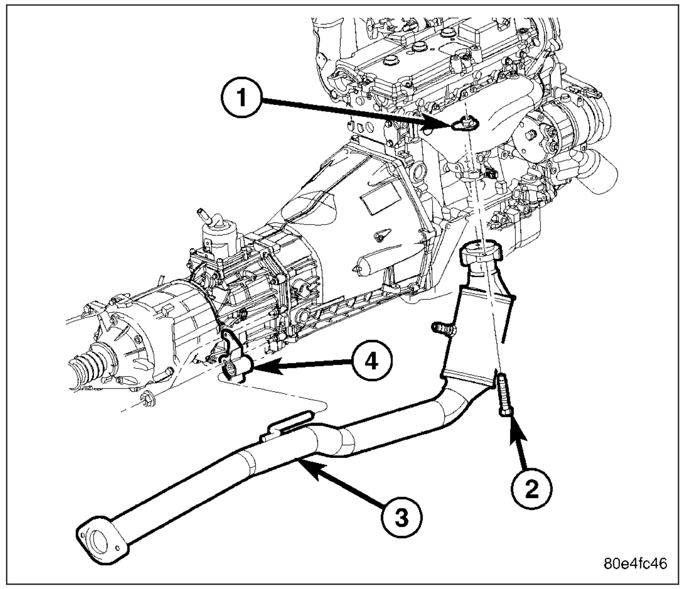
## INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

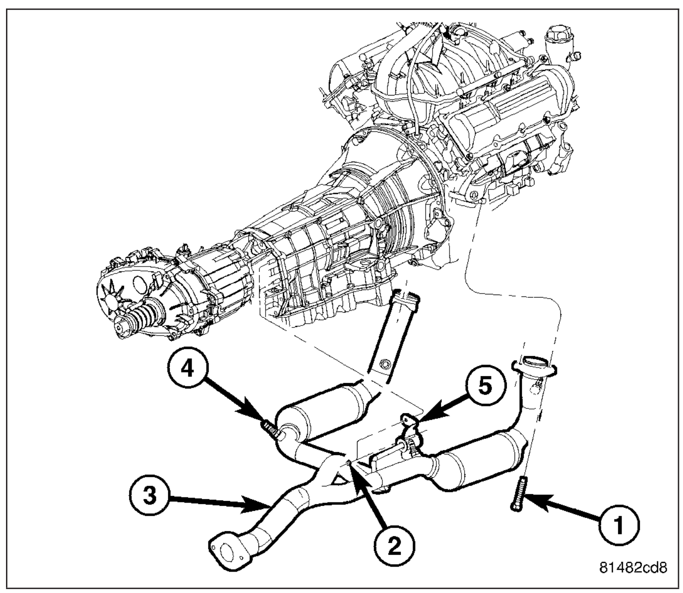
## INSTALLATION

## 2.4L ENGINE



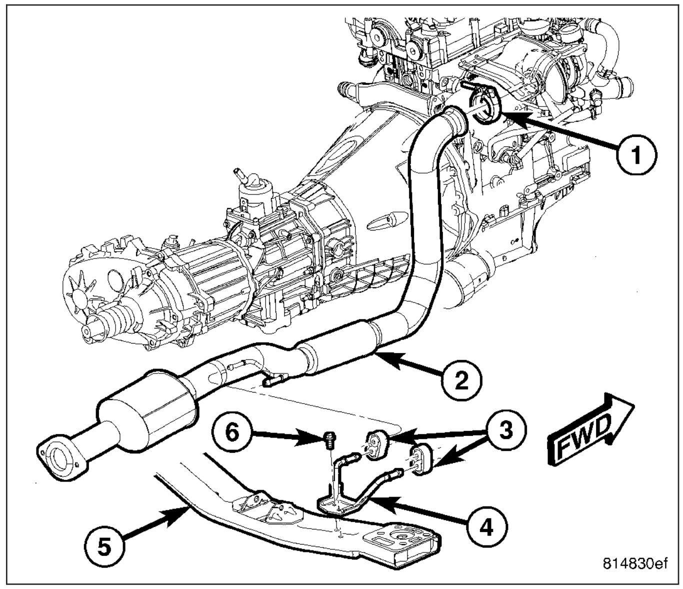
1. Position the front exhaust pipe and catalytic converter assembly (3) into the mount (4) at the transmission (if equipped) and onto the exhaust manifold flange connection.
2. Install the bolts at the muffler and front pipe connection. Do not tighten.
3. Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
4. Tighten the bolt at exhaust manifold (2) to 27 N·m (19 in. lbs.) torque.
5. Tighten the front exhaust pipe and catalytic converter assembly to muffler flange nuts to 27 N·m (19 ft. lbs.) torque.
6. Connect oxygen sensor electrical connector.
7. Lower the vehicle.
8. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.
9. Check the exhaust system for contact with the body panels. Make necessary adjustments, if necessary.

## 3.7L ENGINE



1. Position the front exhaust pipe and catalytic converter assembly (3) into the mount at the transmission (if equipped) and onto the exhaust manifold flange connection.
2. Install the nuts at the front exhaust pipe and catalytic converter assembly to muffler flange. Do not tighten.
3. Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
4. Tighten the bolt (1) at exhaust manifold to 27 N·m (19 in. lbs.) torque.
5. Tighten the front exhaust pipe and catalytic converter assembly to muffler flange nuts to 27 N·m (19 ft. lbs.) torque.
6. Position the front pipe onto the exhaust manifold flange connection. Tighten the clamp to 10 N·m (95 in. lbs.) torque.
7. Connect oxygen sensor electrical connectors.
8. Lower the vehicle.
9. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.
10. Check the exhaust system for contact with the body panels. Make adjustments, if necessary.

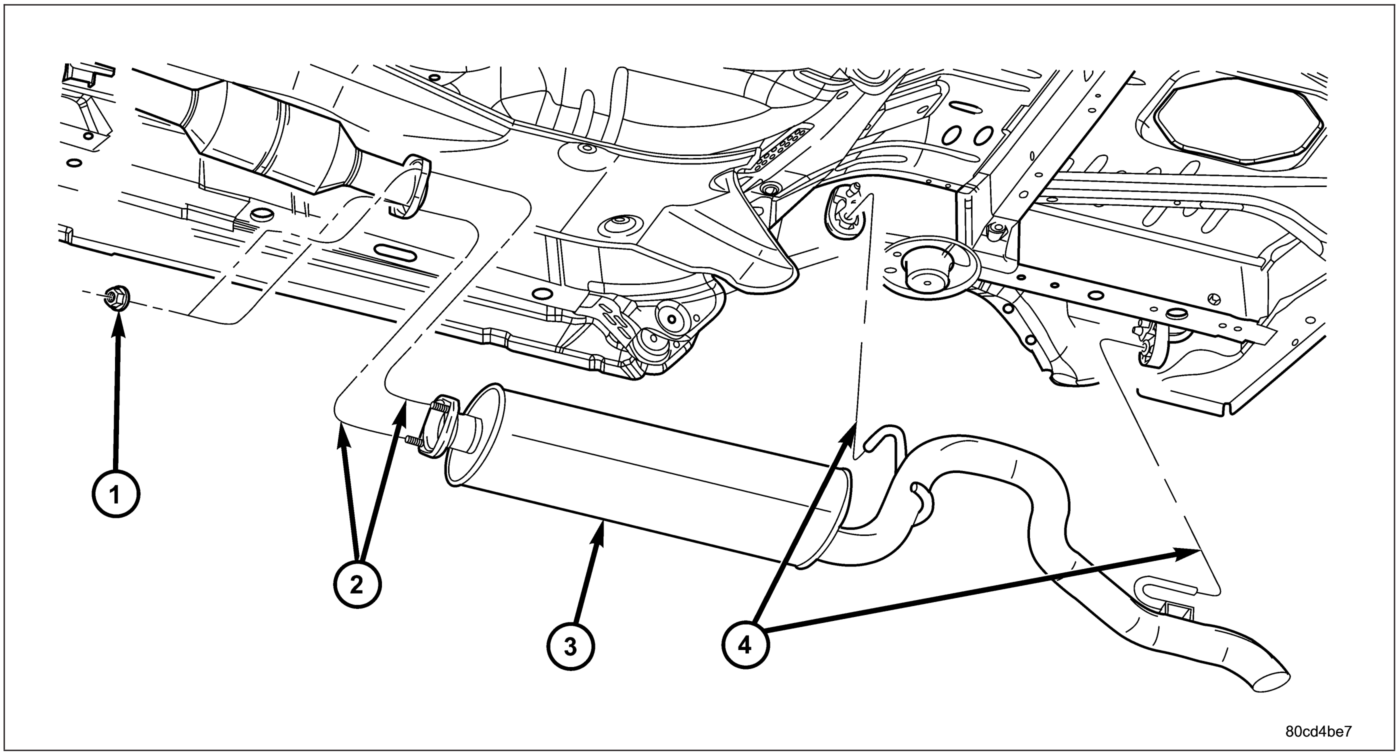
## 2.8L DIESEL



1. Position new turbocharger to front exhaust pipe and catalytic converter clamp (1) on turbocharger.
2. Position the front exhaust pipe and catalytic converter assembly (2) into the mount at the transmission (if equipped) and onto the turbocharger.
3. Install the nuts at the front exhaust pipe and catalytic converter assembly to muffler flange. Do not tighten.
4. Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
5. Tighten turbocharger to front exhaust pipe and catalytic converter assembly clamp nut to 27 N·m (19 ft. lbs.) torque.
6. Install the bolts at the front exhaust pipe and catalytic converter assembly (2) to muffler flange.. Tighten the nuts to 27 N·m (19 ft. lbs.) torque.
7. Lower the vehicle.
8. Start the vehicle and inspect for exhaust leaks. Repair exhaust leaks as necessary.
9. Check the exhaust system for contact with the body panels. Make adjustments, if necessary.

# MUFFLER

## REMOVAL



1. Raise vehicle on hoist.
2. Remove exhaust pipe to muffler and tailpipe assembly retaining nuts (2).
3. Using a suitable pry bar, pry muffler and tailpipe assembly out of exhaust hanger.
4. Remove muffler and tailpipe assembly (3) from vehicle.

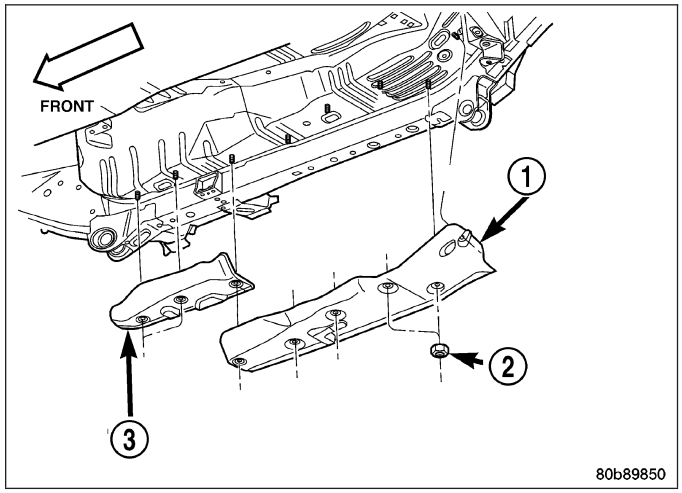
## INSTALLATION

1. Install muffler and tailpipe assembly in vehicle and attach to exhaust hangers.
2. Install muffler and tailpipe assembly to exhaust pipe retaining nuts. Torque nuts to 32 N·m.
3. Lower vehicle from hoist.

# HEAT SHIELDS

## DESCRIPTION

Heat shields (1) (3) are needed to protect both the vehicle and the environment from the high temperatures developed by the catalytic converter. The catalytic converter releases additional heat into the exhaust system. Under severe operating conditions, the temperature increases in the area of the converter. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency.



# TURBOCHARGER SYSTEM

## DIAGNOSIS AND TESTING

### TURBOCHARGER BOOST PRESSURE

Low turbocharger boost pressure can cause poor engine performance and driveability concerns. The following procedure will test the turbocharger boost pressure.

Causes of low boost pressure include the following:

- Restricted air inlet system
- Leak in charge air cooler system
- Restricted/high pressure drop across charge air cooler
- Damaged turbocharger compressor wheel housing
- Turbocharger wastegate stuck open
- Excessive exhaust restriction

Causes of excessively high boost pressure include:

- Turbocharger wastegate stuck closed
- Turbocharger wastegate signal line leaking or damaged
- Damaged wastegate command valve O-rings
- Wastegate command valve mechanically stuck in actuated position

Several Diagnostic Trouble Codes (DTCs) can be set that will indicate high or low system boost levels. There is a DTC for circuit faults relating to the electronically controlled wastegate command valve.

(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/CHARGE AIR COOLER AND PLUMBING - DIAGNOSIS AND TESTING) for diagnosing of low or high boost pressure due to leaks.

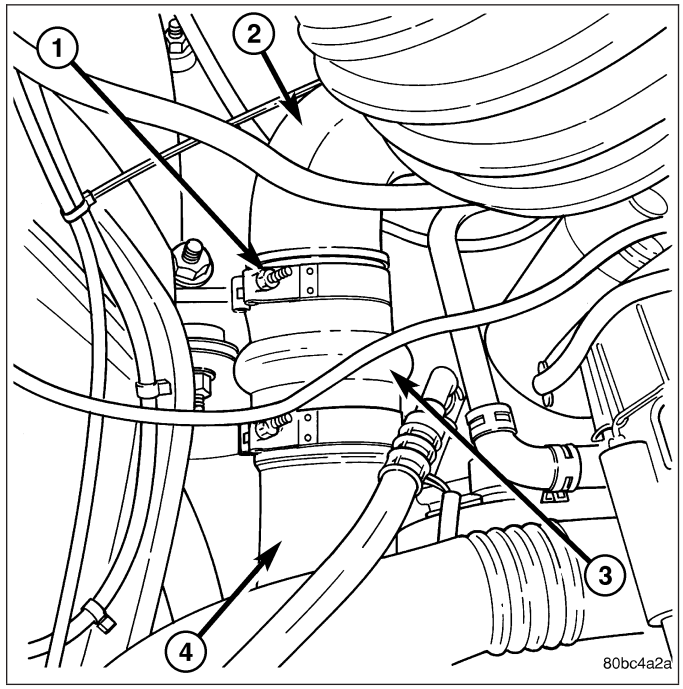
# CHARGE AIR COOLER AND PLUMBING

## DIAGNOSIS AND TESTING

## CHARGE AIR COOLER SYSTEM - LEAKS

Low turbocharger boost pressure and low engine performance can be caused by leaks in the charge air cooler or plumbing. Fuel staining on the exhaust manifold can also be an indication that there are leaks in the air system. The following procedure outlines how to check for leaks in the charge air cooler system.

This procedure can also be used to check for leaks in the wastegate signal line or the wastegate canister.



1. Loosen clamp (1) and remove air inlet hose (3) from turbocharger.
2. Insert Special Tool 9022 Adapter into the turbocharger inlet. Tighten tool clamp to 8 N·m (72 in. lbs.).

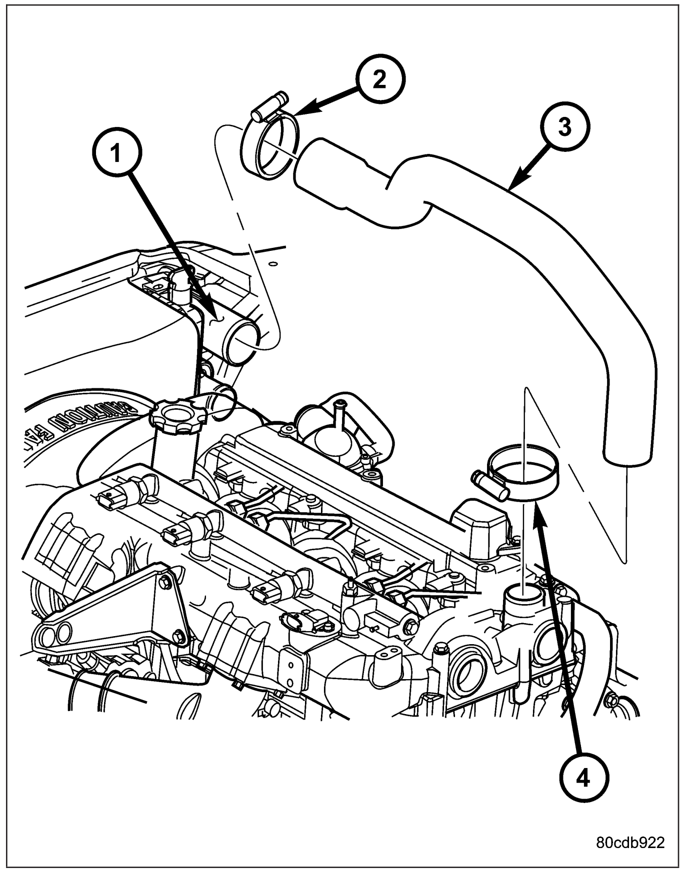
**CAUTION: Do not apply more than 138 kPa (20 psi) air pressure to the charge air cooler system; severe damage to the charge air cooler system may occur.**

3. Connect a regulated air supply to air fitting on Tool 9022 Adapter. Set air pressure to a maximum of 138 kPa (20 psi).
4. Using soapy water check the rubber sleeves, charge air cooler and intake manifold for leaks.
5. Using soapy water check for leaks at the wastegate signal line, wastegate canister and wastegate command valve.

## REMOVAL

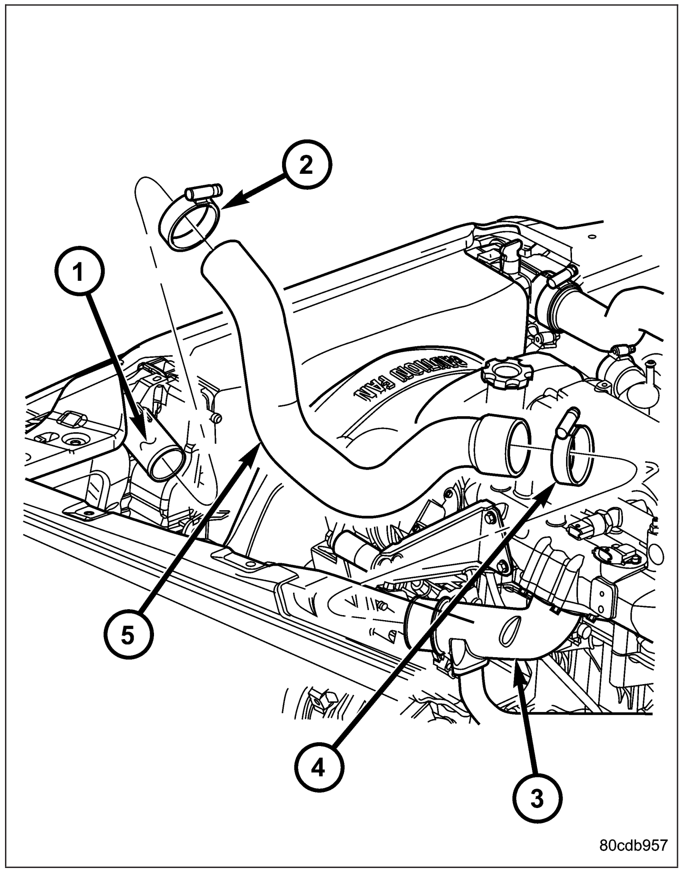
## CHARGE AIR COOLER INLET HOSE

1. Open and support hood of vehicle.
2. Loosen hose clamps at both ends of charge air cooler (CAC) inlet hose.
3. Remove CAC inlet hose (3) from turbocharger and CAC.



## CHARGE AIR COOLER OUTLET HOSE

1. Raise and support hood on vehicle.
2. Loosen hose clamps at both ends of charge air cooler (CAC) outlet hose (5).
3. Remove hose (5) from CAC and intake manifold inlet.



## INSTALLATION

## CHARGE AIR COOLER INLET HOSE

1. Install charge air cooler (CAC) inlet hose on turbocharger and CAC.
2. Tighten hose clamps.
3. Close hood.

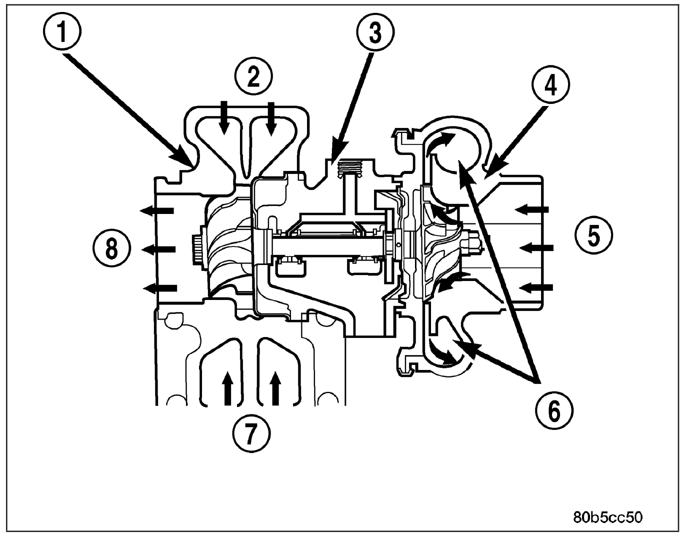
## CHARGE AIR COOLER OUTLET HOSE

1. Install charge air cooler (CAC) outlet hose on CAC and intake manifold inlet.
2. Tighten both hose clamp on CAC outlet hose.
3. Close hood.

# TURBOCHARGER

## DESCRIPTION

**CAUTION: The turbocharger is a performance part and must not be tampered with. The wastegate bracket is an integral part of the turbocharger. Tampering with the wastegate components can reduce durability by increasing cylinder pressure and thermal loading due to incorrect inlet and exhaust manifold pressure. Poor fuel economy and failure to meet regulatory emissions laws may result. Increasing the turbocharger boost WILL NOT increase engine power.**



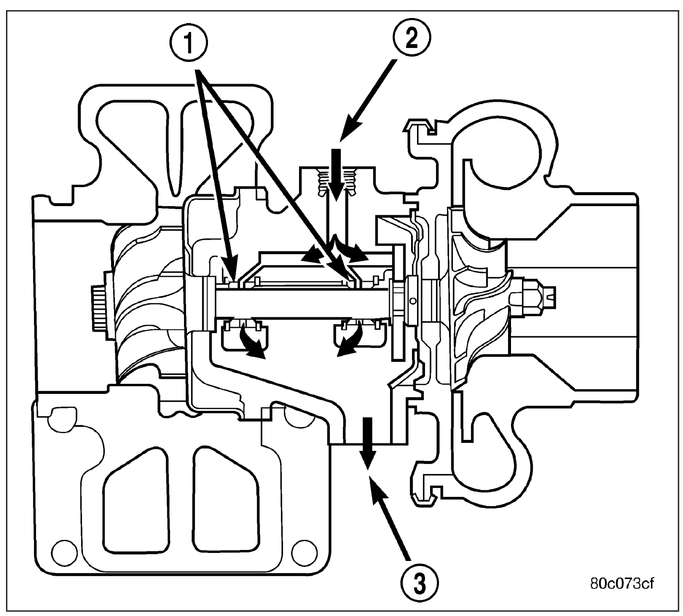
The turbocharger is an exhaust-driven supercharger which increases the pressure and density of the air entering the engine through the charge air cooler. With the increase of air entering the engine, more fuel can be injected into the cylinders, which creates more power during combustion.

The turbocharger assembly consists of four (5) major component systems

- Turbine section
- Compressor section
- Bearing housing
- Variable veins
- Actuator

## OPERATION

Exhaust gas pressure and energy drive the turbine, which in turn drives a centrifugal compressor that compresses the inlet air, and forces the air into the engine through the charge air cooler and plumbing. Since heat is a by-product of this compression, the air must pass through a charge air cooler to cool the incoming air and maintain power and efficiency.



**Increasing air flow to the engine provides:**

- Improved engine performance
- Lower exhaust smoke density
- Improved operating economy
- Altitude compensation
- Noise reduction.

The turbocharger is lubricated by engine oil that is pressurized, cooled, and filtered. The oil is delivered to the turbocharger by a supply line (2) that is tapped into the engine block. The oil travels into the bearing housing, where it lubricates the shaft (1) and bearings. A return pipe (3) at the bottom of the bearing housing, routes the engine oil back to the crankcase.

The most common turbocharger failure is bearing failure related to repeated hot shutdowns with inadequate “cool-down” periods. A sudden engine shut down after prolonged operation will result in the transfer of heat from the turbine section of the turbocharger to the bearing housing. This causes the oil to overheat and break down, which causes bearing and shaft damage the next time the vehicle is started.

Letting the engine idle after extended operation allows the turbine housing to cool to normal operating temperature. The following chart should be used as a guide in determining the amount of engine idle time required to sufficiently cool down the turbocharger before shut down, depending upon the type of driving and the amount of cargo.

| TURBOCHARGER ″COOL DOWN″ CHART | | | |
|---|---|---|---|
| **Driving Condition** | **Load** | **Turbocharger Temperature** | **Idle Time (in minutes) Before Shut Down** |
| Stop & Go | Empty | Cool | Less than 1 |
| Stop & Go | Medium | Warm | 1 |
| Highway Speeds | Medium | Warm | 2 |
| City Traffic | Max. GCWR | Warm | 3 |
| Highway Speeds | Max. GCWR | Warm | 4 |
| Uphill Grade | Max. GCWR | Hot | 5 |

## REMOVAL

1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE - REMOVAL).
3. Disconnect the MAF and Inlet air pressure sensors wiring harness connectors, disconnect the air outlet duct from the turbocharger, and remove air cleaner assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove charge air cooler inlet hose from turbocharger (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/CHARGE AIR COOLER AND PLUMBING - REMOVAL).
5. Drain cooling system.
6. Remove coolant recovery pressure container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - REMOVAL).
7. Disconnect the turbocharger actuator vacuum hose and position aside.
8. Remove turbocharger upper heat shield.
9. Raise and support the vehicle.
10. Remove the lower splash shield.
11. Disconnect the front exhaust pipe from the turbocharger.
12. Remove the turbocharger support bracket.
13. Disconnect turbocharger oil return line at turbocharger.
14. Lower the vehicle.
15. Remove the turbocharger oil supply line.
16. Remove turbocharger to exhaust manifold retaining nuts and separate turbocharger from exhaust manifold.

## CLEANING

All old gaskets should be inspected for any tears or signs of prior leakage. If any gaskets show such indications, they should be replaced with new gaskets. All gasket mating surfaces must be cleaned of old gasket material to produce a smooth and dirt free sealing surface for the new gasket.

## INSTALLATION

1. Connect turbocharger to exhaust manifold with new gasket. Torque retaining nuts to 32 N·m.

**NOTE: After Tightening The Exhaust Manifold To Specification Using a Diagonal-Cross Pattern, Retrace The Pattern Checking The Correct Torque Value Again.**

2. Install exhaust manifold and turbocharger assembly with new gasket in position on studs in cylinder head. Install retaining nuts and torque to 36 N·m.

3. Install thermostat housing (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION).
4. Install viscous heater (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ELECTRIC COOLANT PUMP - INSTALLATION).
5. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
6. Raise vehicle on hoist.
7. Connect turbocharger oil return line at turbocharger.
8. Connect exhaust pipe at turbocharger downpipe.
9. Lower vehicle from hoist.
10. Connect oil supply line at turbocharger. Torque banjo fitting to 24 N·m.
11. Install exhaust manifold heat shield. Torque retaining bolts to 24 N·m (18 lbs.ft.).
12. Reposition EGR cooler and or EGR valve assembly on exhaust manifold. Torque retaining nuts and bolt to 32.4N·m.
13. Connect EGR pipe to EGR valve. Torque bolts to 32 N·m.
14. Connect EGR cooler coolant hoses at cooler (2.8L).
15. Install coolant recovery pressure container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - INSTALLATION).
16. Refill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
17. Connect charge air cooler inlet hose at turbocharger.
18. Install air cleaner assembly.
19. Connect air inlet hose to turbocharger.
20. Install engine cover (Refer to 9 - ENGINE - INSTALLATION).
21. Connect negative battery cable.

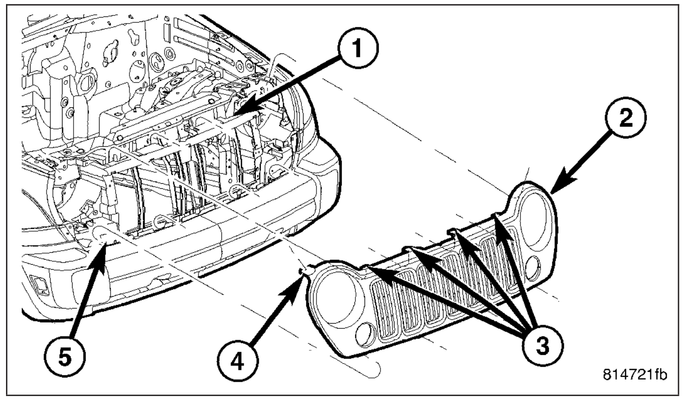
# FRAME & BUMPERS

## TABLE OF CONTENTS

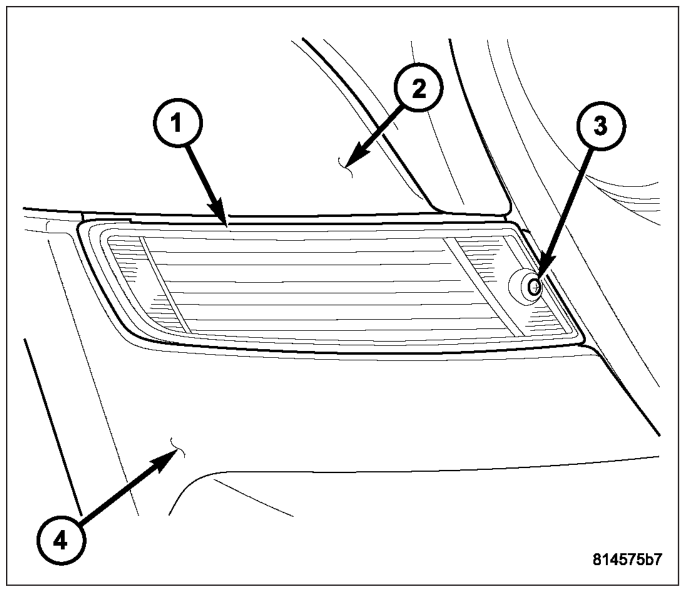
# FRONT FASCIA

## REMOVAL

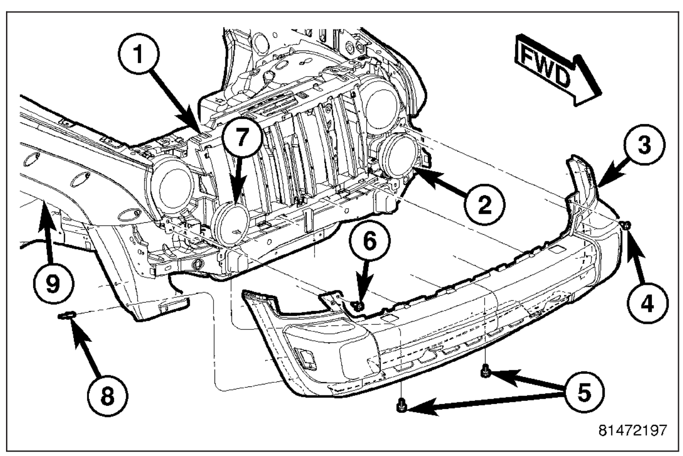
1. Remove the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).



2. Remove the turn signal lamps (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/PARK/TURN SIGNAL LAMP - REMOVAL).

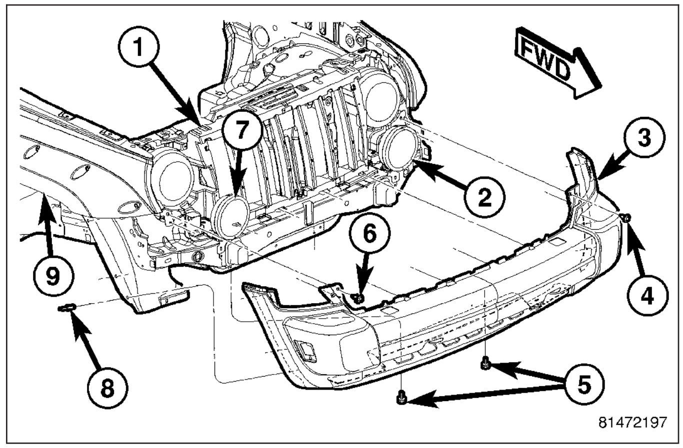


3. Remove the fascia screws next to the turn signal lamps (6).
4. Remove the two screws at the bottom of the fascia (5).
5. Remove the three plastic rivets (8) securing the fascia (3) to each wheelhouse splash shield.
6. Release the three tabs securing the fascia to the grille opening reinforcement (1).
7. Remove the fascia (3).

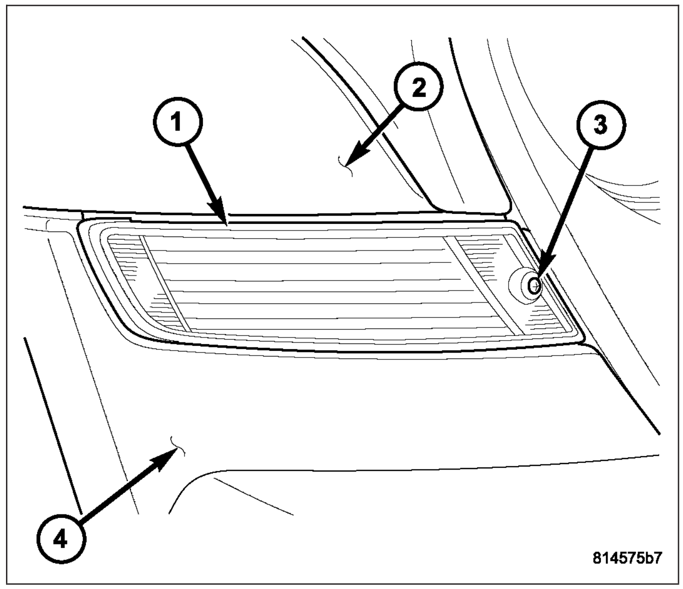


## INSTALLATION

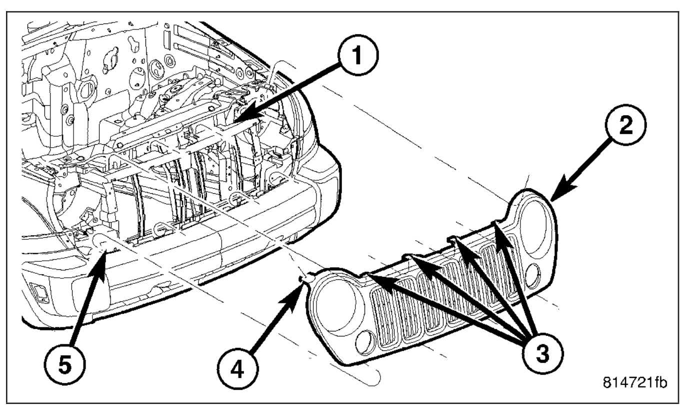
1. Position the fascia (3) onto the vehicle and align the center pin into the hole located near the center of the grille opening reinforcement (1).
2. Secure the three tabs onto the grille reinforcement fully.
3. Install the two screws (4 & 6) next to the turn signal lamps.
4. Install the two lower screws (5).
5. Install new rivets (8) attaching the wheelhouse splash shield to the fascia (3).



6. Install the turn signal lamps (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/PARK/TURN SIGNAL LAMP - INSTALLATION).



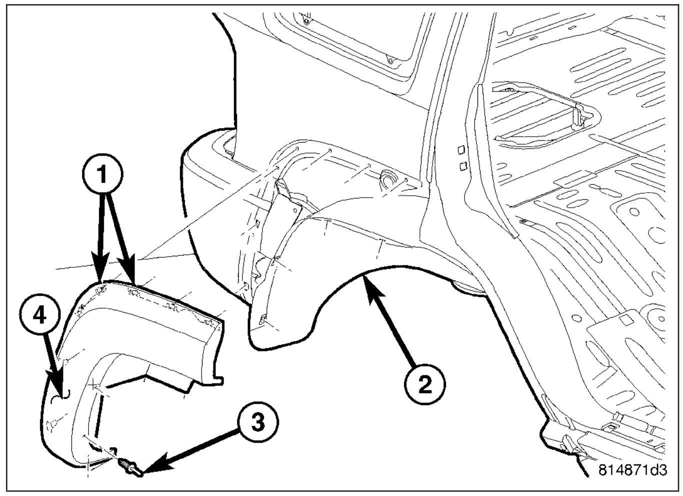
7. Install the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).



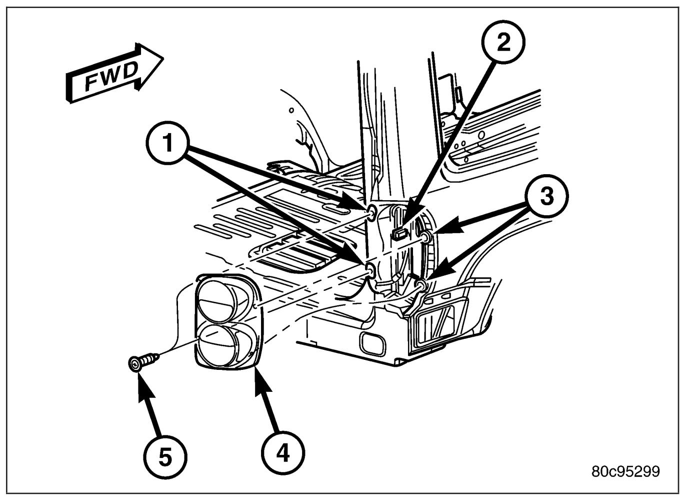
# REAR FASCIA

## REMOVAL

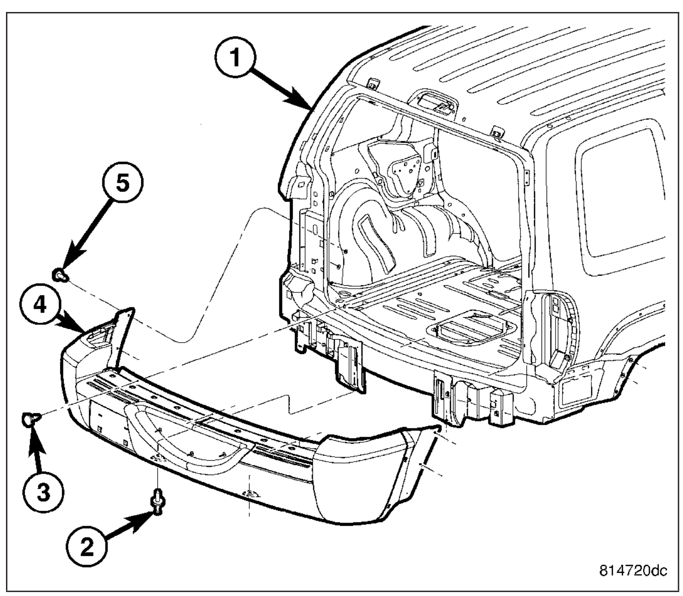
1. Remove the wheel flares (rear) (Refer to 23 - BODY/EXTERIOR/REAR WHEEL OPENING FLARE MOLDINGS - REMOVAL).



2. Remove the rear lamp units (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/REAR LAMP UNIT - REMOVAL).



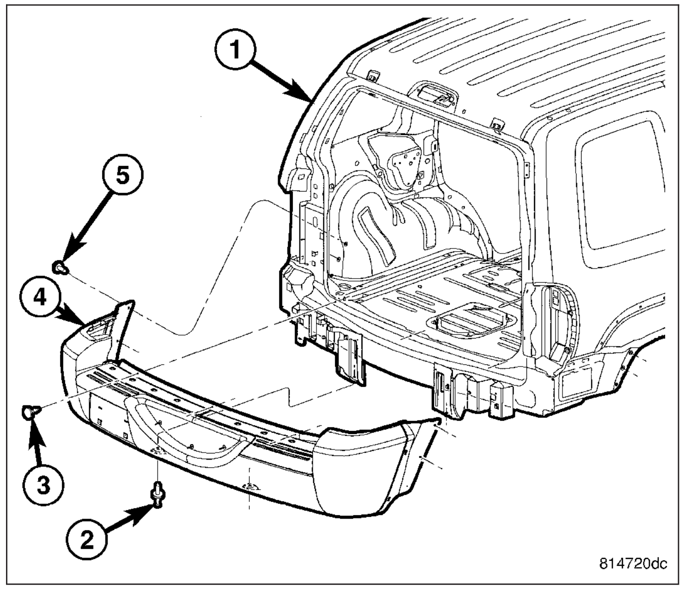
3. Remove the four side bolts.
4. Remove the two bottom rivets.
5. Remove the 3 screws along the upper edge.
6. Separate the side plastic retainers and remove the fascia from the vehicle.



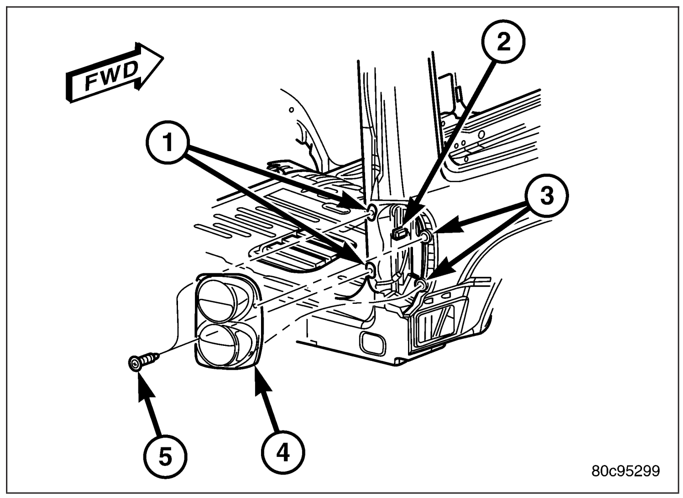
## INSTALLATION

**NOTE: Fascia must be pushed completely forward to allow the plastic retainers full engagement in their respective slots.**

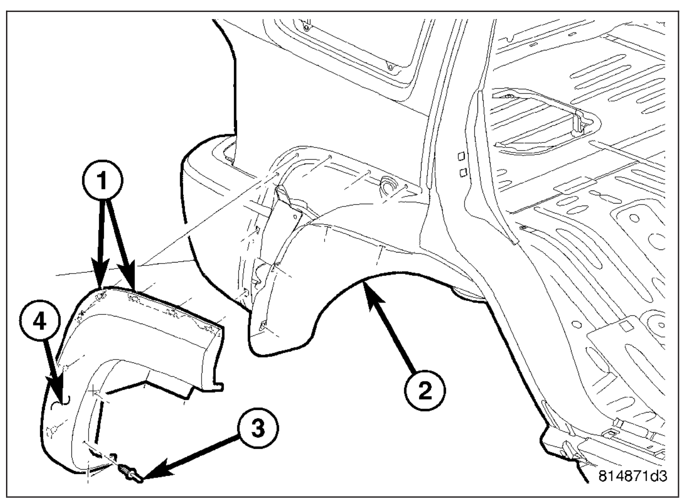
1. Install the fascia and insert the plastic retainers.
2. Install the three upper screws.
3. Install the four side bolts.
4. Install two bottom rivets.



5. Install the rear lamp units (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/REAR LAMP UNIT - INSTALLATION).



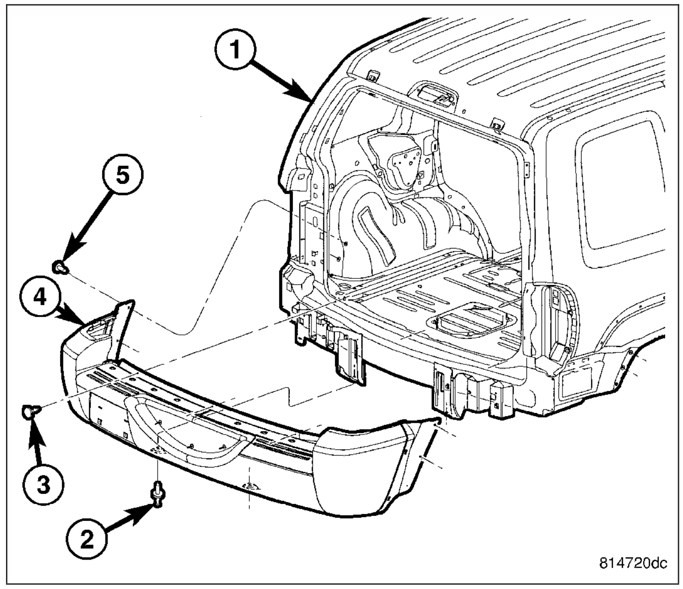
6. Install the rear half wheel opening flares (Refer to 23 - BODY/EXTERIOR/WHEEL OPENING FLARE MOLDING - INSTALLATION).



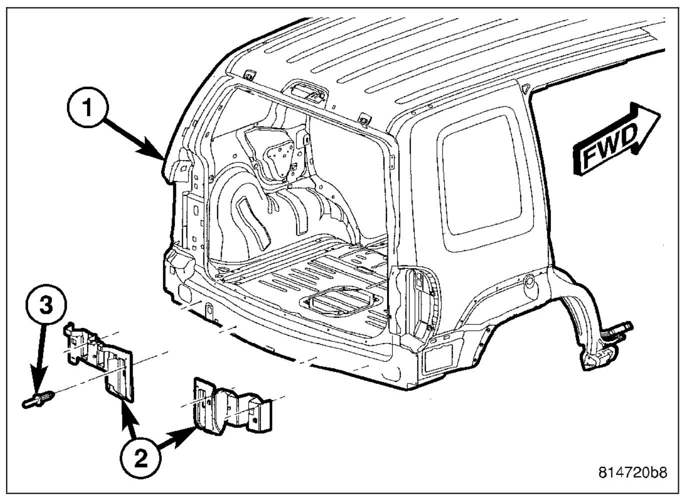
# REAR FASCIA SUPPORT

## REMOVAL

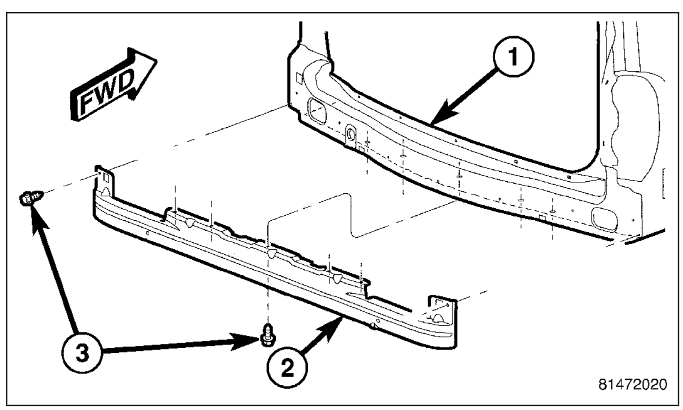
1. Remove the rear fascia assembly (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL).



2. Remove the four rivets and remove the two fascia supports.

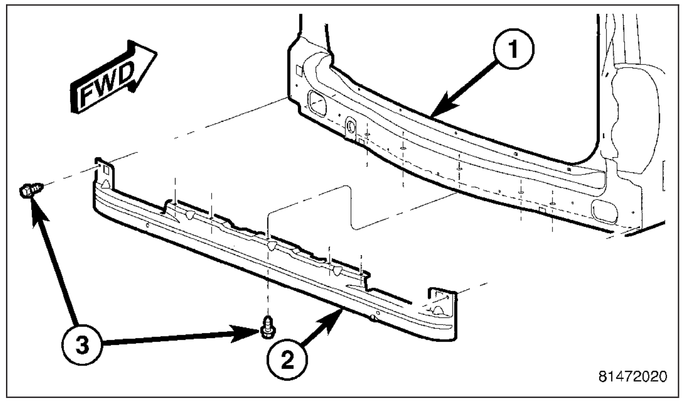


3. For export models, remove the seven bolts and remove the fascia support.

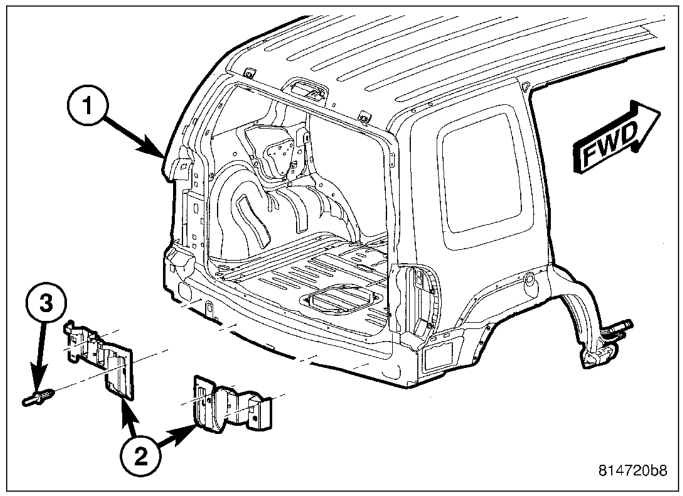


## INSTALLATION

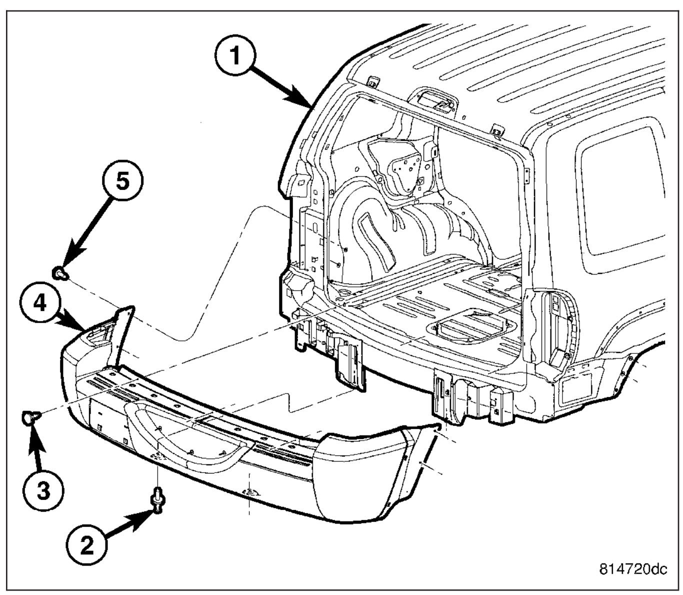
1. For export models, install the fascia support and install the seven bolts.



2. Install the fascia supports onto the vehicle and install four new rivets.



3. Install the rear fascia assembly (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).



# REAR FASCIA - STEP PAD

## REMOVAL

1. Remove the rear fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL).
2. Remove the rain diverter (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - RAIN DIVERTER - REMOVAL).
3. Remove the retaining clips and remove the step pads.

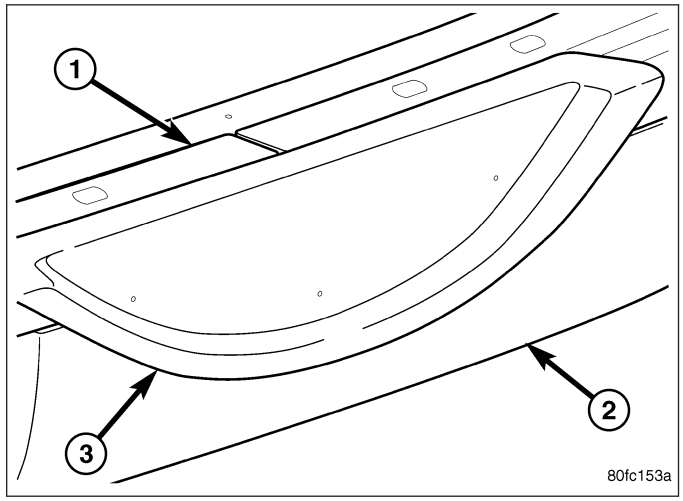
## INSTALLATION

1. Install the step pads and new retainer clips.
2. Install the rain diverter (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - RAIN DIVERTER - INSTALLATION).
3. Install the rear fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).

# REAR FASCIA - RAIN DIVERTER

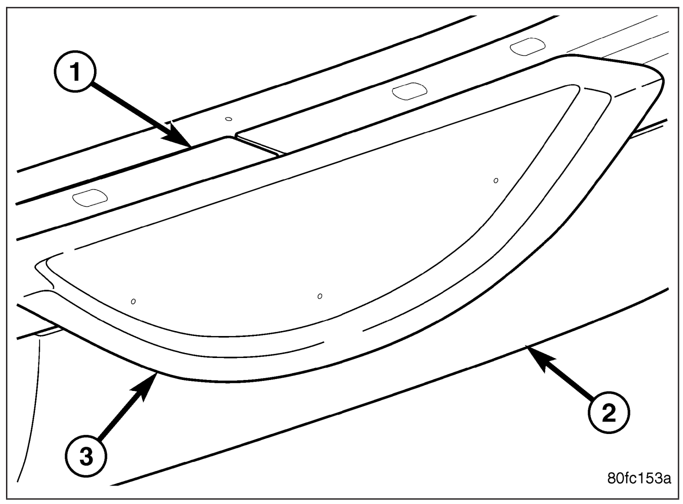
## REMOVAL

1. Open the swing gate.
2. Remove the three rivets from the diverter and remove the diverter.



## INSTALLATION

1. Install the diverter and install new rivets.



# FRAME

## SPECIFICATIONS

## SPECIFICATIONS - FRAME DIMENSIONS

Frame dimensions are listed in metric scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

### VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

**NOTE: All measurements are in MM.**

### DIMENSION ILLUSTRATIONS

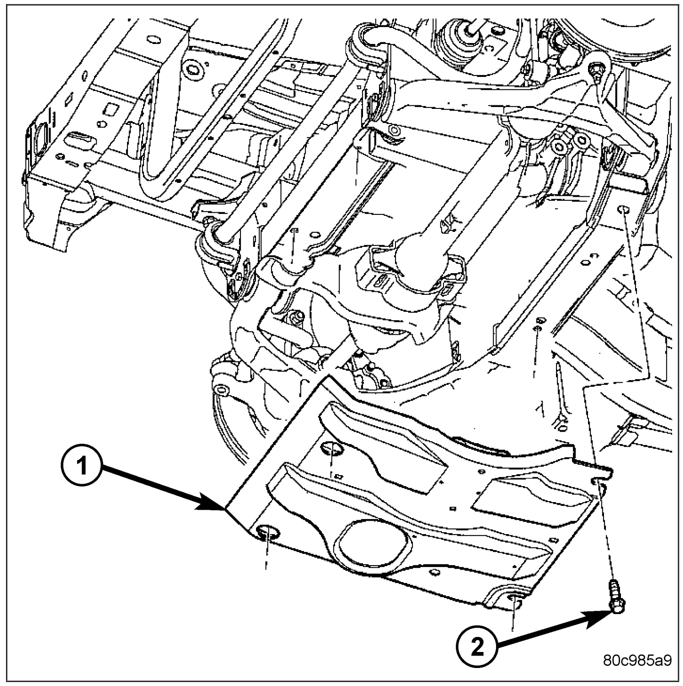
| Transmission mount through bolt/nut | 88 | 65 | — |

# FRONT SKID PLATE

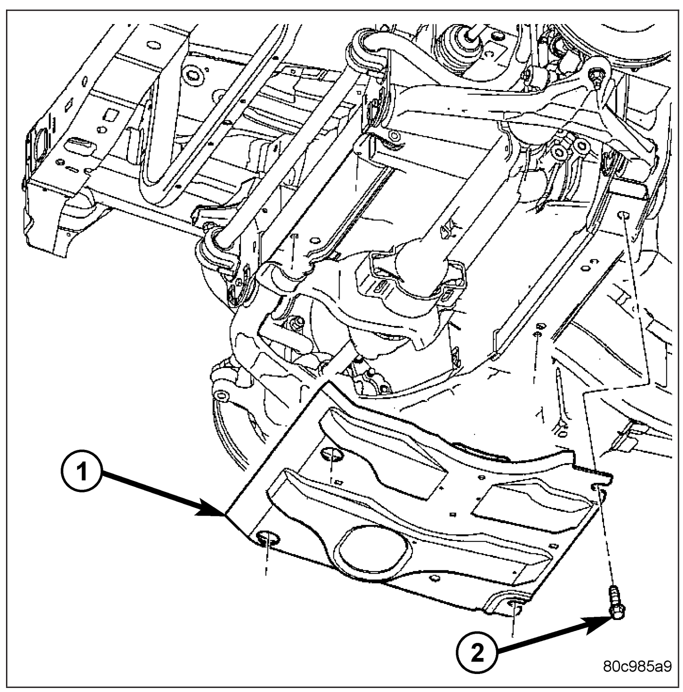
## REMOVAL

1. Raise and support the vehicle.
2. Remove the skid plate bolts and remove the skid plate.



## INSTALLATION

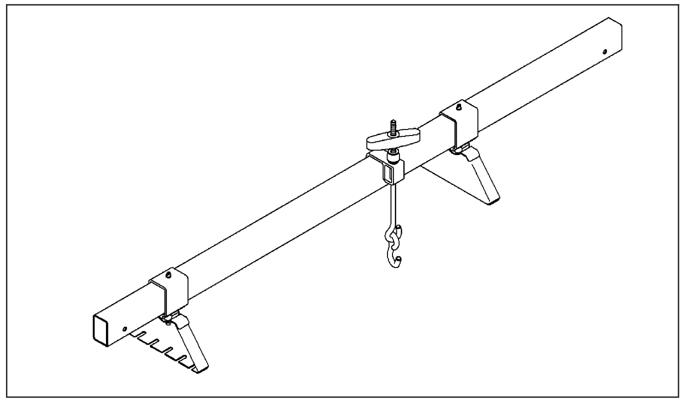
1. Install the skid plate.
2. Install the bolts and tighten to 61 N·m (45 ft. lbs.).



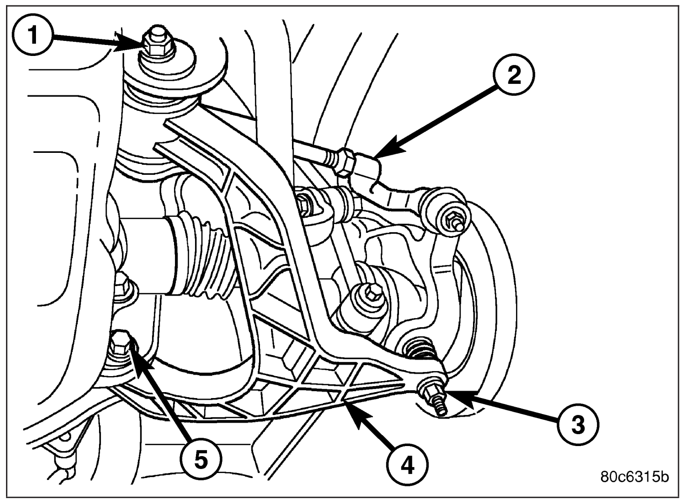
# ENGINE CRADLE CROSSMEMBER

## REMOVAL

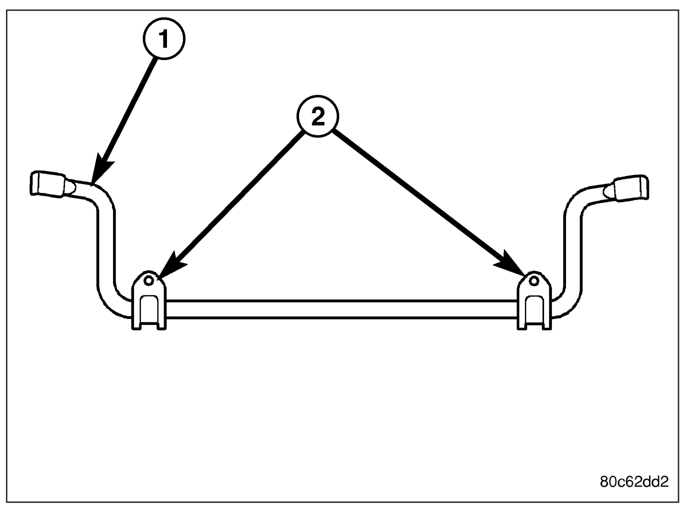
1. Install engine support tool 8534 or equivalent.



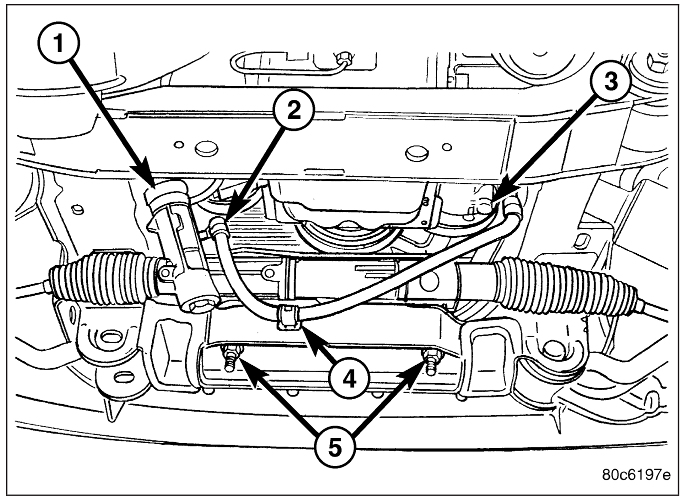
2. Raise and support the vehicle.
3. Remove the lower control arms (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).



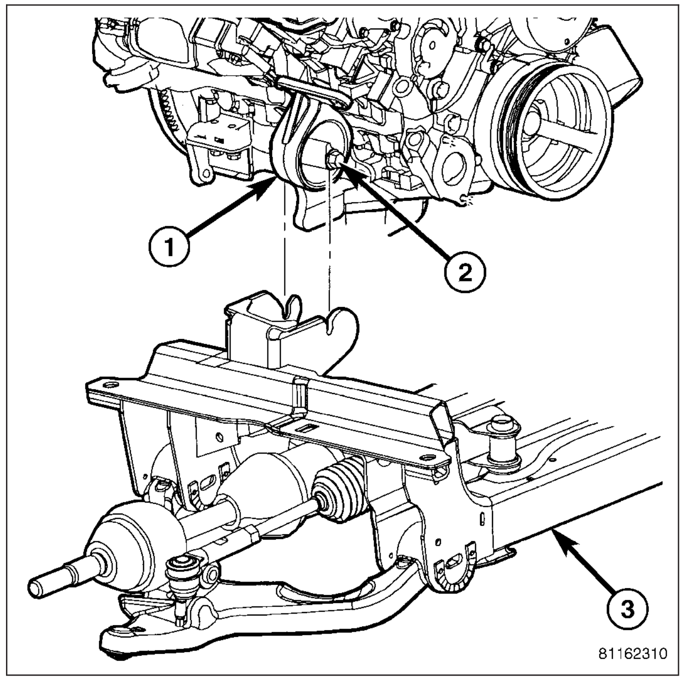
4. Remove the stabilizer bar (Refer to 2 - SUSPENSION/FRONT/STABILIZER BAR - REMOVAL).



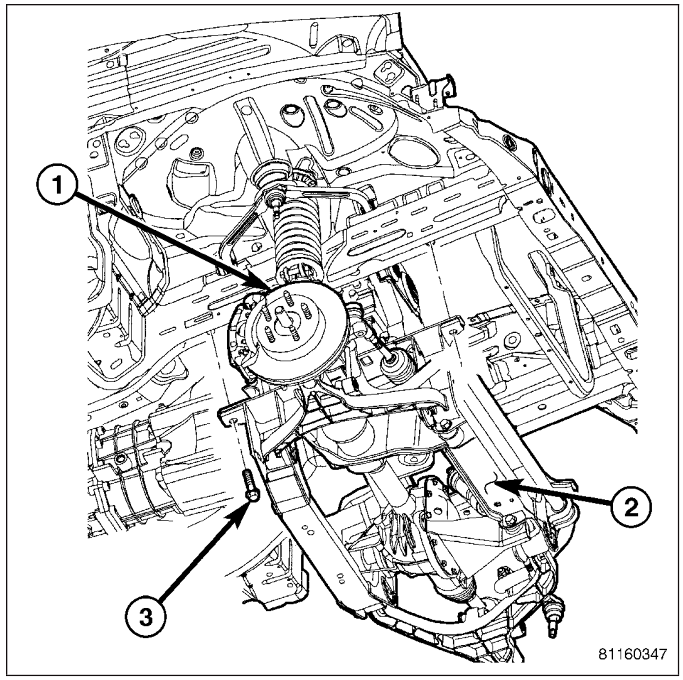
5. Remove the front axle, if equipped (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - REMOVAL).
6. Remove the power steering rack (Refer to 19 - STEERING/GEAR - REMOVAL).



7. Loosen the engine mount through bolts.

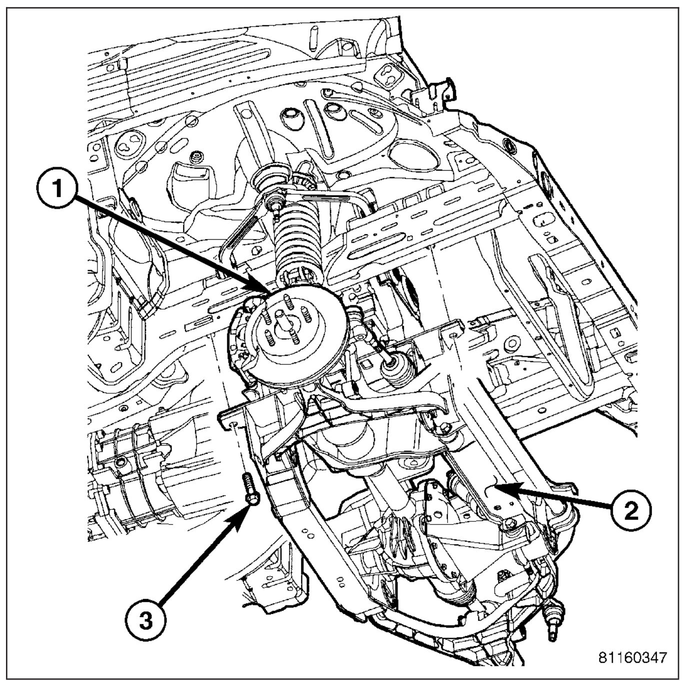


8. Support the engine cradle with a suitable lifting device.
9. Using a grease pencil or equivalent, mark the location of the engine support cradle.
10. Remove the engine cradle support bolts and remove the engine cradle.

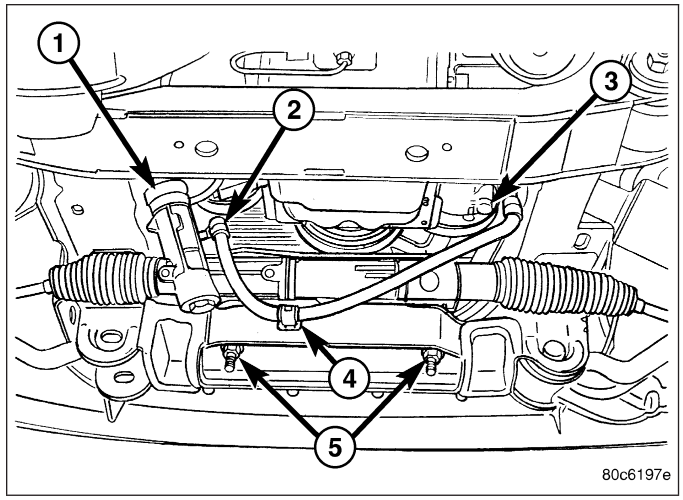


## INSTALLATION

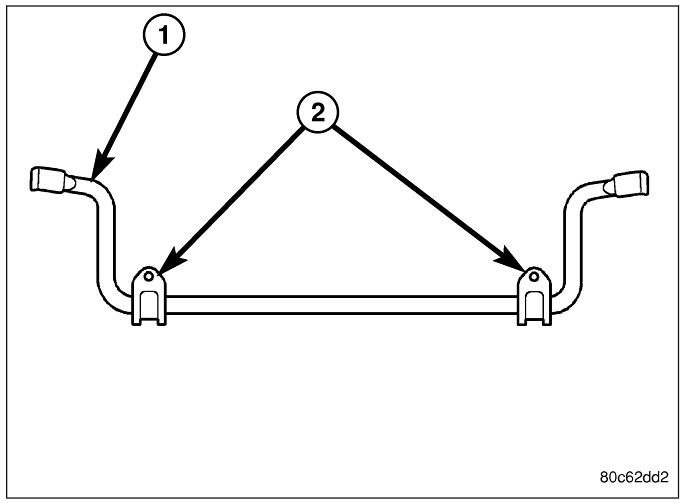
1. Raise and support the vehicle.
2. Using a suitable lifting device raise the engine cradle into the vehicle while lining up the engine mount through bolts.
3. Align the engine cradle to the marks made during removal and install the mounting and inner rail bolts.
4. Tighten the mounting front bolts to 122 N·m (90 ft. lbs.) and tighten the rear bolts to 115 N·m (85 ft. lbs.).
5. Tighten the engine mount through bolts to 88 N·m (65 ft. lbs.).



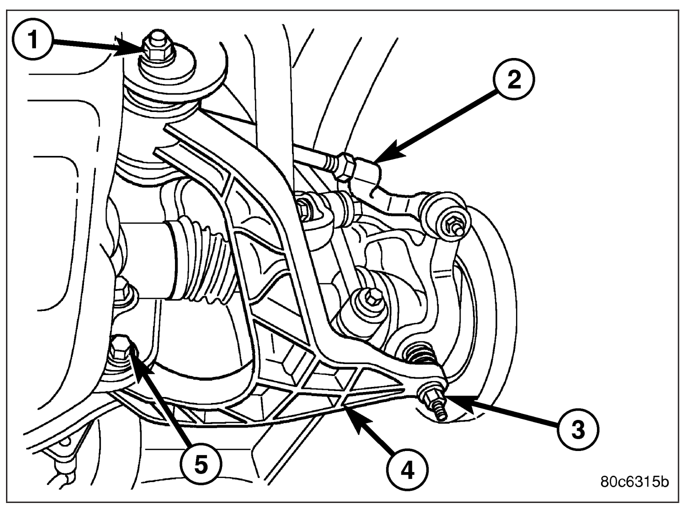
6. Install the power steering rack (Refer to 19 - STEERING/GEAR - INSTALLATION).



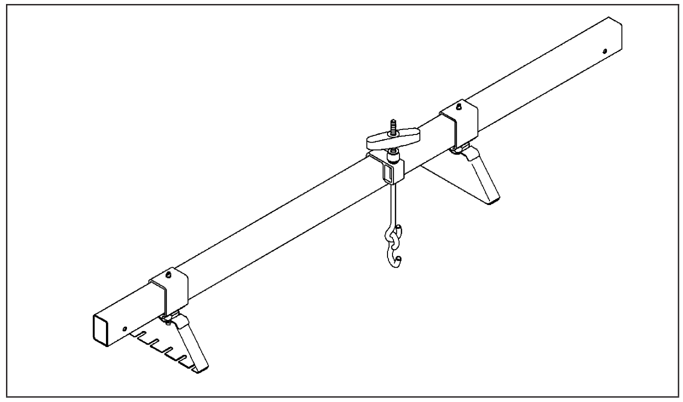
7. Install the front axle, if equipped (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - INSTALLATION).
8. Install the stabilizer bar (Refer to 2 - SUSPENSION/FRONT/STABILIZER BAR - INSTALLATION).



9. Install the lower control arms (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).



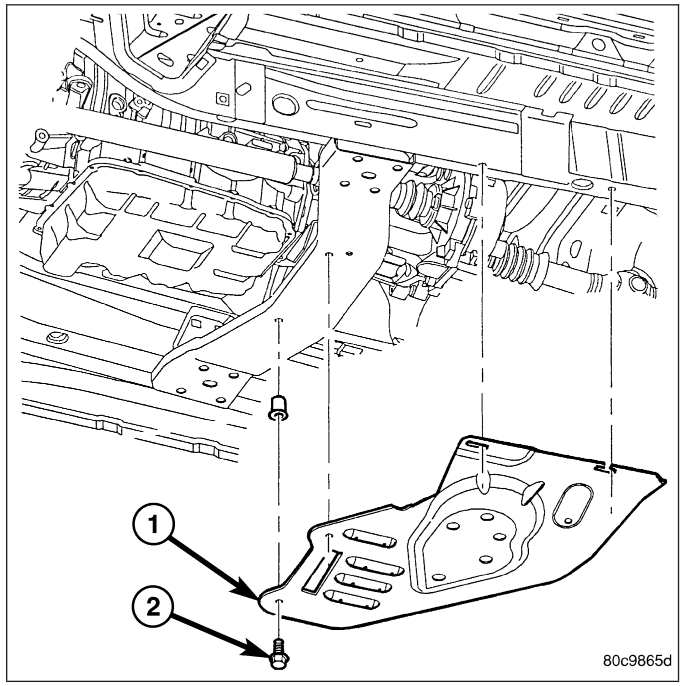
10. Lower the vehicle and remove the engine support tool.



# TRANSFER CASE SKID PLATE

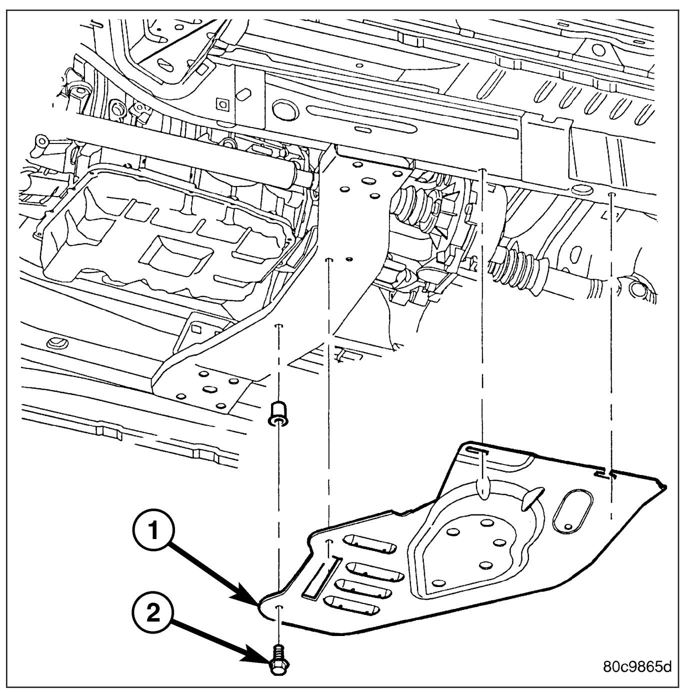
## REMOVAL

1. Remove the bolts (2) and remove the skid plate (1).



## INSTALLATION

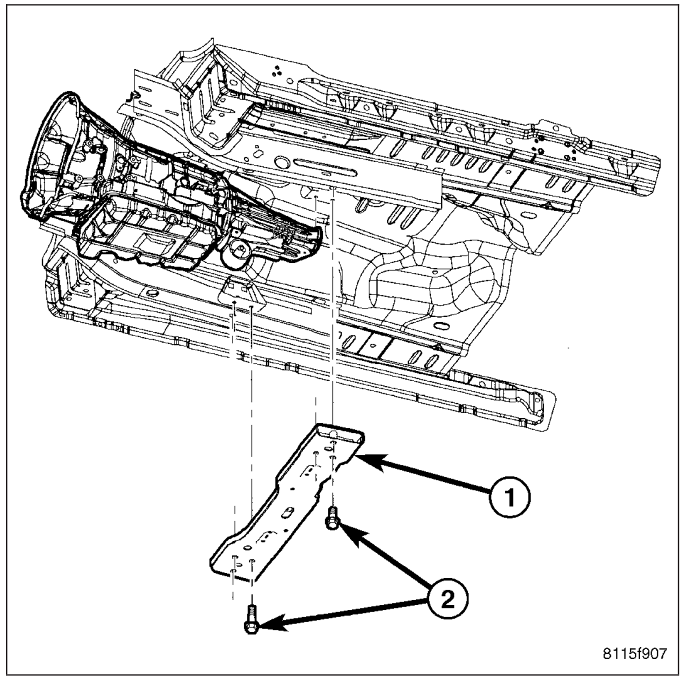
1. Install the skid plate.
2. Install the bolts and tighten to 34 N·m (25 ft. lbs.).



# REAR CROSSMEMBER

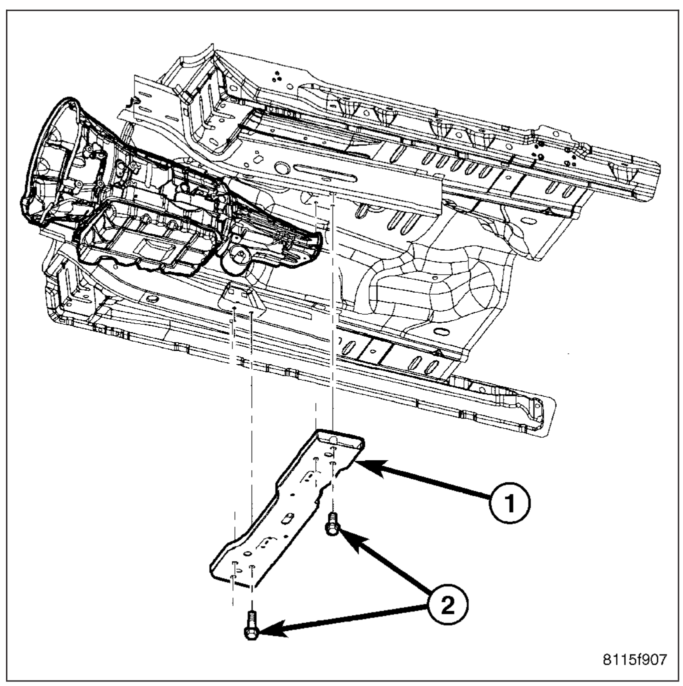
## REMOVAL

1. Raise and support the vehicle.
2. Support the transmission with a suitable lifting device.
3. Remove the transmission mount through bolt.
4. Remove the six crossmember bolts (2) and remove the crossmember.



## INSTALLATION

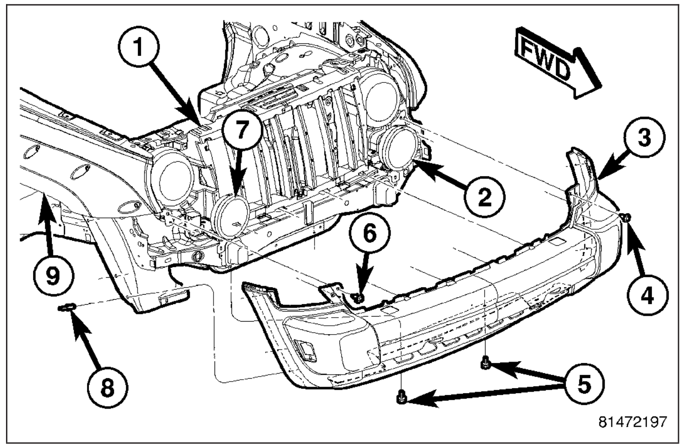
1. Install the crossmember and install the bolts.
2. Tighten the bolts to 47 N·m (35 ft. lbs.)
3. Install transmission mount through bolt and tighten to 88 N·m (65 ft. lbs.).



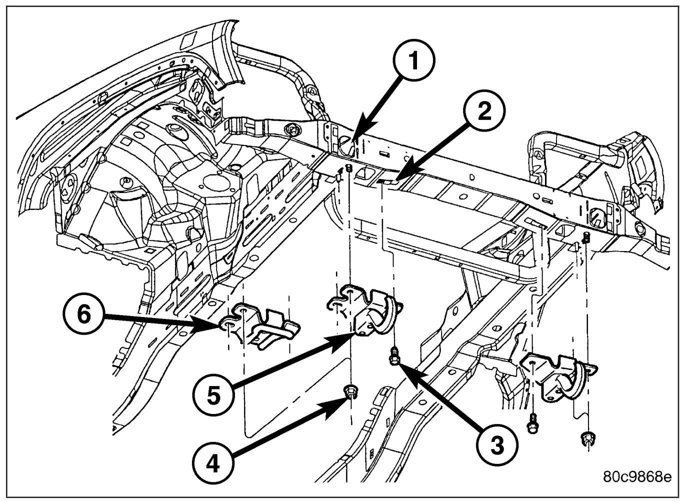
# FRONT TOW HOOK

## REMOVAL

**NOTE: Front fascia must be removed to replace the stud plate (Refer to 13 - FRAME & BUMPERS/ BUMPERS/FRONT FASCIA - REMOVAL).**

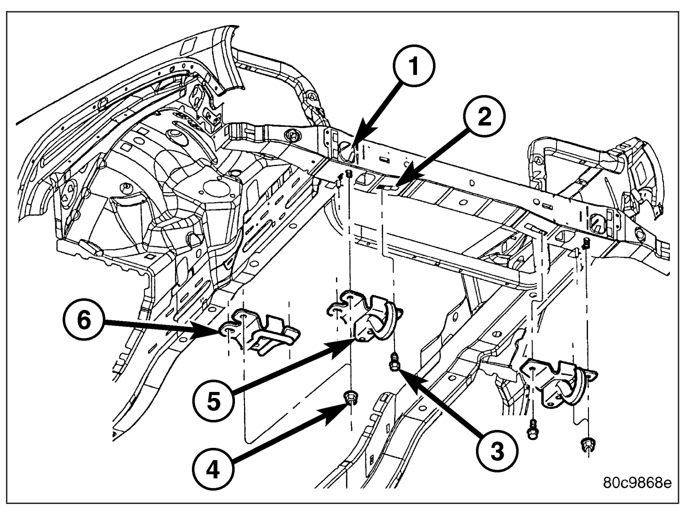


1. Remove the nuts and bolt and remove the tow eye/ hook.

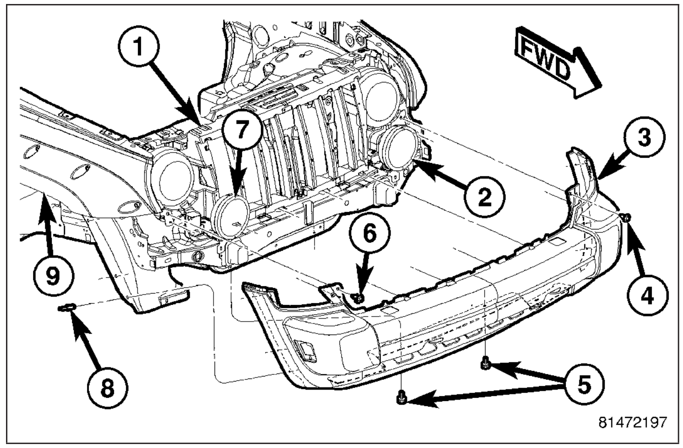


## INSTALLATION

1. Install the stud plate if previously removed.
2. Install the tow eye/hook.
3. Install the nuts and bolt and tighten to 61 N·m (45 ft. lbs.).



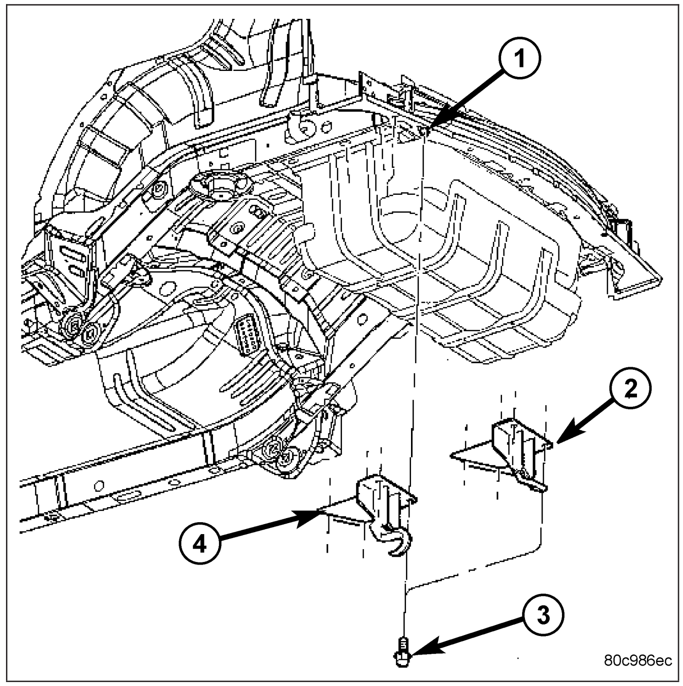
4. Install the front fascia if the stud plate was replaced (Refer to 13 - FRAME & BUMPERS/BUMPERS/ FRONT FASCIA - INSTALLATION).



# REAR TOW HOOK

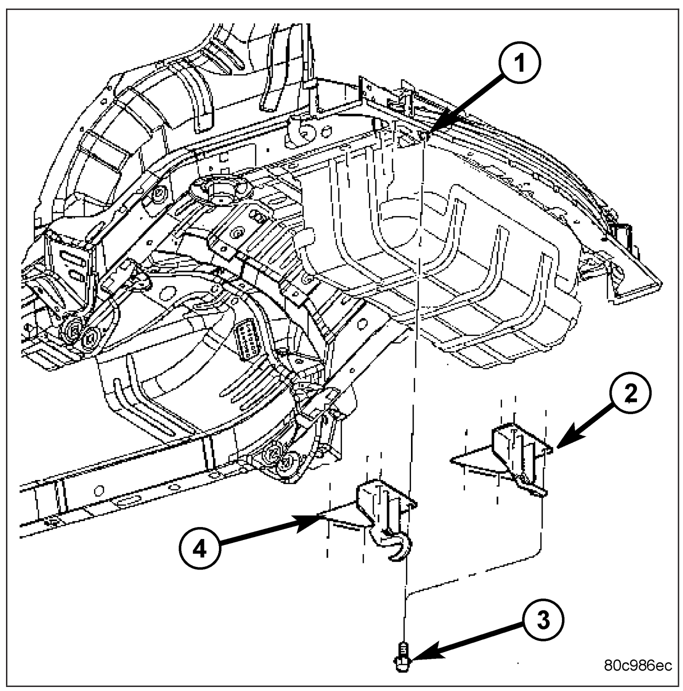
## REMOVAL

1. Remove the bolts and remove the tow hook/eye.



## INSTALLATION

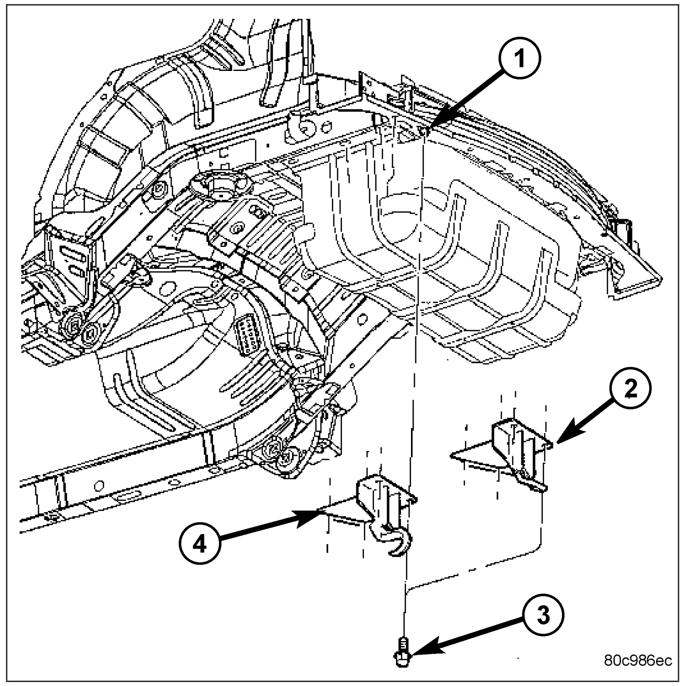
1. Install the tow hook/eye.
2. Install the bolts and tighten to 88 N·m (65 ft. lbs.).



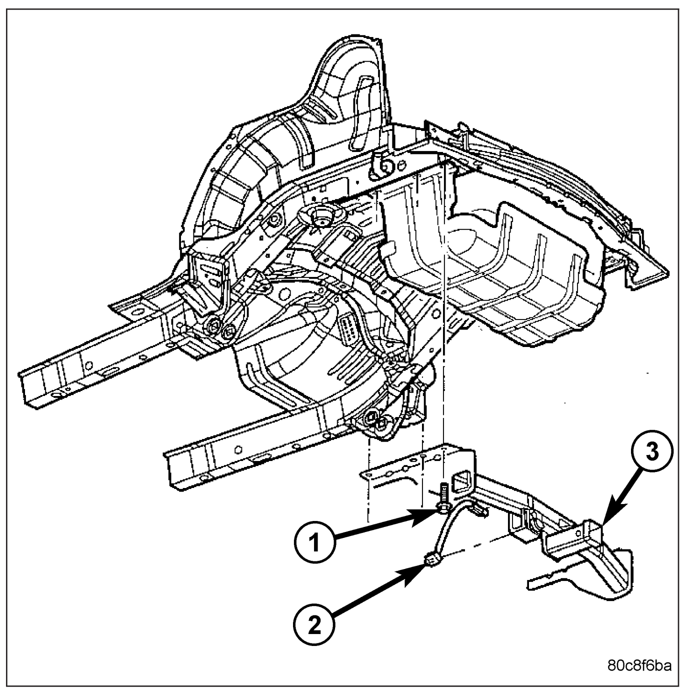
# TRAILER HITCH

## REMOVAL

1. Remove the tow hooks, if equipped (Refer to 13 - FRAME & BUMPERS/FRAME/REAR TOW HOOK - REMOVAL).

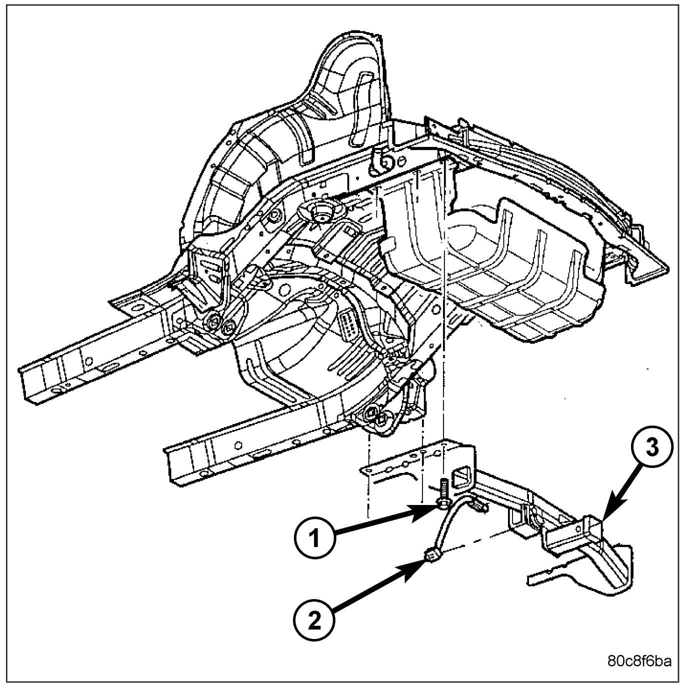


2. Disconnect trailer electrical connector.
3. Support the hitch with a suitable lifting device.
4. Remove the bolts and remove the trailer hitch.

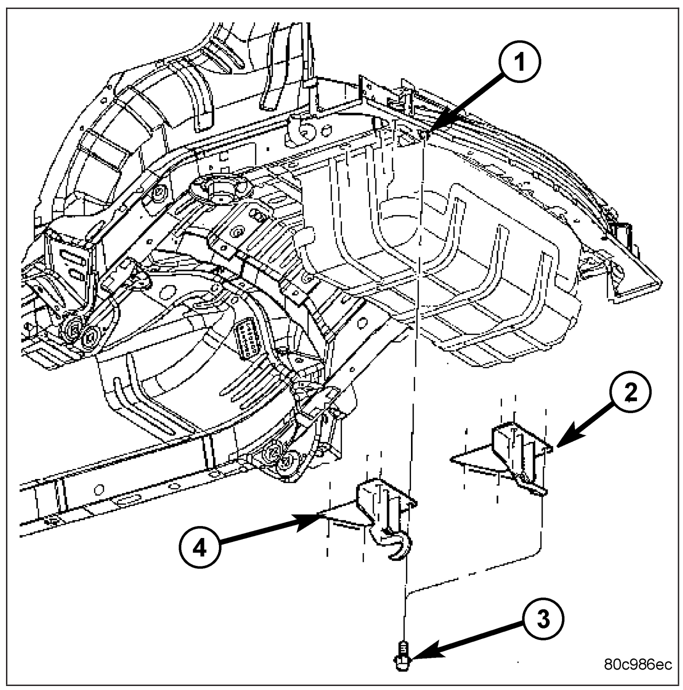


## INSTALLATION

1. Support the hitch with a suitable lifting device and install the hitch.
2. Install the bolts (1) and tighten to 88 N·m (65 ft. lbs.)
3. Connect the electrical connector.



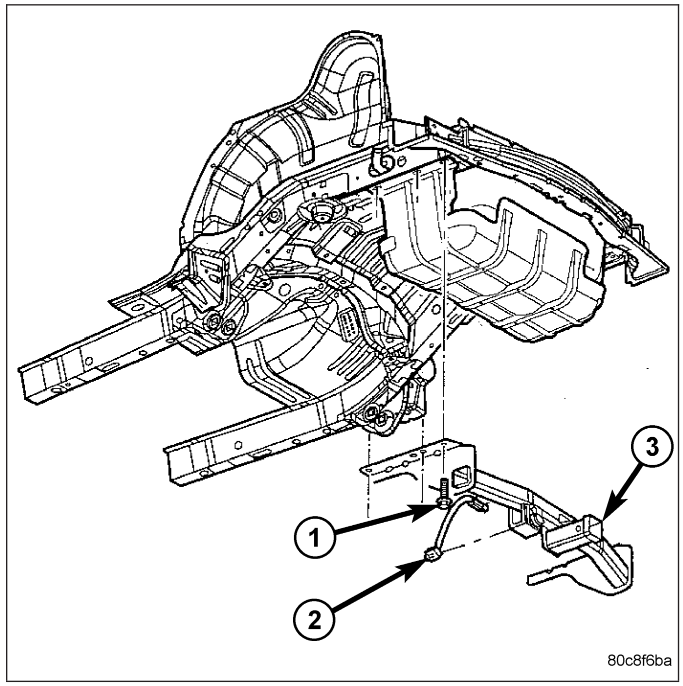
4. Install the tow hooks, if required (Refer to 13 - FRAME & BUMPERS/FRAME/REAR TOW HOOK - INSTALLATION).



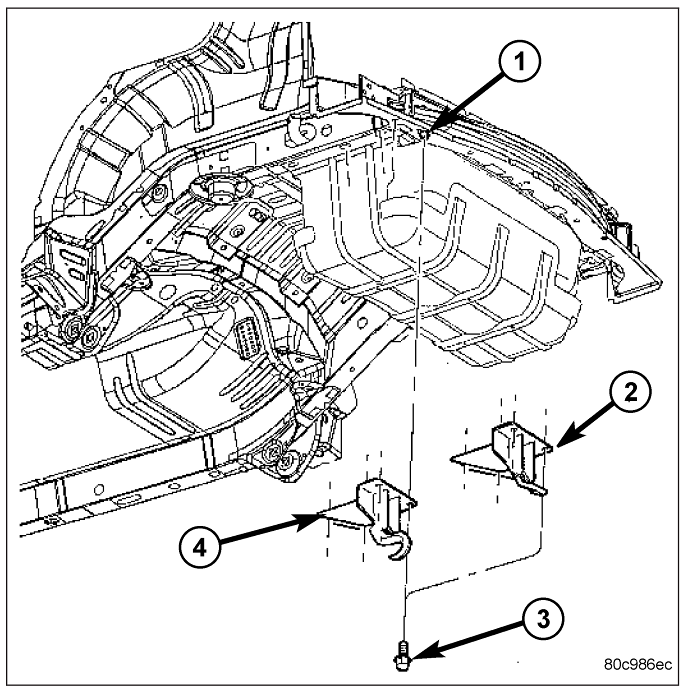
# FUEL TANK SKID PLATE

## REMOVAL

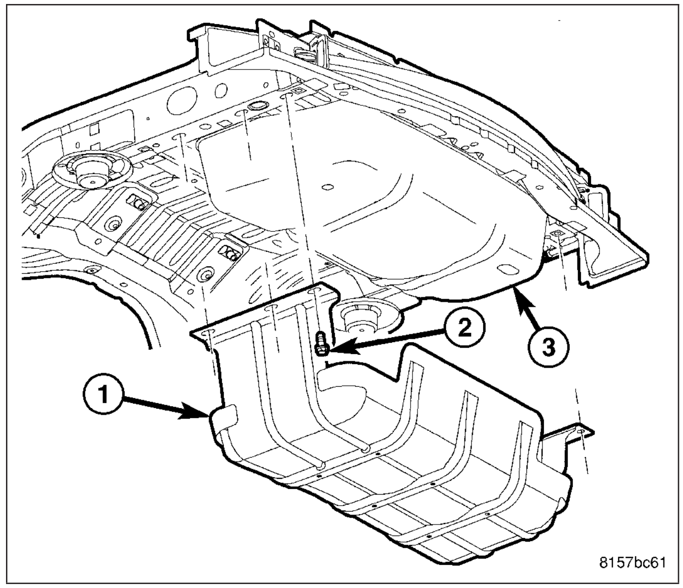
1. Raise and support the vehicle.
2. Support the skid plate with a suitable lifting device.
3. Remove the trailer hitch, if equipped (Refer to 13 - FRAME & BUMPERS/FRAME/TRAILER HITCH - REMOVAL).



4. Remove the tow hooks, if not previously removed (Refer to 13 - FRAME & BUMPERS/FRAME/REAR TOW HOOK - REMOVAL).

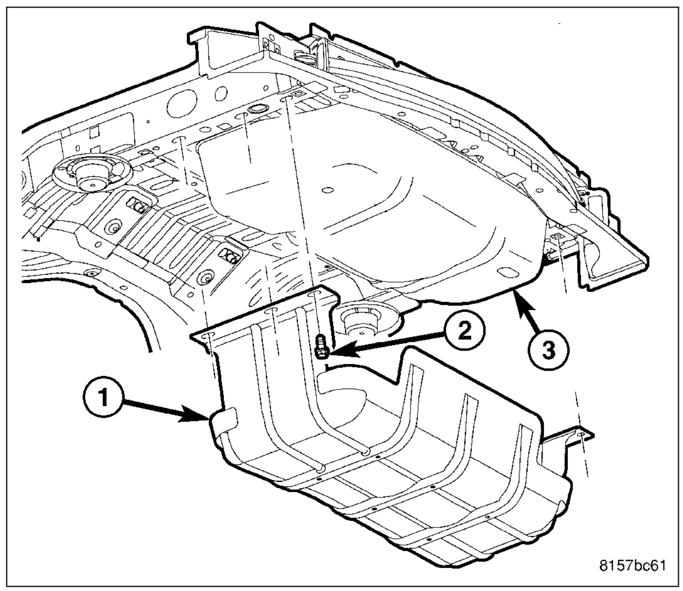


5. Remove the bolts and remove the fuel tank skid plate.

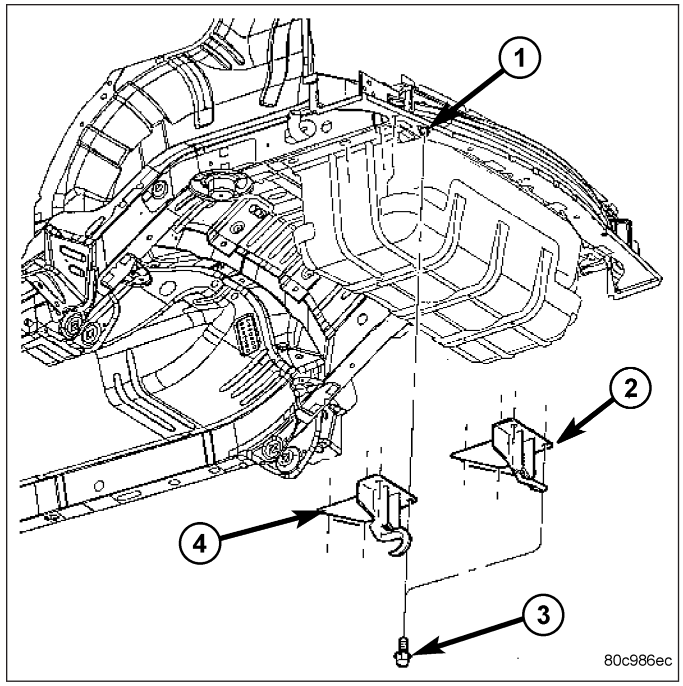


## INSTALLATION

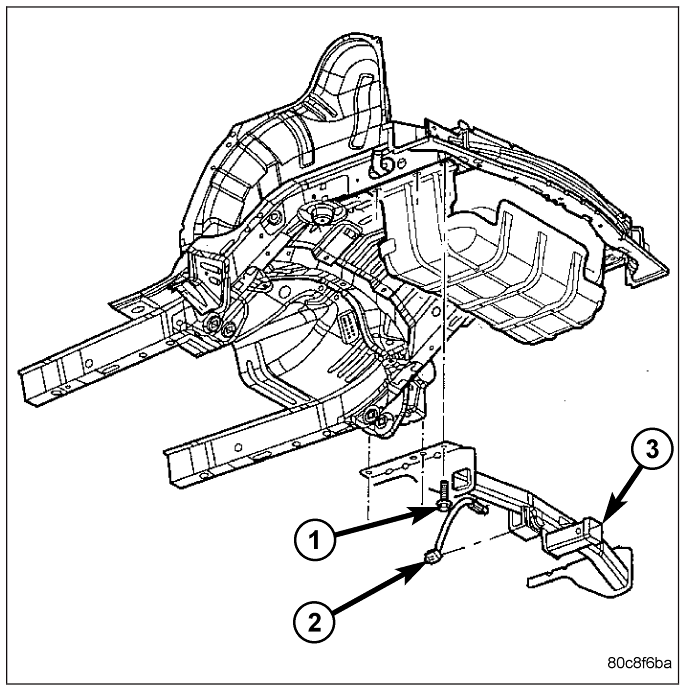
1. Install the skid plate and support with a suitable lifting device.



2. Install the tow hooks, if equipped (Refer to 13 - FRAME & BUMPERS/FRAME/REAR TOW HOOK - INSTALLATION).



3. Install the trailer hitch, if equipped (Refer to 13 - FRAME & BUMPERS/FRAME/TRAILER HITCH - INSTALLATION).
4. Install the bolts and tighten to 88 N·m (65 ft. lbs.).



# FUEL SYSTEM

## TABLE OF CONTENTS

## FUEL DELIVERY - 3.7L GAS

### TABLE OF CONTENTS

# FUEL DELIVERY - 3.7L GAS

## OPERATION

Fuel is picked up in the fuel tank by the fuel pump module. This module is located on the bottom of the fuel tank.

A fuel return system is provided within the fuel pump module using check valves. A separate fuel return line from the engine to the tank is not used.

The fuel pressure regulator and the main fuel filter are combined within the fuel pump module.

The fuel tank assembly consists of: the fuel tank, fuel pump module assembly, fuel pump module lock ring/gasket, ORVR components. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/ORVR - DESCRIPTION)

A fuel filler/vent tube assembly using a pressure/vacuum, 1/4 turn fuel filler cap is used. A one-way check valve is installed into the tanks fuel fill fitting.

Also to be considered part of the fuel system is the evaporation control system and ORVR system. This is designed to reduce the emission of fuel vapors into the atmosphere.

Both fuel filters are designed for extended service. They do not require normal scheduled maintenance.

## STANDARD PROCEDURE

## FUEL SYSTEM PRESSURE RELEASE

**Use following procedure if the fuel injector rail is, or is not equipped with a fuel pressure test port.**

1. Remove fuel fill cap.
2. Remove fuel pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.
3. Start and run engine until it stalls.
4. Attempt restarting engine until it will no longer run.
5. Turn ignition key to OFF position.

**CAUTION: Steps 1, 2, 3 and 4 must be performed to relieve high pressure fuel from within fuel rail. Do not attempt to use following steps to relieve this pressure as excessive fuel will be forced into a cylinder chamber.**

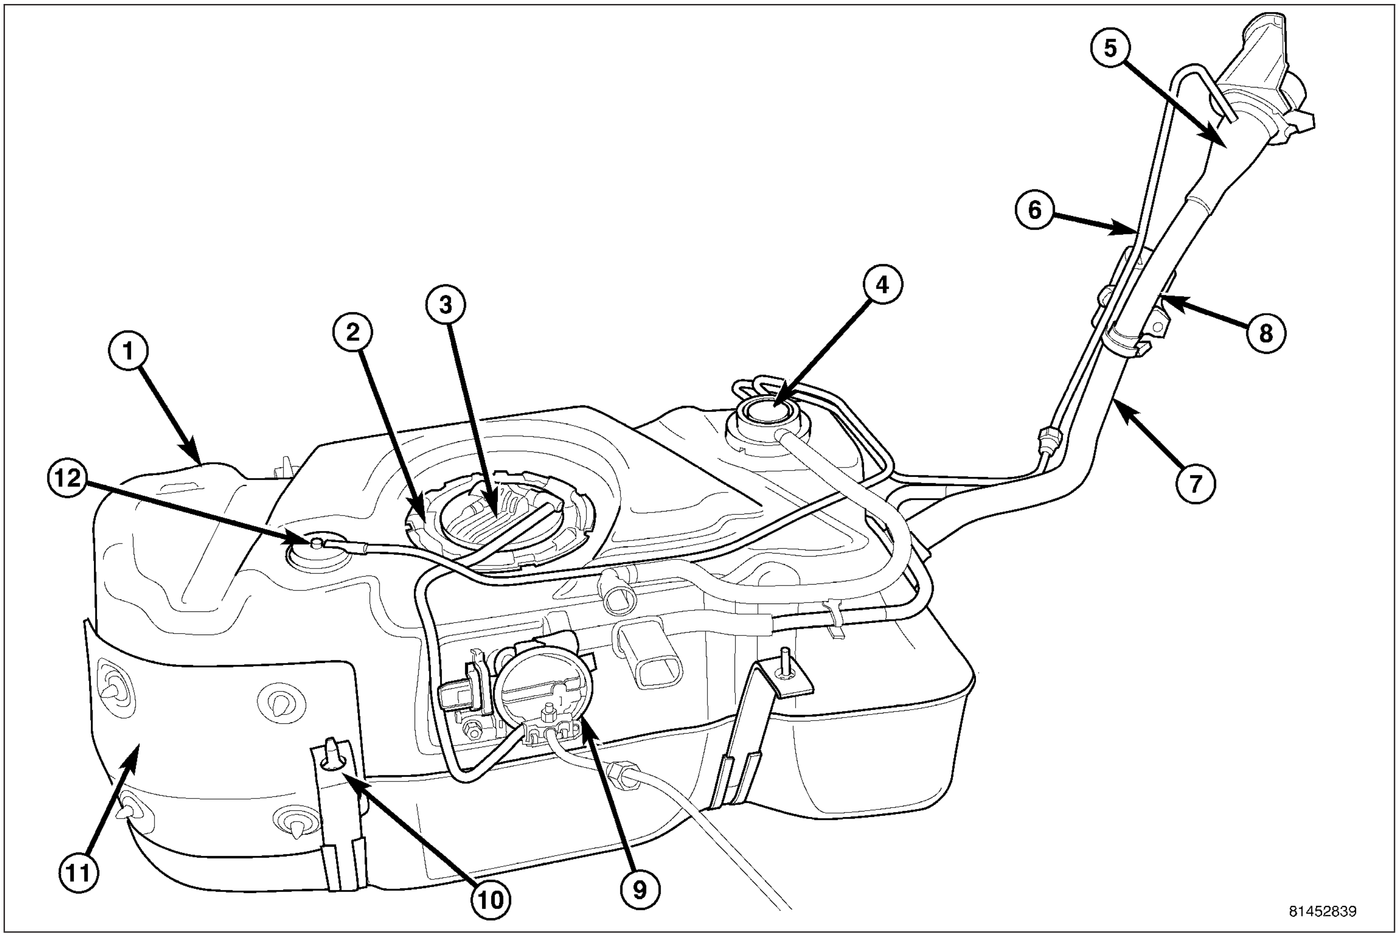
6. Unplug connector from any fuel injector.
7. Attach one end of a jumper wire with alligator clips (18 gauge or smaller) to either injector terminal.
8. Connect other end of jumper wire to positive side of battery.
9. Connect one end of a second jumper wire to remaining injector terminal.

**CAUTION: Powering an injector for more than a few seconds will permanently damage the injector.**

10. Momentarily touch other end of jumper wire to negative terminal of battery for no more than a few seconds.
11. Place a rag or towel below fuel line quick-connect fitting at fuel rail.
12. Disconnect quick-connect fitting at fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)
13. Return fuel pump relay to PDC.
14. One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB® scan tool must be used to erase a DTC.

## DRAINING FUEL TANK

**WARNING: The fuel system may be under constant fuel pressure even with the engine off. This pressure must be released before servicing fuel tank.**



Two different procedures may be used to drain fuel tank: through the fuel fill fitting on tank, or using a diagnostic scan tool.

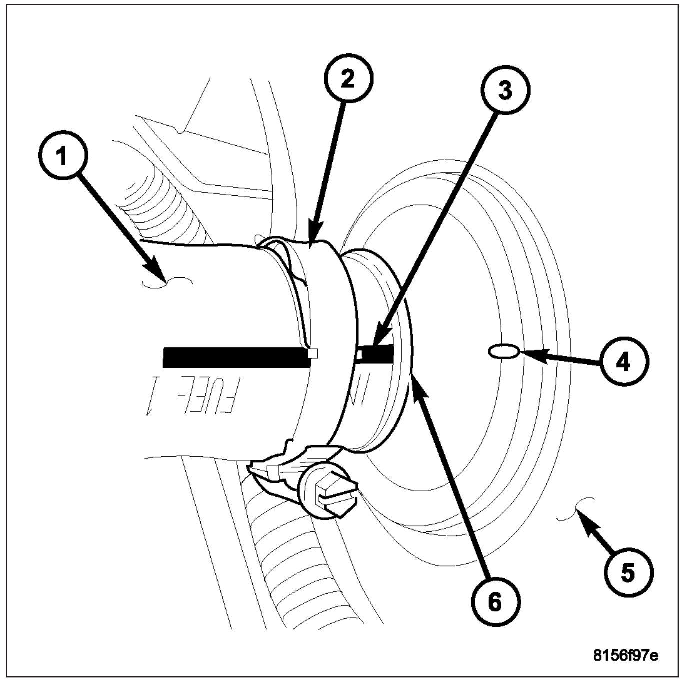
The quickest draining procedure involves removing the rubber fuel fill hose (7) from fuel tank fitting.

As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to appropriate scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE) Attach end of Fuel Pressure Test Adapter 6631 or 6539 at fuel rail disconnection (tool number 6631 is used on 5/16" fuel lines while tool number 6539 is used on 3/8" fuel lines). Position opposite end of this hose tool to an approved gasoline draining station. Activate fuel pump and drain tank until empty.

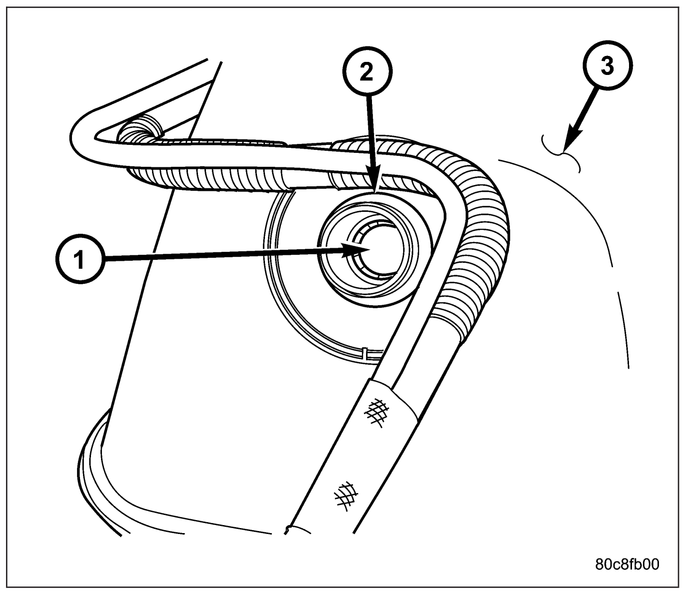
If electric fuel pump is not operating, fuel must be drained through fuel fill fitting at tank. Refer to following procedures.

1. Release fuel system pressure.
2. Raise vehicle.
3. If equipped, remove fuel tank skid plate.

4. Thoroughly clean area around fuel fill fitting (6) and rubber fuel fill hose (1) at side of fuel tank. After cleaning, loosen fuel fill hose clamp (2) at tank.
5. Before removing rubber hose (1) from fitting, note hose orientation while referring to index mark (3).



6. Disconnect rubber fuel fill hose at fuel tank fitting (2). Using an approved gas holding tank, drain fuel tank through this fitting.



## SPECIFICATIONS

## FUEL SYSTEM PRESSURE

**If equipped with NGC Powertrain Control Module using 4 electrical connectors:** The correct fuel pressure 400 kPa +/- 34 kPa (58 psi +/- 5 psi).

# VALVE-FLOW MANAGEMENT

## DESCRIPTION

The flow management valve is a part of the ORVR system. This plastic valve is placed inline between the fuel tank vent fitting and the EVAP canister. It is located on top of the fuel tank.

## OPERATION

The flow management valve is one of the components used in the ORVR system. The valve meters the flow of fuel vapors to the EVAP canister during vehicle run and refueling. Pressure from the tank during refueling opens the main port valve and allows vapors to enter the EVAP canister. During vehicle run, the vapors are metered through an orifice to the EVAP canister. It is also used as a liquid separator to keep liquid fuel out of the EVAP canister.

# FILTER-FUEL

## DESCRIPTION

The fuel filter and fuel pressure regulator are combined within the fuel pump module assembly. They are not serviceable.

# SENSOR-FUEL LEVEL SENDING UNIT

## DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor track (card).

## OPERATION

The fuel pump module has 4 different circuits (wires). Two of these circuits are used for the fuel gauge sending unit for fuel gauge operation, and for certain OBD II emission requirements. The other 2 wires are used for electric fuel pump operation.

**For Fuel Gauge Operation:** A constant current source of approximately 32 milliamps is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel pump module electrical connector unplugged). With the connectors plugged, output voltages will vary from about 0.6 volts at FULL, to about 8.6 volts at EMPTY (about 8.6 volts at EMPTY for Jeep models, and about 7.0 volts at EMPTY for Dodge Truck models).** The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

**For OBD II Emission Monitor Requirements:** The PCM will monitor the voltage output sent from the resistor track on the sending unit to indicate fuel level. The purpose of this feature is to prevent the OBD II system from recording/ setting false misfire and fuel system monitor diagnostic trouble codes. The feature is activated if the fuel level in the tank is less than approximately 15 percent of its rated capacity. If equipped with a Leak Detection Pump (EVAP system monitor), this feature will also be activated if the fuel level in the tank is more than approximately 85 percent of its rated capacity.

# LINES-FUEL

## DESCRIPTION

(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)

**WARNING: The fuel system may be under a constant pressure (even with the engine off). Before servicing any fuel system hoses, fittings, lines, or most components, fuel system pressure must be released. Refer to the fuel system pressure release procedure.**

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

**If equipped:** The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

# FITTING-QUICK CONNECT

## DESCRIPTION

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are: a single-button type, a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)

**CAUTION: Before separating a quick-connect fitting, pay attention to what type of fitting is being used by referring to Quick-Connect Fitting Removal. This will prevent unnecessary fitting or fitting latch breakage.**

**CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.**

## STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are: a single-button type, a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal.

## DISCONNECTING

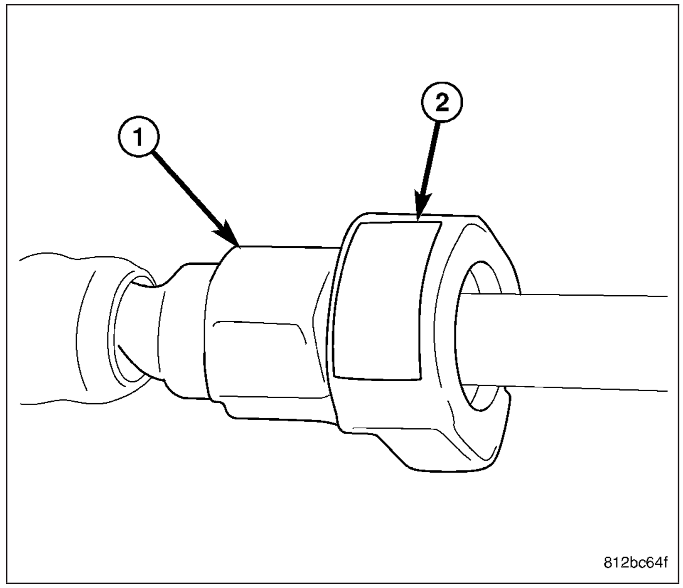
**WARNING: The fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released. Refer to fuel system pressure release procedure.**

**CAUTION: Before separating a quick-connect fitting, pay attention to what type of fitting is being used by referring to Quick-Connect Fitting Removal. This will prevent unnecessary fitting or fitting latch breakage.**

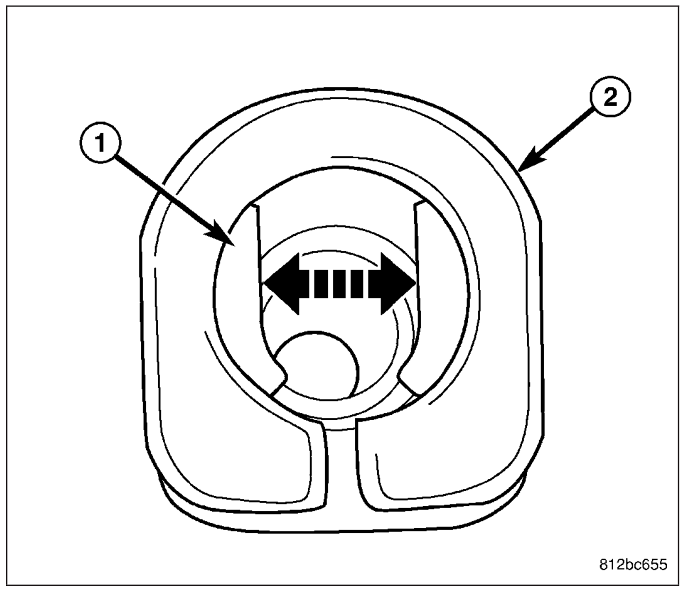
**CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.**

1. Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
2. Disconnect negative battery cable from battery.
3. Clean fitting of any foreign material before disassembly.

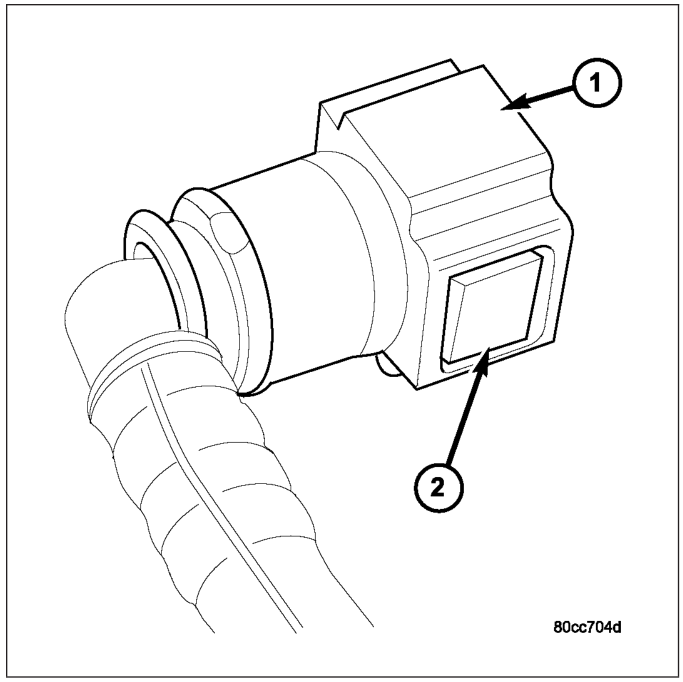
4. **Single–Button Type Fitting:** This type of fitting is equipped with a single push-button (2) located on the quick-connect fitting.



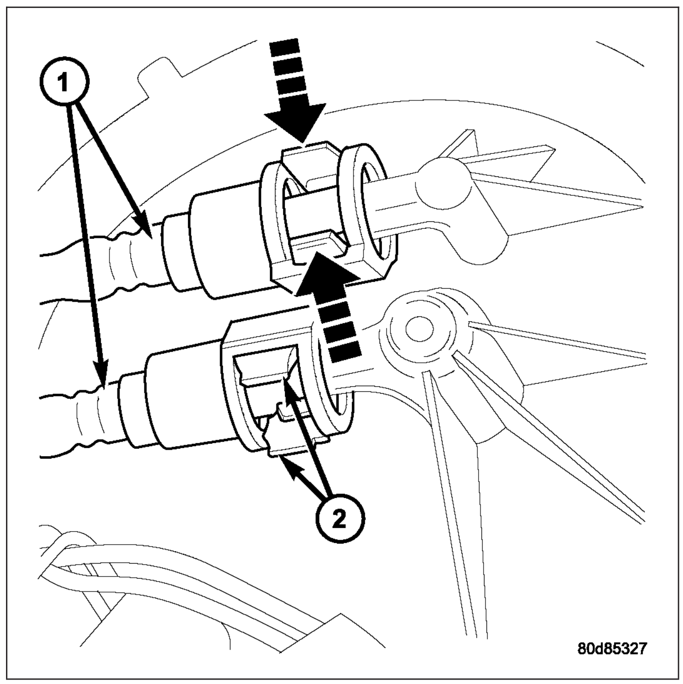
5. The push-button is attached to two internal latches (1). To disconnect, press on push-button with your thumb and unlatch fitting from fuel line. Tools are not required for disconnection. **DO NOT ATTEMPT TO PRY OR PULL UP ON PUSH-BUTTON. LATCHES WILL BE BROKEN.**



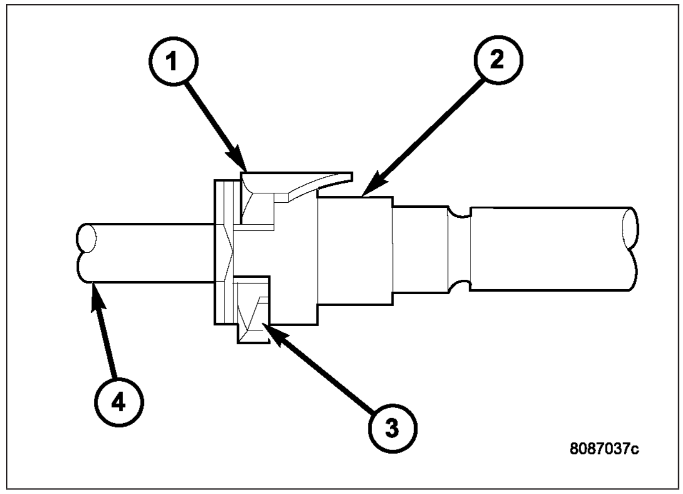
6. Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
7. Disconnect negative battery cable from battery.
8. Clean fitting of any foreign material before disassembly.
9. **2–Button Type Fitting:** This type of fitting (1) is equipped with a push-button located on each side of quick-connect fitting (2). Press on both buttons simultaneously for removal. Tools are not required for disconnection.



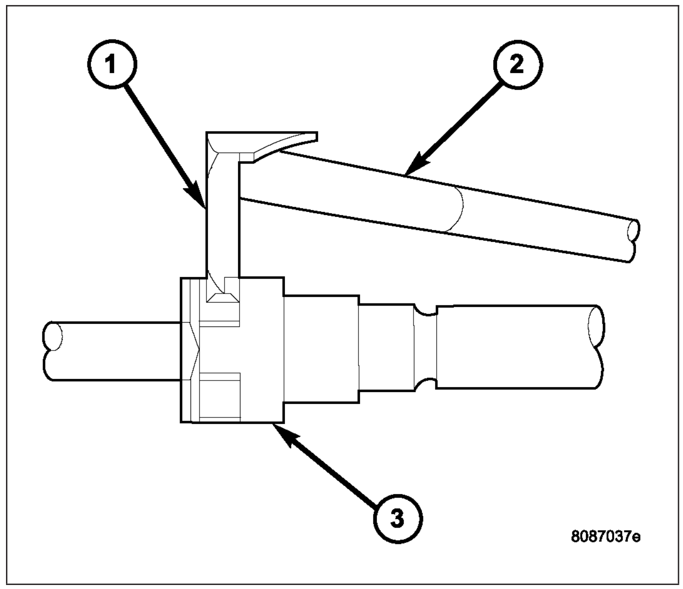
10. **Pinch-Type Fitting:** This fitting (1) is equipped with two finger tabs (2). Pinch both tabs together while removing fitting. Tools are not required for disconnection.



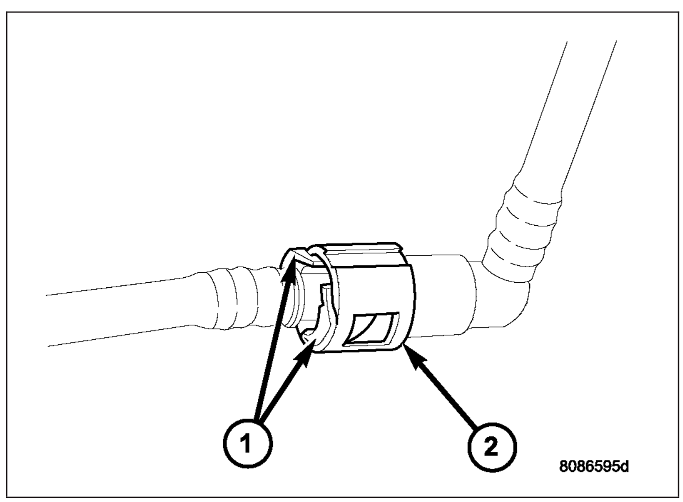
11. **Single-Tab Type Fitting:** This type of fitting (3) is equipped with a single pull tab (1). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component. Tools are not required for disconnection.



12. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**
13. While pressing release tab on side of fitting, use screwdriver (2) to pry up pull tab.
14. Raise pull tab until it separates from quick-connect fitting.



15. **Two-Tab Type Fitting:** This type of fitting (2) is equipped with tabs located on both sides of fitting (1). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.
    a. To disconnect quick-connect fitting, squeeze plastic retainer tabs (1) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.
    b. Pull fitting from fuel system component being serviced.
    c. The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.

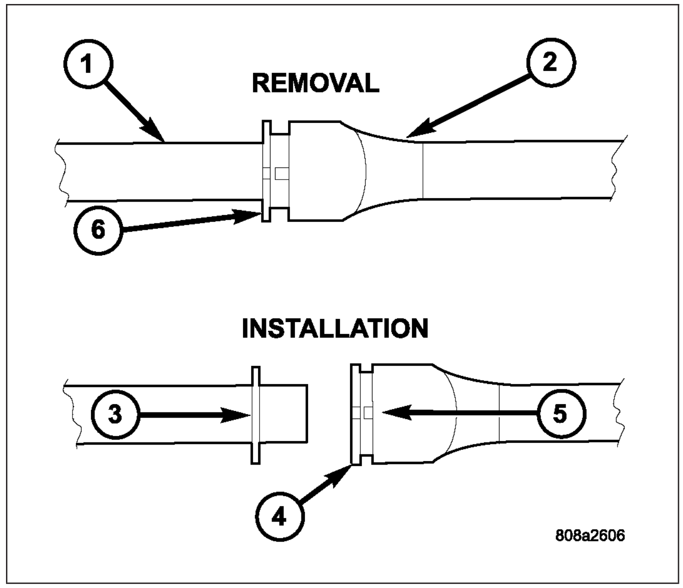


16. **Plastic Retainer Ring Type Fitting:** This type of fitting can be identified by the use of a full-round plastic retainer ring (4) usually black in color.

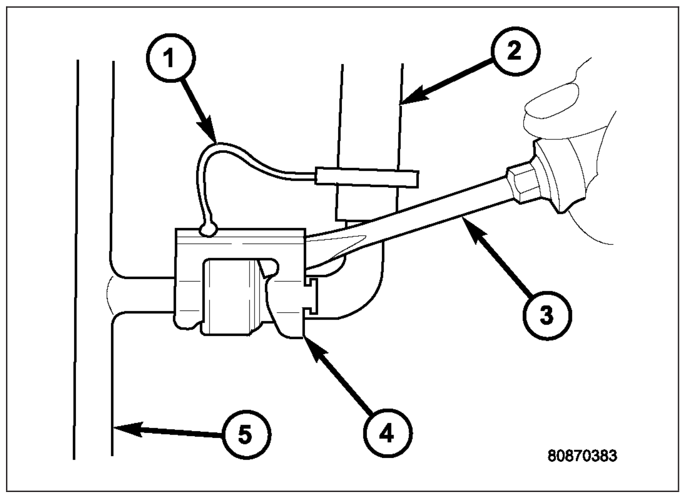
    a. To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (6). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

    b. After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

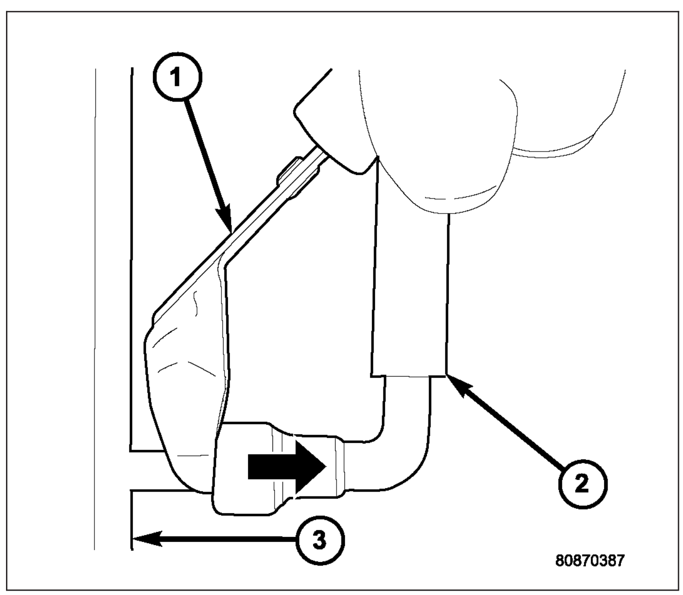
    c. Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.



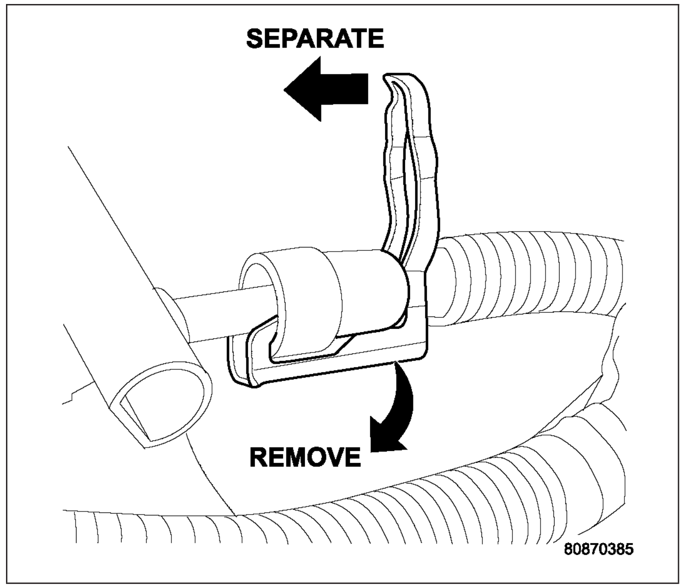
17. **Latch Clips - Type 1:** Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type-1 (4) is tethered to fuel line and type-2 is not. A tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.
18. Pry up on latch clip with a screwdriver (3).
19. Slide latch clip toward fuel rail while lifting with screwdriver.



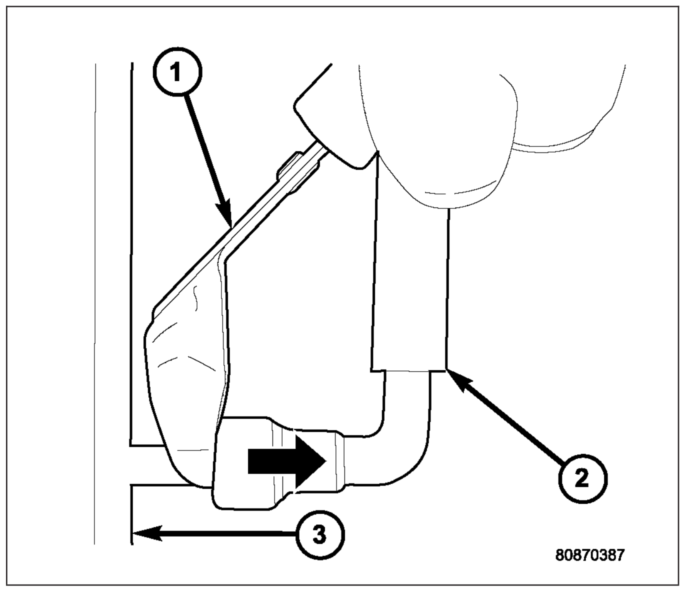
20. Insert fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (1). Use tool to release locking fingers in end of line.
21. With tool still inserted, pull fuel line from fuel rail.
22. After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.
23. Disconnect quick-connect fitting from fuel system component being serviced.



24. **Latch Clips - Type 2:** Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type-1 is tethered to fuel line and type-2 is not. A tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.
25. Type 2: Separate and unlatch 2 small arms (1) on end of clip and swing away from fuel line.
26. Slide latch clip toward fuel rail while lifting with screwdriver.



27. Insert fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (1). Use tool to release locking fingers in end of line.
28. With tool still inserted, pull fuel line from fuel rail.
29. After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.
30. Disconnect quick-connect fitting from fuel system component being serviced.

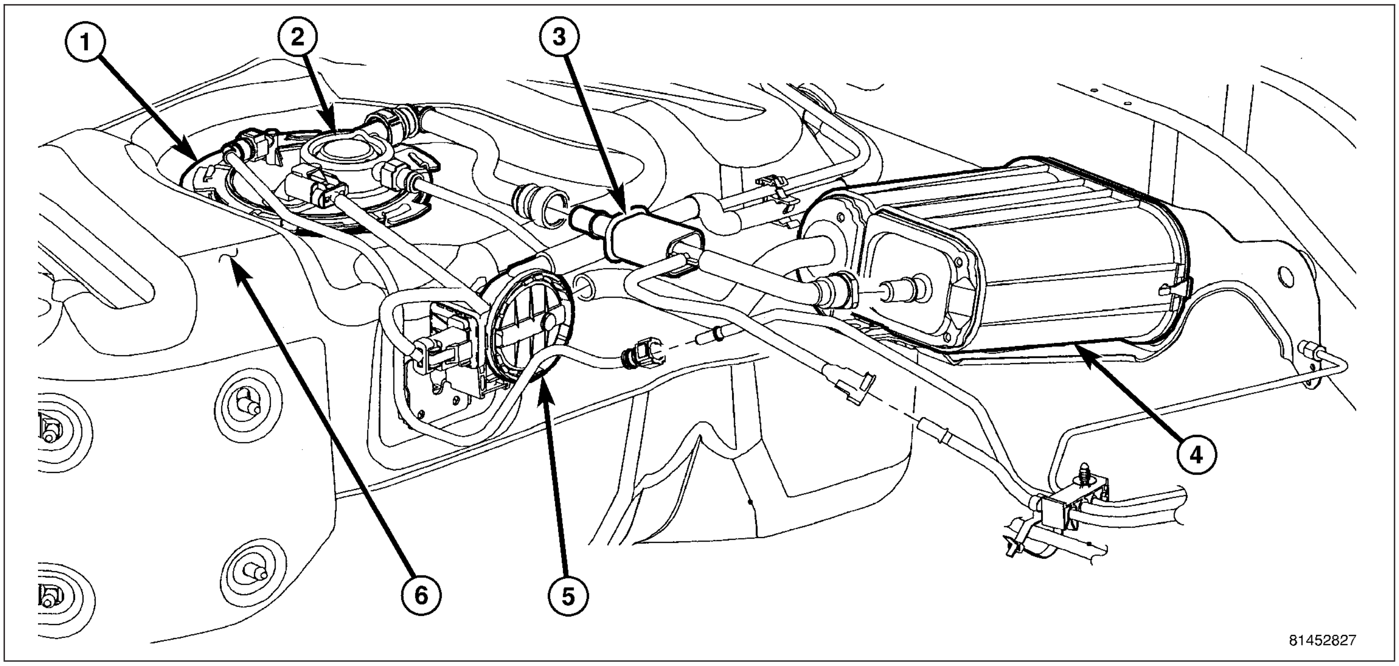


## CONNECTING

1. Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.
2. Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.
4. Continue pushing until a click is felt.
5. Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.
6. Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).
7. Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**
8. Connect negative cable to battery.
9. Start engine and check for leaks.

# REGULATOR-FUEL PRESSURE

## DESCRIPTION



The fuel pressure regulator is located on the top of the fuel pump module assembly (2) , and is non-serviceable.

## OPERATION

The fuel pressure regulator is a mechanical device that is not controlled by engine vacuum or the Powertrain Control Module (PCM).

**JTEC Powertrain Control Module:** The regulator is calibrated to maintain fuel system operating pressure of approximately 339 kPa +/- 34 kPa (49.2 psi +/- 5 psi) at the fuel injectors if equipped with a JTEC powertrain control module. **NGC powertrain control module:** The regulator is calibrated to maintain fuel system operating pressure of approximately 400 kPa +/- 34 kPa (58 psi +/- 2 psi) at the fuel injectors if equipped with an NGC powertrain control module. The regulator contains a diaphragm, calibrated springs and a fuel return valve.

**Fuel Flow:** Fuel migrates into the fuel pump module reservoir through a one-way check valve located on the bottom of the module. This check valve prevents the reservoir from running empty such as when going up or down hills with a low amount of fuel in the tank. If fuel pressure at the pressure regulator exceeds approximately 49 psi (JTEC module) or 58psi (NGC module), an internal diaphragm within the regulator closes, and excess fuel is routed through a second fitting on the main fuel filter, and back into the fuel tank (the fuel pressure regulator is installed into the return side of the system). Pressure regulated fuel is then delivered from the third fitting on the fuel filter, up to and through the fuel rail, and on to the fuel injectors.

The fuel pressure regulator also acts as a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine. A second check valve is located at the outlet of the fuel pump module housing.

A separate fuel return line from the engine is not used with this system.

# PUMP-FUEL

## DESCRIPTION

The electric fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump. The electric fuel pump is not a separate, serviceable component.

## OPERATION

Voltage to operate the electric pump is supplied through the fuel pump relay.

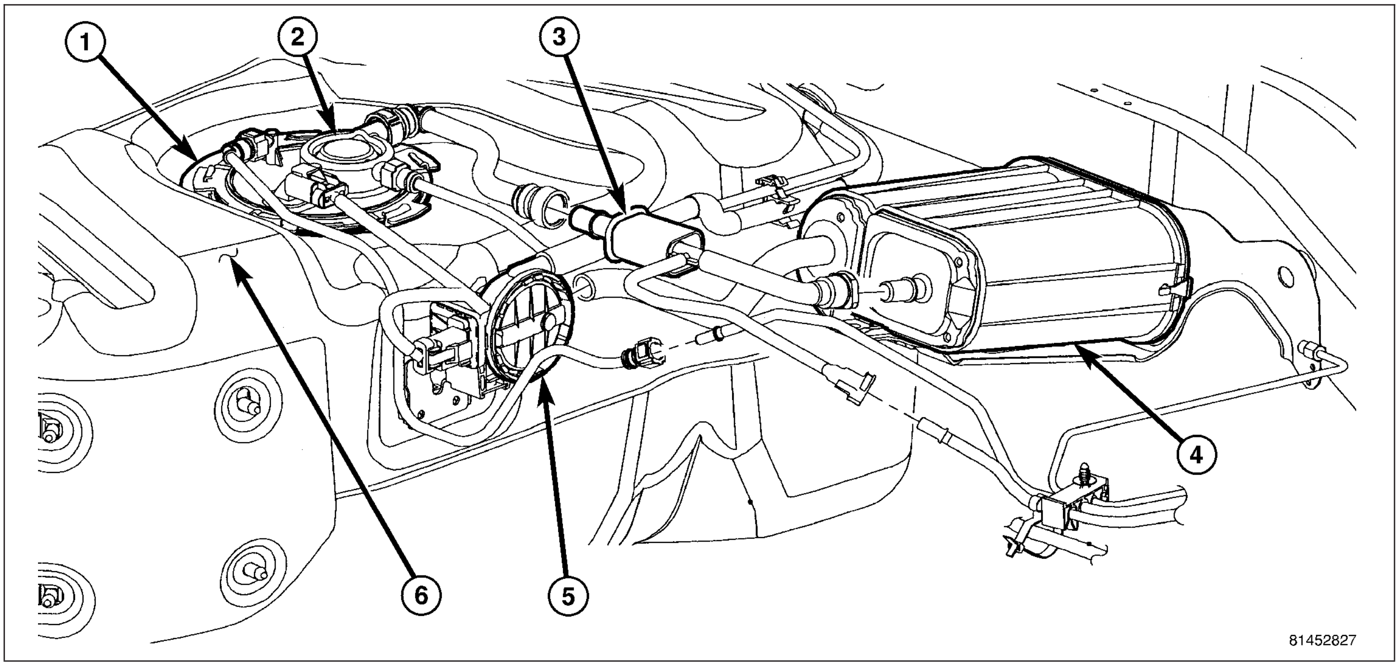
Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

**Check Valve Operation:** The fuel pump module contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.**

The electric fuel pump is not a separate, serviceable component.

# MODULE-FUEL PUMP

## DESCRIPTION



The fuel pump module assembly (2) is located on top of the fuel tank. The complete assembly contains the following components:

- A fuel pressure regulator
- A built-in primary fuel filter
- A separate fuel pick-up, or inlet filter
- An electric fuel pump
- A lockring to retain pump module to tank
- A soft gasket between tank flange and module
- A fuel gauge sending unit (fuel level sensor)
- A fuel line connection

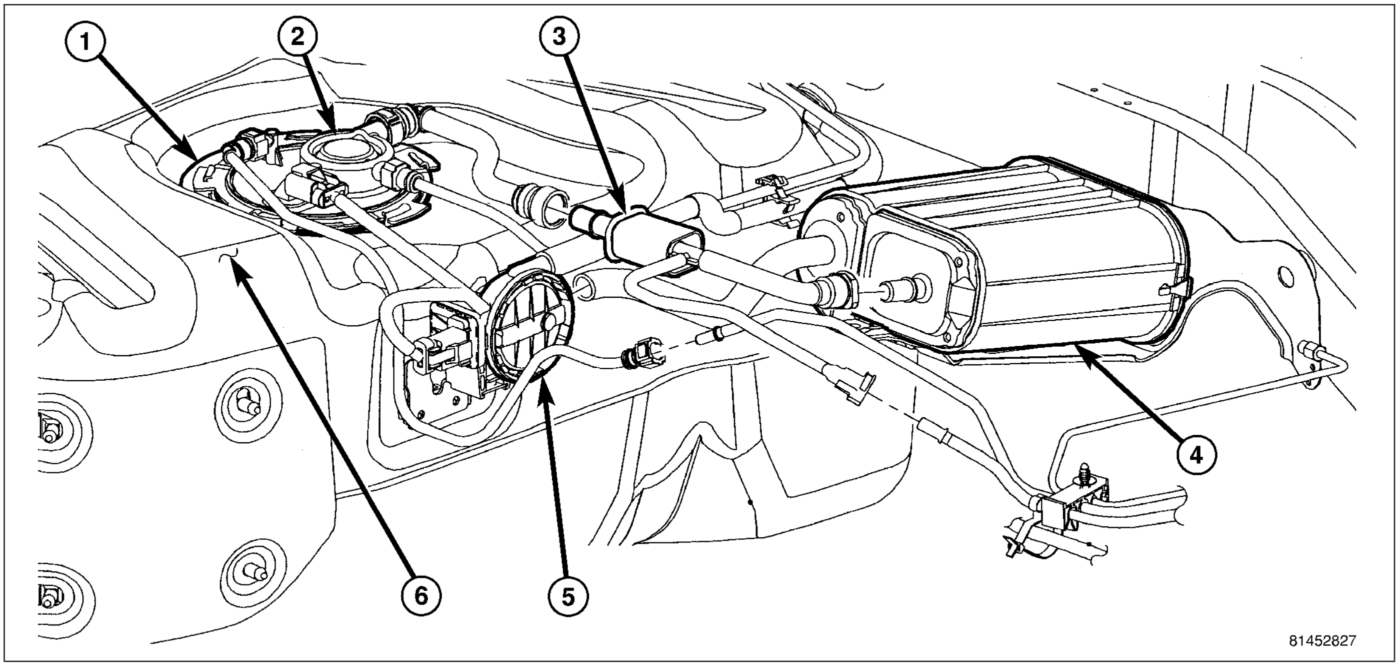
If the electrical fuel pump, primary inlet filter or fuel pressure regulator require service, the fuel pump module must be replaced.

## OPERATION

Refer to Fuel Pump, Inlet Filter, Fuel Pressure Regulator and Fuel Gauge Sending Unit.

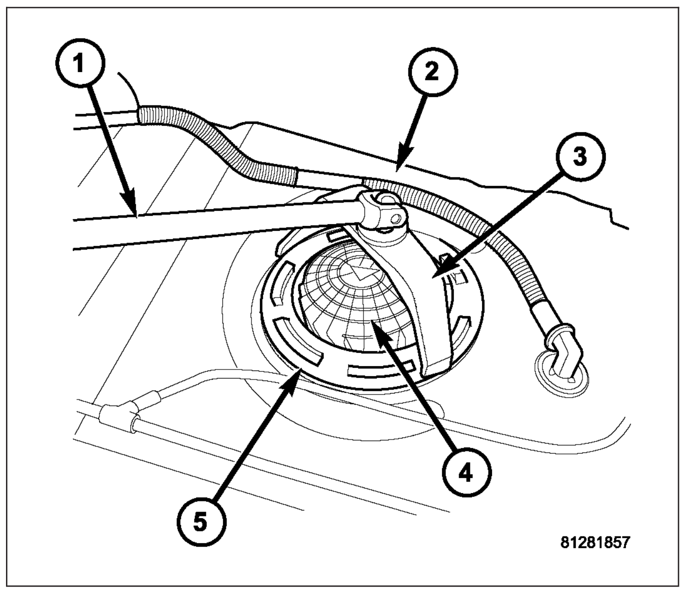
## REMOVAL

**WARNING: The fuel system may be under a constant pressure (even with the engine off). Before servicing the fuel pump module, the fuel system pressure must be released.**



The fuel pump module (2) and pump module lock ring (1) are located on the top of the fuel tank.

**A typical fuel pump module is displayed in the graphic.**

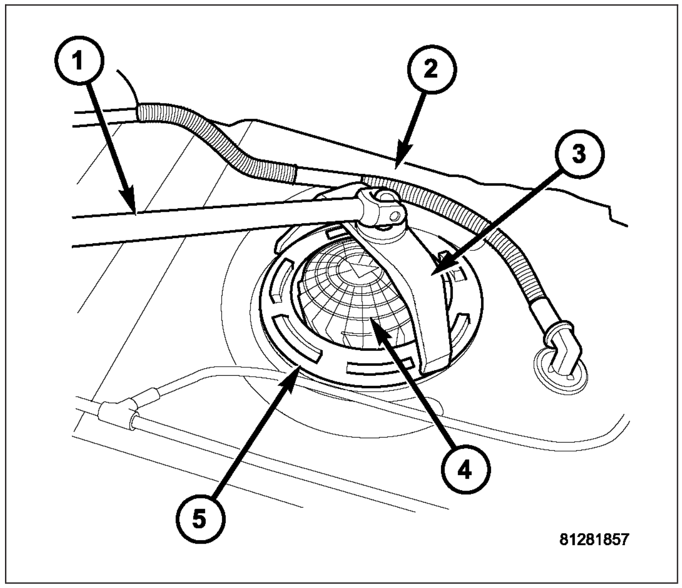


1. Drain and remove fuel tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL)
2. Note rotational position of module before attempting removal. An indexing arrow is located on top of module for this purpose.
3. Position Lockring Remover/Installer 9340 (3) into notches on outside edge of lockring (5).
4. Install 1/2 inch drive breaker bar (1) to Lockring Remover/Installer 9340 (3).
5. Rotate breaker bar counterclockwise to remove lockring (5).
6. Remove lockring. The module will spring up slightly when lockring is removed.
7. Remove module from fuel tank. Be careful not to bend float arm while removing.

## INSTALLATION

**A typical fuel pump module is displayed in the graphic.**

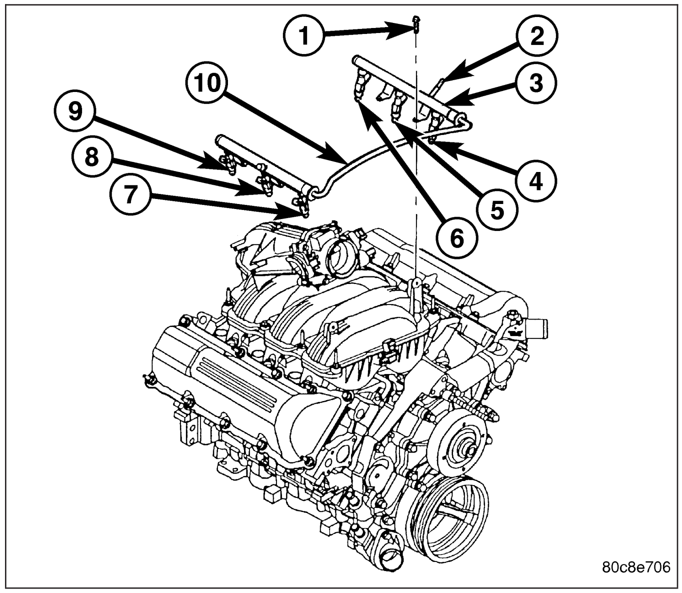
1. Using a new seal (gasket), position fuel pump module into opening in fuel tank.
2. Position lockring (5) over top of fuel pump module.
3. Rotate module until embossed alignment arrow points to center alignment mark. This step must be performed to prevent float from contacting side of fuel tank.
4. Install Lockring Remover/Installer 9340 (3) to lockring.
5. Install 1/2 inch drive breaker (1) into Lockring Remover/Installer 9340 (3).
6. Tighten lockring (clockwise) until all seven notches have engaged.
7. Install fuel tank. (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY/FUEL TANK - INSTALLATION)



# RAIL-FUEL

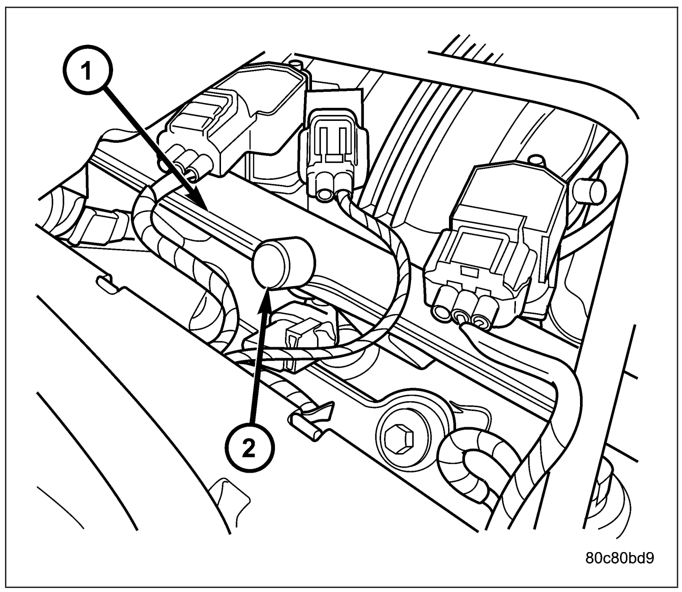
## DESCRIPTION

The fuel injector rail (3) is mounted to the intake manifold. It is used to mount the fuel injectors to the engine. The rail is equipped with a test port to check/test fuel system pressure.



The rail is equipped with a test port (2) to check/test fuel system pressure.

A fuel rail mounted, fuel damper is not used with this engine.



## OPERATION

High pressure fuel from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

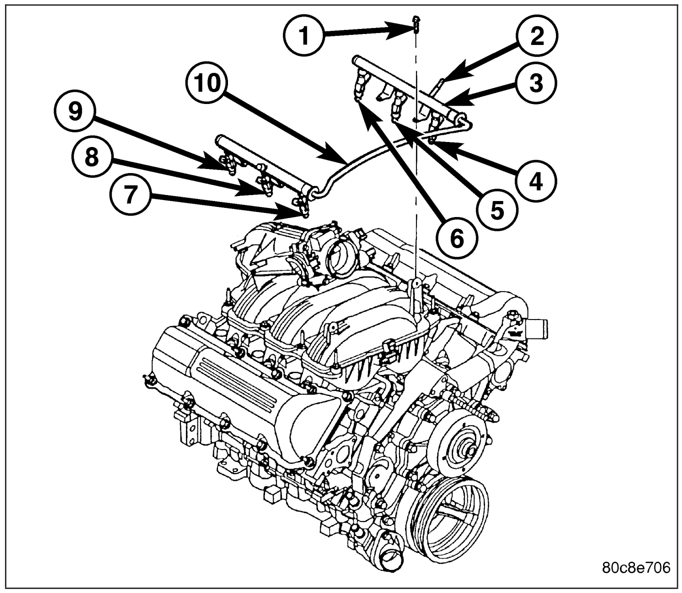
A quick-connect fitting with a safety latch is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

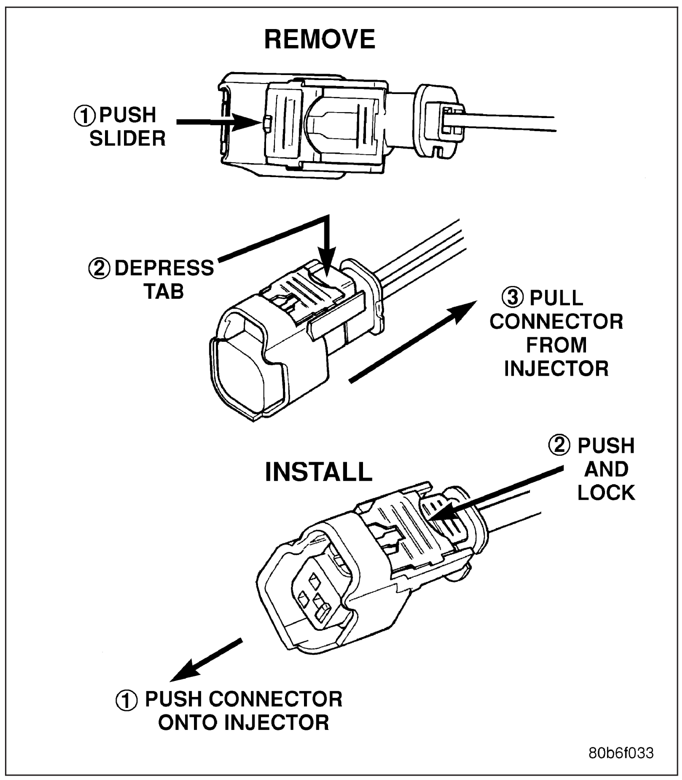
## REMOVAL

**WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel rail, fuel system pressure must be released.**

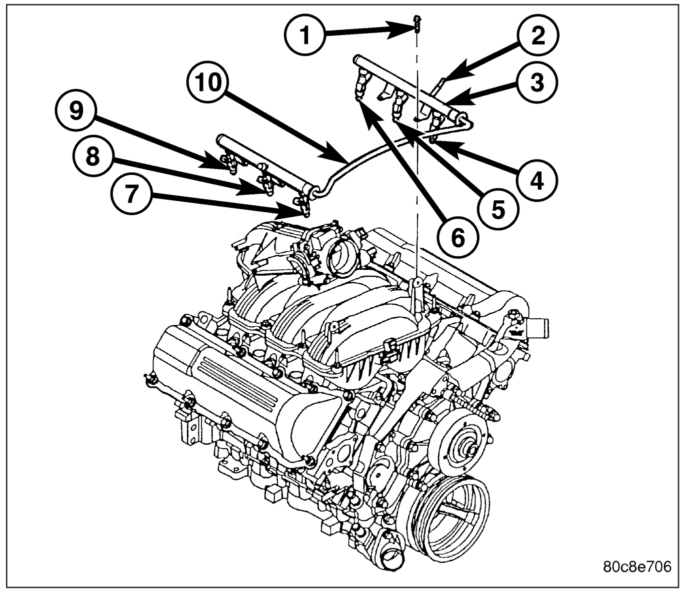
**CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate rail halves at connector tube (10). Due to design of tube, it does not use any clamps. Never attempt to install a clamping device of any kind to tube. When removing fuel rail assembly for any reason, be careful not to bend or kink tube.**



1. Remove fuel tank filler tube cap.
2. Perform Fuel System Pressure Release Procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
3. Remove negative battery cable at battery.
4. Remove air duct at throttle body air box.
5. Remove air box at throttle body.
6. Disconnect fuel line latch clip and fuel line at fuel rail. A special tool will be necessary for fuel line disconnection. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)
7. Remove necessary vacuum lines at throttle body.
8. Disconnect electrical connectors at all 6 fuel injectors. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.
9. Disconnect electrical connectors at throttle body sensors.
10. Remove 6 ignition coils. (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - REMOVAL)

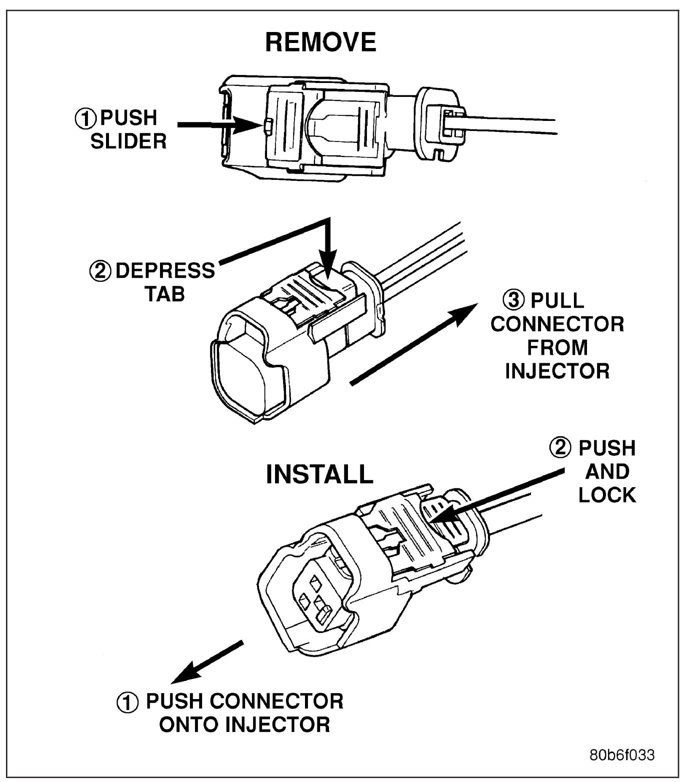


11. Remove four fuel rail mounting bolts (1).
12. Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in cylinder head. Gently rock and pull **right** side of rail until injectors just start to clear cylinder head holes. Repeat this procedure (left/right) until all injectors have cleared cylinder head holes.
13. Remove fuel rail (with injectors attached) from engine.
14. If fuel injectors are to be removed, (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL) .



## INSTALLATION

1. If fuel injectors are to be installed, (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).
2. Clean out fuel injector machined bores in intake manifold.
3. Apply a small amount of engine oil to each fuel injector O-ring. This will help in fuel rail installation.
4. Position fuel rail/fuel injector assembly to machined injector openings in cylinder head.
5. Guide each injector into cylinder head. Be careful not to tear injector O-rings.
6. Push **right** side of fuel rail down until fuel injectors have bottomed on cylinder head shoulder. Push **left** fuel rail down until injectors have bottomed on cylinder head shoulder.
7. Install 4 fuel rail mounting bolts and tighten to 11 N·m (100 in. lbs).
8. Install 6 ignition coils. (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - INSTALLATION)
9. Connect electrical connectors to throttle body.
10. Connect electrical connectors at all fuel injectors. Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.
11. Connect necessary vacuum lines to throttle body.
12. Connect fuel line latch clip and fuel line to fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE)
13. Install air box to throttle body.
14. Install air duct to air box.
15. Connect battery cable to battery.
16. Start engine and check for leaks.



# TANK - FUEL

## DESCRIPTION

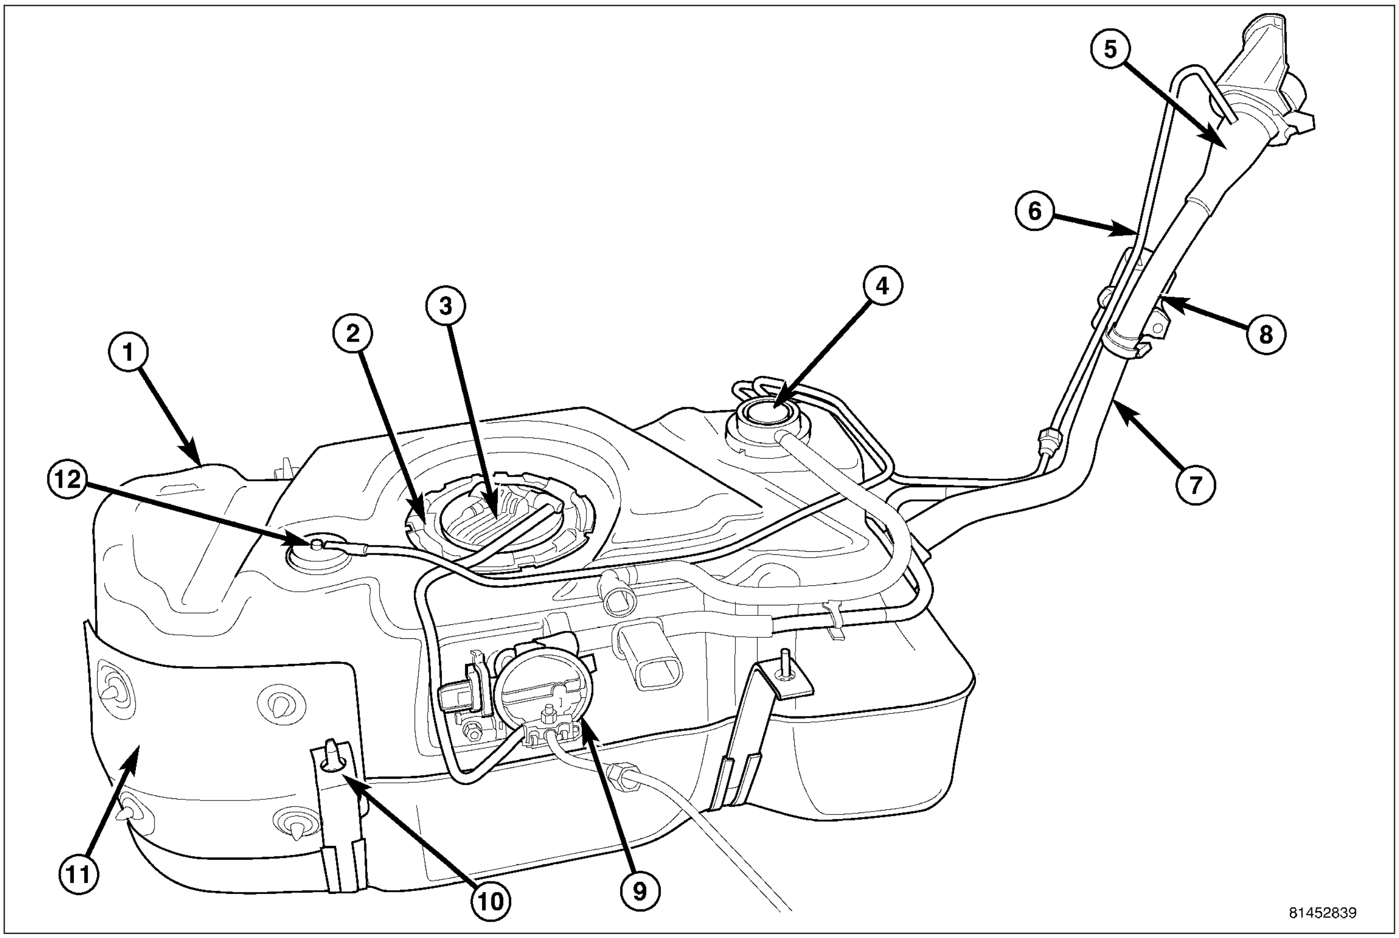
The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module, and certain ORVR components.

## OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

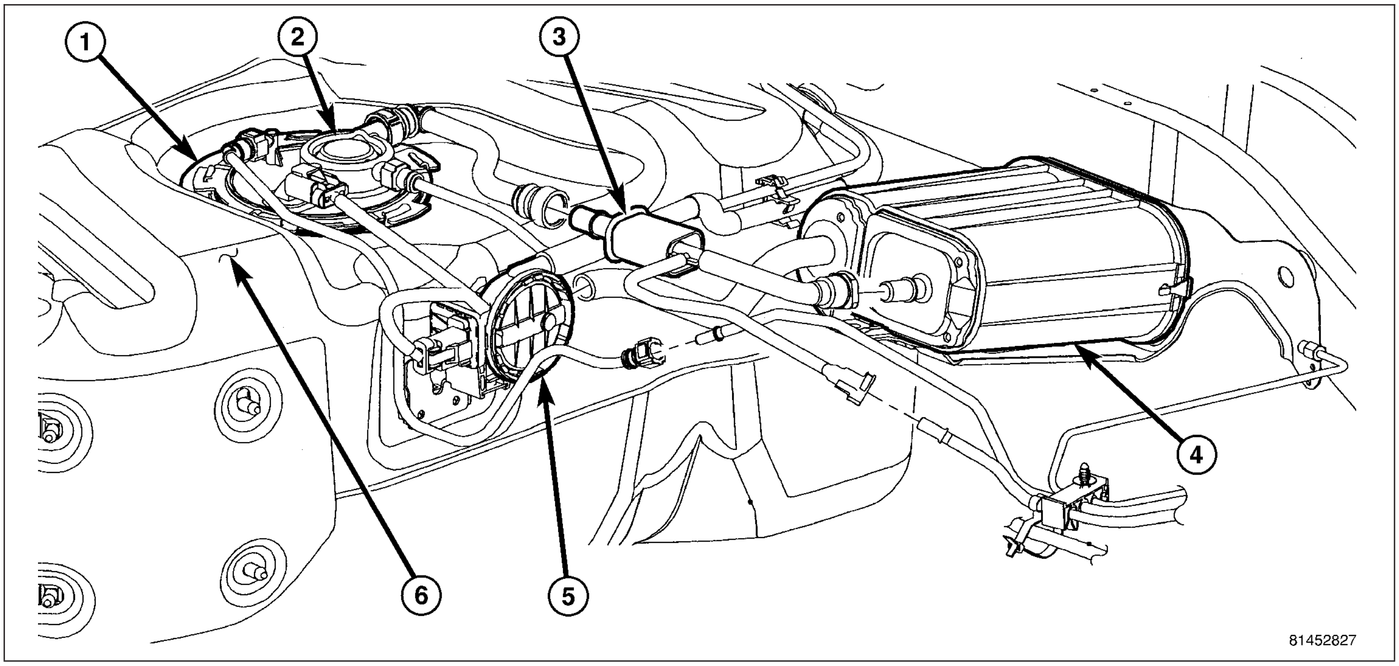
An evaporation control system is connected to the fuel tank to reduce emissions of fuel vapors into the atmosphere. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. Certain models are also equipped with a self-diagnosing system using either an NVLD pump, or a Leak Detection Pump (LDP) and/or an ORVR system.

## REMOVAL



1. Release fuel system pressure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
2. Drain fuel tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
3. If equipped, remove fuel tank skid plate and tow hooks. Certain equipment packages will also require removal of the trailer hitch.
4. Disconnect and separate fresh air tube (6) quick-connect fitting.
5. Disconnect air tubes at front of NVLD pump (9).
6. Disconnect NVLD pump (9) electrical connector.
7. Disconnect fuel pump module electrical connector jumper. This is located near front of fuel tank.
8. Support tank with a hydraulic jack.

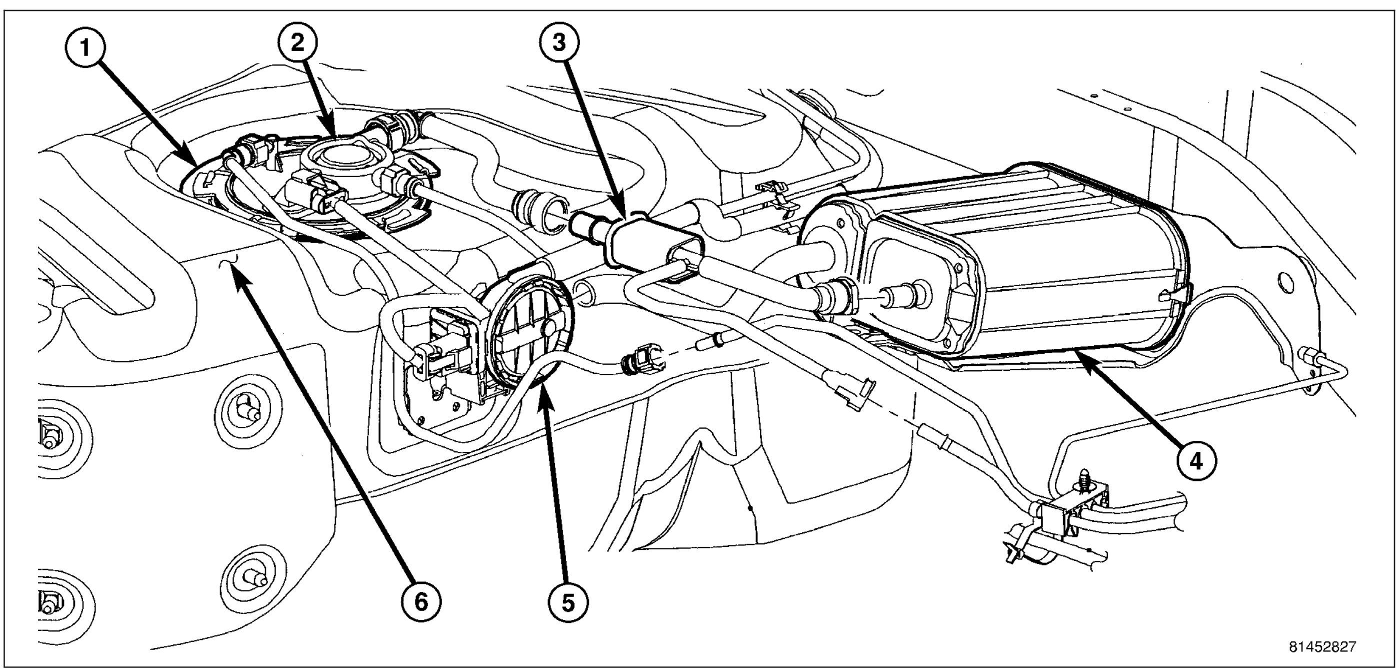
9. Remove four fuel tank strap bolts (10) (2 at front of tank; 2 at rear of tank), and remove both tank support straps.
10. Carefully lower tank a few inches.



11. Continue lowering tank while guiding remaining hoses and lines through plastic isolator sleeve (3).
12. If fuel tank is to be replaced, remove NVLD pump and fuel pump module from tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL PUMP MODULE - REMOVAL)

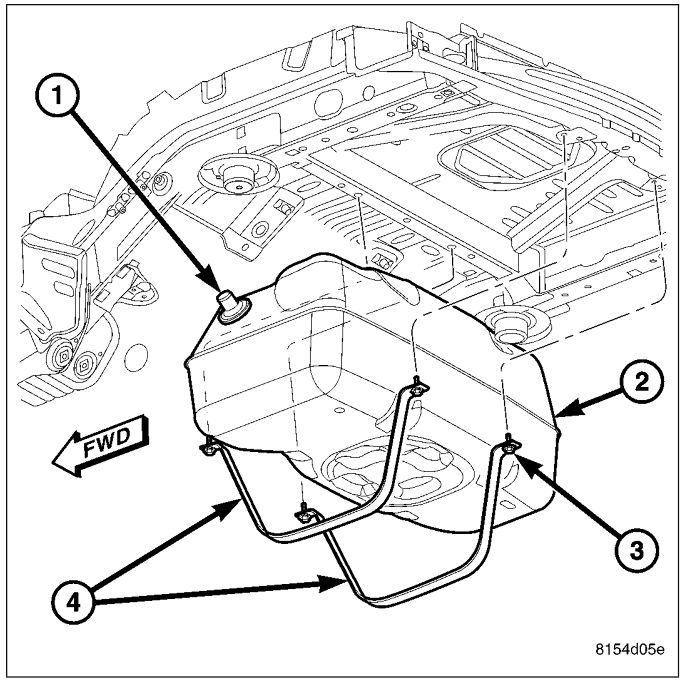
## INSTALLATION

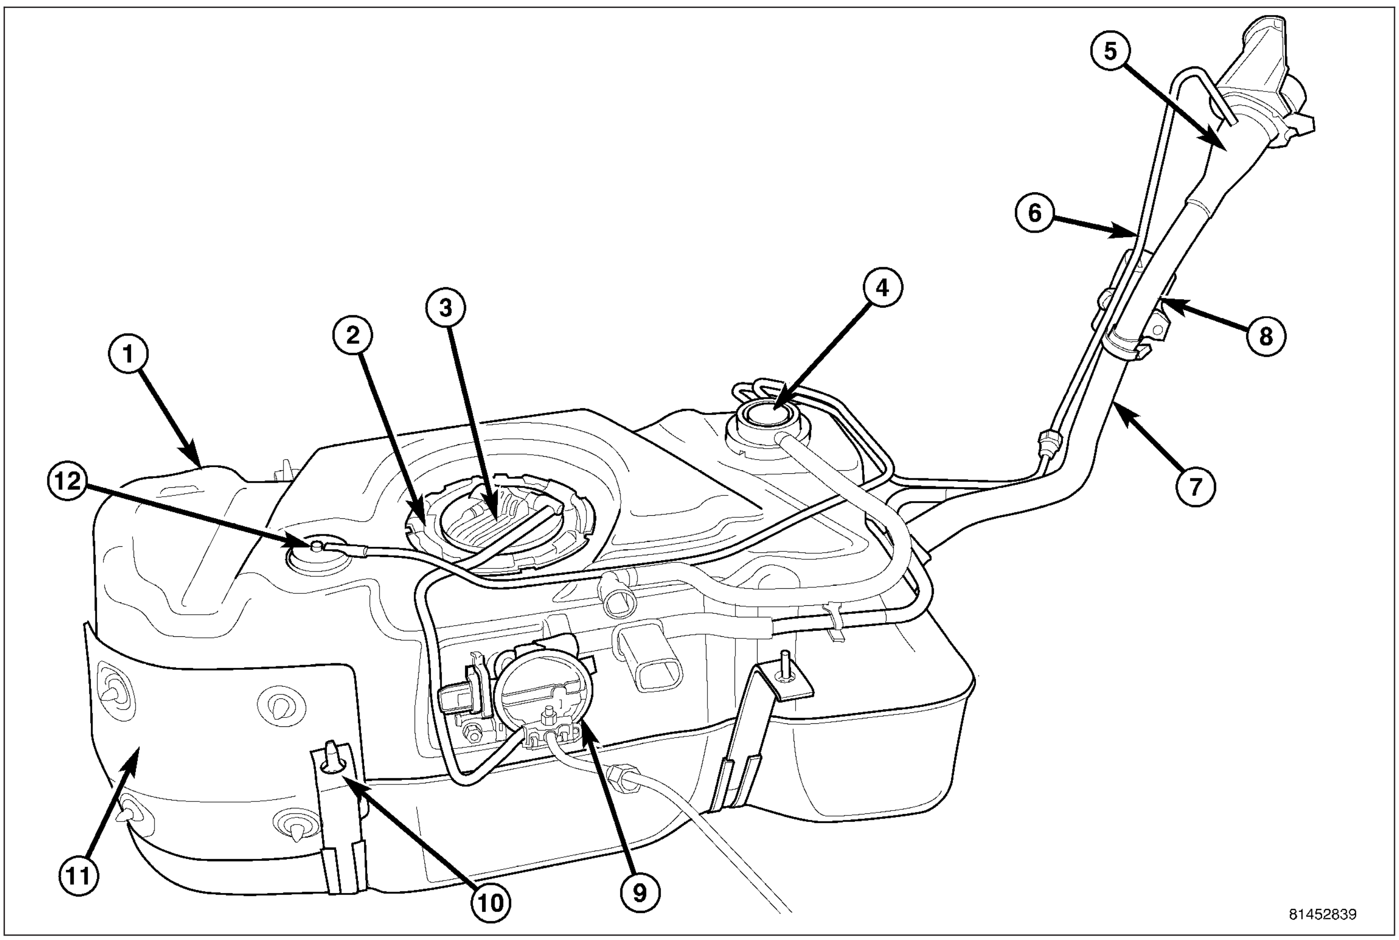
1. If fuel tank is to be replaced, install NVLD pump and fuel pump module to tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL PUMP MODULE - INSTALLATION)
2. Position fuel tank to hydraulic jack.



3. Raise tank while carefully guiding vent tubes/hoses through isolator sleeve (3) and crossmember.
4. Continue raising tank until positioned to body.

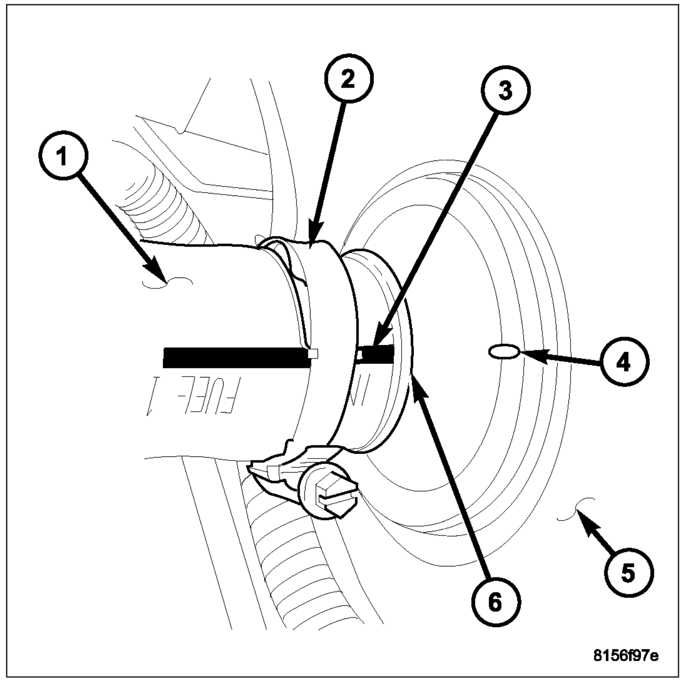
5. Attach two fuel tank mounting straps (4) and four mounting bolts (3). Tighten bolts to 61 N·m (45 ft. lbs.) torque.





6. Connect electrical connector to NVLD pump (9).
7. Connect fresh air (6) and recirculation lines to fuel fill tube.
8. Connect electrical connector to fuel pump module.
9. Connect fuel line quick-connect fitting.

10. Install fuel fill hose and hose clamp to fuel tank fitting. Rotate hose until white painted index mark (3) on hose is located at alignment notch (4) on fuel tank fitting. Tighten clamp to 3.4 N·m (30 in. lbs.) torque.
11. If equipped, install fuel tank skid plate, trailer hitch and tow hooks.
12. Lower vehicle.
13. Connect negative battery cable to battery.
14. Fill fuel tank with fuel.
15. Start engine and check for fuel leaks.



# FUEL DELIVERY - 2.8L DIESEL

## TABLE OF CONTENTS

# FUEL DELIVERY - 2.8L DIESEL

## DESCRIPTION - DIESEL FUEL DELIVERY SYSTEM

The fuel system on the 2.8L Common Rail Diesel Engine uses a fuel injection pump and an Electronic Control Module (ECM).

The fuel delivery system consists of the:

- Accelerator pedal
- Air cleaner housing/element
- Fuel filter/water separator
- Fuel temperature sensor
- Fuel heater
- Fuel rail solenoid
- Fuel rail pressure sensor
- Fuel injection pump
- Fuel injectors
- Fuel tank
- Fuel tank filler/vent tube assembly
- Fuel tank filler tube cap
- Fuel tank module containing the roll over valve and a fuel gauge sending unit (fuel level sensor).
- Fuel tubes/lines/hoses
- High-pressure fuel injector lines
- Low-pressure fuel supply and return lines
- Low-pressure fuel return line
- Overflow valve
- Quantity control valve
- Quick-connect fittings
- Water draining

## WARNING - HIGH FUEL SYSTEM PRESSURE

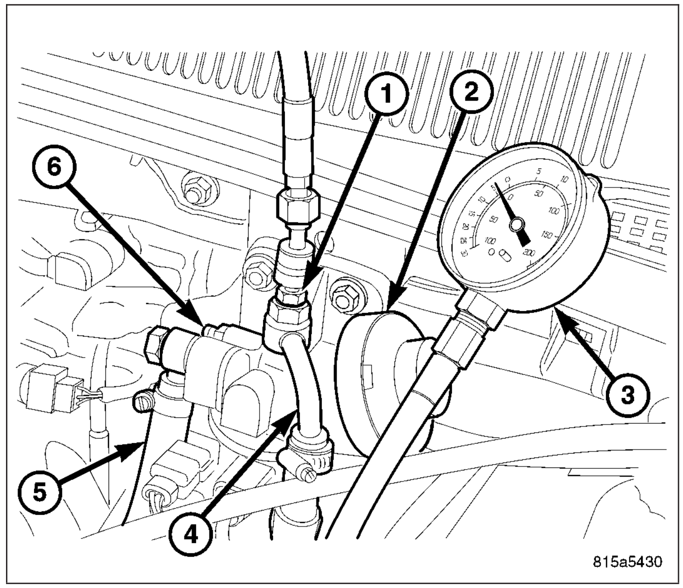
**WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This maybe as high as 1600bar (23,200psi). Use extreme caution when inspecting for high-pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

## DIAGNOSIS AND TESTING

## FUEL SYSTEM SUPPLY

**NOTE: The gear rotor pump in the back of the high pressure pump, draws fuel from the tank, through the filter, to the back of the high pressure pump. The gear rotor pump is capable of drawing up to 20 in. of vacuum, depending on cranking speed. A specification of under 3 in. of vacuum reveals the high pressure pump suspect if there is no air intrusion into the fuel system.**

**NOTE: There can not be any visible signs of fuel leakage at the filter outlet line or fitting during testing. If a fuel leak is detected, STOP testing, remove special tool fitting #9745, and replace both fuel outlet line washer seals.**



Test Set Up Assumptions for this test are that the fuel gauge is operating properly and that there is know good fuel in the fuel tank.

- Disconnect the camshaft position sensor to prevent the vehicle from starting.
- Remove the fuel filter outlet line and install special tool fitting #9745.
- Connect vacuum and pressure gauge # 6828 to the #9745 fitting.
- Re-prime the fuel system to remove all air (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
- Restrict the inlet side of the fuel filter by clamping the inlet hose close to the filter assembly.
- Crank the engine 3–4 times in 10 seconds intervals while monitoring the gauge.

Results The supply pump should draw at least 3 in. of vacuum. If the supply pump was unable to reach 3 in. of vacuum, replace the high pressure pump (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - REMOVAL).

If the pump was able to reach 3 in. of vacuum, continue with this test.

Pressure Test This test will check the ability of the fuel system to hold pressure.

- Reconnect the camshaft position sensor.
- Remove the clamping pliers from the fuel inlet hose.
- Pump the hand primer until 10 psi. is obtained on the pressure side of the gauge.

Will the engine start ?

Results If the engine starts, refer to the fuel filter restriction test (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

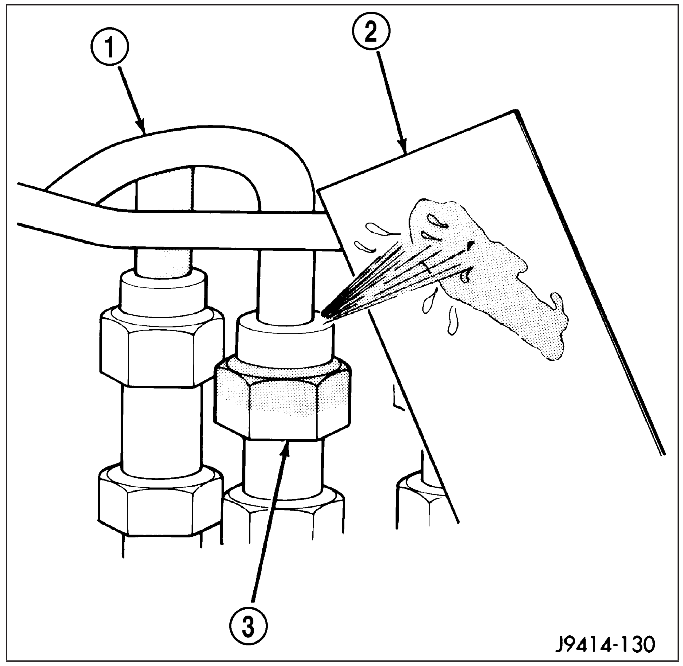
If you were able to obtain 10 psi. with the hand primer, refer to the Crank No Start Chart in the Diagnostics manual. If you were unable to obtain 10 psi. with the hand primer, check fuel supply from tank to filter assembly. If the fuel supply is OK, replace the fuel primer/filter assembly (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL FILTER / WATER SEPARATOR - REMOVAL).

## HIGH PRESSURE FUEL LEAKS

**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

High-pressure fuel leaks can cause starting problems and poor engine performance.

Carefully place a piece of cardboard over the high-pressure fuel lines or suspected area. Move your body and hands away from the area. Start the engine and run till warm. **TURN THE ENGINE OFF**. Inspect the piece of card board for witness marks.. If a high-pressure line connection is leaking, replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.



**CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.**

## AIR IN FUEL SYSTEM

Air will enter the fuel system whenever fuel supply lines, separator filters, injection pump, high-pressure lines or injectors are removed or disconnected. Air trapped in the fuel system can result in hard starting, a rough running engine, engine misfire, low power, excessive smoke and fuel knock.

Inspect the fuel system from the fuel tank to the injectors for loose connections (Refer to 14 - FUEL SYSTEM - WARNING). Leaking fuel is an indicator of loose connections or defective seals. Air can also enter the fuel system between the fuel tank and the fuel filter. Inspect the fuel tank and fuel lines for damage that might allow air into the system.

Trapped air or leaking lines may also be identified by placing a clear piece of fuel line between the fuel supply hose to the filter and the fuel supply hose to the high pressure pump. If a steady stream of large air bubbles are visible in the clear hose while the engine is cranking or running the air intrusion is occurring before the high pressure pump.

With the scan tool connected to the vehicle, select Engine and then select Sensor Display. Page down to view Fuel Pressure Set Point and Actual Fuel Pressure. Start the engine and observe the Fuel Pressure Set Point and the Actual Fuel Pressure. If the Actual Fuel Pressure Oscillates above and below the Fuel Pressure Set Point in a regular cycle, inspect the fuel system for air intrusion.

If the Actual Fuel Pressure gradually drops below the Fuel Pressure Set Point then spikes well above the Fuel Pressure Set Point, replace the fuel rail pressure solenoid (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL PRESSURE SOLENOID - REMOVAL).

## FUEL SUPPLY RESTRICTIONS

### LOW-PRESSURE LINES

Fuel supply line restrictions or a restricted fuel filter can cause starting problems and prevent engine from accelerating. The starting problems include; no start, longer cranking times, low power and/or white fog like exhaust.

Inspect all fuel supply lines for restrictions or blockage, including the fuel filter. Flush or replace as necessary.

## HIGH-PRESSURE LINES

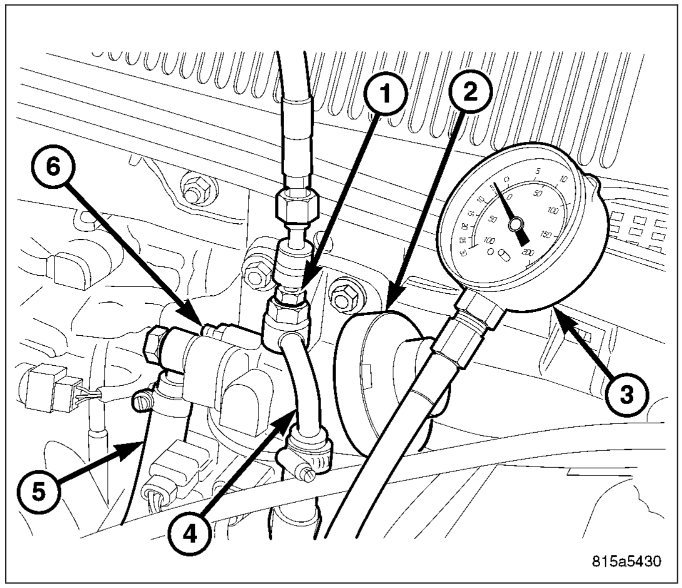
**CAUTION: High pressure lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. High pressure lines can be reused only after close inspection for cracks or deformation around the sealing cone. Corroded pipes must be replaced. Use only recommended lines when replacement of high-pressure fuel line is necessary.**

Restricted (kinked or bent) high-pressure lines can cause starting problems, poor engine performance, engine misfire and white smoke from exhaust (Refer to 14 - FUEL SYSTEM - WARNING).

# FUEL FILTER

Refer to the maintenance schedules for the recommended fuel filter replacement intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

The gear supply pump located in the back of the high pressure pump draws fuel from the fuel tank, through the fuel filter and into the high pressure pump. Restricted fuel filters may cause hard starting, no starting, and or white smoke.



## Testing The Filter For Restrictions

**NOTE: There can not be any visible signs of fuel leakage at the filter outlet line or fitting during testing. If a fuel leak is detected, STOP testing, remove special tool fitting #9745, and replace both fuel line washer seals.**

- Disconnect the fuel filter outlet line at the fuel filter housing.
- Install fitting, special tool #9745 in place of the fuel line bolt and tighten to 35 N·m (25 ft. lbs.)..
- Connect pressure/vacuum gauge #6828 to the fitting.
- Prime the fuel filter to remove any entrained air.
- Start the engine and allow to idle.
- Monitor and record the vacuum reading on the gauge for 30 seconds.
- Raise the engine rpm to 1500 rpm and monitor and record the vacuum reading on the gauge for 30 seconds.

The vacuum on the gauge should not exceed 10 in. H.g at idle, and throughout the entire rpm range. If the vacuum reading is higher than 10 in. Hg, inspect the low pressure fuel system for restrictions such as, kinked lines or collapsed hoses, before replacing the fuel filter.

Remove special tools, install the fuel filter outlet line using the fuel line bolt with two **new** washer seals. Tighten the fuel line bolt to 35 N·m (25 ft. lbs.).

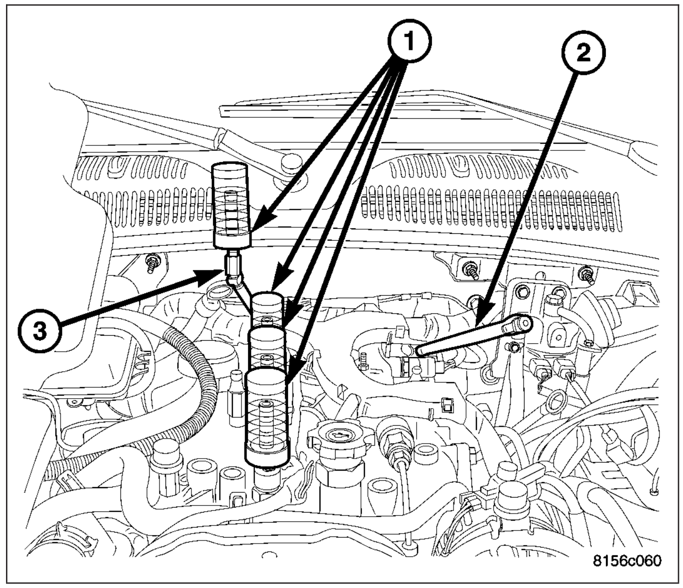
Prime fuel system (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE), start the engine, allow to warm, turn engine off and inspect for leaks at the fuel filter and housing.

## INJECTOR LEAK QUANTITY

**WARNING: Review the high pressure fuel system warning before beginning service (refer to 14 - fuel system - warning).**

**NOTE: If an injector is found to be out of specification, repeat the test procedure after the injector replacement. Hydraulic flow will take the path of least resistance and multiple failures may be identified.**

Perform this test with the engine at operating temperature. This test will assist in determining a defective or internally leaking injector(s) is present by measuring the amount of fuel return.



### Cranking Test

1. Turn the ignition off.
2. Remove the engine cover.

**NOTE: DO NOT remove the return fuel line clips retaining the return line to the injector. Push IN on the clip to release the hose and then again to install the test vials.**

3. Disconnect the return fuel hose at the top of each of the injectors.

**NOTE: Care must be taken not to damage the return line check valve between cylinder number four injector and the fuel rail.**

4. Block off the disconnected return fuel hose before the fuel return junction on the left rear of the cylinder head cover.
5. Disconnect the camshaft position sensor (CMP).

**NOTE: Attach special tool adaptor #9686 to the #4 injector and fill with clean diesel fuel to purge the air from the adaptor, then install the test vial onto the adaptor.**

6. Install the test vials onto the injectors and secure with the return hose clips.
7. Crank the engine for ten seconds while monitoring each inner test vial.
8. Evaluate the individual return quantities.

The maximum permissible difference between the return quantity of the individual injectors and the injector with the highest return quantity is 3 graduation marks in the small vial.

**EXAMPLE**

| Injector | Graduated Vial Mark | Content |
|---|---|---|
| 1 | 4 marks, small vial | 4 ml |
| 2 | 1 mark, small vial | 1 ml |
| 3 | 1 mark, small vial | 1 ml |
| 4 | 1/2 mark, small vial | 0.5 ml |

Evaluation Injector #1 has excessive fuel return quantity, replace the injector. Injectors #2, #3, #4 are OK.

9. Perform the cranking test after the repair to assure no other injectors are identified.

### Engine Running

1. Start the engine with the test vials in place.
2. Run the engine until the top mark on one of the large graduated vials is obtained.
3. Turn engine off immediately.
4. Evaluate the individual return quantities.

The maximum permissible difference between return quantities of the individual injectors, and the injector with the highest return quantity, is 3 graduation marks.

**EXAMPLE**

| Injector | Graduated Vial Mark | Content |
|---|---|---|
| 1 | 5 marks, large vial | 42 ml |
| 2 | 2 mark, large vial | 21 ml |
| 3 | 2 mark, large vial | 21 ml |
| 4 | Surround, large vial | 8 ml |

Evaluation Injector #1 has excessive return quantity, replace the injector. Injectors #2, #3, #4 are OK.

5. Perform the running test again after the repair to assure no other injectors are identified.

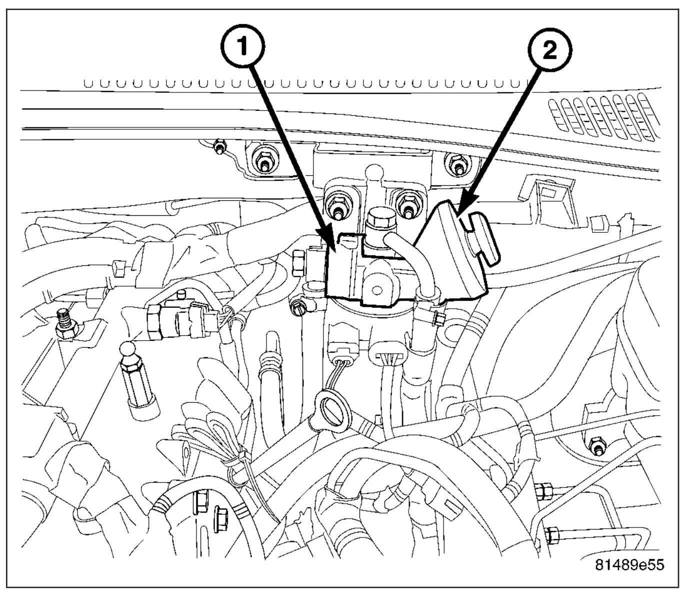
If the injectors pass the quantity test, continue with the diagnostic manual.

## STANDARD PROCEDURE

## PRIMING FUEL SYSTEM

**CAUTION: Cranking the engine for an extended period with out a fuel supply may result in damage to the high pressure fuel pump. DO NOT force the plunger when priming the fuel system. Damage to the plunger or fuel filter/water separate will result.**

**NOTE: Should the vehicle run out of fuel, the fuel system must be re-primed in order to start. Factors such as temperature, how long the vehicle has been sitting, and engine cranking speed will influence how quickly the engine starts. If the water in fuel light is illuminated in the instrument panel, refer to the water in fuel sensor for draining procedure.**



The fuel system must be primed if the fuel system has been serviced. This is done using the fuel primer button located at the top of the fuel filter/water separator.

1. With service completed on the fuel system.
2. Depress the fuel primer 20 consecutive times then open the bleeder screw on top of the housing to dispel trapped air.
3. Close the bleeder screw and continue the step above until the primer button becomes slightly harder to depress.
4. Turn the ignition to START and crank the engine a maximum of ten seconds.

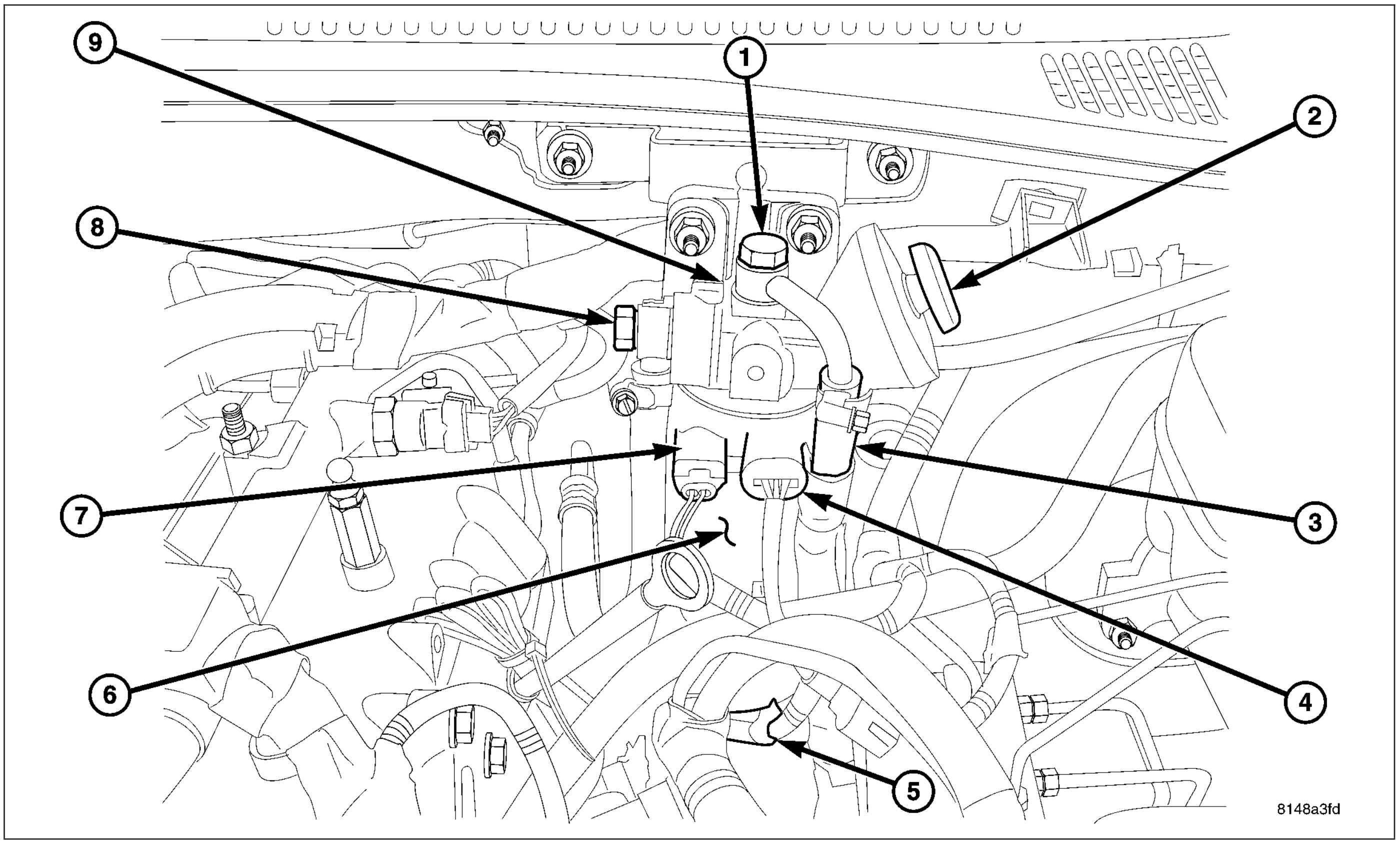
**NOTE: If the engine does not start with in ten seconds, repeat the priming procedure. The engine will typically start within ten seconds; the engine may idle, idle rough, or stall, purging any trapped air from the lines and filter.**

5. Tighten bleeder screw to 10.8 N·m (96 in.lbs.).

## CLEANING FUEL SYSTEM COMPONENTS

**CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines, fuel rail, and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. DO NOT wire brush injector nozzles when cleaning. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.**

## DRAINING WATER IN FUEL



**WARNING: Store fuel in approved and properly marked containers. Wear safety goggles and adequate protective clothing when servicing fuel system.**

1. Disconnect the negative battery cable.
2. Disconnect the water in fuel (WIF) wiring harness connector located under the fuel filter.
3. Connect a drain hose to the WIF sensor.
4. Place the other end of the drain hose in a approved and properly marked container.
5. Open the bleed screw on top of the fuel filter housing.
6. Loosen the WIF sensor on the bottom of the fuel filter to begin draining.
7. Allow the filter to drain into the container until fuel is visible.
8. Tighten the WIF sensor, remove the drain hose and clean any spillage.
9. Tighten the bleeder screw on top of the fuel filter housing.
10. Connect the WIF wiring harness connector.
11. Connect the negative battery cable.

## FUEL CONTAMINATION

If a diesel engine's fuel supply has been contaminated with gasoline, the following procedure must be followed:

1. Remove all fuel from the fuel tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE-DRAINING FUEL TANK) Use an appropriate fuel container. Dispose of the contaminated fuel using the proper procedures.

**CAUTION: Dispose of petroleum based products in a manner consistent with all applicable Local, State, Federal, and Provincial regulations.**

2. Remove and clean fuel tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL)
3. Install the fuel tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION)
4. Fill fuel tank with fresh diesel fuel.
5. Drain and remove the fuel filter. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL FILTER / WATER SEPARATOR - REMOVAL)
6. Install a new fuel filter. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL FILTER / WATER SEPARATOR - INSTALLATION)
7. Check the engine control module for any diagnostic trouble codes (DTCs). Record and clear any DTCs that are present.
8. Start and run the engine. Run the engine for up to 15 minutes to allow time for any DTCs to reset and shut off the engine.
9. Check the engine control module for any diagnostic trouble codes (DTCs). Record any DTCs that are present. Refer to the appropriate engine electrical diagnostics to diagnose any DTCs that were set.

**CAUTION: With the high pressure fuel system in this vehicle, any residual contaminated fuel will be removed very quickly. Shut off the engine immediately if signs of engine damage are noted.**

The engine should then be evaluated to determine if the contaminated fuel has caused any damage to the fuel system and/or engine. Indicators that the fuel system has been damaged include the following:

- Unstable fuel rail pressure. This can manifest itself as instability of idle speeds, excessive undershoot/overshoot at engine start-up, or excessive undershoot/overshoot when the engine operating conditions change. A typical engine response to a large rail pressure undershoot would be a decrease in engine speed or engine stall.
- Excessive noise from the engine. This could indicate poor rail pressure control or the inability of the injection system to inject the proper amount of fuel.
- Excessive smoke (black or white). This could indicate the inability of the fuel system to inject the proper amount of fuel.

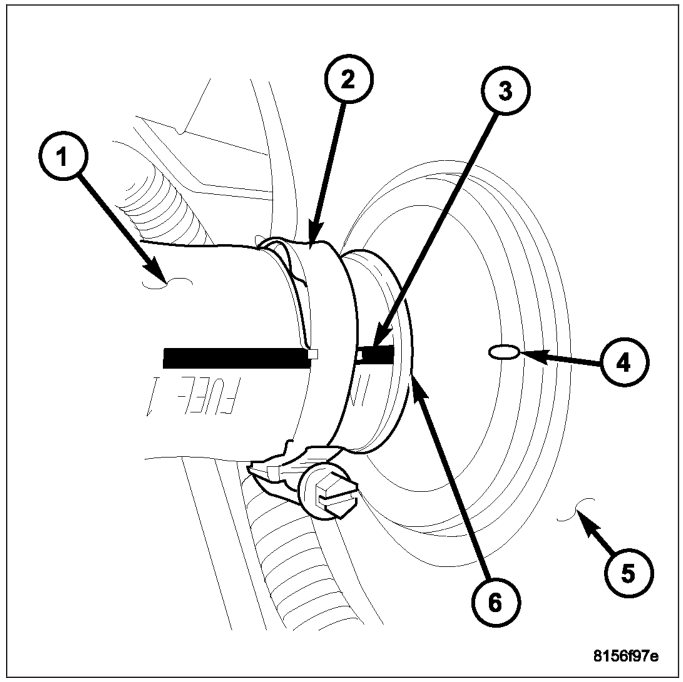
**NOTE: If any of these conditions are exhibited after cleaning the fuel system, proceed to the appropriate engine electrical diagnostic information. Repair the fuel system and/or engine as necessary.**

## DRAINING FUEL TANK - DIESEL

1. Raise vehicle.
2. Thoroughly clean area around fuel fill fitting (6) and rubber fuel fill hose (1) at side of fuel tank. After cleaning, loosen fuel fill hose clamp (2) at tank.

Note position of index mark (3) before removing hose from fuel tank fitting.

3. Remove rubber fuel fill hose (1) from fuel tank fill fitting (6). Drain fuel into an approved diesel fuel oil draining station.



## SPECIFICATIONS

## TORQUE - 2.8L DIESEL

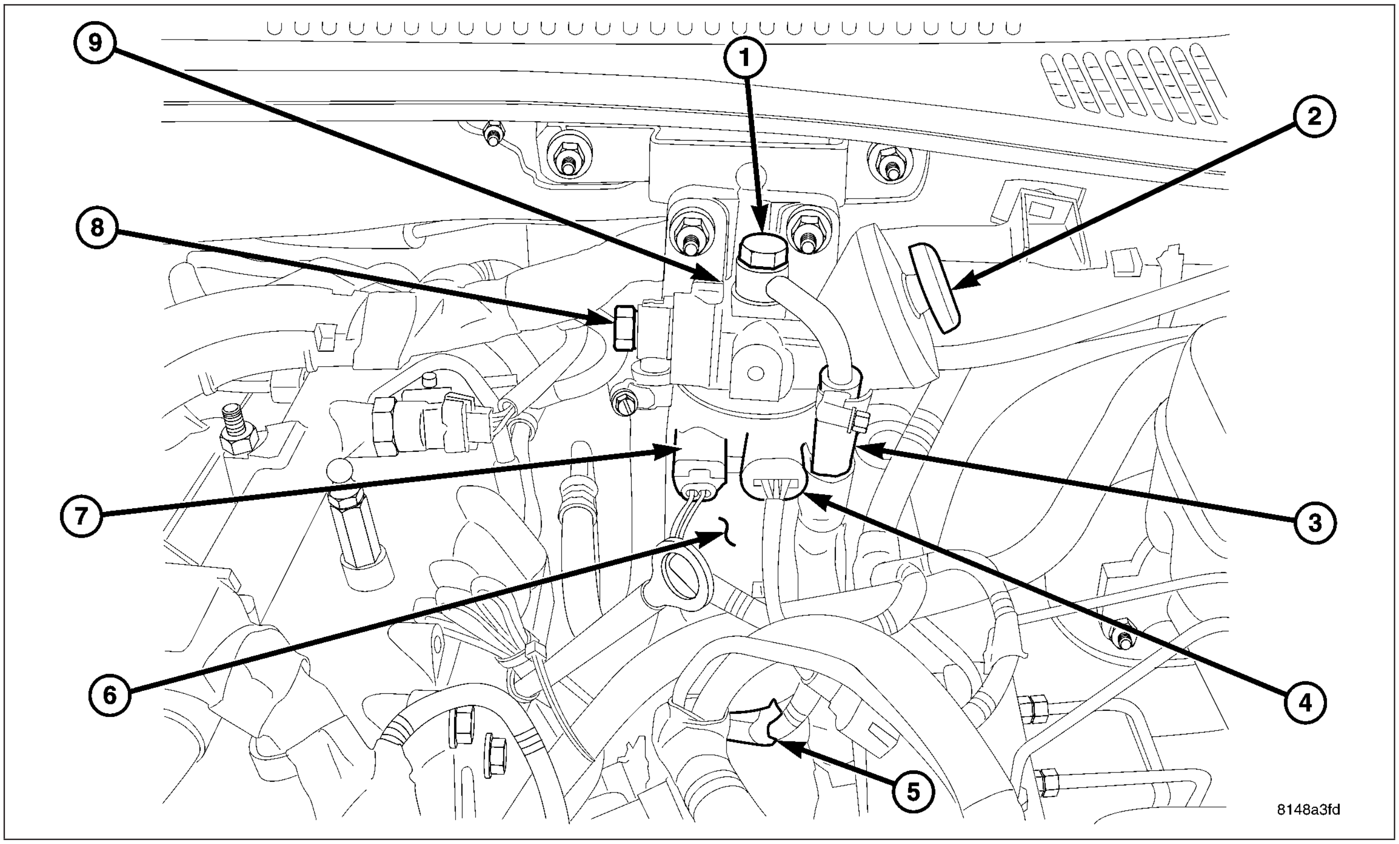
# FUEL FILTER / WATER SEPARATOR

## DESCRIPTION



The fuel filter/water separator assembly is located in the left rear corner of the engine compartment. It incorporates the fuel system prime button, bleed screw, fuel temperature sensor, fuel heater and a water in fuel (WIF) sensor. Only the fuel filter canister and the WIF sensor are serviced separately. The fuel filter has a 3 micron element and tightens clockwise to the housing..

## OPERATION

The fuel filter/water separator protects the high pressure fuel injection pump by removing water and contaminants from the fuel with a three micron filter element. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the canister.

Refer to the maintenance schedules for the recommended fuel filter replacement intervals.

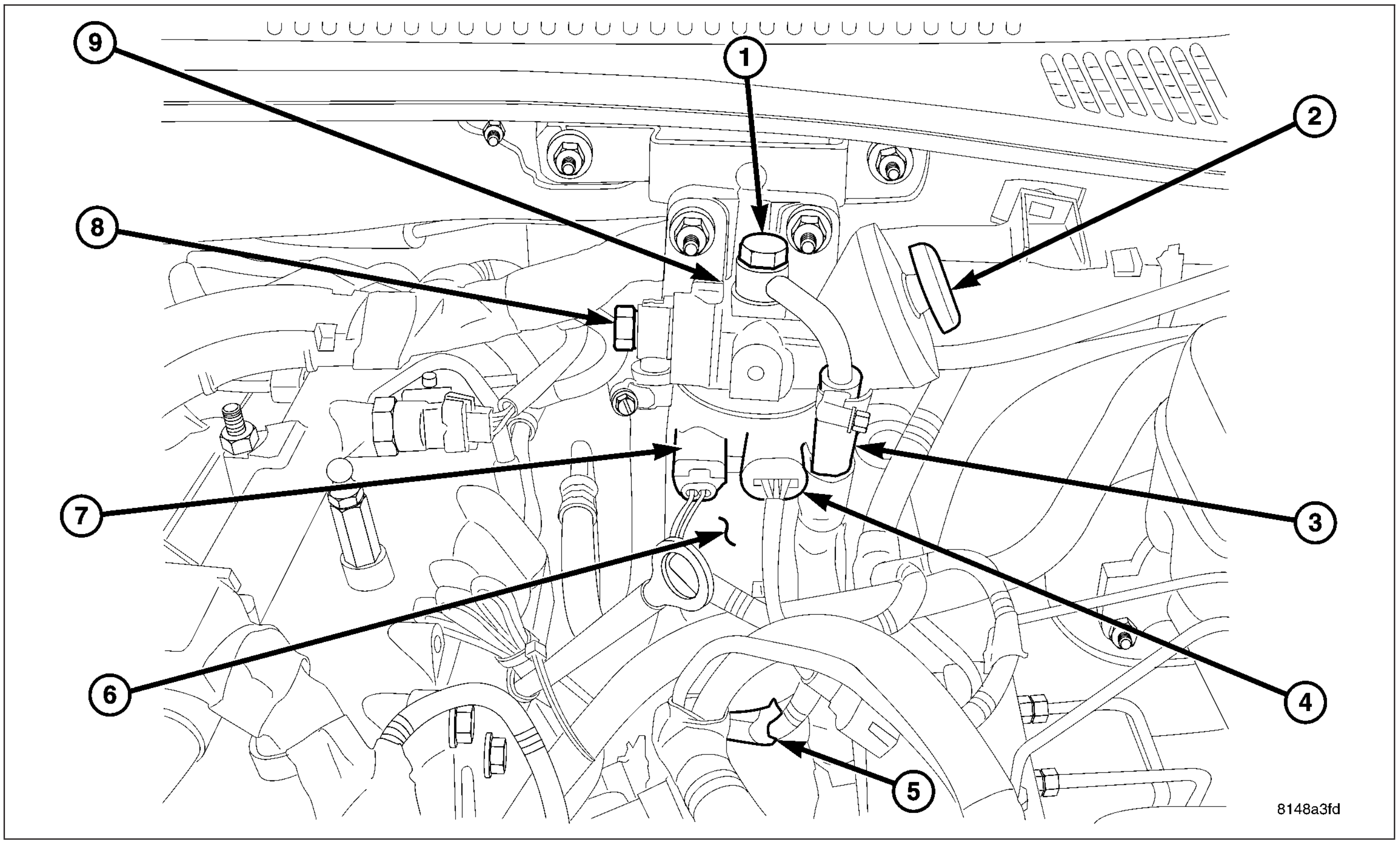
For draining of water from canister, (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).

A Water-In-Fuel (WIF) sensor is attached to the fuel filter and serviced separately. Refer to Water-In-Fuel Sensor Description/Operation.

The fuel heater and fuel temperature sensor are part of the fuel filter assembly head and not serviced separately from the head.

## REMOVAL

## FUEL FILTER/WATER SEPARATOR ASSEMBLY



**WARNING: Store fuel in approved and properly marked containers. Wear safety goggles and adequate protective clothing when servicing fuel system.**

1. Disconnect negative battery cable.
2. Drain fuel filter/water separator assembly (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE)

**NOTE: DO NOT loosen the banjo bolt fittings. Loosen the fuel hose clamps and remove hoses from the fuel lines.**

3. Remove two fuel lines from the water separator. Loosen retaining clamps and slide the hose from barbed fittings.
4. Disconnect the fuel heater and temperature sensor harness connectors.
5. Remove the fuel filter/water separator assembly from the engine cowl.

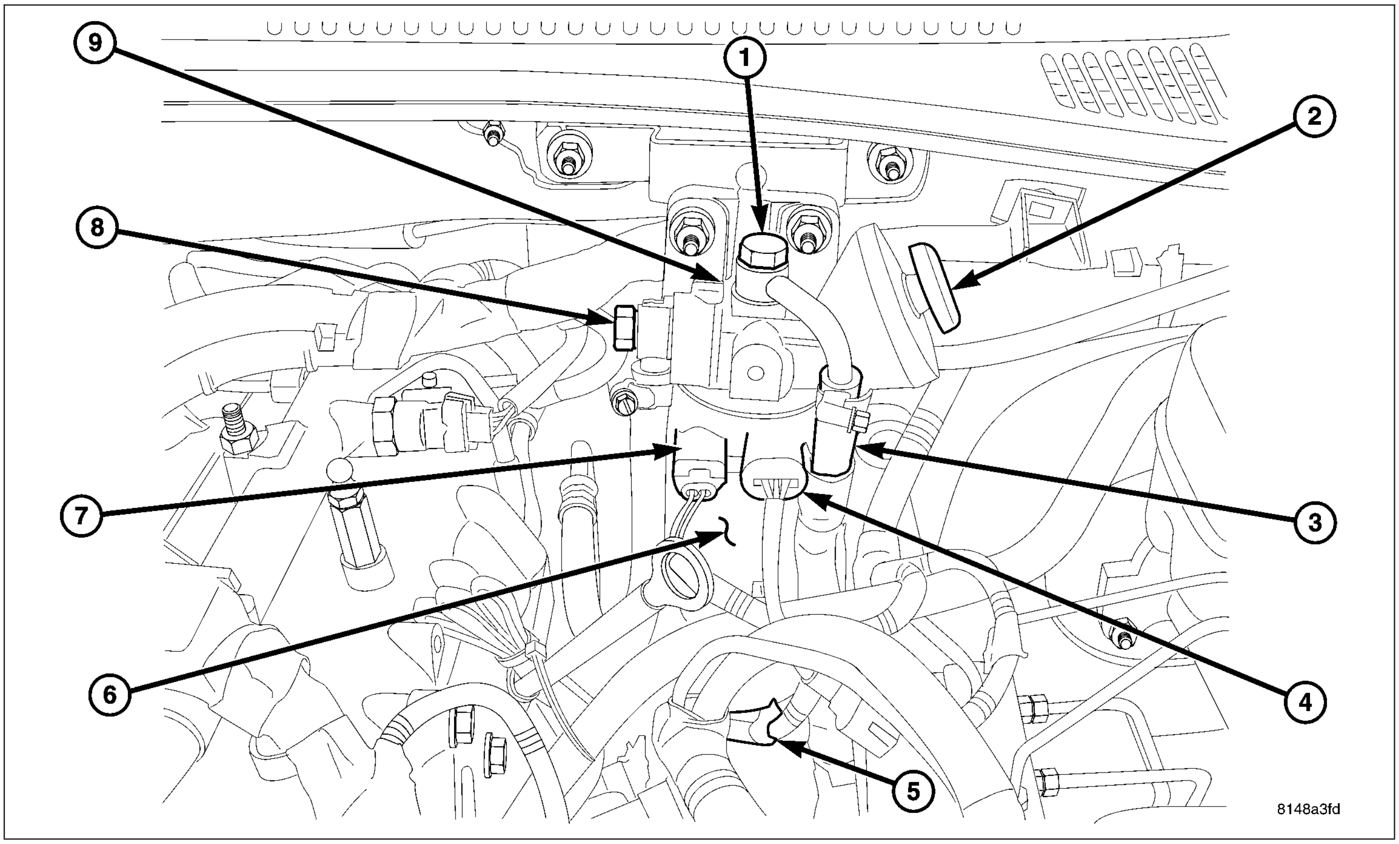
## FUEL FILTER

**NOTE: Capture all fuel in approved and appropriately marked containers. Wear safety goggles and adequate protective clothing when servicing the fuel system.**

1. Disconnect the negative battery cable.
2. Disconnect the water in fuel (WIF) sensor wiring harness connector.
3. Drain the fuel filter/water separator (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
4. Unscrew the filter assembly from the head assembly by rotating the housing counterclockwise.
5. Separate the WIF sensor and seal from the housing by rotating counterclockwise.

## INSTALLATION

## FUEL FILTER / WATER SEPARATOR ASSEMBLY

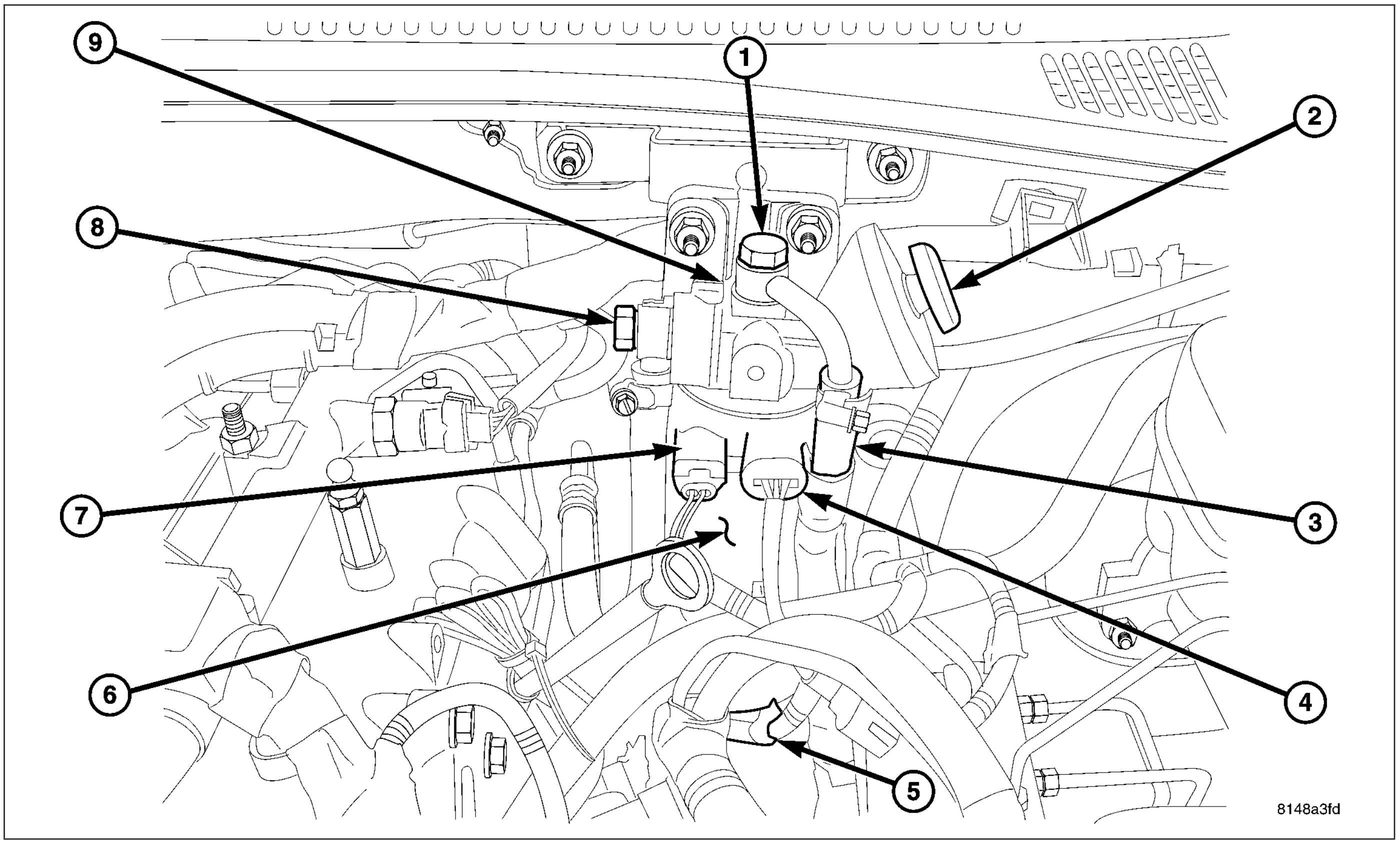


1. Carefully position fuel water separator over the mounting studs, install fasteners and tighten to 24.5 N·m (18 ft. lbs.).

**NOTE: Make sure the fuel supply hose to the high pressure pump is mounted to the left side of the filter assembly.**

2. Install the fuel lines to the housing assembly. tighten hose clamps to 7 N·m (62 in.lbs.).
3. Connect the water in fuel, fuel temperature sensor and the fuel heater electrical connectors.
4. Prime fuel system (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
5. Connect negative battery cable.

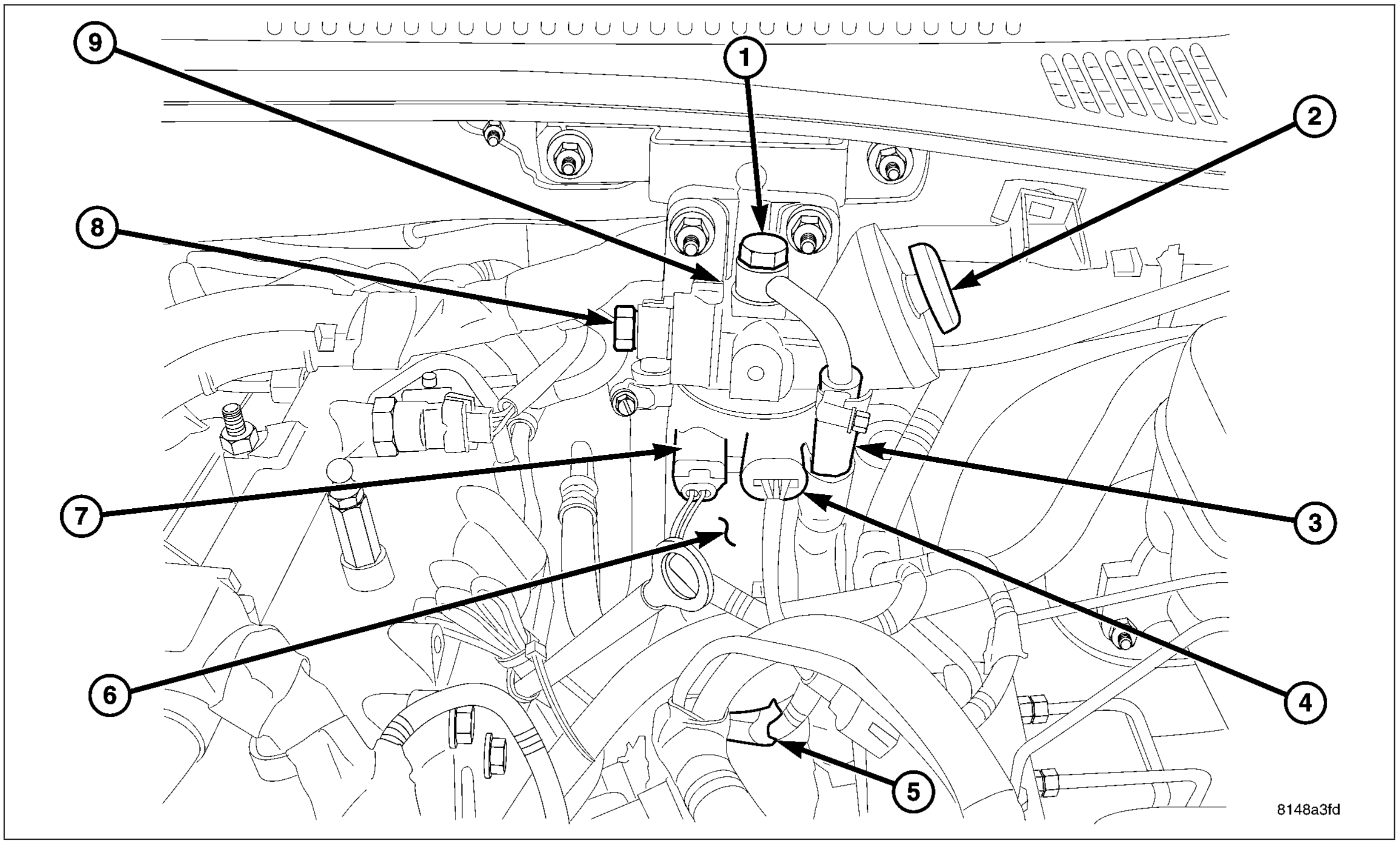
## FUEL FILTER



1. Lubricate the fuel filter seal with clean diesel fuel.
2. Install the water in fuel (WIF) sensor hand tight.
3. Screw filter assembly onto the fuel filter/water separator head. Tighten filter to 18 N·m (159 in. lbs.).
4. Connect the WIF wiring harness connector.
5. Prime the fuel system (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
6. Start the engine and allow to warm.
7. Turn engine off and inspect for leaks.

# WATER IN FUEL SENSOR

## DESCRIPTION

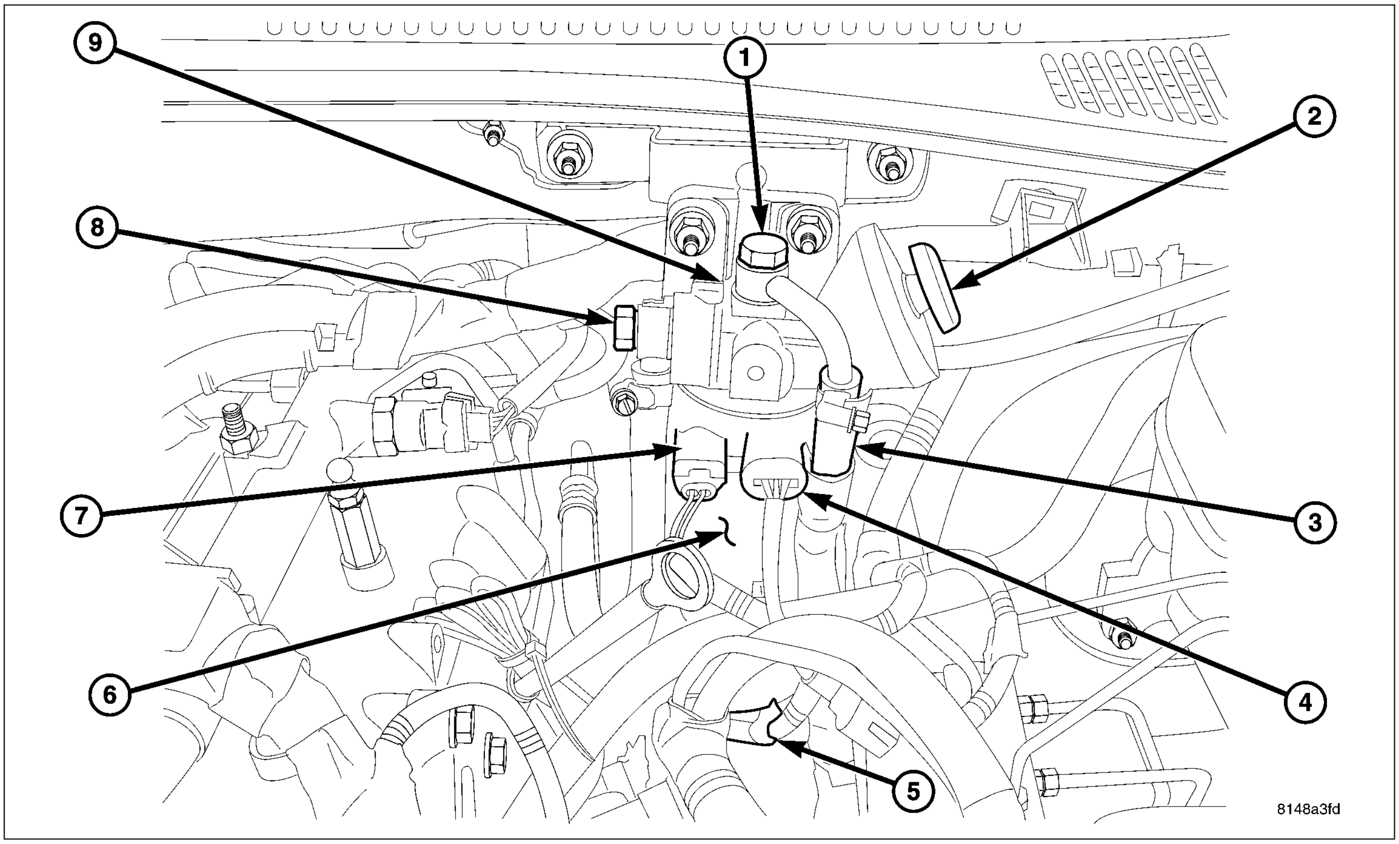


The WIF sensor is located in the bottom of the fuel filter/water separator. The sensor also has a drain channel and a protrusion for adapting a hose during draining.

## OPERATION

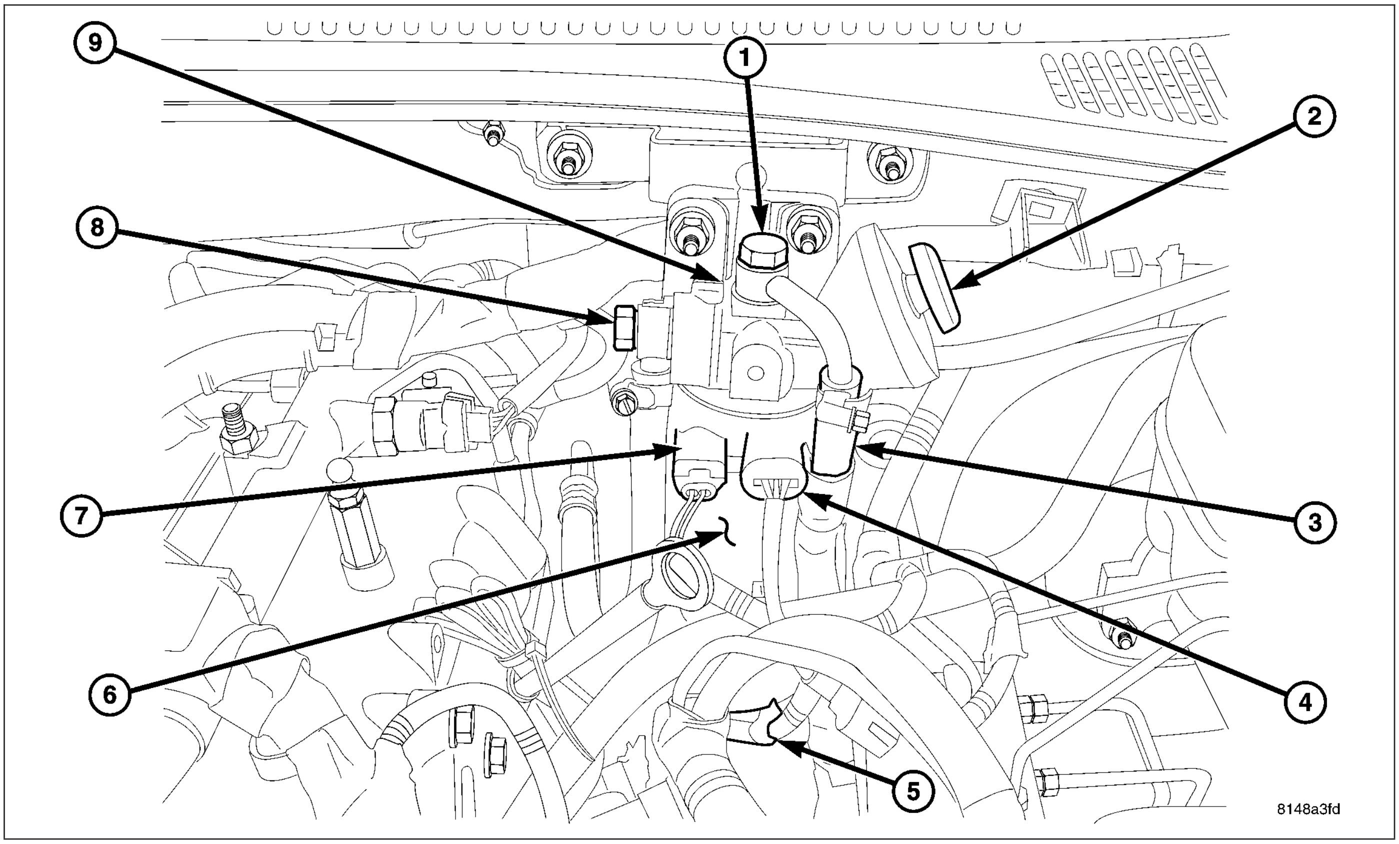
The sensor sends an input to the Engine Control Module (ECM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the ECM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the ECM will activate the water-in-fuel warning lamp. This all takes place when the ignition key is initially put in the ON position.

## REMOVAL



1. Disconnect negative battery cable.
2. Disconnect WIF sensor electrical connector.
3. Drain fuel filter/water separator assembly by loosening the WIF at bottom of fuel filter and opening the bleeder screw on top of the filter/separator. (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
4. Unscrew WIF sensor from fuel filter/water separator assembly.

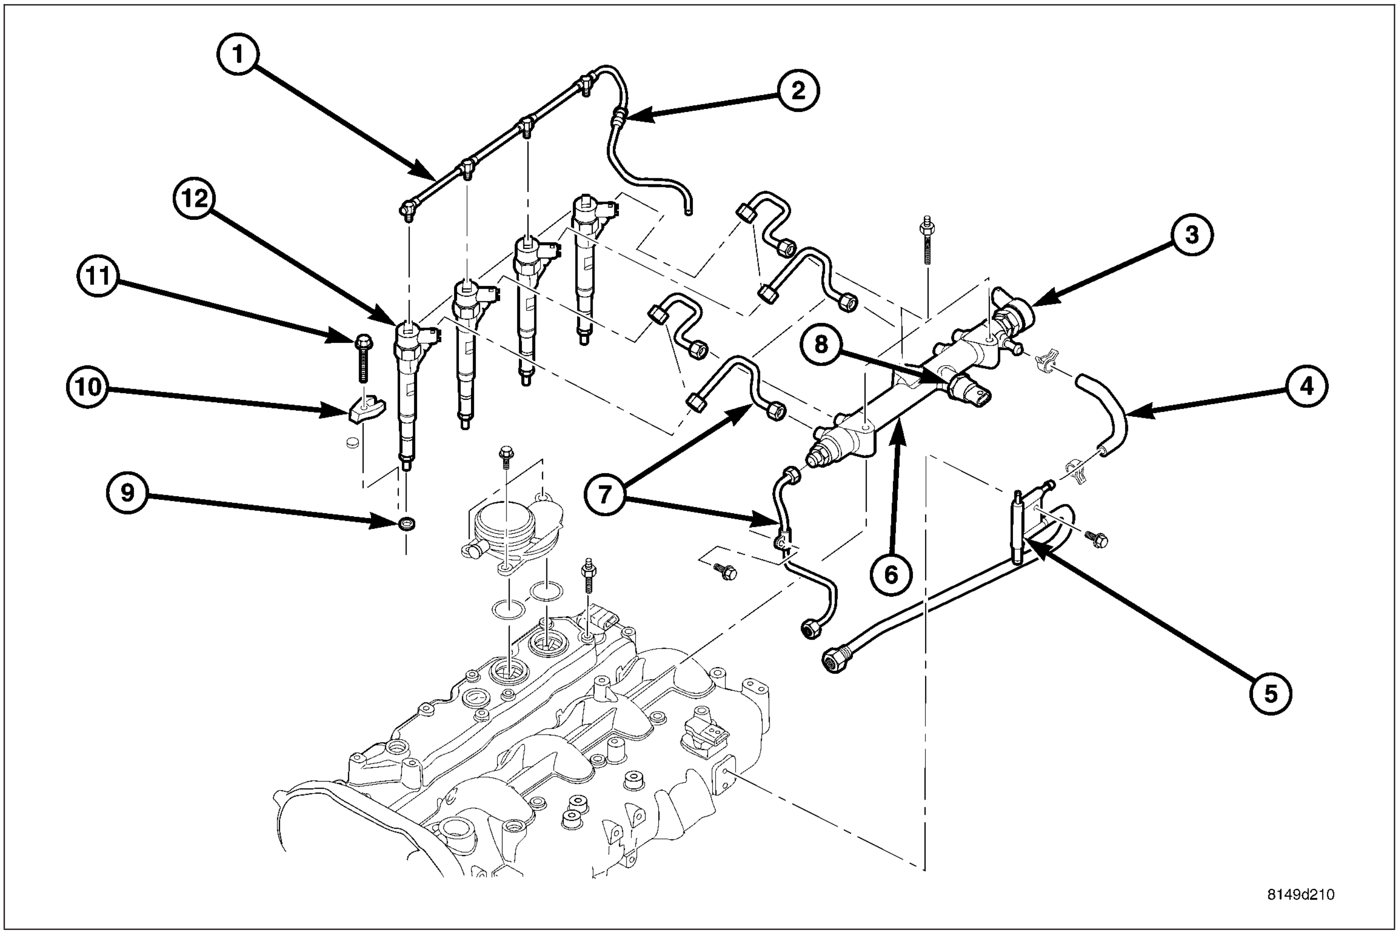
## INSTALLATION



1. Install WIF sensor with new seal into fuel filter hand tight.
2. Connect WIF sensor electrical connector.
3. Prime fuel system using fuel priming diaphragm (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
4. Connect negative battery cable.

# FUEL RAIL

## DESCRIPTION



**WARNING: High - pressure fuel line deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

The fuel rail is mounted to the cylinder head cover/intake manifold. The rail supplies constant high fuel pressure to the fuel injectors.

## OPERATION

**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

The fuel rail stores the fuel for the injectors at high pressure. At the same time, the pressure oscillations which are generated due to the high-pressure pump delivery and the injection of fuel are dampened by the rail volume.

The fuel rail is common to all cylinders, hence it’s name “common rail”. Even when large quantities of fuel are extracted, the fuel rail maintains a constant inner pressure. This ensures that the injection pressure remains constant from the moment the injector opens.

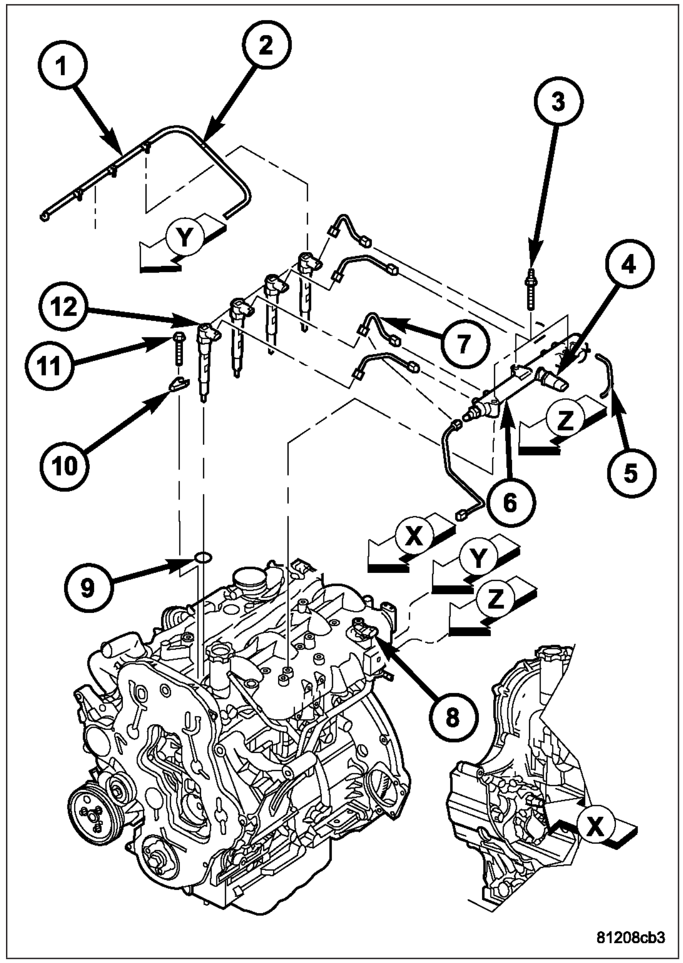
## REMOVAL

**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

1. Disconnect negative battery cable.
2. Remove engine cover and bracket assembly (Refer to 9 - ENGINE COVER - REMOVAL).
3. Disconnect fuel pressure sensor electrical connector.

**NOTE: If fuel rail is being replaced it is necessary to replace the fuel rail solenoid.**

4. Disconnect the fuel rail solenoid electrical connector.
5. Disconnect fuel rail return line at fuel rail.
6. Disconnect fuel high pressure line from injection pump to fuel rail at fuel rail.
7. Disconnect fuel high pressure line from fuel rail to fuel injector at fuel rail.
8. Remove fuel rail retaining bolts and remove rail from cylinder head cover/intake manifold.



## INSTALLATION

**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

**NOTE: The fuel rail solenoid must be replaced upon removal. When replacing fuel lines or solenoid it is necessary to counterhold and correctly torque the fitting. Refer to the proper procedure.**

1. Replace the fuel rail solenoid (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL PRESSURE SOLENOID - REMOVAL).
2. Install the fuel pressure sensor (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL PRESSURE SENSOR - INSTALLATION).
3. Install fuel rail on cylinder head cover/intake manifold. Torque retaining bolts to 24.5 N·m (18 ft. lbs.).
4. Connect injector high pressure fuel lines at fuel rail.
5. Connect fuel rail high pressure fuel line at fuel rail.

6. Connect fuel rail fuel return line at fuel rail.
7. Connect fuel pressure sensor electrical connector.
8. Install engine cover and bracket assembly (Refer to 9 - ENGINE COVER - INSTALLATION).
9. Connect negative battery cable.

# FUEL LINES

## DESCRIPTION

### LOW-PRESSURE FUEL LINES

All fuel lines up to the fuel injection pump are considered low-pressure. This includes the fuel lines from the fuel tank to the high pressure fuel injection pump. The fuel return lines and the fuel drain lines are also considered low-pressure lines. High-pressure lines are used between the fuel injection pump and the fuel injectors (Refer to 14 - FUEL SYSTEM - WARNING). Also refer to High-Pressure Fuel Lines Description/Operation (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - OPERATION).

### HIGH PRESSURE FUEL LINES

**CAUTION: High pressure lines can not contact each other or other components. Do not attempt to repair or weld high pressure fuel lines that are damaged. If lines are kinked or bent, they MUST be replaced. Use only recommended lines when replacement of high pressure fuel line is necessary.**

(Refer to 14 - FUEL SYSTEM - WARNING). The high-pressure fuel lines are used between the high pressure fuel injection pump and the fuel injector rail, and between the fuel injection rail and fuel injectors. All other fuel lines are considered low-pressure lines.

## OPERATION - HIGH PRESSURE FUEL LINES

**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

**CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If lines are ever kinked or bent, they must be replaced. Use only the recommended lines when replacement of high-pressure fuel line is necessary.**

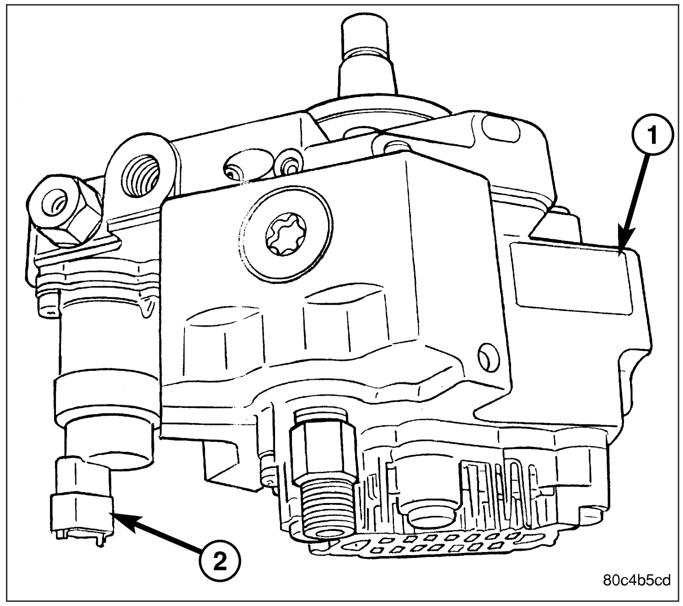
High-pressure fuel lines deliver fuel under extremely high pressure from the high pressure pump to the fuel injectors (Refer to 14 - FUEL SYSTEM - WARNING). The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

# FUEL INJECTION PUMP

## DESCRIPTION

A radial, 3 piston pump with a gear type fuel pump attached to the back, is used as the high pressure pump for fuel pressure generation (Refer to 14 - FUEL SYSTEM - WARNING).

The pump is driven by the timing belt. Pressure is generated independently of the injection process. The pump is lubricated with diesel fuel and is not responsible for fuel injection timing.



## OPERATION

### Cascade Overflow Valve

Instead of using an electric supply pump, this fuel system uses a gear supply pump located inside the rear of the high pressure pump. The pump is driven by an eccentric on the end of the high pressure pump shaft. The gear pump draws fuel from the fuel tank through the fuel filter.

The pressurized outlet side of the gear pump provides pressurized fuel to a branched circuit internal to the high pressure pump flange, which supples both the fuel quantity solenoid and the cascade overflow valve. Because the gear pump increases fuel flow and pressure as the engine rpm increases, the pressure is regulated by the cascade overflow valve. The cascade overflow valve and gear supply pump are not serviced independently of the high pressure pump.

The cascade overflow valve has two functions:

- Regulation of lubrication fuel to the internal moving parts of the high pressure pump
- Regulation of the fuel pressure being supplied to the fuel quantity solenoid

The cascade valve has a machined center piece that has three drillings. One for overflow, one for lubrication and one for supply. The valve works in three stages based on the pressure entering the inlet of the valve.

### Stage 1

When the fuel pressure entering the tip of the cascade valve is between 0 and 3 bar (44 psi), the spring force is not overcome and fuel only flows through the center drilling. This drilling always allows fuel flow through to the pump center ring and lubricates the pump bushings and internal moving parts. This circuit also allows air to bleed during initial cranking and returns the air to the fuel tank. The cascade valve is only in stage one during cranking.

### Stage 2

When the fuel entering the cascade valve exceeds 3 bar (44 psi), but is less than 5 bar (73 psi), the center piece of the valve moves against the spring force aligning another passage for lubrication purposes. Stage 2 can be reached during cranking and initial start up.

### Stage 3

When fuel pressure exceeds 5 bar (73 psi), the center of the valve aligns with the overflow passage. This stage relieves the pressure into an overflow circuit that sends the fuel back to the inlet side of the gear pump which limits maximum fuel pressure to 5 bar (73 psi). Lubrication fuel also continues to flow though the other ports during this stage. Excess is sent back to the fuel tank through the return circuit.

### High Pressure Pumping Plungers

The fuel quantity solenoid supples three high pressure pumping chambers. The pumping chambers have one way inlet valves that allow fuel to flow into the chambers. The valves then close during compression of the fuel and cause the high pressure fuel to overcome a ball and angled seat outlet valve.

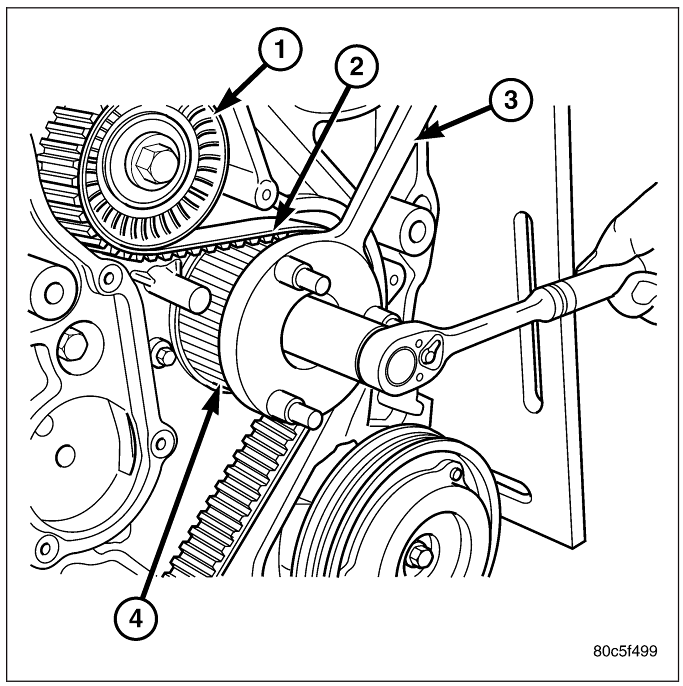
All three pumping chambers are tied together in one circuit internal to the pump and provide high pressure fuel up to 1600 bar (23,000 psi) through a steel line, to the fuel rail.

The pump is driven at 1:1 engine speed and is not responsible for injection timing. The pump is only responsible for providing high pressure fuel while the ECM controls the injection timing.

## REMOVAL

**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

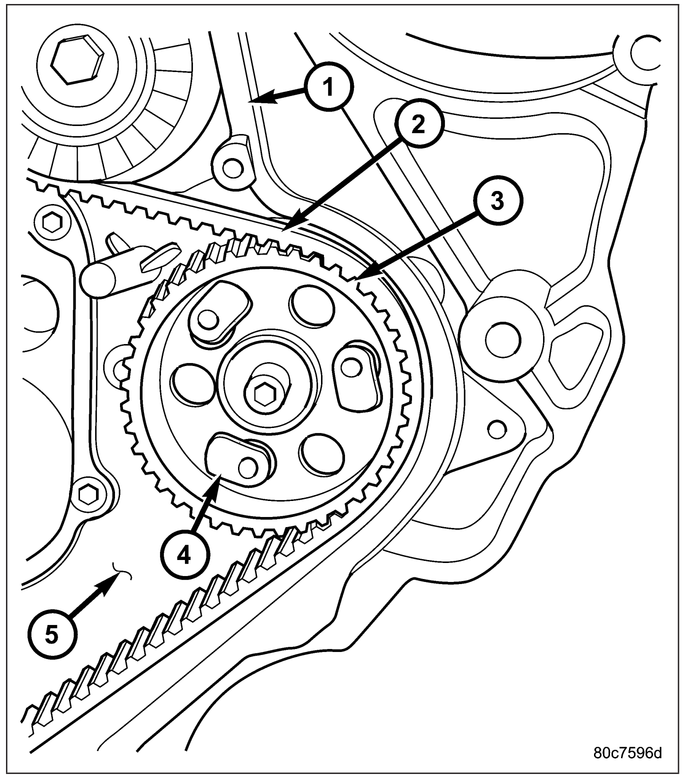
1. Disconnect negative battery cable.
2. Remove engine cover and bracket (Refer to 9 - ENGINE - REMOVAL).
3. Evacuate A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
4. Remove cooling fan and fan shroud.
5. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
6. Remove fan support assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
7. Bring piston #1 to TDC, turn crankshaft until notch on the crankshaft hub is at the 12 o'clock position.
8. Looking at the engine from the belt side, rotate the crankshaft 90° clockwise.
9. Remove the intake and exhaust camshaft plugs from the camshaft cover, to introduce the camshaft timing pins VM.1052 Intake, and VM.1053 Exhaust (if the engine is timed correctly, the pins can be installed).



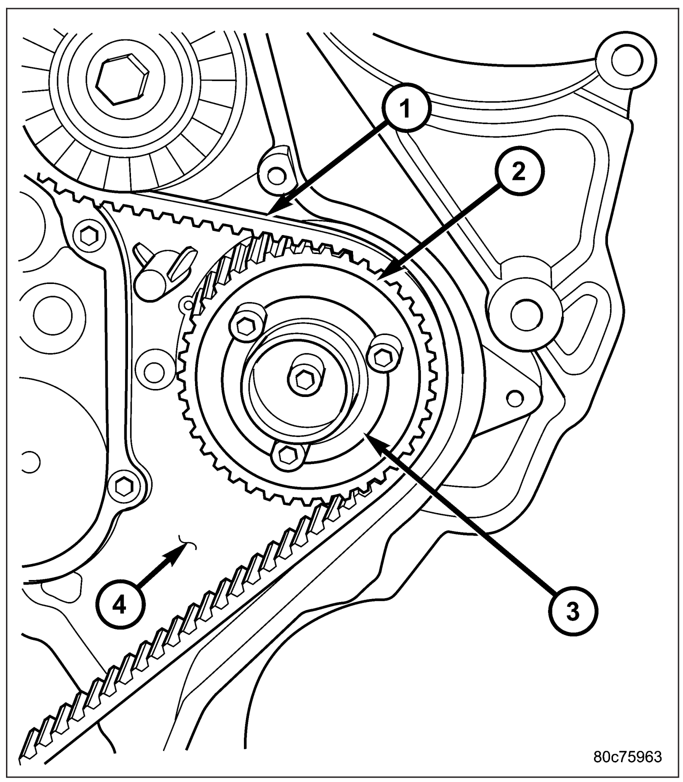
10. Remove timing belt outer cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
11. Using special tool VM.1055, remove high pressure injection pump sprocket retaining nut.

**NOTE: The use of special tool VM.1067 will allow you to remove the high pressure injection pump without removing the timing belt from the engine. This will allow you to remove and install the high pressure injection pump without altering engine timing.**

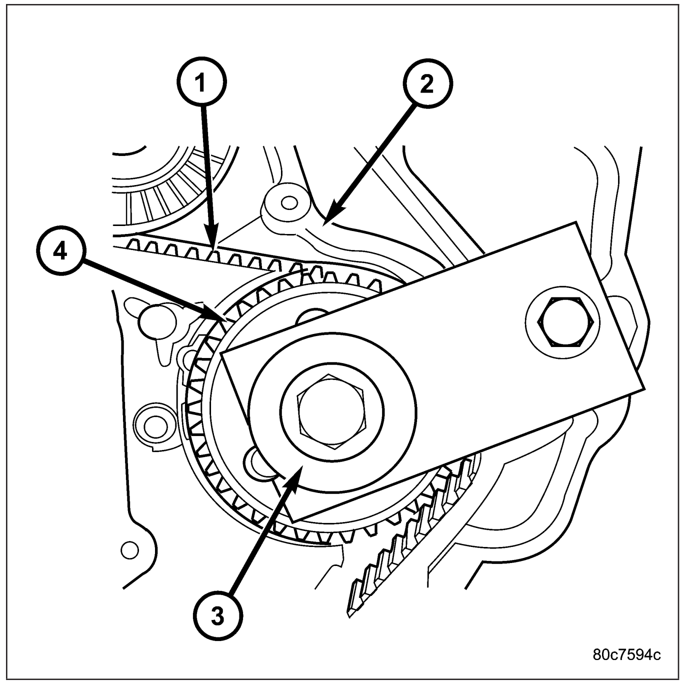
12. Install feet from VM.1067 in injection pump sprocket as shown.



13. Install inner flange of special tool VM.1067 on injection pump sprocket as shown. Secure flange to feet in injection pump sprocket with allen bolts supplied with tool.



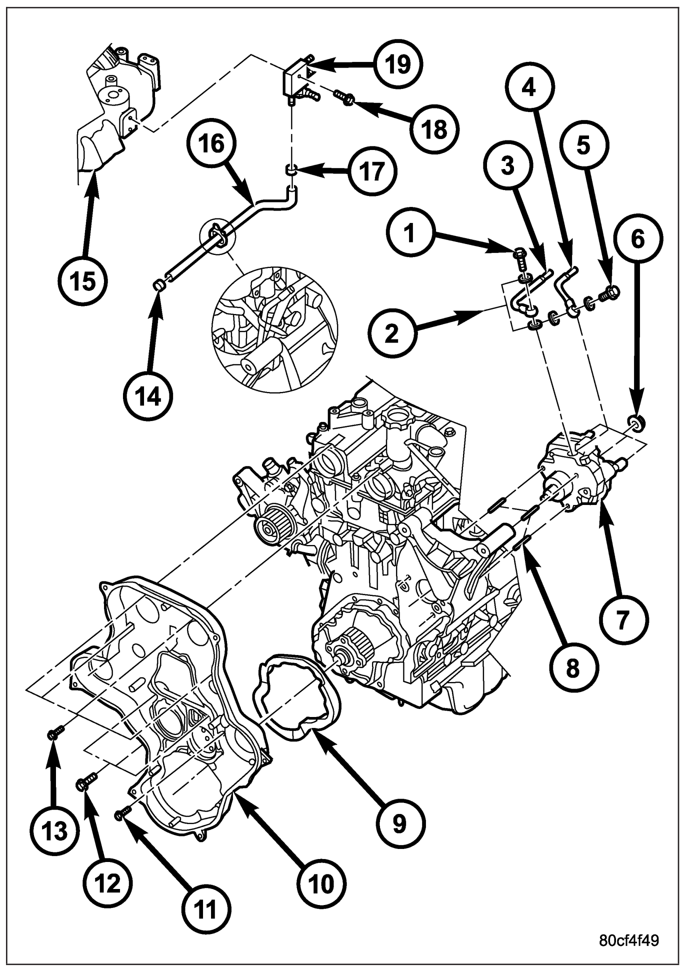
14. Screw the high pressure injection pump sprocket holding plate assembly into flange of VM.1067 Using left hand threaded bolt supplied, secure holding plate assembly to timing belt inner cover.



15. Remove the EGR airflow control valve from the intake manifold (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - REMOVAL).
16. Remove high pressure injection pump to fuel rail high pressure line.
17. Disconnect high pressure injection pump quantity control valve electrical connector.
18. Disconnect fuel supply and return lines at high pressure injection pump.
19. Remove alternator to intake manifold bracket.

**CAUTION: Care must be taken not to bend the brake vacuum tube when removing high pressure pump.**

20. Remove high pressure injection pump retaining nuts and remove pump.



## INSTALLATION

**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard (refer to 14 - fuel system/fuel delivery - diagnosis and testing). Wear safety goggles and adequate protective clothing when servicing fuel system.**

**NOTE: If Engine Timing Is Of Concern, (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) or (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - ADJUSTMENTS).**

1. Rotate the high pressure pump as necessary to align the key in the pump to the keyway in the sprocket.
2. Loosen bolt in center of injection pump holding plate and slide high pressure injection pump through the accessory bracket into the injection pump sprocket.
3. Install high pressure injection pump retaining nuts. Torque nuts to 27.5N·m (20 ft. lbs.).
4. Unscrew injection pump holding plate (part of VM.1067) from inner timing belt cover and remove.
5. Install high pressure injection pump sprocket retaining nut to hold sprocket in place.
6. Remove flange and feet (both part of VM.1067) from high pressure injection pump sprocket.
7. Using special tool VM.1055 , torque high pressure injection pump sprocket retaining nut to 88.3N·m.(65 ft.lbs.).
8. Remove the camshaft lockpins and install the access plugs.
9. Connect fuel quantity control valve electrical connector.
10. Connect fuel supply and return lines at high pressure injection pump. (Refer to 14 - FUEL SYSTEM - WARNING).
11. Install the EGR airflow control valve (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - INSTALLATION).
12. Install outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
13. Install fan support assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
14. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
15. Install cooling fan and shroud assembly.
16. Install charge air cooler outlet hose.
17. Install engine cover and bracket (Refer to 9 - ENGINE - INSTALLATION).
18. Connect negative battery cable.
19. Evacuate and recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

# FUEL LEVEL SENDING UNIT / SENSOR

## DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the lower fuel tank module. The sending unit consists of a float, an arm, and a variable resistor track (card).

## OPERATION

**For Fuel Gauge Operation:** A constant current source of approximately 32 milliamps is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Engine Control Module (ECM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel tank module electrical connector unplugged). With the connectors plugged, output voltages will vary from about 0.6 volts at FULL, to about 8.6 volts at EMPTY (about 8.6 volts at EMPTY for Jeep models, and about 7.0 volts at EMPTY for Dodge Truck models).** The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the ECM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the ECM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the ECM, the ECM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

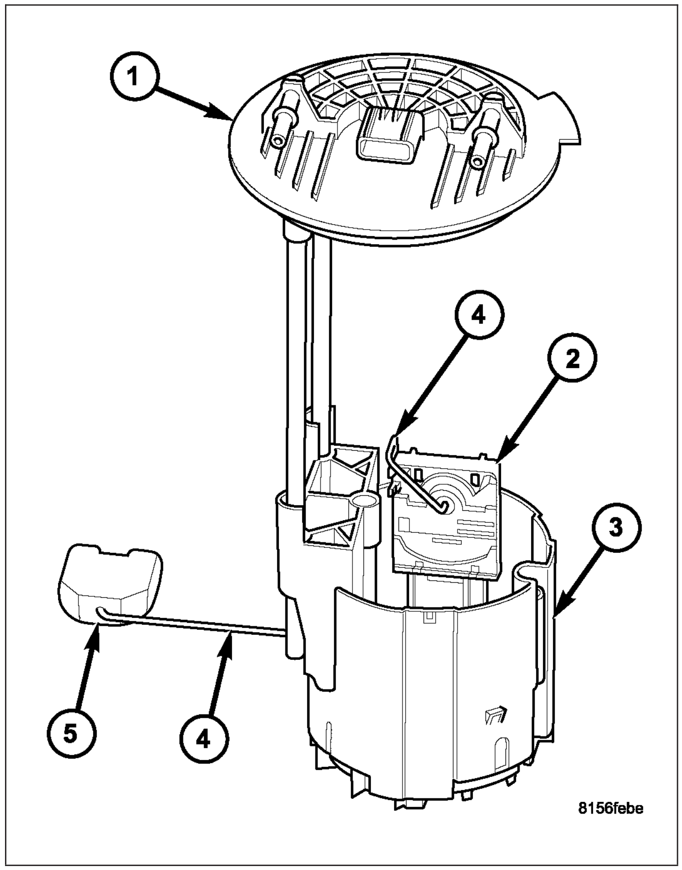
## DIAGNOSIS AND TESTING - FUEL LEVEL SENDING UNIT

The fuel level sending unit contains a variable resistor (track). As the float moves up or down, electrical resistance will change. Refer to Instrument Panel and Gauges for Fuel Gauge testing. To test the gauge sending unit only, it must be removed from vehicle. The unit is a separate part of the lower fuel tank module section. Refer to Fuel Tank Module Removal/Installation for procedures (remove only the upper section of the fuel pump module). Measure the resistance across the sending unit terminals. With float in up position, resistance should be 20 ohms (+/- 5%). With float in down position, resistance should be 220 ohms (+/- 5%).

## REMOVAL

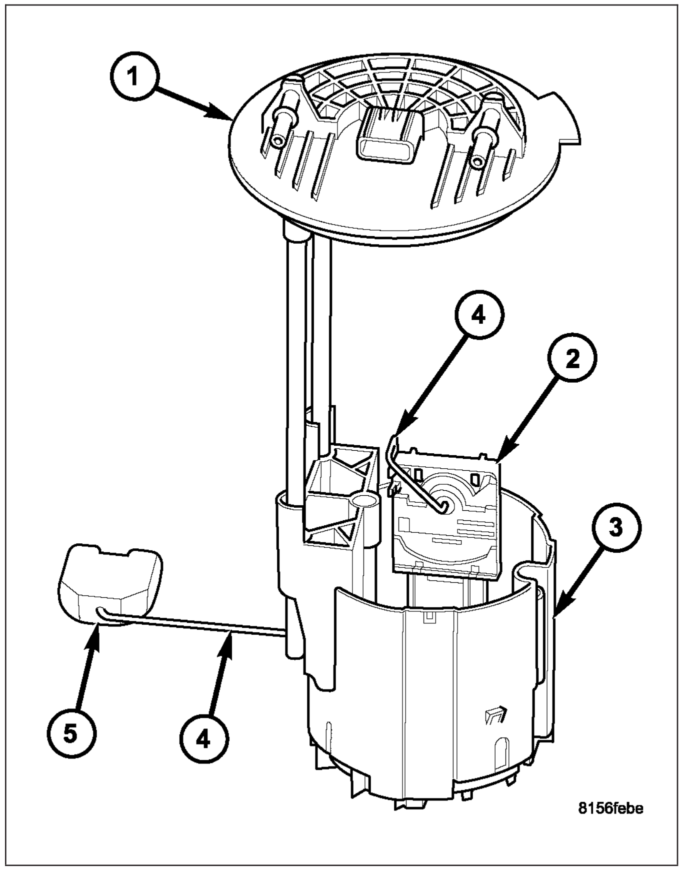
The fuel level sending unit (fuel level sensor) (2) and float assembly (4) and (5) are located on the fuel tank module.

1. Remove fuel tank module from fuel tank (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK MODULE - REMOVAL).
2. To remove sending unit from tank module, lift on plastic locking tab while sliding sending unit upwards.
3. Disconnect electrical connectors from fuel tank module. Separate necessary sending unit wiring.



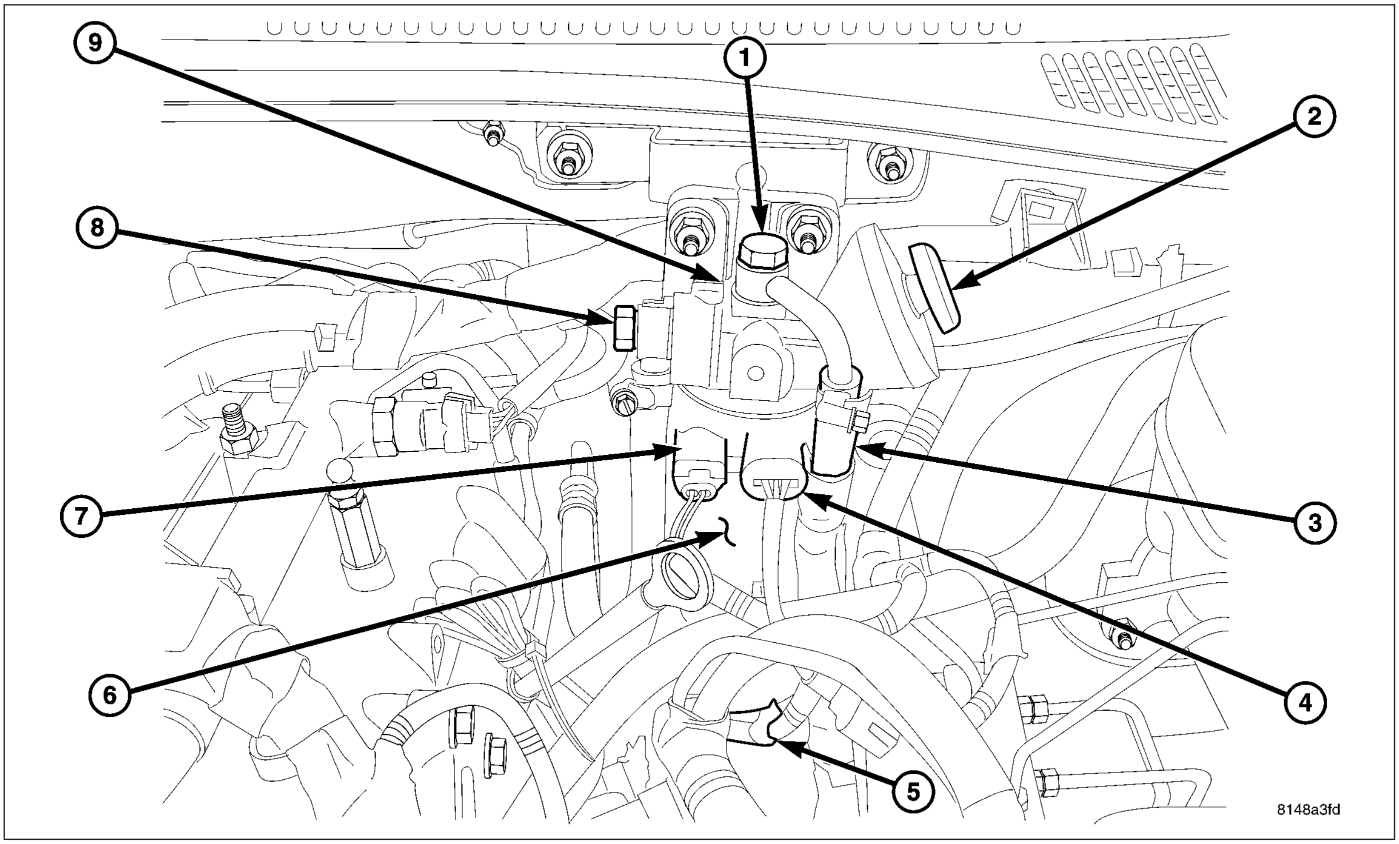
## INSTALLATION

1. Connect necessary wiring into electrical connectors.
2. Position sending unit (2) to tank module. Slide and snap into place until tab engages.
3. Install fuel tank module into fuel tank.



# FUEL HEATER

## DESCRIPTION



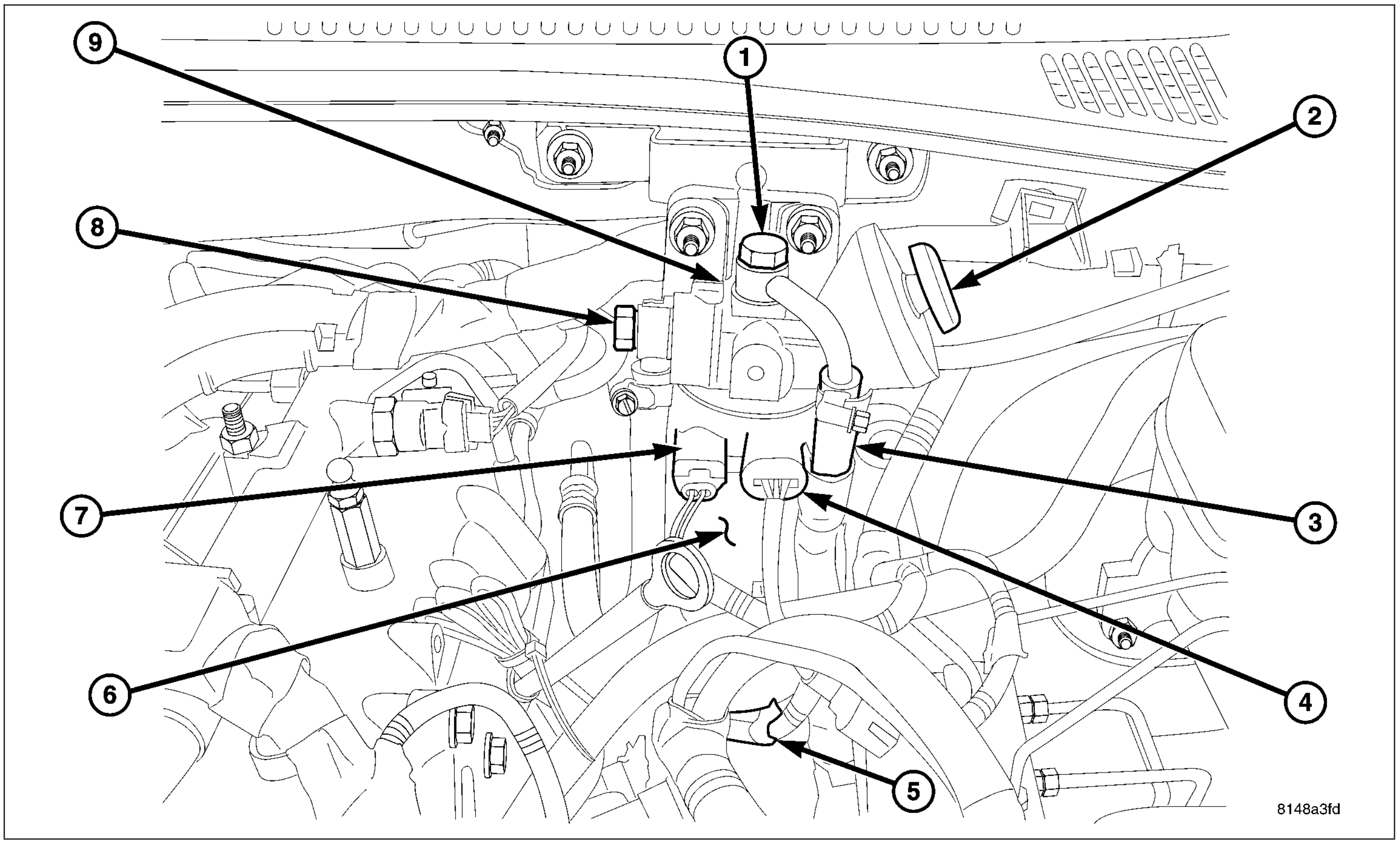
The fuel heater is used to prevent diesel fuel from waxing and plugging the fuel filter during cold weather operation. The fuel heater is located in the fuel filter/water separator assembly head, next to the fuel temperature sensor.

## OPERATION

The element inside the heater assembly is made of a Positive Temperature Coefficient (PTC) material, and has power applied to it by the fuel heater relay anytime the ignition key is in the “on” position. PTC material has a high resistance to current flow when its temperature is high, which means that it will not generate heat when the temperature is above a certain value. When the temperature is below 7°C (45° F), the resistance of the PTC element is lowered, and allows current to flow through the fuel heater element warming the fuel. When the temperature is above 29°C (85° F), the PTC element’s resistance rises, and current flow through the heater element stops .

Voltage to operate the fuel heater is supplied from the glow plug module, through the fuel heater relay, when the ECM senses the ignition (key) switch.

## REMOVAL



**WARNING: Store fuel in approved and properly marked containers. Wear safety goggles and adequate protective clothing when servicing fuel system.**

1. Disconnect negative battery cable.
2. Disconnect fuel heater, fuel temperature and water in fuel (WIF) sensor electrical connectors.
3. Drain fuel filter/water separator assembly into a suitable and appropriately marked container by loosening the WIF at the bottom of fuel filter.

**NOTE: Care must be taken to identify the fuel supply and return hoses before removal from the fuel filter housing. They can easily be crossed during installation and lead to a no start condition.**

4. Paint mark and remove the fuel inlet and outlet hoses.
5. Remove fuel supply and return hose from the housing.
6. Remove the fuel filter housing fasteners and housing.

## INSTALLATION

1. Install fuel filter/water separator assembly. Tighten retaining fasteners to 24.5 N·m (18 ft.lbs.).

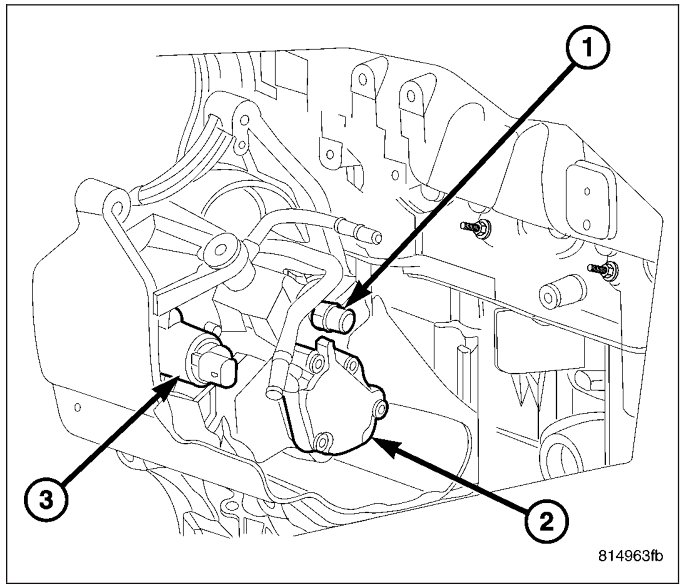
**NOTE: Care must be taken when installing the fuel lines to assure proper routing. The lines can easily be crossed and cause a no start condition after the repair.**

2. Connect the fuel supply and return lines. Tighten clamps to 7 N·m (62 in. lbs.).
3. Connect fuel heater, WIF and fuel temperature sensor electrical connectors.
4. Prime fuel system using the fuel priming plunger. (Refer to 14 - FUEL SYSTEM - STANDARD PROCEDURE).
5. Connect negative battery cable.

# FUEL QUANTITY SOLENOID

## DESCRIPTION

The fuel quantity solenoid is located in the back of the high pressure pump. The solenoid is pulse width modulated by the ECM and meters the amount of fuel that flows into the high pressure elements inside of the high pressure pump. The solenoid is also inactive during the first 30 seconds to allow maximum fuel pressure to the fuel rail during start up.



## OPERATION

The fuel quantity solenoid is a pulse width modulated valve that controls the amount of fuel sent or delayed to the high pressure pump elements inside of the high pressure pump. The ECM determines the fuel pressure set point based on engine sensor inputs. If the actual fuel rail pressure is too low, the ECM commands the solenoid to allow more fuel to flow to the high pressure pump. This minimizes the difference between the actual fuel rail pressure reading and the set point. The ECM will also operate the solenoid, delaying fuel if the fuel rail pressure becomes to high.

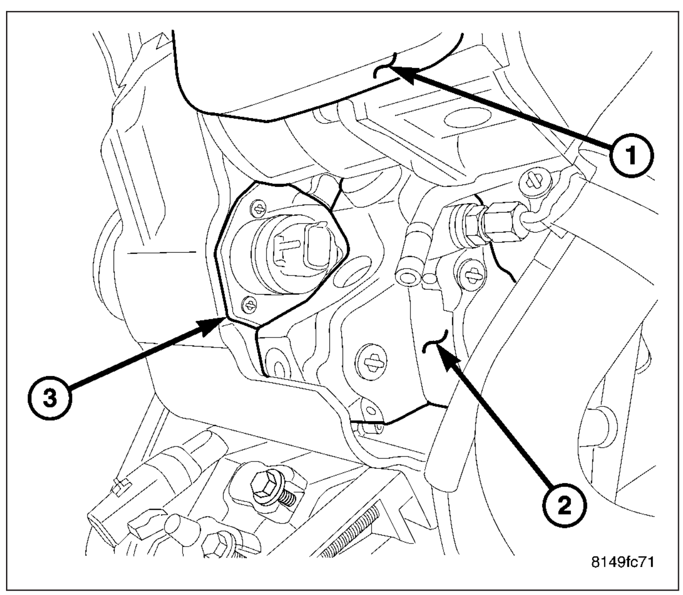
The fuel quantity solenoid is commanded open by the ECM to allow the high pressure pump to build maximum pressure (1600 BAR, 23,200 PSI) (Refer to 14 - FUEL SYSTEM - WARNING). the solenoid also has fuel tank heat protection function that meters the exact amount of fuel to prevent excess heated fuel from returning to the fuel tank

## REMOVAL

1. Disconnect the negative battery cable
2. Remove the charge air inlet hose.
3. Disconnect the fuel quantity solenoid wiring harness connector.
4. Remove the solenoid from the back of the high pressure pump.

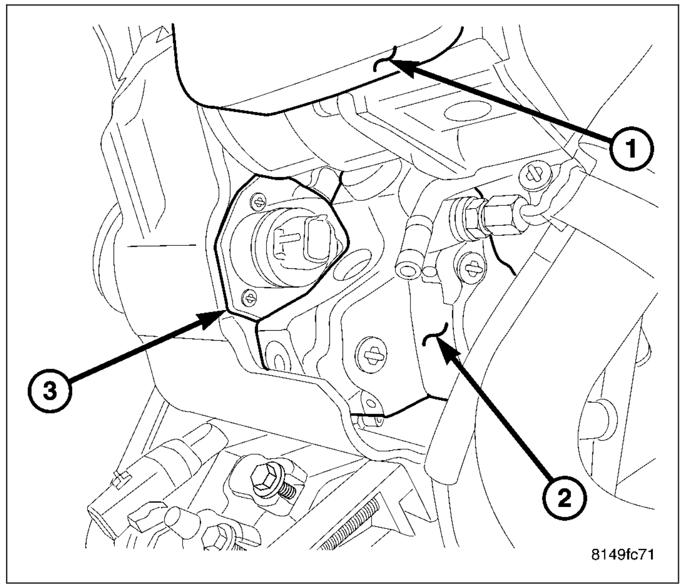
**NOTE: Inspect the fuel quantity solenoid and high pressure pump passage for contamination or corrosion. If contamination or corrosion is present replace the high pressure pump.**

5. Inspect solenoid and pump for corrosion.



## INSTALLATION

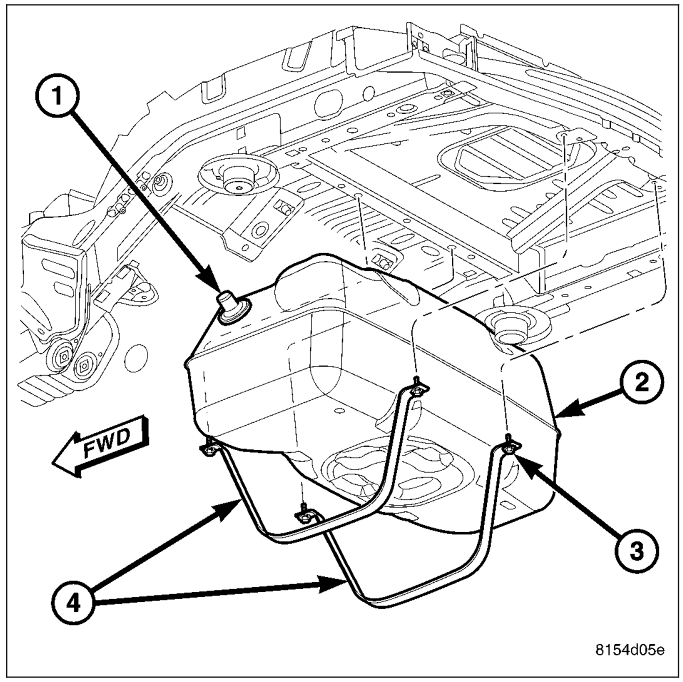
1. Review the high pressure fuel system warning (Refer to 14 - FUEL SYSTEM - WARNING).
2. Lubricate the fuel quantity solenoid and seal with clean diesel fuel.
3. Install the solenoid into the high pressure pump, hand tighten the fasteners.
4. Torque the solenoid fasteners to 10.8 N·m (96 in. lbs.).
5. Connect the wiring harness connector.
6. Install the charge air inlet hose.
7. Start engine, allow to warm, shut engine off and inspect for leaks.

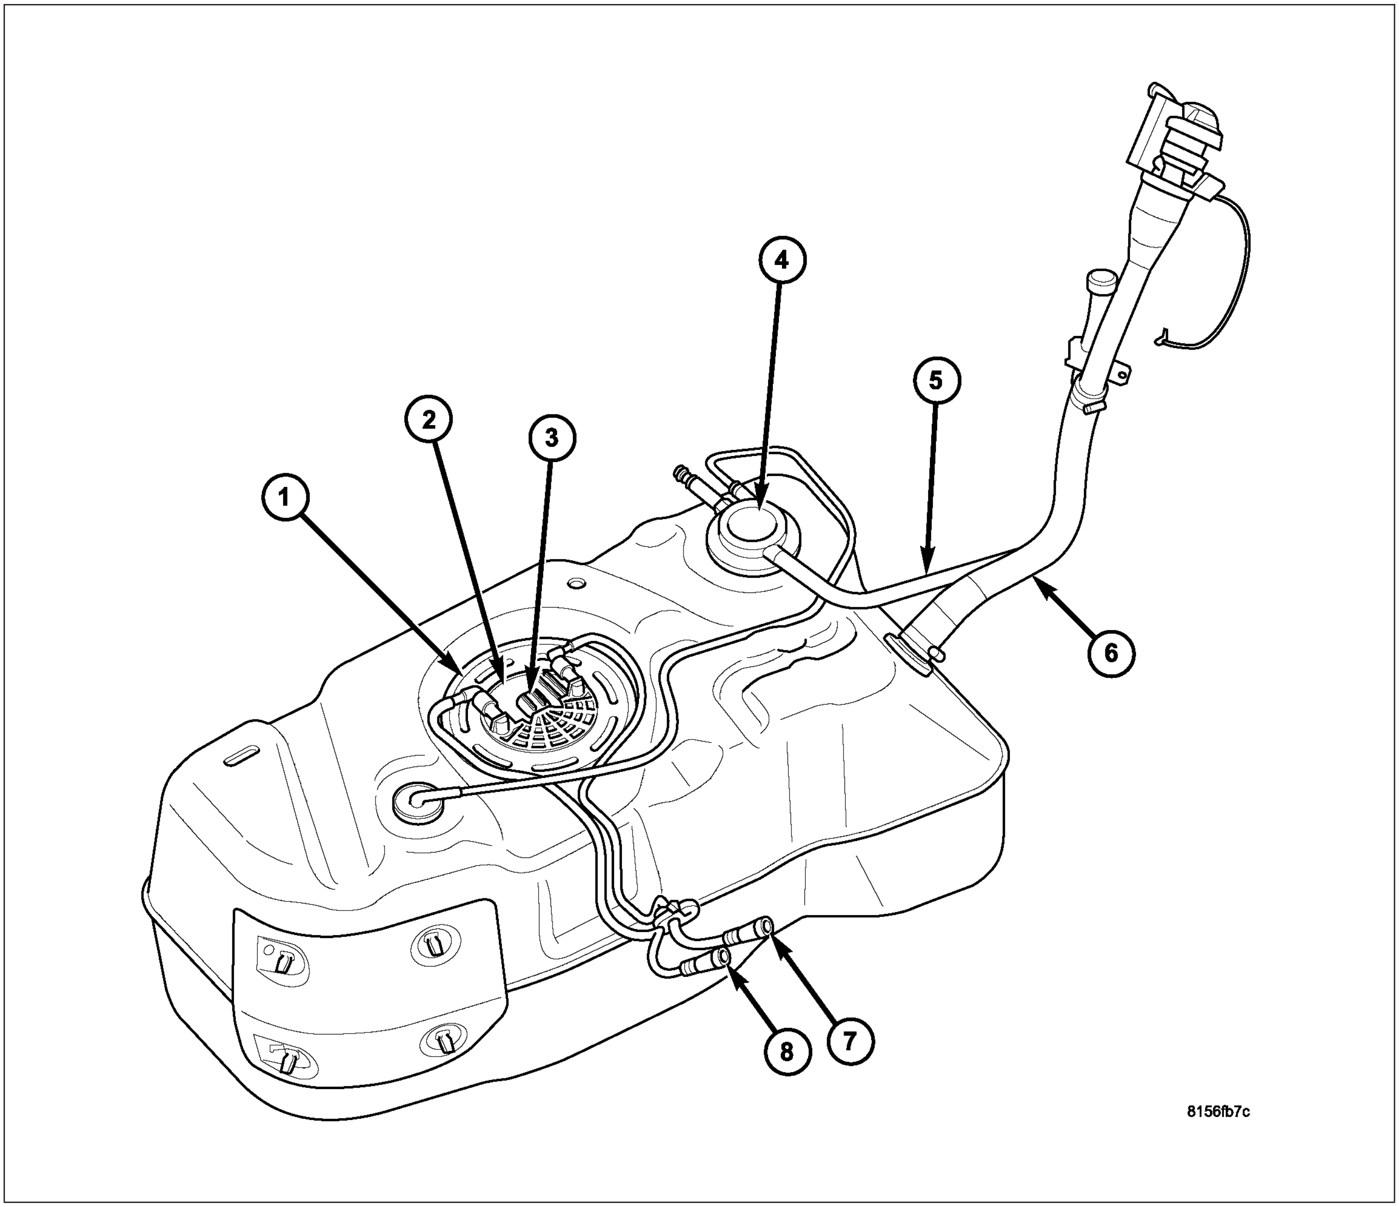


# FUEL TANK

## REMOVAL - DIESEL

1. Drain fuel tank. (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY - STANDARD PROCEDURE)
2. If equipped, remove fuel tank skid plate and tow hooks. Certain equipment packages will also require removal of the trailer hitch.
3. Support tank with a hydraulic jack.
4. Remove four fuel tank strap bolts (3) (2 at front of tank; 2 at rear of tank), and remove both tank support straps (4).
5. Carefully lower tank a few inches.

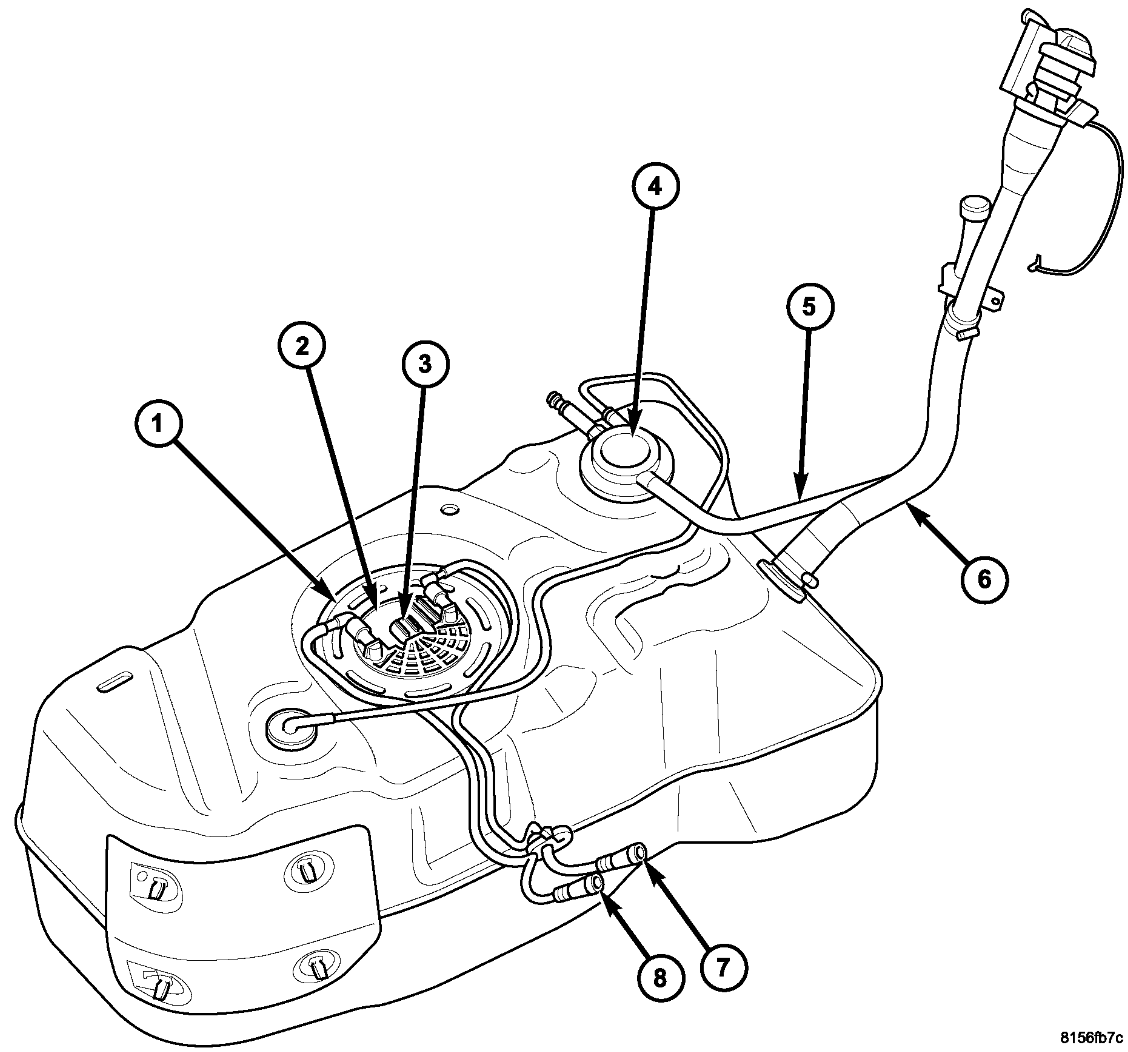




6. Disconnect fuel tank module electrical connector (3) on top of fuel tank.
7. Disconnect fuel supply line (8) at front of fuel tank.
8. Disconnect fuel return line (7) at front of fuel tank.
9. Disconnect vent hose (5).
10. Continue lowering tank while guiding remaining hoses and lines through plastic isolator sleeve on frame rail.
11. If fuel tank is to be replaced, remove fuel tank module from tank. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK MODULE - REMOVAL)

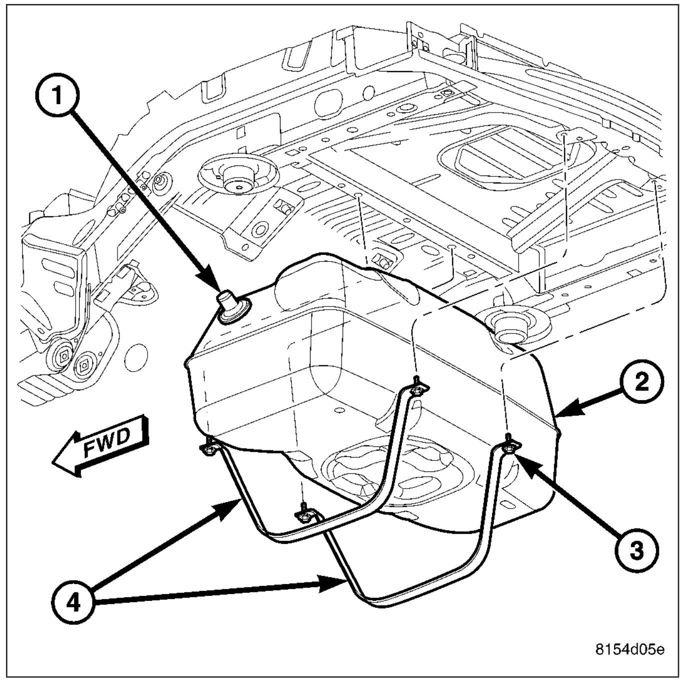
## INSTALLATION - DIESEL

1. If fuel tank is to be replaced, install fuel tank module to tank. Refer to Fuel Tank Module Removal/Installation procedures.
2. Position fuel tank to hydraulic jack.
3. Raise tank while carefully guiding vent tubes/hoses through plastic isolator sleeve located on crossmember.

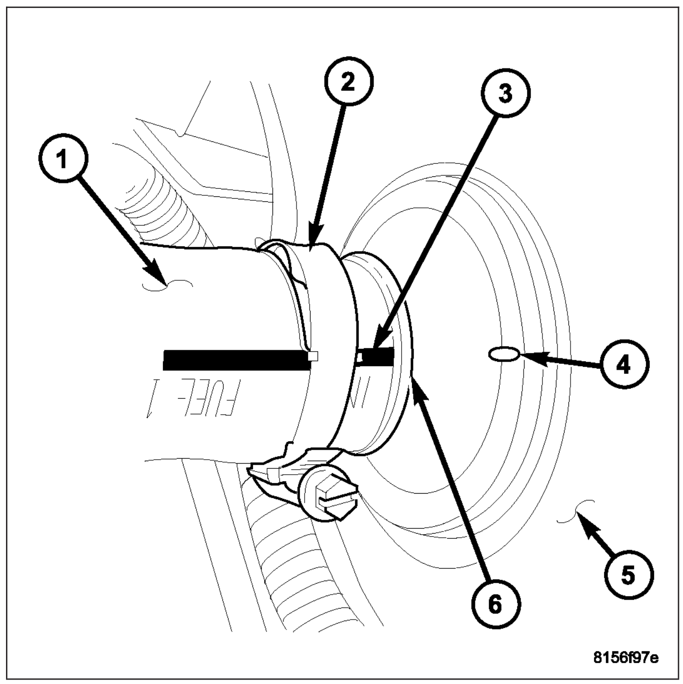


4. Continue raising tank until module electrical connector (7) can be connected. After connection has been made, continue to raise tank to body.
5. Connect fuel supply line (3).
6. Connect fuel return line (6).

7. Attach two fuel tank mounting straps (4) and four mounting bolts (3). Tighten bolts to 61 N·m (45 ft. lbs.) torque.

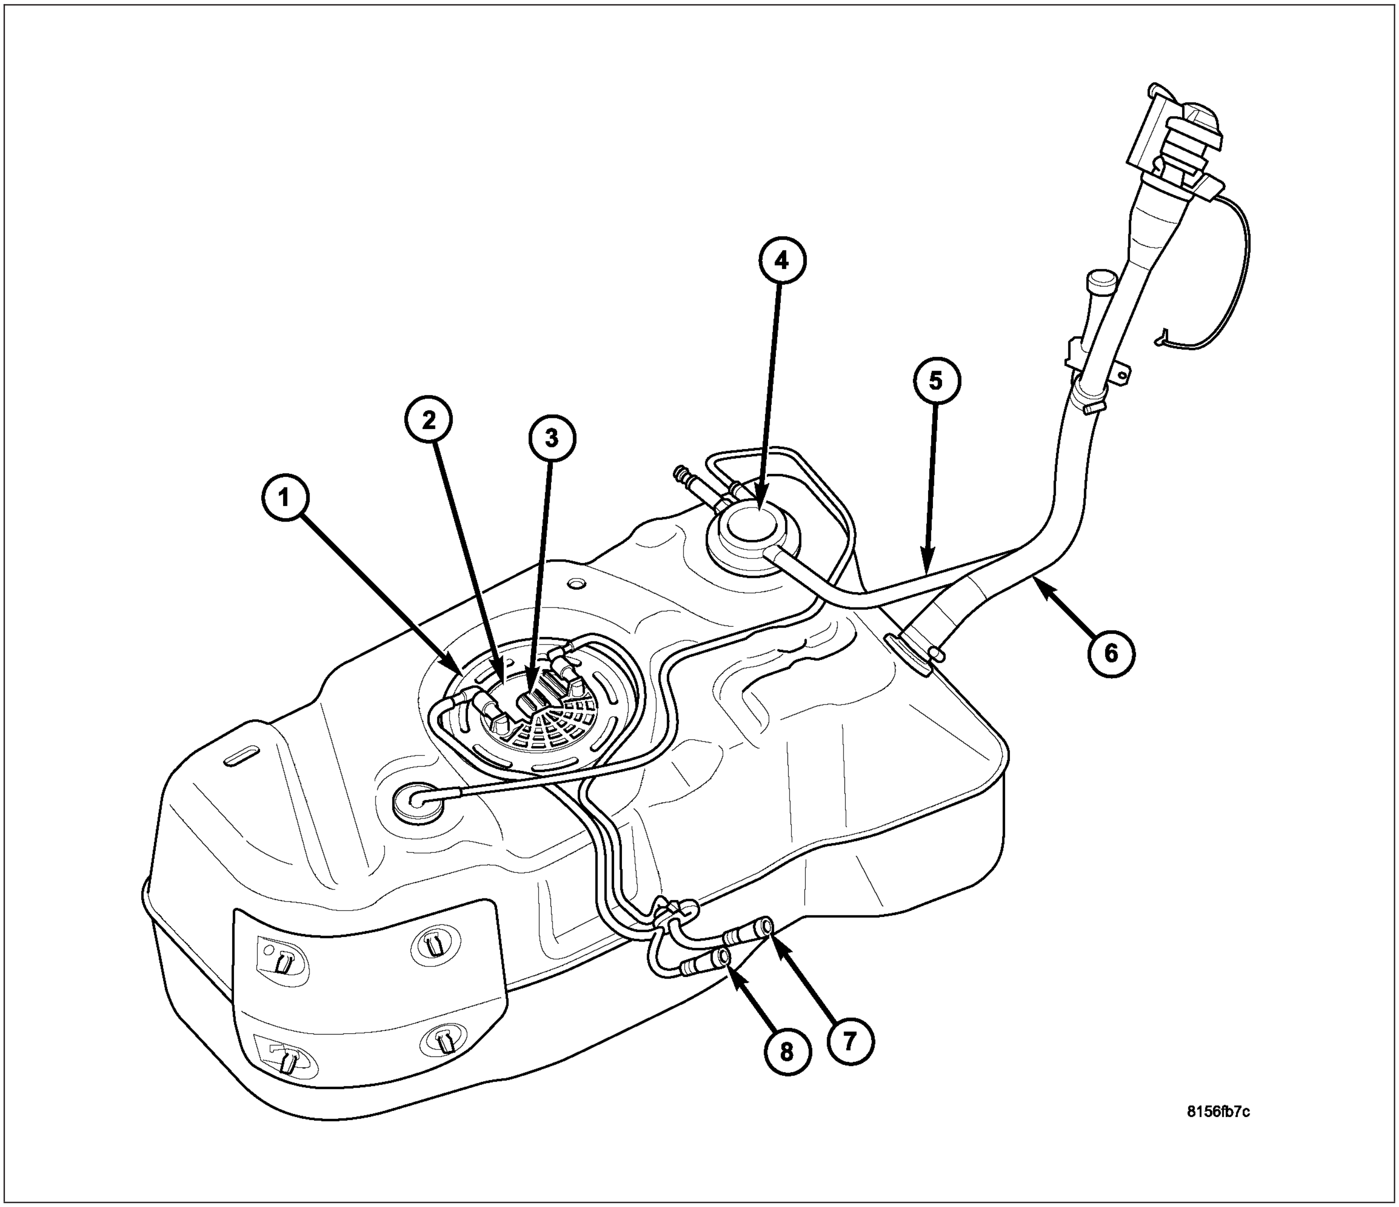


8. Install fuel fill hose and hose clamp to fuel tank fitting. Rotate hose until white painted index mark (3) on hose is located to alignment notch (4) on fuel tank fitting. Tighten clamp to 3.4 N·m (30 in. lbs.) torque.
9. If equipped, install fuel tank skid plate, trailer hitch and tow hooks. Refer to Tow Hooks, Trailer Hitch or Skid Plate in 23, Body for removal/installation procedures.
10. Lower vehicle.
11. Connect negative battery cable to battery.
12. Fill fuel tank with fuel.
13. Start engine and check for fuel leaks.



# FUEL TANK MODULE

## DESCRIPTION

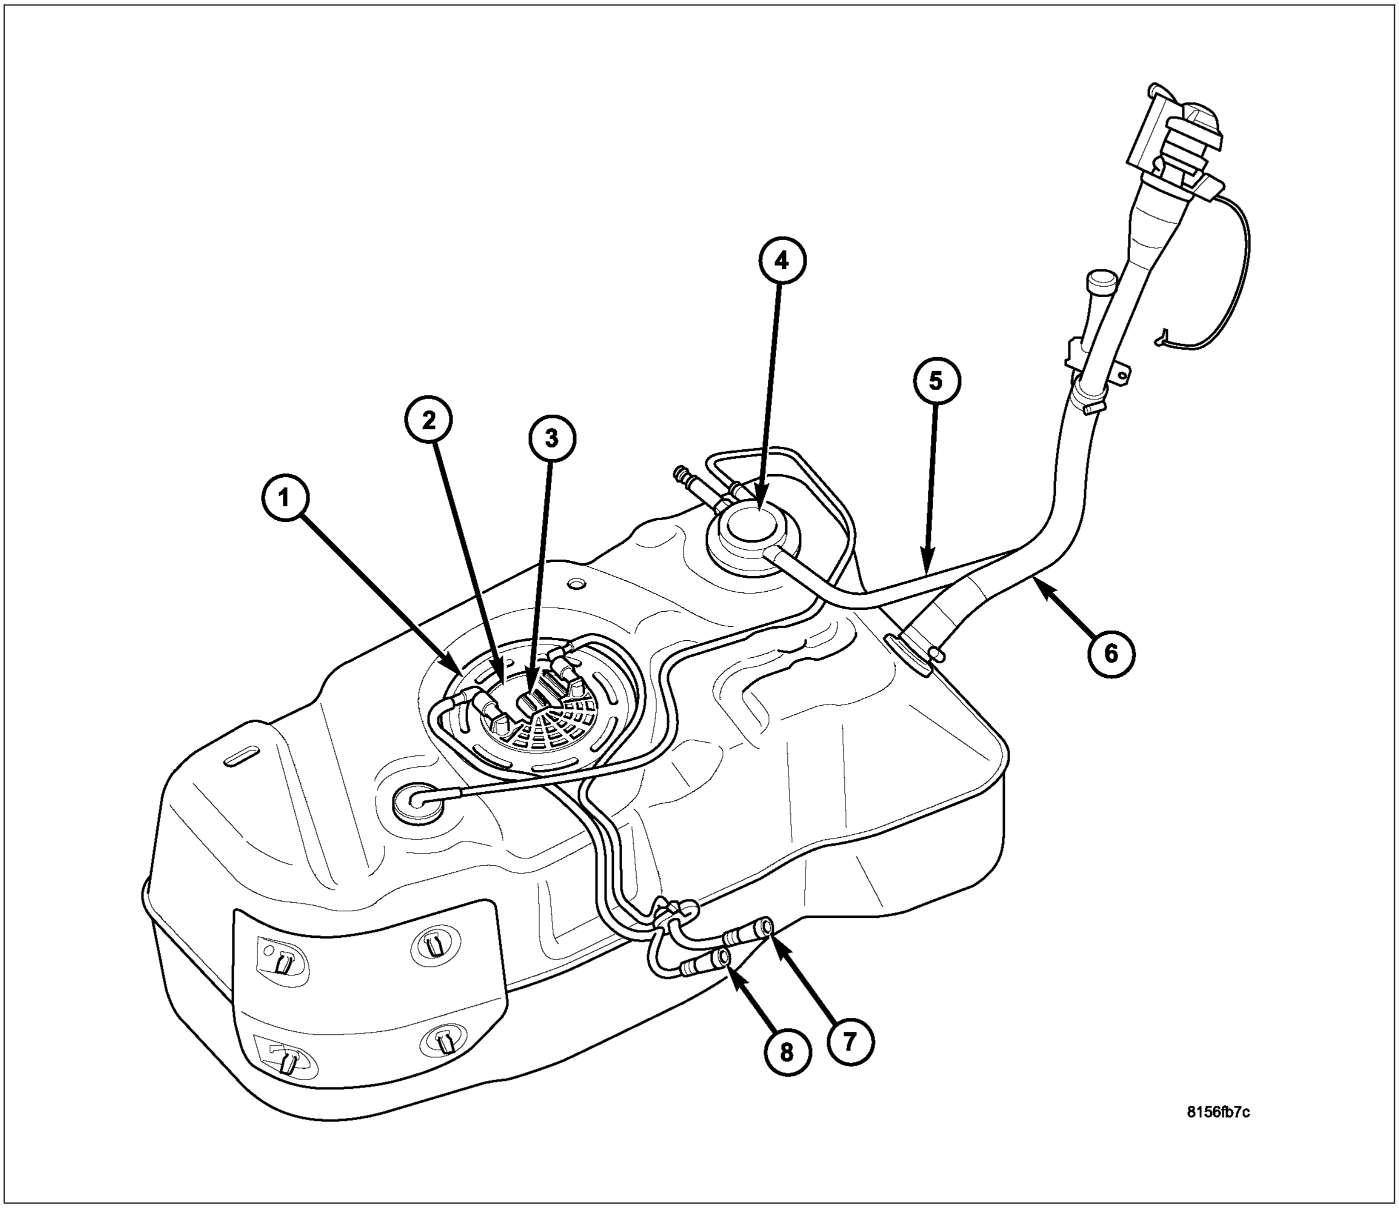


The fuel tank module (2) is installed in the top of the fuel tank. The fuel tank module contains the following components:

- Fuel reservoir
- A separate in-tank fuel filter
- Fuel gauge sending unit (fuel level sensor)
- A special lockring (1) to retain module to fuel tank
- Fuel supply line connections
- Fuel return line connections

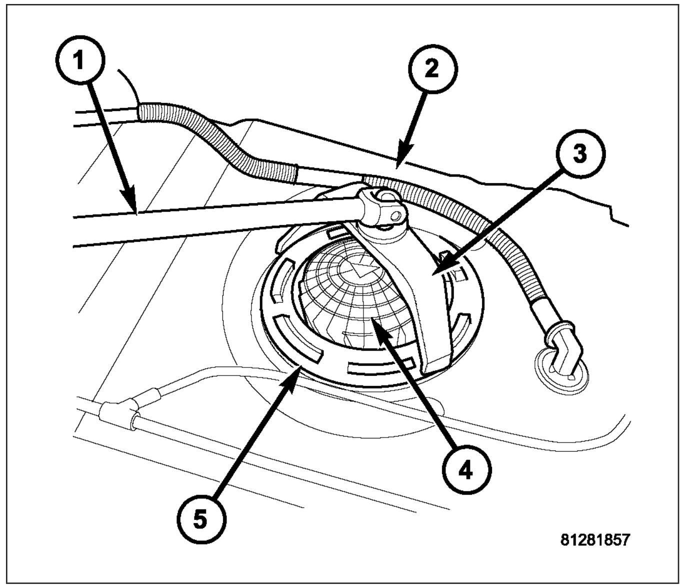
A separate electric fuel pump (sometimes referred to as a low-pressure fuel transfer or lift pump) **is not attached** to the fuel tank module. Instead, a gear supply pump is mounted to the rear of the high-pressure fuel injection pump. This supply pump draws fuel under a vacuum; through the fuel filter; and from the fuel tank. Refer to Fuel Injection Pump for additional information.

## REMOVAL



The fuel tank module (2) is located on top of the fuel tank.

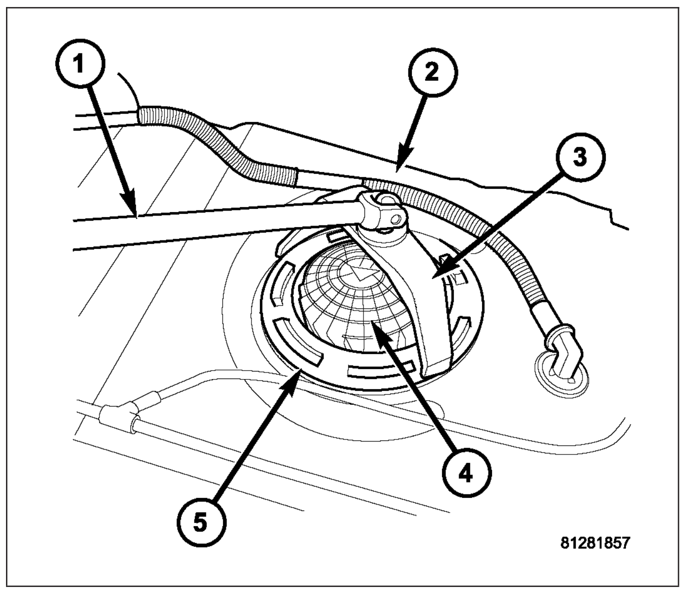
1. Drain and remove fuel tank. Refer to Fuel Tank Removal/Installation.
2. Note rotational position of module before attempting removal. An indexing arrow is located on top of module for this purpose.
3. Position Special Tool 9340 (3) into notches on outside edge of lockring (5).
4. Install 1/2 inch drive breaker bar (1) to tool 9340 (3).
5. Rotate breaker bar counter-clockwise to remove lockring.
6. Remove lockring. The module will spring up slightly when lockring is removed.
7. Remove module from fuel tank. Be careful not to bend float arm while removing.



## INSTALLATION

**CAUTION: Whenever the fuel pump module is serviced, the rubber seal (gasket) must be replaced.**

1. Using a new seal (gasket), position fuel tank module into opening in fuel tank.
2. Position lockring (5) over top of fuel pump module.
3. Rotate module until embossed alignment arrow points to center alignment mark. This step must be performed to prevent float from contacting side of fuel tank. Also be sure fuel fitting on top of pump module is pointed to front of vehicle.
4. Install Special Tool 9340 (3) to lockring.
5. Install 1/2 inch drive breaker (1) into Special Tool 9340 (3).
6. Tighten lockring (clockwise) until all seven notches have engaged.
7. Install fuel tank. Refer to Fuel Tank Removal/Installation.



# FUEL INJECTION - 3.7L GAS

## TABLE OF CONTENTS

# FUEL INJECTION - 3.7L GAS

## DESCRIPTION

The Powertrain Control Module (PCM) operates the fuel injection system. Refer to Powertrain Control Module in Electronic Control Modules for information.

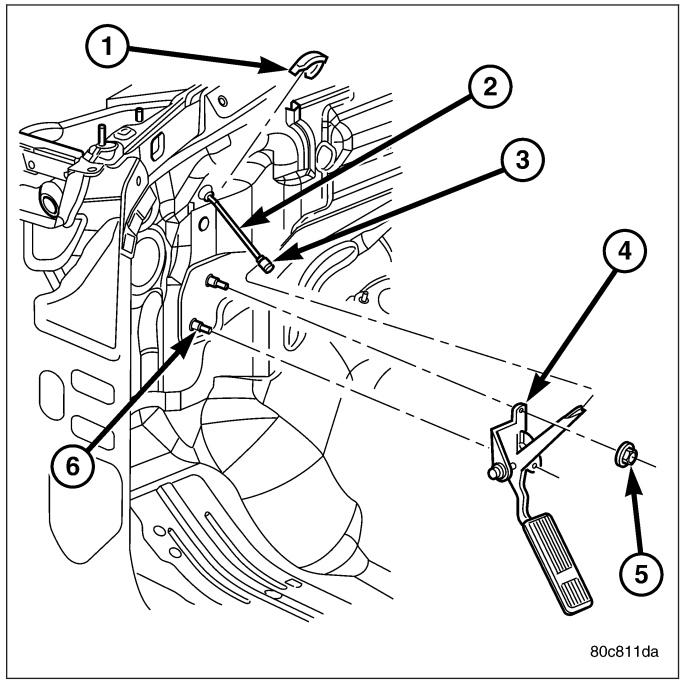
# PEDAL-ACCELERATOR

## REMOVAL

The accelerator pedal is serviced as a complete assembly including the bracket.

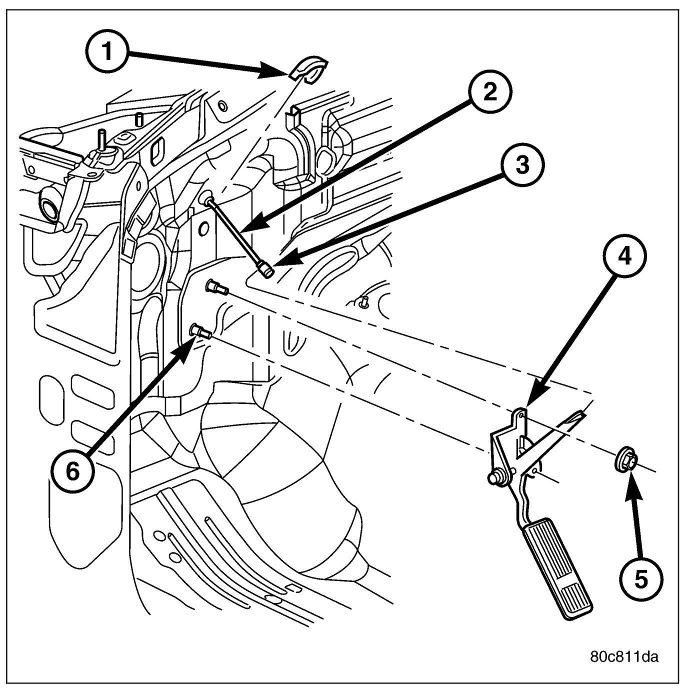
The accelerator pedal is connected to the upper part of the accelerator pedal arm by a plastic retainer (clip). This plastic retainer (3) snaps into the top of the accelerator pedal arm.

1. From inside the vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of accelerator pedal arm. Plastic cable retainer (clip) snaps into pedal arm.
2. Remove 2 accelerator pedal mounting bracket nuts (5). Remove accelerator pedal assembly (4).



## INSTALLATION

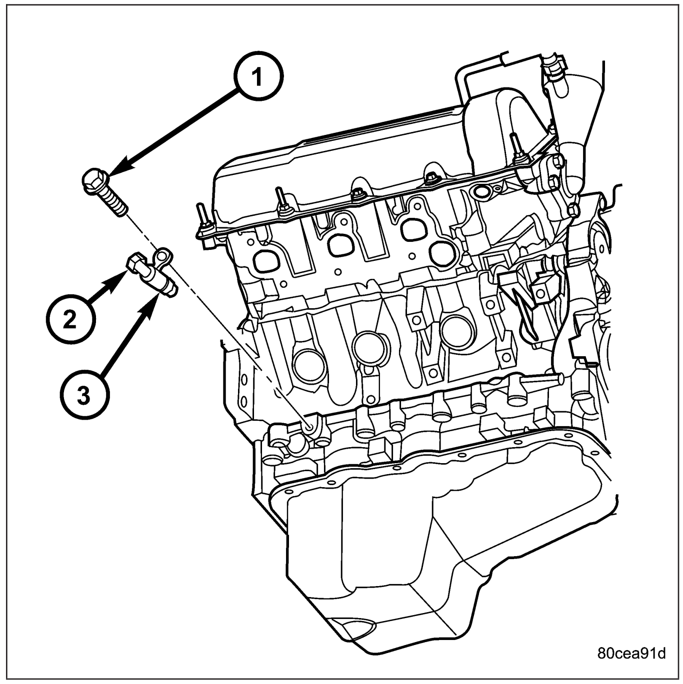
1. Place accelerator pedal assembly (4) over two mounting studs (6) protruding from floor pan.
2. Install two mounting nuts (5). Torque to 12 N·m (105 in. lbs.).
3. Slide throttle cable into opening slot in top of pedal arm.
4. Push plastic cable retainer (clip) (3) into accelerator pedal arm opening until it snaps into place.
5. Before starting engine, operate accelerator pedal to check for any binding.



# SENSOR-CRANKSHAFT POSITION

## DESCRIPTION

The Crankshaft Position (CKP) sensor (2) is mounted into the right rear side of the cylinder block. It is positioned and bolted into a machined hole.



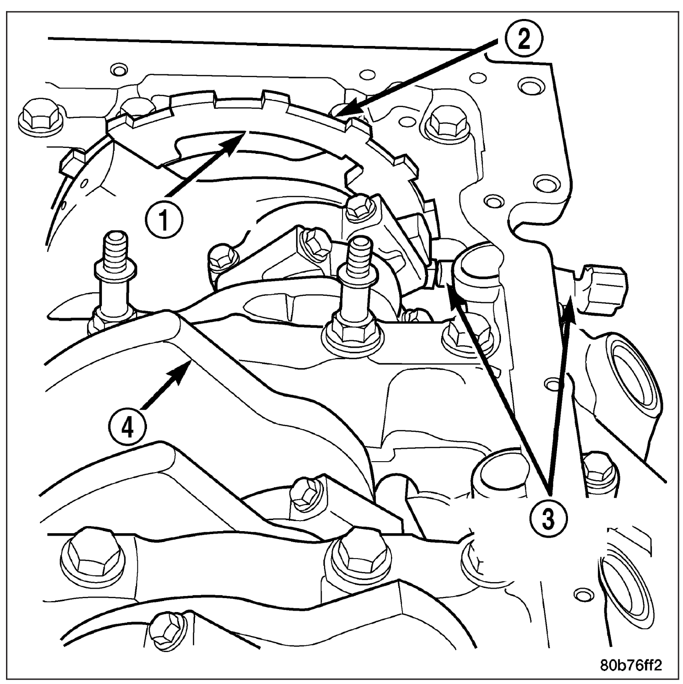
## OPERATION

Engine speed and crankshaft position are provided through the CKP (Crankshaft Position) sensor. The sensor generates pulses that are the input sent to the Powertrain Control Module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

A tonewheel (targetwheel) is bolted to the engine crankshaft (1). This tonewheel has sets of notches (2) at its outer edge.

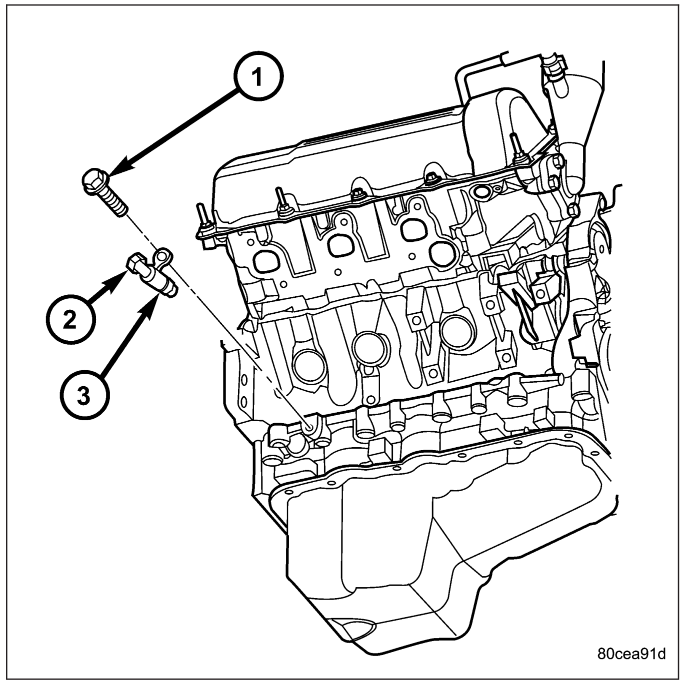
The notches (2) cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM.



## REMOVAL

The Crankshaft Position (CKP) sensor (2) is mounted into the right rear side of the cylinder block. It is positioned and bolted into a machined hole.

1. Raise vehicle.
2. Disconnect sensor electrical connector.
3. Remove sensor mounting bolt (1).
4. Carefully twist sensor from cylinder block.
5. Check condition of sensor O-ring (3).

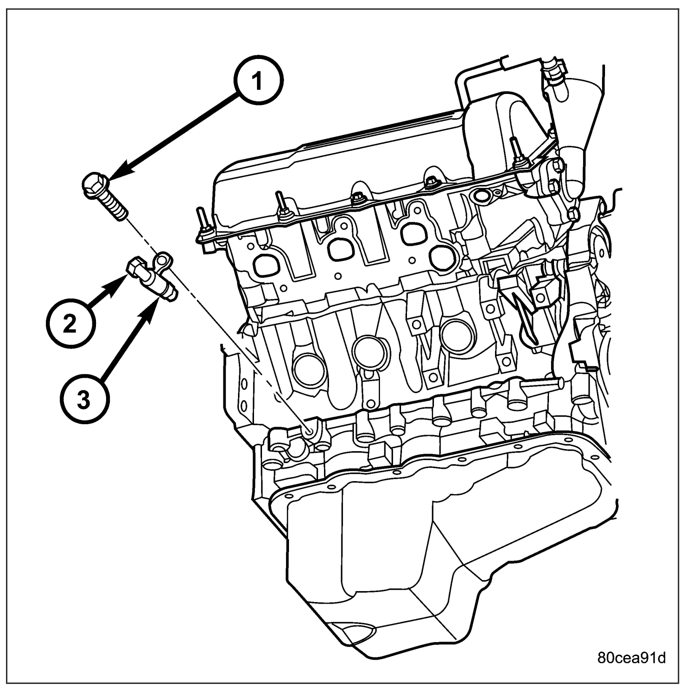


## INSTALLATION

1. Clean out machined hole in engine block.
2. Apply a small amount of engine oil to sensor O-ring (3).
3. Install sensor (2) into engine block with a slight rocking and twisting action.

**CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.**

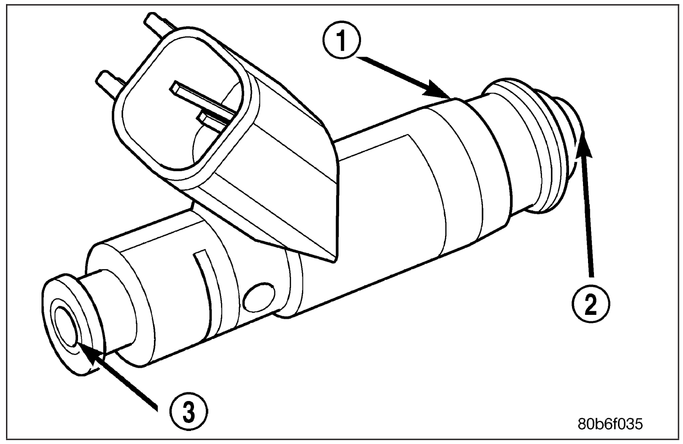
4. Install mounting bolt (1) and tighten to 28 N·m (21 ft. lbs.) torque.
5. Connect electrical connector to sensor.
6. Lower vehicle.



# INJECTOR-FUEL

## DESCRIPTION

An individual fuel injector (1) is used for each individual cylinder.



## OPERATION

## FUEL INJECTOR

The top (fuel entry) end of the injector is attached into an opening on the fuel rail.

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

## PCM OUTPUT

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

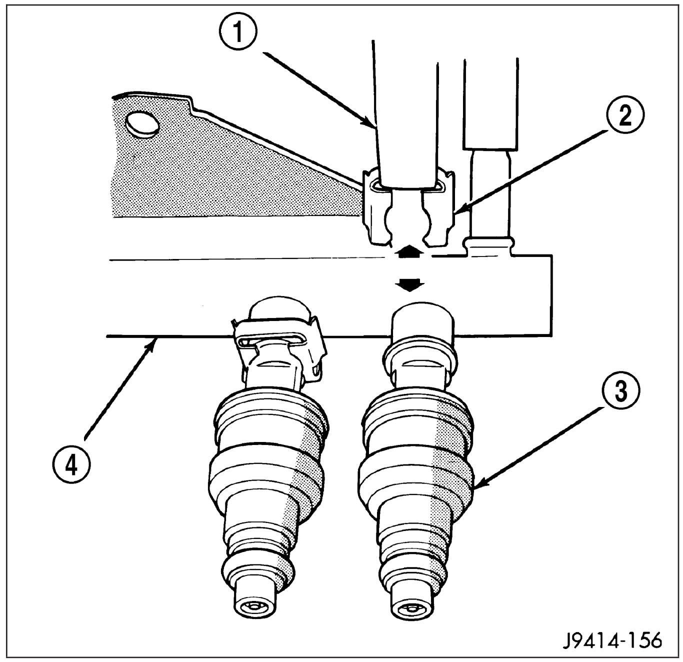
The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shut-down the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

## REMOVAL

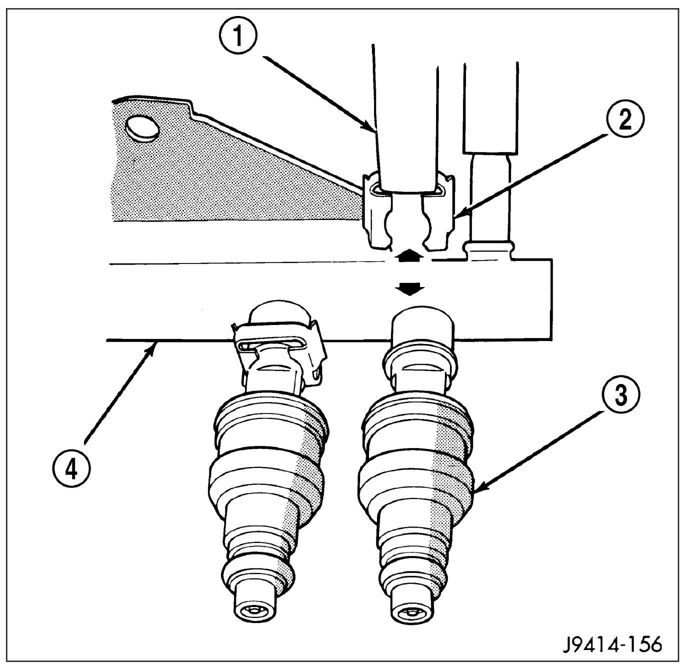
1. Remove fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - REMOVAL)
2. Disconnect clip(s) (2) that retain fuel injector(s) (3) to fuel rail (4)



.

## INSTALLATION

1. Install fuel injector(s) (3) into fuel rail assembly (4) and install retaining clip(s) (2).
2. If same injector(s) is being reinstalled, install new O-ring(s). Two different O-rings are being used. These can be easily identified by color. Install black O-ring at intake manifold end of injector. Install red/rust colored O-ring at fuel rail end of injector.
3. Apply a small amount of clean engine oil to each injector O-ring. This will aid in installation.
4. Install fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION)
5. Start engine and check for fuel leaks.



# RELAY-FUEL PUMP

## DESCRIPTION

The 5-pin, 12-volt, fuel pump relay is located in the Power Distribution Center (PDC). Refer to the label on the PDC cover for relay location.

## OPERATION

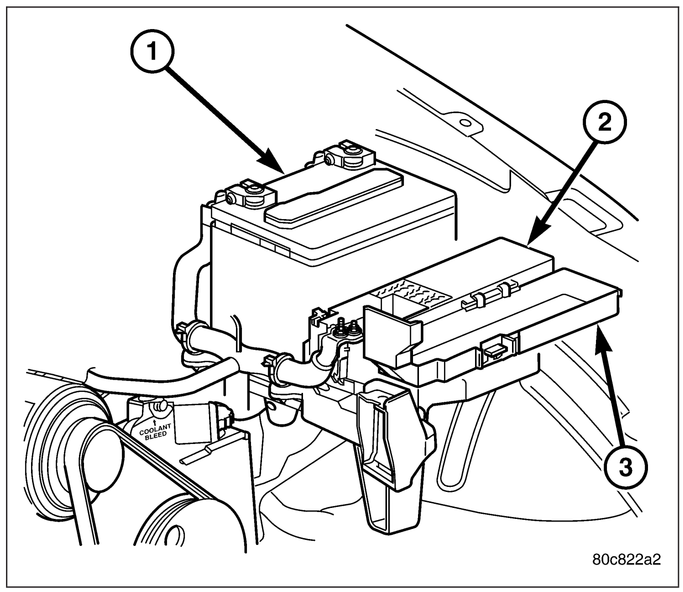
The Powertrain Control Module (PCM) energizes the electric fuel pump through the fuel pump relay. The fuel pump relay is energized by first applying battery voltage to it when the ignition key is turned ON, and then applying a ground signal to the relay from the PCM.

Whenever the ignition key is turned ON, the electric fuel pump will operate. But, the PCM will shut-down the ground circuit to the fuel pump relay in approximately 1–3 seconds unless the engine is operating or the starter motor is engaged.

## REMOVAL

The fuel pump relay is located in the Power Distribution Center (PDC) (2). Refer to label on PDC cover (3) for relay location.

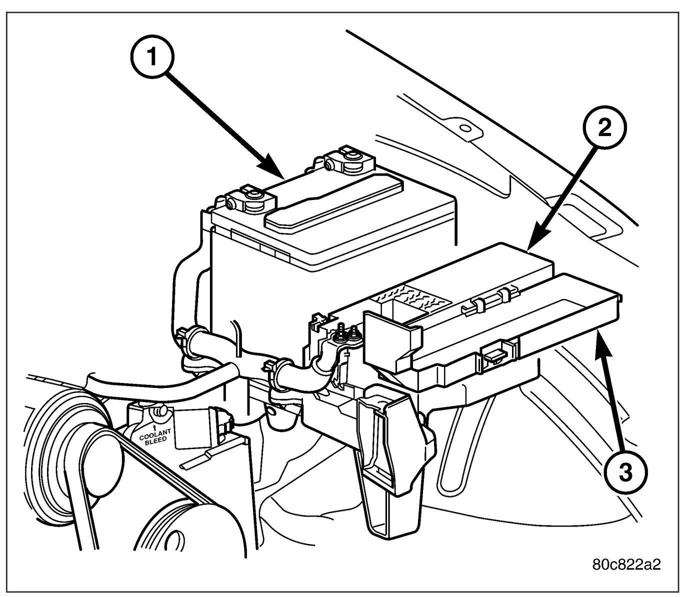
1. Remove PDC cover (3).
2. Remove relay from PDC.
3. Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
4. Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.



## INSTALLATION

The fuel pump relay is located in the Power Distribution Center (PDC) (2). Refer to label on PDC cover (3) for relay location.

1. Install relay to PDC.
2. Install cover (3) to PDC.



# MOTOR-IDLE AIR CONTROL

## DESCRIPTION

The IAC stepper motor is mounted to the throttle body, and regulates the amount of air bypassing the control of the throttle plate. As engine loads and ambient temperatures change, engine rpm changes. A pintle on the IAC stepper motor protrudes into a passage in the throttle body, controlling air flow through the passage. The IAC is controlled by the Powertrain Control Module (PCM) to maintain the target engine idle speed.

## OPERATION

At idle, engine speed can be increased by retracting the IAC motor pintle and allowing more air to pass through the port, or it can be decreased by restricting the passage with the pintle and diminishing the amount of air bypassing the throttle plate.

The IAC is called a stepper motor because it is moved (rotated) in steps, or increments. Opening the IAC opens an air passage around the throttle blade which increases RPM.

The PCM uses the IAC motor to control idle speed (along with timing) and to reach a desired MAP during decel (keep engine from stalling).

The IAC motor has 4 wires with 4 circuits. Two of the wires are for 12 volts and ground to supply electrical current to the motor windings to operate the stepper motor in one direction. The other 2 wires are also for 12 volts and ground to supply electrical current to operate the stepper motor in the opposite direction.

To make the IAC go in the opposite direction, the PCM just reverses polarity on both windings. If only 1 wire is open, the IAC can only be moved 1 step (increment) in either direction. To keep the IAC motor in position when no movement is needed, the PCM will energize both windings at the same time. This locks the IAC motor in place.

In the IAC motor system, the PCM will count every step that the motor is moved. This allows the PCM to determine the motor pintle position. If the memory is cleared, the PCM no longer knows the position of the pintle. So at the first key ON, the PCM drives the IAC motor closed, regardless of where it was before. This zeros the counter. From this point the PCM will back out the IAC motor and keep track of its position again.

When engine rpm is above idle speed, the IAC is used for the following:

- Off-idle dashpot (throttle blade will close quickly but idle speed will not stop quickly)
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)
- Power steering load control

The PCM can control polarity of the circuit to control direction of the stepper motor.

**IAC Stepper Motor Program:** The PCM is also equipped with a memory program that records the number of steps the IAC stepper motor most recently advanced to during a certain set of parameters. For example: The PCM was attempting to maintain a 1000 rpm target during a cold start-up cycle. The last recorded number of steps for that may have been 125. That value would be recorded in the memory cell so that the next time the PCM recognizes the identical conditions, the PCM recalls that 125 steps were required to maintain the target. This program allows for greater customer satisfaction due to greater control of engine idle.

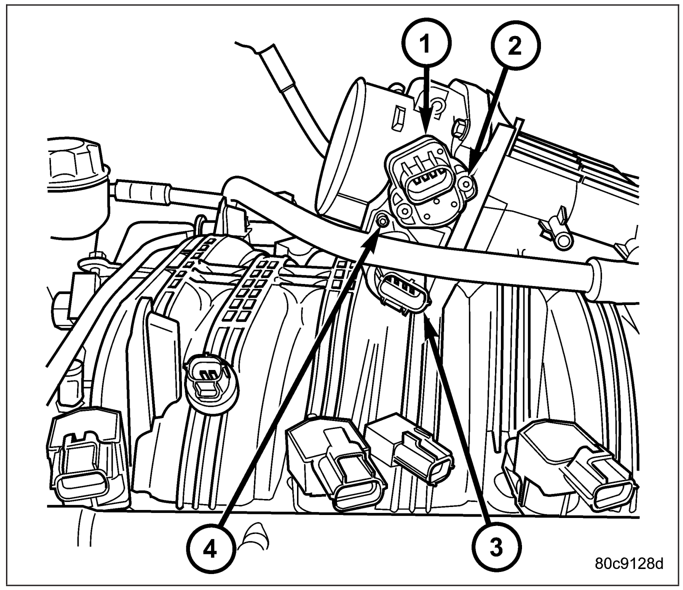
Another function of the memory program, which occurs when the power steering switch (if equipped), or the A/C request circuit, requires that the IAC stepper motor control engine rpm, is the recording of the last targeted steps into the memory cell. The PCM can anticipate A/C compressor loads. This is accomplished by delaying compressor operation for approximately 0.5 seconds until the PCM moves the IAC stepper motor to the recorded steps that were loaded into the memory cell. Using this program helps eliminate idle-quality changes as loads change. Finally, the PCM incorporates a ″No-Load″ engine speed limiter of approximately 1800 - 2000 rpm, when it recognizes that the TPS is indicating an idle signal and IAC motor cannot maintain engine idle.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the IAC motor through the PCM.

## REMOVAL

The Idle Air Control (IAC) motor (3) is located on the side of the throttle body.

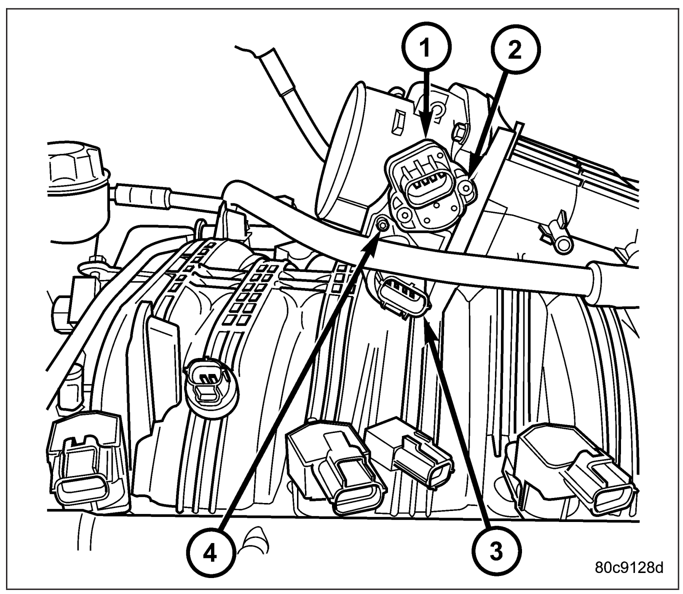
1. Disconnect electrical connector from IAC motor.
2. Remove two mounting bolts (screws) (4).
3. Remove IAC motor (3) from throttle body.



## INSTALLATION

The Idle Air Control (IAC) motor (3) is located on the side of the throttle body.

1. Install IAC motor (3) to throttle body.
2. Install and tighten two mounting bolts (screws) (4) to 7 N·m (60 in. lbs.) torque.
3. Install electrical connector.



# SENSOR-INTAKE AIR TEMPERATURE

## DESCRIPTION

The 2–wire Intake Manifold Air Temperature (IAT) sensor is installed in the intake manifold with the sensor element extending into the air stream.

The IAT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as intake manifold temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

## OPERATION

The IAT sensor provides an input voltage to the Powertrain Control Module (PCM) indicating the density of the air entering the intake manifold based upon intake manifold temperature. At key-on, a 5–volt power circuit is supplied to the sensor from the PCM. The sensor is grounded at the PCM through a low-noise, sensor-return circuit.

The PCM uses this input to calculate the following:

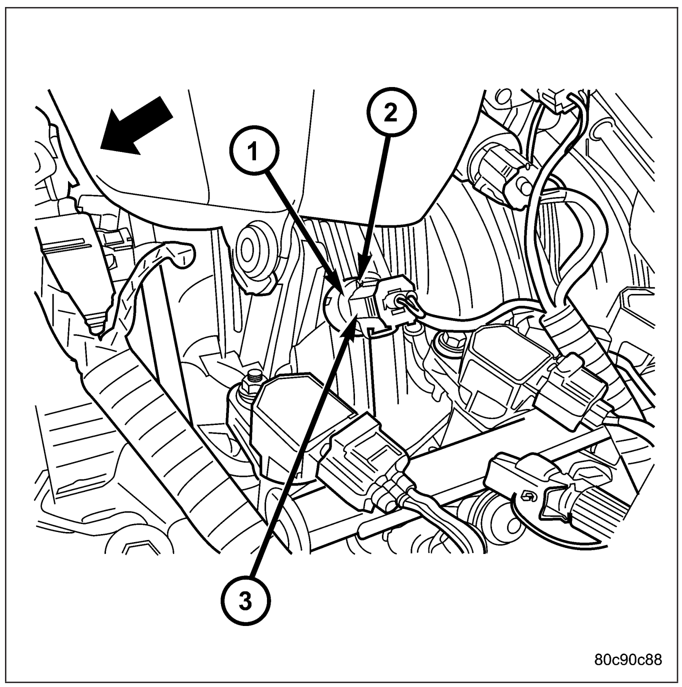
- Injector pulse-width
- Adjustment of spark timing (to help prevent spark knock with high intake manifold air-charge temperatures)

The resistance values of the IAT sensor is the same as for the Engine Coolant Temperature (ECT) sensor.

## REMOVAL

The intake manifold air temperature (IAT) sensor (1) is installed into the left side of intake manifold plenum.

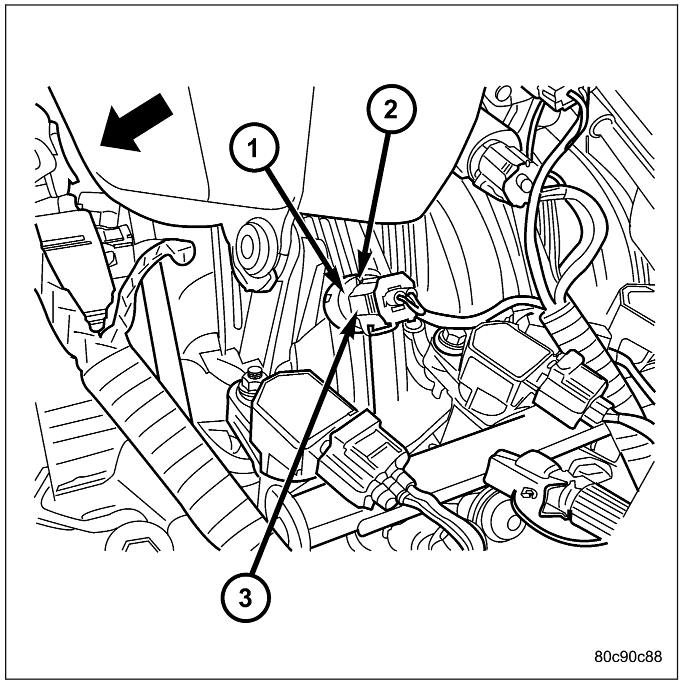
1. Disconnect electrical connector (3) from IAT sensor.
2. Clean dirt from intake manifold at sensor base.
3. Gently lift on small plastic release tab (2) or and rotate sensor about 1/4 turn counter-clockwise for removal.
4. Check condition of sensor O-ring.



## INSTALLATION

The intake manifold air temperature (IAT) sensor (1) is installed into the left side of intake manifold plenum.

1. Check condition of sensor O-ring.
2. Clean sensor mounting hole in intake manifold.
3. Position sensor into intake manifold and rotate clockwise until past release tab (2).
4. Install electrical connector (3).



# SENSOR-MANIFOLD AIR PRESSURE

## DESCRIPTION

The Manifold Absolute Pressure (MAP) sensor is mounted into the front of the intake manifold with 2 screws.

## OPERATION

The MAP sensor is used as an input to the Powertrain Control Module (PCM). It contains a silicon based sensing unit to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When manifold absolute pressure (MAP) equals Barometric pressure, the pulse width will be at maximum.

A 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0–15 psi, the voltage changes 4.0V. To operate the sensor, it is supplied a regulated 4.8 to 5.1 volts. Ground is provided through the low-noise, sensor return circuit at the PCM.

The MAP sensor input is the number one contributor to fuel injector pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or at a higher altitude, because the air density changes with altitude. It will also help to correct for varying barometric pressure. Barometric pressure and altitude have a direct inverse correlation; as altitude goes up, barometric goes down. At key-on, the PCM powers up and looks at MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure (relative to altitude). Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key-on. The difference between current voltage and what it was at key-on, is manifold vacuum.

During key-on (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring a known good sensor.

As the altitude increases, the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key-on, the barometric pressure needs to be updated. Any time the PCM sees Wide Open Throttle (WOT), based upon Throttle Position Sensor (TPS) angle and RPM, it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor input to aid in calculating the following:

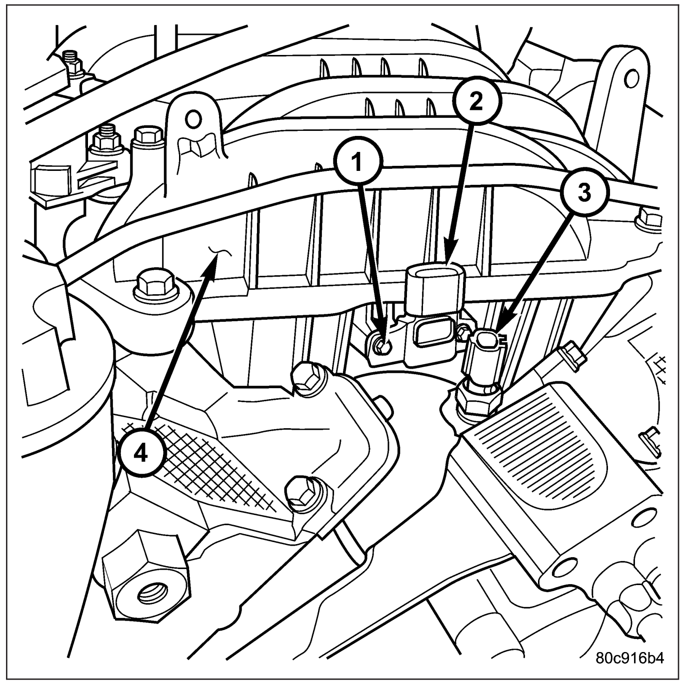
- Manifold pressure
- Barometric pressure
- Engine load
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (certain automatic transmissions only)
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As manifold pressure changes, the diaphragm moves causing the element to deflect, which stresses the silicone. When silicone is exposed to stress, its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

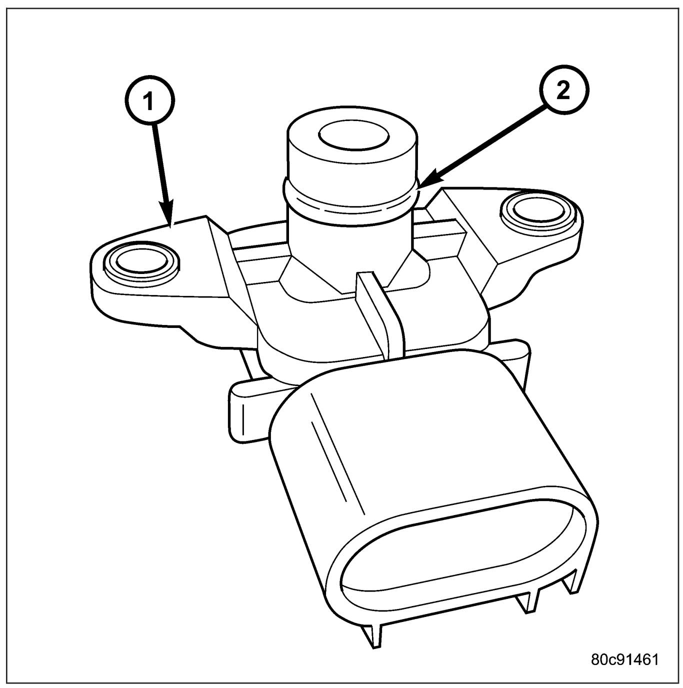
The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; meaning as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is approximately 29.92 in Hg. For every 100 feet of altitude, barometric pressure drops 0.10 in. Hg. If a storm goes through, it can change barometric pressure from what should be present for that altitude. You should know what the average pressure and corresponding barometric pressure is for your area.

## REMOVAL

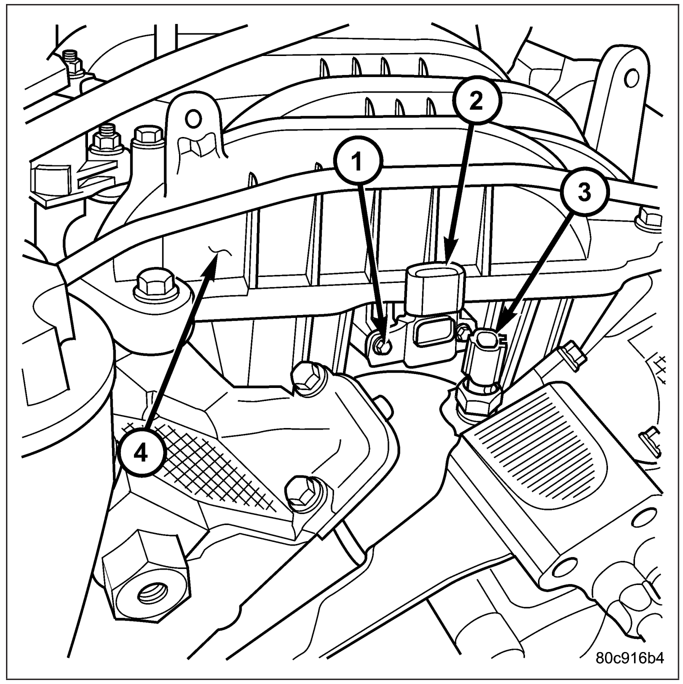
The Manifold Absolute Pressure (MAP) sensor (2) is mounted into the front of the intake manifold.



An O-ring (2) is used to seal the sensor to the intake manifold.



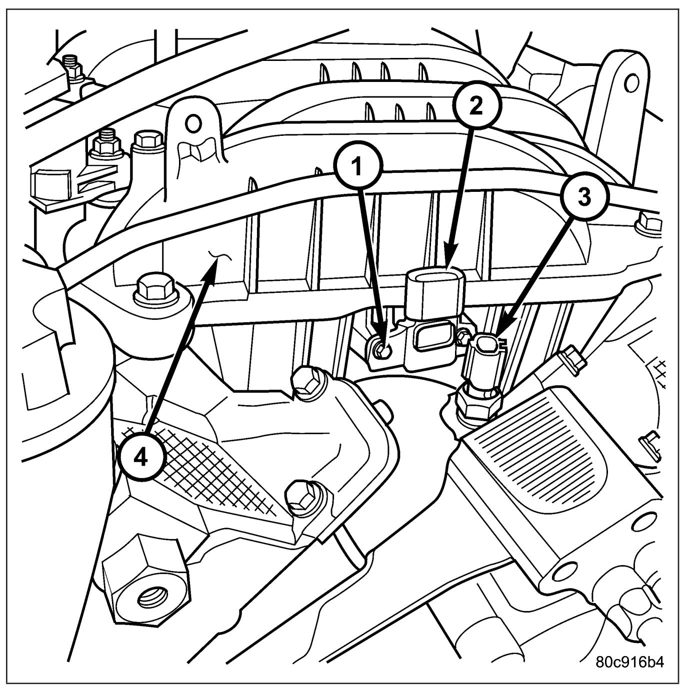
1. Disconnect electrical connector at sensor (2).
2. Clean area around MAP sensor.
3. Remove 2 sensor mounting screws (1).
4. Remove MAP sensor from intake manifold.
5. Check condition of sensor O-ring.



## INSTALLATION

The Manifold Absolute Pressure (MAP) sensor (2) is mounted into the front of the intake manifold. An O-ring is used to seal the sensor to the intake manifold.

1. Clean MAP sensor mounting hole at intake manifold.
2. Check MAP sensor O-ring seal for cuts or tears.
3. Position sensor (2) into manifold.
4. Install MAP sensor mounting bolts (screws) (1). Tighten screws to 3 N·m (25 in. lbs.) torque.
5. Connect electrical connector.



# SENSOR-OXYGEN

## DESCRIPTION

The Oxygen Sensors (O2S) are attached to, and protrude into the vehicle exhaust system. Depending on the engine or emission package, the vehicle may use a total of either 2 or 4 sensors.

On this emissions package, 4 sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2). With this emission package, the right upstream sensor (2/1) is located in the right exhaust downpipe just before the mini-catalytic convertor. The left upstream sensor (1/1) is located in the left exhaust downpipe just before the mini-catalytic convertor. The right downstream sensor (2/2) is located in the right exhaust downpipe just after the mini-catalytic convertor, and before the main catalytic convertor. The left downstream sensor (1/2) is located in the left exhaust downpipe just after the mini-catalytic convertor, and before the main catalytic convertor.

## OPERATION

An O2 sensor is a galvanic battery that provides the PCM with a voltage signal (0-1 volt) inversely proportional to the amount of oxygen in the exhaust. In other words, if the oxygen content is low, the voltage output is high; if the oxygen content is high the output voltage is low. The PCM uses this information to adjust injector pulse-width to achieve the 14.7–to–1 air/fuel ratio necessary for proper engine operation and to control emissions.

The O2 sensor must have a source of oxygen from outside of the exhaust stream for comparison. Current O2 sensors receive their fresh oxygen (outside air) supply through the O2 sensor case housing.

Four wires (circuits) are used on each O2 sensor: a 12–volt feed circuit for the sensor heating element; a ground circuit for the heater element; a low-noise sensor return circuit to the PCM, and an input circuit from the sensor back to the PCM to detect sensor operation.

Four heated oxygen sensors are used. A separate oxygen sensor relay is used to supply voltage to the sensors heating elements for only the 1/2 and 2/2 downstream sensors. Voltage for the other 2 sensor heating elements is supplied directly from the Powertrain Control Module (PCM) through a Pulse Width Module (PWM) method.

**Pulse Width Module (PWM):** Voltage to the O2 sensor heating elements is supplied directly from the Powertrain Control Module (PCM) through two separate Pulse Width Module (PWM) low side drivers. PWM is used on the 2 upstream sensors (1/1 and 2/1). The main objective for a PWM driver is to avoid overheating of the O2 sensor heater element. With exhaust temperatures increasing with time and engine speed, it's not required to have a full-voltage duty-cycle on the O2 heater elements.

To avoid the large simultaneous current surge needed to operate all 4 sensors, power is delayed to the 2 downstream heater elements by the PCM for approximately 2 seconds.

**Oxygen Sensor Heater Elements:**

The O2 sensor uses a Positive Thermal Co-efficient (PTC) heater element. As temperature increases, resistance increases. At ambient temperatures around 70°F, the resistance of the heating element is approximately 4.5 ohms. As the sensor's temperature increases, resistance in the heater element increases. This allows the heater to maintain the optimum operating temperature of approximately 930°-1100°F (500°-600° C). Although the sensors operate the same, there are physical differences, due to the environment that they operate in, that keep them from being interchangeable.

Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors certain O2 sensor input(s) along with other inputs, and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

Two upstream sensors are used (1/1 and 2/1). The 1/1 sensor is the first sensor to receive exhaust gases from the #1 cylinder. They provide an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensors. The PCM will change the air/fuel ratio until the upstream sensors input a voltage that the PCM has determined will make the downstream sensors output (oxygen content) correct.

The upstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

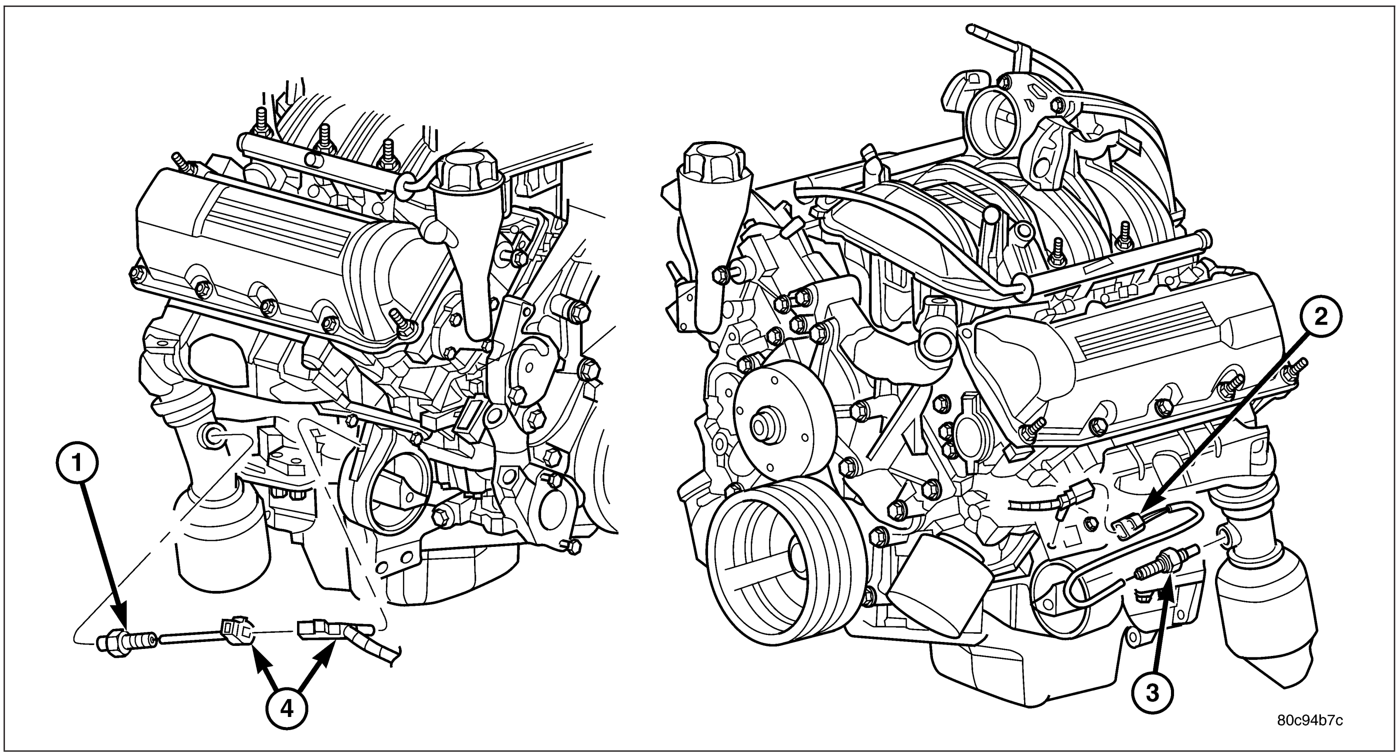
Two downstream sensors are used (1/2 and 2/2). The downstream sensors are used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage, and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

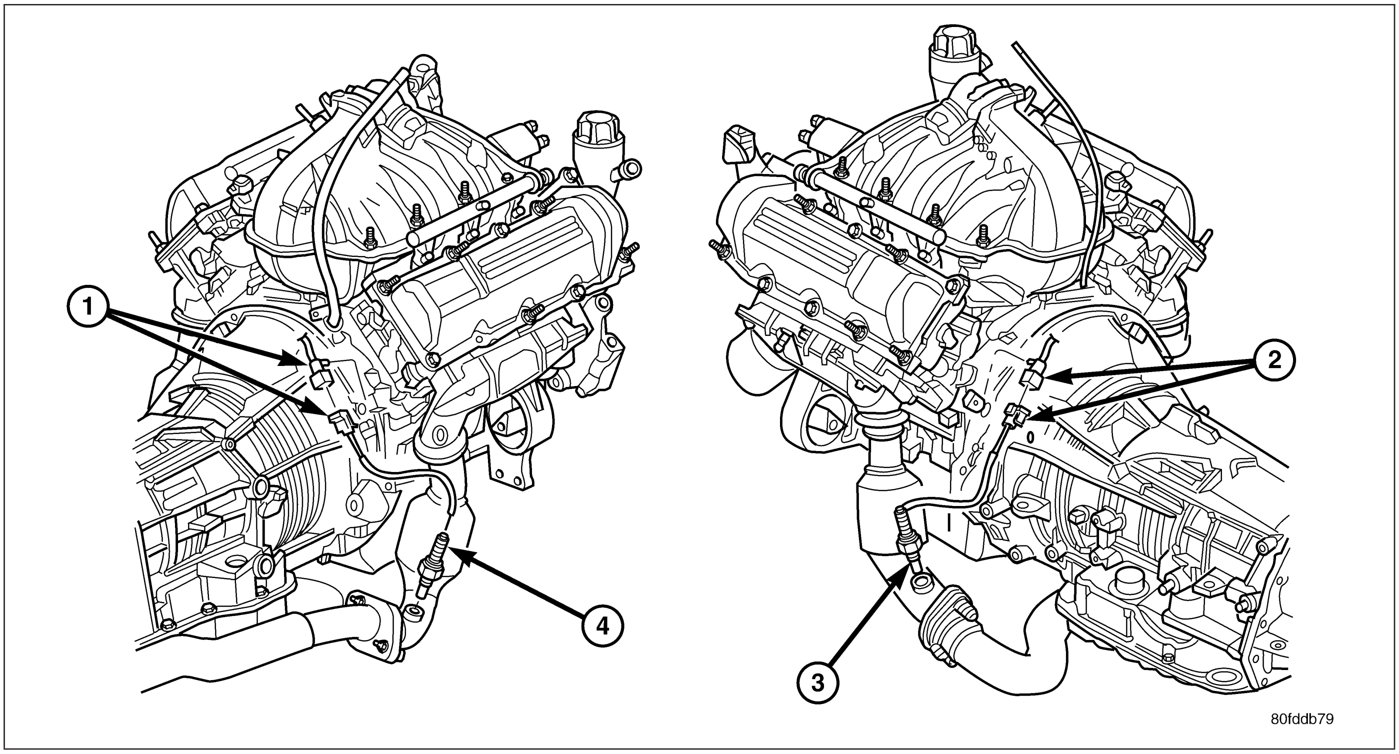
Engines equipped with either a downstream sensor(s), or a post-catalytic sensor, will monitor catalytic convertor efficiency. If efficiency is below emission standards, the Malfunction Indicator Lamp (MIL) will be illuminated and a Diagnostic Trouble Code (DTC) will be set. Refer to Monitored Systems in Emission Control Systems for additional information.

## REMOVAL

**CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.**



The upstream sensors are (1) and (3).



The downstream sensors are (3) and (4).

**WARNING: The exhaust manifold, exhaust pipes and catalytic converter become very hot during engine operation. Allow engine to cool before removing oxygen sensor.**

1. Raise and support vehicle.
2. Disconnect wire connector from O2S sensor.

**CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.**

3. Remove O2S sensor with an oxygen sensor removal and installation tool.
4. Clean threads in exhaust pipe using appropriate tap.

## INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to threads of a new oxygen sensor.**

1. Install O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.
2. Connect O2S sensor wire connector.
3. Lower vehicle.

# BODY-THROTTLE

## DESCRIPTION

The throttle body is located on the intake manifold. Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

## OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

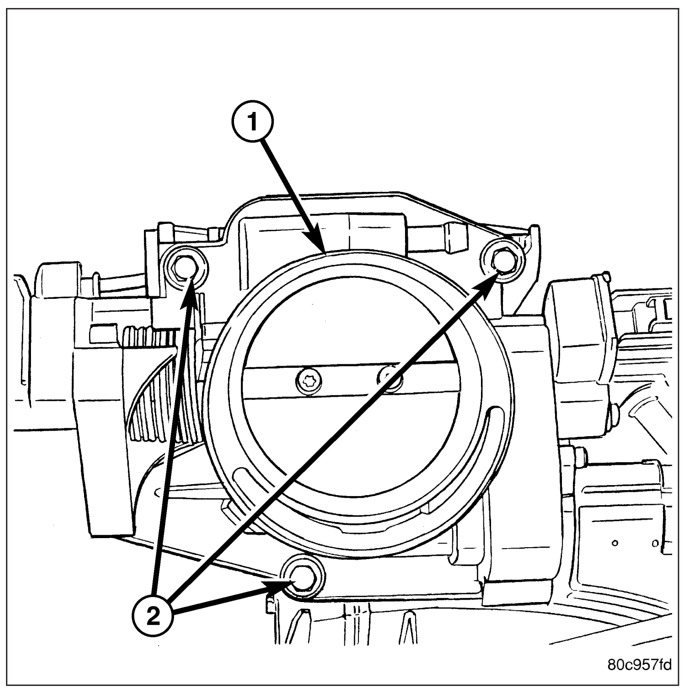
Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

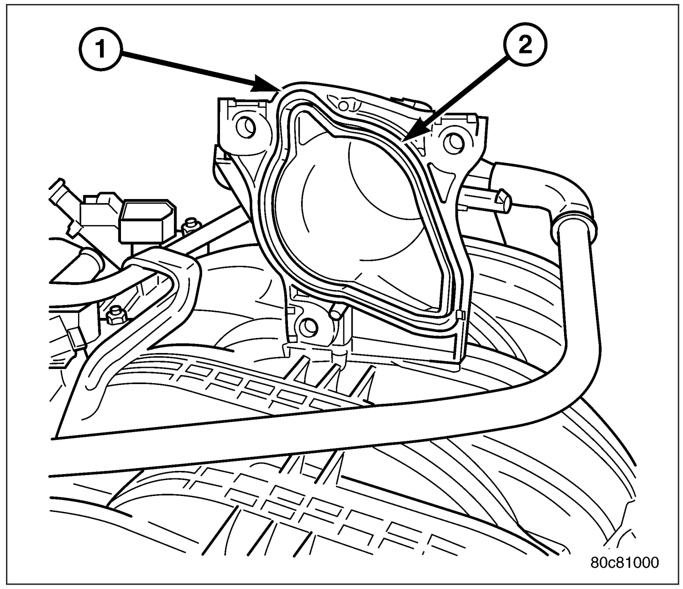
## REMOVAL

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the Powertrain Control Module (PCM).

1. Remove air cleaner tube at throttle body.
2. Disconnect throttle body electrical connectors at IAC motor and TPS.
3. Remove all control cables from throttle body (lever) arm. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL)
4. Disconnect necessary vacuum lines at throttle body.
5. Remove three throttle body mounting bolts (2).
6. Remove throttle body from intake manifold.

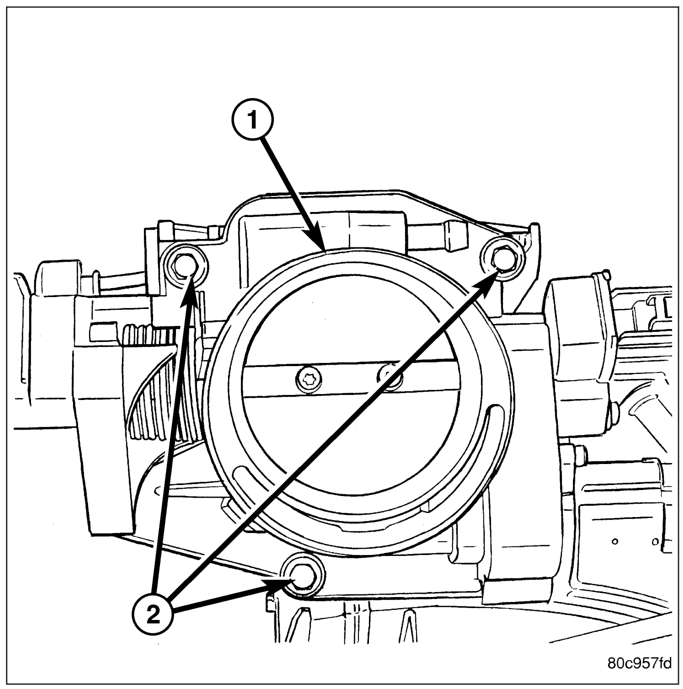


7. Check condition of old throttle body-to-intake manifold o-ring (2).



## INSTALLATION

1. Check condition of throttle body-to-intake manifold o-ring. Replace as necessary.
2. Clean mating surfaces of throttle body and intake manifold.
3. Install throttle body-to-intake manifold O-ring.
4. Install throttle body (1) to intake manifold.
5. Install three mounting bolts (2). Tighten bolts to 12 N·m (105 in. lbs.) torque.
6. Install control cables.
7. Install electrical connectors.
8. Install necessary vacuum lines.
9. Install air cleaner duct at throttle body.

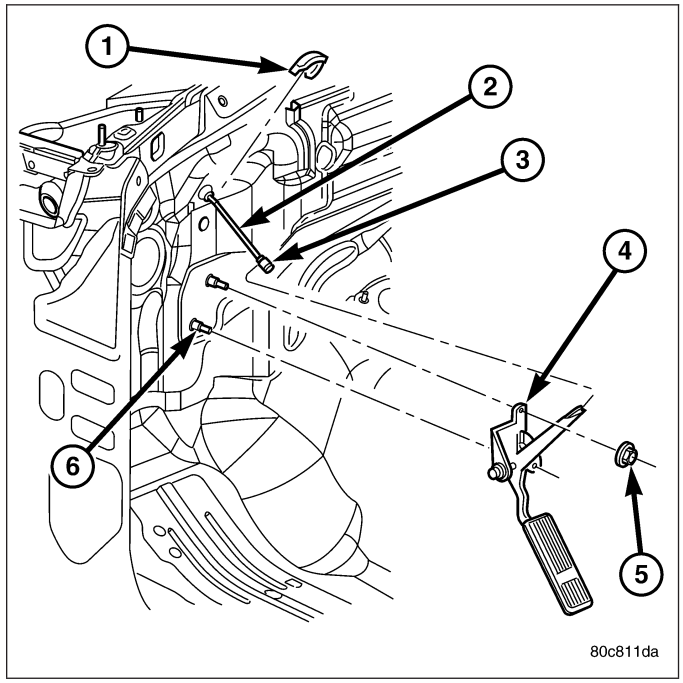


# CABLE-THROTTLE CONTROL

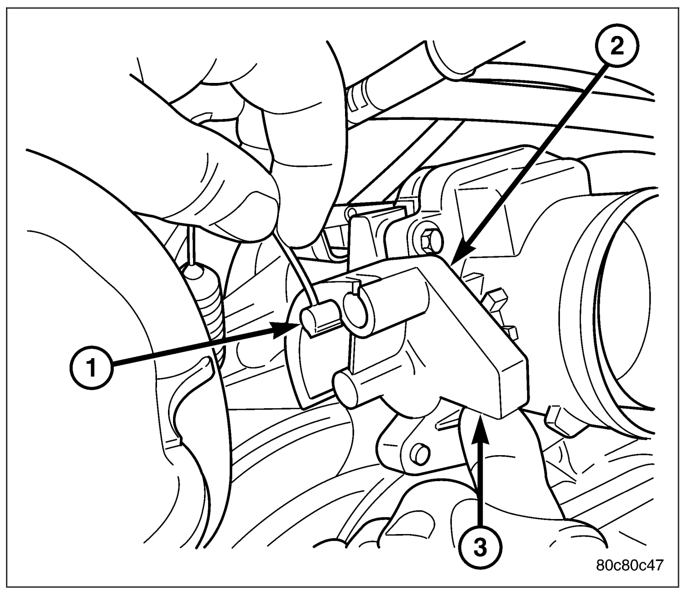
## REMOVAL

**CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or throttle cable.**

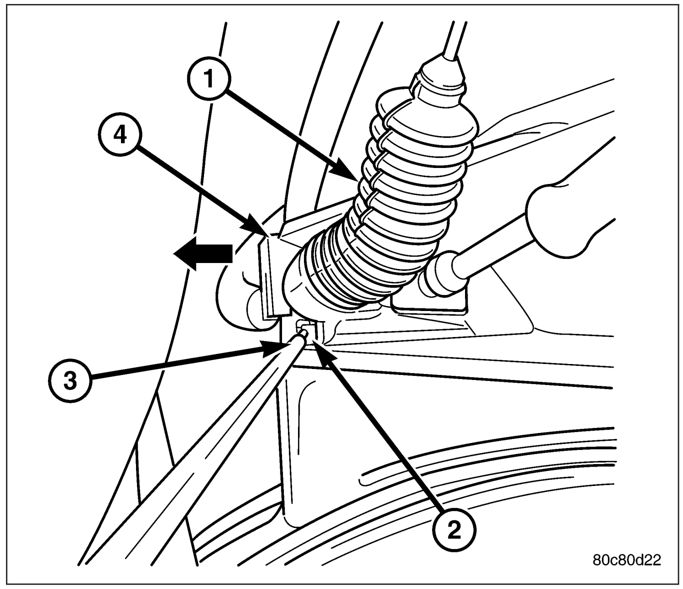
1. From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) (3) and throttle cable core wire from upper end of pedal arm. Plastic cable retainer snaps into top of pedal arm.
2. Remove cable core wire at pedal arm.
3. From inside vehicle, remove metal clip (1) holding cable to dashpanel.
4. Remove air box at throttle body.
5. Unsnap cable from dashpanel routing clip.
6. Remove cable housing from dash panel and pull into engine compartment.



7. Hold throttle in wide open position. While held in this position, slide throttle cable pin (1) from throttle body bellcrank (2).

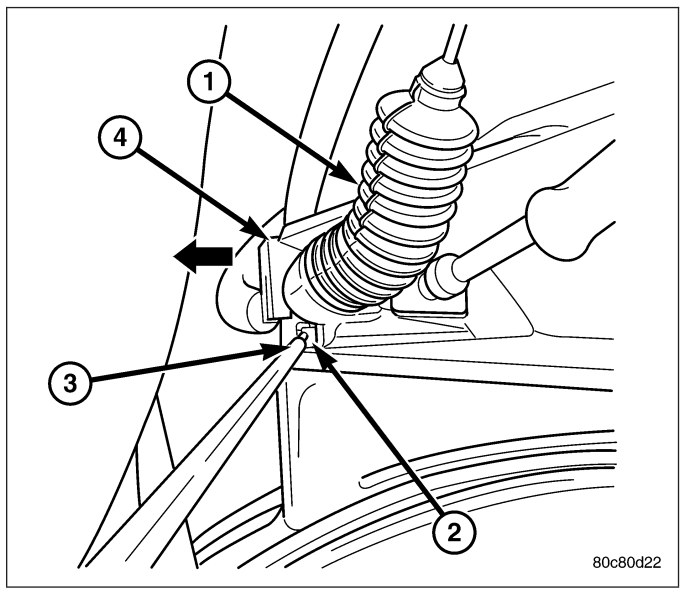


8. Using a pick or small screwdriver (3), press release tab (2) to release plastic cable mount from bracket. **Press on tab (2) only enough to release cable from bracket. If tab is pressed too much, it will be broken.** Slide plastic mount (4) towards right side of vehicle to remove throttle cable from throttle body bracket.
9. Remove throttle cable from vehicle.

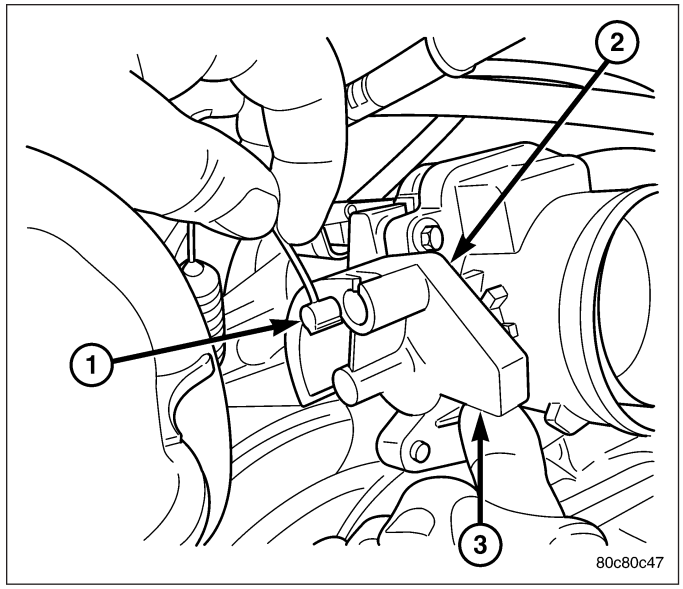


## INSTALLATION

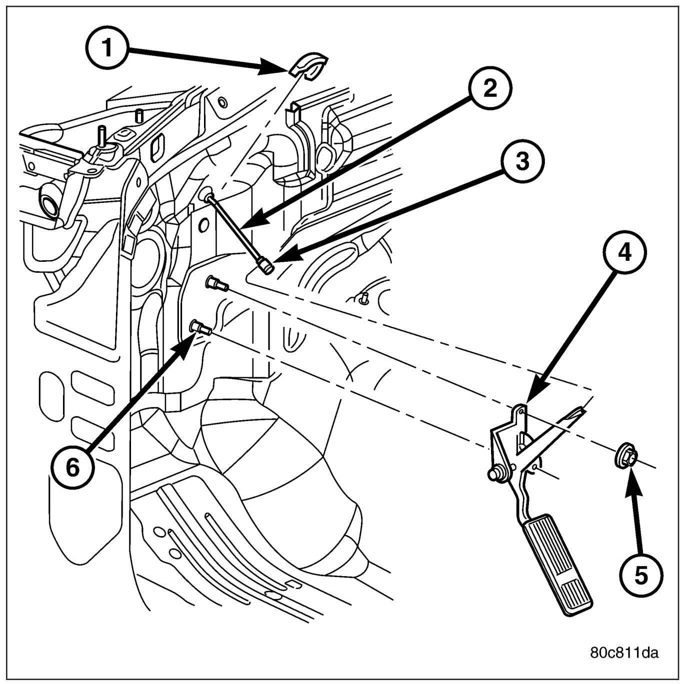
1. Slide accelerator cable plastic mount (4) into throttle body mounting bracket. Continue sliding until release tab (2) is aligned to hole in mounting bracket.



2. Hold throttle in wide open position. While held in this position, slide throttle cable pin (1) into throttle body bellcrank (2).
3. Push cable housing into rubber grommet and through opening in dash panel.



4. From inside vehicle, install metal clip (1) holding cable to dashpanel.
5. From inside vehicle, slide throttle cable core wire into opening (slot) in top of pedal arm.
6. Push plastic cable retainer (clip) (3) into pedal arm opening until it snaps in place.
7. Install air box to throttle body.
8. Before starting engine, operate accelerator pedal to check for any binding.



# SENSOR-THROTTLE POSITION

## DESCRIPTION

The 3-wire Throttle Position Sensor (TPS) is mounted on the throttle body and is connected to the throttle blade shaft.

## OPERATION

The 3-wire TPS provides the Powertrain Control Module (PCM) with an input signal (voltage) that represents the throttle blade position of the throttle body. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the output voltage of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from 0.26 volts at minimum throttle opening (idle), to 4.49 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

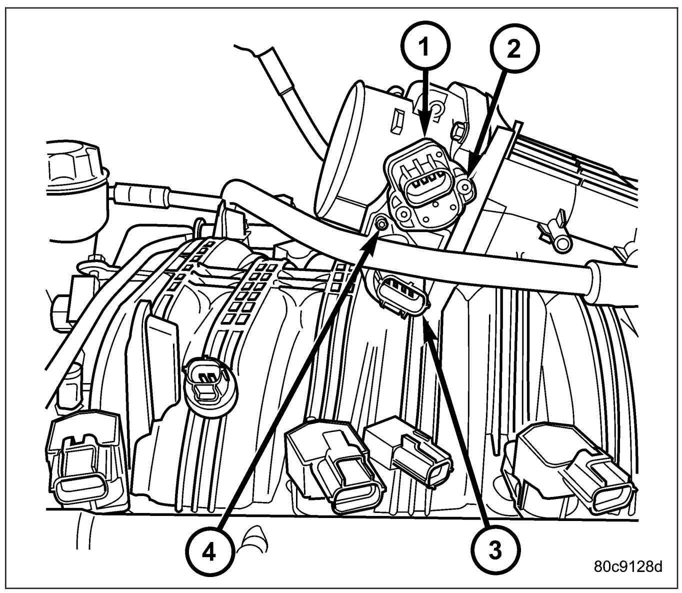
The PCM needs to identify the actions and position of the throttle blade at all times. This information is needed to assist in performing the following calculations:

- Ignition timing advance
- Fuel injection pulse-width
- Idle (learned value or minimum TPS)
- Off-idle (0.06 volt)
- Wide Open Throttle (WOT) open loop (2.608 volts above learned idle voltage)
- Deceleration fuel lean out
- Fuel cutoff during cranking at WOT (2.608 volts above learned idle voltage)
- A/C WOT cutoff (certain automatic transmissions only)

## REMOVAL

The Throttle Position Sensor (TPS) (1) is mounted to the throttle body.

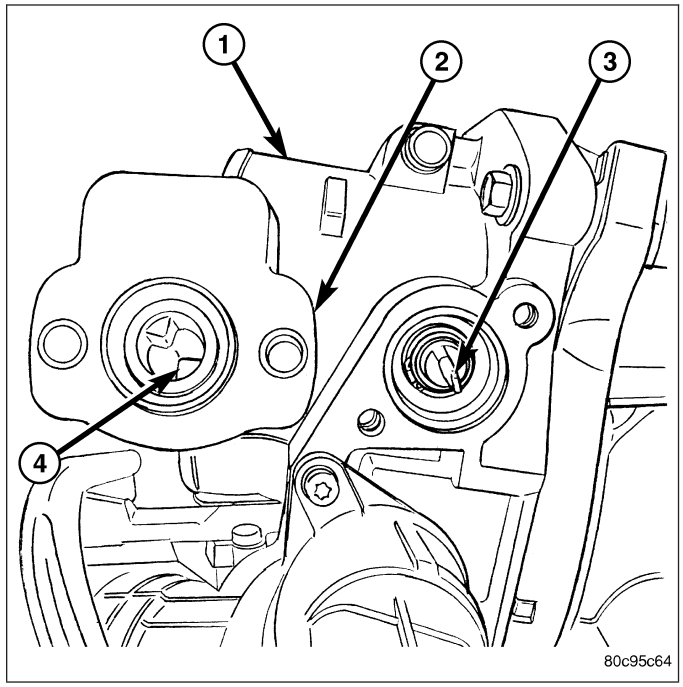
1. Disconnect TPS electrical connector.
2. Remove two TPS mounting screws (2).
3. Remove TPS.



## INSTALLATION

The throttle shaft end of the throttle body (3) slides into a socket (4) in the TPS. The TPS must be installed so that it can be rotated a few degrees. (If sensor will not rotate, install sensor with throttle shaft on other side of socket tangs). The TPS will be under slight tension when rotated.

1. Install TPS and retaining screws.
2. Tighten screws to 7 N·m (60 in. lbs.) torque.
3. Connect TPS electrical connector to TPS.
4. Manually operate throttle (by hand) to check for any TPS binding before starting engine.
5. Install air cleaner tube to throttle body.



# FUEL INJECTION - 2.8L DIESEL

## TABLE OF CONTENTS

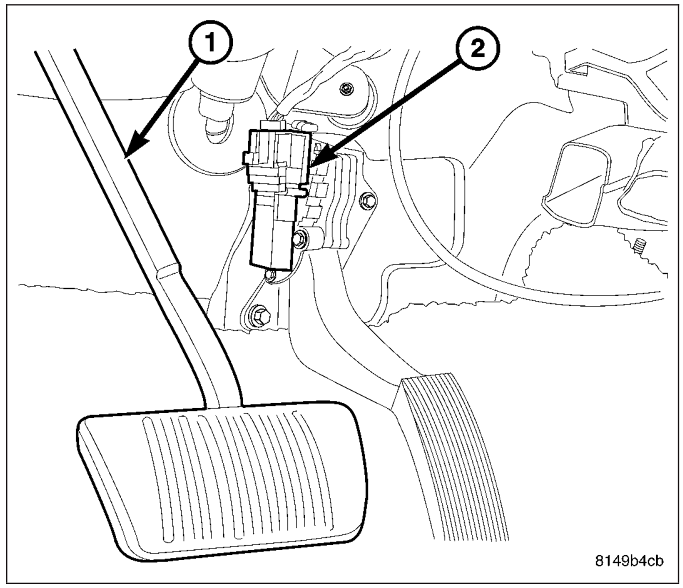
# ACCELERATOR PEDAL POSITION SENSOR

## DESCRIPTION

The Accelerator Pedal Position (APP) Sensor is a Hall Effect, angle of rotation sensor. The Accelerator Pedal Position sensor is located inside the accelerator pedal assembly. A magnet located in the pedal shaft cylinder rotates around a hall effect pick-up. The voltage signal increases as the accelerator pedal depresses. The APP sensor receives a 5–volt reference signal from the ECM and based upon the position of the pedal shift magnet relative to the windows on the Hall effect sensor, a portion of the 5 volts is returned to the ECM indicating pedal position.

## REMOVAL

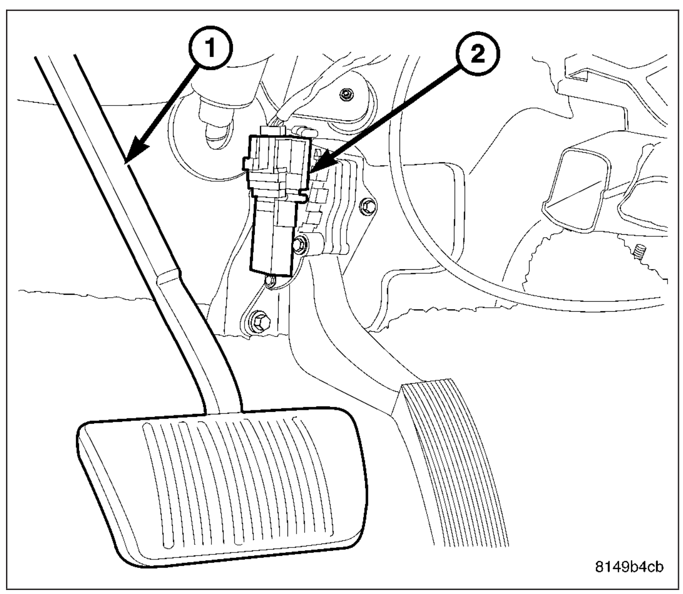
1. Disconnect negative battery cable.
2. Disconnect accelerator pedal position sensor electrical connector.
3. Remove accelerator pedal position sensor assembly mounting bolts.
4. Open accelerator pedal position sensor assembly and disconnect accelerator cable.
5. Remove accelerator pedal position sensor assembly.



## INSTALLATION

Position the APP sensor and install the fasteners hand tight.

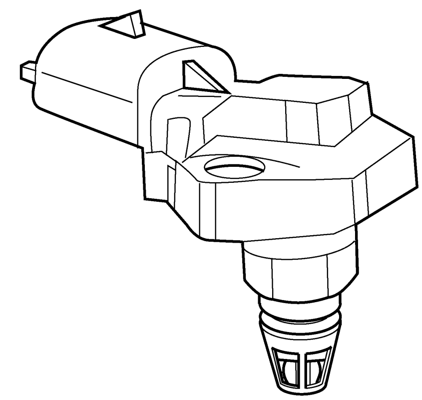
1. Tighten the APP sensor fasteners to 10.8N·m (96 in. lbs.).
2. Connect the APP sensor wiring harness connector.
3. Connect negative battery cable.



# BOOST PRESSURE SENSOR

## DESCRIPTION

The boost pressure/intake air temperature sensor is mounted to the top of the intake manifold. The sensor allows the ECM to monitor air pressure within the intake manifold. This sensor is also used to monitor the intake air temperature.



8100a221

## OPERATION

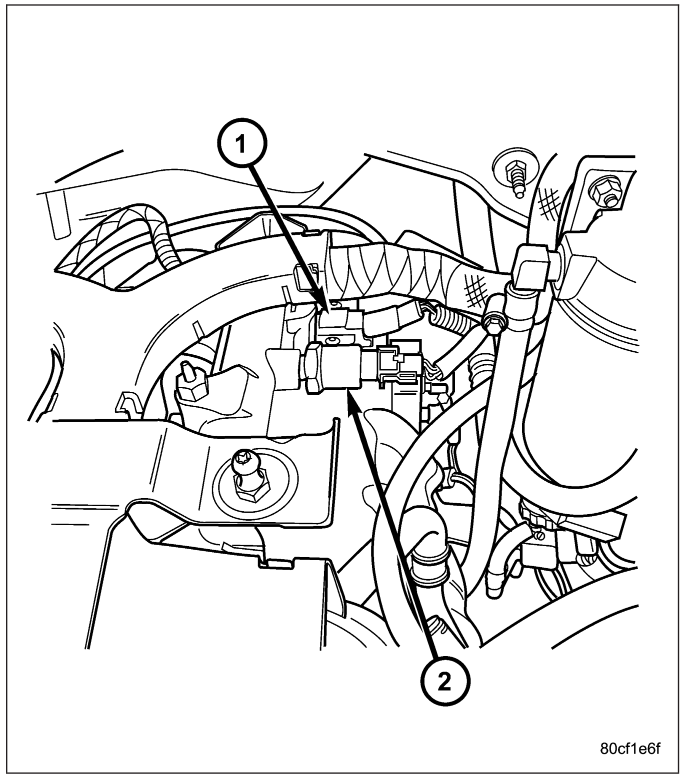
When the intake manifold pressure is low sensor voltage output is 0.25-1.8 volts at the ECM. When the intake manifold pressure is high due to turbo boost, sensor voltage output is 2.0-4.7 volts. The sensor receives a 5-volts reference from the ECM. Sensor ground is also provides by the ECM. The ECM uses boost pressure combined with intake air temerature to determine the volume of air entering the engine.

## DIAGNOSIS AND TESTING - BOOST PRESSURE/INTAKE AIR TEMPERATURE SENSOR

If the boost pressure sensor fails, the ECM records a DTC into memory and continues to operate the engine in one of the three limp-in modes. When the ECM is operating in this mode, a loss of power will be present, as if the turbocharger was not operating. The best method for diagnosing faults with the boost pressure sensor is with the scan tool. Refer to the Diesel Powertrain Diagnostic Manual for more information.

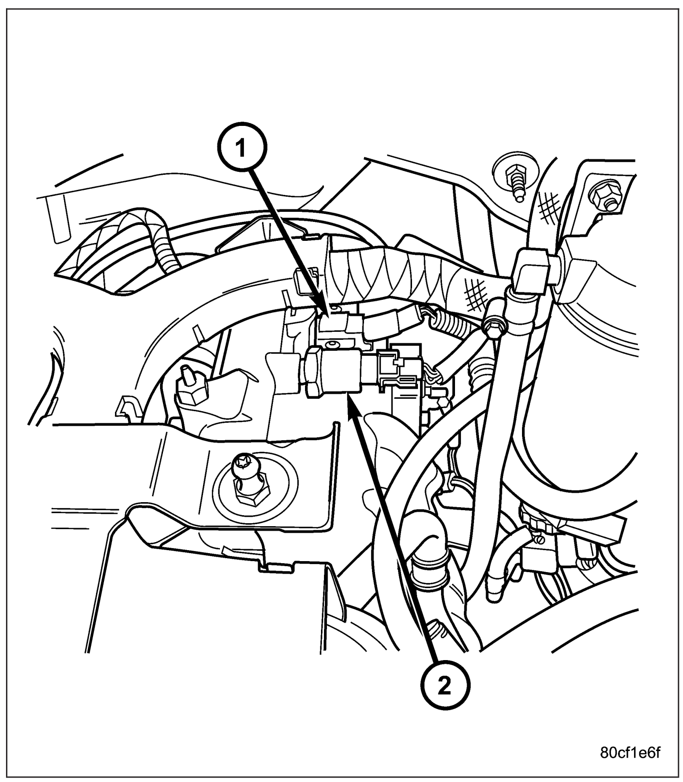
## REMOVAL

1. Disconnect negative battery cable.
2. Remove engine cover and bracket assembly (Refer to 9 - ENGINE COVER - REMOVAL).
3. Disconnect sensor electrical connector.
4. Remove retaining bolts and remove sensor (1) from cylinder head cover/intake manifold.



## INSTALLATION

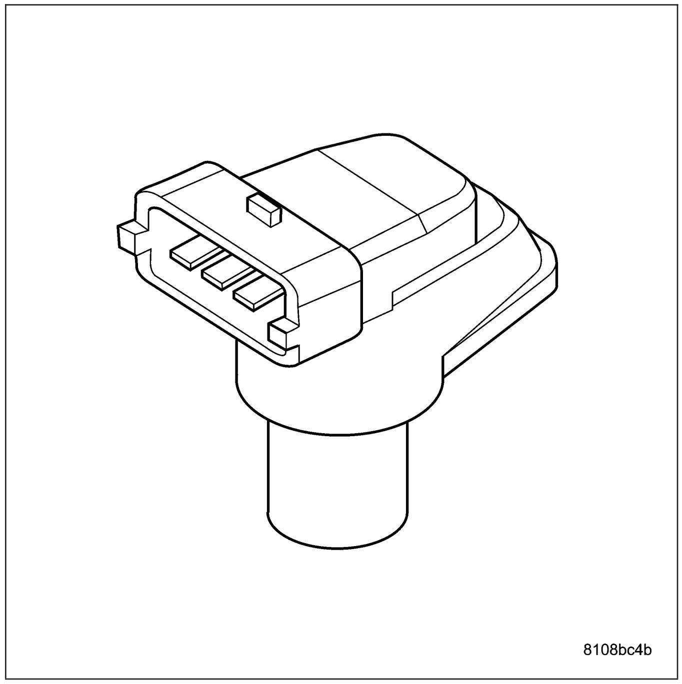
1. Install sensor (1) and retaining bolts into cylinder head cover/intake manifold. Torque to 5.4 N·m (48 in. lbs.)..
2. Connect sensor electrical connector.
3. Install engine cover and bracket assembly (Refer to 9 - ENGINE - INSTALLATION).
4. Connect negative battery cable.



# CAMSHAFT POSITION SENSOR

## DESCRIPTION

The camshaft position sensor (2) is mounted on the cylinder head cover toward the rear of the engine. The camshaft sensor utilizes a non contact method on one segment of the camshaft to record the camshaft position. When the ECM receives the signal from this sensor, it can then detect TDC of cylinder number one. The signal from the camshaft sensor is only required during engine starting. Injection timing is synchronized by means of the camshaft signal and the crankshaft signal.

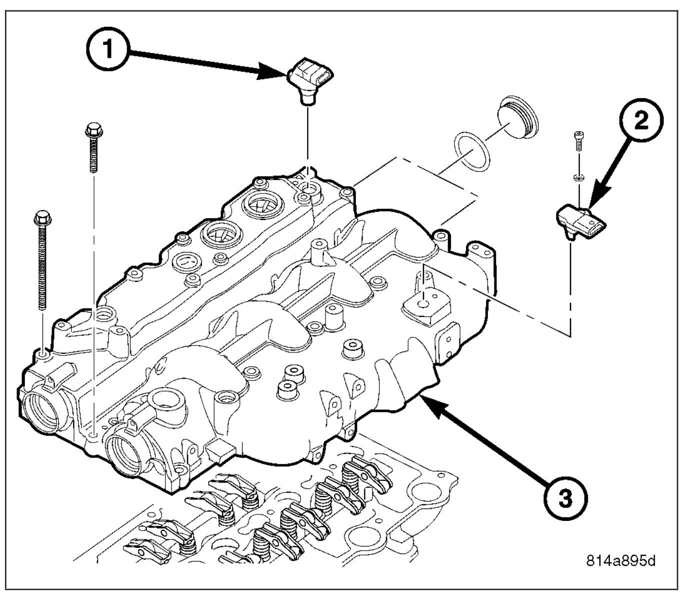


## OPERATION

On the camshaft sensor's signal line, a high signal corresponds to a voltage of 0-5V. If the segment machined into the exhaust camshaft sprocket is positioned opposite the camshaft sensor, the camshaft signal is low, approximately 0V. This signal is used by the engine control module (ECM) for detecting ignition TDC of cylinder 1 as the engine rotates. If no signal is supplied by the camshaft position sensor, the vehicle will not start because cylinder order can not be detected. If the signal is lost while the engine is running the vehicle will continue to run until shut off.

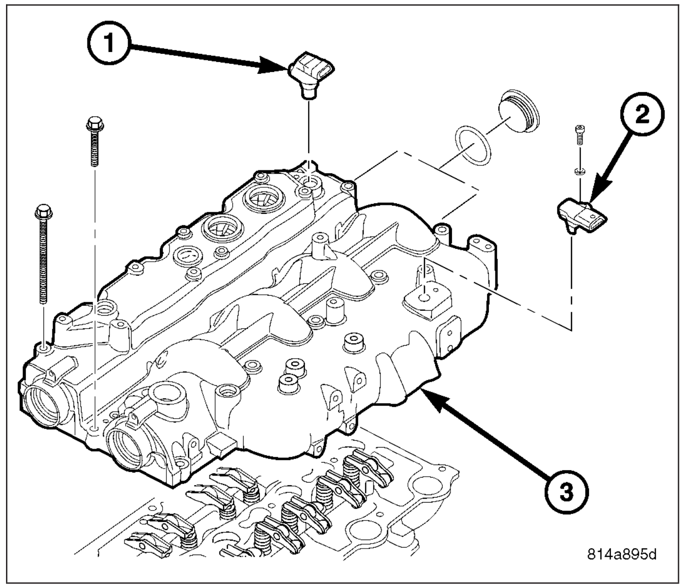
## REMOVAL

1. Disconnect negative battery cable.
2. Remove engine cover
3. Disconnect camshaft position sensor (1) electrical connector.
4. Remove retaining bolt, seal and remove sensor.



## INSTALLATION

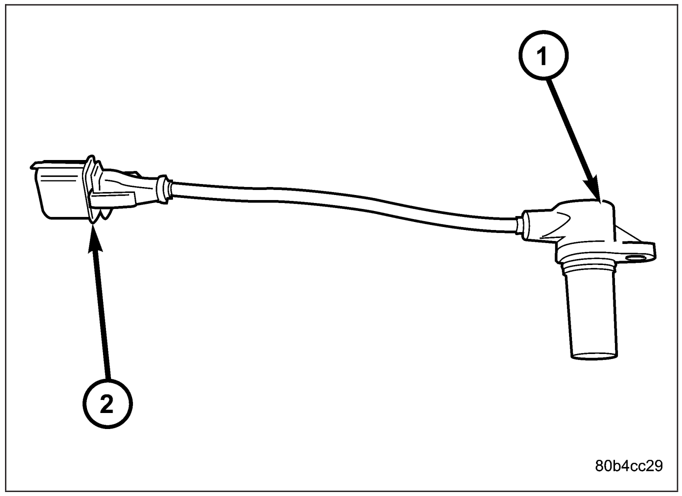
1. Install camshaft position sensor (1) and tighten bolt to 10.8 N·m (95 in lbs.).
2. Reconnect electrical connector.
3. Install engine cover.
4. Reconnect negative battery cable.



# CRANKSHAFT POSITION SENSOR

## DESCRIPTION

The crankshaft position sensor (1) is mounted in the right rear of the engine block, below the turbocharger, behind a heat shield. This sensor is used to detect engine speed.

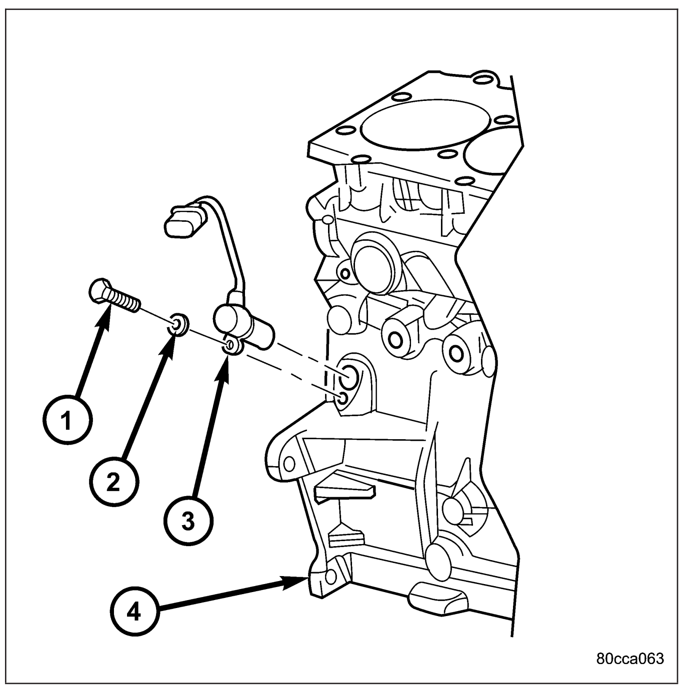


## OPERATION

The crankshaft position sensor is a magnetic pickup type sensor that generates an A/C signal. The sensor contains a permanent magnet and a coil of wire. The sensor generates an A/C signal each time a notch in the reluctor wheel on the crankshaft passes across the permanent magnet. The ECM calculates engine speed based on the frequency of the A/C signal.

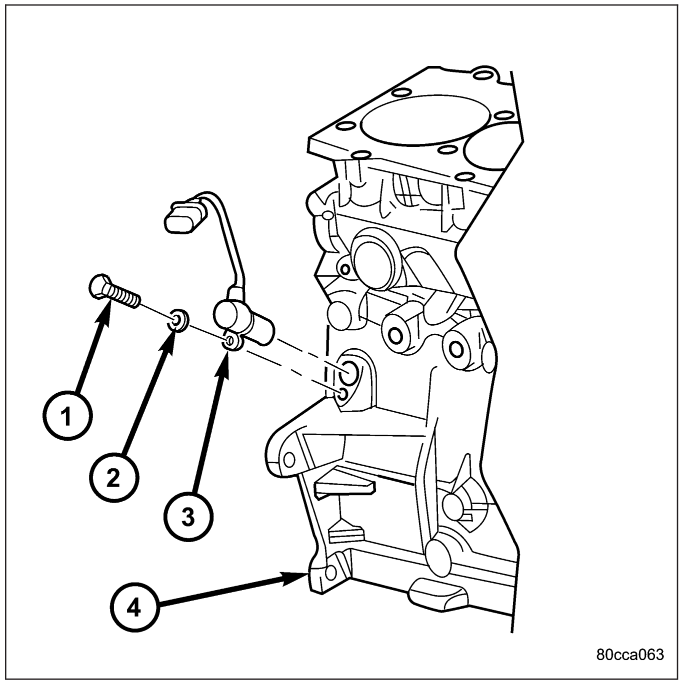
## REMOVAL

1. Disconnect negative battery cable.
2. Raise vehicle on hoist.
3. Remove exhaust pipe to turbocharger down pipe retaining bolts and lower exhaust pipe from turbocharger downpipe.
4. Disconnect crankshaft position sensor electrical connector.
5. Remove the heat shield.
6. Remove crankshaft position sensor (3) retaining bolt and remove sensor from engine block.



## INSTALLATION

1. Lubricate O-ring on crankshaft position sensor and install sensor in engine block.
2. Install crankshaft position sensor (3) retaining bolt. Torque bolt to 10.8N·m.(95 in.lbs.).
3. Connect crankshaft position sensor electrical connection.
4. Install the heat shield. Tighten fasteners to 10.8 N·m (95 in. lbs.).
5. Connect exhaust pipe to turbocharger downpipe. Torque bolts to 32.4 N·m (24 ft. lbs.).
6. Lower vehicle from hoist.
7. Connect negative battery cable.



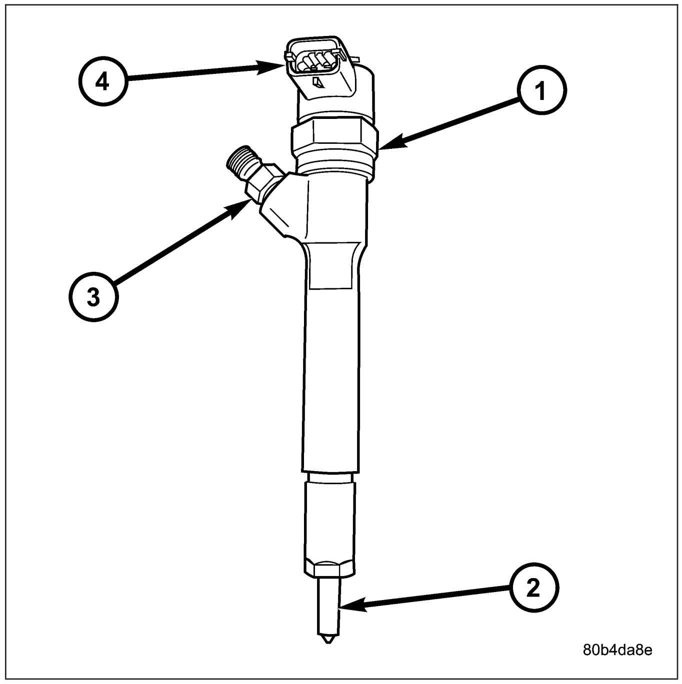
# FUEL INJECTOR

## DESCRIPTION

### FUEL INJECTOR

**CAUTION: There is a small seal at the bottom of the injector that seals the injector to the cylinder head. This seal MUST be replaced every time the injector is serviced.**

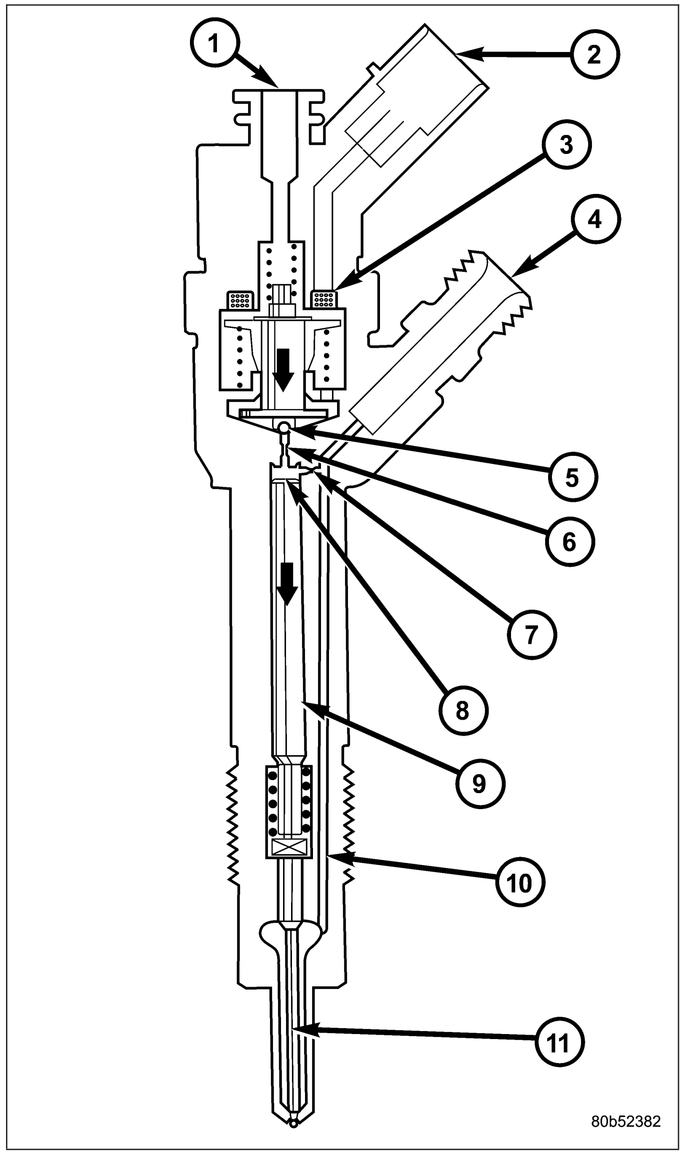
(Refer to 14 - FUEL SYSTEM - WARNING) There are individual fuel injectors (1) for all cylinders. Each injector nozzle has seven holes (2). The fuel injectors are used to spray fuel into the combustion chamber. Each injector has a six digit alphanumeric code on the injector top which identifies it's calibration. This number must be entered into to ECM using the scan tool. Specific moving parts inside the injector are graphite coated to assist with the lubrication process.



## OPERATION

(Refer to 14 - FUEL SYSTEM - WARNING) The injector operation can be subdivided into four operating states with the engine running and the high-pressure pump generating pressure:

- Injector closed (with high pressure applied)
- Injector opens (start of injection)
- Injector opened fully
- Injector closes (end of injection)



### Injector closed (with high pressure applied)

With the injector closed (at-rest state), the solenoid valve is not energized and is therefore closed. With the bleed orifice closed, the valve spring forces the armature's ball onto the bleed-orifice seat. The rail's high pressure build up in the valve control chamber, and the same pressure is also present in the nozzle's chamber volume. The rail pressure applied at the control plunger's end face, together with the force of the nozzle spring, maintain the nozzle in the closed position against the opening forces applied to its pressure stage.

### Injector opens (start of injection)

The solenoid valve is energized with the pickup current which serves to ensure that it open quickly. The force exerted by the triggered solenoid now exceeds that of the valve spring and the armature opens the bleed orifice. Almost immediately, the high-level pick-up current is reduced to the lower holding current required for the electromagnet. This is possible due to the magnetic circuit's air gap now being smaller. When the bleed orifice opens, fuel can flow from the valve control chamber into the cavity situated above it, and from there via the fuel return to the tank. The bleed orifice prevents complete pressure balance, and the pressure in the valve control chamber sinks as a result. This leads to the pressure in the valve-control chamber being lower than that in the nozzle's chamber volume which is still at the same pressure level as the rail. The reduced pressure in the valve-control chamber causes a reduction in the force exerted on the control plunger, the nozzle needle opens as a result, and injection starts.

### Injector opens fully

The control plunger reaches its upper stop where it remains supported by a cushion of fuel which is generated by the flow of fuel between the bleed and feed orifices. The injector nozzle has now opened fully, and the fuel is injected into the combustion chamber at a pressure almost equal to that in the fuel rail.

### Injector closes (end of injection)

As soon as the solenoid valve is no longer triggered, the valve spring forces the armature downwards and the ball closes the bleed orifice. The armature is a 2–piece design. Here, although the armature plate is guided by a driver shoulder in its downward movement, it can “overspring” with the return spring so that it exerts no downwards-acting forces on the armature and the ball. The closing of the bleed orifice lead to pressure build up in the control chamber via the input from the feed orifice. This pressure is the same as that in the rail and exerts an increased force on the control plunger through its end face. This force, together with that of the spring, now exceeds the force exerted by the chamber volume and the nozzle needle closes. Injection ceases as soon as the nozzle needle comes up against its bottom stop again.

## STANDARD PROCEDURE

## CLEANING FUEL INJECTORS

**NOTE: Before cleaning the injector recesses, seal the injector holes in the injector recesses with the appropriate pin to prevent debris from falling into the recesses and entering the motor.**

1. Seal the injector holes inside the cylinder head recesses.
2. Wipe out injector recesses with a non-woven cloth, then clean with a cylinder brush.
3. Clean the bottom of the cylinder recess with a round brush.
4. Blow out the recess and clean again with a non-woven cloth and cover over.
5. Perform these steps for each injector recess.

**NOTE: DO NOT clean the tip of the injector with a wire brush. Use a non - woven cloth.**

6. Clean injector body with a wire brush.
7. Clean injector tips with a non-woven cloth.

**NOTE: Do Not apply antiseize lubricant to the injector nozzle area.**

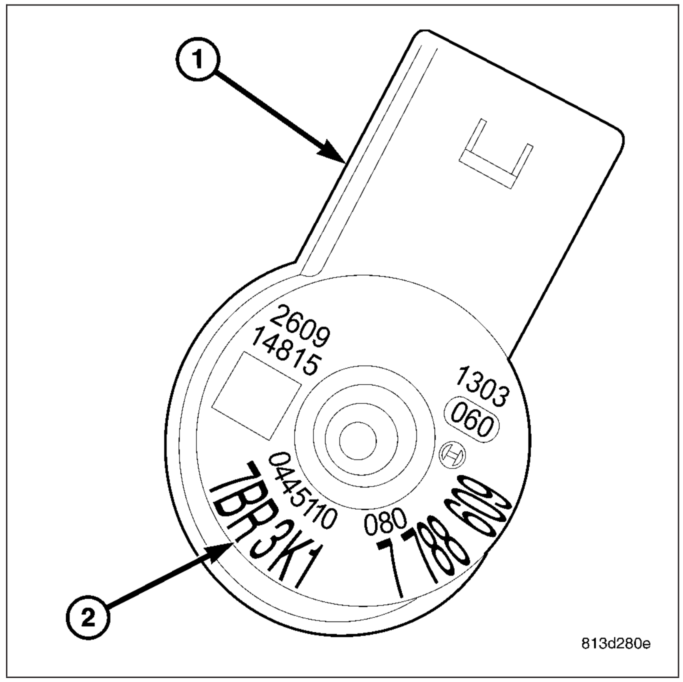
8. Grease injector body with anti seize lubricant.

**NOTE: Always replace the seals that seal off the injectors at the cylinder head to the combustion chamber and replace the retaining screws.**

## INJECTOR CLASSIFICATION

**NOTE: Fuel Injectors have different flow rates. When ALL injectors are removed, re-enter all injector six digit codes. If more than one injector is replaced, remove the injector sticker on the front of the timing cover.**

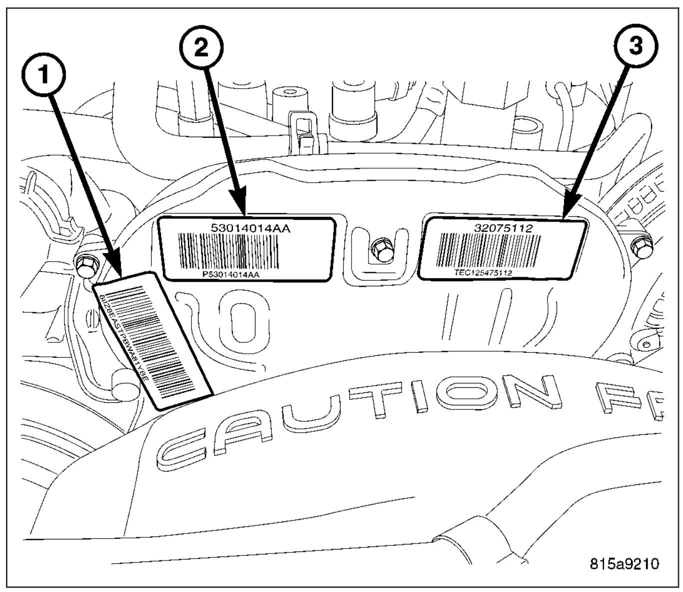
Classified injectors can be recognized by the six digit alpha-numeric code (2) on the magnetic head. The code corresponds to the classification stage. The classification stage may be checked against the fuel injector identification sticker (1) on the front of the timing cover. Number one cylinder will be the first six digits, number two cylinder will be the second six digits, and so on.



The classification of injectors describes the fuel flow quantity characteristic of the injector. This will make it possible in the future to match the engine software to the tolerances of the injector within a more narrowly graduated range. Classification can be clearly recognized, and assigned only by means of a scan tool.

These general conditions equally apply if, as a result of replacing an engine, carrying out repairs to the cylinder head etc., the cylinder selective assignment of the injectors or the engine control module assignment may have changed. If proper attention is not paid to the classification on these vehicles driveability and smoking concerns could result.

If an injector is replaced, it is then necessary to assign the classification code to the corresponding cylinder in the engine control module with the appropriate scan tool.



## INJECTOR CLASSIFICATION PROCEDURE

1. Turn ignition switch “ON”.
2. Using the scan tool, select ENGINE then MISCELLANEOUS.
3. Select LEARN INJECTORS.
4. Using the up and down arrows, scroll to the appropriate injector.
5. Using the right and left arrows, set injector to proper classification code.
6. Once injectors are classified, cycle ignition to complete.

## REMOVAL

1. Review the High Pressure Fuel System Warning (Refer to 14 - FUEL SYSTEM - WARNING).
2. Disconnect negative battery cable.
3. Remove engine cover (Refer to 9 - ENGINE - REMOVAL).
4. Disconnect injector electrical connector.

**CAUTION: Repeated mounting of the retaining ring is not permitted.**

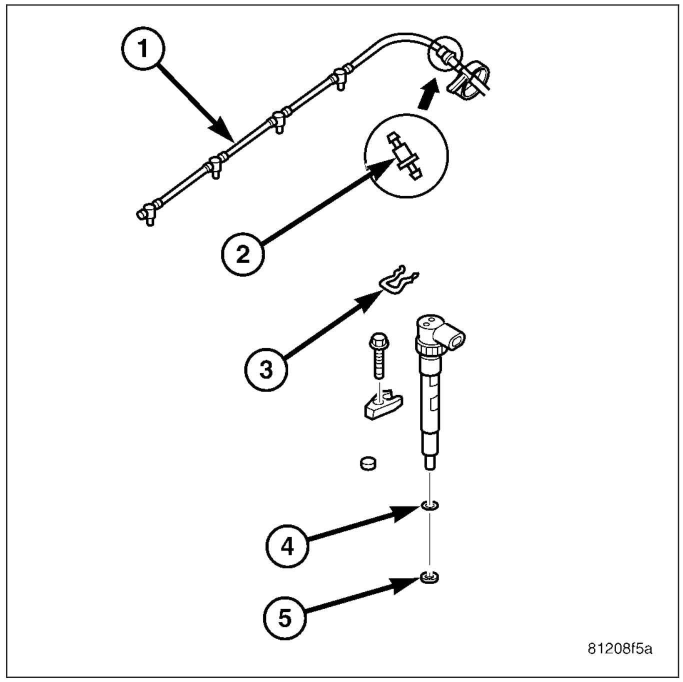
5. Remove fuel return line from injector.
6. Remove fuel injector high pressure line (Refer to 14 - FUEL SYSTEM - WARNING).
7. Remove fuel injector retainer and retaining bolt.
8. Using compressed air, clean surface area in and around injector bore to prevent foreign material from falling into the injector bore, after injector removal.

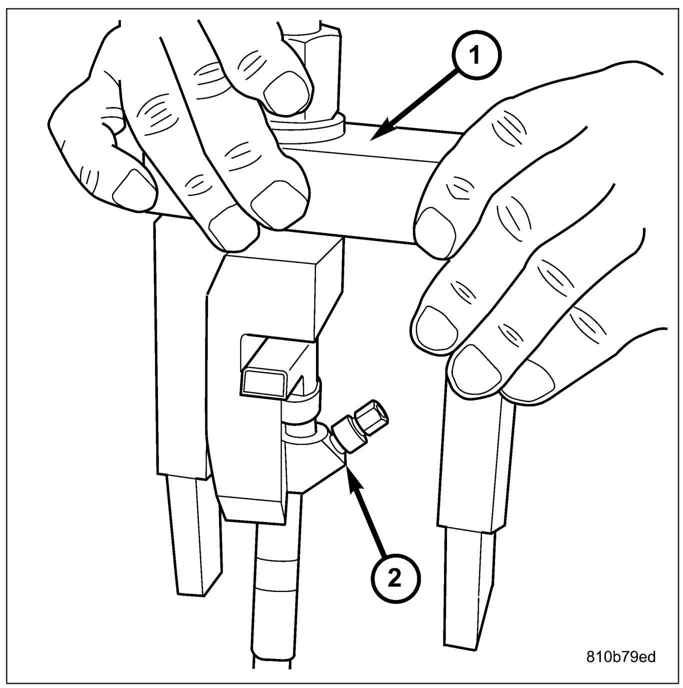
**NOTE: DO NOT use a wire brush to clean the fuel injector or nozzle. Possible restriction of the injector needle may result.**

9. Remove fuel injector from cylinder head.

**CAUTION: If the fuel injectors will not come out of the cylinder head, perform the following steps to prevent damaging other components.**

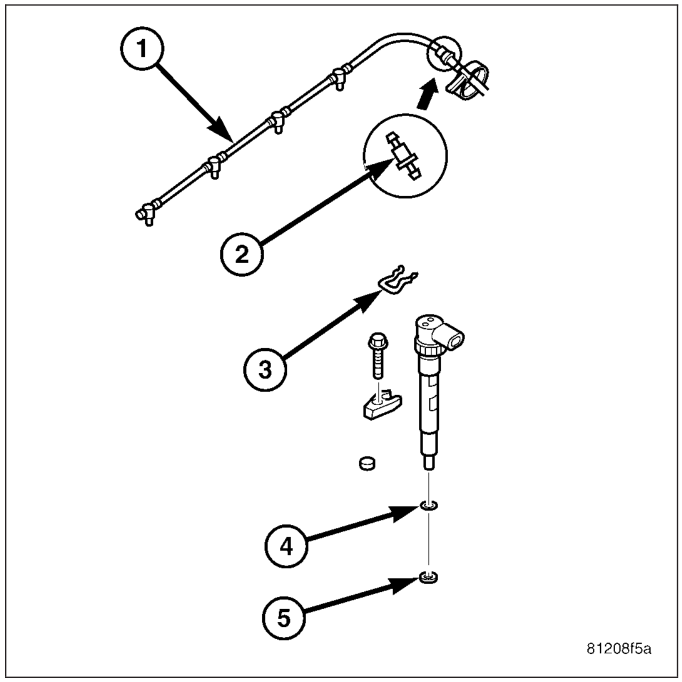
10. Assemble and install Injector extractor special tool VM 9075A on to injector and cylinder head.





## INSTALLATION

**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**



**NOTE: DO NOT use a brush to clean around the injector nozzle. DO NOT lubricate area around injector nozzle. The injector may become restricted with debris.**

**NOTE: Be sure a new copper washer/seal is installed on end of injector and the old seal is removed, before installing in cylinder head.**

**NOTE: Apply anti seize compound to injector body.**

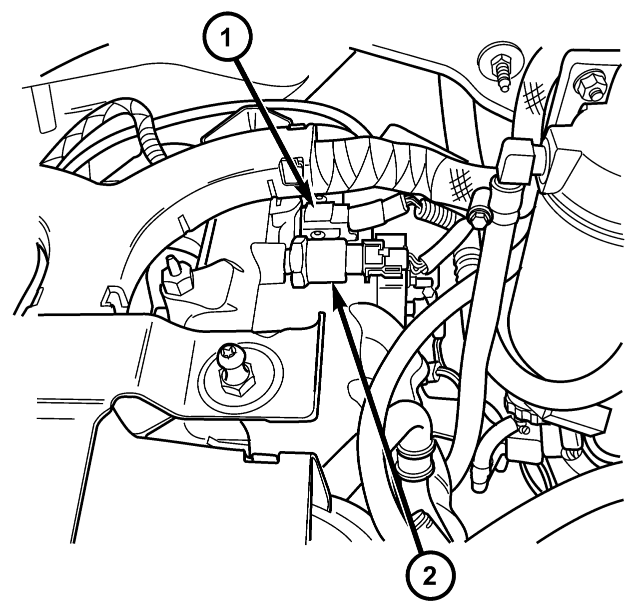
1. Install fuel injector in cylinder head with new seal and O-ring.
2. Install fuel injector retainer and bolt. Torque bolt to 32.4 N·m (24 ft. lbs.)..
3. Install fuel injector high pressure line.
4. Install fuel return line to injector.
5. Connect fuel injector electrical connector.
6. Install engine cover and bracket assembly (Refer to 9 - ENGINE COVER - INSTALLATION).
7. Connect negative battery cable.
8. Perform the injector classification procedure with the scan tool (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ FUEL INJECTOR - STANDARD PROCEDURE).
9. Start the engine, allow to warm, **Turn Off the Ignition**, Inspect for leaks.

# FUEL PRESSURE SENSOR

## DESCRIPTION

**WARNING: High - pressure fuel line deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

The fuel rail pressure sensor (2) screws into the fuel rail at the top of the engine. The ECM uses this sensor to monitor the fuel rail pressure.



80cf1e6f

## OPERATION

Review the high pressure fuel system warning (Refer to 14 - FUEL SYSTEM - WARNING).

The fuel flows to the fuel pressure sensor through an opening in the rail, the end of which is sealed off by the sensor diaphragm. Pressurized fuel reaches the sensor's diaphragm through a blind hole. The sensor element (semiconductor device) converts the pressure to an electric signal is mounted on this diaphragm. The signal generated by the sensor is sent to the ECM.

## REMOVAL

1. Disconnect negative battery cable.
2. Remove engine cover (Refer to 9 - ENGINE COVER - REMOVAL).
3. Disconnect fuel pressure sensor electrical connector .
4. Remove fuel pressure sensor from fuel rail.

## INSTALLATION

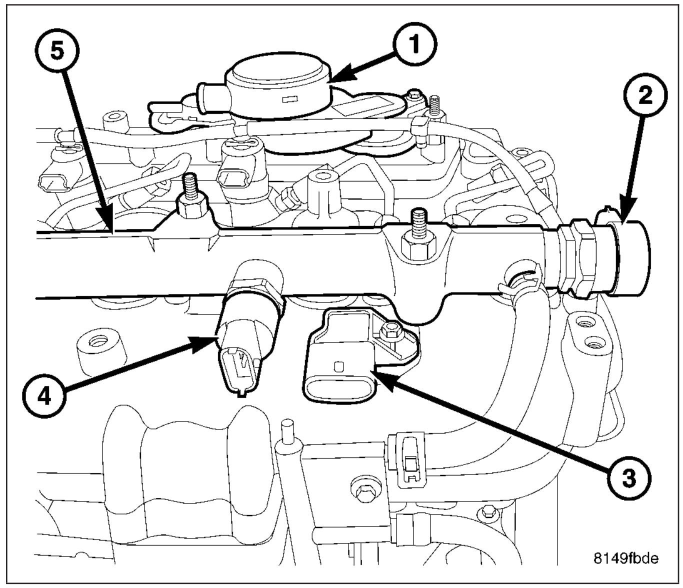
**WARNING: High - pressure lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 1600 bar (23,200 psi.). Use extreme caution when inspecting for high - pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high - pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.**

1. Install fuel pressure sensor in fuel rail. Tighten sensor to 35 N·m (26 ft. lbs.)..
2. Connect fuel pressure sensor electrical connector.
3. Install engine cover (Refer to 9 - ENGINE COVER - INSTALLATION).
4. Connect negative battery cable.

# FUEL PRESSURE SOLENOID

## DESCRIPTION

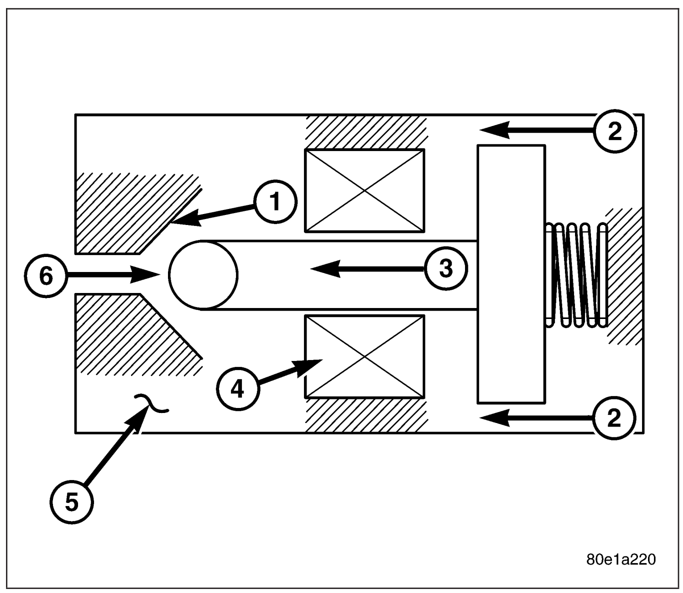
The fuel pressure solenoid is attached to the rear of the fuel rail. The tip of the fuel pressuer solenoid uses a knife edge, for metal to metal sealing. The knife edge actually deforms the metal in the fuel rail in order to seal the surfaces. The solenoid must be replaced when ever it is removed from the rail. The solenoid controls and maintains the rail pressure constant along with a control current transmitted by the engine control module (ECM).



## OPERATION

High pressure which is present in the fuel rail flows to the ball seat (1) of the pressure solenoid. The specified pressure required by the system is built up in the rail by the fuel pressure solenoid building up a magnetic force which corresponds to this specific pressure by means of a control current from the Electronic Control Module (ECM). This magnetic force equals a certain outlet cross section at the ball seat of the valve. The rail pressure is altered as a result of the quantity of fuel which flows off. The current fuel pressure is signaled by the fuel rail pressure sensor to the engine control module (ECM). The controlled fuel flows back along the return fuel line, into the tank.

In a de-energized state, the fuel pressure solenoid is closed as the spring force (2) presses the ball into the ball seat. When driving, the fuel pressure solenoid is constantly open. When engine is started, the fuel pressure solenoid is held closed by magnetic force. When driving, the pressure of the fluid counteracts the magnetic force of the coil and the slight spring force.



## REMOVAL

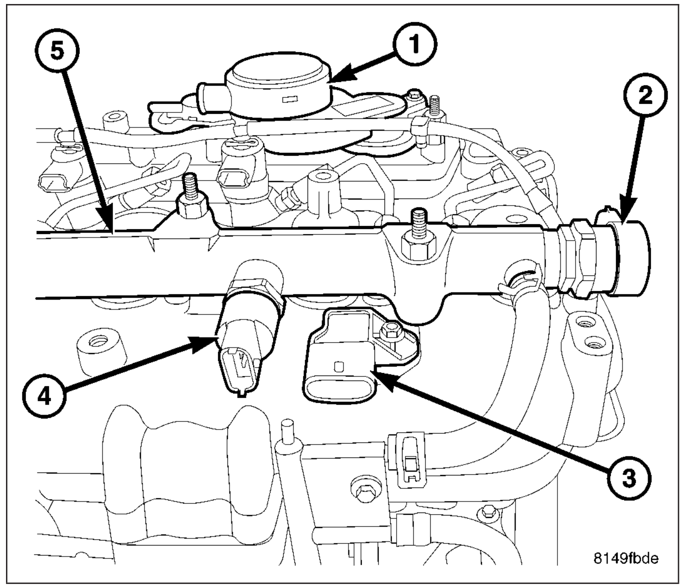
**Review the high pressure fuel system warning before beginning repair (Refer to 14 - FUEL SYSTEM - WARNING)**

**WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.**

1. Disconnect negative battery cable.
2. Remove fuel rail (Refer to 14 - FUEL SYSTEM/ FUEL INJECTION/FUEL INJECTOR - REMOVAL).
3. Clamp fuel rail securely in vise with protective jaws.

**CAUTION: Once removed, the solenoid must always be replaced.**

4. Counterhold and unscrew the fuel pressure solenoid (2).

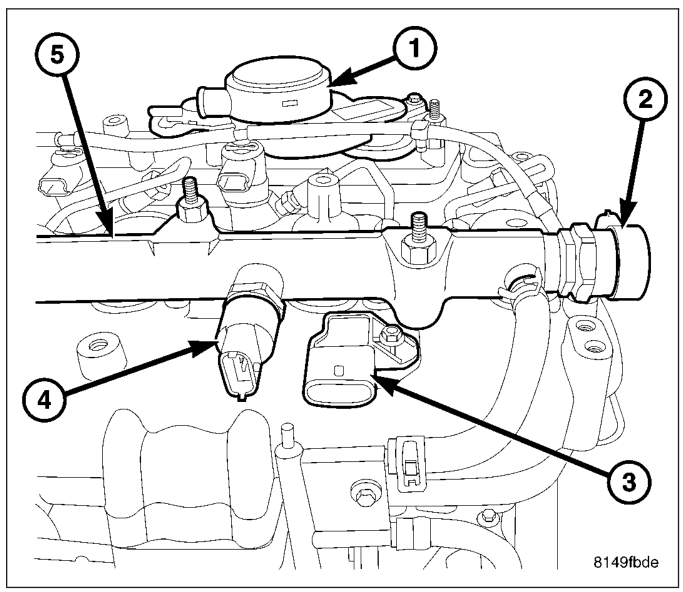


## INSTALLATION

**Review the high pressure fuel system warning before beginning repair (Refer to 14 - FUEL SYSTEM - WARNING)**

**WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.**

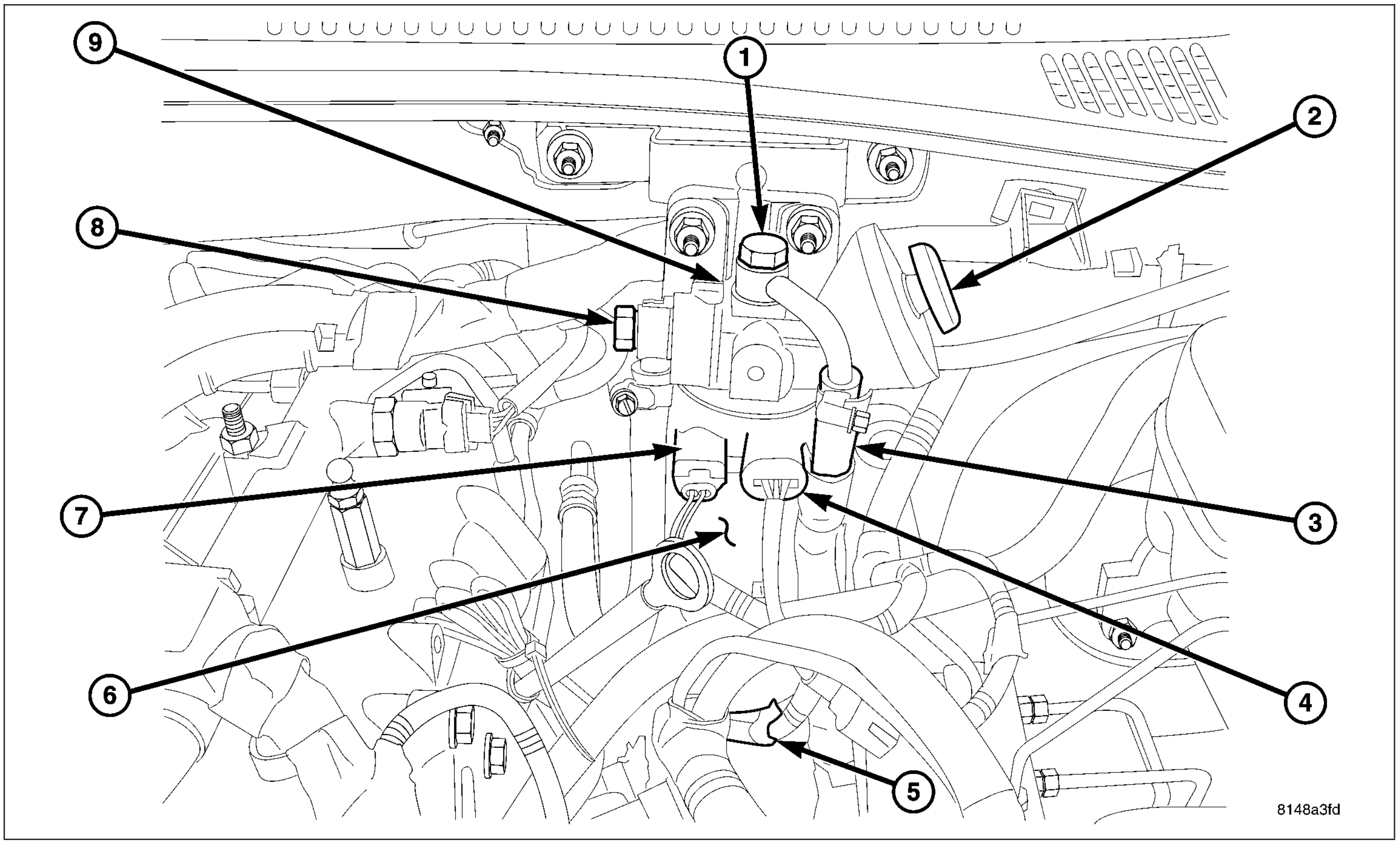
**CAUTION: There is a special tightening procedure for the fuel rail solenoid that must be followed along with the proper use of a torque wrench. Therefore the fuel rail must be removed before installing the fuel pressure solenoid.**



1. Position the fuel rail (5) into a soft jawed vise.
2. Screw the fuel pressure solenoid to the fuel rail until hand tight.
3. Tighten the fuel rail solenoid as follows:
   a. Tighten the nut to 60 N·m (44 ft. lbs.)
   b. Loosen the nut 90 degrees.
   c. Retighten the nut to 80 N·m (59 ft. lbs.).
4. Install fuel rail (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).
5. Connect negative battery cable.
6. Start engine, allow to warm, turn engine off and inspect for leaks (Refer to 14 - FUEL SYSTEM - DIAGNOSIS AND TESTING).

# FUEL TEMPERATURE SENSOR

## DESCRIPTION



The fuel temperature sensor is integrated into the fuel filter housing, along side of the fuel heater. The sensor detects the temperature of the fuel and supplies that information to the ECM. The sensor ranges from - 40°F (-40°C) to 284°F (140°C). If the engine is cold, the actual value sent will read ambient temperature. The value rises after the engine has been started. The fuel temperature sensor IS NOT SERVICED separate from the housing assembly.

## OPERATION

An negative temperature coefficient (NTC) resistor integrated in the fuel temperature sensor alters it's electrical resistance in line with the fuel temperature (the resistance drops as the temperature rises). The ECM uses this reading to calculate optimum engine performance under all driving conditions. If the fuel is to warm, the rail pressure in the system is lowered. The controlled quantity of the fuel rail pressure solenoid is reduced and the fuel temperature is lowered.

## REMOVAL

**WARNING: Store fuel in approved and properly marked containers. Wear safety goggles and adequate protective clothing when servicing fuel system.**

1. The fuel temperature sensor is serviced as an assembly along with the fuel heater (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY/FUEL HEATER - REMOVAL).

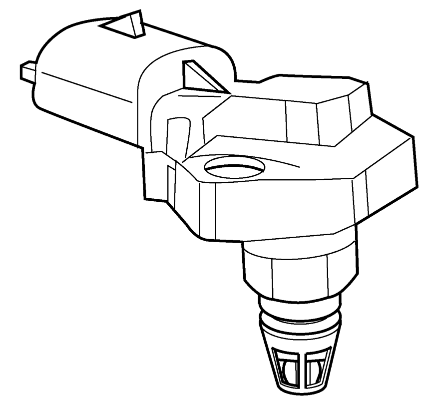
## INSTALLATION

1. The fuel temperature sensor is serviced along with the fuel heater (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL HEATER - INSTALLATION).

# INTAKE AIR TEMPERATURE SENSOR

## DESCRIPTION

The boost pressure/intake air temperature sensor is mounted to the top of the intake manifold. The sensor allows the ECM to monitor air pressure within the intake manifold. This sensor is also used to monitor the intake air temperature.



8100a221

## OPERATION

The intake air temperature sensor is a negative temperature coefficient (NTC) thermistor (resistance varies inversely with temperature). This means at cold air temperature its resistance is high, so the voltage signal will be high. As intake air temperature increases, sensor resistance decreases and the signal voltage will be low. This allows the sensor to provide an analog voltage signal (0.2-4.8 volts) to the ECM.

## REMOVAL

1. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/BOOST PRESSURE SENSOR - REMOVAL)

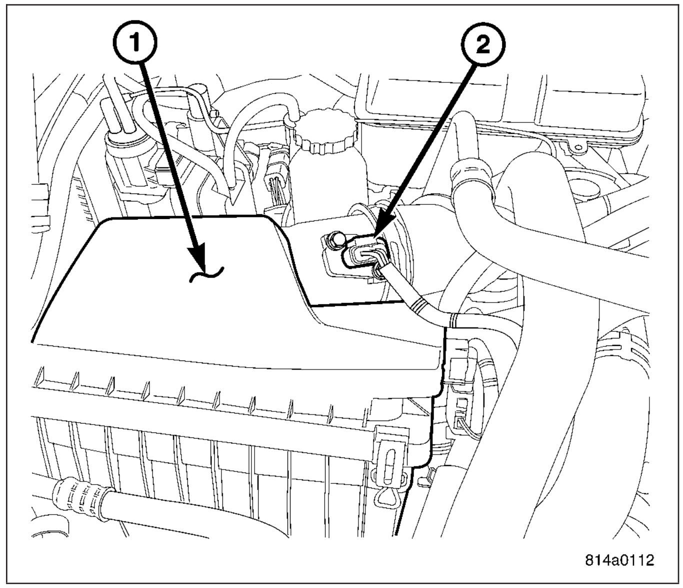
## INSTALLATION

1. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/BOOST PRESSURE SENSOR - INSTALLATION)

# MASS AIR FLOW SENSOR

## DESCRIPTION

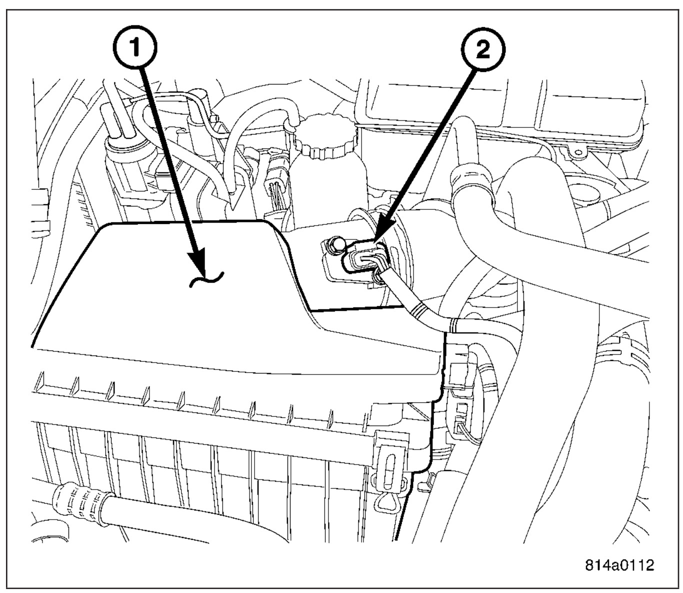
The Mass Air Flow (MAF) Sensor is located on the air cleaner cover. The MAF sensor uses semiconductor technology throughout, and is used to calculate the air mass flowing past it per time unit. This mass is important for determining the exhaust gas recirculation rate. The MAF sensor sends a corresponding signal to the ECM, which evaluates the signal to adjust the EGR air flow control valve.



## OPERATION

The ECM uses the mass air flow (MAF) sensor to measure air density. The temperature resistor located at the front of the MAF sensor measures the temperature of the inlet air. By varying the voltage, the electronic circuit regulates the temperature of the heating resistor in the rear so that it is 320° F (160°C) higher than the temperature of the intake air. The temperature at the heating resistor is measured by a sensor resistor in-between.

Because the incoming air has a cooling effect, the greater the amount of air that flows in, then the higher the voltage of the heating resistor. The heating resistor is therefore a measure of mass of air flowing past. If a temperature change occurs as a result of a increase or reduction of air flow, the ECM corrects the voltage at the heating resistor until the temperature difference is again achieved. This control voltage is use by the ECM as a unit measure for metered air mass.



## REMOVAL

The Mass Air Flow (MAF) sensor is serviced along with the air cleaner cover.

## INSTALLATION

The Mass Air Flow (MAF) sensor is serviced along with the air cleaner cover.

# STEERING

## TABLE OF CONTENTS

# STEERING

## DESCRIPTION

Power steering systems consist of:

- Steering column & Intermediate Shaft
- Rack and pinion steering gear
- Belt driven hydraulic steering pump
- Pump pressure, supply and return hoses
- Oil Cooler

## OPERATION

The steering column intermediate shaft attaches the steering column to the gear pinion. The rotation of the pinion moves the gear rack from side-to-side. This lateral action of the rack pushes and pulls the tie rods to change the direction of the front wheels.

Power assist is provided by an engine mounted hydraulic pump. The pump supplies hydraulic fluid to the steering gear. All 3.7L vehicles with trailer tow option are equipped with an oil cooler.

## DIAGNOSIS AND TESTING

## POWER STEERING SYSTEM

There is some noise in all power steering systems. One of the most common is a hissing sound evident at a standstill/parking, or when the steering is at the end of it's travel. Hiss is a high frequency noise similar to that of a water tap being closed slowly. The noise is present in all valves that have a high velocity fluid passing through an orifice. There is no relationship between this noise and steering performance.

### STEERING NOISE

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| OBJECTIONAL HISS OR WHISTLE | 1. Steering intermediate shaft to dash panel seal.<br>2. Noisy valve in power steering gear.<br>3. Inoperative or defective valve in pump | 1. Check and repair seal at dash panel.<br>2. Replace steering gear.<br>3. Replace pump |
| RATTLE OR CLUNK | 1. Gear mounting bolts loose.<br>2. Loose or damaged suspension components.<br>3. Internal gear noise.<br>4. Loose or damaged intermediate shaft or column. | 1. Tighten bolts to specification.<br>2. Inspect and repair suspension.<br>3. Replace steering gear.<br>4. Inspect and repair or replace. |
| MOAN | 1. Pressure hose in contact with other components. | 1. Reposition hose. |
| CHIRP OR SQUEAL | 1. Loose belt. | 1. Adjust or replace. |
| WHINE OR GROWL | 1. Low fluid level.<br>2. Pressure hose in contact with other components.<br>3. Internal pump noise. | 1. Fill to proper level.<br>2. Reposition hose.<br>3. Replace pump. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SUCKING AIR SOUND | 1. Loose return line clamp.<br>2. O-ring missing or damaged on hose fitting.<br>3. Low fluid level.<br>4. Air leak between pump and reservoir.<br>5. Reservoir cap not installed correctly. | 1. Replace clamp.<br>2. Replace o-ring.<br>3. Fill to proper level.<br>4. Repair as necessary.<br>5. Install reservoir cap correctly. |
| SCRUBBING OR KNOCKING | 1. Wrong tire size.<br>2. Wrong gear.<br>3. Tire Pressure | 1. Verify tire size.<br>2. Verify gear.<br>3. Adjust Tire Pressure |

**BINDING AND STICKING**

| CONDITION | POSSIBLE CAUSE | CORRECTION |
|---|---|---|
| DIFFICULT TO TURN WHEEL STICKS OR BINDS | 1. Low fluid level.<br>2. Tire pressure.<br>3. Steering components (ball joints/tie rod ends).<br>4. Loose belt.<br>5. Low pump pressure.<br>6. Column Intermediate shaft binding.<br>7. Steering gear worn. | 1. Fill to proper level.<br>2. Adjust tire pressure.<br>3 Inspect and repair as necessary.<br>4. Adjust or replace.<br>5. Pressure test and replace if necessary.<br>6. Replace Intermediate Shaft.<br>7. Replace gear. |

**INSUFFICIENT ASST. OR POOR RETURN TO CENTER**

| CONDITION | POSSIBLE CAUSE | CORRECTION |
|---|---|---|
| HARD TURNING OR MOMENTARY INCREASE IN TURNING EFFORT | 1. Tire pressure.<br>2. Low fluid level.<br>3. Loose belt.<br>4. Low pump pressure.<br>5. Internal gear leak. | 1. Adjust tire pressure.<br>2. Fill to proper level.<br>3. Adjust or replace.<br>4. Pressure test and repair as necessary.<br>5. Replace gear. |
| STEERING WHEEL DOES NOT WANT TO RETURN TO CENTER POSITION | 1. Tire pressure.<br>2. Wheel alignment.<br>3. Lack of lubrication.<br>4. High friction in steering gear. | 1. Adjust tire pressure.<br>2. Align front end.<br>3. Inspect and lubricate suspension compnents.<br>4. Replace gear. |

**LOOSE STEERING AND VEHICLE LEAD**

| CONDITION | POSSIBLE CAUSE | CORRECTION |
|---|---|---|
| EXCESSIVE PLAY IN STEERING WHEEL | 1. Worn or loose suspension or steering components. | 1. Inspect and repair as necessary. |
| | 2. Worn or loose wheel bearings. | 2. Inspect and replace bearings. |
| | 3. Steering gear mounting. | 3. Tighten / replace gear mounting bolts/ isolators to specification. |
| | 4. Gear out of adjustment. | 4. Replace gear. |
| | 5. Worn or loose steering intermediate shaft. | 5. Inspect and replace as necessary. |
| VEHICLE PULLS, DRIFTS OR LEADS TO ONE SIDE. | 1. Tire Pressure. | 1. Adjust tire pressure. |
| | 2. Radial tire lead. | 2. Rotate tires. |

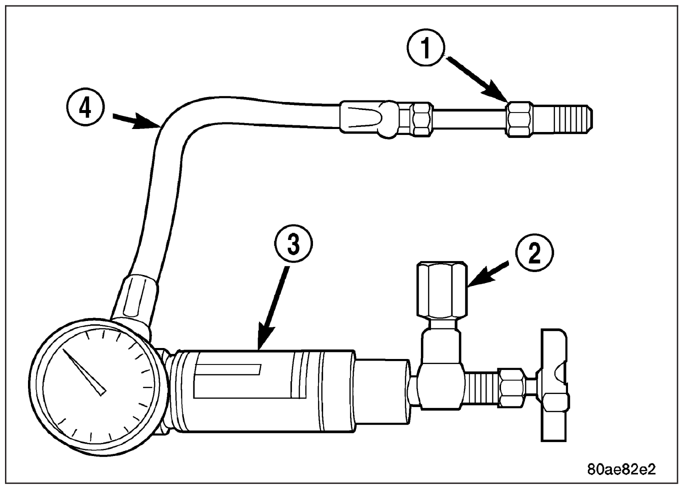
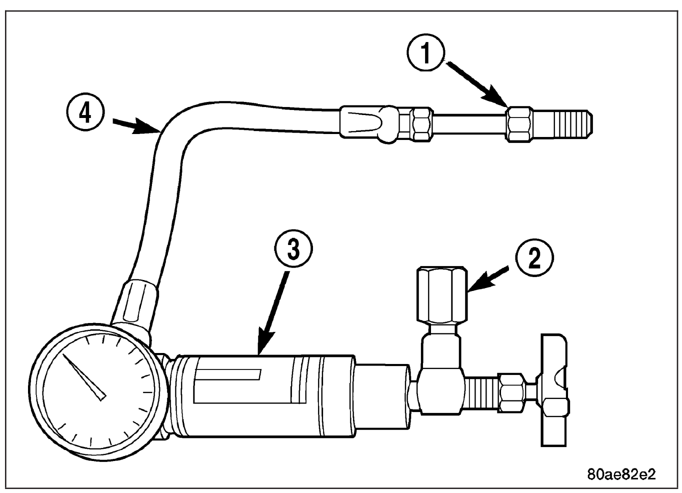
## POWER STEERING FLOW AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool kit 6815 and Adapter Kit 6893.



## FLOW AND PRESSURE TEST

1. Check the power steering belt to ensure it is in good condition and adjusted properly.
2. Connect pressure gauge hose from the Power Steering Analyzer to Tube 6844.
3. Connect Adapter 6826 to Power Steering Analyzer test valve end.
4. Disconnect the high pressure hose from the power steering pump.
5. Connect the tube to the pump hose fitting.
6. Connect the power steering hose from the steering gear to the adapter.
7. Open the test valve completely.



8. Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge and to get air out of the fluid. Then shut off engine.
9. Check fluid level, add fluid as necessary. Start engine again and let idle.
10. Check for air bubbles, Evacuate if necessary.

11. Gauge should read below 862 kPa (125 psi). If above, inspect the hoses for restrictions and repair as necessary. The initial pressure reading should be in the range of 345-552 kPa (50-80 psi).
12. Increase the engine speed to 1500 RPM and read the flow meter. If the flow rate (GPM) is below specification, (refer to pump specification chart for GPM) the pump should be replaced.

**CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.**

13. Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**
    - Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
    - Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.
14. Open the test valve and turn the steering wheel to the extreme left and right positions three times against the stops. Record the highest pressure reading at each position. Compare readings to the pump specifications chart. If pressures readings are not within 50 psi of each other, the gear is leaking internally and must be replaced.

**CAUTION: Do not force the pump to operate against the stops for more than 2 to 3 seconds at a time because, pump damage will result.**

**PUMP SPECIFICATION**

| ENGINE | RELIEF PRESSURE | FLOW RATE (GPM) AT 1500 RPM |
|---|---|---|
| ALL | 10342 kPa, PREFERRED (1450 psi) with a MAX 1550 psi & 7929 kPa, MIN (1400 psi) | 2.4 - 2.8 |

# COLUMN

## TABLE OF CONTENTS

# COLUMN

## DESCRIPTION

**NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.**

The standard non-tilt and tilt steering column has been designed to be serviced as an assembly. The column is connected to the steering gear with a one piece shaft. The upper half has a support bearing mounted to a bracket. The bracket mounts to the frame rail with two nuts. The shaft is serviceable. The key cylinder, switches, clock spring, trim shrouds and steering wheel are serviced separately.

## OPERATION - SERVICE PRECAUTIONS

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or airbag, refer to Electrical - Restraints and follow all WARNINGS and CAUTIONS.

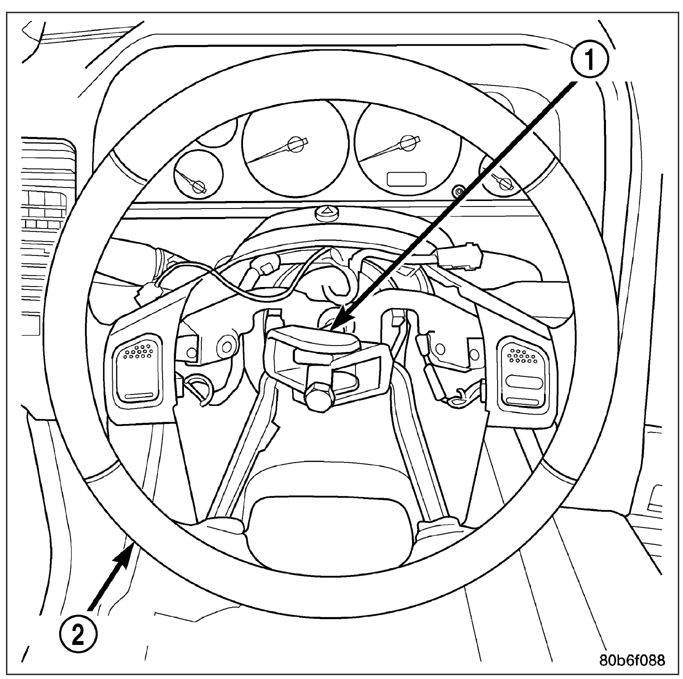
**WARNING: The airbag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the airbag system components you must first disconnect and isolate the battery negative (ground) cable. Then wait two minutes for the system capacitor to discharge. Failure to do so could result in accidental deployment of the airbag and possible personal injury. The fasteners, screws, and bolts, originally used for the airbag components, have special coatings and are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books.**

## REMOVAL

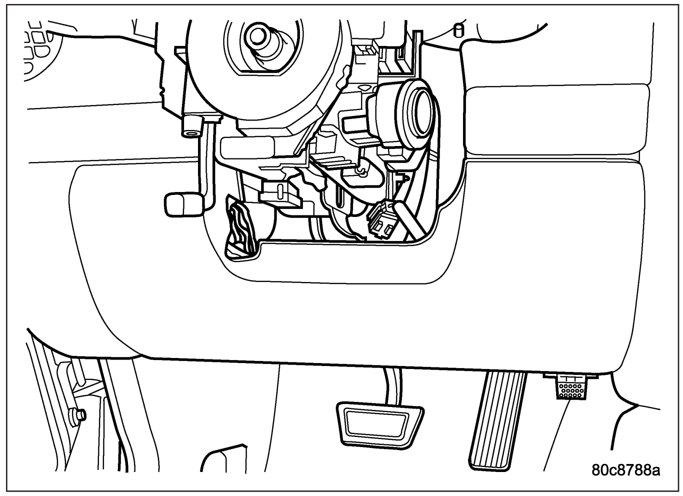
1. Position front wheels **straight ahead.**
2. Remove and isolate the negative ground cable from the battery.
3. Remove the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

**NOTE: If equipped with cruise control, disconnect clock spring harness from the cruise switch harness on the steering wheel.**

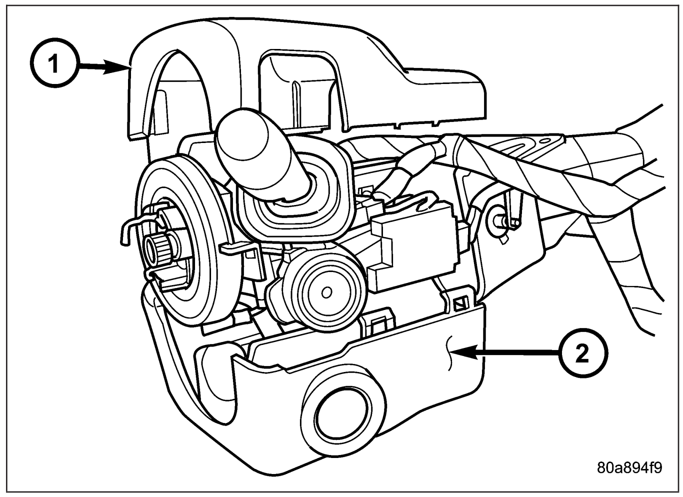
4. Remove the steering wheel (2) with puller C-3894–A (1) or an appropriate puller (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).



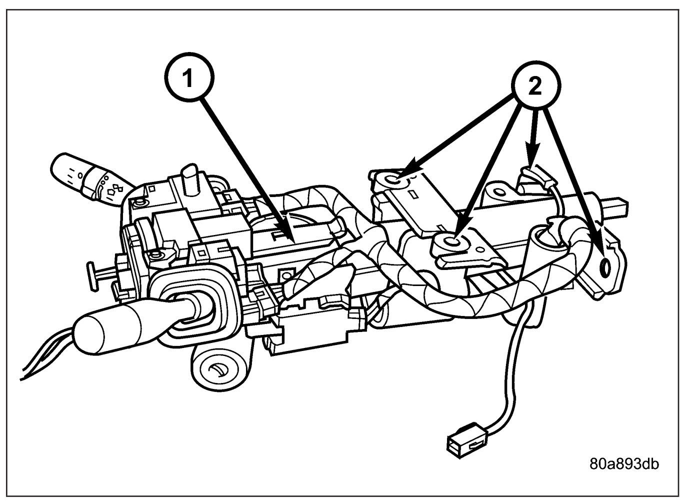
5. Remove knee blocker cover and knee blocker, (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).



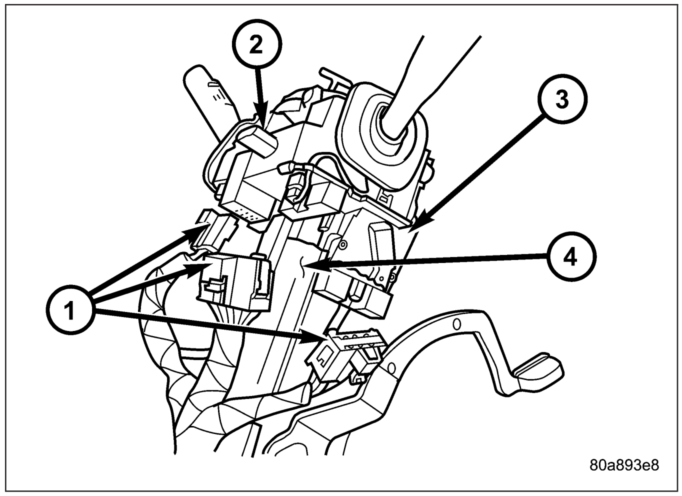
6. Remove screws from the lower column shroud (2) and remove both the upper and lower shrouds.



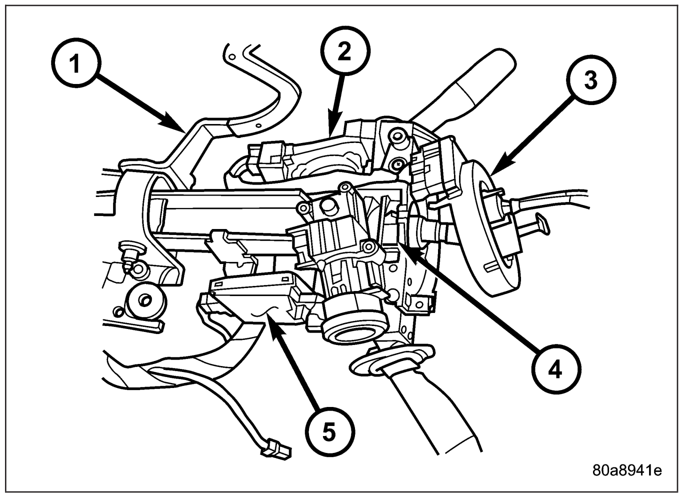
7. Turn ignition key to the on position.
8. If vehicle is equipped with automatic transmission, disconnect shifter interlock cable from the column.
9. Remove the steering coupler bolt and column mounting nuts and bolts (2) then lower column (1) off the mounting studs.



10. Disconnect and remove the wiring harness (1) from the column.
11. Slide the shifter interlock cable from the tie straps.

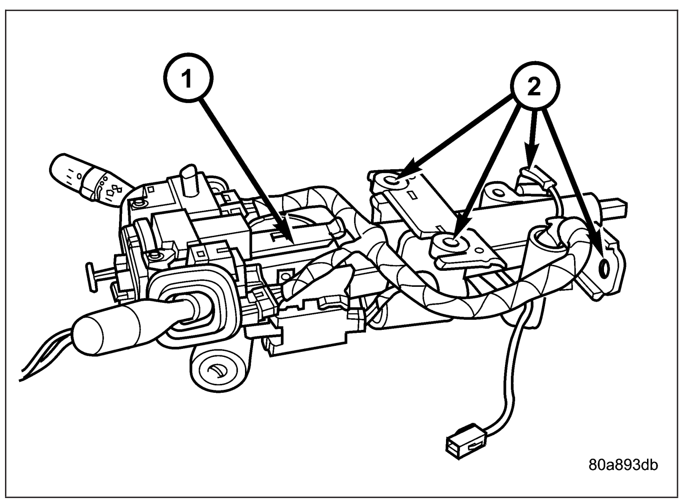


12. Remove column (4).
13. Transfer the necessary parts if needed.
14. Remove clock spring (3) , switches, (SKREEM if equipped) (5) (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

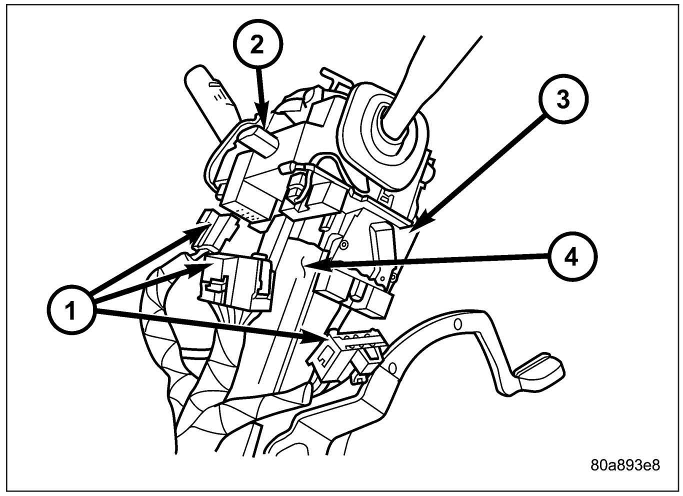


## INSTALLATION

1. Align and install column (1) into the steering coupler.



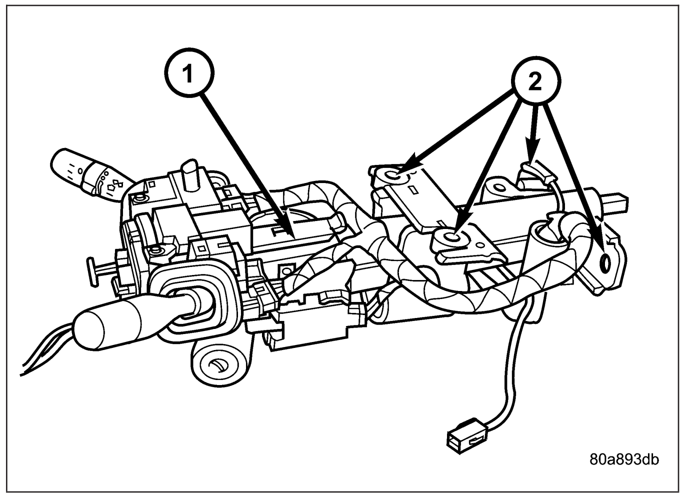
2. Install column harness (1) and connect harness to switches.
3. Reroute the shifter interlock cable through the tie straps.



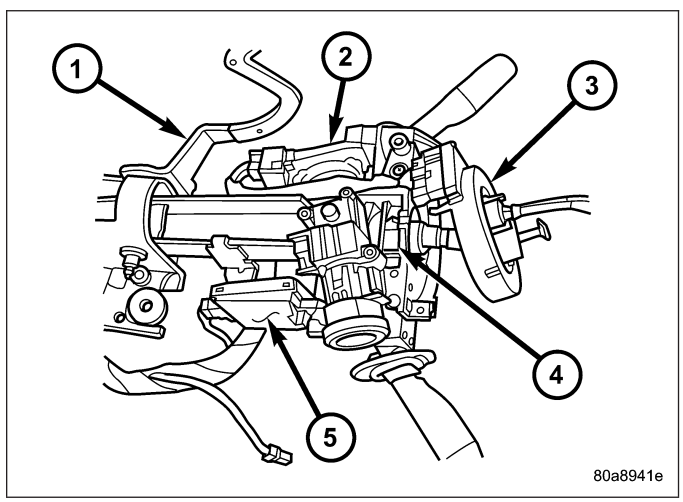
4. Install the column (1) onto the mounting studs (2).
5. Install the two mounting nuts and the two mounting bolts all finger tight.

**CAUTION: Lower nuts must be installed and tightened first then the upper nuts in order to prevent damage to the capsules.**

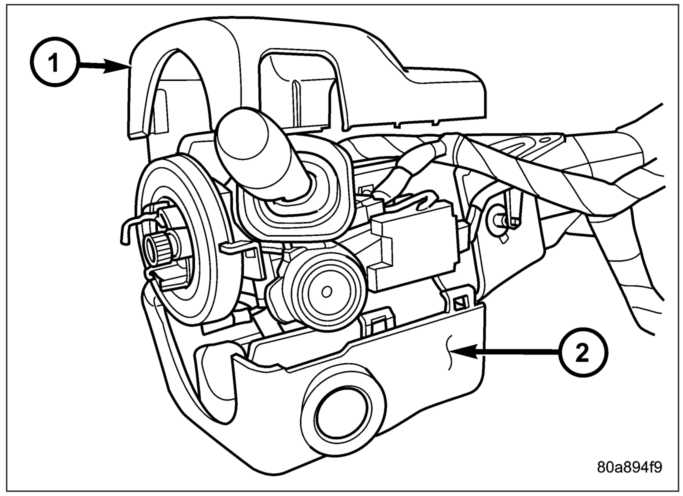
6. Tighten the lower mounting nuts to 17 N·m (150 in. lbs.).
7. Tighten the upper mounting nuts to 17 N·m (150 in. lbs.).



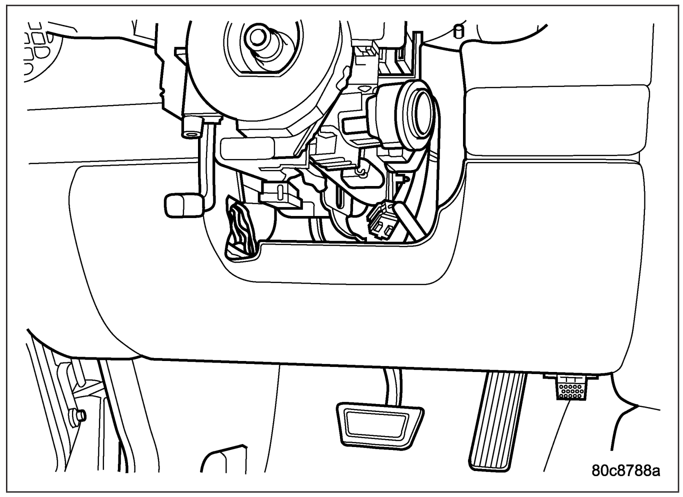
8. Install the steering column coupler bolt and tighten to 49 N·m (36 ft. lbs.).
9. Reconnect the shifter interlock cable.
10. Center the clock spring (3) (if necessary) and install it on the column (4) , (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).



11. Snap together the column shrouds (1&2) and install the mounting screws.



12. Install the knee blocker and the knee blocker cover , (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION).



**NOTE: Do not reuse the old steering wheel bolt (a new bolt must be used)**

**NOTE: Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.**

13. Install the steering wheel and tighten bolt to 54 N·m (40 ft. lbs.) (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).

**NOTE: If equipped with cruise control, connect clock spring harness to cruise switch harness on the steering wheel.**

14. Install the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
15. Install the negative battery terminal.

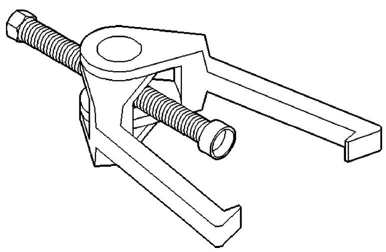
## SPECIAL TOOLS

## STEERING COLUMN



*Puller C-3894-A*

# IGNITION SWITCH

## DESCRIPTION

The electrical ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

## DIAGNOSIS AND TESTING - IGNITION SWITCH

### ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, Refer to the appropriate section for the component.

### MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

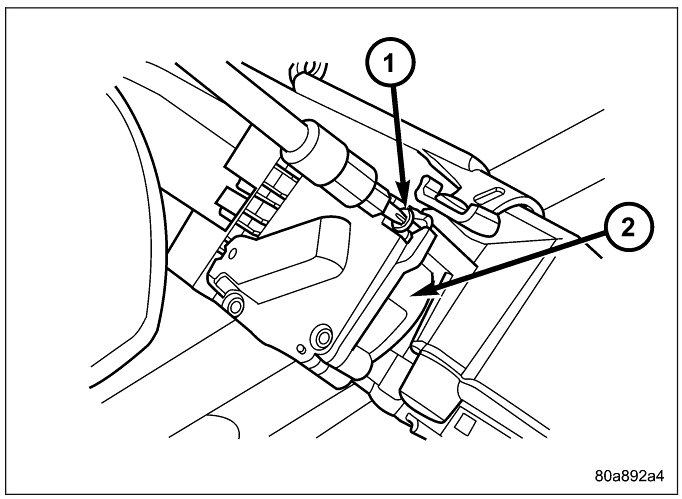
**Vehicles equipped with an automatic transmission and a floor mounted shifter:** a cable is used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock system is used to lock the transmission shifter in the PARK position when the key cylinder is rotated to any position. If the ignition key is difficult to rotate to or from any position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment. (Refer to 21 - TRANSMISSION/ TRANSAXLE/AUTOMATIC - 30RH/GEAR SHIFT CABLE - ADJUSTMENTS). The interlock system within the steering column is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

**Vehicles equipped with a manual transmission and a floor mounted shifter:** on certain models, a button is located on the steering column behind the ignition key cylinder. The button must be manually depressed to allow rotation of the ignition key cylinder to any position. If it is difficult to rotate the key to any position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

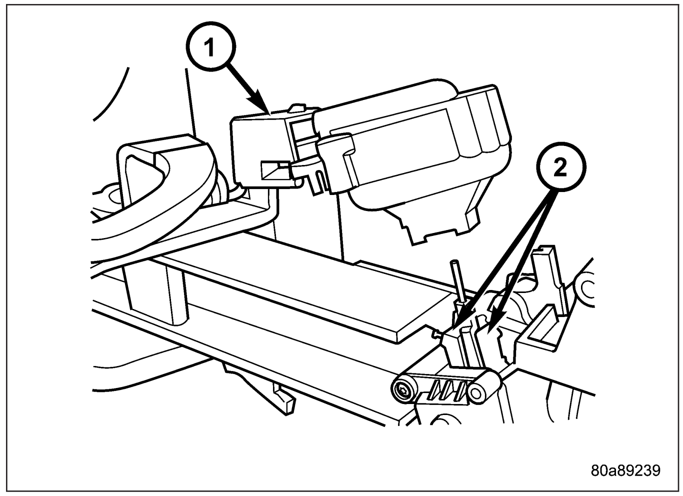
## REMOVAL

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

1. Remove lower steering column cover screws and remove cover.
2. Remove lock cylinder. (Refer to 19 - STEERING/ COLUMN/KEY/LOCK CYLINDER - REMOVAL).
3. Remove the multi-function switch.
4. Disconnect the electrical connector at the rear of the ignition switch.
5. Remove the ignition switch mounting screw (1). Use tamper proof torx bit to remove the screw (1).

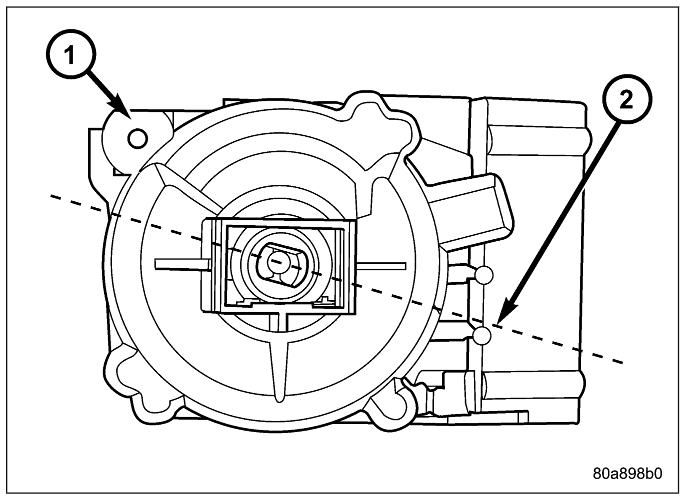


6. Pull the ignition switch (1) straight out to remove from the locking tabs (2).



## INSTALLATION

The ignition key must be in the key cylinder for cylinder installation. The key cylinder must be aligned with the ignition switch for installation.



1. Before installing ignition switch (1), rotate the slot in the switch to the ON position (2).
2. Connect the electrical connector to rear of ignition switch (1). Make sure that locking tab is fully seated into wiring connector.
3. Position the switch to the column and install tamper proof screw. Tighten screw to 2 N·m (17 in. lbs.).
4. Install the lock cylinder (Refer to 19 - STEERING/COLUMN/KEY/LOCK CYLINDER - INSTALLATION).
5. Test the operation of the lock cylinder for smooth rotating.
6. Install the multi-function switch.
7. Install steering column lower cover.

# KEY-IN IGNITION SWITCH

## DESCRIPTION

The key-in ignition switch is integral to the ignition switch, which is mounted on the left side of the steering column, opposite the ignition cylinder. It closes a path to ground for the instrument cluster chime warning circuitry when the ignition key is inserted in the ignition lock cylinder and the driver door jamb switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition cylinder.

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced. (Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - REMOVAL).

## DIAGNOSIS AND TESTING - KEY-IN IGNITION SWITCH

For circuit descriptions and diagrams, Refer to the appropriate sections on the individual components.

**WARNING: On vehicles equipped with airbags, refer to electrical - passive restraint systems before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

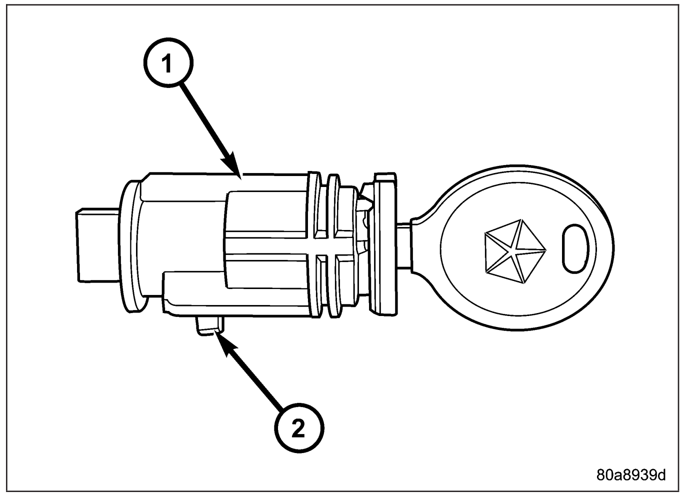
1. Disconnect and isolate the battery negative cable. Remove the steering column shrouds. Unplug the key-in ignition switch wire harness connector from the ignition switch.
2. Check for continuity between the key-in switch sense circuit and the left front door jamb switch sense circuit terminals of the key-in ignition switch. There should be continuity with the key in the ignition cylinder, and no continuity with the key removed from the ignition cylinder. If OK, go to Step 3. If not OK, replace the faulty ignition switch assembly.
3. Check for continuity between the left front door jamb switch sense circuit cavity of the key-in ignition switch wire harness connector and a good ground. There should be continuity with the driver door open, and no continuity with the driver door closed. If OK, see the diagnosis for Instrument Cluster in this group. If not OK, repair the circuit to the driver door jamb switch as required.

# KEY CYLINDER

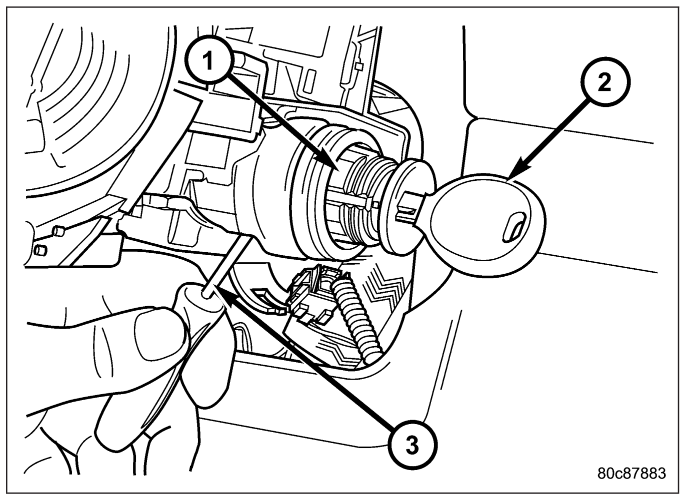
## REMOVAL

The ignition key must be in the key cylinder (1) for cylinder removal. The key cylinder must be removed first before removing ignition switch.

1. If equipped with an automatic transmission, place shifter in PARK position.
2. Remove the lower shroud cover.
3. Remove the remote keyless entry (R.K.E.) module.
4. Remove the halo ring around the cylinder.
5. Rotate key to ON position.
6. A release tang (2) is located on bottom of key cylinder (1).



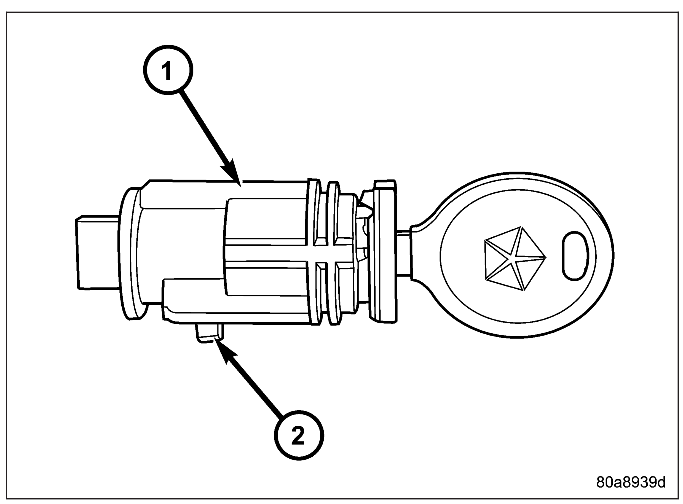
7. Position a small screwdriver or pin punch (3) into tang access hole on bottom of steering column.
8. Push the pin punch (3) up while pulling key cylinder (1) from steering column.



## INSTALLATION

The ignition key must be in the key cylinder (1) for cylinder installation.

1. Install the key cylinder (1) into the housing using care to align the end of the key cylinder with the ignition switch.
2. Push the key cylinder (1) in until it clicks .
3. Rotate the key to the insert position.
4. install the halo ring around the key cylinder housing.
5. Install the R.K.E. module.
6. Install the lower shroud cover.



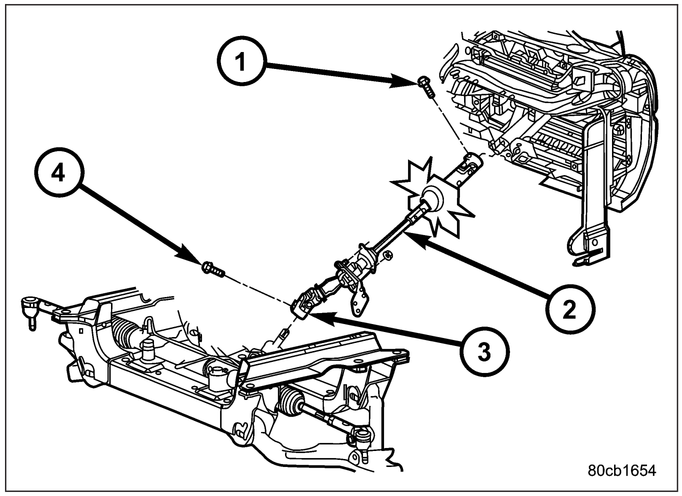
# INTERMEDIATE SHAFT

## REMOVAL

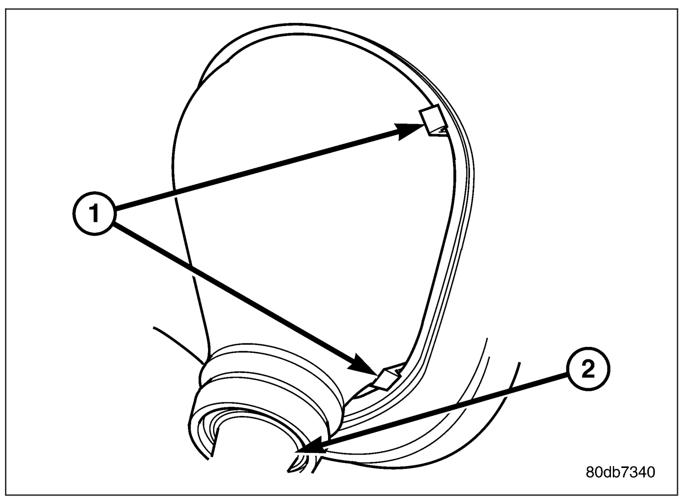
1. Disconnect the negative battery cable.
2. Remove knee blocker cover and knee blocker, (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL).

**NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.**

3. Lock the steering wheel with the tires in the straight ahead position.
4. Remove the lower column pinch bolt (4).
5. Lower the steering coupler (3) shaft from the column.



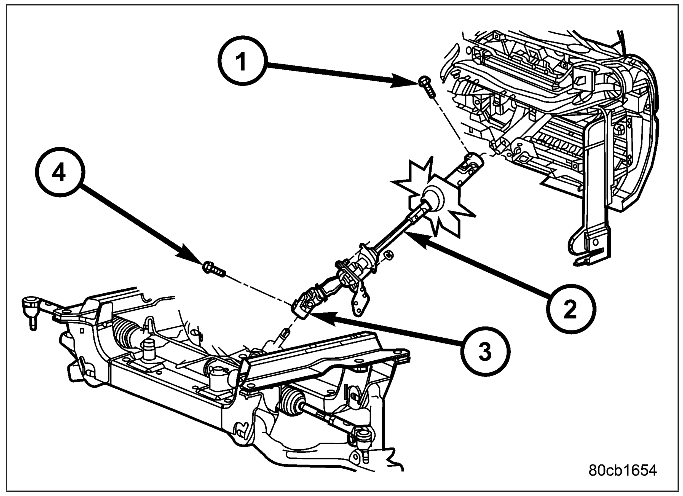
6. Remove the intermediate shaft seal by pushing in the four tangs (1) securing it to the panel.
7. Remove the center support bearing bracket from the mount on the shock tower.



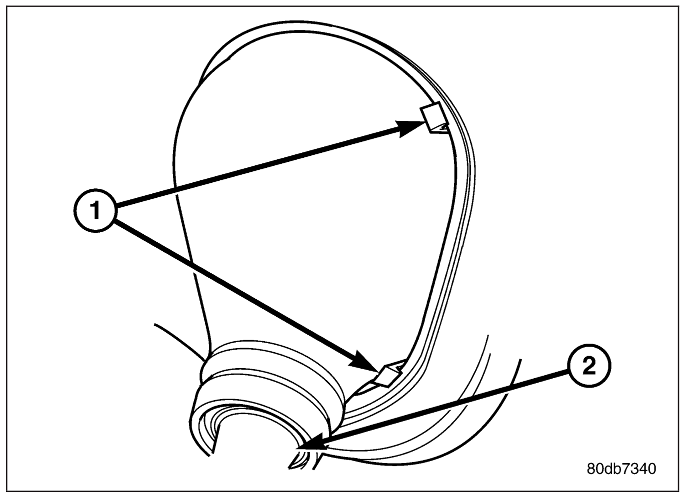
8. Remove the lower coupler pinch bolt (4) at the steering gear.
9. Remove the coupler (3) at the steering gear.
10. Remove the intermediate shaft (2) from the vehicle.
11. Remove the center support bracket from the steering shaft (if replacing the intermediate shaft).

## INSTALLATION

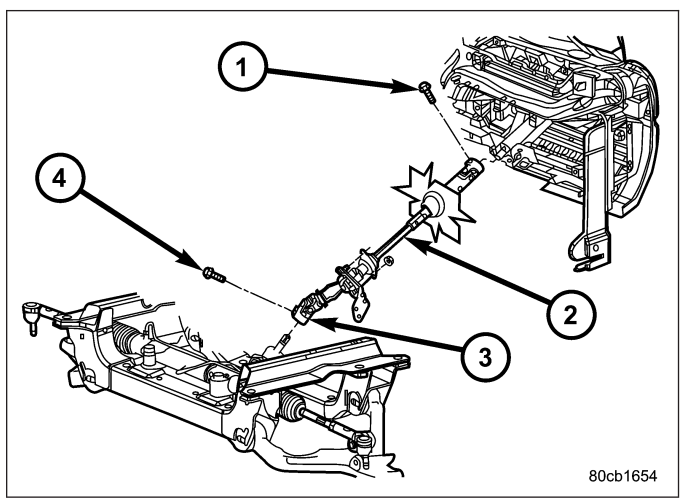
1. Install the center support bearing bracket to the steering shaft (if removed). Tighten to 14 N·m (125 in.lbs.).
2. Install the intermediate shaft (2) to the vehicle.
3. Install the coupler (3) at the steering gear.
4. Install the lower coupler pinch bolt (4) at the steering gear and tighten the bolt to 49 N·m (36 ft. lbs.).



5. Install the center support bearing bracket to the mounting holes on the shock tower.
6. Install the intermediate shaft seal by pushing it in securing the four tangs (1) to the panel.



7. Install the steering coupler shaft to the column.
8. Install the upper pinch bolt (1) and tighten the bolt to 49 N·m (36 ft. lbs.).
9. Unlock the steering wheel.
10. Install the knee blocker cover and knee blocker (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION).
11. Reconnect the negative battery cable.



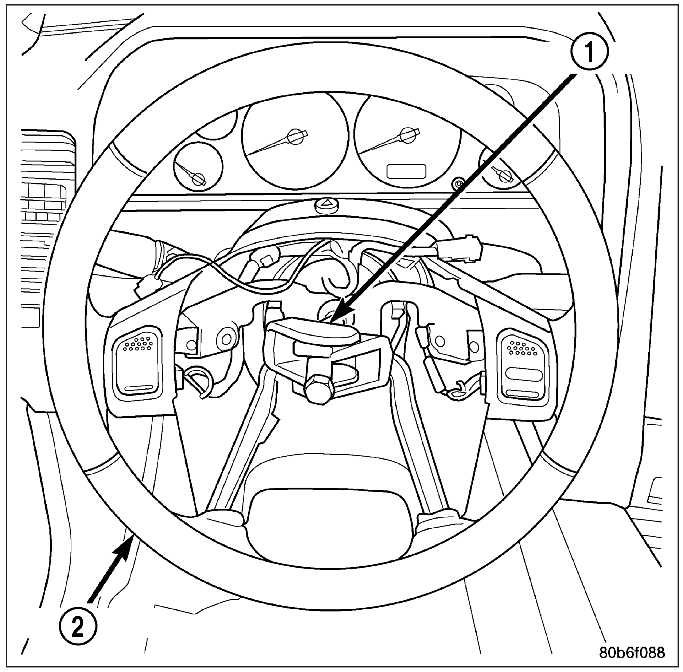
# STEERING WHEEL

## REMOVAL

1. Disable and remove the drivers side airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
2. Partially remove the steering wheel bolt and leave the bolt in the column.
3. Install puller C-3894–A or equivalent using the top of the bolt to push on.

**NOTE: Ensure the puller jaws are seated in the pockets of the steering wheel armature.**

4. Remove the steering wheel.



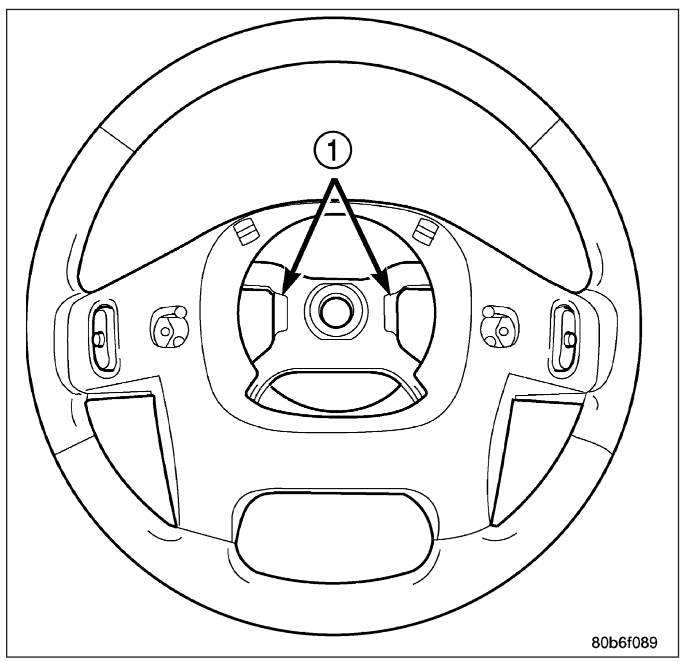
## INSTALLATION

**NOTE: Do not reuse the old steering wheel bolt (a new bolt must be used)**

1. Install steering wheel to the column

**NOTE: Be certain that the steering wheel mounting bolt is tightened to the proper torque specification to ensure proper clockspring operation.**

2. Install the new steering wheel bolt. Tighten the bolt to 54 N·m (40 ft. lbs.).
3. Install the drivers side air bag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).



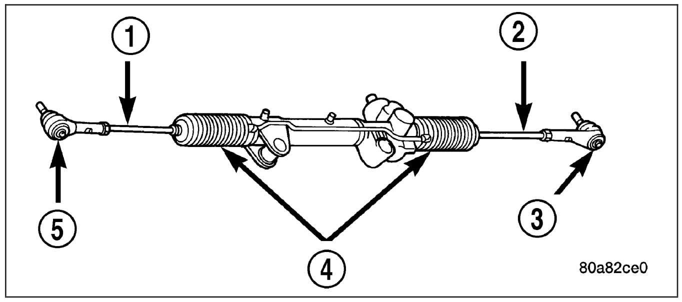
# GEAR

## TABLE OF CONTENTS

# GEAR

## DESCRIPTION

A rack and pinion steering gear is made up of two main components, the pinon shaft and the rack. The gear cannot be adjusted or internally serviced. If a malfunction or a fluid leak occurs, the gear must be replaced as an assembly, With the exception of the outer tie rods (3&5) which are serviced separately.



## OPERATION

The steering column intermediate shaft is attached to the gear pinion. The rotation of the pinion moves the gear rack from side-to-side. This lateral action of the rack pushes and pulls the tie rods, which are connected to the steering knuckles to change the direction of the front wheels.

## REMOVAL

### 4WD

1. Siphon the power steering fluid from the power steering reservoir.

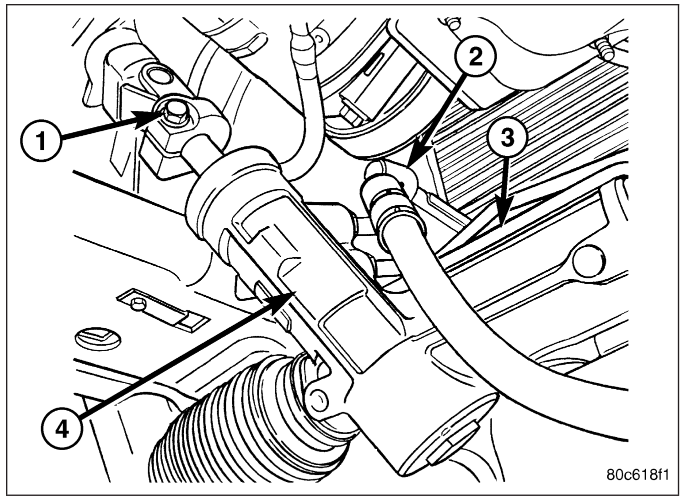
**NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.**

2. Lock the steering wheel to prevent spinning of the clockspring.
3. Raise and support the vehicle.
4. Remove the skid plate from under the front end to gain access to the gear (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL).
5. Remove the front tire and wheel assemblies.

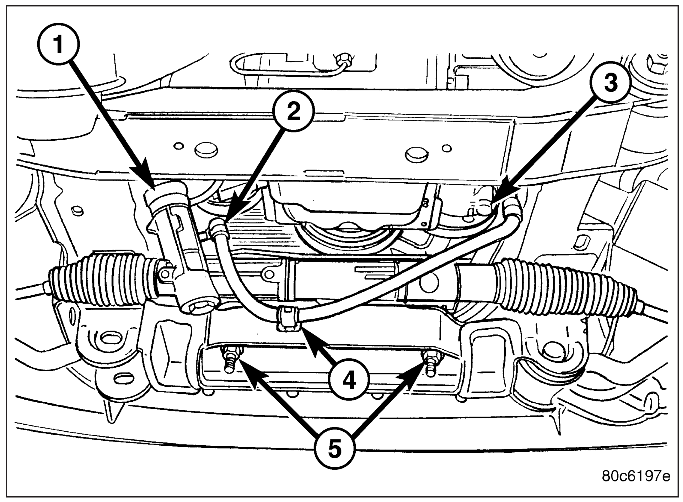
**NOTE: Mark the alignment adjusting cams for easier installation.**

6. Remove the lower control arms. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).
7. Remove the front axle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - REMOVAL).
8. Remove the tie rod end nuts.
9. Separate tie rod ends from the knuckles with Puller C-3894-A.

10. Remove the intermediate shaft lower coupler pinch bolt (1) and slide the coupler off the gear.
11. Remove the power steering lines (2) from the gear (4).



12. Remove the mounting bolts (5) from the gear to the front cradle.
13. Remove the steering gear (1) from the vehicle.



## 2WD

1. Siphon the power steering fluid from the power steering reservoir.

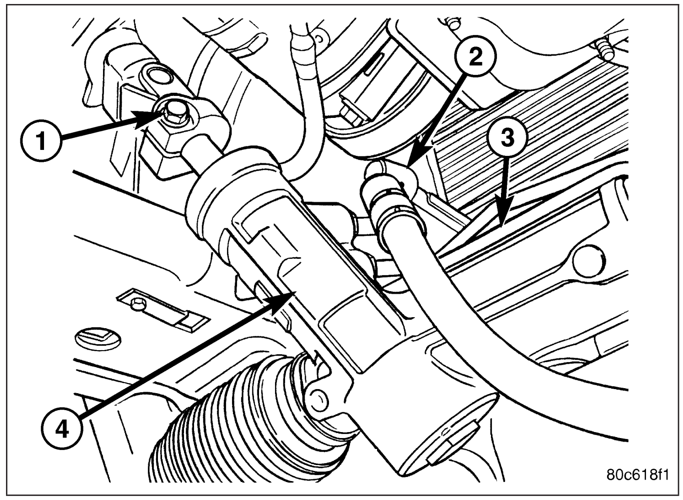
**NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.**

2. Lock the steering wheel to prevent spinning of the clockspring.
3. Raise and support the vehicle.
4. Remove the skid plate from under the front end to gain access to the gear (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL).
5. Remove the tire and wheel assembly.

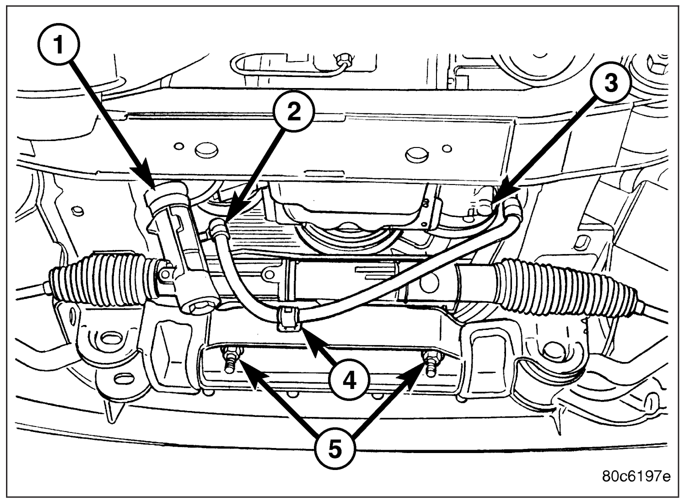
**NOTE: Mark the alignment adjusting cams and tie rod end jam nuts on the steering gear for easier installation.**

6. Remove the tie rod end nuts.
7. Separate tie rod ends from the knuckles with Puller C-3894-A.

8. Remove the lower intermediate shaft coupler pinch bolt (1) and slide the coupler off the gear (4).



9. Remove the power steering lines (2) from the gear (1).
10. Remove the mounting bolts (5) from the gear (1) to the front cradle.
11. Remove the steering gear (1) from the vehicle.



## DIESEL

1. Siphon the power steering fluid from the power steering reservoir.

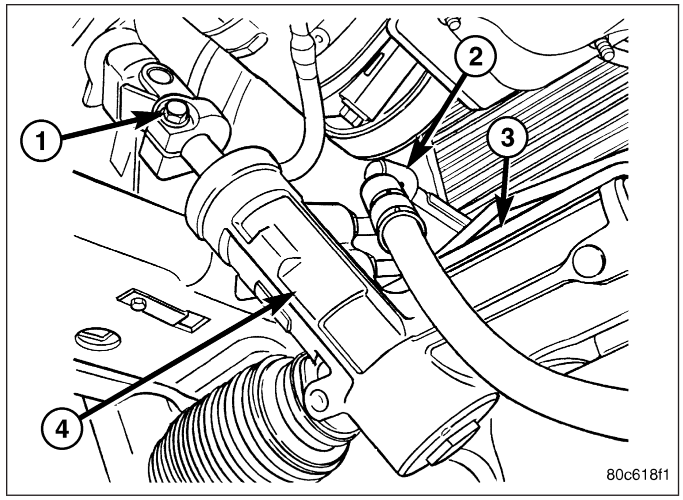
**NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.**

2. Lock the steering wheel to prevent spinning of the clockspring.
3. Raise and support the vehicle.
4. Remove the skid plate from under the front end to gain access to the gear (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL)
5. Remove the tire and wheel assembly.

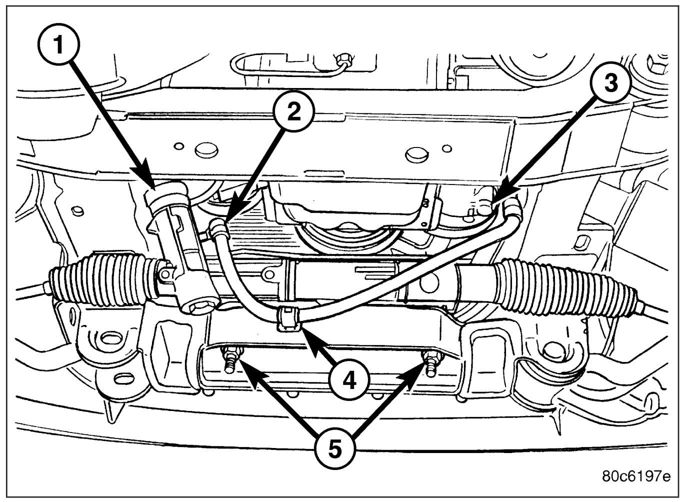
**NOTE: Mark the alignment adjusting cams for easier installation.**

6. Remove the lower control arms. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).
7. Remove the front axle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - REMOVAL).
8. Remove the tie rod end nuts.
9. Separate tie rod ends from the knuckles with Puller C-3894-A.

10. Remove the lower coupler pinch bolt (1) and slide the coupler off the gear (4).



11. Remove the power steering lines (2) from the gear (1).
12. Remove the mounting bolts (5) from the gear to the front cradle.
13. Remove the steering gear from the vehicle.



## RHD - 4X2 & 4X4

1. Siphon the power steering fluid from the power steering reservoir.

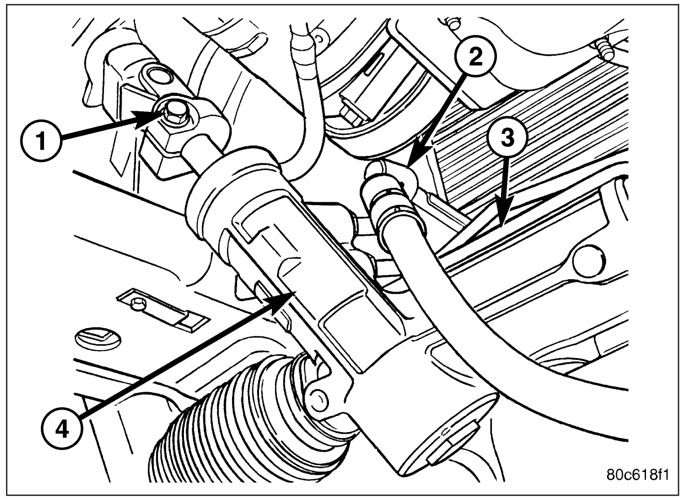
**NOTE: The steering column on vehicles with an automatic transmission may not be equipped with an internal locking shaft that allows the ignition key cylinder to be locked with the key. Alternative methods of locking the steering wheel for service will have to be used.**

2. Lock the steering wheel to prevent spinning of the clockspring.
3. Raise and support the vehicle.
4. Remove the skid plate from under the front end to gain access to the gear (Refer to 13 - FRAME & BUMPERS/ FRAME/FRONT SKID PLATE - REMOVAL).
5. Remove the tire and wheel assembly.

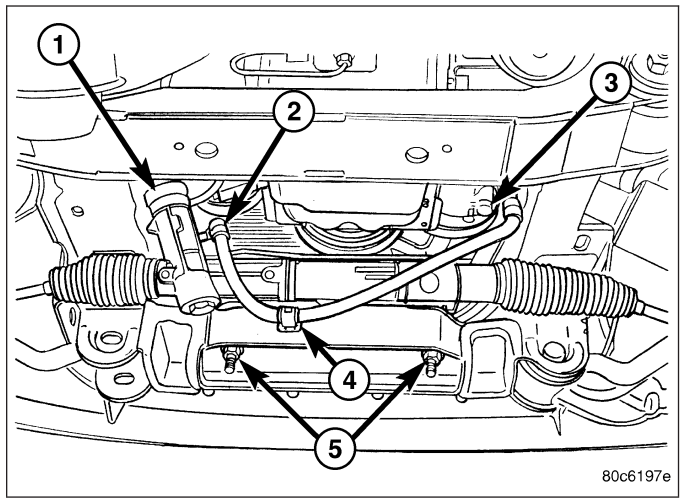
**NOTE: Mark the alignment adjusting cams and tie rod end jam nuts on the steering gear for easier installation.**

6. Remove the tie rod end nuts.
7. Separate tie rod ends from the knuckles with Puller C-3894-A.

8. Remove the lower intermediate shaft coupler pinch bolt (1) and slide the coupler off the gear (4).



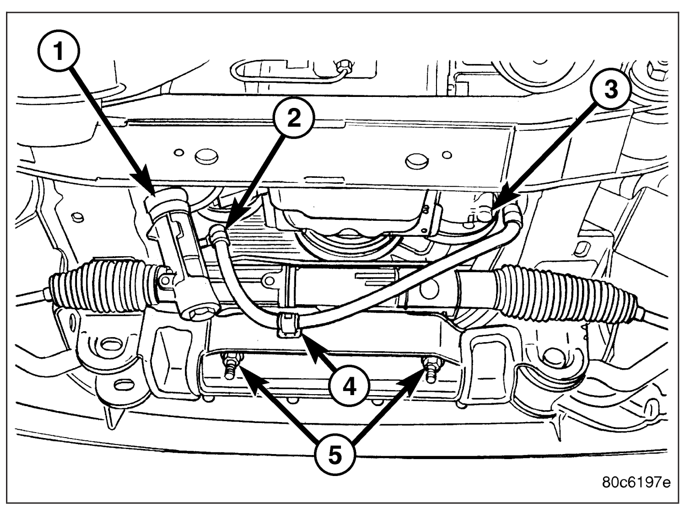
9. Remove the power steering lines (2) from the gear (1).
10. Remove the mounting bolts (5) from the gear (1) to the front cradle.
11. Remove the steering gear (1) from the vehicle.



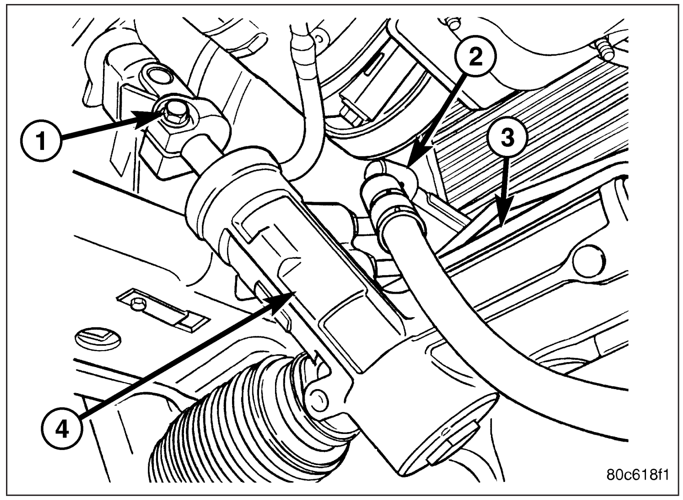
## INSTALLATION

## 4WD

1. Transfer the tie rod ends to the new steering gear (if needed).
2. Install the steering gear (1) to the vehicle.
3. Install the gear mounting bolts (5) to the front cradle. Tighten the gear mounting bolts to 162 N·m (120 ft.lbs.)
4. Install the power steering lines (2) to the gear, tighten the tube nuts to 37 N·m (20 ft.lbs.).



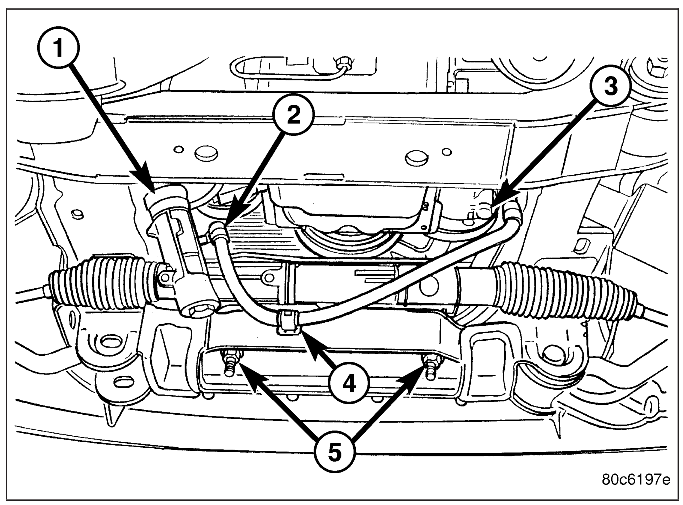
5. Install the lower coupler bolt (1) and slide the coupler on to the gear (4).



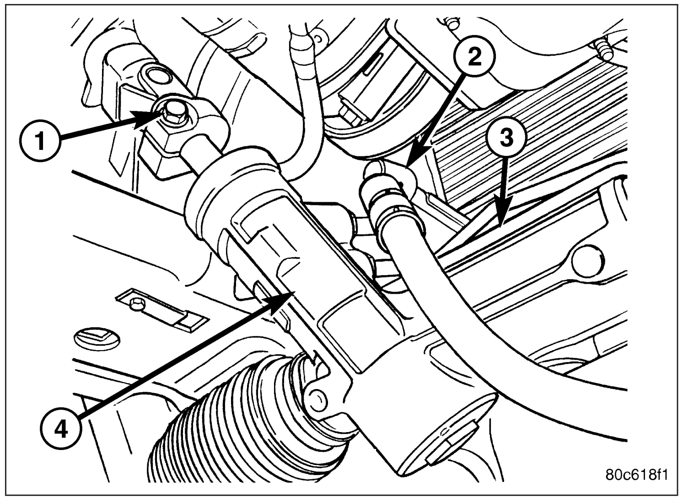
6. Install the tie rod end to the knuckle and tighten the nuts.
7. Install the front axle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - INSTALLATION).
8. Install the lower control arms. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).
9. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
10. Install the skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).
11. Lower the vehicle.
12. Unlock the steering wheel.
13. Fill the power steering fluid (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
14. Reset the toe and center the steering wheel (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

## 2WD

1. Transfer the outer tie rod ends to the new steering gear (if needed).
2. Install the steering gear to the vehicle.
3. Install the gear mounting bolts (5) to the front cradle. Tighten the gear mounting bolts to 162 N·m (120 ft.lbs.)
4. Install the power steering lines (2) to the gear (1) tighten the tube nuts to 37 N·m (20 ft.lbs.).



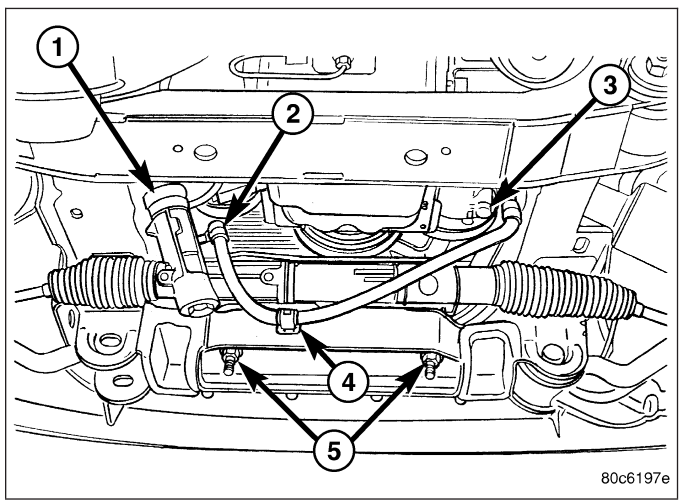
5. Install the lower coupler pinch bolt (1) and slide the coupler on to the gear (4).



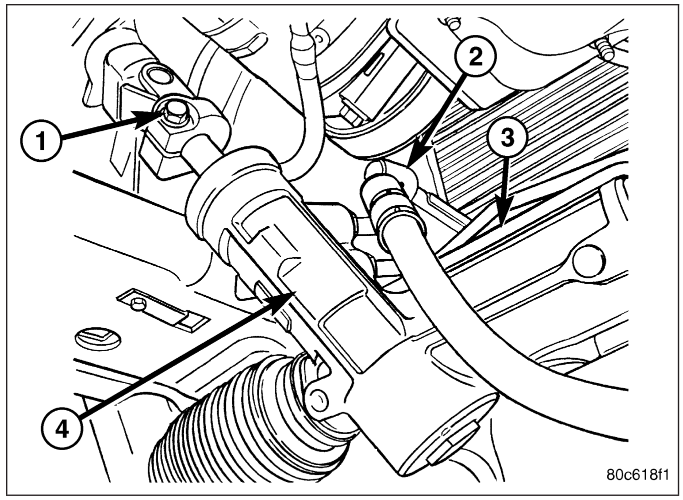
6. Install the tie rod end to the knuckle and tighten the nuts.
7. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
8. Install the skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).
9. Lower the vehicle.
10. Unlock the steering wheel.
11. Fill the power steering fluid (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
12. Reset the toe and center the steering wheel (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

## DIESEL

1. Transfer the tie rod ends to the new steering gear (if needed).
2. Install the steering gear (1) to the vehicle.
3. Install the gear mounting bolts (5) to the front cradle . Tighten the gear mounting bolts to 162 N·m (120 ft.lbs.)
4. Install the power steering lines (2) to the gear (1), tighten the tube nuts to 37 N·m (20 ft.lbs.).



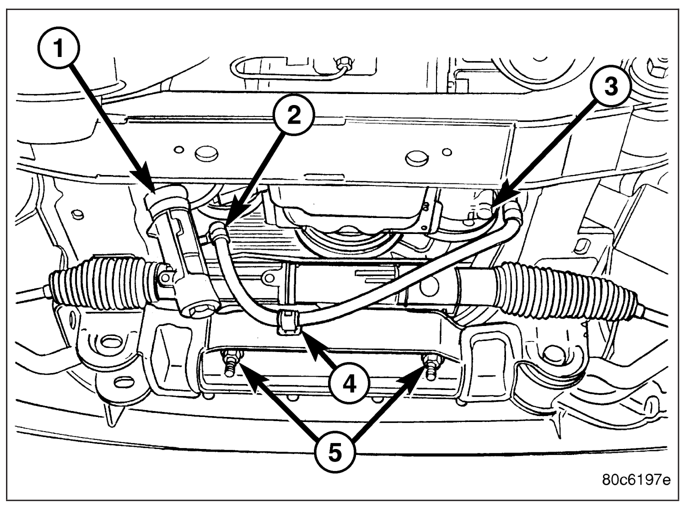
5. Install the lower coupler pinch bolt (1) and slide the coupler on to the gear (4).



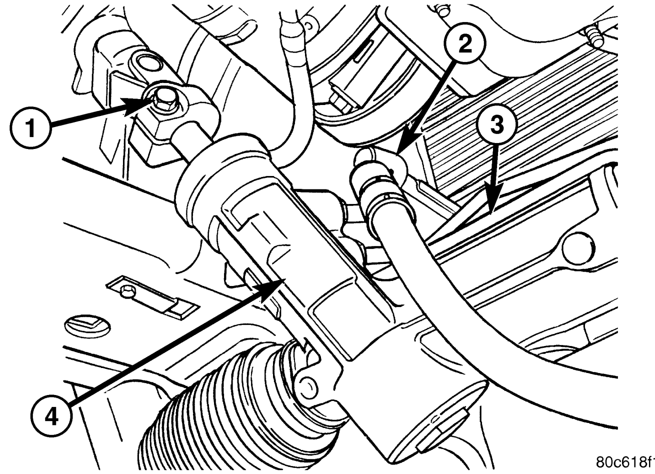
6. Install the tie rod end to the knuckle and tighten the nuts.
7. Install the front axle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE - INSTALLATION).
8. Install the lower control arms. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).
9. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
10. Install the skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).
11. Lower the vehicle.
12. Unlock the steering wheel.
13. Fill the power steering fluid (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
14. Align the front end.

## RHD - 4X2 & 4X4

1. Transfer the outer tie rod ends to the new steering gear (if needed).
2. Install the steering gear (1) to the vehicle.
3. Install the gear mounting bolts (5) to the front cradle.. Tighten the gear mounting bolts to 162 N·m (120 ft.lbs.)
4. Install the power steering lines (2) to the gear (1), tighten the tube nuts to 37 N·m (20 ft.lbs.).



5. Install the lower coupler pinch bolt (1) and slide the coupler on to the gear (4).



6. Install the tie rod end to the knuckle and tighten the nuts.
7. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
8. Install the skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).
9. Lower the vehicle.
10. Unlock the steering wheel.
11. Fill the power steering fluid (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
12. Reset the toe and center the steering wheel (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

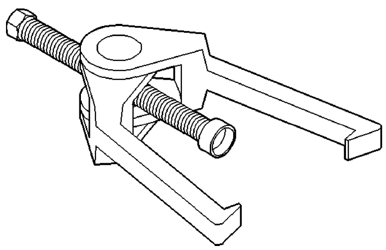
## SPECIAL TOOLS

## OUTER TIE ROD END REMOVAL TOOL



**_Puller C-3894-A_**

# LINKAGE

## TABLE OF CONTENTS

# TIE ROD END

## STANDARD PROCEDURE - STEERING LINKAGE

The tie rod end and ball stud seals should be inspected during all oil changes. If a seal is damaged, replace the tie rod.

**CAUTION: If any steering components are replaced or serviced an alignment must be performed, to ensure the vehicle meets all alignment specifications.**

## REMOVAL

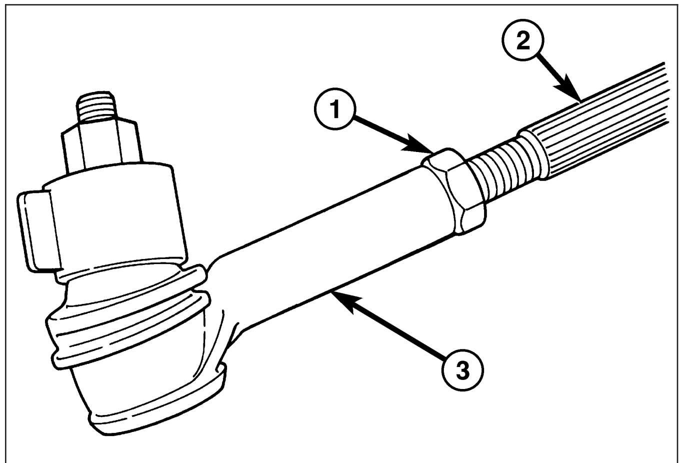
1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.

**NOTE: Mark the tie rod end jam nuts on the steering gear for easier installation.**

3. Loosen the tie rod end jam nut (1).
4. Remove the outer tie rod end (3) nut.
5. Separate the outer tie rod end (3) from the knuckle using tool C3894A.

**NOTE: Count the number of turns when removing.**

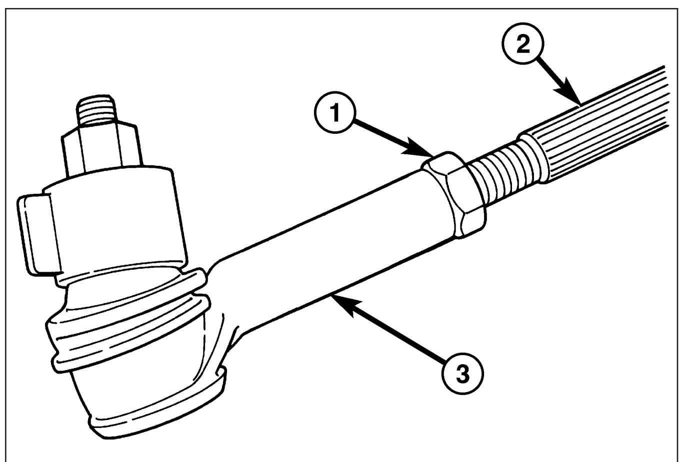
6. Remove the outer tie rod end (3) from the inner tie rod (2).



80cdf759

## INSTALLATION

1. Install the outer tie rod end (3) to the inner tie rod end (2) to the exact number of turns that it was removed.
2. Install the outer tie rod end (3) to the knuckle. Tighten the nut to 108 N·m (80 ft.lbs).
3. Tighten the jam nut to 75 N·m (55 ft.lbs).
4. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
5. Reset the toe and center the steering wheel (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).



80cdf759

# PUMP

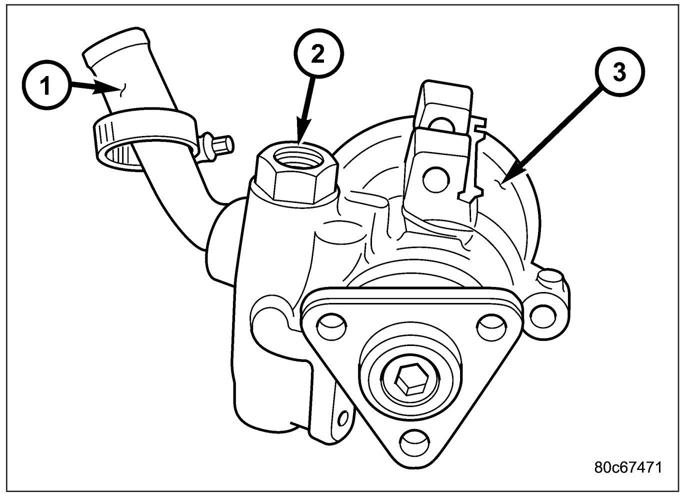
## TABLE OF CONTENTS

# PUMP

## DESCRIPTION

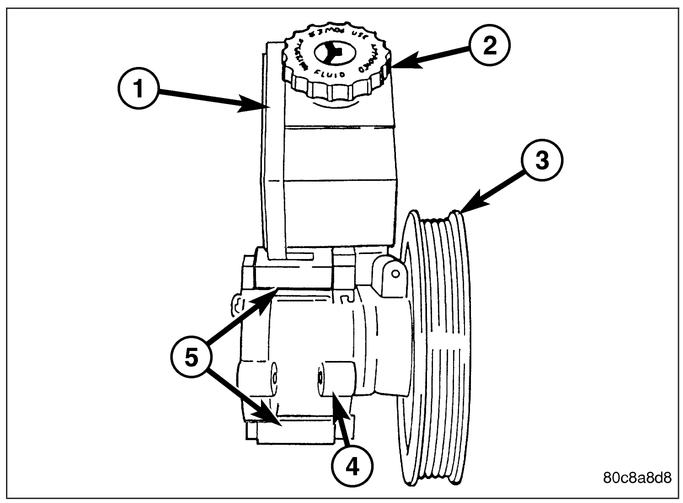
### DIESEL POWER STEERING PUMP

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump (3). The pump shaft has a bolt-on drive pulley that is belt driven by the crankshaft pulley. The reservoir is seperate from the pump body (3). The power steering pump is connected to the steering gear by the pressure and return hoses.



### 3.7L POWER STEERING PUMP

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump (4). The pump shaft has a pressed-on high strength plastic drive pulley (3) that is belt driven by the crankshaft pulley. The integral reservoir (1) used on the 3.7L is attached to the pump body (4) with spring clips (5).



## OPERATION

The power steering pump is a constant flow rate and displacement, vane-type pump. The pump internal parts operate submerged in fluid. The flow control orifice is part of the high pressure line fitting. The pressure relief valve inside the flow control valve limits the pump pressure.

**NOTE: Power steering pumps have different pressure rates and are not interchangeable with other pumps.**

## STANDARD PROCEDURE

### POWER STEERING PUMP - INITIAL OPERATION - GAS ENGINE

**WARNING: The fluid level should be checked with engine off to prevent injury from moving components.**

**CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.**

**NOTE: Power steering reservoir cap contains a dipstick. The reservoir has a molded in level indicator and a window to observe fluid level.**

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal ambient temperature.

1. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
2. Raise the front wheels off the ground.
3. Slowly turn the steering wheel right and left, lightly contacting the wheel stops at least 20 times.
4. Check the fluid level add if necessary.
5. Lower the vehicle, start the engine and turn the steering wheel slowly from lock to lock.
6. Stop the engine and check the fluid level and refill as required.

**CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.**

7. If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.
8. Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.

## POWER STEERING PUMP - INITIAL OPERATION - DIESEL ENGINE

**WARNING: The fluid level should be checked with engine off to prevent injury from moving components.**

**CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.**

**NOTE: If the air is not purged from the power steering system correctly, pump failure could result.**

**NOTE: Power steering reservoir cap doe contains a dipstick. The reservoir has a molded in level indicator and a window to observe fluid level.**

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal ambient temperature.

### PRE AIR EVACUATION PROCEDURE

1. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
2. Remove the fuel rail electrical connector.
3. Crank the engine (DO NOT START) to pressurize the system.
4. Check fluid level.
5. Repeat steps #1 & #3).
6. Reconnect the fuel rail electrical connector.

## AIR EVACUATION AND FILL PROCEDURE

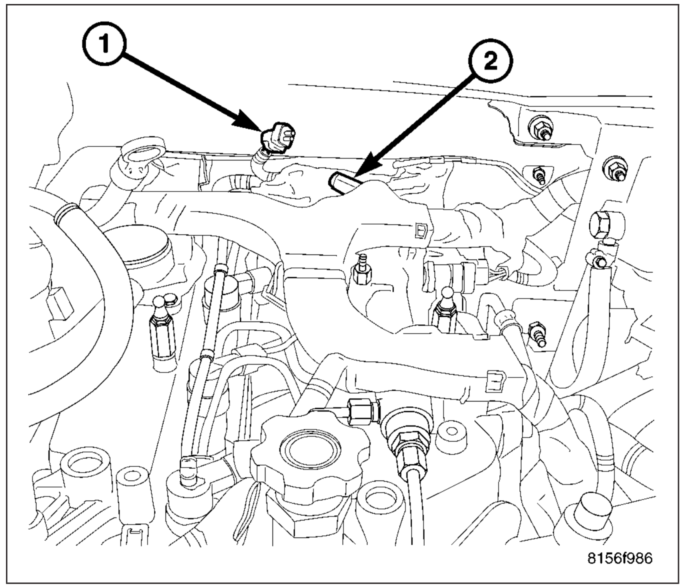
1. Fill the pump fluid reservoir to the proper level at the cold mark.
1. Tightly insert reservoir vacuum plug 9688 onto the pump reservoir.
2. Apply 20–25 in HG (68–85 Kpa) of vacuum for a minimum of 3 minutes with a hand vacuum pump.
3. Remove the vacuum and reservoir vacuum plug 9688 and add fluid to the proper level.
4. Repeat steps #2 thru # 4 until fluid level stabilizes.
5. Raise the vehicle so the front tires are off the ground.
6. With reservoir vacuum plug 9688 installed onto the reservoir apply 20–25 in HG (68–85 Kpa) of vacuum, while cycling the steering wheel from lock to lock every 30 seconds for approximately 5 minutes.

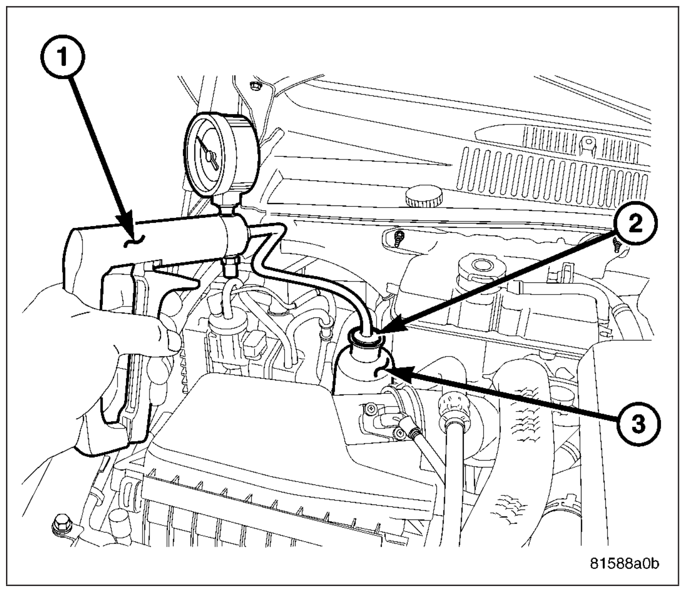
**NOTE: Do not hold the steering wheel on stops.**

7. Remove the vacuum and add fluid if necessary.
8. Start the engine and cycle the steering wheel from lock to lock every 30 seconds for approximately 5 minutes.

**NOTE: Do not hold the steering wheel on stops.**

9. Stop the engine, lower the vehicle to the floor and check for leaks at all connections. Check for any signs of air in the reservoir. If air is present repeat the procedure if necessary.
10. While the engine is off fill and adjust the fluid level to the desire level.

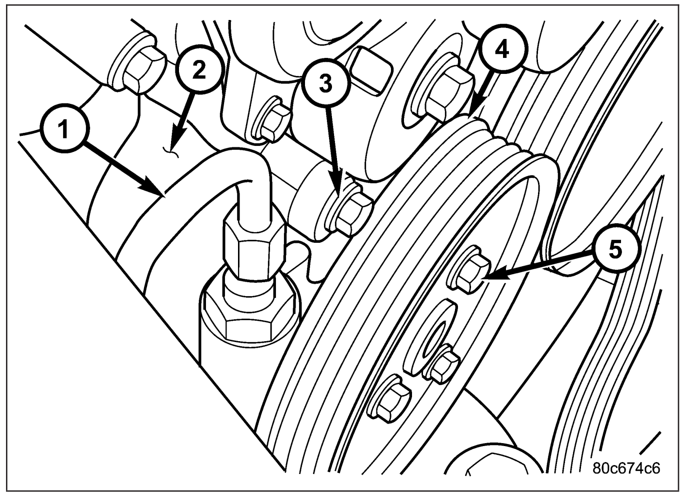




## REMOVAL

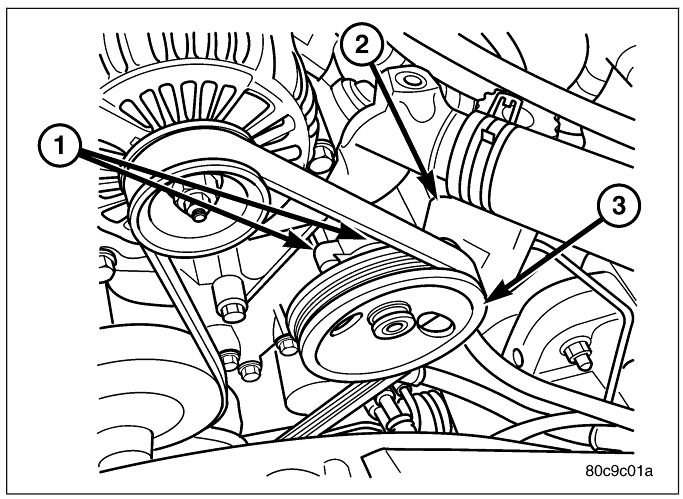
### 2.8L- DIESEL

1. Siphon out as much power steering fluid as possible.
2. Remove the engine cooling fan.
3. Remove the fan shroud
4. Remove the serpentine drive belt.
5. Remove the three bolts (5) securing the pulley (4) to the pump (2).
6. Remove the power steering hoses (1).
7. Remove the three bolts (3) securing the pump (2) to the bracket.
8. Remove the pump from the vehicle.



### 3.7L

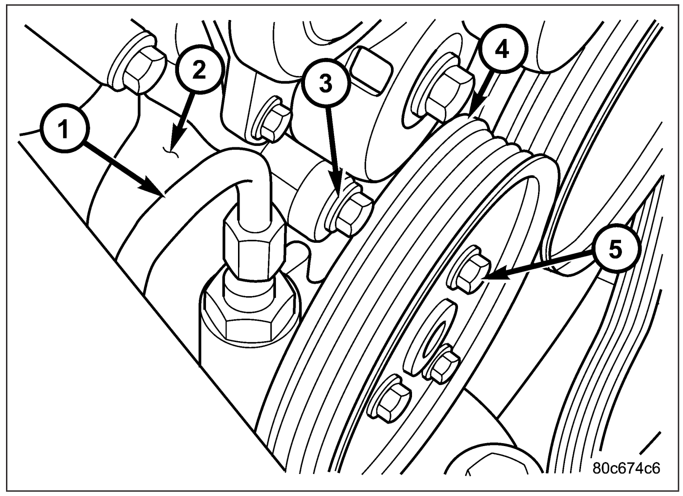
1. Siphon out as much power steering fluid as possible.
2. Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Remove the power steering high pressure hose at the pump.
4. Remove the return hose at the pump.
5. Remove the three bolts (1) securing the pump to the enginet thru the holes in the pulley (3).
6. Remove the pump from the vehicle.



## INSTALLATION

### 2.8L–DIESEL

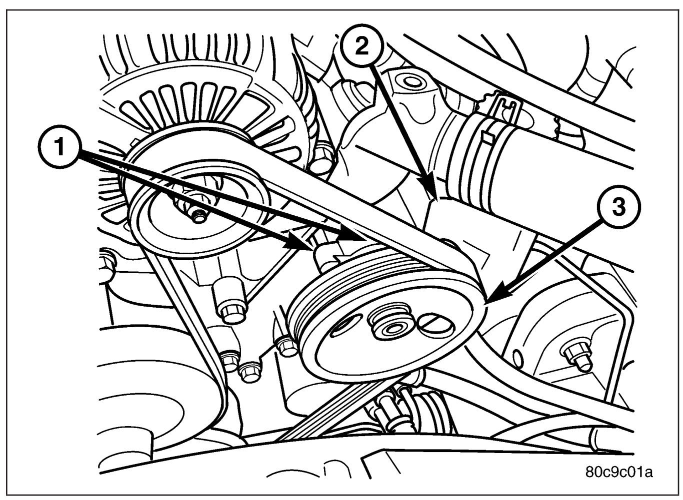
1. Install the pump to the vehicle.
2. Install the three bolts (3) securing the pump (2) to the bracket..
3. Install the power steering hoses (1).
4. Install the three bolts (5) securing the pulley (4) to the pump (2)..



5. Install the serpentine belt.
6. Install the fan shroud
7. Install the engine cooling fan.
8. Refill the power steering fluid and bleed the system (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

### 3.7L

1. Install the pump to the vehicle.
2. Install the three bolts (1) securing the pump to the engine. Tighten the bolts to 47 N·m (35 ft.lbs.).
3. Install the power steering hoses.
4. Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).



5. Refill the power steering fluid and check for leaks (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## SPECIFICATIONS

## TORQUE CHART

#### TORQUE SPECIFICATIONS

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Power Steering Pump to Engine | 47 | 35 | — |
| Power Steering Pump Bracket to Engine Diesel Engine | 47 | 35 | — |
| Power Steering Reservoir Diesel engine | 12 | 9 | 108 |
| Power Steering Pump Flow Control Valve | 75 | 55 | — |
| Power Steering Pump Pressure Line | 28 | 21 | — |
| Power Steering Pump Pressure Line Bracket | 12 | 9 | 105 |

***RESERVOIR VACUUM PLUG - 9688***

# FLUID

## DESCRIPTION

The recommended fluid for the power steering system is Mopar® ATF +4.

Mopar® ATF+4, when new is red in color. The ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition, As the vehicle is driven, the ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

## STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING

**WARNING: The fluid level should be checked with engine off to prevent injury from moving components.**

**CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.**

**NOTE: Power steering reservoir does not contain a dipstick. Fluid level indicators are molded into the side of the reservoir WITH REMOTE RESERVOIR.**

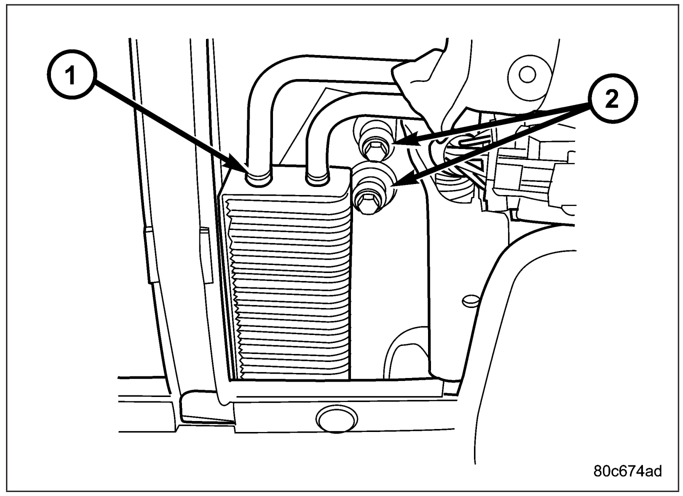
The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two ranges listed on the dipstick, COLD and HOT. Before opening power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the minimum and maximum area of the cold range. When the fluid is hot, fluid level is allowed to read up to the highest end of the HOT range. Only add fluid when the vehicle is cold.

**Use only Mopar® ATF+4** . Do not overfill the power steering system.

# FLUID COOLER

## DESCRIPTION

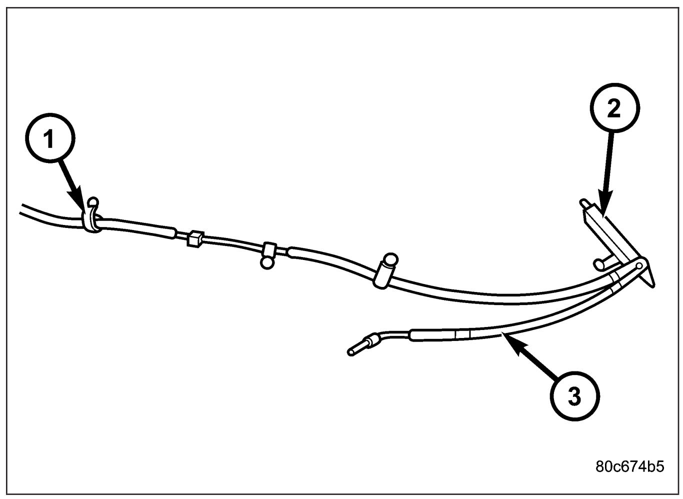
The power steering fluid cooler (1) is located at the front of the vehicle. It is mounted to the radiator lower support just forward of the air-conditioning condenser and just rearward of the front fascia. The cooler is positioned so it is in the air flow through the front fascia of the vehicle. The cooler is serviced as an assembly with the return hose.



## OPERATION

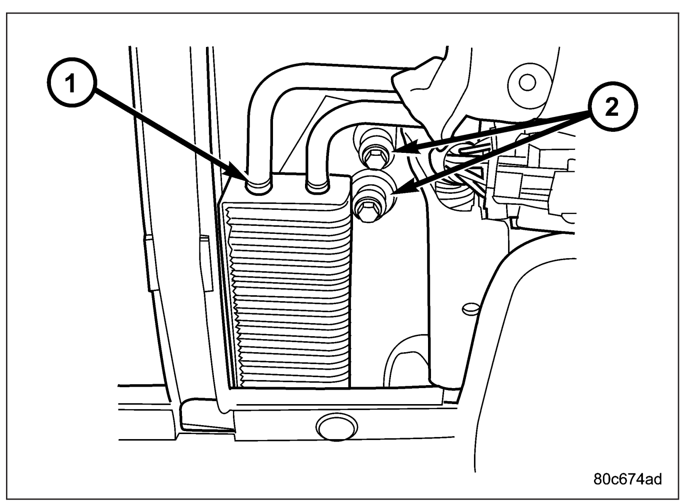
The purpose of the power steering fluid cooler (2) is to keep the temperature of the power steering system fluid from rising to a level that would affect the performance of the power steering system.

The cooler used on this vehicle is referred to as a fluid-to-air type cooler. This means that the air flow across the fin/tubes of the cooler is used to extract the heat from the cooler which it has absorbed from the power steering fluid flowing through it. The cooler is placed in series with the power steering fluid return line (1), between the steering gear and the power steering fluid reservoir. This lowers the temperature of the power steering fluid prior to it entering the power steering fluid reservoir where it is resupplied to the power steering pump.



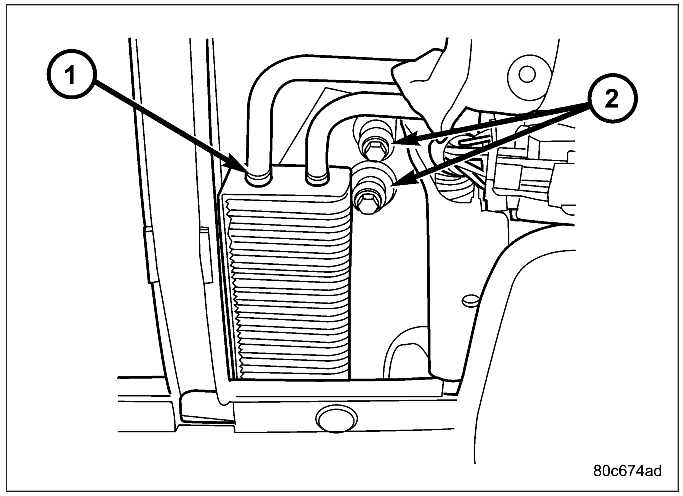
## REMOVAL

1. Remove the return line at the gear.
2. Remove the return line at the reservoir.
3. Remove the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
4. Remove the two cooler mounting bolts (2).
5. Remove the cooler (1) and return hose assembly from the vehicle.



## INSTALLATION

1. Install the cooler (1) / return hose assembly to the vehicle.
2. Install the two cooler mounting bolts (2).
3. Install the grille (Refer to 23 - BODY/EXTERIOR/ GRILLE - INSTALLATION).
4. Install the return line at the reservoir.
5. Install the return line at the gear.
6. Refill the power steering fluid and check for leaks (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

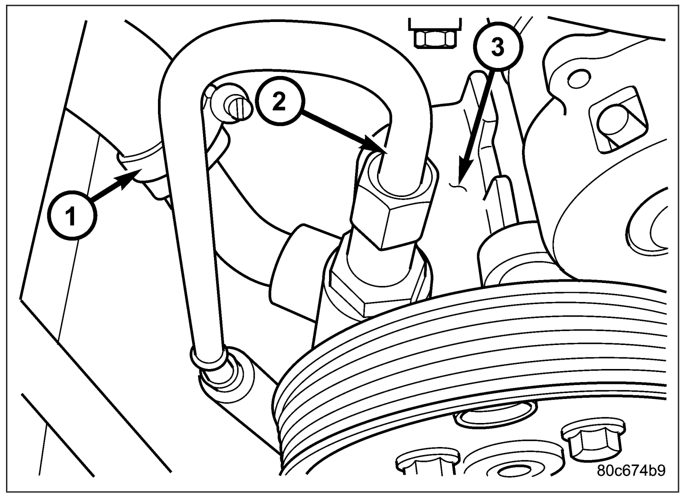


# HOSES

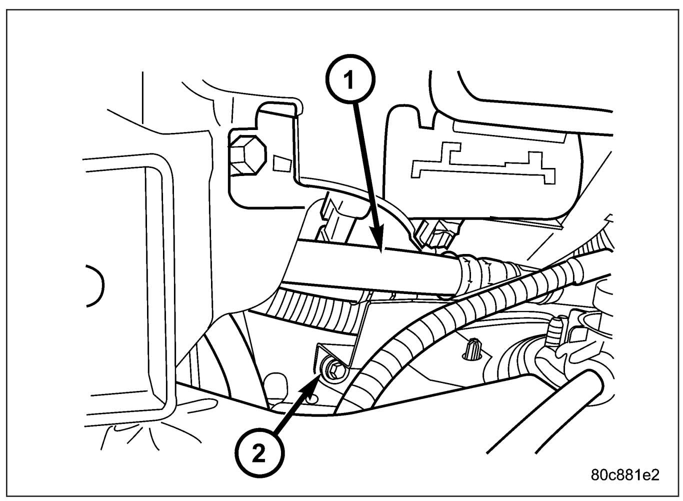
## REMOVAL

### PRESSURE HOSE

1. Siphon the power steering fluid from the reservoir.
2. Remove the radiator crossmember (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - REMOVAL).
3. Remove the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
4. Remove the fan shroud.
5. Remove the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
6. Remove the pressure hose (2) at the pump (3).



7. Remove the pressure hose from the gear.
8. Remove the pressure hose (1) mounting bracket bolts (2) from behind the headlamp assembly.
9. Remove the pressure hose (1) from the vehicle.

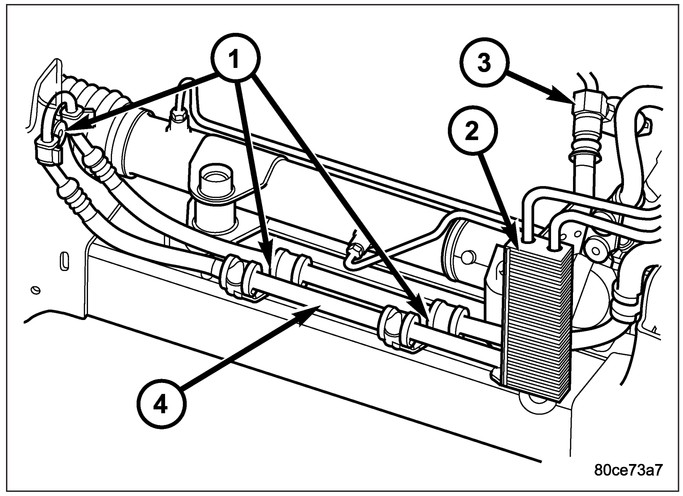


### RETURN HOSE (GEAR TO THE COOLER)

**NOTE: Return hose and the cooler are serviced as an assembly.**

1. Siphon the power steering fluid from the reservoir.
2. Remove the radiator crossmember (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - REMOVAL).
3. Remove the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
4. Remove the fan shroud.
5. Remove the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

6. Remove the return hose (4) from the gear.
7. Remove the return hose and cooler mounting bracket bolts (1) from the front cradle.
8. Remove the return hose and cooler assembly from the vehicle.

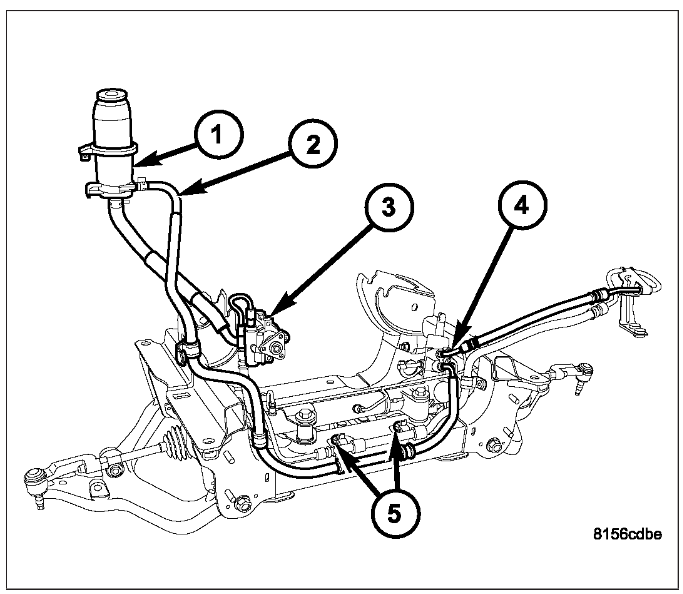


## RETURN HOSE (RESERVOIR TO THE COOLER)

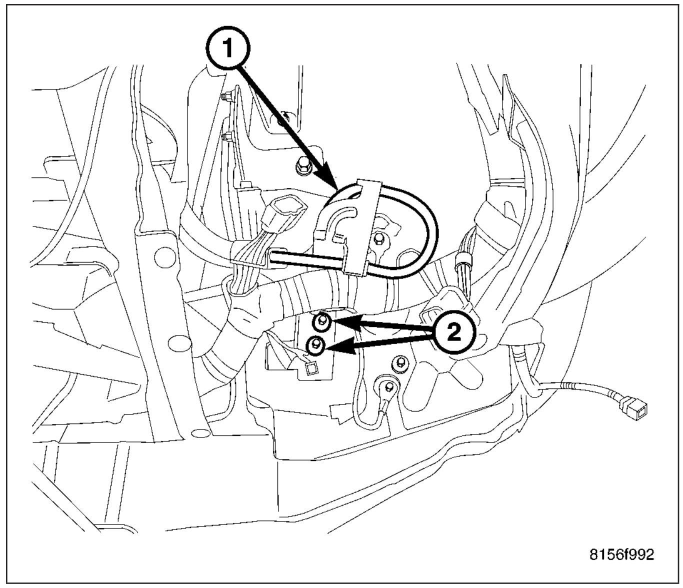
1. Siphon the power steering fluid from the reservoir.
2. Remove the return hose from the pump reservoir.
3. Remove the return hose at the cooler.
4. Remove the return hose from the vehicle.

## PRESSURE / RETURN HOSE ASSEMBLY - DIESEL

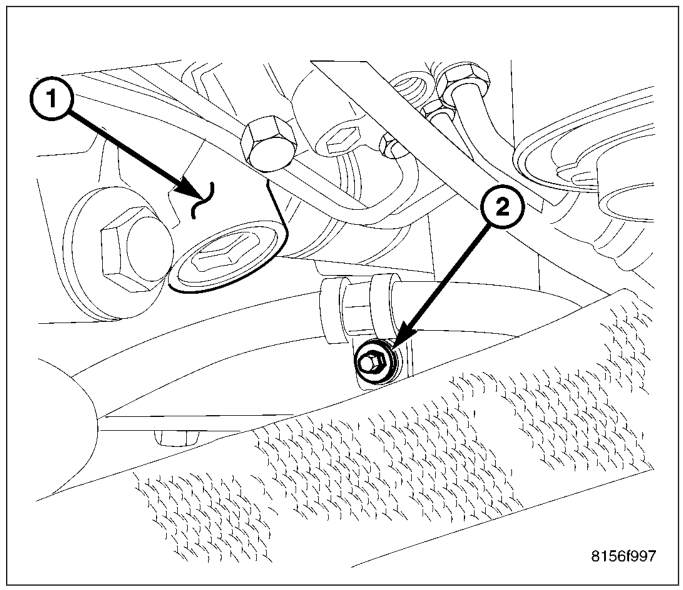
1. Siphon the power steering fluid from the reservoir.
2. Remove the air box (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Remove the clutch fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
4. Remove the fan shroud.
5. Remove the front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
6. Remove the grille and reinforcement (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - REMOVAL).
7. Remove the pressure line at the pump (3).
8. Remove the return hose (2) at the reservoir (1).



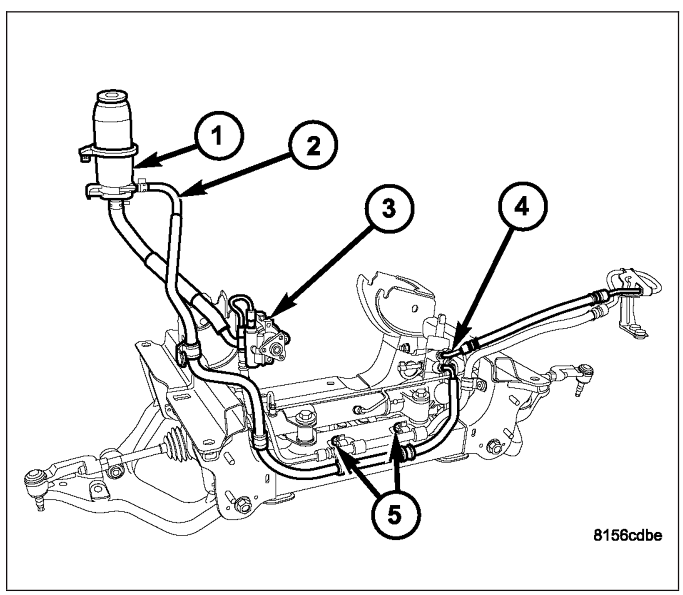
9. Remove the pressure line routing bracket bolts (2) behind the left headlight bucket.



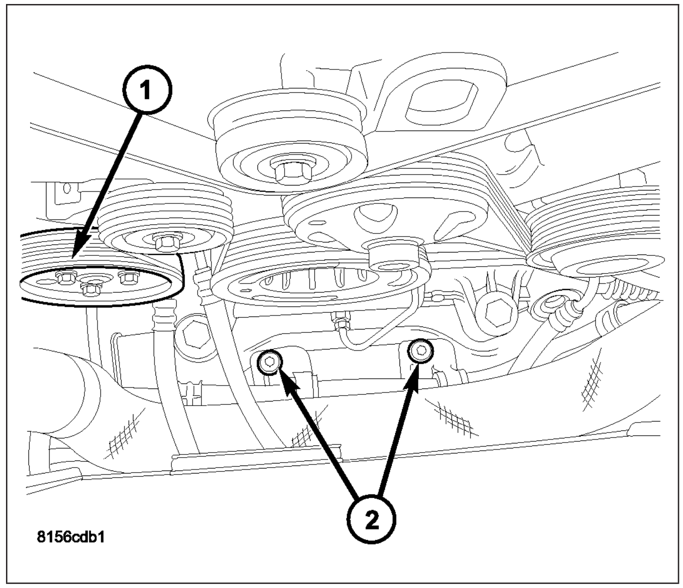
10. Remove the pressure line mounting bracket (2) at the frame both right and left side.



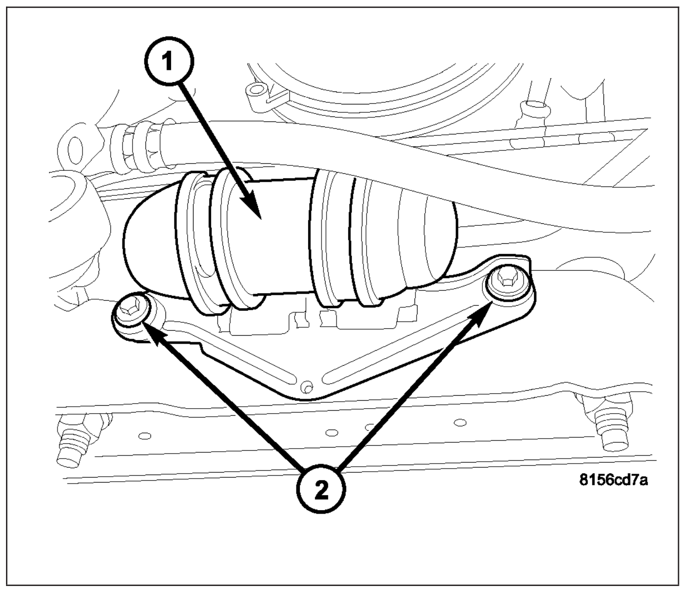
11. Remove the pressure line at the gear (4).
12. Remove the return line (2) at the gear.



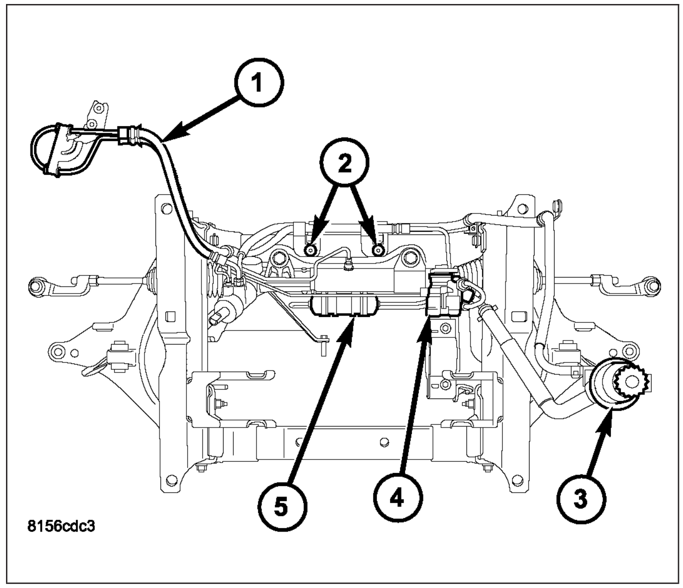
13. Remove the pressure / return line mounting bracket bolts (2) at the frame.



14. Raise and support the vehicle.
15. Remove the skid plate. (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL).
16. Remove the push pins and then the lower engine belly pan.
17. Disconnect the suppressor (1) from the power steering hose bundle at the frame.



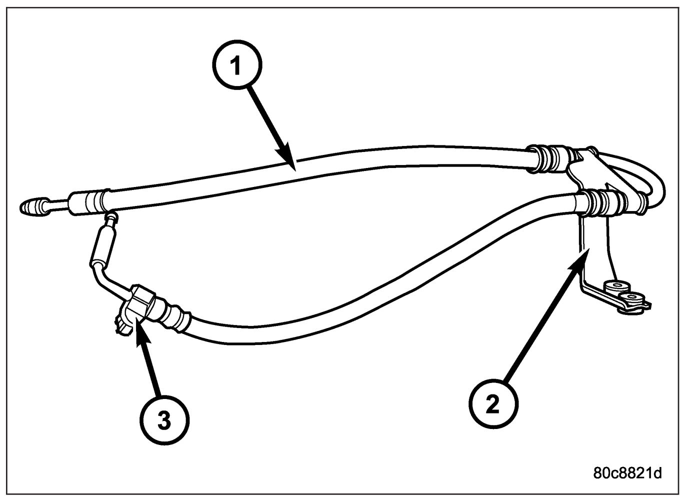
18. Remove the pressure/return hose (1) from the vehicle.



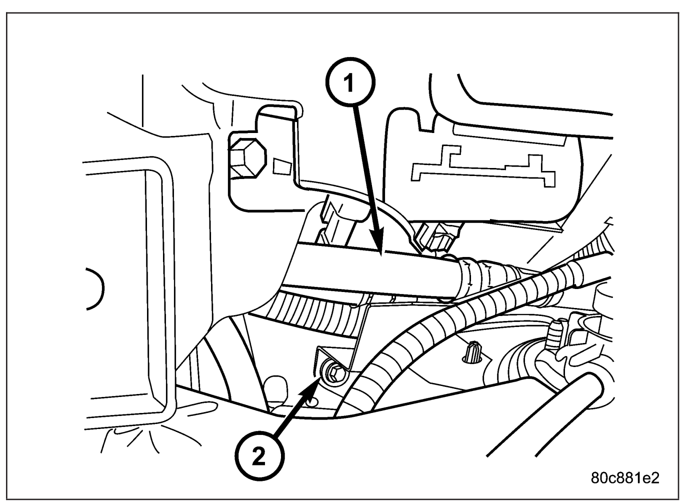
## INSTALLATION

## PRESSURE HOSE

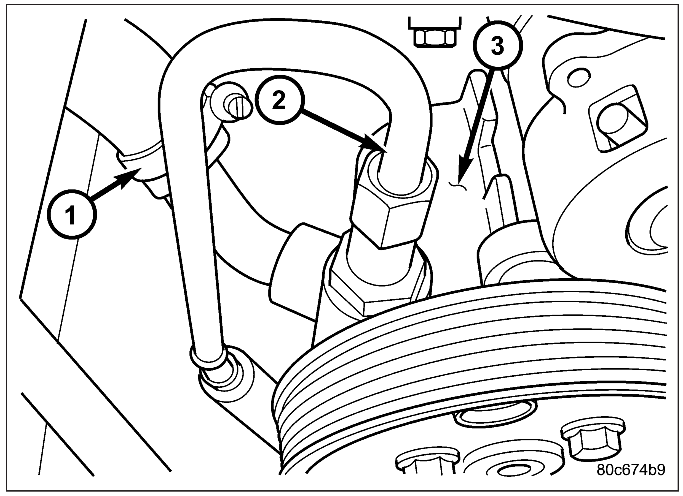
1. Install the pressure hose (1) to the vehicle..



2. Install the pressure hose mounting bracket bolts (2) behind the headlamp assembly. Tighten to to 12 N·m (9 ft.lbs.).
3. Install the pressure hose to the gear. Tighten the hose to28 N·m (21 ft.lbs.).



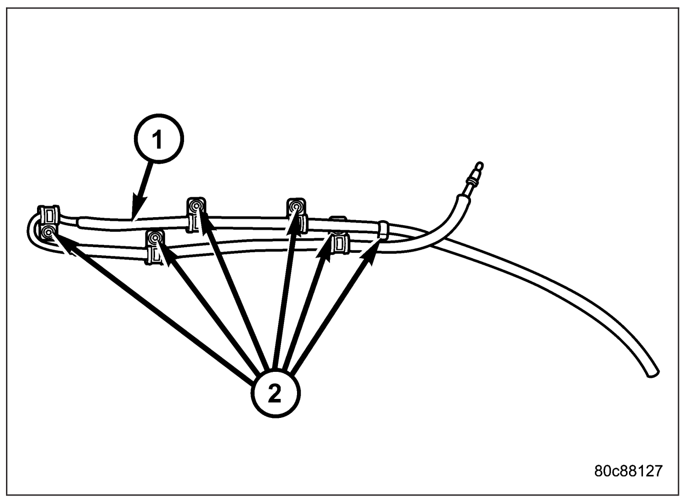
4. Install the pressure hose (2) at the pump (3). Tighten the hose to28 N·m (21 ft.lbs.).



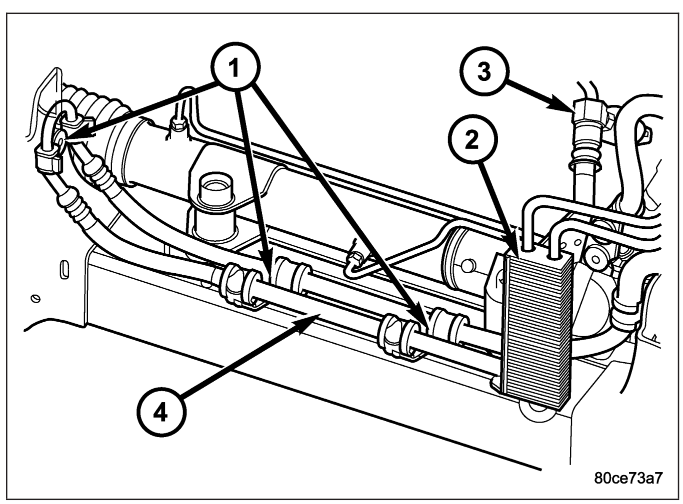
5. Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
6. Install the fan shroud.
7. Install the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
8. Install the radiator crossmember (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - INSTALLATION).
9. Refill the power steering fluid (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## RETURN HOSE (GEAR TO THE COOLER)

1. Install the return hose (1) / cooler assembly to the vehicle.
2. Install the return hose and cooler mounting bracket bolts (2) to the front cradle.



3. Install the return hose (4) at the gear 28 N·m (21 ft.lbs.).



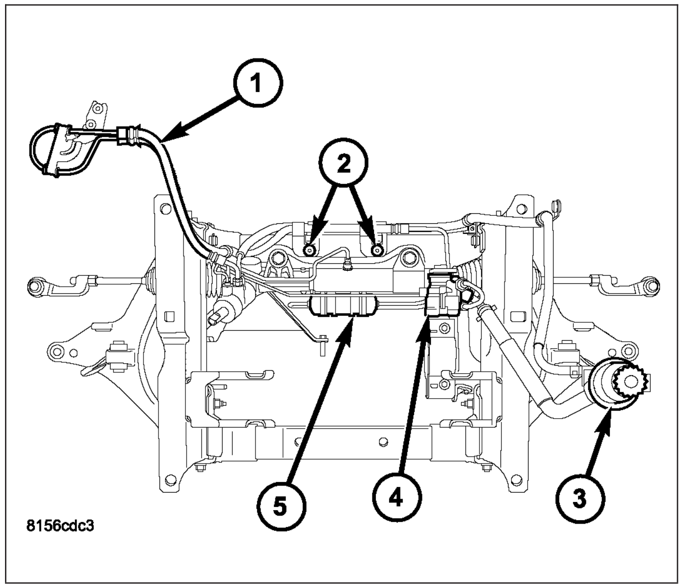
4. Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
5. Install the fan shroud.
6. Install the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
7. Install the radiator crossmember (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - INSTALLATION).
8. Refill the power steering fluid (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## RETURN HOSE (RESERVOIR TO THE COOLER)

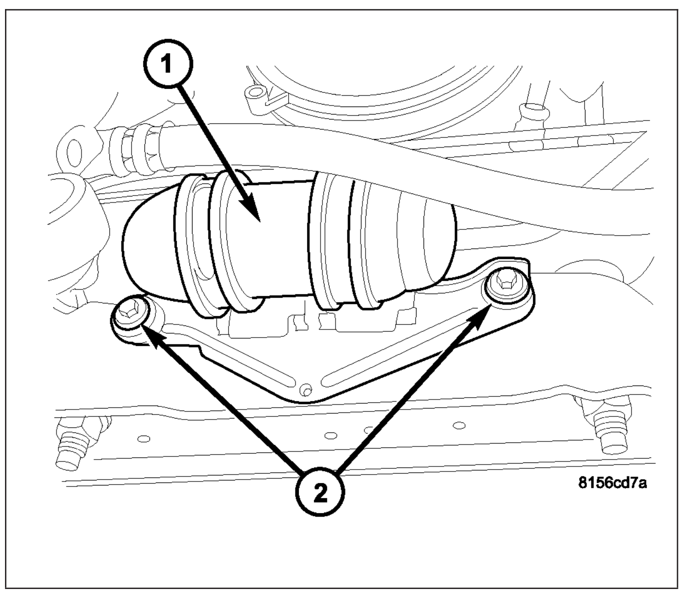
1. Install the return hose to the vehicle.
2. Install the return hose to the pump reservoir.
3. Install the return hose at the cooler.
4. Refill the power steering fluid (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## PRESSURE / RETURN HOSE ASSEMBLY - DIESEL

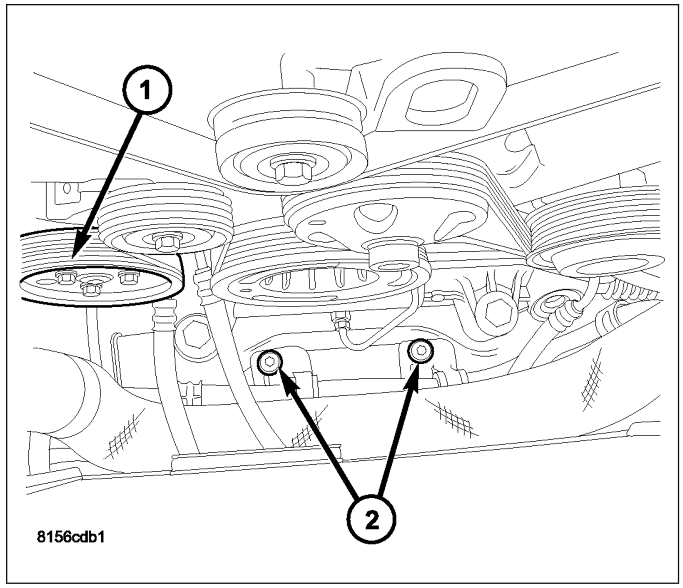
1. Install the pressure/return hose (1) to the vehicle.



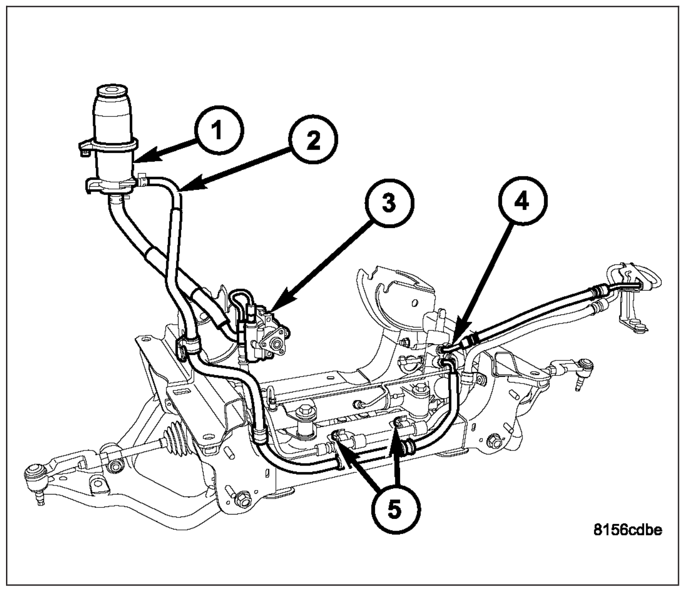
2. Install the power steering hose bundle to the suppressor (1).



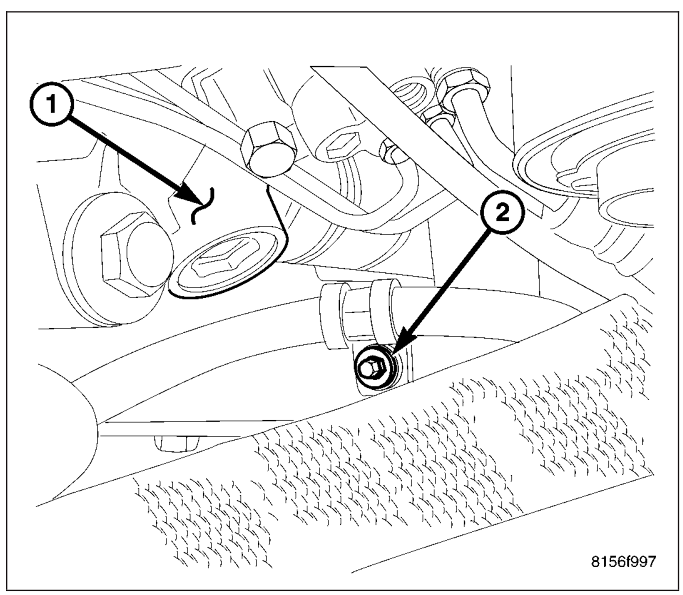
3. Install the pressure/return hose mounting bracket bolts (2) to the front cradle.



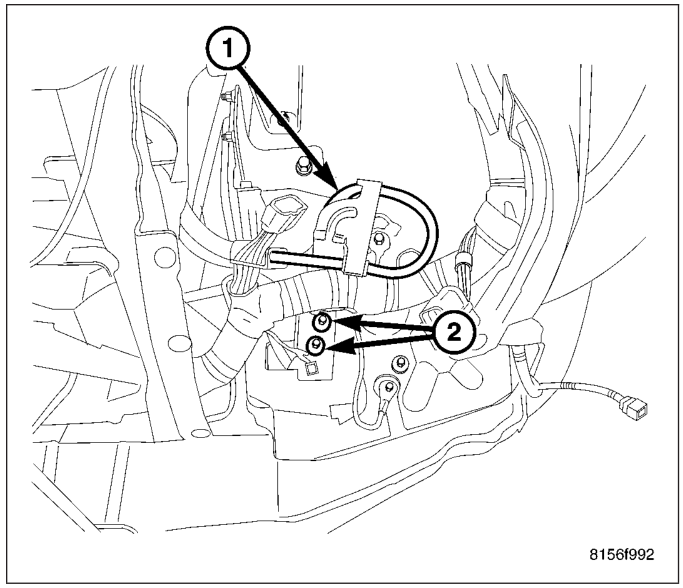
4. Install the return hose (2) at the gear.
5. Install the pressure hose at the gear (4).



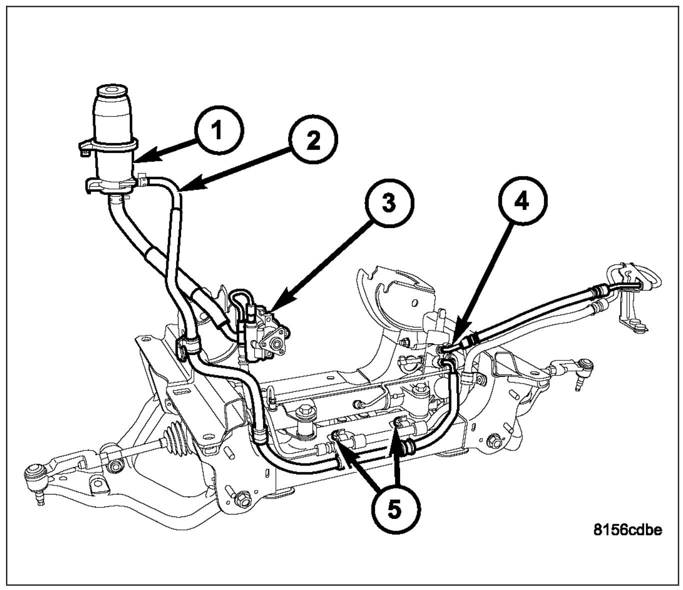
6. Install the pressure/return hose mounting bracket (2) to the left and right sides of the cradle.



7. Install the two bolts (2) for the hose (1) behind the headlamp bucket on the left side.



8. Install the return hose (2) at the reservoir (1).
9. Install the pressure line (4) at the pump.



10. Install the fan shroud.
11. Install the clutch fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
12. Install the airbox (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
13. Refill the power steering fluid.
14. Bleed the power steering system (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
15. Check for leaks.
16. Install the grille and grille reinforcement (Refer to 23 - BODY/EXTERIOR/GRILLE OPENING REINFORCEMENT - INSTALLATION).
17. Install the front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
18. Raise the vehicle and install the lower engine belly pan and push pins.
19. Install the skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).

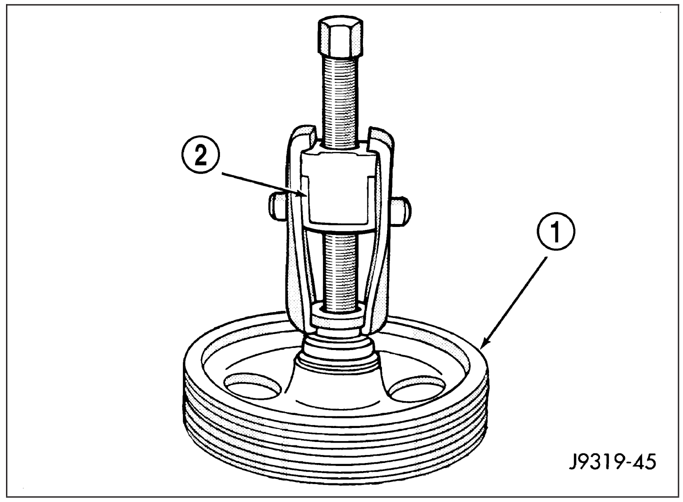
# PULLEY

## REMOVAL

### GAS

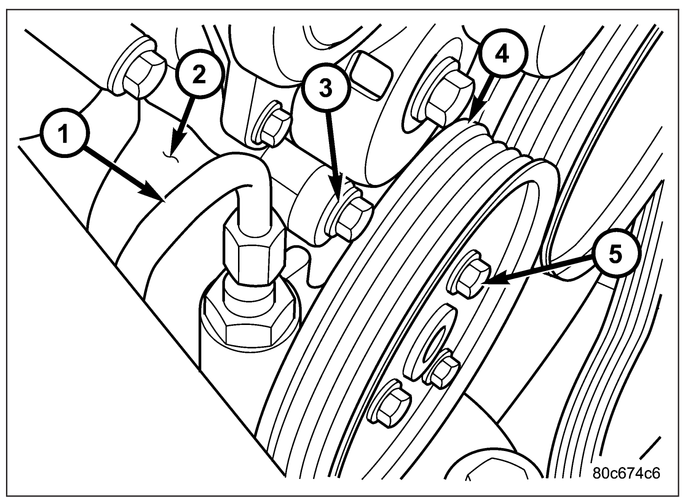
**CAUTION: On vehicles equipped with the pressed on pulley, Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.**

1. Remove pump assembly. (Refer to 19 - STEERING/PUMP - REMOVAL).
2. Remove pulley (1) from pump with Puller C-4333 (2) or equivalent puller.



### DIESEL

1. Remove the engine cooling fan.
2. Remove the fan shroud.
3. Remove the serpentine drive belt.
4. Remove the three bolts securing the pulley to the pump.



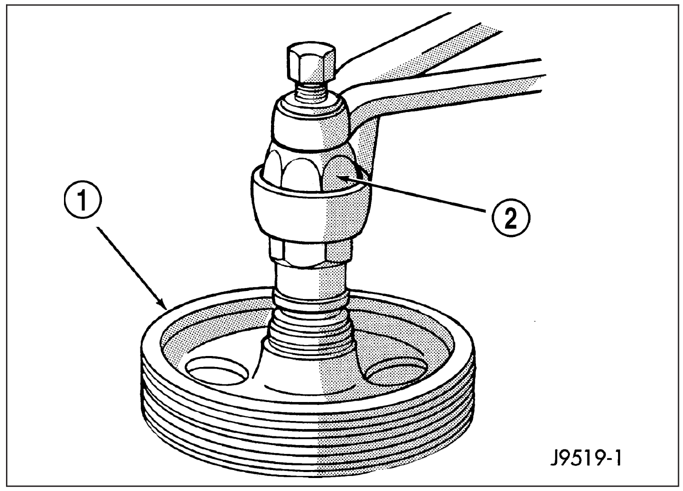
## INSTALLATION

## GAS

**CAUTION: Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.**

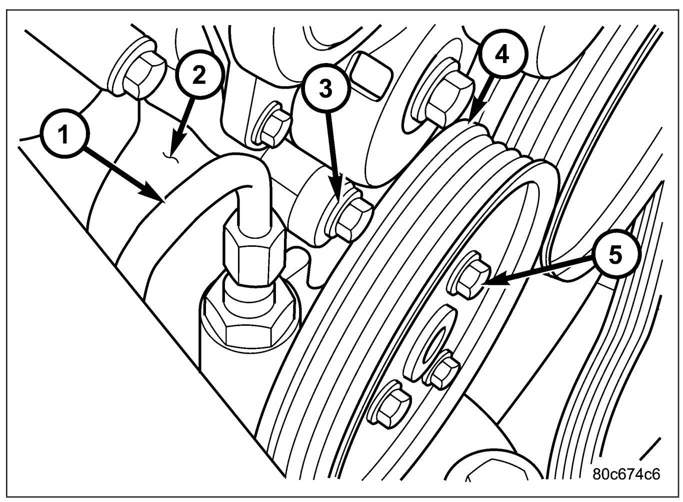
**NOTE: The pulley is marked front for installation.**

1. Replace pulley if bent, cracked, or loose.
2. Install pulley (1) on pump with Installer C-4063-B (2) or equivalent installer. The pulley must be flush with the end of the shaft. Ensure the tool and pulley are aligned with the pump shaft.
3. Install pump assembly. (Refer to 19 - STEERING/ PUMP - INSTALLATION)
4. With Serpentine Belt, run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**



## DIESEL

1. Install the pulley to the pump shaft.
2. Install the three bolt securing the pulley to the pump .
3. Install the serpentine belt.
4. Install the fan shroud.
5. Install the engine cooling fan.



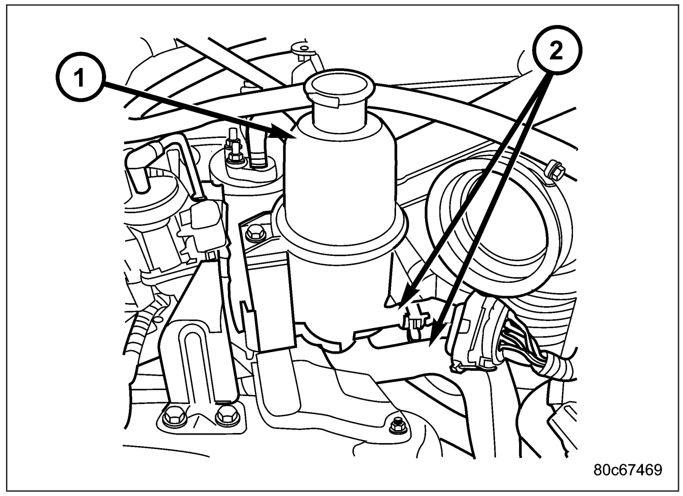
# RESERVOIR

## DESCRIPTION

Only the diesel engine reservoir is serviced separately. The 3.7L power steering reservoir is not serviced separately from the pump.

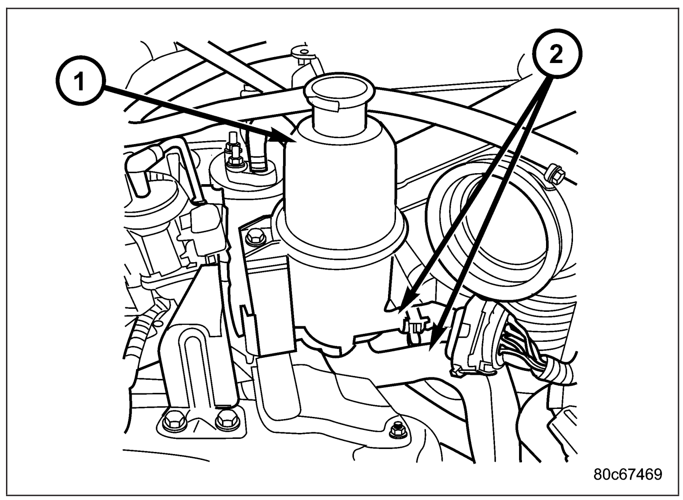
## REMOVAL - DIESEL

1. Siphon out as much power steering fluid as possible.
2. Remove the power steering hoses (2).
3. Remove the bolt securing the reservoir (1) to the mounting bracket.
4. Remove the reservoir (1).



## INSTALLATION - DIESEL

1. Install the reservoir (1) to the mounting bracket.
2. Install and tighten the bolt to 12 N·m (9 ft. lbs.).
3. Install the hoses (2).
4. Refill the power steering fluid and check for leaks (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).



# TRANSMISSION AND TRANSFER CASE

## TABLE OF CONTENTS

# MANUAL TRANSMISSION - NSG370

## TABLE OF CONTENTS

# MANUAL TRANSMISSION - NSG370

## DIAGNOSIS AND TESTING

## MANUAL TRANSMISSION - NSG370

### LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or incorrect lubricant level check.

**Rear transmission leaks** will be from the oil seals or component mating surfaces.

**Front transmission leaks** will be from the front input shaft retainer seal. Lubricant may drip from the clutch housing after extended operation. If leak is severe, it may contaminate the clutch disc.

**Lubricant level check** can only be made when the vehicle is level and allowing the lubricant to settle for a minute before checking. This will ensure an accurate check and avoid an underfill or overfill condition.

### HARD SHIFTING

Hard shifting is usually caused by low lubricant level, improper or contaminated lubricants. This will cause noise, excessive wear, internal bind, and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. The first indications of component damage is usually hard shifting and noise.

Shift component damage, clutch adjustment, worn pressure plate or disc are also causes of increased shift effort. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchronizer rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases, this condition will decline as the rings wear-in.

### TRANSMISSION NOISE

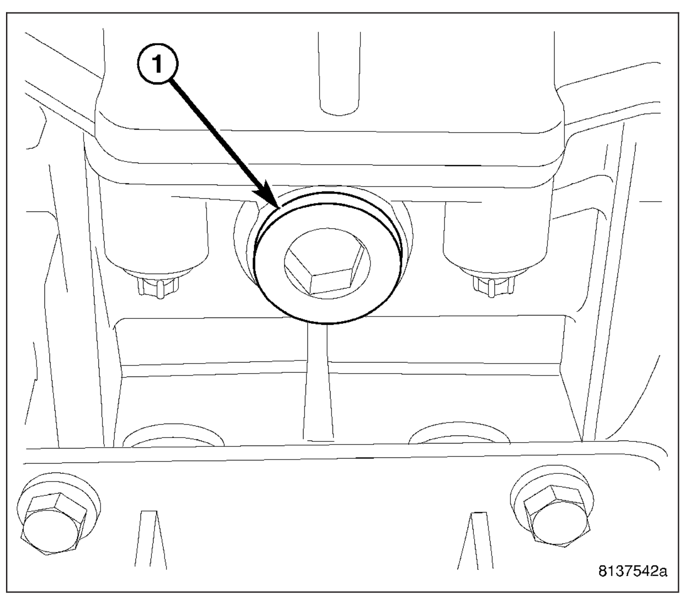
Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe, highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear and bearing damage.

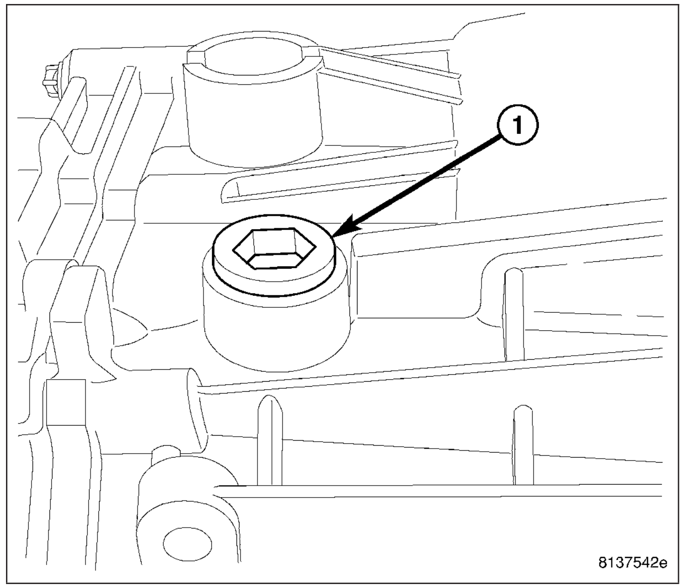
## STANDARD PROCEDURE

## DRAIN AND FILL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove drain plug (1) and drain fluid.

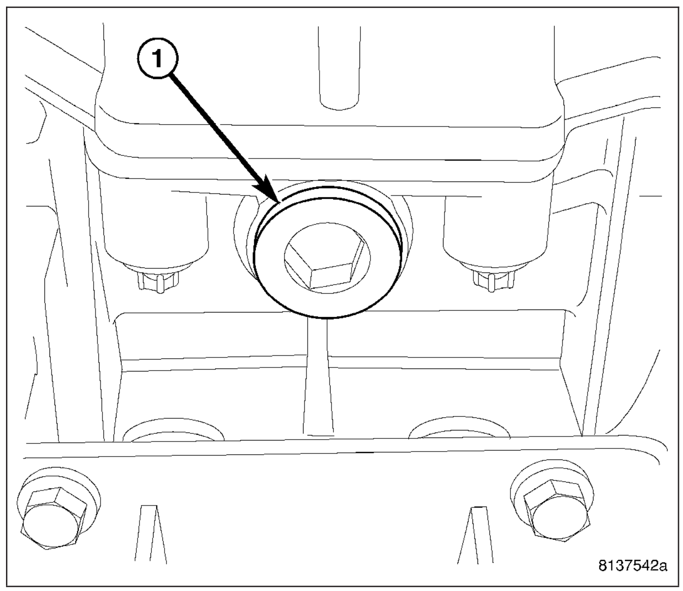


3. Install drain plug and remove fill plug (1).
4. Fill transmission with 1.5 L (3.17 pts.) of Mopar® Manual Transmission Lubricant MS-9224 or to the bottom of the fill plug (1) hole.

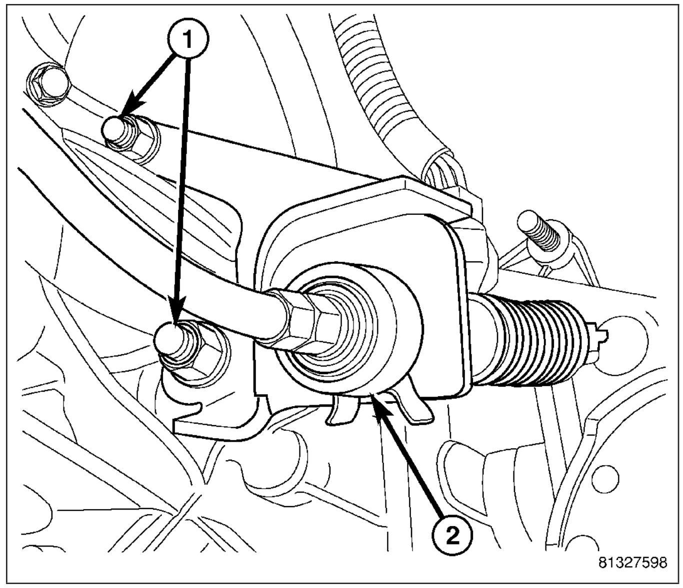


## REMOVAL

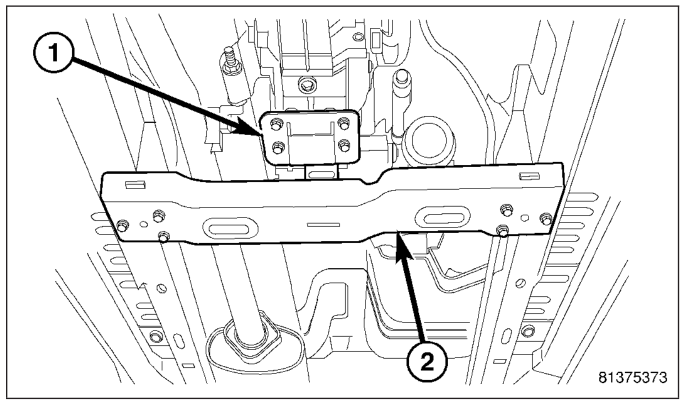
1. Disconnect negative battery cable.
2. With vehicle in neutral, position vehicle on hoist.
3. Remove drain plug (1) and drain fluid.



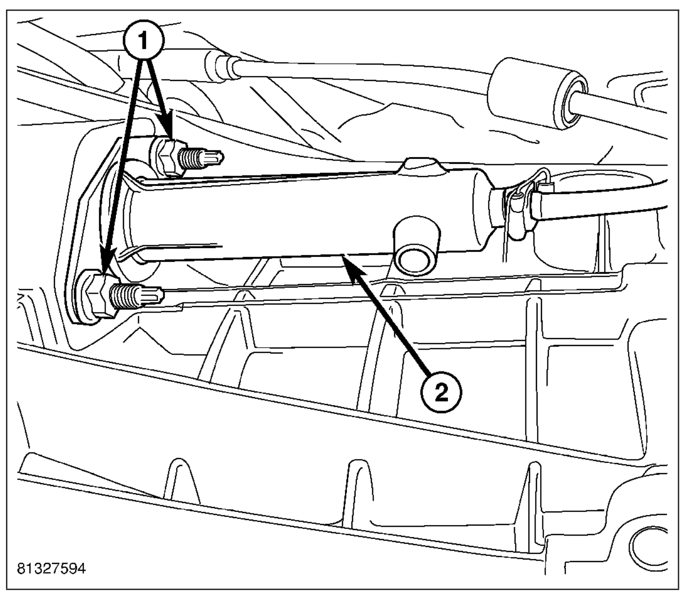
4. Mark installation reference marks on propeller shaft/shafts and remove shafts.
5. Remove transfer case shift cable (2) bracket nuts (1), cable (2), wiring connector, and vent hose, if equipped.
6. Remove transfer case, if equipped.



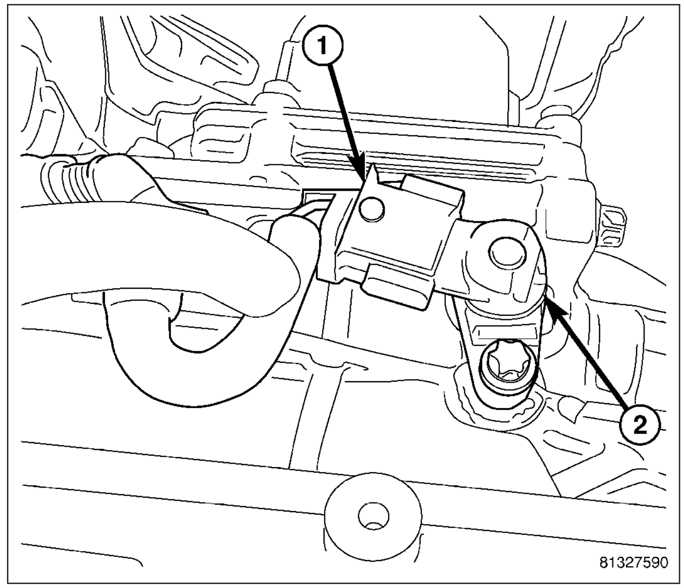
7. Support transmission with jack.
8. Remove transmission mount (1) and crossmember (2).



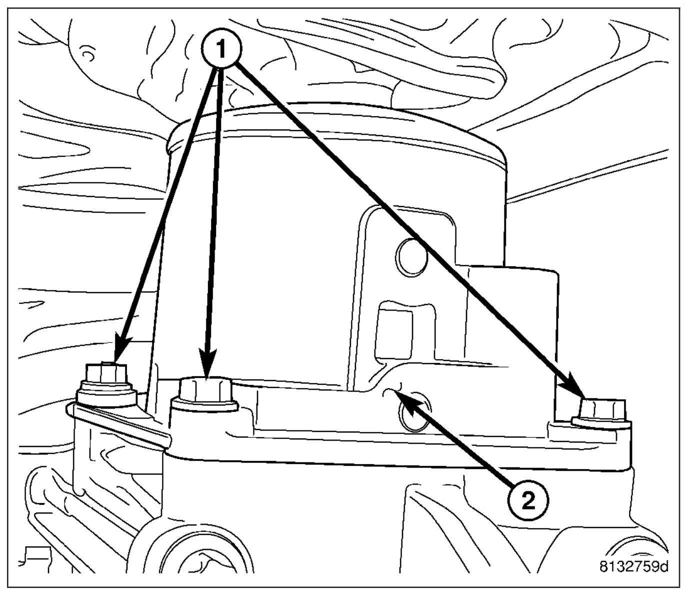
9. Remove clutch slave cylinder nuts (1) and remove cylinder (2).



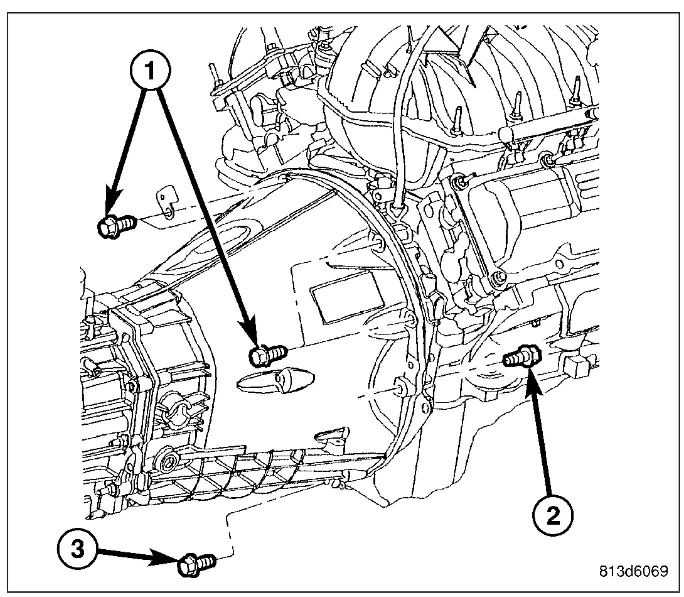
10. Remove backup lamp switch (1) wiring connector (2).



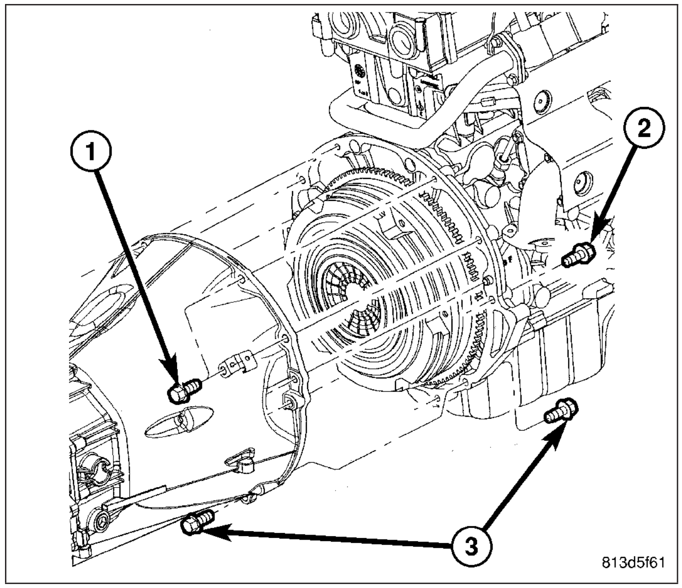
11. Remove shift lever tower bolts (1) and remove shift lever housing (2).
12. Remove starter bolts and remove starter.



13. Remove transmission bolts (1,2,3) on 3.7L engine and remove transmission.

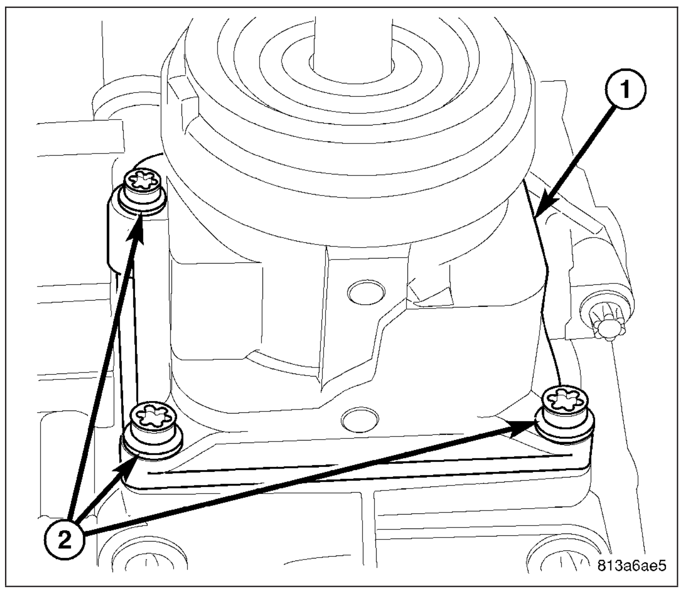


14. Remove transmission bolts (1,2,3) on 2.8L diesel engine and remove transmission.

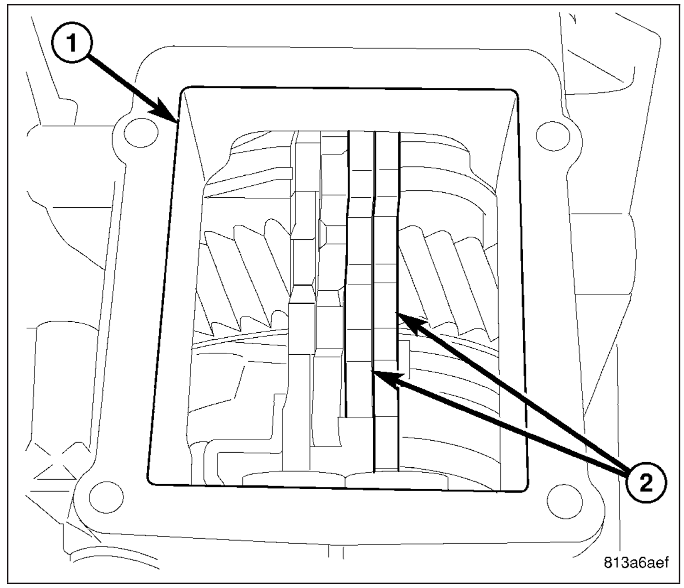


## DISASSEMBLY

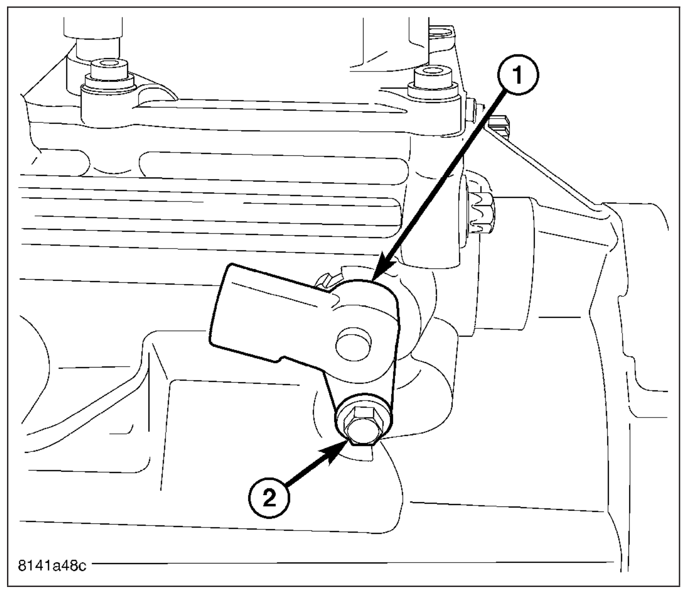
1. Remove shift tower (1) bolts (2) and remove tower.



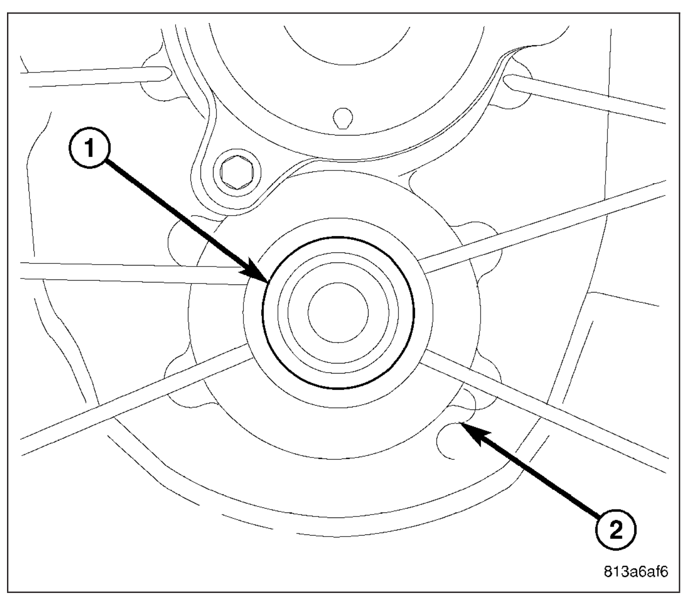
2. Through shift tower opening (1) shift two shift rails (2) forward to engage two gears.



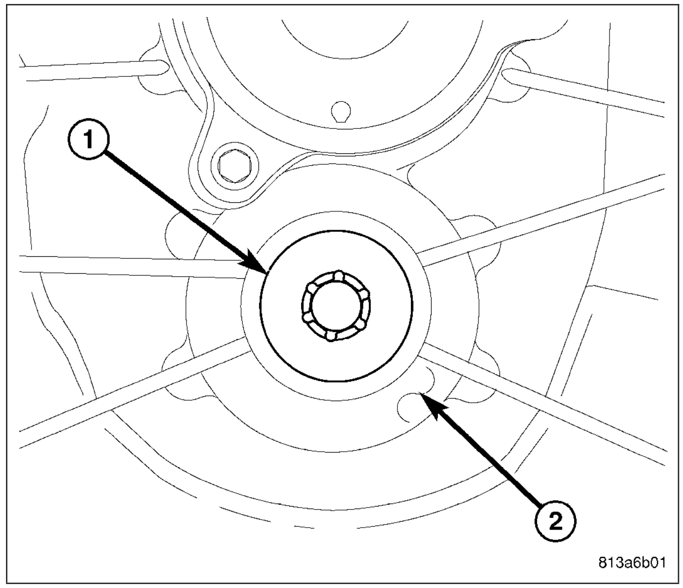
3. Remove back-up lamp switch (1) bolt (2) and remove switch.



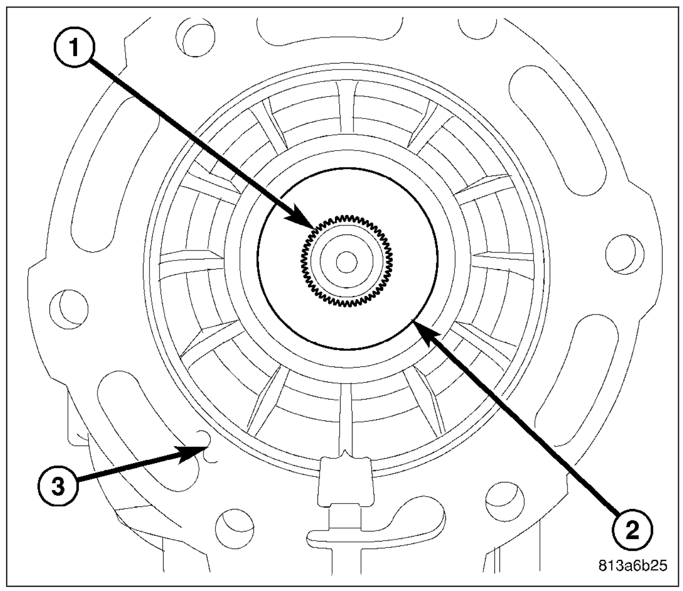
4. Remove countershaft plug (1) from the front housing (2) with a seal pick.



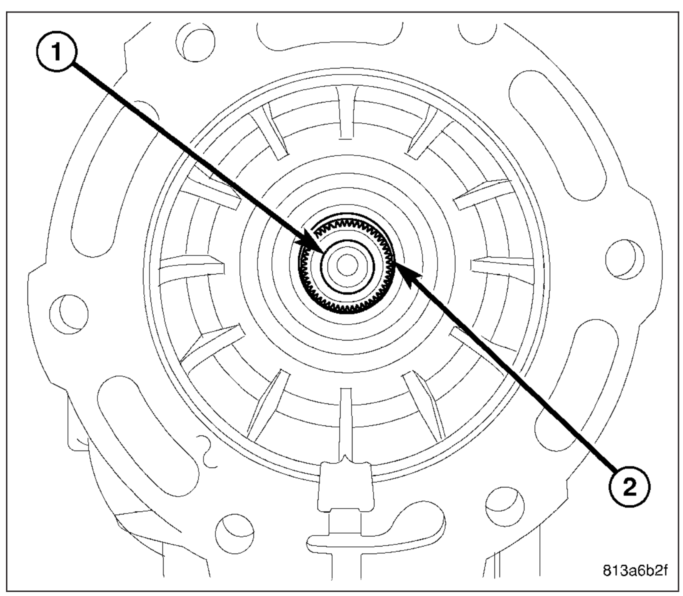
5. Remove countershaft bolt (1) from the front housing (2).



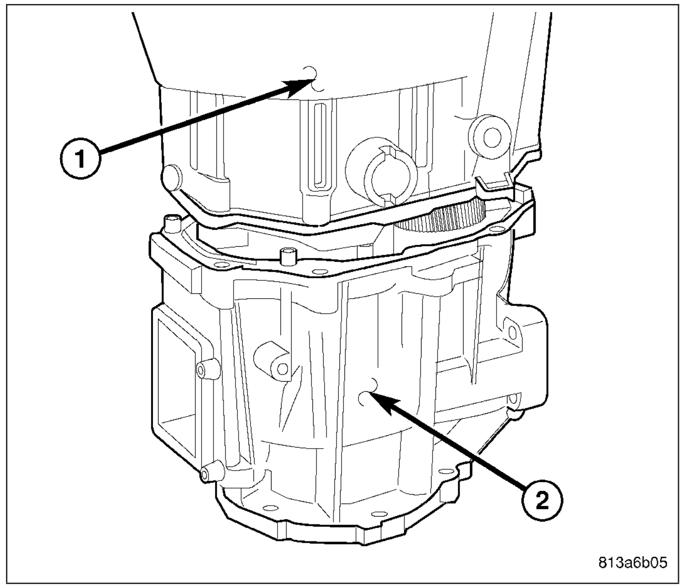
6. Remove output shaft (1) seal (2) from rear housing (3) with a seal pick.



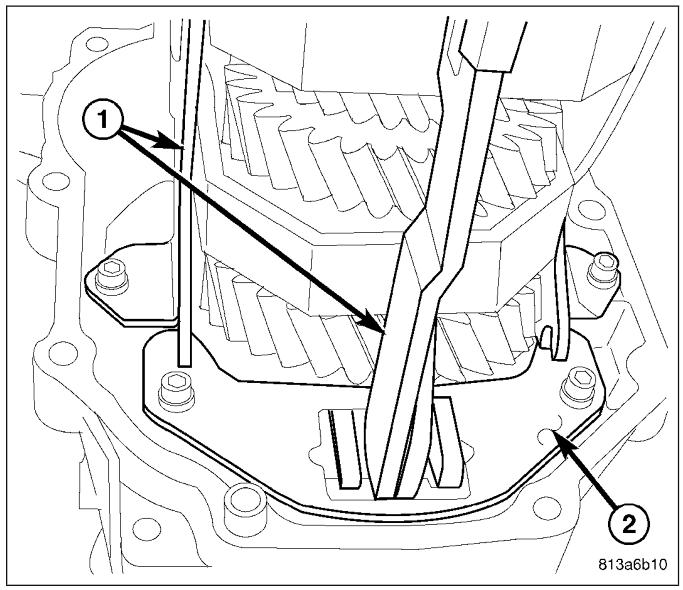
7. Remove output shaft (1) snap ring (2) 4x4 only.



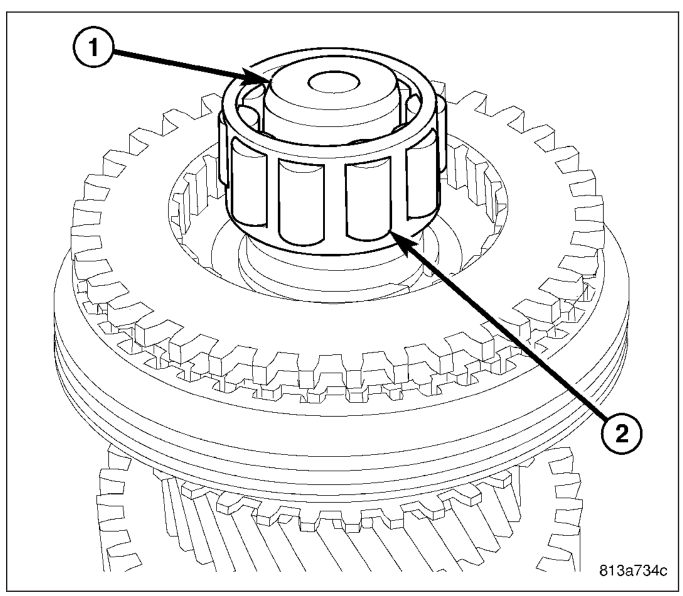
8. Stand transmission on the rear housing and remove the housing bolts.
9. Remove front housing (1) from the rear housing (2).



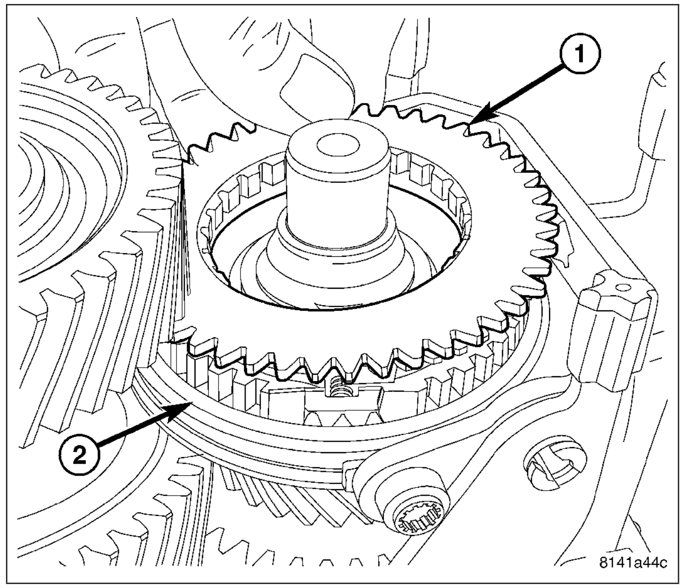
10. Remove shift rails (1) support plate (2) bolts.



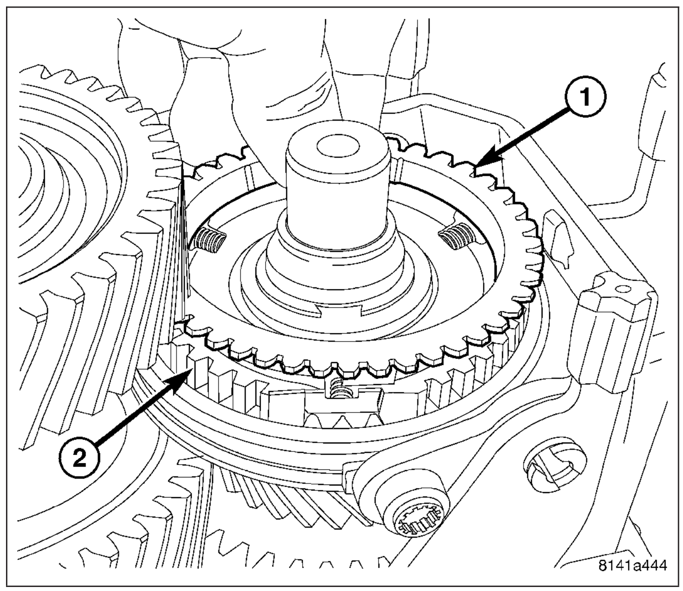
11. Remove input shaft (1) roller bearing (2).



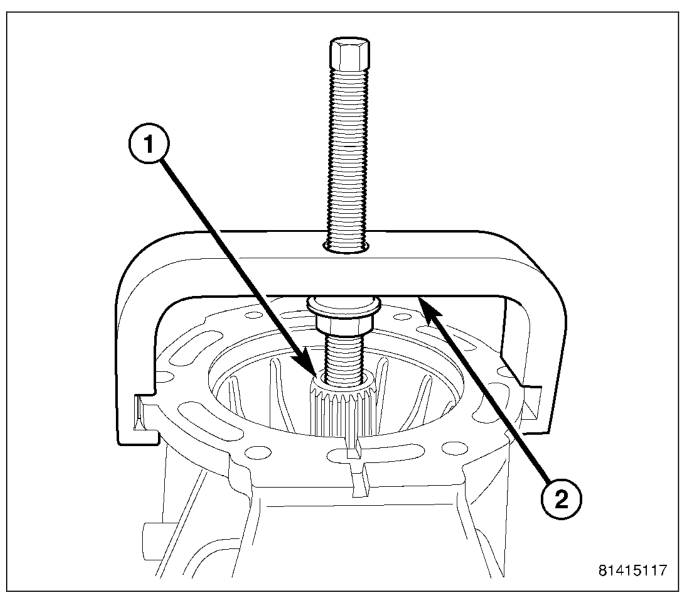
12. Remove fifth gear synchronizer blocker ring (1) from 5-6 synchronizer hub (2).



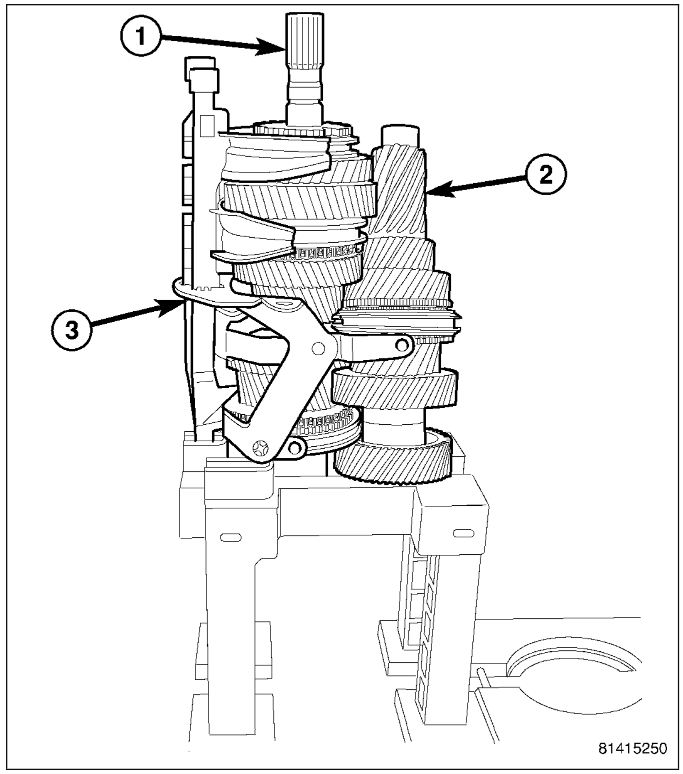
13. Remove fifth gear synchronizer friction ring (1) from 5-6 synchronizer hub (2).



14. Set geartrain and shift rails with rear housing into Fixture 9633.
15. Remove mainshaft (1) from rear housing bearing with Remover/Installer 9636 (2).

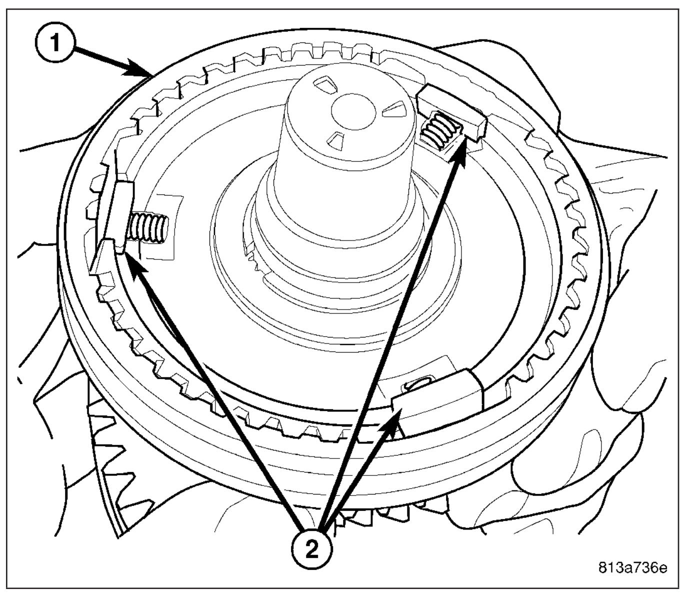


16. Remove mainshaft (1), countershaft (2) and shift rails/forks (3) from fixture.

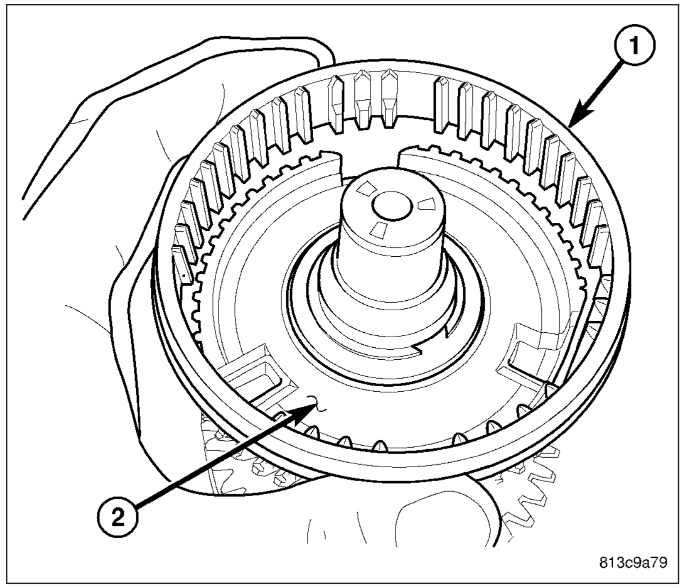


## MAINSHAFT

1. Clamp build Fixture 9648 in a vise. Install mainshaft with 5-6 synchronizer facing up in build Fixture 9648.
2. Push 5-6 synchronizer sleeve (1) down on hub and remove detents (2) springs and balls.

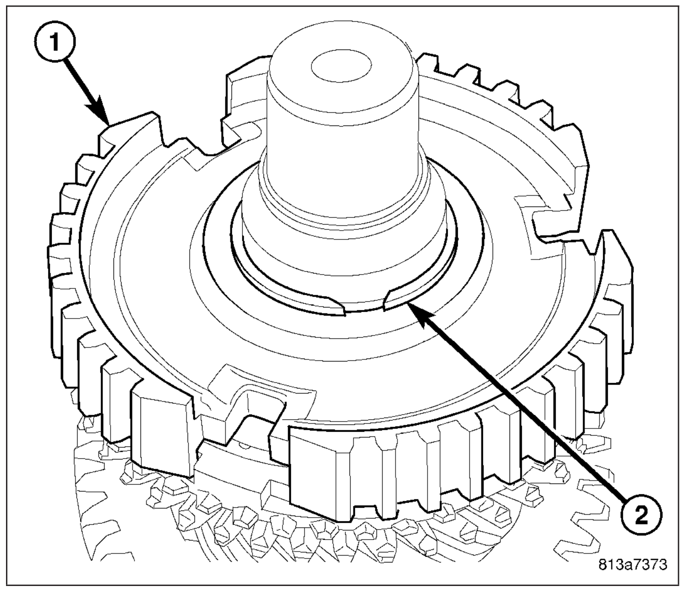


3. Remove 5-6 synchronizer sleeve (1) from synchronizer hub (2).

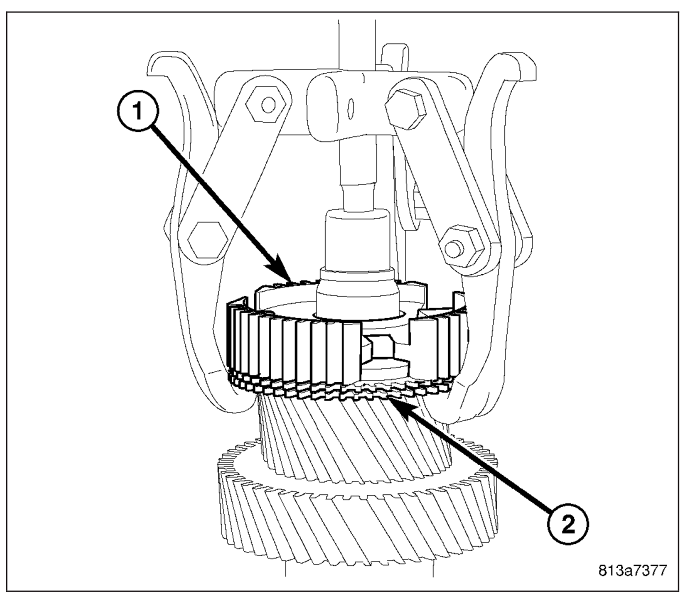


4. Remove 5-6 synchronizer hub (1) snap ring (2) and record location.

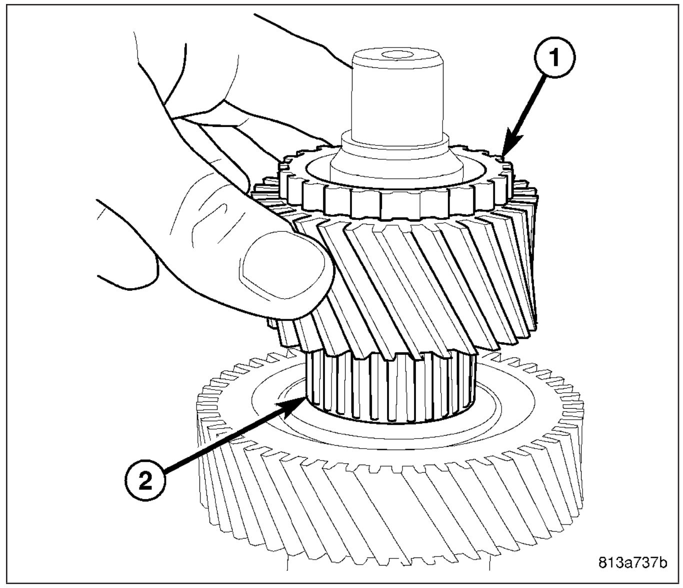
**NOTE: All snap rings are select fit from the factory, and must be installed in their original location.**



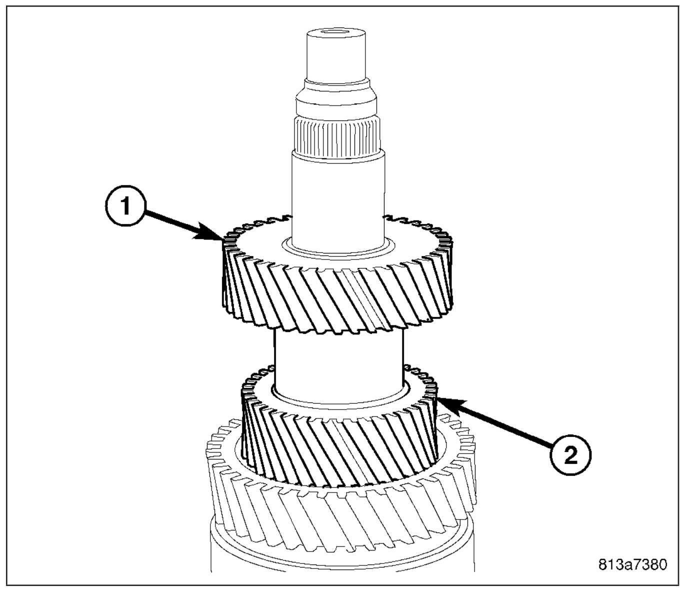
5. Remove 5-6 synchronizer hub (1) and sixth gear synchronizer rings (2) with a three jaw puller. Place puller jaws under sixth gear synchronizer rings (2).



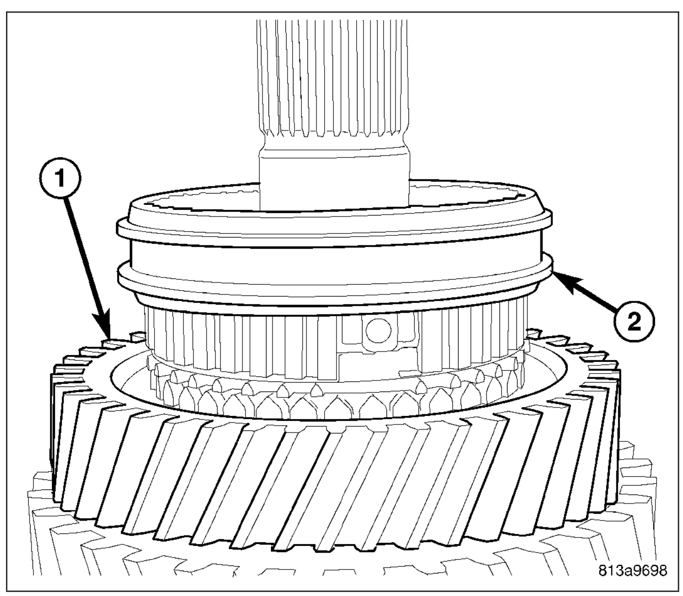
6. Remove sixth gear (1) and bearing (2).



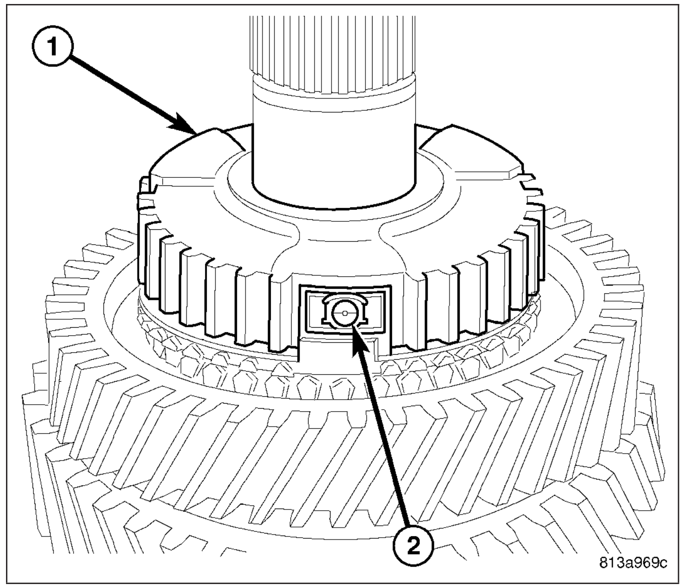
7. Third gear (1) and fourth gear (2) are serviced with the mainshaft only.
8. Remove mainshaft from Fixture 9648. Turn fixture over in vise and set opposite end of mainshaft into the fixture.



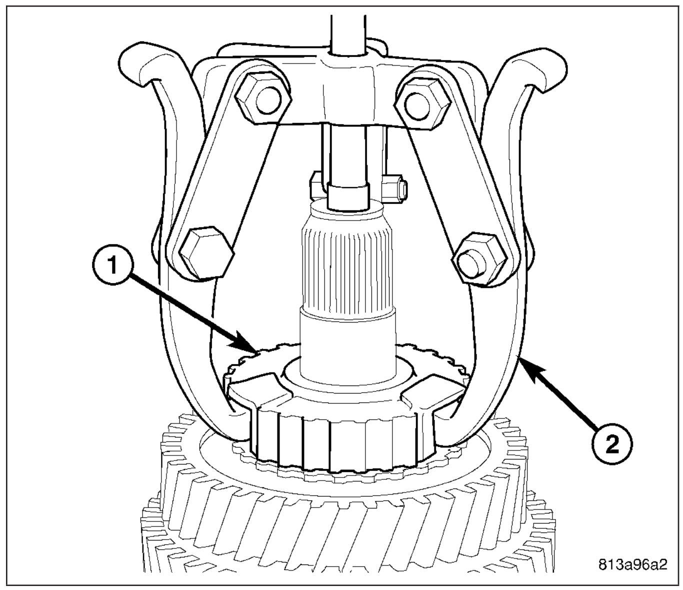
9. Remove reverse gear (1) synchronizer sleeve (2) off synchronizer hub.



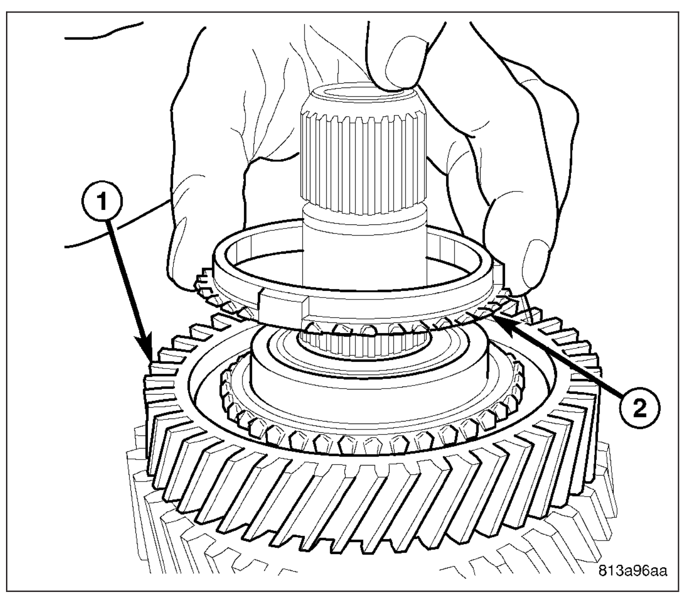
10. Remove reverse synchronizer hub (1) detents (2).



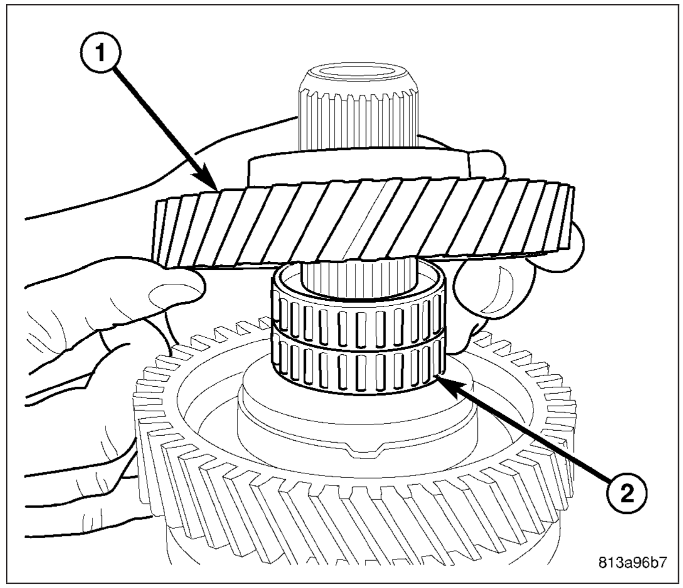
11. Remove reverse synchronizer hub (1) with three jaw puller (2). Place puller jaws in hub detent openings.



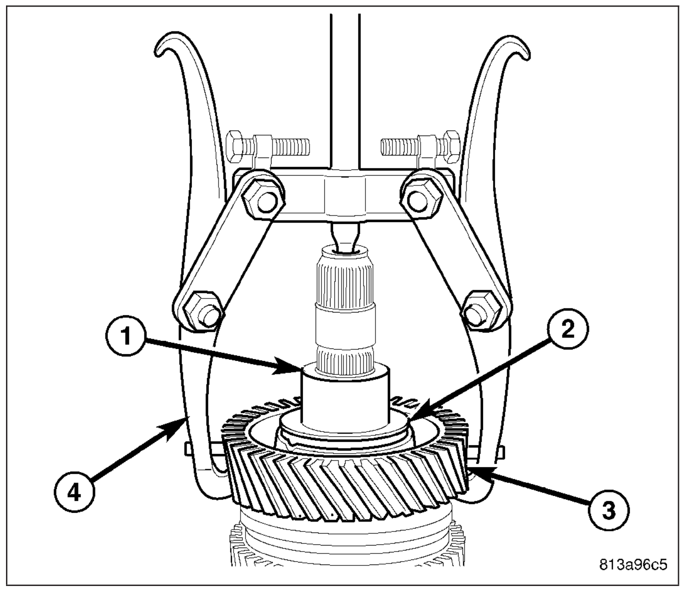
12. Remove reverse gear (1) synchronizer ring (2).



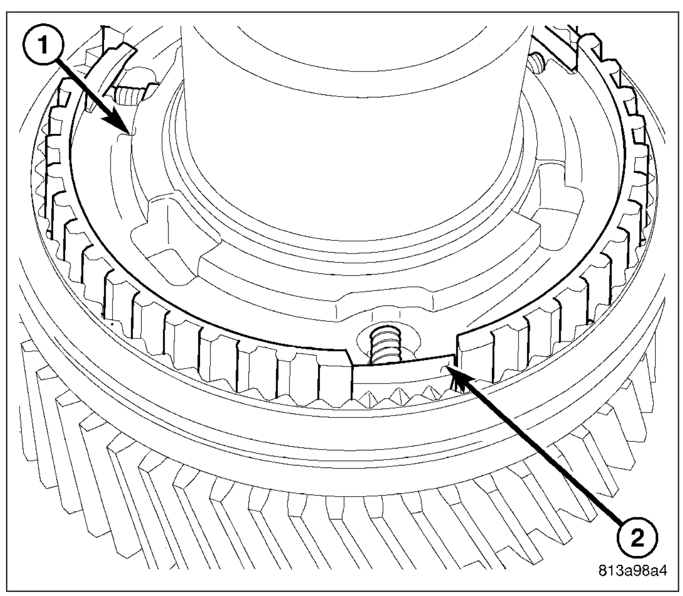
13. Remove reverse gear (1) and bearing (2).



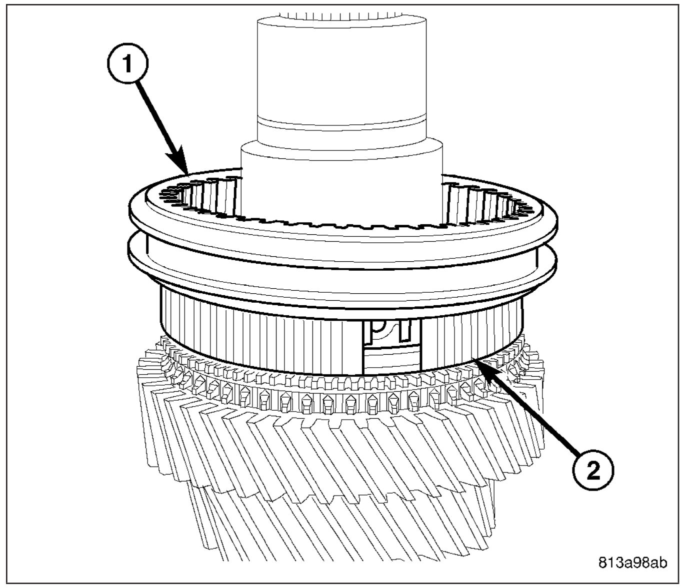
14. Remove reverse gear bearing race (1), thrust washer (2) and first gear (3) with puller (4). Place puller jaws under first gear (3).
15. Remove first gear bearing.



16. Remove first gear synchronizer rings.
17. Push 1-2 synchronizer sleeve down on synchronizer hub (1) detents (2), balls and springs.

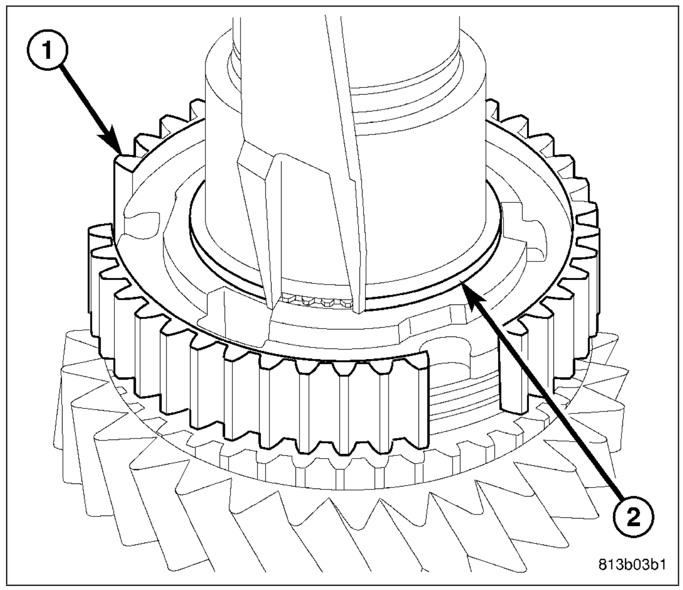


18. Remove 1-2 synchronizer sleeve (1) from synchronizer hub (2).

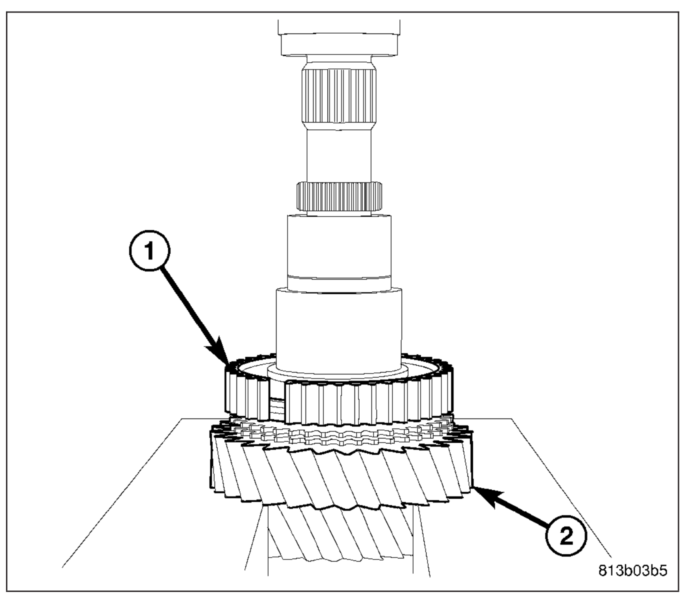


19. Remove 1-2 synchronizer hub (1) snap ring (2).

**NOTE: All snap rings are select fit from the factory, and must be installed in their original location.**

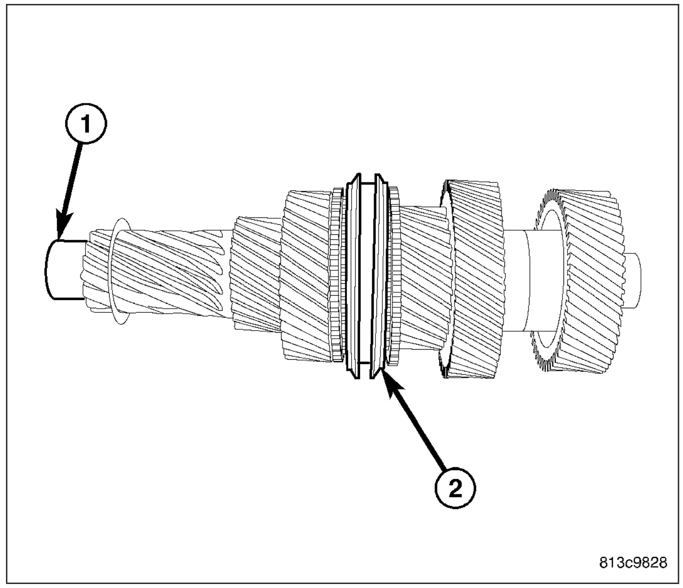


20. Remove 1-2 synchronizer hub (1), synchronizer rings and second gear (2) off shaft with a press. Place second gear (2) on press plates and press shaft through 1-2 synchronizer hub (1), synchronizer rings and second gear (2)



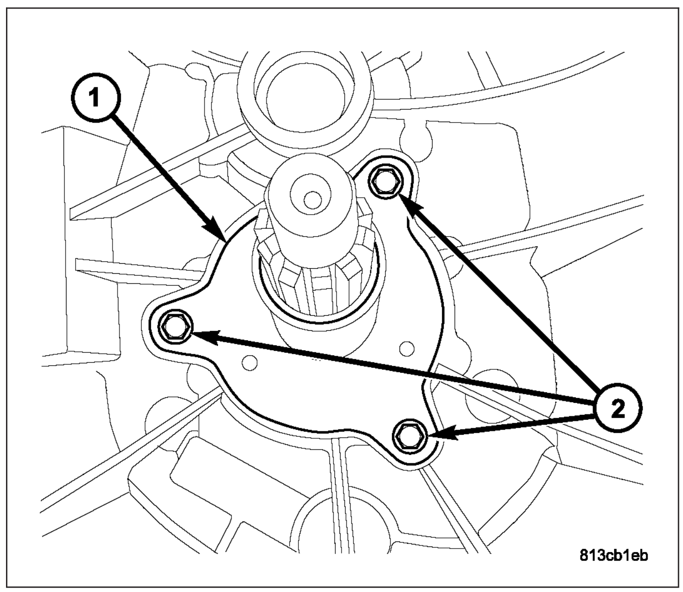
## COUNTERSHAFT

The countershaft (1) and 3-4 synchronizer (2) are serviced as an assembly only.

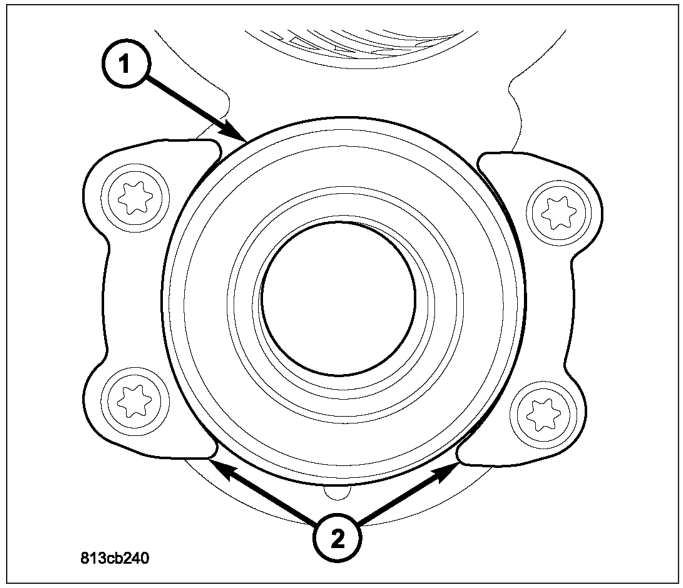


## FRONT HOUSING

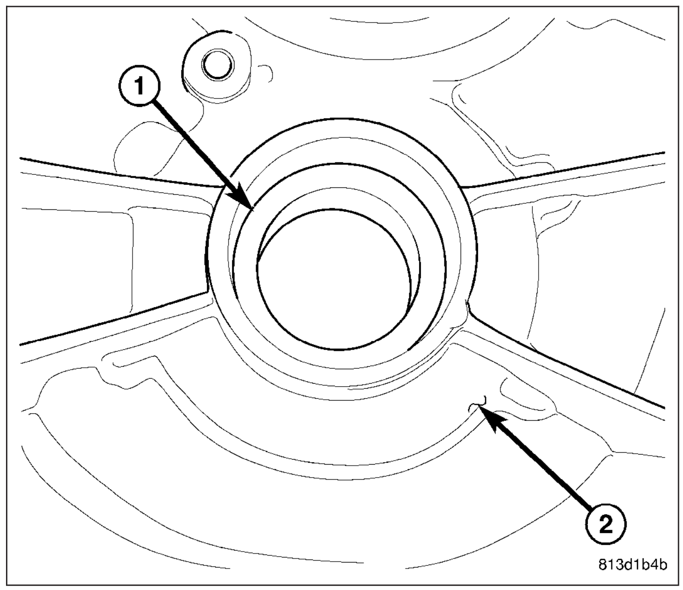
1. Remove input shaft retainer bolts (2) and remove retainer (1).



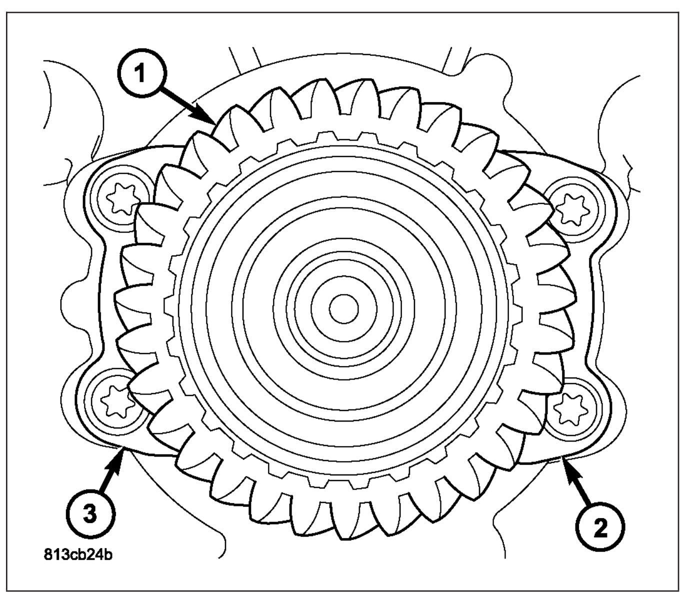
2. Remove countershaft bearing (1) retainer (2) bolts and remove retainers.



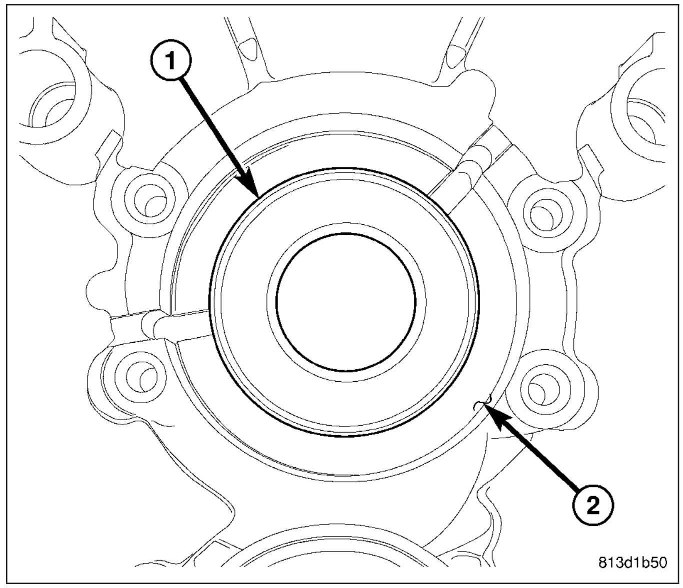
3. Remove countershaft bearing (1) from housing (2) with a hammer and driver.



4. Remove input shaft (1) bearing retainer bolts and remove retainers (2, 3).
5. Remove input shaft and bearing from housing with a dead blow hammer.



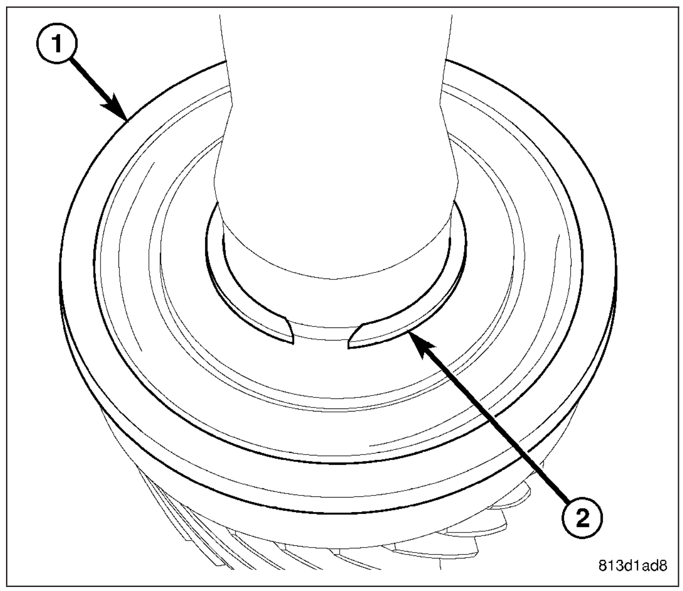
6. Remove input shaft seal (1) from housing (2) with a hammer and driver.



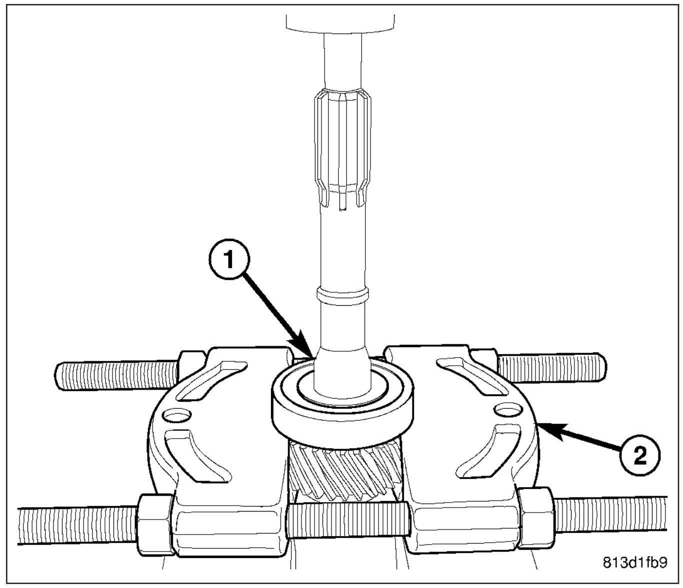
## INPUT SHAFT

1. Remove input shaft bearing (1) snap ring (2).

**NOTE: All snap rings are select fit from the factory, and must be installed in their original location.**

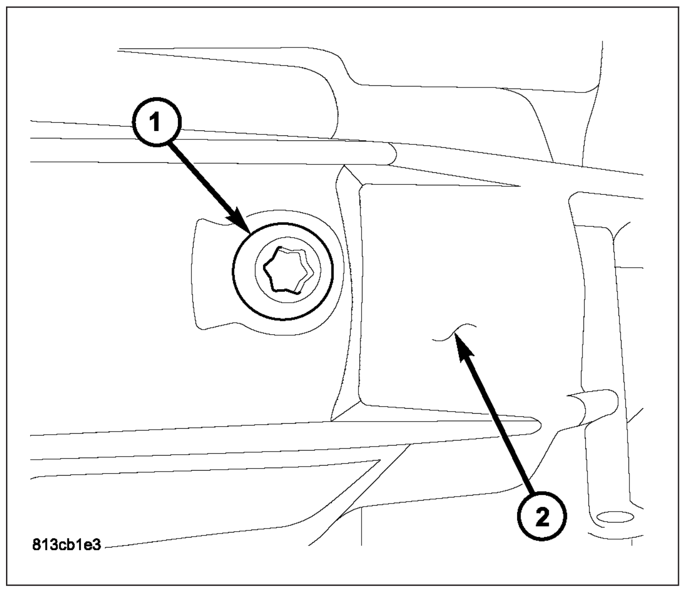


2. Remove input shaft bearing (1) from input shaft with a Splitter 1130 (2) and press. Place splitter around bearing retainer lip and press input shaft through the bearing.

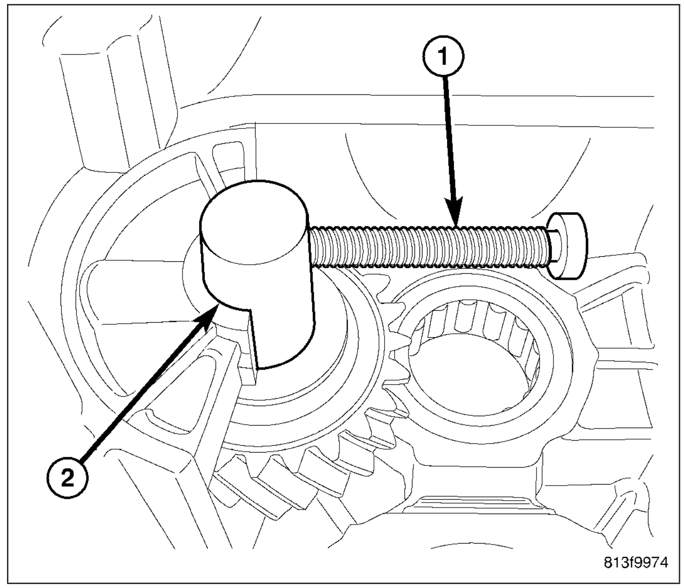


## REAR HOUSING

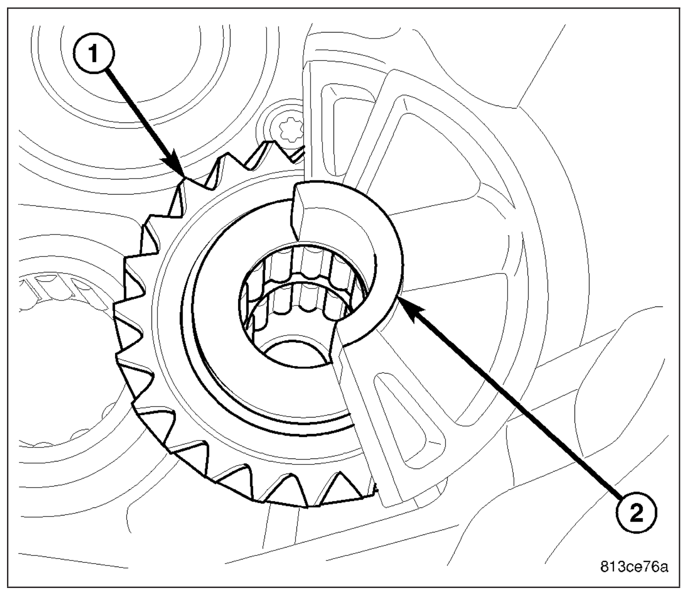
1. Remove reverse idler gear shaft bolt (1) from housing (2).



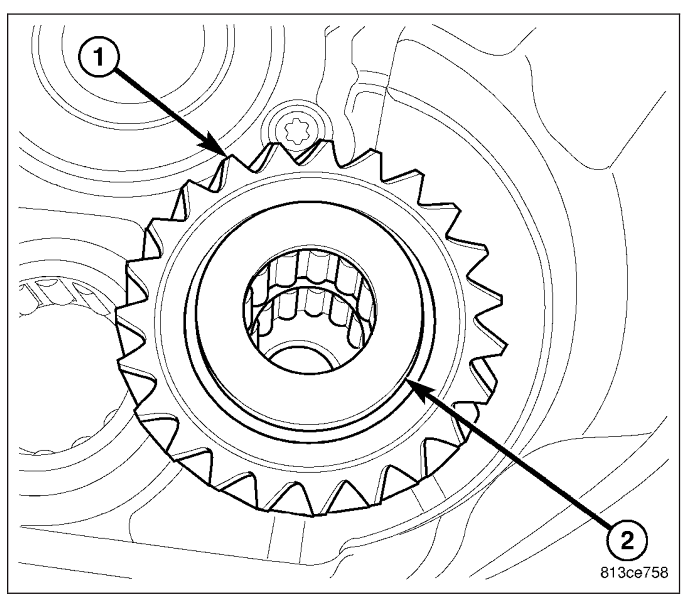
2. Thread idler gear shaft bolt (1) into the shaft (2). Then work shaft (2) out of the idler gear.



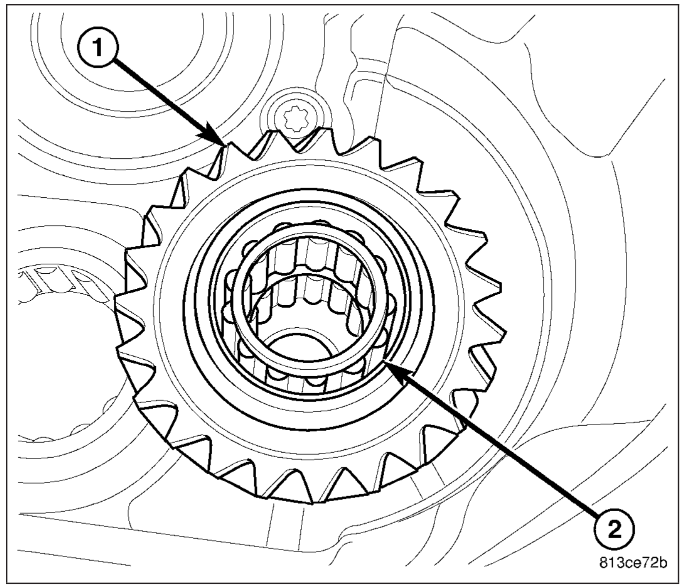
3. Remove reverse idler gear (1) shaft support (2).



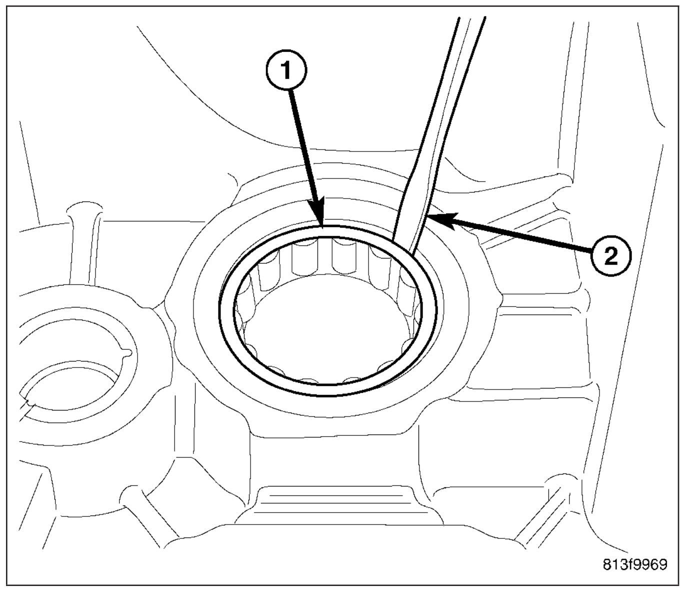
4. Remove reverse idler gear (1) thrust washer (2).



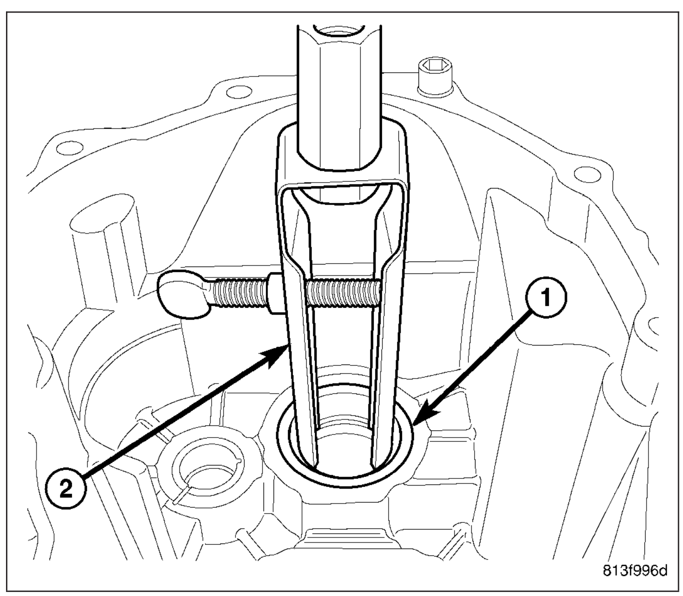
5. Remove reverse idler gear (1) and bearing (2).



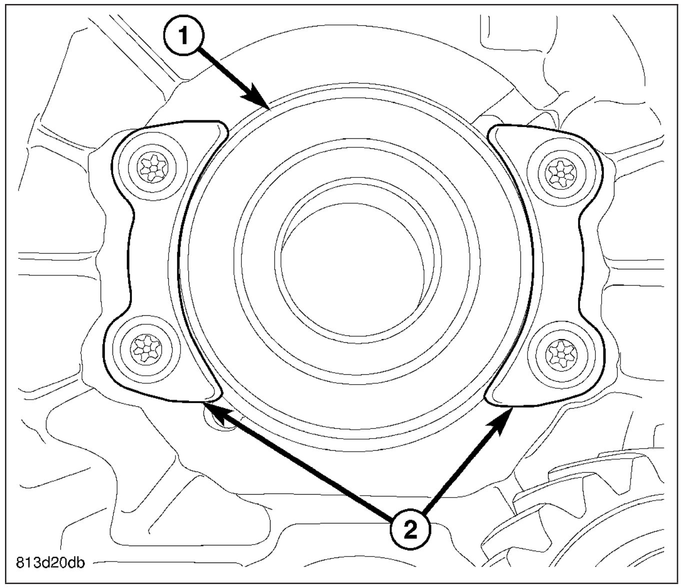
6. Break plastic countershaft roller bearing cage (1) with a screw driver (2). Then remove cage and roller bearing.



7. Remove countershaft roller bearing shell (1) from the rear housing with Remover 7794-A (2) and Slide Hammer C-637.



8. Remove mainshaft bearing (1) retainer bolts and remove retainers (2).
9. Remove bearing from housing with a hammer and driver.



## CLEANING

Clean gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean shaft bearings with a mild solvent such as Mopar™ degreasing solvent or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

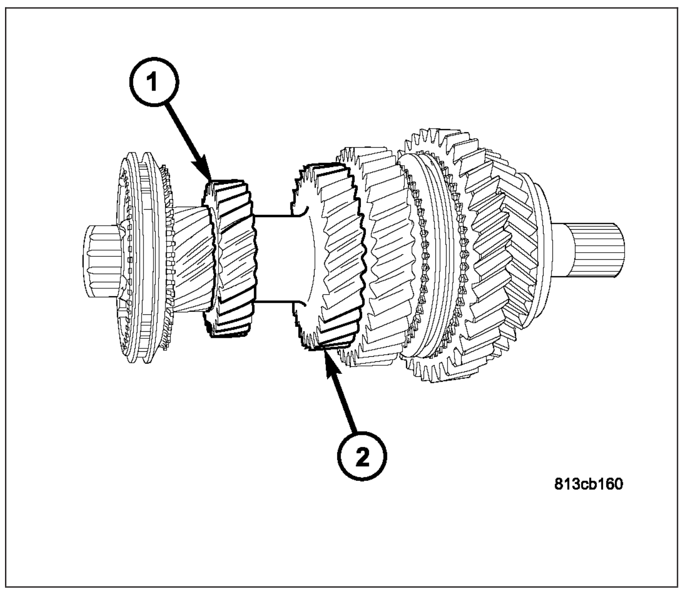
## INSPECTION

**NOTE: Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.**

**Bearings:** Inspect for worn, cracked, flat-spotted or brinnelled.

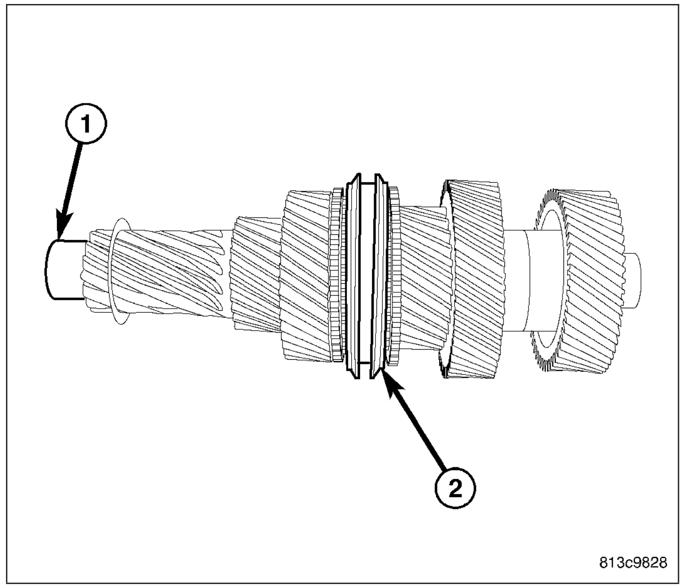
**Gears:** Inspect for worn, chipped or cracked teeth. Inspect bearing surfaces for ware or flat-spotted.

**Mainshaft:** Inspect for worn splines, snap ring grooves and threads. Inspect bearing surfaces for ware or flat-spotted. **Third gear (1) and fourth gear (2) are serviced with mainshaft only.**

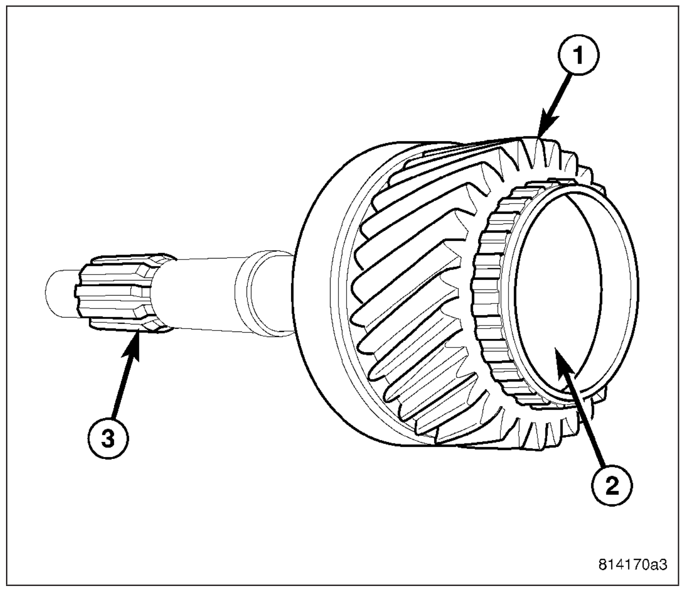


**Countershaft:** Inspect for worn, chipped or cracked teeth. Inspect bearing surfaces (1) for wear or flat-spots. Inspect 3-4 synchronizer assembly (2). Inspect oil slinger for cracks. **The countershaft is serviced as an assembly.**

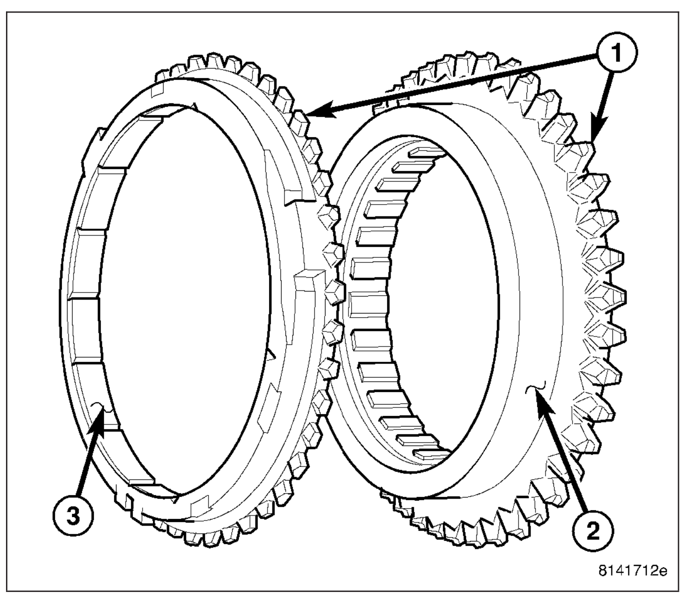
**Oil Slinger:** Inspect first/reverse oil slinger for cracks.



**Input Shaft:** Inspect for worn, chipped or cracked teeth (1). Inspect bearing surface (2) for wear or flat-spots. Inspect for worn splines (3).

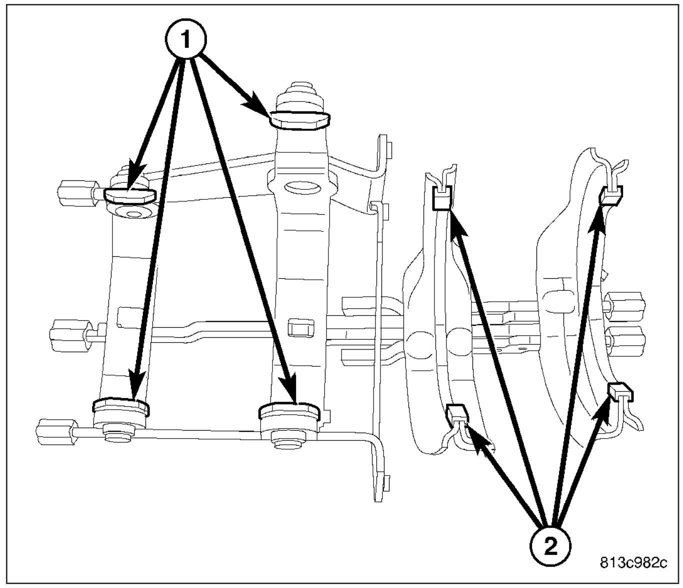


**Synchronizer components:** Inspect for worn, chipped or cracked teeth (1) and burned friction surface (2) or flaking off friction material (3). **Synchronizers are serviced as an assembly. 3-4 synchronizer assembly (2) is serviced with countershaft.**

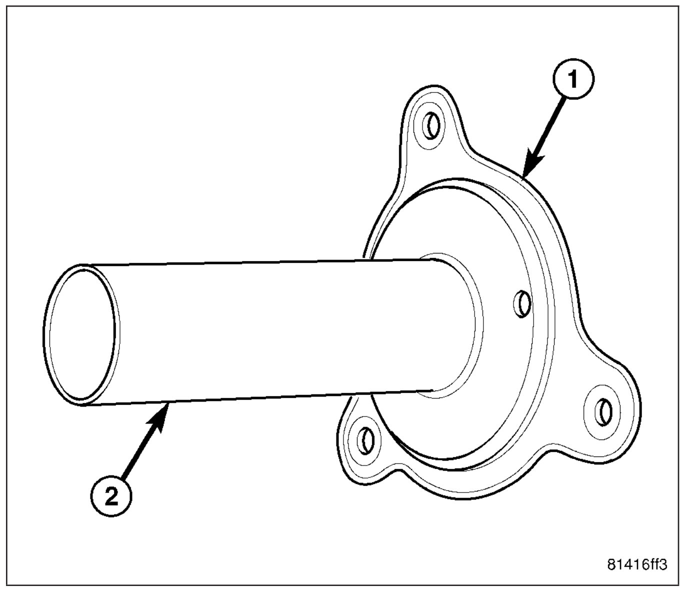


**Shift forks:** Inspect shift forks and shoes (1) for wear and distortion. Check fit of fork shoes in synchronizer sleeve to ensure parts fit and work smoothly, replace if necessary. If shift fork pads (2) are worn, the shift fork must be replaced.

**Housing/Tail housing:** Inspect sealing and mating surfaces are free of burrs and nicks. Inspect alignment dowels are tight and in good condition.



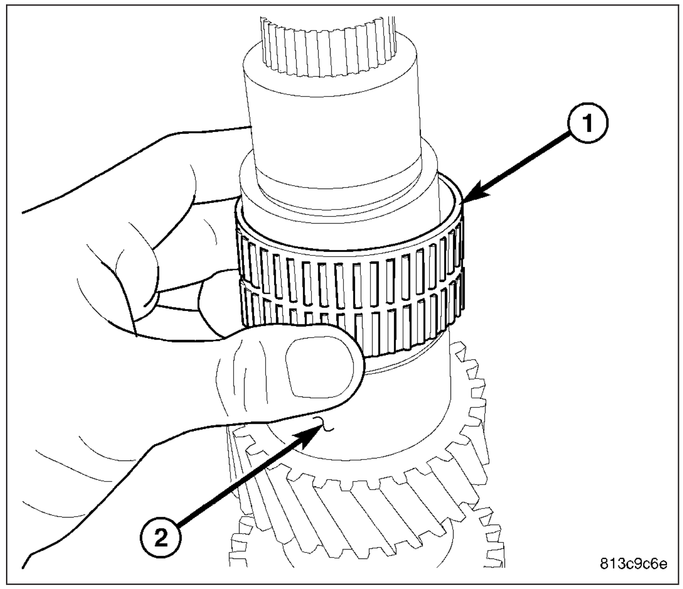
**Input Shaft Retainer:** Inspect retainer (1) release bearing slide surface (2).



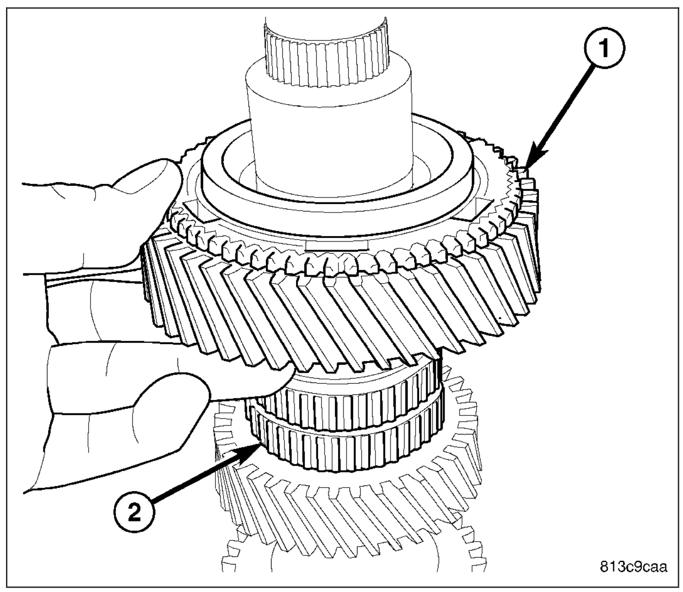
## ASSEMBLY

### MAINSHAFT

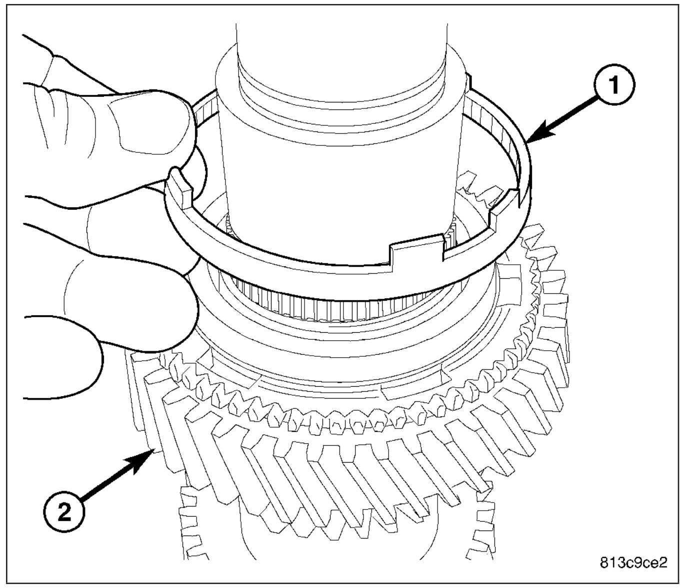
1. Place mainshaft in Fixture 9648 mounted in a vise.
2. Install second gear bearing (1) on mainshaft (2).



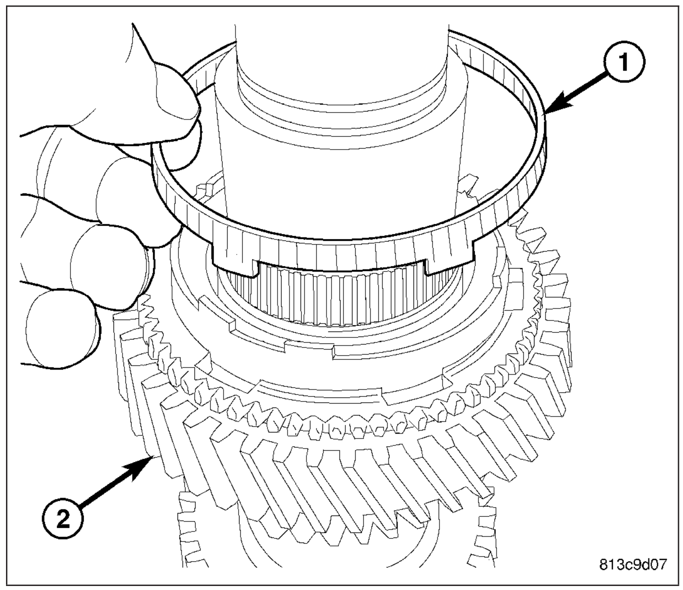
3. Install second gear (1) and bearing (2) on mainshaft.



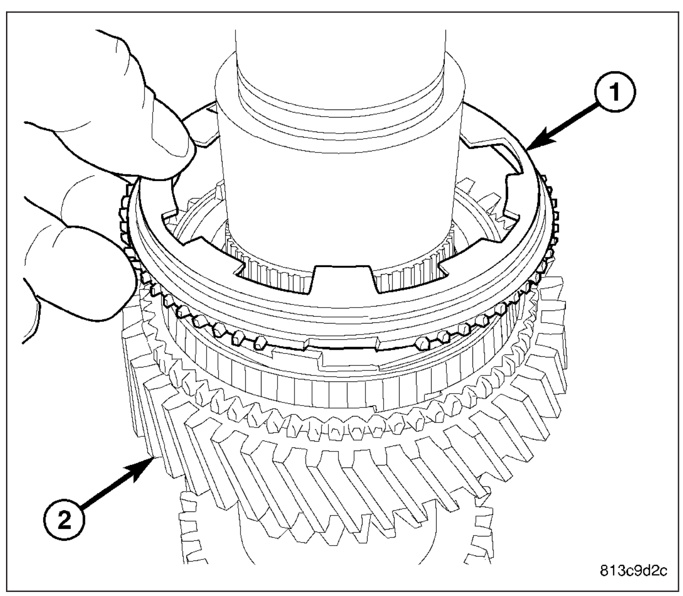
4. Install inner synchronizer friction ring (1) on second gear (2).



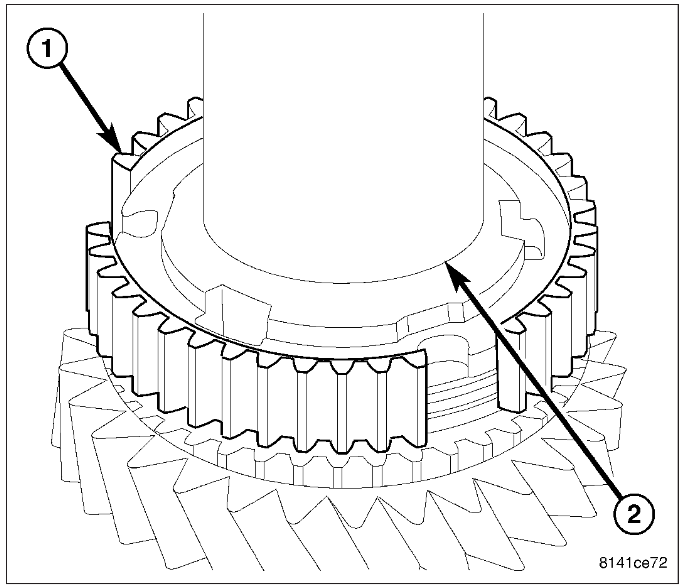
5. Install outer synchronizer friction ring (1) on second gear (2).



6. Install synchronizer blocker ring (1) on second gear (2).

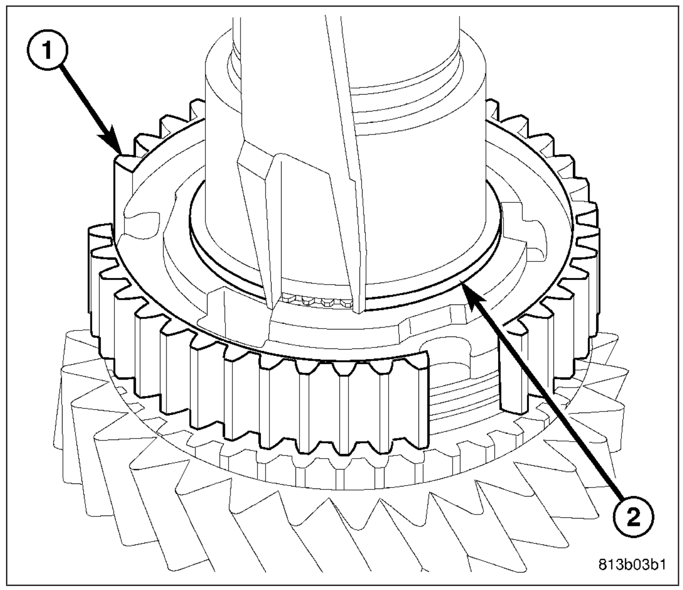


7. Install 1-2 synchronizer hub (1) with Installer 8228 (2) and a press. Align hub detent openings with synchronizer rings.

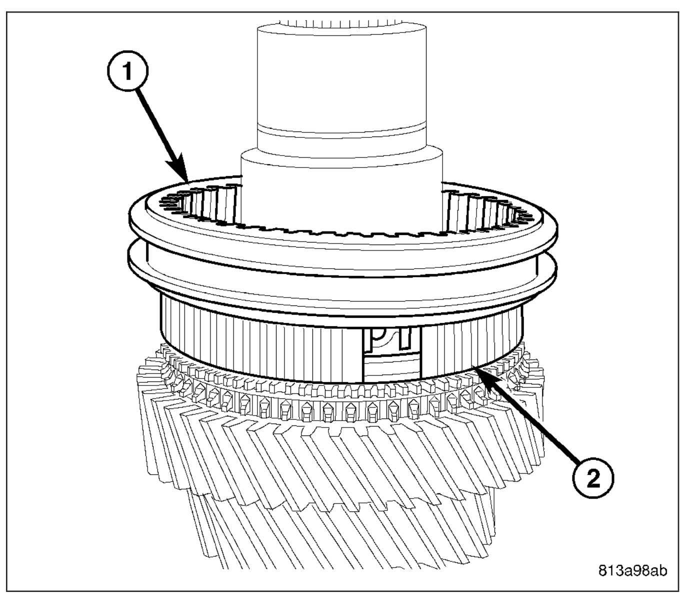


8. Install 1-2 synchronizer hub (1) snap ring (2).

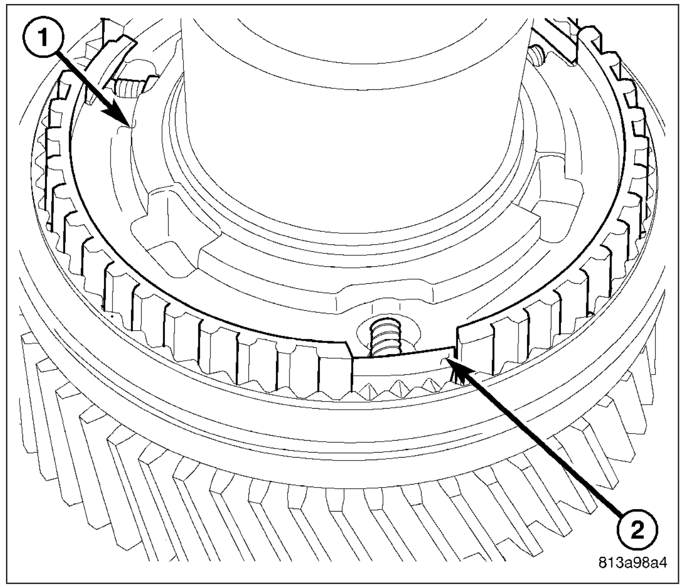
**NOTE: Reuse original snap ring or thickest ring that will fit.**



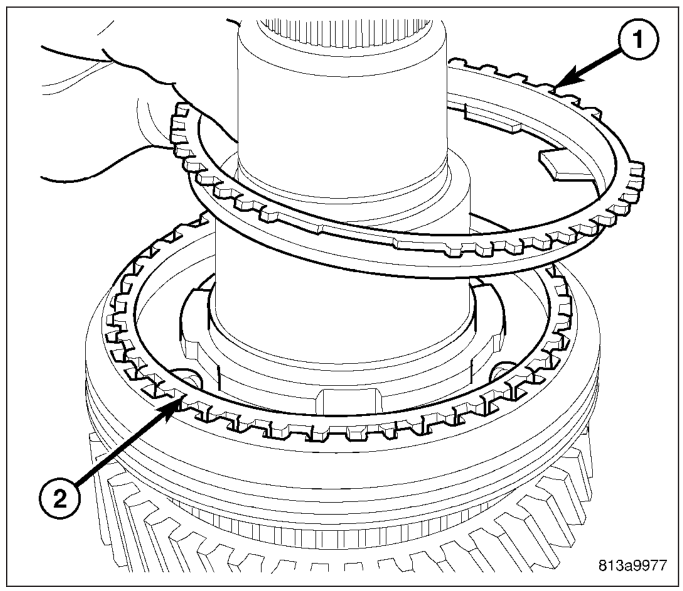
9. Install 1-2 synchronizer sleeve (1) and push to the bottom of the synchronizer hub (2).



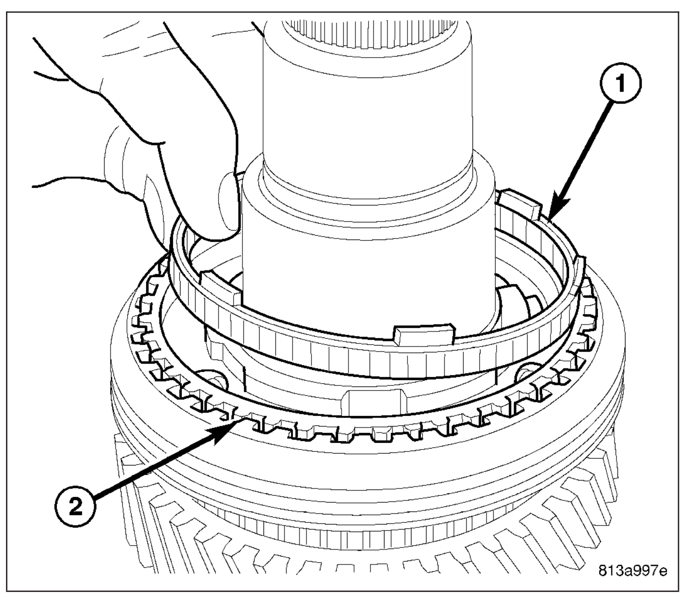
10. Install 1-2 synchronizer hub (1) detents, springs, and balls (2).



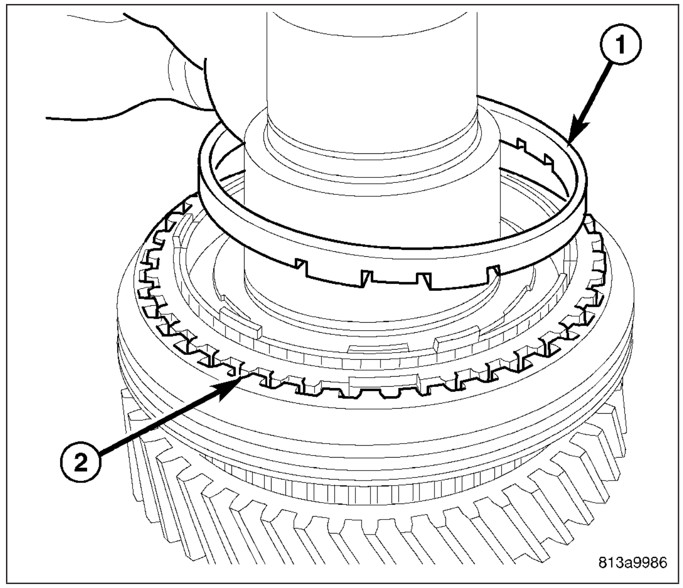
11. Install first gear blocker ring (1) into synchronizer hub (2).



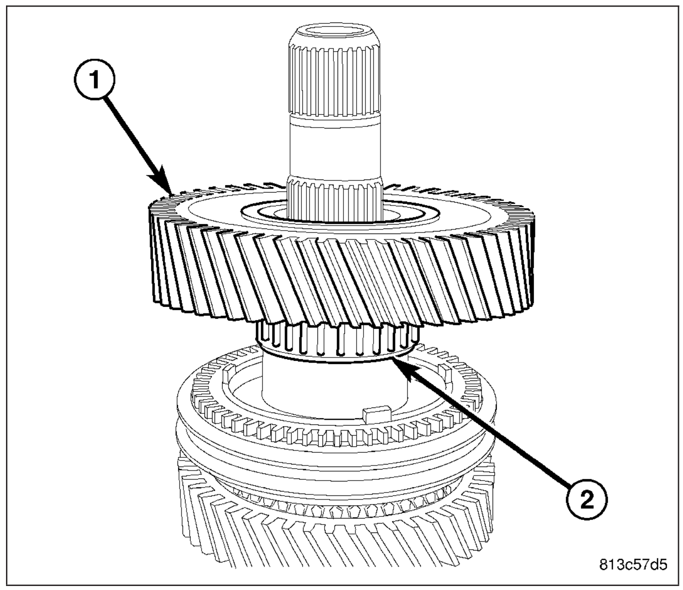
12. Install first gear outer friction ring (1) into synchronizer hub (2).



13. Install first gear inner friction ring (1) into synchronizer hub (2).

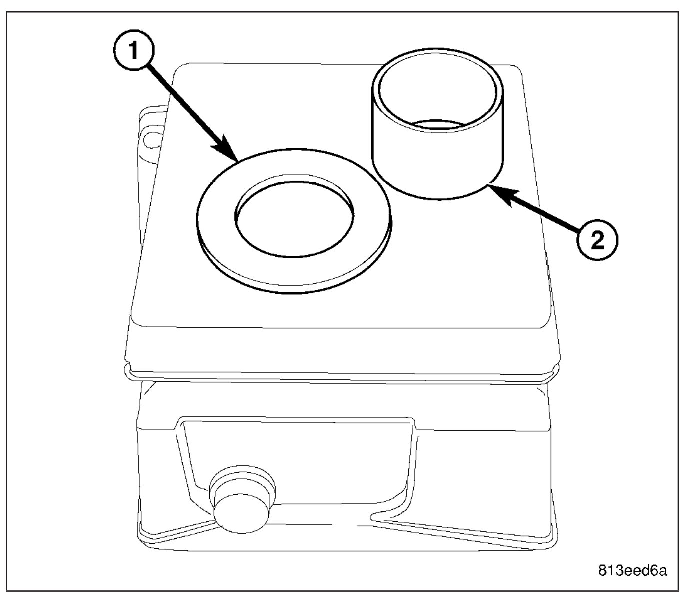


14. Install first gear (1) and bearing (2). Then center 1-2 synchronizer sleeve on synchronizer hub.

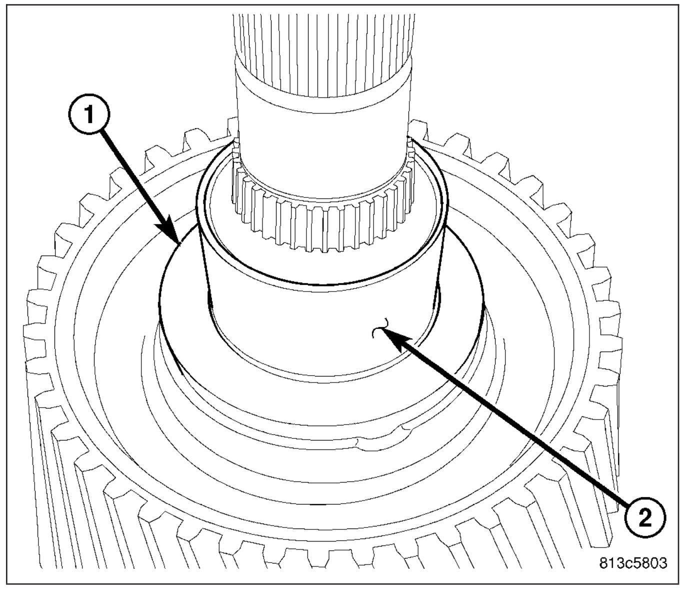


**WARNING: Use welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.**

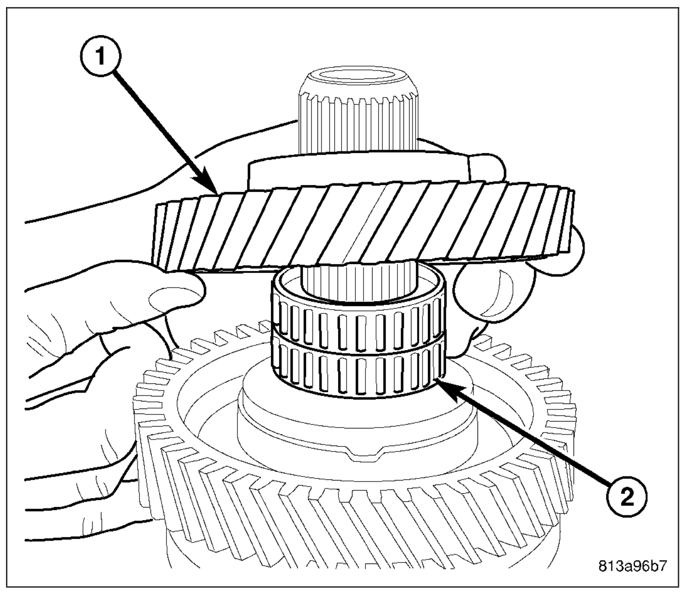
**CAUTION: A bearing heater is used to assembly first gear thrust washer (1) and reverse gear bearing race (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 177 Celsius (212° Min. - 350° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for and extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.**



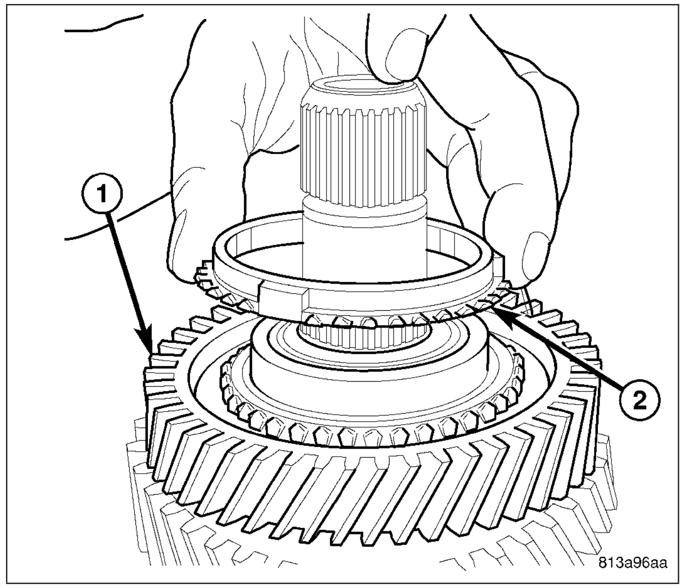
15. Heat first gear thrust washer (1) and reverse gear bearing race (2) with bearing heater to maximum of 177 Celsius (350° Fahrenheit).
16. Using welding gloves or tongs, install first gear thrust washer (1) then reverse gear bearing race (2).



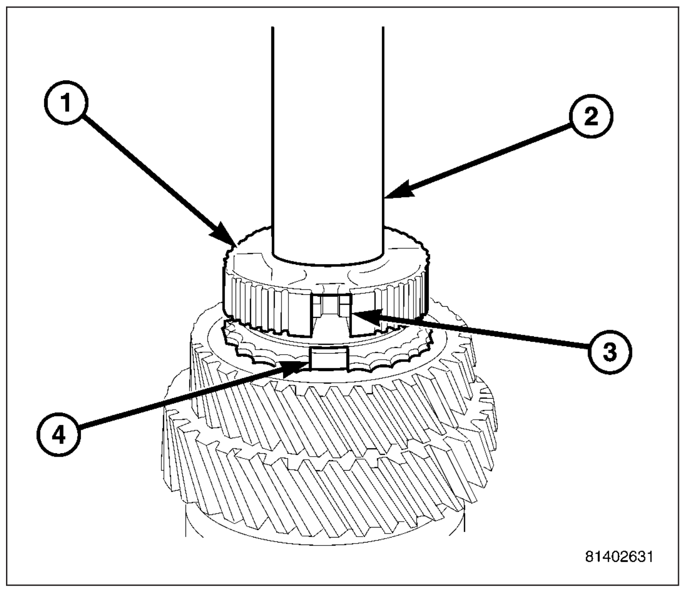
17. Install reverse gear (1) and bearing (2).



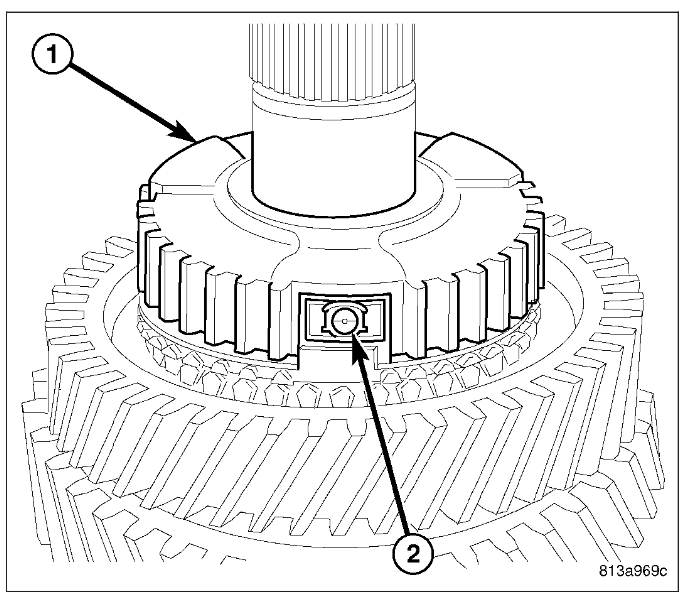
18. Install reverse gear (1) synchronizer friction ring (2).



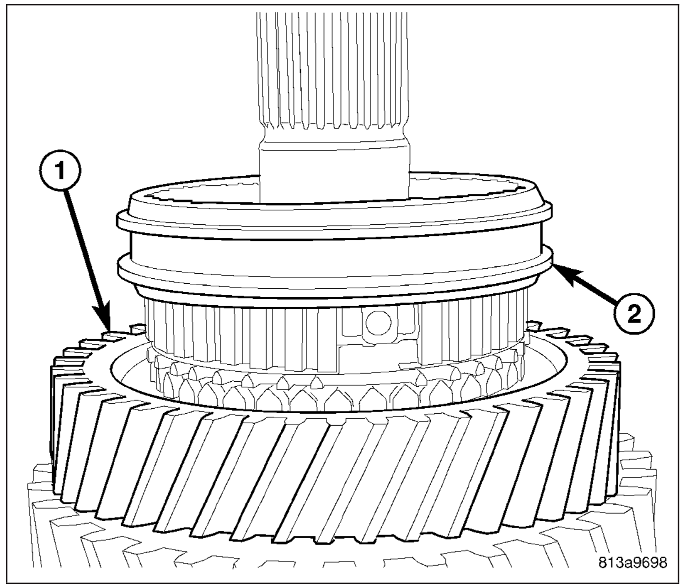
19. Install reverse gear synchronizer hub (1) on main-shaft with Installer W-262 (2) and a press. Align hub detent opening (3) with friction ring (4) lugs.



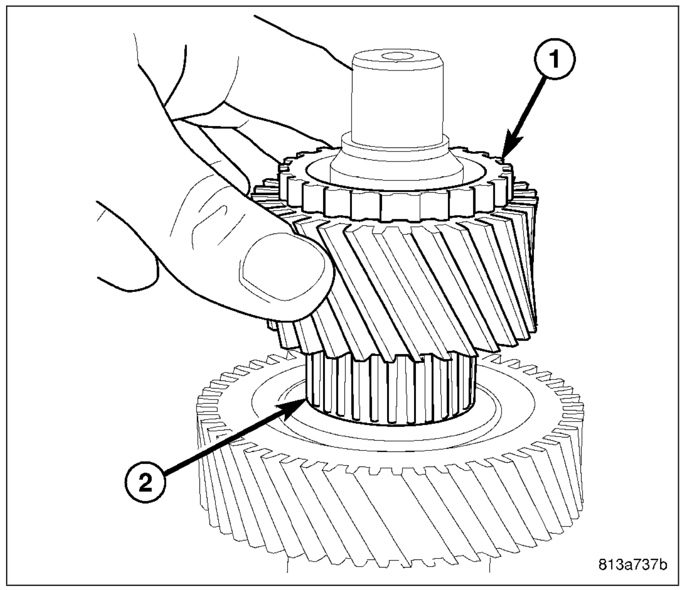
20. Install reverse gear synchronizer hub (1) detents (2).



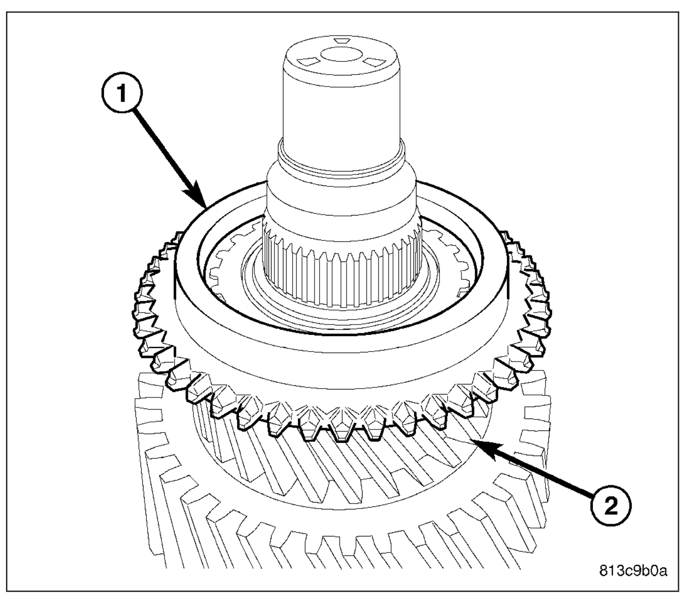
21. Install reverse gear (1) synchronizer sleeve (2) and center sleeve on synchronizer hub.
22. Remove mainshaft from Fixture 9648. Turn fixture over in the vise, then install opposite end of mainshaft in the fixture.



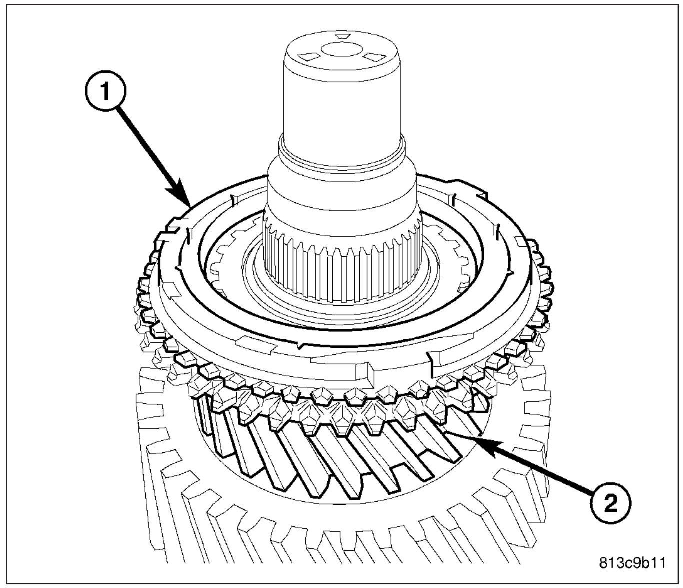
23. Install sixth gear (1) and bearing (2) on mainshaft.



24. Install sixth gear synchronizer blocker ring (1) on sixth gear (2).

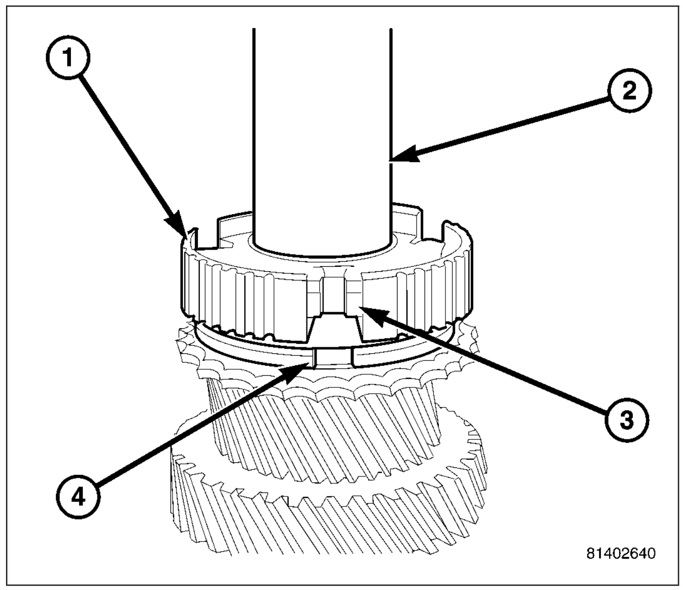


25. Install sixth gear synchronizer friction ring (1) on sixth gear (2).



26. Install 5-6 synchronizer hub (1) with Installer W-262 (2) and a press. Align hub detent opening (3) with friction ring lugs (4).

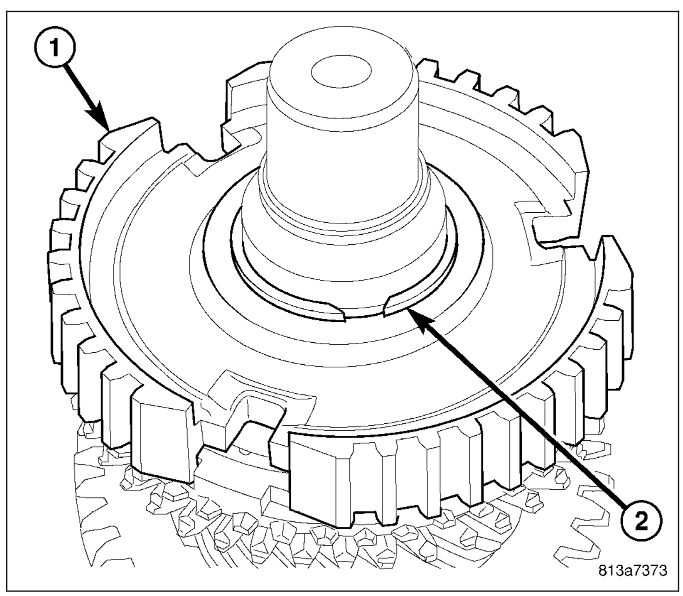
**NOTE: 5-6 synchronizer hub center, is offset and must be install larger offset down.**



27. Install 5-6 synchronizer hub (1) snap ring (2).

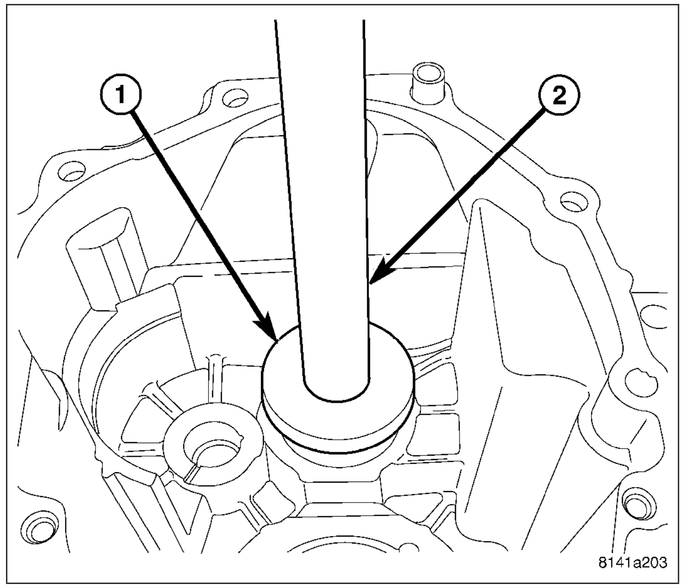
**NOTE: Reuse original snap ring or thickest ring that will fit.**

28. Install 5-6 synchronizer sleeve on hub (1).

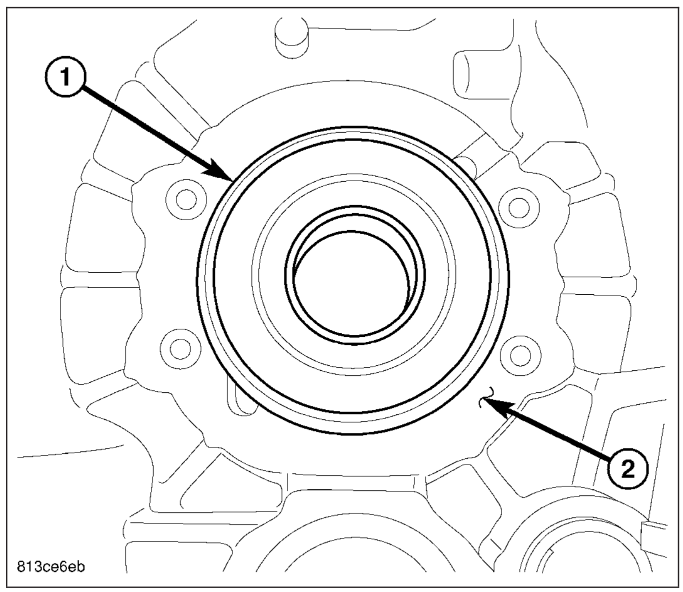


## REAR HOUSING

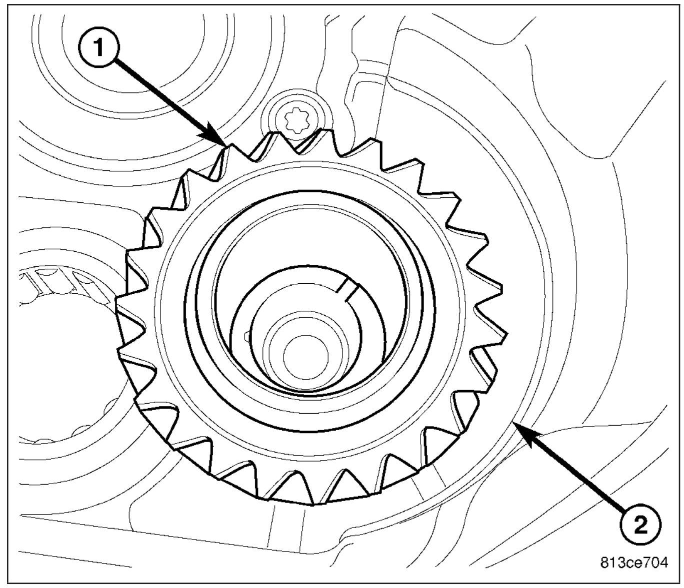
1. Install countershaft bearing into rear housing with Installer 9643 (1) and Handle C-4171 (2).



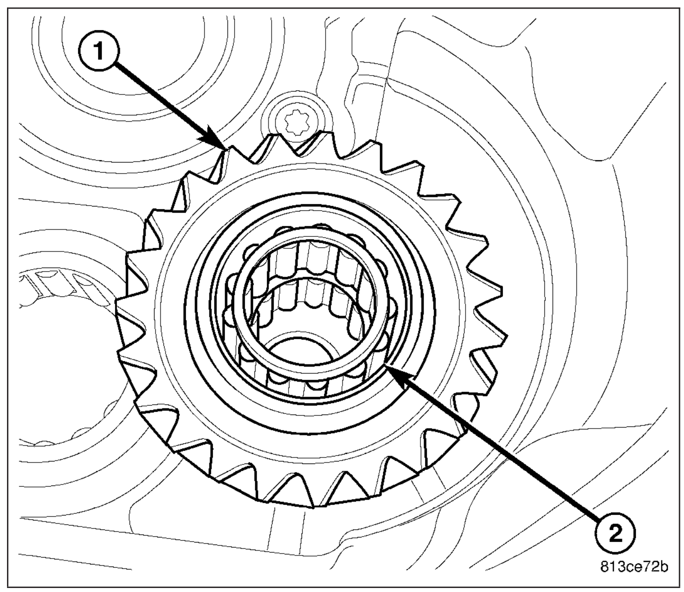
2. Install mainshaft bearing (1) into housing (2).
3. Install bearing retainer and tighten bolts to 10 N·m (7.3 ft. lbs.).



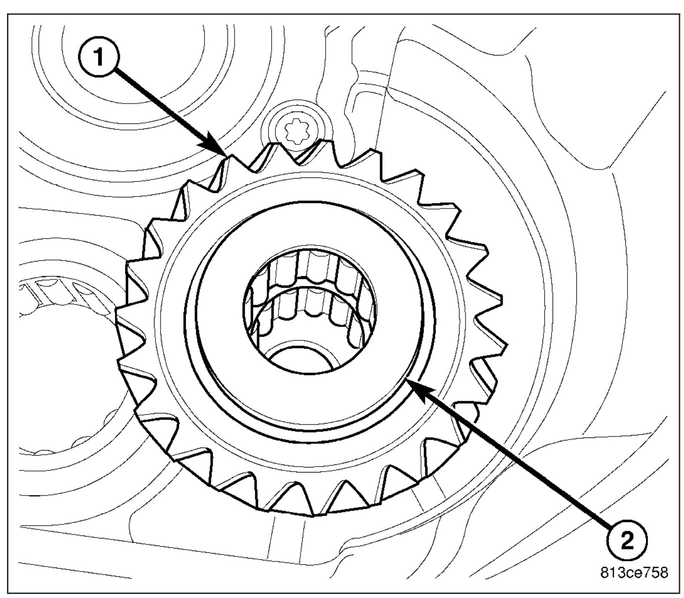
4. Install reverse idler gear (1) into housing (2).



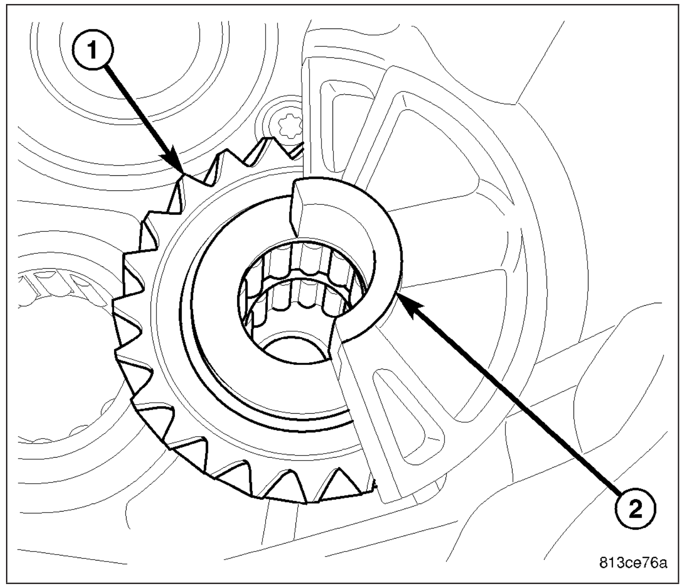
5. Install idler gear (1) bearing (2) into gear.



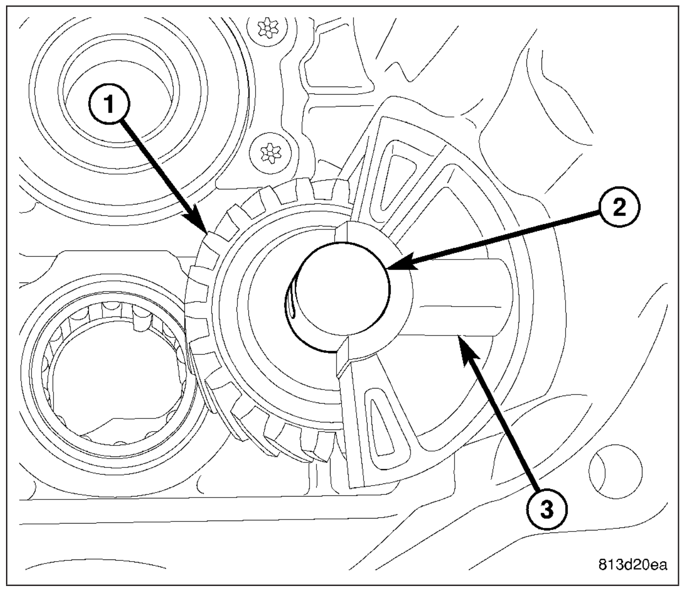
6. Install idler gear (1) thrust washer (2) on idler gear.



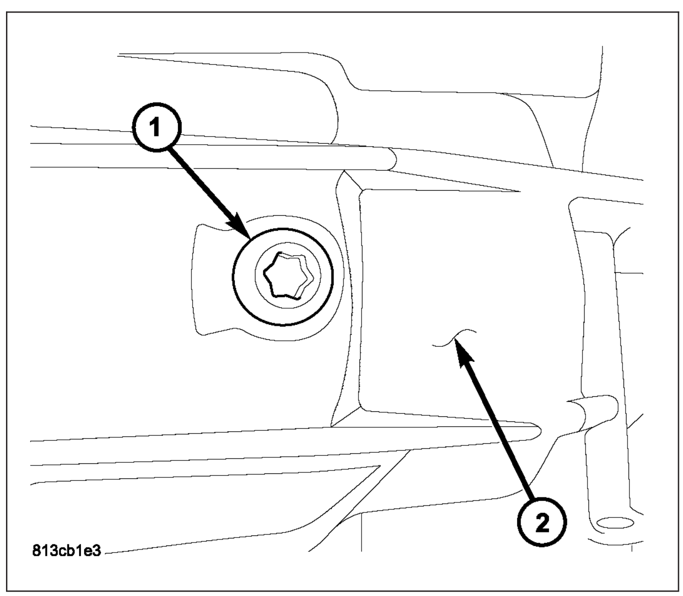
7. Install idler gear (1) shaft support (2) into housing.



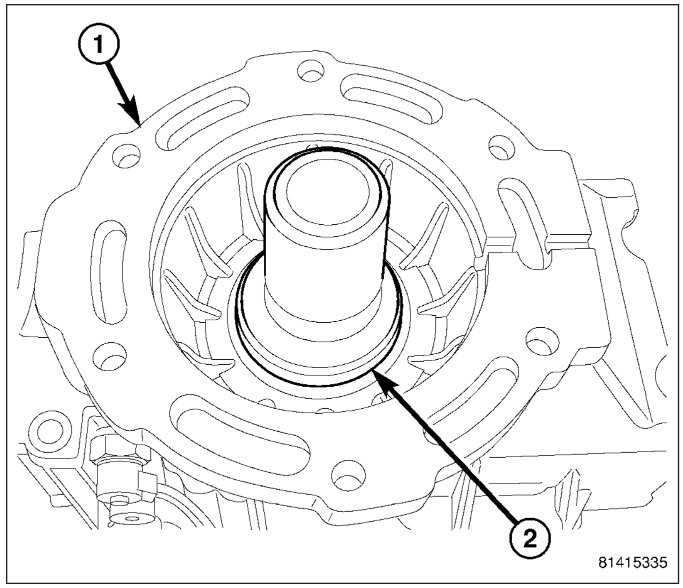
8. Install idler gear (1) shaft (2) with shaft bolt hole aliened with shaft support hole (3).



9. Install idler gear shaft bolt (1) into the housing (2) and tighten to 20 N.m (15 ft. lbs.).

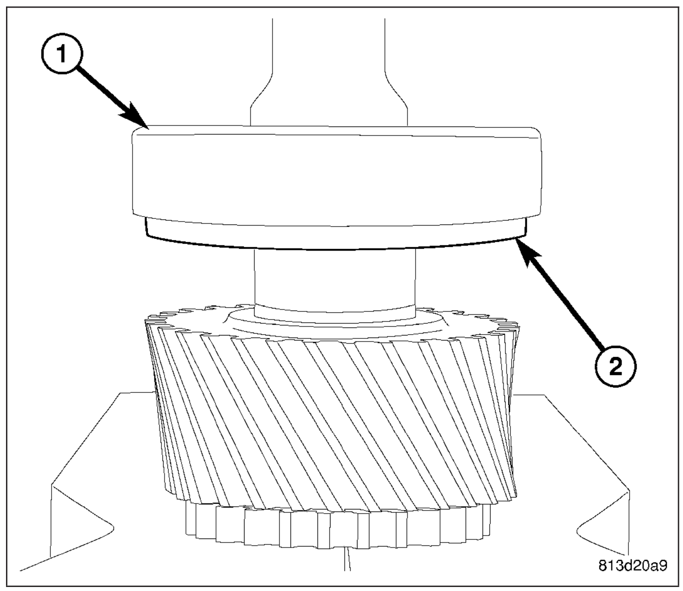


10. Install 4x4 output shaft seal into rear housing (1) with Installer 9638 (2). Install 4x2 output shaft seal into rear housing with Installer 9635 and Installer 6448A.

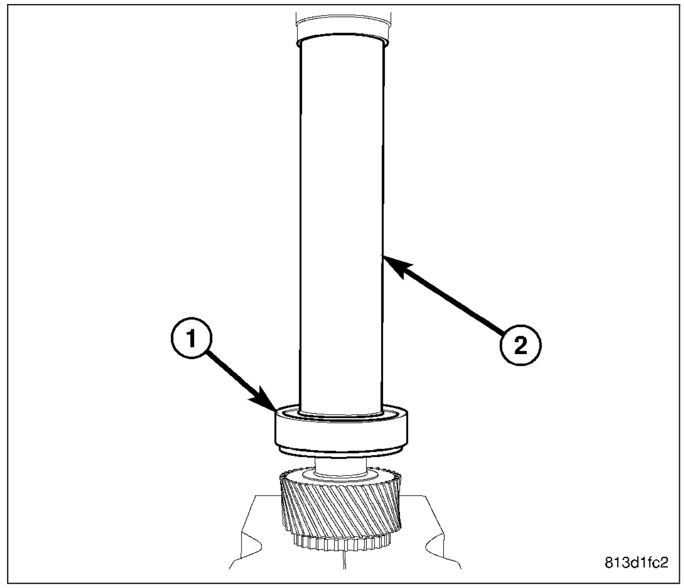


## INPUT SHAFT

1. Install input shaft bearing (1) on input shaft with the bearing retainer lip (2) facing fifth gear.

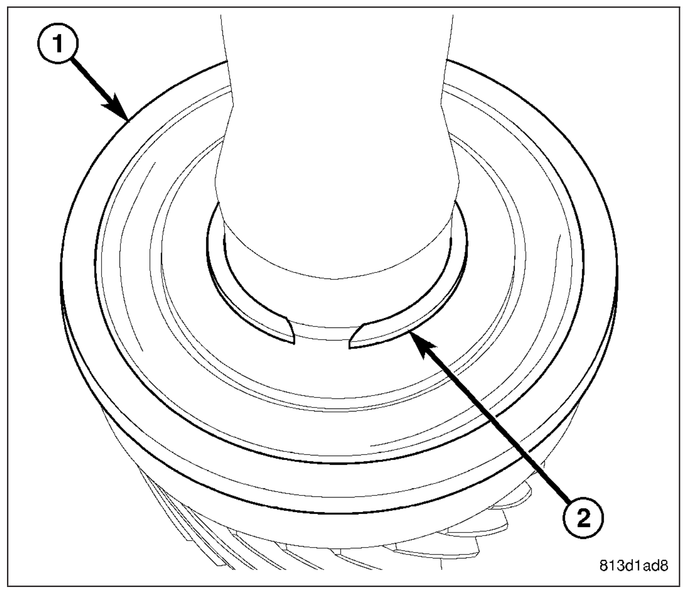


2. Install input shaft bearing (1) with Installer 6448A (2) and a press.



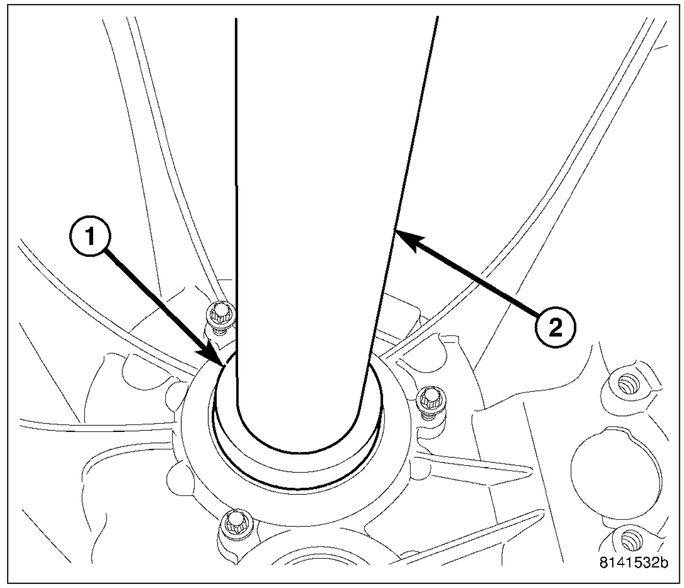
3. Install input shaft bearing (1) snap ring (2).

**NOTE: Reuse original snap ring or thickest ring that will fit.**

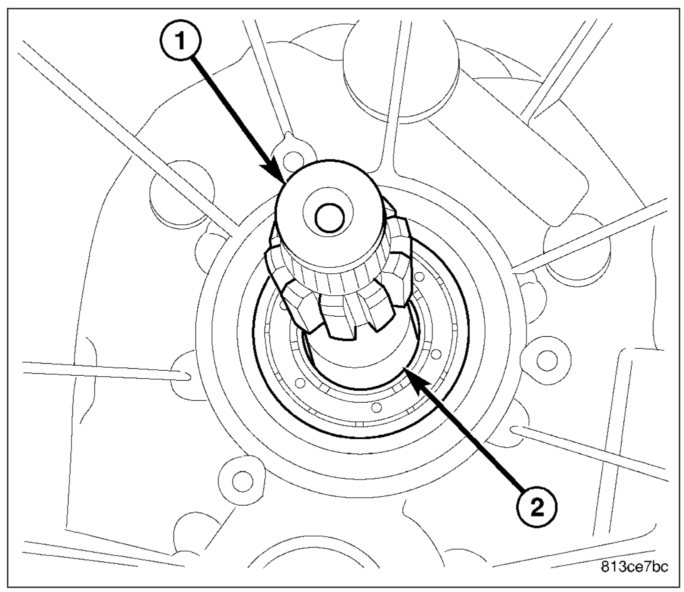


## FRONT HOUSING

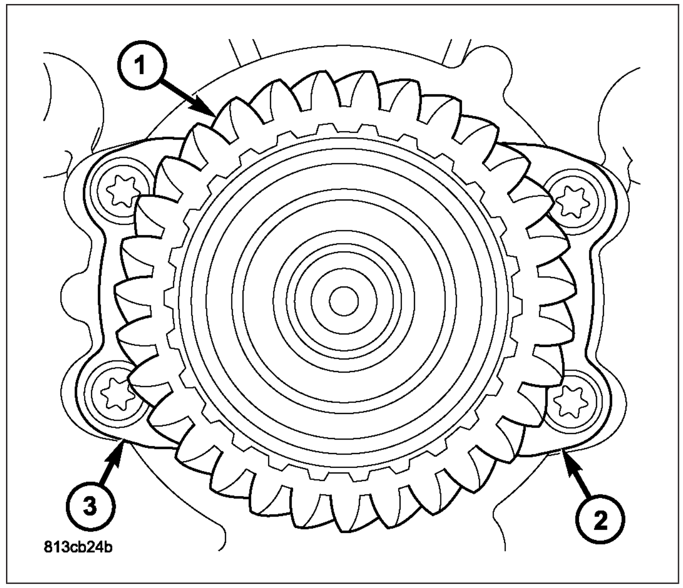
1. Install input shaft seal with Installer 9635 (1) Installer 6448A (2).



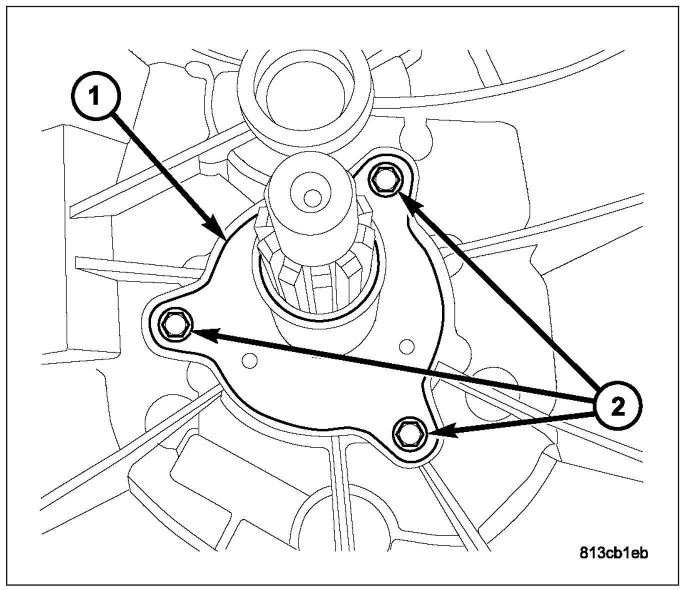
2. Install input shaft (1) with bearing (2) into housing.



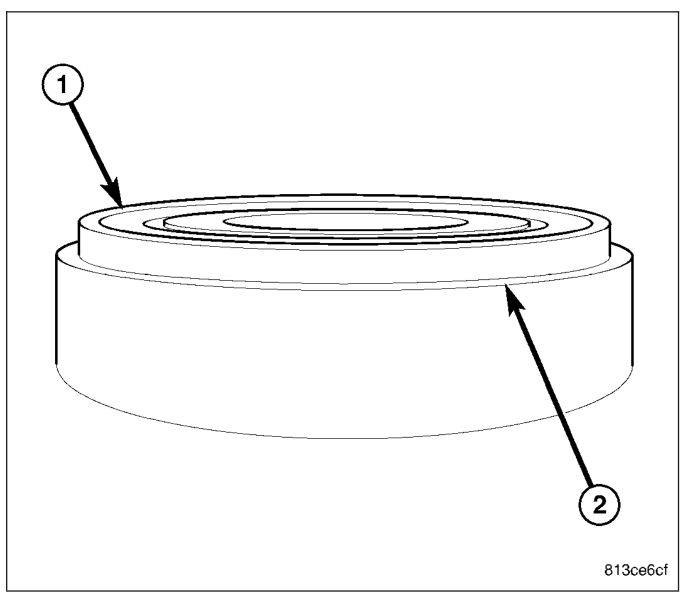
3. Install input shaft (1) bearing retainers (2, 3) and tighten bolts to 10 N·m (88 in. lbs.).



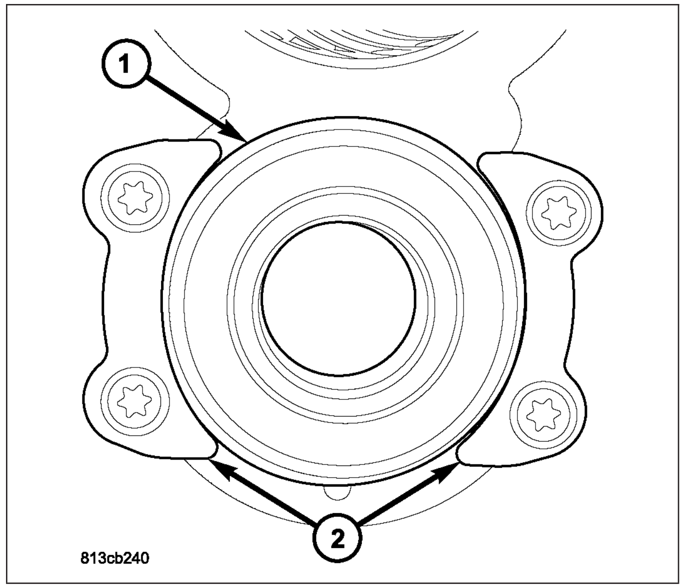
4. Install input shaft retainer (1) and tighten bolts (2) to 9 N·m (80 in. lbs.).



5. Install countershaft bearing (1) into housing with bearing retainer lip (2) facing up.

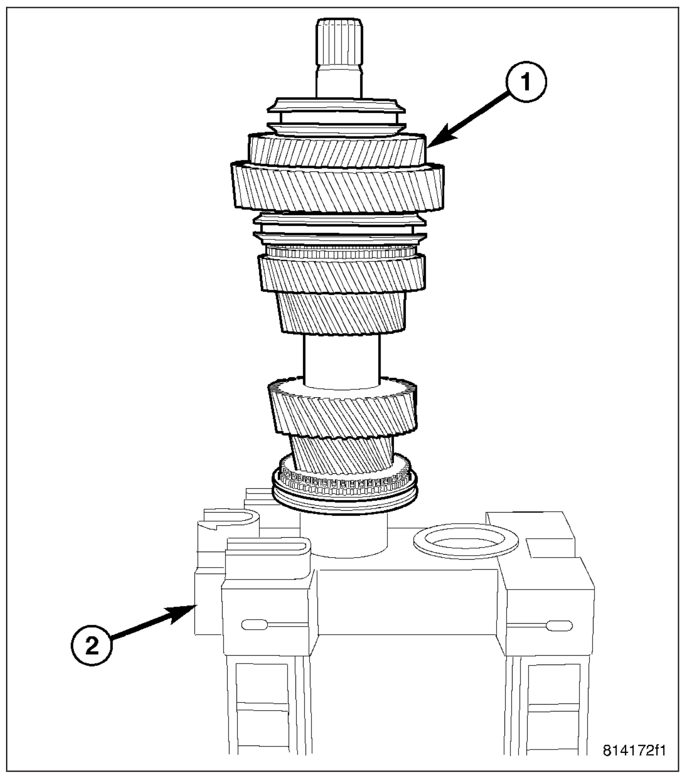


6. Install countershaft bearing (1) retainers (2) and tighten bolts to 10 N·m (88 in. lbs.).

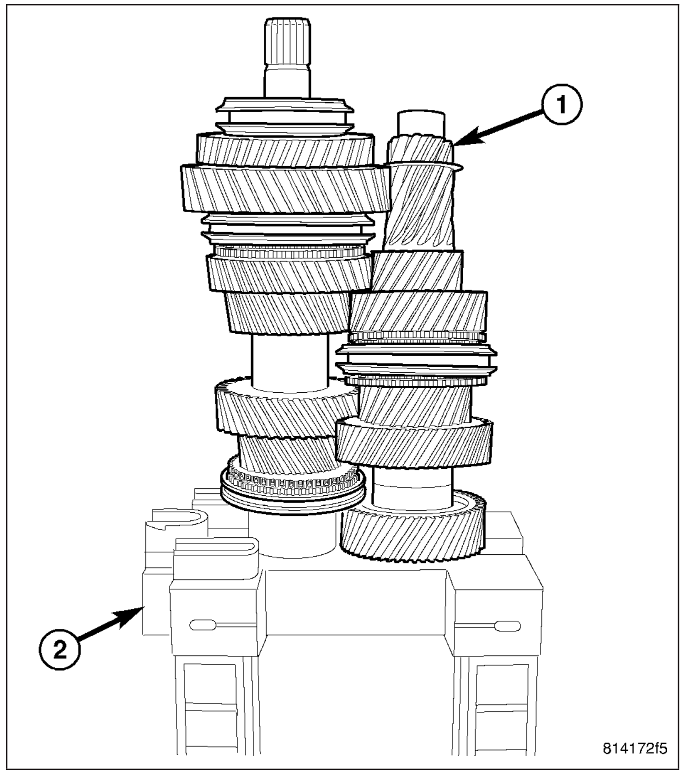


## FINAL ASSEMBLY

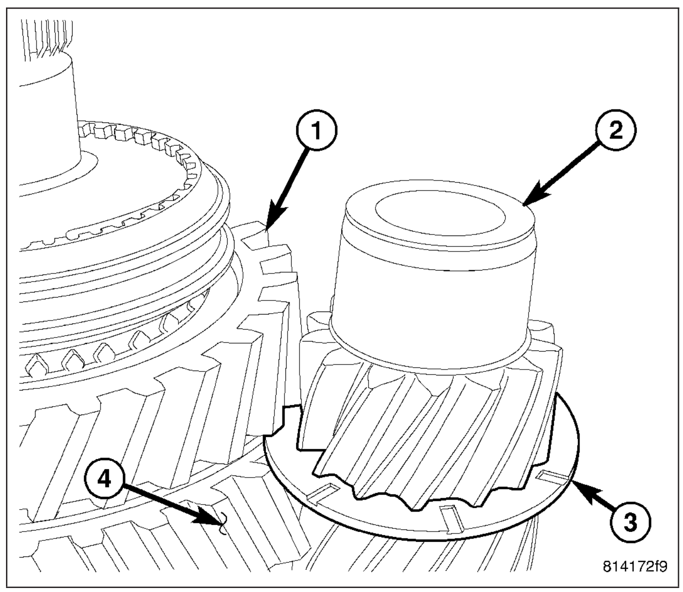
1. Install mainshaft (1) onto Build Fixture 9633 (2).



2. Install countershaft (1) onto Build Fixture 9633 (2).

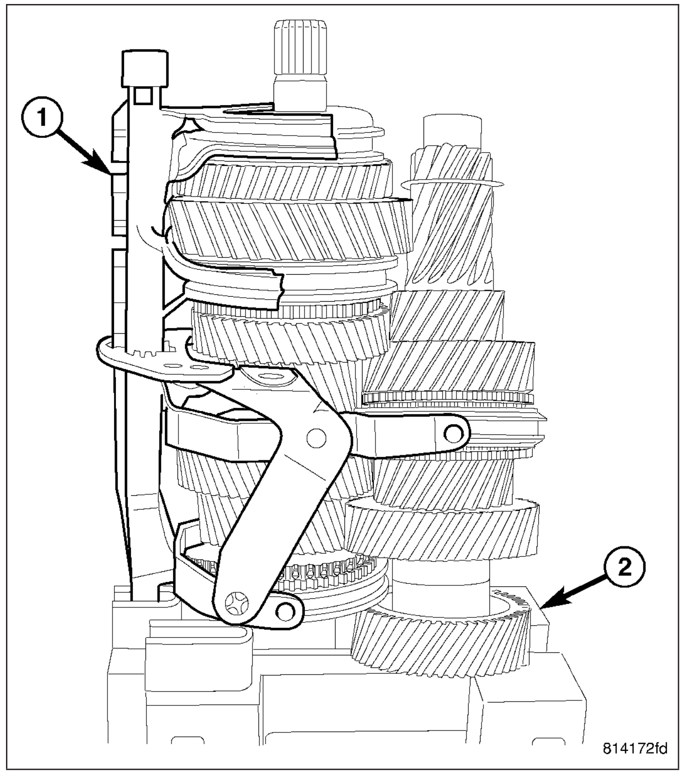


3. Install oil slinger (3) on countershaft (2) between reverse (1) and first gear (4).

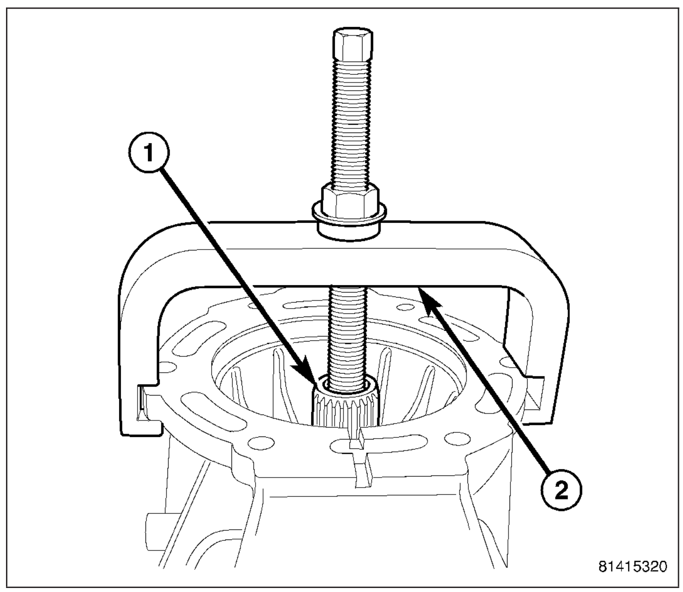


**CAUTION: Oil slinger is fragile and can crack during installation. Failure to follow these instructions will result in cracking the oil slinger and lack of oil to first/reverse bearing.**

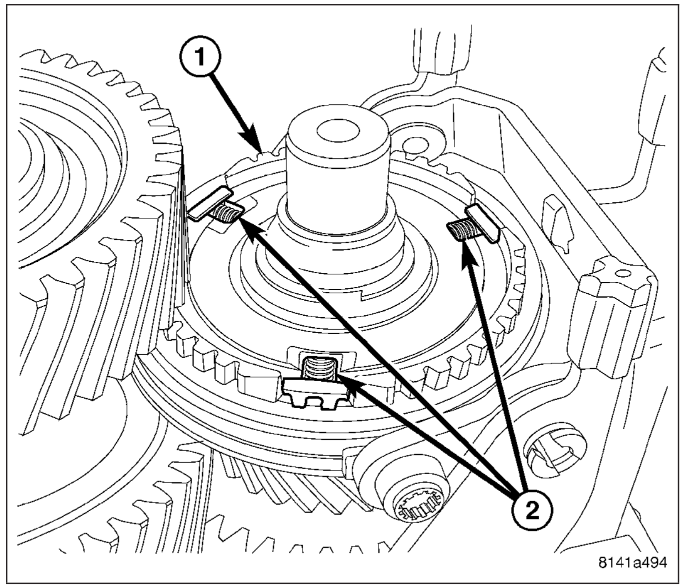
4. Install shift rails and forks (1) onto Build Fixture 9633 (2) and countershaft/mainshaft.



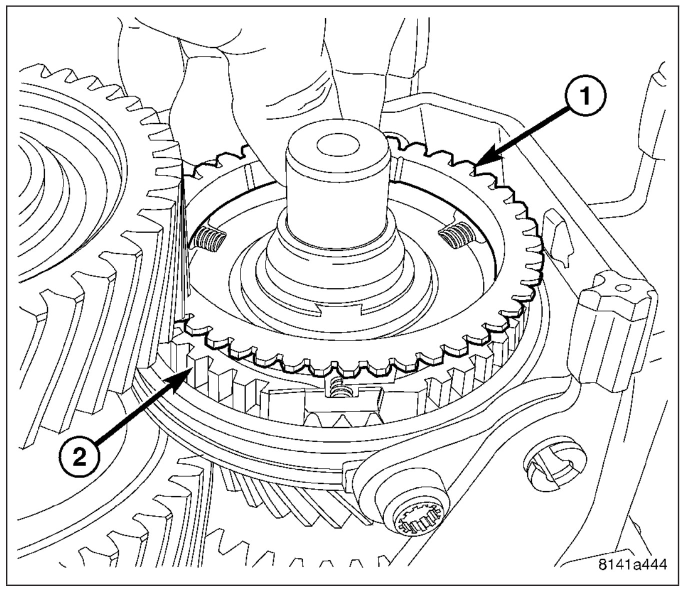
5. Install rear housing on mainshaft (1) with Installer 9636 (2).



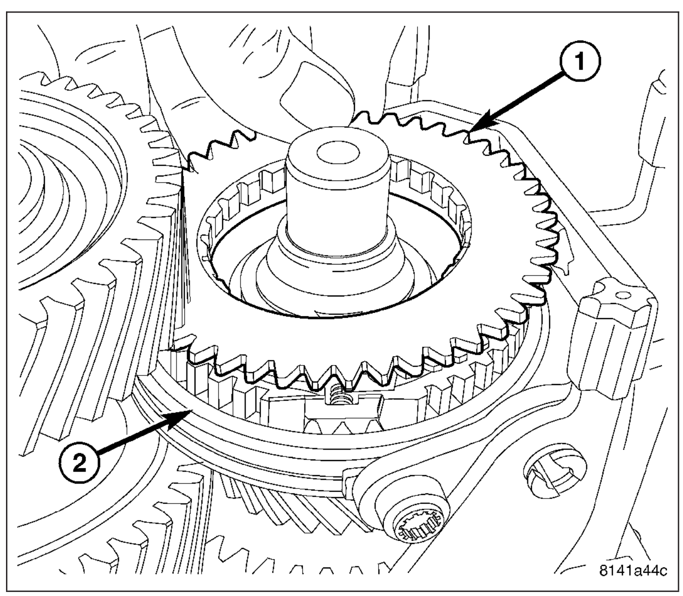
6. Remove rear housing with mainshaft, countershaft and shift rails from fixture. Set assembly on rear housing with shafts pointing up.
7. Install 5-6 synchronizer hub (1) detents, springs, and balls (2).



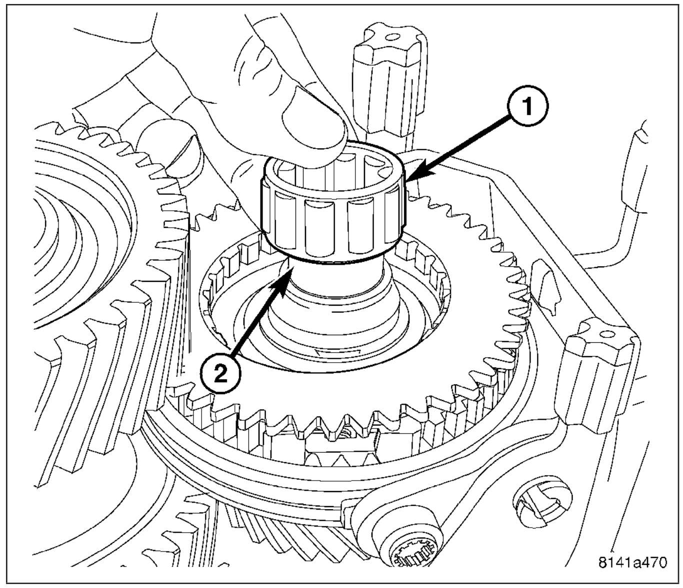
8. Install fifth gear synchronizer friction ring (1) on 5-6 synchronizer hub (2).



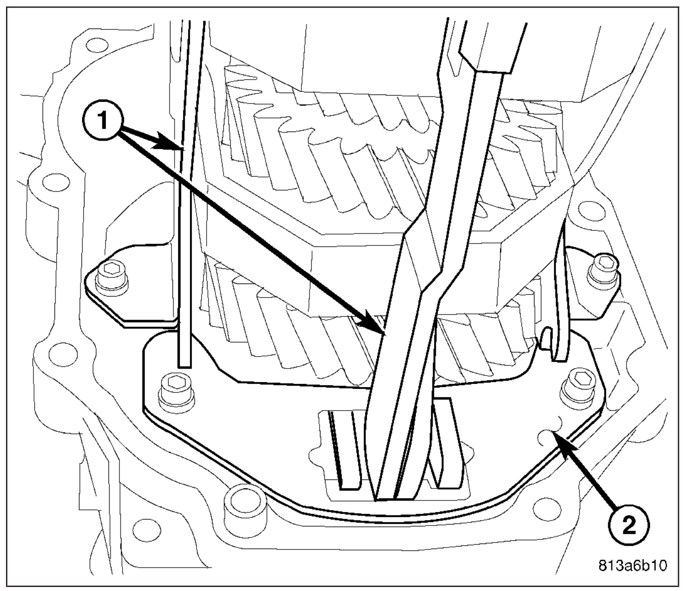
9. Install fifth gear blocker ring (1) on 5-6 synchronizer hub (2). Then hold blocker ring and center synchronizer sleeve.



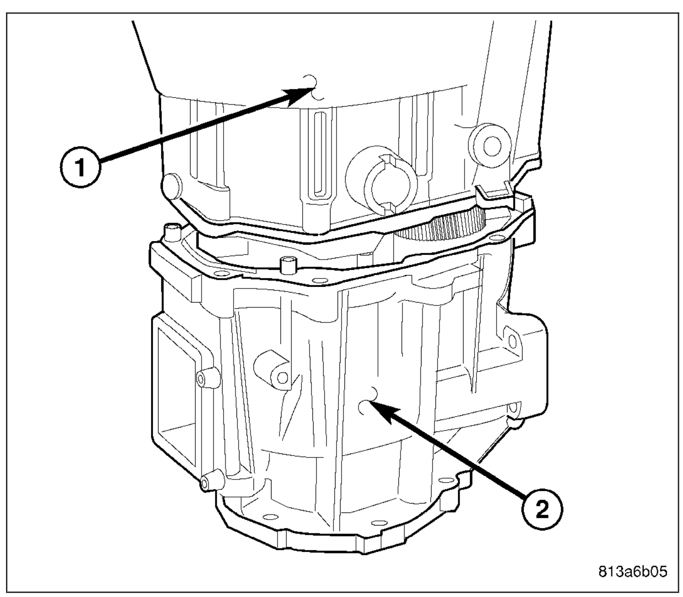
10. Install input shaft roller bearing (1) on mainshaft (2).



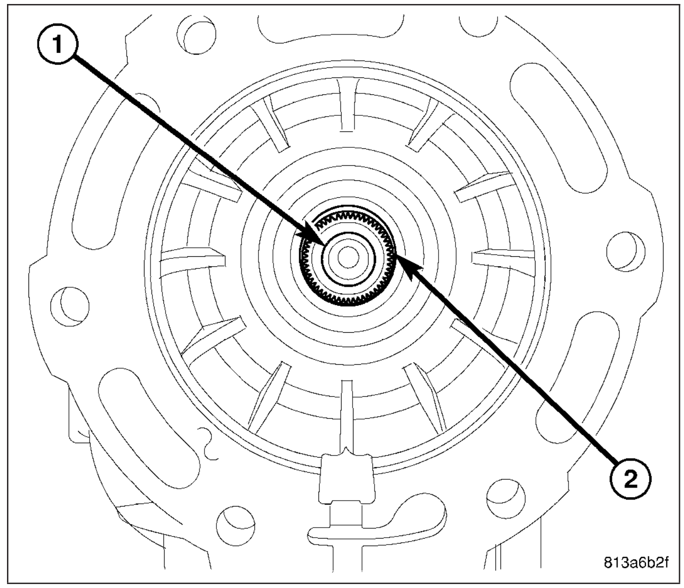
11. Install shift rail (1) support plate (2) bolts and tighten to 8 N·m (71 in. lbs.).



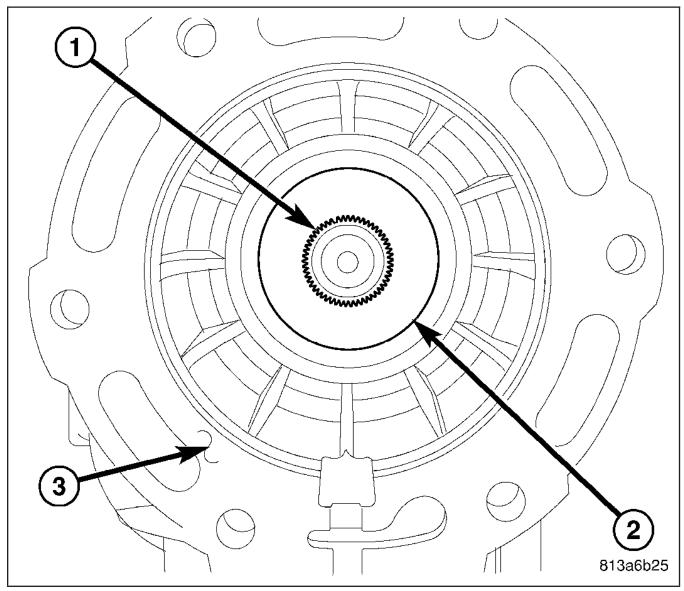
12. Apply MOPAR® Gasket Maker to front housing.
13. Install front housing (1) on rear housing (2) and tighten bolts to 28 N·m (21 ft. lbs.).



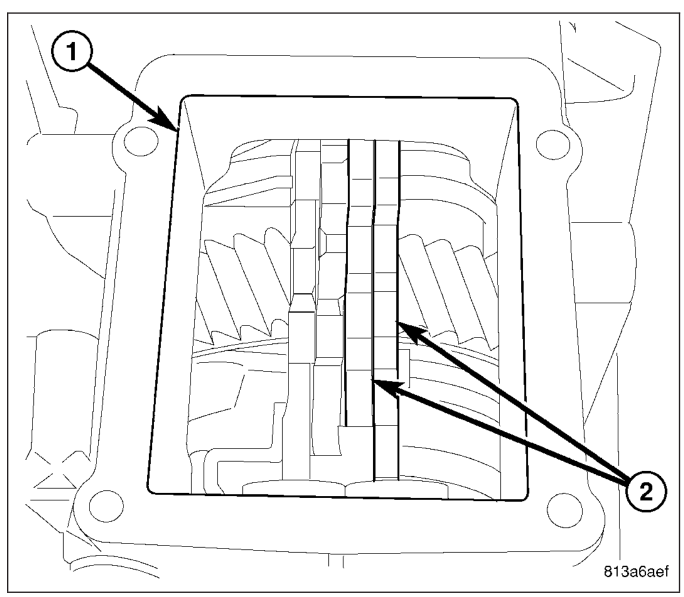
14. Install output shaft (1) snap ring (2) 4x4 only.



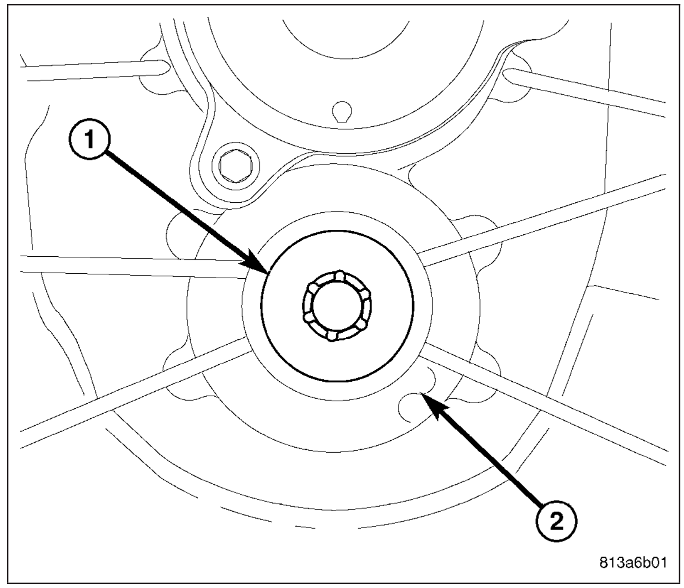
15. Install output shaft (1) seal (2) in rear housing with Installer 9638.



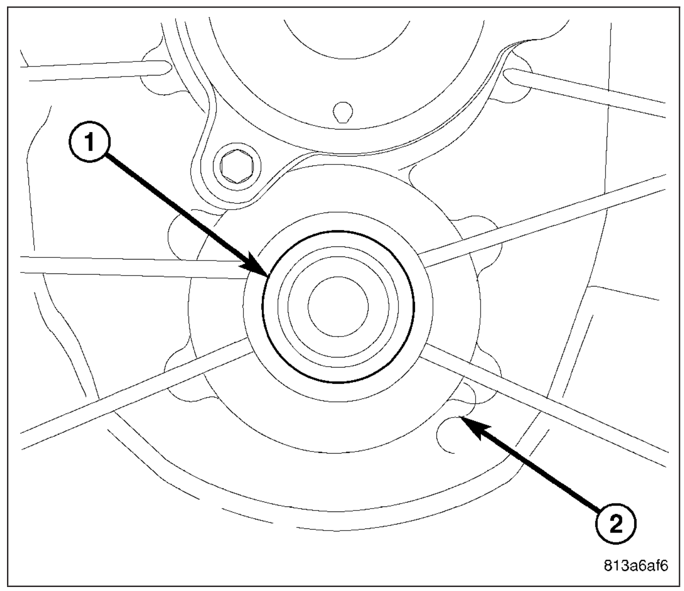
16. Through the shift tower opening (1) move two shift rails (2) forward to lock the transmission in two gear.



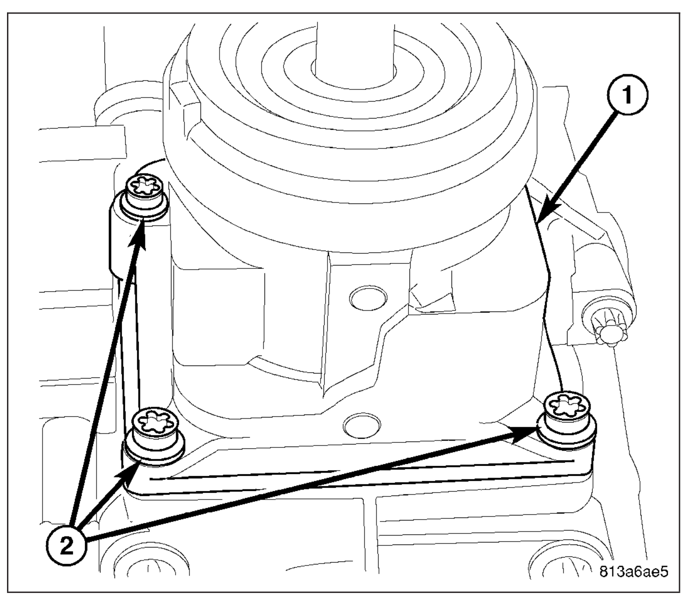
17. Install countershaft bolt (1) into the front housing (2) and tighten to 100 N·m (74 ft. lbs.).



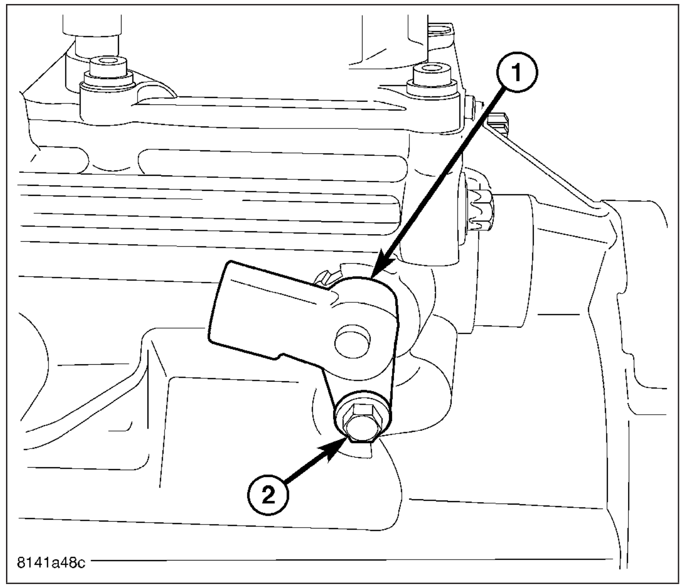
18. Install countershaft plug (1) in front housing (2) with Installer 7829-A and Handle C-4171.



19. Move shift rails to neutral.
20. Apply MOPAR™ Gasket Maker to shift tower (1).
21. Install shift tower (1) and tighten bolts (2) to 14 N·m (10 ft. lbs.).

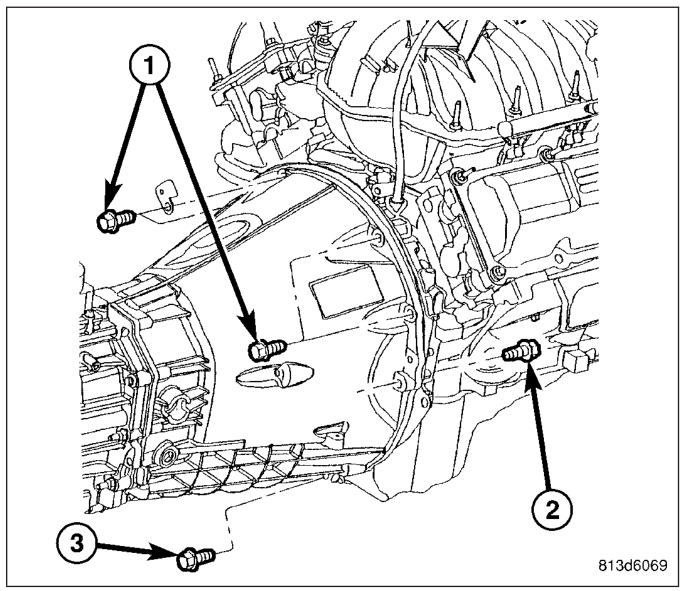


22. Install back up lamp switch (1) and bolt (2).

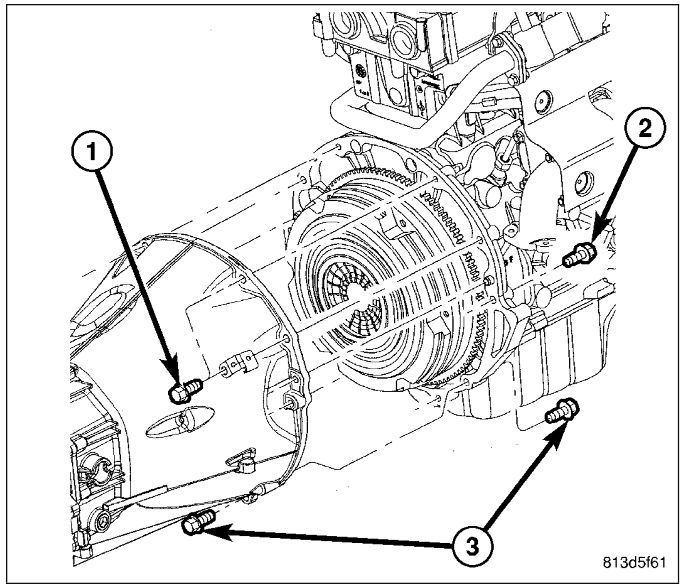


## INSTALLATION

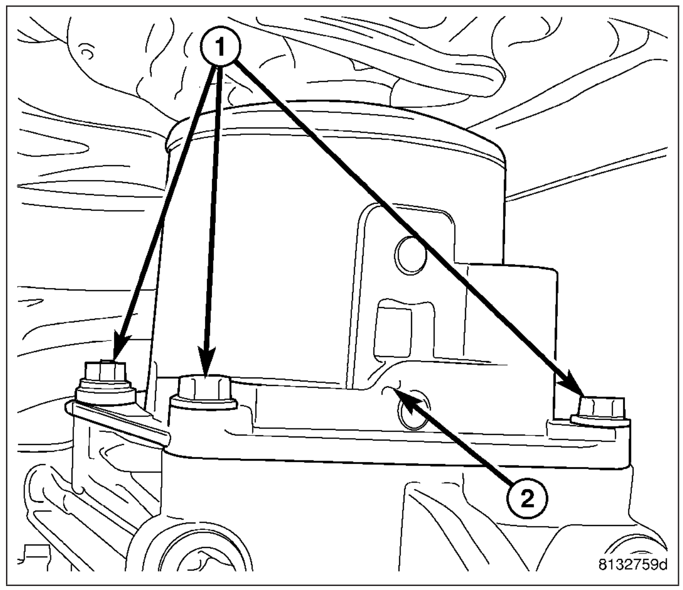
1. Install transmission on engine.
2. On 3.7L engine tighten bolts (1) to 41 N·m (30 ft. lbs.). Tighten bolts (2) to 67 N·m (50 ft. lbs.). Tighten bolts (3) to 54 N·m (40 ft. lbs.).



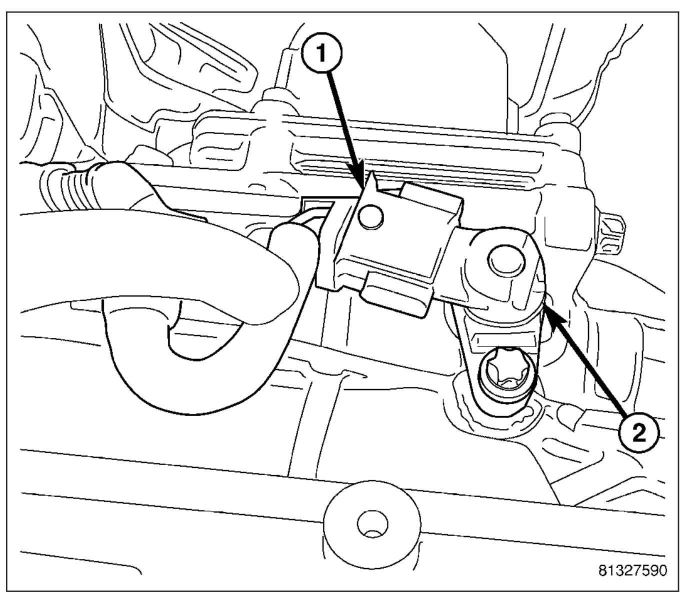
3. On 2.8L diesel engine tighten bolts (1) to 41 N·m (30 ft. lbs.). Tighten bolts (2) to 67 N·m (50 ft. lbs.). Tighten bolts (3) to 54 N·m (40 ft. lbs.).



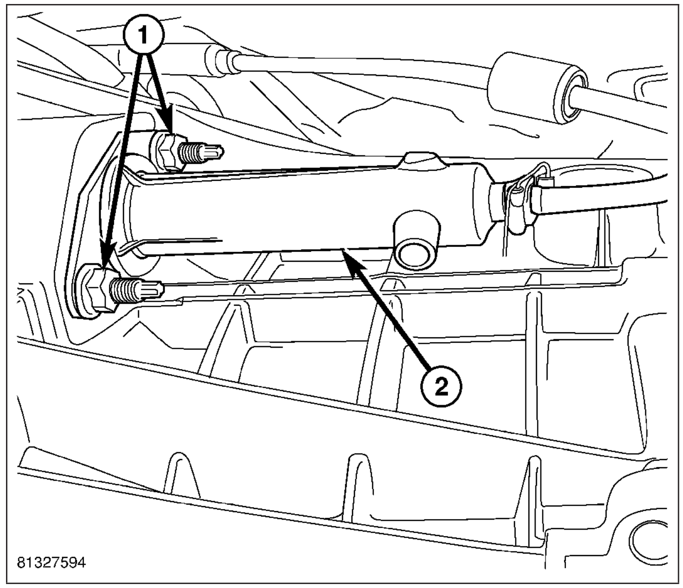
4. Clean shift tower and mating surface then apply Mopar Gasket Maker to shift tower.
5. Install shift tower (2) and tighten bolts (1) to 14 N·m (10 ft. lbs.).
6. Install transmission crossmember and tighten bolts to 47 N·m (35 ft. lbs.). Install transmission mount bolts and tighten to 47 N·m (35 ft. lbs.).



7. Install backup lamp (2) wiring connector (1).



8. Install clutch slave cylinder (2) and mounting nuts (1).
9. Install transfer case and shift linkage, if equipped.
10. Install transfer case wiring connector and vent hose.
11. Install propeller shaft/shafts with reference marks aligned.



12. Remove fill plug (1) and fill transmission to specifications.

# AUTOMATIC TRANSMISSION 42RLE - ELECTRICAL DIAGNOSTICS

## TABLE OF CONTENTS

# AUTOMATIC TRANSMISSION 42RLE - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## P0122-TPS/APP CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set if the monitored TPS voltage drops below .078 volts for the period of 0.48 seconds.

| Possible Causes |
|---|
| RELATED TPS ENGINE DTCS PRESENT |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

### Diagnostic Test

#### 1. DETERMINING IF RELATED ENGINE TPS DTCS ARE PRESENT

With the scan tool, check Engine DTCs, including pending DTCs and one trip failures.

**Are there any Engine TPS DTCs present?**

**Yes** >> Refer to the Driveability category and perform the appropriate diagnostic procedure.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 2

#### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, record the DTC EVENT DATA to help identify the conditions in which the DTC was set.

With the scan tool, erase Transmission DTCs.

**NOTE: To erase EVENT DATA information, a BATTERY DISCONNECT must be performed. Performing a BATTERY DISCONNECT will reset all learned Transmission values to controller defaults which may lead to erratic shift schedules.**

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the DTC EVENT DATA.

With the scan tool, read Transmission DTCs.

**Does this DTC reset?**

**Yes** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Pay particular attention to the TPS signal and sensor ground circuits.

With the scan tool, check the EVENT DATA to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0123-TPS/APP CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set if the monitored TPS voltage rises above 4.94 volts for the period of 0.48 seconds.

| Possible Causes |
|---|
| RELATED TPS ENGINE DTCS PRESENT |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

### Diagnostic Test

#### 1. DETERMINING IF RELATED ENGINE TPS DTCS ARE PRESENT

With the scan tool, check Engine DTCs, including pending DTCs and one trip failures.

**Are there any Engine TPS DTCs present?**

**Yes** >> Refer to the Driveability category and perform the appropriate diagnostic procedure.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 2

#### 2. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, record the DTC EVENT DATA to help identify the conditions in which the DTC was set.

With the scan tool, erase Transmission DTCs.

**NOTE: To erase EVENT DATA information, a BATTERY DISCONNECT must be performed. Performing a BATTERY DISCONNECT will reset all learned Transmission values to controller defaults which may lead to erratic shift schedules.**

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the DTC EVENT DATA.

With the scan tool, read Transmission DTCs.

**Does this DTC reset?**

**Yes** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Pay particular attention to the TPS signal and sensor ground circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0124-TPS/APP INTERMITTENT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set if the monitored TPS throttle angle between the angles of 6° and 120° and the degree change is greater than 5° within a period of less than 7.0 ms.

| Possible Causes |
|---|
| RELATED TPS ENGINE DTCS PRESENT |
| THROTTLE POSITION SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The powertrain controller receives the throttle position signal from the Throttle Position Sensor (TPS). The controller provides the TPS with a 5 volt pull up and a sensor ground. The signal is checked for being out of range as well as for intermittent operation (excessive signal changes). The engine controller transmits the throttle value onto the Bus. Most engine controllers will calculate the throttle value if the throttle signal is lost. If an error is detected by the transmission controller and the throttle value is available on the Bus, the Bus value will be used, normal operation will continue, and a TPS code will be set. If an error is detected and the throttle value is not available on the Bus, normal operation will be discontinued, a TPS DTC will be set, and the MIL will be turned on after 5 minutes of calculated operation.

## Diagnostic Test

### 1. CHECK IF RELATED ENGINE TPS DTCS ARE PRESENT

With the scan tool, check Engine DTCs, including pending DTCs and one trip failures.

**Are there any Engine TPS DTCs present?**

**Yes** >> Refer to the Driveability category and perform the appropriate diagnostic procedure.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, record the DTC EVENT DATA to help identify the conditions in which the DTC was set.

With the scan tool, erase Transmission DTCs.

**NOTE: To erase EATX EVENT DATA information, a BATTERY DISCONNECT must be performed. Performing a BATTERY DISCONNECT will reset all learned Transmission values to controller defaults which may lead to erratic shift schedules.**

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the EVENT DATA.

With the scan tool, read Transmission DTCs.

**Does this DTC reset?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK THE THROTTLE POSITION SENSOR OPERATION

Ignition on, engine not running.

With the scan tool, under Transmission Sensors, monitor the TPS voltage in the following step.

Slowly open and close the throttle while checking for erratic voltage changes.

**Did the TPS voltage change smooth and consistent?**

**Yes** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Replace the Throttle Position Sensor per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Pay particular attention to the TPS signal and sensor ground circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running.
- **Set Condition:**
  Immediately when a Overheat shift schedule is activated when the Transmission Oil Temperature reaches 155° C or 240° F.

| Possible Causes |
|---|
| ENGINE COOLING SYSTEM OPERATION |
| TRANSMISSION OIL COOLER PLUGGED |
| HIGH TEMPERATURE OPERATIONS ACTIVATED |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

If the transmission oil temperature rises above 115° C (240° F), the overheat shift schedule is activated refer to Transmission Operation as a function of Transmission Oil Temperature and the code is set. The DTC is an informational code only and is being set to aid the technician in determining root cause of a customer driveability issue. The code is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler should be added to the vehicle if the customer regularly drives in a manner that overheats the transmission. Extended operation above 115° C (240° F) will reduce the durability of the transmission and should be avoided. Correcting the cooling system malfunction or installing an additional transmission oil cooler will improve transmission durability especially for customers who operate in city/construction stop and go traffic, tow trailers regularly, drive aggressively in low gear or drive regularly in mountainous areas.

### Diagnostic Test

#### 1. CHECK ENGINE COOLING SYSTEM

Perform Engine Cooling System diagnostics per the Service Information.

**Is the Engine Cooling System functioning properly?**

**Yes** >> Go To 2

**No** >> Repair the cause of the engine overheating. Refer to the Service Information for the related diagnostic or repair procedures.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

#### 2. TRANSMISSION OIL COOLER RESTRICTED

Check the Transmission Oil Cooler Flow in accordance with the Service Information.

**Is the transmission oil cooler restricted or plugged?**

**Yes** >> Go To 3

**No** >> Repair the cause of the plugged Transmission Oil Cooler as necessary and repair or replace the Transmission Oil Cooler per the Service Information.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 3. HIGH TEMPERATURE OPERATION

This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints.

This DTC indicates that the transmission has been operating in the ″Overheat″ shift schedule which may generate a customer complaint.

The customer driving patterns may indicate the need for an additional transmission oil cooler.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

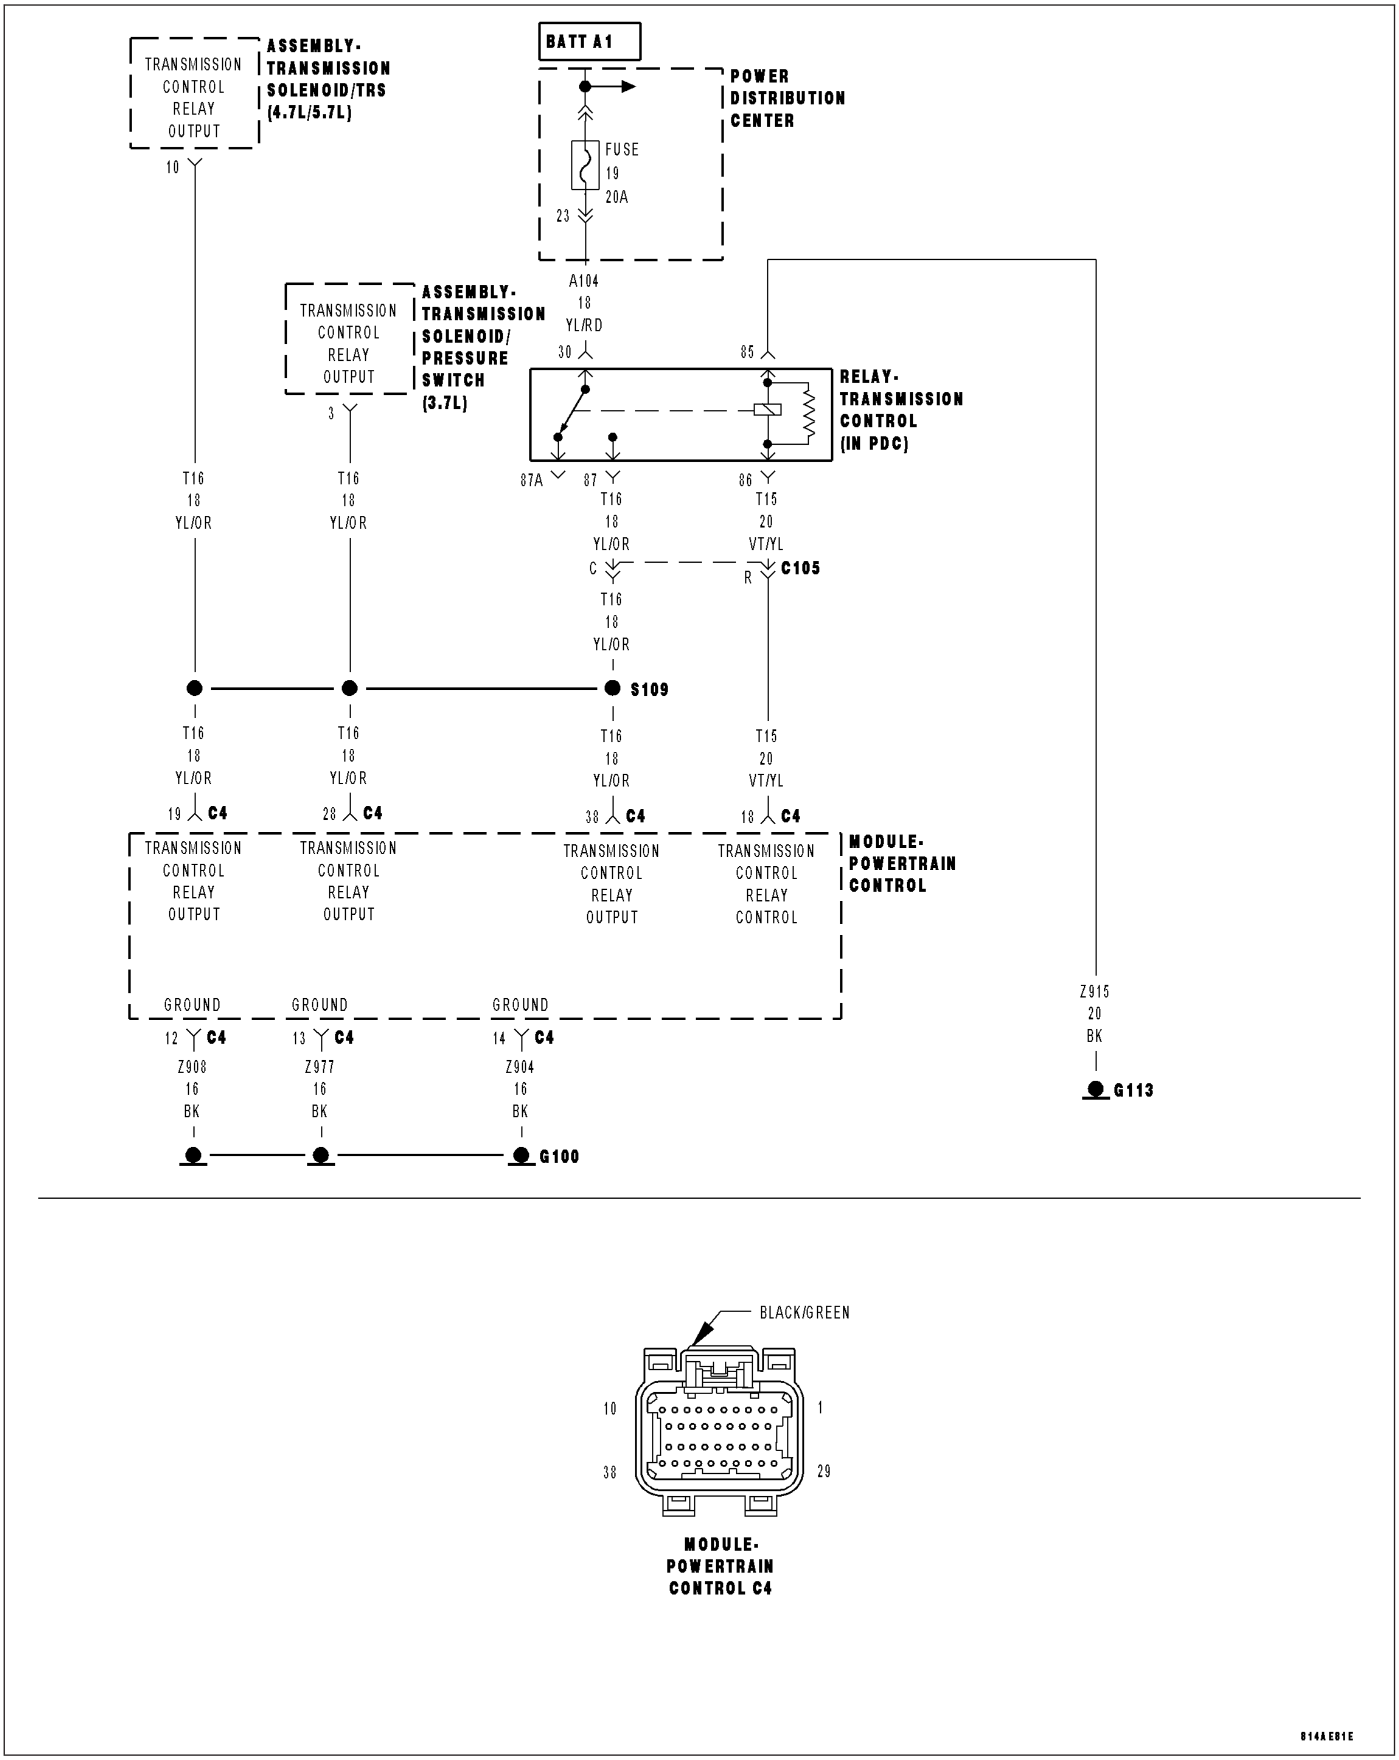
**If there are no possible causes remaining, view repair.**

**Repair**

Repair the cause of transmission overheating per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0562-BATTERY VOLTAGE LOW



*42RLE MINI PWR GND CKTS*

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running and the PCM has closed the Transmission Control Relay.
- **Set Condition:**
  If the battery voltage of the Transmission Control Relay Output Sense circuit(s) to the PCM is less than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will also set if the battery voltage sensed at the PCM is less than 6.5 volts for 200ms or when Transmission Control Relay Output circuits are less than 7.2 volts for 200ms.

| Possible Causes |
|---|
| RELATED CHARGING SYSTEM DTC'S |
| (Z908) OR (Z977) GROUND CIRCUIT OPEN OR HIGH RESISTANCE |
| (A104) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT TO TCM OPEN OR HIGH RESISTANCE |
| TRANSMISSION CONTROL RELAY |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Transmission damage may occur if there is insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

## Diagnostic Test

### 1. CHECK FOR RELATED CHARGING SYSTEM DTC'S

With the scan tool, read the Engine DTC's.

**Are there any Charging System related DTCs present?**

**Yes** >> Refer to the Charging System category and repair any Charging System DTCs before proceeding. After repairing the Charging System DTCs, perform the Transmission Verification test to verify the transmission and or controller was not damaged.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

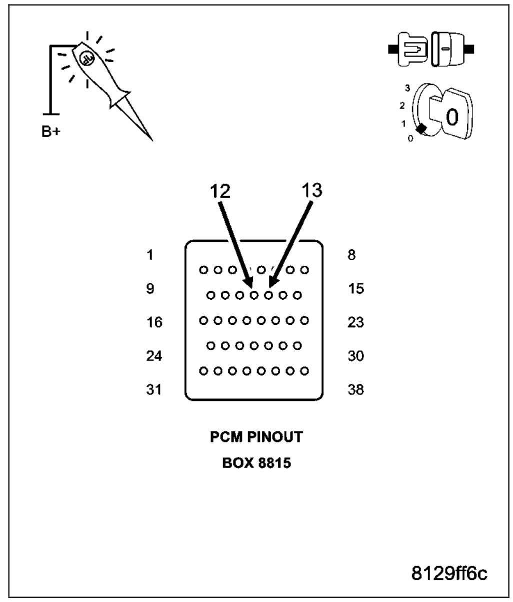
**NOTE: Generator, battery, and charging system must be fully functional before performing this test.**
With the scan tool, read DTCs.

**Is the status for this DTC Active or the STARTS SINCE SET counter set at 0?**

**Yes** >> Go To 3

**No** >> Go To 7

## 3. CHECK THE (Z908) AND (Z977) GROUND CIRCUITS FOR AN OPEN



Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Using a 12-volt test light connected to 12-volts, check the (Z908) and (Z977) Ground circuits in the appropriate terminals of Miller tool #8815.

**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

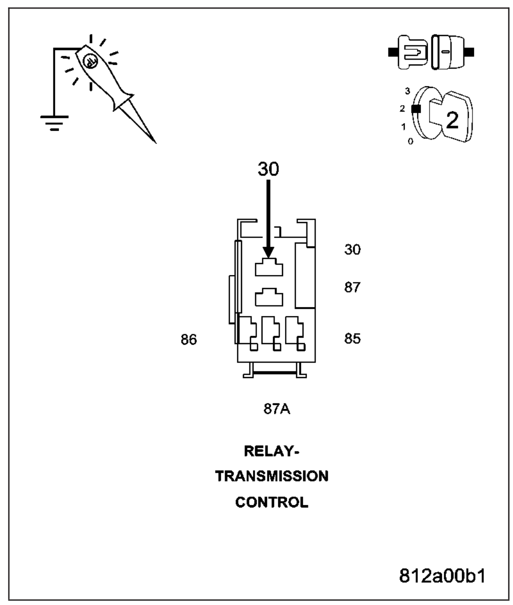
**Does the test light illuminate brightly for all the Ground circuits?**

**Yes** >> Go To 4

**No** >> Repair the (Z908) and/or (Z977) Ground circuit for an open circuit or high resistance.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 4. CHECK THE (A104) FUSED B+ CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check the (A104) Fused B+ circuit in the Transmission Control Relay connector.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (A104) Fused B+ circuit for an open or high resistance.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

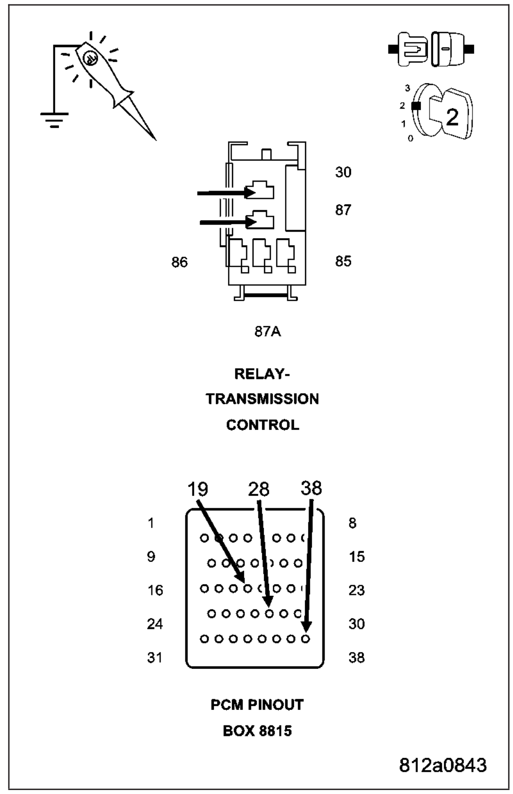
## 5. CHECKING THE (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Connect a jumper wire between (A104) Fused B+ circuit and the (T16) Transmission Control Relay Output circuit.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check all (T16) Transmission Control Relay Output circuits in the appropriate terminal of Miller tool #8815.



**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (T16) Transmission Control Relay Output circuit(s) for an open or high resistance.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 6. CHECK THE TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

Install a substitute Relay in place of the Transmission Control Relay.

Start the engine.

Using a voltmeter, measure the battery voltage.

With the scan tool, monitor the Transmission Switched Battery Voltage.

Compare the scan tool Transmission Switched Battery voltage to the actual battery voltage.

**Is the scan tool voltage within 2.0 volts of the battery voltage?**

**Yes** >> Replace the Transmission Control Relay.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorts and open circuits.

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Check for generic software is made at power-up.
- **Set Condition:**
  If generic software is found, the MIL will light immediately. This DTC is designed to signal the technician that the controller still has generic software installed.

| Possible Causes |
|---|
| PCM - PROGRAMMING ERROR |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

The controller is programmed during manufacturing with generic software to facilitate testing. This software does not have the proper calibrations to control a transmission in a vehicle. The check for generic software is made at power-up. If generic software is found, the MIL will light immediately and the MIL will stay on even if the fault is cleared, until the proper software is installed. Note: Transmission will be placed in limp-in mode.

### Diagnostic Test

#### 1. CONTROL MODULE PROGRAMMING ERROR

**NOTE: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.**

Record the controller part number.

Update the controller with the correct software in accordance with the Service Information.

**Verify that the controller updated successfully.**

**Test Complete**

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0604-INTERNAL CONTROL MODULE RAM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  One time after the ignition key is turned to the run position.
- **Set Condition:**
  The read value does not match the written value in any RAM location.

| Possible Causes |
|---|
| PCM - INTERNAL ERROR |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

After the controller is reset, the microprocessor checks the integrity of each RAM location by writing to it and reading back from it. The read value should be the same as the written value. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

### Diagnostic Test

#### 1. PCM - INTERNAL ERROR

**If there are no possible causes remaining, view repair.**

**Repair**

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0605-INTERNAL CONTROL MODULE ROM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  One time after the ignition key is turned to the run position.
- **Set Condition:**
  If the ROM checksum does not match a known constant.

| Possible Causes |
|---|
| PCM - INTERNAL ERROR |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

After the controller is reset, the microprocessor checks the integrity of the program memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum should be the same as a known constant stored in memory. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

### Diagnostic Test

#### 1. PCM - INTERNAL ERROR

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0613-INTERNAL TRANSMISSION PROCESSOR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  After the ignition key is turned to the run position and 60 seconds thereafter.
- **Set Condition:**
  Either of the following conditions occur 3 times in less than 590 milliseconds: The watchdog line remains high after the watchdog test or the transmission relay coil is energized and remains on after the watchdog delay expires.

| Possible Causes |
|---|
| PCM - INTERNAL ERROR |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

The internal watchdog is a separate hardware circuit which continuously monitors the microprocessor. To make sure the transmission is operating properly, the watchdog must receive a signal from the microprocessor within a specific time window. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

### Diagnostic Test

1. **PCM - INTERNAL ERROR**

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

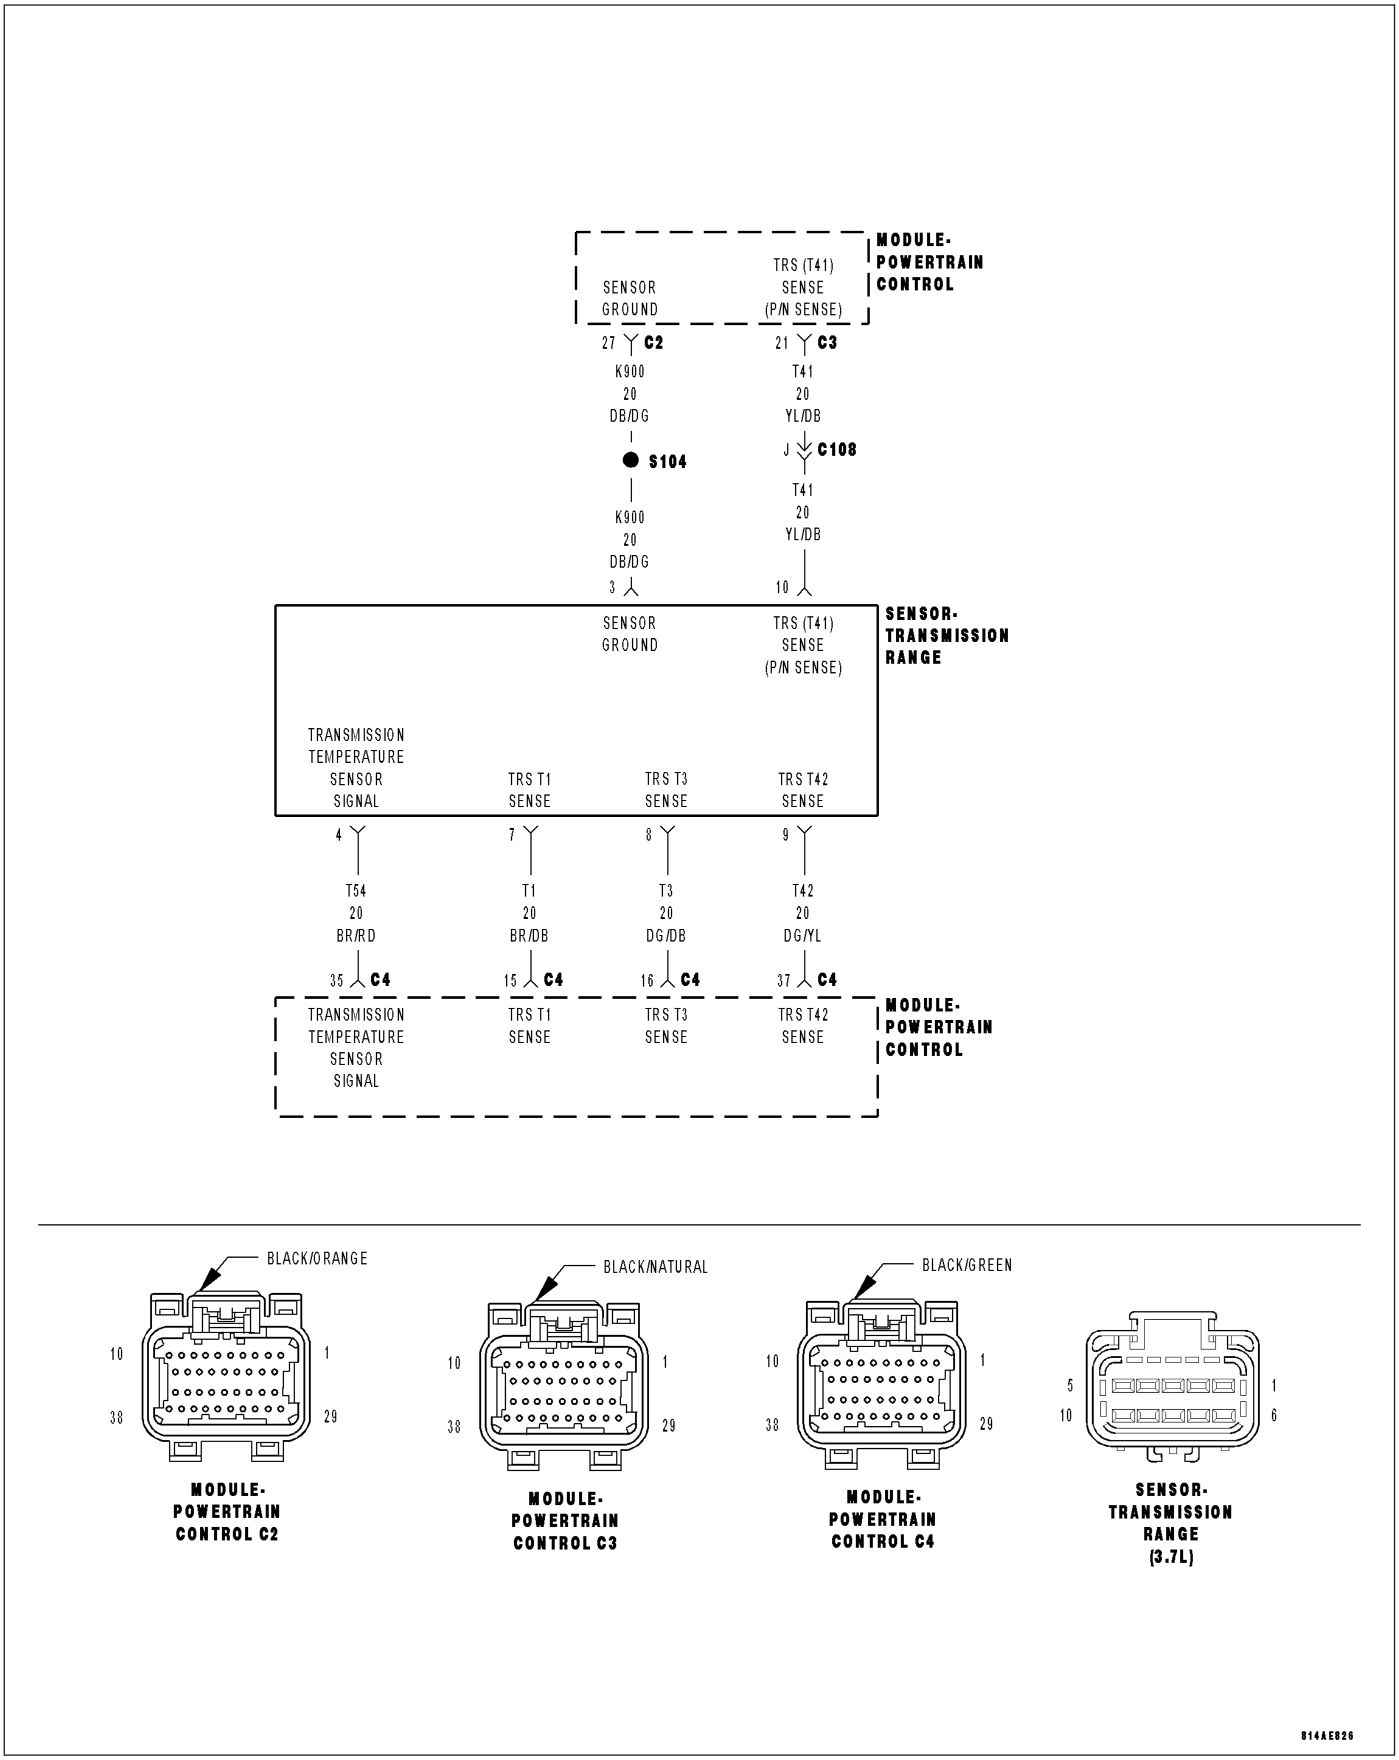
**If there are no possible causes remaining, view repair.**

**Repair**

Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0706-TRANSMISSION RANGE SENSOR RATIONALITY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on.
- **Set Condition:**
  The DTC will set if the controller detects an invalid PRNDL code which lasts for more than 0.042 seconds.

| Possible Causes |
|---|
| SHIFTER OUT OF ADJUSTMENT |
| TRS SENSE CIRCUIT OPEN |
| TRS SENSE CIRCUIT SHORT TO GROUND |
| TRS SENSE CIRCUIT SHORT TO VOLTAGE |
| METAL DEBRIS IN OIL PAN |
| TRANSMISSION RANGE SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The C1 through C4 (T1, T3, T41, and T42) sense circuits communicate the shift lever position to the PCM. Each circuit is terminated at the transmission with a switch. Each switch can be either open or closed, depending on the shift lever position. The PCM can decode this information and determine the shift lever position. Each shift lever position has a certain combination of switches, which will be open and closed, this is called a PRNDL code. There are 4 switches, therefore: there are many possible combinations of open and closed switches (codes). However, there are only 9 valid codes (8 for AutoStick), one for each gear position and three recognized between gear codes. The remainder of the codes should never occur, these are called invalid codes. The following chart shows the normal switch states for each shift lever position.

**TRS SWITCH STATES**

| SLP | T42 | T41 | T3 | T1 |
|---|---|---|---|---|
| **P** | CLOSED | CLOSED | CLOSED | OPEN |
| **R** | CLOSED | OPEN | OPEN | OPEN |
| **N** | CLOSED | CLOSED | OPEN | CLOSED |
| **OD** | OPEN | OPEN | OPEN | CLOSED |
| **3** | OPEN | OPEN | CLOSED | OPEN |
| **L** | CLOSED | OPEN | CLOSED | CLOSED |

## Diagnostic Test

### 1. CHECK TO SEE IF P0706 DTC IS CURRENT

With the scan tool, perform the Shift Lever Position Test.

**Select the test outcome from the following:**

**Test passes:**
Go To 6

**Test fails with Error Code:**
Go To 2

**Test fails without Error Code:**
Perform the Gearshift Adjustment Procedure per the Service Information.
Perform the PRNDL Fault Clearing Procedure – Go To 7

## 2. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, perform the Shift Lever Position Test.

When the scan tool instructs you to put the Gear Selector in a particular position, you must do so using the selector switch on the Transmission Simulator.

The LED for the gear position in question must be illuminated on the Transmission Simulator prior to pressing ″ENTER″ on the scan tool.

**NOTE: When the scan tool requests the O/D off button be depressed, you must use the O/D OFF button in the vehicle or you will fail the Shift Lever Position Test with an error code 11 or OD-TOW/HALL STUCK OPEN.**

**NOTE: If the Shift Lever Position test fails, make sure to note the identification of the TRS Sense circuit for future reference.**

**Did the Shift Lever Position test pass?**

**Yes** >> Remove the Oil Pan and Main Valve Body Assembly per the Service Information. Check for metal debris on top of the TRS Assembly. If debris is present, determine the cause of the debris and repair the transmission as necessary. If no problems are found, replace the Transmission TRS Assembly per the Service Information.

Perform the PRNDL Fault Clearing Procedure – Go To 7

**No** >> Go To 3

## 3. TRS SENSE CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM harness connectors and install Miller tool #8815.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the identified (T1, T3, T41, or T42) TRS Sense circuit, from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of Miller tool #8815.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the identified (T1, T3, T41, or T42) TRS Sense circuit for an open.

Perform the PRNDL Fault Clearing Procedure – Go To 7

**No** >> Go To 4

## 4. TRS SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the identified (T1, T3, T41, or T42) TRS Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the identified (T1, T3, T41, or T42) TRS Sense circuit for a short to ground.
Perform the PRNDL Fault Clearing Procedure – Go To 7

**No** >> Go To 5

## 5. TRS SENSE CIRCUIT SHORT TO OTHER CIRCUITS

Measure the resistance between the identified (T1, T3, T41, or T42) TRS Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

**Is the resistance below 100k ohms between the identified (T1, T3, T41, or T42) TRS Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the identified (T1, T3, T41, or T42) TRS Sense circuit for a short to other circuit(s).
Perform the PRNDL Fault Clearing Procedure – Go To 7

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.
Perform the PRNDL Fault Clearing Procedure – Go To 7

## 6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the PRNDL Fault Clearing Procedure – Go To 7

**No** >> Test Complete.

## 7. PRNDL FAULT CLEARING PROCEDURE

With the scan tool, erase Transmission DTCs.

Cycle the ignition off, then start the vehicle.

Firmly apply the brakes and shift into Overdrive.

**NOTE: Vehicle must remain in Overdrive for at least 3.0 seconds.**

With the brakes firmly applied, shift slowly through all gears (PRNDL) as least three times, pausing momentarily in each gear.

**NOTE: If all the PRNDL lights box individually then the error was cleared.**

Shift into park and turn the ignition off to the lock position.

Ignition on, engine not running.

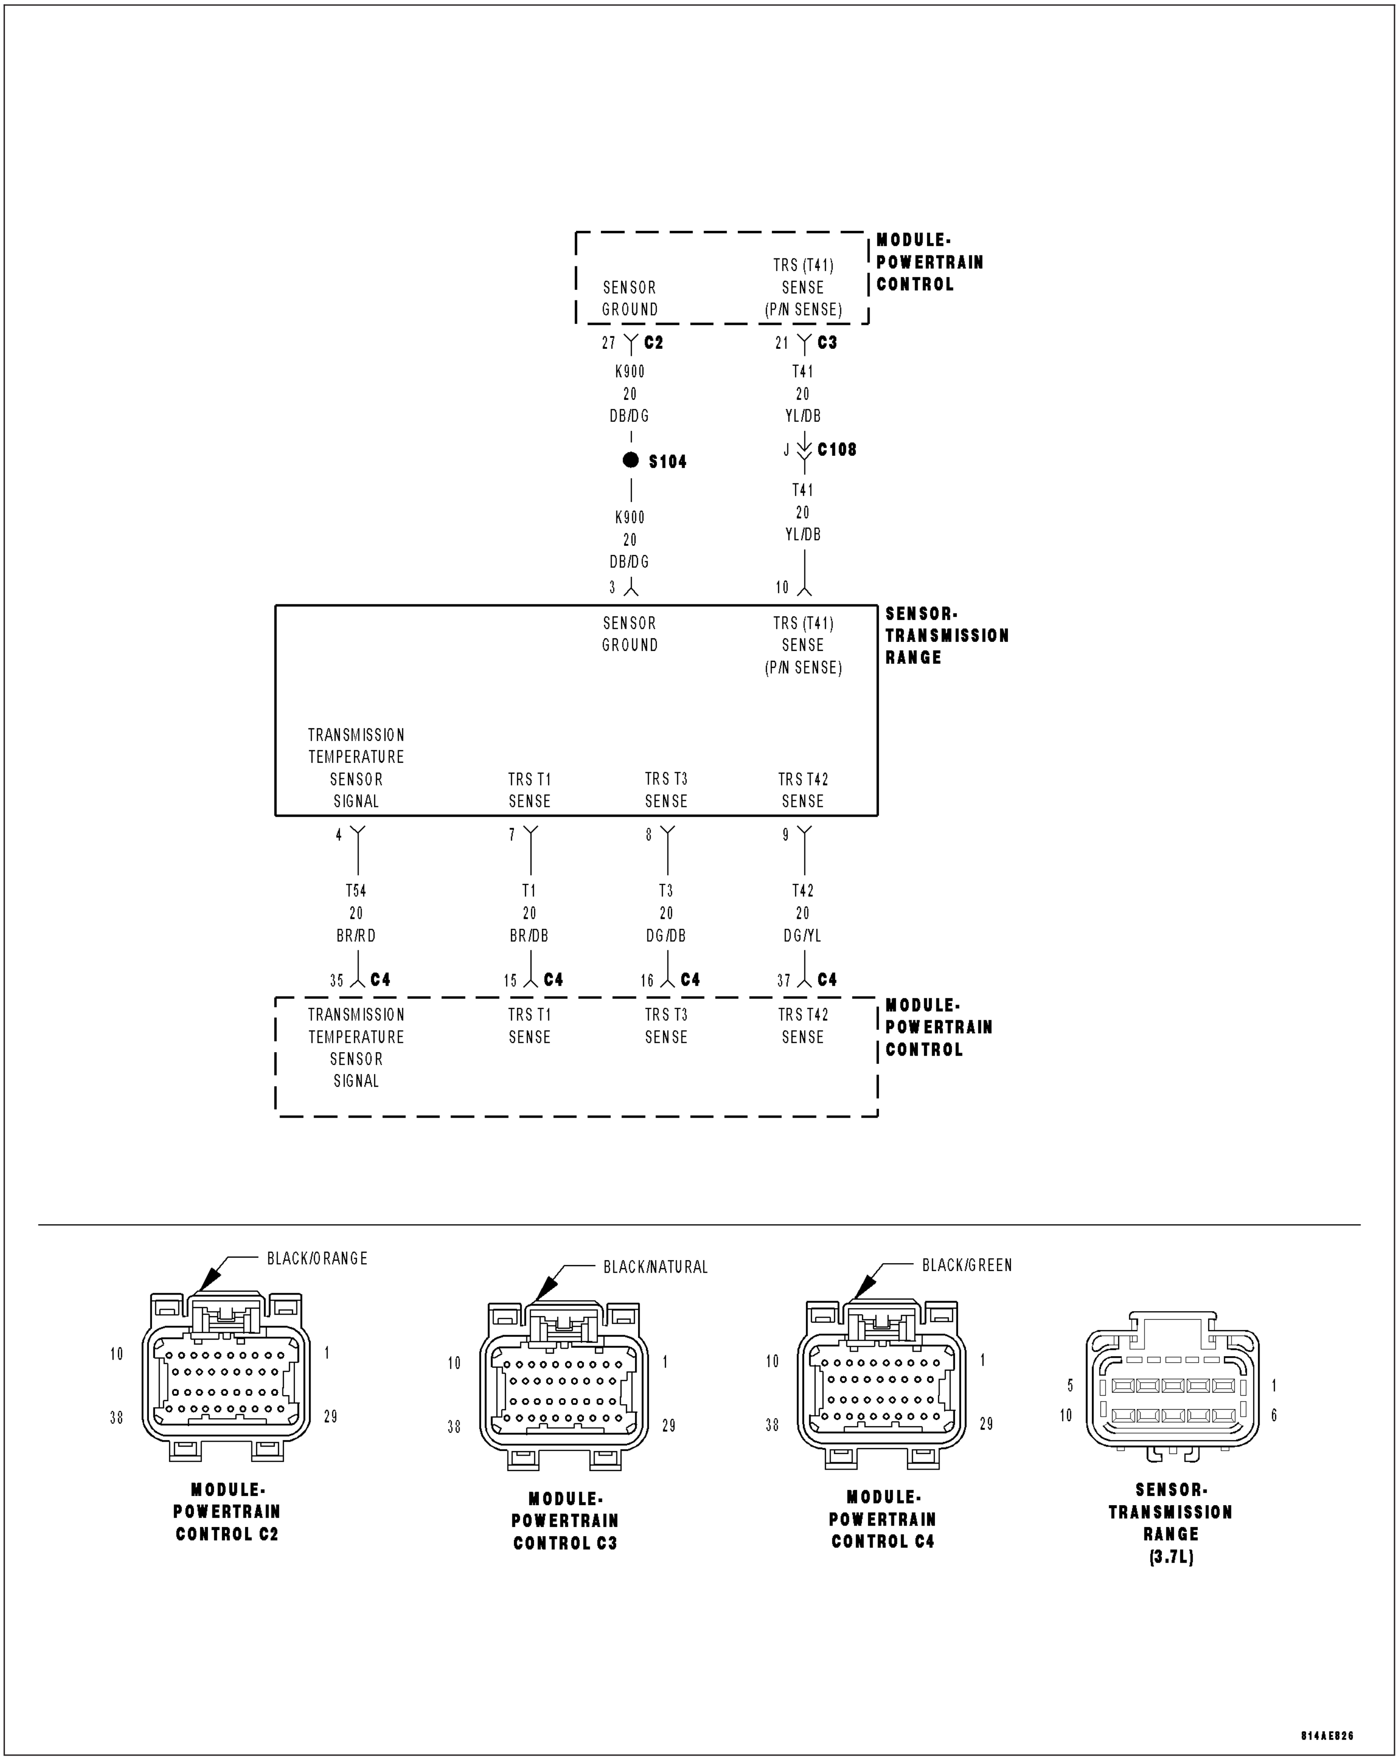
With the scan tool, read Transmission DTCs.

**Does the DTC P0706 reset, or do all the PRNDL indicators remain boxed in park or neutral?**

**Yes** >> Return to the symptom list and perform diagnostics for P0706.
Go To 1

**No** >> Test Complete.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  DTC will set when the transmission temperature does not reach a normal operating temperature within a given time frame. Time is variable due to ambient temperature. Approximate DTC set time is 10 to 35 minutes. The following are starting temperature to warm up times to set this DTC: starting temperature -40° C (-40° F) warm up time 35 minutes, starting temperature -28° C ( -20° F) 25 minutes, starting temperature -6.6° C (20° F) 20 minutes, starting temperature 15.5 ° C (60° F) 10 minutes. When the fault is set, calculated temperature is substituted for measured temperature, however the DTC is stored only after three consecutive occurrences.

| Possible Causes |
|---|
| RELATED TRANSMISSION TEMPERATURE DTC'S PRESENT |
| TRANSMISSION TEMPERATURE SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

## Diagnostic Test

### 1. DETERMINE IF RELATED TRANSMISSION TEMPERATURE DTCS ARE PRESENT

With the scan tool, check Transmission DTCs.

**Are there any other Transmission Temperature Sensor related DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure.

**No** >> Go To 2

### 2. CHECK TO SEE IF DTC IS ACTIVE

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**
Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

**Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 volts?**

**Yes** >> Replace Transmission Solenoid/TRS Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins and S.T.A.R. ON-LINE for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

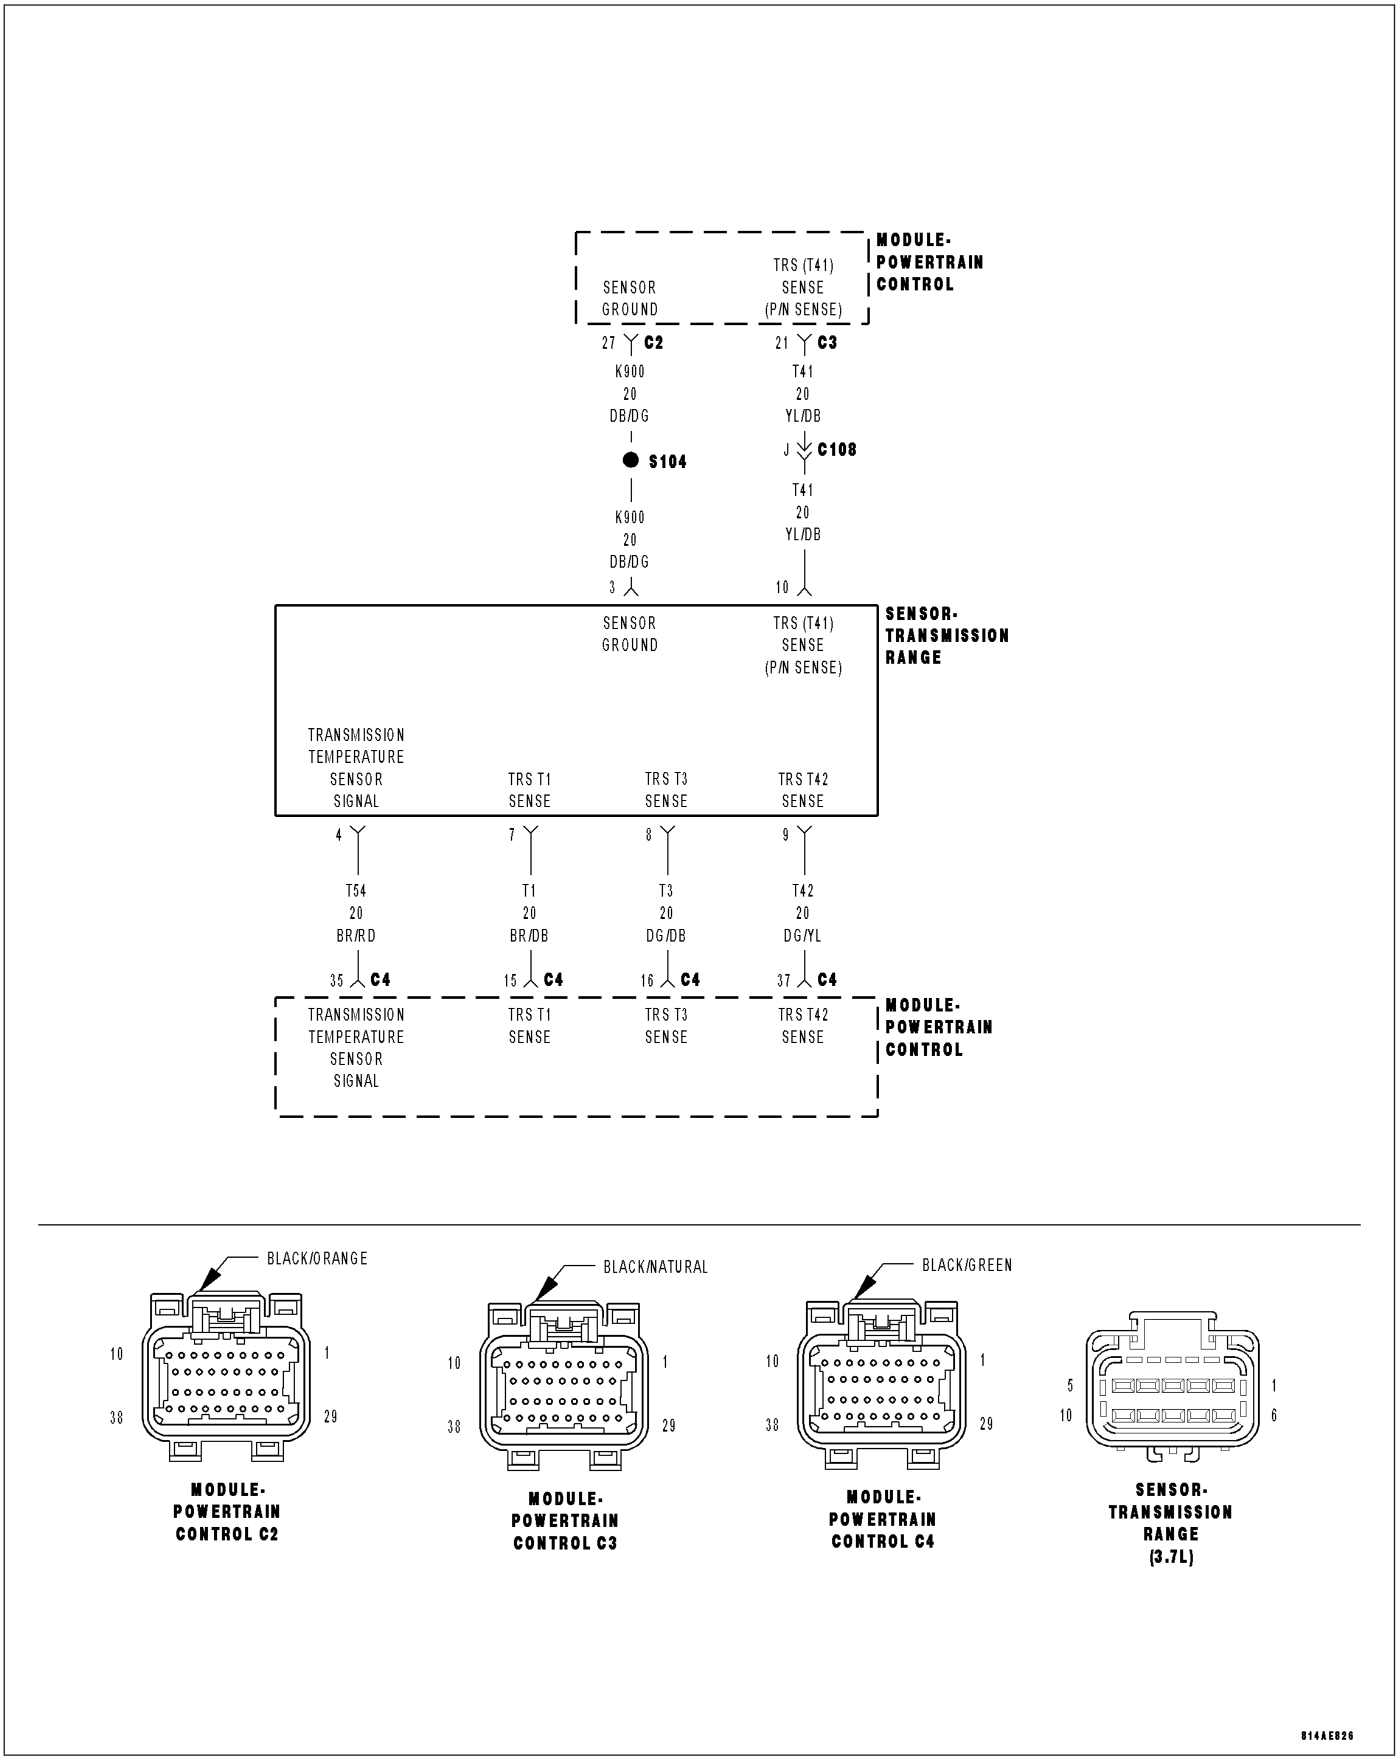
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0712-TRANSMISSION TEMPERATURE SENSOR LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  The DTC will set when the monitored Temperature Sensor voltage drops below 0.078 volts for the period of 1.45 seconds. When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

| Possible Causes |
|---|
| RELATED DTCS PRESENT |
| (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND |
| TRANSMISSION TEMPERATURE SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

## Diagnostic Test

### 1. DETERMINE IF RELATED DTCS ARE PRESENT

With the scan tool, check Transmission DTCs.

**Are there any Speed Sensor DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING)

**No** >> Go To 2

### 2. CHECK TO SEE IF DTC IS ACTIVE

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 5

### 3. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay is to prevent a Transmission NO RESPONSE condition and to disable the starter.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A.

**NOTE: Check connectors - Clean/repair as necessary.**

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

**Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 volts?**

**Yes** >> Replace Transmission Solenoid Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

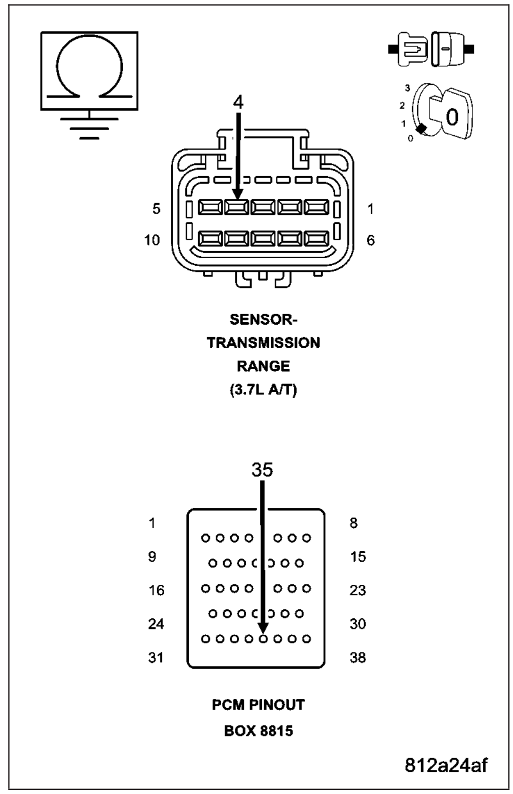
Disconnect the PCM C4 harness connector.

Disconnect the TRS harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Tool #8815 to perform diagnosis.**

Measure the resistance between ground and the (T54) Transmission Temperature Sensor Signal circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

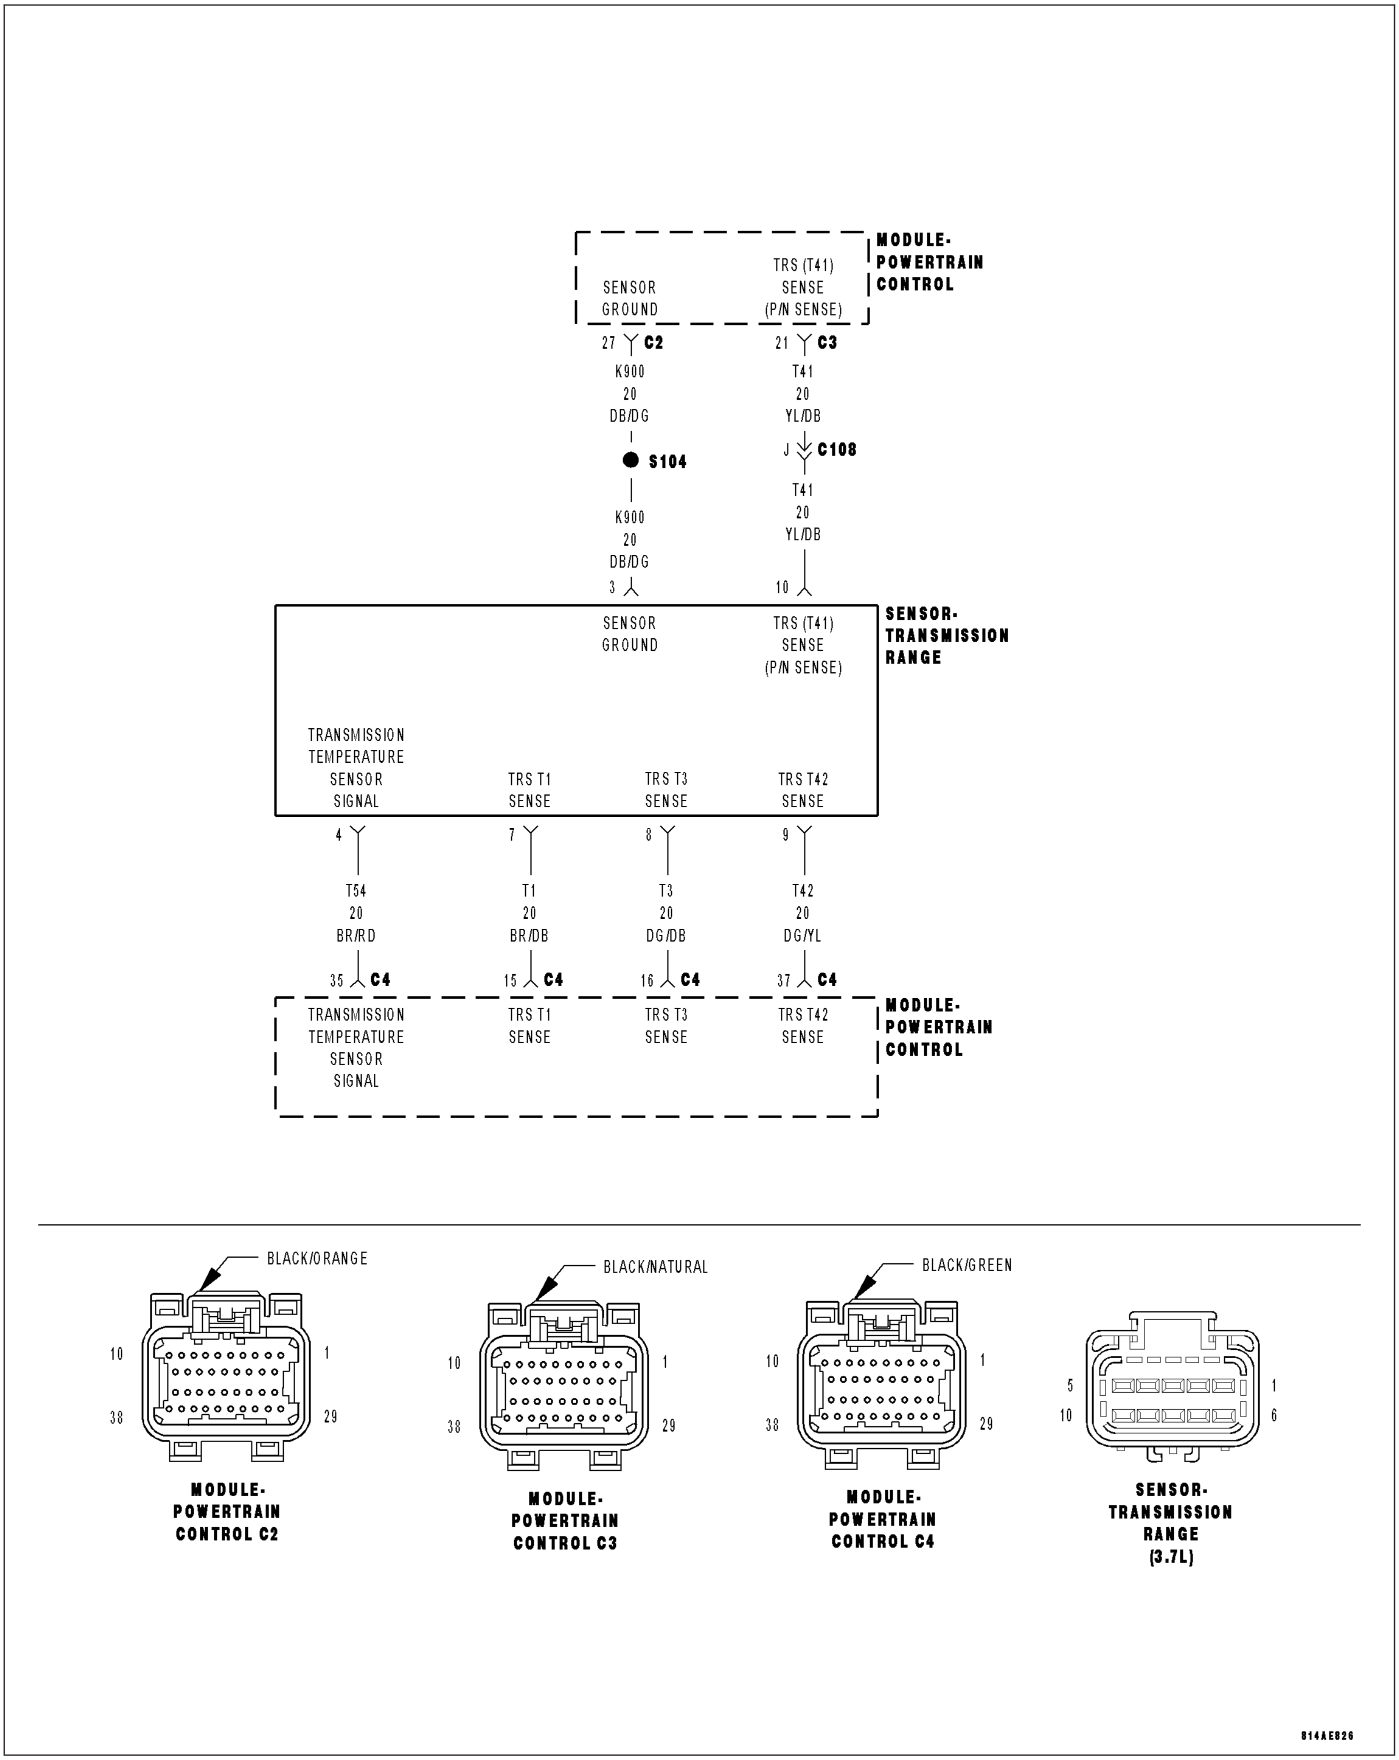
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0713-TRANSMISSION TEMPERATURE SENSOR HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for the period of 1.45 seconds. When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

| Possible Causes |
|---|
| (K900) SENSOR GROUND OPEN |
| (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN |
| (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION TEMPERATURE SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

### 1. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 2

**No** >> Go To 6

### 2. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay is to prevent a Transmission NO RESPONSE condition and to disable the starter.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A.

**NOTE: Check connectors - Clean/repair as necessary.**

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

**Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 volts?**

**Yes** >> Replace Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

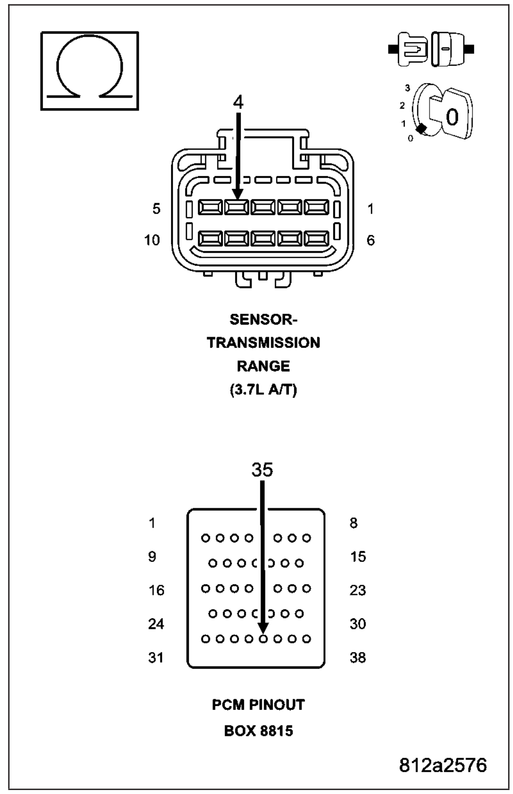
Disconnect the PCM C4 harness connector.

Disconnect the TRS harness connector

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Tool #8815 to perform diagnosis.**

Measure the resistance of the Transmission Temperature Sensor Signal circuit between the appropriate terminal of Miller tool #8815 and the TRS harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Transmission Temperature Sensor Signal circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

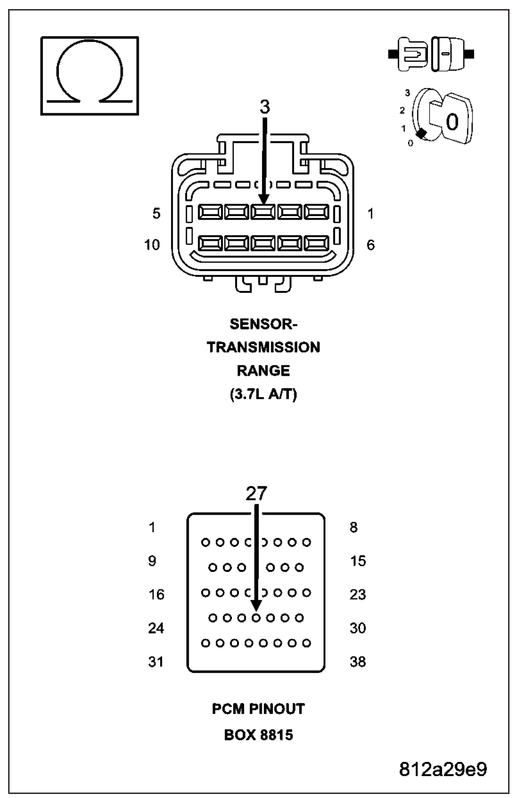
**No** >> Go To 4

## 4. CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN

Disconnect the PCM C2 harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance of the (K900) Sensor Ground circuit between the appropriate terminal of Miller tool #8815 and the TRS harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (K900) Sensor Ground circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

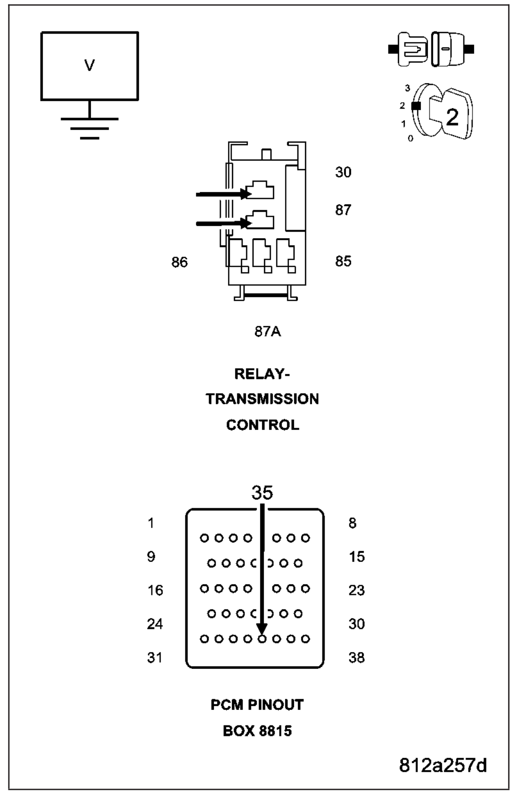
Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between the (A104) Fused B+ circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T54) Transmission Temperature Sensor Signal circuit in the appropriate terminal of Miller tool #8815.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

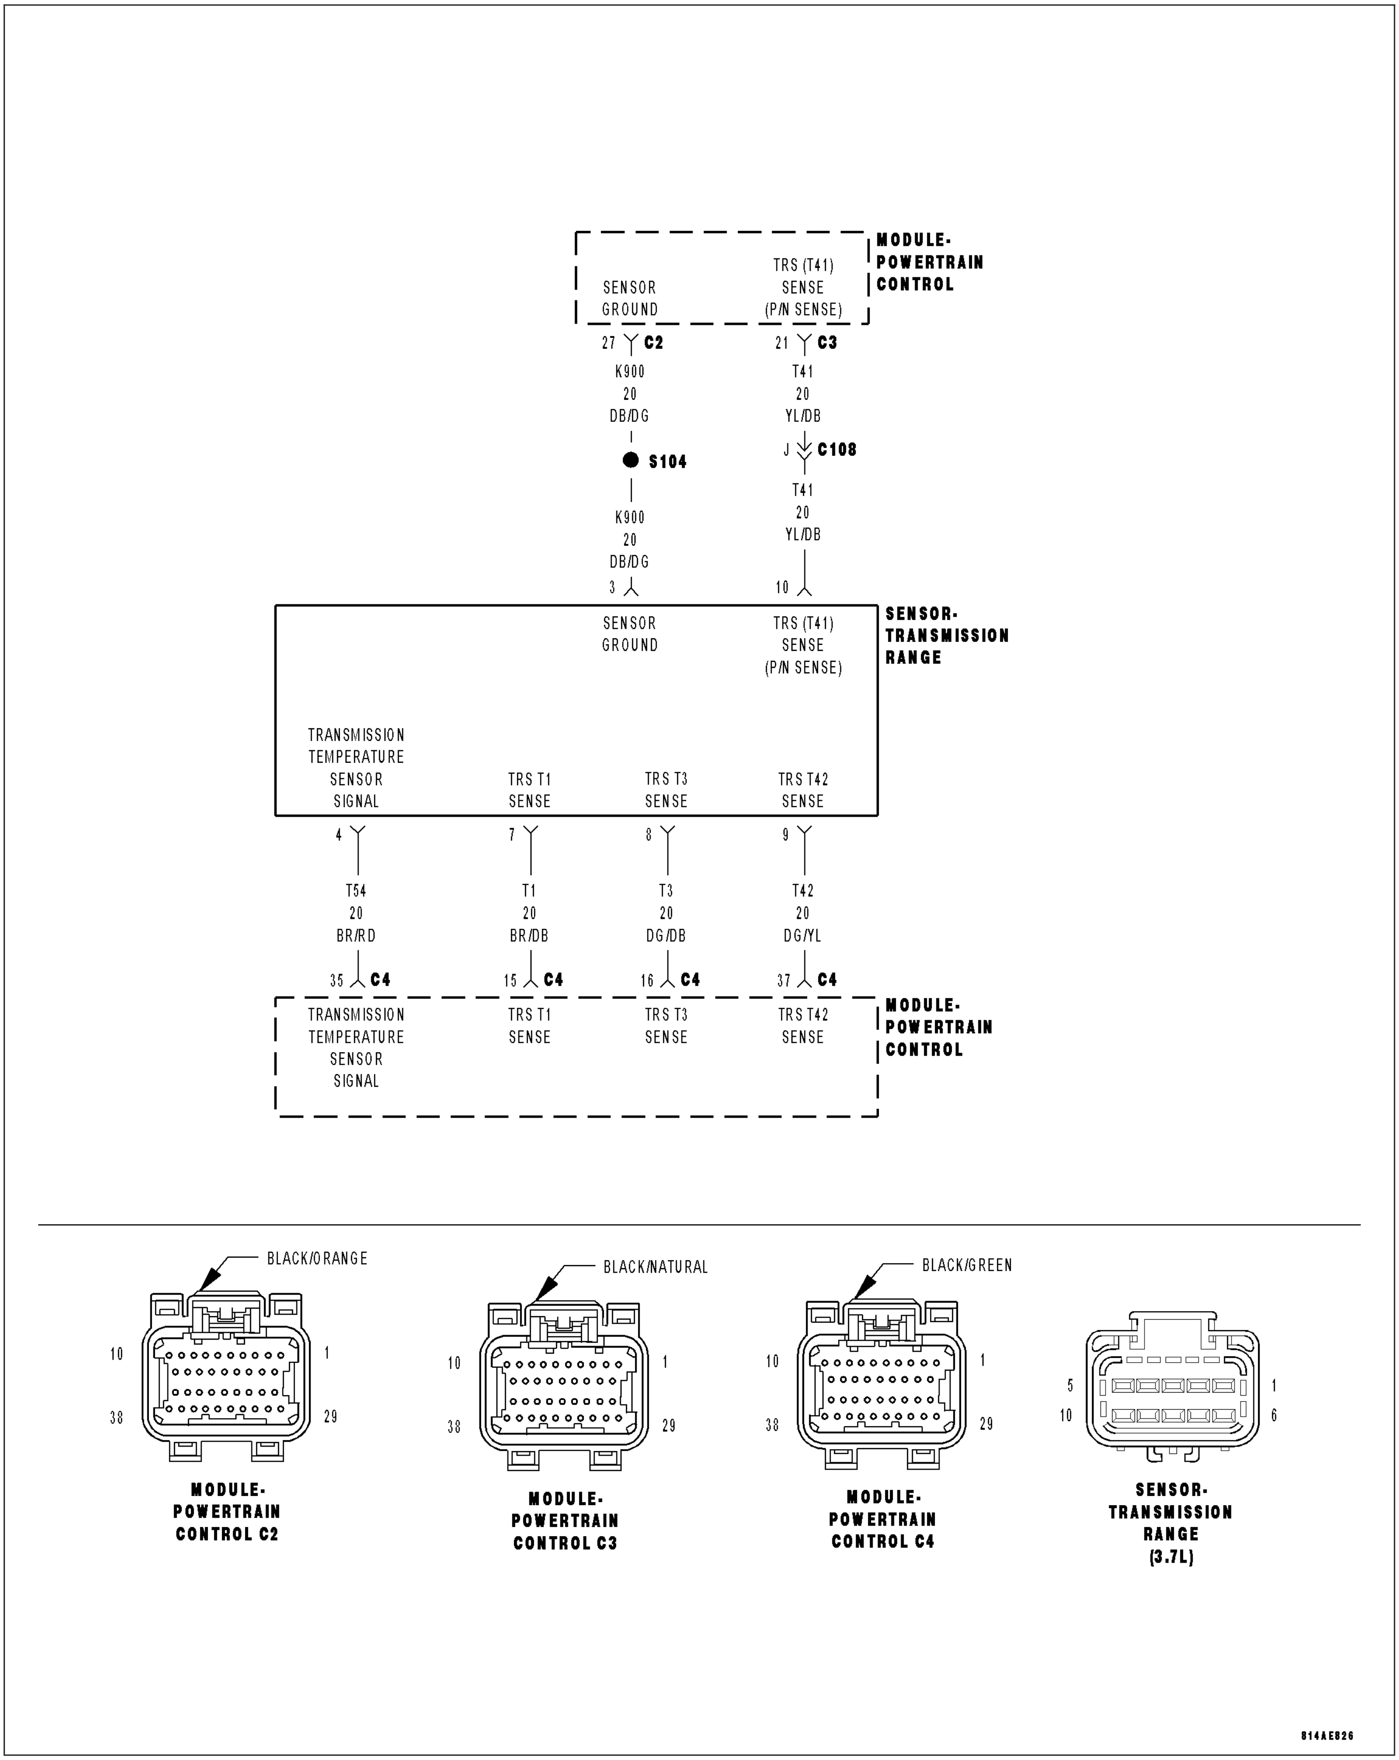
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0714-TRANSMISSION TEMPERATURE SENSOR INTERMITTENT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  The DTC will set when the monitored Temperature Sensor voltage fluctuates or changes abruptly within a predetermined period of time.

| Possible Causes |
|---|
| TRANSMISSION TEMPERATURE SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

### 1. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 2

**No** >> Go To 3

### 2. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool , monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

**Do the readings on the Transmission Simulator match a non-fluctuating scan tool reading ± 0.2 volts?**

**Yes** >> Replace Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool , check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

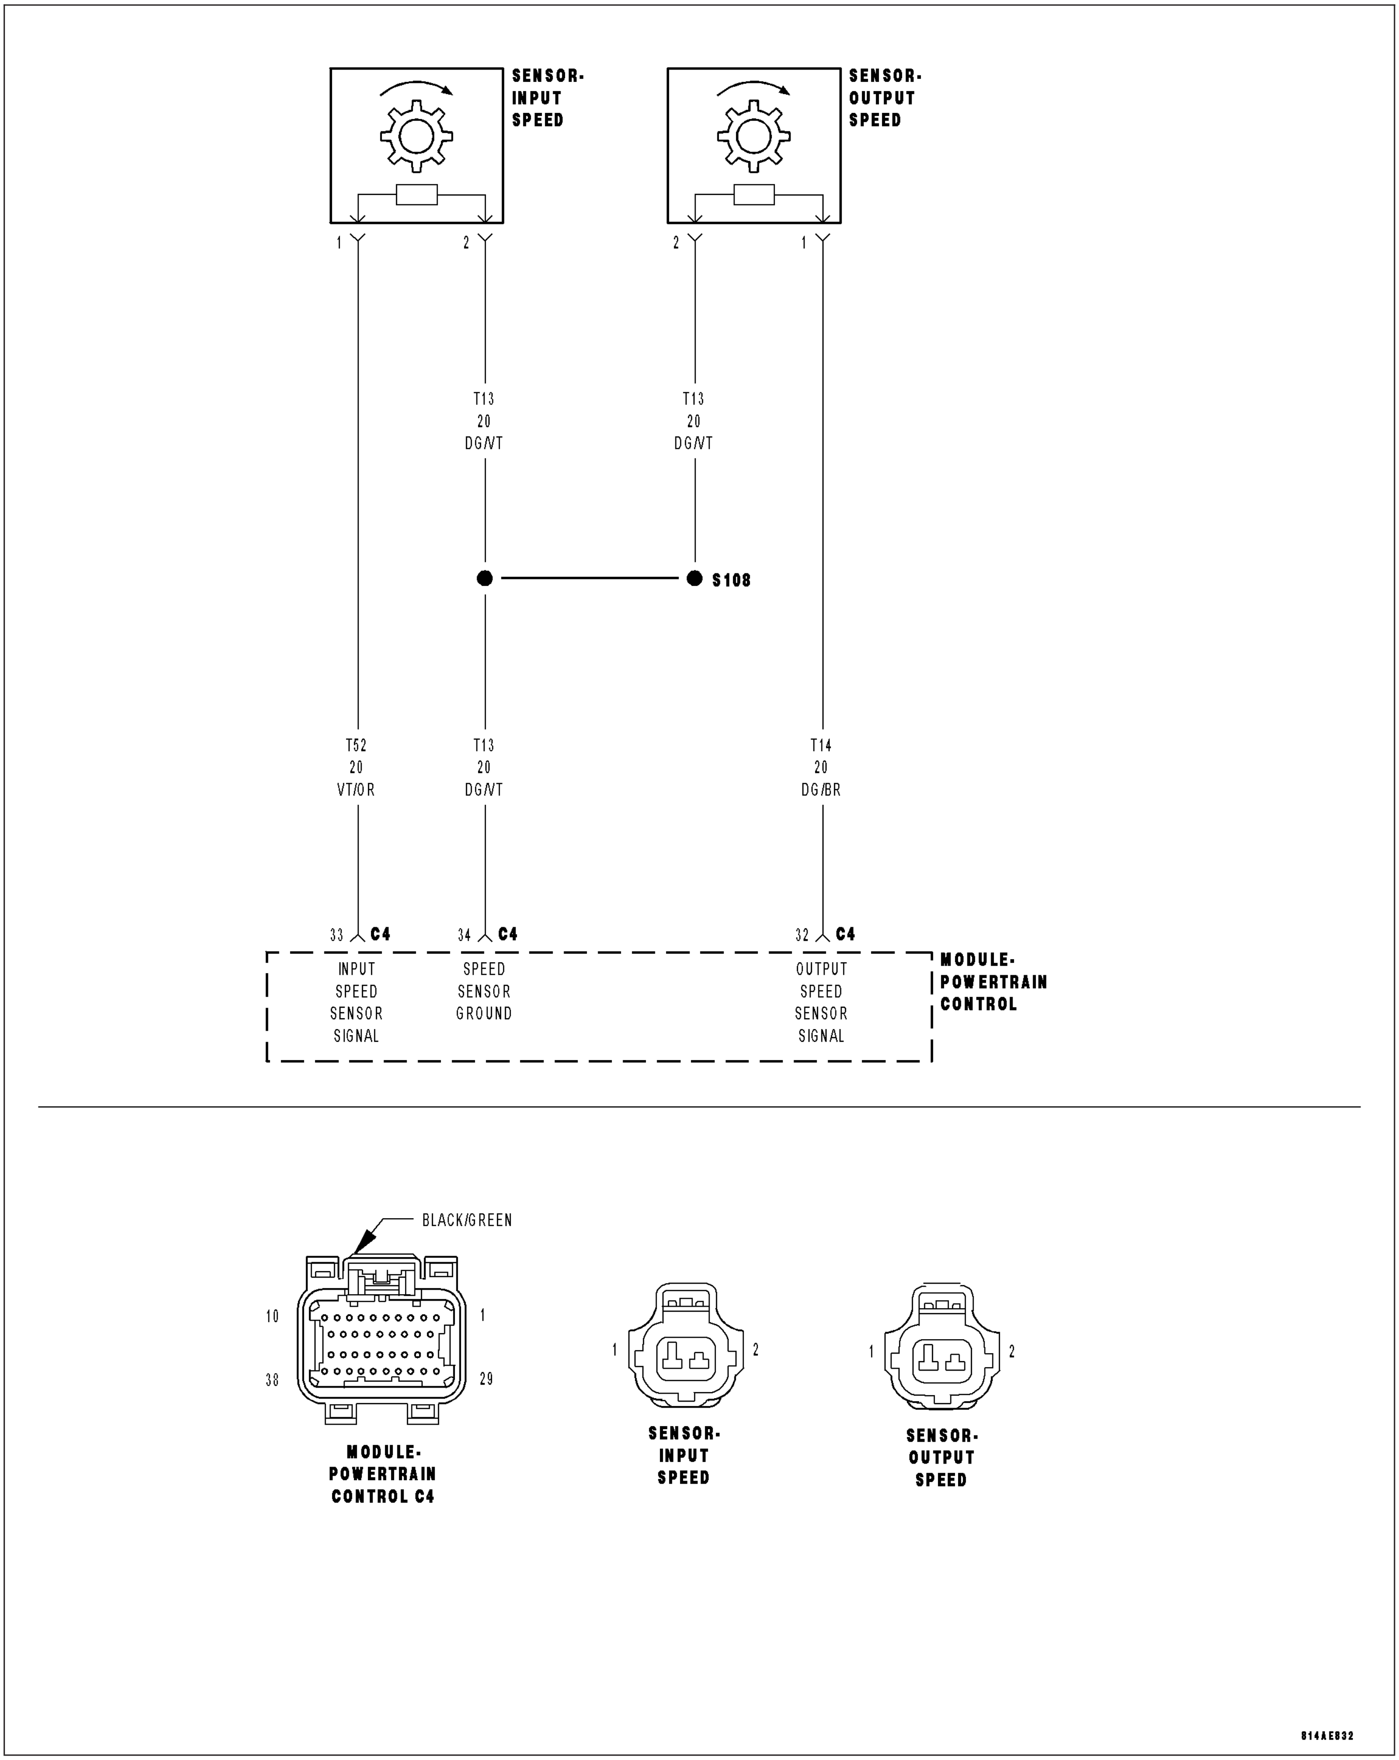
Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0715-INPUT SPEED SENSOR 1 CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If there is an excessive change in the Input RPM in any valid gear (R, 1st, 2nd, 3rd, or 4th).

| Possible Causes |
|---|
| (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN |
| (T13) SPEED SENSOR GROUND CIRCUIT OPEN |
| (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND |
| (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE |
| (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE |
| INPUT SPEED SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission control system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through system checks.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0715 IS CURRENT

Start the engine.

Place the shifter in park.

With the scan tool , read the Input Speed Sensor RPM.

**Is the Input Speed Sensor reading below 400 RPM?**

**Yes** >> Go To 2

**No** >> Go To 8

### 2. CHECK THE PCM AND WIRING WITH THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, set the ″Input/Output Speed″ switch to ″ON″ and the rotary switch to the ″3000/1250″ position.

With the scan tool, read the Input and Output RPM.

**Does the Input speed read 3000 RPM and the Output speed read 1250 RPM ± 50 RPM?**

**Yes** >> Replace the Input Speed Sensor per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN

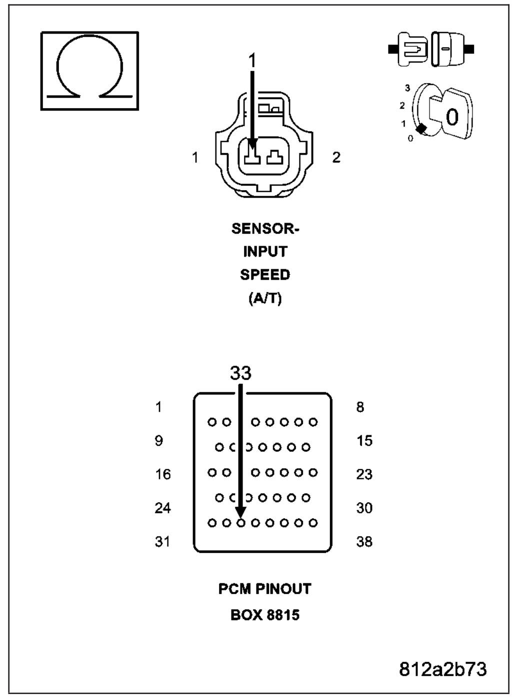
Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Input Speed Sensor harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T52) Input Speed Sensor Signal circuit between the Input Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.



**Is the resistance above 5.0 ohms?**

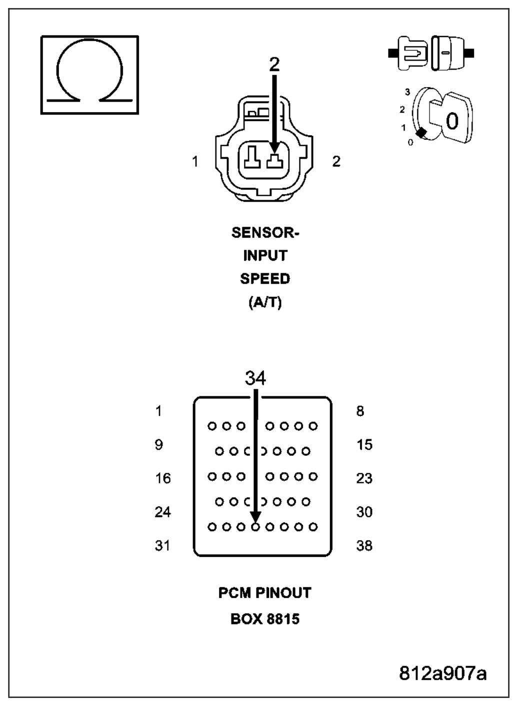
**Yes** >> Repair the (T52) Input Speed Sensor Signal circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (T13) Speed Sensor Ground circuit between the Input Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

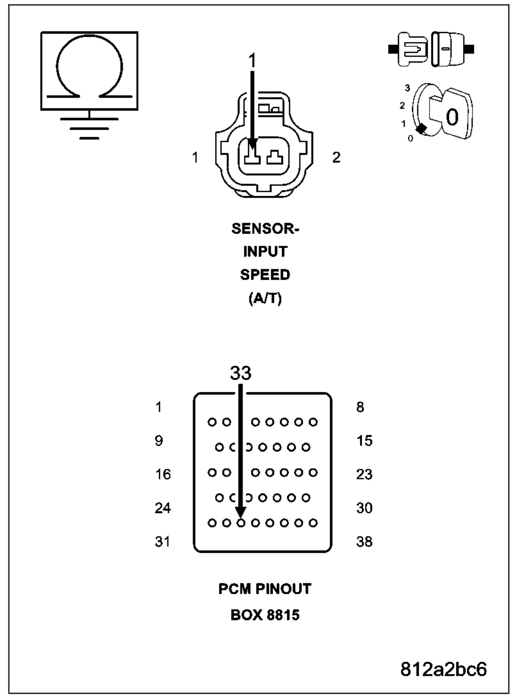
Measure the resistance between ground and the (T52) Input Speed Sensor Signal circuit.

**Is the resistance Below 5.0 ohms?**

**Yes** >> Repair the (T52) Input Speed Sensor Signal circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6



## 6. CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Output Speed Sensor harness connector.

Remove the Transmission Control Relay.

Connect a jumper wire between the (A104) Fused B(+) circuit and (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

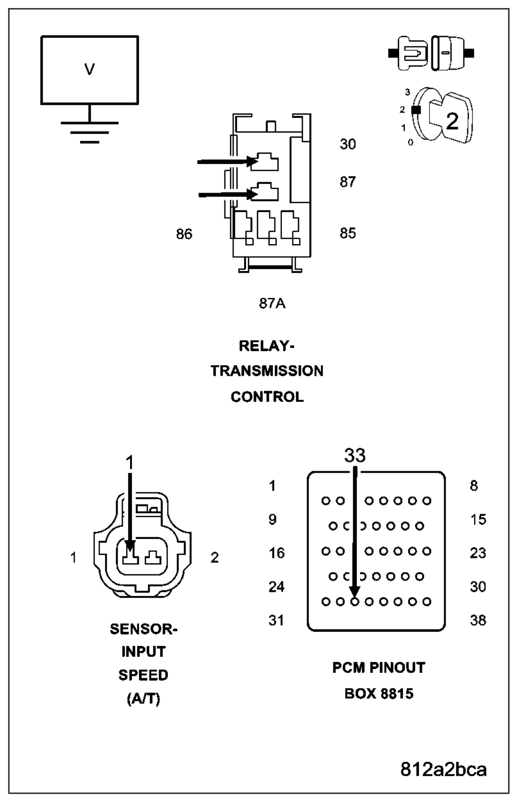
Measure the voltage of the (T52) Input Speed Sensor Signal circuit.

**Is the voltage above 0.5 volt?**

**Yes** >> Repair the (T52) Input Speed Sensor Signal circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

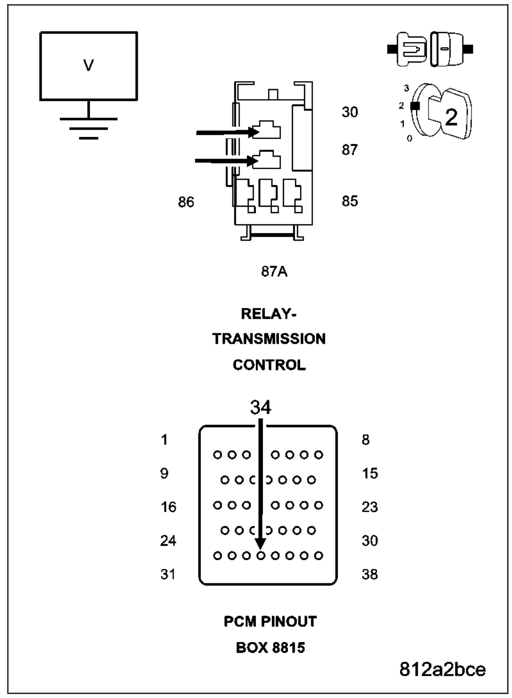
**No** >> Go To 7



## 7. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE

**NOTE: The jumper wire must still be connected.**

Measure the voltage of the (T13) Speed Sensor Ground circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool , check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

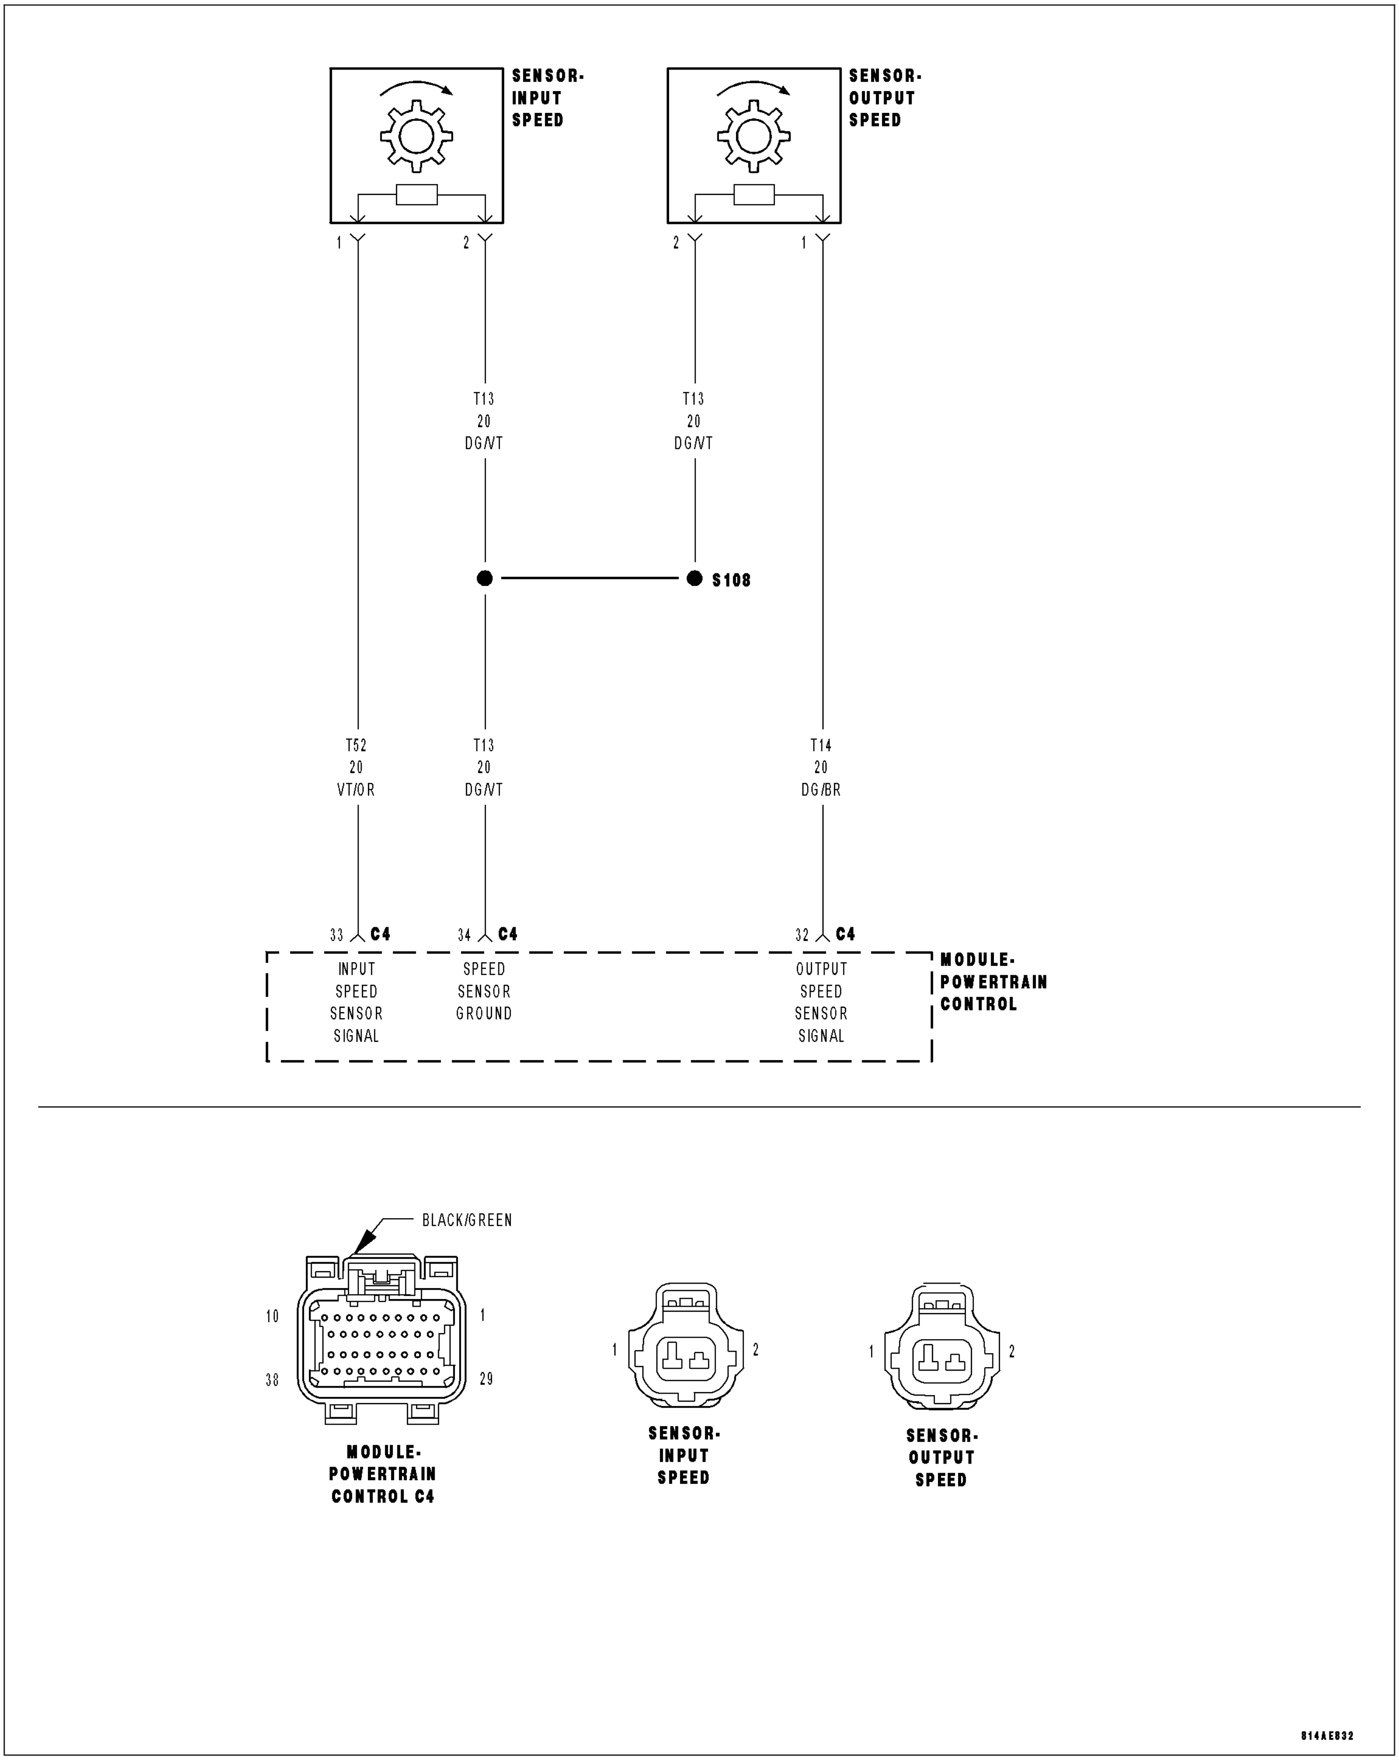
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0720-OUTPUT SPEED SENSOR CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If there is an excessive change in the Output RPM in any gear.

| Possible Causes |
|---|
| (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT OPEN |
| (T13) SPEED SENSOR GROUND CIRCUIT OPEN |
| (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND |
| (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE |
| (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE |
| OUTPUT SPEED SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through system checks.

## Diagnostic Test

### 1. CHECK IF THE DTC IS CURRENT

Start the engine in park.

Raise the drive wheels off of the ground.

**WARNING: Properly support the vehicle.**

Firmly apply the brakes and place the transmission selector in drive.

**WARNING: Be sure to keep hands and feet clear of rotating wheels.**

Release the brakes and allow the drive wheels to spin freely.

**NOTE: The drive wheels must be turning at this point.**

With the scan tool, read the Output RPM

**Is the Output RPM below 100?**

**Yes** >> Go To 2

**No** >> Go To 8

### 2. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, set the ″Input/Output Speed″ switch to ″ON″ and the rotary switch to the ″3000/1250″ position.

With the scan tool , read the Input and Output RPM.

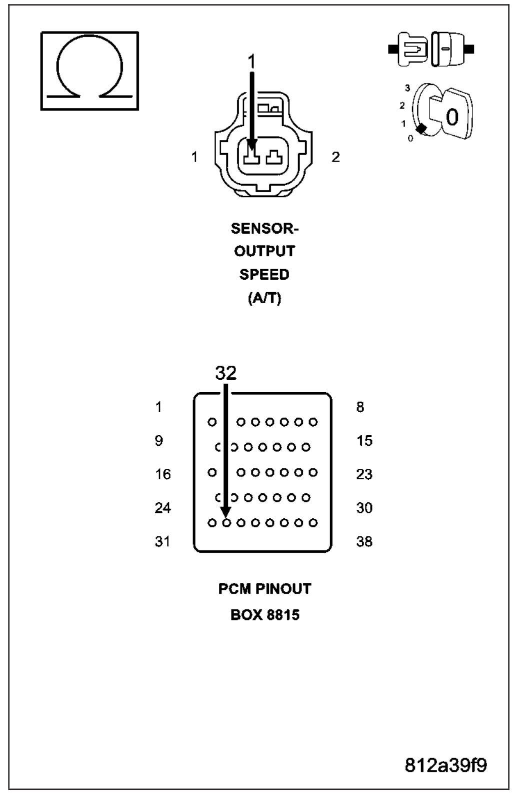
**Does the Input RPM read 3000 and the Output RPM read 1250 (within 50 RPM)?**

**Yes** >> Replace the Output Speed Sensor per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Output Speed Sensor harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T14) Output Speed Sensor Signal circuit between the Output Speed Sensor harness connector and the appropriate terminal of Miller tool #8815.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T14) Output Speed Sensor Signal circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

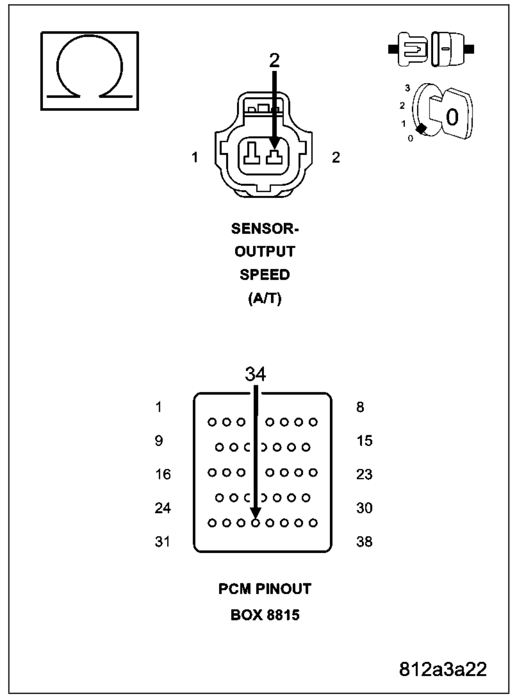
## 4. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the Speed Sensor Ground circuit between the appropriate terminal of Miller tool #8815 and the Output Speed Sensor harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for an open.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5



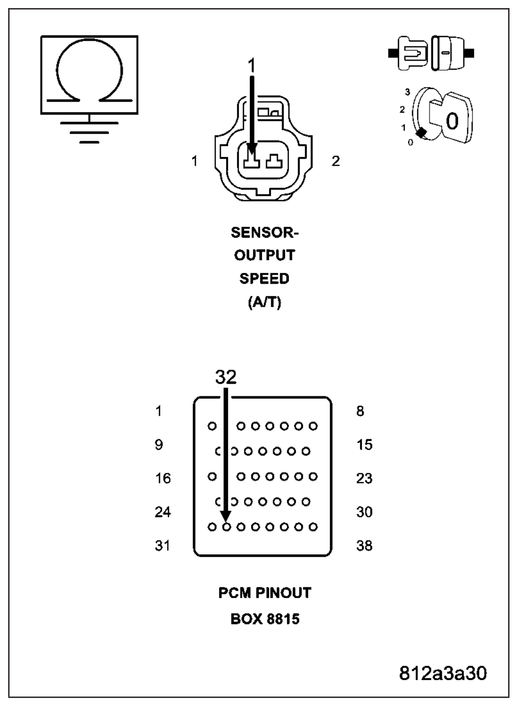
## 5. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T14) Output Speed Sensor Signal circuit.

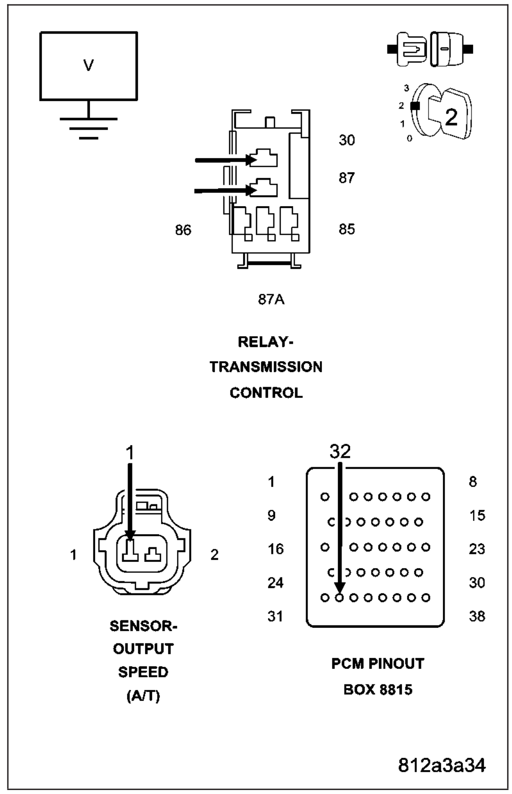
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T14) Output Speed Sensor Signal circuit for a short to ground.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6



## 6. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE



Remove the Transmission Control Relay.

Connect a jumper wire between the (A104) Fused B(+) circuit and (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T14) Output Speed Sensor Signal circuit.

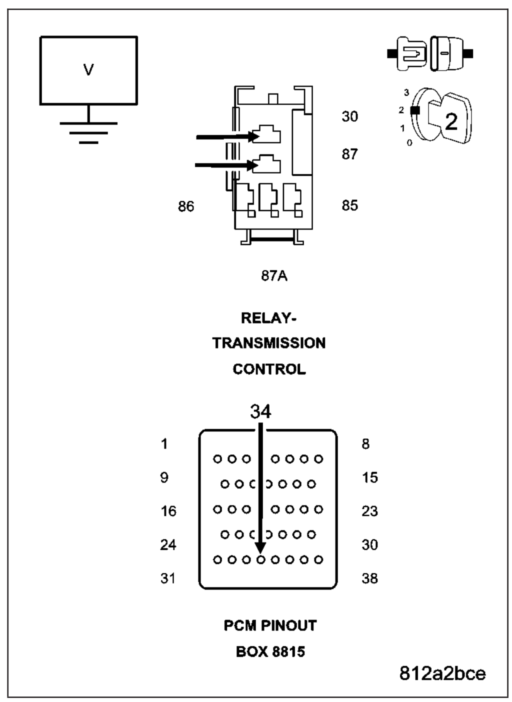
**Is the voltage above 0.5 volt?**

**Yes** >> Repair the (T14) Output Speed Sensor Signal circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE



**NOTE: The jumper wire must still be connected.**

Measure the voltage of the (T13) Speed Sensor Ground circuit.

**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool , check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0725-ENGINE SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running.
- **Set Condition:**
  The Engine RPM is less than 390 or greater than 8000 for more than 2 seconds while the engine is running.

| Possible Causes |
|---|
| ENGINE DTCS PRESENT |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

The PCM uses a dual port RAM internal to the controller to send the engine speed signal to the Transmission Control System. The calculated engine RPM is compared to a minimum and maximum value. If the PCM interprets this signal to be out of range when the engine is running the code is set. The MIL illuminates after 10 seconds of vehicle operation and the transmission system defaults to Limp-in mode.

### Diagnostic Test

#### 1. CHECK IF THE DTC IS CURRENT

Start the engine.

**NOTE: This DTC is not a Transmission Input Speed Sensor DTC.**
With the scan tool, read transmission DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter set at 0?**

**Yes** >> Go To 2

**No** >> Go To 3

#### 2. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

**Are there any engine DTC's present?**

**Yes** >> Refer to Section 9 – Engine Electrical Diagnostics and perform the appropriate diagnostic procedure.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P0731-GEAR RATIO ERROR IN 1ST

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio when compared to the known gear ratio.

| Possible Causes |
|---|
| RELATED TRANSMISSION DTCS PRESENT |
| INTERMITTENT GEAR RATIO ERRORS |
| INTERNAL TRANSMISSION |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into Limp-in mode after four gear ratio error events occur in a given driving cycle.

## Diagnostic Test

### 1. DETERMINING IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

**Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?**

**Yes** >> Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTC's are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

**No** >> Go To 2

### 2. CHECK TO SEE IF P0731 IS CURRENT

With the scan tool, perform the 1st gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**Did the Clutch Test pass, Input Speed remain at zero?**

**Yes** >> Go To 3

**No** >> Repair internal Transmission as necessary. Check all of the components related to the UD and LR clutches. Inspect the Oil Pump and repair or replace as necessary. Refer to the Service Information for the proper repair procedures.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

### 3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P0732-GEAR RATIO ERROR IN 2ND

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio when compared to the known gear ratio.

| Possible Causes |
|---|
| RELATED TRANSMISSION DTCS PRESENT |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| INTERMITTENT GEAR RATIO ERRORS |
| INTERNAL TRANSMISSION |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into Limp-in mode after four gear ratio error events occur in a given driving cycle.

## Diagnostic Test

### 1. CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

**Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?**

**Yes** >> Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the 2nd gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**Did the Clutch Test pass, Input Speed remain at zero?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors to the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## 4. CHECK FOR RELATED PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTC's.

**Are the DTCs P0845 and/or P0846 present also?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Repair internal Transmission per the Service Information. Check all of the components related to the UD and 2/4 clutches. Inspect the Oil Pump and repair or replace as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

# P0733-GEAR RATIO ERROR IN 3RD

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio when compared to the known gear ratio.

| Possible Causes |
|---|
| RELATED TRANSMISSION DTCS PRESENT |
| INTERMITTENT GEAR RATIO ERRORS |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| INTERNAL TRANSMISSION |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into Limp-in mode after four gear ratio error events occur in a given driving cycle.

## Diagnostic Test

### 1. CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

**Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?**

**Yes** >> Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the 3rd gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**Did the Clutch Test pass, Input Speed remain at zero?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## 4. CHECK FOR RELATED PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTCs.

**Are the DTCs P0870 and/or P0871 present also?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Repair internal Transmission per the Service Information. Check all of the components related to the UD and O/D clutches. Inspect the Oil Pump and repair or replace as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0734-GEAR RATIO ERROR IN 4TH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio when compared to the known gear ratio.

| Possible Causes |
|---|
| RELATED TRANSMISSION DTCS PRESENT |
| INTERMITTENT GEAR RATIO ERRORS |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| INTERNAL TRANSMISSION |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into Limp-in mode after four gear ratio error events occur in a given driving cycle.

### Diagnostic Test

#### 1. CHECK IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

**Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?**

**Yes** >> Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

**No** >> Go To 2

#### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, perform the 4th gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**Did the Clutch Test pass, Input Speed remain at zero?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTC's can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets a Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## 4. CHECK FOR RELATED PRESSURE SWITCH DTCS

With the scan tool, read Transmission DTC's.

**Are the DTC's P0870 and/or P0871 present also?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Repair internal Transmission per the Service Information. Check all of the components related to the O/D and 2/4 clutches. Inspect the Oil Pump and repair or replace as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

# P0736-GEAR RATIO ERROR IN REVERSE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio when compared to the known gear ratio.

| Possible Causes |
|---|
| RELATED TRANSMISSION DTCS PRESENT |
| INTERMITTENT GEAR RATIO ERRORS |
| INTERNAL TRANSMISSION |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into Limp-in mode after four gear ratio error events occur in a given driving cycle.

## Diagnostic Test

### 1. DETERMINING IF RELATED TRANSMISSION DTCS ARE PRESENT

With the scan tool, read Transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

**Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?**

**Yes** >> Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTCs are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

**No** >> Go To 2

### 2. CHECK TO SEE IF P0731 IS CURRENT

With the scan tool, perform the Reverse gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**Did the Clutch Test pass, Input Speed remain at zero?**

**Yes** >> Go To 3

**No** >> Repair internal Transmission per the Service Information. Check all of the components related to the Reverse and LR clutches. Inspect the Oil Pump and repair or replace as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Check the wiring and connectors related to the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0740-TCC OUT OF RANGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Torque Converter Clutch (TCC) is in FEMCC or PEMCC, Transmission temperature is hot, Engine temperature is greater than 38° C or 100° F, Transmission Input Speed greater than engine speed, TPS less than 30°, and brake not applied.
- **Set Condition:**
  The TCC is modulated by controlling the duty cycle of the L/R Solenoid until the difference between the Engine RPM and the Transmission Input Speed RPM or duty cycle is within a desired range. The DTC is set after the period of 10 seconds and 3 occurrences of either: FEMCC - with slip greater than 100 RPM or PEMCC - duty cycle greater than 85%.

| Possible Causes |
|---|
| RELATED L/R SOLENOID OR PRESSURE SWITCH DTCS PRESENT |
| INTERNAL TRANSMISSION |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

When in 2nd, 3rd, or 4th gear, the torque converter clutch (TCC) can be locked or partially locked when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the LR/TCC solenoid until the torque converter slip difference (difference between engine and turbine speed) is within 60 RPM. Then the LR/TCC solenoid is fully energized (FEMCC / 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity. The transmission will attempt normal EMCC operation (not in Limp-in) even after the MIL is illuminated. MIL will illuminate after 5 minutes of accumulated slip in FEMCC.

### Diagnostic Test

#### 1. CHECK IF RELATED DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are the DTCs P0750 and/or P0841 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

#### 2. CHECK IF THE DTC IS CURRENT

Ignition on, engine not running.

With the scan tool, record and erase DTCs.

Drive the vehicle until it is fully warmed up to at least 43° C (110° F).

Perform the following step 3 times.

Drive the vehicle at 50 mph and allow 4th gear to engage for at least 10 seconds. Close the throttle, then tip back in until the throttle angle is between 25 and 29 degrees. Note that if you go over 30 degrees, you must back off of the throttle and retry.

**Did the TCC engage during any of the attempts?**

**Yes** >> Go To 3

**No** >> Perform the Hydraulic Pressure test per the Service Information and repair the internal transmission components and Torque convertor as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

This DTC can also be set under extreme temperature conditions. This is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

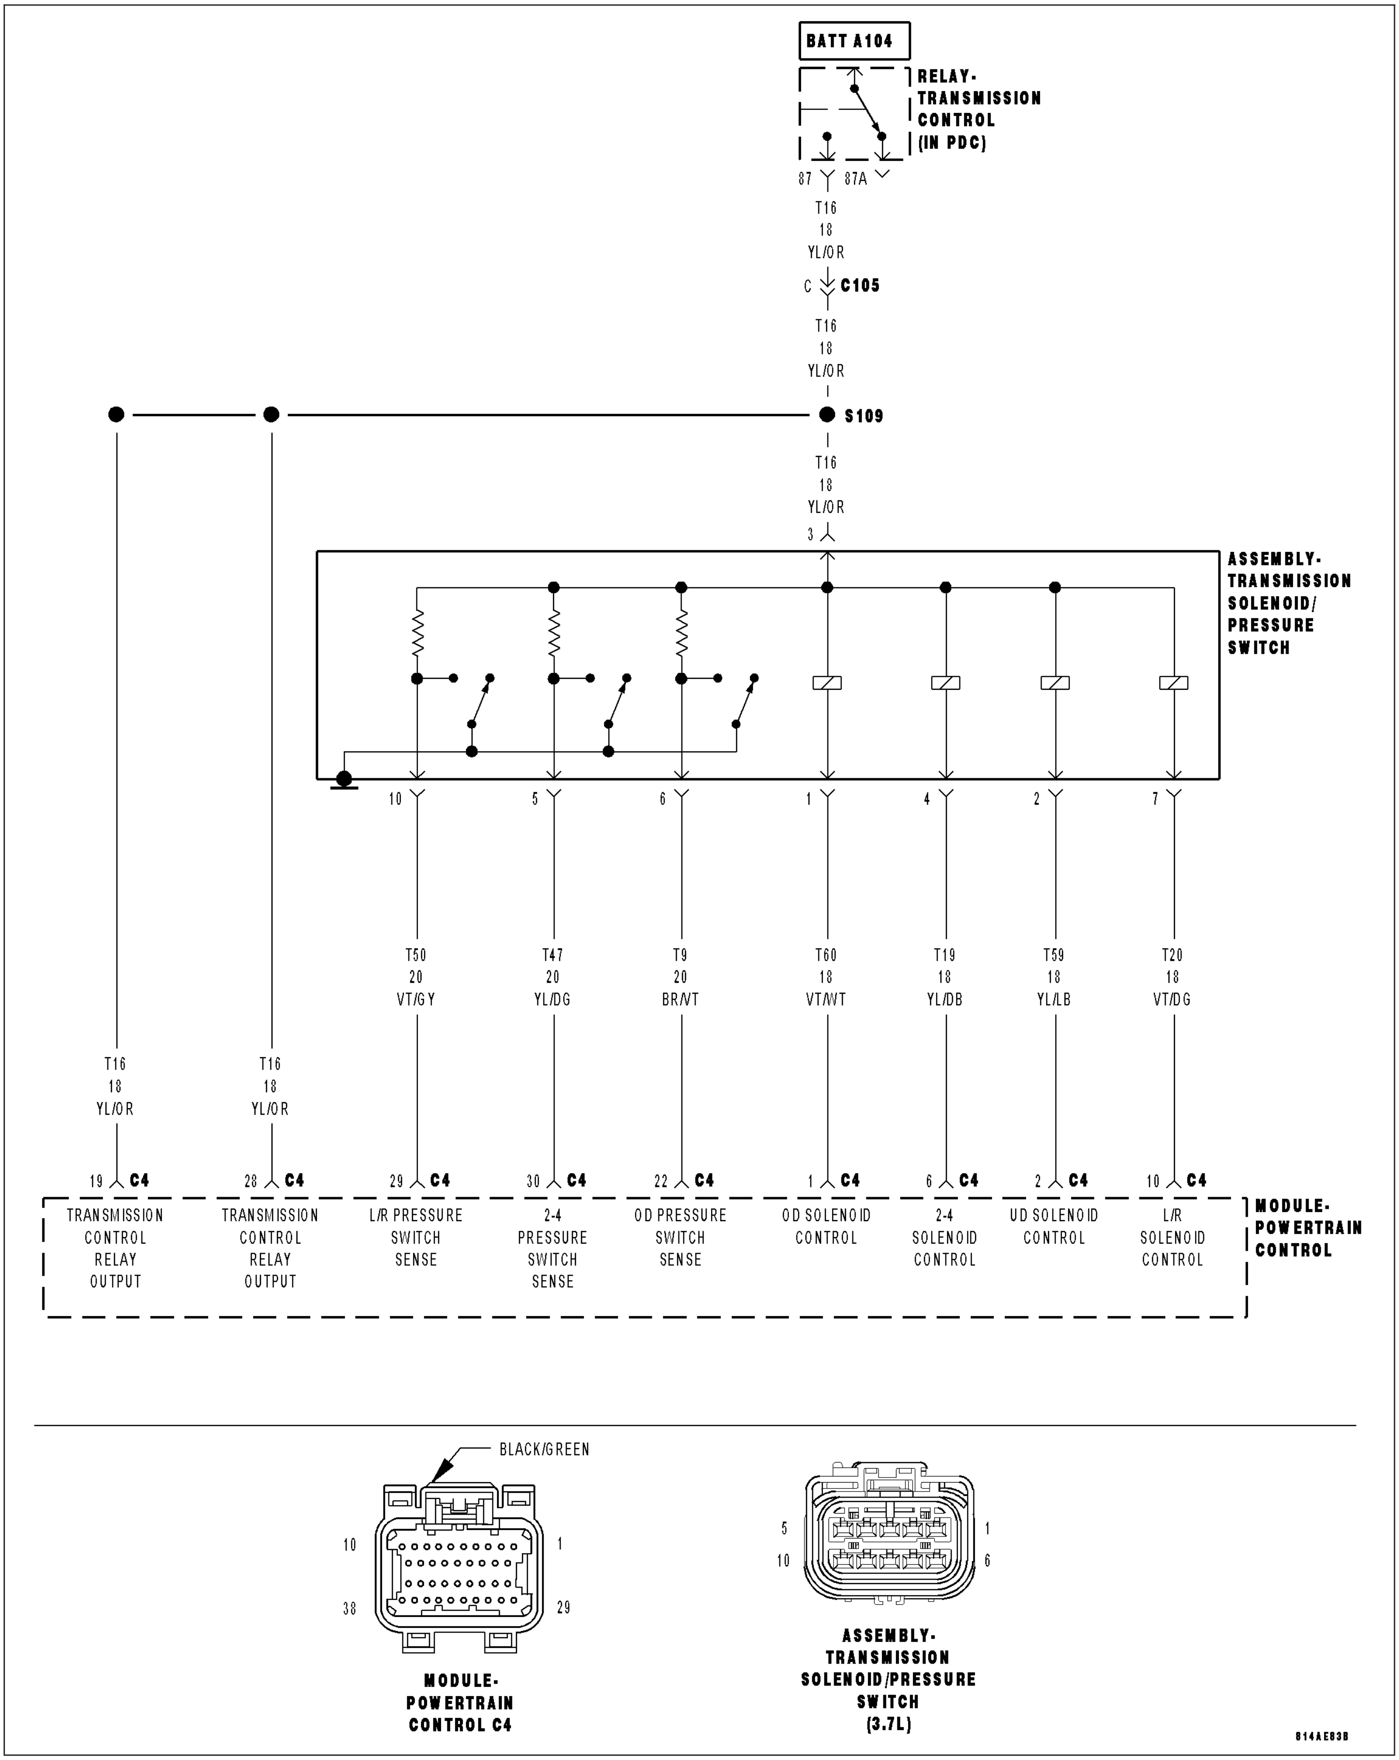
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0750-LR SOLENOID CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.
- **Set Condition:**
  Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

| Possible Causes |
|---|
| RELATED TRANSMISSION RELAY DTCS PRESENT |
| (T20) L/R SOLENOID CONTROL CIRCUIT OPEN |
| (T20) L/R SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| (T20) L/R SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into neutral, if the DTC is set above 35 Kmh (22 mph), Limp-in mode when vehicle speed is below 35 Kmh (22 mph).

## Diagnostic Test

### 1. CHECK IF RELATED RELAY DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any Transmission Control Relay DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure.

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, view DTCs.

**Is the status Active or is STARTS SINCE SET counter set at 0 for this DTC?**

**Yes** >> Go To 3

**No** >> Go To 7

### 3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the L/R Solenoid.

Monitor the L/R Solenoid LED on the Transmission Simulator.

**Did the L/R Solenoid LED on the Transmission Simulator blink on and off during actuation?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR AN OPEN

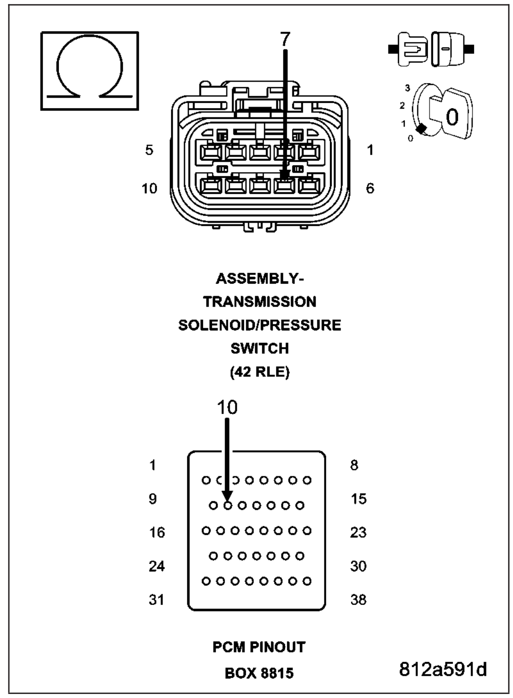
Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T20) L/R Solenoid Control circuit between the Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.



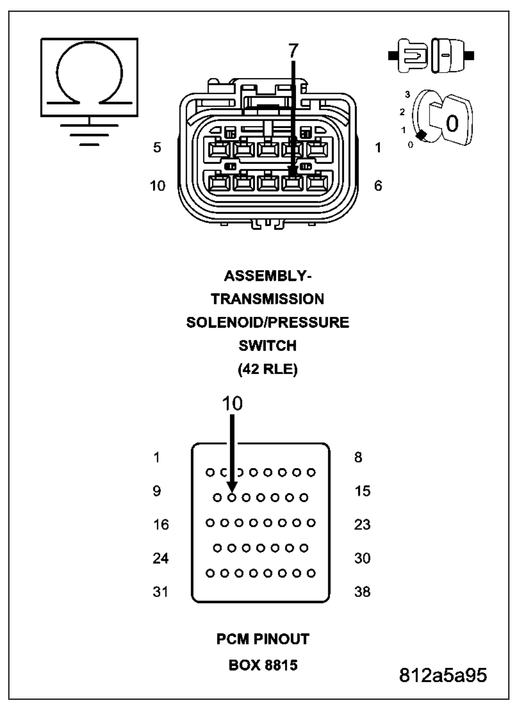
**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T20) L/R Solenoid Control circuit for an open.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T20) L/R Solenoid Control circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T20) L/R Solenoid Control circuit for a short to ground.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

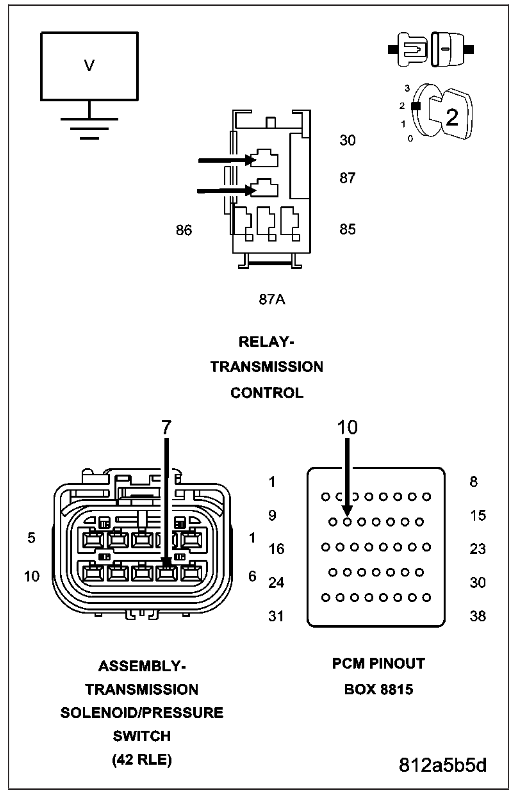
## 6. CHECK THE (T20) L/R SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Remove the Transmission Control Relay.

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T20) L/R Solenoid Control circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T20) L/R Solenoid Control circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

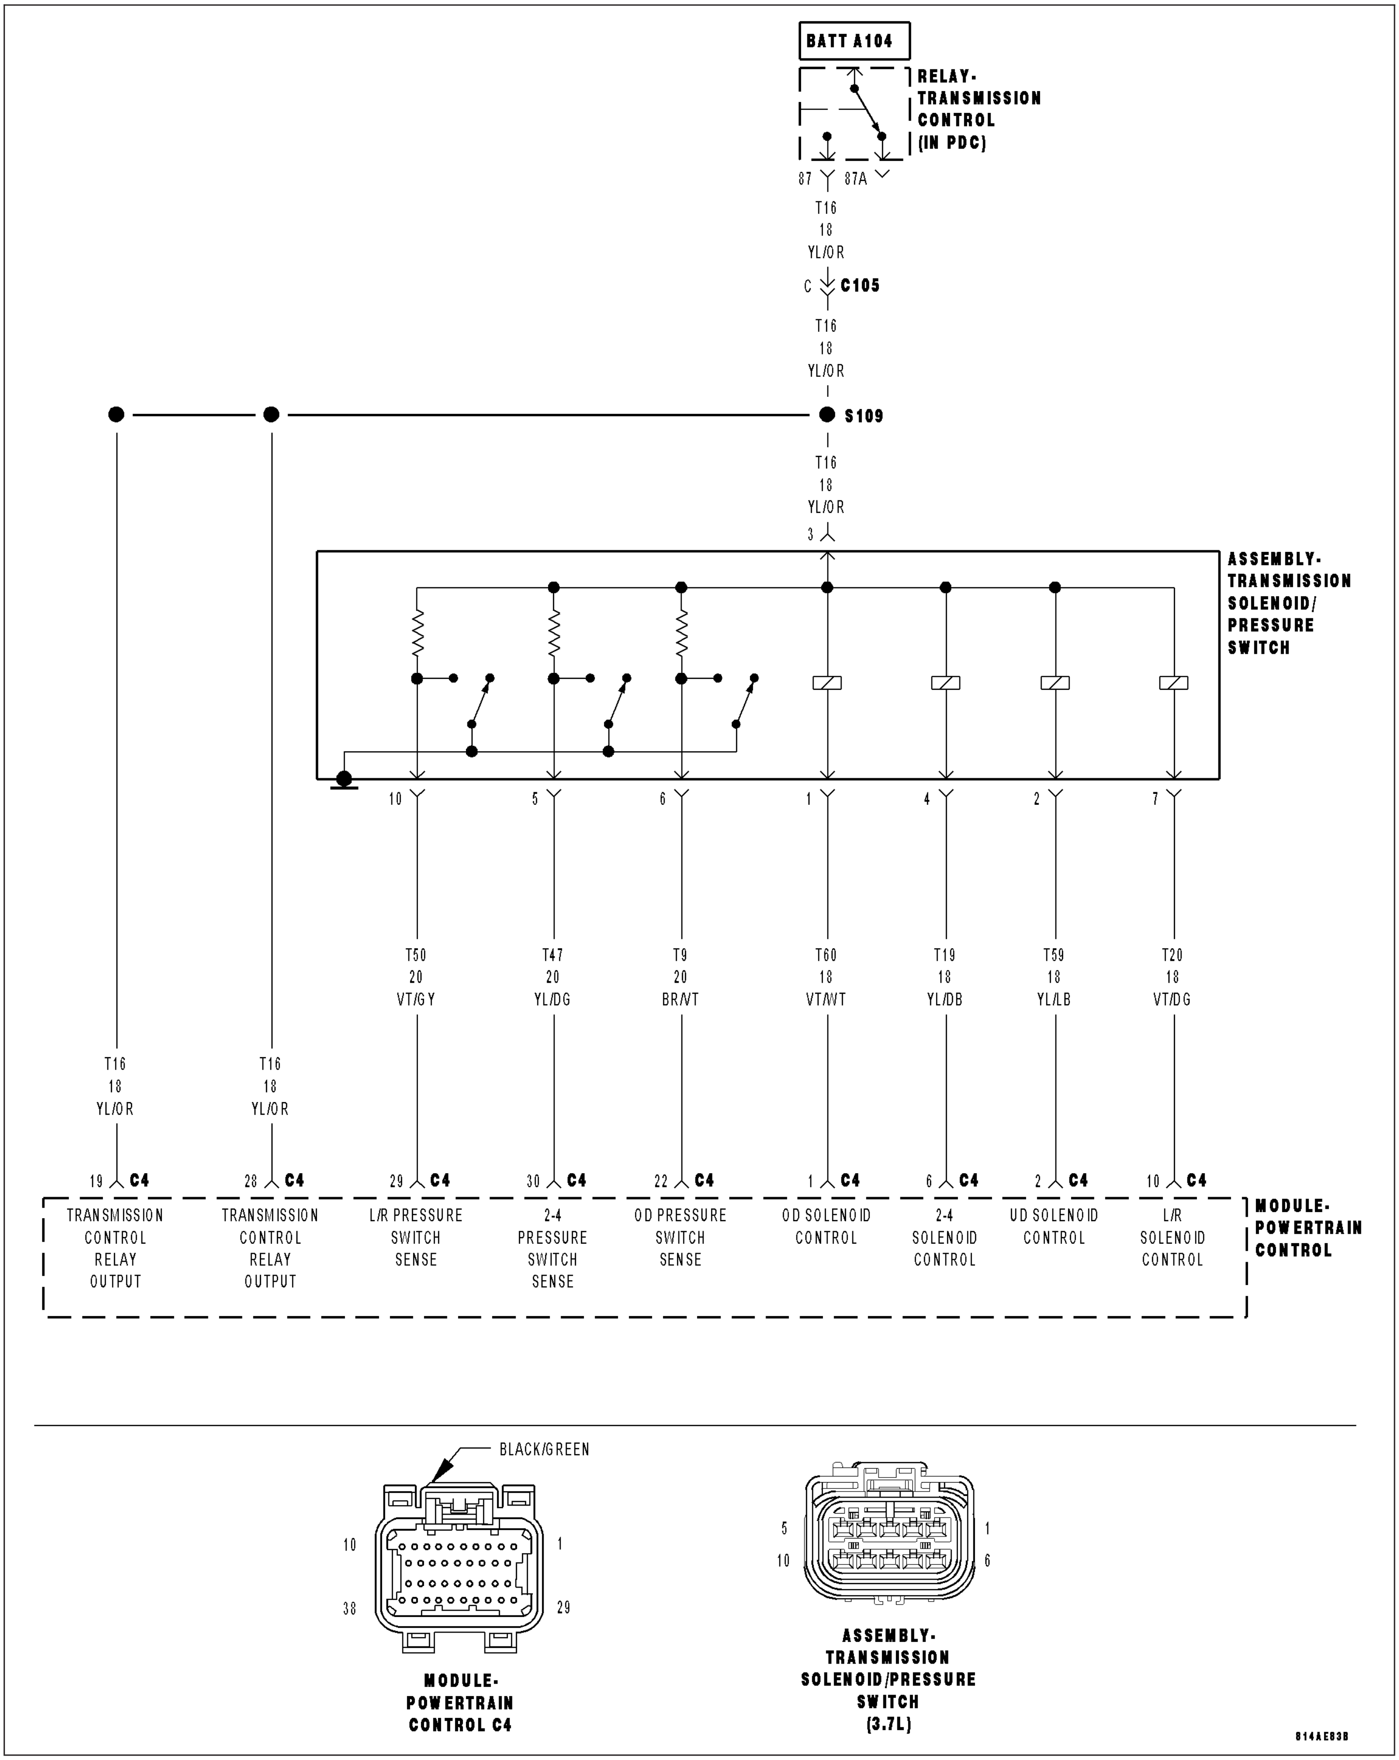
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0755-2/4 SOLENOID CIRCUIT



42RLE MINI SOL PRS CKTS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.
- **Set Condition:**
  Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

| Possible Causes |
|---|
| RELATED TRANSMISSION RELAY DTCS PRESENT |
| (T19) 2/4 SOLENOID CONTROL CIRCUIT OPEN |
| (T19) 2/4 SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| (T19) 2/4 SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into neutral, if the DTC is set above 35 Kmh (22 mph), Limp-in mode when vehicle speed is below 35 Kmh (22 mph).

## Diagnostic Test

### 1. CHECK IF RELATED TRANSMISSION RELAY DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any Transmission Control Relay DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure.

**No** >> Go To 2

### 2. CHECK TO SEE IF P0755 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active or is the STARTS SINCE SET counter set at 0 for this DTC?**

**Yes** >> Go To 3

**No** >> Go To 7

## 3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the 2/4 Solenoid.

Monitor the 2/4 Solenoid LED on the Transmission Simulator.

**Did the 2/4 Solenoid LED on the Transmission Simulator blink on and off during actuation?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (T19) 2/4 SOLENOID CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

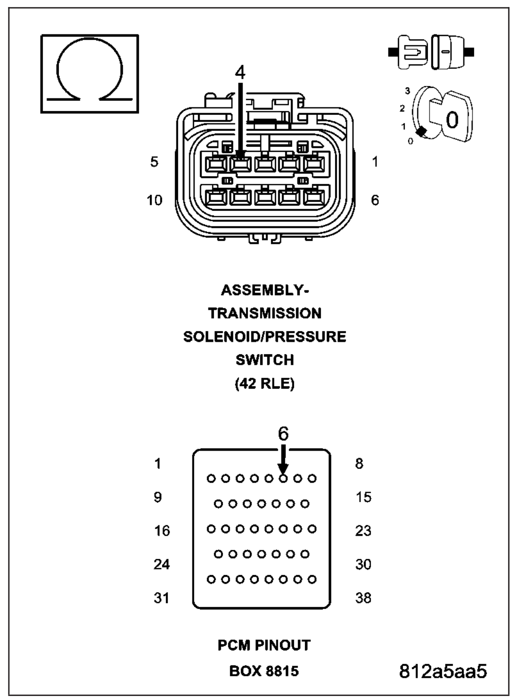
Measure the resistance of the (T19) 2/4 Solenoid Control circuit between the Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T19) 2/4 Solenoid Control circuit for an open.

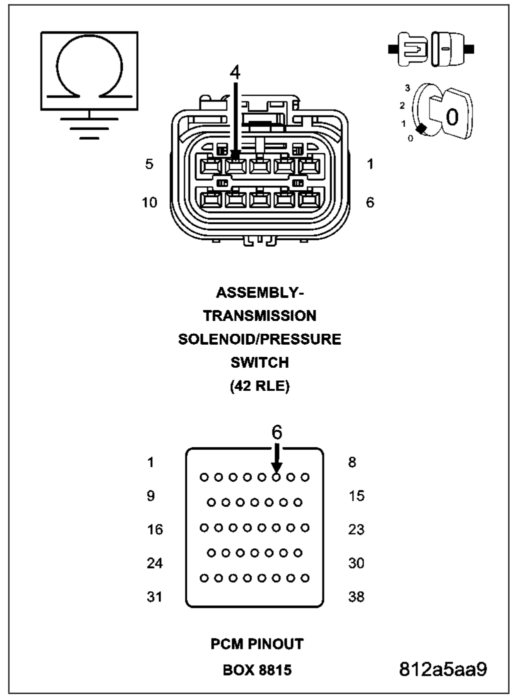
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5



## 5. CHECK THE (T19) 2/4 SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T19) 2/4 Solenoid Control circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T19) 2/4 Solenoid Control circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK THE (T19) 2/4 SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

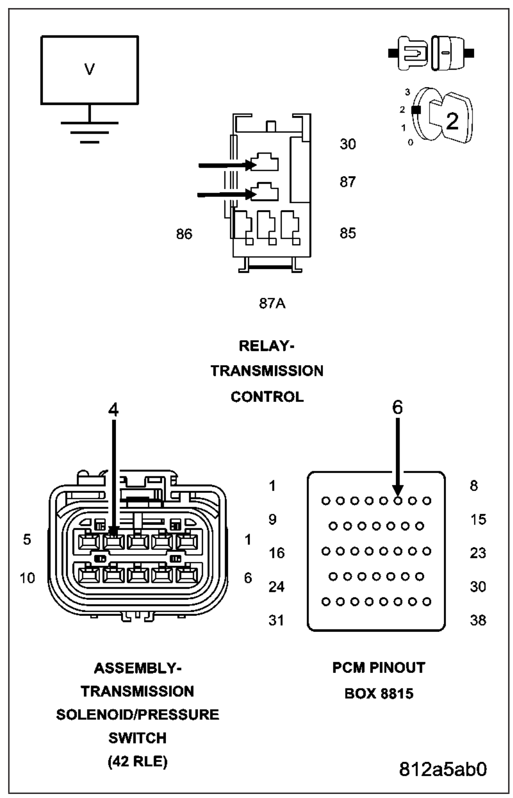
Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T19) 2/4 Solenoid Control circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T19) 2/4 Solenoid Control circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

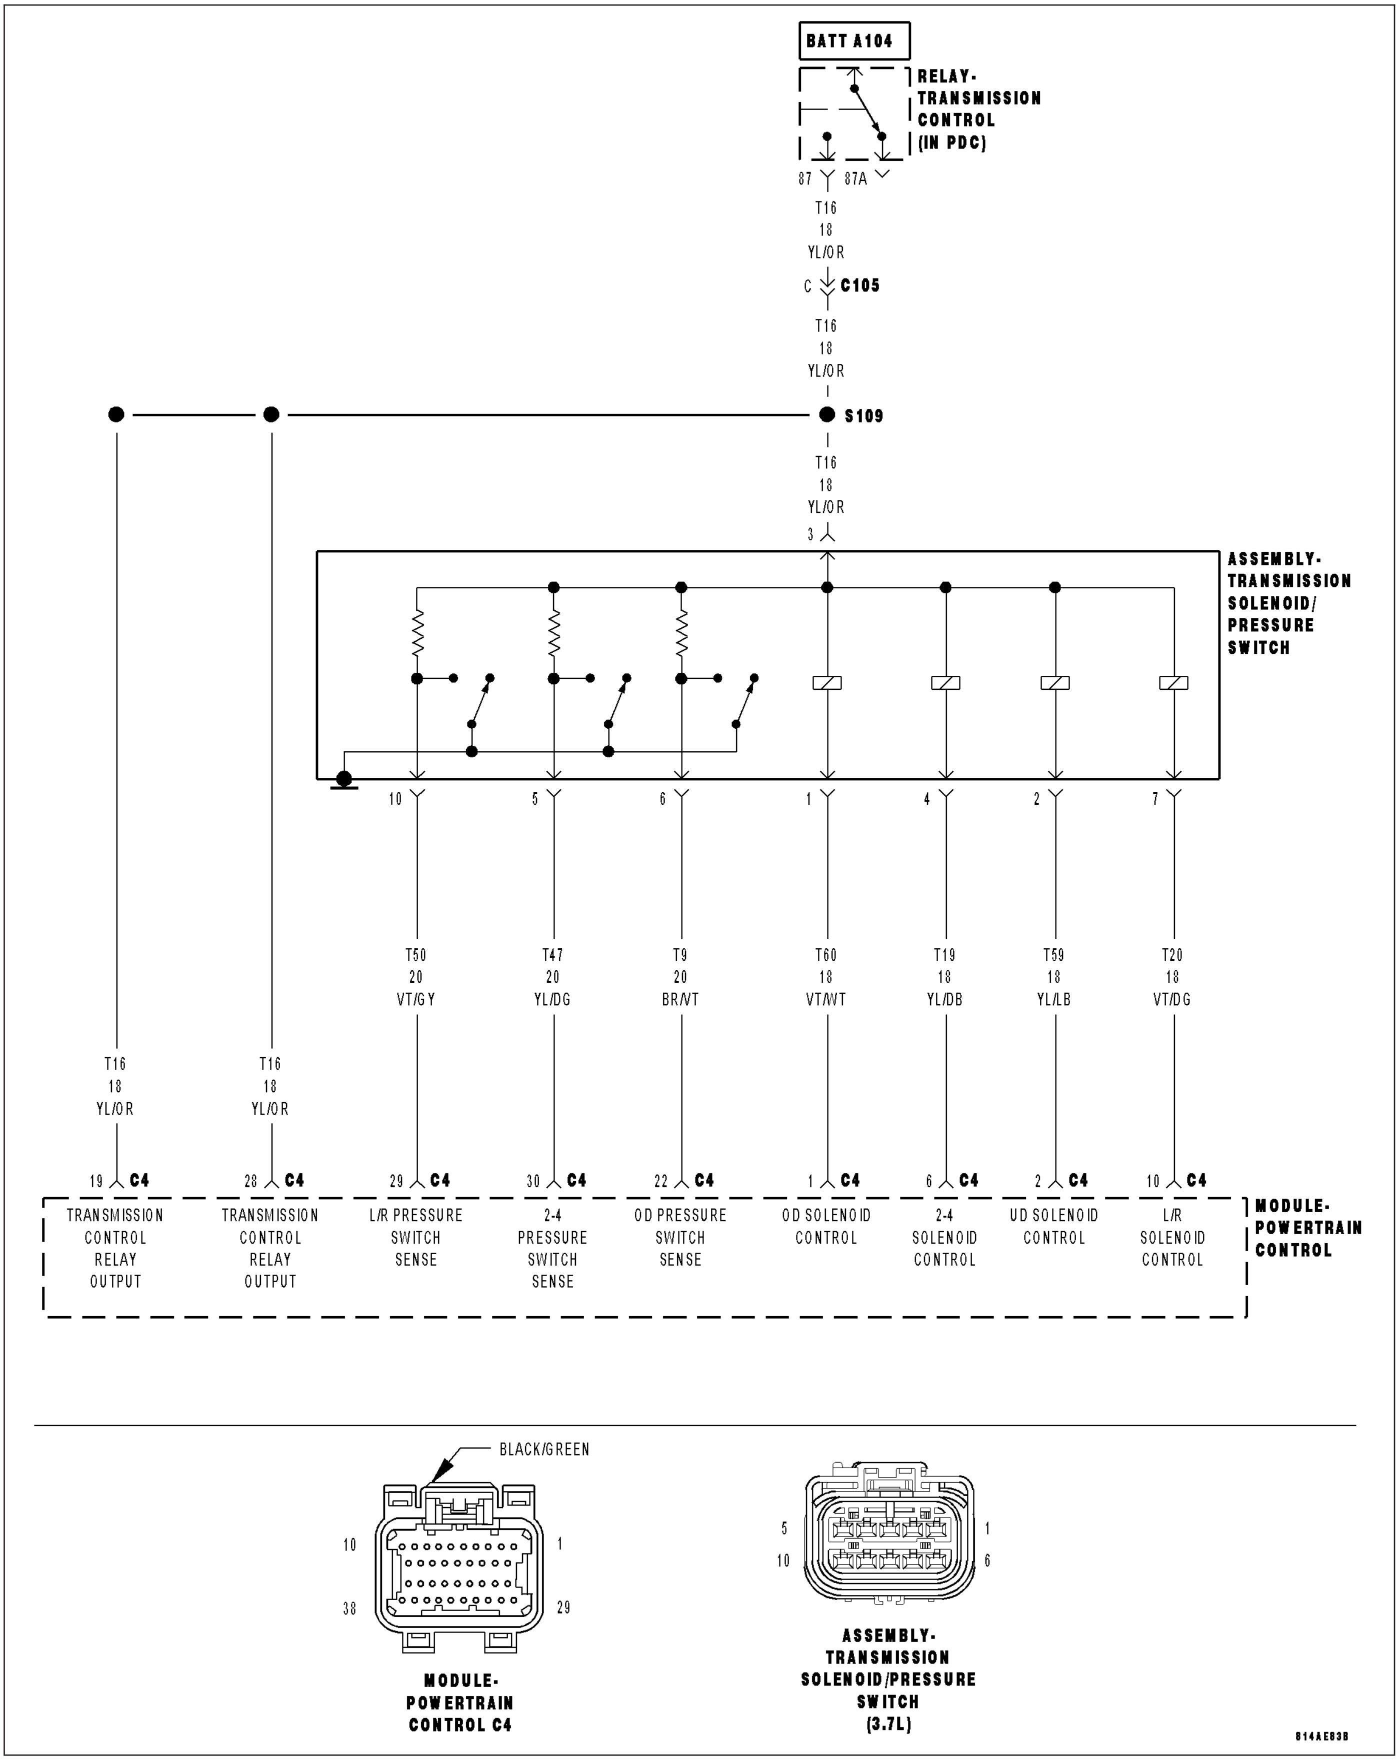
Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0760-OD SOLENOID CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.
- **Set Condition:**
  Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

| Possible Causes |
|---|
| RELATED TRANSMISSION CONTROL OUTPUT DTCS PRESENT |
| (T60) OD SOLENOID CONTROL CIRCUIT OPEN |
| (T60) OD SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| (T60) OD SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoid circuits is periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into neutral, if the DTC is set above 35 Kmh (22 mph), Limp-in mode when vehicle speed is below 35 Kmh (22 mph).

## Diagnostic Test

### 1. CHECK IF RELATED RELAY DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any Transmission Control Relay DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure.

**No** >> Go To 2

### 2. CHECK IF DTC IS CURRENT

With the scan tool, view DTCs.

**Is the status Active or is the STARTS SINCE SET counter set at 0 for this DTC?**

**Yes** >> Go To 3

**No** >> Go To 7

### 3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the OD Solenoid.

Monitor the OD Solenoid LED on the Transmission Simulator.

**Did the OD Solenoid LED on the Transmission Simulator blink on and off during actuation?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (T60) OD SOLENOID CONTROL CIRCUIT FOR AN OPEN

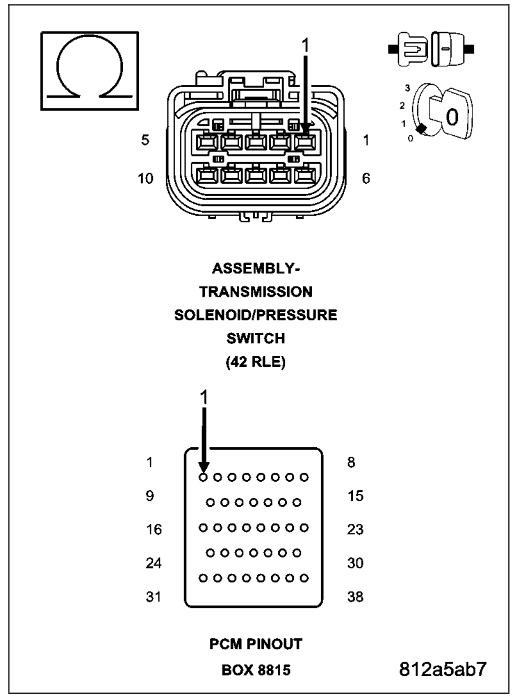
Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T60) OD Solenoid Control circuit between the appropriate terminal of Miller tool #8815 and the Solenoid/Pressure Switch Assembly harness connector.



**Is the resistance above 5.0 ohms?**

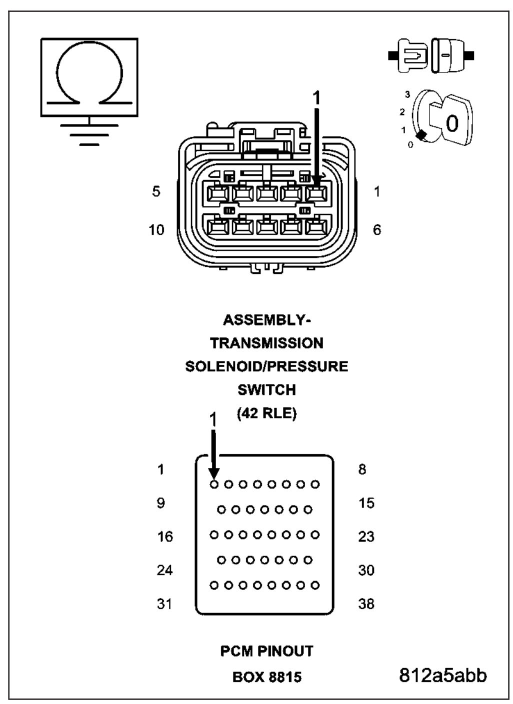
**Yes** >> Repair the (T60) OD Solenoid Control circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T60) OD SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T60) OD Solenoid Control circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T60) OD Solenoid Control circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK THE (T60) OD SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Remove the Transmission Control Relay.

Connect a jumper wire between the (A104) Fused B+ circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T60) OD Solenoid Control circuit.

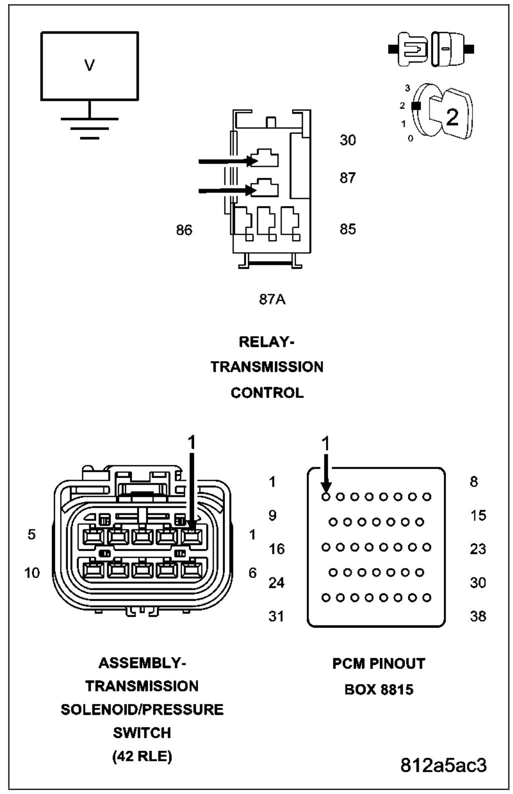
**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T60) OD Solenoid Control circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

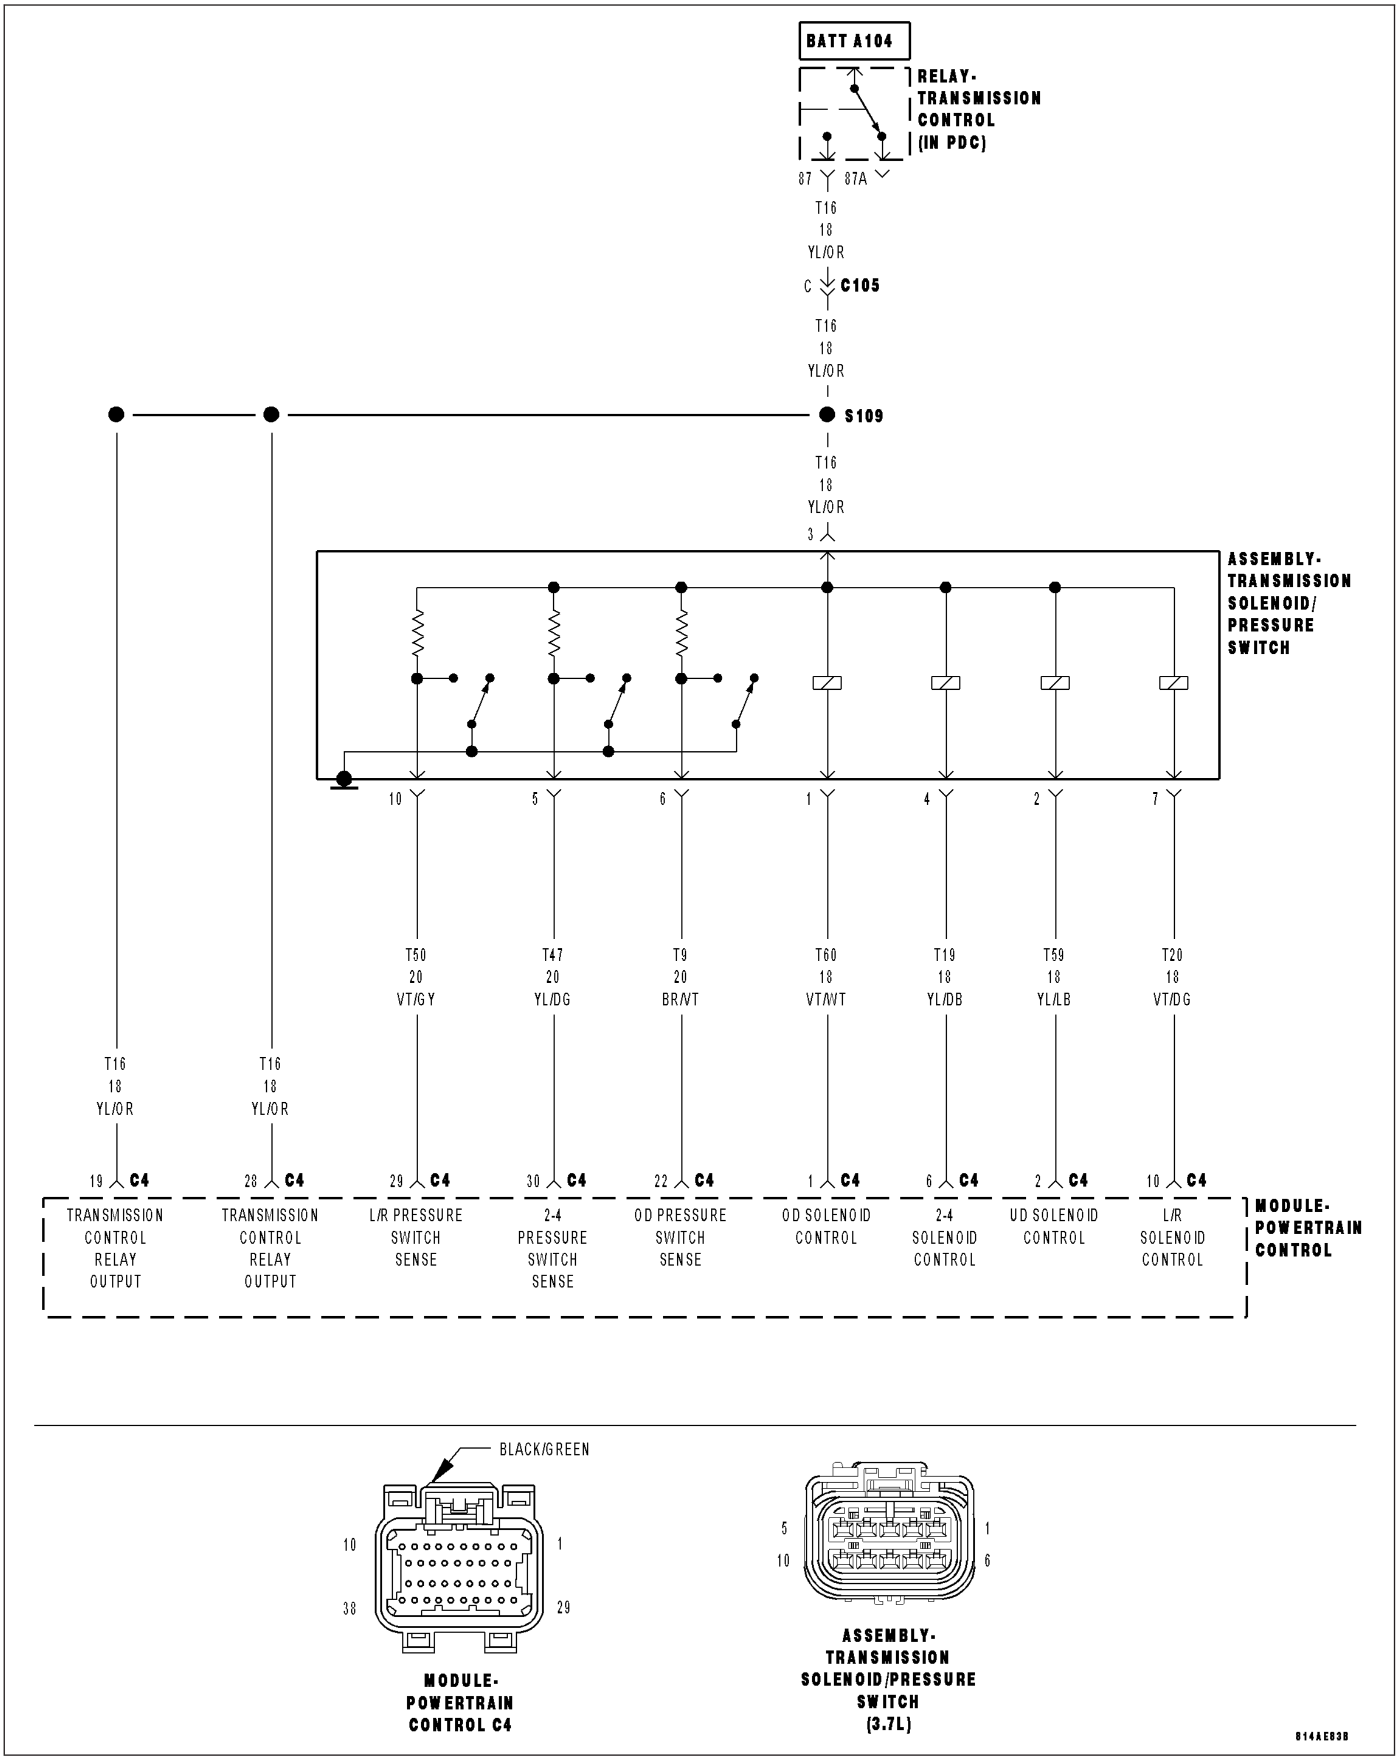
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0765-UD SOLENOID CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Initially at ignition on, then every 10 seconds thereafter. The solenoids will also be tested immediately after a gear ratio error or pressure switch error is detected.
- **Set Condition:**
  Three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error.

| Possible Causes |
| --- |
| RELATED TRANSMISSION CONTROL OUTPUT DTCS PRESENT |
| (T59) UD SOLENOID CONTROL CIRCUIT OPEN |
| (T59) UD SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| (T59) UD SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoid circuits is periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into neutral, if the DTC is set above 35 Kmh (22 mph), Limp-in mode when vehicle speed is below 35 Kmh (22 mph).

## Diagnostic Test

### 1. CHECK IF RELATED RELAY DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any Transmission Control Relay DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, view DTCs.

**Is the status Active or is the STARTS SINCE SET counter set at 0 for this DTC?**

**Yes** >> Go To 3

**No** >> Go To 7

### 3. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the UD Solenoid.

Monitor the UD Solenoid LED on the Transmission Simulator.

**Did the UD Solenoid LED on the Transmission Simulator blink on and off during actuation?**

**Yes** >> Replace Transmission Solenoid/Pressure Switch Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DISASSEMBLY)

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (T59) UD SOLENOID CONTROL CIRCUIT FOR AN OPEN

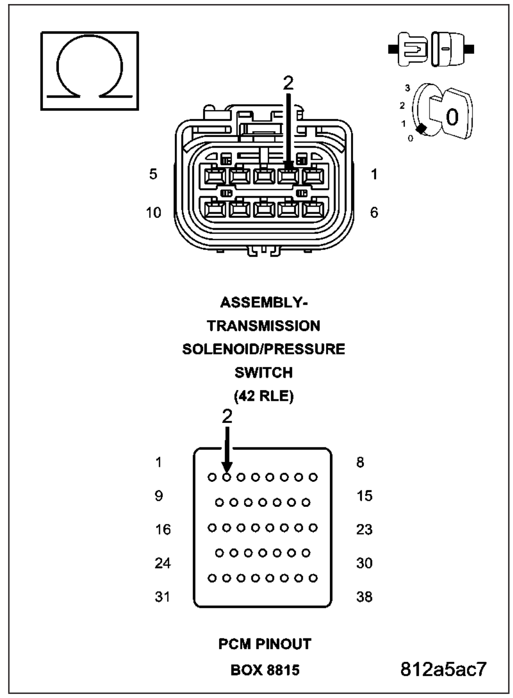
Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T59) UD Solenoid Control circuit between the Solenoid/Pressure Switch Assembly harness connector and the appropriate terminal of Miller tool #8815.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T59) UD Solenoid Control circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T59) UD SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

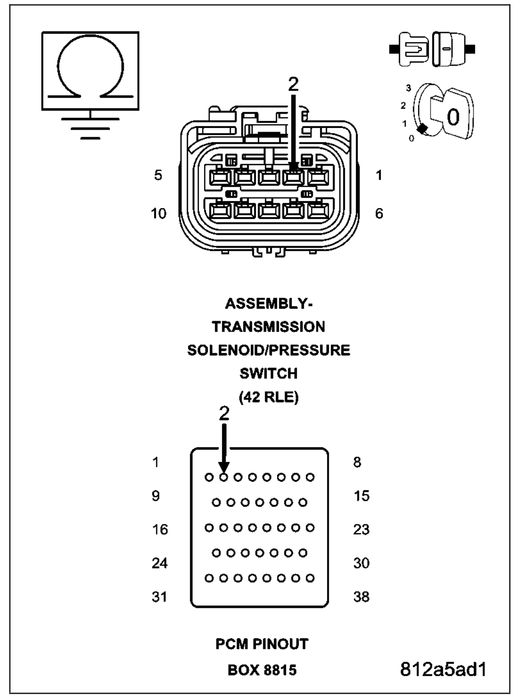
Measure the resistance between ground and the (T59) UD Solenoid Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T59) UD Solenoid Control circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6



## 6. CHECK THE (T59) UD SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between the (A104) Fused B+ circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T59) UD Solenoid Control circuit.

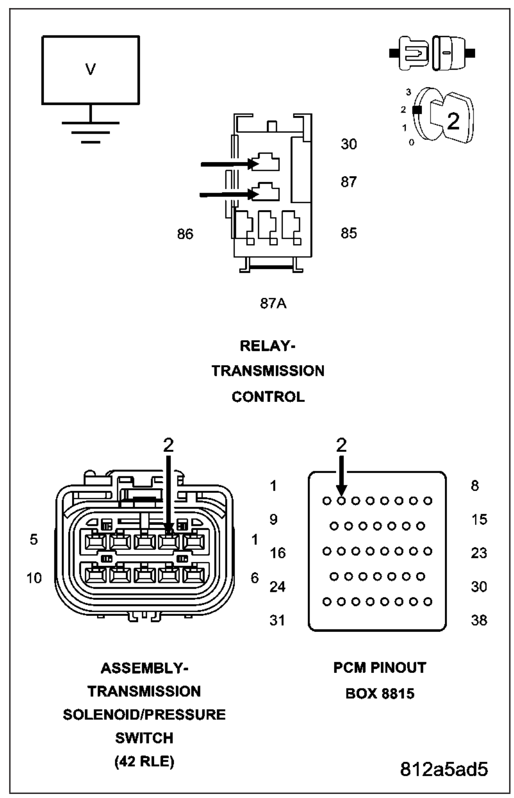
**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T59) UD Solenoid Control circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

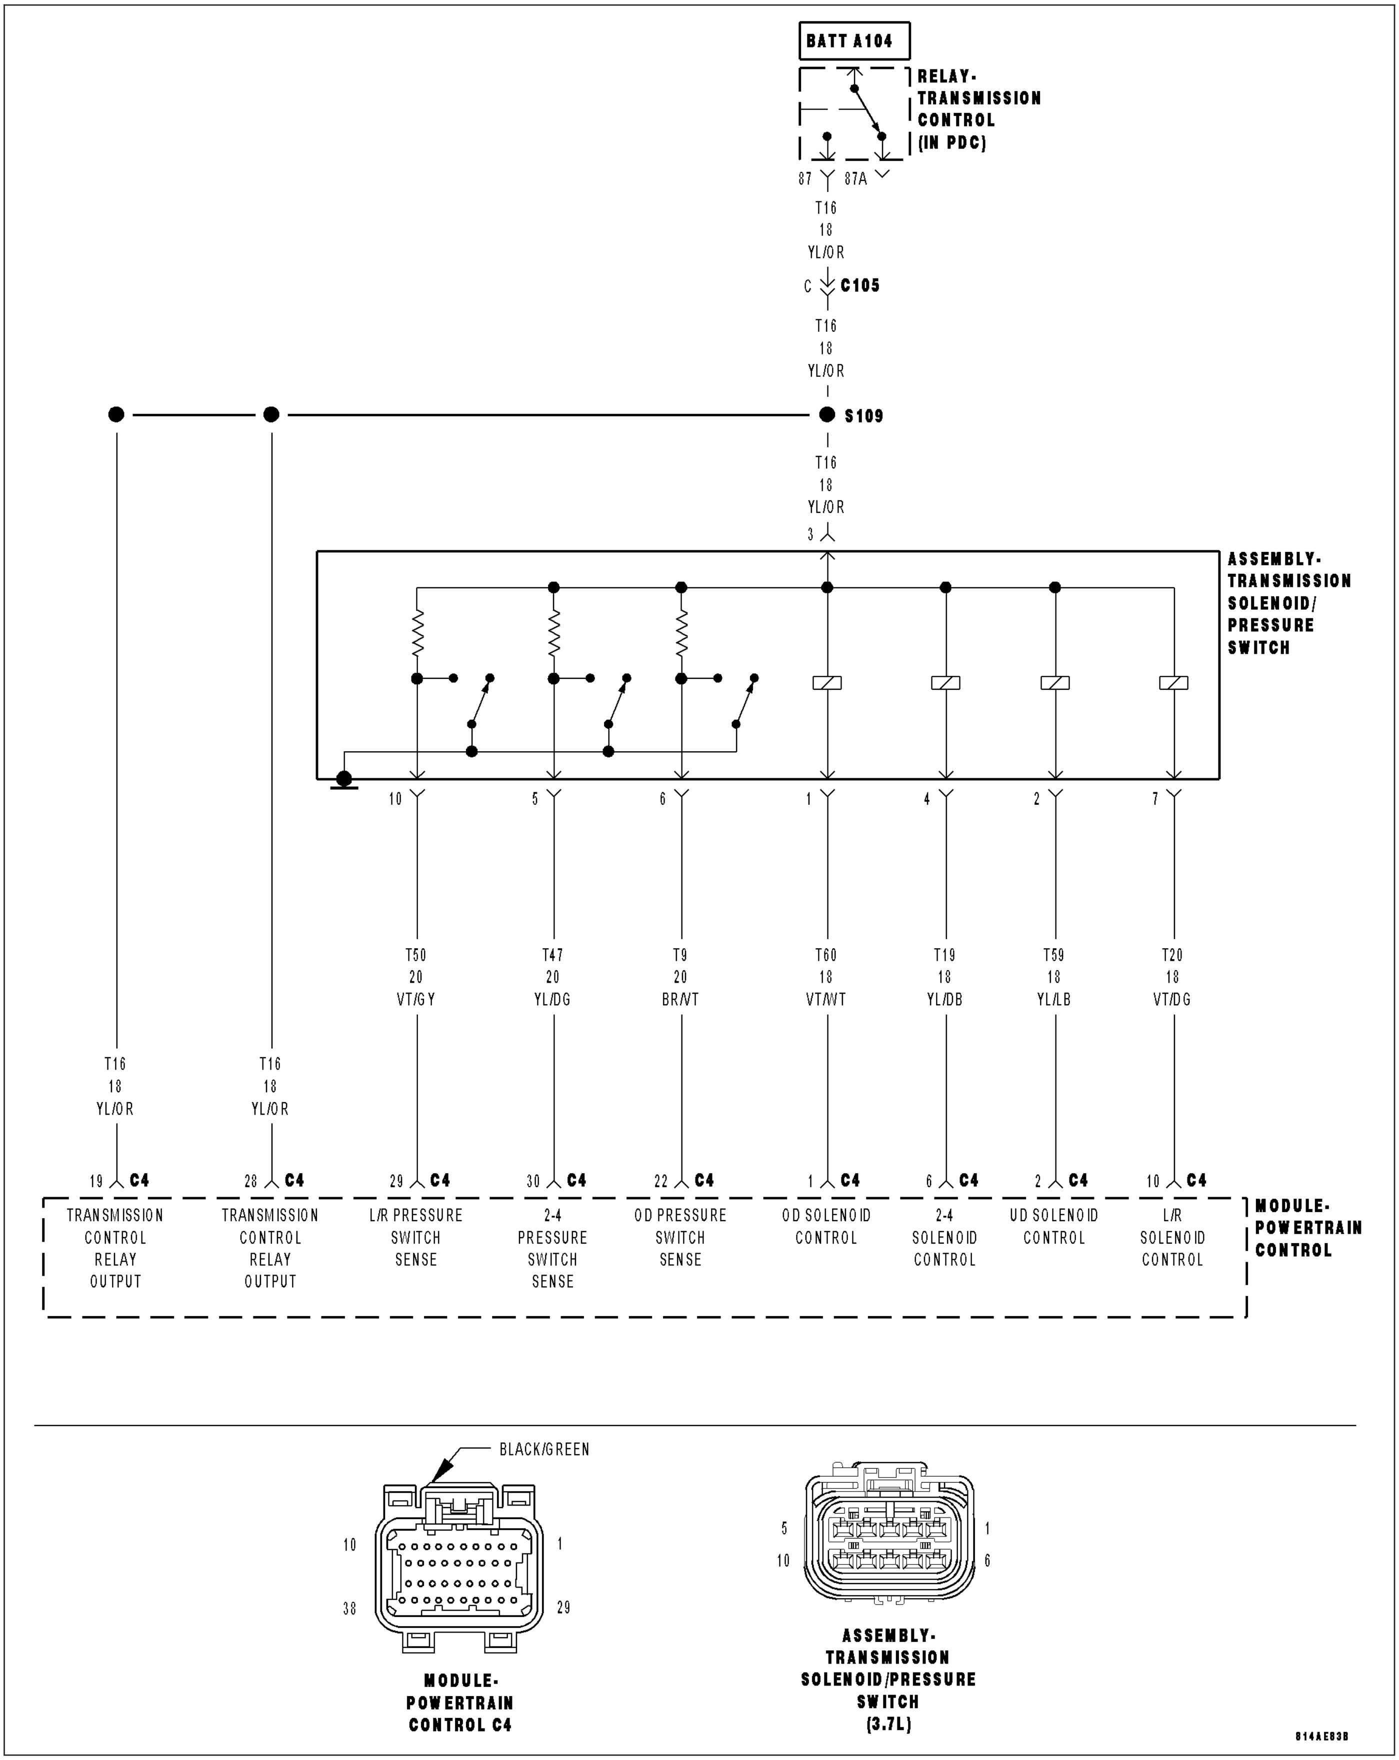
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/ TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0841-LR PRESSURE SWITCH RATIONALITY



*42RLE MINI SOL PRS CKTS*

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running.
- **Set Condition:**
  The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into Limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

| Possible Causes |
|---|
| RELATED TRANSMISSION RELAY DTCS PRESENT |
| LOSS OF PRIME DTC PRESENT |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. If a set condition is identified, 1st gear and torque converter lock-up (EMCC) will be inhibited. The vehicle will launch in 2nd gear and shift normally through the gears without allowing EMCC. If during the same key start, the set condition is no longer valid, the transmission will return to normal operation (1st and EMCC available). Limp-in will not occur unless DTC P0841 is accompanied by a code P0706 and the MIL will illuminate after 5 minutes of substituted operation.

**PRESSURE SWITCH STATES**

| GEAR | L/R | 2/4 | OD |
|---|---|---|---|
| R | OP | OP | OP |
| P/N | CL | OP | OP |
| 1st | CL | OP | OP |
| 2nd | OP | CL | OP |
| D | OP | OP | CL |
| OD | OP | CL | CL |

**OP = OPEN**

**CL = CLOSED**

## Diagnostic Test

### 1. DETERMINING IF RELATED TRANSMISSION RELAY DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any Transmission Control Relay DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

## 2. CHECK FOR LOSS OF PRIME DTC

With the scan tool, check for other Transmission DTCs.

**Is the DTC P0944 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 3

## 3. CHECK TO SEE IF P0841 IS CURRENT

With the scan tool, view DTCs.

**Is the status active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 4

**No** >> Go To 8

## 4. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector to L/R.

With the scan tool , monitor the L/R Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

**Did the L/R Pressure Switch state change?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN

Turn the ignition off to the lock position.

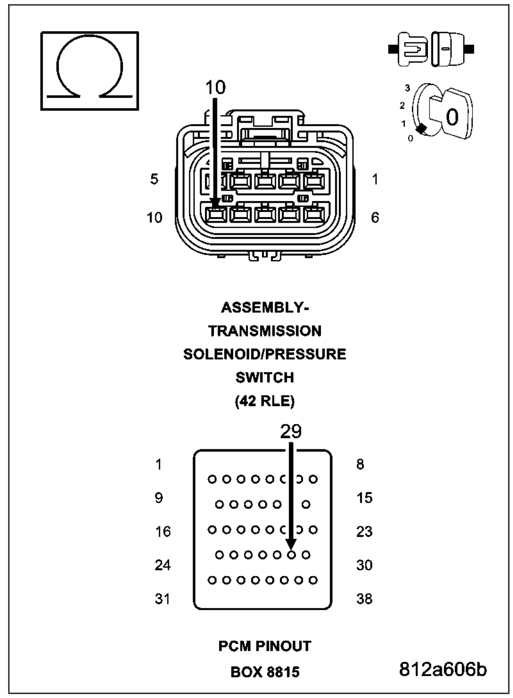
Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (T50) L/R Pressure Switch Sense circuit from the appropriate terminal of special tool #8815 to the Transmission Solenoid/Pressure Switch Assembly harness connector.



**Is the resistance above 5.0 ohms?**

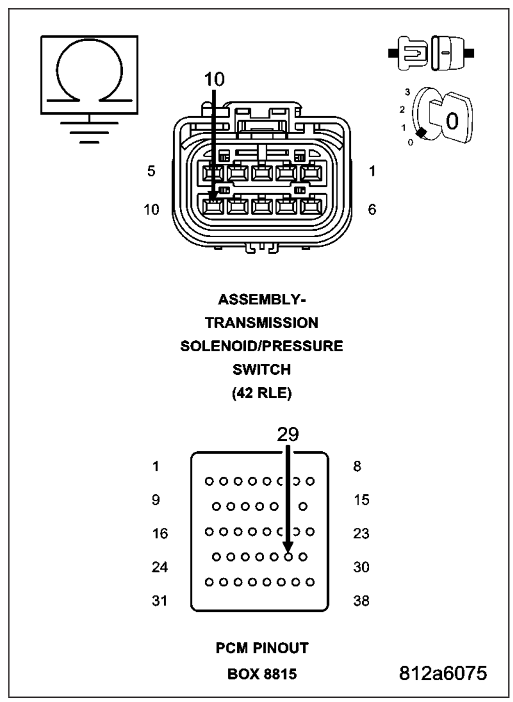
**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.



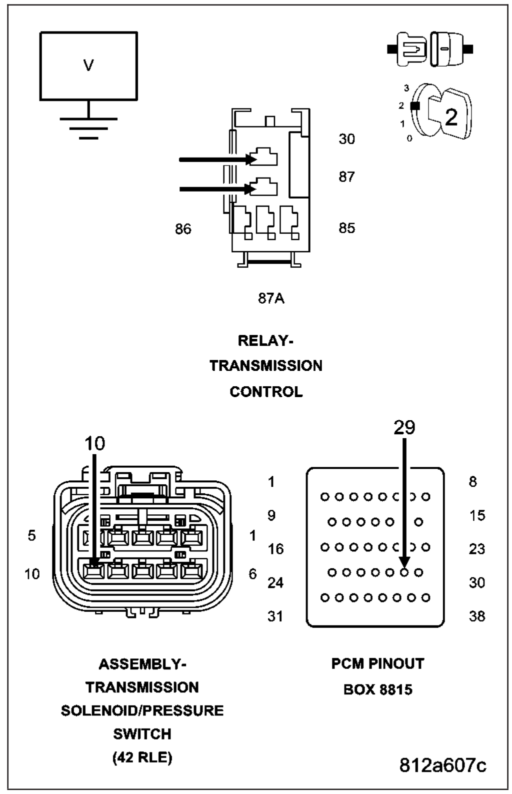
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE



Remove the Transmission Control Relay.

Connect a jumper wire between the (A104) Fused B+ circuit and (T16) Transmission Control Relay Output circuit.

Ignition on, engine not running.

Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.

**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

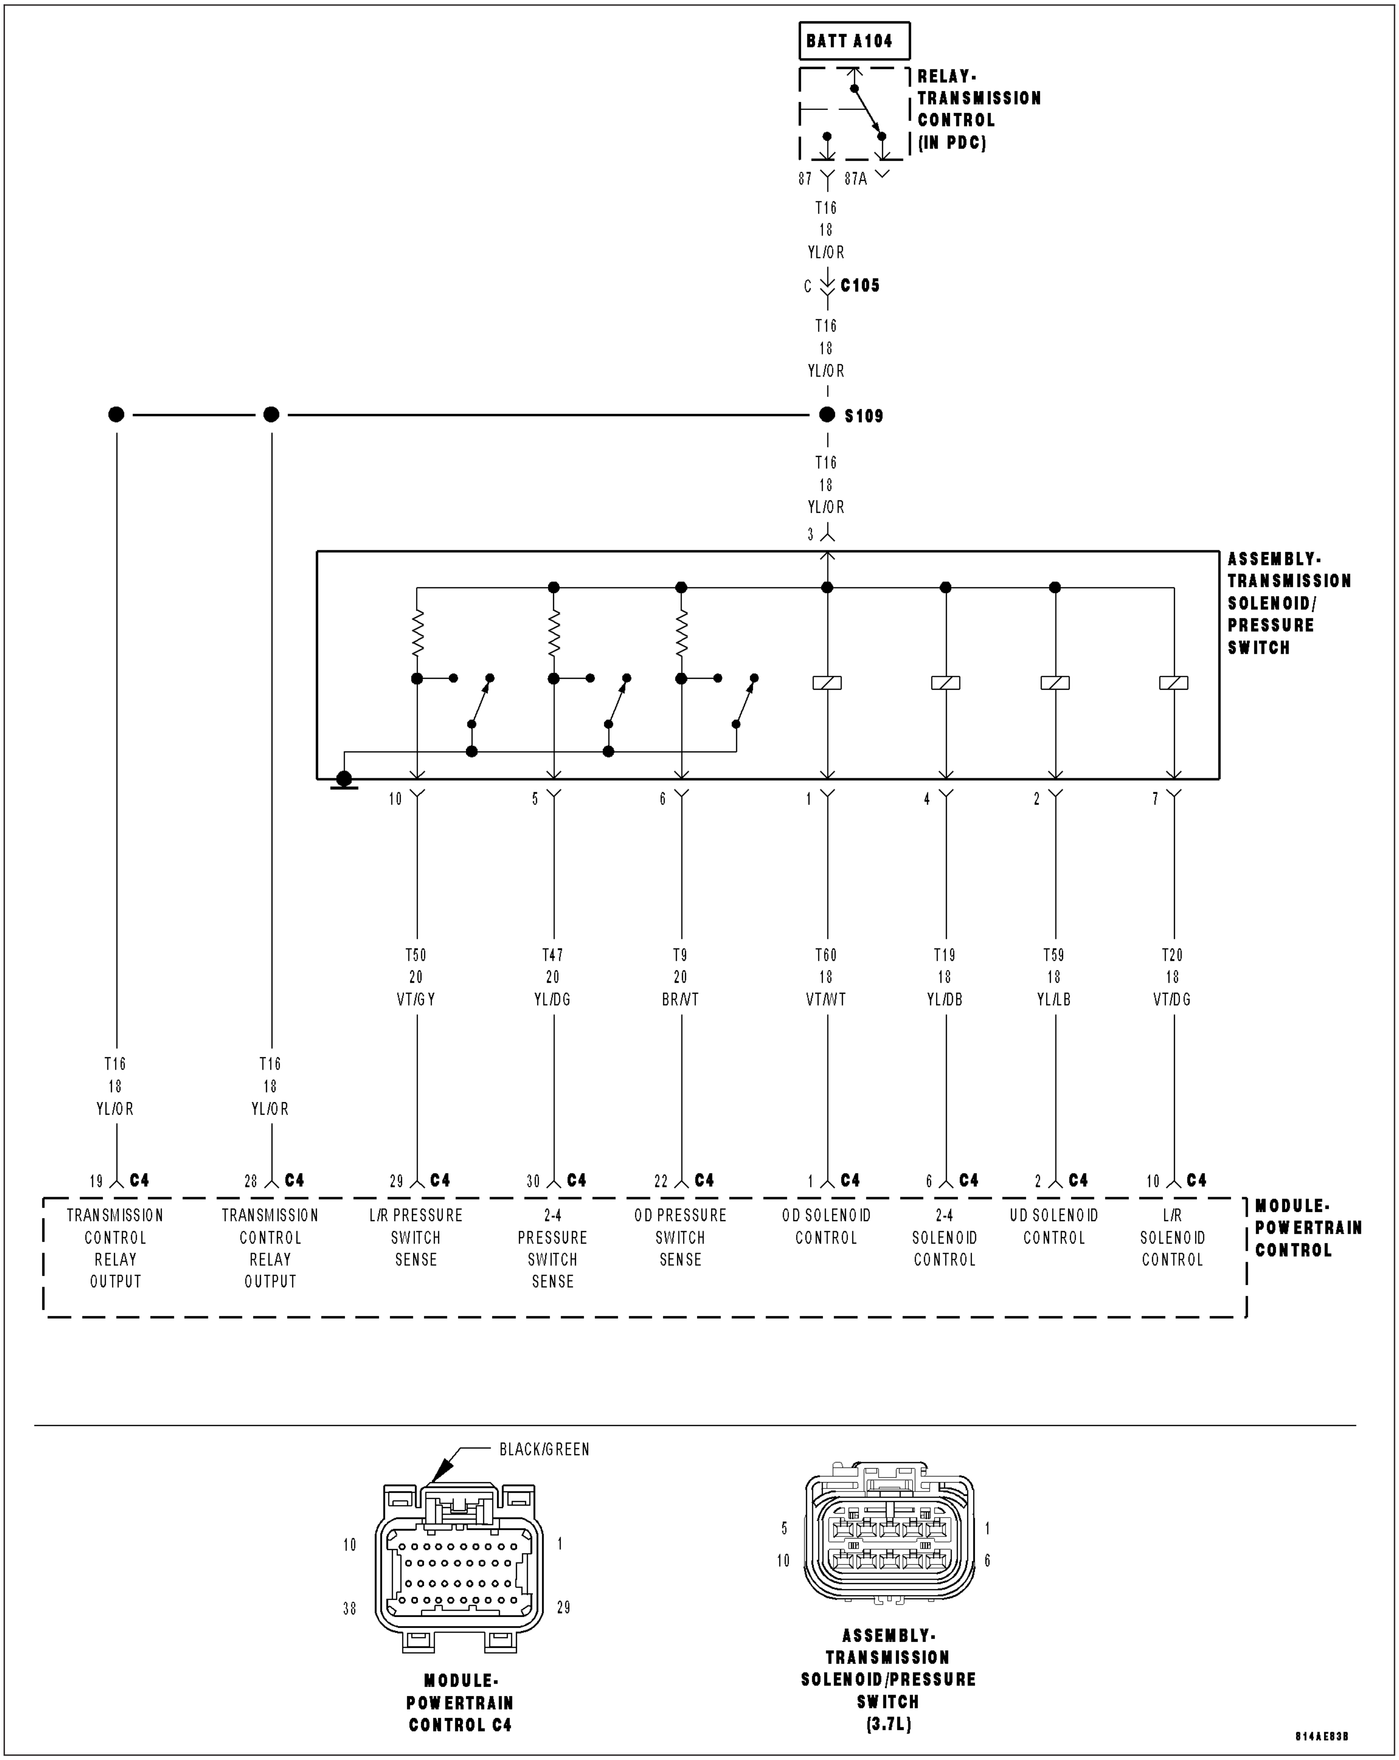
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0845-2/4 HYDRAULIC PRESSURE TEST



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  In any forward gear with engine speed above 1000 RPM, shortly after a shift and every minute thereafter.
- **Set Condition:**
  After a shift into a forward gear, with engine speed greater than 1000 RPM, the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to verify that the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets

| Possible Causes |
|---|
| LOSS OF PRIME P0944 PRESENT |
| (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN |
| (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T47) 2/4 PRESSURE SWITCH CIRCUIT SHORT TO GROUND |
| (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| INTERNAL TRANSMISSION |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 24 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 24 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to Limp-in mode.

## Diagnostic Test

### 1. CHECKING FOR LOSS OF PRIME DTC

With the scan tool, check for other Transmission DTCs.

**Is the DTC P0944 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK FOR RELATED TRANSMISSION DTCS

With the scan tool, read Transmission DTCs.

**Are any of the DTCs P0732, P0734 and/or P0846 present also?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK TO SEE IF DTC P0845 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 4

**No** >> Go To 9

## 4. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to 2/4.

With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Wiggle the wires leading to the PCM while pressing and holding the Pressure Switch Test button.

**Did the 2/4 Pressure Switch state change to closed and remain closed while wiggling the wires?**

**Yes** >> Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/Pressure Switch Assembly.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT OPEN

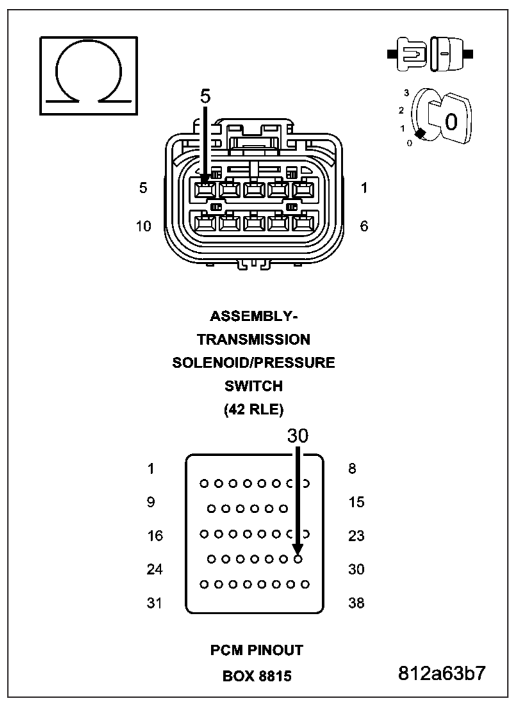
Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T47) 2/4 Pressure Switch Sense circuit from the appropriate terminal of special tool #8815 to the Transmission Solenoid/Pressure Switch Assembly harness connector.



**Is the resistance above 5.0 ohms?**

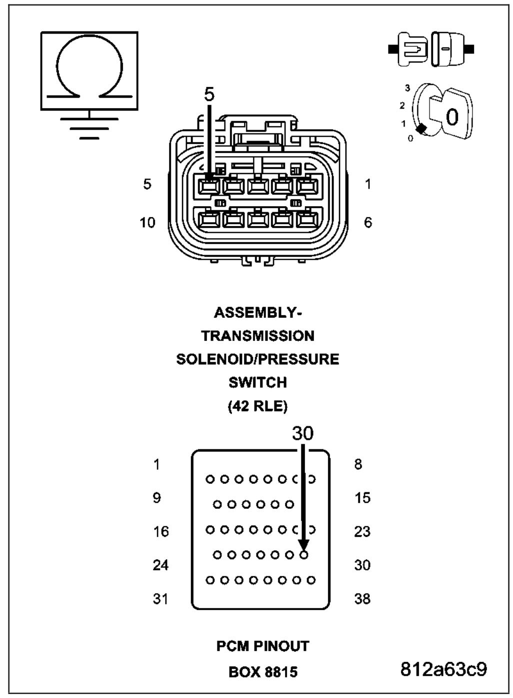
**Yes** >> Repair the (T47) 2/4 Pressure Switch Sense circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T47) 2/4 Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T47) 2/4 Pressure Switch Sense circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

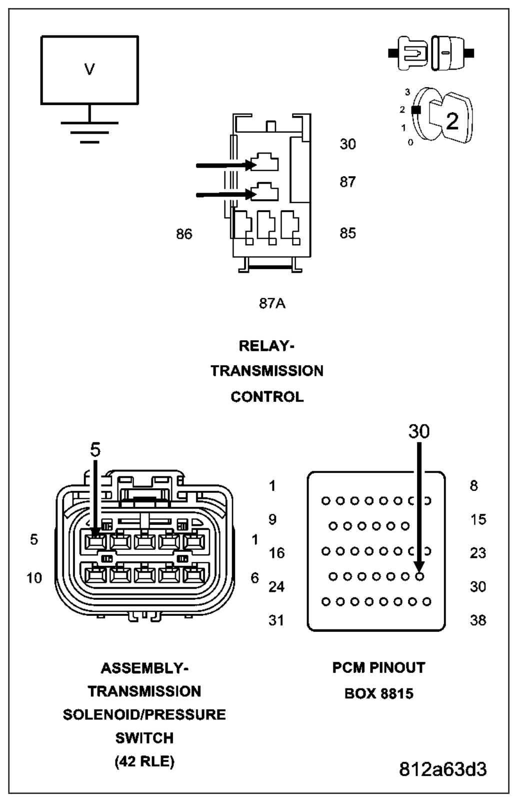
Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit.

Ignition on, engine not running.

Measure the voltage of the (T47) 2/4 Pressure Switch Sense circuit.



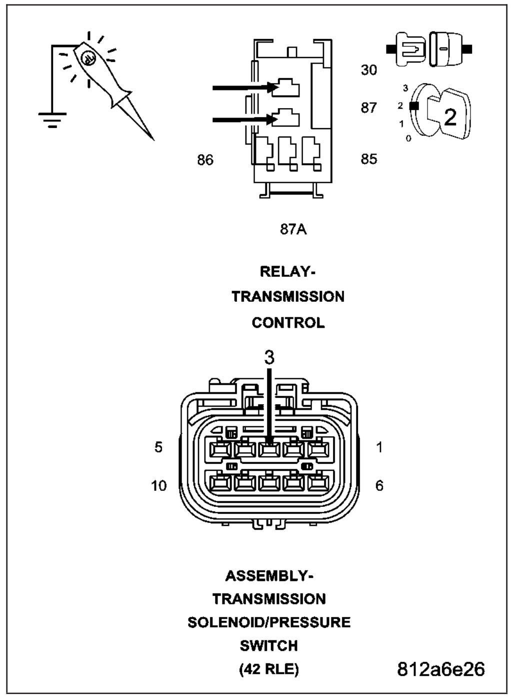
**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T47) 2/4 Pressure Switch Sense circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN



**NOTE: The jumper wire must still be in place.**

Using a 12-volt test light connected to ground, check (T16) Transmission Control Relay Output circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Repair the Transmission Control Relay Output circuit for an open or high resistance. If the fuse is open make sure to check for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

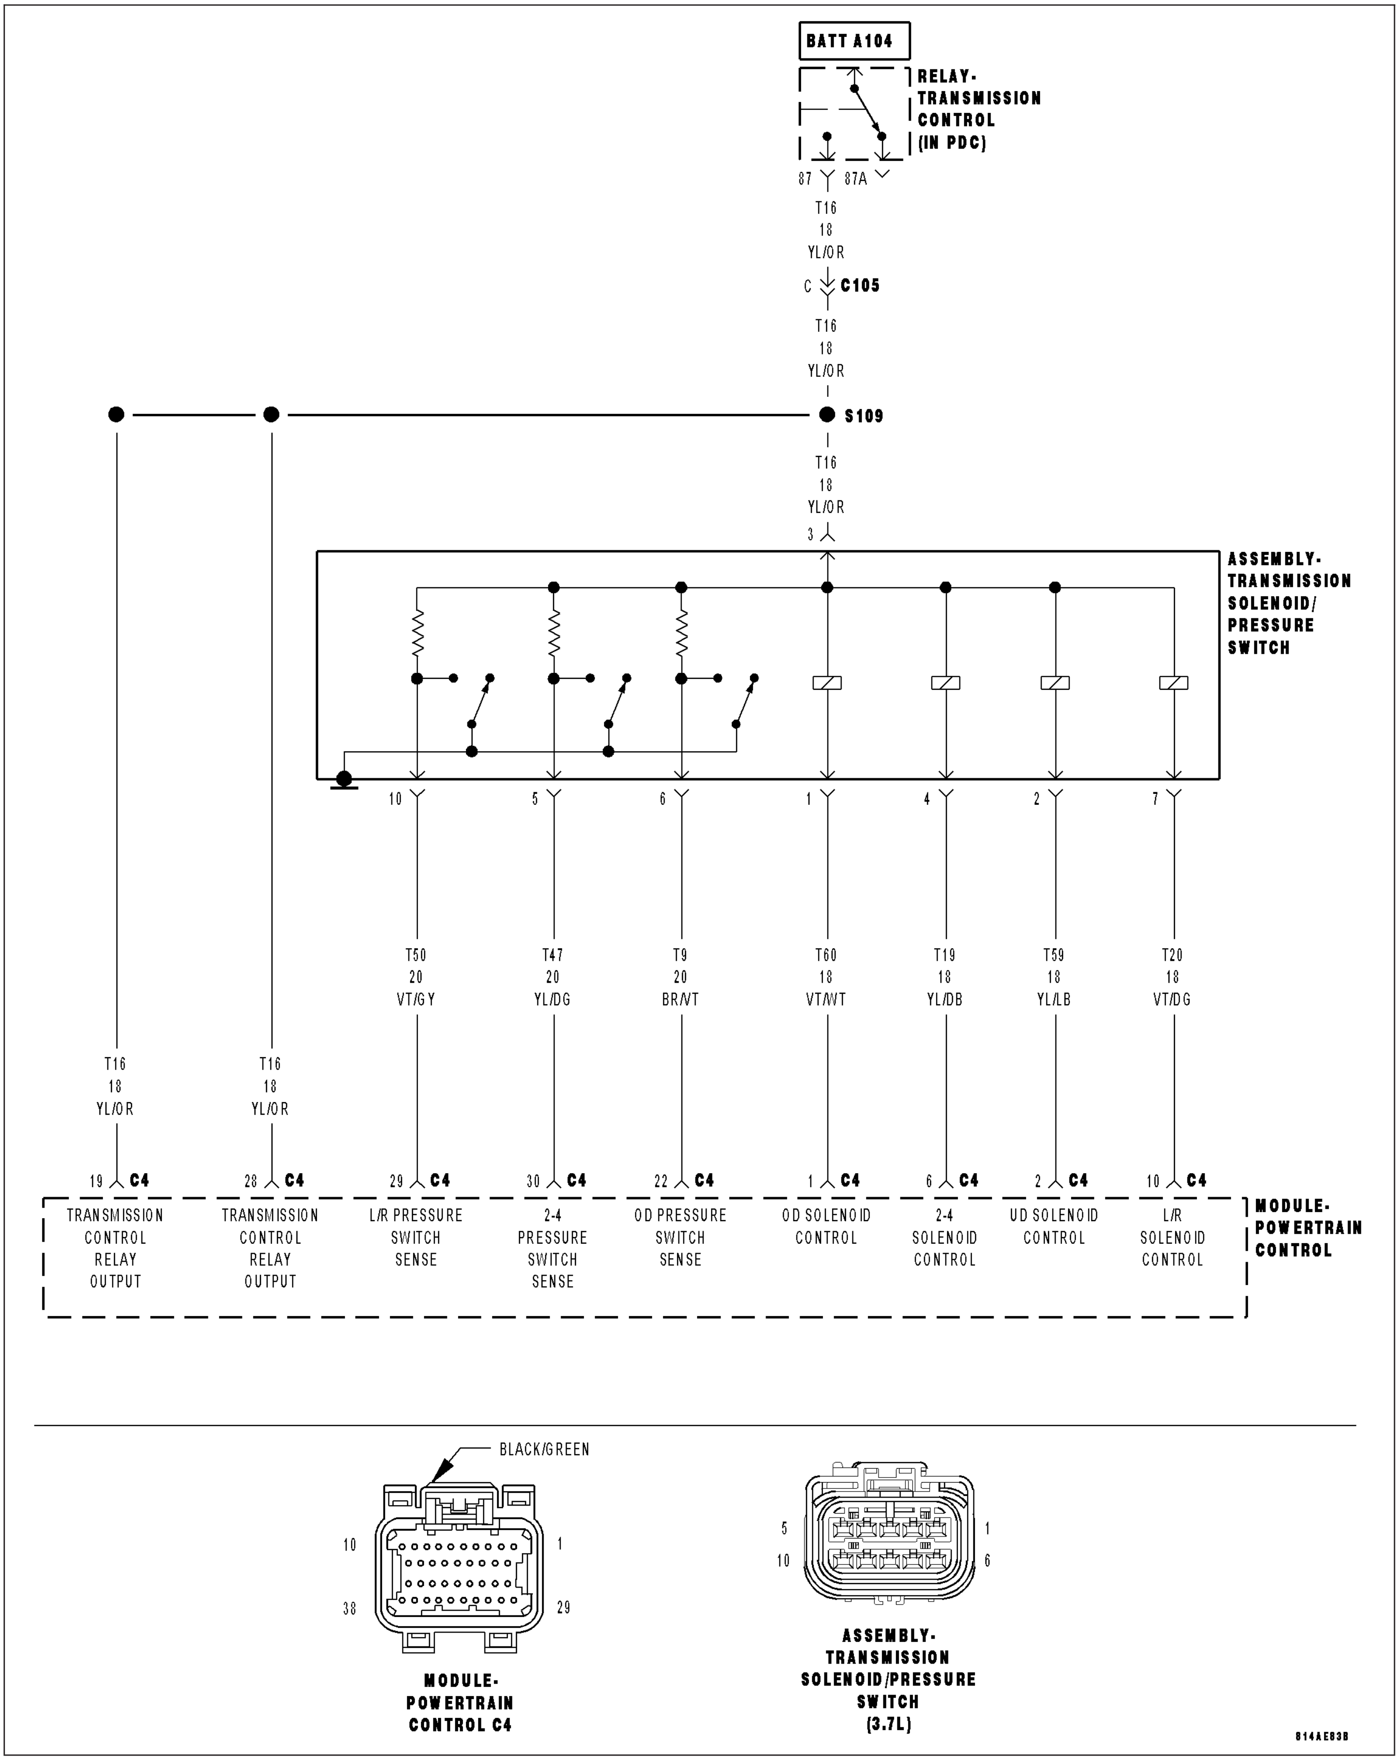
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0846-2/4 PRESSURE SWITCH RATIONALITY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running.
- **Set Condition:**
  The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into Limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

| Possible Causes |
| --- |
| RELATED TRANSMISSION CONTROL OUTPUT DTCS PRESENT |
| LOSS OF PRIME DTC PRESENT |
| (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. The 2/4 pressure switch monitors the fluid pressure to the 2/4 clutch to confirm proper operation of the 2/4 solenoid. If the 2/4 pressure switch is identified as closed in P or N, the code will immediately be set and normal operation will be allowed for that given key start. If the problem is identified for 3 successive ignition cycles, the transmission will go into Limp-in mode.

**PRESSURE SWITCH STATES**

| GEAR | L/R | 2/4 | OD |
| --- | --- | --- | --- |
| R | OP | OP | OP |
| P/N | CL | OP | OP |
| 1st | CL | OP | OP |
| 2nd | OP | CL | OP |
| D | OP | OP | CL |
| OD | OP | CL | CL |

**OP = OPEN**

**CL = CLOSED**

## Diagnostic Test

### 1. DETERMINING IF RELATED TRANSMISSION RELAY DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any Transmission Control Relay DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

## 2. CHECK FOR LOSS OF PRIME DTC

With the scan tool, check for other Transmission DTCs.

**Is the DTC P0944 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure.

**No** >> Go To 3

## 3. CHECK TO SEE IF P0846 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 4

**No** >> Go To 8

## 4. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector to 2/4.

With the scan tool , monitor the 2/4 Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

**Did the 2/4 Pressure Switch state change?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT OPEN

Turn the ignition off to the lock position.

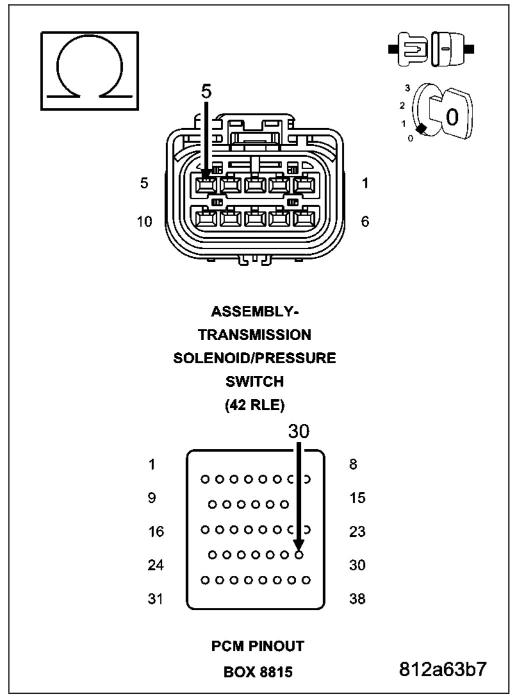
Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T47) 2/4 Pressure Switch Sense circuit from the appropriate terminal of special tool #8815 to the Transmission Solenoid/Pressure Switch Assembly harness connector.



**Is the resistance above 5.0 ohms?**

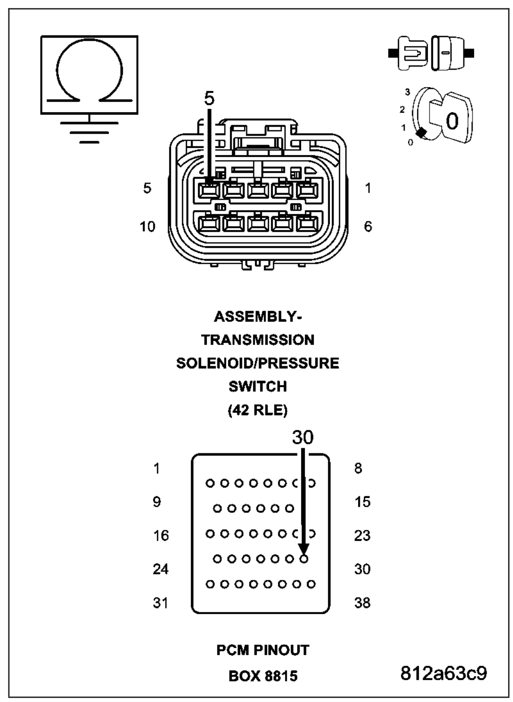
**Yes** >> Repair the (T47) 2/4 Pressure Switch Sense circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T47) 2/4 Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T47) 2/4 Pressure Switch Sense circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

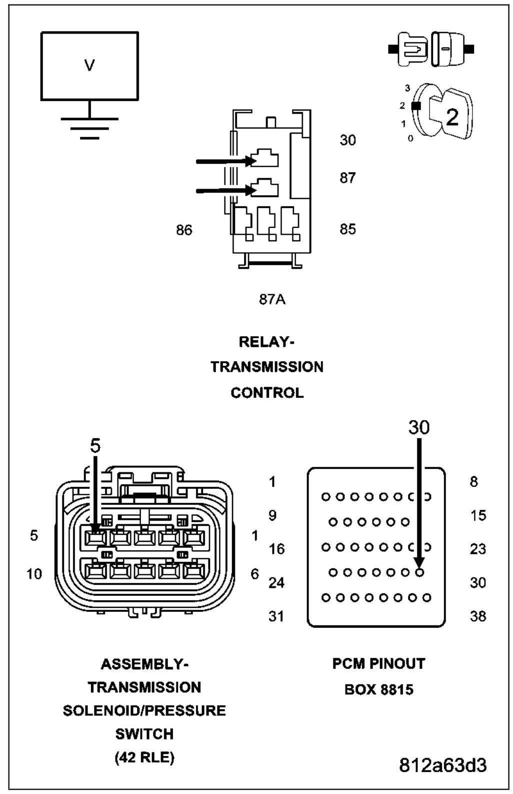
Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between the (A104) Fused B+ circuit and (T16) Transmission Control Relay Output circuit.

Ignition on, engine not running.

Measure the voltage of the (T47) 2/4 Pressure Switch Sense circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T47) 2/4 Pressure Switch Sense circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

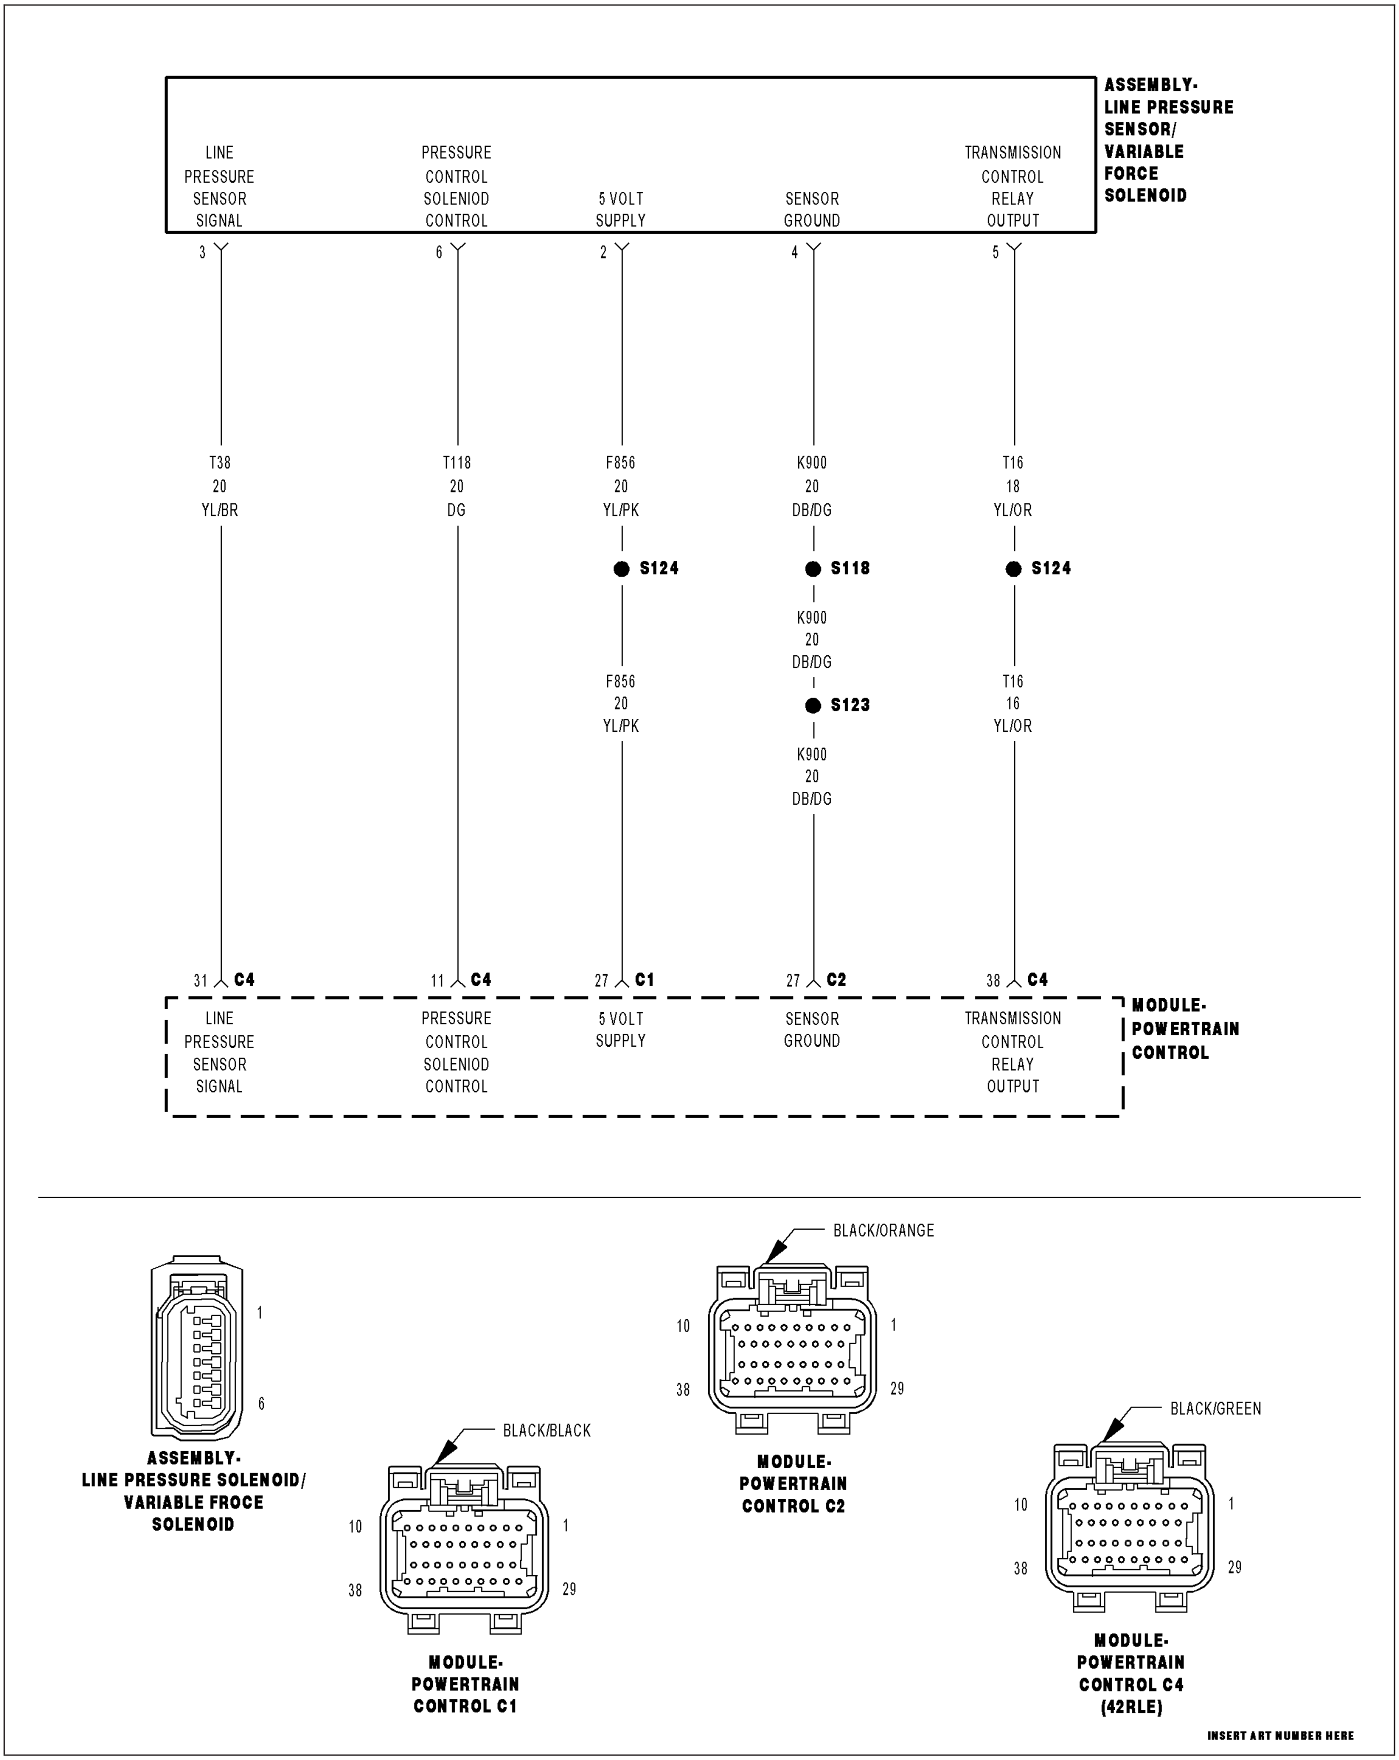
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0868-LINE PRESSURE LOW



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while driving in a forward gear.
- **Set Condition:**
  The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure is more than 10 psi below Desired Line Pressure, this DTC will set.

| Possible Causes |
|---|
| CHECK FOR RELATED DTC'S |
| LOW FLUID LEVEL |
| (F856) 5-VOLT SUPPLY CIRCUIT OPEN |
| (F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (F856) 5-VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE |
| (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT |
| INTERNAL TRANSMISSION |
| LINE PRESSURE SENSOR |
| CRACKED, PLUGGED, OR MIS-INSTALLED PRIMARY OIL FILTER |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs

**Is the DTC P0932 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

## 2. CHECK IF THE DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0868.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET COUNTER 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 10

## 3. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay from the PDC.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

On the Transmission Simulator select the ″OFF″ position of the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following steps.

Using the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions.

**NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?**

**Yes** >> Go To 4

**No** >> Go To 6

## 4. CHECK THE LINE PRESSURE SENSOR

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and reconnect all previously disconnected connectors.

Install a Pressure Gauge, 0 to 2000 kPa or 0 to 300 psi to the L/R test port.

Start the engine in park.

Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

**Is the line pressure gauge reading within 34 kPa or 5 psi of the scan tool reading?**

**Yes** >> Go To 5

**No** >> Replace the Line Pressure Sensor per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 5. CHECK FOR A PLUGGED TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Transmission Oil Filter per the Service Information.

**Does the Oil Pan contain excessive debris and/or is the Transmission Oil Filter plugged?**

**Yes** >> Repair as necessary. If the Transmission Oil Filter is plugged or there is excessive debris, refer to the Service Information for the proper Hydraulic repair procedure.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Repair internal transmission and inspect the Transmission Oil Pump per the Service Information and replace if necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

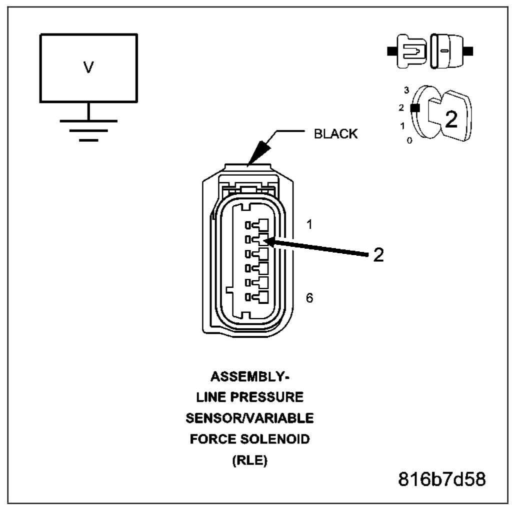
## 6. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Reconnect all previously disconnected connectors except the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (F856) 5-volt Supply circuit.



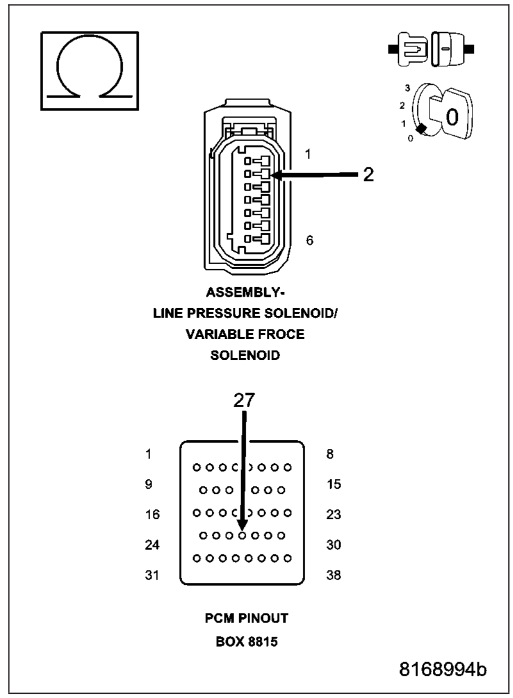
**Is the voltage above 5.5 volts?**

**Yes** >> Repair the (F856) 5-volt Supply circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

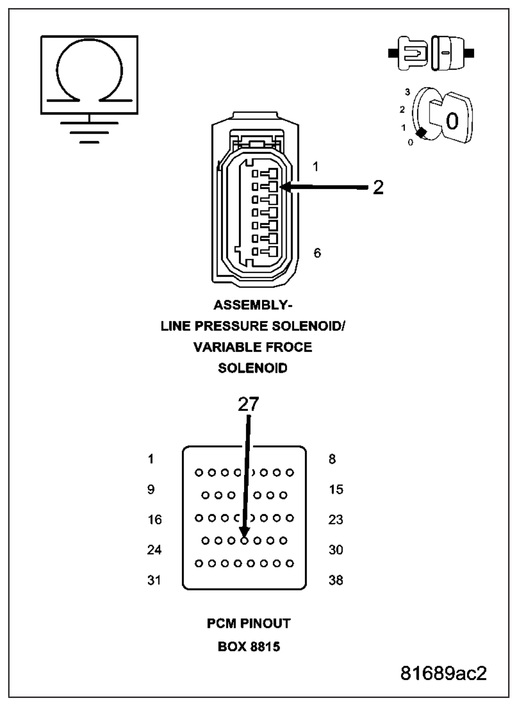
**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (F856) 5-volt Supply circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND



Measure the resistance between ground and the (F856) 5-volt Supply circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (F856) 5-volt Supply circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 9

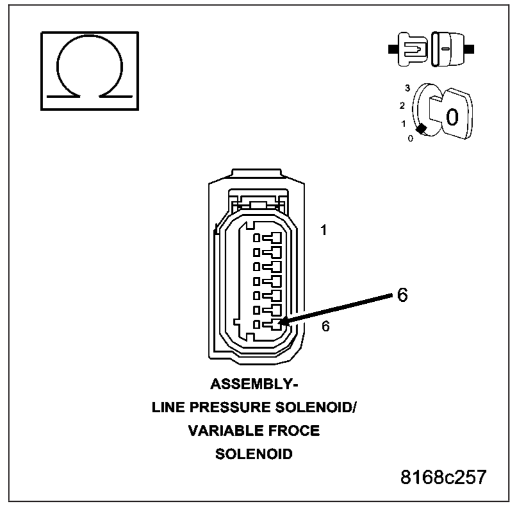
## 9. CHECK THE (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.

Disconnect all PCM harness connectors.

Measure the resistance between the (T118) Pressure Control Solenoid Control circuit and all other circuits in the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T118) Pressure Control Solenoid Control circuit and any other circuit(s) in the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector?**

**Yes** >> Repair the (T118) Pressure Control Solenoid Control circuit for a short to another circuit(s).

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 10. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

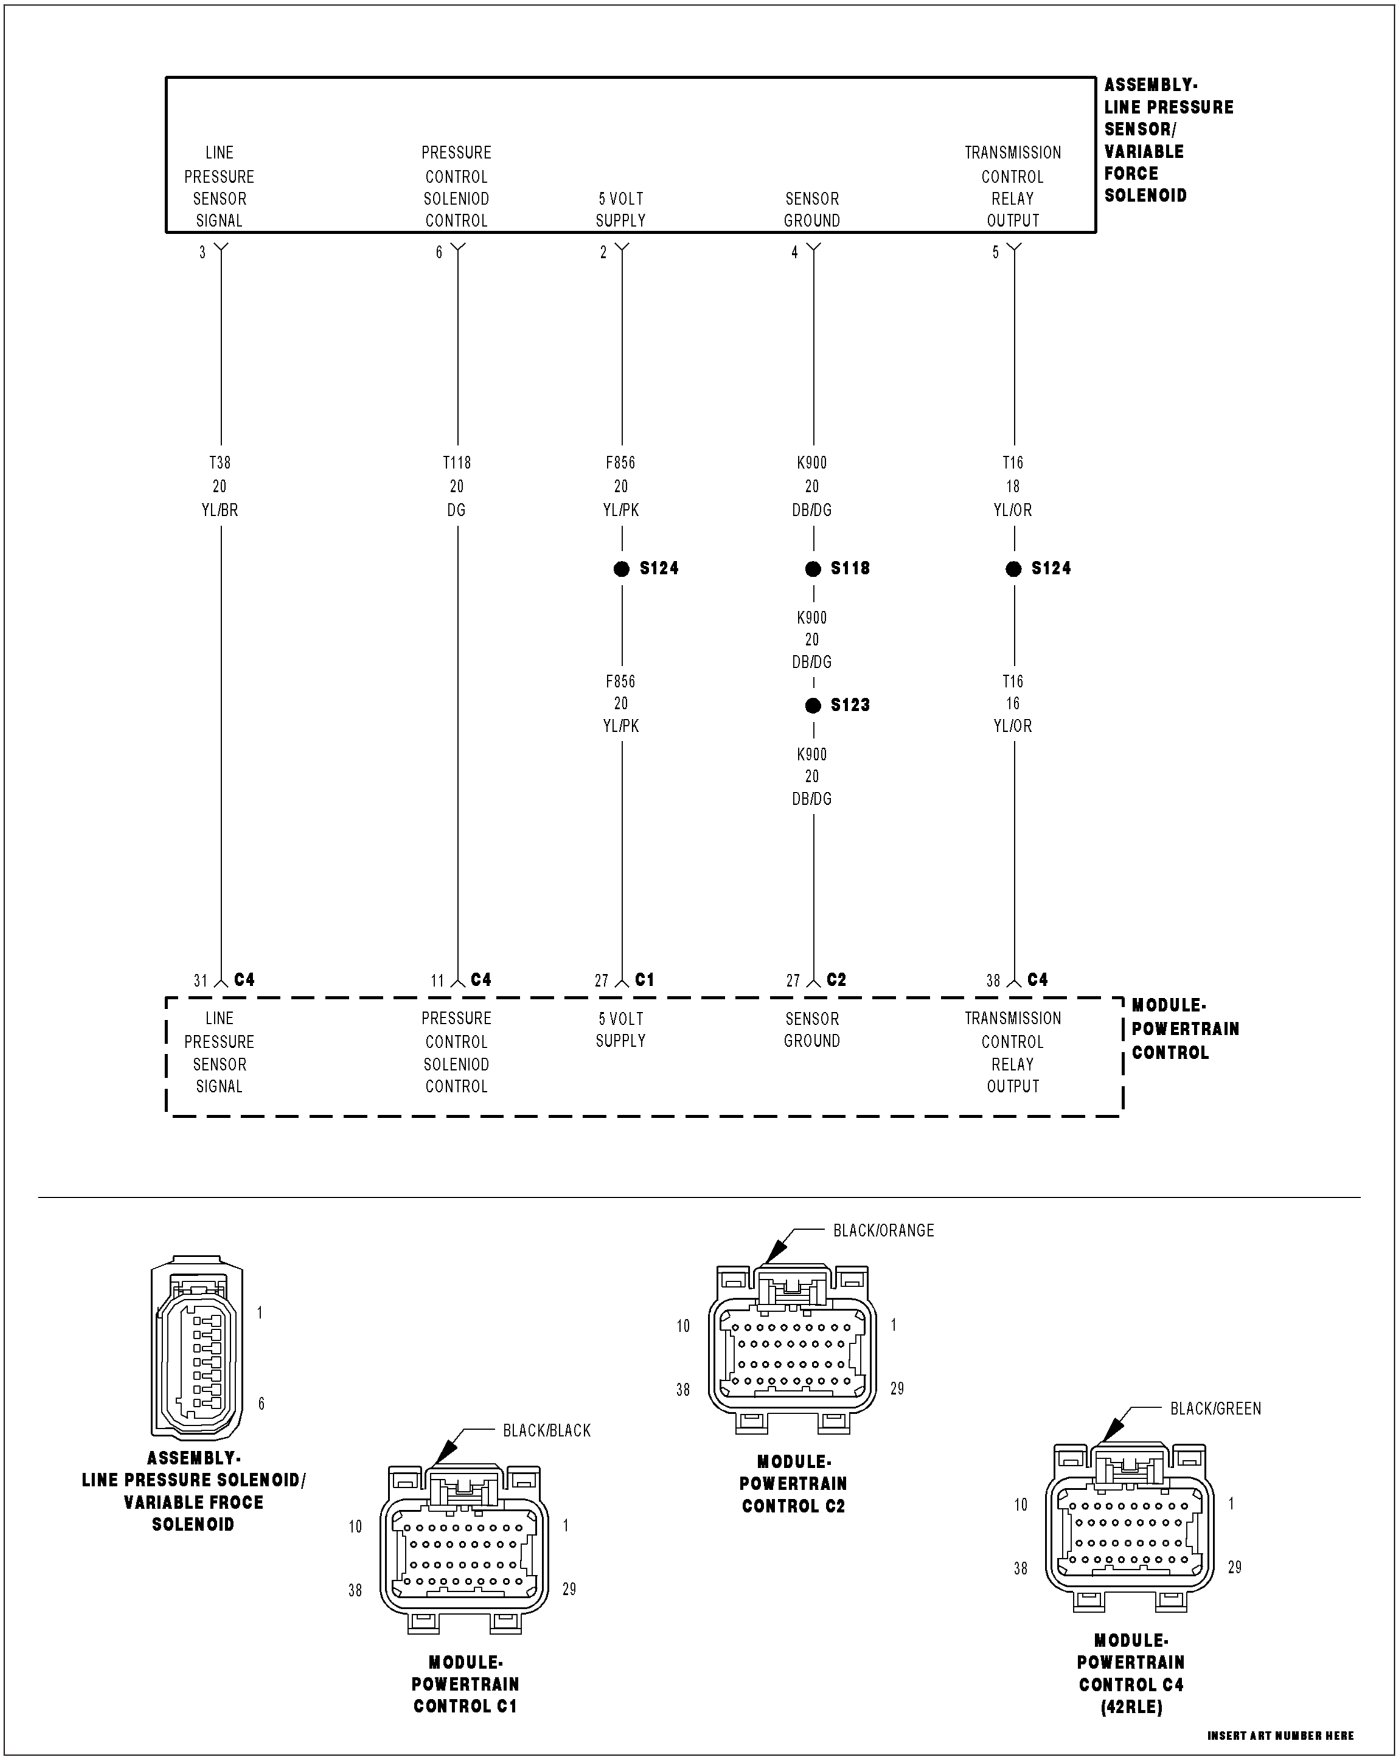
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0869-LINE PRESSURE HIGH



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while driving in a forward gear.
- **Set Condition:**
  The PCM continuously monitors Actual Line Pressure. If the Actual Line Pressure reading is greater than the highest Desired Line Pressure ever used in the current gear, while the Pressure Control Solenoid duty cycle is at or near its maximum value (which should result in minimum line pressure), the DTC will set.

| Possible Causes |
|---|
| (F856) 5-VOLT SUPPLY CIRCUIT OPEN |
| LINE PRESSURE SENSOR CONNECTION |
| (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT OPEN |
| (F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT |
| LINE PRESSURE SENSOR |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = Max line pressure, 62% duty cycle = solenoid on = Min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently higher than the highest desired line pressure ever used in the current gear, the line pressure high DTC P0869 will set.

## Diagnostic Test

### 1. CHECK FOR RELATED DTC'S

With the scan tool, check for other Transmission DTC's

**Are there any line pressure sensor or transmission relay output DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0869.

**Is the STARTS SINCE SET COUNTER 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 9

## 3. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following step.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

**NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?**

**Yes** >> Go To 4

**No** >> Go To 5

## 4. CHECK THE LINE PRESSURE SENSOR CALIBRATION

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit and reconnect all previously disconnected connectors.

Install the Line Pressure Gauge, Miller tool #C-3293, 0 to 2000 kPa or 0 to 300 psi in the L/R pressure port.

Start the engine in park.

Monitor the Line Pressure readings on the scan tool and the pressure gauge.

Compare the Line Pressure readings between the scan tool and the pressure gauge.

**Is the pressure gauge reading within 34 kPa or 5 psi of the scan tool reading?**

**Yes** >> Repair the internal transmission and inspect the Transmission Oil Pump per the Service Information and replace if necessary. If no problem is found, replace the Pressure Control Solenoid.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Replace the Line Pressure Sensor per the Service information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 5. CHECK THE (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR AN OPEN

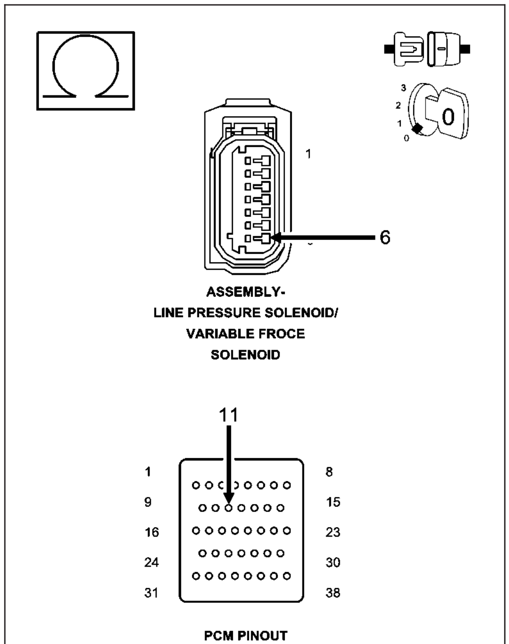
Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the Powertrain Control Module C4 harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T118) Pressure Control Solenoid Control circuit between the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.



816896d2

**Is the resistance above 5.0 ohms?**

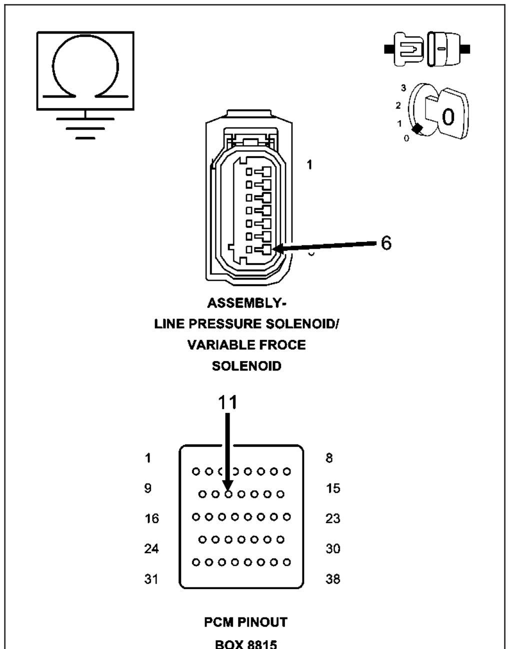
**Yes** >> Repair the (T118) Pressure Control Solenoid Control circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK THE (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T118) Pressure Control Solenoid Control circuit.



816897c7

**Is the resistance below 5.0 ohms?**

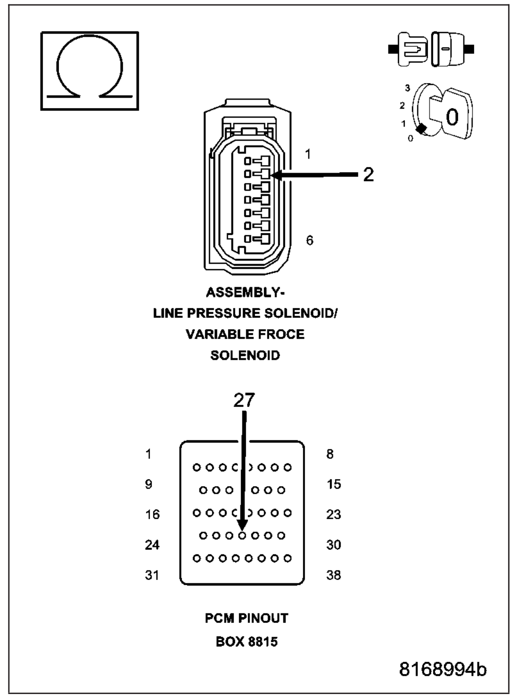
**Yes** >> Repair the (T118) Pressure Control Solenoid Control circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Measure the resistance of the (F856) 5-volt Supply circuit between the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector to the appropriate terminal of Miller tool #8815.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (F856) 5-volt Supply circuit for an open.

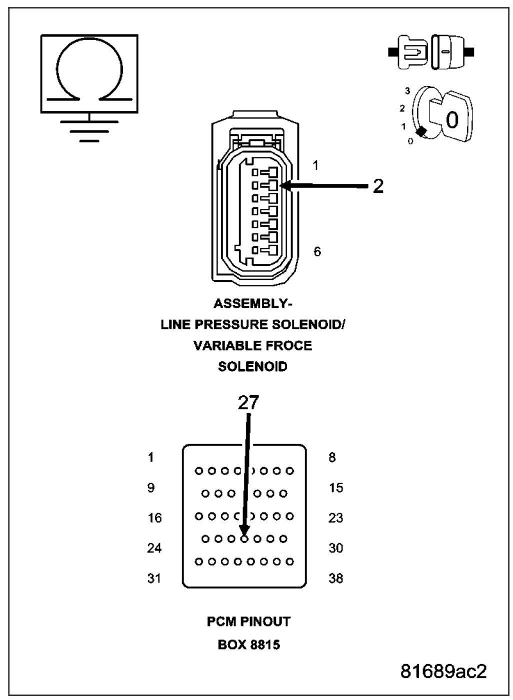
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Disconnect the PCM C1 harness connector.

Disconnect the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector.



**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (F856) 5-volt Supply circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 9. INTERMITTENT WIRING AND CONNECTORS

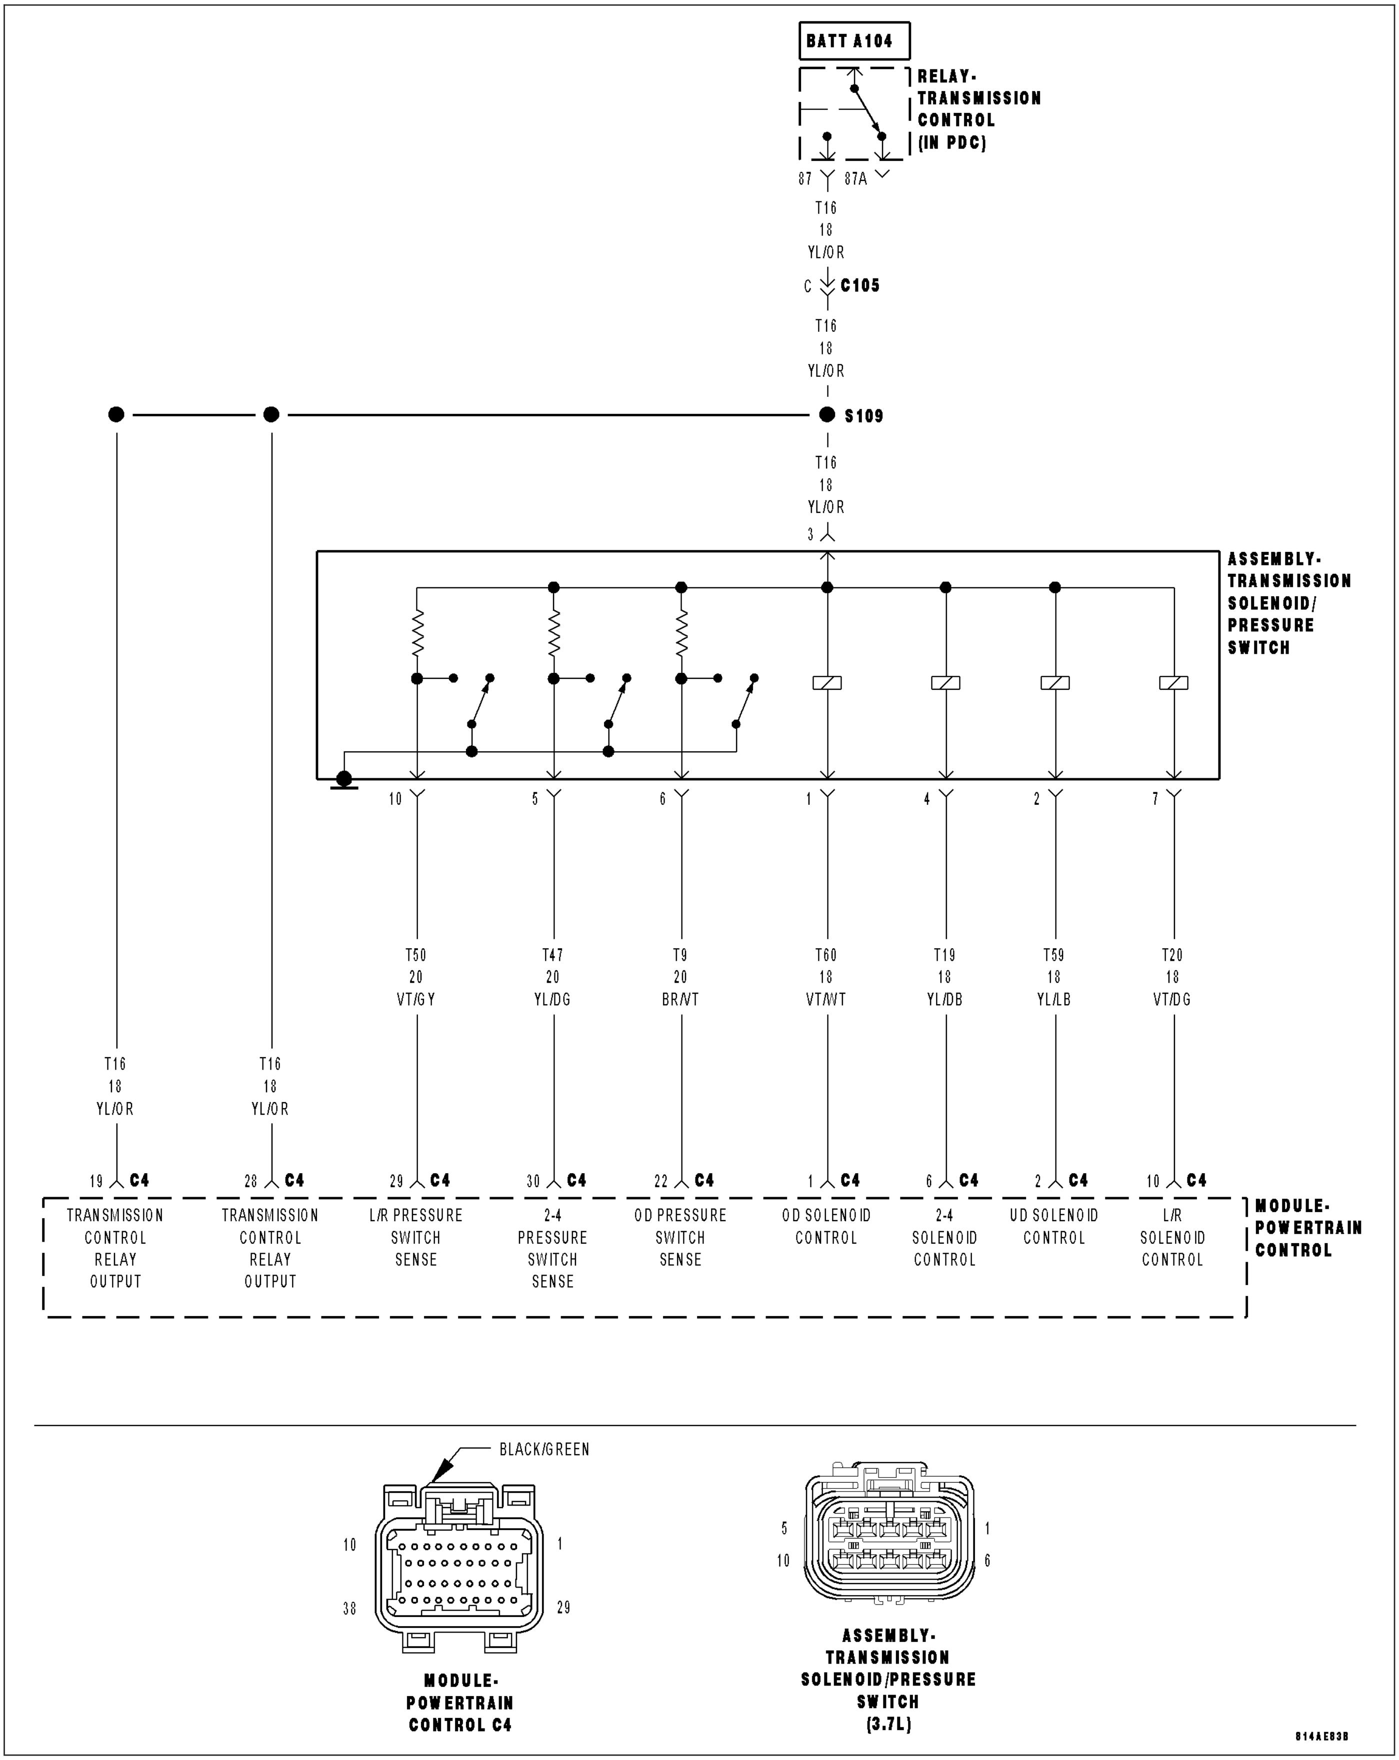
The conditions necessary to set this DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wires while checking for shorted and open circuits.
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Where there any problems found?**

**Yes** >> Repair as necessary.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0870-OD HYDRAULIC PRESSURE TEST



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  In any forward gear with engine speed above 1000 RPM, shortly after a shift and every minute thereafter.
- **Set Condition:**
  After a shift into a forward gear, with engine speed greater than 1000 RPM, the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to identify the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets.

| Possible Causes |
|---|
| LOSS OF PRIME P0944 PRESENT |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T9) OD PRESSURE SWITCH CIRCUIT SHORT TO GROUND |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| INTERNAL TRANSMISSION |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 2/4 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to Limp-in mode.

## Diagnostic Test

### 1. CHECKING FOR LOSS OF PRIME DTC

With the scan tool, check for other Transmission DTCs.

**Is the DTC P0944 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure.

**No** >> Go To 2

### 2. CHECK FOR RELATED TRANSMISSION DTCS

With the scan tool, read Transmission DTCs.

**Are any of the DTCs P0732, P0734 and/or P0846 present also?**

**Yes** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK TO SEE IF DTC P0870 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 4

**No** >> Go To 9

## 4. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to OD.

With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

Wiggle the wires leading to the PCM while pressing and holding the Pressure Switch Test button.

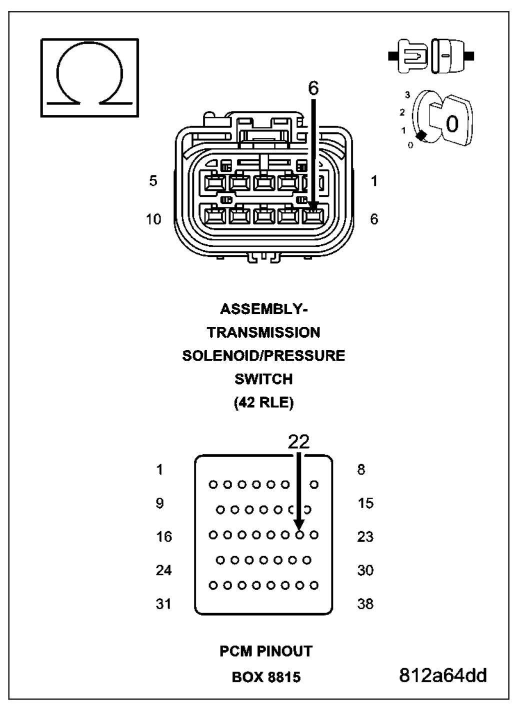
**Did the OD Pressure Switch state change to closed and remain closed while wiggling the wires?**

**Yes** >> Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/Pressure Switch Assembly.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (T9) OD PRESSURE SWITCH SENSE CIRCUIT OPEN



Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (T9) OD Pressure Switch Sense circuit from the appropriate terminal of special tool #8815 to the Transmission Solenoid/Pressure Switch Assembly harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

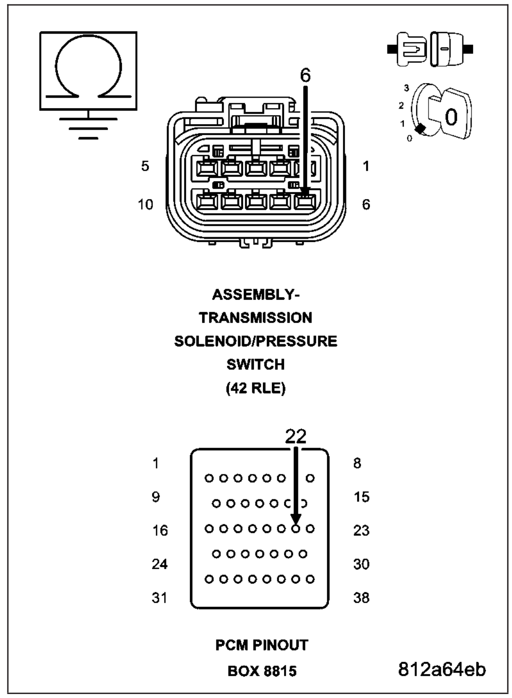
Measure the resistance between ground and the (T9) OD Pressure Switch Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7



## 7. (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit.

Ignition on, engine not running.

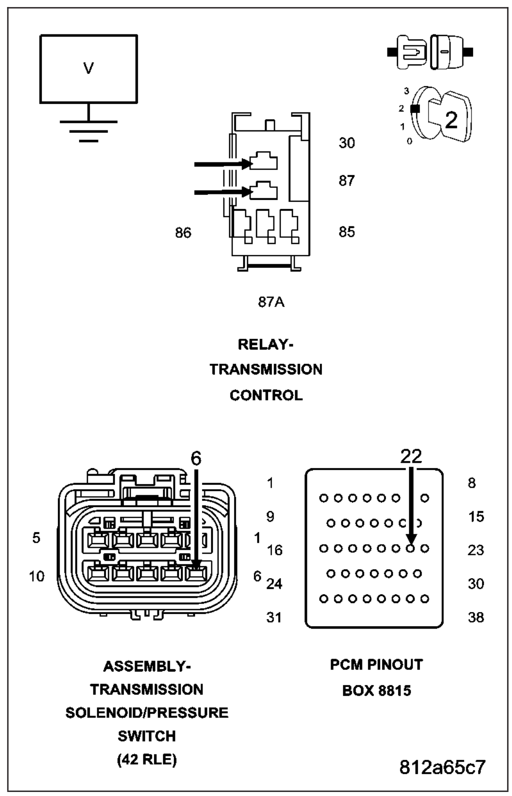
Measure the voltage of the (T9) OD Pressure Switch Sense circuit.

**Is the voltage above 0.5 volts?**

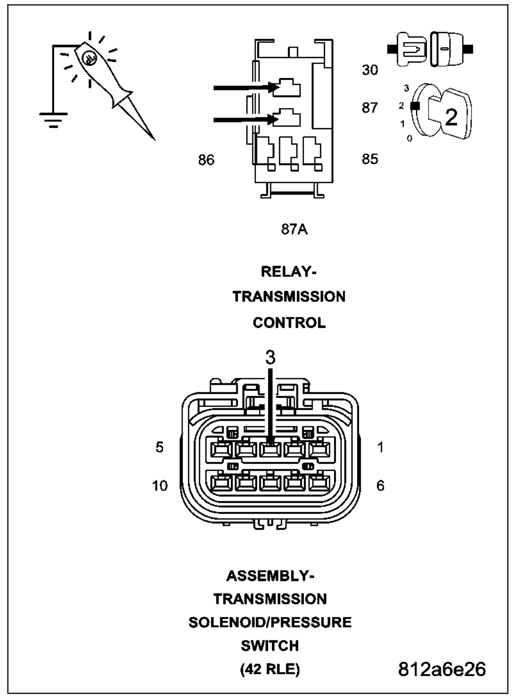
**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 8



## 8. (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN



**NOTE: The jumper wire must still be in place.**

Using a 12-volt test light connected to ground, check (T16) Transmission Control Relay Output circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Repair the (T16) Transmission Control Relay Output circuit for an open. If the fuse is open make sure to check for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

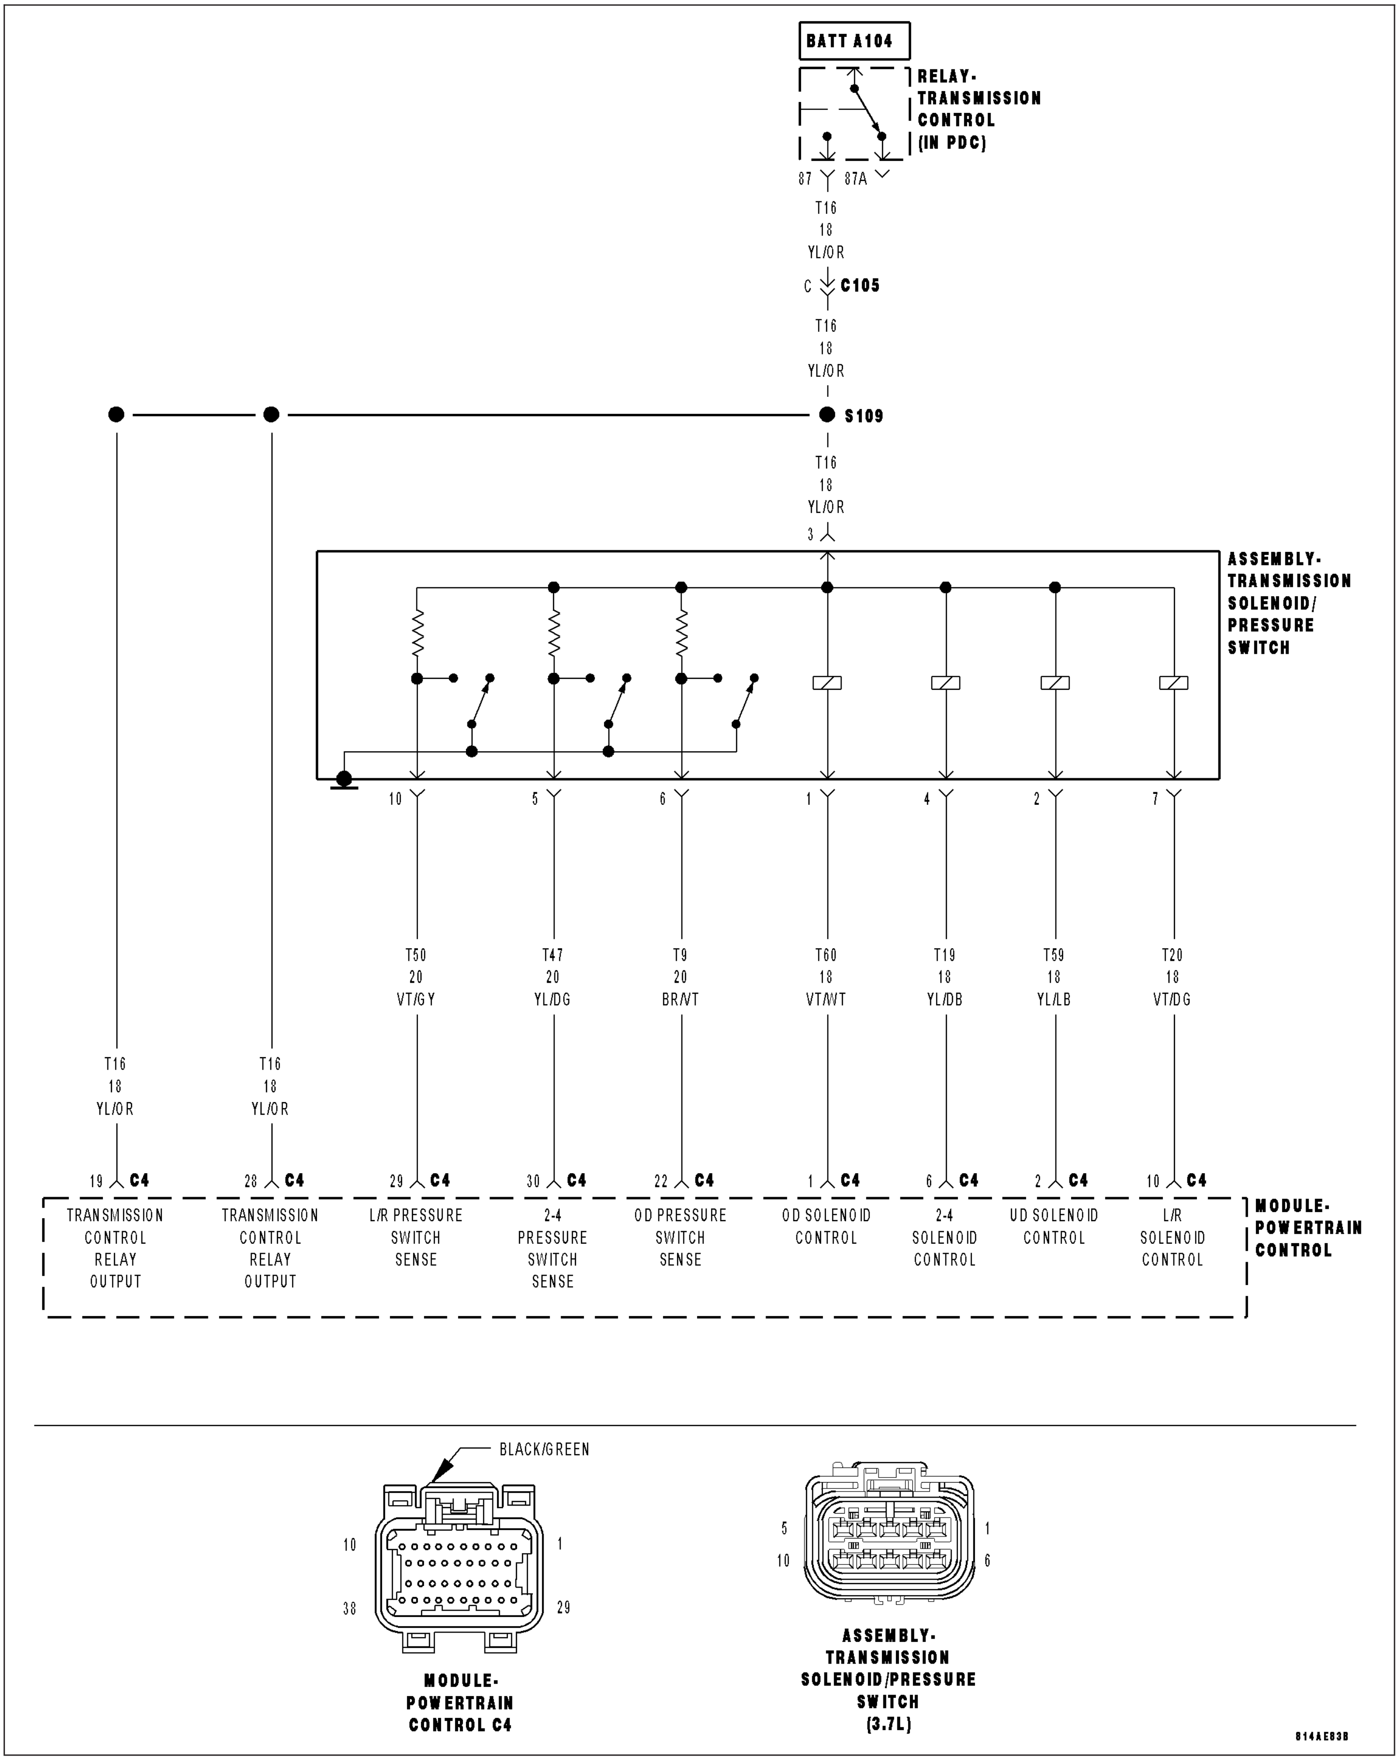
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0871-OD PRESSURE SWITCH RATIONALITY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running.
- **Set Condition:**
  The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into Limp-in mode and the MIL will turn on after 10 seconds of vehicle operation.

| Possible Causes |
| --- |
| RELATED TRANSMISSION RELAY DTCS PRESENT |
| LOSS OF PRIME DTC PRESENT |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. Normal operation will be experienced if no other codes are present. Transmission Control System will ignore the code. Limp-in condition will only occur if DTC P0871 is present with a DTC P0706.

**PRESSURE SWITCH STATES**

| GEAR | L/R | 2/4 | OD |
| --- | --- | --- | --- |
| R | OP | OP | OP |
| P/N | CL | OP | OP |
| 1st | CL | OP | OP |
| 2nd | OP | CL | OP |
| D | OP | OP | CL |
| OD | OP | CL | CL |

**OP = OPEN**

**CL = CLOSED**

## Diagnostic Test

### 1. DETERMINING IF RELATED TRANSMISSION RELAY DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any Transmission Control Relay DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 2

## 2. CHECK FOR LOSS OF PRIME DTC

With the scan tool, check for other Transmission DTCs.

**Is the DTC P0944 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate diagnostic procedure.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK TO SEE IF P0841 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 4

**No** >> Go To 10

## 4. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay is to prevent a Transmission NO RESPONSE condition and to disable the starter.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A.

**NOTE: Check connectors - Clean/repair as necessary.**

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector to OD.

With the scan tool , monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

**Did the OD Pressure Switch state change?**

**Yes** >> Go To 8

**No** >> Go To 5

## 5. (T9) OD PRESSURE SWITCH SENSE CIRCUIT OPEN

Turn the ignition off to the lock position.

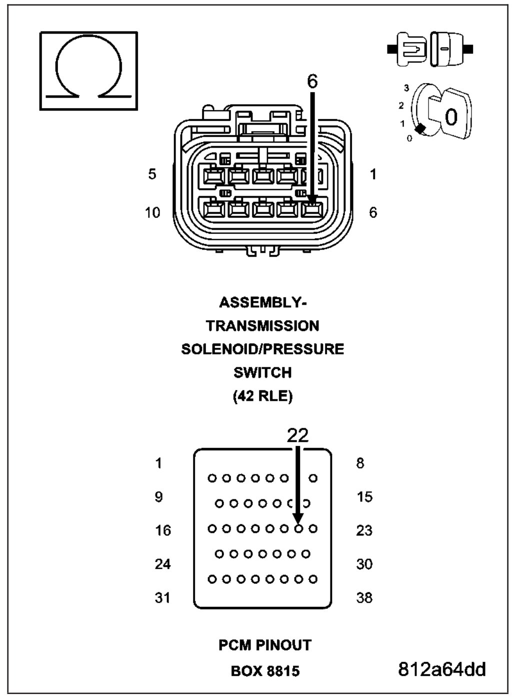
Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (T9) OD Pressure Switch Sense circuit from the appropriate terminal of special tool #8815 to the Transmission Solenoid/Pressure Switch Assembly harness connector.



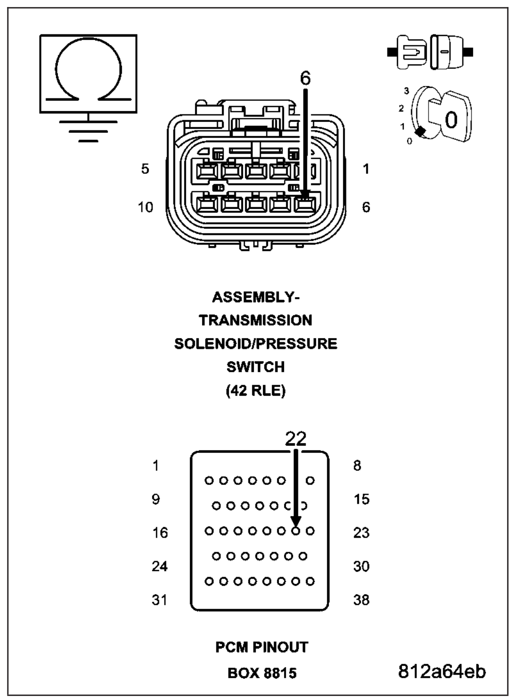
**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for an open.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T9) OD Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to ground.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 7

## 7. (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

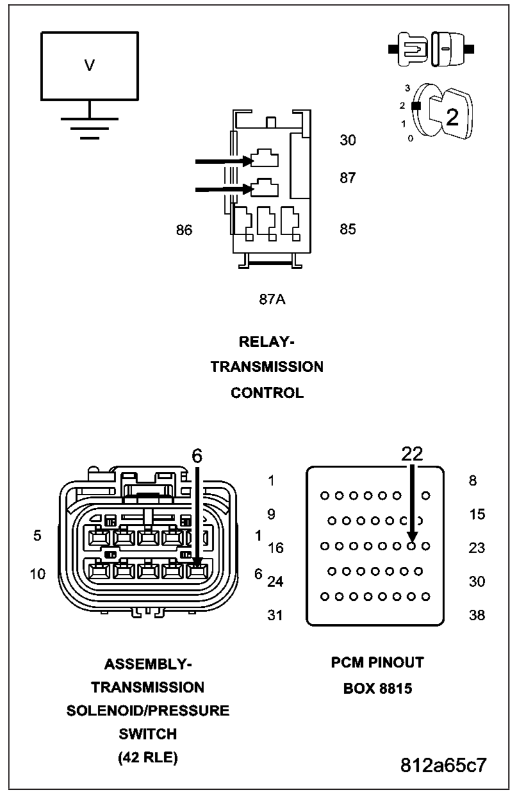
Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between the (A104) Fused B+ circuit and (T16) Transmission Control Relay Output circuit.

Ignition on, engine not running.

Measure the voltage of the (T9) OD Pressure Switch Sense circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 9

## 8. OD PRESSURE SWITCH

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

## 9. POWERTRAIN CONTROL MODULE

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Powertrain Control Module per the Service Information. With the scan tool perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

## 10. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

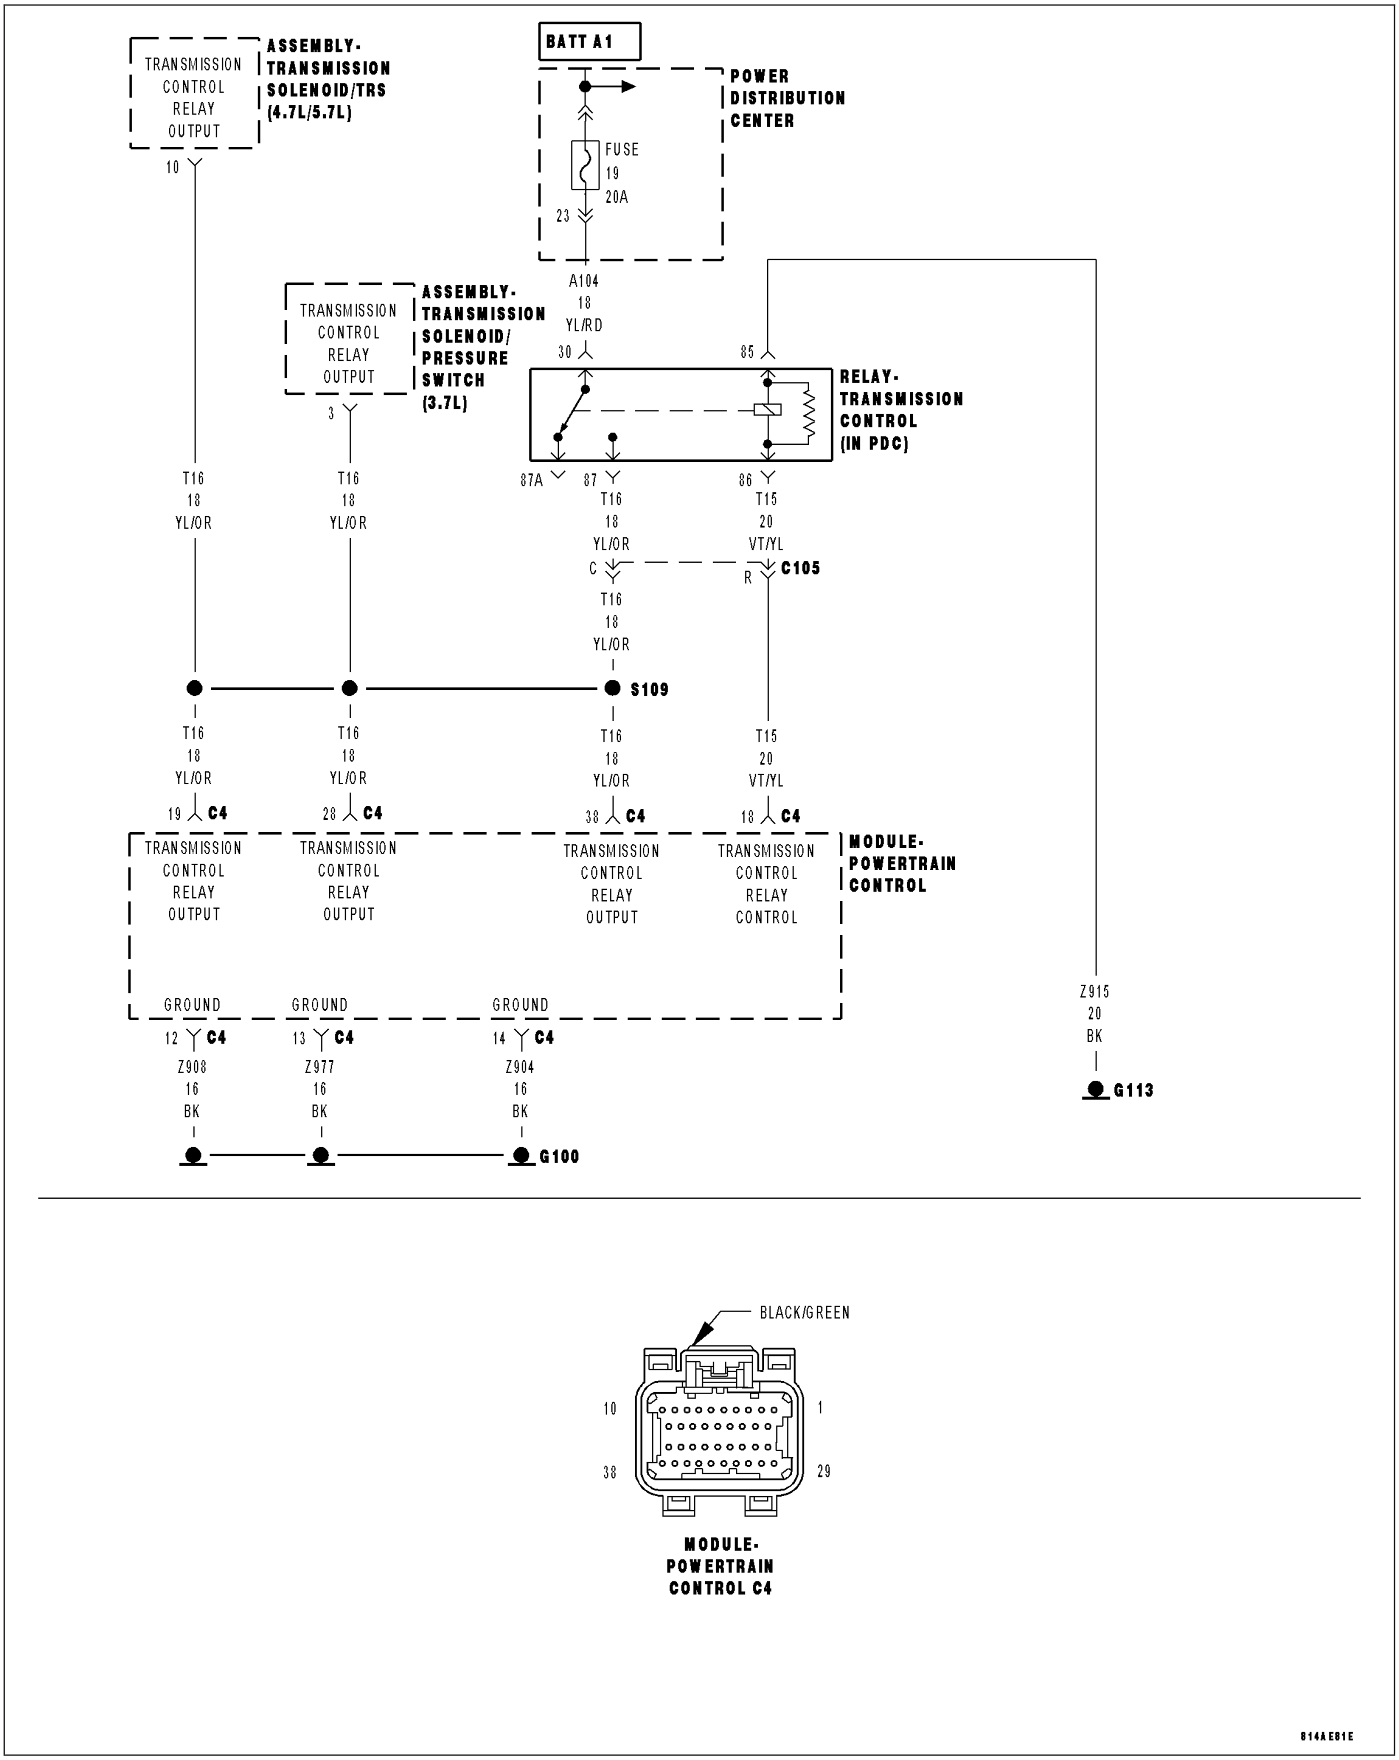
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## P0882-TCM POWER INPUT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  This DTC is set when the Transmission Control Relay output circuit voltage at the Powertrain Control Module is less than 3 volts when the PCM is energizing the relay. Note: Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.

| Possible Causes |
| --- |
| (A104) FUSED B(+) CIRCUIT OPEN |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN |
| (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT OPEN |
| (Z915) TRANSMISSION CONTROL RELAY GROUND CIRCUIT OPEN |
| (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO GROUND |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT TO GROUND |
| TRANSMISSION CONTROL RELAY |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the PCM. It is referred to as the Trans Relay Output circuit or switched battery. After a controller reset (ignition key turned to the run position or after cranking engine), the controller energizes the relay. Prior to this, the PCM verifies that the contacts are open by checking for no voltage at the transmission control relay outputs (switched battery) terminals. After the relay is energized, the PCM monitors the terminals to verify that the voltage is greater than 3 volts. The MIL illuminates and the transmission will be placed in Limp-in.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0882 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter equal to 0?**

**Yes** >> Go To 2

**No** >> Go To 10

## 2. CHECK THE (A104) FUSED B(+) CIRCUIT

Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

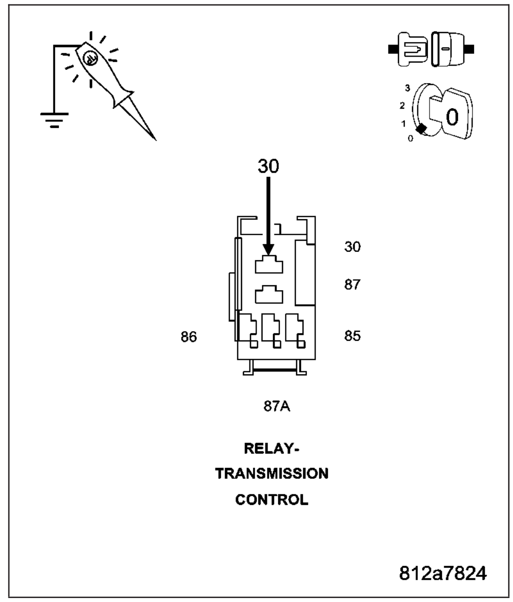
Using a 12-volt test light connected to ground, check the (A104) Fused B(+) circuit in the Transmission Control Relay connector.

**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Go To 8



## 3. (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuits at the Transmission Control Relay connector.

Ignition on, engine not running.

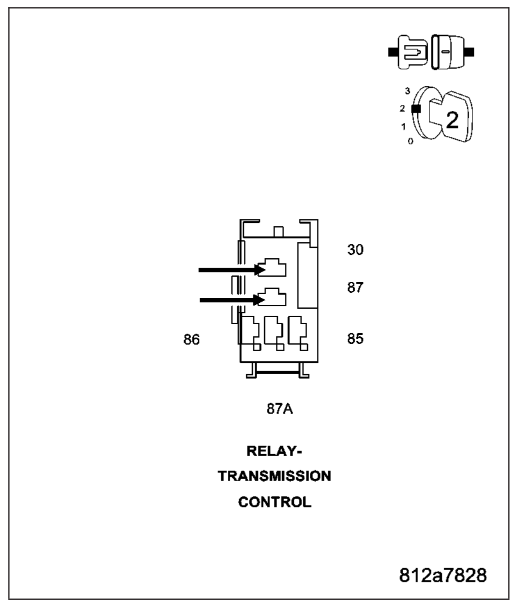
With the scan tool, read the Transmission Switched Battery voltage.

**Is the Switched Battery voltage equal to battery voltage?**

**Yes** >> Go To 4

**No** >> Repair the (T16) Transmission Control Relay Output circuits for an open or high resistance. Note: There are multiple Transmission Control Relay Output circuits.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 4. TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

Install a substitute Relay in place of the Transmission Control Relay.

Ignition on, engine not running.

With the scan tool, read the Transmission Switched Battery voltage.

**Is the Switched Battery voltage equal to battery voltage?**

**Yes** >> Replace the Transmission Control Relay.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (Z915) TRANSMISSION CONTROL RELAY GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z915) Transmission Control Relay Ground circuit.

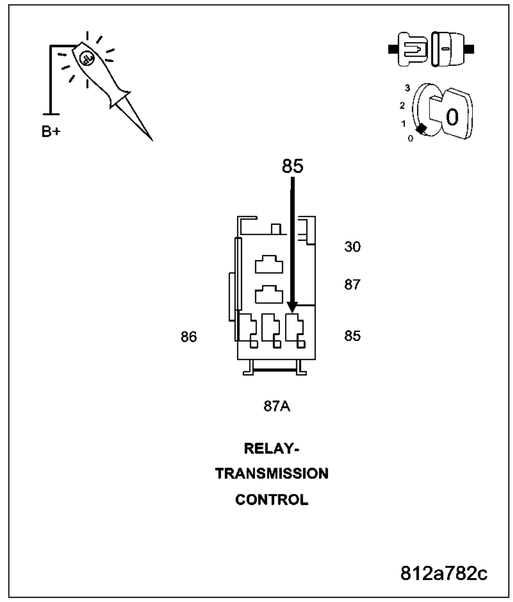
**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (Z915) Transmission Control Relay Ground circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 6. (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

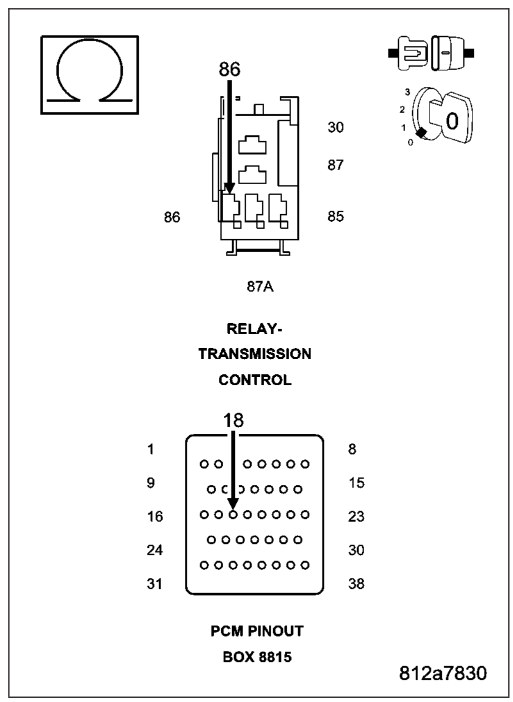
Measure the resistance of the (T15) Transmission Control Relay Control circuit between the Transmission Control Relay connector and the appropriate terminal of special tool #8815.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T15) Transmission Control Relay Control circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7



## 7. (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T15) Transmission Control Relay Control circuit.

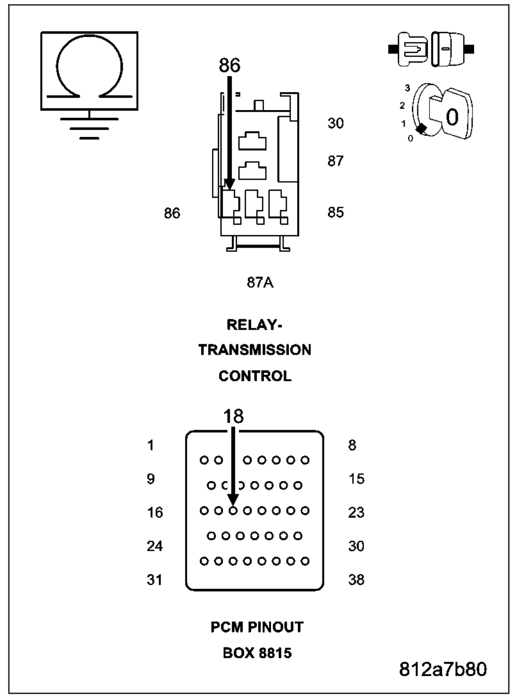
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T15) Transmission Control Relay Control circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 8. CHECK THE FUSED B(+) CIRCUIT FOR SHORT TO GROUND

Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

Disconnect the PCM C4 harness connectors.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

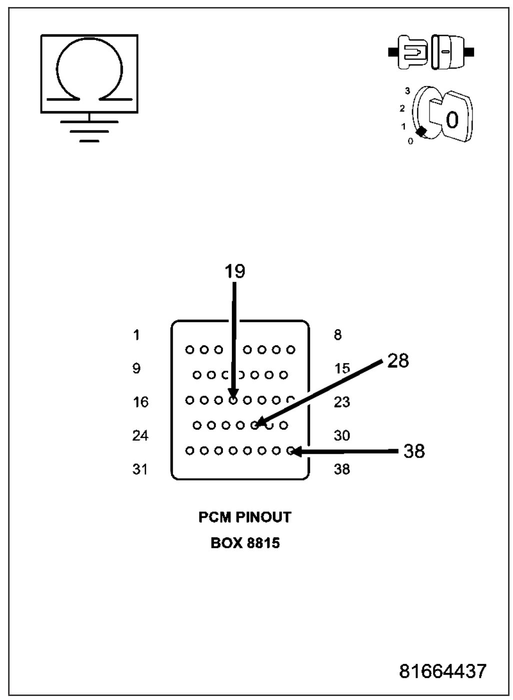
Measure the resistance between ground and the (T16) Transmission Control Relay Output circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 9

**No** >> Repair the Fused B(+) circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 9. (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT TO GROUND

Disconnect the Transmission Solenoid/Pressure Switch harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between ground and the (T16) Transmission Control Relay Output circuit.

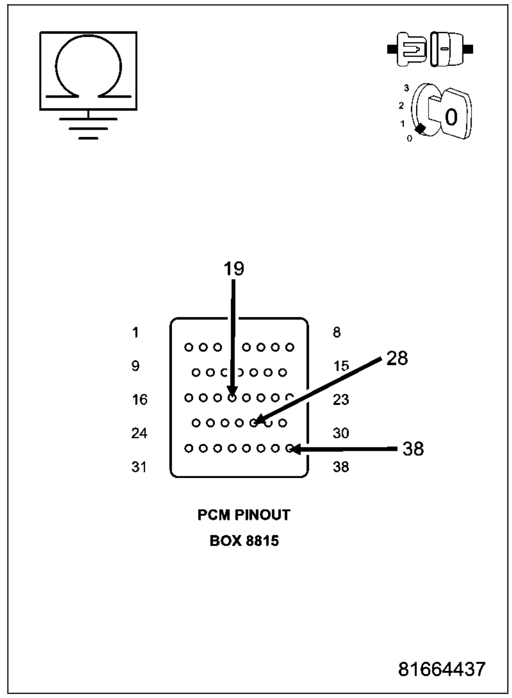
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T16) Transmission Control Relay Output circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 10. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the EVENT DATA to help identify the conditions in which the DTC was set.

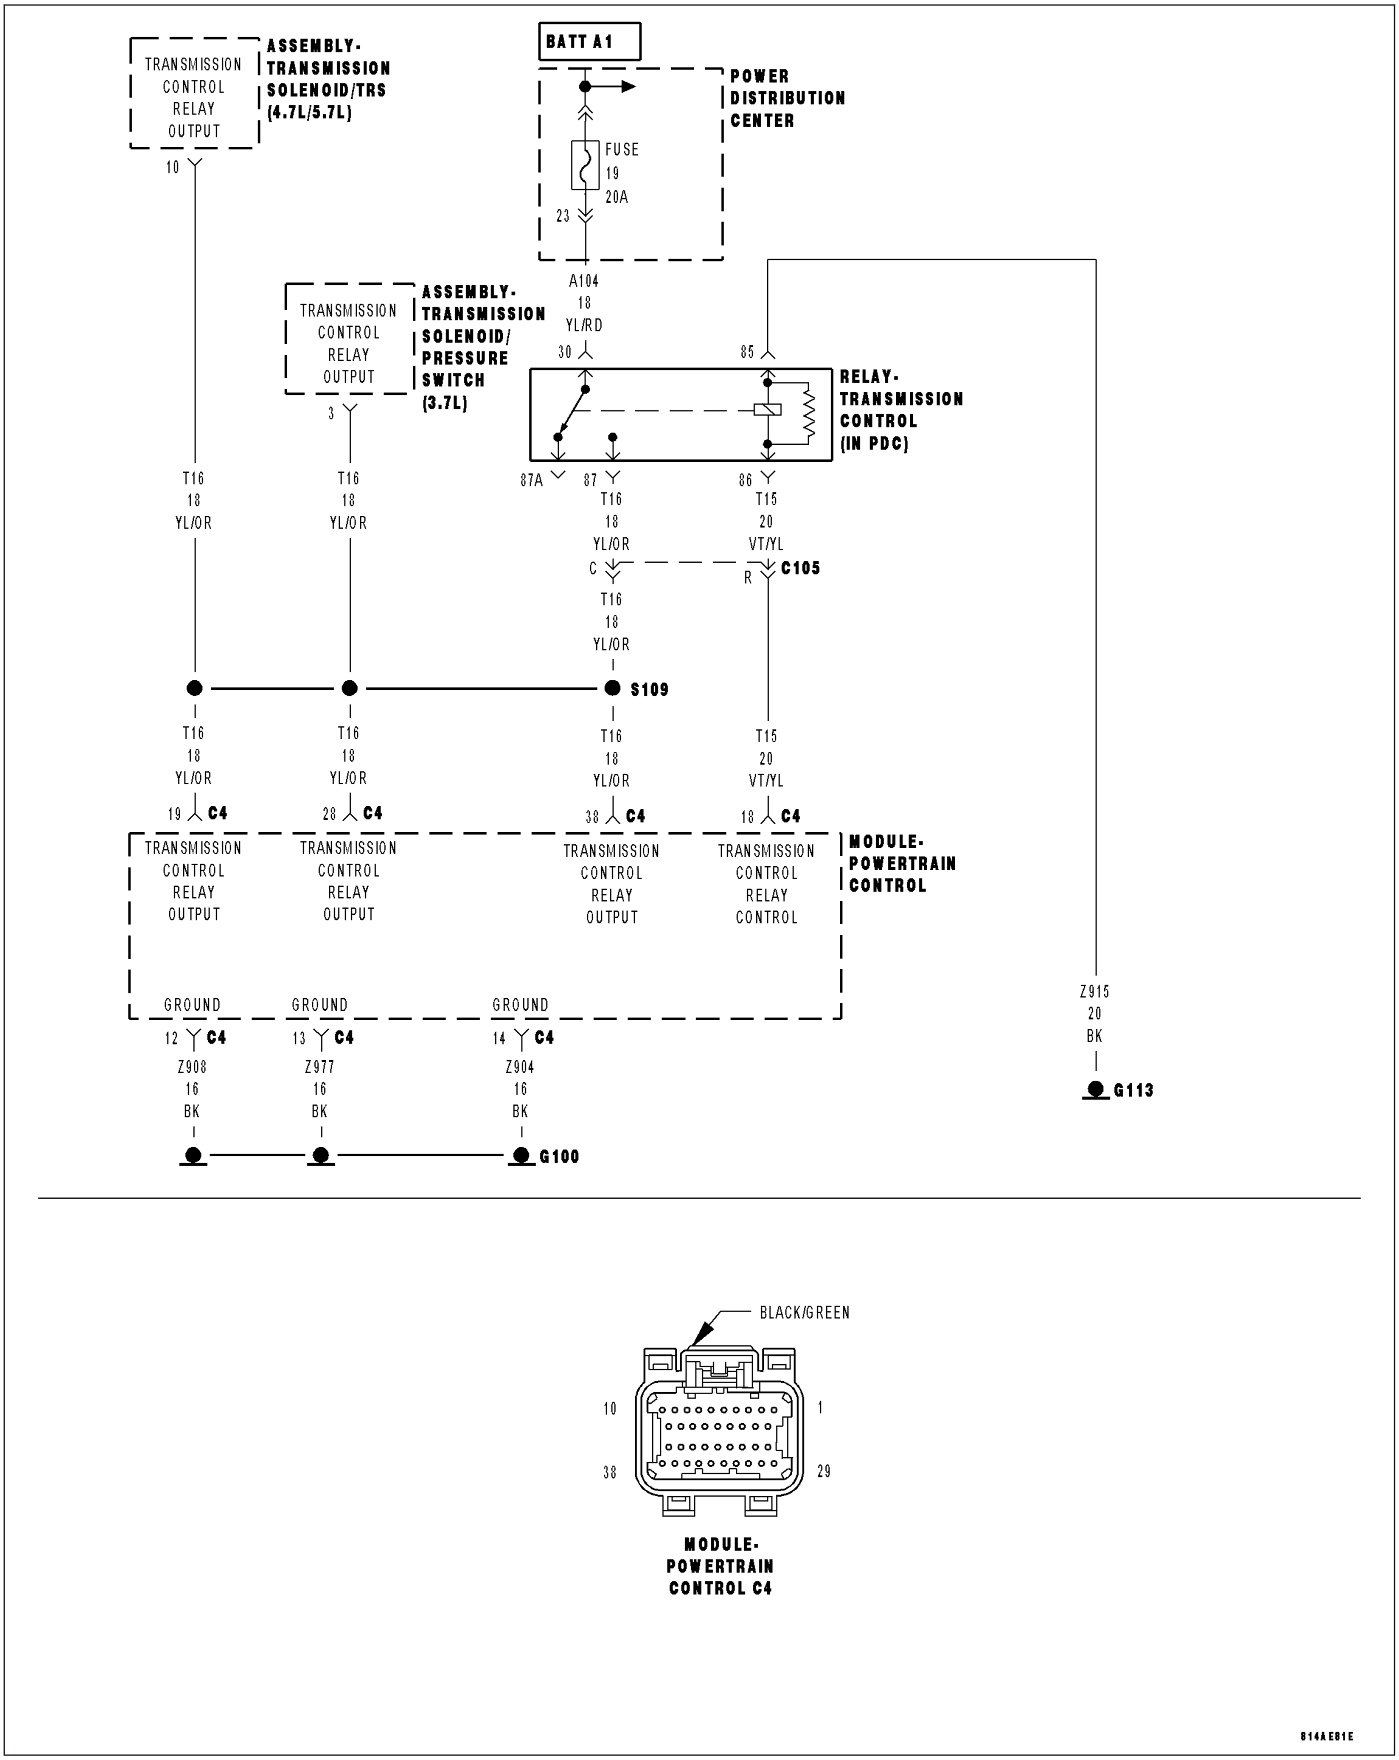
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0883-TCM POWER INPUT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  After a reset (ignition key turned to the RUN position) and after a power down.
- **Set Condition:**
  Relay output (Switched Battery) is higher than 3 volts when relay is not energized by the controller. Fault Set Time: Less than 100 msec

| Possible Causes |
|---|
| TRANSMISSION CONTROL RELAY STUCK CLOSED |
| (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO VOLTAGE |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUITS SHORT TO VOLTAGE |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission relay is used to supply power to the solenoid pack when in normal operating mode and to turn off power to produce transmission ″limp-in″ mode. The relay output (which supplies power to the solenoid pack) is fed back to the controller This is referred to as SWITCHED BATTERY. After a controller reset (ignition key turned to the RUN position or after cranking engine), the controller verifies that the relay contacts are open by checking for no voltage on Switched battery line (relay output) before the relay is energized. Transmission locked in Limp-In. MIL on after 10 seconds of vehicle operation.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0883 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter equal to 0?**

**Yes** >> Go To 2

**No** >> Go To 5

### 2. TRANSMISSION CONTROL RELAY CONTACTS STUCK CLOSED

Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between the Fused B(+) circuit and the Transmission Control Relay Output Circuit at the terminals of the Transmission Control Relay.

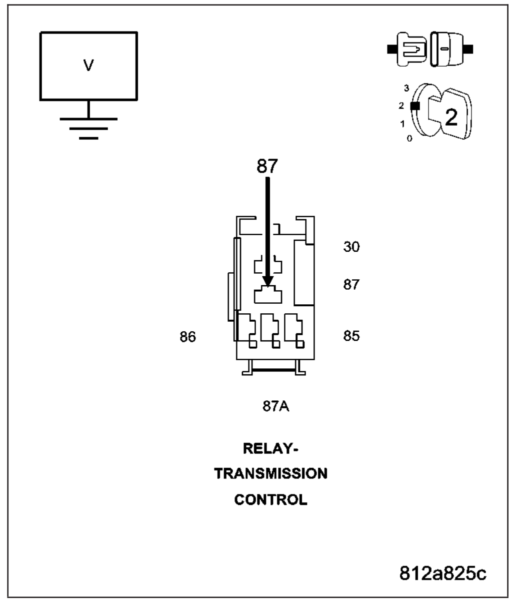
**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Replace the Transmission Control Relay.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 3. (T16) TRANSMISSION RELAY OUTPUT CIRCUIT SHORT TO VOLTAGE



Ignition on, engine not running.

Measure the voltage at the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

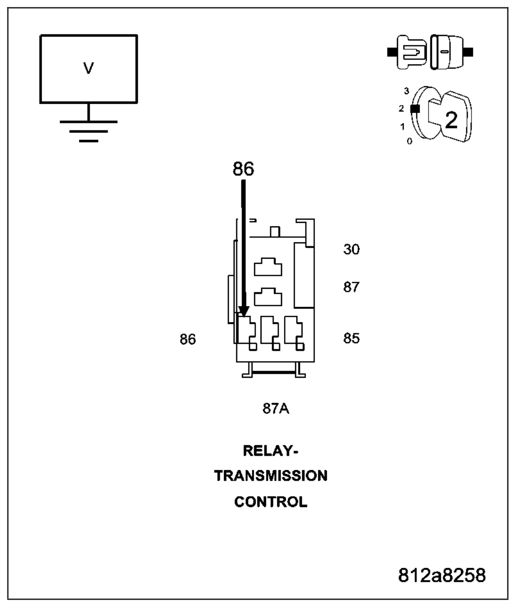
**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T16) Transmission Control Relay Output circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO VOLTAGE



**NOTE: The Transmission Controller will power up the Transmission Control Relay Control circuit for approximately 3.0 seconds after initial ignition on. Wait at least 3.0 seconds after turning the ignition to the on position before performing the following voltage check.**

**NOTE: P0882 Relay Always Off may set. Disregard this DTC.**

Measure the voltage at the (T15) Transmission Control Relay Control circuit after a 3.0 second wait period.

**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T15) Transmission Control Relay Control circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0884-POWER UP AT SPEED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  One time after each controller reset. Note: the Transmission Control Module is integrated with Powertrain Control Module. The Transmission Control Module has separate powers and grounds specifically to its portion of the PCM.
- **Set Condition:**
  This DTC will set if the PCM powers up and senses the vehicle in a valid forward gear (no PRNDL DTCs) with a output speed above 800 RPM, approximately 32 Kmh or 20 mph.

| Possible Causes |
|---|
| INTERMITTENT POWER AND GROUND CIRCUITS |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

If a vehicle loses power to the PCM, the vehicle will go to the 2nd gear mode since there is no power available to control the transmission solenoids. However if power is restored, the PCM will power-up and normal operation will be restored. This DTC identifies that power to the PCM was restored when the gear selector was in a ″Drive″ position while the vehicle was moving at speeds above 32 Kmh (20 mph). If a customer shifts to Neutral and cycles the ignition key and quickly shifts to ″Drive″ while moving before the PCM comes out of its START ROUTINE, the DTC can be set. Therefore it is critical that this DTC diagnosis repair procedure should only be used if the vehicle is experiencing intermittent 2nd gear operation and subsequently a return to normal operation during normal driving. The transmission will not be placed in Limp-in. This is an informational DTC to be used when attempting to diagnose an intermittent 2nd gear operation and subsequent return to normal transmission operation.

### Diagnostic Test

#### 1. CHECK THE POWER AND GROUND CIRCUITS

This DTC is set when the PCM is initialized while the vehicle is moving in a valid forward gear. This is usually caused by a momentary loss of power to the Transmission portion of the PCM.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

**NOTE: Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.**

Check all of the Fused B(+), Fused Ignition Switch Output, and Ground circuits related to the PCM for an intermittent open or short to ground.

Perform a wiggle test on all wiring and connectors pertaining to the PCM while looking for shorted or open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

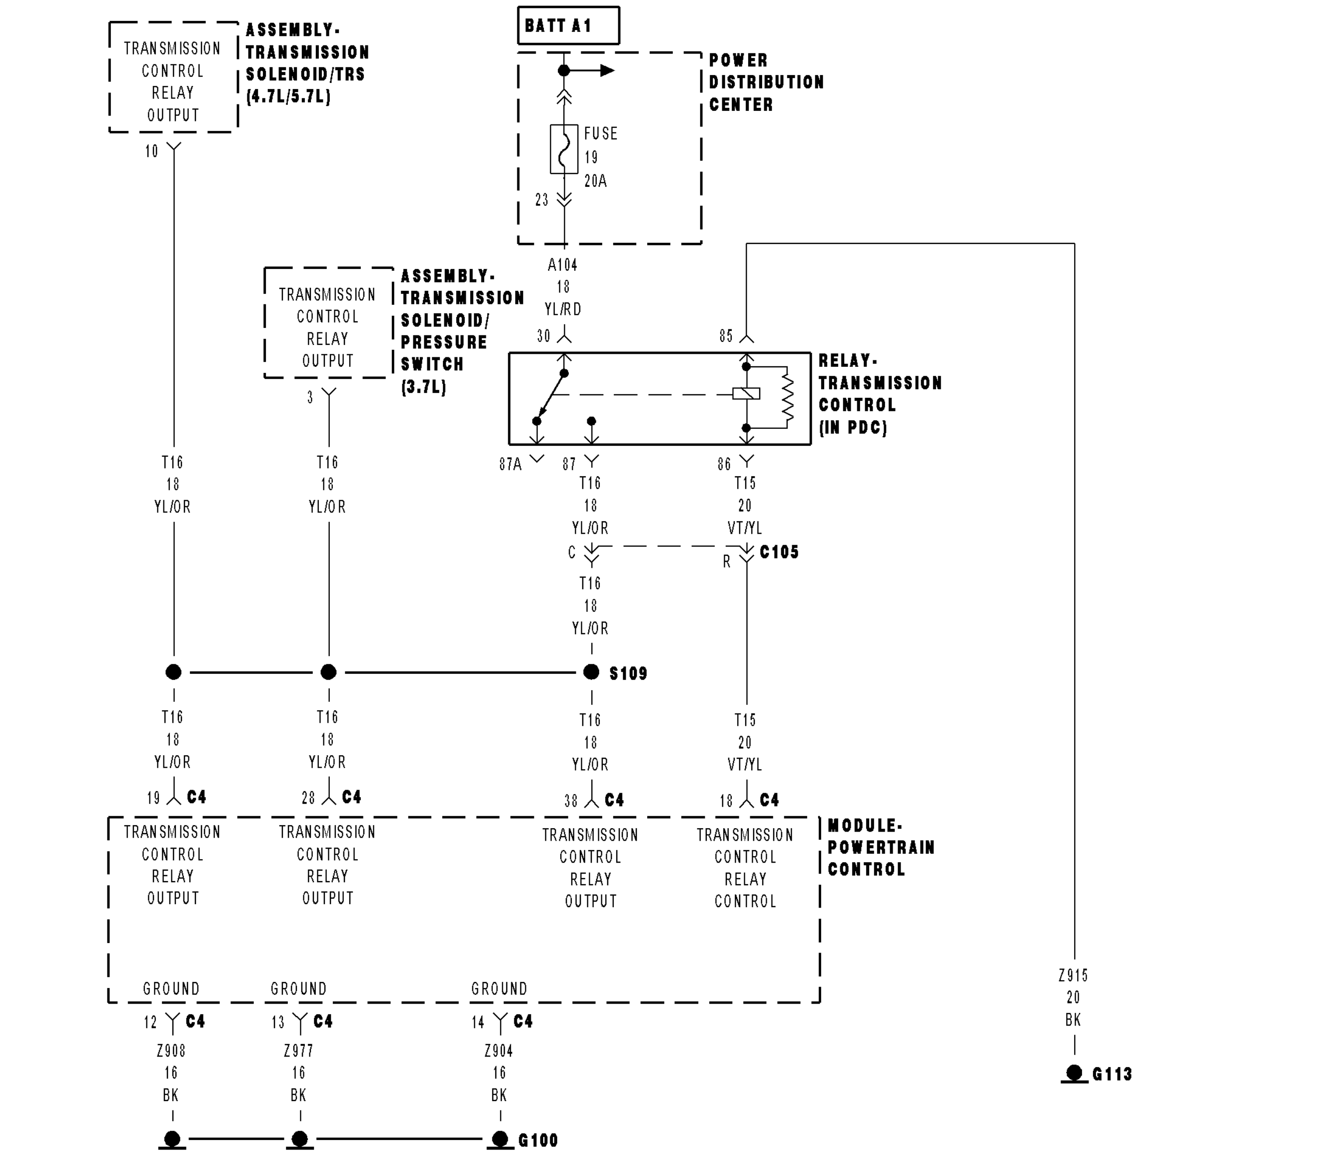
**If there are no possible causes remaining, view repair.**

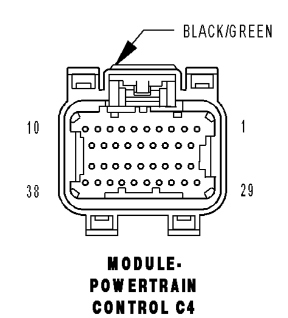
**Repair**

Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0888-TRANSMISSION RELAY ALWAYS OFF





*42RLE MINI PWR GND CKTS*

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  This DTC is set when the Transmission Control Relay output circuit voltage at the Powertrain Control Module is less than 3 volts when the PCM is energizing the relay. Note: Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.

| Possible Causes |
|---|
| (A104) FUSED B+ CIRCUIT OPEN |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN |
| (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT OPEN |
| (Z915) TRANSMISSION CONTROL RELAY GROUND CIRCUIT OPEN |
| (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO GROUND |
| (A104) FUSED B+ CIRCUIT SHORT TO GROUND |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT TO GROUND |
| TRANSMISSION CONTROL RELAY |
| TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the PCM. It is referred to as the Trans Relay Output circuit or switched battery. After a controller reset (ignition key turned to the run position or after cranking engine), the controller energizes the relay. Prior to this, the PCM verifies that the contacts are open by checking for no voltage at the transmission control relay outputs (switched battery) terminals. After the relay is energized, the PCM monitors the terminals to verify that the voltage is greater than 3 volts. The MIL illuminates and the transmission will be placed in Limp-in.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0888 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter equal to 0?**

**Yes** >> Go To 2

**No** >> Go To 12

## 2. CHECK THE (A104) FUSED B+ CIRCUIT FOR VOLTAGE

Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

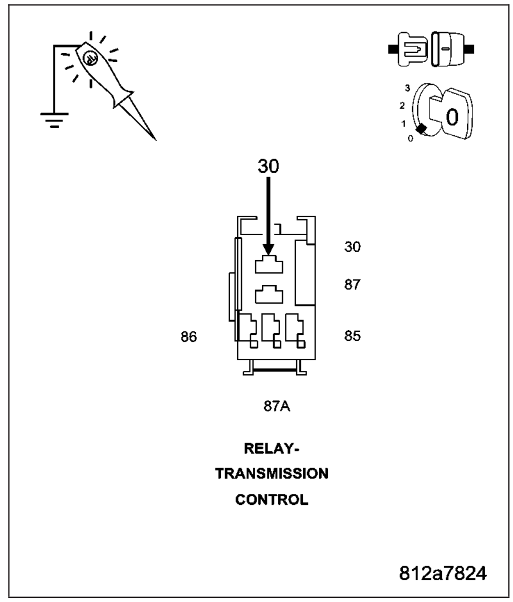
Using a 12-volt test light connected to ground, check the (A104) Fused B+ circuit in the Transmission Control Relay connector.

**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Go To 9



## 3. (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN

Connect a jumper wire between the (A104) Fused B+ circuit and the (T16) Transmission Control Relay Output circuits at the Transmission Control Relay connector.

Ignition on, engine not running.

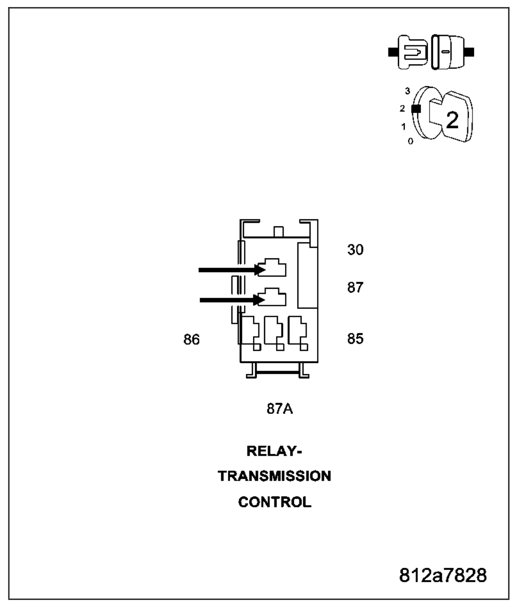
With the scan tool, read the Transmission Switched Battery voltage.

**Is the Switched Battery voltage equal to battery voltage?**

**Yes** >> Go To 4

**No** >> Repair the (T16) Transmission Control Relay Output circuits for an open or high resistance. Note: There are multiple Transmission Control Relay Output circuits.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 4. TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

Install a substitute Relay in place of the Transmission Control Relay.

Ignition on, engine not running.

With the scan tool, read the Transmission Switched Battery voltage.

**Is the Switched Battery voltage equal to battery voltage?**

**Yes** >> Replace the Transmission Control Relay.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (Z915) TRANSMISSION CONTROL RELAY GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z915) Transmission Control Relay Ground circuit.

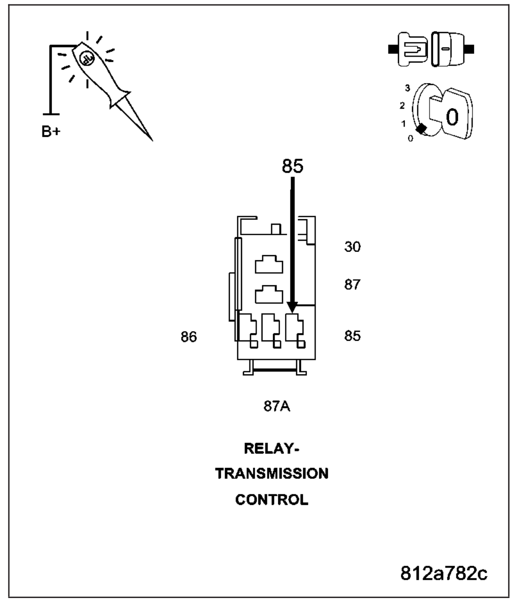
**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (Z915) Transmission Control Relay Ground circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 6. (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

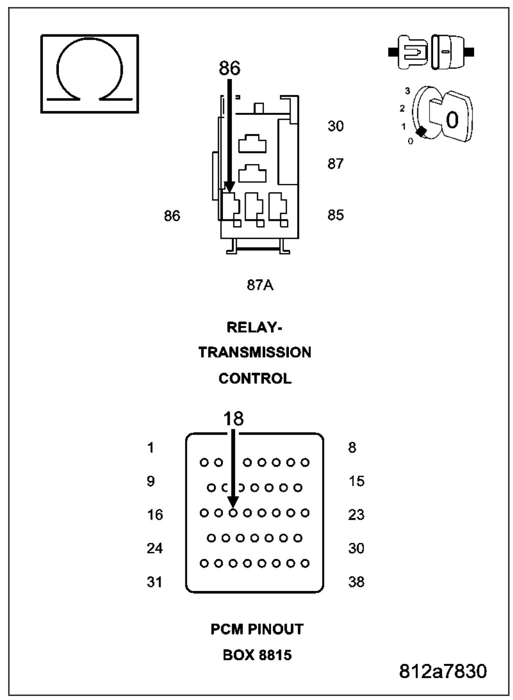
Measure the resistance of the (T15) Transmission Control Relay Control circuit between the Transmission Control Relay connector and the appropriate terminal of special tool #8815.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T15) Transmission Control Relay Control circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7



## 7. (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO GROUND

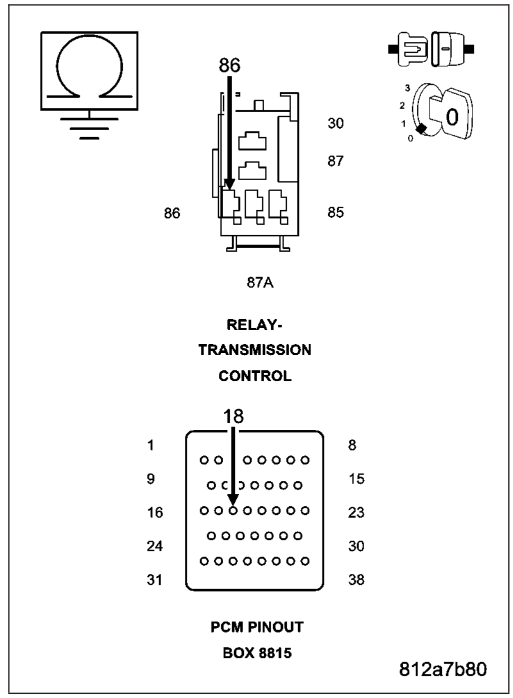
Measure the resistance between ground and the (T15) Transmission Control Relay Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T15) Transmission Control Relay Control circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 8



## 8. POWERTRAIN CONTROL MODULE

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Powertrain Control Module per the Service Information. With the scan tool PERFORM QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 9. CHECK THE FUSED B+ CIRCUIT FOR SHORT TO GROUND

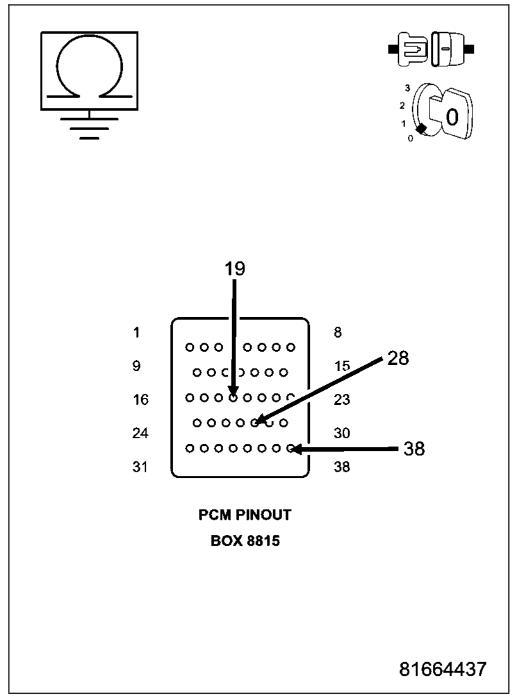
Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connectors.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance between ground and the (T16) Transmission Control Relay Output circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 10

**No** >> Repair the Fused B+ circuit for an open.

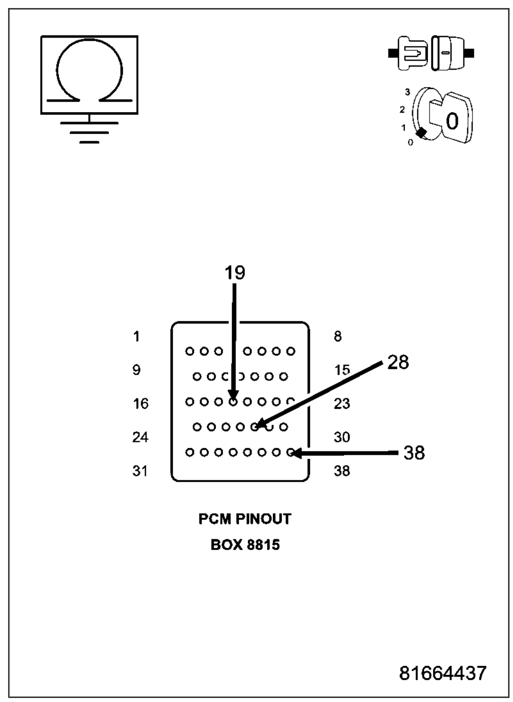
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 10. (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT TO GROUND

Disconnect the Transmission Solenoid/Pressure Switch harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between ground and the (T16) Transmission Control Relay Output circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T16) Transmission Control Relay Output circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 11

## 11. TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Transmission Solenoid/Pressure Switch Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 12. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the EVENT DATA to help identify the conditions in which the DTC was set.

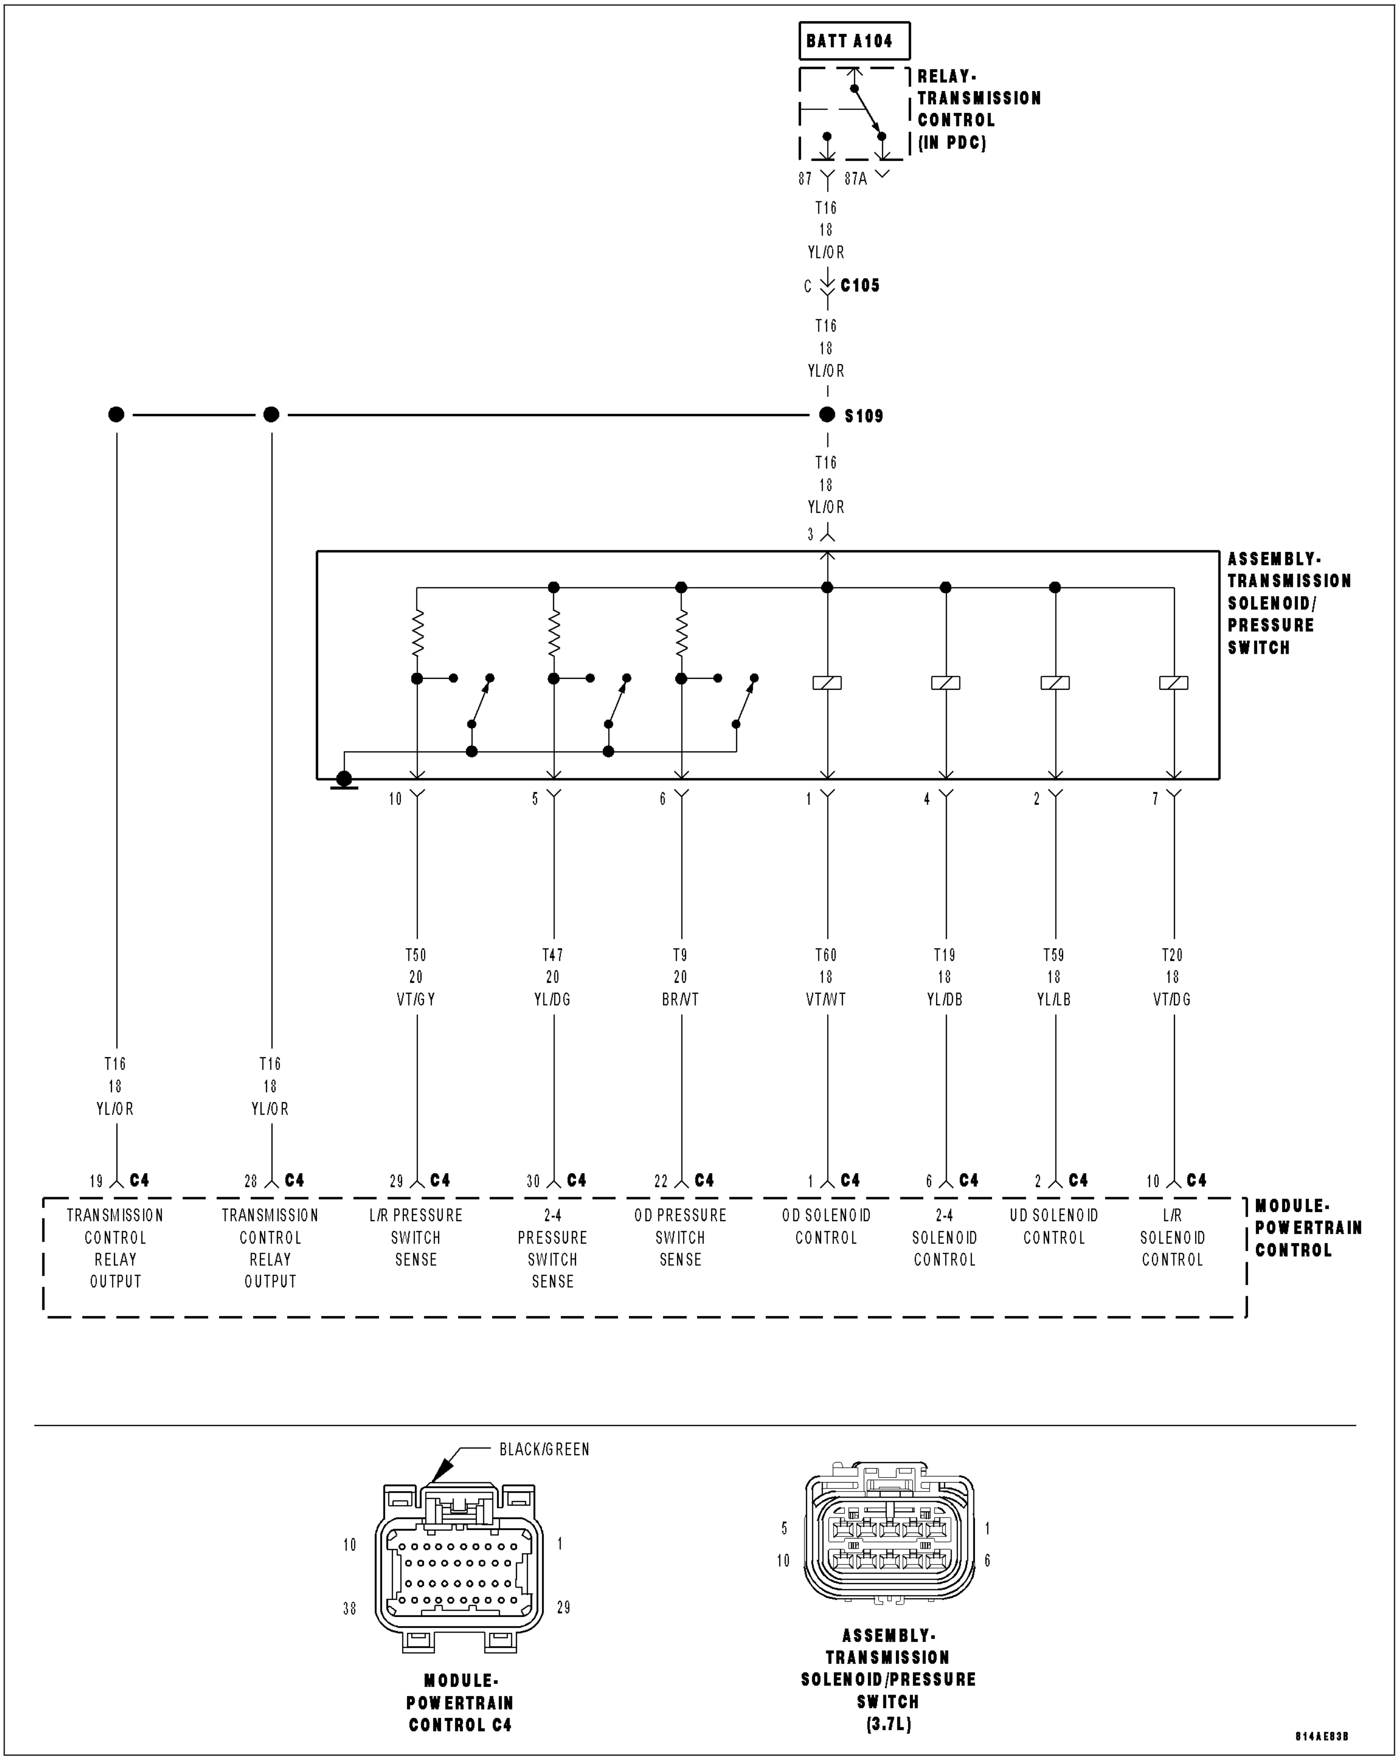
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0890-SWITCHED BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  One time after a reset (ignition key turned to the RUN position or after cranking engine).
- **Set Condition:**
  A fault is set if voltage greater than 4.5 volts is detected for 7 msec on any of the pressure switch circuits before the relay is energized. The transmission is placed in Limp-In. The MIL is on after 10 seconds. of vehicle operation.

| Possible Causes |
|---|
| (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission relay is used to supply power to the solenoid pack when in normal operating mode and to turn off power to produce transmission ″limp-in″ mode. The relay output (which supplies power to the solenoid pack) is fed back to the controller. It is referred to as SWITCHED BATTERY. After a controller reset (ignition key turned to the RUN position or after cranking engine), the controller verifies that the relay contacts are open by checking for no voltage on Switched battery line (transmission control relay output) before the relay is energized. After switched battery is verified for no voltage, the voltage of each of the solenoid pack pressure switches is also checked. Since the solenoid pack is not powered up, there should be no voltage on any of the pressure switches.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0890 IS PRESENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter set at 0?**

**Yes** >> Go To 2

**No** >> Go To 5

## 2. (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between the (A104) Fused B+ circuit and (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

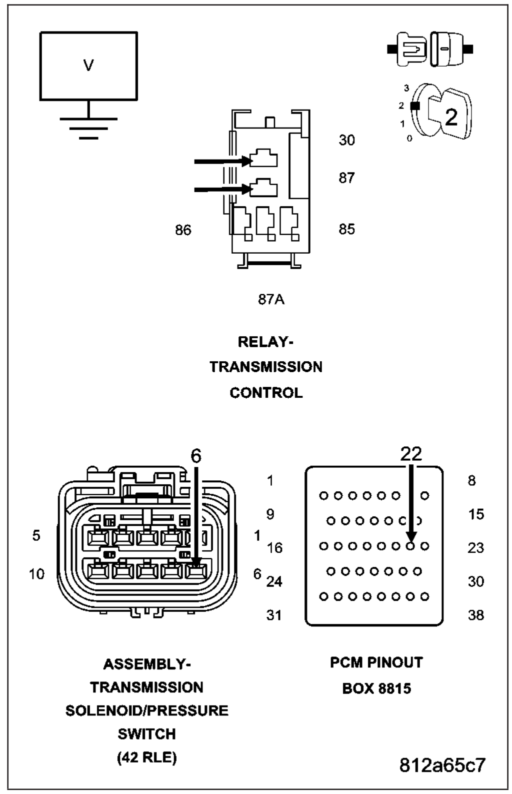
Ignition on, engine not running.

Measure the voltage of the (T9) OD Pressure Switch Sense circuit.

**Is the voltage above 0.5 volt?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to voltage.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3



## 3. (T47) 2/4 PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

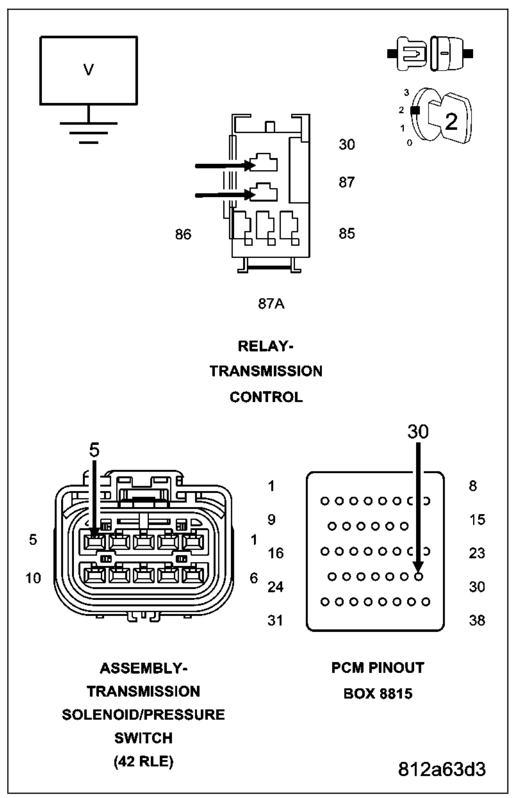
**NOTE: The jumper wire must still be in place.**

Measure the voltage of the (T47) 2/4 Pressure Switch Sense circuit.

**Is the voltage above 0.5 volt?**

**Yes** >> Repair the (T47) 2/4 Pressure Switch Sense circuit for a short to voltage.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

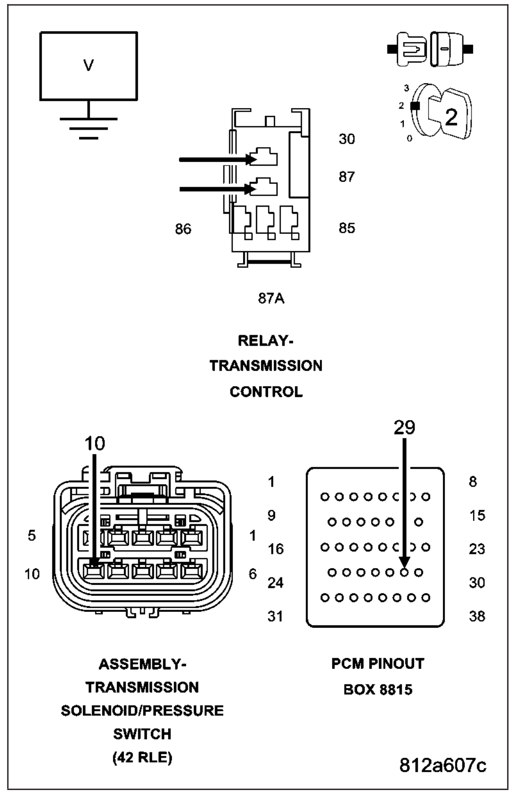


## 4. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

**NOTE: The jumper wire must still be in place.**

Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.

**Is the voltage above 0.5 volts?**



**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

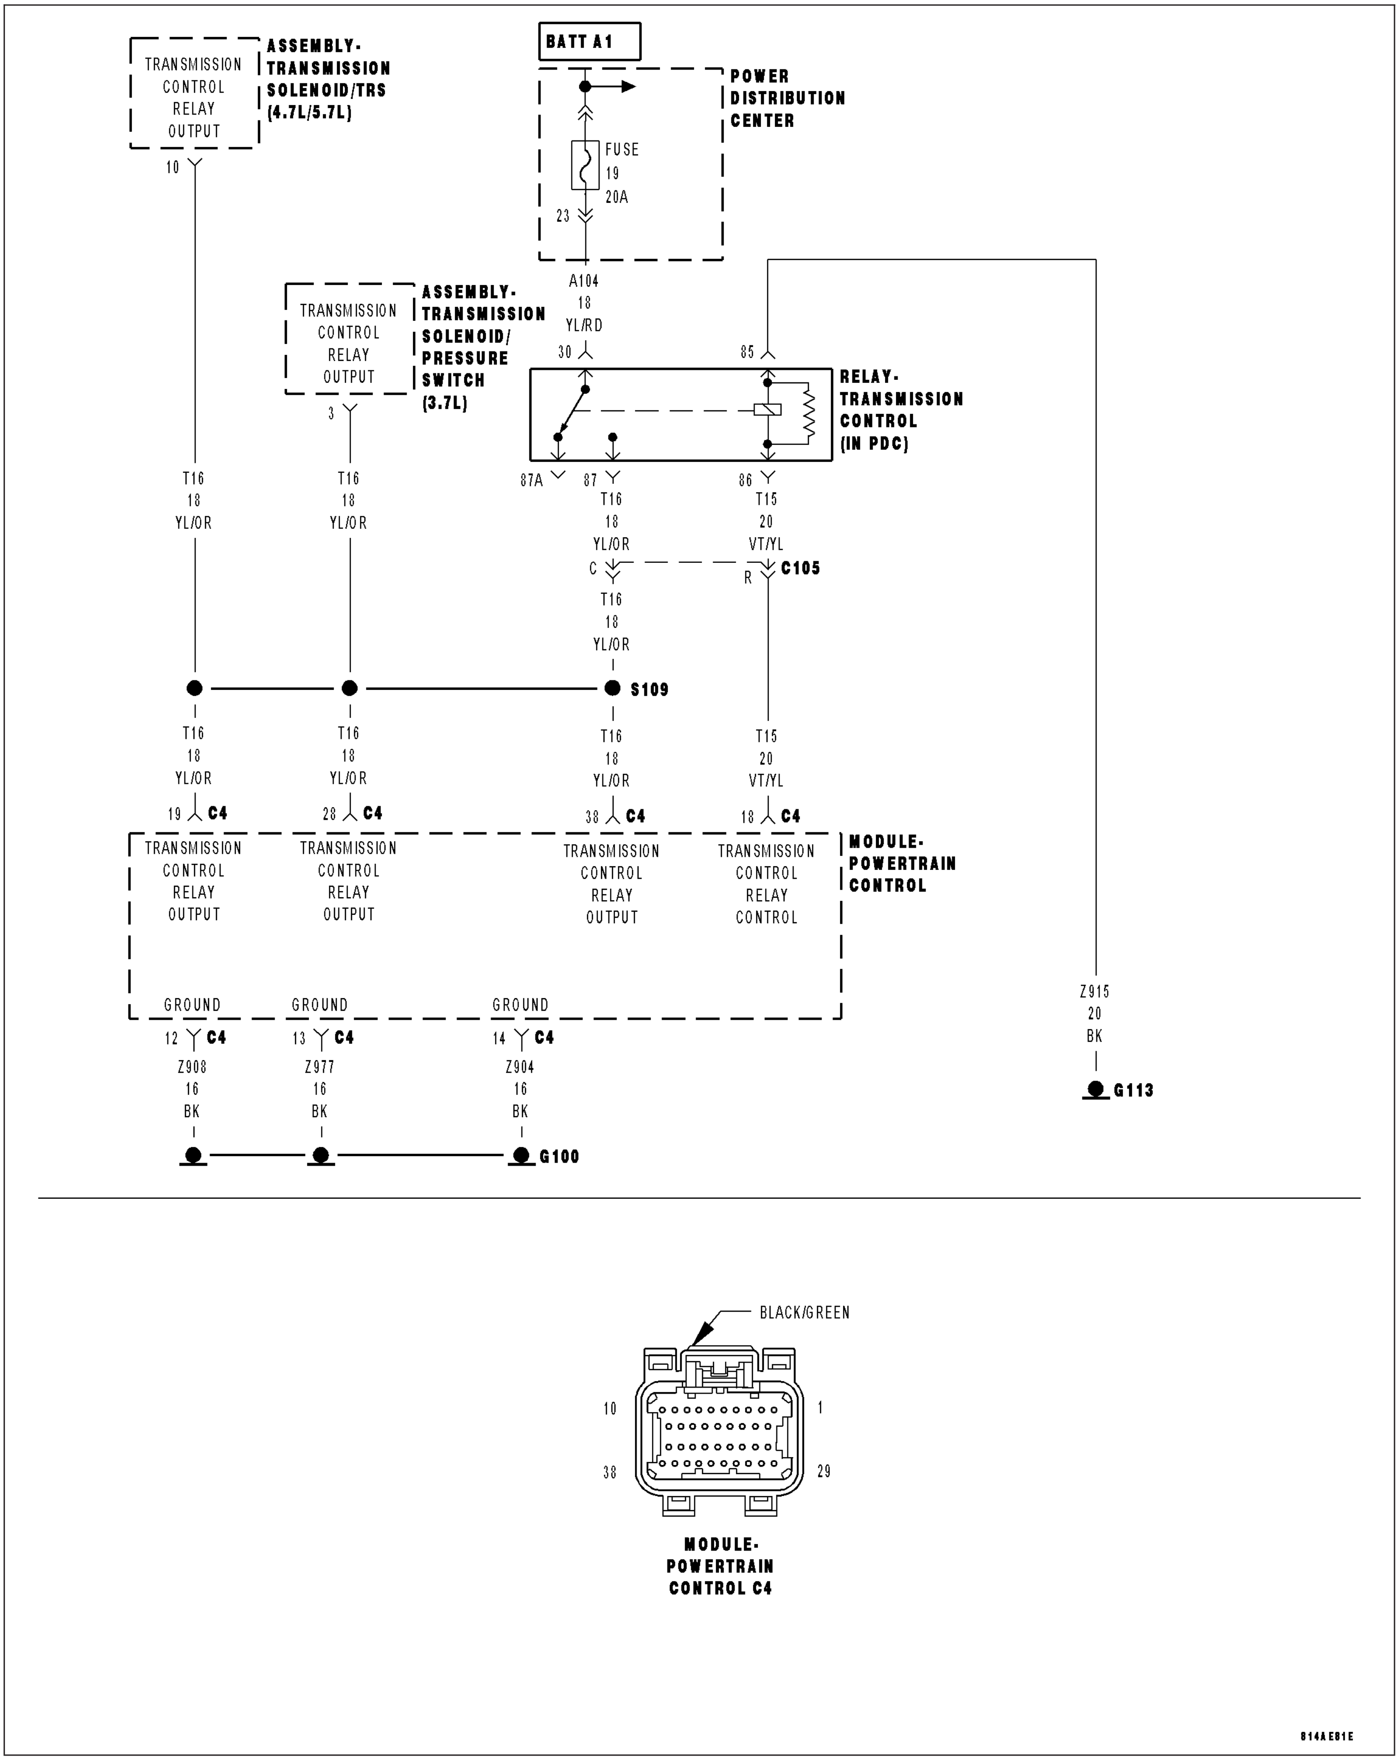
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0891-TRANSMISSION RELAY ALWAYS ON



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  After a reset (ignition key turned to the RUN position) and after a power down.
- **Set Condition:**
  Relay output (Switched Battery) is higher than 3 volts when relay is not energized by the controller. Fault Set Time: Less than 100 msec

| Possible Causes |
| --- |
| TRANSMISSION CONTROL RELAY STUCK CLOSED |
| (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO VOLTAGE |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUITS SHORT TO VOLTAGE |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission relay is used to supply power to the solenoid pack when in normal operating mode and to turn off power to produce transmission ″limp-in″ mode. The relay output (which supplies power to the solenoid pack) is fed back to the controller This is referred to as SWITCHED BATTERY. After a controller reset (ignition key turned to the RUN position or after cranking engine), the controller verifies that the relay contacts are open by checking for no voltage on Switched battery line (relay output) before the relay is energized. Transmission locked in Limp-In. MIL on after 10 seconds of vehicle operation.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0891 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter equal to 0?**

**Yes** >> Go To 2

**No** >> Go To 5

### 2. TRANSMISSION CONTROL RELAY CONTACTS STUCK CLOSED

Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between the Fused B(+) circuit and the Transmission Control Relay Output Circuit at the terminals of the Transmission Control Relay.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Replace the Transmission Control Relay.

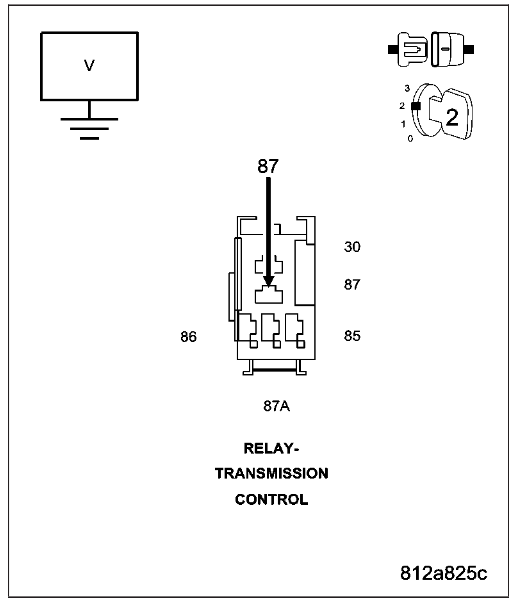
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 3. (T16) TRANSMISSION RELAY OUTPUT CIRCUIT SHORT TO VOLTAGE

Ignition on, engine not running.

Measure the voltage at the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

**Is the voltage above 0.5 volts?**



**Yes** >> Repair the (T16) Transmission Control Relay Output circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

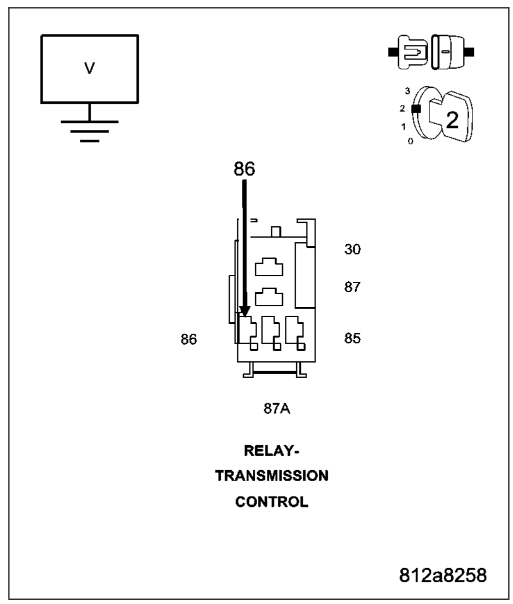
## 4. (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO VOLTAGE

**NOTE: The Transmission Controller will power up the Transmission Control Relay Control circuit for approximately 3.0 seconds after initial ignition on. Wait at least 3.0 seconds after turning the ignition to the on position before performing the following voltage check.**

**NOTE: P0888 Relay Always Off may set. Disregard this DTC.**

Measure the voltage at the (T15) Transmission Control Relay Control circuit after a 3.0 second wait period.

**Is the voltage above 0.5 volts?**



**Yes** >> Repair the (T15) Transmission Control Relay Control circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wiring and connectors while checking for shorted and open circuits.
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## P0897-TRANSMISSION FLUID DETERIORATED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Each transition from full EMCC to partial EMCC for A/C bump prevention.
- **Set Condition:**
  DTC set if 20 occurrences of a turbine acceleration sum. Fault Set Time: 20 transitions from full EMCC to partial EMCC. Transmission will not use partial EMCC. Established for A/C bump prevention.

| Possible Causes |
|---|
| WORN OUT/ BURNT TRANSAXLE FLUID |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

To prevent a bump due to A/C clutch engagement, a temporary torque converter partial EMCC condition is established prior to A/C clutch engagement. A message is received over the bus indicating that A/C clutch engagement is imminent. Partial EMCC is then established and a reply message, ″OK to engage A/C clutch″ is sent via the bus. Partial EMCC will be held for 450 ms before returning to full EMCC. During the transition from full to partial EMCC, a turbine acceleration sum is calculated, if this value exceeds a threshold value for several transitions, degraded transmission fluid is indicated.

### Diagnostic Test

#### 1. WORN OUT/ BURNT TRANSMISSION FLUID

Turn the ignition off to the lock position.

Flush the Transmission Oil Cooler and lines, replace the Transmission Oil Filter, refill with new Transmission Fluid, start the engine, and adjust the fluid per the Service Information.

**NOTE: The Transmission Cooler must be flushed before proceeding.**

Allow the engine to idle for 10 minutes, in Park.

Turn the ignition off to the lock position.

Again, flush the Transmission Oil Cooler and lines, replace the Transmission Oil Filter, refill with new Transmission Fluid, start the engine, and adjust the fluid per the Service Information.

With the scan tool, perform a Battery Disconnect.

**NOTE: The Battery Disconnect must be done to re-enable EMCC during an A/C Clutch engagement.**

**NOTE: The vehicle may exhibit intermittent shudder during the first few hundred miles. The new Transmission Fluid will gradually penetrate the Torque Convertor Clutch friction material and the shudder should disappear.**

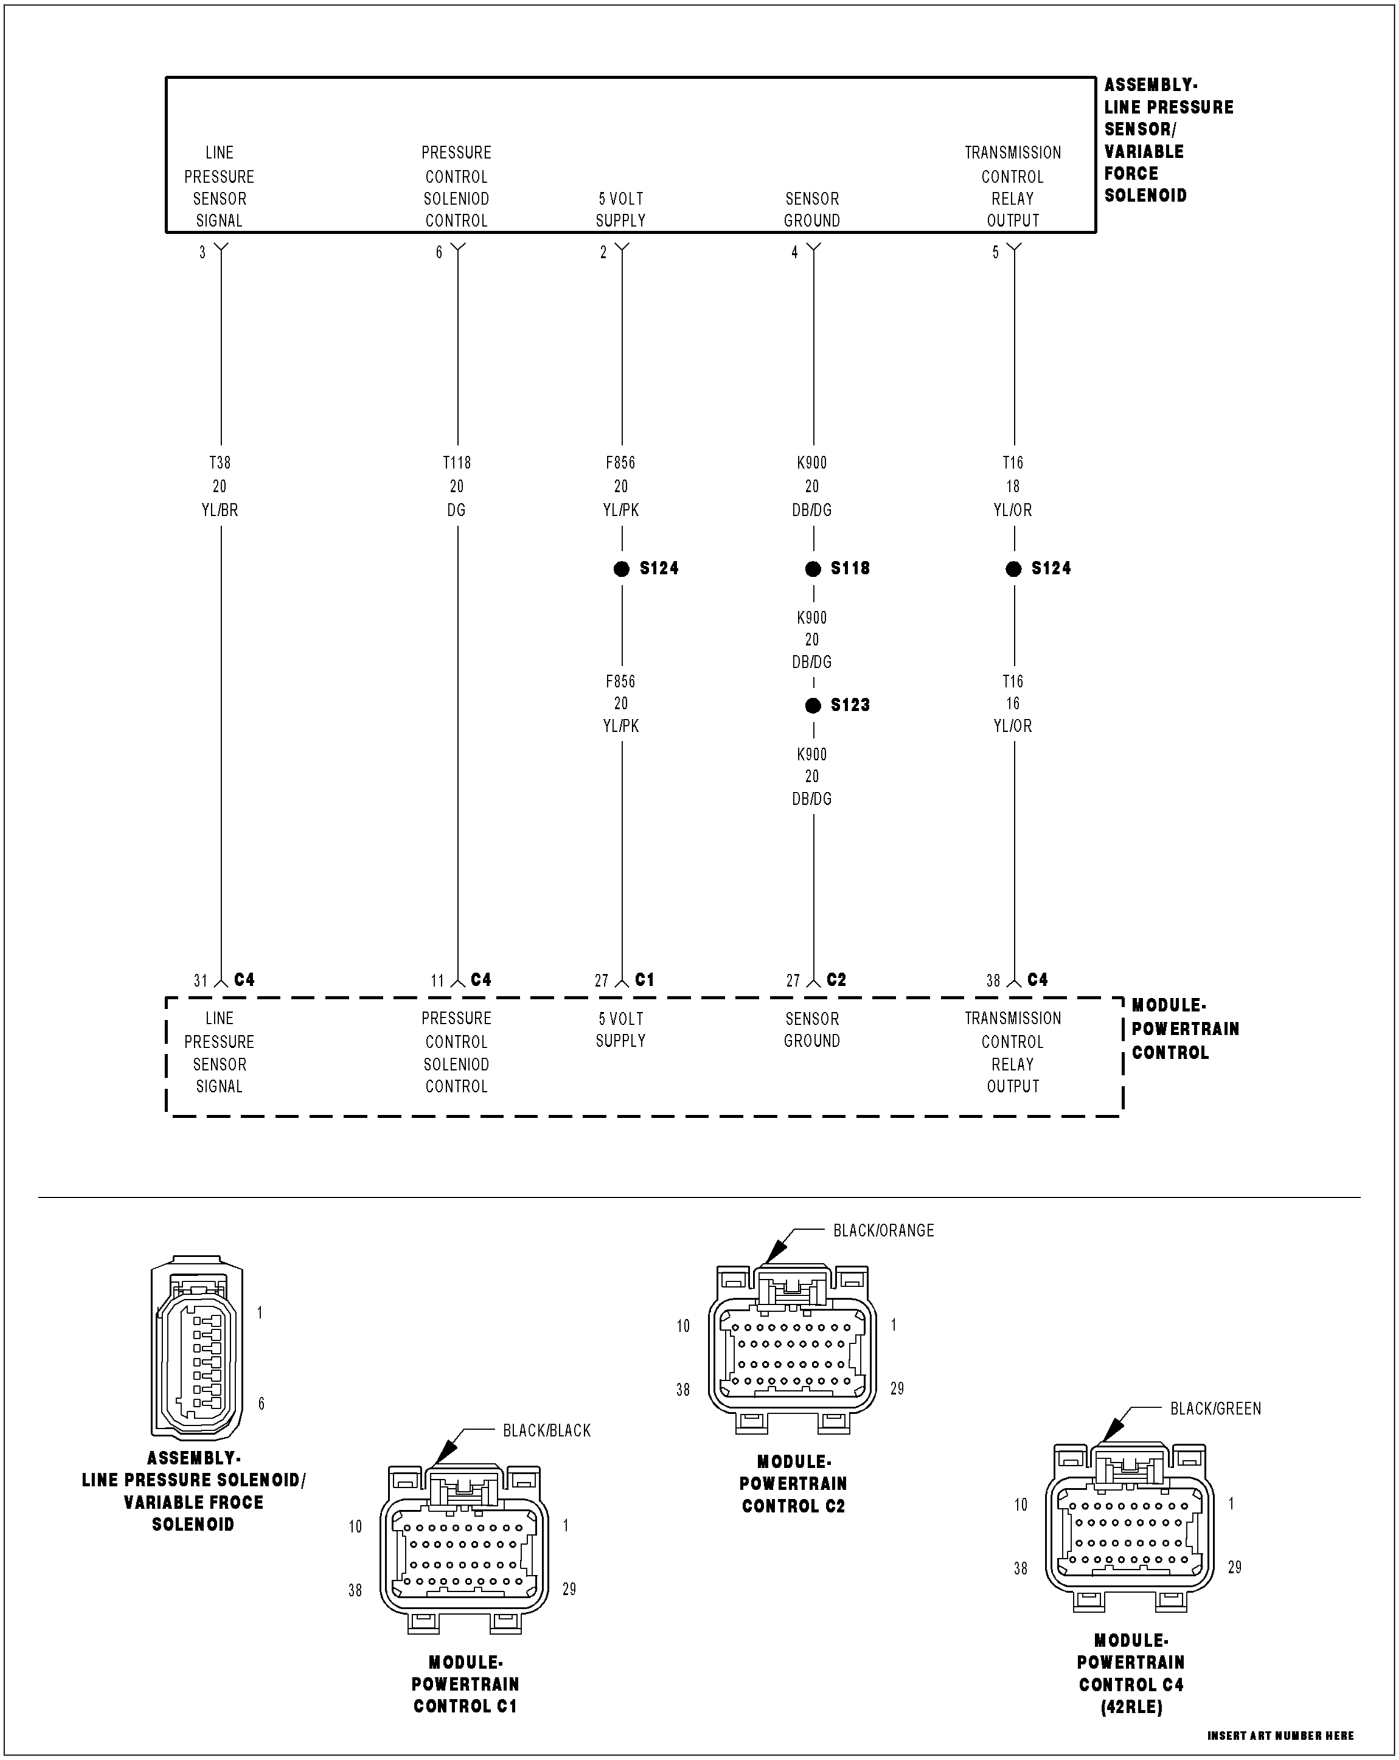
Erase the DTC and return the vehicle to the customer.

**Did the DTC reset and/or does the vehicle still shudder after a few thousand miles?**

**Yes** >> Replace the Torque Converter per the Service Information.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0932-LINE PRESSURE SENSOR CIRCUIT



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  The PCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure reading is more than 172.4 kPa (25 psi) higher than the Desired Line Pressure, but is less than the highest Line Pressure ever used in the current gear, the DTC sets.

| Possible Causes |
|---|
| RELATED DTC'S PRESENT |
| LINE PRESSURE CONNECTOR AND WIRING |
| INTERNAL TRANSMISSION |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality.

## Diagnostic Test

### 1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check for other transmission DTCs.

**Are there any other line pressure related DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. Perform the test for P0934 and/or P0935 first if present.

**No** >> Go To 2

### 2. COMPARE ACTUAL LINE PRESSURE TO DESIRED LINE PRESSURE

**CAUTION: Apply Parking Brake**
Start the engine.

**CAUTION: Firmly apply the brakes.**
With the scan tool, monitor the Line Pressure, Desired Line Pressure and the TPS degrees.

While firmly applying the brakes, place the shifter in reverse, then slowly press the accelerator pedal to a TPS degree of 15°.

Compare the Line Pressure reading to the Desired Line Pressure reading on the scan tool.

**Does the Line Pressure stay within ± 34 kPa or 5 psi of the Desired Line Pressure?**

**Yes** >> Go To 5

**No** >> Go To 3

## 3. CHECK LINE PRESSURE CONNECTOR AND WIRING

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor/Variable Force Solenoid Assembly.

**Did the voltage remain steady while wiggling the wiring harness and connectors?**

**Yes** >> Go To 4

**No** >> Disconnect and properly reconnect the Line Pressure Sensor/Variable Force Solenoid Assembly connector. Inspect terminals and repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 4. CHECK PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following step.

With the Transmission Simulator, turn the selector switch to each of the 3 Line Pressure positions.

**NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?**

**Yes** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Repair internal transmission and inspect the oil pump per the Service information and replace if necessary. If no problems are found, replace the Line Pressure Sensor/Variable Force Solenoid Assembly — possible cause is the Pressure Control Solenoid is stuck.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 5. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

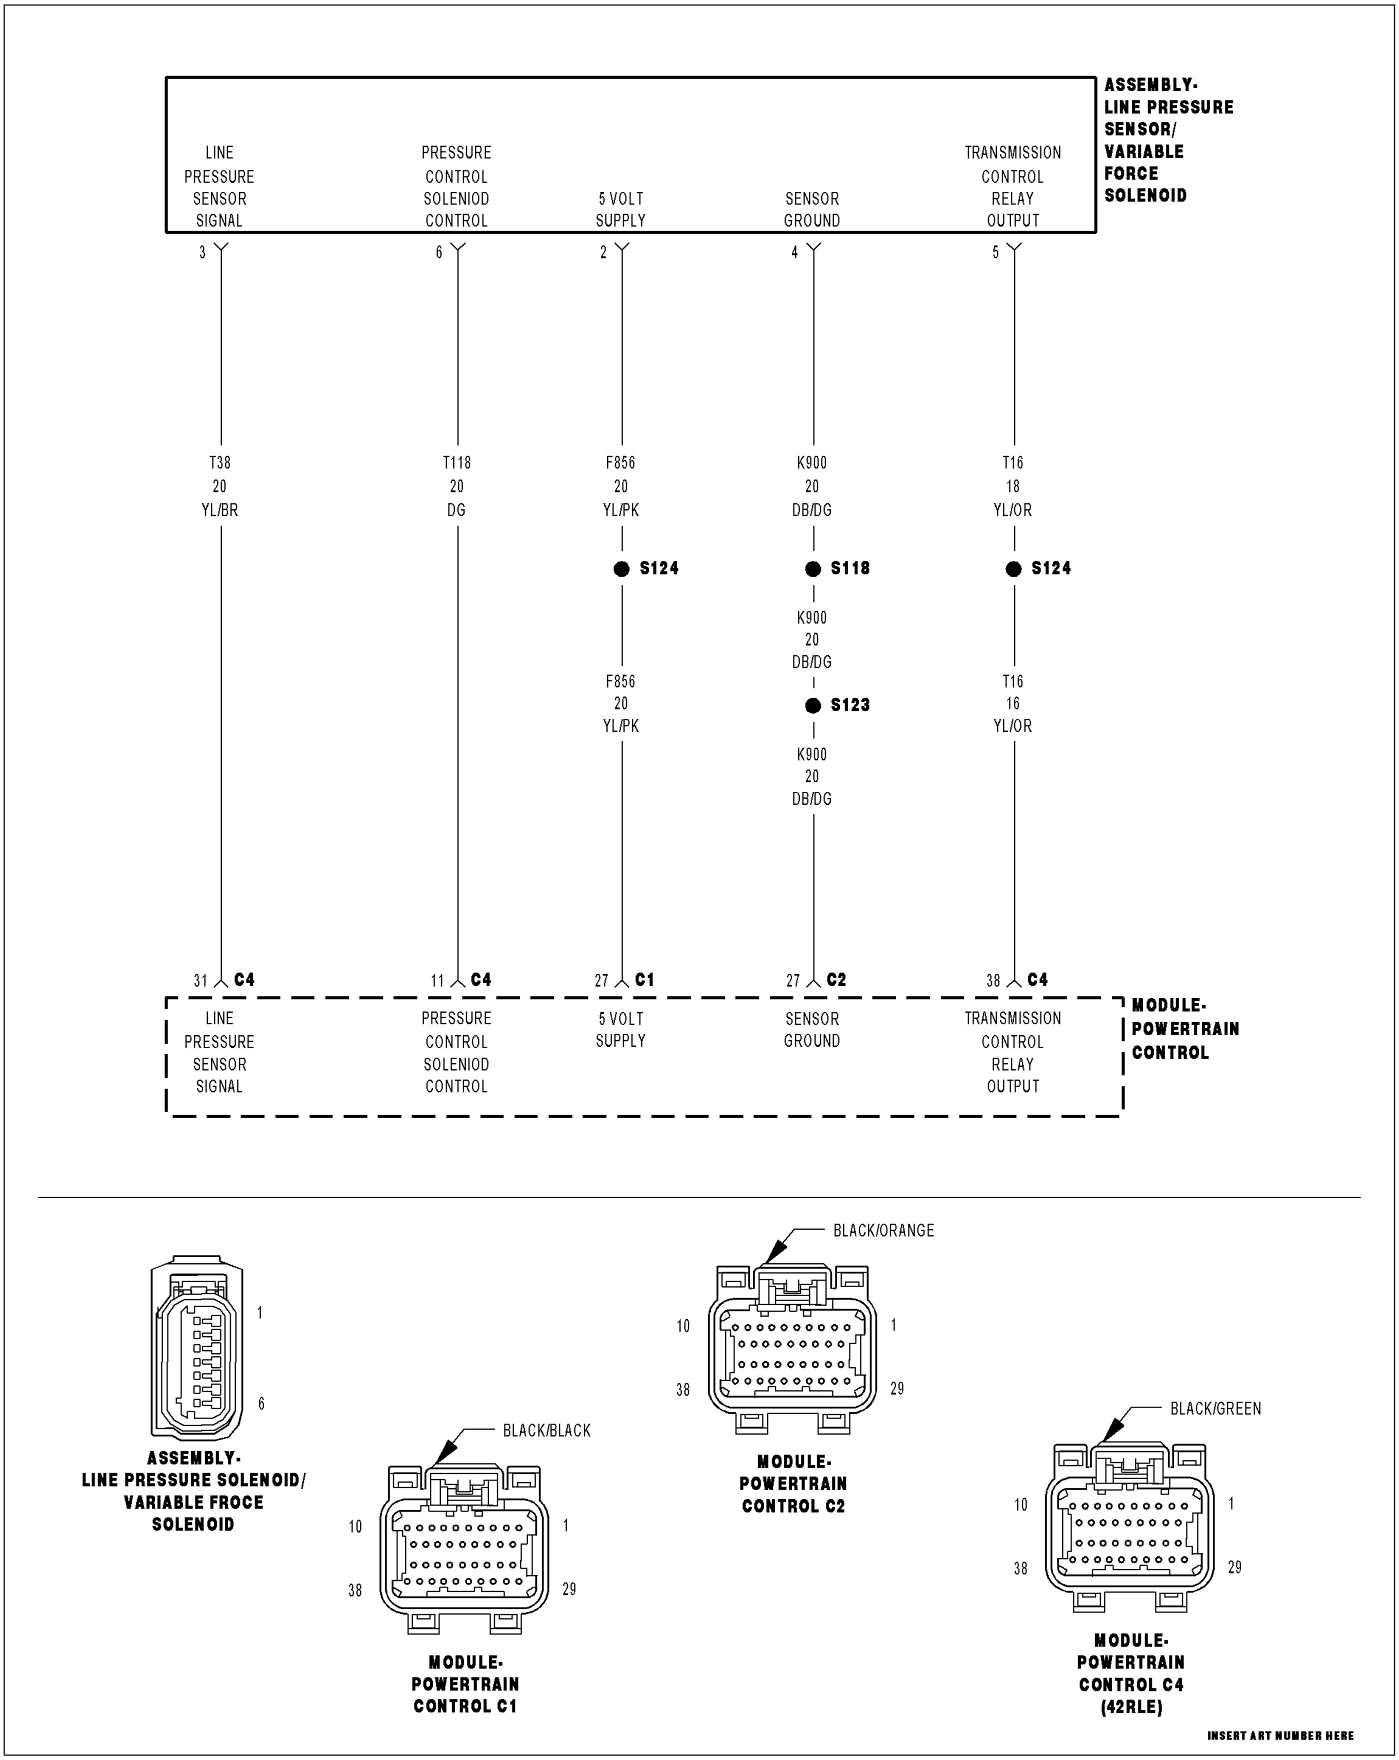
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0934-LINE PRESSURE SENSOR CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set when the monitored Line Pressure Sensor voltage is less than or equal to 0.35 volts for 0.18 seconds.

| Possible Causes |
|---|
| (F856) 5-VOLT SUPPLY CIRCUIT OPEN |
| (F856) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND |
| LINE PRESSURE SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

## Diagnostic Test

### 1. CHECK IF DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0934.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 2

**No** >> Go To 6

### 2. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, under Transmission Sensors, monitor the Line Pressure.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

**NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?**

**Yes** >> Replace the Line Pressure Sensor per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

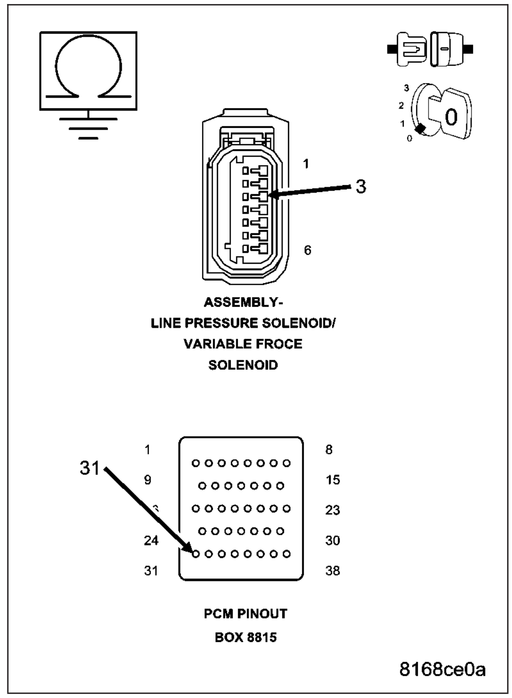
Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance between ground and the (T38) Line Pressure Sensor Signal circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T38) Line Pressure Sensor Signal circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

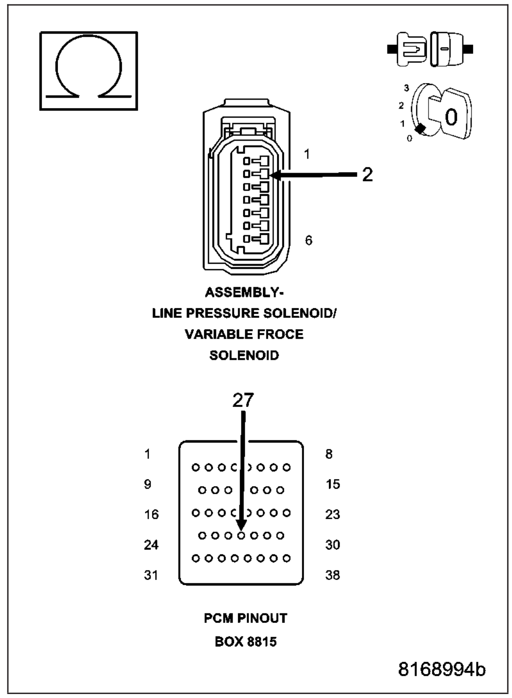
Measure the resistance of the (F856) 5-volt Supply circuit between Line Pressure Sensor/Variable Force Solenoid Assembly harness connector and the appropriate terminal of Miller tool #8815.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (F856) 5-volt Supply circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 5. CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Disconnect the PCM C1 harness connector and connect Miller tool #8815.

Measure the resistance between ground and the (F856) 5-volt Supply circuit.

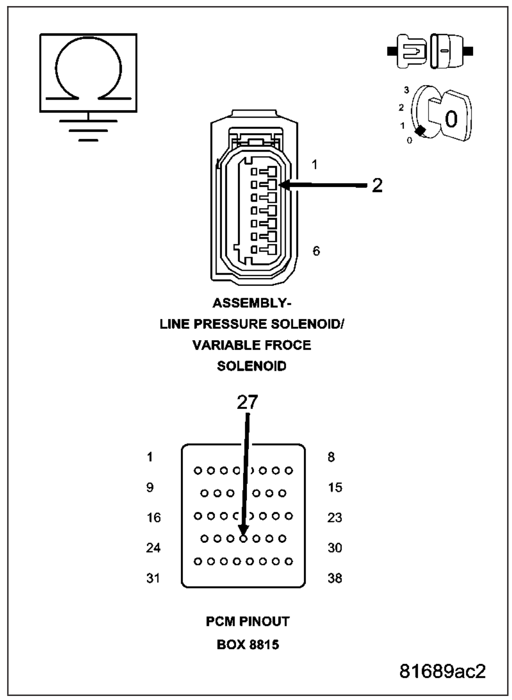
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (F856) 5-volt Supply circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)



## 6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

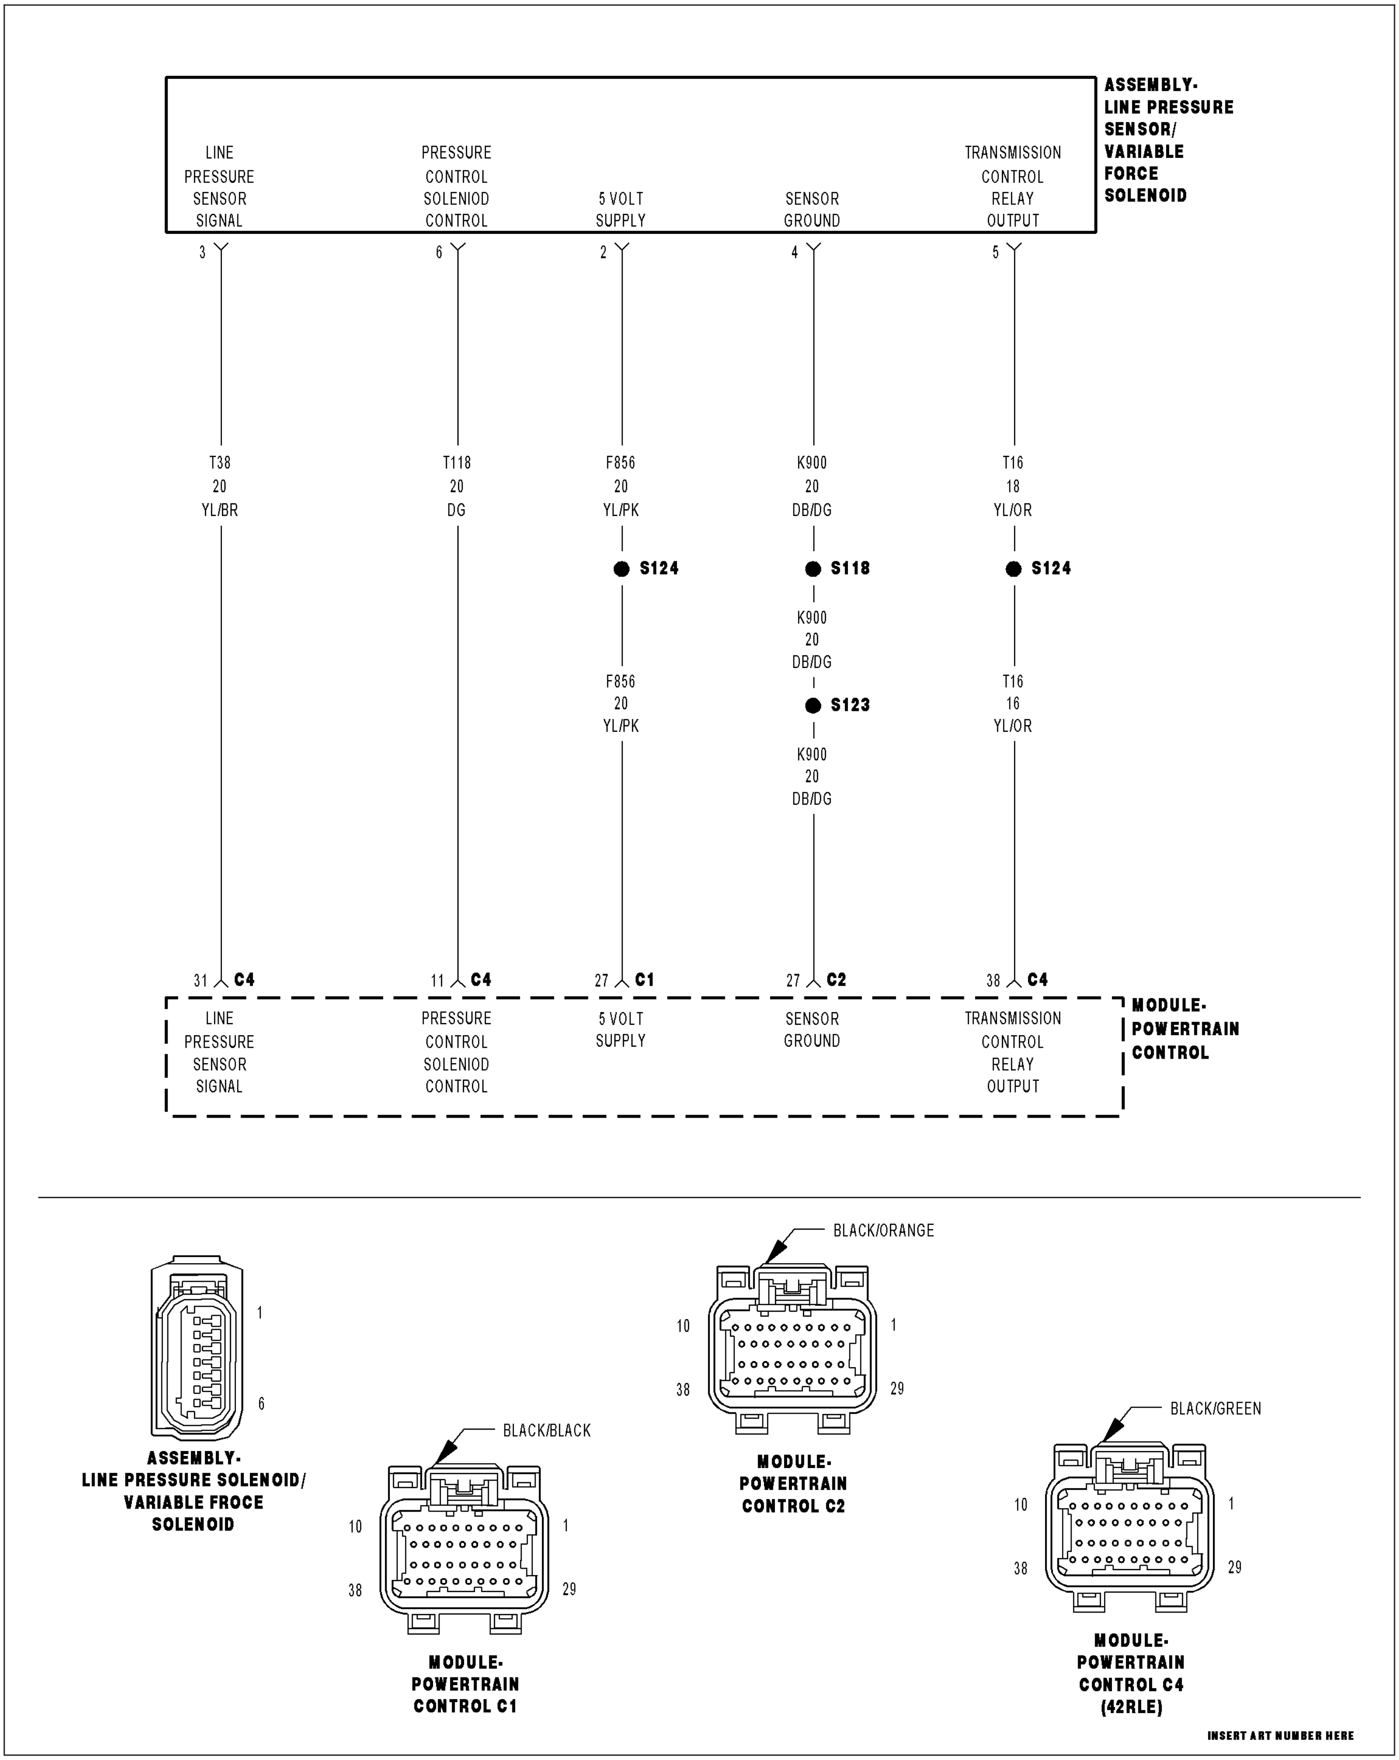
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0935-LINE PRESSURE SENSOR CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with ignition on and engine running.
- **Set Condition:**
  This DTC will set if the monitored Line Pressure Sensor voltage is greater than or equal to 4.75 volts for the period of 0.18 seconds

| Possible Causes |
|---|
| (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN |
| (K900) SENSOR GROUND CIRCUIT OPEN |
| (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE |
| LINE PRESSURE SENSOR |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0935.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 2

**No** >> Go To 6

### 2. CHECK THE PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

**NOTE: All three scan tool Line Pressure readings should be steady and ± 14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the Line Pressure read within ± 14 kPa or 2.0 psi in all three positions?**

**Yes** >> Replace the Line Pressure Sensor per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN

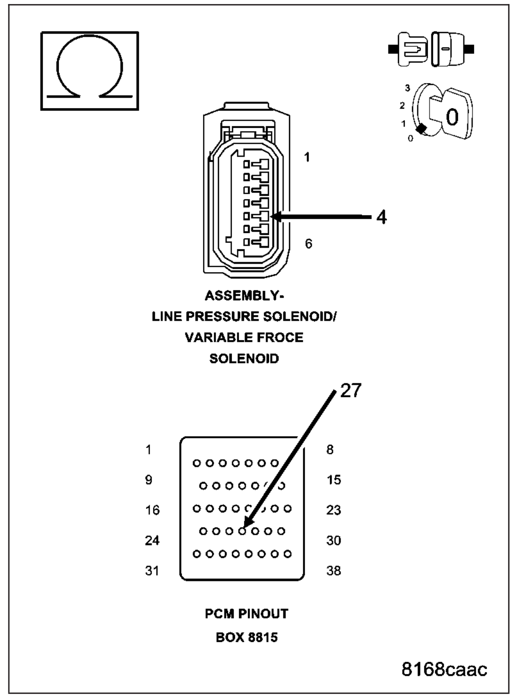
Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Disconnect the PCM C2 harness connector and connect Miller tool #8815.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (K900) Sensor Ground circuit from the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector to the appropriate terminal of Miller tool #8815.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (K900) Sensor Ground circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

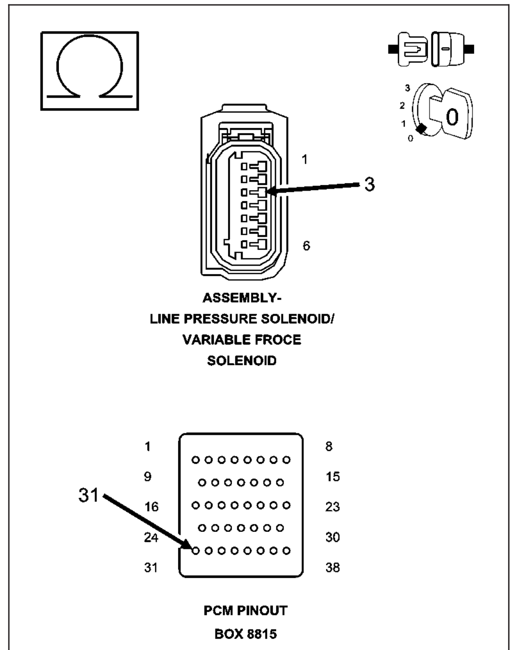
**No** >> Go To 4

## 4. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the PCM C4 harness connector and connect Miller tool #8815.

Measure the resistance of the (T38) Line Pressure Sensor Signal circuit from the Line Pressure Sensor/Variable Force Solenoid Assembly harness connector to the appropriate terminal of Miller tool #8815.

**Is the resistance above 5.0 ohms?**



8168ca63

**Yes** >> Repair the (T38) Line Pressure Sensor Signal circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

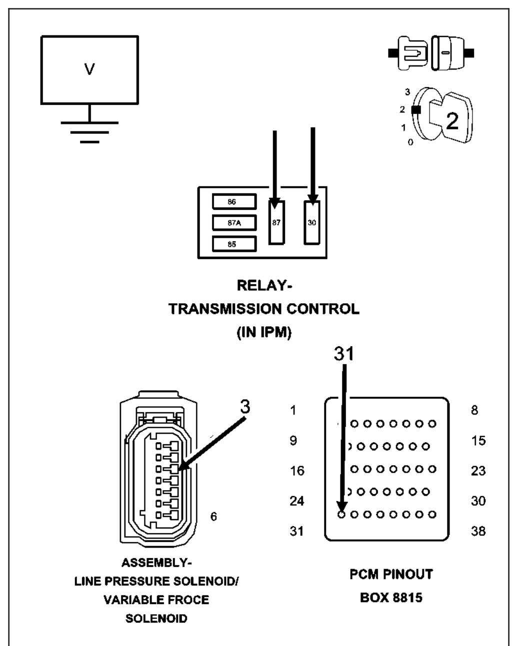
Remove the Transmission Control Relay.

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T38) Line Pressure Sensor Signal circuit.

**Is the voltage above 5.5 volts?**



8168cb27

**Yes** >> Repair the (T38) Line Pressure Sensor Signal circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wires while checking for shorted and open circuits.
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Where there any problems found?**

**Yes** >> Repair as necessary.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0944-LOSS OF HYDRAULIC PUMP PRIME

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Every 350 msec
- **Set Condition:**
  If the transmission begins to slip in any forward gear, and the pressure switch or switches that should be closed for a given gear are open, a loss of prime test begins. All available elements (in 1st gear LR, 2/4 and OD, in 2nd, 3rd, and 4th gear 2/4 and OD) are turned on by the PCM to see if pump prime exists. The code is set if none of the pressure switches respond. The PCM will continue to run the loss of prime test until pump pressure returns. The vehicle will not move or the transmission will slip. Normal operation will continue if pump prime returns.

| Possible Causes |
|---|
| LOW TRANSMISSION FLUID LEVEL |
| SHIFT LEVER POSITION |
| PLUGGED TRANSMISSION FILTER |
| TRANSMISSION OIL PUMP |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

The Loss of Prime Test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or ruptured oil filter. The Loss of Prime fault is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

### Diagnostic Test

1. **CHECK TO SEE IF DTC P0944 IS CURRENT**

Place the gear selector in park.

Start the engine.

**NOTE: The Transmission Temperature must be at least 43° C (110° F) before performing the following steps.**
The Transmission must be at operating temperature prior to checking pressure. Cold transmission fluid will result in higher pressure readings.

Place the Transmission in Reverse.

With the scan tool, observe the Transmission Pressure Switch states.

**Are any of the Pressure Switches closed?**

**Yes** >> Go To 2

**No** >> Go To 4

## 2. INTERMITTENT OPERATION

The conditions necessary to set this DTC are not present at this time.

Test drive the vehicle. Allow the Transmission to shift through all gears and ranges.

**Was a delayed engagement and/or a no drive condition present during the test drive?**

**Yes** >> Go To 4

**No** >> Go To 3

## 3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring while checking for shorted and open circuits.

With the scan tool, check the EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## 4. SHIFT LEVER POSITION TEST

With the scan tool, perform a Shift Lever Position test. Follow the instructions on the screen.

**Did the Shift Lever Position Test pass?**

**Yes** >> Go To 5

**No** >> Perform the diagnostic procedure for P0706-CHECK SHIFTER SIGNAL.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 5. CHECK FOR PLUGGED TRANSMISSION FILTER

Remove the Transmission Pan and inspect the Transmission Fluid and Transmission Filter per the Service Information.

**Does the Transmission Oil Pan contain excessive debris and/or is the Oil Filter plugged?**

**Yes** >> Repair the cause of the plugged Transmission Filter. Refer to the Service Information for the proper repair procedure.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Oil Pump per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P0992-2/4/OD HYDRAULIC PRESSURE TEST

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  In any forward gear with engine speed above 1000 RPM, shortly after a shift and every minute thereafter.
- **Set Condition:**
  After a shift into a forward gear, with engine speed greater than 1000 RPM, the PCM momentarily turns on element pressure to the clutch circuits that do not have pressure to identify that the correct pressure switch closes. If the pressure switch does not close 2 times the DTC sets.

| Possible Causes |
|---|
| CONDITION P0992 PRESENT |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

### Theory of Operation

Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied, the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 2/4 pressure switches when they are off (when the corresponding friction element is not applied) by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to Limp-in mode.

### 1. CHECK TO SEE IF DTC P0992 IS CURRENT

**NOTE: The vehicle must be driven to set this DTC. The transmission must at operating temperature with the Engine RPM above 1000 RPM.**

This DTC is an indication of both the 2/4 and the O/D Hydraulic Pressure Switch DTCs present.

Perform the diagnostic procedures for both P0845 and P0870.

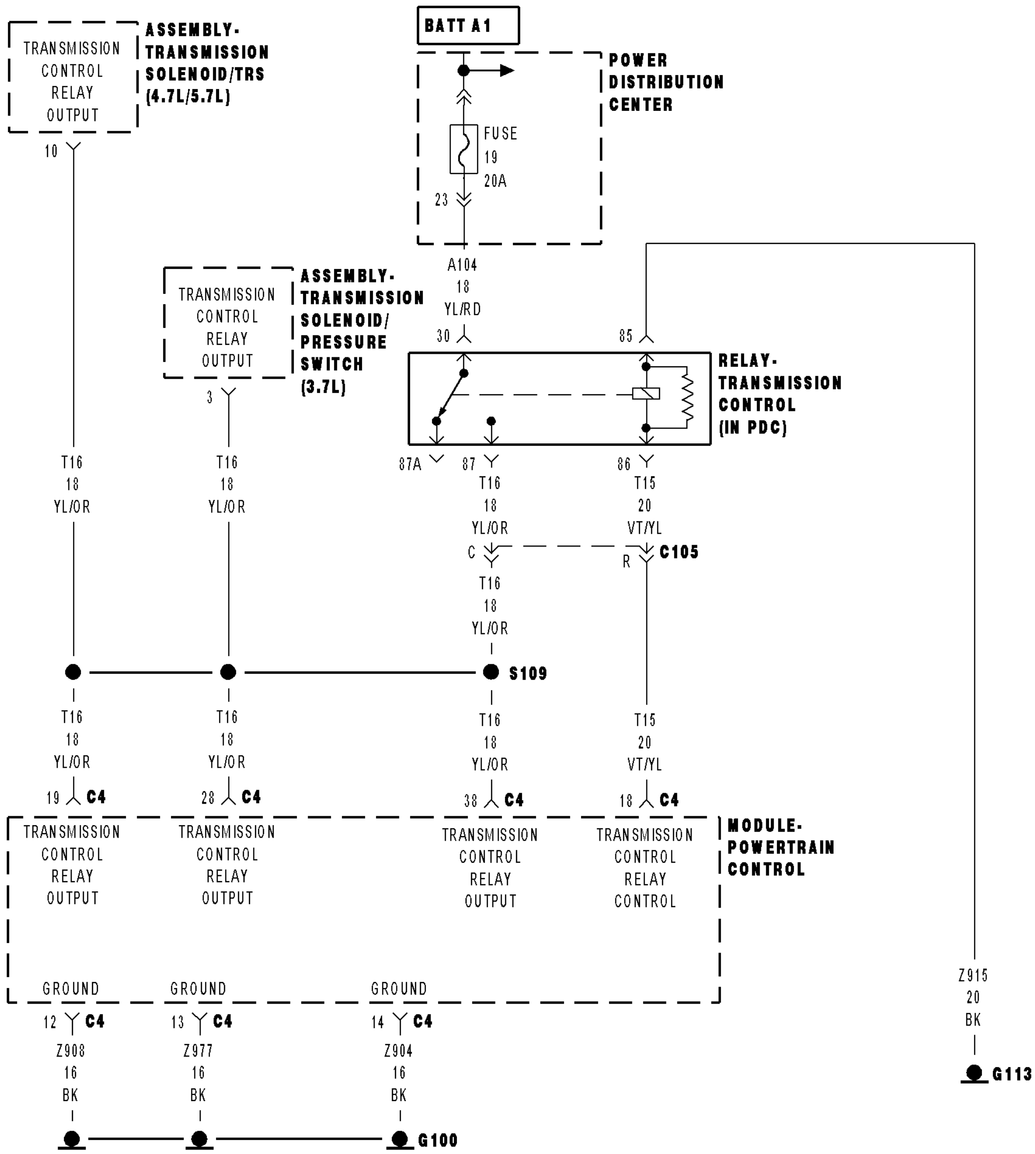
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

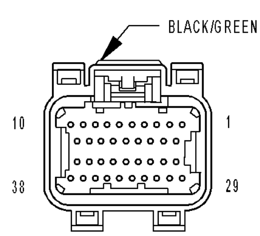
**If there are no possible causes remaining, view repair.**

**Repair**

Refer to the Transmission category and perform the diagnostic procedures for P0845 and P0870.

## P1684-BATTERY WAS DISCONNECTED





MODULE-POWERTRAIN CONTROL C4

814AE81E

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  After a reset (ignition key turned to the RUN position).
- **Set Condition:**
  The checksum of the battery backed RAM does not match the stored checksum. Set Time: Less than 7 msec.

| Possible Causes |
|---|
| BATTERY WAS DISCONNECTED |
| PCM WAS REPLACED OR DISCONNECTED |
| QUICK LEARN WAS PERFORMED |
| (A919) FUSED B+ CIRCUIT TO PCM OPEN |
| (Z908 and Z977) GROUND CIRCUIT OPEN |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

Note: This is not a fault code. It exists to provide reference information only. A battery backed RAM is used to maintain some learned values. When the battery is disconnected, this memory is lost. When the battery is reconnected, the loss of learned values will be detected by the controller. The code will be set and the learned values will be initialized to known constants and the learning process will continue. Setting the code has no effect except for re-initialization of learned values.

## Diagnostic Test

### 1. BATTERY WAS DISCONNECTED

**Has the battery been disconnected, lost it's charge, or been replaced recently?**

**Yes** >> Disconnecting or replacing the battery will set this DTC. Erase the DTC.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 2

### 2. WAS QUICK LEARN PERFORMED

**Has a Quick Learn procedure been performed?**

**Yes** >> Performing Quick Learn will set this DTC. Erase the DTC.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. PCM REPLACED OR DISCONNECTED

**Has the PCM been replaced or disconnected?**

**Yes** >> Replacing or disconnecting the PCM will set this DTC. Erase the DTC.
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. (A919) FUSED B+ CIRCUIT

Turn the ignition off to the lock position.

Disconnect the PCM C1 harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Using a 12-volt test light connected to ground, check the (A919) Fused B+ circuit.

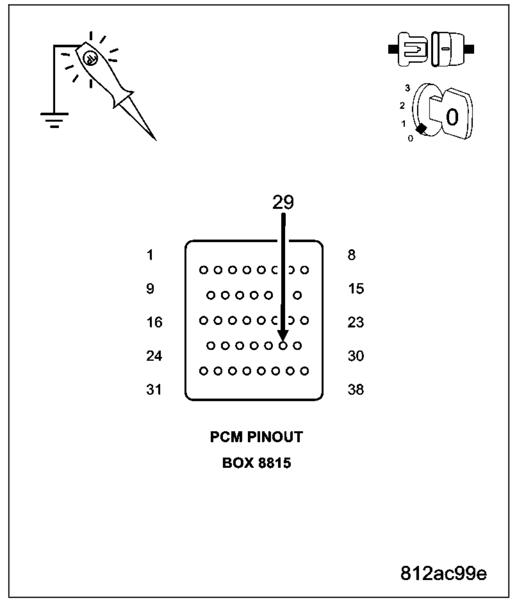
**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the Fused B+ circuit for an open. If the fuse is open make sure to check for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.



## 5. (Z908) AND (Z977) GROUND CIRCUITS

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

Using a 12-volt test light connected to 12-volts, check the (Z908) and (Z977) Ground circuits in the appropriate terminal of special tool #8815.

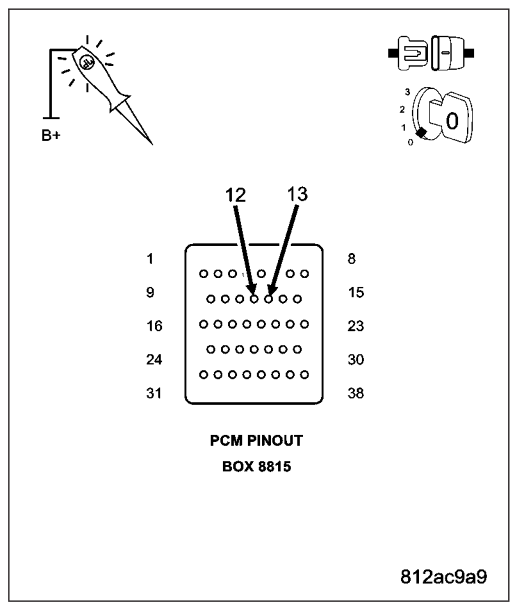
**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly for all of the ground circuits?**

**Yes** >> Go To 6

**No** >> Repair the Ground circuits for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.



## 6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLETRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## P1713-RESTRICTED MANUAL VALVE IN T2 RANGE

For a complete wiring diagram**Refer to Section 8W**

- **When Monitored:**
  Ignition on, engine running with the gear shift selector in a valid forward gear.
- **Set Condition:**
  This DTC sets whenever Transmission control system detects the manual valve is in the T2 range when it should be in OD. This is mainly an informational DTC.

| Possible Causes |
|---|
| RELATED TRANSMISSION DTC'S PRESENT |
| CUSTOMER DRIVING HABITS |
| MIS-ADJUSTED SHIFTER CABLE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Diagnostic Test

### 1. DETERMINING IF RELATED DTC'S ARE PRESENT

With the scan tool, check for other transmission DTC's

**Are there any speed sensor or gear ratio DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK THE GEAR SHIFT CABLE FOR PROPER ADJUSTMENT

Check the Gear shift cable adjustment per the Service Information.

Also check the cable for possible binding or improperly routed.

**Is the Gear shift cable properly adjusted and not binding or improperly routed?**

**Yes** >> Go To 3

**No** >> Adjust the Shifter Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

### 3. CHECK CUSTOMER DRIVING HABIT

This DTC can be set if the customer does not move the shift lever completely into the OD position (in between gears) causing the manual valve to be in the T2 position.

When this occurs, the feed port to the clutch is restricted, the transmission will declare neutral, and this DTC will set.

This DTC can also be set by simply bumping the shift lever toward neutral while accelerating.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**If there are no possible causes remaining, view repair.**

**Repair**

This DTC can be set by the shift lever in the wrong position or not completely in the OD position. Make sure the customer is properly informed.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

# P1745-TRANSMISSION LINE PRESSURE TOO HIGH FOR TOO LONG

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with ignition on.
- **Set Condition:**
  If the transmission has been operating in an open-loop line pressure control for 2000 miles or 1000 2-3 upshifts.

| Possible Causes |
|---|
| LINE PRESSURE DTCS PRESENT |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

This DTC is an informational DTC to inform the technician that transmission has been operating in an open-loop line pressure control for 2000 miles or 1000 2-3 upshifts resulting from a Line Pressure DTC. The 42RLE Transmission is not designed to operate in open-loop line pressure control for an extended period time. This DTC is intended to protect the transmission. If the DTC sets, the transmission controller will place the transmission into limp-in mode.

## Diagnostic Test

### 1. CHECK FOR RELATED DTC'S

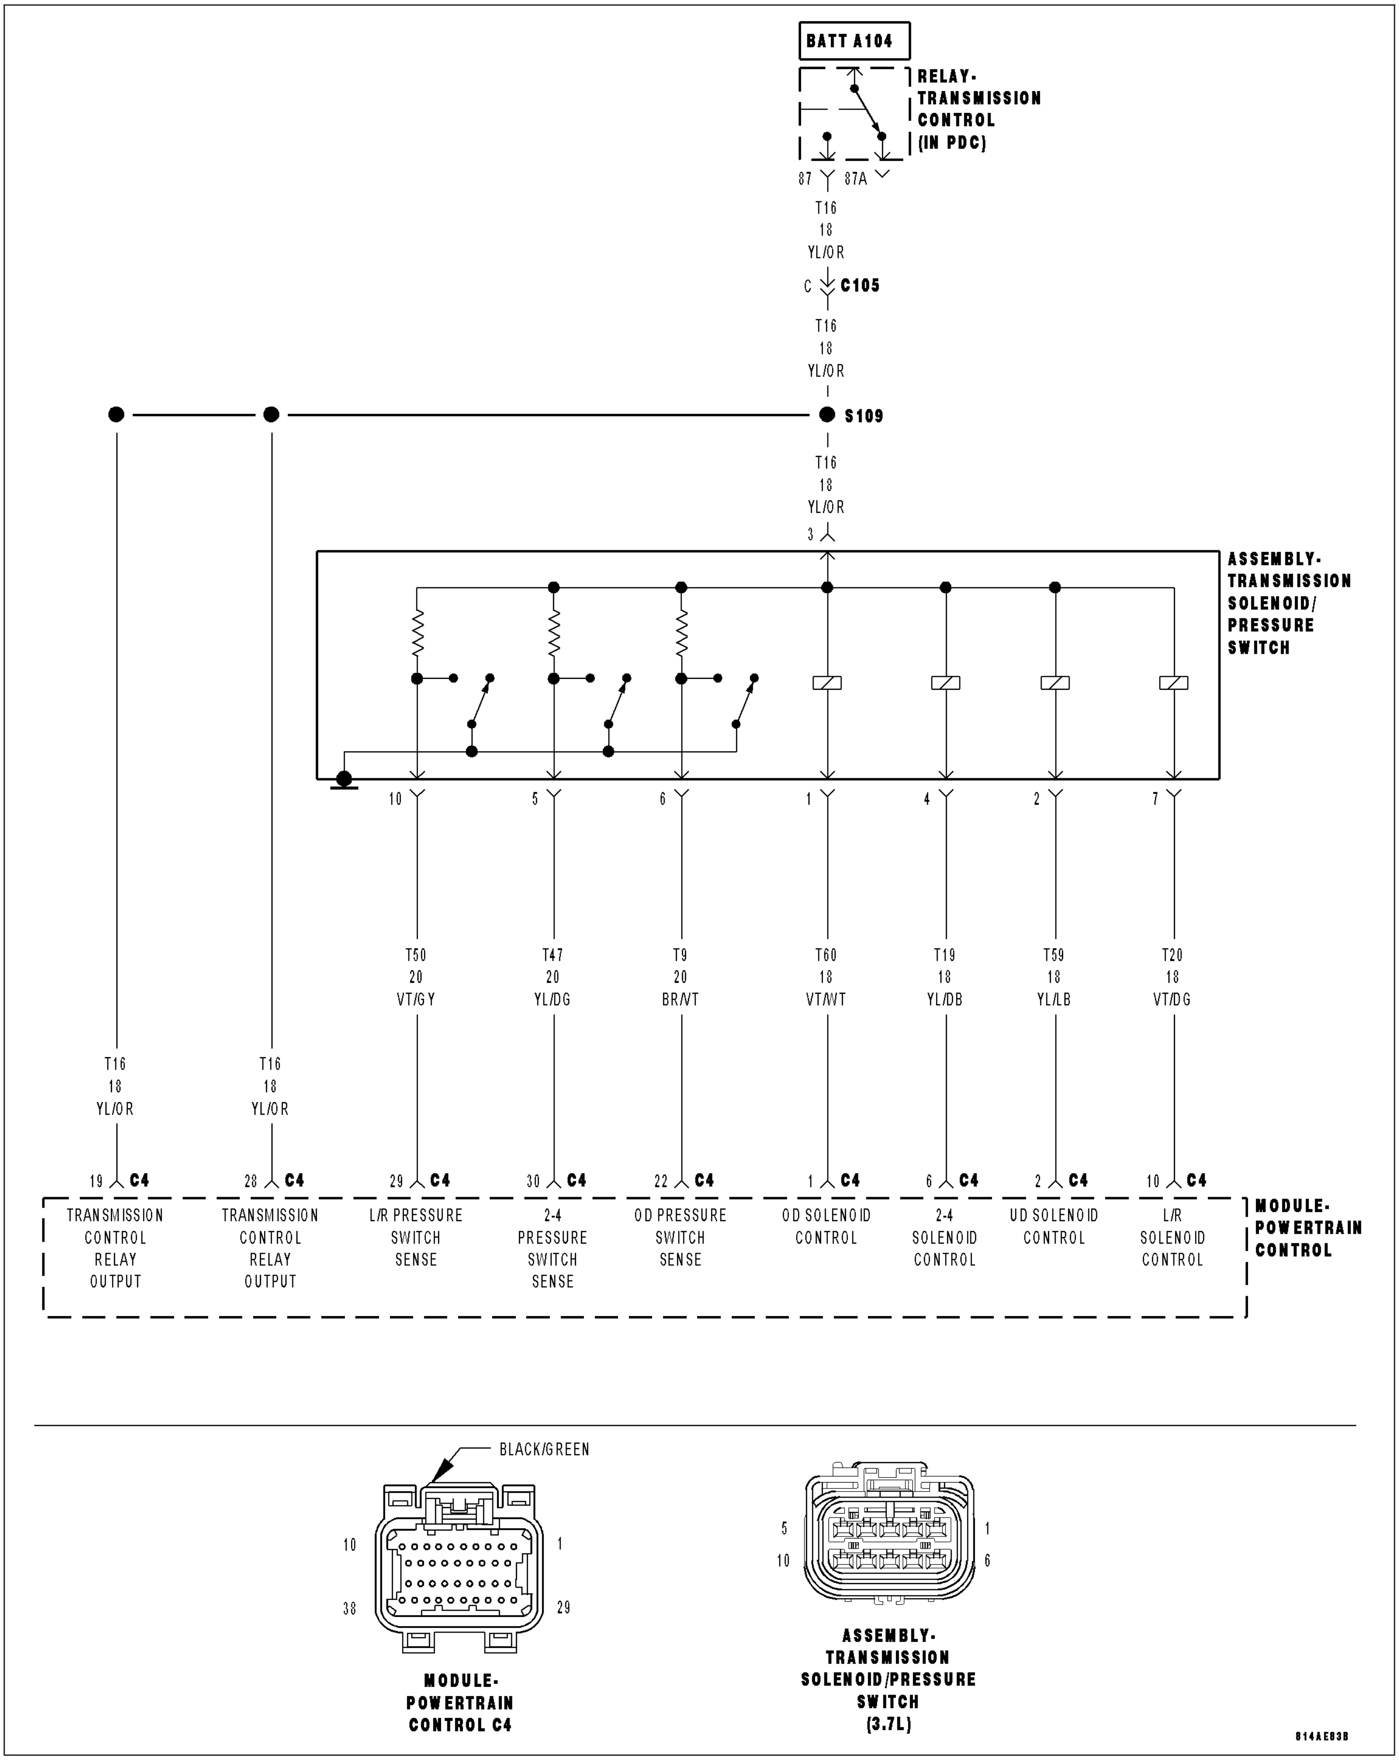
With the scan tool, check for Transmission Line Pressure DTCs.

**View repair**

**Repair**

Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING)

## P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Prior to a shift into 1st gear.
- **Set Condition:**
  Transmission temperature must be hot. DTC is set after six unsuccessful attempts to shift into 1st gear.

| Possible Causes |
|---|
| RELATED DTC P0841 PRESENT |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| INTERNAL TRANSMISSION |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The Solenoid Switch Valve, an internal, hydraulically operated valve, controls the direction of the transmission fluid when the LR solenoid is energized. When the solenoid switch valve is in the downshifted position and the LR solenoid is energized, fluid is directed to the LR element for 1st gear. When the solenoid switch valve is In the upshifted position (2nd, 3rd, and 4th gear) and the LR solenoid is energized, fluid is directed into the Lockup Switch Valve which controls the Torque Converter Clutch. When shifting into 1st gear, a special sequence is followed to insure solenoid switch valve movement into the downshifted position. The LR pressure switch is monitored to confirm switch valve movement. If the solenoid switch valve movement is not confirmed (i.e. no LR pressure when the LR solenoid is energized), 2nd gear is substituted for 1st. No 1st gear (2nd gear is substituted). The transmission Torque converter FEMCC operation is inhibited. MIL on after 5 min. of substituted operation.

## Diagnostic Test

### 1. DETERMINING IF RELATED DTCS ARE PRESENT

With the scan tool, check for other Transmission DTCs

**Is the DTC P0841 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK TO SEE IF DTC P1775 IS CURRENT

With the scan tool, view DTCs.

**Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 8

## 3. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.

With the scan tool, monitor the L/R Pressure Switch State while pressing the Pressure Switch Test button.

**Did the Pressure Switch state change from open to closed when the test button was pressed?**

**Yes** >> Repair internal transmission as necessary per the Service Information. Inspect the Solenoid Switch Valve per the Service Information and repair or replace as necessary. If no problems are found, replace the Transmission Solenoid/Pressure Switch Assembly.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Disconnect the PCM C4 harness connector.

Remove the Transmission Control Relay.

Remove the Starter Relay.

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit at the Transmission Control Relay connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Using a 12-volt test light connected to ground, check all (T16) Transmission Control Relay Output circuits in the appropriate terminals of special tool #8815.

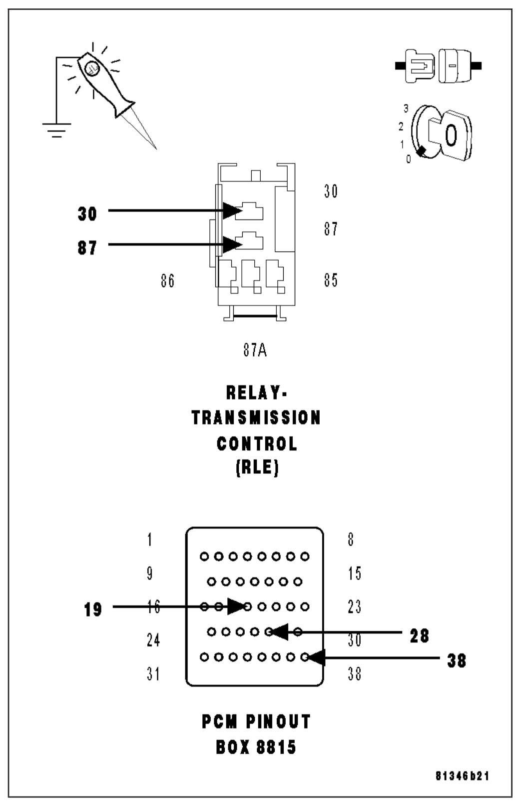
**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly on all Transmission Control Relay Output circuits?**

**Yes** >> Repair the (T16) Transmission Control Relay Output circuit for an open.

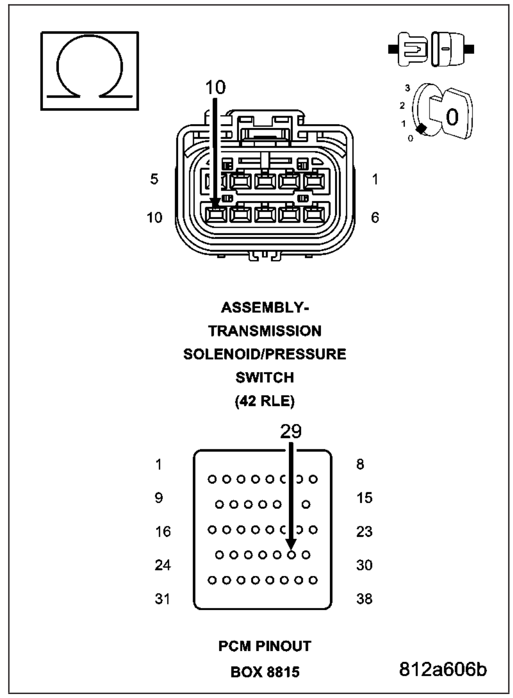
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 5



## 5. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN

Measure the resistance of the (T50) L/R Pressure Switch Sense circuit from the appropriate terminal of special tool #8815 to the Transmission Solenoid/Pressure Switch Assembly harness connector.



**Is the resistance above 5.0 ohms?**

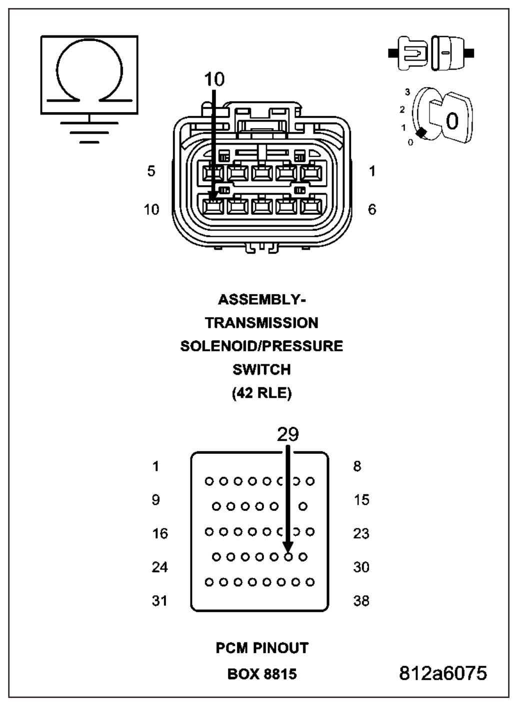
**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7

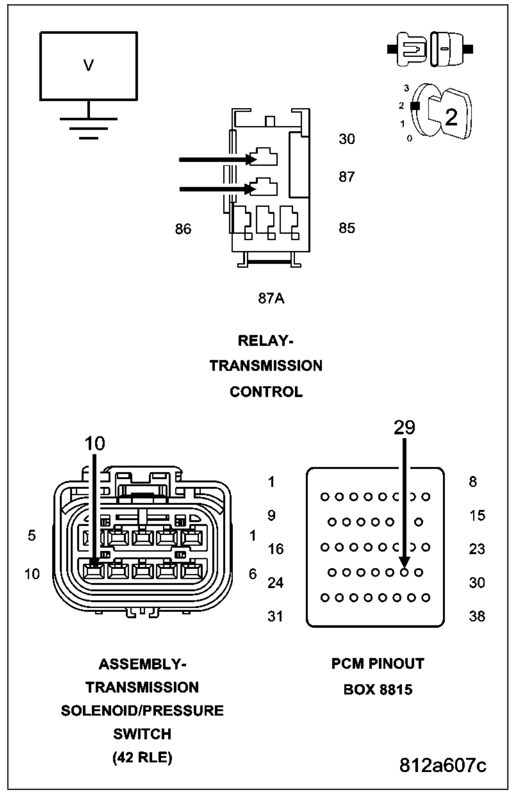
## 7. (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

**NOTE: The jumper wire must still be in place in the Transmission Control Relay connector.**

Ignition on, engine not running.

Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.

**Is the voltage above 0.5 volts?**



**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Test drive and verify if the transmission is launching in 2nd gear and/or no TCC engagement.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

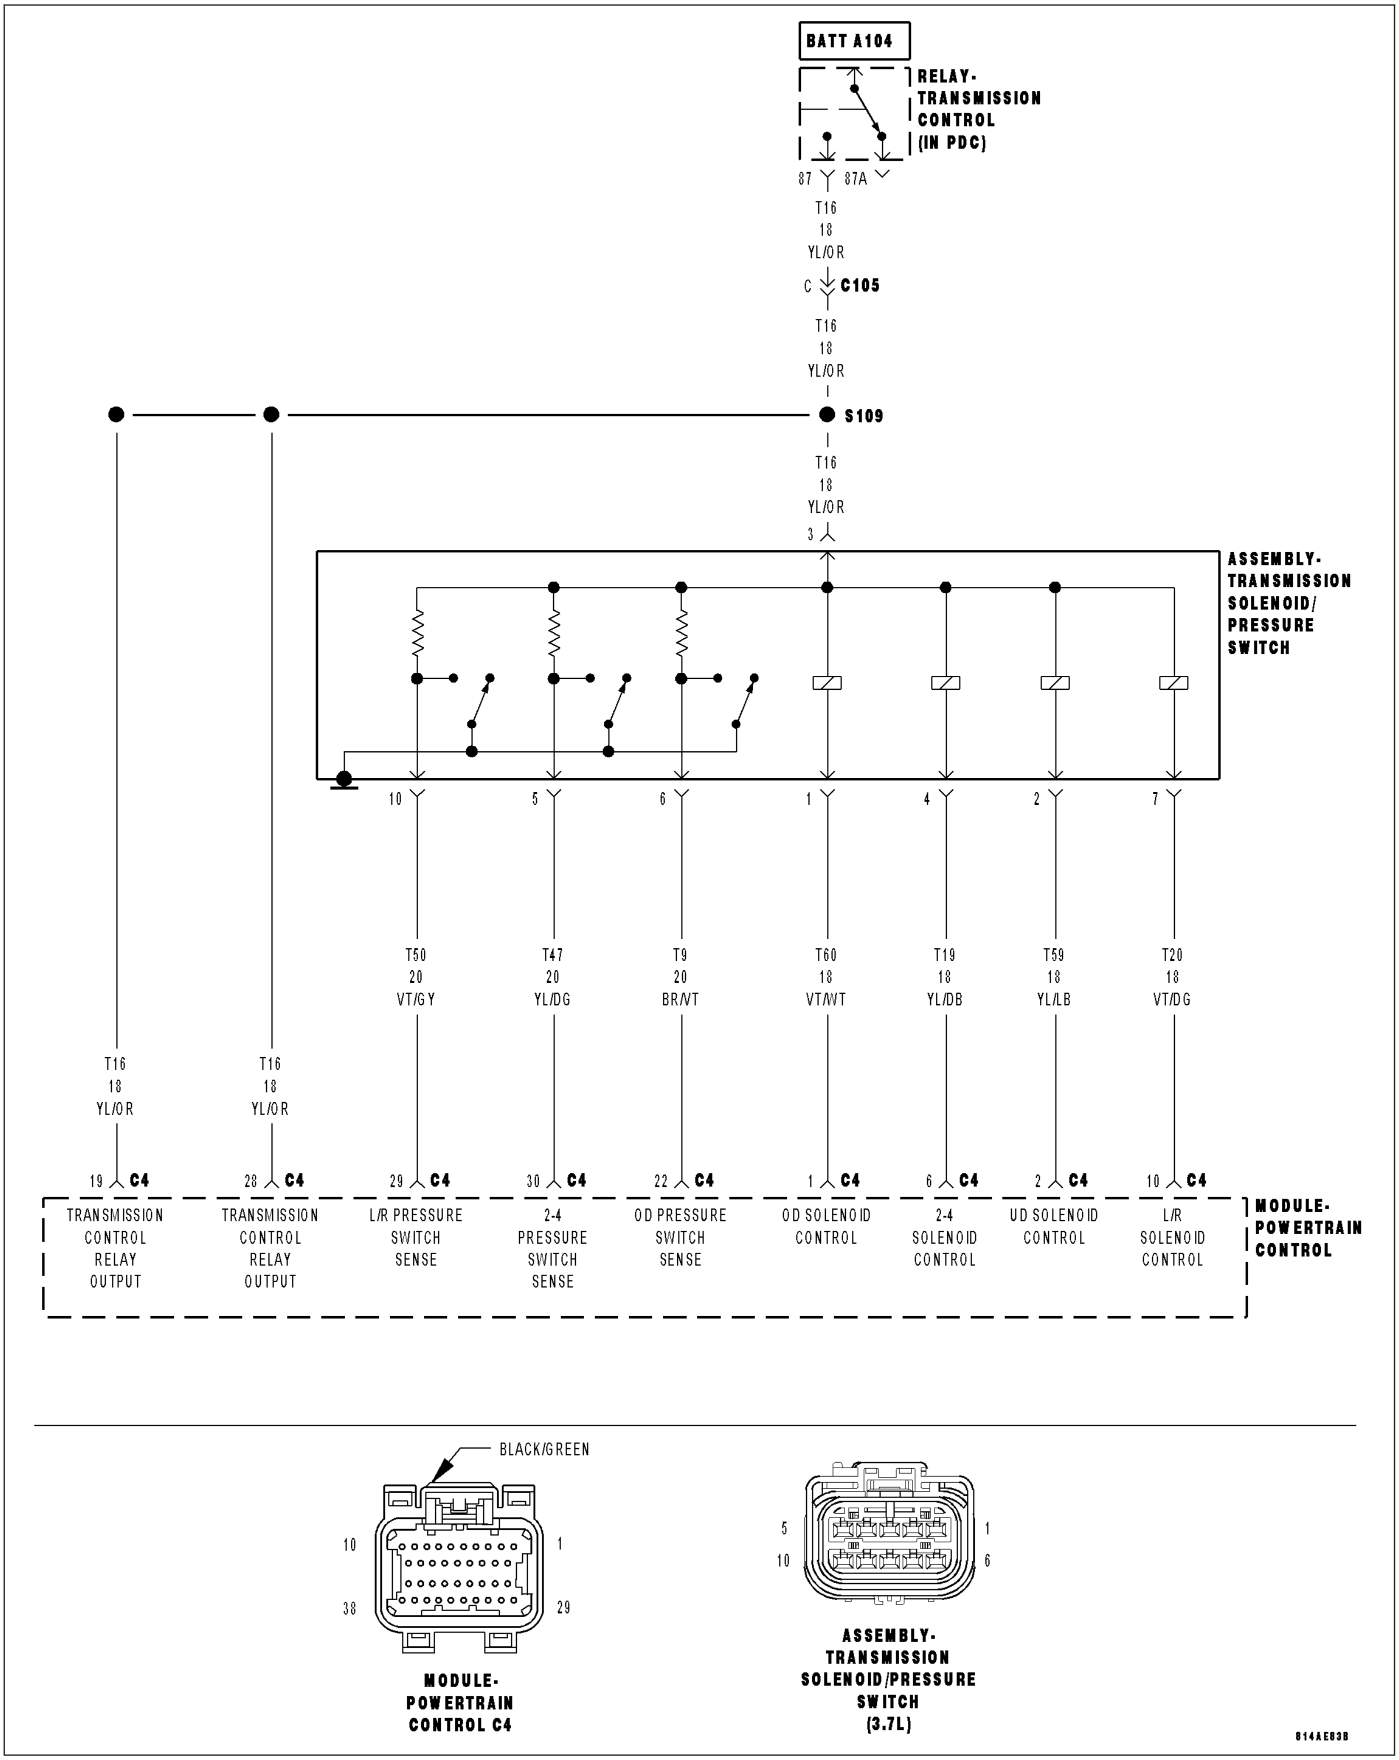
**Are there 2nd gear launches and/or no TCC engagement?**

**Yes** >> Disassemble and inspect the Valve Body per the Service Information and repair or replace as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid Pressure Switch Assembly.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Every 7 ms when doing PEMCC or FEMCC.
- **Set Condition:**
  Must be in partial or full EMCC. The DTC is set if L/R pressure is detected high for the fourth time.

| Possible Causes |
|---|
| RELATED DTC P0841 PRESENT |
| DTC EVENT DATA SHOWS TRS CODE TR2 - SHIFT LEVER OR MANUAL CONTROL VALVE IN A INVALID POSITION |
| SHIFTER CABLE OUT OF ADJUSTMENT |
| SOLENOID SWITCH VALVE STICKING IN ITS BORE |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| VALVE BODY |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The Solenoid Switch Valve, an internal, hydraulically operated valve, controls the direction of the transmission fluid when the L/R solenoid is energized. When the solenoid switch valve is in the downshifted position and the L/R solenoid is energized, fluid is directed to the L/R element for 1st gear. When the solenoid switch valve is In the up-shifted position (2nd, 3rd, and 4th gear) and the L/R solenoid is energized, fluid is directed into the Lockup Switch Valve which controls the Torque Converter Clutch. When doing PEMCC or FEMCC, the L/R pressure switch should indicate no pressure if the solenoid switch valve is in the LU position. If the L/R pressure switch indicates pressure for some time while in partial or full EMCC, the EMCC operation is aborted and momentarily inhibited to avoid accidental application of the L/R clutch. EMCC is attempted again when there is no L/R pressure. The fourth detection of L/R pressure while in PEMCC or FEMCC will result in setting the DTC.Torque converter EMCC operation inhibited. MIL on after 5 min. of substituted operation.

## Diagnostic Test

### 1. DETERMINING IF RELATED DTC'S ARE PRESENT

With the scan tool, check for other Transmission DTC's

**Is the DTC P0841 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK THE DTC EVENT DATA FOR TRS CODE TR2

With the scan tool, check the DTC EVENT DATA for P1776.

**Does the DTC EVENT DATA show a TRS Code of TR2?**

**Yes** >> This indicates the shift lever and the manual control valve were in an invalid position between Neutral and OD. Check the shifter cable for: proper adjustment, binding, friction, improper routing, or the shifter was moved in transit. Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK TO SEE IF DTC P1776 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P1776.

**NOTE: This counter only applies to the last DTC set.**

**Is the status Active or is the STARTS SINCE SET counter 2 or less for this DTC?**

**Yes** >> Go To 4

**No** >> Go To 9

## 4. CHECK THE PCM AND WIRING USING THE TRANSMISSION SIMULATOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to L/R.

With the scan tool, monitor the L/R Pressure Switch State while pressing the Pressure Switch Test button.

**Did the Pressure Switch state change from open to closed when the test button was pressed?**

**Yes** >> Go To 5

**No** >> Go To 6

## 5. CHECK THE SOLENOID SWITCH VALVE FOR STICKING

Remove the transmission oil pan and Valve body and inspect the Solenoid Switch Valve for sticking in its bore, repair or replace as necessary.

**NOTE: This DTC may be caused by debris lodged in the Transmission Solenoid Switch Valve bore. If debris is found, clean the valve body and reassemble the transmission per the Service Information.**

With the scan tool, record the DTC EVENT DATA for P1776 and erase DTCs.

Reassemble the transmission and test drive the vehicle. Try to duplicate the original set conditions using the DTC EVENT DATA recorded earlier.

With the scan tool, check Transmission DTCs.

**Did the DTC P1776 reset?**

**Yes** >> Replace the Transmission Solenoid Assembly per the Service Information.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 6. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

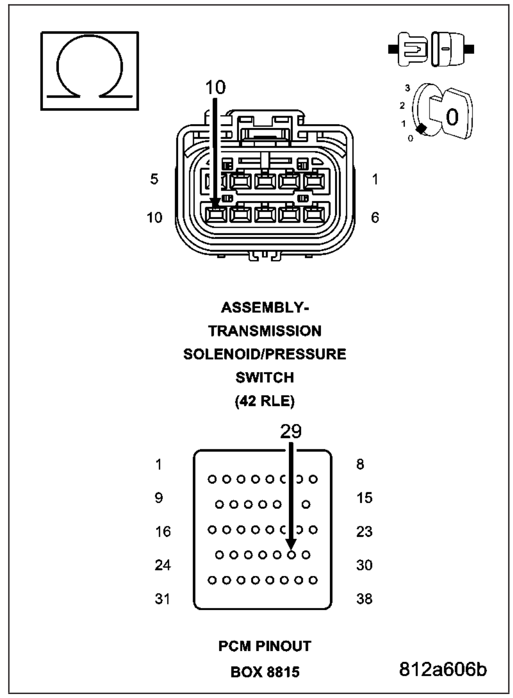
Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller tool #8815 to perform diagnosis.**

Measure the resistance of the (T50) L/R Pressure Switch Sense circuit between the appropriate terminal of Miller tool #8815 and the Transmission Solenoid/Pressure Switch Assembly harness connector.



**Is the resistance above 5.0 ohms?**

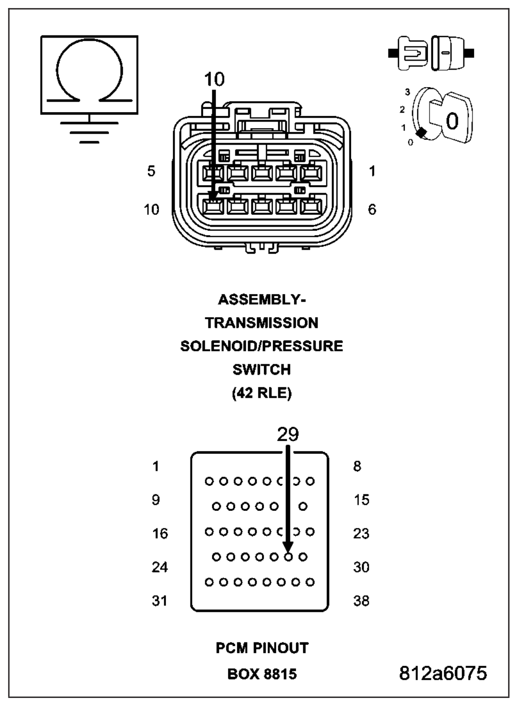
**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T50) L/R Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for a short to ground.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 8

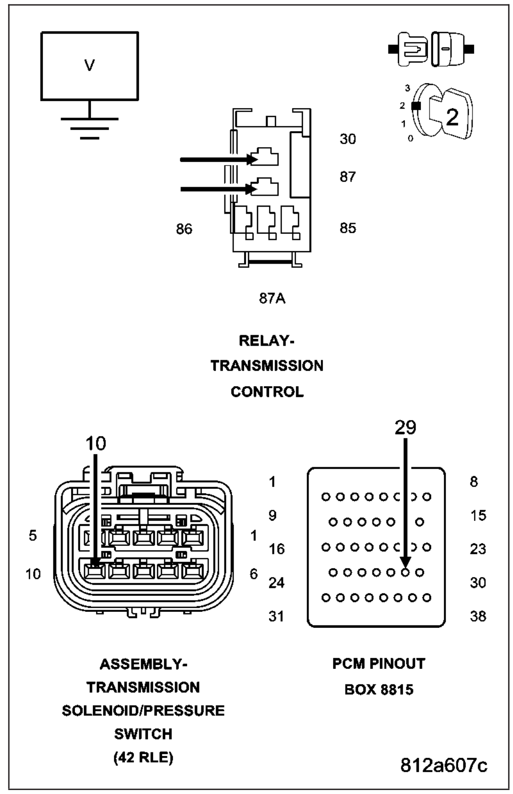
## 8. CHECK THE (T50) L/R PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE

Remove the Transmission Control Relay.

Connect a jumper wire between the (Internal) Fused B(+) circuit and (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T50) L/R Pressure Switch Sense circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T50) L/R Pressure Switch Sense circuit for a short to voltage.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 9. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Test Drive the vehicle and verify if the transmission is launching in 2nd gear and/or there is no TCC engagement.

With the scan tool, check the EVENT DATA to help identify the conditions in which the DTC was set.

Check for any Service Information Tune-ups or Service Bulletins for possible causes that may apply.

**Are there 2nd gear launches and/or no TCC engagement?**

**Yes** >> Disassemble and inspect the Valve Body per the Service Information Inspect the Solenoid Switch Valve for sticking in its bore and repair or replace as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P1790-FAULT IMMEDIATELY AFTER SHIFT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  After a Gear Ratio Error code is stored.
- **Set Condition:**
  After a Gear Ratio Error DTC has already been set. The DTC is set if the fault happened within 1.3 seconds of a shift. The DTC set time will vary from 1.214 seconds to 15 seconds.

| Possible Causes |
|---|
| FAULT AFTER SHIFT |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

This DTC is not stored alone. It is stored if a Gear Ratio DTC is detected immediately after shift. The existence of DTC P1790 indicates a mechanical or hydraulic (not electrical) related problems. It should be noted, however, that all mechanical problems don't necessarily result in DTC P1790. When this DTC exists, diagnosing the system should be based on the associated DTC and only mechanical causes should be considered.

### Diagnostic Test

1. **FAULT AFTER SHIFT**

This DTC is set along with a Gear Ratio DTC. Perform the appropriate test for the Gear Ratio DTC stored.

**NOTE: Check Pending DTCs or 1 trip failures if there are no Active or Stored Gear Ratio DTCs.**

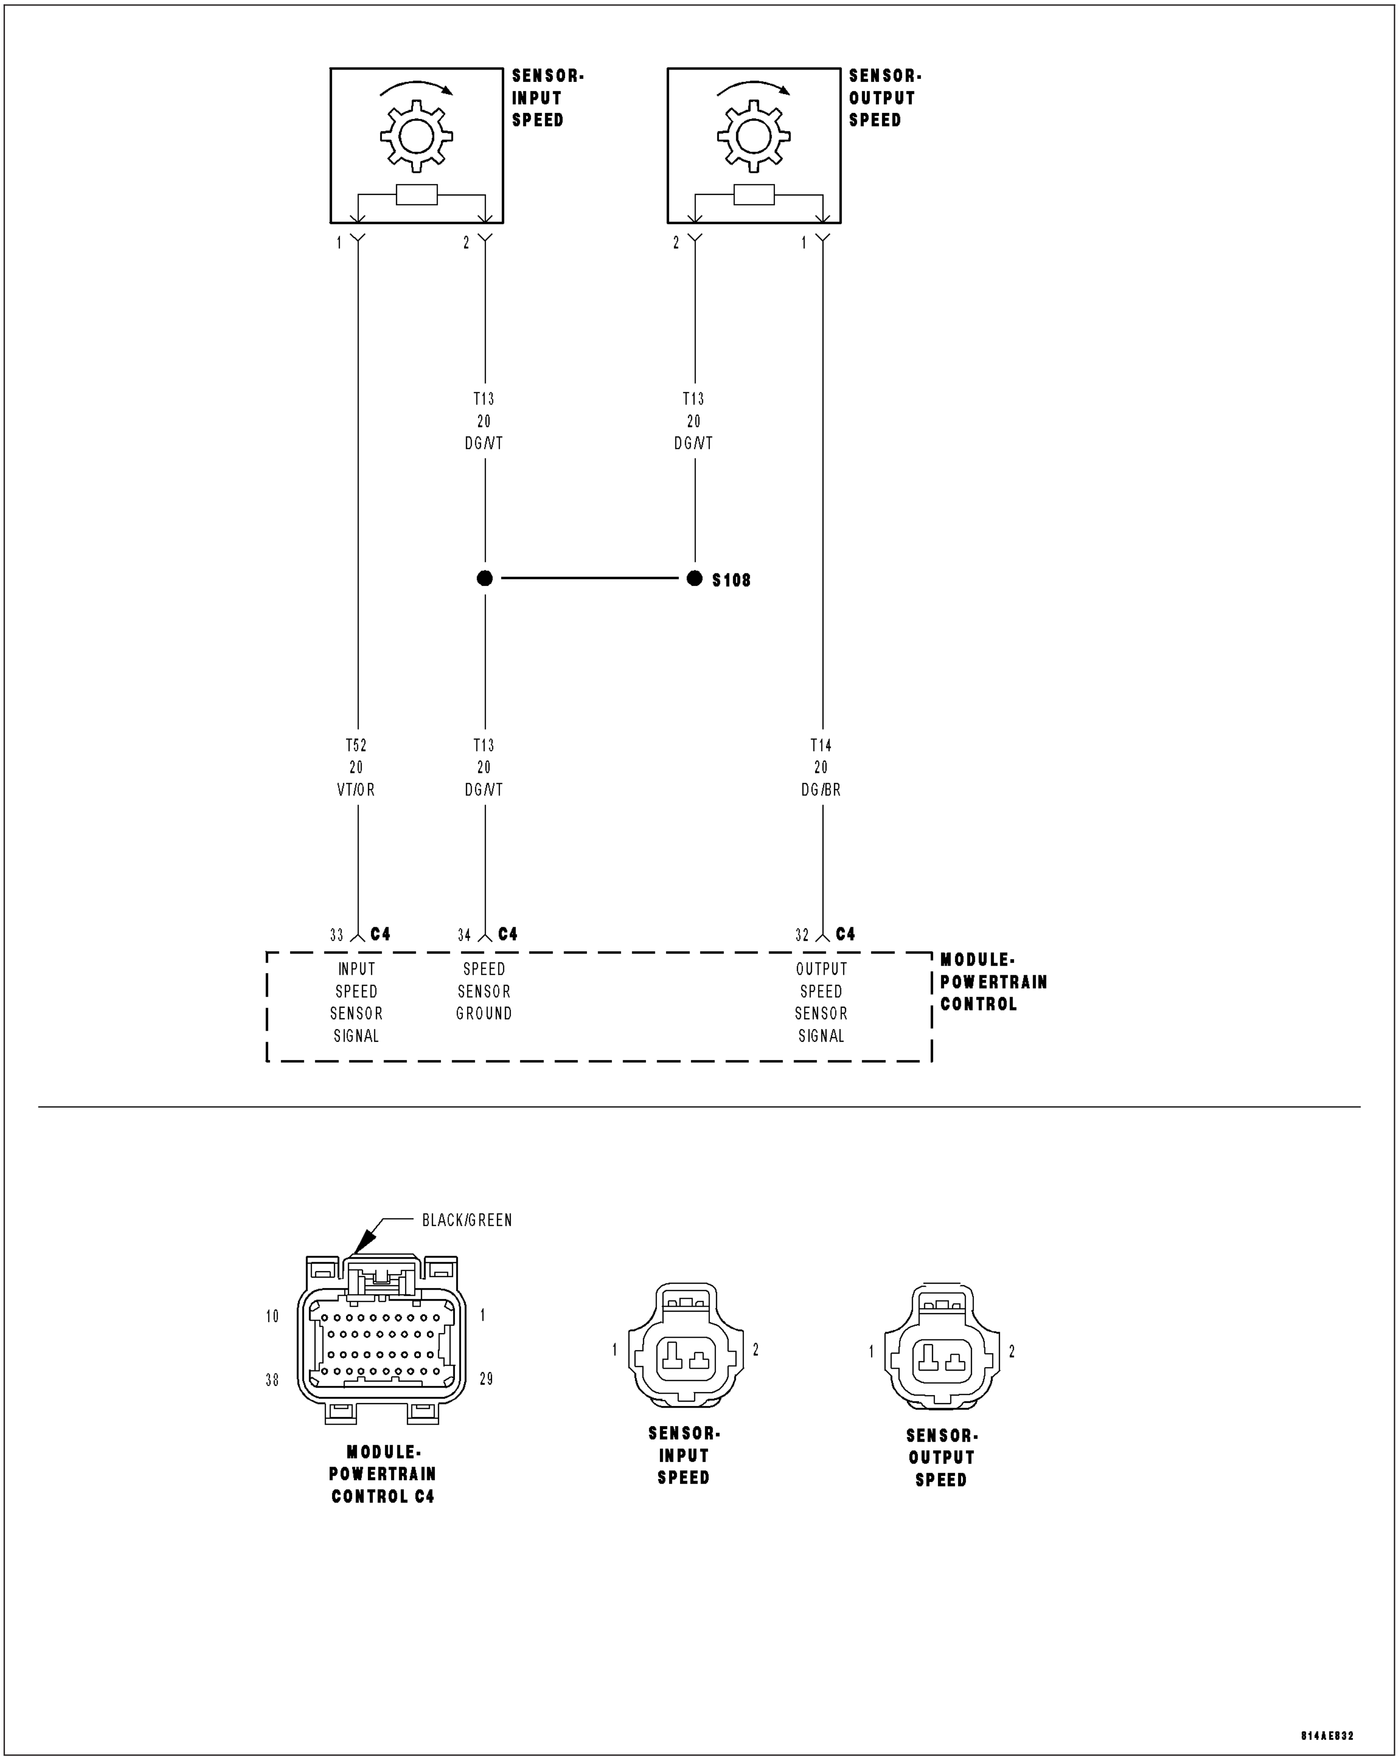
**If there are no possible causes remaining, view repair.**

**Repair**

Refer to the Transmission category and perform the appropriate symptom.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## P1794-SPEED SENSOR GROUND ERROR



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Every 7ms after a controller reset with transmission in neutral.
- **Set Condition:**
  After a PCM reset in neutral and Input and Output sensor ratio equals 2.50 to 1.0 ± 50.0 RPM.

| Possible Causes |
|---|
| SPEED SENSOR GROUND CIRCUIT OPEN |
| POWERTRAIN CONTROL MODULE |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

## Theory of Operation

The input and output speed sensors use a common ground circuit. The loss of this common ground results in the input signal being sensed for both. After a reset in neutral, and after observing a specific ratio, the Speed Check Fault Counter will increment. Because the speed sensors and the thermistor share the same ground circuit, this DTC may indicate a loss of the common speed sensor ground. In some cases this fault will cause a Gear Ratio Error DTC to be set.

## Diagnostic Test

### 1. PCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A.

Ignition on, engine not running.

With the Transmission Simulator, set the ″Input/Output Speed″ switch to ″ON″ and the rotary switch to the ″3000/1250″ position.

With the scan tool, monitor the Input and Output Speed Sensor readings.

**Does the Input Speed read 3000 RPM and the Output Speed read 1250 RPM, ± 50 RPM?**

**Yes** >> Go To 2

**No** >> Go To 4

## 2. (T13) SPEED SENSOR GROUND CIRCUIT OPEN

Turn the ignition off to the lock position.

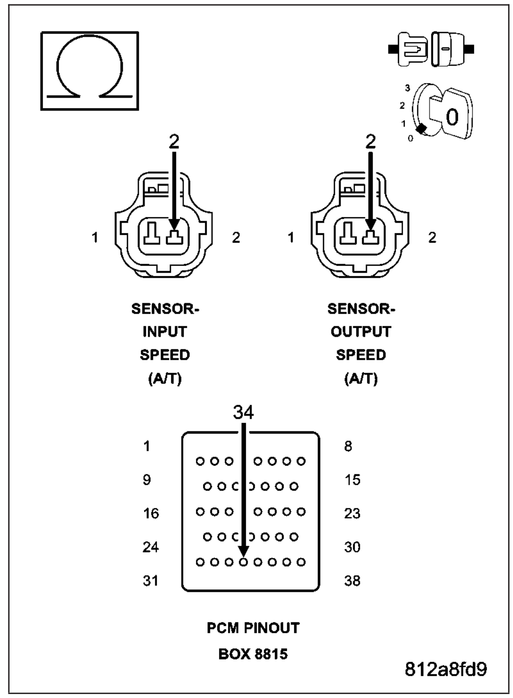
Disconnect the PCM C4 harness connector.

Disconnect the Input and Output Speed Sensor harness connectors.

**NOTE: Check connectors - Clean/repair as necessary.**

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of both of the (T13) Speed Sensor Ground circuits from the appropriate terminal of special tool #8815 to the Input and Output Speed Sensor harness connectors.



**Is the resistance above 5.0 ohms on either circuit?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for an open.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. POWERTRAIN CONTROL MODULE

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace and program the Powertrain Control Module per the Service Information. With the scan tool perform QUICK LEARN.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## 4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P1797-MANUAL SHIFT OVERHEAT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with engine running.
- **Set Condition:**
  If the Engine Temperature exceeds 123° C (255° F) or the Transmission Temperature exceeds 135° C (275° F) while in AutoStick® mode. Note: Aggressive driving or driving in low for extended periods of time will set this DTC.

| Possible Causes |
| --- |
| MANUAL SHIFT OVERHEAT |

**Always perform the 42RLE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)**

### Theory of Operation

The major cause of heat build up in the transmission is torque converter slip. With the transmission in the AutoStick® mode, the torque converter can slip during aggressive driving or heavy loading conditions such as trailer towing or driving up steep grades. In the non AutoStick® mode, internal controller logic prevents the transmission from overheating by managing the shift and EMCC schedule. In the AutoStick® mode, when the transmission or engine temperature approaches an overheat condition, the manual shift overheat DTC sets and the AutoStick® mode is temporarily suspended until the temperature returns to normal.

### Diagnostic Test

#### 1. MANUAL SHIFT OVERHEAT

This is an informational DTC only.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

Check the engine and transmission cooling system for proper operation.

Check the Radiator Cooling Fan operation.

Check the Transmission Cooling operation.

Check the Transmission Fluid Level per the Service Information to verify that it is not overfilled.

**NOTE: Aggressive driving or driving in low for extended periods of time will set this DTC.**

**If there are no possible causes remaining, view repair.**

**Repair**

If the Transmission Fluid is low, repair any Transmission Fluid leak as necessary and adjust the Transmission Fluid Level per the Service Information. Refer to Service Information for the related symptoms and repair as necessary.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

## U0100 LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Every 7 msec with:
  1) Engine speed greater than 500 RPM.
  2) Battery voltage between 10 and 16 volts.
- **Set Condition:**
  CAN C bus messages are not received for 10 seconds.

## Theory of Operation

The NGC controller communicates over the CAN C bus. The transmission controller continuously monitors bus activity. The CAN C bus is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for diagnostic procedures and for further possible causes.**

## U0002–CAN C BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Anti-Lock Brakes Module detects a short in either CAN C Bus circuit.

Perform CAN C Bus Communication Failure diagnostic test procedure. **(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)**.

## U0121 LOST COMMUNICATION WITH ABS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Every 7 msec with:
  1) Engine speed greater than 500 RPM.
  2) Battery voltage between 10 and 16 volts.
- **Set Condition:**
  CAN C bus messages are not received for 10 seconds.

## Theory of Operation

The NGC controller communicates over the CAN C bus. The transmission controller continuously monitors bus activity. The CAN C bus is also used to communicate transmission MIL status to the Engine Controller. If the Engine Controller is unable to communicate with the Transmission Controller, a DTC will set and the Engine Controller will illuminate the MIL.

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for diagnostic procedures and for further possible causes.**

## STANDARD PROCEDURE

## PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 42RLE

For a complete wiring diagram **Refer to Section 8W**.

### 1.

Perform the following steps prior to any diagnostic procedure:

- Many transmission symptoms can be caused by a low fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper fluid level. Refer to the Service Information for the proper repair and fluid fill procedures.
- Testing should only be performed with the battery fully charged to avoid false diagnosis.
- With the scan tool, read Engine (PCM) DTCs. If Engine DTCs are present, refer to the Driveability Category and perform to the appropriate diagnostic procedure(s) before proceeding.
- With the scan tool, read Transmission (TCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
- With the scan tool, read DTC EVENT DATA. Use this data to identify the conditions in which the DTC was set.
-

**NOTE: Performing a Battery Disconnect will clear all DTC EVENT DATA and reset all learned Transmission values to the controllers default values, which may temporarily result in erratic shift schedules.**

- With the scan tool, perform the Shift Lever Position Test. If the test does not pass, refer to the diagnostic procedure for P0706-Check Shifter Signal.
- For Gear Ratio Error DTCs, use the scan tool to read and record the Clutch Volume Index (CVI) information.
- Use the wiring diagram as a guide, inspect the wiring and connectors related to this circuit and repair as necessary.
- Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, driving under specific conditions, and after controller diagnostic monitors have run.
- Refer to applicable Technical Service Bulletins (TSBs) for controller software update information. Some conditions can be corrected by upgrading the Engine (PCM) or Transmission (TCM) controller software.
- Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

**Were there any repairs made that fixed the vehicle?**

**Yes** >> Testing complete.

Perform 42RLE VERIFICATION TEST - VER 1 (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - STANDARD PROCEDURE)

**No** >> Refer to the Transmission category and perform the appropriate diagnostic procedure(s). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING)

## 42RLE TRANSMISSION VERIFICATION TEST - VER 1

# 1.

Perform the following after completion of a diagnostic repair:

-

**NOTE: After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed. Refer to the Engine Category.**

- Reconnect any disconnected components.
- With the scan tool, erase all Transmission and Engine DTCs.
- Erase DTC P0700 under engine to turn off the MIL off after completion of transmission repairs.
- Perform *PRNDL FAULT CLEARING PROCEDURE after completion of repairs for P0706-TRANSMISSION RANGE SENSOR RATIONALITY.
- If the Powertrain Control Module or the Transmission has been repaired or replaced, it is necessary to perform the scan tool Quick Learn Procedure.
- If the Torque converter has been replaced, with the scan tool perform TCC BREAK-IN.
- If the Powertrain Control Module or Front Control Module has been replaced you must reset the Pinion Factor in the Front Control Module.
- With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT, above 43° C or 110° F.
- Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure.
- Road test the vehicle. With the scan tool, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 mph with a constant throttle opening of 20 to 25 degrees.
- With speeds below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
- For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC is repaired.
- If equipped with AutoStick®, upshift and downshift several times using the AutoStick® feature during the road test.
-

**NOTE: Use the OBDII task manager to run a Good Trip in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.**

- Check for any Diagnostic Trouble Codes (DTC's) during and after the road test.

**Did any Diagnostic Trouble Codes set during the road test?**

**Yes** >> Repair is not complete. Refer to the Transmission category and perform the appropriate symptom(s). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING)

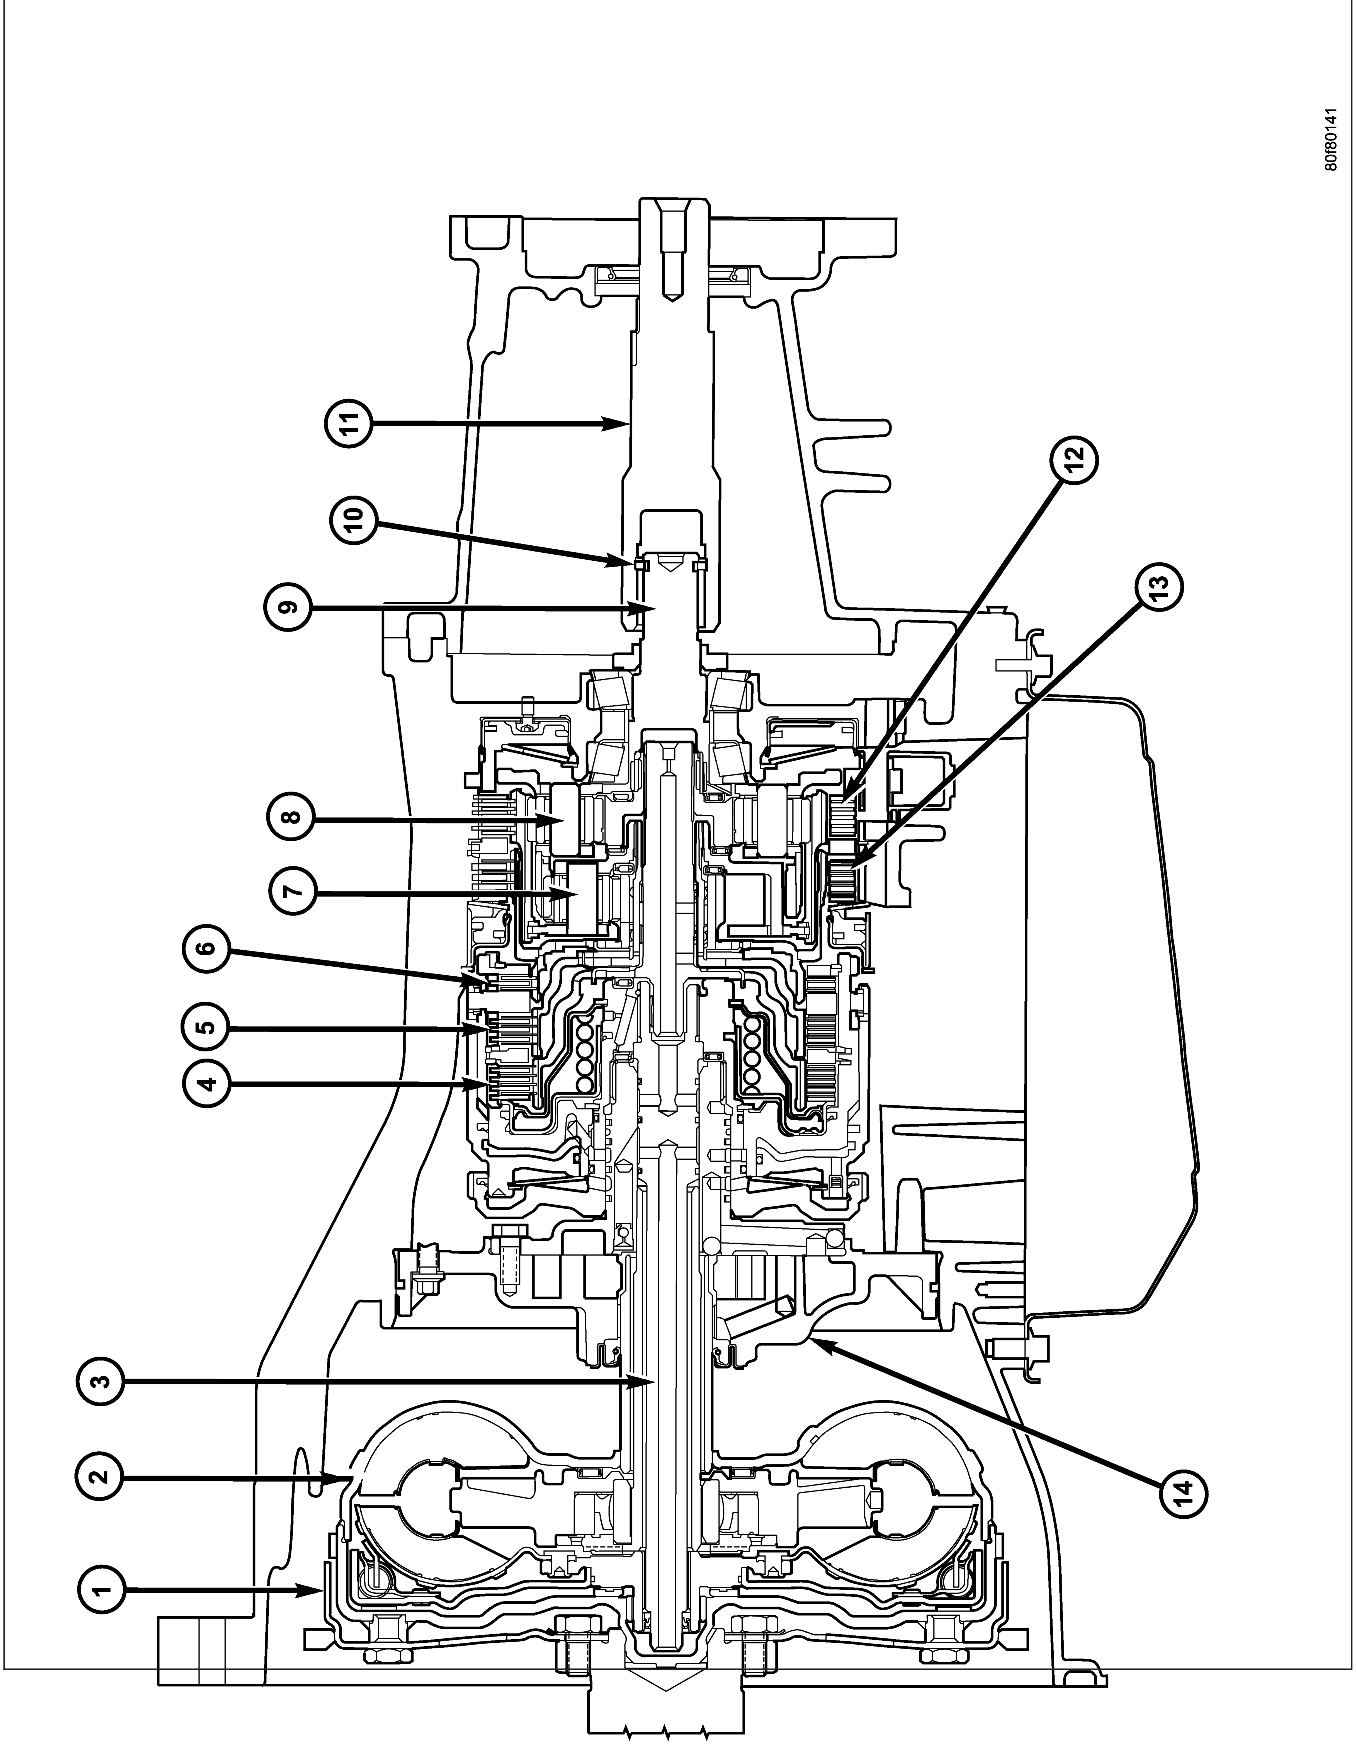
**No** >> Repair is complete.

# AUTOMATIC TRANSMISSION - 42RLE

## TABLE OF CONTENTS

# AUTOMATIC TRANSMISSION - 42RLE

## DESCRIPTION



The 42RLE is a four-speed transmission that is a conventional hydraulic/mechanical assembly controlled with adaptive electronic controls and monitors. The hydraulic system of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly

Control of the transmission is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Transmission Control Module (TCM) portion of the Powertrain Control Module (PCM).

The TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

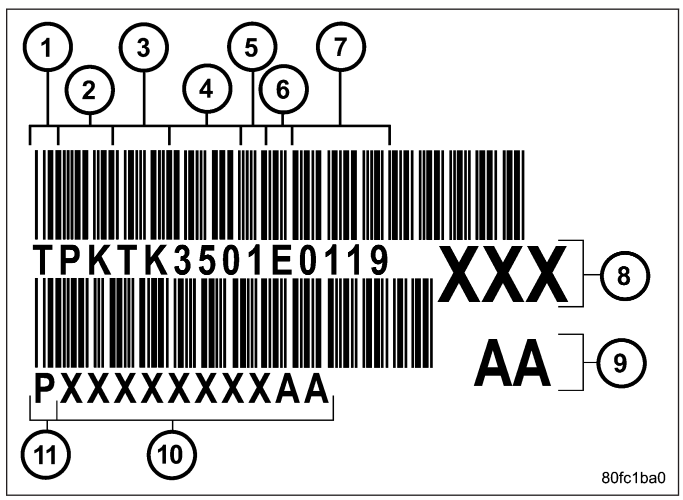
The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the scan tool.

## TRANSMISSION IDENTIFICATION

The 42RLE transmission can be identified by a barcode label that is affixed to the upper left area of the bellhousing.

The label contains a series of digits that can be translated into useful information such as transmission part number (10), date of manufacture (4, 5), manufacturing origin (2), assembly line identifier (6), build sequence number (7), etc..

If the tag is not legible or is missing, the "PK" number, which is stamped into the left rear flange of the transmission case, can be referred to for identification. The entire part number, build code, and sequence number are stamped into the flange.

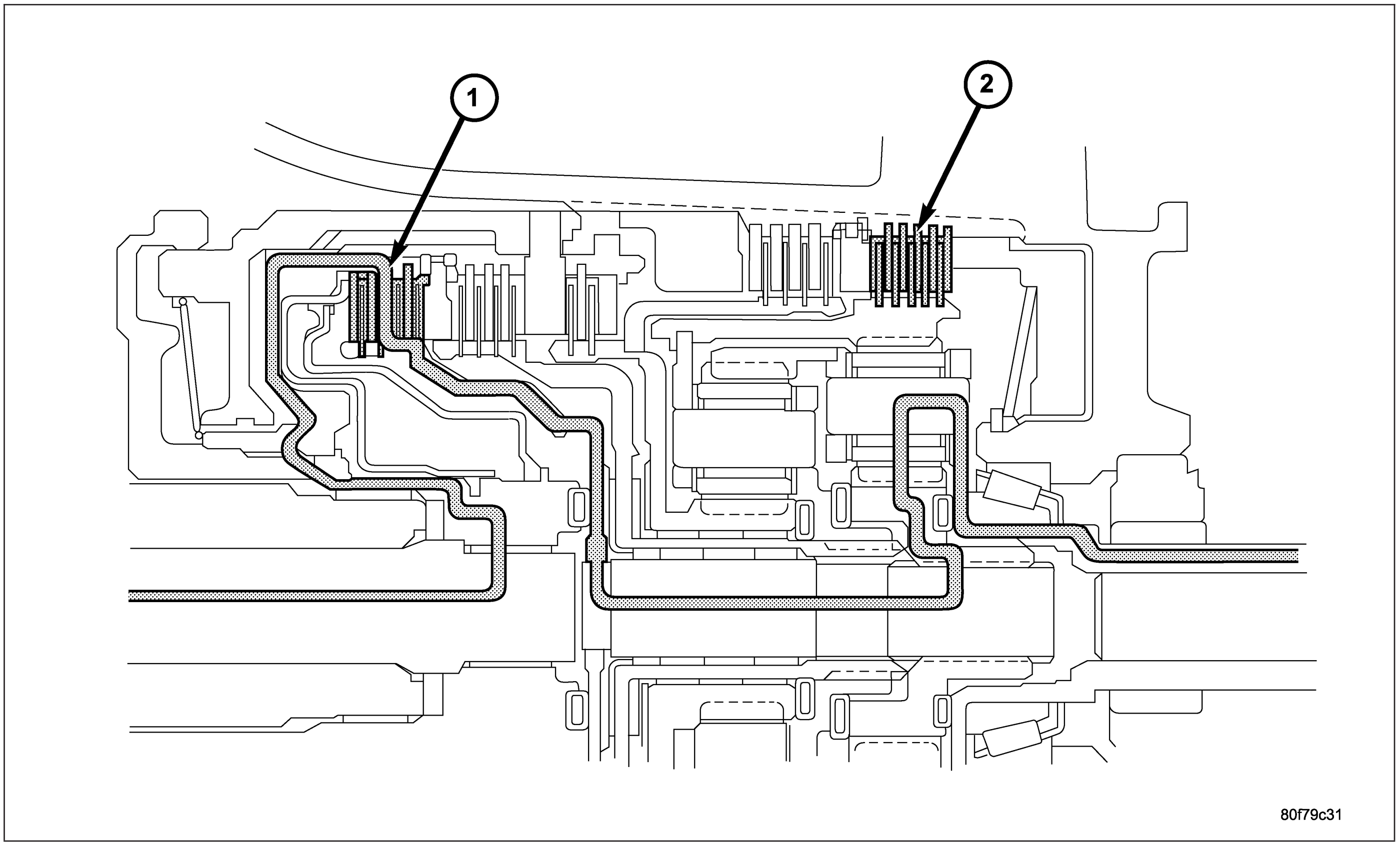


## OPERATION

The 42RLE transmission ratios are:

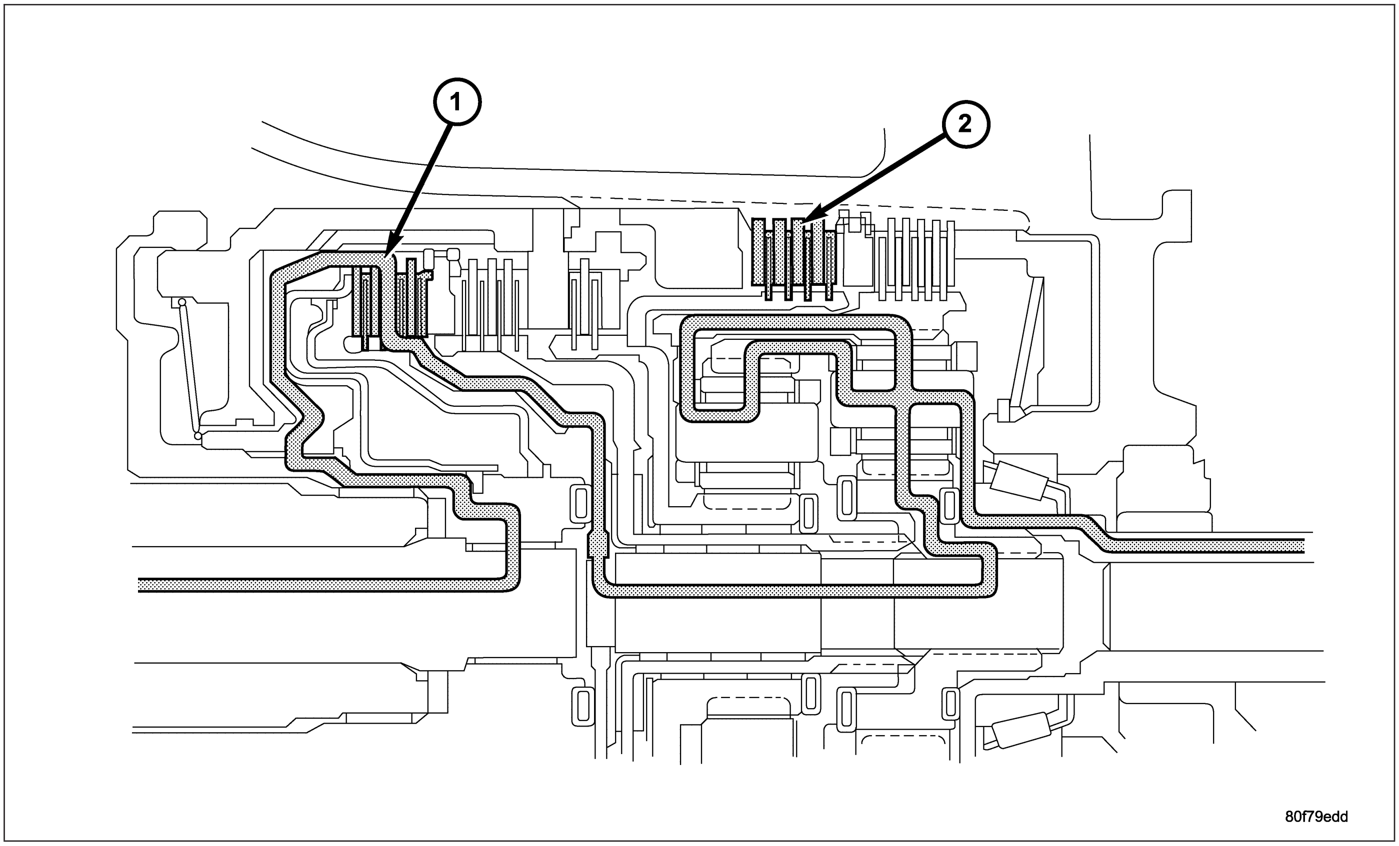
| | |
|---|---|
| First | 2.84 : 1 |
| Second | 1.57 : 1 |
| Third | 1.00 : 1 |
| Overdrive | 0.69 : 1 |
| Reverse | 2.21 : 1 |

## FIRST GEAR POWERFLOW



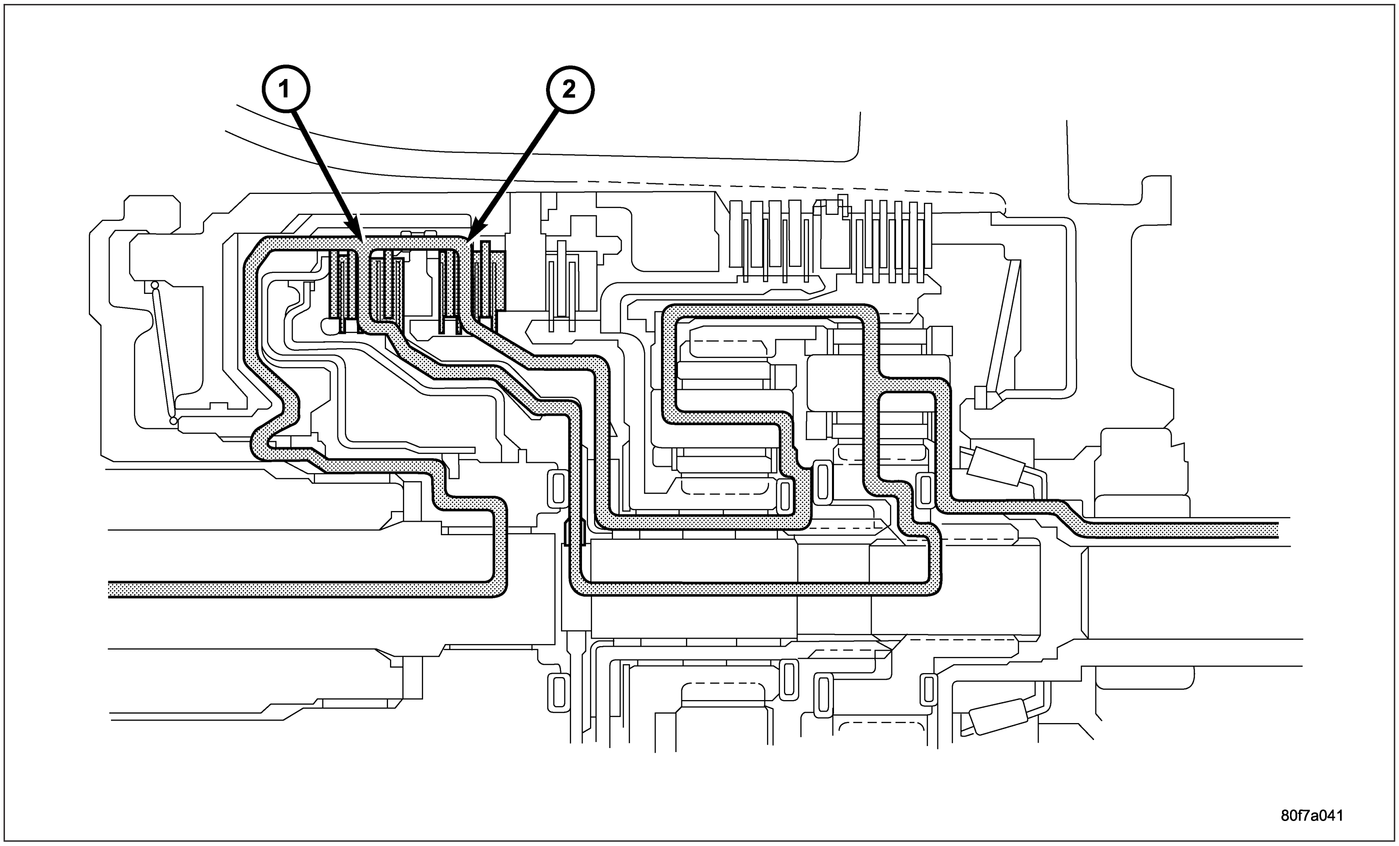
In first gear range, torque input is through the underdrive clutch (1) to the underdrive hub assembly. The underdrive hub is splined to the rear sun gear. When the underdrive clutch is applied, it rotates the underdrive hub and rear sun gear. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly. The rear sun gear drives the rear planetary pinion gears. The rear planetary pinion gears are forced to walk around the inside of the stationary rear annulus gear. The pinions are pinned to the rear carrier and cause the rear carrier assembly to rotate as they walk around the annulus gear. This provides the torque output for first gear. The other planetary gearset components are freewheeling. The first gear ratio is 2.84:1.

## SECOND GEAR POWERFLOW



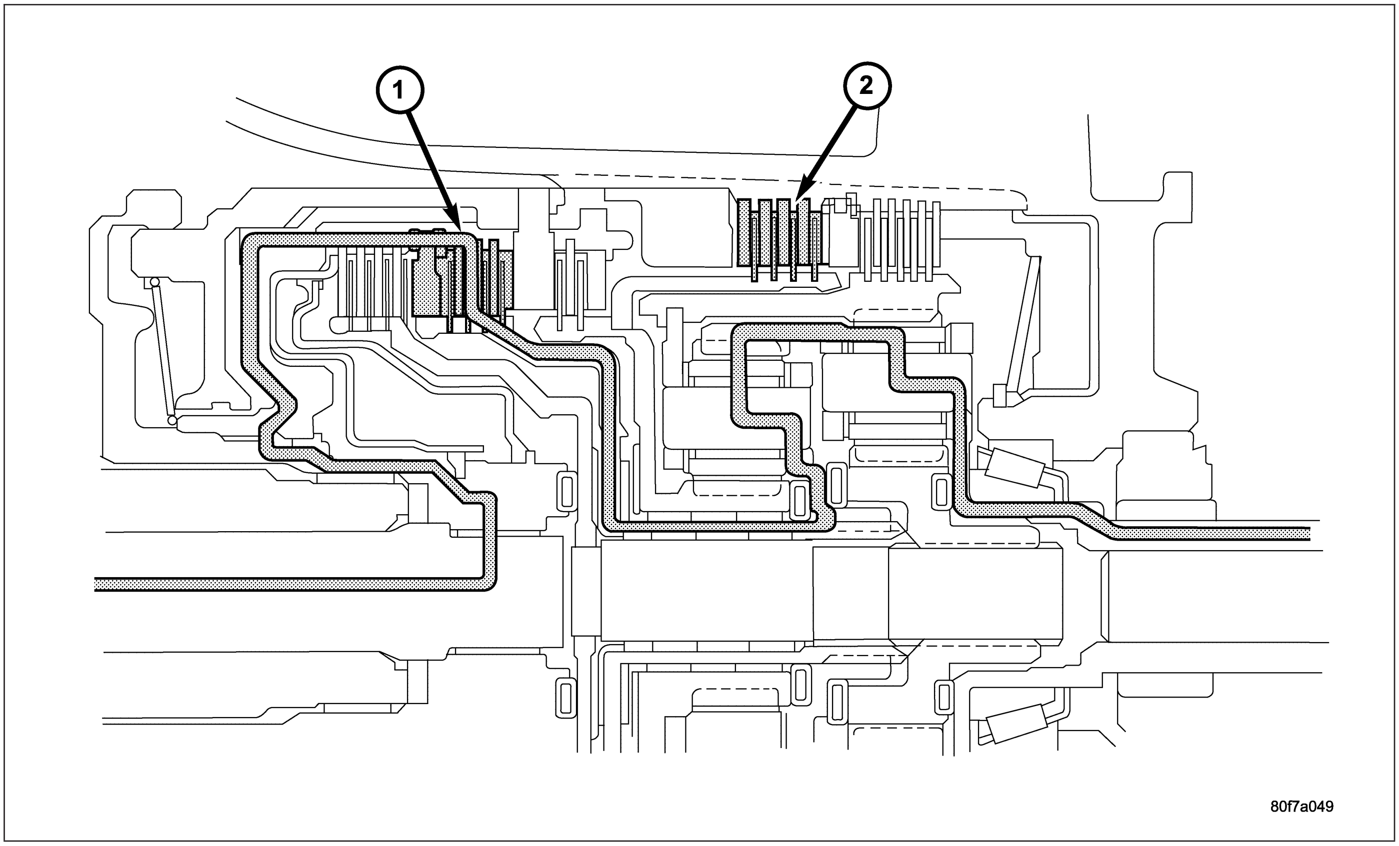
Second gear is achieved by having both planetary gear sets contribute to torque multiplication. As in first gear, torque input is through the underdrive clutch (1) to the rear sun gear. The 2/4 clutch (2) is applied to hold the front sun gear stationary. The rotating rear sun gear turns the rear planetary pinions. The rear pinions rotate the rear annulus/front carrier assembly. The pinions of the front carrier walk around the stationary front sun gear. This transmits torque to the front annulus/rear carrier assembly, which provides output torque and a gear ratio of 1.57:1.

## THIRD GEAR POWERFLOW



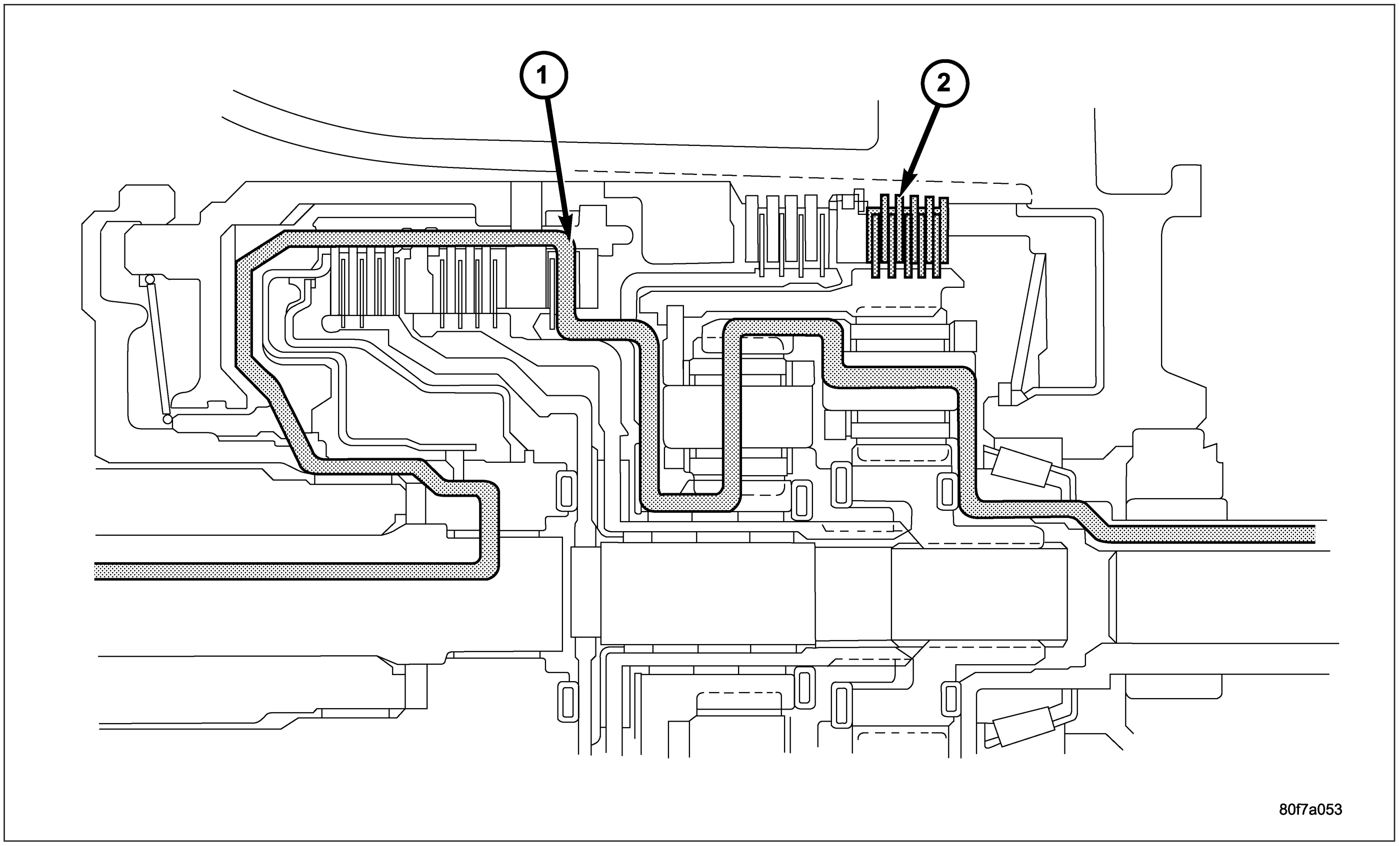
In third gear, two input clutches are applied to provide torque input: the underdrive clutch (1) and overdrive clutch (2). The underdrive clutch rotates the rear sun gear, while the overdrive clutch rotates the front carrier/rear annulus assembly. The result is two components (rear sun gear and rear annulus gear) rotating at the same speed and in the same direction. This effectively locks the entire planetary gearset together and is rotated as one unit. The gear ratio in third is 1:1.

## FOURTH GEAR POWERFLOW



In fourth gear input torque is through the overdrive clutch (1) which drives the front carrier. The 2/4 clutch (2) is applied to hold the front sun gear. As the overdrive clutch rotates the front carrier, it causes the pinions of the front carrier to walk around the stationary front sun gear. This causes the front carrier pinions to turn the front annulus/ rear carrier assembly which provides output torque. In fourth gear, transmission output speed is more than engine input speed. This situation is called overdrive and the gear ratio is 0.69:1.

## REVERSE GEAR POWERFLOW



In reverse, input power is through the reverse clutch (1). When applied, the reverse clutch drives the front sun gear through the overdrive hub and shaft. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly stationary. The front carrier is being held by the L/R clutch so the pinions are forced to rotate the front annulus/rear carrier assembly in the reverse direction. Output torque is provided, in reverse, with a gear ratio of 2.21:1.

## DIAGNOSIS AND TESTING

## AUTOMATIC TRANSMISSION

**CAUTION: Before attempting any repair on the 42RLE Four Speed Automatic Transmission, always check for proper shift cable adjustment. Also check for diagnostic trouble codes with the scan tool and the 42RLE Transmission Diagnostic information.**

42RLE automatic transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

When diagnosing a problem always begin with recording the complaint. The complaint should be defined as specific as possible. Include the following checks:

- Temperature at occurrence (cold, hot, both)
- Dynamic conditions (acceleration, deceleration, upshift, cornering)
- Elements in use when condition occurs (what gear is transmission in during condition)
- Road and weather conditions
- Any other useful diagnostic information.

After noting all conditions, check the easily accessible variables:

- Fluid level and condition
- Shift cable adjustment
- Diagnostic trouble code inspection

Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem exists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

## ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transmission should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transmission cleaning.

Slipping clutches can be isolated by comparing the “Elements in Use” chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transmission in all selector positions.

**ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER**

| Shift Lever Position | INPUT CLUTCHES | | | HOLDING CLUTCHES | |
|---|---|---|---|---|---|
| | Underdrive | Overdrive | Reverse | 2/4 | Low/Reverse |
| P - PARK | | | | | X |
| R - REVERSE | | | X | | X |
| N - NEUTRAL | | | | | X |
| OD - OVERDRIVE | | | | | |
| First | X | | | | X |
| Second | X | | | X | |
| Direct | X | X | | | |
| Overdrive | | X | | X | |
| D - DRIVE* | | | | | |
| First | X | | | | X |
| Second | X | | | X | |
| Direct | X | X | | | |
| L - LOW* | | | | | |
| First | X | | | | X |
| Second | X | | | X | |
| Direct | X | X | | | |
| * Vehicle upshift and downshift speeds are increased when in these selector positions. | | | | | |

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

## HYDRAULIC PRESSURE TESTS

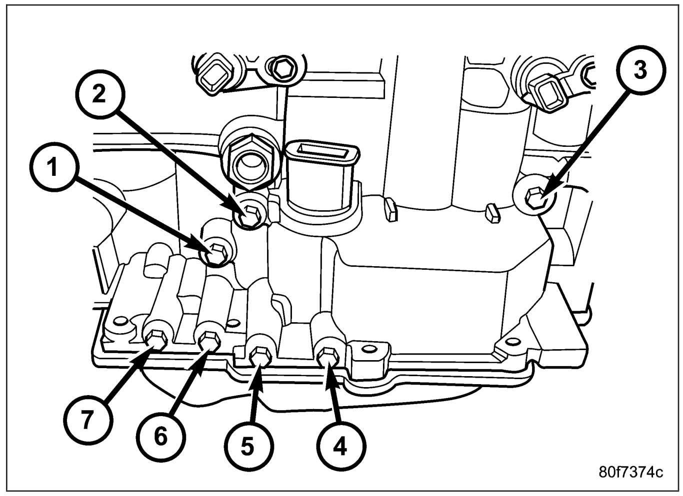
Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most transmission problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature, 65.5°-93° C (150°-200° F).

Install an engine tachometer, raise vehicle on hoist which allows the wheels to turn, and position tachometer so it can be read.

Using Adapter Set L-4559, attach 300 psi Pressure Gauge(s) C-3293SP to the port(s) required for test being conducted.

Test port locations are shown in the Pressure Taps graphic.



## TEST ONE - SELECTOR IN MANUAL 1 (1st Gear)

**NOTE: This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.**

1. Attach pressure gauge to the low/reverse clutch tap.
2. Move selector lever to the MANUAL 1 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.
4. Low/reverse clutch pressure should read 115 to 145 psi.

## TEST TWO - SELECTOR IN MANUAL 2 (Second Gear)

**NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.**

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the MANUAL 2 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.
4. In second gear the underdrive clutch pressure should read 110 to 145 psi.

## TEST TWO A - SELECTOR IN DRIVE (OD ON - Fourth Gear)

**NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.**

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the DRIVE position. Verfy that the OD switch is ON.
3. Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.
4. Underdrive clutch pressure should read below 5 psi. If not, than either the solenoid assembly or controller is at fault.

## TEST THREE - SELECTOR IN DRIVE (OD OFF - Third and Second Gear)

**NOTE: This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.**

1. Attach gauge to the overdrive clutch tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph.

4. Overdrive clutch pressure should read 74 to 95 psi.
5. Move selector lever to the DRIVE position and increase indicated vehicle speed to 30 mph.
6. The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.

## TEST FOUR - SELECTOR IN DRIVE (OD ON - Fourth Gear)

**NOTE: This test checks the 2/4 clutch hydraulic circuit.**

1. Attach gauge to the 2/4 clutch tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in fourth gear.
4. The 2/4 clutch pressure should read 75 to 95 psi.

## TEST FIVE-SELECTOR IN DRIVE (OD ON - Fourth Gear, CC on)

**NOTE: These tests check the torque converter clutch hydraulic circuit.**

1. Attach gauge to the torque converter clutch off pressure tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

**CAUTION: Both wheels must turn at the same speed.**

4. Torque converter clutch off pressure should be less than 5 psi.
5. Now attach the gauge to the torque converter clutch on pressure tap.
6. Move selector to the OD position.
7. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph.
8. Verify the torque converter clutch is applied mode using the RPM display of the scan tool.
9. Torque converter clutch on pressure should be 60-90 psi.

## TEST SIX-SELECTOR IN REVERSE

**NOTE: This test checks the reverse clutch hydraulic circuit.**

1. Attach gauge to the reverse and low/reverse clutch tap.
2. Move selector lever to the REVERSE position.
3. Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 rpm.
4. Reverse and low/reverse clutch pressure should read 165 to 235 psi.

## TEST RESULT INDICATIONS

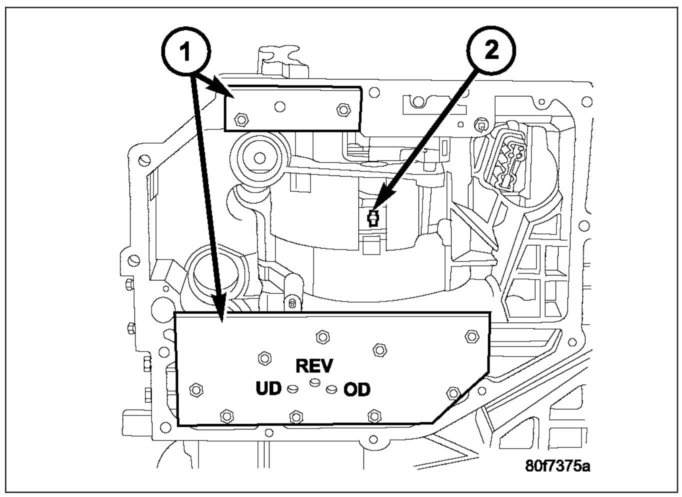
1. If proper line pressure is found in any one test, the pump and pressure regulator are working properly.
2. Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.
3. Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.
4. If the overdrive clutch pressure is greater than 5 psi in Step 6 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.
5. If the underdrive clutch pressure is greater than 5 psi in Step 4 of Test Two-A, a defective solenoid/pressure switch assembly or controller is the cause.

**ALL PRESSURE SPECIFICATIONS ARE PSI (on hoist, with wheels free to turn)**

| Gear Selector Position | Actual Gear | PRESSURE TAPS | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | Underdrive Clutch | Overdrive Clutch | Reverse Clutch | Torque Converter Clutch Off | Torque Converter Clutch On | 2/4 Clutch | Low/ Reverse Clutch |
| PARK - 0 mph * | PARK | 0-2 | 0-5 | 0-2 | 60-110 | 45-100 | 0-2 | 115-145 |
| REVERSE - 0 mph * | REVERSE | 0-2 | 0-7 | 165-235 | 50-100 | 35-85 | 0-2 | 165-235 |
| NEUTRAL - 0 mph * | NEUTRAL | 0-2 | 0-5 | 0-2 | 60-110 | 45-100 | 0-2 | 115-145 |
| Low - 20 mph # | FIRST | 110-145 | 0-5 | 0-2 | 60-110 | 45-100 | 0-2 | 115-145 |
| Third - 30 mph # | SECOND | 110-145 | 0-5 | 0-2 | 60-110 | 45-100 | 115-145 | 0-2 |
| Third - 45 mph # | DIRECT | 75-95 | 75-95 | 0-2 | 60-90 | 45-80 | 0-2 | 0-2 |
| OD - 30 mph # | OVERDRIVE | 0-2 | 75-95 | 0-2 | 60-90 | 45-80 | 75-95 | 0-2 |
| OD - 50 mph # | OVERDRIVE WITH TCC | 0-2 | 75-95 | 0-2 | 0-5 | 60-95 | 75-95 | 0-2 |
| *** Engine Speed at 1500 rpm** | | | | | | | | |
| **# CAUTION: Both wheels must be turning at same speed.** | | | | | | | | |

## CLUTCH AIR PRESSURE TESTS

Inoperative clutches can be located by substituting air pressure for fluid pressure. The clutches may be tested by applying air pressure to their respective passages after the valve body has been removed. Use Plate Set 6599-1 (1) and 6599-2 (1) to perform test.



To make air pressure tests, proceed as follows:

**NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.**

1. Remove oil pan and valve body. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)
2. Apply air pressure to the holes in the special tool (1), one at a time.
3. Listen for the clutch to apply. It will give a slight thud sound. If a large amount of air is heard escaping, the transmission must be removed from vehicle, disassembled and all seals inspected.

### 2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer (2). Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

### OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

### REVERSE CLUTCH

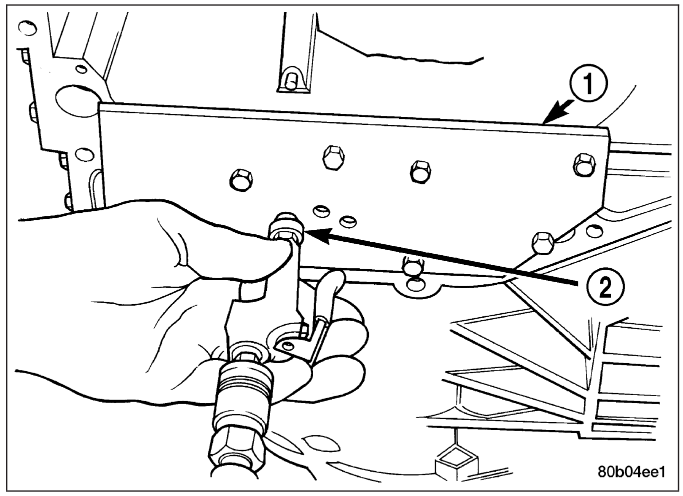
Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

### LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole passage. Look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

### UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Use an air nozzle (2) to apply air pressure is to the low/reverse or the 2/4 clutch opening in Plate Set 6599-1 (2). This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.



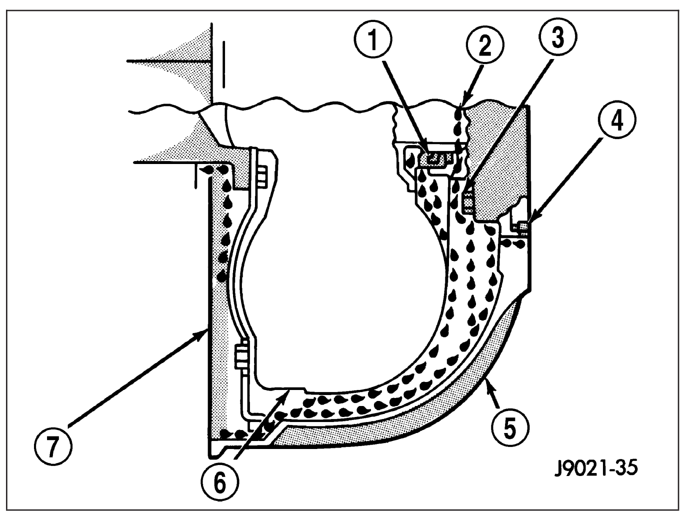
## FLUID LEAKAGE

### FLUID LEAKAGE - TORQUE CONVERTER HOUSING AREA

When diagnosing converter housing (5) fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (7). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.



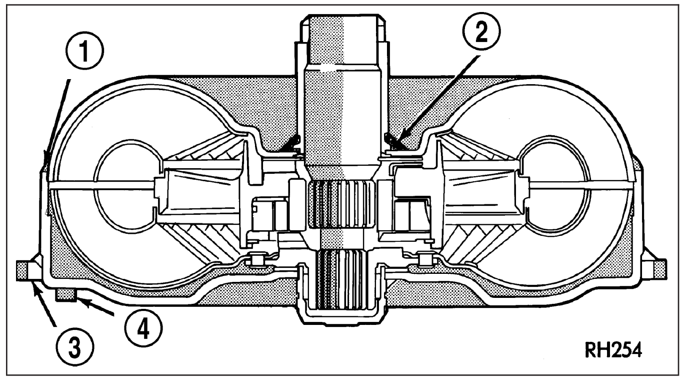
Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal (1) leaks tend to move along the drive hub and onto the rear of the converter. Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt (3) leaks are generally deposited on the inside of the converter housing (5) and not on the converter itself. Pump seal (1) or gasket (4) leaks usually travel down the inside of the converter housing.

## TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (1).
- Torque converter hub weld (2).



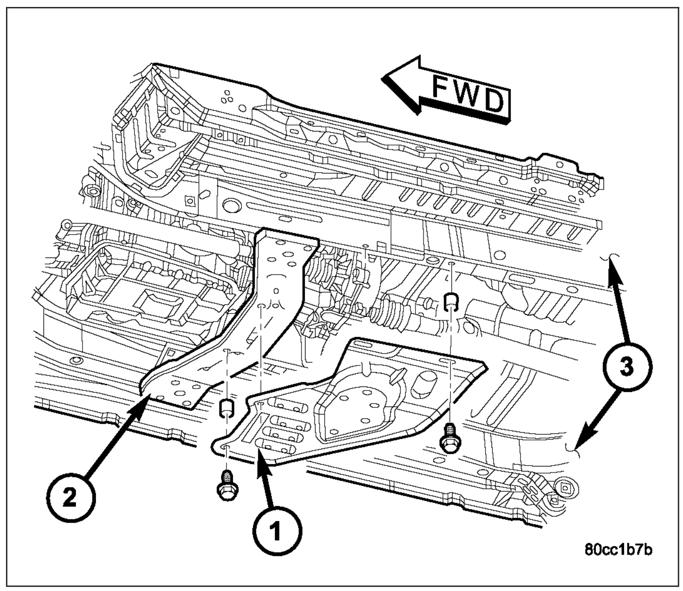
## STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils®, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil® tap, or equivalent, and installing a Heli-Coil® insert, or equivalent, into the hole. This brings the hole back to its original thread size.

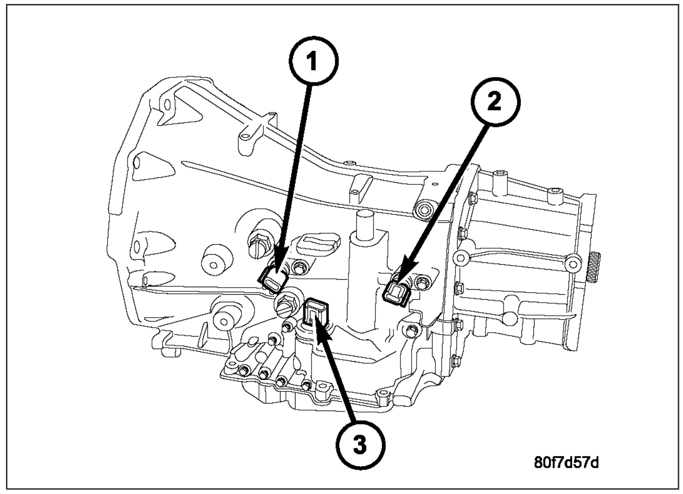
Heli-Coil®, or equivalent, tools, and inserts are readily available from most automotive parts suppliers.

## REMOVAL

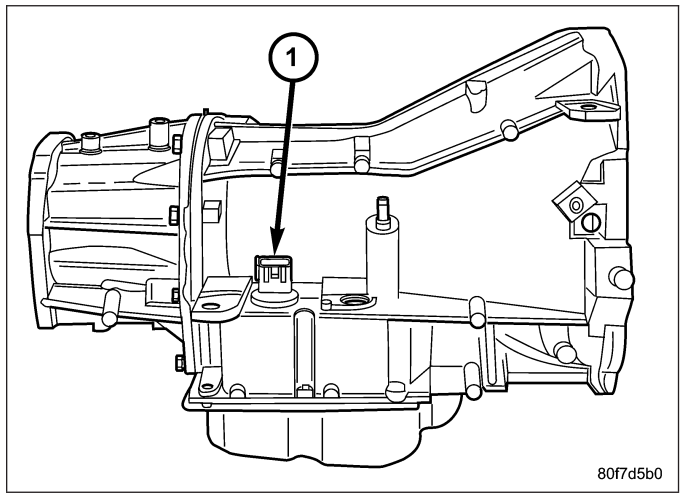
1. Disconnect the negative battery cable.
2. Raise and support the vehicle
3. Remove any necessary skid plates (1). (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)



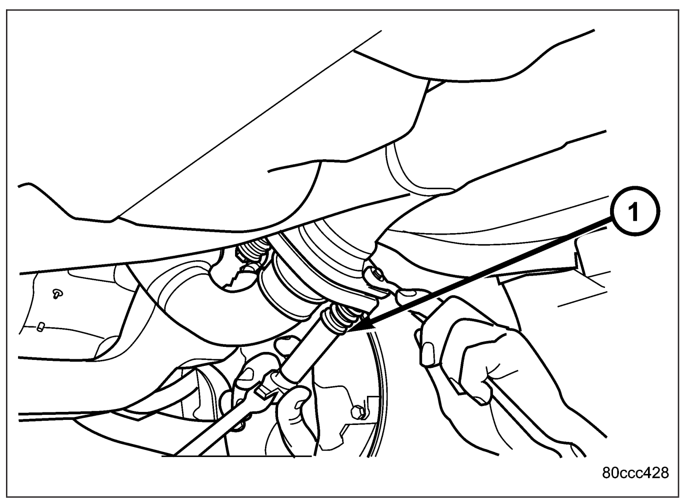
4. Mark propeller shaft and axle companion flanges for assembly alignment.
5. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
6. Remove the front propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
7. Disconnect wires from the input and output speed sensors (1, 2).
8. Disconnect wires from the transmission range sensor (3).



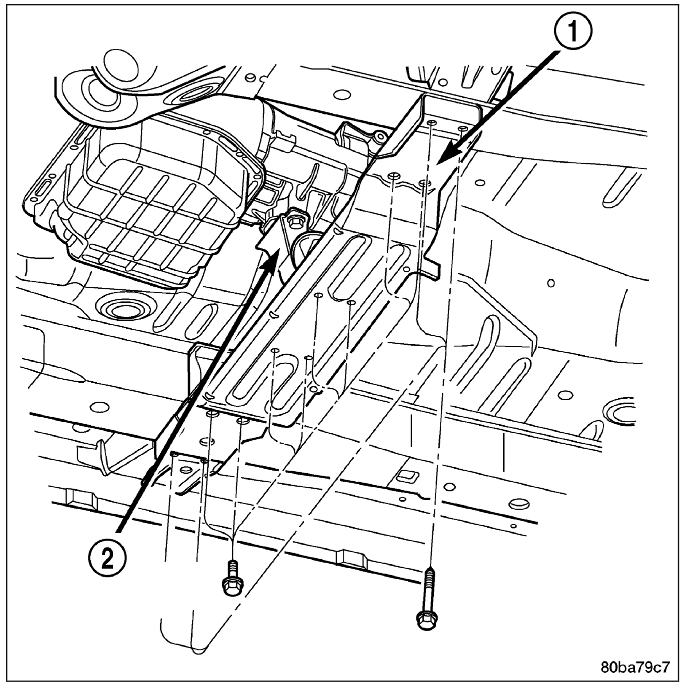
9. Disconnect wires from the solenoid/pressure switch assembly (1).



10. Remove the bolts (1) holding the exhaust crossover pipe to the pre-catalytic converter pipe flanges.
11. Remove the bolts holding the exhaust crossover pipe to the catalytic converter flange.



12. Disconnect gearshift cable from transmission manual valve lever.
13. Disengage the shift cable from the cable support bracket.
14. Remove the starter motor.
15. Remove the engine to transmission collar.
16. Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.
17. Disconnect the transmission vent hose from the transmission.
18. Remove transfer case.
19. Support rear of engine with safety stand or jack.
20. Raise transmission slightly with service jack to relieve load on crossmember and supports.
21. Remove bolts securing rear support and cushion (2) to transmission and crossmember (1).
22. Remove bolts attaching crossmember to frame and remove crossmember.



23. Disconnect transmission fluid cooler lines at transmission fittings and clips.
24. Remove all remaining converter housing bolts.
25. Carefully work transmission and torque converter assembly rearward off engine block dowels.
26. Hold torque converter in place during transmission removal.
27. Lower transmission and remove assembly from under the vehicle.
28. To remove torque converter, carefully slide torque converter out of the transmission.

## DISASSEMBLY

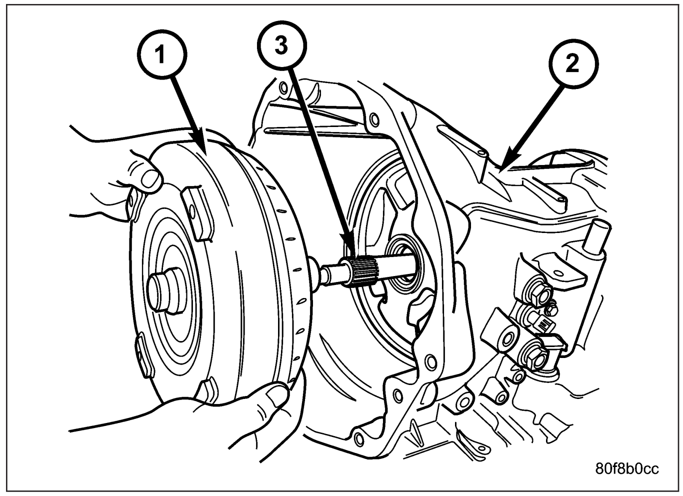
**NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).**

**NOTE: Tag all clutch pack assemblies, as they are removed, for reassembly identification.**

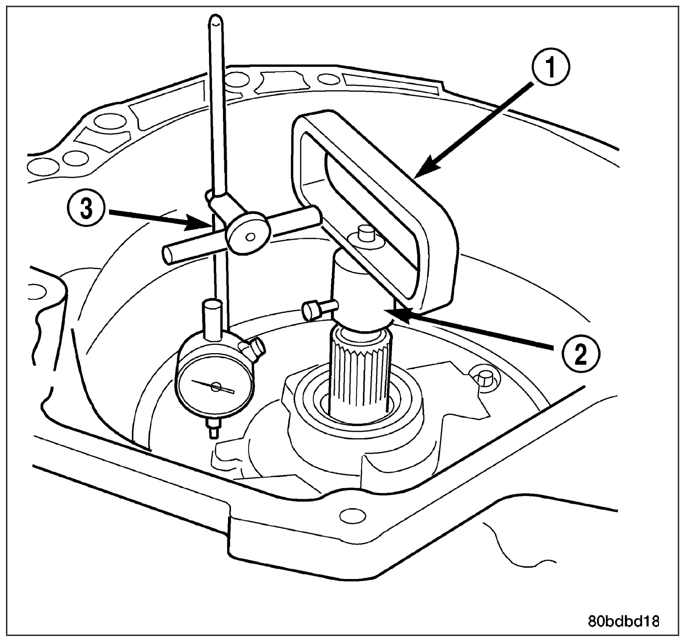
**CAUTION: Do not intermix clutch discs or plates as the unit might then fail.**

Before disassembling transmission, move the shift lever clockwise as far as it will go and then remove the shift lever.

1. Remove the torque converter (1) from the transmission input shaft (3).

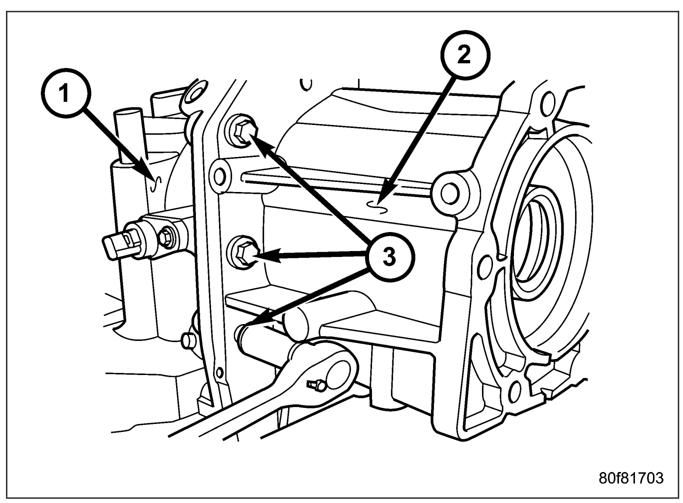


2. Measure input shaft end play using End Play Set 8266 (1, 2). Set up the required items from End Play Set 8266 and a dial indicator as shown.
3. Move input shaft in and out to obtain end play reading. End play specifications are 0.127 to 0.635 mm (0.005 to 0.025 inch). Record indicator reading for reference when reassembling the transmission. If end play exceeds the specified range, the #4 thrust plate needs to be inspected and changed if necessary.

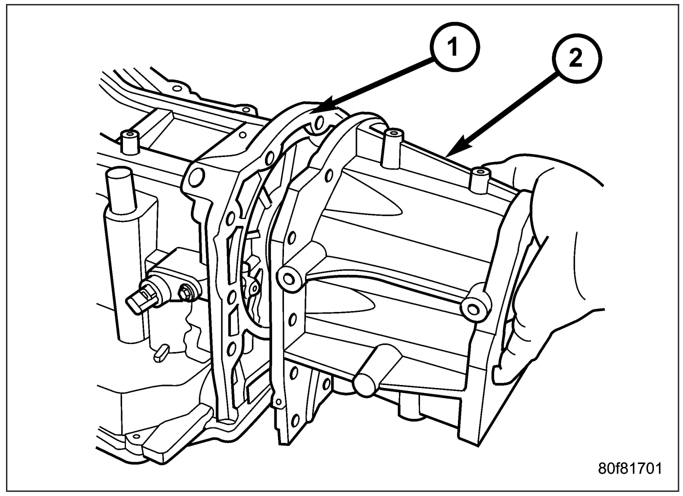


**NOTE: The four bolts (3) along the bottom of the adapter or extension housing (2) have a sealing patch applied from the factory. Note the locations of these bolts and separate these bolts for reuse.**

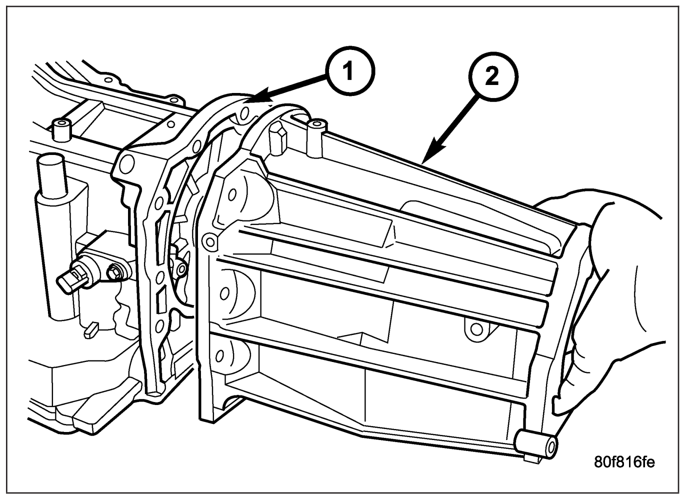
4. Remove the bolts that hold the adapter or extension housing (2) onto the transmission case.



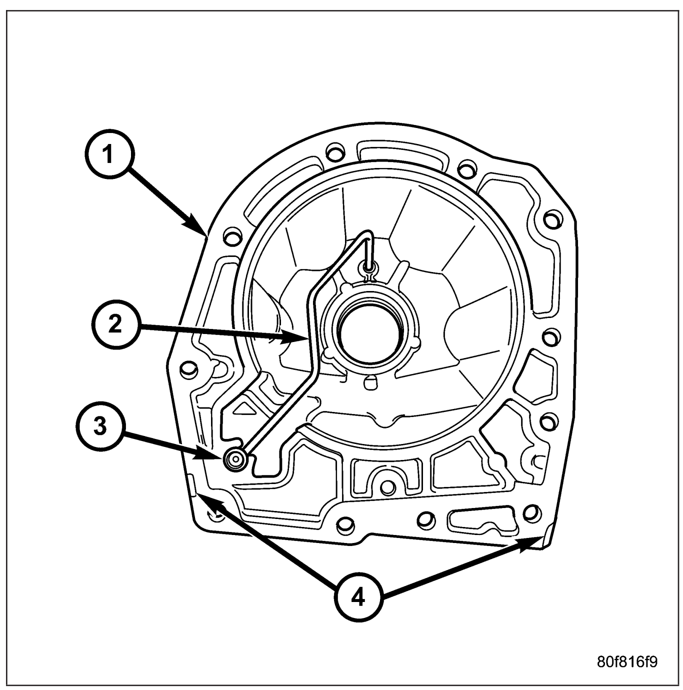
5. Remove the adapter (2) housing, 4X4 vehicles only, from the transmission case. There are two pry slots located near the bottom corners of the housing for separating the housing from the transmission case.



6. Remove the extension (2) housing, 4X2 vehicles only, from the transmission case. There are two pry slots located near the bottom corners of the housing for separating the housing from the transmission case.

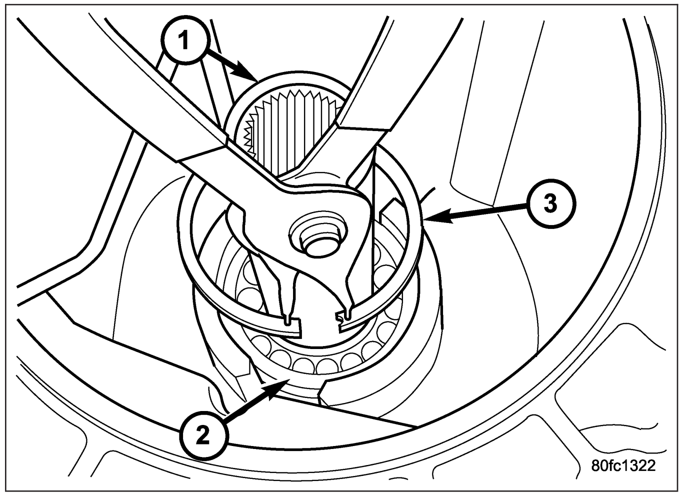


7. Inspect the lube tube grommet (3) for damage. If the grommet lip is damaged, it will need to be replaced.



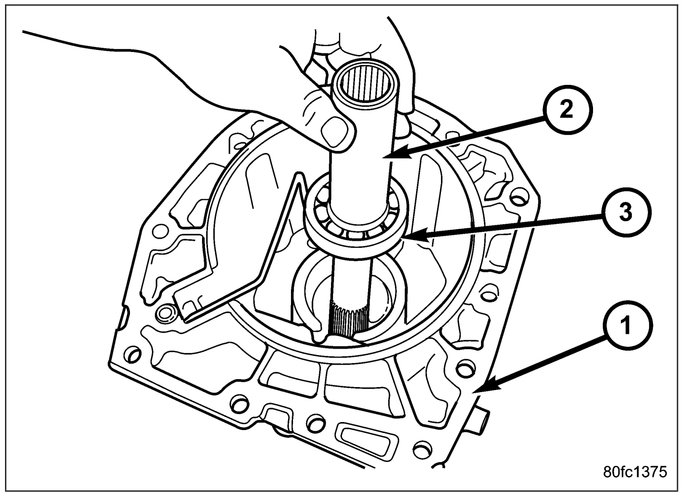
8. On 4X2 transmissions, perform the following, if necessary:

a. Remove the extension shaft bearing snap ring (3) from the extension housing.



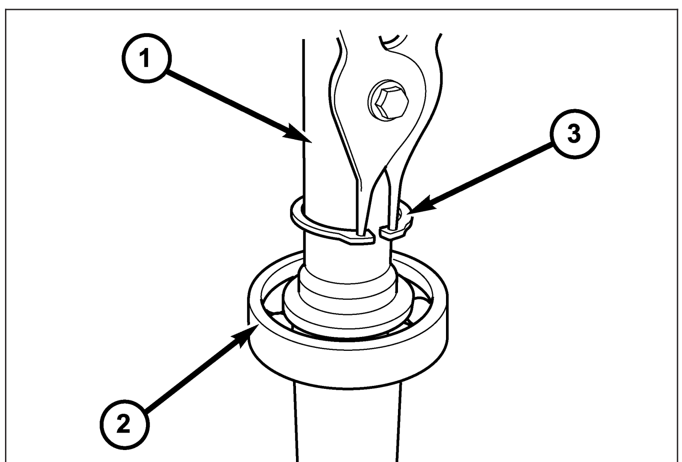
80fc1322

b. Remove the extension shaft and bearing assembly (2) from the extension housing (1).



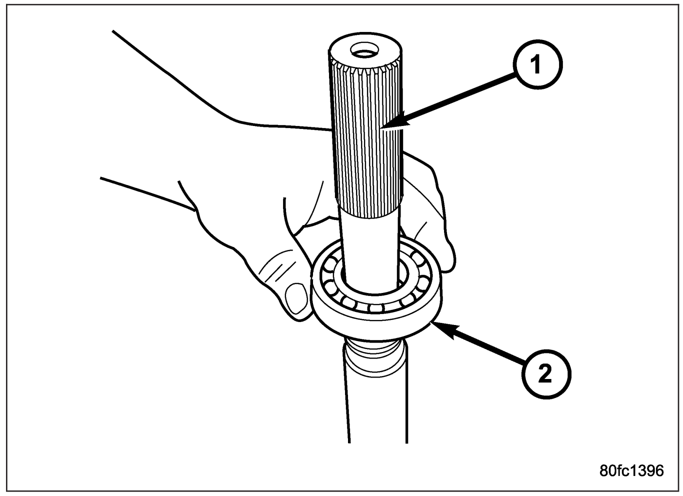
80fc1375

c. Remove the extension shaft bearing retaining ring (3) from the extension shaft (1).

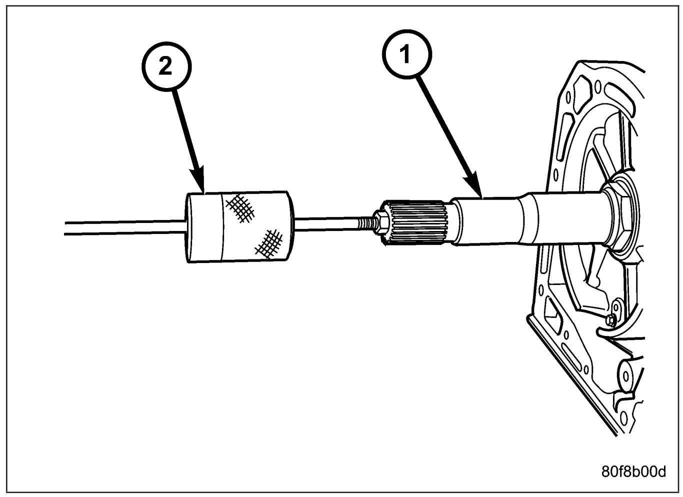


80fc1386

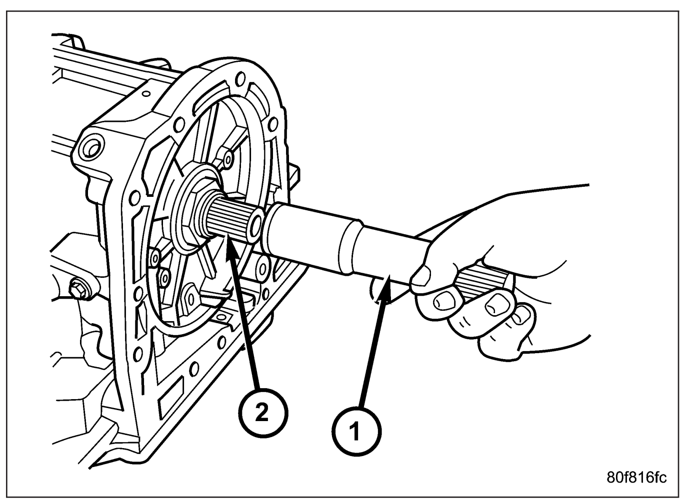
d. Remove the extension shaft bearing (2) from the extension shaft (1).



9. Using a Slide Hammer C-3752 (2), remove the 4X4 stub shaft (1).

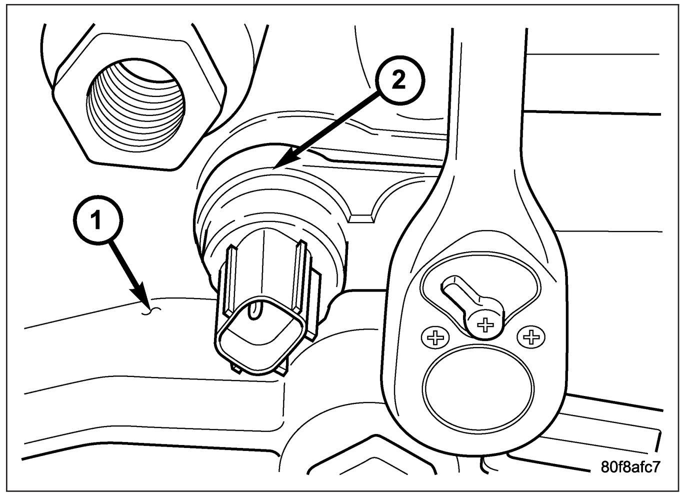


10. Remove the 4X4 stub shaft (1) from the transmission output shaft. Inspect the cir-clip on the shaft for damage and replace the clip if necessary.



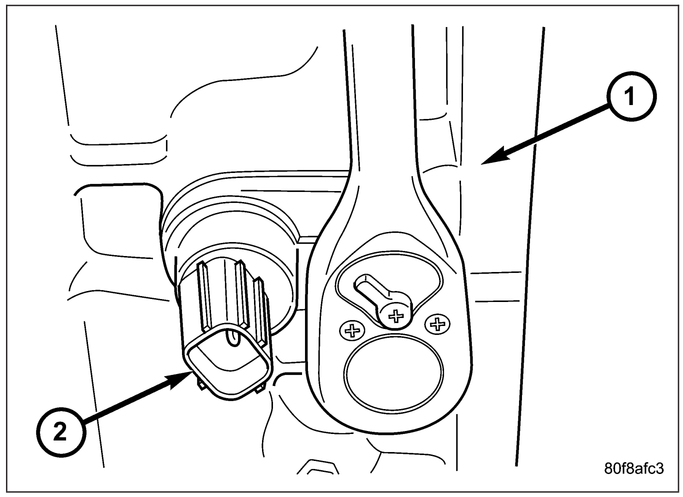
**NOTE: The speed sensor bolts have a sealing patch applied from the factory. Separate these bolts for reuse.**

11. Remove the input speed sensor bolt.

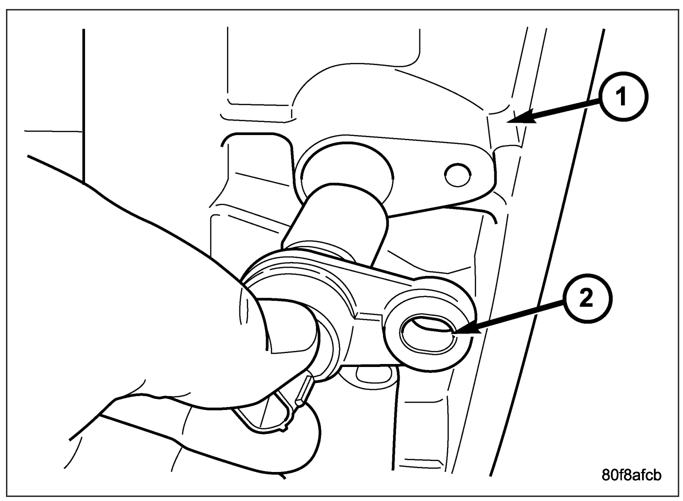


**NOTE: The speed sensor bolts have a sealing patch applied from the factory. Separate these bolts for reuse.**

12. Remove the output speed sensor bolt.

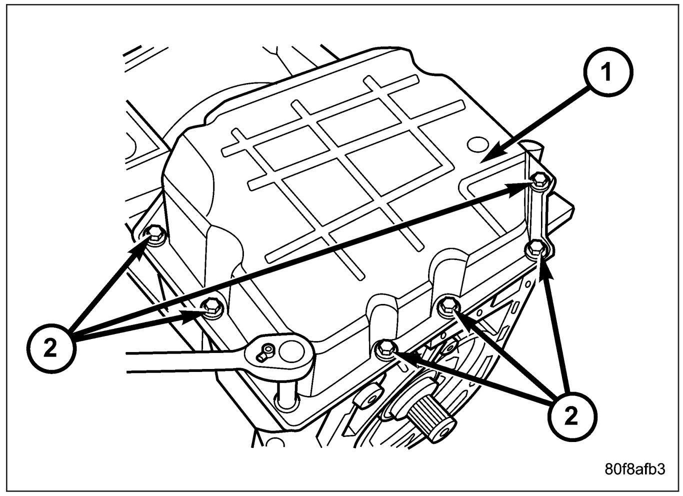


13. Remove the input and output (2) speed sensors. Identify the speed sensors for re-installation since they are not interchangeable.

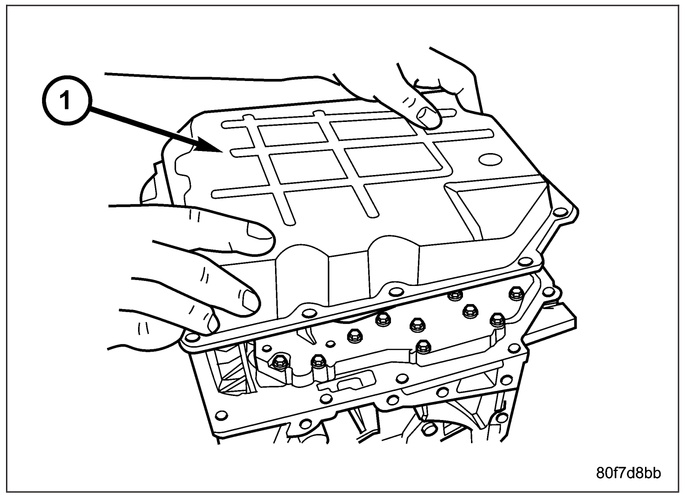


**NOTE: One of the oil pan bolts has a sealing patch applied from the factory. Separate this bolt for reuse.**

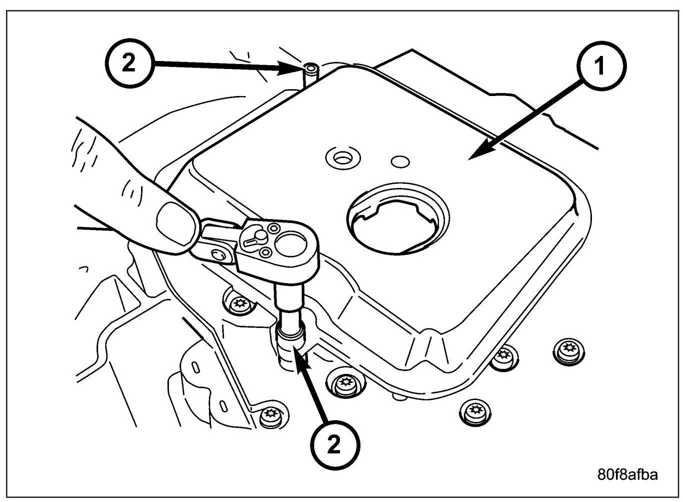
14. Remove the transmission oil pan bolts (2).



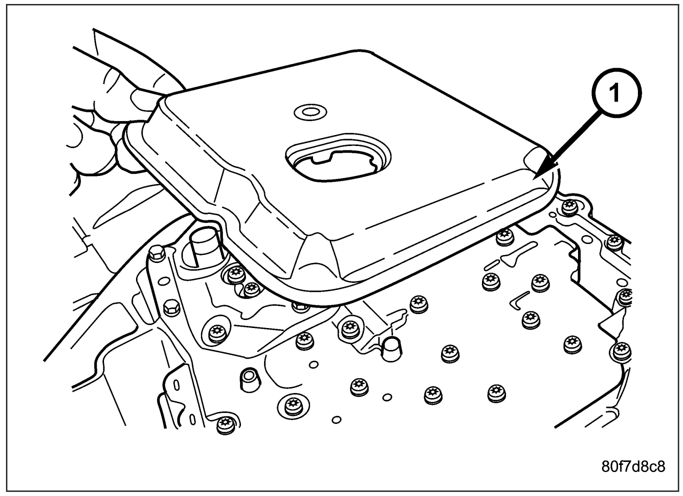
15. Remove the transmission oil pan (1).



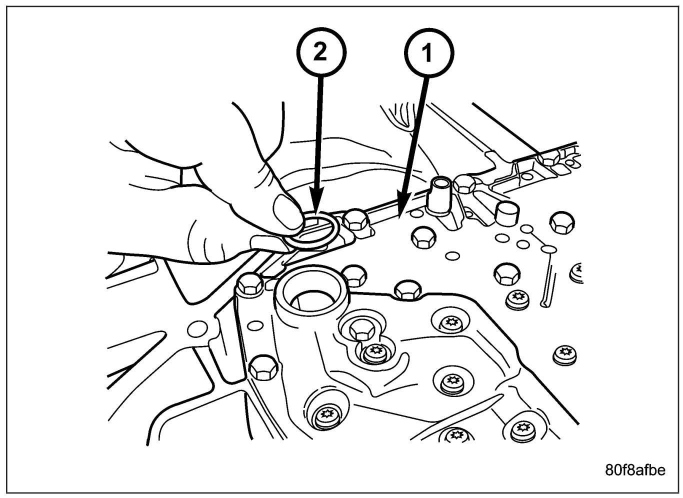
16. Remove the transmission oil filter screws (2).



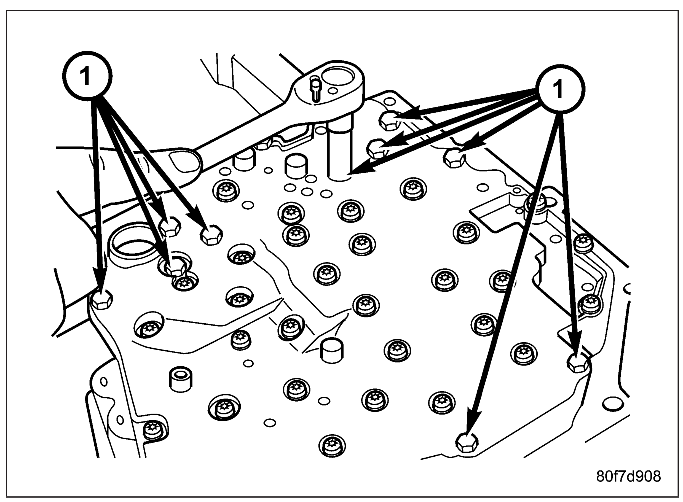
17. Remove transmission oil filter (1).



18. Remove the oil filter o-ring (2) from the valve body.

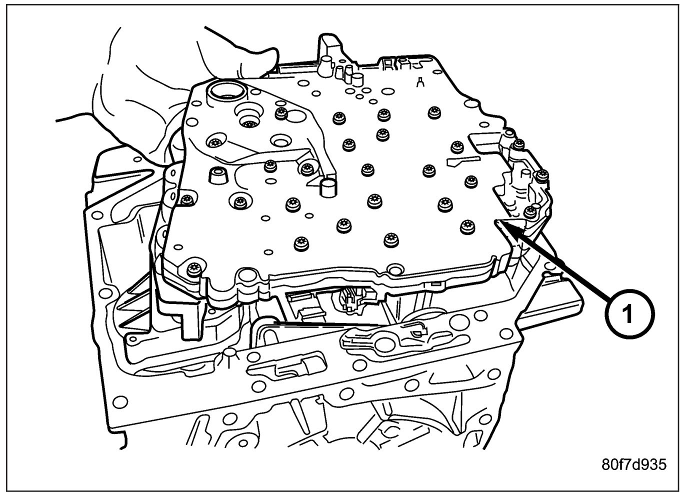


19. Remove valve body-to-case bolts (1).

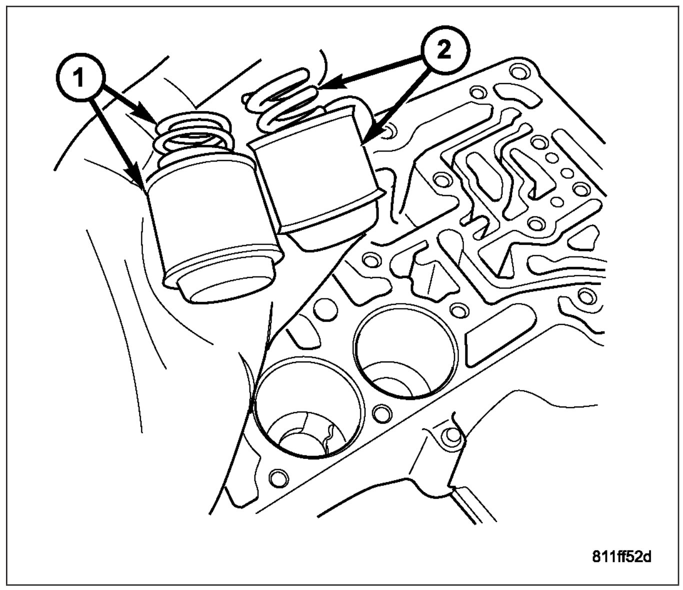


**CAUTION: Do not handle the valve body by the manual shaft. Damage could result.**

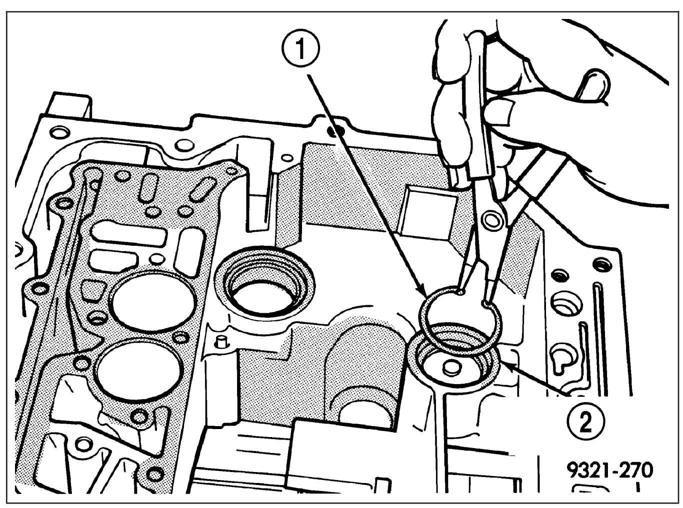
20. Remove valve body (1) from transmission.



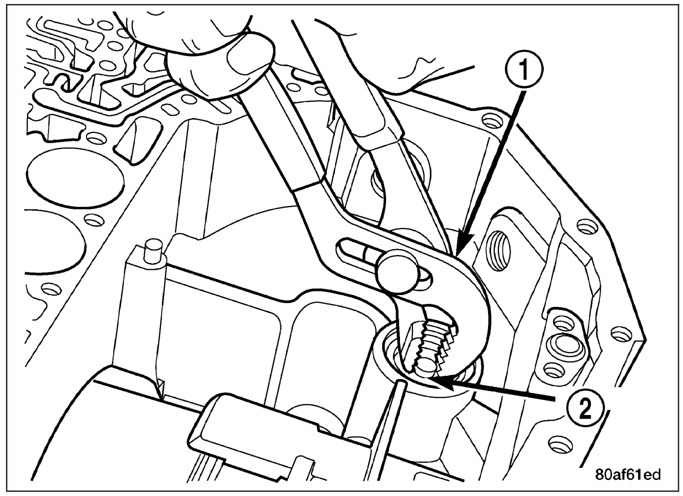
21. Remove underdrive and overdrive accumulators (1, 2).



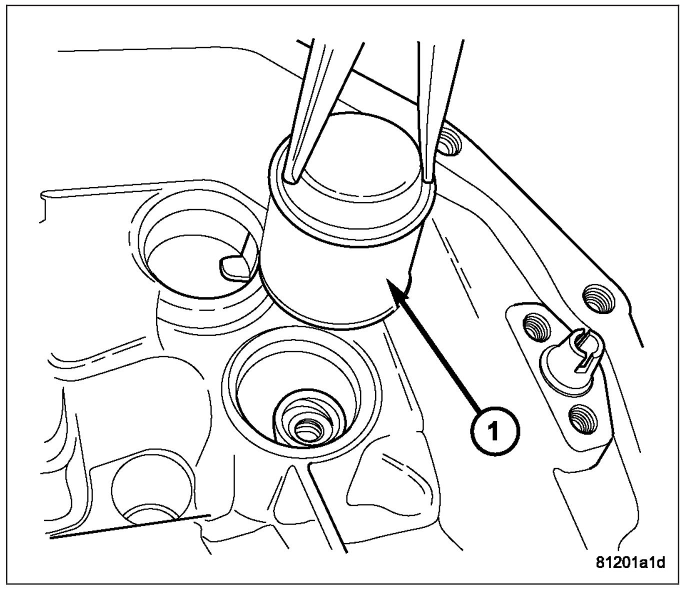
22. Remove the low/reverse accumulator snap ring (1).



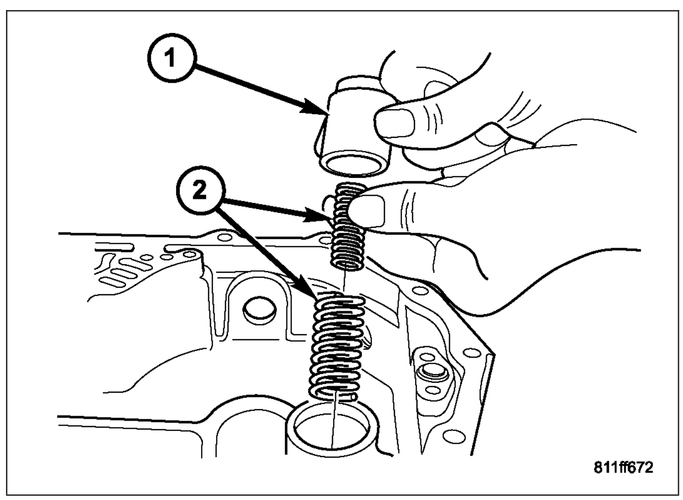
23. Remove the low/reverse accumulator plug (2).



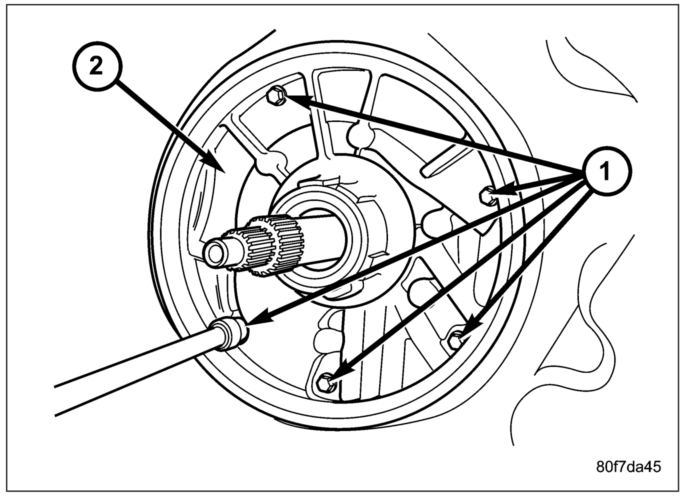
24. Remove low/reverse accumulator piston (1) using suitable pliers.



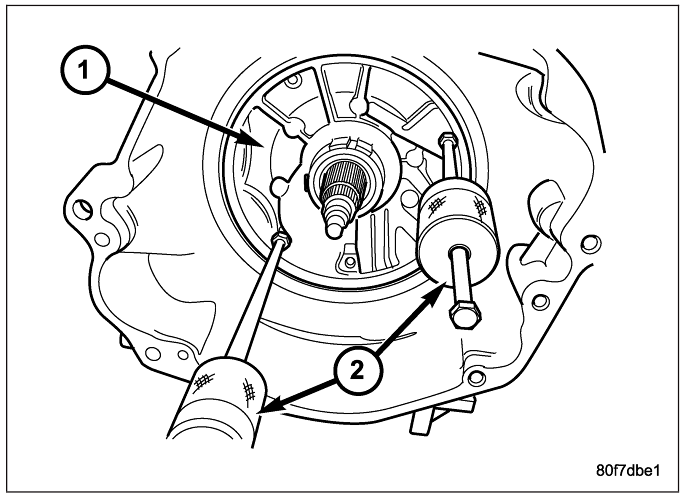
25. Remove piston (1) and springs (2).



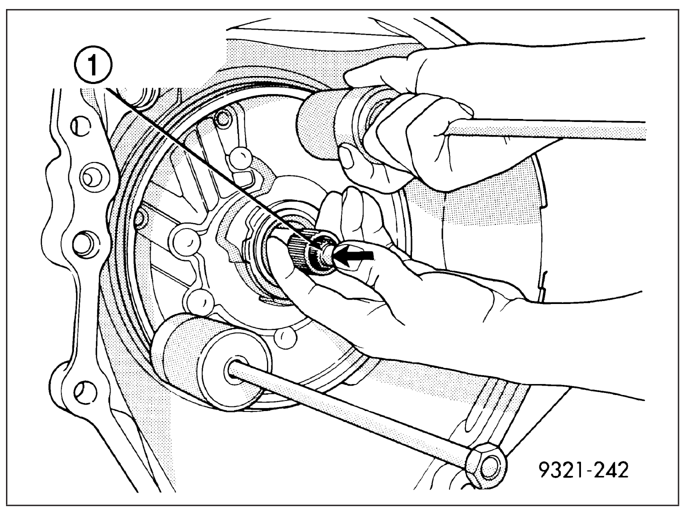
26. Remove and discard the oil pump-to-case bolts (1). The oil pump bolts are not to be reused.



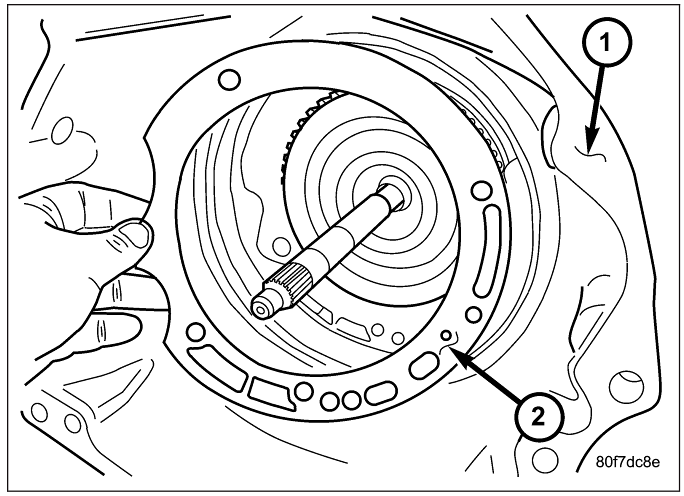
27. Remove oil pump using Slide Hammers C-3752 (2).



28. Remove oil pump while pushing in on input shaft (1).

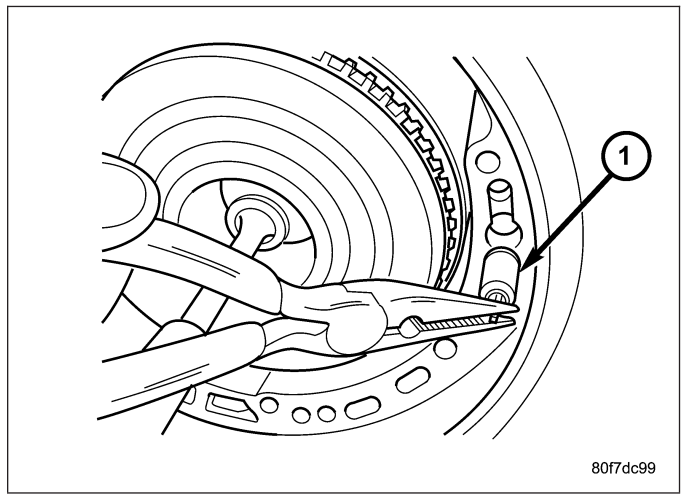


29. Remove oil pump gasket (2).

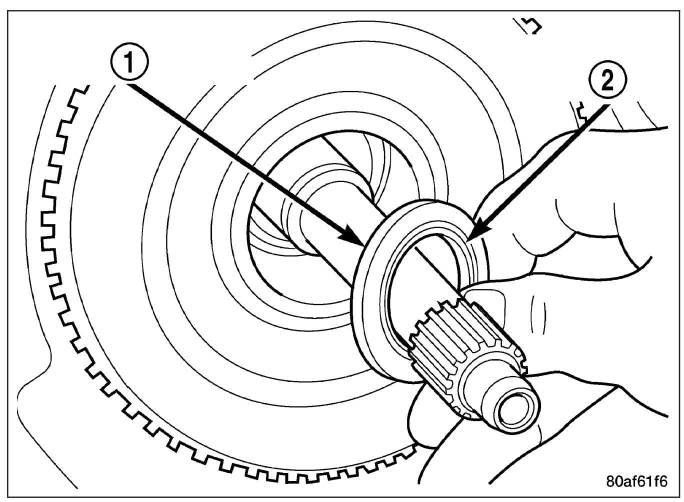


**CAUTION: By-pass valve must be replaced if transmission failure occurs.**

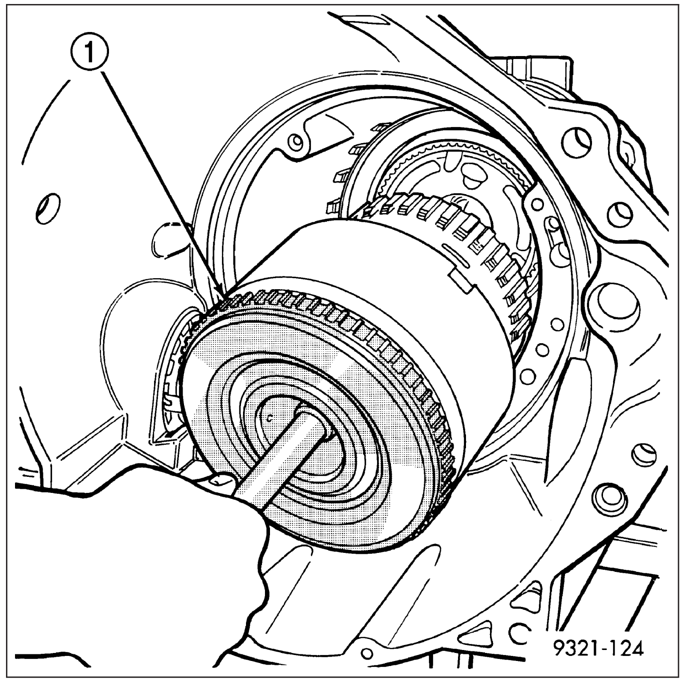
30. Remove the cooler by-pass valve (1).



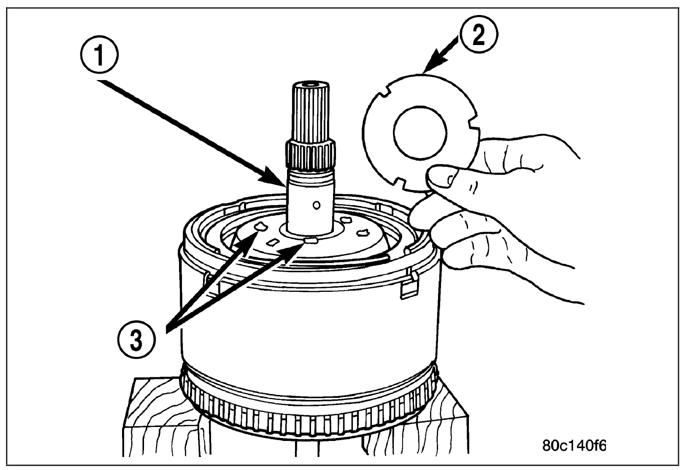
31. Remove the #1 caged needle bearing (1).



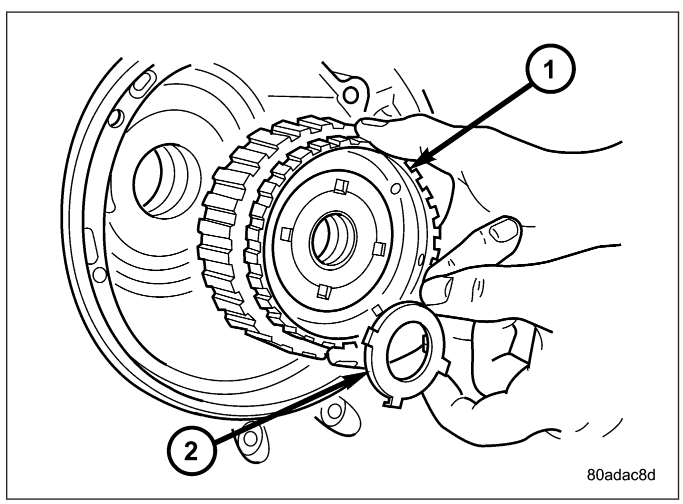
32. Remove the input clutch assembly (1).



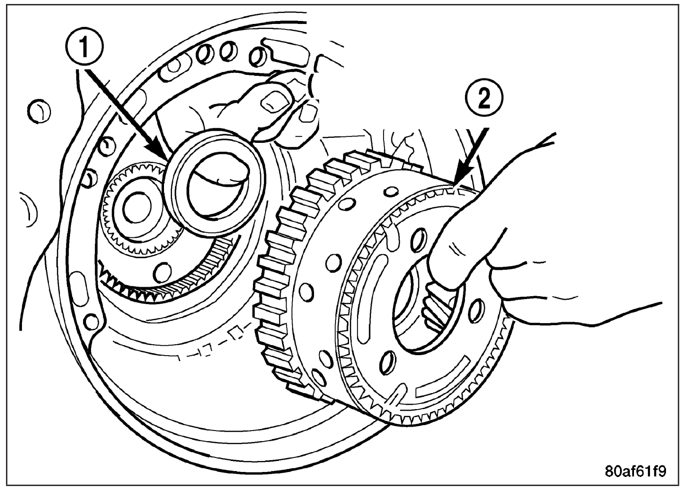
33. Remove the #4 thrust plate (2).



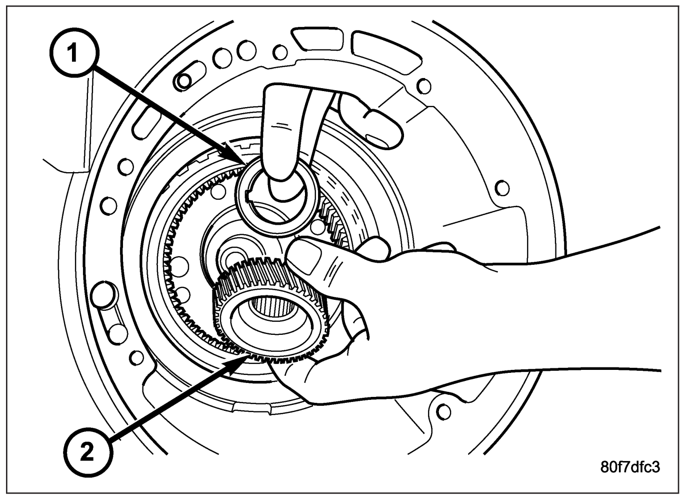
34. Remove the front sun gear assembly (1) and #4 thrust washer (if still in place).



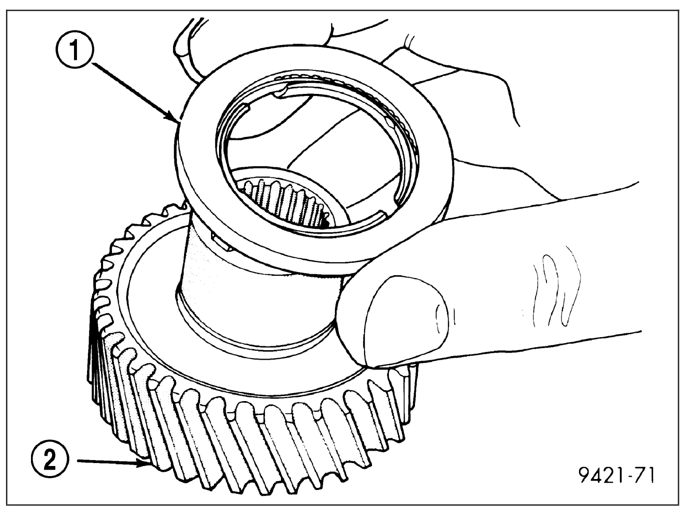
35. Remove the front carrier/rear annulus (2) and #6 needle bearing (1).



36. Remove the rear sun gear (2) and #7 needle bearing (1).

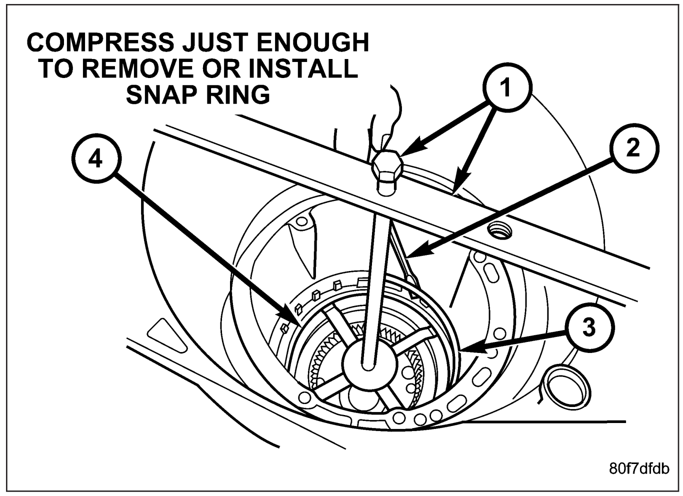


**NOTE: The number seven needle bearing (1) has three antireversal tabs and is common with the number five and number two position. The orientation should allow the bearing to seat flat against the rear sun gear. A small amount of petrolatum can be used to hold the bearing to the rear sun gear.**



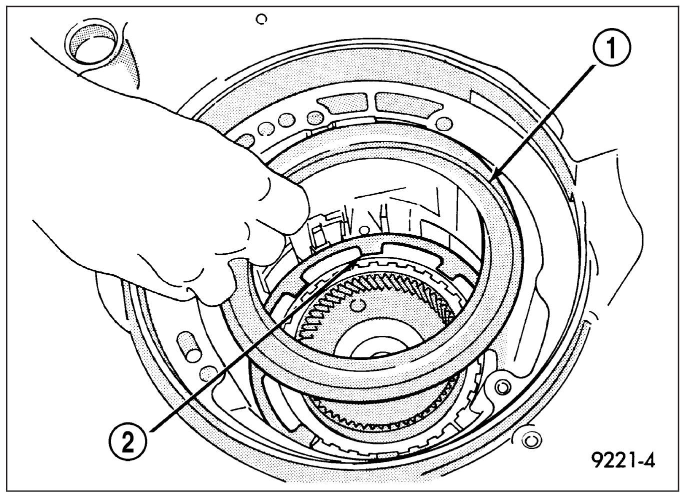
**NOTE: Verify that Compressor 5058A (1) is centered properly over the 2/4 clutch retainer (4) before compressing. If necessary, fasten the Compressor 5058A bar to the bellhousing flange with any combination of locking pliers and bolts to center the tool properly.**

37. Install and load Compressor 5058A to remove the 2/4 clutch retainer snap ring (3).

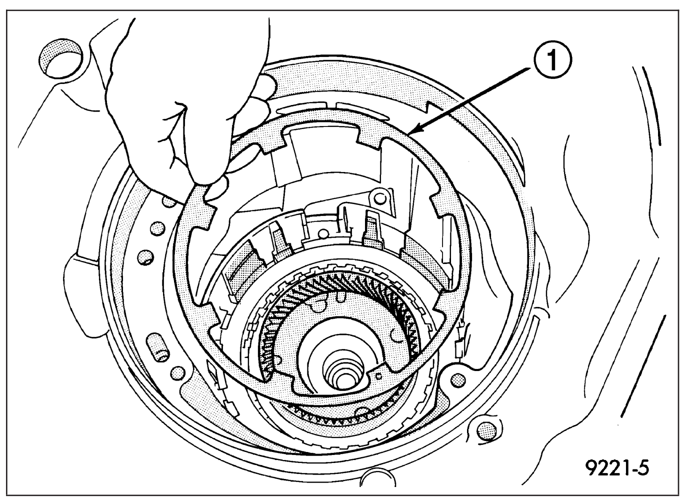


**NOTE: The 2/4 Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.**

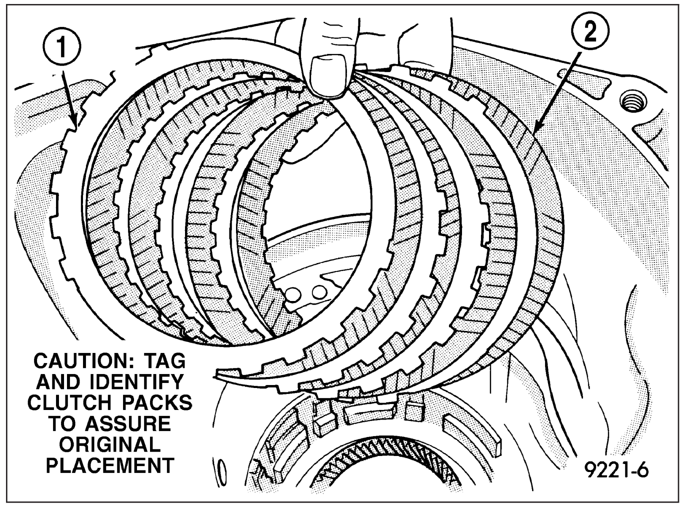
38. Remove the 2/4 clutch retainer (1).



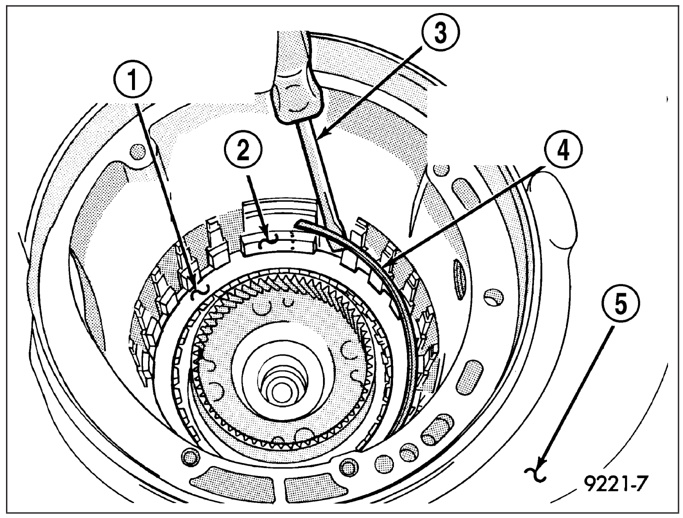
39. Remove the 2/4 clutch return spring (1).



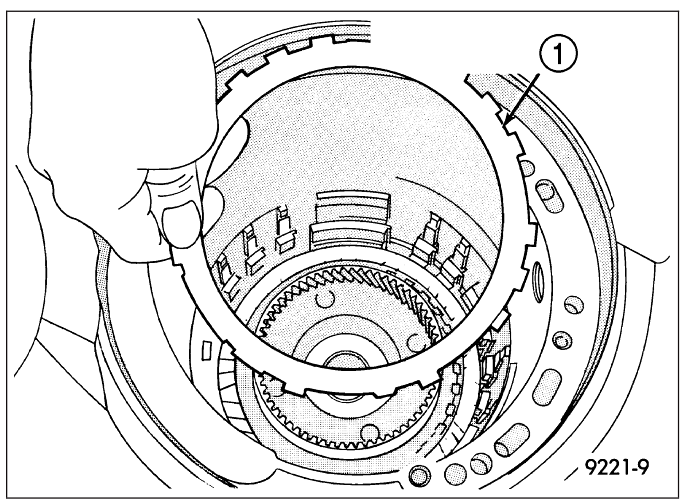
40. Remove the 2/4 clutch pack (1, 2).



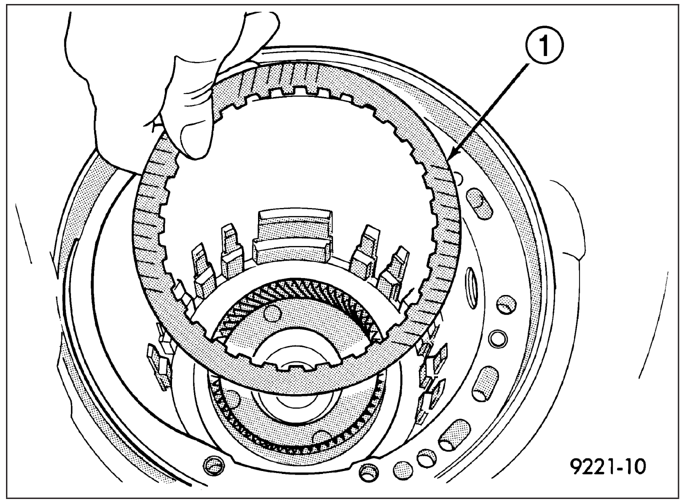
41. Remove the tapered snap ring (4).



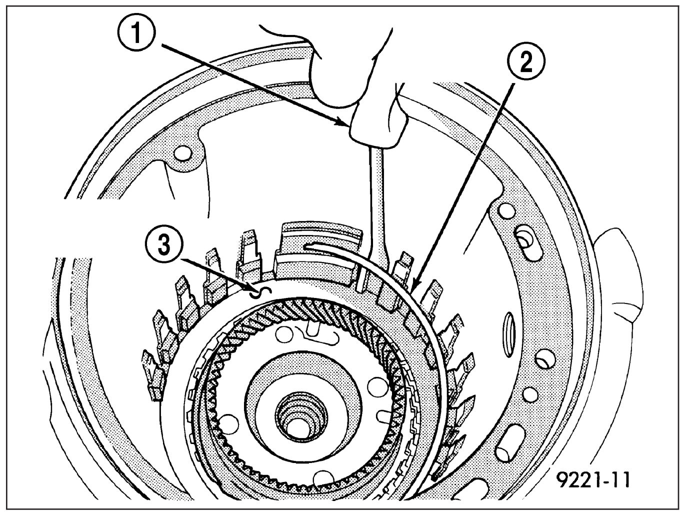
42. Remove the low/reverse reaction plate (1).



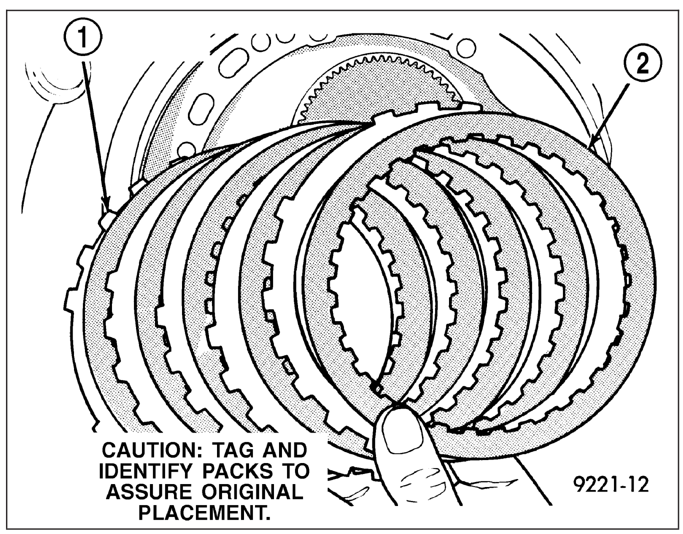
43. Remove one (1) low/reverse clutch disc to facilitate snap ring removal.



44. Remove the low/reverse reaction plate snap ring (2).

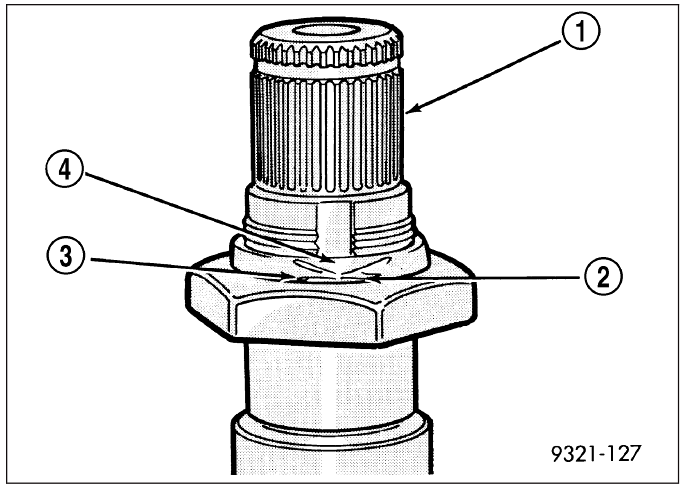


45. Remove the low/reverse clutch pack (1, 2).

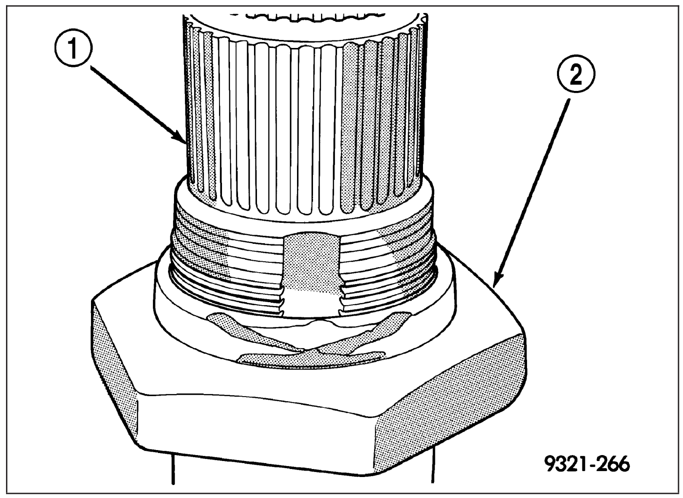


**CAUTION: Failure to grind and open stakes (4) of the output shaft nut will result in thread damage to the shaft during nut removal.**

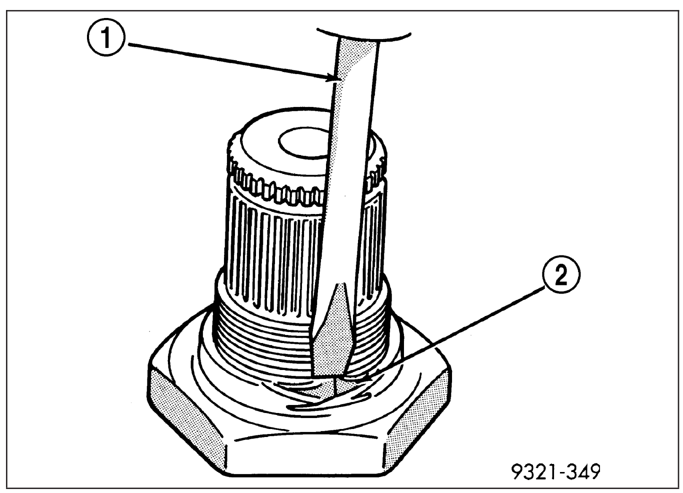
**WARNING: Wear safety goggles while grinding stake nuts.**



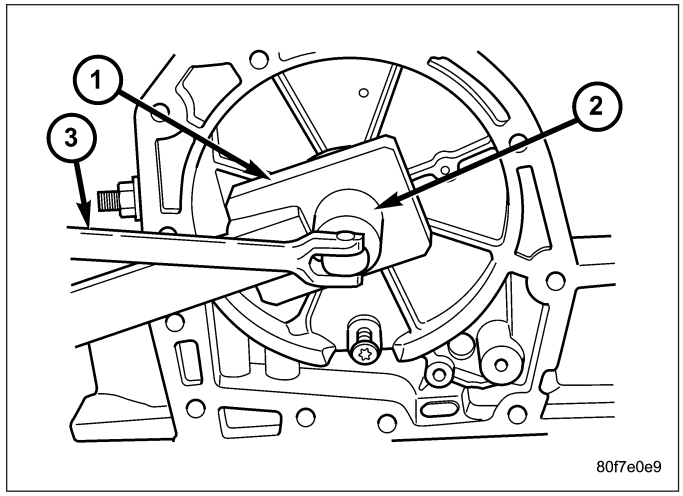
46. Using a die grinder or equivalent, grind the stakes in the shoulder of the shaft nut (2) as shown. Do not grind all the way through the nut and into the shaft. There are two stakes on each nut.



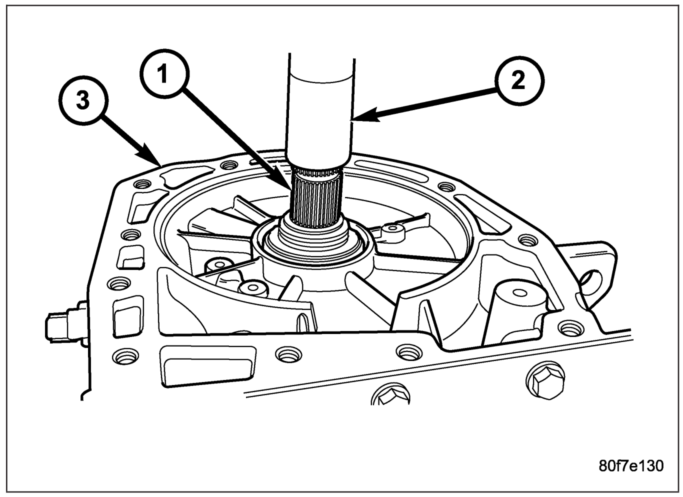
47. Using a small chisel (1), carefully open the stakes on nut (2).



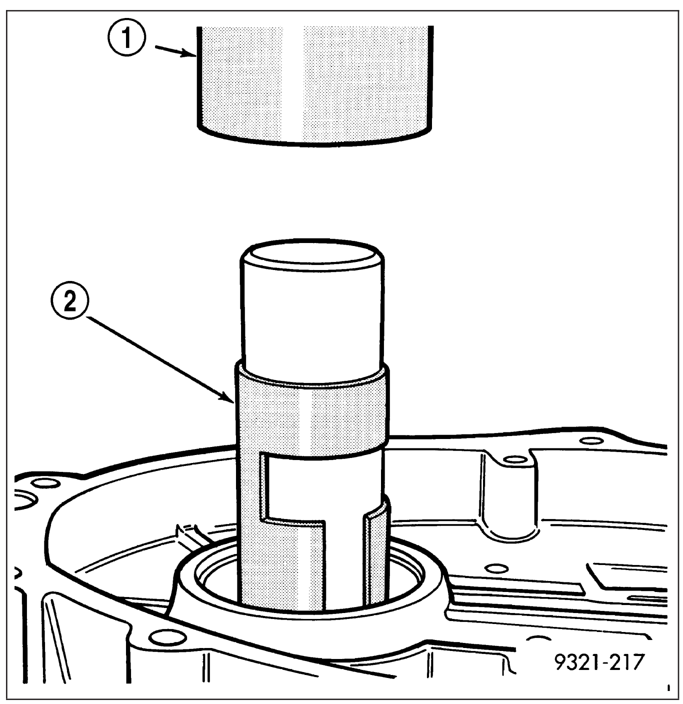
48. Use Wrench 6497 (1) and Wrench 6498A (2) to remove the output shaft nut.



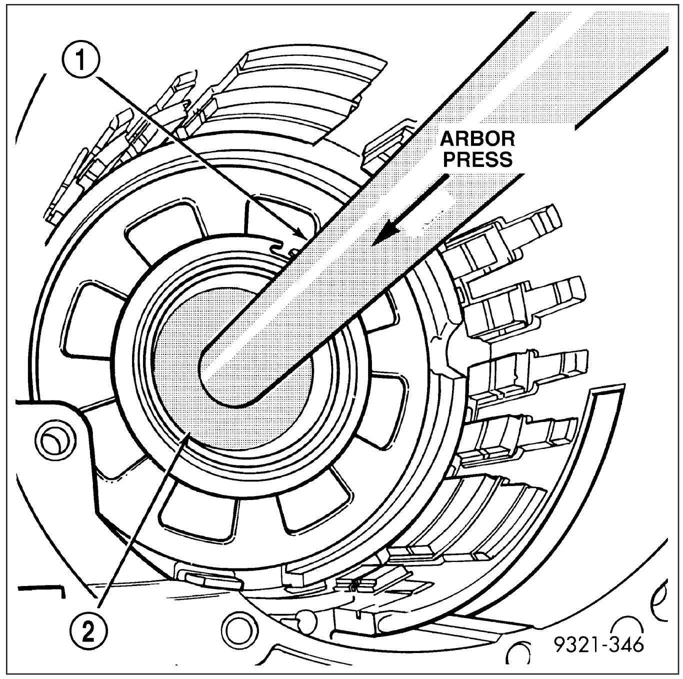
49. Remove the output shaft (1) from case (3) using a shop press (2).



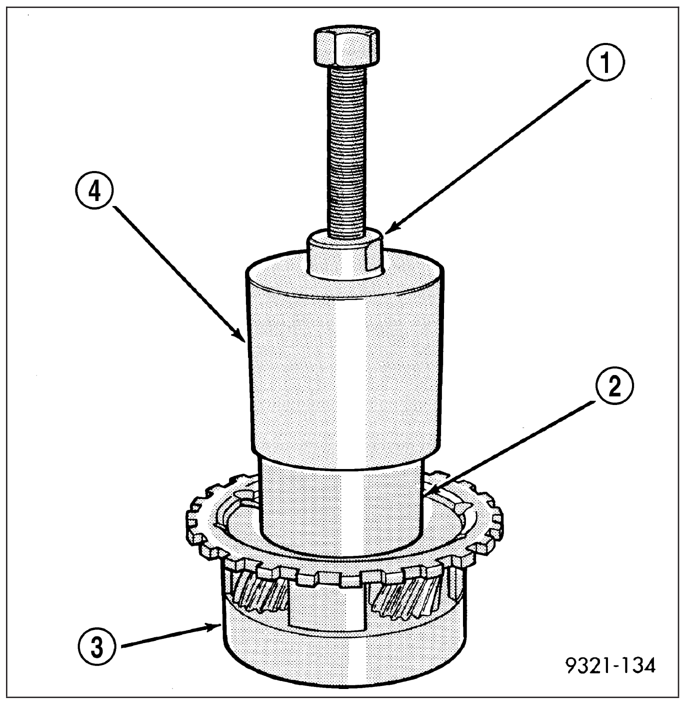
50. Use Remover 6596 (2) with a shop press (1) to remove the front output shaft bearing cup.



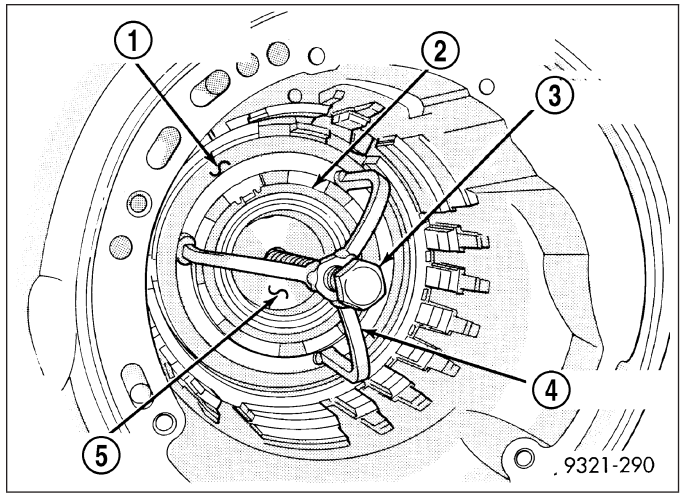
51. Use Disc 6597 (2) and Universal Handle C-4171 (1) and Handle Extension C-4171-2 to press the rear output shaft bearing cup rearward.



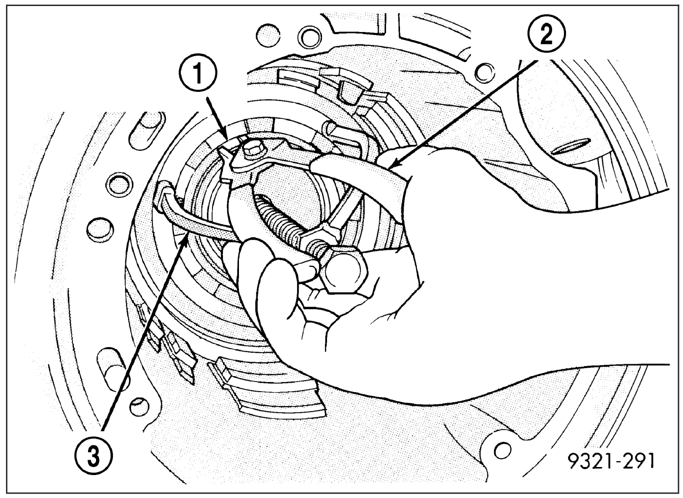
52. Remove the rear carrier front bearing cone (3).



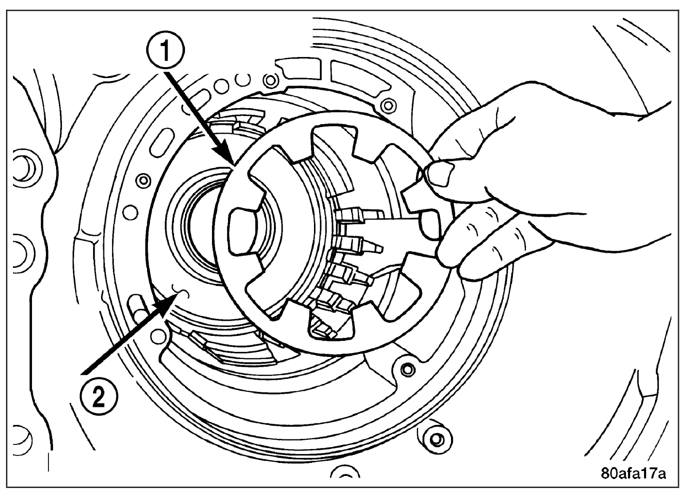
53. Install and load Compressor 5059A (4), Compressor 5058A (3), and Disc 6057 (5) as shown.



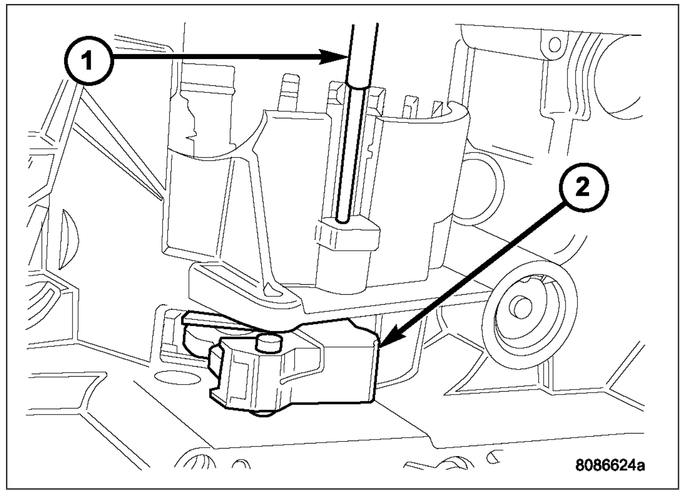
54. Remove the low/reverse belleville spring snap ring (1).



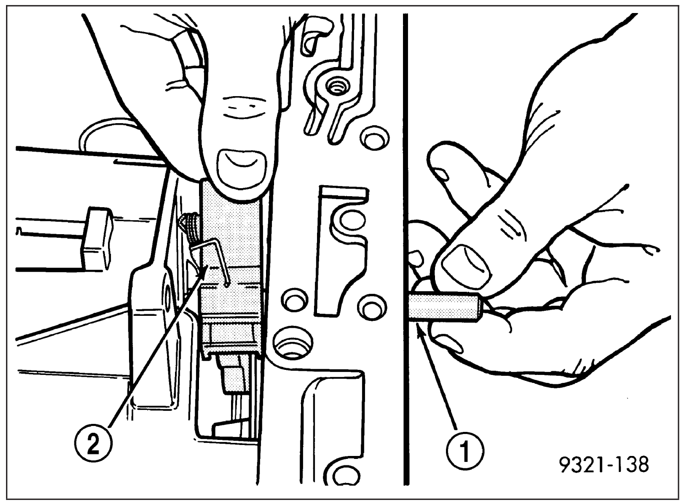
55. Remove the low/reverse piston belleville spring (1).



56. Remove the park sprag pivot retaining screw.
57. Drive out the anchor shaft using suitable punch (1).

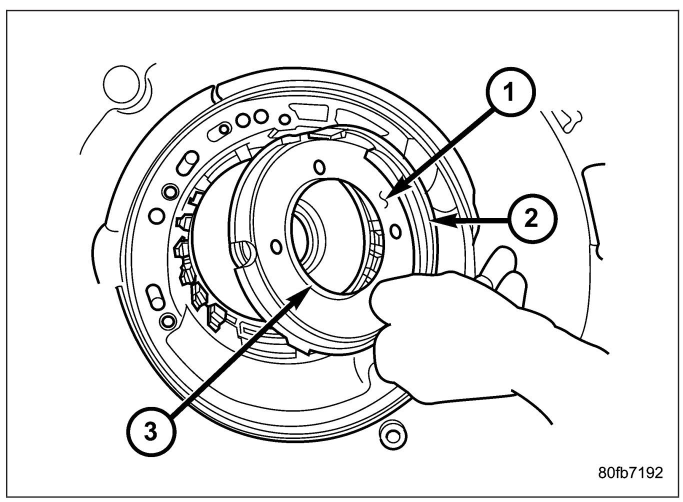


58. Remove the guide bracket pivot pin (1). Inspect all components for wear and replace if necessary.

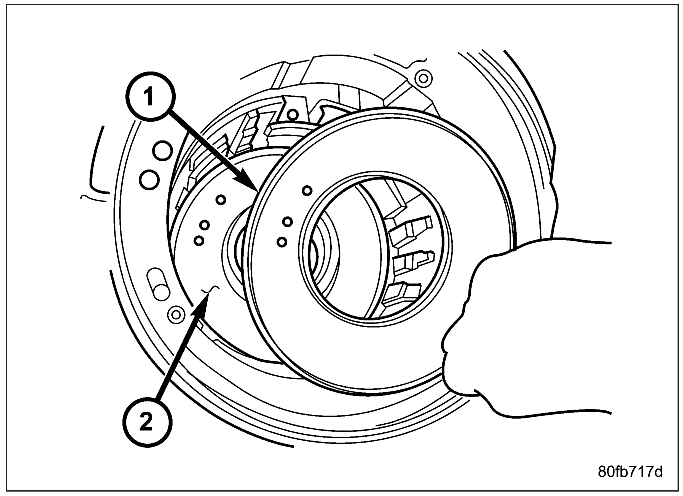


**NOTE: The Low/Reverse Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.**

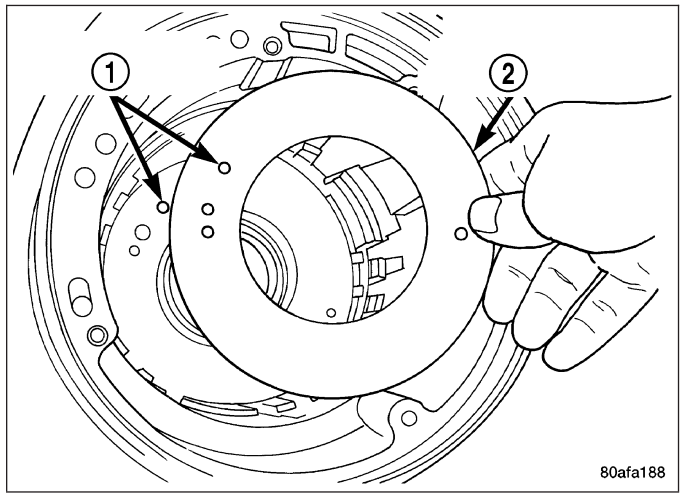
59. Remove the low/reverse clutch piston (1).
60. Remove the low/reverse piston retainer screws.



61. Remove low/reverse piston retainer (1).



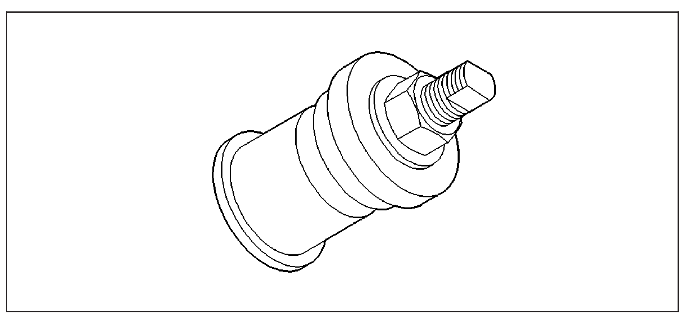
62. Remove the low/reverse piston retainer gasket (2).



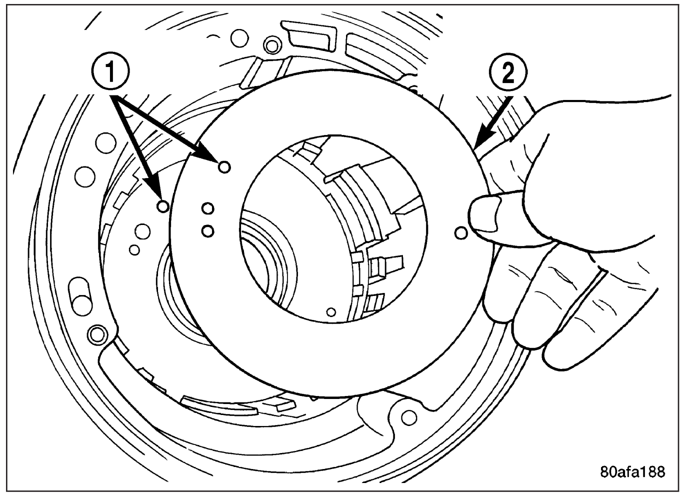
## ASSEMBLY

**NOTE: If the transmission assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).**

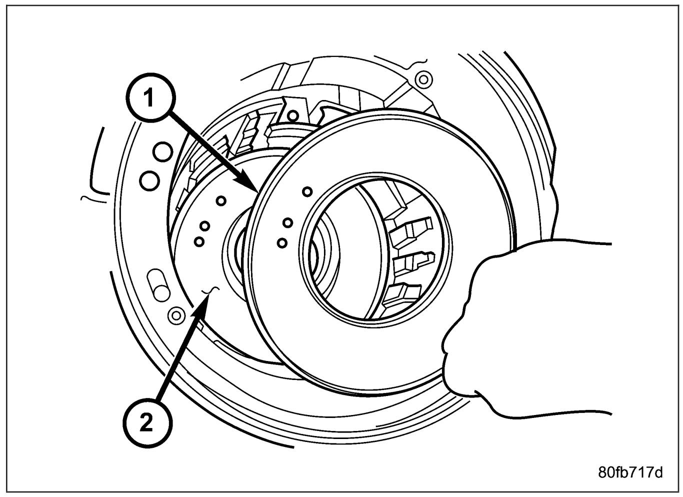
1. Install the output bearing cups using Installer 5050A.



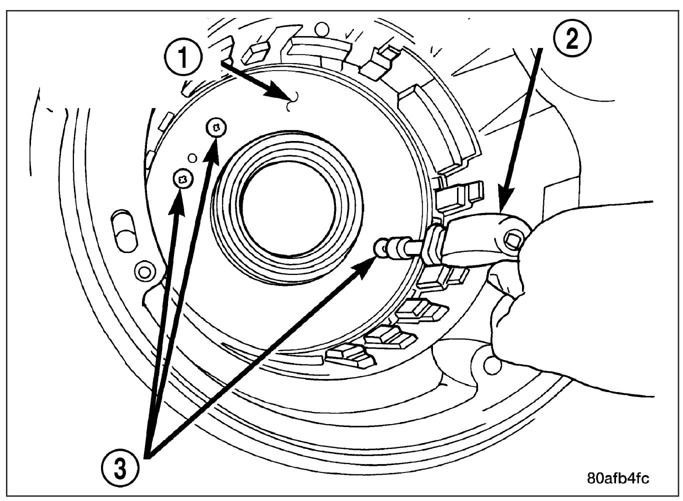
2. Install low/reverse piston retainer gasket (2).



3. Install low/reverse piston retainer (1).

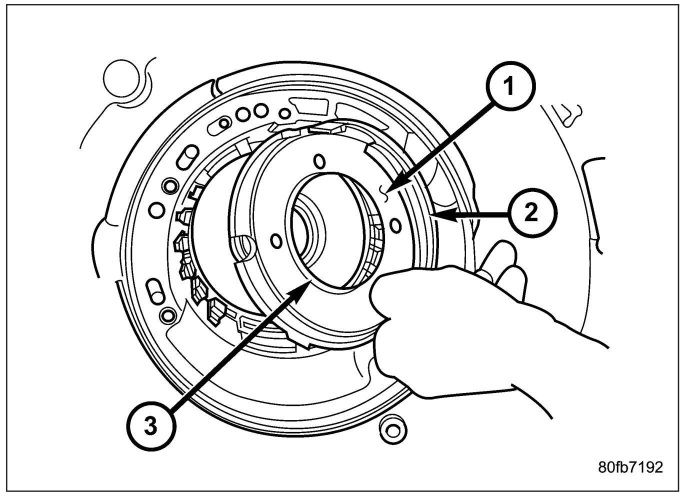


4. Install low/reverse piston retainer-to-case screws (3) and torque to 5 N·m (45 in. lbs.).

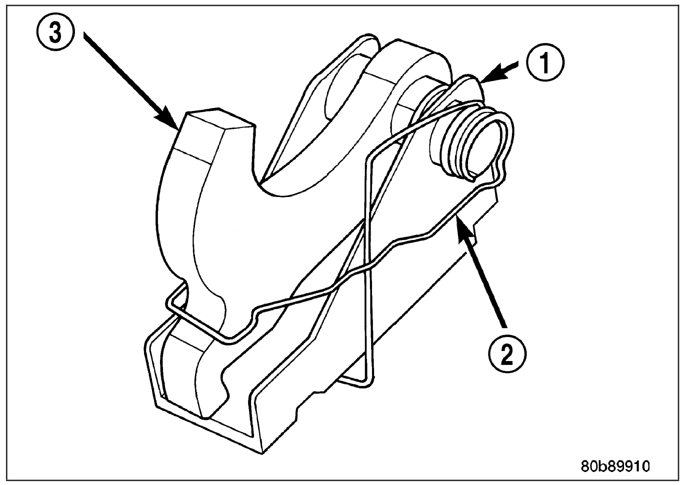


**NOTE: The Low/Reverse Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.**

5. Install low/reverse clutch piston (1).

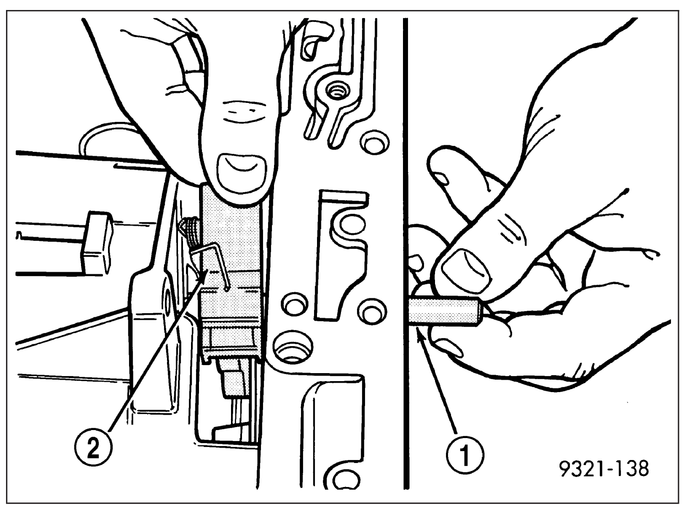


6. Assemble guide bracket (1) assembly as shown, if necessary.

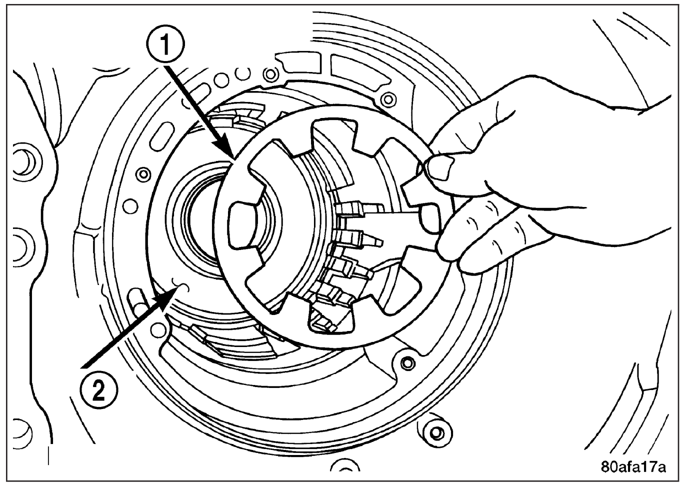


**CAUTION: When installing, be sure guide bracket and split sleeve touch the rear of the transmission case.**

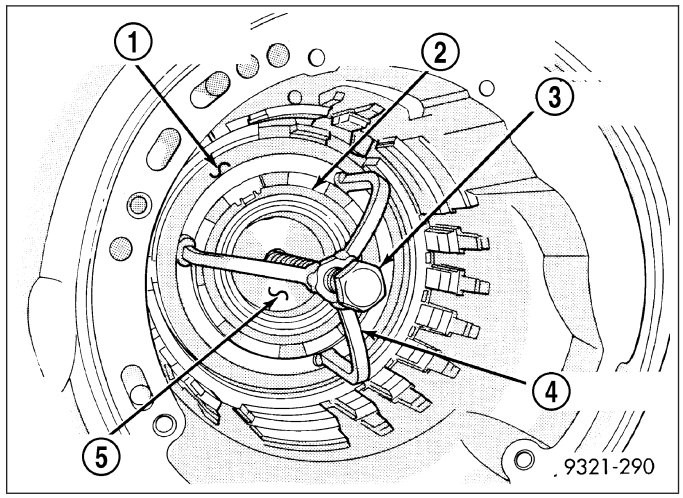
7. Install guide bracket pivot pin (1).
8. Install park sprag pivot retaining screw and torque to 4.5 N·m (40 in. lbs.).



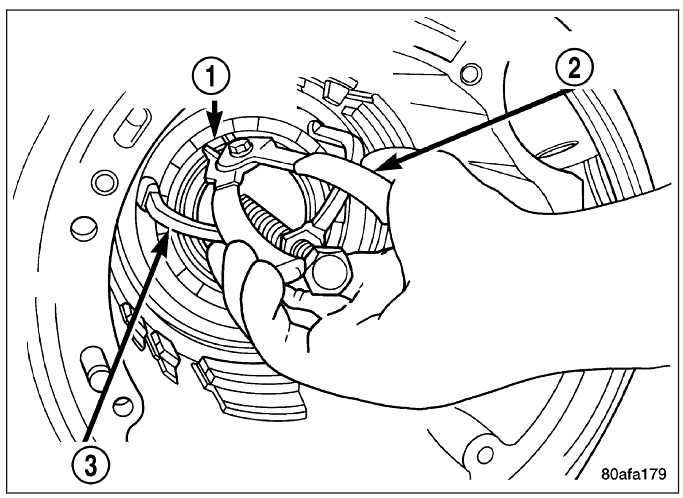
9. Install low/reverse piston belleville spring (1) into position.



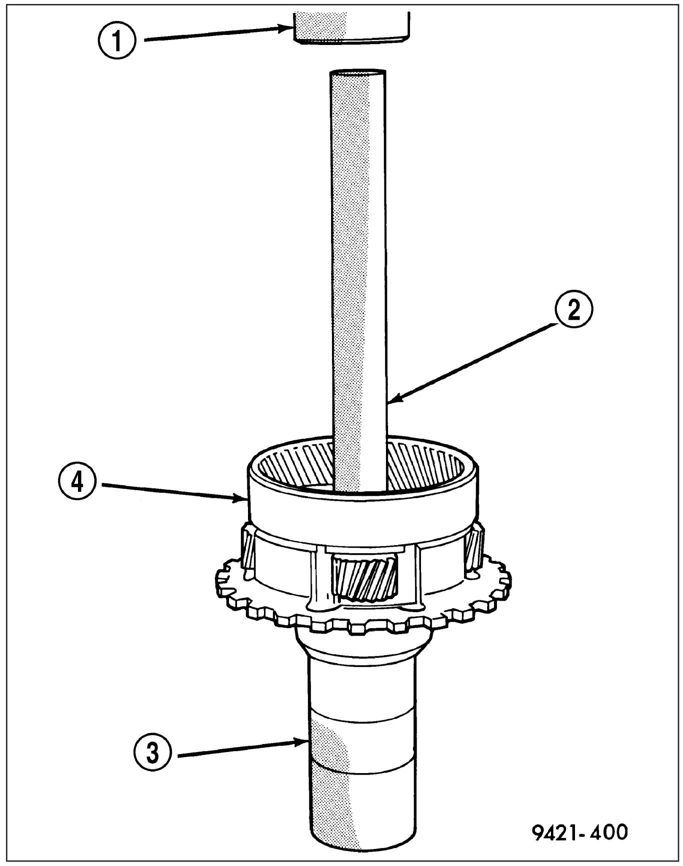
10. Install and load low/reverse spring compressor tool (3, 4, 5) as shown in to facilitate snap ring (2) installation.



11. Install snap ring (1) and remove compressor tool.



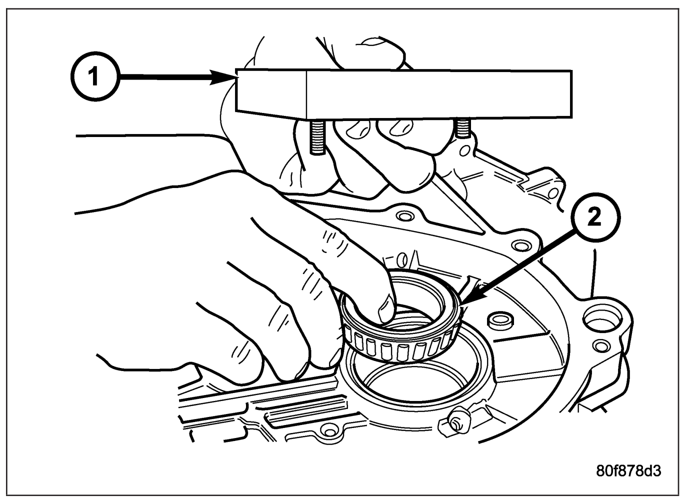
12. Install rear carrier (4) front bearing cone.



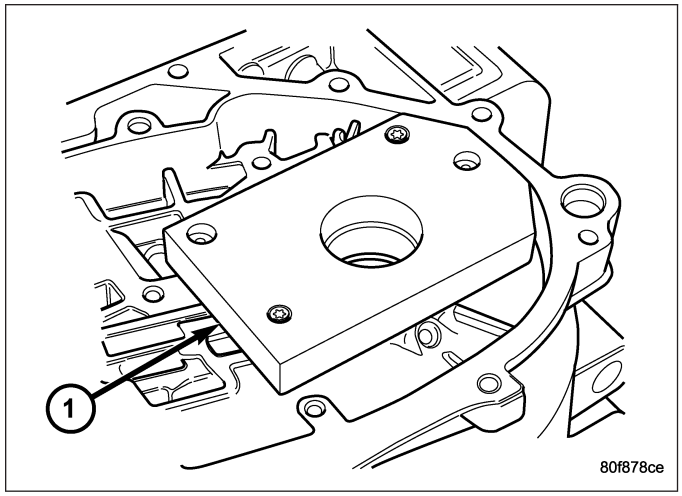
Check output bearing preload. **Output bearing preload must be checked and/or adjusted if any of the following items have been replaced:**

- Output shaft (rear carrier assembly)
- Output shafts bearings
- Transmission case

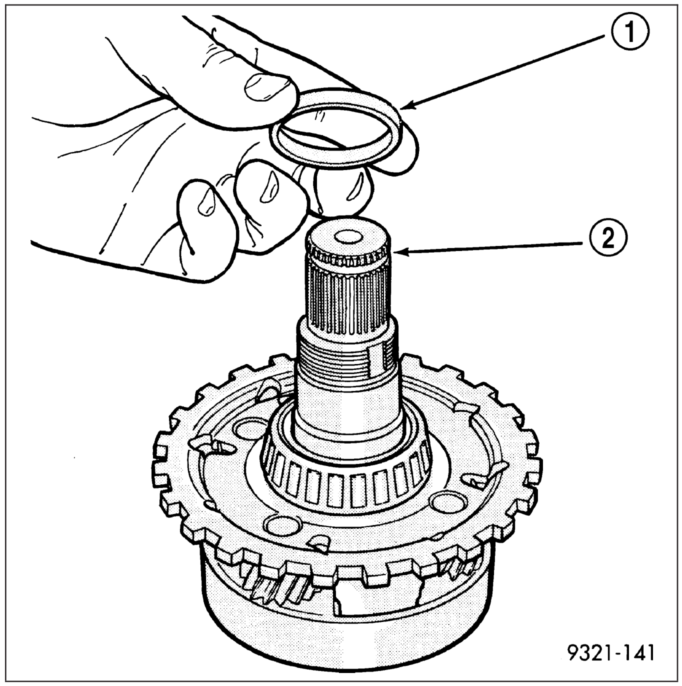
13. **PRELOAD CHECK/SHIM SELECTION:** Install rear output shaft bearing cone and Support Plate 6618A (1).



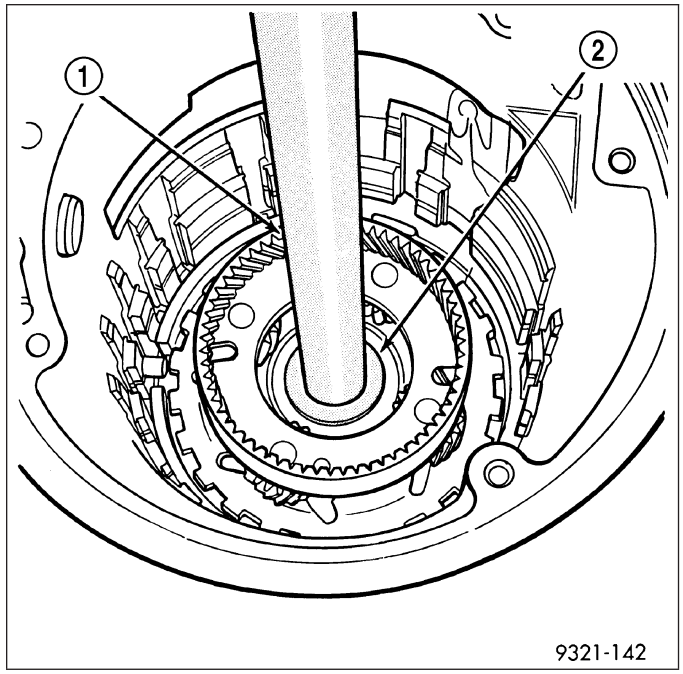
14. Install Support Plate 6618A (1). Lightly tighten retaining screws. Screws should be below the plate surface, but do not snug screws.
15. Turn case over on arbor press so that the plate is resting on the press base. **CAUTION: The output shaft will extend through the hole of Support Plate 6618A. Ensure your press table has clearance for the output shaft.**



16. Install shim (1) on output shaft (2). Apply small amount of petrolatum onto the shim to hold it in place. Use the original shim as a starting point. If original shim is not available, use the thickest shim available.

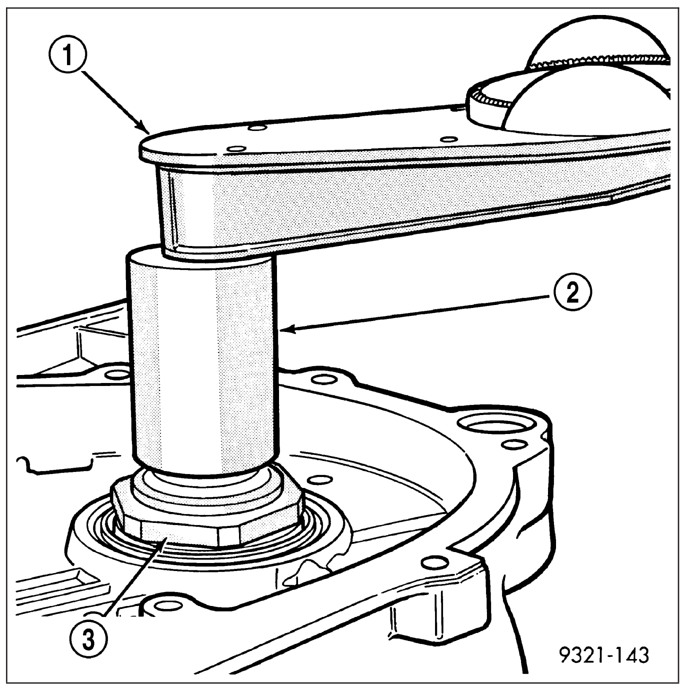


17. Install output shaft/rear carrier into rear bearing. The shaft must be pressed into position. Use Disc MD-998911 (2) and Universal Handle C- 4171 and Handle Extension C4171-2 (1) to press shaft into rear bearing.



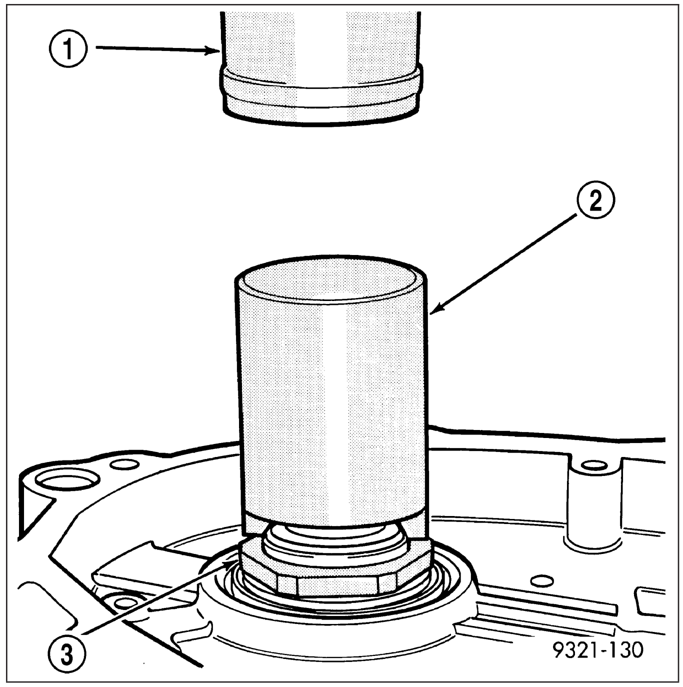
**CAUTION: Do not re-use old output shaft nut because the removed stake weakens the nut flange. Using Wrenches 6497 and 6498-A, install new output shaft nut. Tighten new output shaft nut to 271 N·m (200 ft. lbs.).**

18. Check the turning torque (1) of the output shaft. The shaft should have 1 to 8 in. lbs. of turning torque. If the turning torque is **higher than** 8 in. lbs., install a thicker shim. If turning torque is **less than** 1 in. lb., install a thinner shim. Make sure there is no end play.

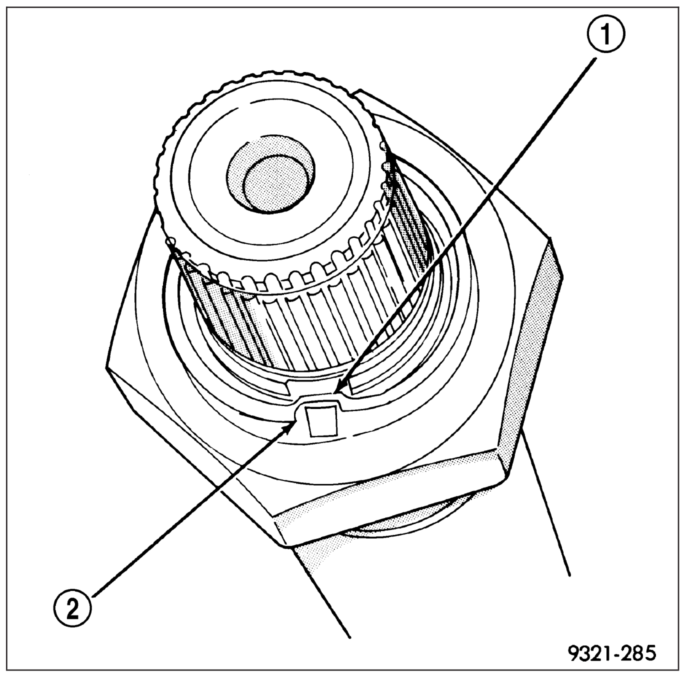


**CAUTION: Failure to stake nut could allow the nut to back-off during use.**

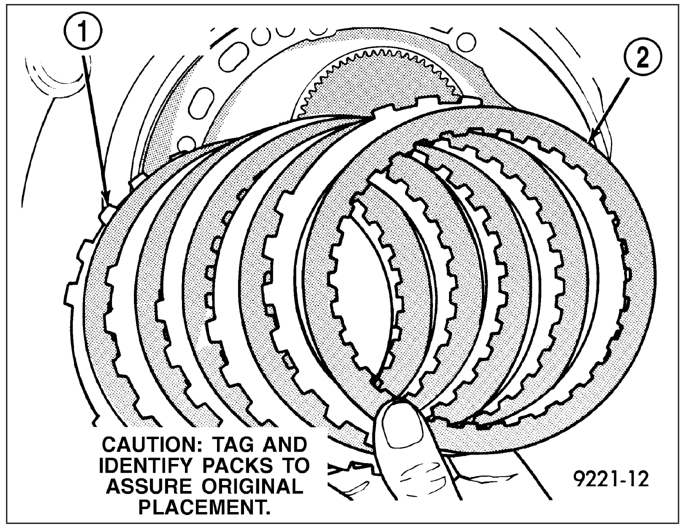
19. The new nut (3) must be staked after the correct turning torque is obtained. Use Staking Tool 6639 (2) to stake output shaft nut.



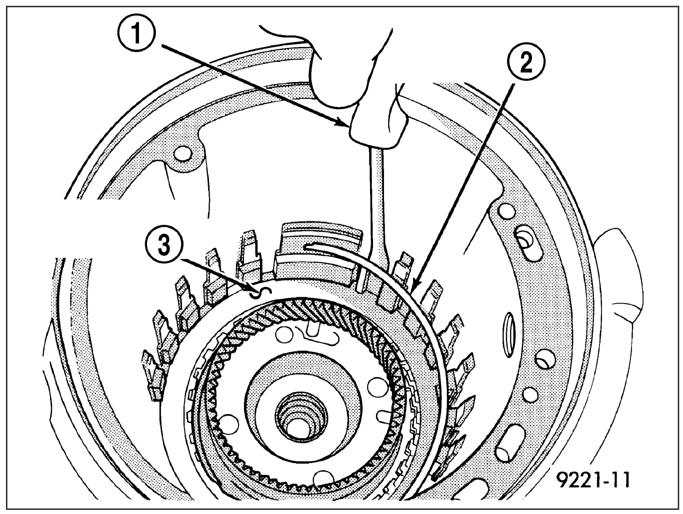
20. Verify that the nut has been properly staked to the output shaft.



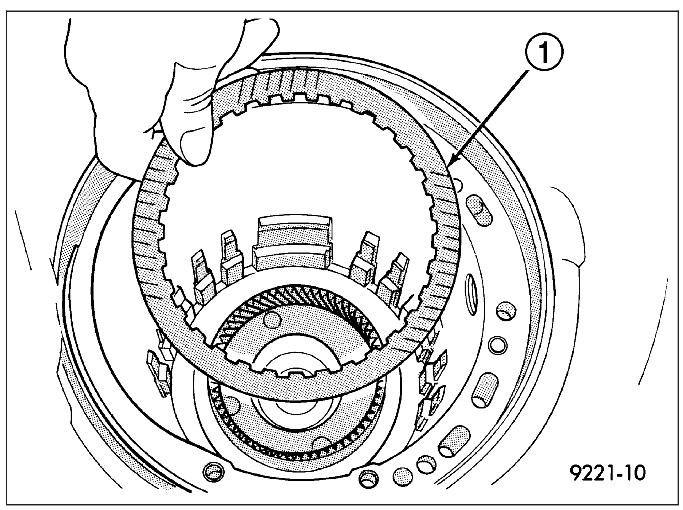
21. Install low/reverse clutch pack (1, 2). Leave uppermost disc out to facilitate snap ring installation.



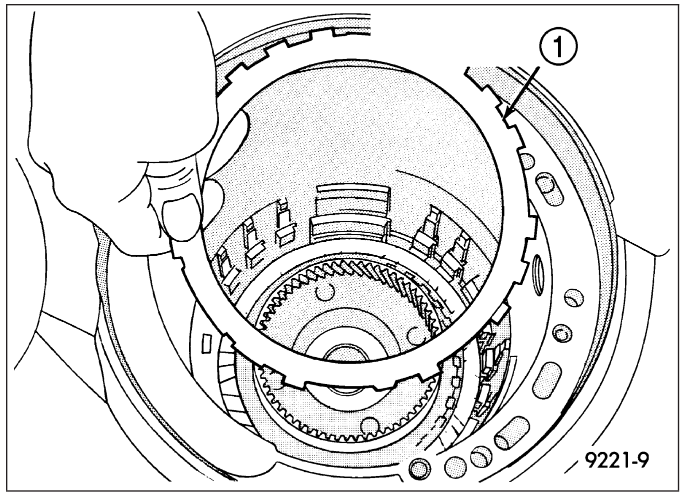
22. Install low/reverse reaction plate snap ring (2).



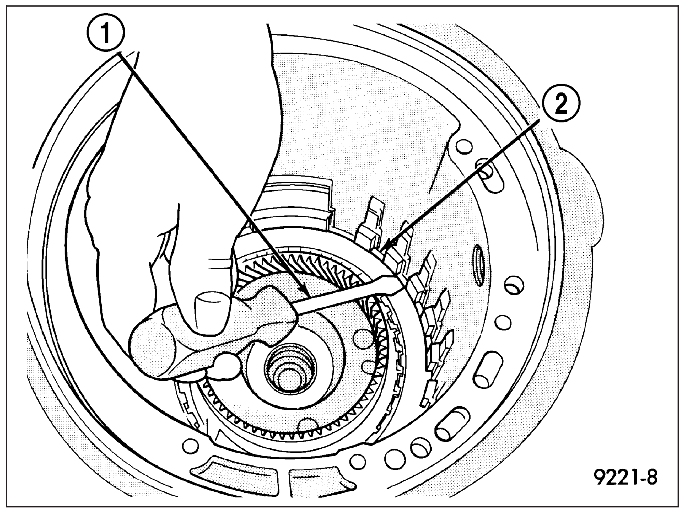
23. Install one low/reverse clutch disc (1).



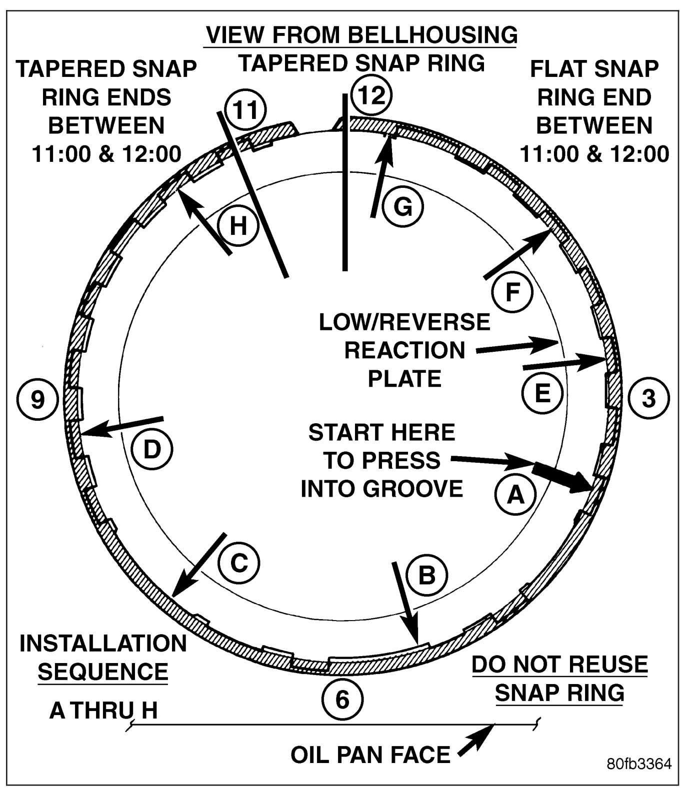
24. Install low/reverse reaction plate (1) with flat side up.



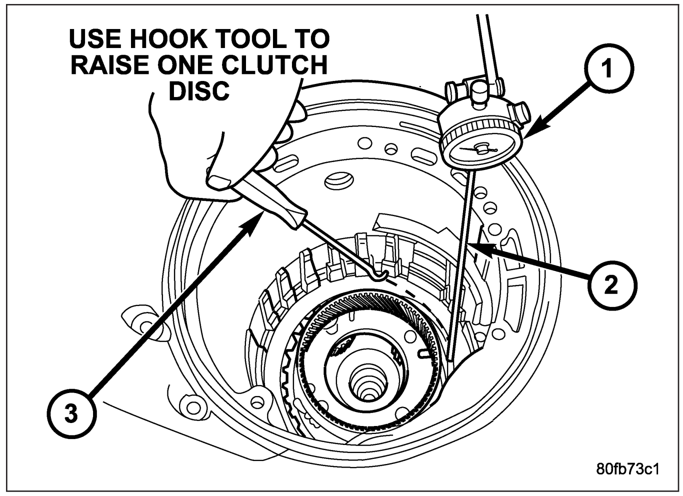
25. Install a new tapered snap ring (2) (tapered side out).



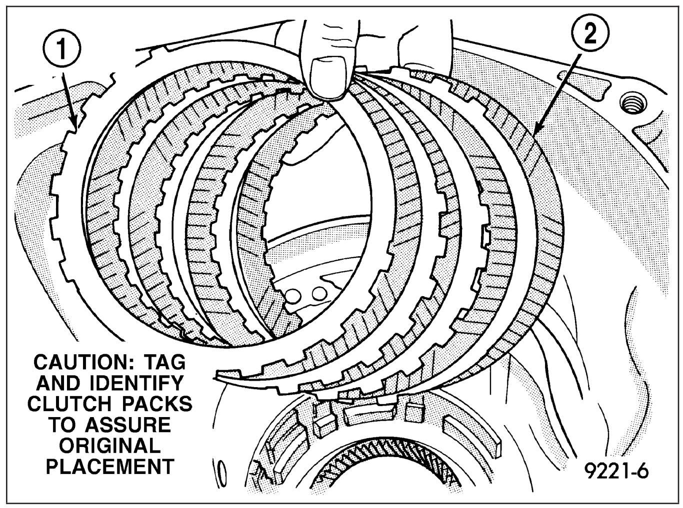
26. Make sure that the snap ring ends are oriented as shown.



27. Measure low/reverse clutch pack. Set up dial indicator (1) as shown. Press down clutch pack with finger and zero dial indicator. Record measurement in four (4) places and take average reading. **Low/Reverse clutch pack clearance is 0.84 to 1.60 mm (0.033 to 0.063 inch).**
28. Select the proper low/reverse reaction plate to achieve specifications.

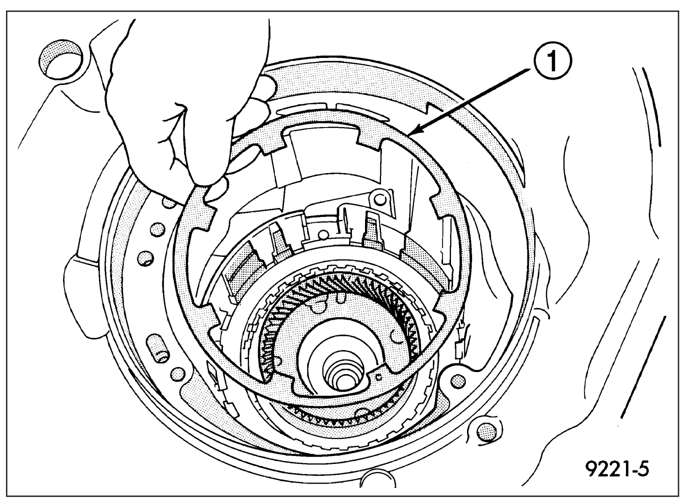


29. Install 2/4 clutch pack (1, 2).

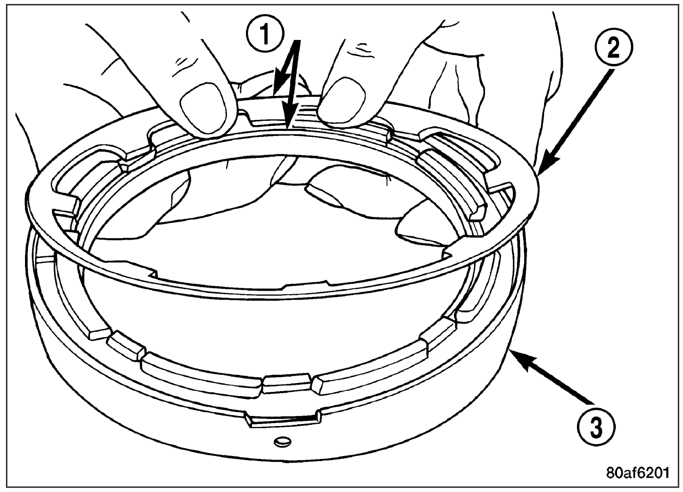


**NOTE: The 2/4 Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.**

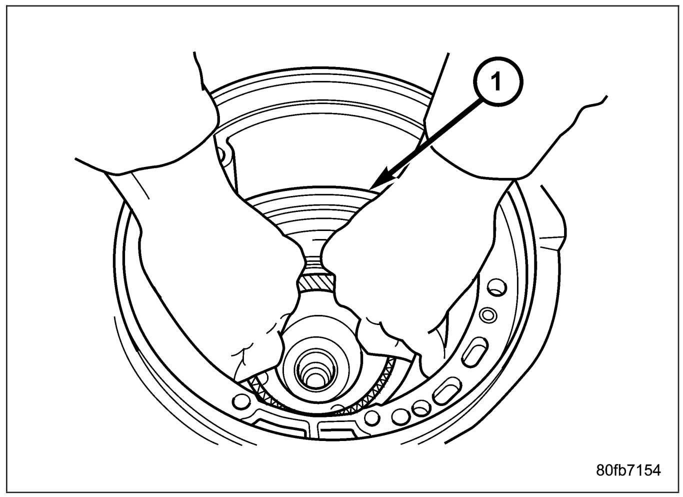
30. Install 2/4 clutch belleville spring (1).



31. Verify the proper orientation of the return spring (2) to the 2/4 retainer (3).

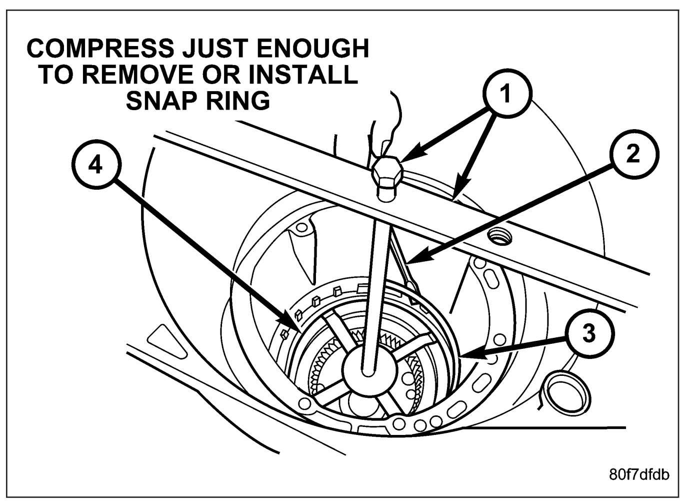


32. Install 2/4 clutch retainer (1).

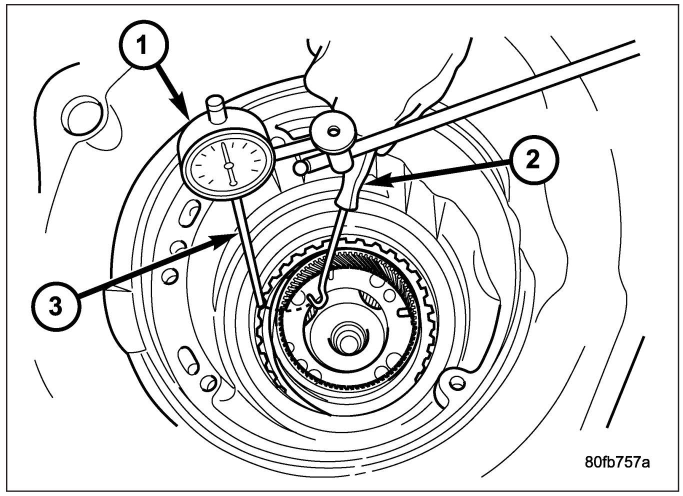


**NOTE: Verify that Compressor 5058A (1) is centered properly over the 2/4 clutch retainer (4) before compressing. If necessary, fasten the bar from Compressor 5058A to the bellhousing flange with any combination of locking pliers and bolts to center the tool properly.**

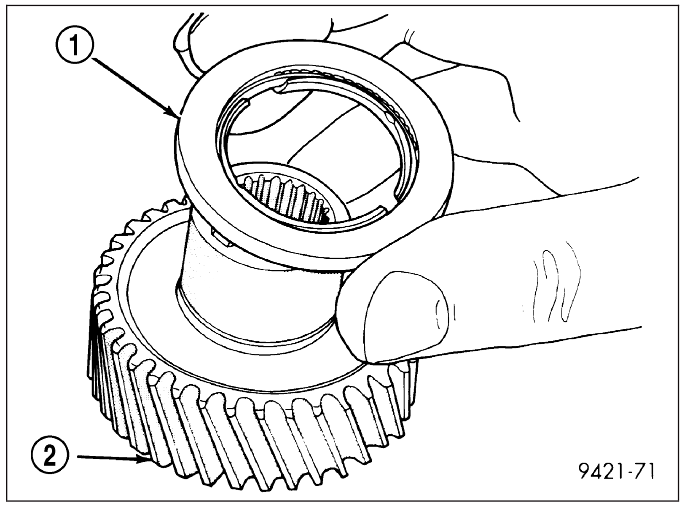
33. Set up Compressor 5058 (1) as shown. Compress 2/4 clutch just enough to facilitate snap ring installation.



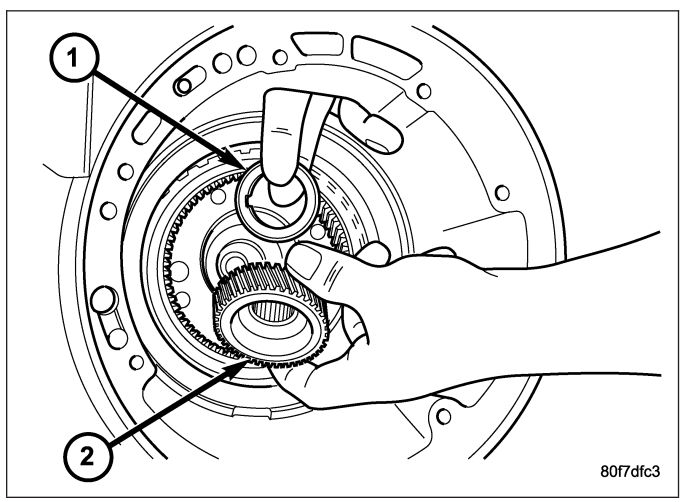
34. **Measure 2/4 clutch clearance:** Set up dial indicator (1) as shown. Press down clutch pack with finger and zero dial indicator. Record measurement in four (4) places and take average reading. **The 2/4 clutch pack clearance is 0.76 to 2.64 mm (0.030 to 0.104 inch).** If not within specifications, the clutch is not assembled properly or is excessively worn. **There is no adjustment for the 2/4 clutch clearance.**



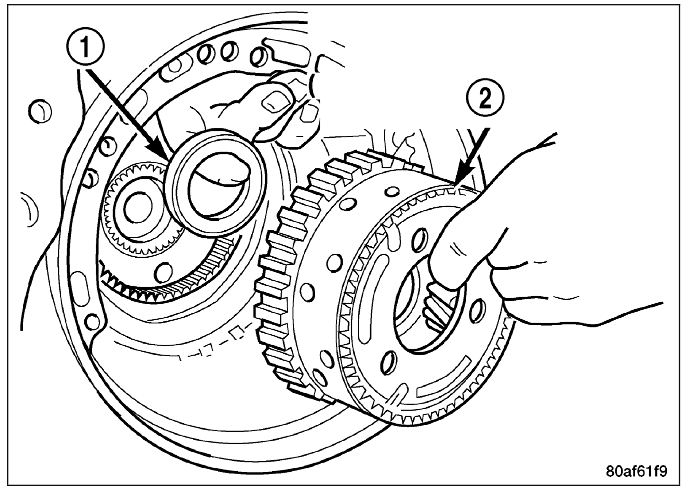
35. Install the #7 needle bearing (1) to the rear sun gear (2). **The number 7 needle bearing has three antireversal tabs and is common with the number 5 and number 2 position. The orientation should allow the bearing to seat flat against the rear sun gear. A small amount of petrolatum can be used to hold the bearing to the rear sun gear.**



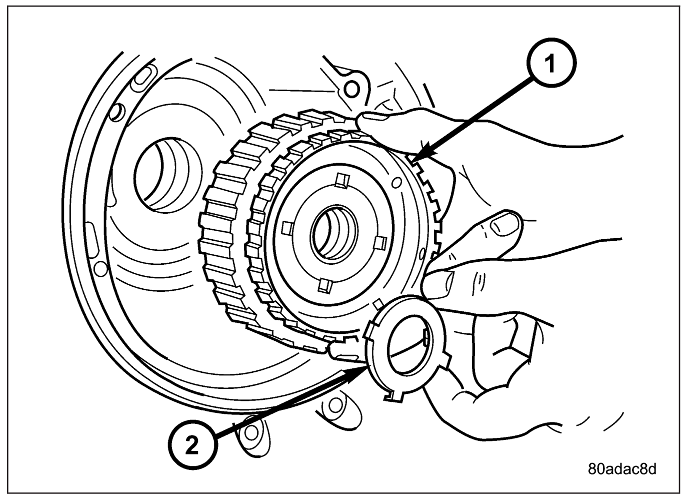
36. Install rear sun gear (2) and #7 needle bearing (1).



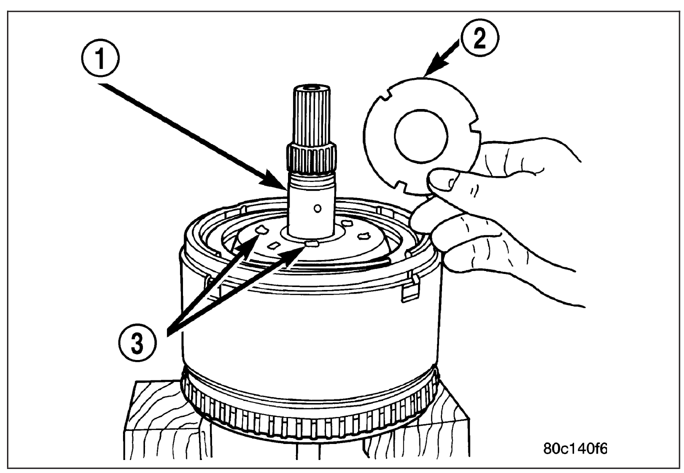
37. Install front carrier/rear annulus assembly (2) and #6 needle bearing (1).



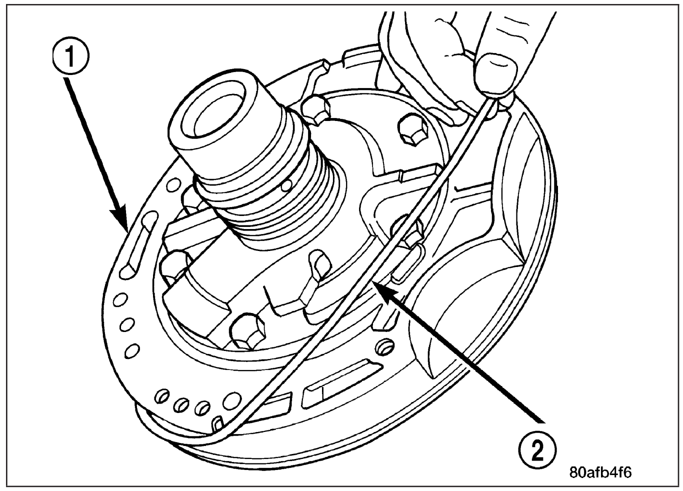
38. Install front sun gear assembly (1) and #4 thrust washer (2).



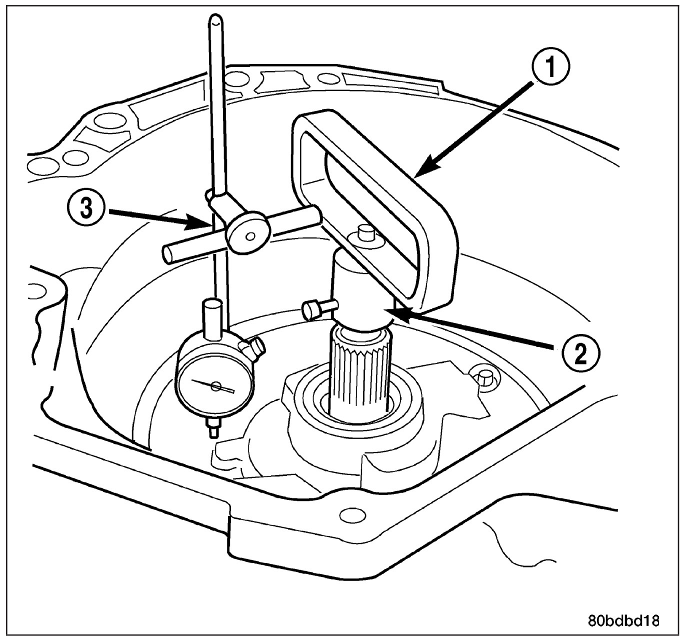
39. Determine proper #4 thrust plate thickness. Select the thinnest available #4 thrust plate.
40. Install #4 thrust plate (2) using petrolatum to hold into position.
41. Install input clutch assembly. Ensure the input clutch assembly is completely seated by viewing position through input speed sensor hole. **If the speed sensor tone wheel is not centered in the opening, the input clutches assembly is not seated properly.**



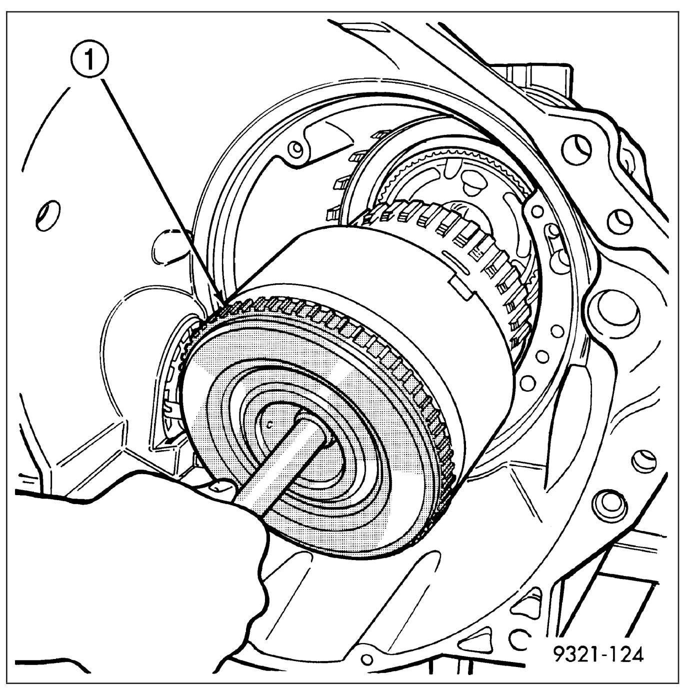
42. Remove the oil pump o-ring (2) and install oil pump and gasket to transmission. **Use screw-in dowels or Phillips head screwdrivers to align pump to case. Be sure to reinstall O-ring on oil pump after selecting the proper No. 4 thrust plate.**



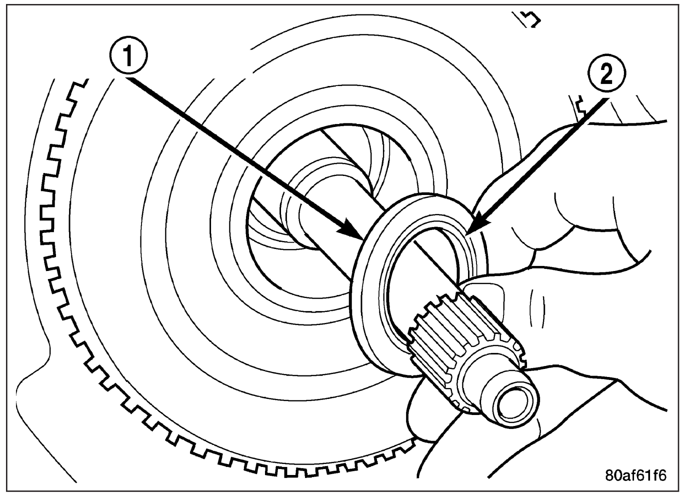
43. Measure the input shaft end play with the transmission in the vertical position. This will ensure that the measurement will be accurate.
44. Set up and measure endplay using End Play Set 8266 (1, 2) and Dial Indicator Set C3339 (3) as shown.
45. Measure input shaft end play. **Input shaft end play must be 0.127 to 0.635 mm (0.005 to 0.025 inch).** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch, which is within specifications.



46. Remove oil pump, gasket, and input clutch assembly to gain access to and install proper #4 thrust plate.
47. Install input clutch assembly (1) with proper thrust plate.

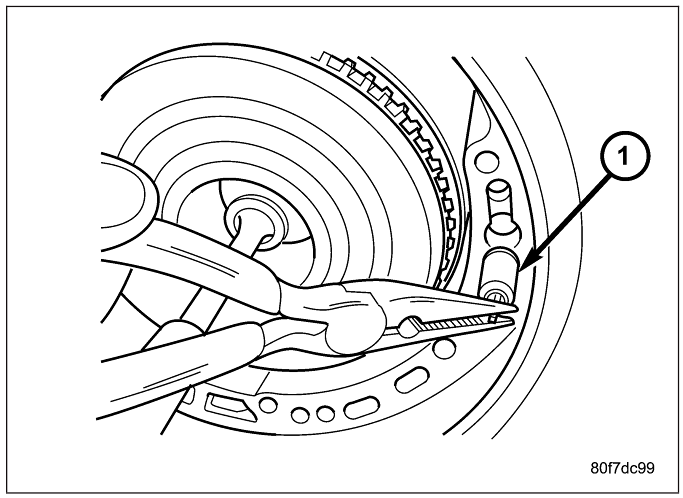


48. Install #1 caged needle bearing (1).



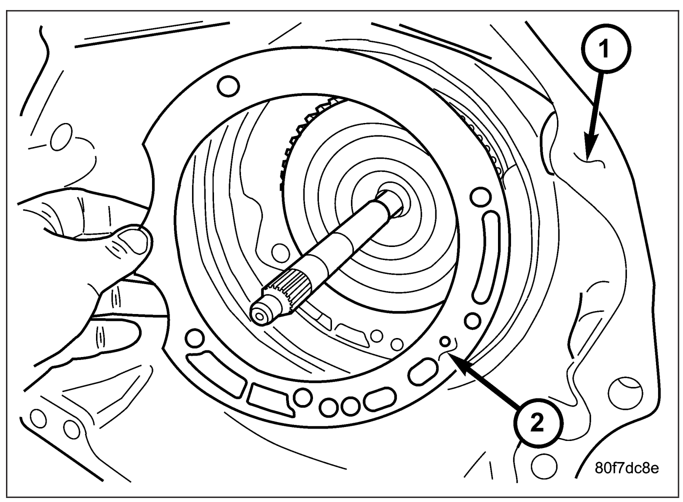
**CAUTION: By-pass valve MUST be replaced if transmission failure occurs.**

49. Replace cooler by-pass valve (1) if transmission failure has occurred.

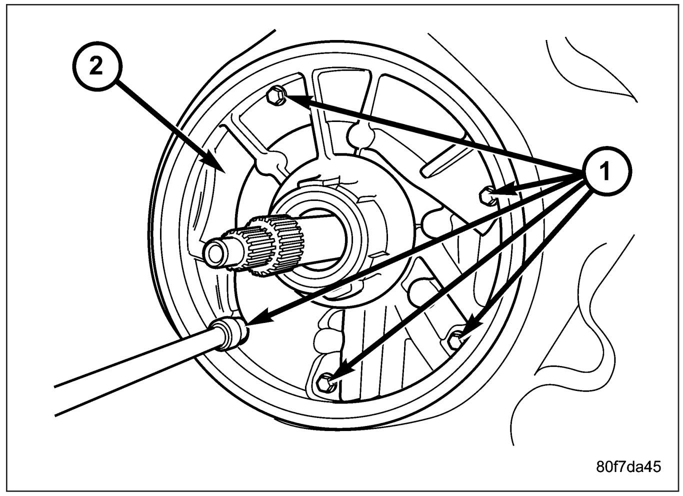


**NOTE: To align oil pump, gasket, and case during installation, use threaded dowels or Phillips screwdrivers.**

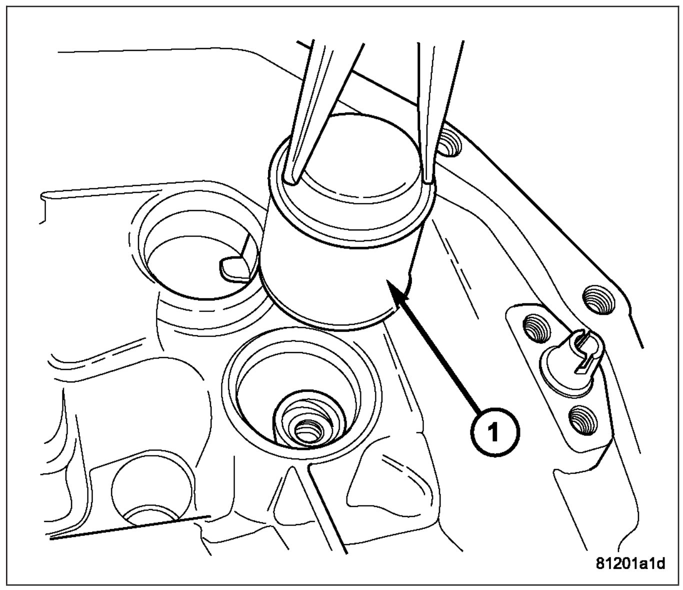
50. Install oil pump gasket (2).



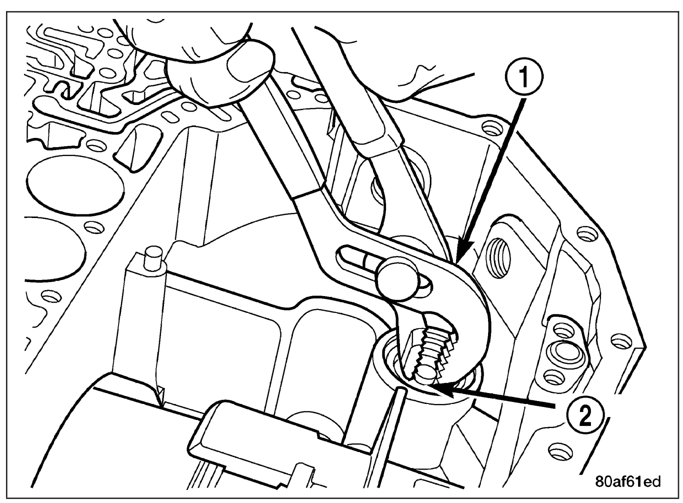
51. Install oil pump (2) and torque oil pump-to-case bolts (1) to 30 N·m (265 in. lbs.). Do not reuse original oil pump bolts.



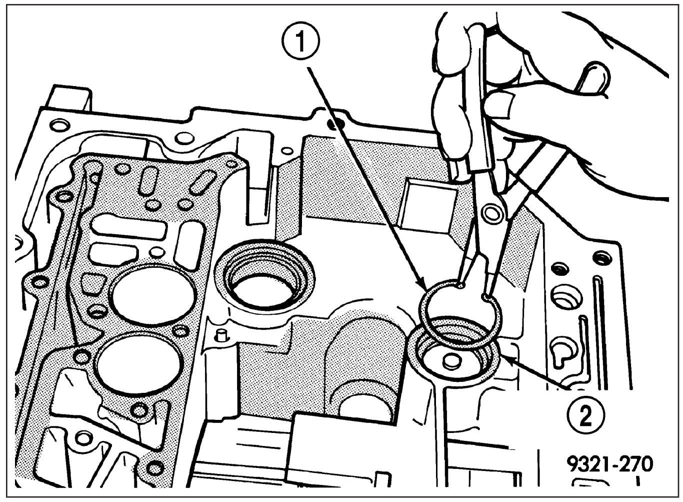
52. Install low/reverse accumulator (1) as shown.



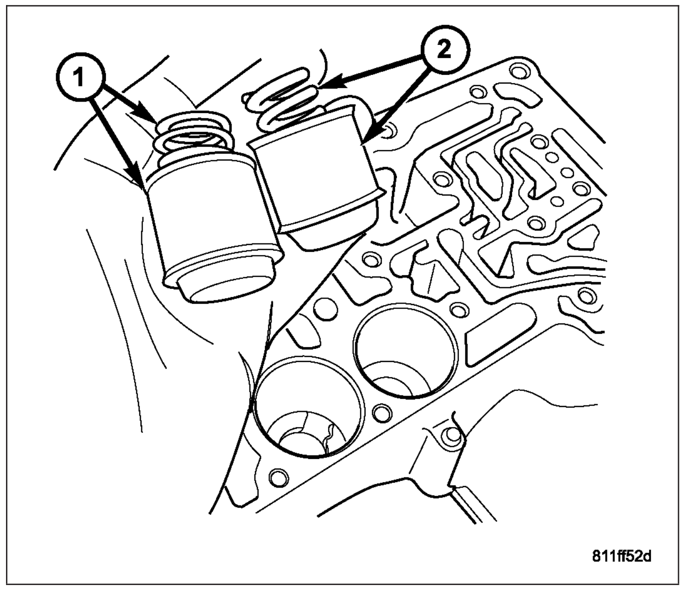
53. Install low/reverse accumulator plug (2).



54. Install low/reverse accumulator snap ring (1).

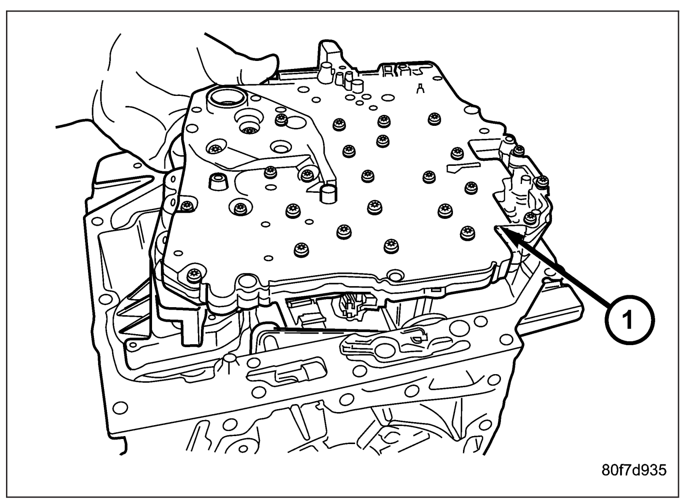


55. Install underdrive (2) and overdrive (1) accumulators and springs.

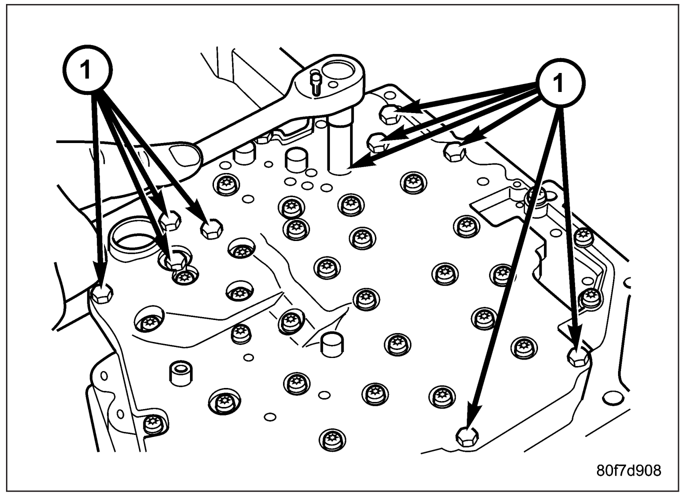


**CAUTION: Do not handle the valve body by the manual shaft. Damage could result.**

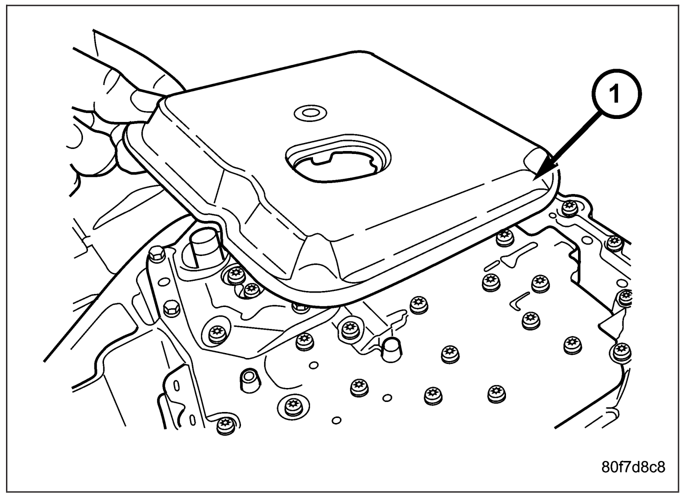
56. Install valve body (1) into place as shown.



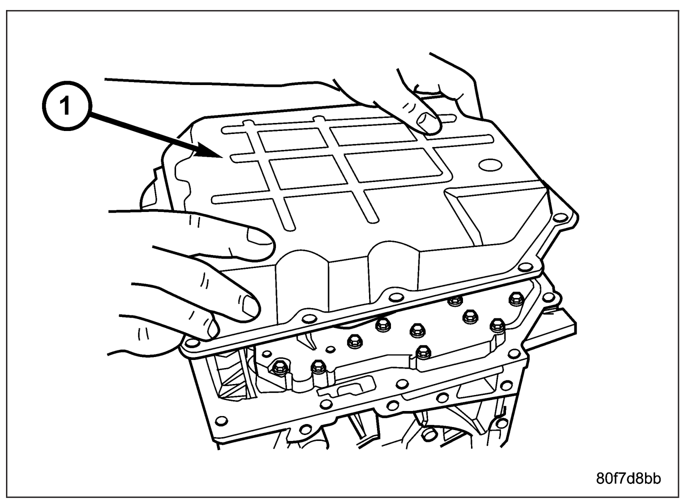
57. Install seven (7) valve body-to-case bolts (1) and torque to 12 N·m (105 in. lbs.).



58. Install transmission oil filter (1). Tighten the bolts to 5 N·m (45 in. lbs.).

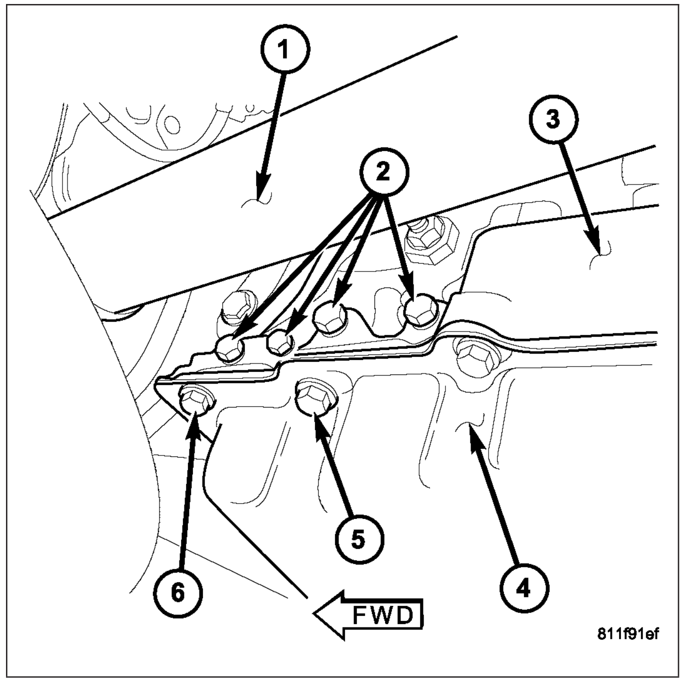


59. Install transmission oil pan (1) with a bead of Mopar® ATF RTV.



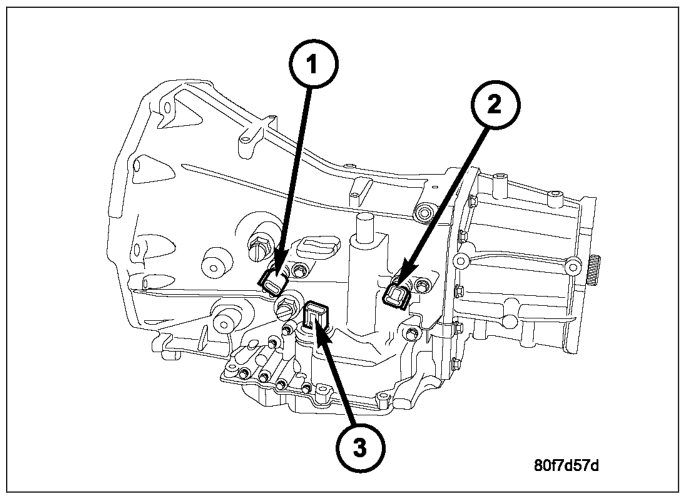
**NOTE: Before installing the oil pan bolt in the bolt hole located between the torque converter clutch on and U/D clutch pressure tap circuits , it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.**

60. Install and torque the oil pan-to-case bolts to 20 N·m (14.5 ft. lbs.).

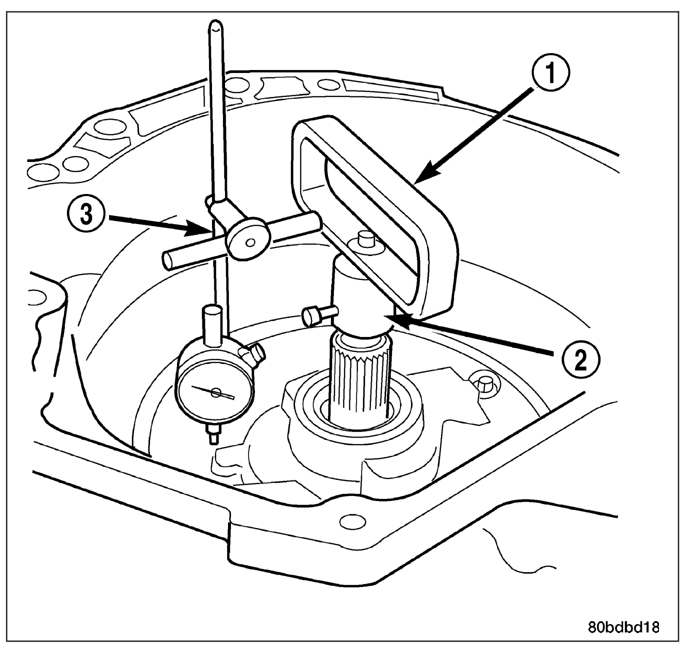


**NOTE: Before installing either speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.**

61. Install both speed sensors (1, 2) into the transmission case. Torque the speed sensor bolts to 9 N·m (80 in. lbs.).

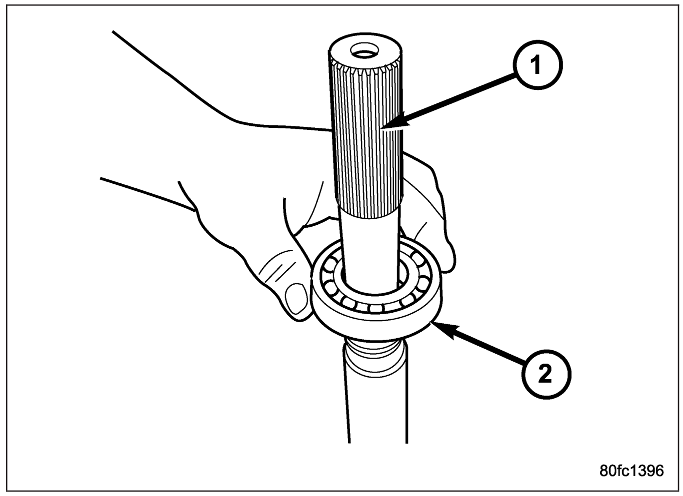


62. As a final check of the transmission, measure the input shaft end play. This will indicate when a #4 thrust plate change is required. The #4 thrust plate is located behind the overdrive clutch hub. Attach a dial indicator to transmission bell housing with its plunger seated against end of input shaft. Move input shaft in and out to obtain end play reading. **Input shaft end play must be 0.127 to 0.635 mm (0.005 to 0.025 inch).** If not within specifications, make the necessary thrust plate adjustment.

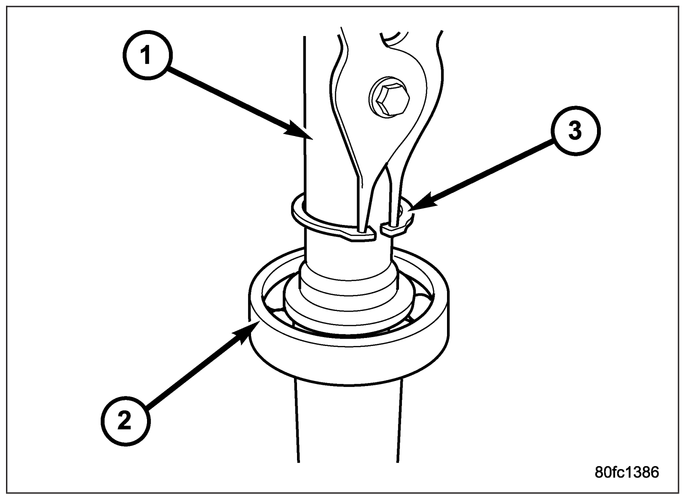


63. On 4X2 transmissions, perform the following, if necessary:

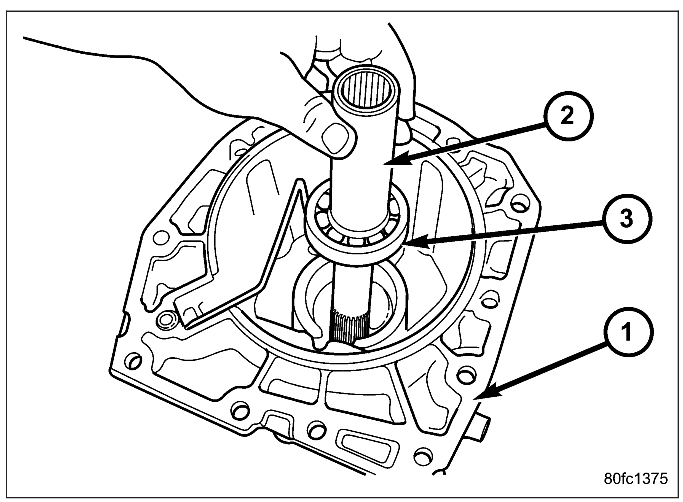
a. Install the extension shaft bearing (2) onto the extension shaft.



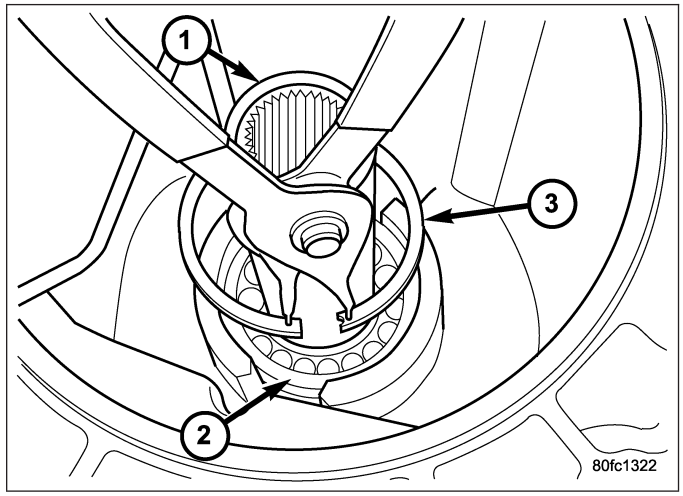
b. Install the extension shaft bearing retaining ring (3) onto the extension shaft (1).



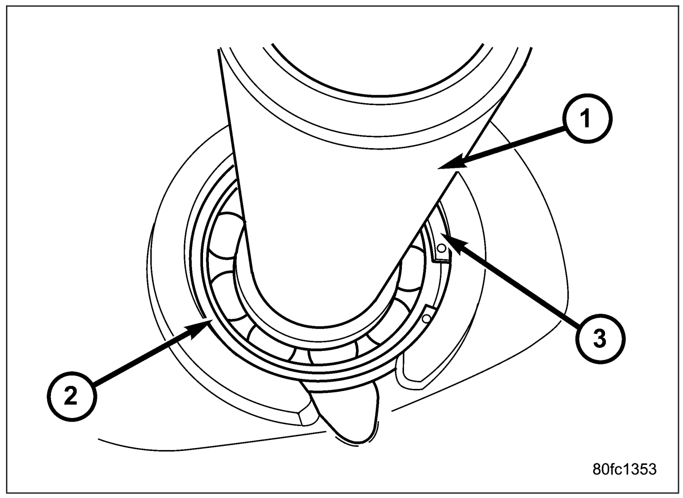
c. Install the extension shaft (2) and bearing assembly (3) into the extension housing (1).



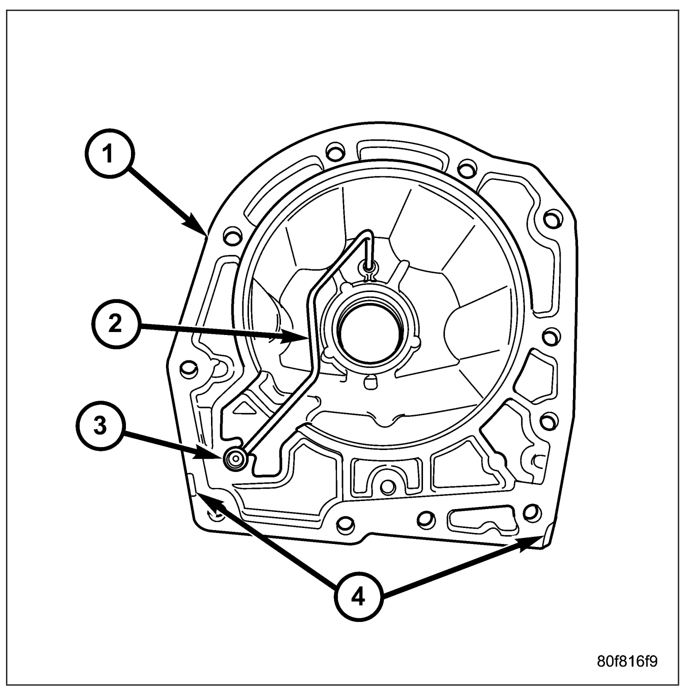
d. Install the extension shaft bearing snap ring (3) into the extension housing.



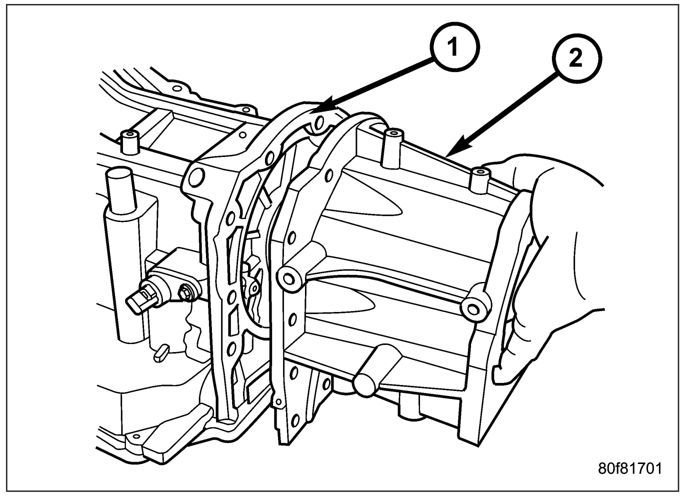
e. Verify that the extension shaft snap ring (3) is fully engaged in the snap ring groove.



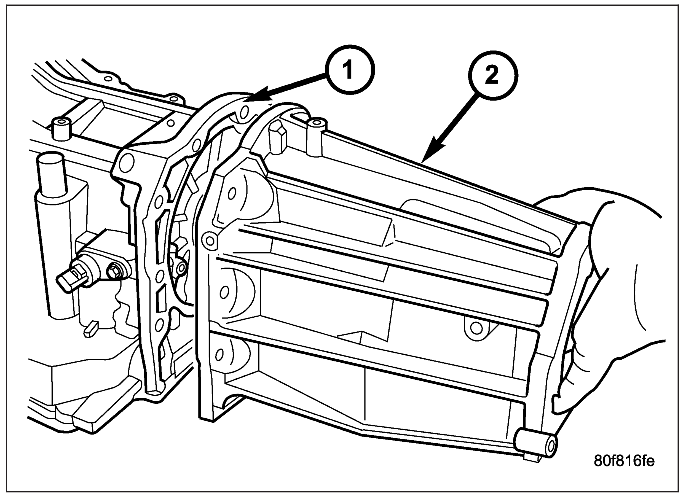
64. Inspect the lube tube grommet (2) for damage. If the grommet lip is damaged, it will need to be replaced.



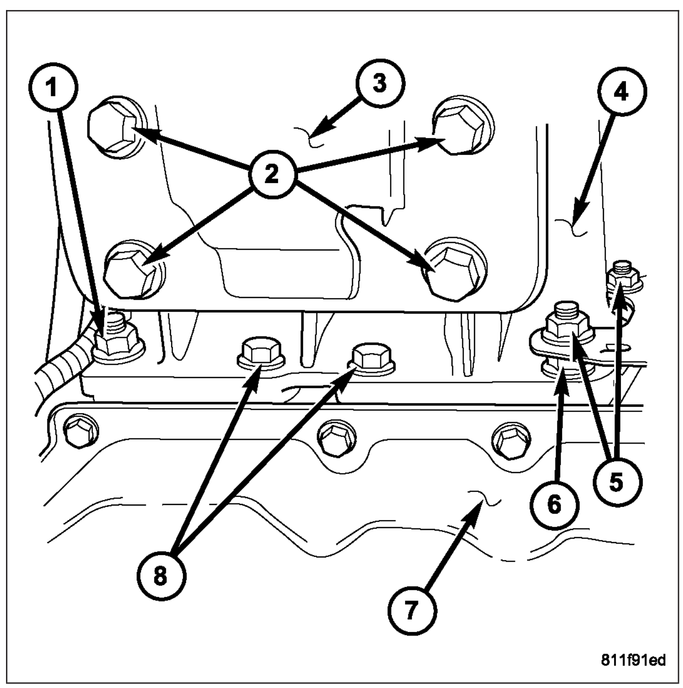
65. Install the 4X4 stub shaft onto the transmission output shaft.
66. Place a bead of Mopar® ATF RTV on the rear surface of the transmission case for the adapter/extension housing.
67. Install the adapter housing (2) onto the transmission case, 4X4 vehicles only.



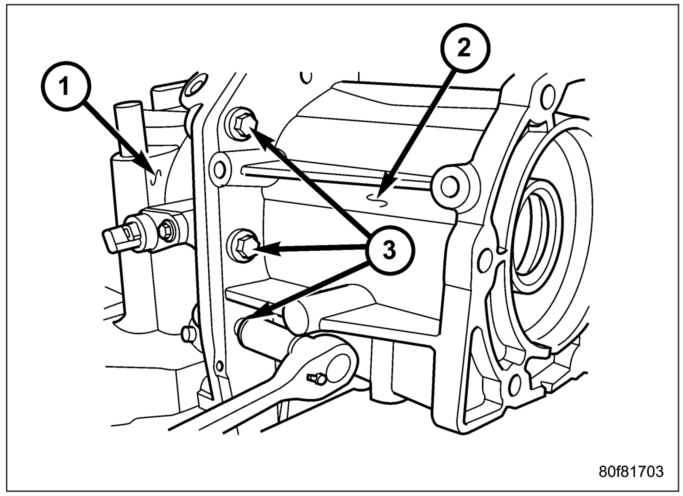
68. Install the extension housing (2) onto the transmission case, 4X2 vehicles only.



**NOTE: Before installing the lowermost four adapter/extension housing bolts, it will be necessary to replenish the sealing patch on the bolts using Mopar® Lock & Seal Adhesive.**

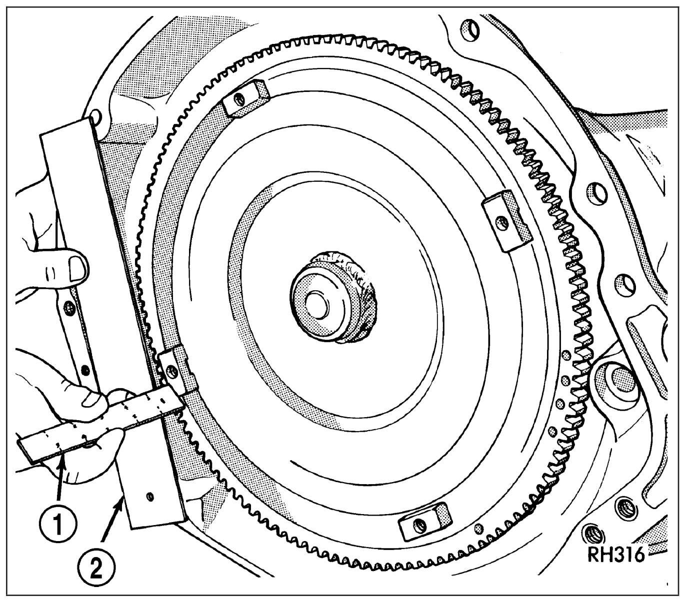


69. Install the bolts that hold the adapter or extension housing onto the transmission case. Be sure to install any stud bolts to their original locations. Tighten the bolts to 54 N·m (40 ft.lbs.).

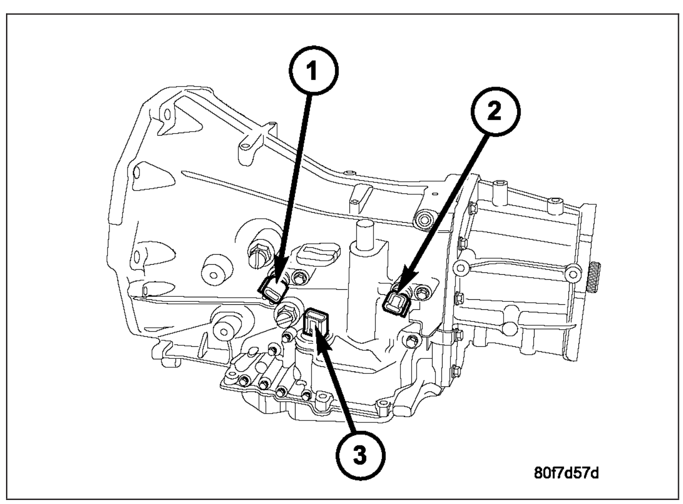


## INSTALLATION

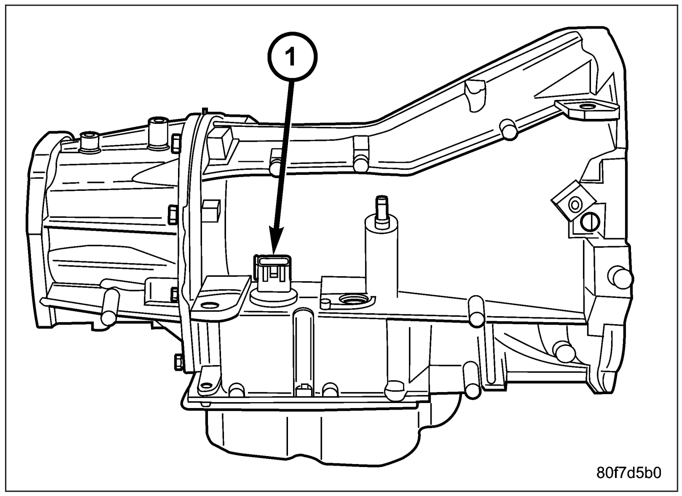
1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free of any debris. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.
4. Align converter and oil pump.
5. Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.



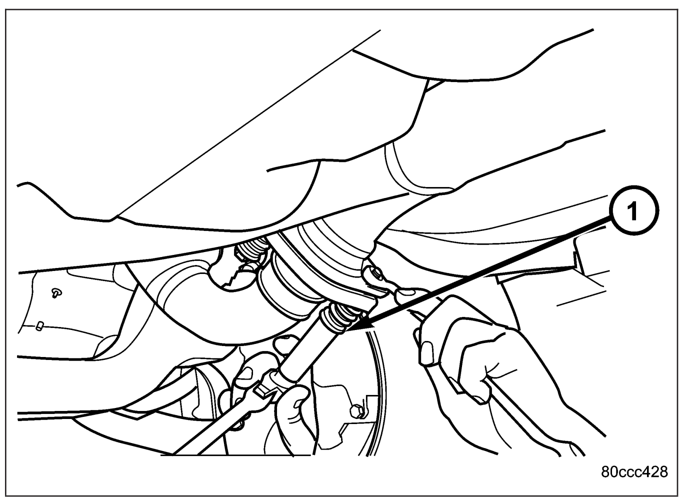
6. Check converter seating with steel scale (1) and straightedge (2). Surface of converter lugs should be at least 13mm (1/2 in.) to rear of straightedge when converter is fully seated.
7. Temporarily secure converter with C-clamp.
8. Position transmission on jack and secure it with chains.
9. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
10. Apply a light coating of MOPAR® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
11. Raise transmission and align the torque converter with the drive plate and transmission converter housing with the engine block.
12. Move transmission forward. Then raise, lower or tilt transmission to align the converter housing with engine block dowels.



13. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
14. Install two bolts to attach the transmission to the engine.
15. Install remaining torque converter housing to engine bolts. Tighten to 68 N·m (50 ft.lbs.).
16. Install transfer case, if equipped. Tighten transfer case nuts to 35 N·m (26 ft.lbs.).
17. Install rear transmission crossmember. Tighten crossmember to frame bolts to 68 N·m (50 ft.lbs.).
18. Install rear support to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).
19. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts to 47 N·m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N·m (50 ft.lbs.).
20. Remove engine support fixture.
21. Connect gearshift cable to support bracket and transmission manual lever.
22. Connect input (1) and output speed sensor (3) wires.
23. Connect wires to the transmission range sensor (3).
24. Connect wires to the solenoid/pressure switch assembly (1).



**CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.**



25. Install torque converter-to-driveplate bolts. Tighten bolts to 88 N·m (65 in. lbs.).
26. Install starter motor and cooler line bracket.
27. Connect cooler lines to transmission.
28. Install transmission fill tube.
29. Install exhaust components (1).

30. Align and connect propeller shaft(s).
31. Adjust gearshift cable if necessary.
32. Install any skid plates removed previously (1). (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)
33. Lower vehicle.
34. Fill transmission with Mopar® ATF +4, Automatic Transmission Fluid.

# SPECIFICATIONS

## 42RLE AUTOMATIC TRANSMISSION

### GENERAL SPECIFICATIONS

| | |
|---|---|
| Transmission Type | Four-Speed Automatic, Electronically Controlled, Fully Adaptive, Electronically Modulated Torque Converter |
| Lubrication Method | Pump (internal - external gear-type) |
| Cooling Method | Water Heat Exchanger and/or Air-to-Oil Heat Exchanger |

### GEAR RATIOS

| | |
|---|---|
| 1st Gear | 2.84:1 |
| 2nd Gear | 1.57:1 |
| 3rd Gear (Direct) | 1.00:1 |
| 4th Gear (Overdrive) | 0.69:1 |
| Reverse Gear | 2.21:1 |

### BEARING PRELOAD (Drag Torque)

| Description | Metric | Standard |
|---|---|---|
| Output Shaft | 0.22-0.903 N·m | 1-8 in. lbs. |

### CLUTCH PACK

| Description | Metric | Standard |
|---|---|---|
| Low/Reverse Clutch (Select Reaction Plate) | 0.84-1.60 mm | 0.033-0.063 in. |
| Two/Four Clutch (No Select) | 0.76-2.64 mm | 0.030-0.104 in. |
| Reverse Clutch (Select Snap Ring) | 0.89-1.37 mm | 0.035-0.054 in. |
| Overdrive Clutch (No Select) | 1.07-3.25 mm | 0.042-0.128 in. |
| Underdrive Clutch (Select Reaction Plate) | 0.94-1.50 mm | 0.037-0.059 in. |

### INPUT SHAFT

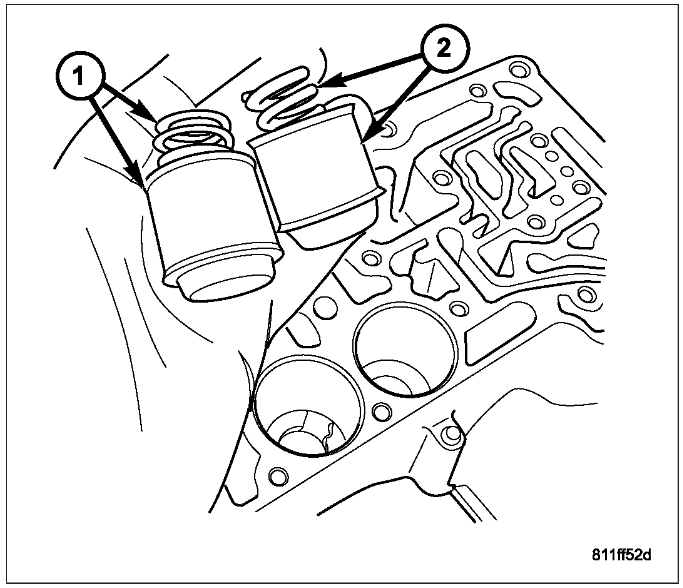
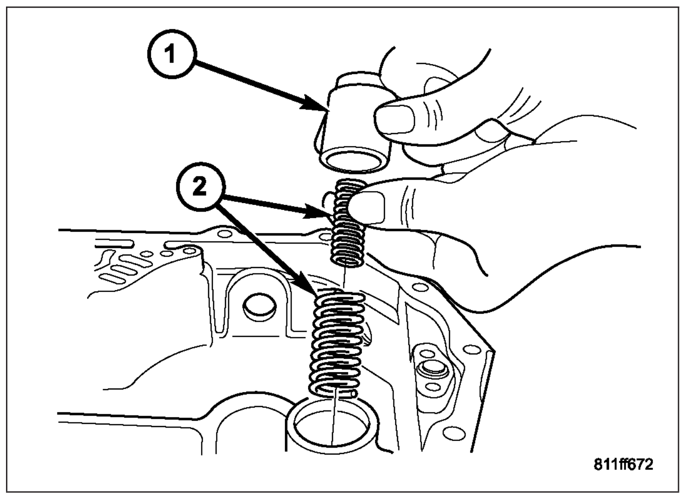
# ACCUMULATOR

## DESCRIPTION

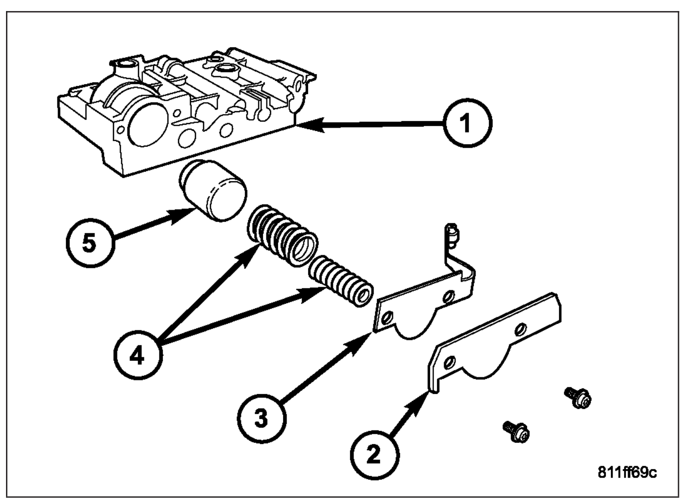
The 42RLE underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston, return spring(s), and a cover or plug. The overdrive (1) and underdrive (2) accumulators are located within the transmission case, and are retained by the valve body.



The low reverse (1) accumulator is also located within the transmission case, but the assembly is retained by a cover and a snap-ring.



The 2/4 accumulator (5) is located in the valve body. It is retained by a cover and retaining screws.



## OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and springs. The intended result is a smooth, firm clutch application.

# ADAPTER HOUSING SEAL

## REMOVAL

1. Remove the transfer case (Refer to 21 - TRANSMISSION/TRANSFER CASE - REMOVAL).
2. Using a screw mounted in a slide hammer, remove the adapter housing seal.

## INSTALLATION

1. Install a new adapter housing seal with Universal Handle C-4171 and Seal Installer C-3860-A.
2. Install the transfer case (Refer to 21 - TRANSMISSION/TRANSFER CASE - INSTALLATION).

# BEARINGS

## ADJUSTMENTS

### BEARING ADJUSTMENT PROCEDURES

Take extreme care when removing and installing bearing cups and cones. **Use only an arbor press for installation,** as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat will give a false end play reading, while gauging for proper shims. Improperly seated bearing cup and cones are subject to low-mileage failure.

Bearing cups and cones should be replaced if they show signs of pitting or heat distress.

If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.

**NOTE: Bearing drag torque specifications must be maintained to avoid premature bearing failures.**

Used (original) bearing may lose up to 50 percent of the original drag torque after break-in.

**NOTE: All bearing adjustments must be made with no other component interference or gear inter-mesh.**

Oil all bearings before checking turning torque.

# BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM

## DESCRIPTION

The Brake Transmission Shift Interlock System (BTSI), consists of a Park-Interlock cable and a solenoid mounted in the shift lever assembly. The Park-Interlock cable connects the automatic transmission floor mounted shifter to the steering column ignition switch.

## OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in the shift lever assembly is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

## DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM

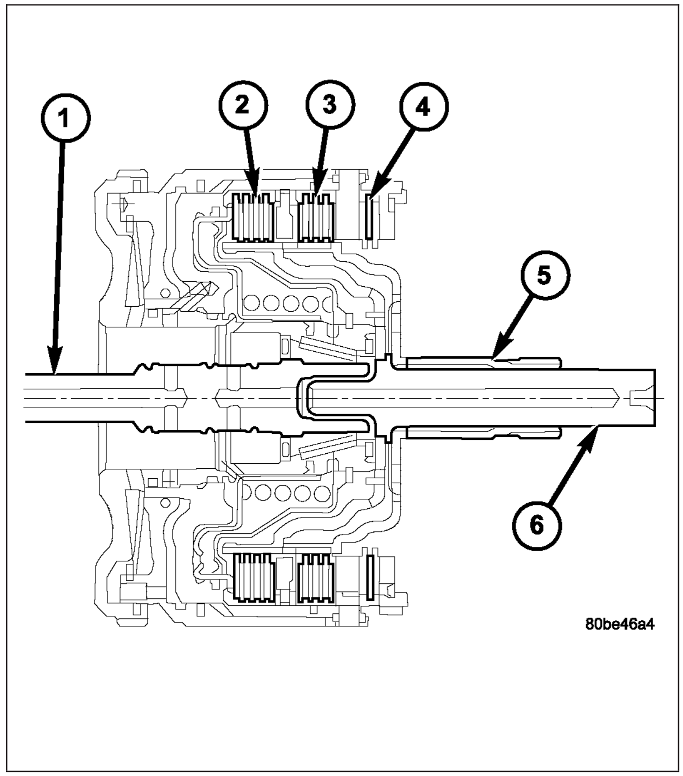
1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK And the shift handle pushbutton is in the “OUT” position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
4. Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

# DRIVING CLUTCHES

## DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive (2), overdrive (3), and reverse (4) clutches are considered input/driving clutches and are contained within the input clutch assembly. The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub



## OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

**NOTE: (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING) for a collective view of which clutch elements are applied at each position of the selector lever.**

### UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

### OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

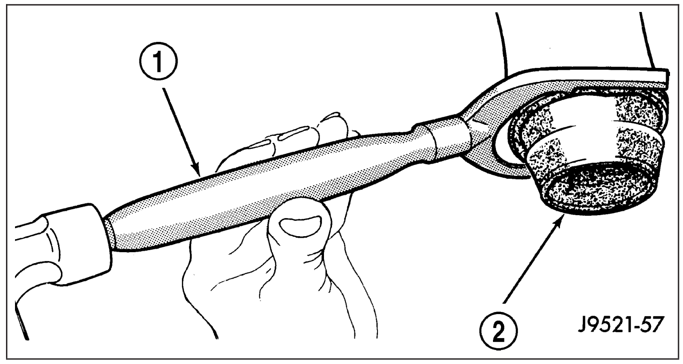
### REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

# EXTENSION HOUSING SEAL

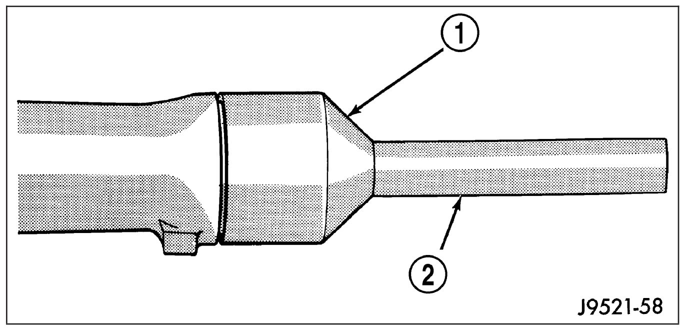
## REMOVAL

1. Raise vehicle.
2. Mark propeller shaft and axle yoke, or companion flange, for alignment reference.
3. Disconnect and remove propeller shaft.
4. Remove old seal with a generic seal remover (1) from overdrive extension housing.



## INSTALLATION

1. Place seal in position on overdrive housing.
2. Drive seal into overdrive housing with Seal Installer C-3995-A (1).
3. Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.



# FLUID AND FILTER

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

1. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
2. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

## EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

## FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

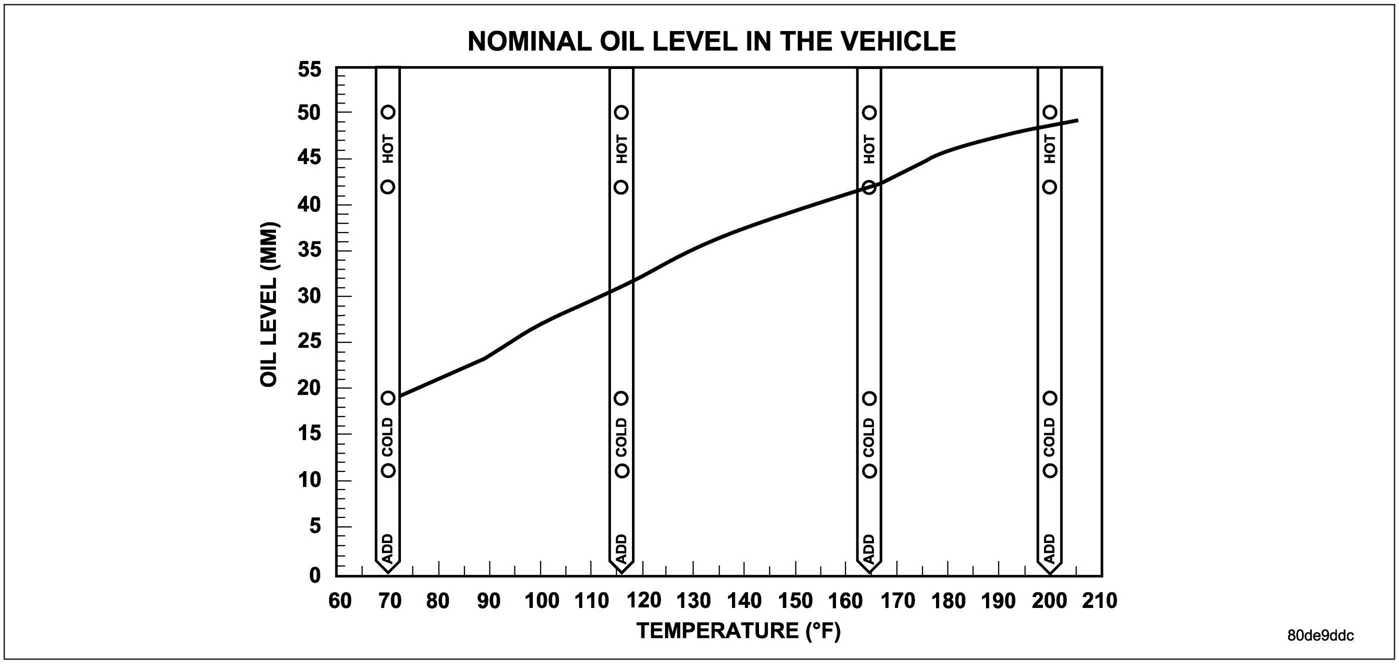
## STANDARD PROCEDURE

## FLUID LEVEL CHECK

The transmission sump has a dipstick to check oil similar to most automatic transmissions. It is located on the left side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the PARK and NEUTRAL positions. Place the selector lever in PARK to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82° C or 180° F), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level should be in COLD region at 21° C (70° F) fluid temperature. Adjust fluid level as necessary. Use only Mopar® ATF+4, Automatic Transmission Fluid.

## FLUID LEVEL CHECK USING SCAN TOOL



**NOTE: Engine and Transmission should be at normal operating temperature before performing this procedure.**

1. Start engine and apply parking brake.
2. Connect scan tool and select transmission.
3. Select sensors.
4. Read the transmission temperature value.
5. Compare the fluid temperature value with the chart.
6. Adjust transmission fluid level shown on the dipstick according to the 42RLE Fluid Temperature Chart. Use only Mopar® ATF+4, Automatic Transmission Fluid.
7. Check transmission for leaks.

## FLUID/FILTER SERVICE

**NOTE: Only fluids of the type labeled Mopar® ATF+4, Automatic Transmission Fluid, should be used in the transmission sump. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.**

**NOTE: If the transmission is disassembled for any reason, the fluid and filter should be changed.**

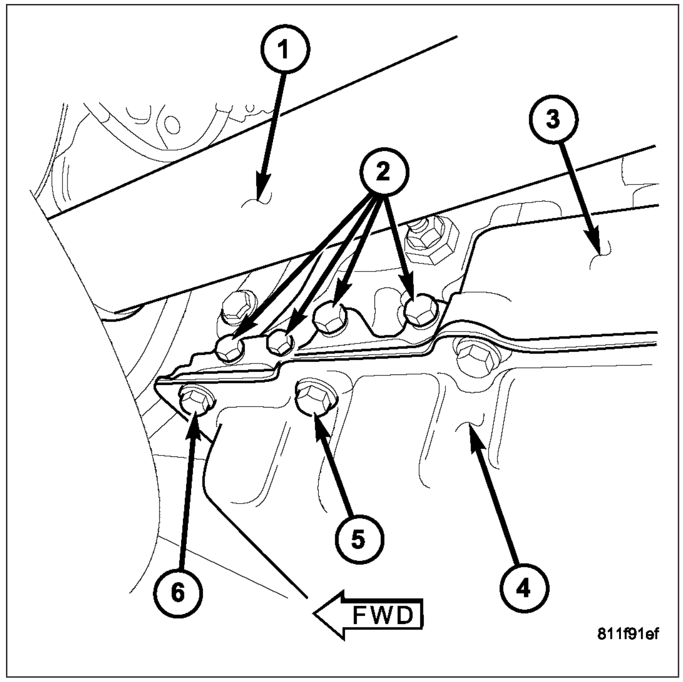
1. Raise vehicle on a hoist. Place a drain container with a large opening, under transmission oil pan.

**NOTE: One of the oil pan bolts (5) has a sealing patch applied from the factory. Separate this bolt for reuse.**

2. Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.
3. Install a new filter and o-ring on bottom of the valve body and tighten retaining screws to 5 N·m (45 in. lbs.).

**NOTE: Before installing the oil pan bolt (5) in the bolt hole located between the torque converter clutch on and U/D clutch pressure tap circuits, it will be necessary to replentish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.**

4. Clean the oil pan and magnet. Reinstall pan using new Mopar® Silicone Adhesive sealant. Tighten oil pan bolts to 20 N·m (14.5 ft. lbs.).
5. Pour four quarts of Mopar® ATF+4, Automatic Transmission Fluid, through the dipstick opening.



6. Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.
7. Check the transmission fluid level and add an appropriate amount to bring the transmission fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick.
8. Recheck the fluid level after the transmission has reached normal operating temperature, 82° C (180°F).
9. To prevent dirt from entering transmission, make certain that dipstick is fully seated into the dipstick opening.

## STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® ATF +4, Automatic Transmission Fluid, to transmission:
   a. If only fluid and filter were changed, add **6 pints (3 quarts)** of ATF +4 to transmission.
   b. If transmission was completely overhauled, or torque converter was replaced or drained, add **10 pints (5 quarts)** of ATF +4 to transmission.
3. Apply parking brakes.
4. Start and run engine at normal curb idle speed.
5. Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.
6. Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.
7. Drive vehicle until transmission fluid is at normal operating temperature.
8. With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

**CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.**

9. Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

# GEARSHIFT CABLE

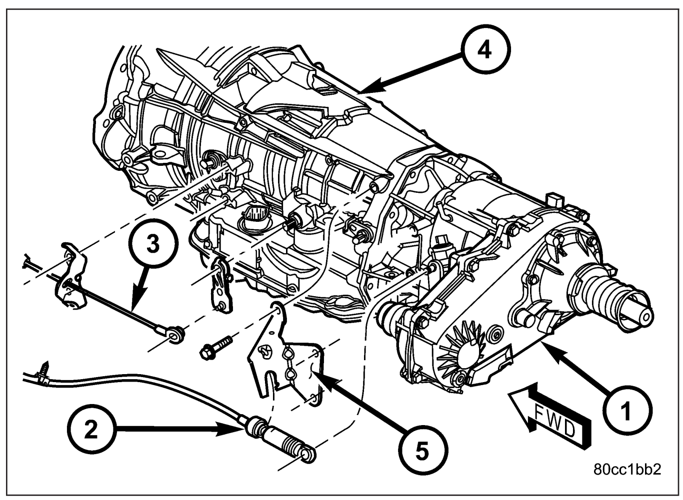
## DIAGNOSIS AND TESTING

## GEARSHIFT CABLE

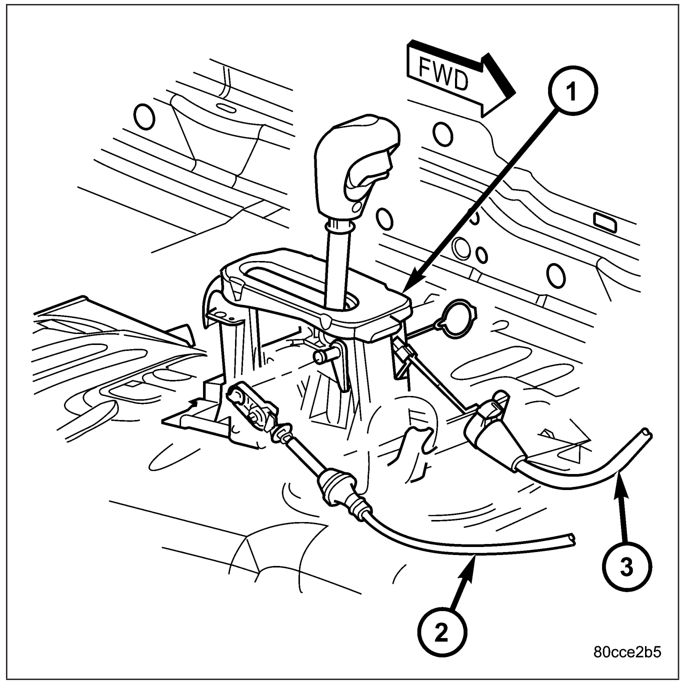
1. The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.
2. Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.
3. With floor shift lever handle push-button not depressed and lever in:
   a. PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.
   b. PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.
   c. NEUTRAL position - Normal position. Engine starts must be possible.
   d. NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

## REMOVAL

1. Shift transmission into PARK.
2. Raise vehicle.
3. Remove the shift cable eyelet from the transmission manual shift lever.
4. Remove shift cable from the cable support bracket.
5. Lower vehicle.
6. Remove necessary console parts for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
7. Disconnect cable at shift lever and shifter assembly bracket.
8. Remove the nuts holding the shift cable seal plate to the floor pan.

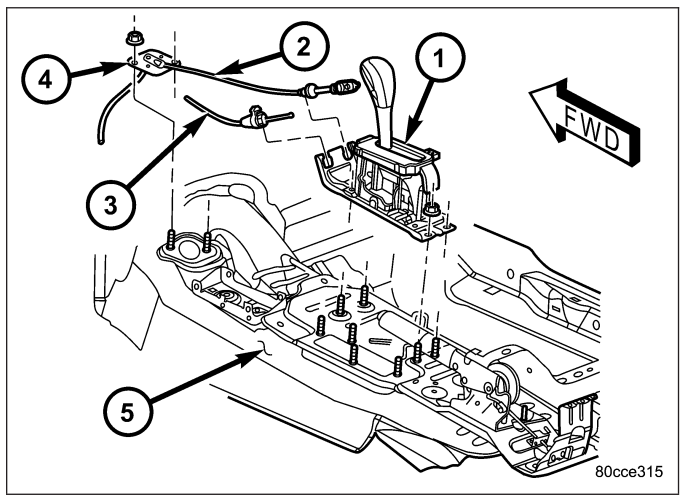


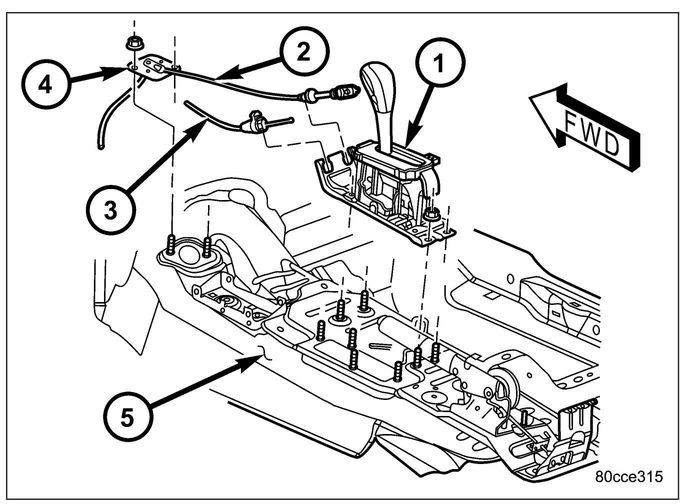
9. Pull cable through floor panel opening.
10. Remove shift cable from vehicle.



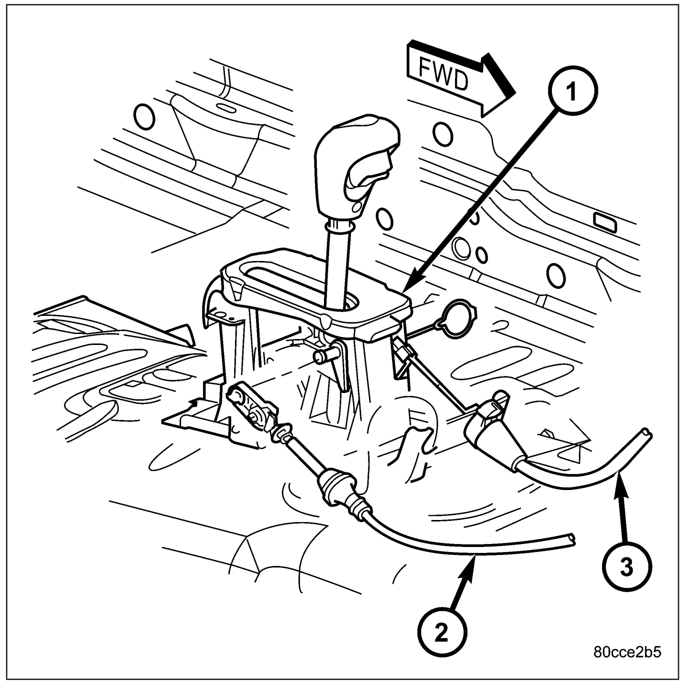
## INSTALLATION

1. Route cable through hole in floor pan.
2. Install seal plate to studs in floor pan.
3. Install nuts to hold seal plate to floor pan. Tighten nuts to 7 N·m (65 in.lbs.).
4. Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
5. Place the floor shifter lever in PARK position.
6. Loosen the adjustment screw on the shift cable.
7. Snap the shift cable onto the shift lever pin.





8. Raise the vehicle.
9. Install the shift cable to the shift cable support bracket.
10. Shift the transmission into PARK. PARK is the rearmost detent position on the transmission manual shift lever.
11. Snap the shift cable onto the transmission manual shift lever.
12. Lower vehicle.
13. Verify that the shift lever is in the PARK position.
14. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
15. Verify correct shifter operation.
16. Install any console parts removed for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

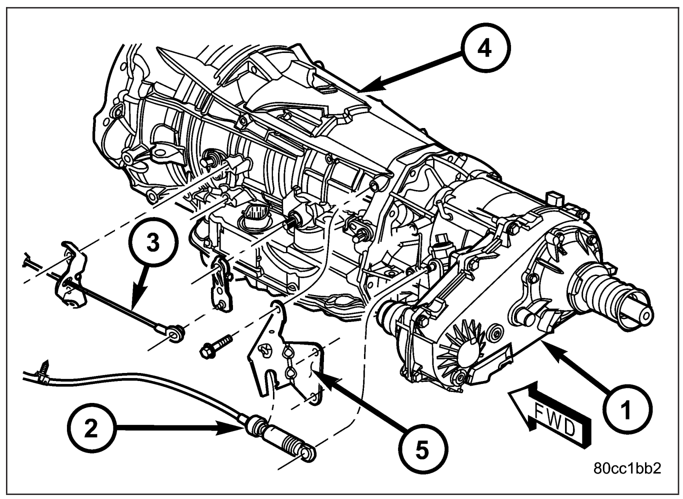


## ADJUSTMENTS - GEARSHIFT CABLE

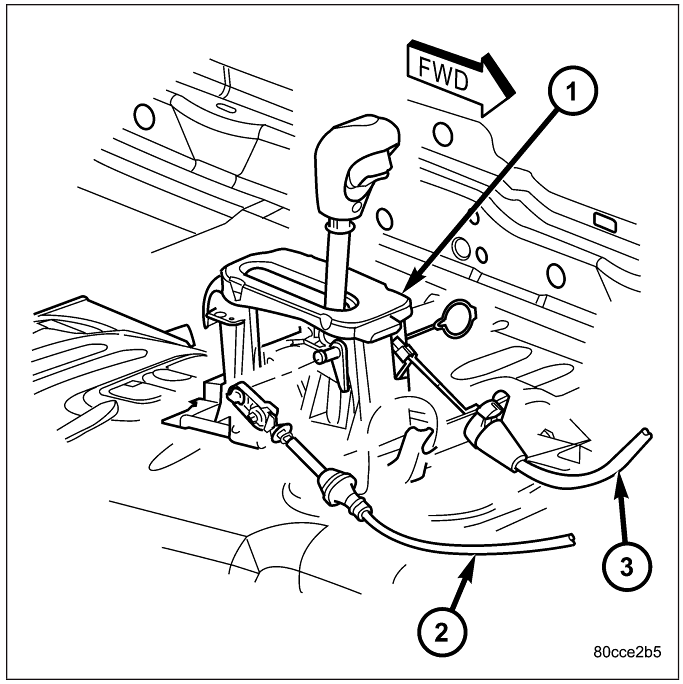
Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the TRS may be faulty.

### Gearshift Adjustment Procedure

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
3. Loosen the shift cable adjustment screw.



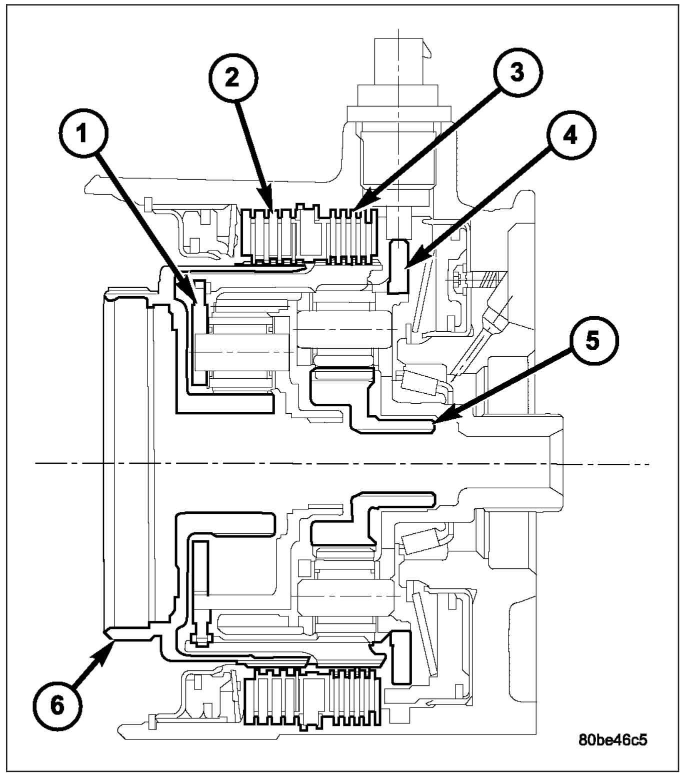
4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.
9. Lower vehicle
10. Tighten the shift cable adjustment screw to 7 N·m (65 in.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)



# HOLDING CLUTCHES

## DESCRIPTION

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 (2) and Low/Reverse (3) clutches are considered holding clutches and are contained at the rear of the transmission case.



## OPERATION

**NOTE: (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING) for a collective view of which clutch elements are applied at each position of the selector lever.**

### 2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transmission case.

### LOW/REVERSE CLUTCH

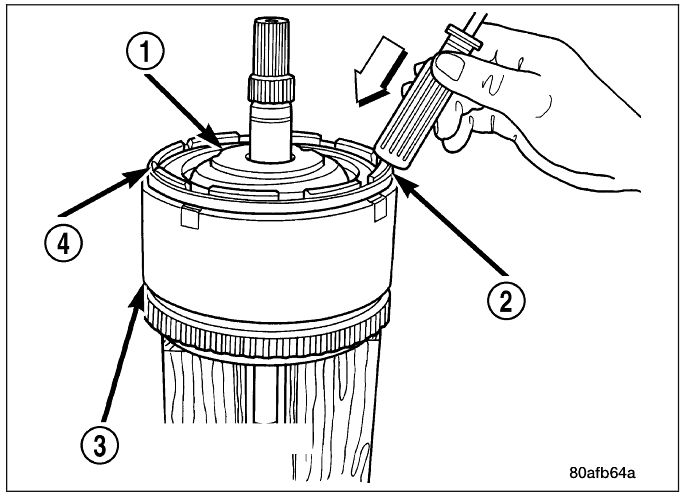
The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transmission case.

# INPUT CLUTCH ASSEMBLY

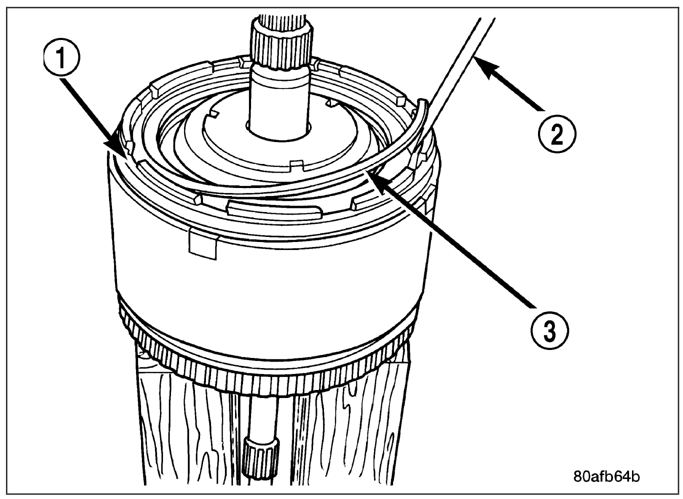
## DISASSEMBLY

**NOTE: If the input clutch assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).**

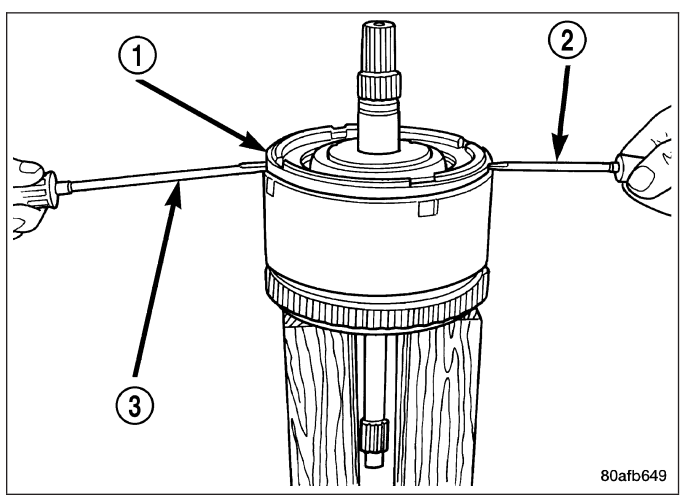
1. Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).
2. Tap down (2) reverse clutch reaction plate (4) to release pressure from snap ring.



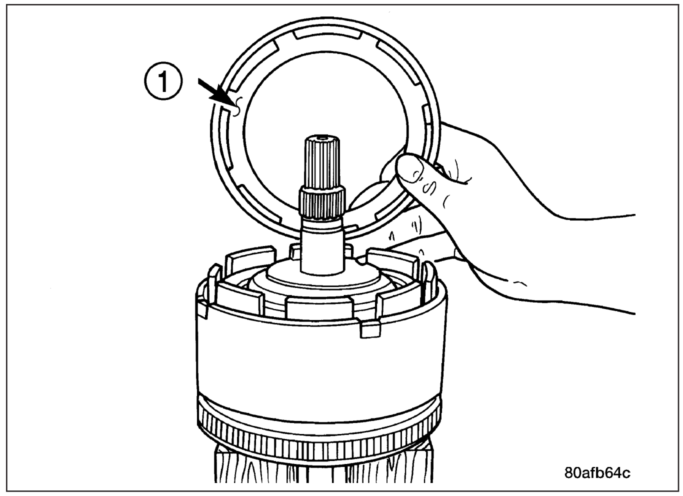
3. Remove reverse clutch snap ring (3).



4. Pry up reverse clutch reaction plate (1).

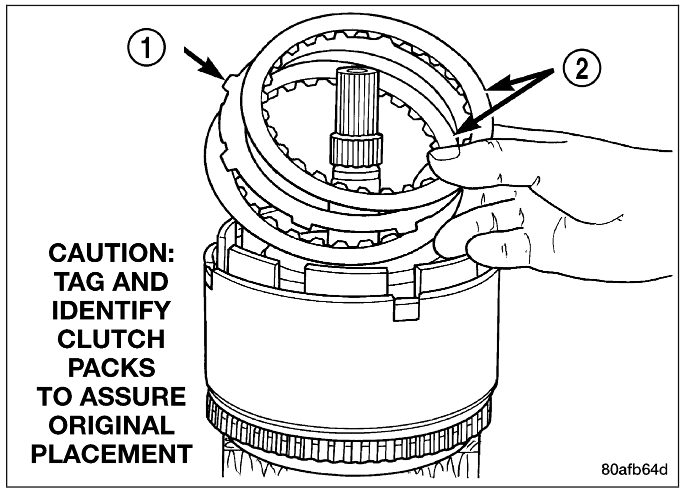


5. Remove reverse clutch reaction plate (1).

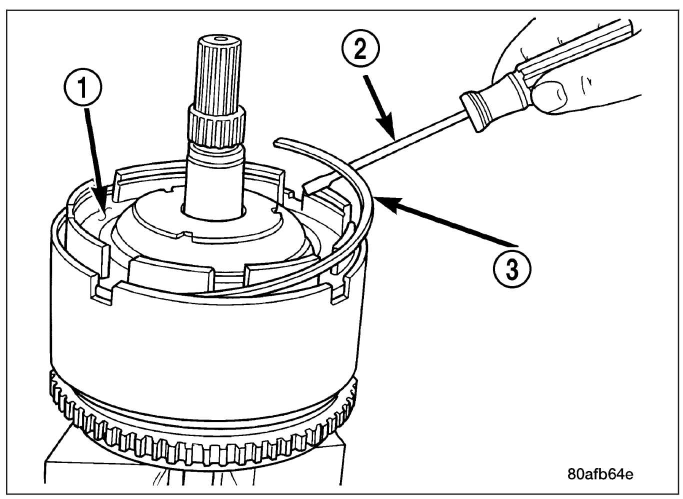


**NOTE: Tag reverse clutch pack for reassembly identification.**

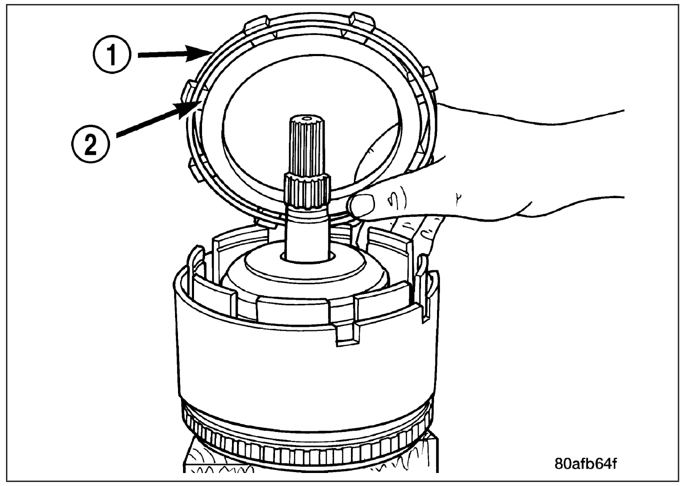
6. Remove the reverse clutch pack (two fibers/one steel) (1, 2).



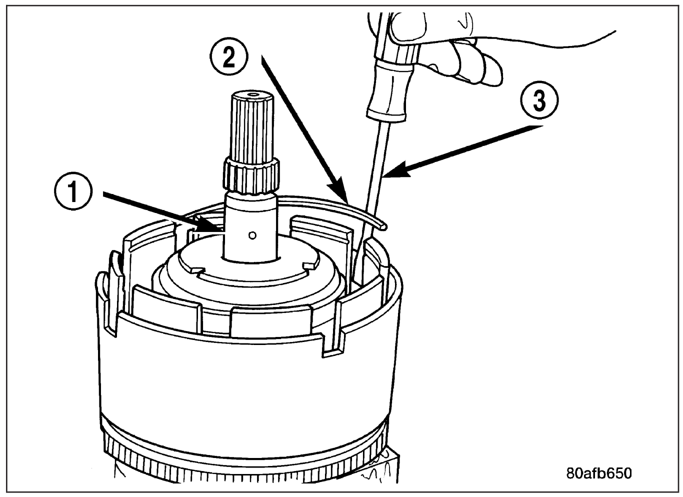
7. Remove the OD/Reverse reaction plate (1) snap ring (3).



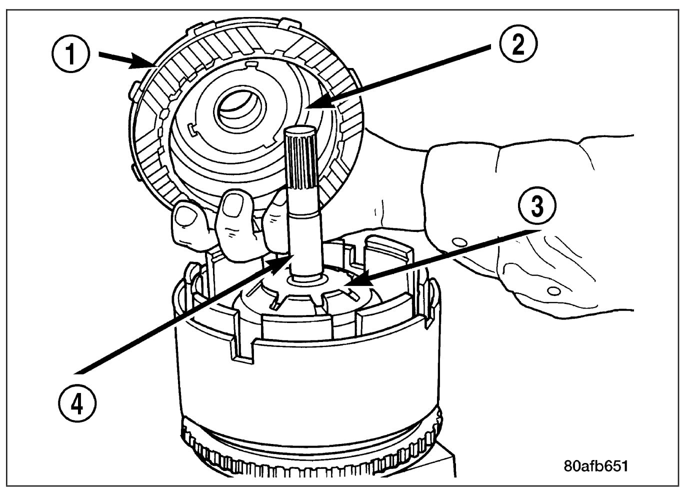
8. Remove OD/Reverse pressure plate (1).



9. Remove OD/Reverse reaction plate wave snap ring (2).

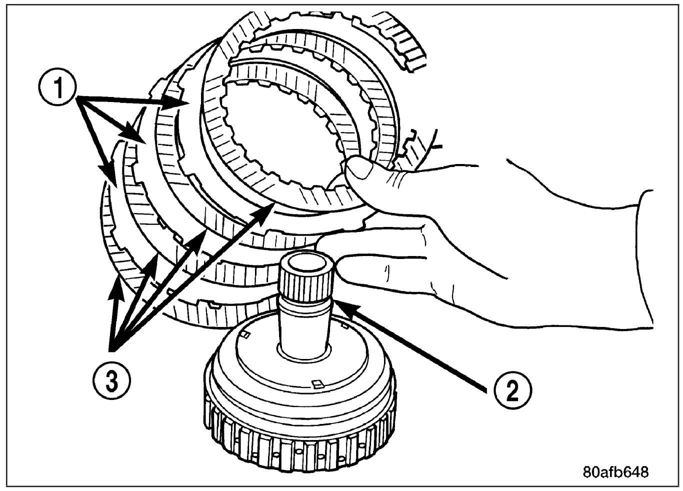


10. Remove OD shaft/hub and OD clutch pack (1).

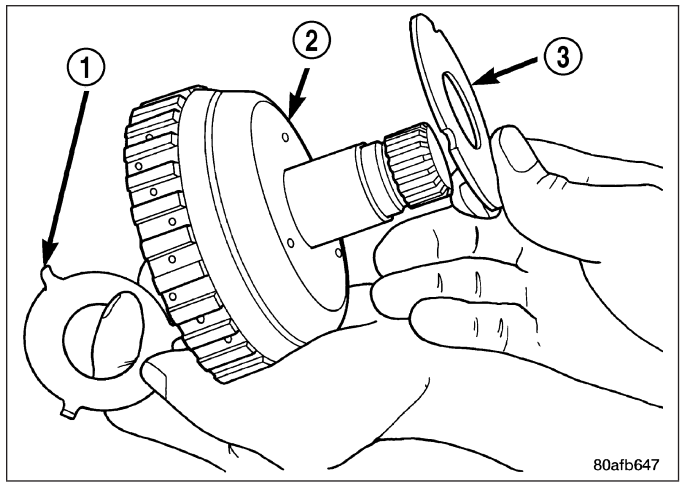


**NOTE: Tag overdrive clutch pack for reassembly identification.**

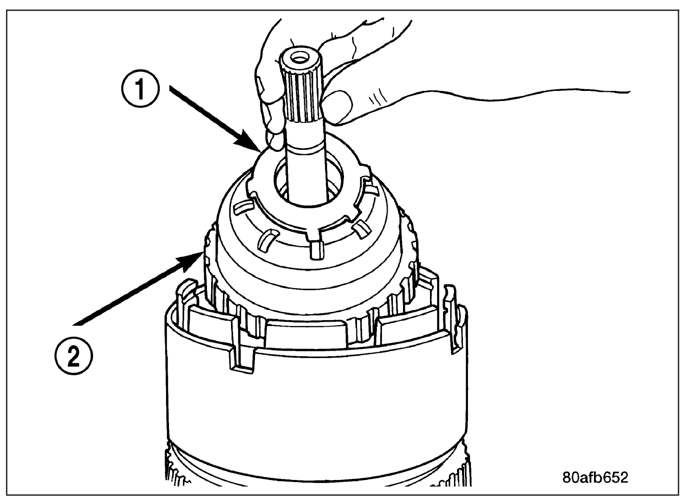
11. Remove the overdrive clutch (1, 3) from the overdrive hub/shaft (2).



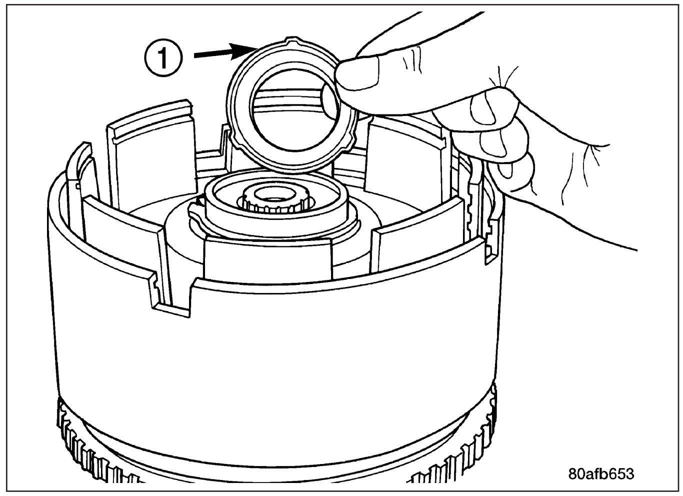
12. Remove and inspect number 3 and 4 thrust plates (1, 3).



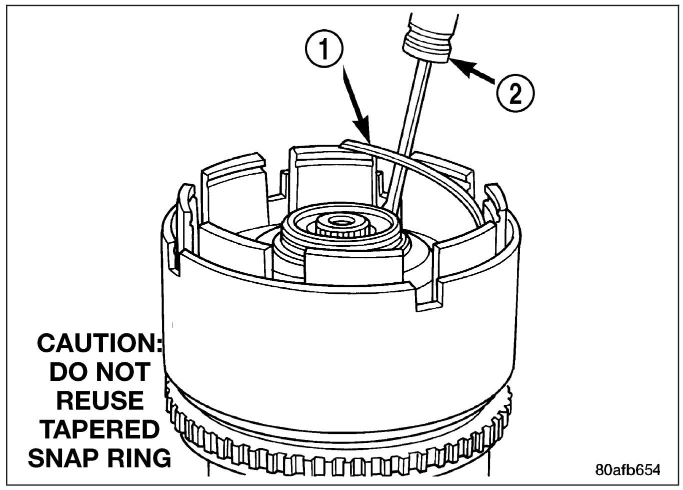
13. Remove the underdrive shaft assembly (2).



14. Remove the number 2 needle bearing (1).

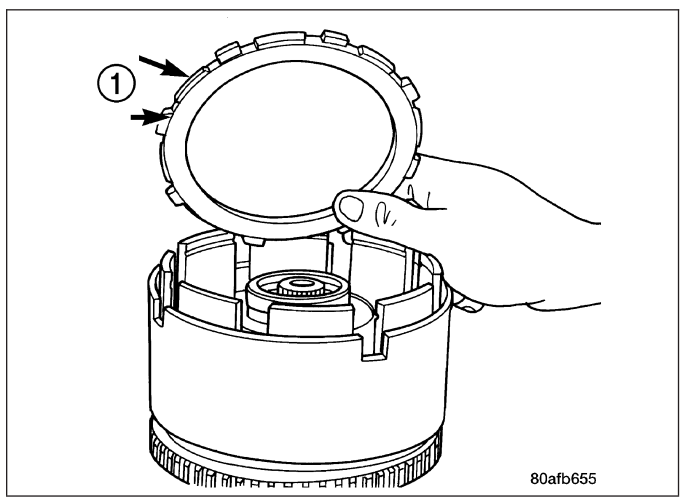


15. Remove the OD/UD reaction plate tapered snap ring (1).

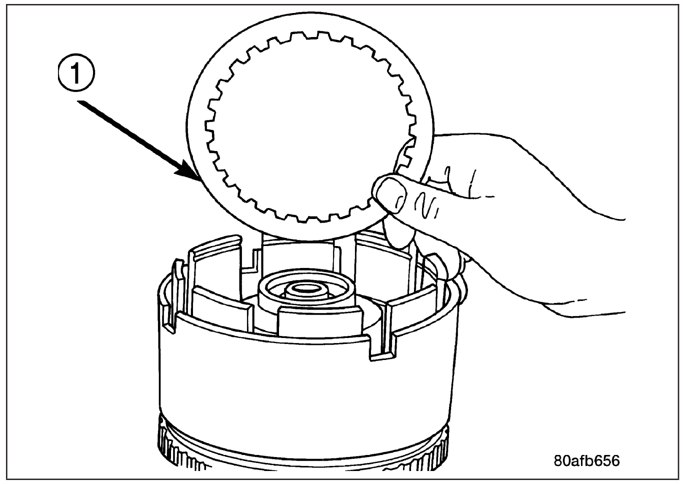


**NOTE: The OD/UD clutch reaction plate has a step on both sides. The OD/UD clutches reaction plate goes tapered step side up.**

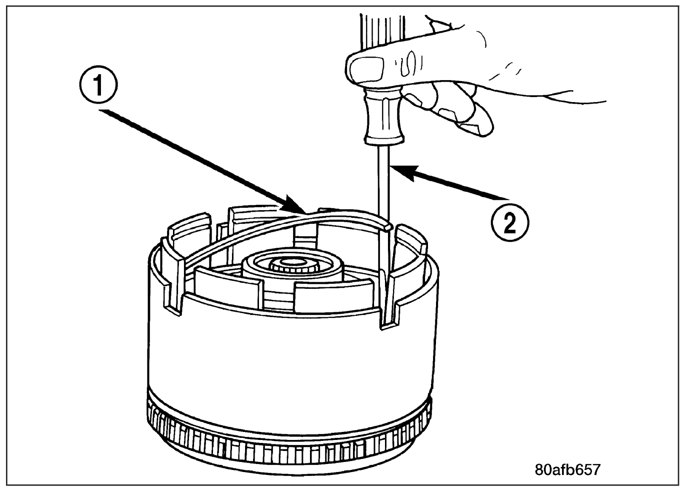
16. Remove the OD/UD reaction plate (1).



17. Remove the first UD clutch disc (1).

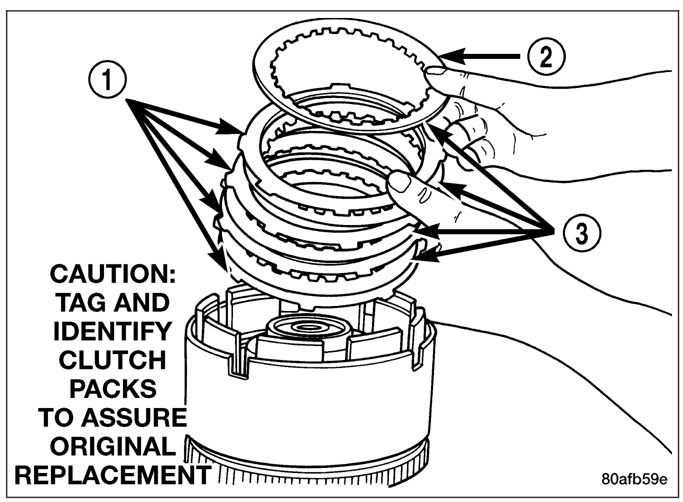


18. Remove the UD clutch flat snap ring (1).



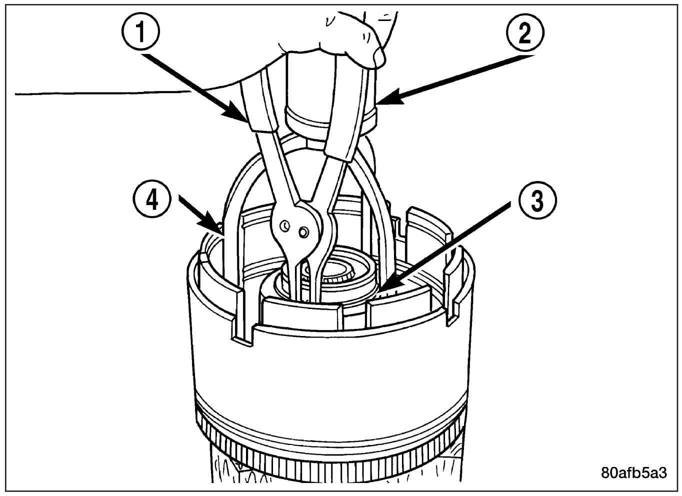
**NOTE: Tag underdrive clutch pack for reassembly identification.**

19. Remove the UD clutch pack (1, 3).



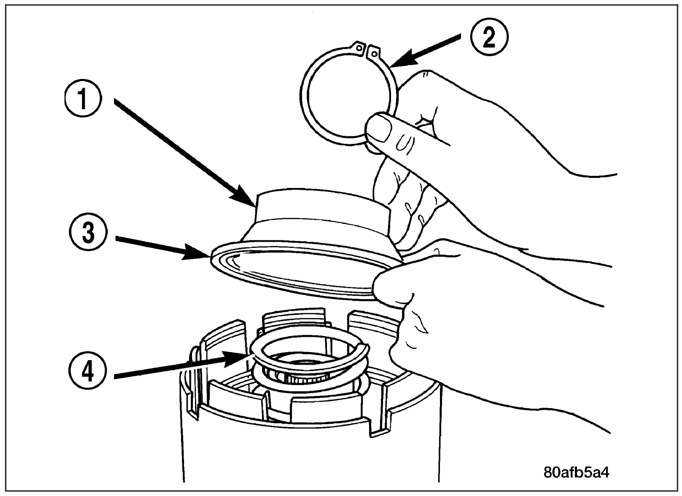
**CAUTION: Compress return spring just enough to remove or install snap ring.**

20. Using Compressor 5059A (4) and an arbor press (2), compress UD clutch piston enough to remove snap ring (3).



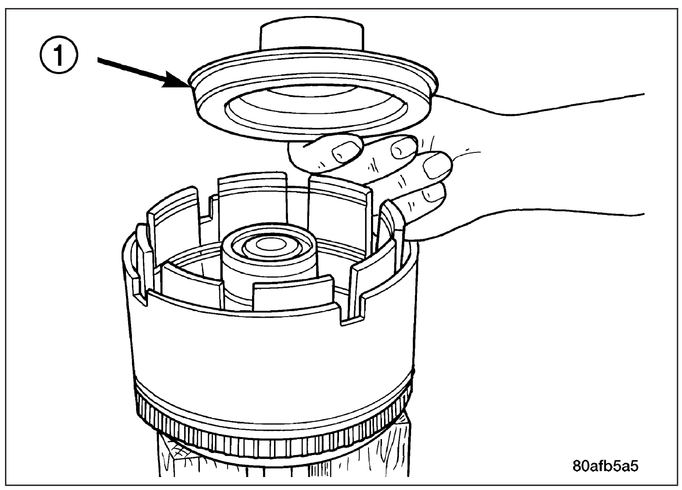
80afb5a3

21. Remove the underdrive spring retainer snap ring (2), spring retainer (1), and spring (4).



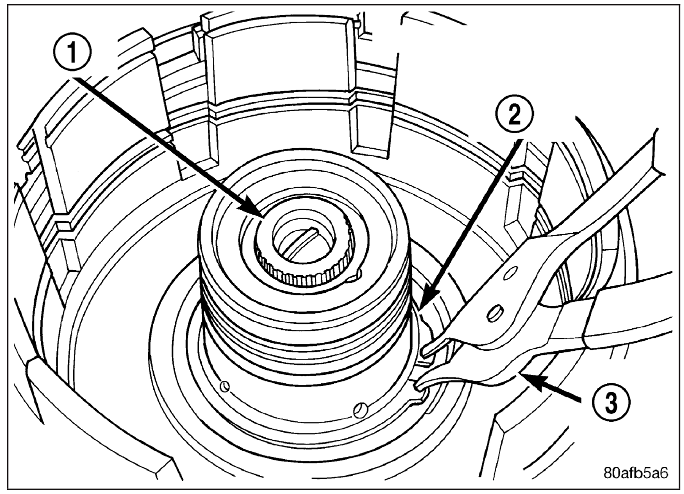
80afb5a4

22. Remove the UD clutch piston (1).

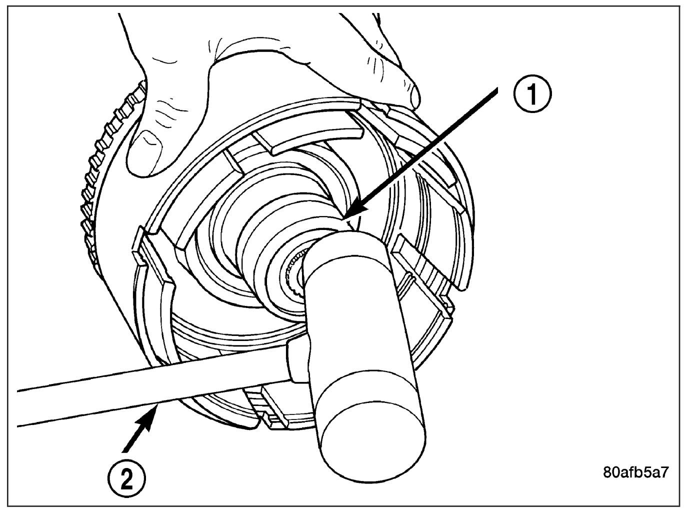


80afb5a5

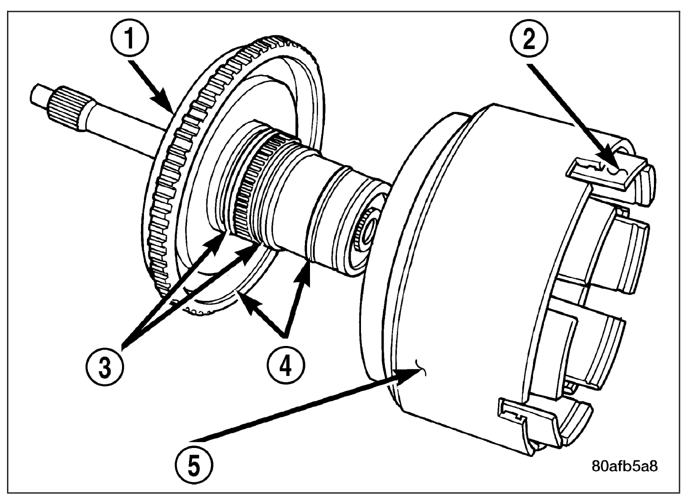
23. Remove the input hub tapered snap ring (2).



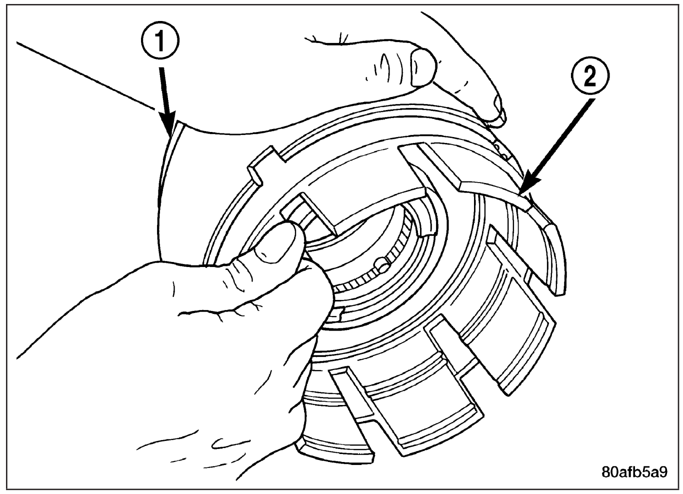
24. Tap on input hub (1) with soft faced hammer (2) and separate input hub from OD/Reverse piston and clutch retainer.



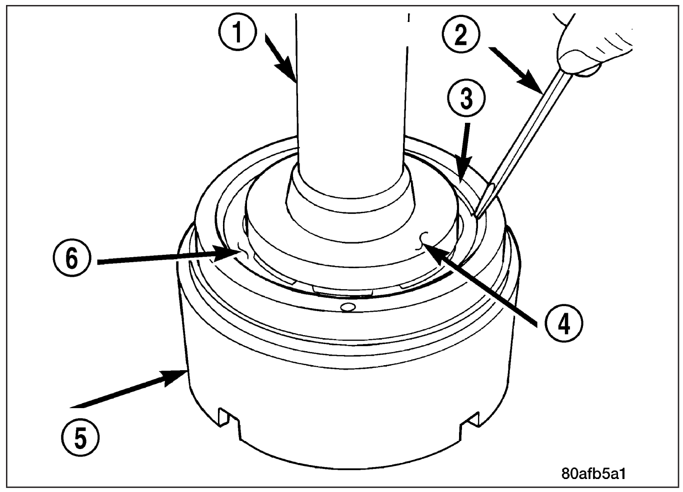
25. Separate the input hub from OD/Reverse piston (5) and clutch retainer (2).



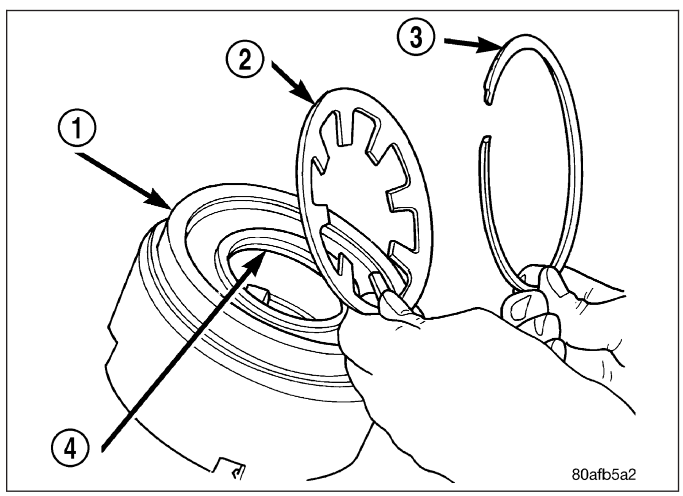
26. Separate clutch retainer (2) from OD/Reverse piston (1).



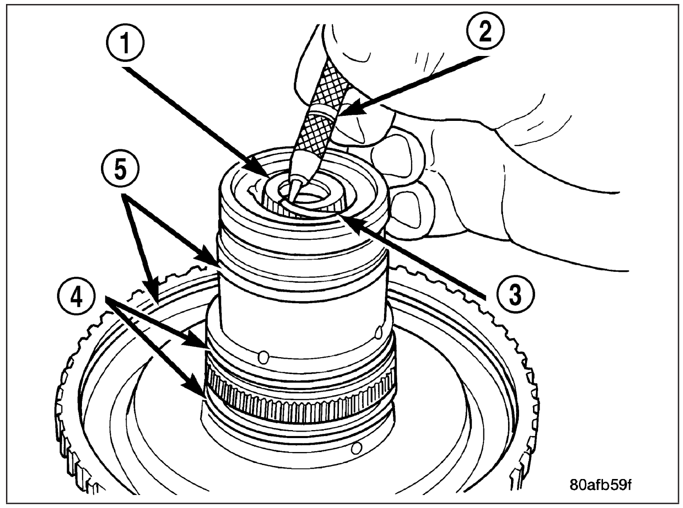
27. Using Disc 6057 (4) and an arbor press (1), compress OD/Reverse piston (5) return spring just enough to remove snap ring (3).



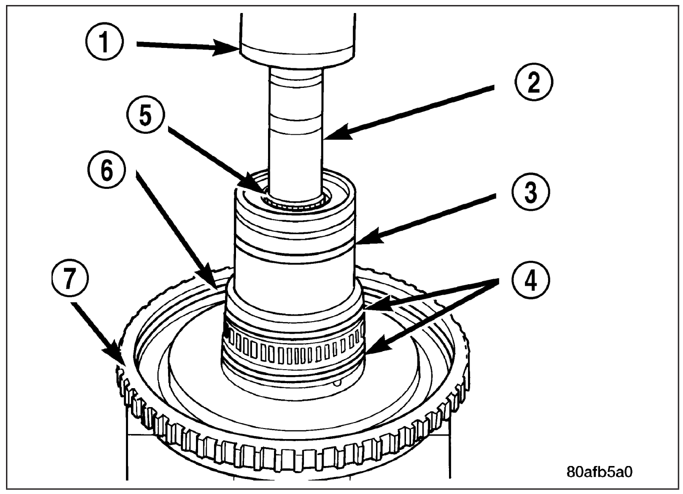
28. Remove the OD/Reverse piston return spring (2) and snap ring (3).



29. Remove input shaft (1) to input clutch hub snap ring (3).



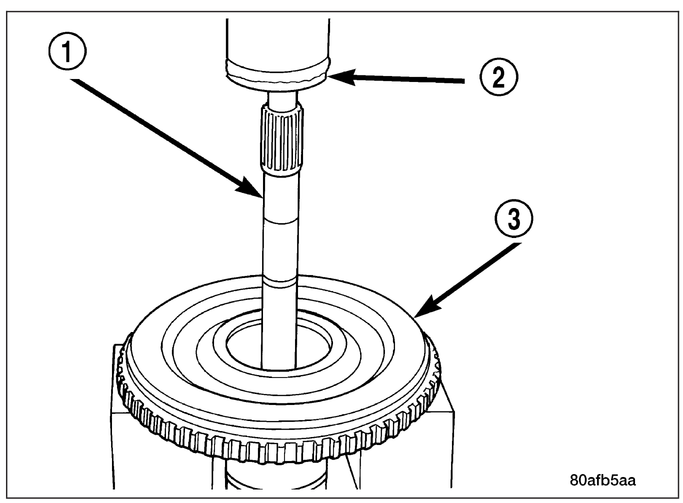
30. Using a suitably sized socket (2) and an arbor press (1), remove input shaft (5) from input shaft hub.



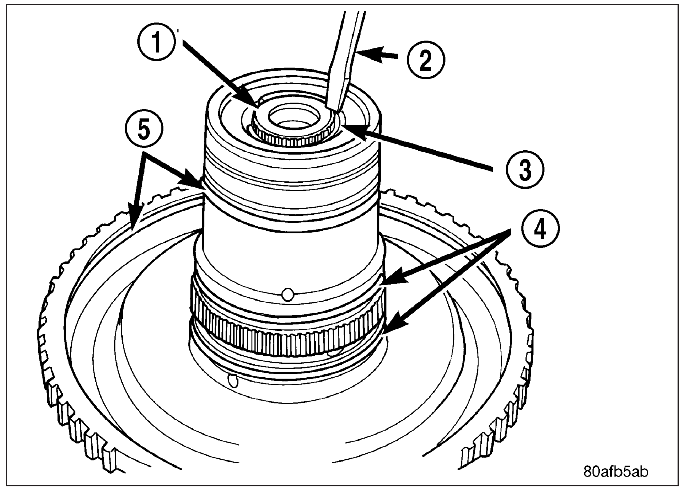
## ASSEMBLY

Use petrolatum on all seals to ease assembly of components.

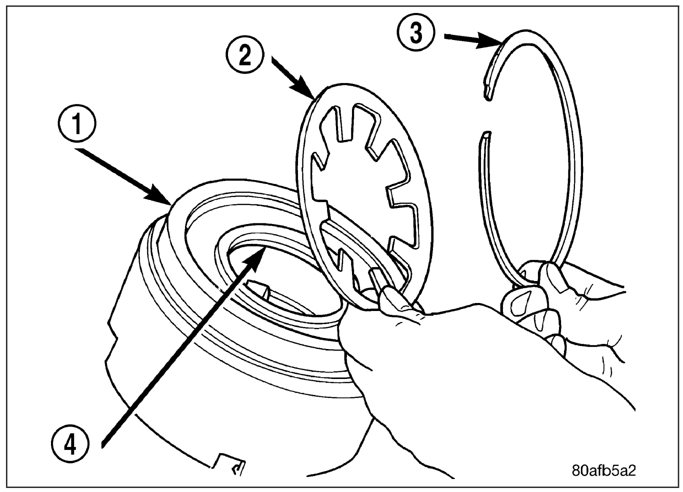
1. Using an arbor press (2), install input shaft (1) to input shaft hub (3).



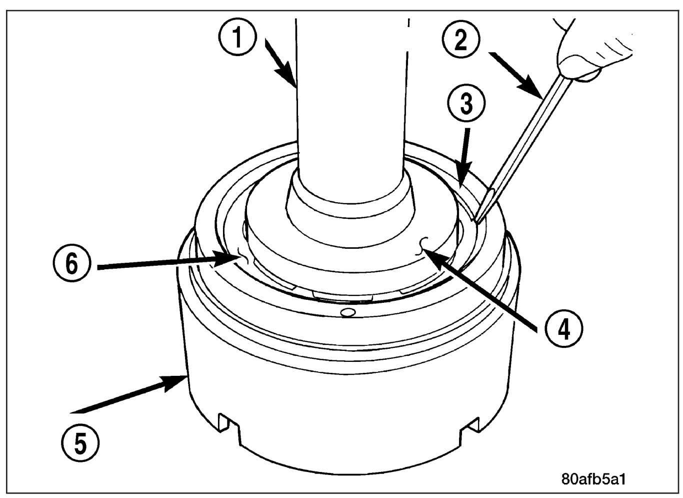
2. Install input shaft snap ring (3).



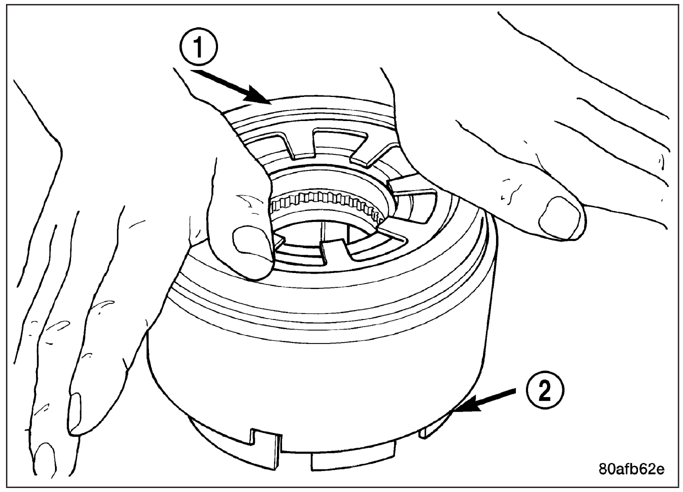
3. Position the OD/Reverse piston return spring (2) and snap ring (3) onto the OD/Reverse piston (1).



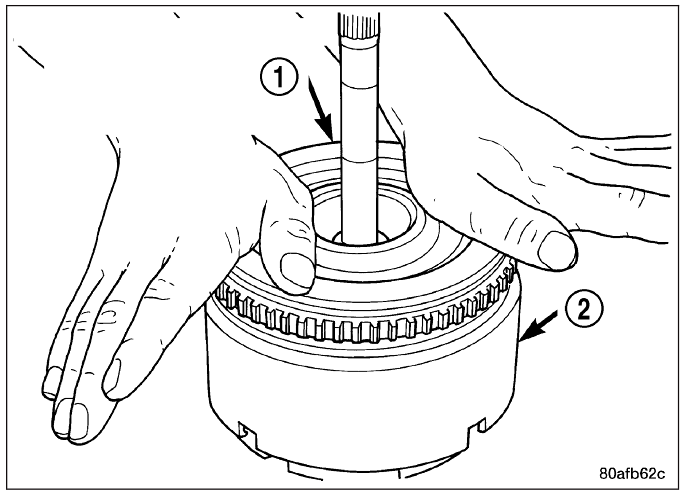
4. Using an arbor press (1) and Disc 6057 (4), install the OD/Reverse piston return spring (6) and snap ring (3).



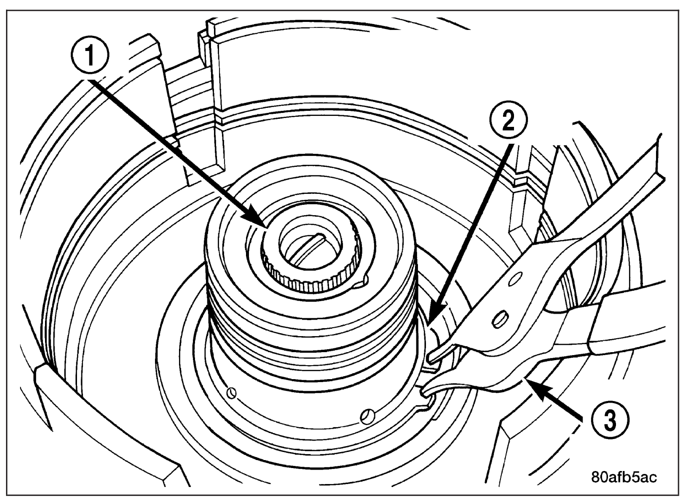
5. Install the OD/Reverse piston (1) assembly to the input clutch retainer (2).



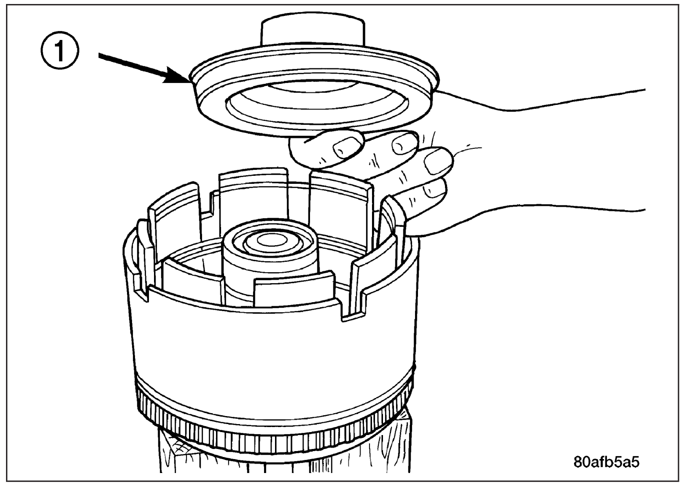
6. Install the input hub/shaft assembly (1) to the OD/Reverse piston/clutch retainer assembly (2).



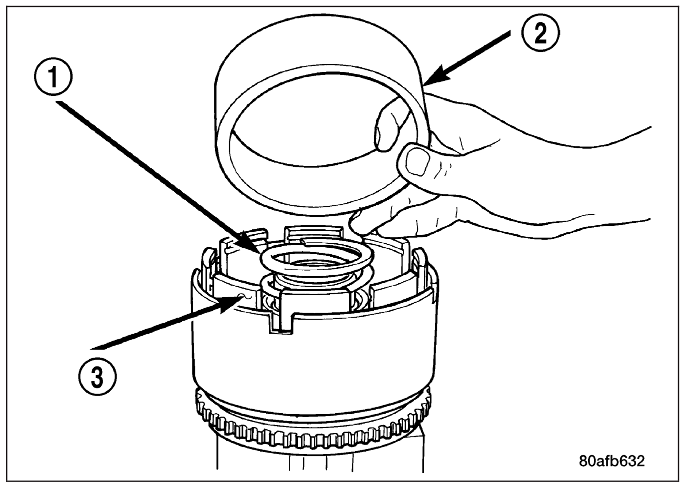
7. Install input hub tapered snap ring (2). **Make sure snap ring is fully seated.**



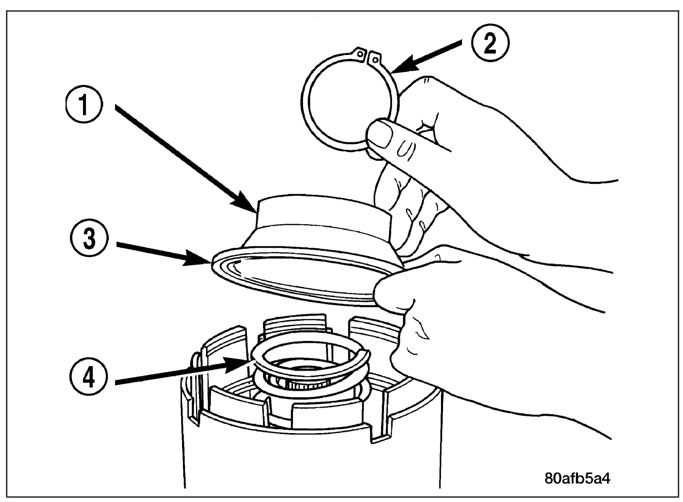
8. Install the UD clutch piston (1).



9. Install UD piston return spring (1) and Disc 5067 (2).

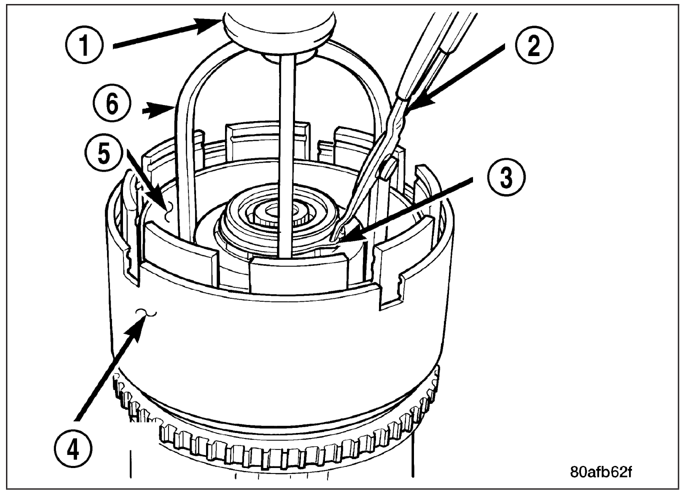


10. Position the UD spring retainer (1) and snap ring (2) on the piston return spring (4).

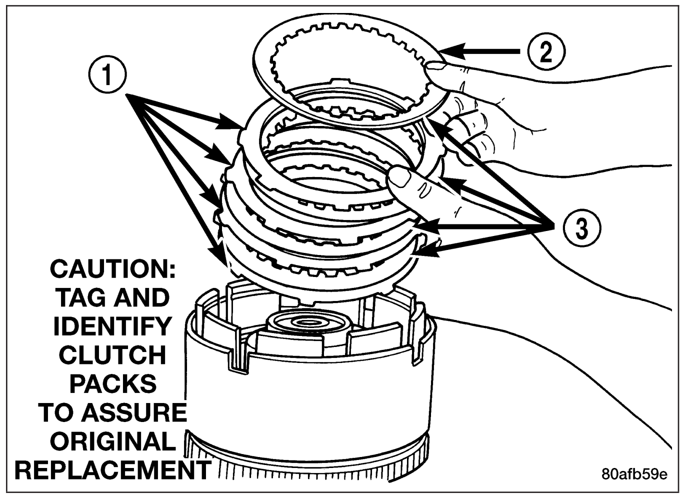


**CAUTION: Compress return spring just enough to install snap ring.**

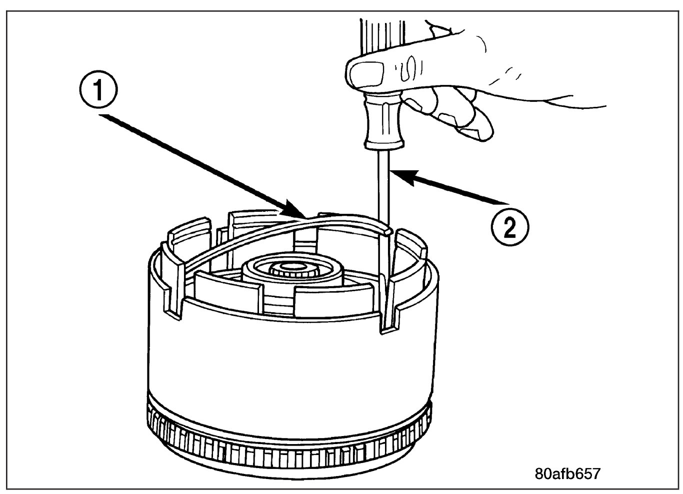
11. Using Compressor 5059A (6) and an arbor press (1), install the UD spring retainer and snap ring (3).



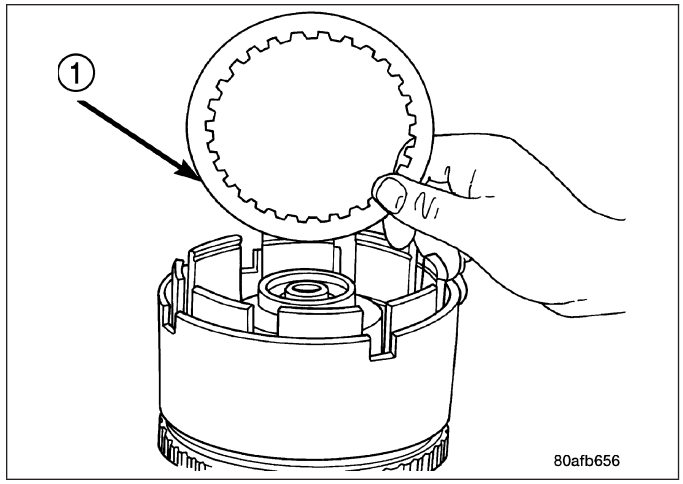
12. Install the UD clutch pack (four fibers/four steels) (1, 3). Leave the top disc (2) out until after the snap ring is installed.



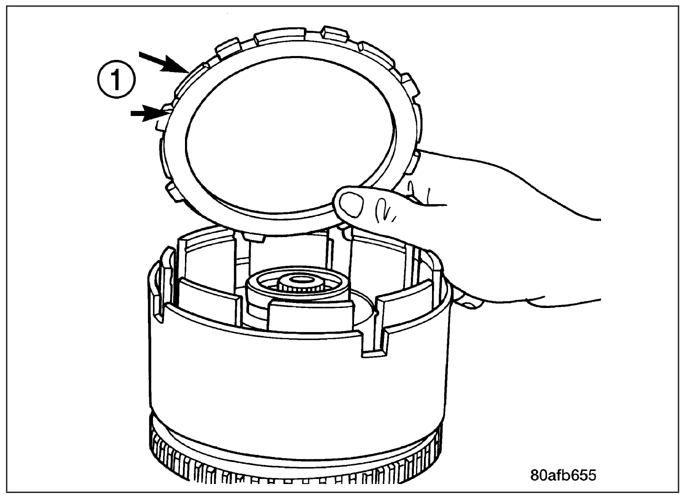
13. Install the UD clutch flat snap ring (1).



14. Install the last UD clutch disc (1).

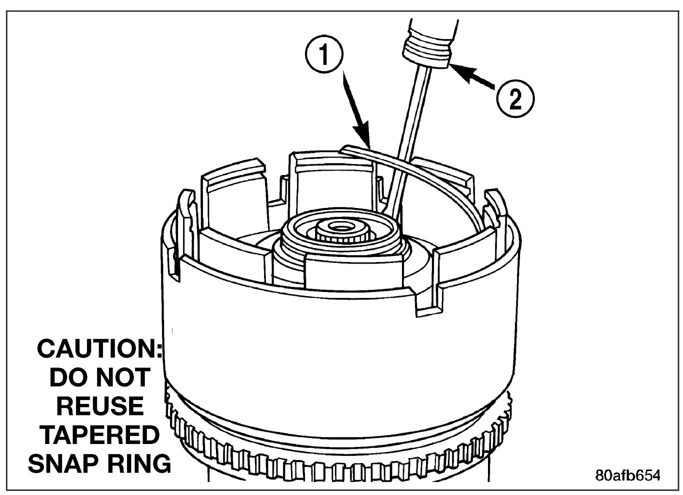


15. Install the OD/UD clutch reaction plate (1). The OD/UD clutches reaction plate has a step on both sides. Install the OD/UD clutches reaction plate tapered step side up.

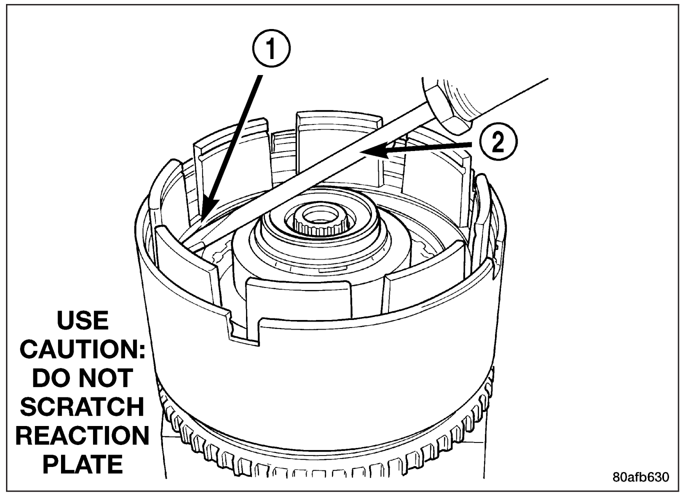


**NOTE: Snap ring ends must be located within one finger of the input clutch hub. Be sure that snap ring is fully seated, by pushing with screwdriver, into snap ring groove all the way around.**

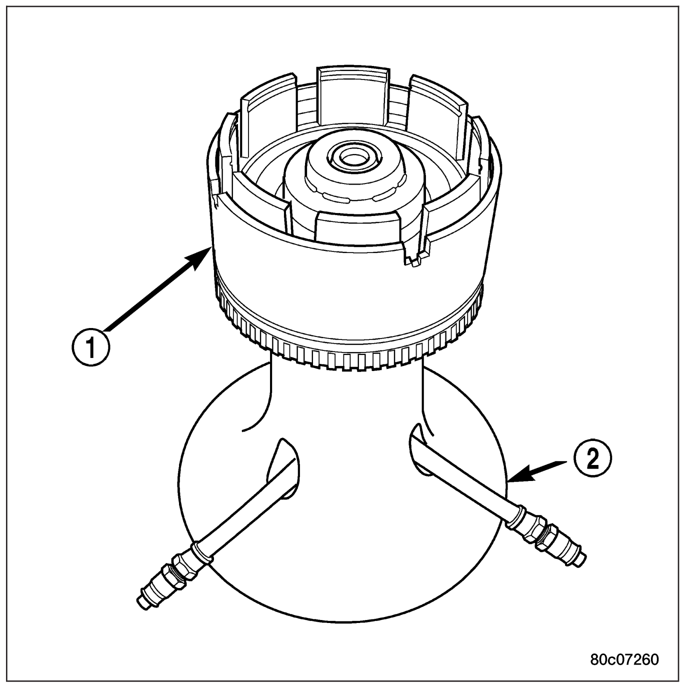
16. Install the UD/OD tapered snap ring (1).



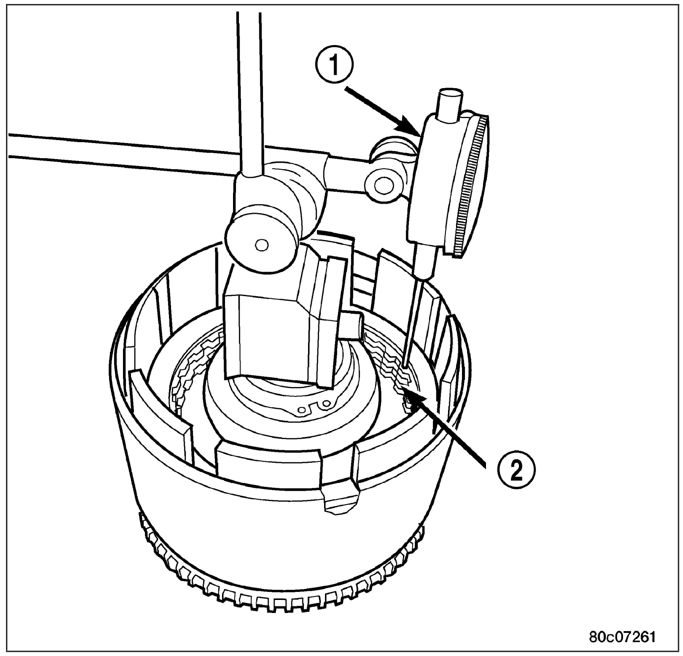
17. Seat tapered snap ring (1) to ensure proper installation.



18. Install input clutch assembly (1) to the Input Clutch Pressure Fixture 8391 (2).



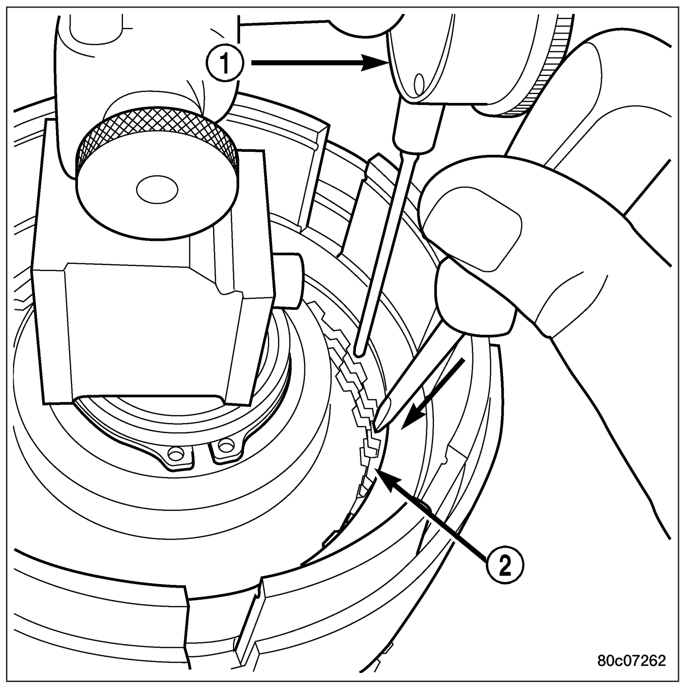
19. Set up Dial Indicator C-3339 (1) on the UD clutch pack (2).



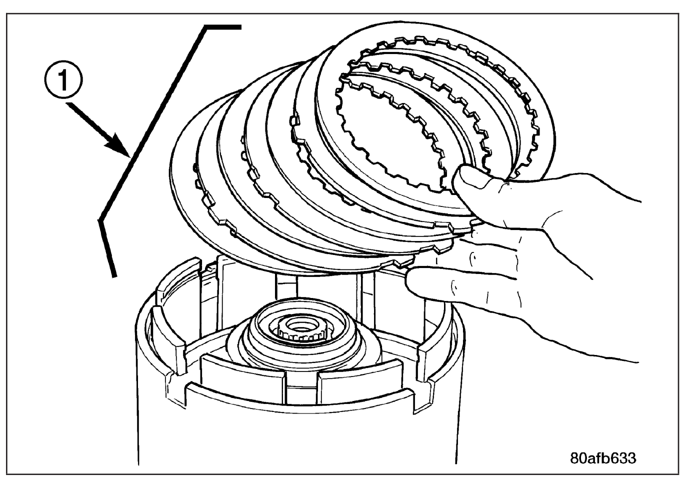
20. Using moderate pressure, press down and hold (near indicator) the UD clutch pack (2) with screwdriver or suitable tool and zero dial indicator (1). When releasing pressure on clutch pack, indicator reading should advance 0.005-0.010 inches.

**CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.**

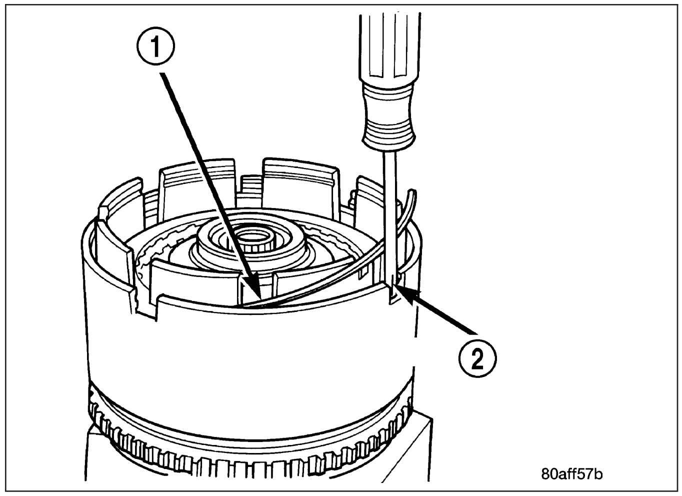
21. Apply 30 psi (206 kPa) to the underdrive hose on Pressure Fixture 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four (4) places, 90° apart.
22. Take average of four measurements and compare with UD clutch pack clearance specification. **Underdrive clutch pack clearance must be 0.94-1.50 mm (0.037-0.059 in.).**
23. If necessary, select the proper reaction plate to achieve specifications.



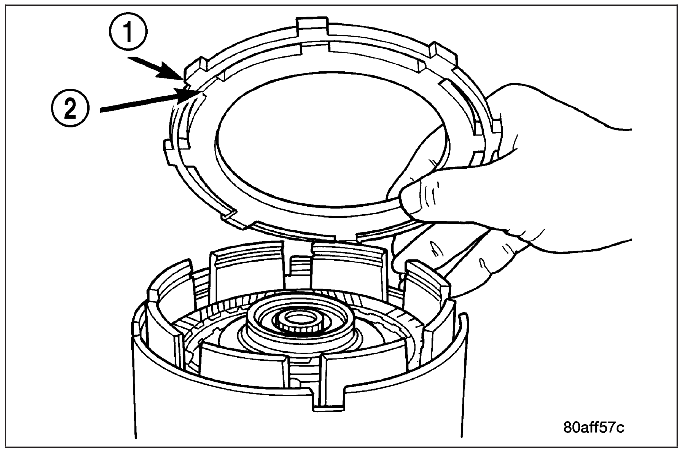
24. Install the OD clutch pack (four fibers/three steels) (1).



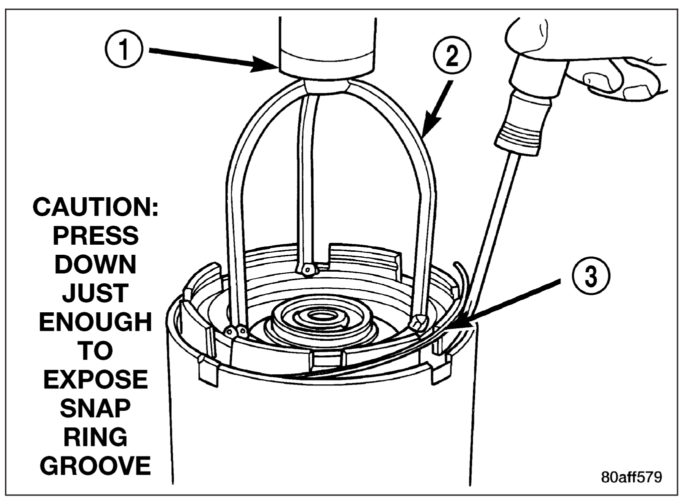
25. Install OD reaction plate waved snap ring (1).



26. Install the OD/Reverse reaction plate (1) with large step down (towards OD clutch pack).

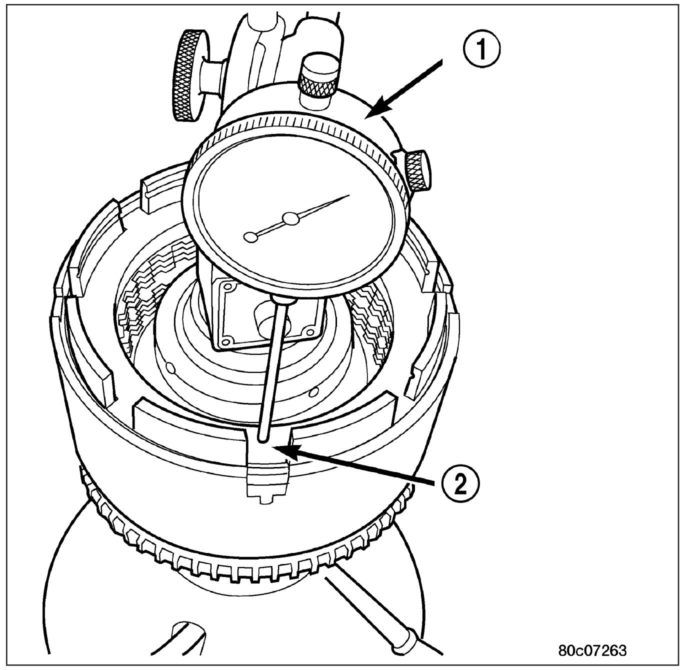


27. Install OD reaction plate flat snap ring (3).

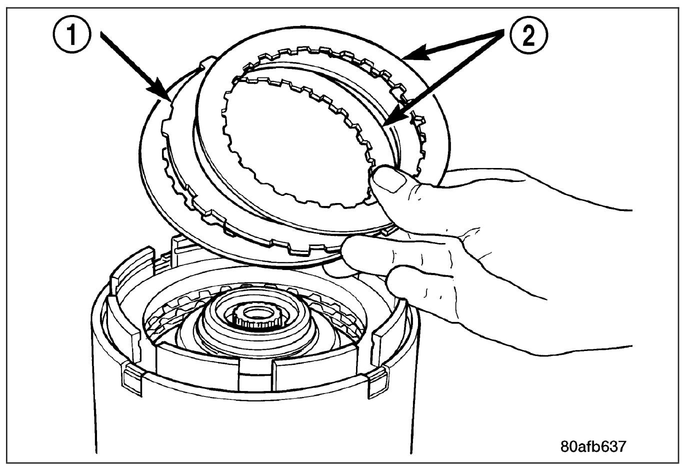


28. Measure OD clutch pack clearance. Set up Dial Indicator C-3339 (1) on top of the OD/Reverse reaction plate (2).
29. Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Pressure Fixture 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.
30. Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 1.07-3.25 mm (0.042-0.128 in.).**

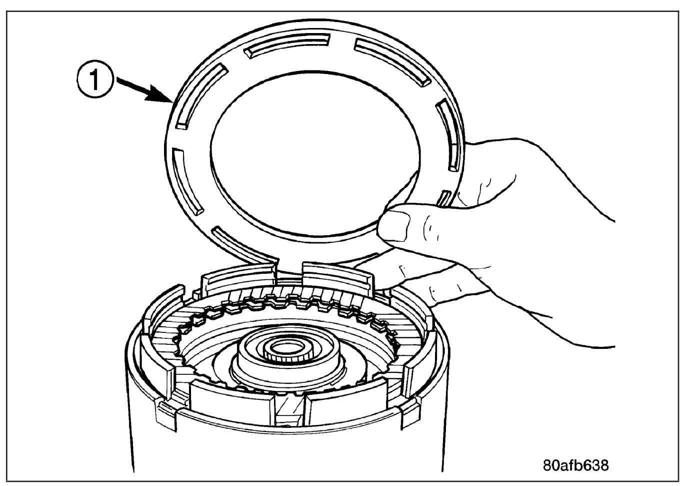
If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.



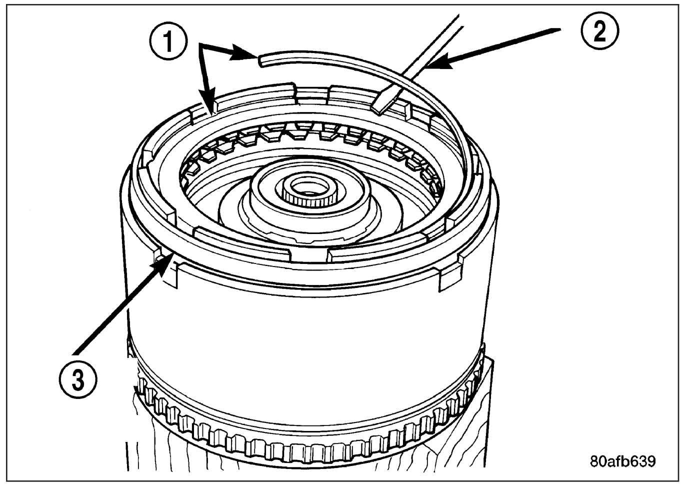
31. Install reverse clutch pack (two fibers/one steel) (1, 2).



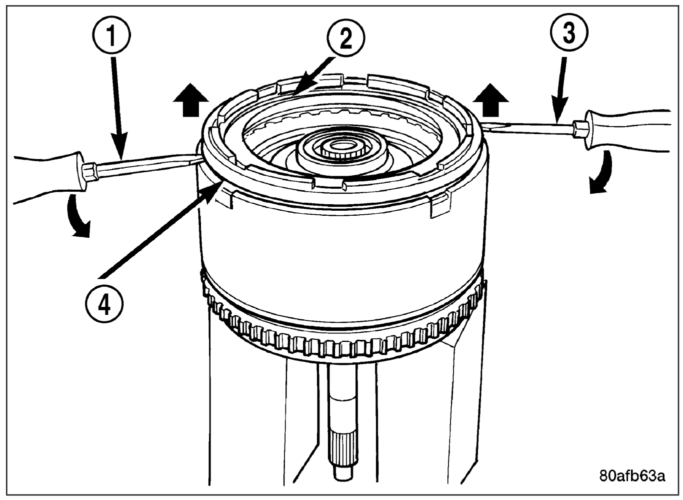
32. Install reverse clutch reaction plate (1) with the flat side down towards reverse clutch.



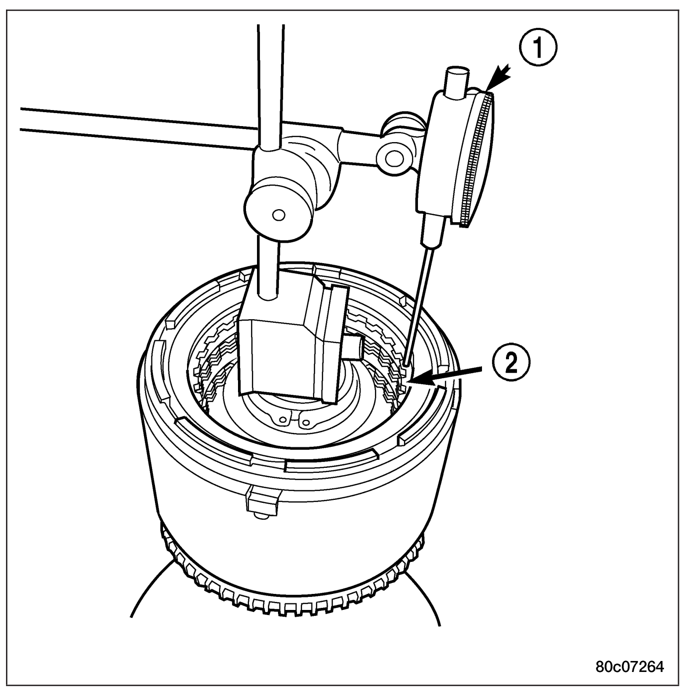
33. Tap reaction plate (3) down to allow installation of the reverse clutch snap ring (1). Install reverse clutch snap ring (1).



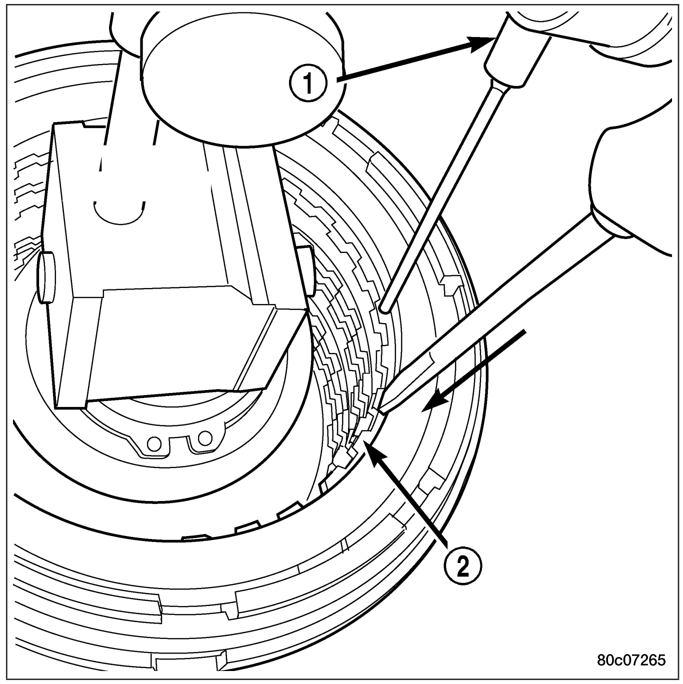
34. Pry up reverse reaction plate (4) to seat against snap ring (2).



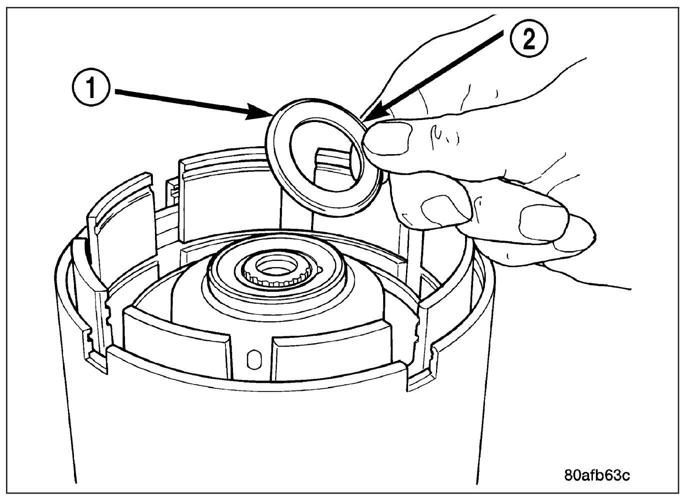
35. Set up a Dial Indicator C-3339 (1) on the reverse clutch pack (2).



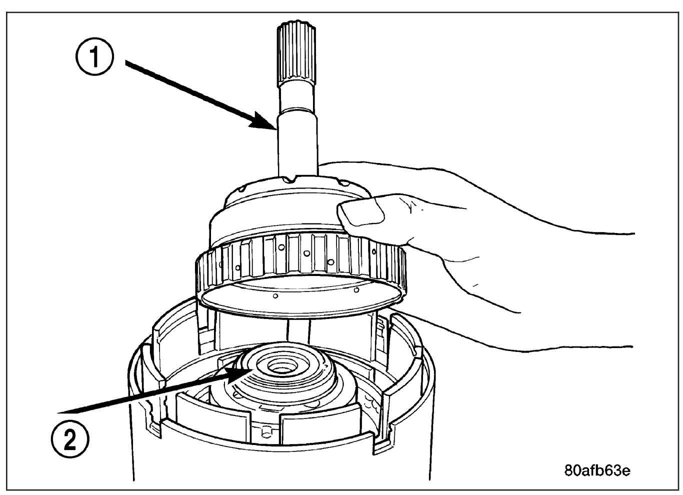
36. Using moderate pressure, press down and hold (near indicator) reverse clutch disc (2) with screwdriver or suitable tool and zero dial indicator (1). When releasing pressure, indicator should advance 0.005-0.010 inches as clutch pack relaxes.
37. Apply 30 psi (206 kPa) air pressure to the reverse clutch hose on Pressure Fixture 8391. Measure and record reverse clutch pack measurement in four (4) places, 90° apart.
38. Take average of four measurements and compare with reverse clutch pack clearance specification. **The reverse clutch pack clearance is 0.89-1.37 mm (0.035-0.054 in.).** Select the proper reverse clutch snap ring to achieve specifications.
39. To complete the assembly, reverse clutch and overdrive clutch must be removed.



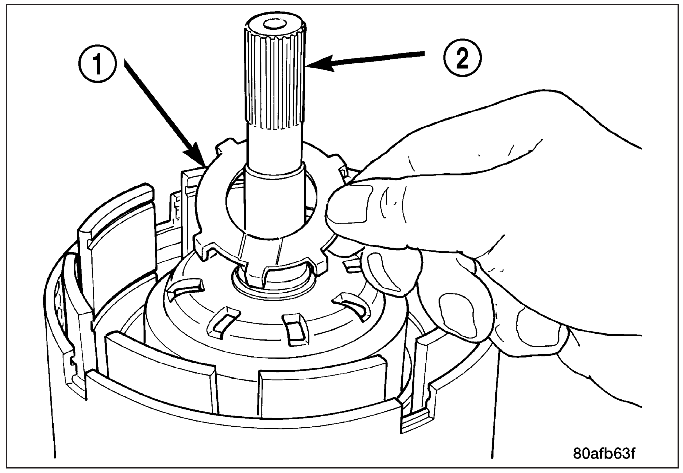
40. Install the number 2 needle bearing (1).



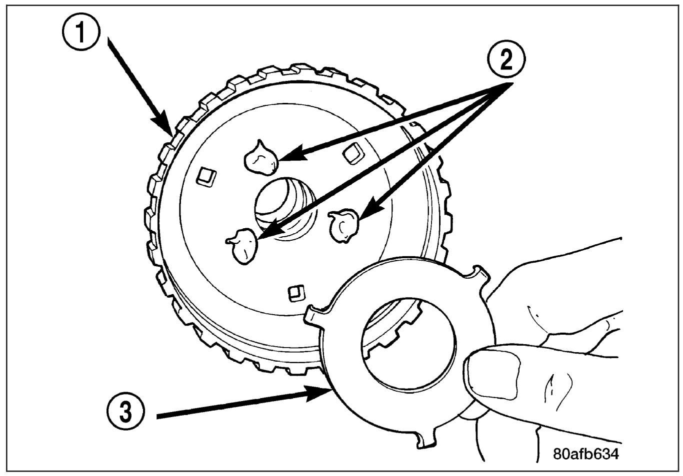
41. Install the underdrive shaft assembly (1).



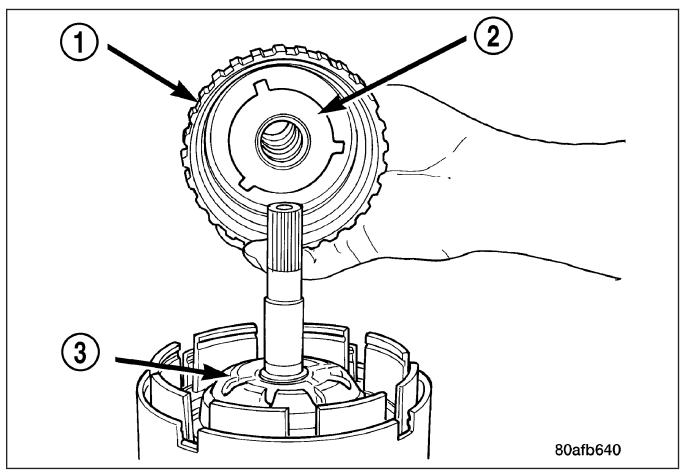
42. Install the number 3 thrust washer (1) to the underdrive shaft assembly (2). Be sure five tabs are seated properly.



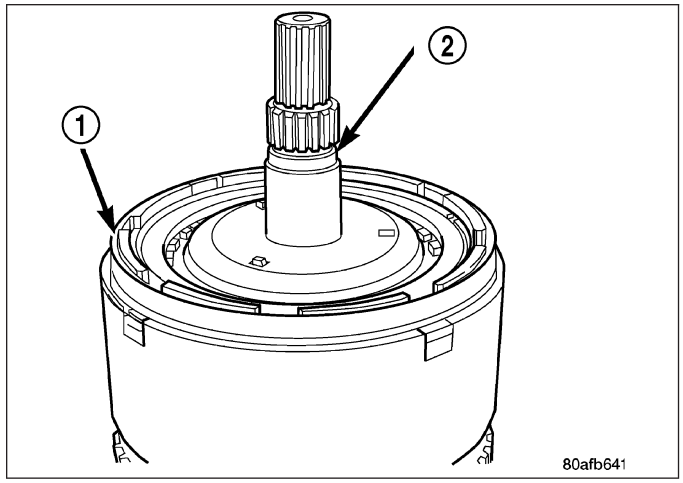
43. Install the number 3 thrust plate (3) to the bottom of the overdrive shaft assembly (1). Retain with petrolatum or transmission assembly gel (2).



44. Install the overdrive shaft assembly (1).



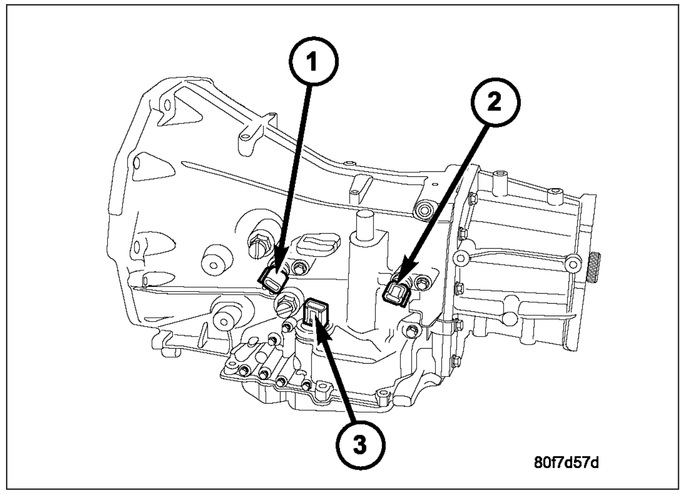
45. Reinstall overdrive and reverse clutch. **Rechecking these clutch clearances is not necessary.**



# INPUT SPEED SENSOR

## DESCRIPTION

The Input (1) and Output (2) Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).



## OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

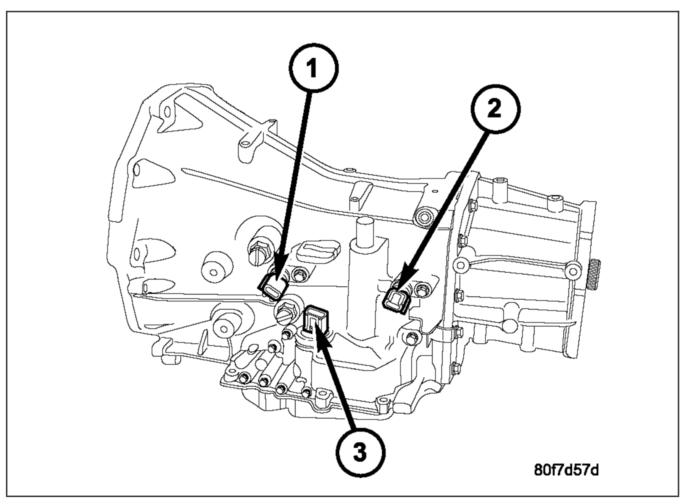
- Torque converter clutch slippage
- Torque converter element speed ratio

## REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the input speed sensor.

**NOTE: The speed sensor bolt has a sealing patch applied from the factory. Be sure to reuse the same bolt.**

4. Remove the bolt holding the input speed sensor to the transmission case.
5. Remove the input speed sensor from the transmission case.

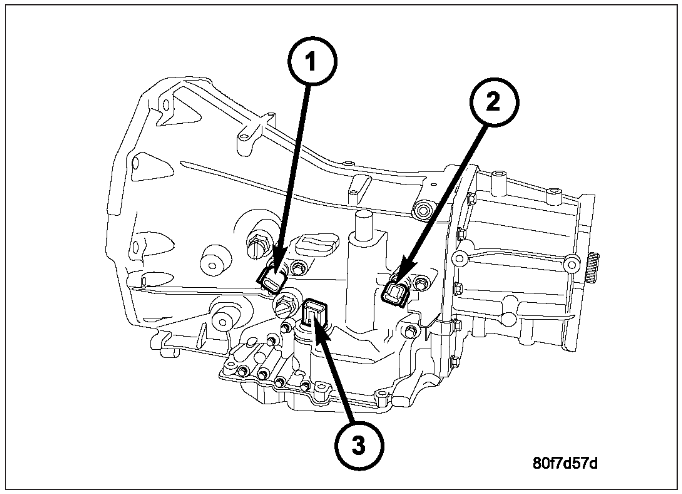


## INSTALLATION

1. Install the input speed sensor (1) into the transmission case.

**NOTE: Before installing the speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using MOPAR® Lock & Seal Adhesive.**

2. Install the bolt to hold the input speed sensor into the transmission case. Tighten the bolt to 9 N·m (80 in.lbs.).
3. Install the wiring connector onto the input speed sensor
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.

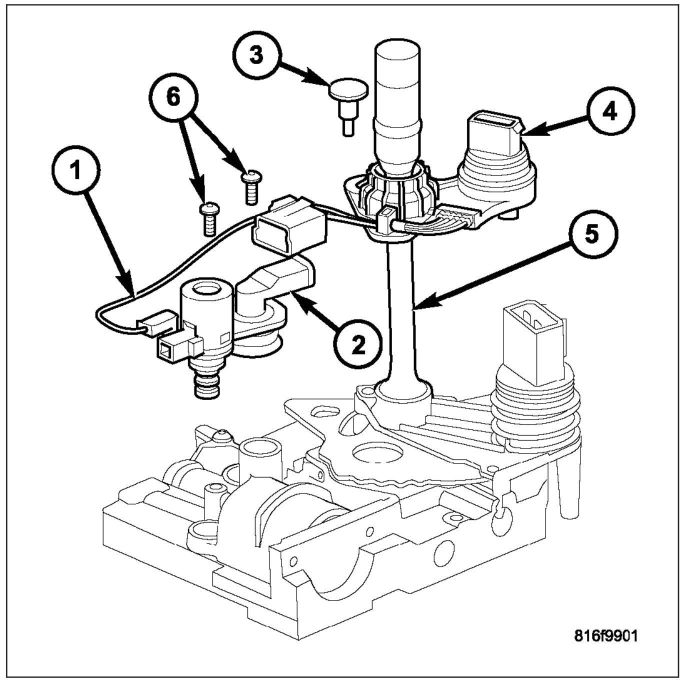


# SENSOR-VARIABLE LINE PRESSURE

## DESCRIPTION

The line pressure sensor (2) is mounted on the top of the valve body, next to the pressure control solenoid (1).

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump. The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure solenoid monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

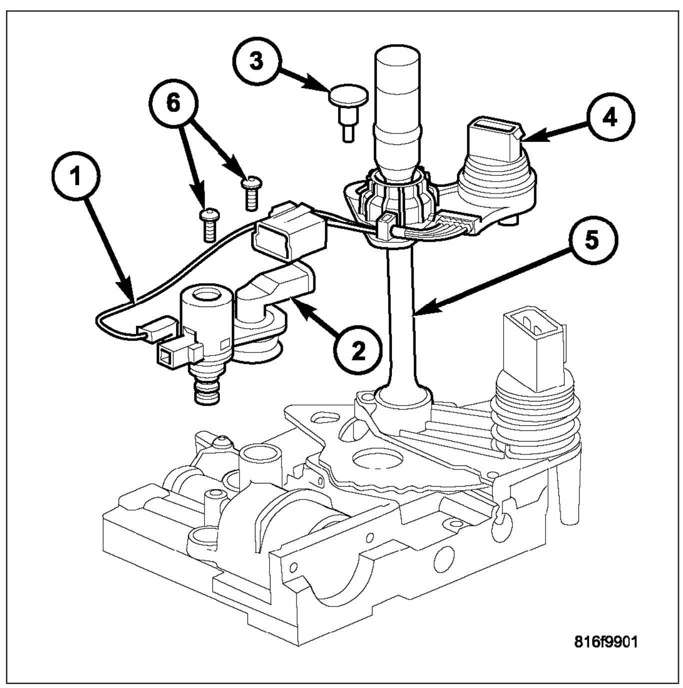


## OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts and when the transmission is in the PARK and NEUTRAL positions. This is done to ensure consistent shift quality. During all other operation, the actual line pressure is compared to the desired line pressure and adjustments are made to the pressure control solenoid duty cycle.

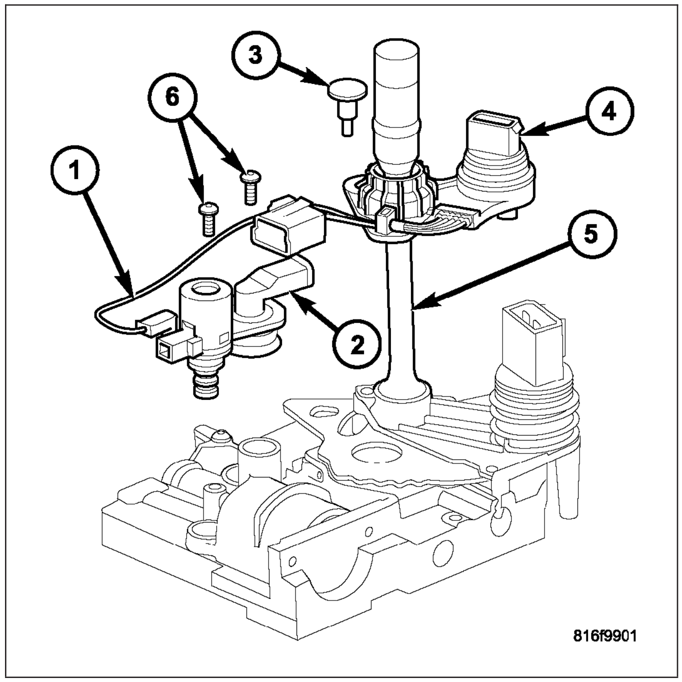
## REMOVAL

1. Remove the valve body from the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)
2. Remove the electrical connectors from the pressure control solenoid (1) and the line pressure sensor (2).
3. Remove the screws (6) holding the pressure control solenoid (1) and line pressure sensor (2) to the valve body.
4. Remove the pressure control solenoid and line pressure sensor from the valve body.



## INSTALLATION

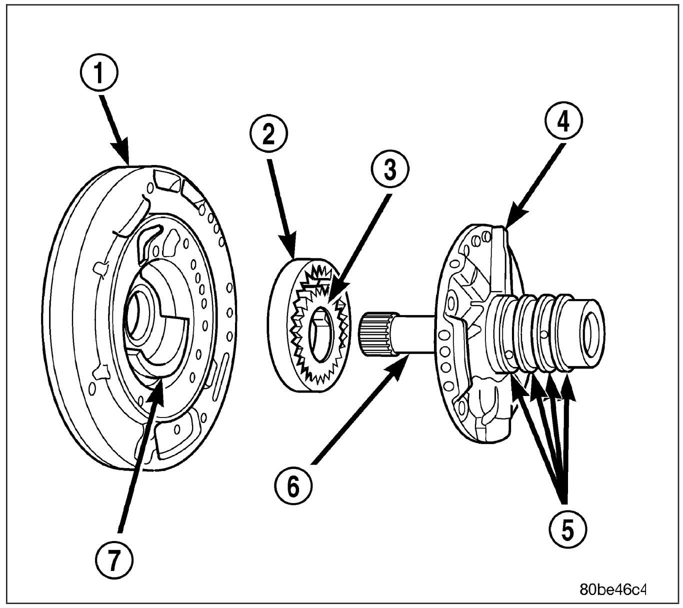
1. Install the pressure control solenoid (1) and line pressure sensor (2) into the valve body.
2. Install the screws (6) to hold the pressure control solenoid (1) and line pressure sensor (2) to the valve body.
3. Install the electrical connectors to the pressure control solenoid (1) and the line pressure sensor (2).
4. Install the valve body into the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE/VALVE BODY - INSTALLATION)



# OIL PUMP

## DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transmission case. The oil pump assembly consists of an inner (3) and outer (2) gear, a housing (1), and a cover that also serves as the reaction shaft support (6).

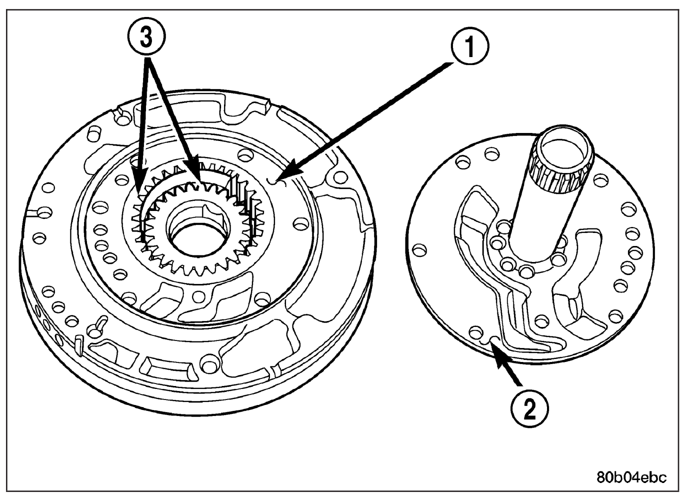


## OPERATION

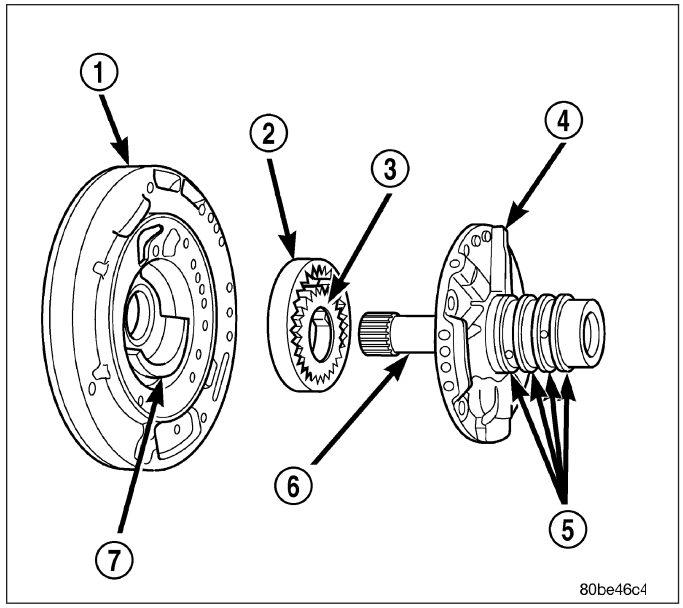
As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

## DISASSEMBLY

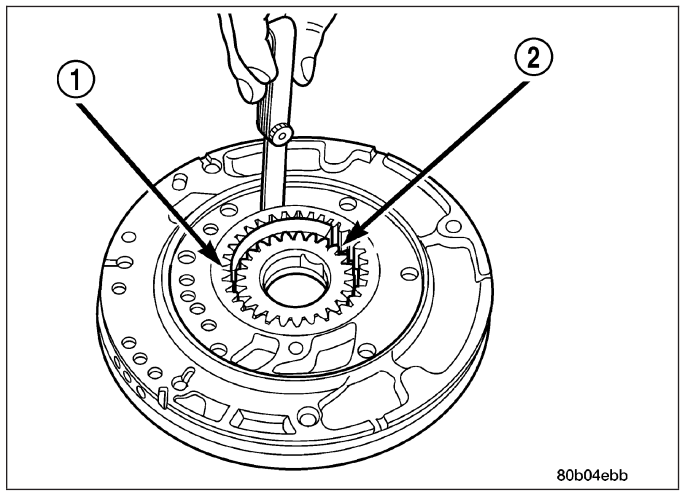
1. Remove the reaction shaft support bolts.
2. Remove the reaction shaft support (2) from the pump housing (1).



3. Remove the pump gears (2, 3) and check for wear and damage on pump housing (1) and gears (2, 3).



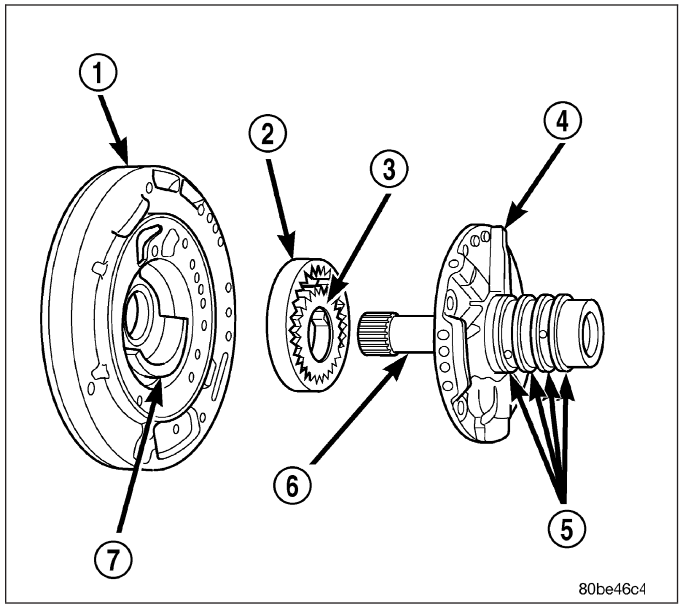
4. Re-install the gears and check clearances.
5. Measure the clearance between the outer gear (1) and the pump pocket (2). Clearance should be 0.089-0.202 mm (0.0035-0.0079 in.).
6. Measure clearance between outer gear and crescent. Clearance should be 0.060-0.298 mm (0.0023-0.0117 in.).
7. Measure clearance between inner gear and crescent. Clearance should be 0.093-0.385 mm (0.0036-0.0151 in.).
8. Position an appropriate piece of Plastigage across both pump gears.
9. Align the Plastigage to a flat area on the reaction shaft support housing.
10. Install the reaction shaft to the pump housing. Tighten the bolts to 28 N·m (250 in. lbs.).



11. Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.
12. Clearance between outer gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.). Clearance between inner gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.).

## ASSEMBLY

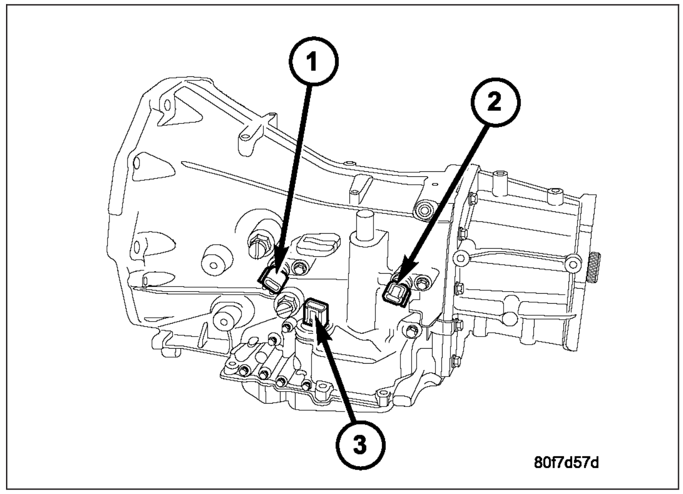
1. Assemble oil pump as shown
2. Install and torque reaction shaft support-to-oil pump housing bolts to 28 N·m (250 in. lbs.) torque.



# OUTPUT SPEED SENSOR

## DESCRIPTION

The Input (1) and Output (2) Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).



## OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

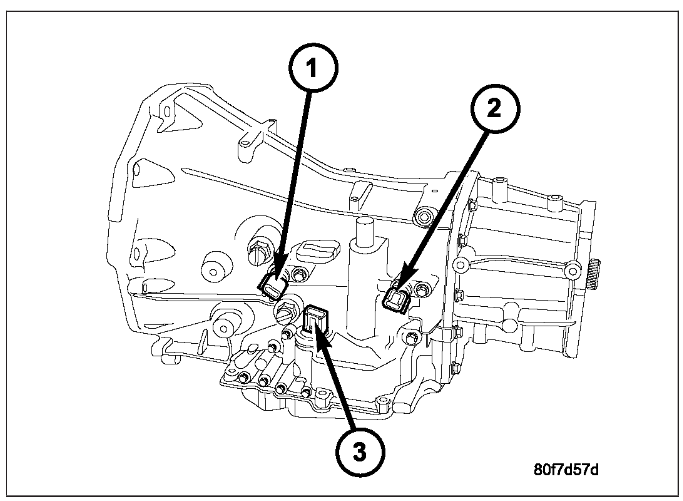
- Torque converter clutch slippage
- Torque converter element speed ratio

## REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the output speed sensor (2).

**NOTE: The speed sensor bolt has a sealing patch applied from the factory. Be sure to reuse the same bolt.**

4. Remove the bolt holding the output speed sensor to the transmission case.
5. Remove the output speed sensor (2) from the transmission case.

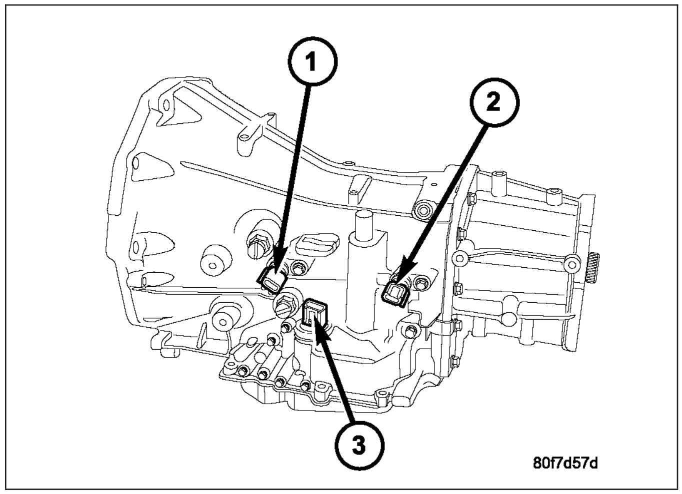


## INSTALLATION

1. Install the output speed sensor (2) into the transmission case.

**NOTE: Before installing the speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using MOPAR® Lock & Seal Adhesive.**

2. Install the bolt to hold the output speed sensor into the transmission case. Tighten the bolt to 9 N·m (80 in.lbs.).
3. Install the wiring connector onto the output speed sensor
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.



# OVERDRIVE SWITCH

## DESCRIPTION

The overdrive OFF (control) switch is located in the shifter handle. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

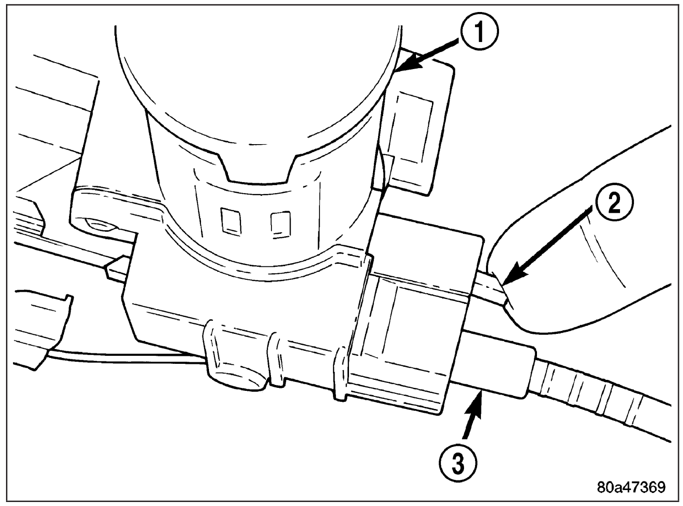
## OPERATION

At key-on, fourth gear operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoids and allow upshifts to fourth gear. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

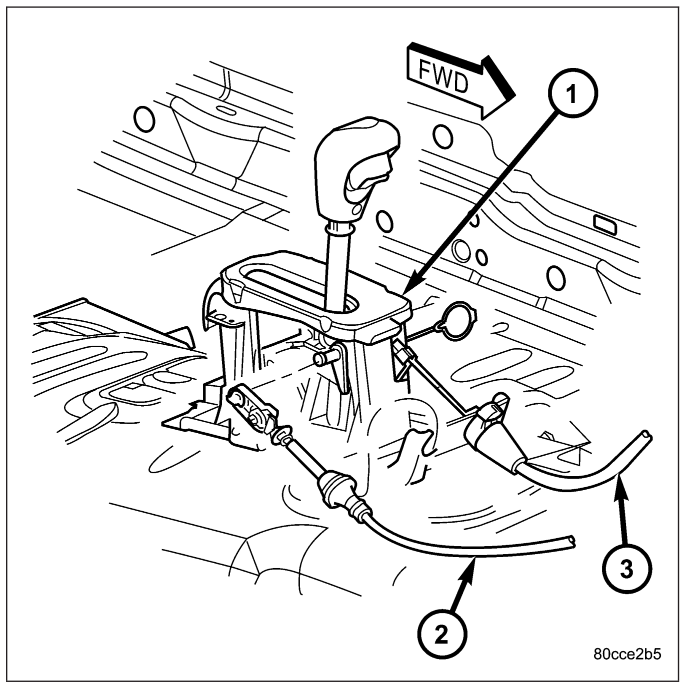
# PARK INTERLOCK CABLE

## REMOVAL

1. Lower the steering column.
2. With the ignition switch in the “RUN” position depress the park-interlock cable locking tab (2), located on top of the cable connector at the steering column and pull the cable straight out.

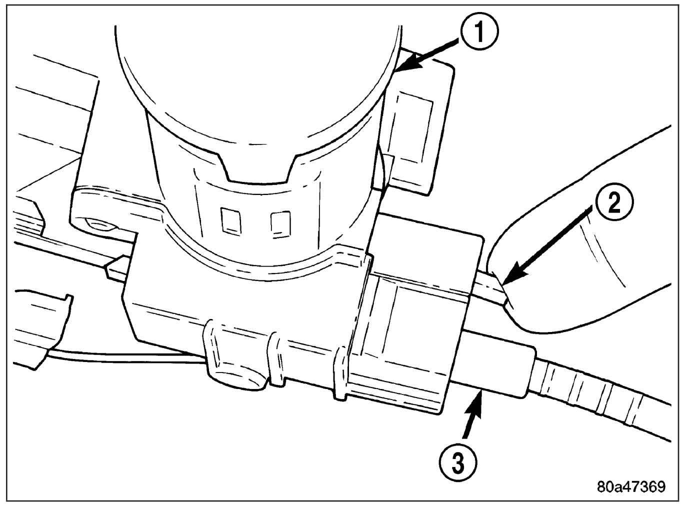


3. Remove the park-interlock cable from steering column.
4. Remove the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
5. Disconnect the park-interlock cable (3) from the shift lever assembly and remove the cable from the shifter assembly bracket.
6. Release the park-interlock cable from any remaining clips.
7. Remove park-interlock cable from the vehicle.

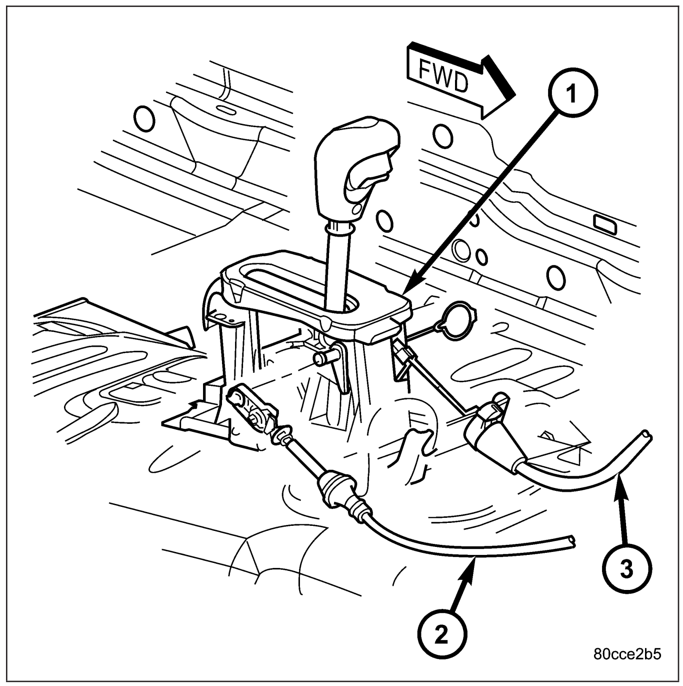


## INSTALLATION

**NOTE: The gearshift cable must be secured into position and properly adjusted before the installation of the Park-Interlock Cable.**



1. Push the park-interlock cable (3) straight into the square mounting hole in the steering column until cable snaps in place.
2. Snap park-interlock cable tie strap into hole in steering column tube.

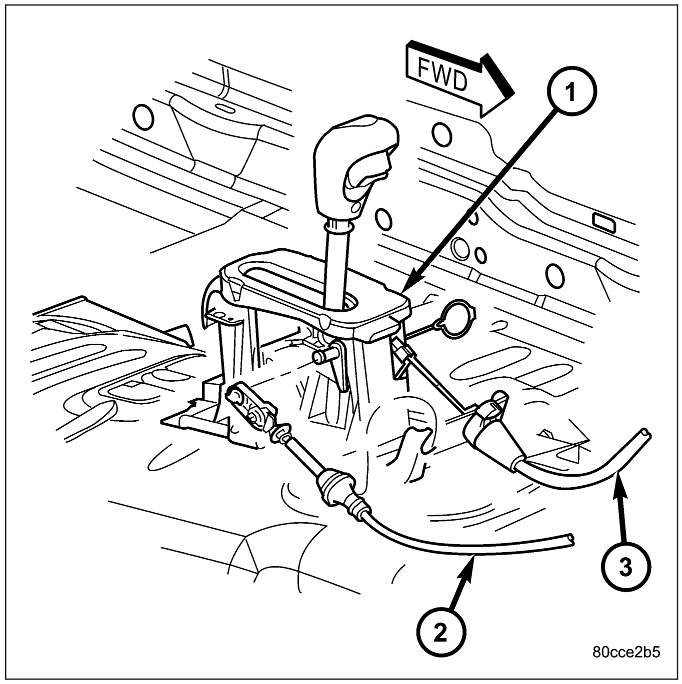


3. Route cable to the shifter mechanism.
4. Install the cable end fitting into shifter lever (1).
5. Snap cable adjuster ears into floor shifter bracket.
6. Place the ignition key cylinder in the LOCK position.
7. Push the cable adjuster lock clamp downward to lock it.
8. Test the park-interlock cable operation.
9. Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## ADJUSTMENTS - PARK-INTERLOCK CABLE

The park-interlock cable is part of the Brake Transmission Shift Interlock (BTSI) system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

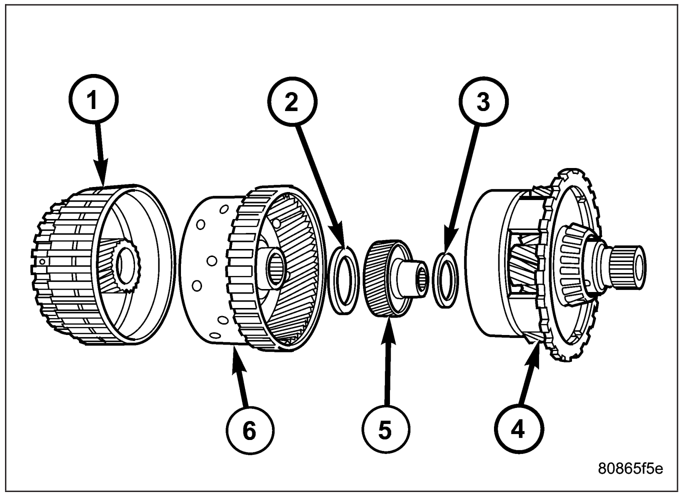
1. Remove floor console as necessary for access to the park-interlock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
2. Shift the transmission into the PARK position.
3. Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**
4. Pull cable lock button up to release cable (3).
5. Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.
6. Push lock button down until it snaps in place.
7. Verify proper operation. (Refer to 21 - TRANSMISSION/AUTOMATIC/SHIFT INTERLOCK SYSTEM - DIAGNOSIS AND TESTING)



# PLANETARY GEARTRAIN

## DESCRIPTION

The planetary geartrain is located between the input clutch assembly and the rear of the transmission case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft.



## OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

# OIL PUMP SEAL

## REMOVAL

1. Remove the transmission from the vehicle (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - REMOVAL).
2. Remove the torque converter from the transmission bellhousing.
3. Use a screw mounted in a slide hammer to remove oil pump seal.

## INSTALLATION

1. Clean and inspect oil pump seal seat. Then install seal using Seal Installer C-4193-A.
2. Clean and inspect torque converter hub. If nicks, scratches or hub wear are found, torque converter replacement will be required.

**CAUTION: If the torque converter is being replaced, apply a light coating of grease to the crankshaft pilot hole. Also inspect the engine drive plate for cracks. If any cracks are found replace the drive plate. Do not attempt to repair a cracked drive plate. Always use new torque converter to drive plate bolts.**

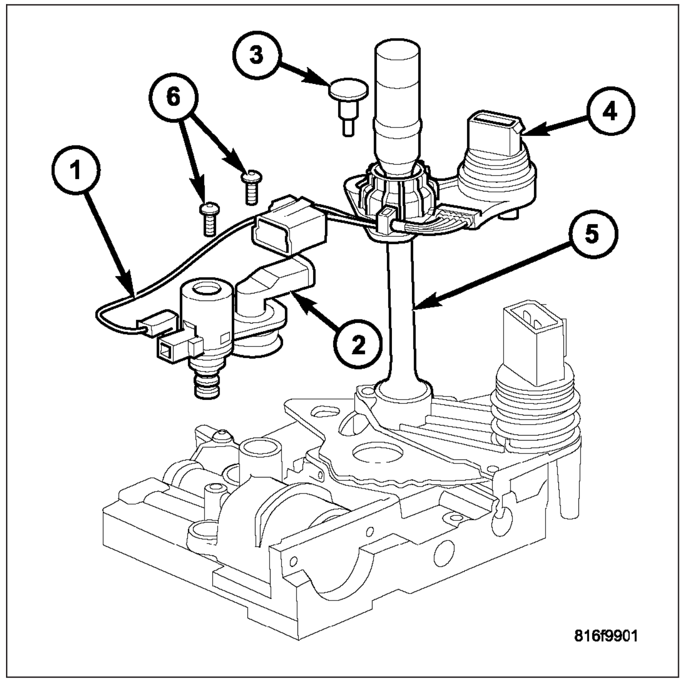
3. Apply a light film of transmission oil to the torque converter hub and oil seal lips. Then install torque converter into transmission. Be sure that the hub lugs mesh with the front pump lugs when installing.
4. Reinstall the transmission into the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION)

# SOLENOID-PRESSURE CONTROL

## DESCRIPTION

The pressure control solenoid (1) is mounted on the top of the valve body, next to the line pressure sensor (2).

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump. The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure solenoid monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.



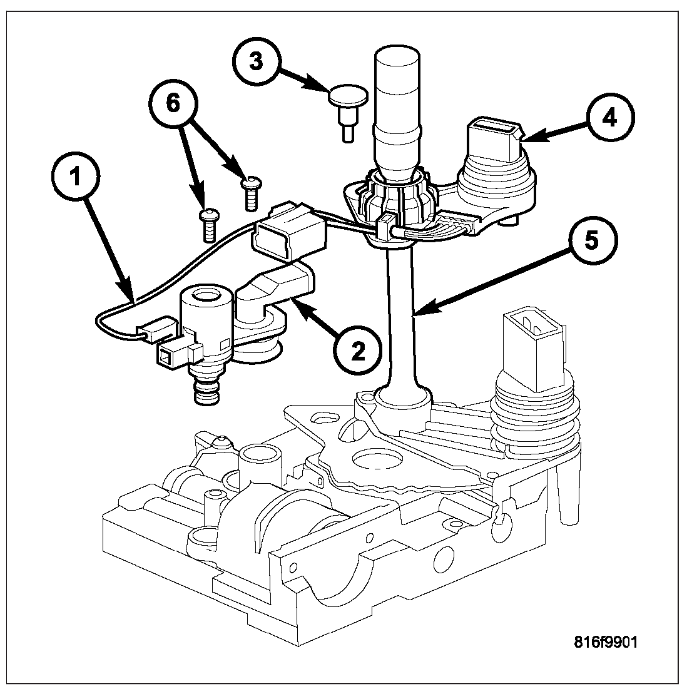
## OPERATION

The pressure control solenoid (PCS) is a variable force (VFS) style solenoid. A VFS solenoid is an electro-hydraulic actuator, combining a solenoid and a regulating valve.

The transmission control module varies the current for the PCS, which varies the pressure in the line pressure hydraulic circuit. When the current (duty cycle) of the PCS is low, the pressure in the circuit is higher. At 0 current (0% duty cycle), the pressure is at the maximum value. Conversely, when the current is maximized (100% duty cycle), the pressure in the circuit is at the lowest possible value.

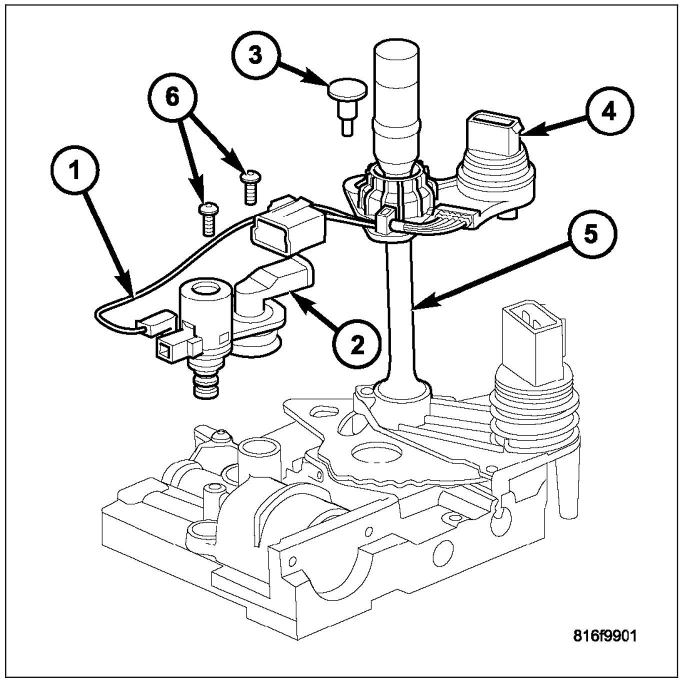
## REMOVAL

1. Remove the valve body from the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)
2. Remove the electrical connectors from the pressure control solenoid (1) and the line pressure sensor (2).
3. Remove the screws (6) holding the pressure control solenoid (1) and line pressure sensor (2) to the valve body.
4. Remove the pressure control solenoid and line pressure sensor from the valve body.



## INSTALLATION

1. Install the pressure control solenoid (1) and line pressure sensor (2) into the valve body.
2. Install the screws (6) to hold the pressure control solenoid (1) and line pressure sensor (2) to the valve body.
3. Install the electrical connectors to the pressure control solenoid (1) and the line pressure sensor (2).
4. Install the valve body into the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE/VALVE BODY - INSTALLATION)



# SHIFT MECHANISM

## DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)
- Manual second (2)
- Manual low (1)

## OPERATION

MANUAL LOW (1) range provides first gear only. Overrun braking is also provided in this range. MANUAL SECOND (2) range provides first and second gear only.

DRIVE range provides FIRST, SECOND THIRD and OVERDRIVE FOURTH gear ranges. The shift into OVERDRIVE FOURTH gear range occurs only after the transmission has completed the shift into D THIRD gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

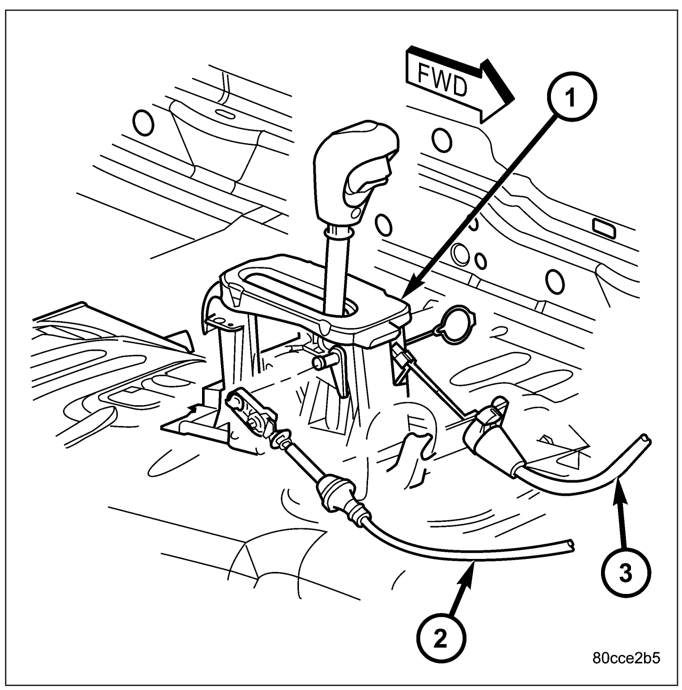
The FOURTH gear upshift occurs automatically when the overdrive selector switch is in the ON position. No upshift to FOURTH gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to THIRD is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.

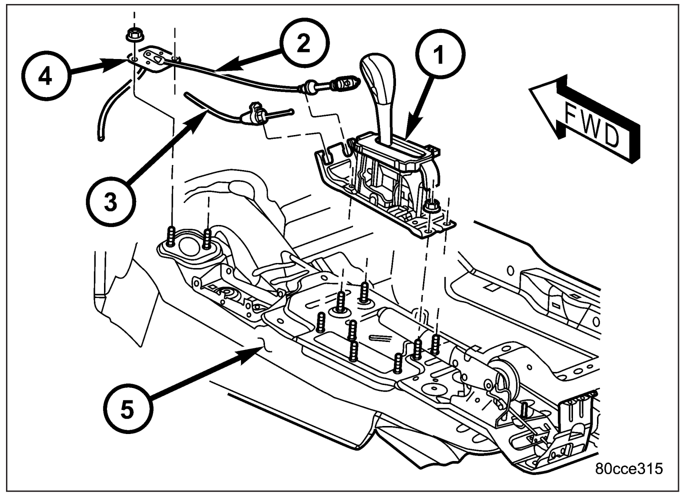
Upshifts into FOURTH will be delayed when the transmission fluid temperature is below 4.5° C (40° F) or above 115.5° C (240° F).

## REMOVAL

1. Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
2. Shift transmission into PARK.
3. Disconnect the transmission shift cable at shift lever and shifter assembly bracket.
4. Disconnect the park-interlock cable from the shifter lever and the shifter assembly bracket.
5. Disengage all wiring connectors from the shifter assembly.
6. Remove all nuts holding the shifter assembly to the floor pan.
7. Remove the shifter assembly from the vehicle.



## INSTALLATION



1. Install shifter assembly onto the shifter assembly studs on the floor pan.
2. Install the nuts to hold the shifter assembly onto the floor pan. Tighten nuts to 28 N·m (250 in.lbs.).
3. Install wiring harness to the shifter assembly bracket. Engage any wire connectors removed from the shifter assembly.
4. Install the park-interlock cable into the shifter assembly bracket and into the shifter lever.
5. Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
6. Place the floor shifter lever in park position.
7. Loosen the adjustment screw on the shift cable.
8. Snap the shift cable onto the shift lever pin.
9. Verify that the shift lever is in the PARK position.
10. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
11. Verify correct shifter operation.
12. Verify proper BTSI operation. (Refer to 21 - TRANSMISSION/AUTOMATIC/SHIFT INTERLOCK SYSTEM - DIAGNOSIS AND TESTING) Adjust the park-interlock cable as necessary. (Refer to 21 - TRANSMISSION/AUTOMATIC/SHIFT INTERLOCK CABLE - ADJUSTMENTS)
13. Install any console parts removed for access to shift lever assembly and shift cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

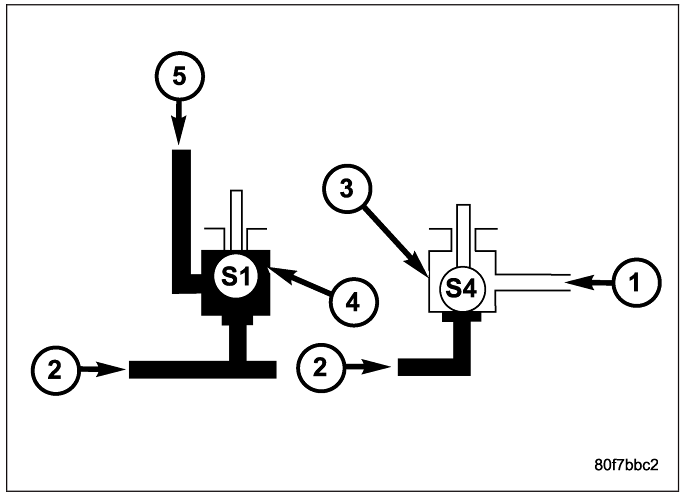
# SOLENOID

## DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

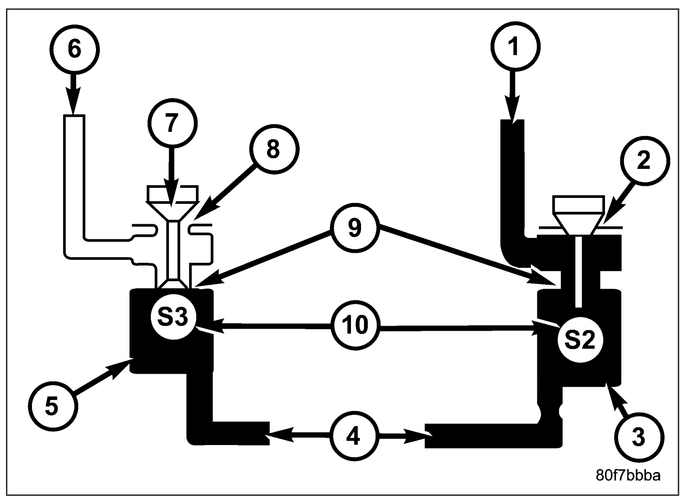
A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed.** The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.



The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

1. Increase the amount of current applied to the coil or
2. Increase the number of turns of wire in the coil.



The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

## OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

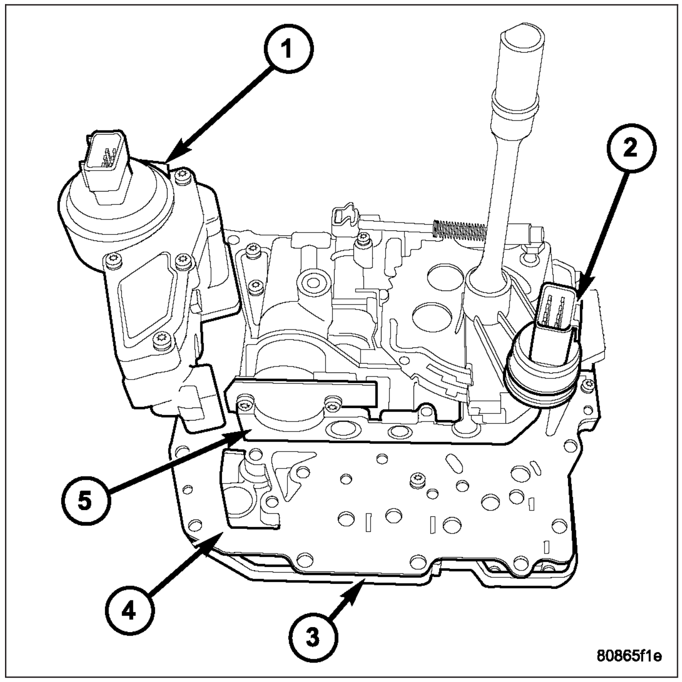
The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

# SOLENOID/PRESSURE SWITCH ASSY

## DESCRIPTION

The Solenoid/Pressure Switch Assembly (1) is inside the transmission and mounted to the valve body assembly. The assembly consists of four solenoids that control hydraulic pressure to the L/R, 2/4, OD, and UD friction elements (transmission clutches), and the torque converter clutch. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the TCM. Likewise, the pressure switches can only be service by replacing the assembly.



## OPERATION

### SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which allows fluid to pass through in their relaxed or “off” state. By design, this allows transmission limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

### PRESSURE SWITCHES

The TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

**PRESSURE SWITCH STATES**

| GEAR | L/R | 2/4 | OD |
|---|---|---|---|
| R | OP | OP | OP |
| P/N | CL | OP | OP |
| 1st | CL | OP | OP |
| 2nd | OP | CL | OP |
| D | OP | OP | CL |
| OD | OP | CL | CL |

**OP = OPEN**

**CL = CLOSED**

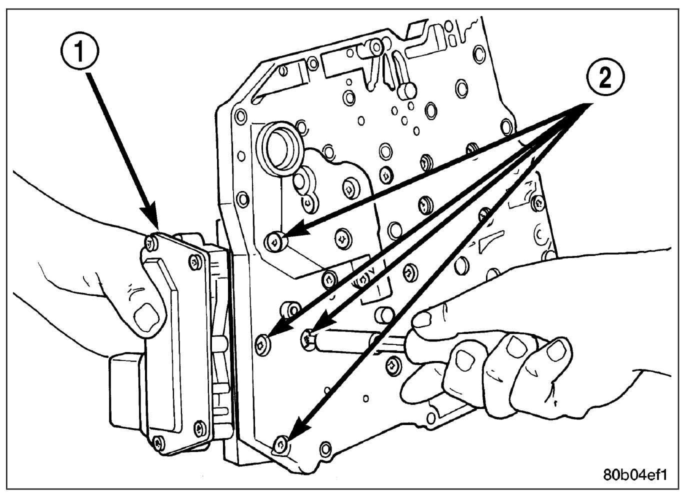
A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

The TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 rpm, the TCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

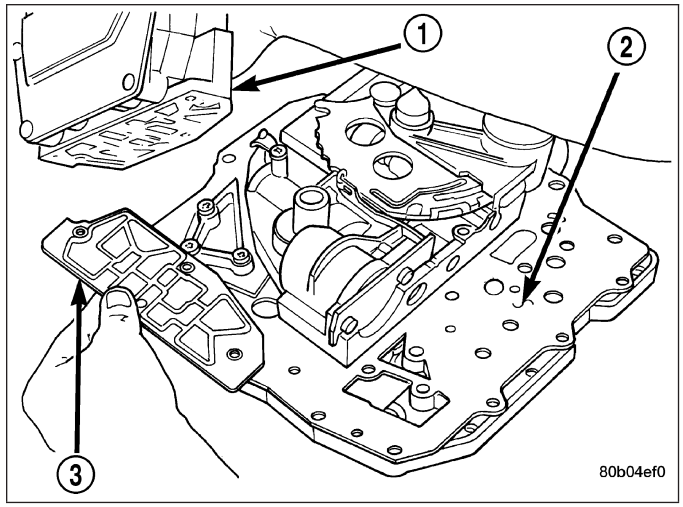
## REMOVAL

**NOTE: If the Solenoid/Pressure Switch Assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

1. Raise vehicle on hoist.
2. Remove valve body assembly from transmission. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)
3. Remove Solenoid/Pressure Switch Assembly retaining screws (2) from solenoid.



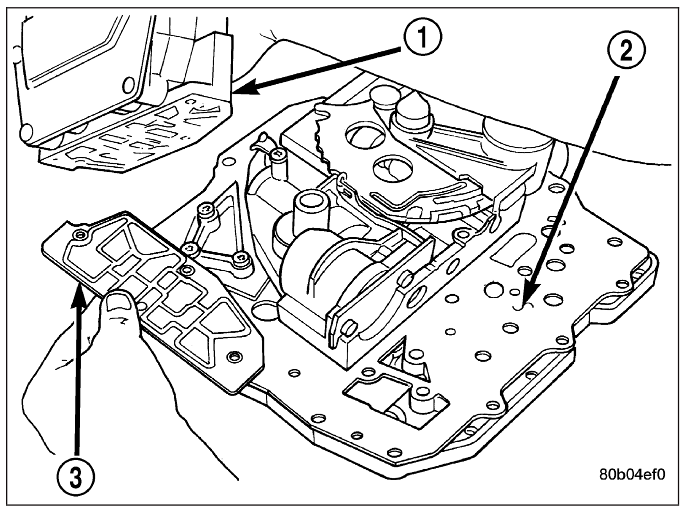
4. Remove Solenoid/Pressure Switch Assembly (1) and screen from valve body (2).



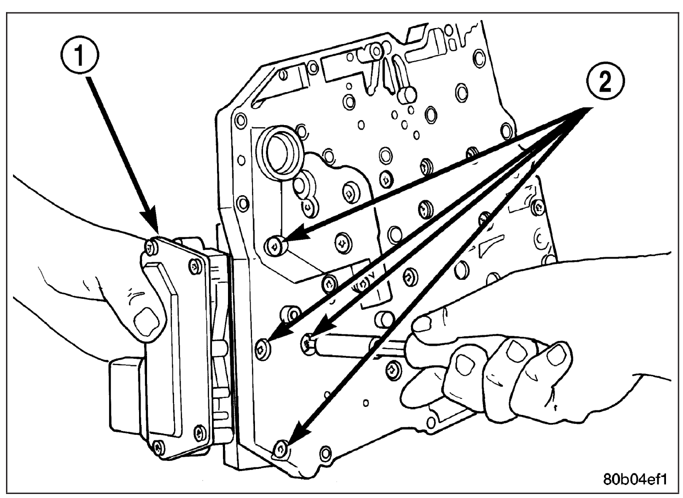
## INSTALLATION

**NOTE: If the Solenoid/Pressure Switch assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

1. Install Solenoid/Pressure Switch Assembly (1) and screen (3) to the separator and transfer plates.



2. Install and tighten retaining screws (2) to 5.5 N·m (50 in. lbs.) torque.
3. Install valve body. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - INSTALLATION)



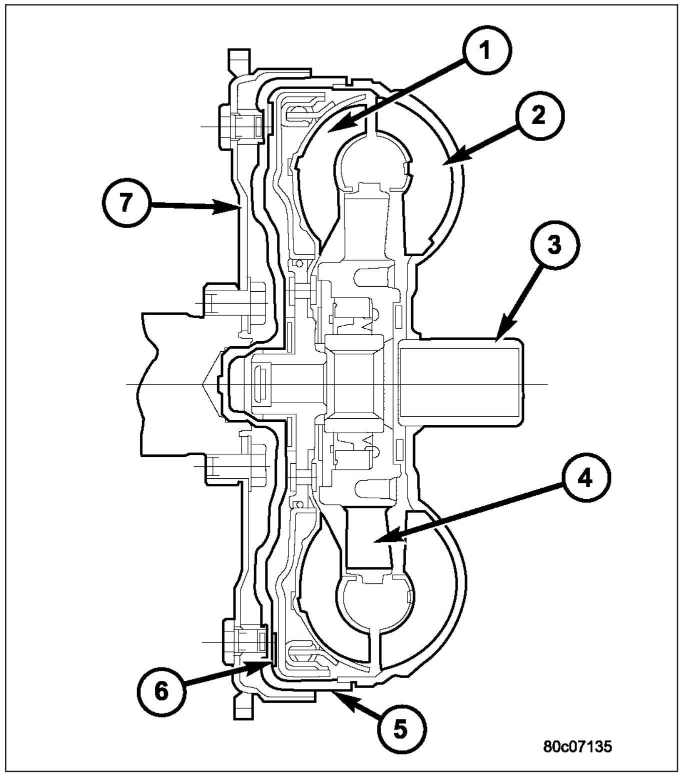
# TORQUE CONVERTER

## DESCRIPTION

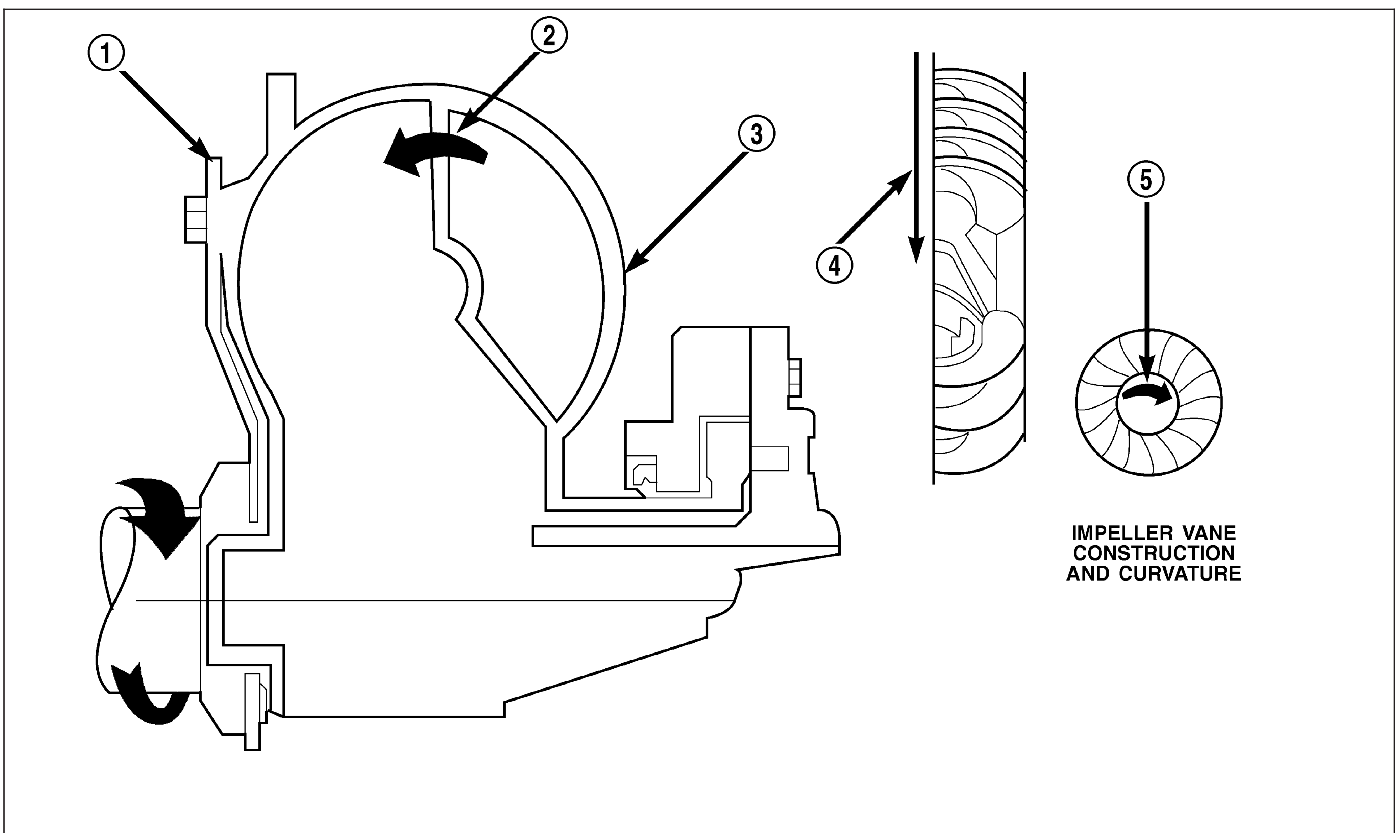
The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (4), an overrunning clutch, an impeller (2) and an electronically applied converter clutch (6). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.**

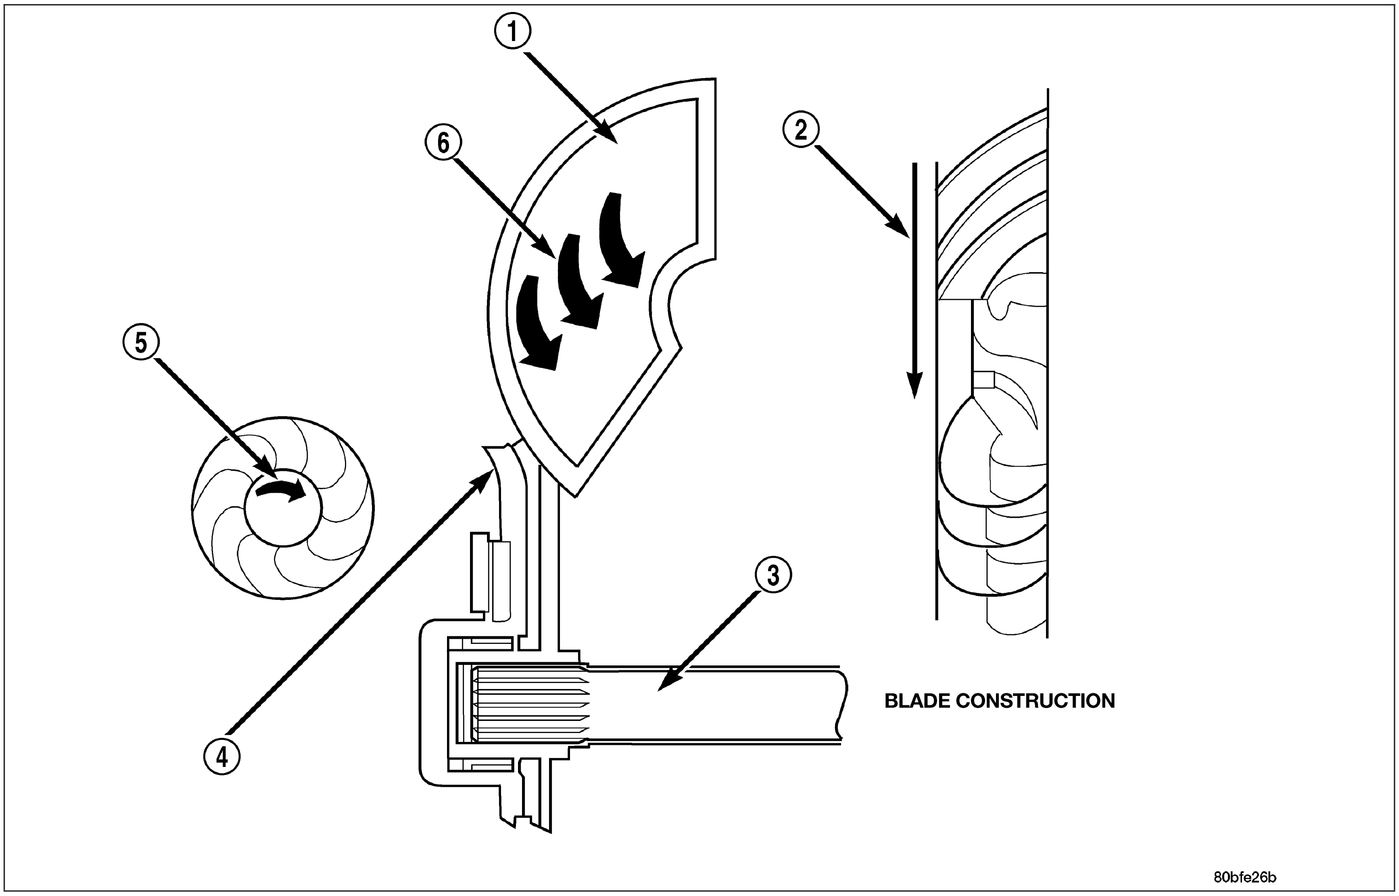


## IMPELLER



The impeller is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

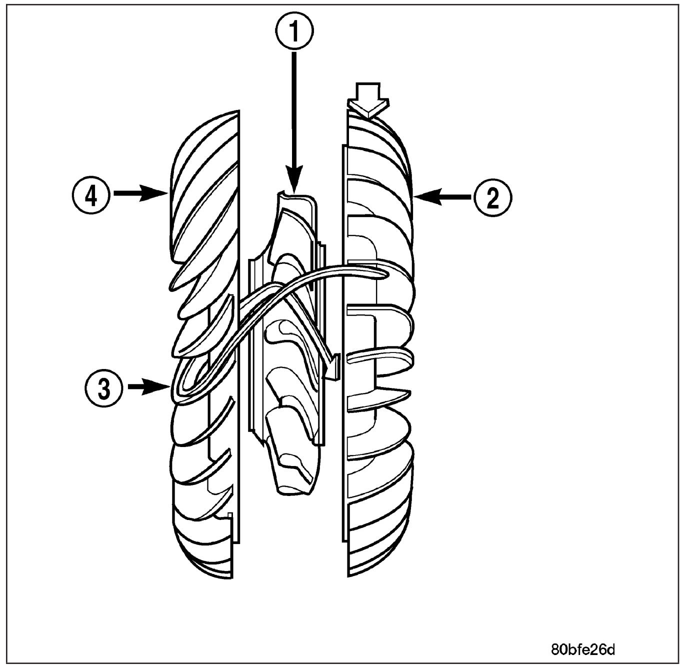
## TURBINE



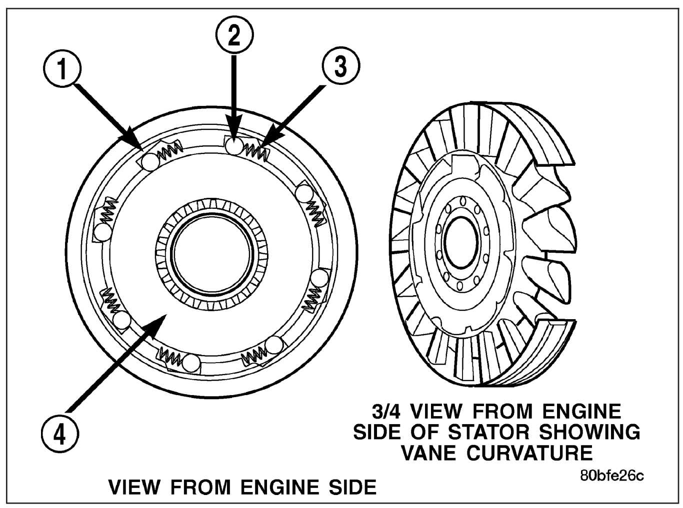
The turbine is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

## STATOR

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

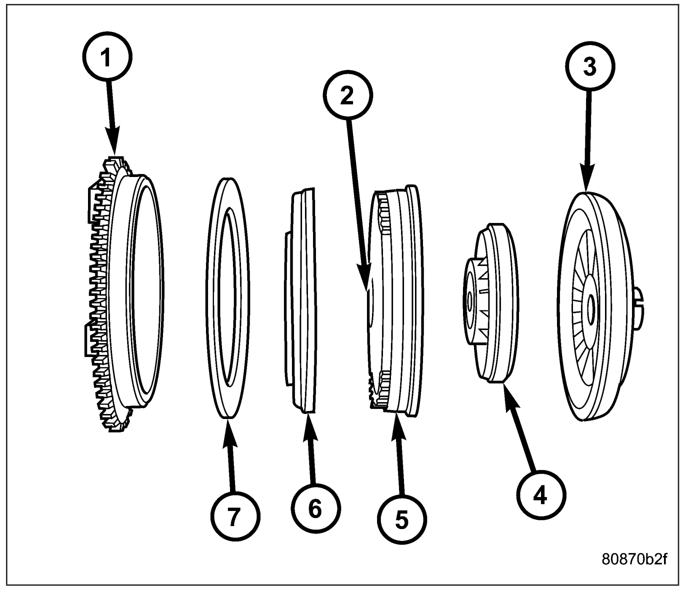


The stator contains an over-running clutch (1-4), which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.



## TORQUE CONVERTER CLUTCH (TCC)

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) with friction material (7) was added to the turbine assembly (5) to provide this mechanical lock-up.

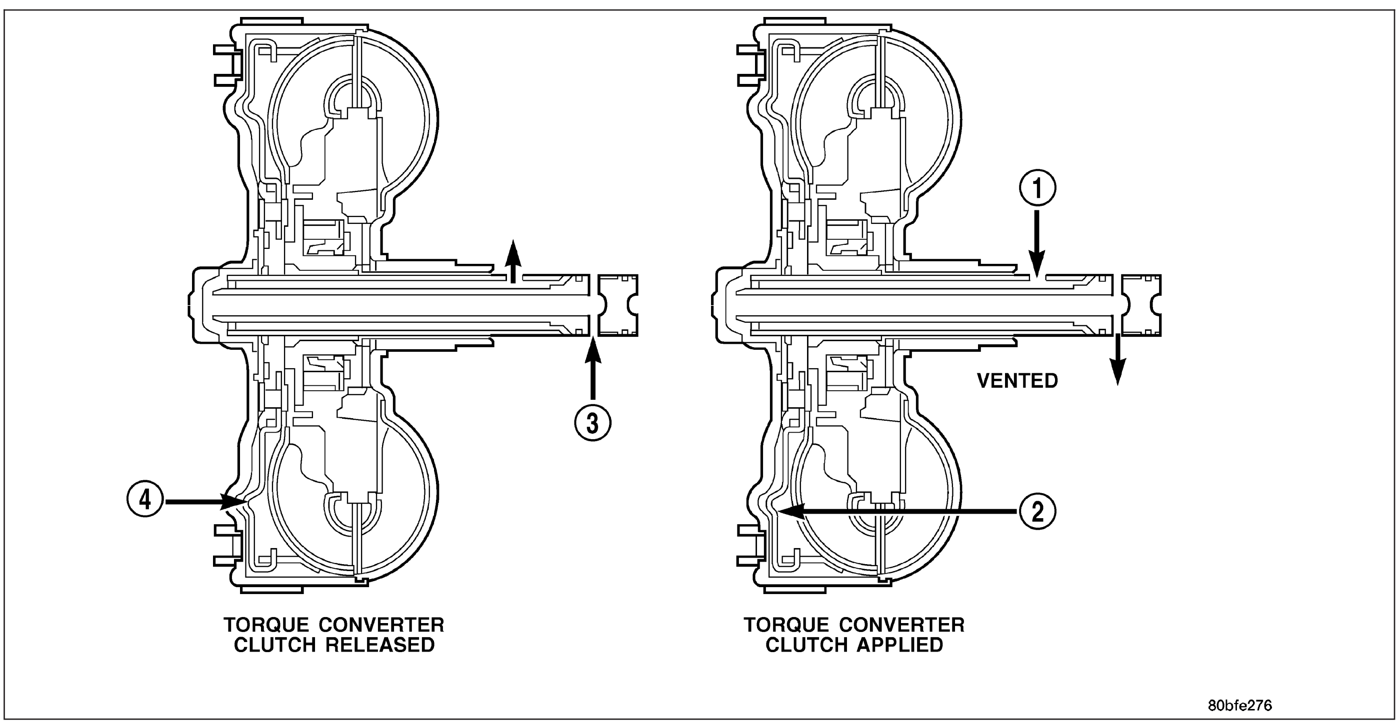


In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

## OPERATION

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.



## TURBINE

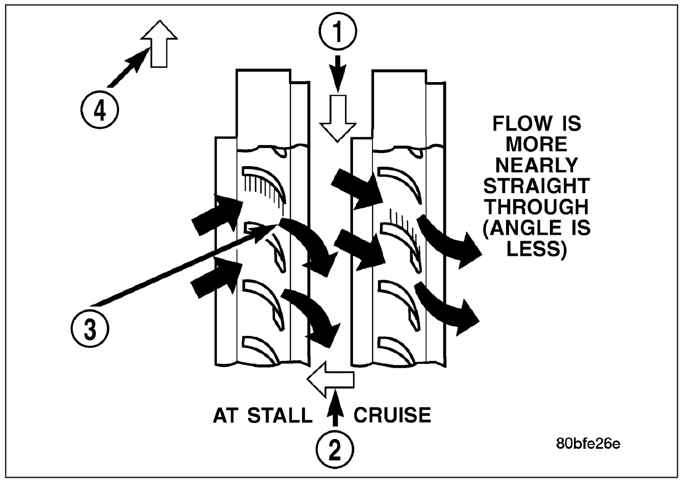
As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

## TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased.



## REMOVAL

1. Remove transmission and torque converter from vehicle. (Refer to 21 - TRANSMISSION/AUTOMATIC - 45RFE/545RFE - REMOVAL)
2. Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.**

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

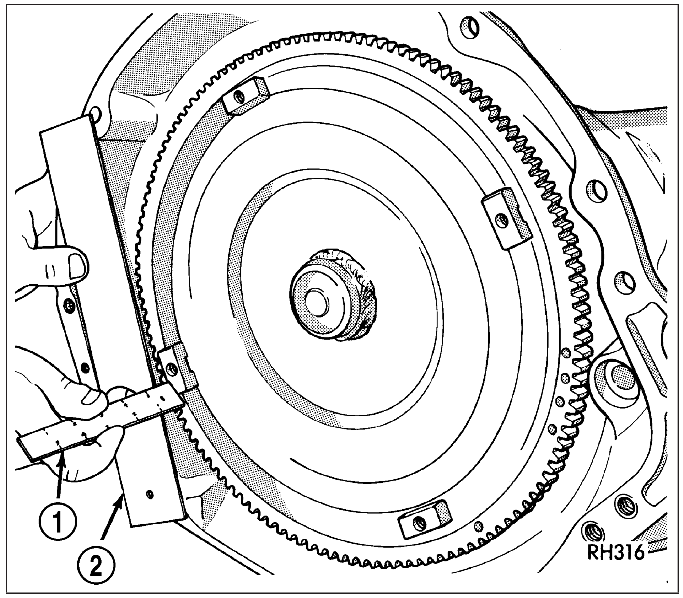
## INSTALLATION

**NOTE: Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.**

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

**CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.**

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle.
9. Fill the transmission with the recommended fluid.



# TRANSMISSION CONTROL RELAY

## DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

## OPERATION

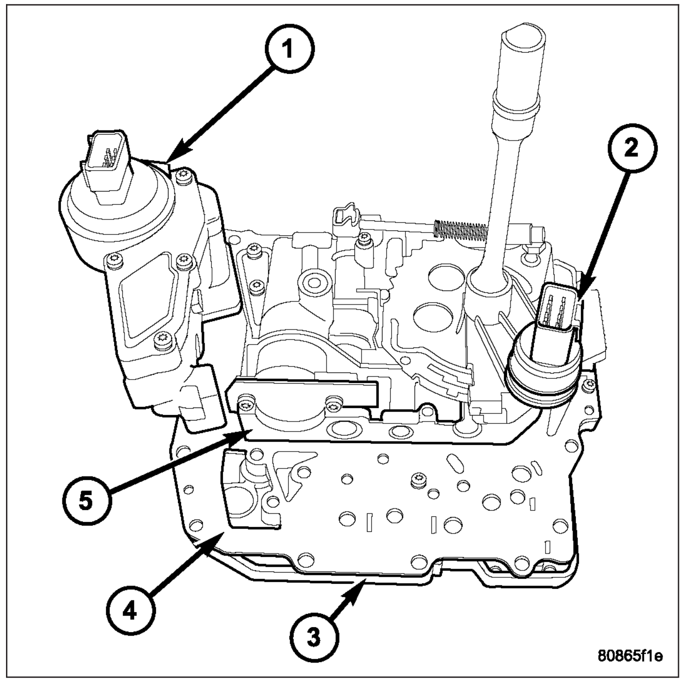
When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

# TRANSMISSION RANGE SENSOR

## DESCRIPTION

The Transmission Range Sensor (TRS) (2) is mounted to the top of the valve body inside the transmission and can only be serviced by removing the valve body assembly. The electrical connector extends through the transmission case.

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the PCM.



## OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position (SLP) to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

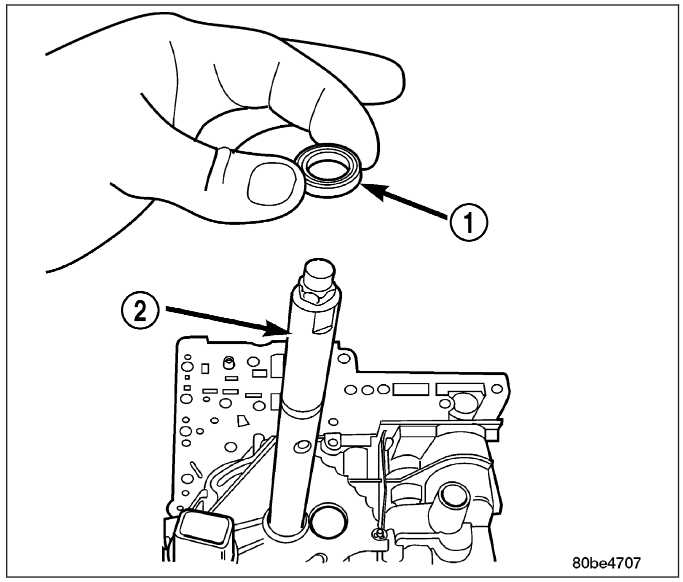
Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as “between gear” codes. This results in six codes which should never occur. These are called “invalid” codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

**TRS SWITCH STATES**

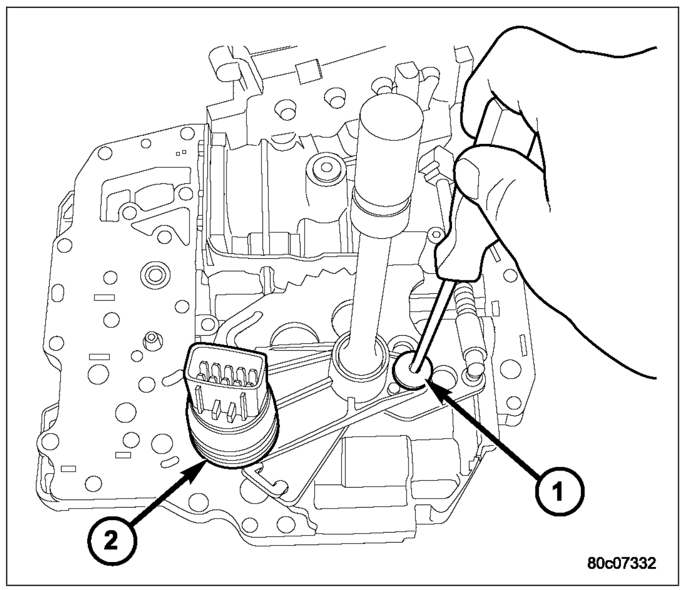
| SLP | T42 | T41 | T3 | T1 |
|---|---|---|---|---|
| **P** | CL | CL | CL | OP |
| **R** | CL | OP | OP | OP |
| **N** | CL | CL | OP | CL |
| **D** | OP | OP | OP | CL |
| **2** | OP | OP | CL | OP |
| **1** | CL | OP | CL | CL |

## REMOVAL

1. Remove valve body assembly from vehicle. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/ VALVE BODY - REMOVAL)
2. Remove the manual shaft seal (1).

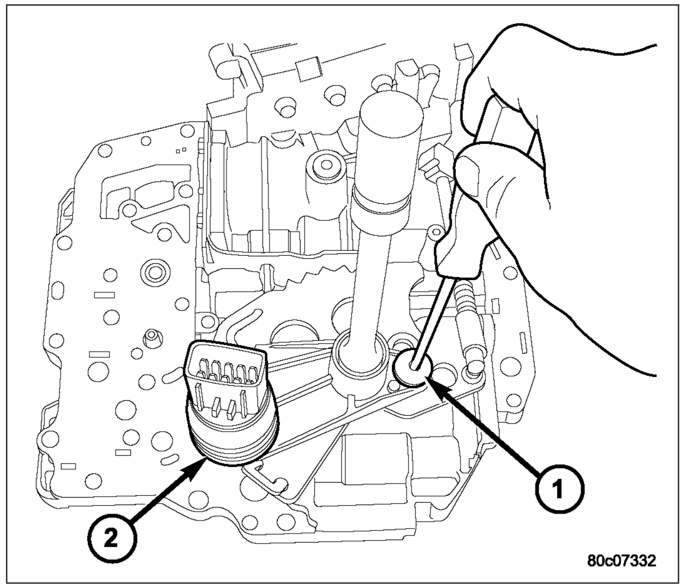


3. Remove manual shaft/TRS retaining screw (1).
4. Slide TRS off of manual valve shaft.

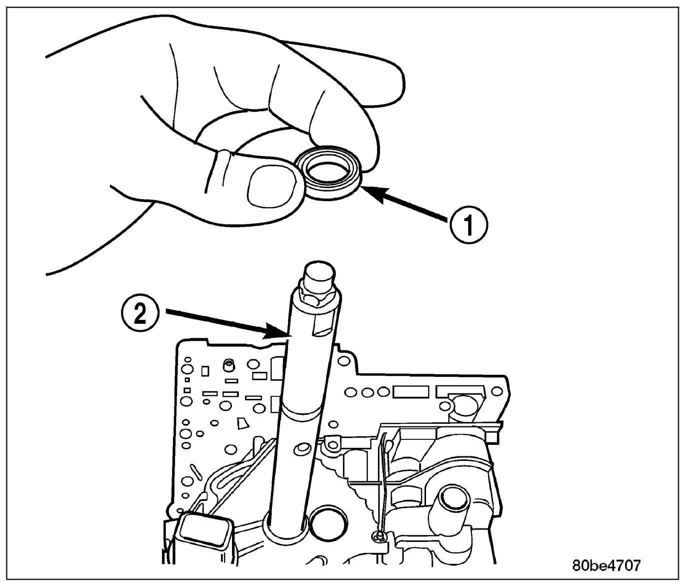


## INSTALLATION

1. Install the TRS (2) to the manual shaft. Make sure TRS locating pin rests in manual valve bore slot.
2. Install the TRS/manual shaft retaining screw (1) and torque to 5 N·m (45 in. lbs.) torque.



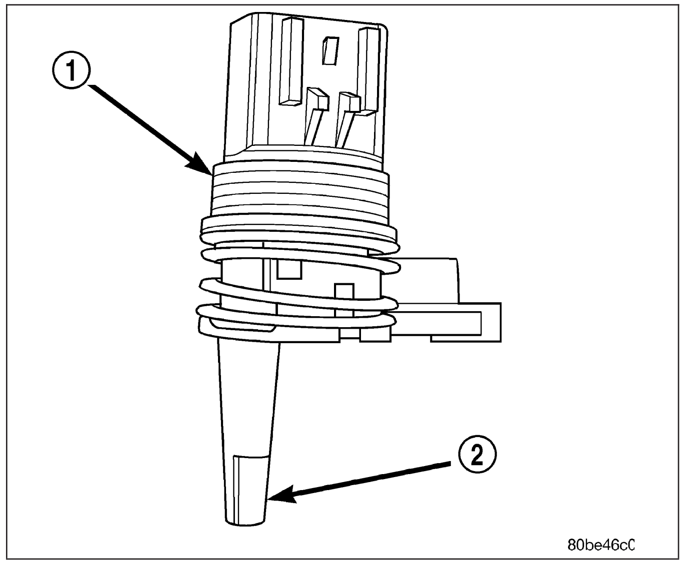
3. Install the manual shaft seal (1).
4. Install valve body to the transmission. (Refer to 21 - TRANSMISSION//AUTOMATIC - 42RLE/VALVE BODY - INSTALLATION)



# TRANSMISSION TEMPERATURE SENSOR

## DESCRIPTION

The transmission temperature sensor (2) is located in the transmission range sensor (1) and communicates transmission sump temperature to the TCM.



## OPERATION

The transmission range sensor (TRS) has an integrated thermistor that the TCM uses to monitor the transmission's sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in. The TCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission “overheat” condition exists. If the thermistor circuit fails, the TCM will revert to calculated oil temperature usage.

## CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

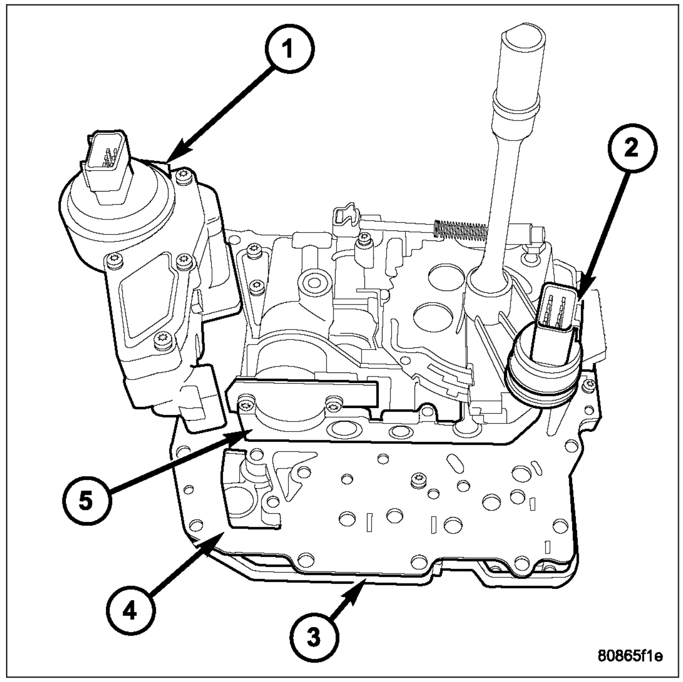
- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

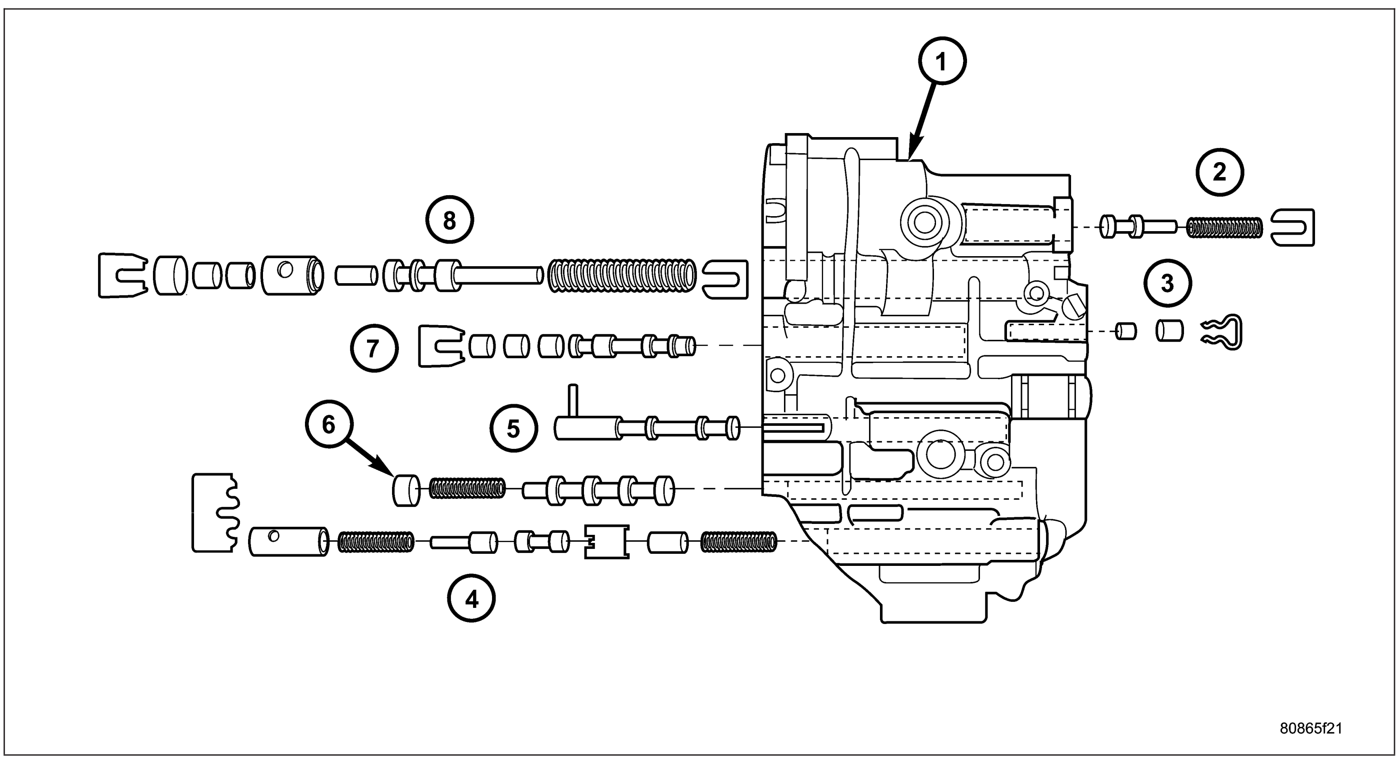
# VALVE BODY

## DESCRIPTION

The valve body assembly consists of a cast aluminum valve body (5), separator plate (4), and transfer plate (3). The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches.

Also mounted to the valve body assembly are the solenoid/pressure switch assembly and the transmission range sensor (2).





The valves contained within the valve body (1) include the following :

- Regulator valve (8)
- Solenoid switch valve (7)
- Manual valve (5)
- Converter clutch switch valve (6)
- Converter clutch control valve (4)
- Torque converter regulator valve (2)

- Low/Reverse switch valve (3)

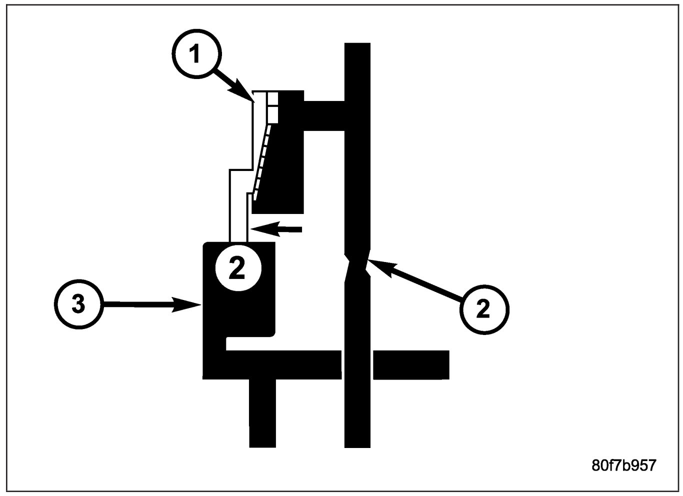
In addition, the valve body also contains the thermal valve, #2, 3, 4 & 5 check balls and the 2/4 accumulator assembly.

## OPERATION

**NOTE: (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS) for a visual aid in determining valve location, operation and design.**

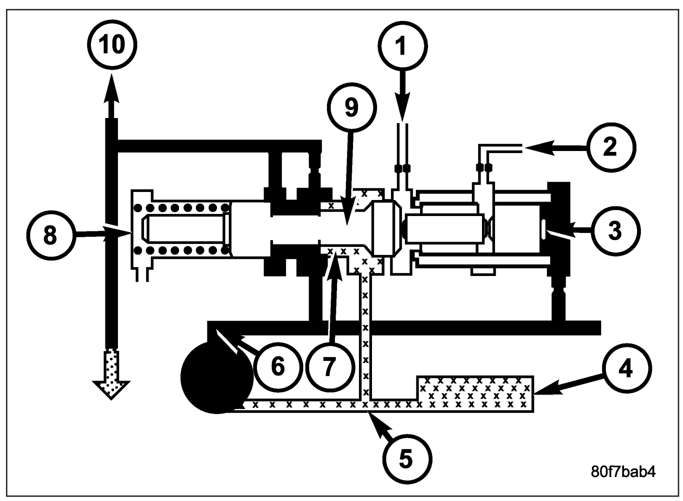
### THERMAL VALVE

The thermal valve (1) is a bi-metallic shudder valve that helps control the venting rate of oil pressure in the underdrive clutch passage during release of the clutch. When the oil temperature is approximately 20 degrees Fahrenheit or less, the valve is fully open to assist in venting oil past the U1 orifice (2). At temperatures above 20 degrees, the valve starts to close and becomes fully closed at approximately 140 degrees. The thermal valve is located in the transfer plate of the valve body.



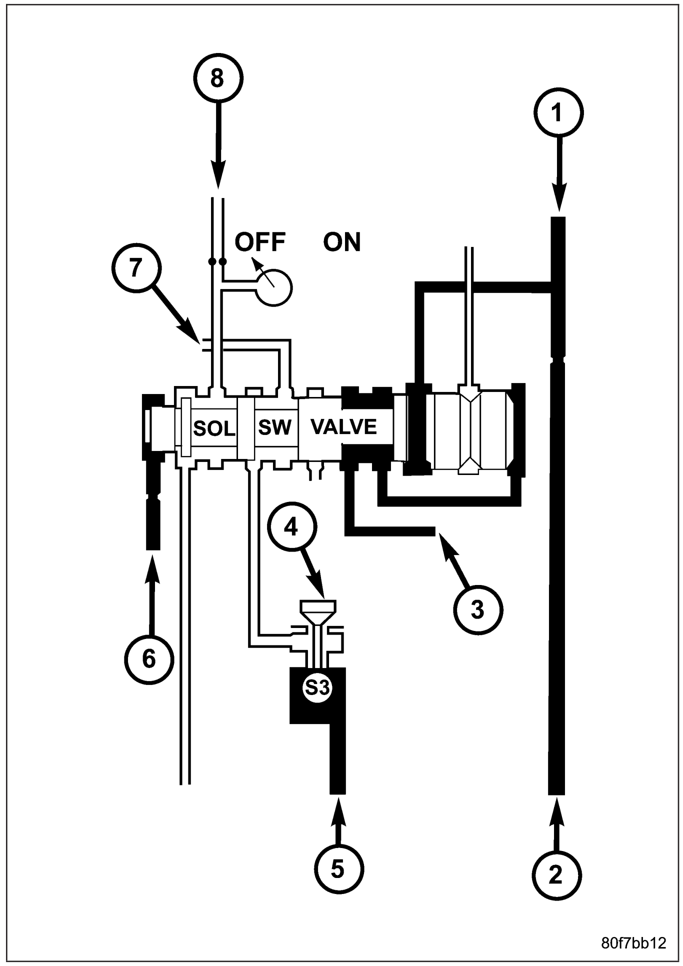
### REGULATOR VALVE

The regulator valve (9) controls hydraulic pressure in the transmission. It receives unregulated pressure from the pump (6), which works against spring tension (8) to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as "line pressure."



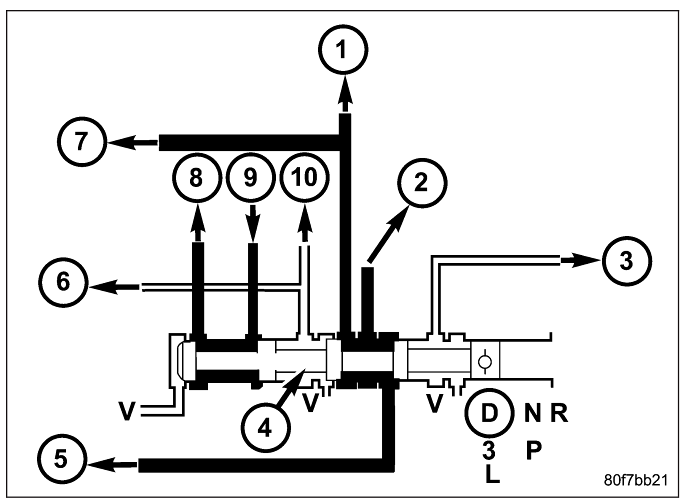
## SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid (4). In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves (7).



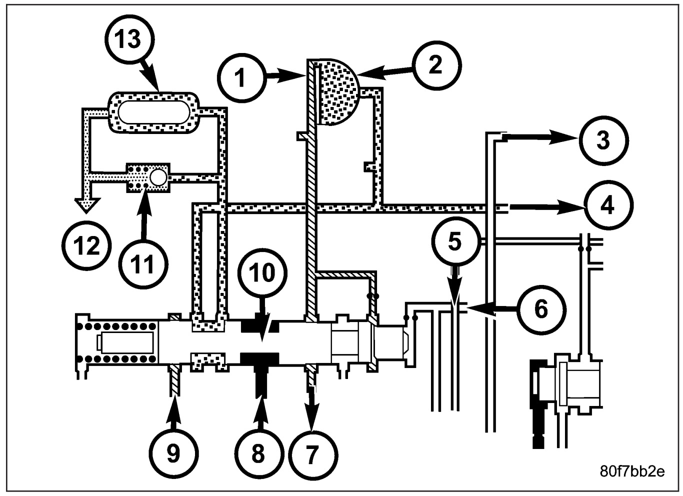
## MANUAL VALVE

The manual valve (4) is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.



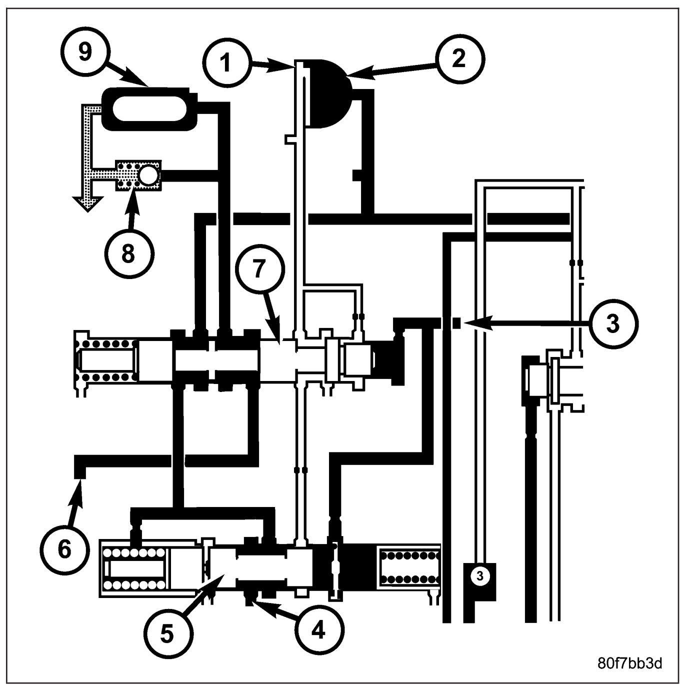
## CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve (10) is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve (5) is fed to the torque converter regulator valve (8). The pressure is then directed to the converter clutch switch valve (10) and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.



## CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve (5) controls the back (on) side of the torque converter clutch (1). When the controller energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve (5) and the converter control valve move, allowing pressure to be applied to the back side of the clutch.



## T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

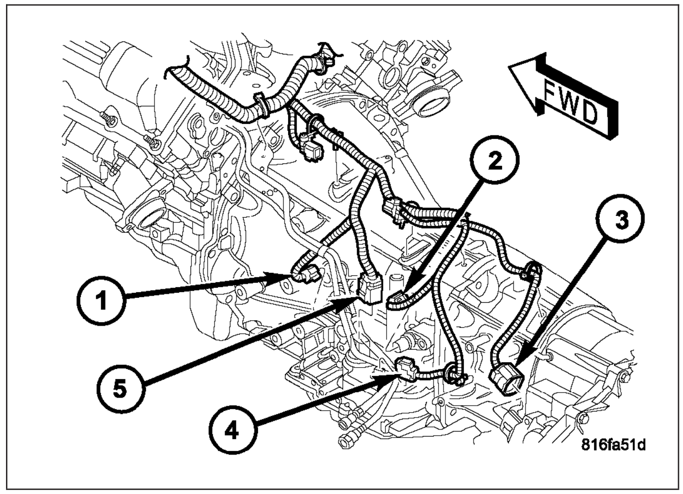
## LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under these operating conditions.

## REMOVAL

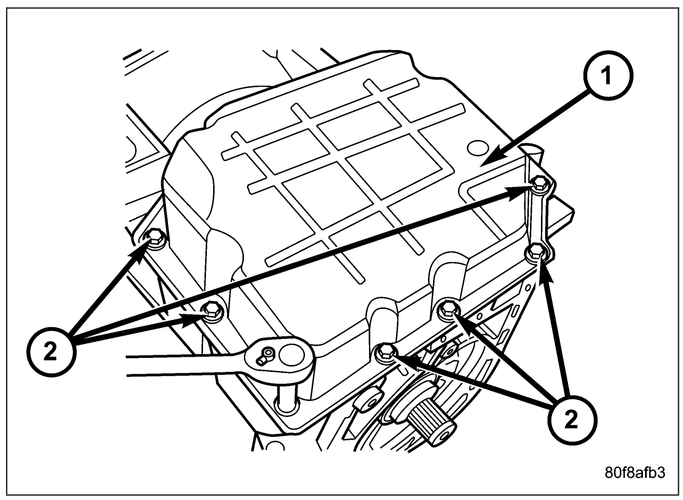
**NOTE: If valve body is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

1. Disconnect the transmission range sensor (5) and solenoid/pressure switch assembly wiring connectors.
2. Disconnect the variable line pressure connector (4), if equipped.
3. Disconnect the shift cable from the shift lever (at the transmission).
4. Move the manual shift lever clockwise as far as it will go. This should be one position past the L position. Then remove the manual shift lever.

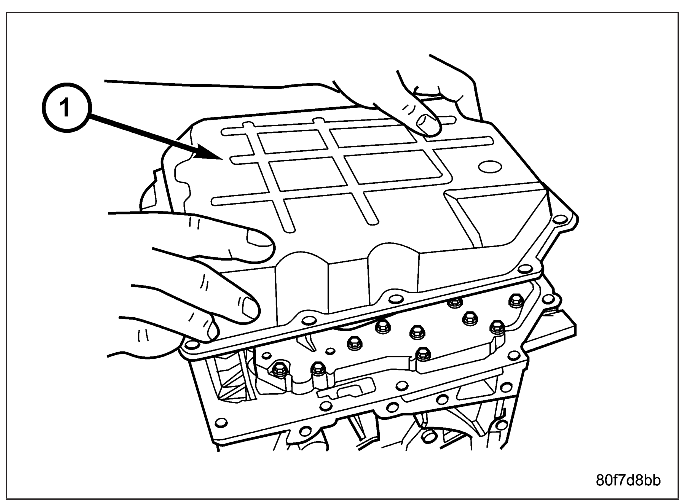


**NOTE: One of the oil pan bolts has a sealing patch applied from the factory. Separate this bolts for reuse.**

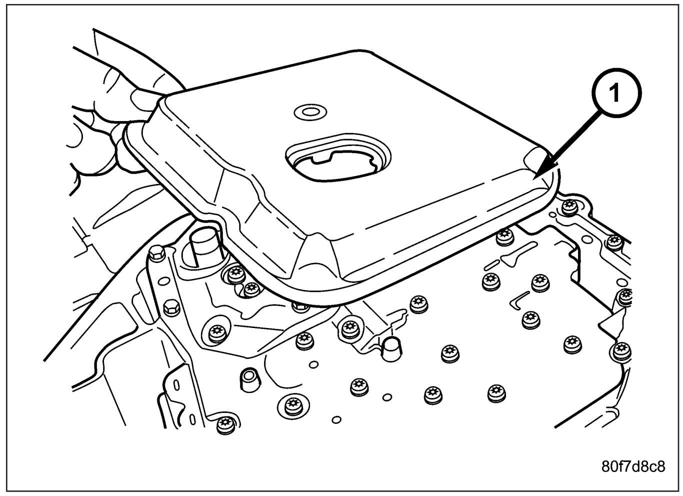
5. Remove transmission pan bolts (2).



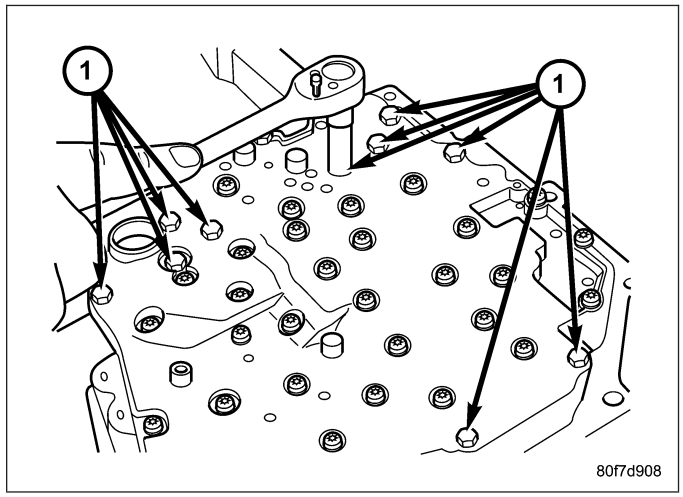
6. Remove transmission oil pan (1).



7. Remove oil filter (1) from valve body. It is held in place by two screws.

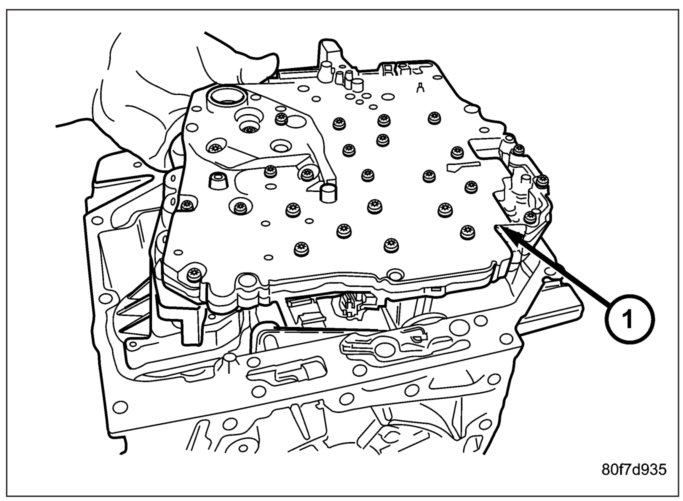


8. Remove valve body bolts-to-case (1).



**CAUTION: The overdrive and underdrive accumulators and springs may fall out when removing the valve body.**

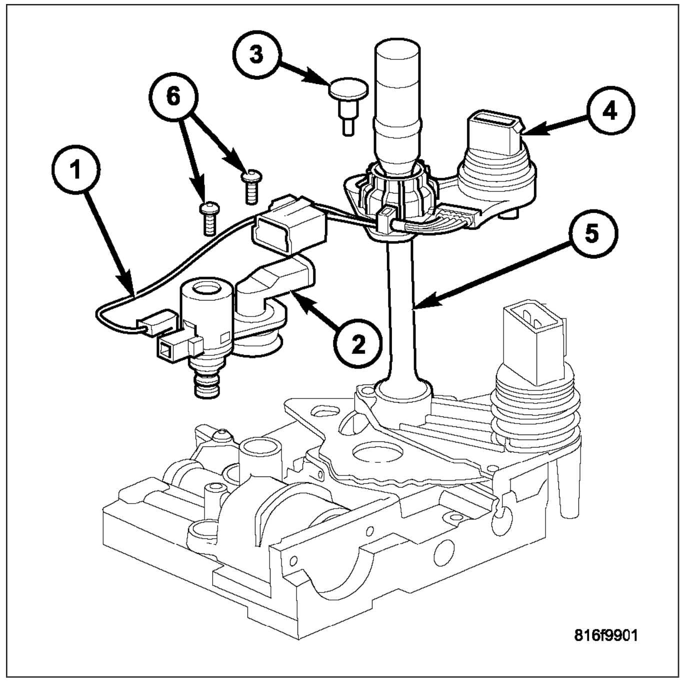
9. Carefully remove valve body assembly (1) from the transmission.



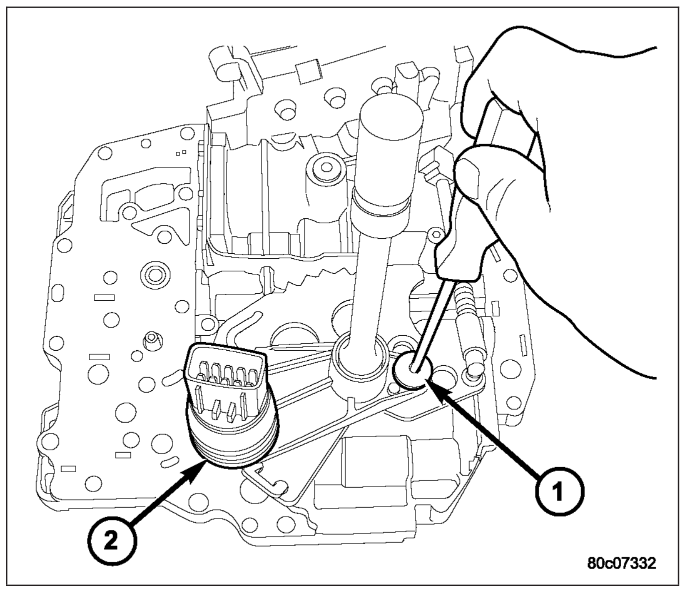
## DISASSEMBLY

**NOTE: If the valve body is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

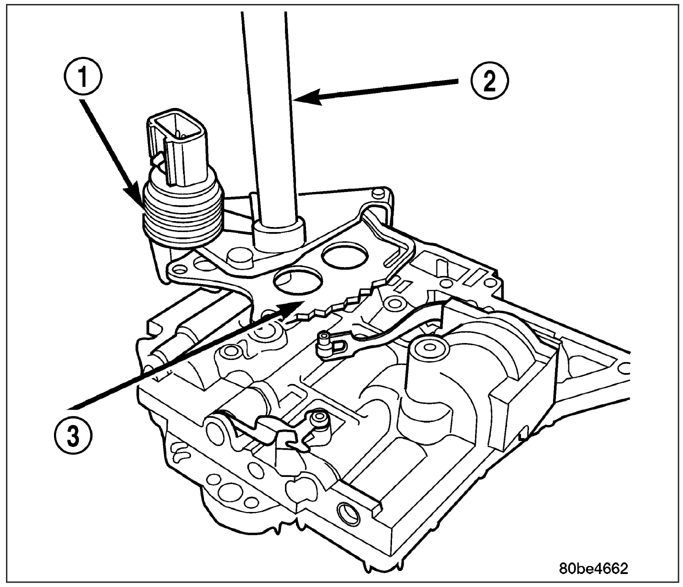
1. Remove the electrical connectors from the pressure control solenoid (1) and the line pressure sensor (2).
2. Remove the screws (6) holding the pressure control solenoid (1) and line pressure sensor (2) to the valve body.
3. Remove the pressure control solenoid and line pressure sensor from the valve body.
4. Remove the shoulder screw (3) holding the variable line pressure header (4) to the valve body.
5. Remove the variable line pressure header from the manual shaft (5).



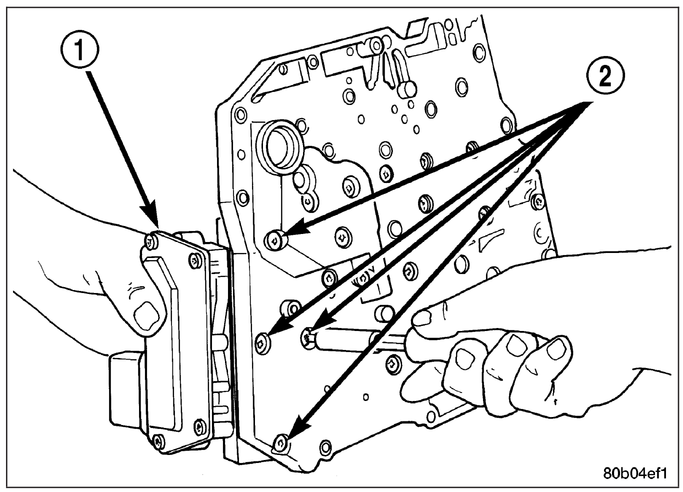
6. Remove manual shaft seal.
7. Remove manual shaft screw (1).



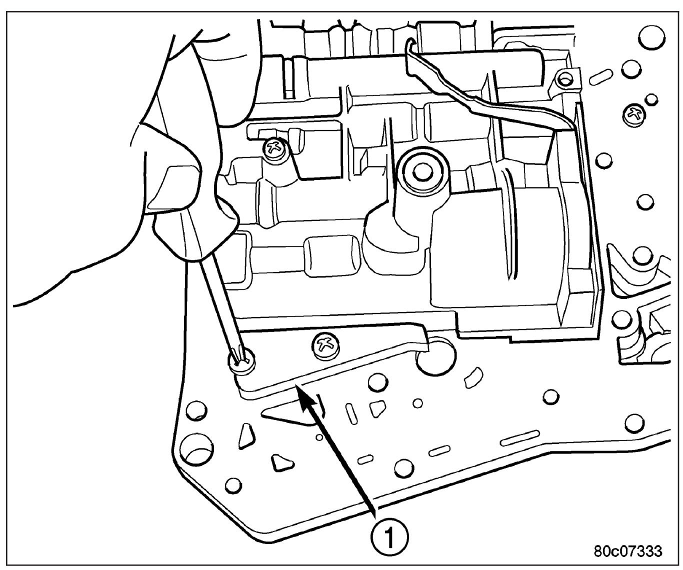
8. Remove Transmission Range Sensor (TRS) (1) and manual shaft (2).



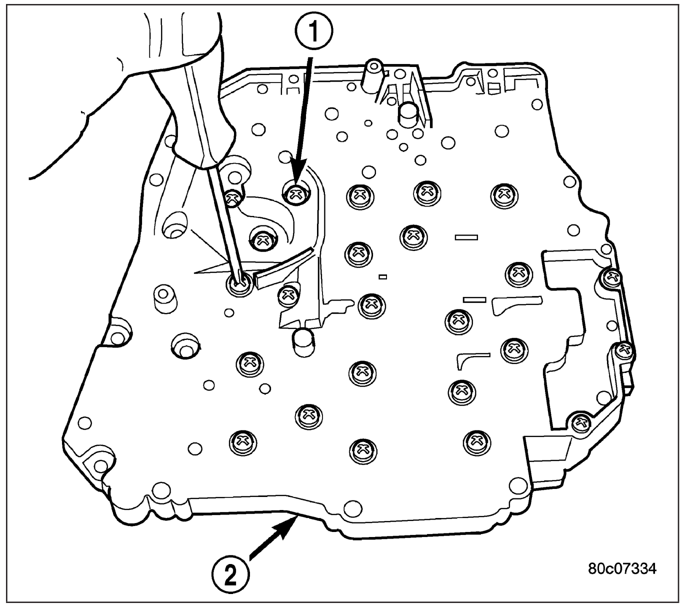
9. Remove Solenoid/Pressure Switch Assembly (1) from valve body.



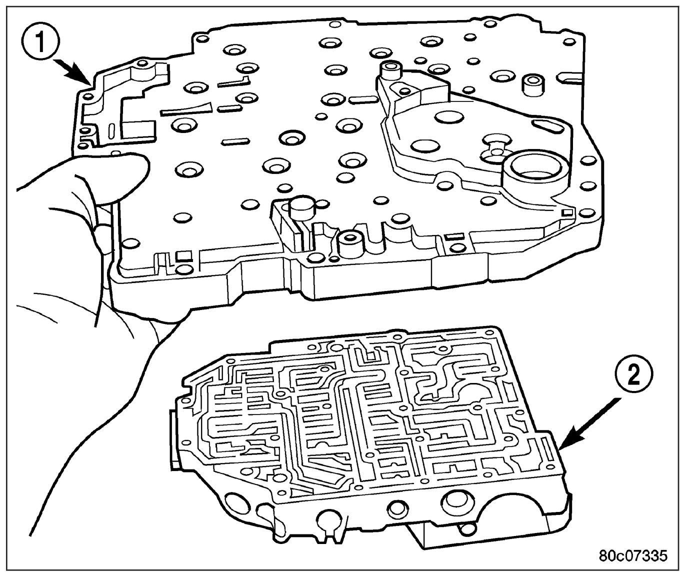
10. Remove valve body stiffener plate (1).



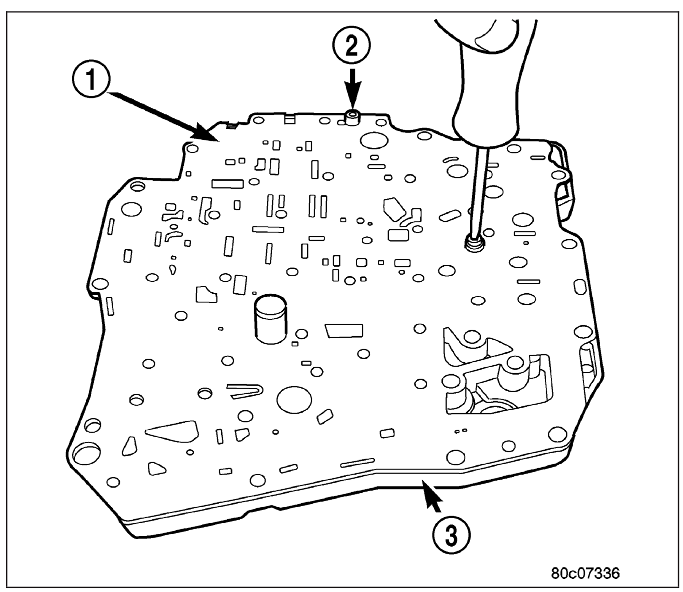
11. Invert valve body assembly and remove transfer plate-to-valve body screws (1).



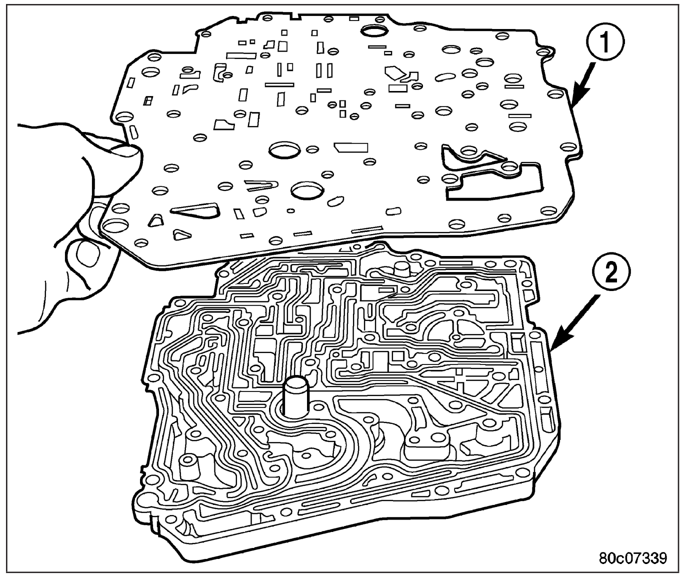
12. Remove transfer/separator plate (1) from valve body (2)



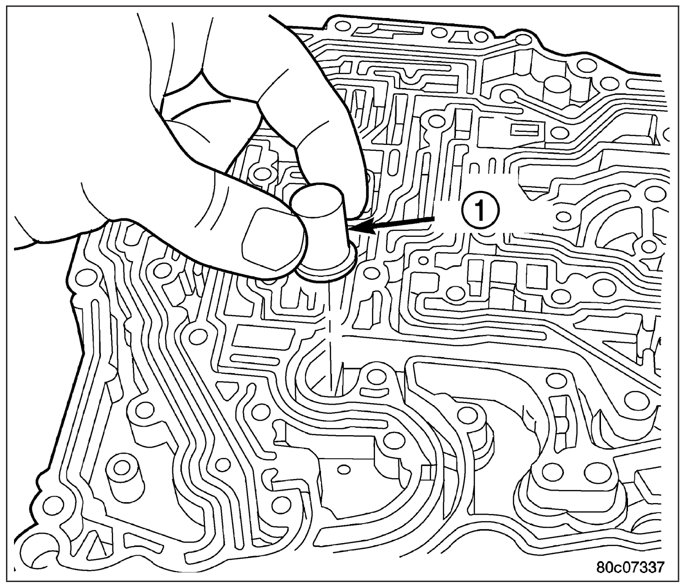
13. Remove separator plate-to-transfer plate screws (2).



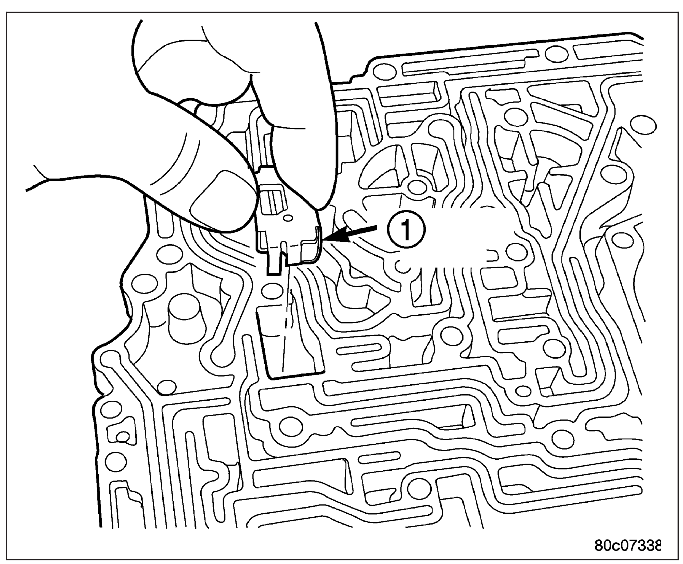
14. Remove separator plate (1) from transfer plate (2).

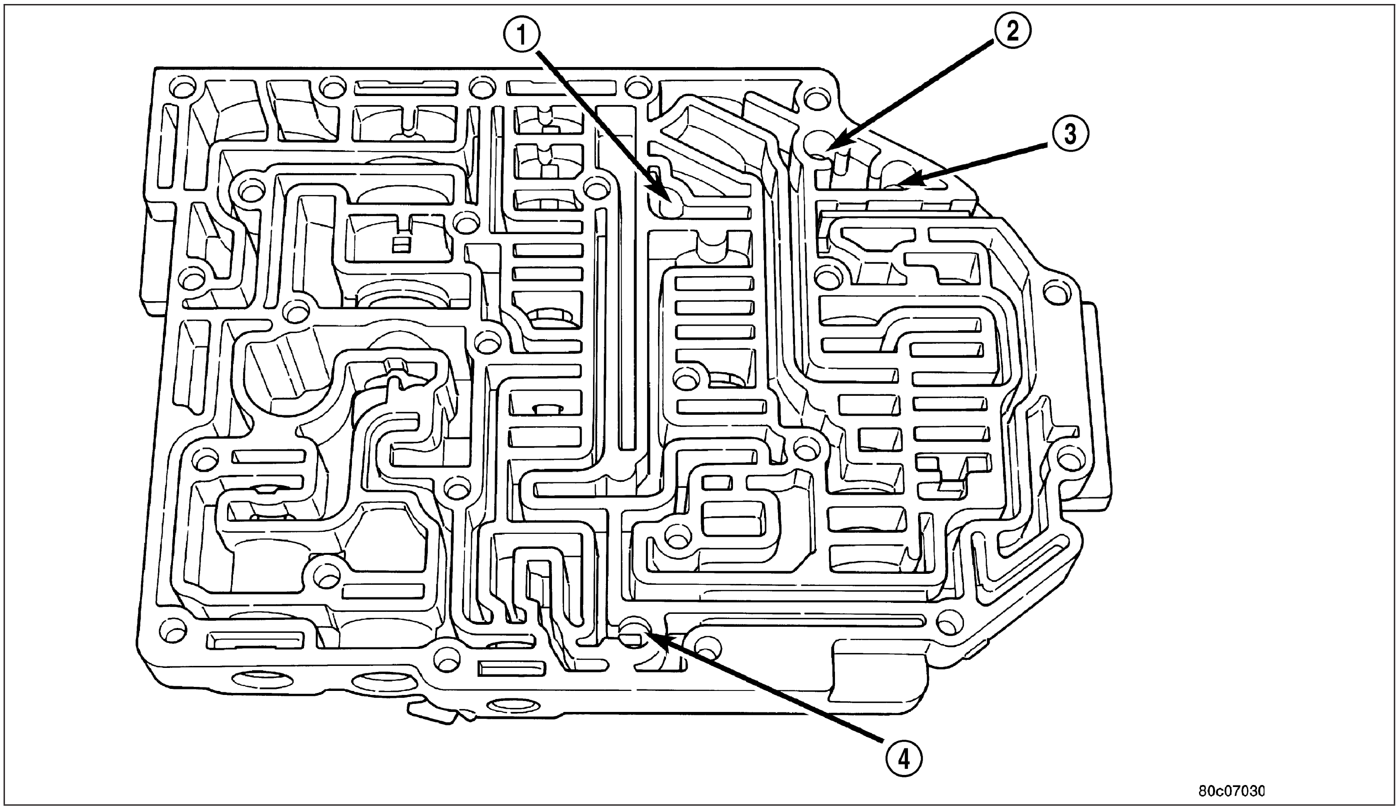


15. Remove the oil screen (1) from the transfer plate.

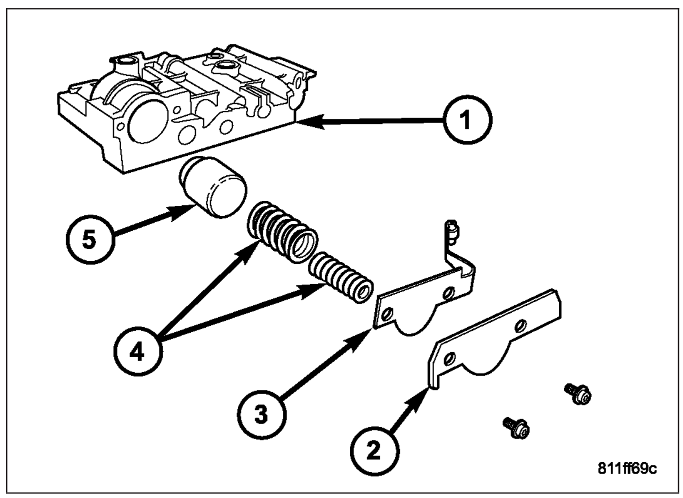


16. Remove thermal valve (1) from transfer plate.

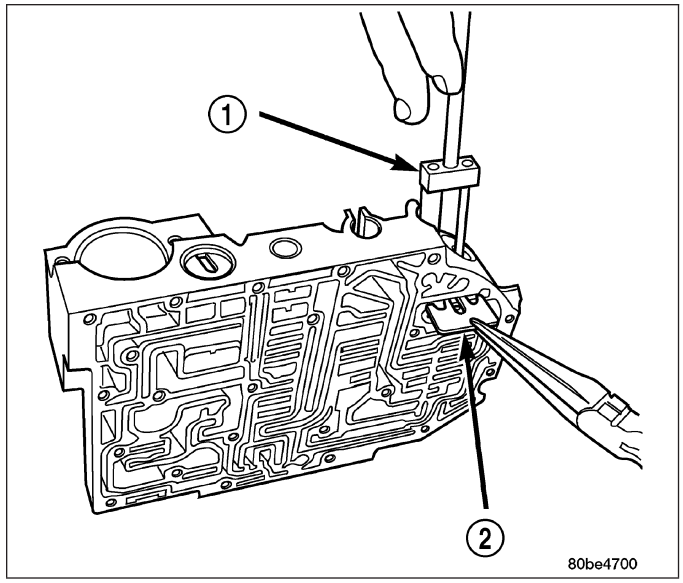




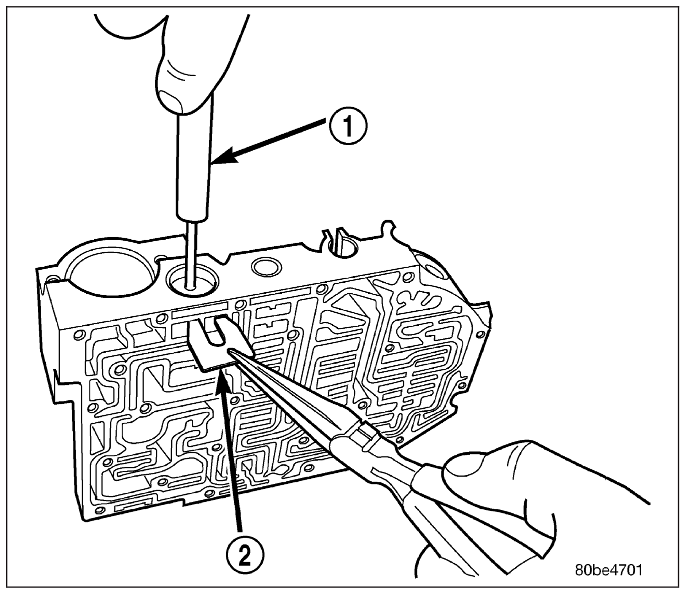
17. Remove valve body check balls (1-4). Note their location for assembly ease.
18. Remove 2/4 accumulator assembly (1-5).



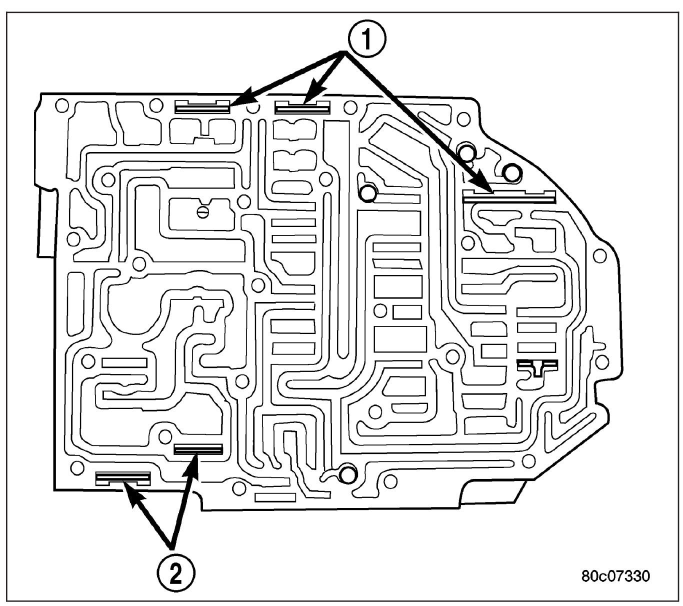
19. Remove dual retainer plate (2) from valve body. Use Remover/Installer 6301 (1) to remove plate (2).

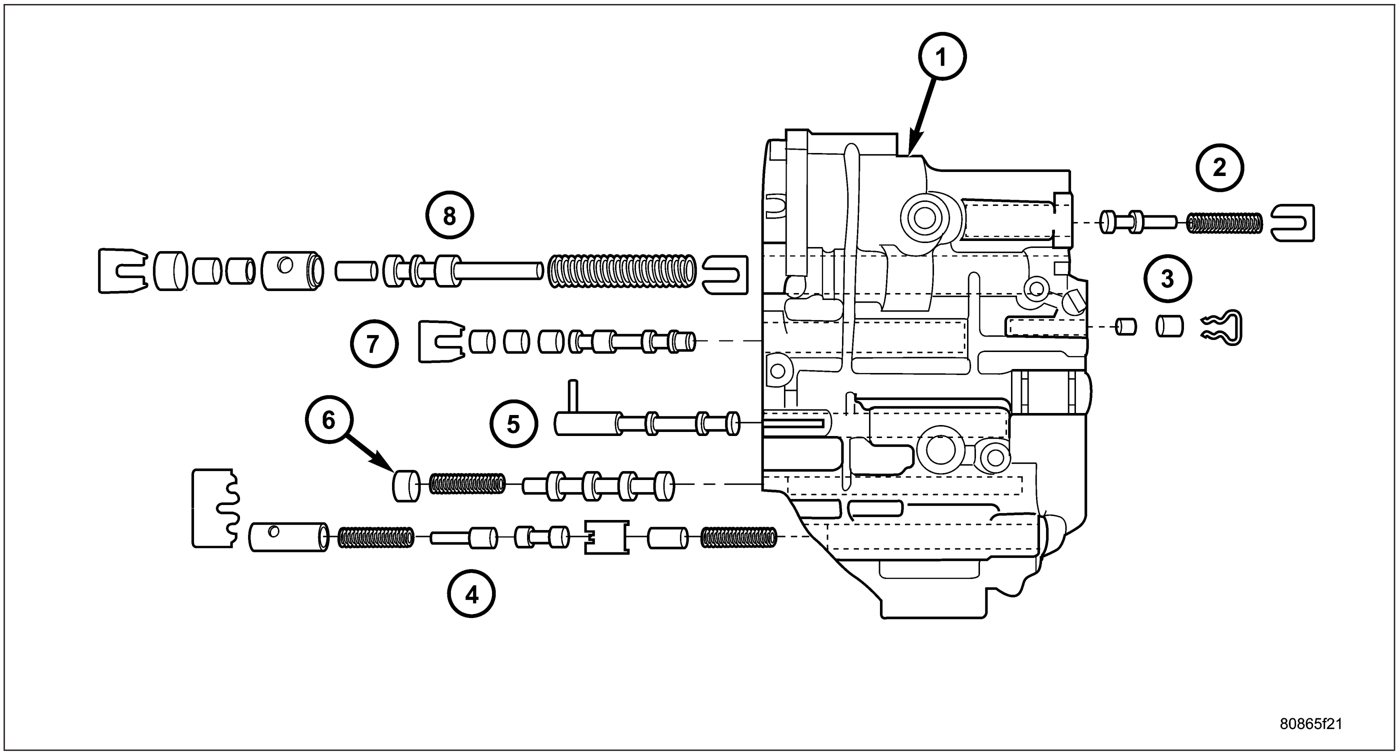


20. Remove regulator valve spring retainer (2).



21. Remove remaining retainers (1, 2).

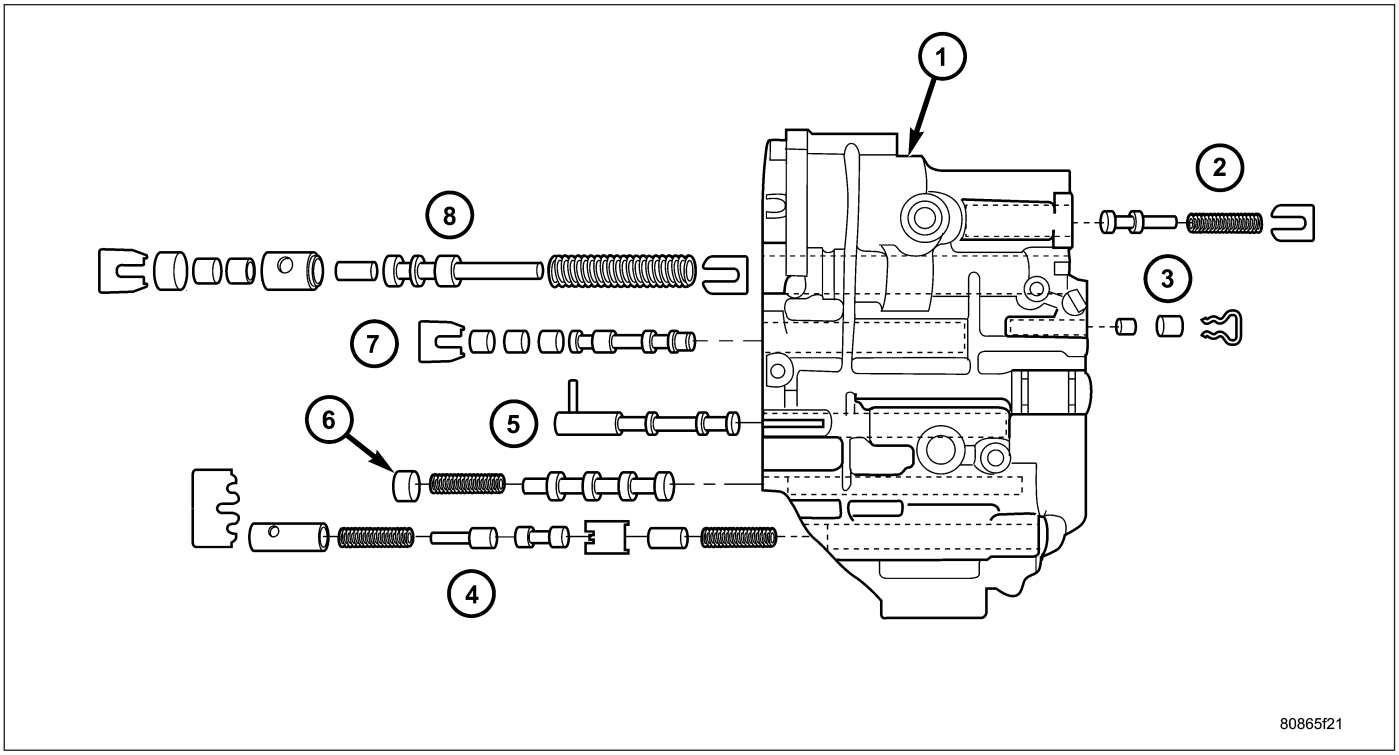




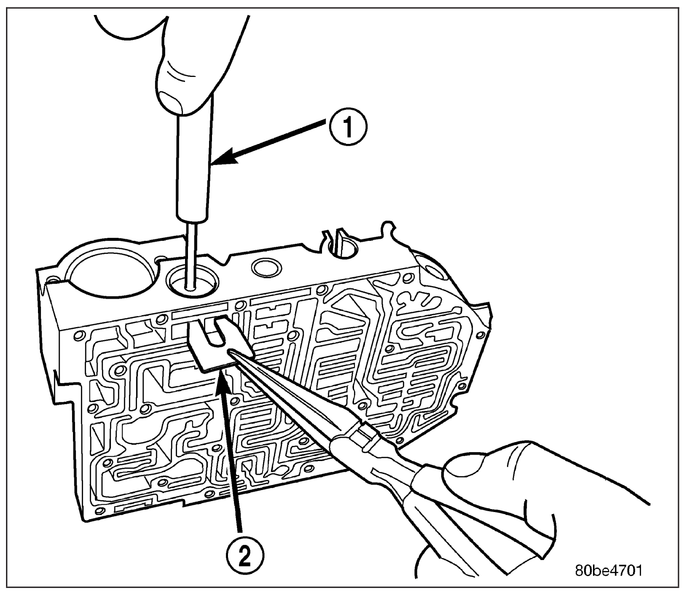
22. Remove all valves and springs.
23. Cleanliness through entire disassembly and assembly of the valve body cannot be overemphasized. When disassembling, each part should be washed in a suitable solvent, then dried by compressed air. **Do not wipe parts with shop towels.** All mating surfaces in the valve body are accurately machined; therefore, careful handling of all parts must be exercised to avoid nicks or burrs.

## ASSEMBLY

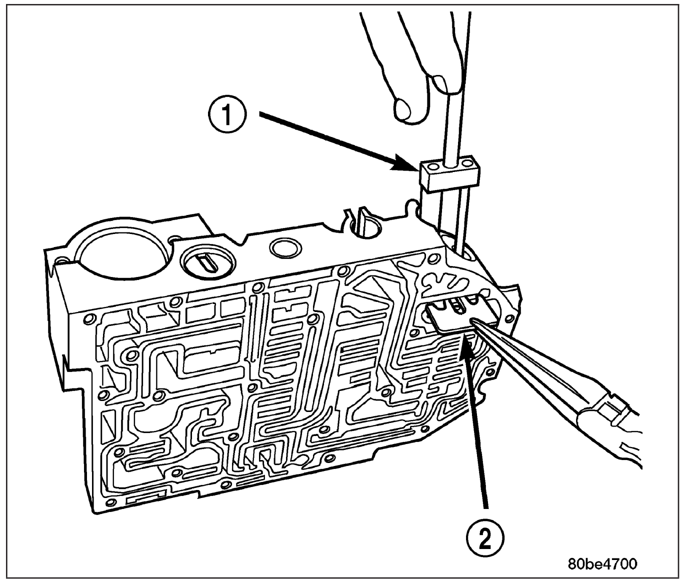
**NOTE: If the valve body assembly is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**



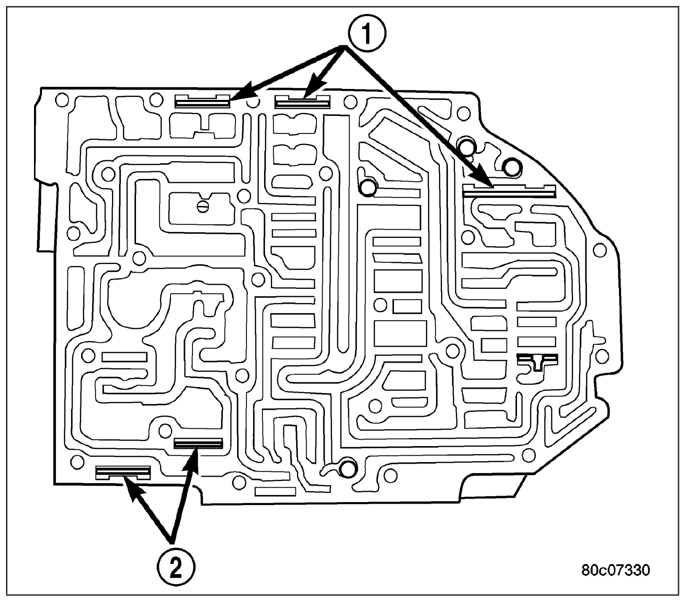
1. Install all valves and springs as shown.
2. Install regulator valve spring retainer (2).



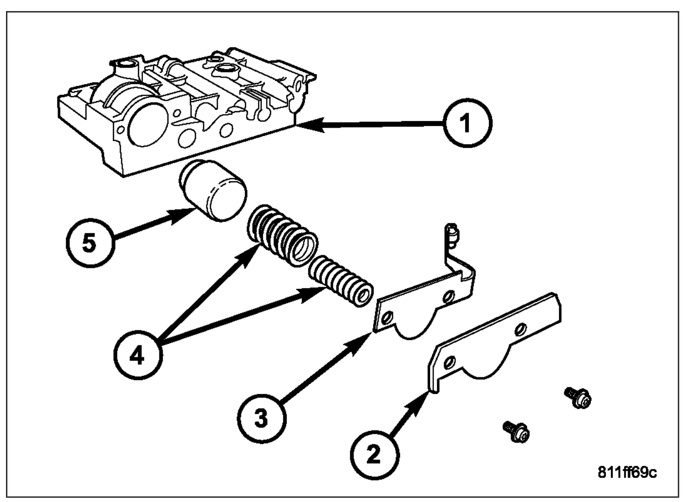
3. Install dual retainer plate (2) using Remover/Installer 6301 (1).

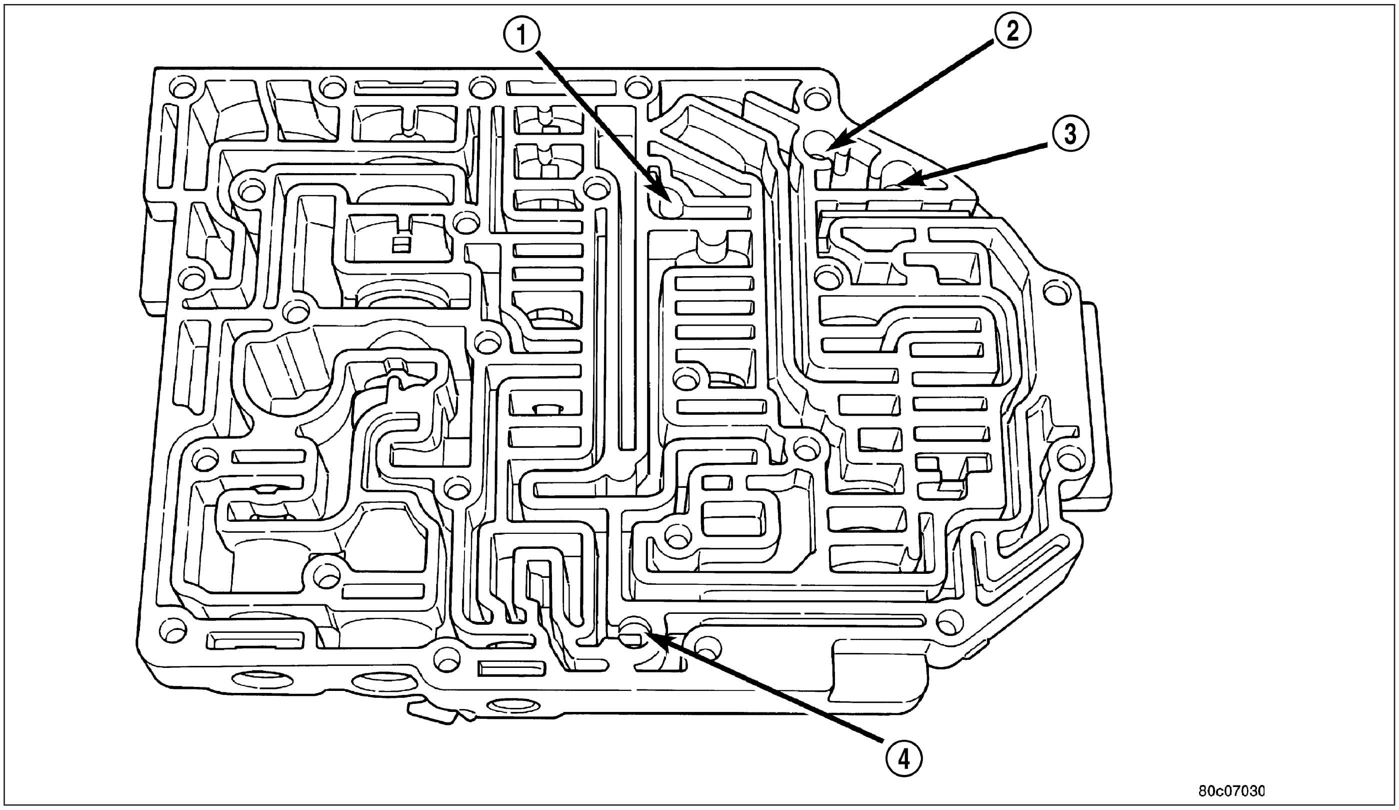


4. Verify that all retainers (1, 2) are installed as shown. Retainers should be flush or below valve body surface.

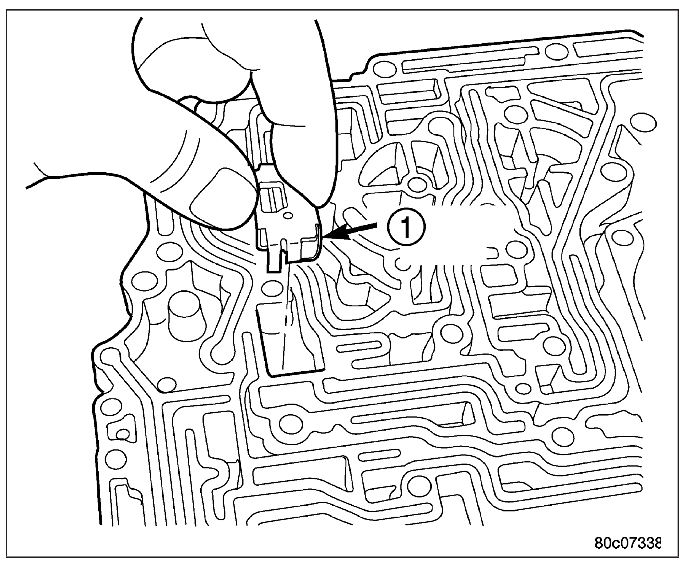


5. Install 2/4 Accumulator components (1-5) as shown. Torque 2/4 Accumulator retainer plate to 5 N·m (45 in. lbs.).

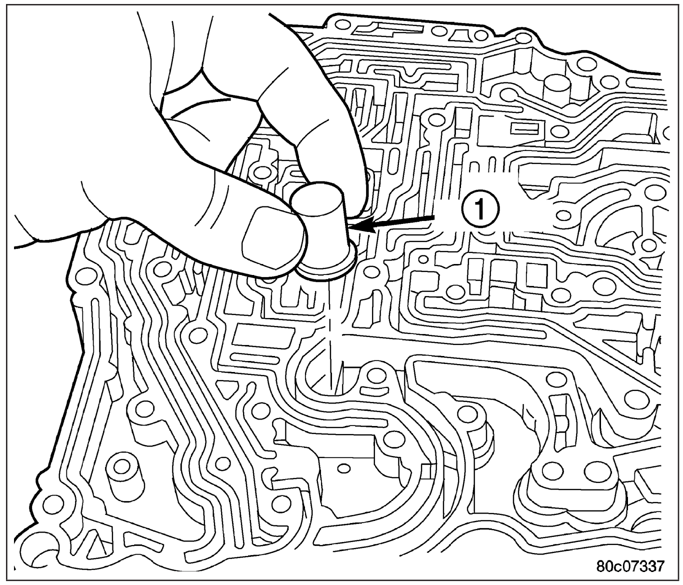




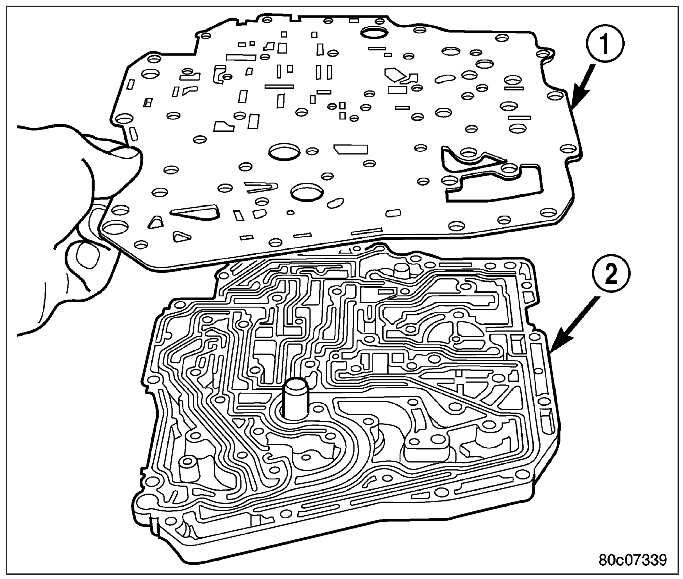
6. Install check balls into position as shown. If necessary, secure them with petrolatum or transmission assembly gel for assembly ease.
7. Install thermal valve (1) to the transfer plate.



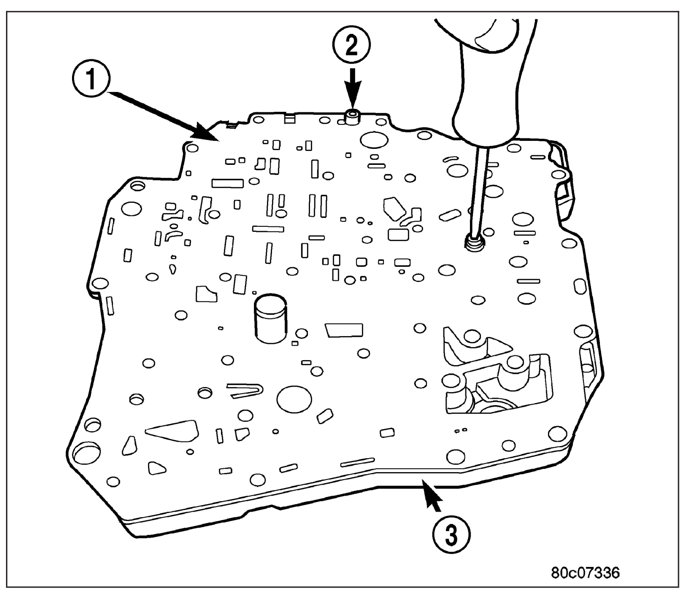
8. Install the oil screen (1) to the transfer plate.



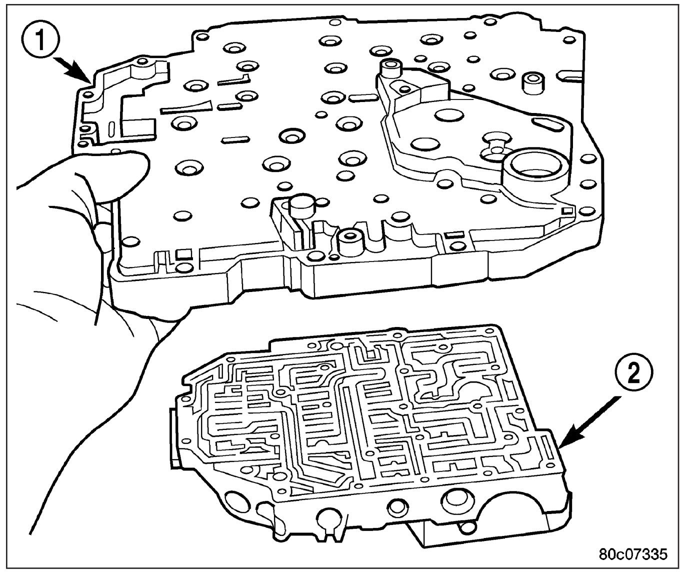
9. Install separator plate (1) to transfer plate (2).



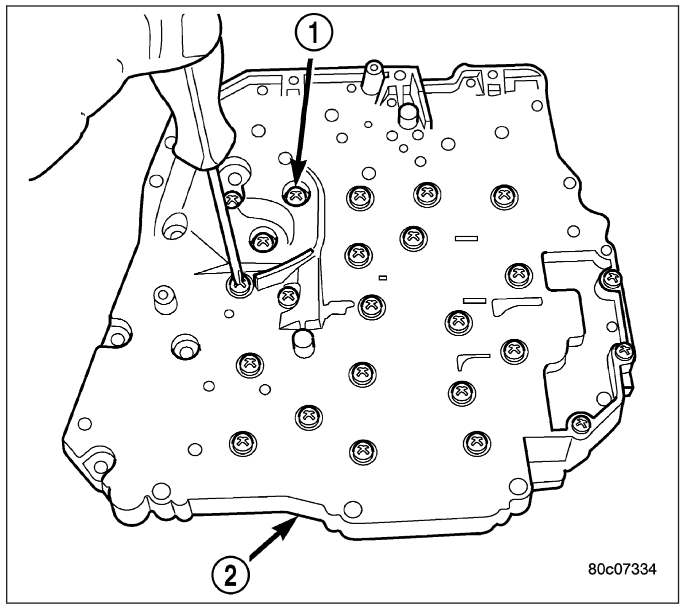
10. Install the two separator plate-to-transfer plate screws (2).



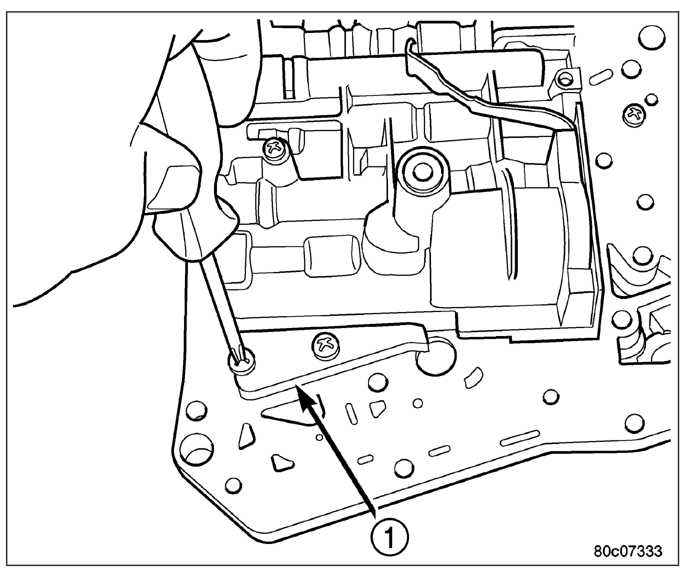
11. Install the transfer plate (1) to the valve body (2).



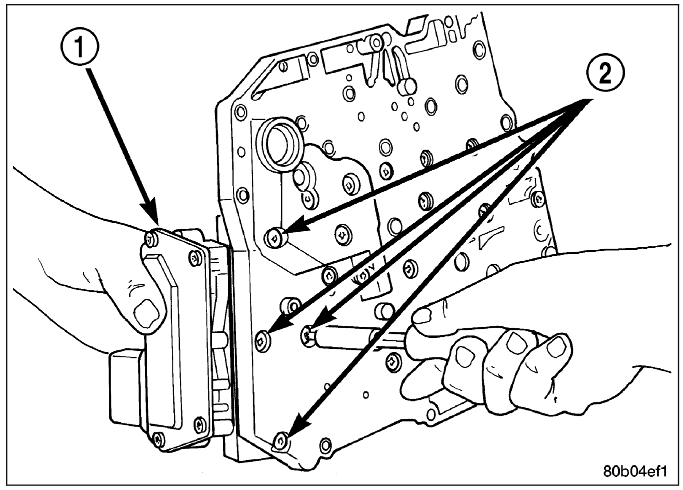
12. Install the transfer plate-to-valve body screws (1) and torque to 5 N·m (45 in. lbs.).



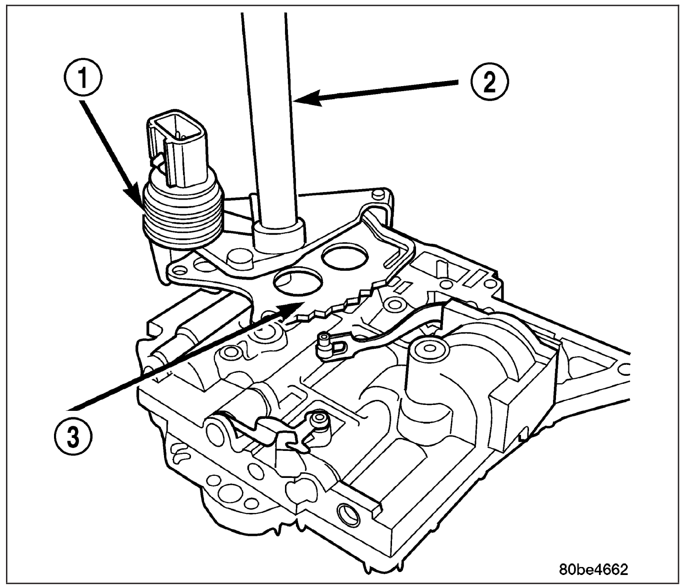
13. Install the stiffener plate (1).



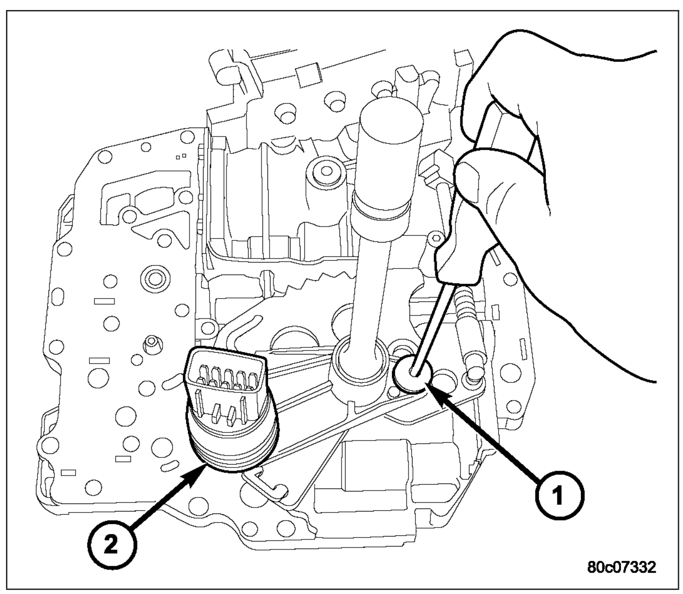
14. Install the solenoid/pressure switch assembly (1) and screws to the transfer plate and torque to 5.5 N·m (50 in. lbs.).



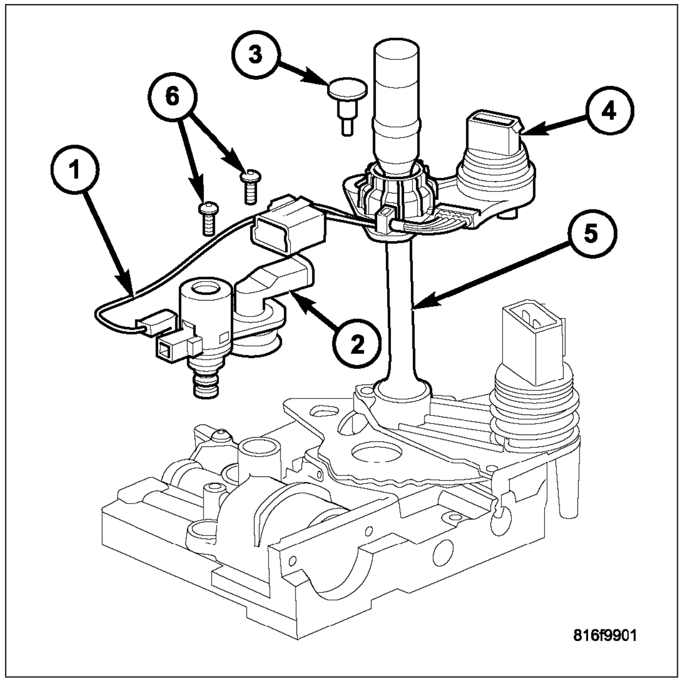
15. Install the manual shaft/rooster comb (3) and transmission range sensor (1) to the valve body.



16. Install the TRS/manual shaft retaining screw (1) and torque to 5 N·m (45 in. lbs.).
17. Install manual shaft seal.

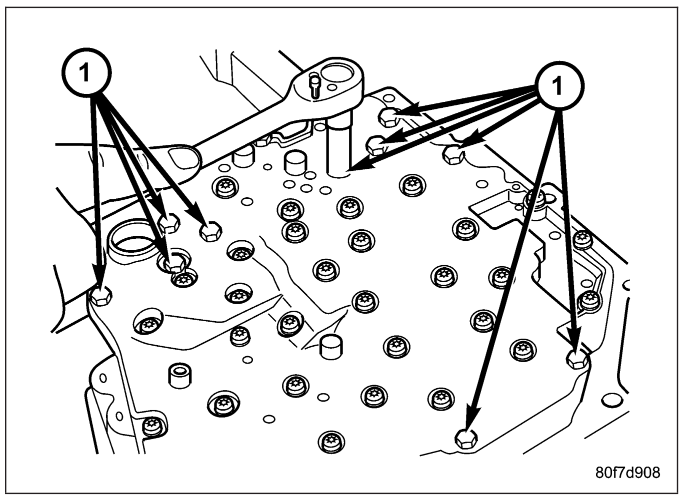


18. Install the variable line pressure header onto the manual shaft (5).
19. Install the shoulder screw (3) to hold the variable line pressure header (4) to the valve body.
20. Install the pressure control solenoid and line pressure sensor into the valve body.
21. Install the screws (6) to hold the pressure control solenoid (1) and line pressure sensor (2) to the valve body.
22. Install the electrical connectors to the pressure control solenoid (1) and the line pressure sensor (2).

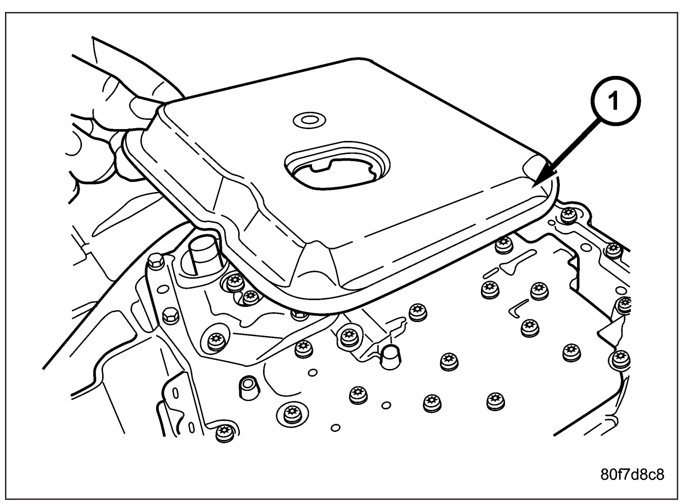


## INSTALLATION

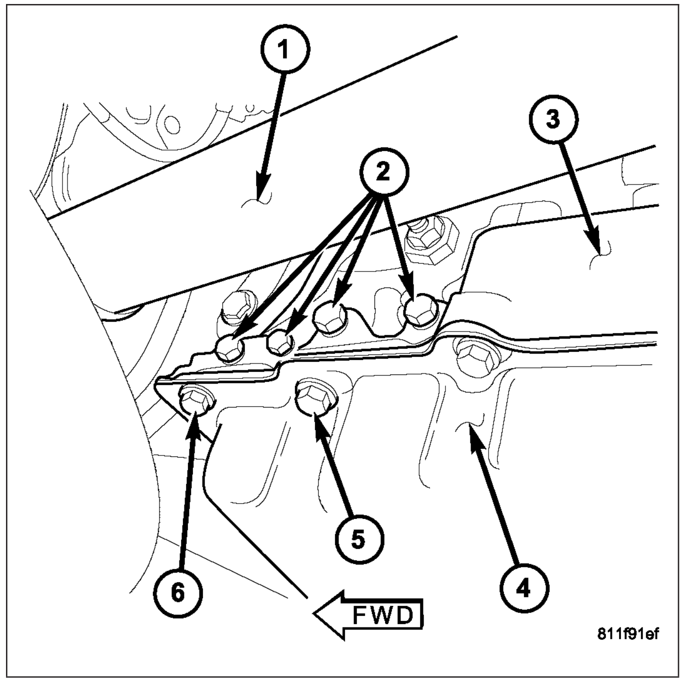
1. Install valve body into position and start bolts (1). Torque valve body to transmission case bolts (1) to 12 N·m (105 in. lbs.) torque.



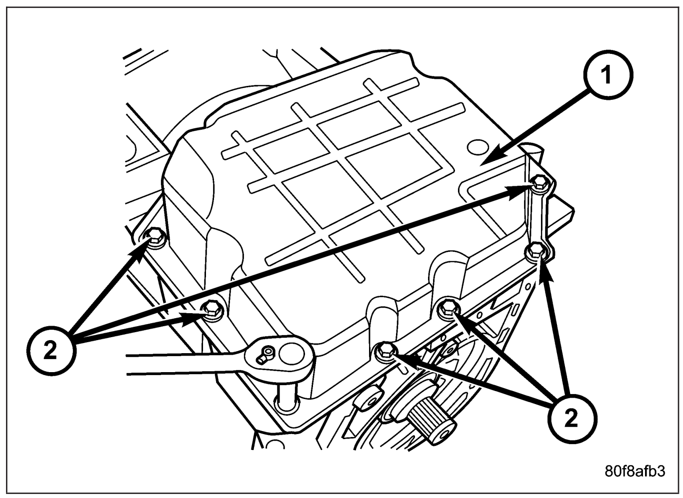
2. Install transmission oil filter (1).



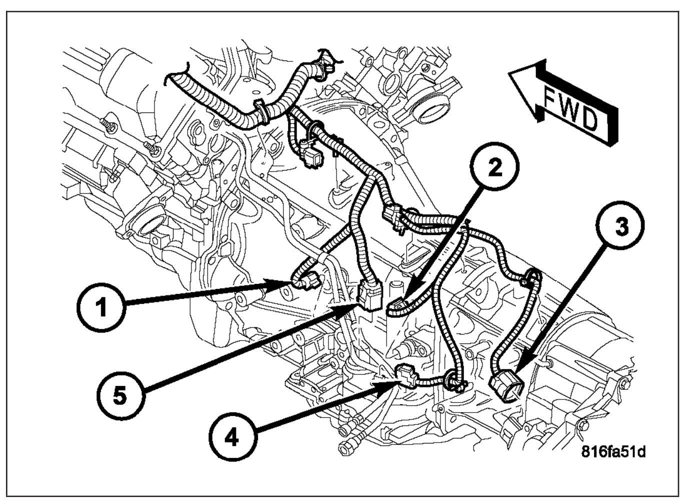
**NOTE: Before installing the oil pan bolt in the bolt hole (5) located between the torque converter clutch on and U/D clutch pressure tap circuits, it will be necessary to replenish the sealing patch on the bolt using MOPAR® Lock & Seal Adhesive.**



3. Make sure oil pan (1) and case rail are clean and dry. Install an 1/8” bead of RTV to the transmission oil pan and install to case. Tighten bolts (2) to 20 N·m (14.5 ft. lbs.).



4. Lower vehicle and connect the transmission range sensor (5) connector.
5. Connect solenoid/pressure switch assembly connector.
6. Connect the variable line pressure connector (4), if equipped.
7. Lower vehicle.
8. Fill transmission with ATF+4, Automatic Transmission Fluid. Verify proper fluid level. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/FLUID - STANDARD PROCEDURE)



**NOTE: If the valve body has been reconditioned or replaced, it is necessary to perform the Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

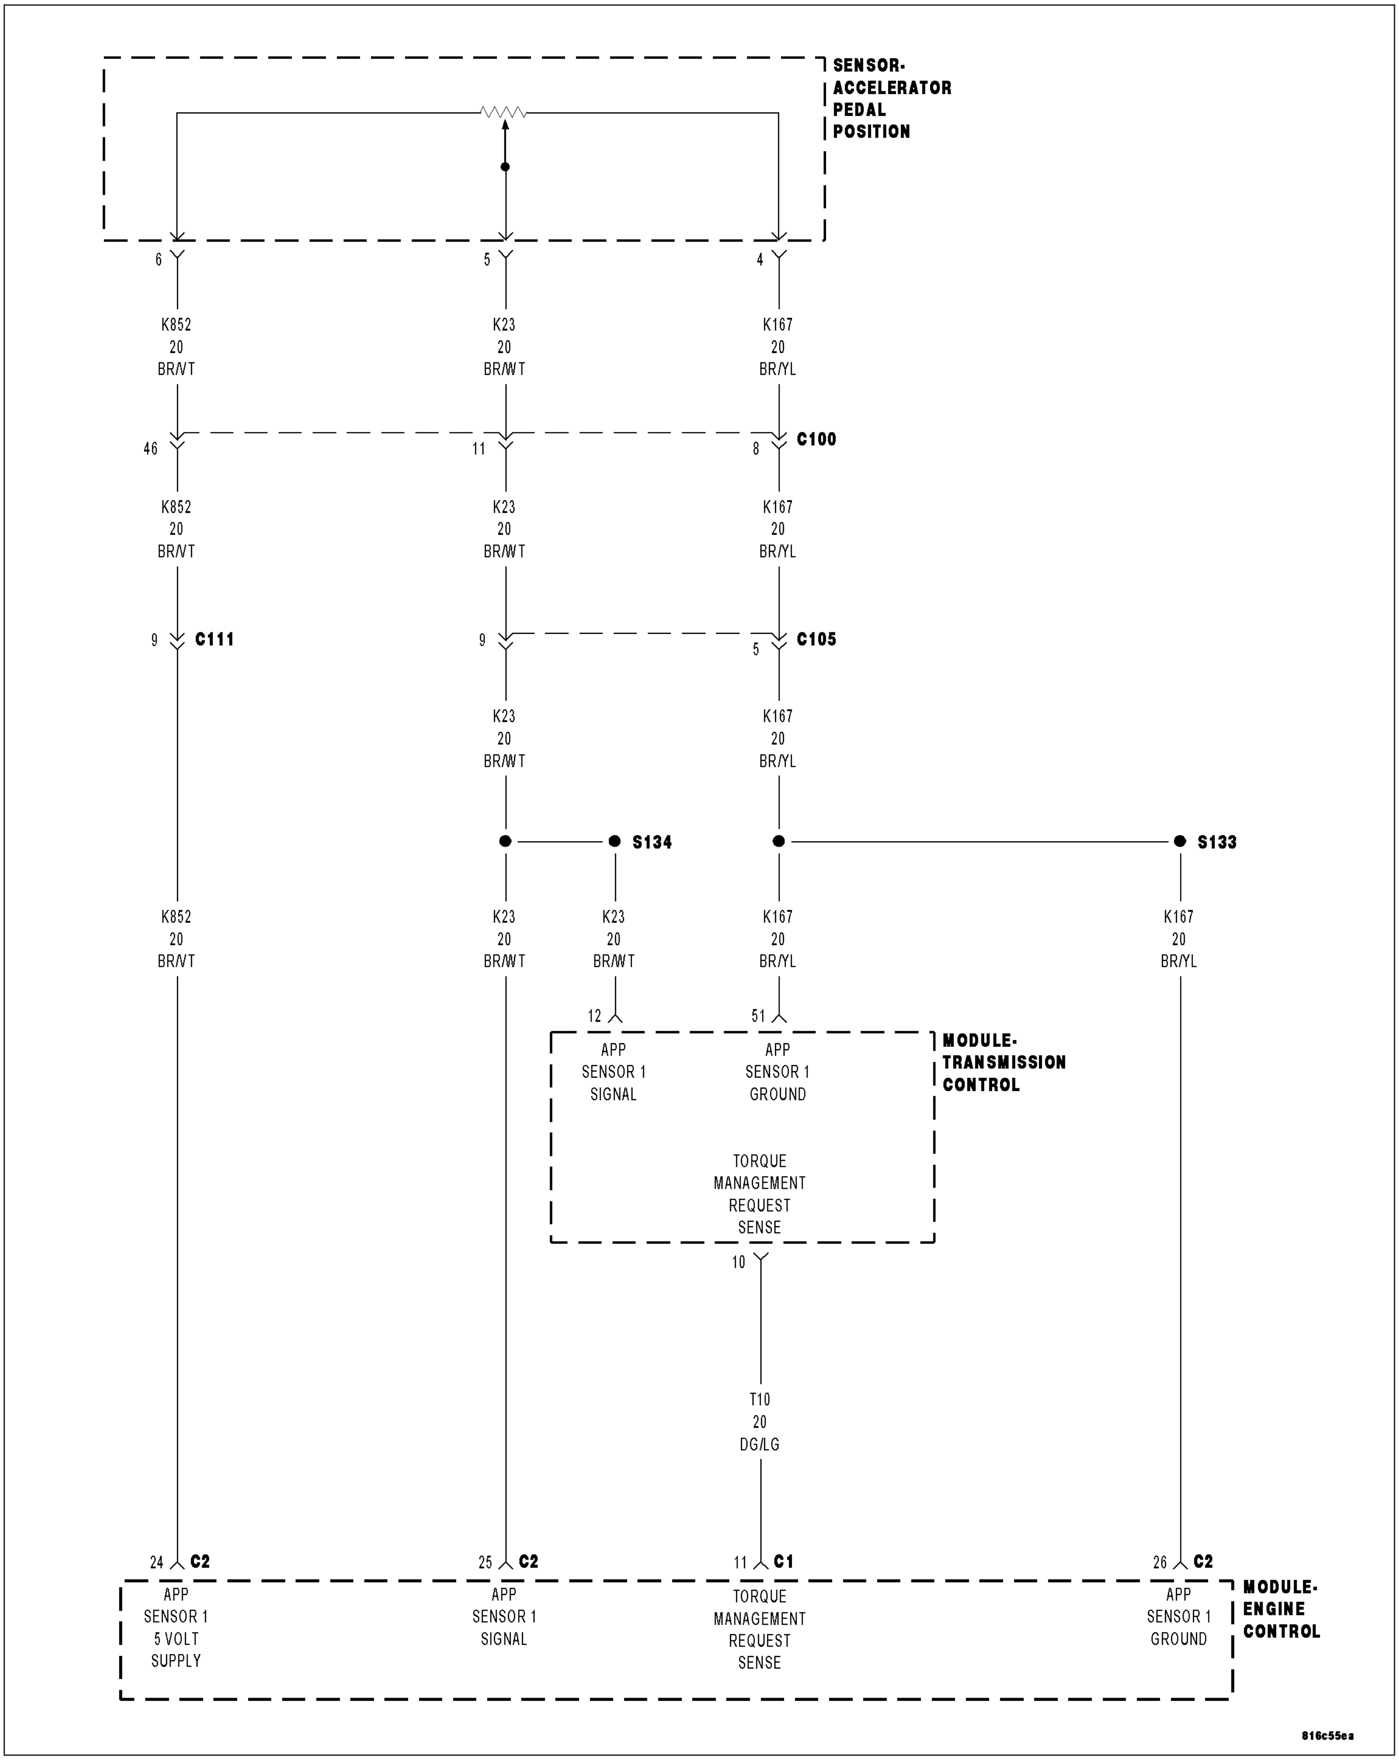
# AUTOMATIC TRANSMISSION 545RFE - ELECTRICAL DIAGNOSTICS - (DIESEL)

## TABLE OF CONTENTS

# AUTOMATIC TRANSMISSION 545RFE - ELECTRICAL DIAGNOSTICS - (DIESEL)

## DIAGNOSIS AND TESTING

## P0122-TPS/APP CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set if the monitored APPS voltage drops below 0.078 volts for the period of 0.48 seconds.

| Possible Causes |
|---|
| (K23) APP SENSOR 1 SIGNAL CIRCUIT OPEN |
| (K23) APP SENSOR 1 SIGNAL CIRCUIT SHORT TO GROUND |
| ACCELERATOR PEDAL POSITION SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the ECM and the TCM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the ECM and the TCM to calculate the throttle position.

## Diagnostic Test

### 1. CHECK IF RELATED ENGINE TPS/APPS DTC'S ARE PRESENT

With the scan tool, check Engine DTC's.

**Are there any Engine TPS/APPS DTCs present?**

**Yes** >> Refer to the Drivability Category and perform the appropriate Symptom.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK TO SEE IF THE DTC IS CURRENT

With the scan tool in Transmission Sensors, read the TPS/APPS voltage.

**Is the TPS/APPS voltage below 0.1 volts?**

**Yes** >> Go To 3

**No** >> Go To 6

### 3. ACCELERATOR PEDAL POSITION SENSOR

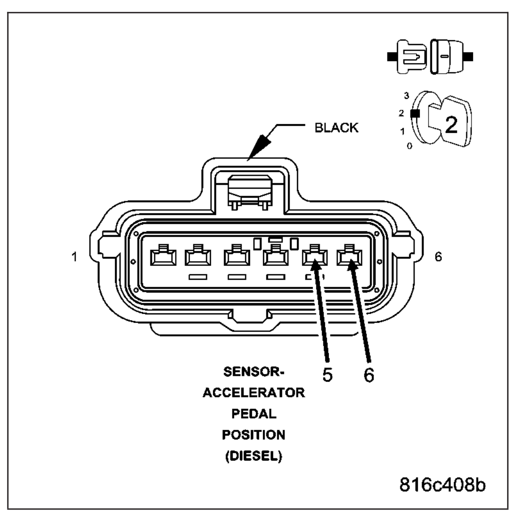
Turn the ignition off to the lock position.

Disconnect the APP Sensor harness connector.

Connect a jumper wire between the (K852) 5-volt Supply circuit and the (K23) APP Sensor 1 Signal circuit.

Ignition on, engine not running.

With the scan tool in Transmission Sensors, read the TPS/APPS voltage.



**Is the TPS/APPS voltage above 4.5 volts?**

**Yes** >> Replace the Accelerator Pedal Position Sensor per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANS-

AXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

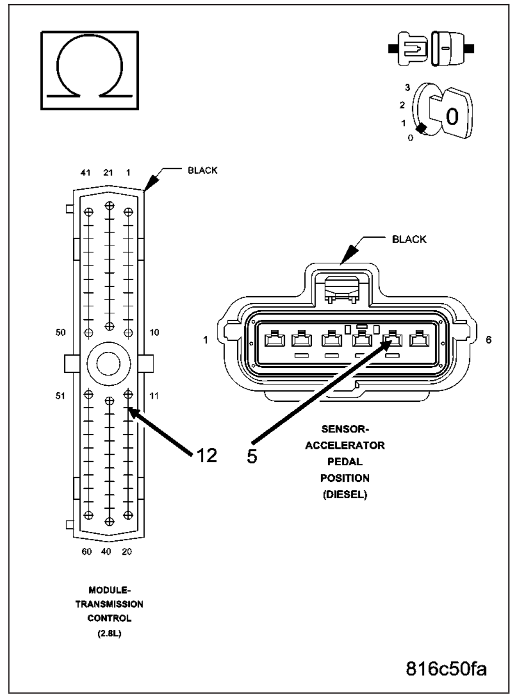
**No** >> Go To 4

## 4. (K23) APP SENSOR 1 SIGNAL CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Measure the resistance of the (K23) APP Sensor 1 Signal circuit between the TCM harness connector and the APP Sensor harness connector.



**Is the resistance above 5.0 ohms?**

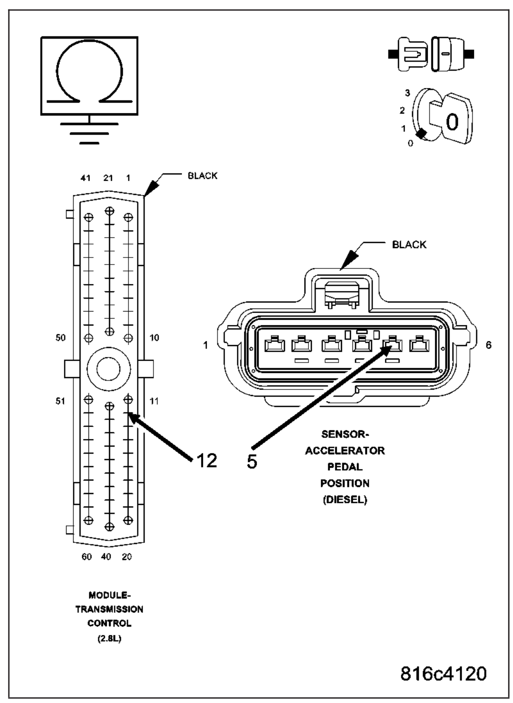
**Yes** >> Repair the (K23) APP Sensor 1 Signal circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (K23) APP SENSOR 1 GROUND CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (K23) APP Sensor 1 Signal circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (K23) APP Sensor 1 Signal circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Engine Control Module (ECM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the ECM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

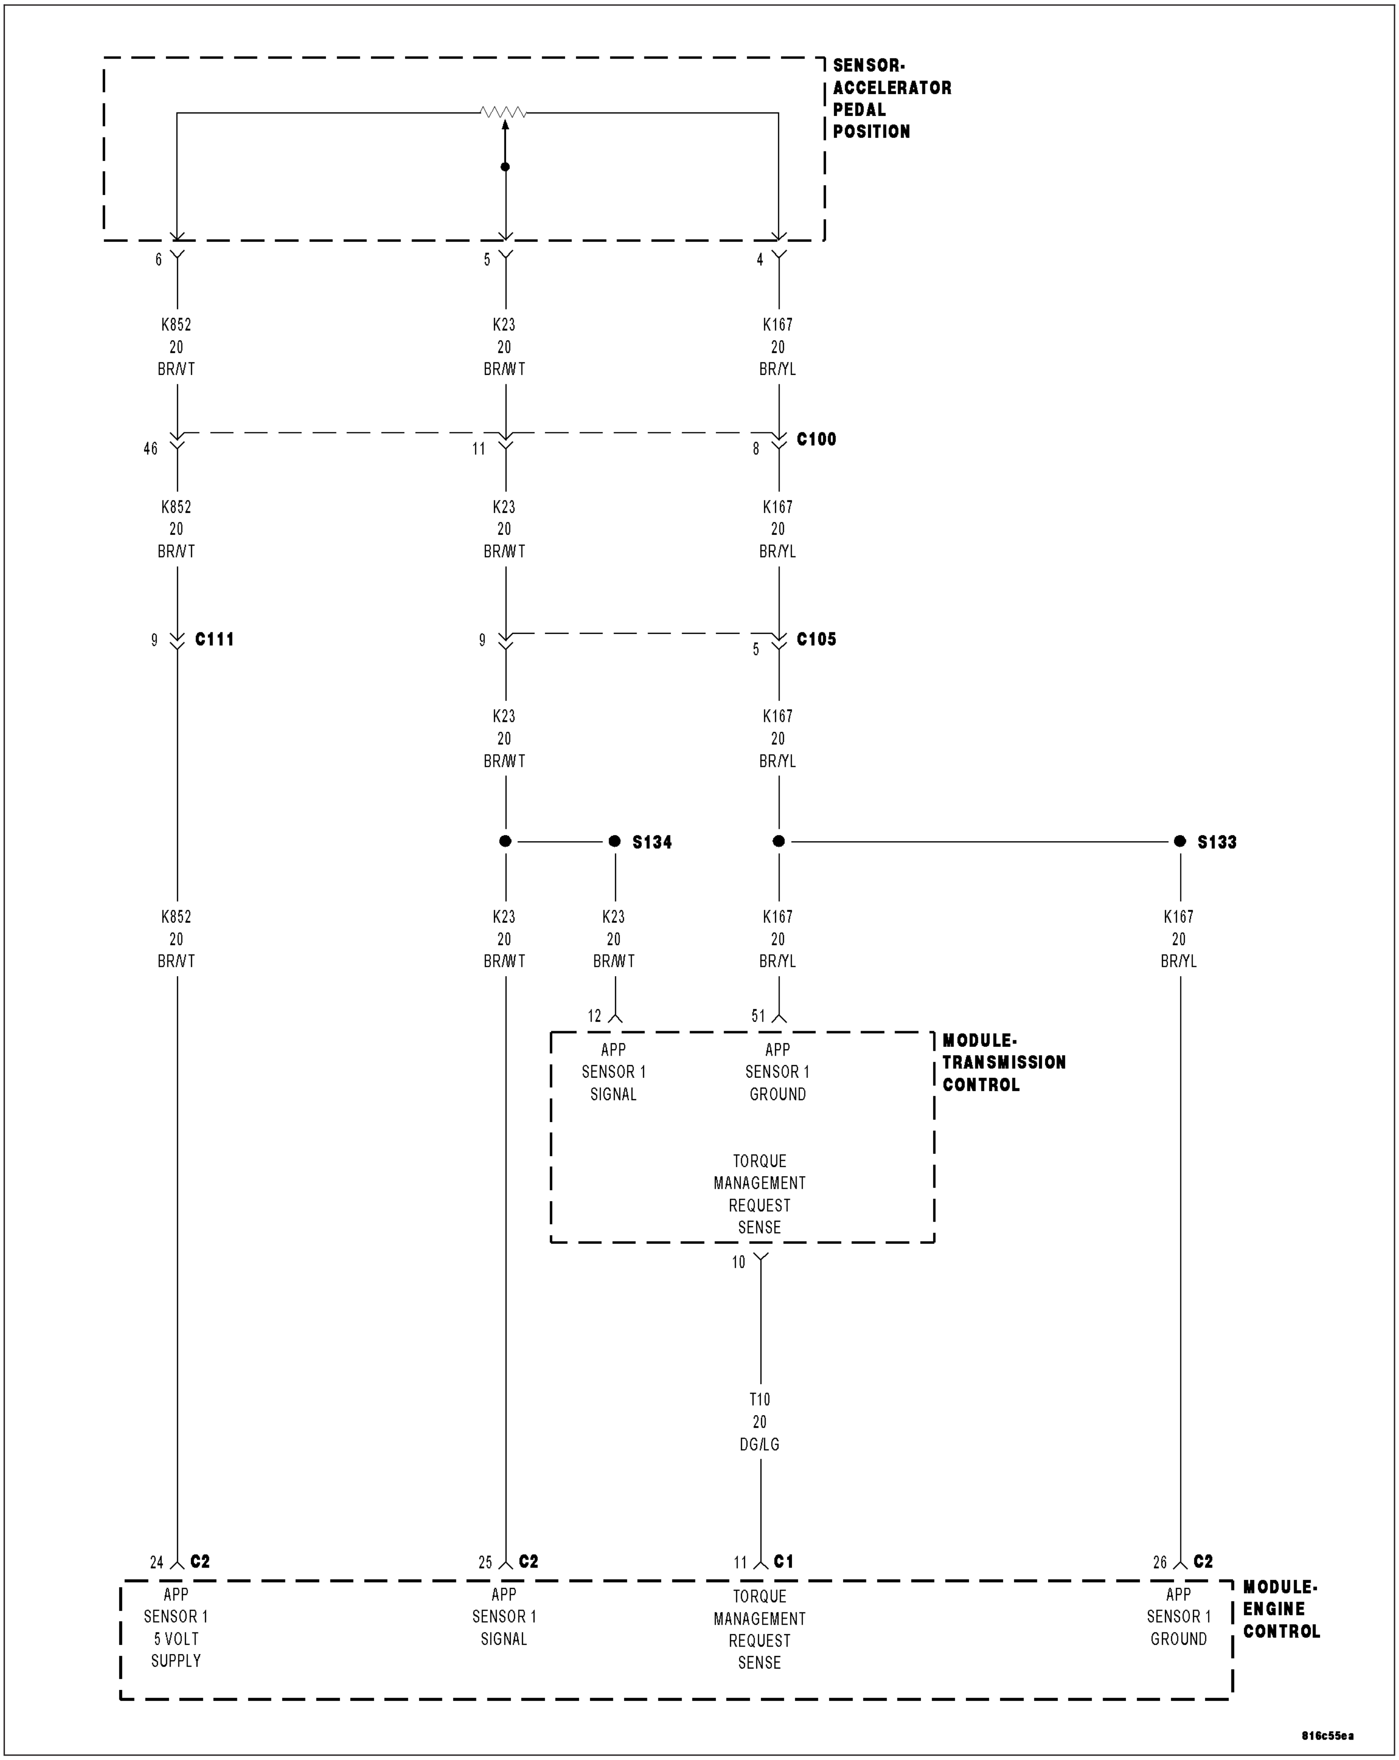
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0123-TPS/APP CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set if the monitored TPS voltage rises above 4.94 volts for the period of 0.48 seconds.

| Possible Causes |
| --- |
| RELATED ENGINE TPS/APPS DTC'S PRESENT |
| (K23) APP SENSOR 1 SIGNAL CIRCUIT SHORT VOLTAGE |
| (K167) APP SENSOR 1 GROUND CIRCUIT OPEN |
| ACCELERATOR PEDAL POSITION SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the ECM and the TCM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the ECM and the TCM to calculate the throttle position.

## Diagnostic Test

### 1. CHECK IF RELATED ENGINE TPS/APPS DTC'S ARE PRESENT

With the scan tool, check Engine DTC's.

**Are there any Engine TPS/APPS DTCs present?**

**Yes** >> Refer to the Drivability Category and perform the appropriate Symptom.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK TO SEE IF THE DTC IS CURRENT

With the scan tool in Transmission Sensors, read the TPS/APPS voltage.

**Is the TPS/APPS voltage above 4.94 volts?**

**Yes** >> Go To 3

**No** >> Go To 5

### 3. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off to the lock position.

Disconnect the APP Sensor harness connector.

Ignition on, engine not running.

With the scan tool in Transmission Sensors, read the TPS/APPS voltage.

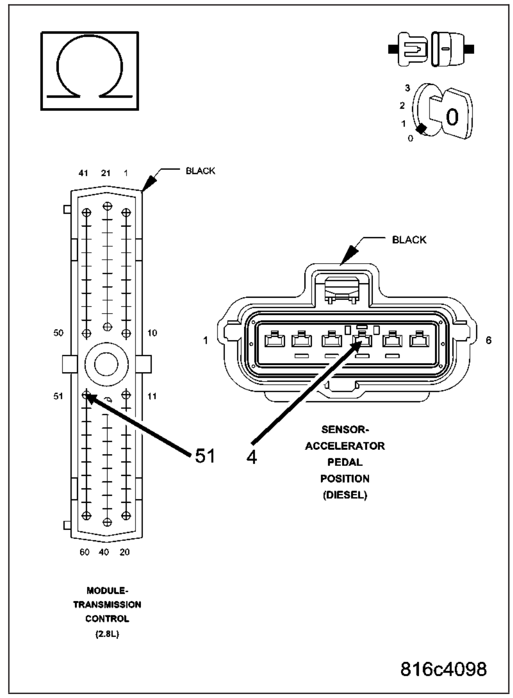
**Is the TPS/APPS voltage below 0.5 volts?**

**Yes** >> Go To 4

**No** >> Repair the (K23) APP Sensor 1 Signal circuit for a short to voltage.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 4. (K167) APP SENSOR 1 GROUND CIRCUIT OPEN

Measure the resistance of the (K167) APP Sensor 1 Ground circuit between the APP Sensor harness connector and the TCM harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (K167) APP Sensor 1 Ground circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Engine Control Module (ECM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the ECM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

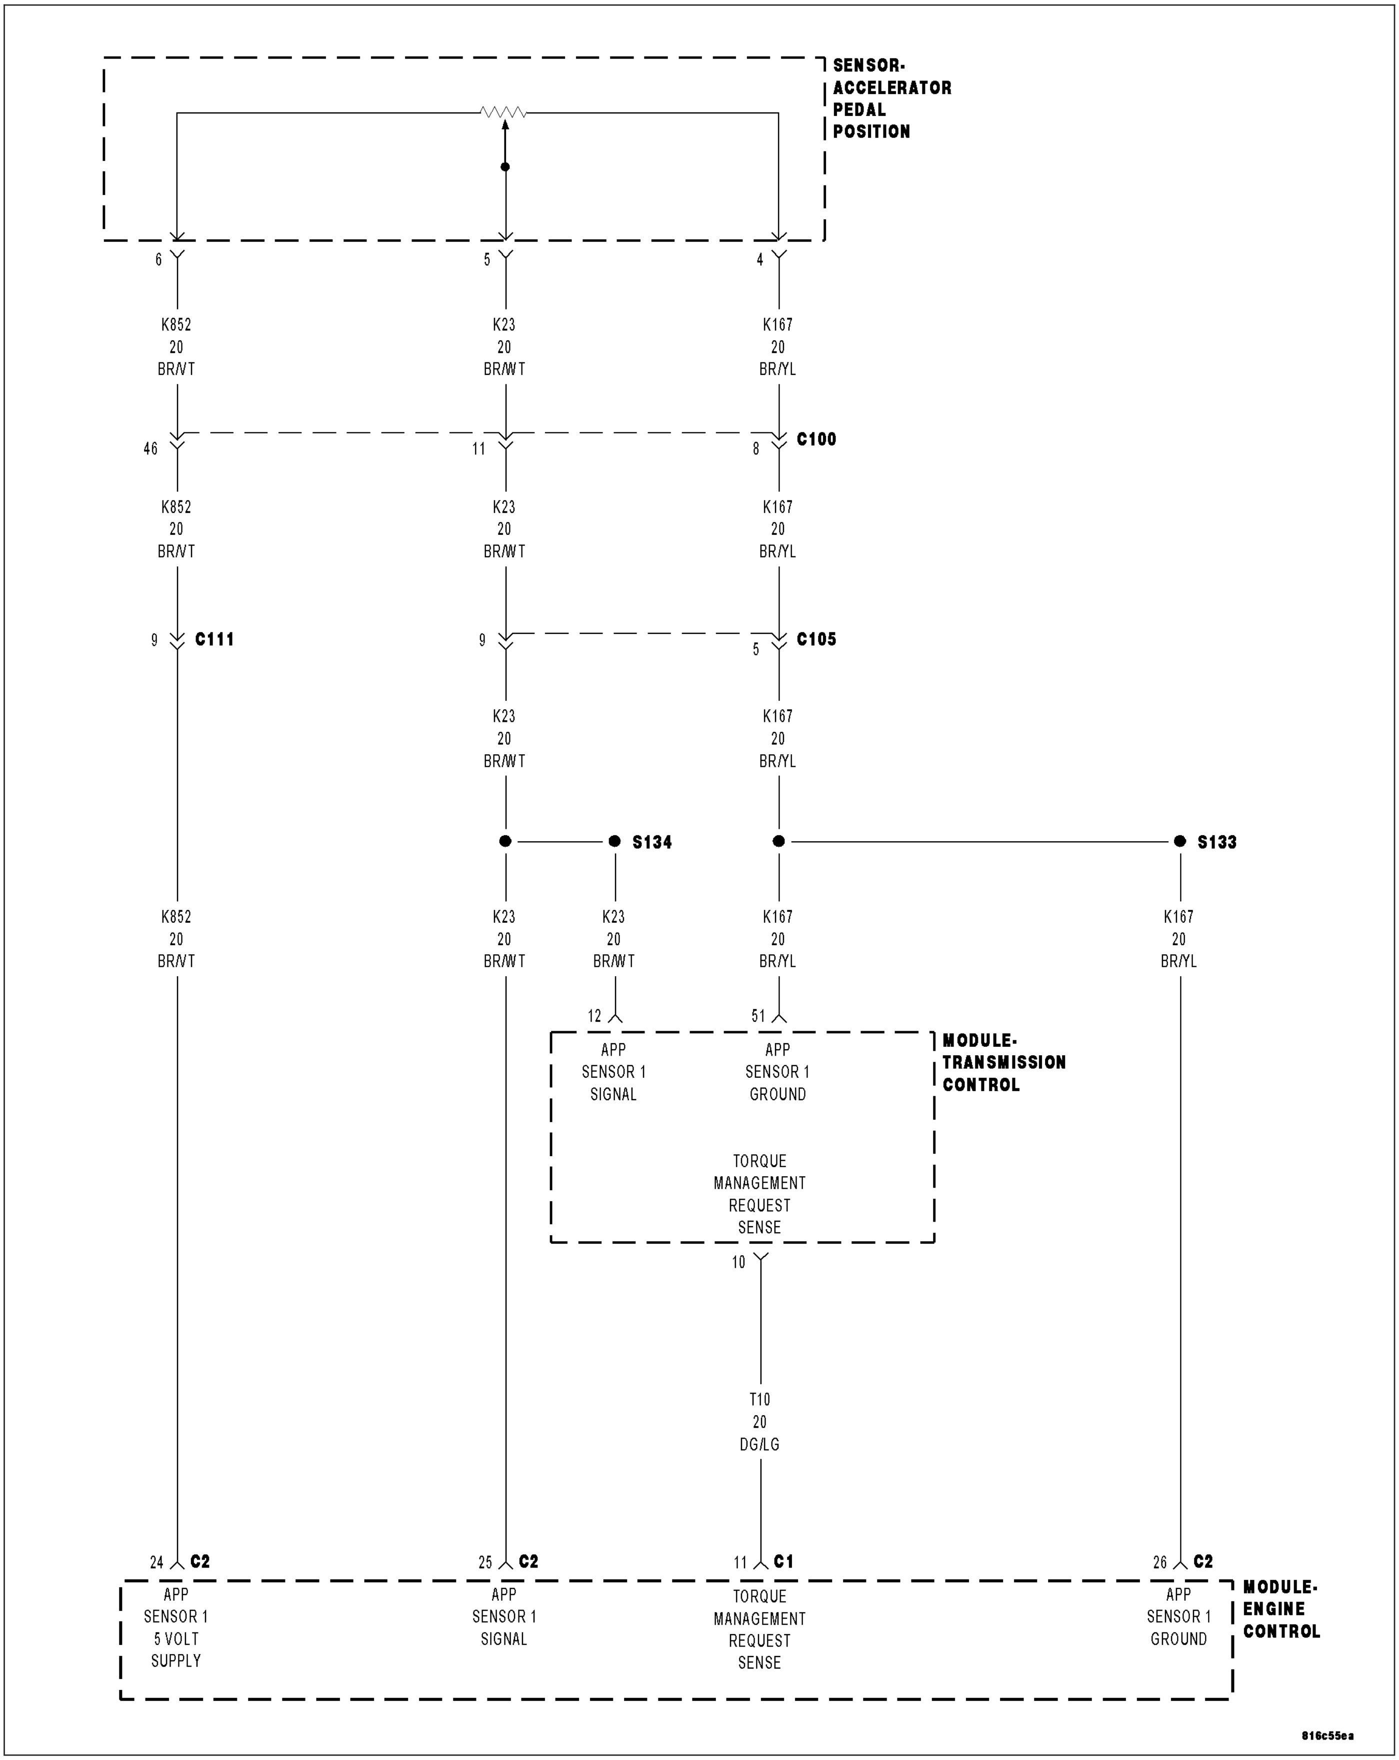
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/SION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0124-TPS/APP INTERMITTENT



For a complete Transmission wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set if the monitored TPS throttle angle between the angles of 6° and 120° and the degree change is greater than 5° within a period of less than 7.0 msec.

| Possible Causes |
|---|
| RELATED TPS ENGINE DTC'S PRESENT |
| THROTTLE POSITION SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the ECM and the TCM with a voltage signal proportional to the angle, or position of the accelerator pedal. The APPS signal along with inputs from other sensors is used by the ECM and the TCM to calculate the throttle position.

## Diagnostic Test

### 1. DETERMINING IF RELATED ENGINE TPS DTC'S ARE PRESENT

With the scan tool, check Engine DTC's including all one trip failures.

**Are there any Engine TPS/APPS DTCs present?**

**Yes** >> Refer to the Powertrain category and perform the appropriate symptom.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, record the DTC EVENT DATA to help identify the conditions in which the DTC was set.

With the scan tool, erase Transmission DTCs.

**NOTE: To erase EVENT DATA information, a BATTERY DISCONNECT must be performed. Performing a BATTERY DISCONNECT may reset all learned transmission values to controller default. This may lead to erratic shift schedules.**

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the DTC EVENT DATA.

With the scan tool, read Transmission DTCs.

**Did the DTC P0124 TPS/APPS INTERMITTENT, reset?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK THROTTLE POSITION SENSOR OPERATION

Ignition on, engine not running.

With the scan tool, under Transmission Sensors, monitor the TPS/APPS 1 voltage in the following step.

Slowly press and depress the throttle peddle while checking for erratic voltage changes.

**Was the TPS/APPS 1 voltage change smooth and consistent?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the APP Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set the DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wiring and connectors while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The DTC is intended as an informational DTC to aid the technician in determining the root cause of a customer dirveability issue. The DTC is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler is needed to support the customers driving behavior.

- **When Monitored:**
  Whenever the engine is running.
- **Set Condition:**
  Immediately after a Overheat shift schedule is activated when the Transmission temperature exceeds 127° C or 260° F.

| Possible Causes |
|---|
| HIGH TEMPERATURE OPERATION ACTIVATED |
| TORQUE CONVERTER CLUTCH SLIPPING / NOT ACTIVATING |
| EXCESSIVE TIME IDLING IN GEAR |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Diagnostic Test

### 1. HIGH TEMPERATURE OPERATION

This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints.

This DTC indicates that the transmission has been operating in the ″Overheat″ shift schedule which may generate a customer complaint.

The customer driving patterns may indicate the need for an additional transmission oil cooler.

Verify proper Engine cooling system operation which would affect proper transmission operation.

Verify proper torque converter clutch operation.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

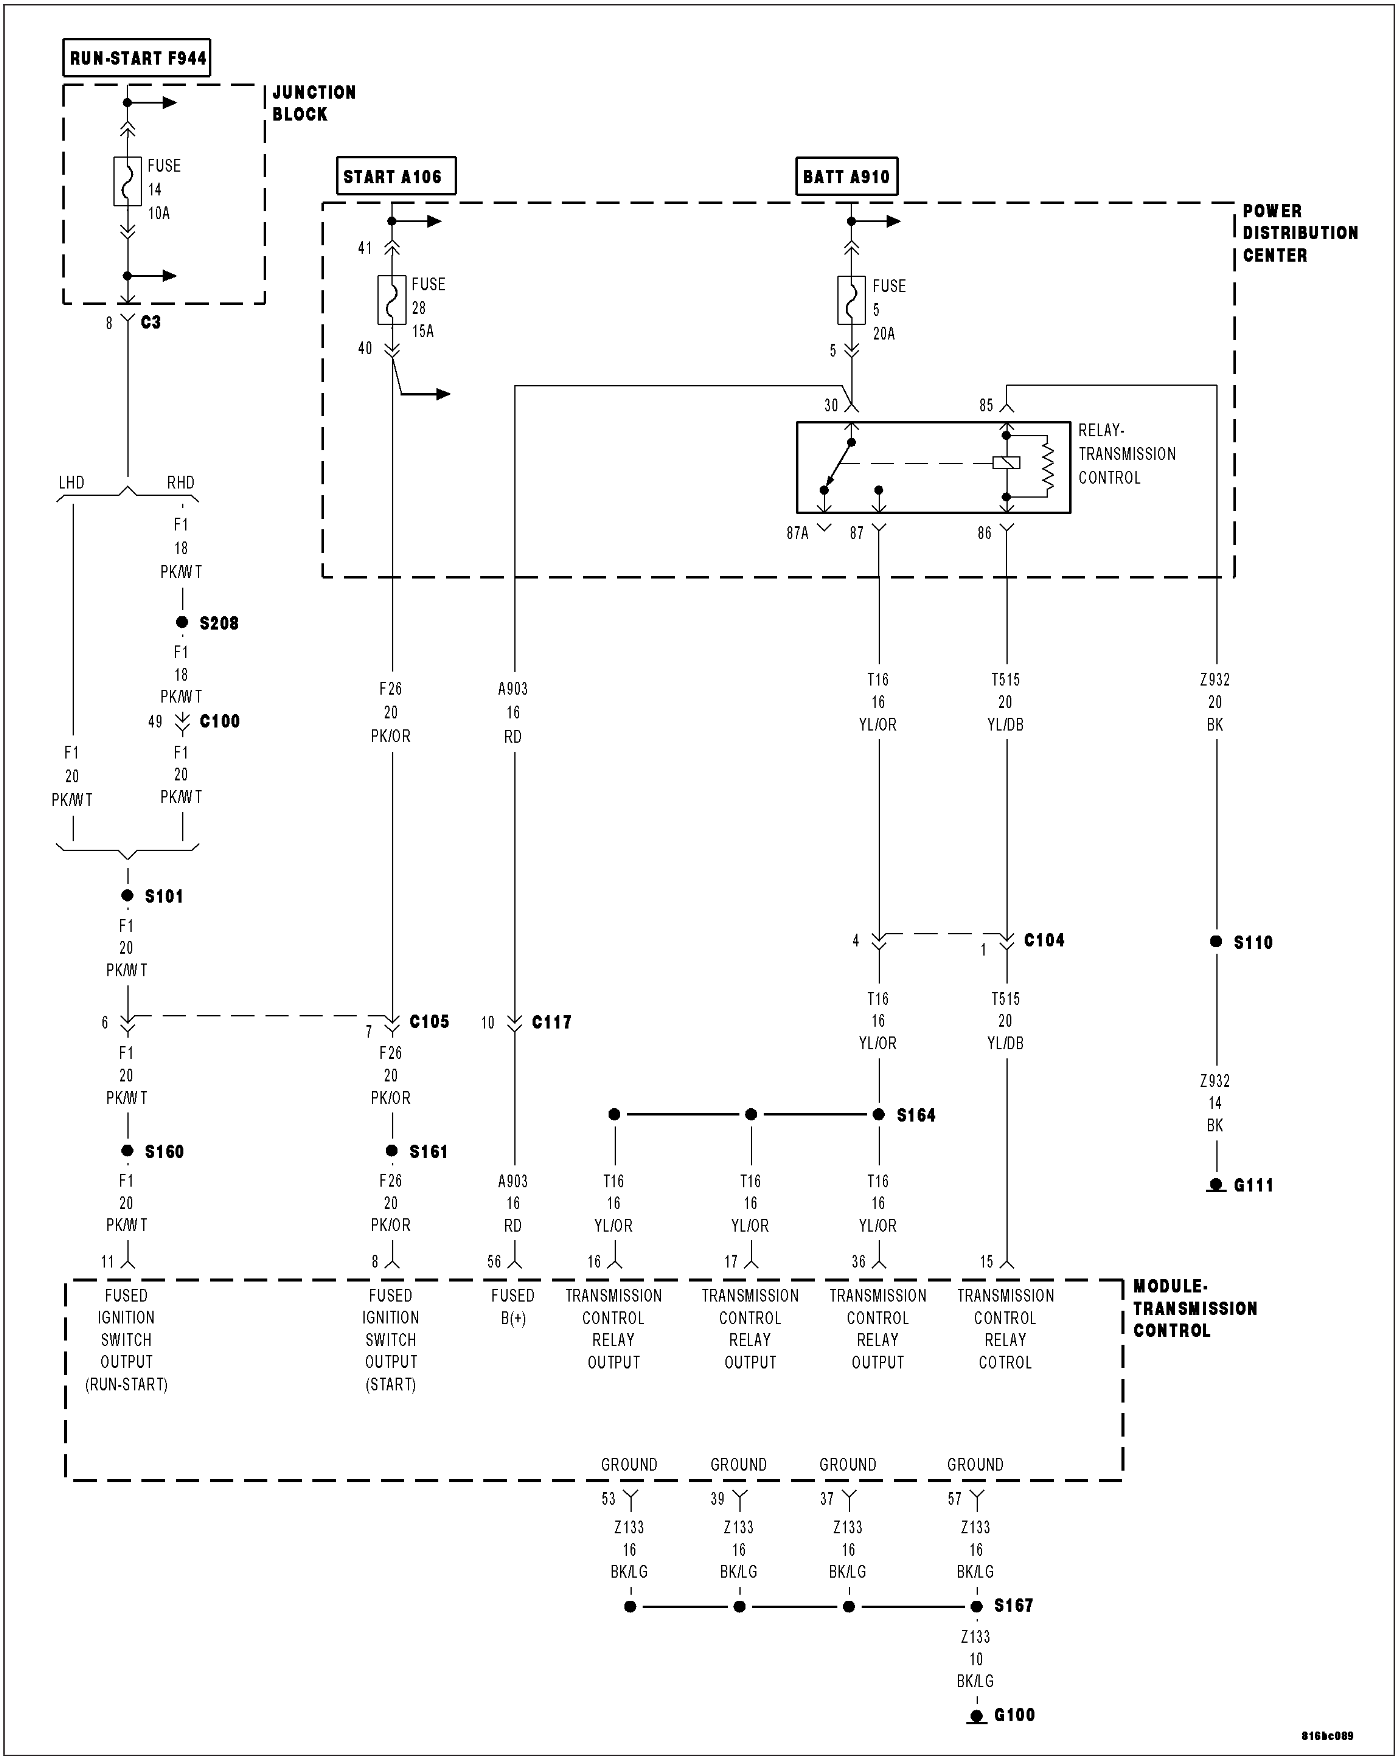
**If there are no possible causes remaining, view repair.**

**Repair**

Repair the cause of transmission overheating. Refer to the Service Information for the proper repair procedure. Make sure to check for any Service Bulletins pertaining to this problem.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0562-BATTERY VOLTAGE LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running and the TCM has closed the Transmission Control Relay.
- **Set Condition:**
  If the battery voltage of the Transmission Control Relay Output Sense circuit(s) to the TCM is less than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the TCM. The DTC will also set if the battery voltage sensed at the TCM is less than 6.5-volts for 200ms or where Transmission Control Relay Output circuits are less than 7.2-volts for 200ms.

| Possible Causes |
|---|
| RELATED CHARGING SYSTEM DTC'S |
| (Z133) GROUND CIRCUIT OPEN OR HIGH RESISTANCE |
| (A903) FUSED B(+) CIRCUIT TO TCM OPEN OR HIGH RESISTANCE |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE |
| TRANSMISSION CONTROL RELAY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

Friction element distress could result from an insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

## Diagnostic Test

### 1. RELATED CHARGING SYSTEM DTC'S

With the scan tool, read the Engine DTC's.

**Are there any related Charging System DTCs also present?**

**Yes** >> Refer to the Charging System category and repair any Engine Charging System DTCs, before testing DTC P0562. NOTE: After repairing the Engine Charging System DTCs, perform the Transmission Verification test to verify the transmission was not damaged.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CONDITION P0562 PRESENT

**NOTE: Generator, battery, and charging system must be fully functional before performing this test.**
With the scan tool, read Transmission DTC's.

With the scan tool, Check the STARTS SINCE SET counter for P0562.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter set at 0?**

**Yes** >> Go To 3

**No** >> Go To 7

## 3. CHECK THE (Z133) GROUND CIRCUITS

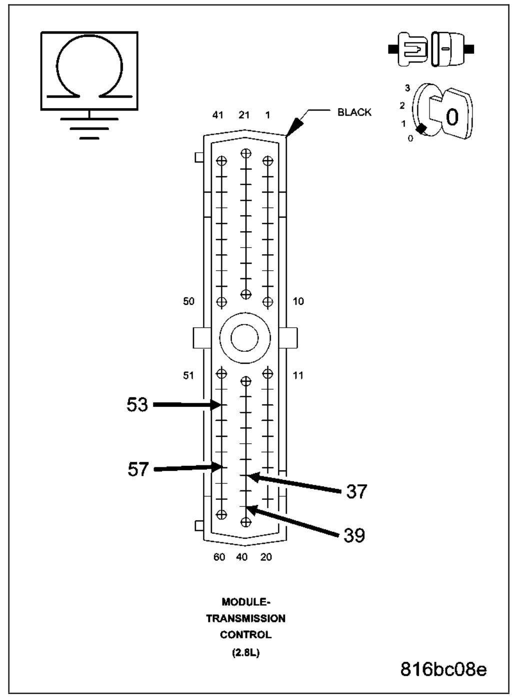
Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

Using a 12-volt test light connected to 12-volts, check the (Z133) Ground circuits.

**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**



**Does the test light illuminate brightly for all the (Z133) Ground circuits?**

**Yes** >> Go To 4

**No** >> Repair the (Z133) Ground circuit(s) for an open or high resistance.

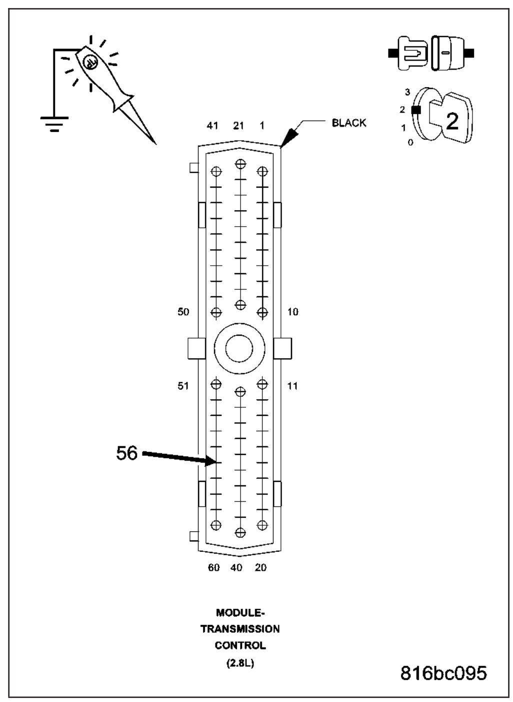
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 4. CHECK THE (A903) FUSED B(+) CIRCUIT

Remove the Transmission Control Relay.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check the (A104) Fused B(+) circuit at the Transmission Control Relay connector.



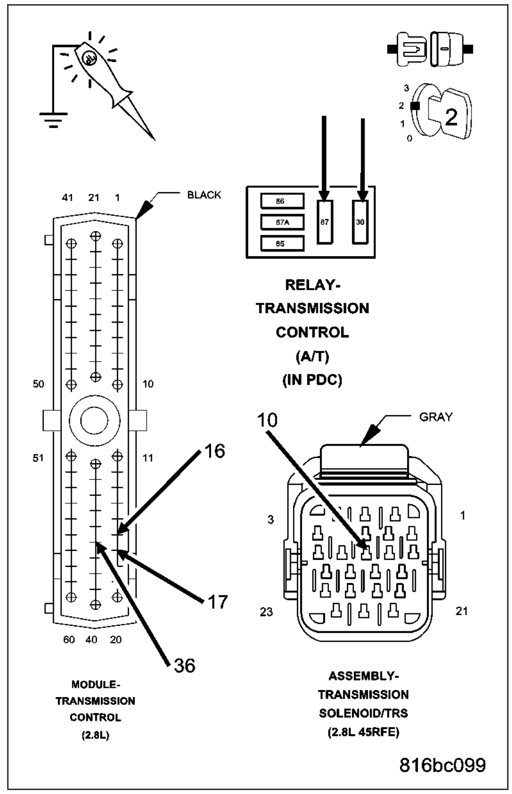
**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (A104) Fused B(+) circuit for an open or high resistance.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. CHECK THE (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT



Turn the ignition off to the lock position.

**NOTE: Check connectors - Clean/repair as necessary.**

Connect a jumper wire between (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check all (T16) Transmission Control Relay Output circuits at the TCM harness connector.

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (T16) Transmission Control Relay Output circuit for an open or high resistance.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK THE TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

Reconnect all previously disconnected connectors.

Install a substitute Relay in place of the Transmission Control Relay.

Start the engine.

Using a voltmeter, measure the vehicles battery voltage.

With the scan tool, monitor the Transmission Switched Battery Voltage.

Compare the scan tool Transmission Switched Battery voltage to the actual battery voltage reading on the voltmeter.

**Is the scan tool voltage within 1.0 volt of the battery voltage?**

**Yes** >> Replace the Transmission Control Relay.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wires while checking for shorted and open circuits.
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Where there any problems found?**

**Yes** >> Repair as necessary.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Check for generic software is made at power-up
- **Set Condition:**
  If generic software is found, the MIL will light immediately. This DTC is designed to inform the technician that the controller still has generic software installed.

| Possible Causes |
|---|
| TCM - PROGRAMMING ERROR |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The controller is programmed during manufacturing with generic software to facilitate testing. However, generic software does not have the proper calibrations to control a transmission in a vehicle. The check for generic software is made at power-up. If generic software is found , the MIL will light immediately and the MIL will stay on even if the fault is cleared, until the proper software is installed. Note: Transmission will be placed in limp-in mode.

## Diagnostic Test

### 1. CONTROL MODULE PROGRAMMING ERROR

**NOTE: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.**

With the scan tool.

Record the vehicles controller part number.

Select Use Controller Part Number under the Flash Tab.

Flash the controller with the correct software.

**Verify the controller flashed successfully.**

**Test Complete**

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0604-INTERNAL CONTROL MODULE RAM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  One time after the controller is reset (ignition turned to the RUN position).
- **Set Condition:**
  Whenever the Transmission Control Module (TCM) detects an internal controller problem.

| Possible Causes |
|---|
| POWER OR GROUND CIRCUIT |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

After the controller is reset (ignition turned to the RUN position), the microprocessor checks the integrity of each RAM location by writing to it and reading back from it. The read value should be same as value written.

### Diagnostic Test

#### 1. CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION

Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Wiggle the wires while checking for shorted and open circuits.

Check for any Service Bulletins that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

# P0605-INTERNAL CONTROL MODULE ROM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  One time after the controller is reset (ignition turned to the RUN position).
- **Set Condition:**
  Whenever the Transmission Control Module (TCM) detects an internal controller problem.

| Possible Causes |
|---|
| POWER OR GROUND CIRCUITS |
| POWERTRAIN CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

After the controller is reset (ignition turned to the RUN position) the microprocessor checks the integrity of the program memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum should be the same as a known constant stored in the program memory.

## Diagnostic Test

### 1. CHECK WIRING AND CONNECTORS FOR INTERMITTENT OPERATION

Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Wiggle the wires while checking for shorted and open circuits.

Check for any Service Bulletins that may apply.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

# P0613-INTERNAL TCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  1) One time after the controller is reset (ignition turned to the RUN position) and every 60 seconds thereafter. The Delay Test is executed after a reset only.
  2) 2 seconds after an invalid test.
- **Set Condition:**
  If either of the following conditions occur 3 times:
  1) The watchdog fault line remains high after the period has elapsed for the too early - too late watchdog test.
  2) The Transmission Control Relay remains on after the watchdog delay expired.

| Possible Causes |
|---|
| POWER OR GROUND CIRCUIT |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The internal Watchdog (WD) is a separate hardware circuit that continuously monitors the microprocessor. To insure the proper operation of the Transmission controller the watchdog must receive a signal from the microprocessor within a specific time window (14 msec ± 1 msec) to prevent a system shutdown after a short delay (570 msec). The microprocessor periodically tests the WD's ability to provide this shutdown function using a three phase test;

1) Send the signal too late > 15 msec

2) Send the signal too early < 13 msec

3) Delay test < 590 msec

If the watchdog input signal arrives too early or too late, the Watchdog Fault line will go low and the watchdog delay will start to time out. The delay will be reset by the correct timing of watchdog signal sent during subsequent operations.

The Delay Test checks the delay time out. The Delay Monitor line is pulled low, which forces the delay to start timing out. At the end of the delay time the Transmission Relay will be turned off. The delay test, upon detection of the relay turning off, will immediately turn the relay back on before shutdown can occur.

## Diagnostic Test

### 1. CHECK THE WIRING AND CONNECTORS

Using the schematics as a guide, check the Powertrain Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

Wiggle the wires while checking for shorted and open circuits.

Check for any Service Bulletins that may apply.

**Were there any problems found?**

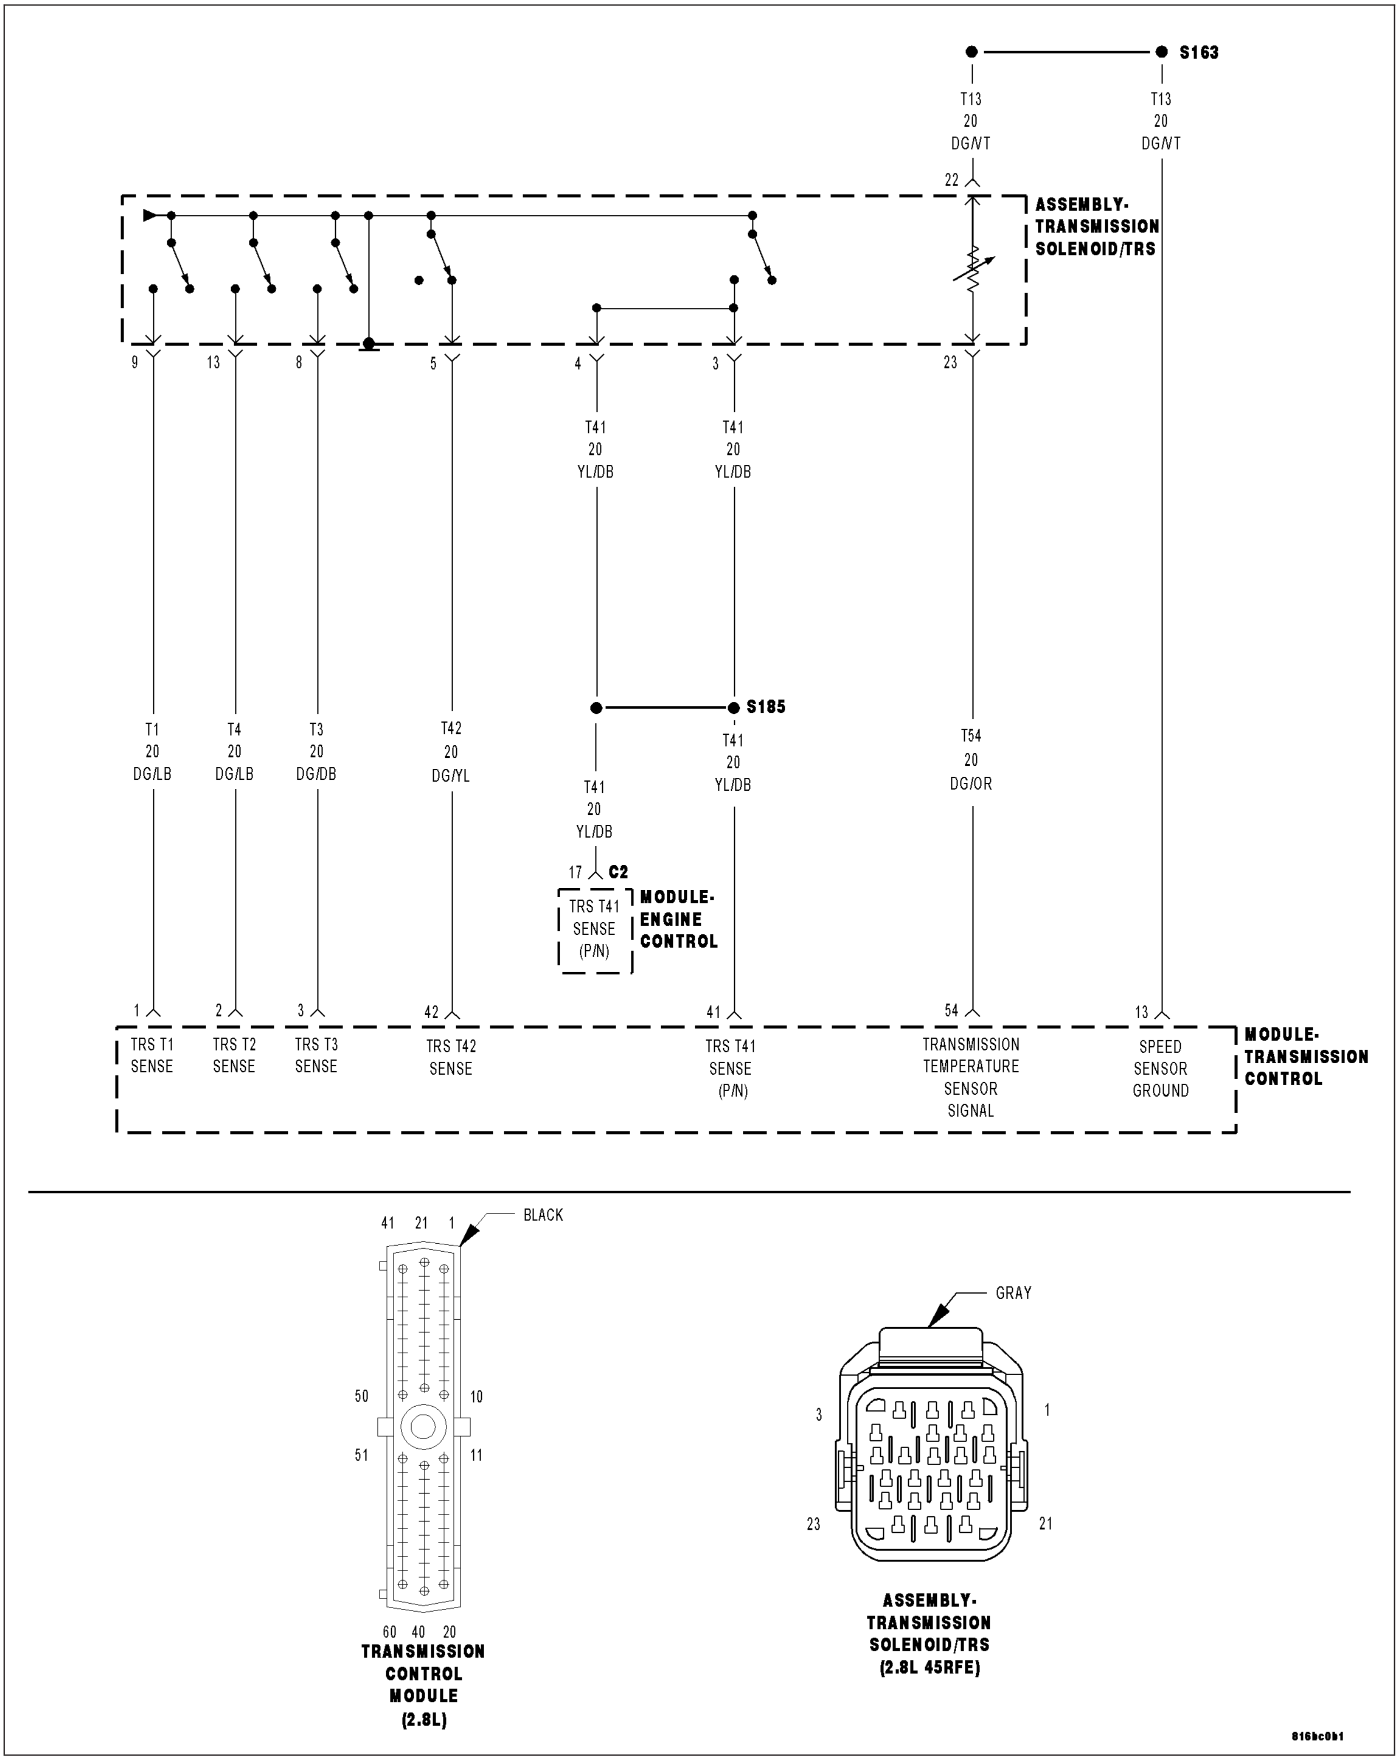
**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0706-TRANSMISSION RANGE SENSOR RATIONALITY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on.
- **Set Condition:**
  The DTC will set if the controller detects an invalid PRNDL code which lasts for more than 0.042 seconds.

| Possible Causes |
|---|
| SHIFTER OUT OF ADJUSTMENT |
| TRS SENSE CIRCUIT OPEN |
| TRS SENSE CIRCUIT SHORT TO GROUND |
| TRS SENSE CIRCUIT SHORT TO VOLTAGE |
| METAL DEBRIS IN OIL PAN |
| TRANSMISSION RANGE SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The T1, T2, T3, T41, or T42 (C1 - C5) Sense circuits communicate the shift lever position to the Transmission Control System. Each circuit is terminated at the transmission by a switch (TRS). Each switch can be either open or closed, depending on the shift lever position. The TCM can decode this information and determine the shift lever position.

Each shift lever position has it own unique combination of closed and open switches. This is called a PRNDL code. There are 5 switches, therefore: there are many possible combinations of open and closed switches (codes). There are 12 valid codes: two for neutral, one for each other gear position (5), and five temporary (transition zone) codes. The remainder of the codes should never occur, these are called invalid codes.

## Diagnostic Test

### 1. CHECK IF P0706 DTC IS CURRENT

With the scan tool, perform the Shift Lever Position Test.

**Select the test outcome from the following:**

**Test passes:**
Go To 6

**Test fails with Error Code:**
Go To 2

**Test fails without Error Code:**
Perform the Gearshift Adjustment Procedure per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

### 2. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, perform the Shift Lever Position Test.

When the scan tool instructs you to put the Gear Selector in a particular position, you must do so using the selector switch on the Transmission Simulator.

The LED for the gear position in question must be illuminated on the Transmission Simulator prior to pressing ″ENTER″ on the scan tool.

**NOTE: When the scan tool requests the O/D off button be depressed, you must use the O/D OFF button in the vehicle or you will fail the Shift Lever Position Test with an error code 11 or OD-TOW/HALL STUCK OPEN.**

**NOTE: If the Shift Lever Position test fails, make sure to note the identification of the TRS Sense circuit for future reference.**

**Did the Shift Lever Position test pass?**

**Yes** >> Remove the Oil Pan and Main Valve Body Assembly per the Service Information. Check for metal debris on top of the Solenoid/TRS Assembly and the manual valve code plate. If debris is present, determine the cause of the debris and repair the transmission as necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE TRS SENSE CIRCUITS FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the identified (T1, T2, T3, T41, or T42) TRS Sense circuit, from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of Miller tool #8815.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the identified (T1, T2, T3, T41, or T42) TRS Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE TRS SENSE CIRCUITS FOR A SHORT TO GROUND

Measure the resistance between ground and the identified (T1, T2, T3, T41, or T42) TRS Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the identified (T1, T2, T3, T41, or T42) TRS Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE TRS SENSE CIRCUITS FOR A SHORT TO ANOTHER CIRCUIT

Measure the resistance between the identified (T1, T2, T3, T41, or T42) TRS Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

**Is the resistance below 100k ohms between the identified (T1, T2, T3, T41, or T42) TRS Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the identified (T1, T2, T3, T41, or T42) TRS Sense circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Using the schematics as a guide, check the Powertrain Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK WIRING AND CONNECTORS

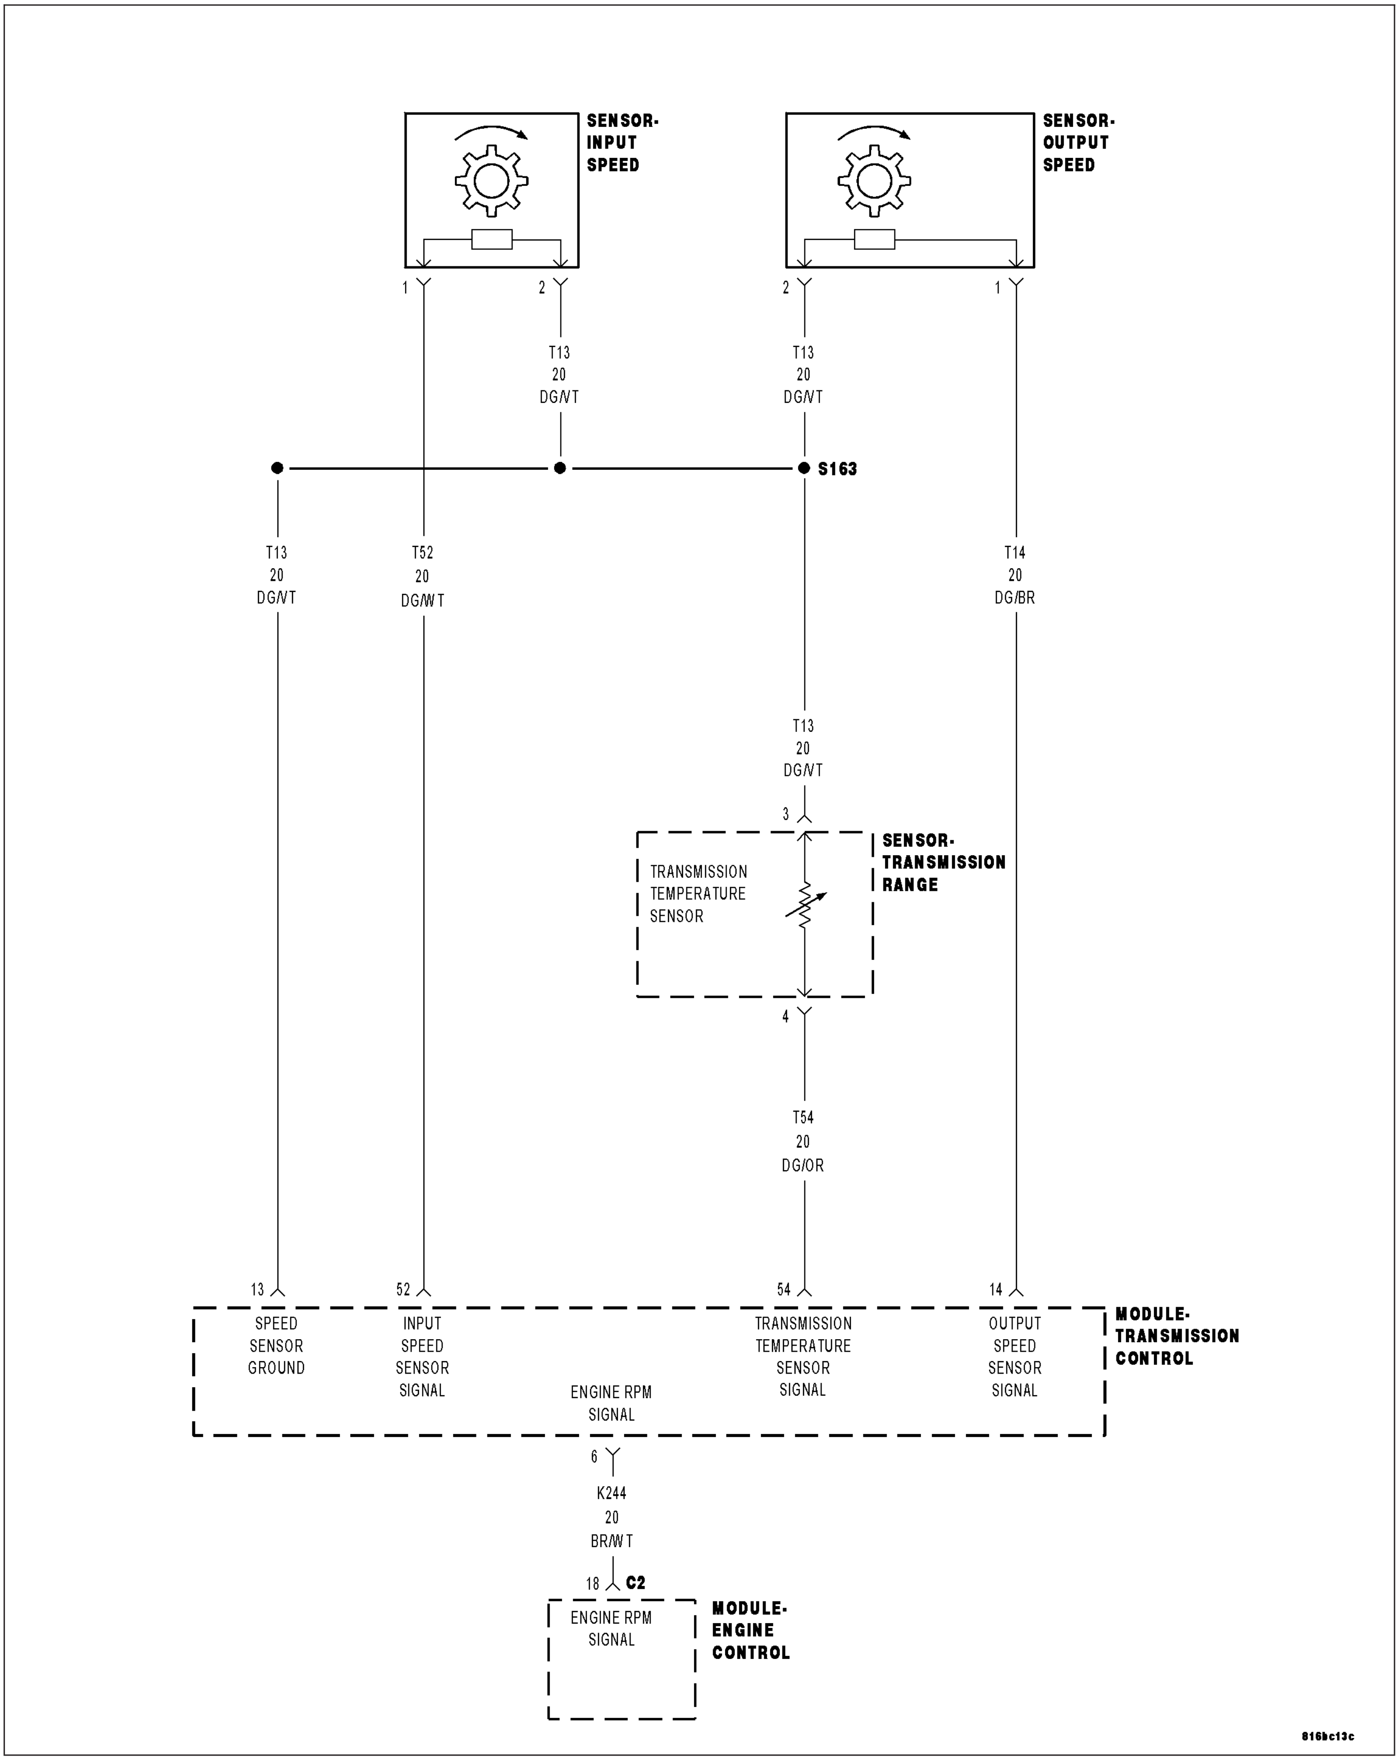
The conditions necessary to set the DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wiring and connectors while checking for shorted and open circuits.
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set when the desired transmission temperature does not reach a normal operating temperature within a given time frame. Time is variable due to ambient temperature. Approximate times are starting temperature to warm up time: (-40° F / -40° C - 35 min) (-20° F / -28° C - 25 min) (20° F / -6.6° C - 20 min) (60° F / 15.5 ° C - 10 min)

| Possible Causes |
|---|
| RELATED DTC'S PRESENT |
| TRANSMISSION TEMPERATURE SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or system self-diagnostic test are performed. The Transmission Control Module (TCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

## Diagnostic Test

### 1. DETERMINE IF RELATED DTC'S ARE PRESENT

With the scan tool, check Transmission DTC's.

**Are there any other related Transmission Temperature Sensor DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0711.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings to the voltage readings listed on the Transmission Simulator.

**Do the readings on the scan tool match the Transmission Simulator readings ± 0.2 volts?**

**Yes** >> Replace Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

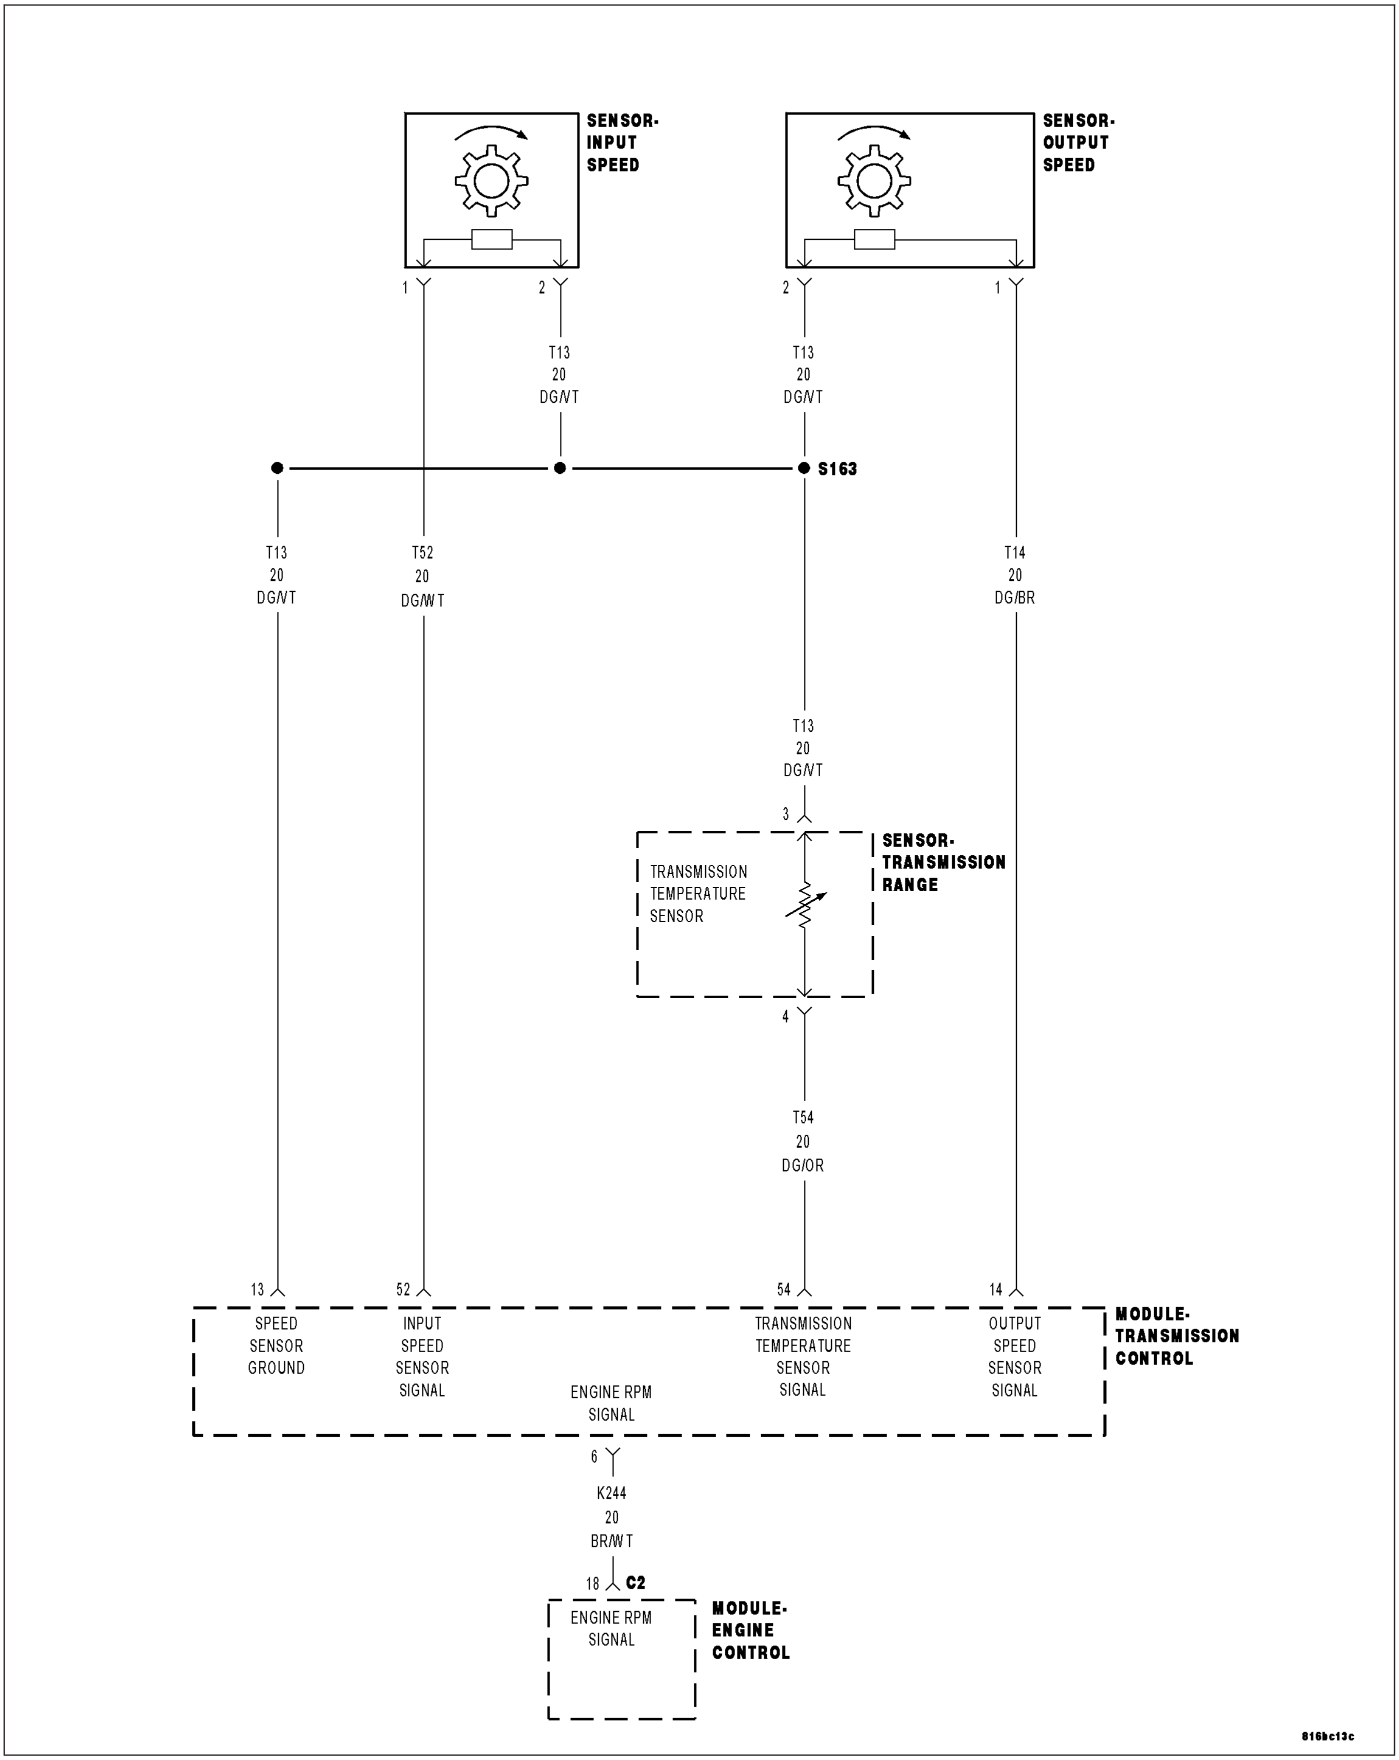
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0712-TRANSMISSION TEMPERATURE SENSOR LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  The DTC will set when the monitored Temperature Sensor voltage drops below 0.078 volts for the period of 0.45 seconds.

| Possible Causes |
| --- |
| RELATED DTC'S PRESENT |
| (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND |
| TRANSMISSION TEMPERATURE SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or system self-diagnostic test are performed. The Transmission Control Module (TCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

## Diagnostic Test

### 1. CHECK IF RELATED DTCS ARE PRESENT

With the scan tool, check Transmission DTCs.

**Are there any line pressure or throttle position sensor DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0712.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 5

### 3. CHECK THE TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**
Install the Transmission Simulator, Miller tool #8333.

**NOTE: Check connectors - Clean/repair as necessary.**
Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

**Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 volts?**

**Yes** >> Replace Transmission Solenoid/TRS Assembly per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

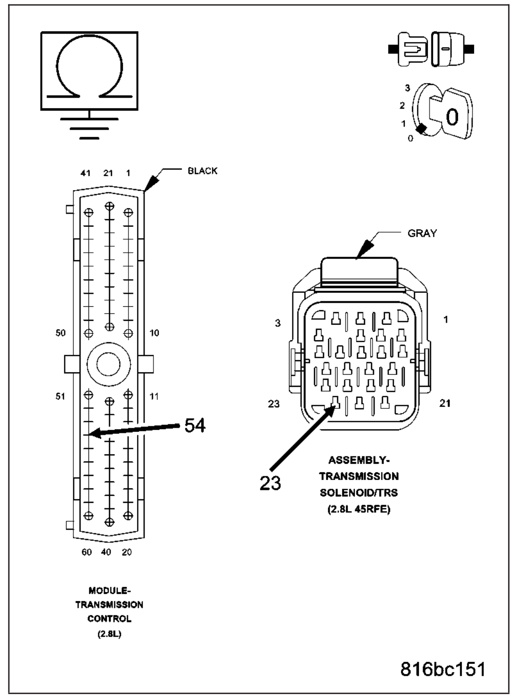
## 4. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance between ground and the (T54) Transmission Temperature Sensor Signal circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to ground.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

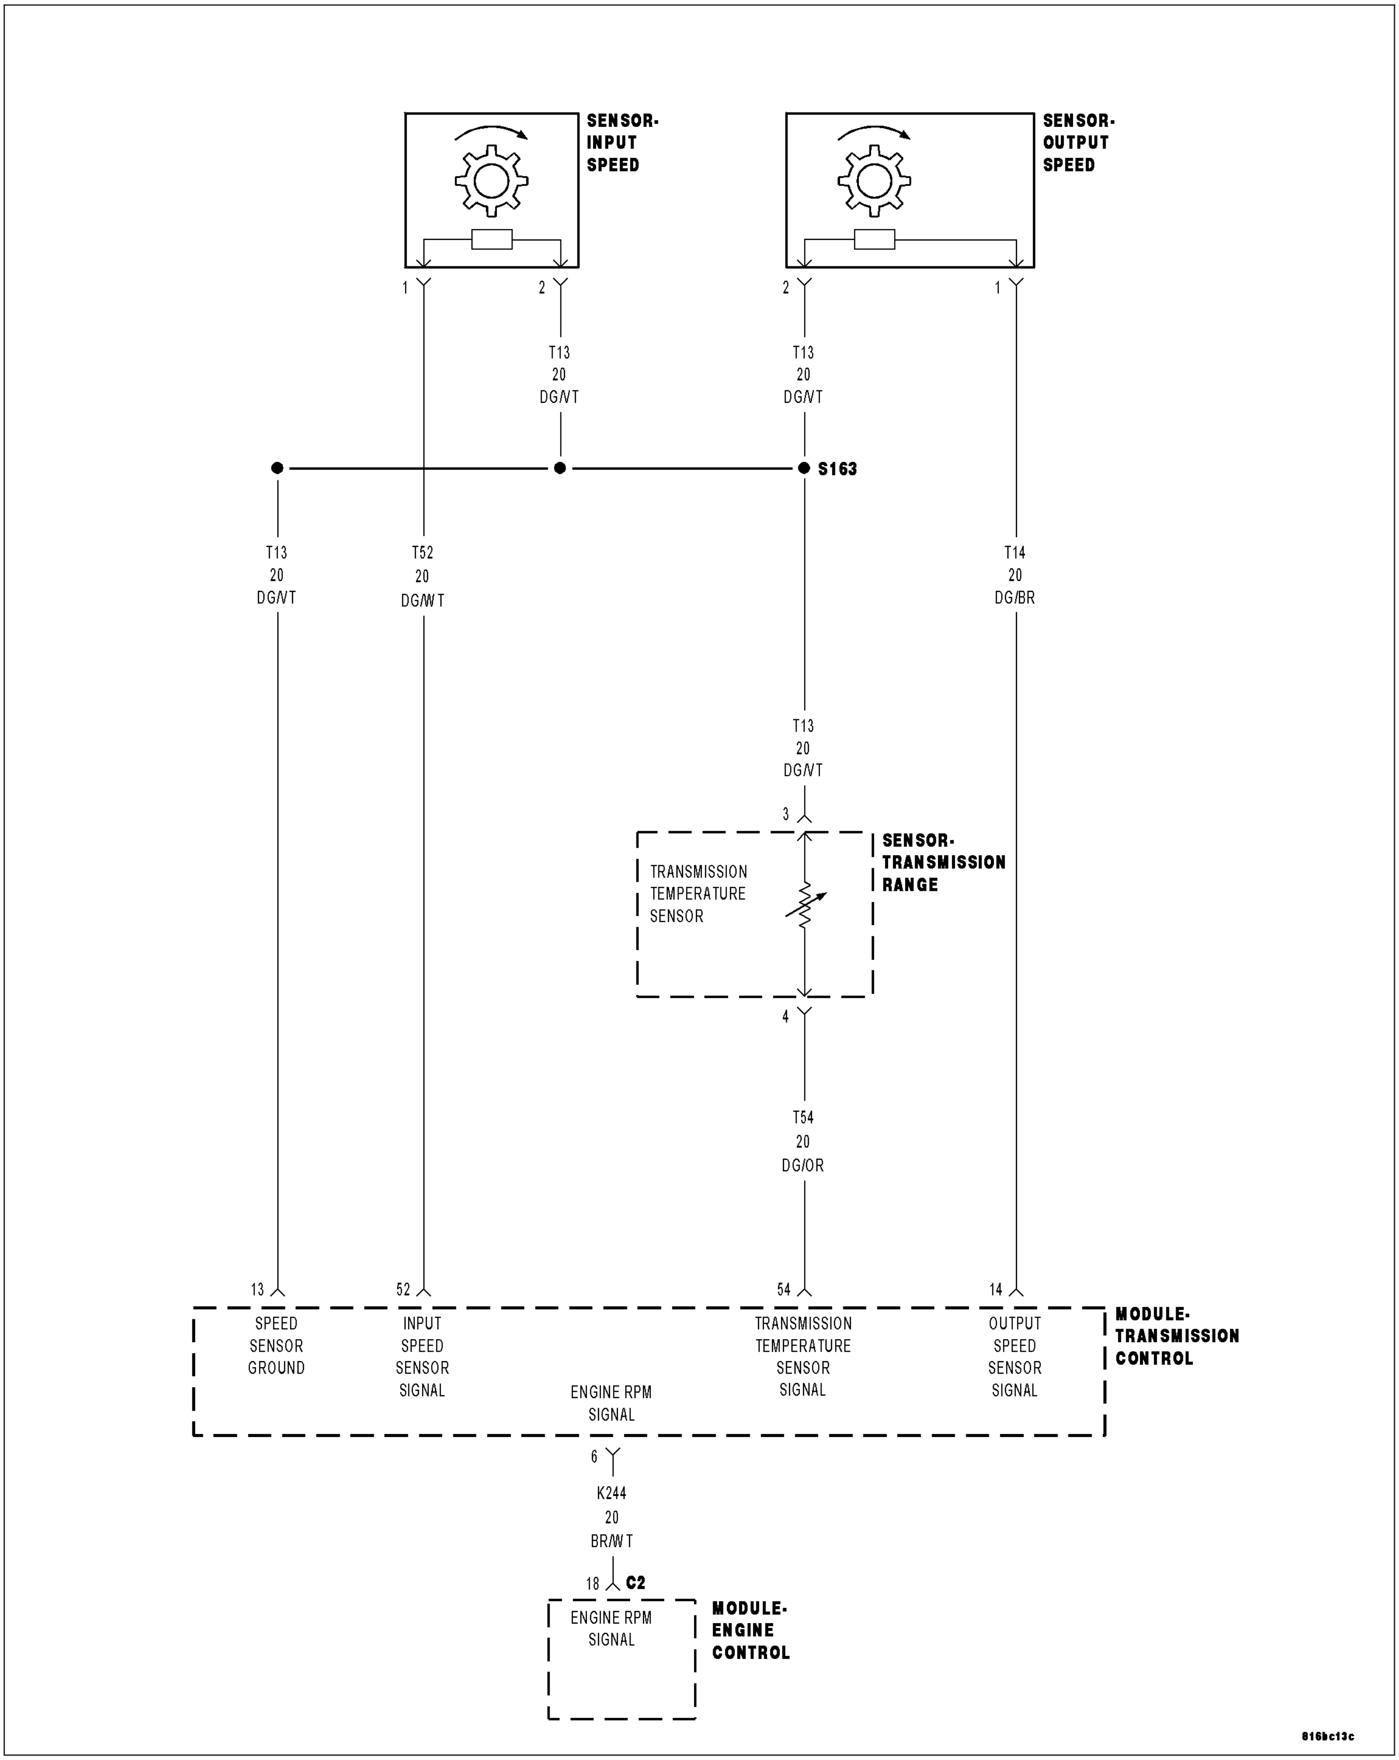
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0713-TRANSMISSION TEMPERATURE SENSOR HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for the period of 0.45 seconds.

| Possible Causes |
| --- |
| RELATED DTC'S PRESENT |
| (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO OTHER CIRCUITS |
| TRANSMISSION TEMPERATURE SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or system self-diagnostic test are performed. The Transmission Control Module (TCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check Transmission DTC's.

**Are there any line pressure or throttle position sensor DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0713.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 5

### 3. CHECK THE TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

**Do the readings on the Transmission Simulator match the scan tool readings ± 0.2 volts?**

**Yes** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

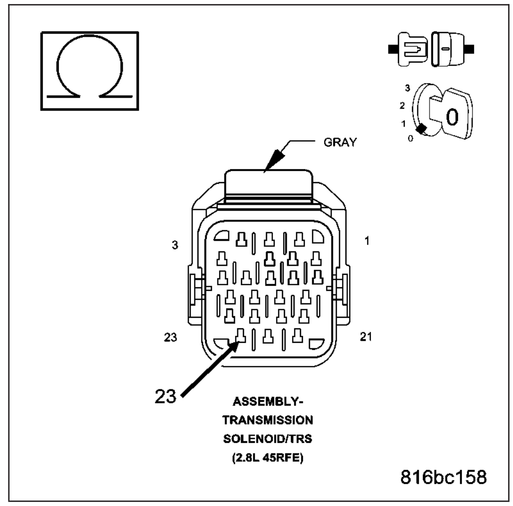
## 4. CHECK THE (T54) TRANSMISSION SENSOR SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T54) Transmission Temperature Sensor Signal circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the Transmission Temperature Sensor Signal circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

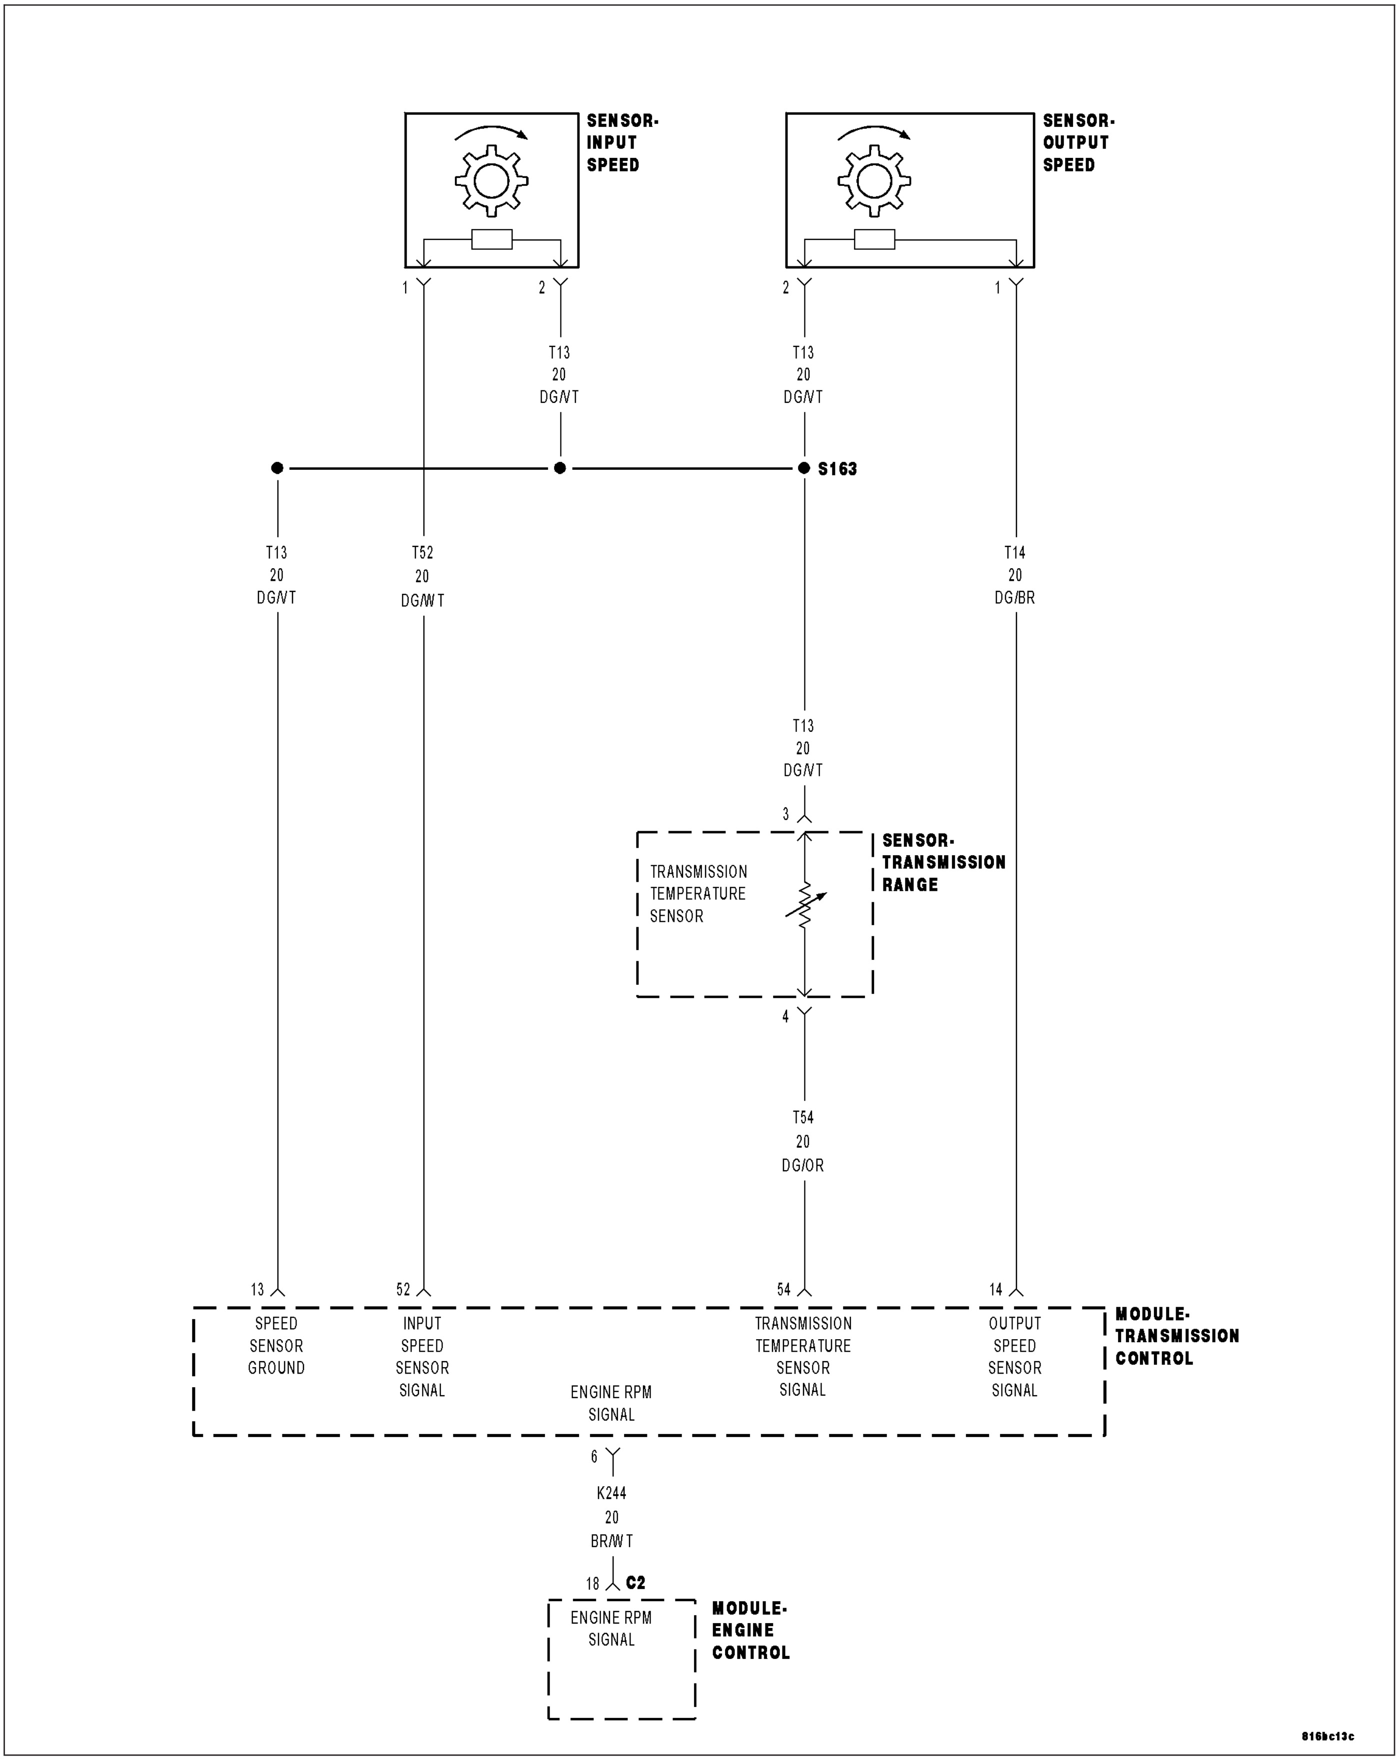
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P0714-TRANSMISSION TEMPERATURE SENSOR INTERMITTENT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  The DTC will set when the monitored Temperature Sensor voltage fluctuates or changes abruptly within a predetermined period of time.

| Possible Causes |
|---|
| RELATED DTC'S PRESENT |
| TRANSMISSION TEMPERATURE SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Temperature Sensor is a variable resistor that changes with temperature, or otherwise known as a thermister. The temperature of the transmission fluid can affect a variety of electronically controlled transmission operations such as shift quality, torque converter lock-up, and when and/or if certain OBDII or system self-diagnostic test are performed. The Transmission Control Module (TCM) substitutes a calculated transmission temperature value if a fault is detected in the Transmission Temperature Sensor circuit.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check Transmission DTCs.

**Are there any line pressure or throttle position sensor DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0714.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. CHECK THE TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Input/Output switch to OFF.

With the scan tool, monitor the TRANS TEMP VOLTS while turning the Thermistor Voltage switch to all three positions on the Transmission Simulator.

Compare the scan tool readings with the numbers listed on the Transmission Simulator.

**Do the readings on the Transmission Simulator match a non-fluctuating scan tool reading ± 0.2 volts?**

**Yes** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 4. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

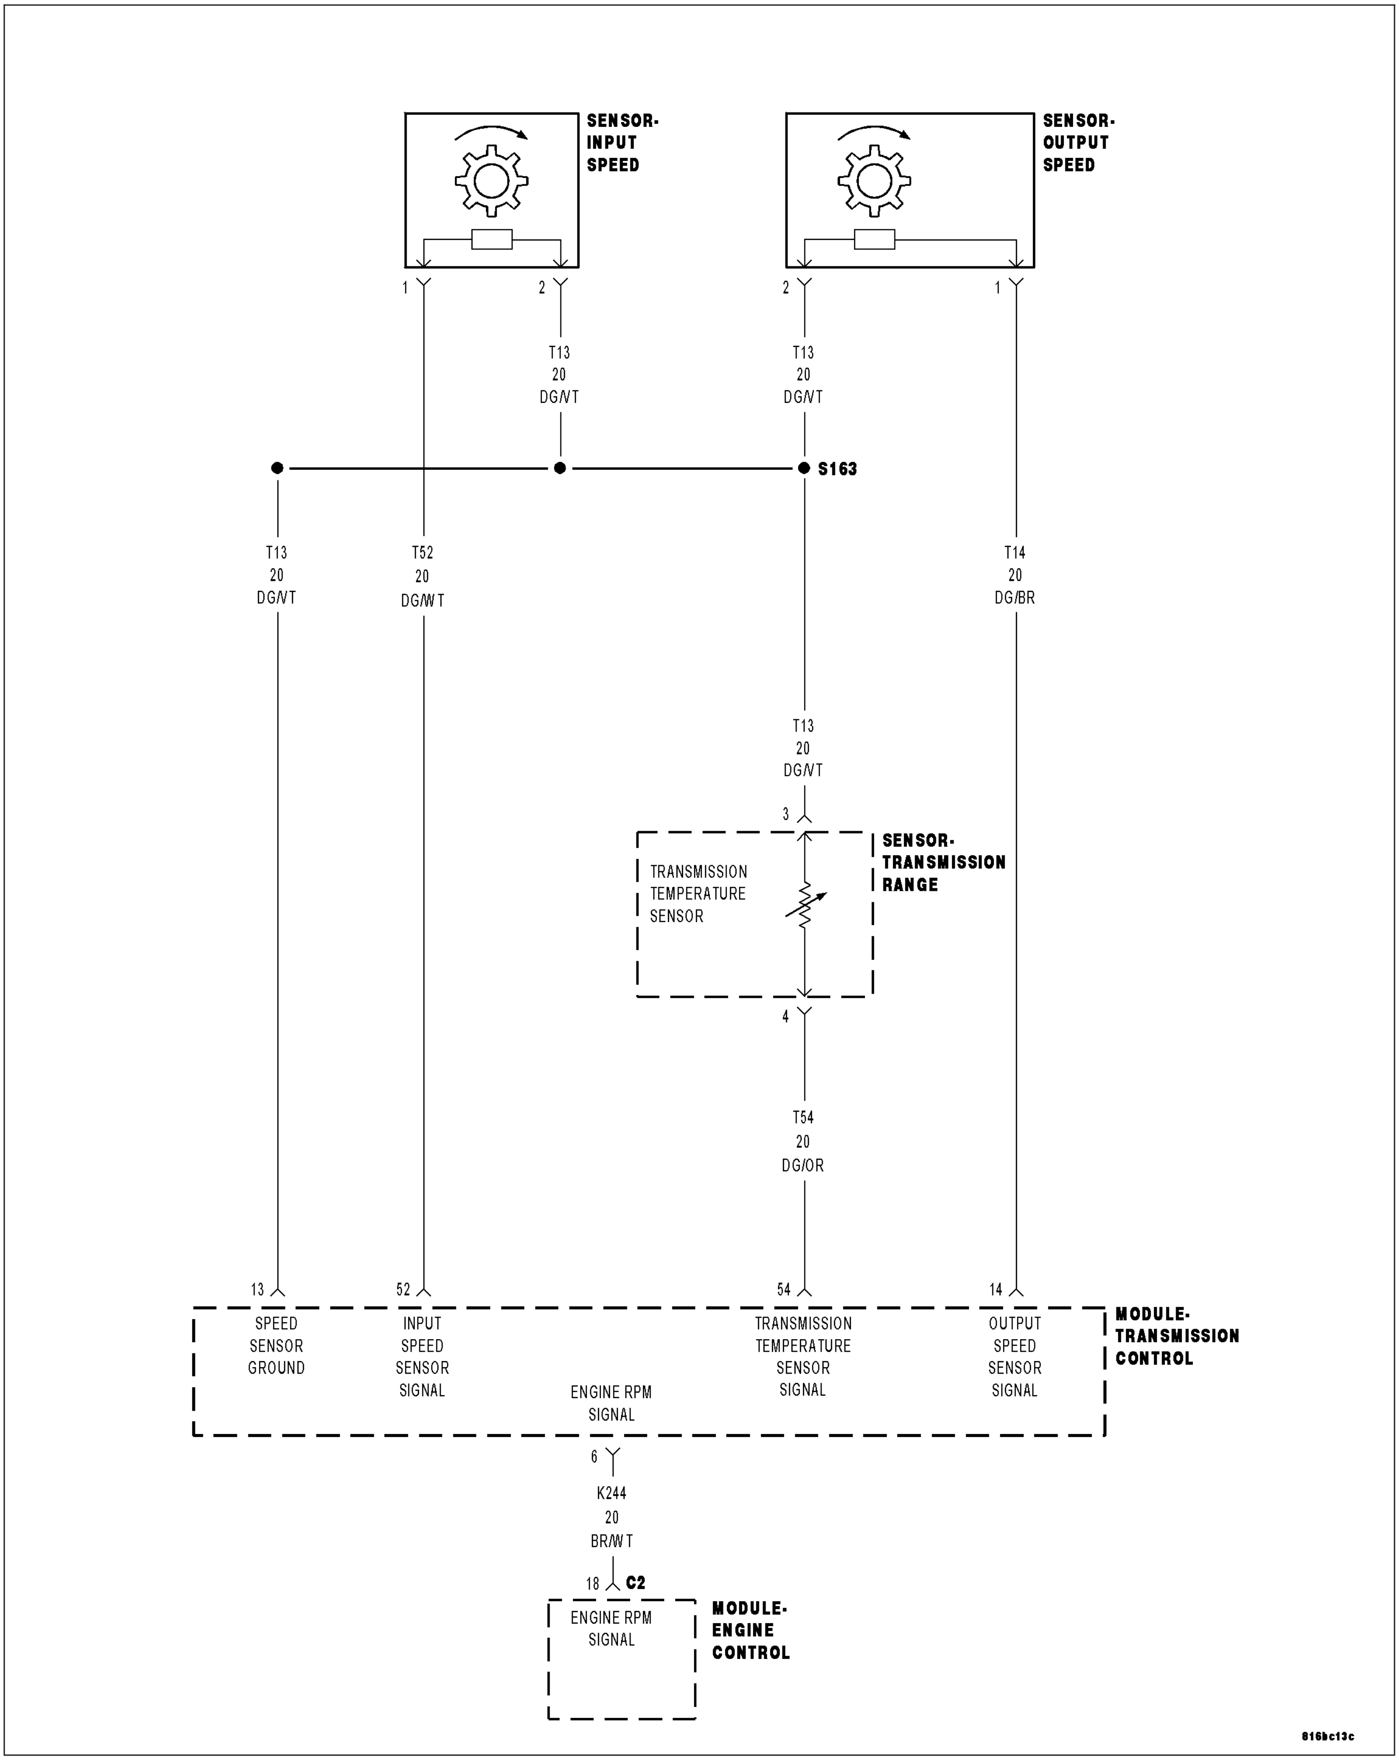
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0715-INPUT SPEED SENSOR 1 CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If there is an excessive change in input RPM in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

| Possible Causes |
|---|
| (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN |
| (T13) SPEED SENSOR GROUND CIRCUIT OPEN |
| (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND |
| (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND |
| (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE |
| (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE |
| INPUT SPEED SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0731–36).

2) An excessive change in input or output speeds indicating signal intermittent which may result in the DTCs P0715 and/or P0720 to set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

## Diagnostic Test

### 1. CHECK IF DTC P0715 IS CURRENT

Start the engine in park.

With the scan tool, monitor the Input Speed Sensor RPM.

**Is the Input Speed Sensor RPM below 400 RPM?**

**Yes** >> Go To 2

**No** >> Go To 9

## 2. CHECK THE INPUT SPEED SENSOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.

With the scan tool, monitor the Input and Output Speed Sensor RPM.

**Does the Input speed read 3000 RPM and the Output speed read 1000 RPM ± 50 RPM?**

**Yes** >> Replace the Input Speed Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

**NOTE: Make sure to leave the Speed Sensor, Transmission Solenoid/TRS Assembly, and Line Pressure Sensor harness connectors disconnected.**

Remove the Transmission Control Relay.

Place a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

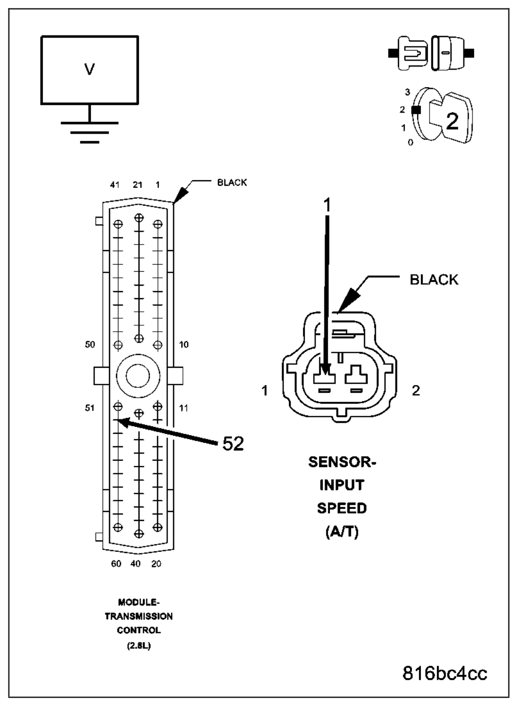
Measure the voltage of the (T52) Input Speed Sensor Signal circuit.

**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T52) Input Speed Sensor Signal circuit for a short to voltage.

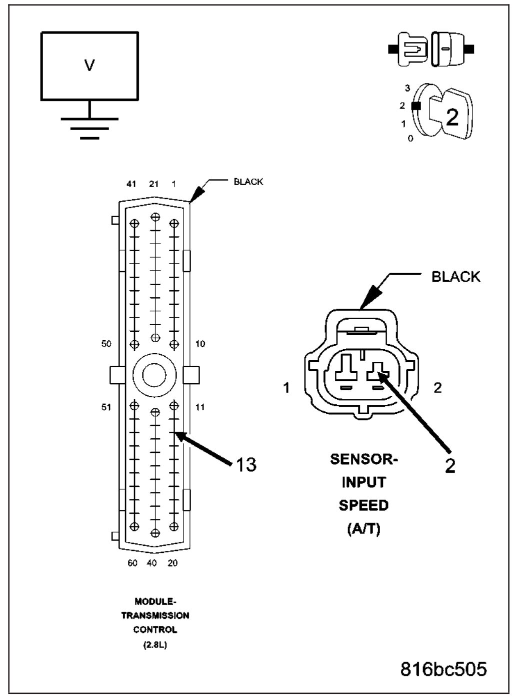
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4



## 4. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage of the (T13) Speed Sensor Ground circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for a short to voltage.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

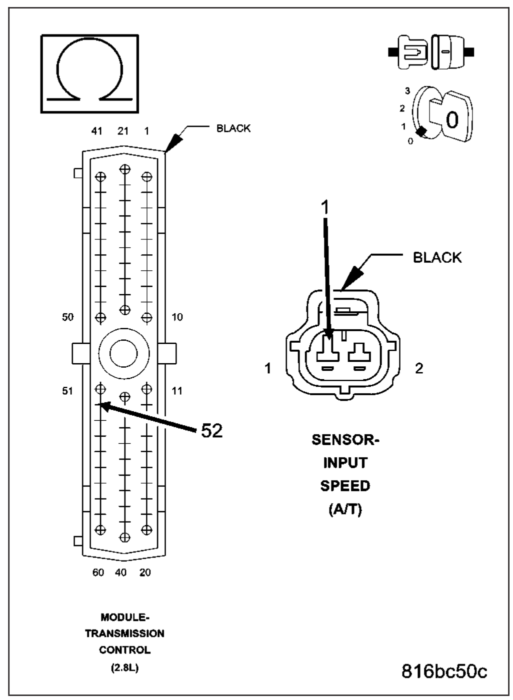
**No** >> Go To 5

## 5. CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Measure the resistance of the (T52) Input Speed Sensor Signal circuit between the Input Speed Sensor harness connector and the TCM harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T52) Input Speed Sensor Signal circuit for an open.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN

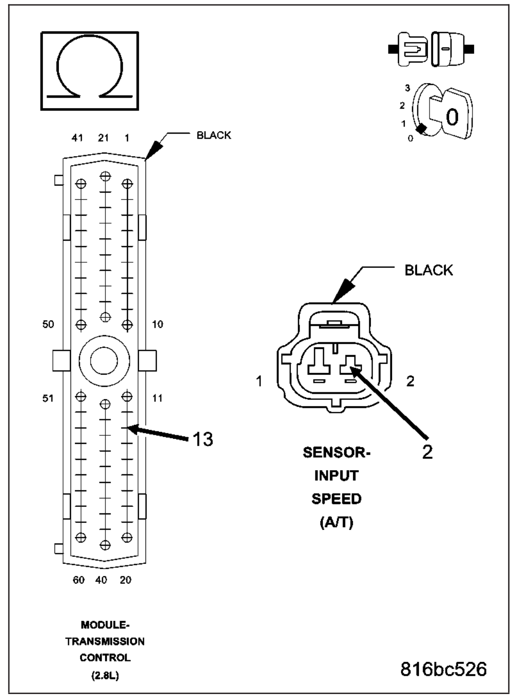
Measure the resistance of the (T13) Speed Sensor Ground circuit between the Input Speed Sensor harness connector and the TCM harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7



## 7. CHECK THE (T52) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

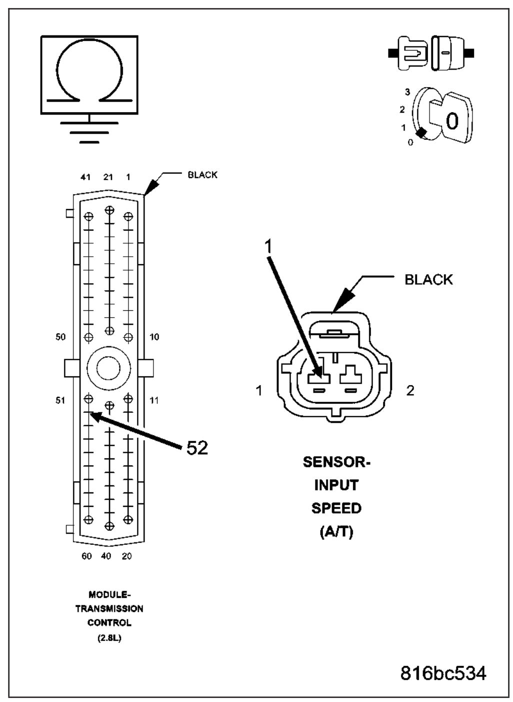
Measure the resistance between ground and the Input Speed Sensor Signal circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T52) Input Speed Sensor Signal circuit for a short to ground.

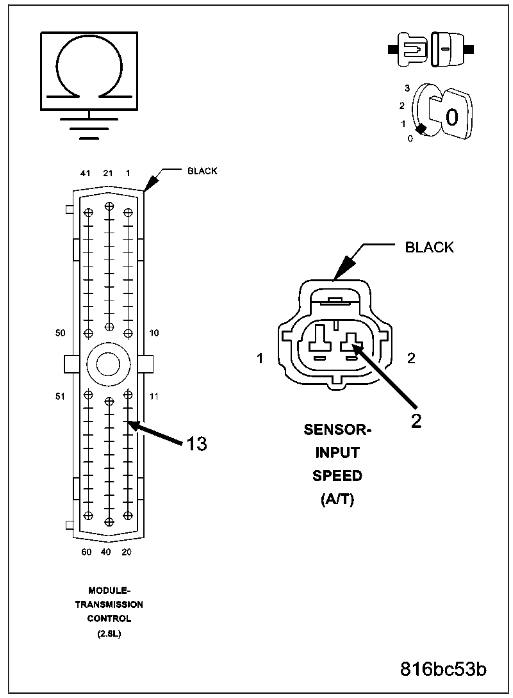
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8



## 8. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 9. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

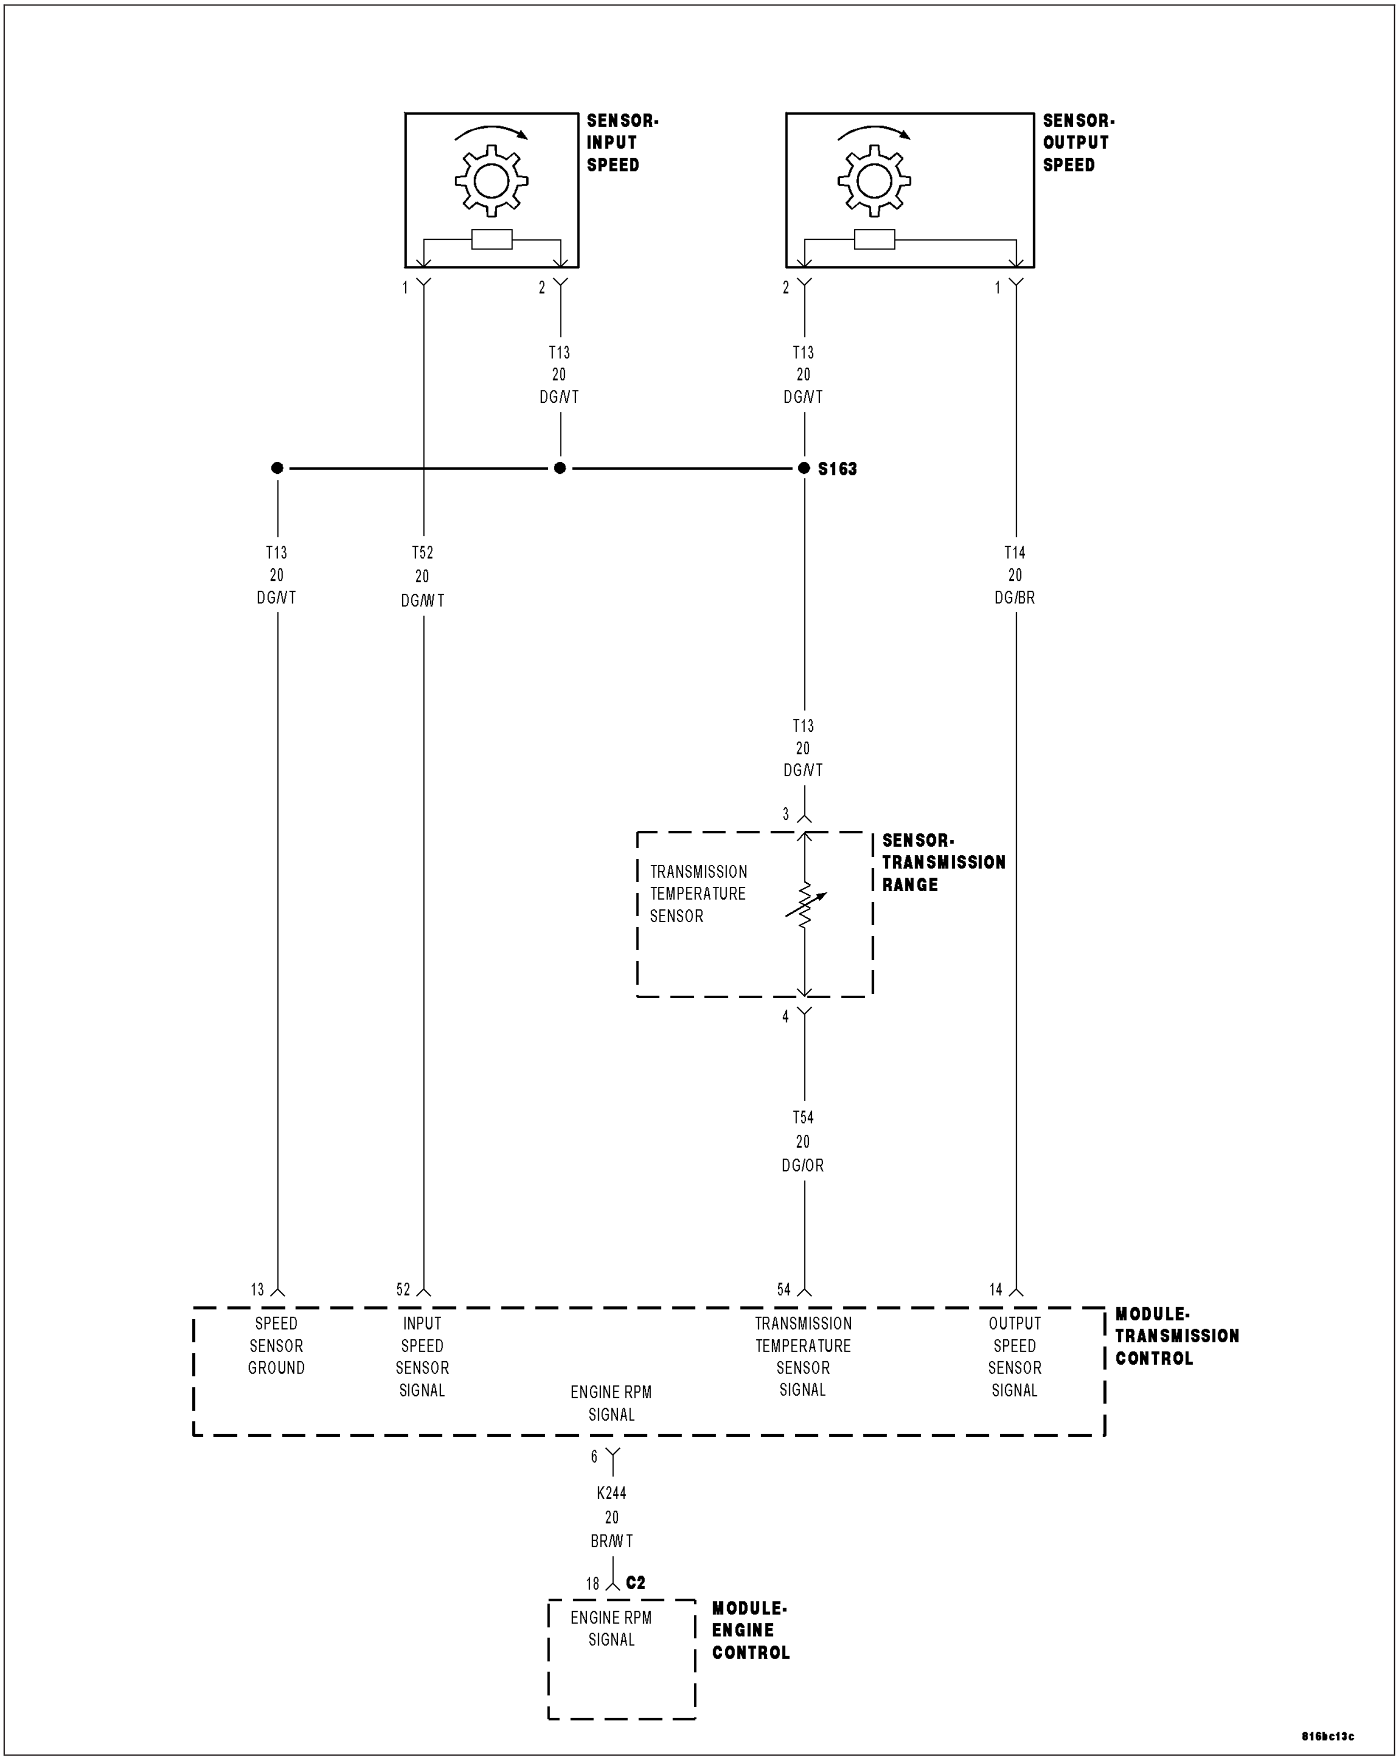
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P0720-OUTPUT SPEED SENSOR CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**
  If there is an excessive change in output RPM in any gear. This DTC can take up to five minutes of problem identification before illuminating the MIL.

| Possible Causes |
|---|
| OUTPUT SPEED SENSOR SIGNAL CIRCUIT OPEN |
| SPEED SENSOR GROUND CIRCUIT OPEN |
| OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND |
| SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND |
| OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE |
| SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE |
| OUTPUT SPEED SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (codes P0731 through P0736).

2) An excessive change in input or output speeds indicating signal intermittent will result in codes P0715 and/or P0720 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor has 60 teeth and the output speed sensor has 30 teeth, this results in a an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

## Diagnostic Test

### 1. CHECK IF DTC P0720 IS CURRENT

Turn the ignition off to the lock position.

**CAUTION: Properly support the vehicle and raise all drive wheels off the ground.**
Release the parking brake.

Start the engine in park.

Place the transmission gear selector in drive, release foot from brake.

**WARNING: Be sure to keep hands and feet clear of rotating wheels.**
With the scan tool, monitor the Output Speed Sensor RPM.

**Is the Output Speed Sensor RPM below 100 RPM?**

**Yes** >> Go To 2

**No** >> Go To 9

## 2. CHECK THE OUTPUT SPEED SENSOR

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, set the selector switch to 3000/1000 and the Input/Output switch to ON.

With the scan tool, monitor the Input and Output Speed Sensor RPM

**Does the Input Speed read 3000 RPM and the Output Speed read 1000 RPM, ± 50 RPM?**

**Yes** >> Replace the Output Speed Sensor per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

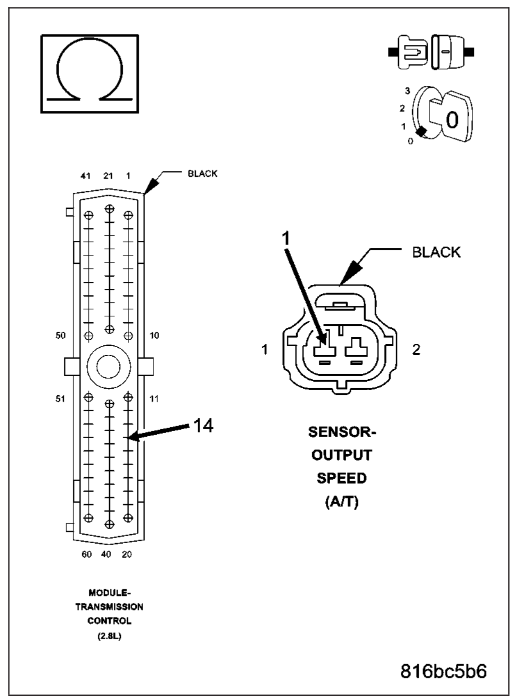
## 3. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T14) Output Speed Sensor Signal circuit between the Output Speed Sensor harness connector and the TCM harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T14) Output Speed Sensor Signal circuit for an open.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR AN OPEN

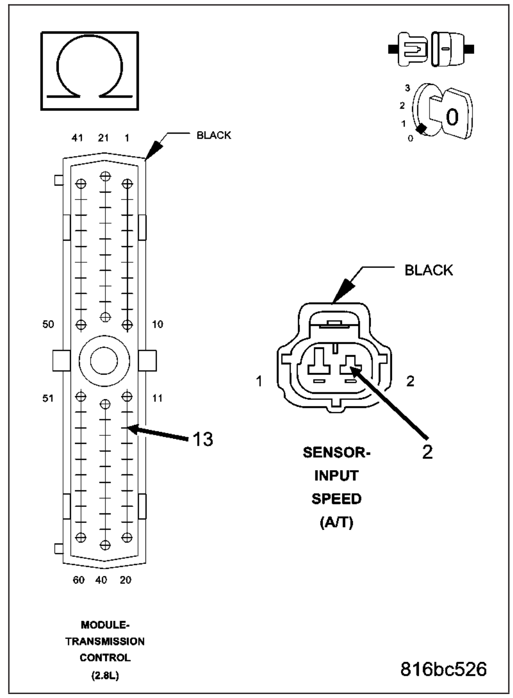
Measure the resistance of the (T13) Speed Sensor Ground circuit between the Output Speed Sensor harness connector and the TCM harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5



## 5. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

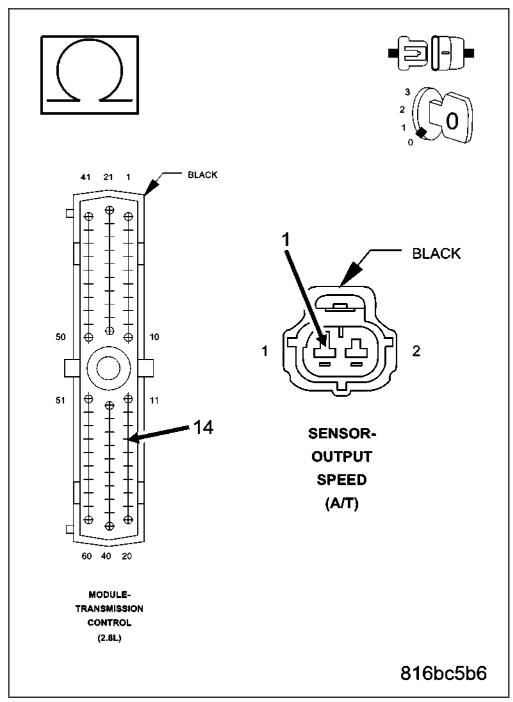
Measure the resistance between ground and the (T14) Output Speed Sensor Signal circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T14) Output Speed Sensor Signal circuit for a short to ground.

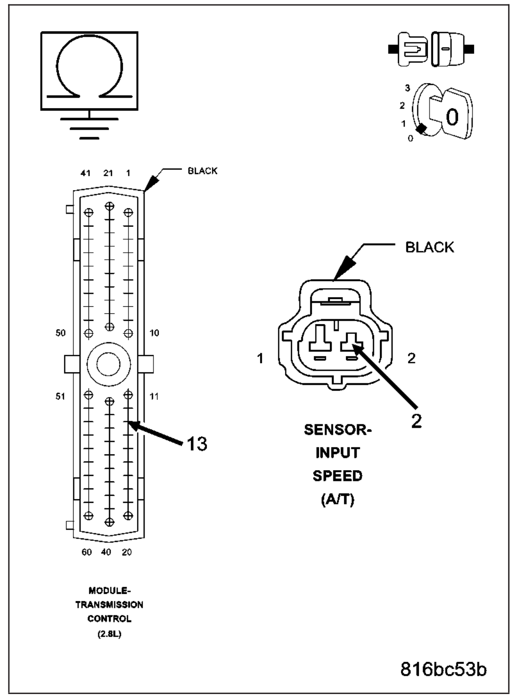
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6



## 6. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

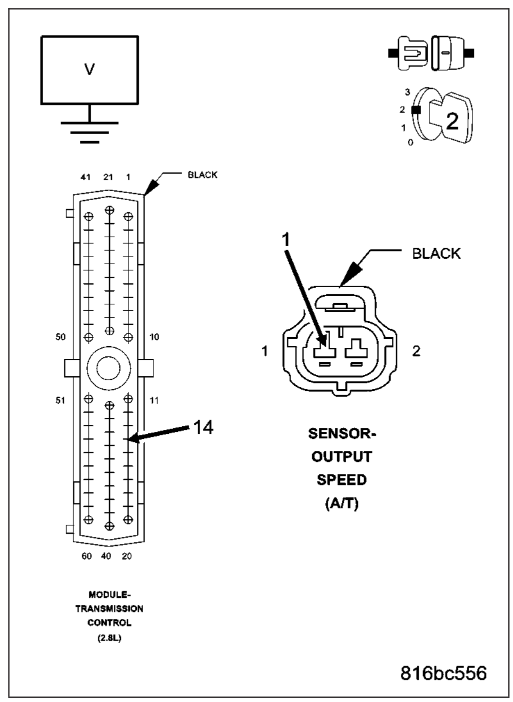
## 7. CHECK THE (T14) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Remove the Transmission Control Relay.

Place a jumper wire between the Fused B(+) circuit and the Transmission Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T14) Output Speed Sensor Signal circuit.



**Is the voltage above 0.5 volts?**

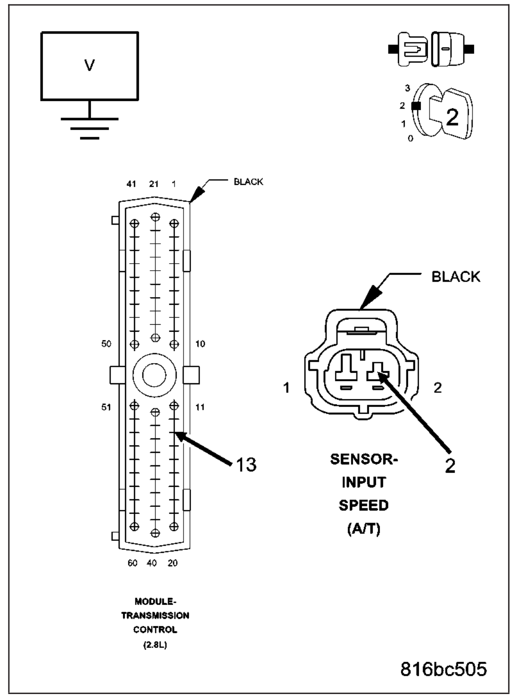
**Yes** >> Repair the (T14) Output Speed Sensor Signal circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. CHECK THE (T13) SPEED SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage of the (T13) Speed Sensor Ground circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 9. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P0725-ENGINE SPEED SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously every 7 msec with the ignition on and engine running.
- **Set Condition:**
  This DTC will set when the calculated engine speed is less than 390 RPM with the engine running, or greater than 8000 RPM, for the period of 2.0 seconds. The TCM will place the Transmission in Limp-in when this DTC is set. **Note: This is not a Transmission Input Speed Sensor DTC.**

| Possible Causes |
|---|
| RELATED ENGINE DTC'S PRESENT |
| ENGINE RPM SIGNAL CIRCUIT OPEN |
| ENGINE RPM SIGNAL CIRCUIT SHORT TO GROUND |
| ENGINE RPM SIGNAL CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION CONTROL MODULE |
| POWERTRAIN CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System calculates the engine RPM by directly reading the engine crank position sensor. It compares the calculated value to the engine speed sensor signal transmitted from the Engine Control System over the Engine RPM Signal circuit. The calculated engine RPM is also compared to a minimum and a maximum value.

## Diagnostic Test

### 1. CHECK FOR RELATED ENGINE DTCS

**NOTE: This is not a Transmission Input Speed Sensor DTC.**
Ignition on, engine not running.

With the scan tool, read all Engine DTCs. This includes any active or stored or one trip DTCs.

**Are there any engine RPM related DTCs present?**

**Yes** >> Refer to the Powertrain category and perform the appropriate symptom.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

Ignition on, engine not running.

With the scan tool, check the Starts Since Set counter for this DTC.

**Is the Starts Since Set counter 2 or less?**

**Yes** >> Repair the (K244) Engine RPM Signal circuit for a short to voltage.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE (K244) ENGINE RPM SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Disconnect the ECM harness connector.

Measure the resistance of the (K244) Engine RPM Signal circuit between the TCM harness connector and the ECM harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (K244) Engine RPM Signal circuit for an open

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (K244) ENGINE RPM SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (K244) Engine RPM Signal circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (K244) Engine RPM Signal circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (K244) ENGINE RPM SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Ignition on, engine not running.

Check the voltage of the (K244) Engine RPM Signal circuit.

**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (K244) Engine RPM Signal circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK THE TCM

Turn the ignition off to the lock position.

Replace and program the TCM per the Service Information.

Start the engine and allow the engine to idle for 6 minutes.

Check the voltage of the (K244) Engine RPM Signal circuit.

**Does the DTC reset?**

**Yes** >> Replace the ECM per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0731-GEAR RATIO ERROR IN 1ST

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

| Possible Causes |
|---|
| CUT UD PISTON SEAL |
| LOW FLUID LEVEL |
| CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| FAILED OVERRUNNING CLUTCH |
| CUT UD ACCUMULATOR SEAL RING |
| BROKEN UD ACCUMULATOR PISTON |
| BROKEN REACTION SHAFT SUPPORT SEAL RING |
| LOW LINE PRESSURE |
| BROKEN / MISSING MAIN VALVE BODY BLEED ORIFICE |
| BROKEN / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT |
| POOR MACHINING ON PUMP VALVE BODY FACE |
| INPUT SPEED SENSOR AND RELATED WIRING |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731–36).

2) An excessive change in input or output speeds indicating signal intermittent may result in the DTCs P0715 and/or P0720 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.

If any of these DTCs are present, perform their respective tests first.

**Are there any Transmission; solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If any of these DTCs are present, they may cause a Speed Ratio Error. Perform the test for P0944 first if it is present.

**No** >> Go To 2

### 2. CHECK IF DTC P0731 IS CURRENT

With the scan tool, perform the 1st Gear Clutch Test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**Did the Clutch Test pass, Input Speed remain at zero?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not currently present.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

- If the DTC Event Data shows fault P0731 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
- If the DTC Event Data shows fault P0731 set with input RPM = zero, check the input speed sensor and related wiring.
- If the DTC Event Data shows fault P0731 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, mis-installed or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
- If the DTC Event Data shows fault P0731 set with the UD pressure switch open (but line pressure matches Desired Line Pressure), air check the UD hydraulic clutch circuit for leakage per the Service Information. If the UD hydraulic clutch circuit is OK, replace the solenoid/TRS assembly.

Check the gearshift linkage adjustment.

Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.

Gear ratio DTCs can also be set under extreme temperature conditions.

Verify if the problem is only experienced under extreme hot or cold conditions.

**Were there any problems found.**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## 4. CHECK INTERNAL TRANSMISSION

Repair internal transmission as necessary. Refer to the Service Information.

If there were any line pressure DTCs present along with this DTC, make sure to inspect the: Primary oil filter and seal, Transmission Oil Pump, and the Main regulator valve per the Service Information.

If DTCs P0876 and/or P0875 were present in addition to the P0731, replace the Transmission Solenoid/TRS Assembly in addition to necessary internal repairs.

Pay particular attention to the following list of possible causes when repairing the transmission:

- Cut UD piston seal
- Failed overrunning clutch
- Cut UD accumulator seal ring
- Broken UD accumulator piston
- Low line pressure
- Broken/missing main valve body bleed orifice
- Broken/missing dribbler orifice assembly in reaction shaft support
- Poor machining on pump valve body face
- Transmission Solenoid/TRS Assembly

**View repair**

**Repair**

Repair internal transmission per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0732-GEAR RATIO ERROR IN 2ND

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

| Possible Causes |
| --- |
| RELATED DTC'S PRESENT |
| INPUT SPEED SENSOR OR WIRING |
| LOW FLUID LEVEL |
| CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL |
| WORN SOLENOID SWITCH VALVE OR PLUGS |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| BURNED UD OR 2C CLUTCH |
| CUT 2C OR UD PISTON SEAL |
| BROKEN 2C PISTON CASTING |
| BROKEN OR MISSING 2C BLEED ORIFICE |
| BROKEN OR MISSING UD BLEED ORIFICE |
| CUT 2C OR UD ACCUMULATOR PISTON SEAL |
| CRACKED 2C OR UD ACCUMULATOR PISTON |
| CUT OR MISSING #5 OR #7 CHECK BALL |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| BROKEN WELD - REACTION CARRIER TO REVERSE SUN GEAR |
| MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent may result in the DTCs P0715 and/or P0720 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.

**Are there any Transmission: solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?**

**Yes** >> Refer to appropriate symptom in the Transmission category. Perform the test for P0944-LOSS OF PRIME first if it is present.

**No** >> Go To 2

### 2. CHECK IF DTC IS CURRENT

With the scan tool, read and record the DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA display information for the DTC P0732?**

**Yes** >> Go To 4

**No** >> Go To 3

### 3. CHECK DTC EVENT DATA

In the DTC EVENT DATA, identify the DTC that was recorded earlier.

**Does the DTC EVENT DATA display information for the DTC P1790, with target gear = 2nd, or with both 2C and UD clutches applying?**

**Yes** >> Go To 4

**No** >> Go To 7

### 4. CHECK RPM IN DTC EVENT DATA

Refer to the DTC EVENT DATA recorded earlier.

**Does the Input RPM read zero?**

**Yes** >> Check the input speed sensor and wiring. Refer to test P0715 and diagnose as if the DTC is current.

**No** >> Go To 5

### 5. CHECK LINE PRESSURE READING

Refer to the DTC EVENT DATA recorded earlier.

**Is the line pressure reading more than 10 psi below the desired line pressure?**

**Yes** >> Go To 6

**No** >> Go To 7

### 6. CHECK TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

**NOTE: Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.**

**Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-in-**

**stalled?**

**Yes** >> Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to the Service Information for the proper hydraulic clutch repair procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Remove the Transmission Oil Pump per the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. CHECK IF THE DTC P0732 IS CURRENT

With the scan tool, perform the 2nd Gear Clutch Test. Follow the instructions on the scan tool.

Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**NOTE: If the 2C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 2nd gear clutch test will not detect a faulty 2C clutch. However, it will detect a faulty UD clutch.**

**Did the clutch test pass, did the Input Speed remain at zero?**

**Yes** >> Go To 8

**No** >> Go To 10

## 8. CHECK FOR INTERMITTENT OPERATION

Check the Shifter adjustment per the Service Information.

Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. CHECK FOR SLIPPAGE

With the scan tool, erase Transmission DTCs.

Road test the vehicle.

**Is there an obvious slippage noticed in 2nd gear, or runaway on the 1–2 shift?**

**Yes** >> Go To 12

**No** >> Go To 15

## 10. CHECK THE UD HYDRAULIC CLUTCH CIRCUIT

Remove Transmission Oil Pan and check for excessive debris.

Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) per the Service Information.

**NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.**

**Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?**

**Yes** >> Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and the dribbler assembly, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 11

## 11. CHECK THE UD ACCUMULATOR PISTON

Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

**Were there any problems found?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 12. CHECK FOR EXCESSIVE DEBRIS

Remove the Transmission Oil Pan and check for excessive debris.

If grey sludge is present, check for a improperly assembled 2C clutch with the thick reaction plate not against the case.

Remove the valve body and air check the 2C hydraulic clutch circuit (in the 2C/4C clutch retainer) per the Service Information.

**NOTE: The 2C clutch passage contains a small bleed orifice, a small amount of air leakage is normal.**

**Were there any problems found, excessive debris, improperly assembled 2C clutch and/or excessive air leakage in the 2C hydraulic clutch circuit?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the 2C piston seals and bleed orifice.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK THE 2C ACCUMULATOR

Check the 2C Accumulator piston for cracks or a cut seal.

Check for a cut or missing #7 or #5 check ball.

Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

**Were there any problems found**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 14

## 14. CHECK FOR BROKEN REVERSE SUN GEAR WELD

Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

1) Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.

2) Rotate the Input Annulus gear and drive shell (the drum that encloses the two rearmost carriers).

3) Check to see if the reaction carrier (the front-most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

**Is the reaction carrier turning faster than the drive shell?**

**Yes** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the reaction carrier per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 15. CHECK IF DTC RESETS

**Did the DTC P0732 reset during the road test?**

**Yes** >> Go To 16

**No** >> Go To 17

## 16. LIST OF POSSIBLE CAUSES

If any other DTCs set during the road test, refer to the appropriate symptom in the Transmission category.

If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those:

- Check for excessive debris in the Transmission Oil pan, plugged, cracked, or misinstalled Primary Transmission Oil Filter and/or seal.
- Check for cut and/or missing #7 and #5 check balls in the main valve body.
- Check the 2C and UD accumulator pistons and seals, UD bleed orifice, and the Solenoid Switch Valve and Plugs in the main valve body.
- Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assembly.
- Check the 2C clutch piston seals, and bleed orifice.
- Check the main regulator valve for sticking in its bore and the flatness of the pump valve body and pump housing faces.
- Check for a improperly assembled 2C clutch with the thick reaction plate not against the case.

**View repair**

**Repair**

Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 17. INTERMITTENT DTC

The conditions to set this DTC are not currently present.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

- If the DTC Event Data shows fault P0732 was set in Park, Reverse, or Neutral, replace the Powertrain Control Module.
- If the DTC Event Data shows fault P0732 set with input RPM = zero, check the input speed sensor and related wiring.
- If the DTC Event Data shows fault P0732 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
- If the DTC Event Data shows fault P0732 set with the UD or 2C pressure switch open (but line pressure matches Desired Line Pressure), air check the UD and 2C hydraulic clutch circuits for leakage per the Service Information. If the UD and 2C hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.

Check the gearshift linkage adjustment.

Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install Transmission Simulator, Miller tool #8333.

Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.

Gear ratio DTCs can also be set under extreme temperature conditions.

Verify if the problem is only experienced under extreme hot or cold conditions.

**Were there any problems found.**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0733-GEAR RATIO ERROR IN 3RD

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

| Possible Causes |
|---|
| RELATED DTCS PRESENT |
| INPUT SPEED SENSOR OR WIRING |
| LOW FLUID LEVEL |
| CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL |
| BENT OR BROKEN ACCUMULATOR COVER ON MAIN VALVE BODY |
| WORN SOLENOID SWITCH VALVE OR PLUGS |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| BURNED UD OR OD CLUTCH |
| CUT OD OR UD PISTON SEAL |
| BROKEN OR MISSING UD OR OD BLEED ORIFICE IN MAIN VALVE BODY |
| BROKEN OR MISSING BLEED ORIFICE IN UD OR OD CLUTCH PISTON |
| CUT OD OR UD ACCUMULATOR PISTON SEAL |
| CRACKED OD OR UD ACCUMULATOR PISTON |
| CUT OR MISSING #6 CHECK BALL |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| BROKEN WELD - REVERSE CARRIER HUB TO CARRIER |
| BROKEN REACTION SHAFT SUPPORT SEAL RING |
| POOR MACHINING ON PUMP VALVE BODY FACE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent may result in the DTCs P0715 and/or P0720 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

## Diagnostic Test

### 1. CHECK IF RELATED DTCS ARE PRESENT

With the scan tool, check for other transmission DTCs

**Are there any Transmission; solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?**

**Yes** >> Refer to appropriate symptom in the Transmission category. Perform the test for P0944-LOSS OF PRIME first if it is present.

**No** >> Go To 2

### 2. CHECK DTC EVENT DATA

With the scan tool, read and record the DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA display information for the DTC P0733?**

**Yes** >> Go To 4

**No** >> Go To 3

### 3. CHECK THE TARGET GEAR IN DTC EVENT DATA

In the DTC EVENT DATA, identify the DTC that was recorded earlier.

**Does the DTC EVENT DATA display information for the DTC P1790, with target gear = 3rd, or with both OD and UD clutches applying?**

**Yes** >> Go To 4

**No** >> Go To 7

### 4. CHECK INPUT RPM IN DTC EVENT DATA

Refer to the DTC EVENT DATA recorded earlier.

**Does the Input RPM read zero?**

**Yes** >> Check the input speed sensor and wiring. Refer to test P0715 and diagnose as if the DTC is current.

**No** >> Go To 5

### 5. CHECK LINE PRESSURE READING

Refer to the DTC EVENT DATA recorded earlier.

**Is the line pressure reading more than 10 psi below the desired line pressure?**

**Yes** >> Go To 6

**No** >> Go To 7

### 6. CHECK TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

**NOTE: Make sure the Primary Transmission Oil Filter and seal are properly installed and are not cracked or split.**

**Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked, plugged or mis-in-**

**stalled?**

**Yes** >> Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If excessive clutch debris is present, check the clutches for damage. Refer to the Service Information for the proper hydraulic clutch repair procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Remove the Transmission Oil Pump per the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. CHECK IF DTC P0733 IS CURRENT

With the scan tool, perform the 3rd Gear Clutch Test. Follow the instructions on the scan tool.

Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**NOTE: If the OD clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 3rd gear clutch test will not detect a faulty OD clutch. However, it will detect a faulty UD clutch.**

**Did the clutch test pass, did the Input Speed remain at zero?**

**Yes** >> Go To 8

**No** >> Go To 10

## 8. CHECK FOR INTERMITTENT OPERATION

Check the Shifter adjustment per the Service Information.

Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. CHECK FOR SLIPPAGE

With the scan tool, erase Transmission DTCs.

Road test the vehicle. Check operation in 3rd gear, 4th gear, and Reverse.

**Is there an obvious slippage noticed in 3rd gear, or runaway on the 2-3 shift?**

**Yes** >> Go To 12

**No** >> Go To 16

## 10. CHECK THE UD HYDRAULIC CLUTCH CIRCUIT

Remove Transmission Oil Pan and check for excessive debris.

Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) per the Service Information.

**NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.**

**Were there any problems found, excessive debris and/or excessive air leakage in the UD hydraulic clutch circuit?**

**Yes** >> Repair as necessary. Check the UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 11

## 11. CHECK UD ACCUMULATOR PISTON

Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

**Were there any problems found?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

**No** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 12. CHECK FOR EXCESSIVE DEBRIS

Remove the Transmission Oil Pan and check for excessive debris.

Remove the valve body and check if the accumulator cover is intact.

Air check the OD hydraulic clutch circuit (in the case) per the Service Information.

**NOTE: The OD clutch passage contains a small bleed orifice which connects to the Reverse clutch hydraulic circuit, a small amount of air leakage into the Reverse clutch passage is normal.**

**Were there any problems found, excessive debris, and/or excessive air leakage in the OD hydraulic clutch circuit?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the bleed orifice in the OD/Reverse clutch piston.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK THE OD ACCUMULATOR

Check the OD Accumulator piston for cracks or a cut seal.

Check for a cut or missing #6 check ball.

Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

**Were there any problems found?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 14

## 14. CHECK FOR NO REVERSE

**During the road test on a previous test, did the vehicle have no reverse and no 3rd gear, but 1st and 2nd gears were OK?**

**Yes** >> Go To 15

**No** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 15. CHECK FOR BROKEN REVERSE CARRIER WELD

Remove the Transmission per the Service Information and inspect the weld on the reverse carrier hub.

**Were there any problems found?**

**Yes** >> Repair as necessary.

**No** >> Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the OD hub and shaft. Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 16. CHECK IF DTC RESETS

**Did the DTC P0733 reset during the road test?**

**Yes** >> Go To 17

**No** >> Go To 18

## 17. LIST OF POSSIBLE CAUSES

If any other DTCs set during the road test, refer to the appropriate symptom in the Transmission category.

If no other DTCs set during the road test, below is a list of possible causes, but not strictly limited to those.

Check for:

- Excessive debris in the Transmission Oil pan, plugged, cracked, or mis-installed Primary Transmission Oil Filter and/or seal.
- Cut or missing #6 check ball in the main valve body.
- OD and UD accumulator pistons and seals and bleed orifices, and the Solenoid Switch Valve and Plugs in the main valve body.
- OD and UD clutch piston seals, reaction shaft support seal rings and dribbler assemblies, and the flatness of the pump valve body and pump housing faces.
- Main regulator valve for sticking in its bore.

**View repair**

**Repair**

Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 18. CHECK FOR INTERMITTENT OPERATION

The conditions to set this DTC are not currently present.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

- If the DTC Event Data shows fault P0733 was set in the Park, Reverse, or Neutral, replace the Powertrain Control Module.
- If the DTC Event Data shows fault P0733 set with input RPM = zero, check the input speed sensor and related wiring.
- If the DTC Event Data shows fault P0733 set with line pressure significantly below desired line pressure, check for the cause of low line pressure (i.e., oil level, misinstalled or damaged primary filter or filter seal, sticking main regulator valve in pump, etc.).
- If the DTC Event Data shows fault P0733 set with the OD or UD pressure switch open (but line pressure matches Desired Line Pressure), air check the OD and UD hydraulic clutch circuits for leakage per the Service Information. If the OD and UD hydraulic clutch circuits are OK, replace the Transmission Solenoid/TRS assembly.

Check the gearshift linkage adjustment.

Intermittent Gear Ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Wiggle wiring and connectors while checking for intermittent operation with the Transmission Simulator.

Gear ratio DTCs can also be set under extreme temperature conditions.

Verify if the problem is only experienced under extreme hot or cold conditions.

**Were there any problems found.**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0734-GEAR RATIO ERROR IN 4TH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

| Possible Causes |
|---|
| LOW FLUID LEVEL |
| INPUT SPEED SENSOR OR WIRING |
| VALVE BODY ACCUMULATOR COVER FAILED |
| CUT OD OR 4C ACCUMULATOR SEAL |
| CRACKED OD OR 4C ACCUMULATOR PISTON |
| BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY |
| CUT 4C TOWER SEAL |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| CUT OR MISSING #5 OR #6 CHECK BALL |
| WORN SOLENOID SWITCH VALVE OR PLUGS |
| CUT OD OR 4C PISTON SEAL |
| STUCK MAIN REGULATOR VALVE |
| BURNED OD OR 4C CLUTCH |
| BROKEN OR MISSING 4C BLEED ORIFICE IN 2C/4C RETAINER |
| BROKEN REACTION SHAFT SUPPORT SEAL RING |
| POOR MACHINING ON PUMP VALVE BODY FACE |
| LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT |
| CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE |
| BROKEN REVERSE CARRIER HUB WELD |
| BROKEN REVERSE SUN GEAR WELD TO REACTION CARRIER |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731–36).

2) An excessive change in input or output speeds indicating signal intermittent may result in the DTCs P0715 and/or P0720 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs

If any of these DTCs are present, perform their respective tests first.

**Are there any Transmission; solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If any of these DTCs are present, they may cause a Speed Ratio Error. Perform the test for P0944 first if it is present.

**No** >> Go To 2

### 2. CHECK DTC EVENT DATA

With the scan tool, read and record the DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA display information for the DTC P0734?**

**Yes** >> Go To 4

**No** >> Go To 3

### 3. CHECK FOR ANOTHER DTC

**In the DTC EVENT DATA recorded earlier, does the DTC EVENT DATA show the DTC P1790, with Target Gear = 4th, or with both the 4C and OD clutches applying?**

**Yes** >> Go To 4

**No** >> Go To 6

### 4. CHECK INPUT RPM

**In the DTC EVENT DATA recorded earlier, does the Input RPM read zero?**

**Yes** >> Refer to the Transmission category and perform the diagnostic procedure for P0715 (Input Speed Sensor Error). Diagnose the DTC as if it is set and current.

**No** >> Go To 5

### 5. CHECK LINE PRESSURE READING

**In the DTC EVENT DATA recorded earlier, is the line pressure reading more than 10 PSI below the desired line pressure reading?**

**Yes** >> Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged, if Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK TRANSMISSION FOR SLIPPAGE

Erase DTCs and road test the vehicle.

Check the transmission operation in reverse and all forward gears.

**During the road test, was there any obvious slippage noted in 4th gear or a runaway during the 3-4 shift?**

**Yes** >> Go To 8

**No** >> Go To 7

## 7. CHECK IF DTC RESETS

With the scan tool, check for Transmission DTCs after the road test.

**Did the DTC P0734 reset?**

**Yes** >> Go To 8

**No** >> Test Complete.

## 8. CHECK INTERNAL TRANSMISSION

Remove the Transmission Oil Pan and Valve Body per the Service Information and check for the following:

- Excessive debris in the oil pan.
- Remove the Valve Body and check if the accumulator cover is intact and the 4C tower seal is not cut or split.
- OD and 4C accumulator pistons for cracks and/or cut seals.
- Solenoid Switch Valve and its plugs for stickiness or wear.
- Cut or missing #5 and/or #6 check ball.
- OD bleed orifice on top of the Valve Body
- Air check the OD and 4C hydraulic clutch circuits for excessive leakage. Refer to the Service information.

**NOTE: Both the OD and 4C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.**

**Were there any problems found?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

**Was there no reverse gear during the road test?**

**Yes** >> Go To 10

**No** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 10. CHECK ROAD TEST RESULTS

**During the road test, was there no 2nd gear and no 4th gear, but 3rd gear (limp-in) was OK?**

**Yes** >> Go To 11

**No** >> Go To 12

## 11. CHECK FOR BROKEN REVERSE SUN GEAR WELD

Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

1) Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.

2) Rotate the Input Annulus gear and drive shell (the drum that encloses the two rearmost carriers).

3) Check to see if the reaction carrier (the front most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

**Is the reaction carrier turning faster than the drive shell?**

**Yes** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the reaction carrier per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 12. CHECK FOR NO REVERSE

Remove the Transmission per the Service Information and inspect the weld on the reverse carrier hub.

**Were there any problems found?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Disassemble and inspect the input clutch assembly. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the OD hub and shaft. Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0735-GEAR RATIO ERROR IN 5TH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL.

| Possible Causes |
|---|
| LOW FLUID LEVEL |
| INPUT SPEED SENSOR OR WIRING |
| VALVE BODY ACCUMULATOR COVER FAILED |
| CUT OD OR 2C ACCUMULATOR SEAL |
| CRACKED OD OR 2C ACCUMULATOR PISTON |
| BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY |
| CUT 2C TOWER SEAL |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| CUT OR MISSING #5, #6, OR #7 CHECK BALL |
| WORN SOLENOID SWITCH VALVE OR PLUGS |
| CUT OD OR 2C PISTON SEAL |
| STUCK MAIN REGULATOR VALVE |
| BURNED OD OR 2C CLUTCH |
| BROKEN OR MISSING 2C BLEED ORIFICE IN 2C/4C RETAINER |
| BROKEN REACTION SHAFT SUPPORT SEAL RING |
| POOR MACHINING ON PUMP VALVE BODY FACE |
| LOOSE / MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT |
| CRACKED / LOOSE / MISSING OD/REVERSE PISTON BLEED ORIFICE |
| BROKEN REVERSE CARRIER HUB WELD |
| BROKEN REVERSE SUN GEAR WELD TO REACTION CARRIER |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent may result in the DTCs P0715 and/or P0720 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTC's

If any of these DTCs are present, perform their respective tests first.

**Are there any Transmission; solenoid, line pressure, speed sensor, and/or loss of prime DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If any of these DTCs are present, they may cause a Speed Ratio Error. Perform the test for P0944 first if it is present.

**No** >> Go To 2

### 2. CHECK DTC EVENT DATA

With the scan tool, read and record the DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA display information for the DTC P0735?**

**Yes** >> Go To 4

**No** >> Go To 3

### 3. CHECK THE TARGET GEAR

**In the DTC EVENT DATA recorded earlier, does the DTC EVENT DATA show the DTC P1790, with Target gear = 5th, or with both the 2C and OD clutches applying?**

**Yes** >> Go To 4

**No** >> Go To 6

### 4. CHECK INPUT RPM

**In the DTC EVENT DATA recorded earlier, does the Input RPM read zero?**

**Yes** >> Refer to the Transmission category and perform the diagnostic procedure for P0715 (Input Speed Sensor Error). Diagnose the DTC as if it is set and current.

**No** >> Go To 5

### 5. CHECK LINE PRESSURE READING

**In the DTC EVENT DATA recorded earlier, is the line pressure reading more than 10 PSI below the desired line pressure reading?**

**Yes** >> Remove the Transmission Oil pan and check the Transmission Oil filter for improper installation or plugged, if Primary oil filter is OK, check the main regulator valve in pump. If excessive debris is in the oil pan, check clutches and repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK TRANSMISSION FOR SLIPPAGE

Erase DTCs and road test the vehicle.

Check the transmission operation in reverse and all forward gears.

**During the road test, was there any obvious slippage noted in 5th gear or a runaway during the 4–5 shift?**

**Yes** >> Go To 8

**No** >> Go To 7

## 7. CHECK IF DTC RESETS

With the scan tool, check for Transmission DTCs after the road test.

**Did the DTC P0735 reset?**

**Yes** >> Go To 8

**No** >> Test Complete.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 8. CHECK INTERNAL TRANSMISSION

Remove the Transmission Oil Pan and Valve Body, per the Service Information, and check for the following:

- Excessive clutch and or metal debris in the oil pan.
- If the accumulator cover is intact and the 2C tower seal is not cut or split.
- OD and 2C accumulator pistons for cracks or cut seals.
- Solenoid Switch Valve and its plugs for stickiness or wear.
- Cut or missing #5, #6, or #7 check ball.
- OD bleed orifice on top of the valve body.
- Air check the OD and 2C hydraulic clutch circuits for excessive leakage. Refer to the Service information.

**NOTE: Both the OD and 2C hydraulic clutch circuits contain a small bleed orifice. A small amount of air leakage is considered normal. The OD hydraulic clutch circuit bleed orifice connects to the Reverse input clutch hydraulic cavity. A small amount of air leakage into the Reverse hydraulic clutch circuit is considered normal.**

**Were there any problems found?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0736-GEAR RATIO ERROR IN REVERSE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

| Possible Causes |
|---|
| LOW FLUID LEVEL |
| CUT LR TOWER SEAL ON MAIN VALVE BODY |
| CUT LR CLUTCH PISTON SEALS |
| BROKEN OR MISSING LR CLUTCH BLEED ORIFICE (IN LR CLUTCH RETAINER) |
| CUT LR ACCUMULATOR PISTON SEAL IN MAIN VALVE BODY |
| CRACKED LR ACCUMULATOR PISTON IN MAIN VALVE BODY |
| CUT OD/REV PISTON SEALS |
| BROKEN OR MISSING OD/REV BLEED ORIFICE (IN OD/REV CLUTCH PISTON) |
| BROKEN REVERSE CARRIER HUB WELD |
| BROKEN REVERSE SUN GEAR WELD TO THE REACTION CARRIER |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) Once in a particular gear, if the gear ratio varies from the correct gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent may result in the DTCs P0715 and/or P0720 being set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the pulses from the input speed sensor when at a stop in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set.

### Diagnostic Test

#### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTC's

**Are there any Transmission; solenoid, line pressure, speed sensor, and/or loss of prime DTC's present?**

**Yes** >> Refer to appropriate symptom in the Transmission category. Perform the test for P0944-LOSS OF PRIME first if it is present.

**No** >> Go To 2

## 2. CHECK IF DTC IS CURRENT

With the scan tool, perform the Reverse Gear Clutch test. Follow the instructions on the scan tool.

Increase the throttle angle, TPS degree, to 30°, for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Did the clutch test pass, input speed remain at zero?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK DTC EVENT DATA

The conditions necessary to set this DTC are not currently present.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Does the DTC EVENT DATA show an input speed reading of zero?**

**Yes** >> Go To 8

**No** >> Go To 4

## 4. POSSIBLE INTERNAL TRANSMISSION CAUSES

Remove the Transmission Oil Pan and Valve Body and check the following per the Service Information:

- Clutch or metal debris in the pan
- LR clutch tower seal on the main valve body or cuts and the LR accumulator piston and seals.
- Air check the Reverse and LR Hydraulic Clutch circuits (in the case) for excessive air leakage.

**NOTE: Both Hydraulic Clutch circuits contain a small bleed orifice , a small amount of air leakage is normal. The Reverse hydraulic clutch circuit bleed orifice connects to the OD hydraulic clutch cavity. A small amount of air leakage into the OD hydraulic clutch circuit is considered normal.**

**Were there any problems found?**

**Yes** >> Repair as necessary. If clutch debris is present, remove the transmission and inspect the Reverse and LR clutches, and inspect the Transmission Oil Pump and Main Regulator Valve for damage or sticking in its bore.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CLUTCH TEST FAILURE

**Did the clutch test fail in reverse?**

**Yes** >> Go To 6

**No** >> Test complete.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK FOR BROKEN REVERSE SUN GEAR WELD

Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

1) Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.

2) Rotate the Input Annulus gear and drive shell, (the drum that encloses the two rearmost carriers).

3) Check to see if the reaction carrier (the front-most carrier, whose outer shell is splined to the 2C clutch) is rotating faster than the drive shell is being turned.

**Is the reaction carrier turning faster than the drive shell?**

**Yes** >> Go To 7

**No** >> Replace the reaction carrier per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. CHECK REVERSE CARRIER HUB

Remove the Transmission per the Service Information and inspect the weld on the reverse carrier hub.

**Were there any problems found?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Disassemble and inspect the input clutch assembly. Check the Reverse clutch reaction plate snap ring. Check the OD and Reverse clutch seals, discs, and bleed orifice (in the OD/Reverse clutch piston). Check the Reverse hub and shaft. Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 8. CHECK FOR INTERMITTENT OPERATION

Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test complete.

## P0740-TCC OUT OF RANGE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  During Electronically Modulated Converter Clutch (EMCC) Operation.
- **Set Condition:**
  Transmission must be in EMCC, with input speed greater than 1750 RPM. TCC-LR Solenoid achieves the maximum duty cycle and can not pull engine speed within 60 RPM of input speed. Also when the transmission is in FEMCC and the engine slips TCC less than 100 RPM for 10 seconds. This DTC can take up to five minutes of problem identification before illuminating the MIL.

| Possible Causes |
|---|
| RELATED DTC P0750 PRESENT |
| L/R SOLENOID |
| TCC SWITCH VALVE STUCK |
| TCC REGULATOR VALVE STUCK |
| INPUT SHAFT SEAL RING CUT |
| TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

When in 2nd, 2nd Prime, 3rd, 4th or 5th gear, the torque converter clutch (TCC) can be engaged when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the LR Solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 RPM. Then the LR solenoid is fully energized (FEMCC – 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

## Diagnostic Test

### 1. CHECK FOR RELATED DTC P0750

With the scan tool, read transmission DTCs.

**Is the DTC P0750 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF DTC P0740 IS CURRENT

With the scan tool, Read and RECORD ALL Transmission DTC's. After recording DTCs, erase DTCs.

Drive the vehicle until the transmission temperature is at least 43° C or 110° F and the engine temperature at least 49° C or 120° F.

Perform the following steps 3 times.

Drive the vehicle to the speed of at least 88 Kmh or 55 mph.

Allow 4th or 5th gear to engage for at least 10 seconds.

Close the throttle.

Tip back into the throttle until the TPS angle is between 25 and 29 degrees.

**NOTE: If the throttle angle goes over 30 degrees, you must close the throttle and try again.**

**Did the TCC engage during any of the attempts, Engine speed approximately equal to input speed?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wires while checking for shorts and open circuits.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorts and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## 4. CHECK THE LR SOLENOID

With the scan tool, check for other transmission DTC's.

**Are the DTCs P1775 and P0841 present also?**

**Yes** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE TORQUE CONVERTER AND/OR INTERNAL TRANSMISSION

Repair internal transmission as necessary.

Check for the following possible causes. Refer to the Service information for the proper repair procedures.

Inspect the Transmission Oil Pump and Valve Body.

If no problems are found, replace the Transmission Solenoid/TRS Assembly.

Check the Torque Converter Switch Valve and the Torque Converter Clutch Control Valve for sticking in the bore.

Check the Teflon seal rings on the input shaft. Note: If one of the seal rings is , the loose piece will often lodge in the TCC switch valve, causing it to stick in it bore.

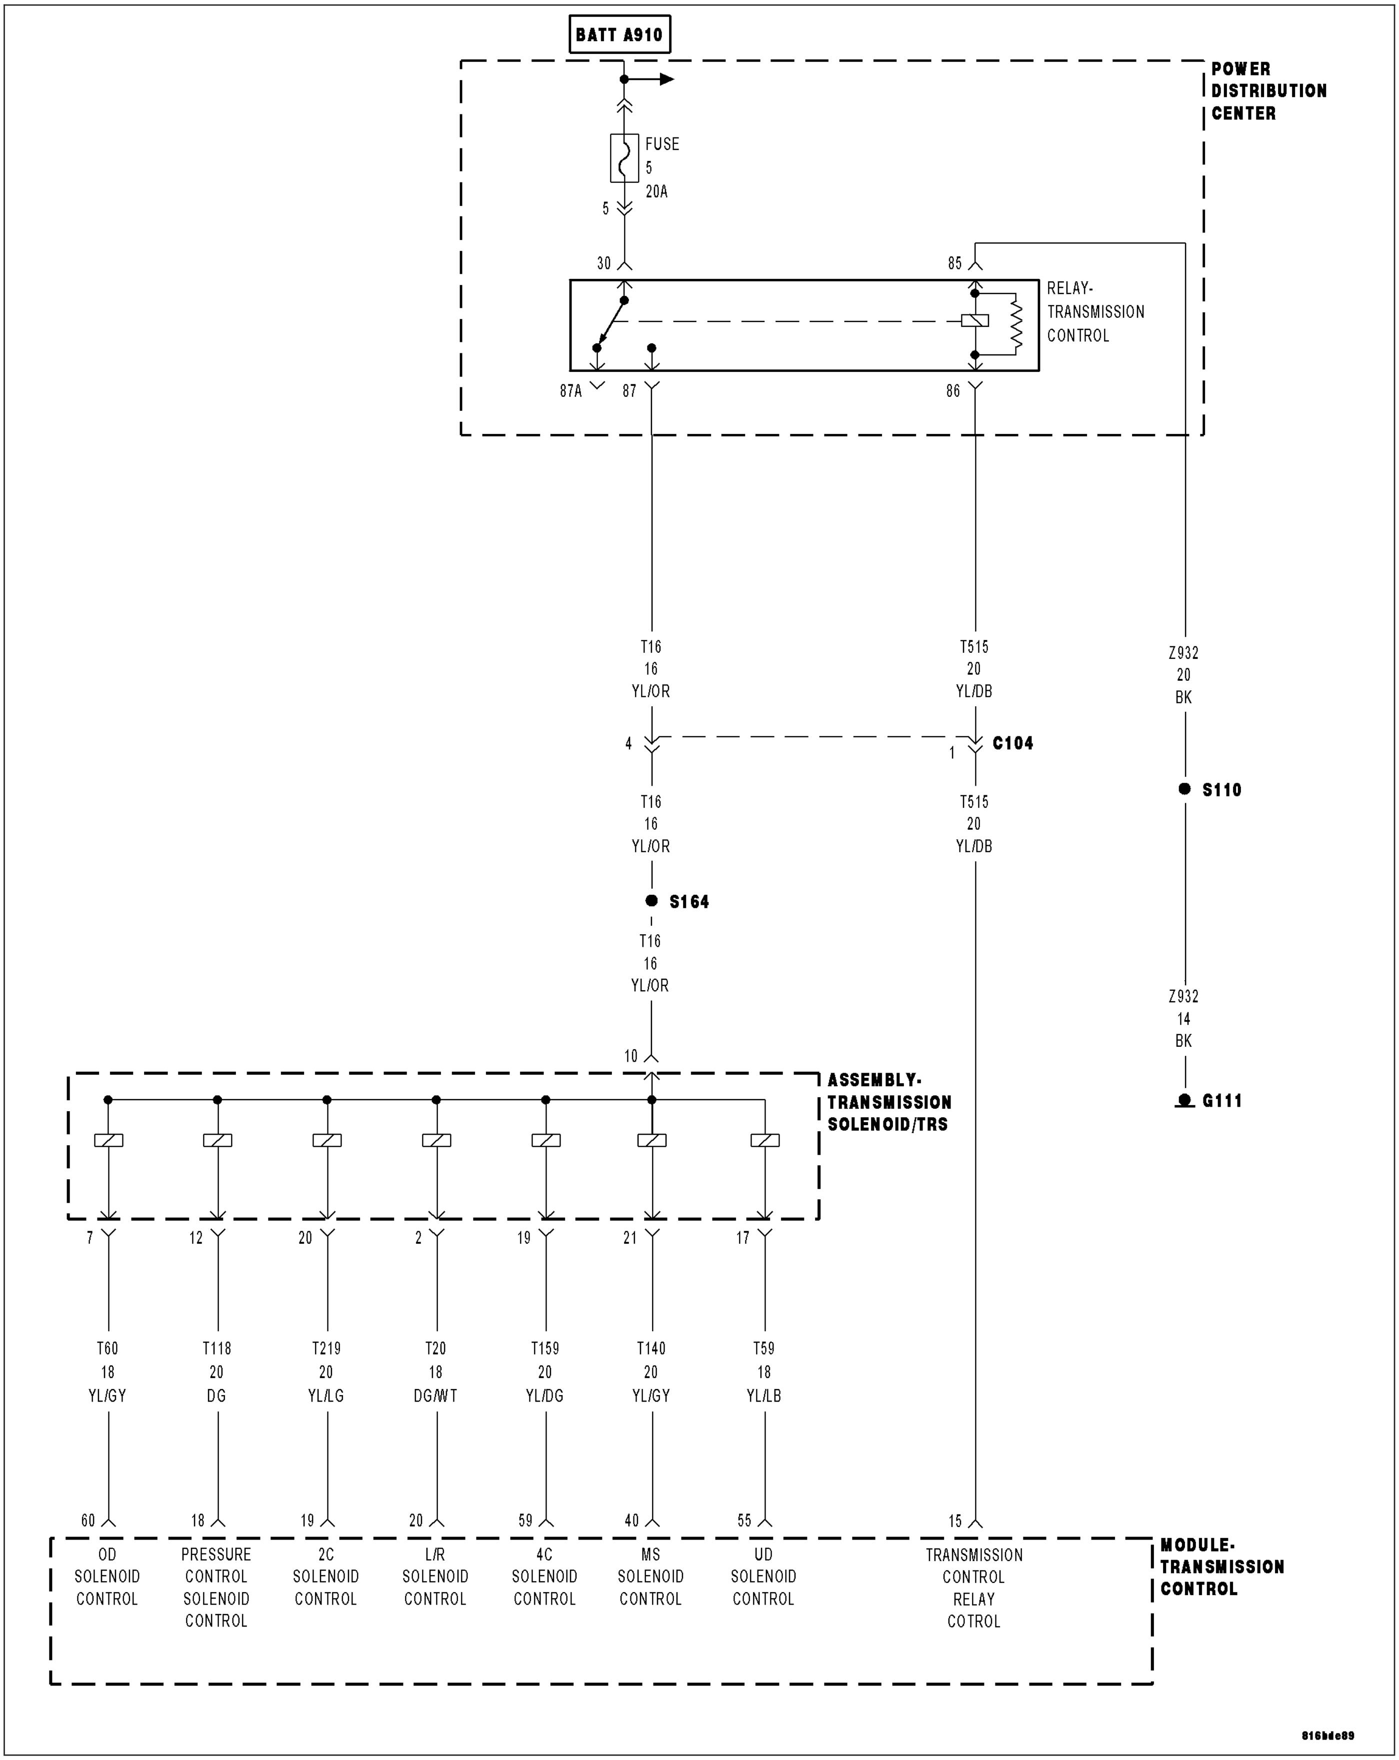
**View repair**

**Repair**

In all cases, replace the Torque Converter. Make sure to check all other possible causes in addition to the Torque Converter.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

# P0750-LR SOLENOID CIRCUIT



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.
- **Set Condition:**
  After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

| Possible Causes |
|---|
| RELATED TCM POWER INPUT DTCS PRESENT |
| (T20) LR SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS |
| (T20) LR SOLENOID CONTROL CIRCUIT OPEN |
| (T20) LR SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

## Diagnostic Test

### 1. DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 2

### 2. CHECK IF DTC P0750 IS PRESENT

Ignition on, engine not running.

With the scan tool, erase all Transmission DTC's.

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit.

Ignition on, engine not running.

With the scan tool, actuate the LR Solenoid.

Monitor the LR Solenoid LED on the Transmission Simulator.

**Did the LR Solenoid LED on the Transmission Simulator blink on and off?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the scan tool, continue to actuate the LR Solenoid for the period of 2 minutes with the Transmission Simulator still connected.

After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

**Did the DTC P0750 reset during the actuation test?**

**Yes** >> Go To 4

**No** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

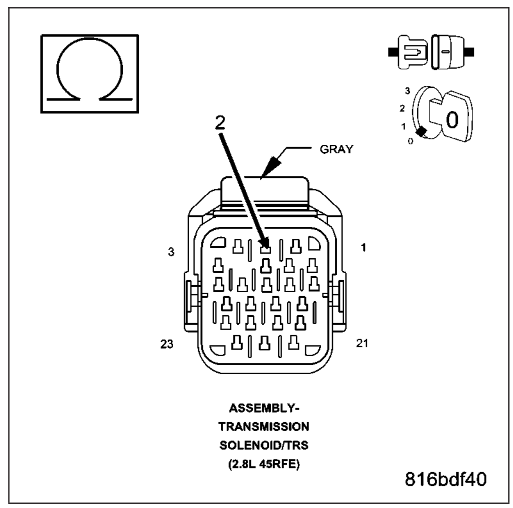
## 4. CHECK THE (T20) LR SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance between the (T20) LR Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T20) LR Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T20) LR Solenoid Control circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T20) LR SOLENOID CONTROL CIRCUIT FOR AN OPEN

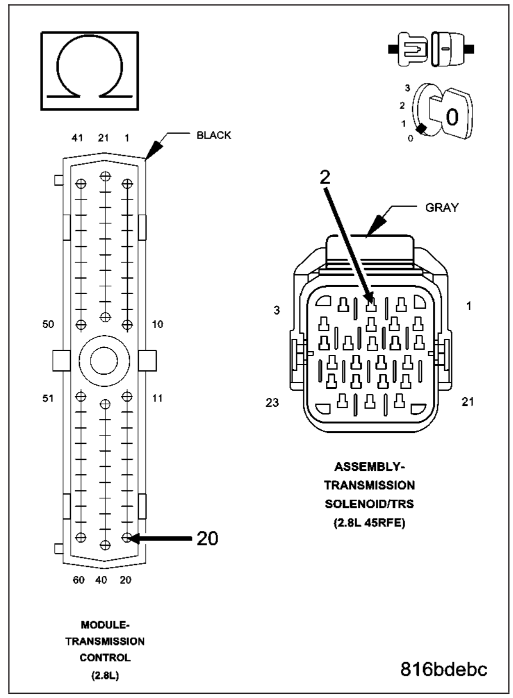
Measure the resistance of the (T20) LR Solenoid Control circuit from the Transmission Solenoid/TRS Assembly harness connector to the TCM harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T20) LR Solenoid Control circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6



## 6. CHECK THE (T20) LR SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T20) LR Solenoid Control circuit.

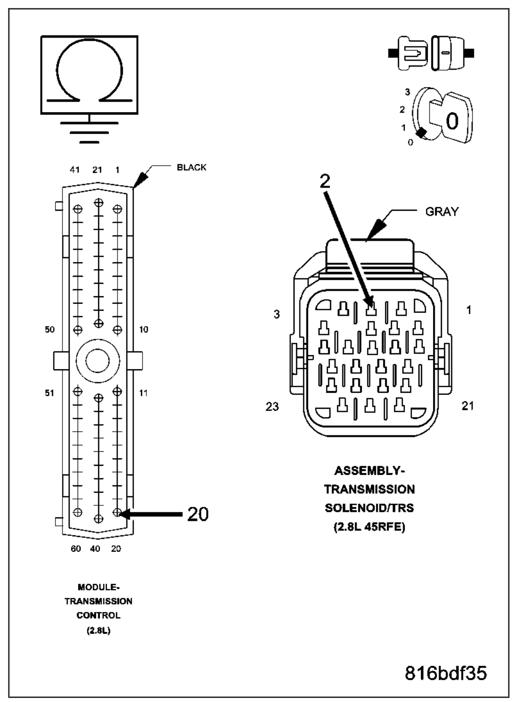
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T20) LR Solenoid Control circuit for a short to ground.

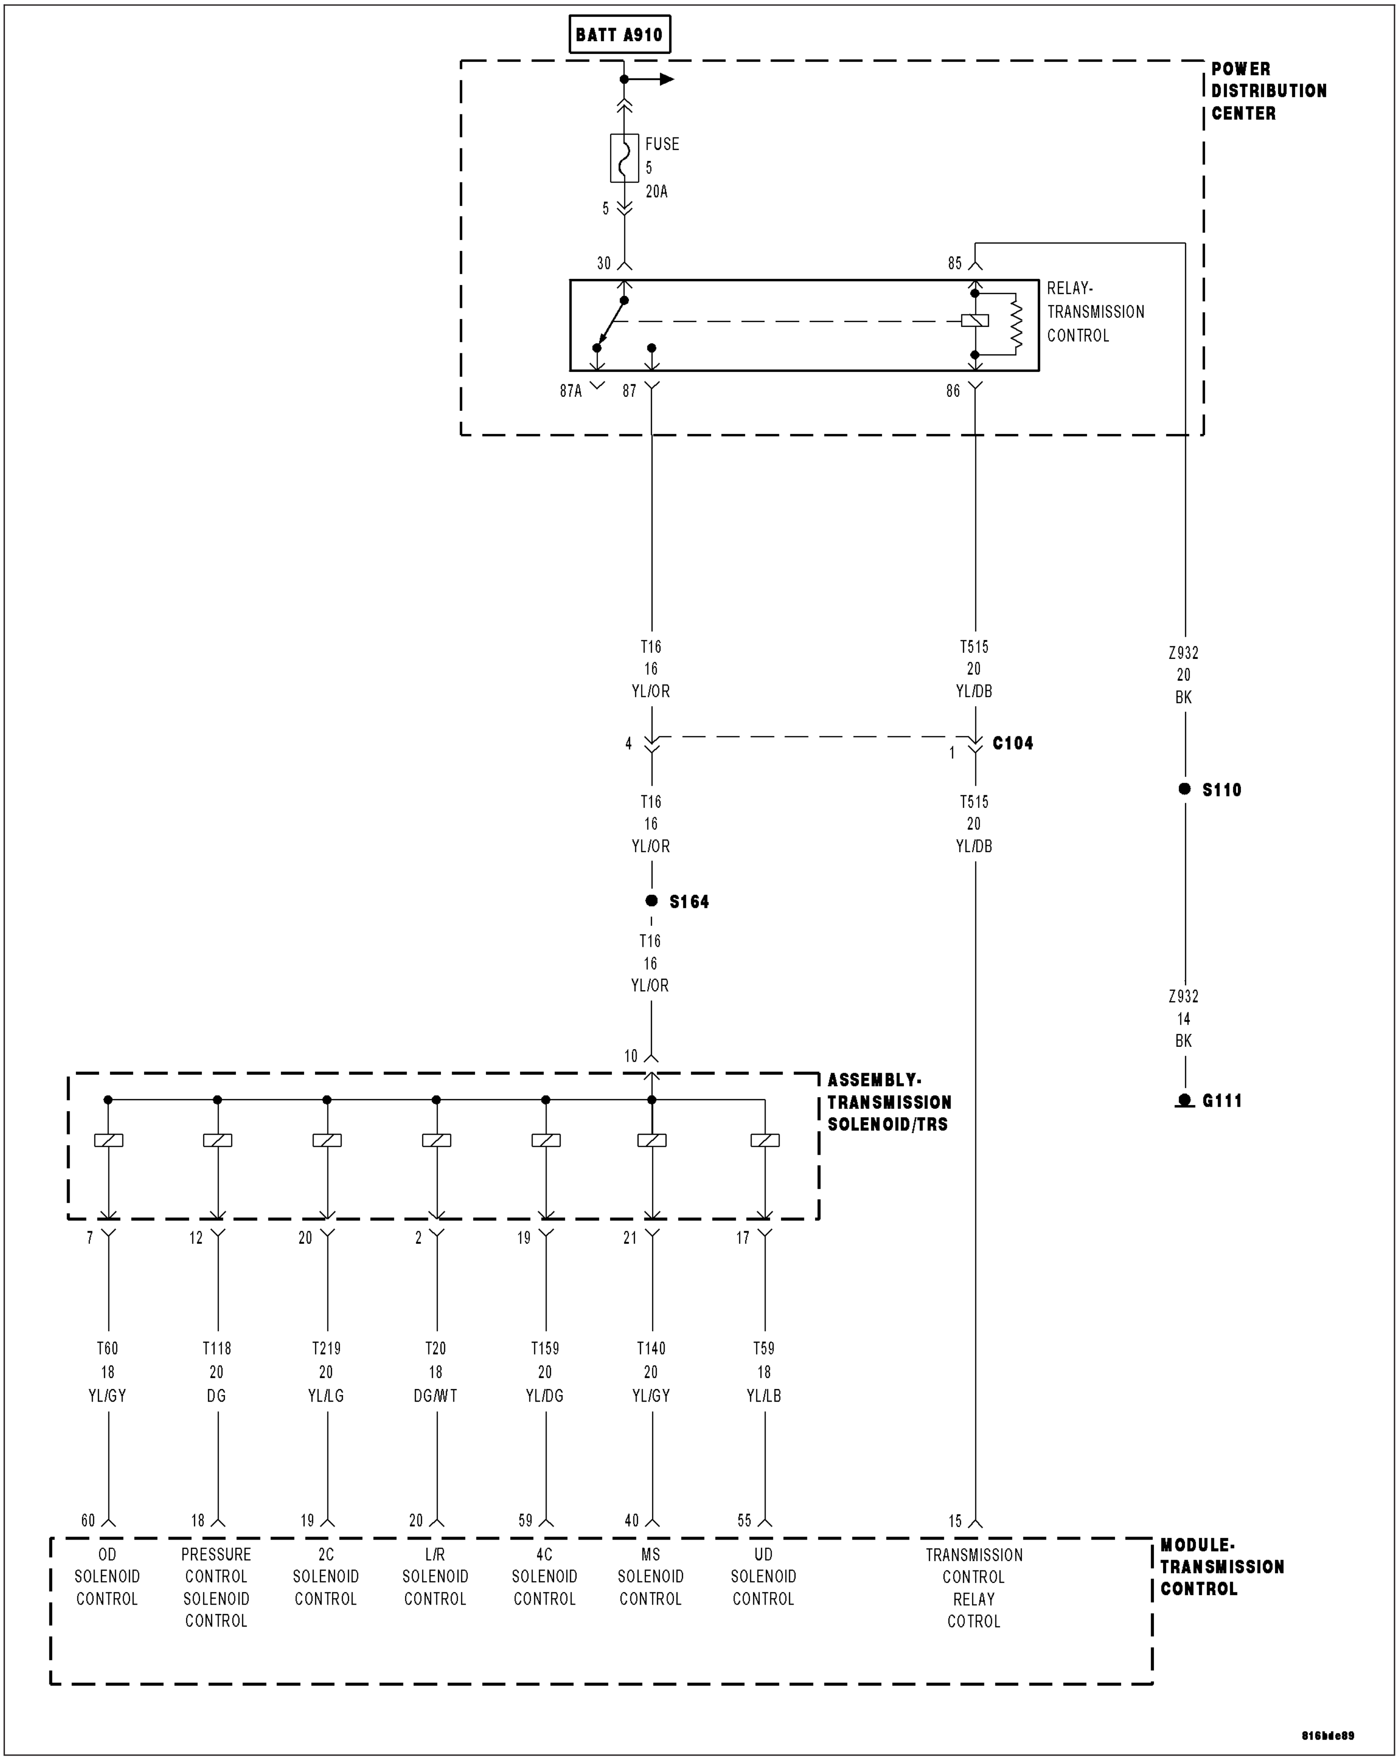
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (PCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the PCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)



## P0755-2C SOLENOID CIRCUIT



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.
- **Set Condition:**
  After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

| Possible Causes |
|---|
| RELATED TCM POWER INPUT DTCS PRESENT |
| (T219) 2C SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS |
| (T219) 2C SOLENOID CONTROL CIRCUIT OPEN |
| (T219) 2C SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

## Diagnostic Test

### 1. DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 2

### 2. CHECK IF DTC P0755 IS PRESENT

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**
Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, actuate the 2C Solenoid.

**Did the 2C Solenoid LED blink on and off on the Transmission Simulator?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the scan tool, continue to actuate the 2C Solenoid for the period of 2 minutes with the Transmission Simulator still connected.

After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

**Did the DTC P0755 reset during the actuation test?**

**Yes** >> Go To 4

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

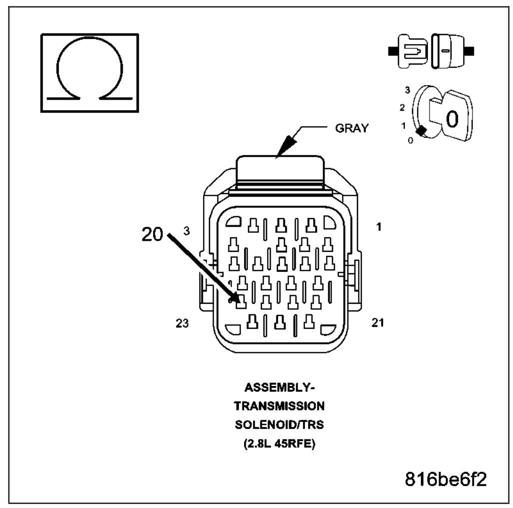
## 4. CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT SHORT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance between the (T219) 2C Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T219) 2C Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

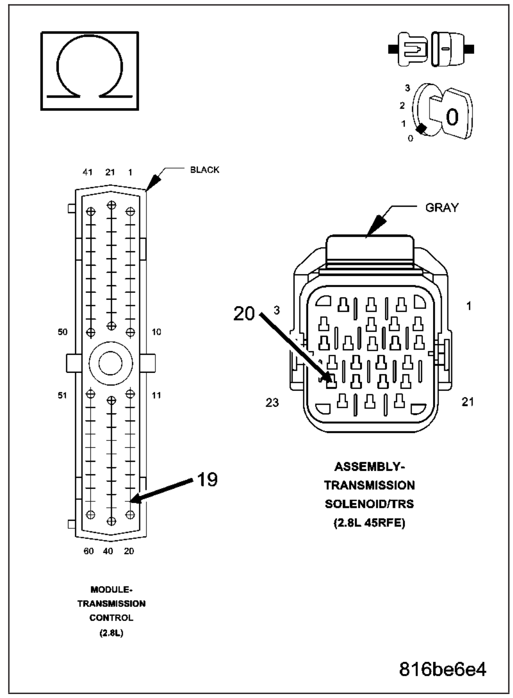
**Yes** >> Repair the (T219) 2C Solenoid Control circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (T219) 2C Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the TCM harness connector



**Is the resistance above 5.0 ohms?**

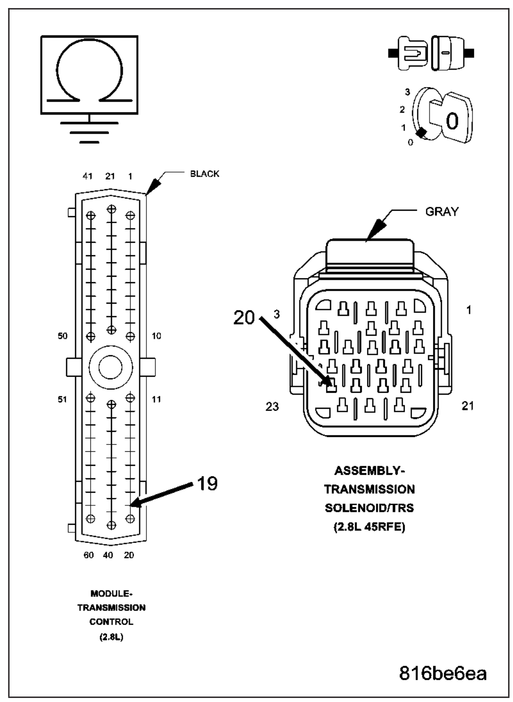
**Yes** >> Repair the (T219) 2C Solenoid Control circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK THE (T219) 2C SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T219) 2C Solenoid Control circuit.



**Is the resistance below 5.0 ohms?**

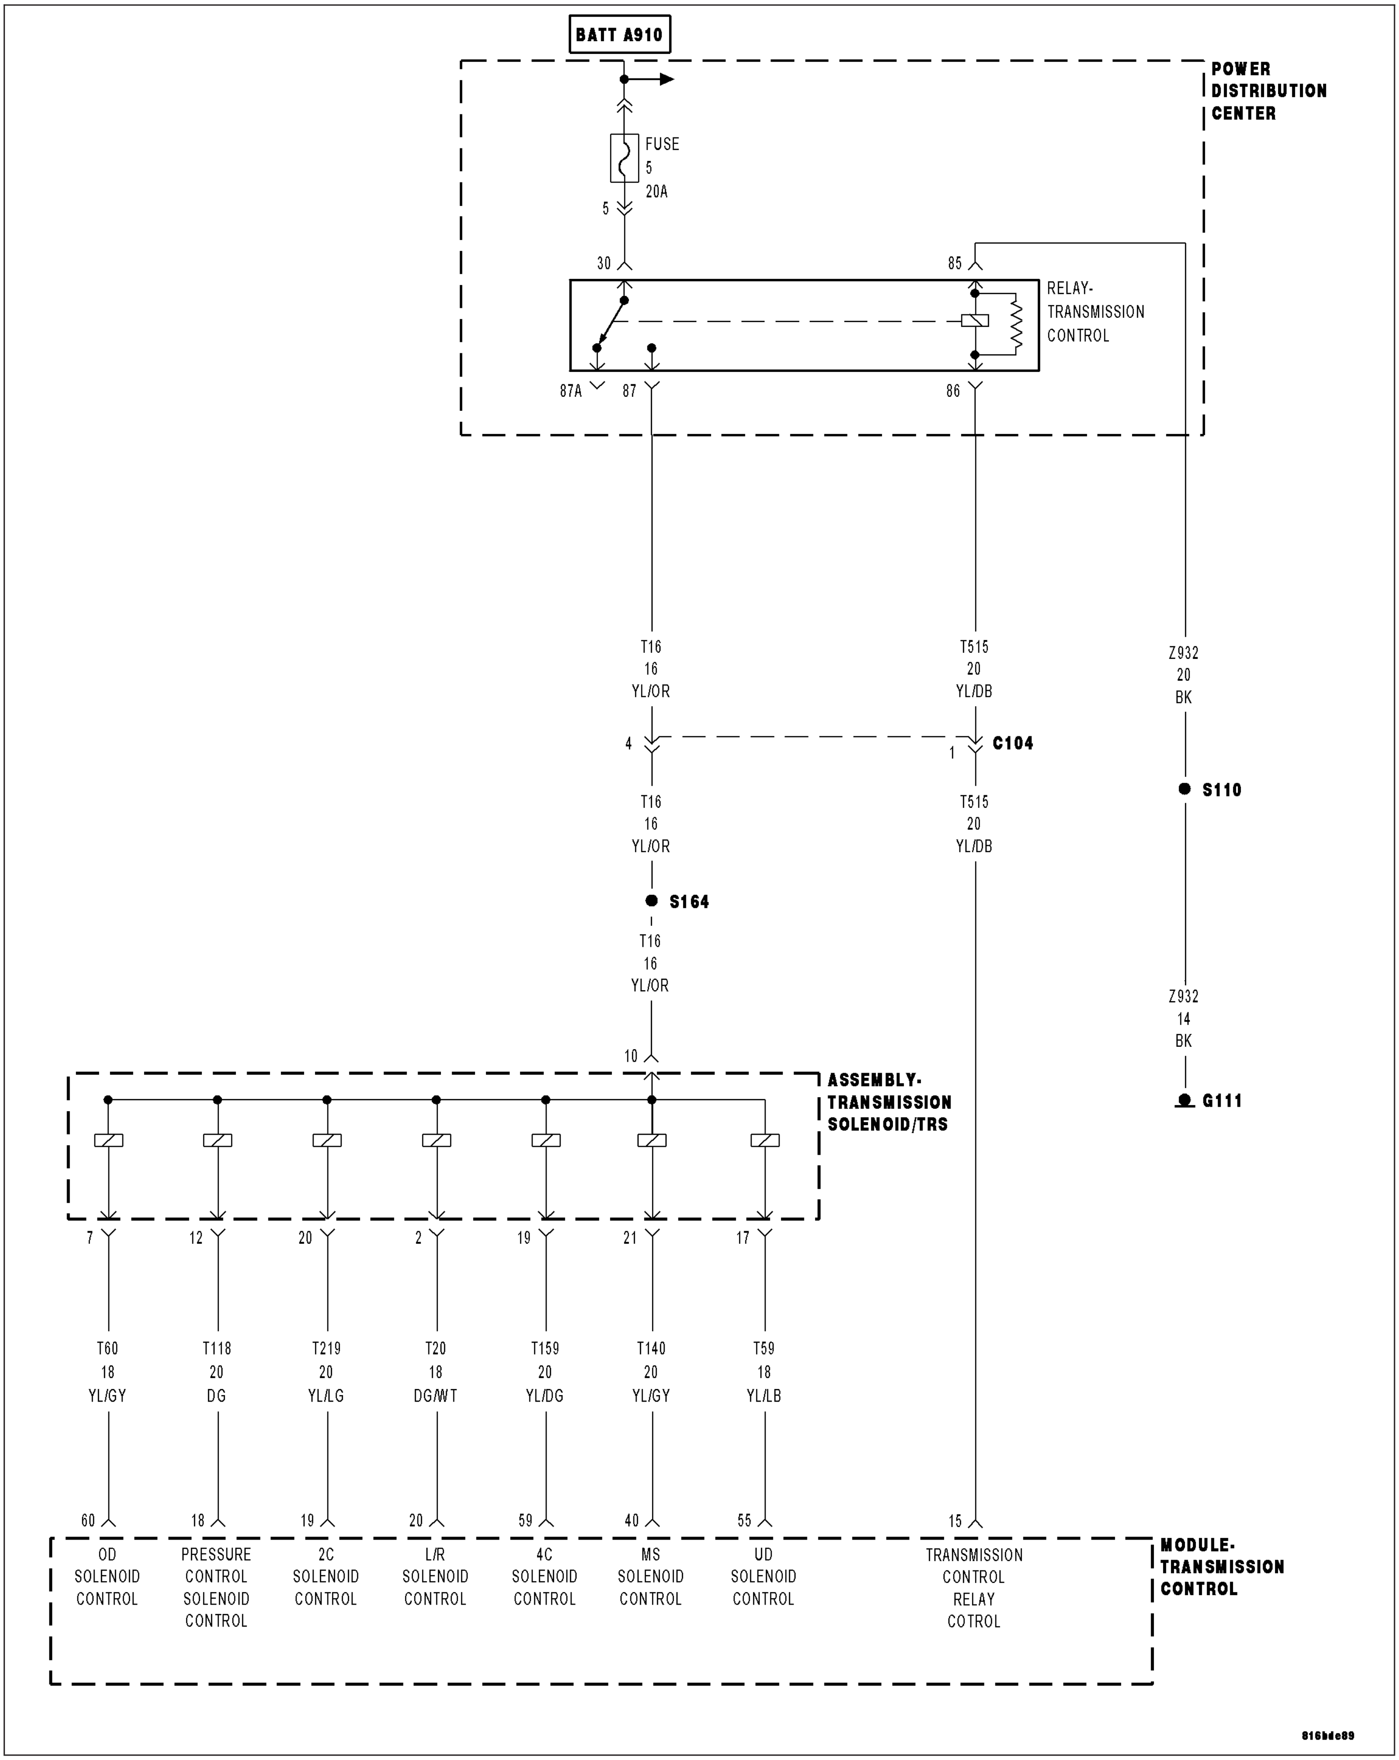
**Yes** >> Repair the (T219) 2C Solenoid Control circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0760-OD SOLENOID CIRCUIT



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.

| (T60) OD SOLENOID CONTROL CIRCUIT OPEN |
| (T60) OD SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

## Diagnostic Test

### 1. DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF DTC P0760 IS PRESENT

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, actuate the OD Solenoid.

Monitor the OD Solenoid LED on the Transmission Simulator.

**Did the OD Solenoid LED on the Transmission Simulator blink on and off?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the scan tool, continue to actuate the OD Solenoid for the period of 2 minutes with the Transmission Simulator still connected.

After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

**Did the DTC P0760 reset during the actuation test?**

**Yes** >> Go To 4

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

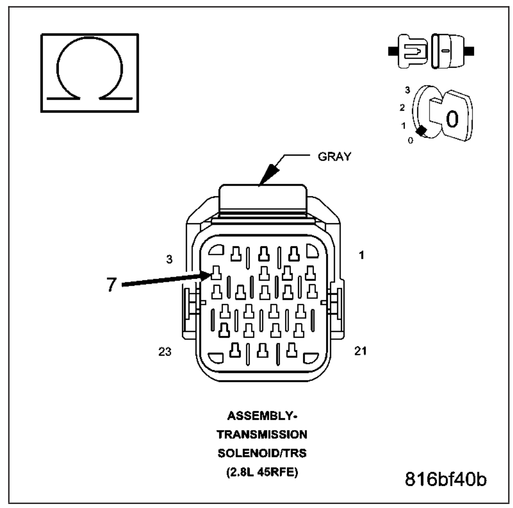
## 4. CHECK THE (T60) OD SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance between the (T60) OD Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T60) OD Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T60) OD Solenoid Control circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T60) OD SOLENOID CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (T60) OD Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the TCM harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T60) OD Solenoid Control circuit for an open.

| (T48) 4C SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

## Diagnostic Test

### 1. CHECK FOR RELATED TRANSMISSION RELAY DTCS

With the scan tool, check for other transmission DTCs.

**Are there any Transmission Control Relay DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF DTC P0770 IS PRESENT

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, actuate the 4C Solenoid.

Monitor the 4C Solenoid LED on the Transmission Simulator.

**Did the 4C Solenoid LED on the Transmission Simulator blink on and off?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

With the scan tool, continue to actuate the 4C Solenoid for the period of 2 minutes with the Transmission Simulator still connected.

After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

**Did the DTC P0770 reset during the actuation test?**

**Yes** >> Go To 4

**No** >> Replace Transmission Solenoid/TRS Assembly per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/TRANS SOLENOID/TRS ASSY - REMOVAL)

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

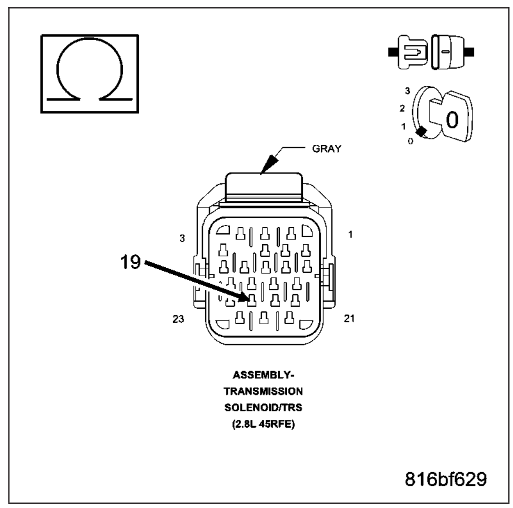
## 4. CHECK THE (T48) 4C SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance between the (T48) 4C Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T48) 4C Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

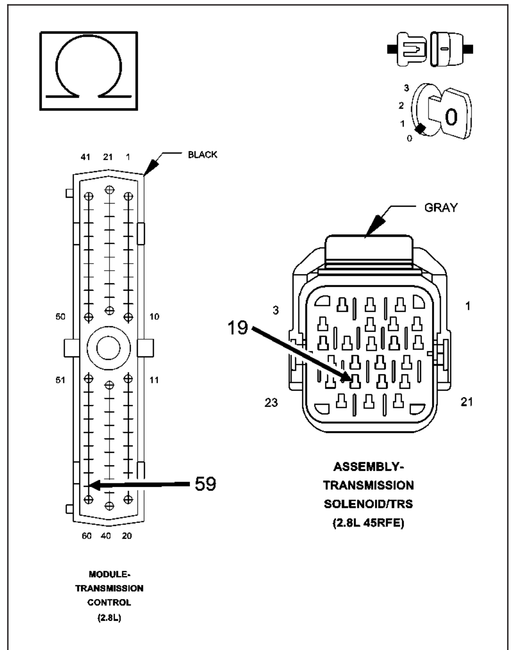
**Yes** >> Repair the (T48) 4C Solenoid Control circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK THE (T48) 4C SOLENOID CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (T48) 4C Solenoid Control circuit between the Transmission Solenoid/TRS Assembly harness connector and the TCM harness connector.



816bf587

**Is the resistance above 5.0 ohms?**

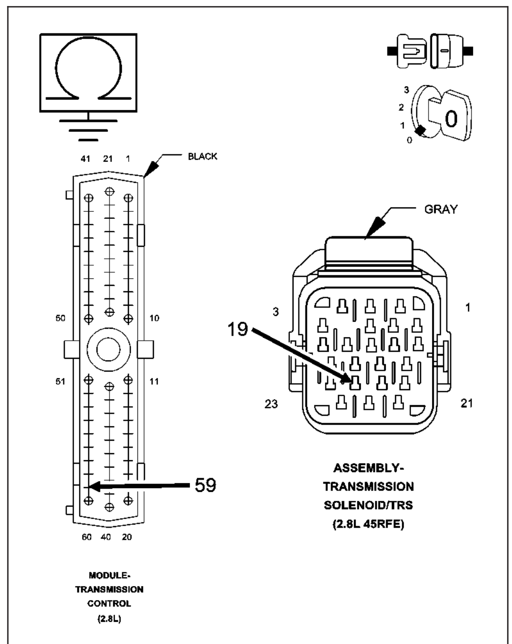
**Yes** >> Repair the (T48) 4C Solenoid Control circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK THE (T48) 4C SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T48) 4C Solenoid Control circuit.



816bf6c1

**Is the resistance below 5.0 ohms?**

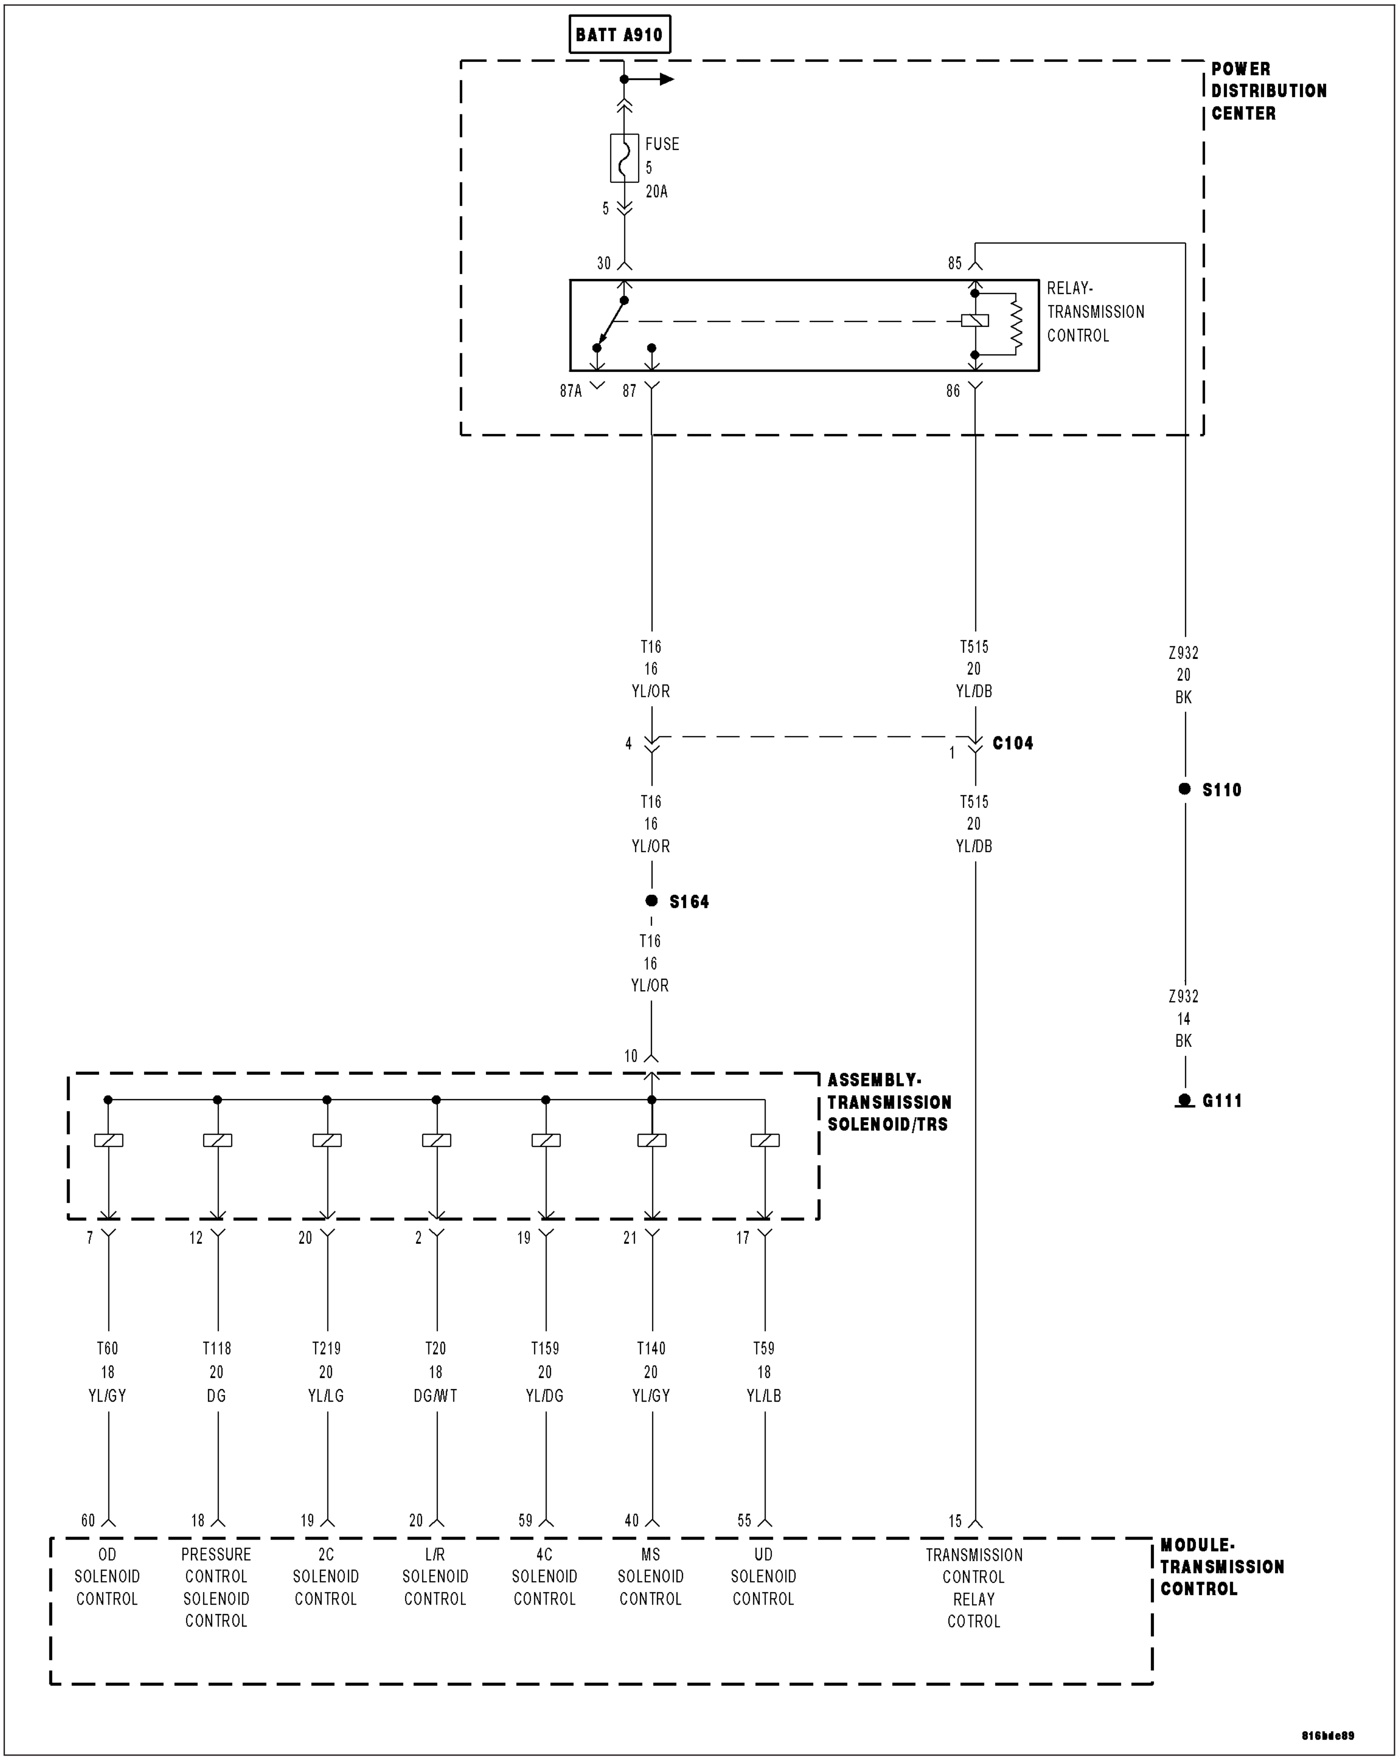
**Yes** >> Repair the (T48) 4C Solenoid Control circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0841-LR PRESSURE SWITCH RATIONALITY



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  The DTC will set if the LR Pressure Switch reads open or closed at the wrong time in a given gear.

| Possible Causes |
|---|
| LOSS OF PRIME AND/OR TCM POWER INPUT DTCS PRESENT |
| LOW FLUID LEVEL |
| LOW LINE PRESSURE |
| REVERSE CARRIER SNAP RING DISLODGED |
| CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR FILTER SEAL |
| STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY |
| NO. 1 CHECK BALL CUT OR DAMAGED |
| WIRING AND CONNECTORS |
| (T50) LR PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T50) LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T50) LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the LR, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

| GEAR | L/R | 2C | 4C | UD | OD |
|---|---|---|---|---|---|
| **REVERSE** | OPEN | OPEN | OPEN | OPEN | OPEN |
| **P/N** | CLOSED** | OPEN | OPEN | OPEN | OPEN |
| **1ST** | CLOSED* | OPEN | OPEN | CLOSED | OPEN |
| **2ND** | OPEN | CLOSED | OPEN | CLOSED | OPEN |
| **2ND PRIME** | OPEN | OPEN | CLOSED | CLOSED | OPEN |
| **3RD** | OPEN | OPEN | OPEN | CLOSED | CLOSED |
| **4TH** | OPEN | OPEN | CLOSED | OPEN | CLOSED |
| **5TH** | OPEN | CLOSED | OPEN | OPEN | CLOSED |

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.

**May be open when rolling in Neutral or at low oil temperatures.

## Diagnostic Test

## 1. CHECK FOR OTHER DTCS

Ignition on, engine not running.

With the scan tool, check for other transmission DTCs.

**Are there any Loss of Prime and/or TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If the DTC P0944 is present, perform its respective test first. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 2

## 2. CHECK IF DTC P0841 IS PRESENT

With the scan tool, check the DTC EVENT DATA for P0841.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA show the DTC P0841?**

**Yes** >> Go To 3

**No** >> Refer to the Symptom Category and perform diagnostics for the DTC reported in the DTC EVENT DATA.

## 3. CHECK IF DTC SET IN REVERSE

**Does the DTC EVENT DATA show the DTC P0841 set while in Reverse?**

**Yes** >> Go To 10

**No** >> Go To 4

## 4. CHECK IF THE LR PRESSURE SWITCH WAS CLOSED

**Does the DTC EVENT DATA show the LR Pressure Switch reading CLOSED when the DTC P0841 was set?**

**Yes** >> Go To 5

**No** >> Go To 14

## 5. CHECK THE TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

Turn the Pressure Switch selector to LR on the Transmission Simulator.

With the scan tool, monitor the LR Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

**Did the LR Pressure Switch state change from open to closed while pressing the Pressure Switch Test button on the Transmission Simulator?**

**Yes** >> Go To 6

**No** >> Go To 10

## 6. CHECK WIRING AND CONNECTORS

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK IF DTC SET IN FIRST GEAR

With the DTC EVENT DATA recorded earlier, check what gear the transmission was in when the DTC P0841 was set.

**Does the DTC EVENT DATA show the Present Gear as first gear when the DTC P0841 was set ?**

**Yes** >> Go To 8

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 8. CHECK IF THE NO. 1 CHECK BALL IS CUT OR DAMAGED

Turn the ignition off to the lock position.

Remove the Transmission Valve Body per the Service Information.

Check the No. 1 Check Ball for any possible cuts or damage.

**Is the No. 1 Check Ball cut or damaged?**

**Yes** >> Replace the No. 1 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the LR Clutch assembly. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. CHECK IF THE REVERSE CARRIER SNAP RING IS DISLODGED

Looking through the windows in the bottom of the case, check whether the snap ring at the front of the Reverse (center) Carrier has dislodged.

**NOTE: It may be necessary to pry the Input Annulus Gear Shell rearward to check this snap ring.**

**Is the Reverse Carrier Snap Ring dislodged?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

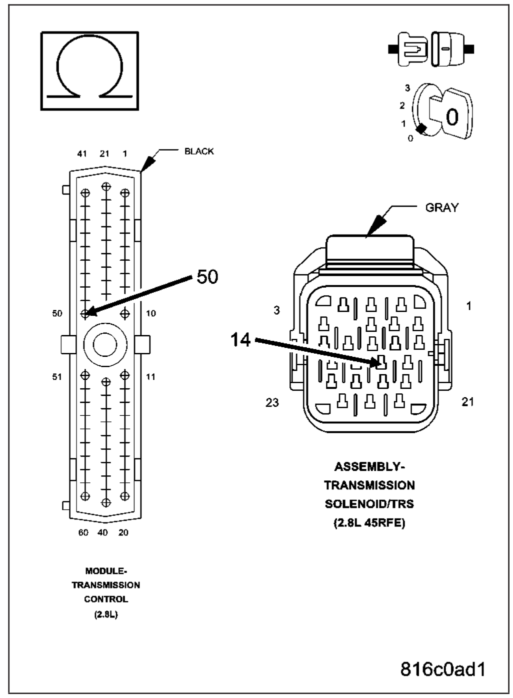
## 10. CHECK THE (T50) LR PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 if connected in a previous step or disconnect the Transmission Solenoid/TRS Assembly harness connector.

Disconnect the TCM harness connector.

Measure the resistance of the (T50) LR Pressure Switch Sense circuit from the Solenoid/TRS Assembly harness connector and the TCM harness connector.



**Is the resistance above 5.0 ohms?**

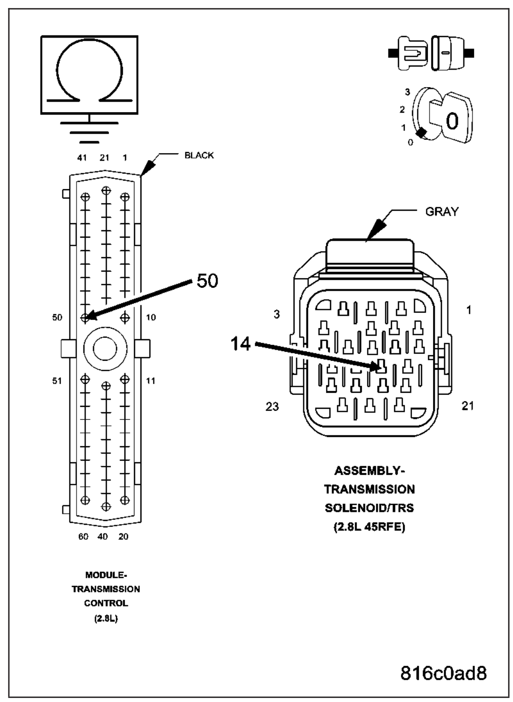
**Yes** >> Repair the (T50) LR Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 11

## 11. CHECK THE (T50) LR PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T50) LR Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T50) LR Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 12

## 12. CHECK THE TCM POWERS AND GROUNDS

Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK IF THE DTC RESETS

With the scan tool, clear the DTC and road test the vehicle.

Try to duplicate the conditions in which the DTC originally set using the DTC EVENT DATA recorded earlier.

**Did the DTC P0841 reset?**

**Yes** >> Replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 17

## 14. CHECK FOR LOW LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

**Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?**

**Yes** >> Repair as necessary to correct low line pressure. Check for low fluid level. Check the Primary Oil Filter seal for a split, crack, or improperly installed. Refer to the Service Information for the proper installation procedure. If the fluid level and Primary Oil Filter are OK, check the Main Regulator Valve in the Oil Pump per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 15

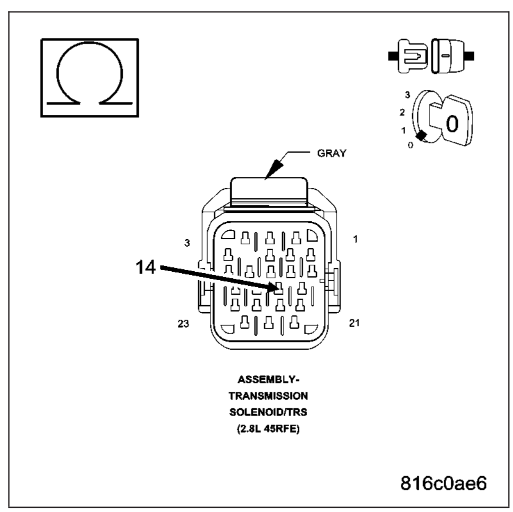
## 15. CHECK THE (T50) LR PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Disconnect the TCM harness connector.

Measure the resistance between the (T50) LR Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T50) LR Pressure Switch Sense circuit and all other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T50) LR Pressure Switch Sense circuit for a short to other circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 16

## 16. CHECK IF DTC RESETS

With the scan tool, clear the DTC and road test the vehicle.

Try to duplicate the conditions in which the DTC originally set using the DTC EVENT DATA recorded earlier.

**Did the DTC P0841 reset?**

**Yes** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 17

## 17. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

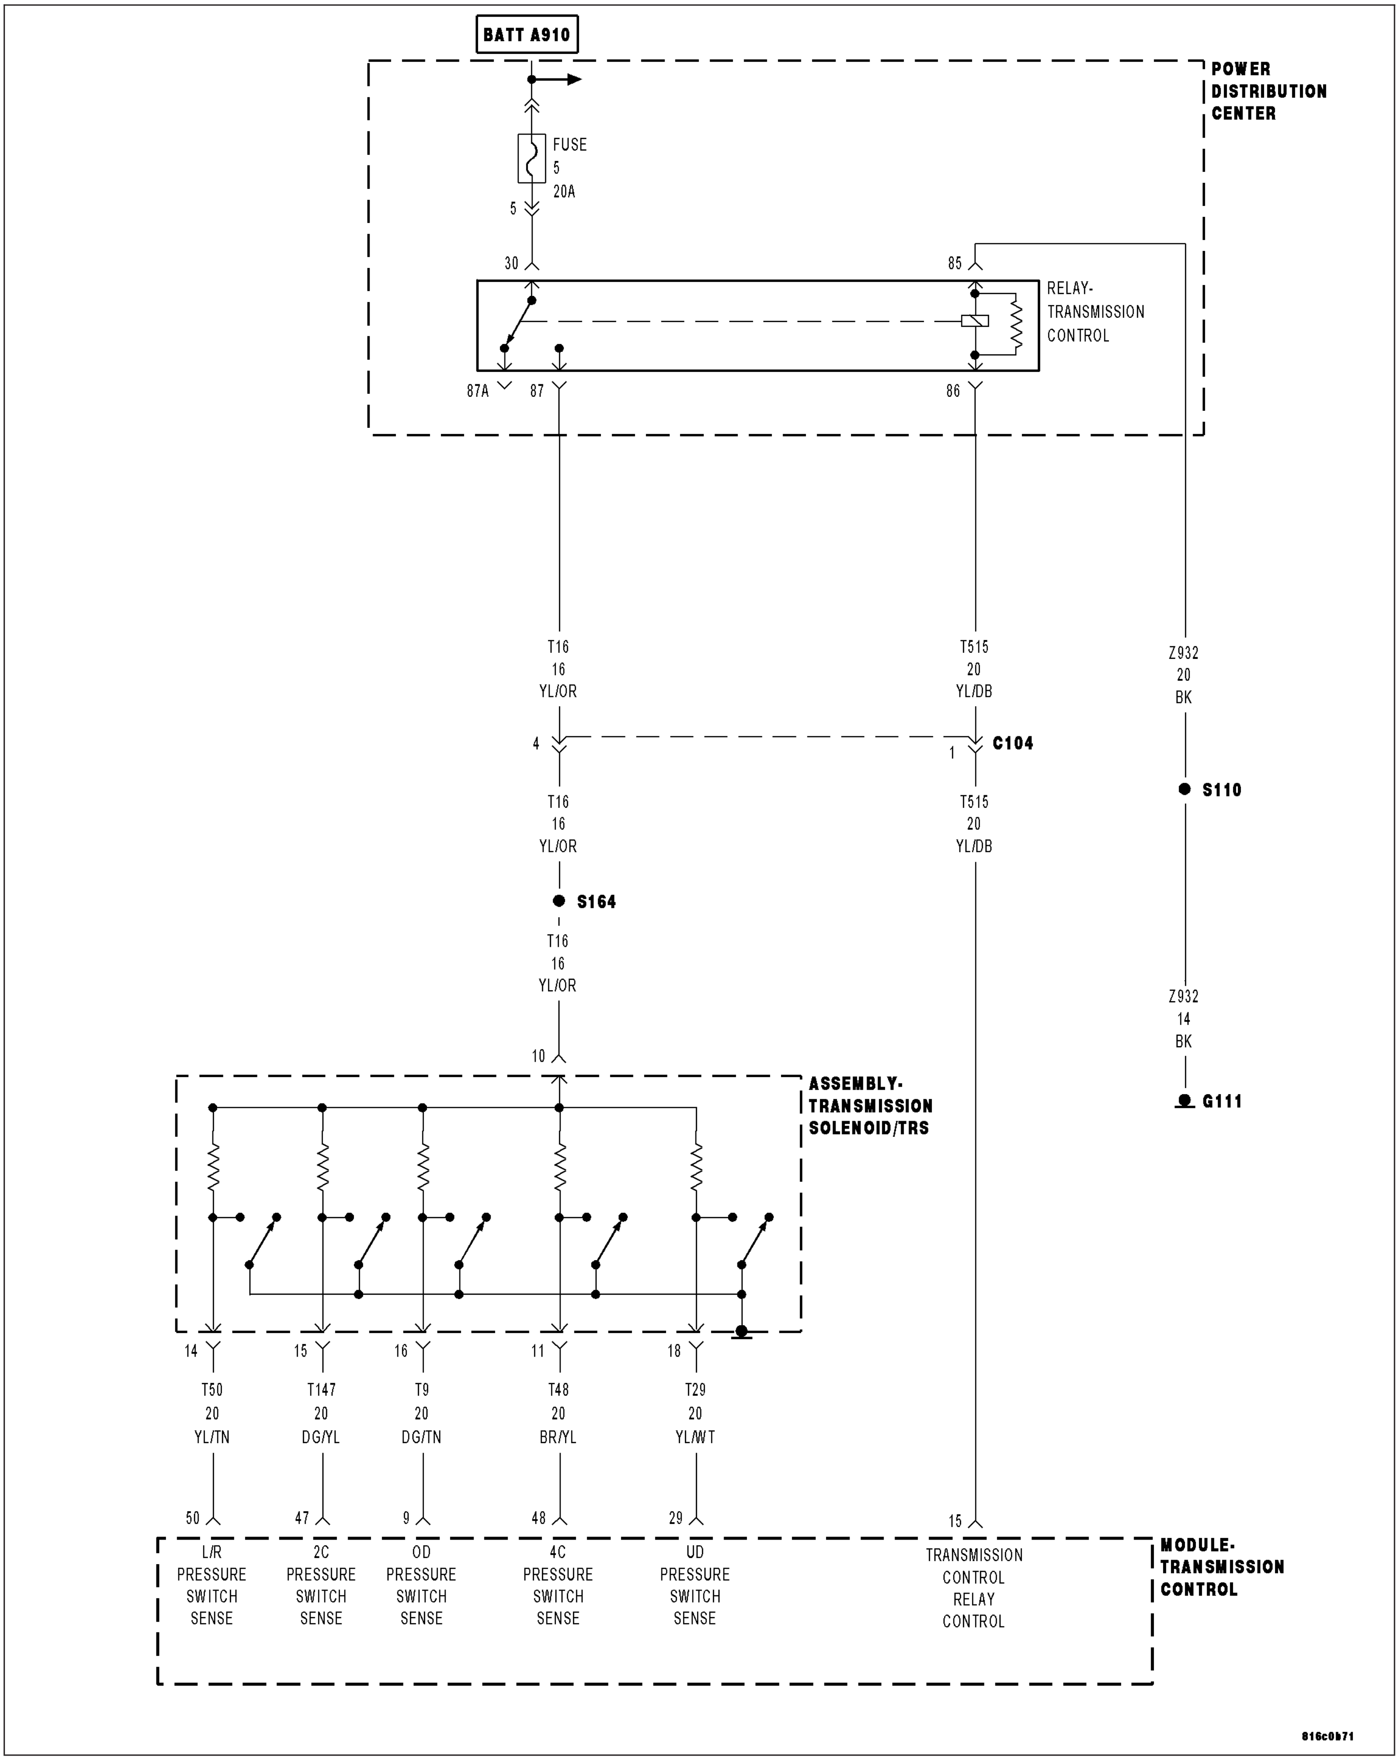
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0845-2C HYDRAULIC PRESSURE TEST



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.
- **Set Condition:**
  After a shift into a forward gear, with engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

| Possible Causes |
|---|
| LINE PRESSURE SENSOR |
| TRANSMISSION FLUID CONTAMINATION |
| RELATED TCM POWER INPUT DTCS PRESENT |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| EXCESSIVE DEBRIS IN OIL PAN |
| POOR LINE PRESSURE SENSOR CONNECTION |
| (T147) 2C PRESSURE SWITCH SENSE CIRCUIT OPEN |
| TRANSMISSION CONTROL RELAY DTCS PRESENT |
| (T147) 2C PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T39) 5-VOLT SUPPLY CIRCUIT OPEN |
| (T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| INTERNAL TRANSMISSION |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs

**Are there any Loss of Prime and/or TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If the DTC, P0944-LOSS OF PRIME is present, perform its respective test first. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 2

## 2. CHECK IF DTC P0755 IS PRESENT

With the scan tool, check Transmission DTCs.

**Is the DTC P0755 also present?**

**Yes** >>

Refer to the Transmission category and perform diagnostics for P0755-2C SOLENOID CIRCUIT. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 3

## 3. CHECK IF DTCS P0732, P0735 AND/OR P0846 ARE PRESENT

With the scan tool, check for other transmission DTC's

**Are the DTCs P0732, P0735, and/or P0846 present also?**

**Yes** >> Go To 12

**No** >> Go To 4

## 4. CHECK IF DTC P0845 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0845.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 5

**No** >> Go To 17

## 5. CHECK IF THE LINE PRESSURE STAYS THE SAME

Start the engine.

Warm the transmission to 82° C or 180° F.

Firmly apply the brakes.

With the scan tool, monitor the Line Pressure during the following step.

Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

**Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?**

**Yes** >> Go To 6

**No** >> Go To 10

## 6. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

**Did the Line Pressure reading on the scan tool change to about 207 kPa or 30 psi when the connector was pushed inward?**

**Yes** >> Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK THE LINE PRESSURE SENSOR OPERATION

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

**NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?**

**Yes** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

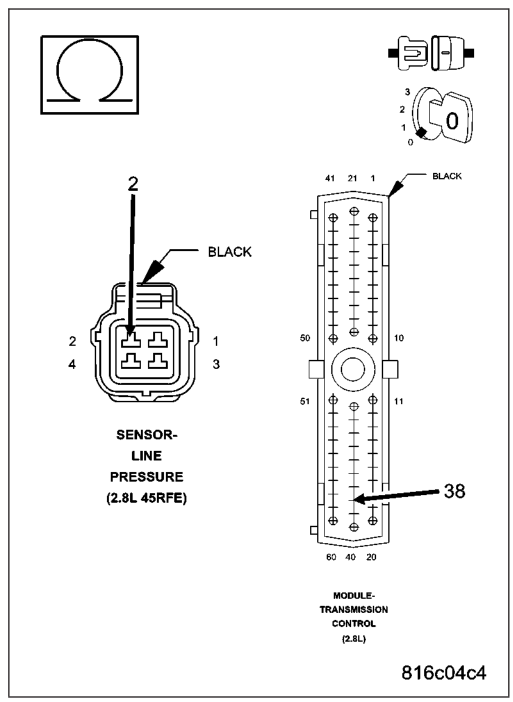
## 8. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect Transmission Simulator.

Disconnect the TCM harness connector.

Measure the resistance of the (T39) 5-volt Supply circuit from the Line Pressure Sensor harness connector to the appropriate terminal of the TCM harness connector.



**Is the resistance above 5.0 ohms?**

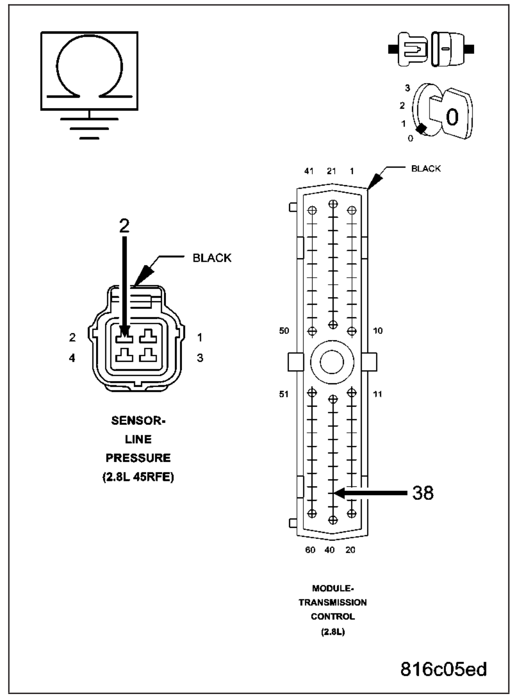
**Yes** >> Repair the (T39) 5-volt Supply circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T39) 5-volt Supply circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for a short to ground.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 10. COMPARE SCAN TOOL TO THE PRESSURE GAUGE

Turn the ignition off to the lock position.

Connect the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP. Refer to the Service Information for proper installation procedure.

**CAUTION: Apply parking brake.**

Start the engine.

In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

**CAUTION: Do not overheat transmission.**

With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.

Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.

Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

**Does the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?**

**Yes** >> Go To 11

**No** >> Replace the Line Pressure Sensor per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 11. CHECK WIRING AND CONNECTORS

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Remove the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP.

Install the Transmission Simulator, Miller tool #8333.

On the Transmission Simulator, turn the Pressure Switch selector switch to 2C.

Ignition on, engine not running.

With the scan tool, monitor the 2C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 2C Pressure Switch.

**Did the 2C Pressure Switch state change to closed and remain closed while wiggling the wires?**

**Yes** >> Go To 12

**No** >> Go To 14

## 12. CHECK FOR EXCESSIVE DEBRIS

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Remove and inspect the Transmission Oil Pan per the Service Information.

**Does the Transmission Oil Pan contain excessive debris or contamination?**

**Yes** >> Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK THE 2C HYDRAULIC CLUTCH CIRCUIT

Remove the Valve Body and air check the 2C clutch hydraulic circuit, in the 2C/4C clutch retainer, for leakage per the Service Information.

**NOTE: The 2C hydraulic clutch circuit contains a small bleed orifice, a small amount of air leakage is normal.**

**Was there excessive air leakage noticed during the air check?**

**Yes** >> Repair as necessary. Check the 2C clutch piston, piston seals and bleed orifice assembly.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Disassemble and inspect the Valve Body and repair as necessary. Inspect the 2C Accumulator piston and seals. Check for an extra check ball downstream from the #7 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

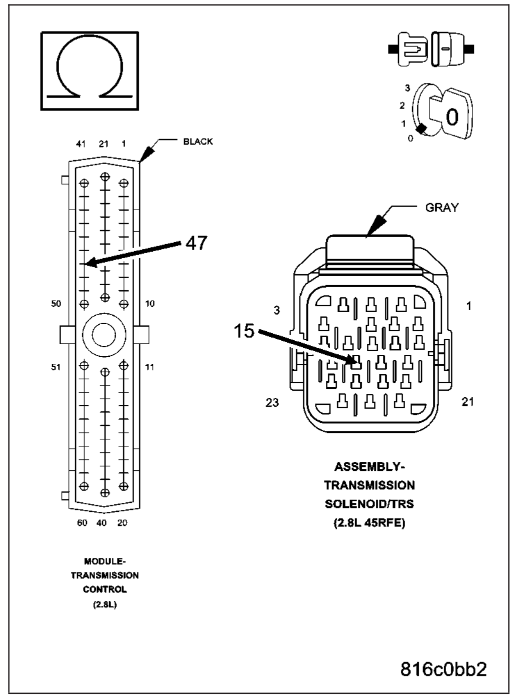
## 14. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T147) 2C Pressure Switch Sense circuit from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the TCM harness connector.



**Is the resistance above 5.0 ohms?**

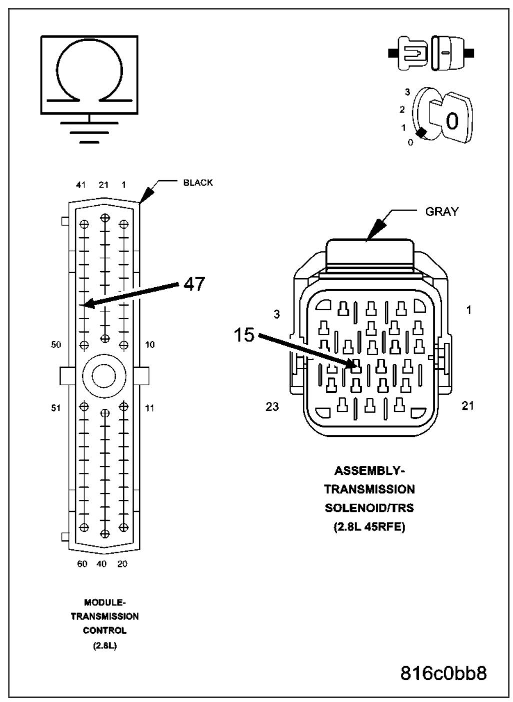
**Yes** >> Repair the (T147) 2C Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 15

## 15. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T147) 2C Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T147) 2C Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 16

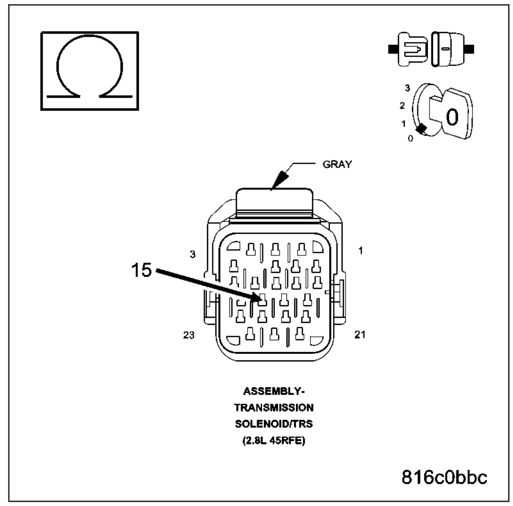
## 16. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Disconnect TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

**NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

Measure the resistance between the (T147) 2C Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T147) 2C Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T147) 2C Pressure Switch Sense circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 17. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

If the DTC EVENT DATA shows the DTC P0845 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

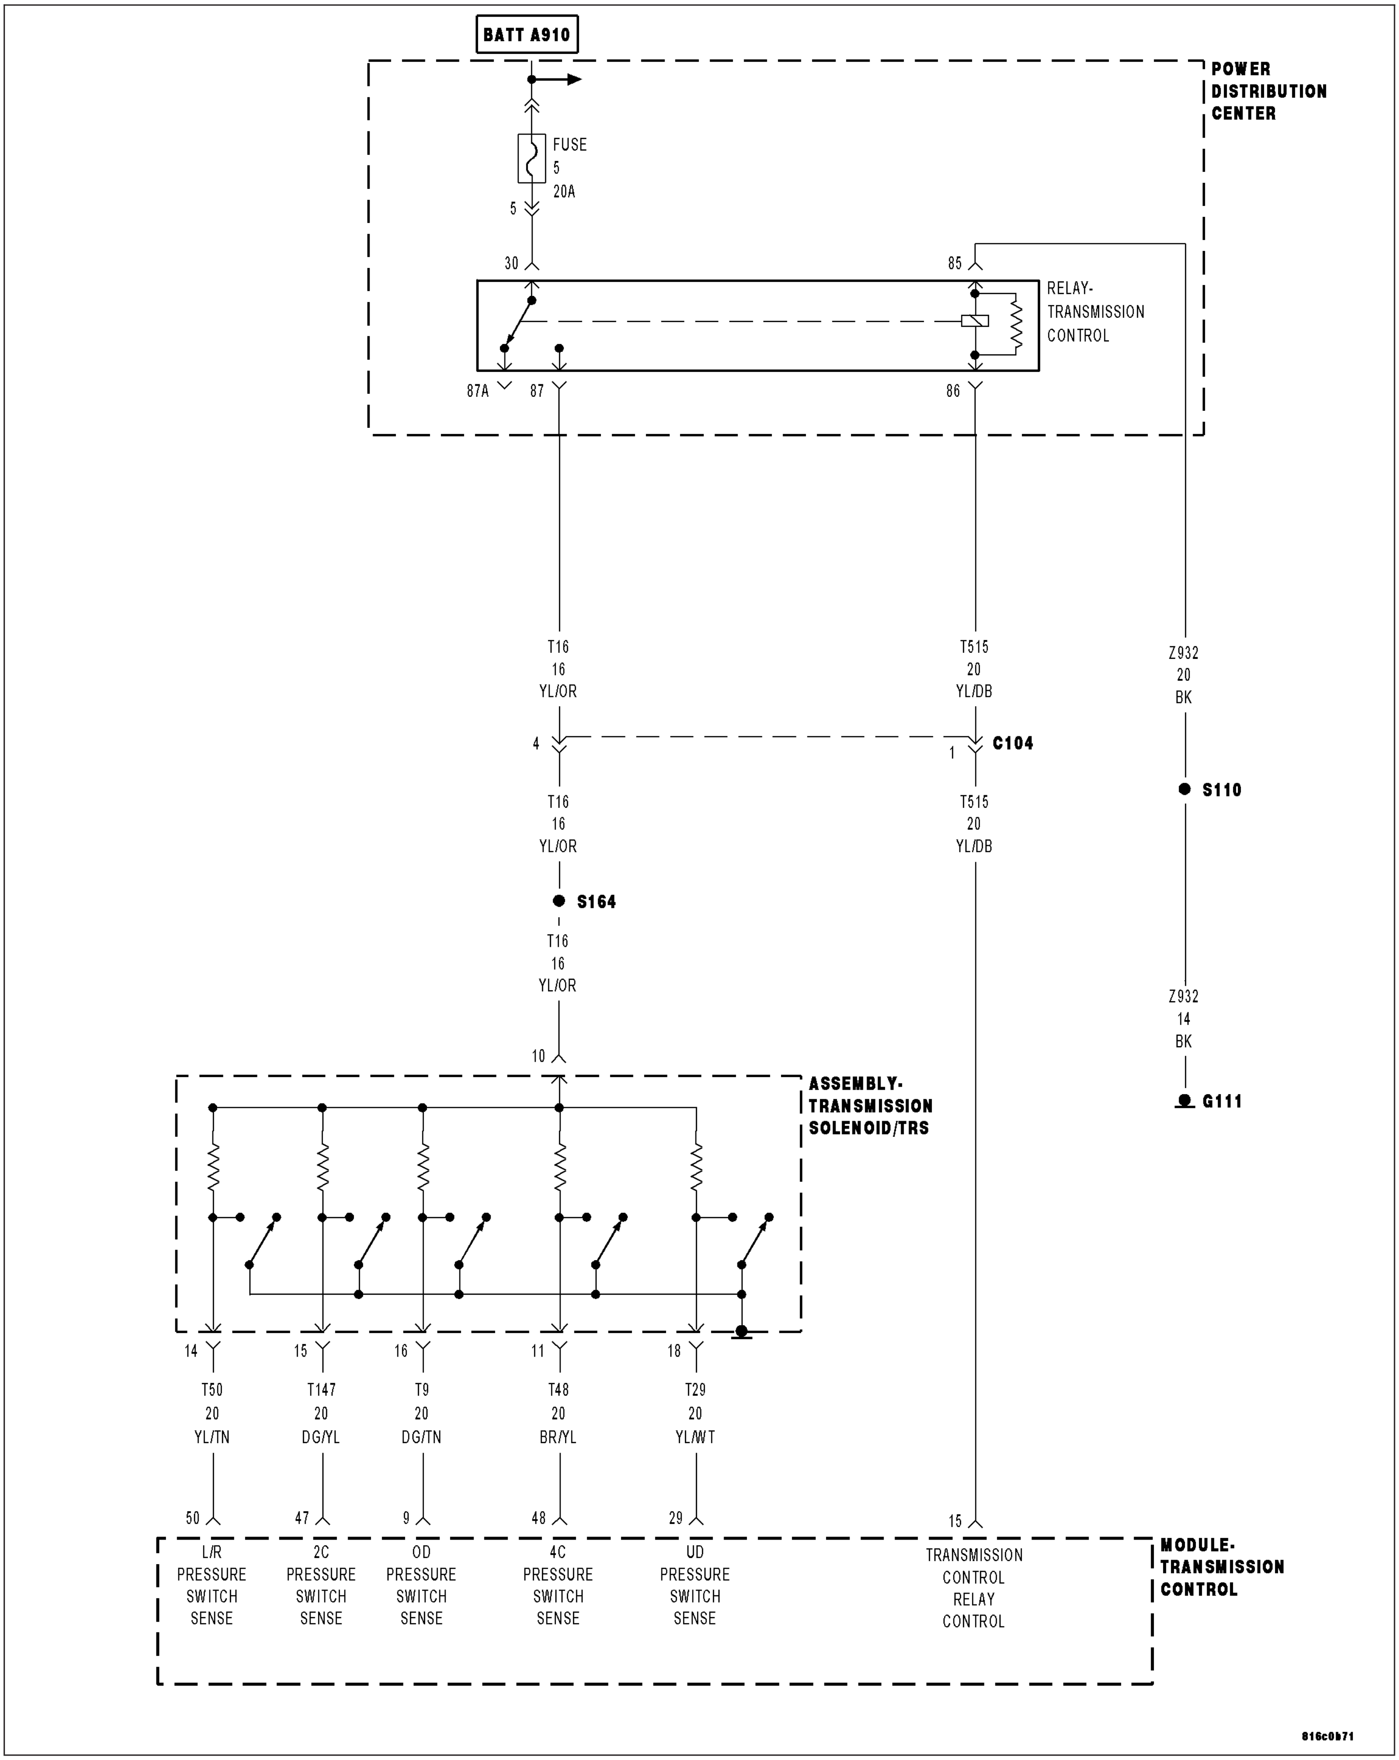
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0846-2C PRESSURE SWITCH RATIONALITY



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  The DTC is set if the 2C Pressure Switch reads open or closed at the wrong time in a given gear.

| Possible Causes |
| --- |
| RELATED TCM POWER INPUT DTCS PRESENT |
| (T147) 2C PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T147) 2C PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHER CIRCUITS |
| EXCESSIVE FLUID LEAKAGE IN 2C CLUTCH CIRCUIT |
| NO. 5 AND/OR NO. 7 CHECK BALL CUT OR DAMAGED |
| EXTRA CHECK BALL DOWNSTREAM OF THE NO. 7 CHECK BALL SOCKET |
| LOW LINE PRESSURE |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |
| WIRING AND CONNECTORS |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the LR, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

| GEAR | L/R | 2C | 4C | UD | OD |
| --- | --- | --- | --- | --- | --- |
| **REVERSE** | OPEN | OPEN | OPEN | OPEN | OPEN |
| **P/N** | CLOSED** | OPEN | OPEN | OPEN | OPEN |
| **1ST** | CLOSED* | OPEN | OPEN | CLOSED | OPEN |
| **2ND** | OPEN | CLOSED | OPEN | CLOSED | OPEN |
| **2ND PRIME** | OPEN | OPEN | CLOSED | CLOSED | OPEN |
| **3RD** | OPEN | OPEN | OPEN | CLOSED | CLOSED |
| **4TH** | OPEN | OPEN | CLOSED | OPEN | CLOSED |
| **5TH** | OPEN | CLOSED | OPEN | OPEN | CLOSED |

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.

**May be open when rolling in Neutral or at low oil temperatures.

## Diagnostic Test

### 1. DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT

With the scan tool, check for other transmission DTCs.

**Are there any TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

## 2. CHECK IF THE DTC IS CURRENT

With the scan tool, check the DTC EVENT DATA.

**Does the DTC EVENT DATA show data for DTC P0846?**

**Yes** >> Go To 3

**No** >> Refer to the Transmission category and perform the appropriate symptom shown in the DTC EVENT DATA.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 3. CHECK FOR MULTIPLE DTCS

With the scan tool, check for other transmission DTC's.

**Are there two or more related pressure switch rationality DTCs present in addition to P0846?**

**Yes** >> Go To 4

**No** >> Go To 7

## 4. CHECK IF ALL PRESSURE SWITCHES READ CLOSED

With the scan tool, check the DTC EVENT DATA for P0846.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Do all the pressure switches read CLOSED in the DTC EVENT DATA for P0846?**

**Yes** >> Refer to Transmission category and perform diagnostics for P0888.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK IF ALL PRESSURE SWITCHES READ OPEN

In the DTC EVENT DATA recorded earlier, read the state of all pressure switches.

**Do all the pressure switches read OPEN?**

**Yes** >> Go To 6

**No** >> Go To 7

## 6. CHECK FOR LOW LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

**Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?**

**Yes** >> Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. CHECK IF THE DTC SET IN PARK REVERSE OR NEUTRAL

With the scan tool, check the DTC EVENT DATA for P0846.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA show the DTC P0846 set in Park, Reverse, or Neutral?**

**Yes** >> Go To 12

**No** >> Go To 8

## 8. CHECK IF THE 2C PRESSURE SWITCH READS CLOSED

With the scan tool, check the DTC EVENT DATA for P0846.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA show the 2C Pressure Switch reading CLOSED?**

**Yes** >> Go To 10

**No** >> Go To 9

## 9. COMPARE THE LINE PRESSURE TO THE DESIRED LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

**Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?**

**Yes** >> Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 15

## 10. CHECK THE TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to the 2C position.

With the scan tool, monitor the 2C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

**Did the state of the 2C Pressure Switch change while pressing the Pressure Switch Test button?**

**Yes** >> Go To 11

**No** >> Go To 12

## 11. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

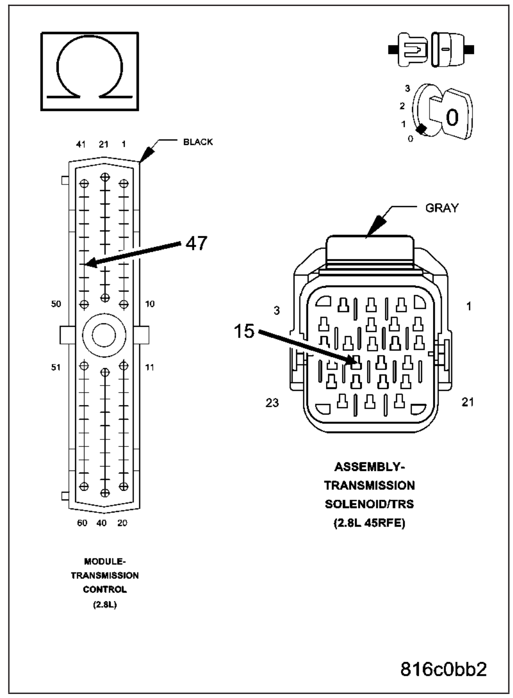
## 12. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T147) 2C Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the TCM harness connector.



**Is the resistance above 5.0 ohms?**

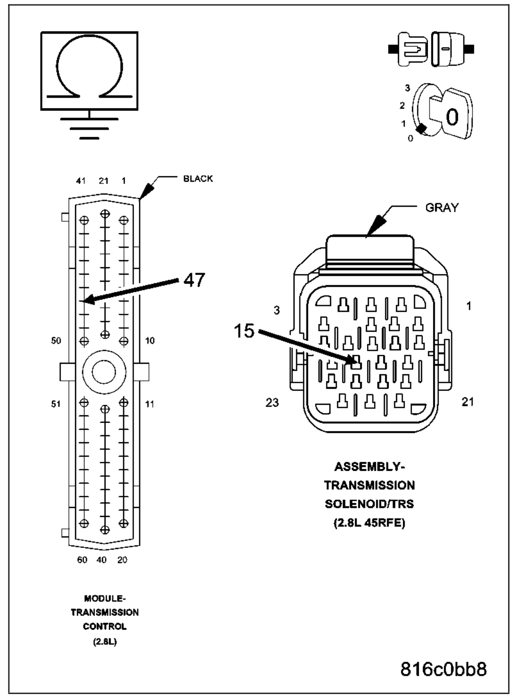
**Yes** >> Repair the (T147) 2C Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T147) 2C Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

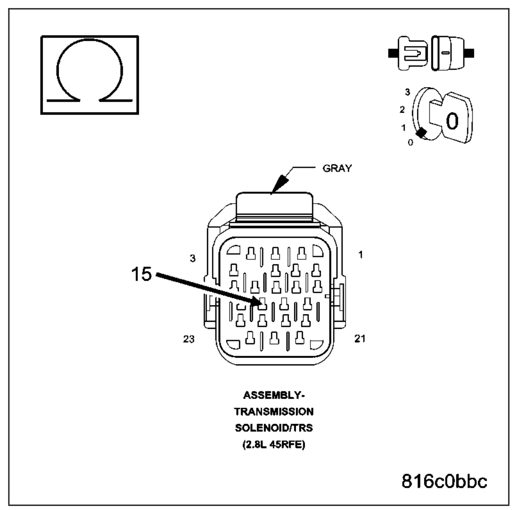
**Yes** >> Repair the (T147) 2C Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 14

## 14. CHECK THE (T147) 2C PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Measure the resistance between the (T147) 2C Pressure Switch Sense circuit and all the other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T147) 2C Pressure Switch Sense circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Powertrain Control Module per the Service Information. With the scan tool, perform the QUICK LEARN procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 15. CHECK IF THE #5 AND/OR #7 CHECK BALL IS CUT OR DAMAGED

Turn the Ignition off to the lock position.

Remove the Valve Body Assembly per the Service Information.

Inspect the #5 and #7 check balls for any cuts or damage.

Inspect the 2C accumulator piston and seals and also the 2C tower seal on top of the valve body. Refer to the Service Information.

**Where there any problems found?**

**Yes** >> Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 2C clutch as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 16

## 16. CHECK FOR EXCESSIVE FLUID LEAKAGE WITHIN 2C CLUTCH CIRCUIT

Air check the 2C Clutch hydraulic circuit. Refer to the Service Information.

**NOTE: This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.**

**Was there excessive air leakage in the 2C Clutch hydraulic circuit?**

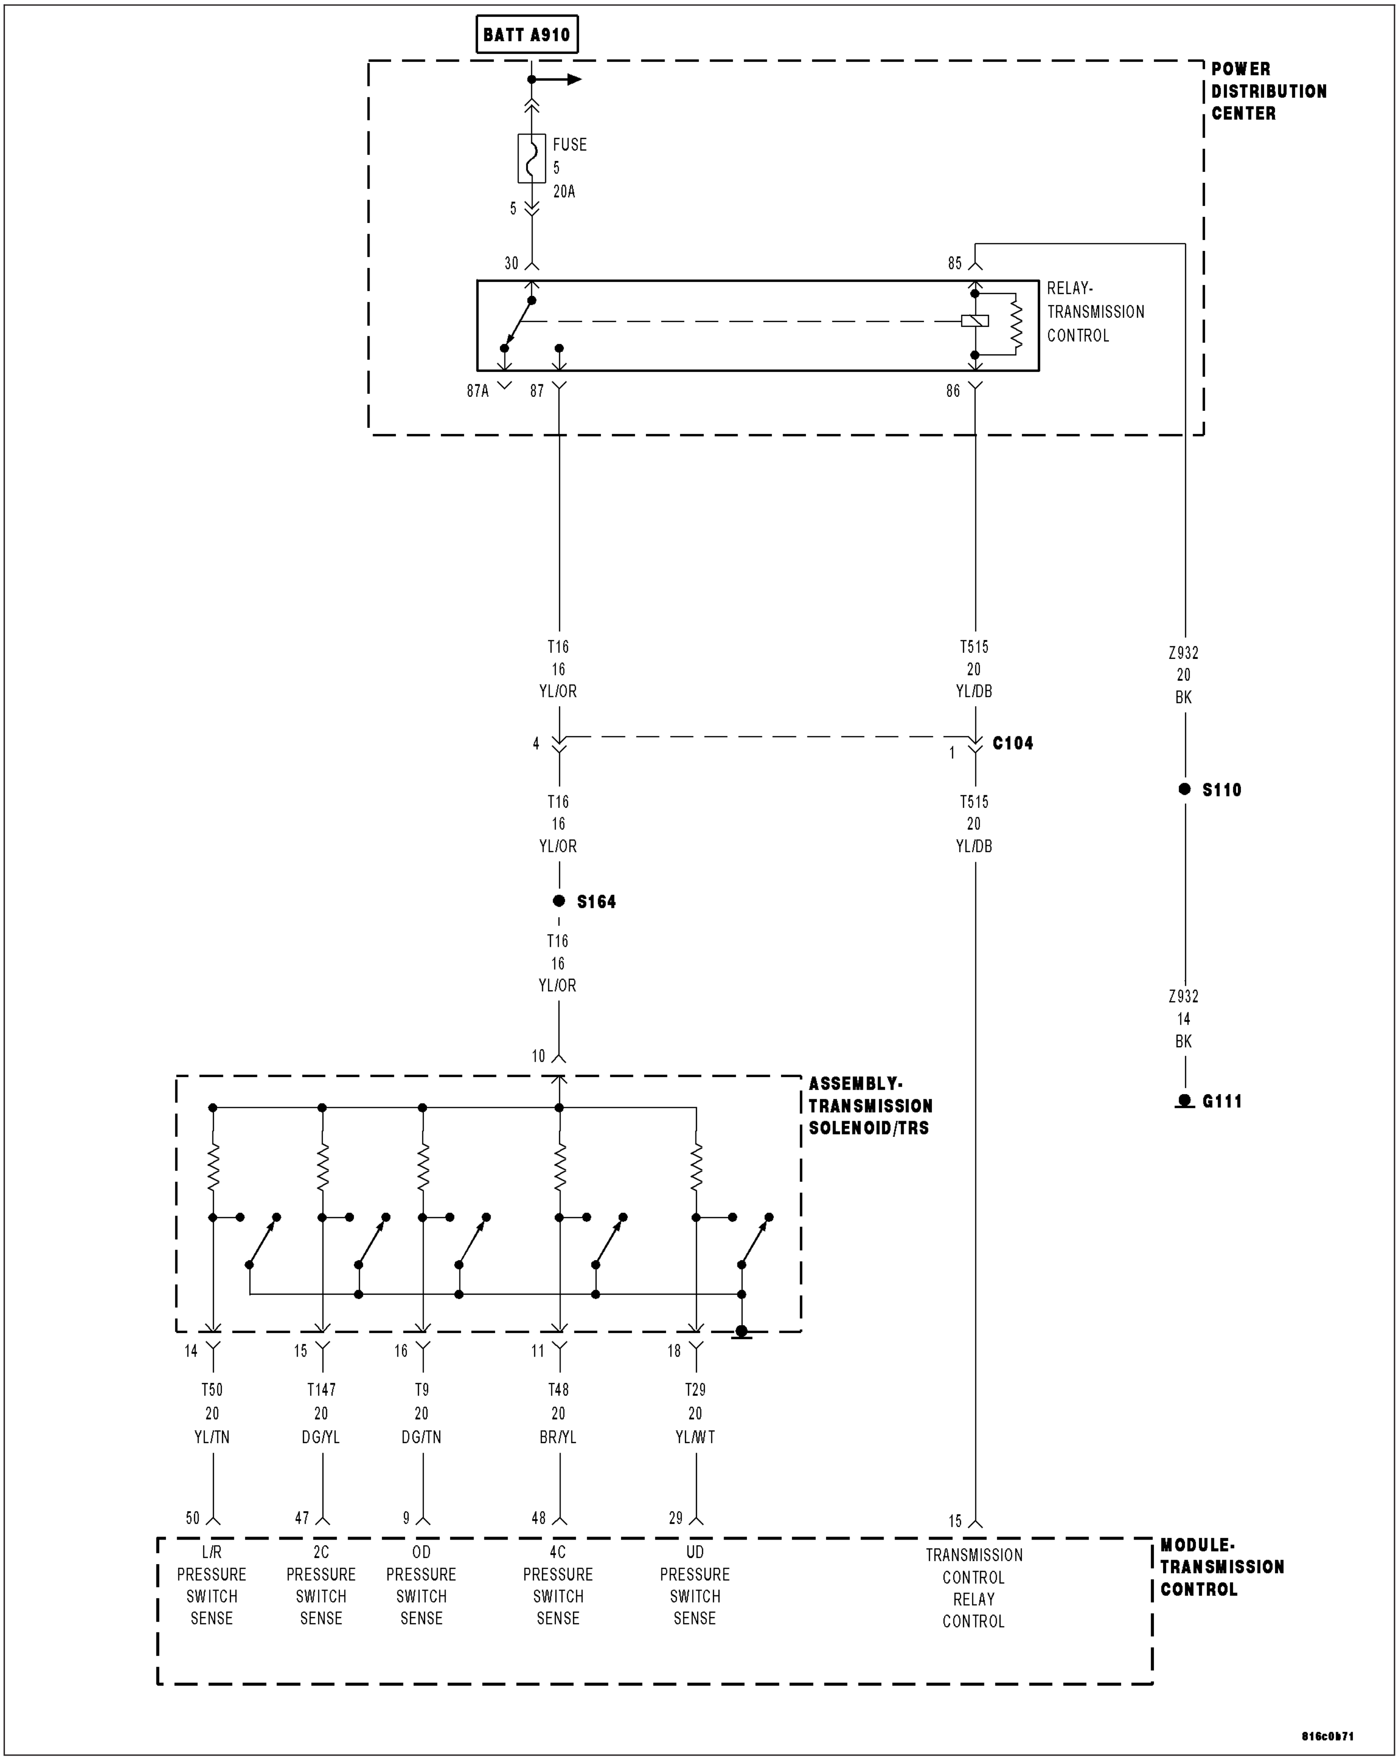
**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0868-LINE PRESSURE LOW



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while driving in a forward gear.
- **Set Condition:**
  The TCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure is more than 10 psi below Desired Line Pressure, this DTC will set.

| Possible Causes |
|---|
| CHECK FOR RELATED DTC'S |
| LOW FLUID LEVEL |
| (T39) 5-VOLT SUPPLY CIRCUIT OPEN |
| POOR LINE PRESSURE SENSOR CONNECTION |
| (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE |
| (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORT TO ANOTHER CIRCUIT |
| INTERNAL TRANSMISSION |
| LINE PRESSURE SENSOR |
| CRACKED, PLUGGED, OR MIS-INSTALLED PRIMARY OIL FILTER |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.

**Is the DTC P0932 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

## 2. CHECK IF THE DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0868.

**NOTE: This counter only applies to the last DTC set.**

**Is the START SINCE SET COUNTER 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 11

## 3. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, **engine not running.**

With the scan tool, monitor the Line Pressure, firmly push the Line Pressure Sensor harness connector towards the Transmission.

**Did the Line Pressure change to about 207 kPa or 30 psi when the connector was pushed?**

**Yes** >> Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following steps.

Using the Transmission Simulator, set the rotary knob to each of the 3 line pressure positions.

**NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the Line Pressure read within ±14 kPa or 2.0psi in all three positions?**

**Yes** >> Go To 5

**No** >> Go To 7

## 5. CHECK THE LINE PRESSURE SENSOR

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and reconnect all previously disconnected connectors.

Install the Line Pressure Adaptor, Miller tool #8259, and the Pressure Gauge, Miller tool #C-3293, 0 to 2000 kPa or 0 to 300 psi.

Start the engine in park.

Monitor the line pressure readings of both the scan tool and the pressure gauge and compare the two readings.

**Is the line pressure gauge reading within 34 kPa or 5psi of the scan tool reading?**

**Yes** >> Go To 6

**No** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK FOR A PLUGGED TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

**NOTE: Make sure the Primary Transmission Oil Filter and/or O-ring is not cracked or split.**

**Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?**

**Yes** >> Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or O-ring. If the Primary Transmission Oil Filter is plugged refer to the Service Information for the proper Hydraulic repair procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Repair internal transmission and inspect the Transmission Oil Pump per the Service Information and replace if necessary. If no problem is found, replace the Solenoid/TRS Assembly.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

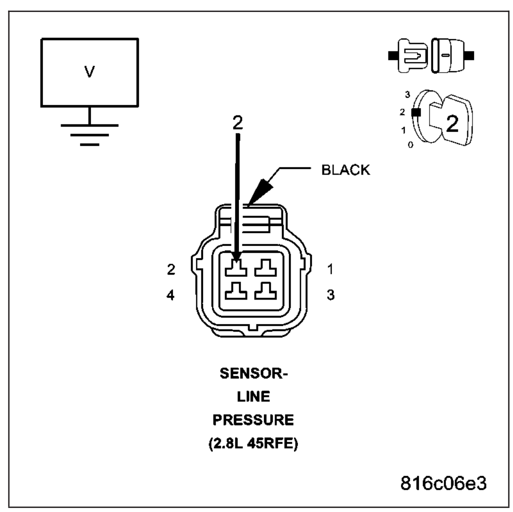
## 7. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Transmission Simulator, Miller tool #8333.

Reconnect all previously disconnected connectors except the Line Pressure Sensor harness connector.

Ignition on, engine not running.

Measure the voltage of the (T39) 5-volt Supply circuit in the Line Pressure Sensor harness connector.



**Is the voltage above 5.5 volts?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

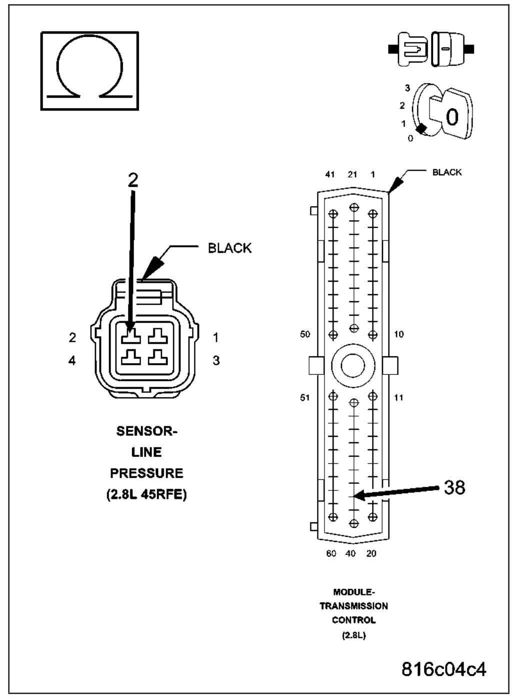
**No** >> Go To 8

## 8. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Measure the resistance of the (T39) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the TCM harness connector.



**Is the resistance above 5.0 ohms?**

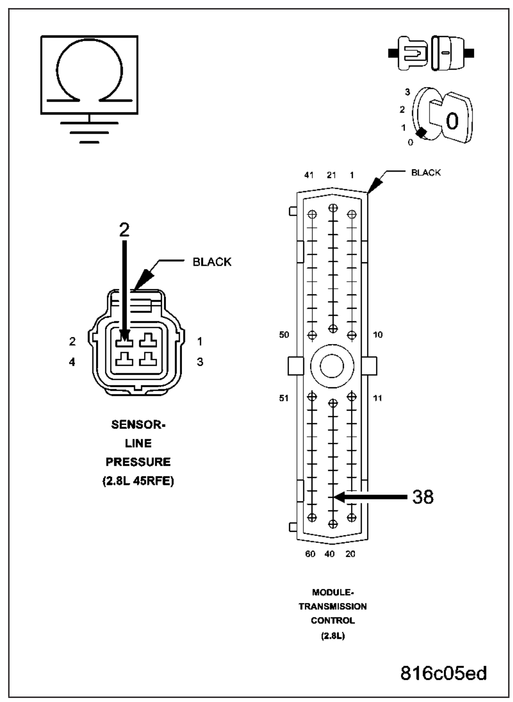
**Yes** >> Repair the (T39) 5-volt Supply circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T39) 5-volt Supply circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 10

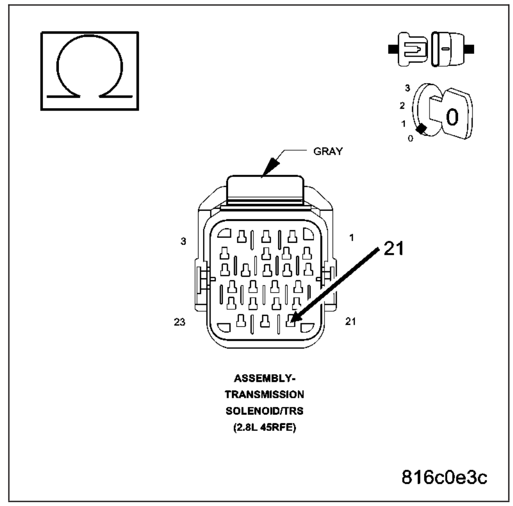
## 10. CHECK THE (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Disconnect the TCM harness connector.

Measure the resistance between the (T118) Pressure Control Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T118) Pressure Control Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T118) Pressure Control Solenoid Control circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 11. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

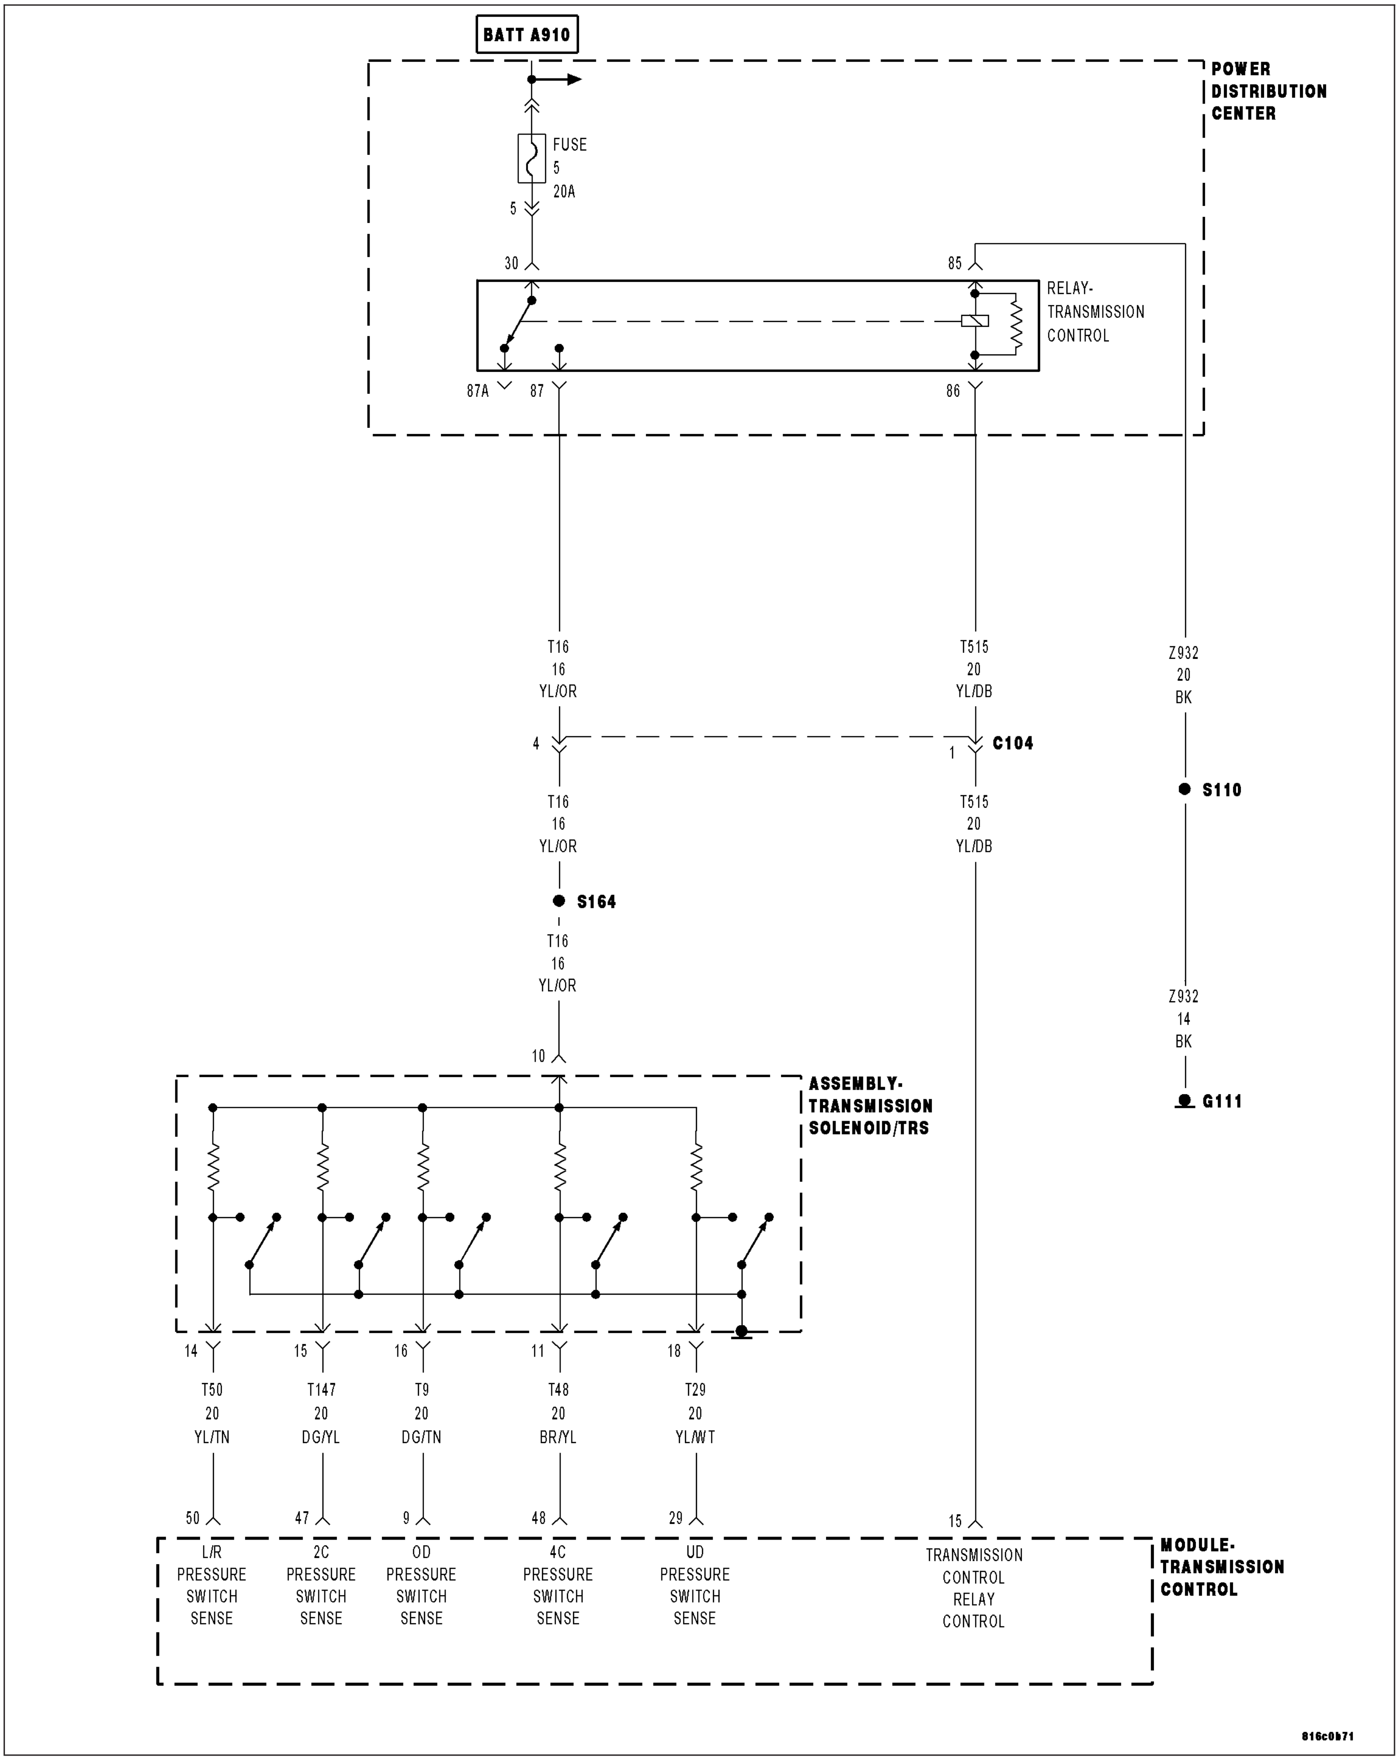
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0869-LINE PRESSURE HIGH



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while driving in a forward gear.
- **Set Condition:**
  The TCM continuously monitors Actual Line Pressure. If the Actual Line Pressure reading is greater than the highest Desired Line Pressure ever used in the current gear, while the Pressure Control Solenoid duty cycle is at or near its maximum value (which should result in minimum line pressure), the DTC will set.

| Possible Causes |
|---|
| (T39) 5-VOLT SUPPLY CIRCUIT OPEN |
| LINE PRESSURE SENSOR CONNECTION |
| (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT OPEN |
| (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (T118) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT |
| LINE PRESSURE SENSOR |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is measured by the Line Pressure Sensor (LPS) and regulation is achieved by changing the duty cycle of the Pressure Control Solenoid (PCS) controlled by the Transmission Control System. (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure). The Transmission Control System calculates the desired line pressure based on inputs from both the engine and transmission.

The Transmission Control System calculates torque input to the transmission and uses it as the primary input to the desired line pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently higher than the highest desired line pressure ever used in the current gear, the line pressure high DTC P0869 will set.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other Transmission DTCs.

**Is the DTC P0932 or P0882 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK IF THE DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0869.

**Is the STARTS SINCE SET COUNTER 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 10

## 3. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, engine not running.

With the scan tool, monitor the Transmission Line Pressure.

Firmly push the Line Pressure Sensor harness connector inward towards the Transmission.

**Did the Line Pressure change to about 207 kPa or 30 psi when the sensor connector was pushed?**

**Yes** >> Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following step.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

**NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the Line Pressure read within ±14 kPa or 2.0 psi in all three positions?**

**Yes** >> Go To 5

**No** >> Go To 6

## 5. CHECK THE LINE PRESSURE SENSOR CALIBRATION

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333 and reconnect all previously disconnected connectors.

Install the Line Pressure Adaptor, Miller tool #8259, and Pressure Gauge, Miller tool #C-3293, 0 to 2000 kPa or 0 to 300 psi.

Start the engine in park.

Monitor the Line Pressure readings on the scan tool and the pressure gauge.

Compare the Line Pressure readings between the scan tool and the pressure gauge.

**Is the pressure gauge reading within 34 kPa or 5 psi of the scan tool reading?**

**Yes** >> Repair the internal transmission and inspect the Transmission Oil Pump per the Service Information and replace if necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly, possible cause is a stuck Pressure Control Solenoid.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Line Pressure Sensor per the Service information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

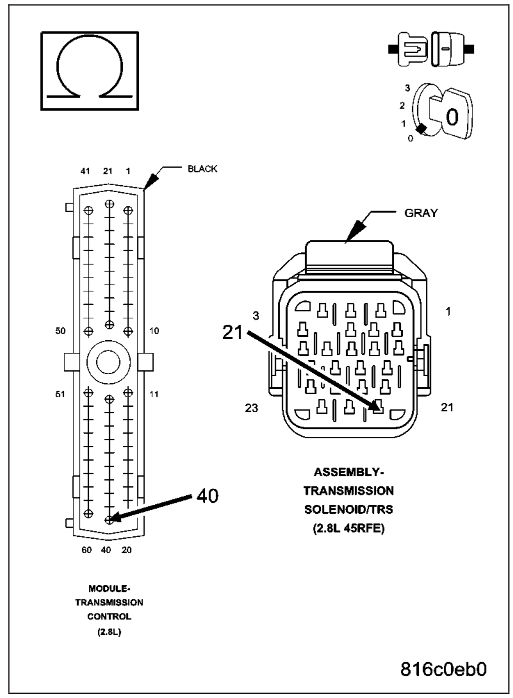
## 6. CHECK THE (T140) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T118) Pressure Control Solenoid Control circuit between the Solenoid/TRS harness connector and the TCM harness connector.



**Is the resistance above 5.0 ohms?**

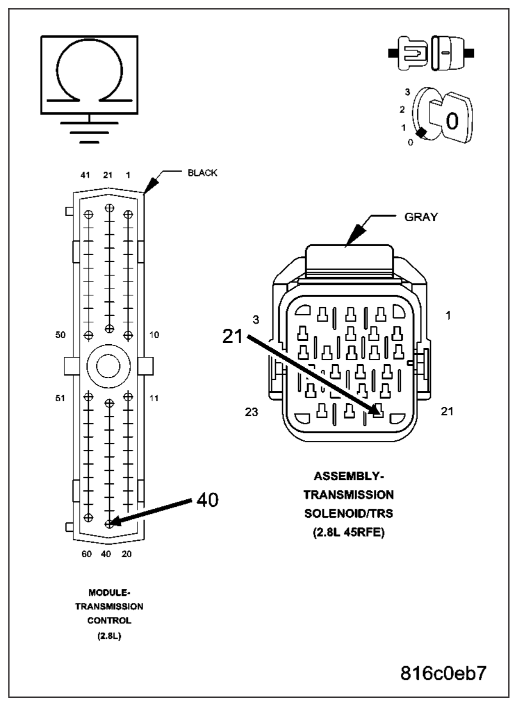
**Yes** >> Repair the (T118) Pressure Control Solenoid Control circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK THE (T140) PRESSURE CONTROL SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T118) Pressure Control Solenoid Control circuit.



**Is the resistance below 5.0 ohms?**

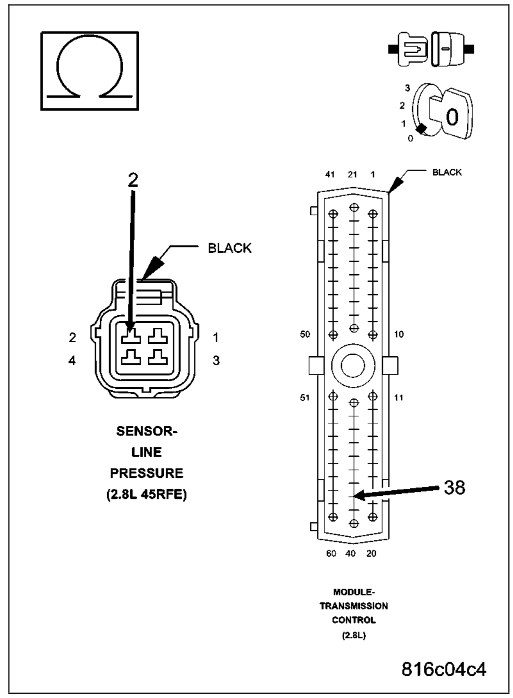
**Yes** >> Repair the (T118) Pressure Control Solenoid Control circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Measure the resistance of the (T39) 5-volt Supply circuit between the Line Pressure Sensor harness connector and the TCM harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

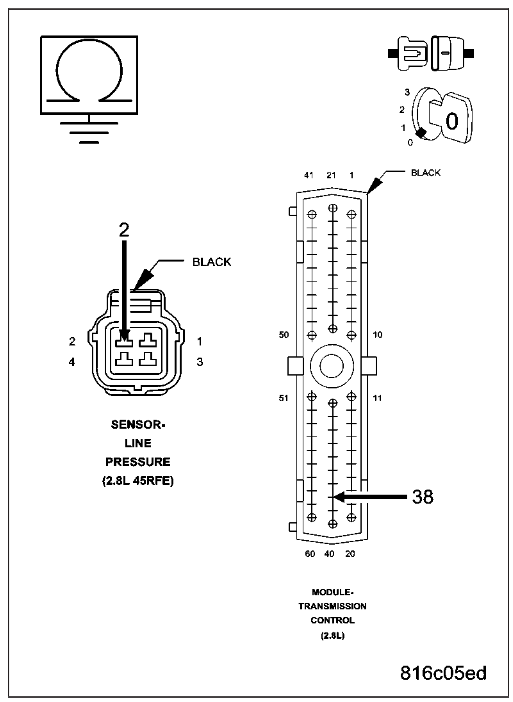
**No** >> Go To 9

## 9. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Disconnect the TCM harness connector.

Disconnect the Line Pressure Sensor harness connector.

Measure the resistance between ground and the (T39) 5-volt Supply circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Control Module per the Service Information. With the scan tool perform the QUICK LEARN procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 10. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

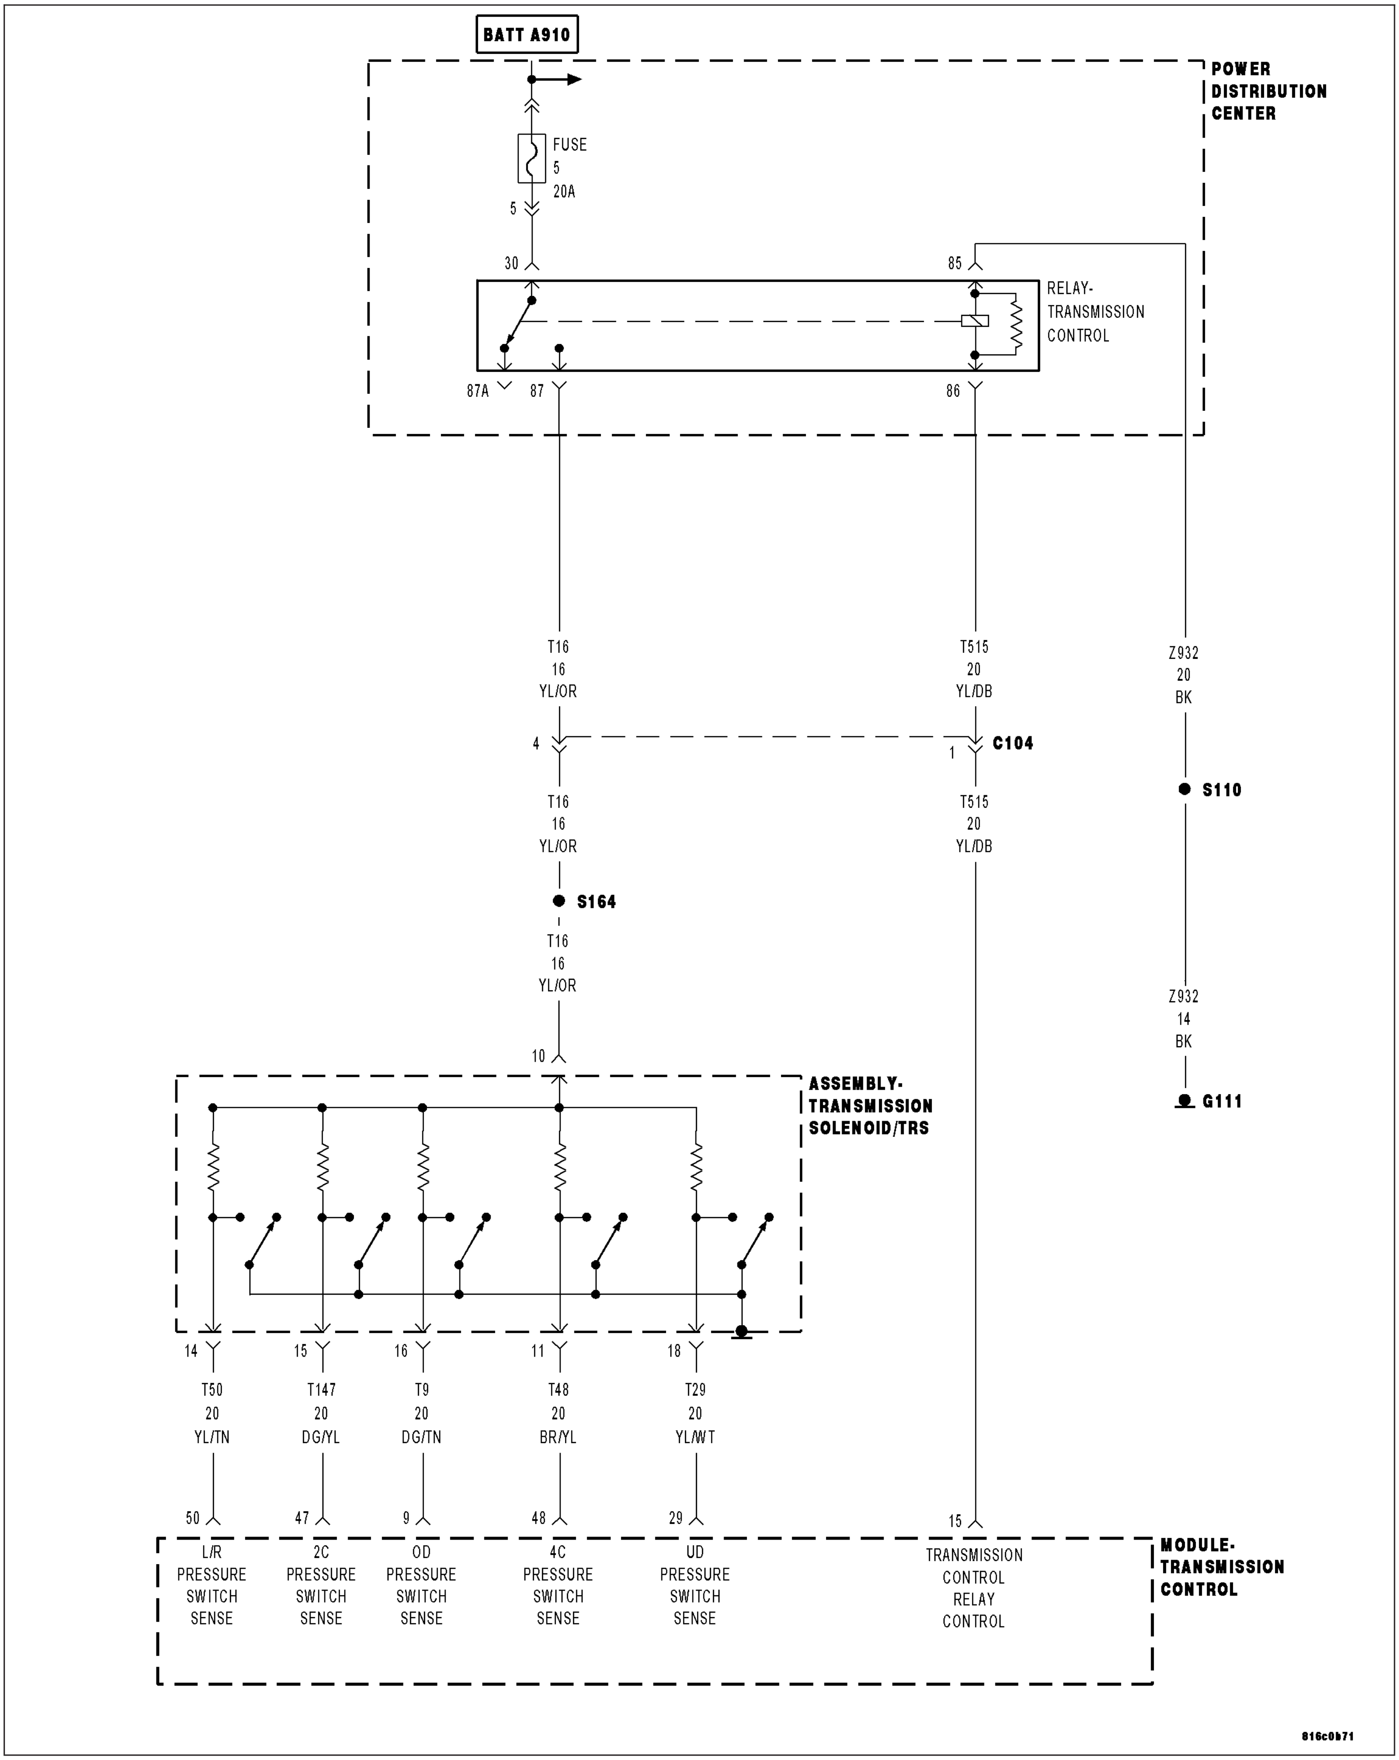
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0870-OD HYDRAULIC PRESSURE TEST



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.
- **Set Condition:**
  After a shift into a forward gear, with engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

| Possible Causes |
|---|
| LINE PRESSURE SENSOR |
| TRANSMISSION FLUID CONTAMINATION |
| RELATED DTC'S PRESENT |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| EXCESSIVE DEBRIS IN OIL PAN |
| POOR LINE PRESSURE SENSOR CONNECTION |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT OPEN |
| RELATED TCM POWER INPUT DTCS PRESENT |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T39) 5-VOLT SUPPLY CIRCUIT OPEN |
| TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.

**Is there any Loss of Prime, TCM Power Input, and/or Line Pressure Sensor DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If the DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

**No** >> Go To 2

## 2. CHECK IF DTC P0760 IS PRESENT

With the scan tool, check Transmission DTCs.

**Is the DTC P0760 also present?**

**Yes** >> Refer to the symptom list and perform diagnostics for P0760-OD SOLENOID CIRCUIT. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 3

## 3. CHECK FOR OTHER DTCS

With the scan tool, check for other transmission DTCs

**Are any of the DTCs, P0733, P0734 ,P0735 and/or P0871 present also?**

**Yes** >> Go To 12

**No** >> Go To 4

## 4. CHECK IF DTC P0870 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0870.

**Is the STARTS SINCE SET COUNTER 2 or less?**

**Yes** >> Go To 5

**No** >> Go To 17

## 5. CHECK LINE PRESSURE

Start the engine.

Warm the transmission to 82° C or 180° F.

Firmly apply the brakes.

With the scan tool, monitor the Line Pressure during the following step.

Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

**Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?**

**Yes** >> Go To 6

**No** >> Go To 10

## 6. CHECK THE LINE PRESSURE SENSOR CONNECTION

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

**Did the Line Pressure reading on the scan tool change to about 207 kPa or 30 psi when the connector was pushed inward?**

**Yes** >> Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK THE LINE PRESSURE SENSOR OPERATION

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

**NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?**

**Yes** >> Replace the Line Pressure Sensor per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect Transmission Simulator.

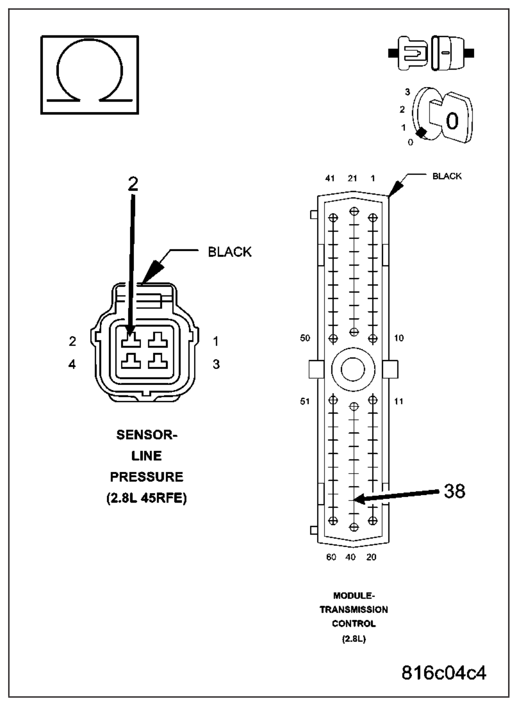
Disconnect the TCM harness connector.

Measure the resistance of the (T39) 5-volt Supply circuit from the Line Pressure Sensor harness connector to the appropriate terminal of the TCM harness connector.

**Is the resistance above 5.0 ohms?**

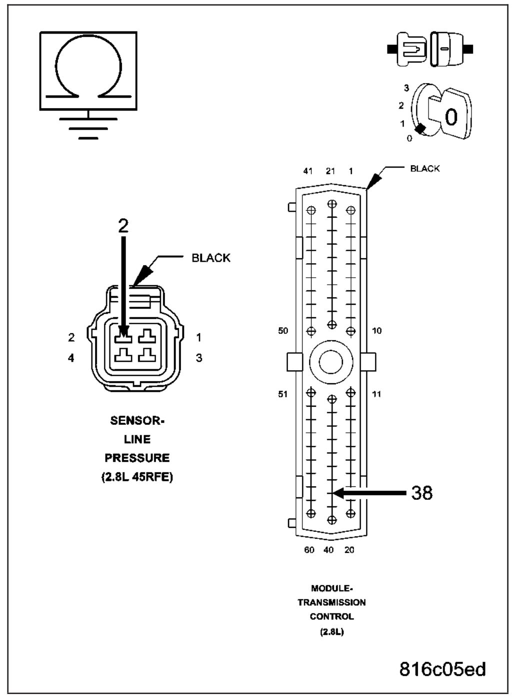
**Yes** >> Repair the (T39) 5-volt Supply circuit for an open.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9



## 9. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T39) 5-volt Supply circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 10. COMPARE SCAN TOOL TO PRESSURE GAUGE

Turn the ignition off to the lock position.

Connect the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP. Refer to the Service Information for proper installation procedure.

**CAUTION: Apply parking brake.**

Start the engine.

In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

**CAUTION: Do not overheat transmission.**

With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.

Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.

Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

**Does the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?**

**Yes** >> Go To 11

**No** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 11. CHECK TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

On the Transmission Simulator, turn the Pressure Switch selector switch to OD.

Ignition on, engine not running.

With the scan tool, monitor the OD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the OD Pressure Switch.

**Did the OD Pressure Switch state change to closed and remain closed while wiggling the wires?**

**Yes** >> Go To 12

**No** >> Go To 14

## 12. CHECK FOR EXCESSIVE DEBRIS

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Remove and inspect the Transmission Oil Pan per the Service Information.

**Does the Transmission Oil Pan contain excessive debris or contamination?**

**Yes** >> Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK THE OD HYDRAULIC CLUTCH CIRCUIT

Remove the Valve Body and air check the OD hydraulic clutch circuit (in the case) for leakage per the Service Information.

**NOTE: The OD hydraulic clutch circuit contains a small bleed orifice which connects to the Reverse hydraulic clutch circuit. A small amount of air leakage is normal.**

**Was there excessive air leakage noticed during the air check?**

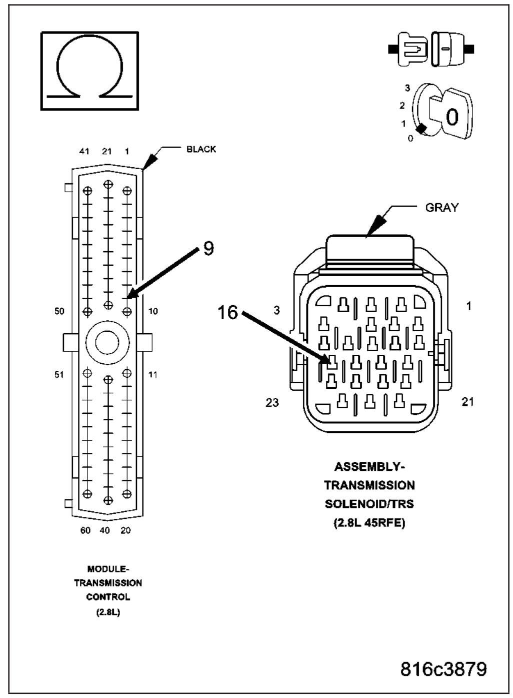
**Yes** >> Repair as necessary. Check the OD/Rev clutch piston seals, bleed orifice assembly, reaction shaft support seal rings, and machining of the main mating faces on the pump housing, pump valve body, and reaction shaft support.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Disassemble and inspect the Valve Body and repair as necessary. Inspect the OD Accumulator piston and seals. Check for an extra check ball downstream from the #6 check ball pocket and repair as necessary. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 14. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T9) OD Pressure Switch Sense circuit from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the TCM harness connector.

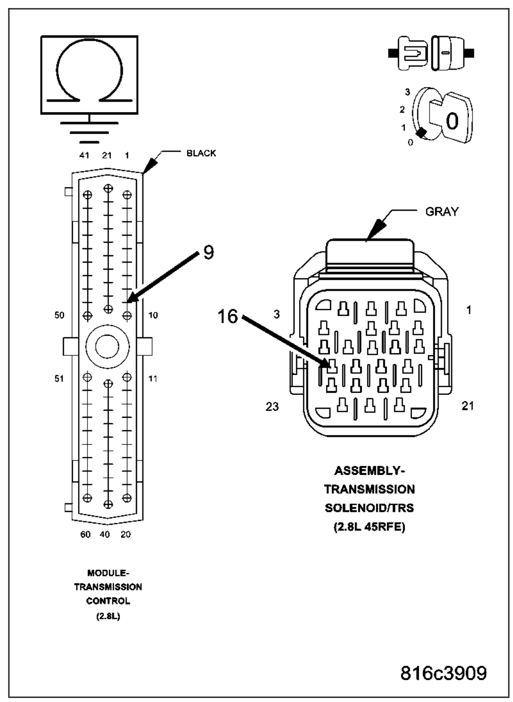
**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 15

## 15. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND



Measure the resistance between ground and the (T9) OD Pressure Switch Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 16

## 16. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

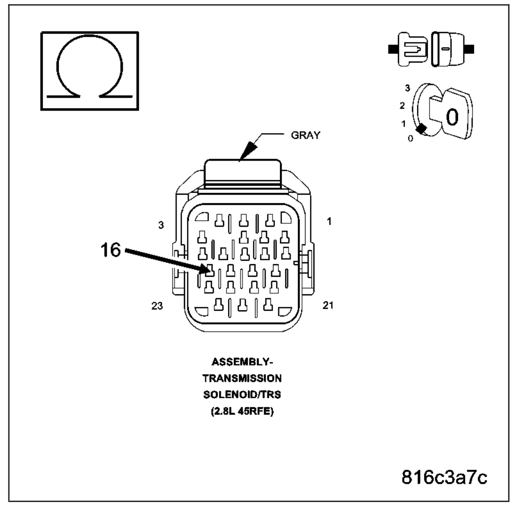
Disconnect the TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

**NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between the (T9) OD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T9) OD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 17. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

If the DTC EVENT DATA shows the DTC P0870 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

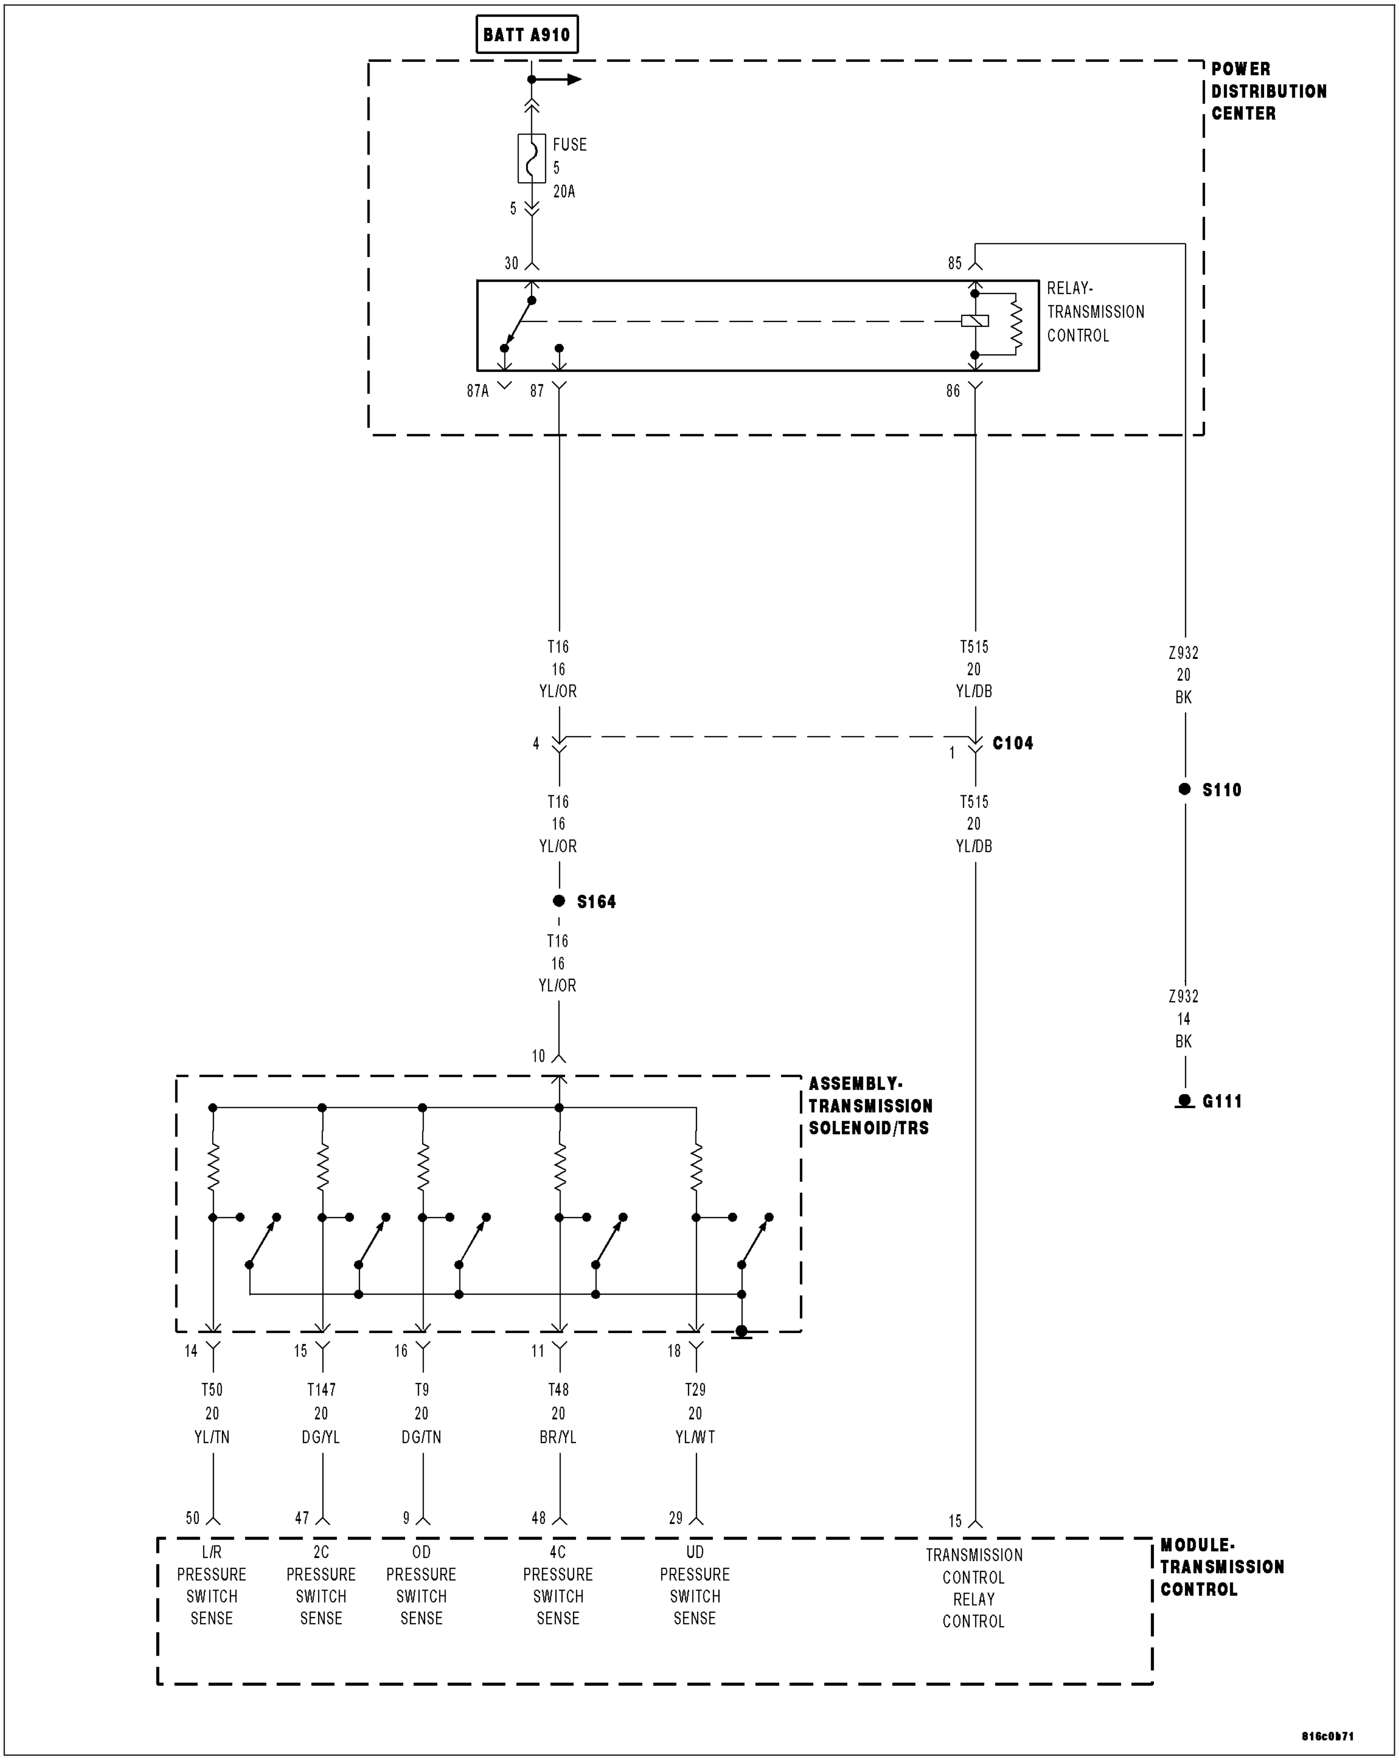
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0871-OD PRESSURE SWITCH RATIONALITY



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  The appropriate DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear.

| Possible Causes |
|---|
| RELATED TCM POWER INPUT DTCS PRESENT |
| LINE PRESSURE DTCS PRESENT |
| NO. 4 OR 6 CHECK BALL CUT OR DAMAGED |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T9) OD PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHER CIRCUITS |
| LOW LINE PRESSURE |
| WIRING AND CONNECTORS |
| CUT OD/REV PISTON SEAL |
| BROKEN OR MISSING DO/REV PISTON BLEED ORIFICE |
| BROKEN REACTION SHAFT SUPPORT SEAL RING |
| POOR MACHINING ON PUMP VALVE BODY FACE |
| BROKEN OR MISSING DRIBBLER ORIFICE ASSEMBLY IN REACTION SHAFT SUPPORT |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| CUT OD ACCUMULATOR PISTON SEAL |
| CRACKED OD ACCUMULATOR PISTON |
| BROKEN OR MISSING OD BLEED ORIFICE IN MAIN VALVE BODY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the LR, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

| GEAR | L/R | 2C | 4C | UD | OD |
|---|---|---|---|---|---|
| **REVERSE** | OPEN | OPEN | OPEN | OPEN | OPEN |
| **P/N** | CLOSED** | OPEN | OPEN | OPEN | OPEN |
| **1ST** | CLOSED* | OPEN | OPEN | CLOSED | OPEN |
| **2ND** | OPEN | CLOSED | OPEN | CLOSED | OPEN |
| **2ND PRIME** | OPEN | OPEN | CLOSED | CLOSED | OPEN |
| **3RD** | OPEN | OPEN | OPEN | CLOSED | CLOSED |
| **4TH** | OPEN | OPEN | CLOSED | OPEN | CLOSED |
| **5TH** | OPEN | CLOSED | OPEN | OPEN | CLOSED |

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.

**May be open when rolling in Neutral or at low oil temperatures.

## Diagnostic Test

### 1. DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT

With the scan tool, check for other transmission DTCs.

**Are there any TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK FOR LINE PRESSURE DTCS

With the scan tool, read Transmission DTCs.

**Are there any Line Pressure DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 3

### 3. CHECK FOR OTHER PRESSURE SWITCH DTCS

With the scan tool, check Transmission DTCs.

**Are there two or more other pressure switch rationality DTCs present in addition to P0871?**

**Yes** >> Go To 5

**No** >> Go To 4

### 4. CHECK IF DTC IS CURRENT

With the scan tool, check and record the DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA show data for P0871?**

**Yes** >> Go To 8

**No** >> Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

### 5. CHECK IF PRESSURE SWITCHES READ CLOSED

With the scan tool, check and record the DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Do all the pressure switches read CLOSED in the DTC EVENT DATA?**

**Yes** >> Refer to the Transmission category and perform diagnostics for P0882. Follow instructions as if the DTC is current. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 6

## 6. CHECK IF PRESSURE SWITCHES READ OPEN

In the DTC EVENT DATA recorded earlier, read the state of all pressure switches.

**Do all the pressure switches read open?**

**Yes** >> Go To 7

**No** >> Go To 8

## 7. CHECK FOR LOW LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure to the Desired Line Pressure.

**Is the Line Pressure less than 40 PSI, and significantly below the Desired Line Pressure?**

**Yes** >> Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter weal for a spit, crack , or improperly installed. If the filer and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 8. CHECK IF IN DTC SET IN PARK, NEUTRAL, OR REVERSE

Ignition on, engine not running.

With the scan tool, read and record the DTC EVENT DATA for P0871.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA show the OD Pressure Switch DTC set while in Park, Neutral, or Reverse?**

**Yes** >> Go To 18

**No** >> Go To 9

## 9. CHECK IF THE OD PRESSURE SWITCH IS OPEN

Refer to the DTC EVENT DATA recorded earlier for P0871.

**Did the OD Pressure Switch read OPEN?**

**Yes** >> Go To 10

**No** >> Go To 15

## 10. CHECK FOR LOW LINE PRESSURE

Refer to the DTC EVENT DATA recorded earlier and compare the Line Pressure and the Desired Line Pressure.

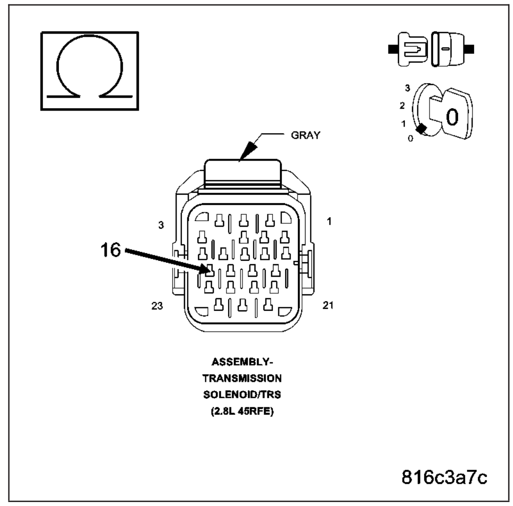
**Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?**

**Yes** >> Repair as necessary to correct low line pressure. Check the fluid level. Check the Primary Oil Filter seal for a split, crack, or improperly installed. Refer to the Service Information for the proper installation procedure. If the fluid level and filter are OK, check the Main Regulator Valve in the Oil Pump.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 11

## 11. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT



Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between the (T9) OD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

**Is the resistance below 5.0 ohms between the (T9) OD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 12

## 12. CHECK IF DTC RESETS

Reconnect all previously disconnected connectors.

With the scan too, erase transmission DTCs.

Test drive the vehicle, use the DTC EVENT DATA recorded earlier to help duplicate the conditions when the DTC originality set.

**Does the DTC P0871 reset?**

**Yes** >> Go To 13

**No** >> Go To 22

## 13. CHECK THE TRANSMISSION CONTROL MODULE

Remove the Transmission Control Relay.

Operate the vehicle in Drive.

**Is the transmission slipping while in Drive?**

**Yes** >> Go To 14

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 14. CHECK INTERNAL TRANSMISSION

Perform an Air Check Transmission Clutch Operation procedure per the Service Information.

**NOTE: The OD/Rev piston contains a small bleed orifice, a small amount of leakage between the OD and Reverse hydraulic clutch circuits is considered normal.**

**Is there excessive air leakage in any clutch circuit?**

**Yes** >> Check the OD/Rev piston seals and bleed orifice, reaction shaft support seal rings, dribbler orifice assemblies in the reaction shaft support and for poor machine on the pump valve body faces. Refer to the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Repair the Valve Body. Check the OD Accumulator piston and seals, OD bleed orifice, and No. 6 check ball cuts or damage. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 15. CHECK TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to OD.

With the scan tool, monitor the OD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

**Did the state of the OD Pressure Switch change from OPEN to CLOSED while pressing the Test button?**

**Yes** >> Go To 16

**No** >> Go To 18

## 16. CHECK IF THE NO. 4 AND/OR NO. 6 CHECK BALL IS CUT OR DAMAGED

With the scan tool, erase previously stored DTC's and test drive the vehicle, use the DTC EVENT DATA to help duplicate the conditions when the DTC originality set. Note any DTCs that may set.

Remove the Transmission Valve Body per the Service Information.

Check the No. 4 and No. 6 Check Balls for cuts or damage.

**Is the No. 4 and/or No. 6 Check Ball cut or damaged?**

**Yes** >> Replace the No. 4 and/or No. 6 Check Ball and check for clutch debris in the transmission oil pan. If there is excessive debris, perform internal repairs to the OD Clutch Assembly. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 17

## 17. TRANSMISSION SOLENOID/TRS ASSEMBLY

**Did the DTC P0871 reset during the test drive in the previous step?**

**Yes** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 22

## 18. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

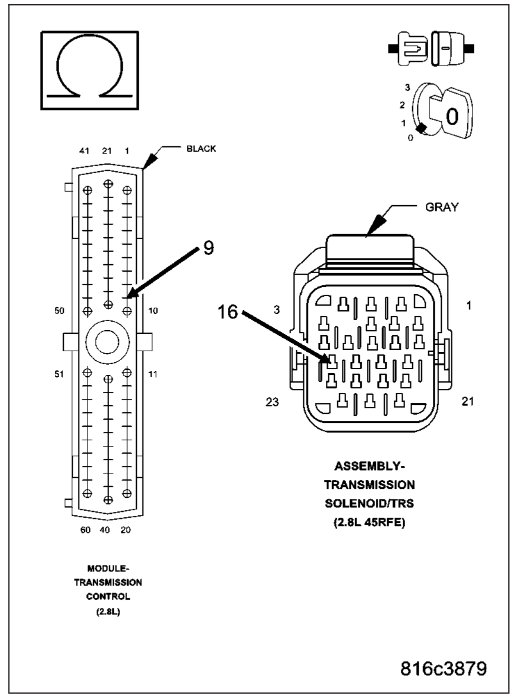
Disconnect the Transmission Solenoid/TRS Assembly harness connector

Measure the resistance of the (T9) OD Pressure Switch Sense circuit from the Solenoid/TRS Assembly harness connector to the appropriate terminal of the TCM harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for an open.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 19



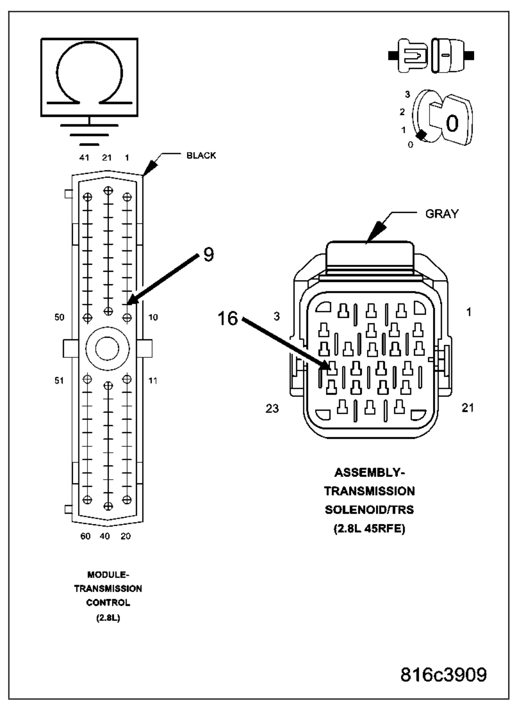
## 19. CHECK THE (T9) OD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T9) OD Pressure Switch Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T9) OD Pressure Switch Sense circuit for a short to ground.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 20



## 20. CHECK WIRING AND CONNECTORS

Using the schematics as a guide, inspect the wiring and connectors. Pay particular attention to all power and ground circuits.

**Were there any problems found**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 21

## 21. CHECK IF DTC RESETS

Reconnect all previously disconnected connectors.

Make sure all DTC EVENT DATA is recorded.

With the scan tool, erase previously stored DTC's and test drive the vehicle, use the DTC EVENT DATA to help duplicate the conditions when the DTC originality set.

**Does the DTC P0871 reset?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 22

## 22. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

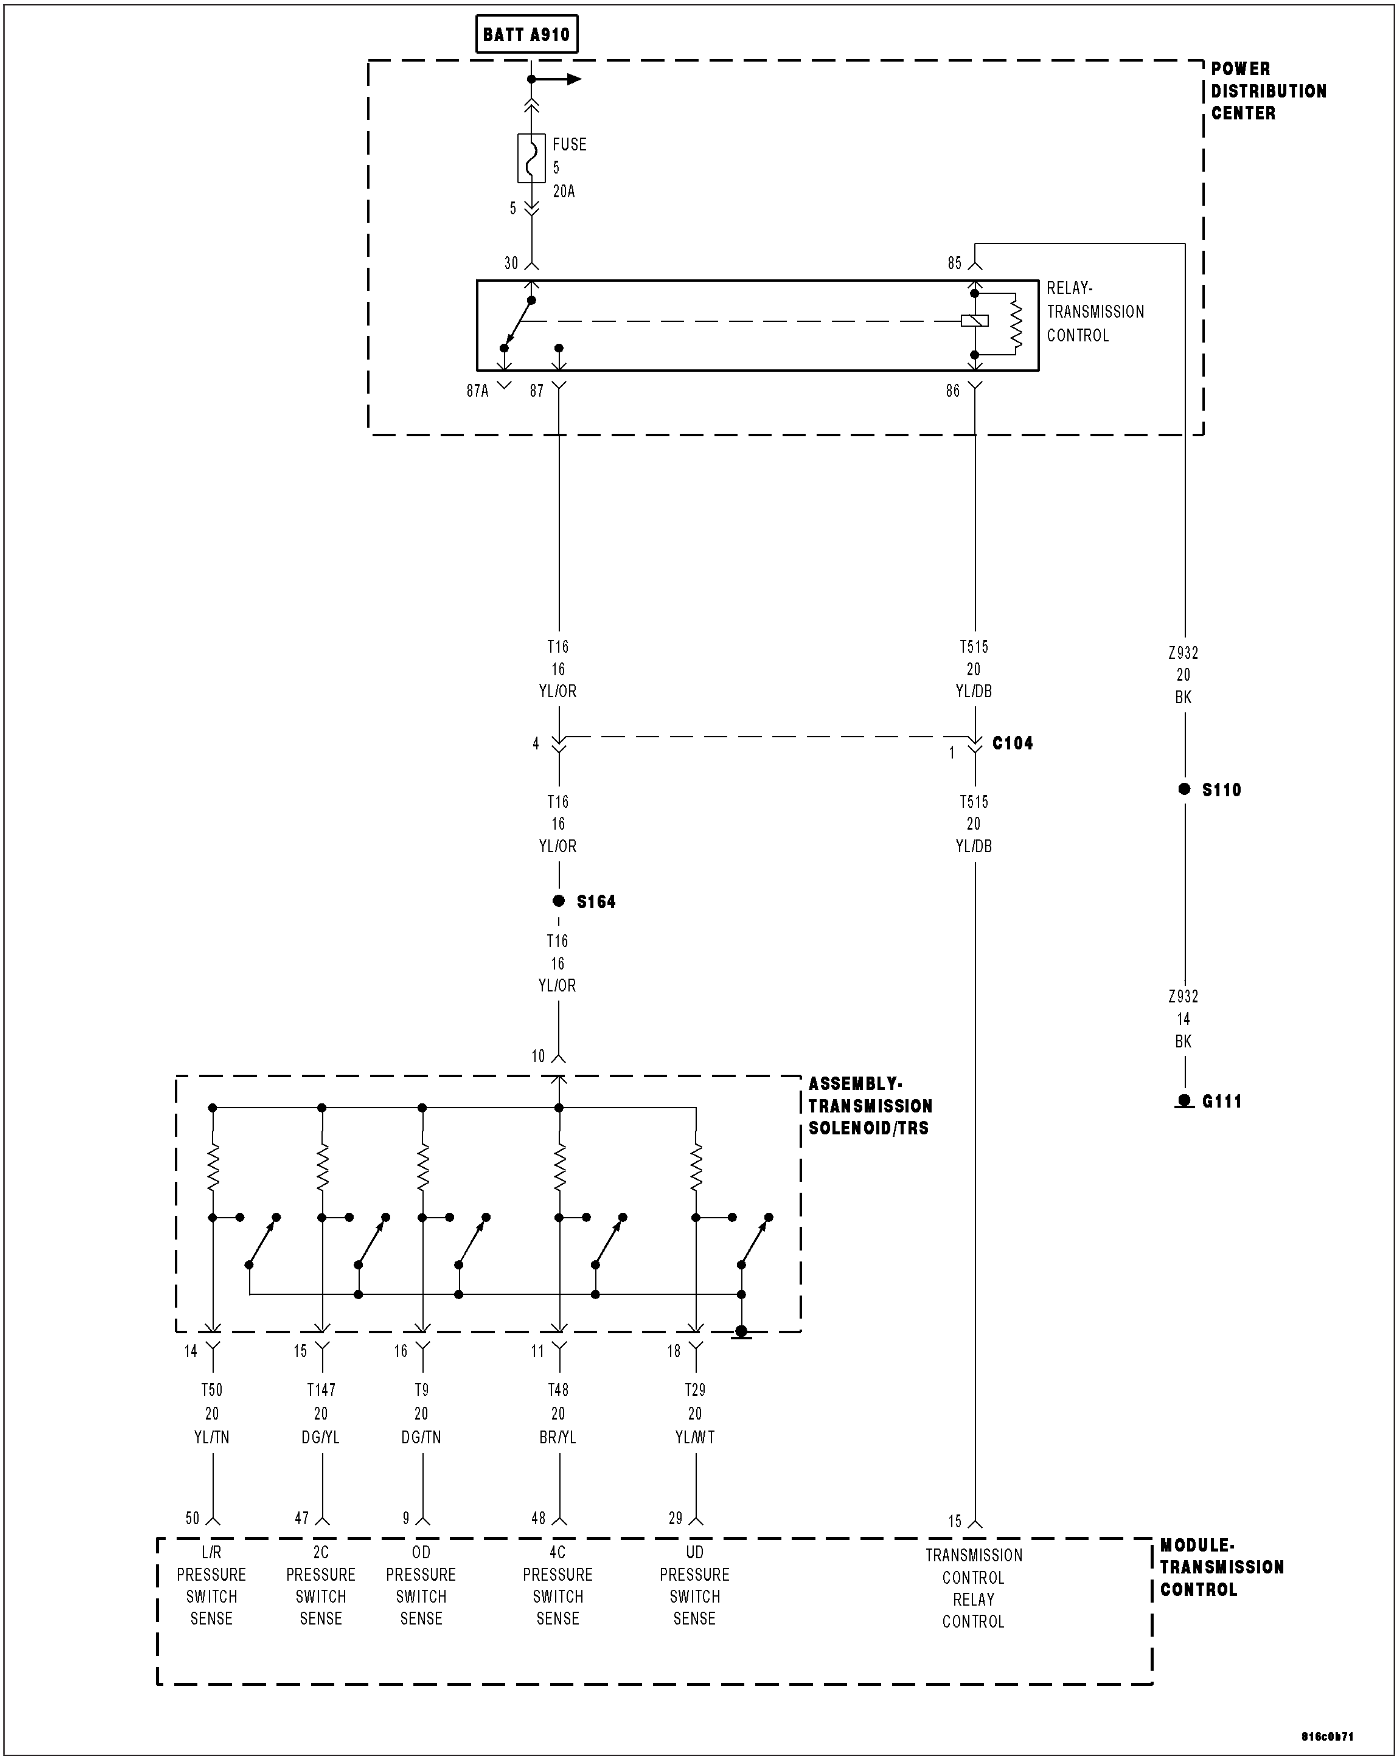
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0875-UD HYDRAULIC PRESSURE TEST



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.
- **Set Condition:**
  After a shift into a forward gear, with engine speed above 1000 RPM, the PCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

| Possible Causes |
| --- |
| LINE PRESSURE SENSOR |
| TRANSMISSION FLUID CONTAMINATION |
| RELATED DTC'S PRESENT |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| EXCESSIVE DEBRIS IN OIL PAN |
| POOR LINE PRESSURE SENSOR CONNECTION |
| (T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN |
| TRANSMISSION CONTROL RELAY DTCS PRESENT |
| (T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T39) 5-VOLT SUPPLY CIRCUIT OPEN |
| (T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| INTERNAL TRANSMISSION |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.

**Is there any Loss of Prime, Transmission Control Relay, and/or Line Pressure Sensor DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If the DTC, P0944-LOSS OF PRIME is present, perform its respective test first.

**No** >> Go To 2

## 2. CHECK FOR DTC P0765

With the scan tool, check Transmission DTCs.

**Is the DTC P0765 also present?**

**Yes** >> Refer to the Transmission category and perform diagnostics for P0765-UD SOLENOID CIRCUIT.

**No** >> Go To 3

## 3. CHECK FOR OTHER DTCS

With the scan tool, check for other transmission DTCs.

**Are any of the DTCs, P0731, P0732, P0733, P0876, and/or P1736 present also?**

**Yes** >> Go To 12

**No** >> Go To 4

## 4. CHECK IF DTC P0875 IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0875.

**Is the STARTS SINCE SET COUNTER 2 or less?**

**Yes** >> Go To 5

**No** >> Go To 17

## 5. CHECK LINE PRESSURE

Start the engine.

Warm the transmission to 82° C or 180° F.

Firmly apply the brakes.

With the scan tool, monitor the Line Pressure during the following step.

Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

**Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 psi in each position?**

**Yes** >> Go To 6

**No** >> Go To 10

## 6. CHECK LINE PRESSURE SENSOR CONNECTION

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

**Did the Line Pressure reading on the scan tool change to about 207 kPa or 30 psi when the connector was pushed inward?**

**Yes** >> Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK LINE PRESSURE SENSOR OPERATION

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

**NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 psi of the reading specified on the Transmission Simulator.**

**Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?**

**Yes** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect Transmission Simulator.

Disconnect the TCM harness connector.

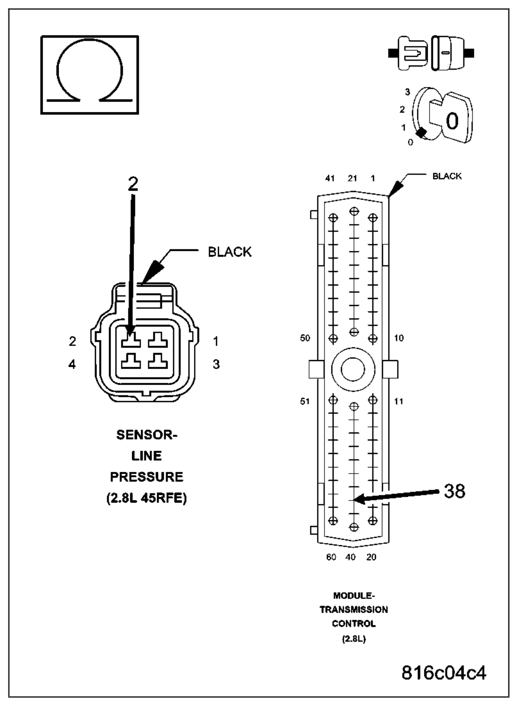
Measure the resistance of the (T39) 5-volt Supply circuit from the Line Pressure Sensor harness connector to the appropriate terminal of the TCM harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for an open.

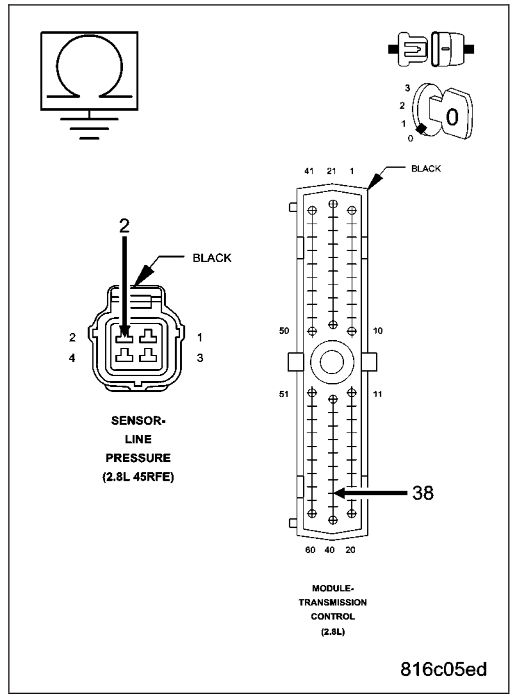
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9



## 9. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T39) 5-volt Supply circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 10. COMPARE SCAN TOOL TO PRESSURE GAUGE

Turn the ignition off to the lock position.

Connect the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP. Refer to the Service Information for proper installation procedure.

**CAUTION: Apply parking brake.**

Start the engine.

In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

**CAUTION: Do not overheat transmission.**

With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.

Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.

Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

**Does the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?**

**Yes** >> Go To 11

**No** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 11. CHECK WIRING AND CONNECTORS

Turn the ignition off to the lock position.

Remove the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

On the Transmission Simulator, turn the Pressure Switch selector switch to UD.

Ignition on, engine not running.

With the scan tool, monitor the UD Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the UD Pressure Switch.

**Did the UD Pressure Switch state change to closed and remain closed while wiggling the wires?**

**Yes** >> Go To 12

**No** >> Go To 14

## 12. CHECK FOR EXCESSIVE DEBRIS

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Remove and inspect the Transmission Oil Pan per the Service Information.

**Does the Transmission Oil Pan contain excessive debris or contamination?**

**Yes** >> Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK THE UD HYDRAULIC CLUTCH CIRCUIT

Remove the Valve Body and air check the UD hydraulic clutch circuit (in the case) for leakage per the Service Information.

**NOTE: The UD hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.**

**Was there excessive air leakage noticed during the air check?**

**Yes** >> Repair as necessary. Check the UD clutch piston, piston seals and bleed orifice, reaction shaft support seal rings, and machining of the main mating faces of the pump housing, pump valve body, and reaction shaft support.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Disassemble and inspect the Valve Body and repair as necessary. Inspect the UD Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

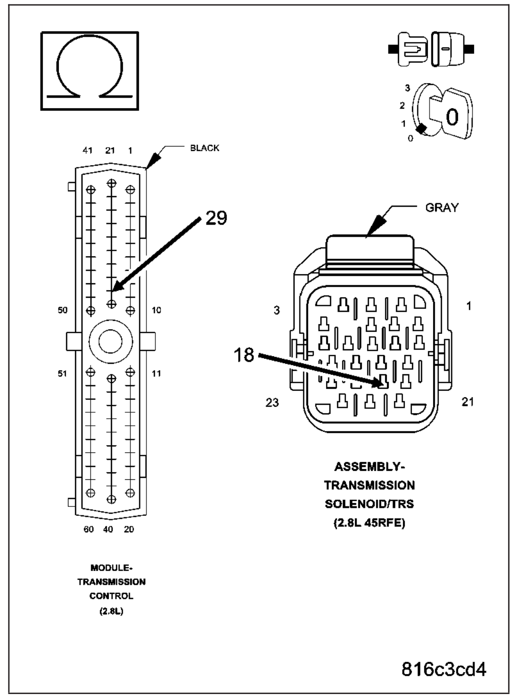
## 14. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T29) UD Pressure Switch Sense circuit between the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the TCM harness connector.



**Is the resistance above 5.0 ohms?**

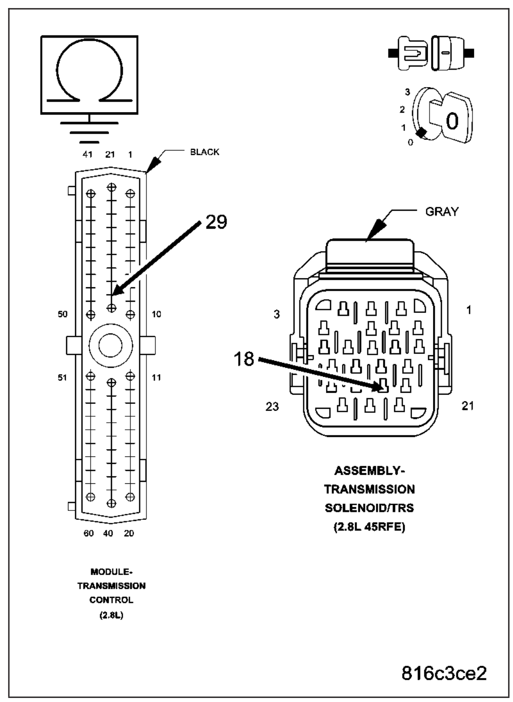
**Yes** >> Repair the (T29) UD Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 15

## 15. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T29) UD Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 16

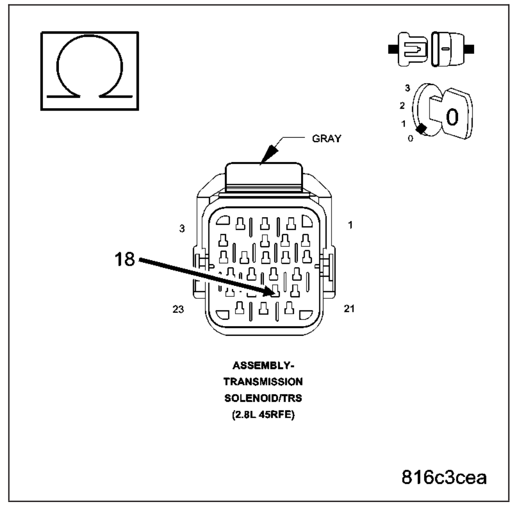
## 16. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Disconnect the TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

**NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 17. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

If the DTC EVENT DATA shows the DTC P0875 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

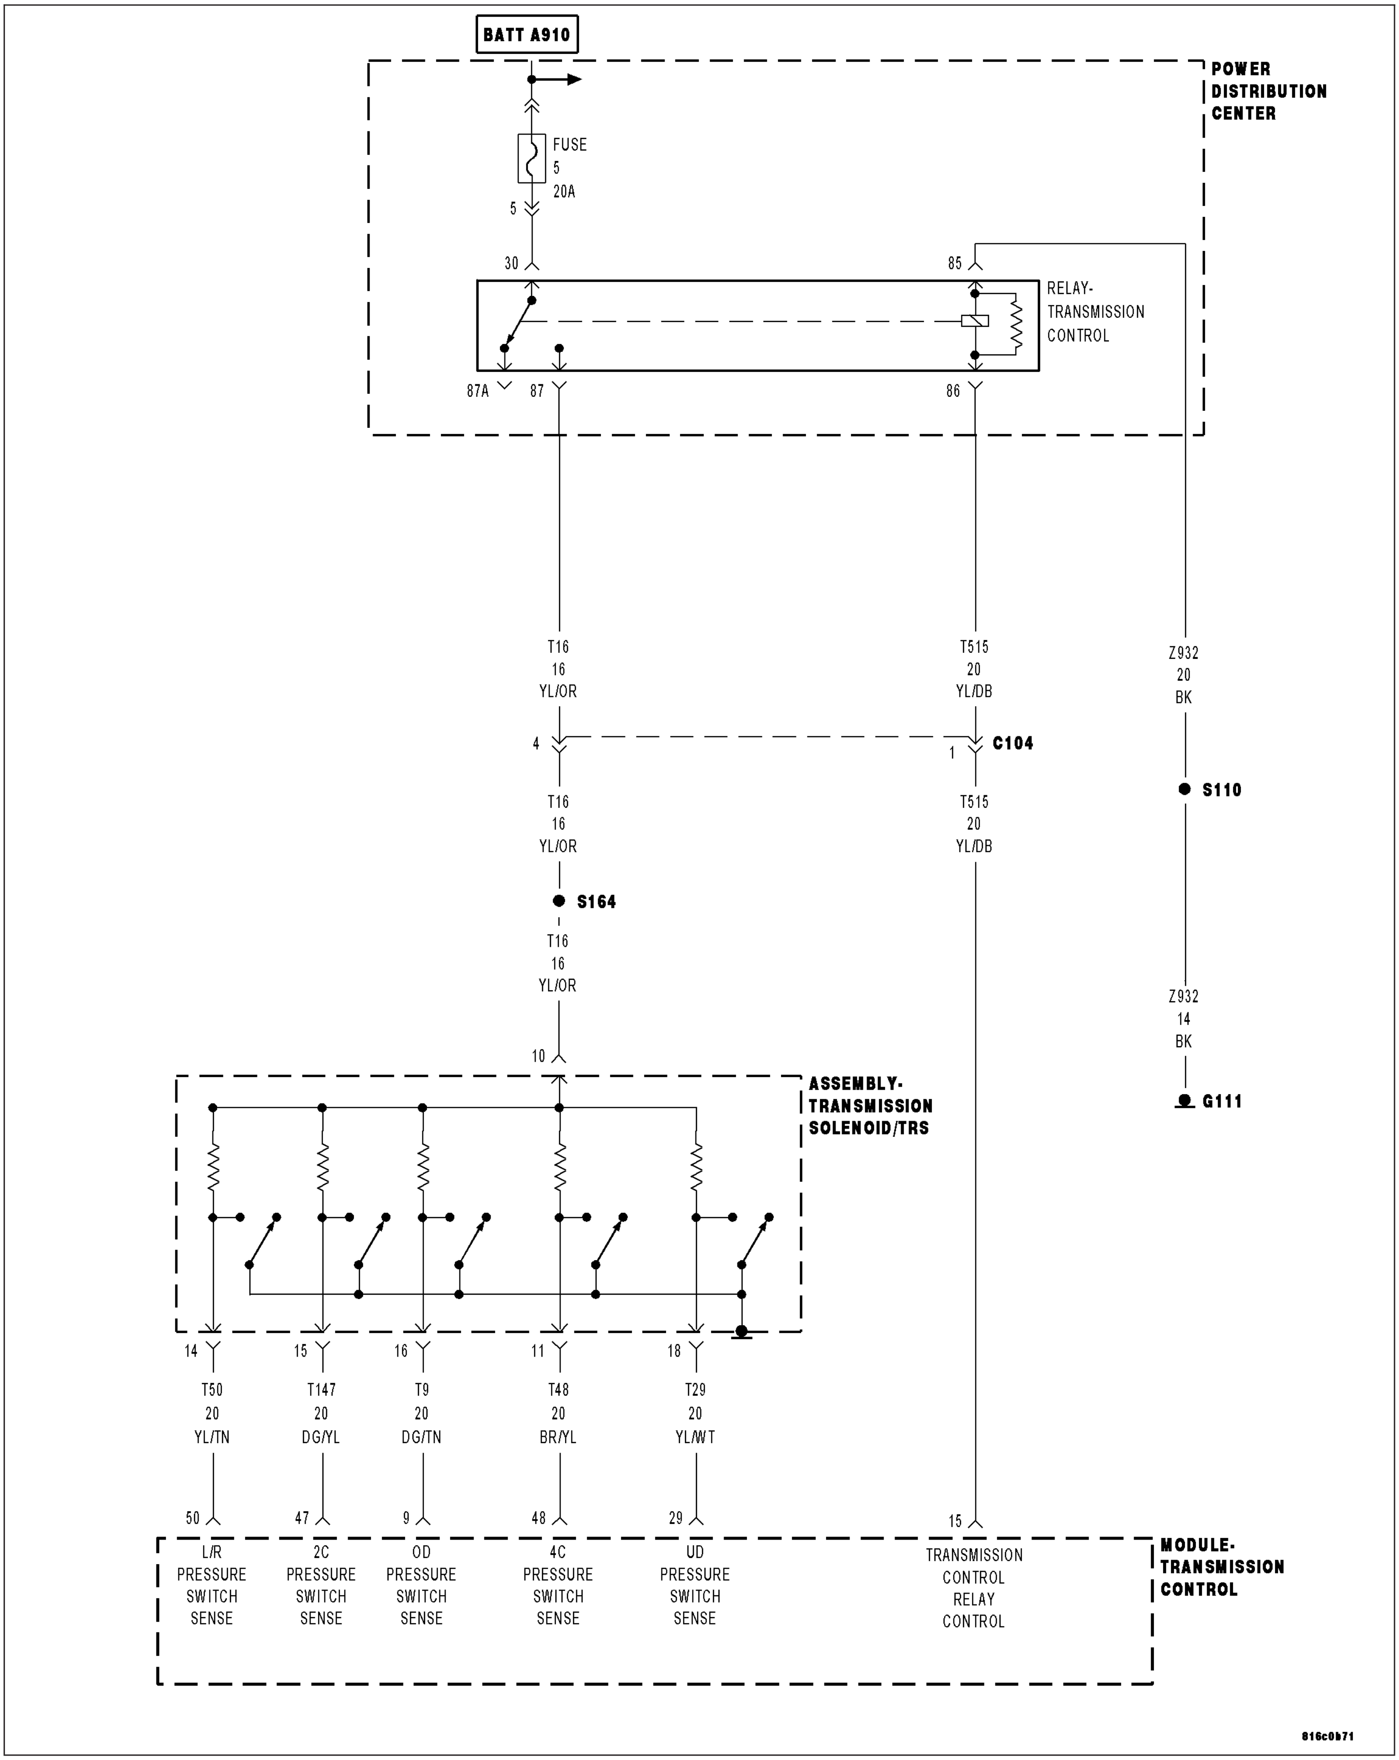
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0876-UD PRESSURE SWITCH RATIONALITY



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC is set if the UD pressure switch is in the wrong state for the current gear. For example, this code would be set if the UD pressure switch remained off while the transmission was in second gear.

| Possible Causes |
|---|
| RELATED RELAY DTC'S PRESENT |
| LOW FLUID LEVEL |
| NO. 2 CHECK BALL CUT OR DAMAGED |
| LOW LINE PRESSURE |
| CRACKED OR MISINSTALLED SUMP FILTER OR SEAL |
| STICKING MAIN REGULATOR VALVE IN PUMP VALVE BODY |
| (T29) UD PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T29) UD PRESSURE SWITCH CIRCUIT SHORT TO GROUND |
| (T29) UD PRESSURE SWITCH SENSE CIRCUIT SHORT TO ANOTHER CIRCUITS |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the LR, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

| GEAR | L/R | 2C | 4C | UD | OD |
|---|---|---|---|---|---|
| **REVERSE** | OPEN | OPEN | OPEN | OPEN | OPEN |
| **P/N** | CLOSED** | OPEN | OPEN | OPEN | OPEN |
| **1ST** | CLOSED* | OPEN | OPEN | CLOSED | OPEN |
| **2ND** | OPEN | CLOSED | OPEN | CLOSED | OPEN |
| **2ND PRIME** | OPEN | OPEN | CLOSED | CLOSED | OPEN |
| **3RD** | OPEN | OPEN | OPEN | CLOSED | CLOSED |
| **4TH** | OPEN | OPEN | CLOSED | OPEN | CLOSED |
| **5TH** | OPEN | CLOSED | OPEN | OPEN | CLOSED |

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is closed in Manual 1.

**May be open when rolling in Neutral or at low oil temperatures.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTC's.

**Are there any Transmission Control Relay, Line Pressure, and/or Loss of Prime DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If a Loss of Prime DTC is present, perform its respective test first. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 2

## 2. CHECK FOR PRESSURE SWITCH DTCS

**Are there two or more other pressure switch rationality DTCs present in addition to P0876?**

**Yes** >> Go To 3

**No** >> Go To 4

## 3. CHECK IF ALL PRESSURE SWITCHES READ CLOSED

With the scan tool, read and record all DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA show all pressure switches reading CLOSED?**

**Yes** >> Refer to the symptom category and perform diagnostics for P0882. Diagnose the symptom as if the DTC is current.

**No** >> Go To 4

## 4. CHECK FOR OTHER DTCS

With the scan tool, check for other transmission DTC's.

**Is the DTC P2704 present also?**

**Yes** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CHECK DTC EVENT DATA

With the scan tool, read and record the DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA display information for the DTC P0876?**

**Yes** >> Go To 6

**No** >> Refer to the symptom list and perform diagnostics for the DTC listed in the DTC EVENT DATA.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK IF DTC EVENT DATA WAS SET IN PARK, NEUTRAL OR REVERSE

Refer to the DTC EVENT DATA recorded earlier.

**Did the DTC P0876 set in Park, Neutral, or Reverse?**

**Yes** >> Go To 10

**No** >> Go To 7

## 7. CHECK FOR UD PRESSURE SWITCH STATUS

Refer to the DTC EVENT DATA recorded earlier.

**Did the DTC P0876 set with the UD Pressure Switch closed?**

**Yes** >> Go To 10

**No** >> Go To 8

## 8. CHECK LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

**Is the Line Pressure less than 40 PSI, and significantly below the Desired Line Pressure?**

**Yes** >> Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9

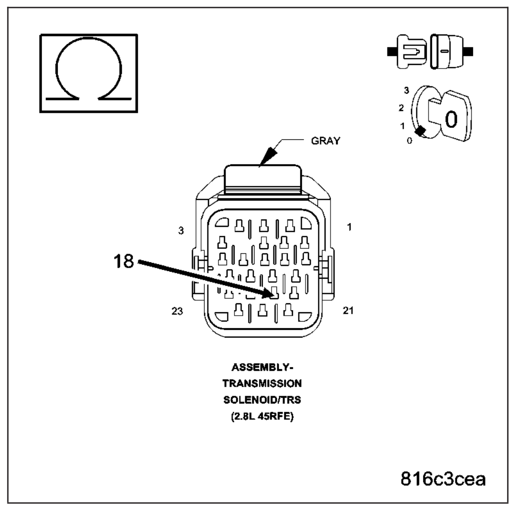
## 9. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT

Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 10. CHECK THE TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to the UD position.

With the scan tool, monitor the UD Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

**Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?**

**Yes** >> Go To 14

**No** >> Go To 11

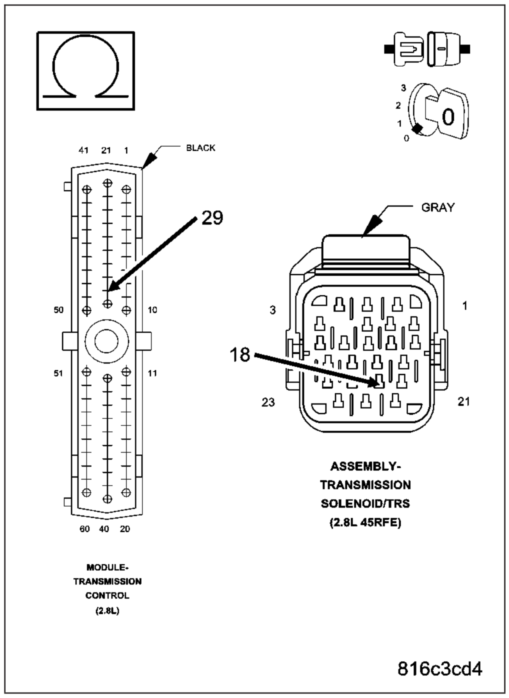
## 11. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T29) UD Pressure Switch Sense circuit from the Transmission Solenoid/TRS Assembly harness connector and the appropriate terminal of the TCM harness connector.



**Is the resistance above 5.0 ohms?**

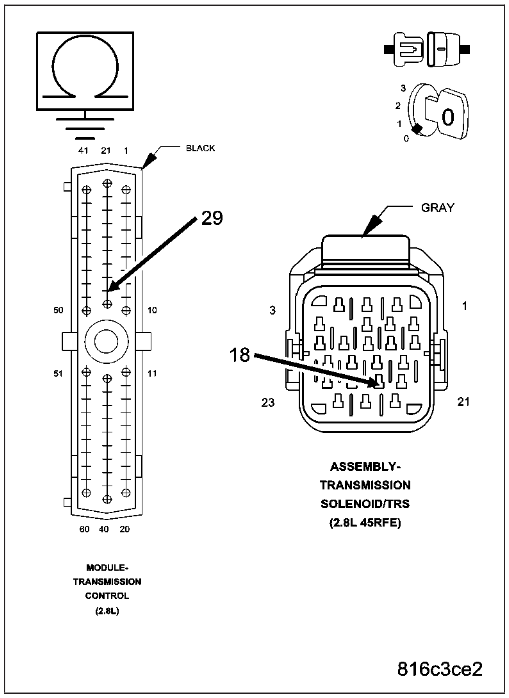
**Yes** >> Repair the (T29) UD Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 12

## 12. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit.



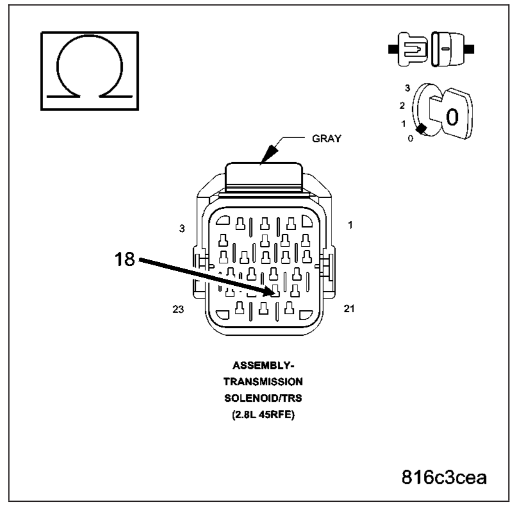
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T29) UD Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK THE (T29) UD PRESSURE SWITCH SENSE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT



Disconnect the TCM harness connector.

**NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

Measure the resistance between the (T29) UD Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

**Is the resistance below 5.0 ohms between the (T29) UD Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T29) UD Pressure Switch Sense circuit for a short to another circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 14. WIGGLE TEST USING THE TRANSMISSION SIMULATOR

Perform the steps in the previous test while wiggling the wiring harness and connectors pertaining to the UD Pressure Switch.

**Did the state of the UD Pressure Switch change while pressing the Pressure Switch Test button?**

**Yes** >> Repair the wiring harness and/or connectors as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

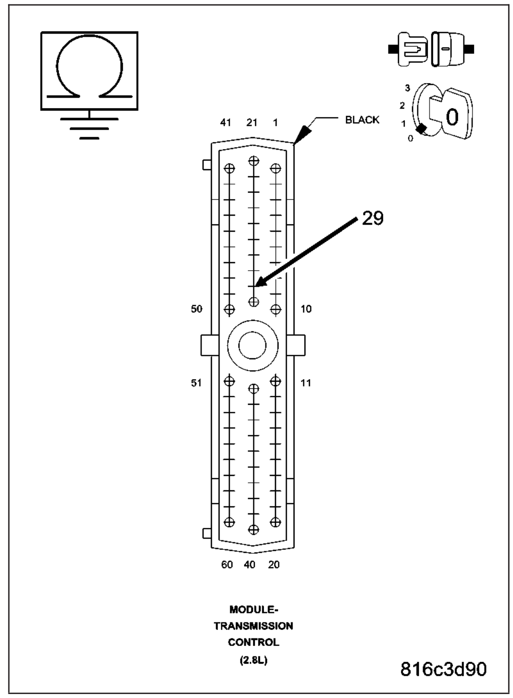
**No** >> Go To 15

## 15. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

Disconnect the Transmission Simulator and reconnect the Transmission Solenoid/TRS Assembly harness connector.

Disconnect the TCM harness connector.

Measure the resistance between ground and the (T29) UD Pressure Switch Sense circuit in the TCM harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 16

## 16. CHECK IF THE DTC RESETS

Reconnect all previously disconnected connectors.

With the scan tool, erase all transmission DTCs.

Test drive the vehicle. Using the DTC EVENT DATA recorded earlier, try to duplicate the conditions in which the DTC originally set.

**Does the DTC P0876 reset?**

**Yes** >> Go To 17

**No** >> Go To 18

## 17. CHECK FOR A CUT NO. 2 CHECK BALL

Remove the Valve Body per the Service Information.

Check the No. 2 check ball for cuts or damage.

**Is the No. 2 check ball cut or damaged?**

**Yes** >> Replace the No. 2 check ball. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information. Check for excessive clutch debris in the oil pan. If excessive debris is present, check the UD Clutch and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 18. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

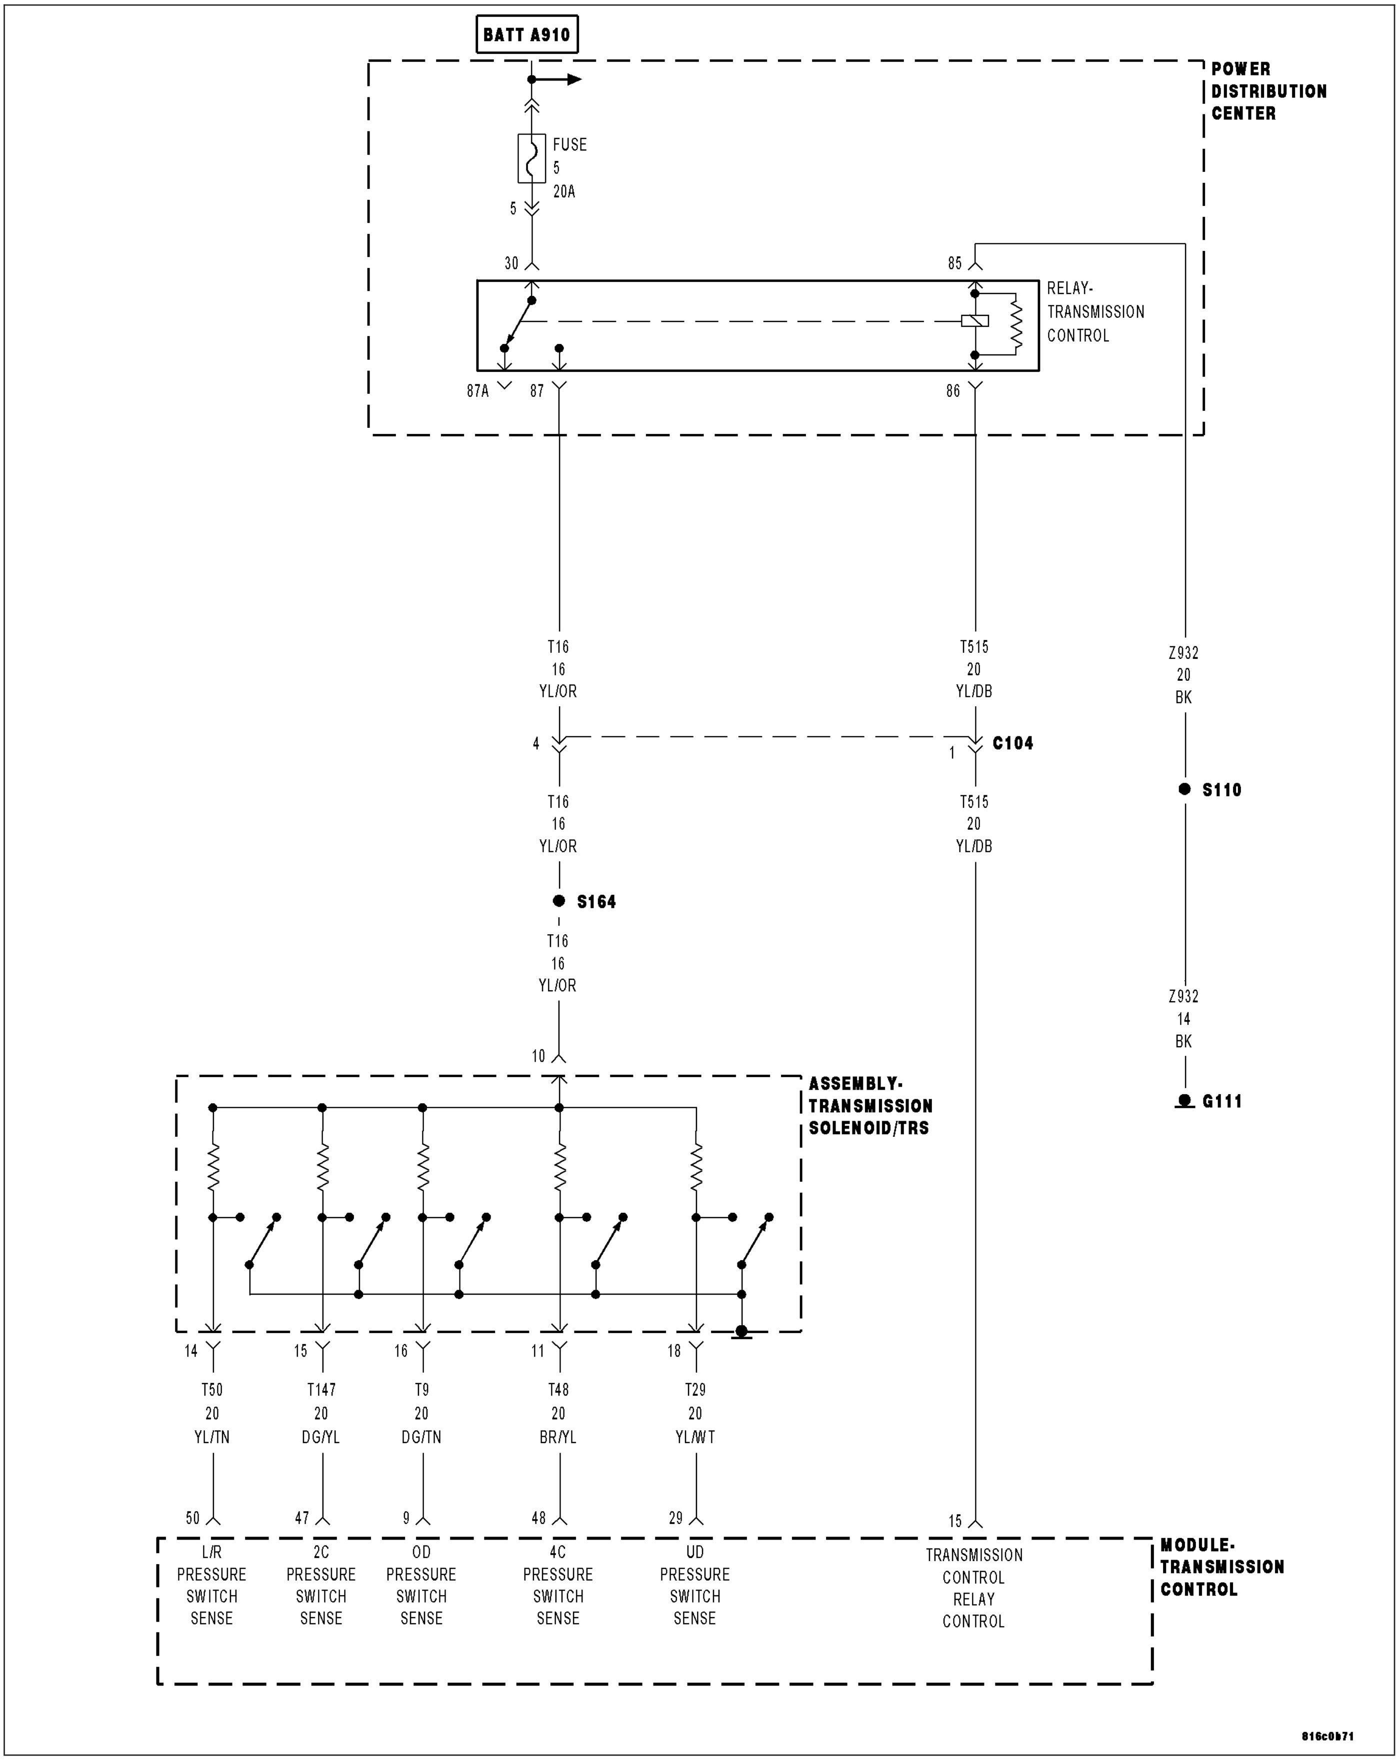
**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0882-TCM POWER INPUT LOW



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  When the ignition is turned from ″OFF″ position to ″RUN″ position and/or the ignition is turned from ″START″ position to ″RUN″ position.
- **Set Condition:**
  This DTC is set when less than 3.0 volts are present at the transmission control relay output circuits at the Transmission Control Module when the TCM is energizing the relay.

| Possible Causes |
|---|
| (A104) FUSED B+ CIRCUIT OPEN |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT TO GROUND |
| (T515) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT OPEN |
| (T515) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO GROUND |
| (Z915) TRANSMISSION CONTROL RELAY GROUND CIRCUIT OPEN |
| TRANSMISSION CONTROL RELAY STUCK OPEN |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission control relay is used to supply power to the solenoids and pressure switches when the transmission is in normal operating mode. The relay output is fed back to the TCM through pins 16, 17, and 36. It is referred to as ″Transmission Control Relay Output″. This circuit does not supply power to the TCM, it is only a sense circuit. When the relay is off, no power is supplied to the solenoids and pressure switches, and the transmission is in ″limp-in″ or ″default″ mode. **Note: Inadequate Transmission Control Relay Output voltage can also cause DTCs P0846, P0869, P0871, P0876 or P0988 to set. This does not indicate an internal transmission or solenoid/ TRS problem. Repairing the P0888 fault should also eliminate the related DTCs.**

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0882 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0882.

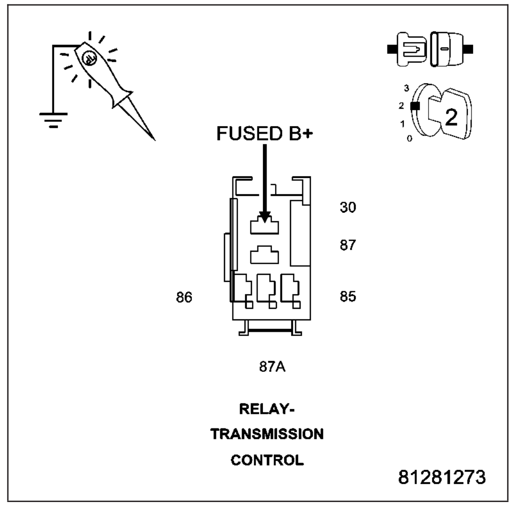
**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter equal to 0?**

**Yes** >> Go To 2

**No** >> Go To 9

## 2. CHECK THE (A104) FUSED B+ CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check the (A104) Fused B(+) circuit in the Transmission Control Relay connector.

**NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

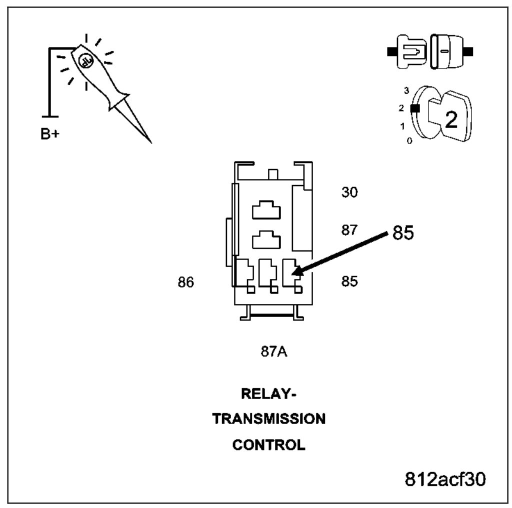
**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A104) Fused B(+) circuit for an open. If the fuse is open make sure to check for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 3. CHECK THE (Z915) TRANSMISSION CONTROL RELAY GROUND CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

Using a 12-volt test light connected to 12-volts, check the (Z915) Transmission Control Relay Ground circuit in the Transmission Control Relay connector.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z915) Transmission Control Relay Ground circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 4. CHECK THE TRANSMISSION CONTROL RELAY

Install a substitute relay in place of the Transmission Control Relay.

Start the vehicle.

With the scan tool, check transmission DTCs.

**Did the DTC P0882 reset?**

**Yes** >> Go To 5

**No** >> Replace the Transmission Control Relay.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. CHECK THE (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

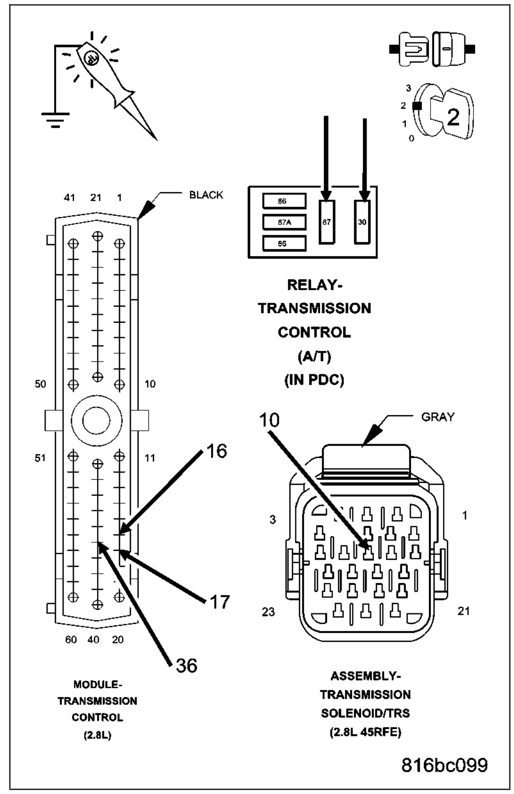
Disconnect the TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Connect a jumper wire between the (A104) Fused B(+) circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check all four (T16) Transmission Control Relay Output circuits in the TCM harness connector and Transmission Solenoid/TRS Assembly harness connector.



**Does the test light illuminate brightly on all four (T16) Transmission Control Relay Output circuits?**

**Yes** >> Go To 6

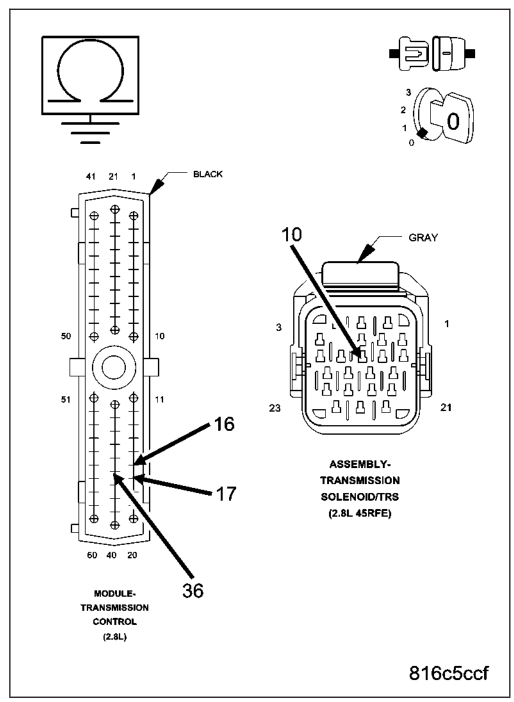
**No** >> Repair the (T16) Transmission Control Relay Output circuit(s) for an open or high resistance.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK THE (T16) TRANSMISSION RELAY OUTPUT CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Measure the resistance between ground and the (T16) Transmission Control Relay Output circuit.



**Is the resistance below 5.0 ohms?**

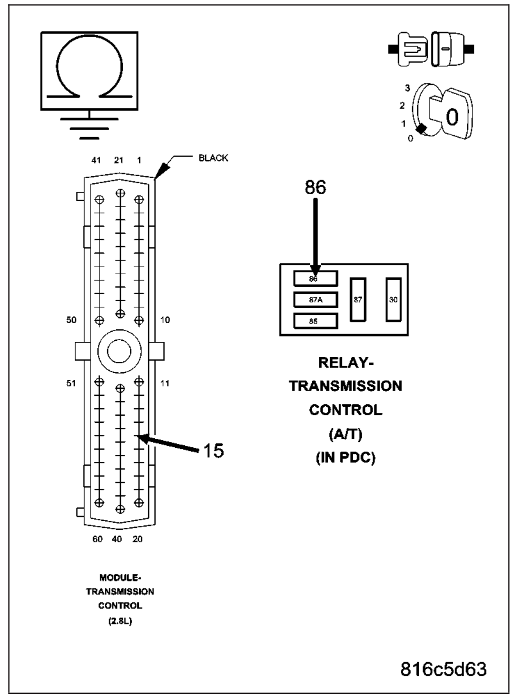
**Yes** >> Repair the (T16) Transmission Control Relay Output circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECK THE (T515) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T515) Transmission Control Relay Control circuit.



**Is the resistance below 5.0 ohms?**

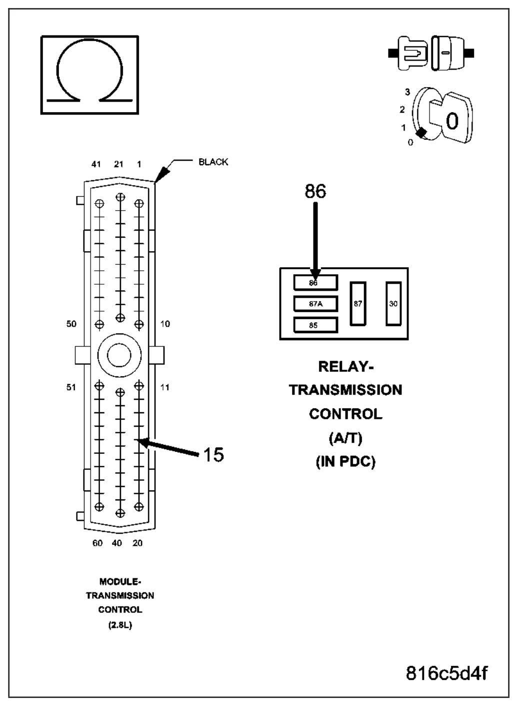
**Yes** >> Repair the (T515) Transmission Control Relay Control circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. CHECK THE (T515) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (T515) Transmission Control Relay Control circuit between the Transmission Control Relay connector and the appropriate terminal of the TCM harness connector..



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T515) Transmission Control Relay Control circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 9. CHECK WIRING AND CONNECTORS

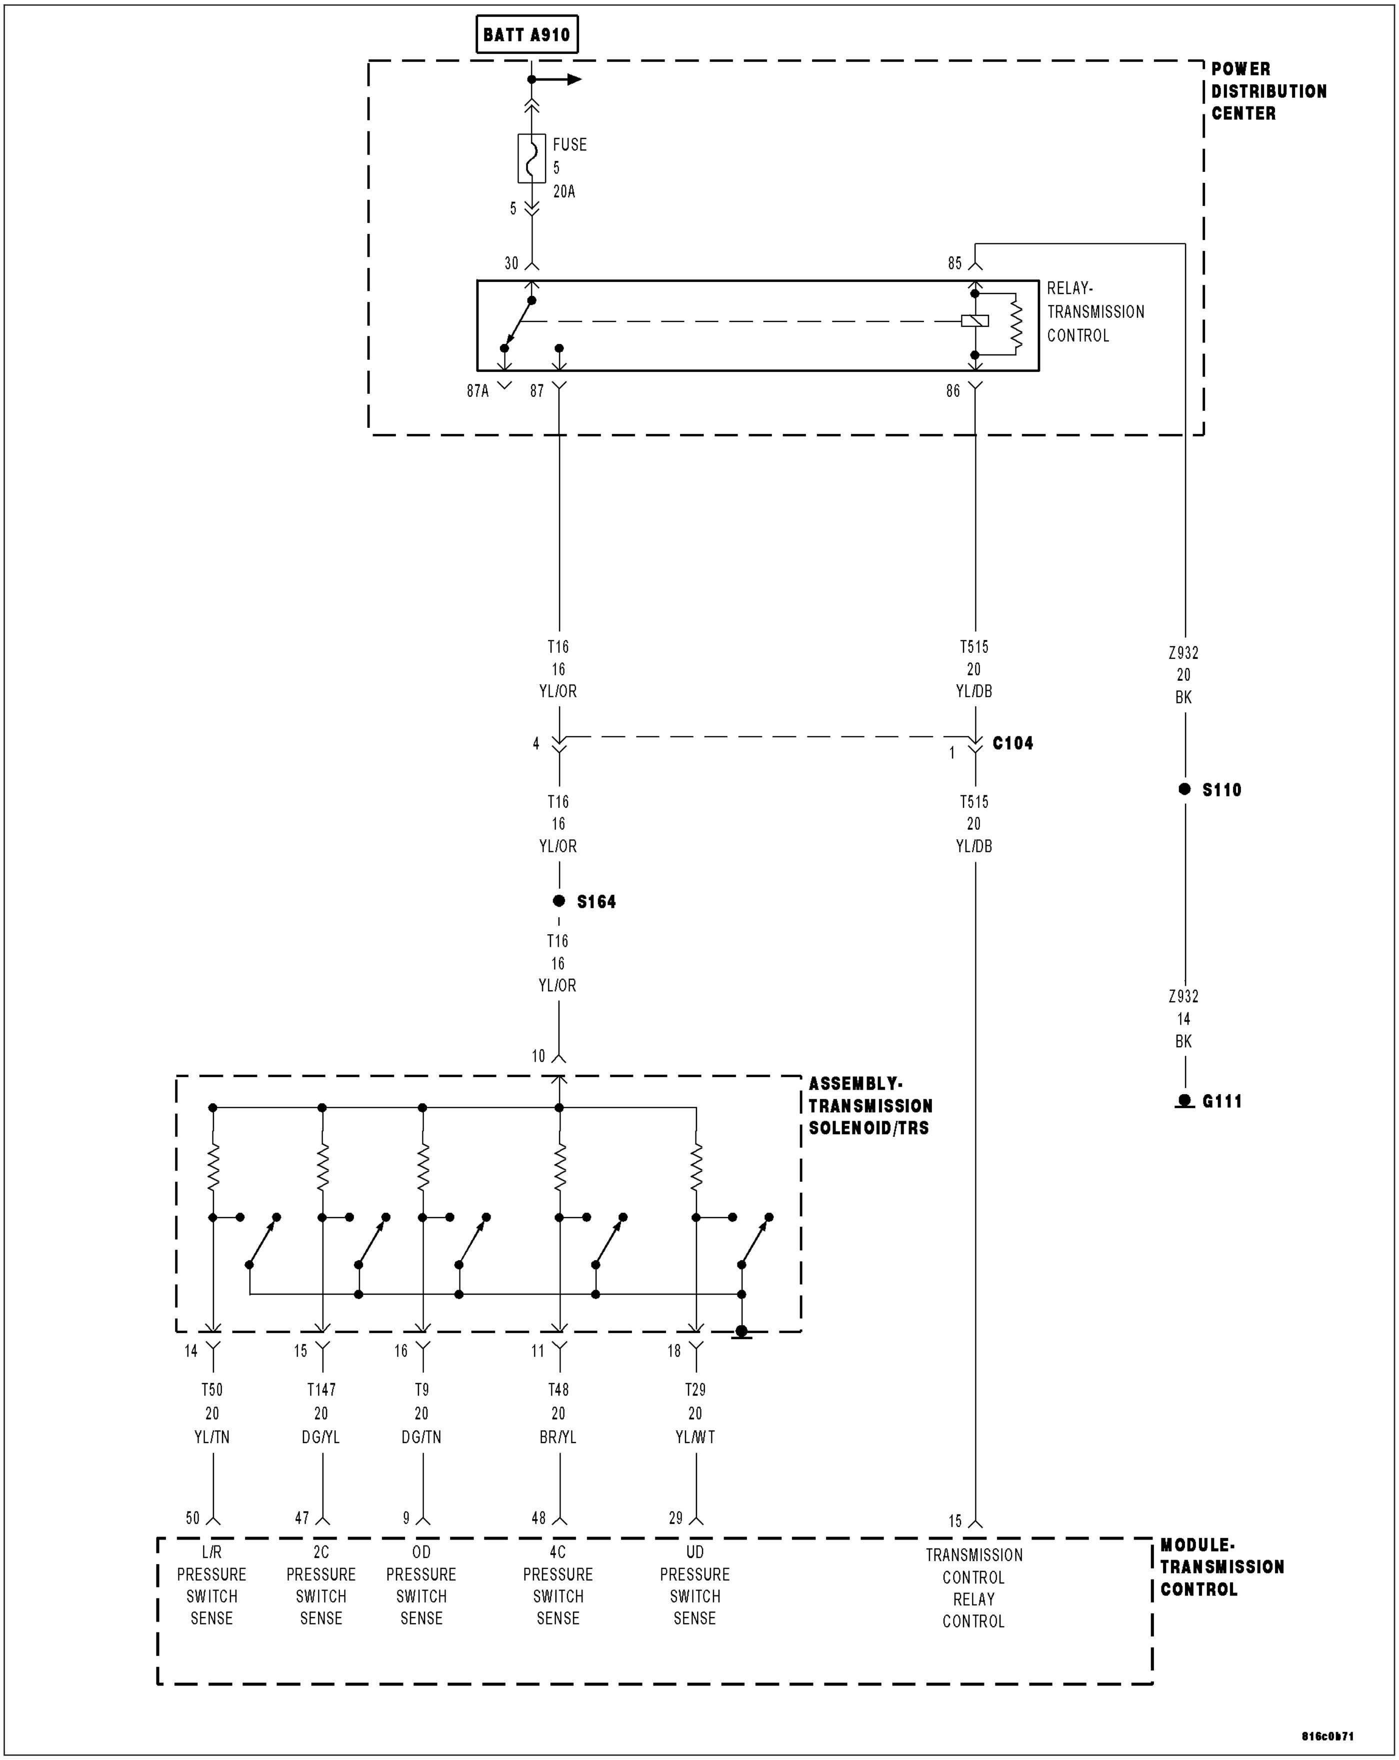
The conditions necessary to set this DTC are not present at this time.
Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
Wiggle the wires while checking for shorted and open circuits.
With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Where there any problems found?**

**Yes** >> Repair as necessary.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0883-TCM POWER INPUT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the ignition is turned from ″OFF″ position to ″RUN″ position and/or the ignition is turned from ″START″ position to ″RUN″ position.
- **Set Condition:**
  This DTC is set if the Transmission Control Module senses greater than 3.0 volts on the Transmission Control Relay Output circuits prior to a request from the TCM to energize the Transmission Control Relay.

| Possible Causes |
|---|
| (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT SHORT TO VOLTAGE |
| (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT SHORT VOLTAGE |
| TRANSMISSION CONTROL RELAY |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control Relay is used to supply power (Transmission Control Relay Output) to the Transmission Solenoid/TRS Assembly when in normal operating mode and to pins C4–19, C4–28 and C4–38 of the PCM. The purpose of the Transmission Control Relay is to allow the PCM to turn off the power to the Transmission Solenoid/TRS Assembly in event that the transmission should need to be placed into “limp-in” mode due to a DTC.

After a TCM reset, (ignition switch turned to the run position, or after cranking engine) the TCM verifies that the Transmission Control Relay contacts are open by checking for voltage on the Transmission Control Relay Output circuit before the Transmission Control Relay is energized. If voltage is detected, the DTC will set.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0883 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0883.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter set to 0?**

**Yes** >> Go To 2

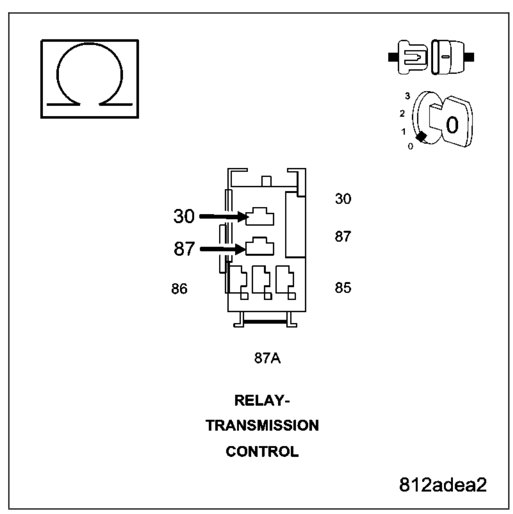
**No** >> Go To 6

### 2. CHECK THE TRANSMISSION CONTROL RELAY

Turn the ignition off to the lock position.

Disconnect the Transmission Control Relay.

Measure the resistance between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output Circuit of the Transmission Control Relay.



**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Replace the Transmission Control Relay.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 3. CHECK THE (T16) TRANSMISSION RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE

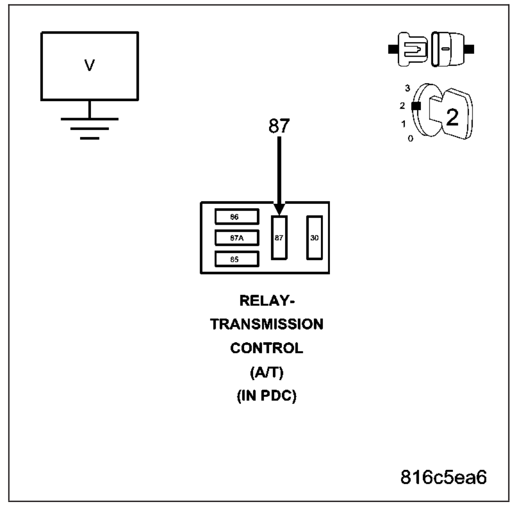
Ignition on, engine not running.

Measure the voltage at the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

**Is the voltage above 0.5 volts?**

**Yes** >> Go To 4

**No** >> Go To 5



## 4. CHECK THE TRANSMISSION SOLENOID/TRS ASSEMBLY

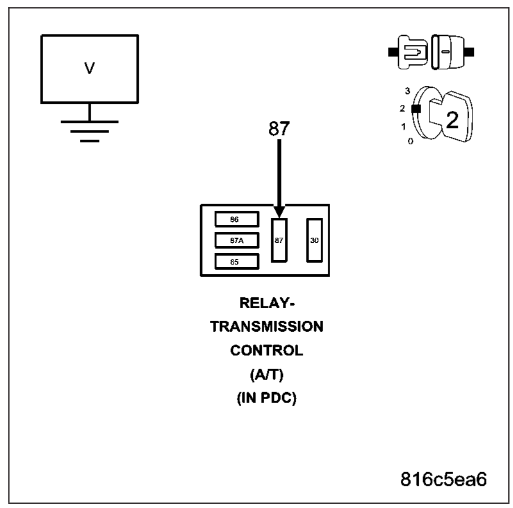
Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Ignition on, engine not running.

Measure the voltage at the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

**Is the voltage above 0.5 volts?**



**Yes** >> Repair the (T16) Transmission Control Relay Output circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. CHECK THE (T15) TRANSMISSION CONTROL RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

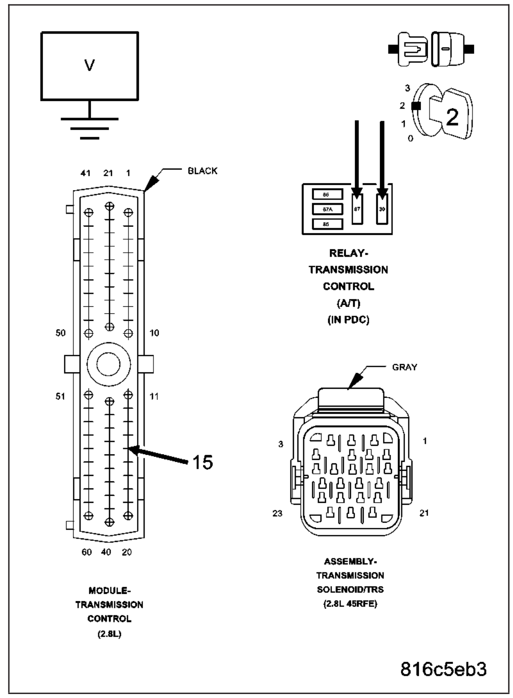
Disconnect the TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T15) Transmission Control Relay Control circuit.



**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (T15) Transmission Control Relay Control circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

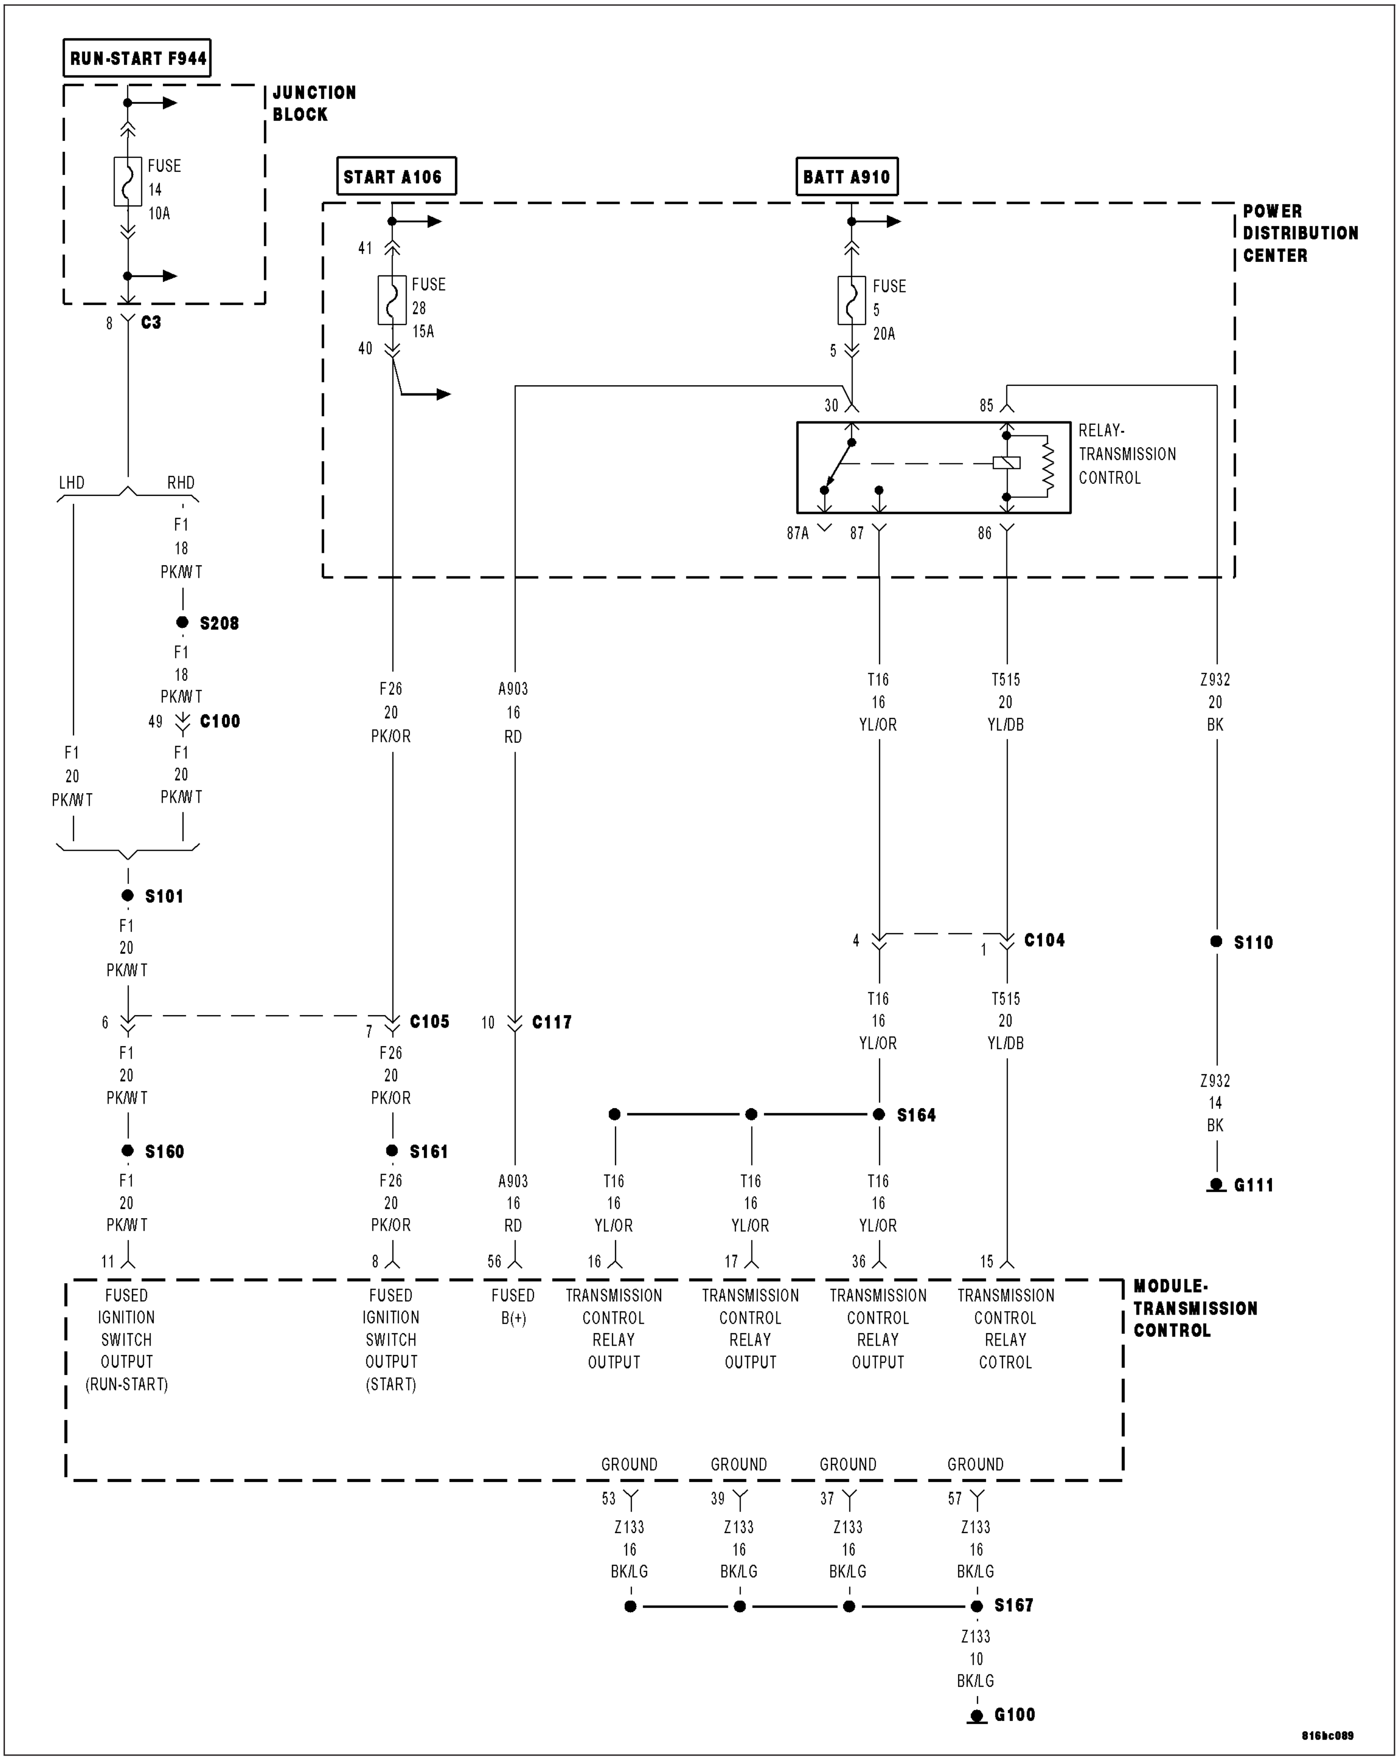
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0884-POWER UP AT SPEED



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When Transmission Control Module initially powers up.
- **Set Condition:**
  This DTC will set if the PCM powers up and senses the vehicle in a valid forward gear, with no PRNDL DTCs, and an output speed above 800 RPM, approximately 32 Kmh (20 MPH).

| Possible Causes |
|---|
| POWER UP AT SPEED |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

If a vehicle loses power to the Transmission Control System, the solenoids (LR, 2C, OD, UD, 4C) will go to their respective power off state. Some solenoids are normally vented and some are normally applied in their power off state. The transmission is designed to be in 3rd gear with all of the solenoids in this state. However, if power is restored, the Transmission Control System will power-up and normal operation will be restored.

This code identifies that power to the Transmission Control System was restored when the gear selector was in a ″Drive″ position while the vehicle was moving at speeds above 32 Kmh (20 MPH). **This DTC does not indicate a problem with the transmission or Transmission Control System,** instead, it suggests intermittent problems in the fused ignition switch output, fused B(+), or ground circuits to the TCM. Alternately, if a person performs a rolling restart maneuver, the DTC can be set. Therefore it is critical that this DTC be investigated if the vehicle is experiencing intermittent 3rd gear operation and a subsequent return to normal operation.

## Diagnostic Test

### 1. CHECK THE POWER AND GROUND CIRCUITS

This DTC is set when the Trnasmission Control Module is initialized while the vehicle is moving down the road in a valid forward gear.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Check all of the Fused B(+), Fused Ignition Switch Output, and ground circuits to the TCM for an intermittent open or short to ground.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

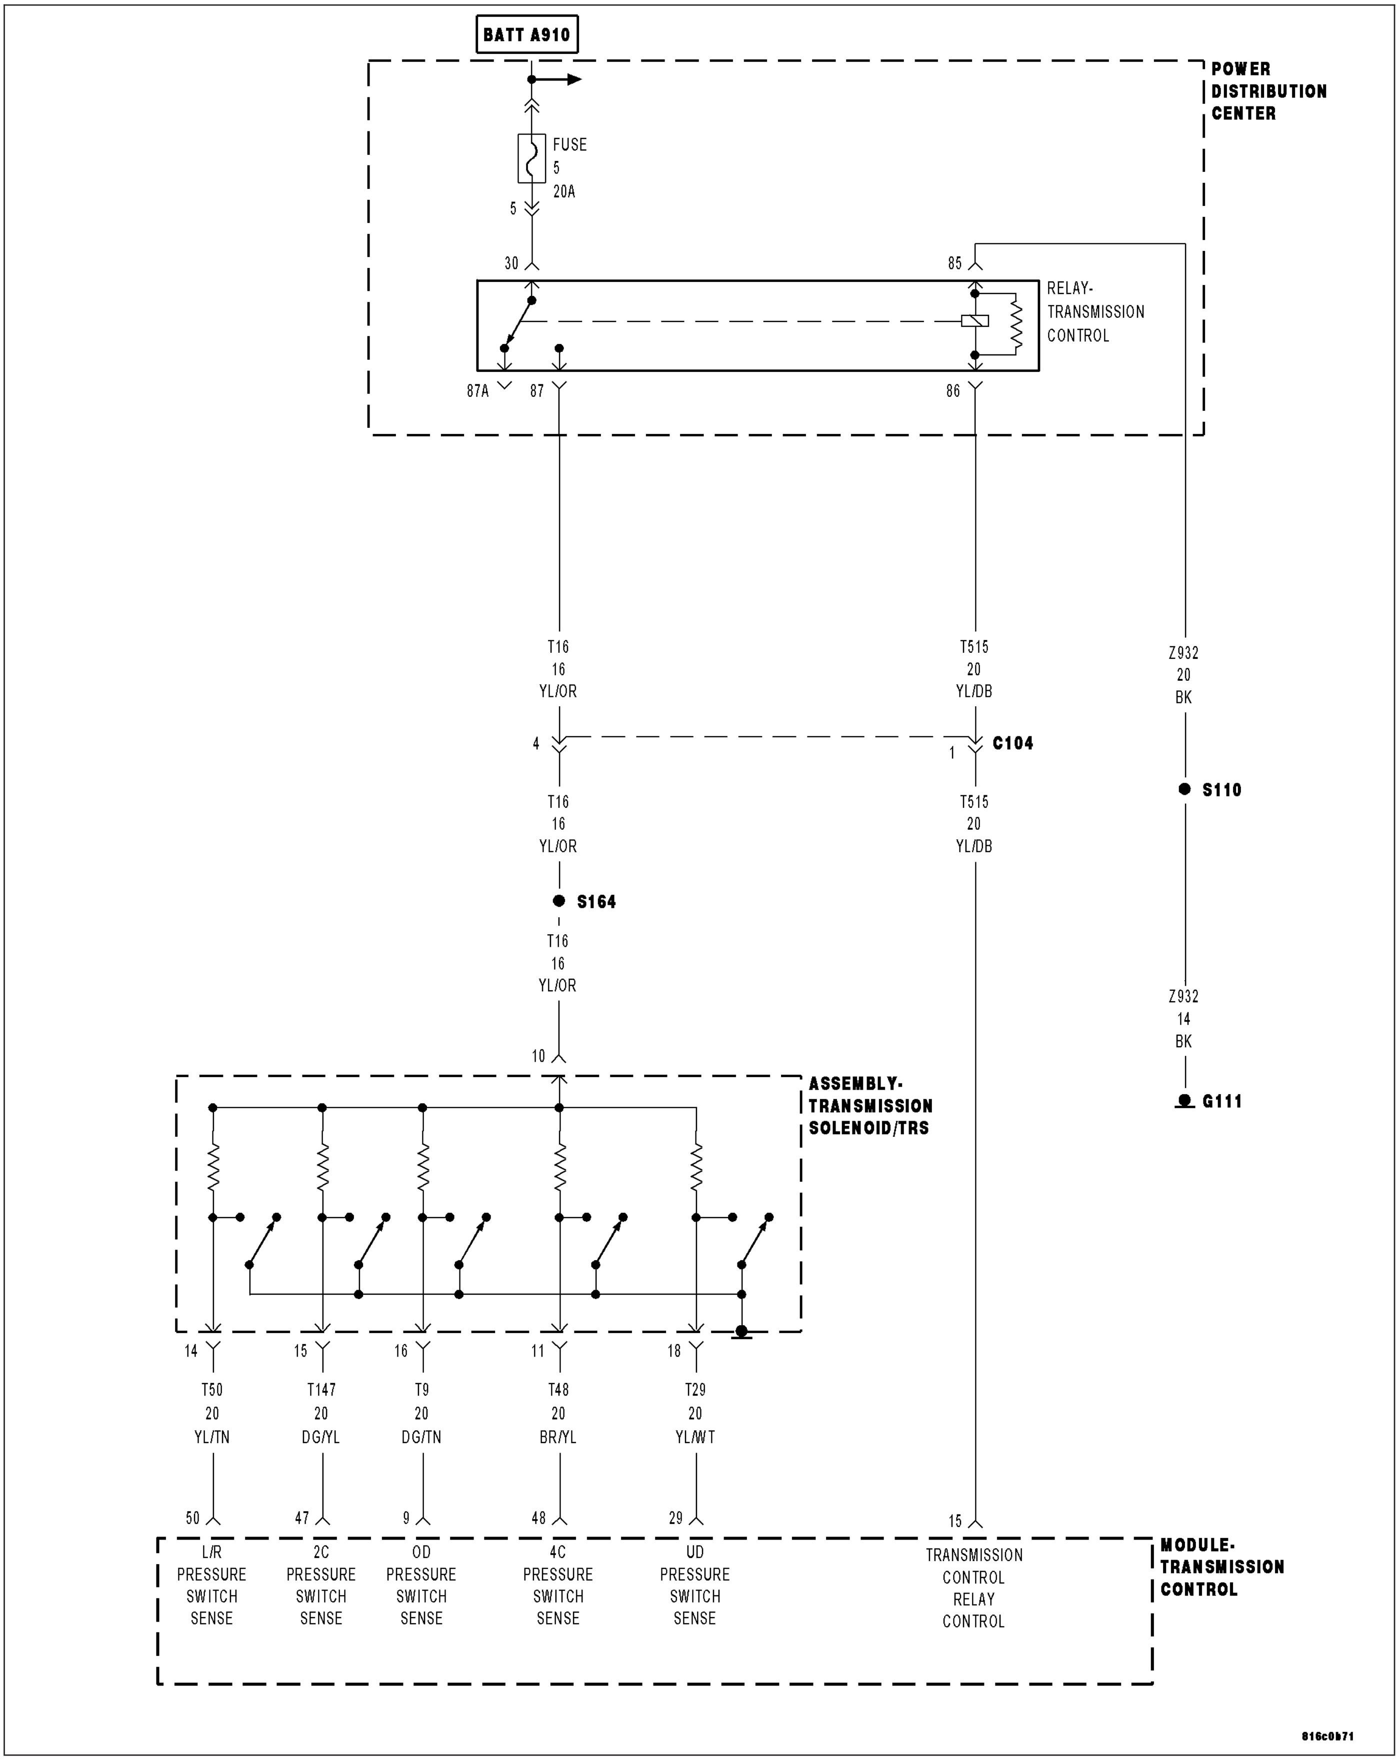
**If there are no possible causes remaining, view repair.**

**Repair**

Check all power and ground circuits to the TCM and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0890-SWITCHED BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the ignition is turned from ″OFF″ position to ″RUN″ position and/or the ignition is turned from ″START″ position to ″RUN″ position.
- **Set Condition:**
  This DTC is set if the Transmission Control Module senses voltage on any of the pressure switch inputs prior to the Transmission Control Relay being energized.

| Possible Causes |
|---|
| PRESSURE SWITCH SENSE CIRCUITS SHORT TO VOLTAGE |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission control relay is used to supply power to the solenoids and pressure switches (Transmission Solenoid/TRS Assembly) when the transmission is in normal operating mode. When the relay is off, no power is supplied and the transmission is in ″limp-in″ mode. The relay output is fed back to the TCM through pins C4-19, C4-28 and C4–38 and are referred to as ″Transmission Control Relay Output″.

Immediately after a controller reset (ignition key turned to the ″run″ position or after cranking engine), the TCM verifies that the relay contacts are open by checking for no voltage at the transmission control relay output terminals. After this is verified, the voltage at the pressure switches are checked. There should be no voltage on the pressure switches at this time. The TCM will then activate the relay.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P0890 IS PRESENT

With the scan tool, Check the STARTS SINCE SET counter for P0890.

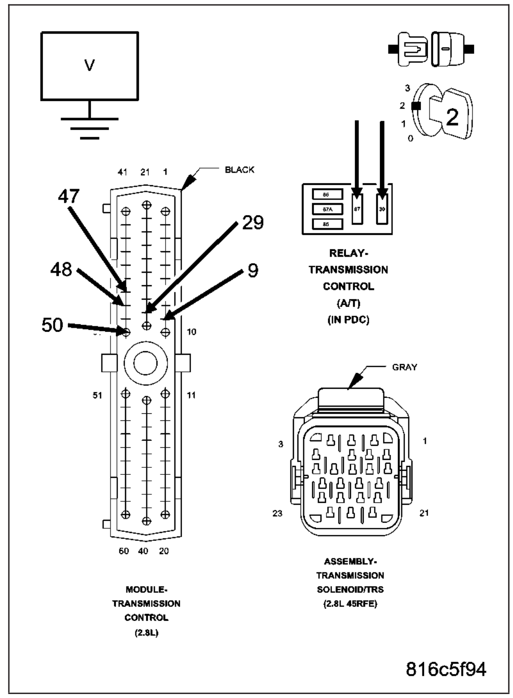
**NOTE: This counter only applies to the last DTC set.**

**Is the ″Starts Since Set″ counter set at 0?**

**Yes** >> Go To 2

**No** >> Go To 4

## 2. PRESSURE SWITCH SENSE CIRCUITS SHORT TO VOLTAGE



Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Remove the Transmission Control Relay.

Connect a jumper wire between the Fused B(+) circuit and the Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and (T29) UD Pressure Switch Sense circuits in the TCM harness connector.

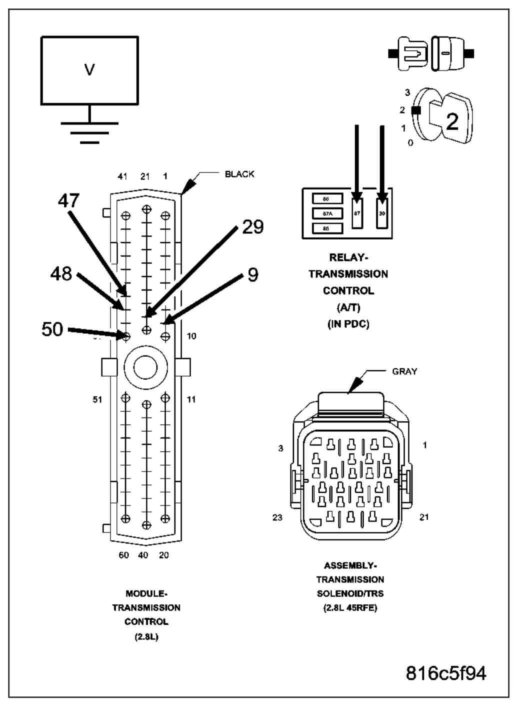
**Is the voltage above 0.5 volt on any of the measured circuits?**

**Yes** >> Repair the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and/or (T29) UD Pressure Switch Sense circuit(s) for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. TRANSMISSION SOLENOID/TRS ASSEMBLY



Turn the ignition off.

Remove the jumper wire.

**NOTE: Do not reinstall the Transmission Relay.**

Reconnect the Transmission Solenoid/TRS Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T147) 2C, (T48) 4C, (T50) LR, (T9) OD, and (T29) UD Pressure Switch Sense circuits in Miller tool #8815.

**Is the voltage above 0.5 volts on any of the sense circuits?**

**Yes** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

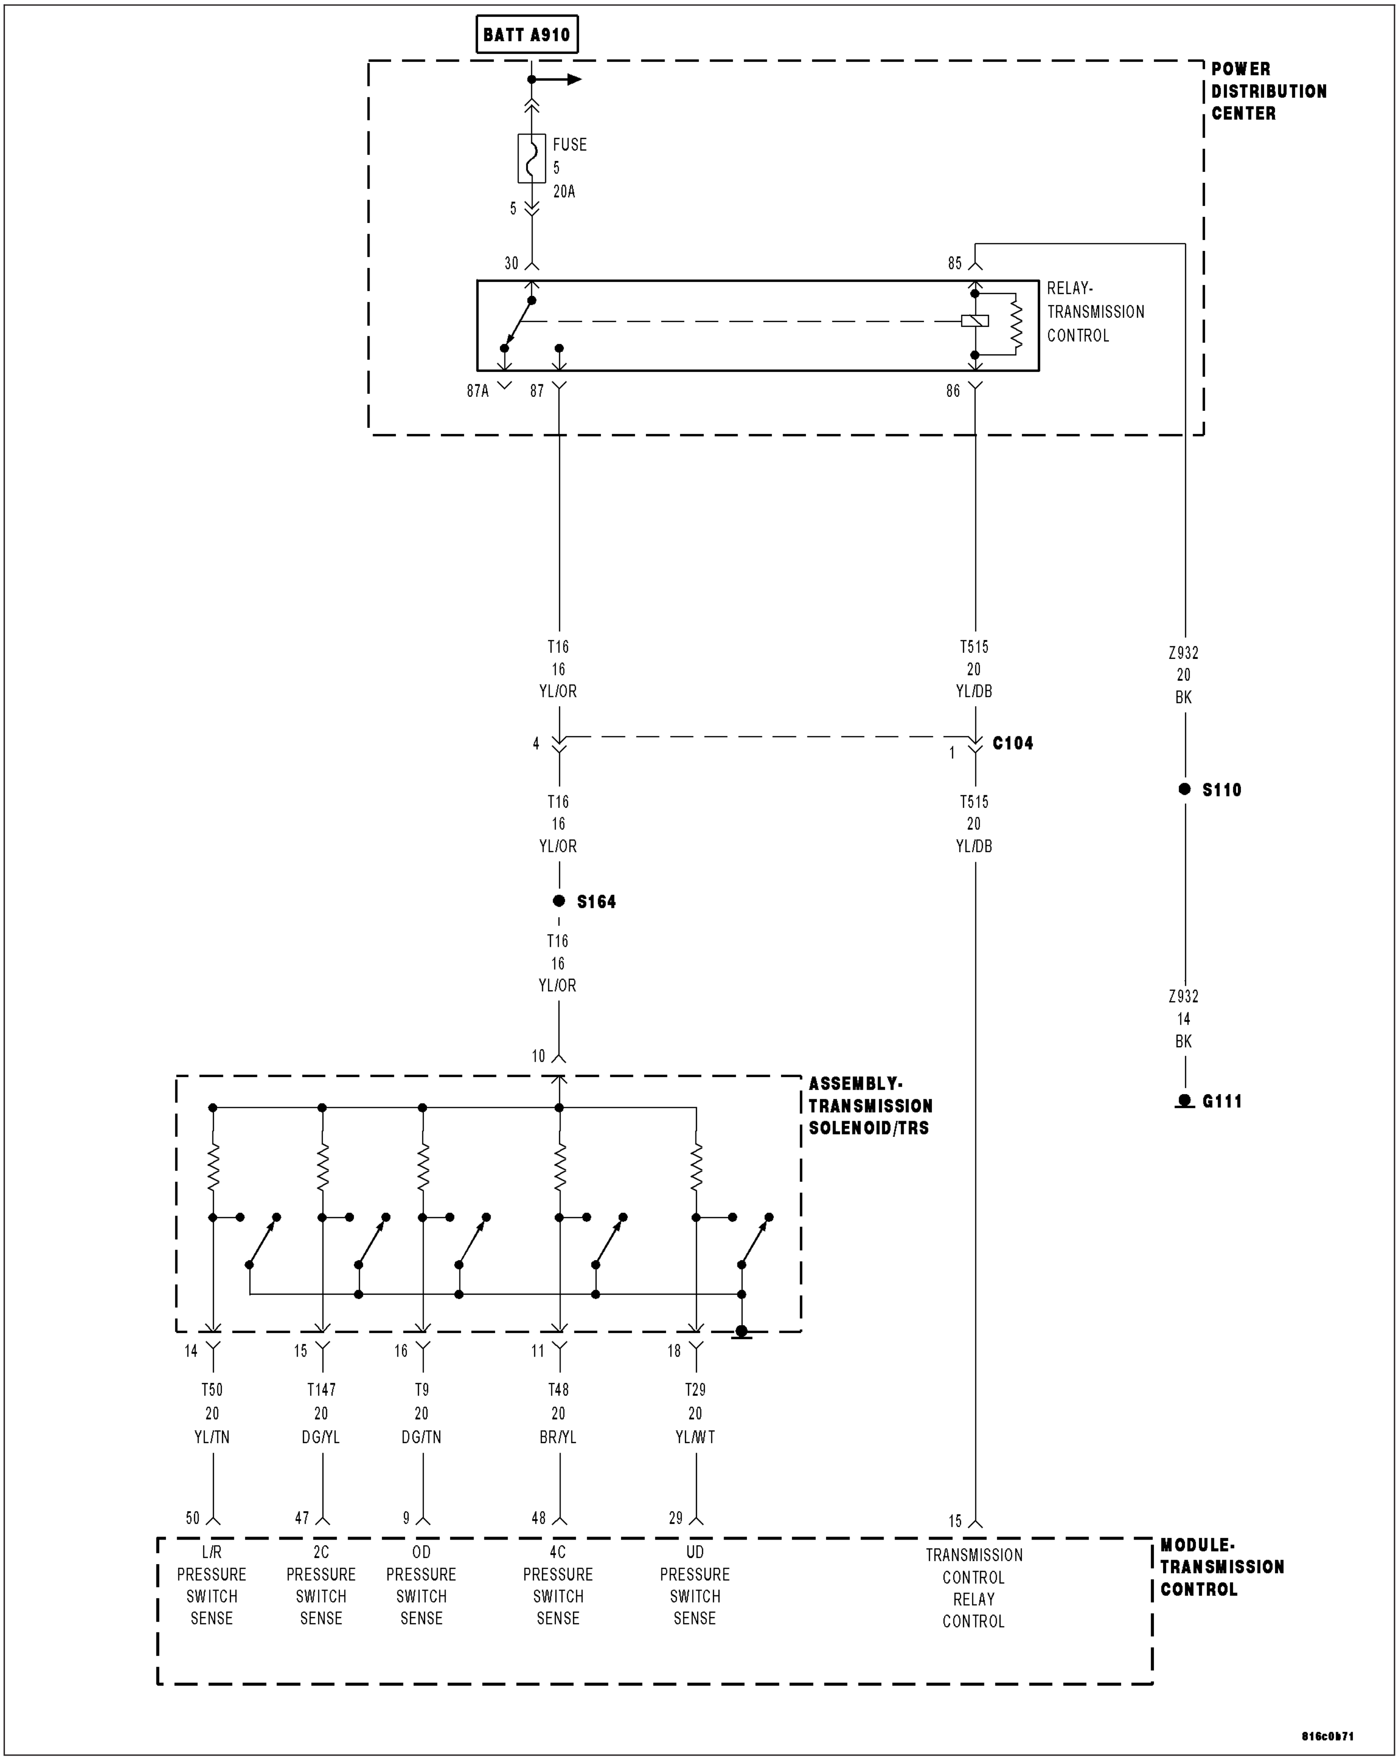
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0932-LINE PRESSURE SENSOR CIRCUIT



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  The TCM continuously monitors Actual Line Pressure and compares it to Desired Line Pressure. If the Actual Line Pressure reading is more than 172.4 kPa (25 psi) higher than the Desired Line Pressure, but is less than the highest Line Pressure ever used in the current gear, the DTC sets.

| Possible Causes |
|---|
| RELATED DTC'S PRESENT |
| LINE PRESSURE CONNECTOR AND WIRING |
| INTERNAL TRANSMISSION |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTCs.

**Are there any other line pressure related DTC's present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. Perform the test for P0934 and/or P0935 first if present. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Go To 2

### 2. CONDITION P0932 PRESENT

**CAUTION: Apply Parking Brake**
Start the engine.

**CAUTION: Firmly apply the brakes.**
With the scan tool, monitor the Line Pressure, Desired Line Pressure and the TPS degrees.

While firmly applying the brakes, place the shifter in reverse, then slowly press the accelerator pedal to a TPS degree of 15°.

Compare the Line Pressure reading to the Desired Line Pressure reading on the scan tool.

**Does the Line Pressure stay within ± 34 kPa or 5 PSI of the Desired Line Pressure?**

**No** >> Go To 3

**Yes** >> Go To 5

## 3. CHECK LINE PRESSURE CONNECTOR AND WIRING

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure Sensor voltage while wiggling the wiring harness and connectors pertaining to the Line Pressure Sensor and the Transmission Solenoid/TRS Assembly.

**Did the voltage remain steady while wiggling the wiring harness and connectors?**

**Yes** >> Go To 4

**No** >> Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 4. CHECK TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure during the following step.

With the Transmission Simulator, turn the selector switch to each of the 3 Line Pressure positions.

**NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 PSI of the reading specified on the Transmission Simulator.**

**Does the Line Pressure on the scan tool fluctuate up and down more than 69 kPa or 10 PSI at any of the 3 line pressure positions on the Transmission Simulator?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Repair internal transmission and inspect the oil pump per the Service information and replace if necessary. If no problems are found, replace the Transmission Solenoid/TRS Assembly — possible cause is the Pressure Control Solenoid is stuck.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

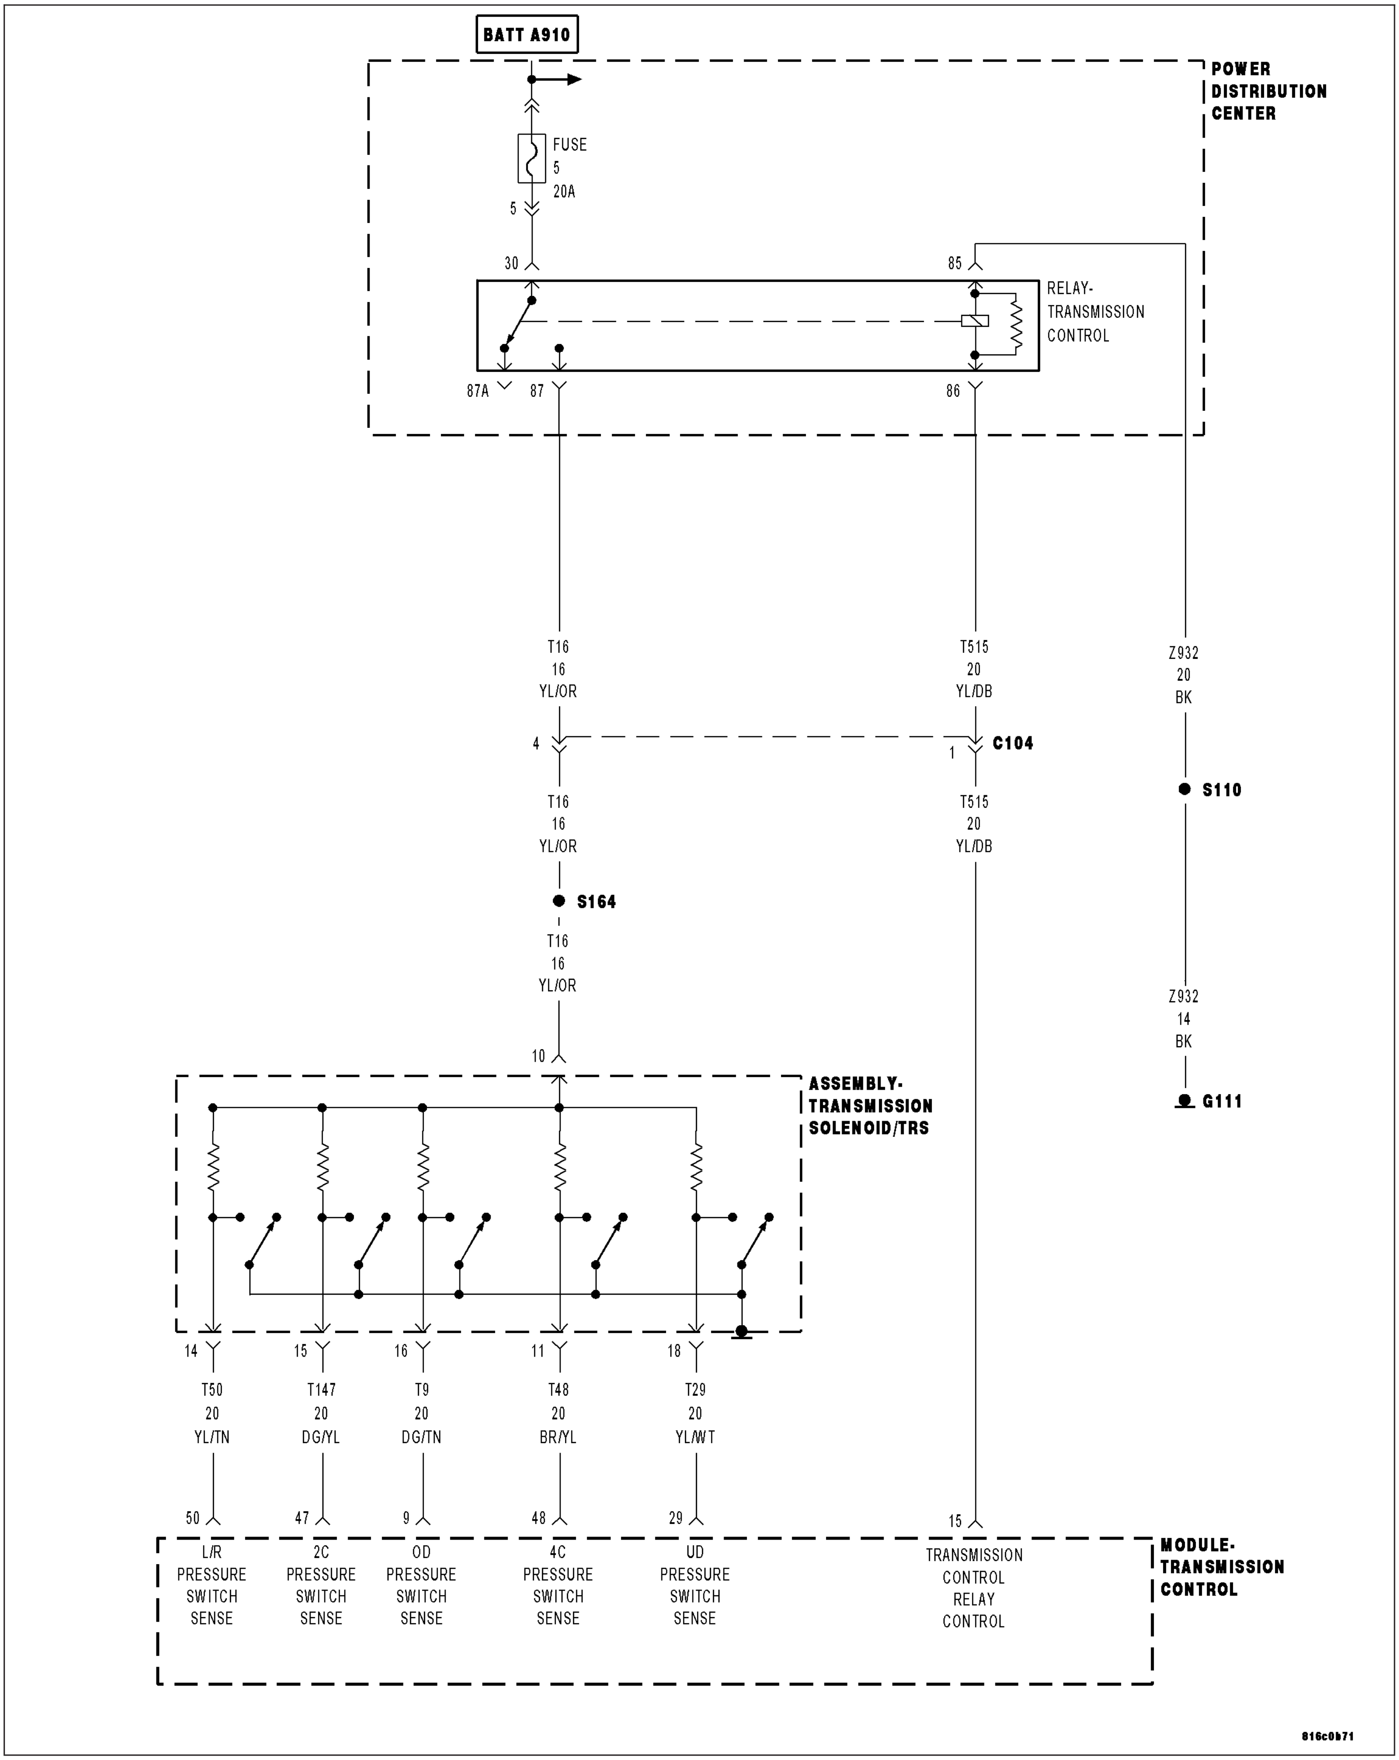
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0934-LINE PRESSURE SENSOR CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on and engine running.
- **Set Condition:**
  This DTC will set when the monitored Line Pressure Sensor voltage is less than or equal to 0.35 volts for 0.18 seconds.

| Possible Causes |
|---|
| (T39) 5-VOLT SUPPLY CIRCUIT OPEN |
| (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND |
| LINE PRESSURE SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

## Diagnostic Test

### 1. CHECK IF DTC IS CURRENT

With the scan tool, check the STARTS SINCE SET counter for P0934.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 2

**No** >> Go To 6

### 2. CHECK TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, under Transmission Sensors, monitor the Line Pressure.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

**NOTE: The readings should be within ±14 kPa or 2.0 PSI on the scan tool to the pressure readings specified on Transmission Simulator.**

**Does the Line Pressure on the scan tool match the line pressures on the Transmission Simulator?**

**Yes** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

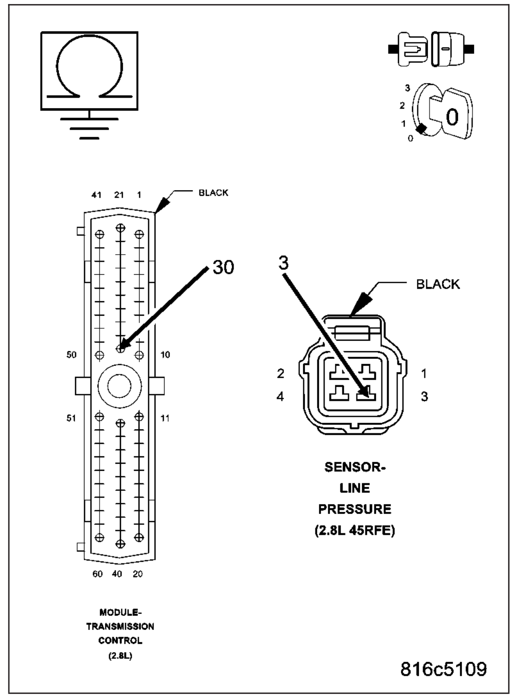
## 3. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Disconnect the Transmission Simulator, Miller tool #8333.

Measure the resistance between ground and the (T38) Line Pressure Sensor Signal circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T38) Line Pressure Sensor Signal circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

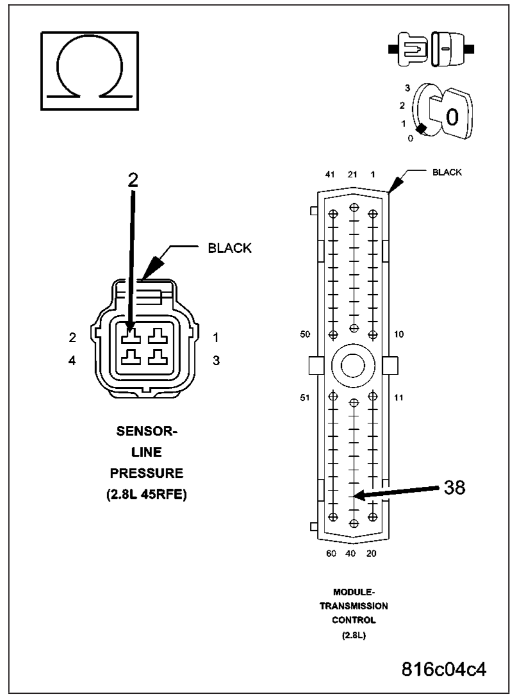
**No** >> Go To 4

## 4. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Disconnect the TCM harness connector.

Measure the resistance of the (T39) 5-volt Supply circuit between Line Pressure sensor harness connector and the appropriate terminal of the TCM harness connector.

**Is the resistance below 5.0 ohms?**



**Yes** >> Repair the (T39) 5-volt Supply circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

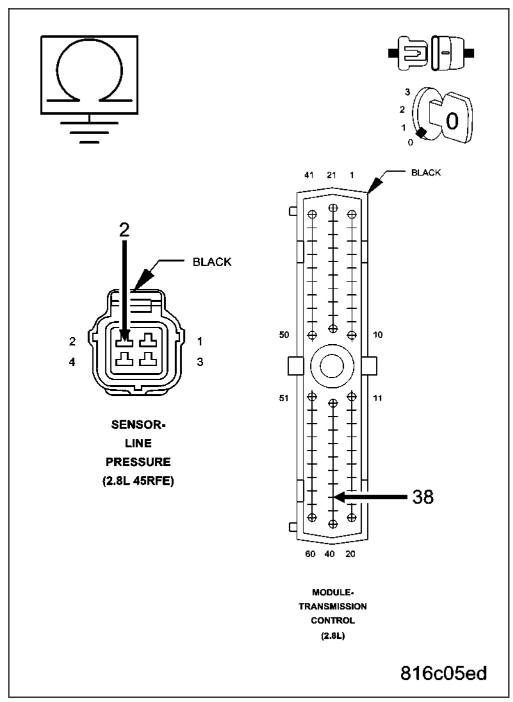
**No** >> Go To 5

## 5. CHECK THE (T39) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Disconnect the TCM harness connector.

Measure the resistance between ground and the (T39) 5-volt Supply circuit.

**Is the resistance below 5.0 ohms?**



**Yes** >> Repair the (T39) 5-volt Supply circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

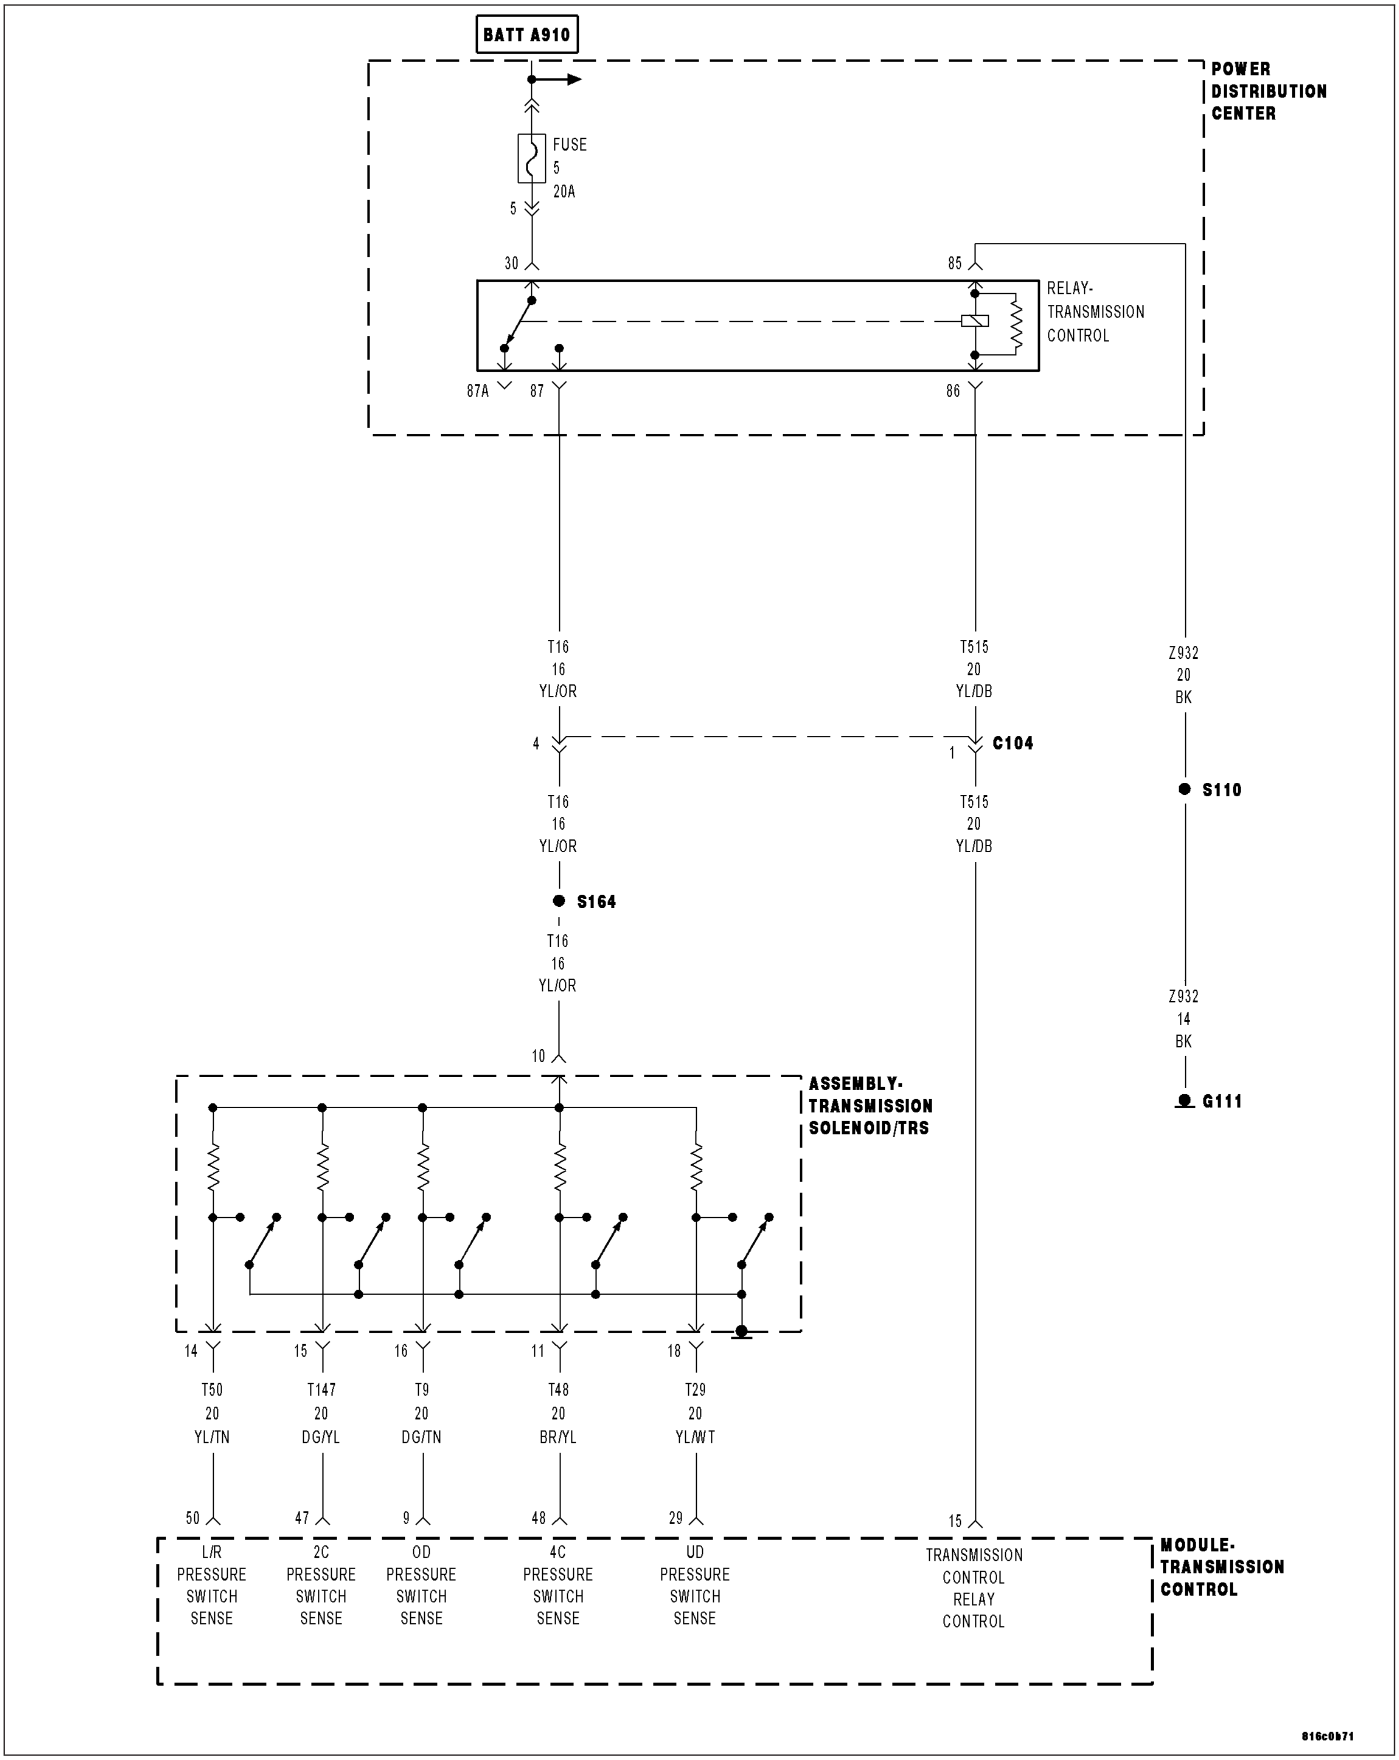
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0935-LINE PRESSURE SENSOR CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with ignition on and engine running.
- **Set Condition:**
  This DTC will set if the monitored Line Pressure Sensor voltage is greater than or equal to 4.75 volts for the period of 0.18 seconds

| Possible Causes |
|---|
| (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT OPEN |
| (Z133) SENSOR GROUND CIRCUIT OPEN |
| (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE |
| LINE PRESSURE SENSOR |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

Line pressure is electronically controlled by the Transmission Control System and is measured by the Line Pressure Sensor (LPS). The desired line pressure is continuously being compared to the actual line pressure and is regulated by electronically changing the duty cycle of the Pressure Control Solenoid (PCS). (5% duty cycle = solenoid off = max line pressure, 62% duty cycle = solenoid on = min line pressure).

The Transmission Control System calculates the desired line pressure based on inputs from the transmission and engine. A calculated torque input to the transmission is used as the primary input of the desired line pressure calculation and is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 to 931 kPa (120 to 135 PSI) during shifts and in Park and Neutral to ensure consistent shift quality.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts. Any monitored voltages outside these parameters indicate an Line Pressure Sensor or wiring problem and will cause either DTC P0934 or P0935 to set.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P0935.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 2

**No** >> Go To 6

### 2. TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure.

Using the Transmission Simulator, set the rotary switch to each of the 3 line pressure positions.

**NOTE: The readings should be within ±14 kPa or 2.0 PSI on the scan tool of the pressure reading specified on Transmission Simulator.**

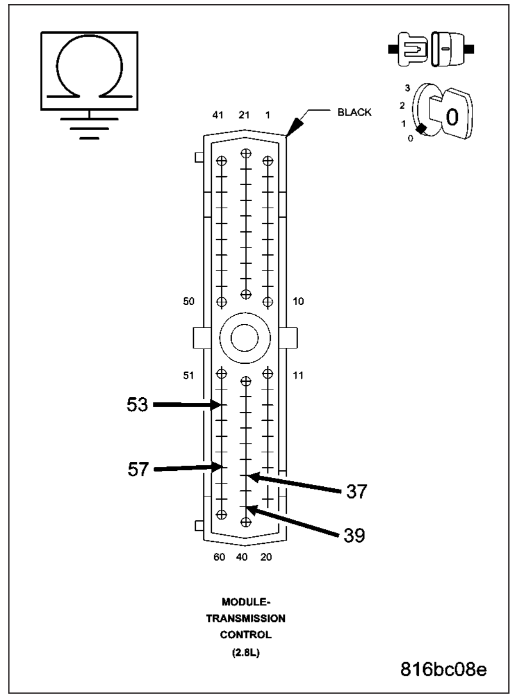
**Does the 3 line pressures on the scan tool match the Line pressure readings on the Transmission Simulator?**

**Yes** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. CHECK THE (Z133) SENSOR GROUND CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (Z133) Sensor Ground circuit from the Line Pressure Sensor harness connector to the appropriate terminal of the TCM harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (Z133) Sensor Ground circuit for an open.

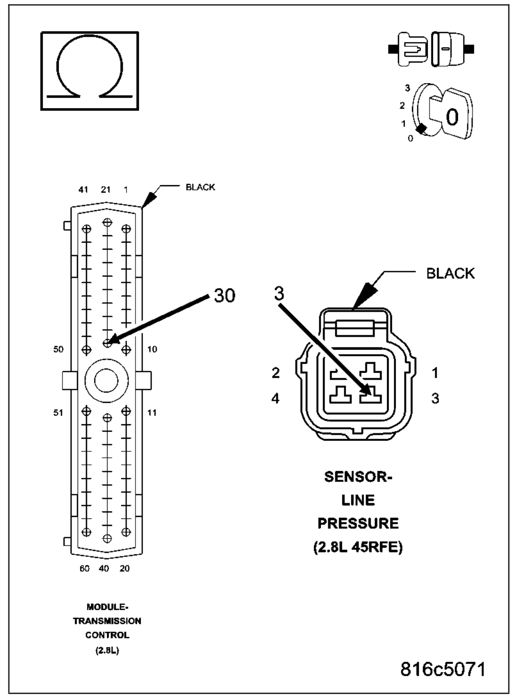
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the TCM harness connector.

Measure the resistance of the (T38) Line Pressure Sensor Signal circuit between the Line Pressure Sensor harness connector and the appropriate terminal of the TCM harness connector.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (T38) Line Pressure Sensor Signal circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

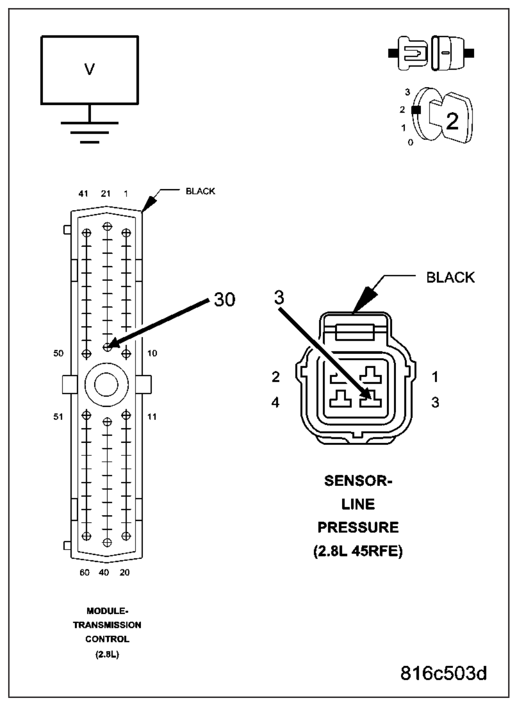
## 5. CHECK THE (T38) LINE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Remove the Transmission Control Relay.

Connect a jumper wire between the (A104) Fused B(+) circuit and the (T16) Transmission Control Relay Output circuit in the Transmission Control Relay connector.

Ignition on, engine not running.

Measure the voltage of the (T38) Line Pressure Sensor Signal circuit.



**Is the voltage above 5.5 volts?**

**Yes** >> Repair the (T38) Line Pressure Sensor Signal circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0944-LOSS OF HYDRAULIC PUMP PRIME

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  If the transmission is slipping in any forward gear and all the pressure switches are not indicating pressure, a loss of prime test is run.
- **Set Condition:**
  If the transmission begins to slip in a forward gear and all the pressure switch(s) that should be closed are open a loss of prime test begins. Available elements are turned on by the TCM to see if pump prime exists. The DTC sets if no pressure switch(s) respond.

| Possible Causes |
|---|
| SHIFT LEVER OUT OF ADJUSTMENT |
| IMPROPER FLUID LEVEL |
| CRACKED OR IMPROPERLY INSTALLED PRIMARY OIL FILTER OR SEAL |
| LOOSE COOLER RETURN FILTER |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| TRANSMISSION OIL PUMP |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

The Loss of prime test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or cracked oil filter.

The Loss of Prime DTC is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

### Diagnostic Test

#### 1. SHIFT LEVER POSITION TEST

Using the scan tool, perform a Shift Lever Position test. Follow the instructions on the scan tool.

**Did the Shift Lever Position Test pass?**

**Yes** >> Go To 2

**No** >> Refer to the Transmission category and perform the appropriate symptom.

#### 2. CHECK TO SEE IF DTC P0944 IS CURRENT

Place the gear selector in Park.

Start the engine.

The transmission must be at operating temperature prior to checking pressure. A cold transmission will give higher readings.

Run the engine at 1500 RPM.

With the scan tool, monitor the Transmission Line Pressure.

**Does the Line Pressure match the Desired Line Pressure within ± 5 psi?**

**No** >> Go To 6

**Yes** >> Go To 3

## 3. CHECK LINE PRESSURE IN DRIVE AND REVERSE

Firmly apply the brake and repeat the previous test in both Drive and the Reverse gear positions.

With the scan tool, monitor the Transmission Line Pressure.

**Does the Line Pressure match the Desired Line Pressure within ± 5 psi in all gear ranges?**

**Yes** >> Go To 4

**No** >> Go To 5

## 4. REVIEW CUSTOMER COMMENTS

The conditions necessary to set this DTC are not present at this time.

Verify with the customer if a delayed engagement and/or an intermittent ″No Drive″ condition has occurred.

If the customers answer is ″No″ erase the DTC and return the vehicle to the customer.

Make sure to check for any TSBs or controller flash updates that my apply.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Has the customer experienced any delayed engagement and/or ″No Drive″ conditions?**

**Yes** >> Repair internal transmission as necessary. Replace the Transmission Oil Pump if inspection reveals no signs of internal seal leakage. Refer to the Service Information for the proper repair procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## 5. DTC VERIFICATION

Read and record the DTC and the DTC EVENT DATA information.

Test drive the vehicle and attempt to operate the vehicle within the parameters in which the DTC set.

With the scan tool, read DTCs.

**Did any following DTCs set, P0868, P0944, P0841, P0846, P0871, P0876, or P0988?**

**Yes** >> Go To 6

**No** >> Test Complete.

## 6. CHECK TRANSMISSION OIL FILTER

Remove and inspect the Transmission Oil Pan per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

Inspect the oil filter seal for damage and proper installation.

**Does the Oil Pan contain excessive debris and/or is the Oil Filter plugged or seal damaged?**

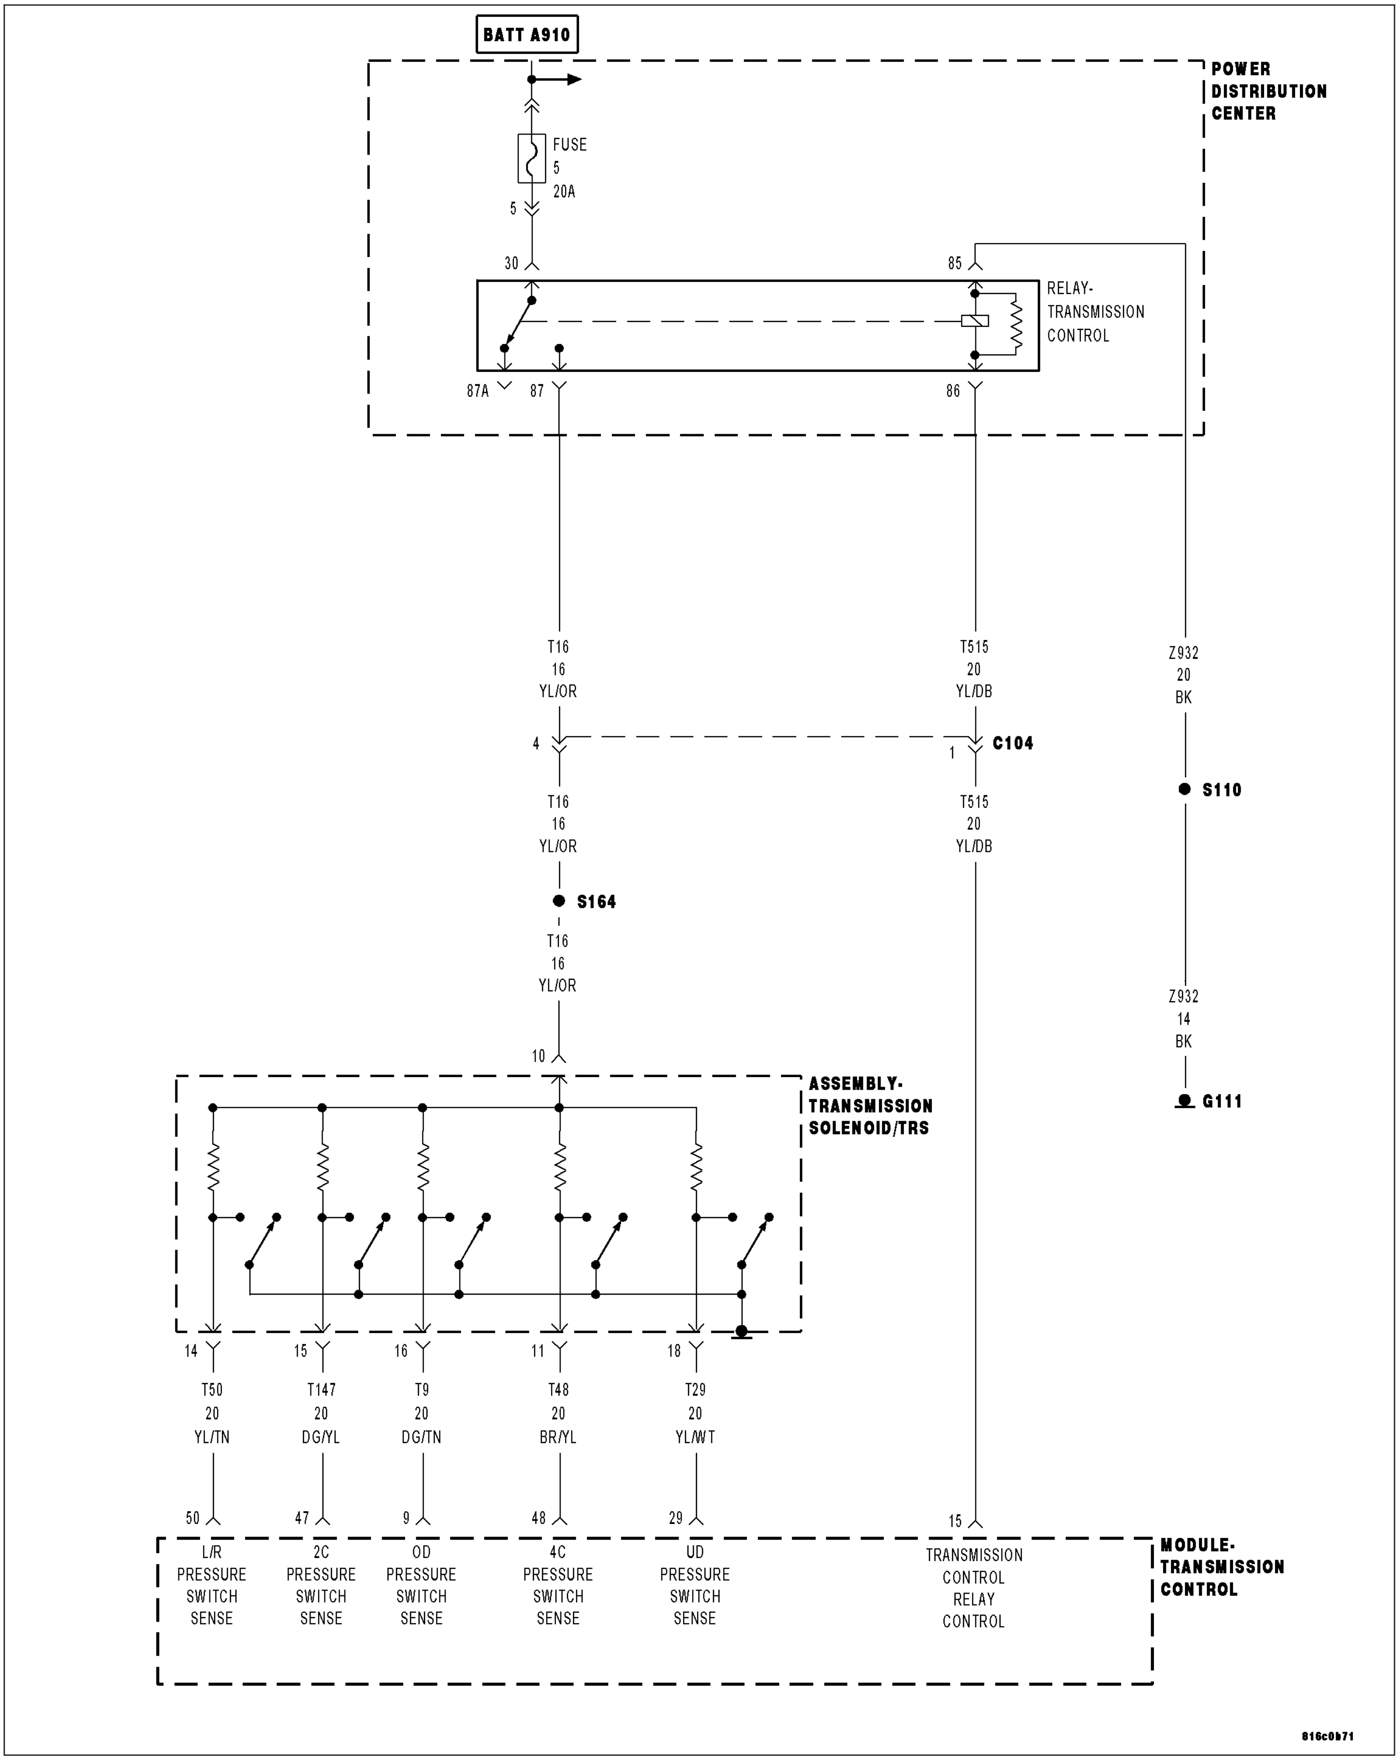
**Yes** >> Repair the cause of the plugged transmission oil filter or excessive debris. Check the Transmission Oil Filter seal for improper installation onto filter neck instead of into the pump bore, not fully seated against pump housing, filter neck not engaged into pump. Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Repair the Transmission Oil Pump as necessary. Check for a stuck main regulator valve and clean if necessary. Refer to the Service Information for the proper repair procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P0987-4C HYDRAULIC PRESSURE TEST



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  In any forward gear with engine speed above 1000 RPM shortly after a shift and every minute thereafter.
- **Set Condition:**
  After a shift into a forward gear, with engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the Clutch circuits that don't have pressure to identify the correct Pressure Switch closes. If the Pressure Switch does not close 2 times, the DTC sets.

| Possible Causes |
|---|
| LINE PRESSURE SENSOR |
| TRANSMISSION FLUID CONTAMINATION |
| RELATED DTC'S PRESENT |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| EXCESSIVE DEBRIS IN OIL PAN |
| POOR LINE PRESSURE SENSOR CONNECTION |
| RELATED TCM POWER INPUT DTCS PRESENT |
| (T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T39) 5-VOLT SUPPLY CIRCUIT OPEN |
| (T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND |
| (T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHERS |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| INTERNAL TRANSMISSION |
| TRANSMISSION CONTROL MODULE |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System tests the pressure switches when they are off. The test verifies that the switches are operational (They will close with pressure applied). The Transmission Control System verifies that the switch closes when the corresponding element is applied. If a switch fails to close, it is re-tested. If it fails the second test, the DTC will set, the MIL will illuminate and the transmission system will default to the orderly Shutdown routine.

## Diagnostic Test

### 1. DETERMINING IF RELATED DTC'S ARE PRESENT

With the scan tool, check for other transmission DTC's

**Is there any Loss of Prime, Transmission Control Relay, and/or Line Pressure Sensor DTCs present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. If the DTC P0944 is present, perform its respective test first.

**No** >> Go To 2

## 2. DTC P0770 PRESENT

With the scan tool, check Transmission DTCs.

**Is the DTC P0770 also present?**

**Yes** >> Refer to the symptom list and perform diagnostics for P0770.

**No** >> Go To 3

## 3. OTHER DTCS PRESENT

With the scan tool, check for other transmission DTC's

**Are the DTCs P0988 and/or P1736 present also?**

**Yes** >> Go To 12

**No** >> Go To 4

## 4. CHECK TO SEE IF DTC P0987 IS CURRENT

With the scan tool, check if the DTC P0987-4C HYDRAULIC PRESSURE TEST FAILURE is active or stored.

**Is the DTC P0987-4C HYDRAULIC PRESSURE TEST FAILURE active?**

**Yes** >> Go To 5

**No** >> Go To 17

## 5. LINE PRESSURE STAYS THE SAME

Start the engine.

Warm the transmission to 82° C or 180° F.

Firmly apply the brakes.

With the scan tool, monitor the Line Pressure during the following step.

Move the shift lever to each gear position, pausing momentarily in each position and record the line pressure reading. Allow the pressure to stabilize for at least 5 seconds in each range.

**Did the line pressure remain at a steady value between 585 and 655 kPa or 85 and 95 PSI in each position?**

**Yes** >> Go To 6

**No** >> Go To 10

## 6. CHECK LINE PRESSURE SENSOR CONNECTION

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while firmly pushing the Transmission Line Pressure Sensor connector inwards towards the Transmission.

**Did the Line Pressure reading on the scan tool change to about 207 kPa or 30 PSI when the connector was pushed inward?**

**Yes** >> Disconnect and properly reconnect the Line Pressure Sensor connector. Inspect terminals and repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. LINE PRESSURE SENSOR OPERATION

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

With the Transmission Simulator select the ″OFF″ position on the ″Input/Output Speed″ switch.

Ignition on, engine not running.

With the scan tool, monitor the Line Pressure while turning the Pressure Switch selector to each of the 3 line pressure positions on the Transmission Simulator.

**NOTE: All three scan tool Line Pressure readings should be steady and ±14 kPa or 2.0 PSI of the reading specified on the Transmission Simulator.**

**Did the scan tool Line Pressure readings match the specified readings on the Transmission Simulator and remain steady in all three positions?**

**Yes** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

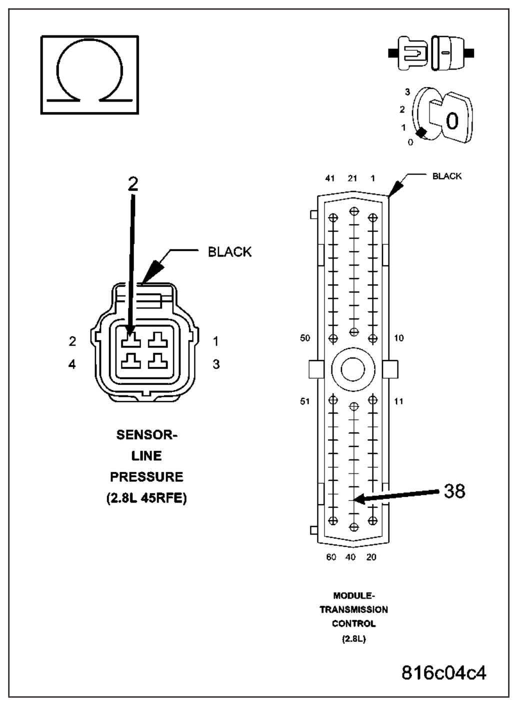
## 8. (T39) 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect Transmission Simulator.

Disconnect the TCM harness connector.

Measure the resistance of the (T39) 5-volt Supply circuit from the Line Pressure Sensor harness connector to the appropriate terminal of the TCM harness connector.



**Is the resistance above 5.0 ohms?**

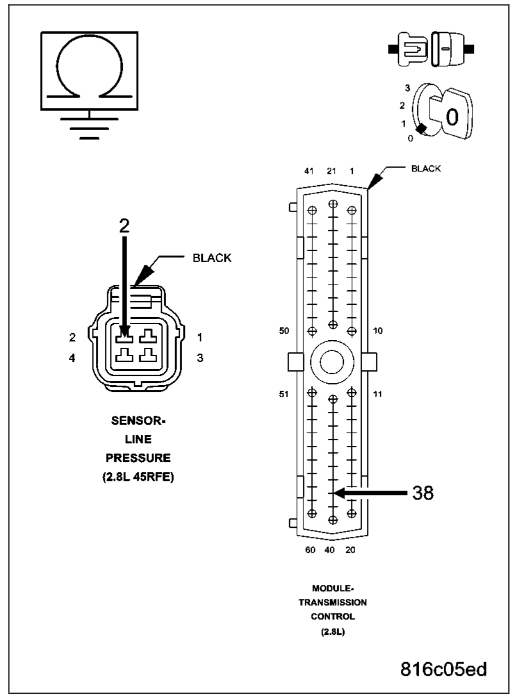
**Yes** >> Repair the (T39) 5-volt Supply circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. (T39) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T39) 5-volt Supply circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T39) 5-volt Supply circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 10. COMPARE SCAN TOOL TO PRESSURE GAUGE

Turn the ignition off to the lock position.

Connect the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP. Refer to the Service Information for proper installation procedure.

**CAUTION: Apply parking brake.**

Start the engine.

In the following steps, compare the scan tool Line Pressure to the Pressure Gauge readings in each gear.

**CAUTION: Do not overheat transmission.**

With the gear selector in park, raise the RPM to 1500, and compare line pressure readings.

Firmly apply the brakes, move the gear selector into reverse, raise the RPM to 1500, and compare the line pressure readings.

Firmly apply the brakes, move the gear selector into drive, raise the RPM to 1500, and compare the line pressure readings.

**Does the scan tool Line Pressure readings match the Pressure Gauge readings ± 10 psi?**

**Yes** >> Go To 11

**No** >> Replace the Line Pressure Sensor per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 11. WIRING AND CONNECTORS

Turn the ignition off to the lock position.

Remove the Starter Relay.

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Remove the Line Pressure Adapter, Miller tool #8259 and 0-300 psi Test Gauge, Miller tool #C-3293-SP.

Install the Transmission Simulator, Miller tool #8333.

On the Transmission Simulator, turn the Pressure Switch selector switch to 4C.

Ignition on, engine not running.

With the scan tool, monitor the 4C Pressure Switch state while pressing and holding the Pressure Switch test button and wiggling the wire harness and connectors that pertain to the 4C Pressure Switch.

**Did the 4C Pressure Switch state change to closed and remain closed while wiggling the wires?**

**Yes** >> Go To 12

**No** >> Go To 14

## 12. CHECK FOR EXCESSIVE DEBRIS

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Remove and inspect the Transmission Oil Pan per the Service Information.

**Does the Transmission Oil Pan contain excessive debris or contamination?**

**Yes** >> Repair the cause of the excessive debris in the Transmission Oil Pan. Refer to the Service Information for the proper procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK 4C HYDRAULIC CLUTCH CIRCUIT

Remove the Valve Body and air check the 4C hydraulic clutch circuit (in the case) for leakage per the Service Information.

**NOTE: The 4C hydraulic clutch circuit contains a small bleed orifice. A small amount of air leakage is normal.**

**Was there excessive air leakage noticed during the air check?**

**Yes** >> Repair as necessary. Check the 4C clutch piston, piston seals and bleed orifice assembly.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Disassemble and inspect the Valve Body and repair as necessary. Inspect the 4C Accumulator piston and seals. If no problems are found in the Valve Body, replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

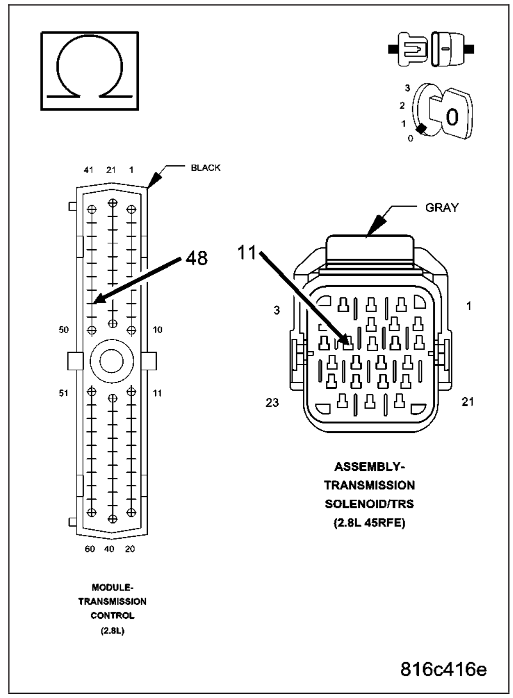
## 14. (T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN

Turn the ignition off to the lock position.

Remove the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T48) 4C Pressure Switch Sense circuit from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the TCM harness connector.



**Is the resistance above 5.0 ohms?**

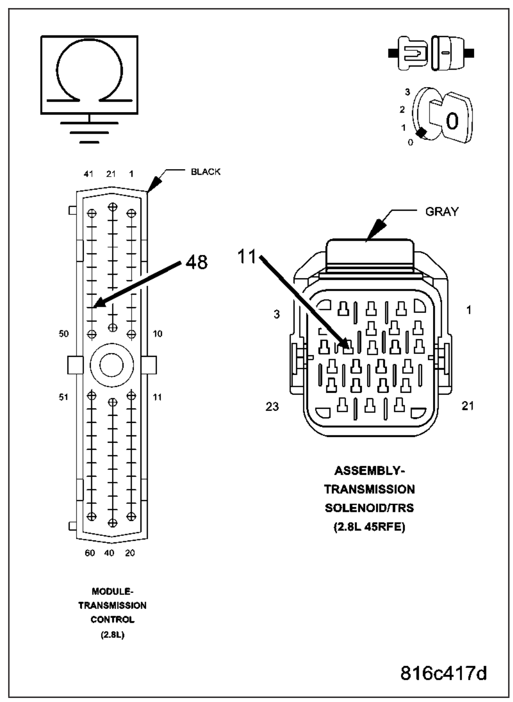
**Yes** >> Repair the (T48) 4C Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 15

## 15. (T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T48) 4C Pressure Switch Sense circuit.



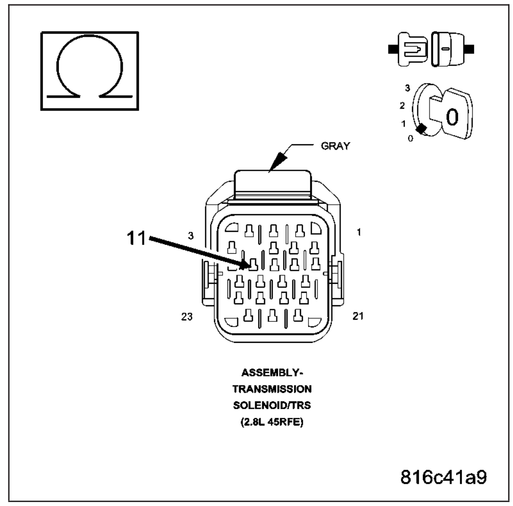
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T48) 4C Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 16

## 16. (T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHER CIRCUITS



Disconnect the TCM harness connector.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

**NOTE: Make sure the Transmission Solenoid/TRS Assembly harness connector is disconnected.**

**NOTE: Check connectors - Clean/repair as necessary.**

Measure the resistance between the (T48) 4C Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.

**Is the resistance below 5.0 ohms between the (T48) 4C Pressure Switch Sense circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T48) 4C Pressure Switch Sense circuit for a short to other circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 17. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

If the DTC EVENT DATA shows the DTC P0987 set while the Line Pressure was significantly below the Desired Line Pressure reading, check for causes of low line pressure (low fluid level, broken or mis-installed primary oil filter or filter seal, sticking Main Regulator Valve in the Pump Valve Body etc.). If the data shows the DTC set while the Line Pressure reading was significantly higher than the Desired Line Pressure, check the Line Pressure Sensor and related wiring.

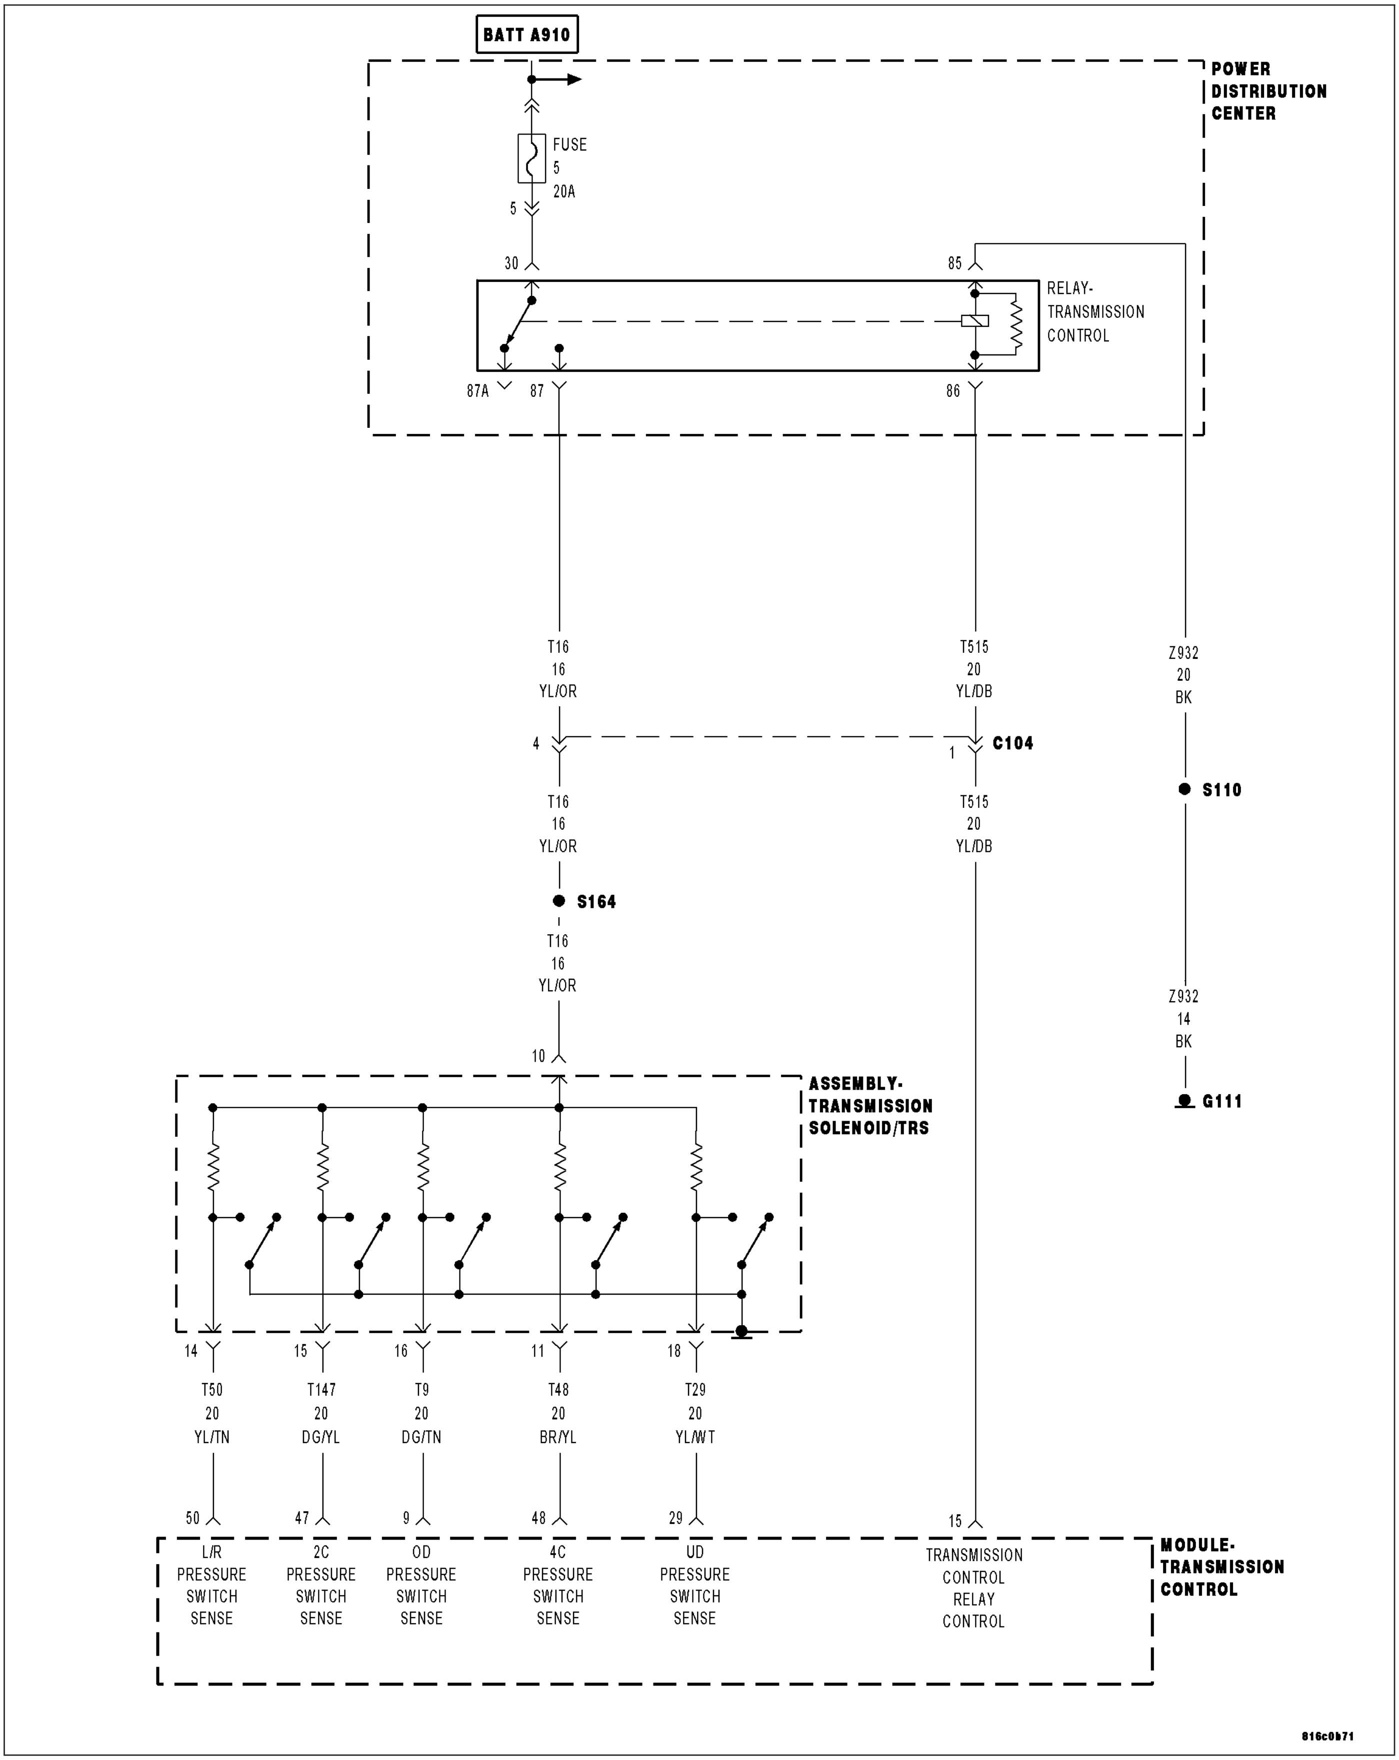
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0988-4C PRESSURE SWITCH RATIONALITY



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  The DTC is set if the 4C Pressure Switch reads open or closed at the wrong time in a given gear.

| Possible Causes |
|---|
| RELATED TCM POWER INPUT DTCS PRESENT |
| DTC P0871 ALSO PRESENT |
| LOSS OF 12-VOLT FEED |
| (T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN |
| (T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| EXCESSIVE FLUID LEAKAGE WITH 2C CLUTCH CIRCUIT |
| #5 AND/OR #7 CHECK BALL CUT OR DAMAGED |
| LOW LINE PRESSURE |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |
| WIRING AND CONNECTORS |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission system uses five pressure switches to monitor the fluid pressure in the LR, 2C, 4C, UD, and OD clutch circuits. The pressure switches are continuously monitored for the correct states in each gear as shown.

| GEAR | L/R | 2C | 4C | UD | OD |
|---|---|---|---|---|---|
| **REVERSE** | OPEN | OPEN | OPEN | OPEN | OPEN |
| **P/N** | CLOSED | OPEN | OPEN | OPEN | OPEN |
| **1ST** | CLOSED* | OPEN | OPEN | CLOSED | OPEN |
| **2ND** | OPEN | CLOSED | OPEN | CLOSED | OPEN |
| **2ND PRIME** | OPEN | OPEN | CLOSED | CLOSED | OPEN |
| **DRIVE** | OPEN | OPEN | OPEN | CLOSED | CLOSED |
| **4TH** | OPEN | OPEN | CLOSED | OPEN | CLOSED |
| **5TH** | OPEN | CLOSED | OPEN | OPEN | CLOSED |

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is open in Manual 1.

## Diagnostic Test

### 1. DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

## 2. DTC DATA SHOW CURRENT DTC

With the scan tool, check the DTC EVENT DATA.

**Does the DTC EVENT DATA show data for DTC P0988?**

**Yes** >> Go To 3

**No** >> Refer to the Transmission category and perform the appropriate symptom shown in the DTC EVENT DATA.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 3. MULTIPLE DTCS PRESENT

With the scan tool, check for other transmission DTC's.

**Are there two or more related Pressure Switch Sense DTCs present in addition to P0988?**

**Yes** >> Go To 4

**No** >> Go To 7

## 4. RELATED DTC PRESENT

With the scan tool, check the DTC EVENT DATA for P0988.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Do all the pressure switches read CLOSED in the DTC EVENT DATA for P0988?**

**Yes** >> Refer to Transmission category and perform diagnostics for the DTC P0888.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. DTC EVENT DATA READ OPEN

In the DTC EVENT DATA recorded earlier, read the state of all pressure switches.

**Do all the pressure switches read OPEN?**

**Yes** >> Go To 6

**No** >> Go To 7

## 6. LOW LINE PRESSURE

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

**Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?**

**Yes** >> Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. DTC P0871 ALSO PRESENT

With the scan tool, check Transmission DTCs.

**Is the DTC P0871 also present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. DTC EVENT DATA READ PARK REVERSE OR NEUTRAL

With the scan tool, check the DTC EVENT DATA for P0988.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA show the DTC set in Park, Neutral, or Reverse for P0988?**

**Yes** >> Go To 13

**No** >> Go To 9

## 9. DTC EVENT DATA READ CLOSED

With the scan tool, check the DTC EVENT DATA for P0988.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA show the 4C Pressure Switch reading CLOSED?**

**Yes** >> Go To 11

**No** >> Go To 10

## 10. PRIMARY OIL FILTER SEAL

In the DTC EVENT DATA recorded earlier, compare the Line Pressure and the Desired Line Pressure.

**Is the Line Pressure less than 40 psi, and significantly below the Desired Line Pressure?**

**Yes** >> Repair as necessary to correct low line pressure. Check fluid level and adjust as necessary. If fluid level is OK, check the Primary Oil Filter seal for a split, crack, or improperly installed. If the filter and seal are OK, check the Main Regulator Valve in the Oil Pump. Refer to the Service Information for the above procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 15

## 11. TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to the 4C position.

With the scan tool, monitor the 4C Pressure Switch while pressing the Pressure Switch test button on the Transmission Simulator.

**Did the state of the 4C Pressure Switch change while pressing the Pressure Switch Test button?**

**Yes** >> Go To 12

**No** >> Go To 13

## 12. TRANSMISSION SOLENOID/TRS ASSEMBLY

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

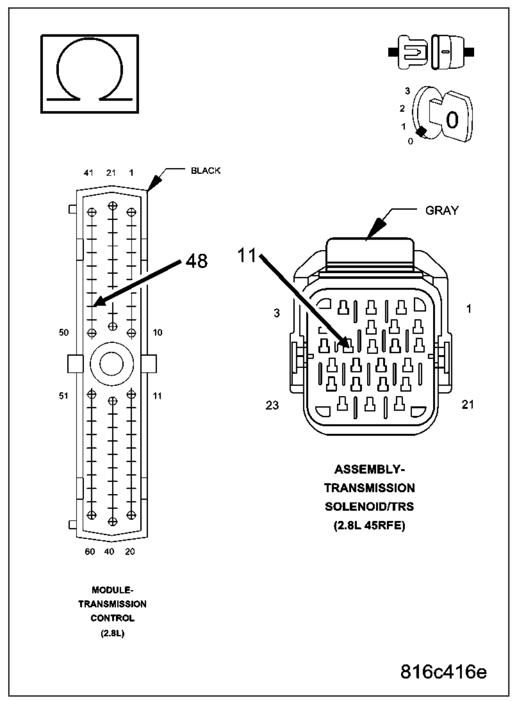
## 13. (T48) 4C PRESSURE SWITCH SENSE CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T48) 4C Pressure Switch Sense circuit from the appropriate terminal of the TCM harness connector to the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance above 5.0 ohms?**

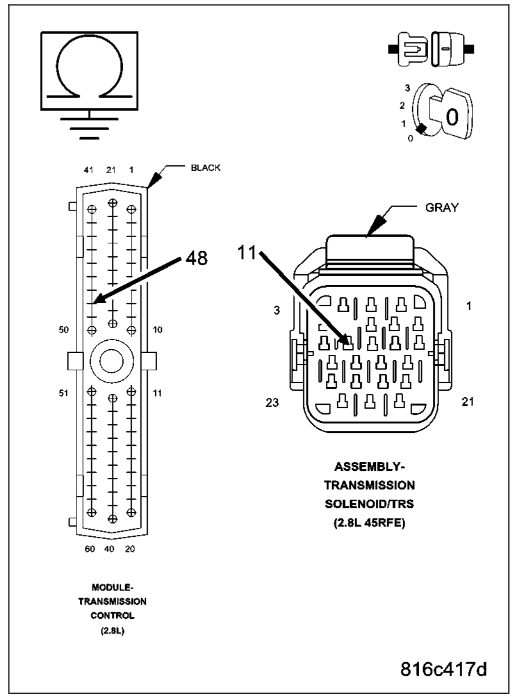
**Yes** >> Repair the (T48) 4C Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 14

## 14. (T48) 4C PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T48) 4C Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T48) 4C Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Powertrain Control Module per the Service Information. With the scan tool, perform the QUICK LEARN procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 15. #5 AND/OR #7 CHECK BALL CUT OR DAMAGED

Turn the Ignition off to the lock position.

Remove the Valve Body Assembly per the Service Information.

Inspect the #5 and #7 check balls for any cuts or damage.

Inspect the 4C accumulator piston and seals and also the 4C tower seal on top of the valve body. Refer to the Service Information.

**Where there any problems found?**

**Yes** >> Repair as necessary. Check for excessive clutch debris in the transmission oil pan. If excessive clutch debris is present, repair 4C clutch as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 16

## 16. EXCESSIVE FLUID LEAKAGE WITH 4C CLUTCH CIRCUIT

Air check the 4C Clutch hydraulic circuit. Refer to the Service Information.

**NOTE: This hydraulic clutch circuit contains a small bleed orifice. Small leakage is considered normal.**

**Was there excessive air leakage in the 4C Clutch hydraulic circuit?**

**Yes** >> Repair as necessary. Refer to the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P1684-BATTERY WAS DISCONNECTED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the ignition is in the Run/Start position.
- **Set Condition:**
  This DTC will set whenever Powertrain Control Module is disconnected from Fused B(+) or ground. It will also be set using the scan tool to perform a Battery Disconnect and/or Quick Learn procedure.

| Possible Causes |
| --- |
| BATTERY WAS DISCONNECTED |
| SCAN TOOL BATTERY DISCONNECT PERFORMED |
| TCM WAS REPLACED OR DISCONNECTED |
| QUICK LEARN WAS PERFORMED |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The TCM uses a battery backed RAM (Random Access Memory) is used to maintain some learned values. When the battery B(+) is disconnected, the memory is lost. When the B(+) is restored, this memory loss is detected by the Transmission Control System. The DTC is set and the learned values are initialized to known constants or previously learned values from EEPROM (Electronic Erasable Programmable Read Only Memory). This results in the reinitialization of some parameters.

## Diagnostic Test

### 1. POSSIBLE CAUSES

This DTC is an informational DTC only.

This DTC is set due to a momentary loss of power and/or the ground circuits to the TCM.

Below are a list of possible causes associated with this DTC.

Battery was disconnected.

The BATTERY DISCONNECT feature on the scan tool was performed.

The QUICK LEARN feature on the scan tool was performed.

TCM was replaced or disconnected.

**Were any of the above possible causes performed?**

**Yes** >> This is the cause of the DTC. Erase the DTC and return vehicle to customer.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 2

## 2. CHECK WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

**NOTE: Check all power and ground circuits to the TCM for a intermittent or high resistance condition.**

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P1715-RESTRICTED MANUAL VALVE IN T3 RANGE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Whenever the PRNDL code indicates Temp 3.
- **Set Condition:**
  This DTC sets when conditions for the DTC P1776 are satisfied or 3 unsuccessful attempts to engage 1st gear while the shifter is in the temp 3 zone. This indicates a restricted port at the manual valve because the shifter is not fully engaged in the drive position.

| Possible Causes |
|---|
| RELATED TRANSMISSION DTC'S PRESENT |
| CUSTOMER DRIVING HABITS |
| MISADJUSTED SHIFTER |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Diagnostic Test

#### 1. DETERMINING IF RELATED DTC'S ARE PRESENT

With the scan tool, check for other transmission DTC's

**Are any of the following DTC's P0731, P0732, P0733, P0734, P1736 or P0715 present?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

#### 2. CHECK SHIFTER ADJUSTMENT

Check Shifter adjustment per the Service Information.

**Is the shifter properly adjusted?**

**Yes** >> Go To 3

**No** >> Adjust the Shifter Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

#### 3. CHECK CUSTOMER DRIVING HABIT

This DTC can be set if the customer rests their hand on the shift lever while they are driving. The transmission can be put in the T3 position if just enough forward pressure is exerted on the shift lever.

When this occurs, the feed port to the clutch is restricted, the transmission will declare neutral, and this DTC will be set. The customer should be informed not to rest their hand on the shifter while driving.

This DTC can also be set by simply bumping the shift lever toward neutral while accelerating.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**If there are no possible causes remaining, view repair.**

**Repair**

This DTC can be set by putting too much forward pressure on the shift lever while it is in the OD position. Make sure the customer is informed.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P1736-GEAR RATIO ERROR IN 2ND PRIME

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on, engine running, with the transmission in gear.
- **Set Condition:**
  If the ratio of the Input RPM to the Output RPM does not match the current gear ratio. This DTC can take up to five minutes of problem identification before illuminating the MIL

| Possible Causes |
|---|
| RELATED DTC'S PRESENT |
| INPUT SPEED SENSOR OR WIRING |
| LOW FLUID LEVEL |
| CRACKED OR MIS-INSTALLED PRIMARY OIL FILTER OR SEAL |
| WORN SOLENOID SWITCH VALVE OR PLUGS |
| STUCK OR STICKING MAIN REGULATOR VALVE |
| BURNED UD OR 4C CLUTCH |
| CUT 4C OR UD PISTON SEAL |
| BROKEN 4C PISTON CASTING |
| BROKEN OR MISSING 4C BLEED ORIFICE |
| BROKEN OR MISSING UD BLEED ORIFICE |
| CUT 4C OR UD ACCUMULATOR PISTON SEAL |
| CRACKED 4C OR UD ACCUMULATOR PISTON |
| EXTRA CHECK BALL IN PASSAGE DOWNSTREAM OF #7 CHECK BALL POCKET |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| BROKEN WELD - REACTION CARRIER TO REVERSE SUN GEAR |
| MISSING TEETH ON INPUT CLUTCH HUB TONE WHEEL |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0731-36).

2) An excessive change in input or output speeds indicating signal intermittent which may result in the DTCs P0715 and/or P0720 to set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

## Diagnostic Test

### 1. DETERMINING IF RELATED DTC'S ARE PRESENT

With the scan tool, check for other transmission DTCs.

**Are any Transmission: solenoid, line pressure, speed sensor, or loss of prime DTCs present?**

**Yes** >> Refer to appropriate symptom in the Transmission category. Perform the test for P0944-LOSS OF PRIME first if it is present.

**No** >> Go To 2

### 2. CHECK DTC EVENT DATA

With the scan tool, read and record the DTC EVENT DATA.

**NOTE: Make sure to record all DTC EVENT DATA stored in the scan tool for future reference in this test procedure.**

**Does the DTC EVENT DATA display information for the DTC P1736?**

**Yes** >> Go To 3

**No** >> Go To 6

### 3. CHECK RPM IN DTC EVENT DATA

Refer to the DTC EVENT DATA recorded earlier.

**Does the Input RPM read zero?**

**Yes** >> Check the input speed sensor and wiring. Refer to test P0715 and diagnose as if the DTC is current.

**No** >> Go To 4

### 4. CHECK LINE PRESSURE READING

Refer to the DTC EVENT DATA recorded earlier.

**Is the line pressure reading more than 10 psi below the desired line pressure?**

**Yes** >> Go To 5

**No** >> Go To 6

### 5. PLUGGED TRANSMISSION OIL FILTER

Turn the ignition off to the lock position.

Remove and inspect the Transmission Oil Pan for excessive debris per the Service Information.

Remove and inspect the Primary Oil Filter per the Service Information.

**NOTE: Make sure the Primary Transmission Oil Filter and/or seal is not cracked or split.**

**Does the Oil Pan contain excessive debris and/or is the Primary Oil Filter cracked or plugged?**

**Yes** >> Repair the plugged, cracked, or split Primary Transmission Oil Filter and/or seal. If the Primary Transmission Oil Filter is plugged, refer to the Service Information for the proper hydraulic clutch repair procedure.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Remove the Transmission Oil Pump per the Service Information. Check the main Regulator Valve for sticking in its bore, scoring, and/or damage and clean and repair as necessary. If no problem is found, replace the Transmission Solenoid/TRS Assembly.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. CHECK TO SEE IF DTC P1736 IS CURRENT

With the scan tool, perform the 2nd Prime Gear Clutch Test. Follow the instructions on the scan tool.

Increase the throttle angle, TPS Degree, to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**NOTE: If the 4C clutch is faulty, the overrunning clutch will hold and the slip test will pass. The 2nd Prime Gear Clutch Test will not detect a faulty 4C clutch. However, it will detect a faulty UD clutch.**

**Did the clutch test pass, did the Input Speed remain at zero?**

**Yes** >> Go To 7

**No** >> Go To 9

## 7. CHECK FOR INTERMITTENT OPERATION

Check the Shifter adjustment per the Service Information.

Intermittent gear ratio DTCs can be set by problems in the Input and Output Speed Sensor circuits and/or Speed Sensor Ground circuit.

Check the Speed Sensor wiring and connectors for good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. CHECK FOR SLIPPAGE

With the scan tool, erase Transmission DTCs.

Road test the vehicle.

During the road test, operate in 4th gear, and perform kickdown shifts from 4th to 2nd (prime) gears.

**Is there an obvious slippage noticed in 4th or 2nd prime gears, or runaway on the 4-2 shift?**

**Yes** >> Go To 11

**No** >> Go To 14

## 9. UD CLUTCH HYDRAULIC CIRCUIT

Remove Transmission Oil Pan and check for excessive debris.

Remove the Valve Body and air check the UD clutch hydraulic circuit (in the case) per the Service Information.

**NOTE: The UD clutch passage contains a small bleed orifice, a small amount of air leakage is normal.**

**Were there any problems found, excessive debris and/or excessive air leakage in the UD clutch hydraulic circuit?**

**Yes** >> Repair as necessary. Check the UD clutch piston seals and the dribbler assembly, reaction shaft support seal rings, and the flatness of the pump valve body and pump housing faces. Check main regulator valve for sticking in the bore.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 10

## 10. UD ACCUMULATOR PISTON

Check the UD bleed orifice, accumulator piston, and accumulator piston seal in the main valve body.

**Were there any problems found?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 11. EXCESSIVE DEBRIS

Remove the Transmission Oil Pan and check for excessive debris.

Remove the valve body and air check the 4C clutch hydraulic circuit per the Service Information.

**NOTE: The 4C clutch passage contains a small bleed orifice, a small amount of air leakage is normal.**

**Were there any problems found, excessive debris, improperly assembled 4C clutch and/or excessive air leakage in the 4C clutch hydraulic circuit?**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures. Note: Check the 4C piston seals and bleed orifice.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 12

## 12. 4C ACCUMULATOR

Check the 4C Accumulator piston for cracks or a cut seal.

Check for a cut or missing #7 or #5 check balls.

Check the Solenoid Switch Valve and its plugs for sticking in its bore or excessive wear.

**Were there any problems found**

**Yes** >> Repair as necessary. Refer to the Service Information for proper repair procedures.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 13

## 13. CHECK FOR BROKEN REVERSE SUN GEAR WELD

Working through the windows in the bottom of the case, check for a broken Reverse Sun gear weld to the reaction carrier as follows:

(1) Hold the Transmission Output Shaft by holding the Transmission Manual Lever in the park position.

(2) Rotate the Input Annulus gear and drive shell, (the drum that encloses the two rearmost carriers).

(3) Check to see if the reaction carrier (the front most carrier, whose outer shell is splined to the 4C clutch) is rotating faster than the drive shell is being turned.

**Is the reaction carrier turning faster than the drive shell?**

**Yes** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the reaction carrier per the Service Information.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 14. CHECK IF DTC RESET

**Did the DTC P1736 reset during the road test?**

**Yes** >> Go To 15

**No** >> Go To 16

## 15. LIST OF POSSIBLE CAUSES

If any other DTC's set during the road test, refer to the appropriate symptom in the Transmission category.

If no other DTC's set during the road test, below is a list of possible causes, but not strictly limited to those:

Check for excessive debris in the Transmission Oil pan, plugged, cracked, or split Primary Transmission Oil Filter and/or seal.

Check for cuts or missing #7 and #5 check balls in the main valve body.

Check the 4C and UD accumulator pistons and seals, UD bleed orifice, and the Solenoid Switch Valve and Plugs in the main valve body.

Check the UD clutch piston seals, reaction shaft support seal rings, and the flatness of the pump valve body and pump housing faces.

Check the 4C clutch piston seals, and bleed orifice.

Check the UD clutch piston seals, reaction shaft support seal rings, and dribbler assemblies, and the flatness of the pump valve body and pump housing faces.

**View repair**

**Repair**

Repair as necessary. Refer to the Service Information for proper repair procedures.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 16. INTERMITTENT DTC

The conditions necessary to set this DTC are not present at this time.

Use the DTC EVENT DATA to help identify the conditions and/or possible causes that may have caused the DTC to set.

Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

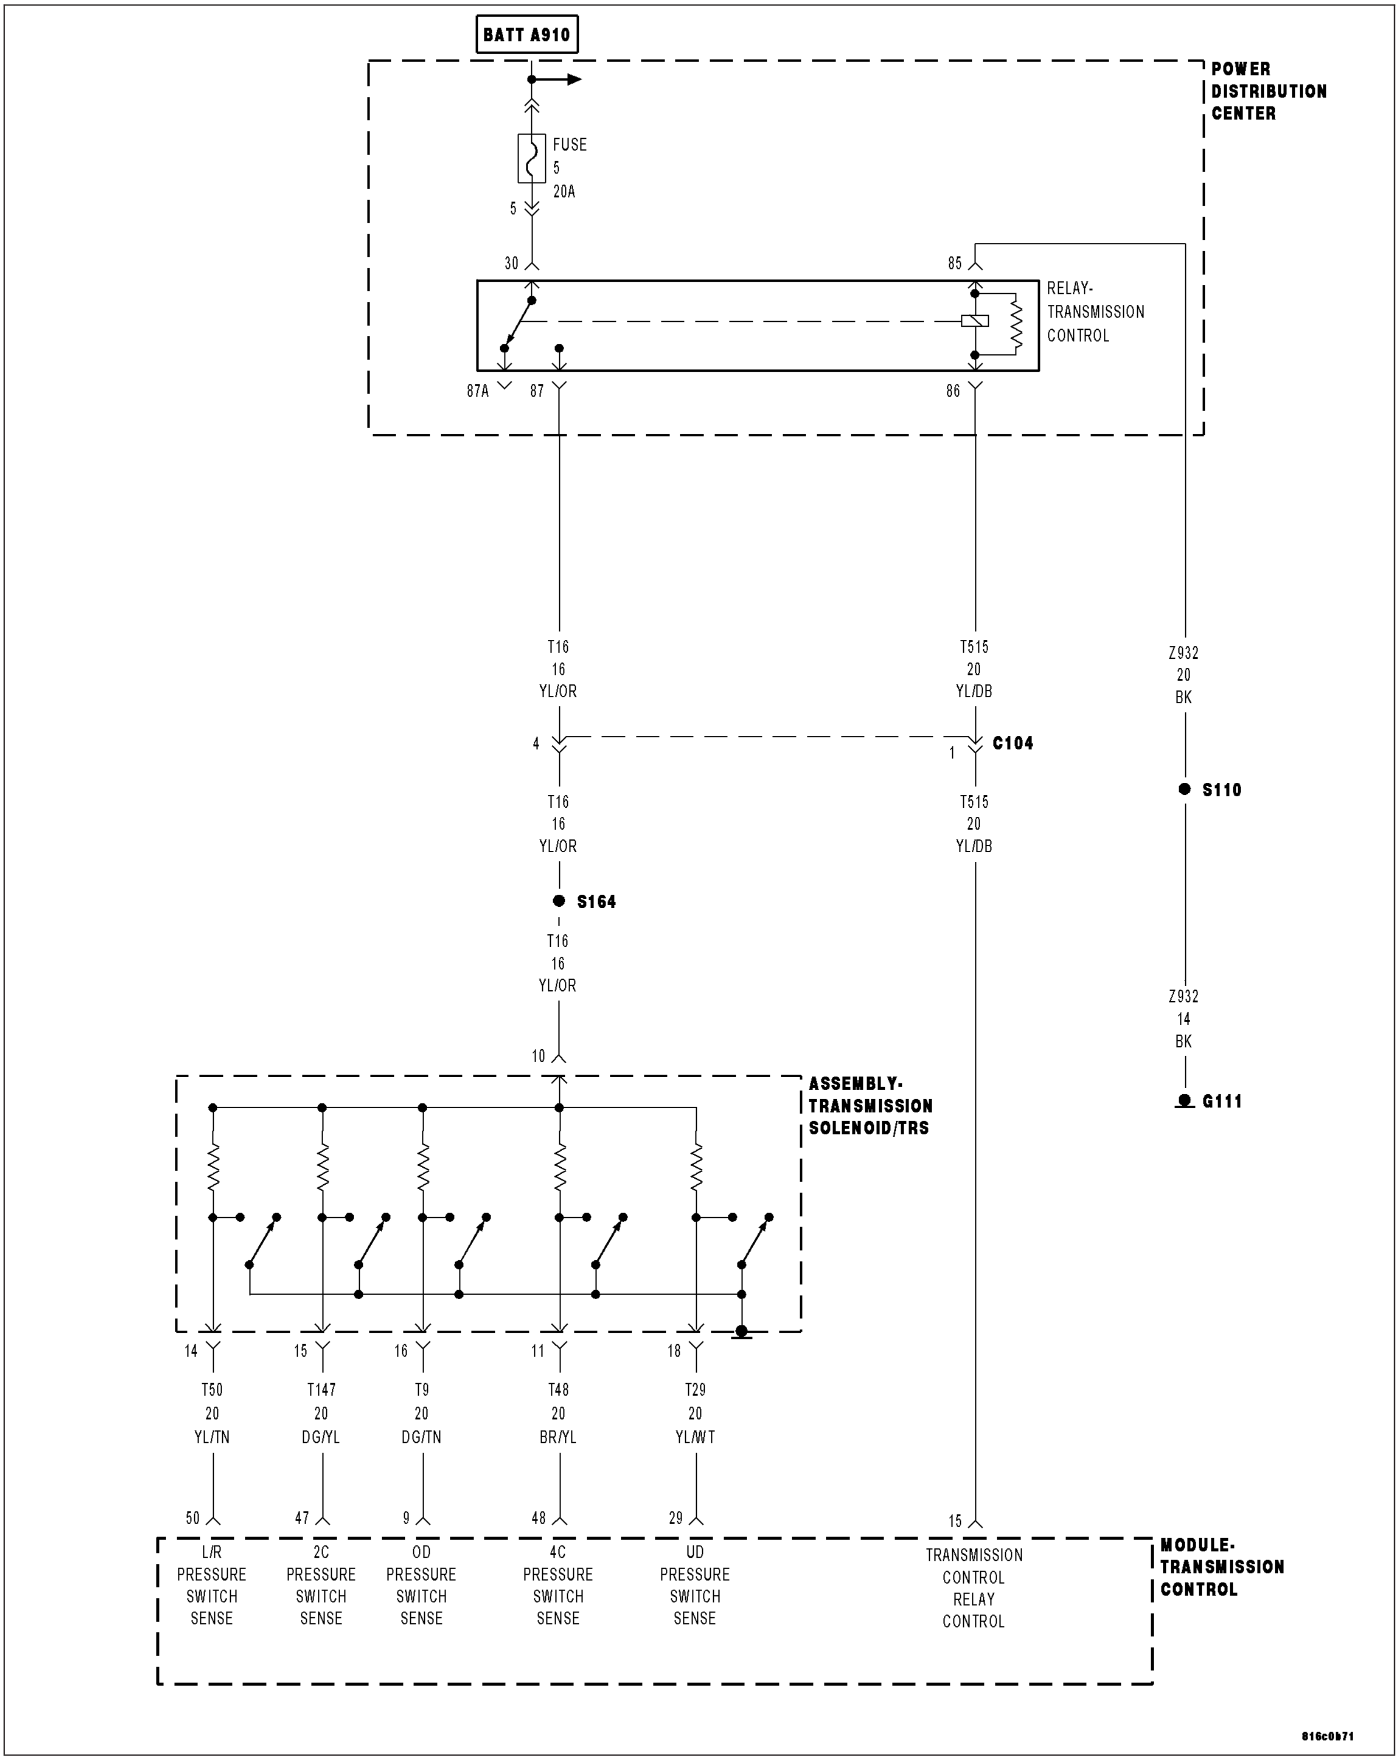
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During an attempted shift into 1st gear.
- **Set Condition:**
  This DTC is set if three unsuccessful attempts are made to shift the Solenoid Switch Valve (SSV) into the downshifted position in one given ignition start. This DTC can take up to five minutes to mature before illuminating the MIL.

| Possible Causes |
|---|
| RELATED DTC P0841 PRESENT |
| SOLENOID SWITCH VALVE STICKING |
| LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHER CIRCUITS |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L/R clutch circuit. In 2nd through 5th gears, it will be in the upshifted position and directing the fluid into the torque converter clutch (TCC).

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R Pressure Switch is monitored to confirm SSV movement. If movement is not confirmed (the L/R pressure switch does not close), EMCC is inhibited until SSV operation is confirmed.

## Diagnostic Test

### 1. DETERMINING IF RELATED DTC'S ARE PRESENT

With the scan tool, check for other transmission DTC's

**Is the DTC P0841 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK TO SEE IF DTC P1775 IS CURRENT

Perform a visual inspection of all connectors, wiring, and cooler connections before proceeding. Repair as necessary.

With the scan tool, Check the STARTS SINCE SET counter.

**NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter for P1775 at 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 6

## 3. TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to LR.

With the scan tool, monitor the LR Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

**Did the state of the L/R Pressure Switch change while pressing the Pressure Switch Test button?**

**Yes** >> Go To 4

**No** >> Go To 5

## 4. SOLENOID SWITCH VALVE STICKING

Turn the ignition off to the lock position.

Remove the Transmission Oil Pan per the Service Information.

Remove the Transmission Valve body per the Service Information.

Inspect the Solenoid Switch Valve and Plugs for sticking.

**Is the Solenoid Switch Valve or Plugs sticking?**

**Yes** >> Clean and inspect per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

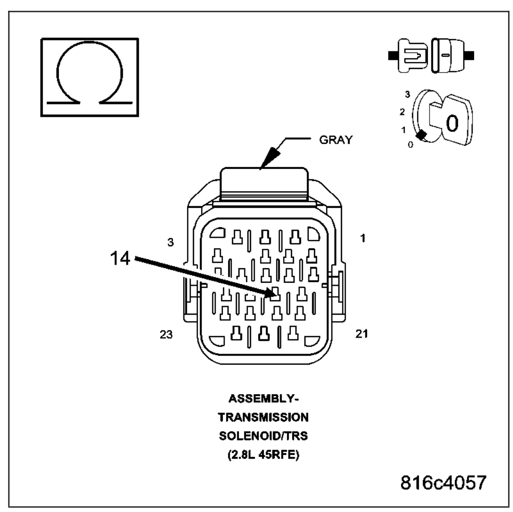
## 5. LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO OTHER CIRCUITS

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/TRS Assembly harness connector.

Disconnect all TCM harness connector.

Measure the resistance between the (T50) LR Pressure Switch Sense circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T50) LR Pressure Switch Sense circuit and all other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T50) LR Pressure Switch Sense circuit for a short to other circuit(s).

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANS-

AXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

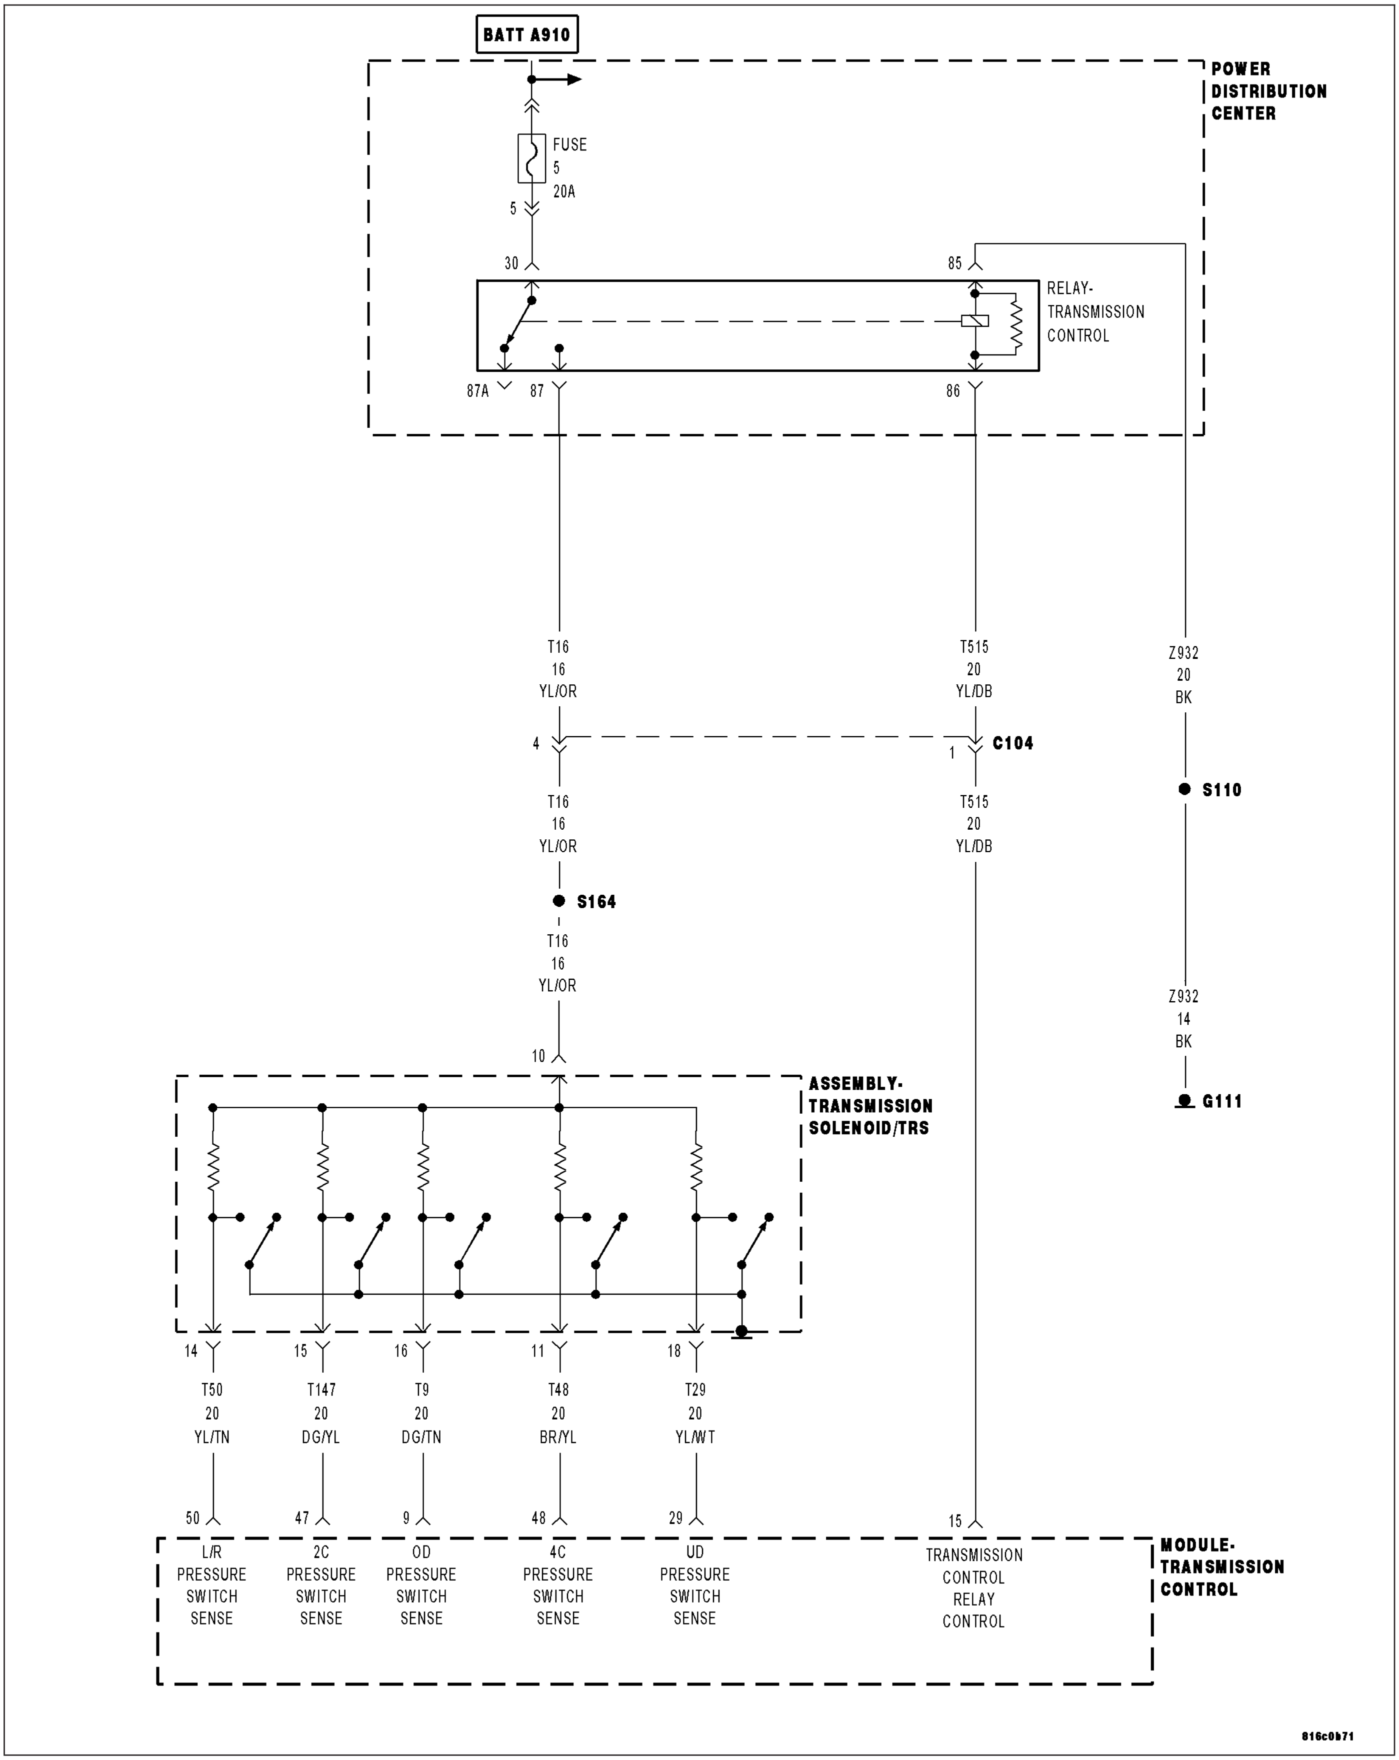
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P1776-SOLENOID SWITCH VALVE LATCHED IN LR POSITION



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously when performing partial or full EMCC - PEMCC or FEMCC.
- **Set Condition:**
  If the transmission senses the L/R pressure switch closing while performing PEMCC or FEMCC. This DTC will set after two unsuccessful attempts to perform PEMCC or FEMCC. This DTC can take up to five minutes of problem identification before illuminating the MIL.

| Possible Causes |
|---|
| RELATED DTC P0841 PRESENT |
| LR PRESSURE SWITCH SENSE CIRCUIT OPEN |
| LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND |
| SOLENOID SWITCH VALVE |
| TRANSMISSION CONTROL MODULE |
| INTERMITTENT WIRING AND CONNECTORS |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R Solenoid is energized. The SSV will be in the downshifted position in 1st gear, thus directing the fluid to the L/R clutch circuit. In 2nd through 5th gears, it will be in the upshifted position and directing the fluid into the torque converter clutch (TCC).

When in 2nd, 2nd Prime, 3rd, 4th, or 5th gear, the Torque Converter Clutch (TCC) can be engaged when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the L/R solenoid until the torque converter slip difference (difference between engine and transmission input speed) is within 60 RPM. Then the L/R solenoid is fully energized (FEMCC / 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity.

## Diagnostic Test

### 1. DETERMINING IF RELATED DTC'S ARE PRESENT

With the scan tool, check for other transmission DTC's

**Is the DTC P0841 present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK TO SEE IF DTC P1776 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter.

**NOTE: NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 7

## 3. TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install the Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the Transmission Simulator, turn the Pressure Switch selector switch to the LR position.

With the scan tool, monitor the LR Pressure Switch state while pressing the Pressure Switch Test button on the Transmission Simulator.

**Did the state of the LR Pressure Switch change while pressing the Pressure Switch Test button?**

**Yes** >> Go To 4

**No** >> Go To 5

## 4. SOLENOID SWITCH VALVE

Remove the Valve Body per the Service Information.

Inspect the Solenoid Switch Valve and plugs for sticking in the bore and/or wear.

**Were there any problems found?**

**Yes** >> Clean and repair as necessary per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 7

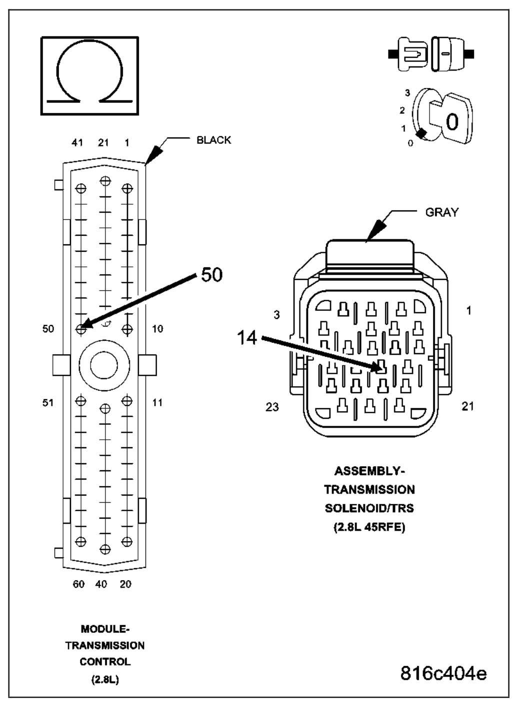
## 5. LR PRESSURE SWITCH SENSE CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the TCM harness connector.

Measure the resistance of the (T50) LR Pressure Switch Sense circuit between the appropriate terminal of the TCM harness connector to the Solenoid/TRS Assembly harness connector.



**Is the resistance above 5.0 ohms?**

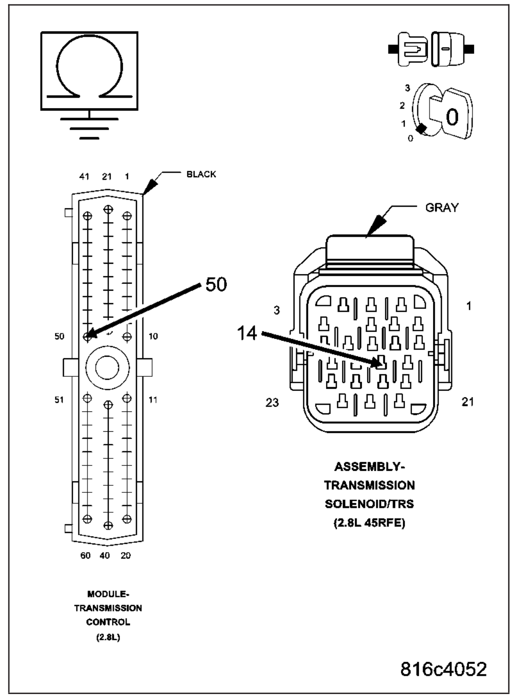
**Yes** >> Repair the (T50) LR Pressure Switch Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (T50) LR PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T50) LR Pressure Switch Sense circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T50) LR Pressure Switch Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

This DTC can also be set by the Solenoid Switch Valve intermittently sticking in it’s bore under extreme temperature conditions, or by a worn Solenoid Switch Valve or plugs.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P1790-FAULT IMMEDIATELY AFTER SHIFT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  After a speed ratio error is stored.
- **Set Condition:**
  This DTC is set if the associated speed ratio DTC is stored within 1.3 seconds after a shift.

| Possible Causes |
|---|
| FAULT AFTER SHIFT |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

This DTC will only be stored along with a gear ratio DTC. If this DTC is set, it indicates a probable hydraulic (line pressure) or mechanical problem exists. Diagnosing the transmission should be based on the associated speed ratio DTC and mechanical causes should be considered first.

| INTENDED GEAR | CLUTCHES APPLYING | RECOMENDED DTC |
|---|---|---|
| REVERSE | UD** - MS | P0738 |
| 1ST | UD - LR* | P0731 |
| 2ND | UD - 2C | P0732 |
| 2ND PRIME | UD - 4C | P1736 |
| 3RD | UD - OD/MS | P0733 |
| 4TH | OD/MS - 2C | P0734 |
| 5TH | OD/MS - 2C | P0735 |

* L/R is used only up to 150 output RPM in 1st gear. ** UD will show as applied in Reverse but the UD clutch is actually released. OD/MS is OD and/or MS.

### Diagnostic Test

#### 1. INTENDED GEAR TO APPLIED CLUTCH

With the scan tool, check the DTC EVENT DATA to determine in which gear the slippage occurred and the clutches that were applied.

With the DTC EVENT DATA, use the information provided above to determine the proper symptom for diagnosis.

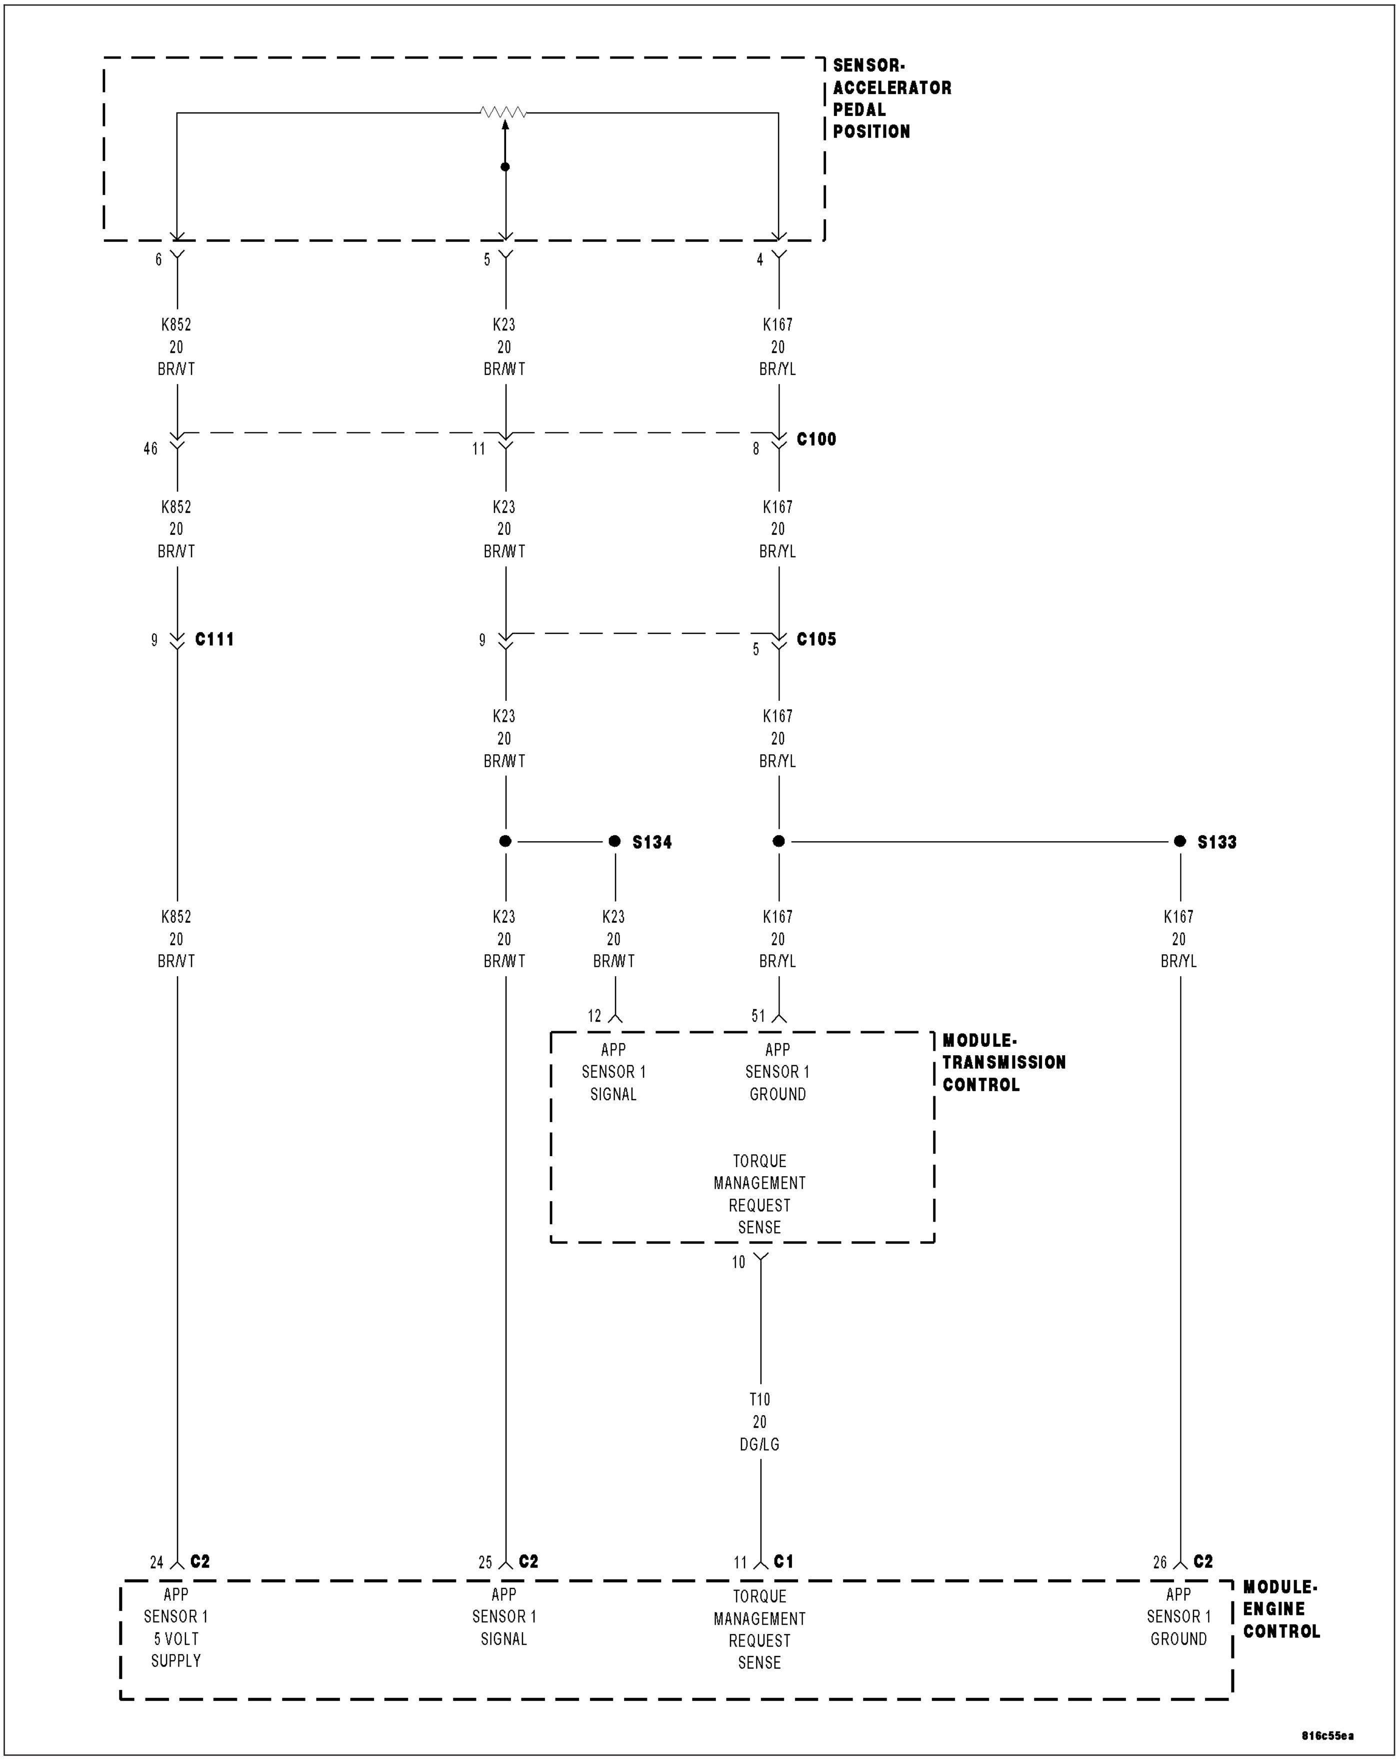
**View repair**

**Repair**

Refer to the Transmission category and perform the appropriate symptom identified from the DTC EVENT DATA, intended gear, and applied clutches.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## P1793-TRD LINK COMMUNICATION ERROR



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During torque managed shifts with Throttle angle above 54 degrees. This system is also tested whenever the vehicle is stopped and the engine speed is below 1000 RPM.
- **Set Condition:**
  This code is set when the Transmission Control Module sends two subsequent Torque Reduction messages (pulses the Torque Management Request Sense circuit to ground) to the Engine Control Module via the Torque Management Request Sense circuit and the TCM does not receive a confirmation from the ECM over the communication bus.

| Possible Causes |
|---|
| RELATED DTC'S PRESENT |
| TORQUE MANAGEMENT REQUEST SENSE CIRCUIT OPEN |
| TORQUE MANAGEMENT REQUEST SENSE CIRCUIT SHORT TO GROUND |
| TORQUE MANAGEMENT REQUEST SENSE CIRCUIT SHORTED TO VOLTAGE |
| ENGINE CONTROL MODULE |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting Procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

Engine Torque Management is used during heavy throttle, high-torque, high speed 1-2, 2-3, 4-2, and 3-1 shifts in order to reduce the energy dissipation in the 2-4 and OD clutches to an acceptable level. The Engine Control Module is expected to respond to a torque management test or request by transmitting a message over the communication bus to the Transmission Control Module.

## Diagnostic Test

### 1. CHECK FOR RELATED DTCS

With the scan tool, check for other transmission DTC's

**Are any of the DTCs P1694, P0731, P0732, P0733, P0734, and/or P1736 present also?**

**Yes** >> If any of these DTCs are present, disregard the P1793 DTC. Refer to the Transmission category and perform the appropriate symptom.
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK TO SEE IF DTC P1793 IS CURRENT

With the scan tool, Check the STARTS SINCE SET counter for P1793.

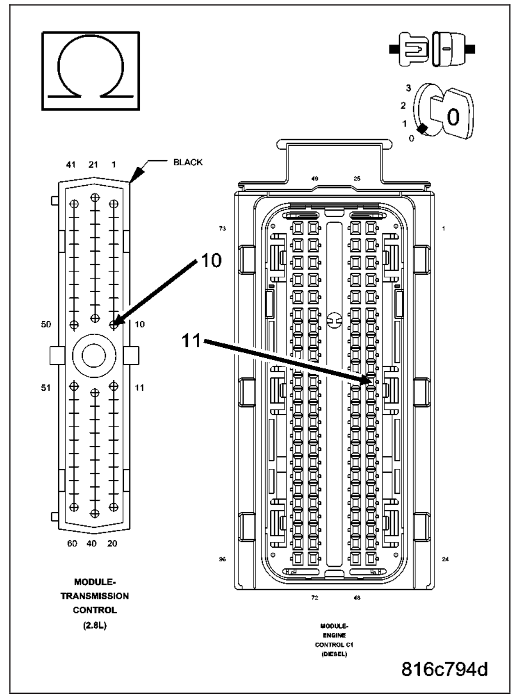
**NOTE: NOTE: This counter only applies to the last DTC set.**

**Is the STARTS SINCE SET counter set at 2 or less?**

**Yes** >> Go To 3

**No** >> Go To 7

## 3. TORQUE MANAGEMENT REQUEST SENSE CIRCUIT OPEN



Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Disconnect the ECM harness connector.

Measure the resistance of the Torque Management Request Sense circuit from the TCM harness connector to the ECM harness connector.

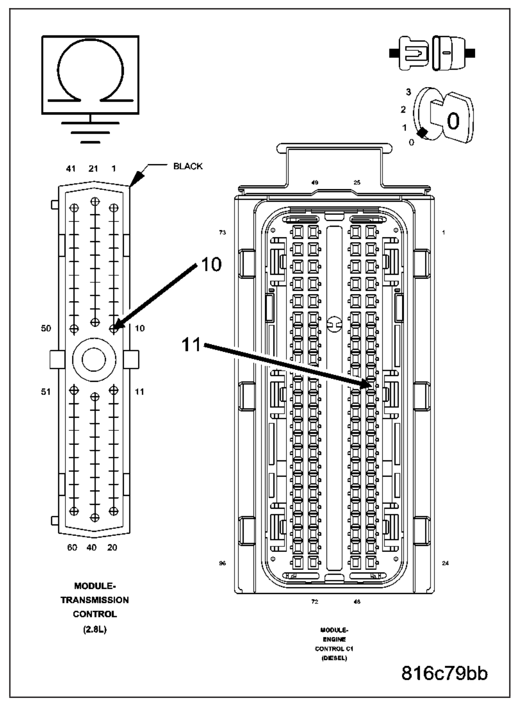
**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Torque Management Request Sense circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. TORQUE MANAGEMENT REQUEST SENSE CIRCUIT SHORT TO GROUND



Measure the resistance between ground and the Torque Management Request Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Torque Management Request Sense circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. TORQUE MANAGEMENT REQUEST SENSE CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

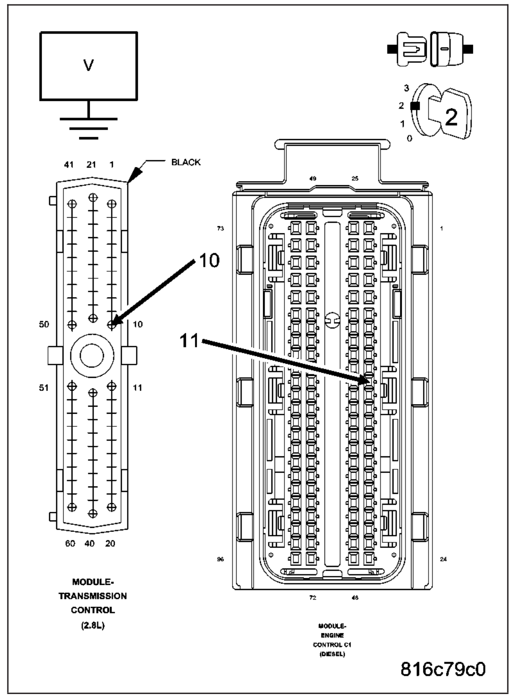
Measure the voltage of the Torque Management Request Sense circuit in the TCM harness connector.

**Is the voltage above 10.5 volts?**

**Yes** >> Repair the Torque Management Request Sense circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 6



## 6. TRANSMISSION CONTROL MODULE

Measure the voltage of the Torque Management Request Sense circuit in the TCM harness connector.

**Is the voltage above 7.0 volts?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Powertrain Control Module (ECM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the ECM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

This DTC can also be set by the Solenoid Switch Valve intermittently sticking in it’s bore under extreme temperature conditions, or by a worn Solenoid Switch Valve or plugs.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

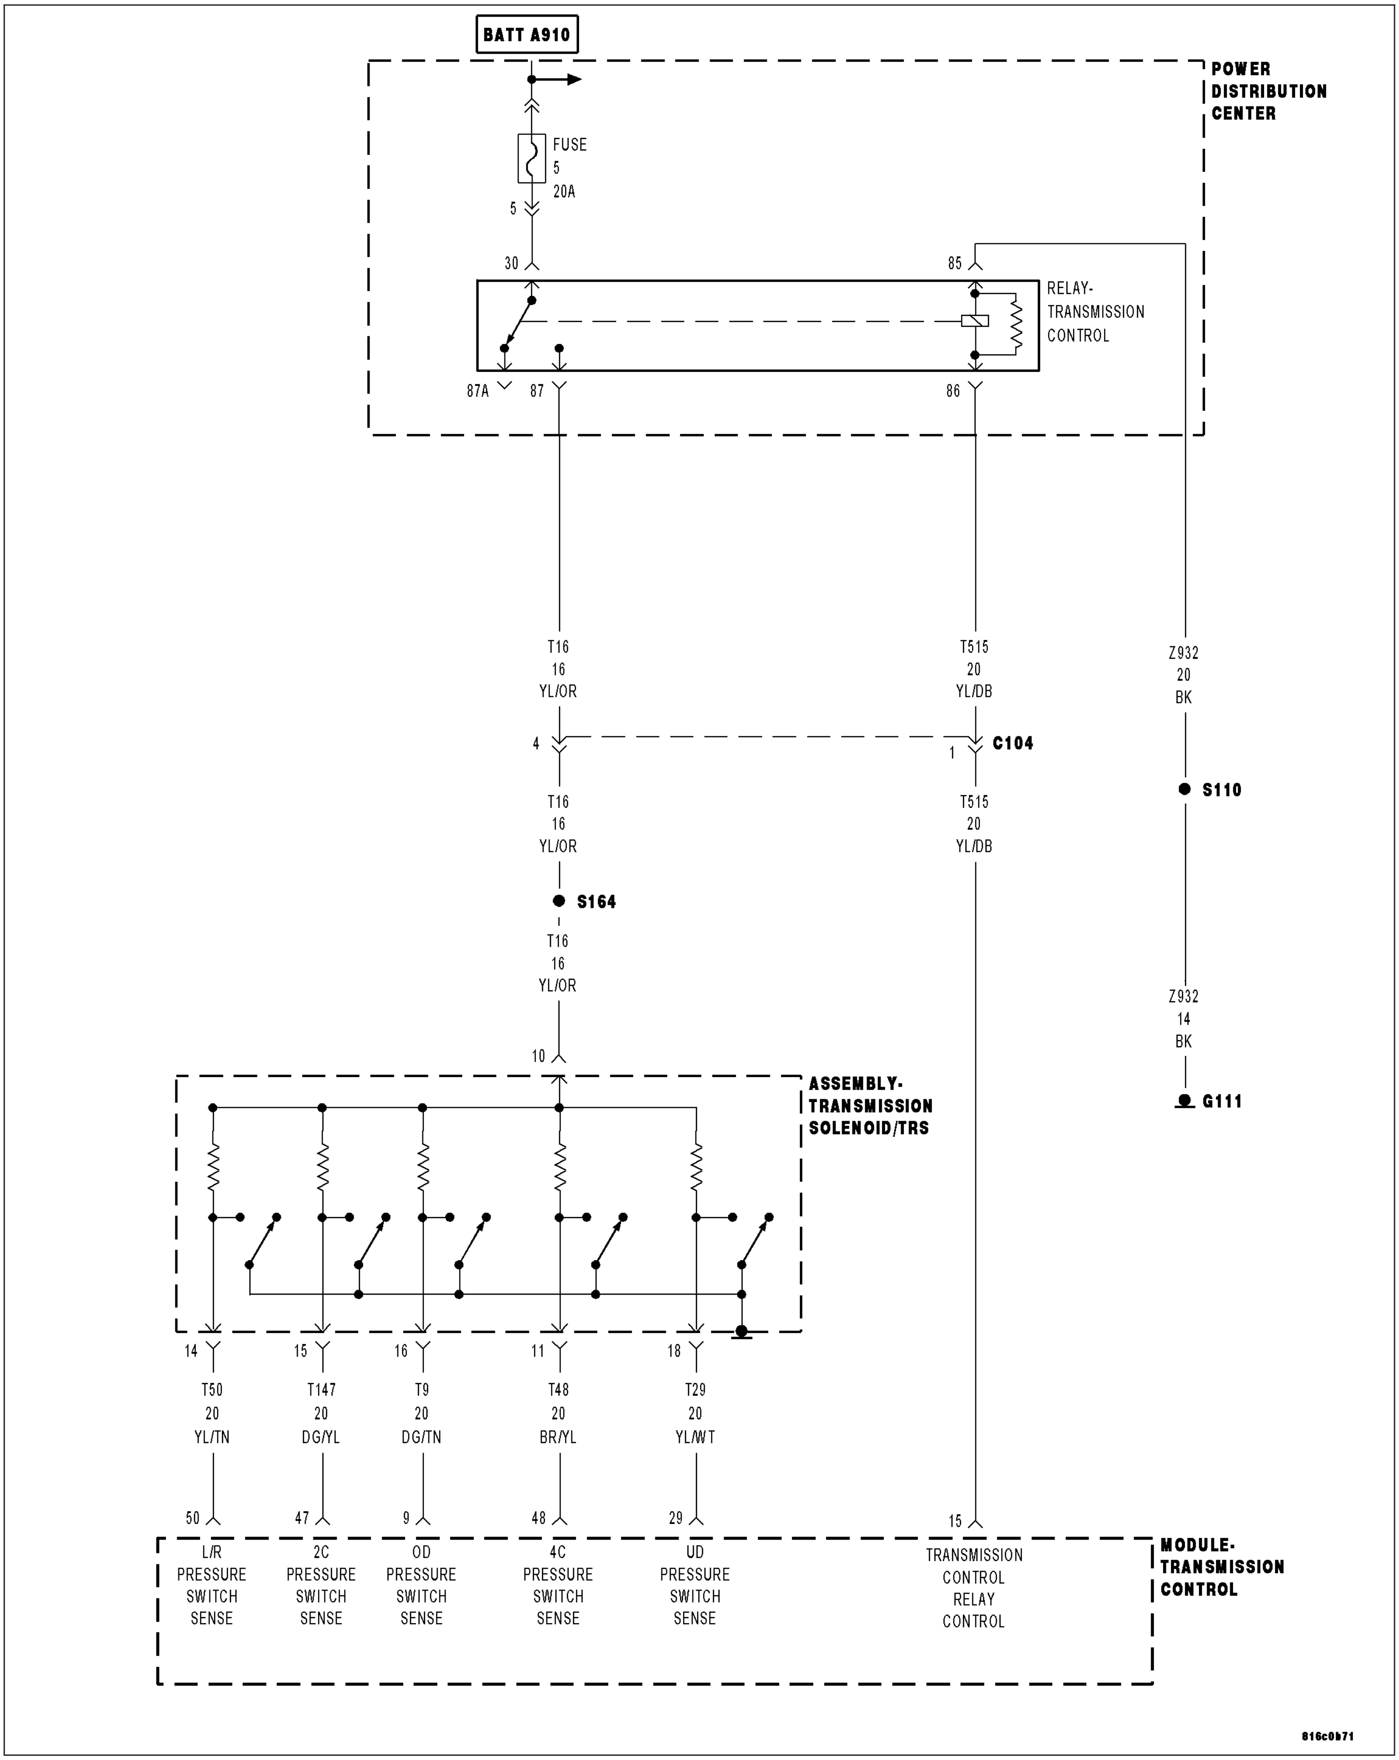
**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P1794-SPEED SENSOR GROUND ERROR



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  The gear ratio is monitored continuously while the Transmission is in gear.
- **Set Condition:**
  After a controller reset in neutral and a ratio of input to output, of 1 to 2. This DTC can take up to five minutes of problem identification before illuminating the MIL.

| Possible Causes |
| --- |
| (T13) SPEED SENSOR GROUND CIRCUIT OPEN |
| (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND |
| (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through the following checks:

1) When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding in-gear trouble code is set (DTCs P0731–36).

2) An excessive change in input or output speeds indicating signal intermittent which may result in the DTCs P0715 and/or P0720 to set.

3) If the common speed sensor ground circuit is lost, both sensor inputs will read the signal from the input speed sensor at idle in neutral. Since the input speed sensor reads 60 teeth from the input clutch hub and the output speed sensor reads 30 teeth from the park gear, the result is an apparent speed ratio of 1:2 and may cause the DTC P1794 to set when at a stop.

## Diagnostic Test

### 1. CHECK TO SEE IF DTC P1794 IS CURRENT

Engine Running, Shift lever in park.

With the scan tool, read the Transmission Output and Input Speed Sensor states.

**Is the Output Speed Sensor reading twice the Input Speed Sensor reading?**

**Yes** >> Go To 2

**No** >> Go To 6

### 2. TCM AND WIRING

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**
Install the Transmission Simulator, Miller tool 8333.

With the Transmission Simulator, set the Input/Output Speed selector switch to the ″3000/1000″ position. Turn the Input/Output Speed switch to ″ON″.

Ignition on, engine not running.

With the scan tool, monitor the Input and Output Speed Sensor state.

**Does the Input speed read 3000 RPM and the Output speed read 1000 RPM, within 50 RPM?**

**Yes** >> Go To 6

**No** >> Go To 3

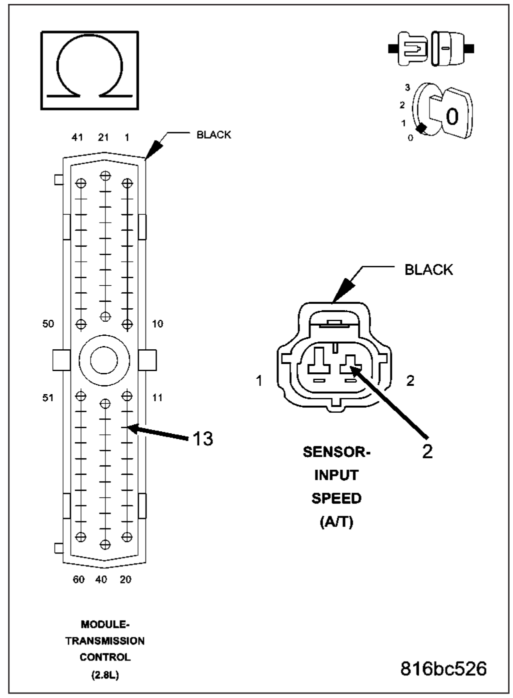
## 3. (T13) SPEED SENSOR GROUND CIRCUIT OPEN

Turn the ignition off to the lock position.

Disconnect the TCM harness connector.

Disconnect the Transmission Simulator, Miller tool #8333.

Measure the resistance of the (T13) Speed Sensor Ground circuit from the appropriate terminal of the TCM harness connector to the Transmission Solenoid/TRS Assembly and both Input and Output Speed Sensor harness connectors.



**Is the resistance above 5.0 ohms on any of the above measurements?**

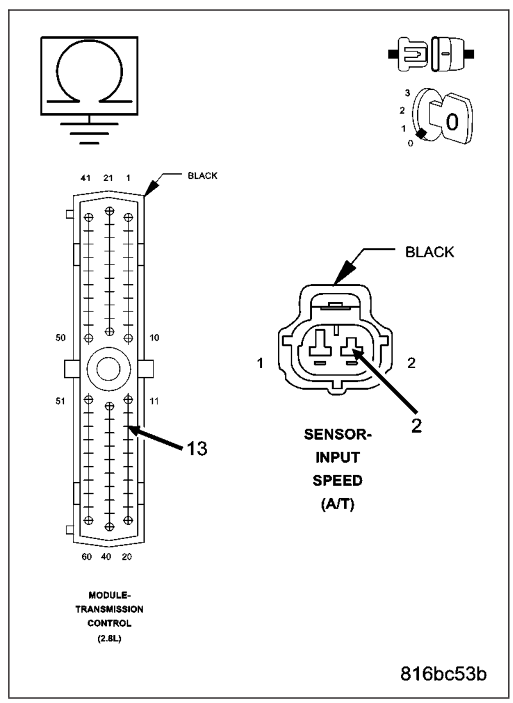
**Yes** >> Repair the (T13) Speed Sensor Ground circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T13) Speed Sensor Ground circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for a short to ground.

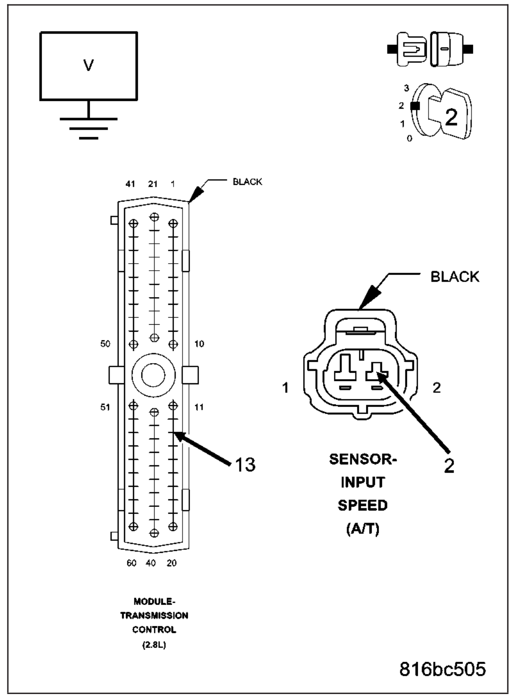
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (T13) SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE

Ignition on, engine not running.

Measure the voltage of the (T13) Speed Sensor Ground circuit.



**Is the voltage above 0.5 volt?**

**Yes** >> Repair the (T13) Speed Sensor Ground circuit for a short to voltage.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

With the scan tool, check the DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P2700-INADEQUATE ELEMENT VOLUME LR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running. The LR clutch volume index (CVI) is updated during a 3-1 or 2-1 manual downshift with throttle angle below 5 degrees. Transmission temperature must be at least 43° C (110° F).
- **Set Condition:**
  When the LR clutch volume index (CVI) falls below 16.

| Possible Causes |
| --- |
| HYDRAULIC LEAK IN THE VALVE BODY |
| BROKEN L/R CLUTCH PISTON RETURN SPRING OR SPRING RETAINERS |
| BROKEN L/R ACCUMULATOR SPRING(S) |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTC's, which indicates an internal transmission problem.

## Diagnostic Test

### 1. OTHER DTCS PRESENT

With the scan tool, check for other transmission DTCs.

**Are there any Pressure Switch Sense circuit DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK LR CLUTCH VOLUME INDEX

With the scan tool, erase DTCs.

Start the engine and warm the transmission.

**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**

Drive the vehicle and perform at least ten 3-1 manual downshifts at closed throttle from speeds of about 32 Kmh or 20 MPH.

With the scan tool, read the LR CL VOL INDEX.

**Is the LR CL VOL INDEX below 20?**

**Yes** >> Go To 3

**No** >> Go To 5

## 3. L/R CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan per the Service Information.

Remove the valve body per the service information.

Check condition of the L/R accumulator springs.

Look for possible leak paths into the L/R clutch hydraulics circuit within the valve body.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. AIR CHECK L/R CLUTCH CIRCUITS

Perform an air check on the L/R Clutch circuit per the Service Information.

Watch and listen for L/R Clutch piston movement.

**Does the L/R piston stroke and return properly?**

**Yes** >> Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Repair internal transmission as necessary. Pay attention to the components related to the L/R clutch. A broken or weak L/R clutch return spring, Accumulator Spring, and/or dislocated snap ring could cause this problem.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. VERIFY TCM OPERATION

**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Kmh or 50 MPH, then brake lightly to a stop. Turn off engine.

With the scan tool, record the CL VOL INDEX (CVI) for all clutches

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVI's and compare them to the readings recorded before the BATTERY DISCONNECT.

**Are any of the CVI's less than 5 or different than before the BATTERY DISCONNECT?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P2701-INADEQUATE ELEMENT VOLUME 2C

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running. The 2C clutch volume index (CVI) is updated during a 3-2 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).
- **Set Condition:**
  When the 2C CVI falls below 5.

| Possible Causes |
|---|
| HYDRAULIC LEAK IN THE VALVE BODY |
| BROKEN 2C CLUTCH PISTON RETURN SPRING / DISLODGED SNAP RING |
| BROKEN ACCUMULATOR SPRING(S) |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTC's, which indicates an internal transmission problem.

## Diagnostic Test

### 1. OTHER DTCS PRESENT

With the scan tool, check for other transmission DTCs.

**Are there any Pressure Switch Sense circuit DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. CHECK 2C CLUTCH VOLUME INDEX

With the scan tool, erase Transmission DTCs.

Drive the vehicle at about 80 Kmh or 50 MPH, then depress the OD off button. This will put the vehicle into third gear.

**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**
Perform at least ten 3-2 kickdowns by depressing the throttle between 10 and 54 TPS DEGREES at speeds of about 80 Kmh or 50 MPH.

With the scan tool, read the 2C CL VOL INDEX.

**Is the 2C CL VOL INDEX below 10?**

**Yes** >> Go To 3

**No** >> Go To 5

## 3. 2C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan per the Service Information.

Remove the valve body per the service information.

Check condition of the 2C accumulator springs.

Look for possible leak paths into the 2C clutch hydraulics circuit within the valve body.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. AIR CHECK 2C CLUTCH CIRCUIT

Turn the ignition off to the lock position.

Perform an air check on the 2C Clutch circuit per the Service Information.

Watch and listen for 2C Clutch piston movement.

**Dose the piston stroke and return properly?**

**Yes** >> Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Repair internal transmission as necessary. Pay attention to the components related to the 2C clutch. A broken or dislodged 2C return spring, snap ring or broken 2C Accumulator Spring could cause this problem.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. VERIFY TCM OPERATION

**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Kmh or 50 MPH, then brake lightly to a stop. Turn off engine.

With the scan tool, record the CL VOL INDEX (CVI) for all clutches

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVI's and compare them to the readings recorded before the BATTERY DISCONNECT.

**Are any of the CVI's less than 5 or different than before the BATTERY DISCONNECT?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P2702-INADEQUATE ELEMENT VOLUME OD

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running. The OD clutch volume index (CVI) is updated during a 2-3 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).
- **Set Condition:**
  When the OD CVI falls below 5.

| Possible Causes |
| --- |
| HYDRAULIC LEAK IN THE VALVE BODY |
| BROKEN OD ACCUMULATOR SPRING |
| BROKEN OD/REV PISTON BELLEVILLE SPRING OR DISLODGED SNAP RING |
| INTERNAL LEAKAGE IN PUMP ASSEMBLY |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTC's, which indicates an internal transmission problem.

### Diagnostic Test

#### 1. OTHER DTCS PRESENT

With the scan tool, check for other transmission DTCs.

**Are there any Pressure Switch Sense circuit DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

#### 2. CHECK THE OD CLUTCH VOLUME INDEX

With the scan tool, erase DTCs.

**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**
Drive the vehicle and perform at least ten 2-3 upshifts with the TPS degree between 10 and 54.

With the scan tool, read the OD CL VOL INDEX.

**Is the OD CL VOL INDEX below 10?**

**Yes** >> Go To 3

**No** >> Go To 5

## 3. OD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan per the Service Information.

Remove the valve body per the service information.

Check condition of the OD accumulator spring.

Look for possible leak paths into the OD clutch hydraulics circuit within the valve body.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. AIR CHECK OD CLUTCH CIRCUIT

Perform an air check on the OD Clutch circuit per the Service Information.

Watch and listen for OD Clutch piston movement.

Air check all other pump passages and watch for air leakage into the OD clutch passage.

**NOTE: There is a bleed orifice between the OD and Reverse Clutch passages, so a small amount of air leakage from Reverse to OD is normal.**

**Were any problems found?**

**Yes** >> Repair internal transmission. Pay attention to the OD Clutch. Broken or weak return spring or a dislocated snap ring could cause this problem. If no problems were found in the OD clutch, or if leakage into the OD passage was noted, replace Pump Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. VERIFY TCM OPERATION

**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Kmh or 50 MPH, then brake lightly to a stop. Turn off engine.

With the scan tool, record the CL VOL INDEX (CVI) for all clutches.

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVI's and compare them to the readings recorded before the BATTERY DISCONNECT.

**Are any of the CVI's less than 5 or different than before the BATTERY DISCONNECT?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P2703- INADEQUATE ELEMENT VOLUME UD

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running. The UD clutch volume index (CVI) is updated during a 4-3 kickdown with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).
- **Set Condition:**
  When the UD CVI falls below 11.

| Possible Causes |
|---|
| BROKEN UD ACCUMULATOR SPRING(S) |
| BROKEN UD CLUTCH PISTON SPRING OR DISLODGED SNAP RING |
| INTERNAL LEAKAGE IN PUMP OR VALVE BODY ASSEMBLIES |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTC's, which indicates an internal transmission problem.

### Diagnostic Test

#### 1. OTHER DTCS PRESENT

With the scan tool, check for other transmission DTCs.

**Are there any Pressure Switch Sense circuit DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

#### 2. CHECK UD CLUTCH VOLUME INDEX

With the scan tool, erase Transmission DTCs.

**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**

Drive the vehicle and perform at least ten 4-3 kickdowns by depressing the throttle between 30 and 54 TPS degrees at speeds about 80 Kmh or 50 MPH.

With the scan tool, read the UD clutch volume index (CVI).

**Is the UD CVI below 10?**

**Yes** >> Go To 3

**No** >> Go To 5

## 3. UD CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan and valve body per the Service Information.

Check the condition of the UD accumulator springs.

Look for possible leak paths into the UD clutch hydraulics circuit within the valve body.

**Were there any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. AIR CHECK UD CLUTCH CIRCUIT

Perform an air check on the UD Clutch circuit per the Service Information.

Watch and listen for UD Clutch piston movement.

Air check all other pump passages for air leakage into the UD Clutch circuit.

**Were any problems found?**

**Yes** >> Repair internal transmission. Pay attention to components related to the UD clutch. Broken or weak return spring or a dislocated snap ring. If no trouble is found in UD clutch component or UD clutch leakage was noted in passage, replace the Pump Assembly.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission/TRS Solenoid Assembly per the service information. With the scan tool, perform Quick Learn.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. VERIFY TCM OPERATION

**NOTE: The TRANS TEMP DEG must be at least 43° C or 110° F before performing the following steps.**

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 80 Kmh or 50 MPH, then brake lightly to a stop. Turn off engine.

With the scan tool, record the clutch volume index (CVI) for all clutches.

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVI's and compare them to the readings recorded before the BATTERY DISCONNECT.

**Are any of the CVI's less than 5 or different than before the BATTERY DISCONNECT?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P2704-INADEQUATE ELEMENT VOLUME 4C

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the engine is running. The 4C clutch volume index (CVI) is updated during a 3-4 upshift with throttle angle between 10 and 54 degrees. Transmission temperature must be at least 43° C (110° F).
- **Set Condition:**
  When the 4C CVI falls below 5.

| Possible Causes |
|---|
| BROKEN 4C RETURN SPRING OR DISLODGED SNAP RING |
| BROKEN 4C ACCUMULATOR SPRING(S) |
| HYDRAULIC LEAK IN THE VALVE BODY |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

### Theory of Operation

The volumes of the transmission fluid needed to apply the friction elements are continuously monitored and learned for adaptive controls. As the clutch friction material wears, the volume of fluid needed to apply the clutch increases. Certain transmission mechanical problems can cause near-zero learned volumes resulting in setting a DTC. The DTC will usually set with other DTC's, which indicates an internal transmission problem.

### Diagnostic Test

#### 1. CHECK THE 4C CLUTCH VOLUME

With the scan tool, record the 4C clutch volume index (CVI) and erase DTC's.

Perform at least 10, 3-4 upshifts with the throttle between 10 and 54 degrees. The Transmission temperature must be at least 43° C or 110° F.

With the scan tool, read the 4C CVI.

**Is the current 4C CVI below 10?**

**Yes** >> Go To 2

**No** >> Go To 5

#### 2. DTC P0876 PRESENT

With the scan tool, read DTCs.

**NOTE: The DTC P0876 must also be set with P2704 in order for this test to be valid.**

**Is the DTC P0876 also present?**

**Yes** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. 4C CLUTCH CIRCUIT LEAKS IN THE VALVE BODY

Turn the ignition off to the lock position.

Remove the transmission oil pan per the Service Information.

Remove the valve body per the Service Information.

Check condition of the 4C accumulator springs.

Look for possible leak paths into the 4C clutch hydraulics circuit within the valve body.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. AIR CHECK 4C CLUTCH CIRCUIT

Perform an air check on the 4C Clutch circuit per the Service Information.

Listen for proper 4C Clutch piston movement.

**Were any problems found?**

**Yes** >> Repair Internal transmission as necessary. Pay attention to the mechanical components related to the 4th clutch. A broken or weak return spring or a dislocated snap ring could cause this problem.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Replace the Transmission Solenoid/TRS Assembly per the service information. With the scan tool, perform Quick Learn.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

## 5. VERIFY TCM OPERATION

Perform eight learnable starts. A learnable start is defined as follows: Start engine. From a standstill, accelerate lightly to 50 MPH, then brake lightly to a stop. Turn off engine.

With the scan tool, record Transmission CL VOL INDEX (CVI) for all clutches.

With the scan tool, perform a BATTERY DISCONNECT.

With the scan tool, read the CVI's and compare them to the reading recorded before the BATTERY DISCONNECT.

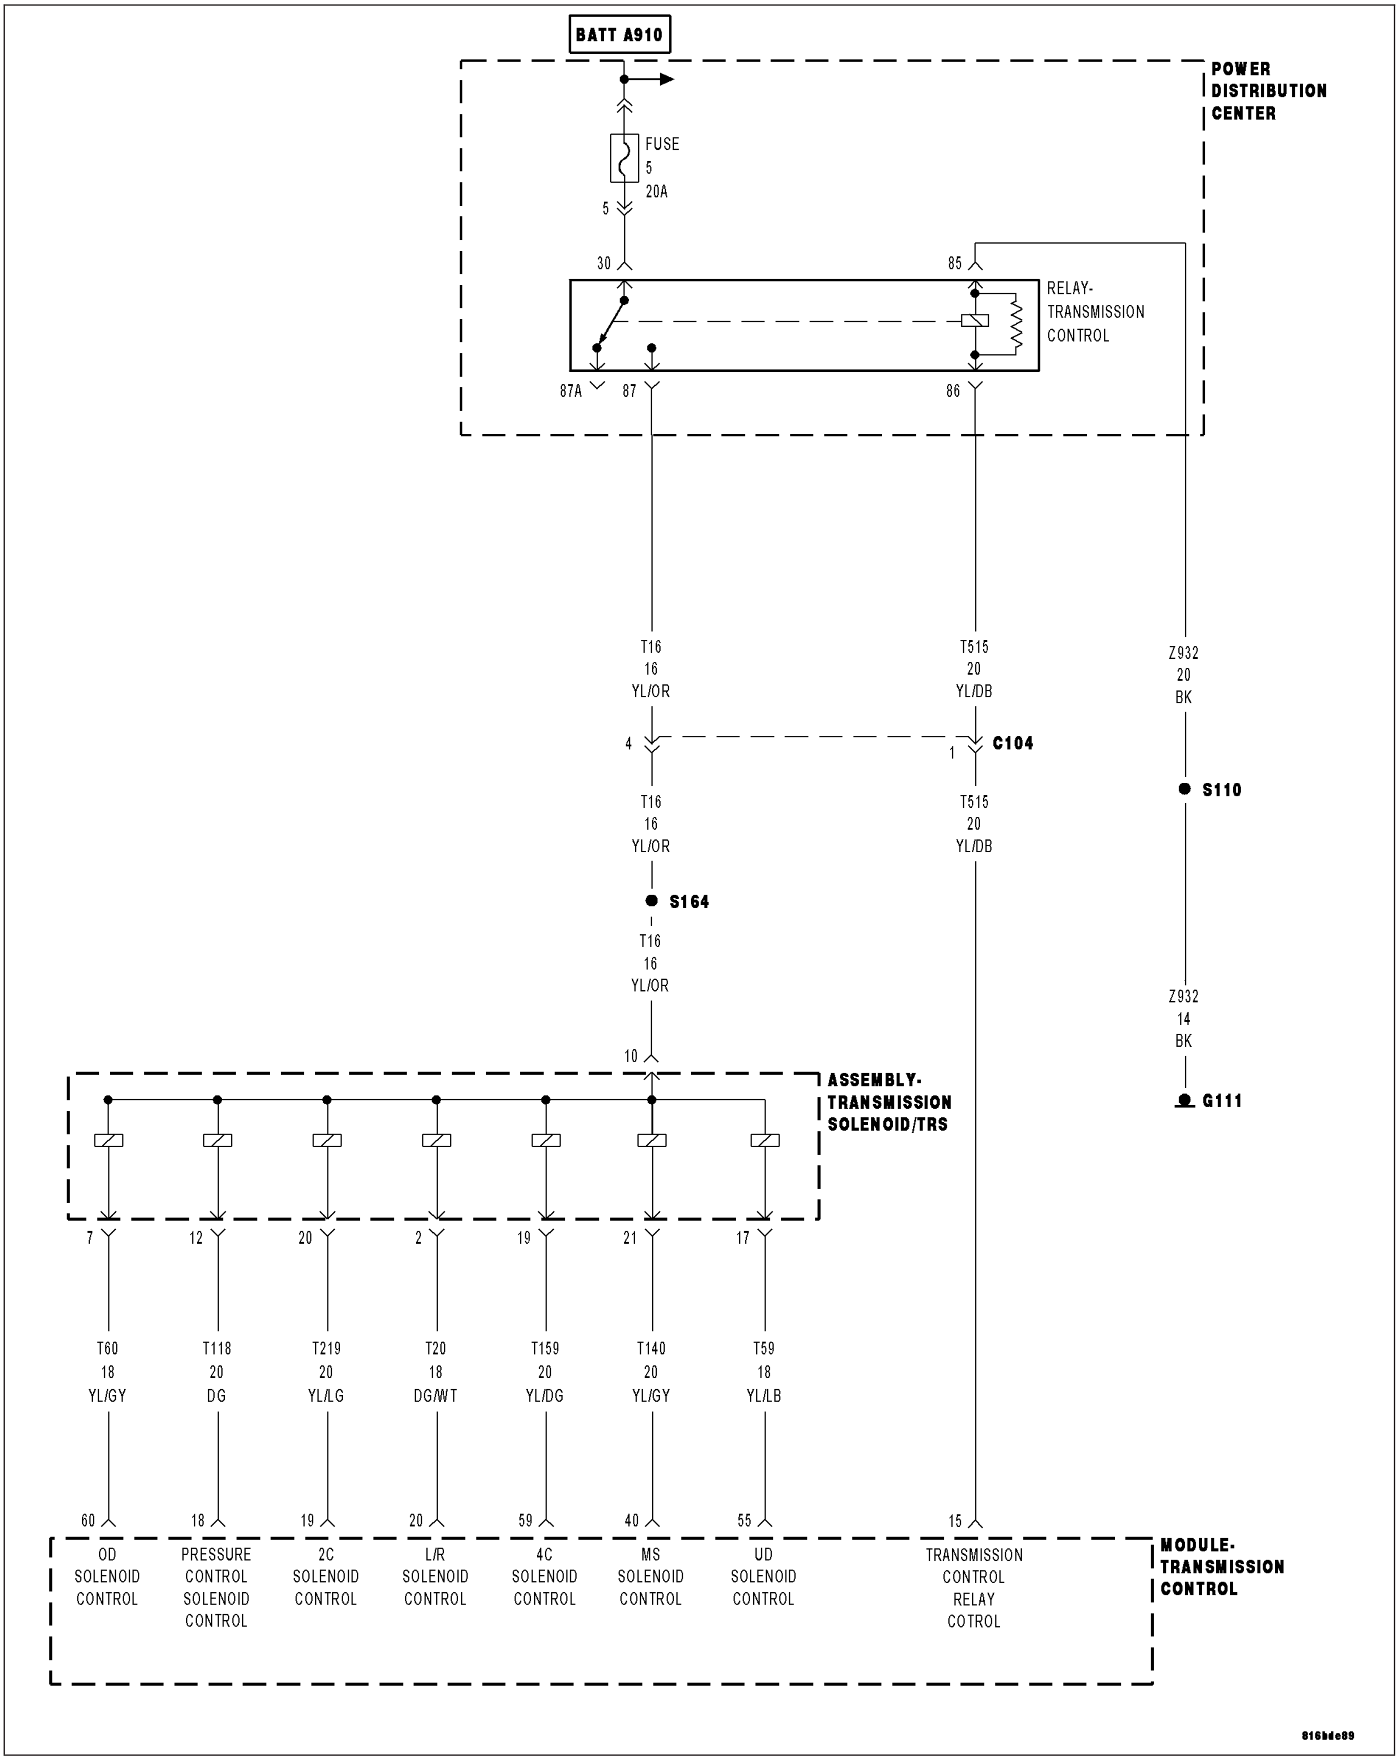
**Are any of the CVI's less than 5 or are they different than before the battery disconnect?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Test Complete.

# P2706-MS SOLENOID CIRCUIT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Initially at power-up, then every 10 seconds thereafter. The solenoid circuits will also be tested immediately after a gear ratio or pressure switch error is detected.
- **Set Condition:**
  After three consecutive solenoid continuity test failures, or one failure if test is run in response to a gear ratio or pressure switch error. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

| Possible Causes |
|---|
| RELATED TCM POWER INPUT DTCS PRESENT |
| (T118) MS SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS |
| (T118) MS SOLENOID CONTROL CIRCUIT OPEN |
| (T118) MS SOLENOID CONTROL CIRCUIT SHORT TO GROUND |
| TRANSMISSION SOLENOID/TRS ASSEMBLY |
| TRANSMISSION CONTROL MODULE |

**Always perform the 45RFE/545RFE Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)**

## Theory of Operation

The Transmission Control System uses six electronically controlled solenoids that allow hydraulic fluid to be applied to various friction elements (clutches), which enables the gear requested. The continuity of each solenoid circuit is periodically tested. Each inactive solenoid is turned on for a few milliseconds, then off. Each active solenoid is turned off for a few milliseconds, then on. This pulsing of voltage to the solenoid causes an inductive spike which can be sensed by the Transmission Control System. If an inductive spike is not sensed by the Transmission Control System during the continuity check, it is tested again. If the test fails three consecutive times, the appropriate Diagnostic Trouble Code (DTC) is set. If the solenoid test is run in response to a gear ratio or pressure switch error, one failure will result in setting the appropriate DTC. **Note: This DTC is strictly an electrical fault and does not apply to any internal transmission failures.**

## Diagnostic Test

### 1. DETERMINE IF RELATED TCM POWER INPUT DTCS ARE PRESENT

With the scan tool, read Transmission DTCs

**Are there any TCM Power Input DTCs present also?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom.

**No** >> Go To 2

### 2. TRANSMISSION SOLENOID/TRS ASSEMBLY

Turn the ignition off to the lock position.

Remove the Starter Relay.

**CAUTION: Removal of the Starter Relay will prevent the vehicle from being started in gear.**

**WARNING: The Starter Relay must be removed from the PDC. Failure to do so can result in personal injury or death.**

**NOTE: Failure to remove the Starter Relay can cause a Transmission - No Response condition.**

Install Transmission Simulator, Miller tool #8333.

Ignition on, engine not running.

With the scan tool, actuate the MS Solenoid.

Monitor the MS Solenoid LED on the Transmission Simulator.

**Did the MS Solenoid LED on the Transmission Simulator blink on and off?**

**Yes** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. TRANSMISSION SOLENOID/TRS ASSEMBLY

With the scan tool, continue to actuate the MS Solenoid for the period of 2 minutes with the Transmission Simulator still connected.

After 2 minutes of actuation, with the scan tool, stop the actuation and check for transmission DTCs.

**Did the DTC P2706 reset during the actuation test?**

**Yes** >> Go To 4

**No** >> Replace the Transmission Solenoid/TRS Assembly per the Service Information.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

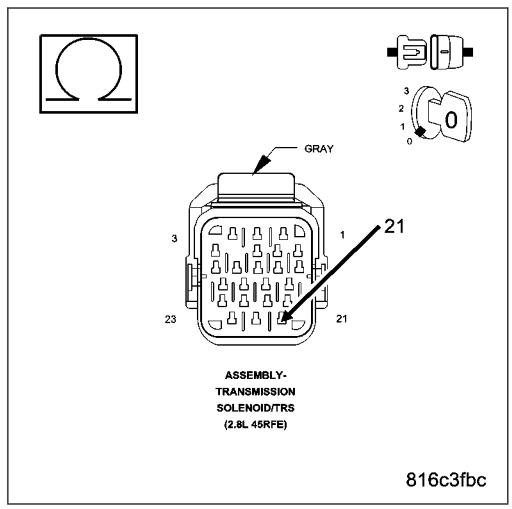
## 4. (T140) MS SOLENOID CONTROL CIRCUIT SHORT TO OTHER CIRCUITS

Turn the ignition off to the lock position.

Disconnect the Transmission Simulator, Miller tool #8333.

Disconnect the PCM harness connectors.

Measure the resistance between the (T140) MS Solenoid Control circuit and all other circuits in the Transmission Solenoid/TRS Assembly harness connector.



**Is the resistance below 5.0 ohms between the (T140) MS Solenoid Control circuit and any other circuit(s) in the Transmission Solenoid/TRS Assembly harness connector?**

**Yes** >> Repair the (T140) MS Solenoid Control circuit for a short to other circuit(s).

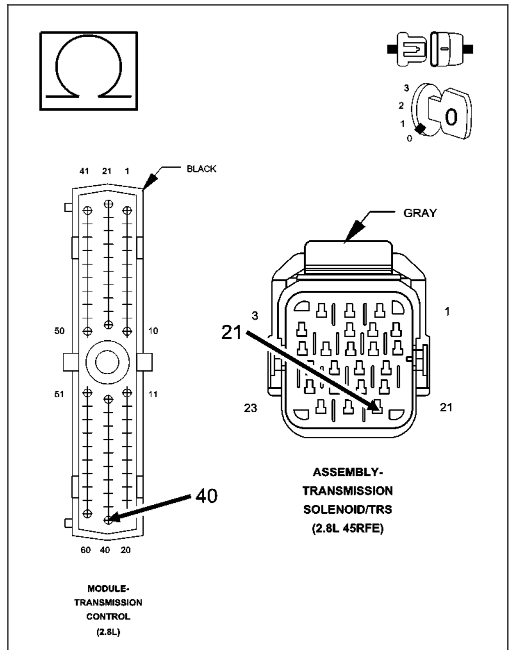
Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (T140) MS SOLENOID CONTROL CIRCUIT OPEN

Disconnect the TCM harness connector.

Measure the resistance of the (T140) MS Solenoid Control circuit from the Transmission Solenoid/TRS Assembly harness connector to the appropriate terminal of the TCM harness connector.



816c0eb0

**Is the resistance above 5.0 ohms?**

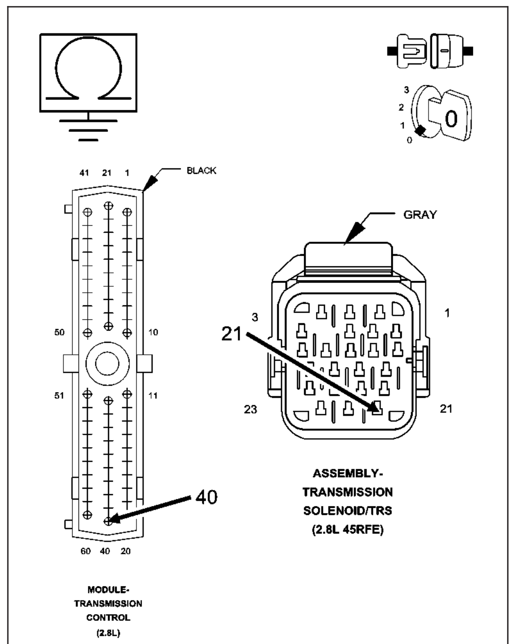
**Yes** >> Repair the (T140) MS Solenoid Control circuit for an open.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PRO-CEDURE)

**No** >> Go To 6

## 6. (T140) MS SOLENOID CONTROL CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T140) MS Solenoid Control circuit.



816c0eb7

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (T140) MS Solenoid Control circuit for a short to ground.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. With the scan tool, perform QUICK LEARN.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PRO-CEDURE)

## STANDARD PROCEDURE

## 45RFE/545RFE PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram **Refer to Section 8W**.

# 1.

Perform the following before attempting any diagnostic procedures:

- Check the transmission fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper level. Refer to the appropriate Service Information for procedures. Many transmission symptoms can be caused by a low fluid level.
- Check the battery. To avoid false diagnosis, testing should only be performed with the battery fully charged.
- With the scan tool, read Engine (PCM) DTCs. If DTCs are present, refer to the Driveability Category and perform to the appropriate diagnostic procedure(s) before proceeding.
- With the scan tool, read Transmission (TCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
- With the scan tool, read DTC EVENT DATA. Use this data to identify the conditions in which the DTC was set.
- Performing a Battery Disconnect will clear all DTC EVENT DATA and reset all learned Transmission values to the default values, which may temporarily result in erratic shift schedules.
- With the scan tool, perform the Shift Lever Position Test. If the test does not pass, refer to the diagnostic procedure for P0706 Check Shifter Signal.
- For Gear Ratio Error DTCs, use the scan tool to view CVI Monitor data. Read and record the Clutch Volume Index information.
- Use the wiring diagram as a guide. Inspect the wiring and connectors related to this circuit. Repair as necessary.
- Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, after driving under specific conditions and after diagnostic monitors have been run.
- Refer to applicable Technical Service Bulletins (TSBs) for controller software update information. Some conditions can be corrected by upgrading the Engine (PCM) or Transmission (TCM) controller software.
- Refer to any Service Information Tune Ups or Technical Service Bulletins that apply.

**Were there any repairs made that fixed the vehicle?**

**Yes** >> Testing complete.

Perform 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - STANDARD PROCEDURE)

**No** >> Refer to the Transmission category and perform the appropriate diagnostic procedure(s).

## 45RFE/545RFE TRANSMISSION VERIFICATION TEST - VER 1

For a complete wiring diagram **Refer to Section 8W**.

### 1.

Perform the following after completion of a diagnostic repair:

- **After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed.**
- Connect the scan tool to the Data Link Connector (DLC).
- Reconnect any disconnected components.
- If the PCM has been replaced or updated (flashed), or the transmission has been repaired or replaced, using the scan tool, perform a Quick Learn Procedure.
- With the scan tool, erase all Transmission and Engine DTC's.
- With the scan tool, perform a BATTERY DISCONNECT, this will clear the DTC EVENT DATA
- With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT.
- Check the Transmission fluid level and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/FLUID - STANDARD PROCEDURE)
- Road test the vehicle.
- Perform the following shifts from a standing start with a constant throttle opening of 20 to 25 degrees to the speeds of 97 Kmh or 60 MPH; make fifteen to twenty 1 to 2, 2 to 3, 3 to 4 upshifts and for 545RFE, 4 to 5.
- Perform the following shifts with speeds below 40 Kmh or 25 MPH; make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
- Check for DTCs during and after the road test.
- If after performing the road test, if any shift concerns are noted, perform the drive learn procedure for those affected shifts. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)
- **Use the EATX OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC does not re-mature.**

**Were there any Diagnostic Trouble Codes (DTCs) set during the road test?**

**Yes** >> Refer to the Transmission category and perform the appropriate symptom. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE - DIAGNOSIS AND TESTING)

**No** >> Repair is complete.

# AUTOMATIC TRANSMISSION - 545RFE

## TABLE OF CONTENTS

# AUTOMATIC TRANSMISSION - 545RFE

## DESCRIPTION

The 545RFE automatic transmission is a sophisticated, multi-range, electronically controlled transmission which combines optimized gear ratios for responsive performance, state of the art efficiency features and low NVH. Other features include driver adaptive shifting and three planetary gear sets to provide wide ratio capability with precise ratio steps for optimum driveability. The three planetary gear sets also make available a unique alternate second gear ratio. The primary 2nd gear ratio fits between 1st and 3rd gears for normal through-gear accelerations. The alternate second gear ratio (2prime) allows smoother 4-2 kickdowns at high speeds to provide 2nd gear passing performance over a wider highway cruising range. An additional overdrive ratio (0.67:1) is also provided for greater fuel economy and less NVH at highway speeds.

The hydraulic portion of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components.

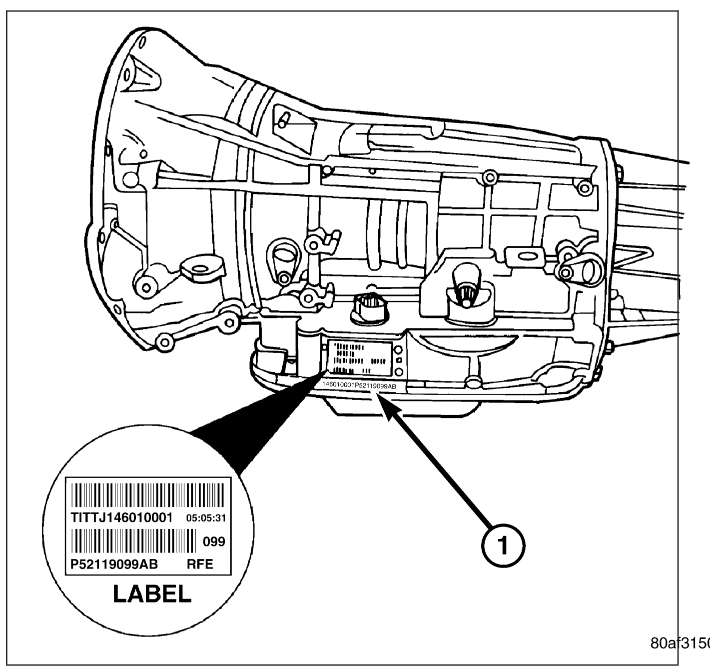
The primary mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Three multiple disc holding clutches
- Five hydraulic accumulators
- Three planetary gear sets
- Dual Stage Hydraulic oil pump
- Valve body
- Solenoid pack

The Transmission Control Module (TCM) is the "heart" or "brain" of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. Depending on the vehicle configuration, the TCM may be a standalone module or it it may be housed along with the Powertrain Control Module (PCM) in a single module. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

## TRANSMISSION IDENTIFICATION

Transmission identification numbers (1) are stamped on the left side of the case just above the oil pan sealing surface. Refer to this information when ordering replacement parts. A label is attached to the transmission case above the stamped numbers. The label gives additional information which may also be necessary for identification purposes.



## GEAR RATIOS

The 545RFE gear ratios are:

| | |
|---|---|
| 1st | 3.00:1 |
| 2nd | 1.67:1 |
| 2nd Prime | 1.50:1 |
| 3rd | 1.00:1 |
| 4th | 0.75:1 |
| 5th | 0.67:1 |
| Reverse | 3.00:1 |

## OPERATION

The 545RFE offers full electronic control of all automatic up and downshifts, and features real-time adaptive closed-loop shift and pressure control. Electronic shift and torque converter clutch controls help protect the transmission from damage due to high temperatures, which can occur under severe operating conditions. By altering shift schedules, line pressure, and converter clutch control, these controls reduce heat generation and increase transmission cooling.

To help reduce efficiency-robbing parasitic losses, the transmissions includes a dual-stage transmission fluid pump with electronic output pressure control. Under most driving conditions, pump output capacity greatly exceeds that which is needed to keep the clutches applied. The 45RFE/545RFE pump-pressure control system monitors input torque and adjusts the pump pressure accordingly. The primary stage of the pump works continuously; the second stage is bypassed when demand is low. The control system also monitors input and output speed and, if incipient clutch slip is observed, the pressure control solenoid duty cycle is varied, increasing pressure in proportion to demand.

A high-travel torque converter damper assembly allows earlier torque converter clutch engagement to reduce slippage. Needle-type thrust bearings reduce internal friction. The 45RFE/545RFE is packaged in a one-piece die-cast aluminum case. To reduce NVH, the case has high lateral, vertical and torsional stiffness. It is also designed to maximize the benefit of the structural dust cover that connects the bottom of the bell housing to the engine bedplate, enhancing overall power train stiffness. Dual filters protect the pump and other components. A cooler return filter is added to the customary main sump filter. Independent lubrication and cooler circuits assure ample pressure for normal transmission operation even if the cooler is obstructed or the fluid cannot flow due to extremely low temperatures.

The hydraulic control system design (without electronic assist) provides the transmission with PARK, REVERSE, NEUTRAL, SECOND, and THIRD gears, based solely on driver shift lever selection. This design allows the vehicle to be driven (in “limp-in” mode) in the event of a electronic control system failure, or a situation that the Transmission Control Module (TCM) recognizes as potentially damaging to the transmission.

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC’s, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the scan tool.

## DIAGNOSIS AND TESTING

## AUTOMATIC TRANSMISSION

**CAUTION: Before attempting any repair on a 545RFE automatic transmission, check for Diagnostic Trouble Codes with the scan tool.**

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

## PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

### VEHICLE IS DRIVABLE

1. Check for transmission fault codes using scan tool.
2. Check fluid level and condition.
3. Adjust gearshift cable if complaint was based on delayed, erratic, or harsh shifts.
4. Road test and note how transmission upshifts, downshifts, and engages.
5. Perform hydraulic pressure test if shift problems were noted during road test.
6. Perform air-pressure test to check clutch operation.

### VEHICLE IS DISABLED

1. Check fluid level and condition.
2. Check for broken or disconnected gearshift cable.
3. Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
4. Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:
   a. If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
   b. If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
   c. If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

## ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line presure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

**545RFE CLUTCH APPLICATION CHART**

| SLP | UD | OD | R | 2C | 4C | L/R | OVERRUNNING |
|---|---|---|---|---|---|---|---|
| **P–PARK** | | | | | | ON | |

| **1–LOW** | ON | | | | | ON | ON |

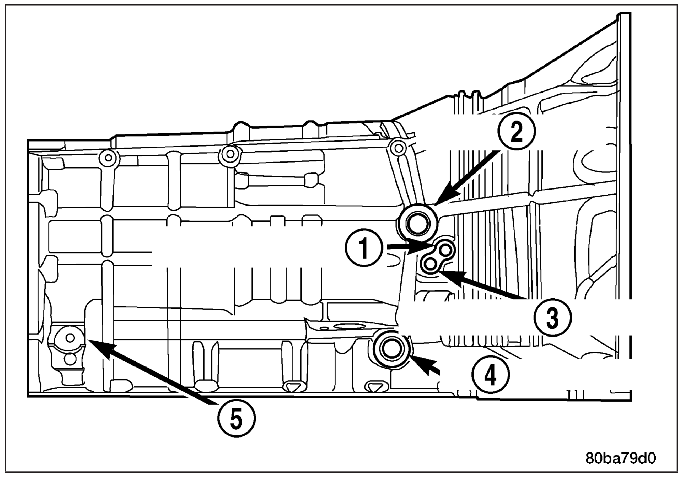
*L/R clutch is on only with the output shaft speed below 150 rpm.

## HYDRAULIC PRESSURE TEST

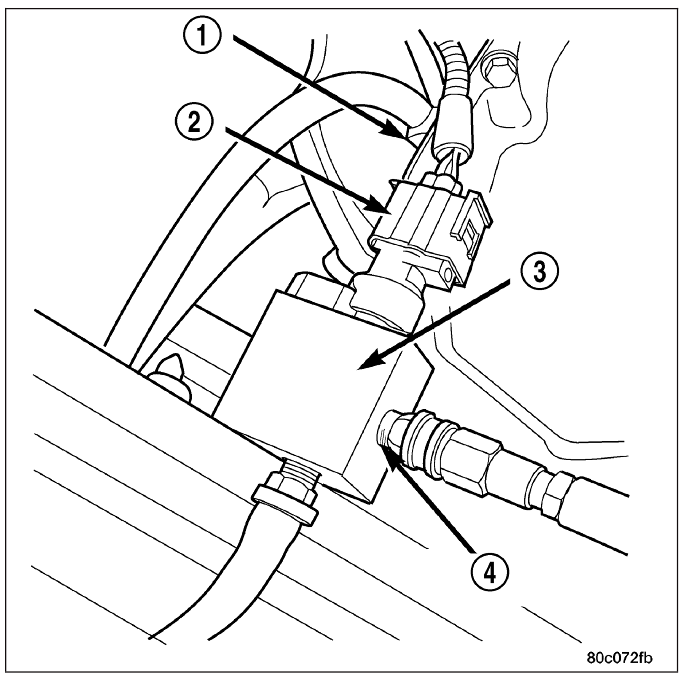
An accurate tachometer and pressure test gauges are required. Oil Pressure Gauge C-3293-SP has a 300 psi range and is used at all locations where pressures exceed 100 psi.

### Pressure Test Port Locations

Only two pressure ports are supplied on the transmission case. The torque converter clutch apply (3) and release (1) ports are located on the right side of the transmission case.

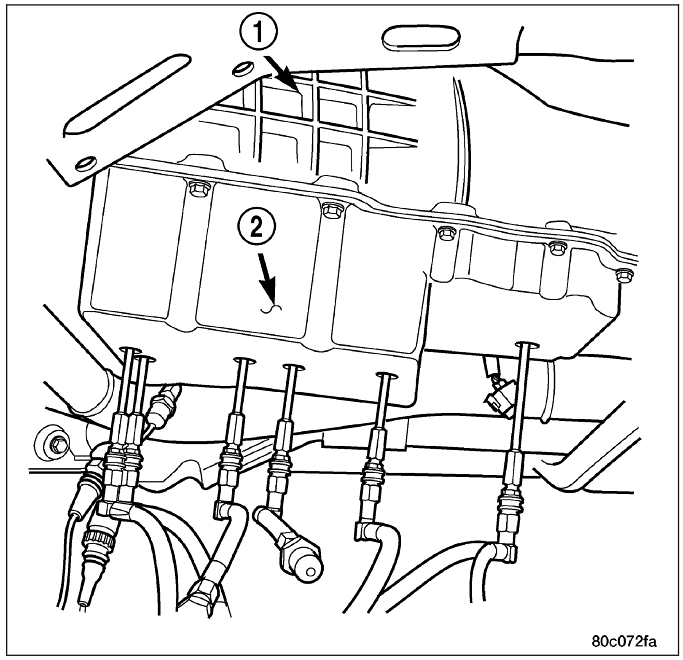


To determine the line pressure, there are two available methods. The scan tool can be used to read line pressure from the line pressure sensor. The second method is to install Line Pressure Adapter 8259 (3) into the transmission case and then install the pressure gauge and the original sensor (2) into the adapter. This will allow a comparison of the scan tool readings and the gauge reading to determine the accuracy of the line pressure sensor. The scan tool

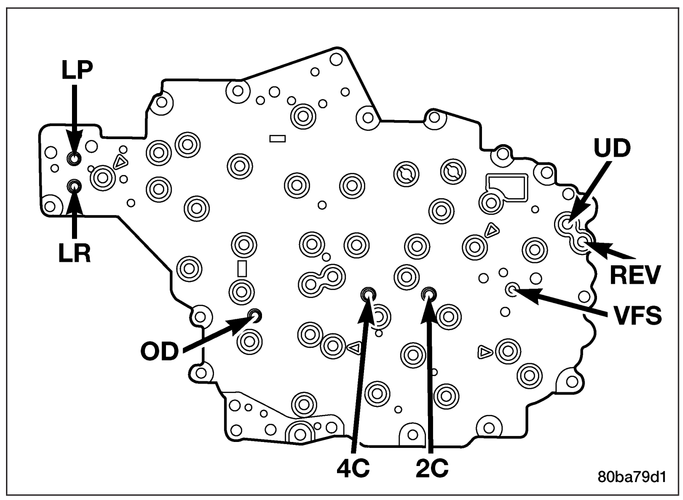


line pressure reading should match the gauge reading within ±10 psi.

In order to access any other pressure tap locations, the transmission oil pan must be removed, the pressure port plugs removed and Valve Body Pressure Tap Adapter 8258-A (2) installed. The extensions supplied with Adapter 8258-A will allow the installation of pressure gauges to the valve body.



Refer to the Pressure Tap Locations graphic for correct pressure tap location identification.



## TEST PROCEDURE

All pressure readings should be taken with the transmission fluid level full, transmission oil at the normal operating temperature, and the engine at 1500 rpm. Check the transmission for proper operation in each gear position that is in question or if a specific element is in question, check the pressure readings in at least two gear positions that employ that element. Refer to the Hydraulic Schematics at the rear of this section to determine the correct pressures for each element in a given gear position.

**NOTE: The 45RFE/545RFE utilizes closed loop control of pump line pressure. The pressure readings may therefore vary greatly but should always follow line pressure.**

Some common pressures that can be measured to evaluate pump and clutch performance are the upshift/downshift pressures, garage shift pressures, and TCC pressure. The upshift/downshift pressure for all shifts are shown in UPSHIFT PRESSURES and DOWNSHIFT PRESSURES . In-gear maximum pressure for each gear position is shown in IN-GEAR PRESSURES . The garage shift pressure when performing a N-R shift is 220 psi. The garage shift pressure for the R-N shift is 120 psi. The garage shift pressure for the N-1 shift is 135 psi. Torque converter lock-up pressure is 120 psi.

**UPSHIFT PRESSURES**

| 1-2 | 2-3 | 2prime-3 | 3-4 | 2prime-4 | 2-5 | 3-5 | 4-5 |
|---|---|---|---|---|---|---|---|
| 120 | 120 | 120 | 120 | 120 | 120 | 120 | 130 |

**DOWNSHIFT PRESSURES**

| 5-4 | 5-3 | 5-2 | 4-3 | 4-2prime | 3-2 | 3-2prime | 2prime-1 | 2-1 | 3-1 |
|---|---|---|---|---|---|---|---|---|---|
| 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 | 120 |

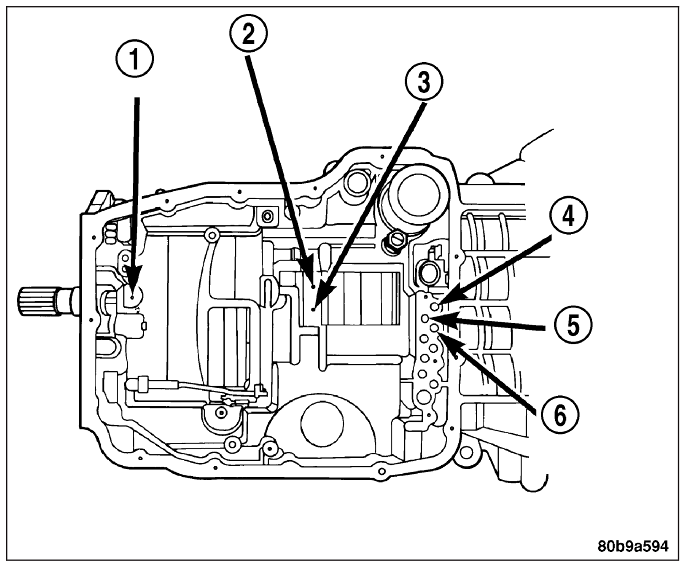
**IN-GEAR PRESSURES**

| 1 | 2 | 2prime | 3 | 4 | 5 | NEUTRAL | REVERSE |
|---|---|---|---|---|---|---|---|
| 135 | 120 | 120 | 120 | 120 | 120 | 120 | 220 |

## AIR CHECKING TRANSMISSION CLUTCH OPERATION

Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The clutch apply passages are shown in the Air Pressure Test Passages graphic.



**NOTE: The air supply which is used must be free of moisture and dirt. Use a pressure of 30 psi to test clutch operation.**

Apply air pressure at each port. If the clutch is functioning, a soft thump will be heard as the clutch is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

## CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

1. Verify that a leak condition actually exists.
2. Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Torque converter seal leaks tend to move along the drive hub and onto the rear of the converter. Pump cover seal leaks tend to run down the cover and the inside surface of the bellhousing.

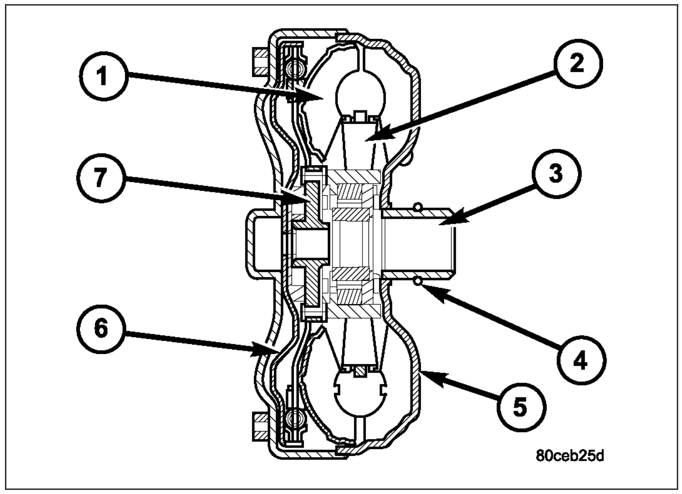
Some leaks, or suspected leaks, may be particularly difficult to locate. If necessary, a Mopar® approved dye should be used to locate and confirm a leak.

## TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

1. Leaks at the weld joint around the outside diameter weld.
2. Leaks at the converter hub weld.

In most cases, a torque converter which is wet from transmission fluid indicates a leak at one of these areas.



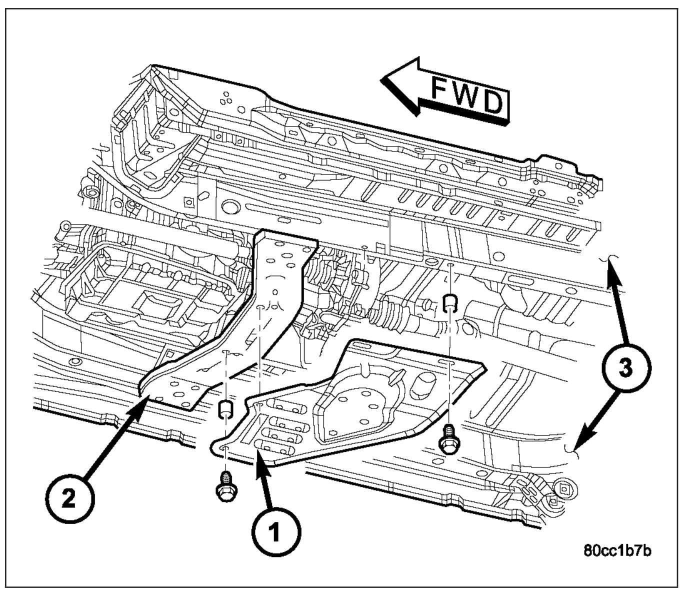
## STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

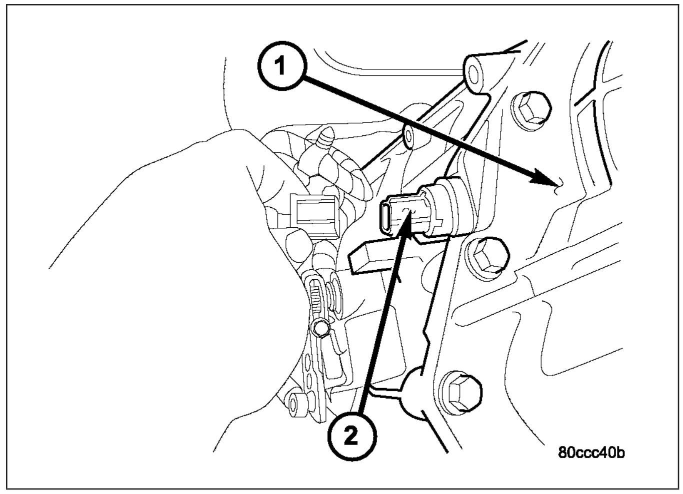
Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

## REMOVAL

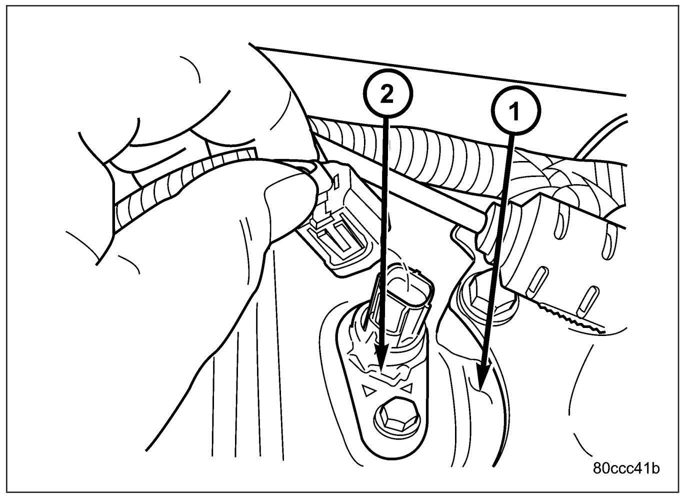
1. Disconnect the negative battery cable.
2. Raise and support the vehicle
3. Remove any necessary skid plates (1). (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)



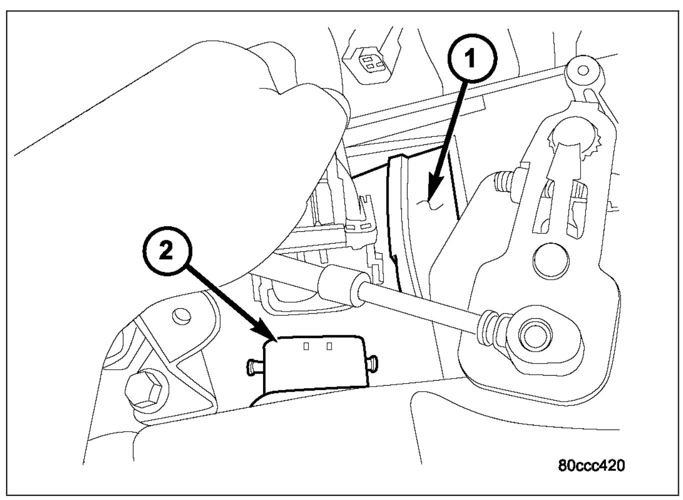
4. Mark propeller shaft and axle companion flanges for assembly alignment.
5. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
6. Remove the front propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
7. Disengage the output speed sensor connector from the output speed sensor (2).



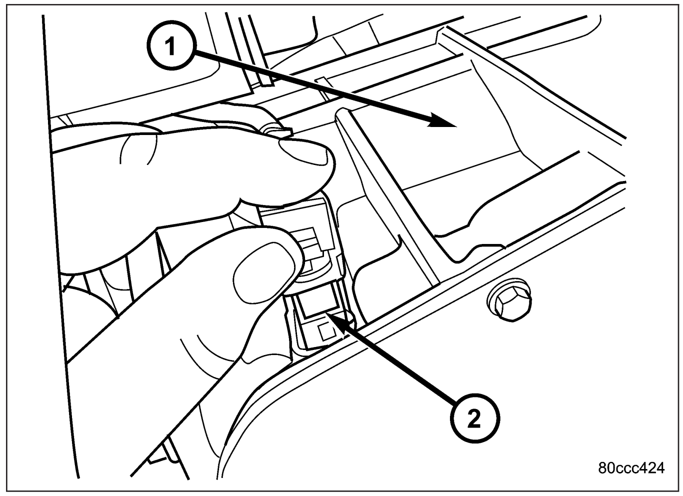
8. Disengage the input speed sensor connector from the input speed sensor (2).



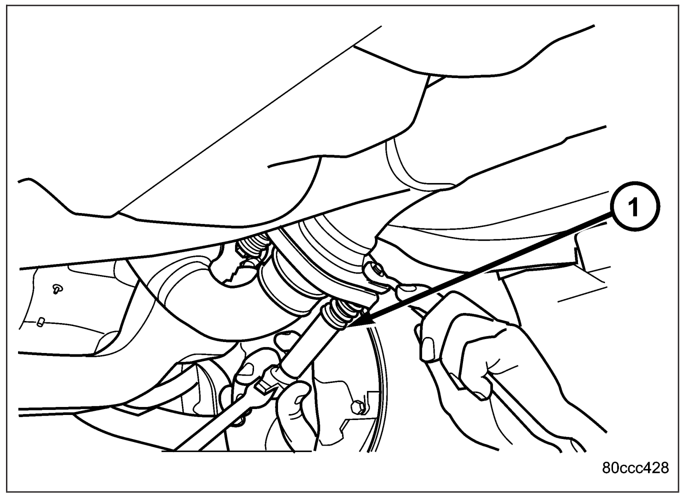
9. Disengage the transmission solenoid/TRS assembly connector from the transmission solenoid/TRS assembly (2).



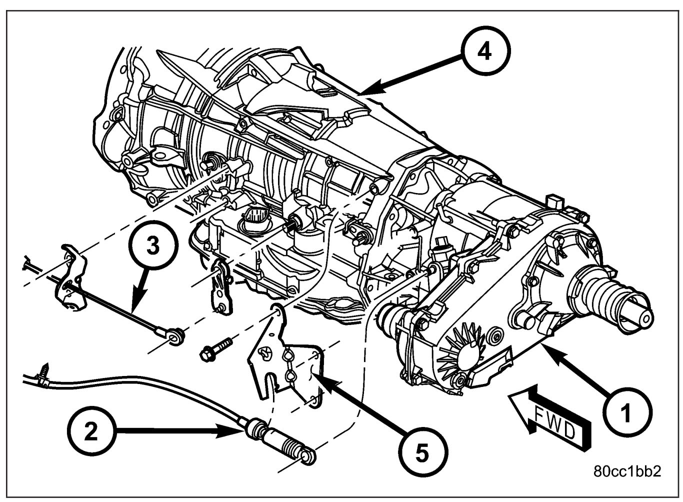
10. Disengage the line pressure sensor connector from the line pressure sensor (2).



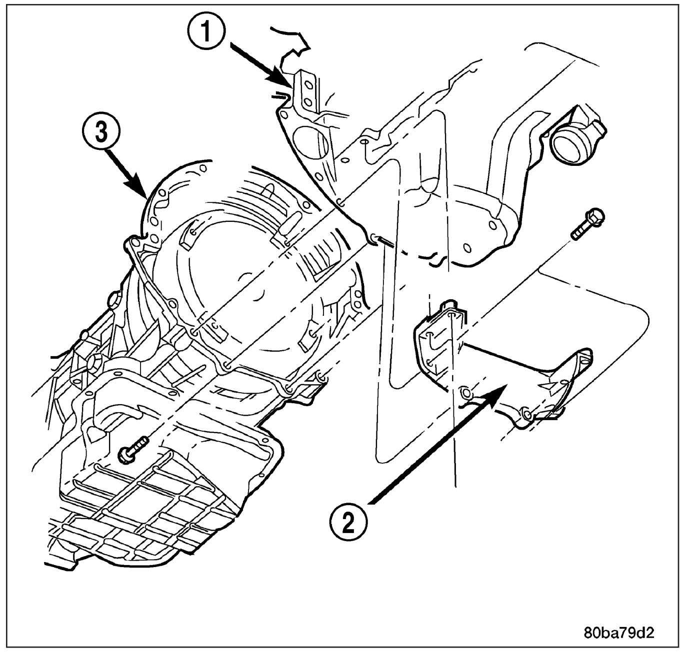
11. Remove the bolts (1) holding the exhaust crossover pipe to the pre-catalytic converter pipe flanges.
12. Remove the bolts holding the exhaust crossover pipe to the catalytic converter flange.



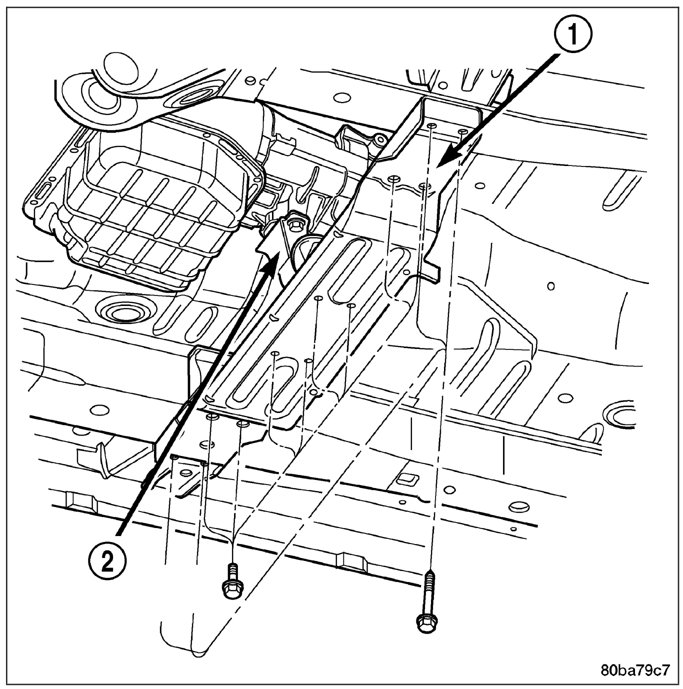
13. Disconnect gearshift cable (2) from transmission manual valve lever.



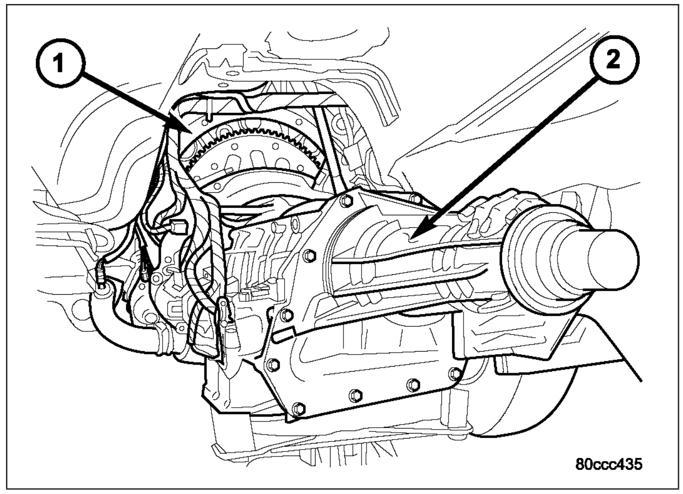
14. Disengage the shift cable from the cable support bracket.
15. Remove the starter motor.
16. Remove the engine to transmission collar (2).



17. Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.
18. Disconnect transmission fluid cooler lines at transmission fittings and clips.
19. Disconnect the transmission vent hose from the transmission.
20. Remove transfer case.
21. Support rear of engine with safety stand or jack.
22. Raise transmission slightly with service jack to relieve load on crossmember and supports.
23. Remove bolts securing rear support and cushion (2) to transmission and crossmember (1).
24. Remove bolts attaching crossmember to frame and remove crossmember.

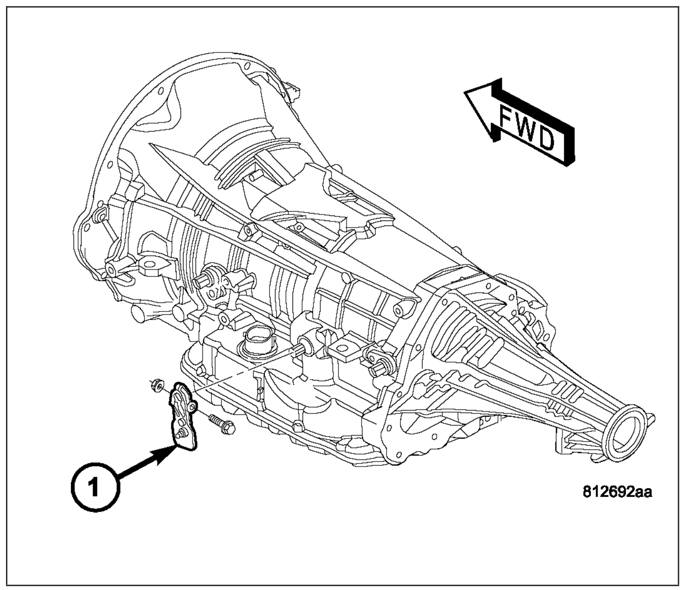


25. Remove all remaining converter housing bolts.
26. Carefully work transmission and torque converter assembly rearward off engine block dowels.
27. Hold torque converter in place during transmission removal.
28. Lower transmission and remove assembly (2) from under the vehicle.
29. To remove torque converter, carefully slide torque converter out of the transmission.

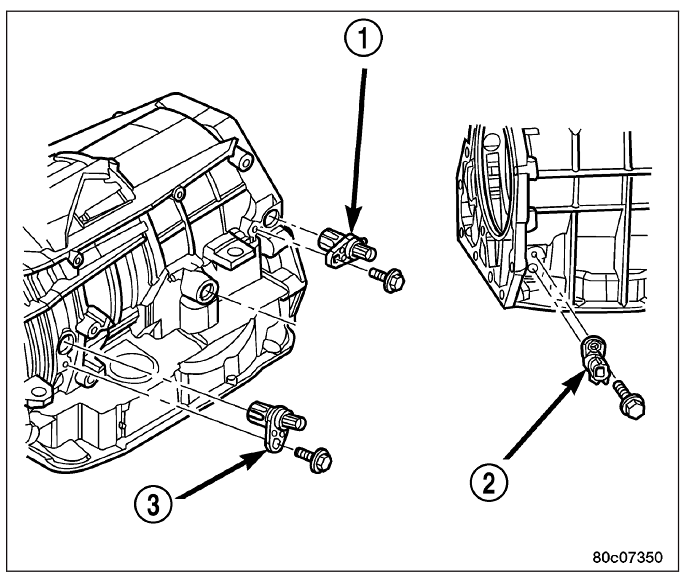


## DISASSEMBLY

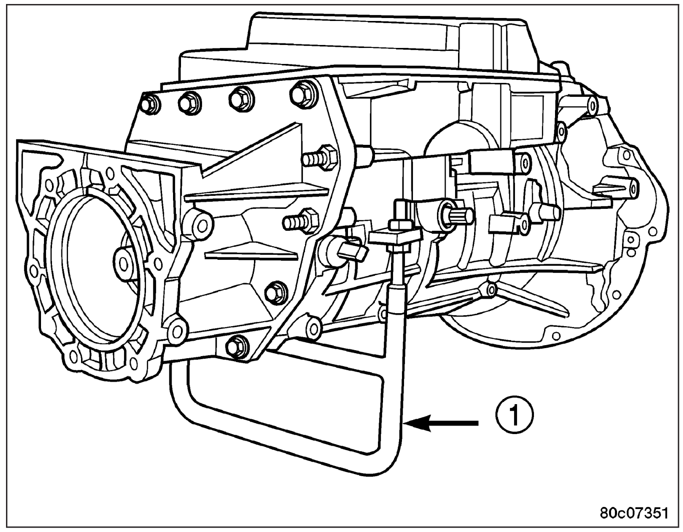
1. Drain fluid from transmission.
2. Clean exterior of transmission with suitable solvent or pressure washer.
3. Remove the torque converter from the transmission.
4. Remove the manual shift lever (1) from the transmission.



5. Remove the input (3), output (1), and line pressure sensors (2) from the transmission case.
6. Inspect the ends of the sensors for debris, which may indicate the nature of the transmission failure.

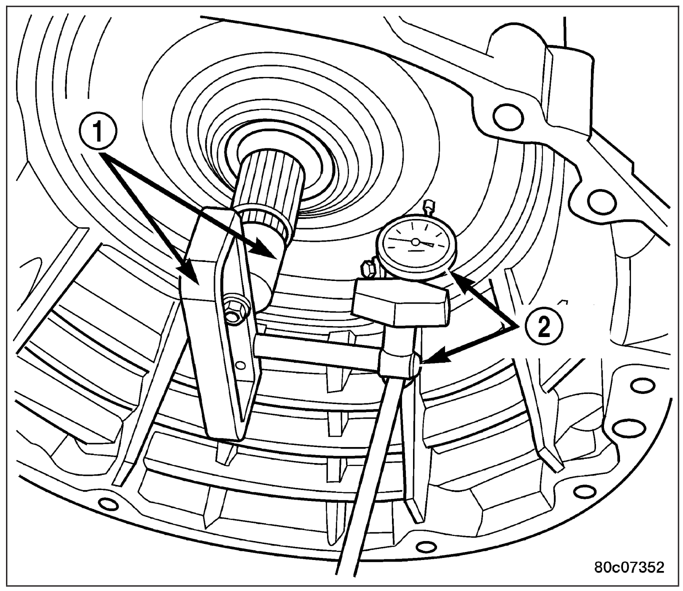


7. Install Support Stand 8257 (1) onto the transmission case.

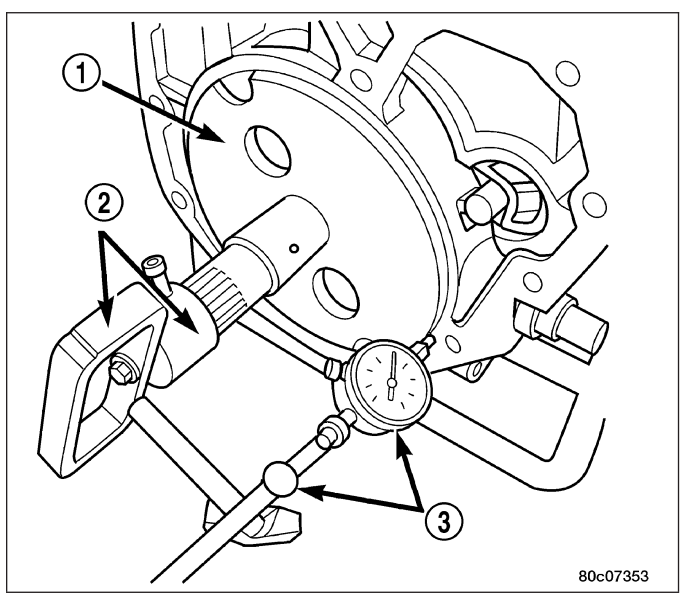


8. Using Adapter 8266-1 from End-Play Tool Set 8266 (1) and Dial Indicator C-3339 (2), measure and record the input shaft end-play.

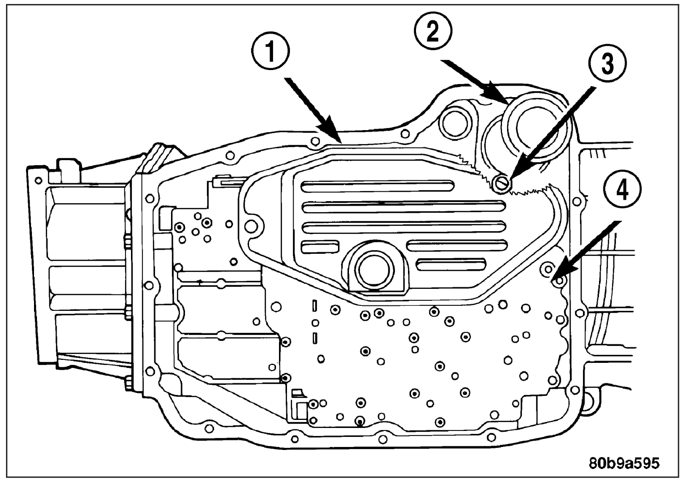
**NOTE: When measuring the input shaft end-play, two ″stops″ will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first ″stop″ felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.**



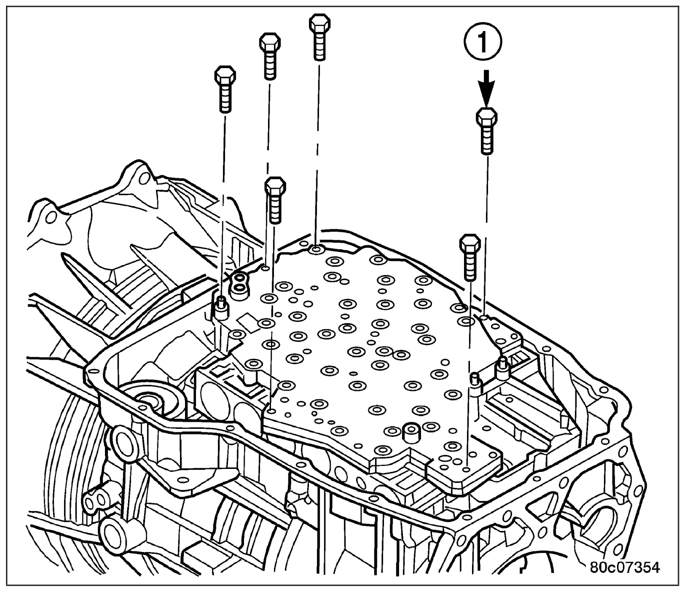
9. Remove the bolts holding the transmission extension/adapter housing to the transmission case.
10. Remove the extension/adapter housing from the transmission case.
11. Using Alignment Plate 8261 (1), Adapter 8266-17 from End-Play Tool Set 8266 (2) and Dial Indicator C-3339 (3), measure and record the output shaft end-play.



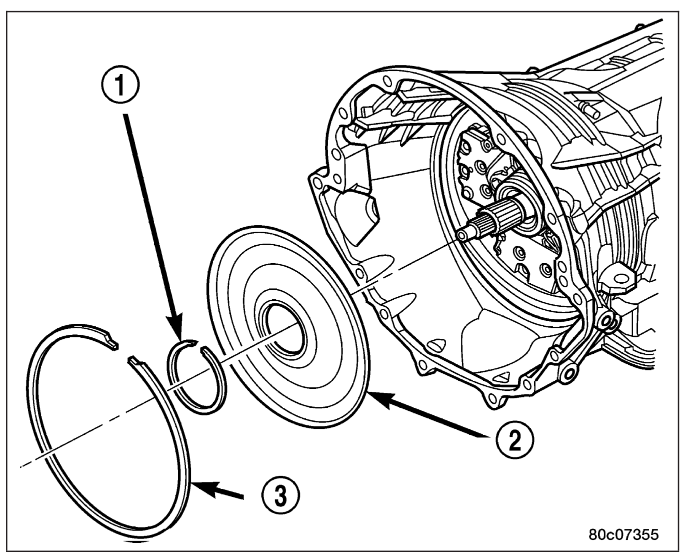
12. Remove the bolts holding the transmission oil pan to the transmission case.
13. Remove the transmission oil pan from the transmission case.
14. Remove the primary oil filter (1) and the oil cooler return filter (2).
15. Remove the cooler return filter bypass valve (3).



16. Remove the bolts (1) holding the valve body to the transmission case.
17. Remove the valve body from the transmission case.

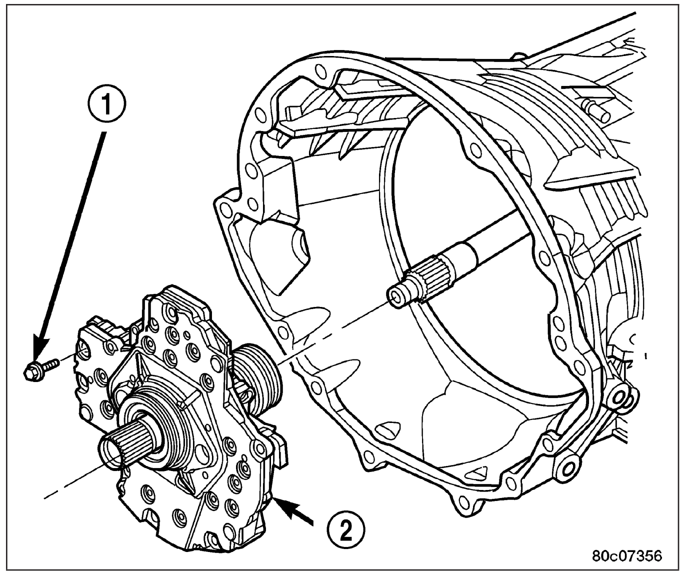


18. Remove the outer snap-ring (3) securing the transmission front cover (2) into the transmission case.
19. Remove the inner snap-ring (1) securing the transmission front cover to the oil pump.
20. Reaching through a case opening in the valve body area with a long blunted tool, remove the transmission front cover from the transmission case.

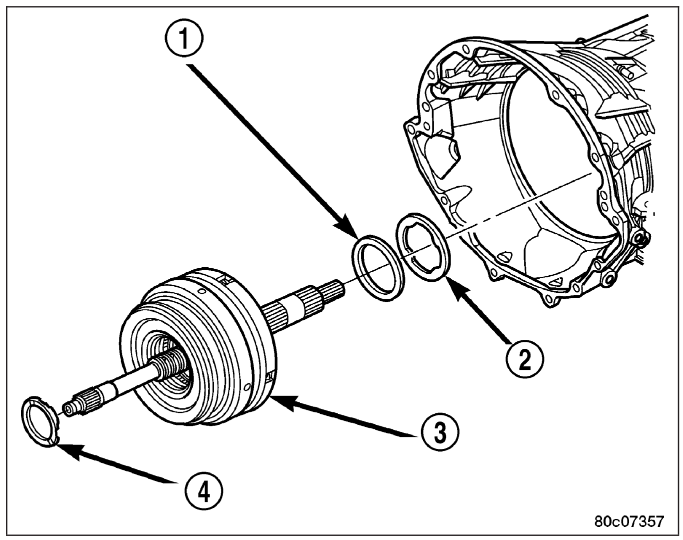


21. Remove the bolts (1) holding the oil pump into the transmission case.
22. Remove the oil pump (2). Hold inward on the input shaft to prevent pulling the input clutch assembly with the oil pump.

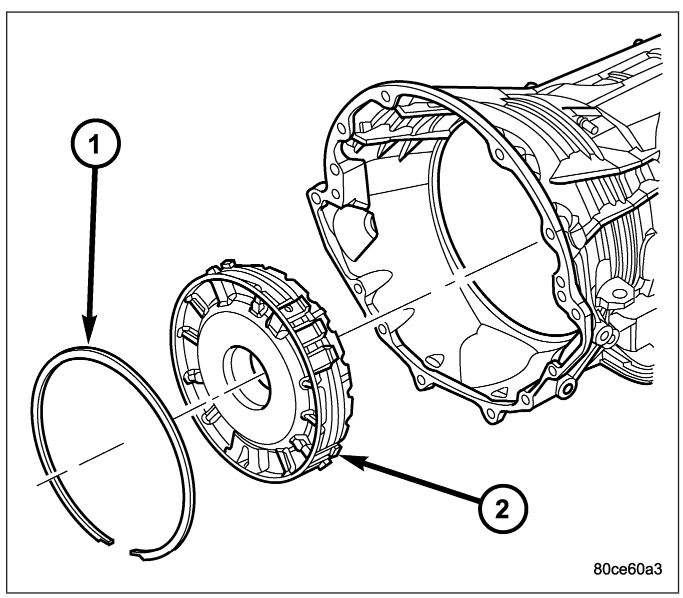
**CAUTION: If the input shaft is not held during oil pump removal, the input clutch assembly will attempt to move forward with the oil pump and the numbers 2, 3, or 4 bearings inside the input clutch assembly may become dislodged.**



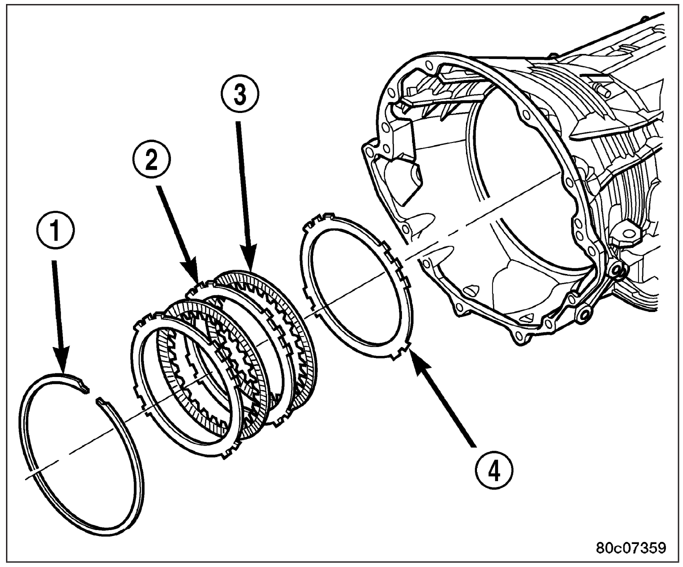
23. Remove the number 1 thrust bearing (4) from the input clutch assembly.
24. Remove the input clutch assembly (3) from the transmission case.
25. Remove the number 5 thrust bearing (1) and selective thrust plate (2) from the input clutch assembly (3), or the 4C clutch retainer/bulkhead.

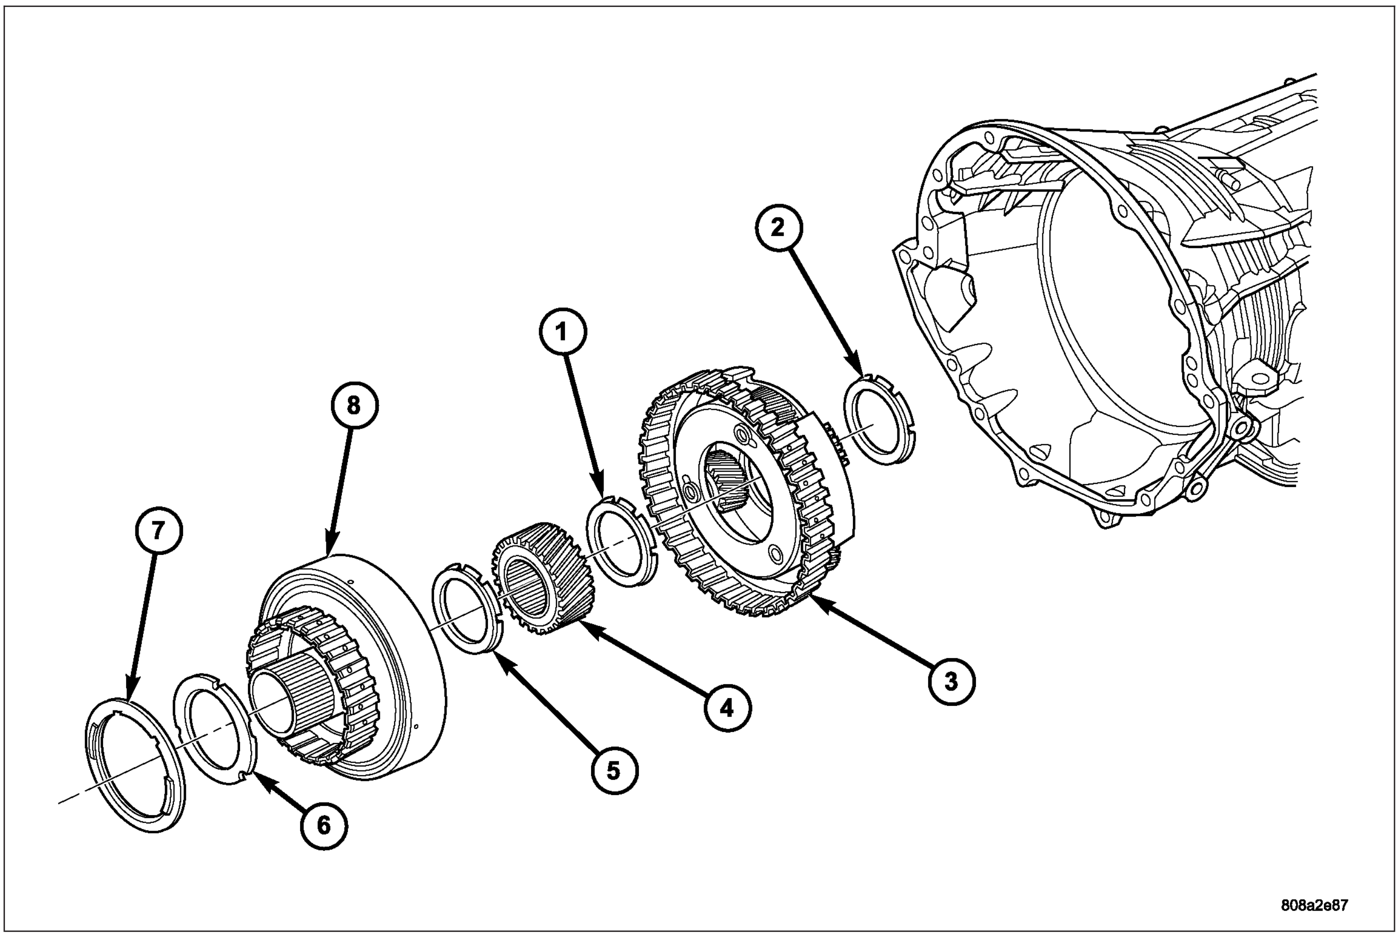


26. Remove the 4C clutch retainer/bulkhead tapered snap-ring (1) from the transmission case.
27. Remove the 4C clutch retainer/bulkhead (2) from the transmission case.



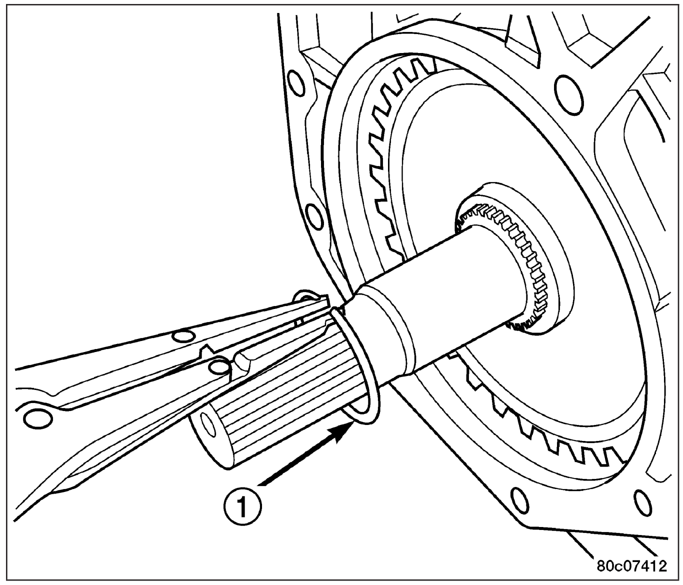
28. Remove the front 2C clutch pack snap-ring (1) from the transmission case.
29. Remove the 2C clutch pack (2, 3, 4) from the transmission case.



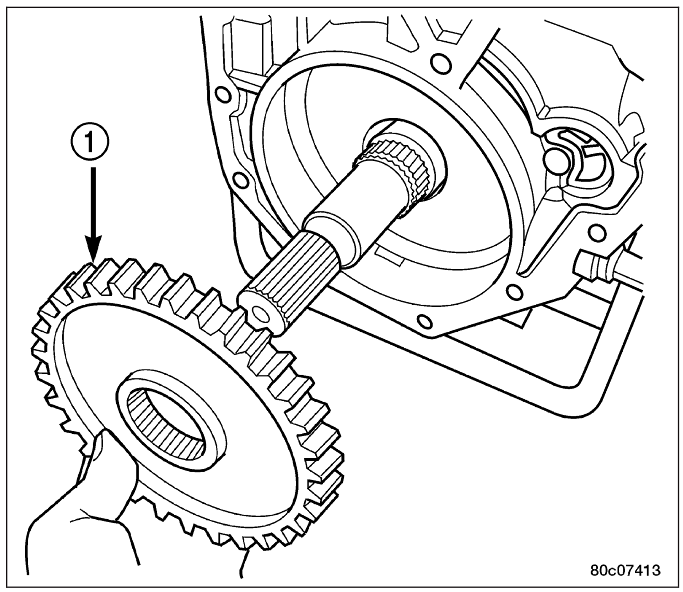


30. Remove the rear selective plate (6) and number 6 thrust bearing (7) from the reaction annulus (8).
31. Remove the reaction annulus (8) from the reaction planetary carrier (3).
32. Remove the number 7 thrust bearing (5).
33. Remove the reaction sun gear (4).
34. Remove the number 8 thrust bearing (1) from the reaction planetary carrier (3).
35. Remove the reaction planetary carrier (3). Note that this planetary gear set has three pinion gears.
36. Remove the number 9 thrust bearing (2) from the reverse planetary gear set.

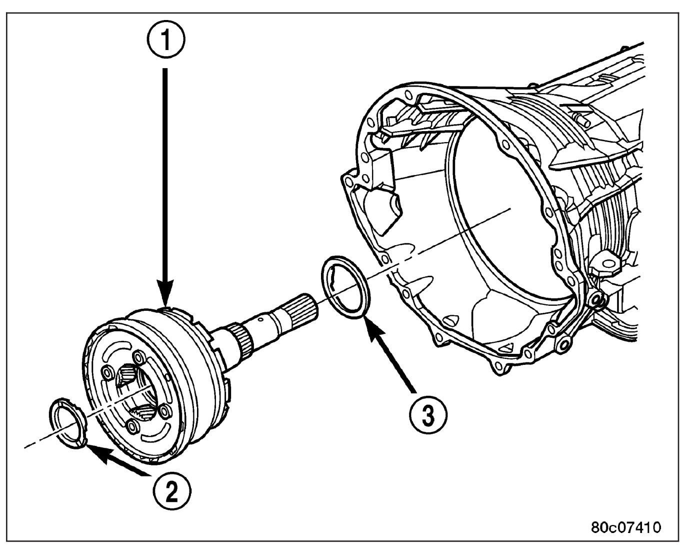
37. Remove the snap-ring (1) holding the park sprag gear onto the output shaft.



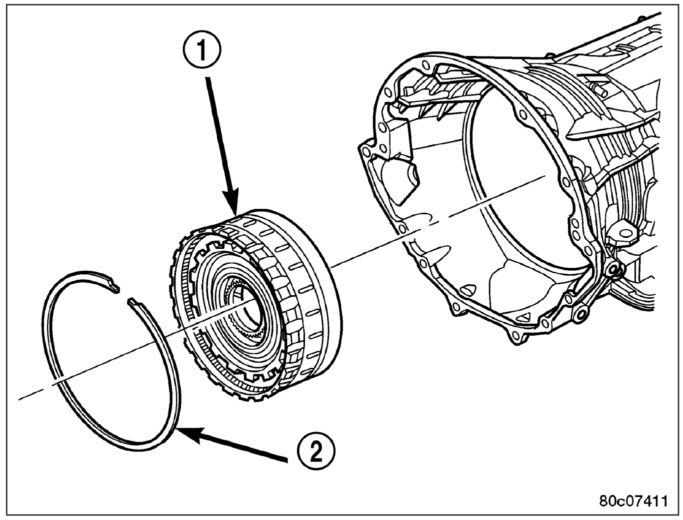
38. Remove the park sprag gear (1) from the output shaft.



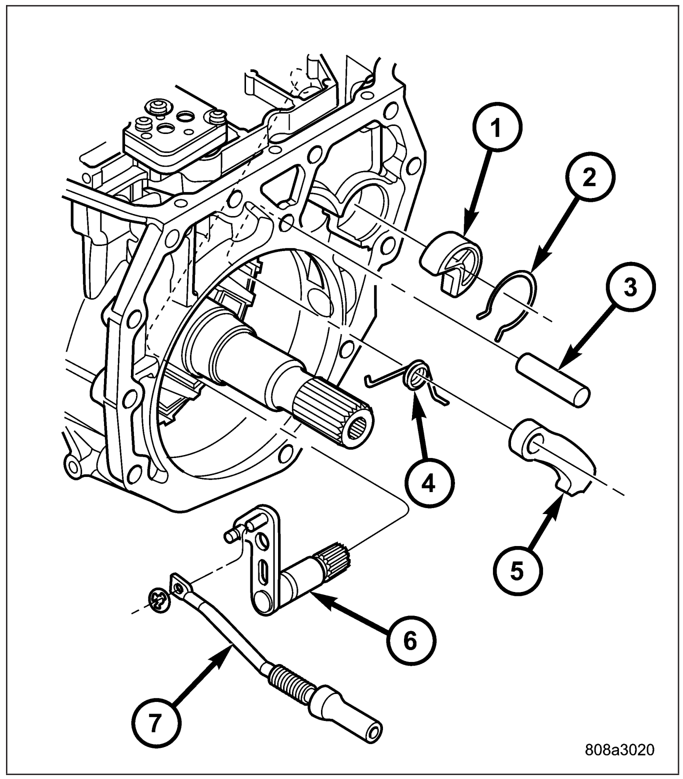
39. Remove the input/reverse planetary assembly (1).
40. Remove the number 12 thrust bearing (3) from the input/reverse planetary assembly (1).



41. Remove the snap-ring (2) holding the low/reverse clutch retainer (1) into the transmission case.
42. Remove the low/reverse clutch retainer (1) from the transmission case.



43. Remove the park rod (7) and e-clip.
44. Remove the park rod guide snap-ring (2).
45. Remove the park rod guide (1).
46. Remove the park pawl pivot shaft (3), park pawl (5), and spring (4).
47. Remove the manual selector shaft (6).
48. Remove the manual selector shaft seal.
49. Remove the dipstick tube seal.



## CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission Fluid, during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

**NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

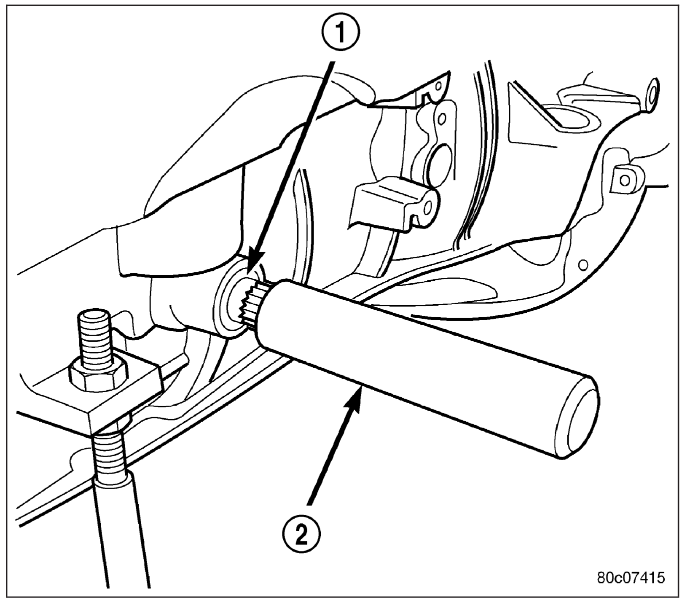
## INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

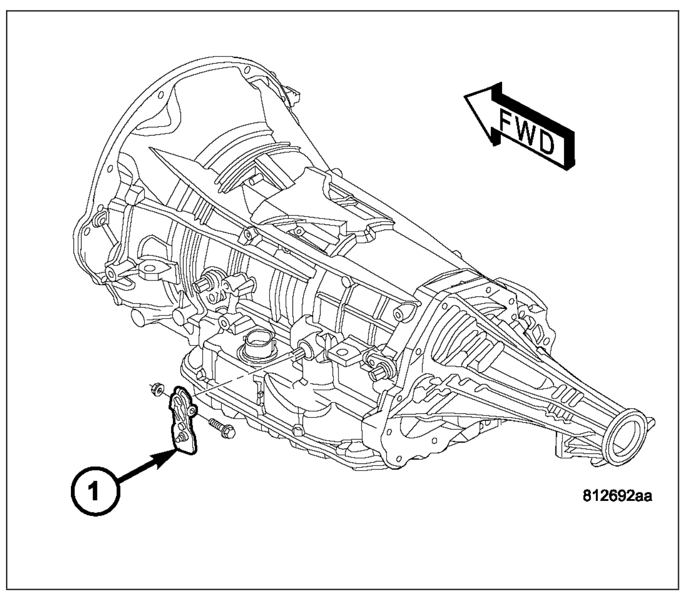
## ASSEMBLY

**NOTE: Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.**

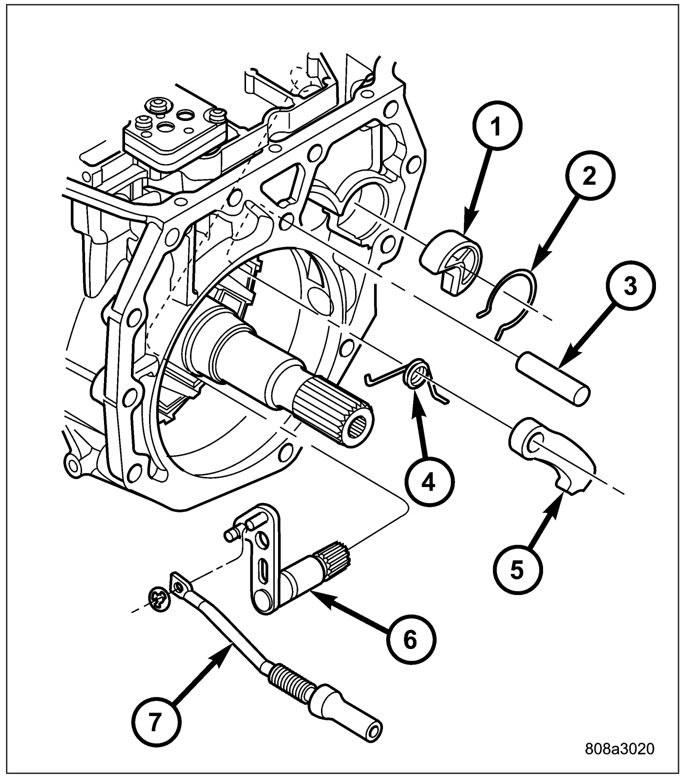
1. Install the cooler filter bypass valve. Torque the bypass valve to specification. The valve uses a tapered pipe thread and excessive torque can damage the transmission case. Tighten the cooler filter bypass valve to 4.5 N·m (40 in.lbs.).
2. Install a new selector shaft seal (1) using Seal Installer 8253 (2).



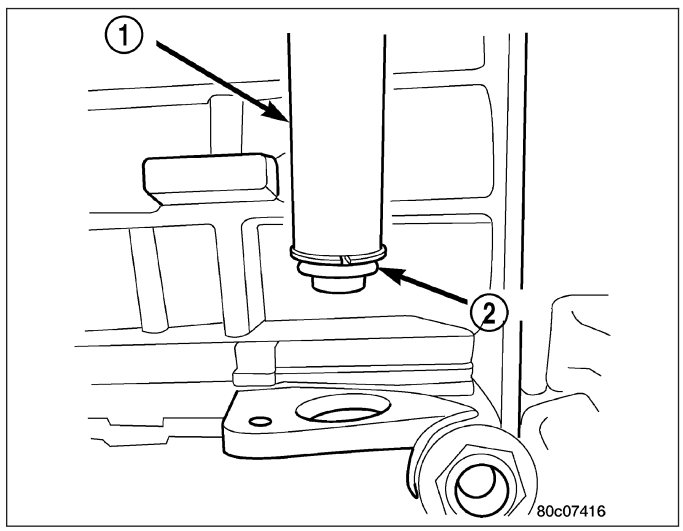
3. Install the manual selector shaft and retaining screw. Tighten the manual selector shaft retaining screw to 28 N·m (250 in.lbs.).
4. Install the manual shift lever (1) onto the manual selector shaft. Torque the retaining cross-bolt to 16 N·m (140 in.lbs.).



5. Install the park pawl (5), spring (4), and shaft (3).
6. Install the park rod (7) and e-clip.
7. Install the park rod guide (1) and snap-ring (2).

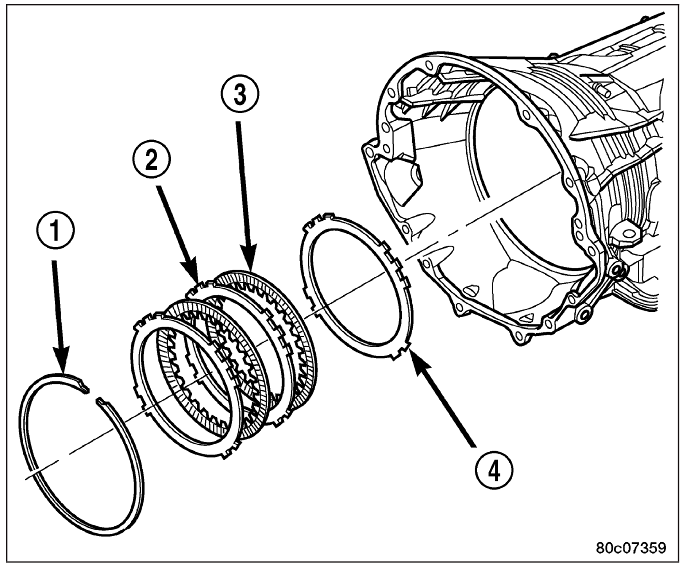


8. Install a new dipstick tube seal (2) using Seal Installer 8254 (1).

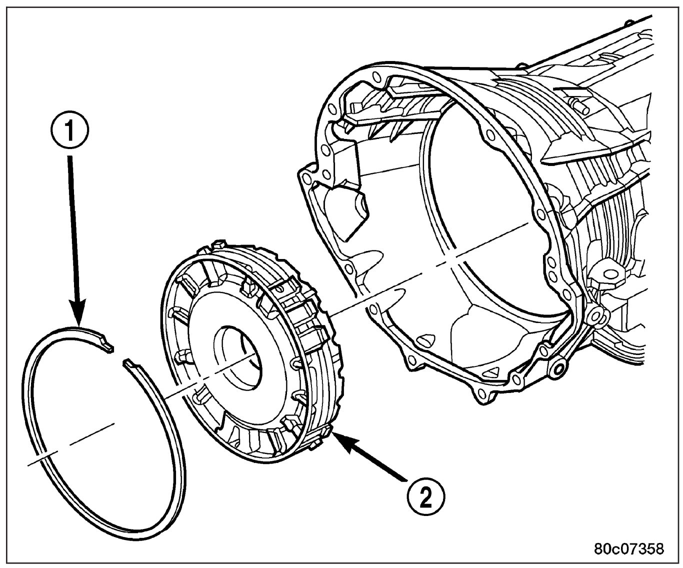


**NOTE: Before final assembly of transmission centerline, the 2C/4C clutch components should be installed into position and measured as follows:**

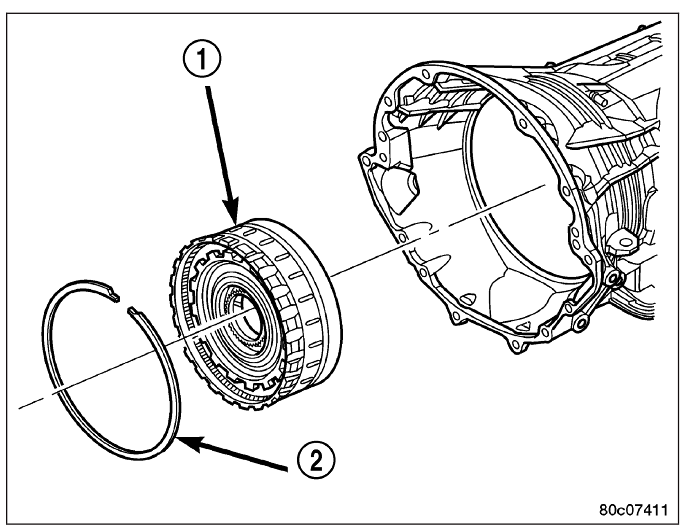
9. Install the 2C reaction plate (4) into the transmission case.
10. Install the 2C clutch pack (2, 3) into the transmission case.
11. Install the flat 2C clutch snap-ring (1) into the transmission case.



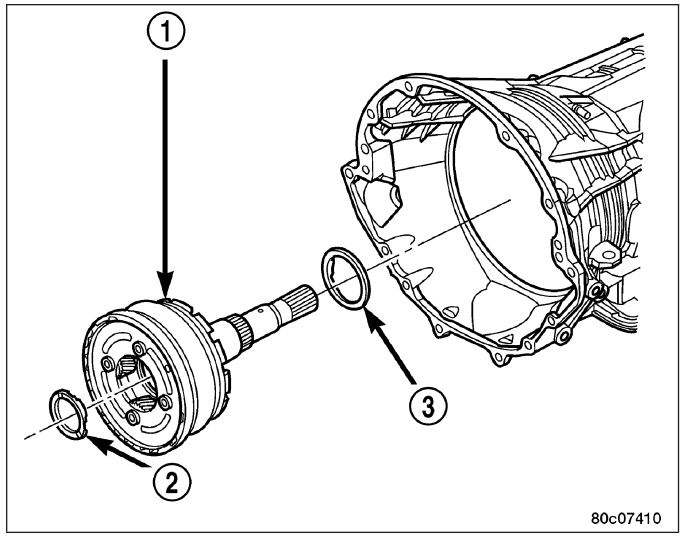
12. Install the 4C retainer/bulkhead (2) into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area.
13. Install the 4C retainer/bulkhead tapered snap-ring (1) into the transmission case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.
14. Using a feeler gauge through the opening in the rear of the transmission case, measure the 2C clutch pack clearance between the 2C reaction plate and the transmission case at four different points. The average of these measurements is the 2C clutch pack clearance. The correct clutch clearance is 0.455-1.335 mm (0.018-0.053 in.). The reaction plate is not selective. If the clutch pack clearance is not within specification, the reaction plate, all the friction discs, and steels must be replaced.
15. Remove the 4C retainer/bulkhead and all of the 2C clutch components from the transmission case.



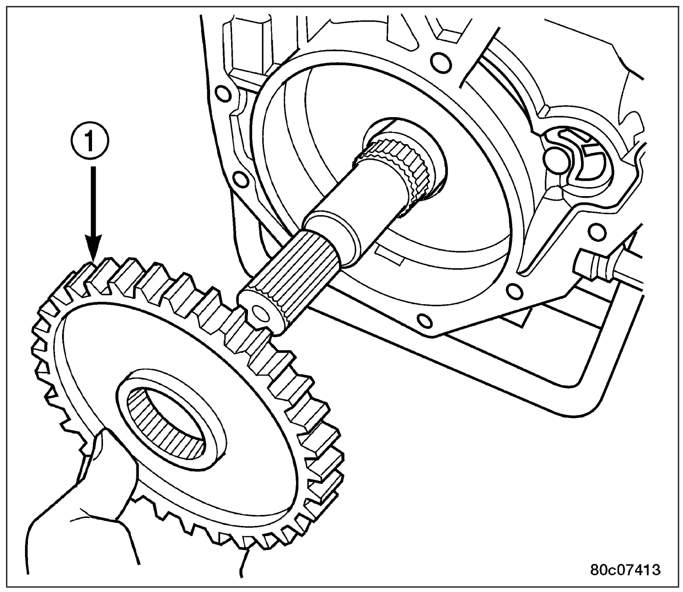
16. Install the low/reverse clutch assembly (1). Make sure that the oil feed hole points toward the valve body area and that the bleed orifice is aligned with the notch in the rear of the transmission case.
17. Install the snap-ring (2) to hold the low/reverse clutch retainer into the transmission case. The snap-ring is tapered and must be installed with the tapered side forward. Once installed, verify that the snap-ring is fully seated in the snap-ring groove.
18. Air check the low/reverse clutch and verify correct overrunning clutch operation.



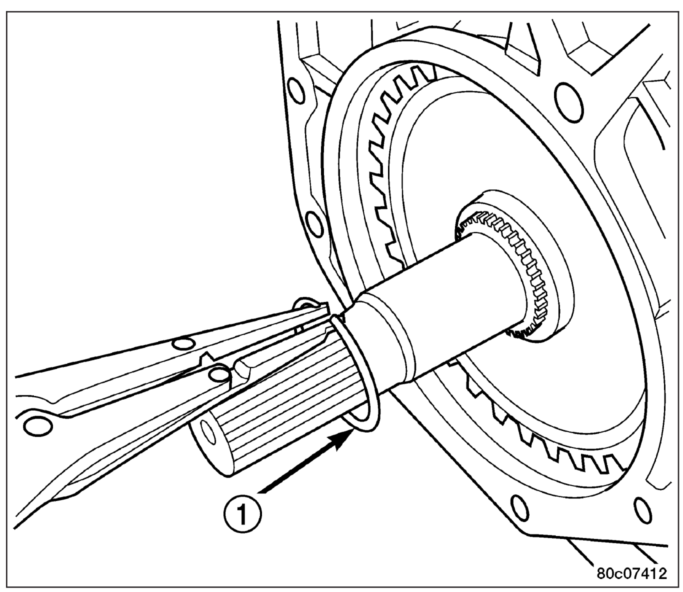
19. Install the number 12 thrust bearing (3) over the output shaft and against the rear planetary gear set. The flat side of the bearing goes toward the planetary gearset and the raised tabs on the inner race should face the rear of the transmission.
20. Install the reverse/input planetary assembly (1) through the low/reverse clutch assembly.



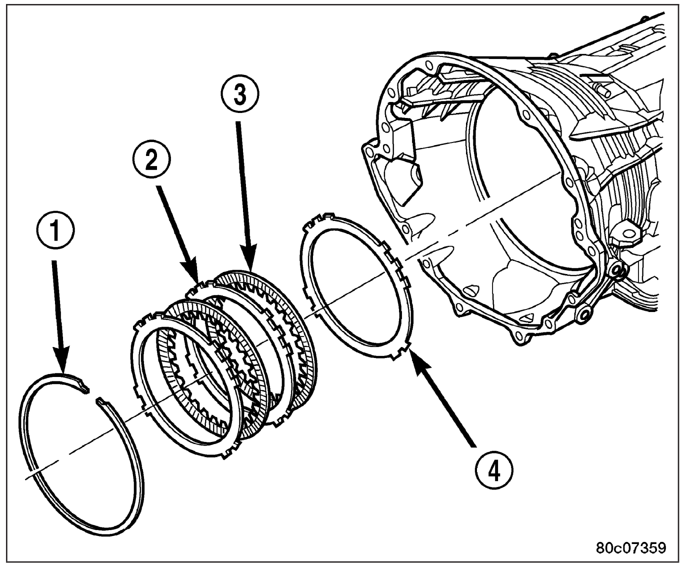
21. Install the park sprag gear (1) onto the output shaft.

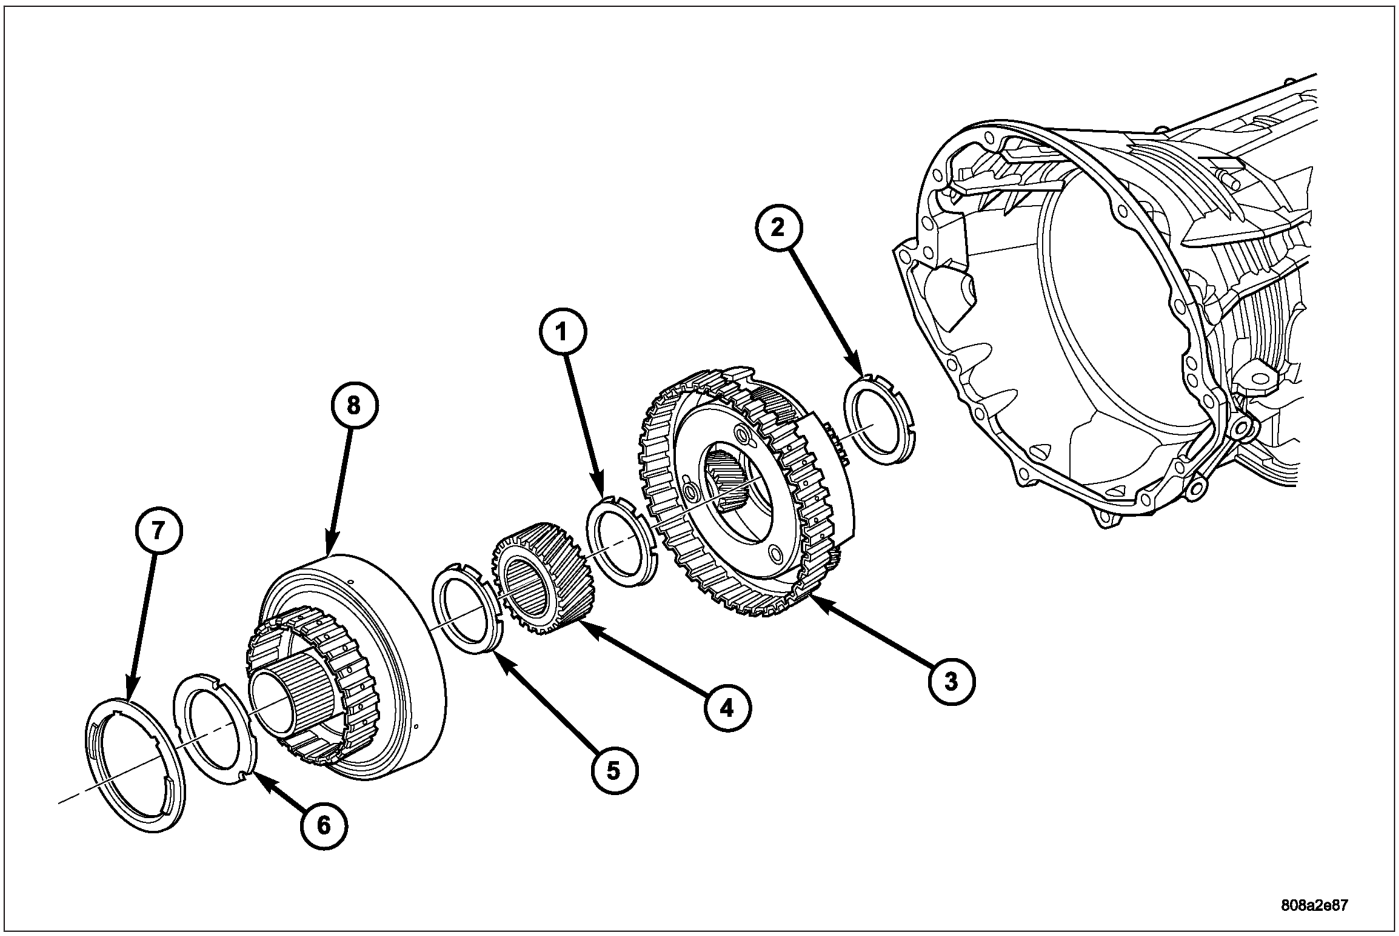


22. Install the snap-ring (1) to hold the park sprag onto the output shaft.



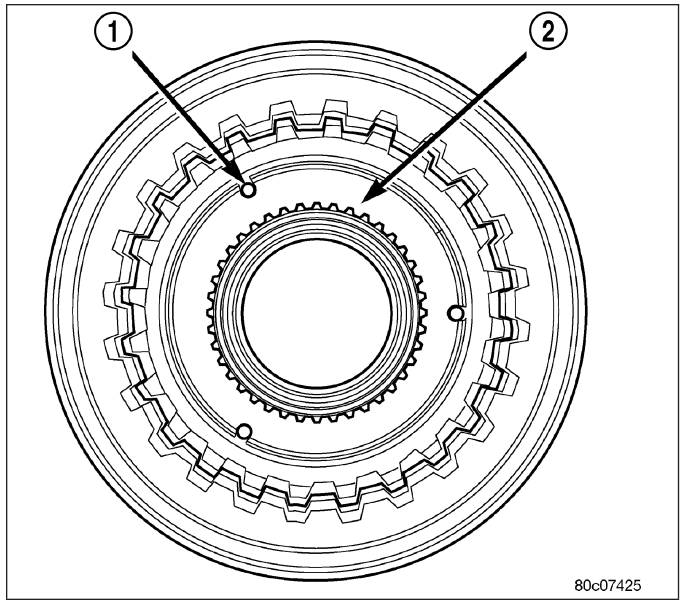
23. Install the 2C reaction plate (4) into the transmission case.
24. Install the 2C clutch pack (2, 3, 4) into the transmission case.

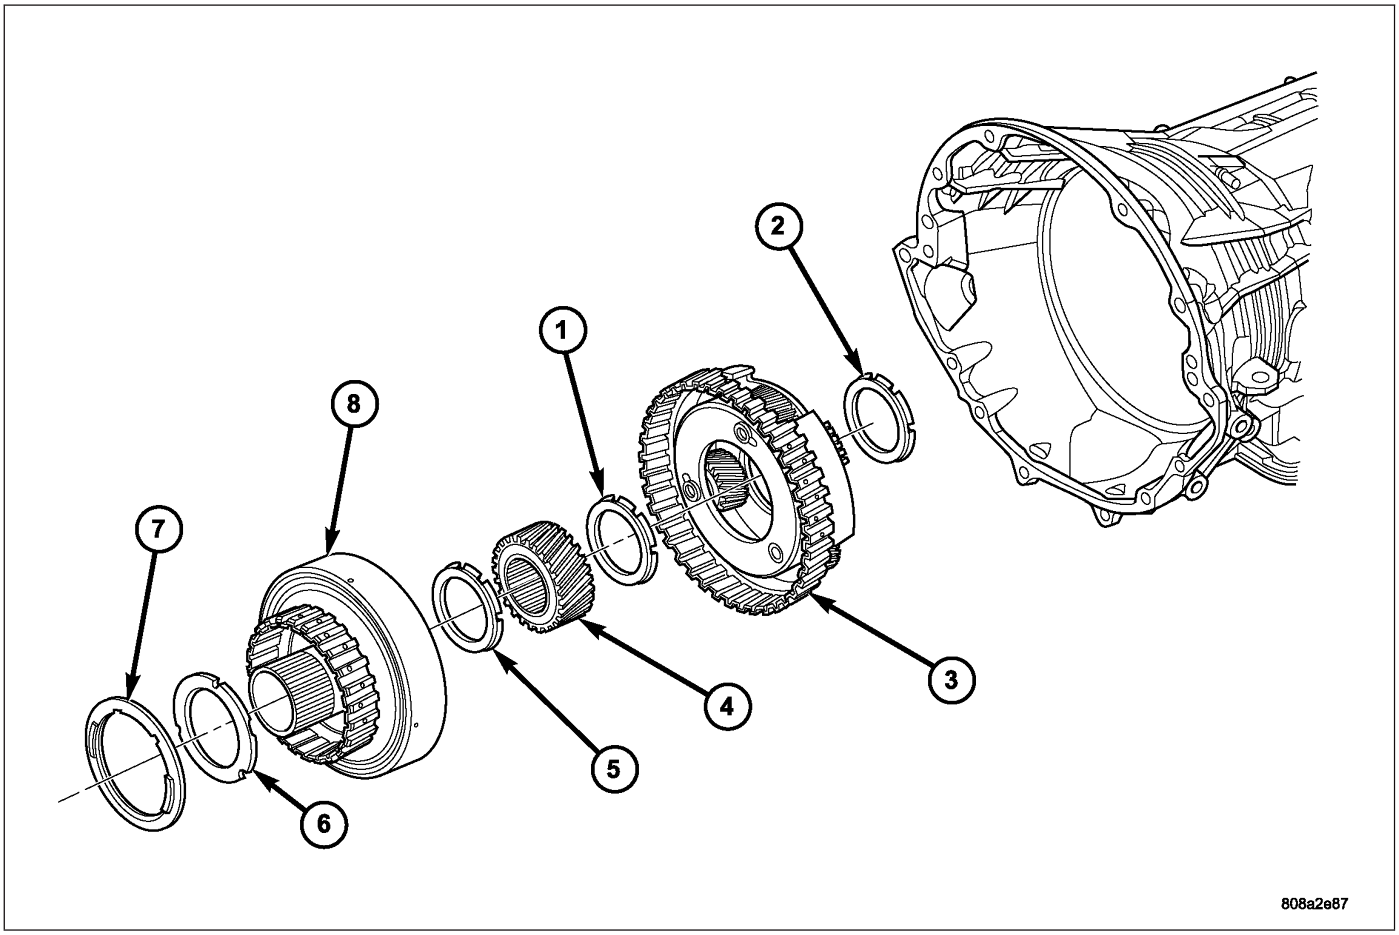




25. Install the number 8 thrust bearing (1) inside the reaction carrier with the outer race against the reaction planetary carrier (3).
26. Install the reaction planetary gear set and the number 9 thrust bearing (2), with the inner race against the reaction planetary carrier (3), into the transmission case.
27. Install the flat 2C clutch snap-ring into the transmission case.
28. Install the reaction sun gear (4) into the reaction planetary gear set. **Make sure** the small shoulder is facing the front of the transmission.
29. Install the number 7 thrust bearing (5) onto the reaction sun gear (4) with the inner race against the sun gear.

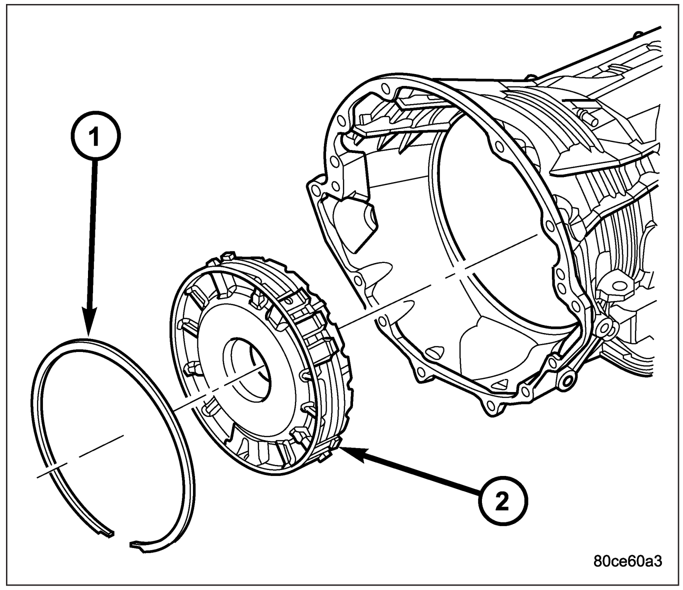
30. Install the output shaft selective thrust plate (2) onto the reaction annulus with the oil grooves facing the annulus gear and the lugs (1) and notches aligned as shown.



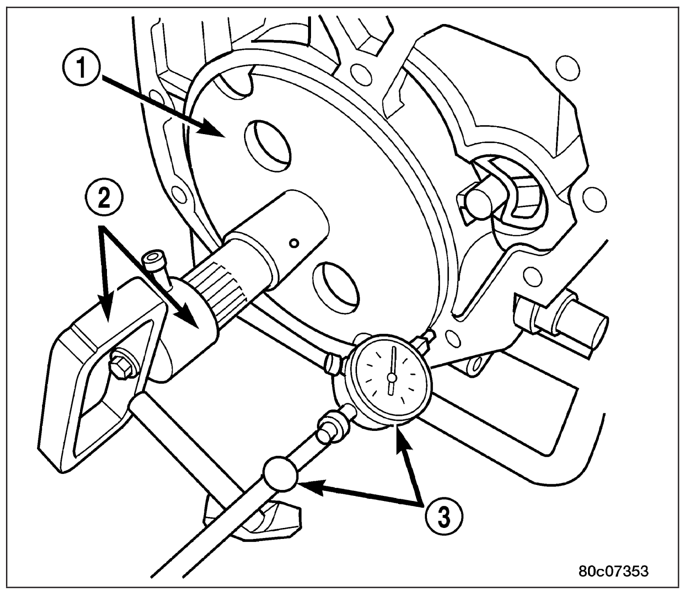


31. Install the number 6 thrust bearing (7) against the output shaft selective thrust plate (6) with the flat side against the thrust plate and the raised tabs on the inner race facing the front of the transmission.
32. Install the reaction annulus (8) into the reaction planetary gear set.

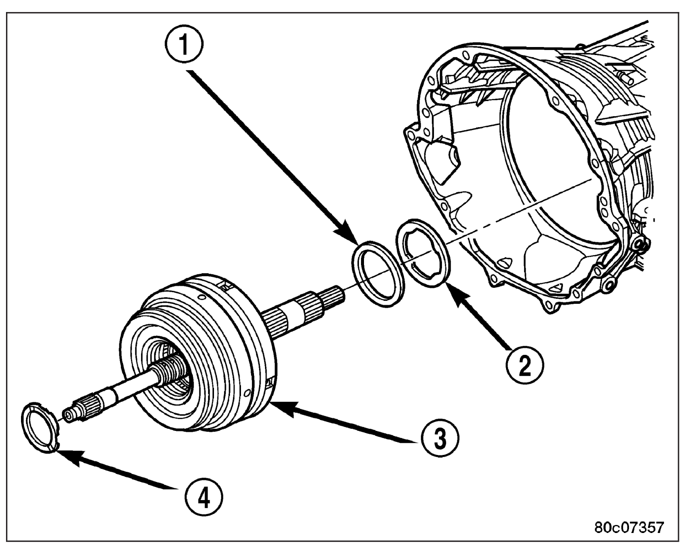
33. Install the 4C retainer/bulkhead (2) into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area. Rotate the reaction annulus during the installation of the 4C retainer/bulkhead to ease installation.
34. Install the 4C retainer/bulkhead tapered snap-ring (1) into the transmission case with the taper toward the front of the case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.
35. Air check the 2C and 4C clutch operation.



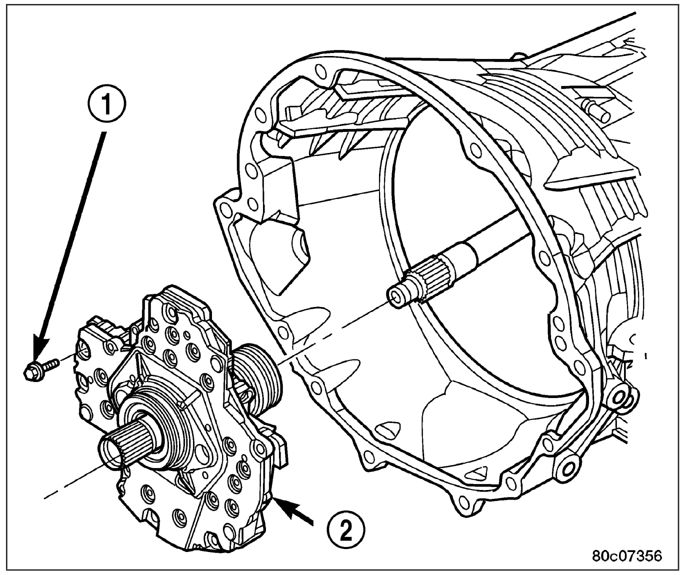
36. Using Alignment Plate 8261 (1), Adapter 8266-17 from End-Play Tool Set 8266 (2) and Dial Indicator C-3339 (3), measure and record the output shaft end-play. The correct output shaft end-play is 0.22-0.55 mm (0.009-0.021 in.). Adjust as necessary. Install the chosen output shaft selective thrust plate and re-measure end-play to verify selection.
37. Apply a bead of RTV silicone and install the extension/adapter housing onto the transmission case.
38. Install and torque the bolts to hold the extension/adapter housing onto the transmission case. The correct torque is 54 N·m (40 ft.lbs.).



39. Install the number 5 thrust bearing (1) and selective thrust plate (2) onto the 4C retainer/bulkhead. Be sure that the outer race of the bearing is against the thrust plate.
40. Install the input clutch assembly (3) into the transmission case. Make sure that the input clutch assembly is fully installed by performing a visual inspection through the input speed sensor hole. If the tone wheel teeth on the input clutch assembly are centered in the hole, the assembly is fully installed.
41. Install the number 1 thrust bearing (4) with the outer race up in the pocket of the input clutch assembly.

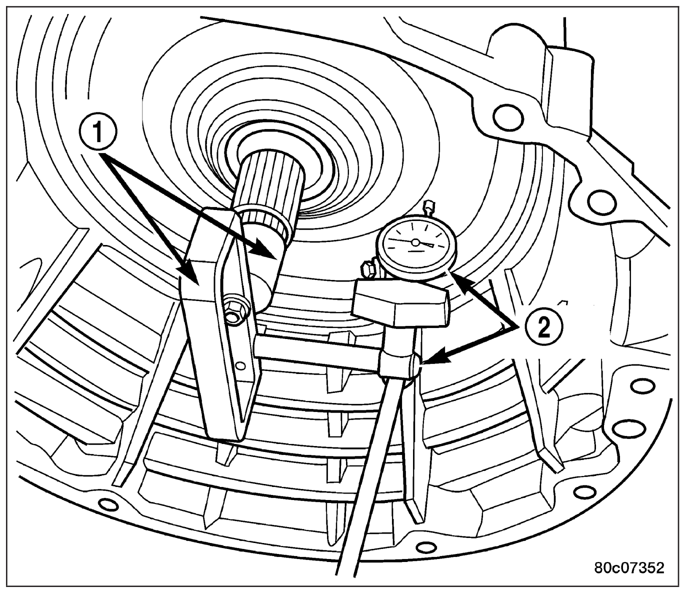


42. Install the oil pump (2) into the transmission case.
43. Install the bolts (1) to hold the oil pump into the transmission case. Tighten the oil pump bolts to 28 N·m (250 in.lbs.).

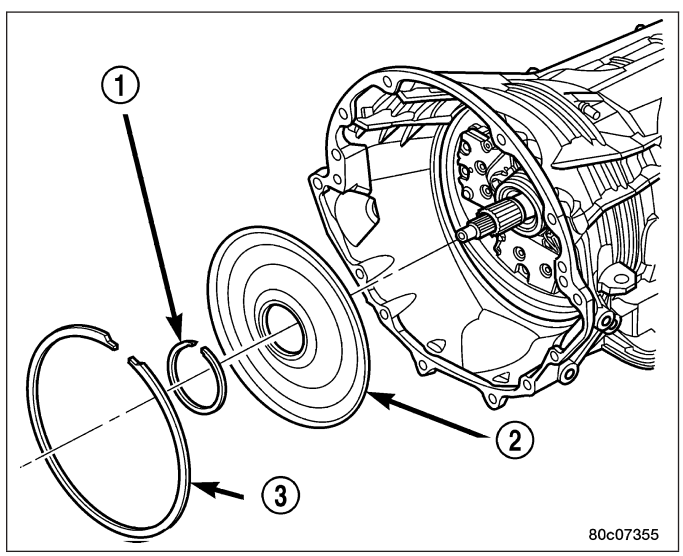


44. Using Adapter 8266-1 from End-Play Tool Set 8266 (1) and Dial Indicator C-3339 (2), measure and record the input shaft end-play. The correct end-play is 0.46-0.89 mm (0.018-0.035 in.). Adjust as necessary. Install the chosen thrust plate on the number 5 thrust bearing and re-measure end-play to verify selection.

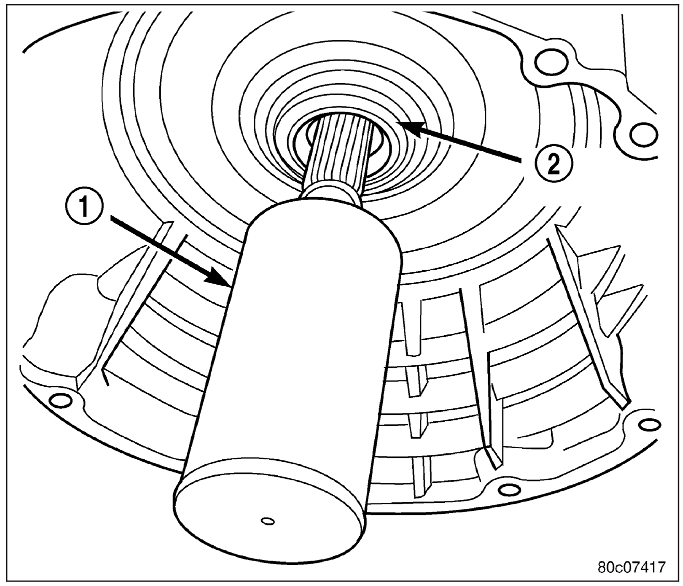
**NOTE: When measuring the input shaft end-play, two ″stops″ will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first ″stop″ felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.**



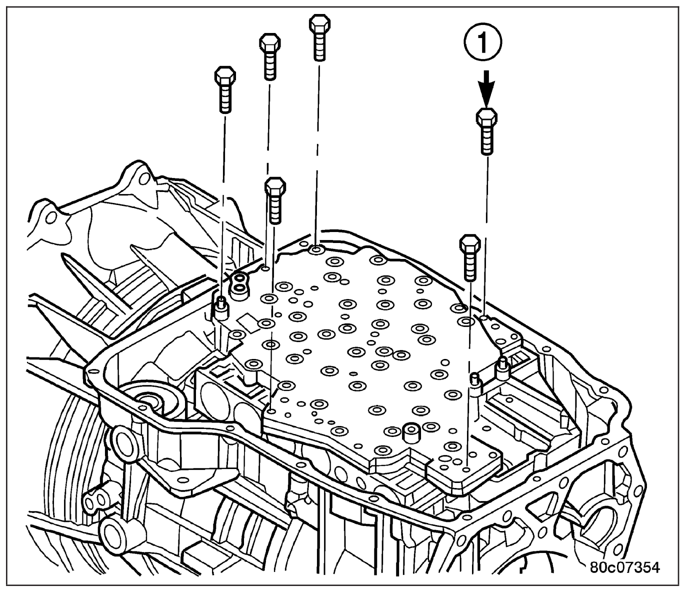
45. Install the transmission front cover (2) into the transmission case.
46. Install the outer snap-ring (3) to hold the transmission front cover (2) into the transmission case.
47. Partially install the inner transmission front cover snap-ring (1) onto the oil pump.



48. Using Snap-ring Installer 8255 (1), install the inner transmission front cover snap-ring (2) the remainder of the way onto the oil pump.

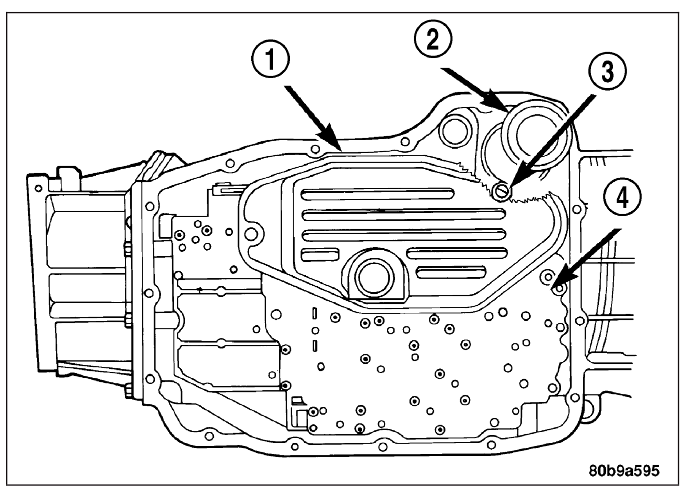


49. Install the valve body. Verify that the pin on the manual lever has properly engaged the TRS selector plate. Tighten the valve body to transmission case bolts (1) to 12 N·m (105 in.lbs.).



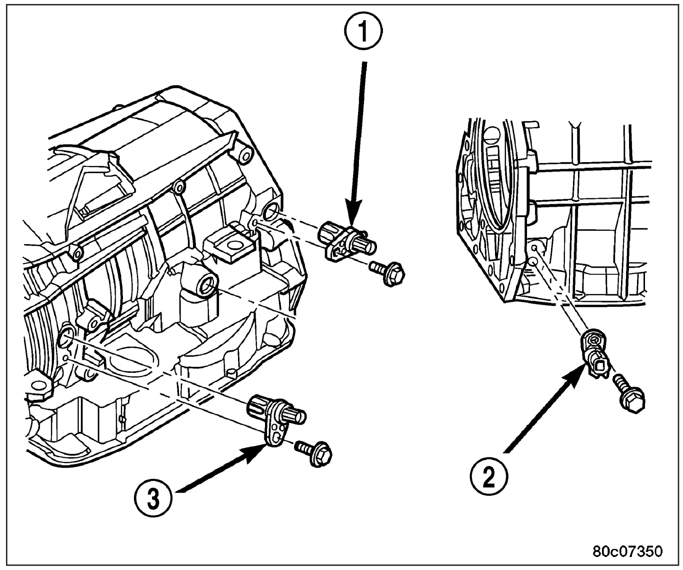
**CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.**

50. Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.
51. Install the primary oil filter (1) and the oil cooler return filter (2). Tighten the screw to hold the primary oil filter to the valve body to 4.5 N·m (40 in.lbs.). Using Filter Wrench 8321, tighten the cooler return oil filter to the transmission case to 9.5 N·m (7 ft.lbs.).



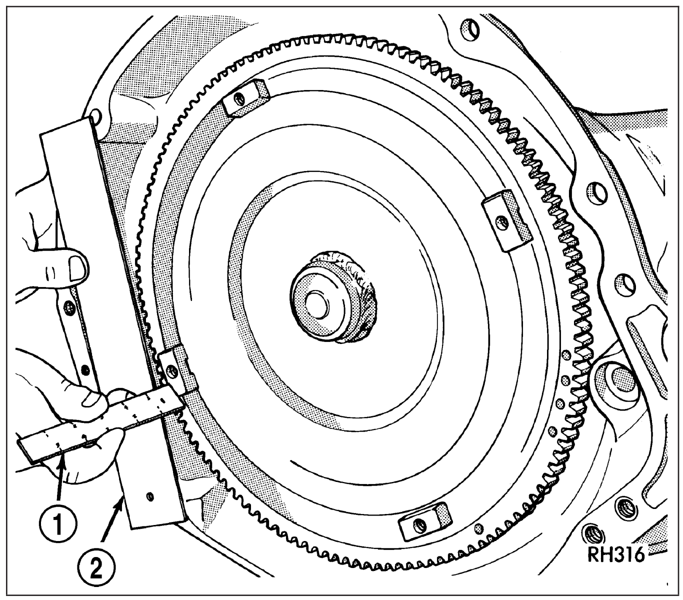
52. Apply RTV silicone to the oil pan and install the transmission oil pan. Tighten the bolts to 12 N·m (105 in.lbs.).

53. Install the input (3), output (1), and line pressure sensors (2). Tighten the bolts to 12 N·m (105 in.lbs.).

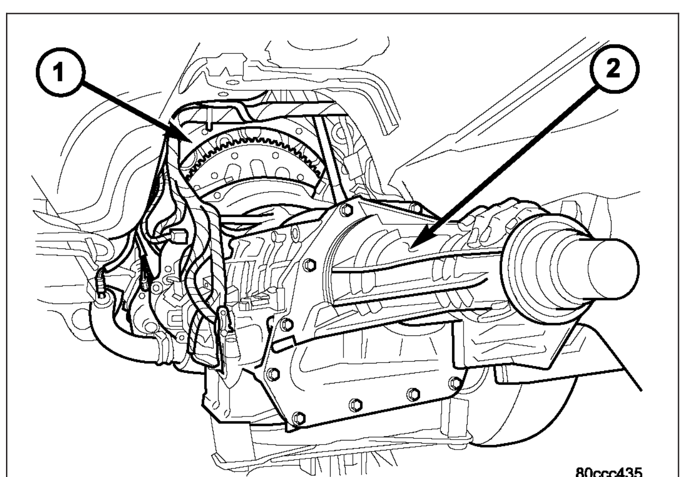


## INSTALLATION

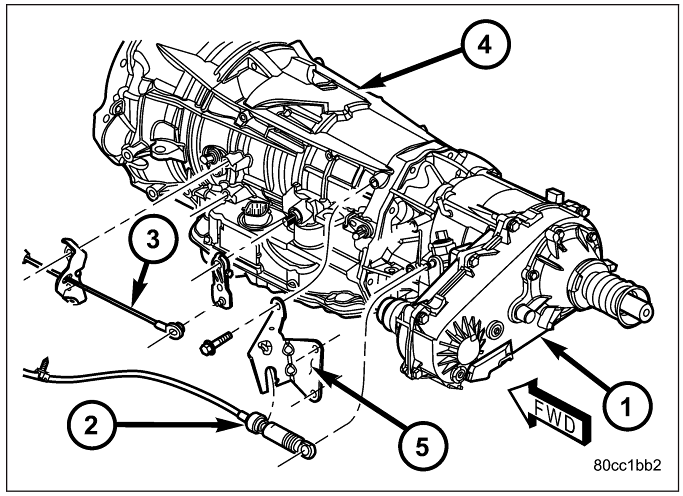
1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free of any debris. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.
4. Align converter and oil pump.
5. Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.



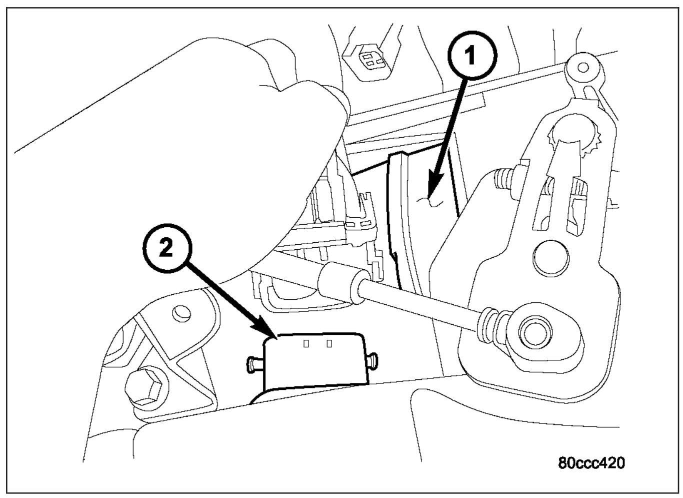
6. Check converter seating with steel scale (1) and straightedge (2). Surface of converter lugs should be at least 13 mm (1/2 in.) to rear of straightedge when converter is fully seated.
7. Temporarily secure converter with C-clamp.
8. Position transmission on jack and secure it with chains.
9. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
10. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
11. Raise transmission (2) and align the torque converter with the drive plate and transmission converter housing with the engine block.



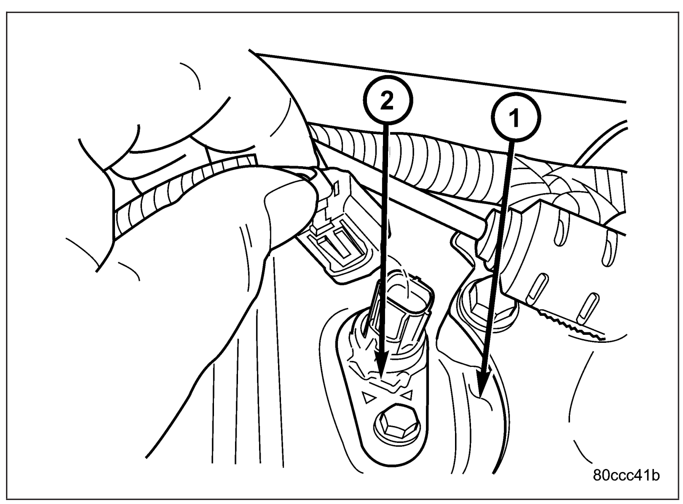
12. Move transmission forward. Then raise, lower or tilt transmission to align the converter housing with engine block dowels.
13. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
14. Install two bolts to attach the transmission to the engine.
15. Install remaining torque converter housing to engine bolts. Tighten to 68 N·m (50 ft.lbs.).
16. Install transfer case, if equipped. Tighten transfer case nuts to 35 N·m (26 ft.lbs.).
17. Install rear transmission crossmember. Tighten crossmember to frame bolts to 68 N·m (50 ft.lbs.).



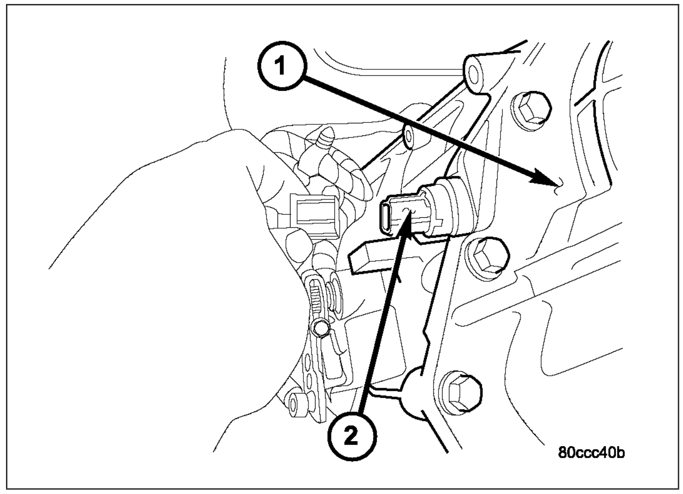
18. Install rear support to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).
19. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts to 47 N·m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N·m (50 ft.lbs.).
20. Remove engine support fixture.
21. Connect gearshift cable (3) to support bracket and transmission manual lever.
22. Connect wires to solenoid and pressure switch assembly (2).



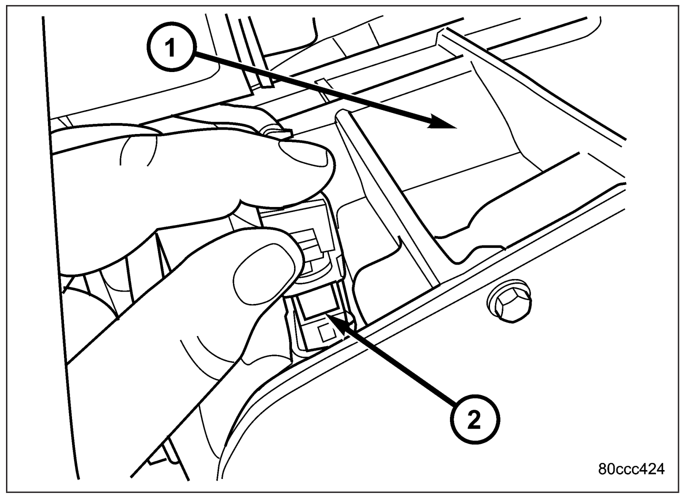
23. Connect wires to input speed sensor (2).



24. Connect wires to output speed sensor (2).

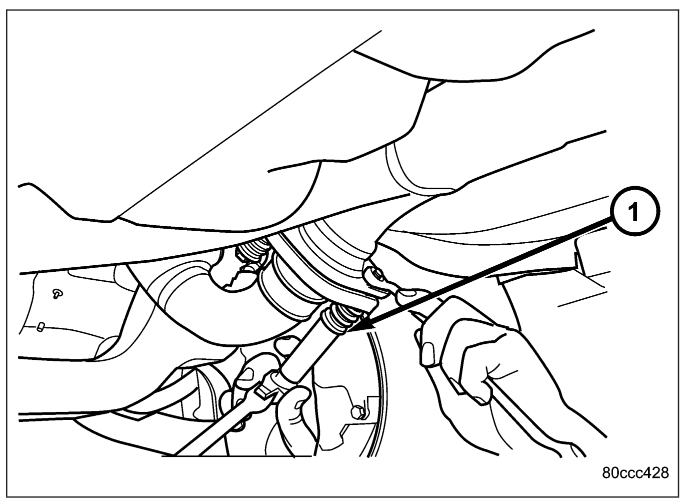


25. Connect wires to line pressure sensor (2). Be sure transmission harnesses are properly routed.

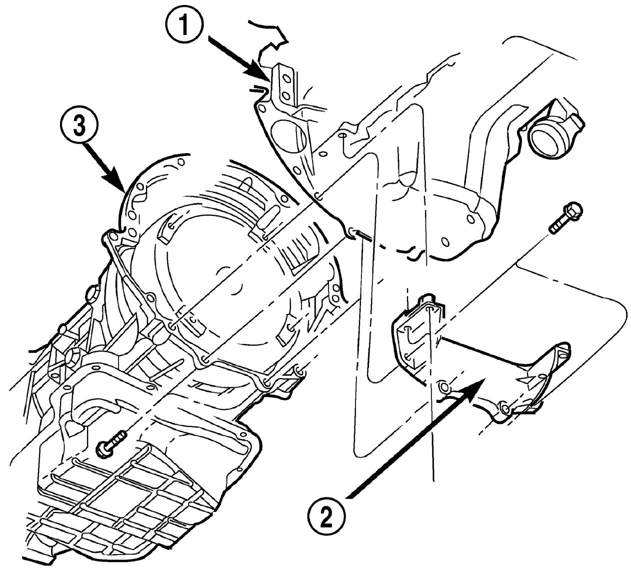


**CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.**

26. Install torque converter-to-driveplate bolts. Tighten bolts to 31 N·m (270 in.lbs.).
27. Install starter motor and cooler line bracket.
28. Connect cooler lines to transmission.
29. Install transmission fill tube.
30. Install exhaust components (1).



31. Install the structural dust cover (2) (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION) onto the transmission and the engine.



80ba79d2

32. Align and connect propeller shaft(s).
33. Adjust gearshift cable if necessary.
34. Install any skid plates (1) removed previously. (Refer to 13 - FRAMES & BUMPERS/FRAME/ TRANSFER CASE SKID PLATE - INSTALLATION)
35. Lower vehicle.
36. Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

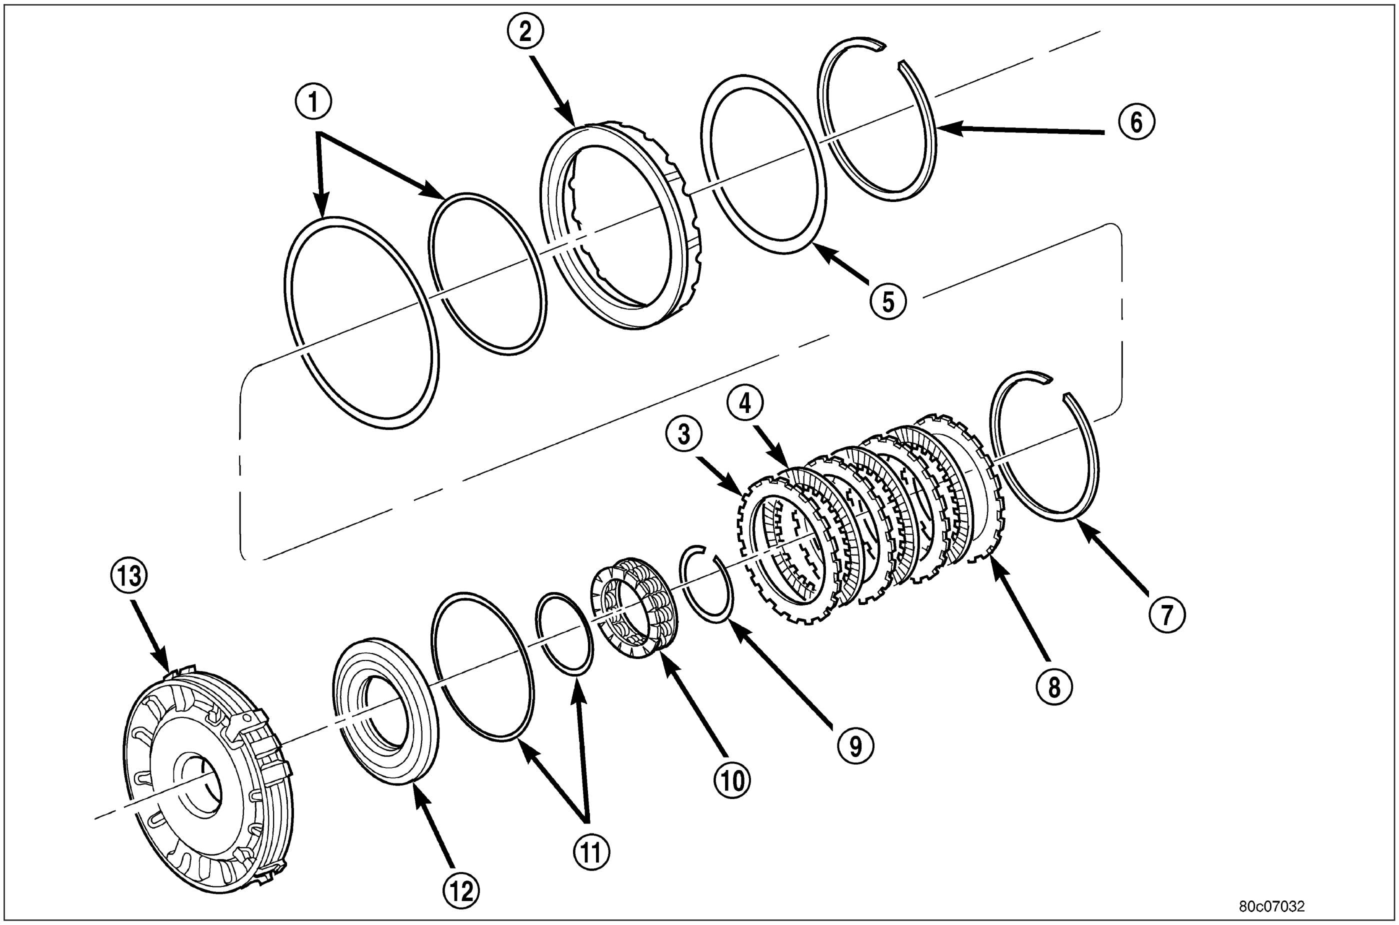
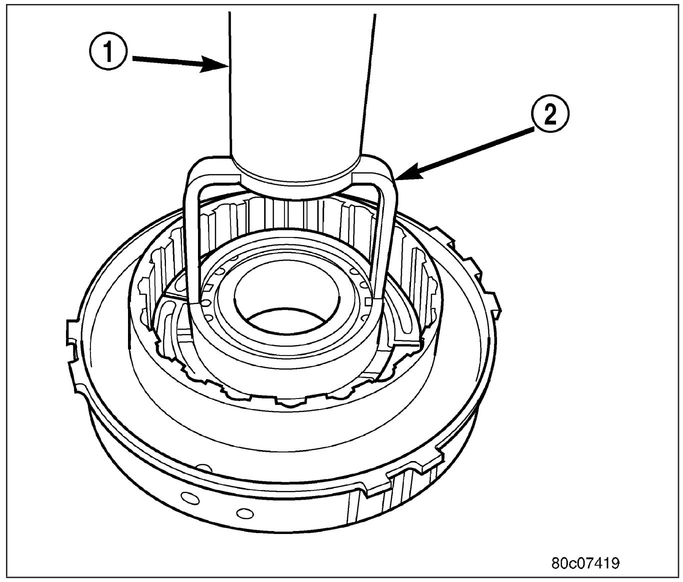
# RETAINER/BULKHEAD-4C

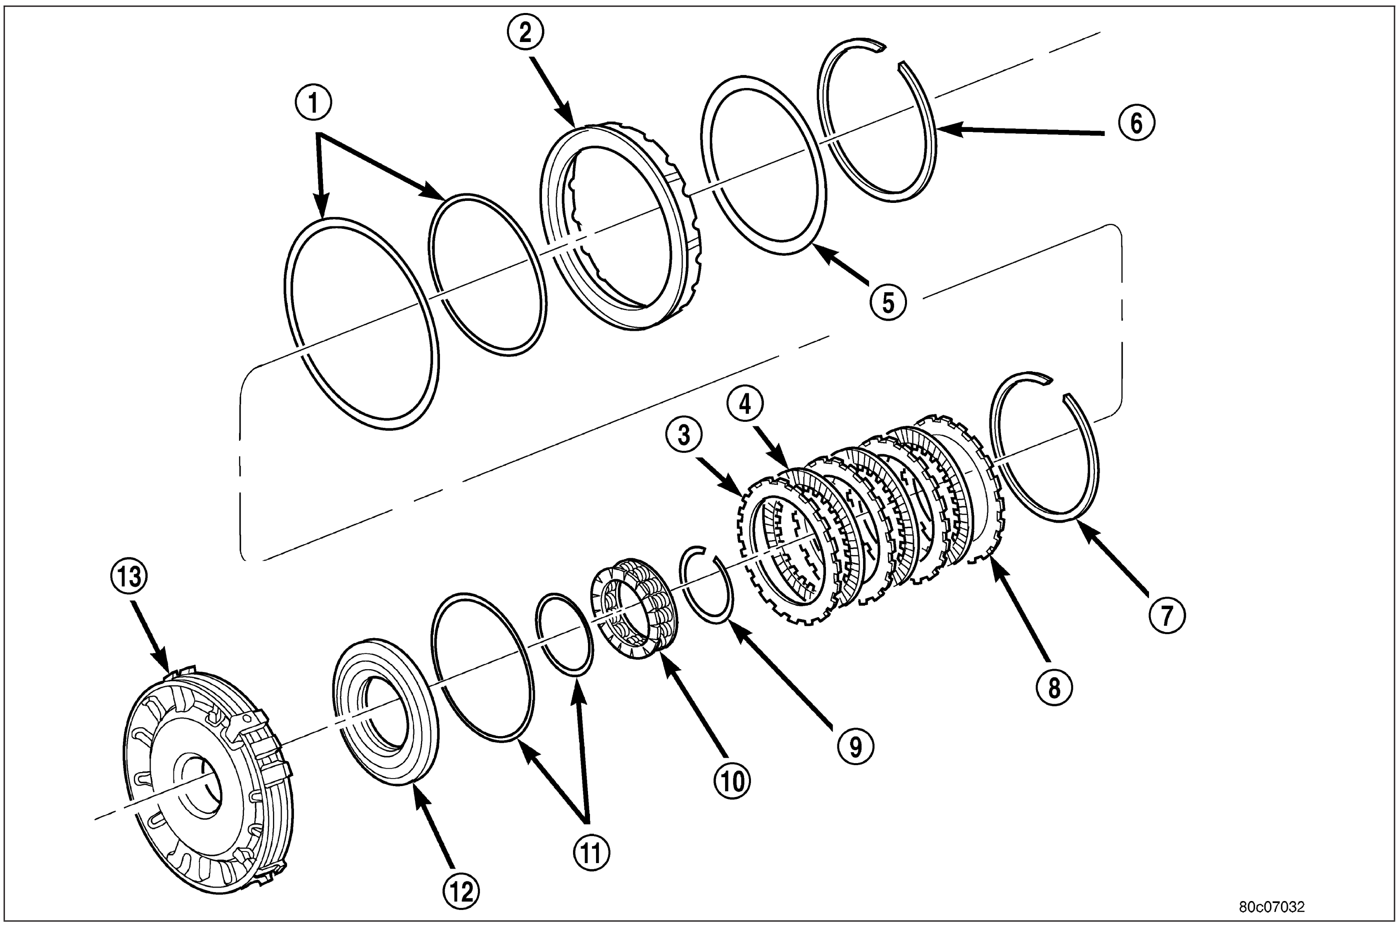
## DISASSEMBLY



1. Remove the 2C piston Belleville spring snap-ring (6) from the 4C retainer/bulkhead (13).
2. Remove the 2C piston Belleville spring (5) from the retainer/bulkhead (13).
3. Remove the 2C piston (2) from the retainer/bulkhead (13). Use 20 psi of air pressure to remove the piston if necessary.
4. Remove the 4C clutch snap-ring (7) from the retainer/bulkhead (13).
5. Remove the 4C clutch pack (3, 4, 8) from the retainer/bulkhead (13).

6. Using Spring Compressor 8250 (2) and a suitable shop press (1), compress the 4C piston return spring and remove the snap-ring.

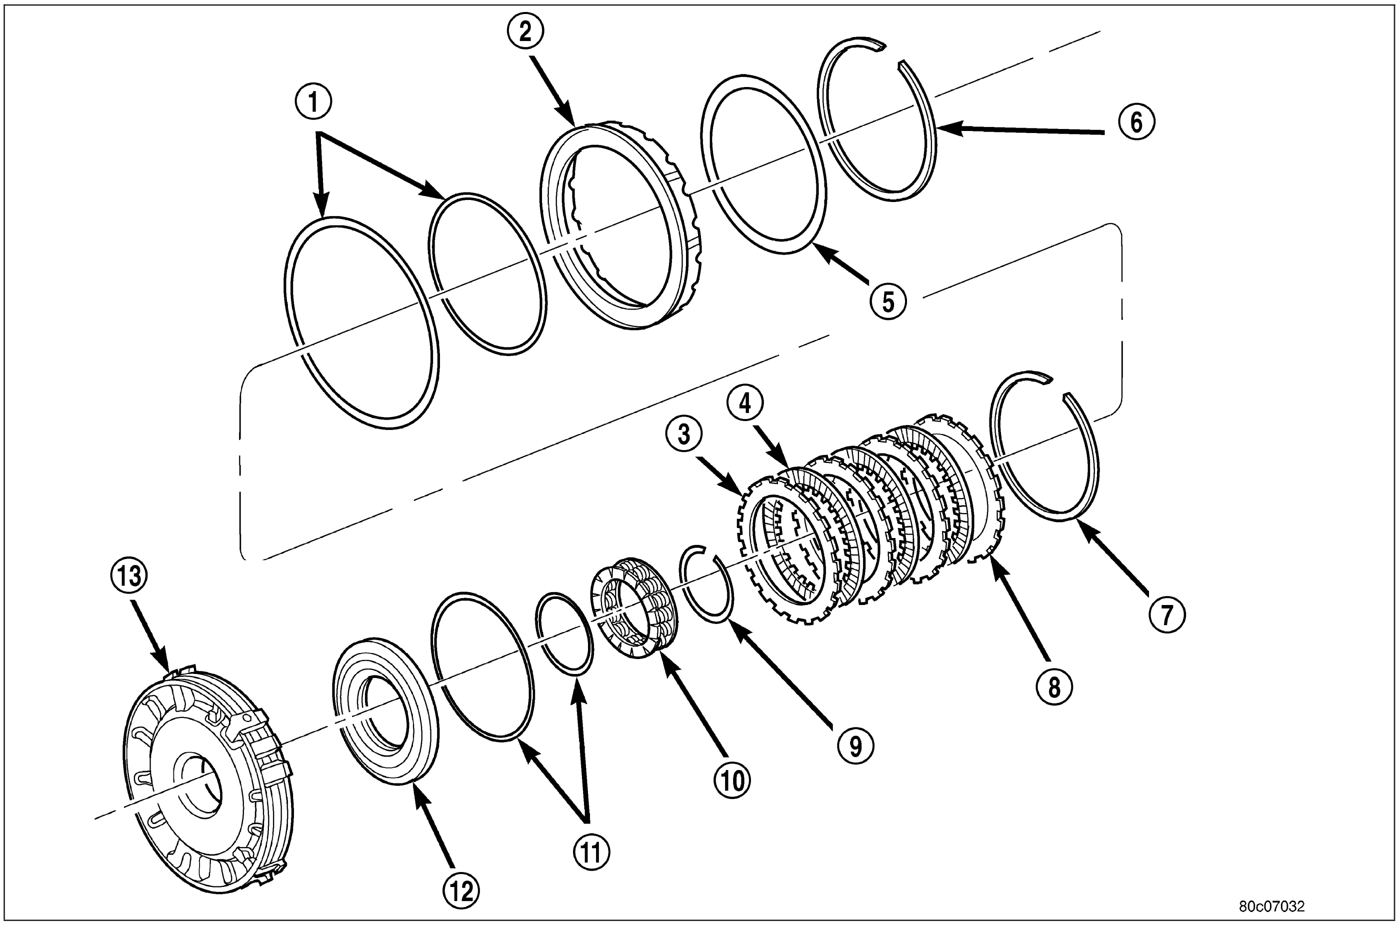




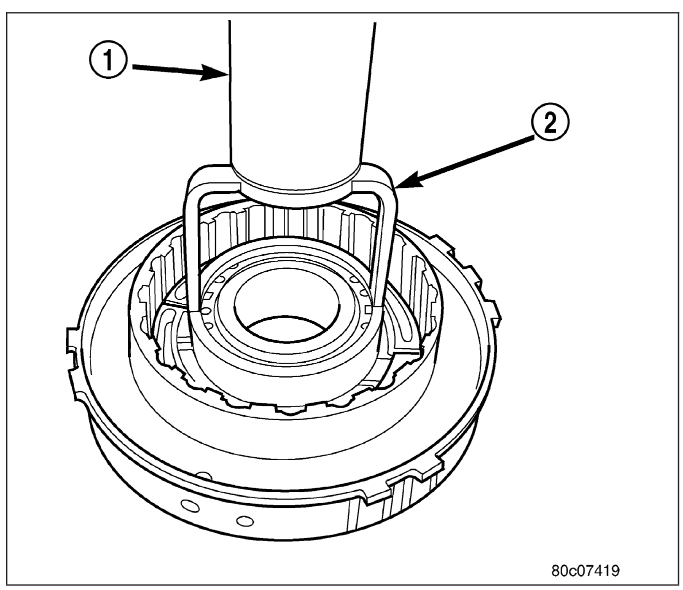
7. Remove the 4C piston return spring (10) and piston (12) from the retainer/bulkhead (13). Use 20 psi of air pressure to remove the piston if necessary.

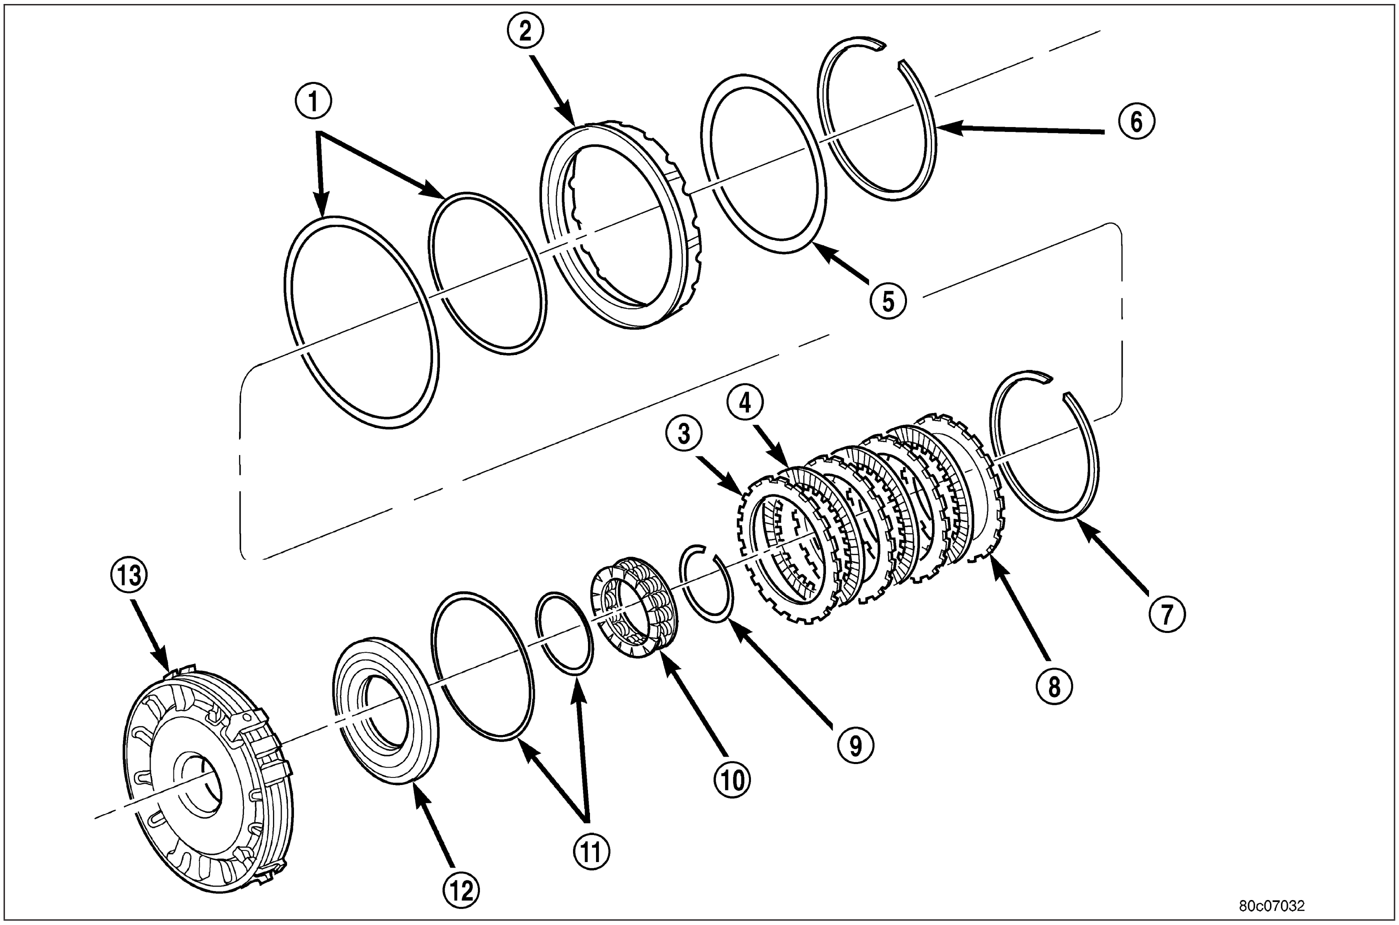
## ASSEMBLY

**NOTE: Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.**

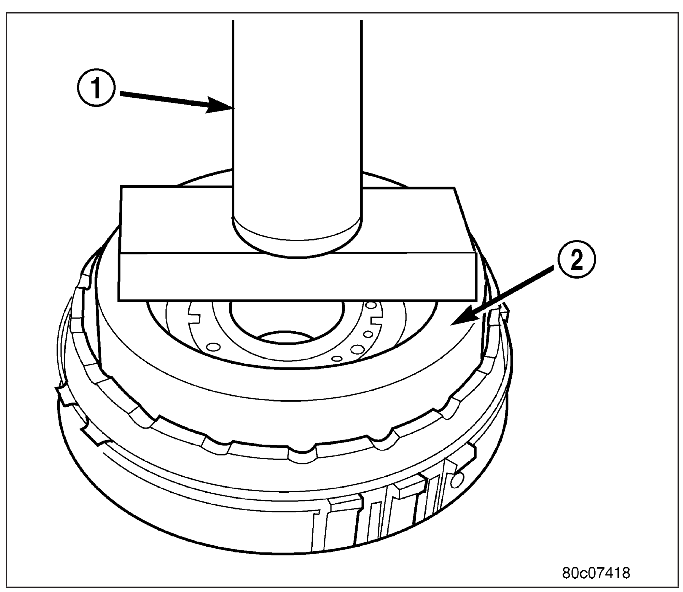


1. Install new seals (1, 11) on the 2C and 4C pistons or in the piston retainers.
2. Lubricate all seals with Mopar® ATF +4 prior to installation.
3. Install the 4C piston (12) into the 4C retainer/bulkhead (13).
4. Position the 4C piston return spring (10) onto the 4C piston (12).
5. Using Spring Compressor 8250 (2) and a suitable shop press (1), compress the 4C piston return spring and install the snap-ring.





6. Assemble and install the 4C clutch pack (3, 4) into the retainer/bulkhead (13) with the steel separator plate against the piston.
7. Install the 4C reaction plate (8) and snap-ring (7) into the retainer/bulkhead (13). The 4C reaction plate is non-directional.
8. Measure the 4C clutch clearance. The correct clutch clearance is 0.770-1.390 mm (0.030-0.055 in.). The snap-ring (7) is selectable. Install the chosen snap-ring and re-measure to verify the selection.
9. Install the 2C piston (2) into the retainer/bulkhead (13).
10. Position the 2C Belleville spring (5) onto the 2C piston (2).
11. Position the 2C Belleville spring snap-ring (6) onto the 2C Belleville spring (5).
12. Using Spring Compressor 8249 (2) and a suitable shop press (1), compress the Belleville spring until the snap-ring is engaged with the snap-ring groove in the retainer/bulkhead.



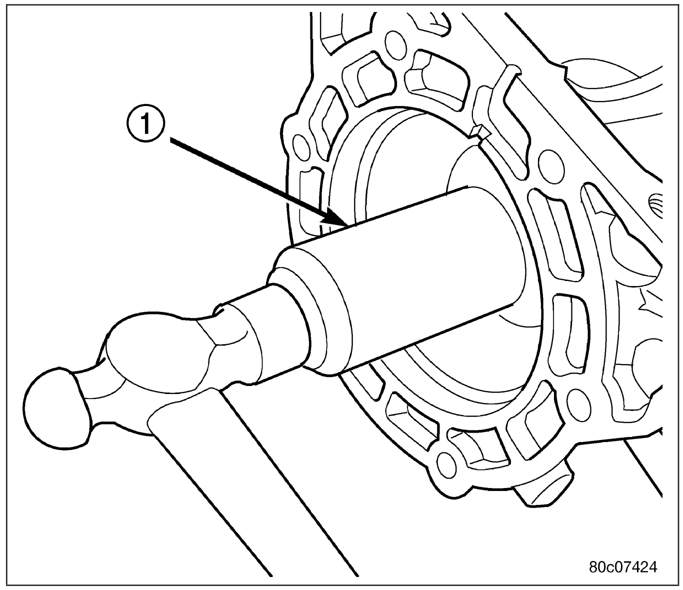
# SEAL-ADAPTER HOUSING

## REMOVAL

1. Remove the transfer case from the transmission.
2. Using a screw mounted on a slide hammer, remove the adapter housing seal.

## INSTALLATION

1. Clean the adapter seal bore in the adapter housing of any residue or particles remaining from the original seal.
2. Install new oil seal in the adapter housing using Seal Installer C-3860-A (1) . A properly installed seal is flush to the face of the seal bore.
3. Install the transfer case onto the transmission.



# SYSTEM-BRAKE TRANSMISSION SHIFT INTERLOCK

## DESCRIPTION

The Brake Transmission Shift Interlock System (BTSI), consists of a Park-Interlock cable and a solenoid mounted in the shift lever assembly. The Park-Interlock cable connects the automatic transmission floor mounted shifter to the steering column ignition switch.

## OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in the shift lever assembly is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

## DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM

1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK And the shift handle pushbutton is in the “OUT” position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the OFF position.
4. Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

# FLUID AND FILTER

## DIAGNOSIS AND TESTING

## EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

## CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

## FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

## STANDARD PROCEDURE

## FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

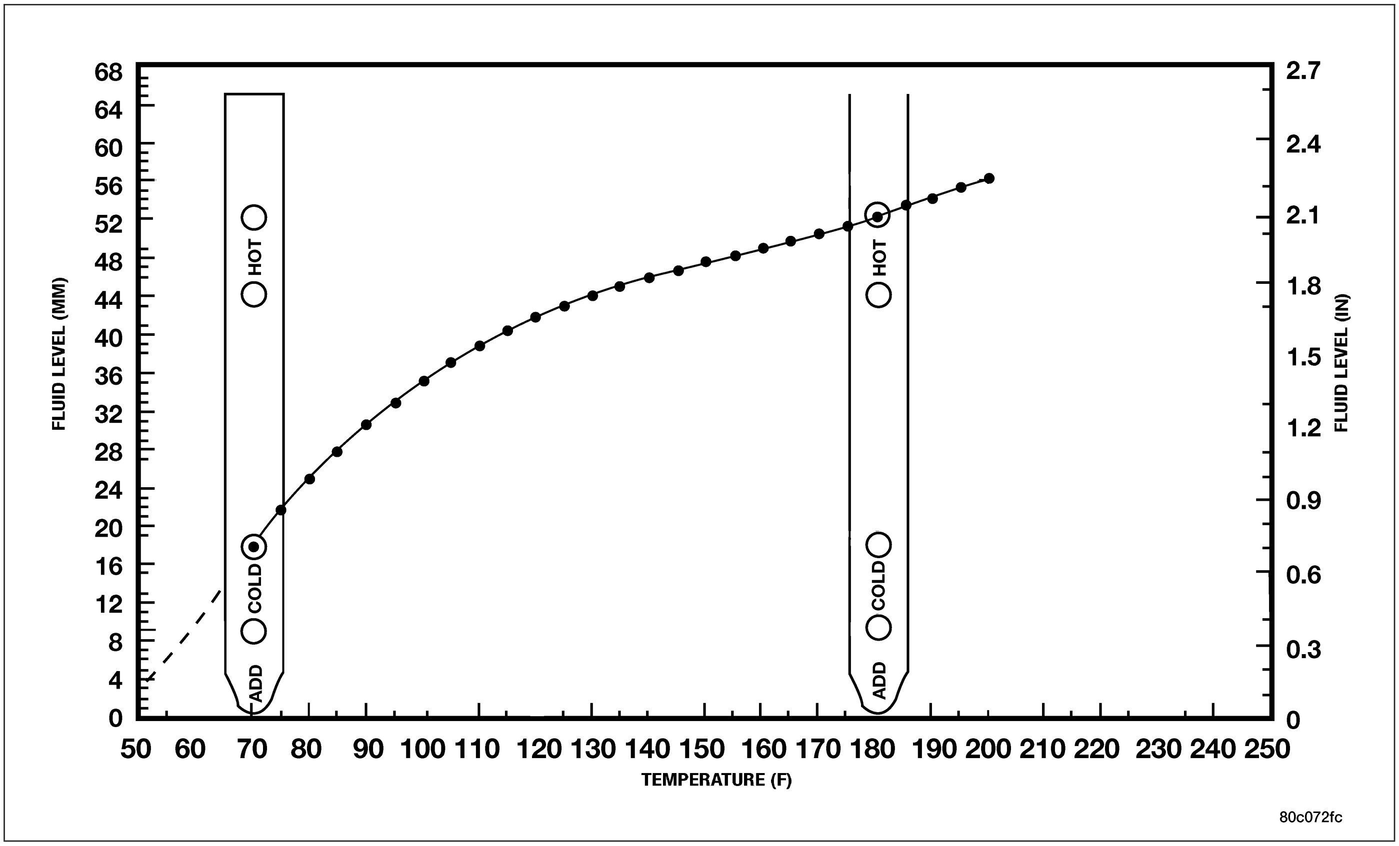
Improper filling can also raise the fluid level too high. When the transmssion has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P (PARK) and N (NEUTRAL) positions. Place the selector lever in P (PARK) to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82° C. or 180° F), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level will be approximately at the upper COLD hole of the dipstick at 21° C (70° F) fluid temperature.



**NOTE: Engine and Transmission should be at normal operating temperature before performing this procedure.**

1. Start engine and apply parking brake.
2. Shift the transmission into DRIVE for approximately 2 seconds.
3. Shift the transmission into REVERSE for approximately 2 seconds.
4. Shift the transmission into PARK.
5. Hook up scan tool and select transmission.
6. Select sensors.
7. Read the transmission temperature value.
8. Compare the fluid temperature value with the chart.
9. Adjust transmission fluid level shown on the dipstick according to the Transmission Fluid Temperature Chart.

**NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.**

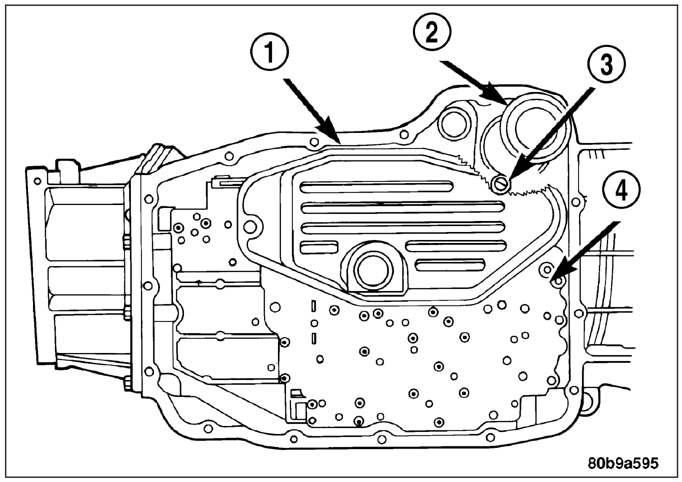
10. Check transmission for leaks.

## FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

### REMOVAL

1. Hoist and support vehicle on safety stands.
2. Place a large diameter shallow drain pan beneath the transmission pan.
3. Remove bolts holding front and sides of pan to transmission.
4. Loosen bolts holding rear of pan to transmission.
5. Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
6. Hold up pan and remove remaining bolts holding pan to transmission.
7. While holding pan level, lower pan away from transmission.
8. Pour remaining fluid in pan into drain pan.
9. Remove the screw holding the primary oil filter (1) to valve body.
10. Separate filter from valve body and oil pump and pour fluid in filter into drain pan.
11. Inspect the oil filter seal in the bottom of the oil pump. If the seal is not installed completely in the oil pump, or is otherwise damaged, then remove and discard the oil filter seal from the bottom of the oil pump. If the seal is installed correctly and is in good condition, it can be reused.
12. If replacing the cooler return filter (2), use Oil Filter Wrench 8321 to remove the filter from the transmission.
13. Dispose of used trans fluid and filter(s) properly.



### INSPECTION

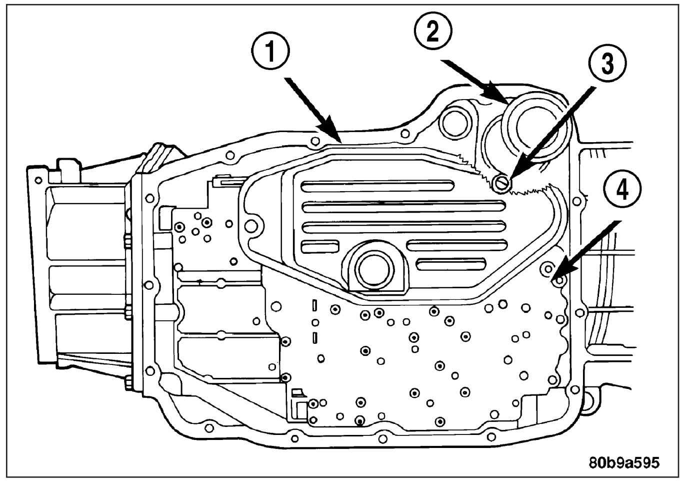
Inspect bottom of pan and magnet for excessive amounts of metal. A light coating of clutch material on the bottom of the pan does not indicate a problem unless accompanied by a slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts of debris, refer to the diagnosis section of this group.

### CLEANING

1. Using a suitable solvent, clean pan and magnet.
2. Using a suitable gasket scraper, clean original sealing material from surface of transmission case and the transmission pan.

## INSTALLATION

**CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.**



1. If necessary, install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with a suitable tool (appropriately sized drift or socket, the butt end of a hammer, or other suitable tool).
2. Place replacement filter in position on valve body and into the oil pump.
3. Install screw to hold the primary oil filter (1) to valve body. Tighten screw to 4.5 N·m (40 in. lbs.) torque.
4. Install new cooler return filter (2) onto the transmission, if necessary. Torque the filter to 9.5 N·m (7 ft.lbs.).
5. Place bead of Mopar® RTV sealant onto the transmission case sealing surface.
6. Place pan in position on transmission.
7. Install bolts to hold pan to transmission. Tighten bolts to 12 N·m (105 in. lbs.) torque.
8. Lower vehicle and fill transmission with MOPAR® ATF +4.

## TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® ATF +4 to transmission:
   a. If only fluid and filter were changed, add **10 pints (5 quarts)** of ATF +4 to transmission.
   b. If transmission was completely overhauled and the torque converter was replaced or drained, add **24 pints (12 quarts)** of ATF +4 to transmission.
3. Check the transmission fluid (Refer to 21 - TRANSMISSION/AUTOMATIC - RFE/FLUID - STANDARD PROCEDURE) and adjust as required.

# CABLE-GEARSHIFT

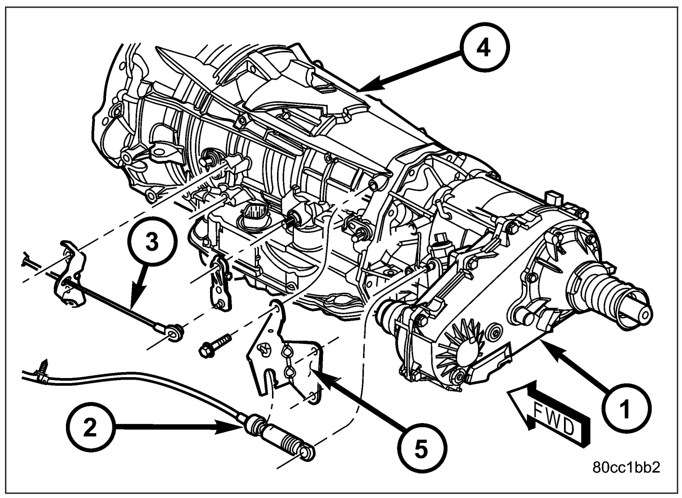
## DIAGNOSIS AND TESTING

### GEARSHIFT CABLE

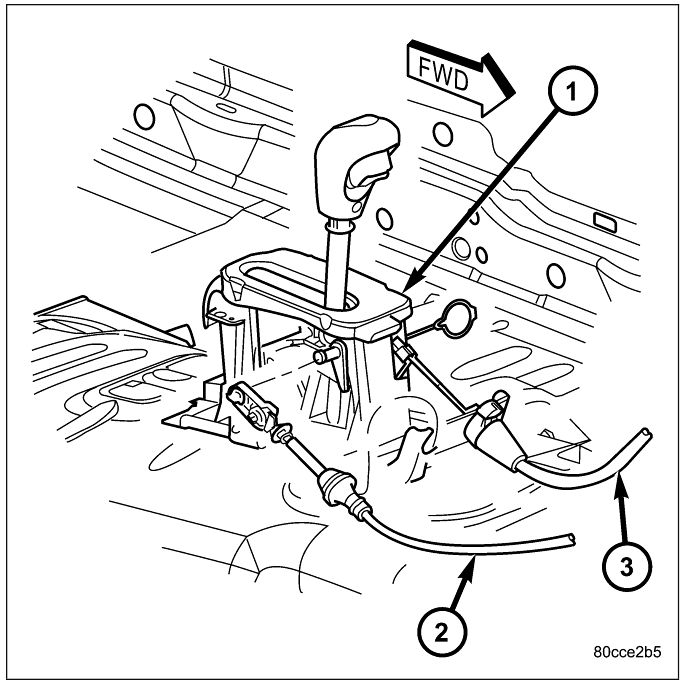
1. The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.
2. Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.
3. With floor shift lever handle push-button not depressed and lever in:
   a. PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.
   b. PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.
   c. NEUTRAL position - Normal position. Engine starts must be possible.
   d. NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

## REMOVAL

1. Shift transmission into PARK.
2. Raise vehicle.
3. Remove the shift cable eyelet from the transmission manual shift lever.
4. Remove shift cable from the cable support bracket.
5. Lower vehicle.
6. Remove necessary console parts for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
7. Disconnect cable at shift lever and shifter assembly bracket.
8. Remove the nuts holding the shift cable seal plate to the floor pan.

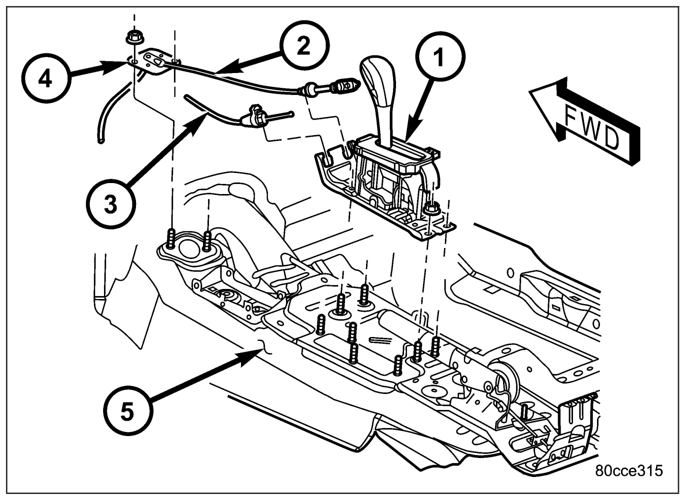


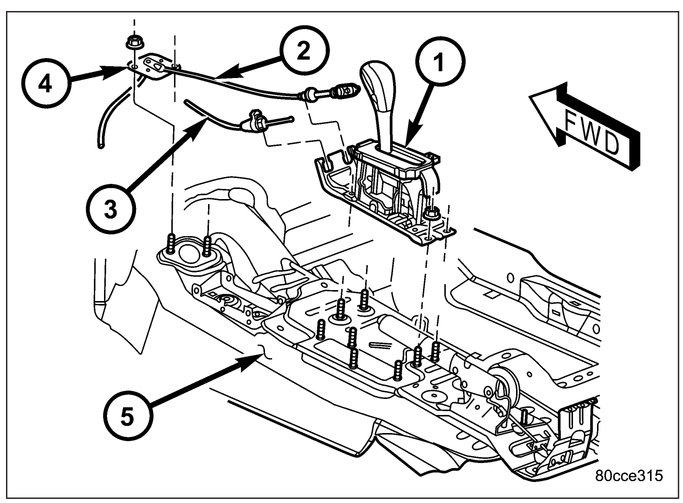
9. Pull cable through floor panel opening.
10. Remove shift cable from vehicle.



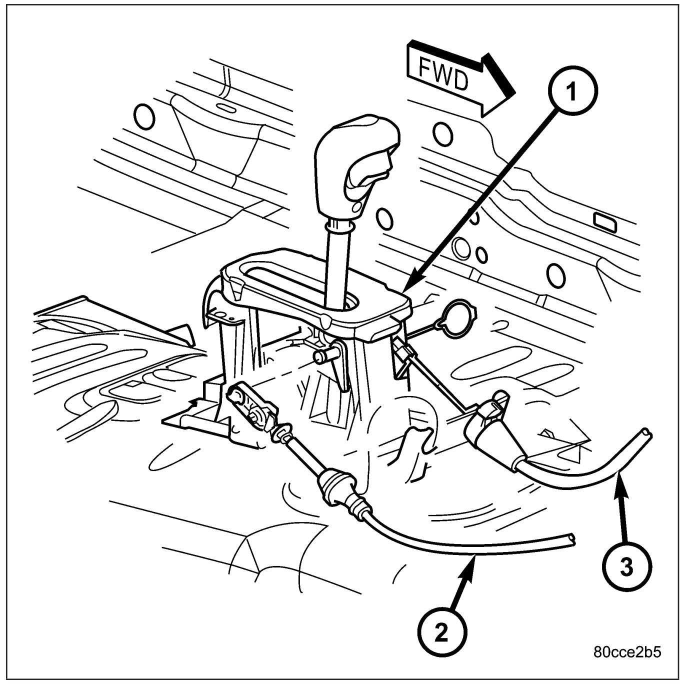
## INSTALLATION

1. Route cable through hole in floor pan.
2. Install seal plate to studs in floor pan.
3. Install nuts to hold seal plate to floor pan. Tighten nuts to 7 N·m (65 in.lbs.).
4. Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
5. Place the floor shifter lever in PARK position.
6. Loosen the adjustment screw on the shift cable.
7. Snap the shift cable onto the shift lever pin.





8. Raise the vehicle.
9. Install the shift cable to the shift cable support bracket.
10. Shift the transmission into PARK. PARK is the rearmost detent position on the transmission manual shift lever.
11. Snap the shift cable onto the transmission manual shift lever.
12. Lower vehicle.
13. Verify that the shift lever is in the PARK position.
14. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
15. Verify correct shifter operation.
16. Install any console parts removed for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

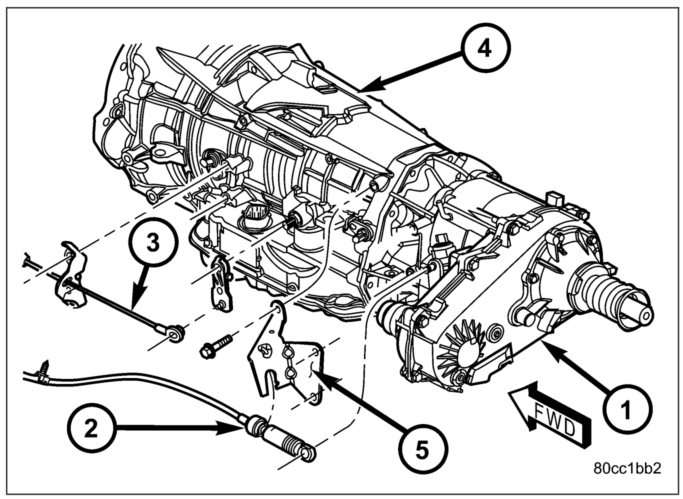


## ADJUSTMENTS - GEARSHIFT CABLE

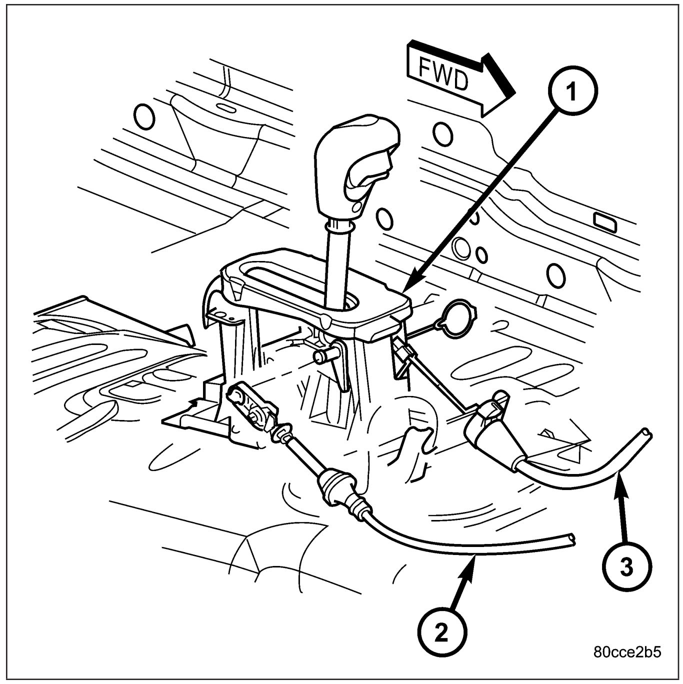
Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the TRS may be faulty.

### Gearshift Adjustment Procedure

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
3. Loosen the shift cable adjustment screw.

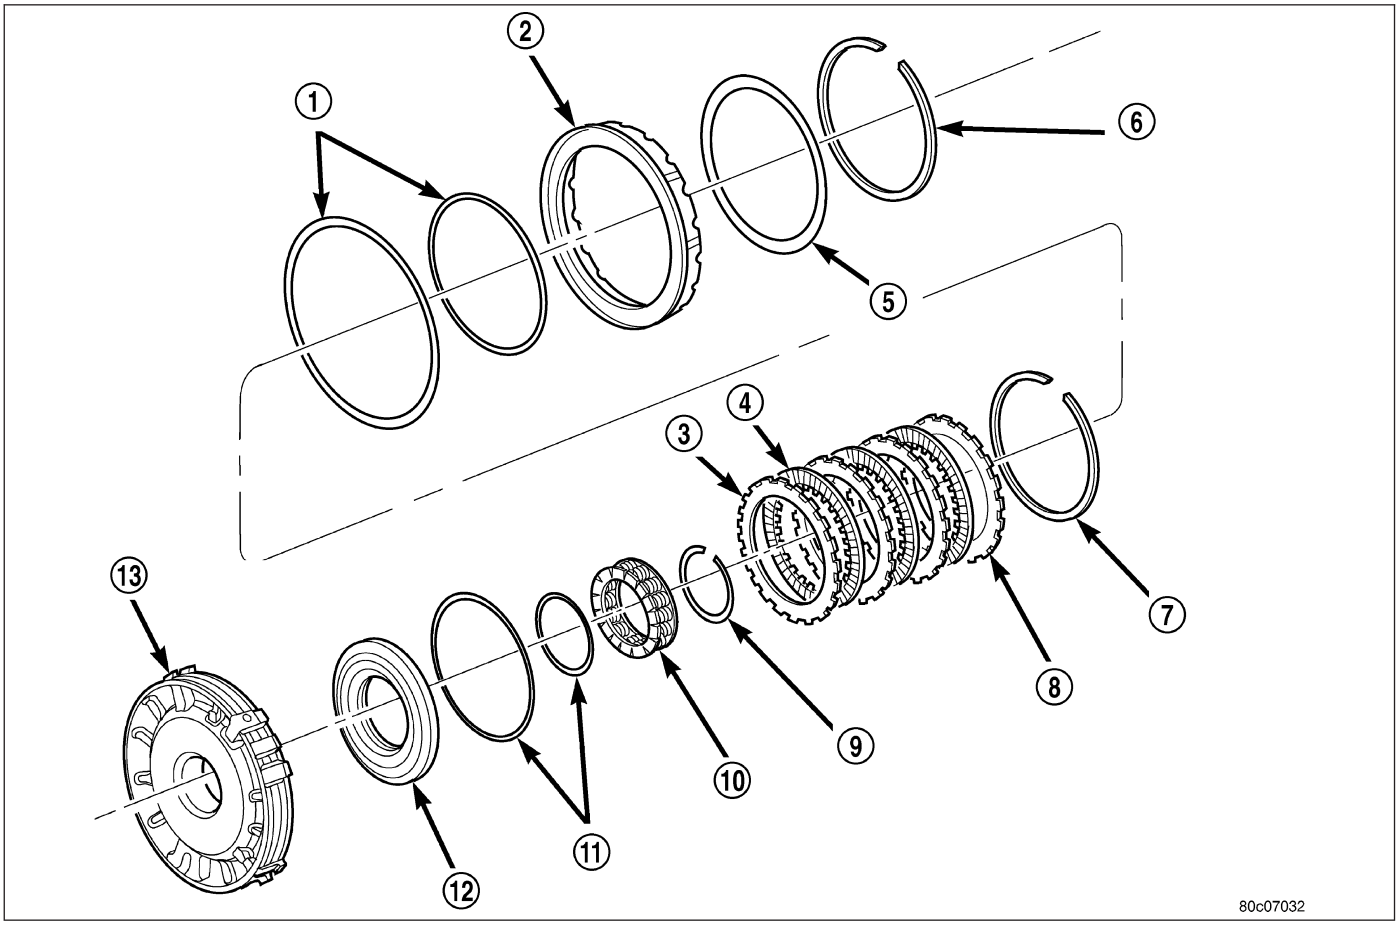


4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.
9. Lower vehicle
10. Tighten the shift cable adjustment screw to 7 N·m (65 in.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

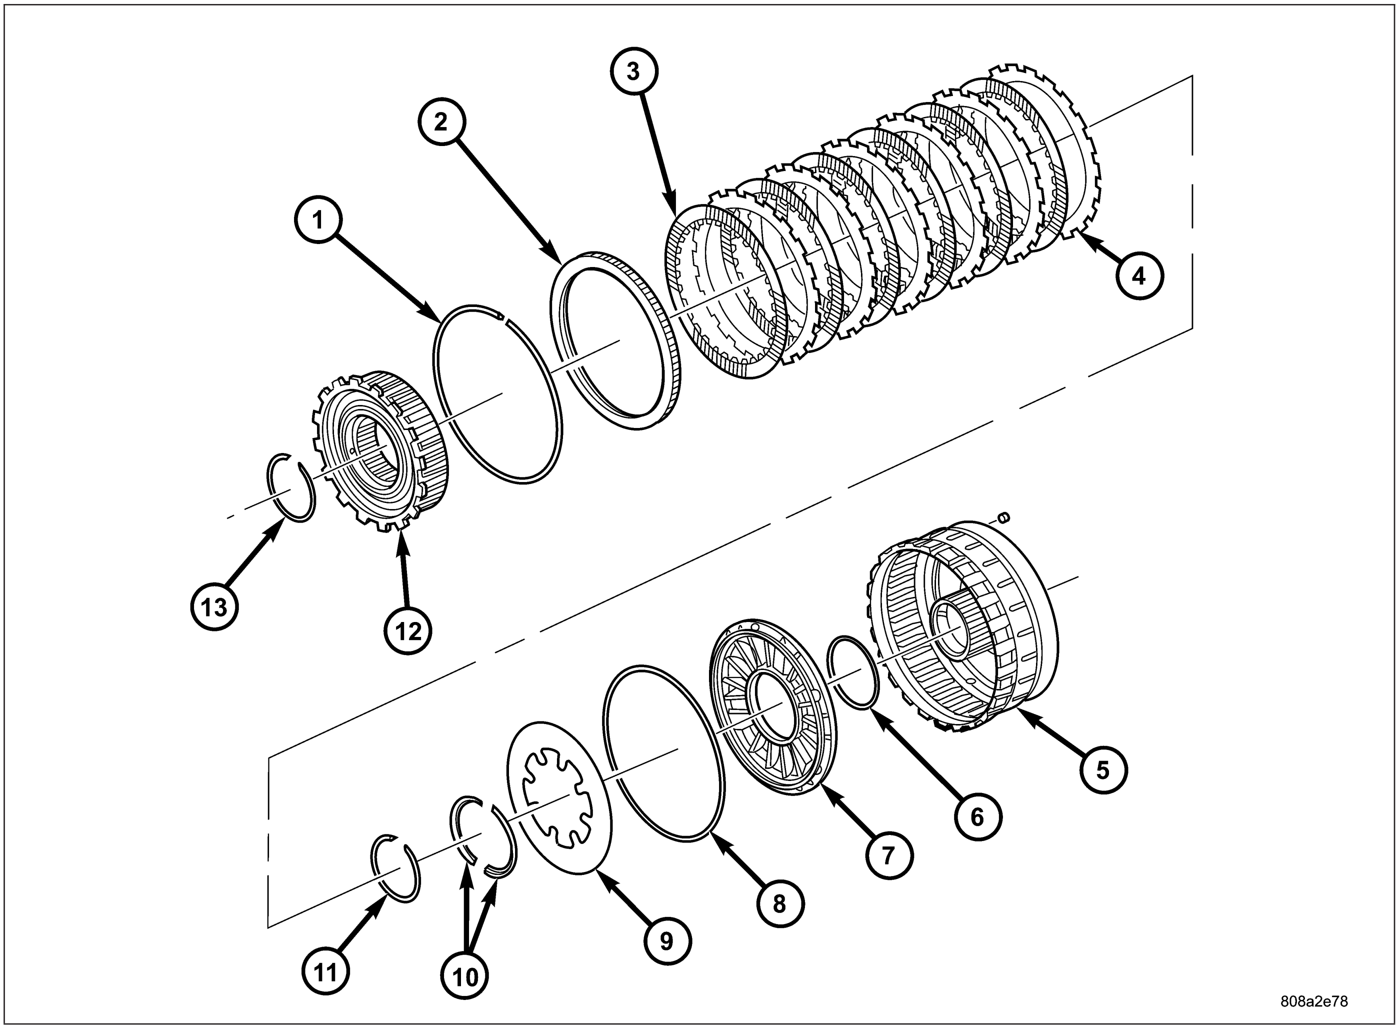


# CLUTCHES-HOLDING

## DESCRIPTION



Three hydraulically applied multi-disc clutches are used to hold some planetary geartrain components stationary while the input clutches drive others. The 2C, 4C, and Low/Reverse clutches are considered holding clutches. The 2C and 4C clutches are located in the 4C retainer/bulkhead (13).



The Low/Reverse clutch is located at the rear of the transmission case.

# OPERATION

## 2C CLUTCH

The 2C clutch is hydraulically applied in second and fifth gear by pressurized fluid against the 2C piston. When the 2C clutch is applied, the reverse sun gear assembly is held or grounded to the transmission case by holding the reaction planetary carrier.

## 4C CLUTCH

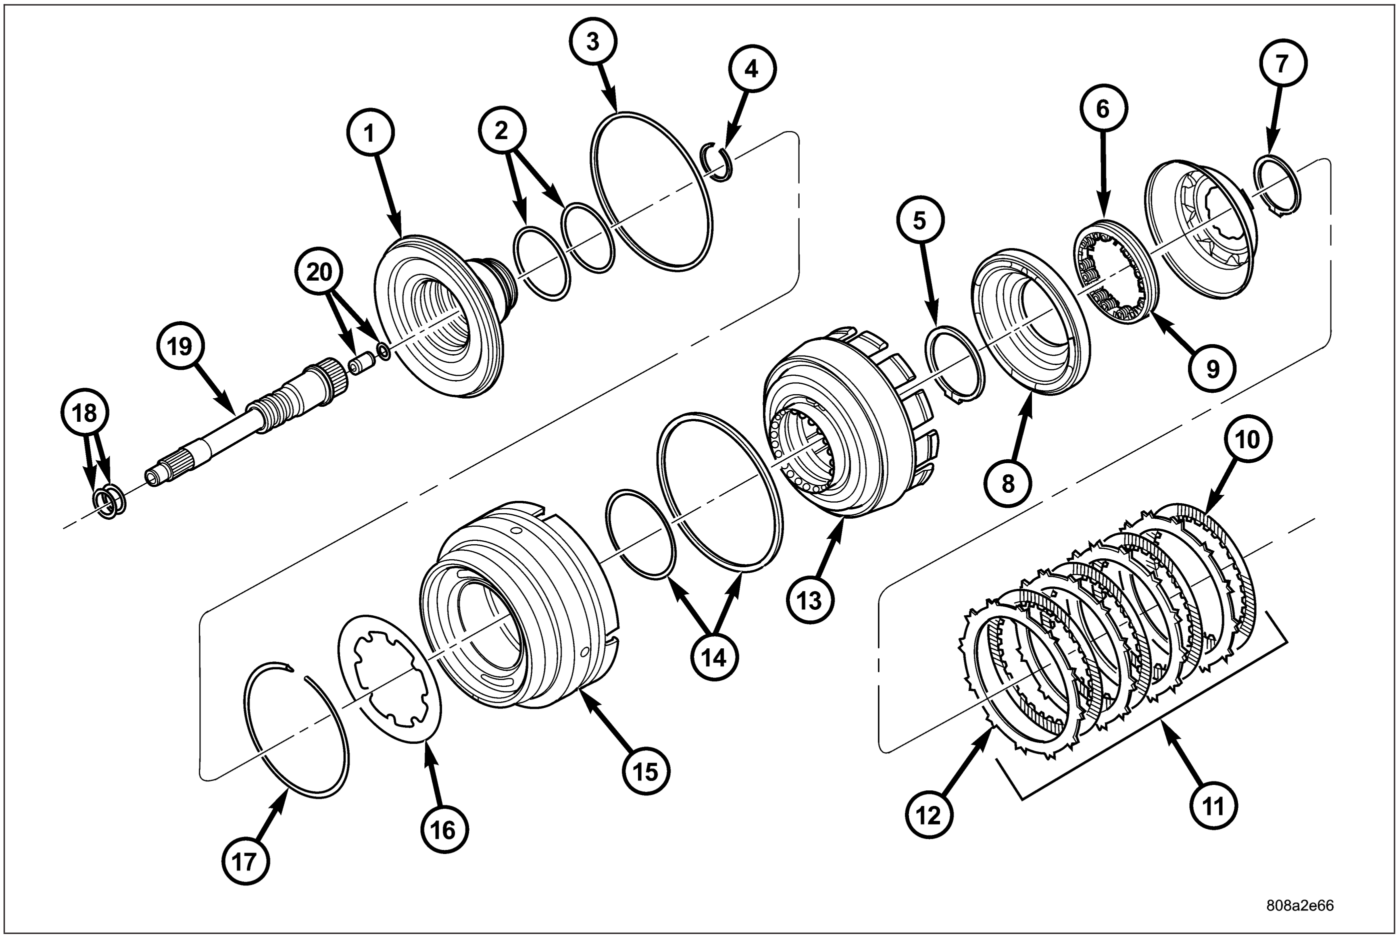
The 4C clutch is hydraulically applied in second prime and fourth gear by pressurized fluid against the 4C clutch piston. When the 4C clutch is applied, the reaction annulus gear is held or grounded to the transmission case.

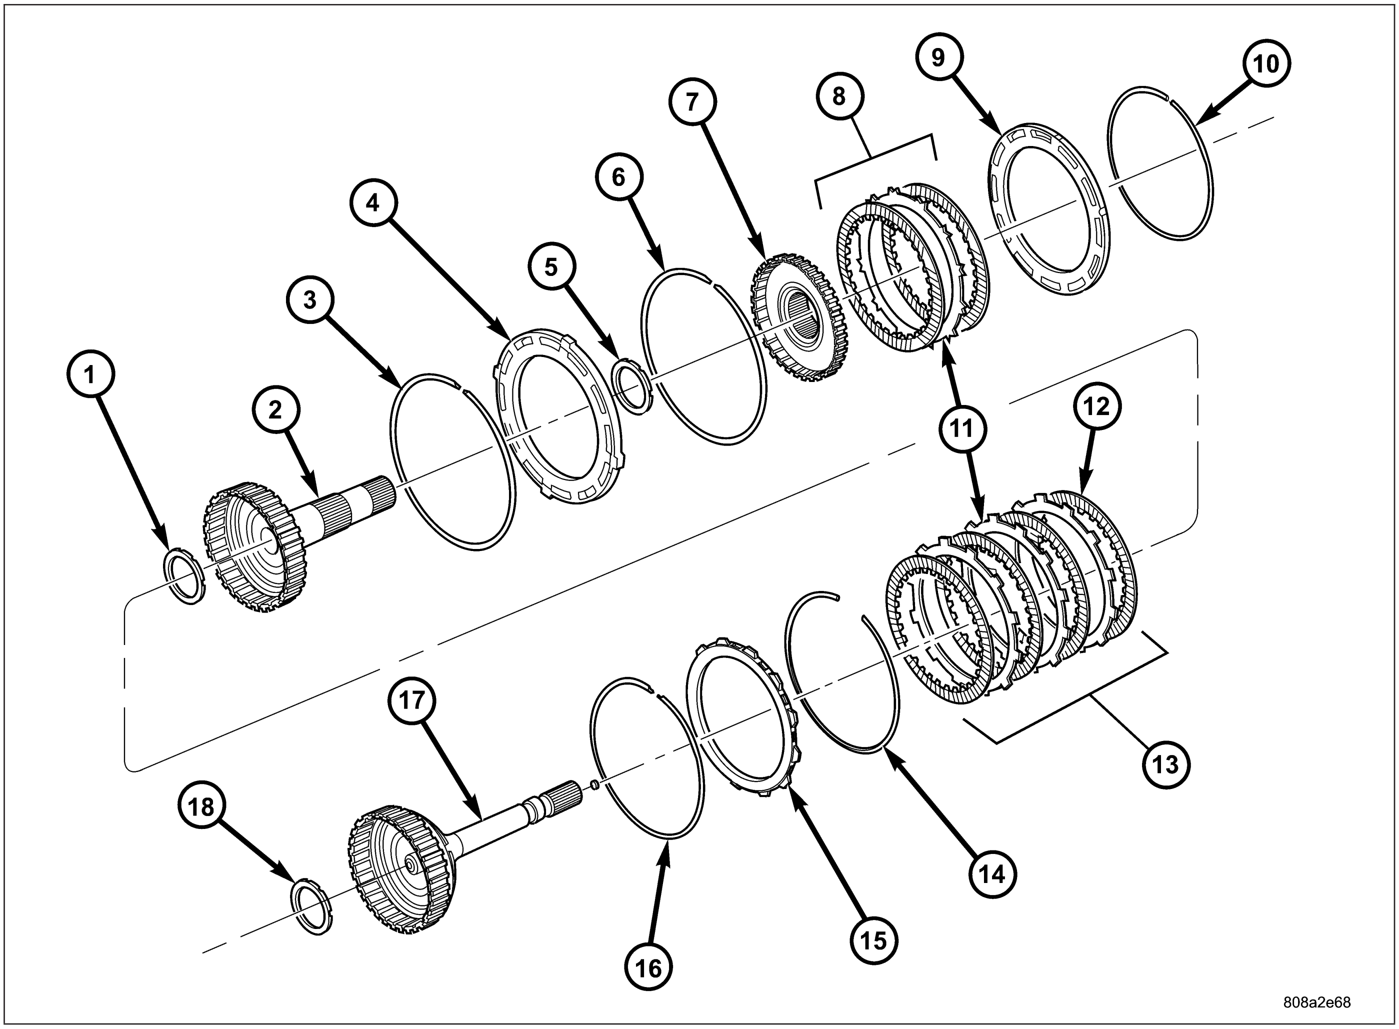
## LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gear, only at low speeds, by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the input annulus assembly is held or grounded to the transmission case.

# ASSEMBLY-INPUT CLUTCH

## DESCRIPTION





Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly.

The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

## OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

### UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, second prime, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the input sun gear.

### OVERDRIVE CLUTCH

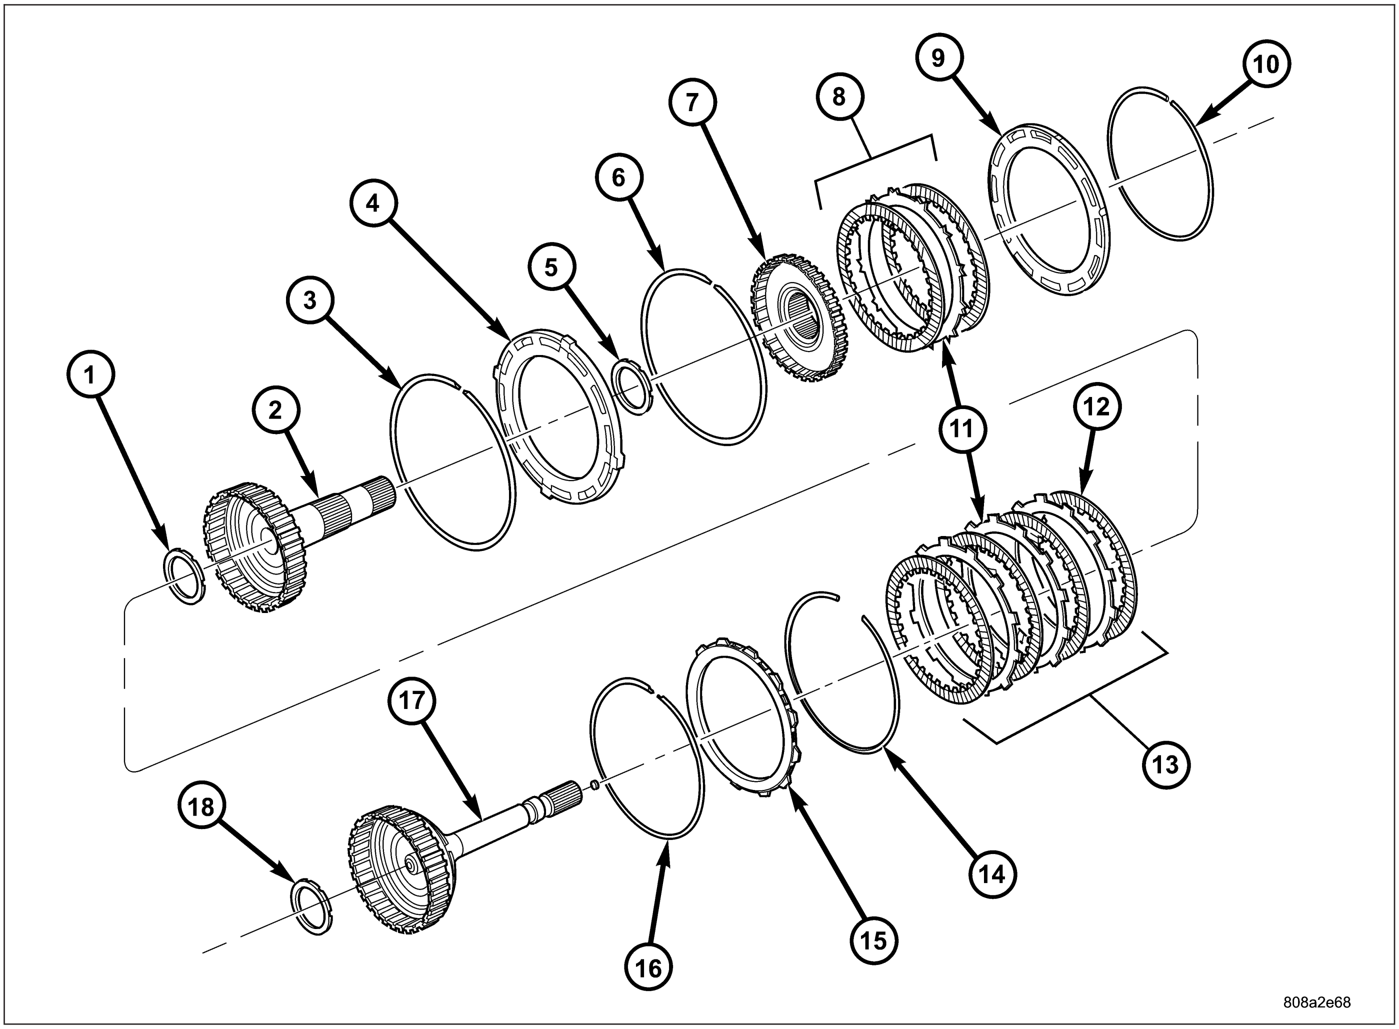
The overdrive clutch is hydraulically applied in third (direct), fourth, and fifth gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the reverse carrier/input annulus assembly.

## REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the reaction annulus gear is driven.

## DISASSEMBLY

**NOTE: If the input clutch assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).**

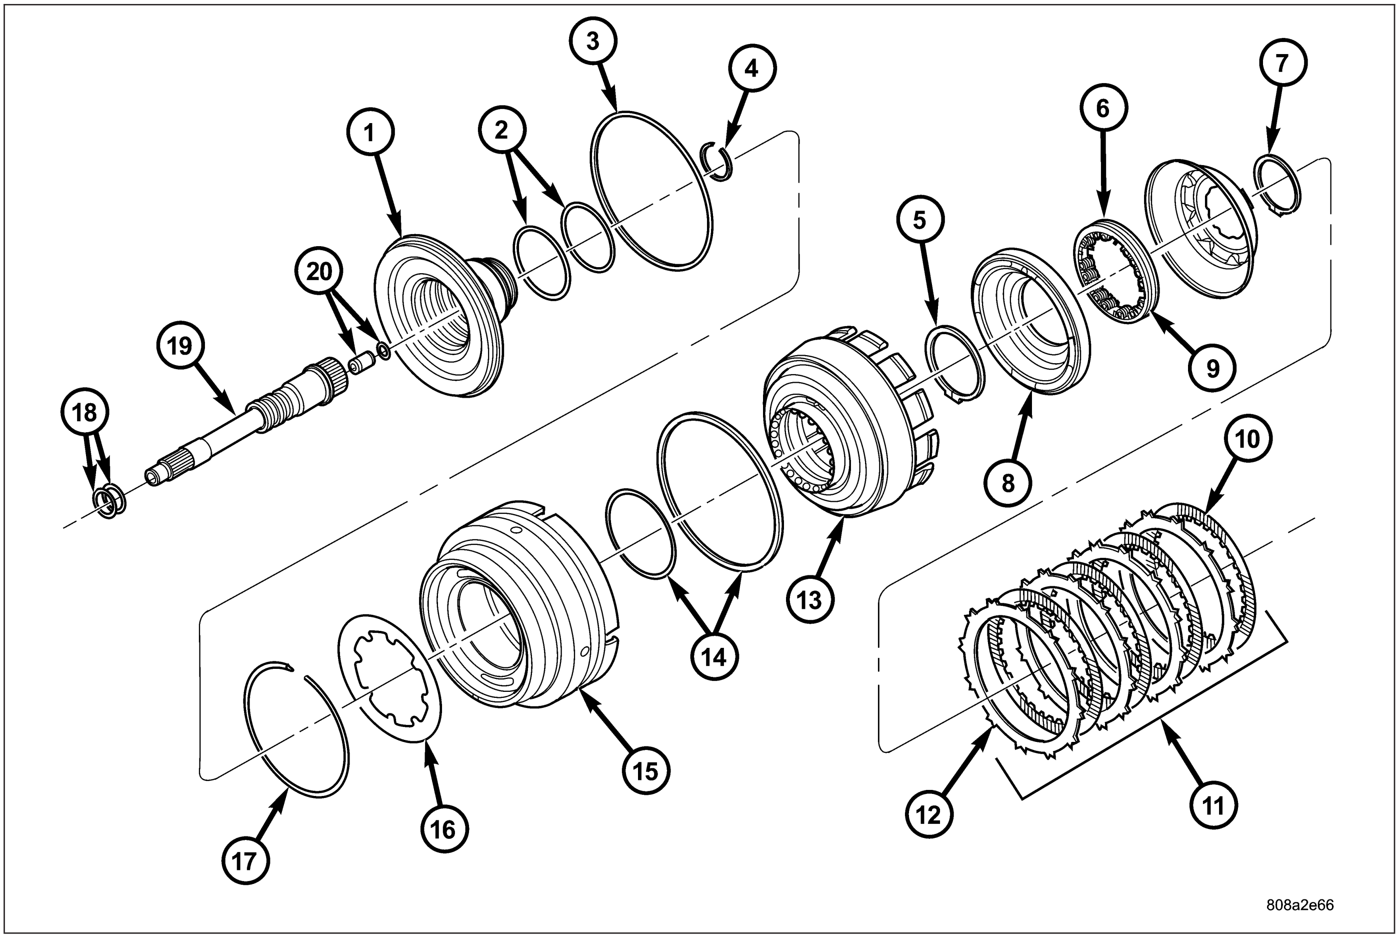


1. Remove the reverse reaction plate selective snap-ring (10) from the input clutch retainer (13).
2. Remove the reverse reaction plate (9) from the input clutch retainer.
3. Remove the reverse hub (7) and reverse clutch pack (8) from the input clutch retainer.
4. Remove the number 4 thrust bearing (5) from the overdrive hub (2).
5. Remove the overdrive hub (2) from the input clutch retainer.
6. Remove the number 3 thrust bearing (1) from the underdrive hub (17).
7. Remove the OD/reverse reaction plate snap-ring (6) from the input clutch retainer.
8. Remove the underdrive hub (17), overdrive clutch (13), and overdrive reaction plate (15) from the input clutch retainer.

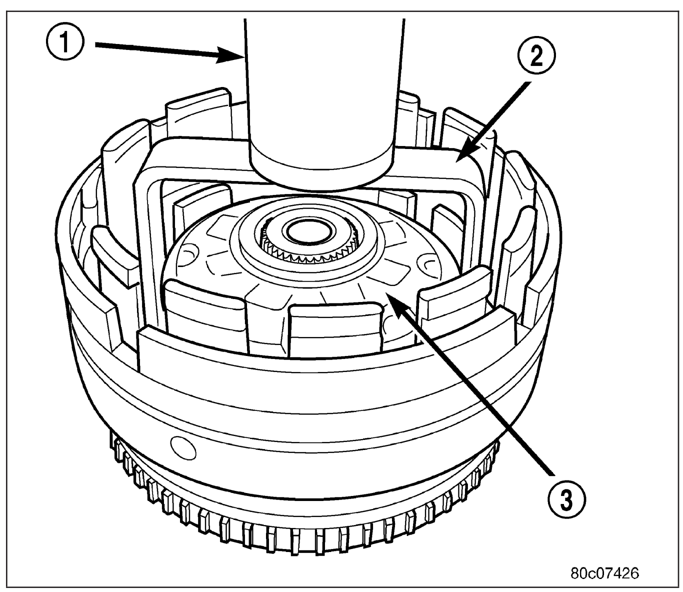
**NOTE: The overdrive friction discs and steel discs are thicker than the matching components in the underdrive and reverse clutches.**

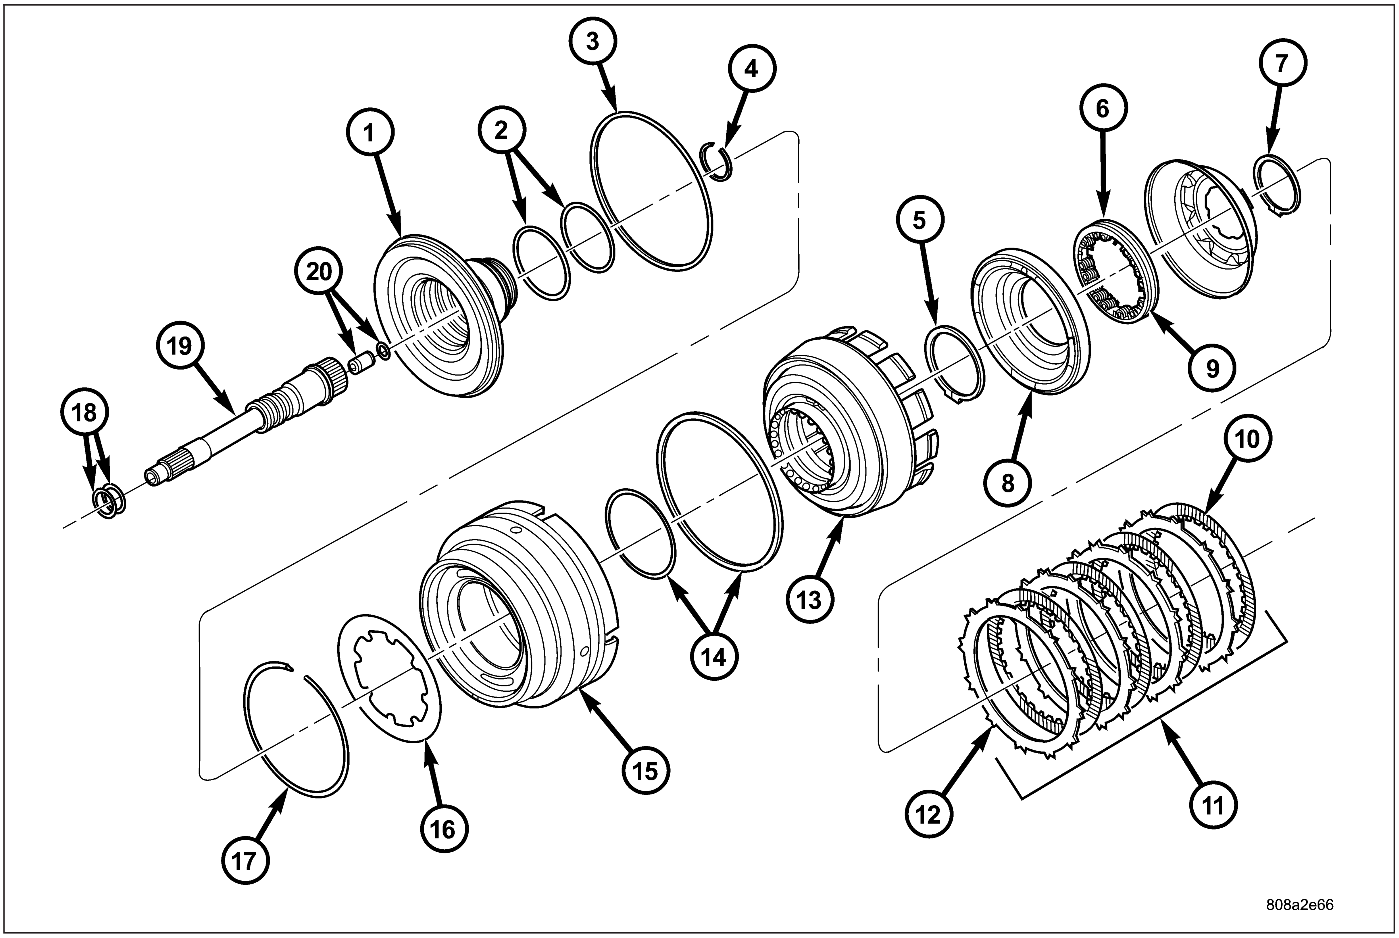
9. Remove the number 2 thrust bearing (18) from the input clutch hub.

10. Remove the overdrive clutch wave snap-ring (3) from the input clutch retainer.
11. Remove the UD/OD reaction plate tapered snap-ring (14) from the input clutch retainer (13).
12. Remove the UD/OD reaction plate (15) from the input clutch retainer.
13. Remove the UD/OD reaction plate flat snap-ring (16) from the input clutch retainer.



14. Remove the underdrive clutch pack (11) from the input clutch retainer (13).
15. Using Spring Compressor 8251 (2) , compress the UD/OD balance piston (3) and remove the snap-ring from the input clutch hub.



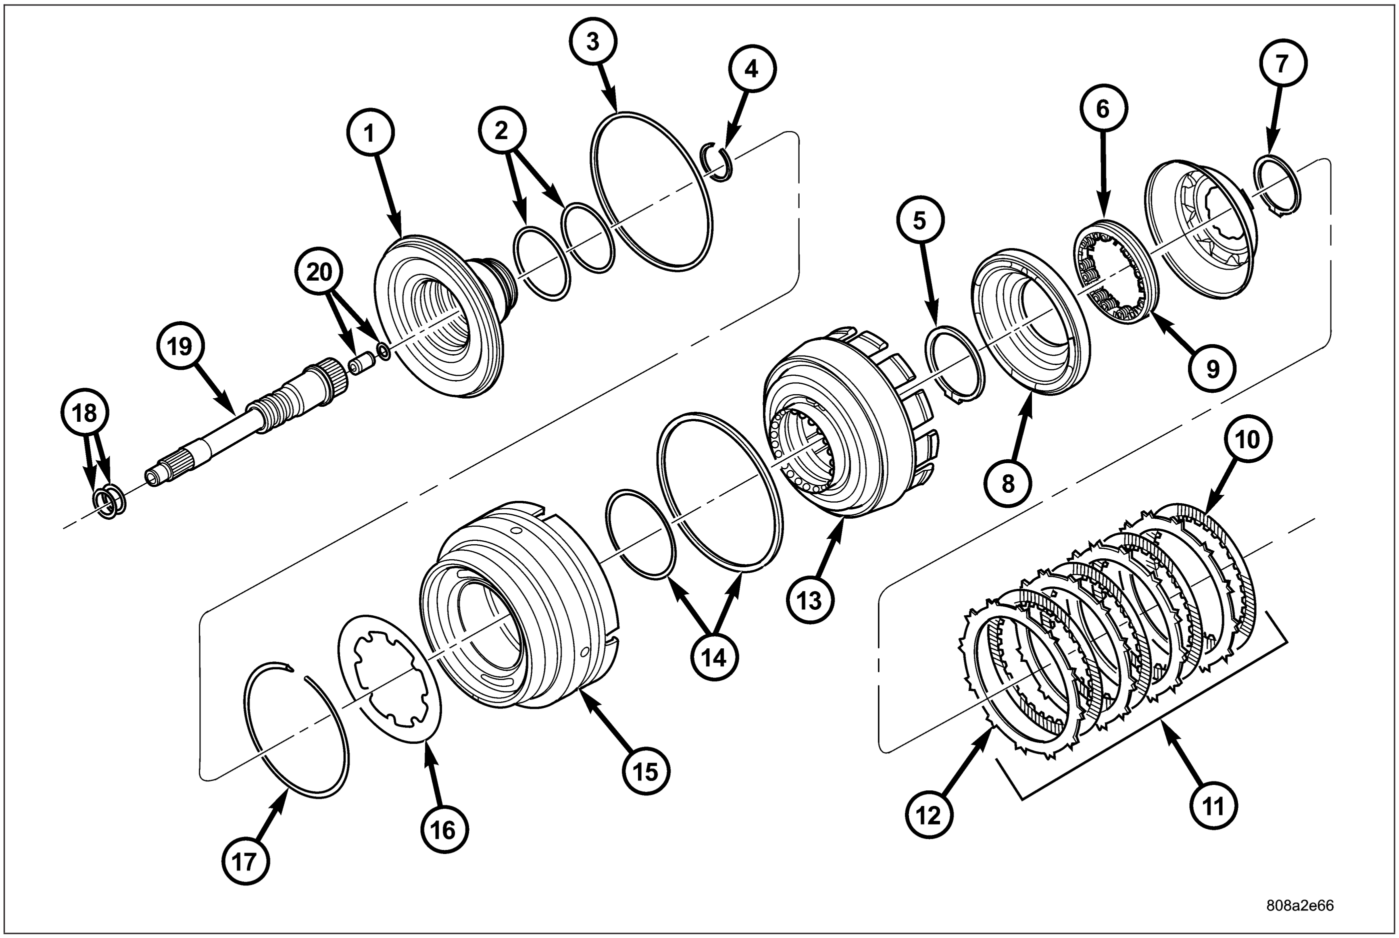


16. Remove the UD/OD balance piston (6) and piston return spring (9) from the input clutch retainer (13).
17. Remove the underdrive piston (8) from the input clutch retainer (13).

**NOTE: Both the UD/OD balance piston and the underdrive piston have seals molded onto them. If the seal is damaged, do not attempt to install a new seal onto the piston. The piston/seal must be replaced as an assembly.**

18. Remove the input clutch retainer tapered snap-ring (5).
19. Separate input clutch retainer (13) from input clutch hub (1).
20. Separate OD/reverse piston (15) from input clutch hub retainer (13).
21. Remove all seals and o-rings from the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to make note of which o-ring belongs in which location.

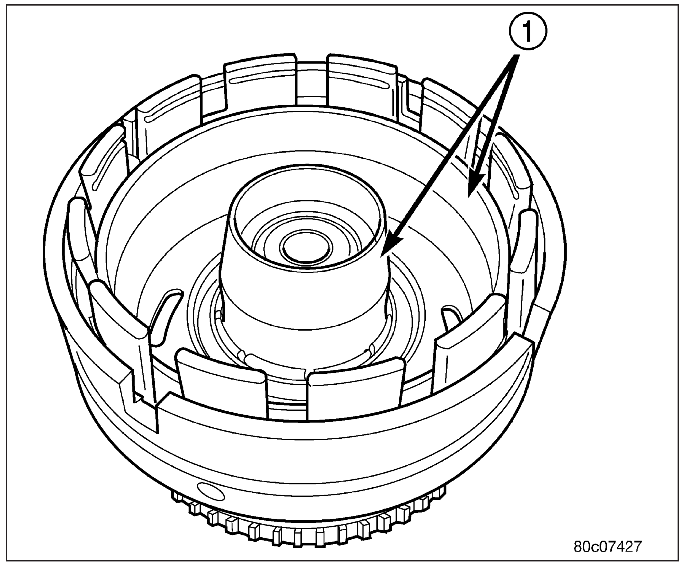
## ASSEMBLY



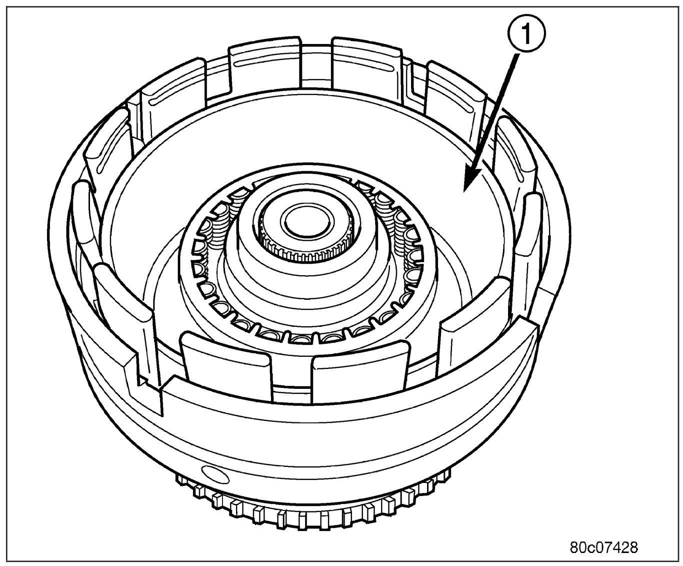
**NOTE: Install all new seals and o-rings onto the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to install the correct o-ring in the correct location.**

1. Check the transmission lubrication check valve (20) located in the input shaft using shop air. The valve should only allow air flow in one direction. If the valve allows no air flow, or air flow in both directions, the valve will need to be replaced.
2. Lubricate all seals with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.
3. Assemble the OD/reverse piston (15) onto the input clutch hub (1).
4. Assemble the input clutch retainer (13) onto the input clutch hub (1).
5. Install the input clutch retainer tapered snap-ring (5) with tapered side up onto the input clutch hub (1).

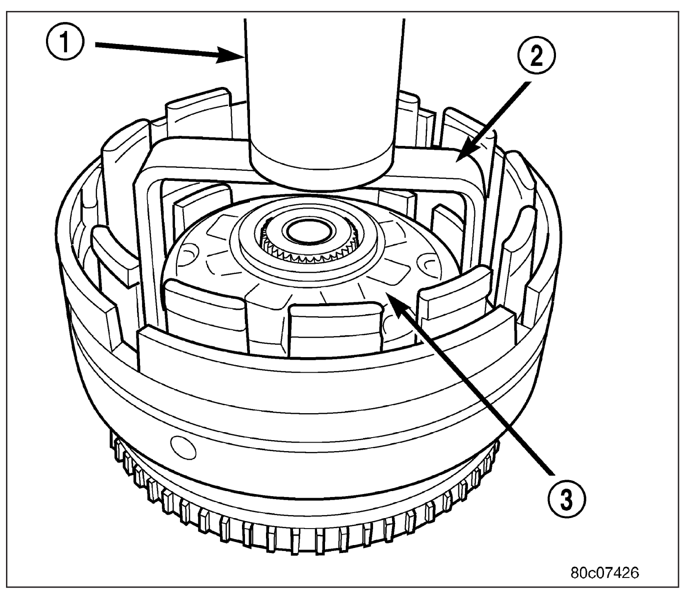
6. Install Piston Installer 8504 (1) into the input clutch retainer and onto the input clutch hub to guide the inner and outer underdrive piston seals into position.
7. Install the underdrive piston into the input clutch retainer and over the input clutch hub.

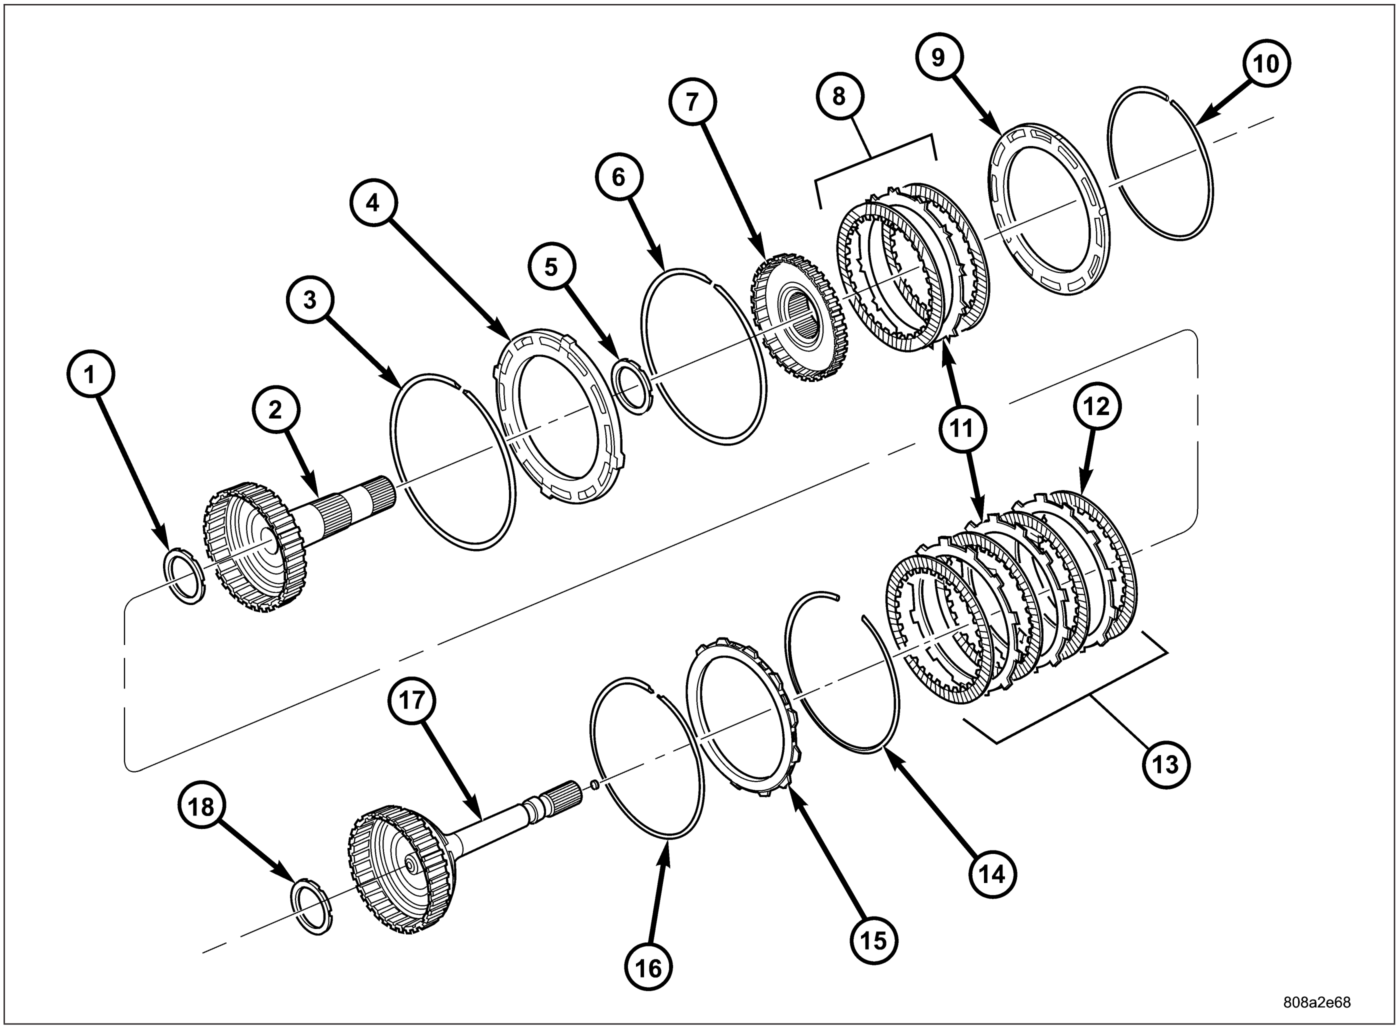


8. Install the UD/OD balance piston return spring pack into the input clutch retainer.
9. Install Piston Installer 8252 (1) into the input clutch retainer to guide the UD/OD balance piston seal into position inside the underdrive piston.

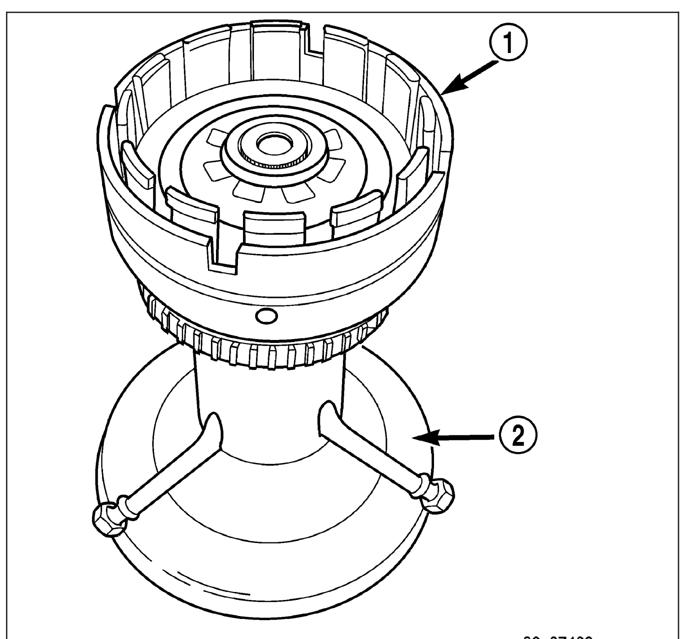


10. Install the UD/OD balance piston (3) into the input clutch retainer and the underdrive piston.
11. Using Spring Compressor 8251 (2), compress the UD/OD return spring pack and secure the piston in place with the snap-ring.
12. Install the underdrive clutch pack into the input clutch retainer.

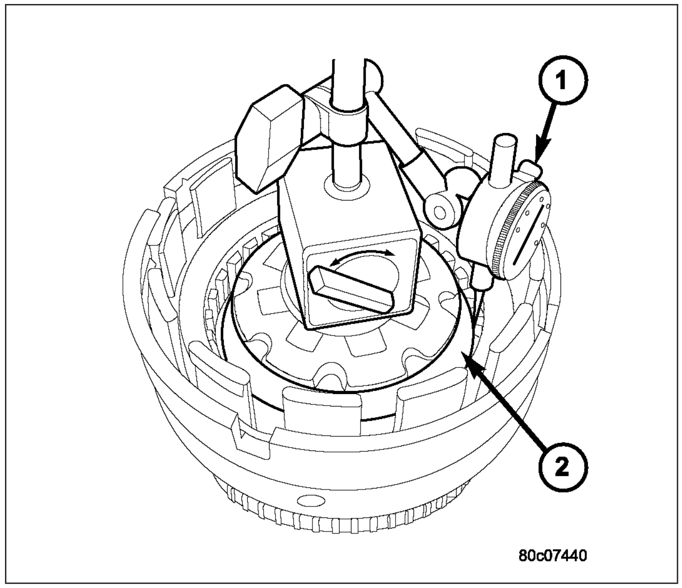


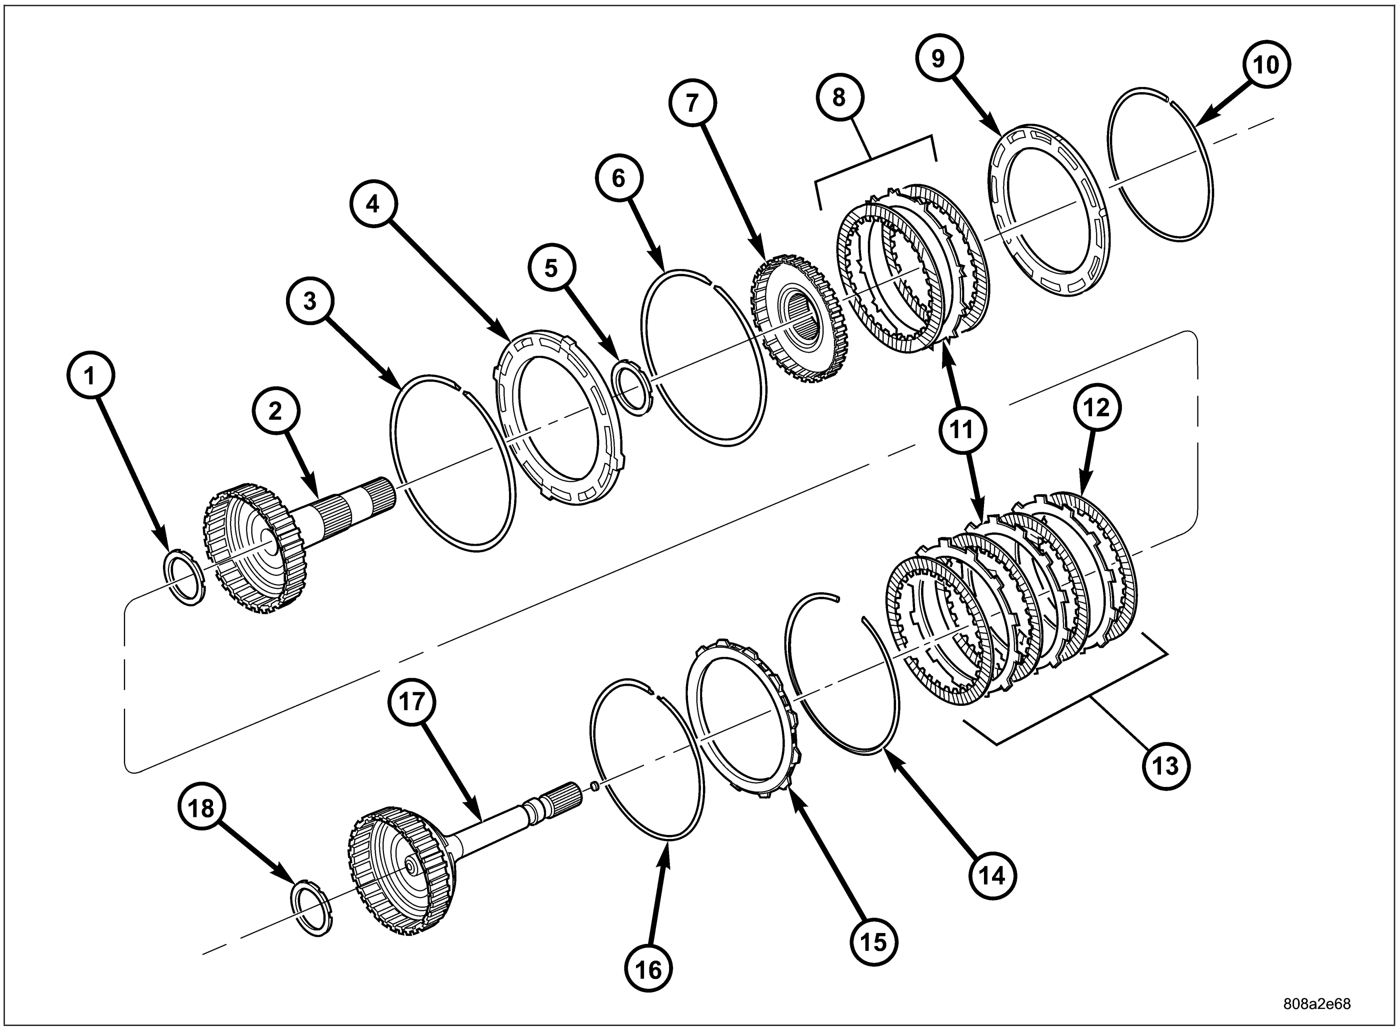


13. Install the UD/OD reaction plate lower flat snap-ring (16). The correct snap-ring can be identified by the two tabbed ears.
14. Install the UD/OD reaction plate (15) into the input clutch retainer. The reaction plate is to be installed with the big step down.
15. Install the UD/OD reaction plate upper tapered snap-ring (14) with tapered side up.
16. Install the input clutch assembly into Input Clutch Pressure Fixture 8260 (2).



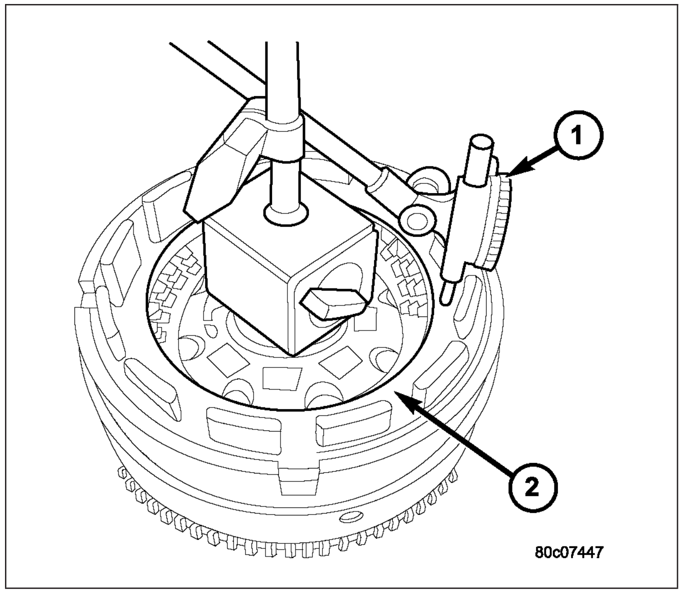
17. Mount a dial indicator to the assembly, push down on the clutch discs and zero the indicator against the underdrive clutch discs. Apply 20 psi of air pressure to the underdrive clutch and record the dial indicator reading. Measure and record UD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with UD clutch pack clearance specification. The correct clutch clearance is 0.84-1.54 mm (0.033-0.061 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.



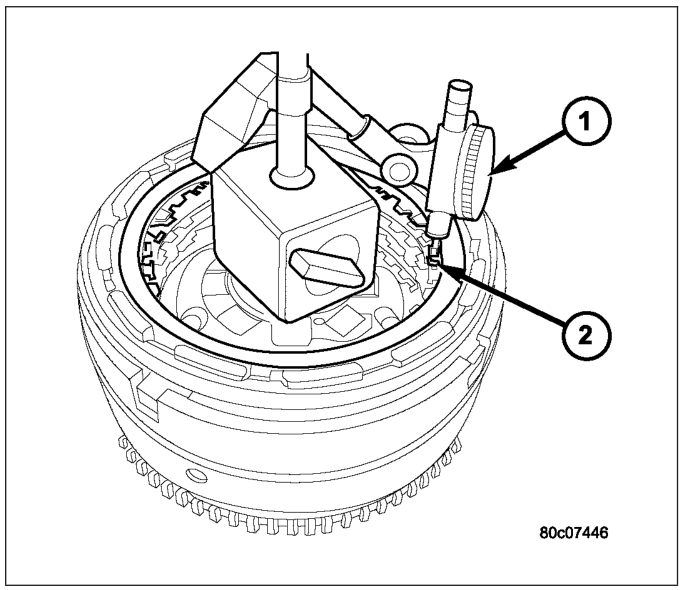


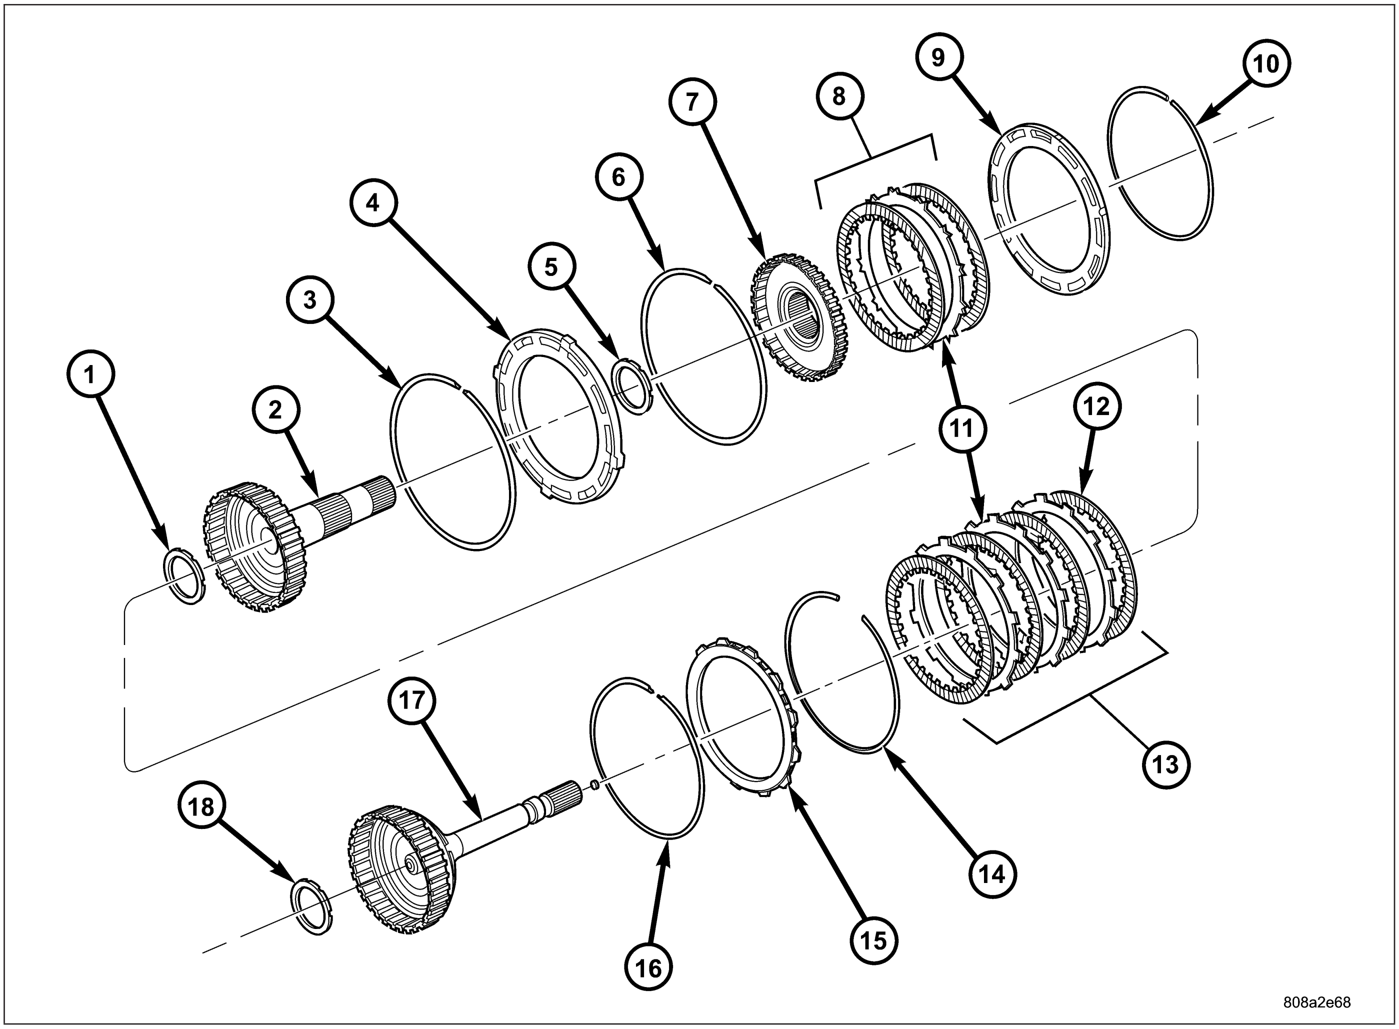
18. Install the overdrive clutch pack (13) into the input clutch retainer. The overdrive steel separator plates can be identified by the lack of the half-moon cuts in the locating tabs.
19. Install the overdrive clutch wavy snap-ring (3) with the two tabbed ears into the input clutch retainer.
20. Install the OD/reverse reaction plate (4) into the input clutch retainer. The reaction plate is non-directional.
21. Install the OD/reverse reaction plate flat snap-ring (6) into the input clutch retainer.

22. Mount a dial indicator to the assembly and zero the indicator against the OD/reverse reaction plate (2). Apply 20 psi of air pressure to the overdrive clutch and record the dial indicator reading. Measure and record OD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with OD clutch pack clearance specification.Verify that the clutch clearance is 1.103-1.856 mm (0.043-0.073 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.



23. Install the reverse clutch pack into the input clutch retainer.
24. Install the reverse reaction plate into the input clutch retainer.
25. Install the reverse reaction plate selective snap-ring into the input clutch retainer.
26. Mount a dial indicator to the assembly, push down on the clutch discs, pull up on the reaction plate to ensure the plate is properly seated and zero the indicator against the reverse clutch discs (2). Apply 20 psi of air pressure to the reverse clutch and record the dial indicator reading. Measure and record Reverse clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with Reverse clutch pack clearance specification. The correct clutch clearance is 0.81-1.24 mm (0.032-0.049 in.). Adjust as necessary. Install the chosen snap-ring and re-measure to verify selection.





27. Remove the reverse clutch pack (8) from the input clutch retainer.
28. Install the number 2 thrust bearing (18) onto the underdrive hub (17) with outer race against the hub with petroleum jelly.
29. Install the underdrive hub (17) into the input clutch retainer.
30. Install the number 3 thrust bearing (1) into the overdrive hub (2) with the outer race against the hub with petroleum jelly.
31. Install the overdrive hub (2) into the input clutch retainer.
32. Install the number 4 thrust bearing (5) into the reverse hub with outer race against the hub with petroleum jelly.
33. Install the reverse hub (7) into the input clutch retainer.
34. Install the complete reverse clutch pack (8).
35. Install the reverse reaction plate (9) and snap-ring (10).
36. Push up on reaction plate to allow reverse clutch to move freely.

# SENSOR-INPUT SPEED

## DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

## OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

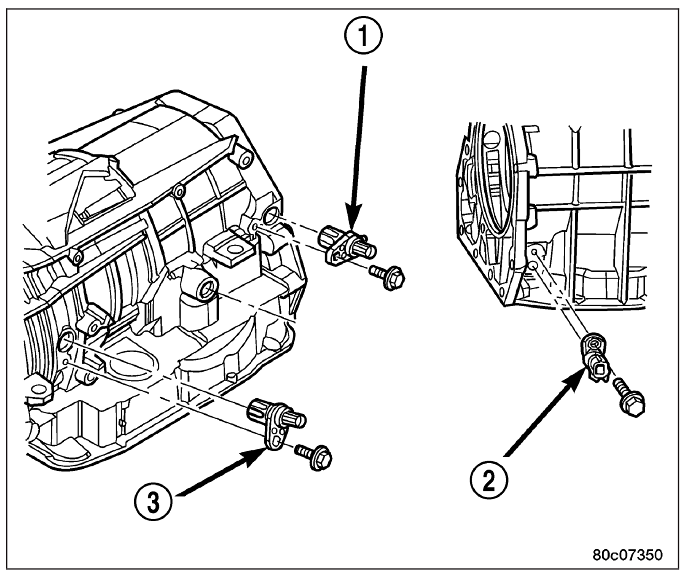
- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

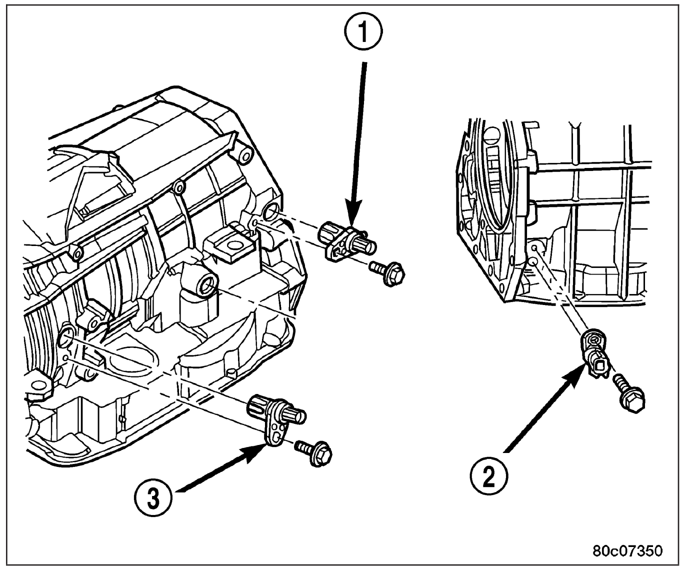
## REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the input speed sensor (3).
4. Remove the bolt holding the input speed sensor to the transmission case.
5. Remove the input speed sensor (3) from the transmission case.



## INSTALLATION

1. Install the input speed sensor (3) into the transmission case.
2. Install the bolt to hold the input speed sensor (3) into the transmission case. Tighten the bolt to 12 N·m (105 in.lbs.).
3. Install the wiring connector onto the input speed sensor.
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.



# SENSOR-LINE PRESSURE (LP)

## DESCRIPTION

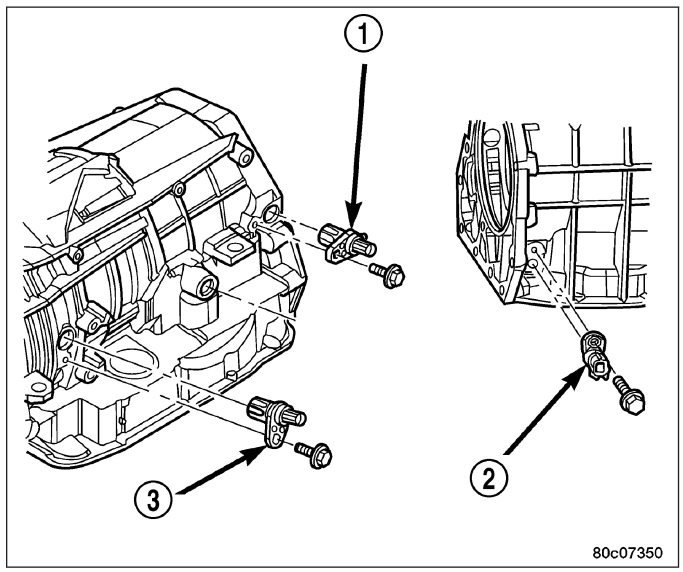
The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid, mounted on the side of the solenoid and pressure switch assembly. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump. The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure solenoid monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

## OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts and when the transmission is in the PARK and NEUTRAL positions. This is done to ensure consistent shift quality. During all other operation, the actual line pressure is compared to the desired line pressure and adjustments are made to the pressure control solenoid duty cycle.

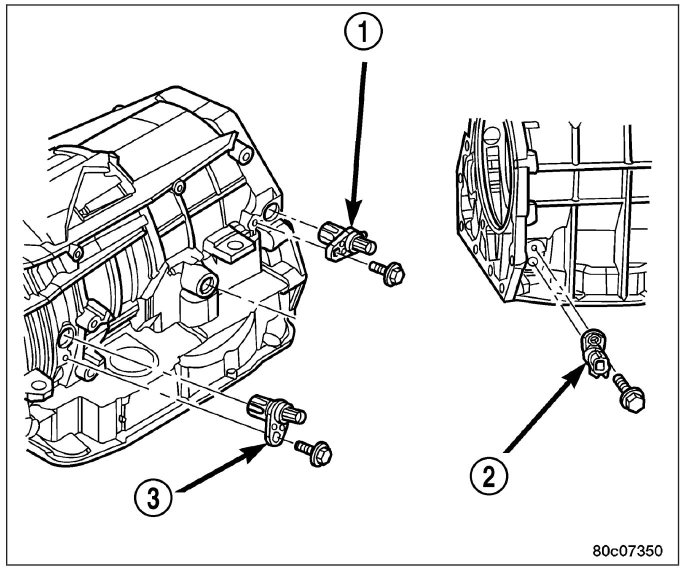
## REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the line pressure sensor (2).
4. Remove the bolt holding the line pressure sensor (2) to the transmission case.
5. Remove the line pressure sensor (2) from the transmission case.



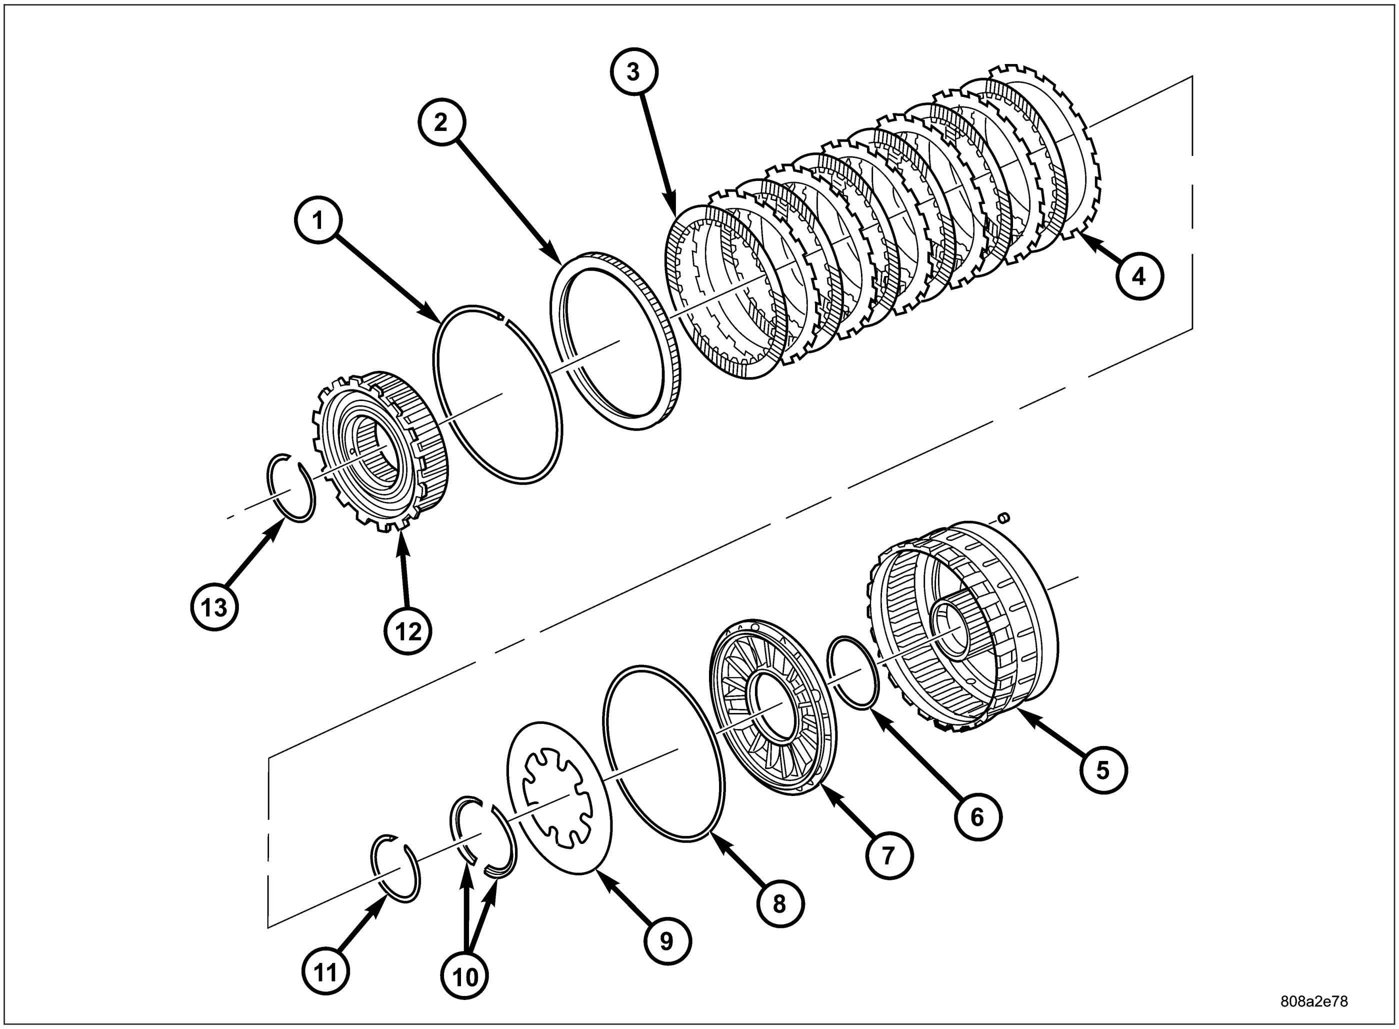
## INSTALLATION

1. Install the line pressure sensor (2) into the transmission case.
2. Install the bolt to hold the line pressure sensor (2) into the transmission case. Tighten the bolt to 12 N·m (105 in.lbs.).
3. Install the wiring connector onto the line pressure sensor (2).
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.



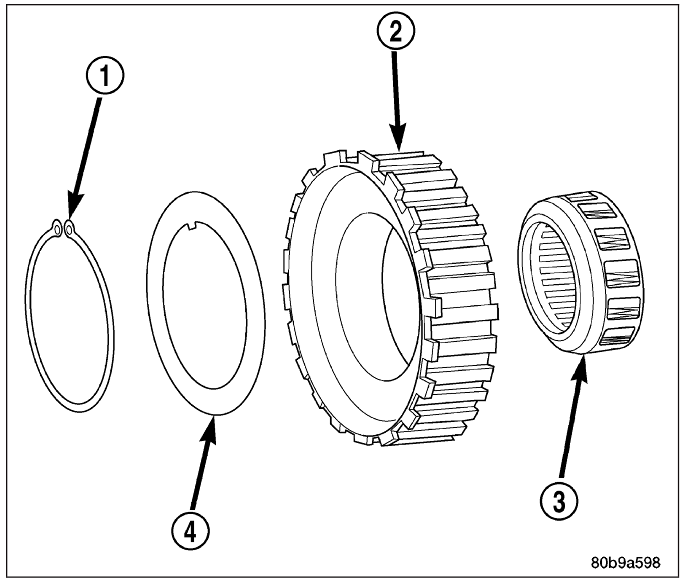
# CLUTCH-LOW/REVERSE

## DISASSEMBLY

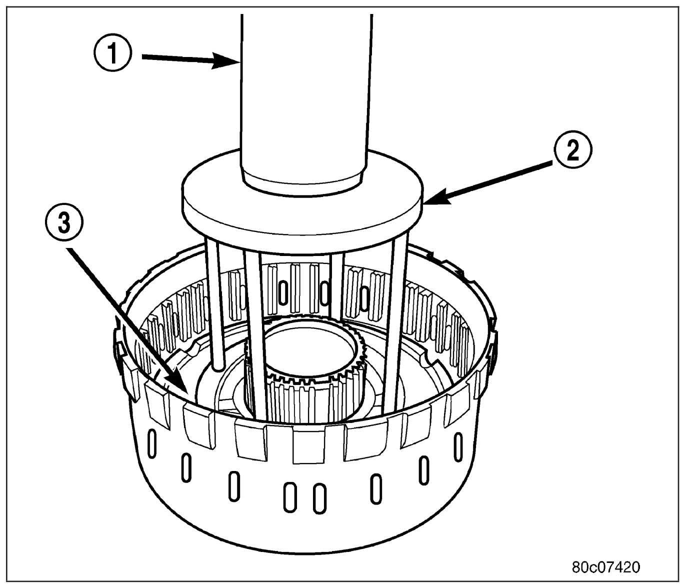


1. Remove the inner overrunning clutch snap-ring (13) from the low/reverse clutch retainer (5).
2. Remove the outer low/reverse reaction plate flat snap-ring (1).
3. Remove the low/reverse clutch (3, 4) and the overrunning clutch (12) from the low/reverse clutch retainer (5) as an assembly.
4. Separate the low/reverse clutch (3, 4) from the overrunning clutch (12).

5. Remove the overrunning clutch snap-ring (1).
6. Remove the spacer (4) from the overrunning clutch (3).
7. Separate the inner and outer races (2) of the overrunning clutch (3).
8. Remove the overrunning clutch lower snap-ring.



9. Using Spring Compressor 8285 (2) and a suitable shop press (1), compress the low/reverse Belleville spring (3) and remove the split retaining ring holding the Belleville spring into the low/reverse clutch retainer.
10. Remove the low/reverse Belleville spring (3) and piston from the low/reverse clutch retainer. Use 20 psi of air pressure to remove the piston if necessary.



## CLEANING

Clean the overrunning clutch assembly, clutch cam, and low-reverse clutch retainer. Dry them with compressed air after cleaning.

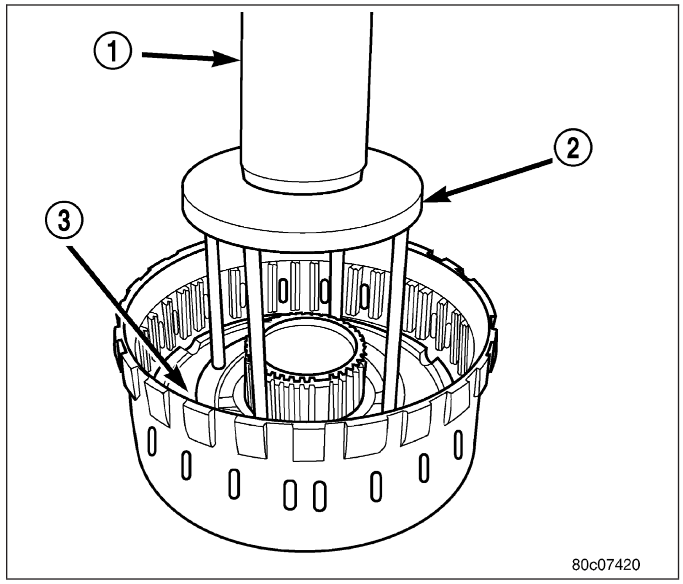
## INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

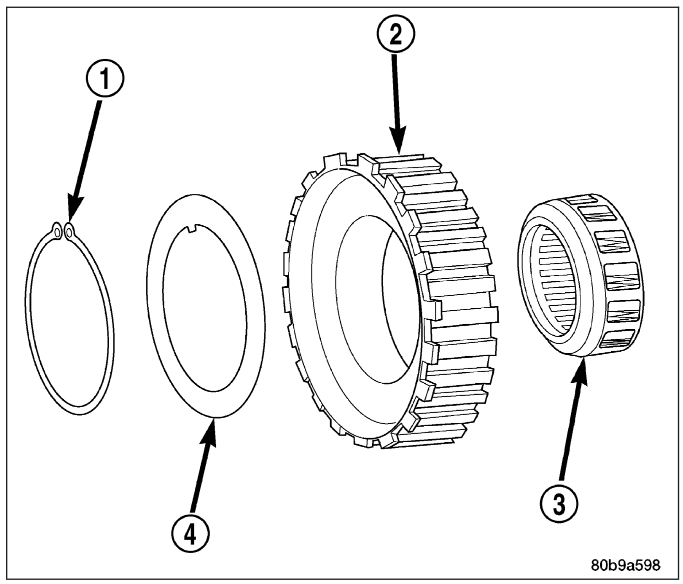
Replace the low-reverse clutch retainer if the clutch race, roller surface or inside diameter is scored, worn or damaged.

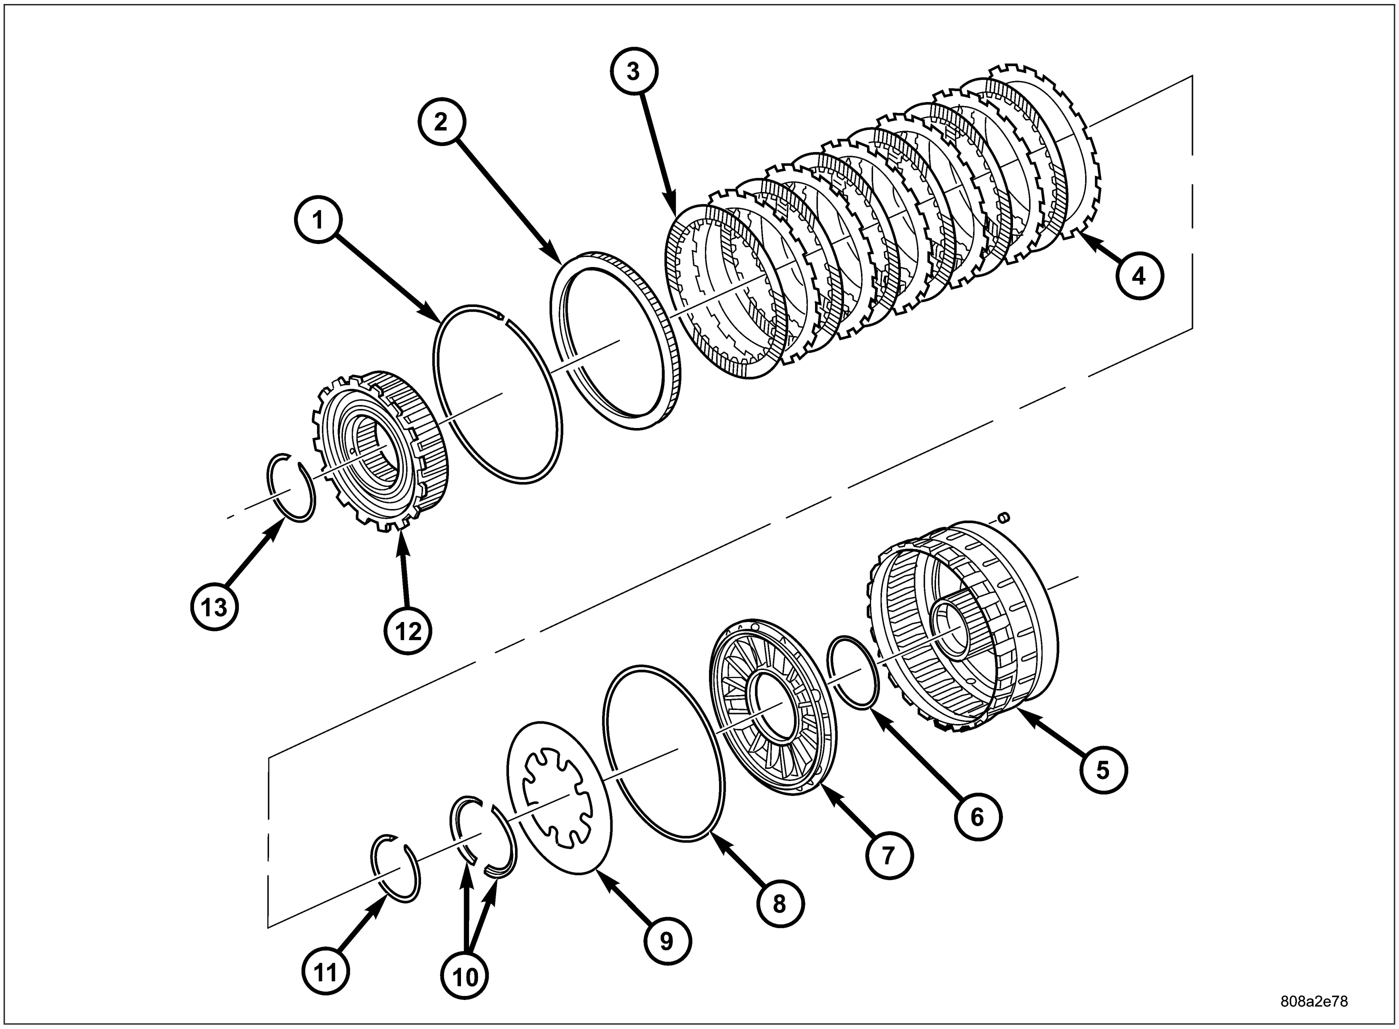
## ASSEMBLY

1. Check the bleed orifice to ensure that it is not plugged or restricted.
2. Install a new seal on the low/reverse piston. Lubricate the seal with Mopar® ATF +4, Automatic Transmission Fluid, prior to installation.
3. Install the low/reverse piston into the low/reverse clutch retainer.
4. Position the low/reverse Belleville spring (3) on the low/reverse piston.
5. Using Spring Compressor 8285 (2) and a suitable shop press (1), compress the low/reverse Belleville spring (3) and install the split retaining ring to hold the Belleville spring into the low/reverse clutch retainer.



6. Install the lower overrunning clutch snap-ring.
7. Assemble the inner and outer races (2) of the overrunning clutch (3).
8. Position the overrunning clutch spacer (4) on the overrunning clutch (3).
9. Install the upper overrunning clutch snap-ring (1).



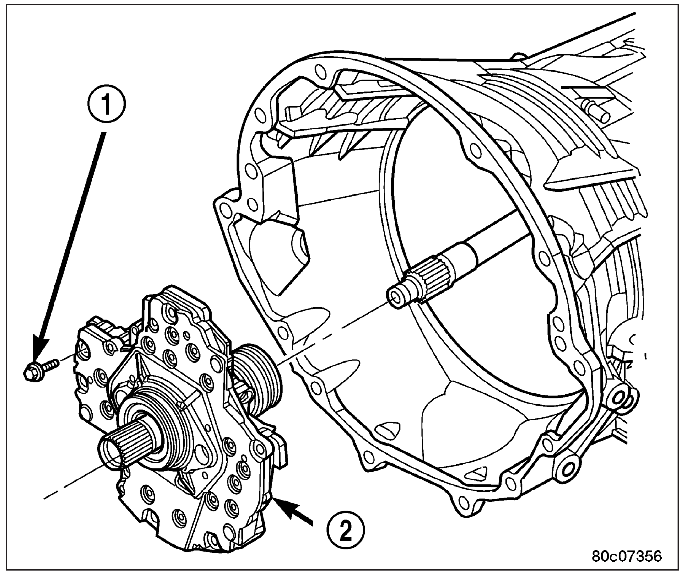


10. Assemble and install the low/reverse clutch pack (3, 4) into the low/reverse clutch retainer (5).
11. Install the low/reverse reaction plate (2) into the low/reverse clutch retainer (5). The reaction plate is directional and must be installed with the flat side down.
12. Install the low/reverse clutch pack snap-ring (1). The snap-ring is selectable and should be chosen to give the correct clutch pack clearance.
13. Measure the low/reverse clutch pack clearance and adjust as necessary. The correct clutch clearance is 1.00-1.74 mm (0.039-0.069 in.).
14. Install the overrunning clutch (12) into the low/reverse clutch retainer (5) making sure that the index splines are aligned with the retainer.
15. Install the overrunning clutch inner snap-ring (13).

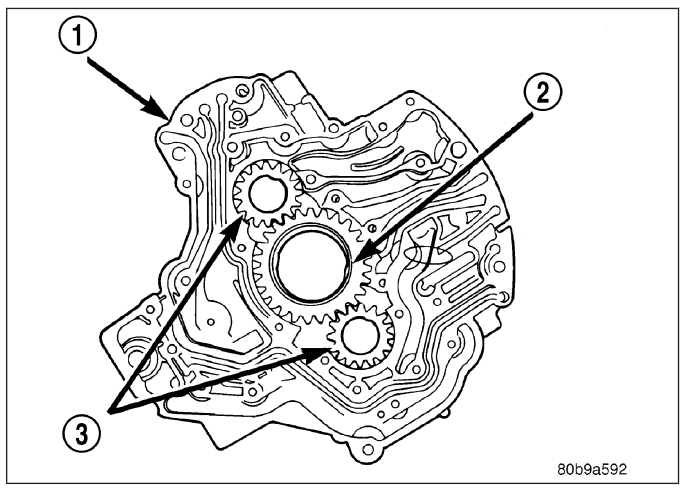
# PUMP-OIL

## DESCRIPTION

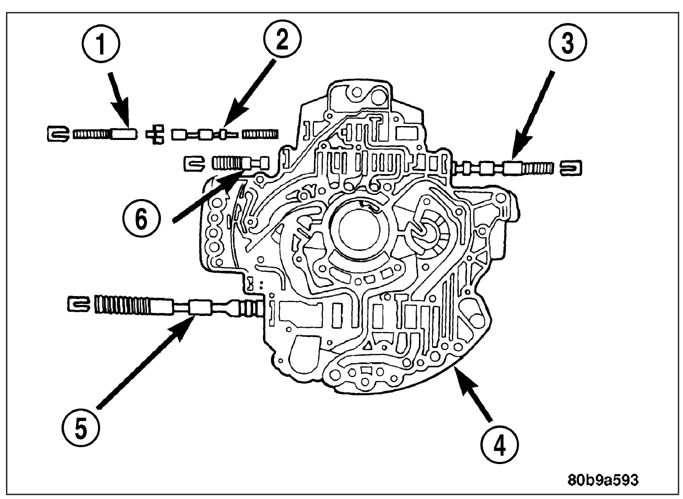
The oil pump (2) is located at the front of the transmission inside the bell housing and behind the transmission front cover.

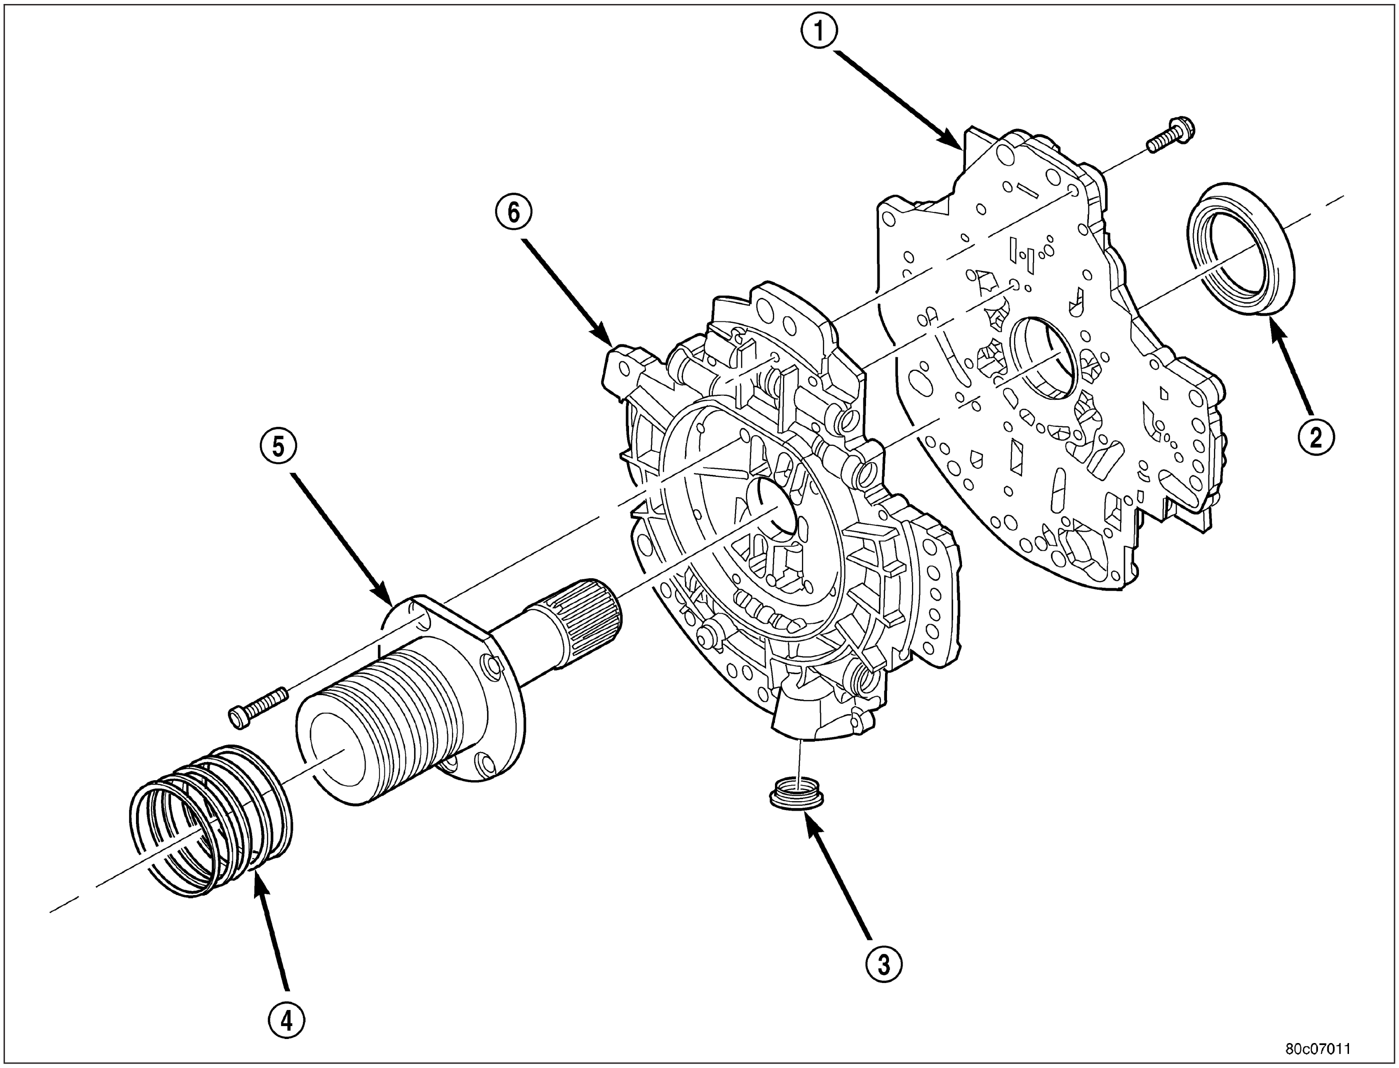


The oil pump consists of two independent pumps.



The oil pump also contains a number of valves. The converter clutch switch (3) and control valves (2), pressure regulator valve (5), and converter pressure limit valve (6) are all located in the oil pump valve body.





A front seal (2), and a bolt on reaction shaft (5) complete the oil pump assembly.

## OPERATION

As the torque converter rotates, the converter hub rotates the oil pump drive gear. As the drive gear rotates both driven gears, a vacuum is created when the gear teeth come out of mesh. This suction draws fluid through the pump inlet from the oil pan. As the gear teeth come back into mesh, pressurized fluid is forced into the pump outlet and to the oil pump valves.

At low speeds, both sides of the pump supply fluid to the transmission. As the speed of the torque converter increases, the flow from both sides increases until the flow from the primary side alone is sufficient to meet system demands. At this point, the check valve located between the two pumps closes. The secondary side is shut down and the primary side supplies all the fluid to the transmission.

### CONVERTER CLUTCH SWITCH VALVE

The converter clutch switch valve is used to control the hydraulic pressure supplied to the front (OFF) side of the torque converter clutch.

### CONVERTER CLUTCH REGULATOR VALVE

The converter clutch regulator valve is used to control the hydraulic pressure supplied to the back (ON) side of the torque converter clutch.

### TORQUE CONVERTER LIMIT VALVE

The torque converter limit valve serves to limit the available line pressure to the torque converter clutch.

## STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

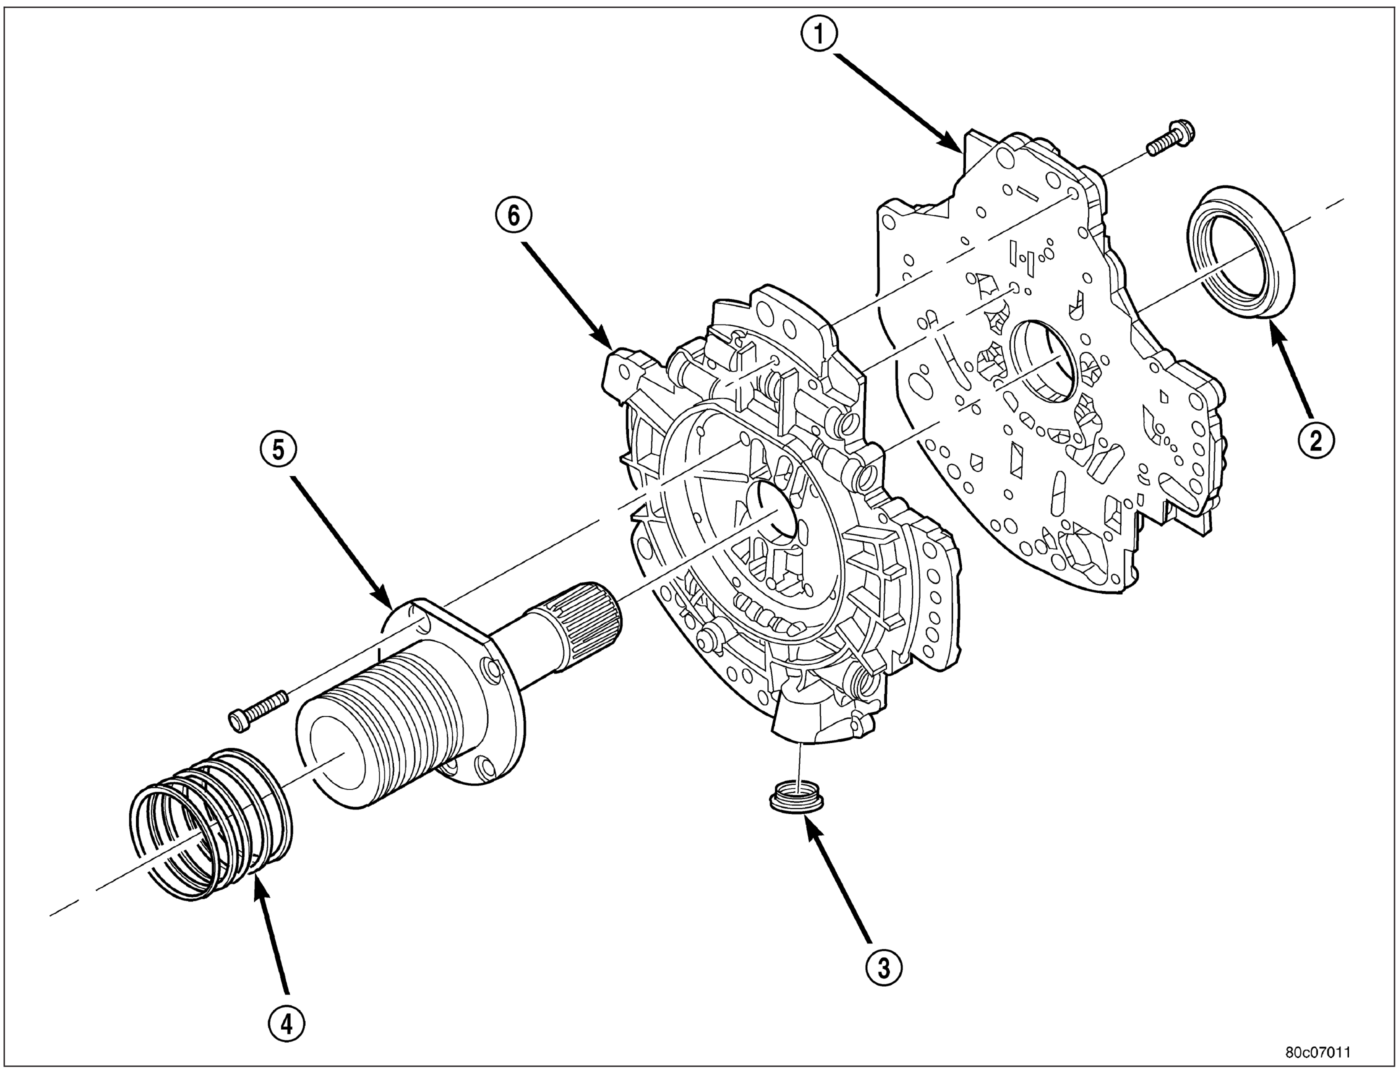
Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, Automatic Transmission Fluid.

1. Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

**CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.**

2. Run the engine **at 1800 rpm**, with the shift selector in neutral. Verify that the transmission fluid temperature is below 104.5° C (220° F) for this test.
3. If one quart of transmission fluid is collected in the container in 30 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 30 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.
4. Re-connect the **To cooler** line to the transmission cooler inlet.
5. Refill the transmission to proper level.

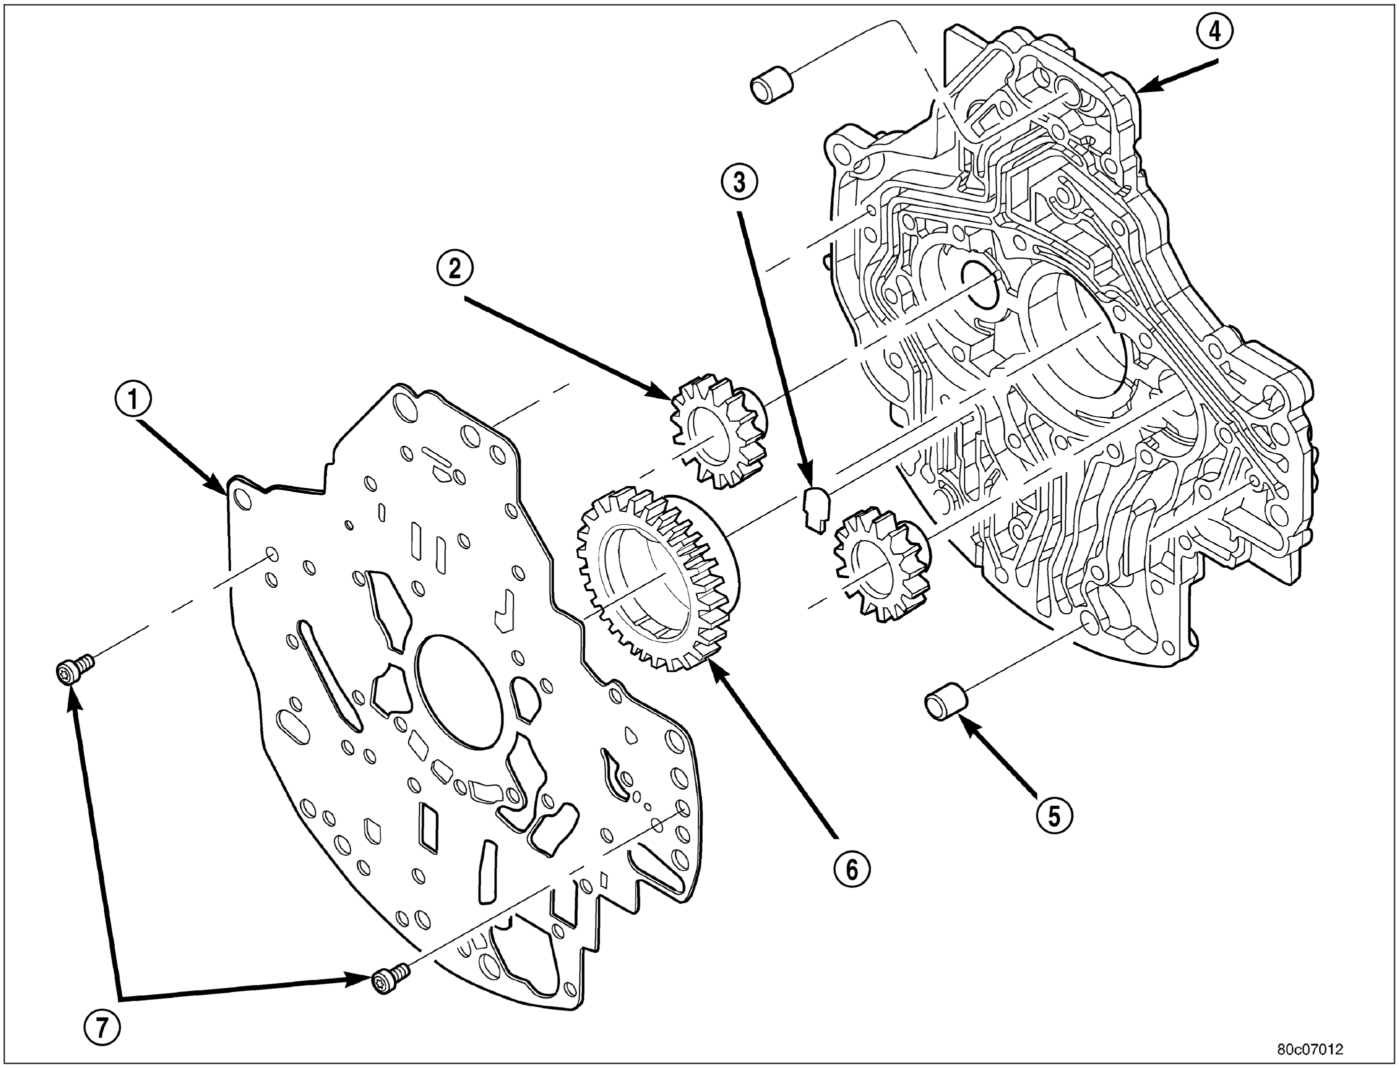
## DISASSEMBLY



1. Remove the bolts holding the reaction shaft support (5) to the oil pump.
2. Remove the reaction shaft support (5) from the oil pump.
3. Remove all bolts holding the oil pump halves together.

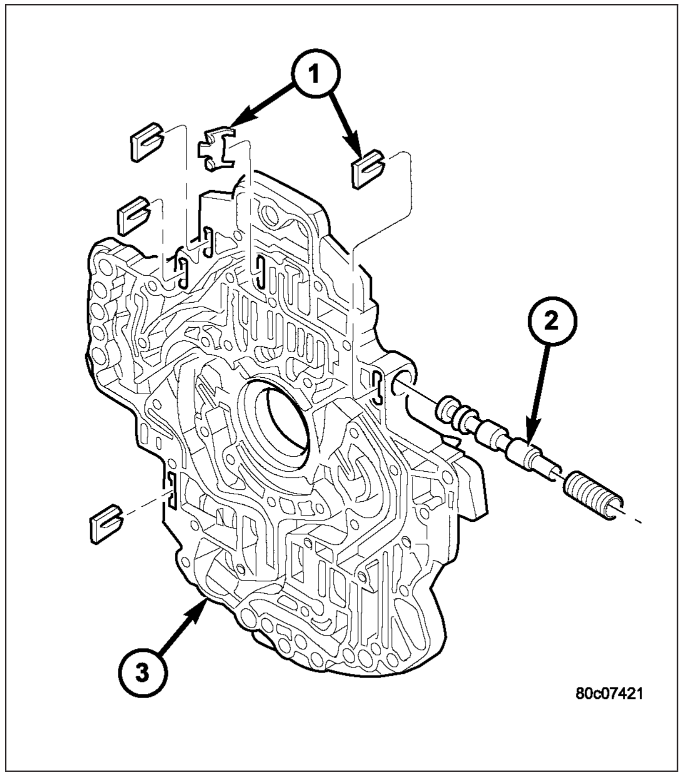
4. Using suitable prying tools, separate the oil pump sections by inserting the tools in the supplied areas and prying the halves apart.

**NOTE: The oil pump halves are aligned to each other through the use of two dowels. Be sure to pry upward evenly to prevent damage to the oil pump components.**

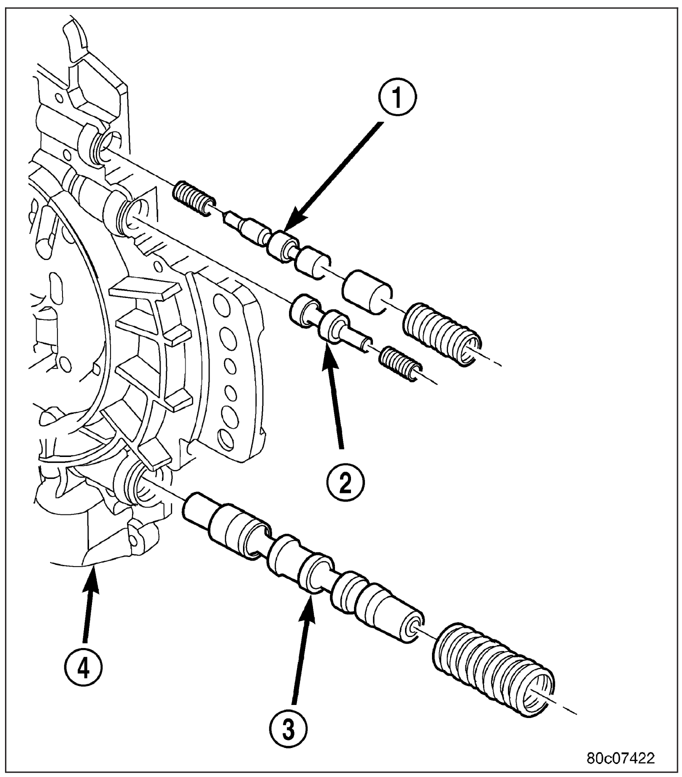


5. Remove the screws (7) holding the separator plate (1) onto the oil pump housing (4).
6. Remove the separator plate (1) from the oil pump housing (4).
7. Mark all gears for location. The gears are select fit and if the oil pump is to be reused, the gears must be returned to their original locations.
8. Remove the oil pump gears (2, 6) from the oil pump housing (4).

9. Remove the oil pump valve retainers (1) and associated valve (2) and spring one at a time. Mark the combination of components as a group and tag them as to the location from which they were removed.



10. Remove the T/C regulator valve (1), T/C limit valve (2), and regulator valve (3).



## CLEANING

Clean pump and support components with solvent and dry them with compressed air.

## INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump reaction shaft support bushings. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

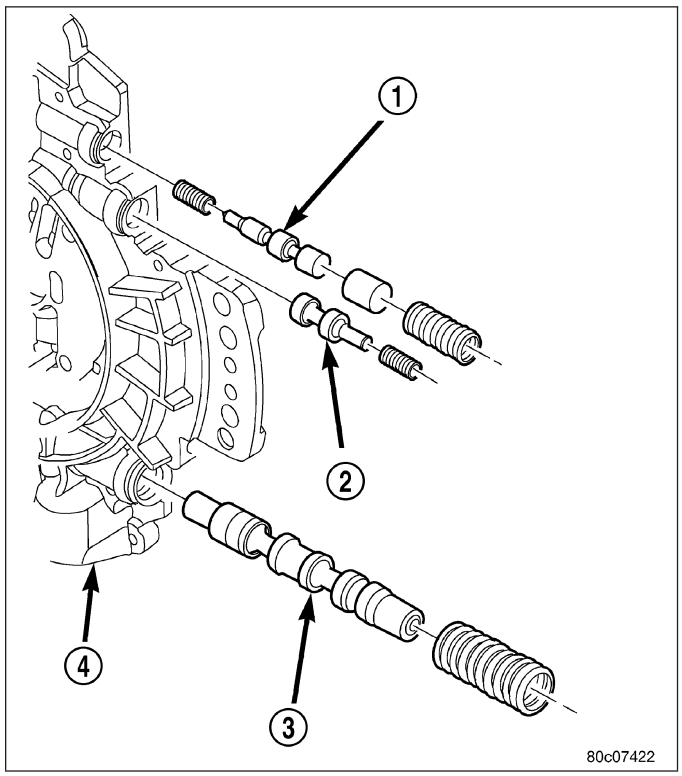
Inspect all the valve and plug bores in the oil pump cover. Use a penlight to view the bore interiors. Replace the oil pump if any bores are distorted or scored. Inspect all of the valve springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

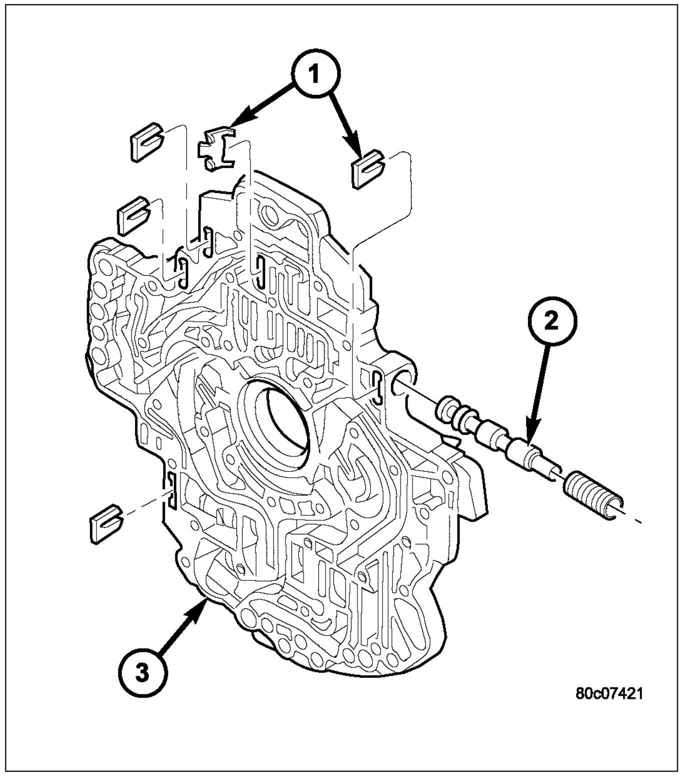
## ASSEMBLY

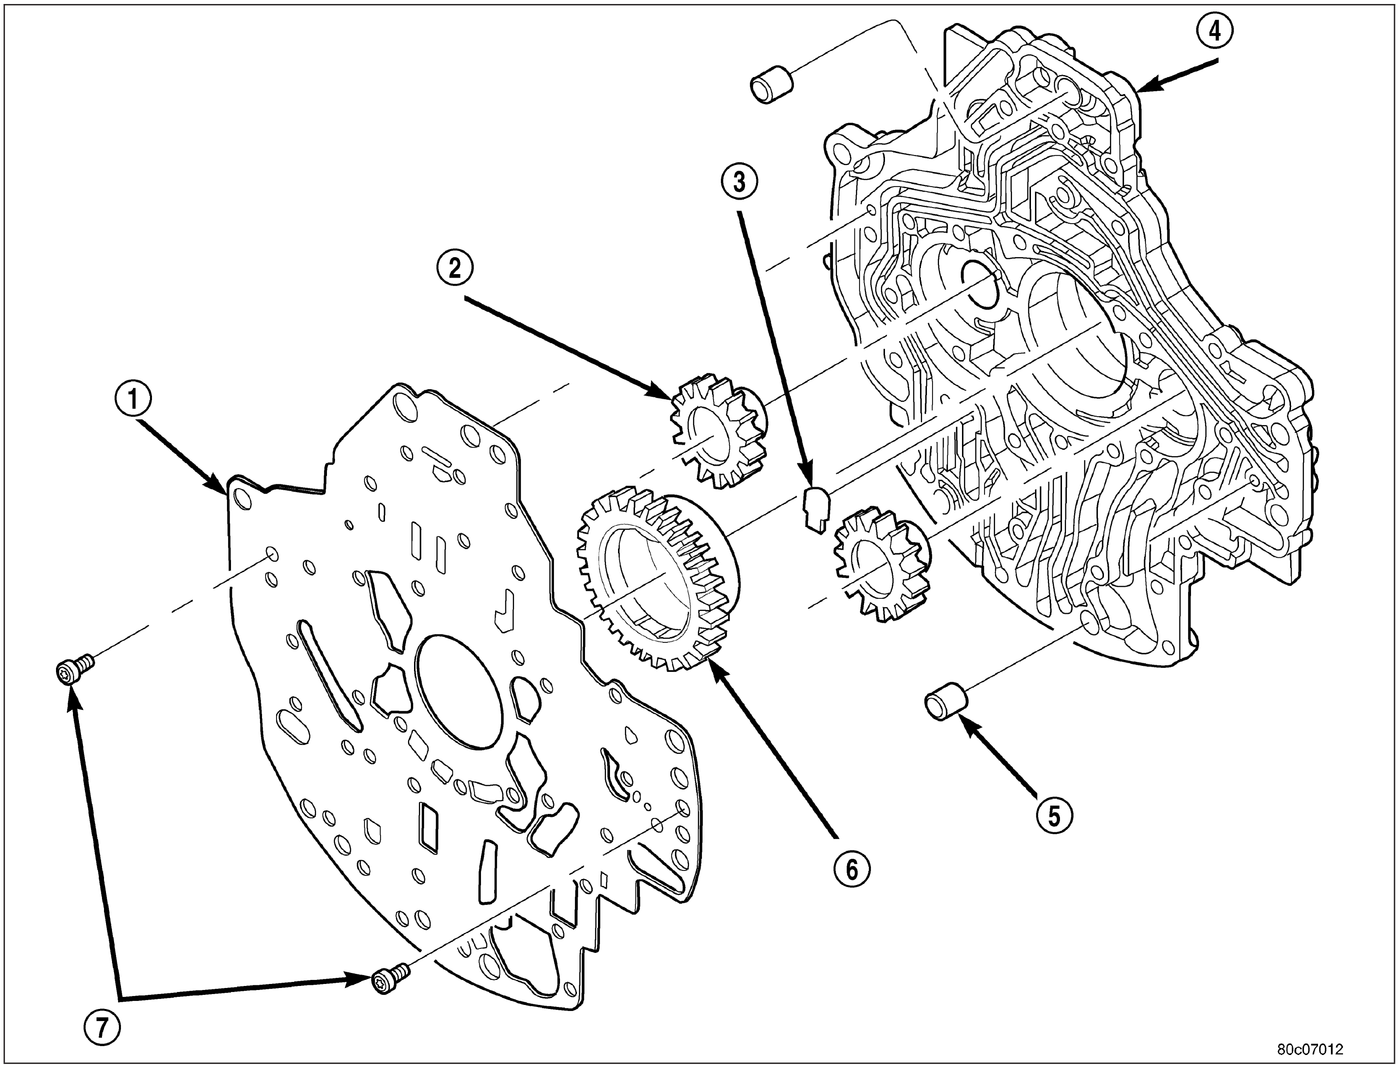
**NOTE: Clean and inspect all components. Make sure that all passages are thoroughly cleaned and are free from dirt or debris. Make sure that all valves move freely in their proper bore. Make sure that all gear pockets and bushings are free from excessive wear and scoring. Replace the oil pump if any excessive wear or scoring is found.**

1. Install the T/C regulator valve (1), T/C limit valve (2), and regulator valve (3).

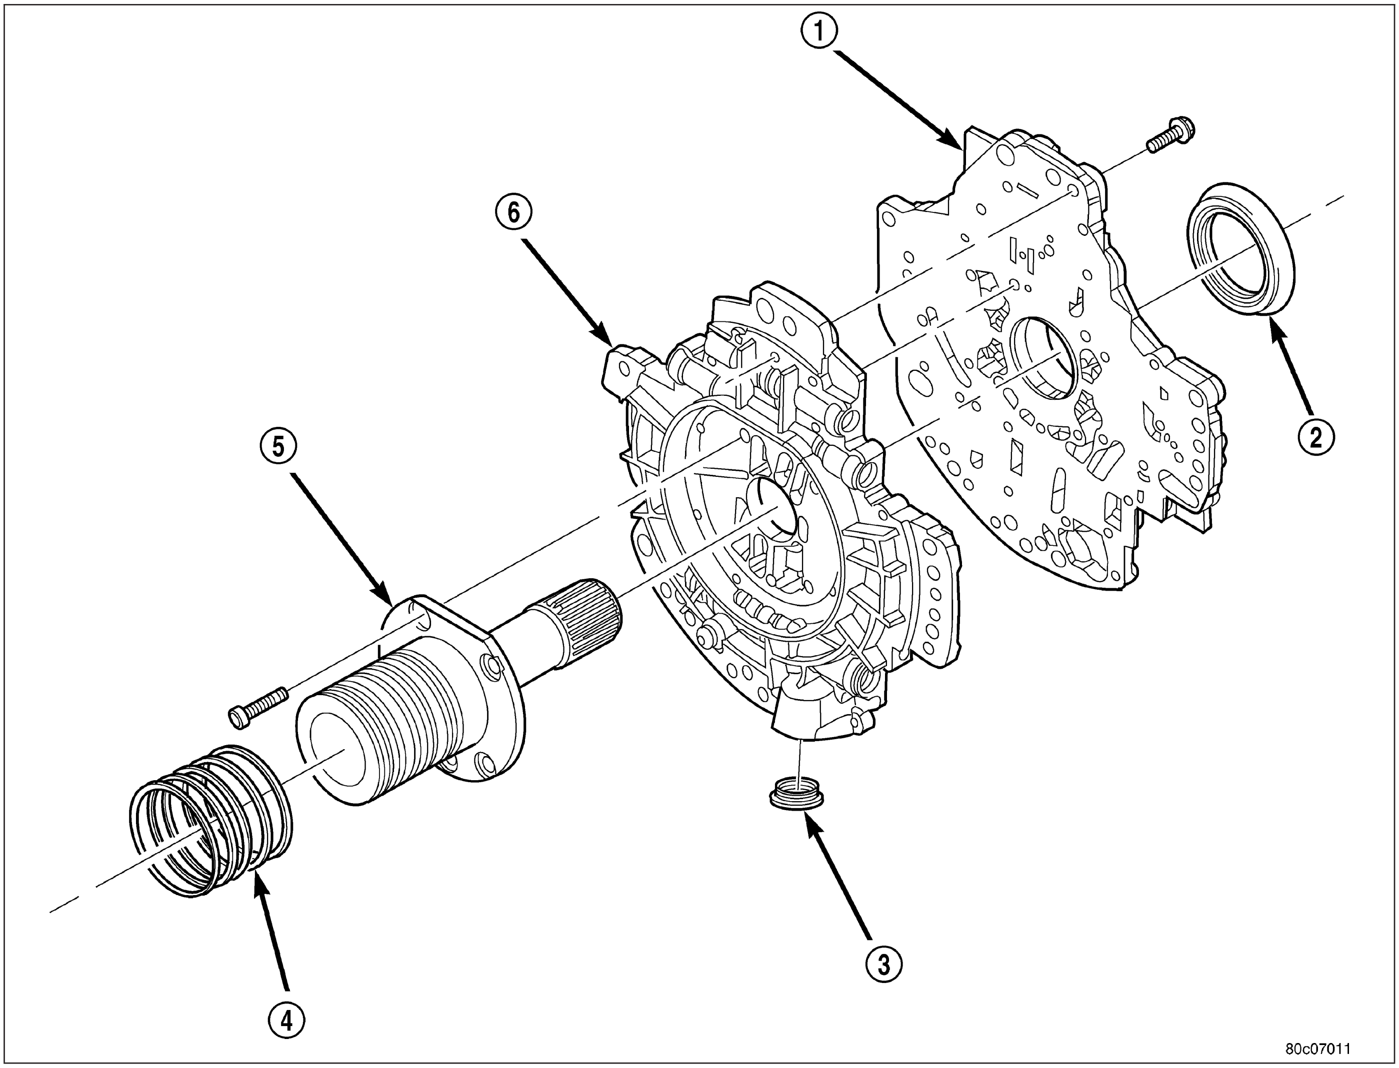


2. Lubricate the oil pump valves with Mopar® ATF +4 and install the valve (2), spring, and retainer (1) into the appropriate oil pump valve body (3) bore.





3. Coat the gears (2, 6) with Mopar® ATF +4 and install into their original locations.
4. Place the separator plate (1) onto the oil pump housing (4).
5. Install the screws (7) to hold the separator plate (1) onto the oil pump housing (4). Tighten the screws to 4.5 N·m (40 in.lbs.).



6. Position the oil pump valve body (6) onto the locating dowels.
7. Seat the two oil pump halves together and install all bolts finger tight.
8. Torque all bolts down slowly starting in the center and working outward. The correct torque is 4.5 N·m (40 in.lbs.).
9. Verify that the oil pump gears rotate freely and smoothly.
10. Position the reaction shaft support (5) onto the oil pump valve body (6).
11. Install and torque the bolts to hold the reaction shaft support (5) to the oil pump valve body (6). The correct torque is 12 N·m (105 in.lbs.).

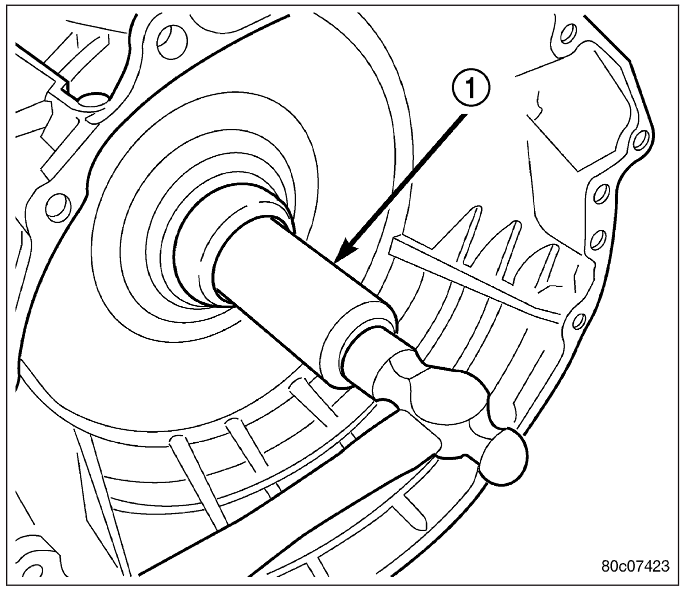
# SEAL-OIL PUMP FRONT

## REMOVAL

1. Remove transmission from the vehicle.
2. Remove the torque converter from the transmission.
3. Using a screw mounted in a slide hammer, remove the oil pump front seal.

## INSTALLATION

1. Clean seal bore of the oil pump of any residue or particles from the original seal.
2. Install new oil seal in the oil pump housing using Seal Installer C-3860-A (1).



# SENSOR-OUTPUT SPEED

## DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

## OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

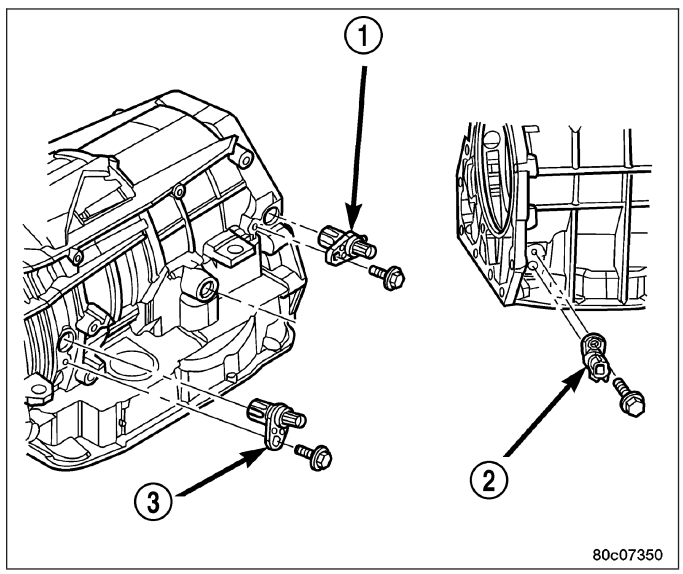
- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

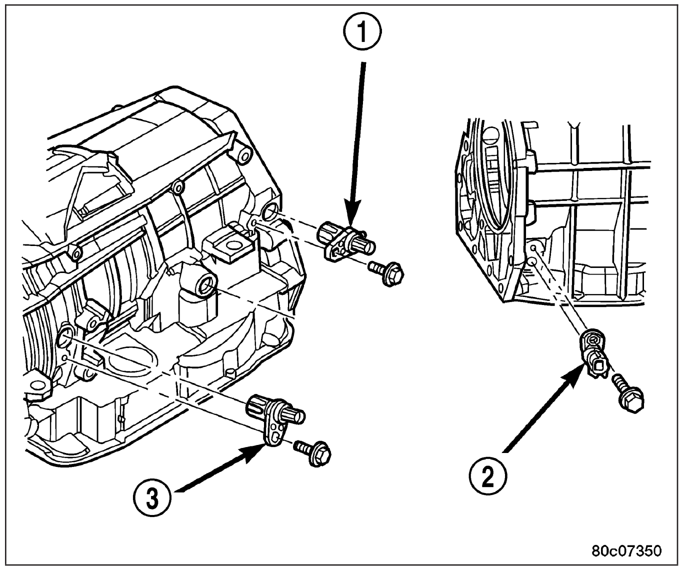
## REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the output speed sensor (1).
4. Remove the bolt holding the output speed sensor (1) to the transmission case.
5. Remove the output speed sensor (1) from the transmission case.



## INSTALLATION

1. Install the output speed sensor (1) into the transmission case.
2. Install the bolt to hold the output speed sensor (1) into the transmission case. Tighten the bolt to 12 N·m (105 in.lbs.).
3. Install the wiring connector onto the output speed sensor (1).
4. Verify the transmission fluid level. Add fluid as necessary.
5. Lower vehicle.



# SWITCH-OVERDRIVE

## DESCRIPTION

The overdrive OFF (control) switch is located in the shifter handle. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

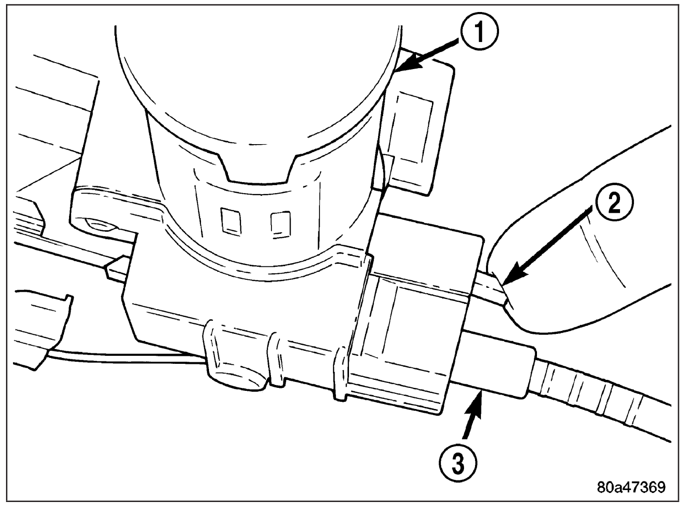
## OPERATION

At key-on, fourth gear operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoids and allow upshifts to fourth gear. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

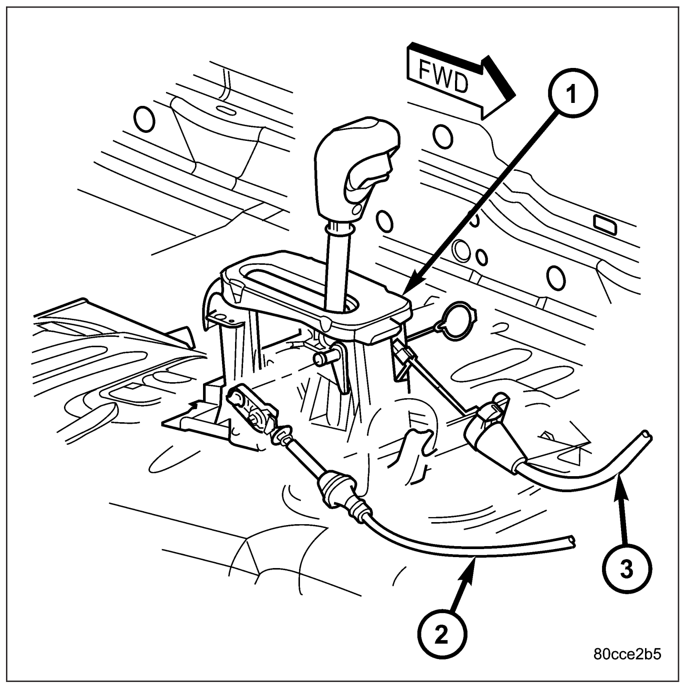
# CABLE-PARK INTERLOCK

## REMOVAL

1. Lower the steering column.
2. With the ignition switch in the “RUN” position depress the park-interlock cable locking tab (2), located on top of the cable connector at the steering column and pull the cable straight out.



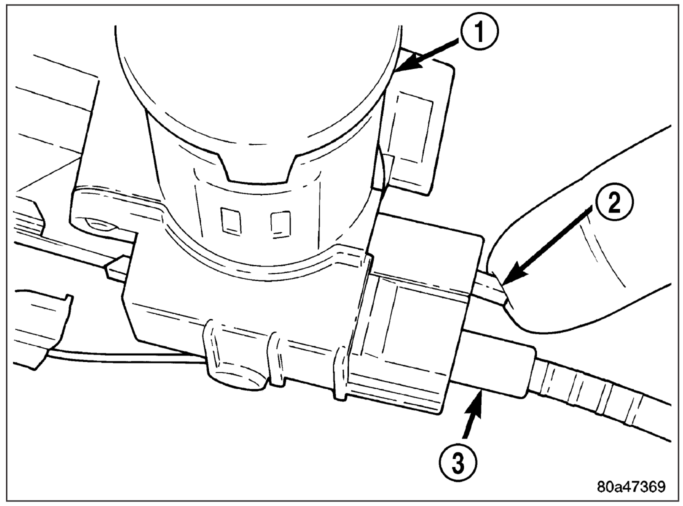
3. Remove the park-interlock cable from steering column.
4. Remove the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
5. Disconnect the park-interlock cable (3) from the shift lever assembly and remove the cable from the shifter assembly bracket.
6. Release the park-interlock cable from any remaining clips.
7. Remove park-interlock cable from the vehicle.



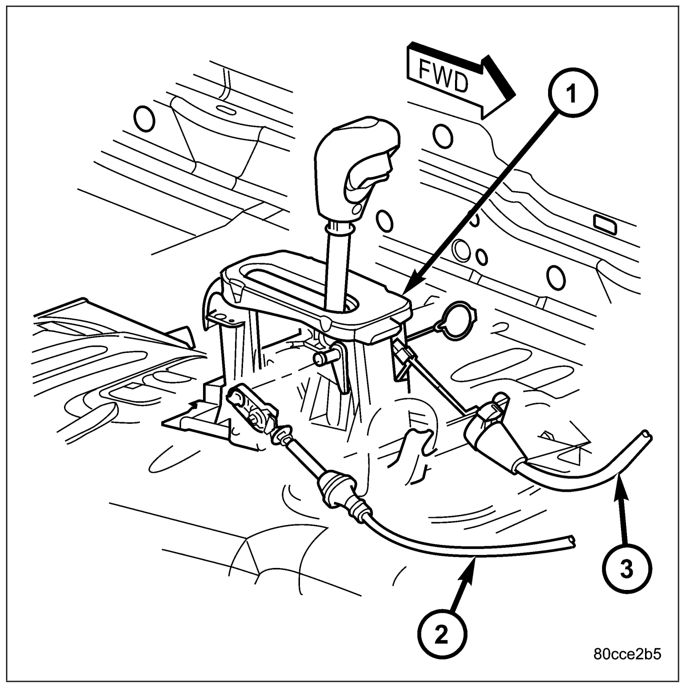
## INSTALLATION

**NOTE: The gearshift cable must be secured into position and properly adjusted before the installation of the Park-Interlock Cable.**

1. Push the park-interlock cable (3) straight into the square mounting hole in the steering column until cable snaps in place.
2. Snap park-interlock cable tie strap into hole in steering column tube.



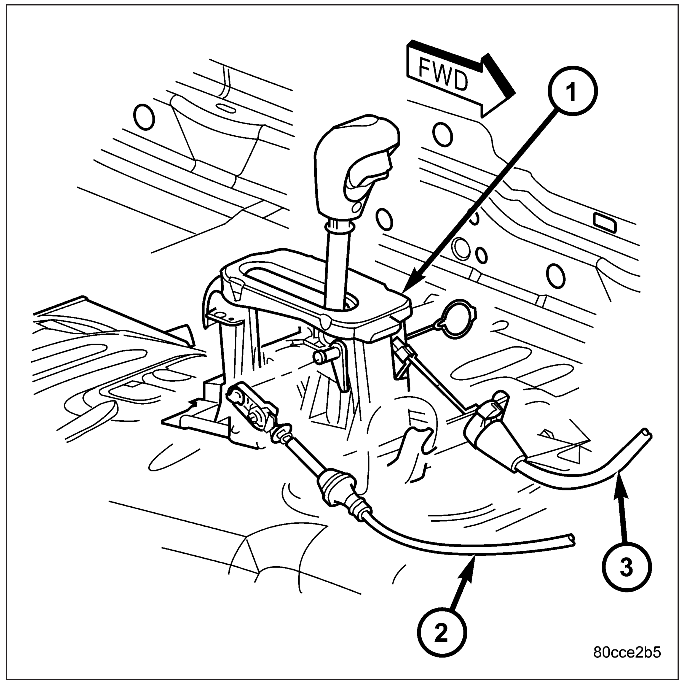
3. Route cable to the shifter mechanism.
4. Install the cable end fitting into shifter lever (1).
5. Snap cable adjuster ears into floor shifter bracket.
6. Place the ignition key cylinder in the LOCK position.
7. Push the cable adjuster lock clamp downward to lock it.
8. Test the park-interlock cable operation.
9. Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)



## ADJUSTMENTS - PARK-INTERLOCK CABLE

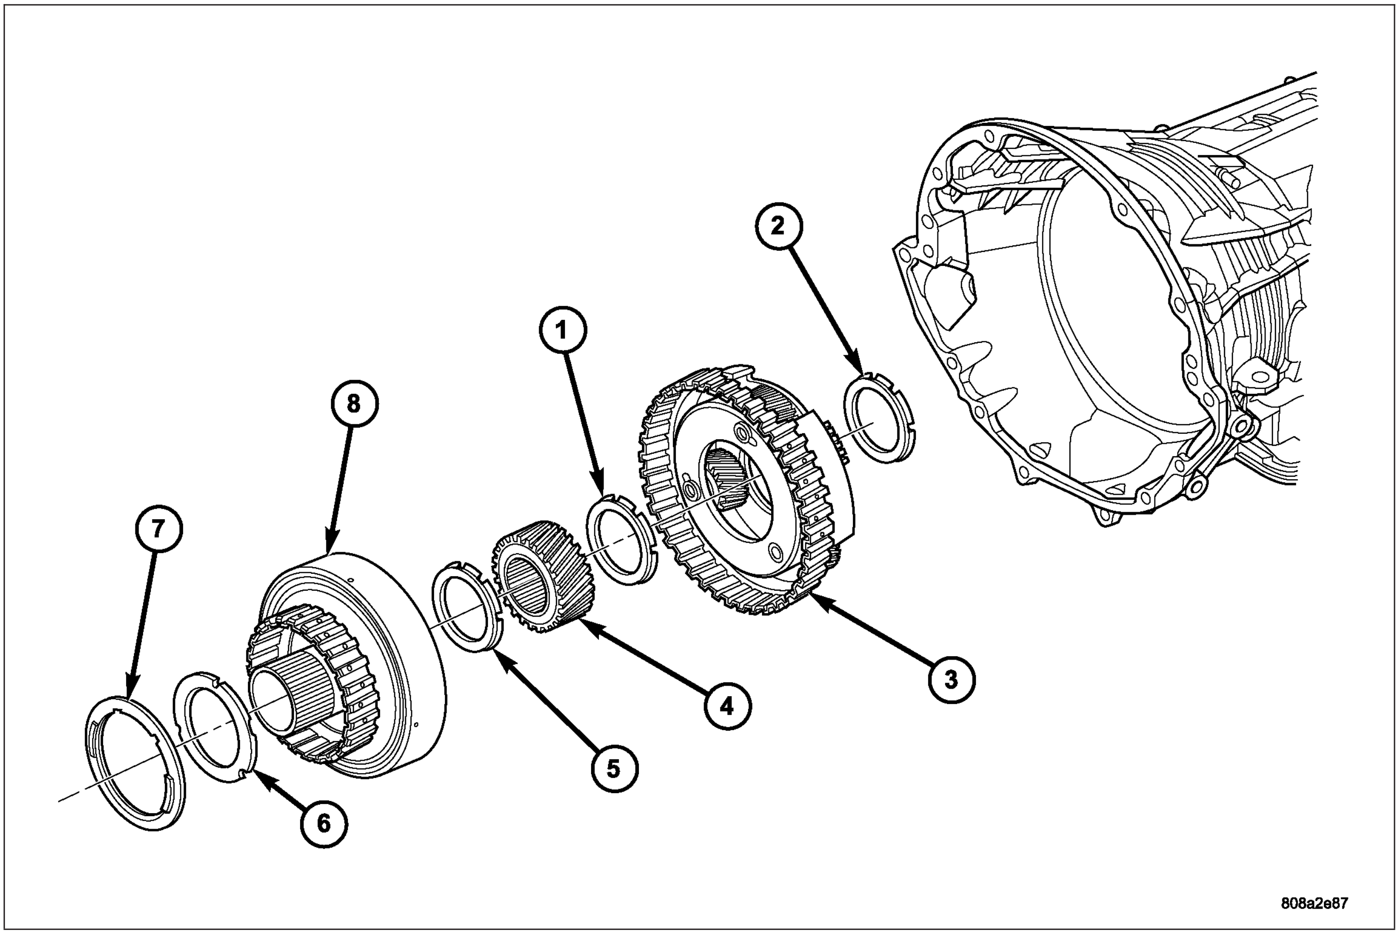
The park-interlock cable is part of the Brake Transmission Shift Interlock (BTSI) system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

1. Remove floor console as necessary for access to the park-interlock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
2. Shift the transmission into the PARK position.
3. Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**
4. Pull cable lock button up to release cable (3).
5. Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.
6. Push lock button down until it snaps in place.
7. Verify proper operation. (Refer to 21 - TRANSMISSION/AUTOMATIC/SHIFT INTERLOCK SYSTEM - DIAGNOSIS AND TESTING)



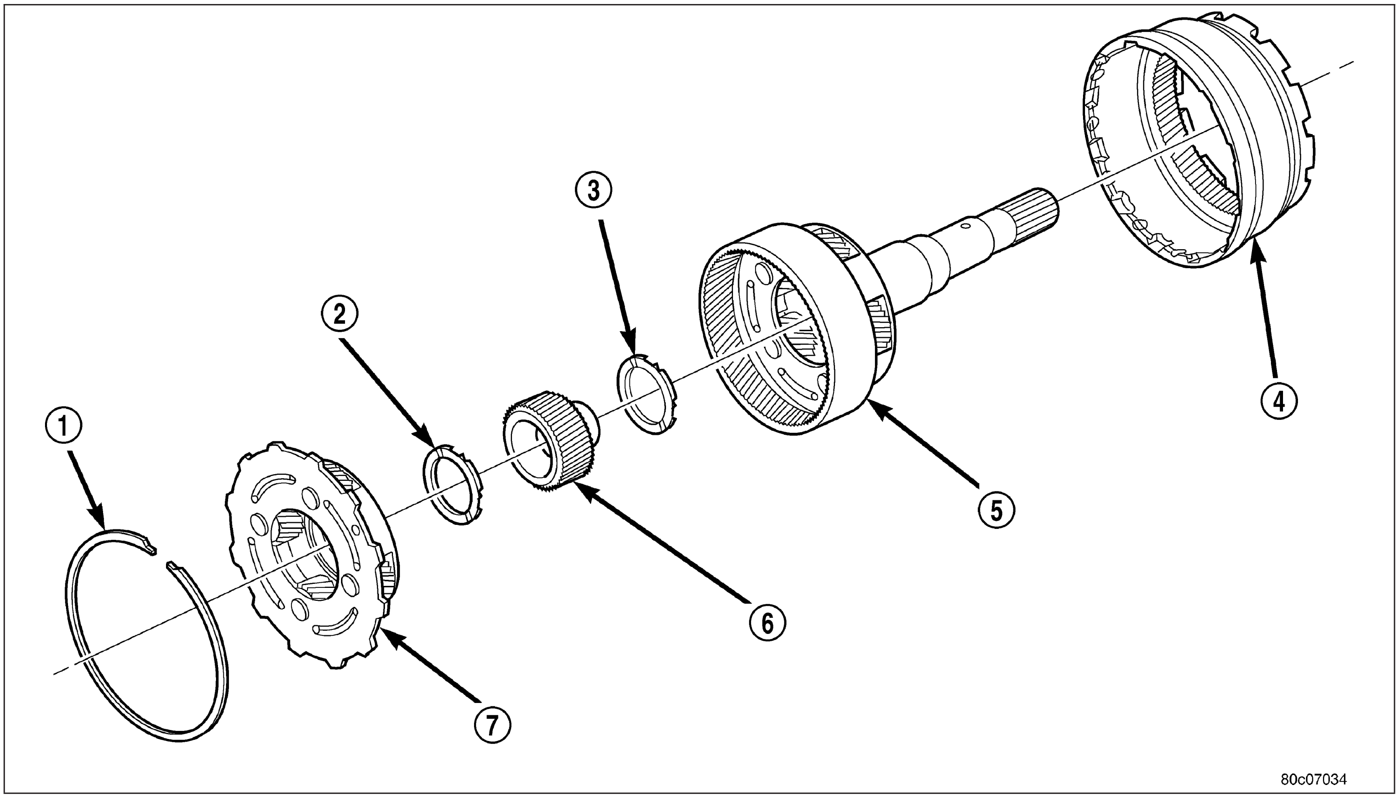
# GEARTRAIN-PLANETARY

## DESCRIPTION



The planetary geartrain is located behind the 4C retainer/bulkhead, toward the rear of the transmission. The planetary geartrain consists of three primary assemblies:

- Reaction (3, 4, 8).



- Reverse (7).
- Input (4, 5, 6).

## OPERATION

### REACTION PLANETARY GEARTRAIN

The reaction planetary carrier and reverse sun gear of the reaction planetary geartrain are a single component which is held by the 2C clutch when required. The reaction annulus gear is a stand alone component that can be driven by the reverse clutch or held by the 4C clutch. The reaction sun gear is driven by the overdrive clutch.

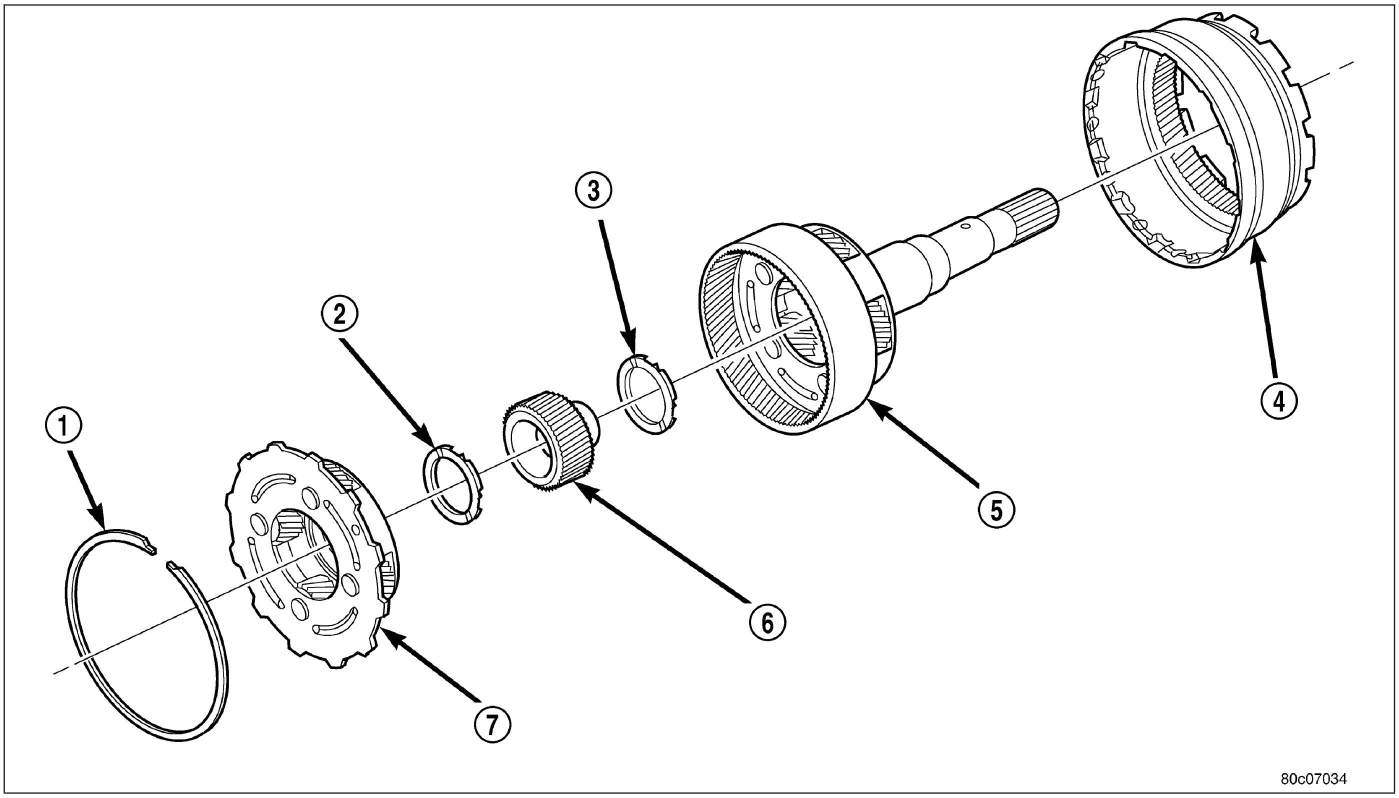
### REVERSE PLANETARY GEARTRAIN

The reverse planetary geartrain is the middle of the three planetary sets. The reverse planetary carrier can be driven by the overdrive clutch as required. The reverse planetary carrier is also splined to the input annulus gear, which can be held by the low/reverse clutch. The reverse planetary annulus, input planetary carrier, and output shaft are all one piece.

### INPUT PLANETARY GEARTRAIN

The input sun gear of the input planetary geartrain is driven by the underdrive clutch.

## DISASSEMBLY



1. Remove the snap-ring (1) holding the input annulus (4) into the input carrier (5).
2. Remove the input annulus (4) from the input carrier (5).
3. Remove the number 9 thrust bearing from the reverse planetary carrier (7). Note that this planetary carrier has four pinion gears.
4. Remove the reverse planetary gear carrier (7).
5. Remove the number 10 thrust bearing (2) from the input sun gear (6).
6. Remove the input sun gear (6) from the input carrier (5).
7. Remove the number 11 thrust bearing (3) from the input carrier (5).

## CLEANING

Clean the planetary components in solvent and dry them with compressed air.

## INSPECTION

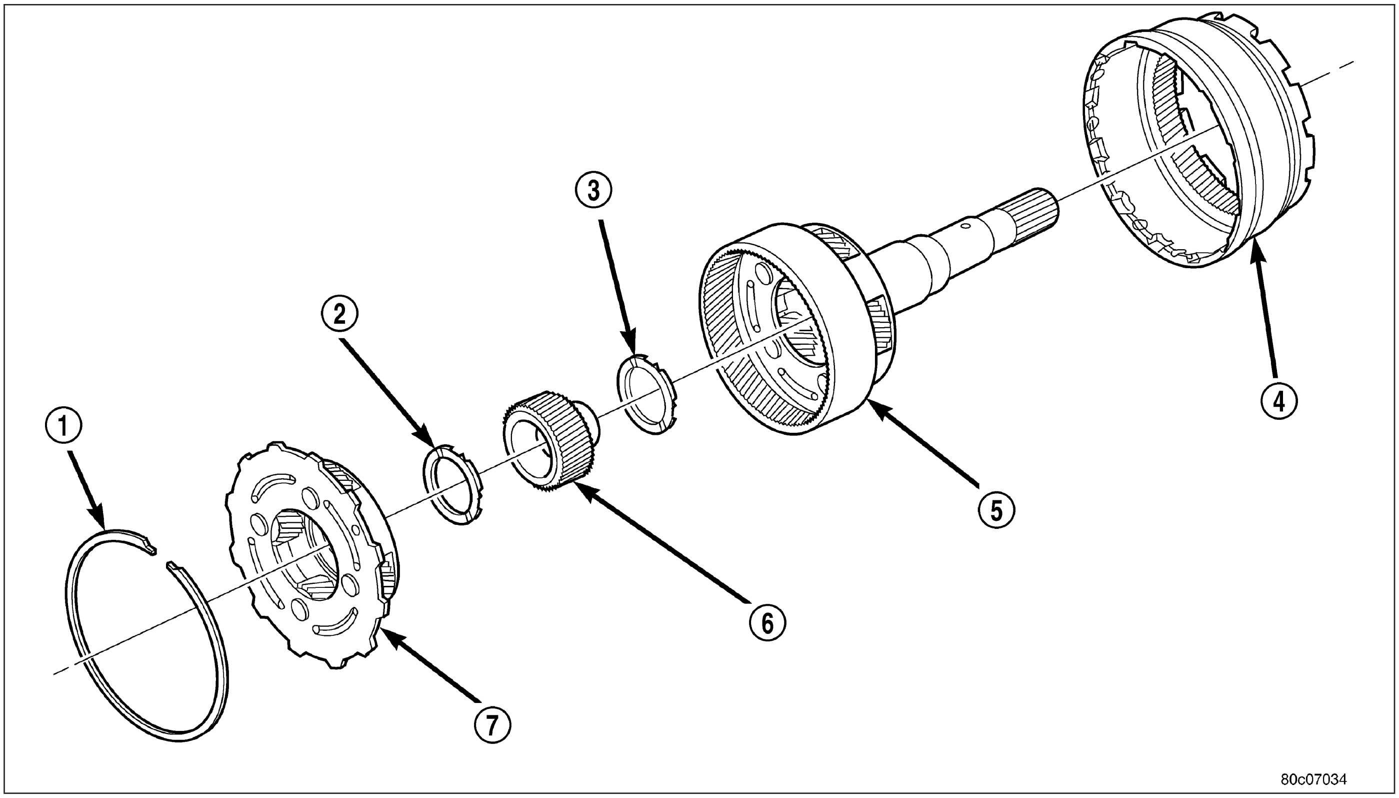
Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location.

## ASSEMBLY

**NOTE: Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.**



1. Install the number 11 thrust bearing (3) into the input planetary carrier (5) so that the inner race will be toward the front of the transmission.
2. Install the input sun gear (6) into the input carrier (5).
3. Install the number 10 thrust bearing (2) onto the rear of the reverse planetary carrier (7) with the inner race toward the carrier.
4. Install the number 9 thrust bearing onto the front of the reverse planetary carrier (7) with the outer race toward the carrier and the inner race facing upward.
5. Install the reverse planetary gear carrier (7) into the input carrier (5).
6. Install the input annulus gear (4) into the input carrier (5).
7. Install the snap-ring (1) to hold the input annulus gear (4) into the input carrier (5).

# MECHANISM-SHIFT

## DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)
- Manual second (2)
- Manual low (1)

## OPERATION

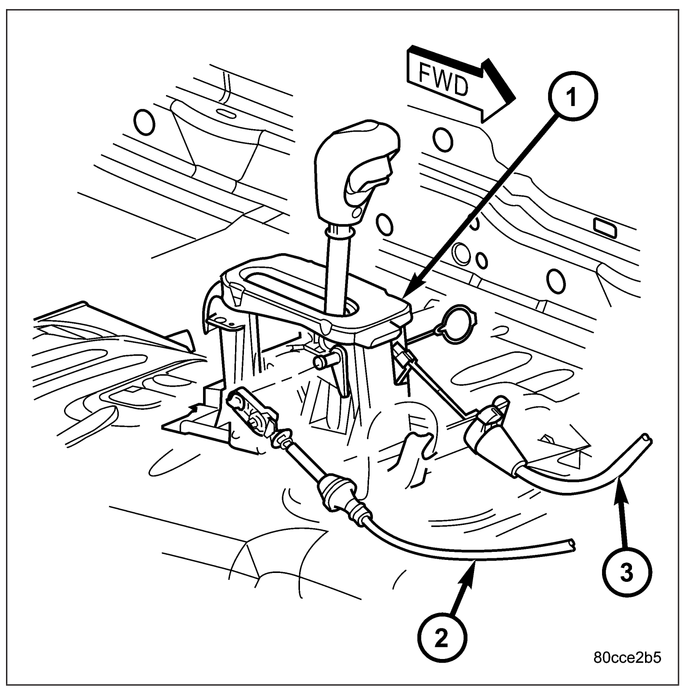
MANUAL LOW (1) range provides FIRST gear only. Overrun braking is also provided in this range. MANUAL SECOND (2) range provides FIRST and SECOND gear only.

DRIVE range provides FIRST, SECOND, THIRD and OVERDRIVE FOURTH and FIFTH gear ranges. The shift into OVERDRIVE FOURTH and FIFTH gear range occurs only after the transmission has completed the shift into D THIRD gear range. No further movement of the shift mechanism is required to complete the 3-4 or 4-5 shifts.

The FOURTH and FIFTH gear upshifts occurs automatically when the overdrive selector switch is in the ON position. An upshift to FOURTH and FIFTH gears may not occur or may be delayed in some of the possible shift schedules. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - OPERATION)

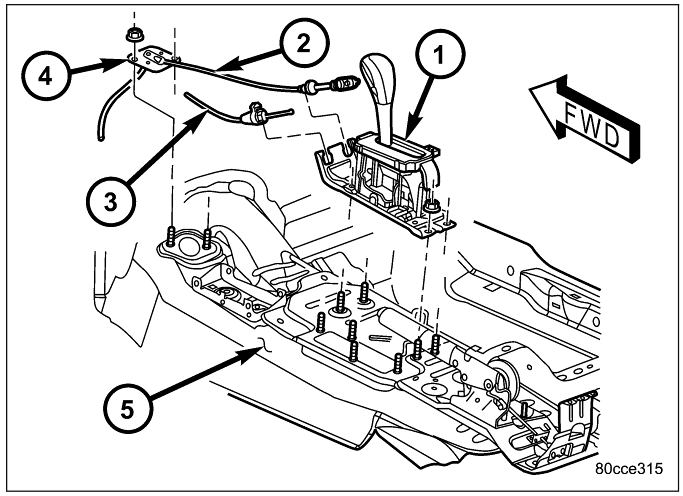
## REMOVAL

1. Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/ INTERIOR/FLOOR CONSOLE - REMOVAL)
2. Shift transmission into PARK.
3. Disconnect the transmission shift cable at shift lever and shifter assembly bracket.
4. Disconnect the park-interlock cable from the shifter lever and the shifter assembly bracket.
5. Disengage all wiring connectors from the shifter assembly.
6. Remove all nuts holding the shifter assembly to the floor pan.
7. Remove the shifter assembly from the vehicle.



## INSTALLATION

1. Install shifter assembly onto the shifter assembly studs on the floor pan.
2. Install the nuts to hold the shifter assembly onto the floor pan. Tighten nuts to 28 N·m (250 in.lbs.).
3. Install wiring harness to the shifter assembly bracket. Engage any wire connectors removed from the shifter assembly.
4. Install the park-interlock cable into the shifter assembly bracket and into the shifter lever.
5. Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
6. Place the floor shifter lever in park position.
7. Loosen the adjustment screw on the shift cable.
8. Snap the shift cable onto the shift lever pin.
9. Verify that the shift lever is in the PARK position.
10. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
11. Verify correct shifter operation.
12. Verify proper BTSI operation. (Refer to 21 - TRANSMISSION/AUTOMATIC/SHIFT INTERLOCK SYSTEM - DIAGNOSIS AND TESTING) Adjust the park-interlock cable as necessary. (Refer to 21 - TRANSMISSION/AUTOMATIC/SHIFT INTERLOCK CABLE - ADJUSTMENTS)
13. Install any console parts removed for access to shift lever assembly and shift cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)



# SWITCH-VALVE-SOLENOID

## DESCRIPTION

The Solenoid Switch Valve (SSV) is located in the valve body and controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

## OPERATION

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and 5th gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

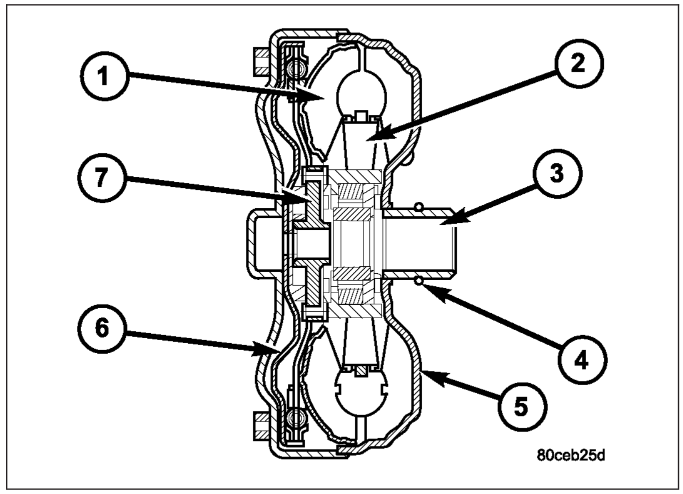
# CONVERTER-TORQUE

## DESCRIPTION

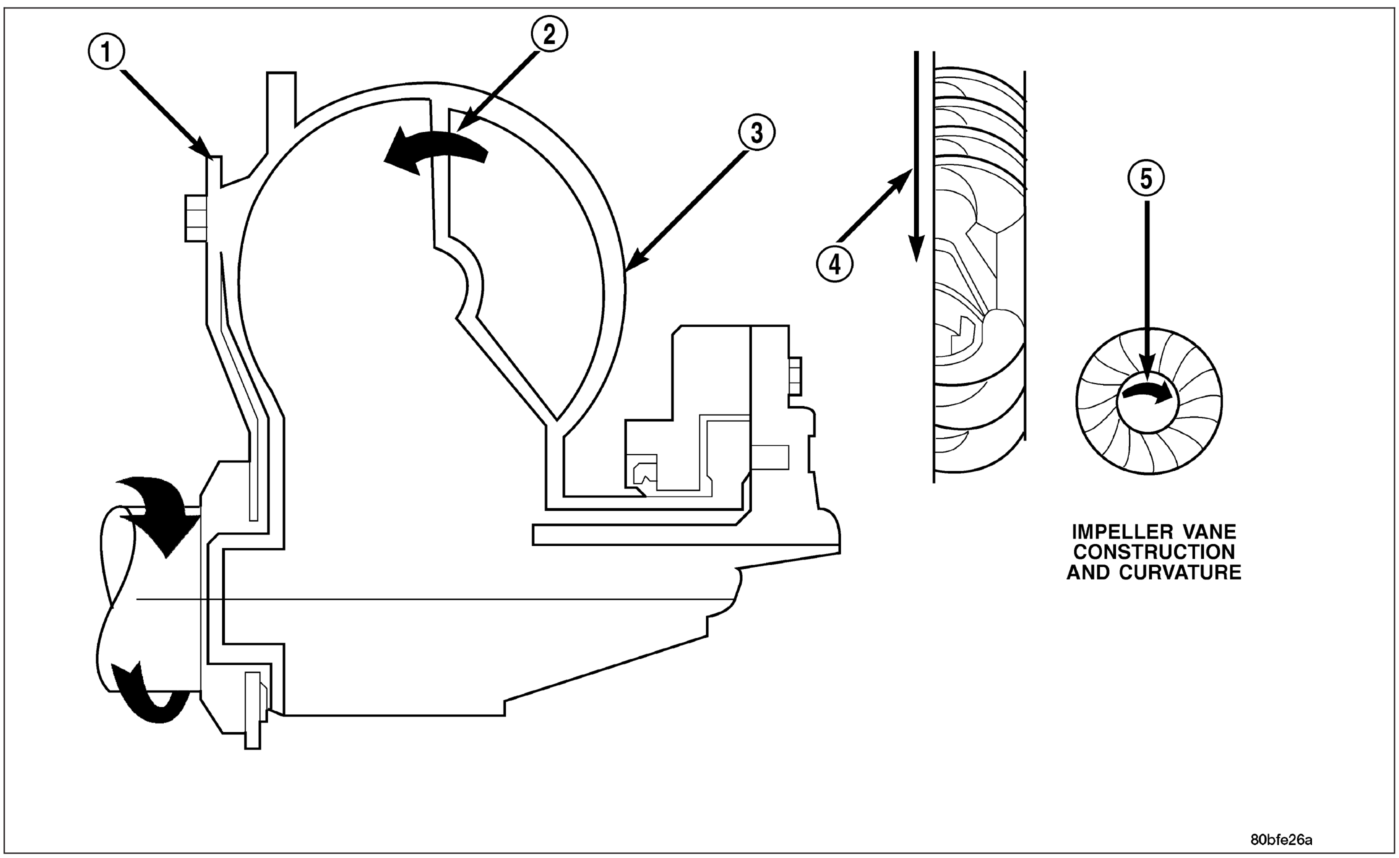
The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (2), an overrunning clutch, an impeller (5), and an electronically applied converter clutch (6). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub (3) drives the transmission oil (fluid) pump and contains an o-ring seal (4) to better control oil flow.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.**

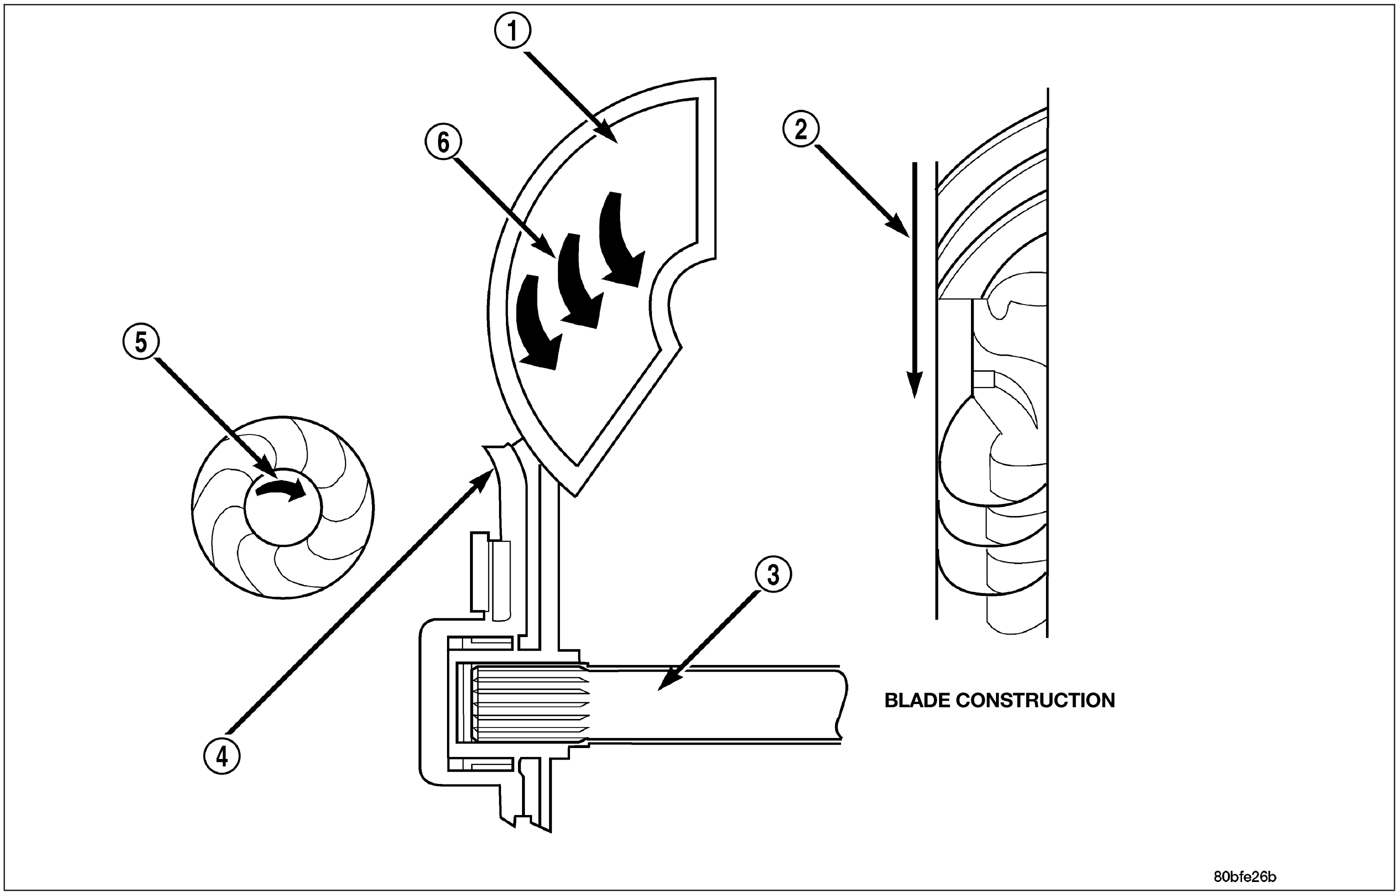


## IMPELLER



The impeller is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

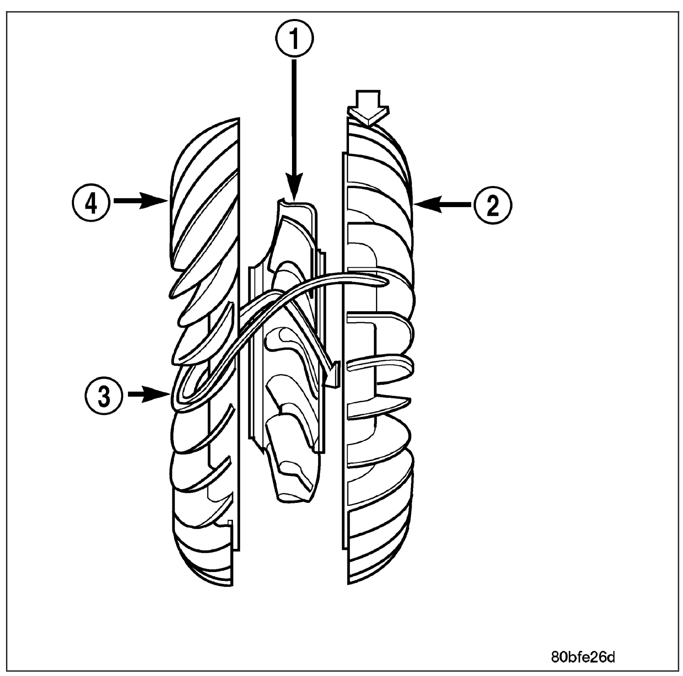
## TURBINE



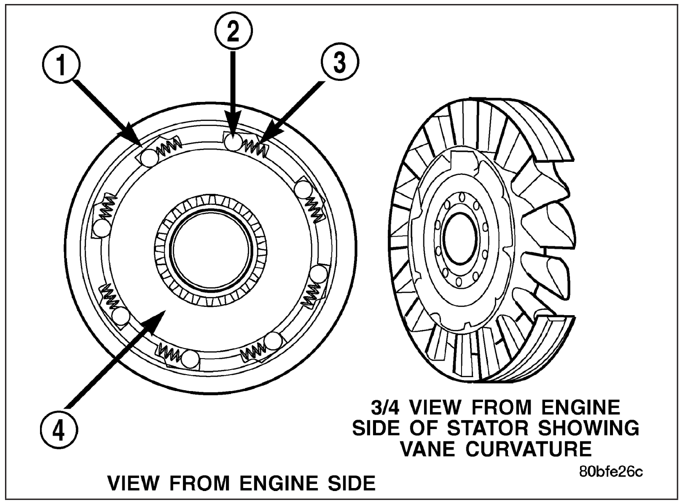
The turbine is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

## STATOR

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

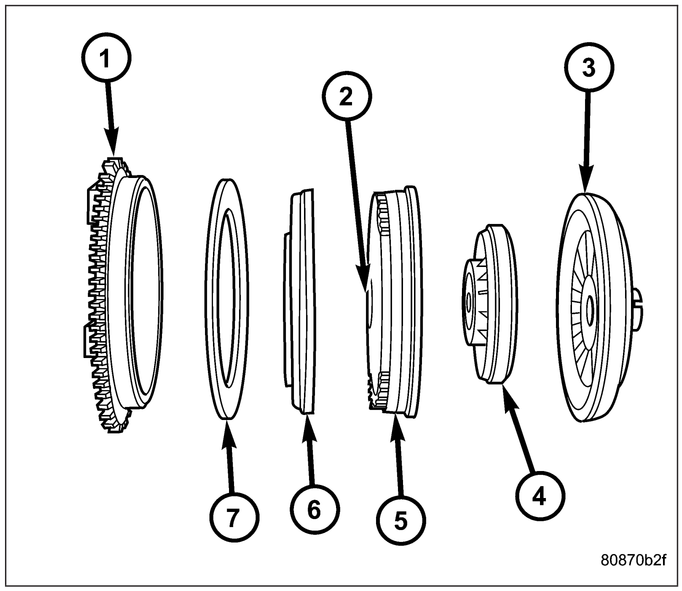


The stator contains an over-running clutch (1-4), which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.



## TORQUE CONVERTER CLUTCH (TCC)

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) with friction material (7) was added to the turbine assembly (5) to provide this mechanical lock-up.

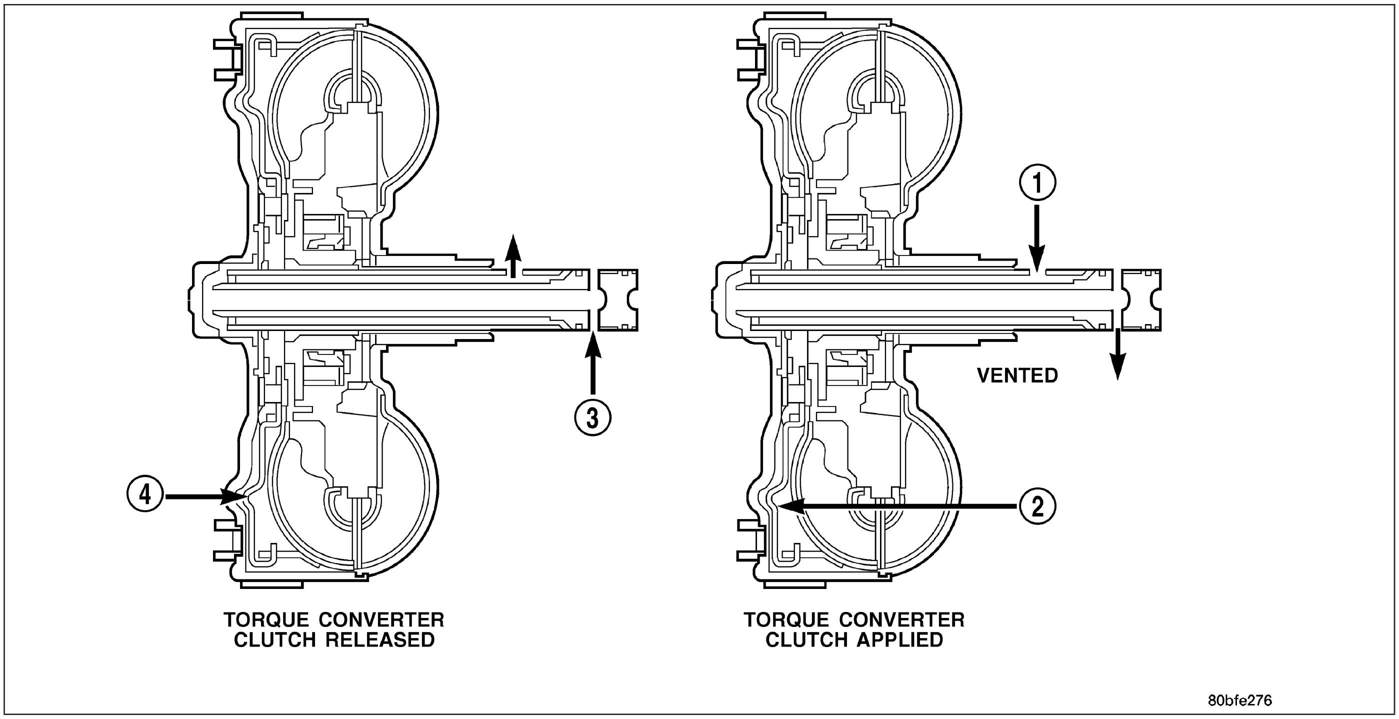


In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

## OPERATION

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.



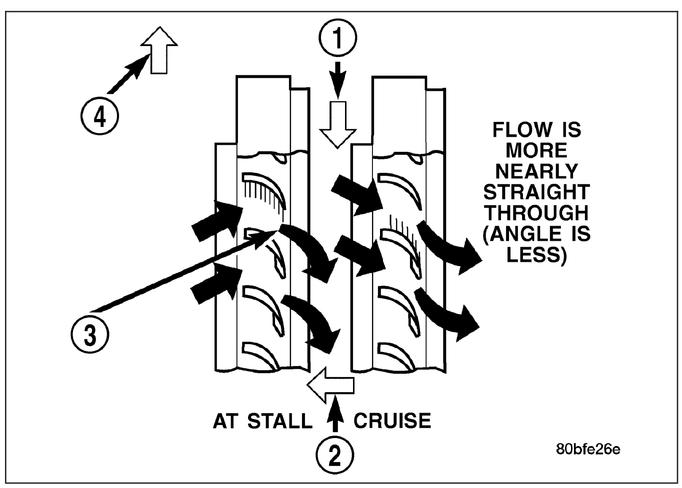
## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

## TORQUE CONVERTER CLUTCH (TCC)



In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, and fifth gear ranges depending on overdrive control switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear, and above approximately 72 km/h (45 mph). If the control switch is in the OFF position, the clutch will engage after the shift to third gear, at approximately 56 km/h (35 mph) at light throttle.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the L/R-CC Solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

**NO EMCC**

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

**PARTIAL EMCC**

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

**FULL EMCC**

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine rpm.

**GRADUAL-TO-NO EMCC**

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the L/R Solenoid duty cycle.

## REMOVAL

1. Remove transmission and torque converter from vehicle. (Refer to 21 - TRANSMISSION/AUTOMATIC - 45RFE/545RFE - REMOVAL)
2. Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.**

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

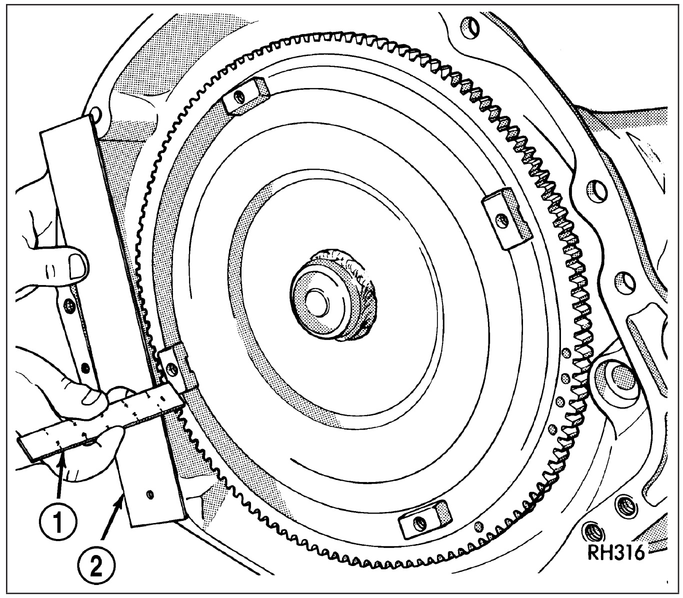
## INSTALLATION

**NOTE: Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper or crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free from debris. The hub must be smooth to avoid damaging the pump seal at installation.**

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

**CAUTION: Do not damage oil pump seal or converter hub o-ring while inserting torque converter into the front of the transmission.**

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be at least 13 mm (1/2 in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle.
9. Fill the transmission with the recommended fluid.



# RELAY-TRANSMISSION CONTROL

## DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

## OPERATION

When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

# SENSOR-TRANSMISSION RANGE

## DESCRIPTION

The Transmission Range Sensor (TRS) is part of the solenoid module, which is mounted to the top of the valve body inside the transmission.

The Transmission Range Sensor (TRS) has five switch contact pins that:

- Determine shift lever position
- Supply ground to the Starter Relay in Park and Neutral only.
- Supply +12 V to the backup lamps in Reverse only.

The TRS also has an integrated temperature sensor (thermistor) that communicates transmission temperature to the TCM and PCM.

## OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

There are many possible combinations of open and closed switches (codes). Seven of these possible codes are related to gear position and five are recognized as “between gear” codes. This results in many codes which should **never occur**. These are called “invalid” codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

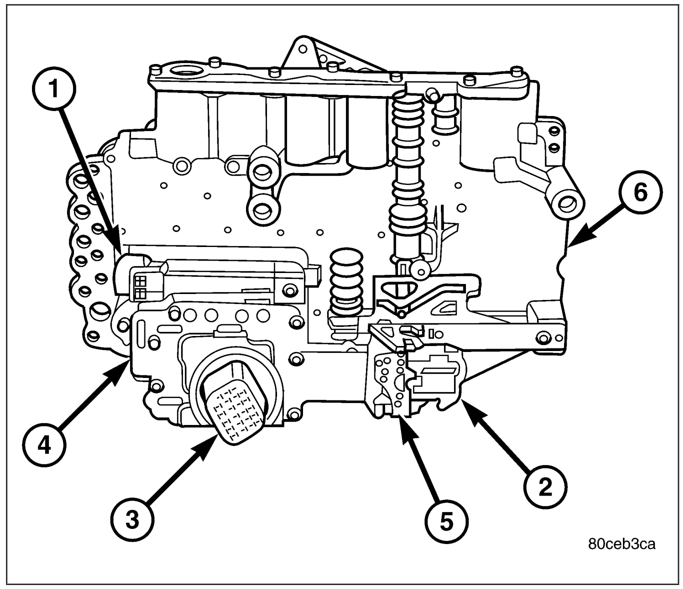
# ASSEMBLY-TRANSMISSION SOLENOID/TRS

## DESCRIPTION

The transmission solenoid/TRS assembly is internal to the transmission and mounted on the valve body assembly. The assembly consists of six solenoids that control hydraulic pressure to the six friction elements (transmission clutches), and the torque converter clutch. The pressure control solenoid is located on the side of the solenoid/TRS assembly. The solenoid/TRS assembly also contains five pressure switches that feed information to the TCM.



## OPERATION

### SOLENOIDS

Solenoids are used to control the L/R, 2C, 4C, OD, and UD friction elements. The reverse clutch is controlled by line pressure and the position of the manual valve in the valve body. All the solenoids are contained within the Solenoid and Pressure Switch Assembly. The solenoid and pressure switch assembly contains one additional solenoid, Multi-Select (MS), which serves primarily to provide 2nd and 3rd gear limp-in operation.

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid as necessary. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The MS and UD solenoids are normally applied to allow transmission limp-in in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

### PRESSURE SWITCHES

The TCM relies on five pressure switches to monitor fluid pressure in the L/R, 2C, 4C, UD, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The switches close at approximately 23 psi and open at approximately 11 psi, and simply indicate whether or not pressure exists. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

| GEAR | L/R | 2C | 4C | UD | OD |
|---|---|---|---|---|---|
| **R** | OP | OP | OP | OP | OP |
| **P/N** | CL | OP | OP | OP | OP |
| **1ST** | CL* | OP | OP | CL | OP |
| **2ND** | OP | CL | OP | CL | OP |
| **2ND PRIME** | OP | OP | CL | CL | OP |

| GEAR | L/R | 2C | 4C | UD | OD |
|---|---|---|---|---|---|
| D | OP | OP | OP | CL | CL |
| 4TH | OP | OP | CL | OP | CL |
| 5TH | OP | CL | OP | OP | CL |

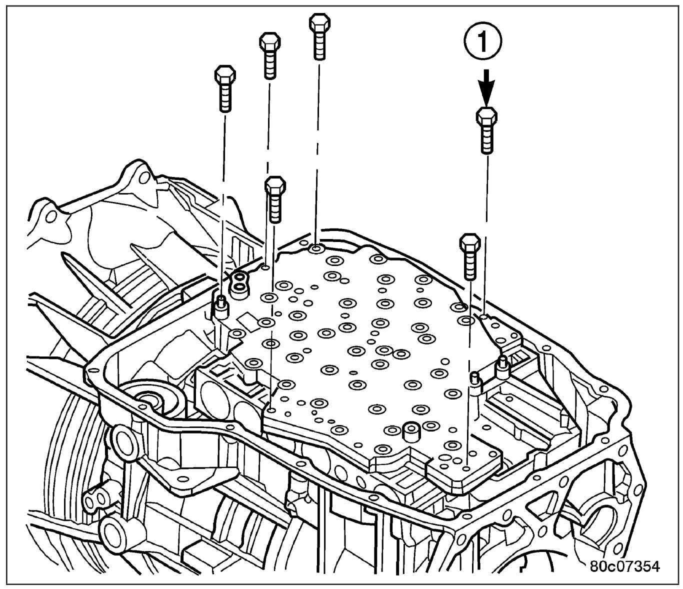
*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is open in Manual 1.

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

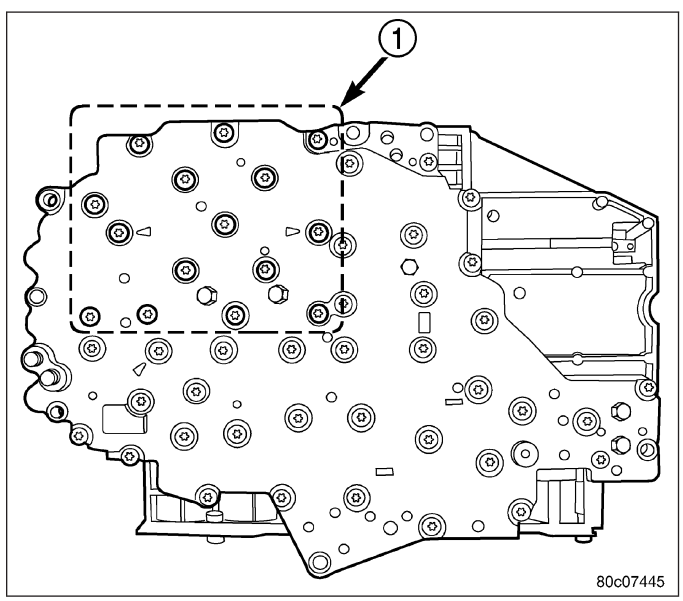
## REMOVAL

**NOTE: If the Transmission Solenoid/TRS Assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

1. Remove the valve body from the transmission. (Refer to 21 - TRANSMISSION/AUTOMATIC - 45RFE/545RFE/VALVE BODY - REMOVAL)

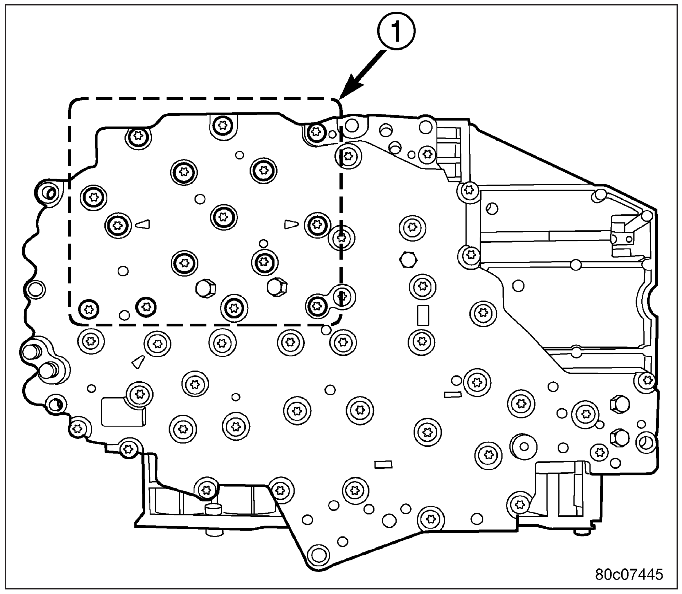


2. Remove the bolts (1) holding the transmission solenoid/TRS assembly onto the valve body.
3. Separate the transmission solenoid/TRS assembly from the valve body.



## INSTALLATION

1. Place TRS selector plate in the PARK position.
2. Position the transmission solenoid/TRS assembly onto the valve body. Be sure that both alignment dowels are fully seated in the valve body and that the TRS switch contacts are properly positioned in the selector plate
3. Install the bolts (1) to hold the transmission solenoid/TRS assembly onto the valve body.
4. Tighten the solenoid assembly screws adjacent to the arrows cast into the bottom of the valve body first. Tighten the screws to 6 N·m (50 in.lbs.).
5. Tighten the remainder of the solenoid assembly screws to 6 N·m (50 in.lbs.).
6. Install the valve body into the transmission.



# SENSOR-TRANSMISSION TEMPERATURE

## DESCRIPTION

The transmission temperature sensor is a thermistor that is integral to the Transmission Range Sensor (TRS).

## OPERATION

The transmission temperature sensor is used by the TCM to sense the temperature of the fluid in the sump. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in.

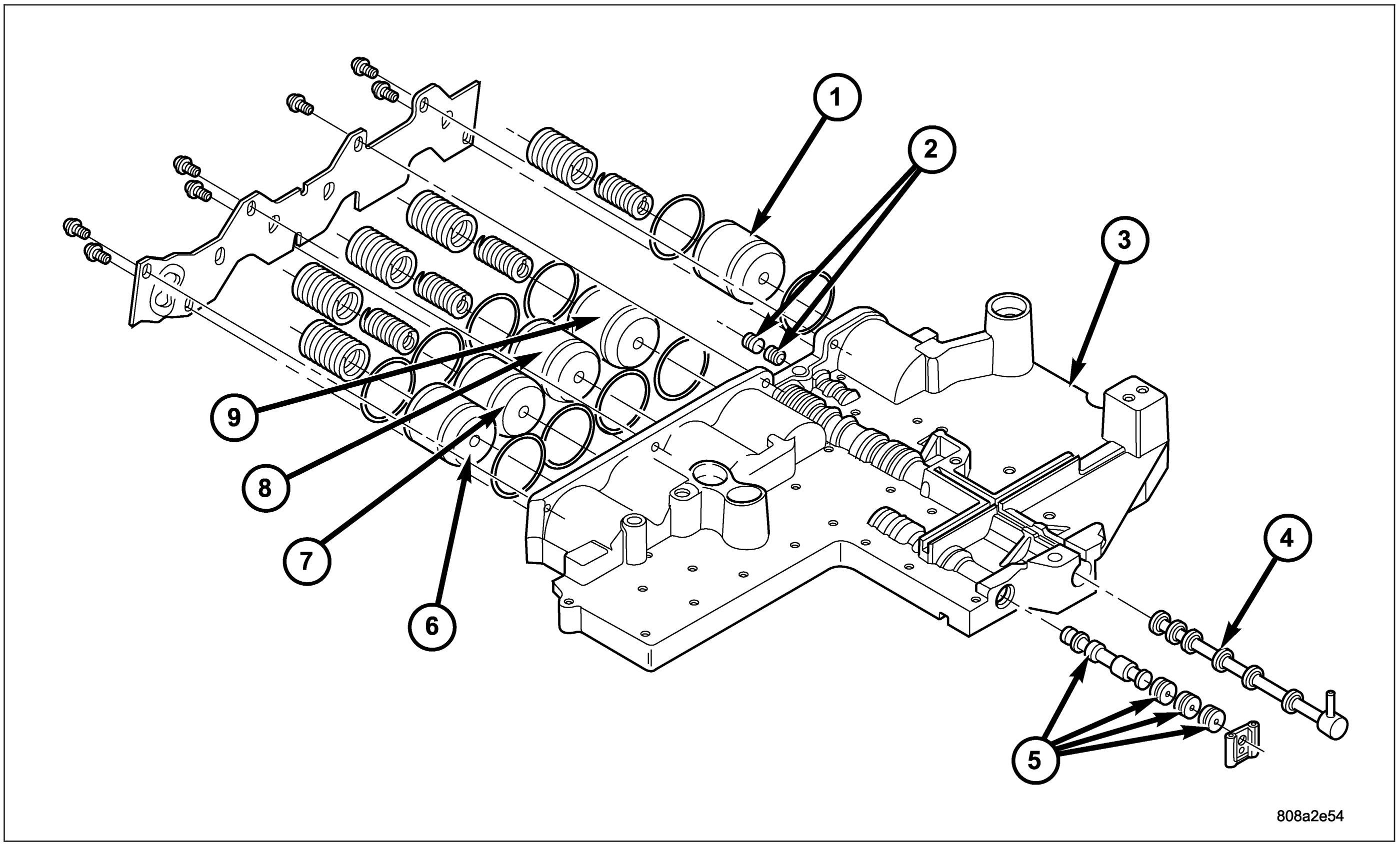
### Calculated Temperature

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

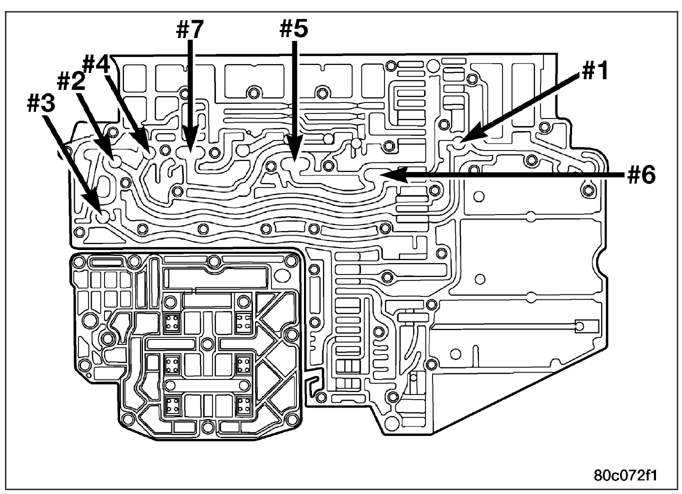
# BODY-VALVE

## DESCRIPTION



The valve body consists of a cast aluminum valve body, a separator plate, and a transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components :

- Solenoid switch valve
- Manual valve
- Low/reverse switch valve
- 5 Accumulators
- 7 check balls



## OPERATION

**NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.**

### SOLENOID SWITCH VALVE

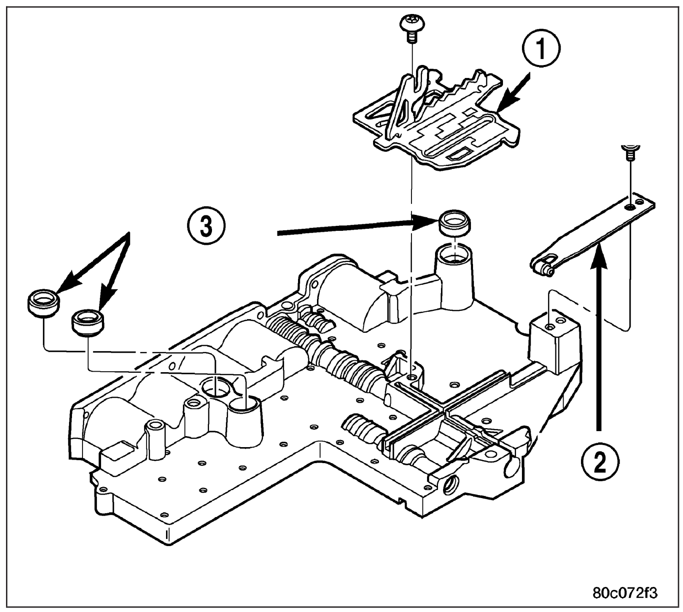
The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and fifth gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

### MANUAL VALVE

The manual valve is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the top of the valve body. The valve is connected mechanically by a cable to the gearshift mechanism. The valve is held in each of its positions by a roller detent spring (2) that engages the roostercomb of the TRS selector plate (1).



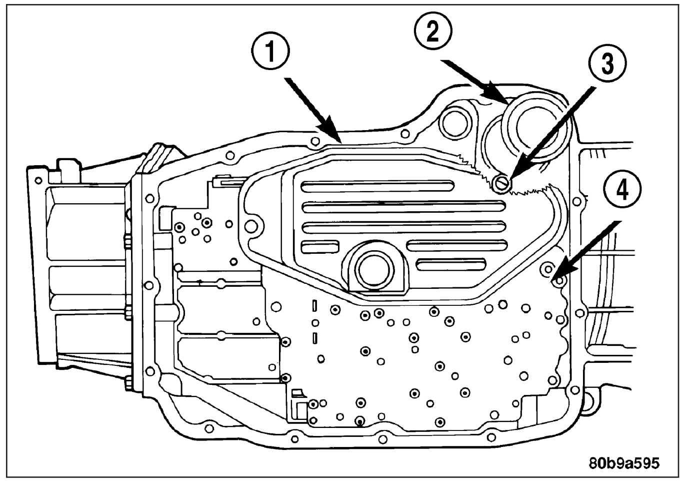
### LOW/REVERSE SWITCH VALVE

The low/reverse switch valve allows the low/reverse clutch to be operated by either the LR/CC solenoid or the MS solenoid.

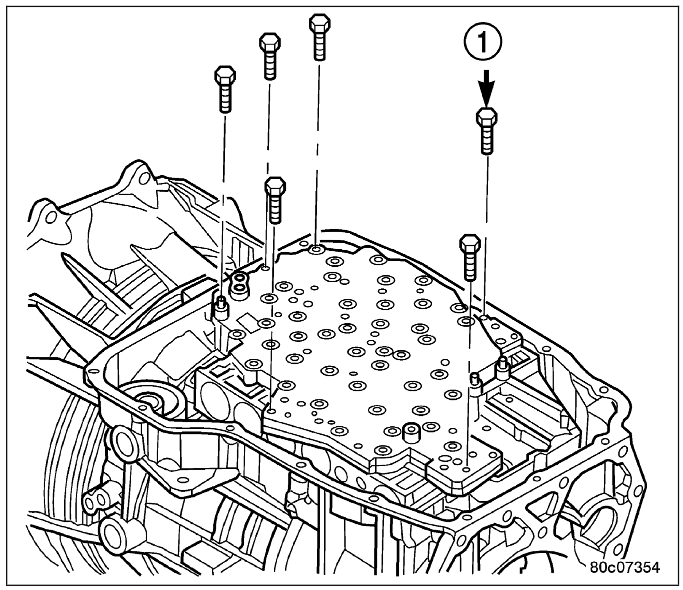
## REMOVAL

**NOTE: The valve body can be removed for service without having to remove the transmission assembly. The valve body can be disassembled for cleaning and inspection of the individual components. (Refer to 21 - TRANSMISSION/AUTOMATIC - 45RFE/VALVE BODY - DISASSEMBLY)**

1. Shift transmission into PARK.
2. Raise vehicle.
3. Disconnect wires at the solenoid and pressure switch assembly connector.
4. Position drain pan under transmission oil pan.
5. Remove transmission oil pan.
6. Remove the primary oil filter (1) from valve body.

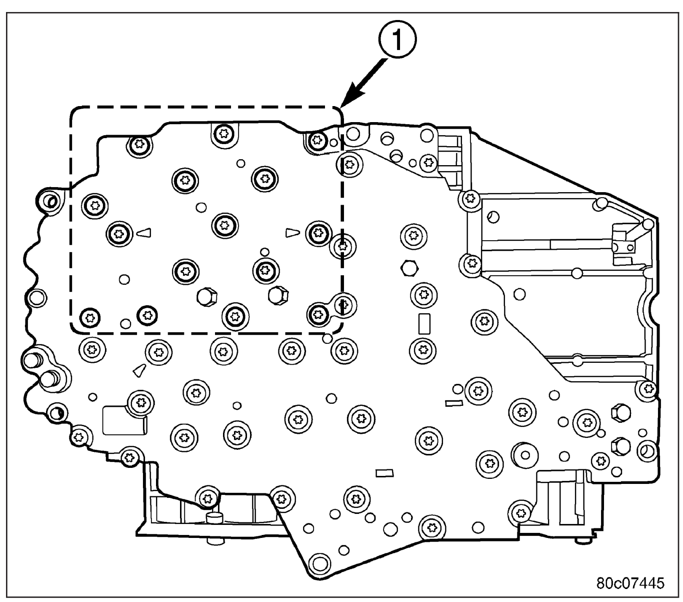


7. Remove bolts (1) attaching valve body to transmission case.
8. Lower the valve body and work the electrical connector out of transmission case.
9. Separate the valve body from the transmission.

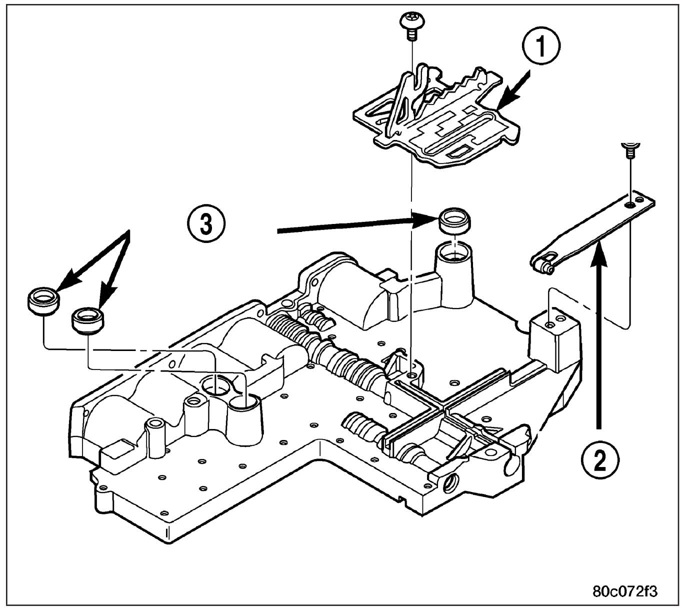


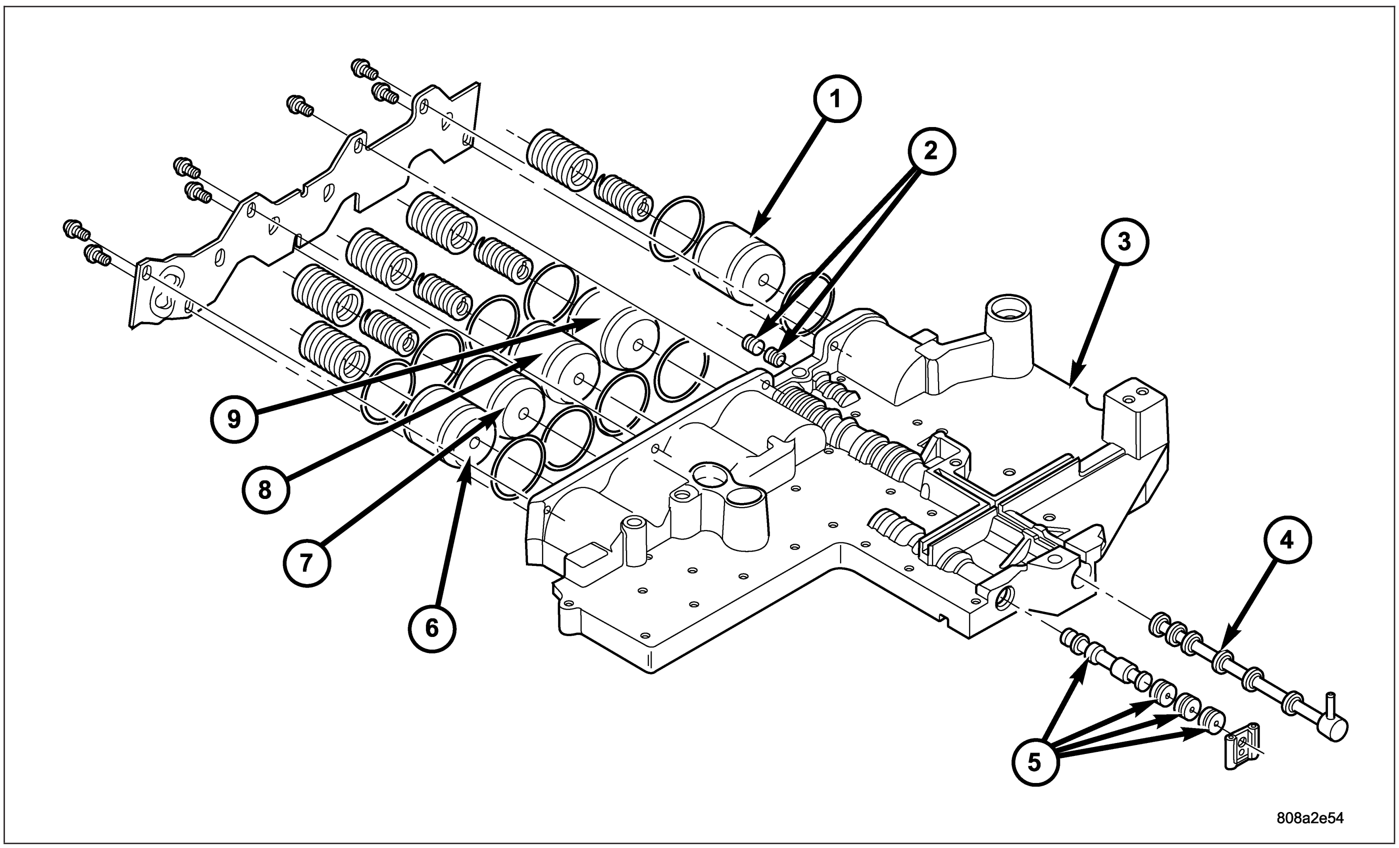
## DISASSEMBLY

1. Remove the bolts (1) holding the solenoid and pressure switch assembly to the valve body. Do not remove the screws on the top of the solenoid and pressure switch assembly.
2. Separate the solenoid and pressure switch assembly from the valve body.



3. Remove the screw holding the detent spring (2) onto the valve body.
4. Remove the detent spring (2) from the valve body.
5. Remove the TRS selector plate (1) from the valve body and the manual valve.
6. Remove the clutch passage seals (3) from the valve body, if necessary.



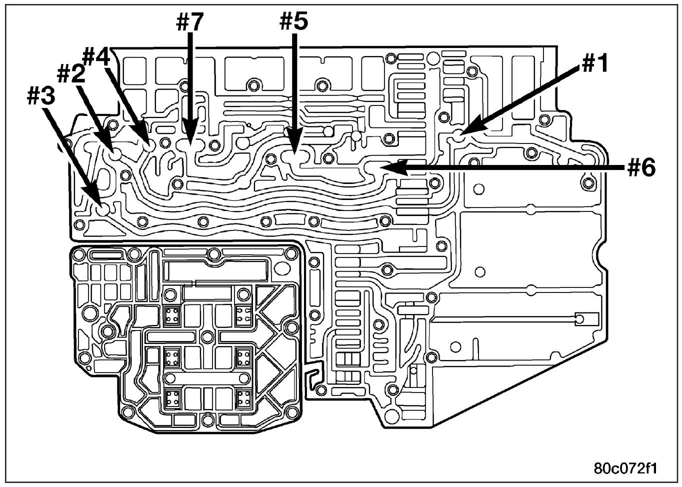


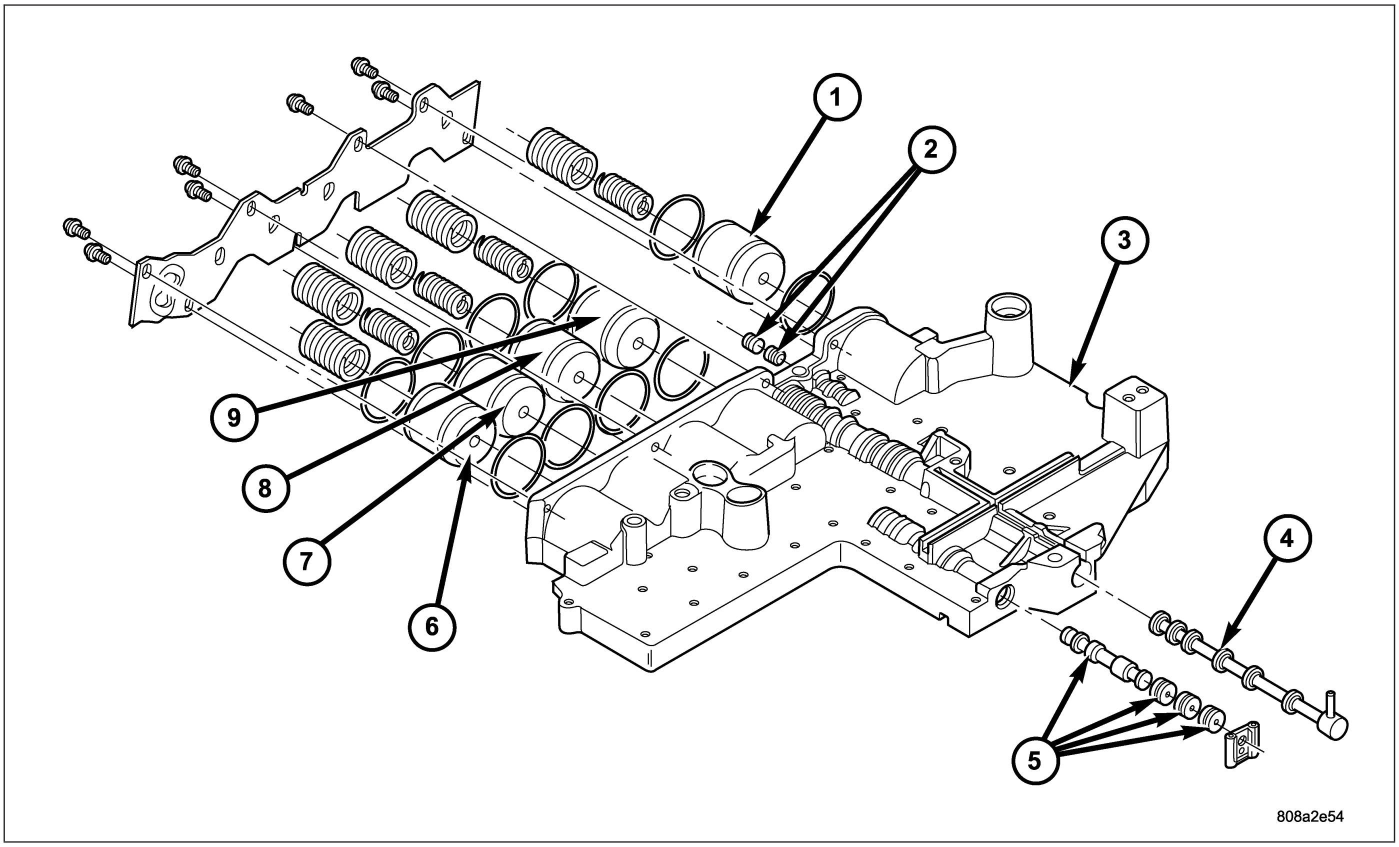
7. Remove the screws holding the accumulator cover onto the valve body.
8. Remove the accumulator springs and pistons (1, 6-9) from the valve body. Note which accumulator piston and spring belong in each location.

9. Place the valve body on the bench with the transfer plate upward.

**NOTE: The valve body contains seven check balls. The transfer plate must be placed upward to prevent losing the check balls when the transfer plate is removed from the valve body.**

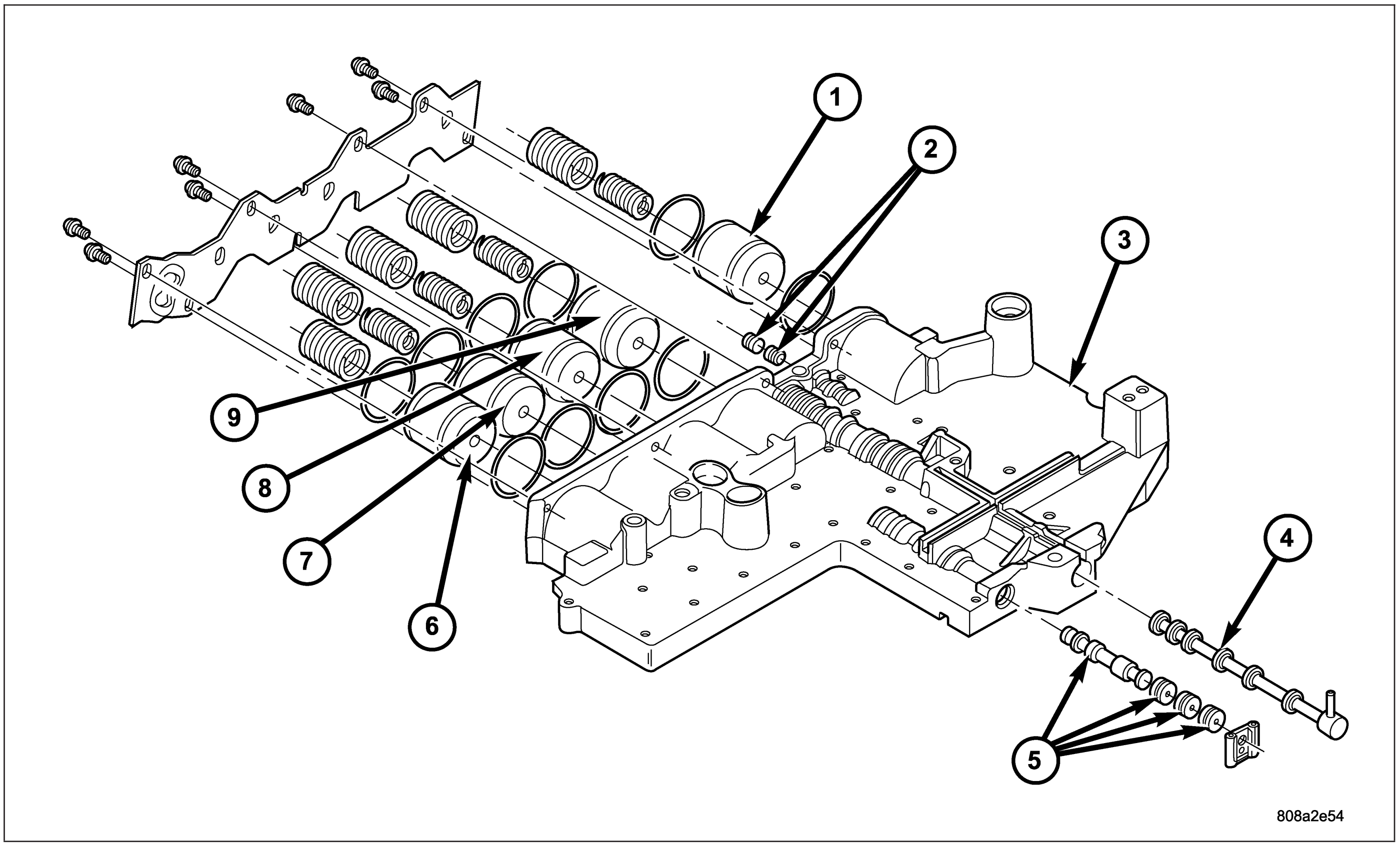
10. Remove the screws holding the valve body to the valve body transfer plate.
11. Remove the transfer plate from the valve body. Note the location of all check balls.
12. Remove the check balls from the valve body.





13. Remove the retainers securing the solenoid switch valve (5), manual valve (4), and the low/reverse switch valve (2) from the valve body and remove the associated valve and spring. Tag each valve and spring combination with location information to aid in assembly.

## CLEANING

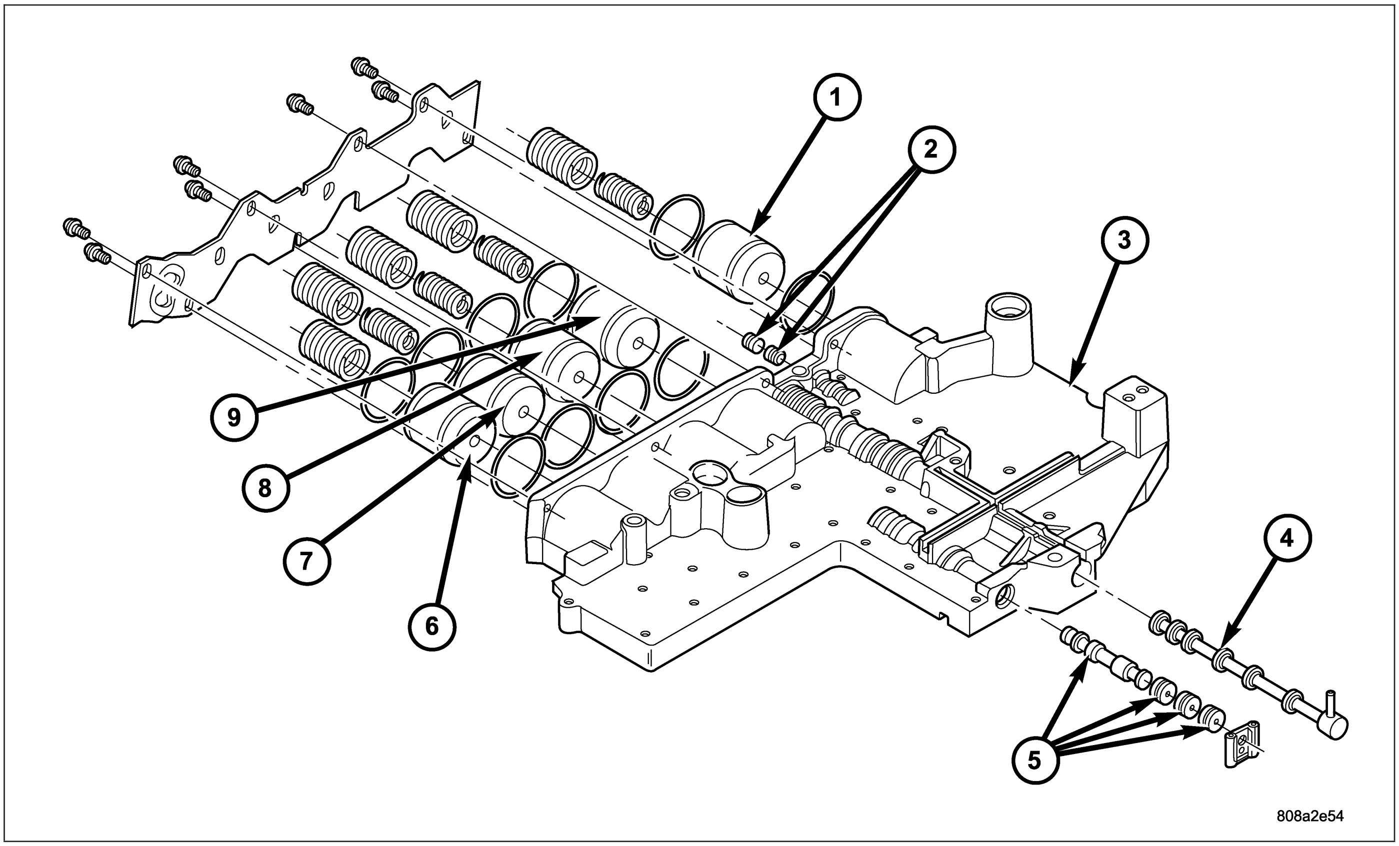


Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

## INSPECTION



Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

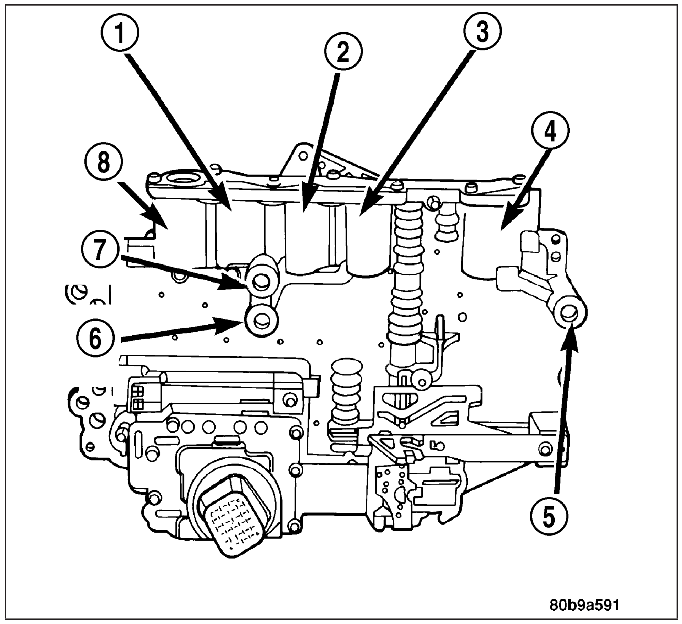
Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

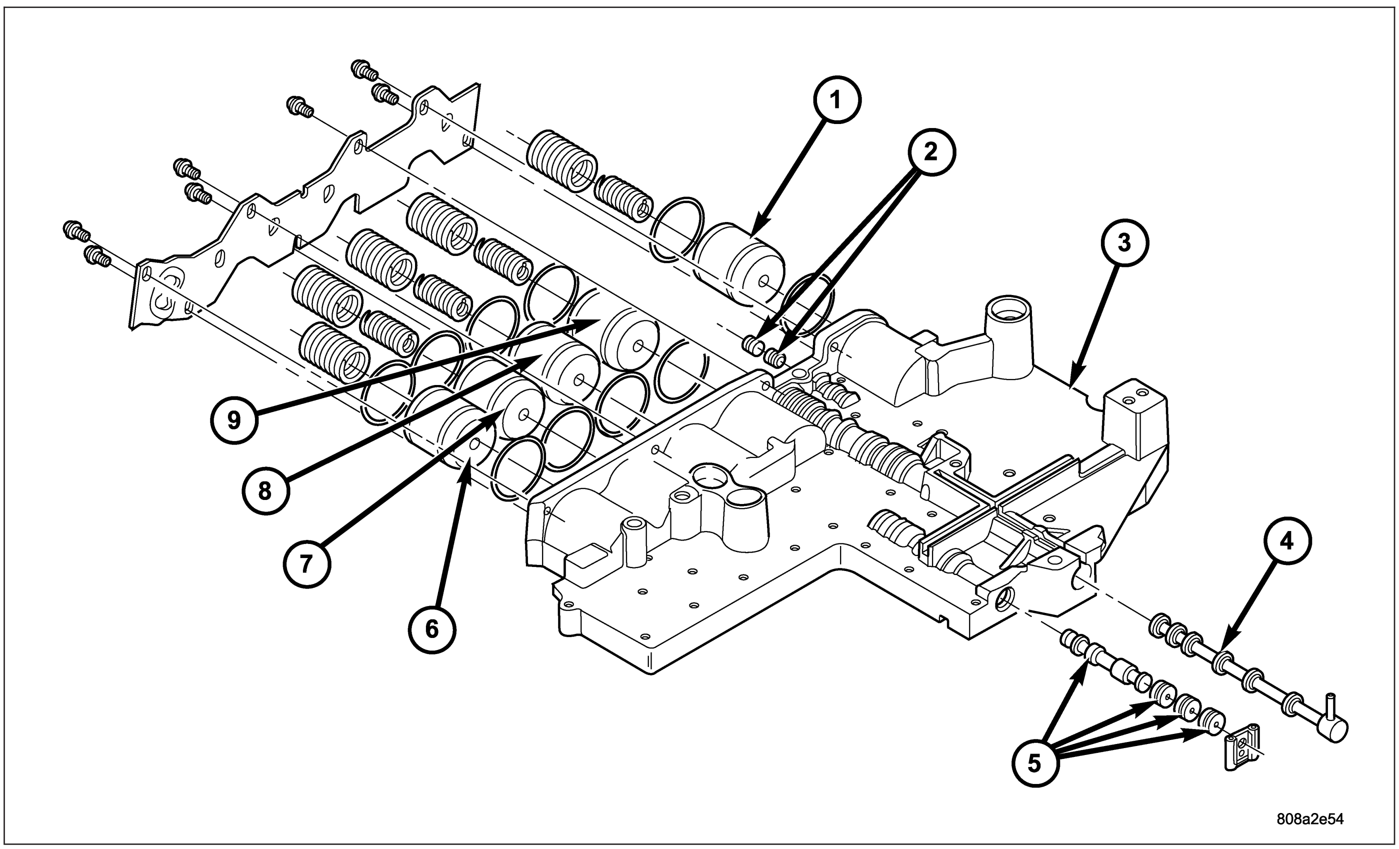
Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

Inspect all the accumulator bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the accumulator springs. The springs must be free of distortion, warpage or broken coils.

Inspect all the fluid seals on the valve body. Replace any seals that are cracked, distorted, or damaged in any way. These seals pass fluid pressure directly to the clutches. Any pressure leak at these points, may cause transmission performance problems.

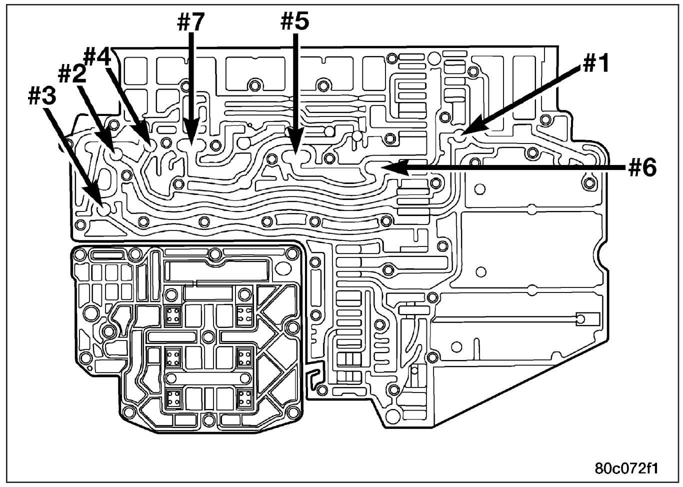


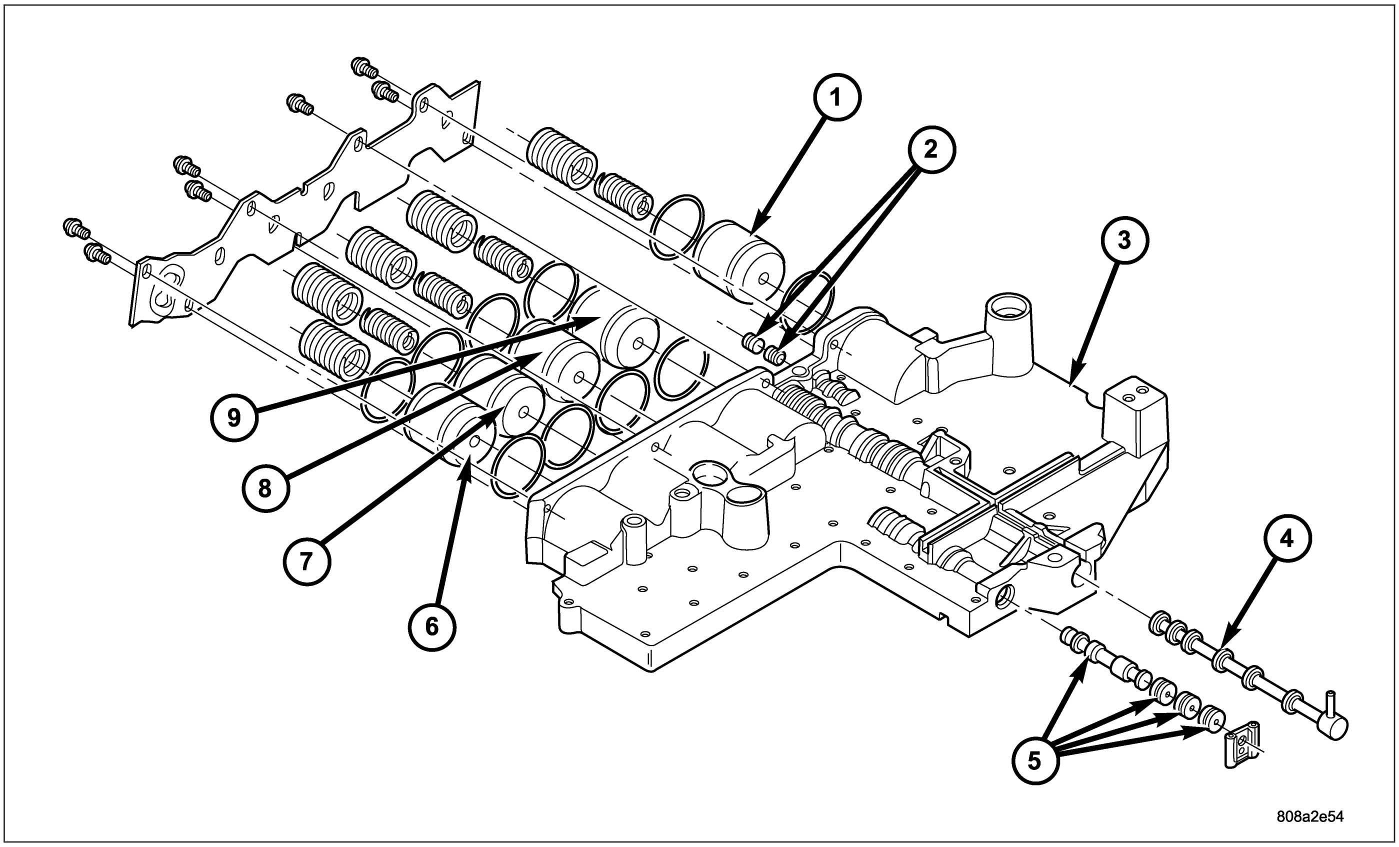
## ASSEMBLY



1. Lubricate valves, springs, and the housing valve bores with clean transmission fluid.
2. Install solenoid switch valve (5), manual valve (4), and the low/reverse switch valve (2) into the valve body.
3. Install the retainers to hold each valve into the valve body.

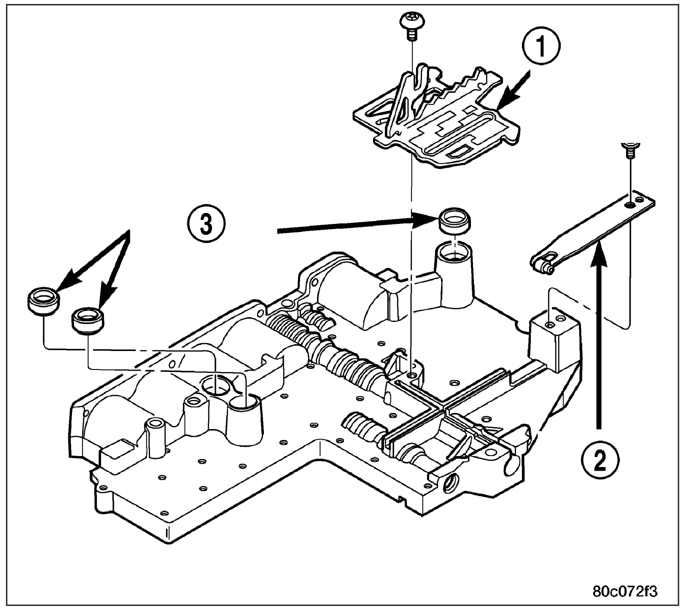
4. Install the valve body check balls into their proper locations.
5. Position the transfer plate onto the valve body.
6. Install the screws to hold the transfer plate to the valve body. Tighten the screws to 6 N·m (50 in. lbs.).



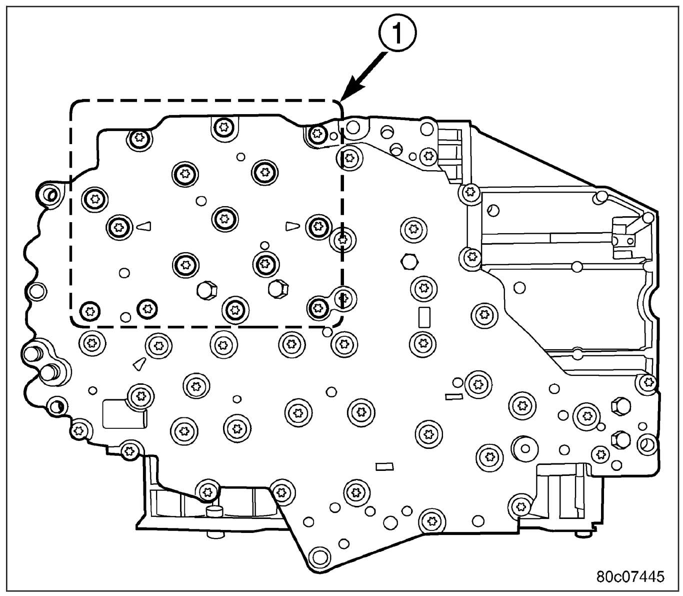


7. Install the accumulator pistons (1, 6-9) and springs into the valve body in the location from which they were removed. Note that all accumulators except the overdrive have two springs. The overdrive accumulator piston (6) has only one spring.
8. Position the accumulator cover onto the valve body.
9. Install the screws to hold the accumulator cover onto the valve body. Tighten the screws to 7 N·m (60 in. lbs.).

10. Install the TRS selector plate (1) onto the valve body and the manual valve.
11. Position the detent spring (2) onto the valve body.
12. Install the screw to hold the detent spring (2) onto the valve body. Tighten the screw to 4.5 N·m (40 in. lbs.).
13. Install new clutch passage seals (3) onto the valve body, if necessary.

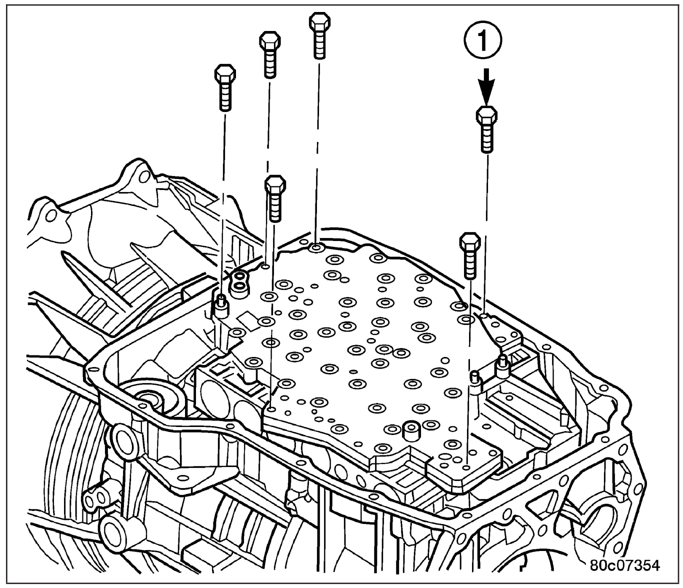


14. Install the solenoid and pressure switch assembly onto the valve body.
15. Install the bolts (1) to hold the solenoid and pressure switch assembly onto the valve body. Tighten the bolts to 6 N·m (50 in. lbs.). Tighten the bolts adjacent to the arrows cast into the bottom of the transfer plate first.

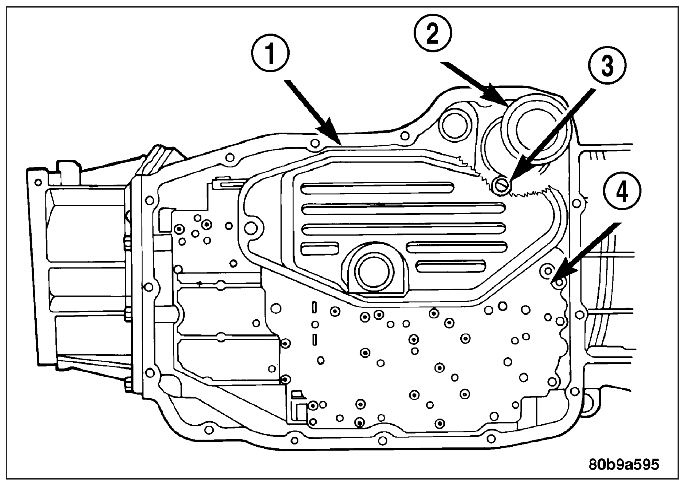


## INSTALLATION

1. Check condition of seals on valve body and the solenoid and pressure switch assembly. Replace seals if cut or worn.
2. Place TRS selector plate in the PARK position.
3. Place the transmission in the PARK position.
4. Lubricate seal on the solenoid and pressure switch assembly connector with petroleum jelly.
5. Position valve body in transmission and align the manual lever on the valve body to the pin on the transmission manual shift lever.
6. Seat valve body in case and install one or two bolts to hold valve body in place.
7. Tighten valve body bolts alternately and evenly to 12 N·m (105 in. lbs.) torque.



**CAUTION: The primary oil filter seal MUST be fully installed flush against the oil pump body. DO NOT install the seal onto the filter neck and attempt to install the filter and seal as an assembly. Damage to the transmission will result.**



8. Install a new primary oil filter seal in the oil pump inlet bore. Seat the seal in the bore with the butt end of a hammer, or other suitable tool.
9. Place replacement filter (1) in position on valve body and into the oil pump.
10. Install screw to hold filter to valve body. Tighten screw to 4.5 N·m (40 in. lbs.) torque.
11. Connect the solenoid and pressure switch assembly connector.
12. Install oil pan. Tighten pan bolts to 12 N·m (105 in. lbs.) torque.
13. Lower vehicle and fill transmission with Mopar® ATF +4.
14. Check and adjust gearshift cable, if necessary.

# TRANSFER CASE - NV231

## TABLE OF CONTENTS

# TRANSFER CASE - NV231

## DESCRIPTION

The NV231 is a part-time transfer case with a low range reduction gear system. The NV231 has three operating ranges plus a NEUTRAL position. A low range system provides a reduction ratio for increased low speed torque capability.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

### OPERATING RANGES

Transfer case operating ranges are:

- 2WD (2-wheel drive)
- 4Hi (4-wheel drive)
- 4 Lo (4-wheel drive low range)

The 2WD range is for use on any road surface at any time.

The 4Hi and 4 Lo ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is wet or slippery or covered by ice and snow.

The low range reduction gear system is operative in 4 Lo range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

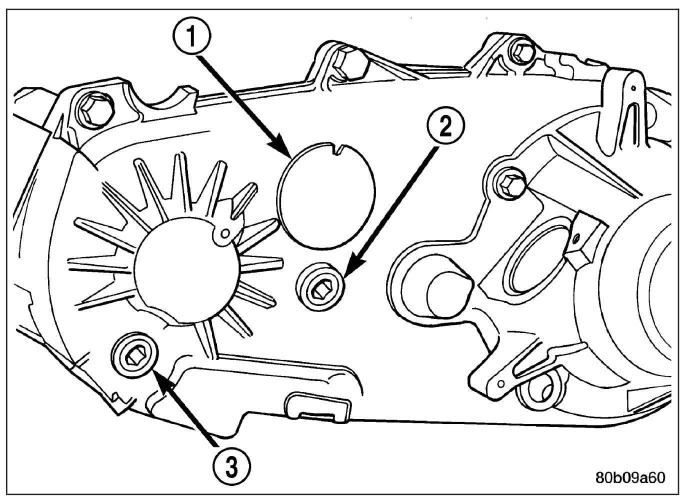
### SHIFT MECHANISM

Operating ranges are selected with a floor mounted shift lever. The shift lever is connected to the transfer case range lever by a shift cable. A straight line shift pattern is used. Range positions are marked on the shifter knob bezel.

### IDENTIFICATION

A circular ID tag (1) is attached to the rear case of each transfer case. The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.



## OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range hub. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchronizer mechanism for shifting.

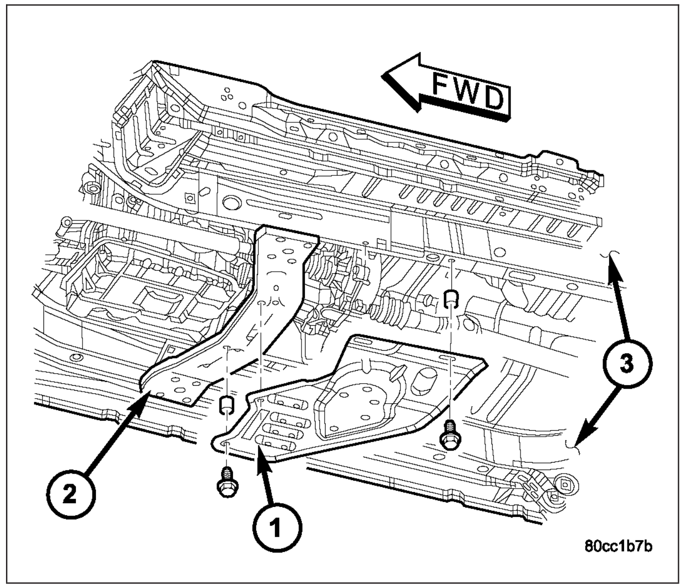
## DIAGNOSIS AND TESTING - TRANSFER CASE - NV231

### DIAGNOSIS CHART

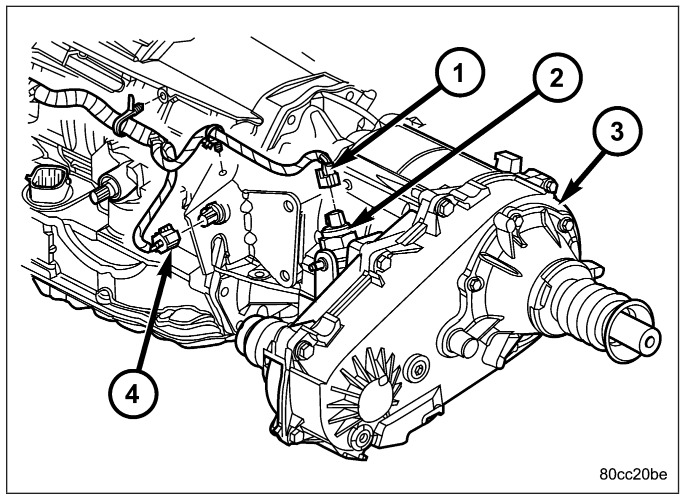
| Condition | Possible Cause | Correction |
|---|---|---|
| Transfer case difficult to shift or will not shift into desired range. | 1) Vehicle speed too great to permit shifting. | 1) Slow vehicle and shift into desired range. |
| | 2) If vehicle was operated for an extended period in 4H mode on dry surface, driveline torque load may cause difficulty. | 2) Stop vehicle and shift transfer case to Neutral position. Transfer case can then be shifted to the desired mode. |
| | 3) Transfer case shift cable binding. | 3) Repair or replace cable as necessary. |
| | 4) Insufficient or incorrect lubricant. | 4) Drain and refill transfer case with the correct type and quantity of lubricant. |
| | 5) Internal transfer case components binding, worn, or damaged. | 5) Repair or replace components as necessary. |
| Transfer case noisy in all drive modes. | 1) Insufficient or incorrect lubricant. | 1) Drain and refill transfer case with the correct type and quantity of lubricant. |
| Transfer case noisy while in, or jumps out of, 4L mode. | 1) Transfer case not completely engaged in 4L position. | 1) Slow vehicle, shift transfer case to the Neutral position, and then shift into the 4L mode. |
| | 2) Transfer case shifter binding. | 2) Repair, replace, or tighten shifter as necessary. |
| | 3) Range fork damaged, inserts worn, or fork is binding on the shift rail. | 3) Repair or replace components as necessary. |
| | 4) Low range gear worn or damaged. | 4) Repair or replace components as necessary. |
| Lubricant leaking from transfer case seals or vent. | 1) Transfer case overfilled. | 1) Drain lubricant to the correct level. |
| | 2) Transfer case vent closed or restricted. | 2) Clean or replace vent as necessary. |
| | 3) Transfer case seals damaged or installed incorrectly. | 3) Replace suspect seal. |
| Abnormal tire wear. | 1) Extended operation in 4Hi mode on dry surfaces, | 1) Operate vehicle in 2H mode on dry surfaces. |

## REMOVAL

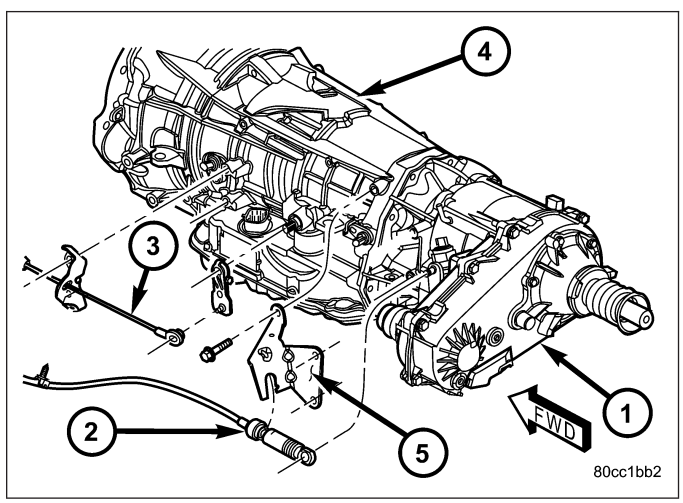
1. Shift transfer case into NEUTRAL.
2. Raise vehicle.
3. Remove skid plate (1).



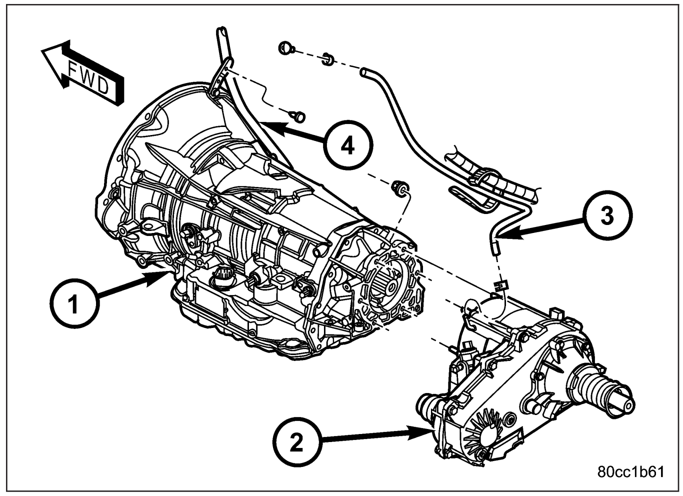
4. Drain transfer case lubricant.
5. Mark front and rear propeller shaft yokes for alignment reference.
6. Disconnect front/rear propeller shafts at transfer case.
7. Disconnect transfer case position sensor connector (1).



8. Disconnect transfer case shift cable (2) at the range lever.
9. Disconnect the transfer case shift cable from the shift cable bracket.



10. Disconnect transfer case vent hose (3).
11. Support transfer case with transmission jack.
12. Secure transfer case to jack with chains.
13. Remove nuts attaching transfer case to transmission.
14. Pull transfer case and jack rearward to disengage transfer case.
15. Remove transfer case from under vehicle.

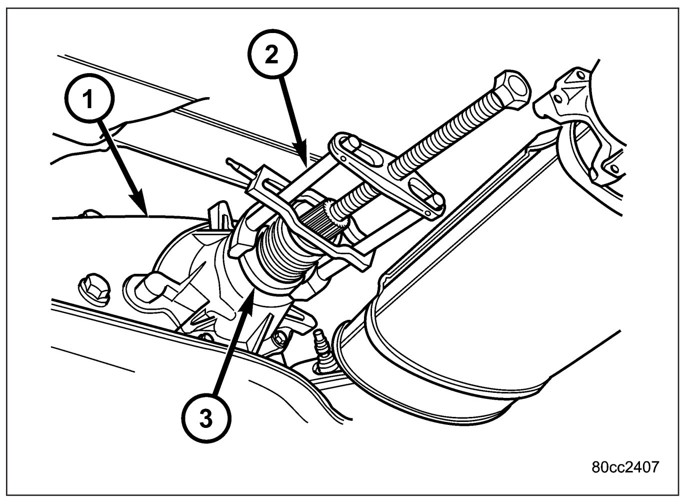


## DISASSEMBLY

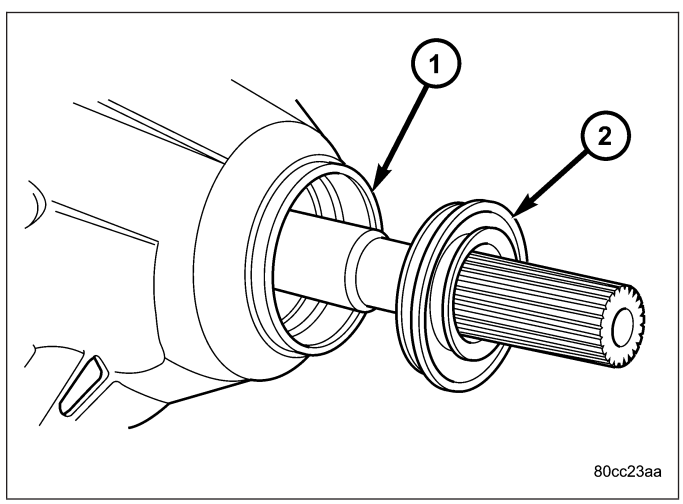
Position transfer case on shallow drain pan. Remove drain plug and drain lubricant remaining in case.

### REAR RETAINER AND OIL PUMP

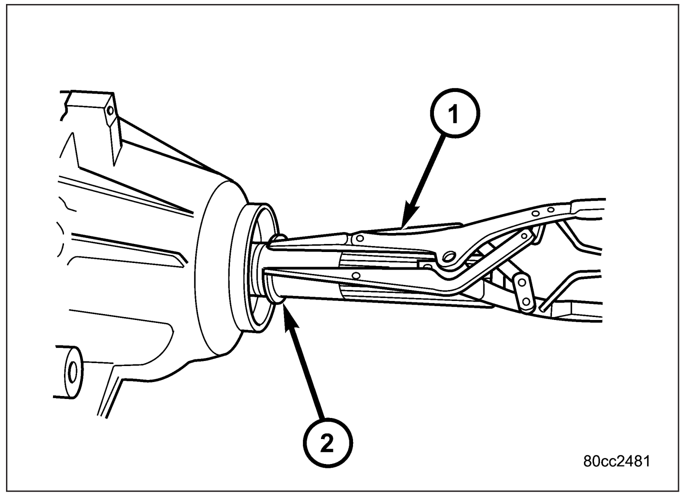
1. Spread band clamp which holds output shaft boot to the output shaft slinger with a suitable awl, or equivalent.
2. Remove output shaft boot from slinger and output shaft.
3. Remove the output shaft rear slinger (3) using Puller MD-998056-A (2).



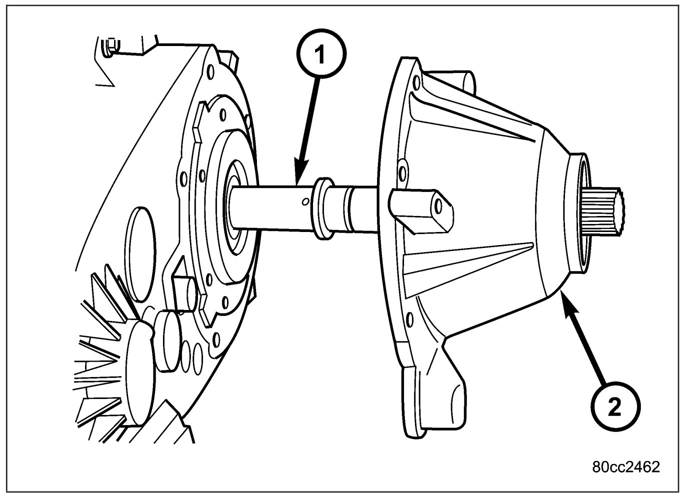
4. Use a suitable pry tool, or a slide hammer mounted screw, to remove the seal (2) from the rear retainer (1).



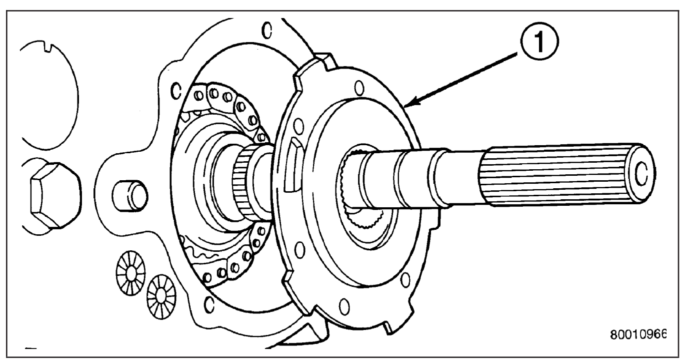
5. Remove the rear output bearing I.D. retaining ring (2).
6. Remove the bolts holding the rear retainer to the rear case half.



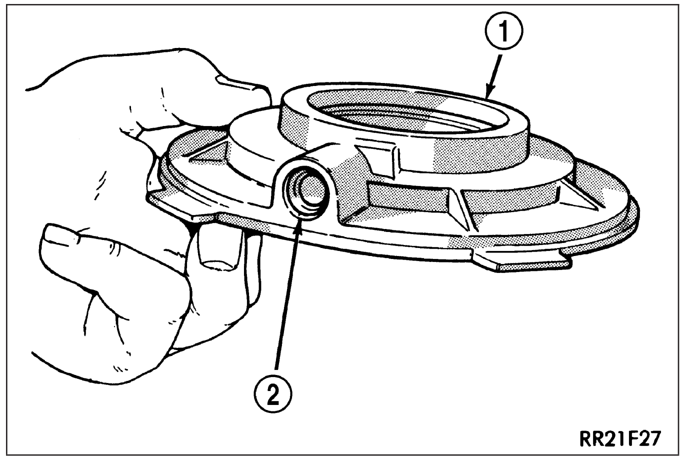
7. Tap rear retainer with rawhide or rubber mallet to loosen sealer bead.
8. Remove rear retainer (2) from rear case half.



9. Remove the remaining output shaft bearing snap-ring.
10. Disengage oil pickup tube from oil pump (1) and remove oil pump assembly. Remove oil pump by tilting the edge of the oil pump from under the edge of the rear case half and sliding the pump off the output shaft.

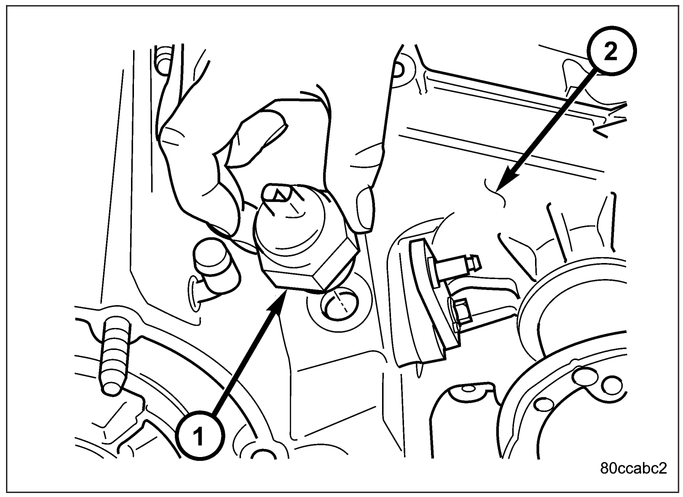


11. Remove pick-up tube o-ring (2) from oil pump (1), if necessary. Do not disassemble the oil pump, it is not serviceable.

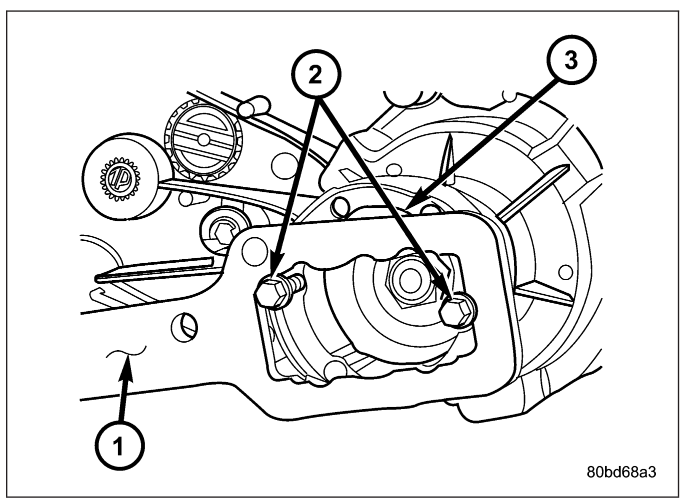


## COMPANION FLANGE AND RANGE LEVER

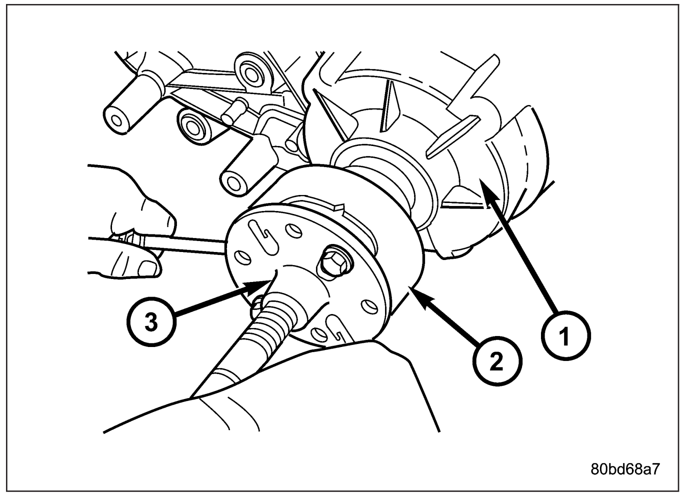
1. Remove transfer case position sensor (1).



2. Install two bolts (2) partially into the propeller shaft companion flange (3), 180° from each other.
3. Install the rectangular end of the Flange Holder C-3281 (1) over the bolts to hold the companion flange stationary and remove the nut holding the companion flange to the output shaft.

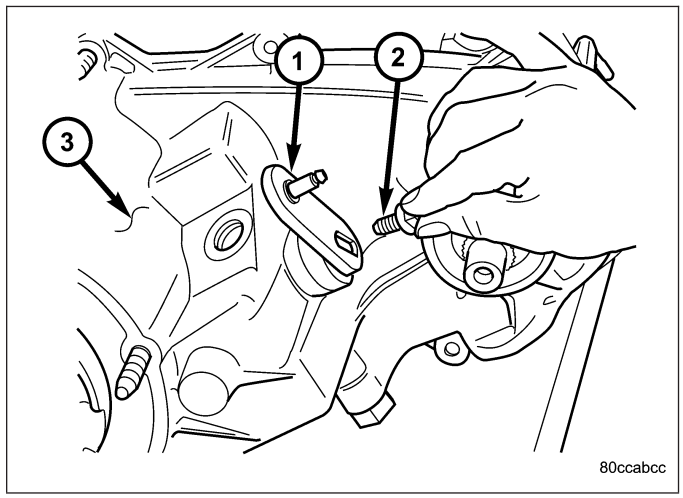


4. Use Remover C-452 (3) to remove the companion flange (2).



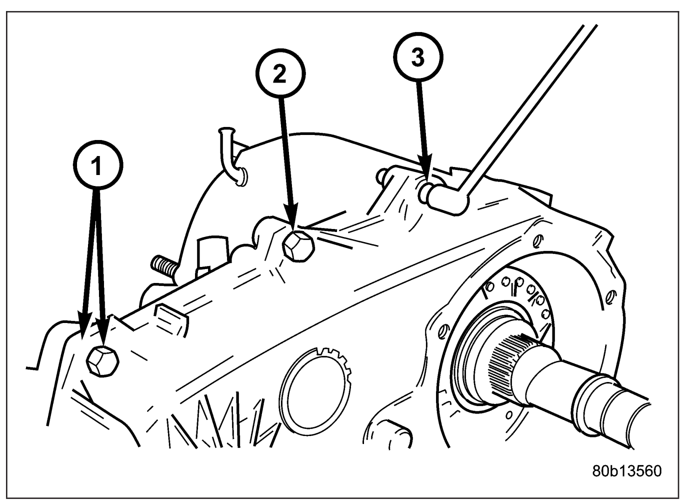
**NOTE: Be sure to note the orientation of the range lever (lever up or down) so that it may be re-installed in the same direction.**

5. Remove seal washer from front output shaft. Discard washer as it should not be reused.
6. Remove the bolt (2) that attaches the range lever (1) to sector shaft. Then move sector to neutral position and remove range lever from shaft.

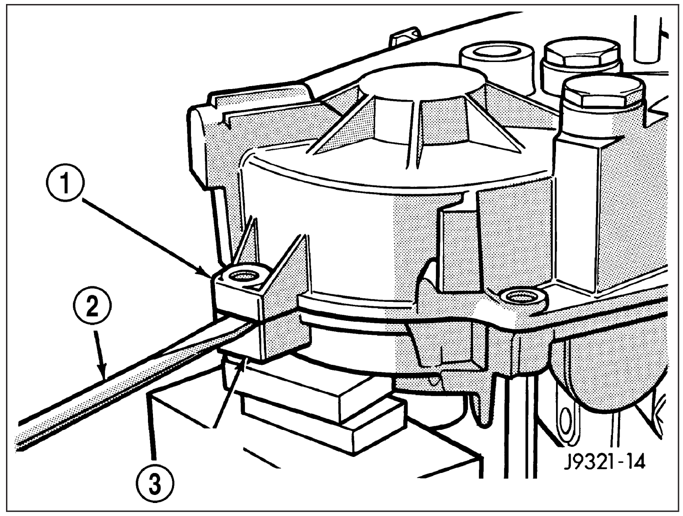


## FRONT OUTPUT SHAFT AND DRIVE CHAIN

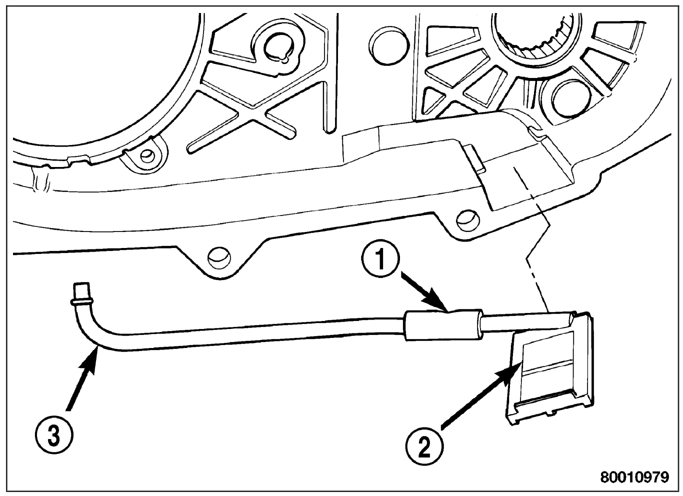
1. Support transfer case so rear case is facing upward.
2. Remove bolts (2) holding front case to rear case. The case alignment bolts require flat washers (1).



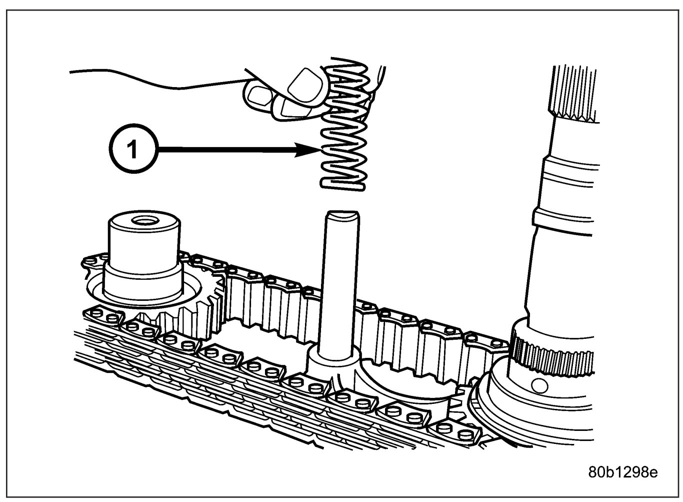
3. Loosen rear case (1) with flat blade screwdriver to break sealer bead. Insert pry tool (2) blade only into notches provided at each end of case.
4. Remove rear case from front case.



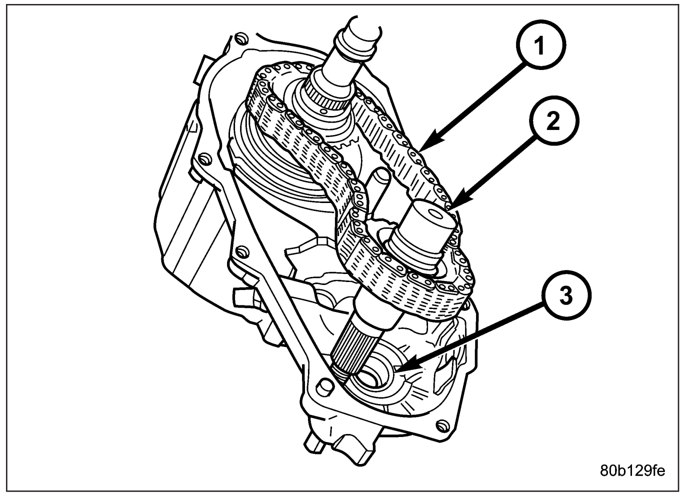
5. Remove oil pickup tube (2) from rear case.



6. Remove mode fork spring (1).

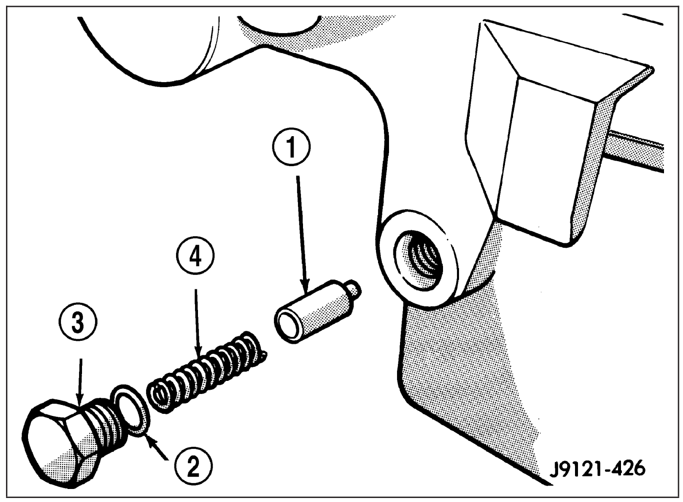


7. Pull front output shaft (2) upward and out of front output shaft bearing (3).
8. Remove front output shaft and chain.

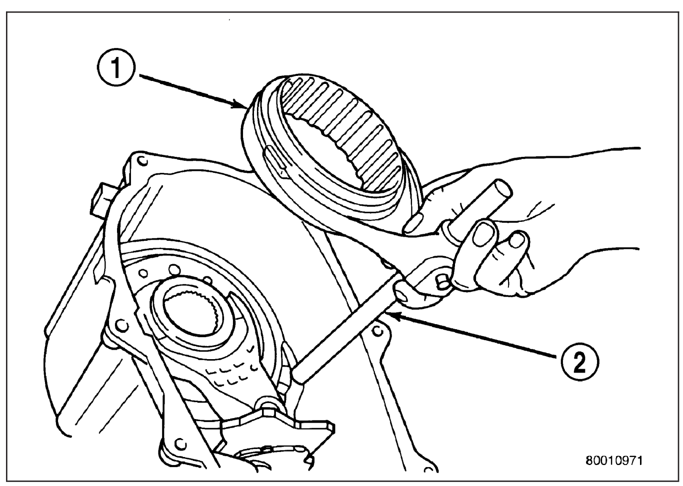


## SHIFT FORKS AND MAINSHAFT

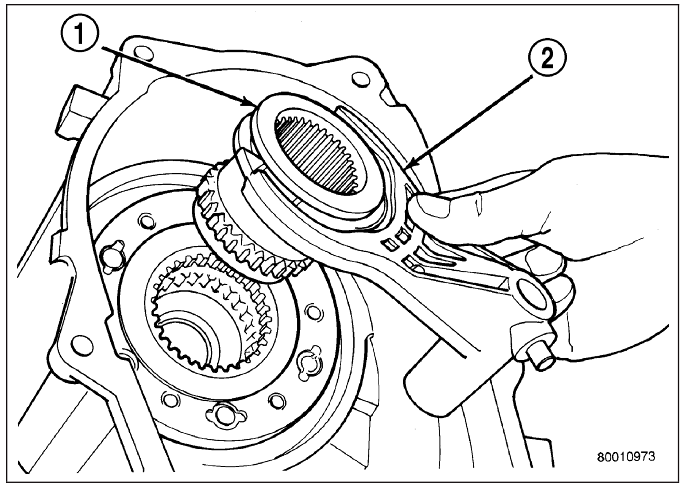
1. Remove mainshaft from mode sleeve and input gear pilot bearing.
2. Remove detent plug (3), O-ring (2), detent spring (4), and detent plunger (1).



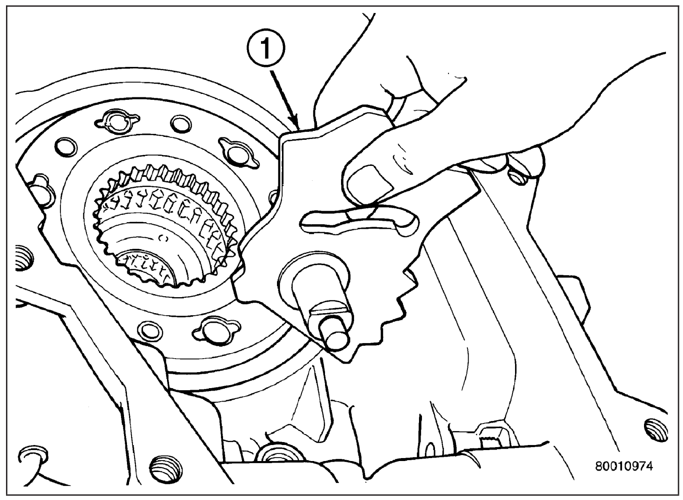
3. Remove mode fork (2) and sleeve (1) as an assembly. Note position of sleeve for assembly reference. The short side of the sleeve faces upward.



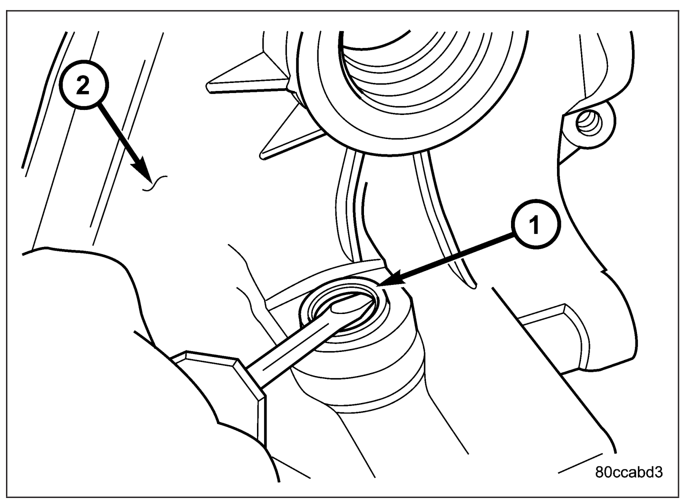
4. Remove range fork (2) and hub as an assembly. Note fork position for installation reference.



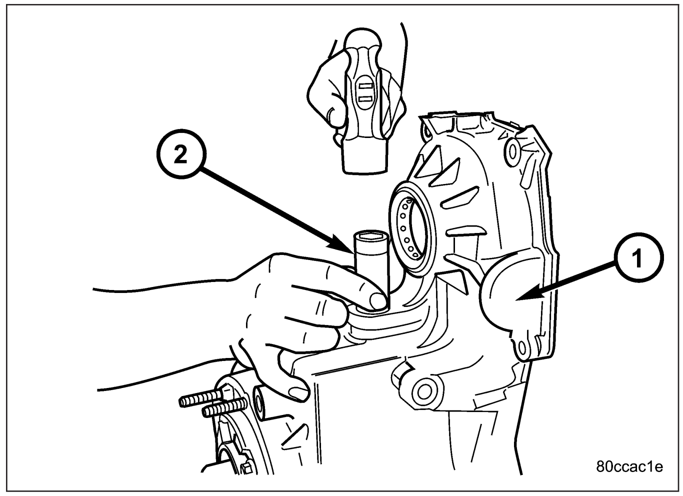
5. Remove shift sector (1) from front case.



6. Remove the shift sector shaft seal (1).

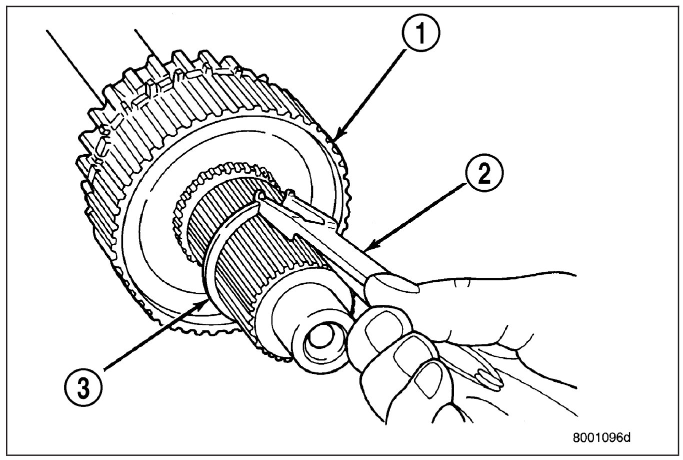


7. Remove the shift sector shaft bearing with an appropriate socket (2).

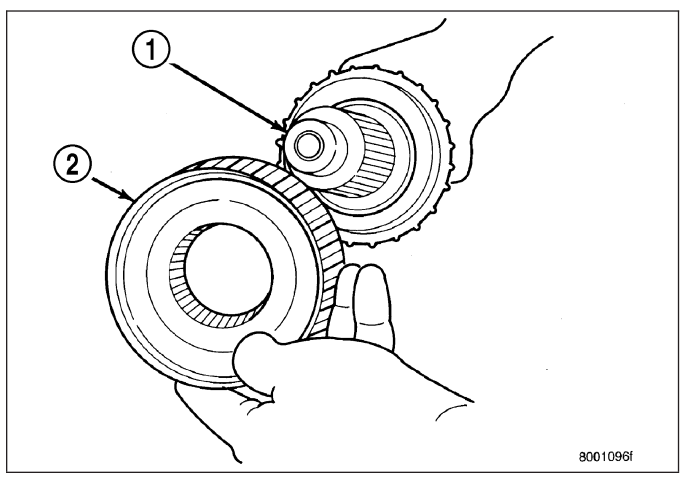


## MAINSHAFT

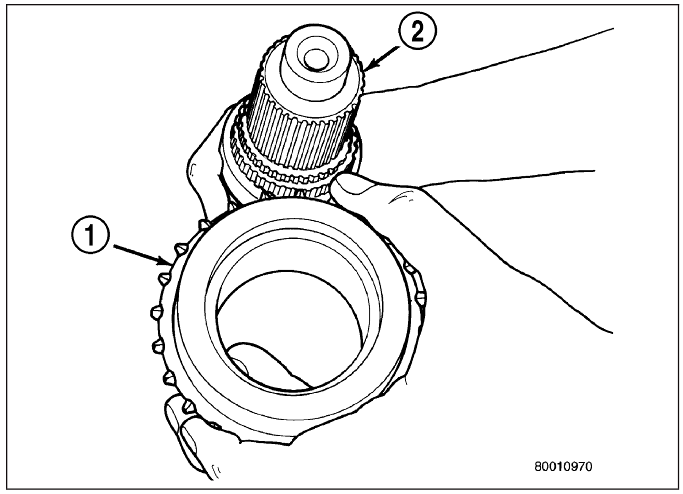
1. Remove mode hub (1) retaining ring (3) with heavy duty snap-ring pliers (2).



2. Slide mode hub (2) off mainshaft (1).

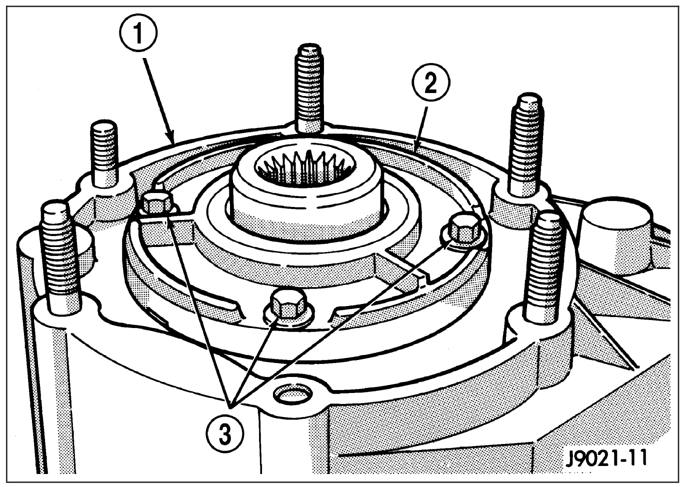


3. Slide drive sprocket (1) off mainshaft (2).

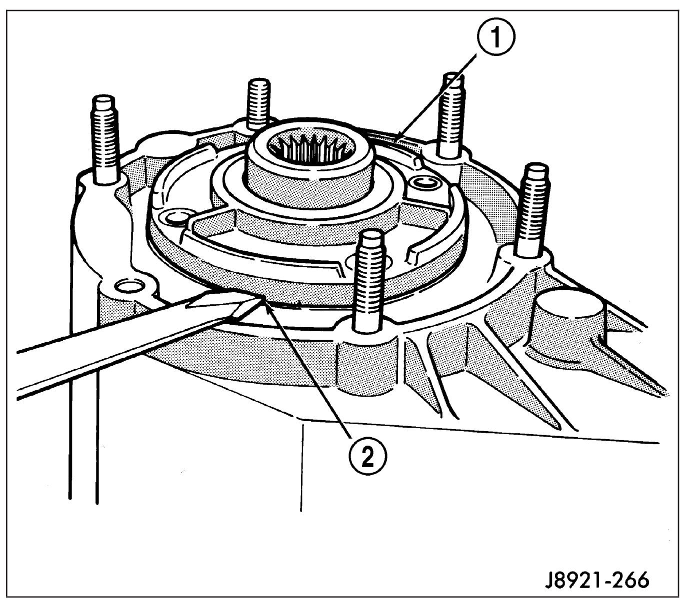


## INPUT GEAR AND LOW RANGE GEAR

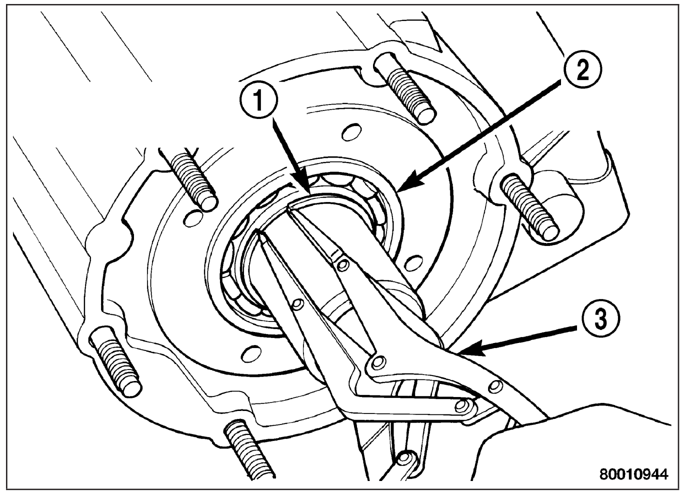
1. Remove front bearing retainer (2) attaching bolts (3).



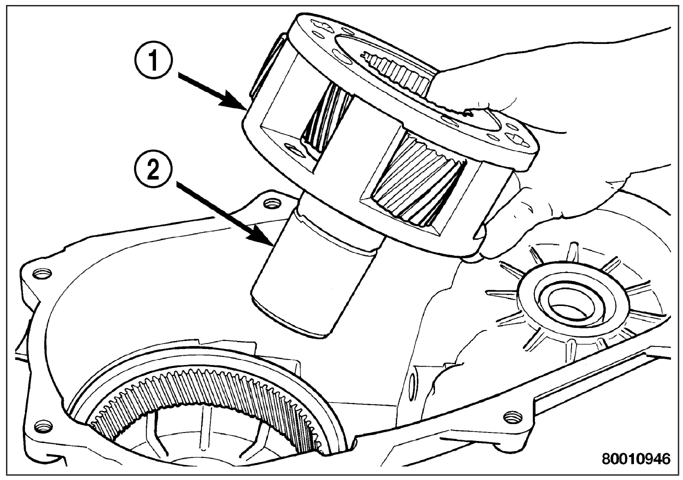
2. Remove front bearing retainer (1). Pry retainer loose with pry tool positioned in slots (2) at each end of retainer.



3. Remove front bearing retainer.
4. Remove input gear retaining ring (1) with heavy duty snap-ring pliers (3)

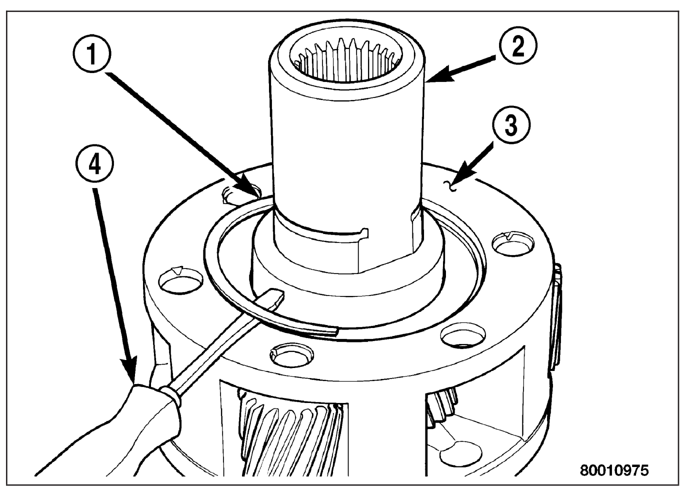


5. Place front case in horizontal position. Then remove input gear (2) and low range gear as an assembly (1). Tap gear out of bearing with plastic mallet if necessary.

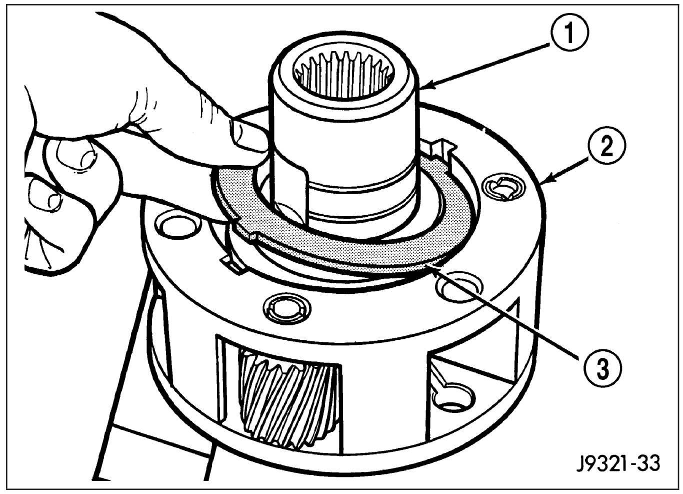


## INPUT AND LOW RANGE GEAR

1. Remove snap-ring (1) that retains input gear (2) in low range gear (3).

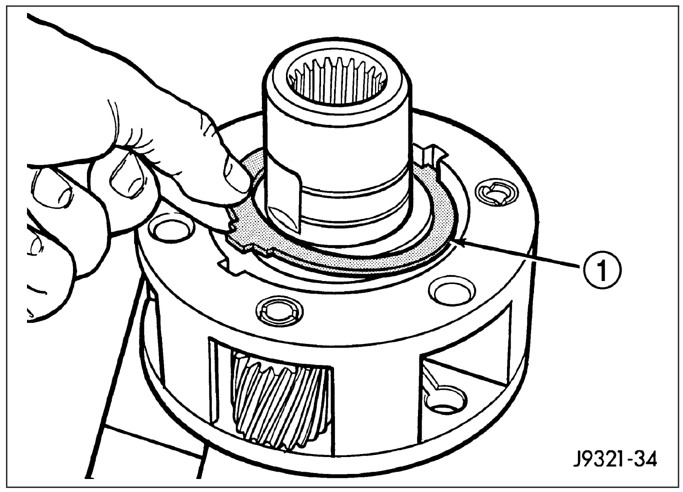


2. Remove retainer (3).



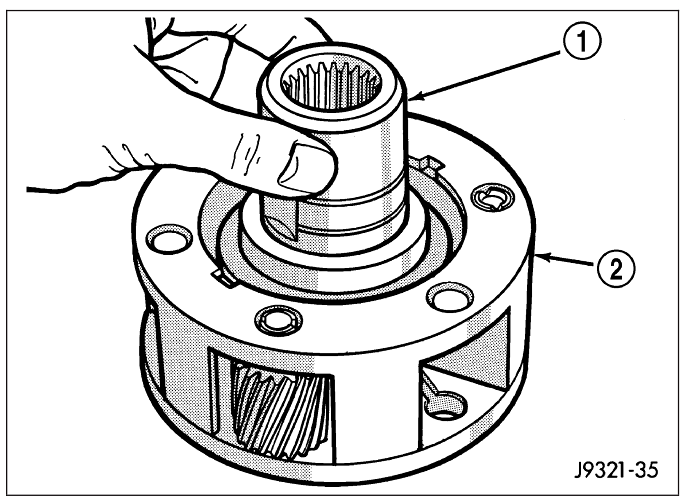
J9321-33

3. Remove front tabbed thrust washer (1).



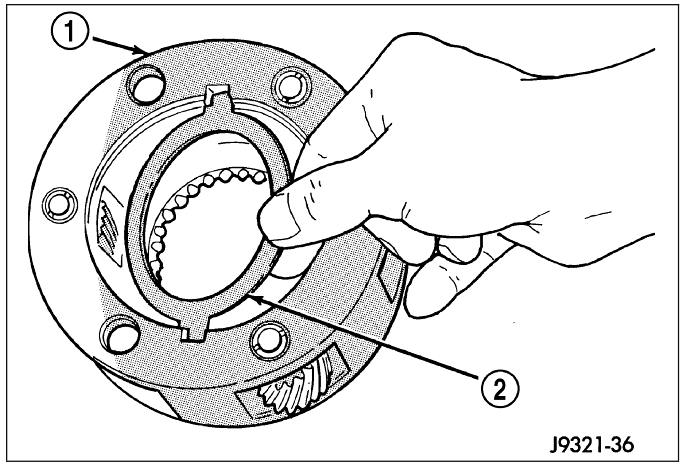
J9321-34

4. Remove input gear (1).



J9321-35

5. Remove rear tabbed thrust washer (2) from low range gear (1).

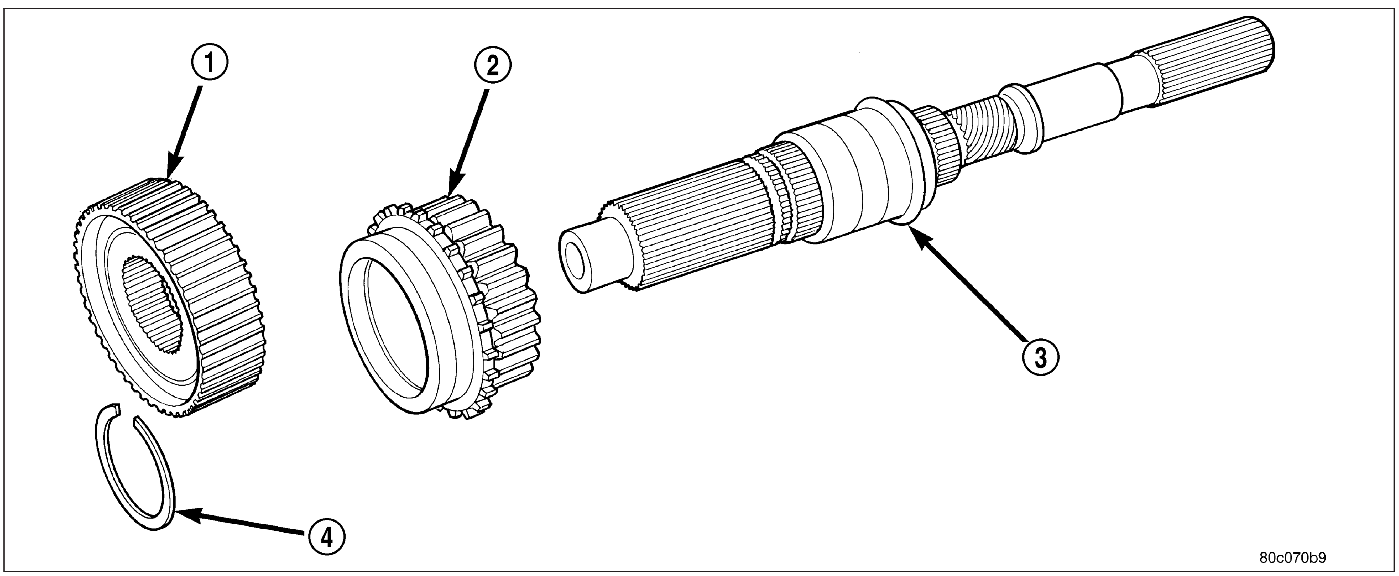


## CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

## INSPECTION

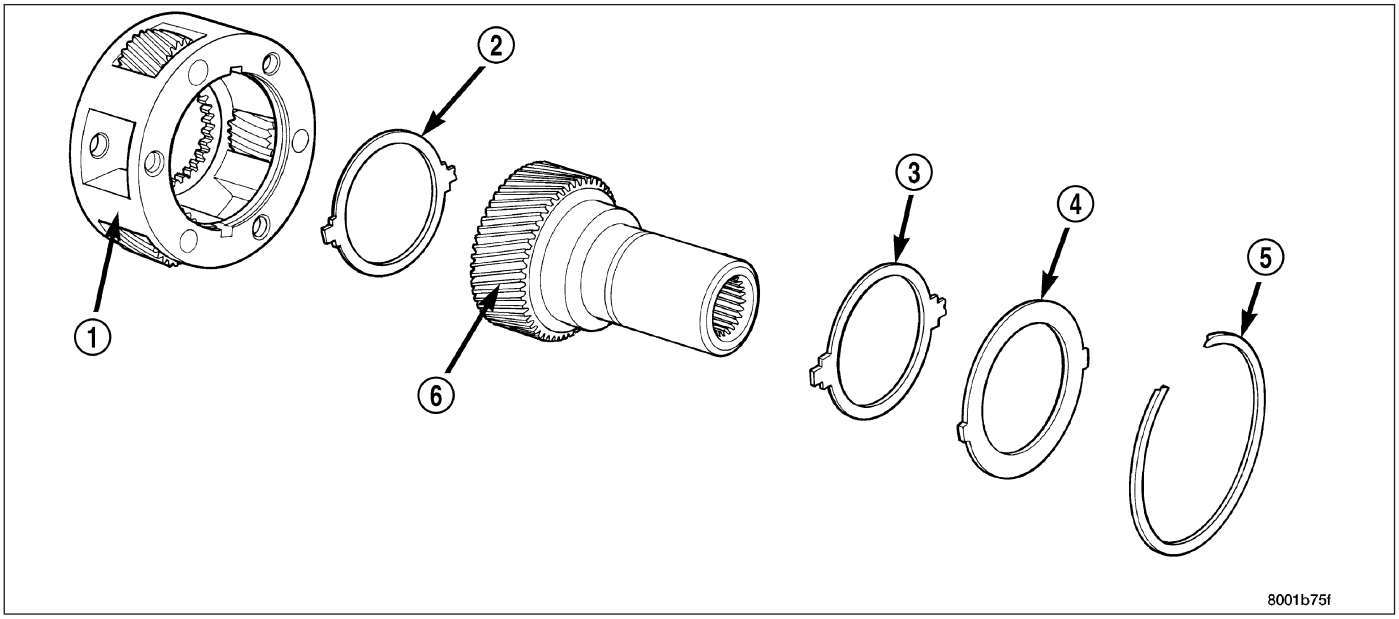
### MAINSHAFT/SPROCKET/HUB



Inspect the splines on the hub (1) and shaft (3) and the teeth on the sprocket (2). Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

## INPUT GEAR AND PLANETARY CARRIER



***Input Gear And Carrier Components***

1 - PLANETARY CARRIER
2 - REAR THRUST WASHER
3 - FRONT THRUST WASHER
4 - CARRIER LOCK RING
5 - CARRIER LOCK RETAINING RING
6 - INPUT GEAR

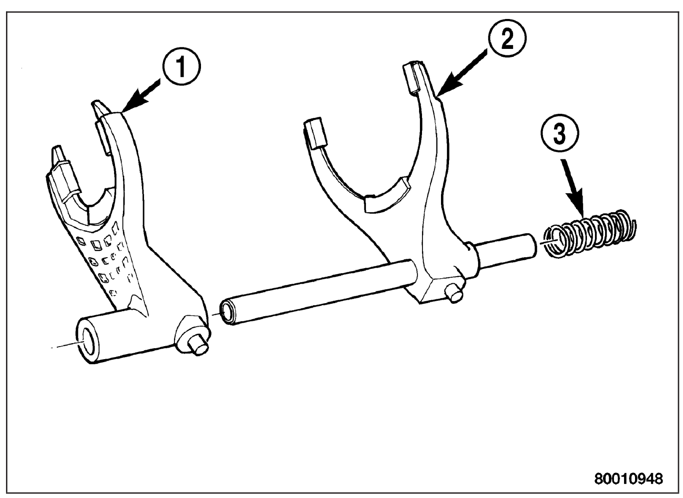
Check the teeth on the gear (6). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body (1) and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring (4) and both thrust washers (2, 3) for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

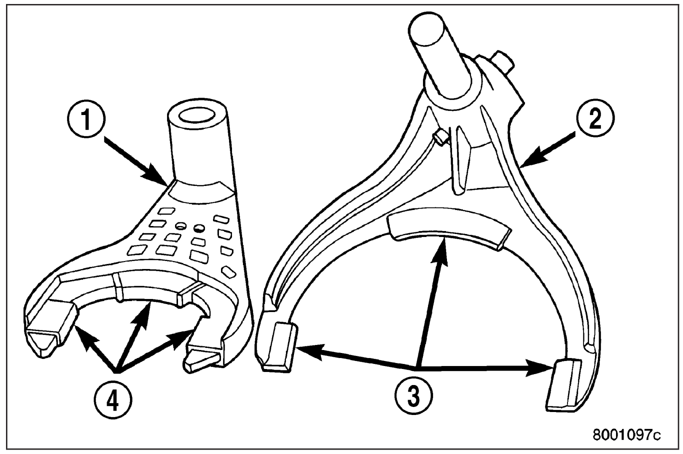
## SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (2). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

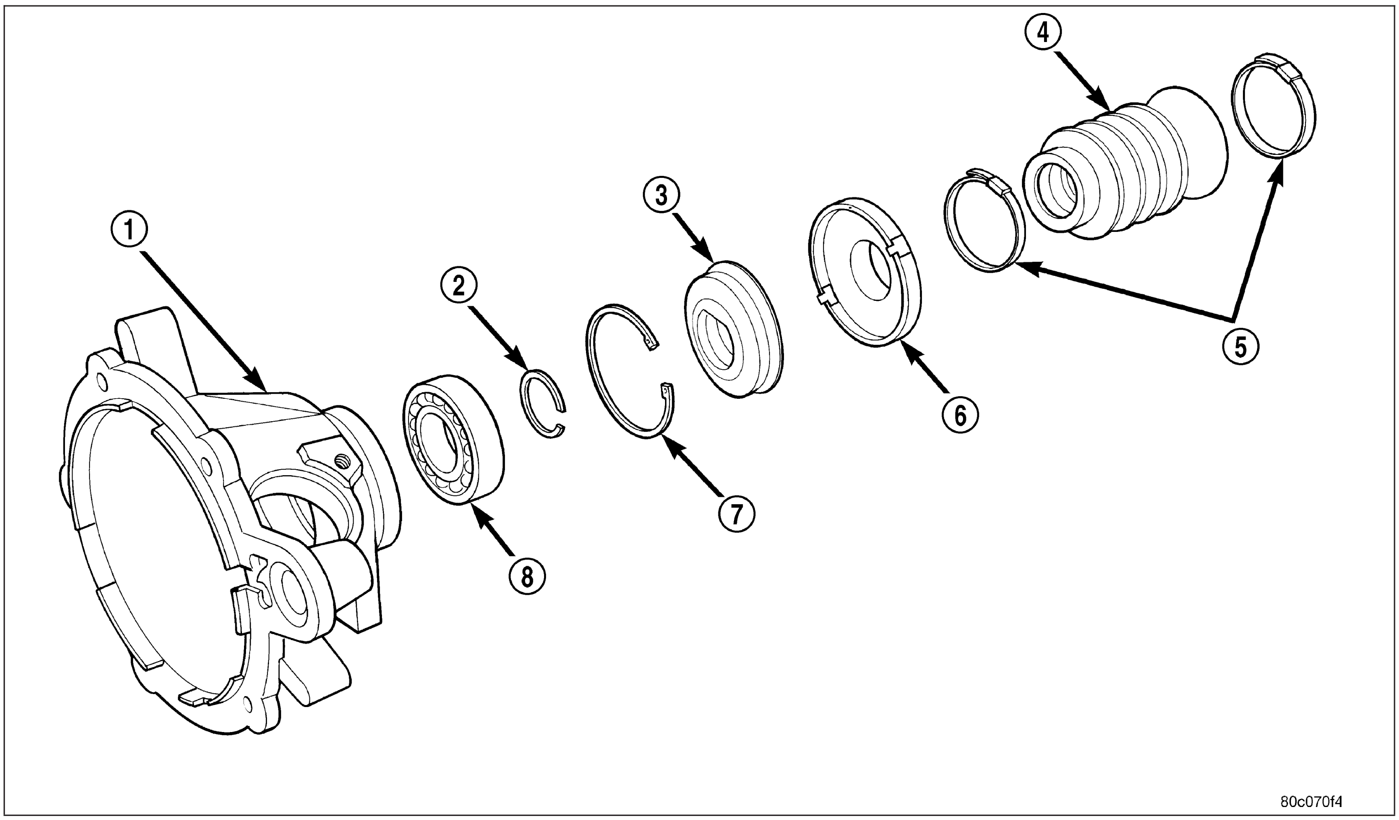


Inspect the shift fork wear pads (3, 4). The mode fork (2) pads are serviceable and can be replaced if necessary. The range fork (1) pads are not serviceable. The fork must be replaced as an assembly if the pads are worn or damaged.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.



## REAR RETAINER/BEARING/ SEAL/SLINGER/BOOT



Inspect the retainer components. Replace the bearing (8) if rough or noisy. Check the retainer (1) for cracks or wear in the bearing bore. Clean the retainer sealing surfaces with a scraper and 3M™ all purpose cleaner. This will ensure proper adhesion of the sealer during reassembly.

The output shaft slinger and seal (3) should be replaced outright; do not reuse either part.

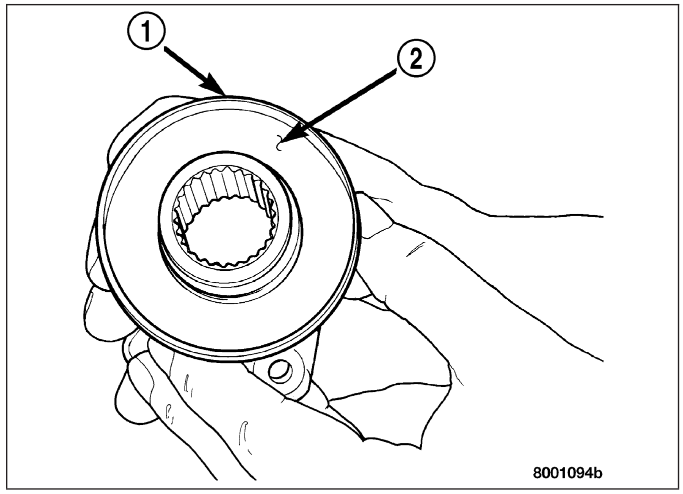
Replace any part if distorted, bent, or broken. Also replace the boot if cut or torn. Replace the boot band clamps, do not reuse them.

## REAR OUTPUT SHAFT/YOKE/DRIVE CHAIN

Check condition of the seal contact surfaces of the yoke slinger (2). This surface must be clean and smooth to ensure proper seal life. Replace the yoke nut and seal washer as neither part should be reused.

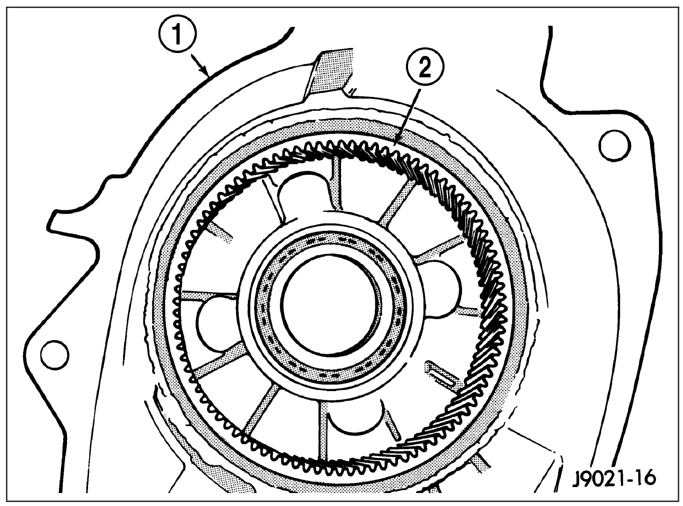
Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.



## LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (2)



## FRONT/REAR CASES AND FRONT RETAINER

Inspect the cases and retainer for wear and damage. Clean the sealing surfaces with a scraper and 3M™ all purpose cleaner. This will ensure proper sealer adhesion at assembly. Replace the input retainer seal; do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

## OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

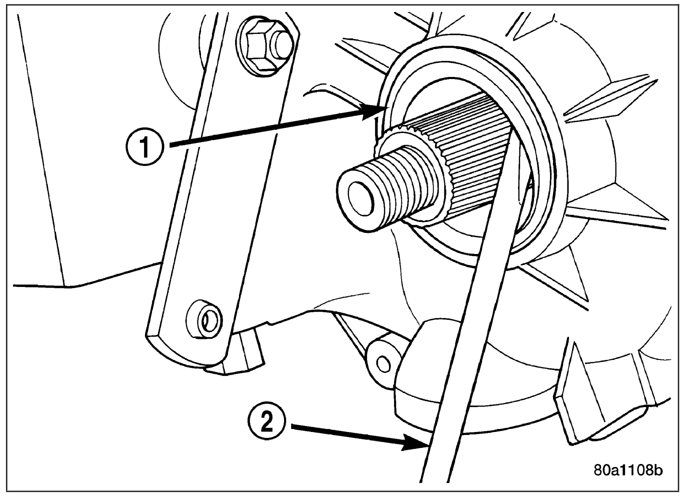
## ASSEMBLY

Lubricate transfer case components with Mopar® ATF +4, Automatic Transmission Fluid or petroleum jelly (where indicated) during assembly.

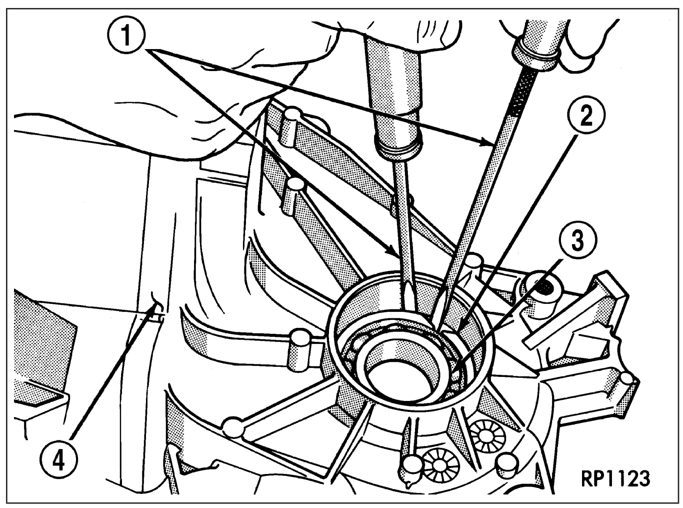
### BEARINGS AND SEALS

**CAUTION: The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.**

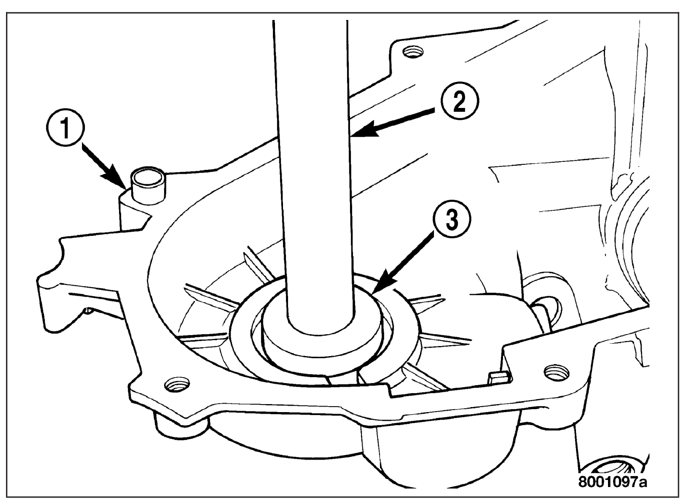
1. Remove the front output shaft seal (1) from case with pry tool (2).



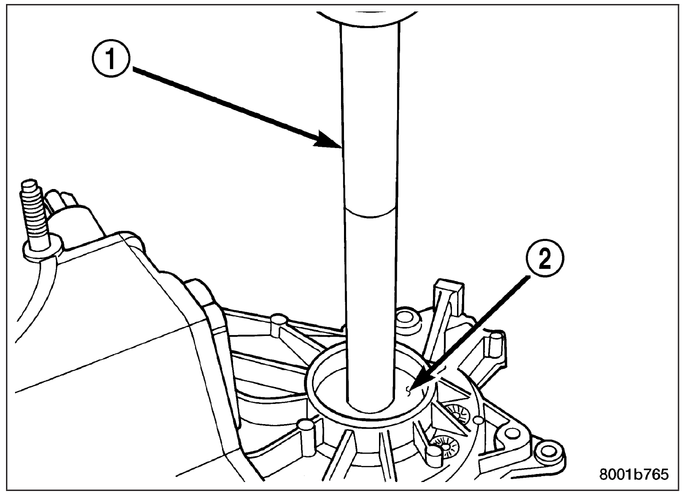
2. Remove the front output shaft bearing (3) retaining ring (2) with screwdriver (1).



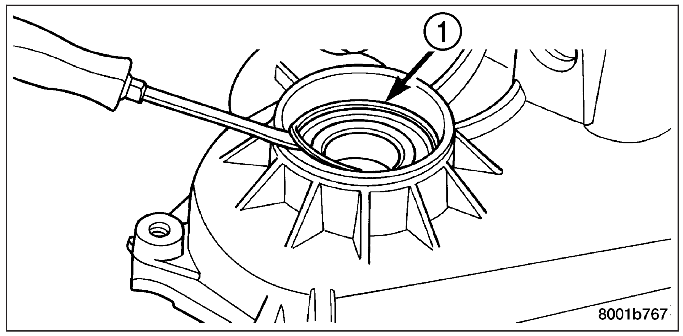
3. Remove bearing with Universal Handle C-4171 (2) and Installer 5065 (3).



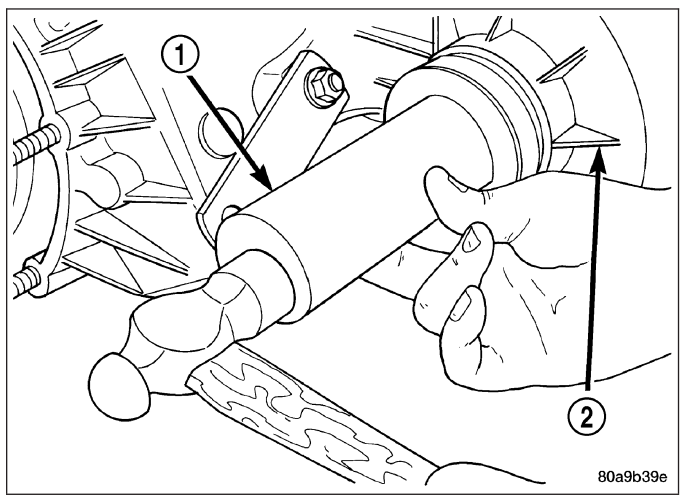
4. Install front output shaft front bearing in case with Universal Handle C-4171 (1) and Installer 5064 (2).



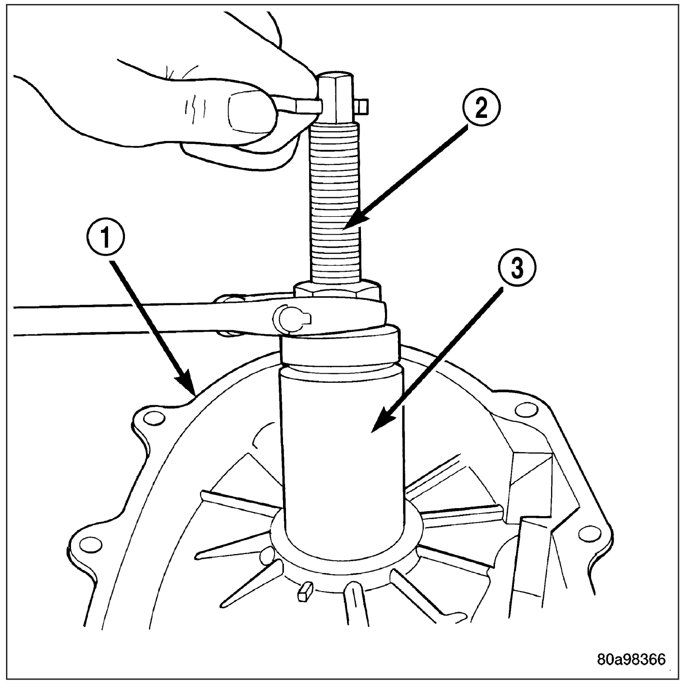
5. Install output shaft front bearing retaining ring (1). Start ring into place by hand. Then use small screwdriver to work ring into case groove. Be sure ring is fully seated before proceeding.



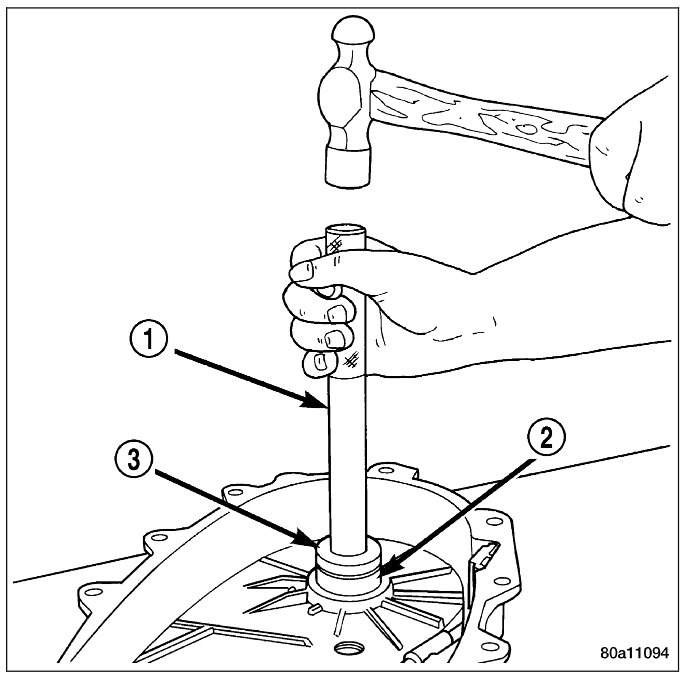
6. Install new front output seal in front case with Seal Installer 8143-A (1) as follows:
   a. Place new seal on tool. **Garter spring on seal goes toward interior of case.**
   b. Start seal in bore with light taps from hammer. Once seal is started, continue tapping seal into bore until installer tool bottoms against case.



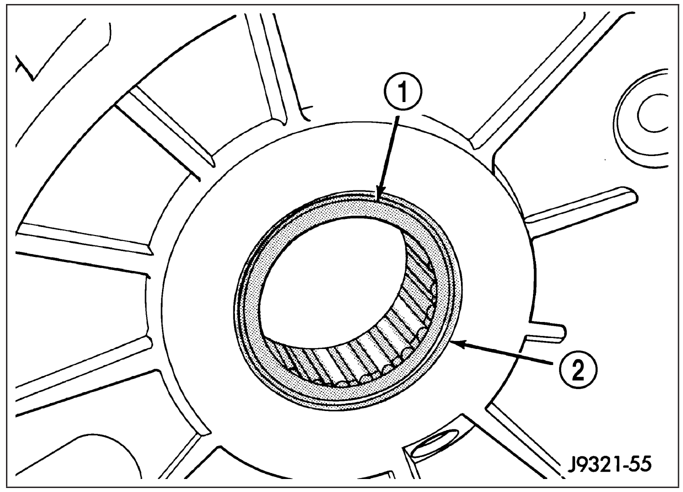
7. Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 (2) and Cup 8148 (3).



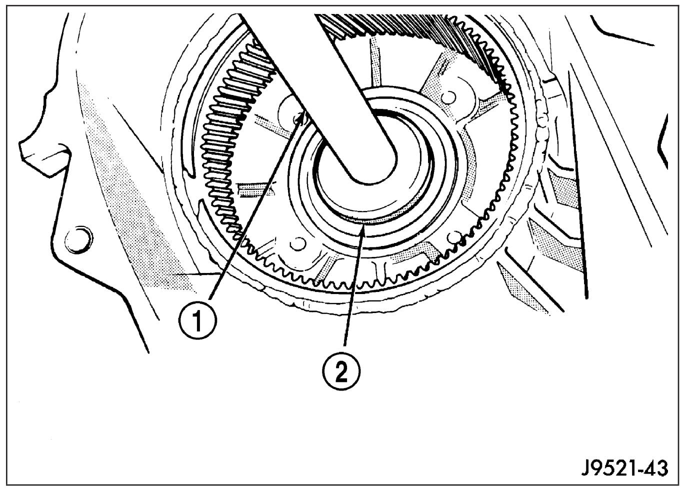
8. Install new bearing with Universal Handle C-4171 (1) and Installer 5066 (3).



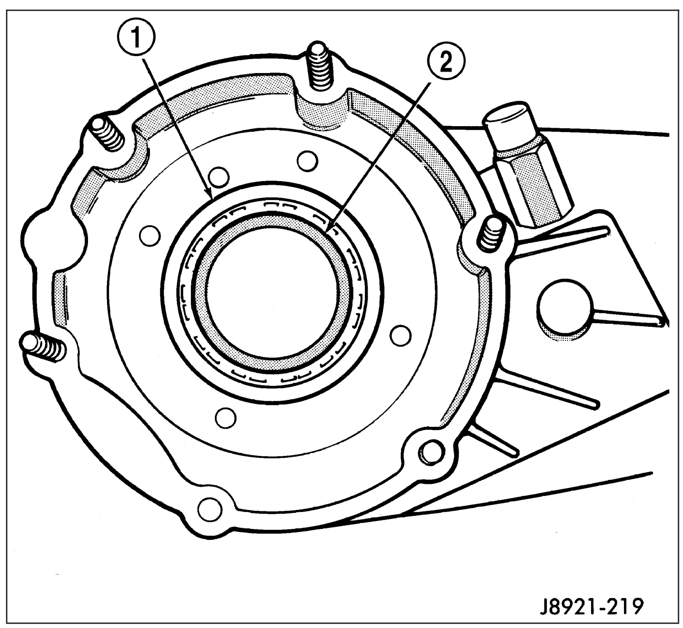
9. The bearing bore is chamfered at the top. Install the bearing (1) so it is flush with the lower edge of this chamfer (2).



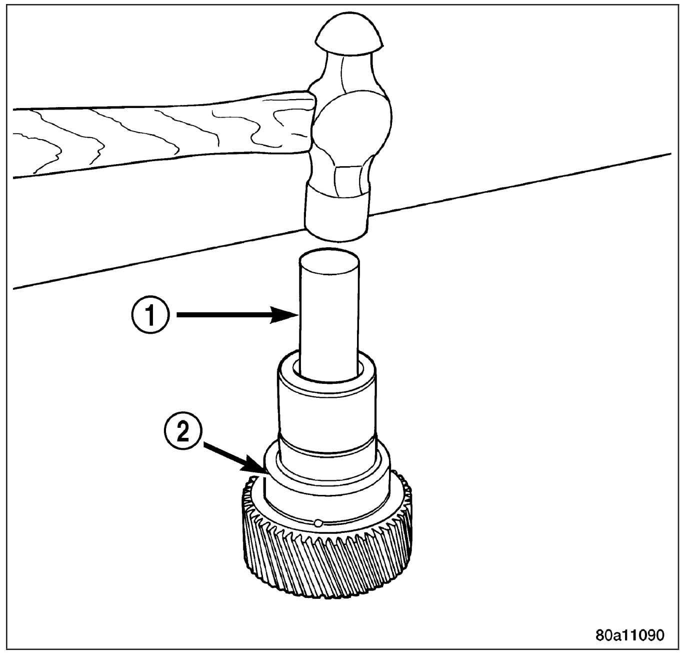
10. Using Remover C-4210 (2) and Universal Handle C-4171 (1), drive input shaft bearing from inside the annulus gear opening in the case.



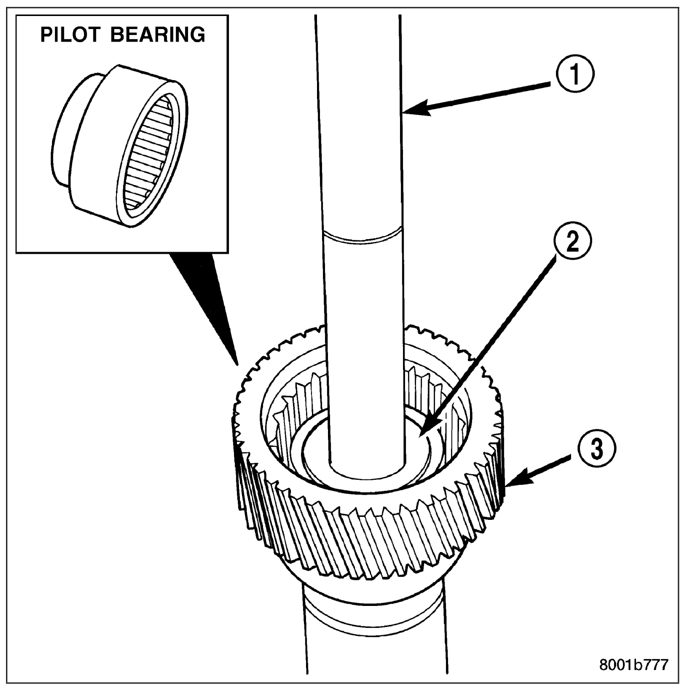
11. Install locating ring on new bearing.
12. Position case so forward end is facing upward.
13. Using Remover C-4210 and Handle C-4171, drive input shaft bearing (1) into case. The bearing locating ring (1) must be fully seated against case surface.



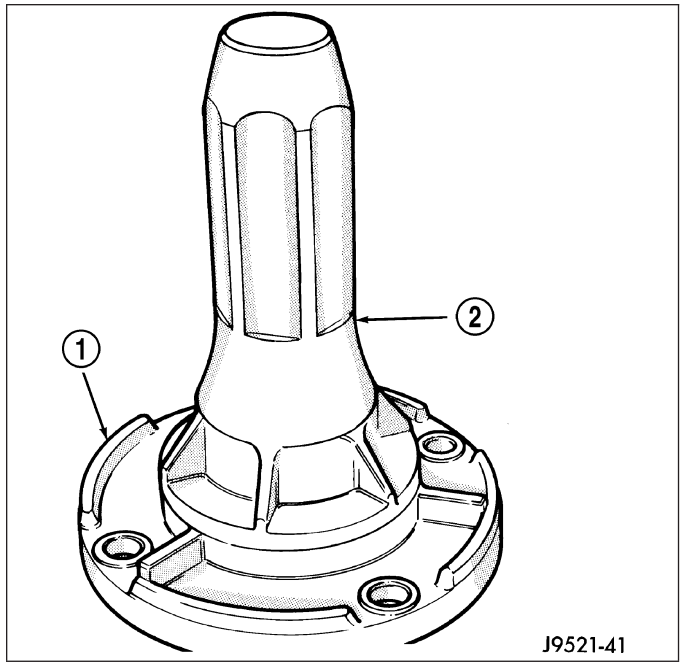
14. Remove input gear pilot bearing by inserting a suitably sized drift (1) into the splined end of the input gear (2) and driving the bearing out with the drift and a hammer.



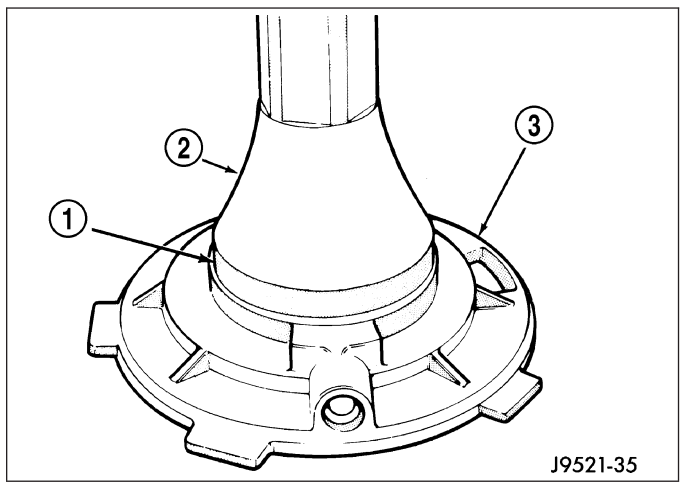
15. Install new pilot bearing with Installer 5065 (2) and Handle C-4171 (1).



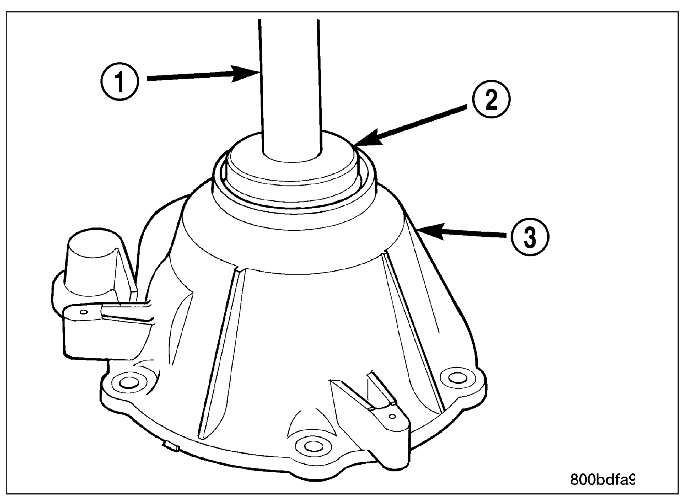
16. Remove front bearing retainer seal with suitable pry tool.
17. Install new front bearing retainer (1) seal with Installer 7884 (2).



18. Remove seal from oil pump housing with a suitable pry tool
19. Install new seal in oil pump housing with Seal Installer 7888 (2).

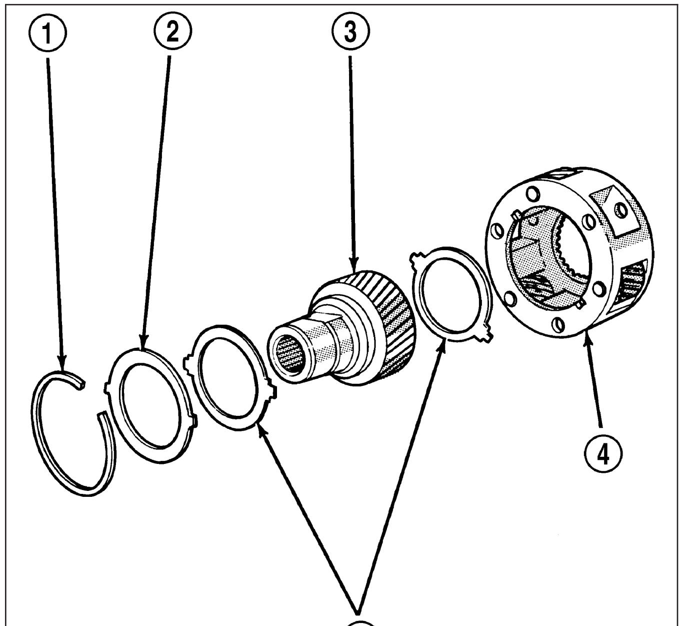


20. Remove rear retainer bearing with Installer 8128 and Handle C-4171.
21. Install rear bearing in retainer with Universal Handle C-4171 (1) and Installer 5052 (2).



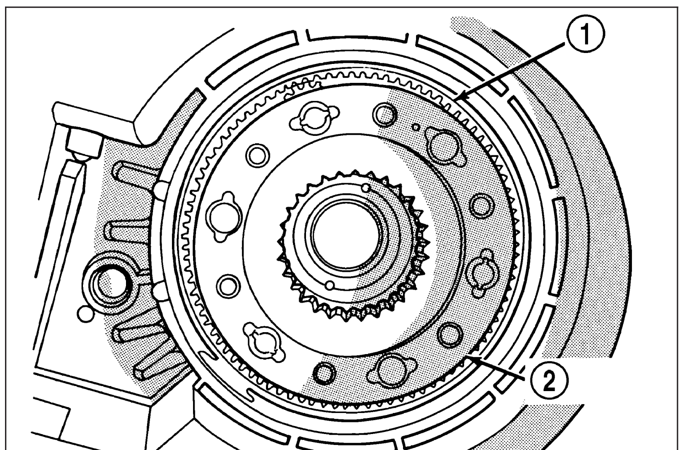
## INPUT AND LOW RANGE GEAR

1. Install first thrust washer (5) in low range gear (3). Be sure washer tabs are properly aligned in gear notches.
2. Install input gear in low range gear (4). Be sure input gear is fully seated.
3. Install remaining thrust washer (5) in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.
4. Install retainer on input gear and install snap-ring (1).



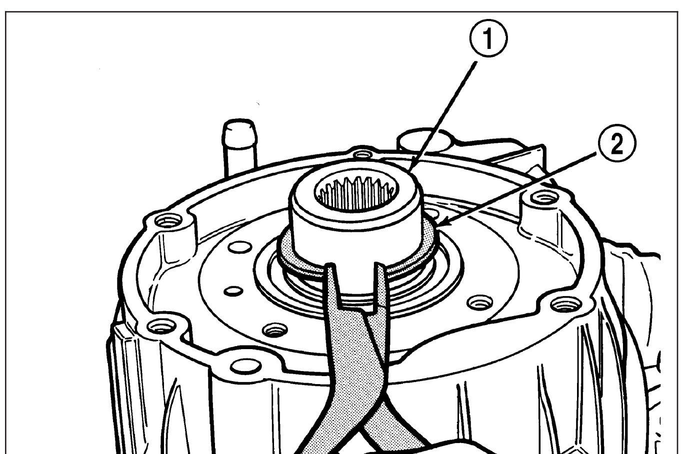
J9321-60

5. Align and install low range/input gear assembly (2) in front case. Be sure low range gear pinions are engaged in annulus gear (1) and that input gear shaft is fully seated in front bearing.



J9321-61

6. Install snap-ring (2) to hold input/low range gear (1) into front bearing.

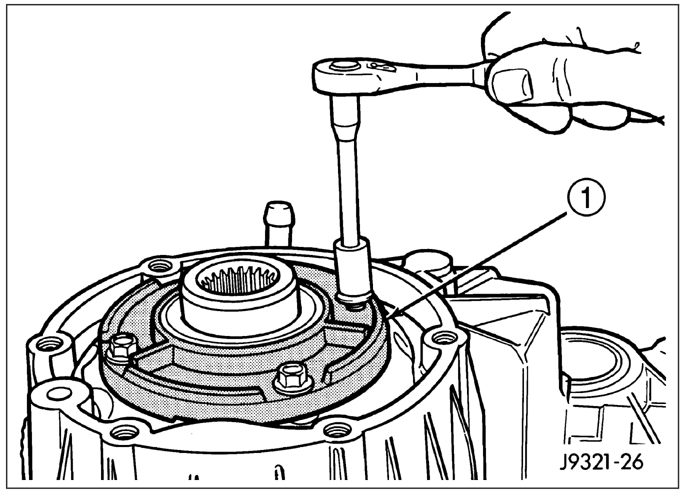


J9321-28

7. Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.
8. Apply a 3 mm (1/8 in.) bead of Mopar® gasket maker or silicone adhesive to sealing surface of retainer.
9. Align cavity in seal retainer with fluid return hole in front of case.

**CAUTION: Do not block fluid return cavity on sealing surface of retainer when applying Mopar® gasket maker or silicone adhesive sealer. Seal failure and fluid leak can result.**

10. Install bolts to hold retainer (1) to transfer case. Tighten to 21 N·m (16 ft. lbs.) of torque.

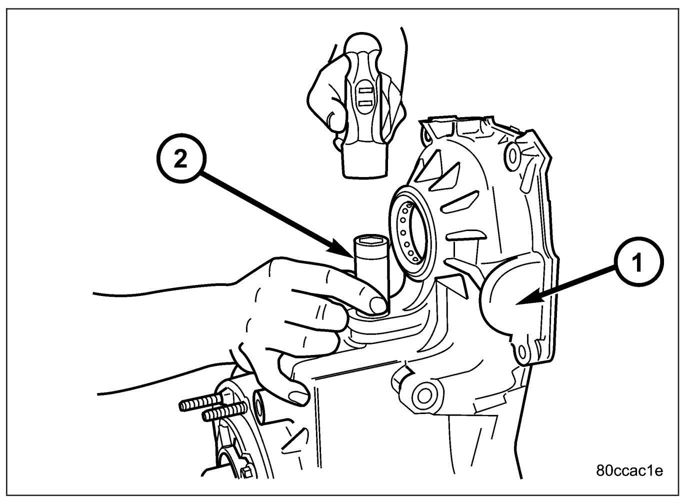


## MAINSHAFT

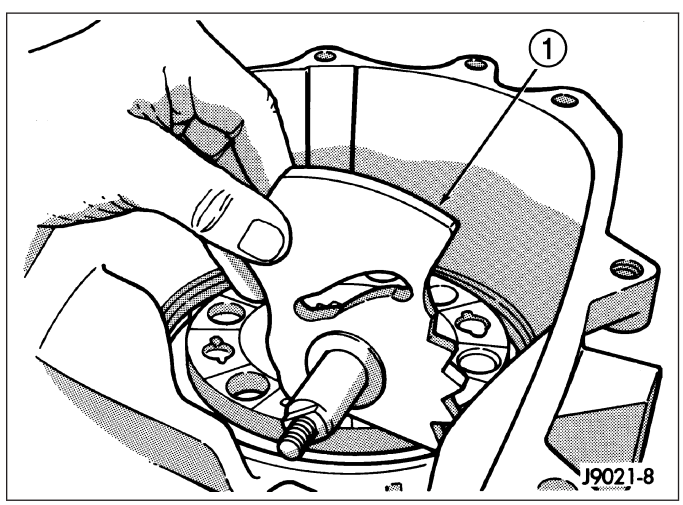
1. Lubricate mainshaft splines with recommended transmission fluid.
2. Slide drive sprocket onto mainshaft.
3. Slide mode hub onto mainshaft.
4. Install mode hub retaining ring. Verify that the retaining ring is fully seated in mainshaft groove.

## SHIFT FORKS, SECTOR, AND MAINSHAFT

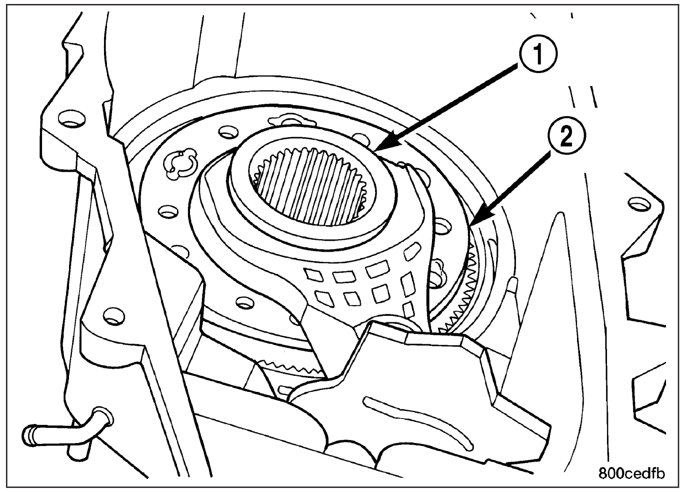
1. Install the shift sector shaft bearing using a suitable socket (2) until the bearing is flush to the bottom, inner edge of the bore.



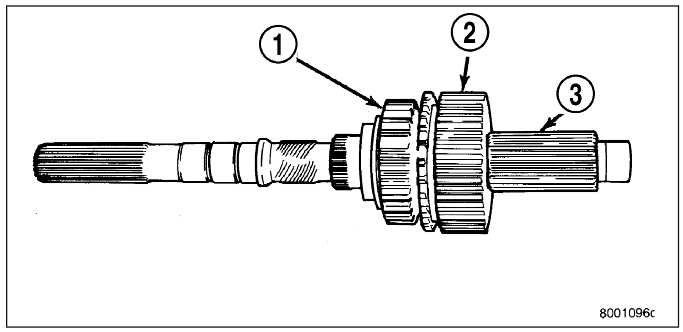
2. Install a new shift sector shaft seal using a suitable socket until the seal is flush to the bottom of the bore lead-in chamfer.
3. Install shift sector (1) in case. Lubricate sector shaft with transmission fluid before installation.



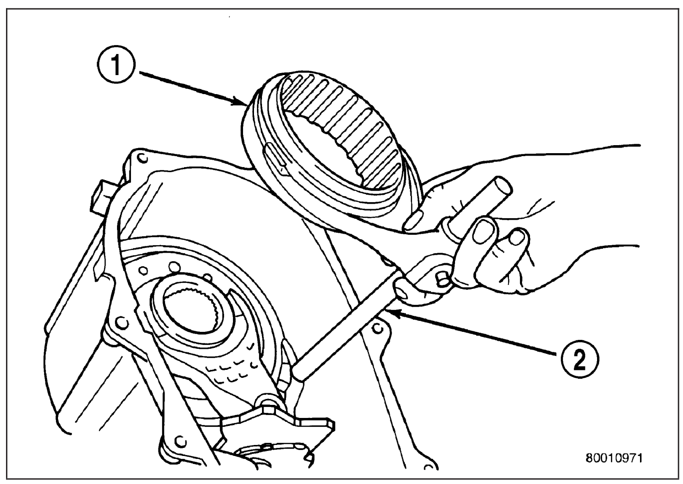
4. Assemble and install range fork (2) and hub (1). Be sure hub is properly seated in low range gear and engaged to the input gear.
5. Align and insert range fork pin in shift sector slot.



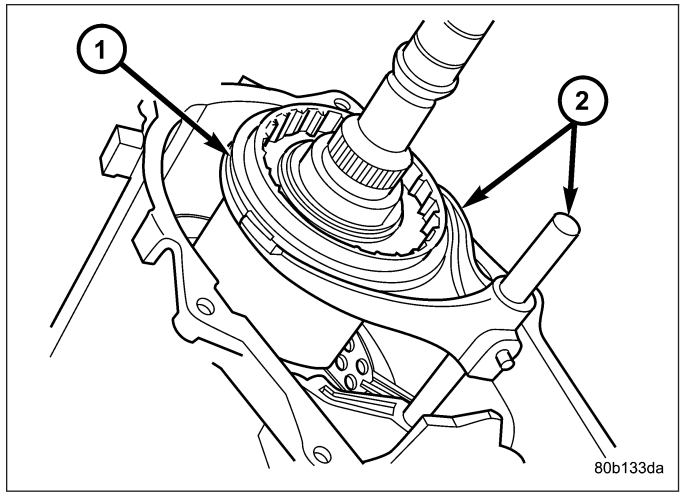
6. Install assembled mainshaft (3). Be sure shaft is seated in pilot bearing and input gear.



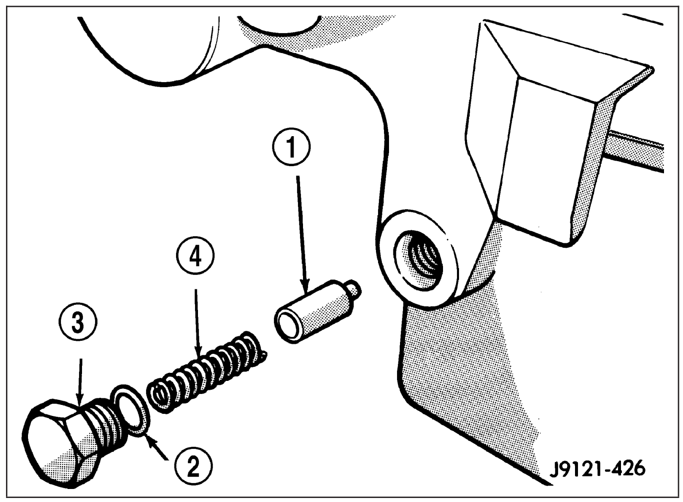
7. Install new pads on mode fork if necessary.
8. Insert mode sleeve (1) in mode fork. Be sure long side of sleeve is toward long end of shift rail (2).



9. Install assembled mode fork (2) and sleeve (1). Be sure fork rail goes through range fork and into case bore. Also be sure sleeve is aligned and seated on mainshaft hub.

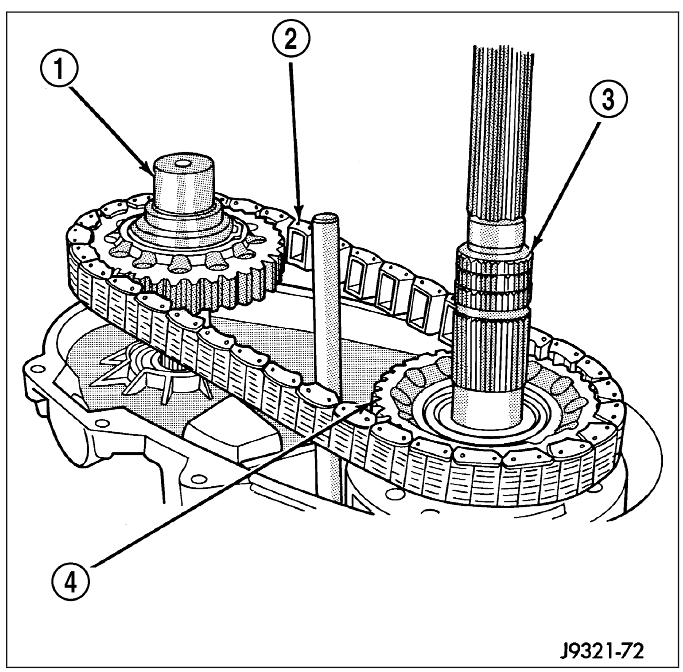


10. Rotate sector to NEUTRAL position.
11. Install new O-ring (2) on detent plug (3).
12. Lubricate detent plunger with transmission fluid or light coat of petroleum jelly.
13. Install detent plunger (1), spring (4). and plug (3).
14. Verify that plunger is properly engaged in sector.

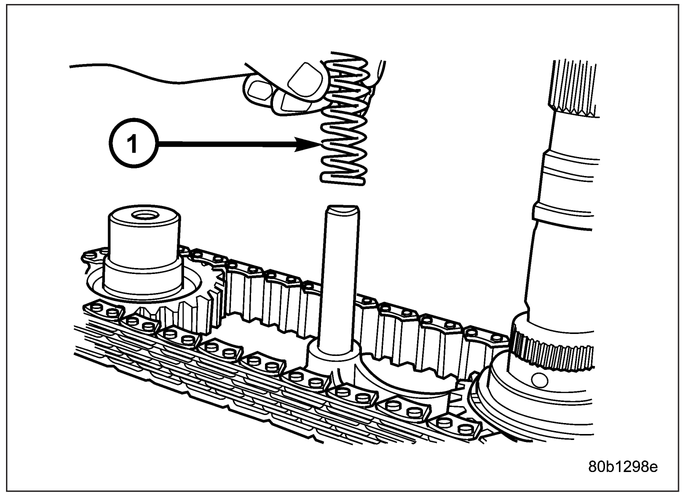


## FRONT OUTPUT SHAFT AND DRIVE CHAIN

1. Lubricate front output shaft-sprocket assembly, drive chain, and drive sprocket with transmission fluid.
2. Assemble drive chain (2) and front output shaft (1).
3. Start chain on mainshaft drive sprocket.
4. Guide front shaft into bearing and drive sprocket onto mainshaft drive gear.

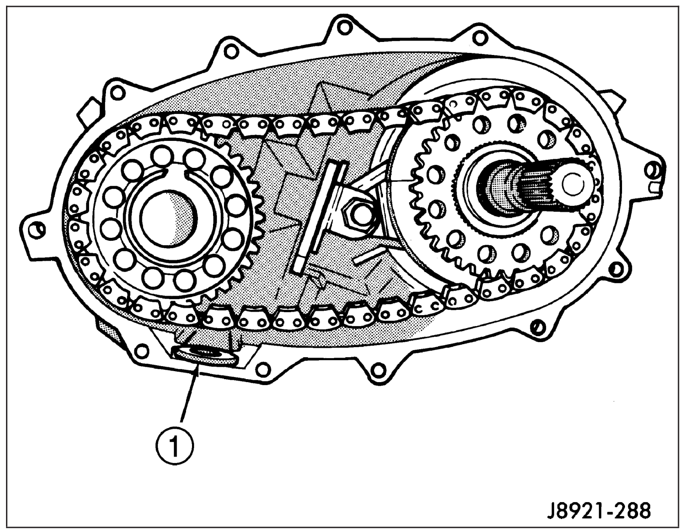


5. Install mode spring (1) on upper end of mode fork shift rail.

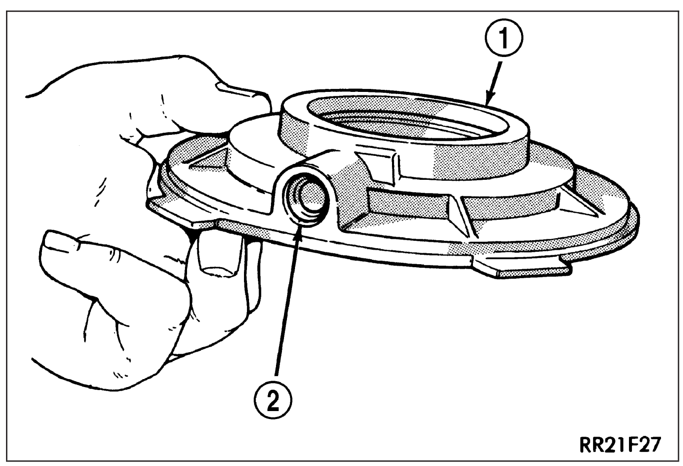


## OIL PUMP AND REAR CASE

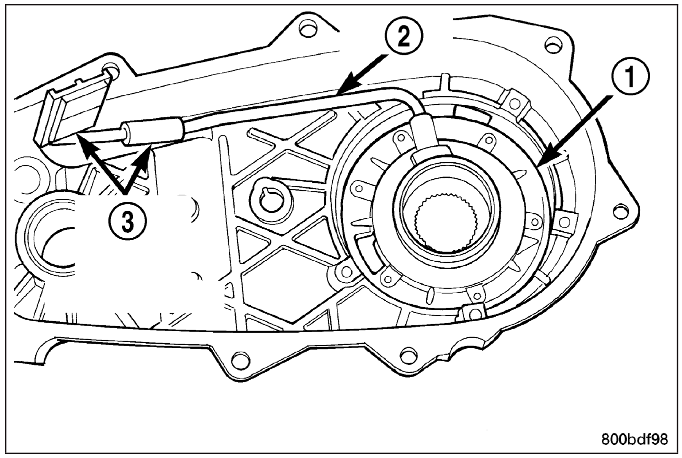
1. Install magnet (1) in front case pocket.



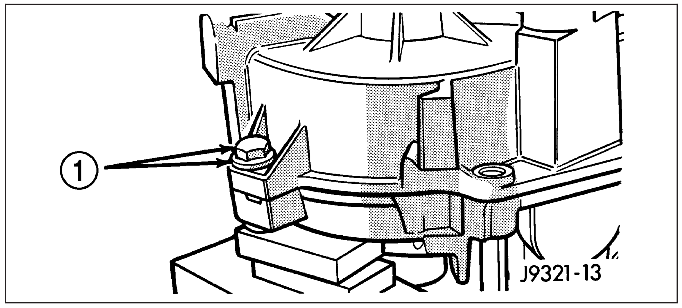
2. Assemble oil pickup screen, connecting hose, and tube.
3. Install new pickup tube O-ring (2) in oil pump (1).



4. Insert oil pickup tube (2) in oil pump (1) inlet.
5. Position assembled oil pump and pickup tube in rear case. Be sure pickup screen is securely seated in case slot. Also be sure oil pump locating tabs are outside rear case.

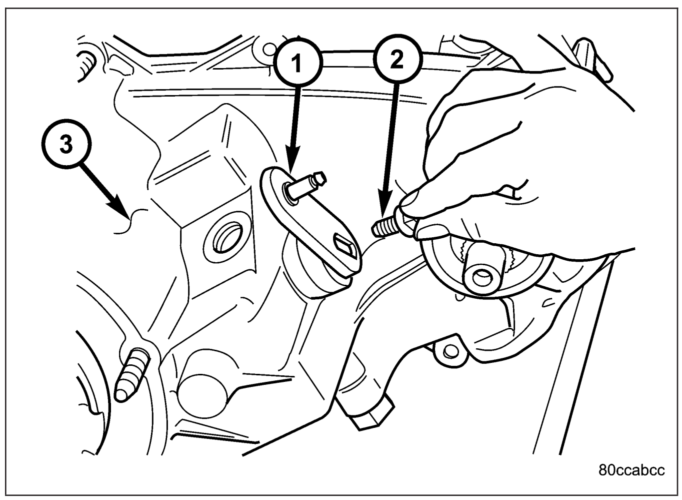


6. Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting flange of front case. Work sealer bead around bolt holes.
7. Lift rear case and oil pump and carefully position assembly on front case. Be sure case dowels are aligned and that mode fork rail extends through rear case before seating rear case on front case.
8. Install case attaching bolts. Alignment bolts at each end of case are only ones requiring washers (1).
9. Tighten case bolts to 27-34 N·m (20-25 ft. lbs.) torque.

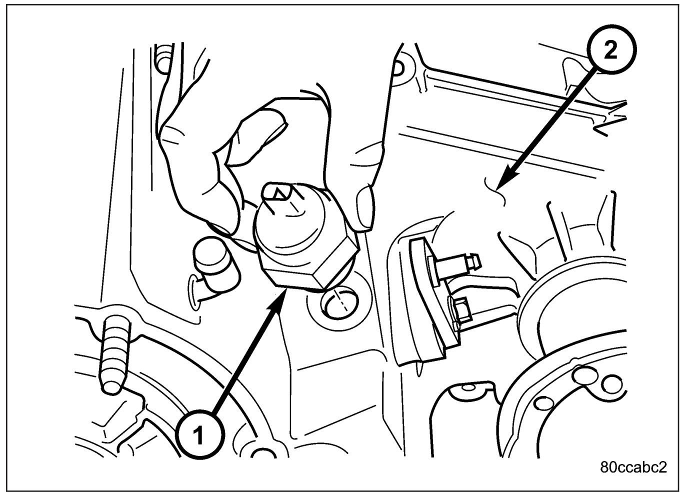


## COMPANION FLANGE AND RANGE LEVER

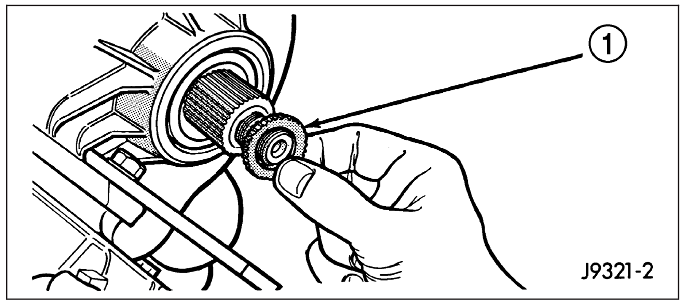
1. Install range lever (1) and bolt (2) on sector shaft. Tighten bolt to 27-34 N·m (20-25 ft. lbs.) torque.



2. Inspect the o-ring on the transfer case position sensor. Replace the o-ring if necessary.
3. Install the transfer case position sensor (1) in the front case. Tighten sensor to 20-34 N·m (15-25 ft. lbs.) torque.

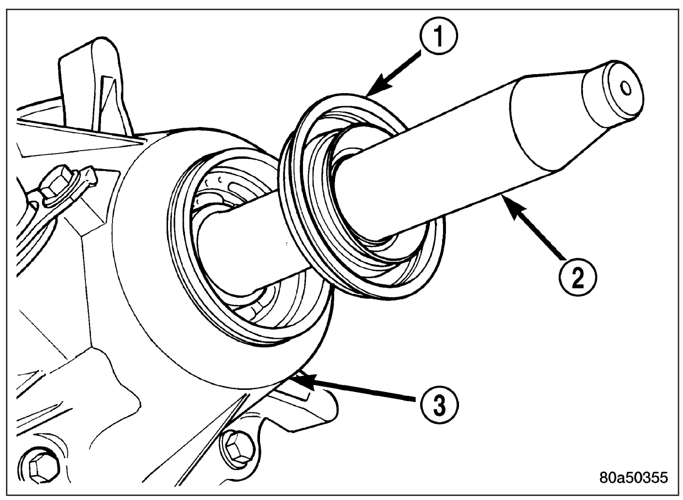


4. Install new seal washer (1) on front output shaft.
5. Lubricate companion flange hub with transmission fluid and install flange onto the front output shaft.
6. Install new seal washer on front shaft.
7. Install new flange nut onto front output shaft.
8. Tighten flange nut to 122-176 N·m (90-130 ft. lbs.) torque.

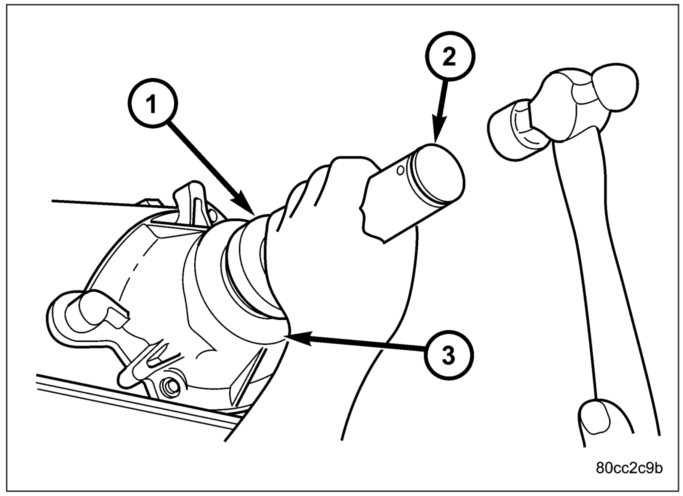


## REAR RETAINER

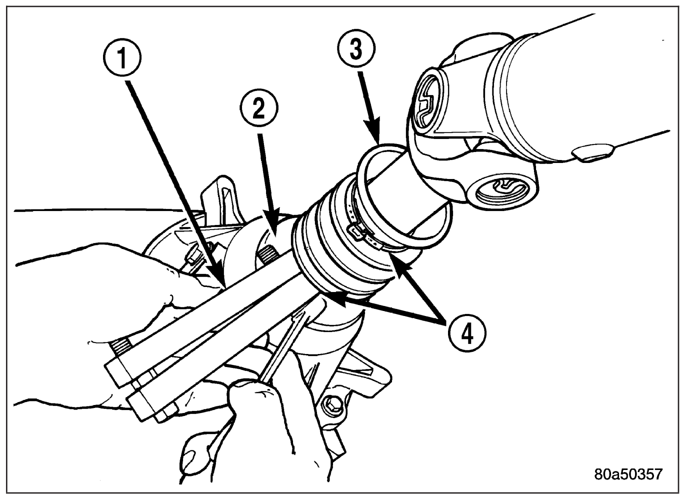
1. Apply bead of Mopar® Sealer P/N 82300234, or Loctite™ Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 inch.
2. Install the forward rear output shaft bearing locating snap-ring.
3. Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.
4. Install rear bearing I.D. retaining ring onto output shaft.
5. Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.
6. Slide seal onto Seal Protector 8824 (2). Slide seal protector and seal onto output shaft.



7. Slide Installer 8691 (1) onto seal and mainshaft. Drive seal into rear bearing retainer.



8. Install a new output shaft rear slinger with Installer 9023.
9. Install boot on output shaft slinger and crimp retaining clamp with tool C-4975-A (1).



## INSTALLATION

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case on transmission.
5. Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque.
6. Connect vent hose.
7. Connect transfer case position sensor connector to sensor.
8. Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).
9. Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.
10. Install skid plate. (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)
11. Remove transmission jack and support stand.
12. Connect shift cable to transfer case range lever.
13. Lower vehicle and verify transfer case shift operation.

# SPECIFICATIONS

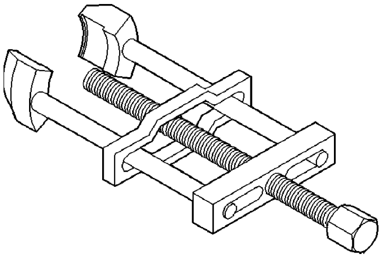
## TRANSFER CASE - NV231

### TORQUE

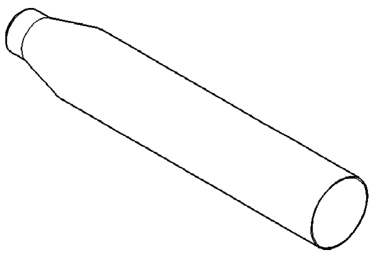
| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Plug, Detent | 16-24 | 12-18 | - |
| Plug, Drain/Fill | 20-34 | 15-25 | - |
| Bolt, Front Brg. Retainer | 21 | 16 | - |
| Bolt, Case Half | 27-34 | 20-25 | - |
| Nut, Front Companion Flange | 122-176 | 90-130 | - |
| Bolt, Range Lever | 27-34 | 20-25 | - |
| Bolt, Rear Retainer | 35-46 | 26-34 | - |
| Nuts, Mounting | 35-47 | 26-35 | - |
| Sensor, Transfer Case Position | 20-34 | 15-25 | - |

## SPECIAL TOOLS

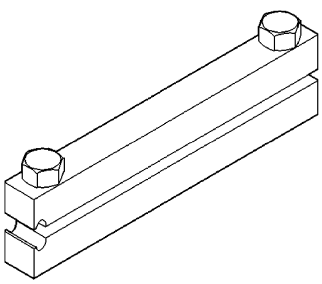
## TRANSFER CASE - NV231



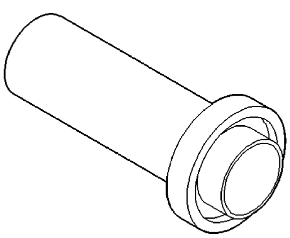
*Puller, Slinger - MD-998056-A*



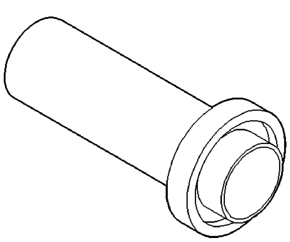
*Protector, Seal - 8824*



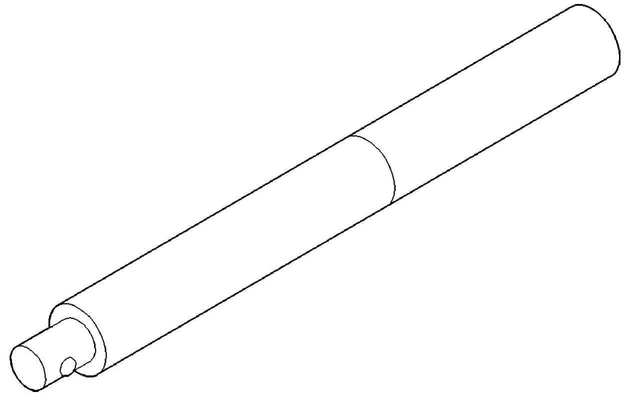
*Installer, Boot Clamp - C-4975-A*



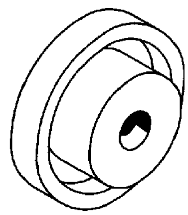
*Installer, Seal - 8143-A*



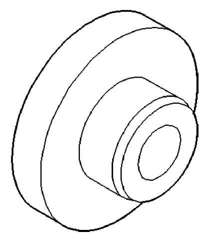
*Installer, Seal - 8691*



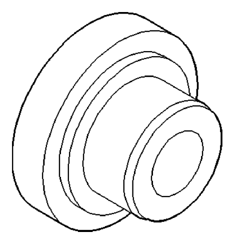
*Handle, Universal - C-4171*



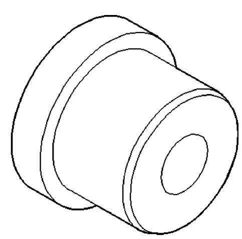
*Installer, Seal - C-4210*



*Installer, Bearing - 5052*



*Installer, Bearing - 5065*



*Installer, Bushing - 5066*

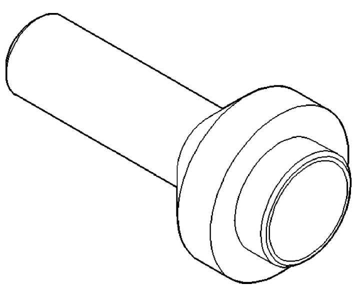
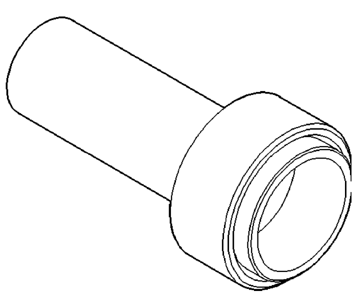
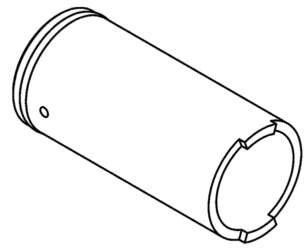
***Cup - 8148***



***Installer, Seal - 7884***



***Installer, Pump Housing Seal - 7888***

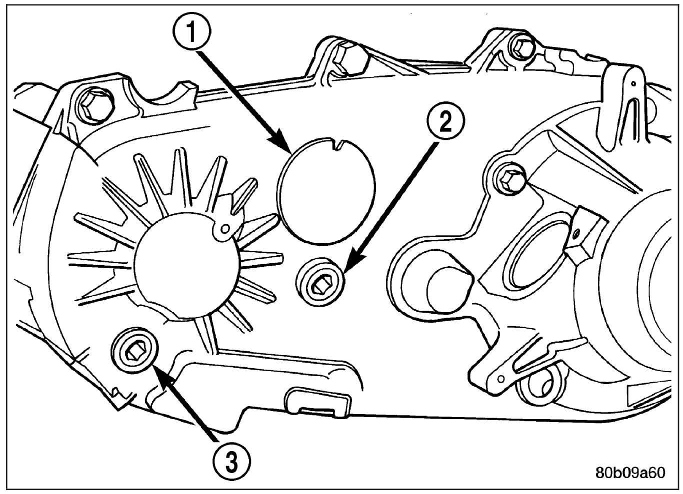


***Installer, Output Shaft Slinger - 8408***

# FLUID

## STANDARD PROCEDURE - FLUID DRAIN AND FILL

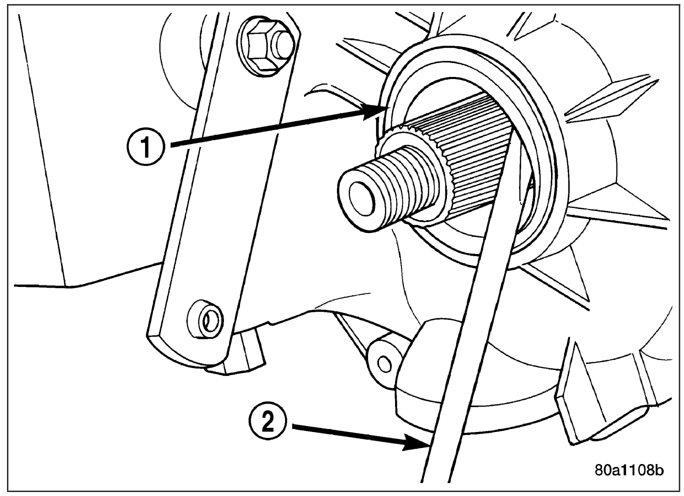
The fill (2) and drain (3) plugs are both in the rear case. Correct fill level is to the bottom edge of the fill plug hole. Be sure the vehicle is level to ensure an accurate fluid level check.



# SEAL-FRONT OUTPUT SHAFT

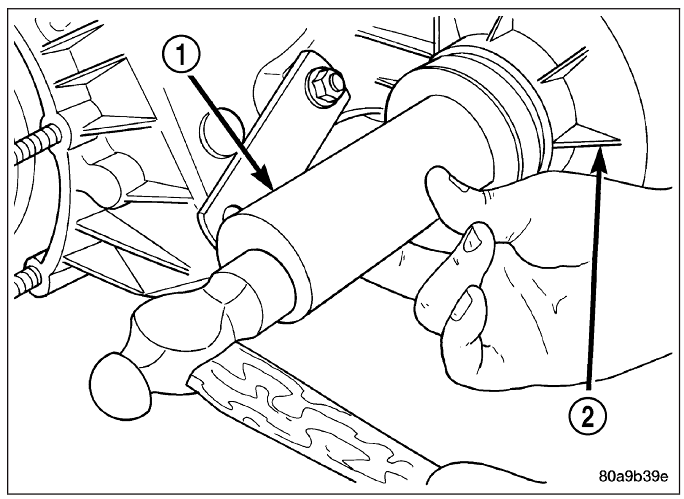
## REMOVAL

1. Raise vehicle.
2. Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Remove front output shaft companion flange.
4. Remove seal (1) from front case with pry tool (2).



## INSTALLATION

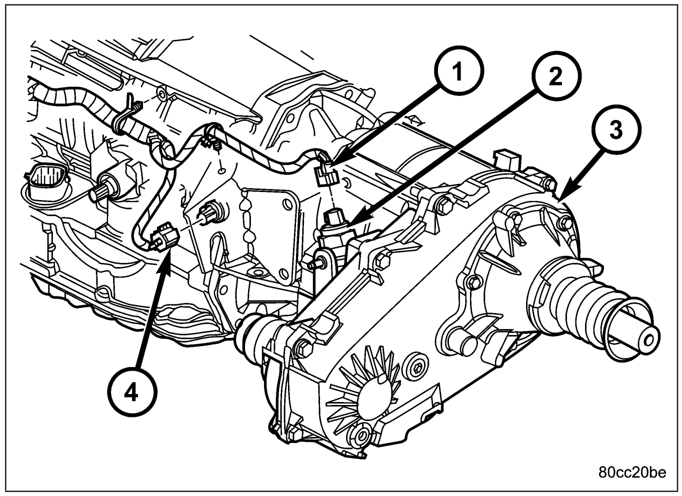
1. Install new front output seal in front case with Seal Installer 8143-A (1) as follows:
   a. Place new seal on tool. Garter spring on seal goes toward interior of case.
   b. Start seal in bore with light taps from hammer. Once seal is started, continue tapping seal into bore until installer tool seats against case.
2. Install the front output shaft companion flange.
3. Install the front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)



# SENSOR-POSITION

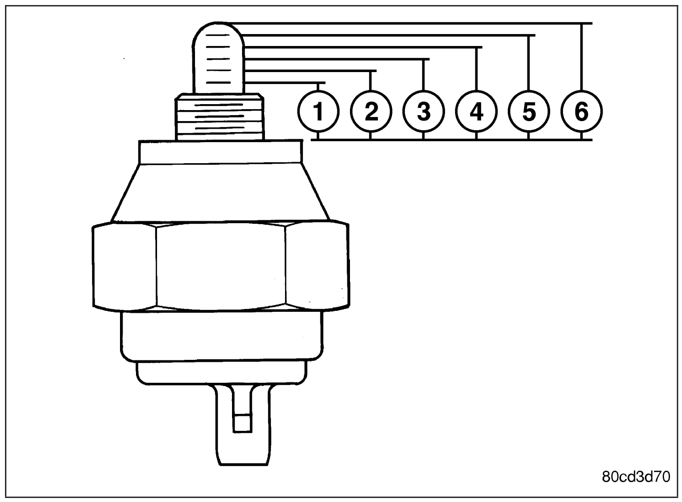
## DESCRIPTION

The transfer case position sensor (2) is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the sector plate roostercomb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.



## OPERATION

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. Refer to the Operating Mode Versus Resistance table for the correct resistance for each position. Note that the NEUTRAL position is allowed to float between sensor positions 3 and 4. If a resistance is measured anywhere in either range, the sensor is operating correctly.



***Position Sensor Linear Movement***

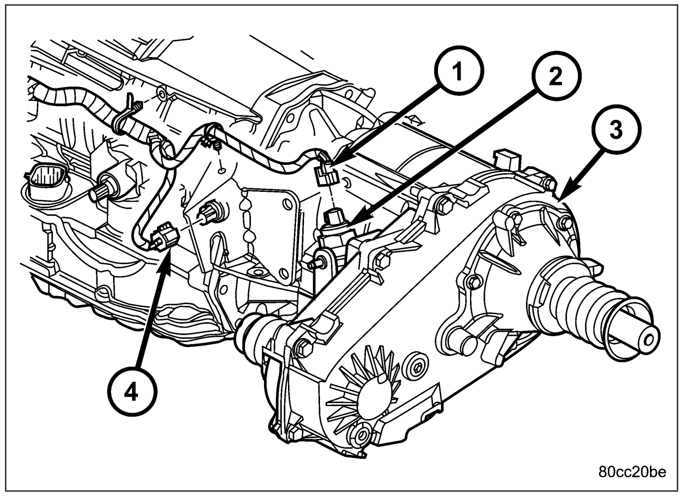
1 - POSITION 1 - 10mm ±0.5mm
2 - POSITION 2 - 12mm ±0.5mm
3 - POSITION 3 - 14mm ±0.5mm
4 - POSITION 4 - 16mm ±0.5mm
5 - POSITION 5 - 18mm ±0.5mm
6 - POSITION 6 - 20mm±0.5mm - FULL EXTENSION

**Operating Mode Versus Resistance**

| SENSOR POSITION | OPERATING MODE | SENSOR RESISTANCE (ohms) |
|---|---|---|
| 1 | 2WD | 1124-1243 |
| 2 | 4WD PART TIME | 650-719 |
| 3 | NEUTRAL | 389-431 |
| 4 | NEUTRAL | 199-221 |
| 5 | 4WD LOW | 57-64 |

## REMOVAL

1. Raise and support the vehicle.
2. Disengage the transfer case position sensor connector from the position sensor (2).
3. Remove the position sensor from the transfer case.



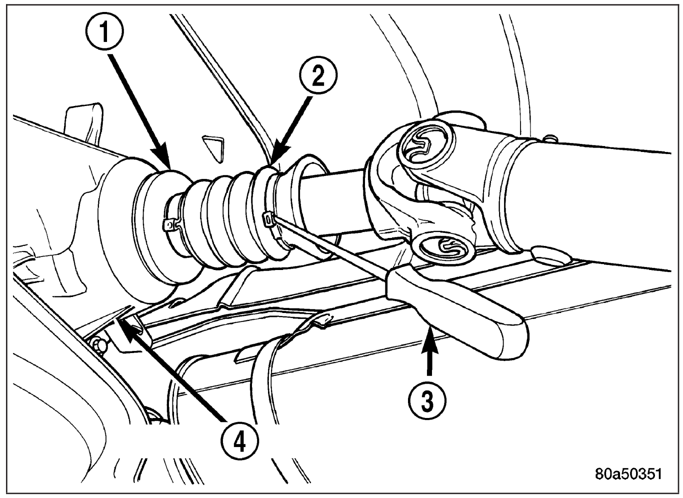
## INSTALLATION

1. Inspect the o-ring seal on the transfer case position sensor. Replace the o-ring if necessary.
2. Install the transfer case position sensor into the transfer case. Torque the sensor to 27 N·m (20 ft.lbs.).
3. Engage the transfer case position sensor connector to the position sensor.
4. Lower vehicle.
5. Verify proper sensor operation.

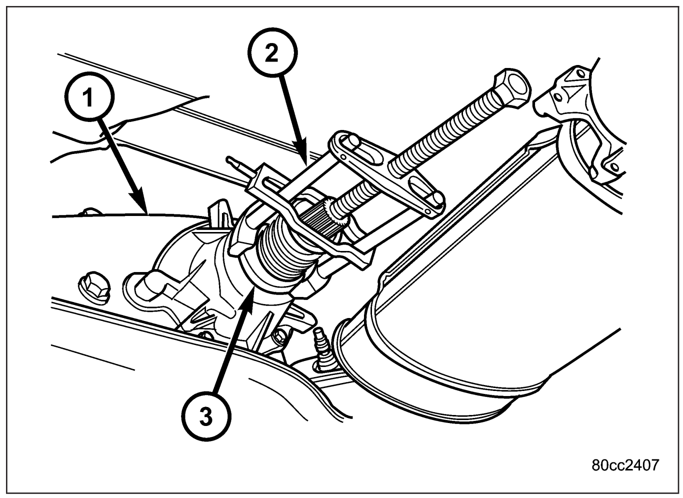
# SEAL-REAR OUTPUT SHAFT

## REMOVAL

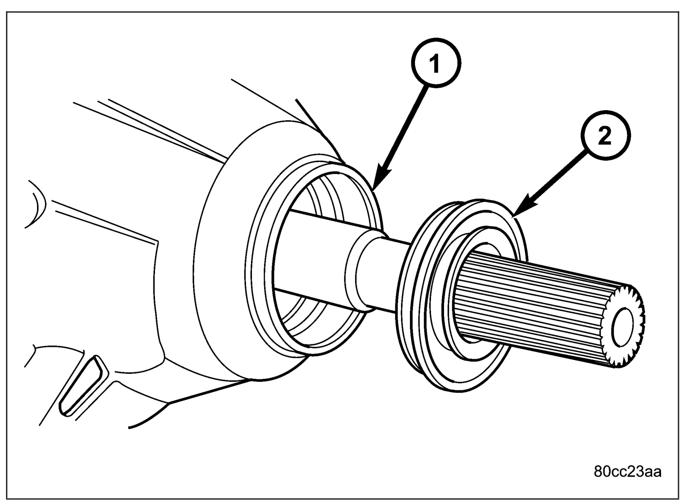
1. Shift the transmission and transfer case into NEUTRAL.
2. Raise and support vehicle.
3. Mark a line across the pinion shaft and at each end of the propeller shaft for installation reference.
4. Remove the U-joint strap bolts at the pinion shaft yoke.
5. Pry open clamp holding the dust boot (2) to propeller shaft yoke.



6. Slide the slip yoke off of the transmission/transfer case output shaft and remove the propeller shaft.
7. Spread band clamp which holds output shaft boot to the output shaft slinger with a suitable awl, or equivalent.
8. Remove output shaft boot from slinger and output shaft.
9. Remove the output shaft rear slinger (3) using Puller MD-998056-A (2).

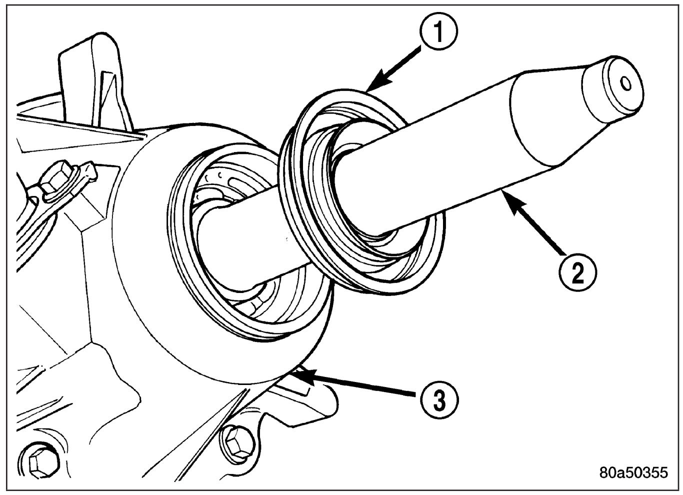


10. Use a suitable pry tool, or a slide hammer mounted screw, to remove the seal (2) from the rear retainer (1).

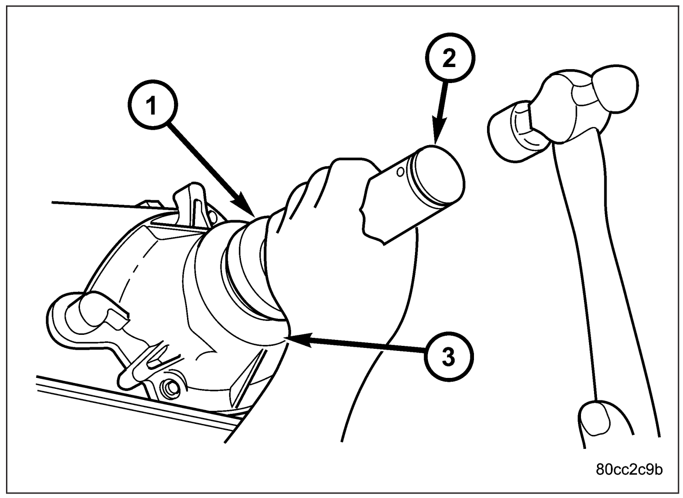


## INSTALLATION

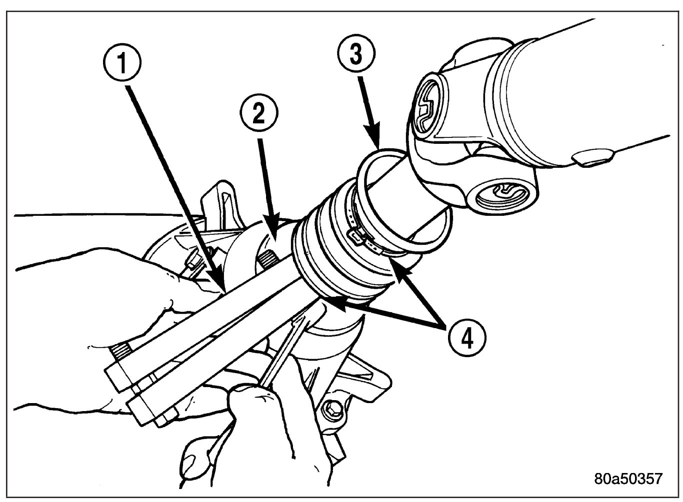
1. Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.
2. Slide seal onto Seal Protector 8824 (2). Slide seal protector and seal onto output shaft.



3. Slide Installer 8691 (1) onto seal and mainshaft. Drive seal into rear bearing retainer.



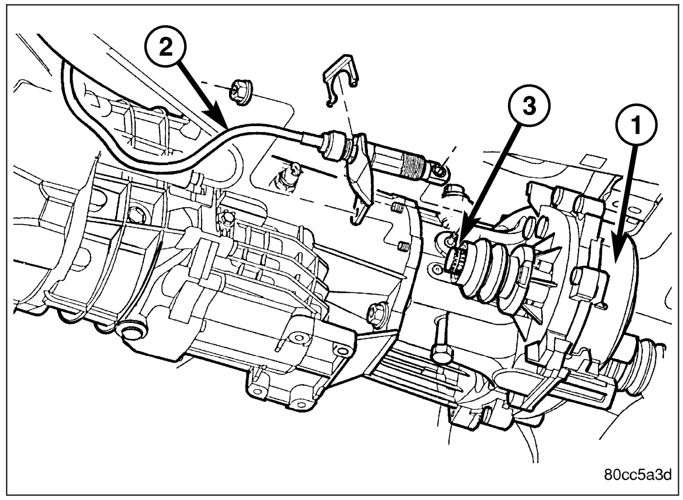
4. Install a new output shaft rear slinger with Installer 9023.
5. Install boot (3) on output shaft slinger and crimp retaining clamp with tool C-4975-A (1).
6. Slide the slip yoke on the transmission/transfer case output shaft. Align installation reference marks at the axle yoke and install the propeller shaft.
7. Tighten the U-joint strap/clamp bolts at the axle yoke to 19 N·m (14 ft. lbs.).
8. Crimp clamp with Clamp Tool C-4975A to hold dust boot to propeller shaft yoke.
9. Remove support and lower the vehicle.



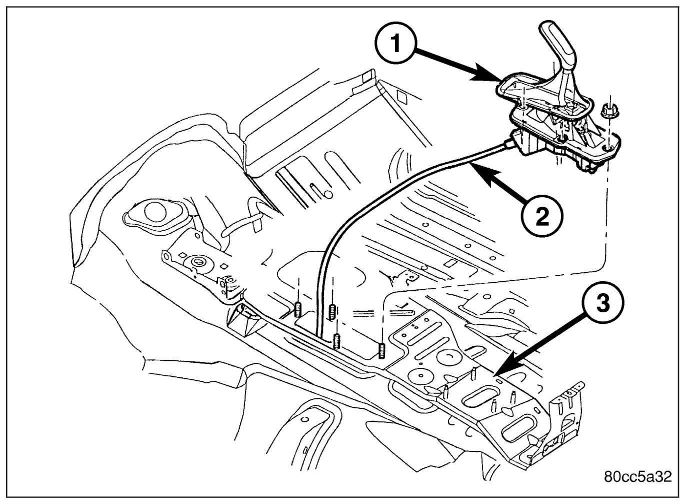
# LEVER-SHIFT

## REMOVAL

1. Shift transfer case into 4L.
2. Raise vehicle.
3. Remove clip securing the transfer case shift cable (2) to the shift cable support bracket.
4. Disengage any additional shift cable routing clips, if necessary.
5. Disengage the shift cable from the transfer case manual lever.



6. Lower vehicle.
7. Remove the floor console as necessary to access the shifter mechanism. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
8. Remove the nuts attaching lever assembly (1) to floorpan and remove assembly and shift cable (2).
9. Remove the shifter mechanism and cable assembly from the vehicle.



## INSTALLATION

1. Route the shift cable through the opening in the floor pan.
2. Position the shift mechanism over the shifter retaining studs on the floor pan.
3. Install the nuts to hold the shifter mechanism to the floor pan. Tighten the nuts to 11.86 N·m (105 in.lbs.).
4. Install any floor console components previously removed. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)
5. Verify that the floor shifter is in the 4L position.
6. Raise vehicle.
7. Route the shift cable through the opening in the shift cable support bracket.
8. Install the cable and a new spring clip into the slot in the support bracket.
9. Install any additional routing clips on the shift cable.
10. Verify that the transfer case is in the 4L position. The 4L position for the transfer case is with the manual lever to the full rearward position.
11. Attach the shift cable to the transfer case manual lever.
12. Lower vehicle and check for proper transfer case shifter operation.

# TRANSFER CASE - NV241 GENII

## TABLE OF CONTENTS

# TRANSFER CASE - NV241 GENII

## DESCRIPTION

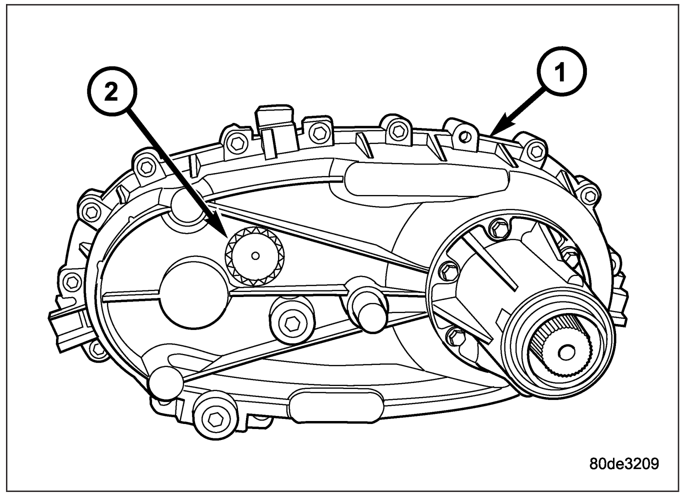
The NV241 GENII transfer case is a part-time transfer case with a low-range gear system. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability.

The gear cases and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

### IDENTIFICATION

An identification tag (2) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.



## OPERATION

### OPERATING RANGE

Transfer case operating ranges are:

- 2H (2-wheel drive)
- 4H (4-wheel drive)
- 4LO (4-wheel drive low range

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

### SHIFT MECHANISM

Operating ranges are selected with a floor mounted shift lever. The shift lever is connected to the transfer case range lever by a shift cable. A straight line shift pattern is used. Range positions are marked on the shifter knob bezel.

### SHIFTING

The transfer case can be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into and out of the 4L operating range.

## DIAGNOSIS AND TESTING - TRANSFER CASE - NV241 GENII

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

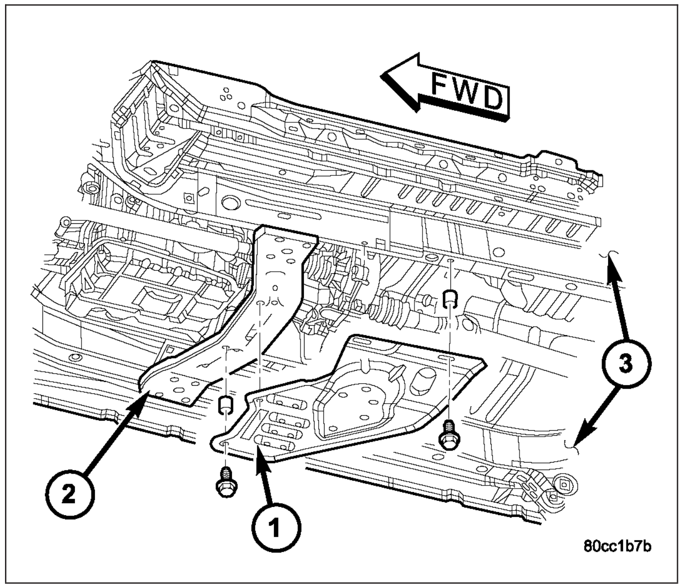
### DIAGNOSIS CHART

| Condition | Possible Cause | Correction |
|---|---|---|
| Transfer Case difficult to shift or will not shift into desired range. | 1) Vehicle speed too great to permit shifting. | 1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift. |
| | 2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind. | 2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces. |
| | 3) Transfer case external shift linkage binding. | 3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary. |
| | 4) Insufficient or incorrect lubricant. | 4) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid. |
| | 5) Internal components binding, worn, or damaged. | 5) Disassemble the transfer case and replace worn or damaged components as necessary. |
| Transfer Case noisy in all operating ranges. | 1) Insufficient or incorrect lubricant. | 1) Drain and refill to edge of fill hole with Mopar® ATF +4, Automatic Transmission fluid. |
| Noisy in, or jumps out of, four wheel drive low range. | 1) Transfer case not completely engaged in 4L position. | 1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position. |
| | 2) Shift linkage out of adjustment. | 2) Adjust linkage. |
| | 3) Shift linkage loose or binding. | 3) Tighten, lubricate, or repair linkage as necessary. |
| | 4) Range fork damaged, inserts worn, or fork is binding on the shift rail. | 4) Disassemble unit and repair as necessary. |
| | 5) Low range gear worn or damaged. | 5) Disassemble unit and repair as necessary. |

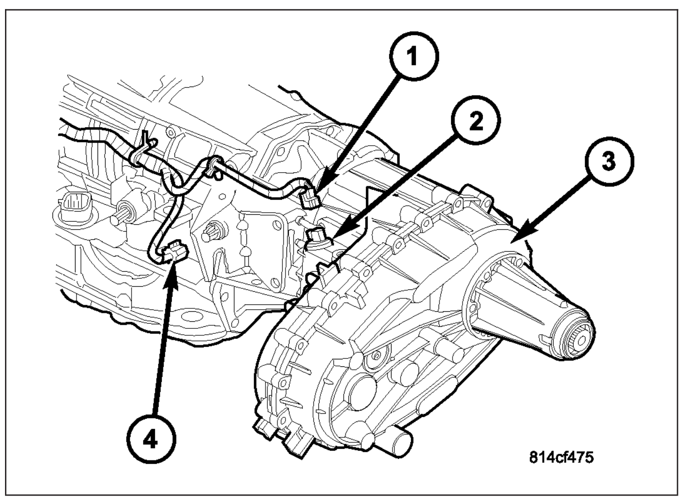
| Condition | Possible Cause | Correction |
|---|---|---|
| Lubricant leaking from output shaft seal or vent. | 1) Transfer case overfilled. | 1) Drain lubricant to the correct level. |
| | 2) Vent closed or restricted. | 2) Clear or replace vent as necessary. |
| | 3) Output shaft seals damaged or installed incorrectly. | 3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal. |
| Abnormal tire wear. | 1) Extended operation on hard, dry surfaces in the 4H position. | 1) Operate vehicle in the 2H position on hard, dry surfaces. |

## REMOVAL

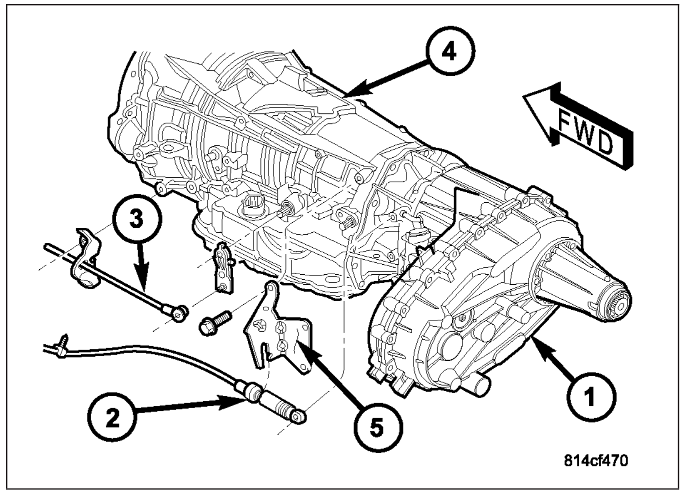
1. Shift transfer case into NEUTRAL.
2. Raise vehicle.
3. Remove skid plate (1).



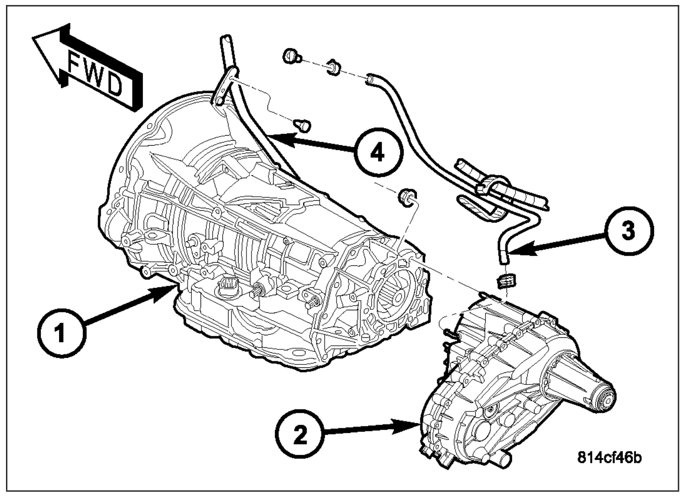
4. Drain transfer case lubricant.
5. Mark front and rear propeller shaft yokes for alignment reference.
6. Remove the front/rear propeller shafts at transfer case. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
7. Disconnect transfer case position sensor connector (1) from the position sensor (2).



8. Disconnect transfer case shift cable (2) at the range lever.
9. Disconnect the transfer case shift cable (2) from the shift cable bracket (5).



10. Disconnect transfer case vent hose (3).
11. Support transfer case (2) with transmission jack.
12. Secure transfer case to jack with chains.
13. Remove nuts attaching transfer case to transmission (1).
14. Pull transfer case and jack rearward to disengage transfer case.
15. Remove transfer case from under vehicle.

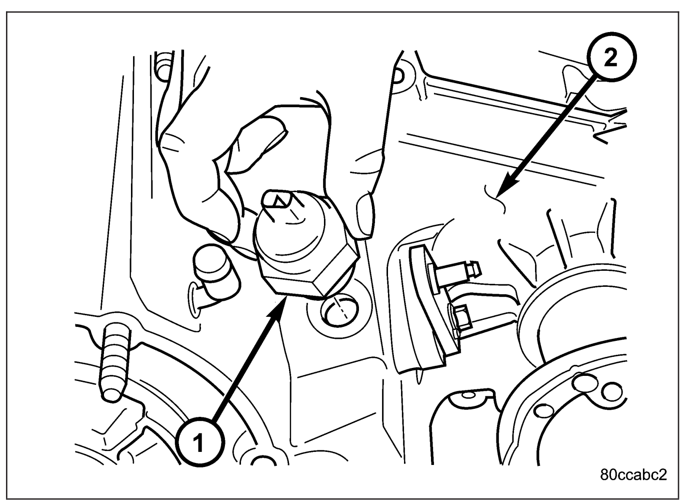


## DISASSEMBLY

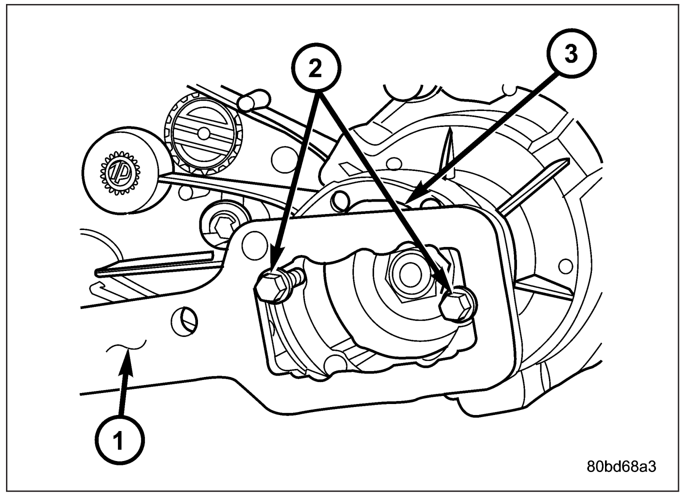
Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

## COMPANION FLANGE AND RANGE LEVER

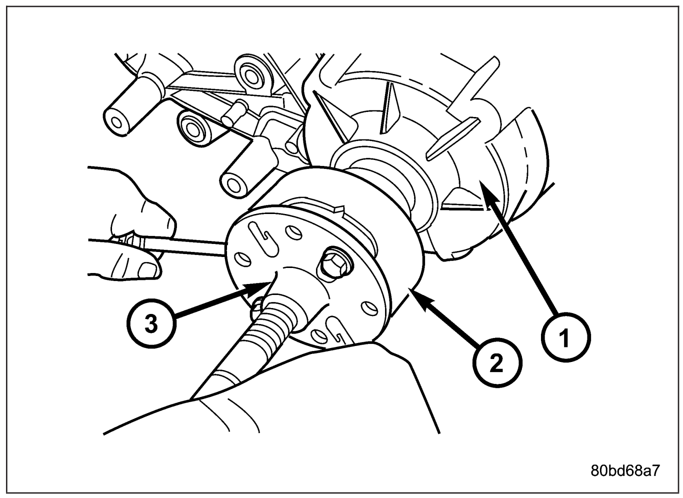
1. Remove transfer case position sensor (1).



2. Install two bolts (2) partially into the propellor shaft companion flange (3), 180° from each other.
3. Install the rectangular end of the Flange Holder C-3281 (1) over the bolts to hold the companion flange stationary and remove the nut holding the companion flange to the output shaft.

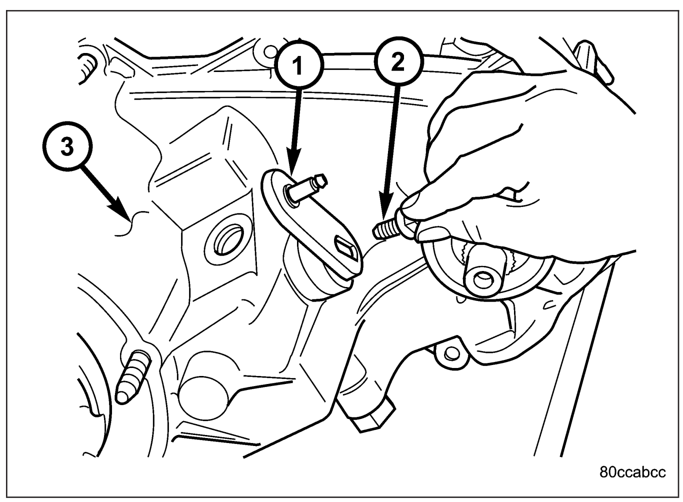


4. Use Remover C-452 (3) to remove the companion flange (2).



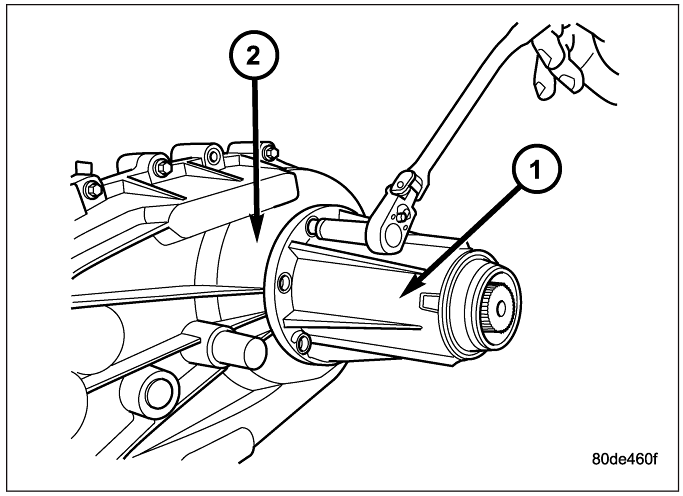
5. Remove seal washer from front output shaft. Discard washer as it should not be reused.
6. Remove the bolt (2) that attaches the range lever (1) to sector shaft. Then move sector to neutral position and remove range lever from shaft.

**NOTE: Be sure to note the orientation of the range lever (lever up or down) so that it may be re-installed in the same direction.**

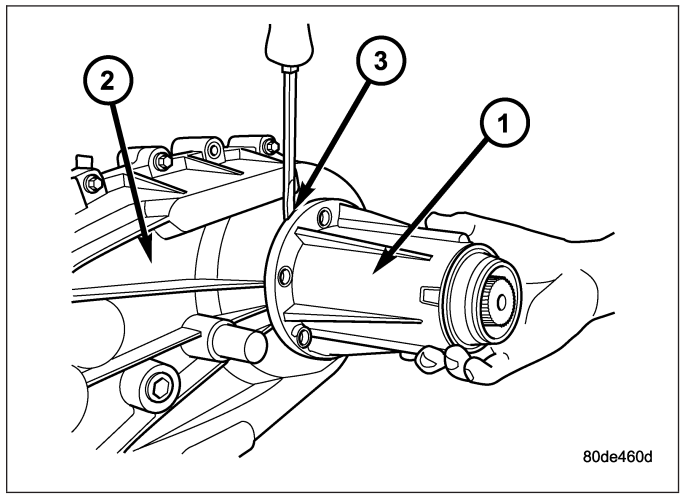


## REAR EXTENSION

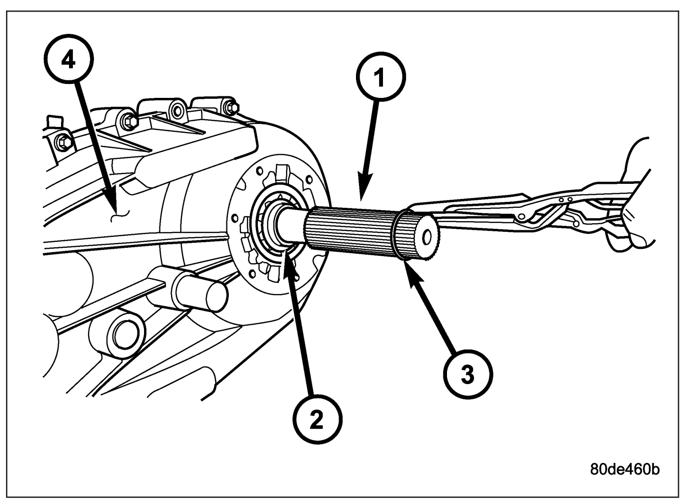
1. Remove rear extension (1) bolts.



2. Remove rear extension housing (1). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

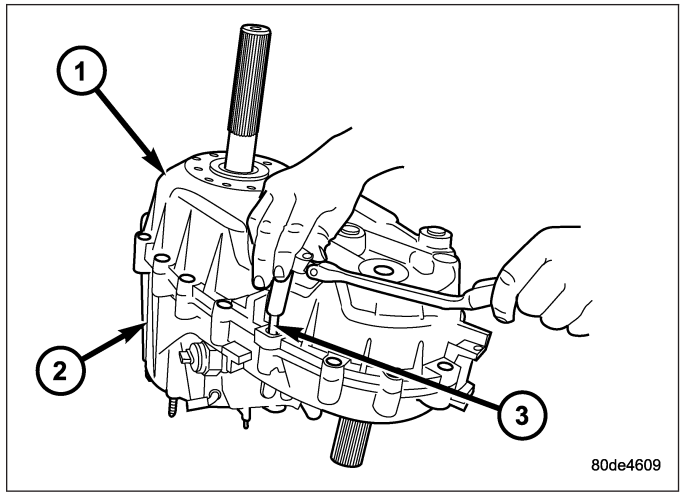


3. Remove output bearing (2) retaining ring (3) with heavy duty snap-ring pliers.

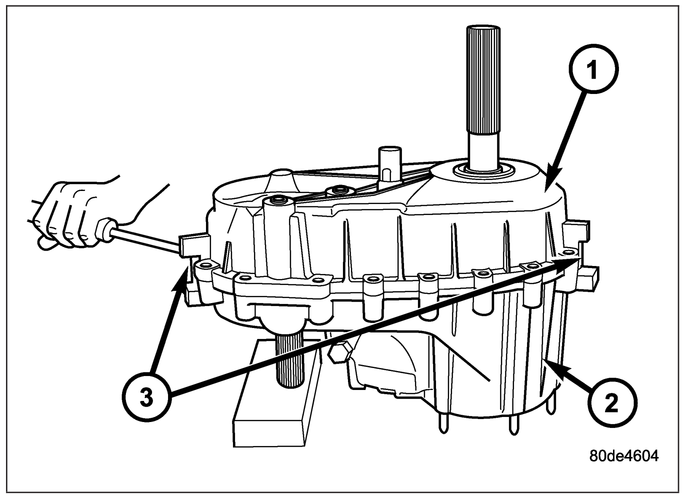


## OIL PUMP AND REAR CASE

1. Remove rear case(1)-to-front case (2) bolts (3).

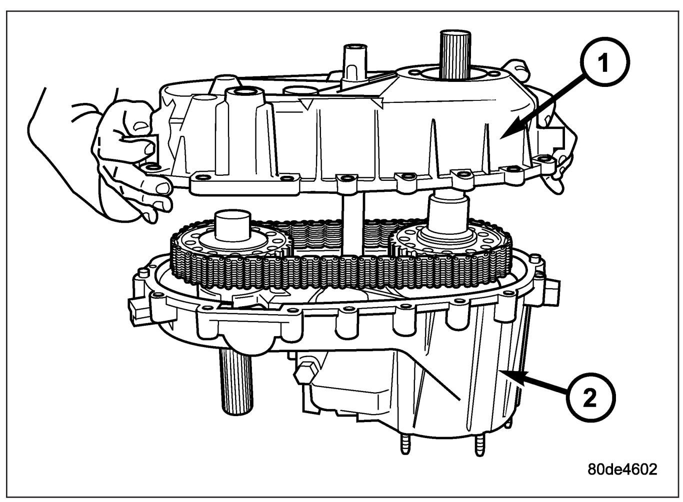


2. Loosen rear case (1) with pry tool to break sealer bead. Insert tool in slot (3) at each end of case.



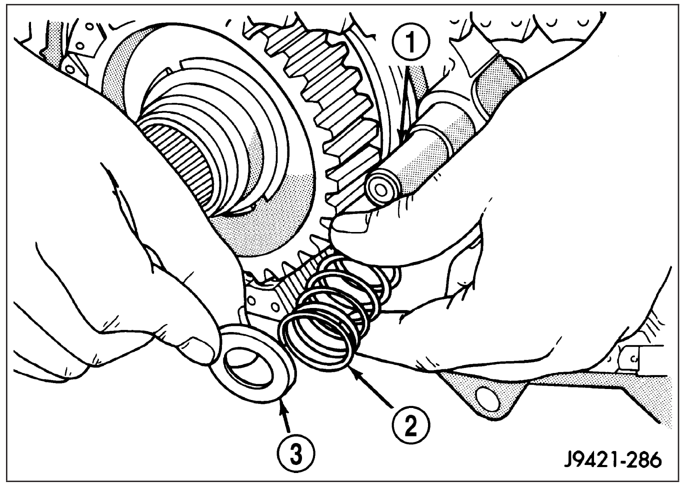
3. Unseat rear case (1) from alignment dowels.
4. Remove rear case and oil pump assembly from front case.

**CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft bearing inner race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump, the rear case and oil pump assembly MUST be replaced.**

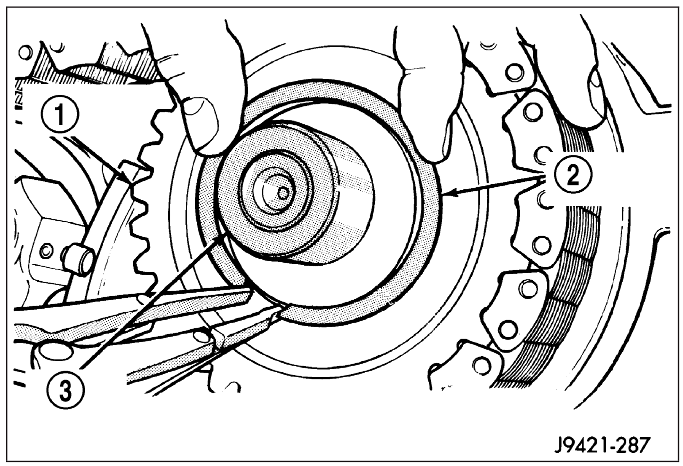


## FRONT OUTPUT SHAFT AND DRIVE CHAIN

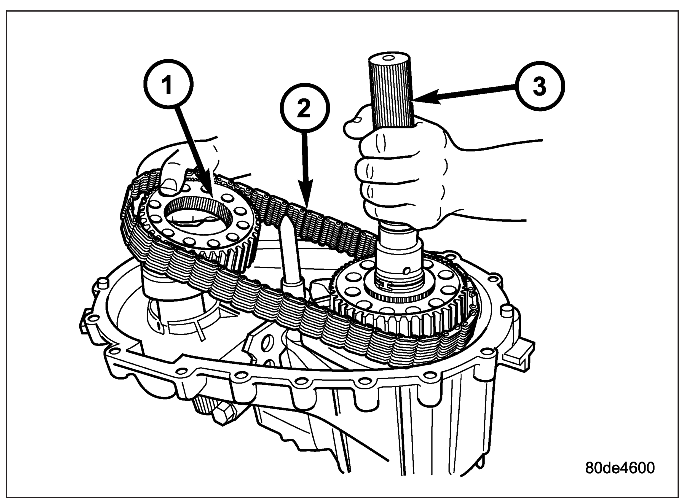
1. Remove shift rail (1) cup (3) and spring (2).



2. Remove front sprocket (1) retaining ring (2).

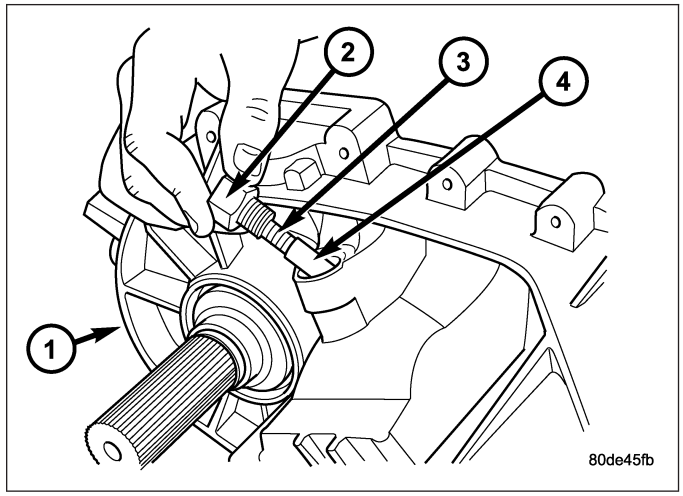


3. Pull mainshaft (3), front sprocket (1) and chain outward about 25.4 mm (1-inch) simultaneously.
4. Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

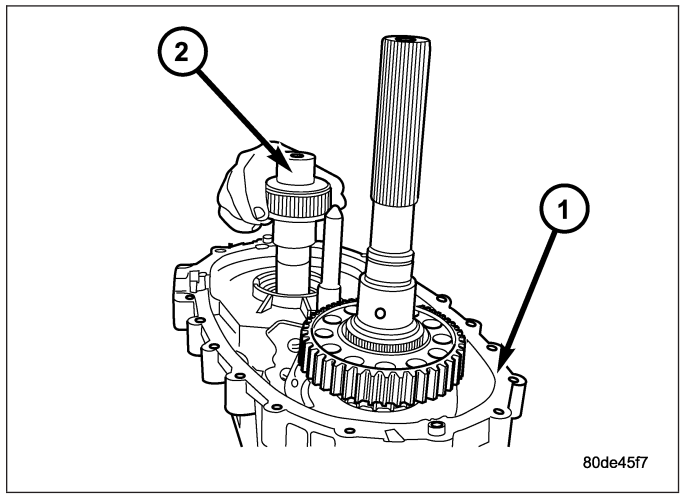


## SHIFT FORKS AND MAINSHAFT

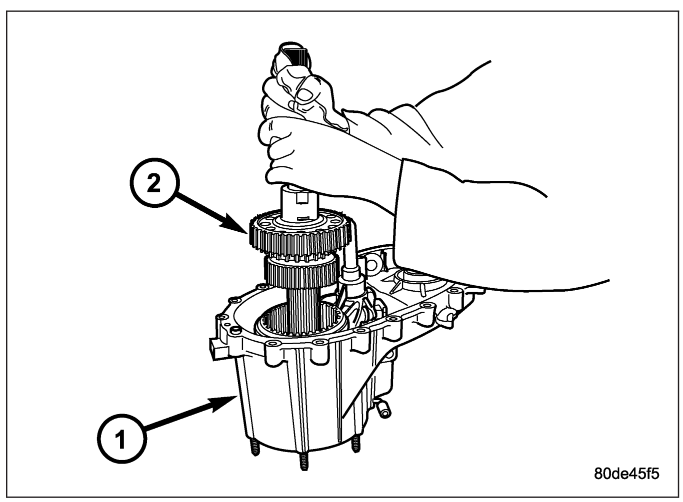
1. Loosen detent plug (2).
2. Remove detent plug (2), spring (3), and plunger (4). Note that the plug has an O-ring seal. Remove and discard this seal.



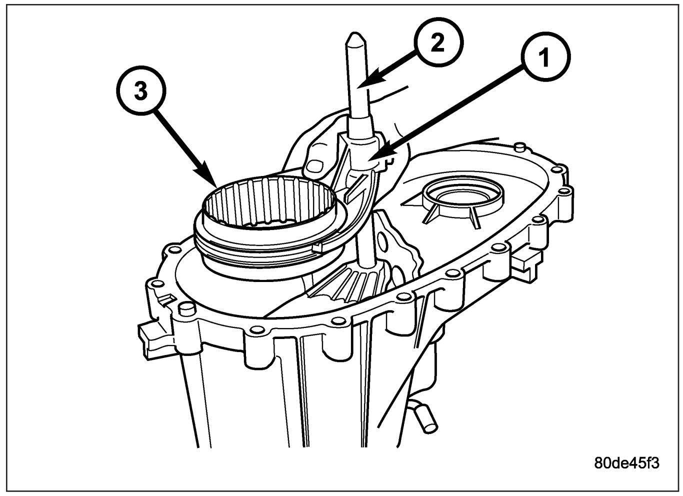
3. Remove front output shaft (2) from bearing in the front case (1).



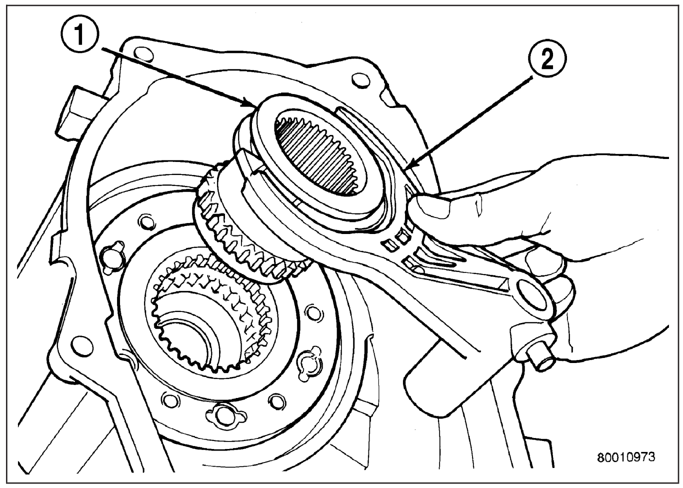
4. Pull mainshaft assembly (2) out of input gear, mode sleeve, and front case (1).



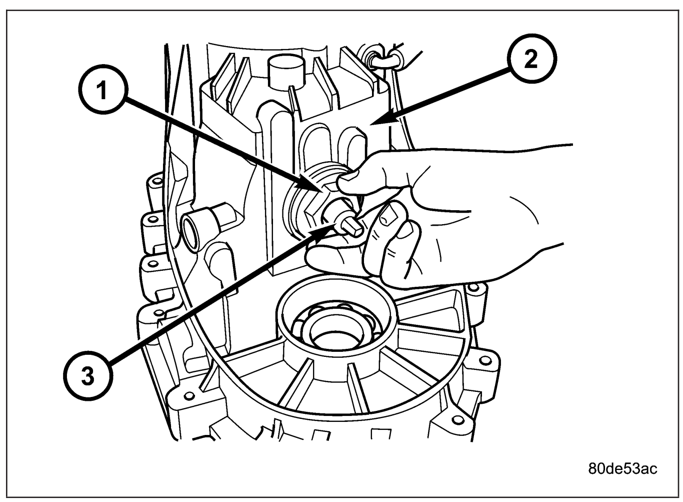
5. Remove mode fork (1), mode sleeve (3), and shift rail (2) as assembly. Note which way the sleeve fits in the fork (long side of sleeve goes to front).



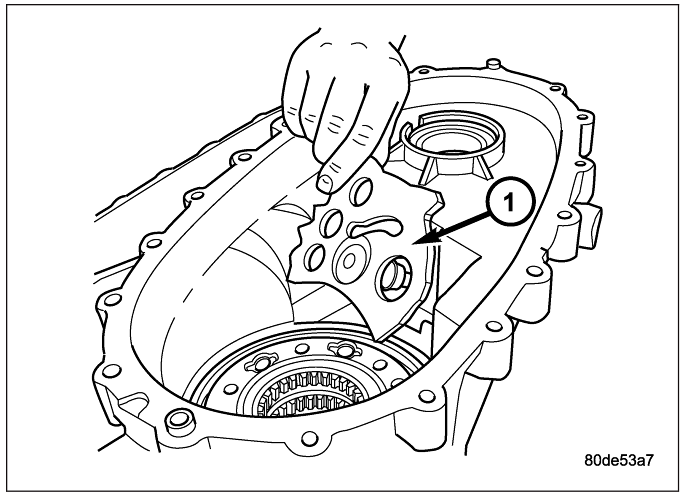
6. Remove range fork retaining ring.
7. Remove range fork (2) and hub (1) as an assembly. Note fork position for installation reference.



8. Remove the shift sector support (1).

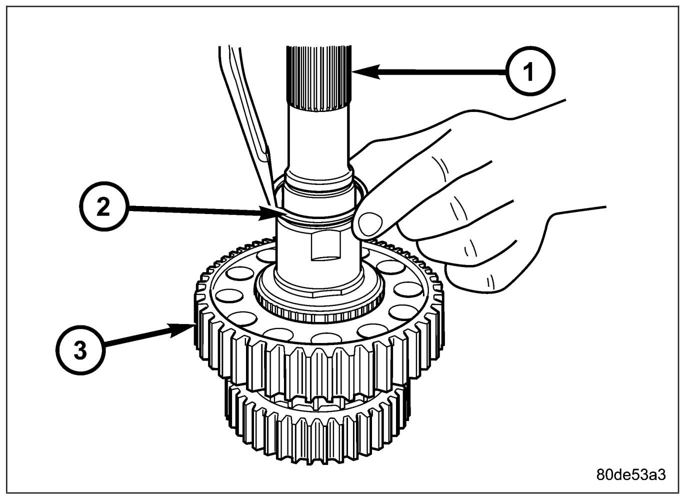


9. Remove shift sector (1).

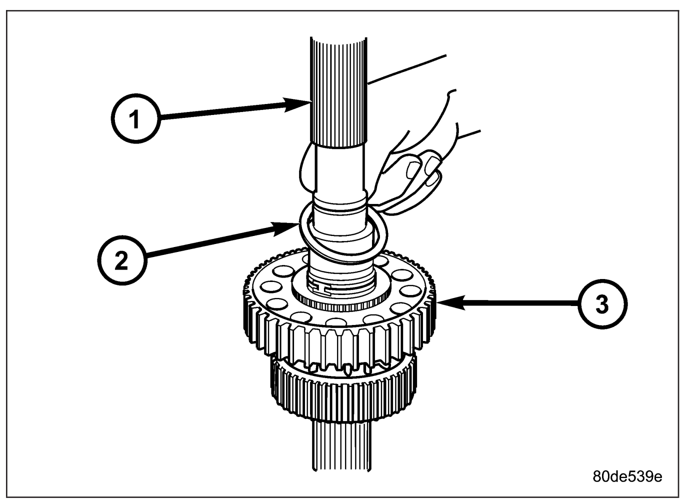


## MAINSHAFT

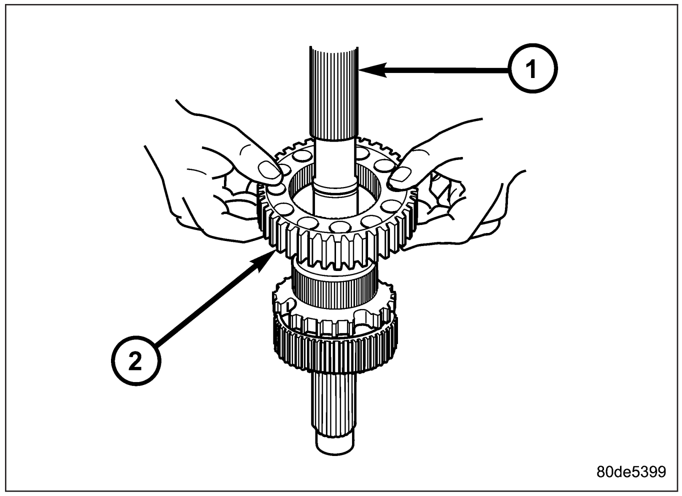
1. Remove the drive sprocket retaining ring (2) from the output shaft (1).



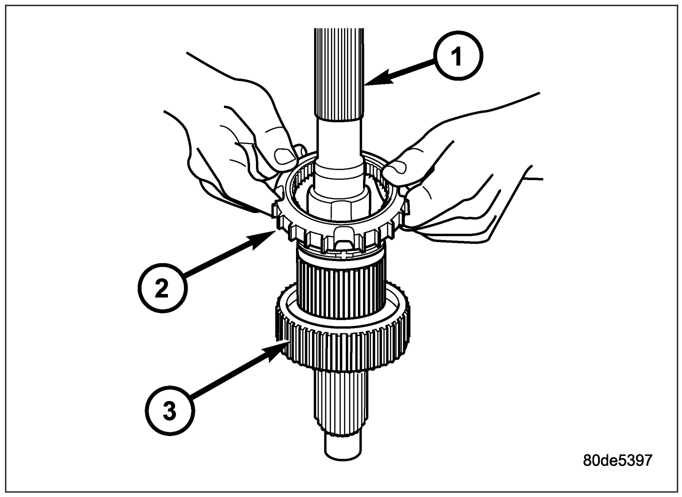
2. Remove the drive sprocket (3) thrust washer (2) from the output shaft (1).



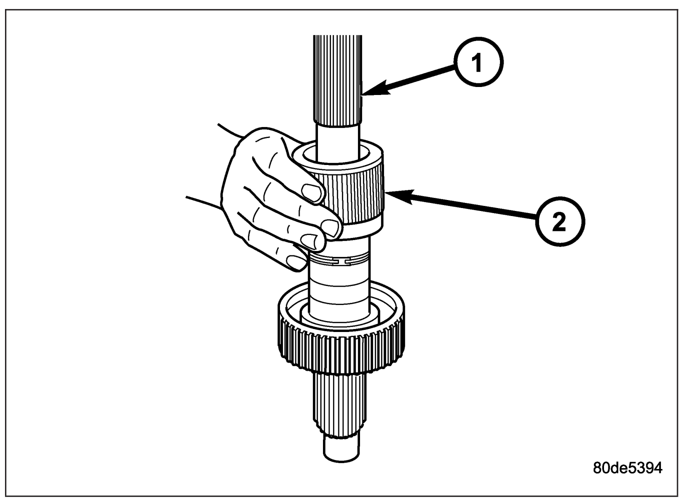
3. Remove drive sprocket (2) from the output shaft (1).



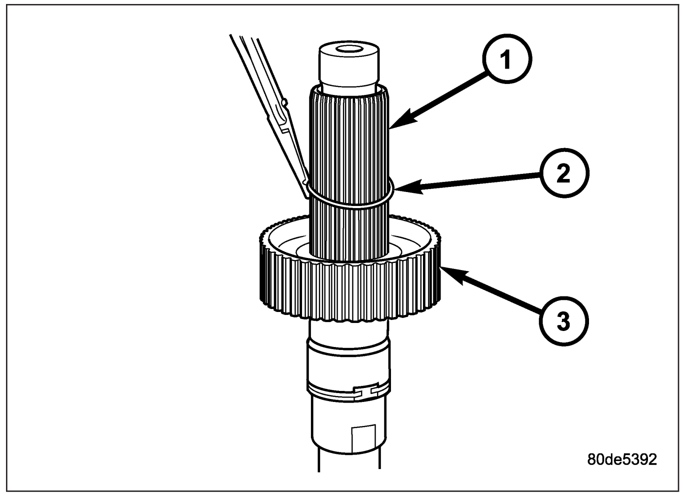
4. Remove the clutch gear (2) from the output shaft (1).



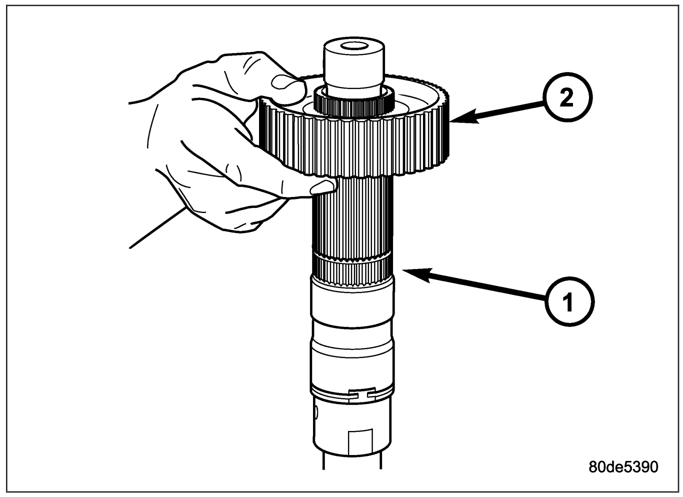
Remove the sprocket hub (2) from the output shaft (1).



5. Remove the mode hub (3) retaining ring (2) from the output shaft (1).

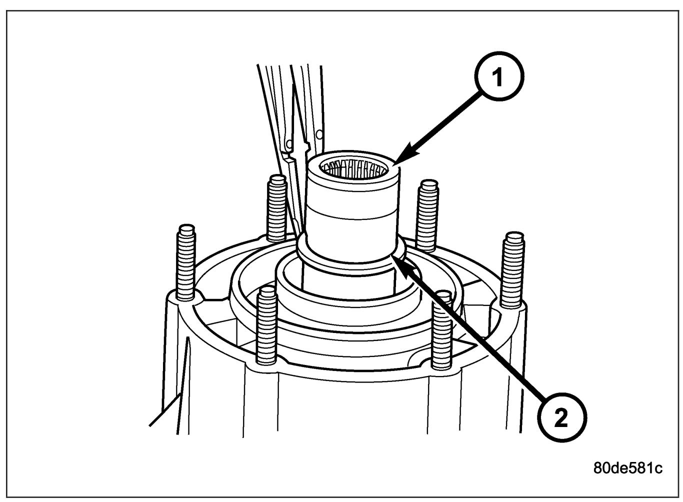


6. Remove the mode hub (2) from the output shaft (1).

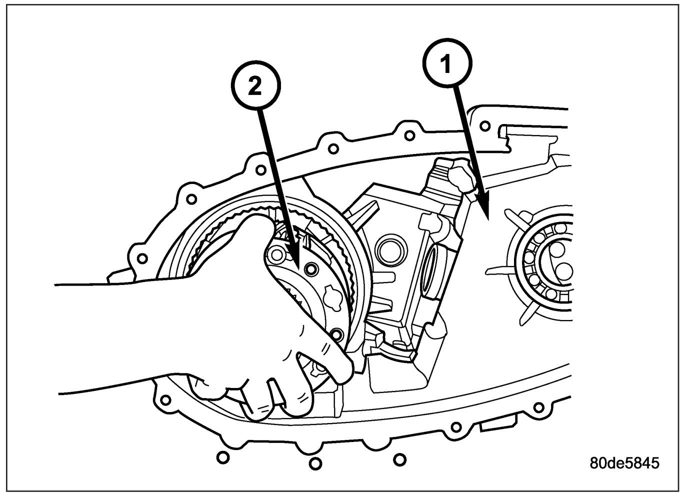


## INPUT AND PLANETARY GEAR

1. Remove input gear seal with suitable screw and slide hammer.
2. Remove input gear (1) retaining ring (2) with heavy duty snap-ring pliers.

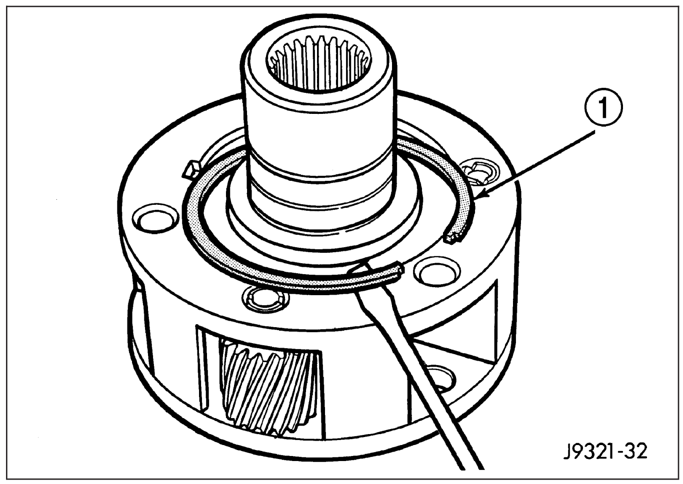


3. Place front case in horizontal position. Then remove input gear and low range gear as an assembly (2). Tap gear out of bearing with plastic mallet, if necessary.

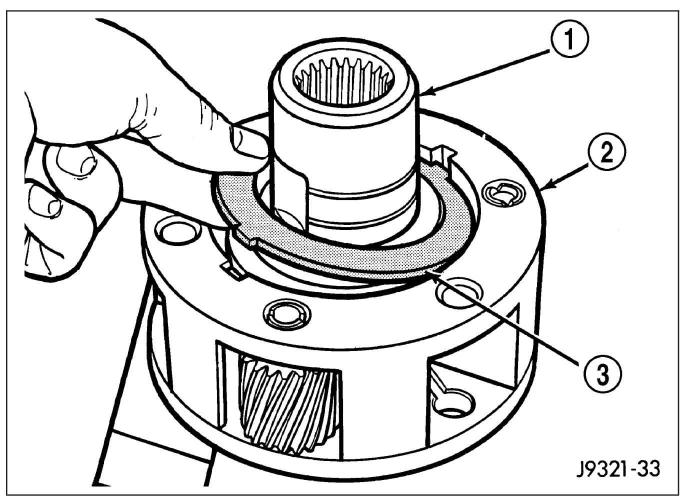


## INPUT AND PLANETARY GEAR

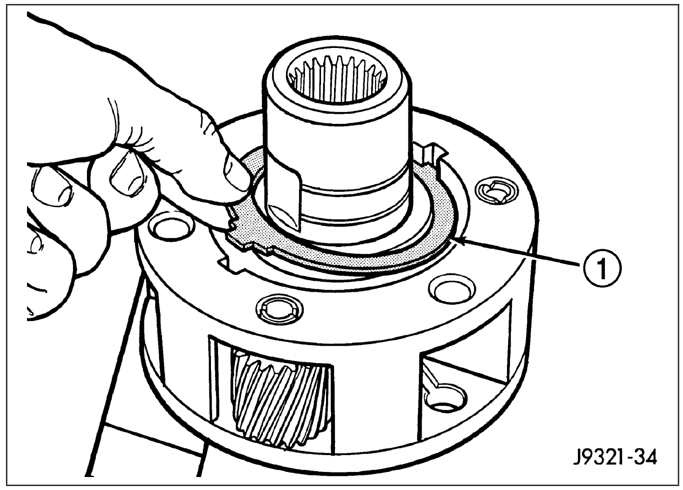
1. Remove snap-ring (1) that retains input gear in low range gear.



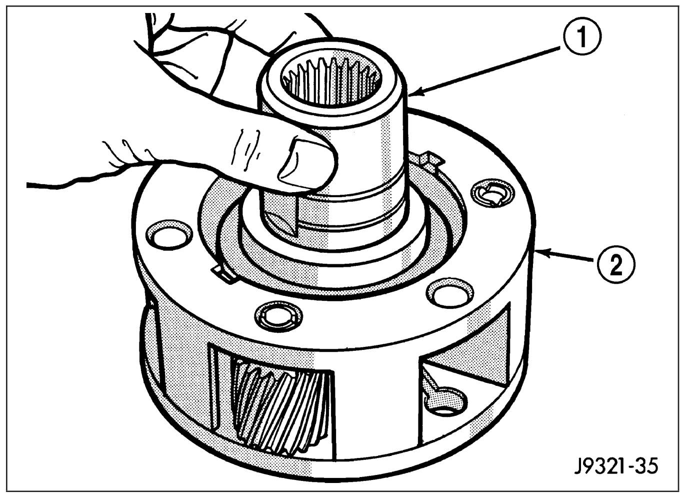
2. Remove retainer (3).



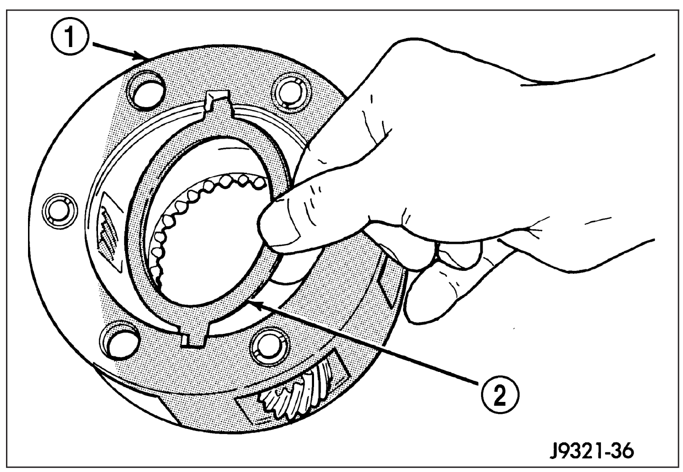
3. Remove front tabbed thrust washer (1).



4. Remove input gear (1).



5. Remove rear tabbed thrust washer (2) from low range gear (1).



## CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

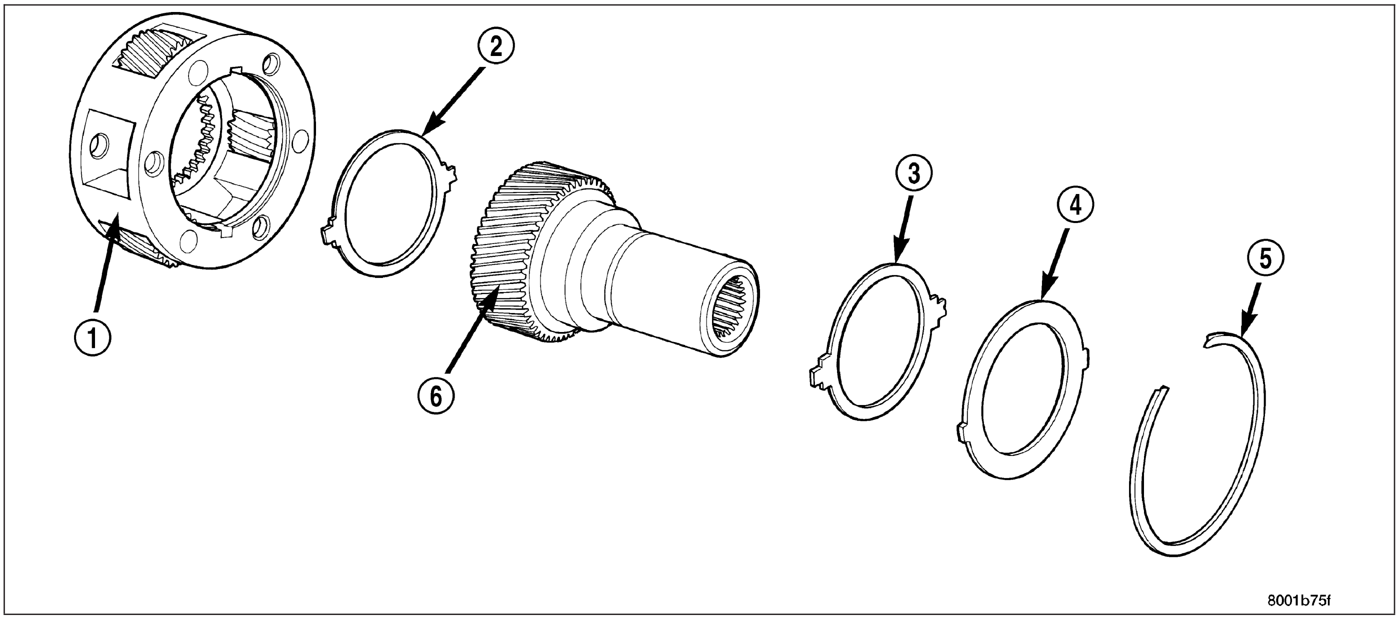
# INSPECTION

## MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

## INPUT GEAR AND PLANETARY CARRIER



***Input Gear And Carrier Components***

1 - PLANETARY CARRIER
2 - REAR THRUST WASHER
3 - FRONT THRUST WASHER
4 - CARRIER LOCK RING
5 - CARRIER LOCK RETAINING RING
6 - INPUT GEAR

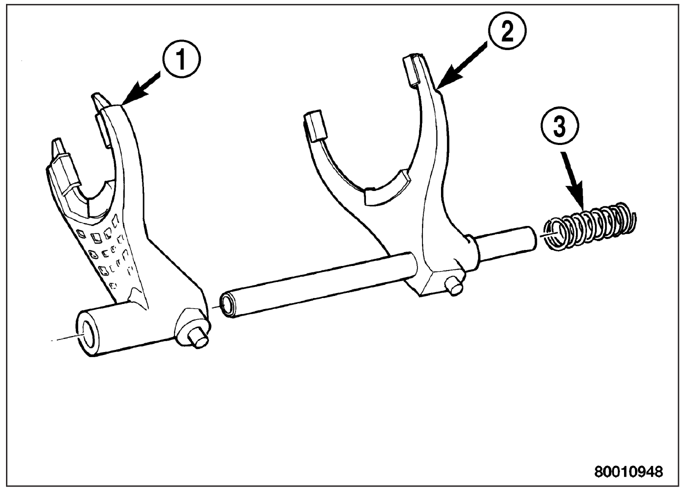
Check the teeth on the input gear (6). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the planetary carrier body (1) and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the carrier lock ring (4) and both thrust washers (2, 3) for wear or cracks. Replace them if necessary. Also replace the carrier lock retaining ring (5) if bent, distorted, or broken.

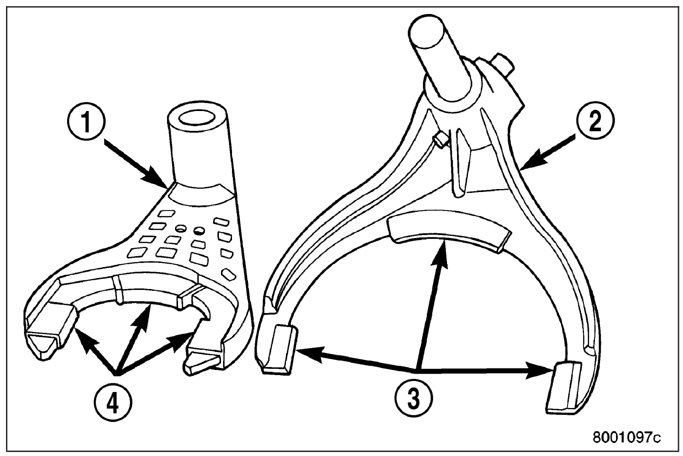
## SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (2). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.



Inspect the shift fork wear pads (3, 4). The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are not serviceable. The fork must be replaced as an assembly if the pads are worn or damaged.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.



## REAR RETAINER COMPONENTS

Inspect the retainer components. Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended.

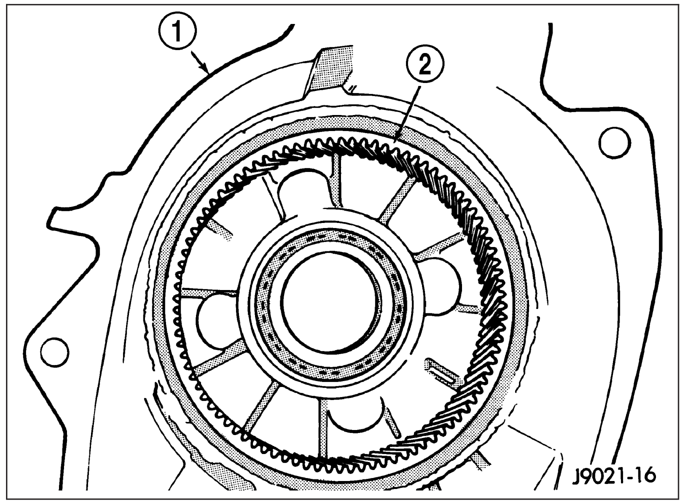
Inspect rear extension bushing. Replace if worn or scored.

## DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

## LOW RANGE ANNULUS GEAR

Inspect annulus gear (2) condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear.



## FRONT CASE AND REAR CASE

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

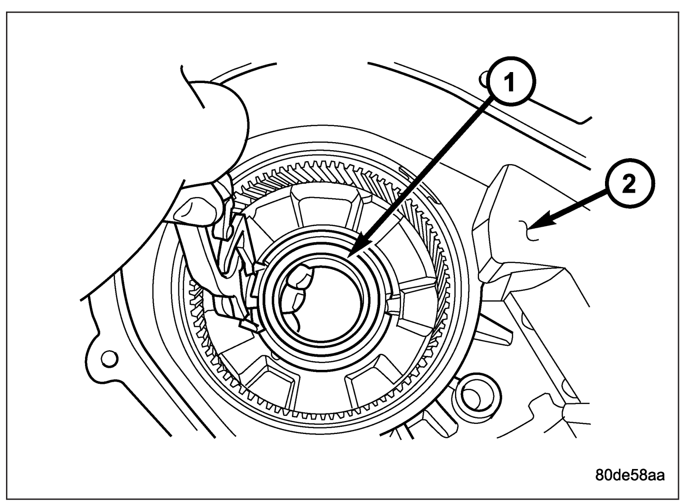
## OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

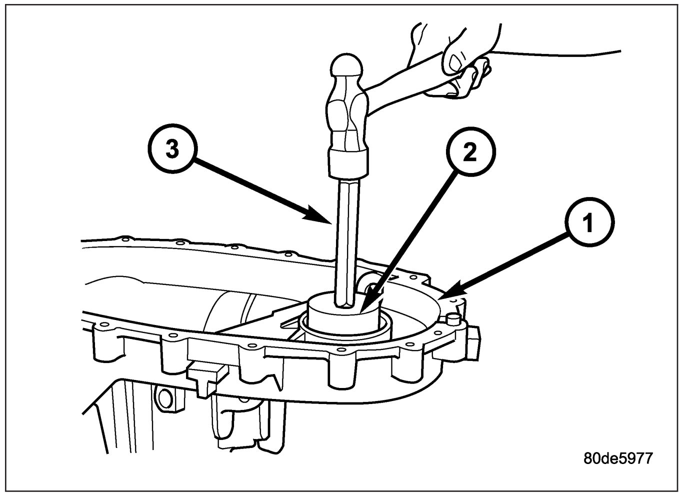
# ASSEMBLY

## BEARINGS AND SEALS

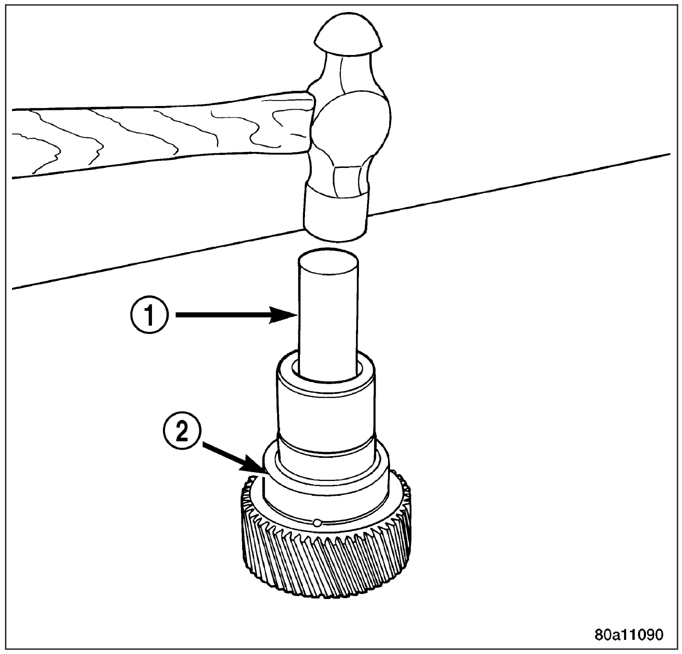
1. Remove the input shaft bearing (1) from the front case (2) with suitable snap-ring pliers.
2. Transfer the retaining ring to the new bearing if necessary and install the bearing into the front case.



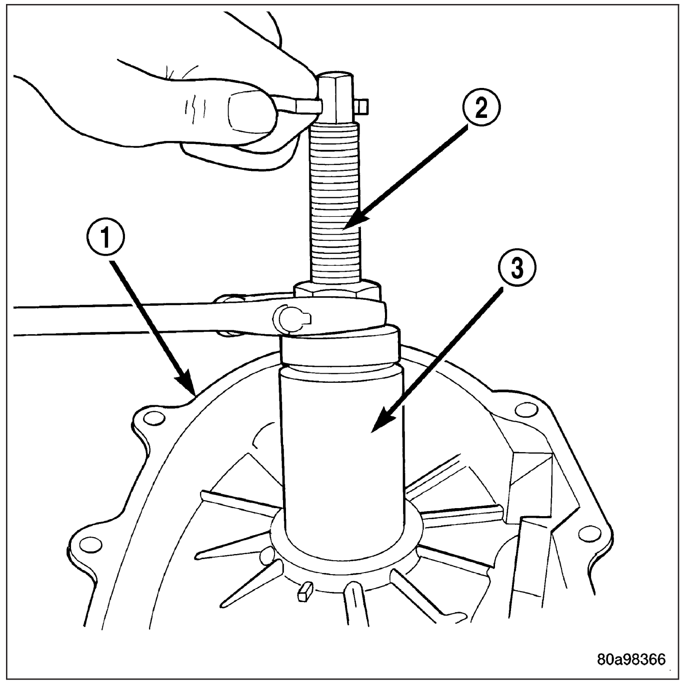
3. Using Installer 6436 (2) and Handle C-4171 (3), remove front output shaft bearing.
4. Start front output shaft bearing in case. Then seat bearing with Handle C-4171 and Installer 6953.
5. Install front output shaft bearing retaining ring.



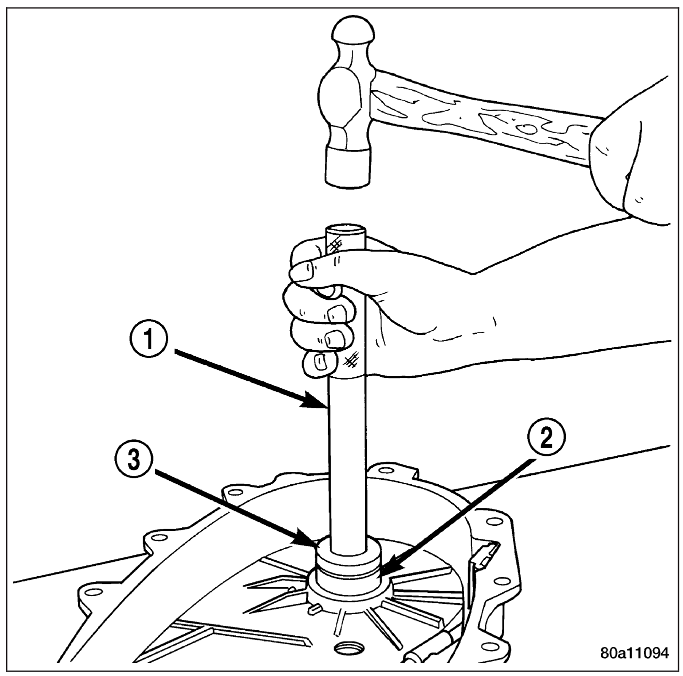
6. Remove input gear pilot bearing by inserting a suitably sized drift (1) into the splined end of the input gear (2) and driving the bearing out with the drift and a hammer.
7. Install new pilot bearing with Remover/Installer 8684.



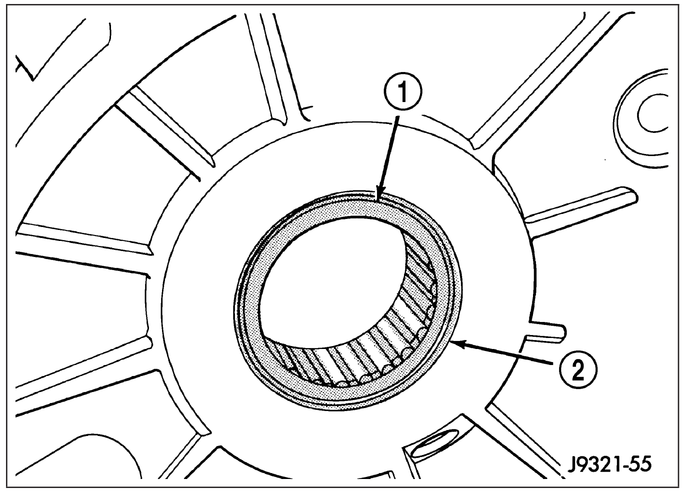
8. Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 (2) and Cup 8148 (3).



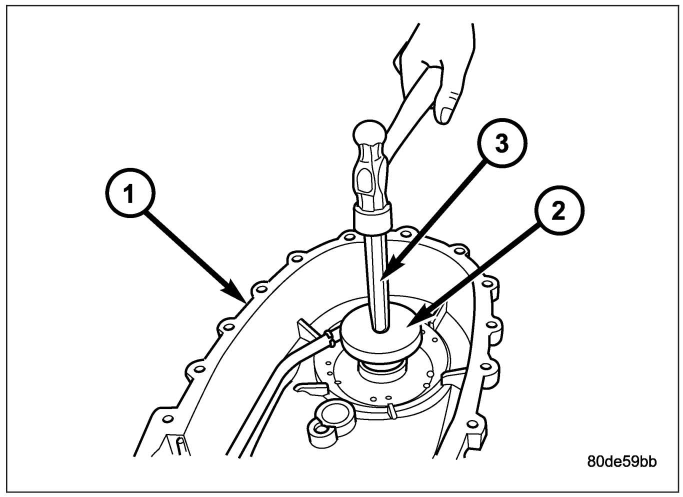
9. Install new bearing with Tool Handle C-4171 (1) and Installer 5066 (3).



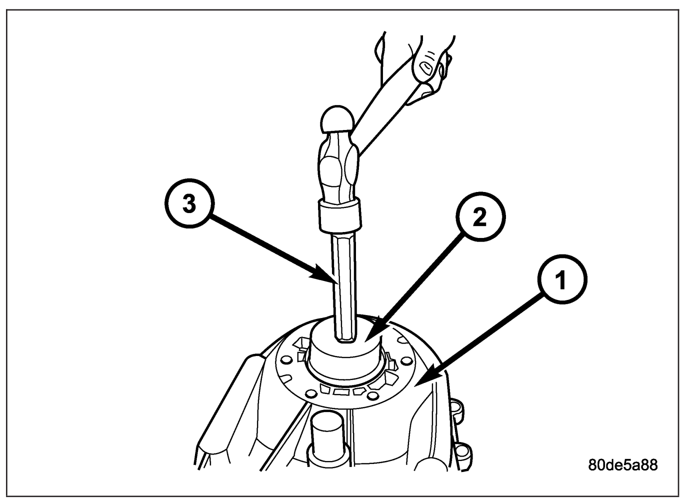
10. The bearing bore is chamfered (1) at the top. Install the bearing so it is flush with the lower edge of this chamfer.



11. Remove the rear output shaft bearing from the rear case using Remover/Installer 8684 (2) and Handle C-4171 (3).

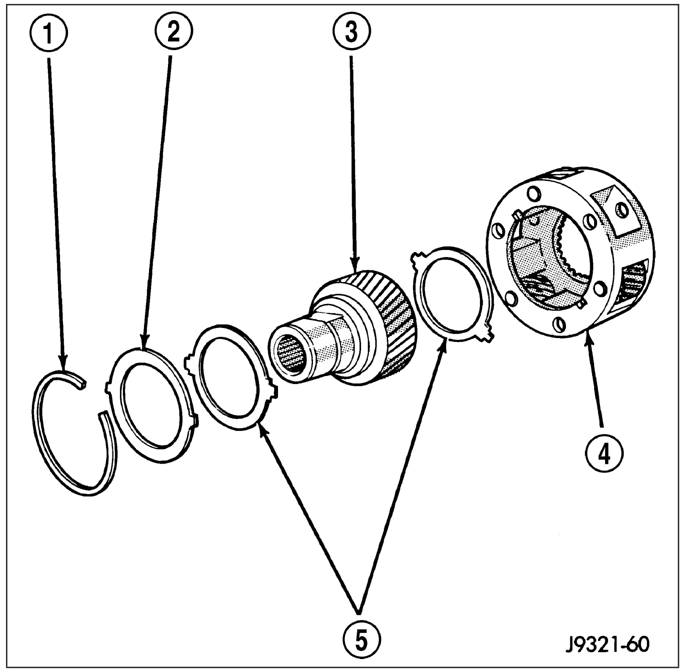


12. Install the rear output shaft bearing into the rear case (1) using Remover/Installer 6953 (2) and Handle C-4171 (3).

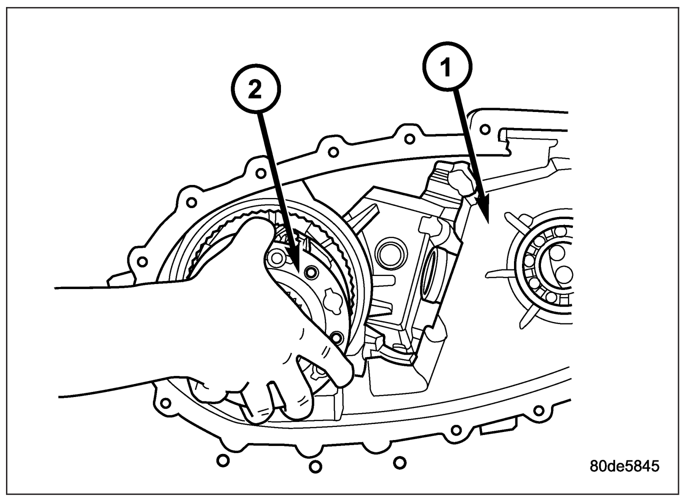


## INPUT AND PLANETARY GEAR

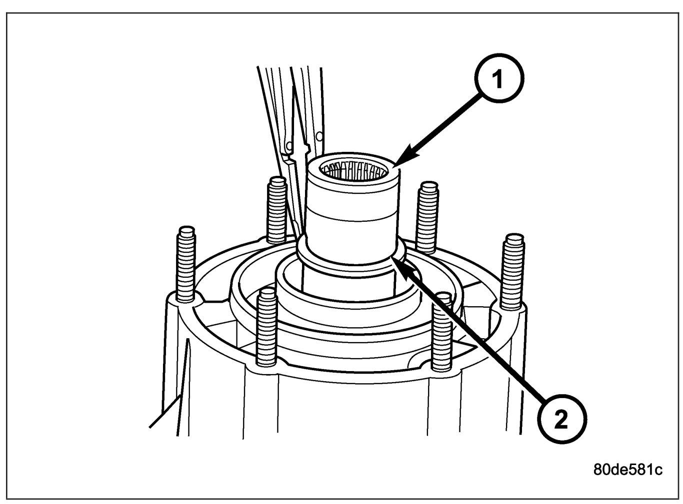
1. Lubricate gears (3, 4) and thrust washers (5) with recommended transmission fluid.
2. Install first thrust washer (5) in low range gear (3). Be sure washer tabs are properly aligned in gear notches.
3. Install input gear (3) in low range gear (4). Be sure input gear is fully seated.
4. Install remaining thrust washer (5) in low range gear (4) and on top of input gear (3). Be sure washer tabs are properly aligned in gear notches.
5. Install retainer (2) on input gear and install snap-ring (1).



6. Align and install low range/input gear assembly (2) in front case (1). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

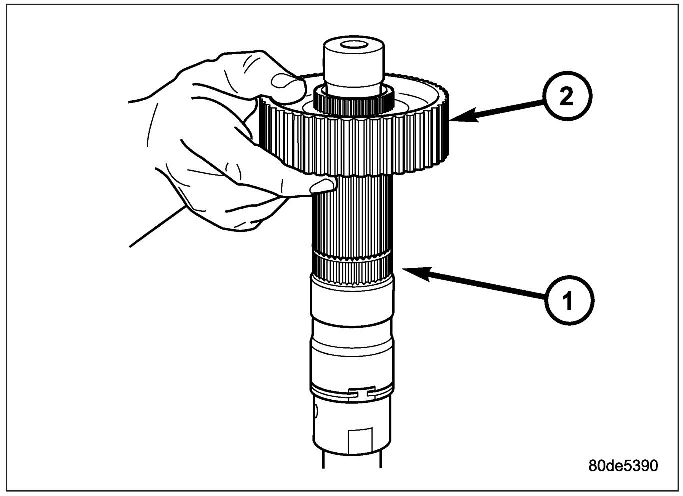


7. Install snap-ring (2) to hold input/low range gear (1) into front bearing.
8. Install a new input gear seal using Installer 8841 and Handle C-4171.

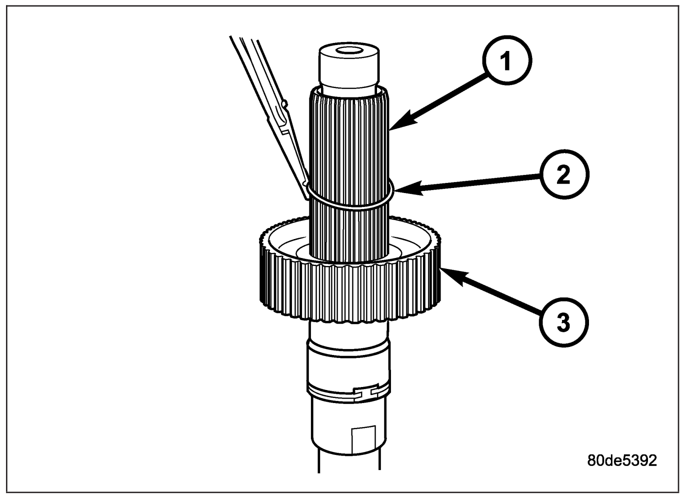


## SHIFT FORKS AND MAINSHAFT

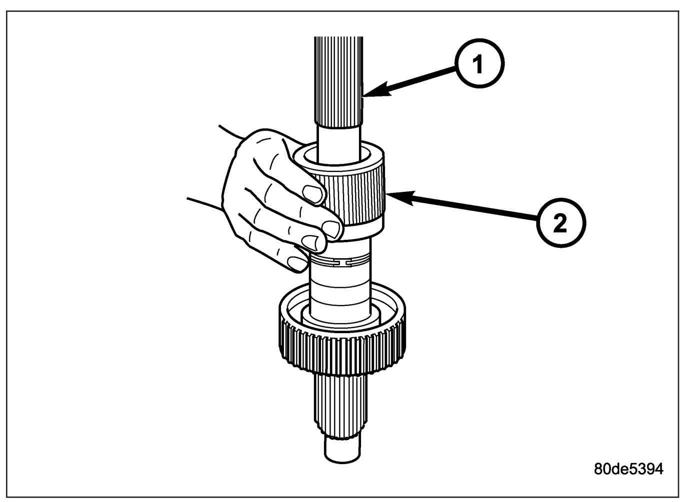
1. Lubricate mainshaft splines with recommended transmission fluid.
2. Install the mode hub (1) onto the output shaft.



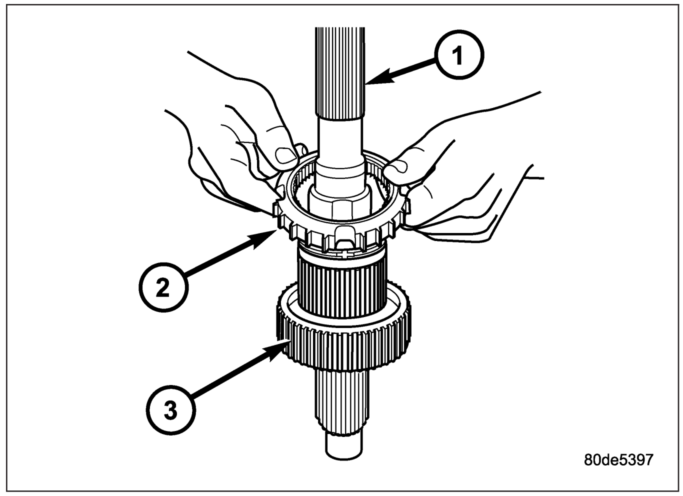
3. Install the mode hub retaining ring (2) onto the output shaft (1).



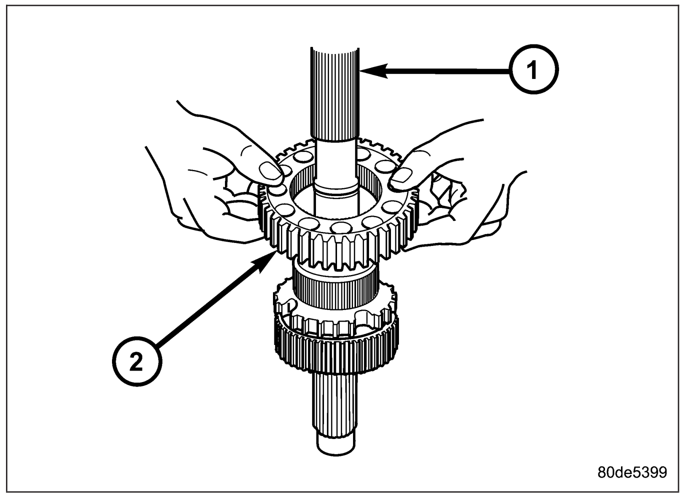
4. Install the sprocket hub (2) onto the output shaft (1).



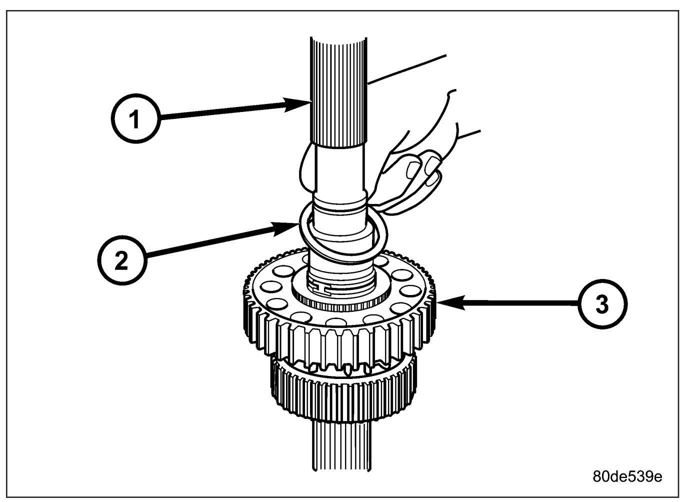
5. Install the clutch gear (2) onto the output shaft (1).



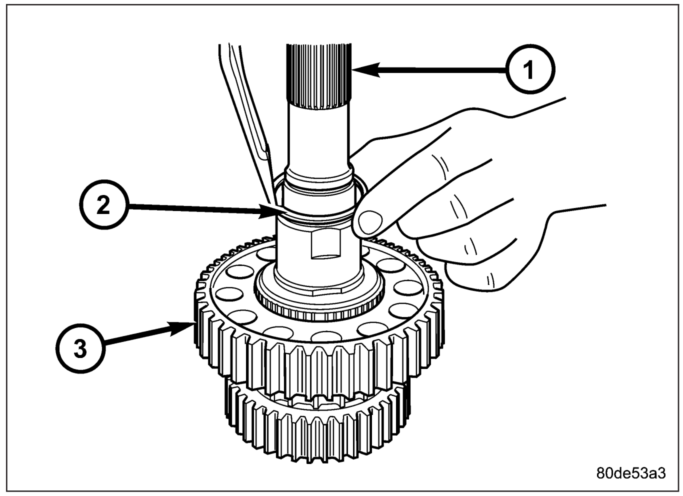
6. Install the drive sprocket (2) onto the output shaft (1).



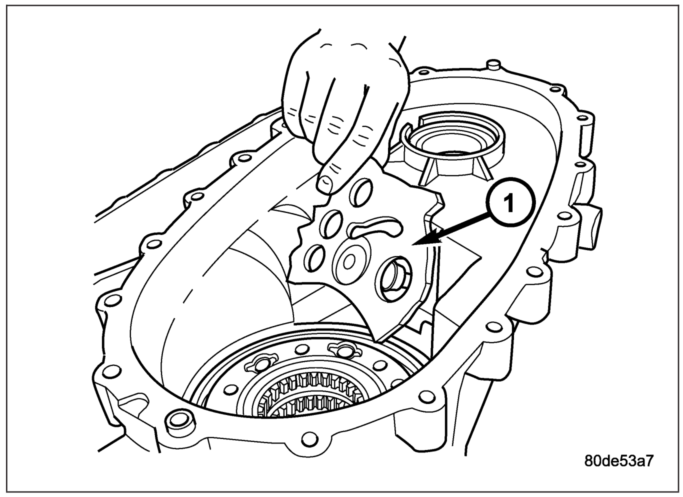
7. Install the drive sprocket (3) thrust washer (2) onto the output shaft (1).



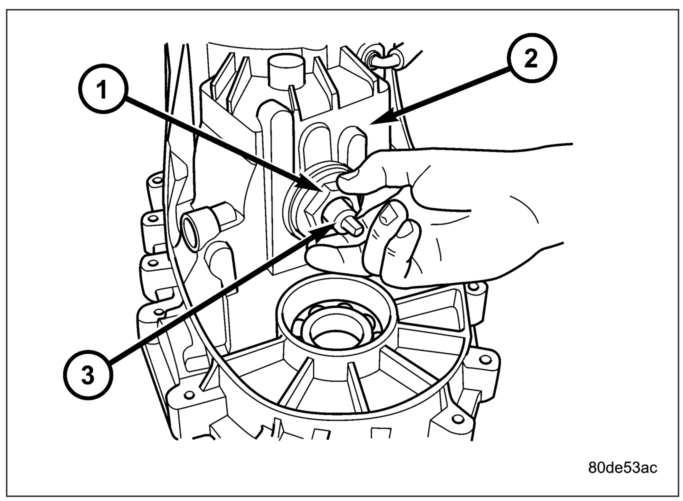
8. Install the drive sprocket retaining ring (2) onto the output shaft (1).



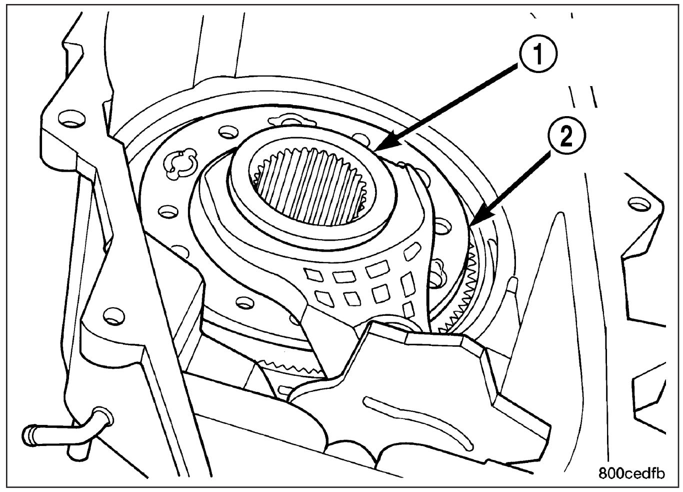
9. Lubricate sector shaft with transmission fluid and install shift sector (1) in case. Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.



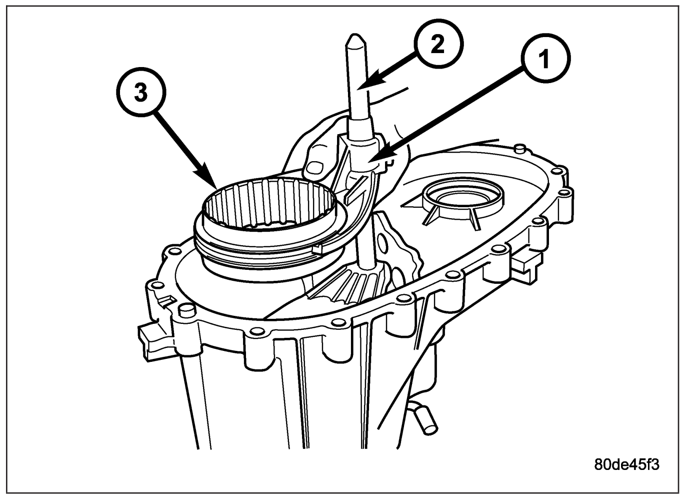
10. Install the shift sector support (1). Tighten the sector support to 27-42 N·m (20-30 ft.lbs.).



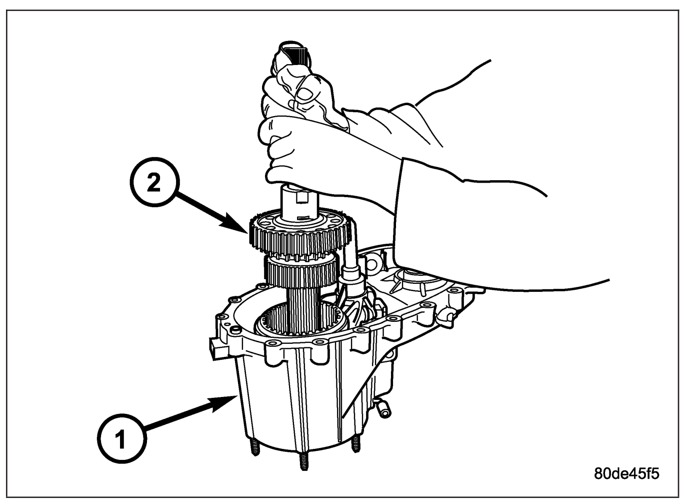
11. Assemble and install range fork (2) and hub (1). Be sure hub is properly seated in low range gear and engaged to the input gear.
12. Align and insert range fork pin in shift sector slot.
13. Install the range fork retaining ring.



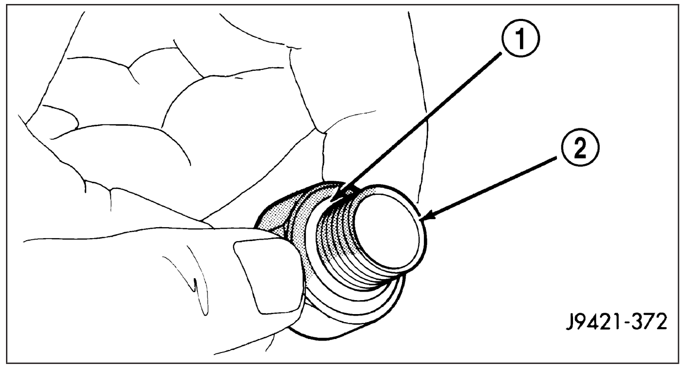
14. Install mode fork (1) and shift rail (2) onto the mode sleeve (3).
15. Install the mode fork, sleeve, and shift rail into the transfer case.



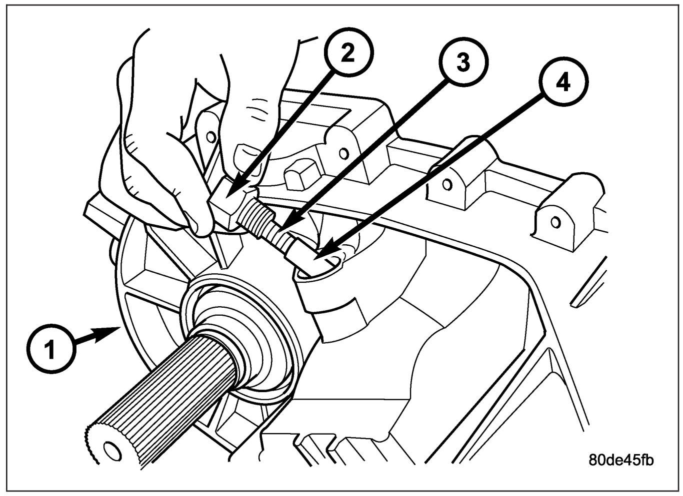
16. Install mainshaft (2) into the transfer case (1). Guide mainshaft through the mode and range sleeves and into the input gear.



17. Install new o-ring on detent plug (2).

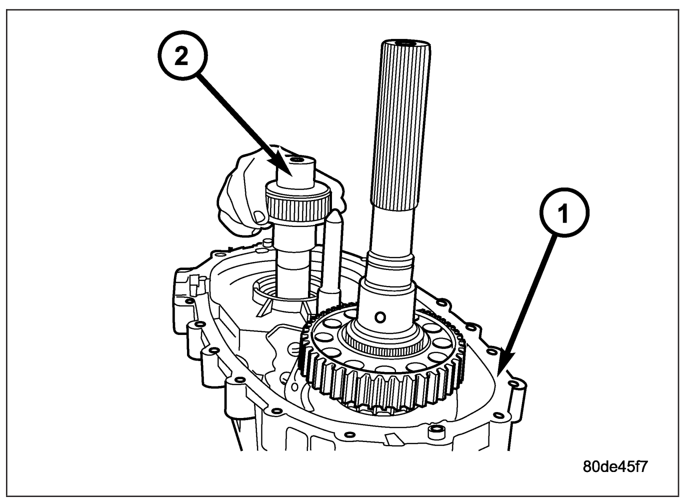


18. Install detent plunger (4), spring (3), and plug (2). Tighten the plug to 16-25 N·m (12-18 ft. lbs.).

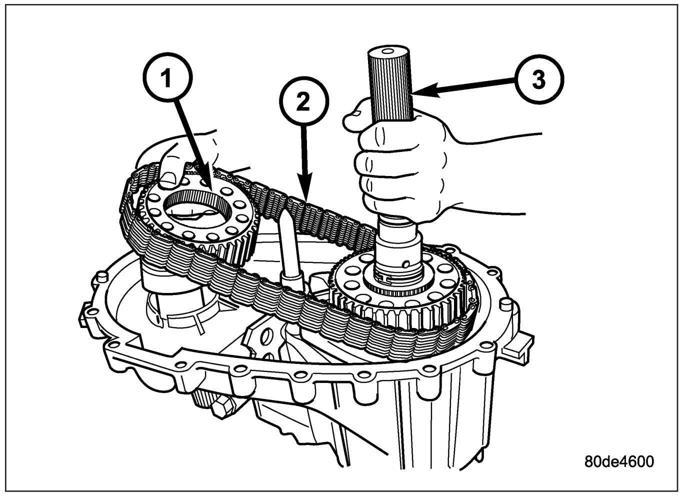


## FRONT OUTPUT SHAFT AND DRIVE CHAIN

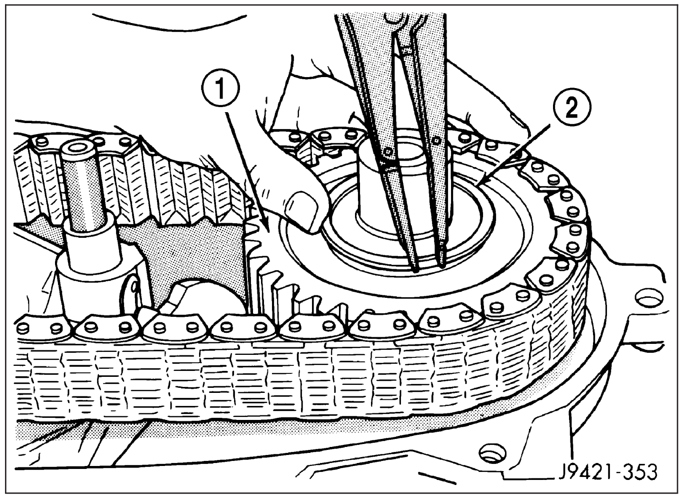
1. Install the front output shaft (2) into the front output shaft bearing.



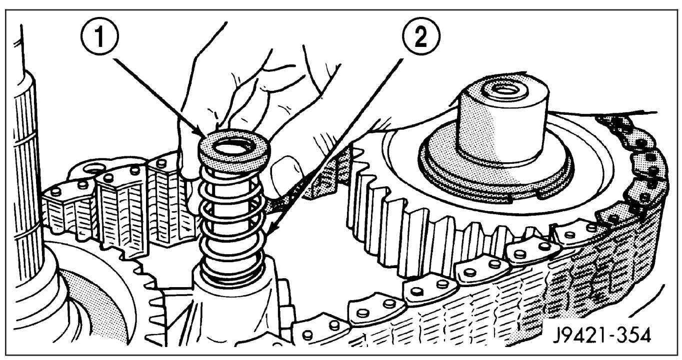
2. Insert front sprocket in drive chain.
3. Install drive chain (2) around mainshaft sprocket (1). Then position front sprocket over front shaft.
4. Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.



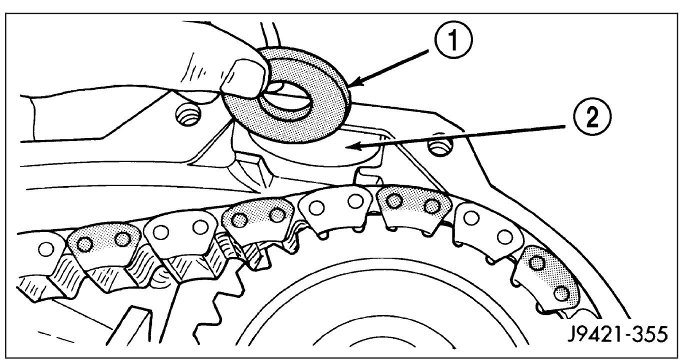
5. If mainshaft and mode sleeve were unseated during chain installation, align and reseat mainshaft in input gear and hub.
6. Install front sprocket (1) retaining ring (2).



7. Install spring (2) and cup (1) on shift rail.



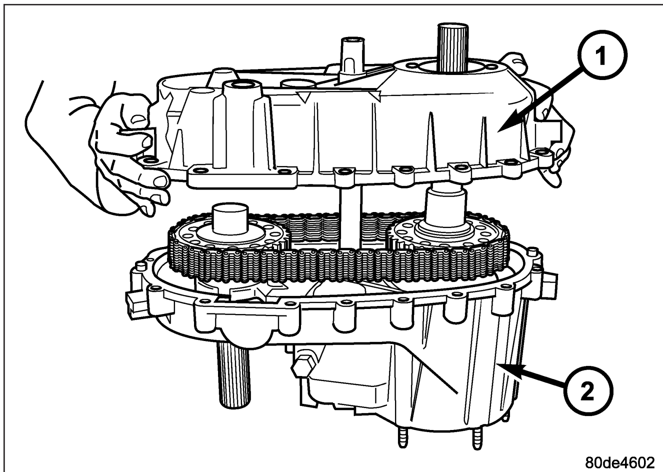
8. Insert magnet (1) in front case pocket (2).



## OIL PUMP AND REAR CASE

**CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump. the rear case and oil pump assembly MUST be replaced.**

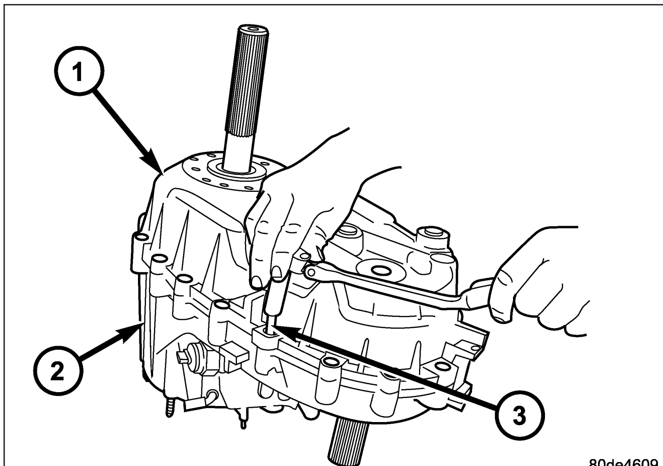
1. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.
2. Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case (1) and oil pump assembly.



80de4602

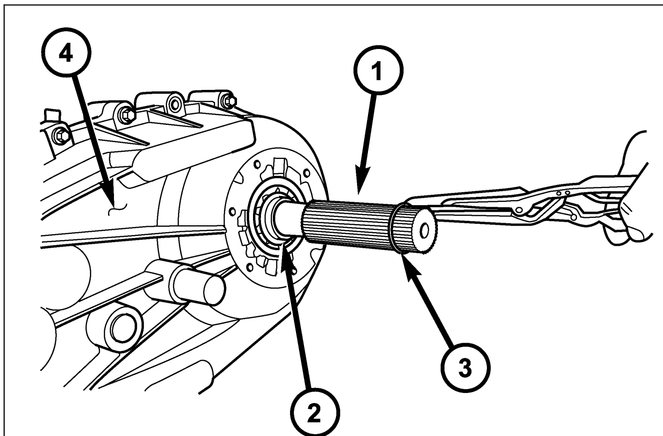
3. Install 4-5 rear case(1)-to front case (2) bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

**CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.**



80de4609

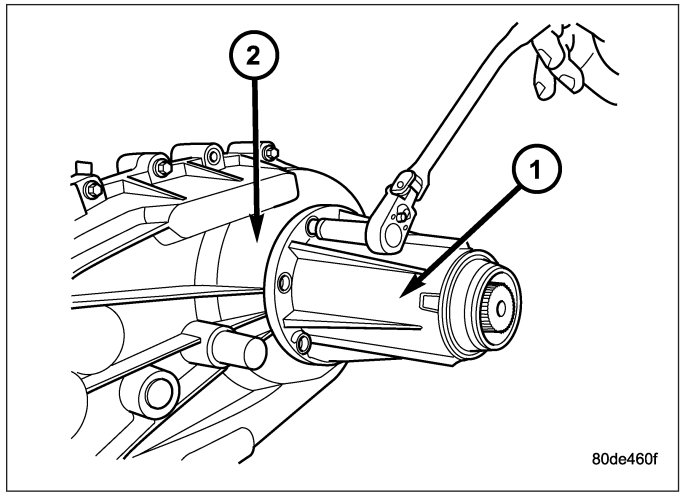
4. Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Tighten bolts to 20-27 N·m (15-24 ft. lbs.),
5. Install rear output bearing (2) snap-ring (3) to output shaft.



80de460b

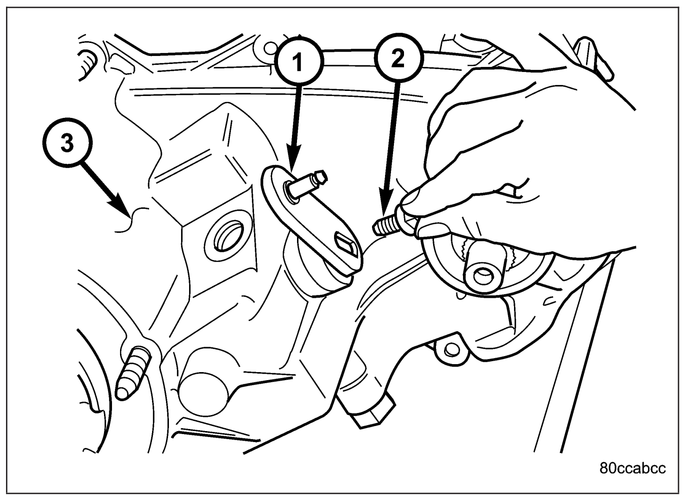
## REAR EXTENSION

1. Install new seal in rear extension housing seal with Installer D-163 and Handle C-4171..
2. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.
3. Align and install rear extension housing (1) on retainer.
4. Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 16-24 N·m (12-18 ft. lbs.) torque.

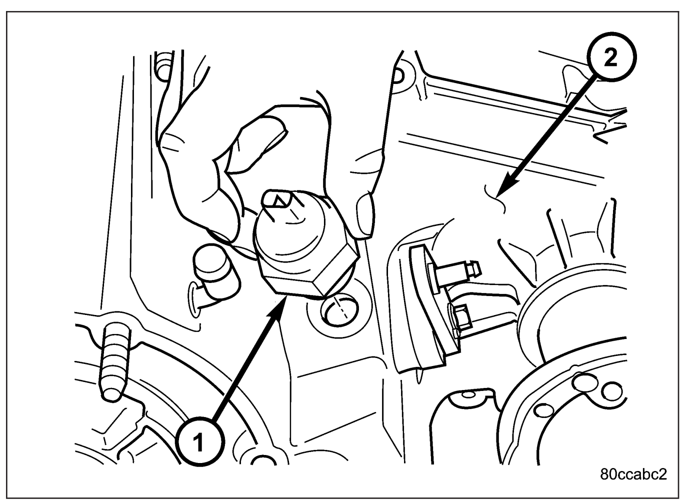


## COMPANION FLANGE AND RANGE LEVER

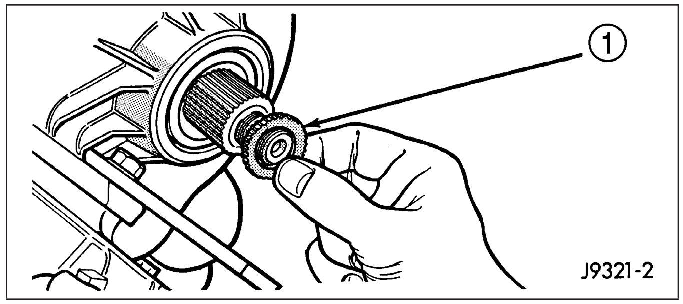
1. Install range lever (1) and bolt (2) on sector shaft. Tighten bolt to 27-34 N·m (20-25 ft. lbs.) torque.



2. Inspect the o-ring on the transfer case position sensor. Replace the o-ring if necessary.
3. Install the transfer case position sensor (1) in the front case (2). Tighten sensor to 20-34 N·m (15-25 ft. lbs.) torque.

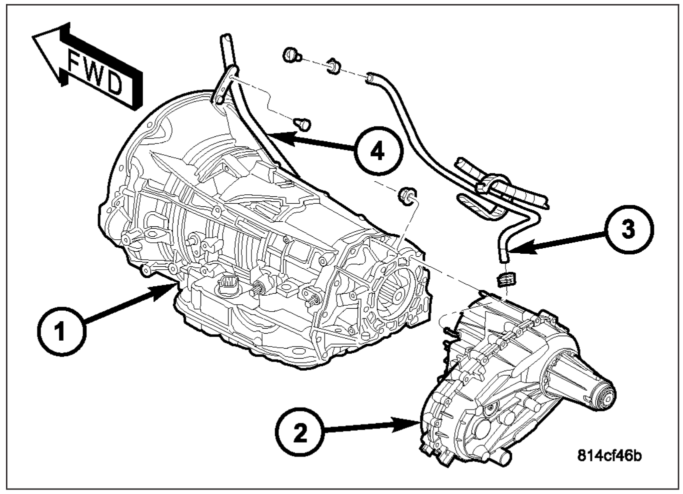


4. Install new seal washer (1) on front output shaft.
5. Lubricate companion flange hub with transmission fluid and install flange onto the front ouput shaft.
6. Install new flange nut onto front output shaft.
7. Tighten flange nut to 122-176 N·m (90-130 ft. lbs.) torque.

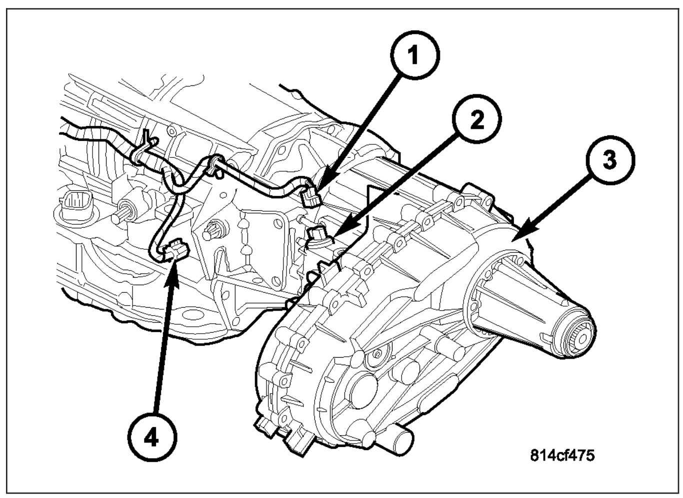


## INSTALLATION

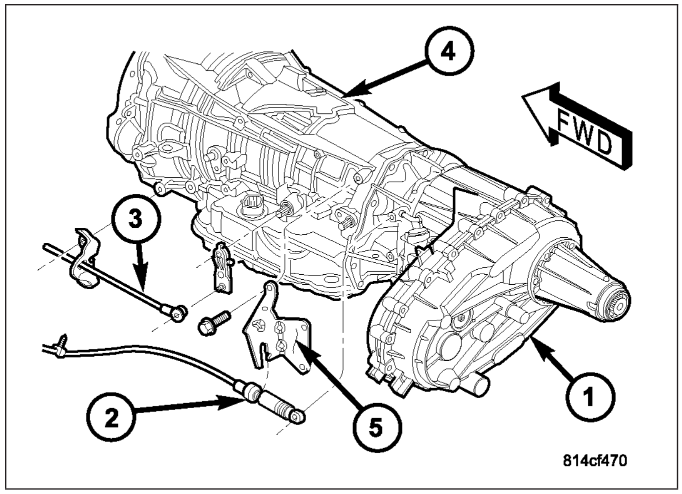
1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case on transmission.
5. Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque.
6. Connect vent hose (3).



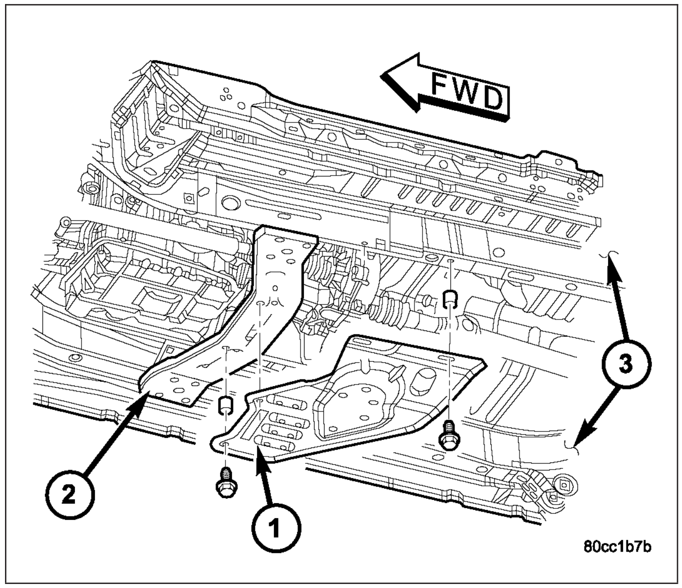
7. Connect transfer case position sensor connector (1) to sensor (2).
8. Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).



9. Connect shift cable (2) to transfer case range (1) lever.



10. Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.
11. Install skid plate (1). (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)
12. Remove transmission jack and support stand.
13. Lower vehicle and verify transfer case shift operation.



## SPECIFICATIONS

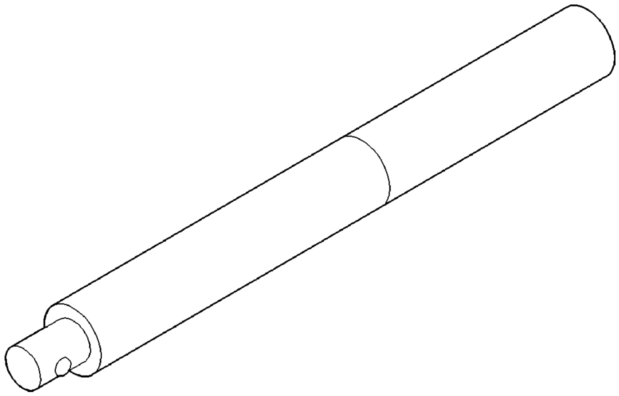
## TRANSFER CASE - NV241 GENII

### TORQUE SPECIFICATIONS

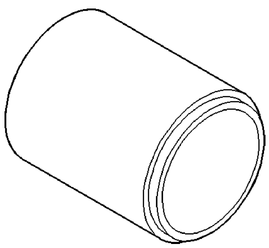
| DESCRIPTION | N-m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Plug, Detent | 16-24 | 12-18 | - |
| Plug, Drain/Fill | 20-34 | 15-25 | - |
| Bolt, Extension Housing | 16-24 | 12-18 | - |
| Bolt, Case Half | 20-27 | 15-24 | - |
| Screw, Oil Pump | 12-16 | 8-12 | - |
| Nut, Front Companion Flange | 122-176 | 90-130 | |
| Nut, Range Lever | 27-34 | 20-25 | - |
| Sector Support | 27-42 | 20-30 | - |
| Nuts, Mounting | 30-41 | 20-30 | - |
| Position Sensor | 20-34 | 16-25 | - |

## SPECIAL TOOLS

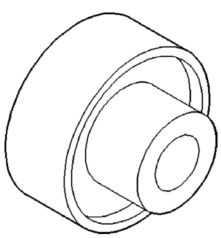
## TRANSFER CASE - NV241 GENII



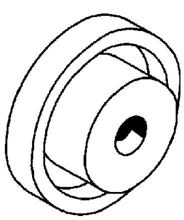
*Handle, Universal - C-4171*



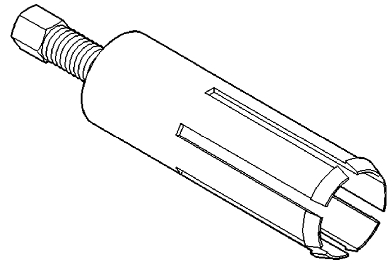
*Installer, Seal - 6888*



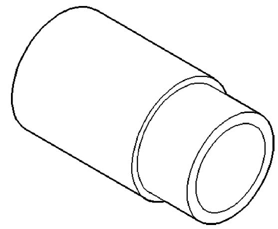
*Installer, Bearing - 6953*



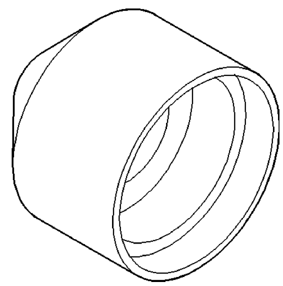
*Installer, Seal - C-4210*



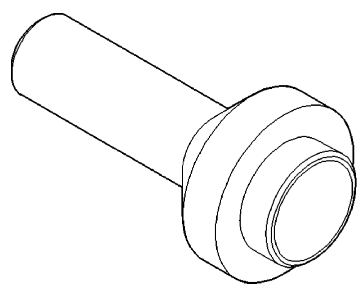
*Remover, Bushing - 6957*



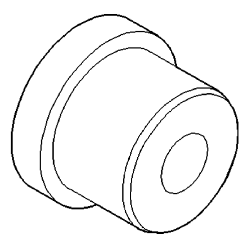
*Installer, Bushing - 8157*



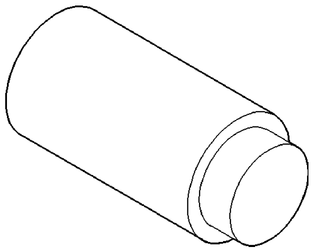
*Installer, Seal - D-163*



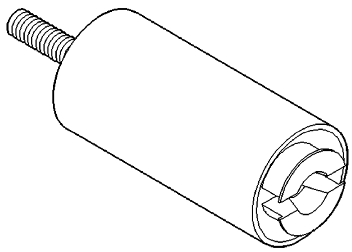
*Installer, Seal - 7884*



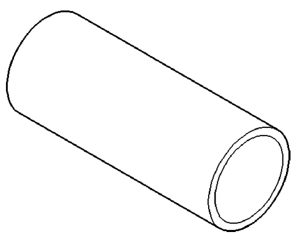
*Installer, Bushing - 5066*



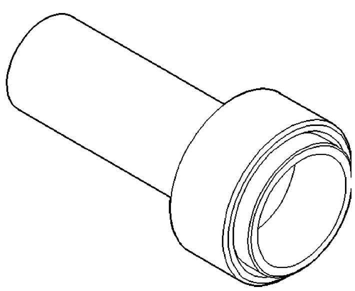
***Plug, Extension - C-293-3***



***Remover - L-4454***



***Cup - 8148***



***Installer, Pump Housing Seal - 7888***

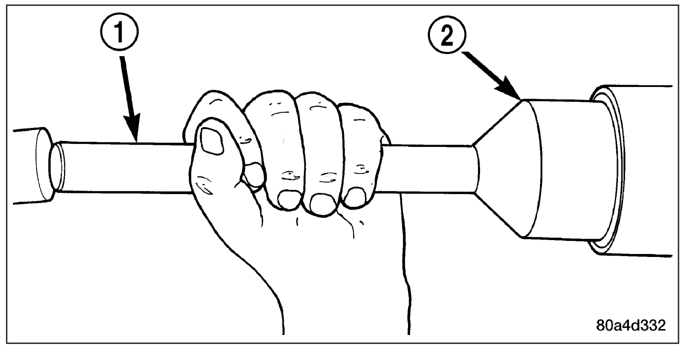
# SEAL-EXTENSION HOUSING

## REMOVAL

1. Raise and support vehicle.
2. Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

## INSTALLATION

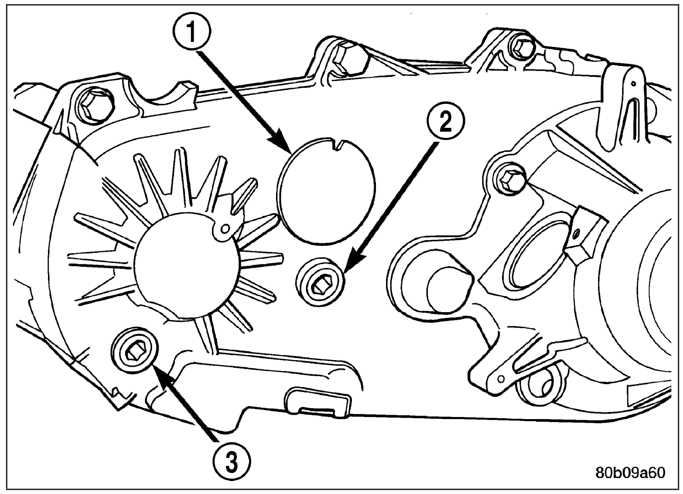
1. Clean fluid residue from sealing surface and inspect for defects.
2. Using Seal Installer D-163 (2) and Universal Handle C-4171 (1), install seal in extension housing.
3. Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
4. Verify proper transfer case fluid level.
5. Lower vehicle.



# FLUID

## STANDARD PROCEDURE - FLUID DRAIN AND FILL

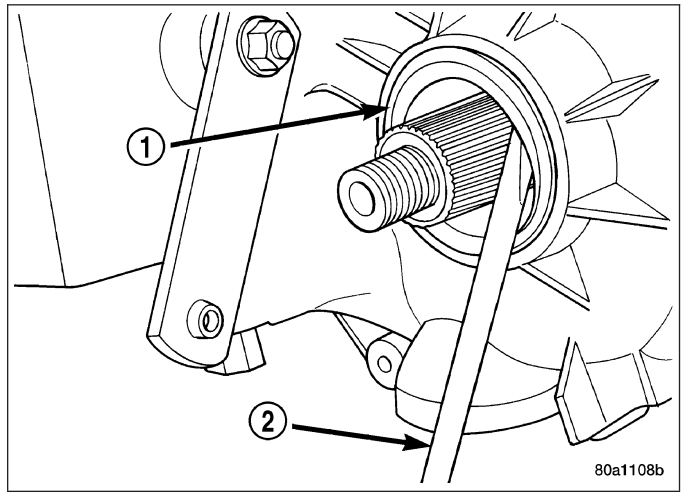
The fill (2) and drain (3) plugs are both in the rear case. Correct fill level is to the bottom edge of the fill plug hole. Be sure the vehicle is level to ensure an accurate fluid level check.



# SEAL-FRONT OUTPUT SHAFT

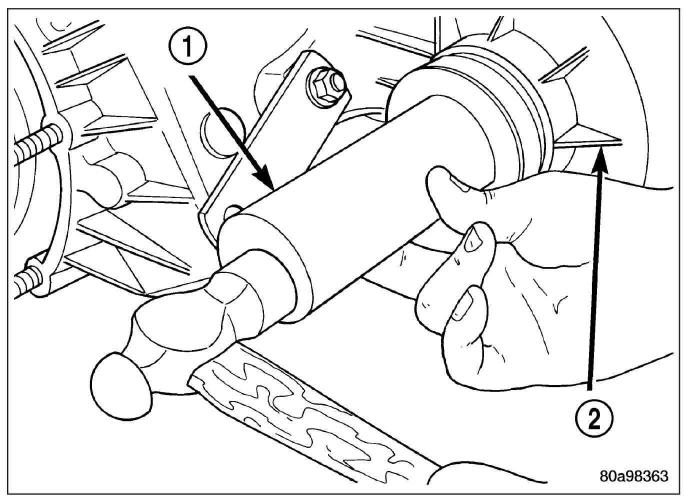
## REMOVAL

1. Raise vehicle.
2. Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Remove front output shaft companion flange.
4. Remove seal (1) from front case with pry tool (2).



## INSTALLATION

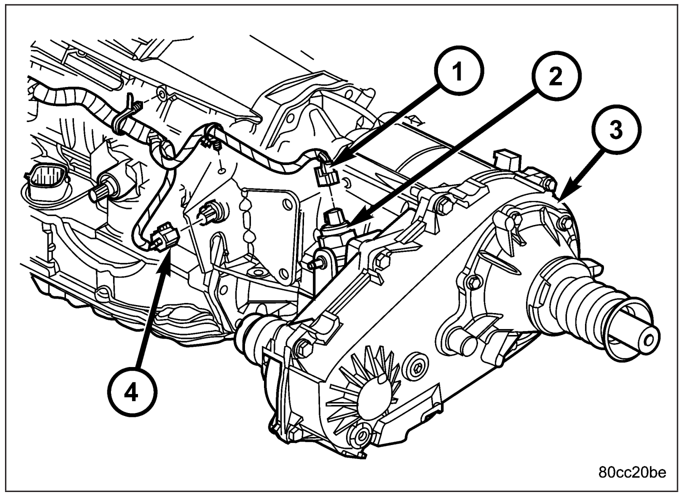
1. Install new front output seal in front case (2) with Installer Tool 6952-A (1) as follows:
   a. Place new seal on tool. Garter spring on seal goes toward interior of case.
   b. Start seal in bore with light taps from hammer. Once seal is started, continue tapping seal into bore until installer tool seats against case.
2. Install the front output shaft companion flange. Tighten the companion flange nut to 149 N·m (110 ft.lbs.).
3. Install the front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)



# SENSOR-POSITION

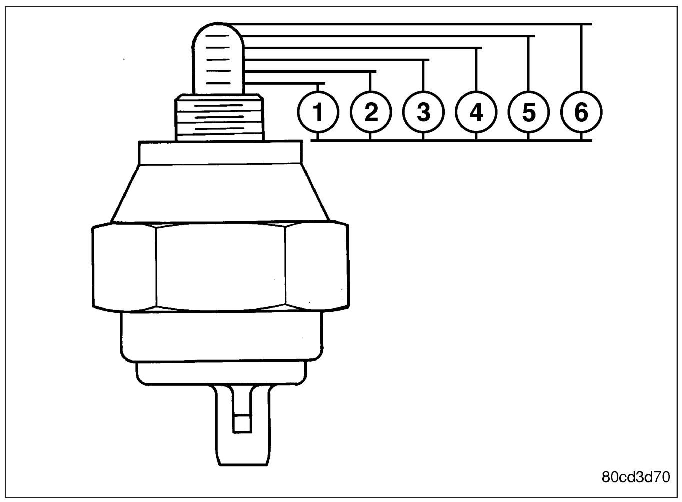
## DESCRIPTION

The transfer case position sensor (2) is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the sector plate roostercomb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.



## OPERATION

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. Refer to the Operating Mode Versus Resistance table for the correct resistance for each position.



***Position Sensor Linear Movement***

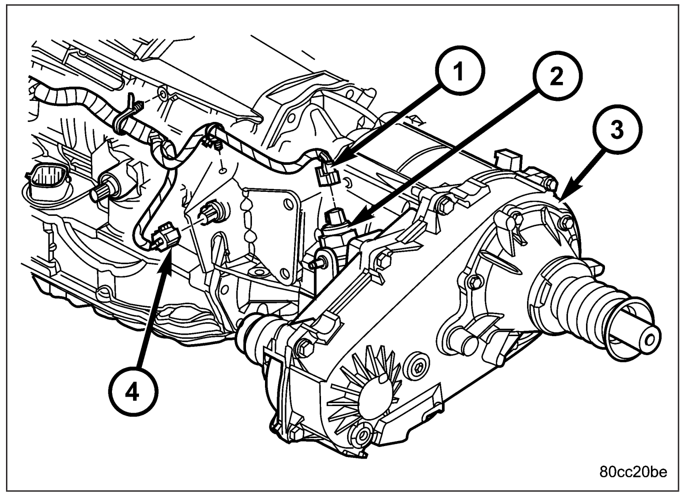
1 - POSITION 1 - 10mm ±0.5mm
2 - POSITION 2 - 12mm ±0.5mm
3 - POSITION 3 - 14mm ±0.5mm
4 - POSITION 4 - 16mm ±0.5mm
5 - POSITION 5 - 18mm ±0.5mm
6 - POSITION 6 - 20mm±0.5mm - FULL EXTENSION

**Operating Mode Versus Resistance**

| SENSOR POSITION | OPERATING MODE | SENSOR RESISTANCE (ohms) |
|---|---|---|
| 1 | 2WD | 1124-1243 |
| 2 | 4WD PART TIME | 650-719 |
| 3 | 4WD FULL TIME | 389-431 |
| 4 | NEUTRAL | 199-221 |
| 5 | 4WD LOW | 57-64 |

## REMOVAL

1. Raise and support the vehicle.
2. Disengage the transfer case position sensor connector from the position sensor (2).
3. Remove the position sensor from the transfer case.



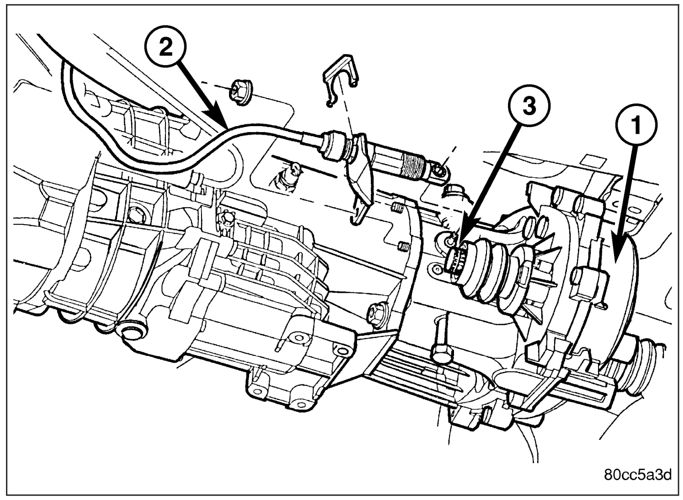
## INSTALLATION

1. Inspect the o-ring seal on the transfer case position sensor. Replace the o-ring if necessary.
2. Install the transfer case position sensor into the transfer case. Torque the sensor to 27 N·m (20 ft.lbs.).
3. Engage the transfer case position sensor connector to the position sensor.
4. Lower vehicle.
5. Verify proper sensor operation.

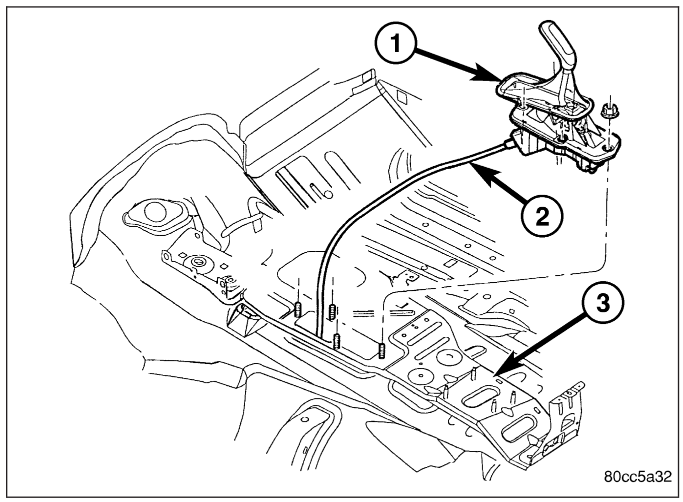
# LEVER-SHIFT

## REMOVAL

1. Shift transfer case into 4L.
2. Raise vehicle.
3. Remove clip securing the transfer case shift cable (2) to the shift cable support bracket.
4. Disengage any additional shift cable routing clips, if necessary.
5. Disengage the shift cable from the transfer case manual lever.



6. Lower vehicle.
7. Remove the floor console as necessary to access the shifter mechanism. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
8. Remove the nuts attaching lever assembly (1) to floorpan and remove assembly and shift cable (2).
9. Remove the shifter mechanism and cable assembly from the vehicle.



## INSTALLATION

1. Route the shift cable through the opening in the floor pan.
2. Position the shift mechanism over the shifter retaining studs on the floor pan.
3. Install the nuts to hold the shifter mechanism to the floor pan. Tighten the nuts to 11.86 N·m (105 in.lbs.).
4. Install any floor console components previously removed. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)
5. Verify that the floor shifter is in the 4L position.
6. Raise vehicle.
7. Route the shift cable through the opening in the shift cable support bracket.
8. Install the cable and a new spring clip into the slot in the support bracket.
9. Install any additional routing clips on the shift cable.
10. Verify that the transfer case is in the 4L position. The 4L position for the transfer case is with the manual lever to the full rearward position.
11. Attach the shift cable to the transfer case manual lever.
12. Lower vehicle and check for proper transfer case shifter operation.

# TRANSFER CASE - NV242

## TABLE OF CONTENTS

# TRANSFER CASE - NV242

## DESCRIPTION

The NV242 is a full-time transfer case. It provides full time 2-wheel, or 4-wheel drive operation.

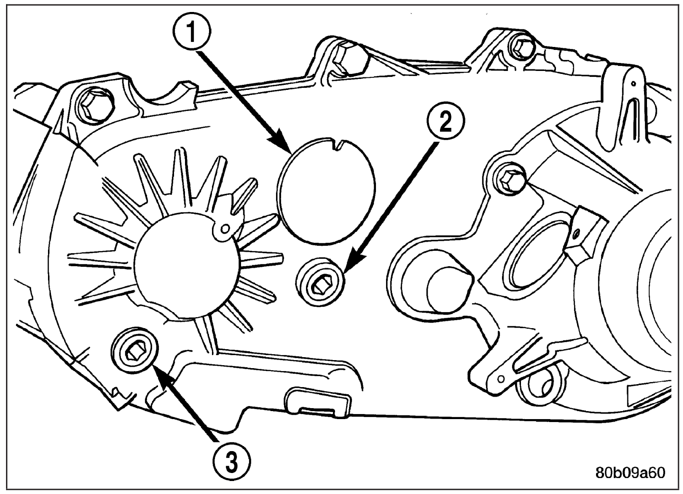
A differential in the transfer case is used to control torque transfer to the front and rear axles. A low range gear provides increased low speed torque capability for off road operation. The low range provides a 2.72:1 reduction ratio.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

### TRANSFER CASE IDENTIFICATION

A circular ID tag (1) is attached to the rear case of each transfer case. The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.



### OPERATING RANGES

NV242 operating ranges are 2WD (2-wheel drive), 4x4 part-time, 4x4 full time, 4 Lo, and Neutral.

The 2WD and 4x4 full time ranges can be used at any time and on any road surface.

The 4x4 part-time and 4 Lo ranges are for off road use only. The only time these ranges can be used on hard surface roads, is when the surface is covered with snow and ice.

### SHIFT MECHANISM

Operating ranges are selected with a floor mounted shift lever. The shift lever is connected to the transfer case range lever by a shift cable. A straight line shift pattern is used. Range positions are marked on the shifter bezel cover plate, or on the shift knob.

## OPERATION

The input gear is splined to the transmission output shaft. It drives the mainshaft through the planetary gear and range hub. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchro mechanism for shifting.

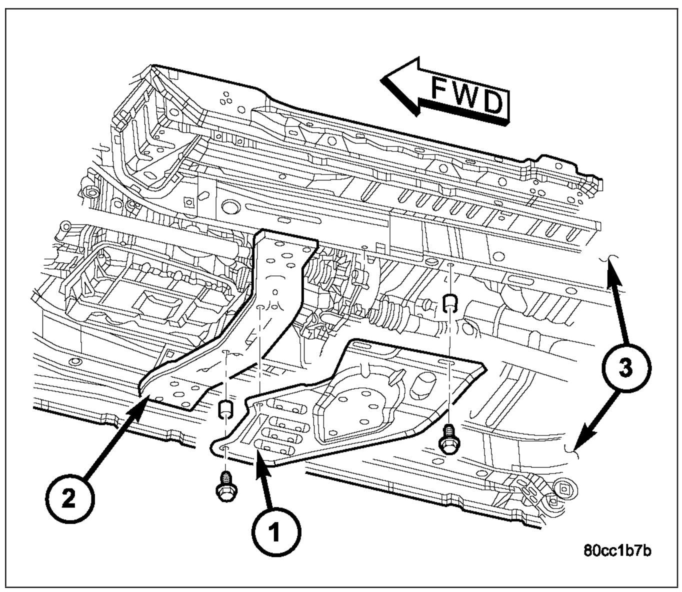
## DIAGNOSIS AND TESTING - TRANSFER CASE - NV242

#### DIAGNOSIS CHART

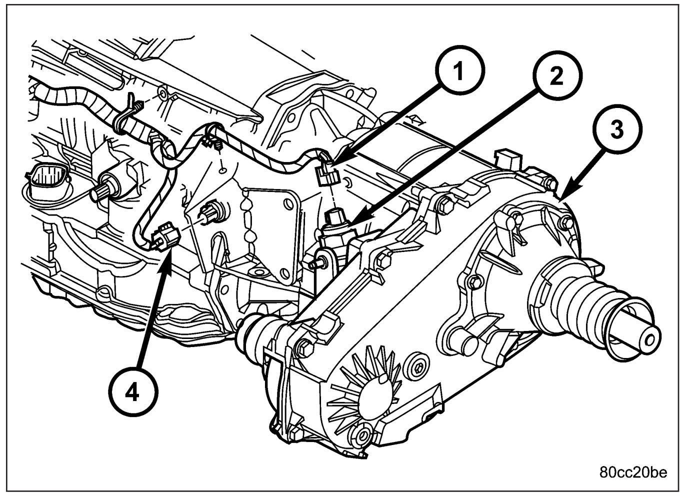
| CONDITION | POSSIBLE CAUSE | CORRECTION |
|---|---|---|
| Transfer case difficult to shift or will not shift into desired range. | 1) Transfer case shift cable binding. | 1) Repair or replace cable as necessary. |
| | 2) Insufficient or incorrect lubricant. | 2) Drain and refill transfer case with the correct type and quantity of lubricant. |
| | 3) Internal transfer case components binding, worn, or damaged. | 3) Repair or replace components as necessary. |
| Transfer case noisy in all drive modes. | 1) Insufficient or incorrect lubricant. | 1) Drain and refill transfer case with the correct type and quantity of lubricant. |
| Lubricant leaking from transfer case seals or vent. | 1) Transfer case overfilled. | 1) Drain lubricant to the correct level. |
| | 2) Transfer case vent closed or restricted. | 2) Clean or replace vent as necessary. |
| | 3) Transfer case seals damaged or installed incorrectly. | 3) Replace suspect seal. |
| Transfer case will not shift through 4X4 part time range (light remains on) | 1) Incomplete shift due to drivetrain torque load. | 1) Momentarily release the accelerator pedal to complete the shift. |
| | 2) Incorrect tire pressure. | 2) Correct tire pressure as necessary. |
| | 3) Excessive Tire wear. | 3) Correct tire condition as necessary. |
| | 4) Excessive vehicle loading. | 4) Correct as necessary. |

## REMOVAL

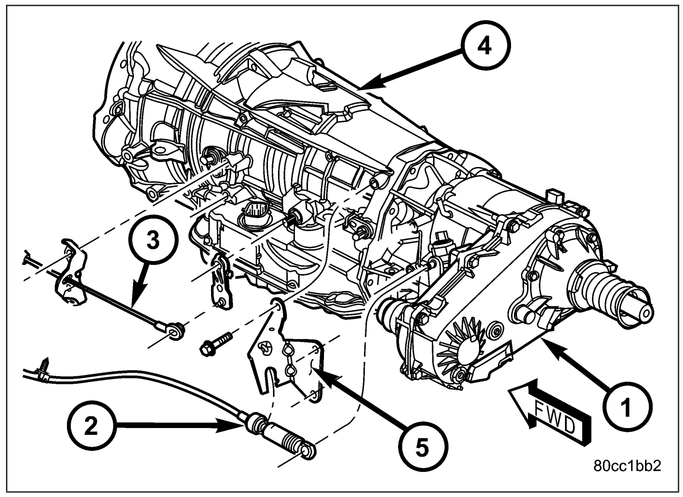
1. Shift transfer case into NEUTRAL.
2. Raise vehicle.
3. Remove skid plate (1).



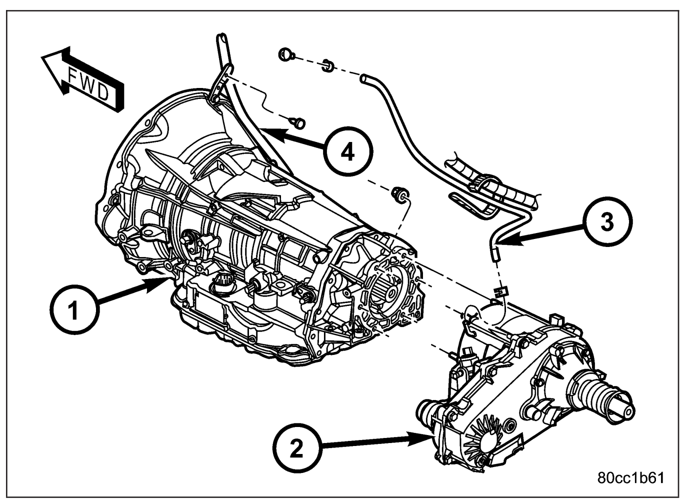
4. Drain transfer case lubricant.
5. Mark front and rear propeller shaft yokes for alignment reference.
6. Disconnect front/rear propeller shafts at transfer case.
7. Disconnect transfer case position sensor connector (1).



8. Disconnect transfer case shift cable (2) at the range lever.
9. Disconnect the transfer case shift cable from the shift cable bracket.



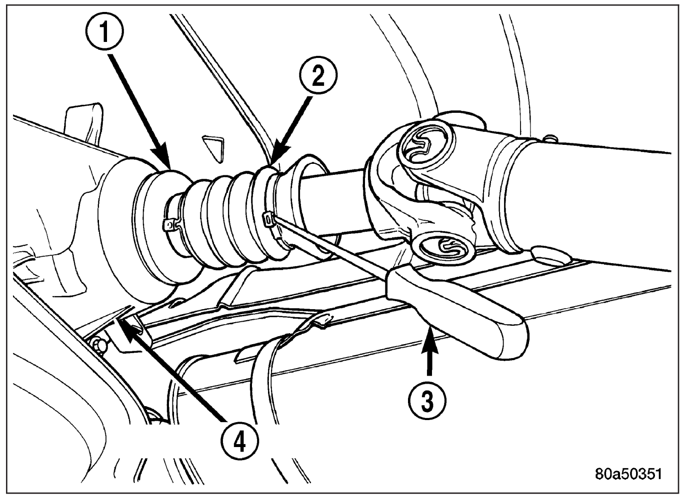
10. Disconnect transfer case vent hose (3).
11. Support transfer case with transmission jack.
12. Secure transfer case to jack with chains.
13. Remove nuts attaching transfer case to transmission.
14. Pull transfer case and jack rearward to disengage transfer case.
15. Remove transfer case from under vehicle.



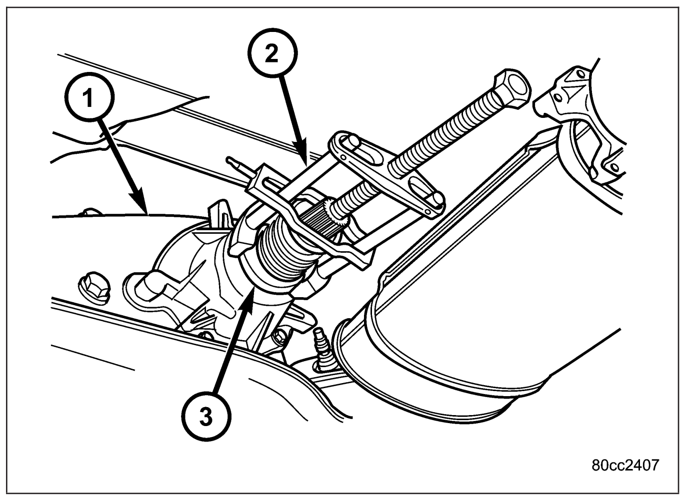
## DISASSEMBLY

### REAR RETAINER

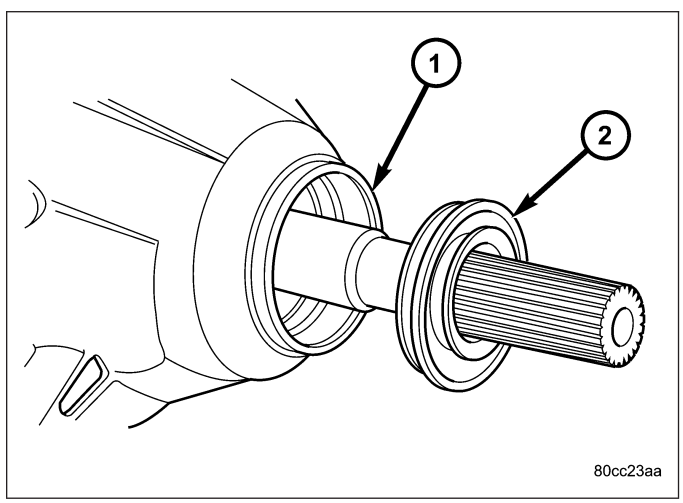
1. Remove output shaft boot (2). Spread band clamp that secures boot on slinger with a suitable awl. Then slide boot off shaft.



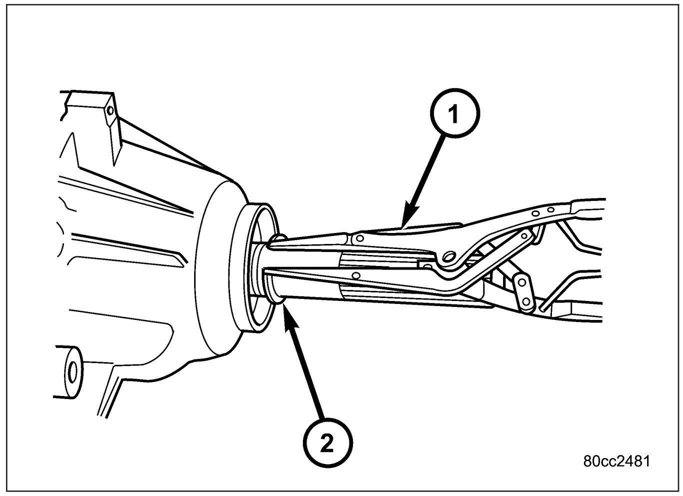
2. Using puller MD-998056-A (2), remove rear slinger (3).



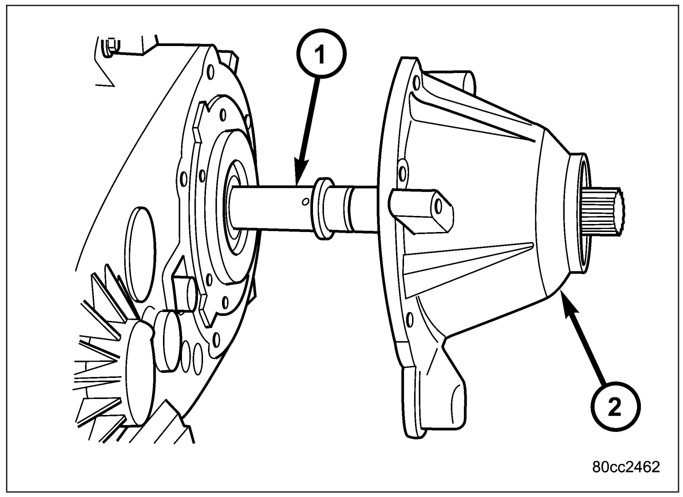
3. Remove rear seal (2) from retainer (1). Use pry tool, or collapse seal with punch to remove it.



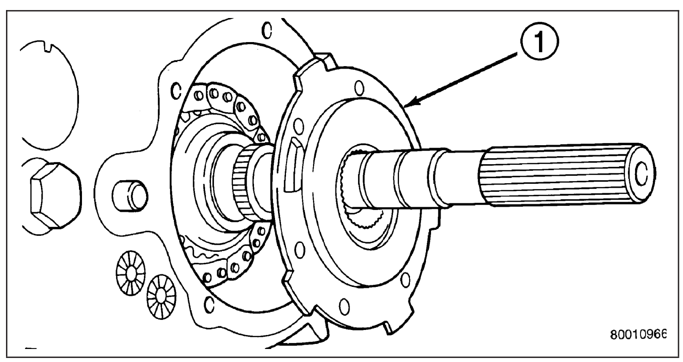
4. Remove rear output bearing I.D. retaining ring (2).



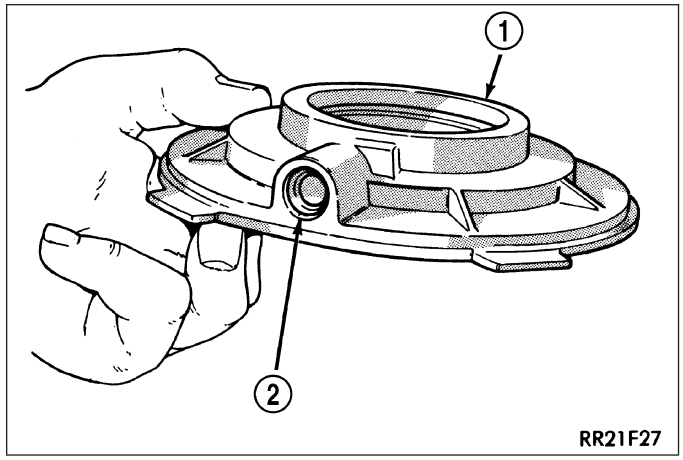
5. Remove rear retainer bolts.
6. Remove rear retainer (2). Tap retainer with mallet and pry upward to break sealer bead. Then slide retainer off case and output shaft.



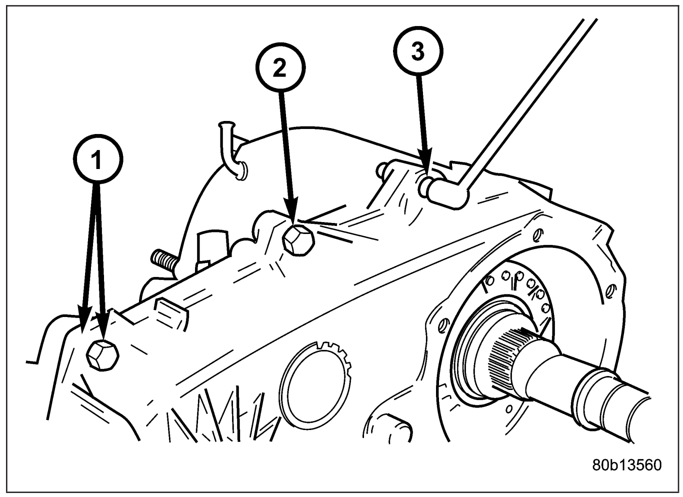
7. Remove rear bearing O.D. retaining ring with snap-ring pliers. Then tilt oil pump (1) and slide it off output shaft.



8. Remove pickup tube O-ring (2) from pump (1) but do not disassemble pump; it is not a serviceable part.

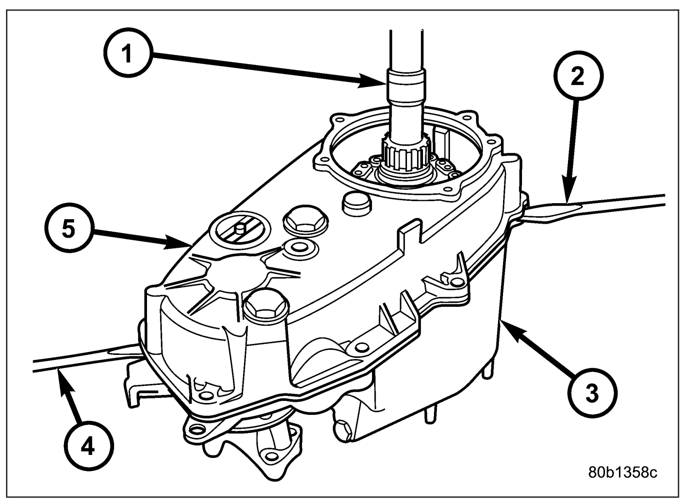


9. Remove bolts (2) attaching rear case to front case. Note position of the two black finish bolts (1) at each end of the case. These bolts go through the case dowels and require a washer under the bolt head.

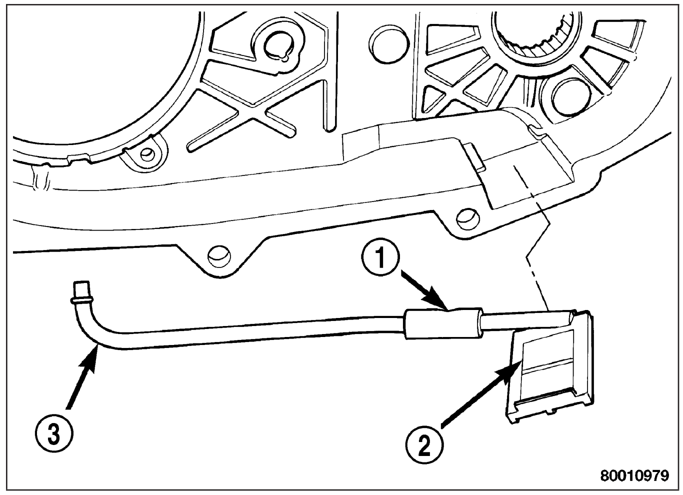


**CAUTION: Do not pry on the sealing surface of either case half as the surfaces will become damaged.**

10. Remove rear case (5) from front case (3). Insert screwdrivers into slots cast into each end of case. Then pry upward to break sealer bead and remove rear case.

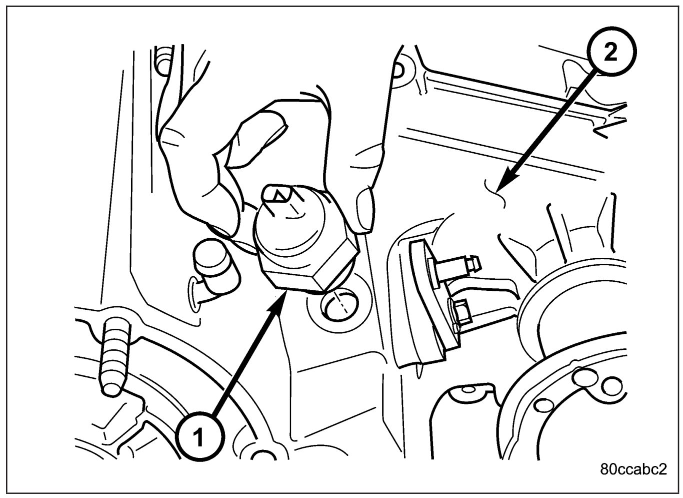


11. Remove oil pickup tube (3) and screen (2) from rear case.

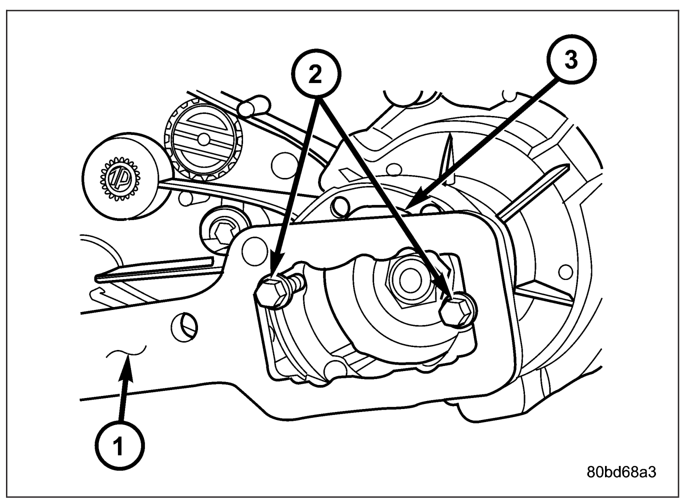


## COMPANION FLANGE AND RANGE LEVER

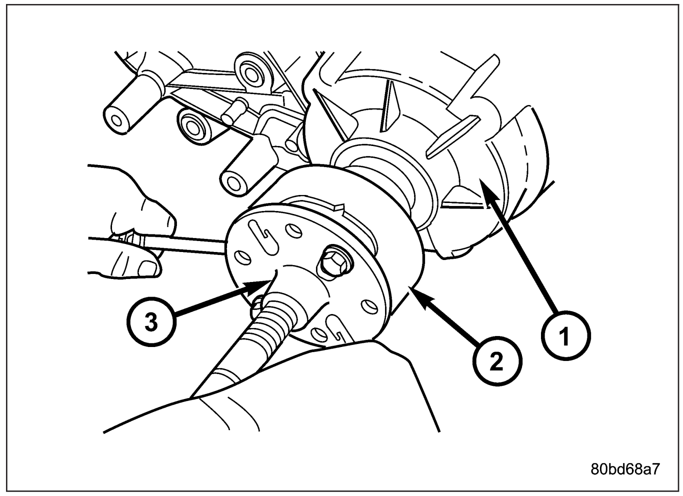
1. Remove transfer case position sensor (1).



2. Install two bolts (2) partially into the propeller shaft companion flange, 180° from each other.
3. Install the rectangular end of the Flange Holder C-3281 (1) over the bolts to hold the companion flange (3) stationary and remove the nut holding the companion flange to the output shaft.

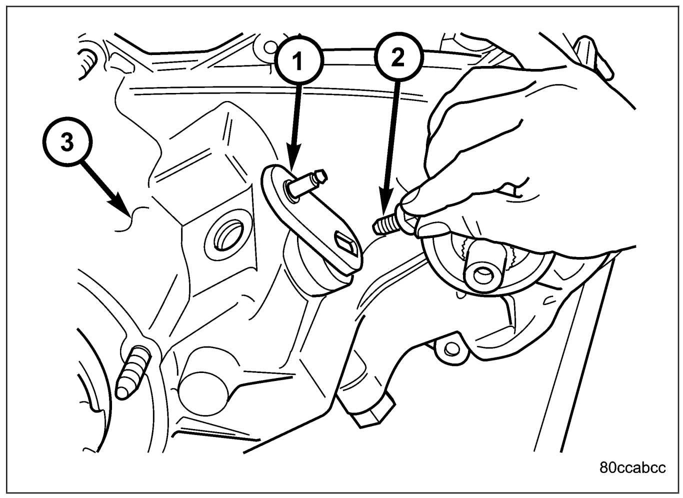


4. Use Remover C-452 (3) to remove the companion flange (2).



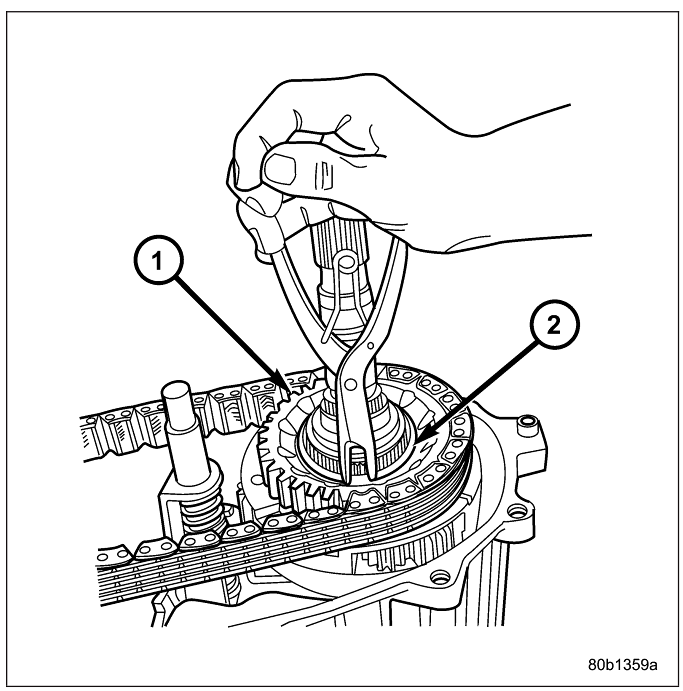
**NOTE: Be sure to note the orientation of the range lever (lever up or down) so that it may be re-installed in the same direction.**

5. Remove seal washer from front output shaft. Discard washer as it should not be reused.
6. Remove the bolt (2) that attaches the range lever (1) to sector shaft. Then move sector to neutral position and remove range lever from shaft.

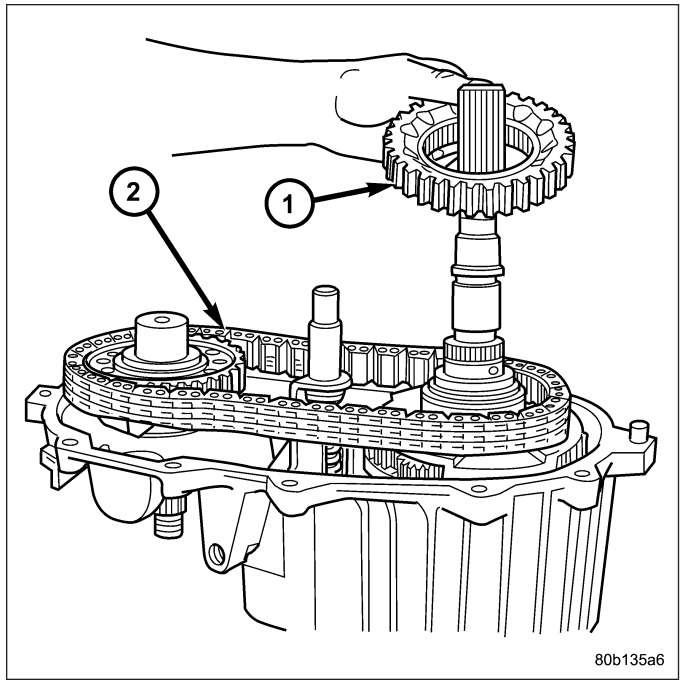


## FRONT OUTPUT SHAFT AND DRIVE CHAIN

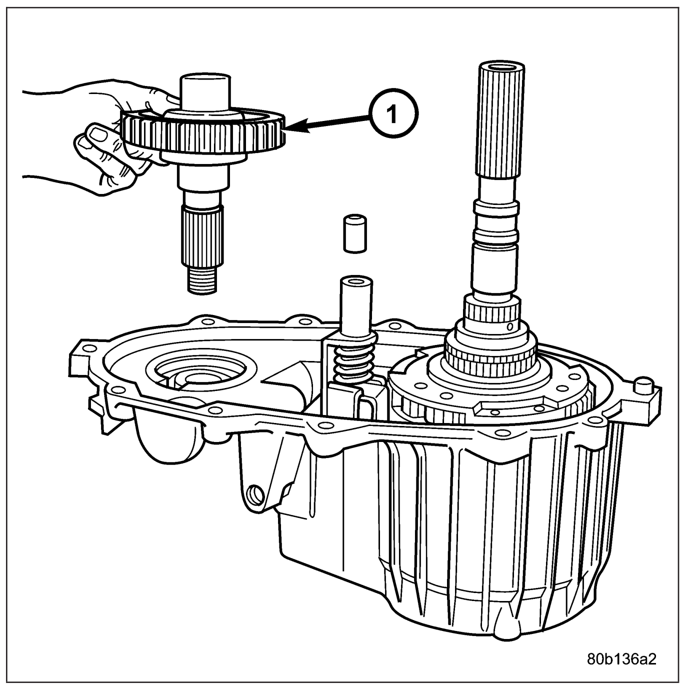
1. Remove drive sprocket (1) snap-ring (2).



2. Remove drive sprocket (1) and chain (2).

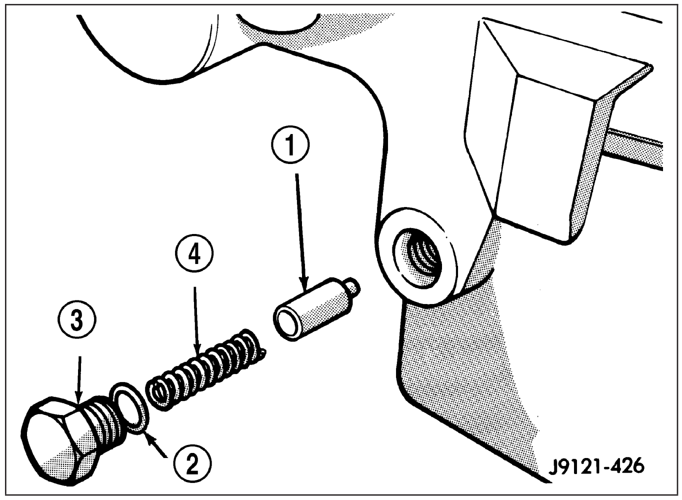


3. Remove front output shaft (1).

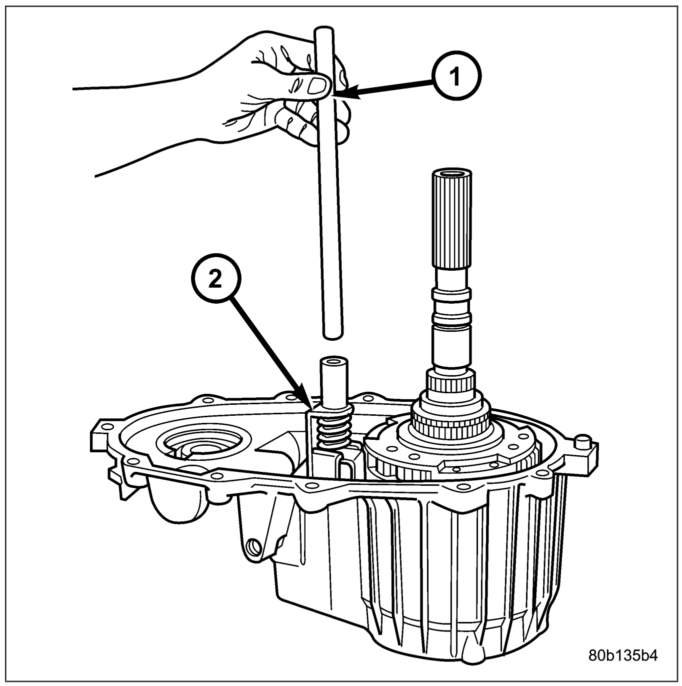


## SHIFT FORKS AND MAINSHAFT

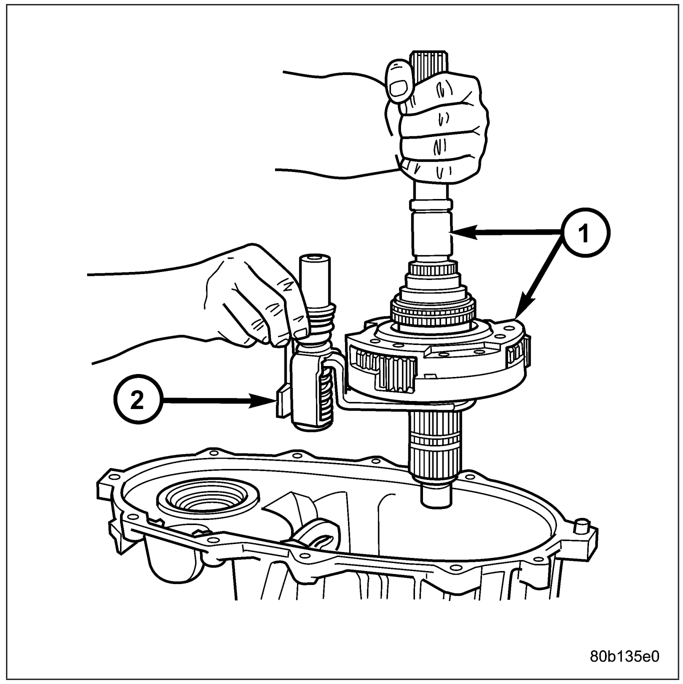
1. Remove shift detent plug (3), spring (4), and plunger (1).



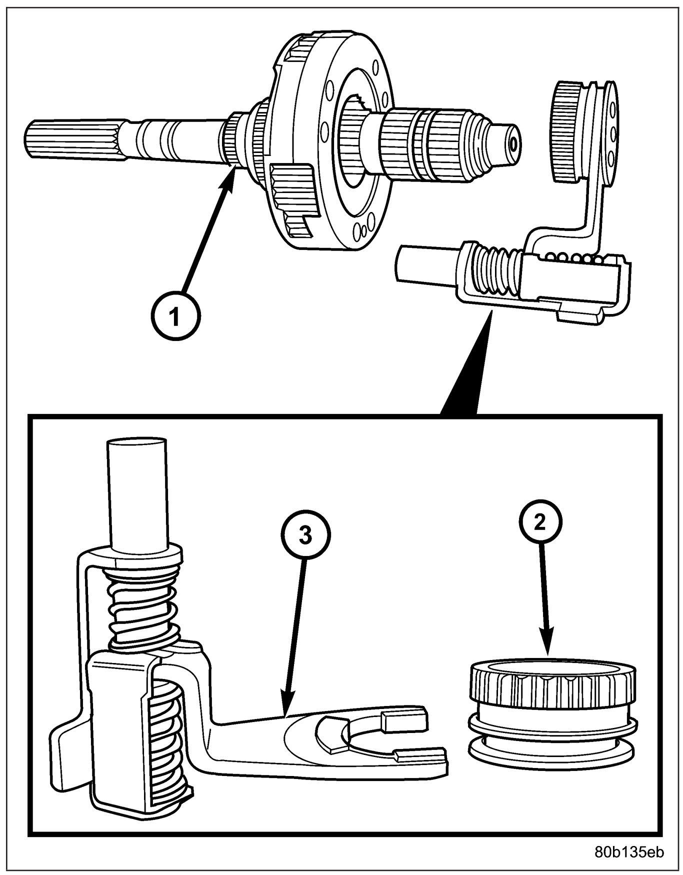
2. Remove seal plug from low range fork lockpin access hole. Then move shift sector to align low range fork lockpin with access hole.
3. Remove range fork lockpin with size number one easy-out tool as follows:
   a. Insert easy-out tool through access hole in side of transfer case and into lock-pin.
   b. Tap easy-out tool into lock-pin with hammer until tool is securely engaged into the lock-pin.
   c. Install a t-handle, such as from a tap and die set, onto the easy-out tool.
   d. Securely tighten the t-handle onto the tool.
   e. In one motion, pull upward and turn the t-handle counter-clockwise to remove the lock-pin.
4. Remove shift rail (1) by pulling it straight up and out of fork (2).



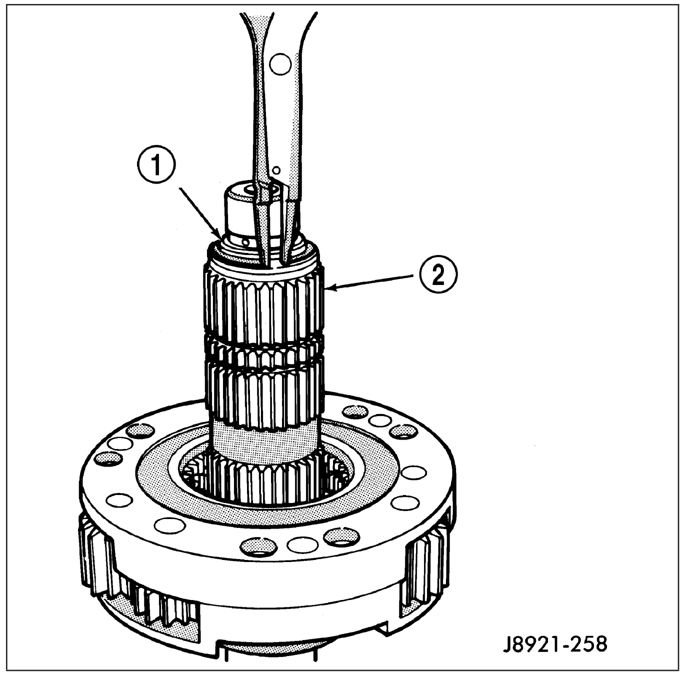
5. Remove mode fork (2) and mainshaft as assembly (1).



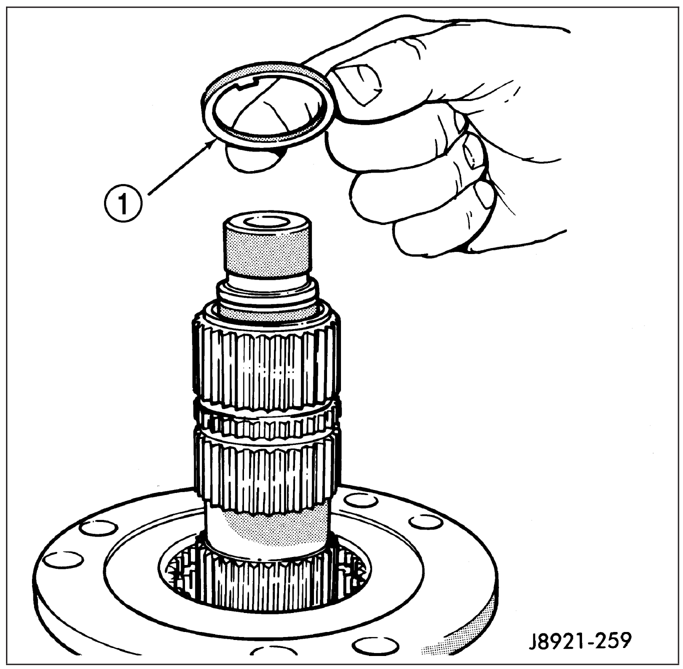
6. Remove mode shift sleeve (2) and mode fork assembly (3) from mainshaft (1). Note position of mode sleeve in fork and remove sleeve.



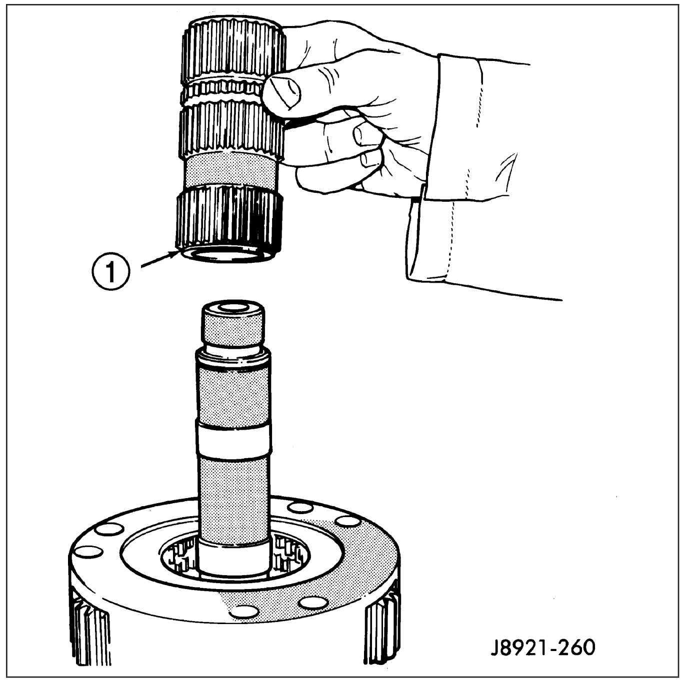
7. Remove intermediate clutch shaft (2) snap-ring (1).



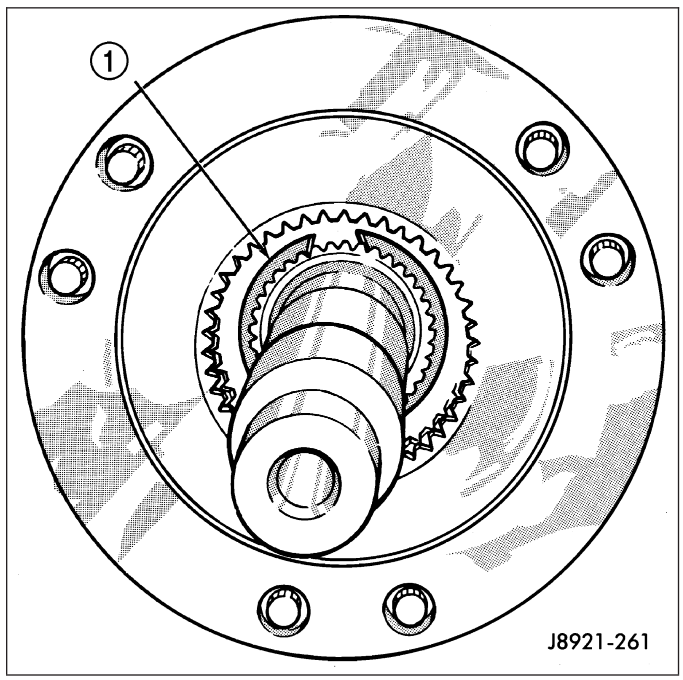
8. Remove clutch shaft thrust ring (1).



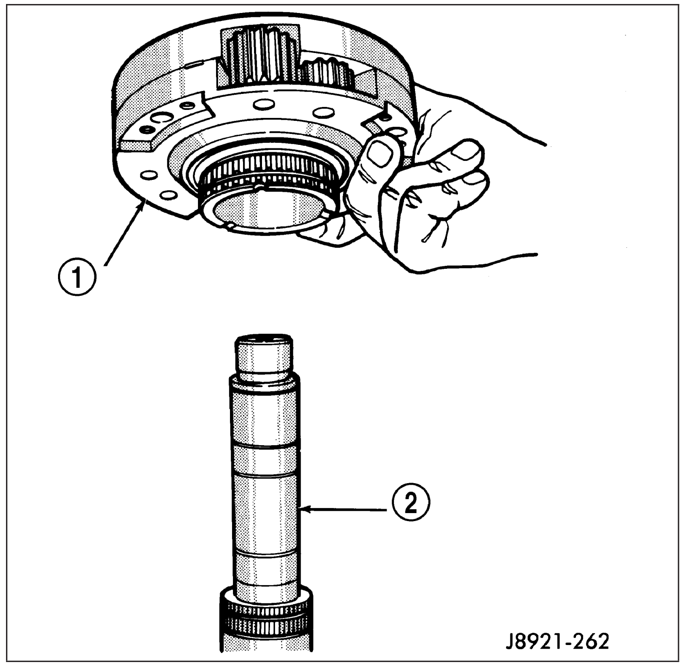
9. Remove intermediate clutch shaft (1).



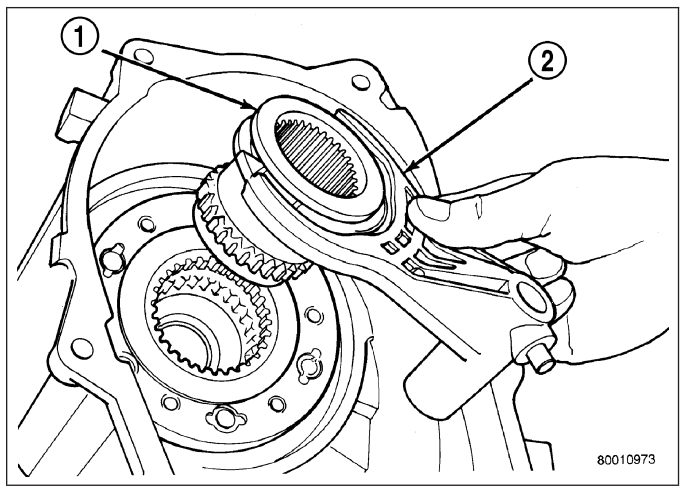
10. Remove differential snap-ring (1).



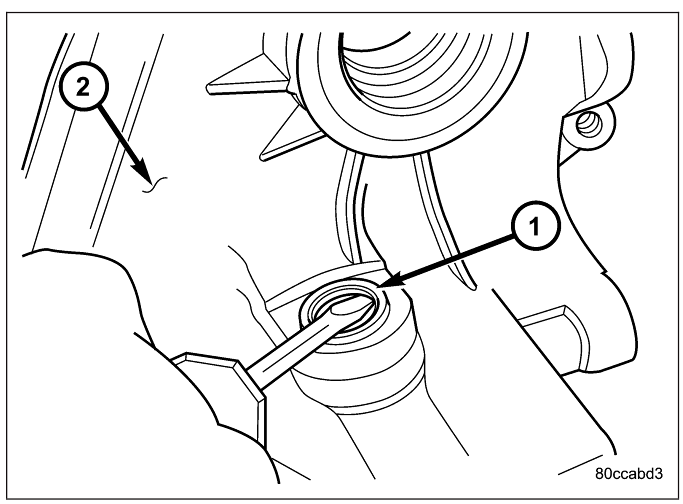
11. Remove differential (1).
12. Remove differential needle bearings and both needle bearing thrust washers from mainshaft.



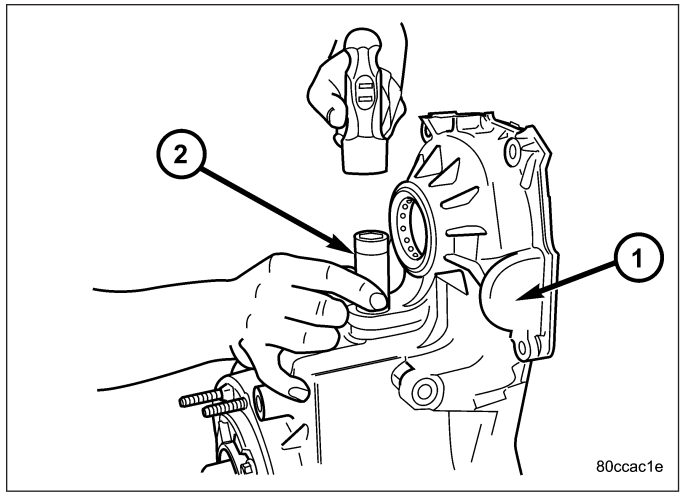
13. Slide low range fork pin out of shift sector slot.
14. Remove low range fork (2) and hub (1).
15. Remove shift sector.



16. Remove the shift sector shaft seal (1).

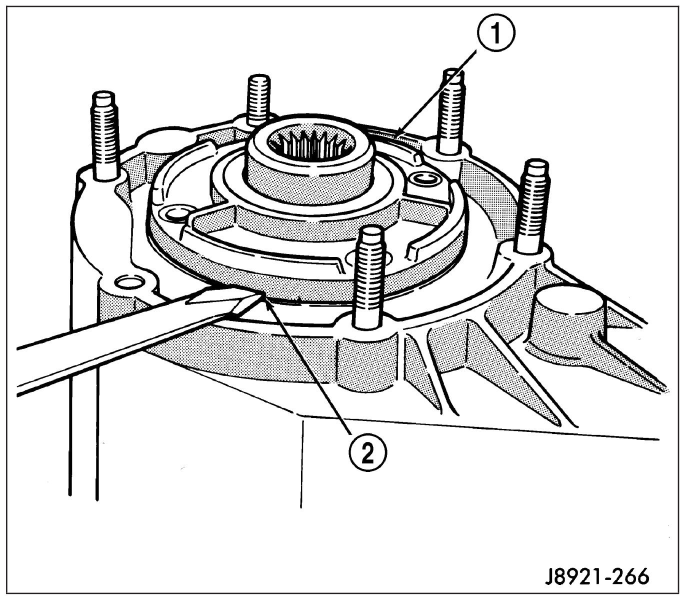


17. Remove the shift sector shaft bearing with an appropriate socket (2).

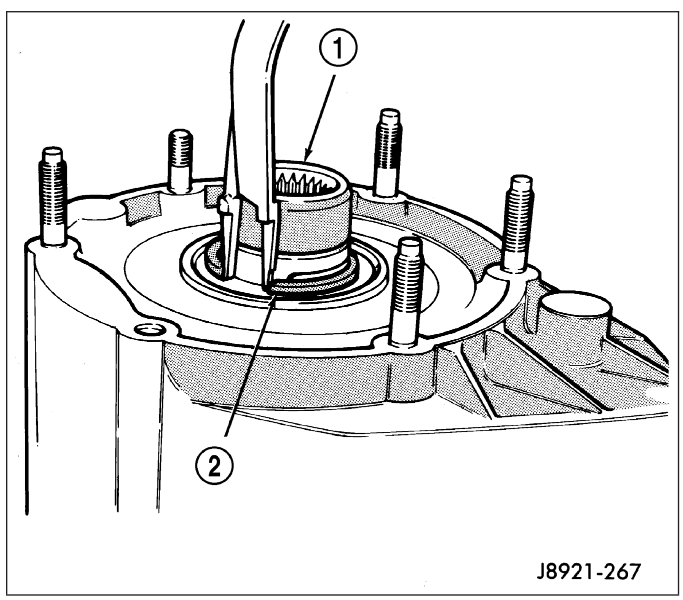


## INPUT GEAR/LOW RANGE ASSEMBLY

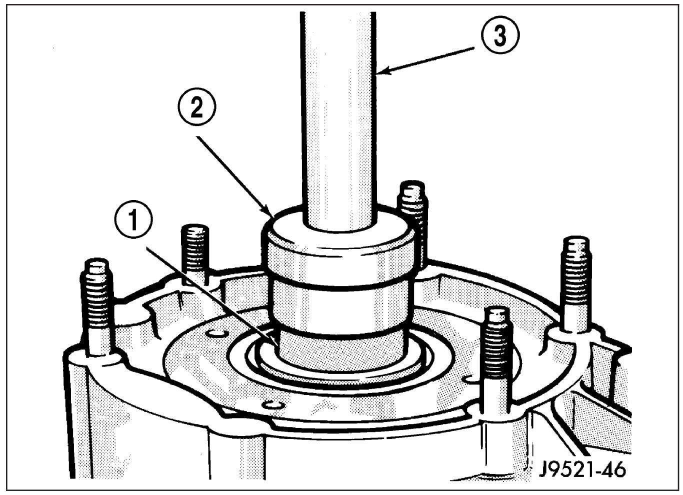
1. Remove front bearing retainer bolts.
2. Remove front bearing retainer (1). Carefully pry retainer loose with screwdriver. Position screwdriver in slots (2) cast into retainer.



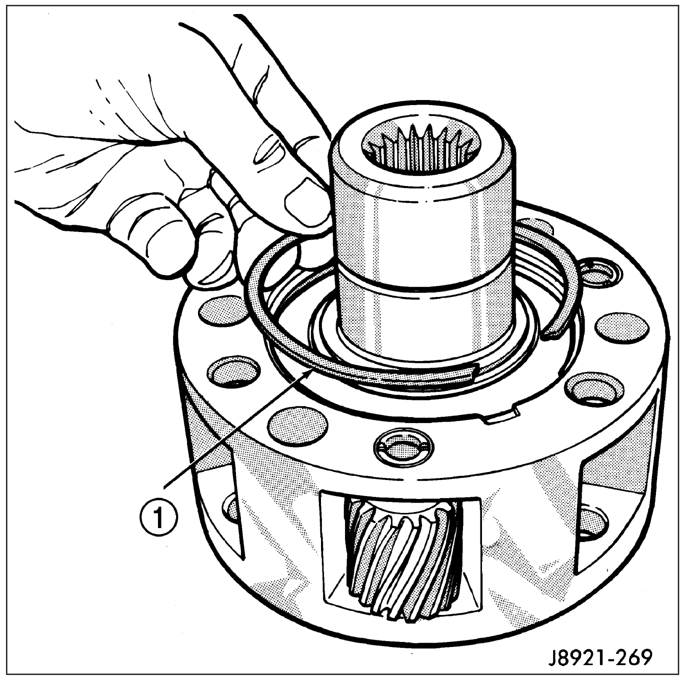
3. Remove input gear snap-ring (2).



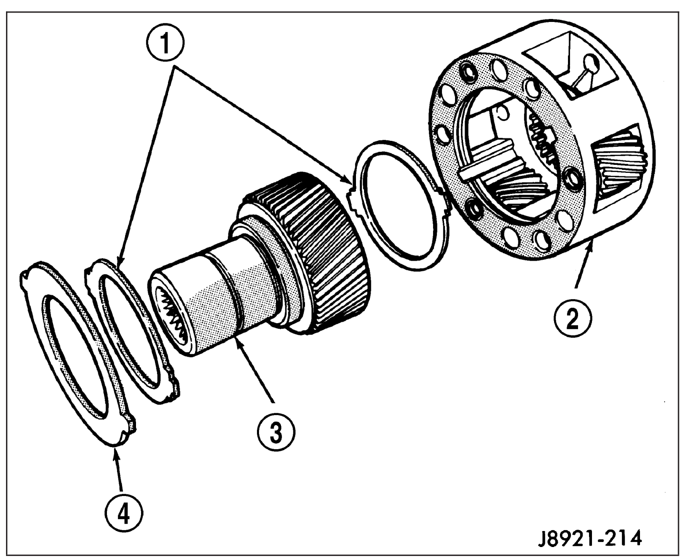
4. Remove input/low range gear assembly from bearing with Universal Handle C-4171 (3) and Tool 7829-A (2).



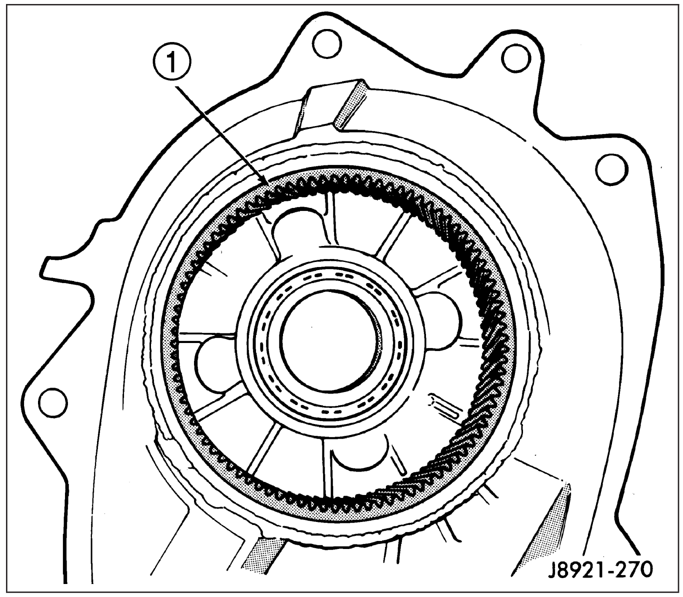
5. Remove low range gear snap-ring (1).



6. Remove input gear retainer, thrust washers (1), and input gear (3) from low range gear (2).

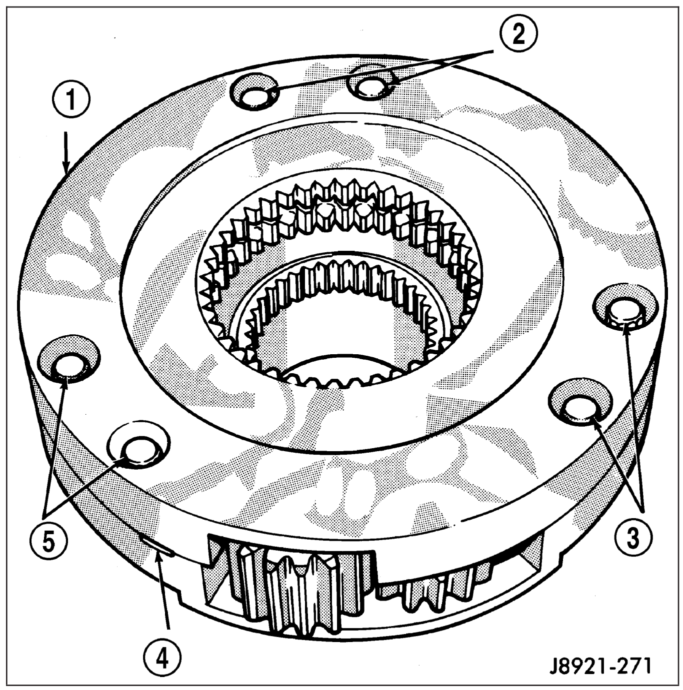


7. Inspect low range annulus gear (1). The annulus gear is not a serviceable component. If damaged, replace gear and front case as assembly.
8. Remove oil seals from following components:
   - front bearing retainer.
   - rear retainer.
   - oil pump.
   - case halves.

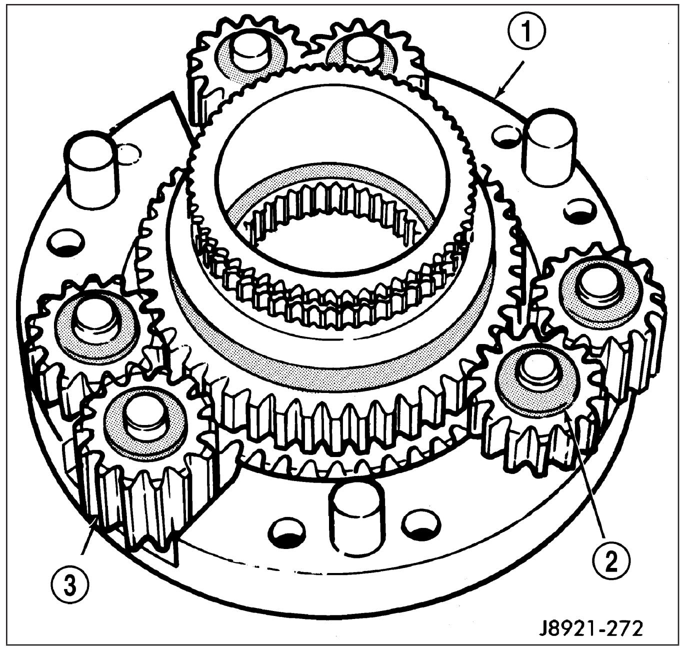


## DIFFERENTIAL

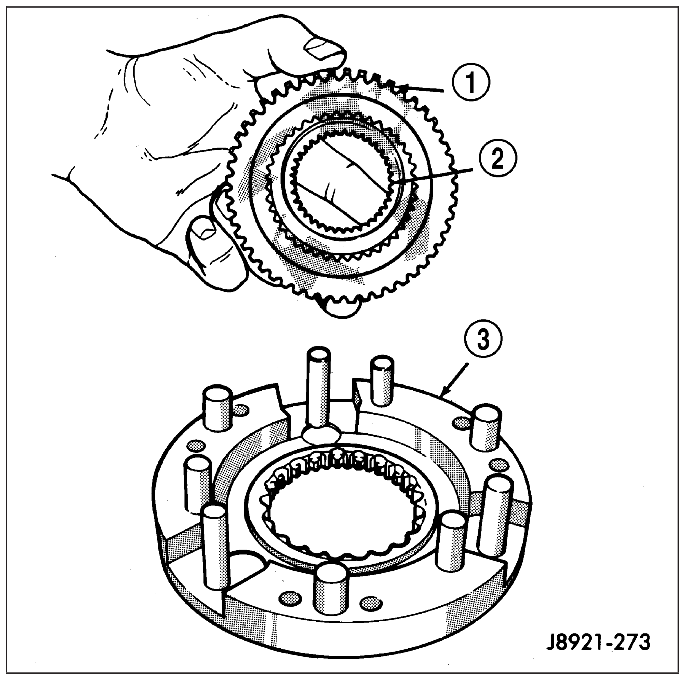
1. Mark differential case halves for reference.
2. Remove differential case bolts.
3. Invert differential on workbench.
4. Separate top case (1) from bottom case. Use slots in case halves to pry them apart.



5. Remove thrust washers (2) and planet gears (3) from case pins.



6. Remove mainshaft (1) and sprocket (2) gears from bottom case (3). Note gear position for reference before separating them.



## CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

The oil pickup screen can be cleaned with solvent. Shake excess solvent from the screen after cleaning and allow it to air dry. Do not use compressed air.

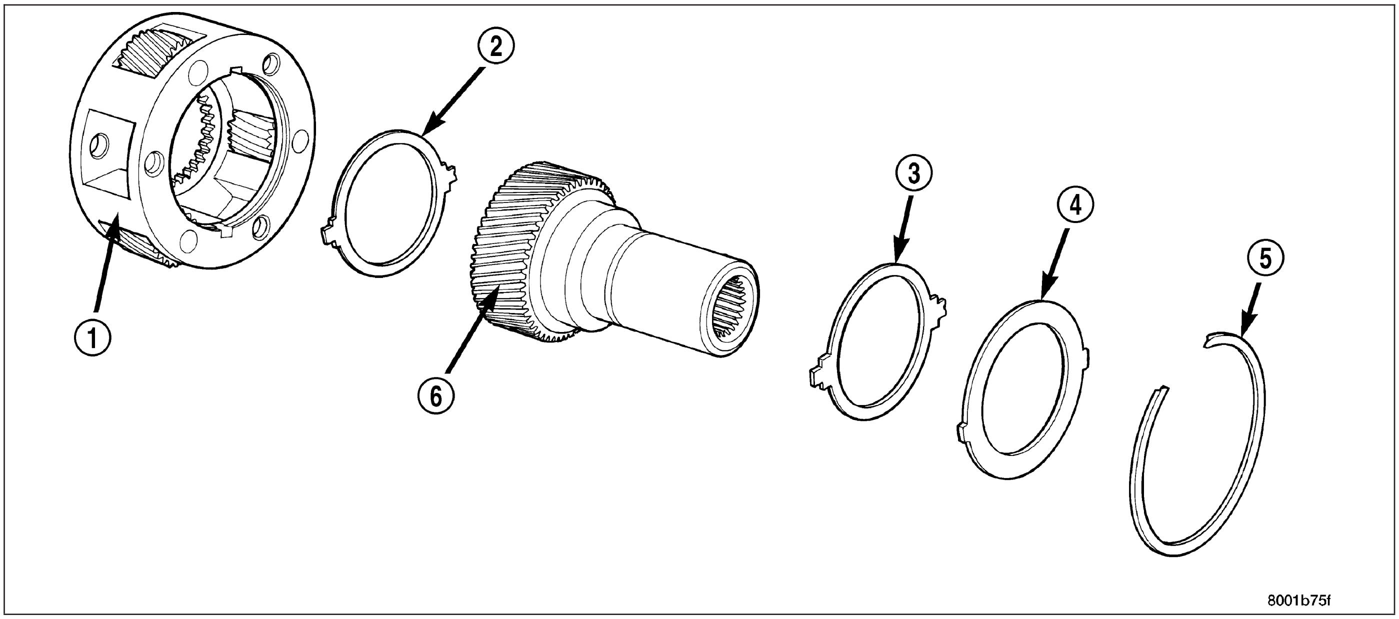
# INSPECTION

## MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

## INPUT GEAR AND PLANETARY CARRIER



Check the teeth on the gear (6). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body (1) and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

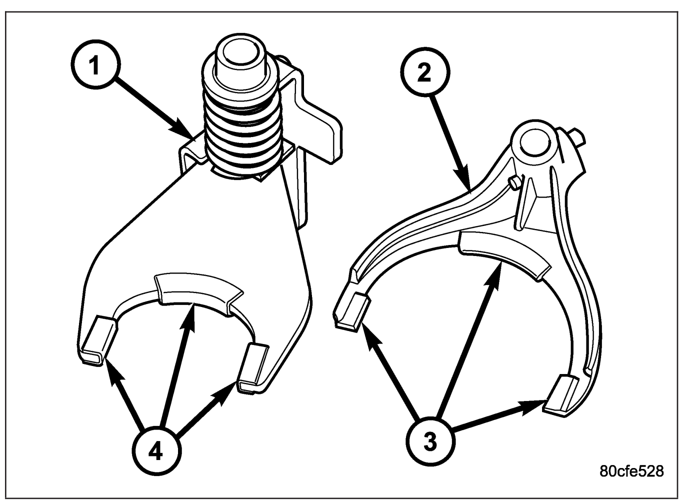
Check the lock ring (4) and both thrust washers (2, 3) for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

## SHIFT FORKS/HUBS/SLEEVES

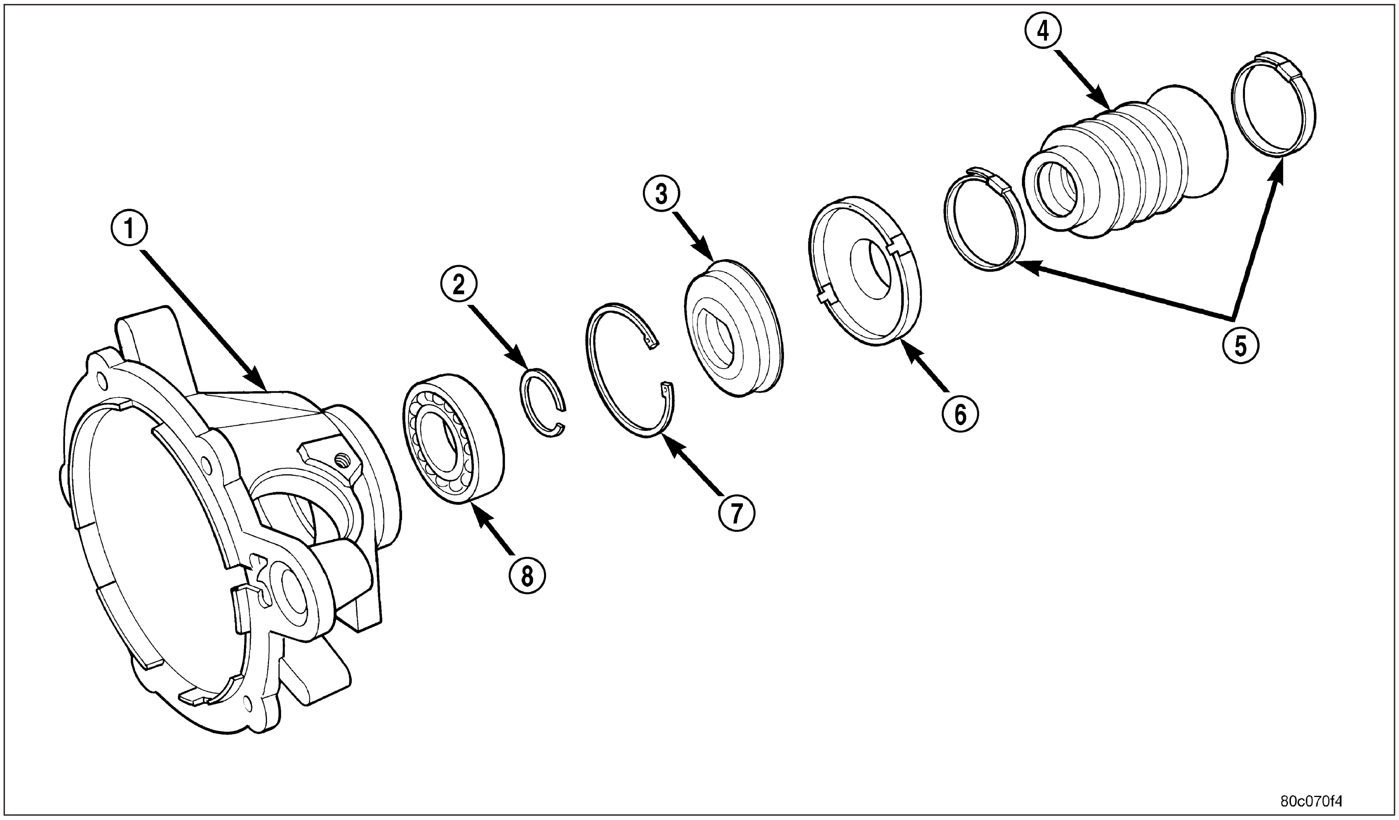
Check condition of the shift forks and mode fork shift rail (1). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads. The mode fork pads (4) are serviceable and can be replaced if necessary. The range fork pads (3) are also serviceable.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.



## REAR RETAINER/BEARING/ SEAL/SLINGER/BOOT



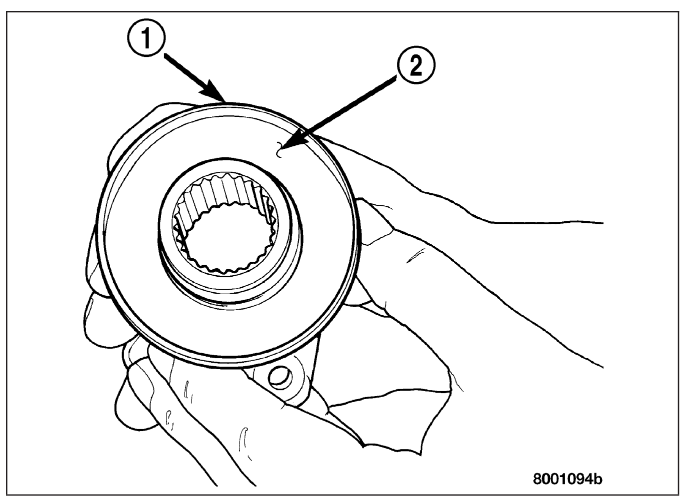
Inspect the retainer components. Replace the bearing (8) if rough or noisy. Check the retainer (1) for cracks or wear in the bearing bore. Clean the retainer sealing surfaces with a scraper and 3M all purpose cleaner. This will ensure proper adhesion of the sealer during reassembly.

Replace the slinger (6) and seal (3) outright; do not reuse either part.

Replace any part if distorted, bent, or broken. Also replace the boot if cut or torn. Replace the boot band clamps, do not reuse them.

## REAR OUTPUT SHAFT/YOKE/DRIVE CHAIN

Check condition of the seal contact surfaces (2) of the yoke slinger (1). This surface must be clean and smooth to ensure proper seal life. Replace the yoke nut and seal washer as neither part should be reused.

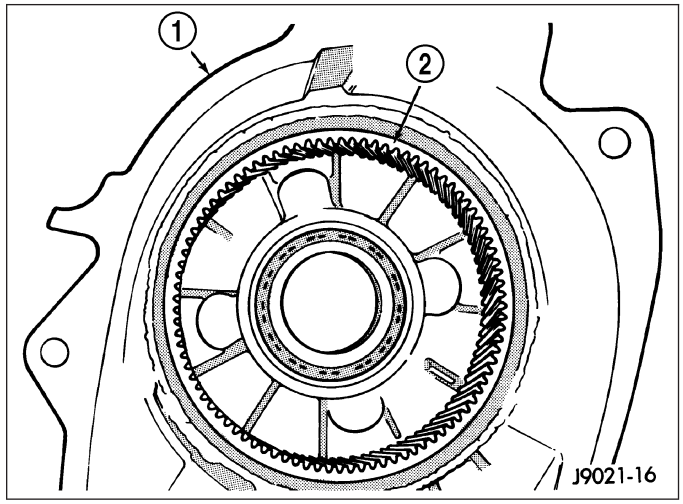


Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

### LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (2)



### FRONT-REAR CASES AND FRONT RETAINER

Inspect the cases and retainer for wear and damage. Clean the sealing surfaces with a scraper and 3M all purpose cleaner. This will ensure proper sealer adhesion at assembly. Replace the input retainer seal; do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

### OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

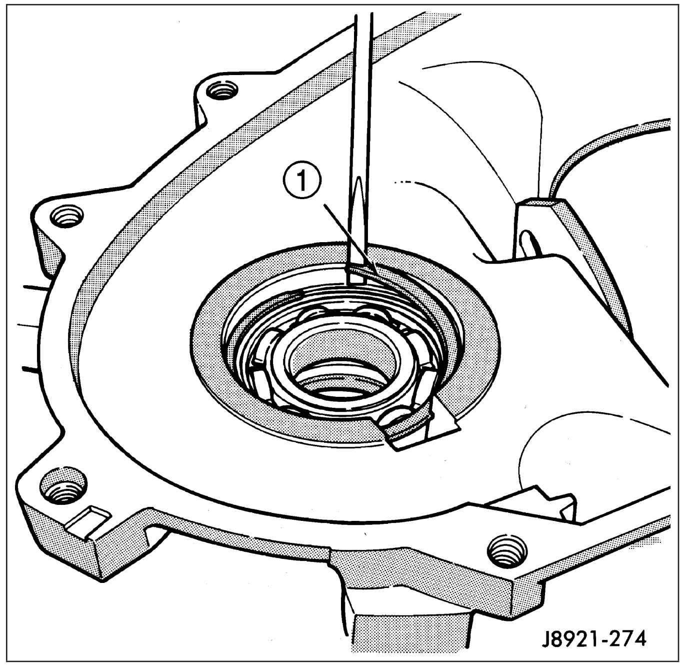
## ASSEMBLY

Lubricate transfer case components with automatic transmission fluid or petroleum jelly (where indicated) during assembly.

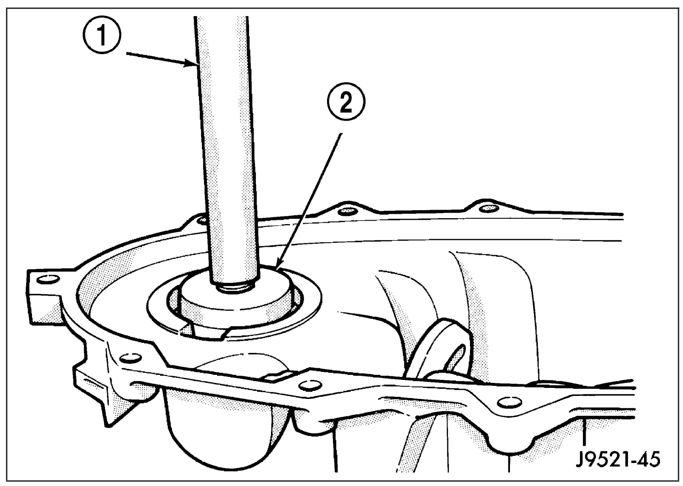
**CAUTION: The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.**

## BEARINGS AND SEALS

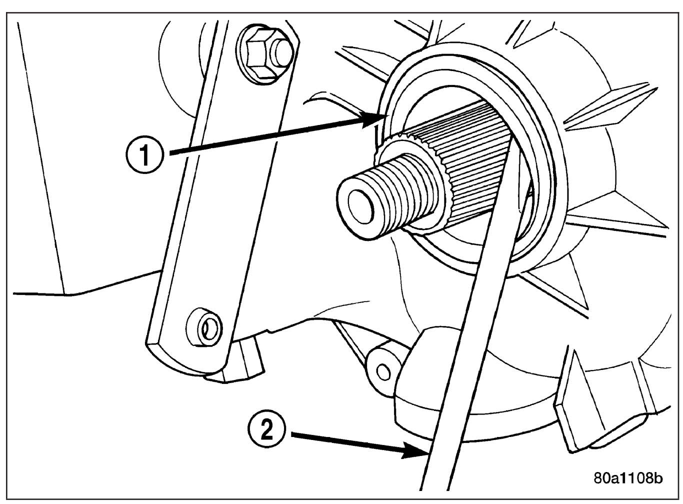
1. Remove snap-ring (1) that retains front output shaft front bearing in case. Then remove bearing. Use hammer handle, or hammer and brass punch to tap bearing out of case.



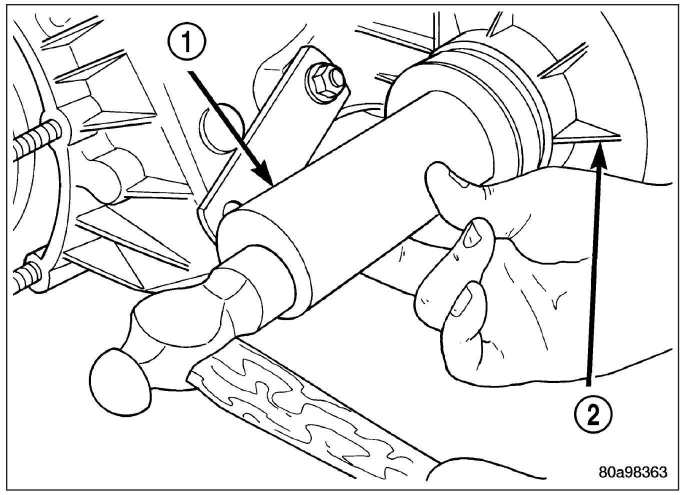
2. Install new front output shaft front bearing with Tool Handle C-4171 (1) and Installer 8033-A (2) with the tapered cone upward.
3. Install front bearing snap-ring.



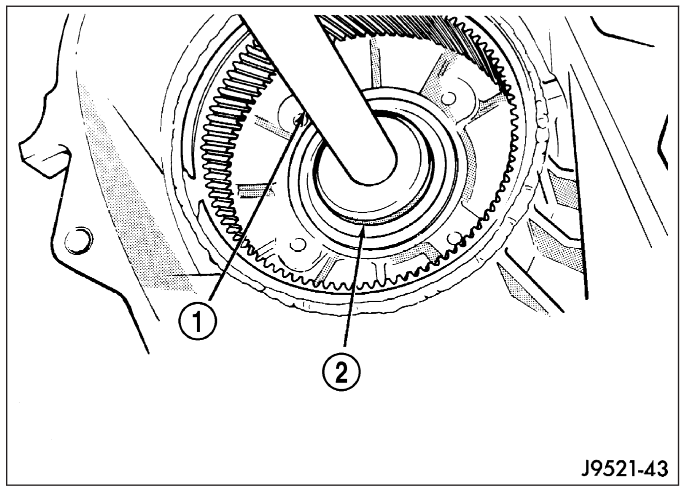
4. Remove front output shaft seal (1) using an appropriate pry tool (2) or slide-hammer mounted screw.



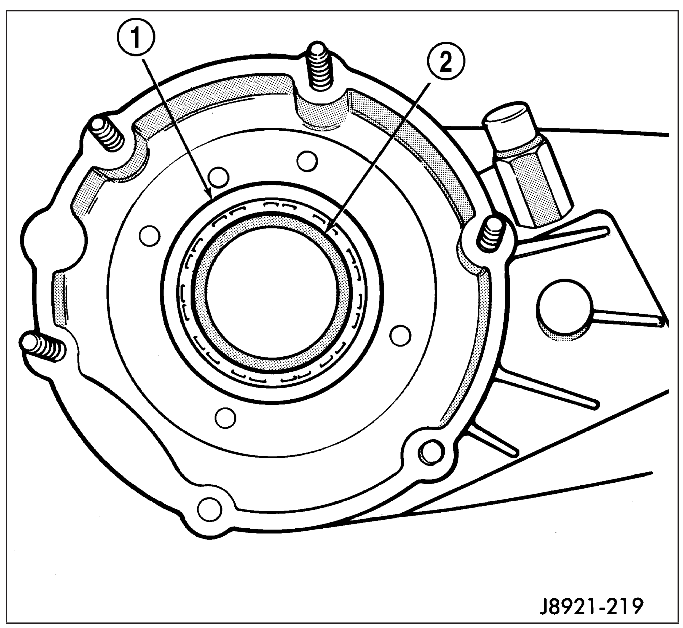
5. Install new front output shaft oil seal with Installer 6952-A (1).



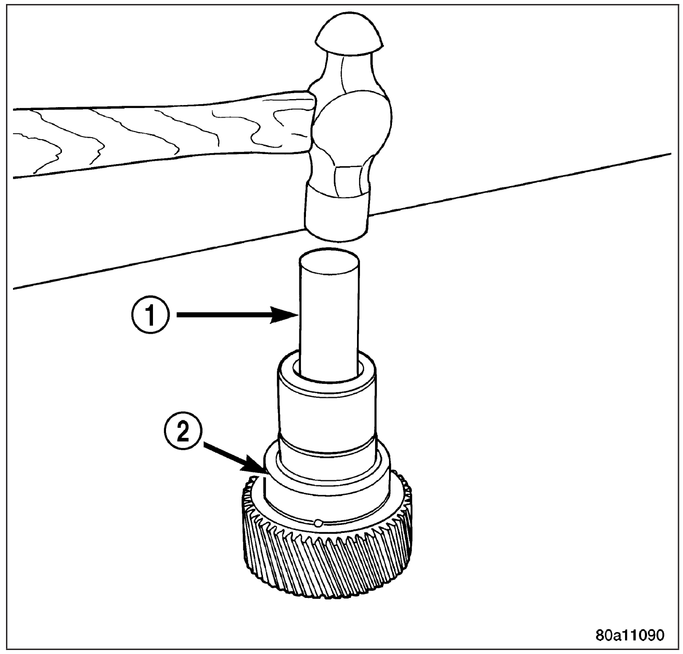
6. Remove input gear bearing with Tool Handle C-4171 (1) and Remover C-4210 (2).



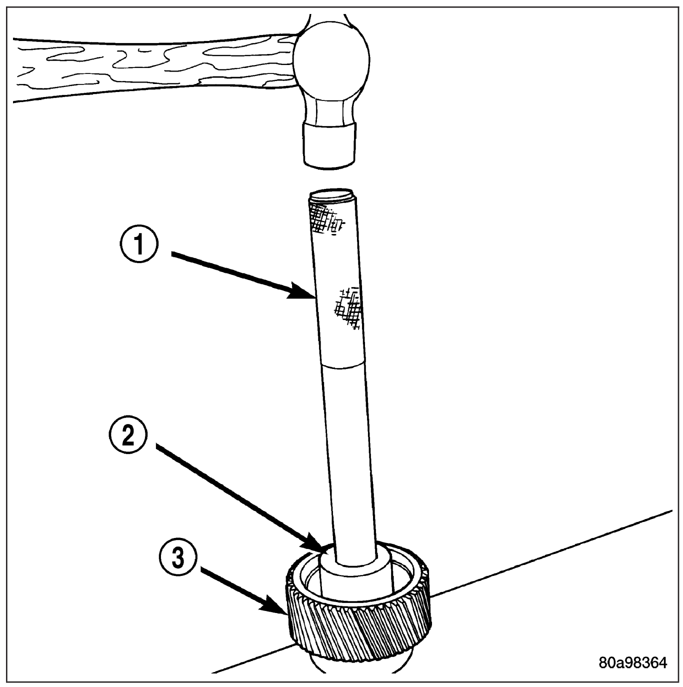
7. Install snap-ring on new input gear bearing.
8. Install new input gear bearing (2) with Tool Handle C-4171 and Remover C-4210. Install bearing far enough to seat snap-ring (1) against case.



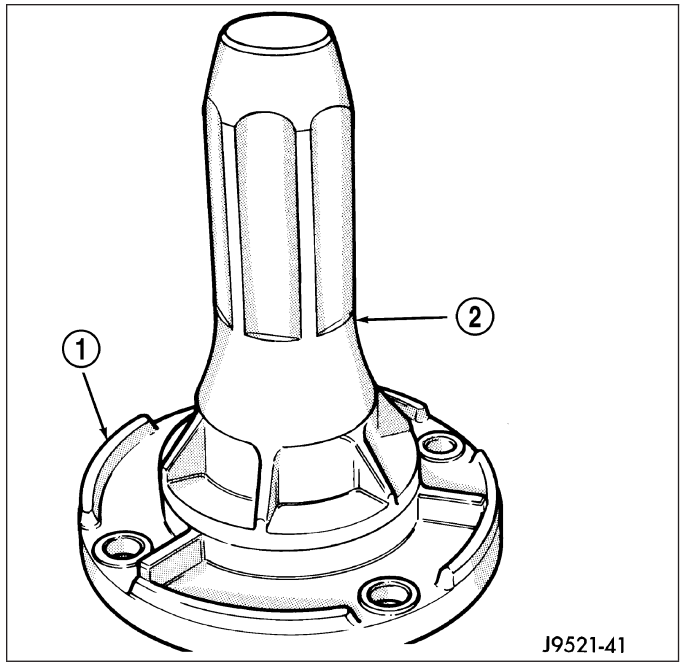
9. Remove the input gear pilot bearing by inserting a suitably sized drift (1) into the splined end of the input gear (2) and driving the bearing out with the drift and a hammer.



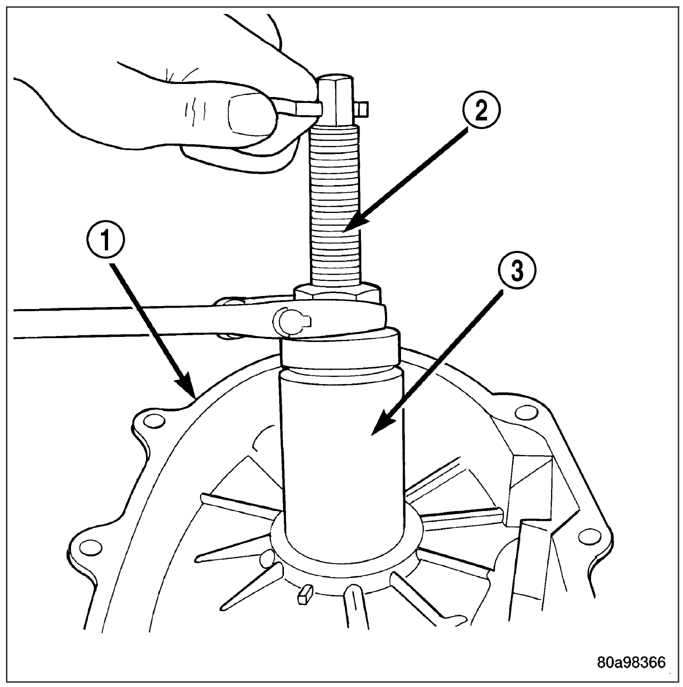
10. Install new pilot bearing with Installer 8128 (2) and Handle C-4171 (1).



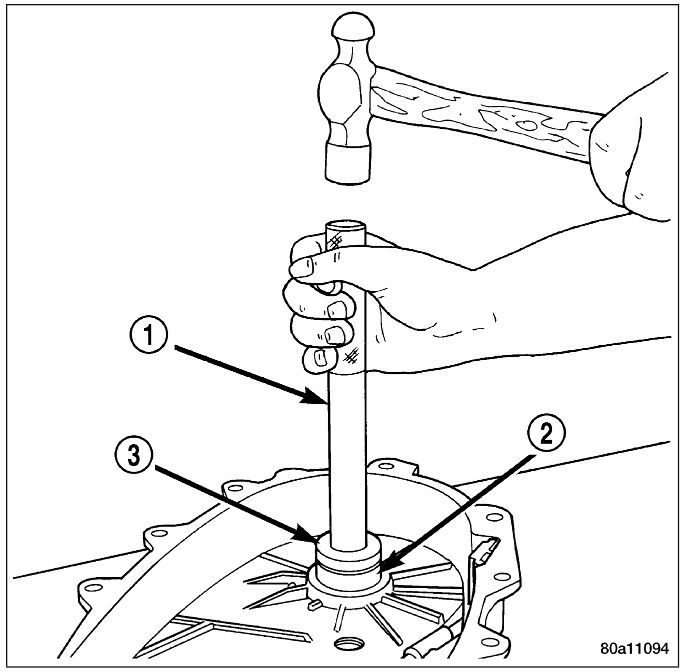
11. Install new seal in front bearing retainer (1) with Installer 7884 (2).



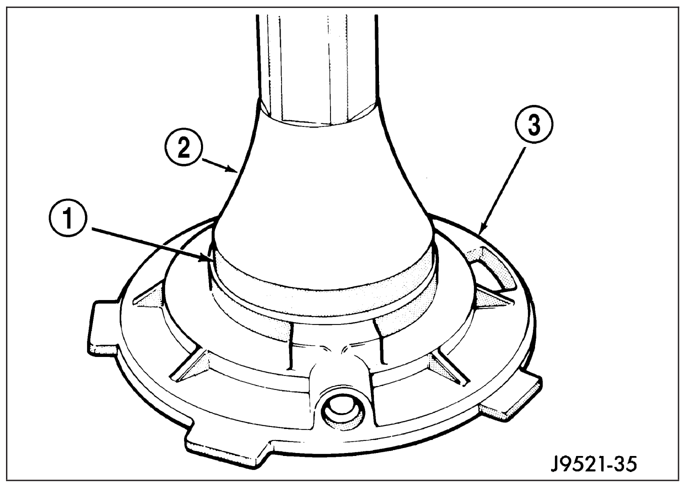
12. Remove output shaft rear bearing with the screw and jaws from Remover L-4454 (2) and Cup 8148 (3).



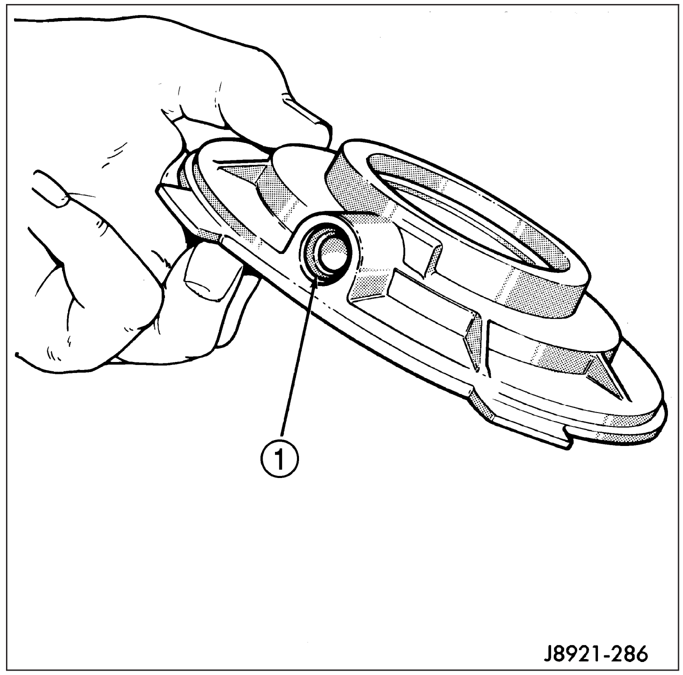
13. Install new bearing with Tool Handle C-4171 (1) and Installer 5066 (3). Lubricate bearing after installation.



14. Install new seal in oil pump feed housing (3) with Special Tool 7888 (2).

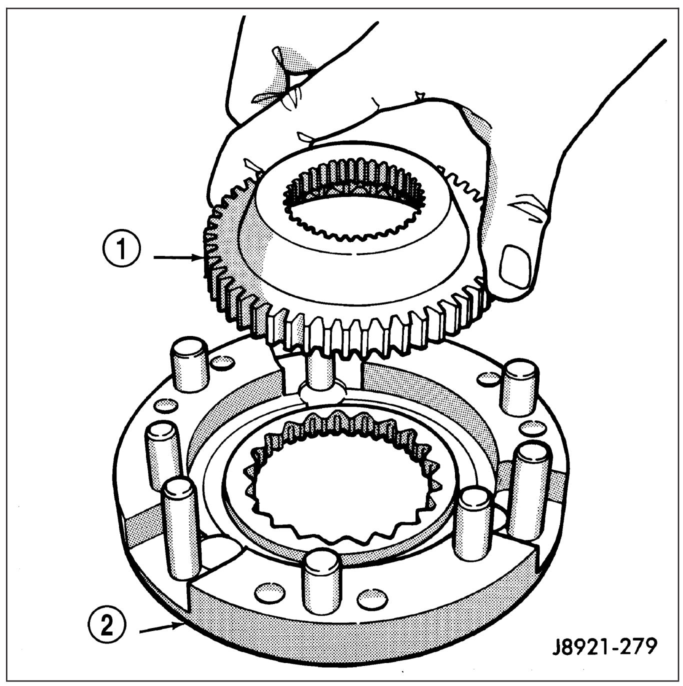


15. Install new pickup tube O-ring (1) in oil pump.

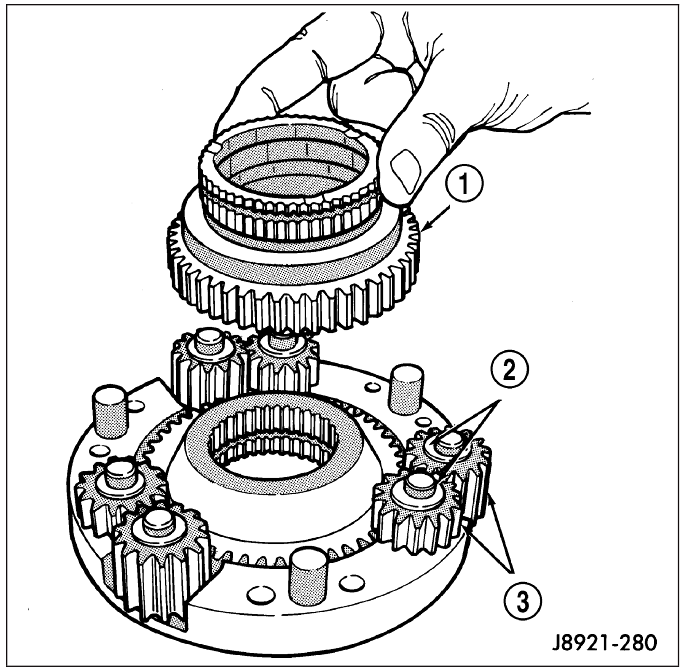


## DIFFERENTIAL

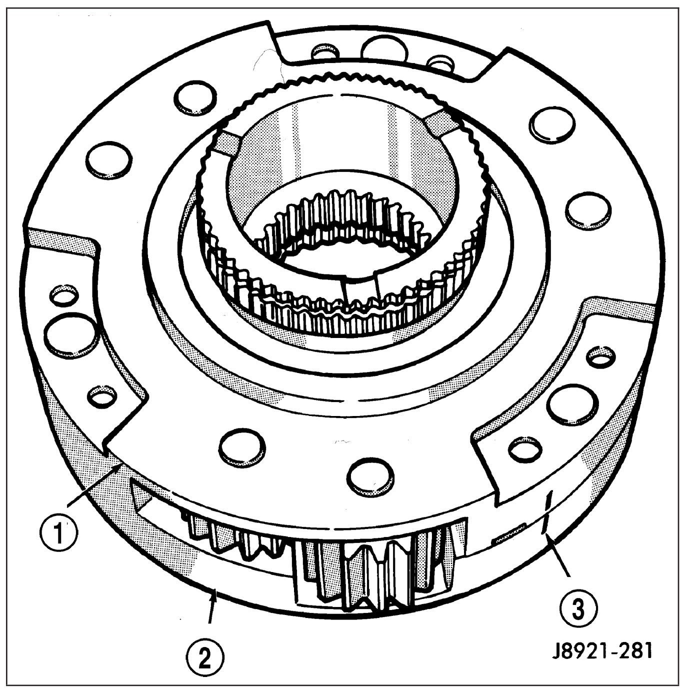
1. Lubricate differential components with automatic transmission fluid.
2. Install sprocket gear (1) in differential bottom case (2).



3. Install differential planet gears (3) and new thrust washers (2). Be sure thrust washers are installed at top and bottom of each planet gear.
4. Install differential mainshaft gear (1).

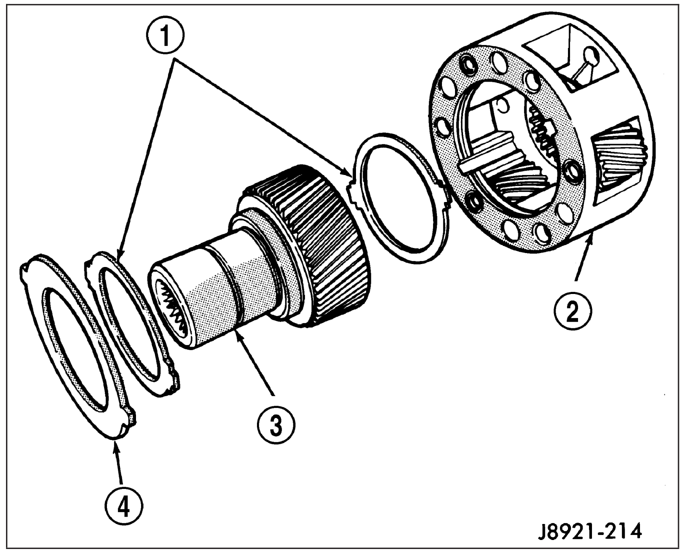


5. Align and position differential top case (1) on bottom case (2). Align using scribe marks (3) made at disassembly.
6. While holding differential case halves together, invert the differential and start the differential case bolts.
7. Tighten differential case bolts to specified torque.

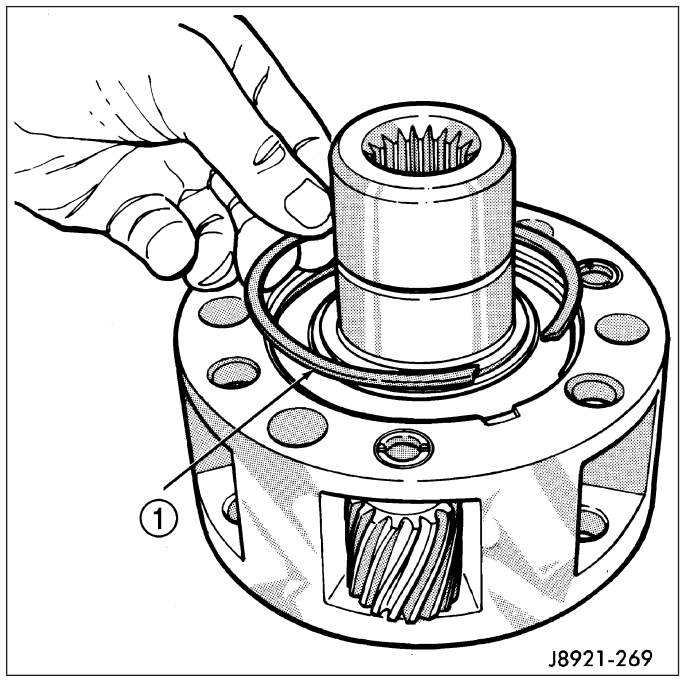


## INPUT GEAR/LOW RANGE ASSEMBLY

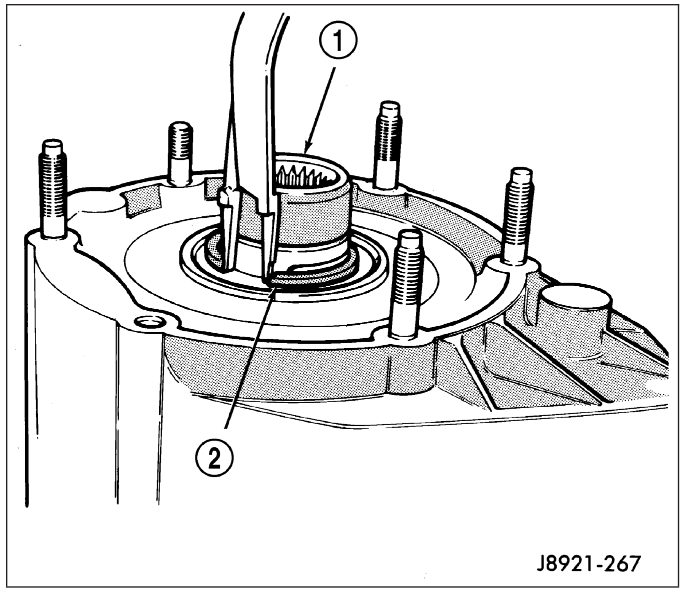
1. Assemble low range gear (2), input gear thrust washers, input gear (3), and input gear retainer (4).



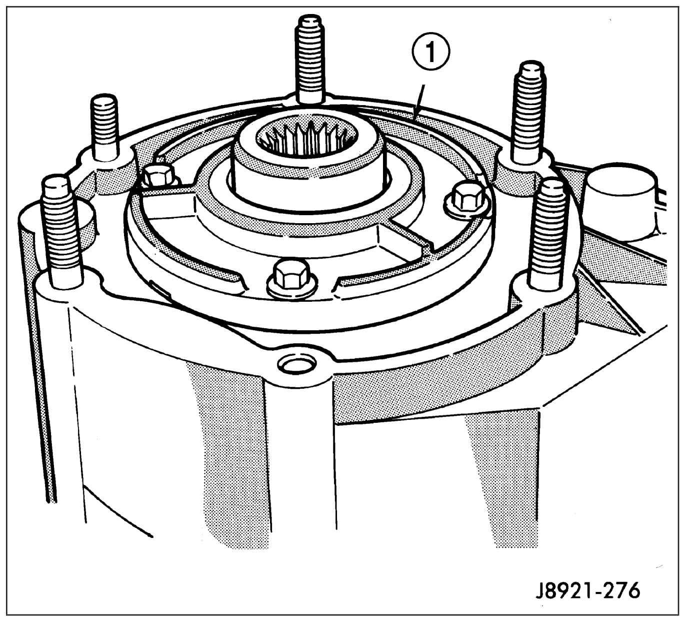
2. Install low range gear snap-ring (1).



3. Lubricate input gear and low range gears with automatic transmission fluid.
4. Start input gear shaft into front case bearing.
5. Press input gear shaft into front bearing.
6. Install new input gear snap ring (2).

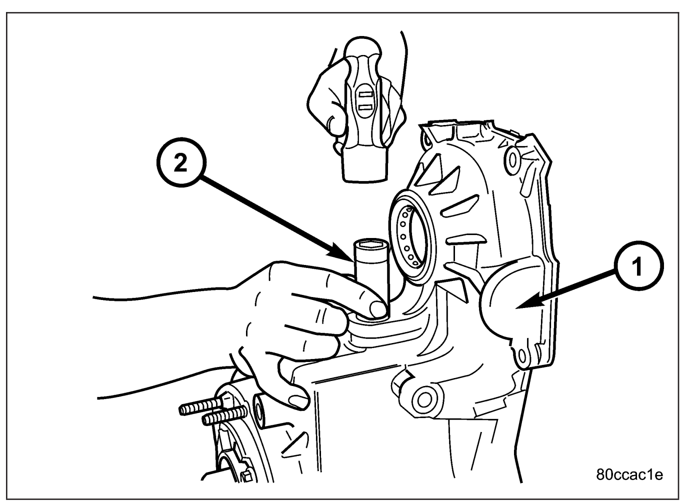


7. Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to seal surface of front bearing retainer.
8. Install front bearing retainer (1). Tighten retainer bolts to 16 ft. lbs. (21 N·m) torque.

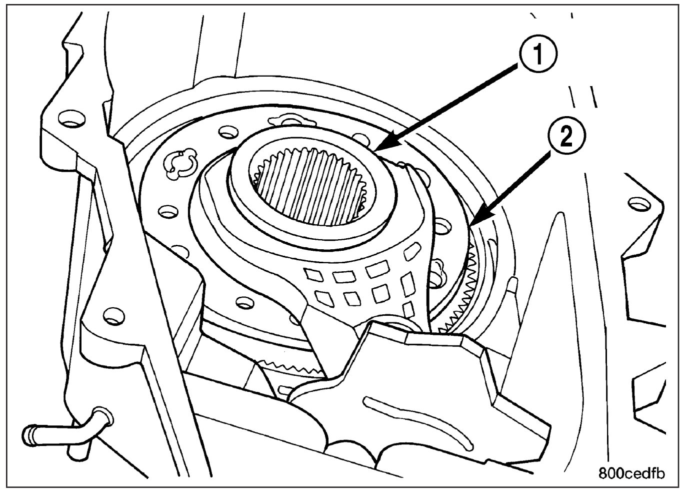


## SHIFT FORKS, SECTOR, AND MAINSHAFT

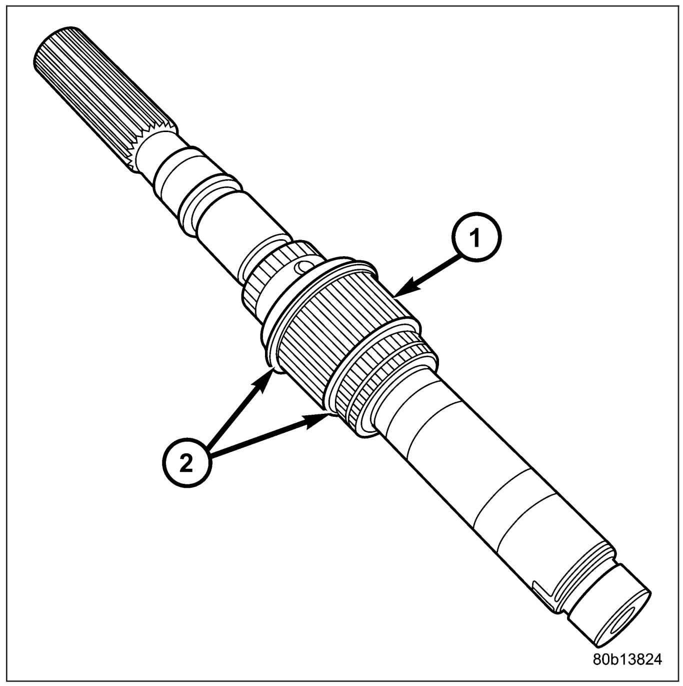
1. Install the shift sector shaft bearing using a suitable socket (2) until the bearing is flush to the bottom, inner edge of the bore.



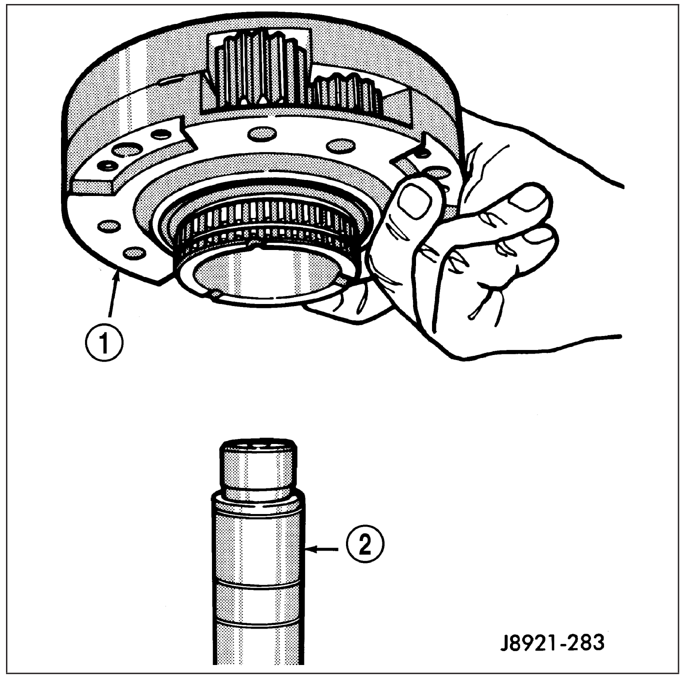
2. Install a new shift sector shaft seal using a suitable socket until the seal is flush to the bottom of the bore lead-in chamfer.
3. Install shift sector.
4. Install new pads on low range fork, if necessary.
5. Assemble low range fork and sleeve.
6. Position low range fork (2) and hub (1) in case. Be sure low range fork pin is engaged in shift sector slot.



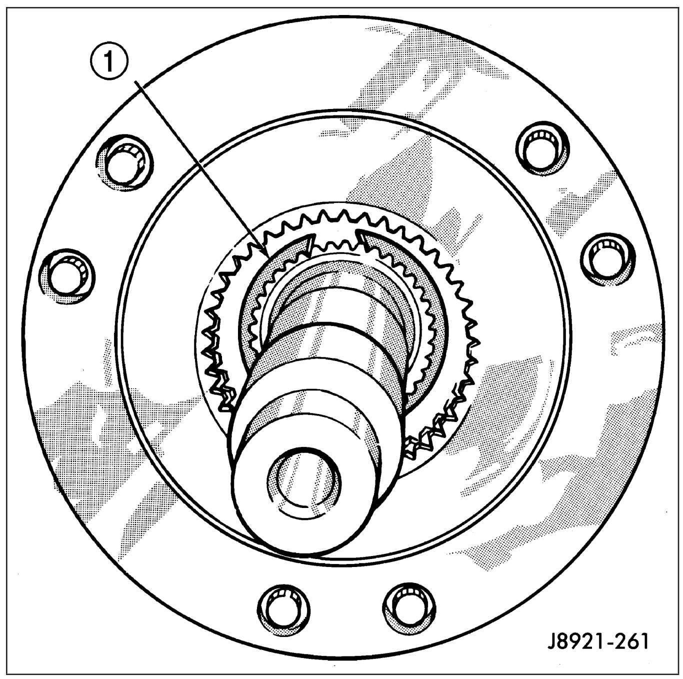
7. Install first mainshaft bearing spacer (2) on mainshaft.
8. Install bearing rollers on mainshaft. Coat bearing rollers with generous quantity of petroleum jelly to hold them in place.
9. Install remaining bearing spacer on mainshaft. Do not displace any bearings while installing spacer.



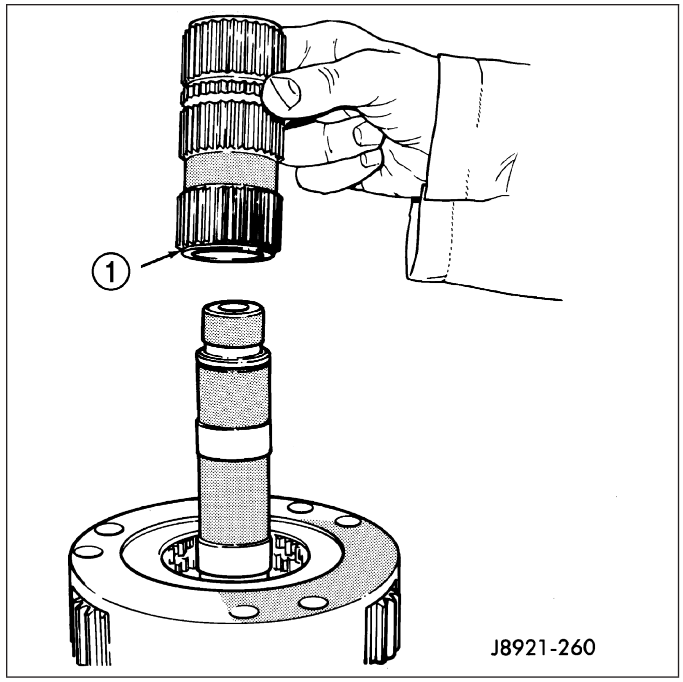
10. Install differential (1). Do not displace mainshaft bearings when installing differential.



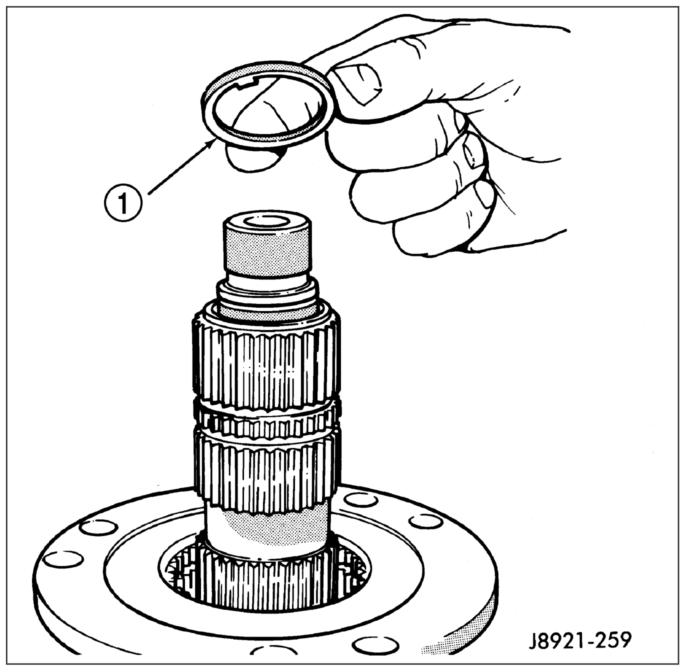
11. Install differential snap-ring (1).



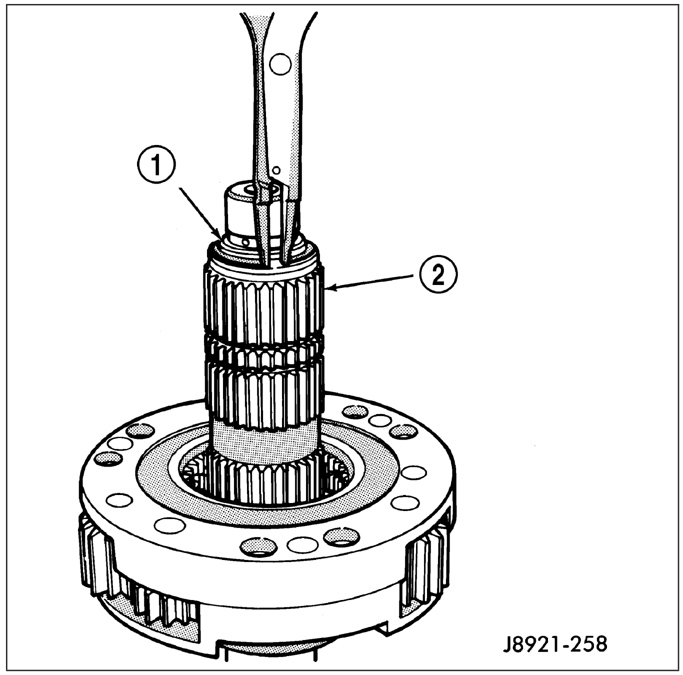
12. Install intermediate clutch shaft (1).



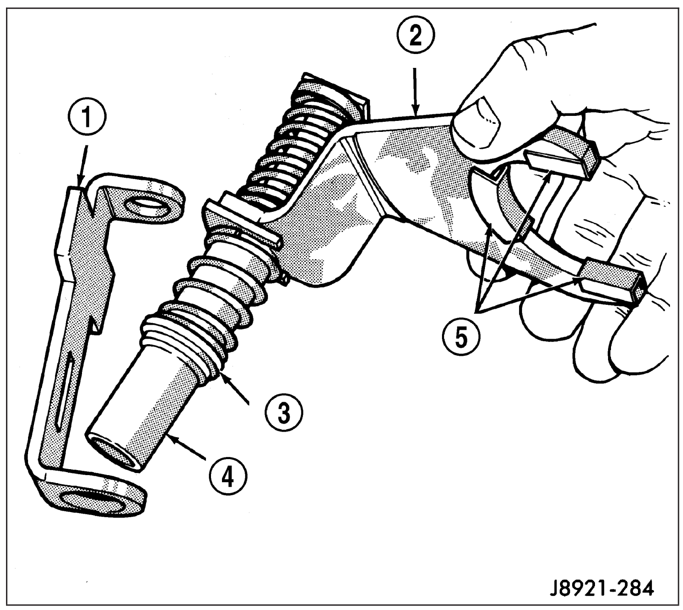
13. Install clutch shaft thrust washer (1).



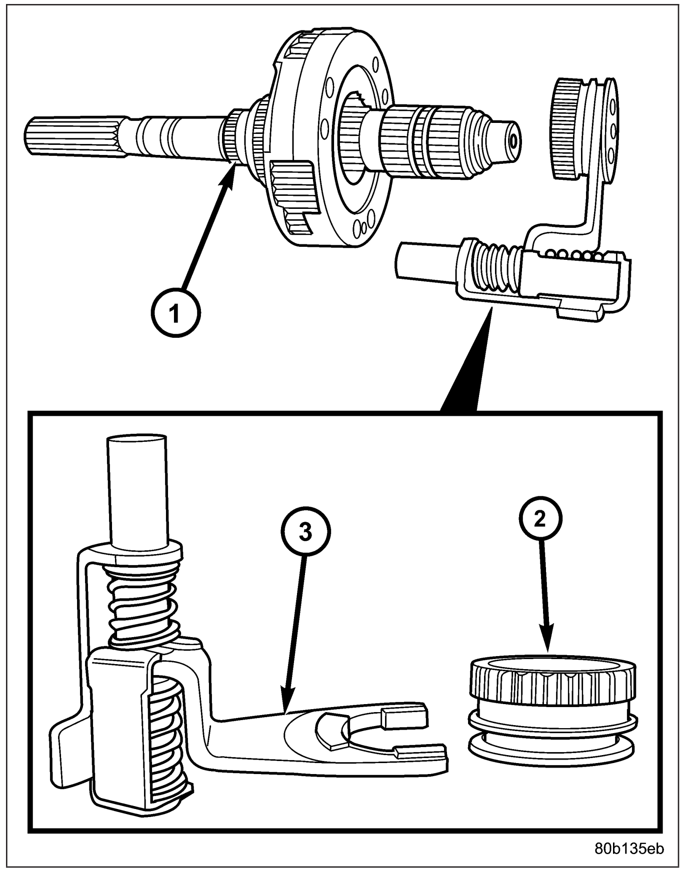
14. Install clutch shaft (2) snap-ring (1).



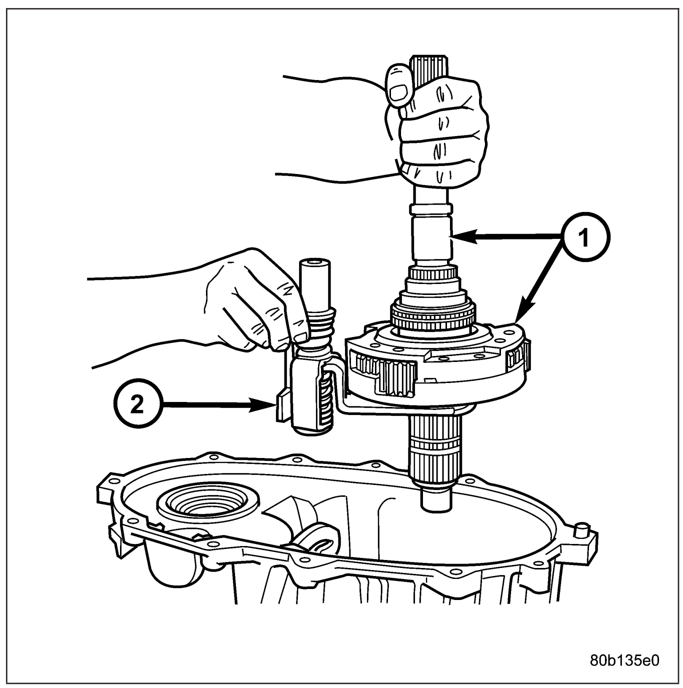
15. Inspect mode fork assembly. Replace pads (5) and bushing (3), if necessary. Replace fork tube (4) if bushings inside tube are worn or damaged. Also check springs (3) and slider bracket. Replace worn, damaged components.



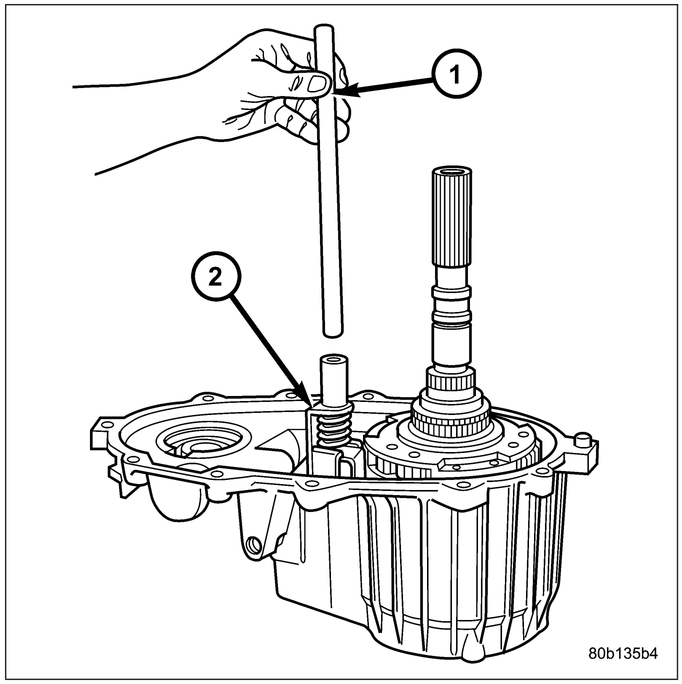
16. Install mode sleeve (2) in mode fork (3). Then install assembled sleeve and fork on mainshaft. Be sure mode sleeve splines are engaged in differential splines.



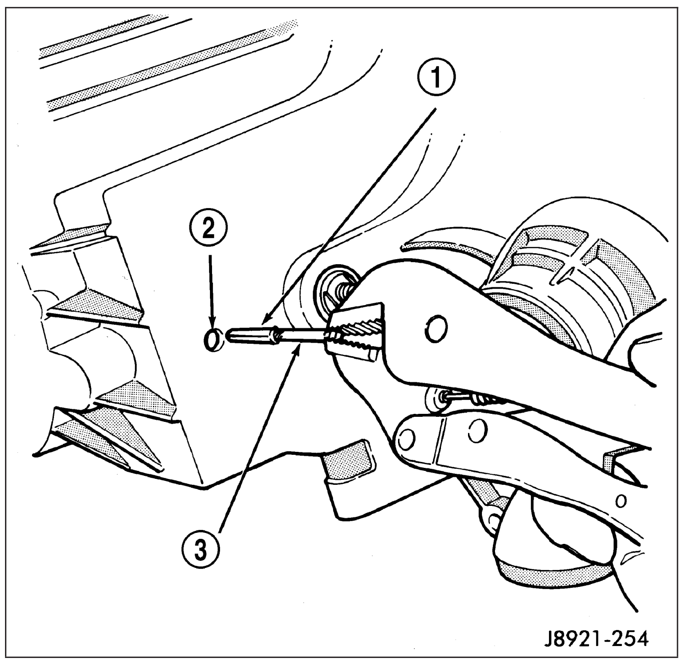
17. Install mode fork (2) and mainshaft assembly (1) in case. Rotate mainshaft slightly to engage shaft with low range gears.
18. Rotate mode fork pin into shift sector slot.



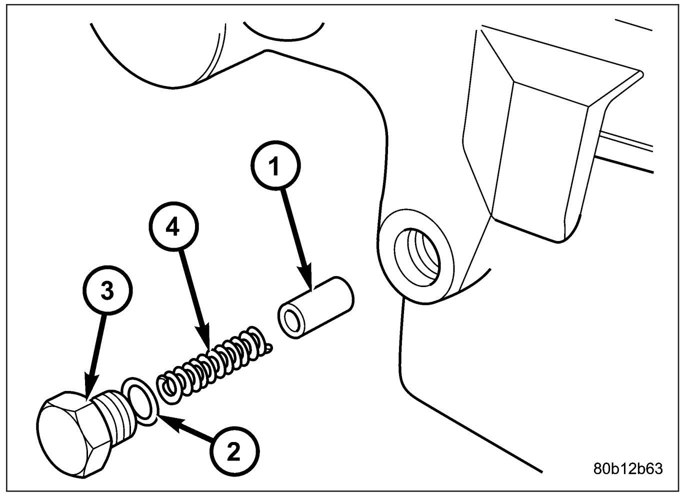
19. Install shift rail (1). Be sure rail is seated in both shift forks.



20. Rotate shift sector to align lockpin hole in low range fork with access hole in case.
21. Insert an easy-out (3) in range fork lockpin (1) to hold it securely for installation. Lockpin is slightly tapered on one end. Insert tapered end into fork and rail.
22. Insert lockpin through access hole and into shift fork. Then remove easy-out and seat the pin with pin punch.
23. Install plug in lockpin access hole.

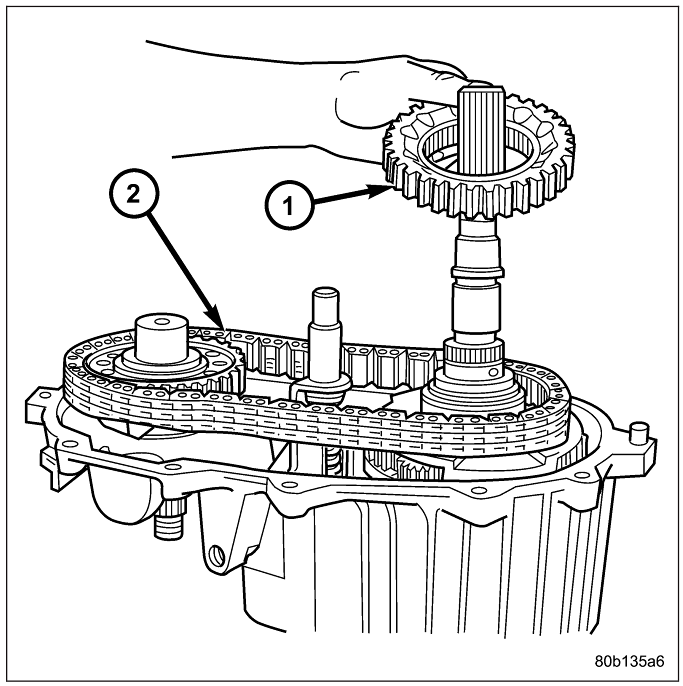


24. Install detent plunger (1), detent spring (4), and detent plug (3) in case.

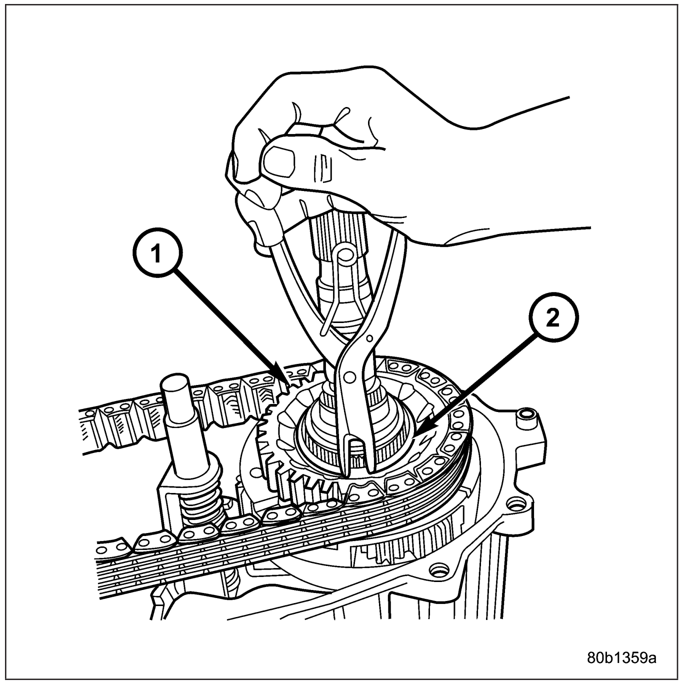


## FRONT OUTPUT SHAFT AND DRIVE CHAIN

1. Install front output shaft.
2. Install drive chain (2). Engage chain with front output shaft sprocket teeth.
3. Install drive sprocket (1). Engage drive sprocket teeth with chain. Then engage sprocket splines with mainshaft splines.

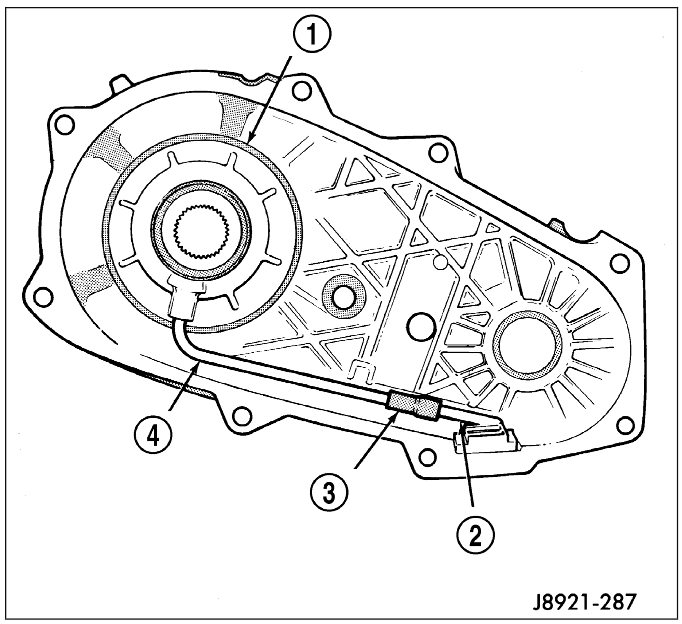


4. Install drive sprocket (1) snap-ring (2).

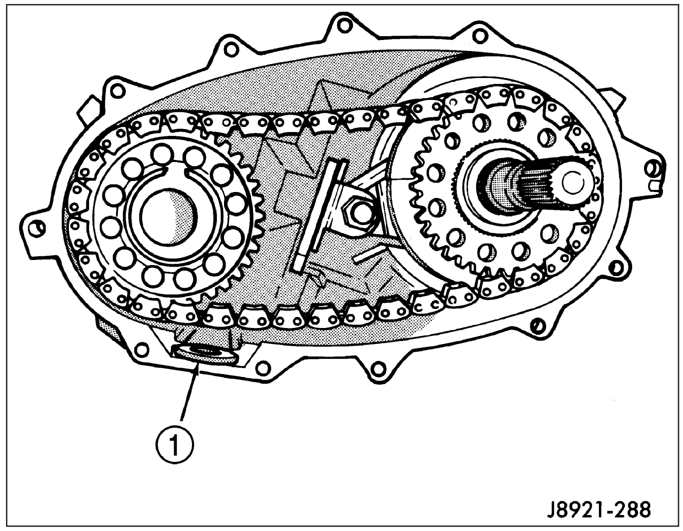


## OIL PUMP AND REAR CASE

1. Insert oil pickup tube (4) in oil pump (1) and attach oil screen (2) and connector hose (3) to pickup tube. Then install assembled pump, tube and screen in rear case. Be sure screen is seated in case slot as shown.

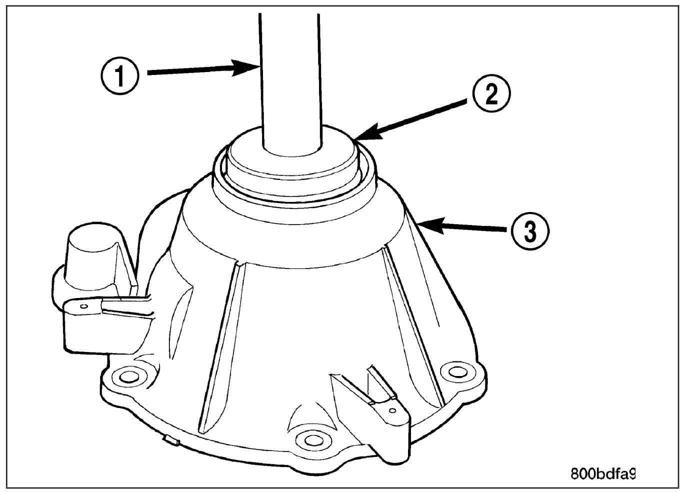


2. Install magnet in front case pocket.
3. Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to seal surface of front case.
4. Align and install rear case on front case. Be sure case locating dowels are in place and that main-shaft splines are engaged in oil pump inner gear.
5. Install and tighten front case-to-rear case bolts to 41 N·m (30 ft. lbs.) torque. Be sure to install a washer under each bolt used at case dowel locations.

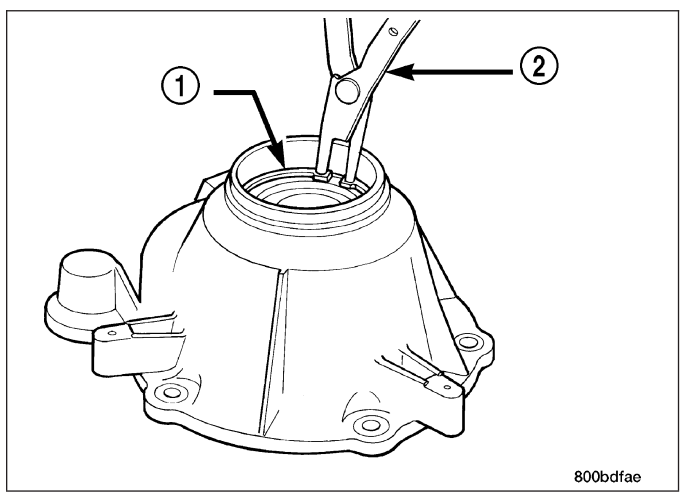


## REAR RETAINER

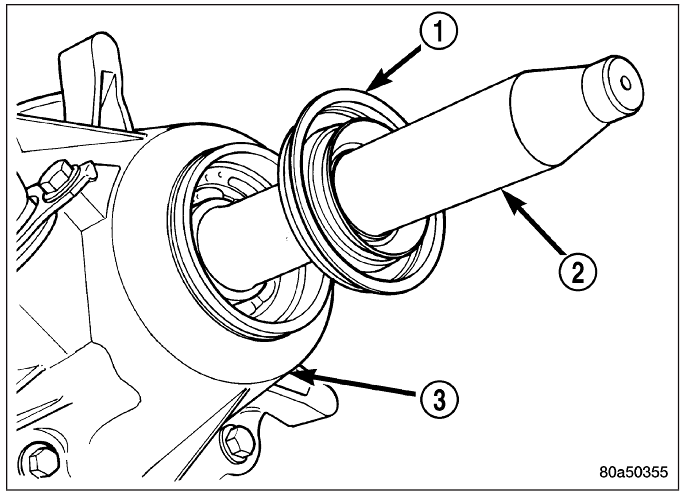
1. Remove rear bearing in retainer using Installer 8128 and Handle C-4171.
2. Install rear bearing in retainer with Tools C-4171 (1) and 5064 (2).



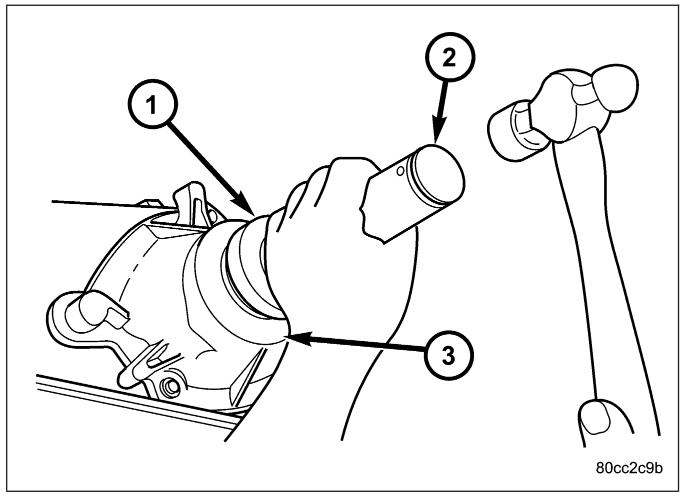
3. Install rear bearing O.D. retaining ring (1) with snap-ring pliers (2). Be sure retaining ring is fully seated in retainer groove.



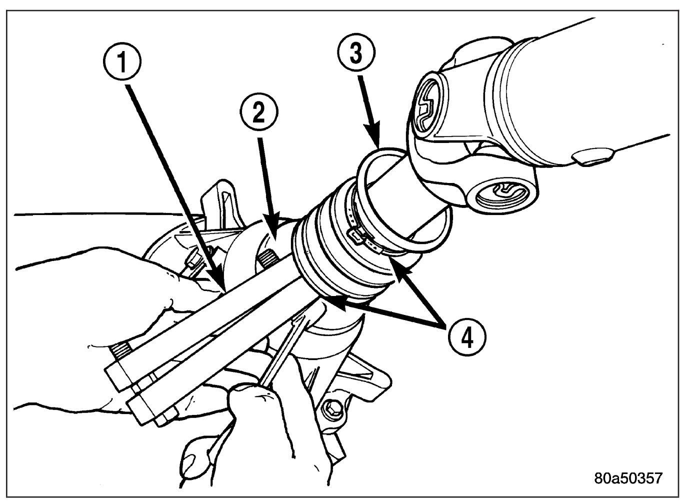
4. Apply bead of Mopar® Sealer P/N 82300234, or Loctite™ Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 in.
5. Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.
6. Install rear bearing I.D. retaining ring and spacer on output shaft.
7. Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.
8. Slide seal onto Seal Protector 8824 (2). Slide seal protector and seal (1) onto output shaft.



9. Slide Installer 8691 (1) onto seal protector with the recessed side of the tool toward the seal. Drive seal into rear bearing retainer with Installer 8691.

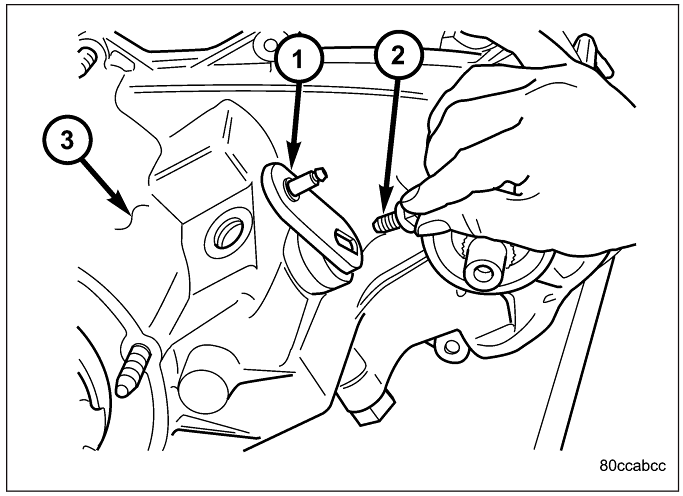


10. Install rear slinger with Installer 9023.
11. Install boot (3) on output shaft slinger (2) and crimp retaining clamp (4) with tool C-4975-A (1).

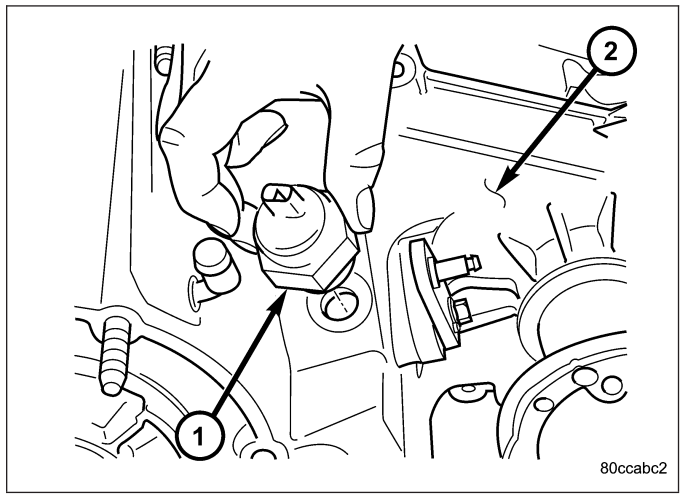


### COMPANION FLANGE AND RANGE LEVER

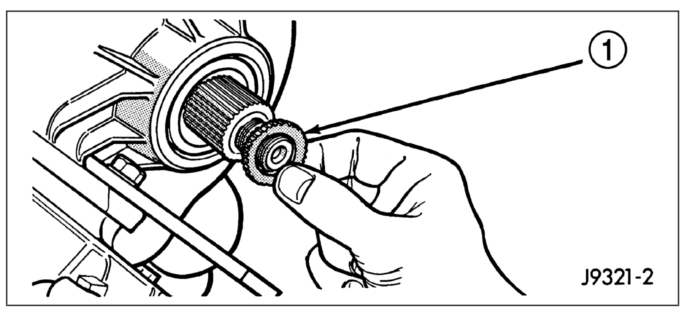
1. Install range lever (1) and bolt (2) on sector shaft. Tighten bolt to 27-34 N·m (20-25 ft. lbs.) torque.



2. Inspect the o-ring on the transfer case position sensor. Replace the o-ring if necessary.
3. Install the transfer case position sensor (1) in the front case (2). Tighten sensor to 20-34 N·m (15-25 ft. lbs.) torque.



4. Install new seal washer (1) on front output shaft.
5. Lubricate companion flange hub with transmission fluid and install flange onto the front ouput shaft.
6. Install new seal washer on front shaft.
7. Install new flange nut onto front output shaft.
8. Tighten flange nut to 122-176 N·m (90-130 ft. lbs.) torque.



## INSTALLATION

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case on transmission.
5. Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque.
6. Connect vent hose.
7. Connect transfer case position sensor connector to sensor.

8. Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).
9. Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.
10. Install skid plate. (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)
11. Remove transmission jack and support stand.
12. Connect shift cable to transfer case range lever.
13. Lower vehicle and verify transfer case shift operation.

# SPECIFICATIONS

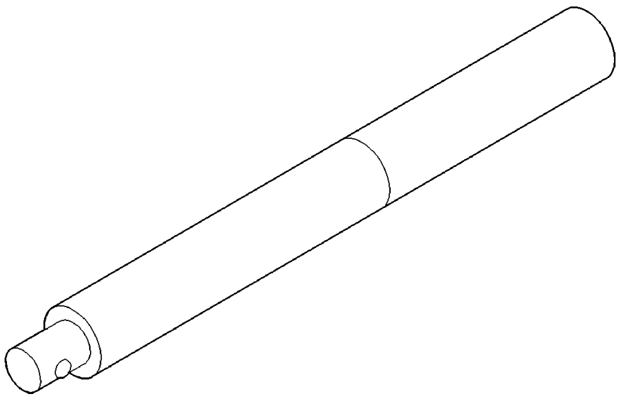
## NV242 TRANSFER CASE

### TORQUE SPECIFICATIONS

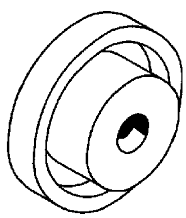
| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Plug, Detent | 20 | 15 | - |
| Bolt, Differential Case | 22 | 16 | - |
| Plug, Drain/Fill | 27 | 20 | - |
| Bolt, Front Brg. Retainer | 22 | 16 | - |
| Bolt, Case Half | 41 | 30 | - |
| Nut, Front Companion Flange | 149 | 110 | - |
| Bolt, Range Lever | 31 | 23 | - |
| Bolt, Rear Retainer | 41 | 30 | - |
| Nuts, Mounting | 35 | 26 | - |
| Screw, Oil Pump | 1.5 | - | 13.5 |
| Sensor, Transfer Case Position | 27 | 20 | - |

## SPECIAL TOOLS

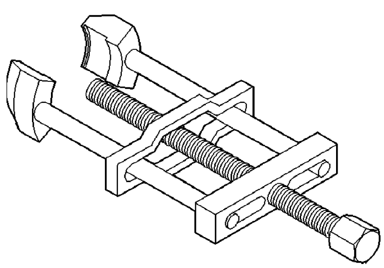
## TRANSFER CASE - NV242



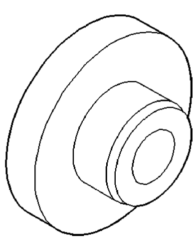
*Handle, Universal - C-4171*



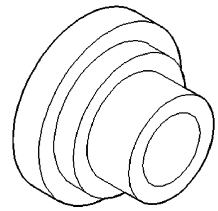
*Remover - C-4210*



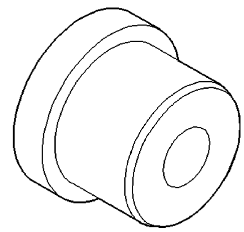
*Puller, Slinger - MD-998056-A*



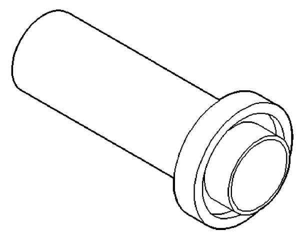
*Installer, Bearing - 5064*



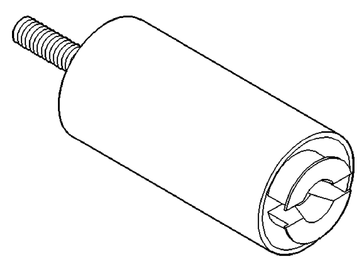
*Installer - 8128*



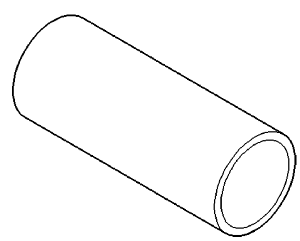
*Installer - 5066*



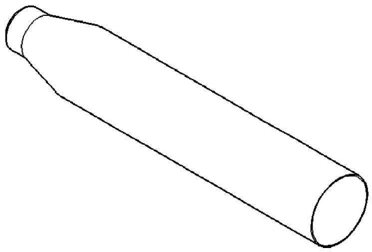
*Installer - 6952-A*



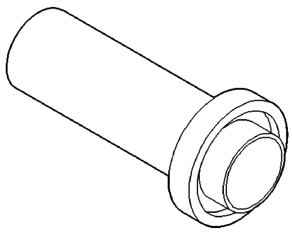
*Remover - L-4454*



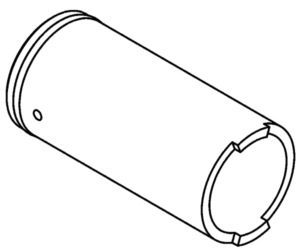
*Cup - 8148*



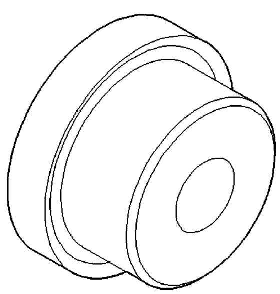
Seal Protector - 8824



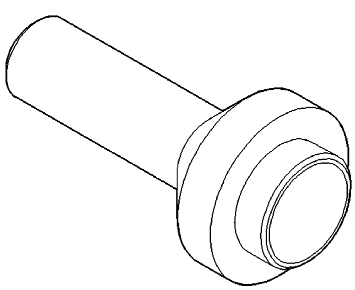
Installer, Seal - 8691



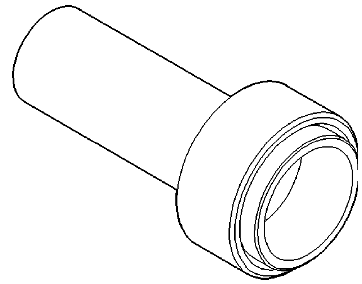
Installer, Output Shaft Slinger - 9023



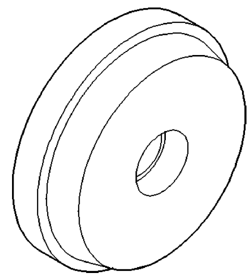
Installer, Input Gear Bearing - 7829-A



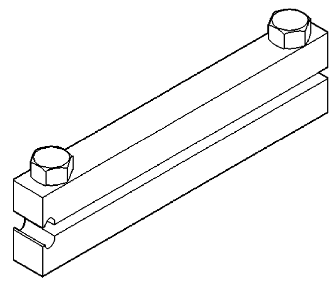
Installer, Seal - 7884



Installer, Pump Housing Seal - 7888



Installer, Bearing - 8033-A

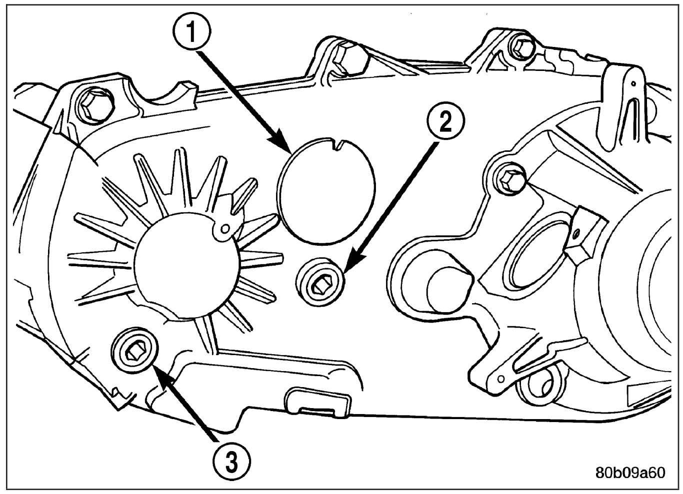


Installer, Boot Clamp - C-4975-A

# FLUID

## STANDARD PROCEDURE - FLUID DRAIN AND FILL

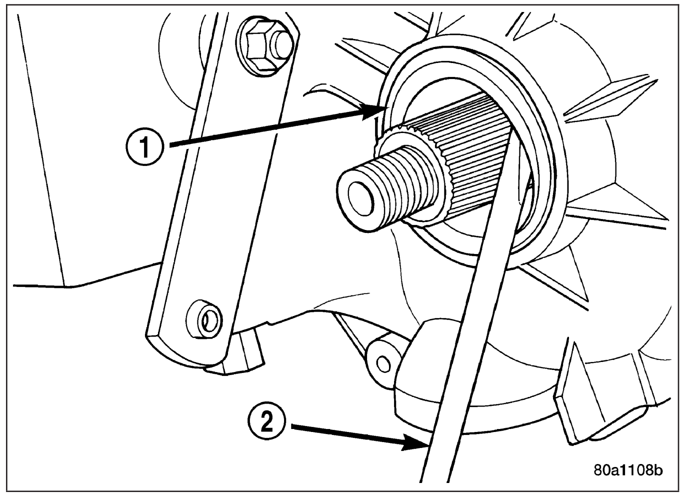
The fill (2) and drain (3) plugs are both in the rear case. Correct fill level is to the bottom edge of the fill plug hole. Be sure the vehicle is level to ensure an accurate fluid level check.



# SEAL-FRONT OUTPUT SHAFT

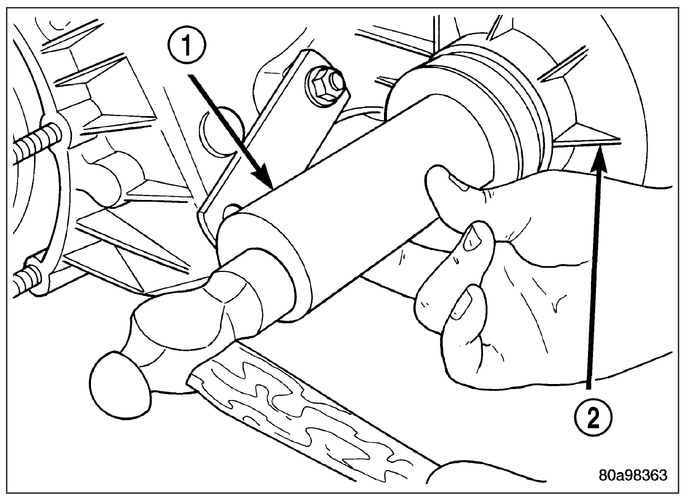
## REMOVAL

1. Raise vehicle.
2. Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Remove front output shaft companion flange.
4. Remove seal (1) from front case with pry tool (2).



## INSTALLATION

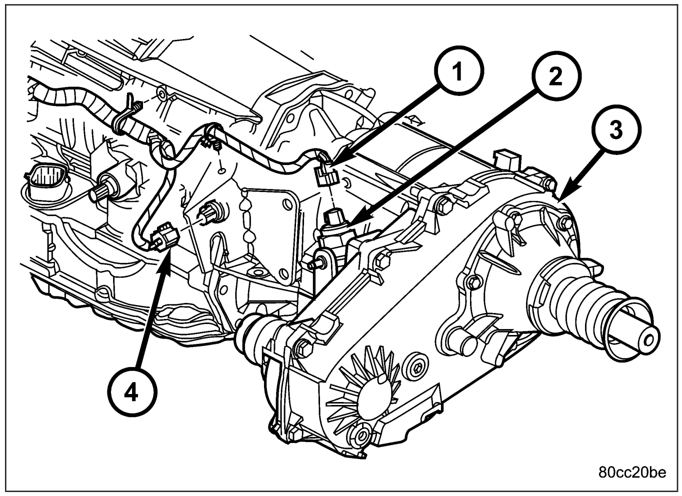
1. Install new front output seal in front case (2) with Installer Tool 6952-A (1) as follows:
   a. Place new seal on tool. Garter spring on seal goes toward interior of case.
   b. Start seal in bore with light taps from hammer. Once seal is started, continue tapping seal into bore until installer tool seats against case.
2. Install the front output shaft companion flange. Tighten the companion flange nut to 149 N·m (110 ft.lbs.).
3. Install the front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)



# SENSOR-POSITION

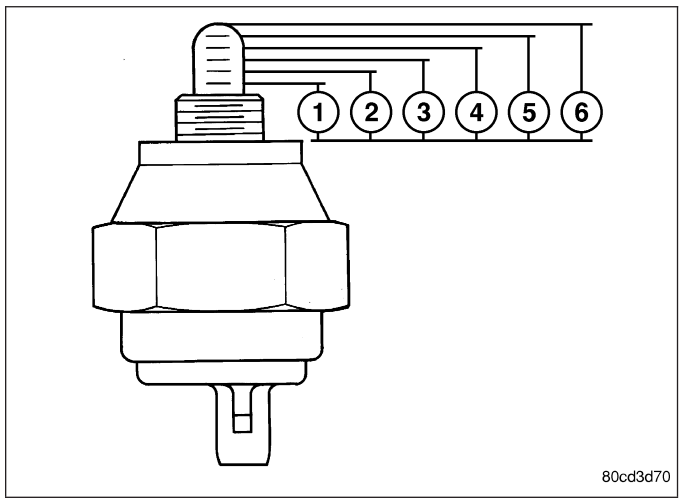
## DESCRIPTION

The transfer case position sensor (2) is an electronic device whose output can be interpreted to indicate the transfer case's current operating mode. The sensor consists of a five position, resistive multiplexed circuit which returns a specific resistance value to the Powertrain Control Module (PCM) for each transfer case operating mode. The sensor is located on the top of the transfer case, just left of the transfer case centerline and rides against the sector plate roostercomb. The PCM supplies 5VDC (+/- 0.5V) to the sensor and monitors the return voltage to determine the sector plate, and therefore the transfer case, position.



## OPERATION

During normal vehicle operation, the Powertrain Control Module (PCM) monitors the transfer case position sensor return voltage to determine the operating mode of the transfer case. Refer to the Operating Mode Versus Resistance table for the correct resistance for each position.



***Position Sensor Linear Movement***

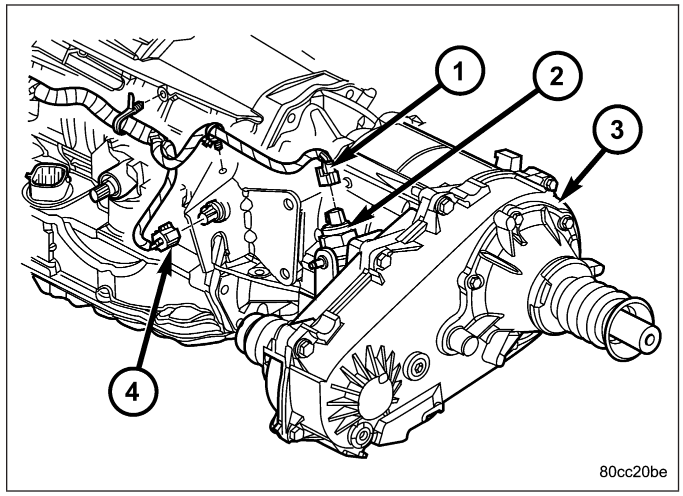
1 - POSITION 1 - 10mm ±0.5mm
2 - POSITION 2 - 12mm ±0.5mm
3 - POSITION 3 - 14mm ±0.5mm
4 - POSITION 4 - 16mm ±0.5mm
5 - POSITION 5 - 18mm ±0.5mm
6 - POSITION 6 - 20mm±0.5mm - FULL EXTENSION

**Operating Mode Versus Resistance**

| SENSOR POSITION | OPERATING MODE | SENSOR RESISTANCE (ohms) |
|---|---|---|
| 1 | 2WD | 1124-1243 |
| 2 | 4WD PART TIME | 650-719 |
| 3 | 4WD FULL TIME | 389-431 |
| 4 | NEUTRAL | 199-221 |
| 5 | 4WD LOW | 57-64 |

## REMOVAL

1. Raise and support the vehicle.
2. Disengage the transfer case position sensor connector from the position sensor (2).
3. Remove the position sensor from the transfer case.



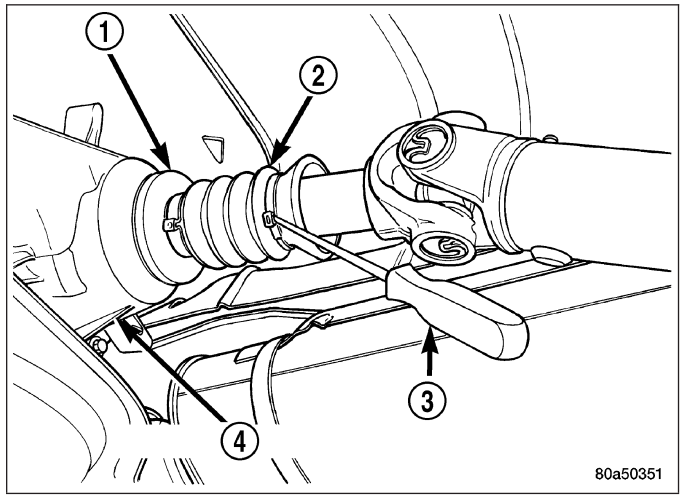
## INSTALLATION

1. Inspect the o-ring seal on the transfer case position sensor. Replace the o-ring if necessary.
2. Install the transfer case position sensor into the transfer case. Torque the sensor to 27 N·m (20 ft.lbs.).
3. Engage the transfer case position sensor connector to the position sensor.
4. Lower vehicle.
5. Verify proper sensor operation.

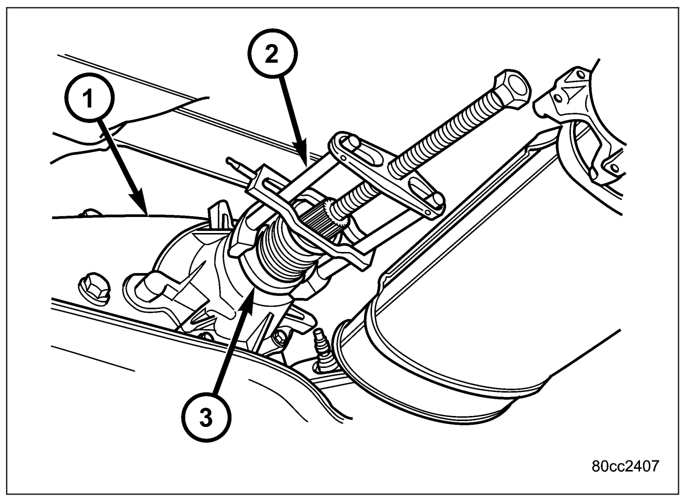
# SEAL-REAR OUTPUT SHAFT

## REMOVAL

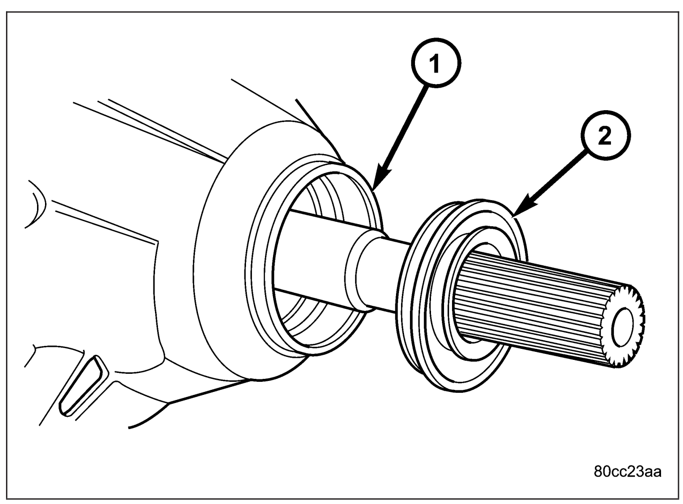
1. Shift the transmission and transfer case into NEUTRAL.
2. Raise and support vehicle.
3. Mark a line across the pinion shaft and at each end of the propeller shaft for installation reference.
4. Remove the U-joint strap bolts at the pinion shaft yoke.
5. Pry open clamp holding the dust boot (2) to propeller shaft yoke.



6. Slide the slip yoke off of the transmission/transfer case output shaft and remove the propeller shaft.
7. Spread band clamp which holds output shaft boot to the output shaft slinger with a suitable awl, or equivalent.
8. Remove output shaft boot from slinger and output shaft.
9. Remove the output shaft rear slinger (3) using Puller MD-998056-A (2).

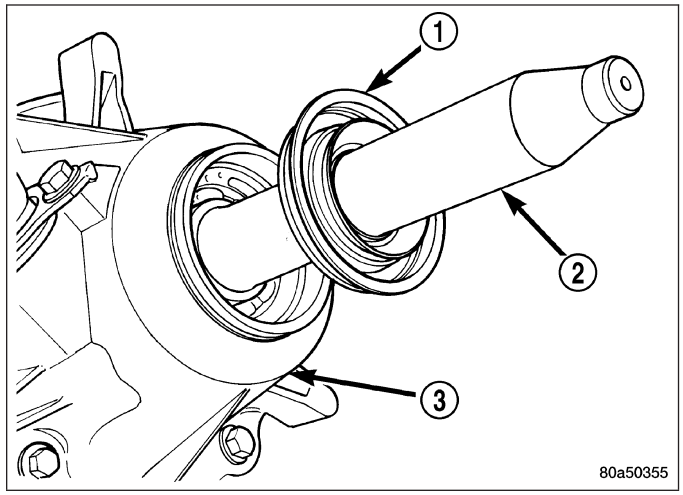


10. Use a suitable pry tool, or a slide hammer mounted screw, to remove the seal (2) from the rear retainer (1).

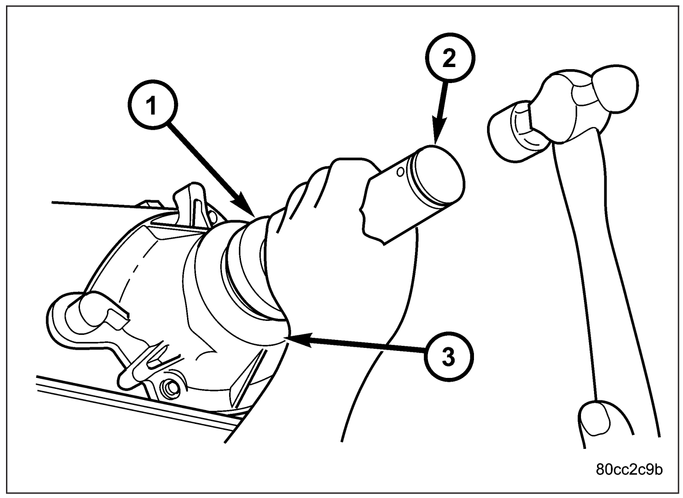


## INSTALLATION

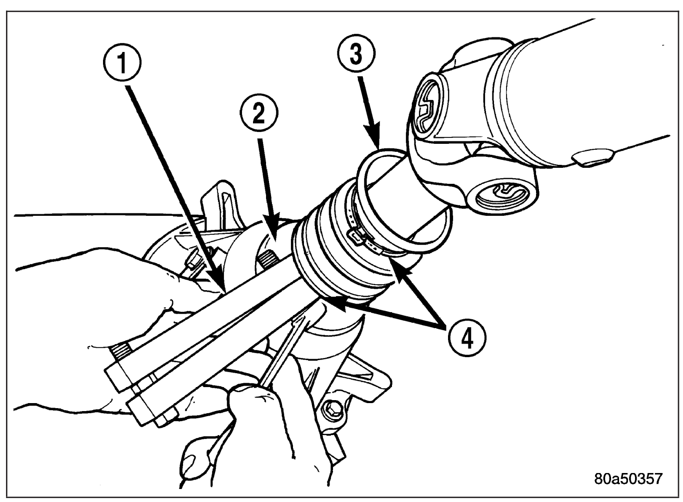
1. Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.
2. Slide seal onto Seal Protector 8824 (2). Slide seal protector and seal onto output shaft.



3. Slide Installer 8691 (1) onto seal and mainshaft. Drive seal into rear bearing retainer.



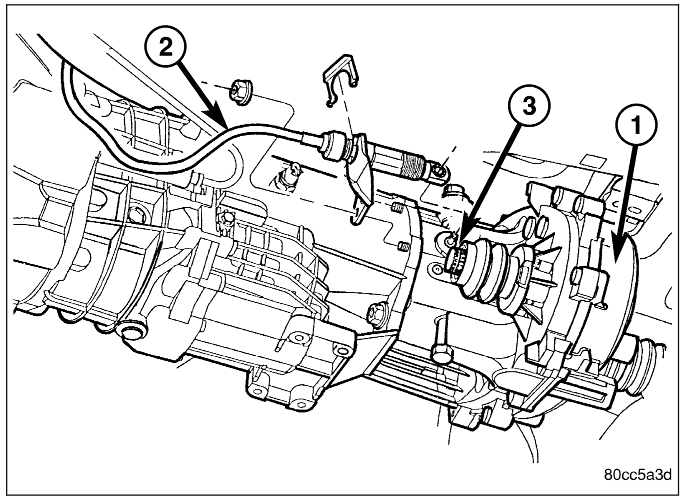
4. Install a new output shaft rear slinger with Installer 9023.
5. Install boot (3) on output shaft slinger and crimp retaining clamp with tool C-4975-A (1).
6. Slide the slip yoke on the transmission/transfer case output shaft. Align installation reference marks at the axle yoke and install the propeller shaft.
7. Tighten the U-joint strap/clamp bolts at the axle yoke to 19 N·m (14 ft. lbs.).
8. Crimp clamp with Clamp Tool C-4975A to hold dust boot to propeller shaft yoke.
9. Remove support and lower the vehicle.



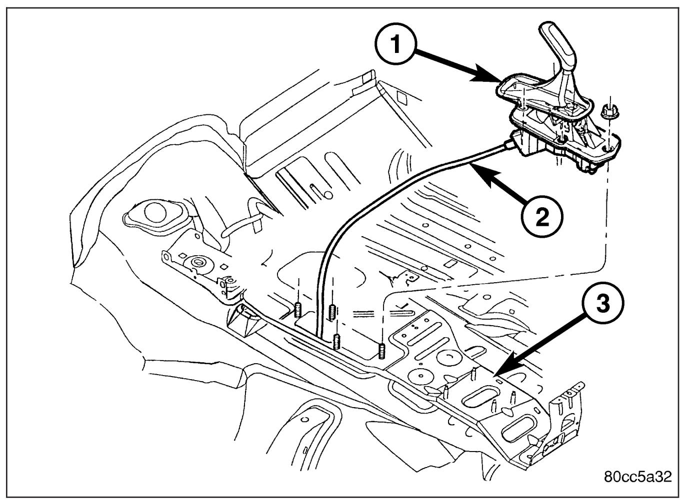
# LEVER-SHIFT

## REMOVAL

1. Shift transfer case into 4L.
2. Raise vehicle.
3. Remove clip securing the transfer case shift cable (2) to the shift cable support bracket.
4. Disengage any additional shift cable routing clips, if necessary.
5. Disengage the shift cable from the transfer case manual lever.



6. Lower vehicle.
7. Remove the floor console as necessary to access the shifter mechanism. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
8. Remove the nuts attaching lever assembly (1) to floorpan and remove assembly and shift cable (2).
9. Remove the shifter mechanism and cable assembly from the vehicle.



## INSTALLATION

1. Route the shift cable through the opening in the floor pan.
2. Position the shift mechanism over the shifter retaining studs on the floor pan.
3. Install the nuts to hold the shifter mechanism to the floor pan. Tighten the nuts to 11.86 N·m (105 in.lbs.).
4. Install any floor console components previously removed. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)
5. Verify that the floor shifter is in the 4L position.
6. Raise vehicle.
7. Route the shift cable through the opening in the shift cable support bracket.
8. Install the cable and a new spring clip into the slot in the support bracket.
9. Install any additional routing clips on the shift cable.
10. Verify that the transfer case is in the 4L position. The 4L position for the transfer case is with the manual lever to the full rearward position.
11. Attach the shift cable to the transfer case manual lever.
12. Lower vehicle and check for proper transfer case shifter operation.

# TIRES/WHEELS

## TABLE OF CONTENTS

## TIRES/WHEELS - ELECTRICAL DIAGNOSIS

### TABLE OF CONTENTS

# TIRE PRESSURE MONITORING SYSTEM - ELECTRICAL DIAGNOSIS

## DIAGNOSIS AND TESTING

## C0077- LOW TIRE PRESSURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  A low pressure condition will exist when the tire pressure falls below or is equal to the low pressure threshold value as specified for the vehicle.

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE:**
**If the following conditions are present:**
**– Low Tire Pressure DTC (Stored)**
**– Tire Pressure Sensor Internal DTC (Active)**
**– Spare Tire is not equipped with a Tire Pressure Sensor**
**– Spare Tire is currently on the vehicle**
**Repair the tire and place it back on the vehicle.**
**Test drive the vehicle.**
**If the DTC(s) reset continue with the diagnostic procedure.**

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 4

### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Test Complete.

## 3. TIRE PRESSURE SENSOR

**NOTE: Before continuing, ensure the tire is free from any leaks or damage that would cause a low tire pressure condition. If a problem is found, repair as necessary and retest.**

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. INTERMITTENT TIRE PRESSURE SENSOR DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

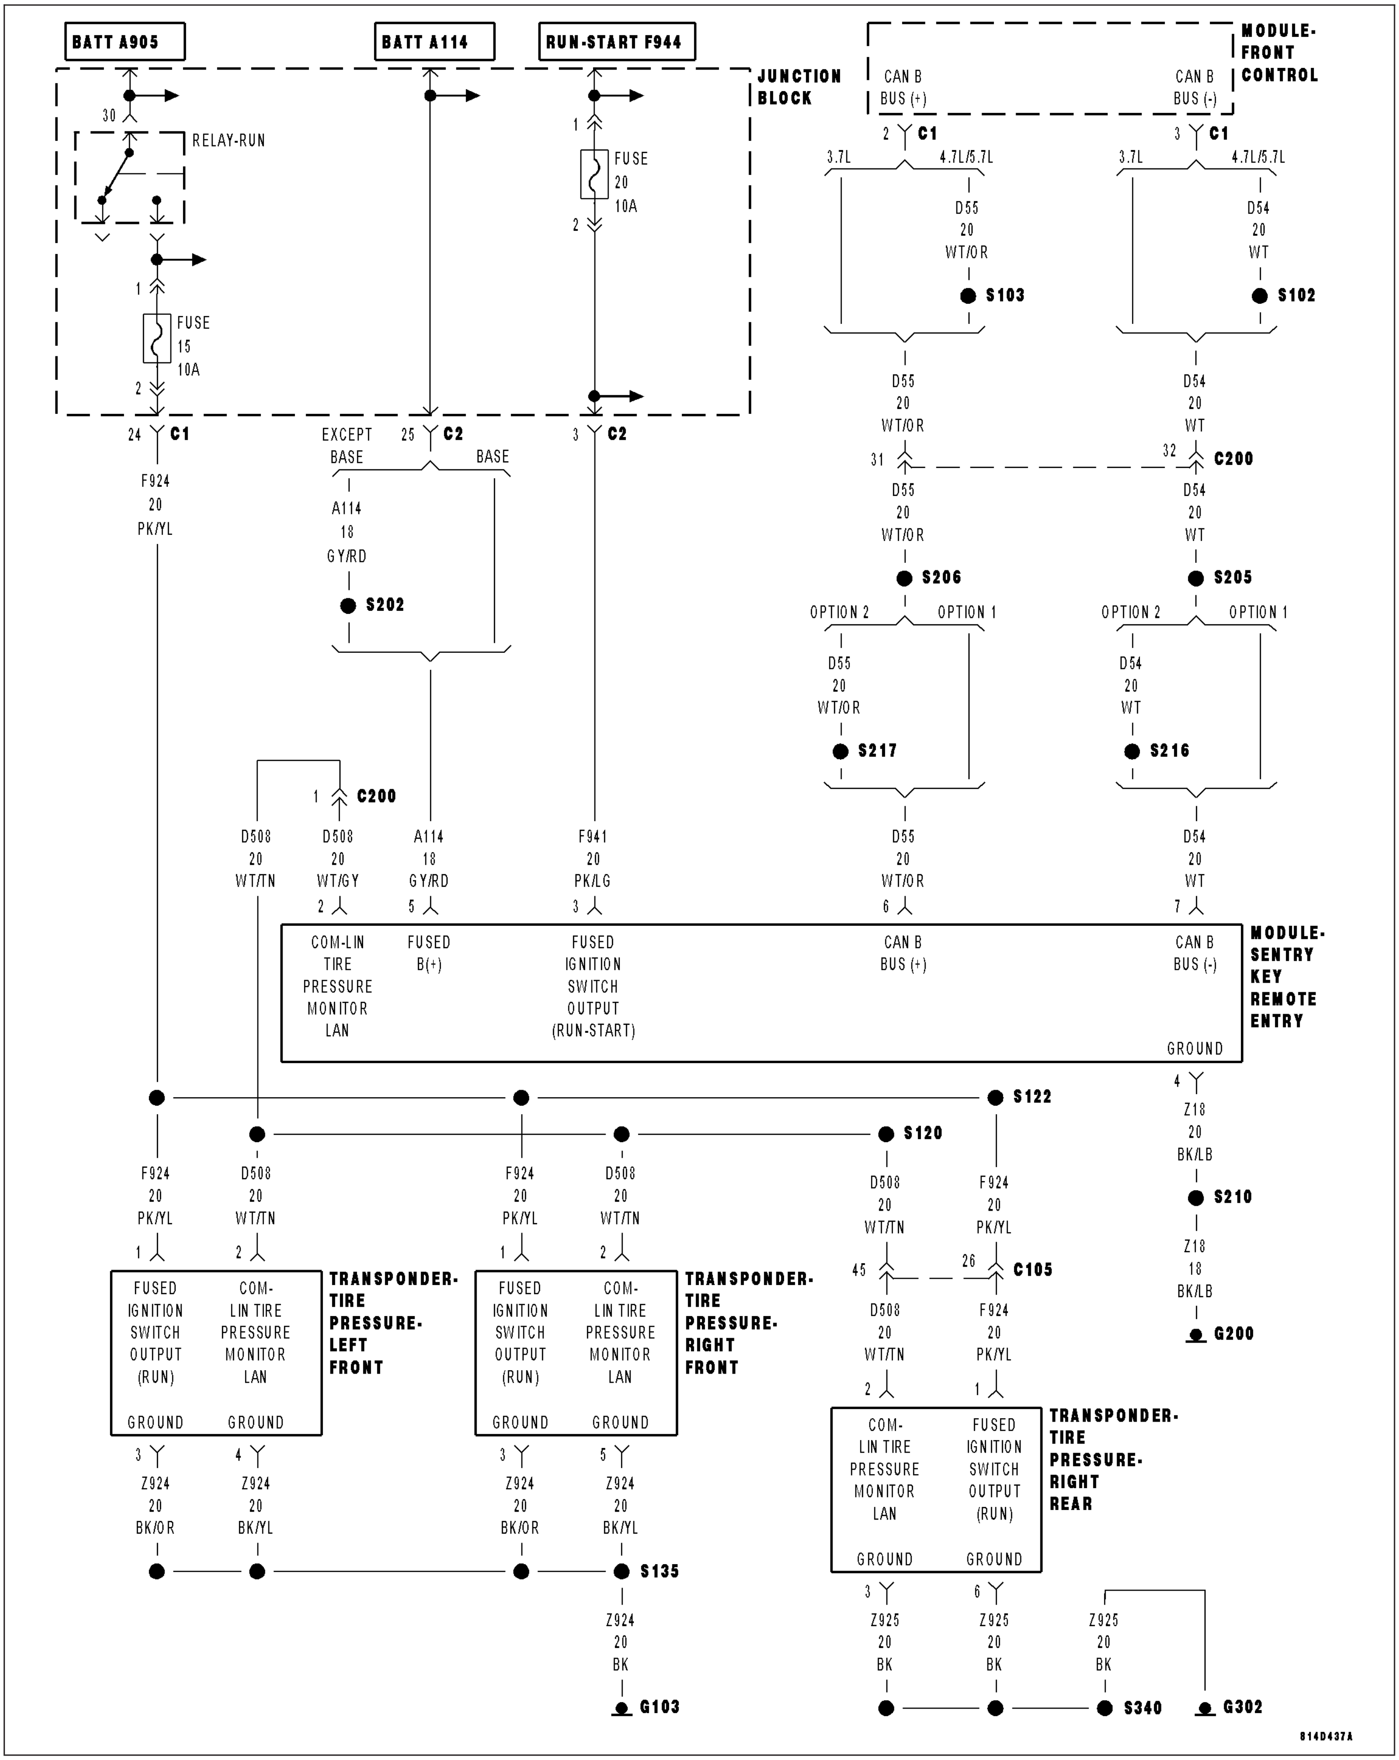
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## C1501–TIRE PRESSURE SENSOR 1 INTERNAL



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**
  With vehicle speed greater than 15 m.p.h. (24 km/h).
- **Set Condition:**
  The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

| Possible Causes |
|---|
| INTERMITTENT TIRE PRESSURE SENSOR INTERNAL DTC |
| TIRE PRESSURE SENSOR |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE:**
**If the following conditions are present:**
**– Low Tire Pressure DTC (Stored)**
**– Tire Pressure Sensor Internal DTC (Active)**
**– Spare Tire is not equipped with a Tire Pressure Sensor**
**– Spare Tire is currently on the vehicle**
**Repair the tire and place it back on the vehicle.**
**Test drive the vehicle.**
**If the DTC(s) reset continue with the diagnostic procedure.**
Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 4

### 2. TIRE PRESSURE SENSOR

**NOTE:**
**When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.**
**1. Set all tire pressures to the recommended specifications and recheck for fault/alert.**
**2. Turn the ignition on.**
**3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.**
**4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**
Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Test Complete.

## 3. WIRELESS CONTROL MODULE (SKREEM)

View repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

## 4. INTERMITTENT TIRE PRESSURE SENSOR DTC

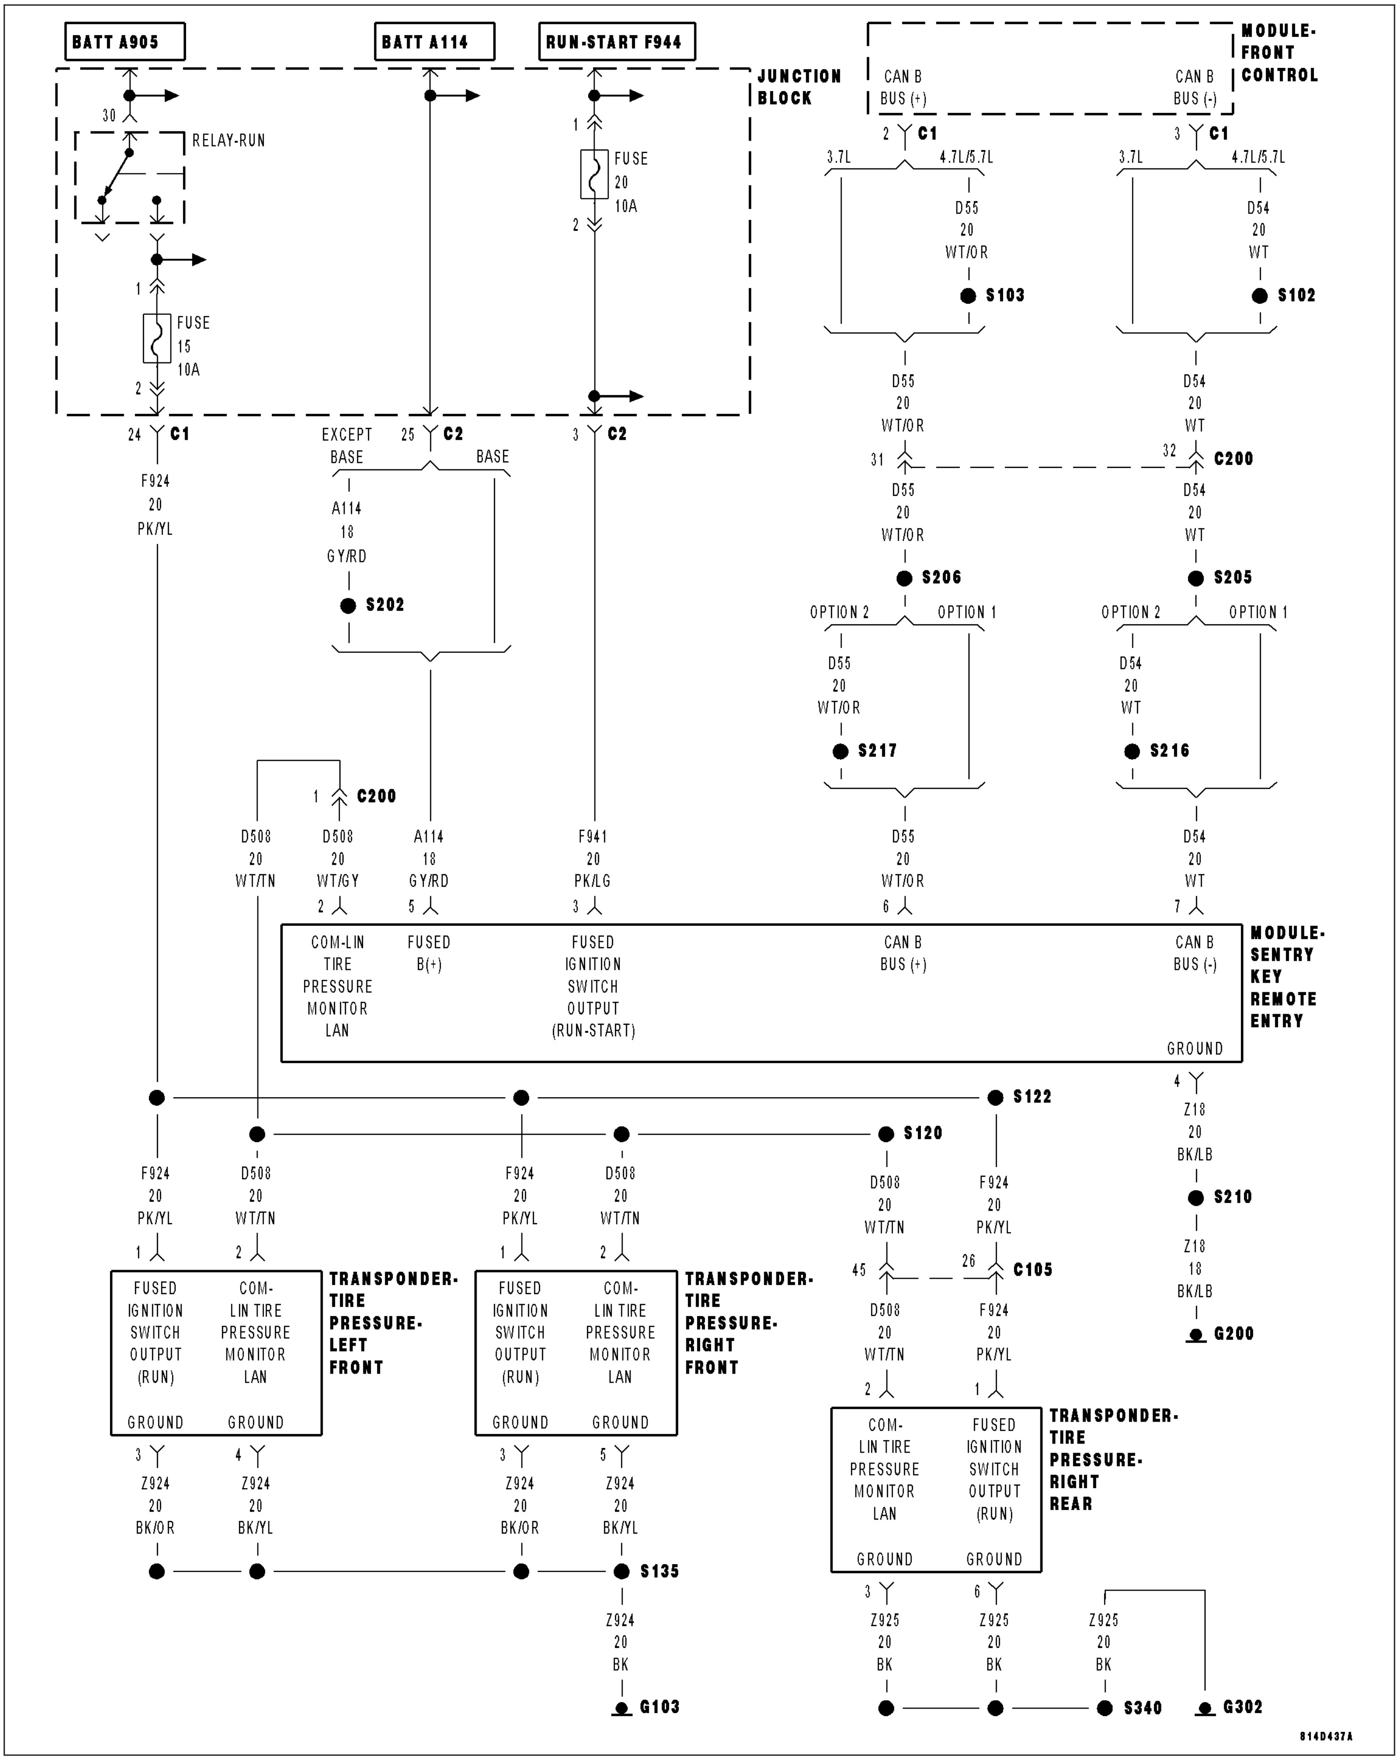
The conditions necessary to set this DTC are not present at this time.
Refer to any Technical Service Bulletins that may apply to this condition.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

**No** >> Test complete.

## C1502–TIRE PRESSURE SENSOR 2 INTERNAL



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**
  With vehicle speed greater than 15 m.p.h. (24 km/h).
- **Set Condition:**

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

**No** >> Test complete.

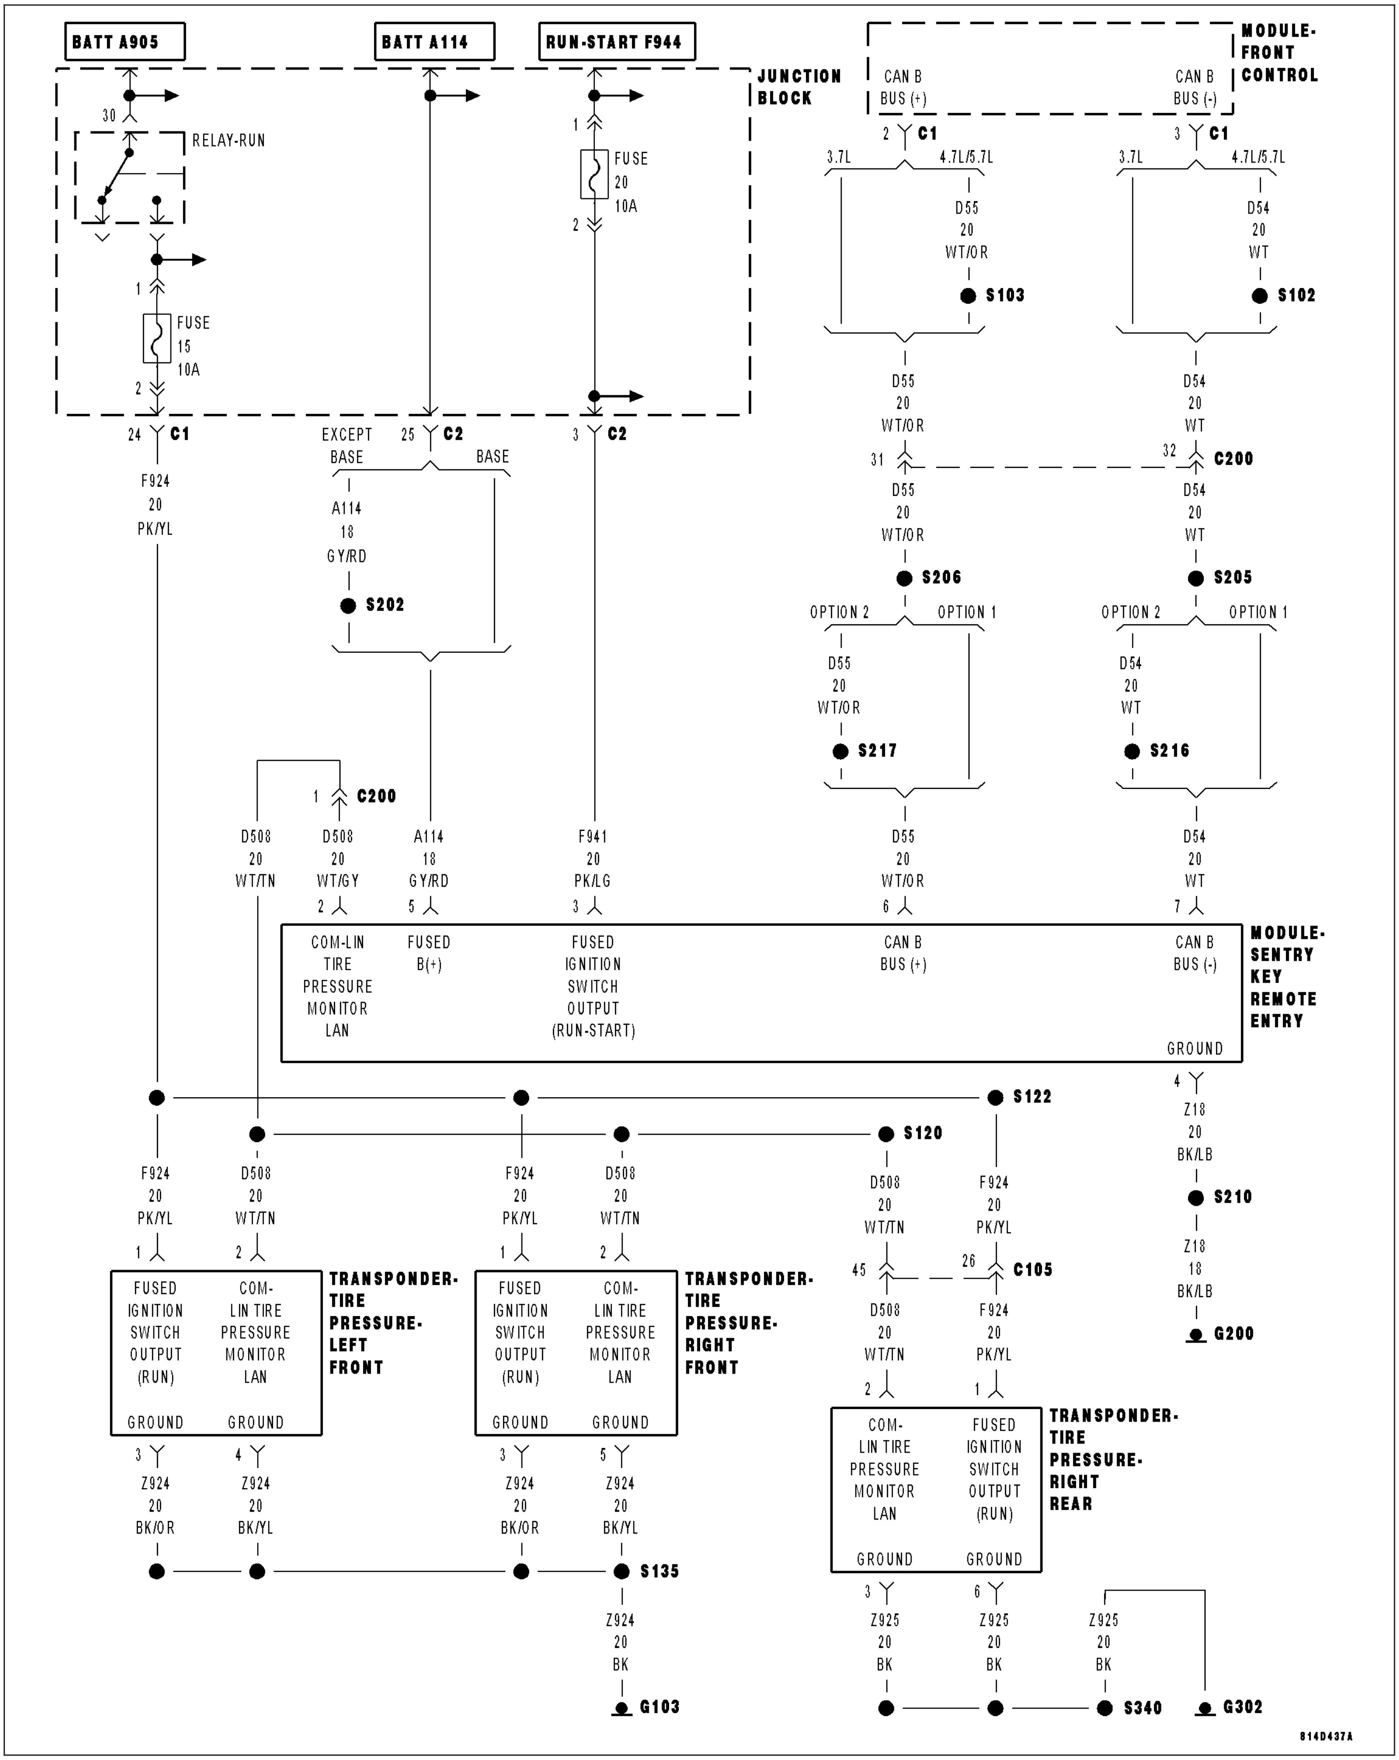
## C1505–TIRE PRESSURE SENSOR 5 INTERNAL



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**
  With vehicle speed greater than 15 m.p.h. (24 km/h).
- **Set Condition:**
  The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

| Possible Causes |
|---|
| INTERMITTENT TIRE PRESSURE SENSOR INTERNAL DTC |
| TIRE PRESSURE SENSOR |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE:**
**If the following conditions are present:**
**– Low Tire Pressure DTC (Stored)**
**– Tire Pressure Sensor Internal DTC (Active)**
**– Spare Tire is not equipped with a Tire Pressure Sensor**
**– Spare Tire is currently on the vehicle**
**Repair the tire and place it back on the vehicle.**
**Test drive the vehicle.**
**If the DTC(s) reset continue with the diagnostic procedure.**

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 4

### 2. TIRE PRESSURE SENSOR

**NOTE:**
**When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.**
**1. Set all tire pressures to the recommended specifications and recheck for fault/alert.**
**2. Turn the ignition on.**
**3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.**
**4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Test Complete.

## 3. WIRELESS CONTROL MODULE (SKREEM)

View repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

## 4. INTERMITTENT TIRE PRESSURE SENSOR DTC

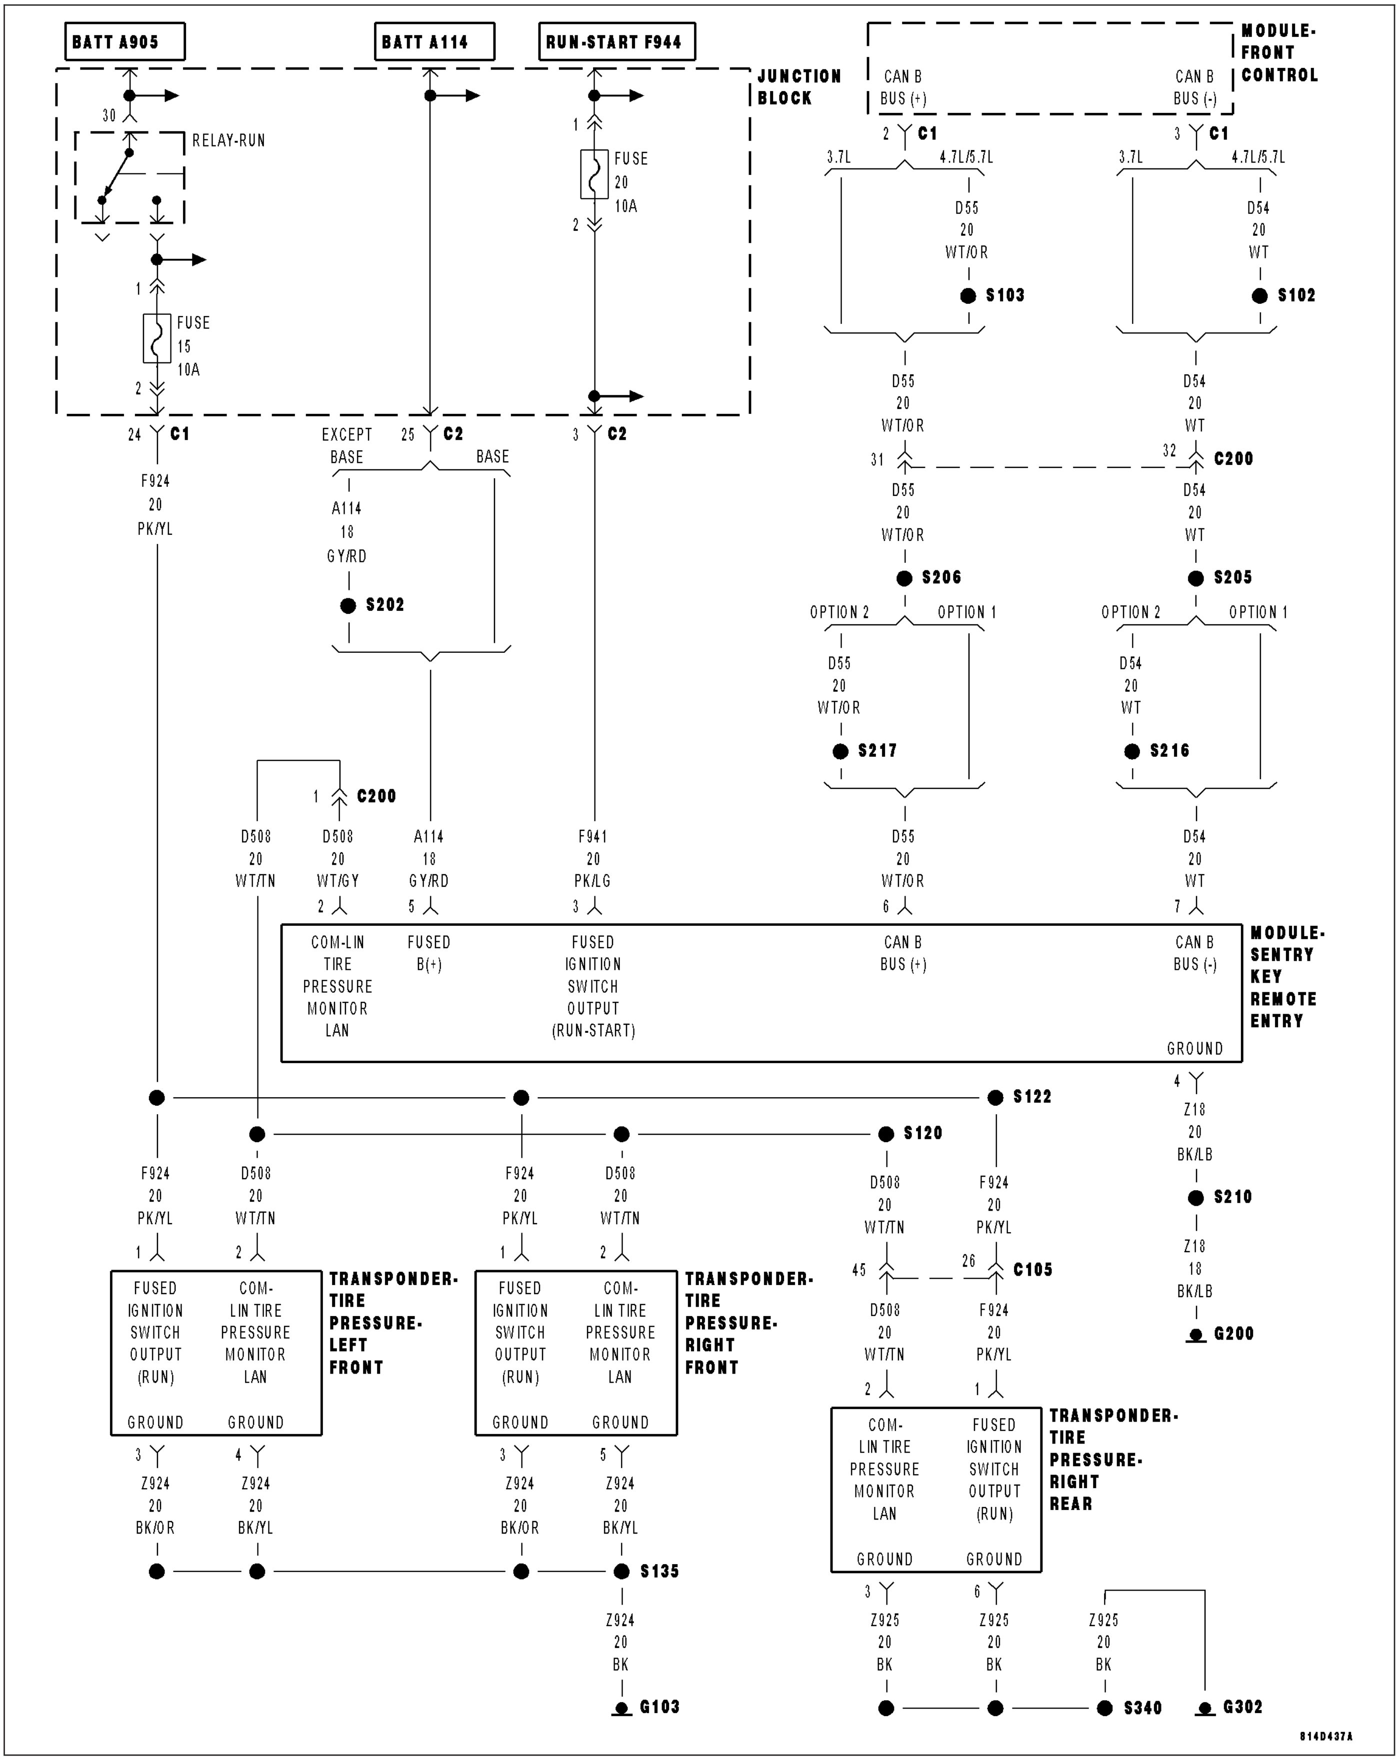
The conditions necessary to set this DTC are not present at this time.
Refer to any Technical Service Bulletins that may apply to this condition.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

**No** >> Test complete.

## C1506–LEFT FRONT TIRE PRESSURE TRIGGER MODULE PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM (SKREEM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

| Possible Causes |
|---|
| INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE |
| (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE |
| (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE |
| TIRE PRESSURE TRIGGER MODULE |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 9

### 2. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

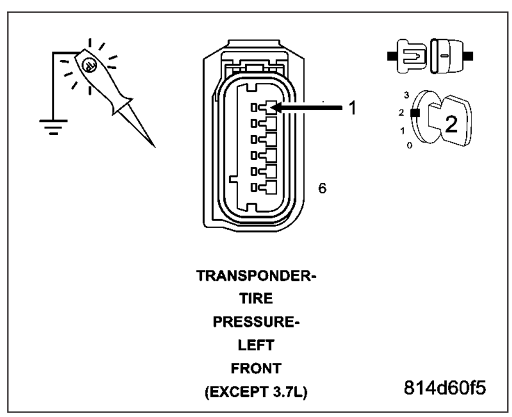
Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.



**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

**Is the test light illuminated and bright?**

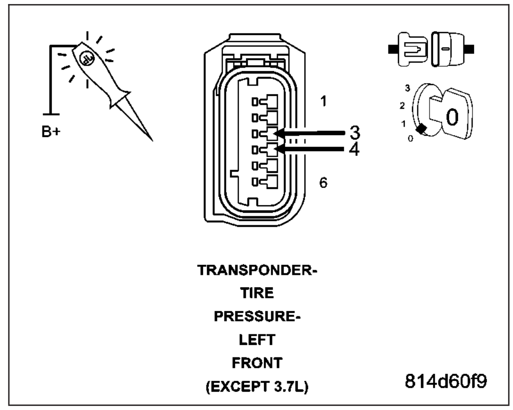
**Yes** >> Go to 3

**No** >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 3. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12-volt test light connect to battery voltage, probe each of the (Z924) Ground circuit(s).



**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go to 4

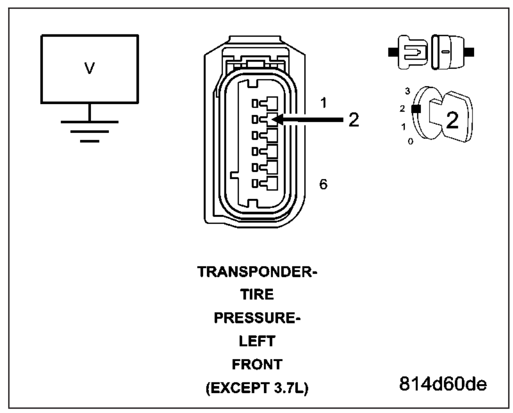
**No** >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 4. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.



**Is there any voltage present?**

**Yes** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

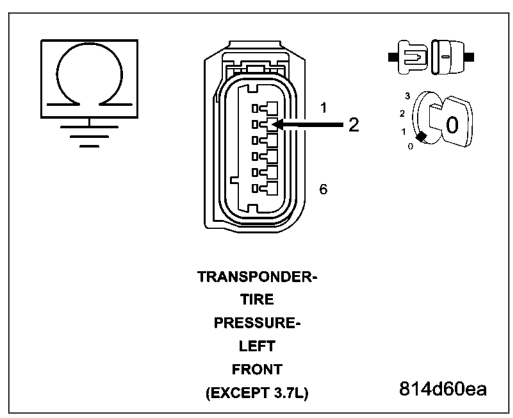
**No** >> Go to 5

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 5. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

**No** >> Go to 6

## 6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the SKREEM harness connector.

**NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.**

**Does the test light illuminate bright?**

**Yes** >> Go to 7

**No** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.
Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 7. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 8

**No** >> Test Complete.
Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 8. WIRELESS CONTROL MODULE (SKREEM)

View repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.
Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 9. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Using the wiring schematic as a guide, inspect the wiring and connectors relative to this circuit.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

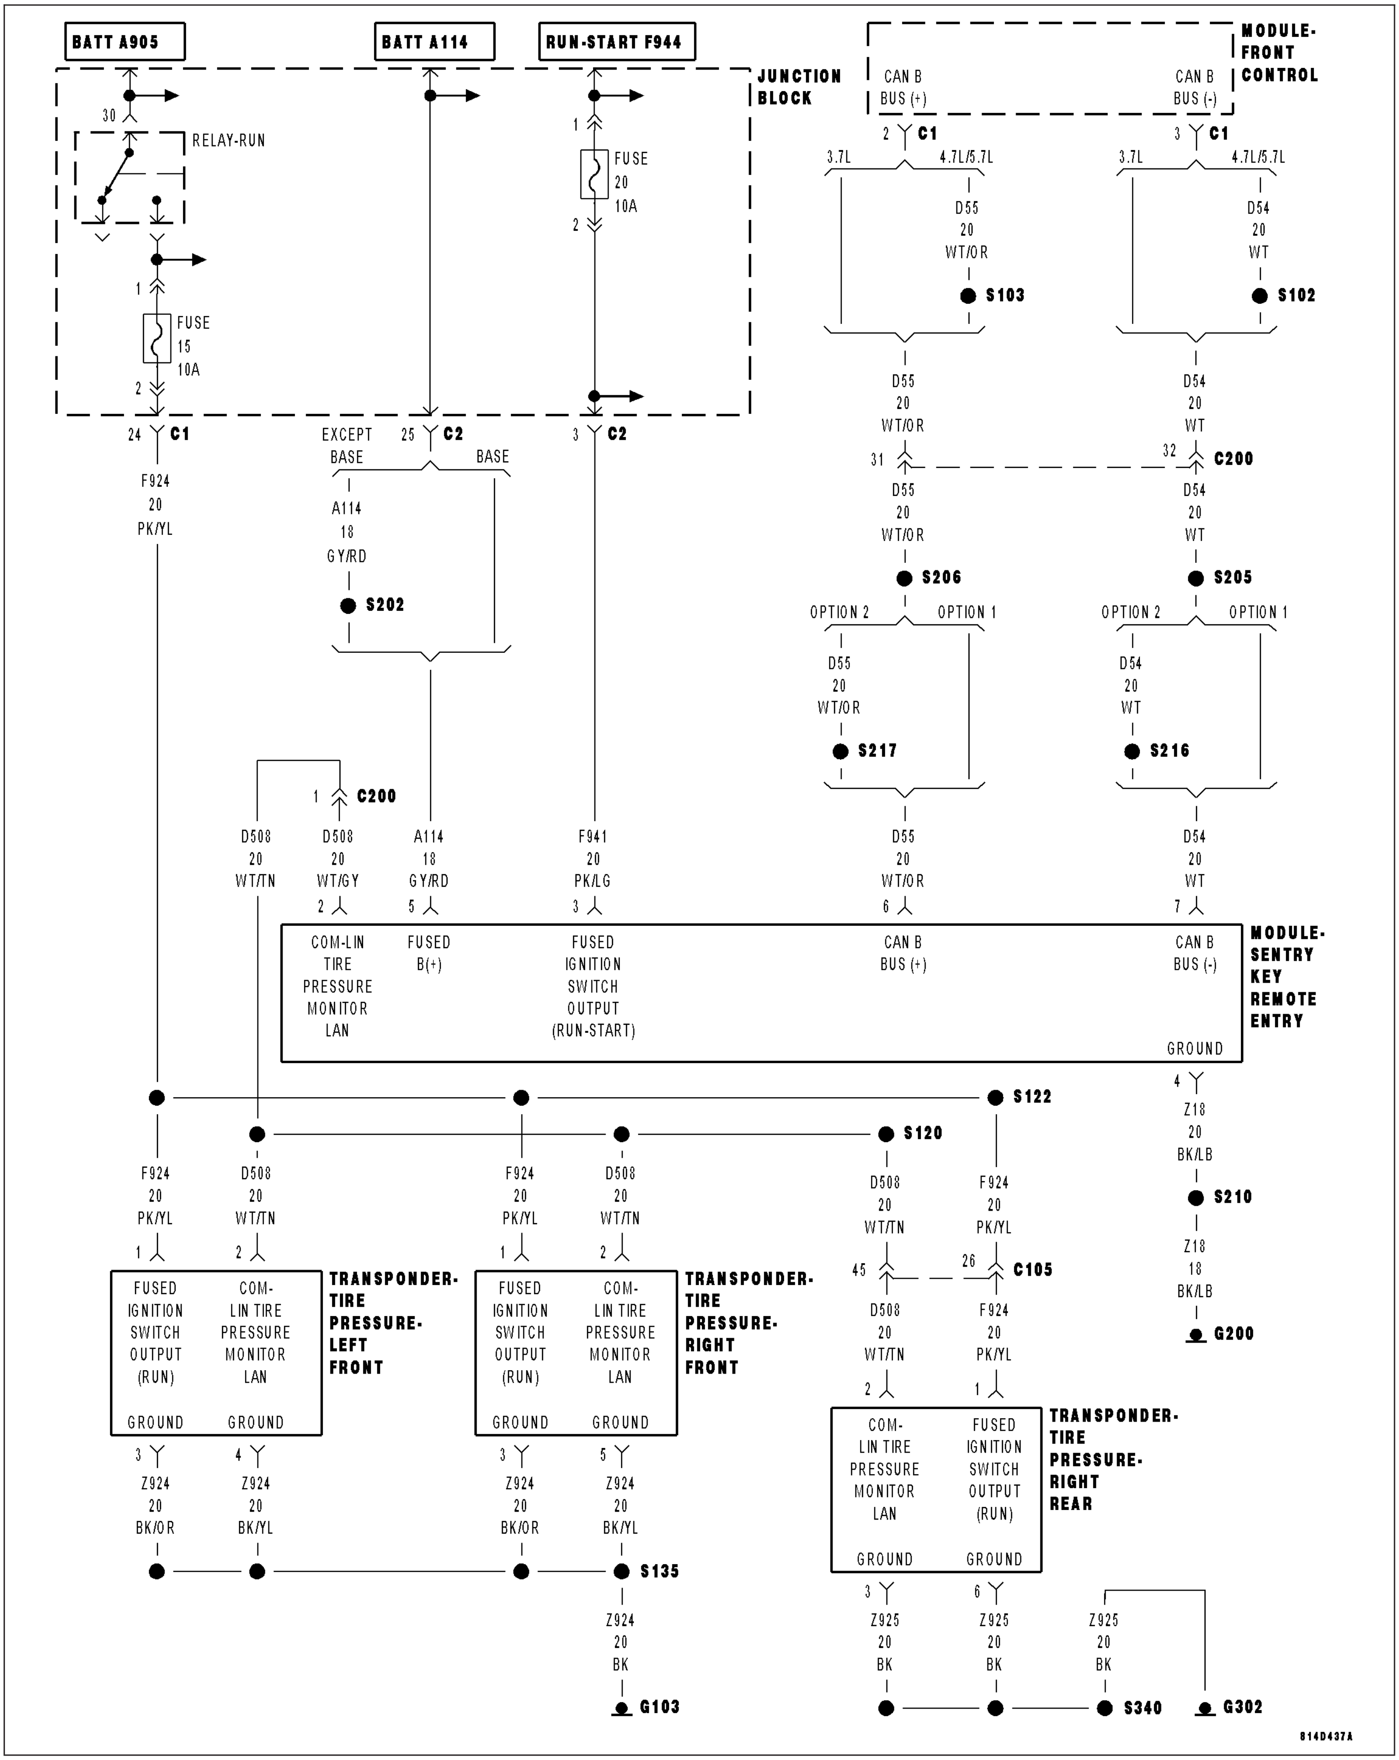
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the first step of this test and perform the diagnostic procedure.

**No** >> Test complete.

## C1507–RIGHT FRONT TIRE PRESSURE TRIGGER MODULE PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM (SKREEM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

| Possible Causes |
|---|
| INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE |
| (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE |
| (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE |
| TIRE PRESSURE TRIGGER MODULE |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 9

### 2. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.

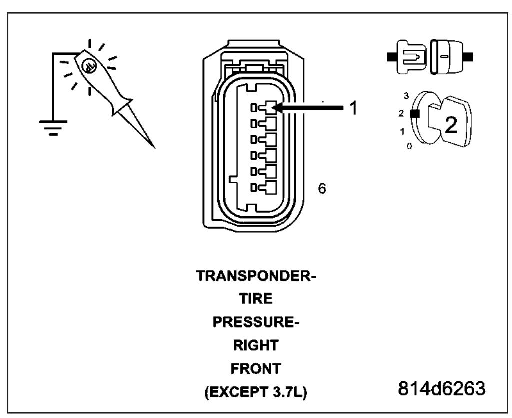
**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

**Is the test light illuminated and bright?**

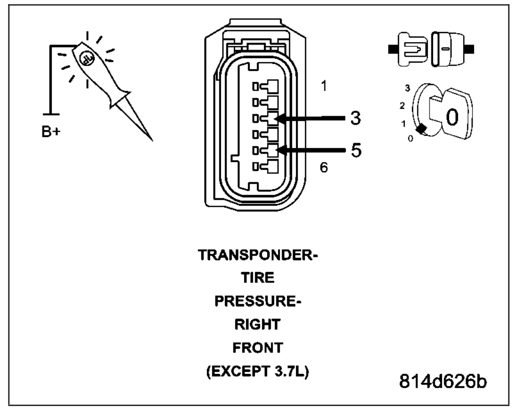
**Yes** >> Go to 3

**No** >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)



## 3. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE



Using a 12–volt test light connect to 12 volts, check each of the (Z924) Ground circuit(s).

**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

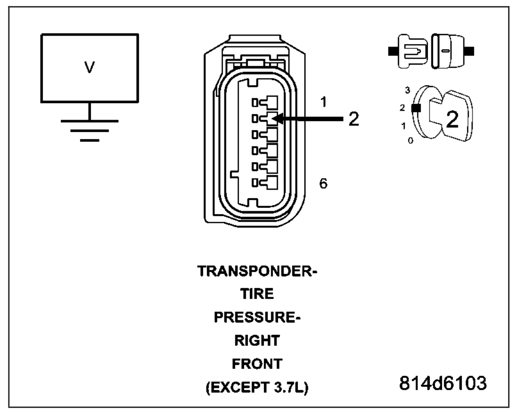
**Is the test light illuminated and bright?**

**Yes** >> Go to 4

**No** >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 4. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE



Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

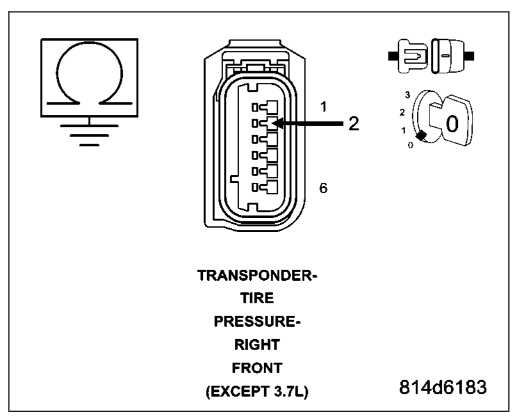
**Is there any voltage present?**

**Yes** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

**No** >> Go to 5

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 5. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND



Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

**No** >> Go to 6

## 6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the SKREEM harness connector.

**NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.**

**Does the test light illuminate bright?**

**Yes** >> Go to 7

**No** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.
Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 7. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 8

**No** >> Test Complete.
Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 8. WIRELESS CONTROL MODULE (SKREEM)

View repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.
Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 9. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Using the wiring schematic as a guide, inspect the wiring and connectors relative to this circuit.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

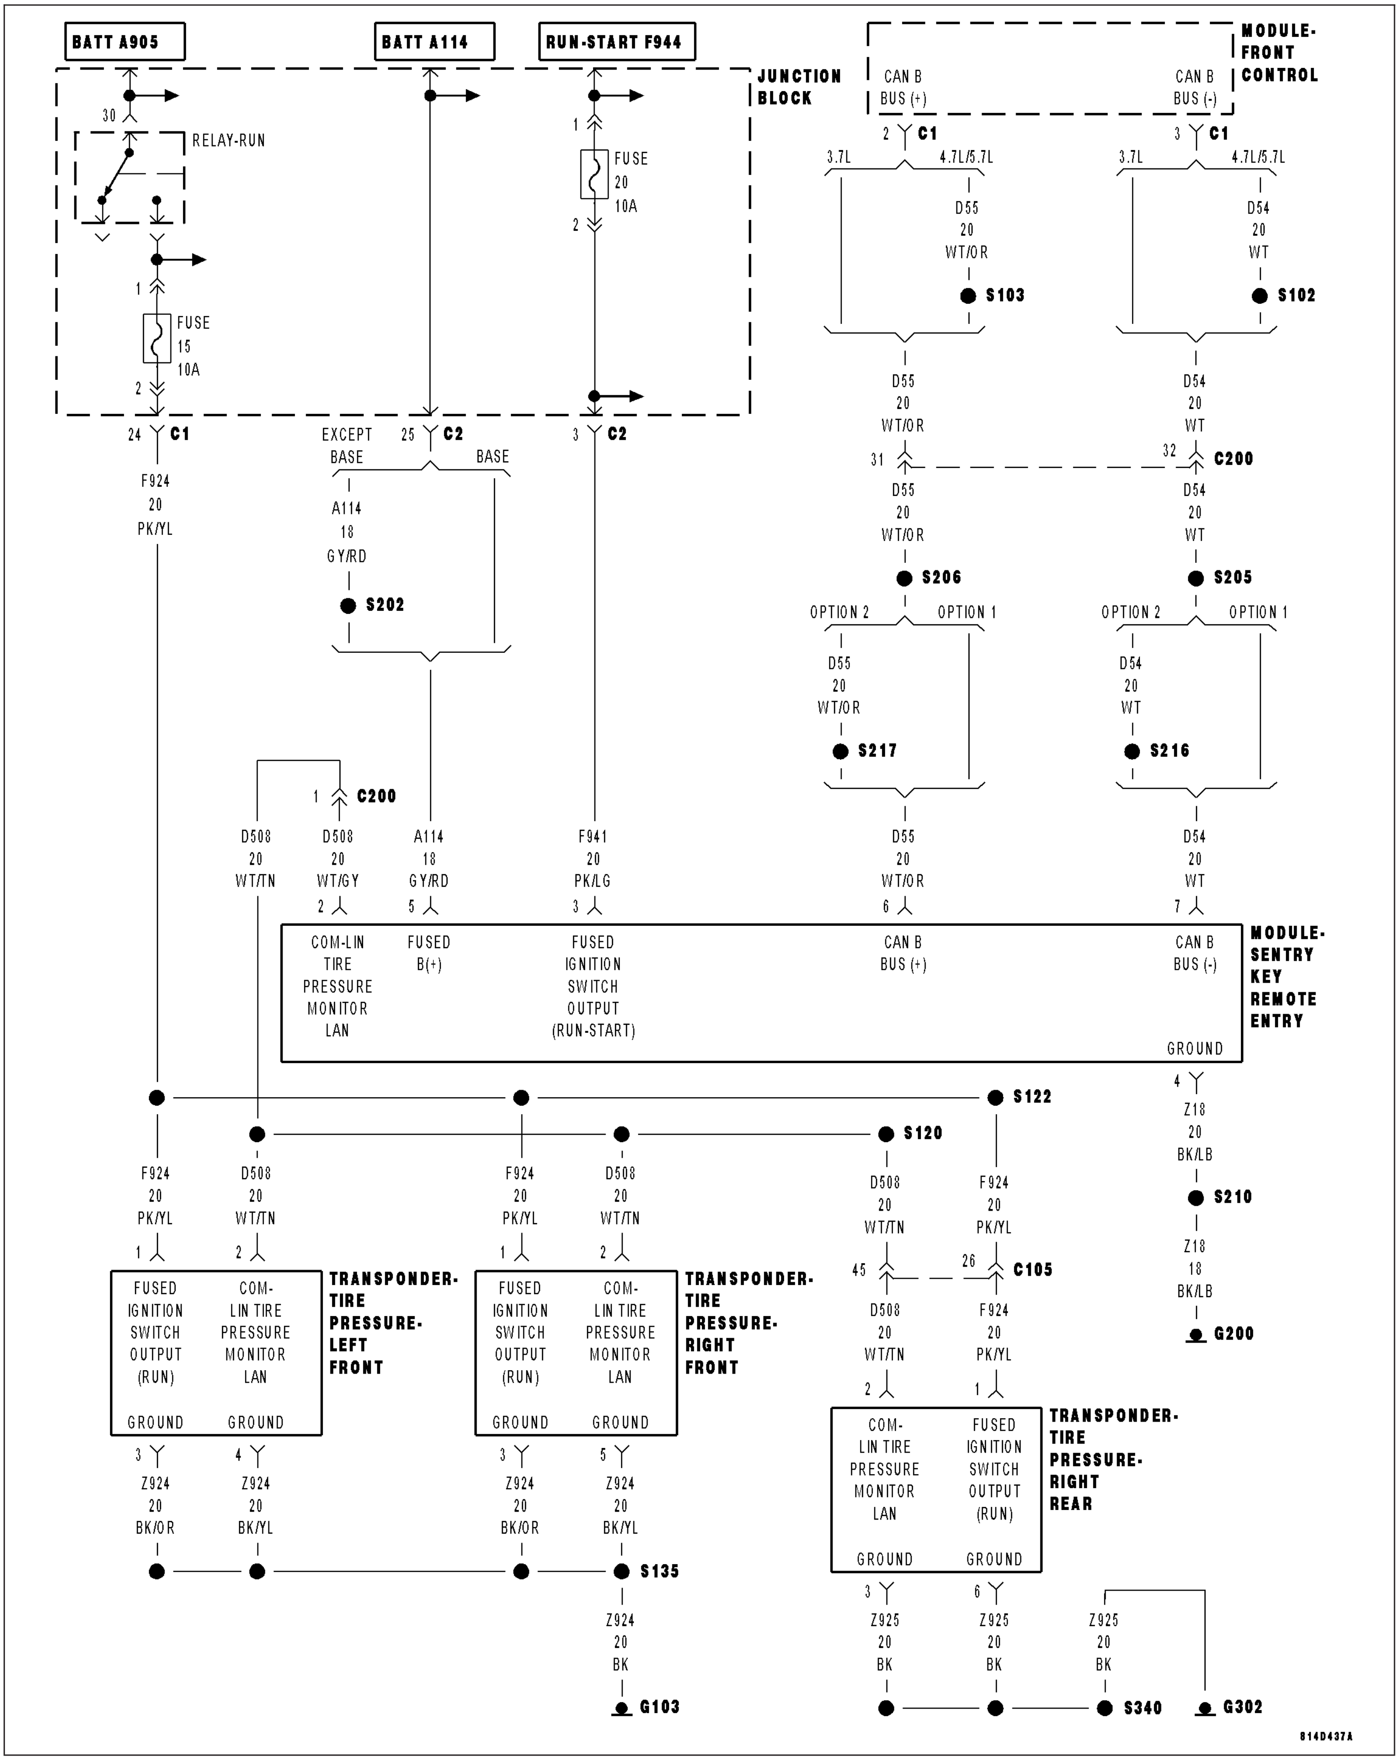
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the first step of this test and perform the diagnostic procedure.

**No** >> Test complete.

## C1509–RIGHT REAR TIRE PRESSURE TRIGGER MODULE PERFORMANCE



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM (SKREEM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

| Possible Causes |
|---|
| INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND |
| (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE |
| (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE |
| (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE |
| TIRE PRESSURE TRIGGER MODULE |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

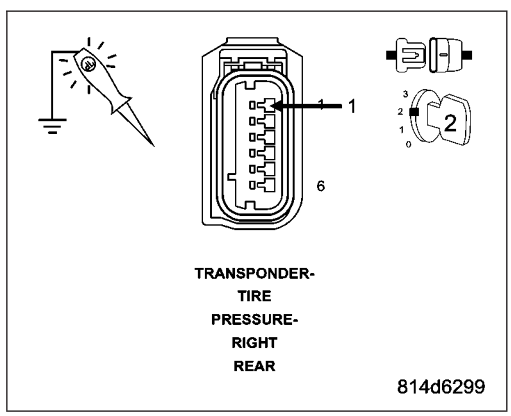
**Yes** >> Go to 2

**No** >> Go to 9

### 2. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.



**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

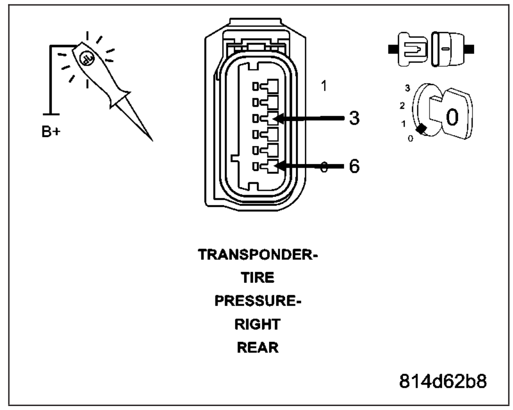
**Is the test light illuminated and bright?**

**Yes** >> Go to 3

**No** >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 3. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE



Using a 12–volt test light connect to 12 volts, check each of the (Z924) Ground circuit(s).

**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

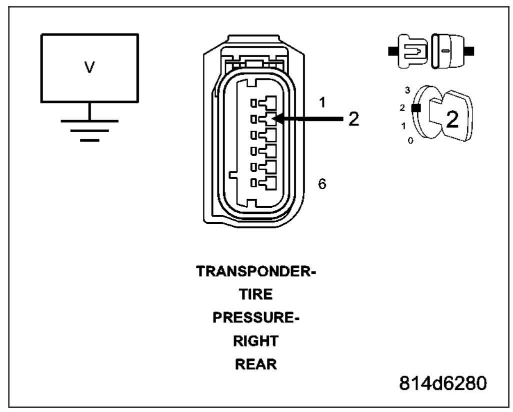
**Is the test light illuminated and bright?**

**Yes** >> Go to 4

**No** >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 4. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE



Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

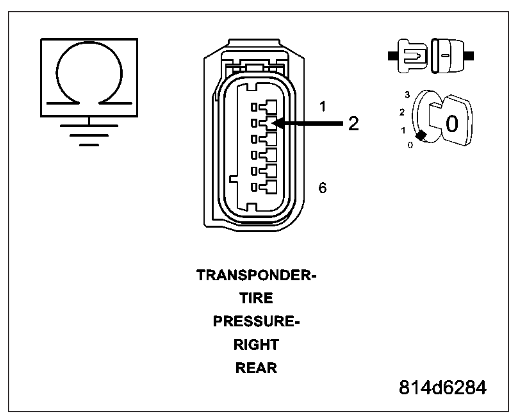
**Is there any voltage present?**

**Yes** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

**No** >> Go to 5

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 5. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND



Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

**No** >> Go to 6

## 6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the SKREEM harness connector.

**NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.**

**Does the test light illuminate bright?**

**Yes** >> Go to 7

**No** >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 7. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 8

**No** >> Test Complete.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 8. WIRELESS CONTROL MODULE (SKREEM)

View repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

Perform SKREEM VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE)

## 9. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Using the wiring schematic as a guide, inspect the wiring and connectors relative to this circuit.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

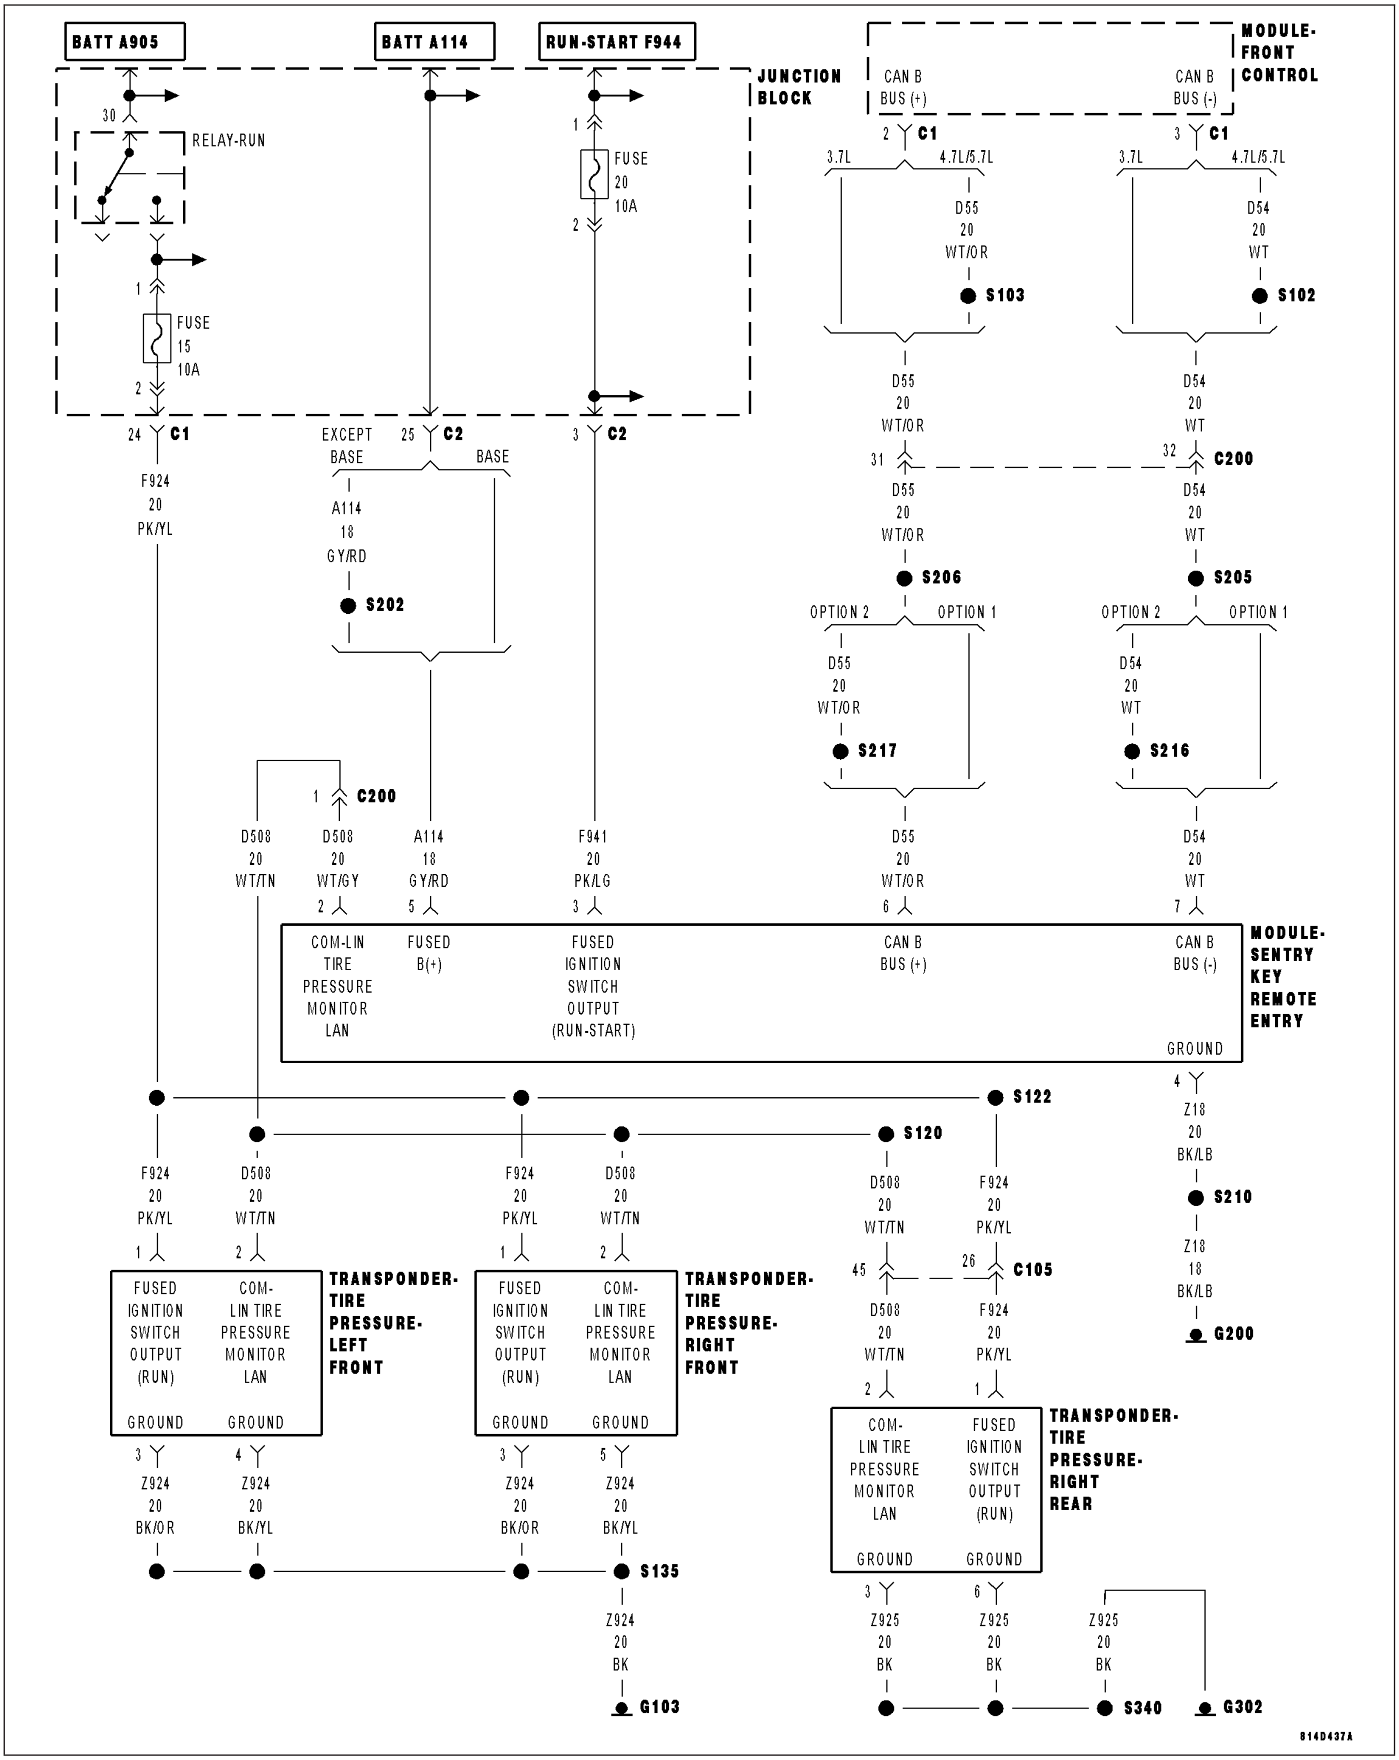
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the first step of this test and perform the diagnostic procedure.

**No** >> Test complete.

## C150A–LEFT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM receives a message from the Tire Pressure Trigger Module indicating that an over voltage condition has been detected.

| Possible Causes |
| --- |
| INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC |
| (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE |
| (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE |
| TIRE PRESSURE TRIGGER MODULE |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

Turn the ignition on.

**NOTE: If a system or battery voltage high DTC is set in the Wireless Control Module (SKREEM) or in the PCM, repair the voltage DTC before continuing with this test.**

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 6

### 2. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

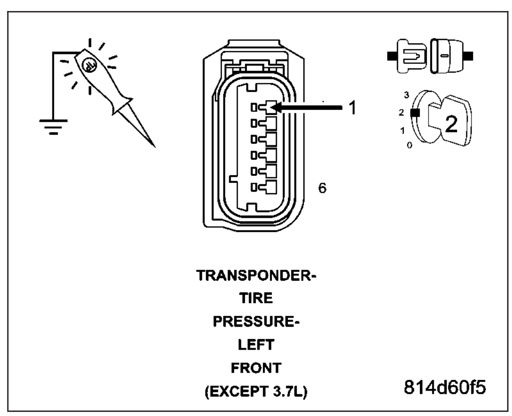
Using a 12–volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.

**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

**Is the test light illuminated and bright?**

**Yes** >> Go to 3

**No** >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.



## 3. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

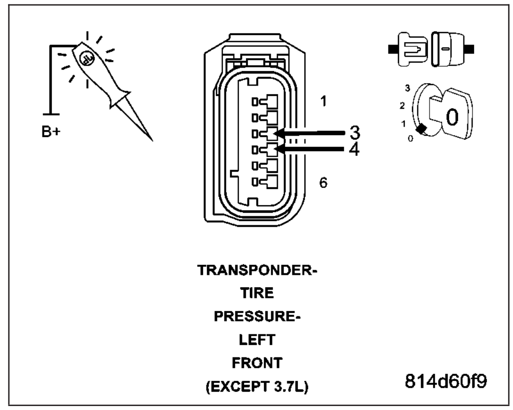
Using a 12–volt test light connect to 12 volts, check each of the (Z924) Ground circuit(s).

**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

**Is the test light illuminated and bright?**

**Yes** >> Go to 4

**No** >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.



## 4. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 5

**No** >> Test Complete.

## 5. WIRELESS CONTROL MODULE (SKREEM)

View repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

## 6. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

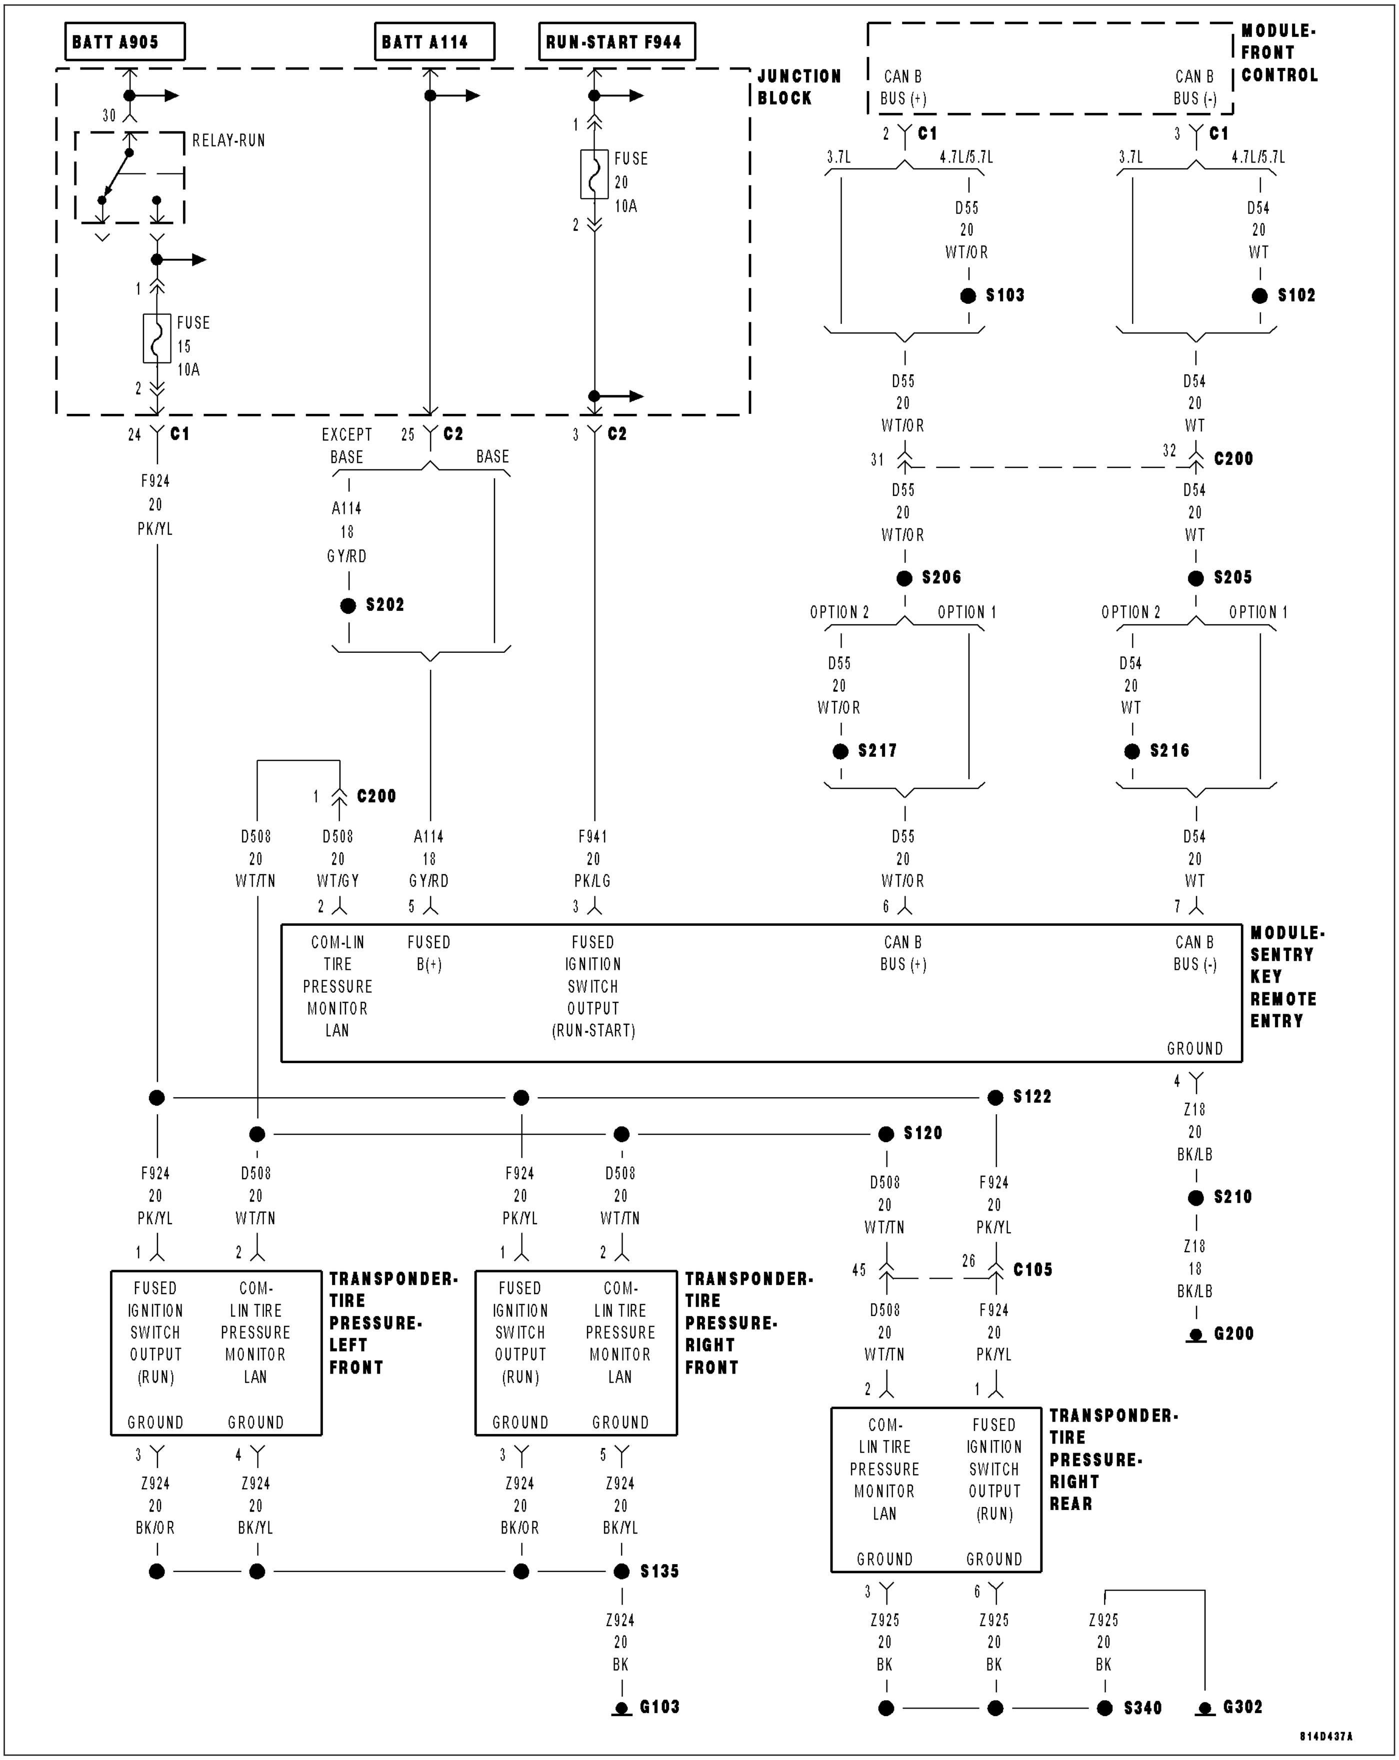
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the first step of this test and perform the diagnostic procedure.

**No** >> Test complete.

# C150B–RIGHT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM receives a message from the Tire Pressure Trigger Module indicating that an over voltage condition has been detected.

| Possible Causes |
|---|
| INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC |
| (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE |
| (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE |
| TIRE PRESSURE TRIGGER MODULE |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

Turn the ignition on.

**NOTE: If a system or battery voltage high DTC is set in the Wireless Control Module (SKREEM) or in the PCM, repair the voltage DTC before continuing with this test.**

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 6

### 2. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

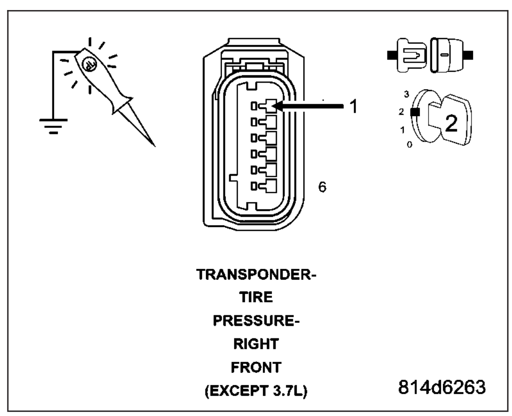
Using a 12–volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.

**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

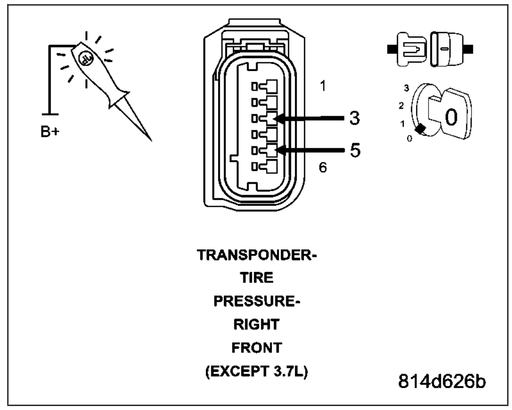
**Is the test light illuminated and bright?**

**Yes** >> Go to 3

**No** >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.



## 3. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE



Using a 12–volt test light connect to 12 volts, check each of the (Z924) Ground circuit(s).

**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

**Is the test light illuminated and bright?**

**Yes** >> Go to 4

**No** >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.

## 4. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 5

**No** >> Test Complete.

## 5. WIRELESS CONTROL MODULE (SKREEM)

View repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

## 6. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

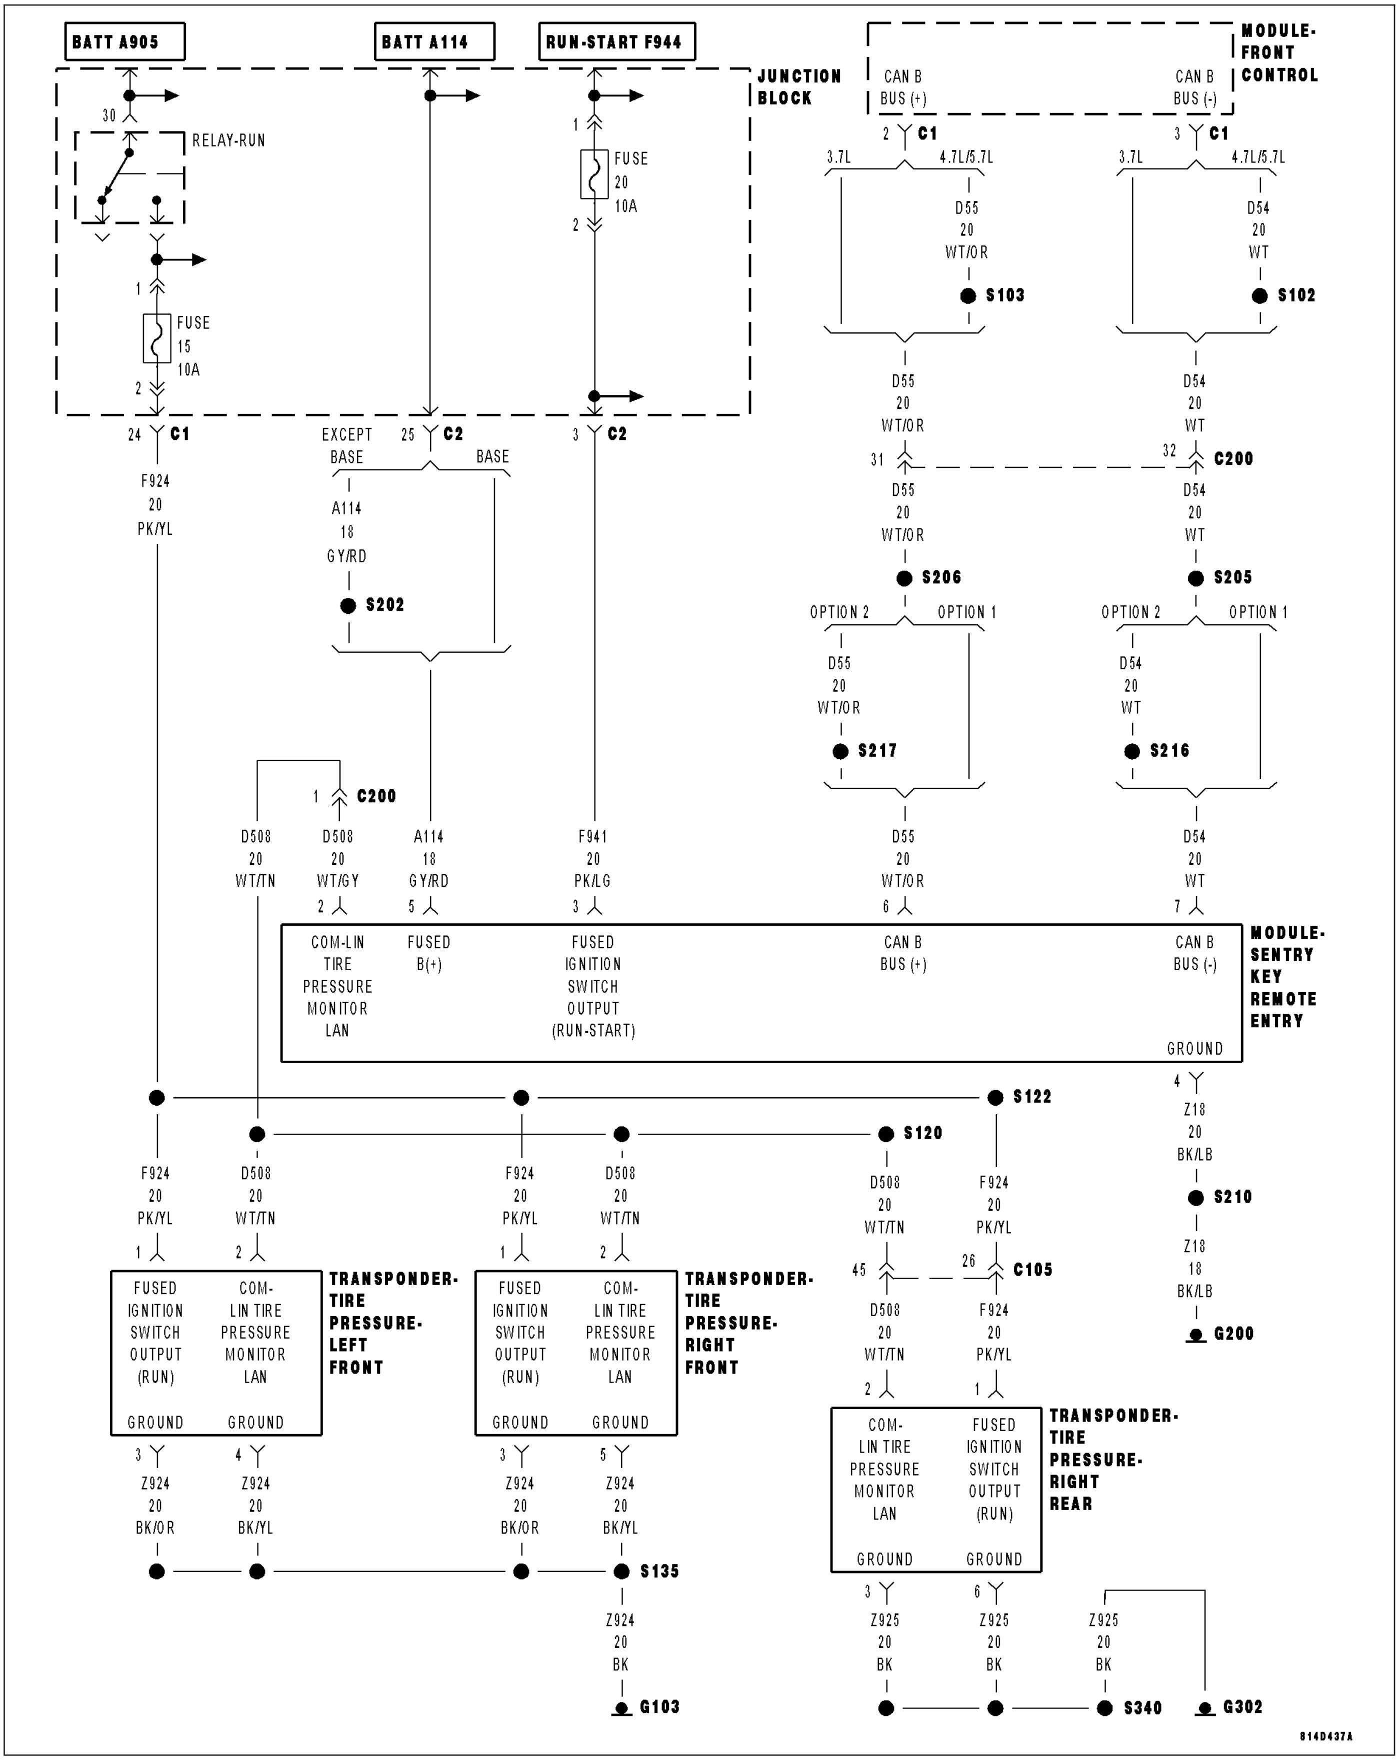
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the first step of this test and perform the diagnostic procedure.

**No** >> Test complete.

## C150C–RIGHT REAR TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH



For a complete wiring diagram **Refer to Section 8W**

## Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM receives a message from the Tire Pressure Trigger Module indicating that an over voltage condition has been detected.

| Possible Causes |
| --- |
| INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC |
| (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE |
| (Z925) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE |
| TIRE PRESSURE TRIGGER MODULE |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

Turn the ignition on.

**NOTE: If a system or battery voltage high DTC is set in the Wireless Control Module (SKREEM) or in the PCM, repair the voltage DTC before continuing with this test.**

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 6

### 2. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

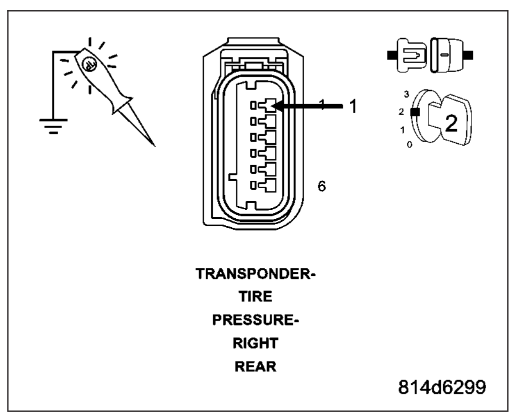
Using a 12–volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.

**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

**Is the test light illuminated and bright?**

**Yes** >> Go to 3

**No** >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.



## 3. (Z925) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

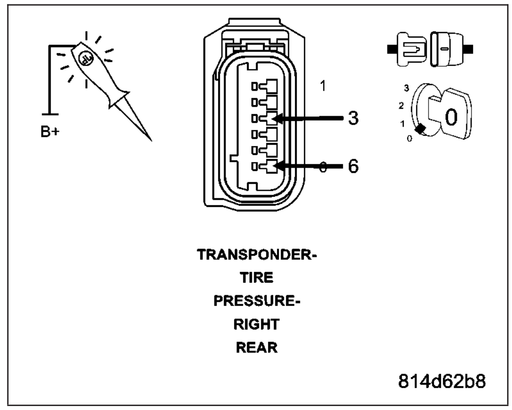
Using a 12–volt test light connect to 12 volts, check each of the (Z925) Ground circuit(s).

**NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

**Is the test light illuminated and bright?**

**Yes** >> Go to 4

**No** >> Repair the (Z925) Ground circuit(s) for an open circuit or high resistance.



## 4. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 5

**No** >> Test Complete.

## 5. WIRELESS CONTROL MODULE (SKREEM)

View repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

## 6. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the first step of this test and perform the diagnostic procedure.

**No** >> Test complete.

## TIRE SENSOR 1 LOW PRESSURE ALERT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The fault is set when there is a low tire pressure condition or sensor pressure measurement failure from the sensor/transmitter.

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

### Diagnostic Test

#### 1. TIRE SENSOR LOCATION PROCEDURE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.**

**NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.**

Set all tire pressures to the recommended specifications and recheck for fault/alert.

Turn the ignition on.

Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

**NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**

**Once the correct sensor/transmitter has been located continue.**

**Continue**
Go to 2

#### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Go to 4

## 3. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. TIRE PRESSURE CORRECTION/INTERMITTENT

**NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## TIRE SENSOR 1 TRANSMIT FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The fault is set when the WCM (SKREEM) does not receive eight consecutive RF transmissions from the sensor/transmitter

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

## Diagnostic Test

### 1. TIRE SENSOR LOCATION PROCEDURE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.**

**NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.**

Set all tire pressures to the recommended specifications and recheck for fault/alert.

Turn the ignition on.

Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

**NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**

**Once the correct sensor/transmitter has been located continue.**

**Continue**
Go to 2

### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Go to 4

## 3. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. TIRE PRESSURE CORRECTION/INTERMITTENT

**NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## TIRE SENSOR 2 LOW PRESSURE ALERT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The fault is set when there is a low tire pressure condition or sensor pressure measurement failure from the sensor/transmitter.

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

### Diagnostic Test

#### 1. TIRE SENSOR LOCATION PROCEDURE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.**

**NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.**

Set all tire pressures to the recommended specifications and recheck for fault/alert.

Turn the ignition on.

Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

**NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**

**Once the correct sensor/transmitter has been located continue.**

**Continue**
Go to 2

#### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Go to 4

## 3. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. TIRE PRESSURE CORRECTION/INTERMITTENT

**NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## TIRE SENSOR 2 TRANSMIT FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The fault is set when the WCM (SKREEM) does not receive eight consecutive RF transmissions from the sensor/transmitter

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

### Diagnostic Test

#### 1. TIRE SENSOR LOCATION PROCEDURE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.**

**NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.**

Set all tire pressures to the recommended specifications and recheck for fault/alert.

Turn the ignition on.

Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

Go to 2

#### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Go to 4

## 3. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. TIRE PRESSURE CORRECTION/INTERMITTENT

**NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## TIRE SENSOR 3 LOW PRESSURE ALERT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The fault is set when there is a low tire pressure condition or sensor pressure measurement failure from the sensor/transmitter.

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

## Diagnostic Test

### 1. TIRE SENSOR LOCATION PROCEDURE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.**

**NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.**

Set all tire pressures to the recommended specifications and recheck for fault/alert.

Turn the ignition on.

Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

**NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**

**Once the correct sensor/transmitter has been located continue.**

**Continue**
Go to 2

### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Go to 4

## 3. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. TIRE PRESSURE CORRECTION/INTERMITTENT

**NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## TIRE SENSOR 3 TRANSMIT FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The fault is set when the WCM (SKREEM) does not receive eight consecutive RF transmissions from the sensor/transmitter

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

## Diagnostic Test

### 1. TIRE SENSOR LOCATION PROCEDURE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.**

**NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.**

Set all tire pressures to the recommended specifications and recheck for fault/alert.

Turn the ignition on.

Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

**NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**

**Once the correct sensor/transmitter has been located continue.**

**Continue**
Go to 2

### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Go to 4

## 3. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. TIRE PRESSURE CORRECTION/INTERMITTENT

**NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## TIRE SENSOR 4 LOW PRESSURE ALERT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The fault is set when there is a low tire pressure condition or sensor pressure measurement failure from the sensor/transmitter.

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

## Diagnostic Test

### 1. TIRE SENSOR LOCATION PROCEDURE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.**

**NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.**

Set all tire pressures to the recommended specifications and recheck for fault/alert.

Turn the ignition on.

Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

**NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**

**Once the correct sensor/transmitter has been located continue.**

**Continue**
Go to 2

### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Go to 4

## 3. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. TIRE PRESSURE CORRECTION/INTERMITTENT

**NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## TIRE SENSOR 4 TRANSMIT FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The fault is set when the WCM (SKREEM) does not receive eight consecutive RF transmissions from the sensor/transmitter

| Possible Causes |
|---|
| INTERMITTENT PERFORMANCE DTC |
| INCORRECT TIRE PRESSURE |
| TIRE PRESSURE SENSOR |
| WCM (SKREEM) |

### Diagnostic Test

#### 1. TIRE SENSOR LOCATION PROCEDURE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

**NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.**

**NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You MUST locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.**

Set all tire pressures to the recommended specifications and recheck for fault/alert.

Turn the ignition on.

Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

**NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.**

**Once the correct sensor/transmitter has been located continue.**

**Continue**
Go to 2

#### 2. LOW TIRE PRESSURE

**NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.**

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Go to 3

**No** >> Go to 4

## 3. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

**No** >> Test Complete.

## 4. TIRE PRESSURE CORRECTION/INTERMITTENT

**NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.**

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## PRNDL MESSAGE MISSING

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  This DTC will set if the PRNDL message is not received for more than 5 seconds.

| Possible Causes |
|---|
| INTERMITTENT PRNDL MESSAGE MISSING DTC |
| PCM DTCS PRESENT |
| CLUSTER DTCS PRESENT |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 5

### 2. DTCS PRESENT IN PCM

Cycle the ignition off and on.

With the scan tool, select View DTCs in the Powertrain Control Module (PCM).

**Are there any DTCs present on the PCM?**

**Yes** >> Refer to the appropriate diagnostic procedure for the PCM DTC.

**No** >> Go to 3

### 3. DTCS PRESENT IN THE CLUSTER

Cycle the ignition off and on.

With the scan tool, select View DTCs in the Instrument Cluster (CCN).

**Are there any DTCs present on the Cluster?**

**Yes** >> Refer to the appropriate diagnostic procedure for the Cluster DTC.

**No** >> Go to 4

## 4. WIRELESS CONTROL MODULE (SKREEM)

Inspect the wiring and connectors relative to this circuit.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring and connectors. Look for the DTC to reset or for the data to change other than as expected.

Refer to any Technical Service Bulletins that may apply to this condition.

If no problems are found view repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

## 5. INTERMITTENT PRNDL MESSAGE MISSING DTC

The conditions necessary to set this DTC are not present at this time.

Inspect the wiring and connectors relative to this circuit.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring and connectors. Look for the DTC to reset or for the data to change other than as expected.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

**No** >> Test complete.

## VEHICLE SPEED MESSAGE MISSING

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  This DTC will set if the Vehicle Speed message is not received for more than 5 seconds.

| Possible Causes |
|---|
| INTERMITTENT VEHICLE SPEED MESSAGE MISSING DTC |
| PCM DTCS PRESENT |
| CLUSTER DTCS PRESENT |
| WIRELESS CONTROL MODULE (SKREEM) |

## Diagnostic Test

### 1. DTC STATUS IS ACTIVE

**NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.**

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 5

### 2. DTCS PRESENT IN PCM

Cycle the ignition off and on.

With the scan tool, select View DTCs in the Powertrain Control Module (PCM).

**Are there any DTCs present on the PCM?**

**Yes** >> Refer to the appropriate diagnostic procedure for the PCM DTC.

**No** >> Go to 3

### 3. DTCS PRESENT IN THE CLUSTER

Cycle the ignition off and on.

With the scan tool, select View DTCs in the Instrument Cluster (CCN).

**Are there any DTCs present on the Cluster?**

**Yes** >> Refer to the appropriate diagnostic procedure for the Cluster DTC.

**No** >> Go to 4

## 4. WIRELESS CONTROL MODULE (SKREEM)

Inspect the wiring and connectors relative to this circuit.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring and connectors. Look for the DTC to reset or for the data to change other than as expected.

Refer to any Technical Service Bulletins that may apply to this condition.

If no problems are found view repair.

**Repair**

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

## 5. INTERMITTENT VEHICLE SPEED MESSAGE MISSING DTC

The conditions necessary to set this DTC are not present at this time.

Inspect the wiring and connectors relative to this circuit.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring and connectors. Look for the DTC to reset or for the data to change other than as expected.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

**Does the DTC reset or is the status Active for this DTC?**

**Yes** >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

**No** >> Test complete.

# TIRES/WHEELS - SERVICE INFORMATION

## TABLE OF CONTENTS

# TIRES/WHEELS - SERVICE INFORMATION

## DIAGNOSIS AND TESTING

### TIRE AND WHEEL RUNOUT

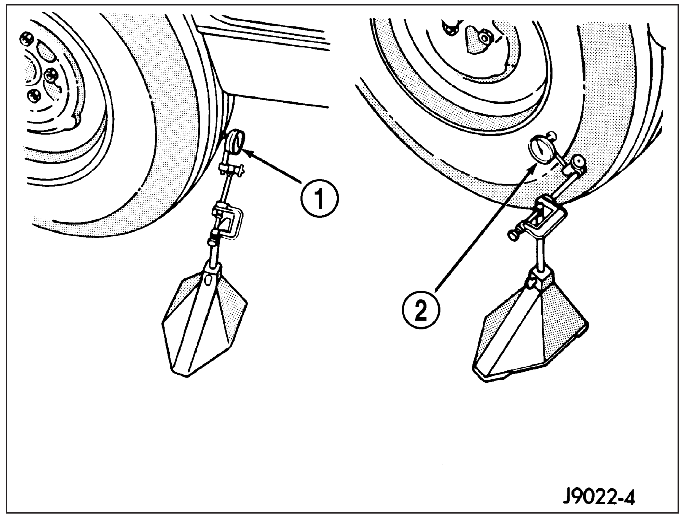
Radial runout is the difference between the high and low points on the tire or wheel.

Lateral runout is the **wobble** of the tire or wheel.

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).



### METHOD 1 (RELOCATE WHEEL ON HUB)

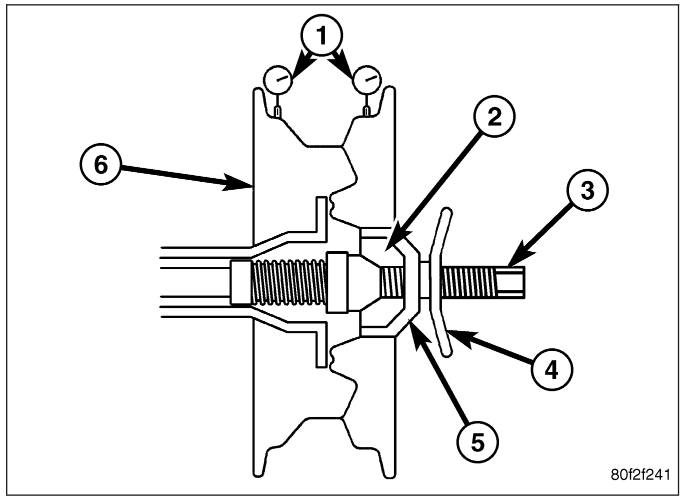
1. Drive vehicle a short distance to eliminate tire flat spotting from a parked position.
2. Check wheel bearings and adjust if adjustable or replace if necessary.
3. Check the wheel mounting surface.
4. Relocate wheel on the mounting, two studs over from the original position.
5. Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.
6. Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

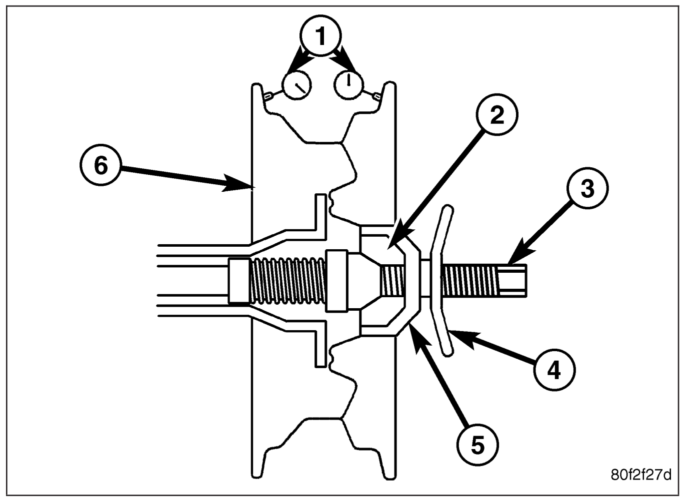
### METHOD 2 (RELOCATE TIRE ON WHEEL)

**NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.**

1. Remove tire from wheel and mount wheel on service dynamic balance machine.
2. Check wheel radial runout and lateral runout.
   - STEEL WHEELS: Radial runout 0.040 in., Lateral runout 0.045 in. (average-maximum)
   - ALUMINUM WHEELS: Radial runout 0.030 in., Lateral runout 0.035 in. (average-maximum)

3. If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout or match mount, (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE).





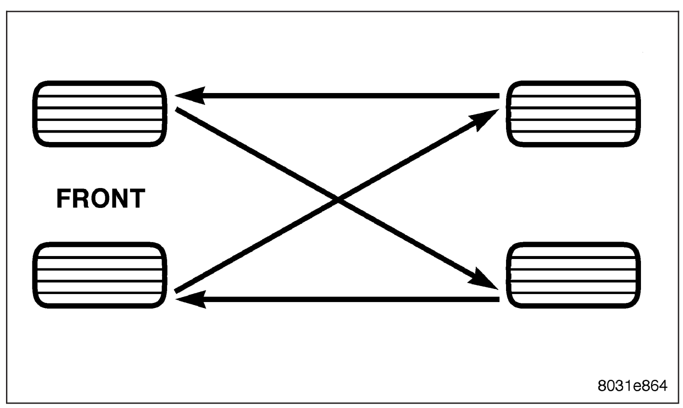
## STANDARD PROCEDURE

## TIRE ROTATION

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is. Other rotation methods can be used, but they will not provide all the tire longevity benefits.



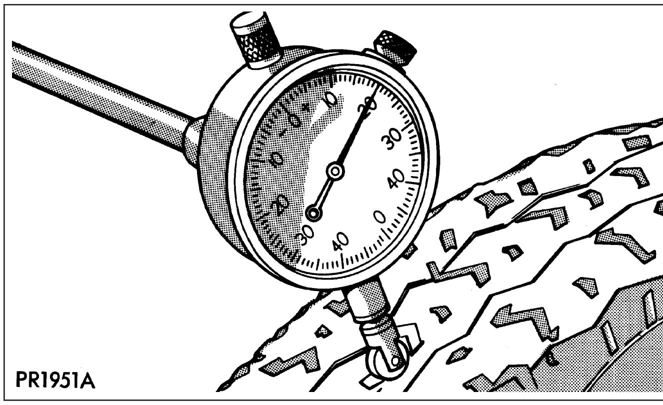
## MATCH MOUNTING

Tires and wheels are currently match mounted at the factory. Match mounting is a technique used to reduce runout in the wheel/tire assembly. This means that the high spot of the tire is aligned with the low spot on the wheel rim. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the rim is identified with a label on the outside of the rim and a dot on the inside of the rim. If the outside label has been removed the tire will have to be removed to locate the dot on the inside of the rim.

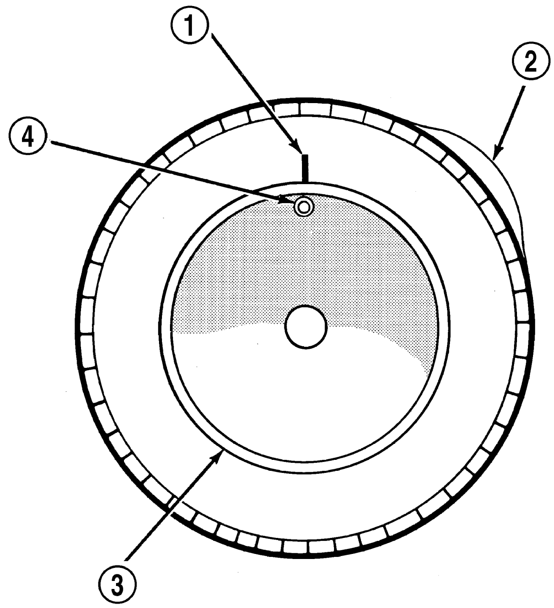
Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

1. Use a dial indicator to locate the high spot of the tire on the center tread rib. Record the indicator reading and mark the high spot on the tire. Place a mark on the tire at the valve stem location.

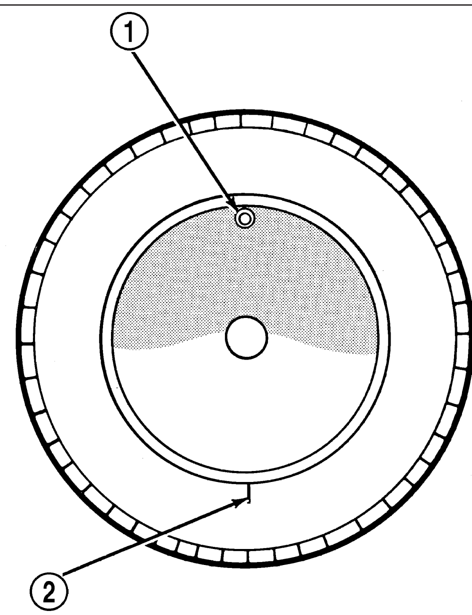
2. Break down the tire and remount it 180 degrees on the rim.
3. Measure the total runout again and mark the tire to indicate the high spot.
4. If runout is still excessive use the following procedures.
   a. If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.
   b. If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications, (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING).
   c. If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot to first. Break down the tire and remount it 90 degrees on rim in that direction. This procedure will normally reduce the runout to an acceptable amount.



PR1951A



J9322-3



J9322-4

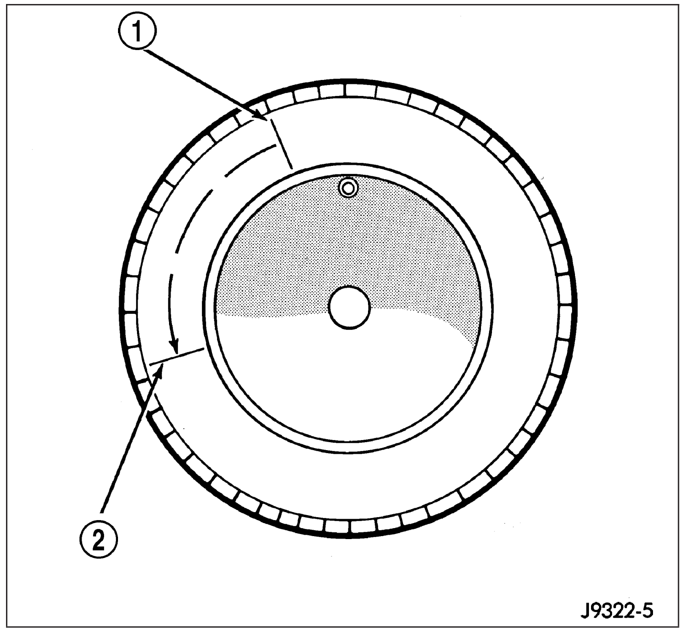
## WHEEL BALANCING

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

**NOTE: Static should be used only when a two plane balancer is not available.**

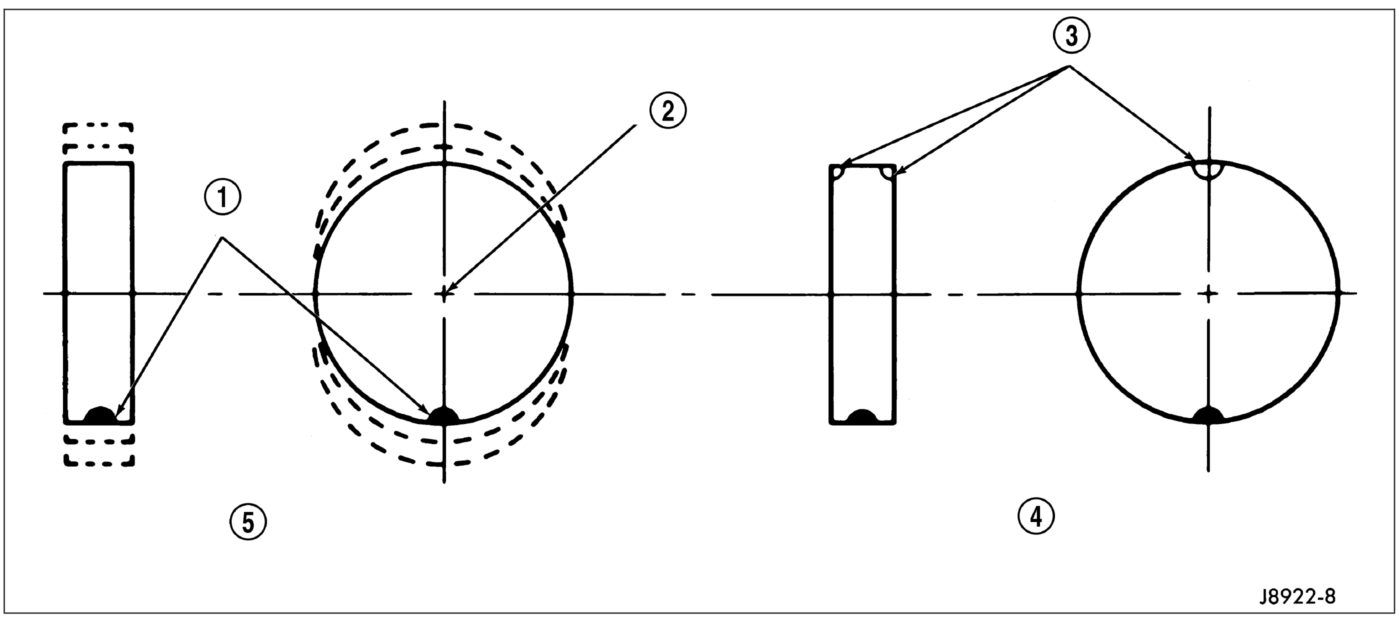
**NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.**

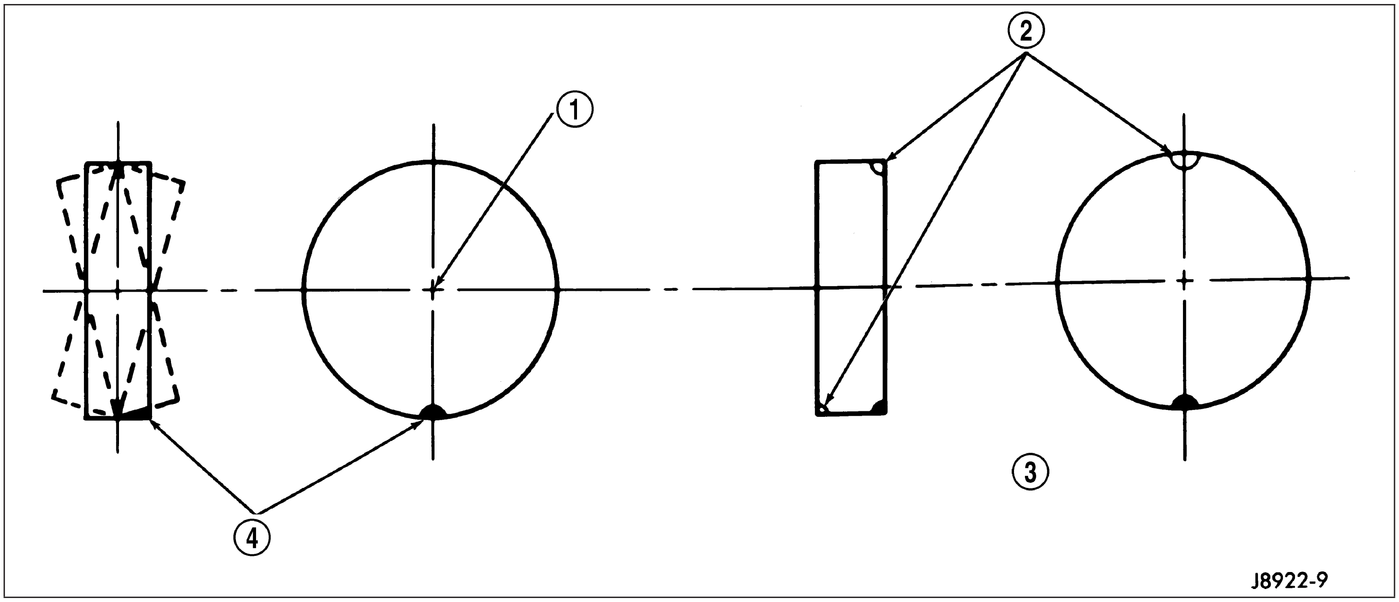
Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.



For static balancing, find location of heavy spot causing the imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange.

For dynamic balancing, the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange.





# TIRES

## DESCRIPTION

## TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval, (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE). This will help to achieve a greater tread life.

### TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code.

Performance tires have a speed rating letter after the aspect ratio number.

| LETTER | SPEED RATING |
|---|---|
| S | 180 km/h (112 mph) |
| T | 190 km/h (118 mph) |
| U | 200 km/h (124 mph) |
| H | 210 km/h (130 mph) |
| V | 240 km/h (149 mph) |
| W | 270 km/h (168 mph) |
| Y | 300 km/h (186 mph) |

The speed rating is not always printed on the tire sidewall.

## TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

## RADIAL-PLY TIRES

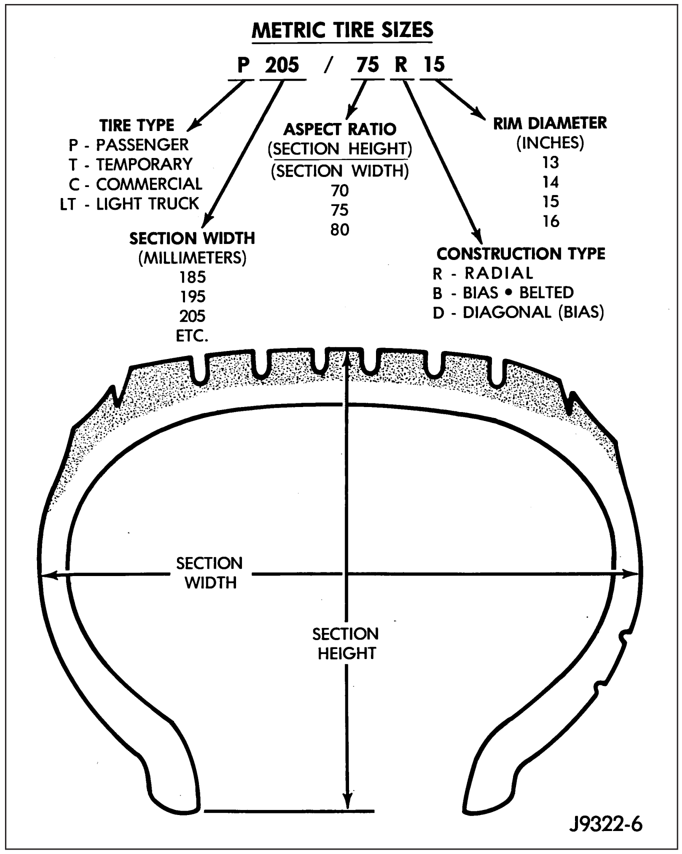
Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 80 KPH (50 MPH) is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.



## TIRE PRESSURE FOR HIGH SPEED

Refer to the Vehicles Owners Manual package.

## SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 KMH (50 MPH). when using the temporary spare tire. Refer to Owner's Manual for complete details.

## FULL SIZE, SPARE WHEEL WITH MATCHING TIRE

The spare is a full usage wheel with a matching tire. It can be used within the (posted legal) speed limits or distance limitations as of the rest of the vehicles four tires. Refer to Owner's Manual for complete details.

## REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

**WARNING: Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.**

## DIAGNOSIS AND TESTING

## PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

## TIRE INFLATION

Under inflation will cause rapid shoulder wear, tire flexing, and possible tire failure.

Over inflation will cause rapid center wear and loss of the tire's ability to cushion shocks.

Improper inflation can cause:

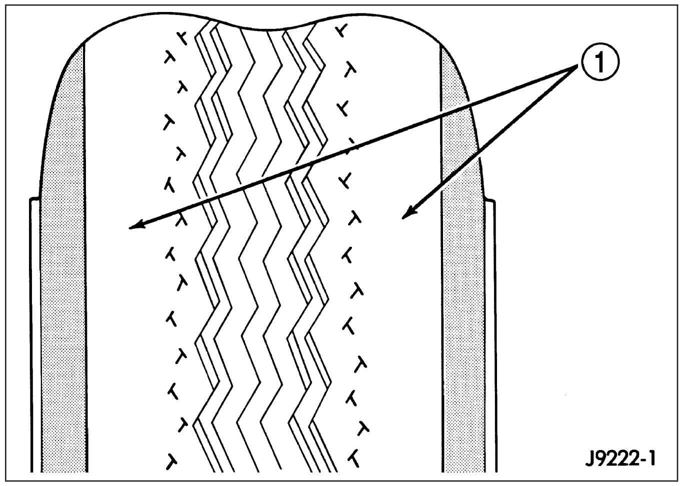
- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the Tire Inflation Pressure Chart provided with the vehicle.

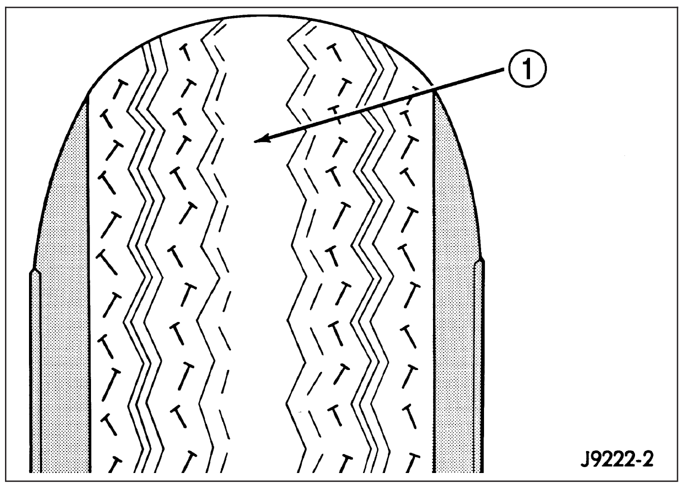
Tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. Tire pressure should be checked cold once a month. The spare tire pressure should be check at least twice annually. Tire pressure decreases as the ambient temperature drops. Check tire pressure frequently when ambient temperature varies widely.

Inflation pressures specified on the placards are cold inflation pressure. The vehicle must sit for at least 3 hours to obtain the correct cold inflation pressure reading. Or driven less than one mile after sitting for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation, due to increased tire temperature.

**WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.**



J9222-1



J9222-2

## TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band.

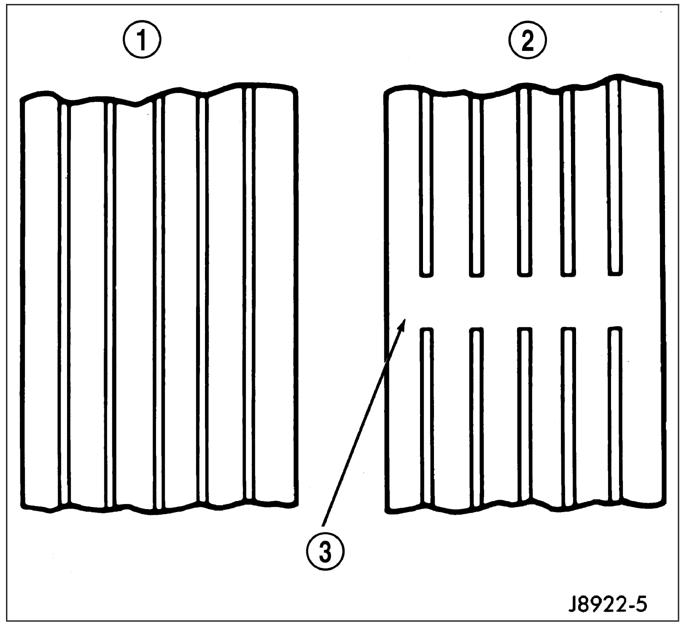
Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

## TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

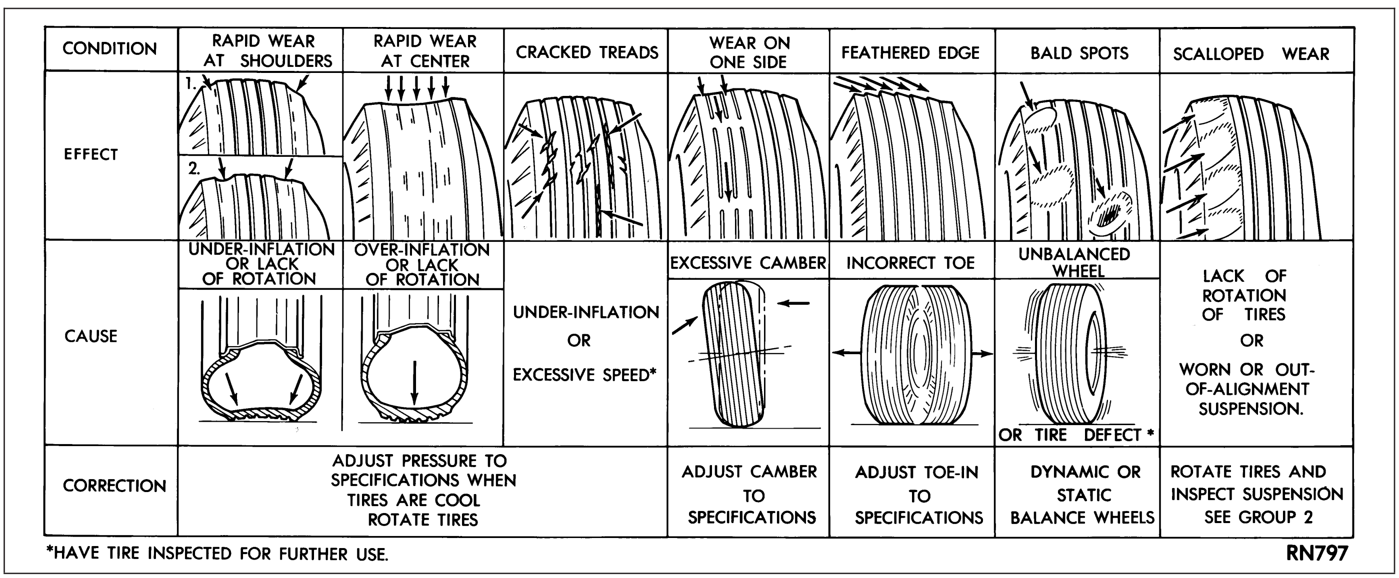


J8922-5

## TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

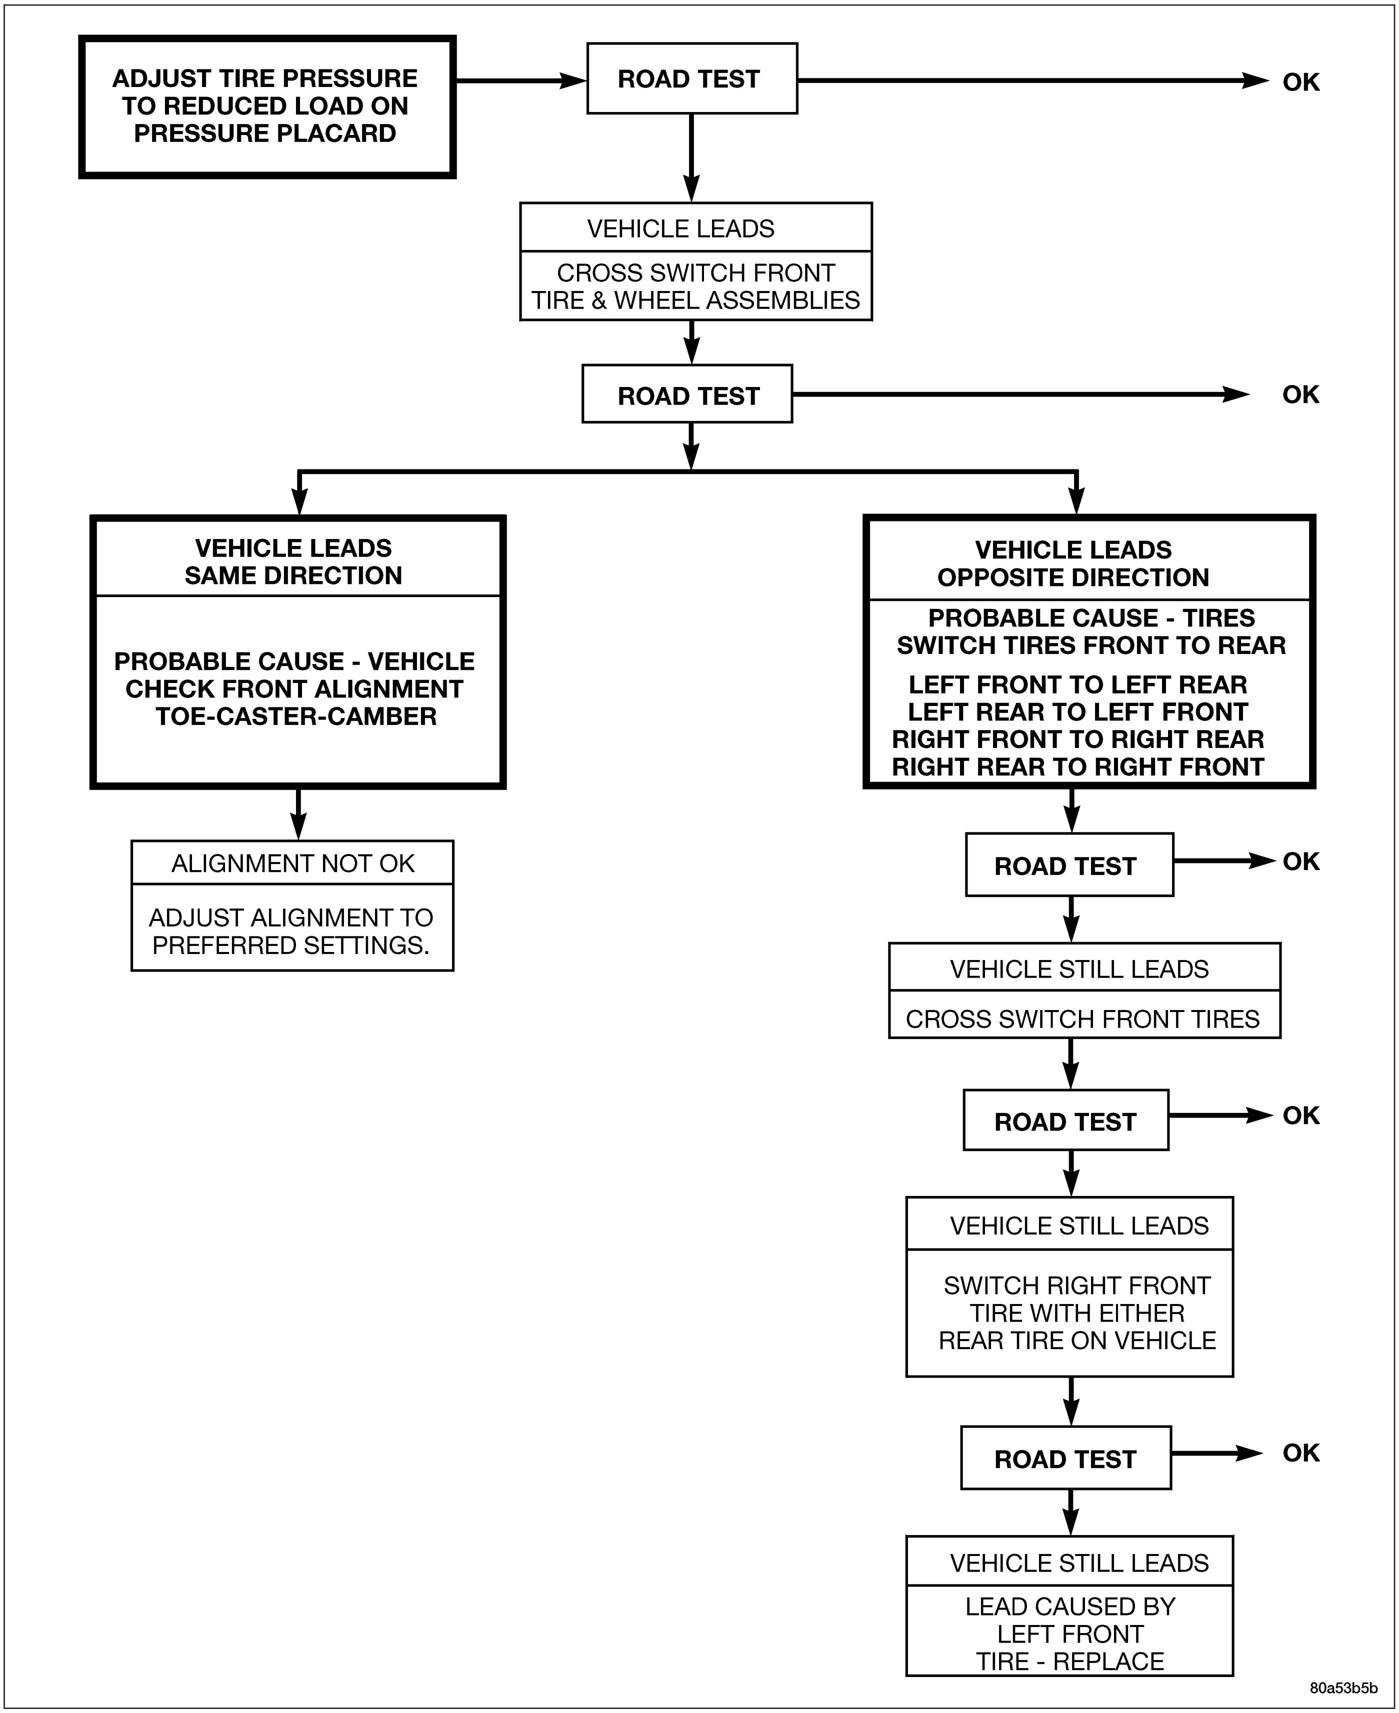
To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.



RN797

## TIRE/VEHICLE LEAD

Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem.



## STANDARD PROCEDURE

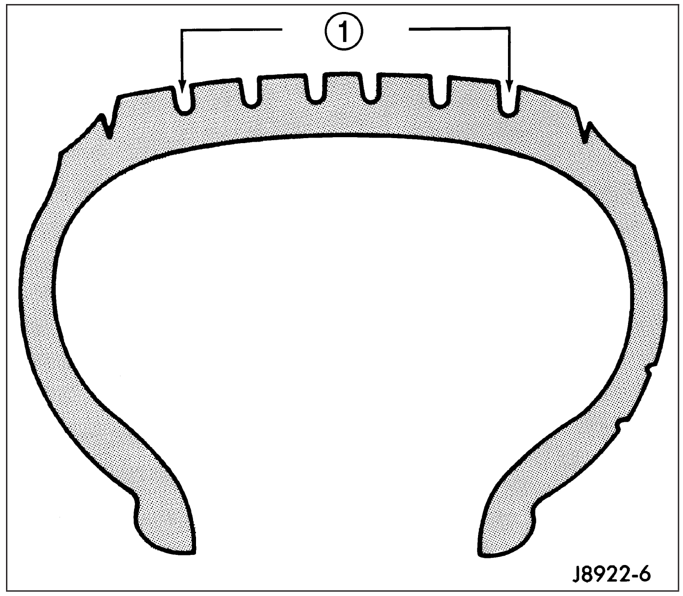
## TIRE REPAIR AREA

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area. The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.



## CLEANING

## TIRES

Remove the protective coating on the tires before delivery of a vehicle. This coating may cause deterioration of the tires.

To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

**NOTE: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.**

## SPECIFICATIONS

# SPARE TIRE CARRIER

## REMOVAL

1. Raise the license plate. (Cherokee model)
2. Remove the two bolts securing the wheel cover to the wheel. (Cherokee model)
3. Remove the two lug nuts and the one wheel lock (if equipped) securing the tire/wheel to the spare tire carrier.
4. Remove the spare tire.

## INSTALLATION

1. Install the spare tire onto the studs on the carrier.
2. Install the two lug nuts and one wheel lock (if equipped). Tighten the nuts to 115 N·m (85 ft.lbs.)
3. Close the plastic wheel cover and install the two mounting bolts. Tighten the nuts to 115 N·m (85 ft.lbs.) (Cherokee model)
4. Close the license plate to cover the bolts and latch. (Cherokee model)

# WHEELS

## DESCRIPTION

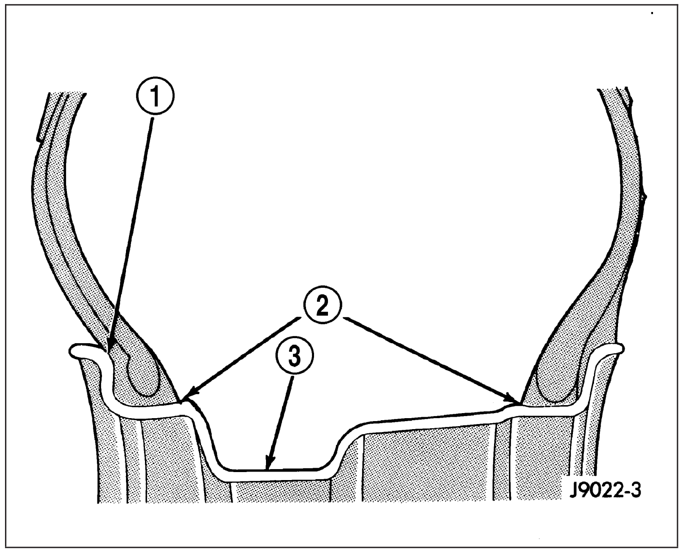
### WHEEL DESIGN

The rim size is on the vehicle safety certification label located on the drivers door shut face. The size of the rim is determined by the drivetrain package. Original equipment wheels/rims are designed for operation up to the specified maximum vehicle capacity.

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges and rim drop well called safety humps.

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pressure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.



## DIAGNOSIS AND TESTING

### WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

**NOTE: Do not attempt to repair a wheel by hammering, heating or welding.**

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

**WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.**

## STANDARD PROCEDURE

## WHEEL INSTALLATION

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

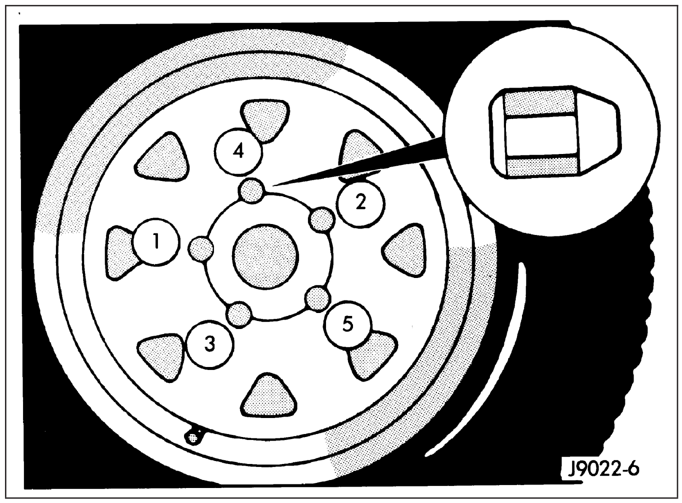
**NOTE: Do not use chrome plated lug nuts with chrome plated wheels.**

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

## WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.



**NOTE: Do not use chrome plated lug nuts with chrome plated wheels.**

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Pilot Bore Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

## SPECIFICATIONS

**CAUTION: DO NOT USE CHROME PLATED LUG NUTS WITH CHROME PLATED WHEELS.**

### TORQUE SPECIFICATIONS

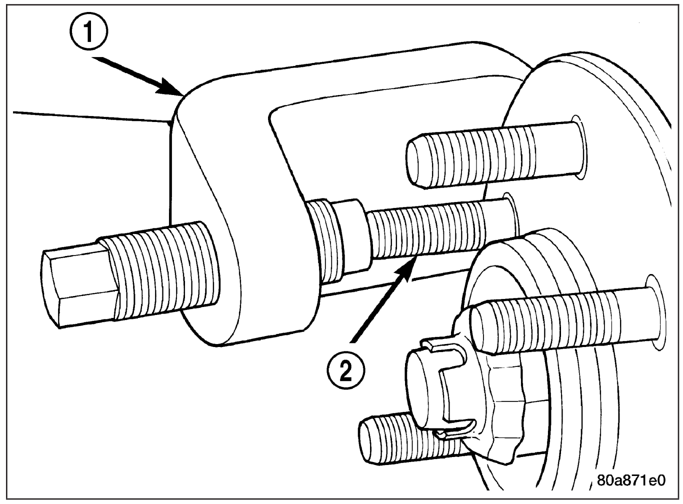
| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Wheel<br>Lug Nut | 115 - 155 | 85 - 115 | — |

# STUDS

## REMOVAL

**CAUTION: Do not use a hammer to remove wheel studs.**

1. Raise and support vehicle.
2. Remove wheel and tire assembly.
3. Remove brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove stud from hub with Remover C-4150A.



## INSTALLATION

**CAUTION: Do not use a hammer to remove wheel studs.**

1. Install new stud into hub flange.
2. Install three washers onto stud, then install lug nut with the flat side of the nut against the washers.
3. Tighten lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove lug nut and washers.
5. Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
6. Install wheel and tire assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE), use new lug nut on stud or studs that were replaced.
7. Remove support and lower vehicle.

# TIRE PRESSURE MONITORING SYSTEM

## DESCRIPTION

### BASE TIRE PRESSURE MONITORING

This system will consist of tire pressure monitoring sensors attached to each wheel through the valve stem mounting hole, a central receiver module (WCM) and a yellow telltale. A sensor shall be installed in the spare wheel if the vehicle is equipped with a matching full size spare wheel and tire assembly.

### PREMIUM TIRE PRESSURE MONITORING

The system will consist of tire pressure monitoring sensors attached to each wheel through the valve stem mounting hole, a wireless control module (WCM), Three Wheel Sensor transponders are mounted in the wheel wells (2 in the front and 1 in the rear wheel wells). a re-configurable dot matrix display module and an amber colored ISO standard Indicator Lamp. A sensor shall be installed in the spare wheel if the vehicle is equipped with a matching full size spare wheel and tire assembly.

### WIRELESS CONTROL MODULE (WCM)

The receiver circuit for the TPM system is integrated into the WCM. The WCM also includes the Remote Keyless Entry (RKE) receiver and the Sentry Key Immobilizer (SKIM) receiver. All three receivers share a number or common components. The WCM decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if ″warning″ or ″fault″ conditions exist within the TPM system.

The WCM communicates with the module that controls the ″ISO Indicator Lamp″ and the text display (Premium system), via the vehicle bus system (CAN B).

Upon detection of a warning or fault condition, the WCM will send a request to illuminate the yellow telltale. Also, upon detection of a warning or fault condition, the display module will send a request to sound the ″chime″. A chime will only be requested once per ignition cycle per warning or fault condition detected.

The WCM will store all warning and fault conditions, placard pressure values, low-pressure threshold values and low pressure threshold hysterisis values in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WCM will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor (not the spare tire) shall be stored in the WCM memory.

## OPERATION

### BASE TIRE PRESSURE MONITORING

The tire pressure monitoring system is designed to operate without loss of function for all types of standard tire constructions. (Function with different types of run flat tire constructions needs to be evaluated for each design). The wheel sensor shall monitor tire pressure, air temperature inside the tire, wheel acceleration and the sensor internal battery status for all four active road tires. The sensor will broadcast this information, along with a unique 32 bit ID, to a central receiver circuit located inside the WCM. The information received by the WCM will be decoded and stored in memory (RAM) in the WCM. If a ″warning or ″fault″ condition exists, the WCM will send a bus message request to illuminate the yellow telltale and to sound the chime.

If the WCM detects a warning or fault condition at ignition key ″on″ it will wait ten seconds +/- 10 % before sending the first request to illuminate the yellow telltale. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle for each ″warning″ or ″fault″ condition detected. A ″warning″ or ″fault″ condition will remain enabled until the problem causing the condition is corrected and removed/reset.

The WCM shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key ″on″ and key ″off″ cycles. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. The recommended ″placard pressure″, ″low-pressure threshold″ and “Hysteresis Pressure Values” for the tires installed on the vehicle, are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. (Note: For vehicles with optional wheel/tire sizes and significantly different tire placard pressures, the placard pressure value and the low-pressure threshold value shall be re-programmable by the dealer to accommodate the customer selected wheel/tire combinations recommended by DaimlerChrysler).

## PREMIUM TIRE PRESSURE MONITORING

The tire pressure monitoring system is designed to operate without loss of function for all types of standard tire constructions. (Function with different types of run flat tire constructions needs to be evaluated for each design). The wheel sensor shall monitor tire pressure, air temperature inside the tire, wheel acceleration and the sensor internal battery status for all four active road tires and the spare tire, if so equipped. The sensor will broadcast this information, along with a unique 32 bit ID, to a central receiver circuit located inside the WCM. The information received by the WCM will be decoded and stored in (RAM) memory in the WCM. The WCM will send bus messages to the re-configurable display module to display the pressures of the four active road tires in vehicle position. The spare tire pressure is monitored but it is not displayed.

If a ″warning″ or ″fault″ condition exists, the WCM will send a bus message request to display the text messages and, when required, illuminate the yellow telltale. ″Warnings″ and ″faults″ are described in more detail below. If the WCM detects a warning or fault condition at ignition key ″on″ it will wait ten seconds +/- 10% before sending the first request to illuminate the yellow telltale and to display the text messages. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle for each ″warning″ or ″fault″ condition detected. A ″warning″ or ″fault″ condition will remain enabled until the problem causing the condition is corrected and removed/reset

The WCM shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key ″on″ and key ″off″ cycles. The wheel sensor ID’s and the location of each sensor (e.g. Left Front, Right Front etc.) are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. The recommended ″placard pressure″, ″low-pressure threshold″ and Hysteresis Pressure Values for the tires installed on the vehicle, are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, as described later in this document or during a service procedure as required. (Note: For vehicles with optional wheel/tire sizes and significantly different tire placard pressures, the placard pressure value and the low-pressure threshold value shall be re-programmable by the dealer to accommodate the customer selected wheel/tire combinations recommended by DaimlerChrysler).

## DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING SYSTEM

All Tire Pressure Monitoring System Faults are specific to one location. If a ″BATTERY LOW″ or ″SENSOR FAILURE″ fault is detected, the location will be displayed (Premium Systems). The appropriate sensor/transmitter can then be replaced. If a single sensor/transmitter cannot be detected by the WCM, replace that sensor transmitter. If none of the sensors/transmitters can be detected, refer to symptoms in the WCM section. For additional system description and diagnosis, refer to Tire Pressure Monitoring in the Body Diagnostic manual.

## SPECIFICATIONS

## TORQUE CHART

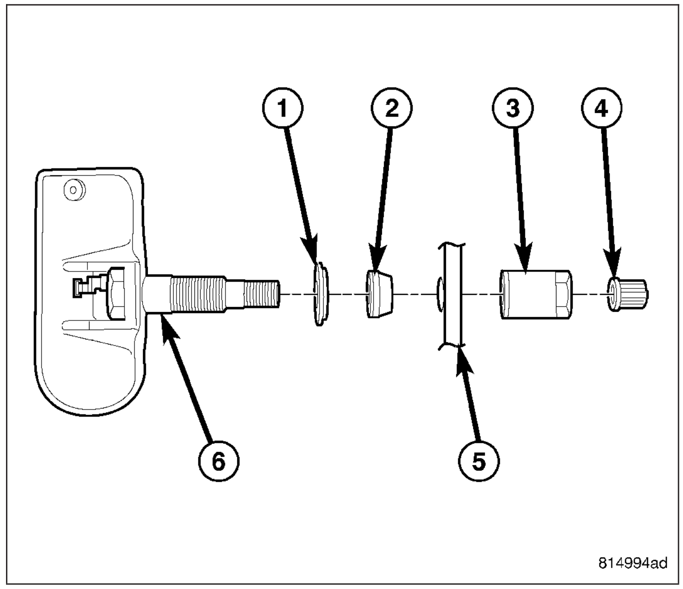
### TORQUE SPECIFICATIONS

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Tire Pressure Sensor/ Transmitter Mounting Nut | 6.5 | — | 58 |

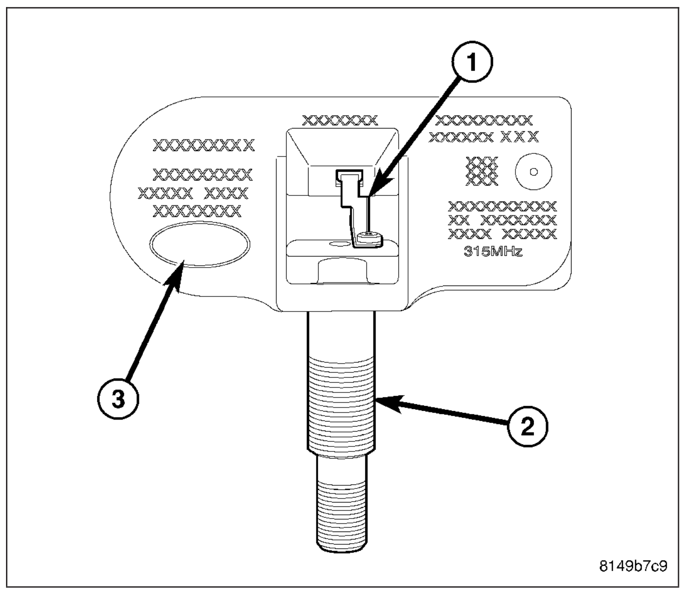
# SENSOR

## DESCRIPTION

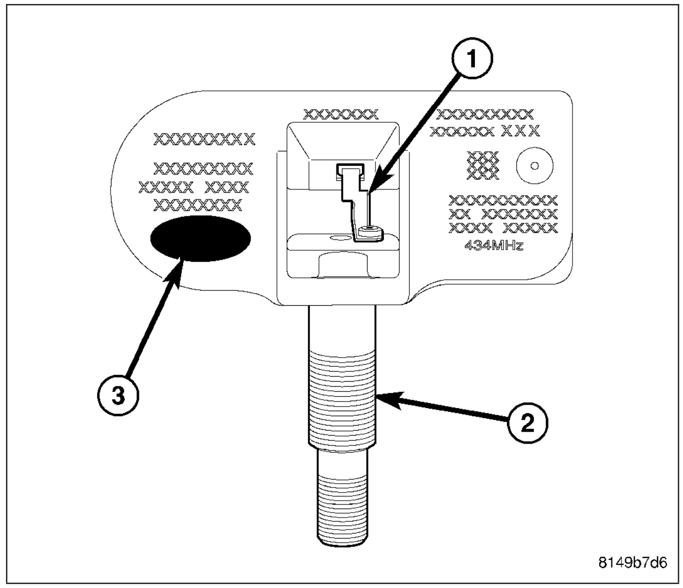
On vehicles equipped with Tire Pressure Monitoring (TPM), one tire pressure sensor (6) is mounted to each wheel (5) in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced.



The TPM system operates on a 315 MHz radio frequency. The 315 MHz sensors can be easily identified by a white outline oval (black center) insignia (3) on the sensor body.



The Export TPM system operates on a 434 MHz radio frequency. The 434 MHz sensors can be easily identified by a solid white oval insignia (3) on the body.

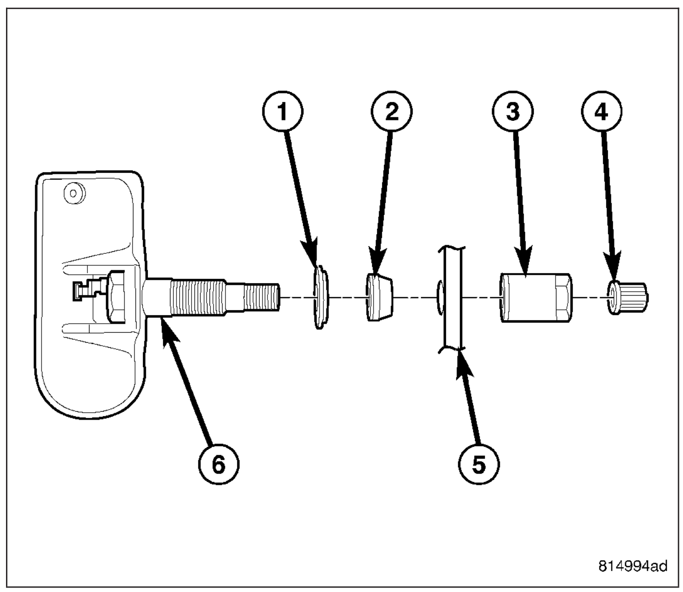


**CAUTION: Although 315 MHz and 434 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used.**

The TPM sensors are designed for original style factory wheels. **Do not attempt to install a tire pressure sensor in an aftermarket wheel.**

The serviceable components of the tire pressure sensor are :

- Sensor-To-Wheel Seal (2) and Metal Washer (1)
- Valve Stem Cap (4)
- Valve Stem Core
- Valve Stem Nut (with pressed-in washer) (3)



The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

## OPERATION

The battery operated tire pressure sensors lay dormant (Park Mode), then wake and start transmitting (Drive Mode) when the vehicle first reaches speeds over 20 mph (32 km/h). Once the wheels stop rotating for a period of approximately 20 minutes, the sensors shut down until again awaken. Although not transmitting as when in Drive Mode, while in Park Mode, the sensors still transmit approximately once every 13 hours to let the receiver know air pressure status at that time.

Using an RF signal, each sensor transmits tire pressure data approximately once every minute. Each sensor's (transmitter) broadcast is uniquely coded so that the wireless control module (WCM) can monitor the state of each of the sensors on the four rotating road wheels. The WCM automatically learns and stores the sensor's ID while driving after a sensor has been replaced. **There is no formal retraining procedure necessary.**

For additional information, refer to appropriate diagnostic information.

## CAUTION

**CAUTION: The use of tire sealants is strictly prohibited for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants can clog tire pressure sensors.**

**CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.**

**CAUTION: Do not attempt to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only.**

**CAUTION: Any time a sensor is to be installed in a wheel, a new seal and washer must be installed on the stem to ensure air tight sealing.**

**NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.**

## DIAGNOSIS AND TESTING

## TIRE PRESSURE SENSOR

**NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.**

When diagnosing a tire pressure issue, always check air pressure in the tires first with a known accurate air gauge. Adjust air pressure as necessary to that listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver's side B-pillar). After adjusting air pressure in a tire, allow approximately two minutes for the message or yellow telltale to go out.

Check the tire pressure yellow telltale in the instrument cluster. If the yellow telltale is illuminating continuously, proceed as listed below. If the yellow telltale is flashing on/off for 60 seconds, once every ten minutes, there is a system fault detected. Refer to the appropriate diagnostic information.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original valve stem cap is securely installed to keep moisture out of the sensor.

If the gauge-read pressure in the tires does not indicate a tire pressure issue, refer to the appropriate diagnostic information.

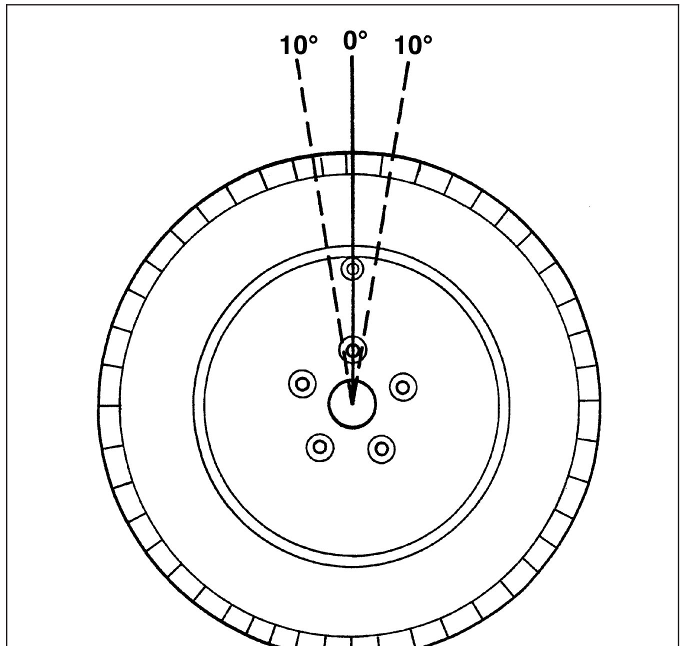
## REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)

**CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.**

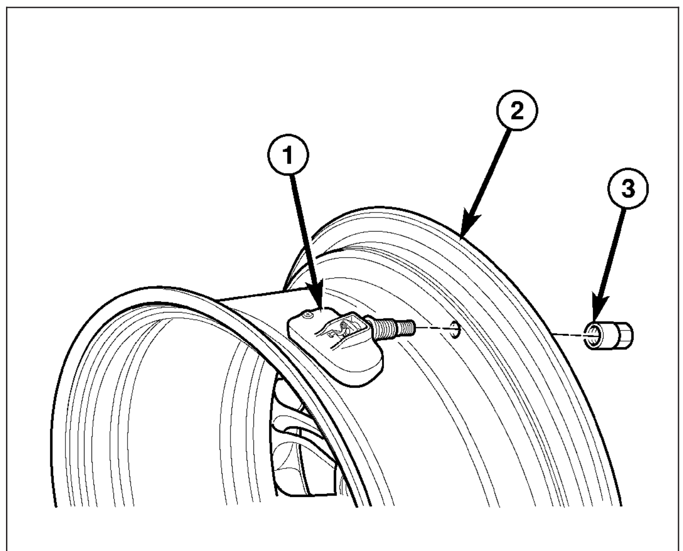
**CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.**

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
   a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire.
   b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool at the valve stem ± 10°, then proceed to dismount the tire from the wheel. Use this process on both the upper and lower tire beads.



80dbf339

4. Remove sensor nut (3) retaining sensor to wheel. While removing nut, hold pressure against rear of metal valve stem (See Arrow) to keep valve stem from pushing rearward, damaging antenna strap.
5. Remove sensor (1) from wheel (2) .

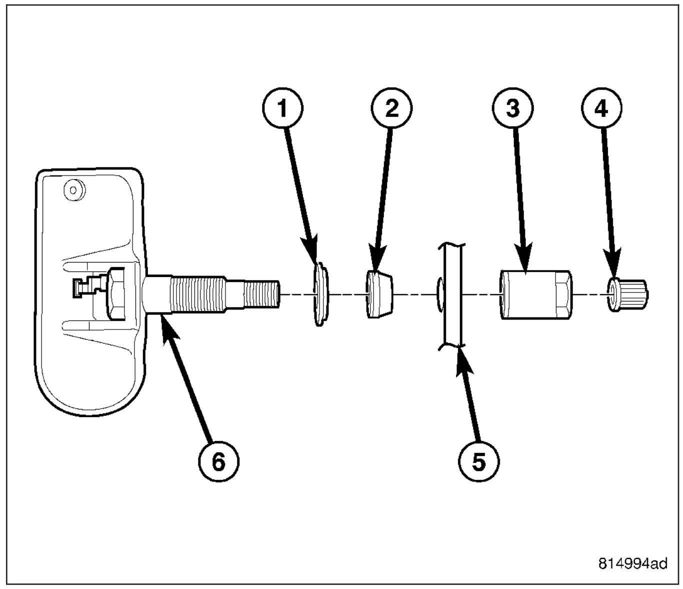


814a12bd

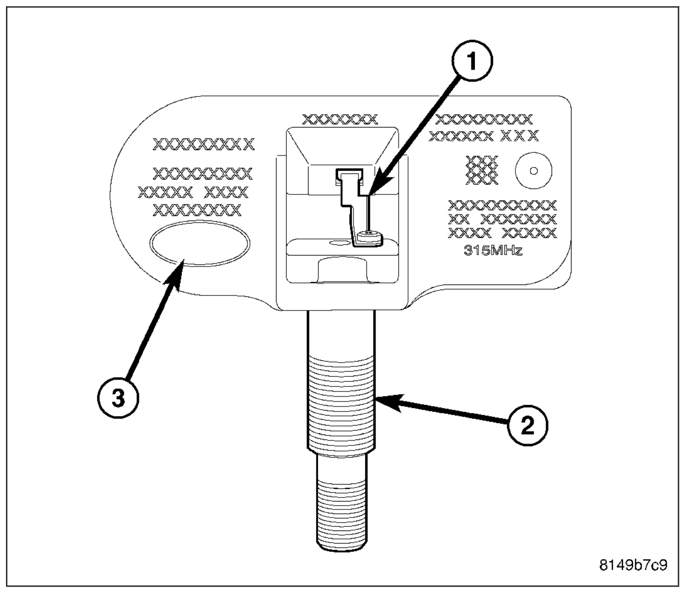
## INSTALLATION

**NOTE: Before reinstalling an existing tire pressure sensor, replace seal (2) and metal washer (1) at base of sensor valve stem (6) to ensure proper sealing.**

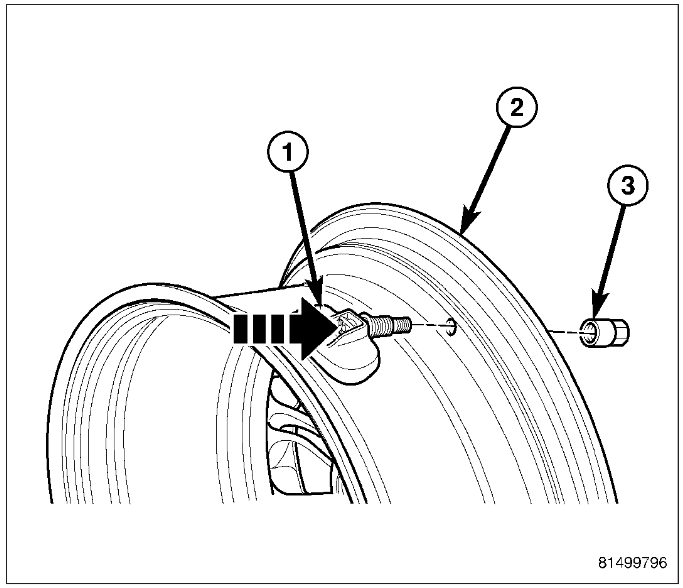
1. Wipe area clean around sensor/valve stem mounting hole in wheel (5). Make sure surface of wheel is not damaged.



**CAUTION: To avoid damaging sensor antenna strap (1), hold pressure against rear of metal valve stem (2) while sensor is inserted through wheel mounting hole and nut is installed.**



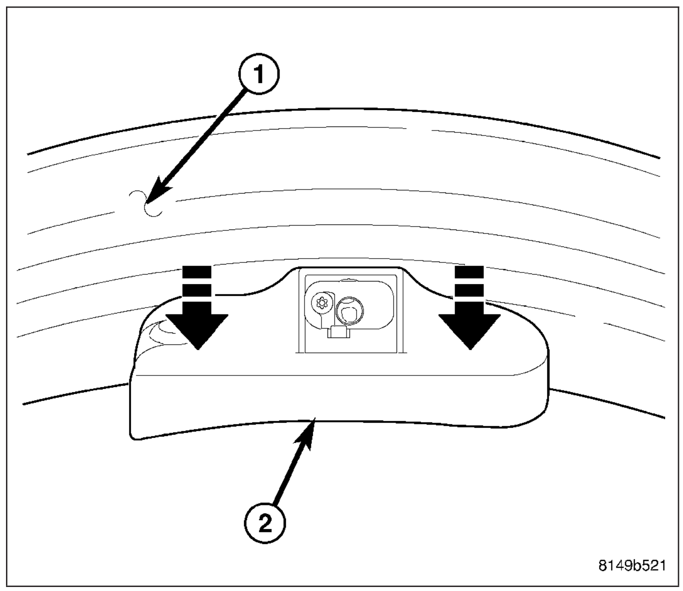
2. Insert sensor (1) through wheel (2) as shown keeping pressure against rear of metal valve stem (See Arrow). Potted side of sensor is to be positioned toward wheel. Do not attempt to mount sensor otherwise, damage may occur.
3. Install sensor nut (with pressed-in washer) (3) by hand.



**NOTE: Before tightening sensor nut, push downward on sensor housing (2) in an attempt to make it flush with interior contour of wheel (1).**

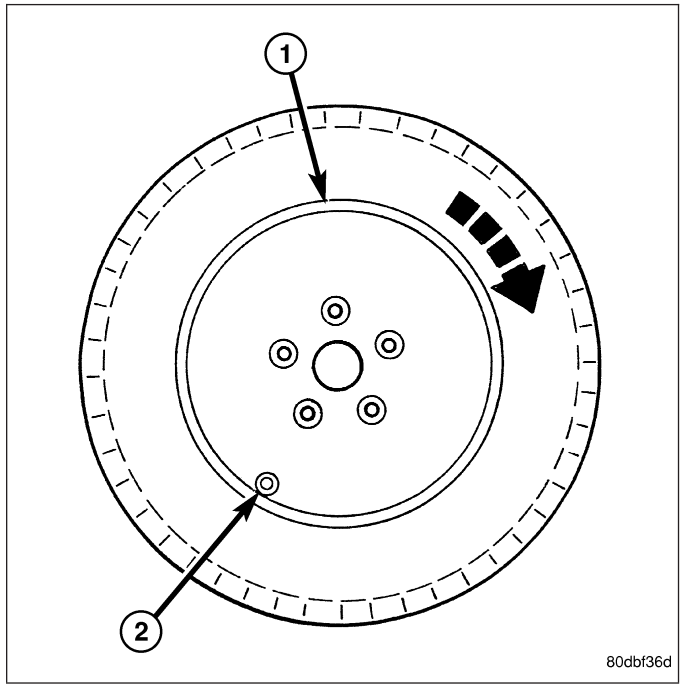
4. While holding sensor in position, tighten sensor nut to 6.5 N·m (58 in. lbs.) torque.

**CAUTION: Over-torquing the sensor nut by as little as 12 N·m (106 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function, however, the condition should be corrected immediately.**

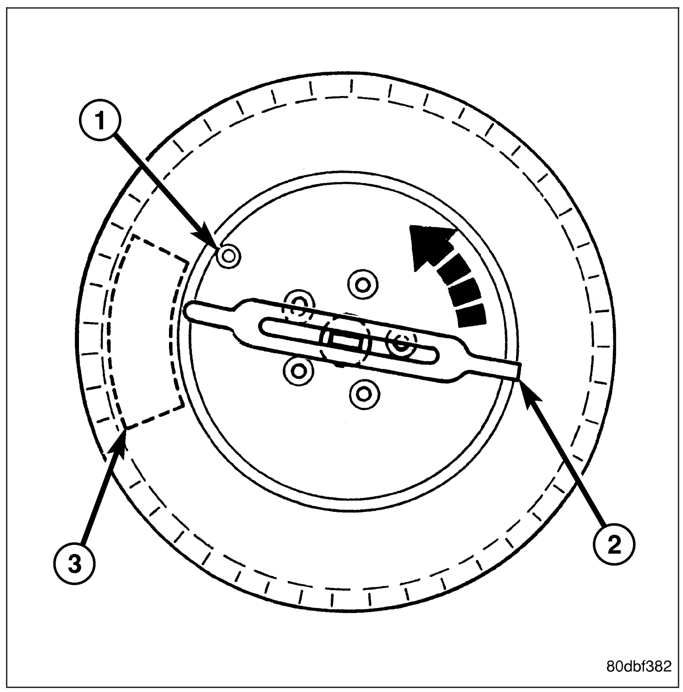


5. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

a.
Rotating Wheel Tire Changers- Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 210° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads.



b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.



6. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
7. Install tire and wheel assembly on vehicle (Refer to 22 - TIRES/WHEELS - INSTALLATION).
8. Lower vehicle.
9. Drive vehicle for a minimum of five minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time the system will learn the new sensor ID code and will clear any DTC's automatically.

**NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.**

# TRANSPONDER

## DESCRIPTION - PREMIUM SYSTEM

A transponder is located in three of the four wheel wells of the vehicle to provide the WCM/SKREEM with the location of the tire pressure sensors on the vehicle. The transponders are located in the left front, right front and right rear wheel wells. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor is in the left rear tire.

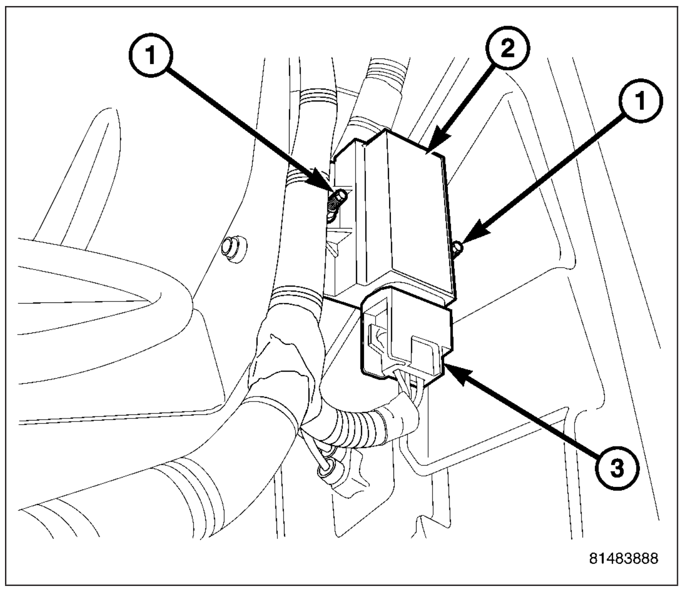
## OPERATION - PREMIUM SYSTEM

Transponders located in three of the four wheel wells of the vehicle to provide the Wireless Control Module (WCM) commonly referred to as the Sentry Key Remote Entry Module (SRKEEM) with the location of the tire pressure sensors on the vehicle. The transponders are located in the left front, right front and right rear wheel wells. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor is in the left rear tire.

## REMOVAL

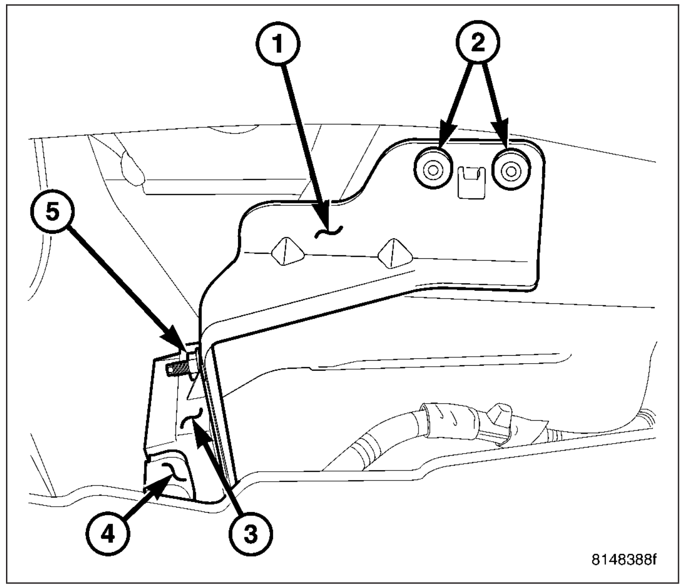
## FRONT

1. Raise and support the vehicle.
2. Remove the front part wheel well housing cover and pull it back toward the tire to gain access to the transponder.
3. Remove the mounting nuts (1) for the transponder (2) from the mounting bracket.
4. Disconnect the electrical connector (3) and remove the transponder (2) from the vehicle.

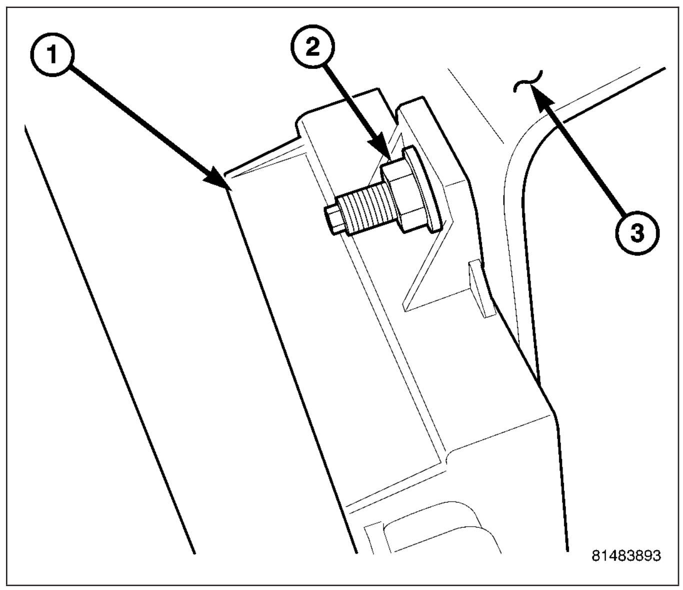


## REAR

1. Raise and support the vehicle.
2. Drill out the rivets (2) for the transponder mounting bracket (1).
3. Disconnect the electrical connector (4).



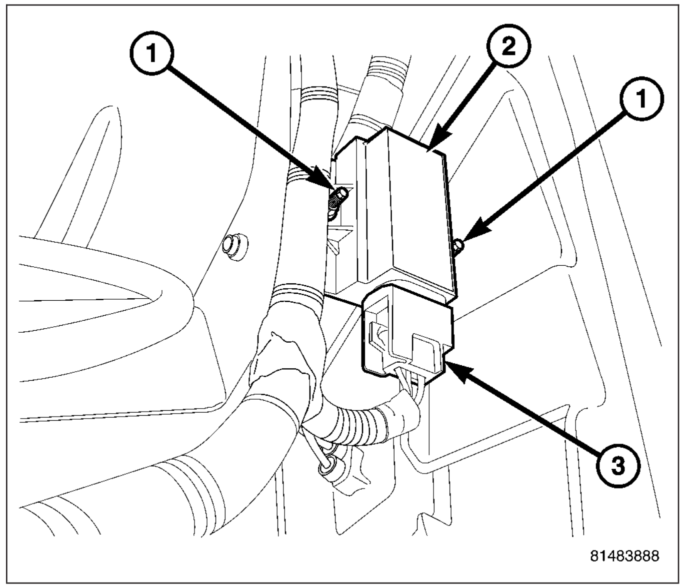
4. Pull the transponder (1) with the bracket down and remove the mounting nuts (2) for the transponder (1).
5. Remove the transponder (1) from the bracket (3).



## INSTALLATION

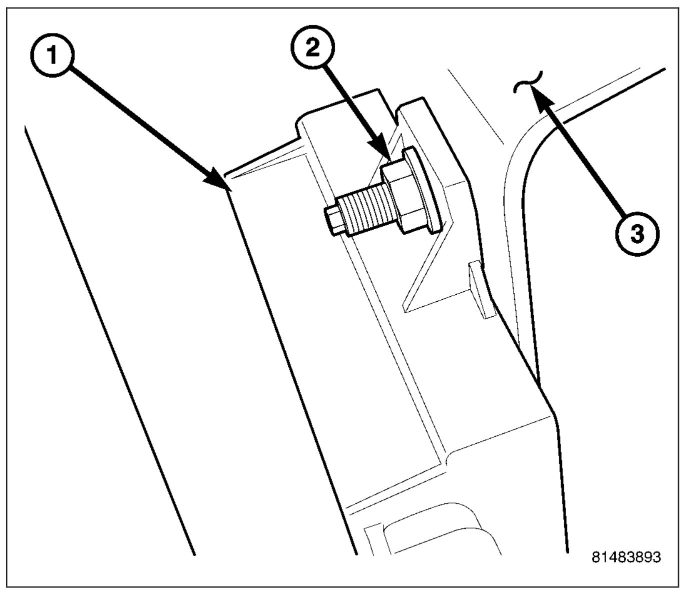
## FRONT

1. Reconnect the electrical connector (3) to the transponder (2).
2. Install the transponder (2) to the mounting bracket and install the mounting nuts (1).
3. Install the front part of the wheel well housing cover.
4. Lower the vehicle.

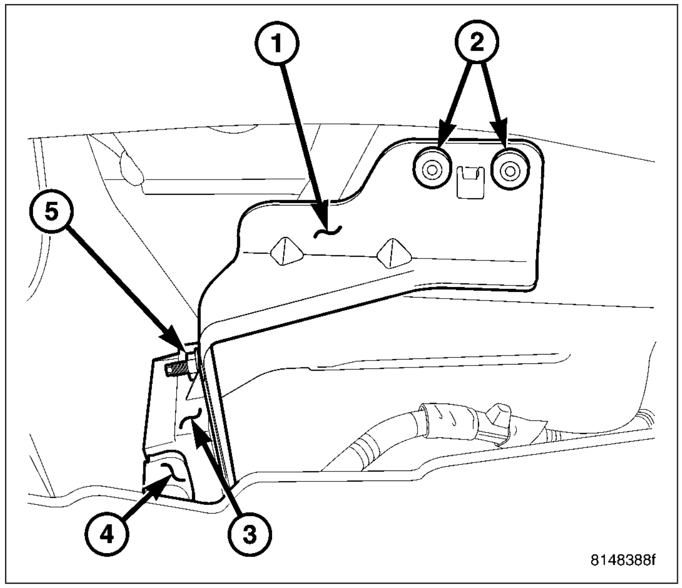


## REAR

1. Install the transponder (1) to the bracket (3) and install the mounting nuts (2).



2. Reconnect the electrical connector (4) to the transponder (3).
3. Install the transponder/bracket assembly (1) to the vehicle and install new rivets (2).
4. Lower the vehicle.



# BODY

## WARNING

## SAFETY PRECAUTIONS AND WARNINGS

**WARNING: Use an OSHA approved breathing filter when spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with petroleum or alcohol – based cleaning solvents. Personal injury can result.**
- **Do not stand under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

**CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.**
- **Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **Always have a fire extinguisher ready for use when welding.**
- **Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.**
- **Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

## DIAGNOSIS AND TESTING

## WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

### VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

### WATER LEAK TESTS

**WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.**

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.
- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the

vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

## WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

### MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

### BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

### PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

## WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

## VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

### ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

**POSSIBLE CAUSE OF WIND NOISE**

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

## STANDARD PROCEDURE

## STANDARD PROCEDURE - BODY LUBRICATION

All mechanisms and linkages should be lubricated when necessary, except the door check straps and latches. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

1. When necessary, lubricate the operating mechanisms with the specified lubricants.
2. Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.
3. Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant should be removed.
4. The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.
5. The door lock cylinders should be lubricated twice each year (preferably autumn and spring).
   - Spray a small amount of lock cylinder lubricant directly into the lock cylinder.
   - Apply a small amount to the key and insert it into the lock cylinder.
   - Rotate it to the locked position and then back to the unlocked position several times.
   - Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.
6. Door and swing gate check straps should be wiped clean but not lubricated.

| Component | Fluid, Lubricant, and Genuine Part |
|---|---|
| Hinges: | |
| Door & Hood | Mopar® Engine Oil |
| Swing Gate | Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB |
| Latches: Hood/Safety Catch | Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB |
| Seat Regulator & Track | Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB |
| Lock Cylinders | Mopar® Lock Cylinder Lube |

## HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
   a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
   b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

## BUZZ, SQUEAK & RATTLE

Buzz, Squeak & Rattles (BSR) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using the Mopar® Parts BSR Noise Reduction Kit. This kit contains various tapes including foam, flock and anti-squeak used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the Buzz, Squeak & Rattle Kit table for material contents and usage.

**Buzz, Squeak & Rattle Kit**

| ITEM | FEATURES | APPLICATIONS | SERVICE TEMP |
|---|---|---|---|
| Itch And Squeak Tape | An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks. | Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels. | -40° to 225° Fahrenheit (-40° to 107° Celsius) |
| Black Nylon Flock | Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant. | Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel. | -40° to 180° Fahrenheit (-40° to 82° Celsius) |
| High Density Urethane Foam | Tear resistant, highly resilient and durable. | Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets. | -40° to 180° Fahrenheit (-40° to 82° Celsius) |
| Open Cell Foam Tape | Soft foam conforms to irregular surfaces. | Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts. | -40° to 180° Fahrenheit (-40° to 82° Celsius) |
| Closed Cell Low Density Foam Tape | Soft, conformable. Water-resistant. | Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P. | -40° to 180° Fahrenheit (-40° to 82° Celsius) |
| NYE® Grease 880 | Long life. | Suspensions. Examples: Strut busings, sway bars. | -40° to 390° Fahrenheit (-40° to 200° Celsius) |
| Krytox® Oil | Long life. Will not dry out or harm plastics or rubber. | When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts. | -30° to 400° Fahrenheit (-34° to 205° Celsius) |
| Krytox® Grease | Long life. Will not dry out or harm plastics or rubber. | Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings. | -30° to 400° Fahrenheit (-34° to 205° Celsius) |

## PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

### Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

### Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

### Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

### Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

### Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

## SAFETY PRECAUTION AND WARNINGS

**WARNING:**
- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

**NOTE:**
- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

## RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

| CODE | FAMILY NAME | COMMON TRADE NAME | TYPICAL APPLICATION |

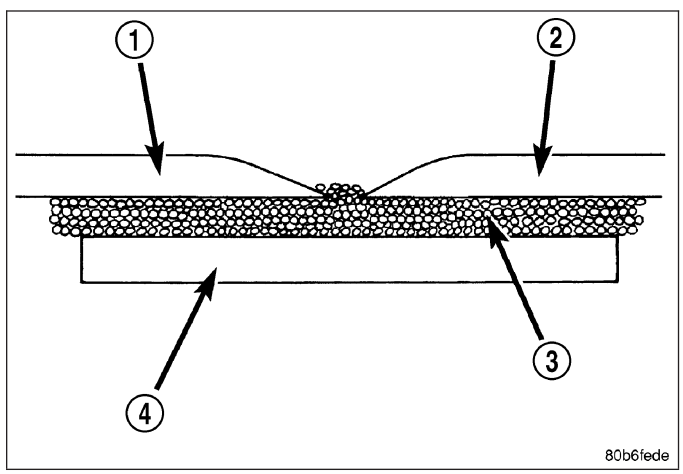
## PANEL SECTIONING

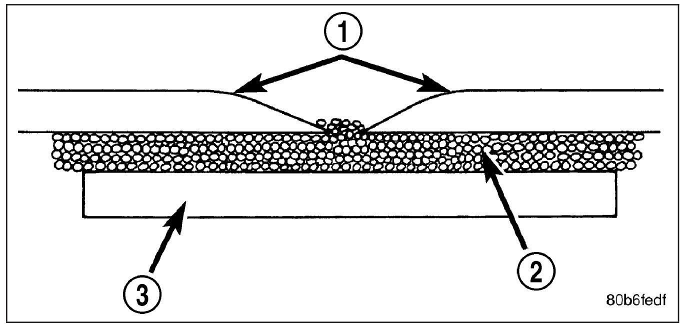
If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be “V’d” at a 20 °angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.



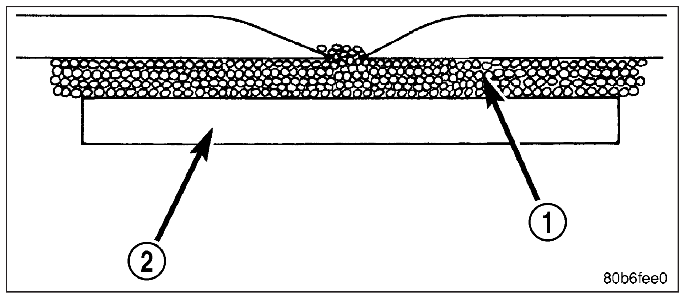
When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

## PANEL REINFORCEMENT

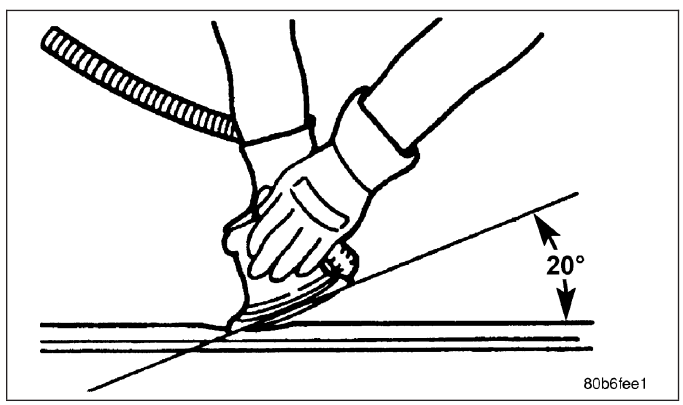
Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.



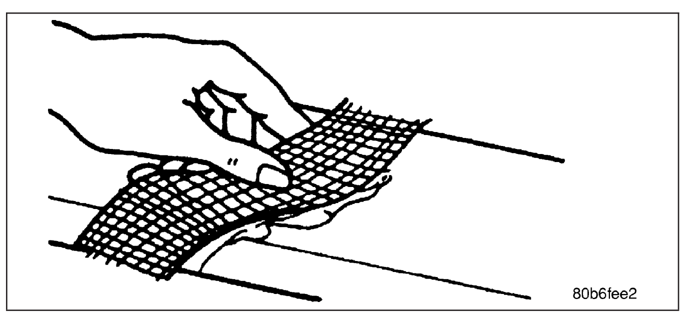
Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.



When repairing plastic, the damaged area is first “V’d” out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 ° angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.



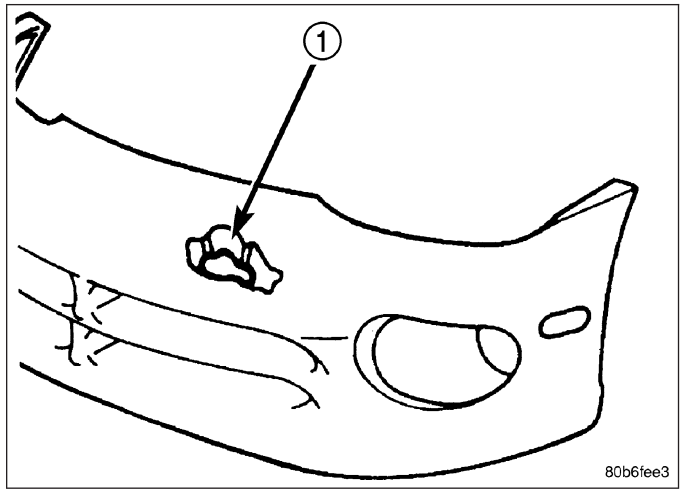
- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.



## VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

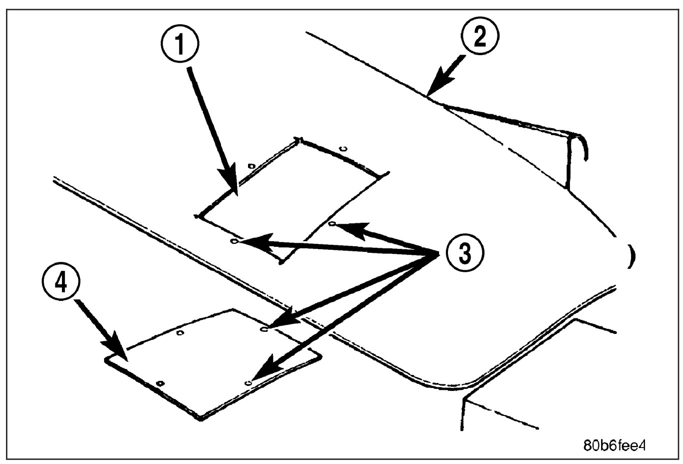


## PANEL SURFACE PREPARATION

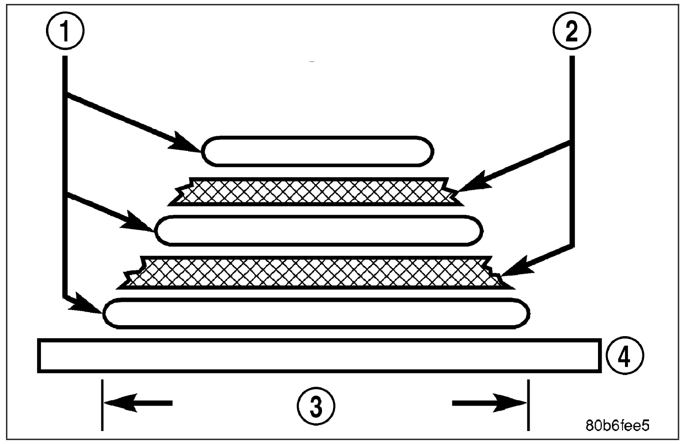
If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

## PATCHING PANELS

A panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20° to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.



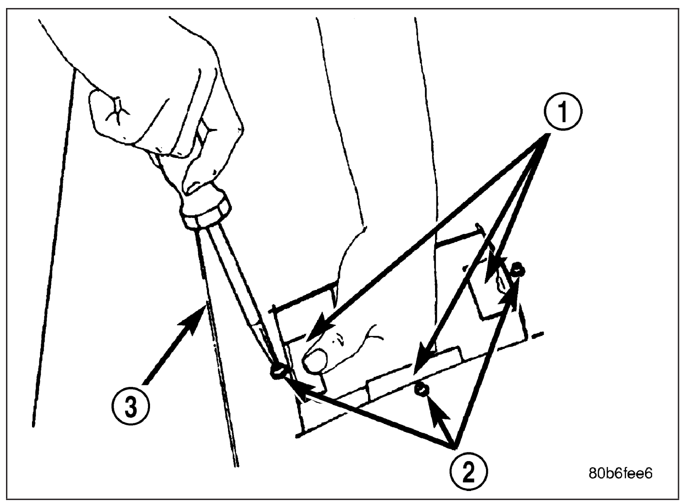
## PANEL PATCH FABRICATIONS



A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

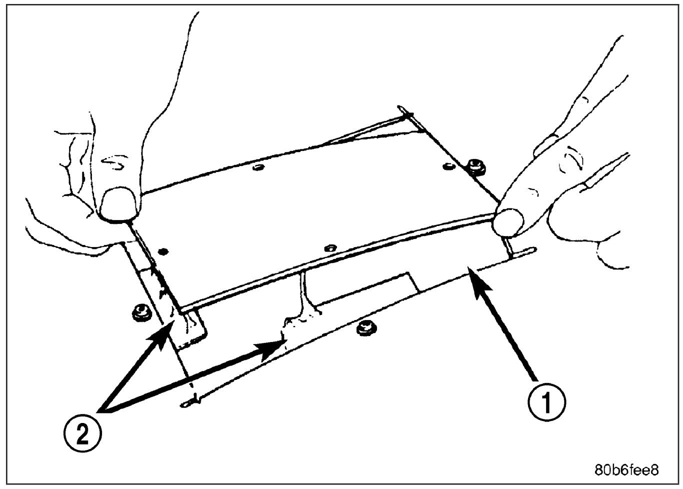
1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

## PANEL PATCH INSTALLATION

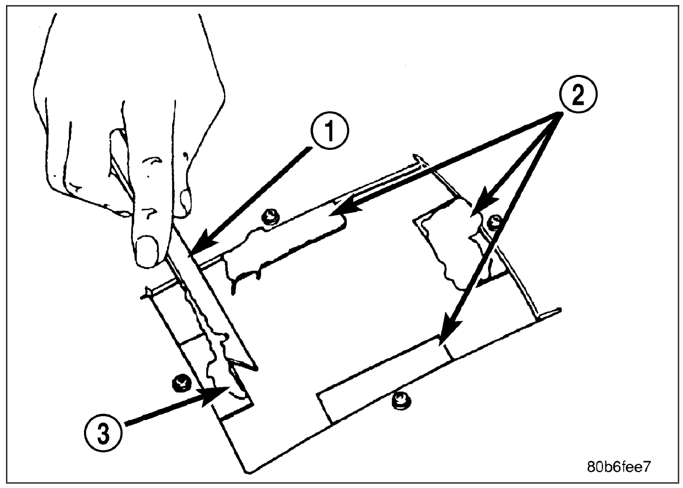


1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.

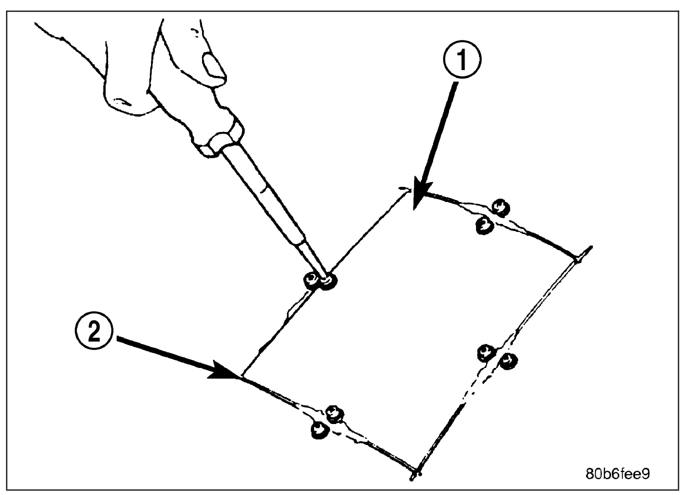
12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.



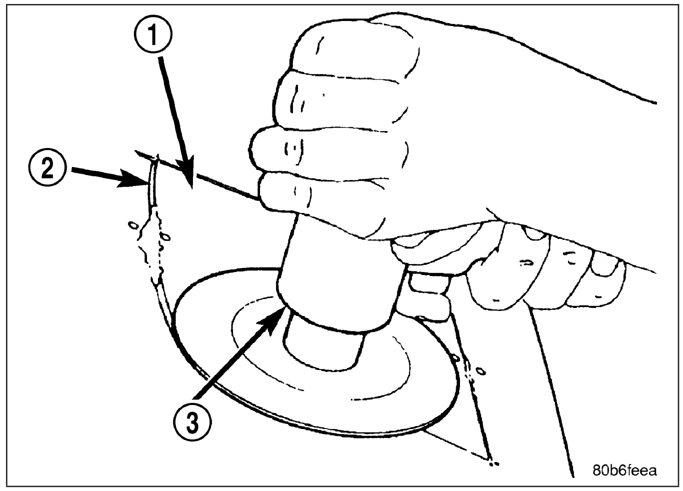
14. Apply a coat of adhesive to the exposed ends of the support squares.



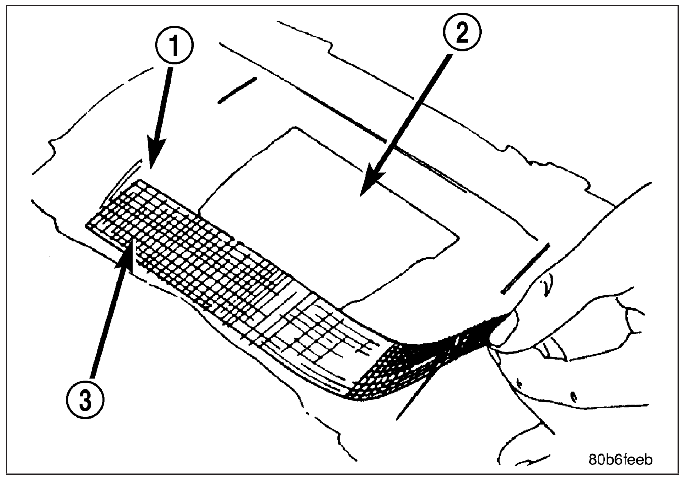
15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.



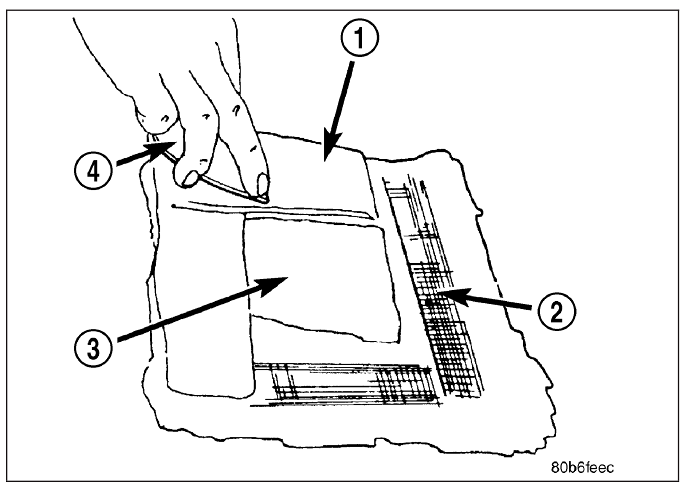
17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.



18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.



20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.



## PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

## SPECIFICATIONS

## TORQUE

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Fender bolts | 12 | 9 | — |

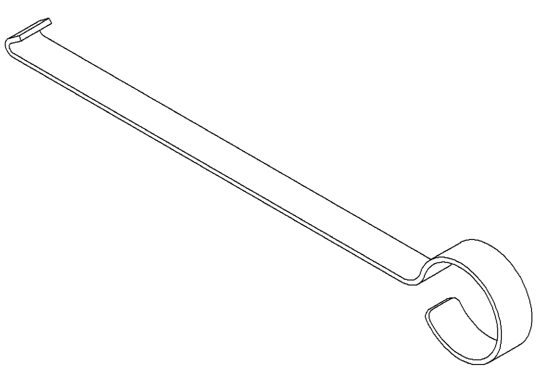
*REMOVER, MOLDINGS C-4829-A*



*Outer Belt Molding Remover - 9093*

# HOOD

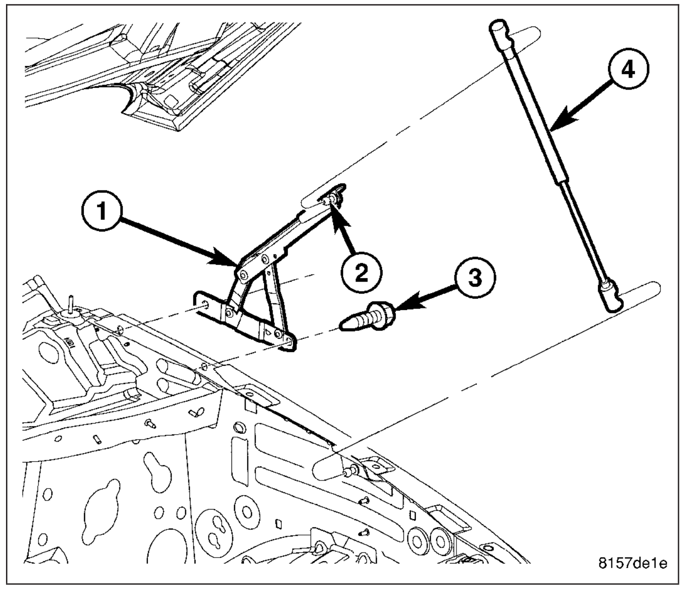
## TABLE OF CONTENTS

# HINGE

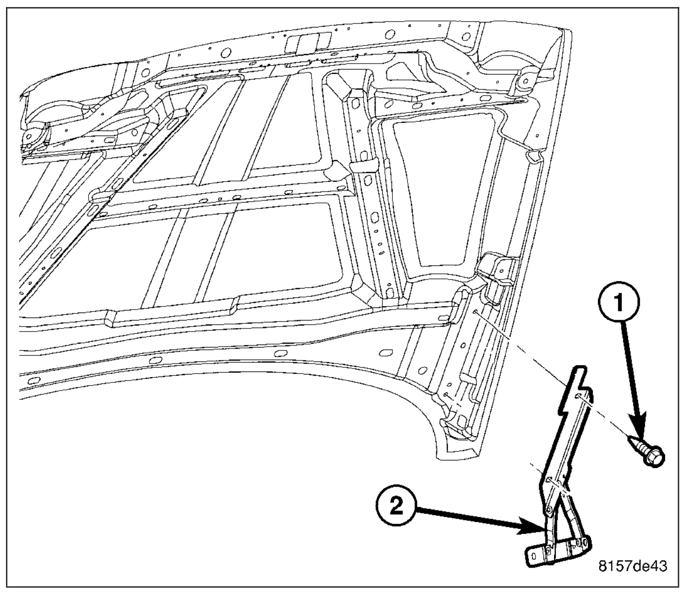
## REMOVAL

**NOTE: It is not necessary to remove the hood to replace one or both hinges. The hinges can be replaced one at a time.**

1. Raise and support hood.
2. Using a grease pencil or equivalent, mark position of hinge (1).
3. Remove hood support cylinder (4). (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - REMOVAL)
4. Remove bolts (3) attaching hinge (1) to body.

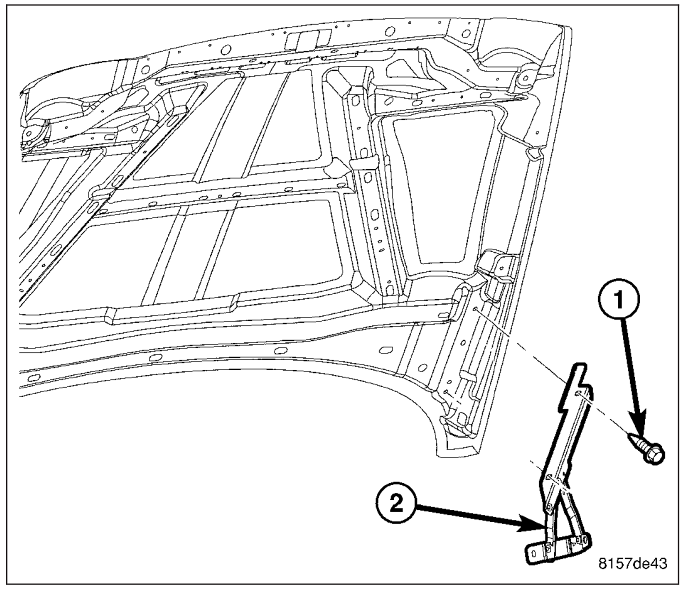


5. Remove bolts (1) attaching hinge (2) to hood.
6. Separate hinge from vehicle.

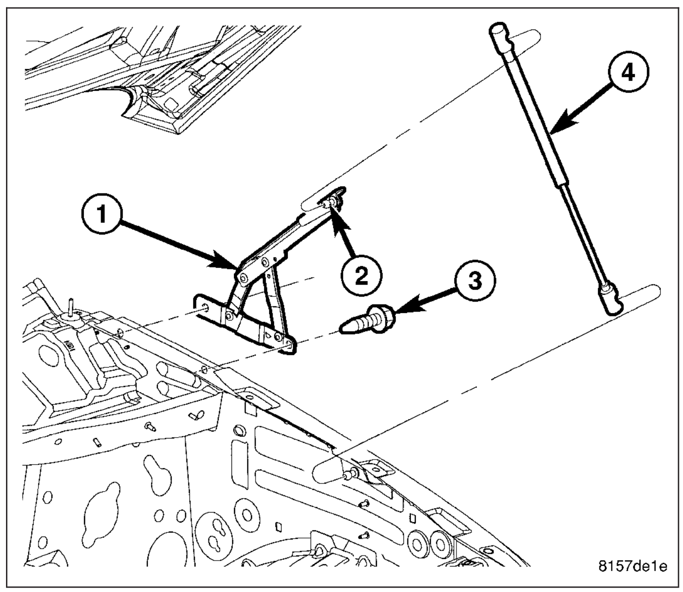


## INSTALLATION

1. Position hinge (2) on vehicle and align reference marks.
2. Install the bolts (1) attaching hinge to hood and tighten to 12 N·m (9 ft. lbs.).



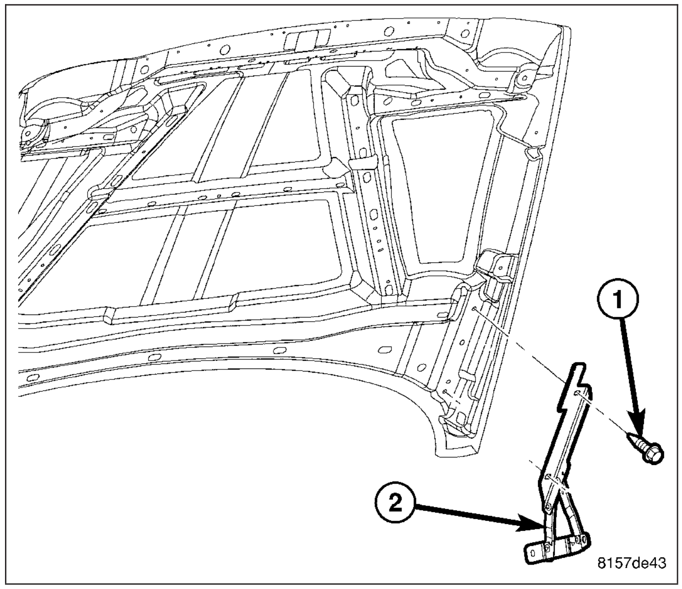
3. Install bolts (3) attaching hinge to body and tighten to 28 N·m (21 ft. lbs.).
4. Install hood hinge support cylinder (4). (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - INSTALLATION)



# HOOD

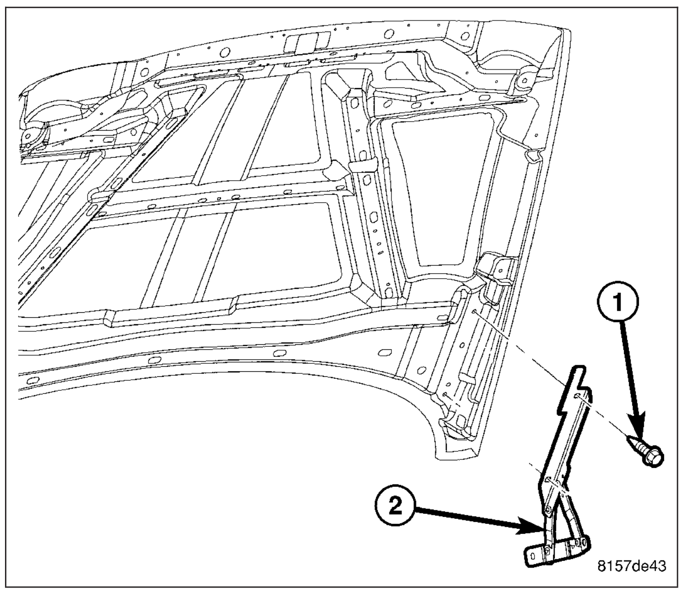
## REMOVAL

1. Raise hood.
2. Using a grease pencil or equivalent, mark location of hood hinges on hood for installation alignment.
3. Remove bolts (1) attaching hinges (2) to hood.
4. With the aid of a helper, remove hood from vehicle.



## INSTALLATION

1. Position hood on hinges.
2. Install bolts (1) finger-tight.
3. Align hinges with installation reference marks made previously and tighten bolts to 12 N·m (9 ft. lbs.).
4. Inspect hood for proper alignment and adjust as necessary. (Refer to 23 - BODY/HOOD/HOOD - ADJUSTMENTS)

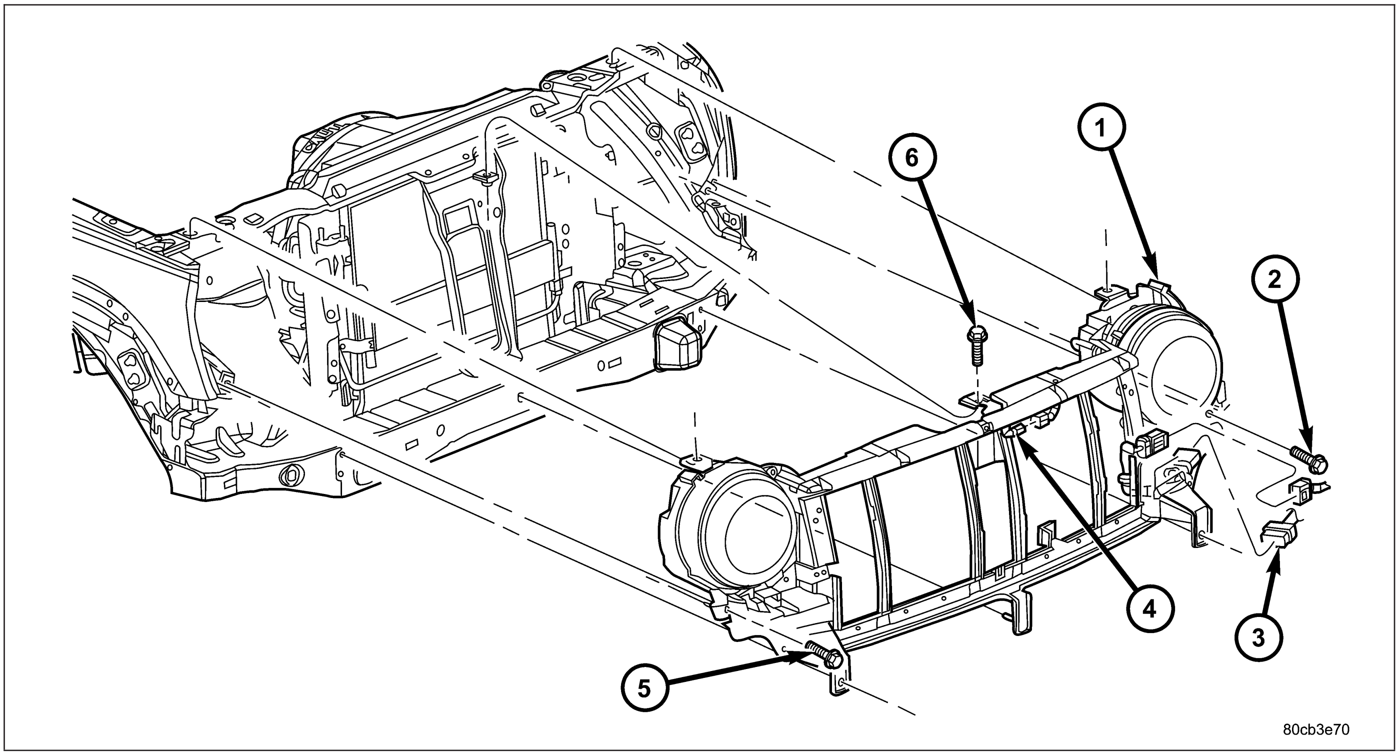


## ADJUSTMENTS

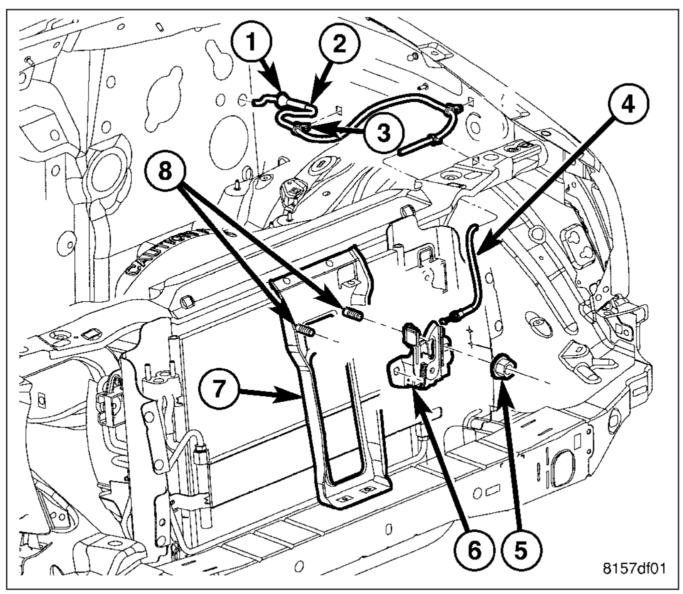
1. If hood is low in relation to cowl panel, insert shims between hinge and hood.
2. Adjust hood bumper in or out to adjust hood-to-fender height alignment.
3. Adjust the hood latch as necessary. Tighten the nuts to 14 N·m (10.5 ft. lbs.).
4. Align the latch striker so that striker enters the latch squarely and without binding.

# LATCH

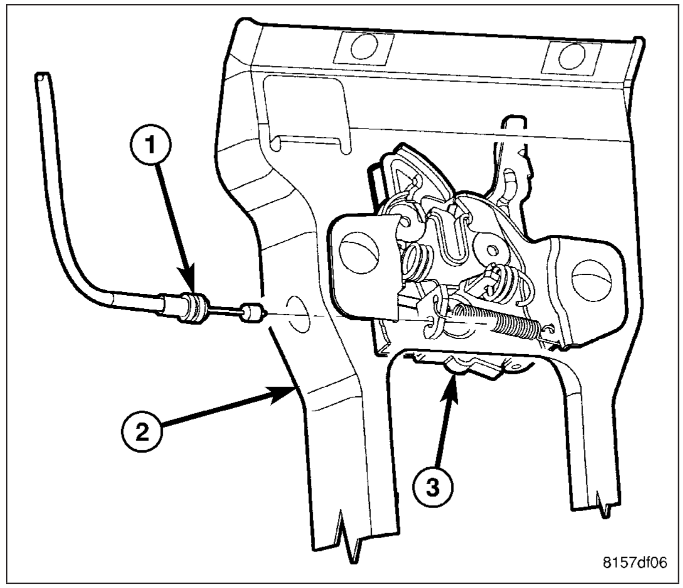
## REMOVAL



1. Remove the three bolts (6) from the top of the grille opening reinforcement (1).
2. Carefully pull the grille opening reinforcement forward and remove the two latch nuts (5) and separate the latch.

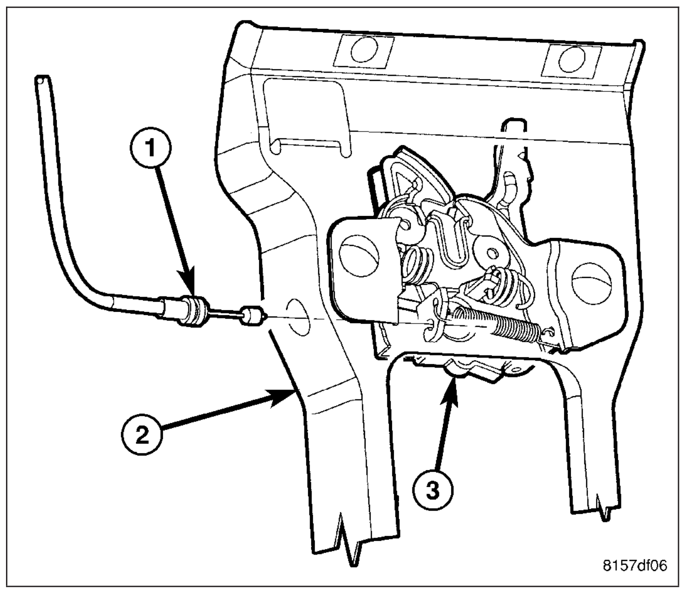


3. Disconnect the release cable (1) and remove the latch (3).

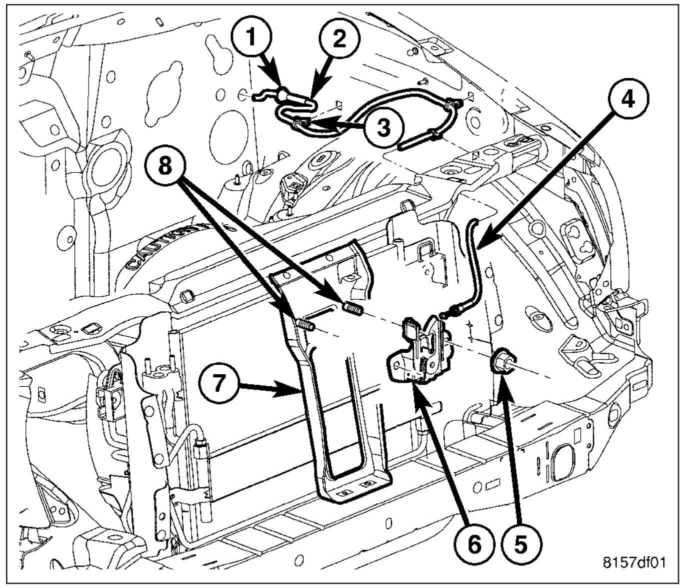


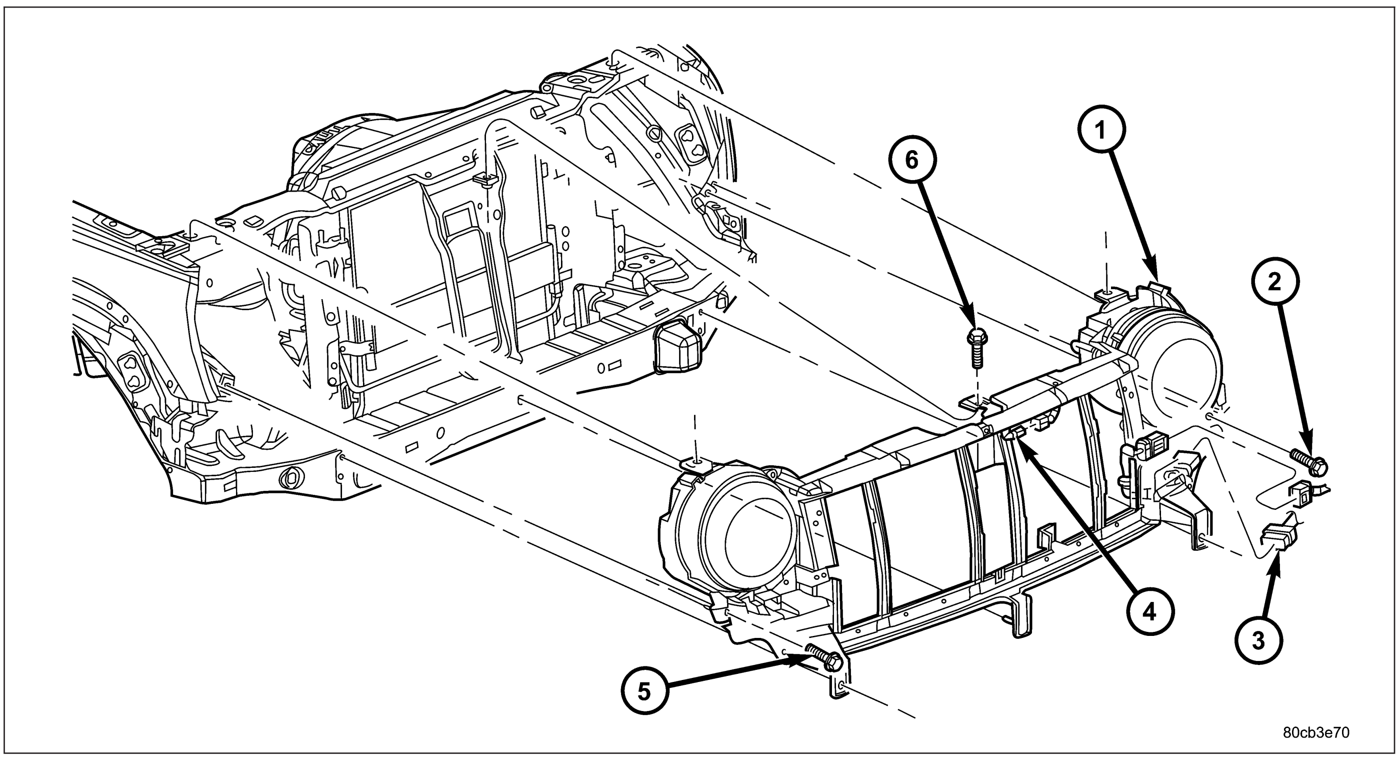
## INSTALLATION

1. Route latch cable (1) through the hole in the support bracket (2).
2. Connect the release cable and install the latch (3) onto the support bracket.



3. Install the two nuts (5) and tighten to 14 N·m (10.5 ft. lbs.).



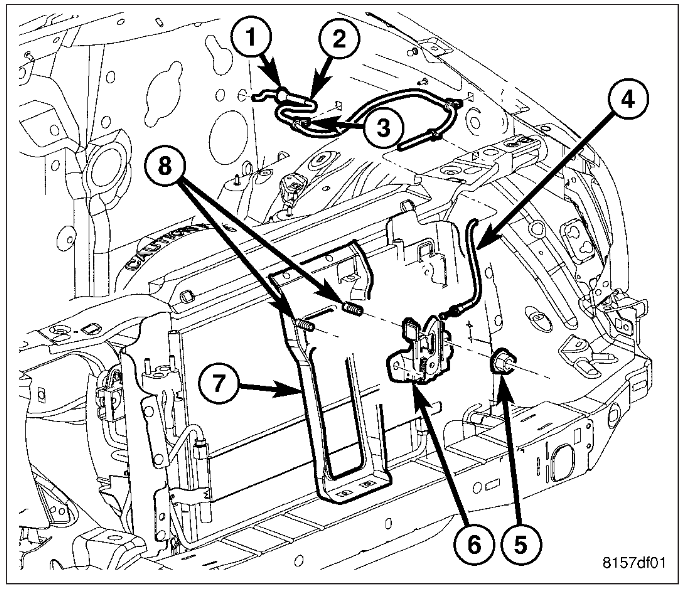


4. Position the grille opening reinforcement (1) back and install the three upper bolts (6).
5. Tighten the bolts to 10 N·m (85 in. lbs.).

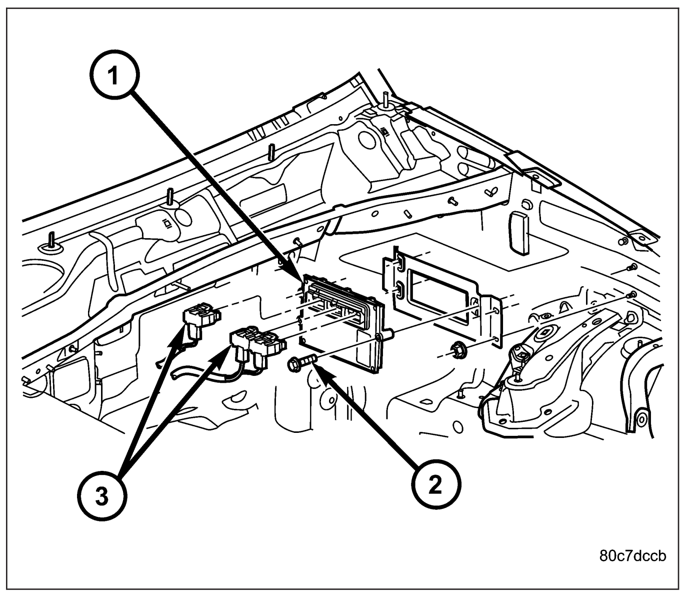
# LATCH RELEASE CABLE

## REMOVAL

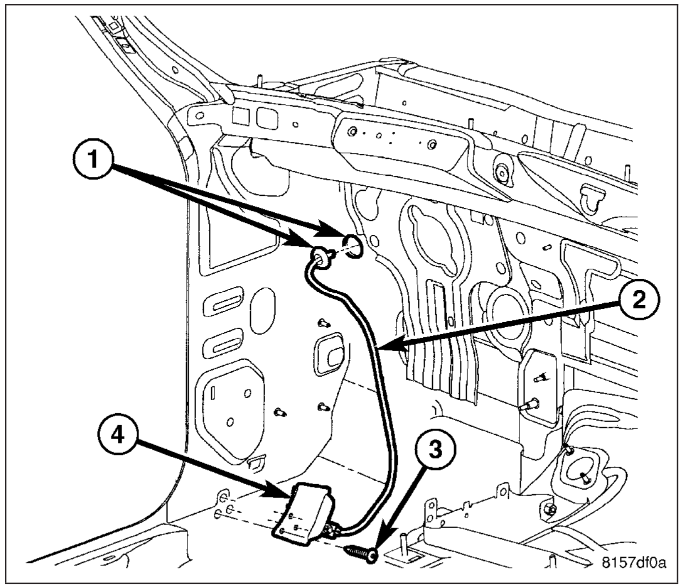
1. Remove the battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL)
2. Remove the hood latch. (Refer to 23 - BODY/HOOD/LATCH - REMOVAL)



3. Remove the powertrain control module. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL)



4. Remove the hood release handle. (Refer to 23 - BODY/HOOD/LATCH RELEASE HANDLE - REMOVAL)



5. Disconnect the attaching clips and remove the cable from the inside.

## INSTALLATION

1. Install the cable from the inside and attach the retaining clips.
2. Install the hood latch release handle. (Refer to 23 - BODY/HOOD/LATCH RELEASE HANDLE - INSTALLATION)
3. Install the powertrain control module. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWER-TRAIN CONTROL MODULE - INSTALLATION)
4. Install the hood latch. (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION)
5. Install the battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION)

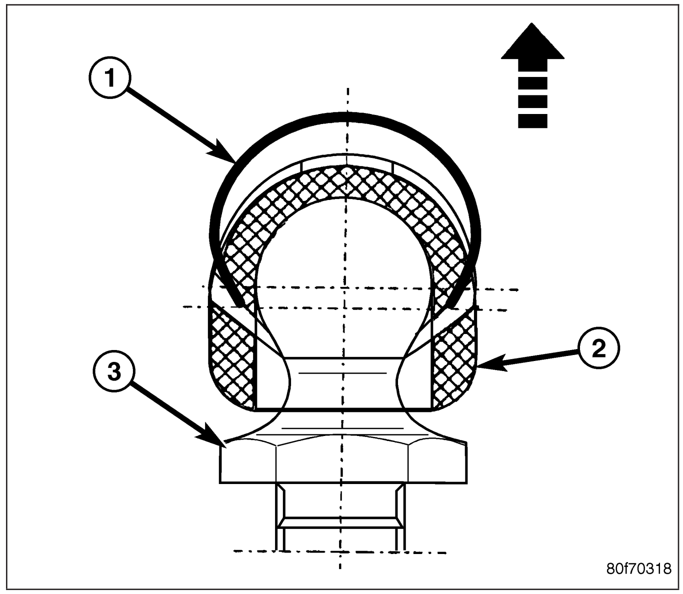
# SUPPORT CYLINDER

## REMOVAL

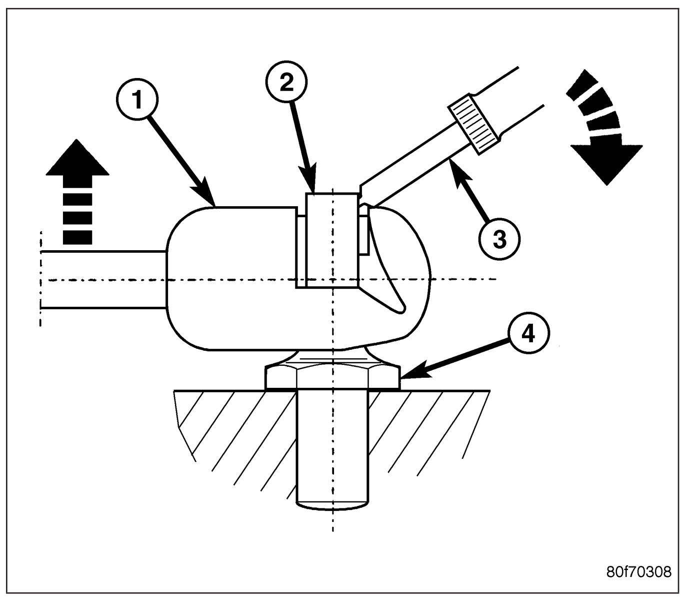
**NOTE: The support cylinders can be replaced one at a time.**

1. Open the hood and support.

**NOTE: Lift the clips only enough to release the ball studs.**

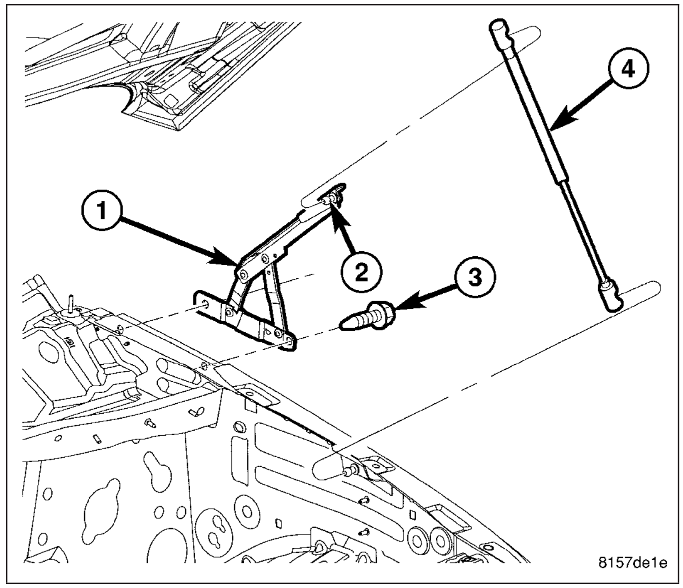


2. Using a small flat bladed tool, or equivalent, release the upper retaining clips while pulling the ball socket away from the ball stud.



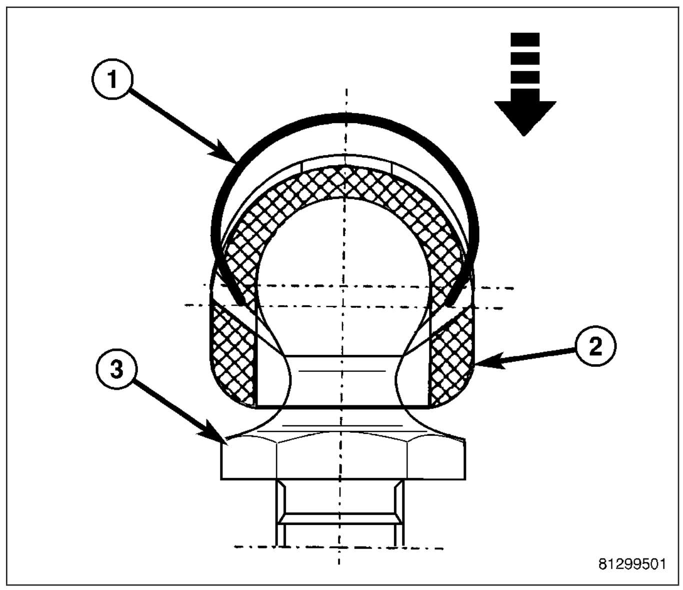
**CAUTION: Do not pull the supports from the middle while removing.**

3. Pulling at the ends only, remove the support cylinder (4).



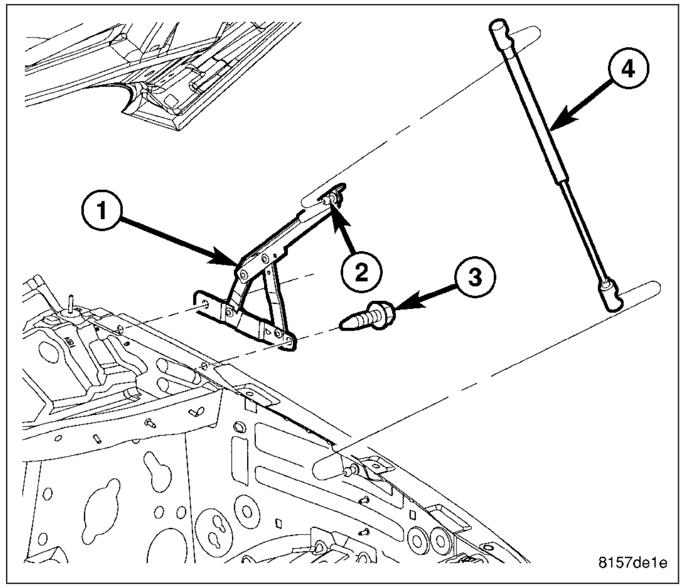
## INSTALLATION

1. Make sure the retaining clips (1) are seated into the ball socket (2) fully.



**CAUTION: Do not install the support cylinders by pressing at the center of the cylinder. Press the ends only.**

2. Install the support cylinder (4) over the ball studs with the thin end connected to the body side of the hinge and the retaining clips snapping into place.



# LATCH RELEASE HANDLE

## REMOVAL

1. Remove the cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL)
2. Remove the three screws and remove the handle.
3. Disconnect the hood release cable.

## INSTALLATION

1. Connect the hood release cable to the handle.
2. Install the handle and install the three screws.
3. Install the cowl trim cover. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION)

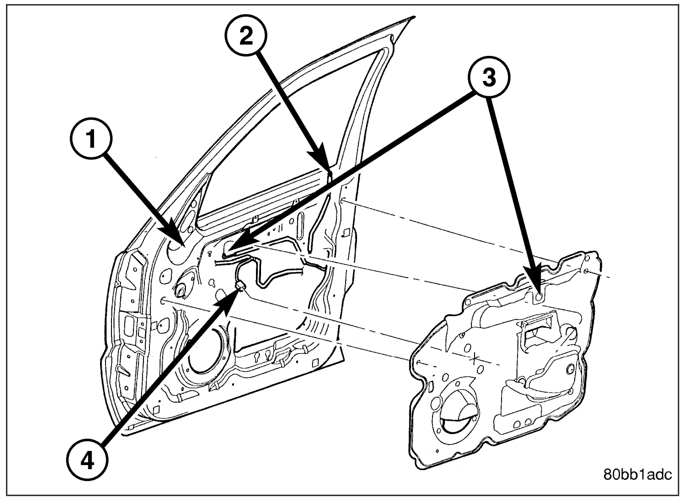
# DOOR - FRONT

## TABLE OF CONTENTS

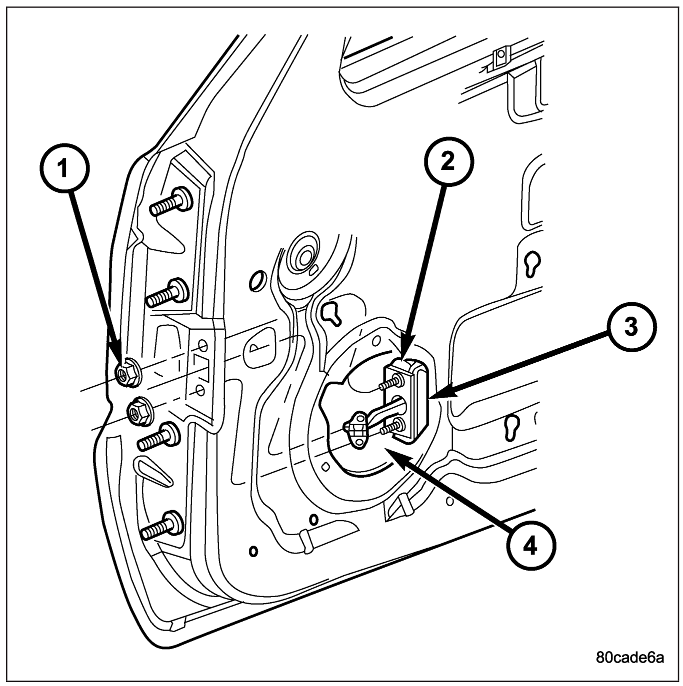
# CHECK STRAP

## REMOVAL

1. Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)



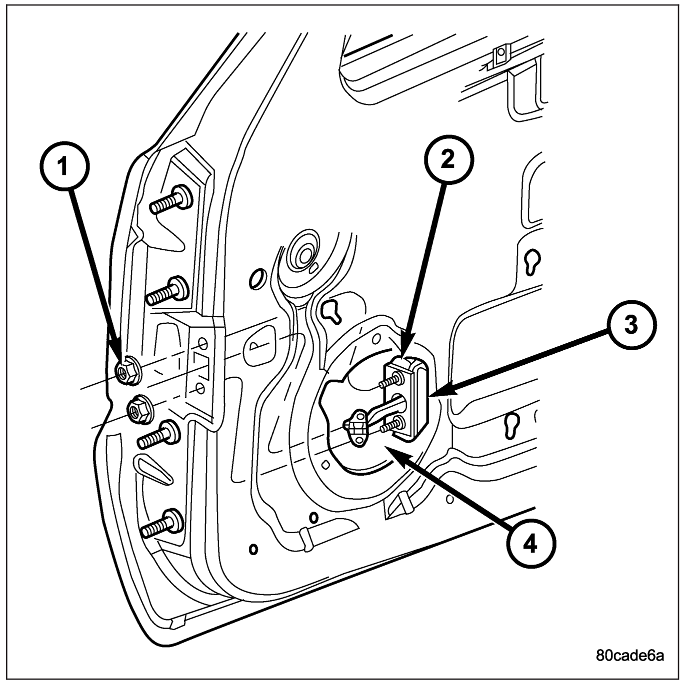
2. Remove screws attaching door check to A-pillar.
3. Remove the two nuts (1) and remove the door check strap (2).



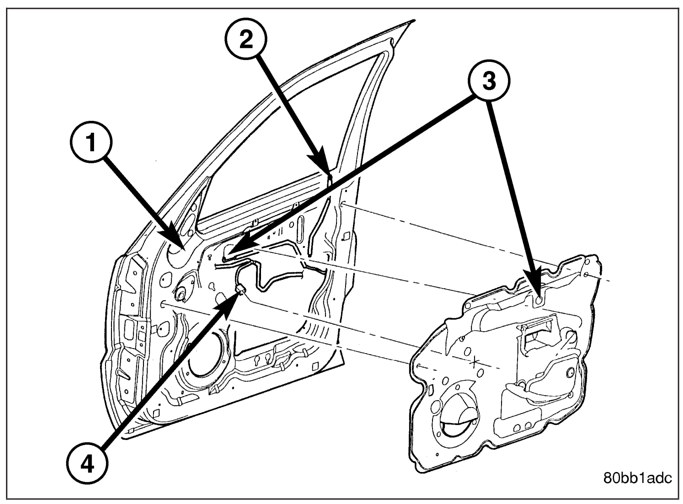
## INSTALLATION

**NOTE: Make sure the proper orientation of the check strap is maintained using the part number (3) printed on the side. The part number should face inboard toward the interior of the vehicle.**

1. Install the check strap (2) through the speaker hole (4).
2. Install the nuts (1) and tighten to 12 N·m (9 ft. lbs.).
3. Connect the strap to the A-pillar and tighten the bolts to 12 N·m (9 ft. lbs.).



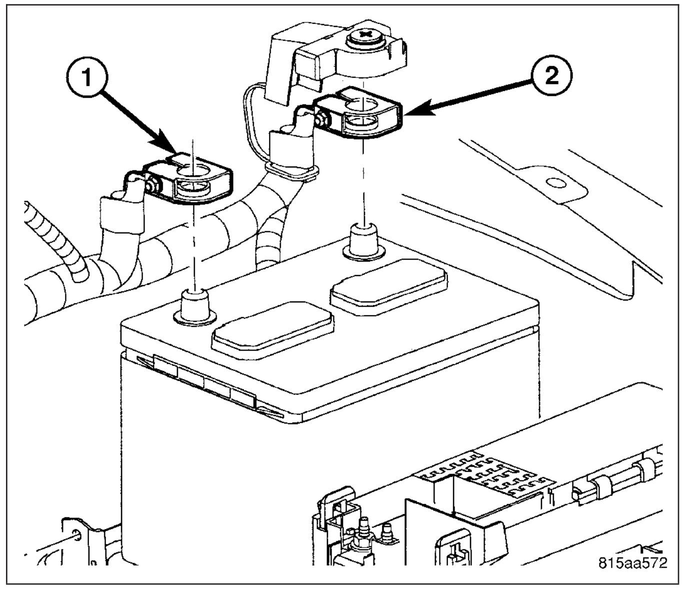
4. Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)



# DOOR

## REMOVAL

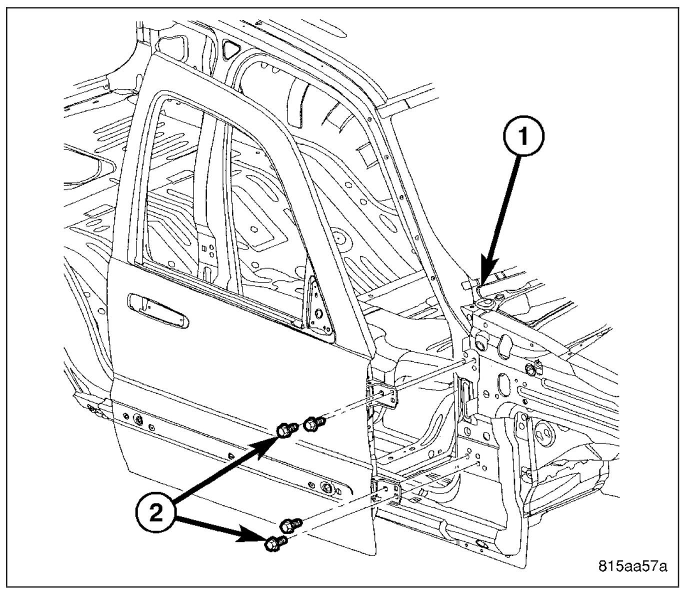
1. Disconnect and isolate the negative battery cable.



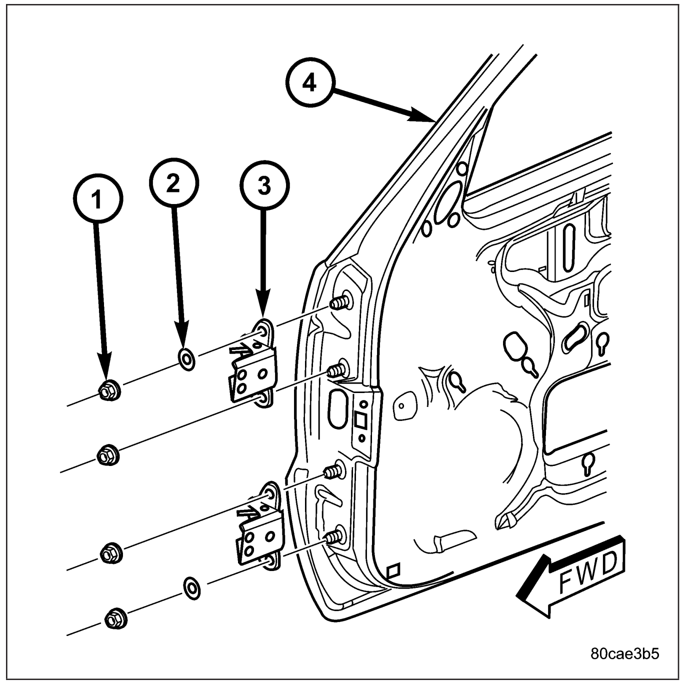
2. Disconnect the door wire harness electrical connector at the A-pillar.
3. Support the door with a suitable lifting device.
4. Remove the bolts attaching the check strap to the A-pillar.

**NOTE: The epoxy washers should not be removed from the hinge. If the washers are removed the door may have to be re-adjusted.**

5. Remove the nuts attaching the door hinges to the door.
6. Carefully remove the door from the body.

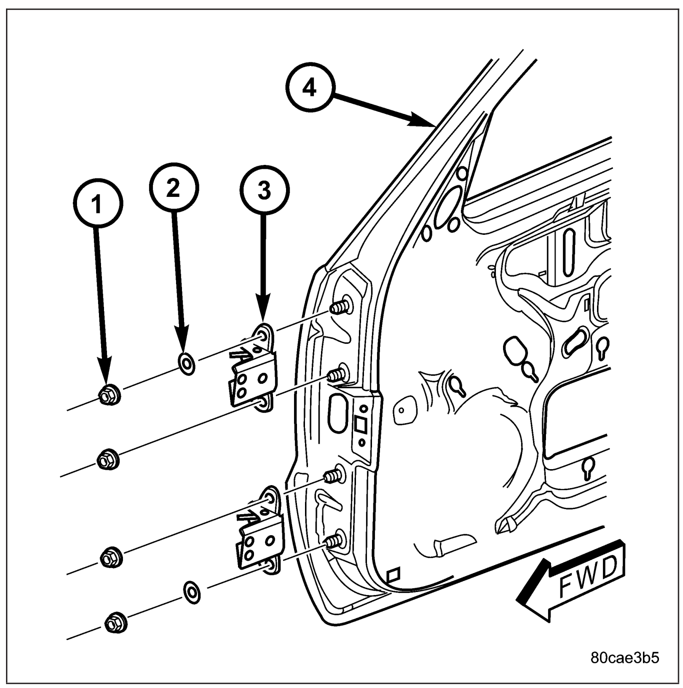


7. If necessary, remove the front door hinges from the door (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL).

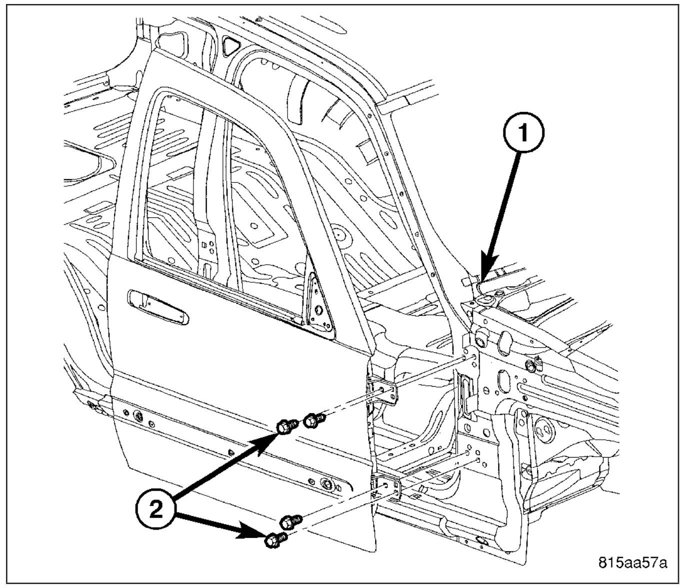


## INSTALLATION

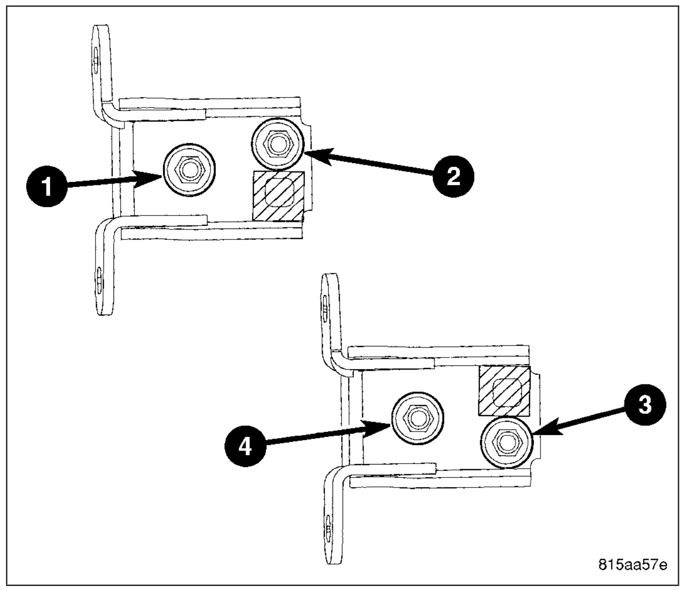
1. If removed, install the front door hinges (3) onto the door (Refer to 23 - BODY/DOOR - FRONT/HINGE - INSTALLATION).



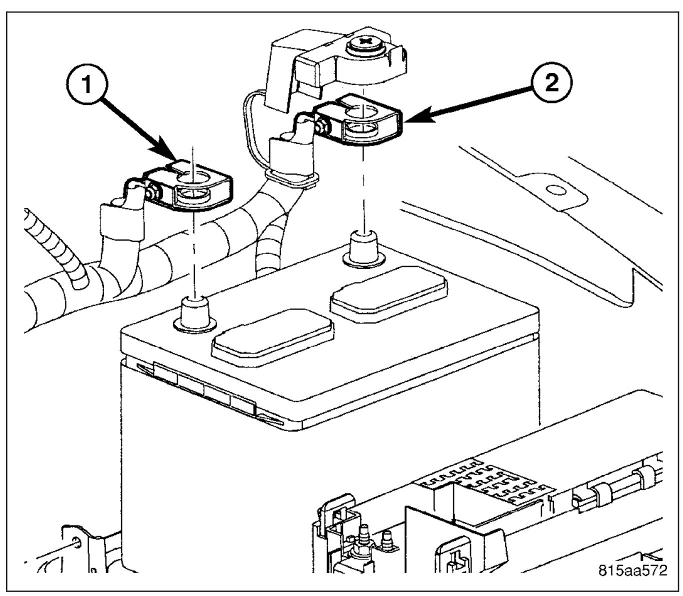
2. Carefully position the door to the body and support the door with a suitable lifting device.
3. Loosely install the four bolts (2) that secure the front door hinges to the A-pillar.
4. Align the door to the body using the reference marks made during the removal procedure.



5. Tighten the hinge to body bolts to 28 N·m (21 ft. lbs.) using the sequence shown.
6. Connect the front door wire harness to the body wire harness.



7. Reconnect the negative battery cable.
8. If necessary, adjust the front door (Refer to 23 - BODY/DOOR-FRONT - ADJUSTMENTS).



## ADJUSTMENTS

## ADJUSTMENT

**NOTE: For vehicles with four doors, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)**

- **Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.**
- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**
- **A suitable body sealant should be used when removing or moving the hinges.**

### FORE/AFT

**NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.**

1. Support the door with a suitable lifting device.
2. Loosen the hinge to hinge pillar fasteners. (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
3. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the hinge pillar fasteners to 28 N·m (21 ft. lbs.).

### UP/DOWN

**NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.**

**NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.**

**NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)**

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)
3. Loosen the hinge to door fasteners (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL) or loosen the hinge to hinge pillar fasteners (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL).
4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the hinge pillar fasteners or the door to hinges fasteners to 28 N·m (21 ft. lbs.).
6. Tighten the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

### IN/OUT

**NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.**

**NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.**

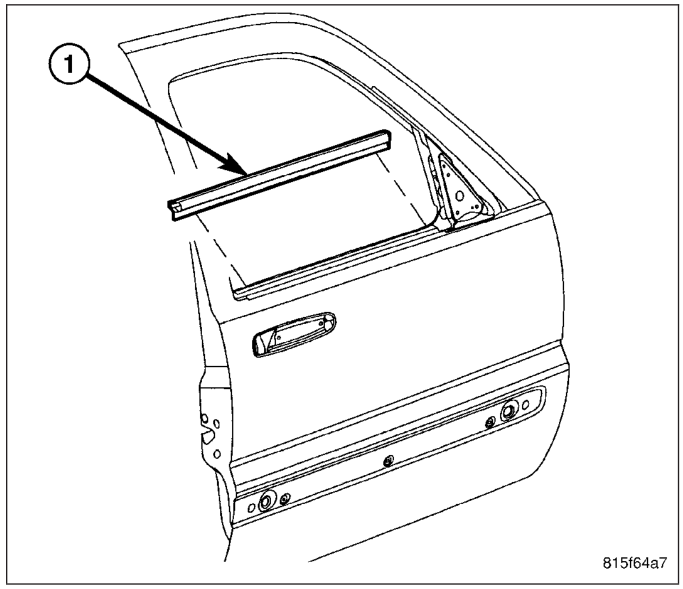
1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)
3. Loosen the hinge to door fasteners. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the door to hinges fasteners to 28 N·m (21 ft. lbs.).
6. Tighten the latch striker bolts. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

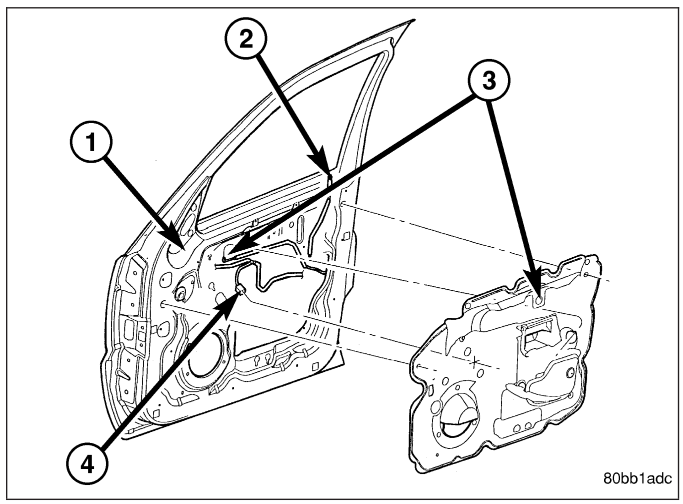
# DOOR GLASS

## REMOVAL

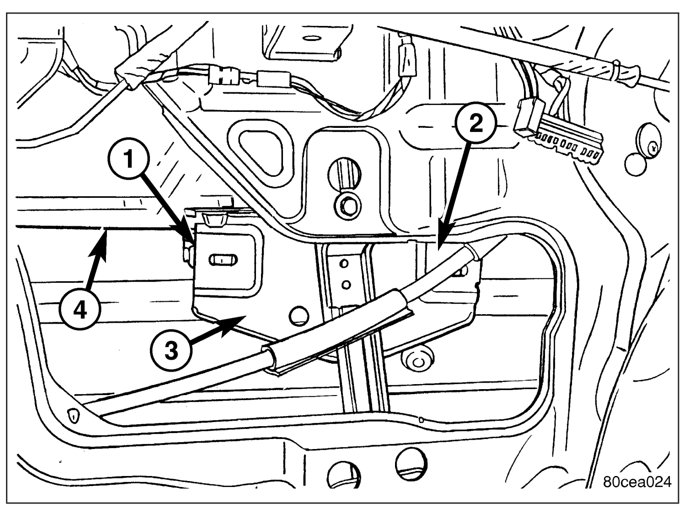
1. Remove the outer belt molding (1). (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR OUTER BELT MOLDING - REMOVAL)



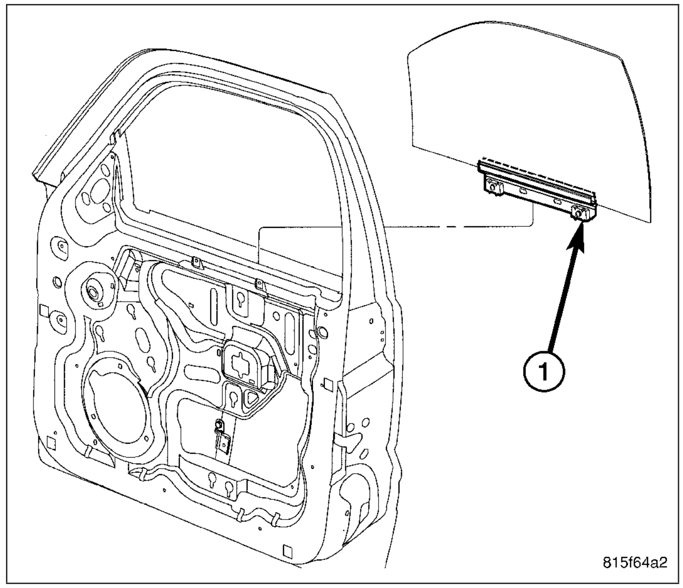
2. Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)



3. Raise the glass (4) to the position shown and using a long flat blade or hook type tool, disengage clips (1) attaching glass retainer to regulator lift plate (3).
4. Disconnect the glass from the regulator lift plate and re-install the clips.

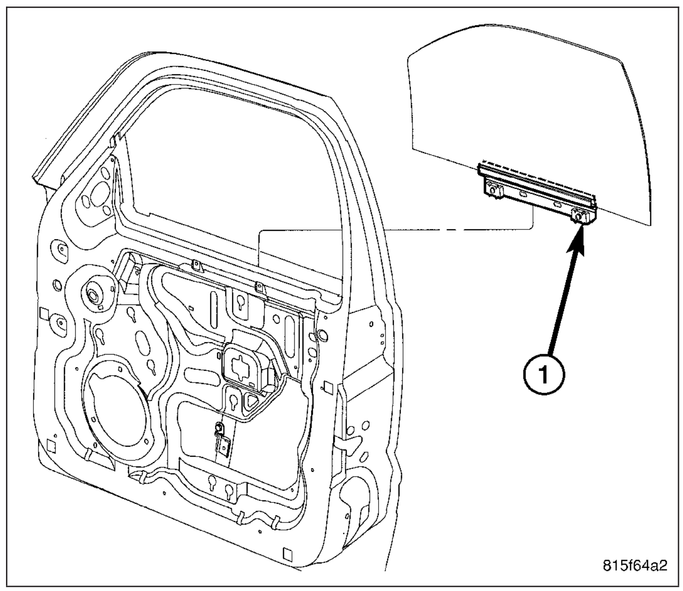


5. Rotate the top of the glass toward the front and remove the glass from the window opening.

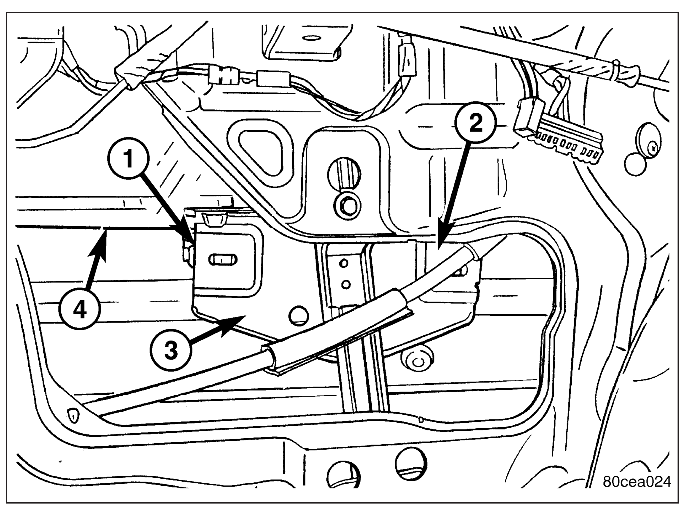


## INSTALLATION

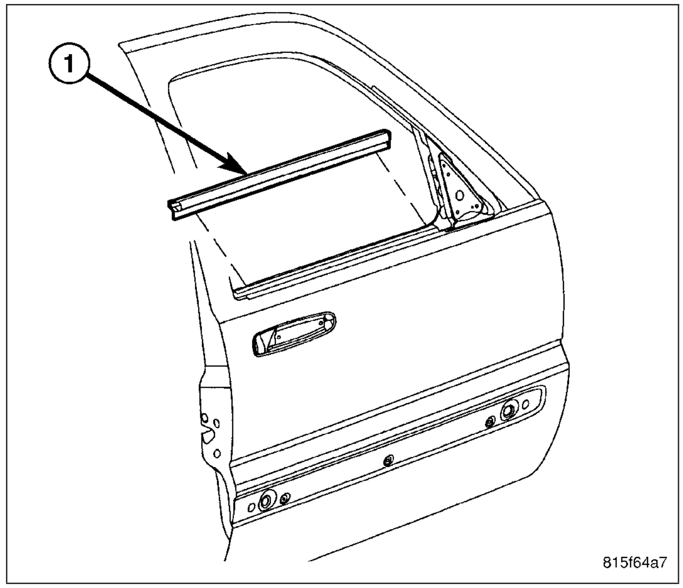
1. Install the glass through the window opening and align the mounting plate to the lift plate.



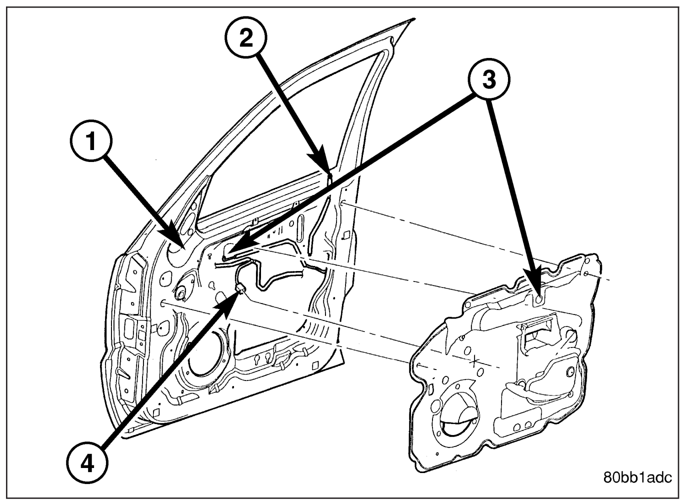
2. Engage the glass (4) to the regulator lift plate (3).



3. Install the outer belt molding (1). (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR OUTER BELT MOLDING - INSTALLATION)



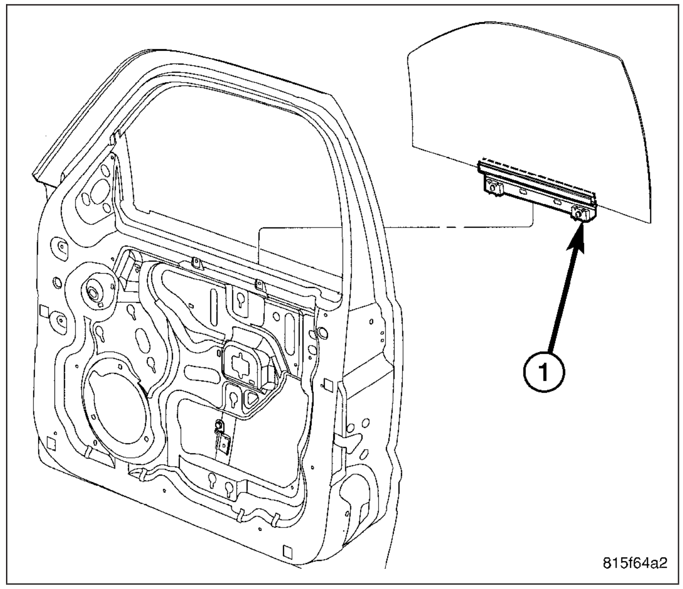
4. Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)



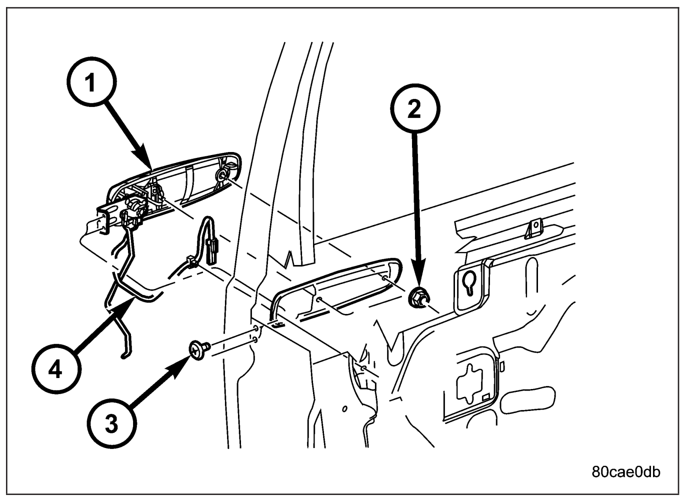
# EXTERIOR HANDLE

## REMOVAL

1. Remove the door glass (1). (Refer to 23 - BODY/ DOOR - FRONT/DOOR GLASS - REMOVAL)

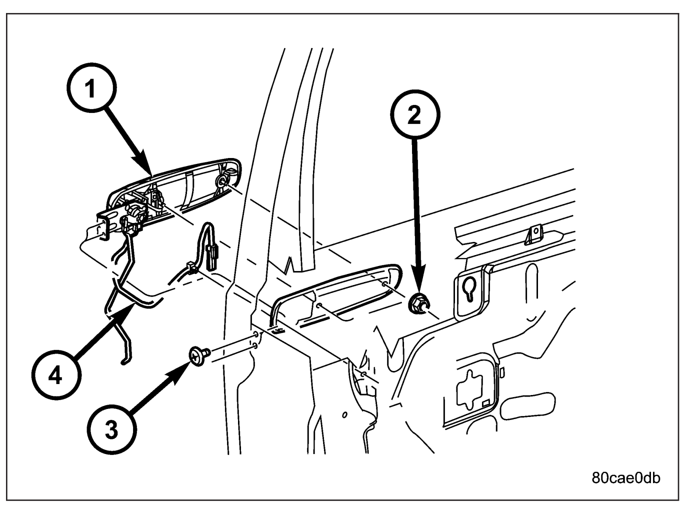


2. Disconnect the lock switch electrical connector (4), if equipped.
3. Disconnect the handle rod at the handle and the key cylinder rod at the latch.
4. Remove the screws (3).
5. Remove the nuts (2) and remove the handle (1).

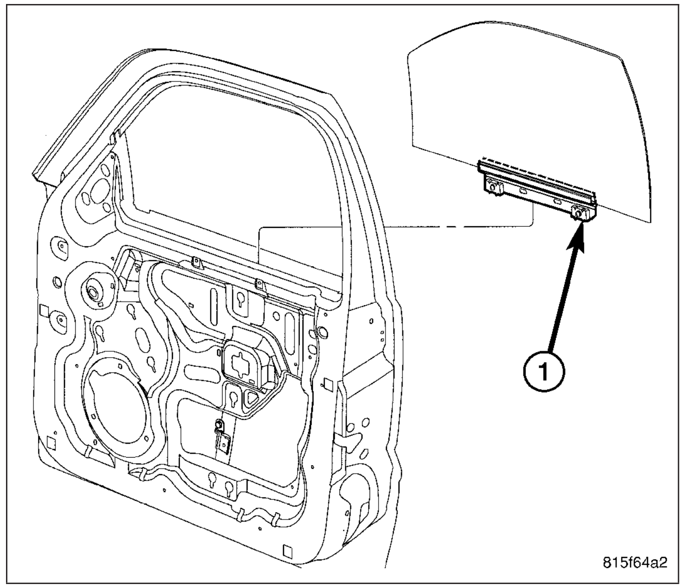


## INSTALLATION

1. Position the handle (1) on the door and slide fully toward the rear of the door.
2. Install the nuts (2) and tighten to 6 N·m (55 in. lbs.).
3. Install the screws (3) and tighten to 6 N·m (55 in. lbs.).
4. Connect the handle rod at the handle and the key cylinder rod at the latch.
5. Connect the lock switch electrical connector (4) , if equipped.



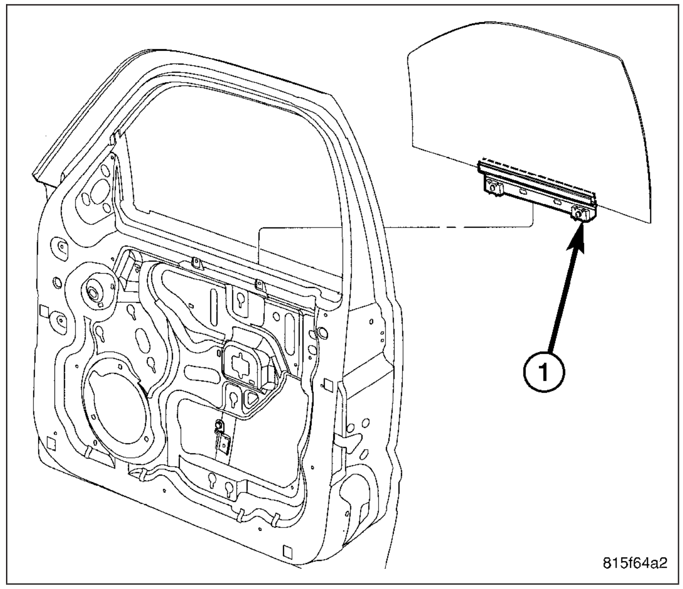
6. Install the door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION)



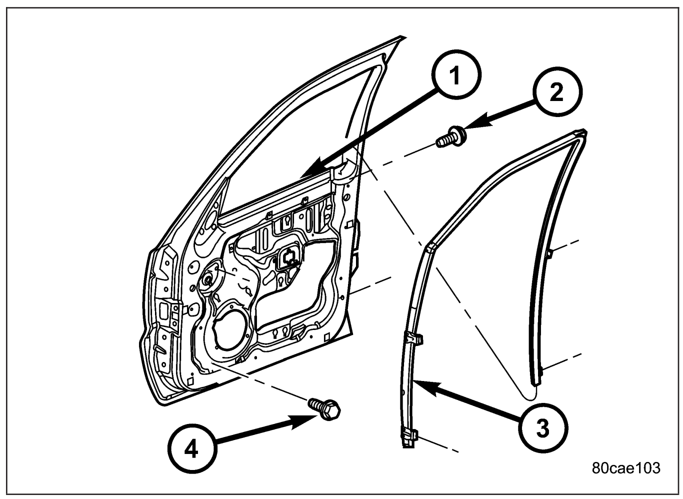
# GLASS RUN CHANNEL

## REMOVAL

1. Remove the door glass. (Refer to 23 - BODY/ DOOR - FRONT/DOOR GLASS - REMOVAL)

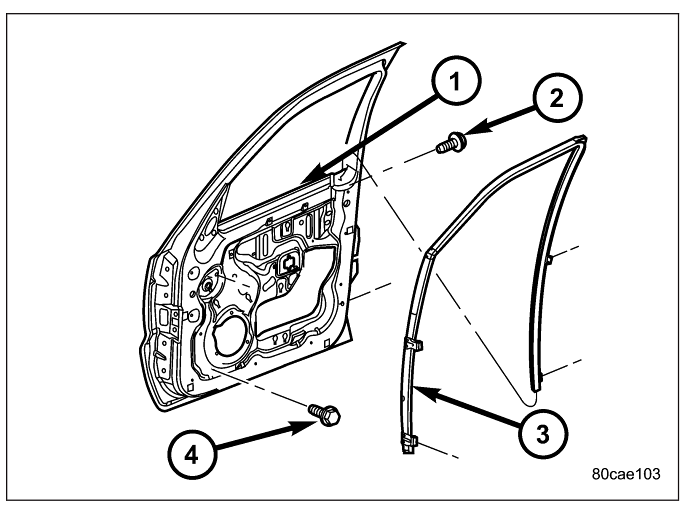


2. Remove the front (4) and rear bolts (2).
3. Peal the weatherstrip out of the door frame and remove the run channel (3) through the window opening (1).

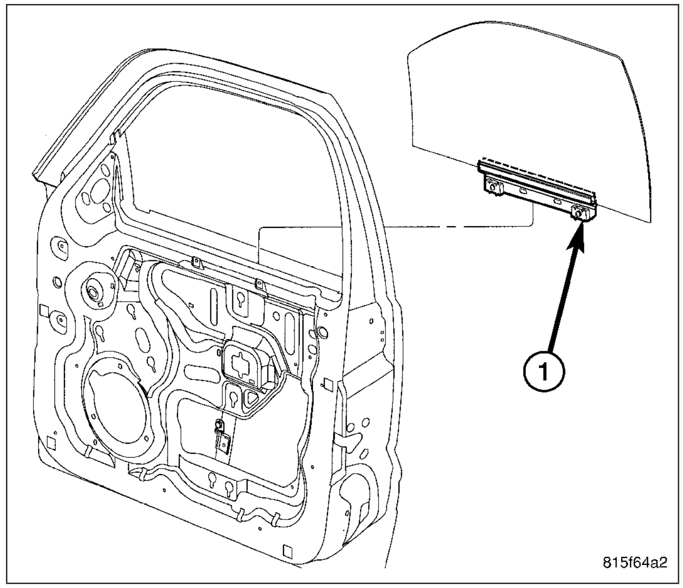


## INSTALLATION

1. Install the run channel (3) through the window opening (1) and into the door frame.
2. Install the front (4), rear bolts (2) and tighten to 9 N·m (80 in. lbs.).



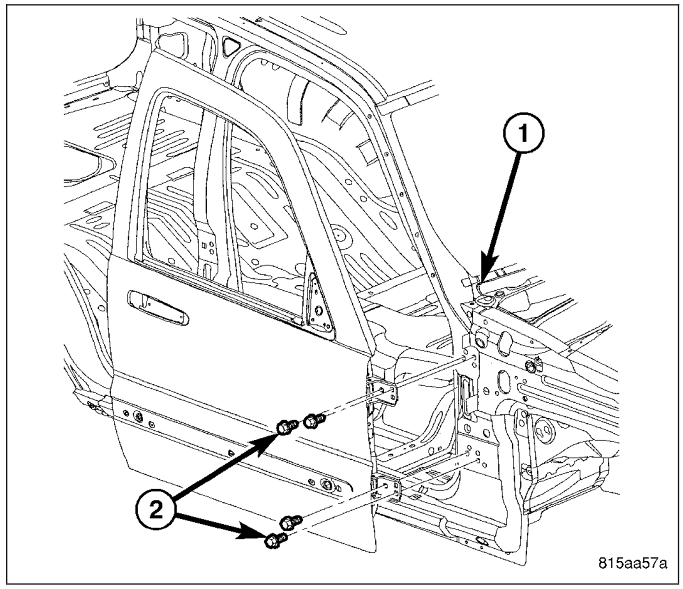
3. Install the door glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION)



# HINGE

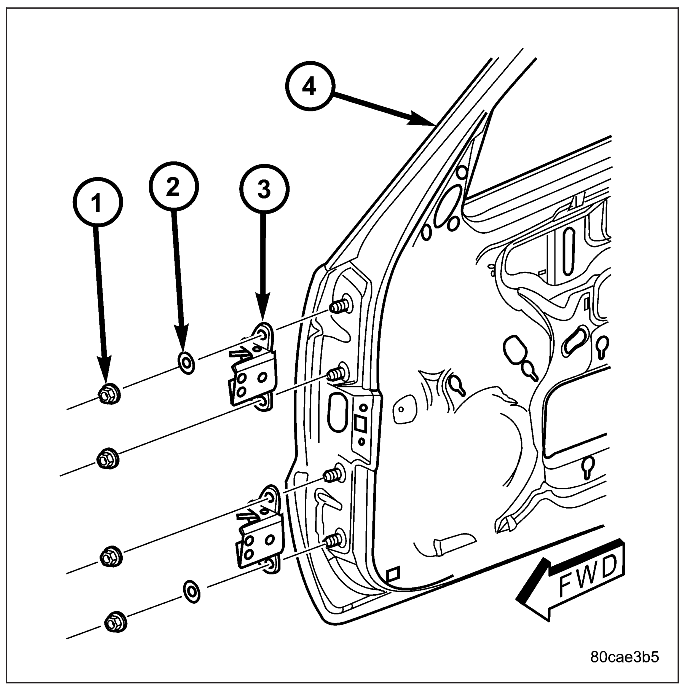
## REMOVAL

1. Remove the door. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)



2. Using a grease pencil or equivalent, mark the location of the door hinges (3) on the front door.

**NOTE: The epoxy bonded washers (2) do not need to be separated from the door hinges. If the washers are removed, the door may need to be readjusted.**



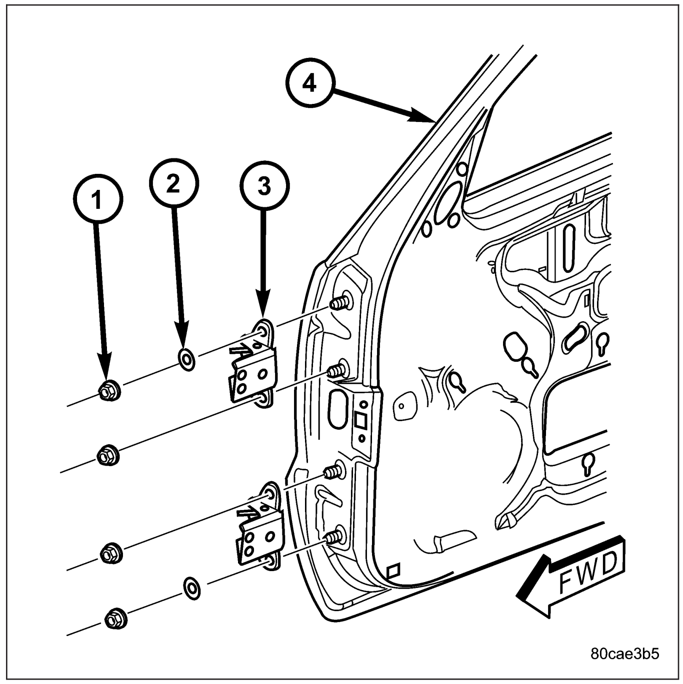
3. Remove the four nuts (1) that secure the front door hinges to the door and remove the hinges.
4. If required, remove the washers (2) from the front door hinges.

## INSTALLATION

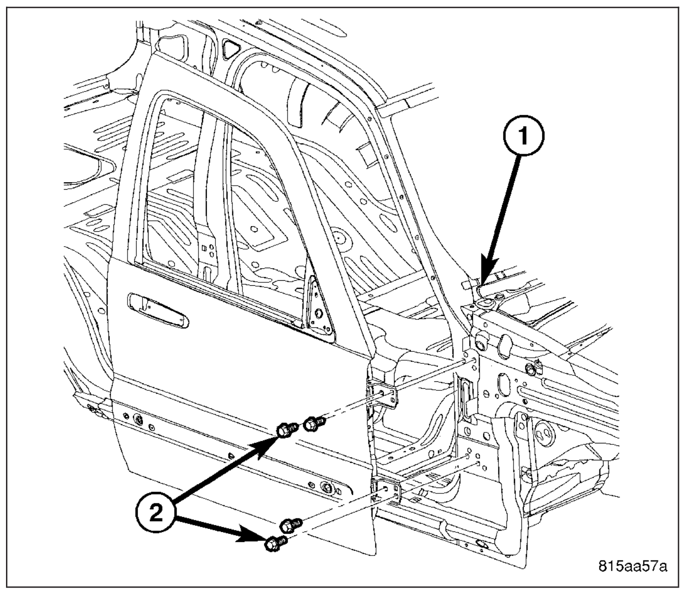
1. Position the front door hinges onto the door.

**NOTE: If the epoxy bonded washers are separated from the door hinges, the door may need to be adjusted.**

2. If removed, install the epoxy bonded washers (2).
3. Loosely install the nuts (1) that secure the hinges to the front door.
4. Align the hinges to the door using the reference marks made during the removal procedure and tighten the nuts to 28 N·m (21 ft. lbs.).



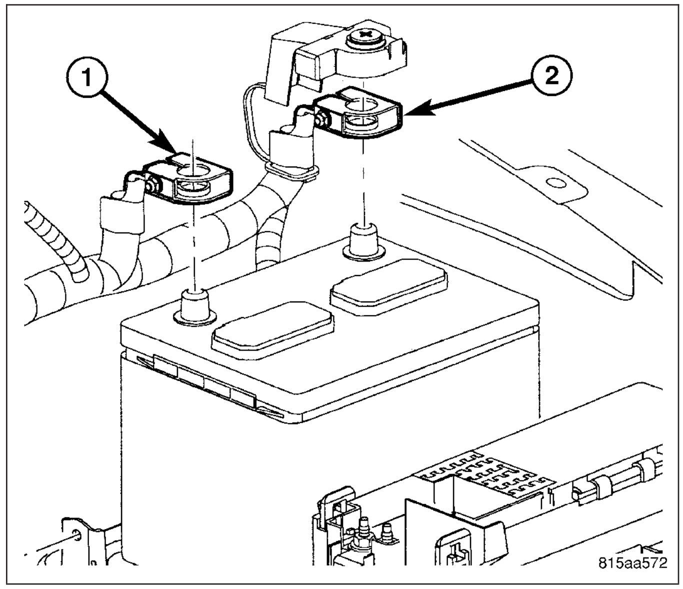
5. Install the door. (Refer to 23 - BODY/DOOR - FRONT/DOOR - INSTALLATION)



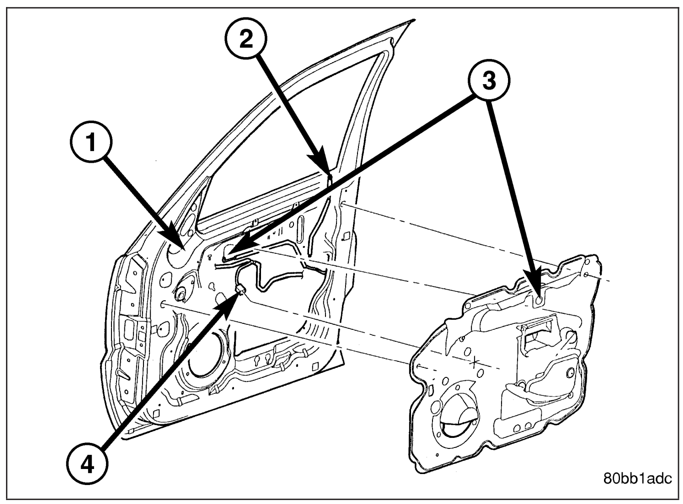
# LATCH

## REMOVAL

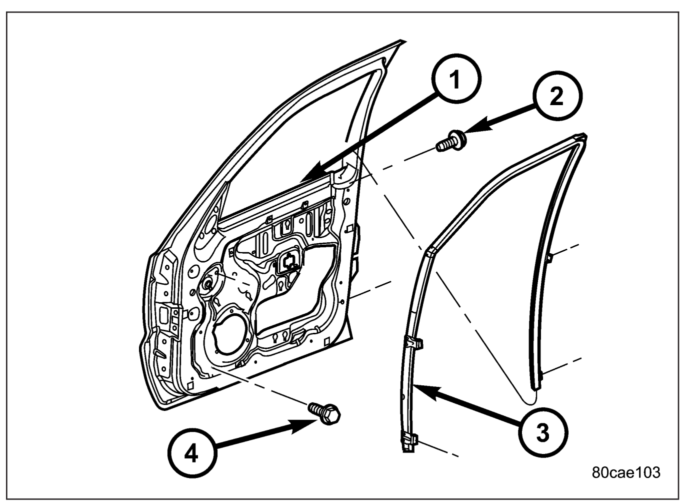
1. Disconnect and isolate the battery negative cable.



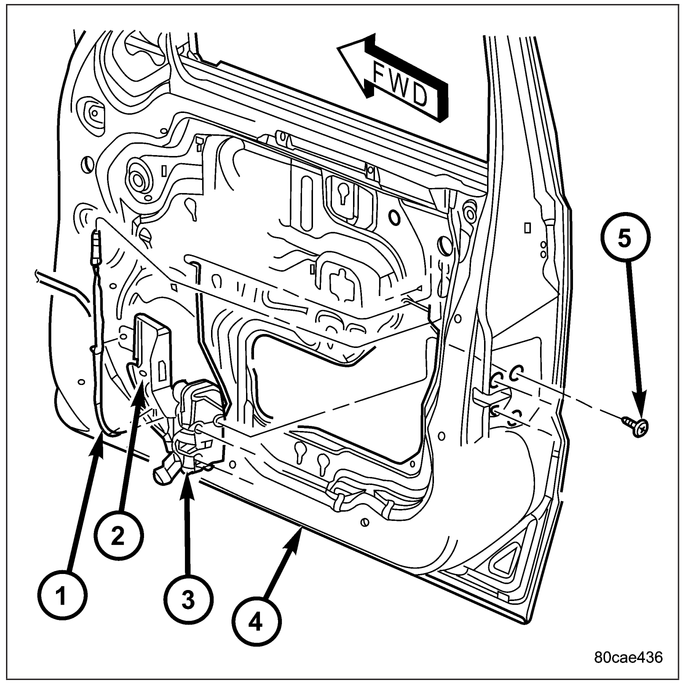
2. Remove the waterdam as necessary to gain access to the latch. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)



3. Remove rear glass run channel bolts (2) and position the channel aside.

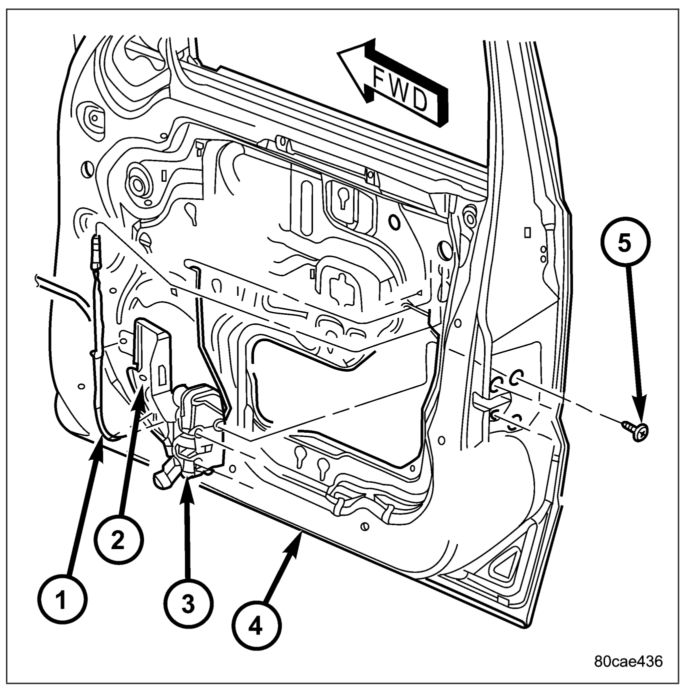


4. Disconnect the exterior handle rod at the handle.
5. Disconnect the lock knob rod (1) and lock cylinder link rod at the latch.
6. Remove the screws (5) and remove the latch assembly (3).
7. Disconnect the electrical connectors.

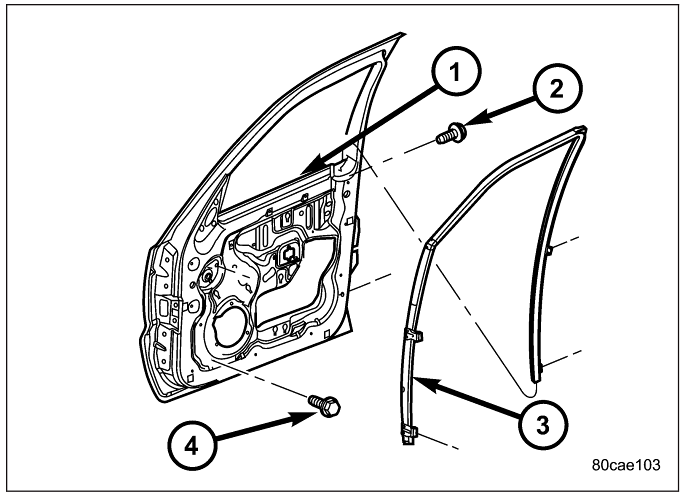


## INSTALLATION

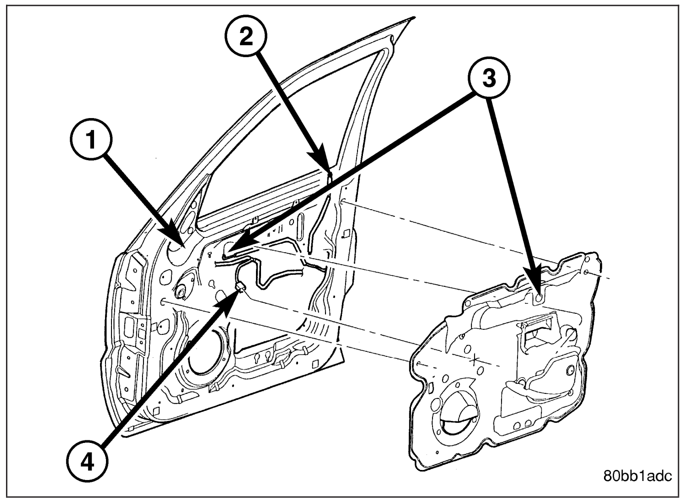
1. Connect the latch electrical connectors.
2. Install the latch assembly (3) into the door (4) and install the screws (5).
3. Tighten the latch screws (5) to 11 N·m (95 in. lbs.).
4. Connect the lock cylinder link rod and lock knob rod at the latch.
5. Connect the exterior handle actuator rod at the handle.



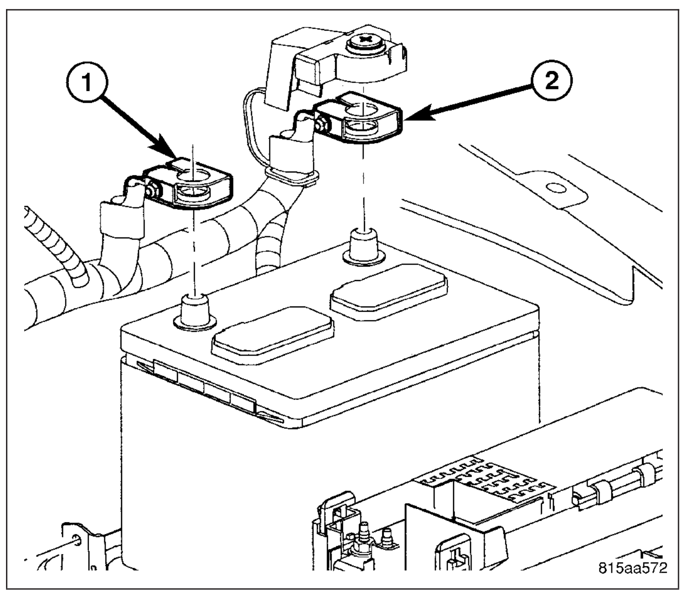
6. Install the rear glass run channel bolts (2) and tighten to 9 N·m (80 in. lbs.).



7. Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)



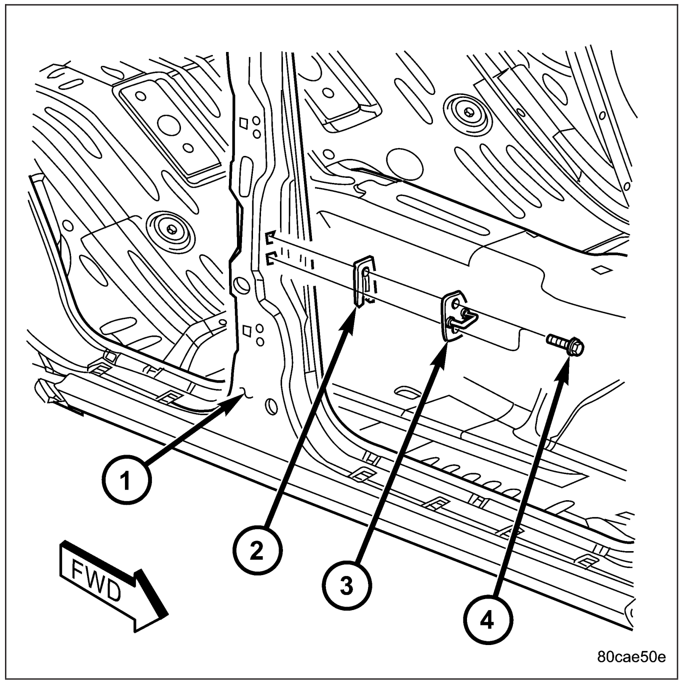
8. Reconnect the battery ground cable (1).



# LATCH STRIKER

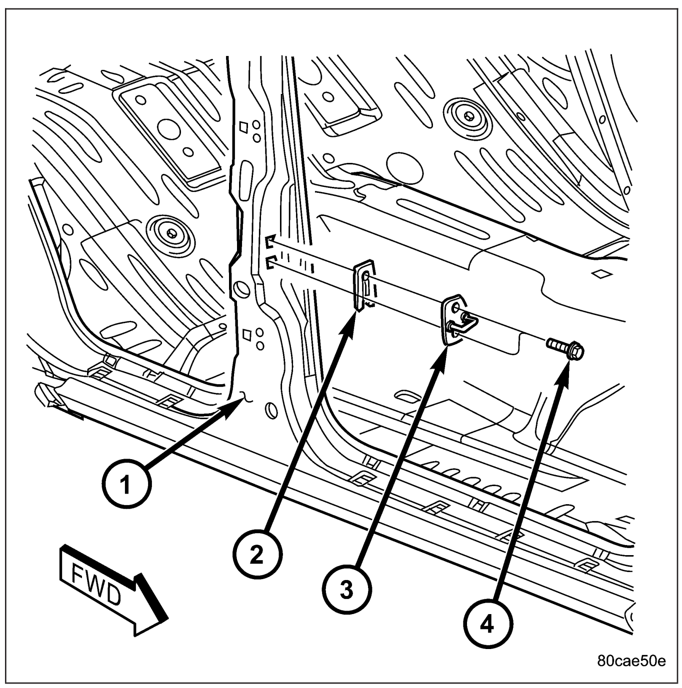
## REMOVAL

1. Remove the bolts (4).
2. Remove the latch striker (3) and the spacer (2), if equipped.



## INSTALLATION

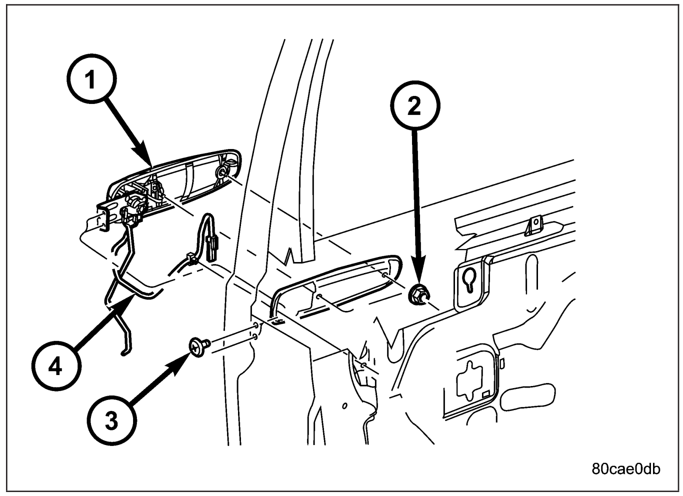
1. Install the striker (3) and spacer (2), if equipped.
2. Install the bolts (4) and tighten to 28 N·m (21 ft. lbs.).
3. Adjust the door as necessary. (Refer to 23 - BODY/ BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)



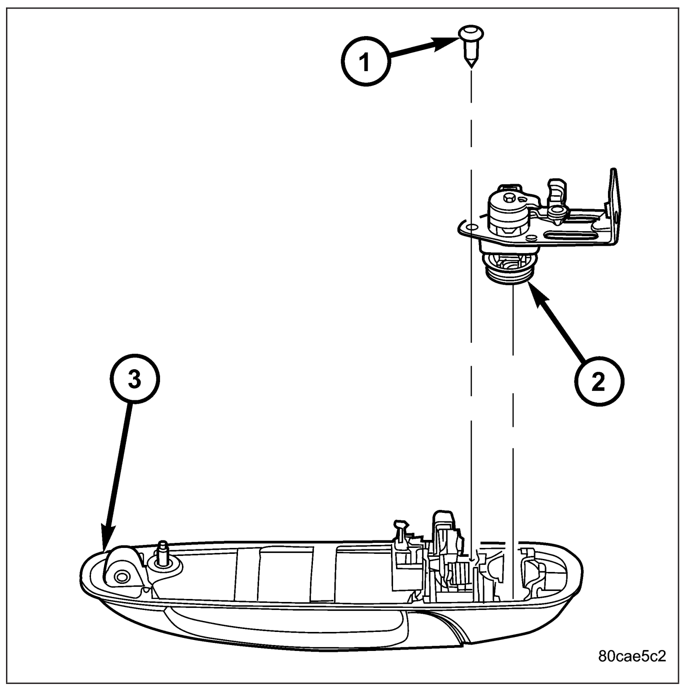
# LOCK CYLINDER

## REMOVAL

1. Remove the exterior handle (1). (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL)

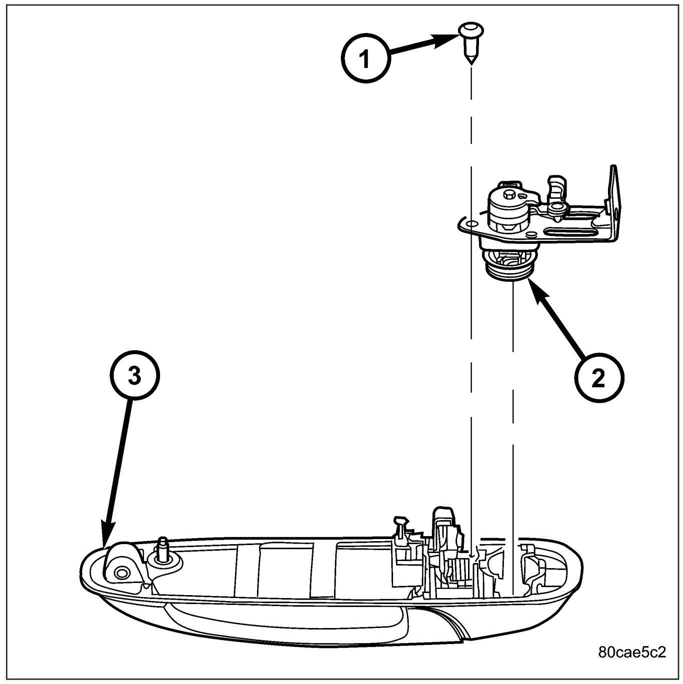


2. Remove the screw (1) and remove the lock cylinder (2).

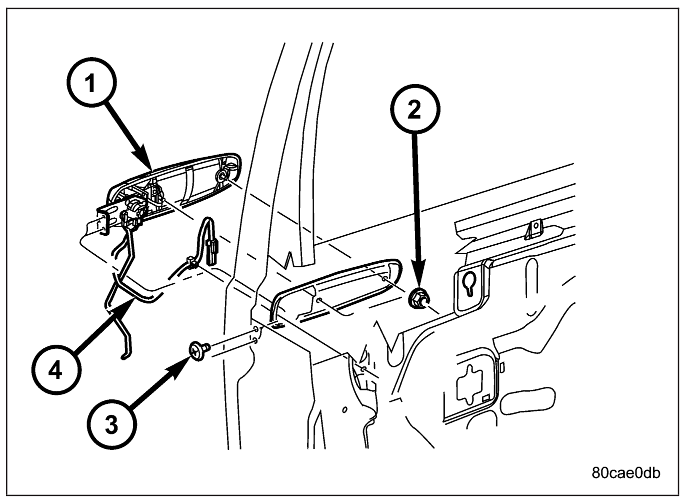


## INSTALLATION

1. Install the lock cylinder (2), the retaining screw (1) and tighten to 6 N·m (55 in. lbs.).



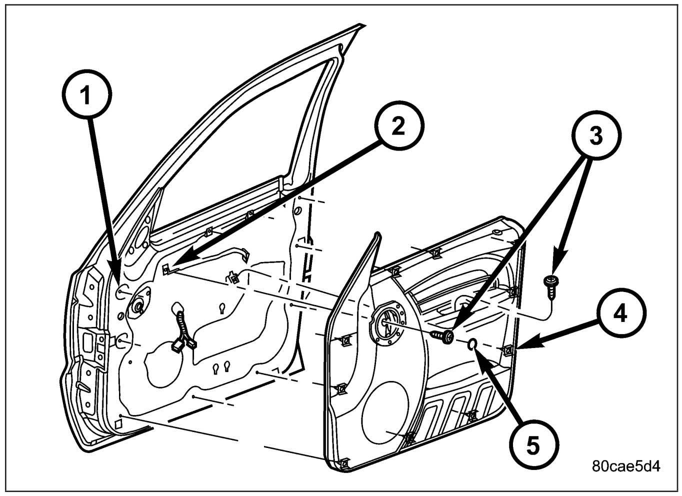
2. Install the exterior handle (1). (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION)



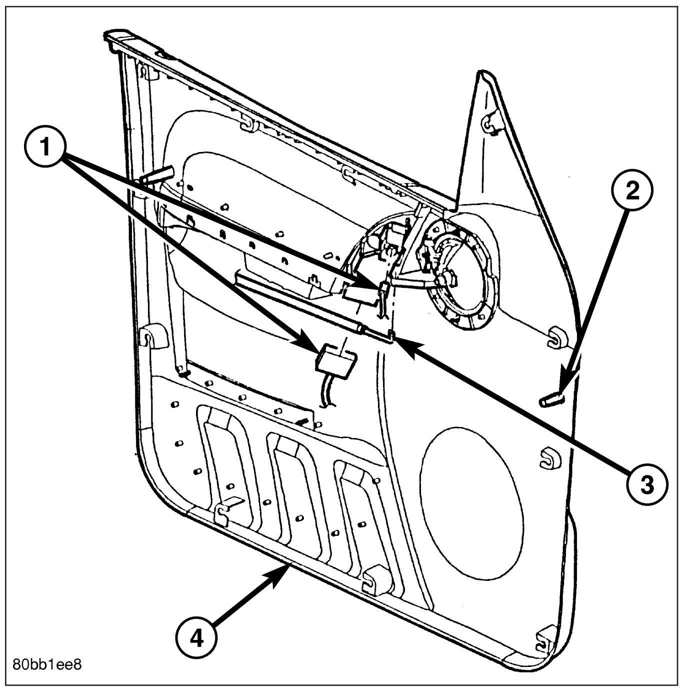
# TRIM PANEL

## REMOVAL

1. Remove the inside handle screw plug (5) and remove the screw (3).
2. Remove the pull handle screw (3).
3. Using a trim stick C-4755 or equivalent, disengage the trim panel clips (4) and remove the trim panel.

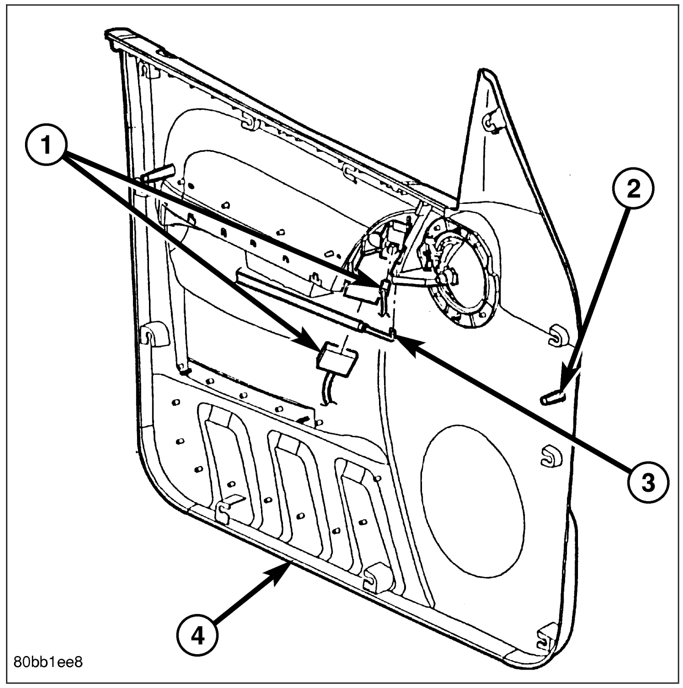


4. Disconnect the electrical connectors (1) and the inside handle actuator rod (3).

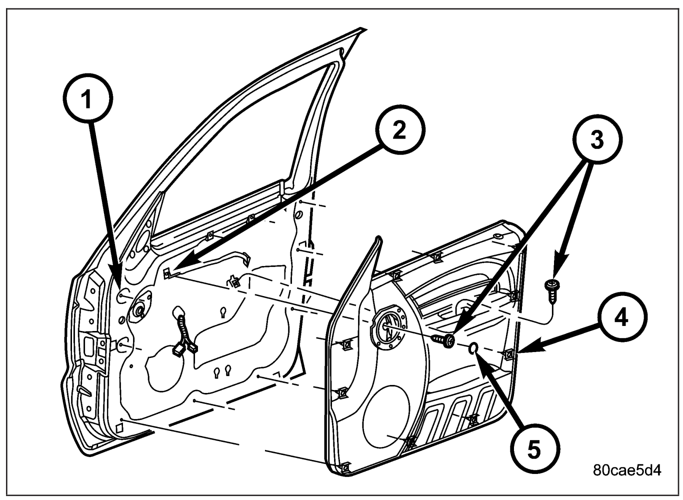


## INSTALLATION

1. Connect the inside handle actuator rod (3) and the electrical connectors (1).



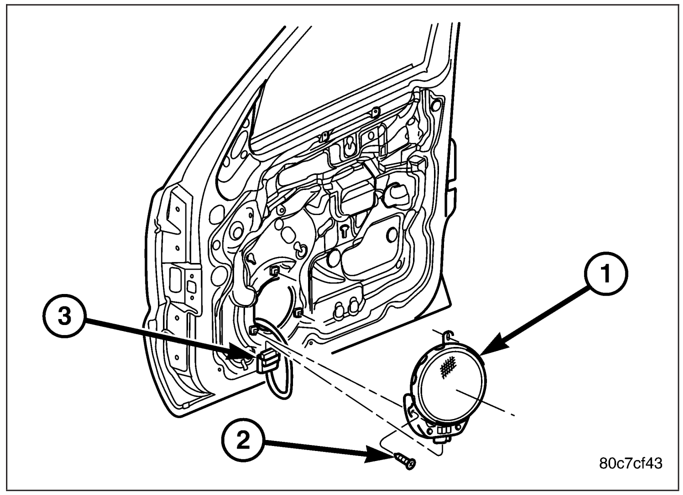
2. Position the trim panel and seat the clips (4) fully.
3. Instal the screws (3) and install the screw plug (5).



# WATERDAM

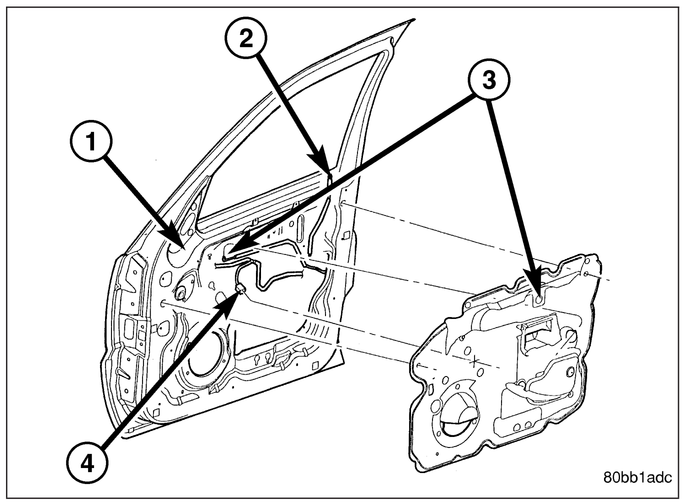
## REMOVAL

1. Remove the door speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)



**CAUTION: Do not allow the waterdam or adhesive to become contaminated with dirt or other foreign substances.**
**Do not damage the waterdam during removal and installation.**
**If the waterdam becomes contaminated or damaged, replace the waterdam.**

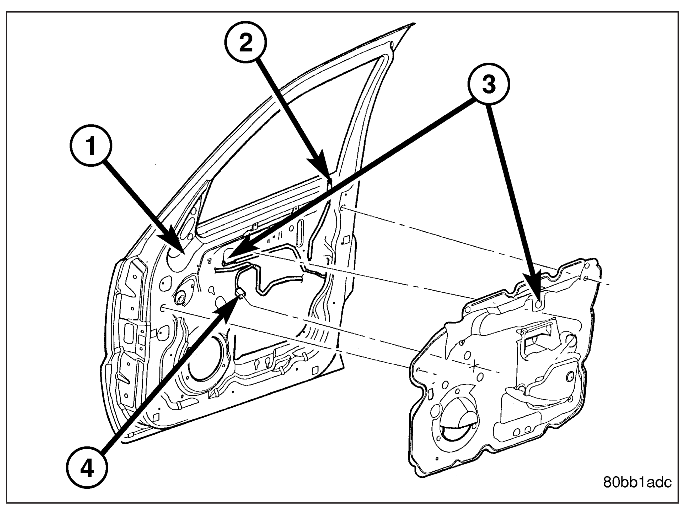
2. Separate the waterdam from the inner door panel and off of the latch linkages.



## INSTALLATION

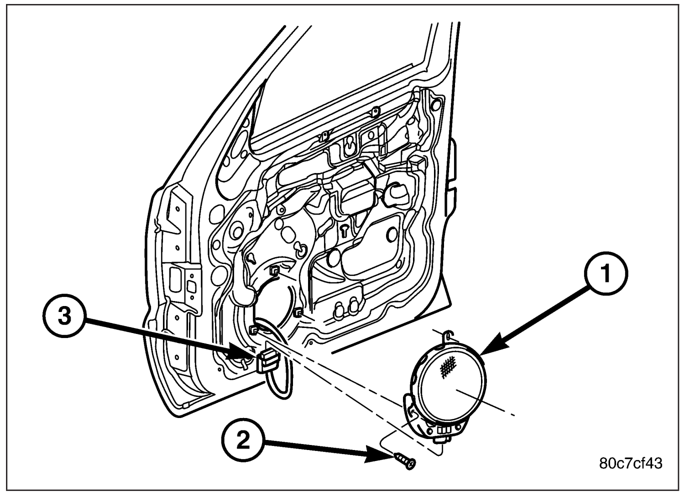
**CAUTION: Do not allow the waterdam or adhesive to become contaminated with dirt or other foreign substances.**
**Do not damage the waterdam during removal and installation.**
**If the waterdam becomes contaminated or damaged, replace the waterdam.**

1. Position the wire harness and actuator rods through the holes in the waterdam.
2. Place waterdam onto the door and pressurize at the butyl bead to seal completely, starting with the top rear locating indent and then moving to the top front locating indent followed by the remaining portion of the waterdam.



3. Run a hard plastic squeegee firmly around the perimeter of the waterdam making sure that the drain holes at the bottom of the inner door panel are fully covered by the waterdam.

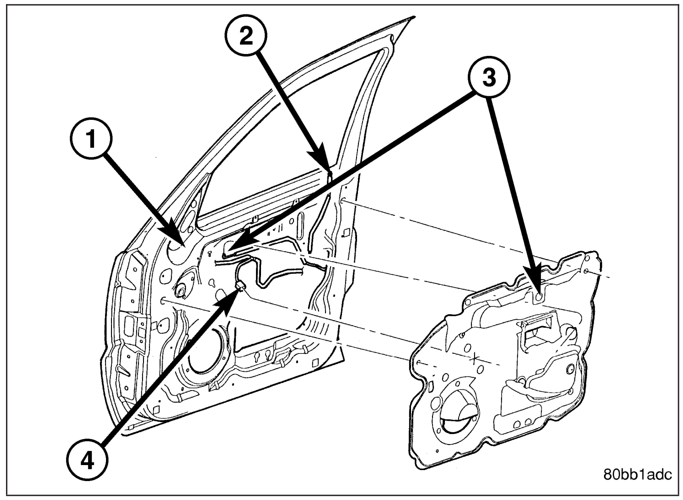
4. Install the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)



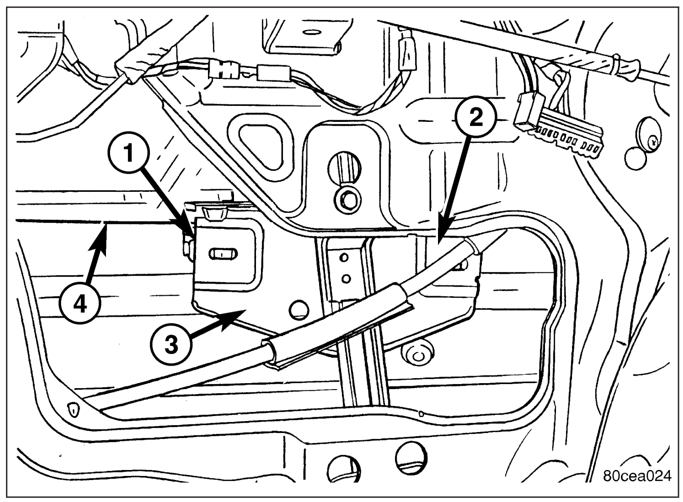
# WINDOW REGULATOR - MANUAL

## REMOVAL

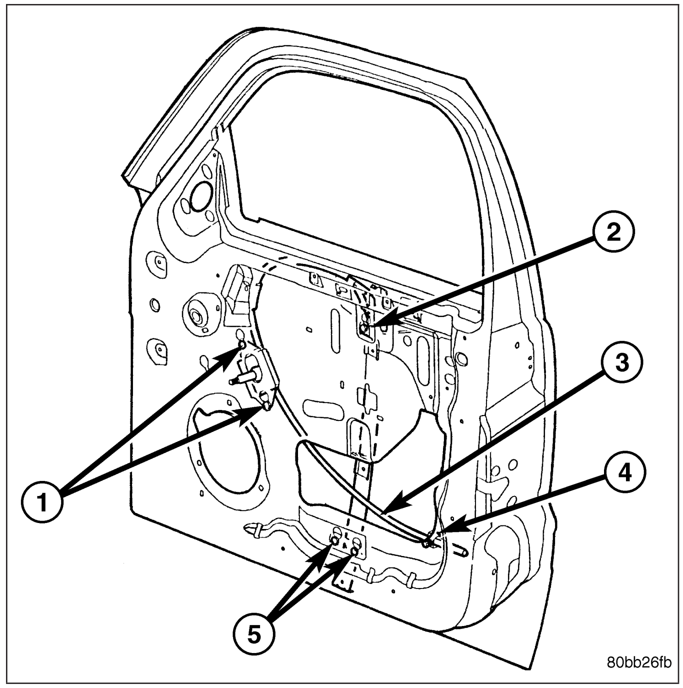
1. Remove the waterdam. (Refer to 23 - BODY/ DOOR - FRONT/WATERDAM - REMOVAL)



2. Raise the glass (4) to the position shown and using a long flat blade or hook type tool, disengage clips (1) attaching glass retainer to regulator lift plate (3).
3. Disconnect the glass from the regulator lift plate (3) and re-install the clips (1).
4. Secure the glass (4) in the up position using a wood wedge, tape or equivalent.

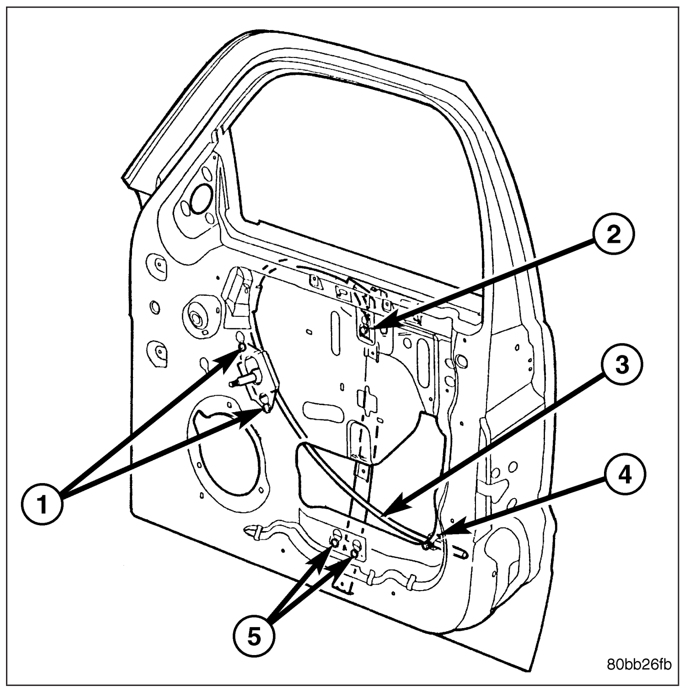


5. Loosen the bolts. (1, 2 and 5)
6. Disconnect the runout tube clip (4) and remove the regulator (3).

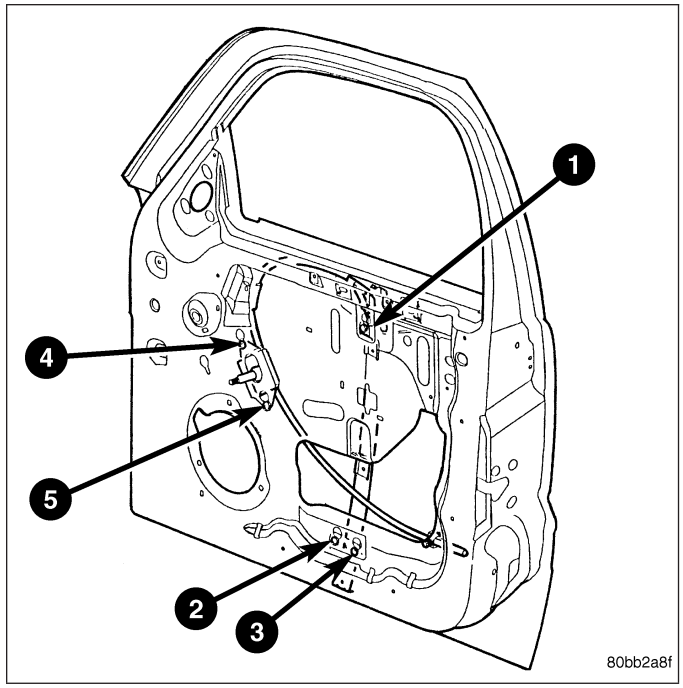


## INSTALLATION

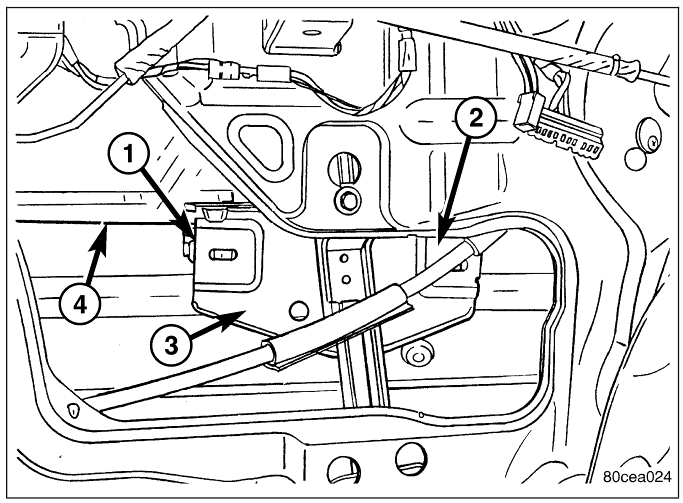
1. Install the regulator assembly (3).



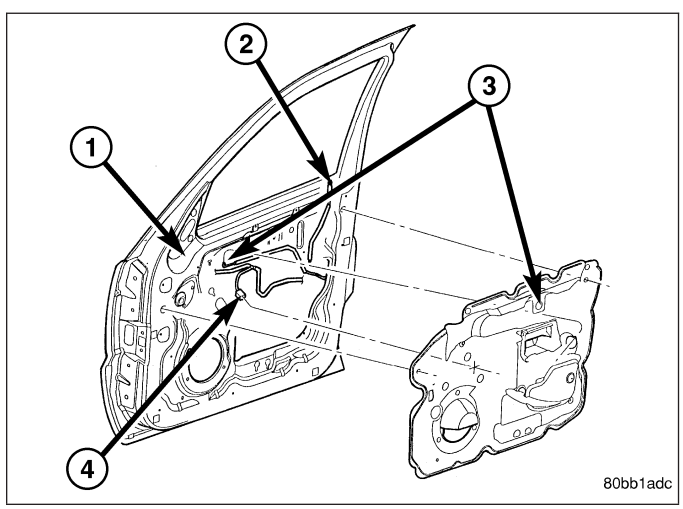
2. Tighten the bolts to 9 N·m (80 in. lbs.) using the sequence shown.



3. Remove the glass support and connect to the regulator lift plate (3).



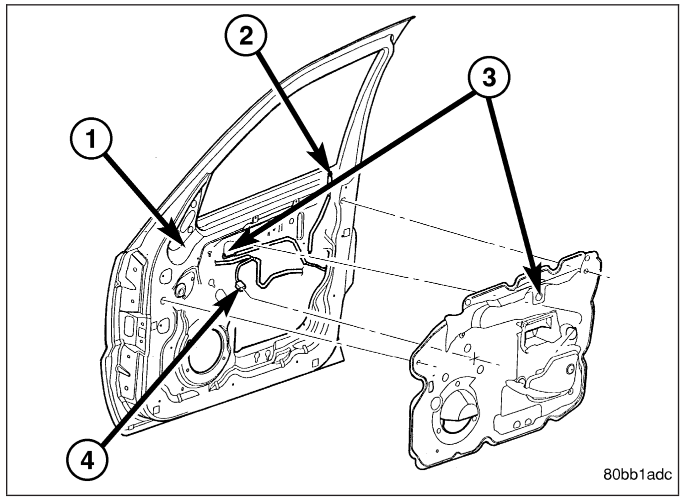
4. Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)



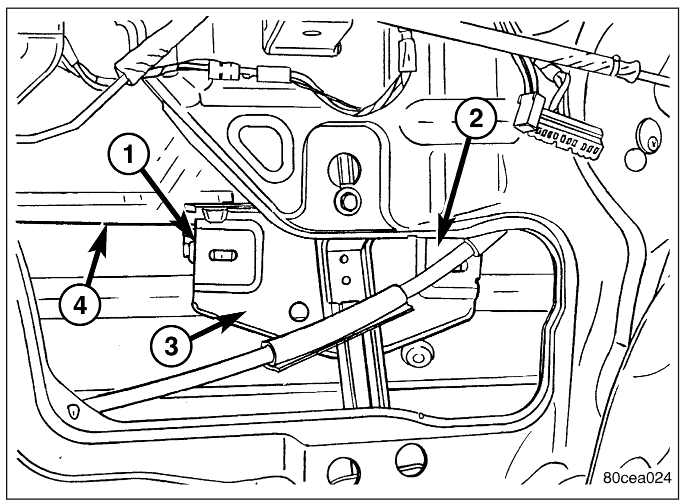
# WINDOW REGULATOR - POWER

## REMOVAL

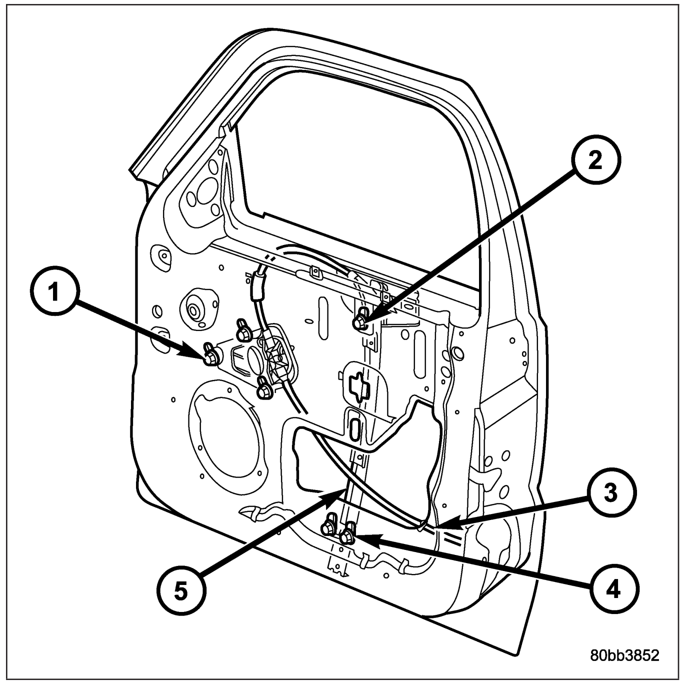
1. Remove the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL)



2. Raise the glass (4) to the position shown and using a long flat blade or hook type tool, disengage clips (1) attaching glass retainer to regulator lift plate (3).
3. Disconnect the glass (4) from the regulator lift plate and re-install the clips (1).
4. Secure the glass in the up position using a wood wedge, tape or equivalent.

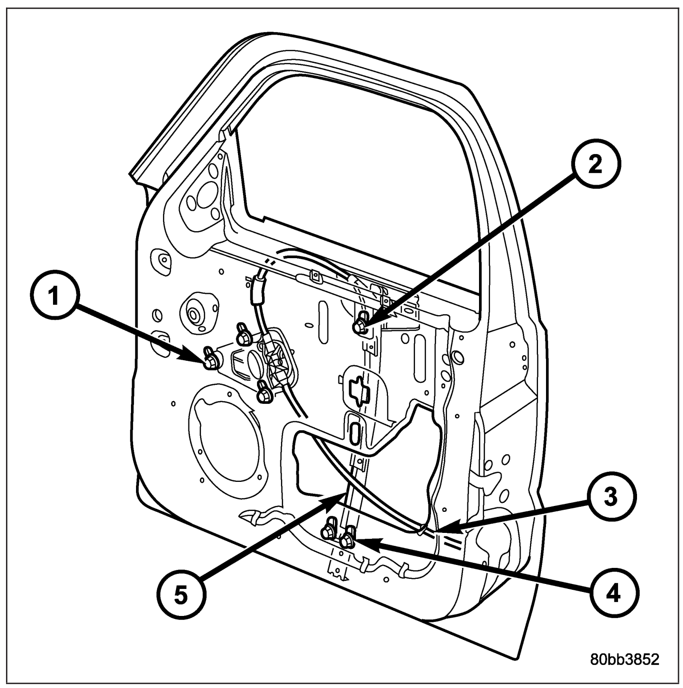


5. Loosen the bolts (1, 2 and 4).
6. Disconnect the runout tube clip (3).
7. Disconnect the electrical connector and remove the regulator (5).

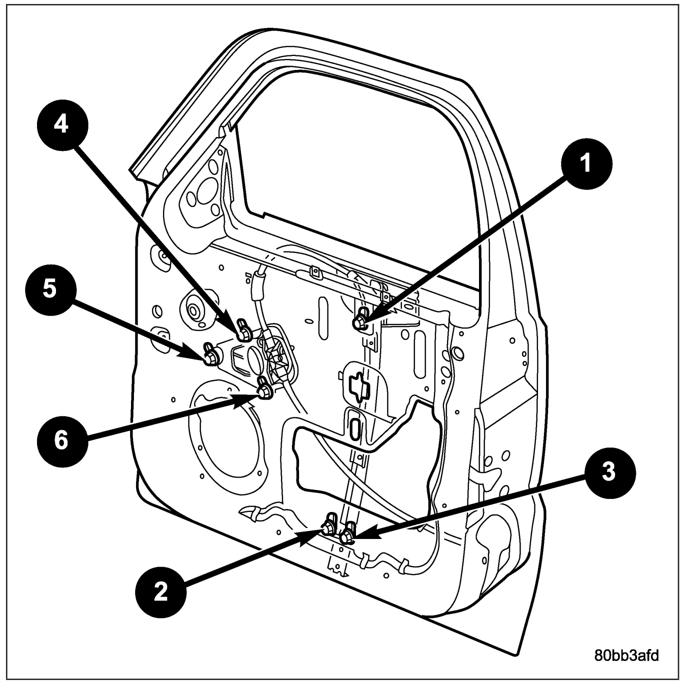


## INSTALLATION

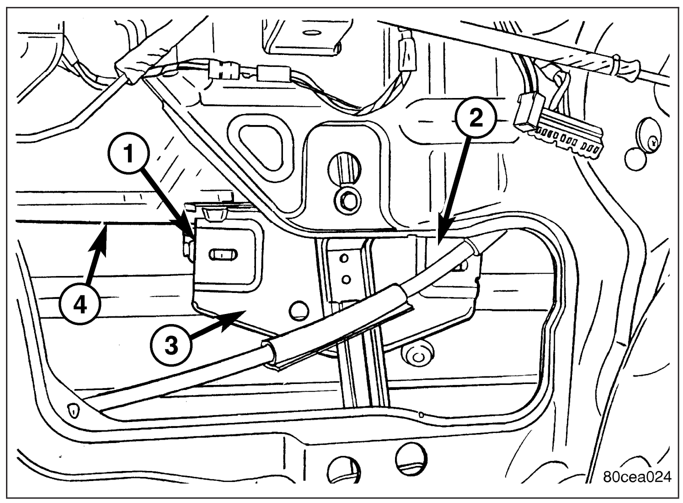
1. Install the regulator assembly (5).
2. Connect the electrical connector.
3. Connect the runout tube clip (3).



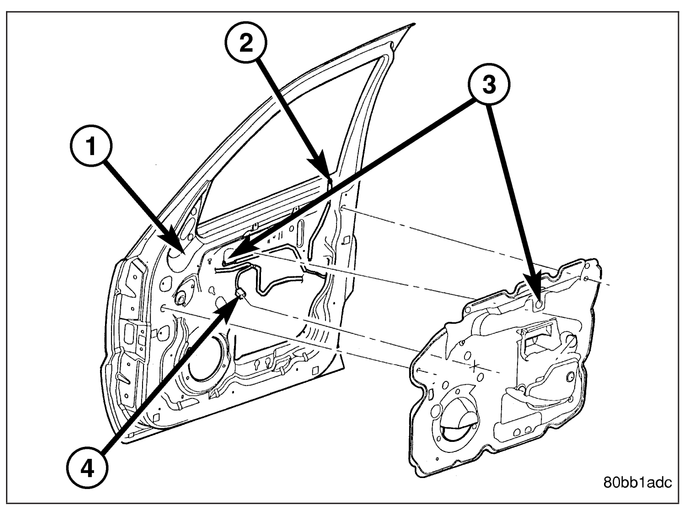
4. Tighten the bolts to 9 N·m (80 in. lbs.) using the sequence shown.



5. Remove the glass support and connect to the regulator lift plate (3).



6. Install the waterdam. (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION)



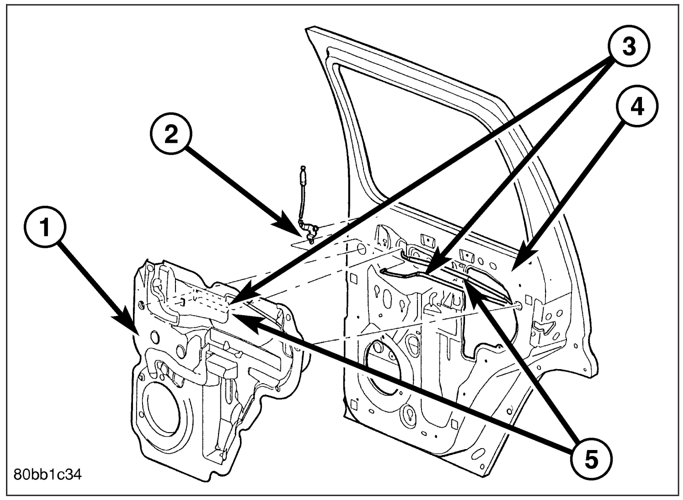
# DOORS - REAR

## TABLE OF CONTENTS

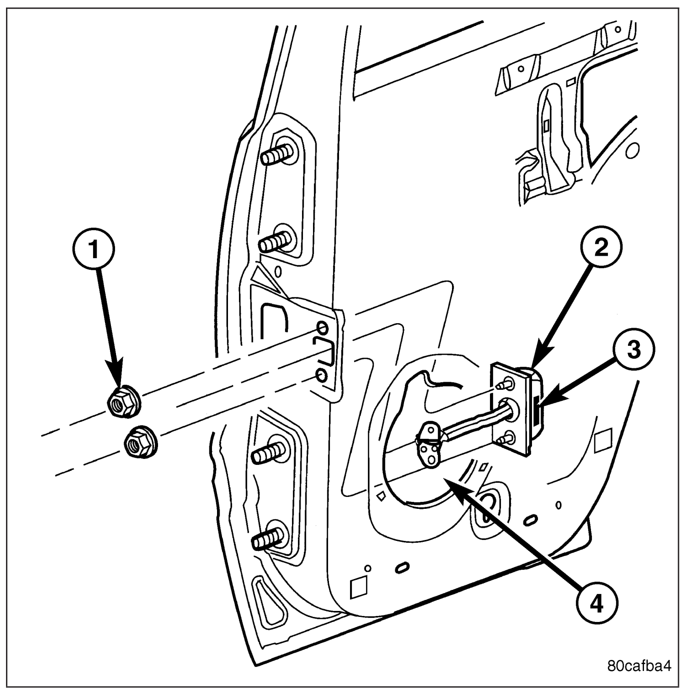
# CHECK STRAP

## REMOVAL

1. Remove the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - REMOVAL)

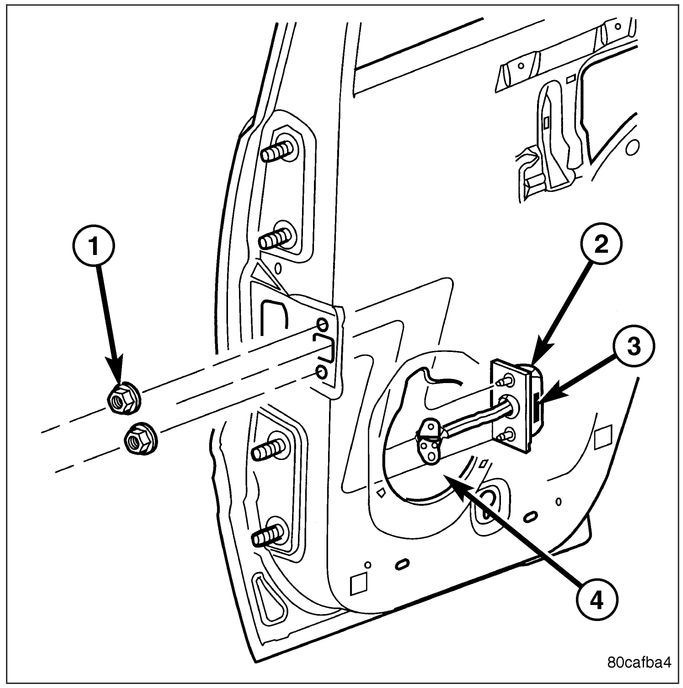


2. Remove screws attaching door check to B-pillar.
3. Remove the two nuts (1) and remove the door check strap (2).

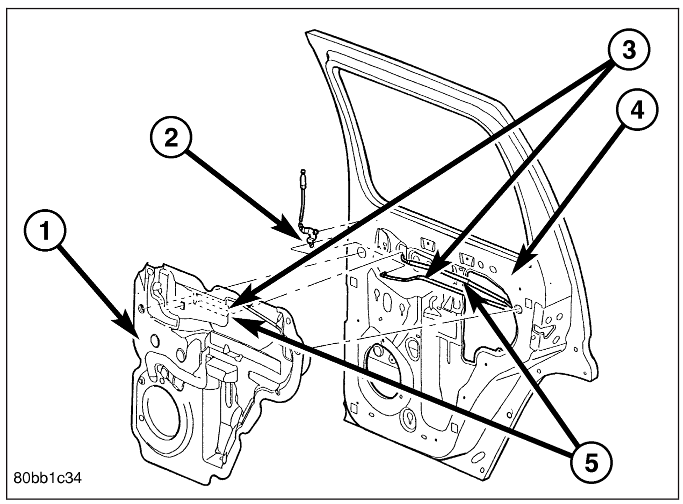


## INSTALLATION

**NOTE: Make sure the proper orientation of the check strap is maintained using the part number printed on the side. The part number should face inboard toward the interior of the vehicle.**



1. Install the check strap (2) through the speaker hole (4).
2. Install the nuts (1) and tighten to 12 N·m (9 ft. lbs.).
3. Connect the strap to the B-pillar and tighten the bolts to 12 N·m (9 ft. lbs.).

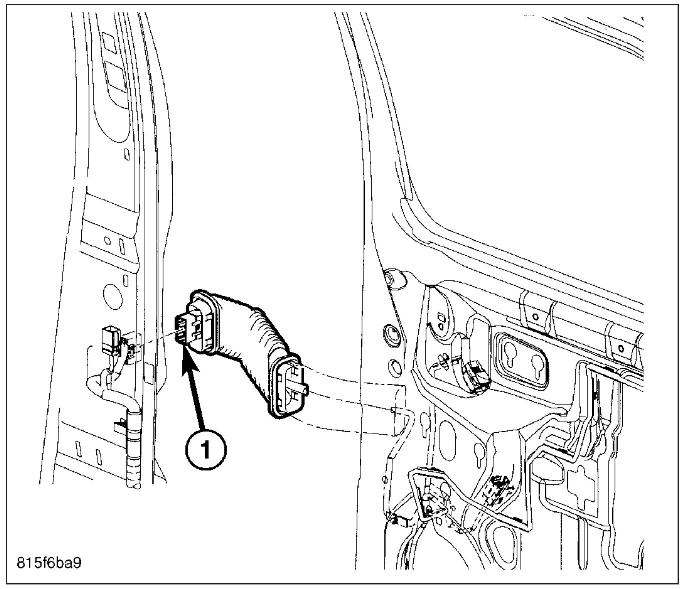


4. Install the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - INSTALLATION)

# DOOR

## REMOVAL

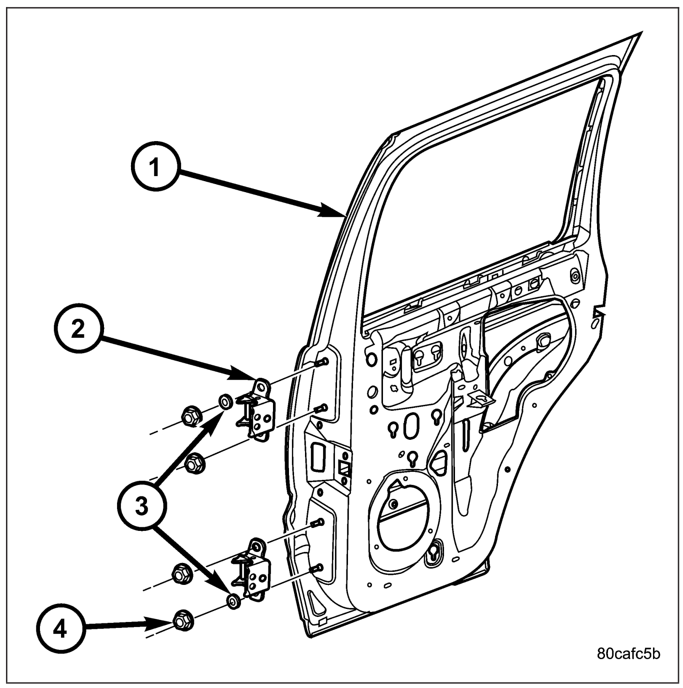
1. Disconnect the door wire harness electrical connector (1) at the B-pillar.
2. Disconnect the check strap from the B-pillar. (Refer to 23 - BODY/DOORS - REAR/CHECK STRAP - REMOVAL)



3. Support the door with a suitable lifting device.

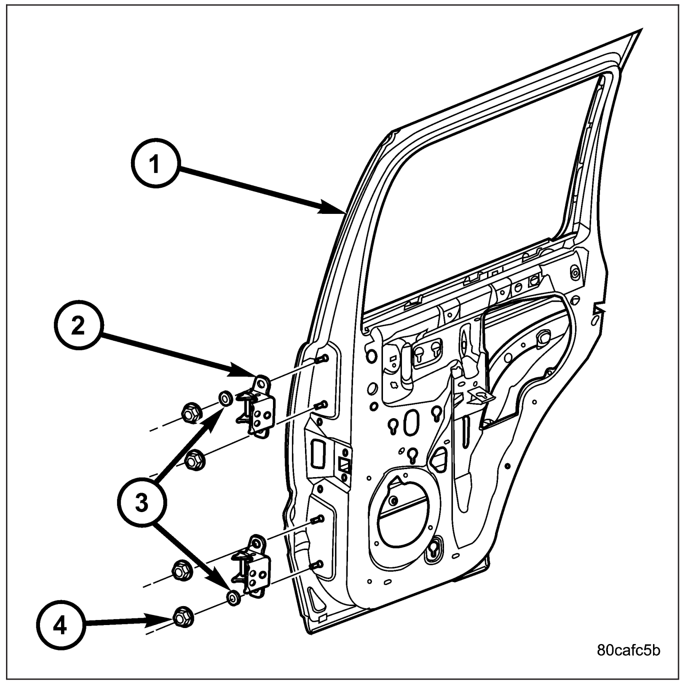
**NOTE: The epoxy washers (3) should not be removed from the hinge. If the washers are removed the door may have to be re-adjusted.**

4. Remove the nuts (4) attaching the door hinges to the door (1).

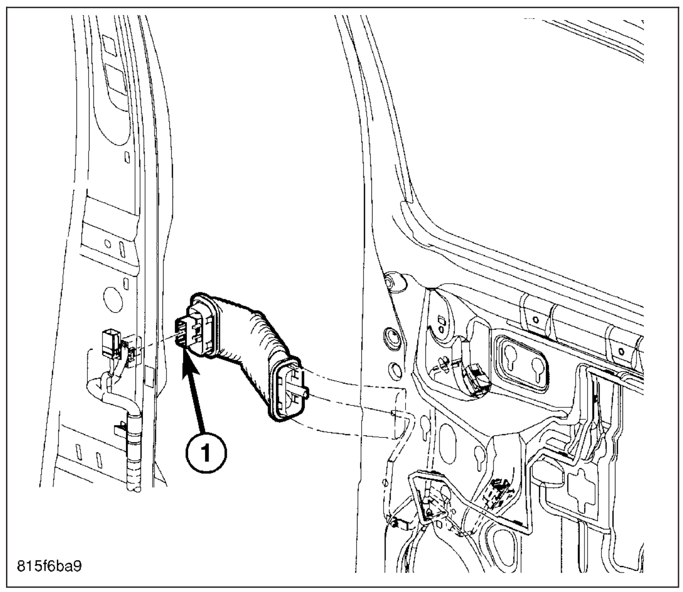


## INSTALLATION

1. Support the door with a suitable lifting device and install the door onto the B-pillar.
2. Install the nuts (4), washers (3) and tighten to 23 N·m (17 ft. lbs.).



3. Connect the door wire harness electrical connector (1).
4. Connect the check strap to the B-pillar. (Refer to 23 - BODY/DOORS - REAR/CHECK STRAP - INSTALLATION)
5. Adjust the door as necessary. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)



## ADJUSTMENTS

**NOTE: For vehicles equipped with four doors, it is recommended that you adjust the rear door before adjusting the front door.**

- **Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.**
- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper fasteners to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**

## FORE/AFT

**NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.**

1. Support the door with a suitable lifting device.
2. Loosen the hinge to hinge pillar fasteners. (Refer to 23 - BODY/DOORS - REAR/HINGE - REMOVAL)
3. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the hinge pillar fasteners to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)

**NOTE: Use a suitable body sealer on the hinge to body mating surfaces.**

## UP/DOWN

**NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.**

**NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.**

**NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)**

1. Support the door with a suitable lifting device.
2. Remove the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - REMOVAL)
3. Loosen the hinge to hinge pillar fasteners (Refer to 23 - BODY/DOORS - REAR/HINGE - REMOVAL) or loosen the hinge to door fasteners (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL).
4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the hinge pillar fasteners or the door to hinges fasteners and fasteners to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)
6. Install the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - INSTALLATION)

## IN/OUT

**NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.**

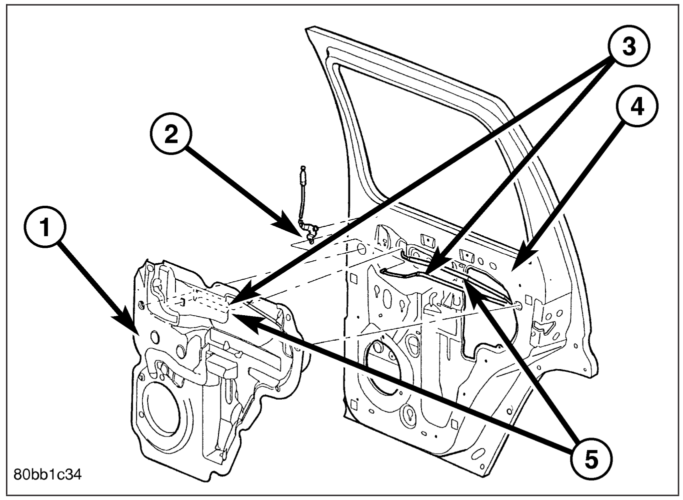
**NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.**

1. Support the door with a suitable lifting device.
2. Remove the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - REMOVAL)
3. Loosen the hinge to door fasteners. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
4. Adjust the front of the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the door to hinges fasteners to 28 N·m (21 ft. lbs.).
6. Install the latch striker. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - INSTALLATION)

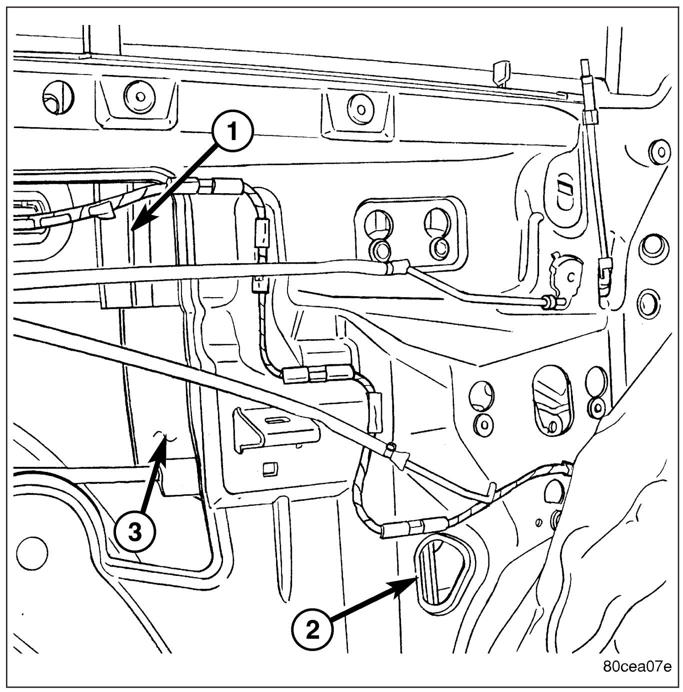
# DOOR GLASS

## REMOVAL

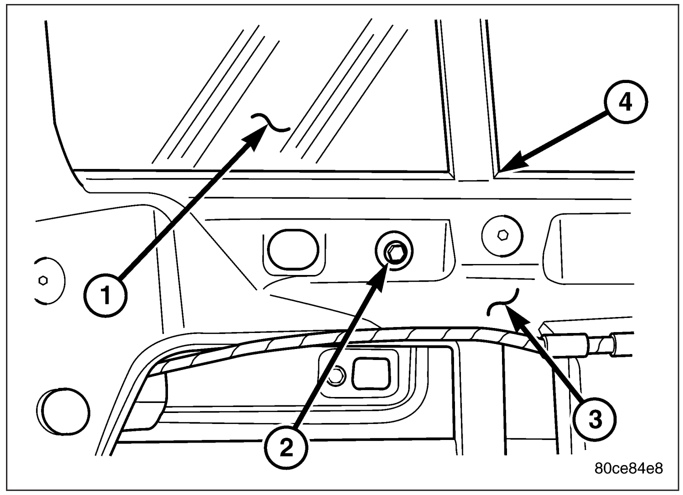
1. Remove the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - REMOVAL)



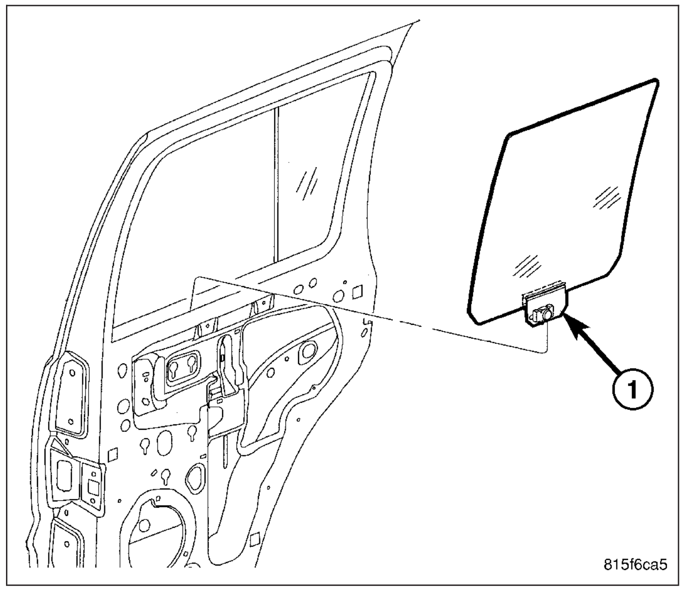
2. Raise the glass (3) and line up the lift plate clip with the hole in the door panel shown (2).
3. Using a long flat blade or hook type tool, disengage the clip attaching glass retainer to regulator lift plate.
4. Disconnect the glass from the regulator lift plate and re-install the clip.
5. Position the glass into the bottom of the door.



6. Remove the glass division bar bolt (2).
7. Twist the division bar towards the inside of the door and disengage the door glass.

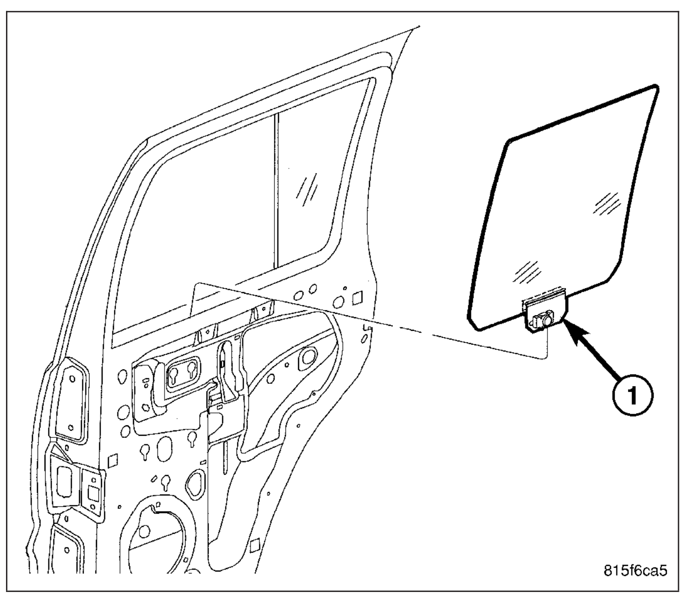


8. Remove the glass from the window opening.

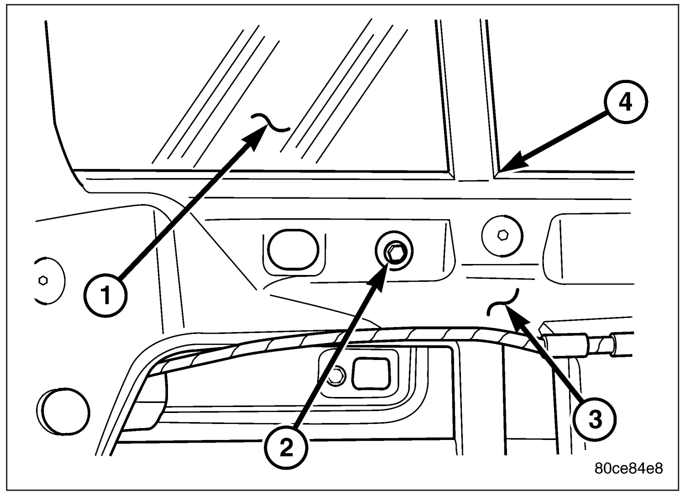


## INSTALLATION

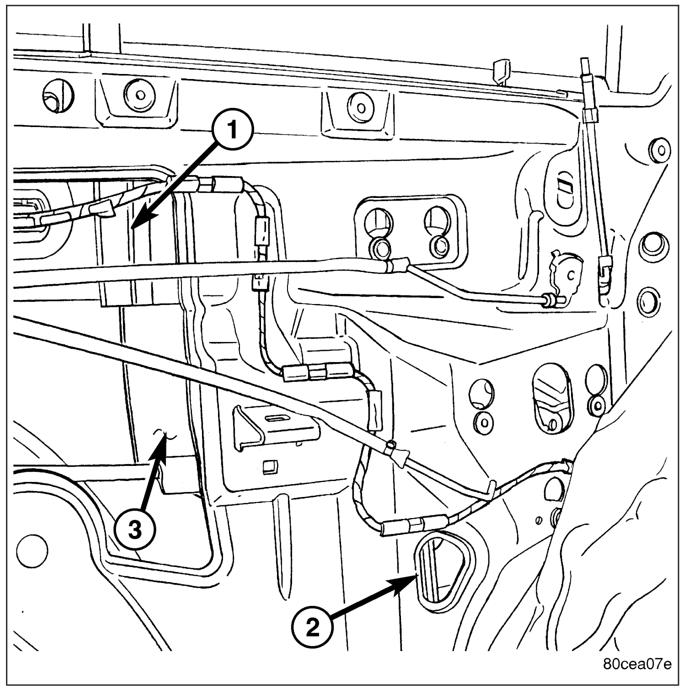
1. Install the glass (1) through the window opening.



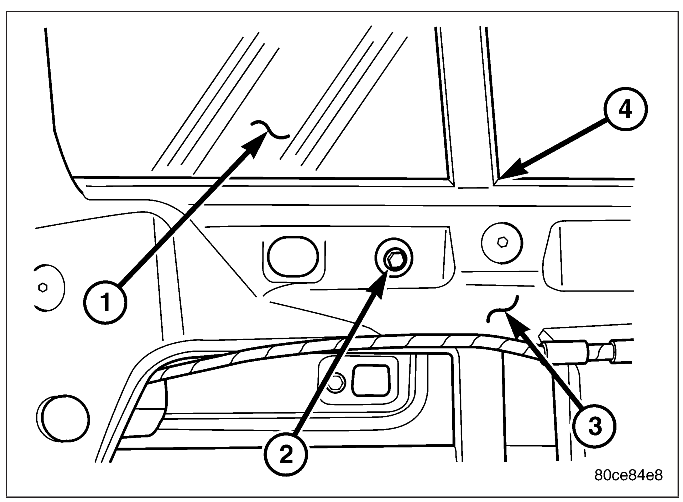
2. Position the front of the glass into the glass run channel and as low as possible in the door.
3. Twist the glass division bar (4) towards the inside of the door and position the door glass into the rear run channel.
4. Seat the division bar firmly up and into the fixed door glass (1), making sure the seal is well engaged into the door frame with no gap inside the car and no folded lip on the C-pillar.



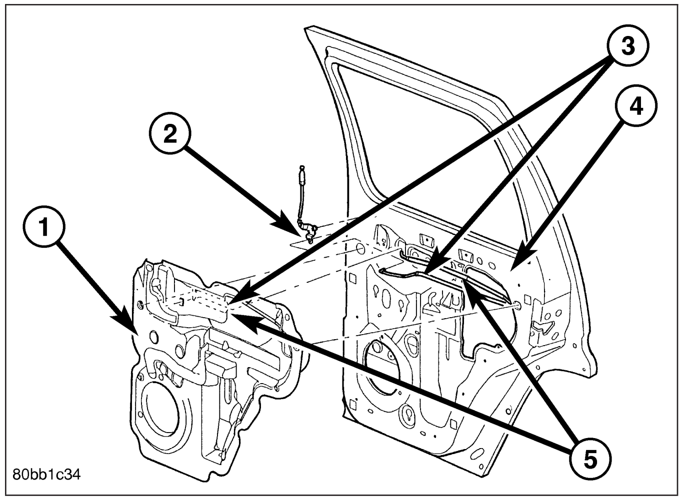
5. Lift glass up in the window and engage the pin into the regulator lift plate (2).



6. Raise the glass into the closed position and install the division bar bolt (2).
7. Tighten the bolt to 9 N·m (80 in. lbs.).



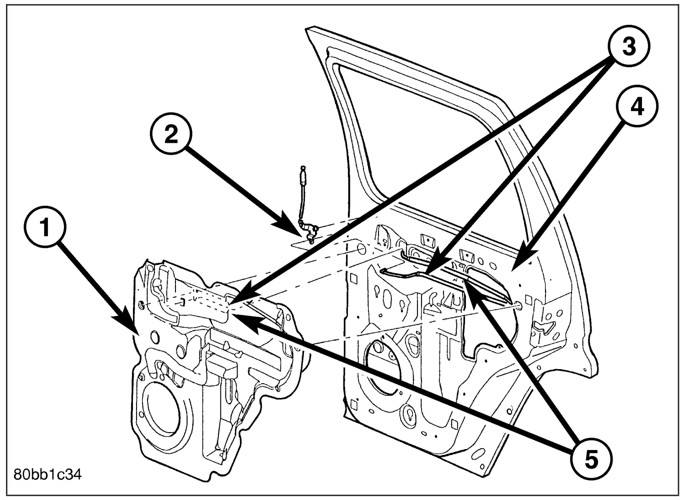
8. Install the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - INSTALLATION)



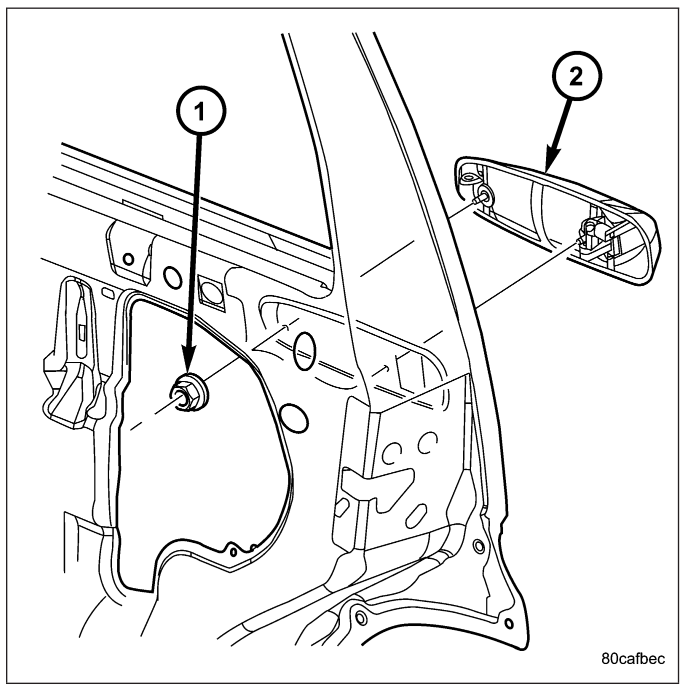
# EXTERIOR HANDLE

## REMOVAL

1. Remove the waterdam as necessary to gain access to the handle. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL)

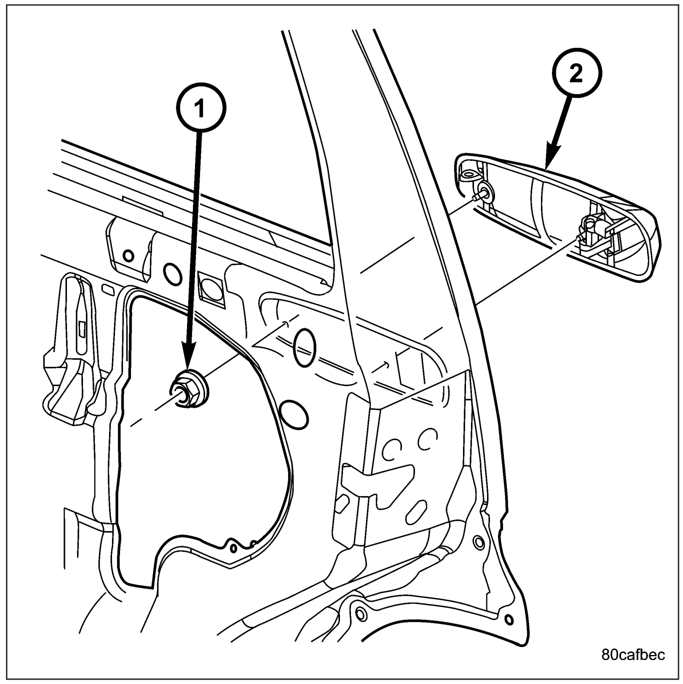


2. Disconnect the handle rod at the handle.
3. Remove the nuts (1) and remove the handle (2).

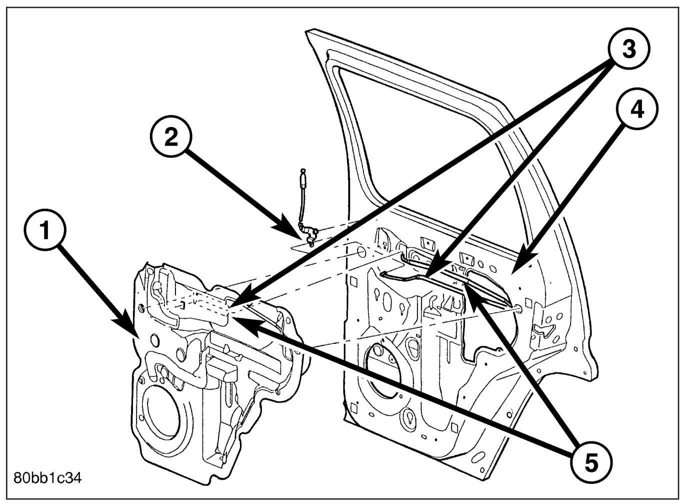


## INSTALLATION

1. Install the handle (2).
2. Install the nuts (1) and tighten to 6 N·m (55 in. lbs.).
3. Connect the handle rod at the handle.



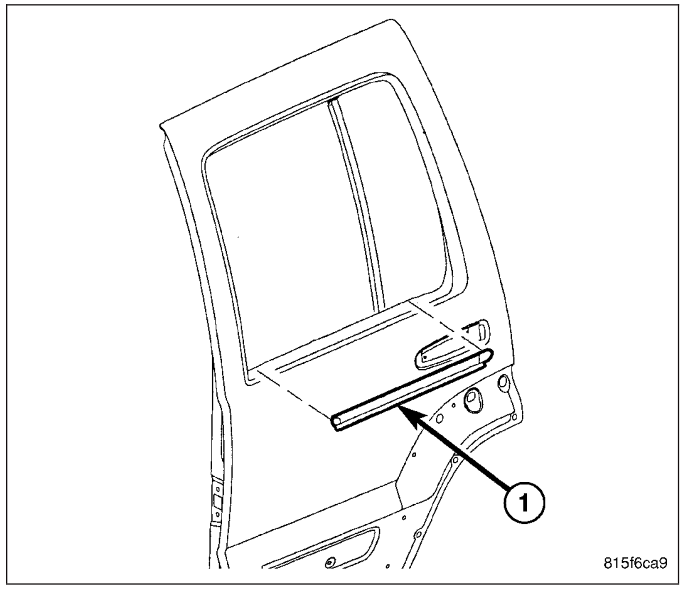
4. Install the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - INSTALLATION)



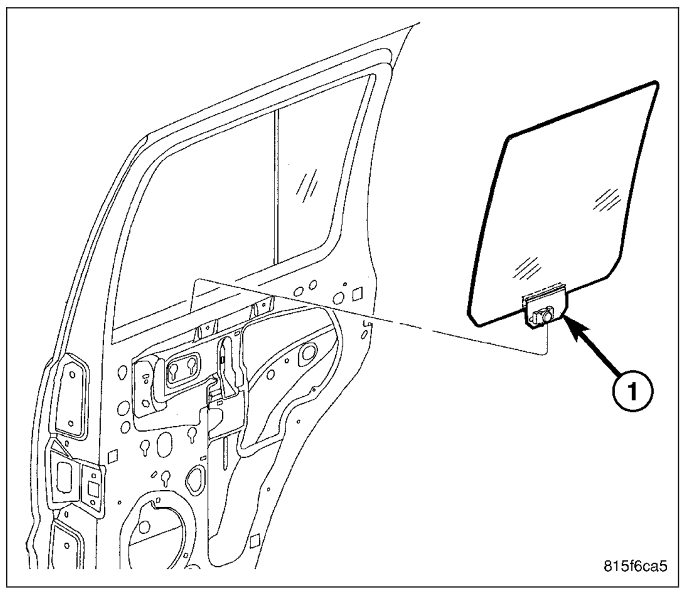
# GLASS RUN CHANNEL

## REMOVAL

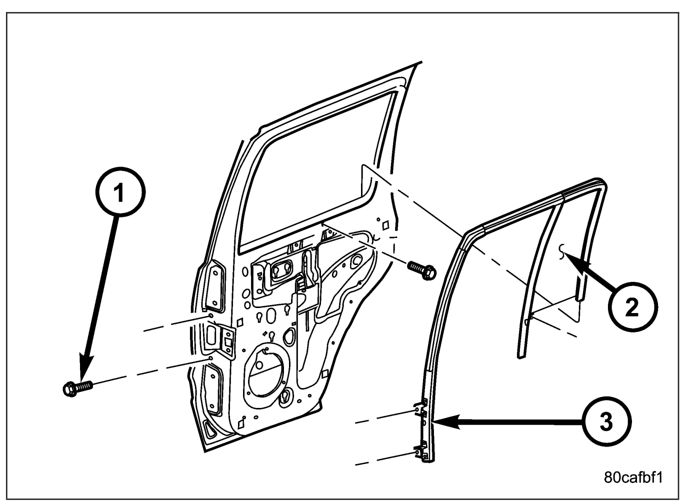
1. Remove the outer belt molding (1). (Refer to 23 - BODY/WEATHERSTRIP/SEALS/REAR DOOR OUTER BELT MOLDING - REMOVAL)



2. Remove the door glass (1). (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - REMOVAL)

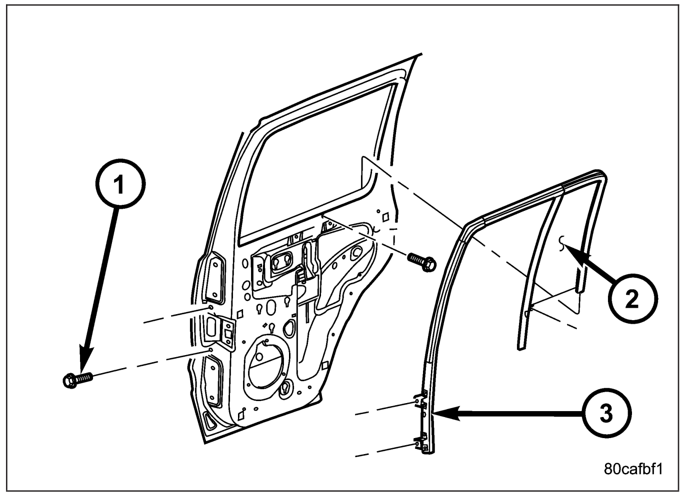


3. Remove the front (1) and rear bolts.
4. Peal the weatherstrip and quarter glass out of the door frame and remove the run channel through the window opening as an assembly.

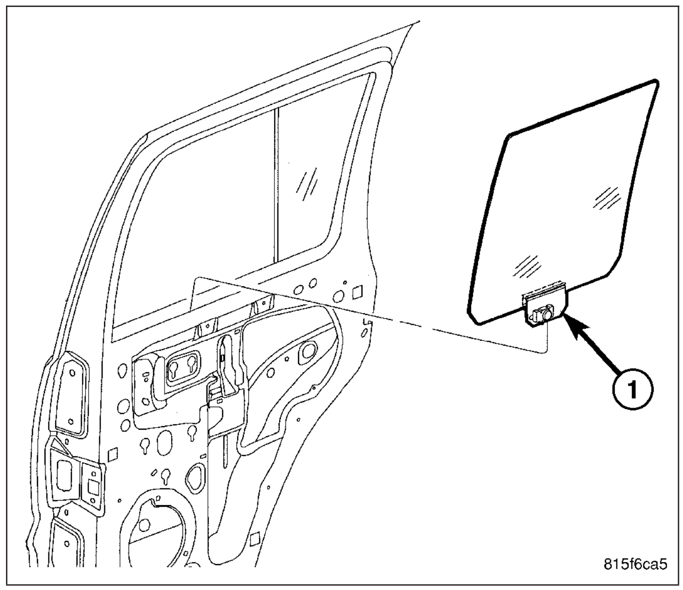


## INSTALLATION

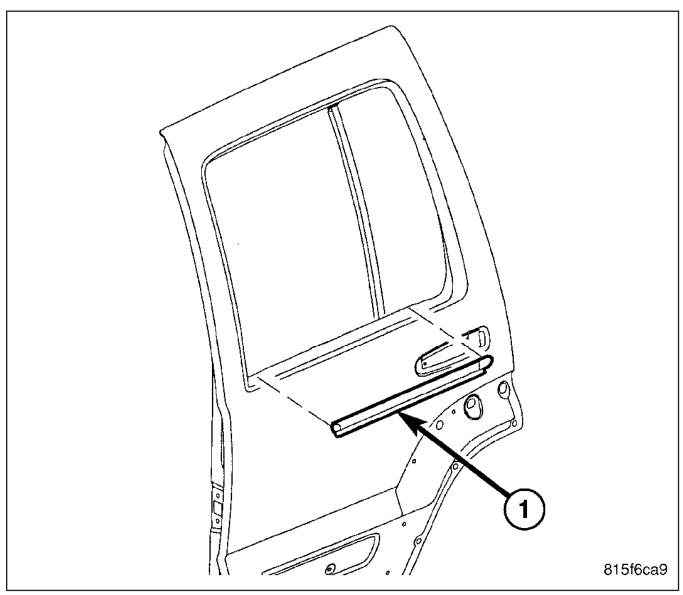
1. Install the run channel and quarter glass assembly through the window opening and into the door frame.
2. Install the front (1), rear bolts and tighten to 9 N·m (80 in. lbs.).



3. Install the door glass (1). (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION)



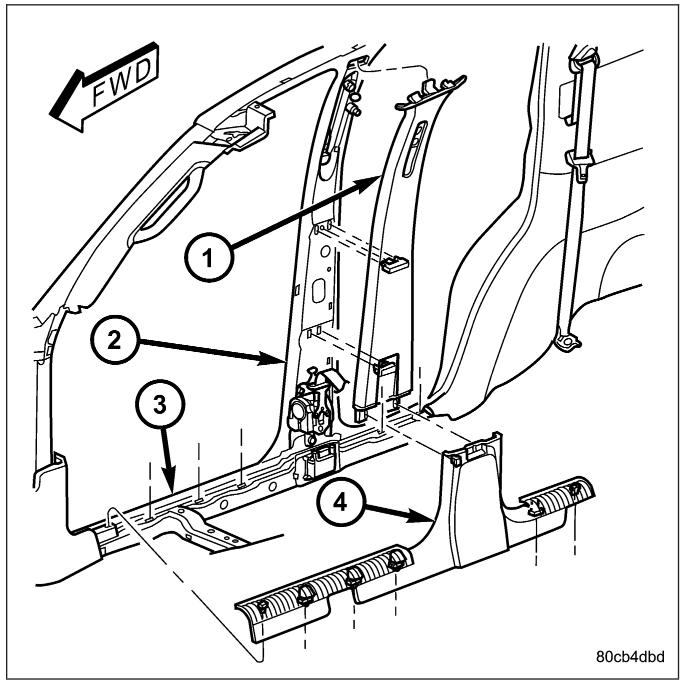
4. Install the outer belt molding (1). (Refer to 23 - BODY/WEATHERSTRIP/SEALS/REAR DOOR OUTER BELT MOLDING - INSTALLATION)



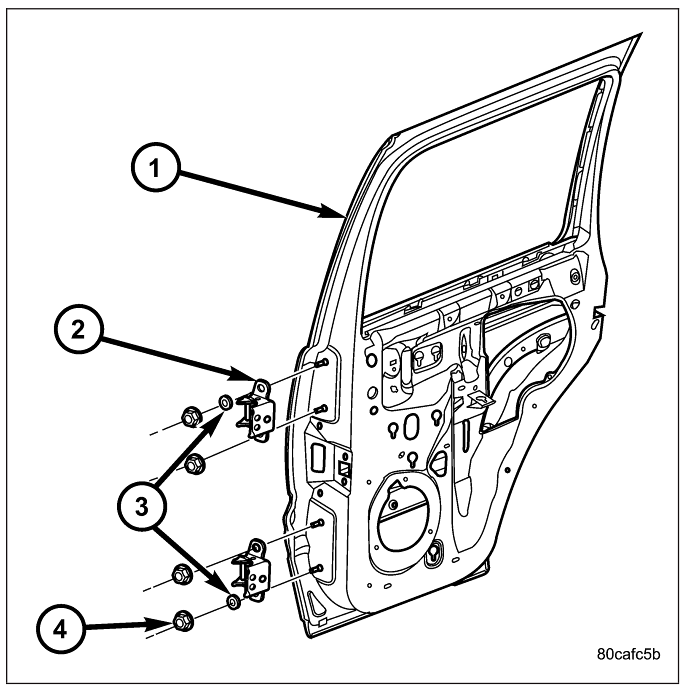
# HINGE

## REMOVAL

1. Remove the upper B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL)

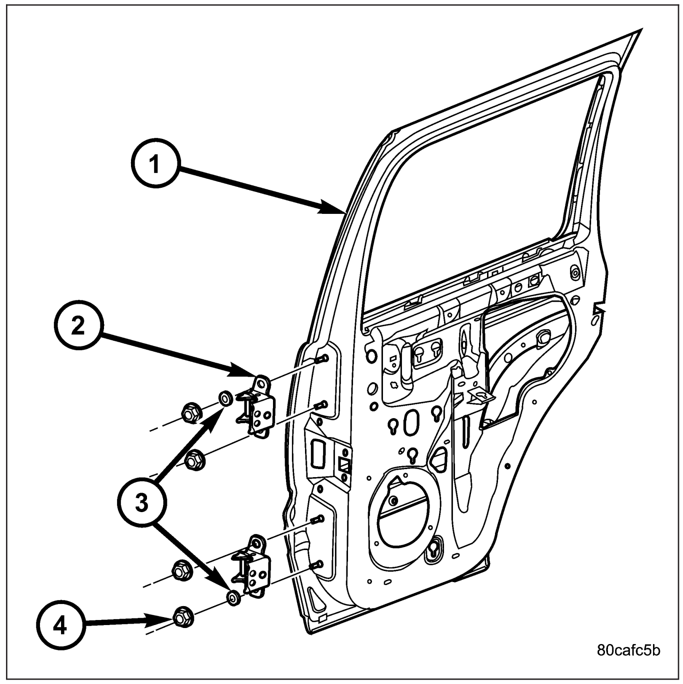


2. Remove the door. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
3. Remove the two door hinge bolts from the inside of the B-pillar.
4. Remove the exterior bolts attaching the door hinges to the B-pillar.

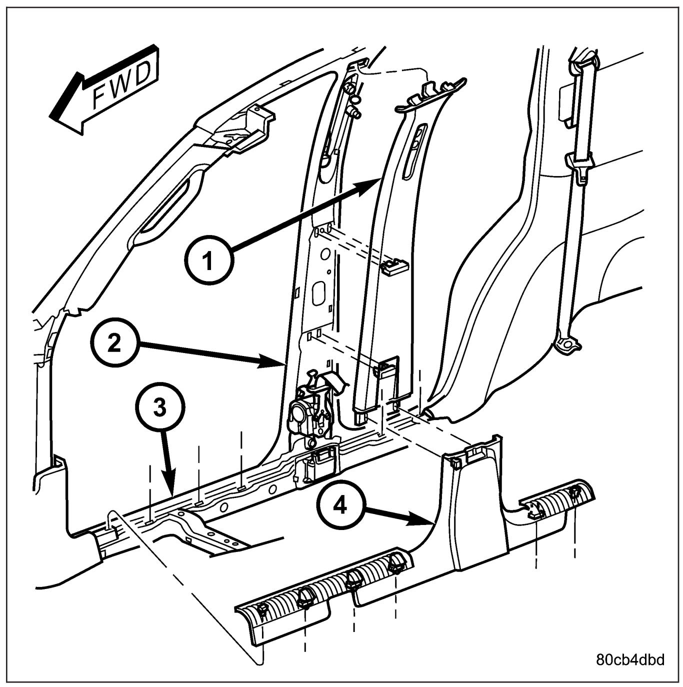


## INSTALLATION

1. Install the hinges.
2. Install the exterior bolts and tighten to 28 N·m (21 ft. lbs.).
3. Install the two inner hinge bolts and tighten to 28 N·m (21 ft. lbs.).
4. Install the door (1). (Refer to 23 - BODY/DOORS - REAR/DOOR - INSTALLATION)



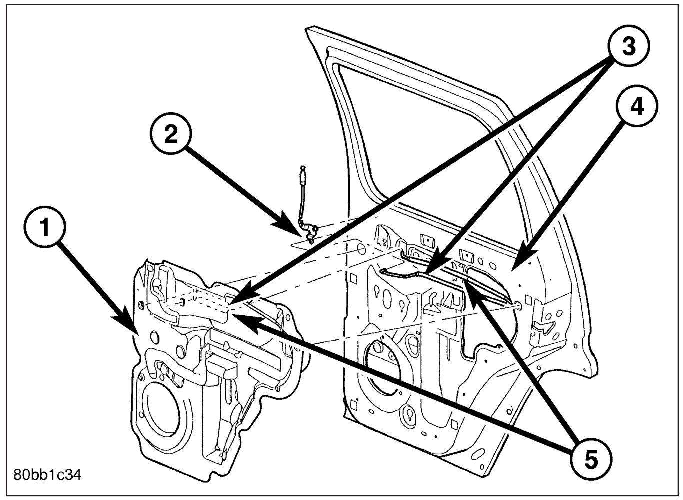
5. Adjust the door as necessary. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
6. Install the upper B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION)



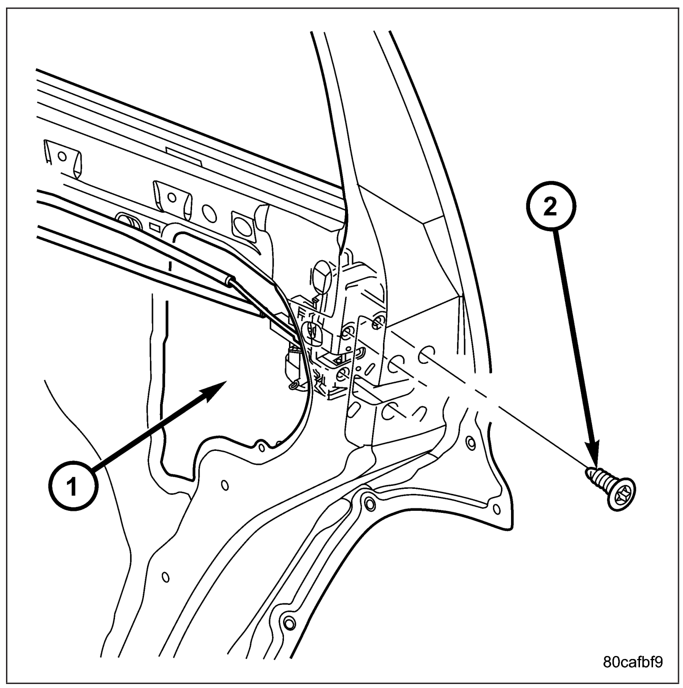
# LATCH

## REMOVAL

1. Remove the waterdam (1) as necessary to gain access to the latch. (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL)

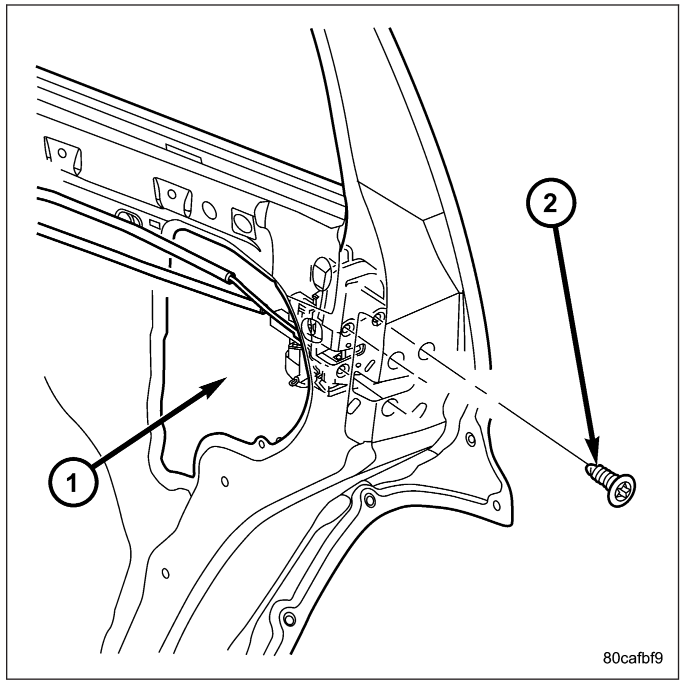


2. Disconnect the lock knob rod at the bell crank and the outside handle rod at the outside door handle.
3. Remove the screws (2) and remove the latch assembly (1).
4. Disconnect the electrical connectors.

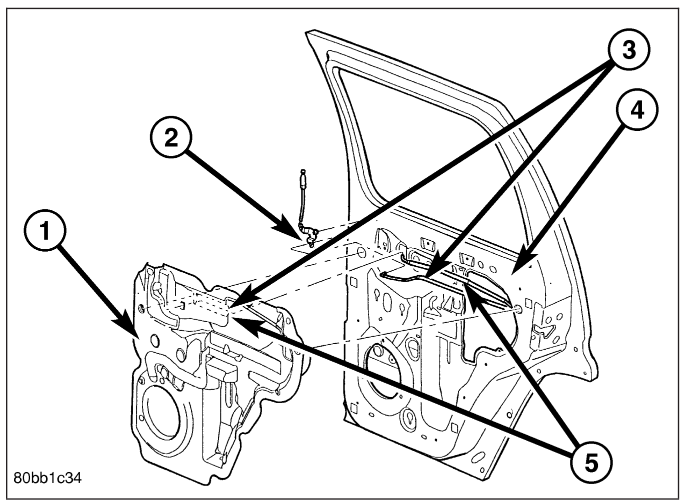


## INSTALLATION

1. Connect the latch electrical connectors.
2. Install the latch assembly (1) into the door and install the screws (2).
3. Tighten the latch screws to 11 N·m (95 in. lbs.).
4. Connect the outside door handle rod at the outside door handle.
5. Connect the lock knob rod at the bell crank and the inside handle rod when installing the trim panel.



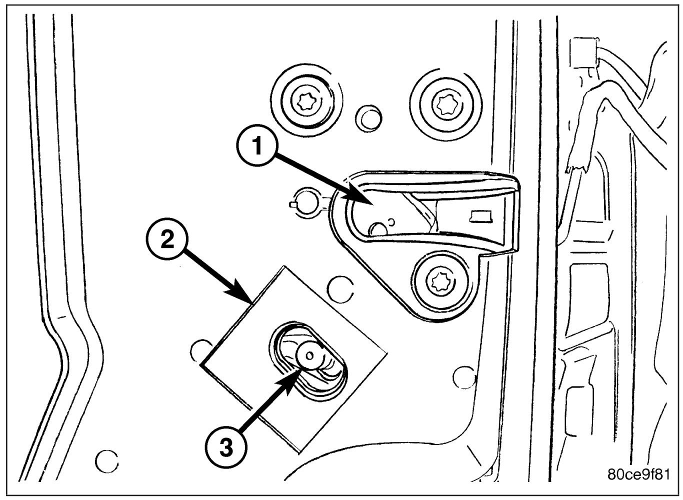
6. Install the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - INSTALLATION)
7. Adjust the latch as needed. (Refer to 23 - BODY/ DOORS - REAR/LATCH - ADJUSTMENTS)



## ADJUSTMENTS

## ADJUSTMENT

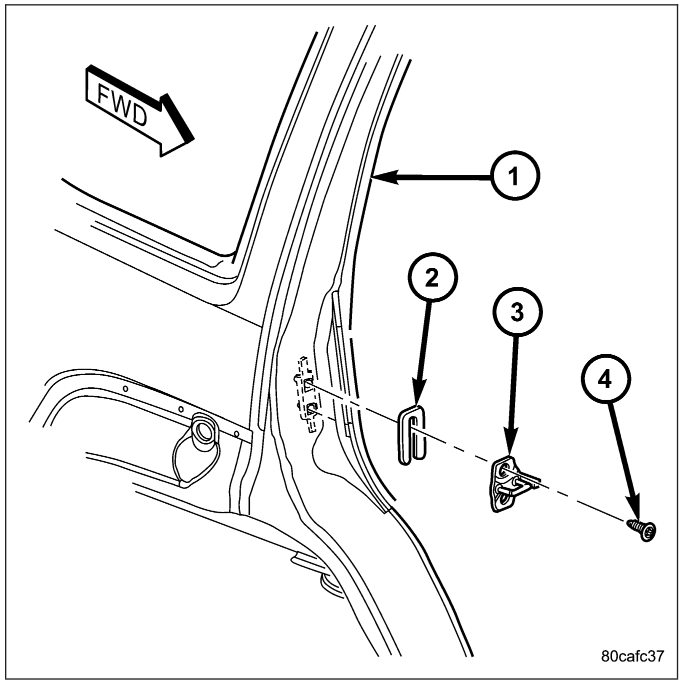
1. Locate access hole and remove the mylar tape (2) covering it.
2. Insert a 5/32” hex-wrench through hole and into adjustment screw (3). Loosen screw.
3. Operate outside handle several times to release any restriction because of mis-alignment.
4. Tighten adjustment screw to 3 N·m (30 in. lbs.).
5. Test handle for proper operation.



# LATCH STRIKER

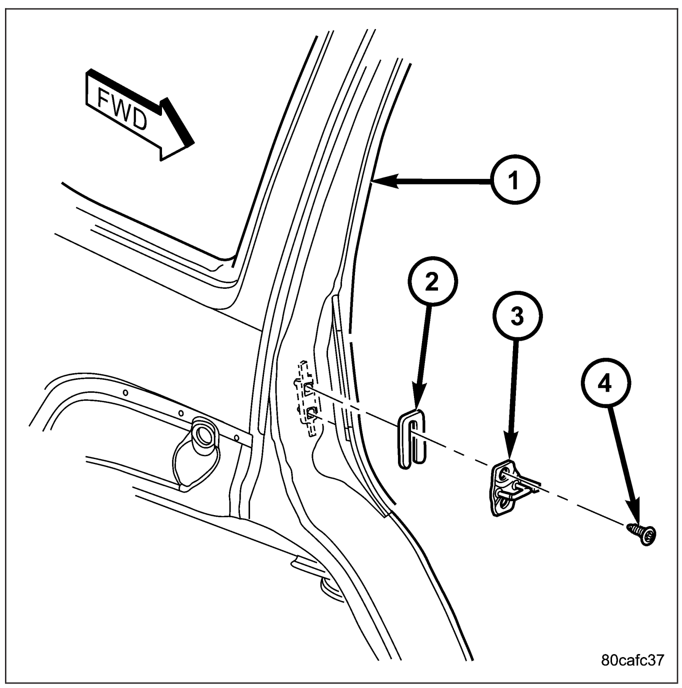
## REMOVAL

1. Remove the bolts (4).
2. Remove the latch striker (3) and the spacer (2), if equipped.



## INSTALLATION

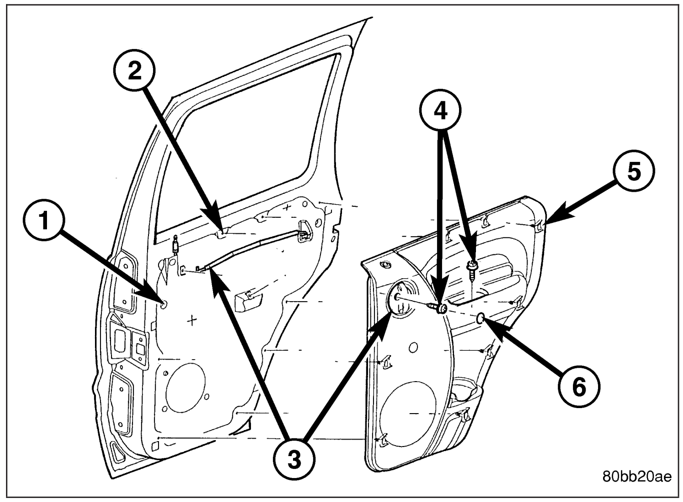
1. Install the striker (3) and spacer (2), if required.
2. Install the bolts (4) and tighten to 28 N·m (21 ft. lbs.).
3. Adjust the door as necessary. (Refer to 23 - BODY/ BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)



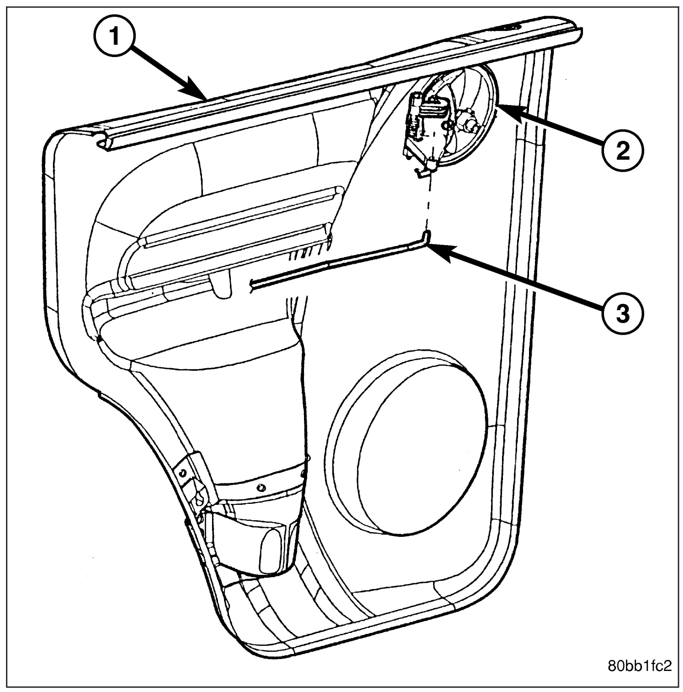
# TRIM PANEL

## REMOVAL

1. Remove the inside handle screw plug and remove the screw (4).
2. Remove the pull handle screw.
3. Using a trim stick C-4755 or equivalent, disengage the trim panel clips (5) and remove the trim panel.

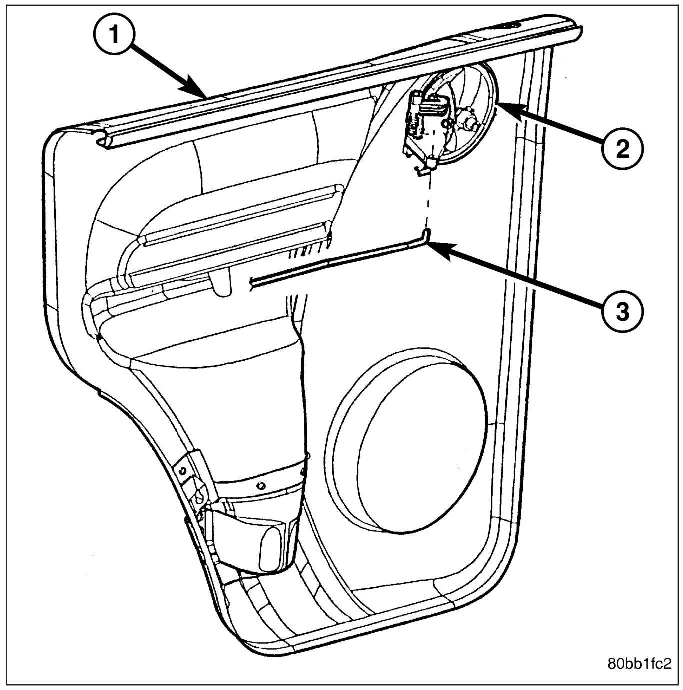


4. Disconnect the electrical connectors and the inside handle actuator rod (3).

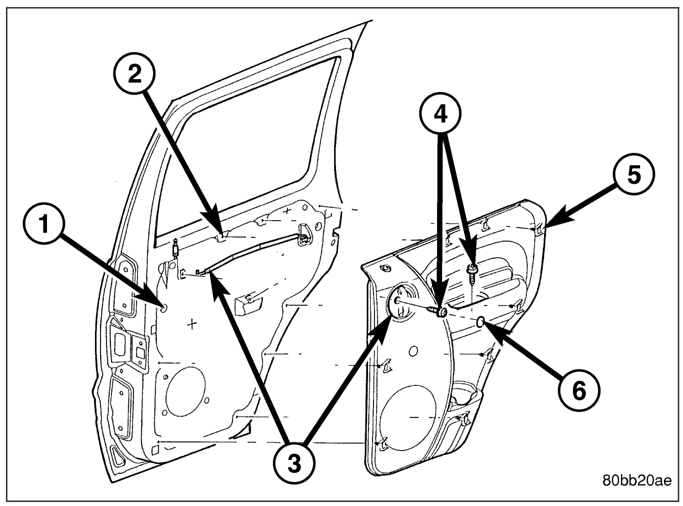


## INSTALLATION

1. Connect the inside handle actuator rod (3) and the electrical connectors.



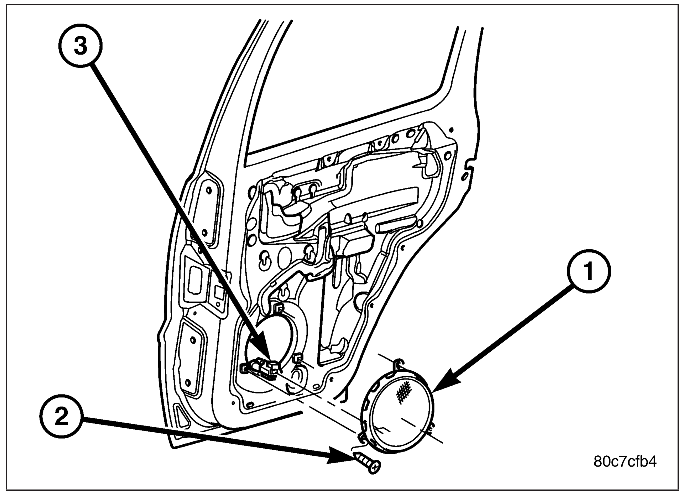
2. Position the trim panel and seat the clips (5) fully.
3. Instal the screws (4) and install the screw plug (6).



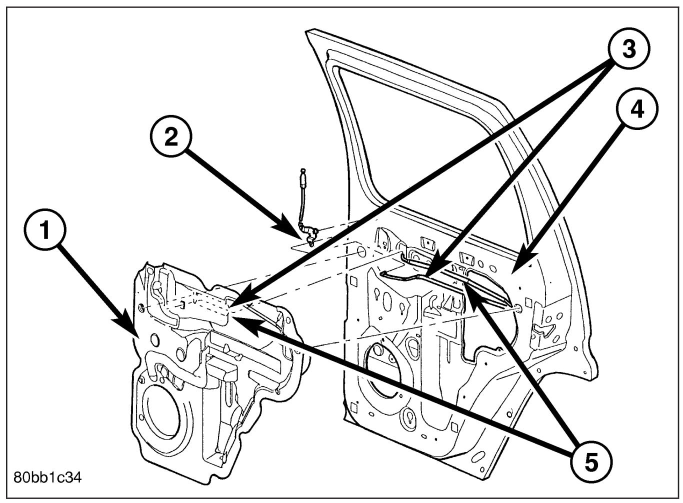
# WATERDAM

## REMOVAL

**CAUTION: Do not allow the waterdam or adhesive to become contaminated with dirt or other foreign substances.**
**Do not damage the waterdam during removal and installation.**
**If the waterdam becomes contaminated or damaged, replace the waterdam.**



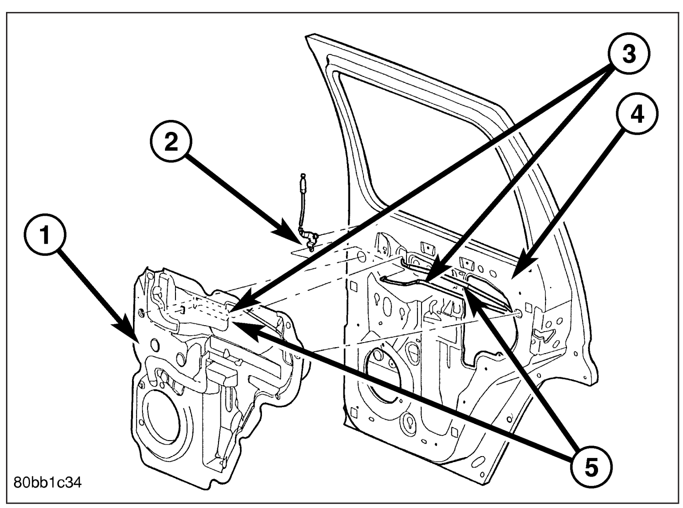
1. Remove the door speaker (1). (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)



2. Separate the waterdam (1) from the inner door panel and off of the latch linkages (3 and 5).

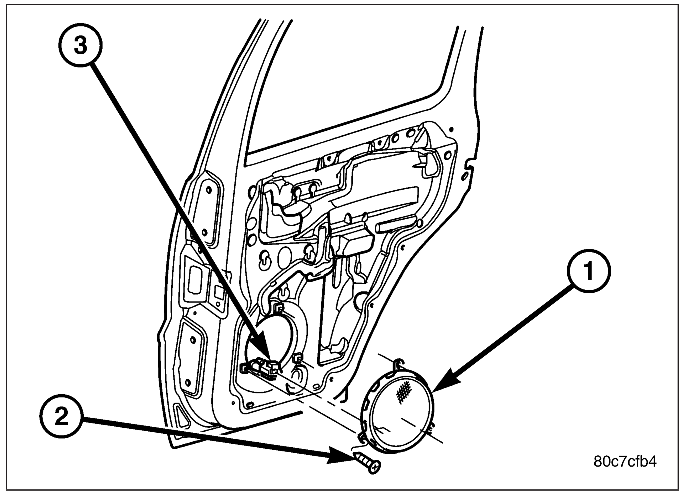
## INSTALLATION

**CAUTION: Do not allow the waterdam or adhesive to become contaminated with dirt or other foreign substances.**
**Do not damage the waterdam during removal and installation.**
**If the waterdam becomes contaminated or damaged, replace the waterdam.**



1. Position the actuator rods through the holes in the waterdam. (3 and 5)
2. Place waterdam (1) onto the door and pressurize at the butyl bead to seal completely, starting with the top rear locating indent and then moving to the top front locating indent followed by the remaining portion of the waterdam.
3. Run a hard plastic squeegee firmly around the perimeter of the waterdam making sure that the drain holes at the bottom of the inner door panel are fully covered by the waterdam.

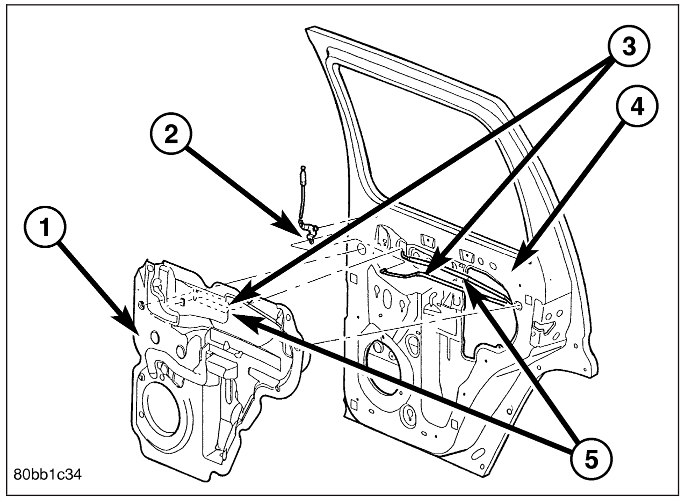
4. Install the door speaker (1). (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)



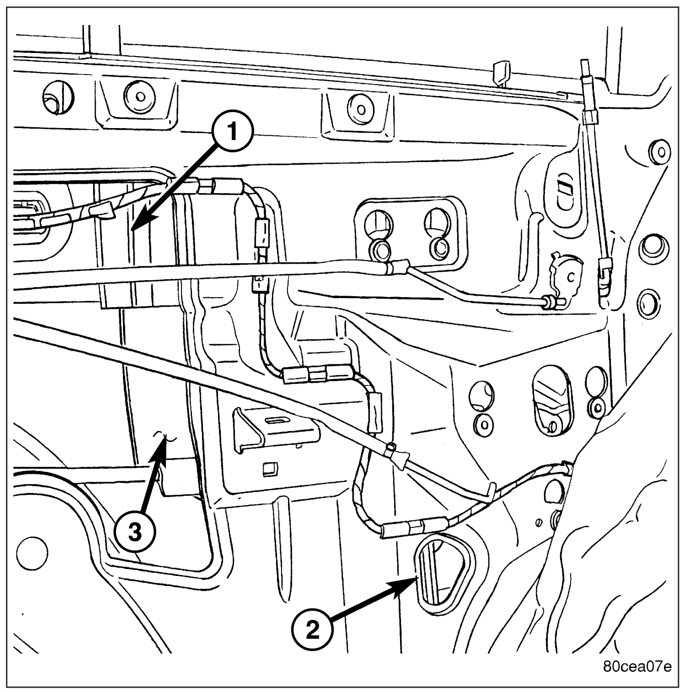
# WINDOW REGULATOR - MANUAL

## REMOVAL

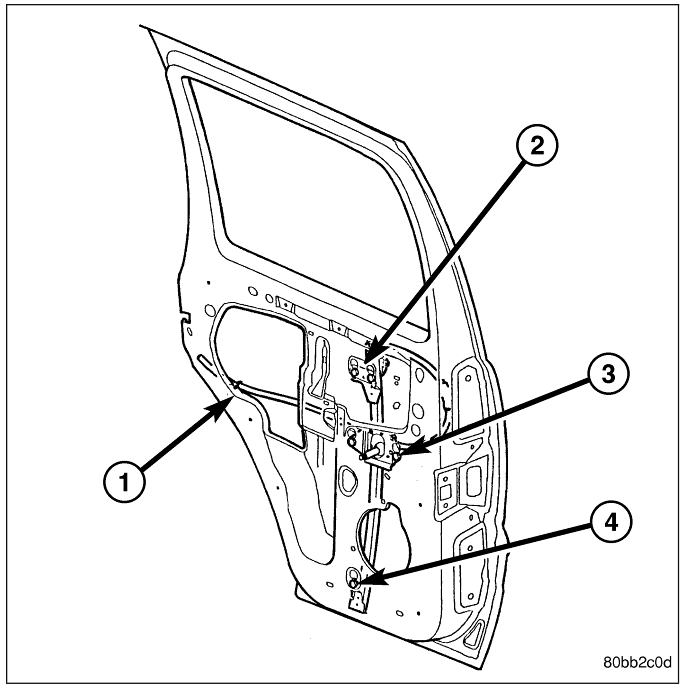
1. Remove the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - REMOVAL)



2. Raise the glass (3) and line up the lift plate clip with the hole (2) in the door panel shown.
3. Using a long flat blade or hook type tool, disengage the clip attaching glass retainer to regulator lift plate.
4. Disconnect the glass from the regulator lift plate and re-install the clip.
5. Secure the glass in the up position using a wood wedge, tape or equivalent.

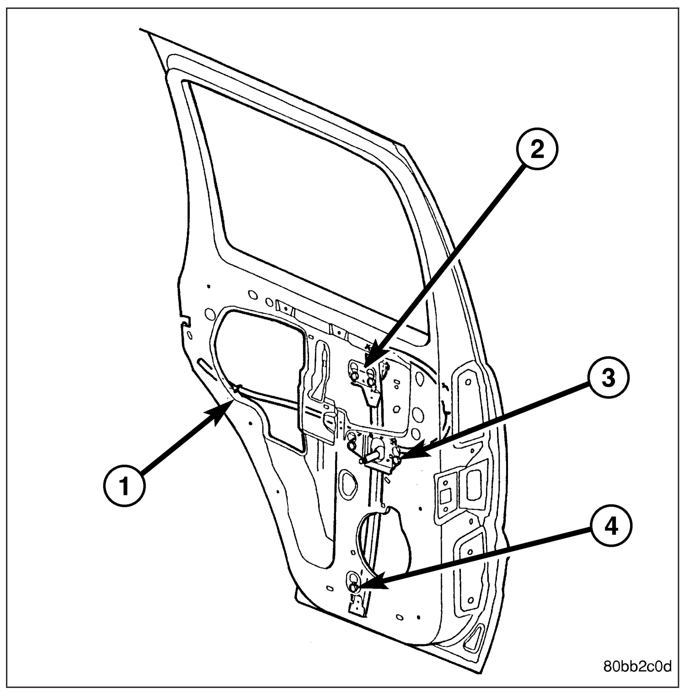


6. Remove the bolts. (2 and 4)
7. Disconnect the runout tube (1) clip and remove the regulator (3).

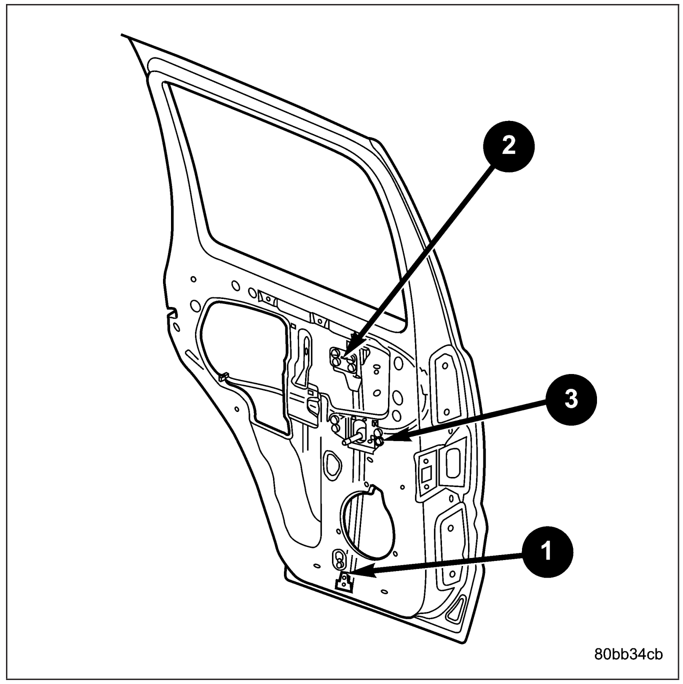


## INSTALLATION

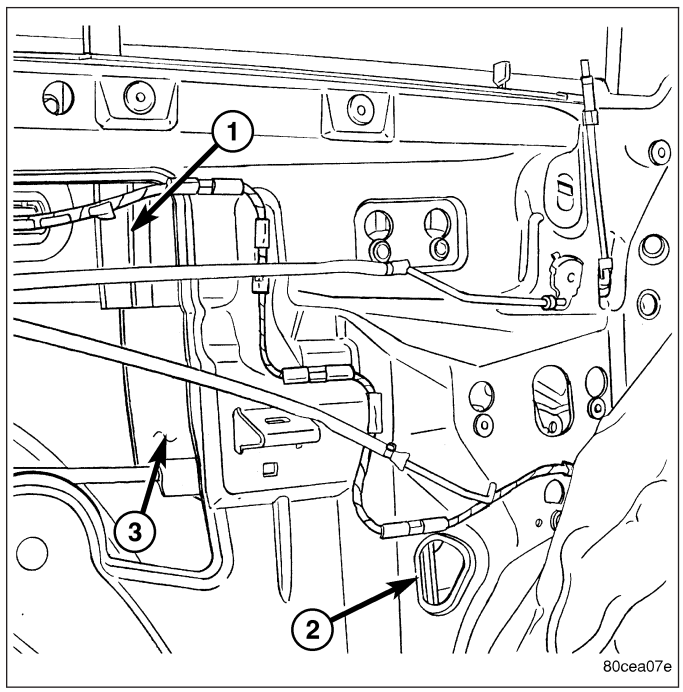
1. Loosely install the bolts onto the regulator assembly (2 and 4).
2. Install the regulator assembly (3).
3. Install the runout tube clip (1).



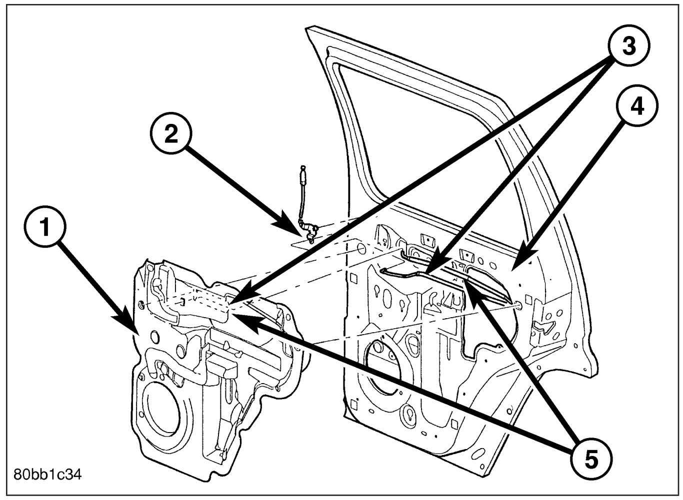
4. Tighten the bolts to 9 N·m (80 in. lbs.) using the sequence shown.



5. Remove the glass support and connect the glass to the regulator lift plate (2).



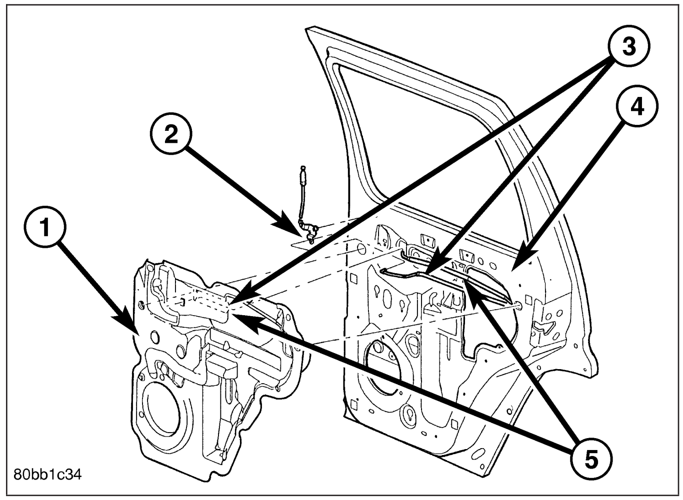
6. Install the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - INSTALLATION)



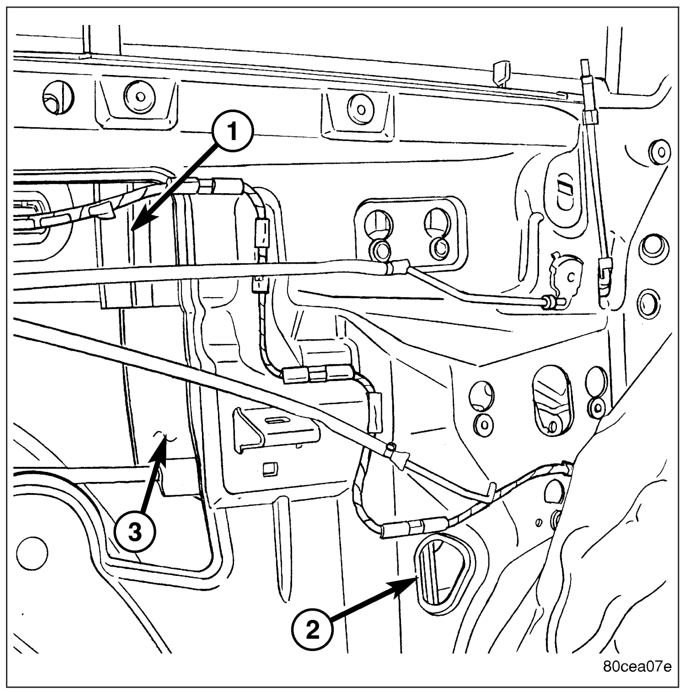
# WINDOW REGULATOR - POWER

## REMOVAL

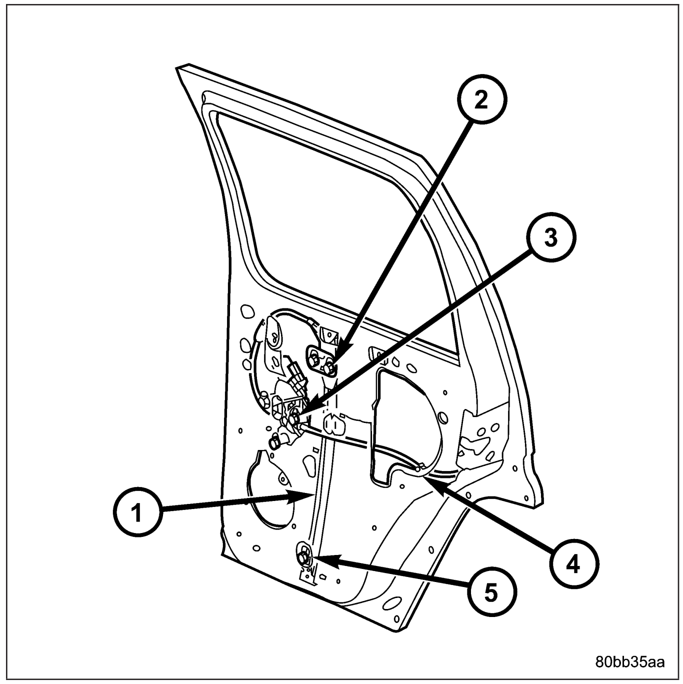
1. Remove the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - REMOVAL)



2. Raise the glass and line up the lift plate clip with the hole in the door panel shown.
3. Using a long flat blade or hook type tool, disengage the clip (2) attaching glass retainer to regulator lift plate.
4. Disconnect the glass from the regulator lift plate and re-install the clip.

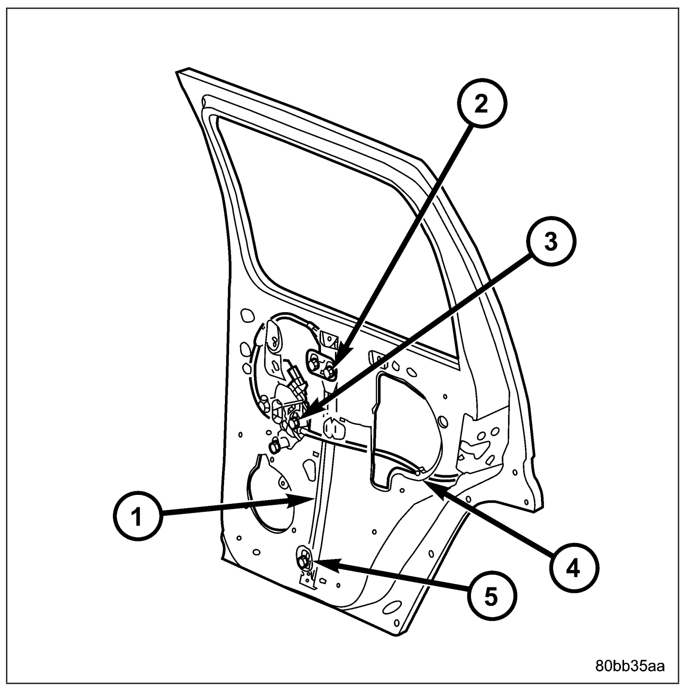


5. Secure the glass in the up position using a wood wedge, tape or equivalent.
6. Remove the bolts. (2, 3 and 5)
7. Disconnect the runout tube clip (4) and remove the regulator.
8. Disconnect the electrical connector.

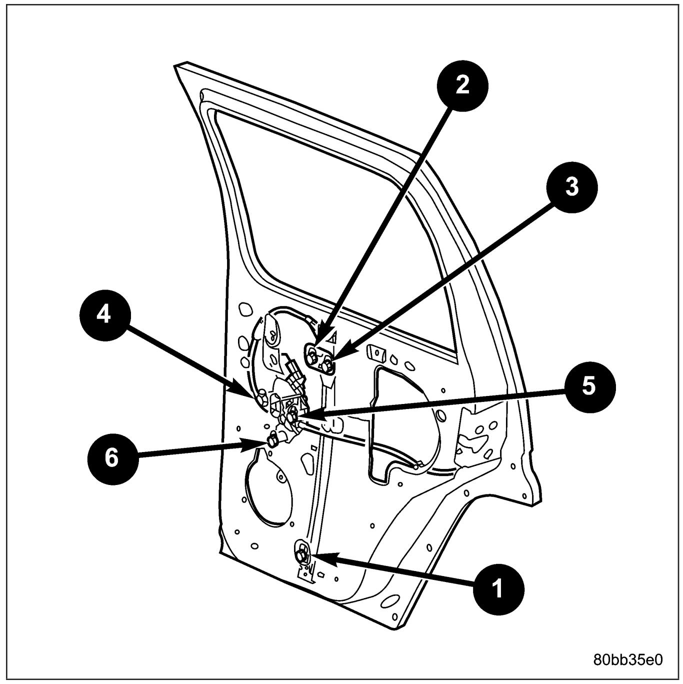


## INSTALLATION

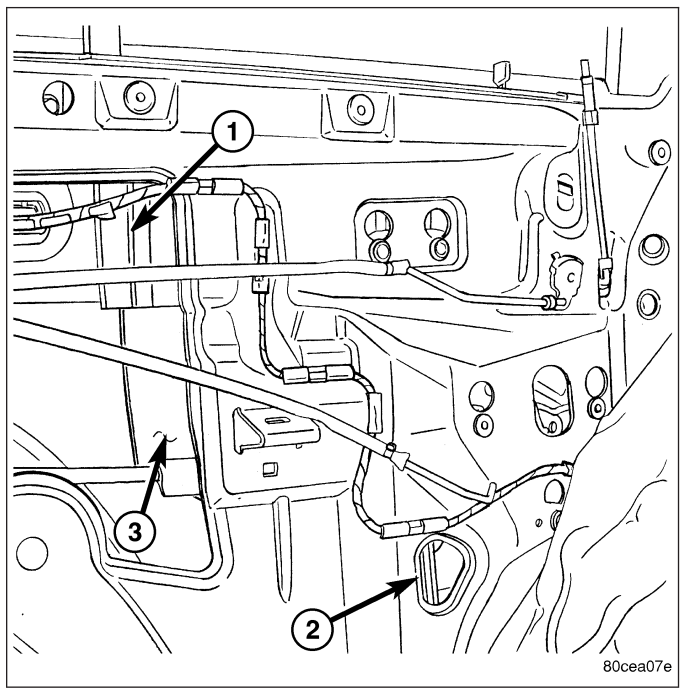
1. Connect the electrical connector.
2. Loosely install the bolts onto the regulator assembly. (2, 3 and 5)
3. Install the regulator assembly (1).



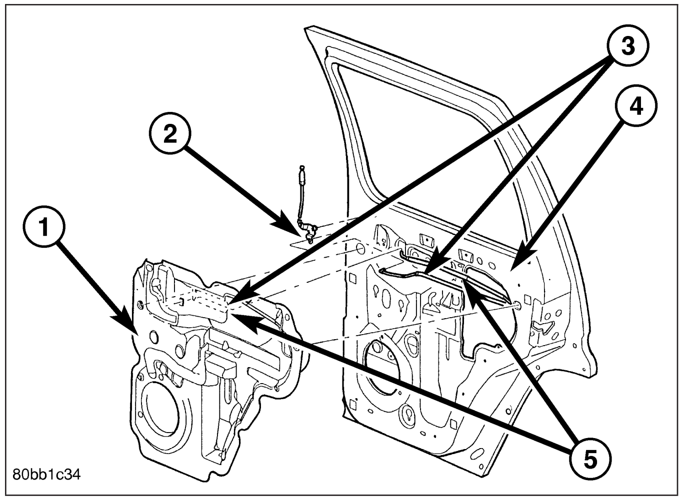
4. Tighten the bolts to 9 N·m (80 in. lbs.) using the sequence shown.



5. Remove the glass support and connect to the regulator lift plate (2).



6. Install the waterdam (1). (Refer to 23 - BODY/ DOORS - REAR/WATERDAM - INSTALLATION)



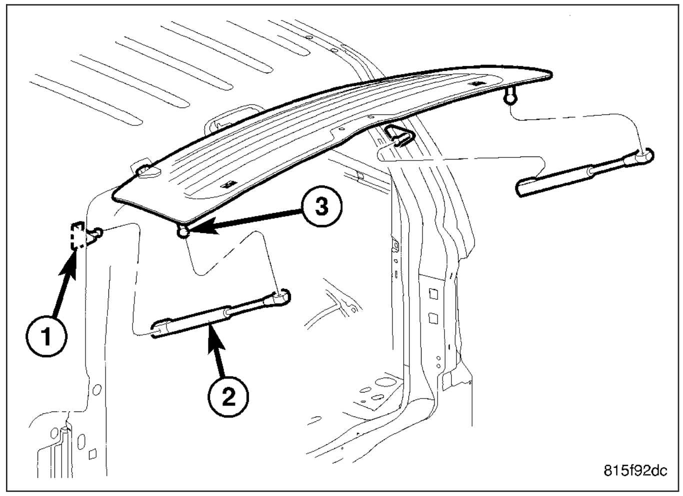
# SWING GATE

## TABLE OF CONTENTS

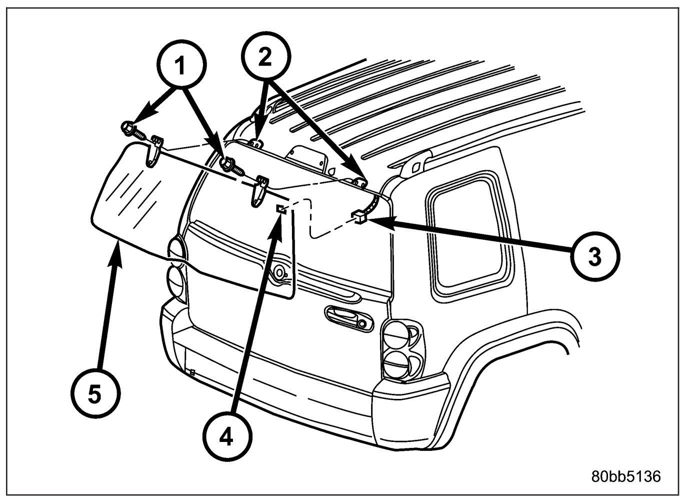
# FLIP-UP GLASS

## REMOVAL

1. Open the flip-up glass.
2. Using a grease pencil or equivalent, mark the position of the hinge on the body to aid installation.
3. Remove the support cylinders (2). (Refer to 23 - BODY/SWING GATE/FLIP-UP GLASS SUPPORT CYLINDER - REMOVAL)

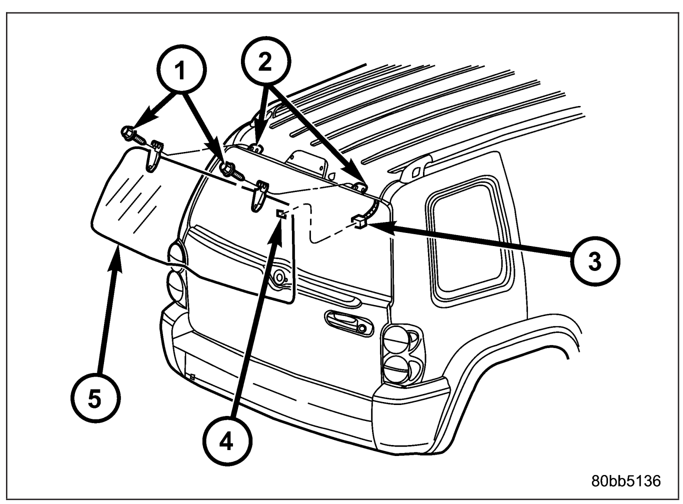


4. Disconnect the electrical connectors (3).
5. Open the glass to the full travel with the support cylinders off.
6. Remove the bolts (1) and remove the glass (5).

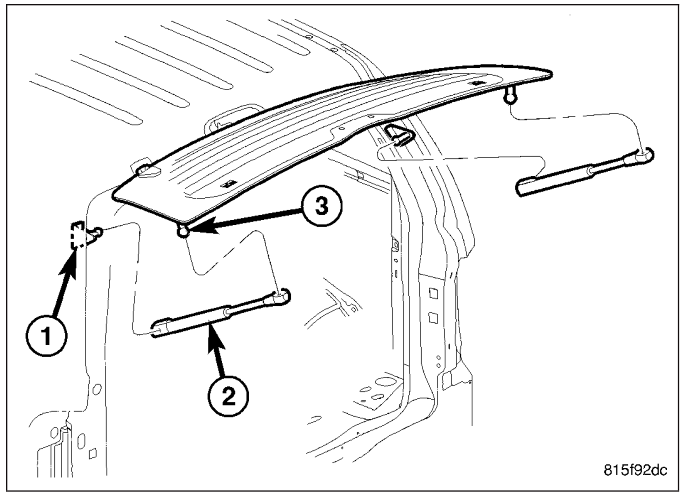


## INSTALLATION

1. Install the flip-up glass, pushing it as far up as it can go and loosely install the hinge bolts (1).
2. Connect the electrical connectors (3).
3. Adjust flip-up glass fit if necessary, making sure there are equal gaps on both sides of the glass while pushing up on the glass and tighten the hinge bolts to 7 N·m (60 in. lbs.). (Refer to 23 - BODY/SWING GATE/FLIP-UP GLASS - ADJUSTMENTS)



4. Install the support cylinders (2). (Refer to 23 - BODY/SWING GATE/FLIP-UP GLASS SUPPORT CYLINDER - INSTALLATION)

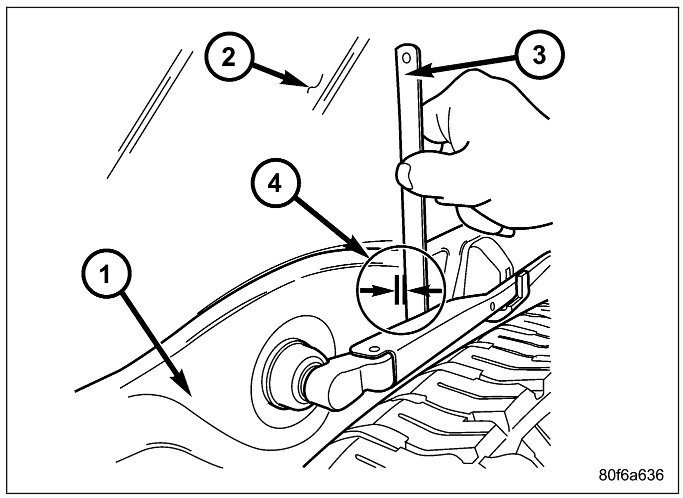


## ADJUSTMENTS

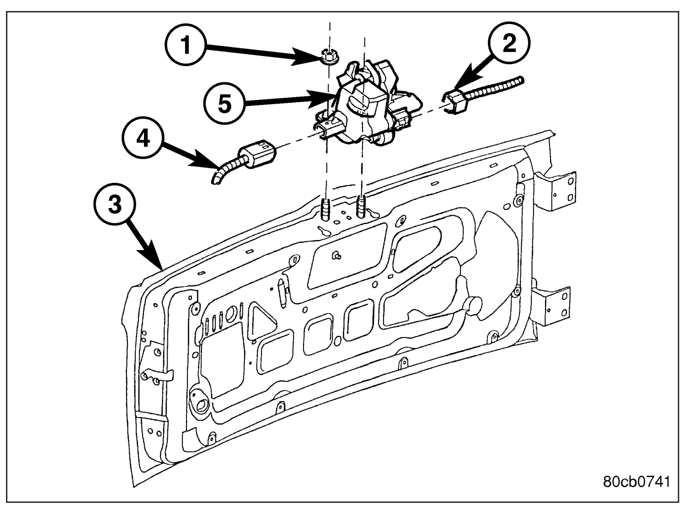
## ADJUSTMENT

1. Verify that the flip-up glass is correctly centered in it’s opening. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
2. Confirm the flip-up glass to swing gate adjustment. Hold a straight edge flush against the glass as indicated, and record the gap/space between the straight edge and the swing gate outer vertical panel.

**NOTE: The flush specification for the flip-up glass to the swing gate outer panel is 0 mm - 2 mm over flush.**



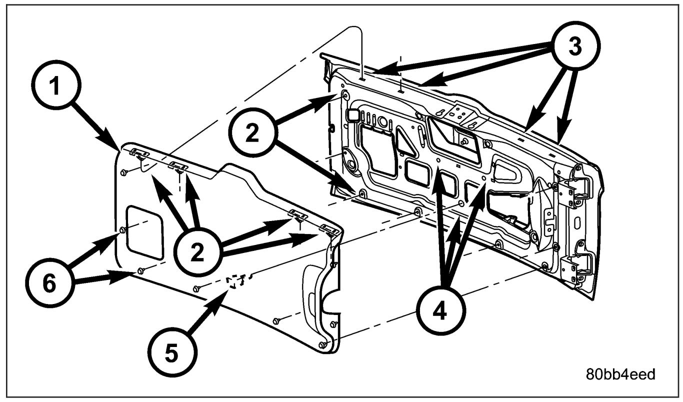
3. If the flip-up glass needs to be adjusted, loosen the two latch attaching fasteners (5) and move the latch for or aft in small increments until desired measurement is achieved.
4. Tighten the flip-up glass latch fasteners to 12 N·m (9 ft. lbs.).
5. Verify correct flip-up glass closing efforts and operation.



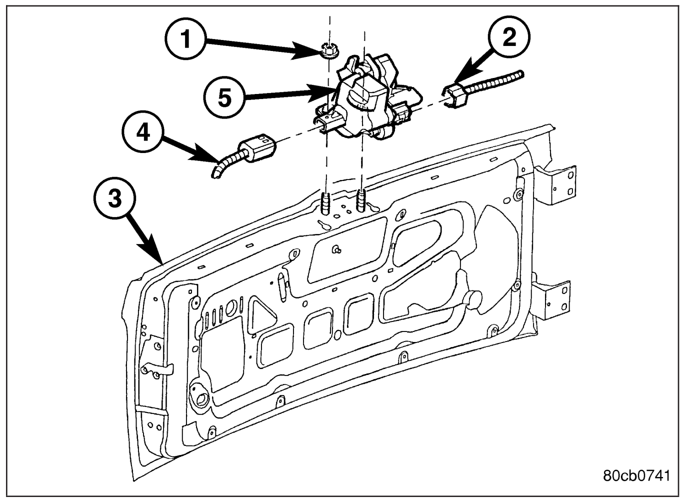
# FLIP-UP GLASS LATCH

## REMOVAL

1. Remove the trim panel (1). (Refer to 23 - BODY/SWING GATE/TRIM PANEL - REMOVAL)

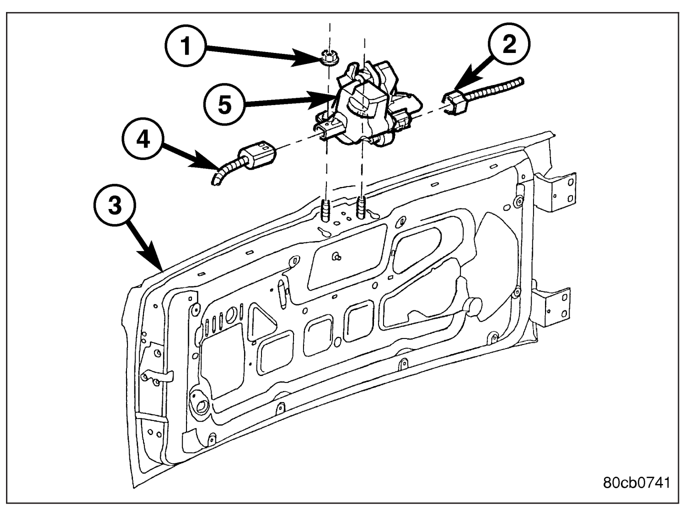


2. Disconnect the electrical connectors (2 and 4).
3. Using a grease pencil or equivalent, mark the location of the latch assembly (5) for installation.
4. Remove the nuts (1) and remove the latch assembly.

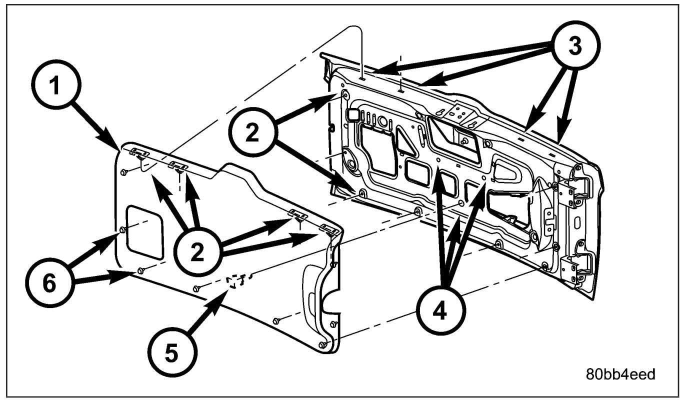


## INSTALLATION

1. Install the latch assembly (5).
2. Install the nuts (1) and tighten to 12 N·m (9 ft. lbs.).
3. Connect the electrical connectors (2 and 4).
4. Adjust the latch to achieve the best glass fit. (Refer to 23 - BODY/SWING GATE/FLIP-UP GLASS - ADJUSTMENTS)



5. Install the trim panel (1). (Refer to 23 - BODY/SWING GATE/TRIM PANEL - INSTALLATION)

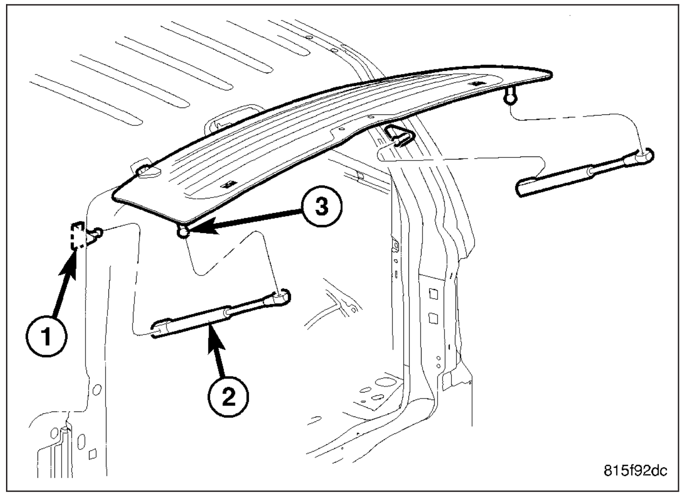


# FLIP-UP GLASS - HINGE

## REMOVAL

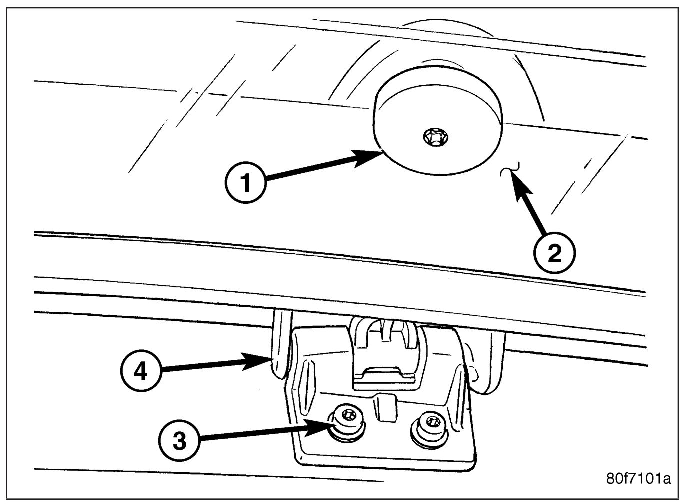
**NOTE: It is not necessary to remove the glass to replace one or both hinges. The hinges can be replaced one at a time.**

1. Open the flip up glass.
2. Using a grease pencil or equivalent, mark the position of the hinge on the body to aid installation.
3. Remove the support cylinders (2) and support glass. (Refer to 23 - BODY/SWING GATE/FLIP-UP GLASS SUPPORT CYLINDER - REMOVAL)

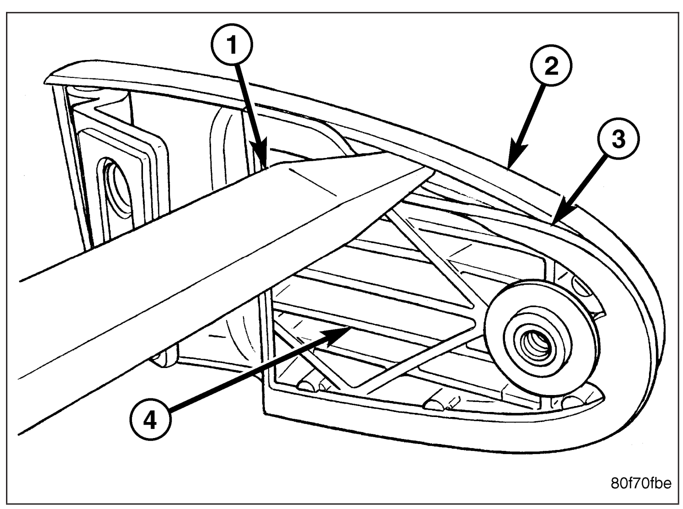


**CAUTION: Do not allow glass to twist on remaining hinge when the other hinge is being serviced. Damage to the hinge that is not being serviced may result.**

4. Remove the bolts (1 and 3) and remove the hinge (4).



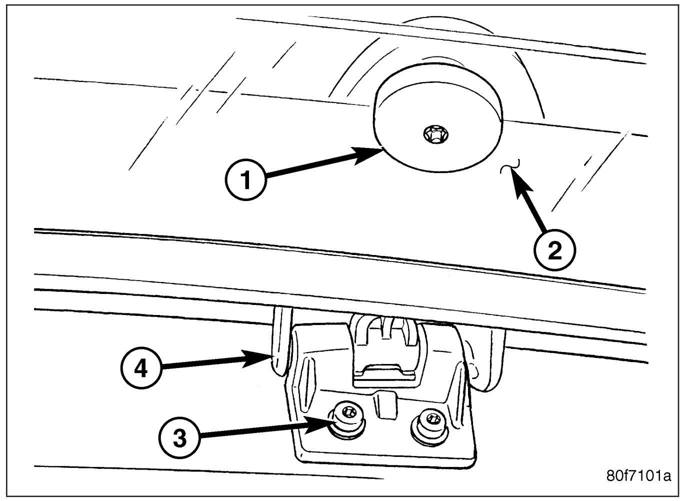
5. Using a trim stick C-4755 (1) or equivalent, release the lower locking tabs (2) and remove the hinge cover.



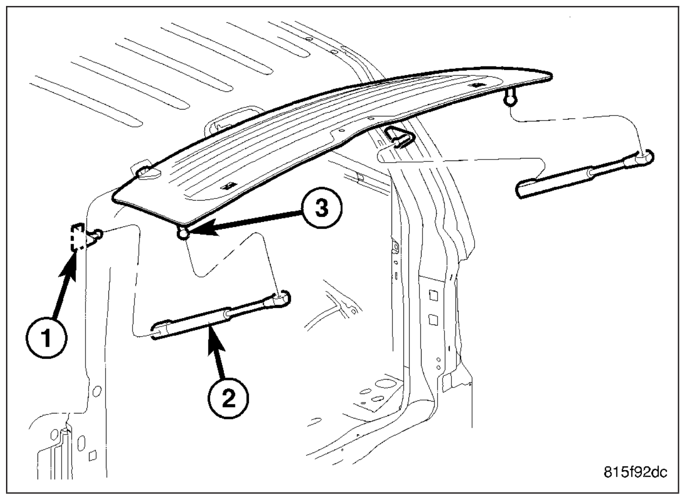
## INSTALLATION

**NOTE: Inspect the hinge cover retention tabs. If they are damaged or cracked, discard the cover and replace with a new one.**

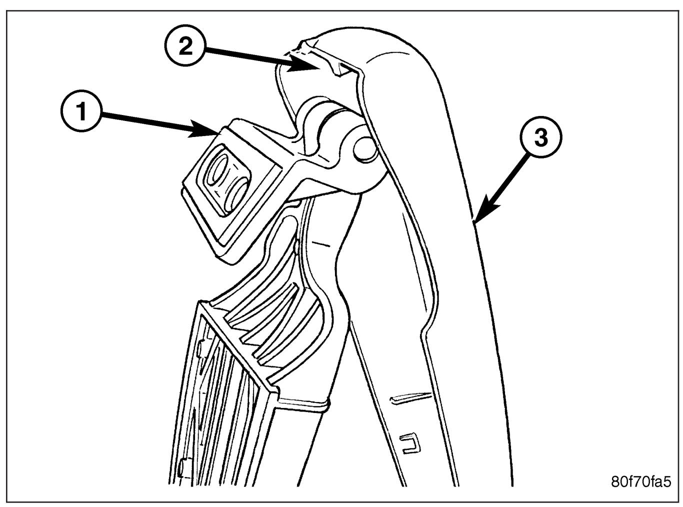
1. Install the hinge onto the vehicle and align with marks made previously.
2. Install the hinge to glass bolt (1) and tighten to 10 N·m (90 in. lbs.).
3. Install the bolts (3) and tighten to 7 N·m (60 in. lbs.).
4. Adjust the flip-up glass as necessary. (Refer to 23 - BODY/SWING GATE/FLIP-UP GLASS - ADJUSTMENTS)



5. Install the support cylinders (2). (Refer to 23 - BODY/SWING GATE/FLIP-UP GLASS SUPPORT CYLINDER - INSTALLATION)



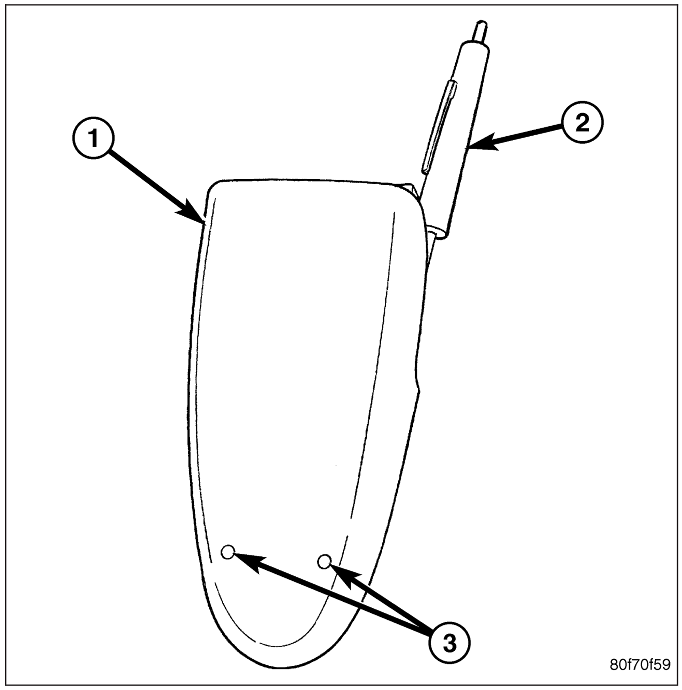
6. Position the top of the hinge cover (3) over the hinge (1) and engage the cover tab (2).
7. Rock the hinge cover down over the hinge and seat fully. Ensure both lower tabs snap into place.



# FLIP-UP GLASS - HINGE COVER

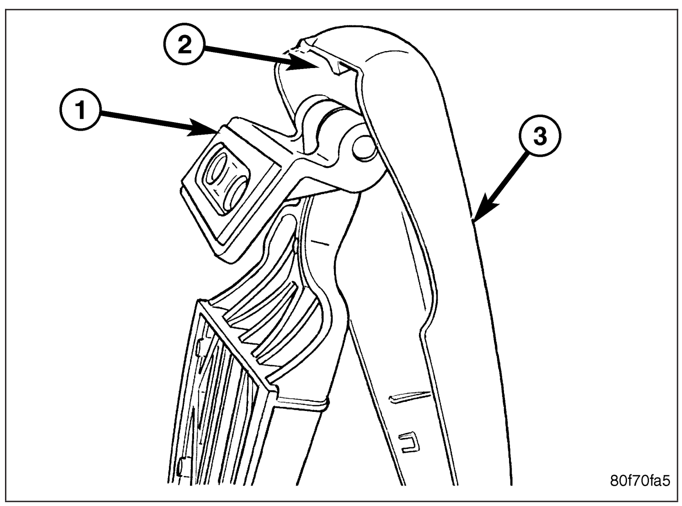
## REMOVAL

1. Using a small flat bladed tool (2) or equivalent, insert the tool under the cover (1) and release the locking tabs (3) as shown.
2. Remove the hinge cover from the hinge.



## INSTALLATION

1. Position the top of the hinge cover (3) over the hinge and engage the cover tab (2).
2. Rock the hinge cover down over the hinge and seat fully. Ensure both lower locking tabs snap into place.

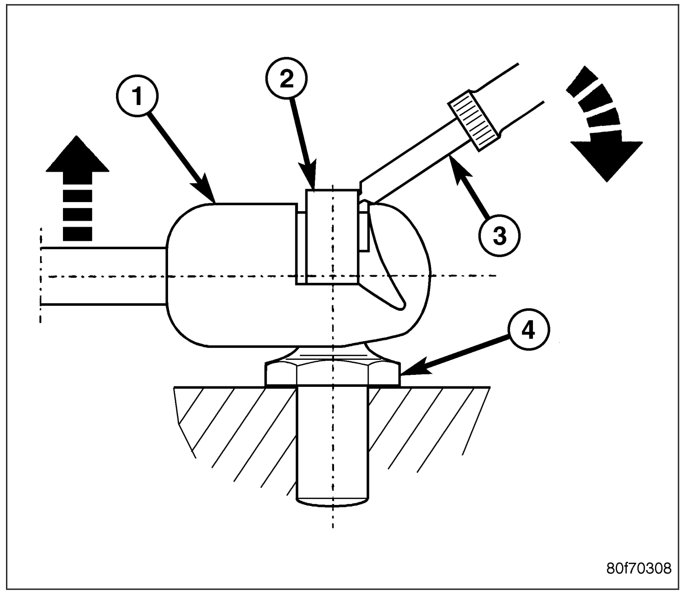


# FLIP-UP GLASS SUPPORT CYLINDER

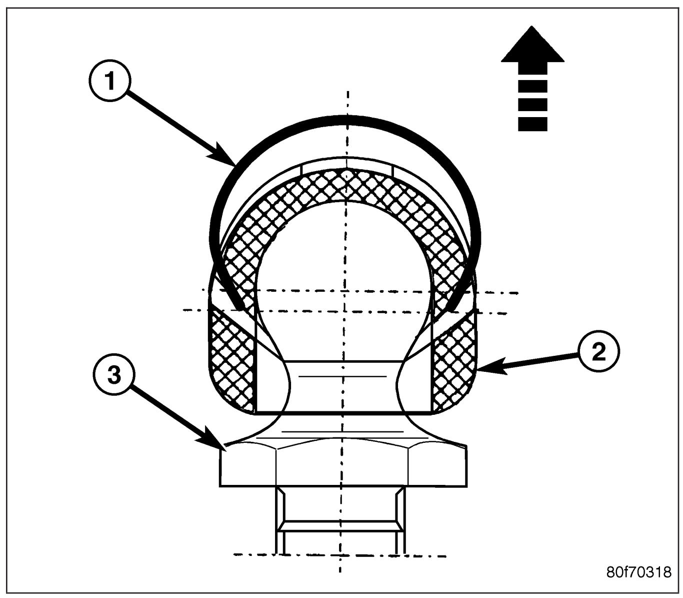
## REMOVAL

**WARNING: Do not remove the flip-up glass support rods with the glass closed. The support rod pistons are operated by high pressure gas and could cause personal injury and/or vehicle damage if they are removed with the pistons compressed (glass closed). Once removed, do not attempt to disassemble or repair the support rods.**

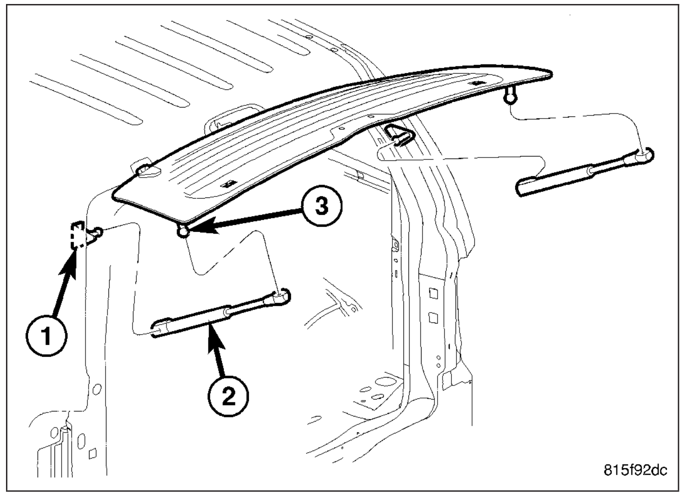
1. Open the flip-up glass and support.
2. Using a small flat bladed tool (3), or equivalent, release the retaining clips (2) while pulling the ball socket (1) away from the ball stud (4).



**NOTE: Lift the clips (1) only enough to release the ball studs (3).**



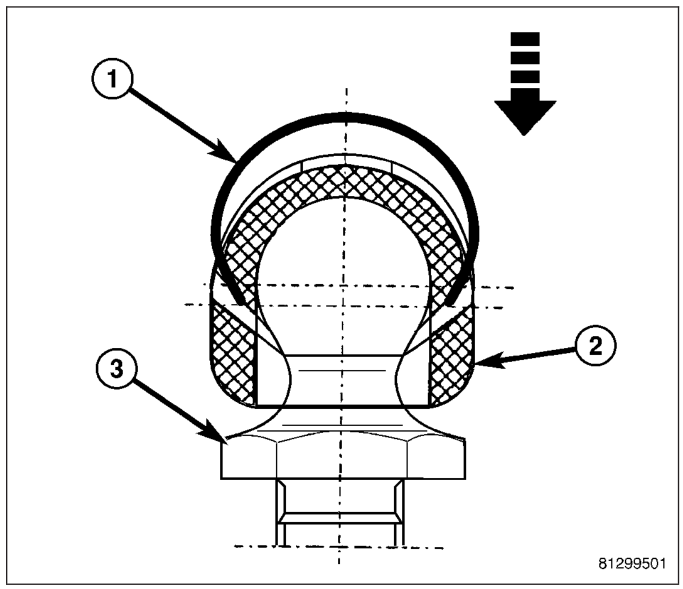
3. Remove the support cylinder (2) from the upper (1) and lower (3) ball studs.



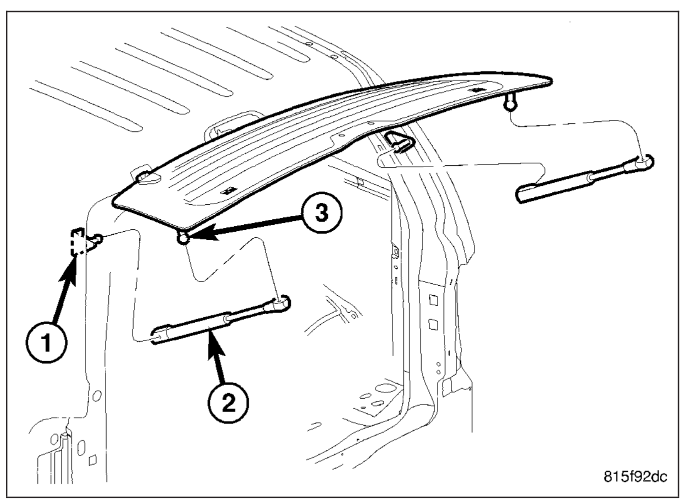
## INSTALLATION

**WARNING: Do not remove the flip-up glass support rods with the glass closed. The support rod pistons are operated by high pressure gas and could cause personal injury and/or vehicle damage if they are removed with the pistons compressed (glass closed). Once removed, do not attempt to disassemble or repair the support rods.**

1. Make sure the retaining clips (1) are seated into the ball socket (2) fully.



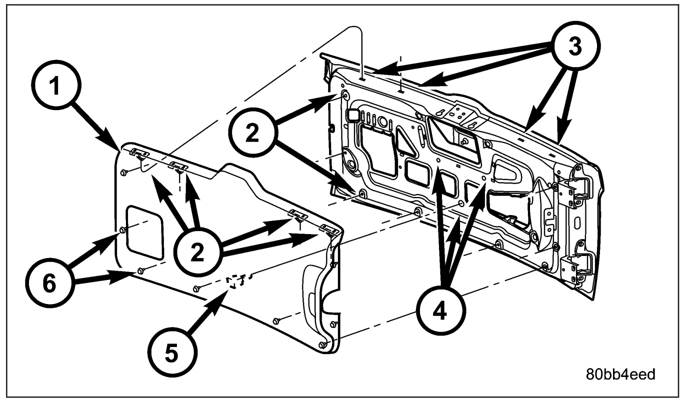
2. Install the support cylinder (2) over the ball studs (1 and 3) with the thin end connected to the glass and the retaining clips snapping into place.



# TRIM PANEL

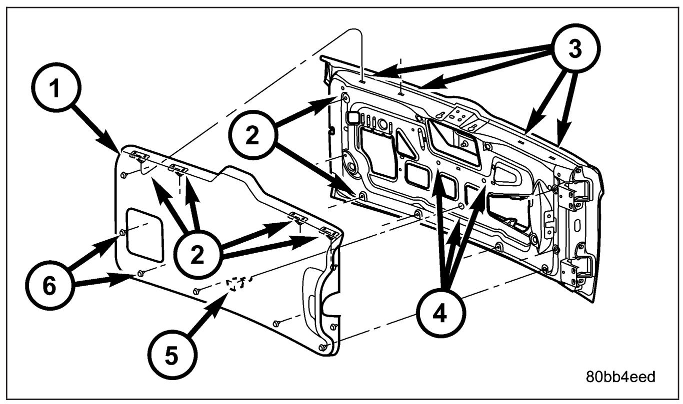
## REMOVAL

1. Using a trim tool C-4829-A or equivalent, release the push pin fasteners.
2. Lift trim panel up off of the upper trim panel clips.



## INSTALLATION

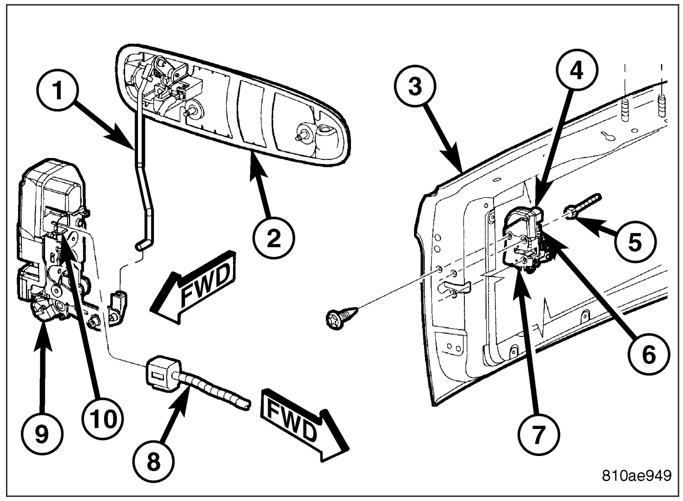
1. Position the trim panel and seat the upper clips.
2. Fully seat the lower trim panel clips.



# LATCH

## REMOVAL

1. Remove the trim panel and waterdam. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - REMOVAL)
2. Disconnect the electrical connector and actuator rod at the clip.
3. Remove the screws and remove the latch.

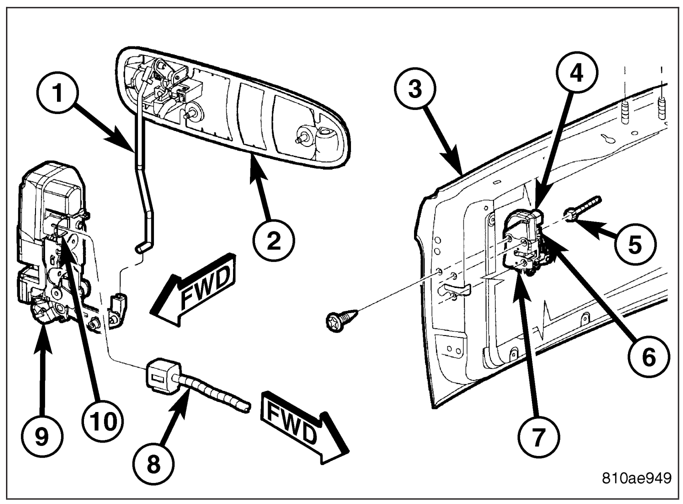


## INSTALLATION

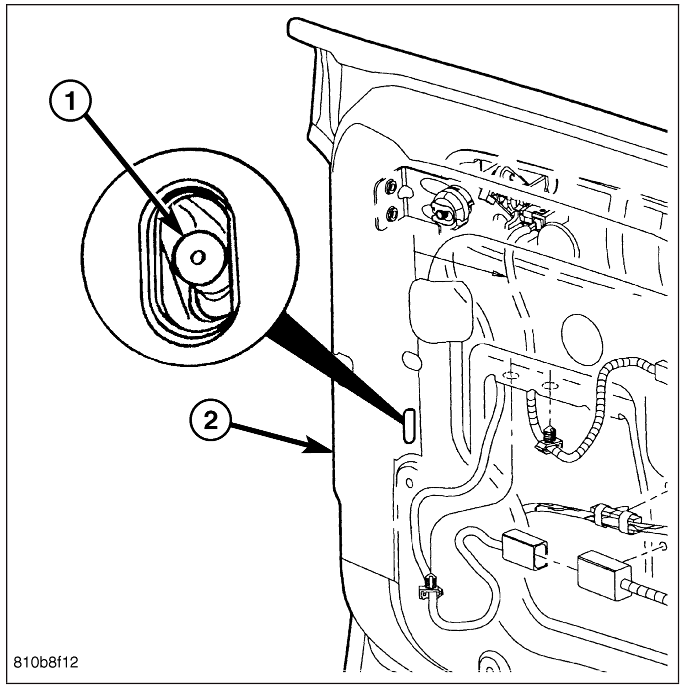
1. Install the latch and tighten the screws to 11 N·m (8 ft. lbs.).
2. Connect the electrical connector.

**CAUTION: Make sure the latch wire harness is installed forward of the actuator rod.**

3. Connect the actuator rod.



4. Insert a 5/32-inch hex-wrench through hole and into adjustment screw. Loosen screw.
5. Operate outside handle several times to release any restriction because of mis-alignment.
6. Tighten adjustment screw to 3 N·m (30 in. lbs.)
7. Test handle for proper operation.
8. Install the trim panel and waterdam. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - INSTALLATION)



# LATCH STRIKER

## REMOVAL

1. Open the gate and using a grease pencil or equivalent, mark the position of the striker to aid installation.
2. Remove the bolts attaching the striker to the D-pillar.

## INSTALLATION

1. Adjust the swing gate as necessary. (Refer to 23 - BODY/SWING GATE/SWING GATE - ADJUSTMENTS)

**NOTE: If the spare tire is removed then add 3 mm on the right side to compensate for sag after the spare tire is installed.**

2. Install the striker and install the bolts.
3. Adjust the striker.

## ADJUSTMENTS

## ADJUSTMENT

**NOTE: Stabilizer insert must be off when adjusting the striker.**

1. Remove the stabilizer insert. (Refer to 23 - BODY/SWING GATE/STABILIZER WEDGE/INSERT - REMOVAL)
2. Loosen the striker bolts.
3. Adjust the striker up/down so that it is centered within the latch opening.
4. Adjust the striker fore/aft so the swing gate is under flush to the body -0.5 mm (+/- 1.0 mm).
5. Adjust the striker cross-car engagement to the latch by adding 2.0 mm shims as necessary.

**NOTE: Make sure the striker is not twisted within the latch opening. Striker should be parallel to the opening.**

6. Tighten the striker bolts to 28 N·m (21 ft. lbs.).
7. Install the stabilizer insert. (Refer to 23 - BODY/SWING GATE/STABILIZER WEDGE/INSERT - INSTALLATION)

# LATCH - ACCESS PANEL

## DESCRIPTION

This panel provides access to the gate latch if gate power fails. The gate can be unlocked by reaching in and pushing the lock lever down.

## REMOVAL

1. Using a trim stick C-4755 or equivalent, remove the access panel.

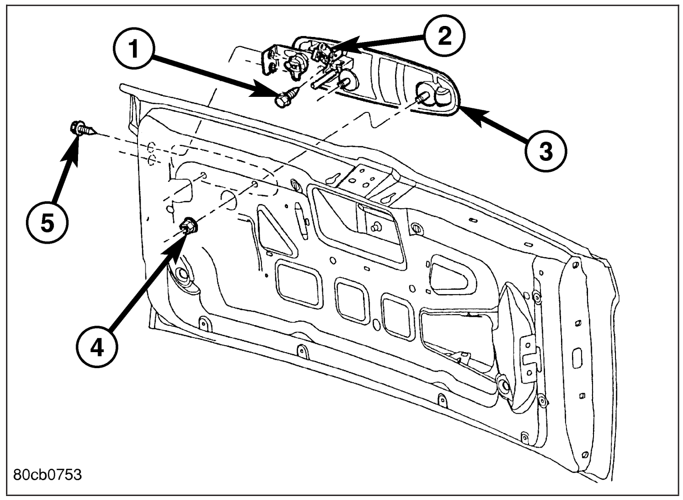
## INSTALLATION

1. Position and install the access panel.

# EXTERIOR HANDLE

## REMOVAL

1. Remove the trim panel and waterdam as necessary to gain access to the handle. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - REMOVAL)
2. Disconnect the lock switch and flip-up glass release electrical connectors.
3. Unclip the threaded clips and disconnect the actuator rods.
4. Remove the screws.
5. Remove the nuts and remove the handle.



## INSTALLATION

1. Install the handle and hold tightly against the gate and support bracket.
2. Install the nuts and tighten to 6 N·m (55 in. lbs.).
3. Install the screws and tighten to 6 N·m (55 in. lbs.).

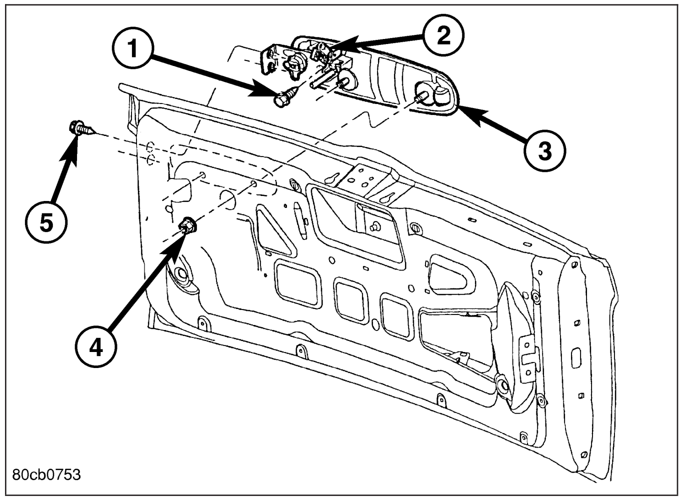
**NOTE: Do not pre-load the latch rod when attaching. The latch and handle must be in a relaxed state when making the connection.**

4. Connect the actuator rod by first pushing the rod into the stationary half of the threaded clip, then close the moving half ensuring the two halves snap together fully.
5. Connect the lock switch and flip-up glass release electrical connectors.
6. Install the trim panel and waterdam. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - INSTALLATION)

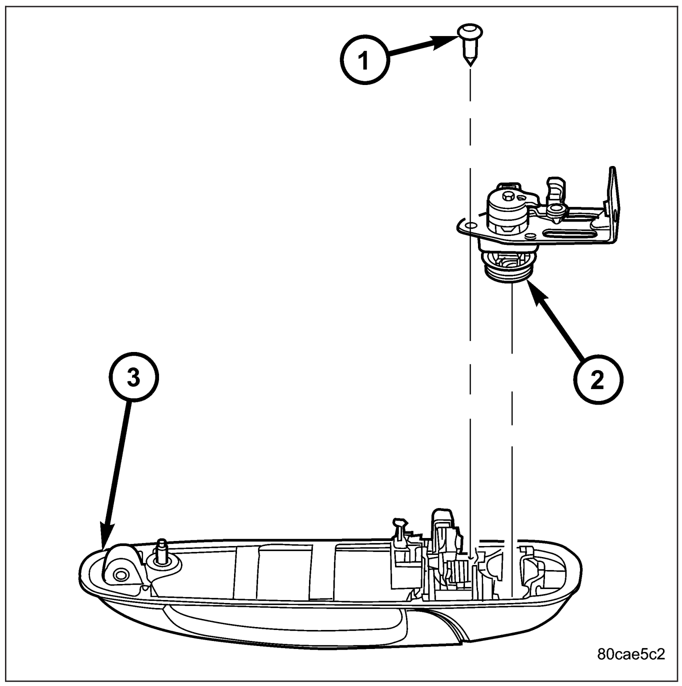
# LOCK CYLINDER

## REMOVAL

1. Remove the exterior handle (1). (Refer to 23 - BODY/SWING GATE/EXTERIOR HANDLE - REMOVAL)

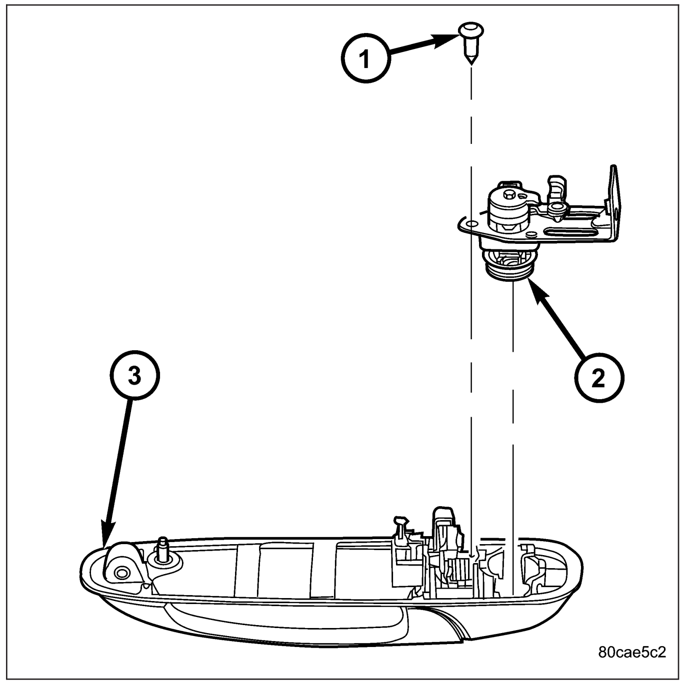


2. Remove the clip and remove the lock cylinder switch.
3. Remove the screw (1) and remove the lock cylinder (2).

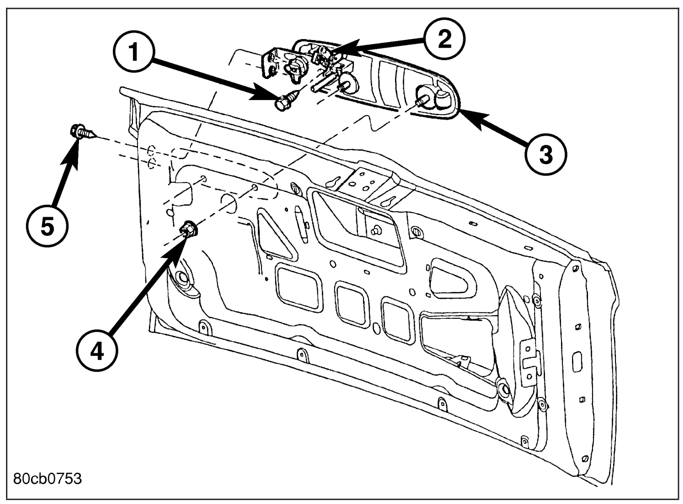


## INSTALLATION

1. Install the lock cylinder.
2. Install the screw (1) and tighten to 6 N·m (50 in. lbs.).
3. Install the lock cylinder switch and retaining clip.



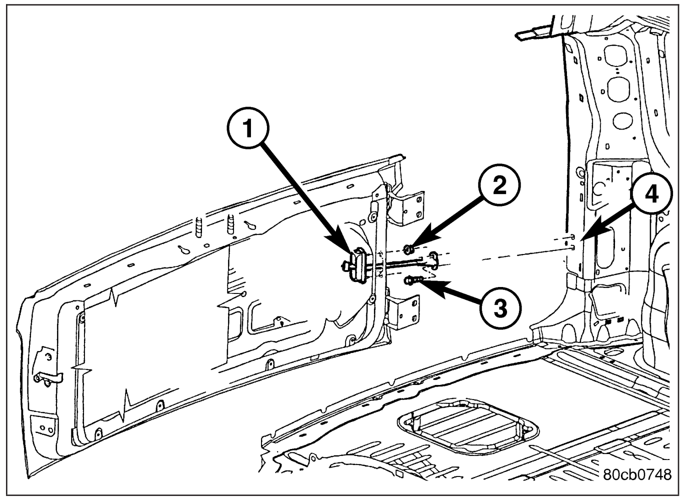
4. Install the exterior handle (3). (Refer to 23 - BODY/SWING GATE/EXTERIOR HANDLE - INSTALLATION)



# CHECK STRAP

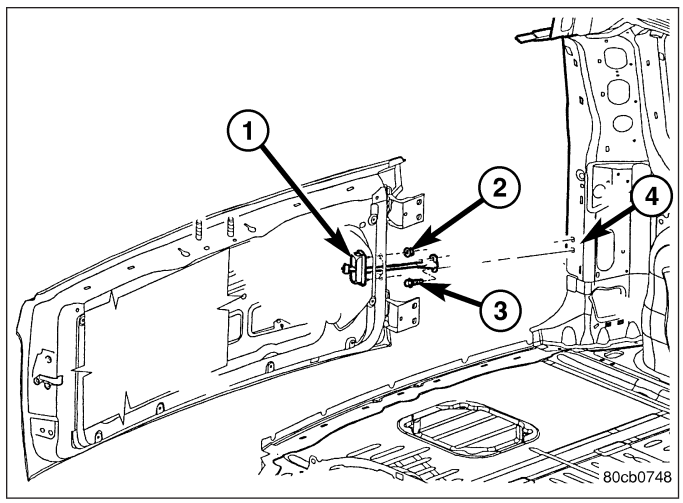
## REMOVAL

1. Remove the swing gate trim panel. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - REMOVAL)
2. Remove the quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)
3. Remove the bolts (3) attaching the check strap (1) to the D-pillar (4).
4. Peel back the waterdam.
5. Remove the nuts and remove the check strap (2) from the swing gate.



## INSTALLATION

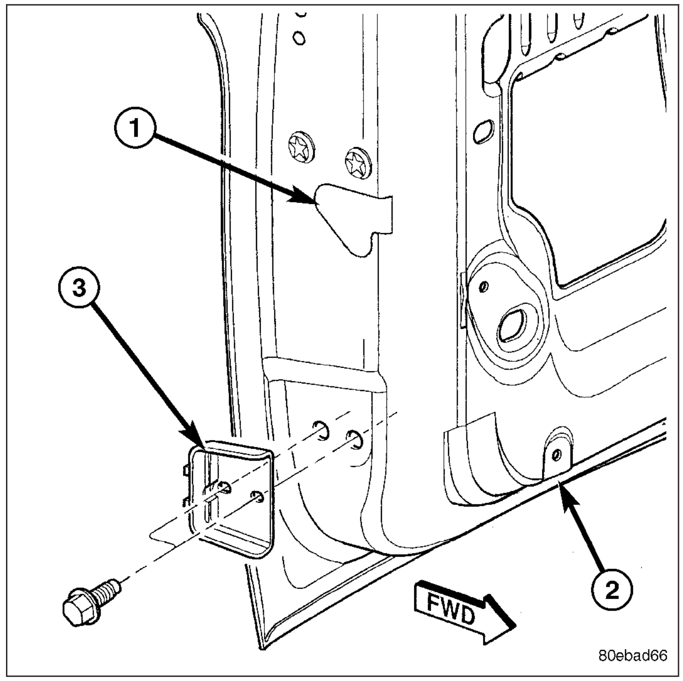
1. Install the check strap.
2. Install the nuts and tighten to 10 N·m (85 in. lbs.).
3. Reposition the waterdam.
4. Install the trim panel. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - INSTALLATION)
5. Install the bolts attaching the check strap to the D-pillar and tighten to 11 N·m (8 ft. lbs.).
6. Install the quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)



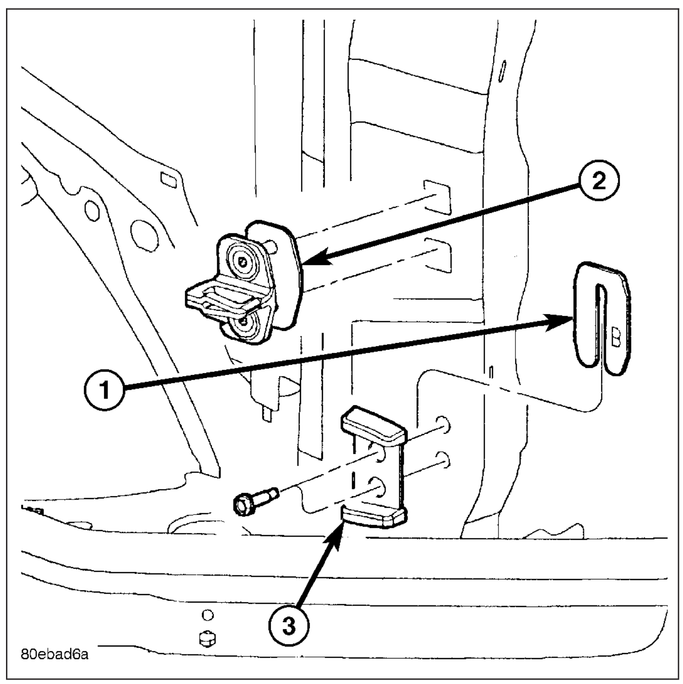
# STABILIZER WEDGE/INSERT

## REMOVAL

1. Open the swing gate.
2. Using a grease pencil or equivalent, mark the location of the stabilizer cup (3) and insert to aid installation.
3. Remove the bolts for the stabilizer cup and remove the cup.

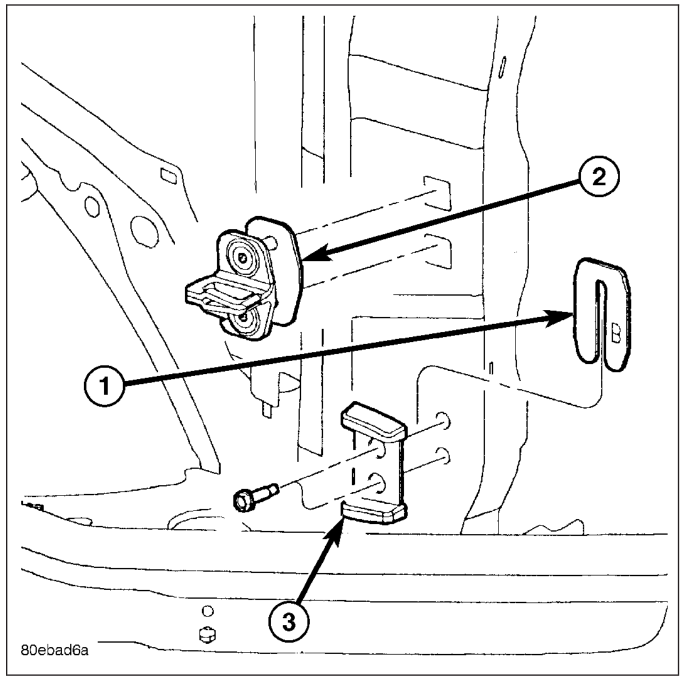


4. Remove the bolts for the insert and remove the insert (3) and shim (1), if equipped.

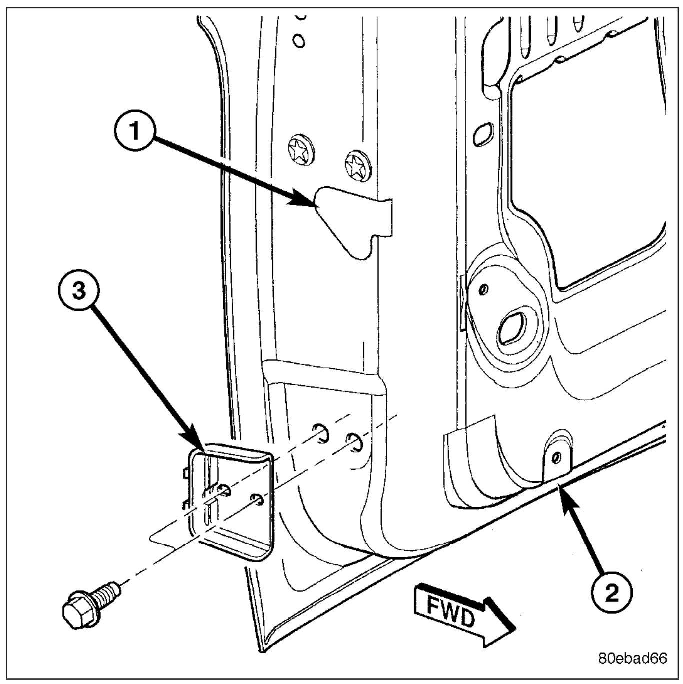


## INSTALLATION

1. Install the stabilizer insert (3) with the narrow end toward the rear of the vehicle and install the bolts.
2. Tighten the bolts to 9 N·m (80 in. lbs.).



3. Install the stabilizer cup (3) and loosely install the bolts.
4. Adjust the stabilizer and tighten the bolts to 9 N·m (80 in. lbs.). (Refer to 23 - BODY/SWING GATE/ STABILIZER WEDGE/INSERT - ADJUSTMENTS)



## ADJUSTMENTS

## ADJUSTMENT

1. Adjust the insert up/down so that it is centered within the stabilizer cup.
2. Adjust the insert for/aft so the swing gate is 1.0 mm over flush to the D-pillar when the insert contacts the rubber bumper in the stabilizer cup.
3. Open the swing gate and tighten the bolts to 9 N·m (80 in. lbs.).

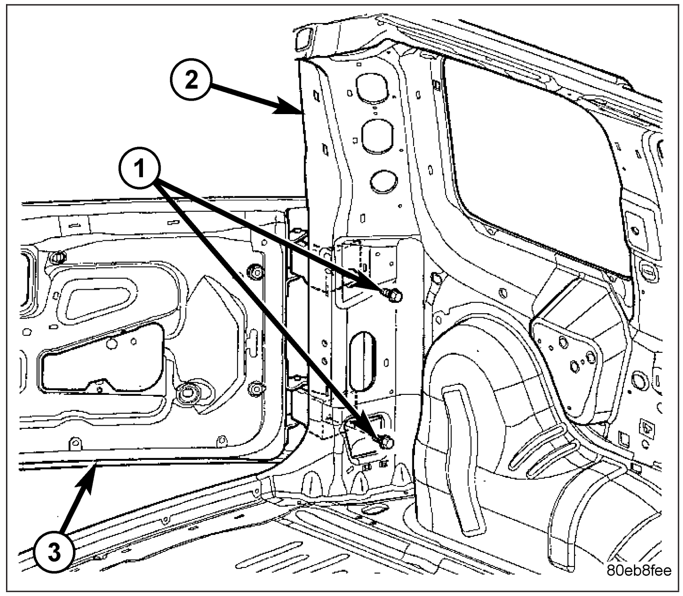
**NOTE: Make sure the stabilizer cup and insert are parallel to each other and not twisted.**

4. Close the swing gate and grab the beltline. Confirm minimal for/aft movement and that closing effort is not excessive. Readjust as required.

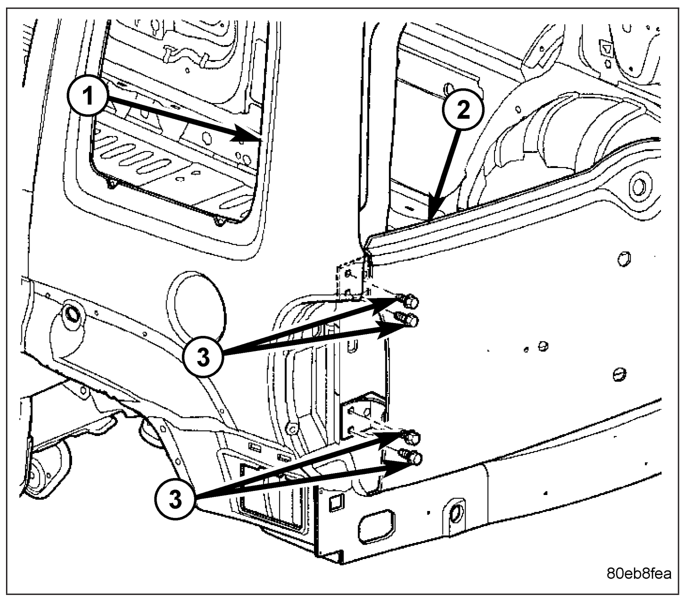
# HINGE

## REMOVAL

1. Remove the swing gate (3). (Refer to 23 - BODY/SWING GATE/SWING GATE - REMOVAL)
2. Using a grease pencil or equivalent, mark the original location of the hinges to aid installation.
3. Remove the bolts (1) from inside the quarter panel.

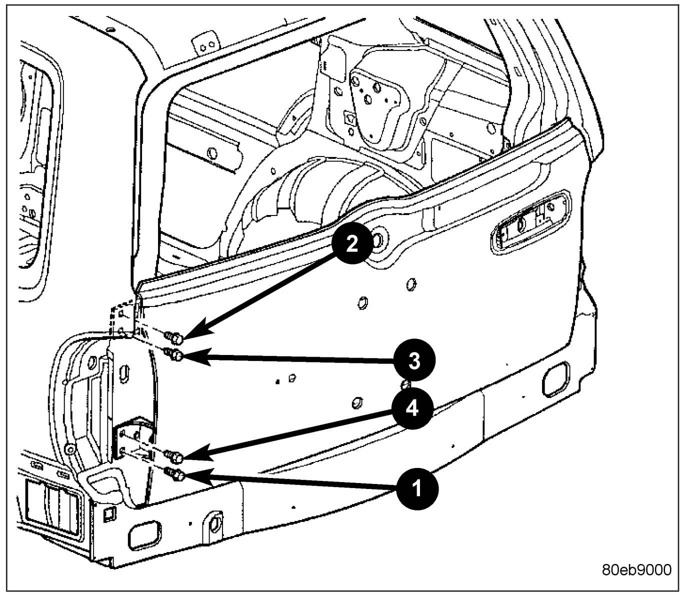


4. Remove the outer hinge bolts (3) and remove the hinges.

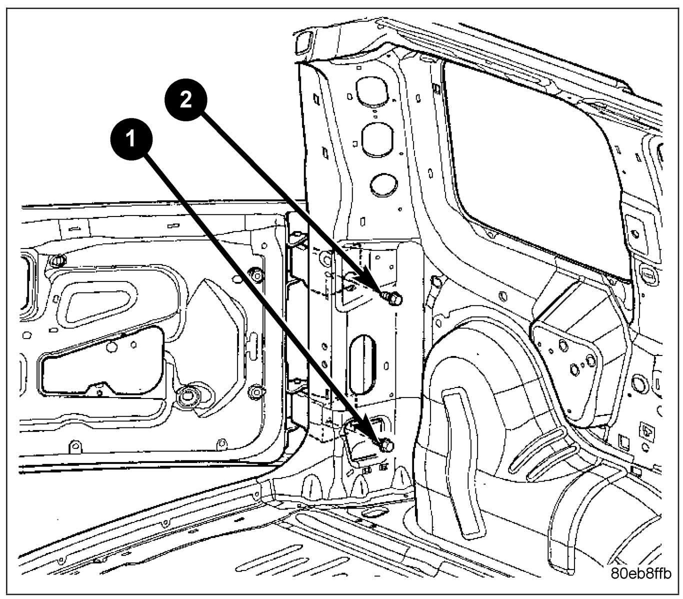


## INSTALLATION

1. Install the hinges and install the inner and outer fasteners.
2. Tighten the outer fasteners to 31 N·m (23 ft. lbs.) using the sequence indicated.



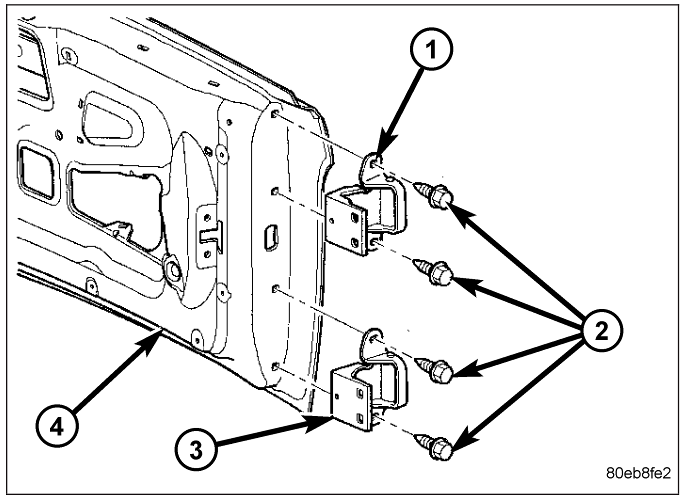
3. Tighten the inner fasteners to 31 N·m (23 ft. lbs.) using the sequence indicated.
4. Install the swing gate. (Refer to 23 - BODY/SWING GATE/ SWING GATE - INSTALLATION)



# SWING GATE

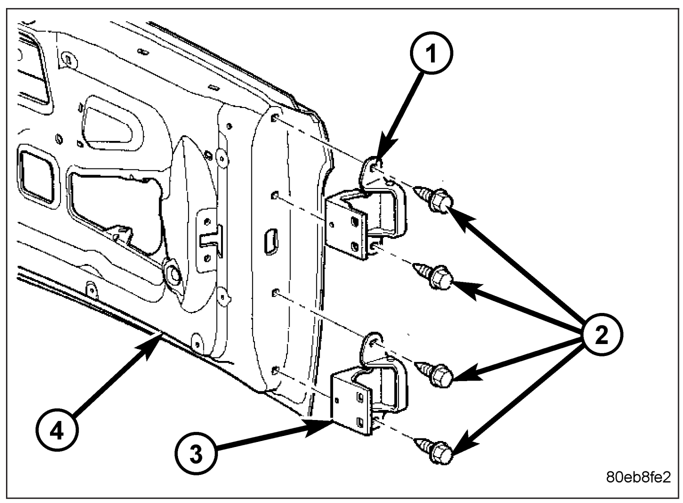
## REMOVAL

1. Remove the spare tire. (Refer to 22 - TIRES/WHEELS/TIRES/SPARE TIRE - REMOVAL)
2. Remove the quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)
3. Support the swing gate with a suitable lifting device.
4. Disconnect the wire harness.
5. Disconnect the check strap from the D-pillar. (Refer to 23 - BODY/SWING GATE/CHECK STRAP - REMOVAL)
6. Remove the bolts (2) and remove the swing gate.



## INSTALLATION

1. Install the swing gate (4) and install the bolts (2).
2. Tighten the bolts to 31 N·m (23 ft. lbs.).
3. Adjust the swing gate as needed adding 3 mm on the right side to compensate for sag after the spare tire is installed. (Refer to 23 - BODY/SWING GATE/SWING GATE - ADJUSTMENTS)
4. Connect the wire harness electrical connector.
5. Connect the check strap. (Refer to 23 - BODY/SWING GATE/CHECK STRAP - INSTALLATION)
6. Install the quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)
7. Install the spare tire. (Refer to 22 - TIRES/WHEELS/TIRES/SPARE TIRE - INSTALLATION)



## ADJUSTMENTS

## ADJUSTMENT

**NOTE: Swing gate adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.**

- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**
- **A suitable body sealant should be used when removing or moving the hinges.**

1. Remove the spare tire. (Refer to 22 - TIRES/WHEELS/TIRES/SPARE TIRE - REMOVAL)

## IN/OUT

**NOTE: In/out swing gate adjustment is done by loosening the hinge to gate fasteners one hinge at a time and moving the door to the correct position.**

**NOTE: With the spare tire removed add 3 mm on the right side to compensate for sag after the spare tire is installed.**

1. Remove the latch striker. (Refer to 23 - BODY/SWING GATE/LATCH STRIKER - REMOVAL)
2. Remove the stabilizer wedge/striker. (Refer to 23 - BODY/SWING GATE/STABILIZER WEDGE - REMOVAL)
3. For hinge side adjustments, loosen the hinge bolts and leave one upper hinge bolt hand tight. (Refer to 23 - BODY/SWING GATE/HINGE - REMOVAL)
4. Adjust the swing gate to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the fasteners. (Refer to 23 - BODY/SWING GATE/HINGE - INSTALLATION)
6. Install the latch striker. (Refer to 23 - BODY/SWING GATE/LATCH STRIKER - INSTALLATION)
7. Install the spare tire. (Refer to 22 - TIRES/WHEELS/TIRES/SPARE TIRE - INSTALLATION)

## UP/DOWN

**NOTE: Up/down swing gate adjustment is done by loosening the hinge to gate fasteners or the hinge to body fasteners, one hinge at a time and moving the door to the correct position.**

**NOTE: With the spare tire removed add 3 mm on the right side to compensate for sag after the spare tire is installed.**

1. Remove the latch striker. (Refer to 23 - BODY/SWING GATE/LATCH STRIKER - REMOVAL)
2. Remove the stabilizer wedge/striker. (Refer to 23 - BODY/SWING GATE/STABILIZER WEDGE - REMOVAL)
3. For hinge side adjustments, loosen the hinge bolts and leave one upper hinge bolt hand tight. (Refer to 23 - BODY/SWING GATE/HINGE - REMOVAL)
4. Adjust the swing gate to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the fasteners. (Refer to 23 - BODY/SWING GATE/HINGE - INSTALLATION)
6. Install the latch striker. (Refer to 23 - BODY/SWING GATE/LATCH STRIKER - INSTALLATION)
7. Install the spare tire. (Refer to 22 - TIRES/WHEELS/TIRES/SPARE TIRE - INSTALLATION)

## LEFT/RIGHT

**NOTE: Left/right swing gate adjustment is done by loosening the hinge to body fasteners one hinge at a time and moving the door to the correct position.**

**NOTE: With the spare tire removed add 3 mm on the right side to compensate for sag after the spare tire is installed.**

1. Remove the latch striker. (Refer to 23 - BODY/SWING GATE/LATCH STRIKER - REMOVAL)
2. Remove the stabilizer wedge/striker. (Refer to 23 - BODY/SWING GATE/STABILIZER WEDGE - REMOVAL)
3. Loosen the hinge to body bolts and leave one upper hinge bolt hand tight. (Refer to 23 - BODY/SWING GATE/HINGE - REMOVAL)
4. Adjust the swing gate to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the fasteners. (Refer to 23 - BODY/SWING GATE/HINGE - INSTALLATION)
6. Install the latch striker. (Refer to 23 - BODY/SWING GATE/LATCH STRIKER - INSTALLATION)
7. Install the spare tire. (Refer to 22 - TIRES/WHEELS/TIRES/SPARE TIRE - INSTALLATION)

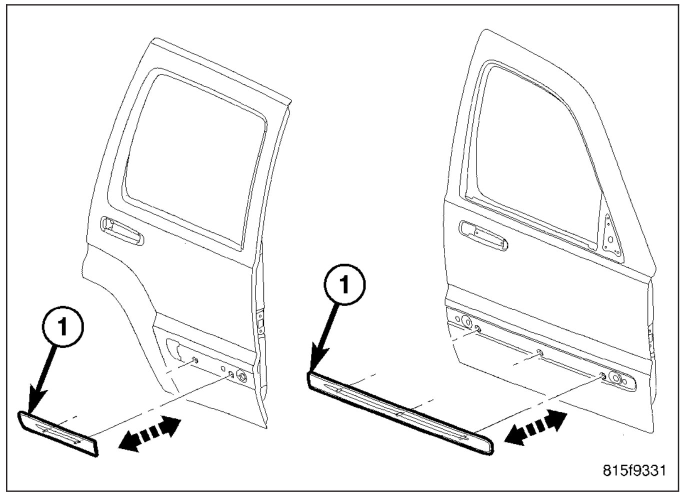
# EXTERIOR

## TABLE OF CONTENTS

# BODY SIDE MOLDINGS

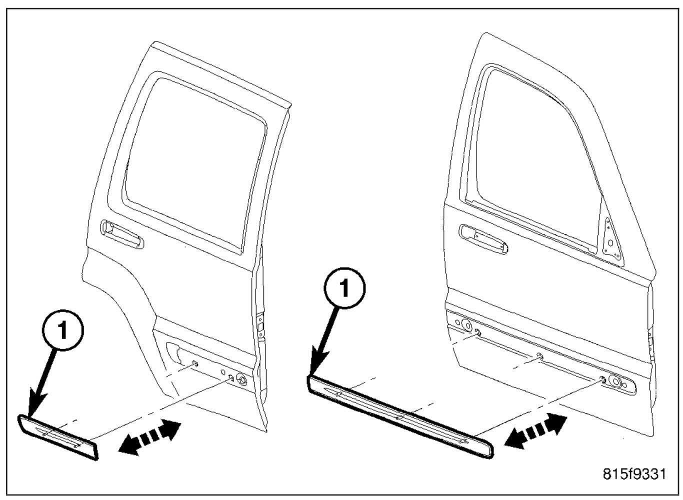
## REMOVAL

1. Using a trim stick C-4755 or equivalent, remove and discard the molding (1) from the outside of the door.



## INSTALLATION

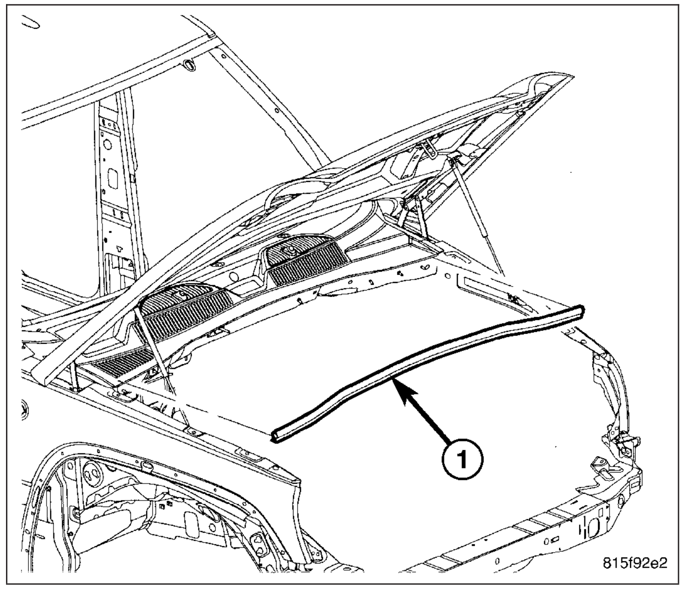
1. Thoroughly clean all residue from the body side molding attachment area of the door.
2. Wipe area clean with a 50% solution of water and alcohol and wipe dry.
3. Apply new body side molding using the locators in the door and apply pressure of approximately 40 p.s.i. over the entire surface of the molding.



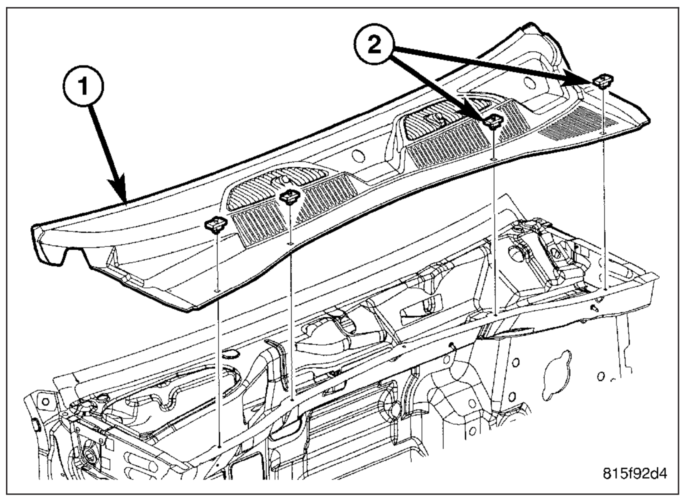
# COWL GRILLE

## REMOVAL

1. Remove the hood seal (1).

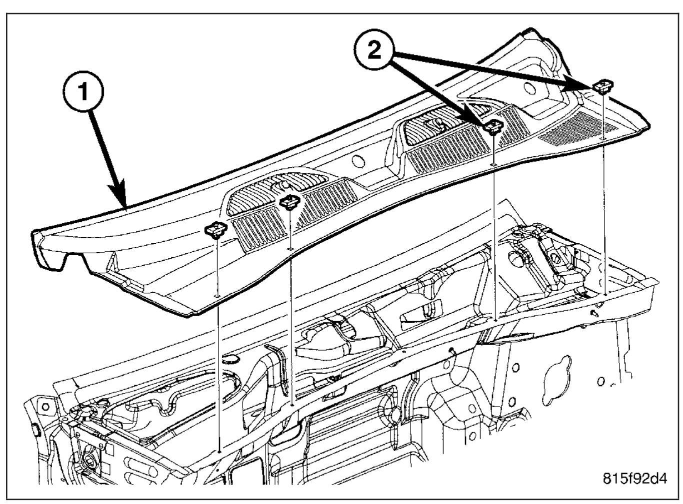


2. Remove the wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL)
3. Remove the four plastic retainers (2) and remove the cowl grille (1).

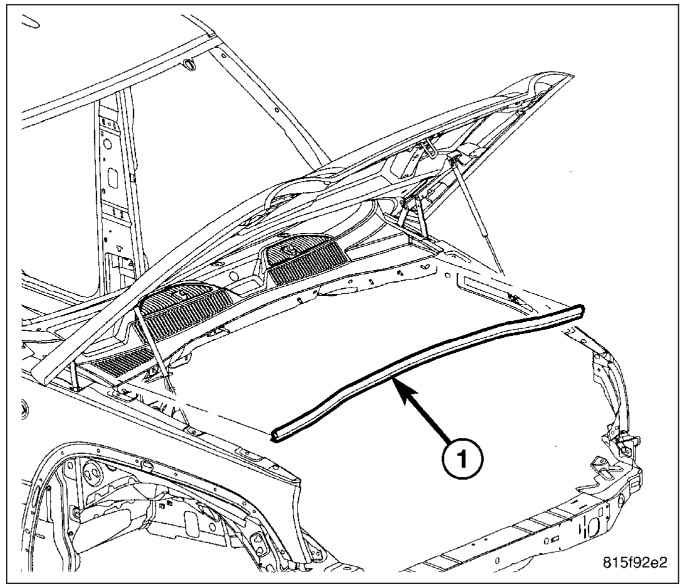


## INSTALLATION

1. Position the cowl grille (1) and engage the nine clips to the bottom of the windshield.
2. Install the four plastic retainers (2).
3. Install the wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION)



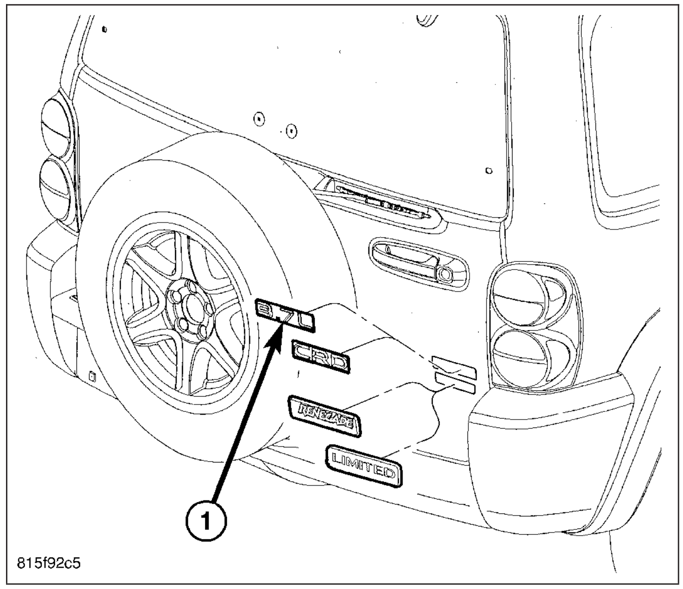
4. Install the hood seal (1).



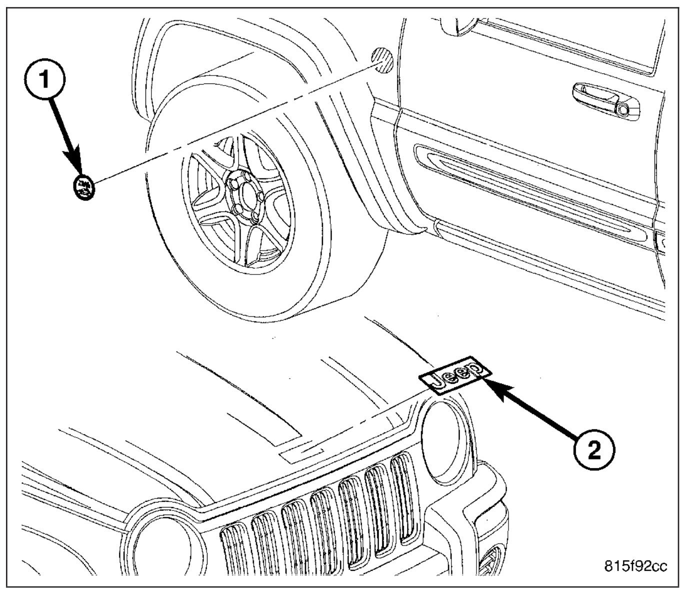
# EXTERIOR NAME PLATES

## REMOVAL

1. Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.

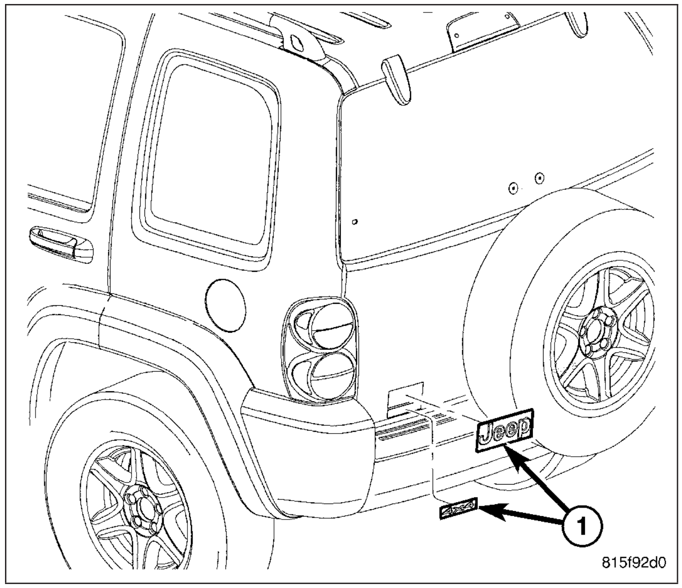


2. Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.



**NOTE: Exterior nameplates are attached to body panels with adhesive tape.**

3. Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.

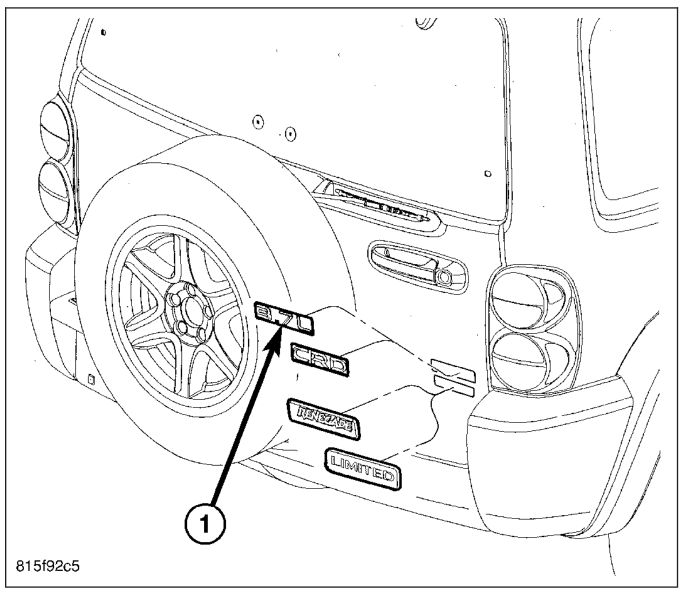


815f92d0

4. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.
5. Using a trim stick C-4755 or equivalent, behind the emblem to separate the adhesive backing from the body.
6. Clean adhesive residue from body with MOPAR® Super Clean solvent or equivalent.

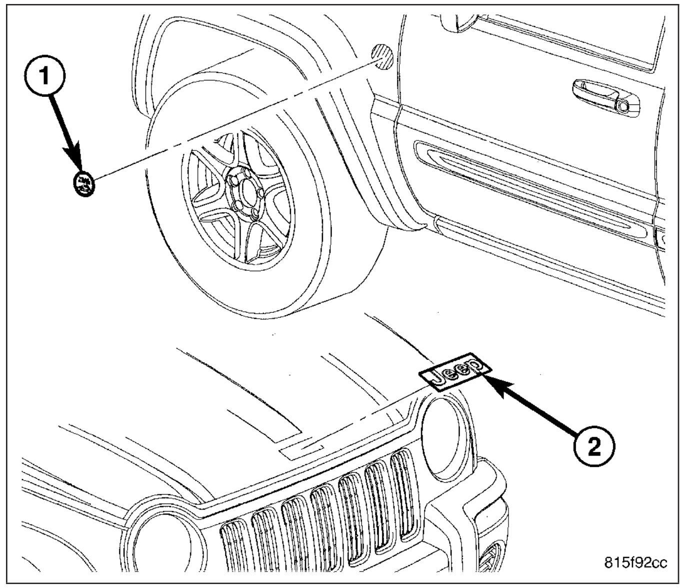
## INSTALLATION

1. Remove protective cover from adhesive tape on back of emblem.
2. Position emblem properly on body.

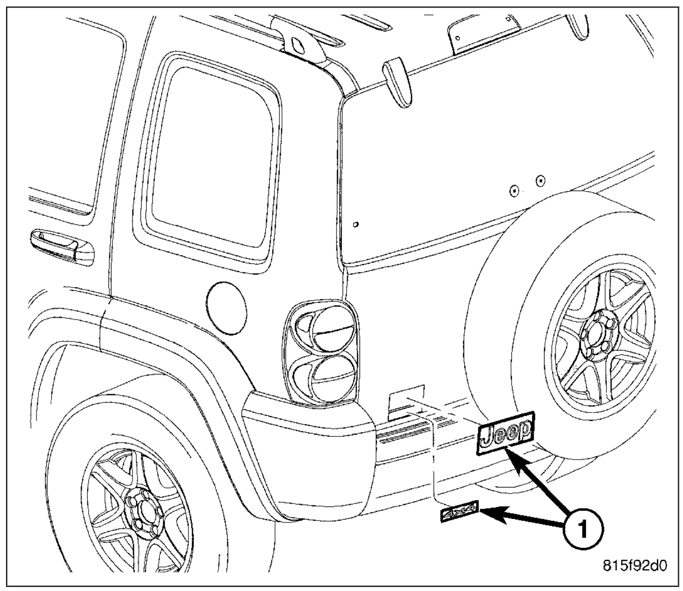


815f92c5

3. Position emblem properly on body.



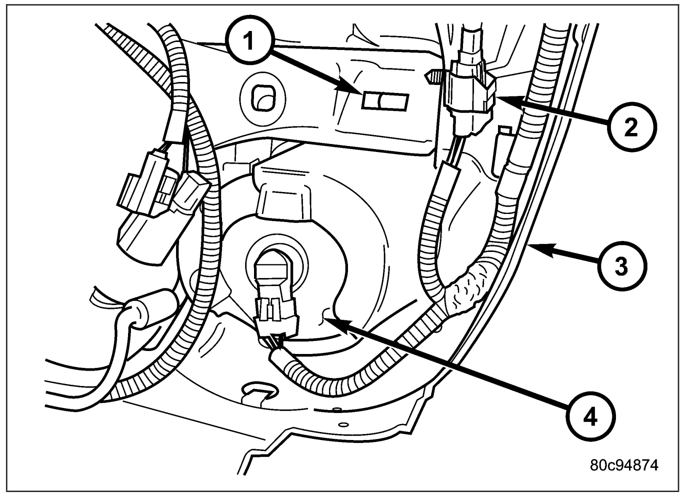
4. Position emblem properly on body.
5. Press emblem firmly to body with palm of hand.
6. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.



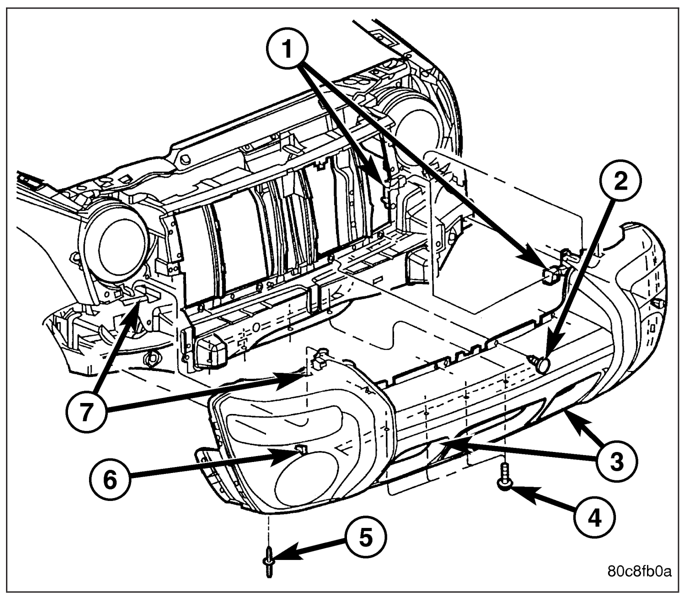
# FRONT FENDER

## REMOVAL

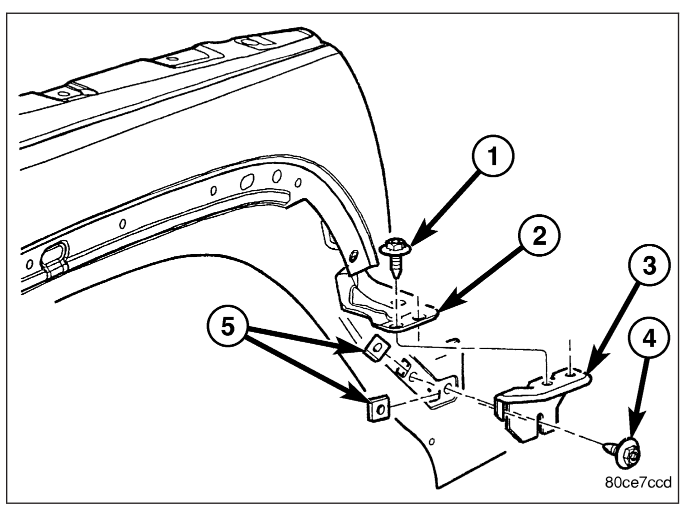
1. Remove the wheel opening splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL)
2. Remove the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL)
3. Raise and support vehicle.
4. Release the inner support clips from within the fascia between the lights.



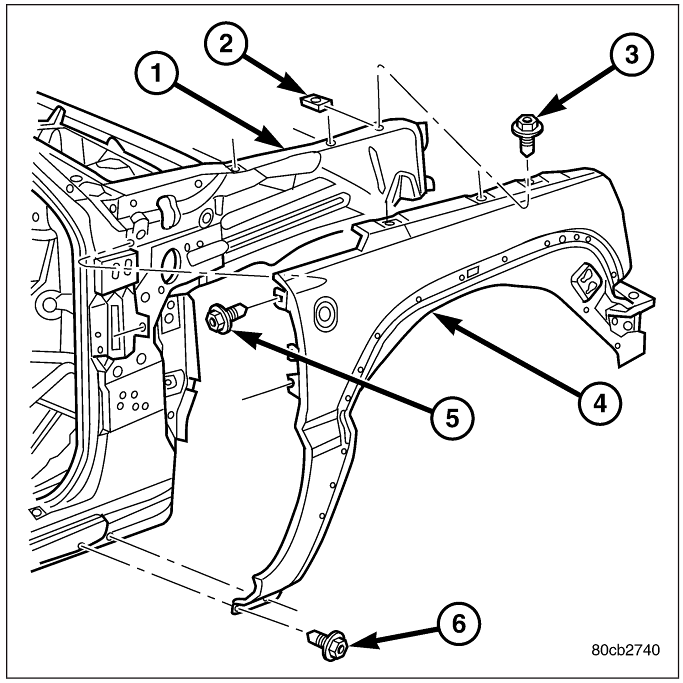
5. Release the support tabs beneath the headlamps and position the fascia assembly aside to access the fender support bracket bolts.



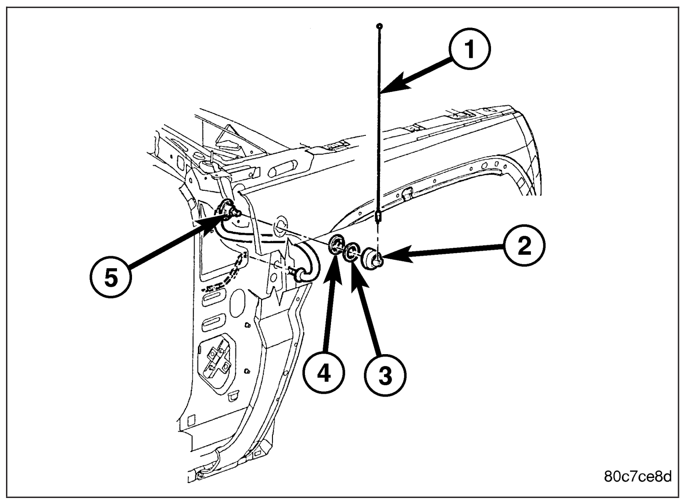
6. Remove the front wheel opening flare moldings. (Refer to 23 - BODY/EXTERIOR/FRONT WHEEL OPENING FLARE MOLDINGS - REMOVAL)
7. Remove the fender support bracket bolts.



8. Remove the bolts and remove the fender.

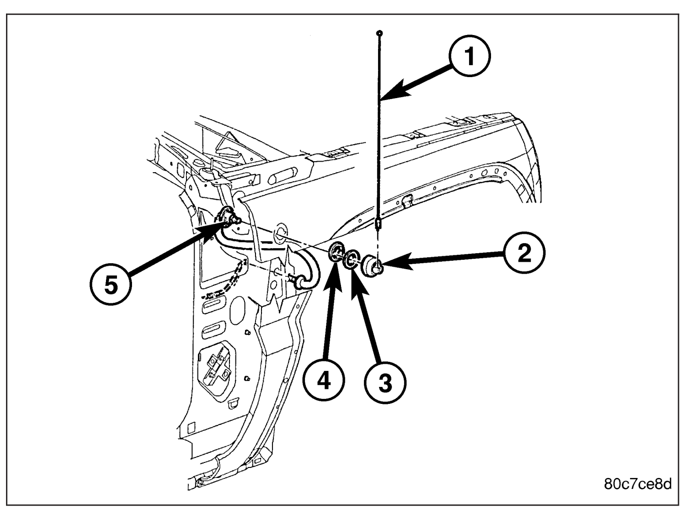


9. Remove the antenna body, if equipped (1). (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - REMOVAL)

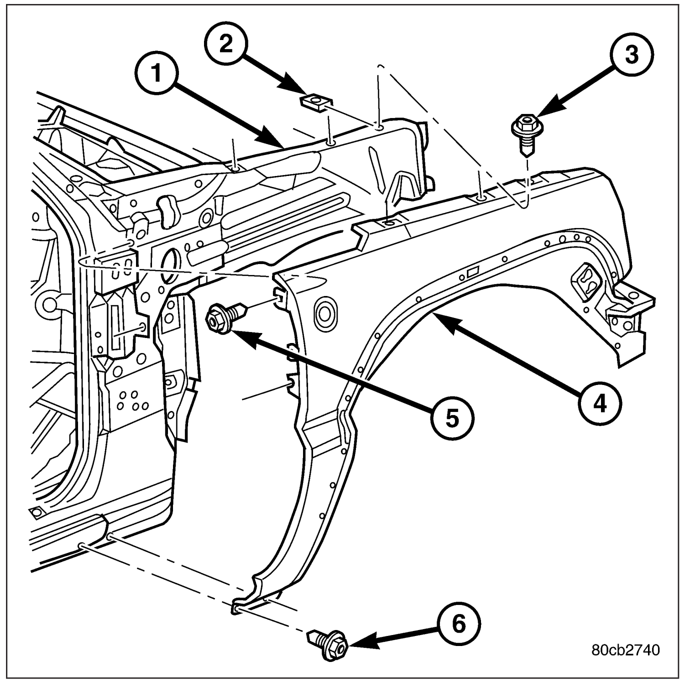


## INSTALLATION

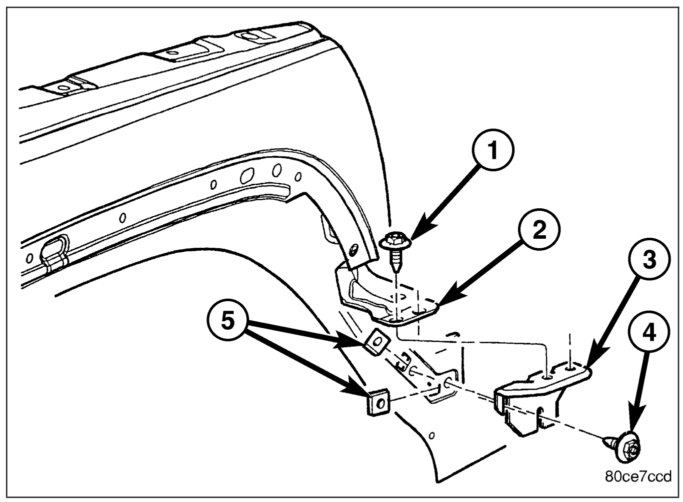
1. Install the antenna body (1), if equipped. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - INSTALLATION)



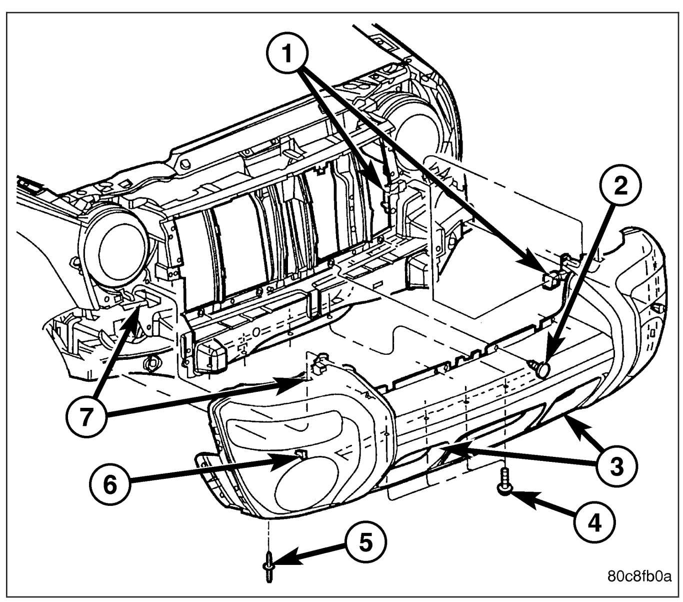
2. Install the fender assembly (4) and install the bolts.



3. Install the fender support bracket (3) and install the bolts.
4. Align the fender with adjacent body parts and tighten the bolts to 12 N·m (9 ft. lbs.). (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)



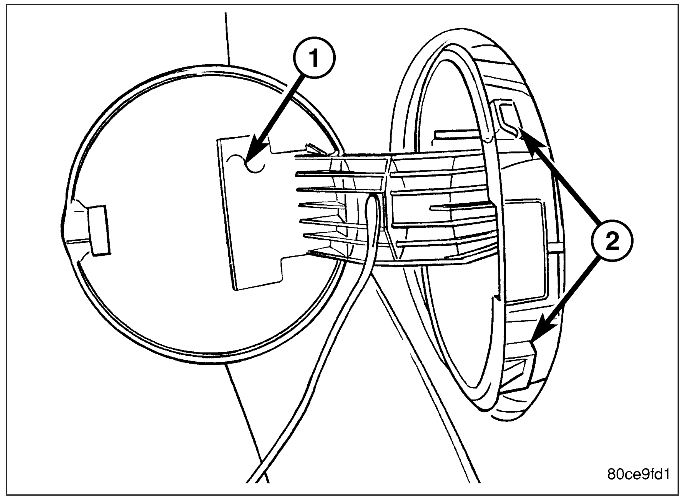
5. Install the fascia assembly. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION)
6. Install the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - INSTALLATION)



# FUEL FILL DOOR/HOUSING

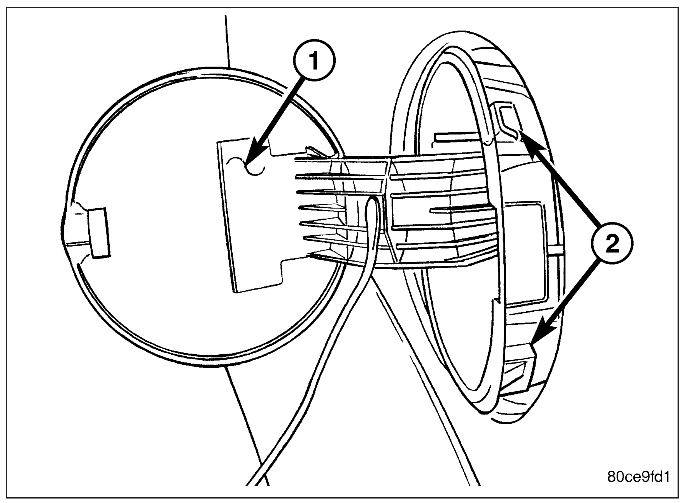
## REMOVAL

1. Remove the fuel cap.
2. Remove the three screws connecting the fuel door/housing to the filler neck.
3. Reach in through the opening and depress the tabs (2) at the upper and bottom right of the door/housing.
4. Remove the fuel door/housing from the vehicle.



## INSTALLATION

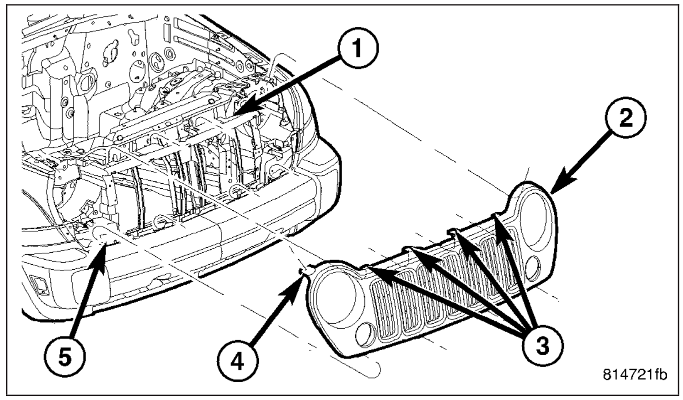
1. Position the fuel filler door/housing into the vehicle and fully seat the tabs (2).
2. Install the three screws.
3. Install the fuel cap.



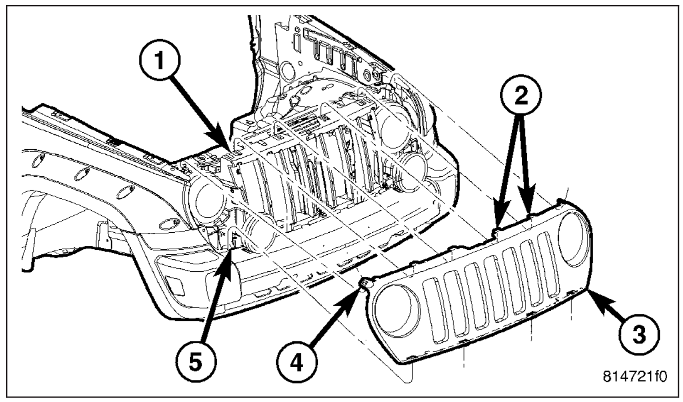
# GRILLE

## REMOVAL

1. Release the upper clips (3 and 4).
2. Roll the grille (2) forward and disengage the two grille hooks (5) under the headlamp units.
3. Lift the grille forward and up off of the location tabs at the bottom and remove.

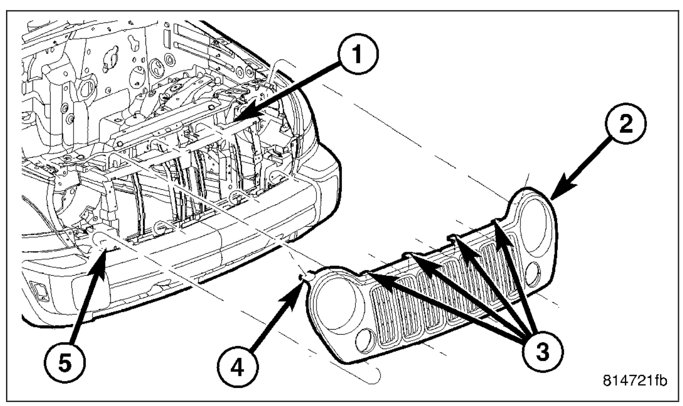


**NOTE: The procedure to remove the Renegade grille (3) is similar to the standard grille shown above.**

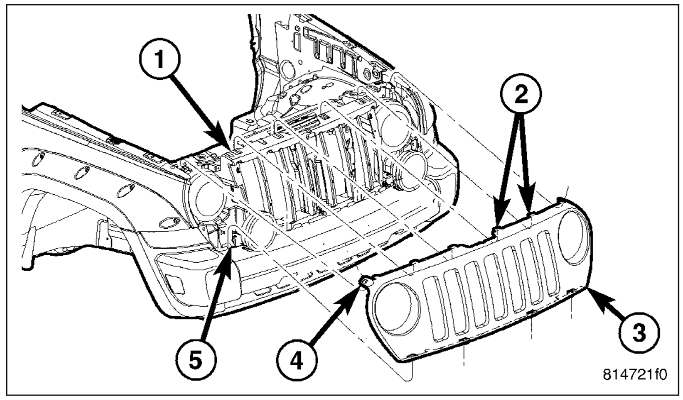


## INSTALLATION

1. Install the grille (2) onto the locating tabs (5) at the bottom.
2. Push the grille back and snap the hooks (3 and 4) onto the grille opening reinforcement (1).

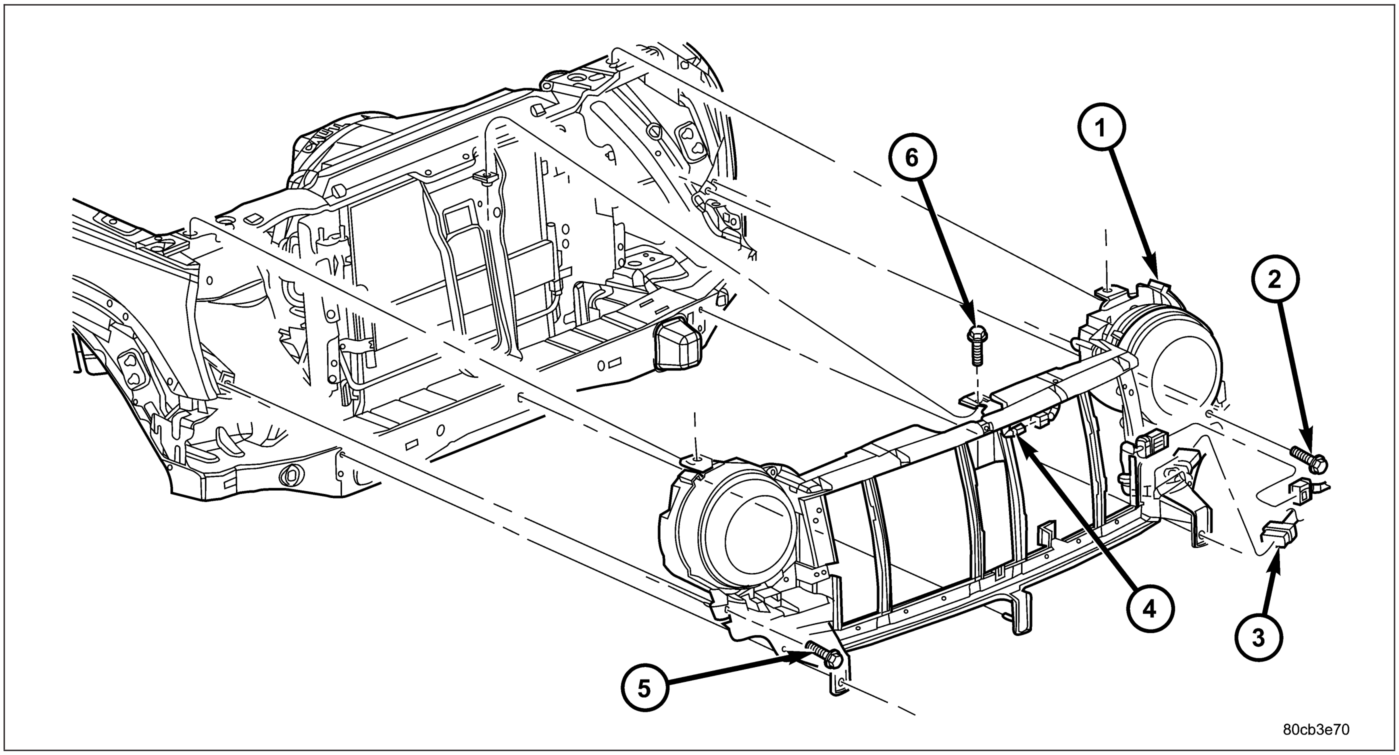


**NOTE: The procedure to install the Renegade grille (3) is similar to the standard grille shown.**



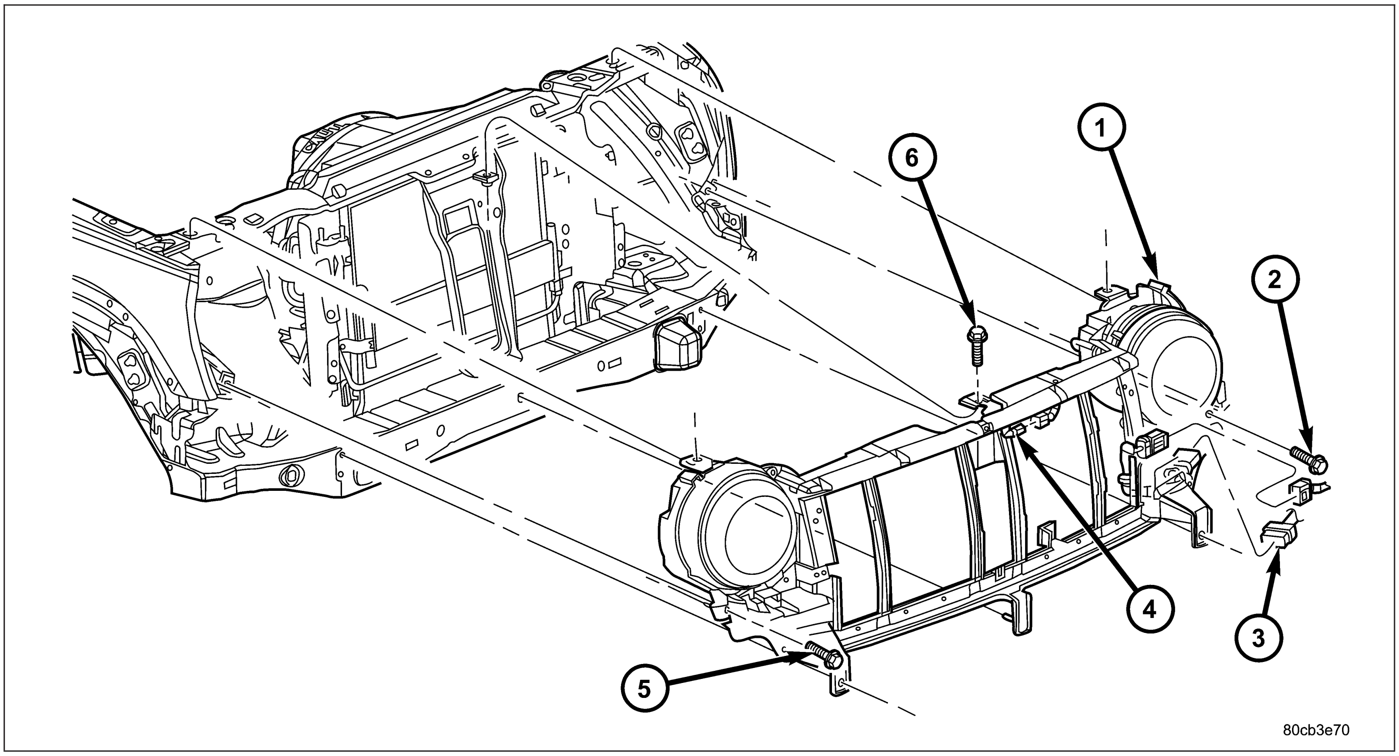
# GRILLE OPENING REINFORCEMENT

## REMOVAL



1. Remove the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL)
2. Remove the front fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)
3. Disconnect the electrical connectors (3).
4. Disconnect the rubber side flap push pin connectors.
5. Remove the seven bolts (2, 5 and 6) and remove the grille opening reinforcement (1).
6. Disconnect the headlamp units electrical connectors.
7. Remove the headlamp units. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL)

## INSTALLATION

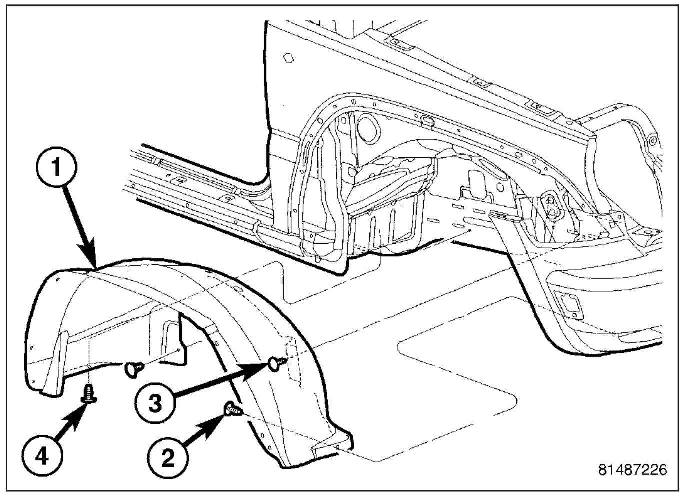


1. Install the headlamp units. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION)
2. Connect the headlamp unit electrical connectors.
3. Install the grille opening reinforcement (1) and install the seven bolts. (2, 5 and 6)
4. Tighten the bolts to 10 N·m (85 in. lbs.).
5. Connect the rubber side flap and install the push pin connectors.
6. Connect the electrical connectors.
7. Install the front fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION)
8. Install the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION)

# FRONT WHEELHOUSE SPLASH SHIELD

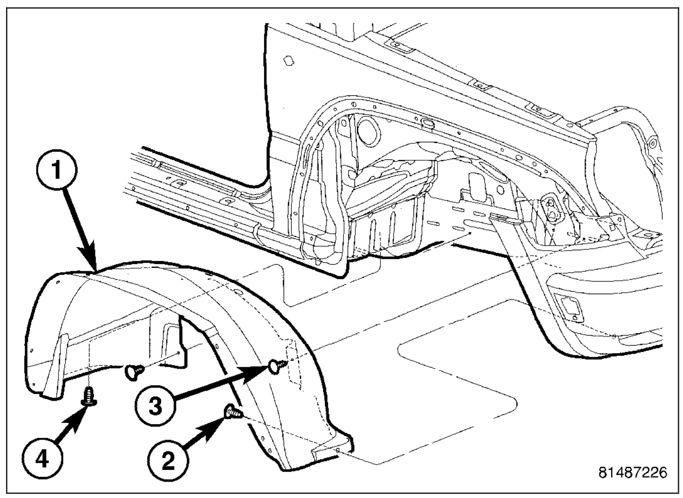
## REMOVAL

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Turn wheel as necessary to gain access to fasteners.
3. Remove the four rivets connecting the flare to the splash shield
4. Remove the rivet connecting the splash shield to the side sill molding.
5. Remove the three screw/rivets connecting the splash shield to the fascia.
6. Remove the four push pin fasteners and remove the splash shield.



## INSTALLATION

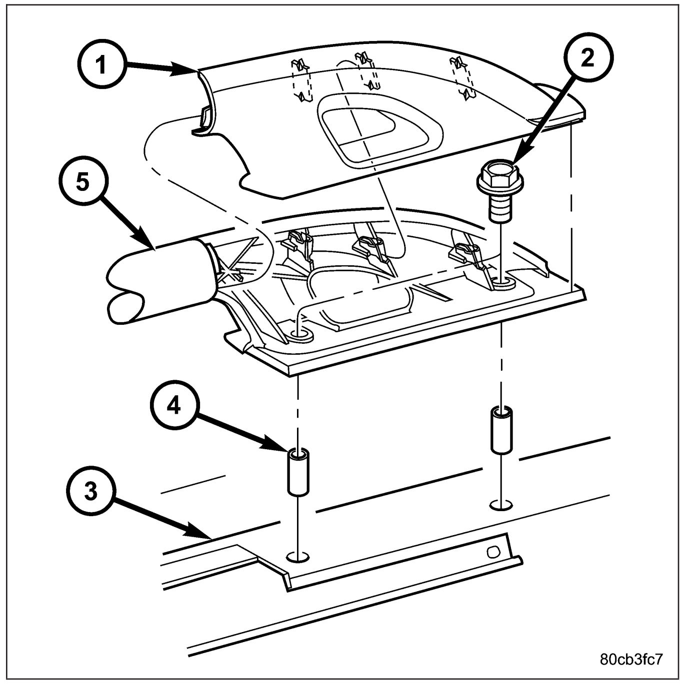
1. Install the splash shield (1) and position above the wheel opening flare molding.
2. Install the four push pin fasteners (2 - 4).
3. Install the three screw/rivets connecting the splash shield to the fascia.
4. Install the four rivets connecting the flare to the splash shield
5. Install the rivet connecting the splash shield to the side sill molding.



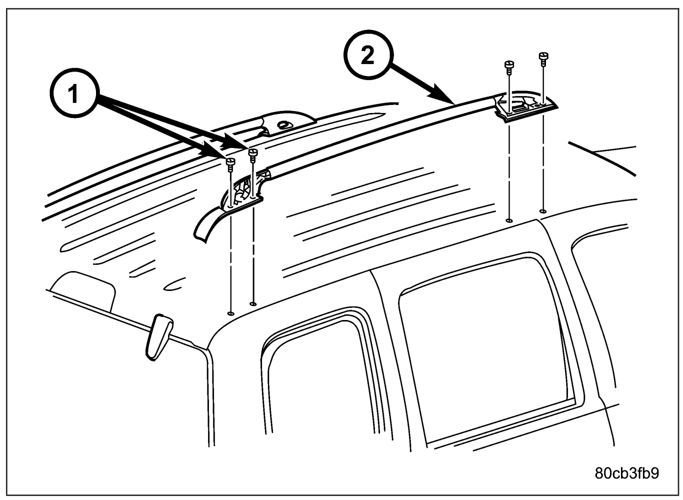
# LUGGAGE RACK

## REMOVAL

1. Using a trim stick C-4755 or equivalent, remove the roof rack covers.

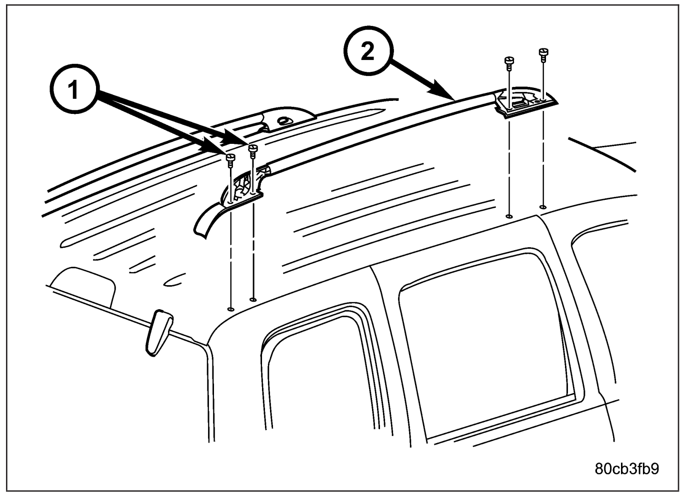


2. Remove the bolts and remove the roof rack.

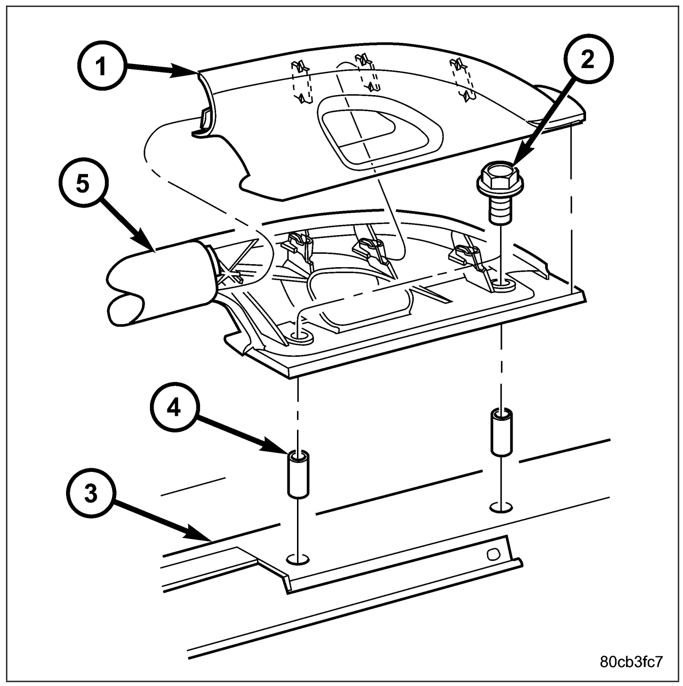


## INSTALLATION

1. Install the roof rack (2) and install the bolts (1).
2. Tighten the bolts to 8 N·m (75 in. lbs.).



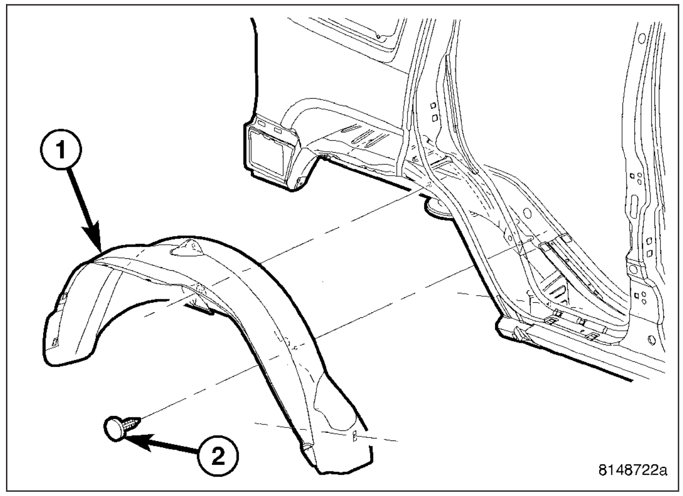
3. Snap on the roof rack covers (1).



# REAR WHEELHOUSE SPLASH SHIELD

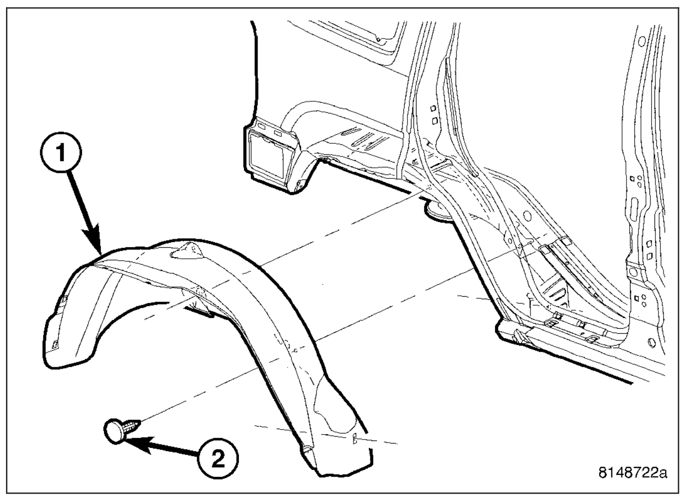
## REMOVAL

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel.
3. Remove the two rivets connecting the shield to the side sill molding.
4. Remove the four rivets connecting the flare molding to the shield.
5. Remove the two push pin fasteners (2) and remove the shield (1).



## INSTALLATION

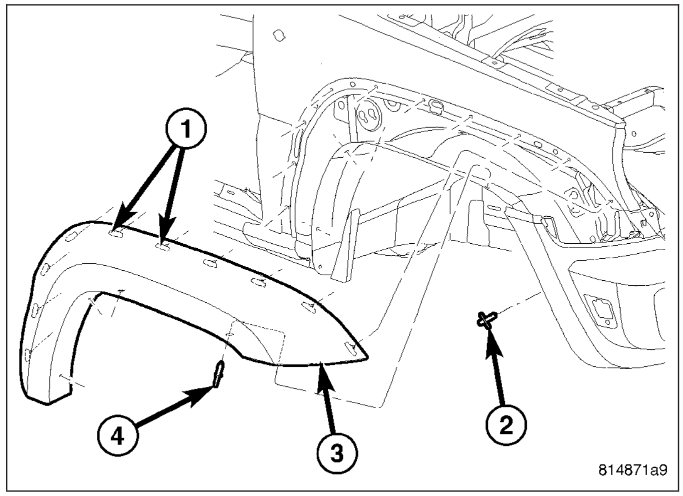
1. Install the splash shield (1) and install the three push pin fasteners (2).
2. Position the rear flare molding and seat the clips attaching it to the body and the rear fascia. (Refer to 23 - BODY/EXTERIOR/WHEEL OPENING FLARE MOLDING - INSTALLATION)
3. Install five new rivets attaching the flare to the splash shield.
4. Install the wheel. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE - WHEEL MOUNTING)



# FRONT WHEEL OPENING FLARE MOLDINGS

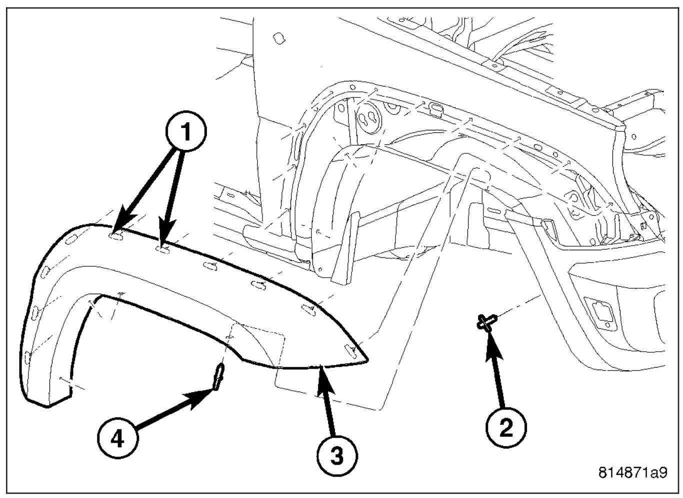
## REMOVAL

1. Remove the four rivets (4) connecting the flare to the splash shield.
2. Using a trim stick C-4755 or equivalent, separate the upper clips (1) attaching the molding (3) to the fender.
3. Remove the flare molding (3).



## INSTALLATION

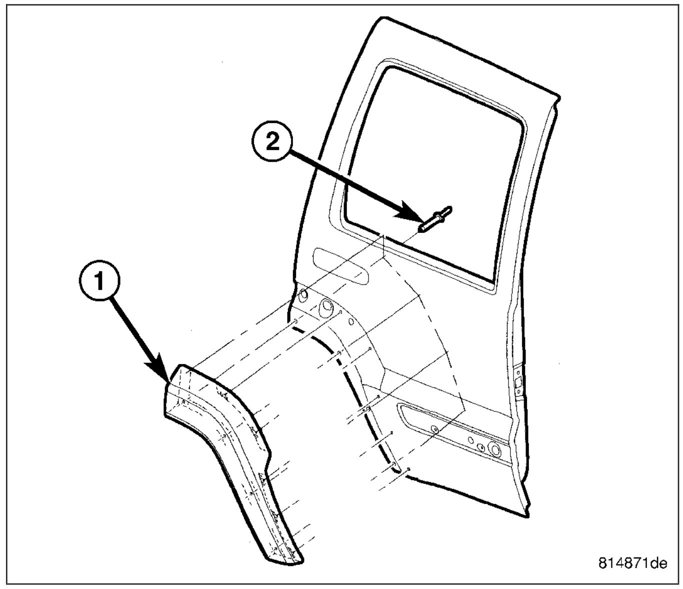
1. Position flare molding and seat clips into the fender.
2. Install four new rivets (4) securing the flare molding to the splash shield.



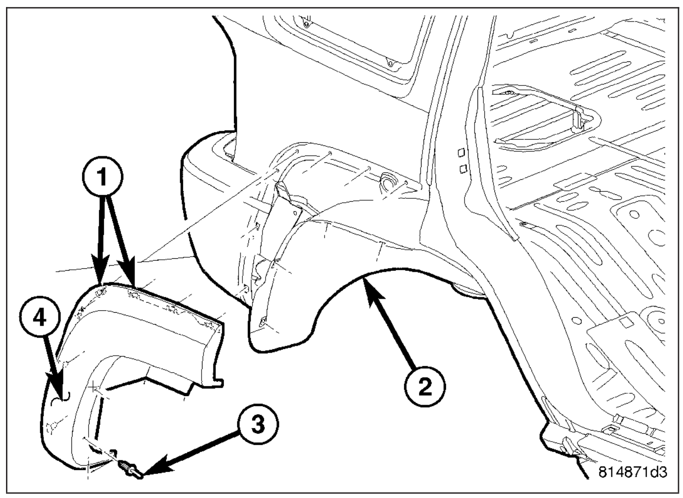
# REAR WHEEL OPENING FLARE MOLDINGS

## REMOVAL

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel.
3. Open the rear door and remove the five rivets (2) from the inside surface of the door.
4. Using a trim stick C-4755 or equivalent, separate the clips attaching the molding to the door and remove the molding.

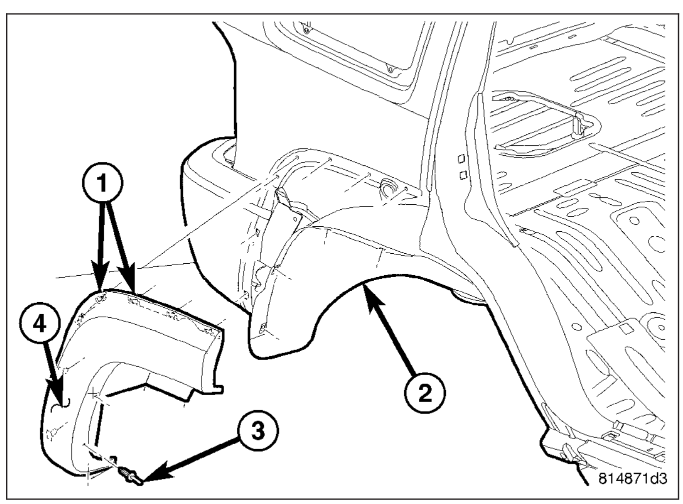


5. Remove the 5 rivets (3) from the rear flare (4) and splash shield (2).
6. Using a trim stick C-4755 or equivalent, separate the clips (1) attaching the molding (4) to the body and the rear fascia and remove the molding.

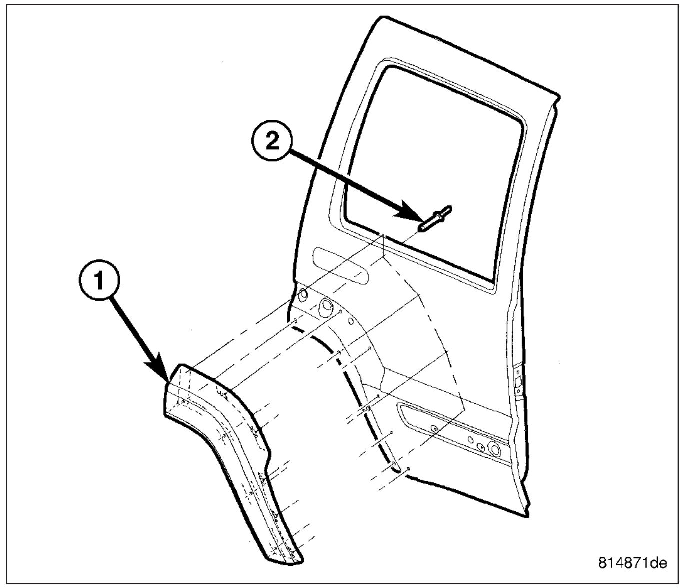


## INSTALLATION

1. Position the rear flare molding and seat the clips (1) attaching it to the body and the rear fascia.
2. Install five new rivets (3) attaching the flare to the splash shield (2).



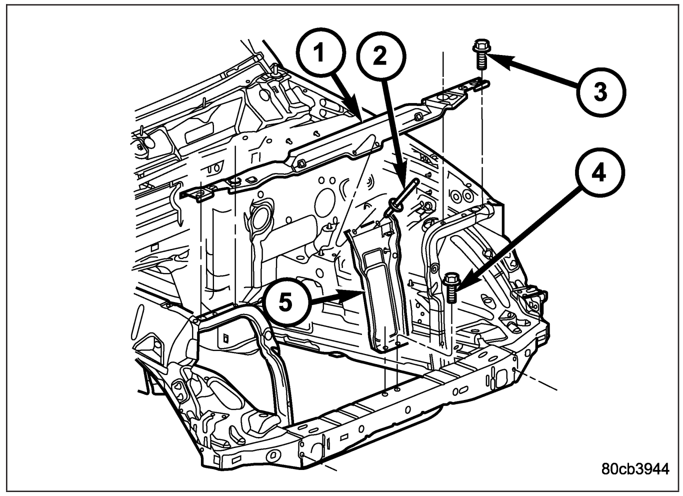
3. Position the door flare (1) and seat the clips.
4. Install five new rivets (2) through the inside surface of the door attaching the flare to the door.
5. Install the wheel. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE - WHEEL MOUNTING)



# RADIATOR CROSSMEMBER

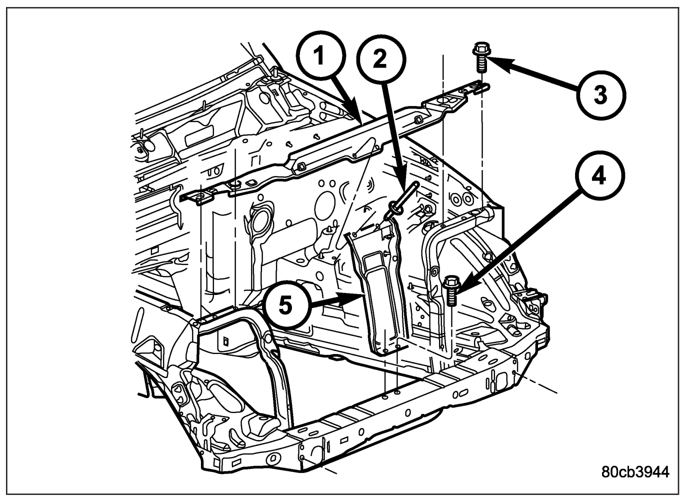
## REMOVAL

1. Remove the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL)
2. Remove the hood latch. (Refer to 23 - BODY/HOOD/LATCH - REMOVAL)
3. Remove the rivet securing the washer bottle to the crossmember.
4. Remove the rivets attaching the hood latch support to the crossmember.
5. Remove the bolts (4) and remove the hood latch support (5).
6. Remove the bolts (3) and remove the crossmember (1).



## INSTALLATION

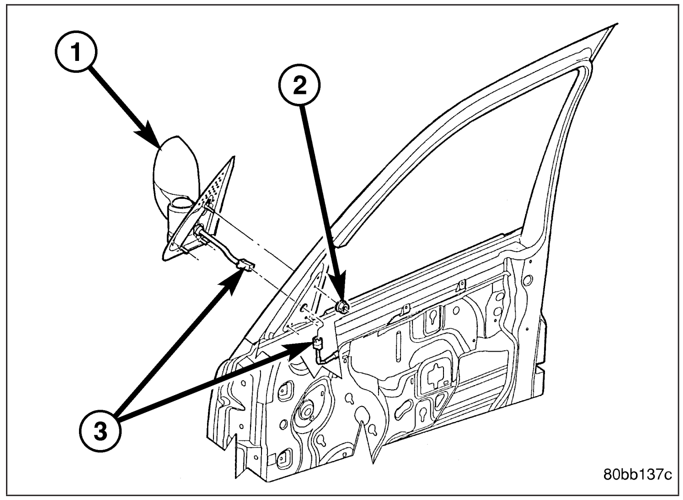
1. Install the crossmember (1) and install the bolts (3).
2. Tighten the bolts to 10 N·m (85 in. lbs.).
3. Install the hood latch support (5) and install the bolts (4).
4. Tighten the bolts to 10 N·m (85 in. lbs.).
5. Install new rivets (2) attaching the hood latch support to the crossmember.
6. Install the hood latch. (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION)
7. Install the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION)
8. Install a new rivet securing the washer bottle to the crossmember.



# SIDE VIEW MIRROR

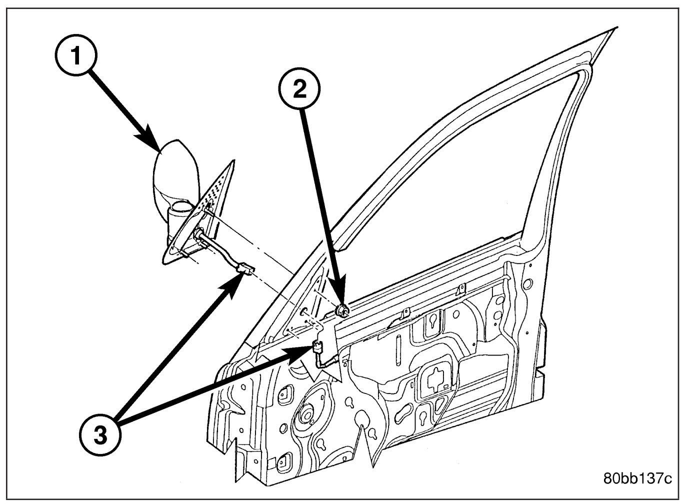
## REMOVAL

1. Remove the trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
2. Disconnect the electrical connector (3).
3. Remove the three nuts (2) and remove the mirror assembly (1).



## INSTALLATION

1. Install the mirror assembly (1).
2. Install the three nuts (2) and tighten to 7 N·m (65 in. lbs.).
3. Connect the electrical connector (3).
4. Install the trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)



# GLASS-OUTSIDE REARVIEW MIRROR

## REMOVAL

**WARNING: Always wear eye and hand protection when servicing the mirror assembly. Failure to observe these warnings may result in personal injury from broken glass.**

1. Carefully pull/pry the broken glass holder from the mirror assembly.
2. Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

## INSTALLATION

**CAUTION: It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.**

1. Position the new mirror glass holder to the mirror assembly.

**NOTE: Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.**

2. Align the mirror glass holder's attaching fingers to the mirror motor housing.

**NOTE: Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.**

3. Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

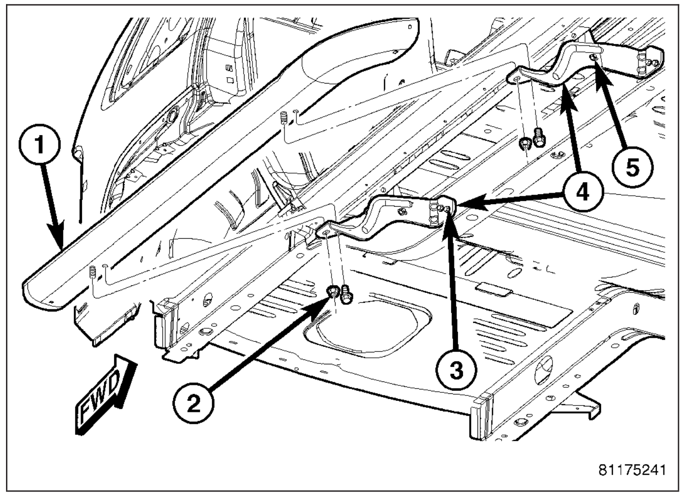
**NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.**

4. Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

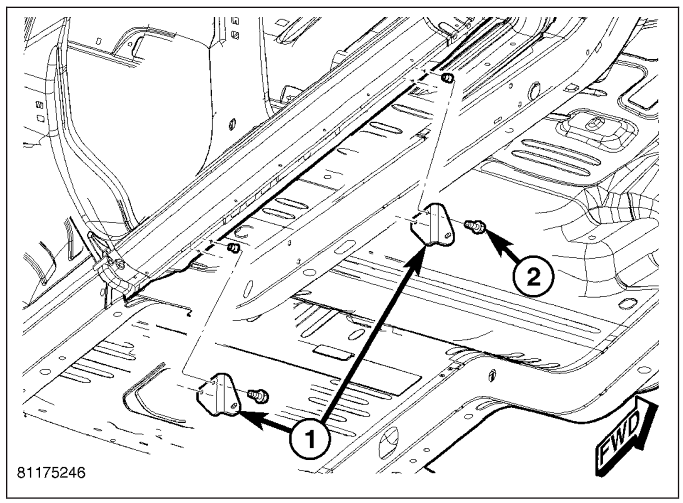
# SIDE STEP

## REMOVAL

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove side step bolts and nuts (2) and remove side step (1).

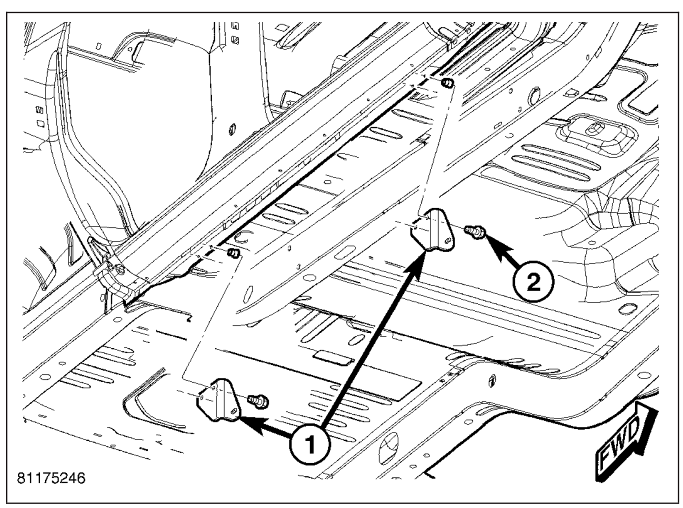


3. Remove sill bracket to frame bracket nuts.
4. Remove frame bracket bolts (2) to frame and remove frame brackets (1).
5. Remove sill bracket bolts and remove sill brackets.

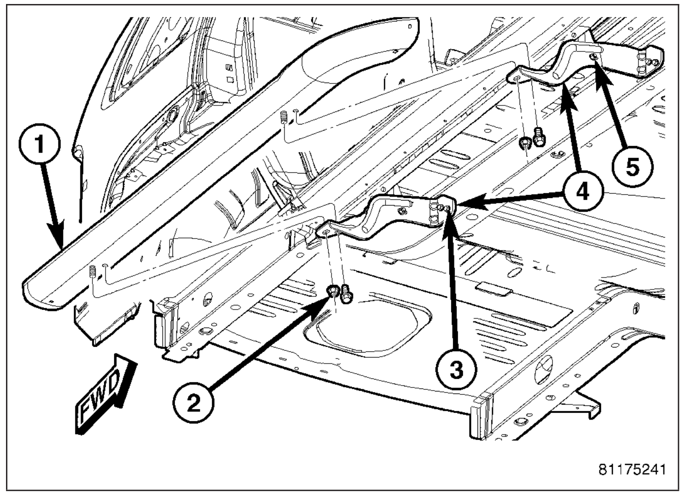


## INSTALLATION

1. Install sill bracket (1) and install bolts (2).
2. Tighten bolts to 23 N·m (17 ft. lbs.).



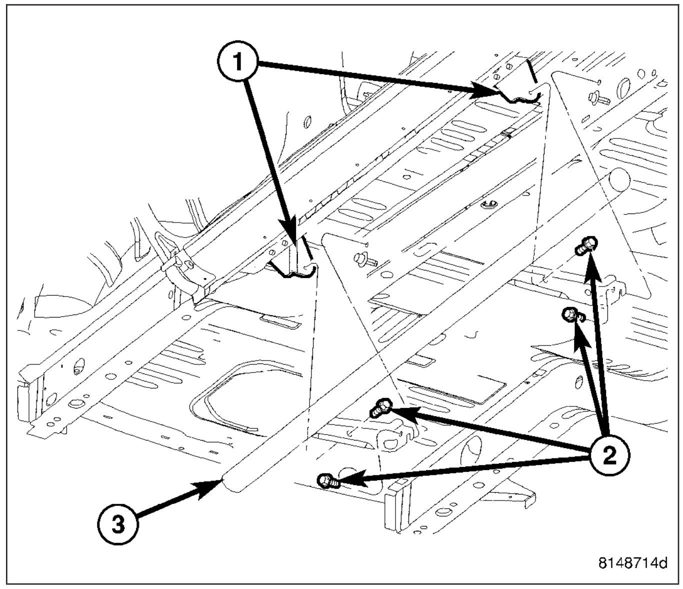
3. Install frame bracket (4) and install bolts.
4. Install sill bracket nut (5).
5. Tighten bolts and nuts to 23 N·m (17 ft. lbs.).
6. Install side step (1) and install bolts/nuts (2).
7. Tighten bolts and nuts to 23 N·m (17 ft. lbs.).



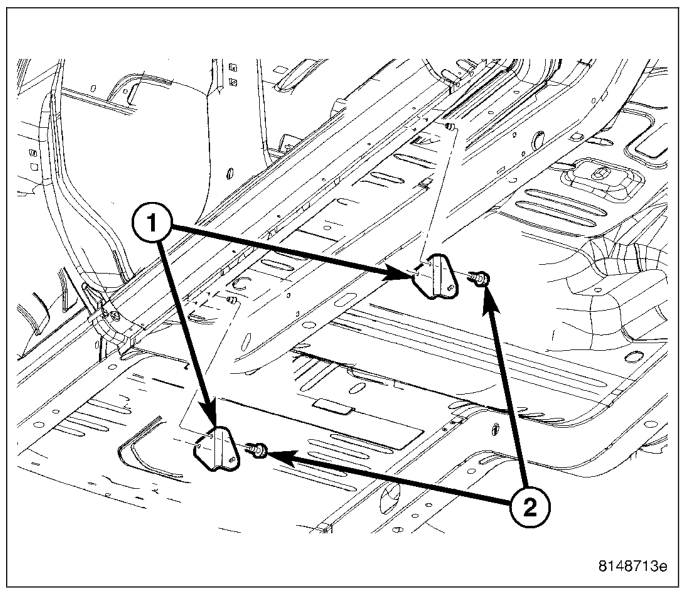
# ROCK RAIL

## REMOVAL

1. Remove the bolts (2) and remove the rock rail.

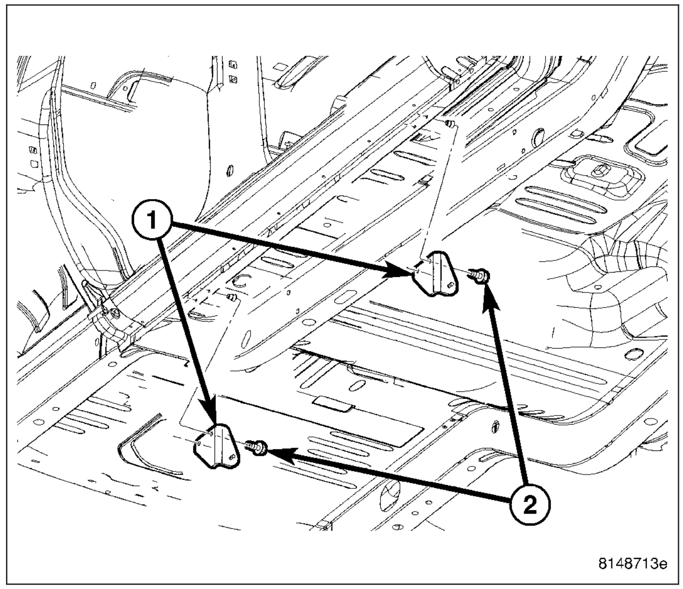


2. Remove the bolts (2) and remove the brackets.

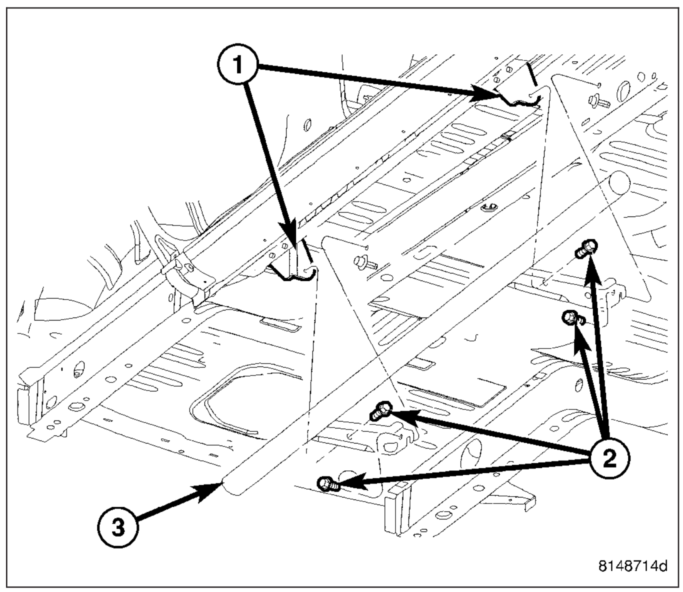


## INSTALLATION

1. Install the brackets (1) and install the bolts (2).
2. Tighten the bolts to 23 N·m (200 in. lbs.).



3. Install the rock rails (3) and install the bolts (2).
4. Tighten the bolts to 23 N·m (200 in. lbs.).

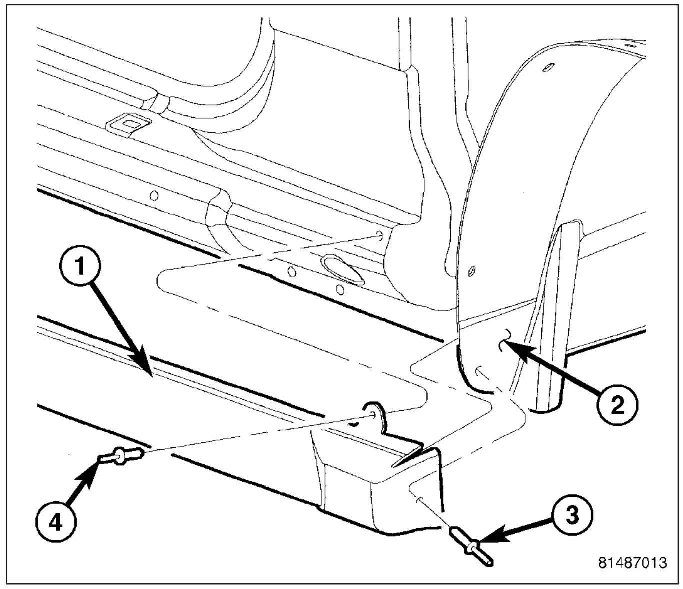


# MOLDING - SILL

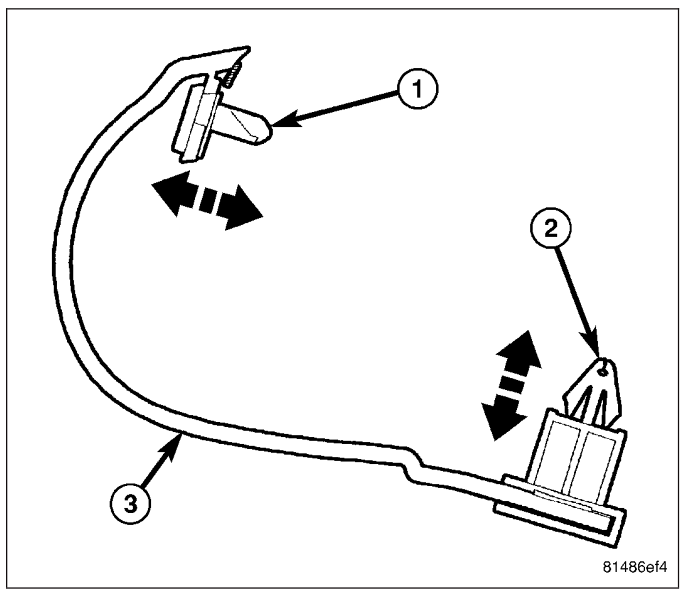
## REMOVAL

### Front Sill Molding

1. Remove the front wheel flare molding as necessary to gain access to the rivets. (Refer to 23 - BODY/EXTERIOR/WHEEL OPENING FLARE MOLDING - REMOVAL)
2. Remove the front rivets (3 and 4).

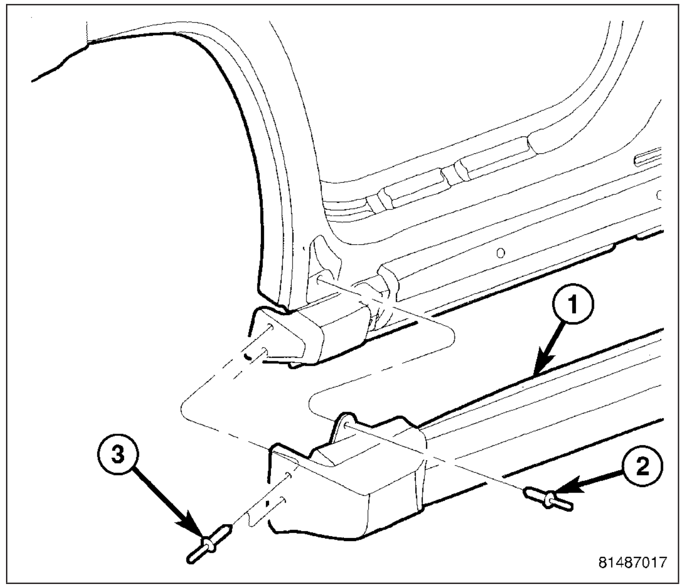


3. Separate the lower clips (2) using a trim tool C-4829-A or equivalent.
4. Using a trim stick C-4755 or equivalent, separate the adhesive tape and upper clips (1) and remove the front sill molding (3).

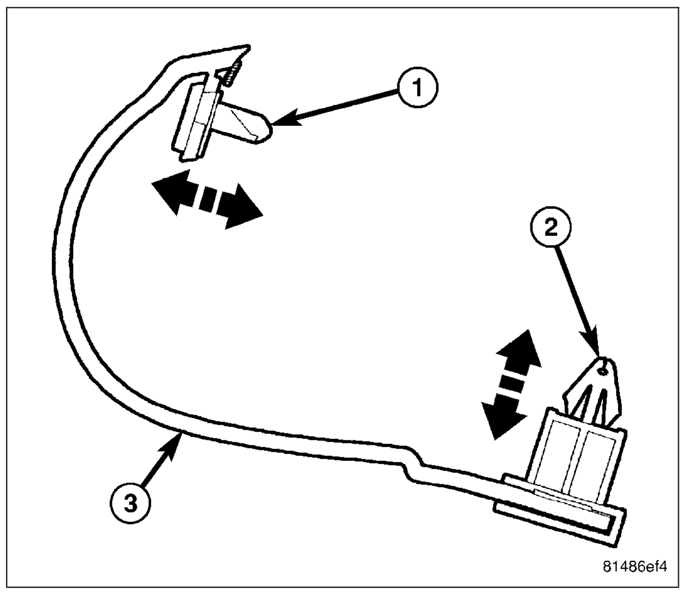


### Rear Sill Molding

1. Open the rear door and remove the rivets (2 and 3).



2. Separate the lower clips (2) using a trim tool C-4829-A or equivalent.
3. Using a trim stick C-4755 or equivalent, separate the adhesive tape and upper clips (1) and remove the rear sill molding (3).

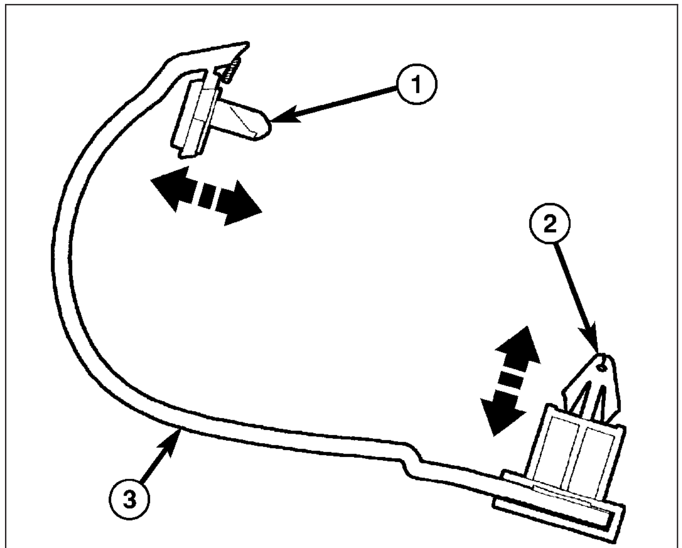


## INSTALLATION

1. Thoroughly clean all residue from the body side sill molding attachment area.
2. Wipe area clean with a 50% solution of water and alcohol and wipe dry.

### Rear Sill Molding

1. Replace the lower push pin fasteners (2) if damaged previously.

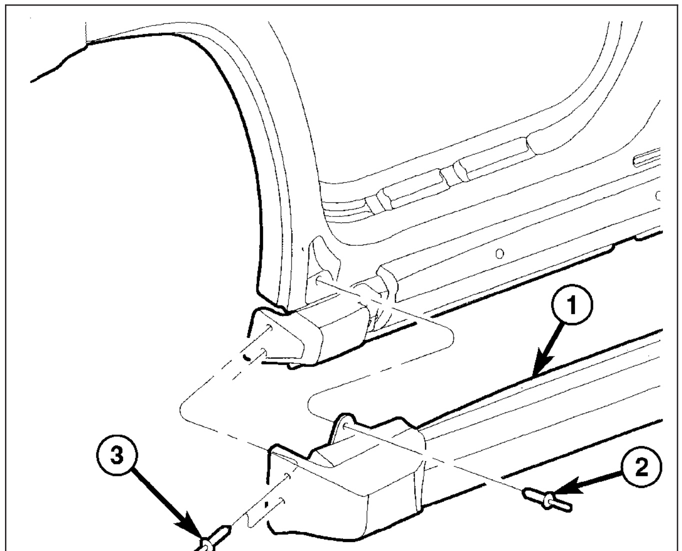


81486ef4

2. Remove the protective backing from the adhesive tape on the upper rear side of the molding.
3. Position the rear sill molding behind the lower rear door and slide forward until fully seated to rear sill with all pins aligned to holes.

**NOTE: Avoid contact with the adhesive strip on rear of sill.**

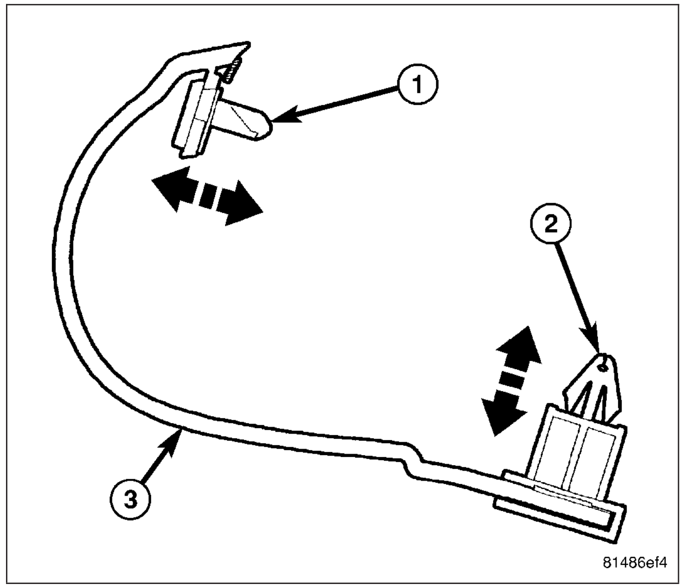
4. Seat the upper push pin fasteners then the lower fasteners fully.



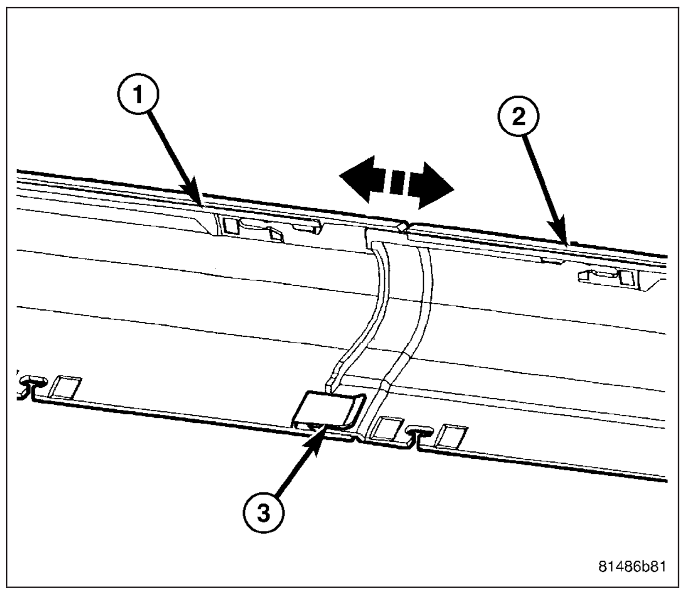
81487017

## Front Sill Molding

1. Replace the lower push pin fasteners (2) if damaged previously.
2. Remove the protective backing from the adhesive tape on the upper rear side of the molding.



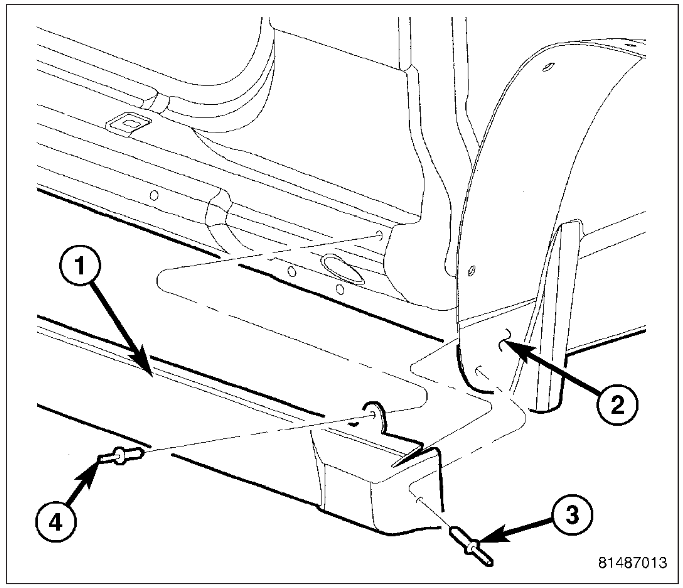
3. Position the front sill molding (1) over the matting flange on the previously installed rear sill molding. Make sure the tab (3) on the front molding (2) is fully engaged onto the rear molding (1) flange and slide rearward.



4. Seat the upper and then the lower push pin fasteners fully.
3. Apply hand pressure along the upper edge (1) of the molding starting at the front of the front molding sliding back to the rear of the rear molding.

**NOTE: This will ensure that the adhesive tape on the back side of the moldings has contacted the sill.**

4. Replace the plastic rivets securing the front and rear moldings at the wheel openings.
5. Install the front wheel opening flare molding as necessary. (Refer to 23 - BODY/EXTERIOR/ WHEEL OPENING FLARE MOLDING - INSTALLATION)



# INSTRUMENT PANEL

## TABLE OF CONTENTS

# INSTRUMENT PANEL

## WARNING

## RESTRAINT SYSTEM

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the Daimlerchrysler Mopar® parts catalog.**

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the airbag control module (ACM). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components.**

**WARNING: To avoid personal injury or death, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 2500 psi.**

**WARNING: To avoid personal injury or death, when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.**

**WARNING: To avoid personal injury or death, replace all restraint system components only with parts specified in the Daimlerchrysler Mopar® parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.**

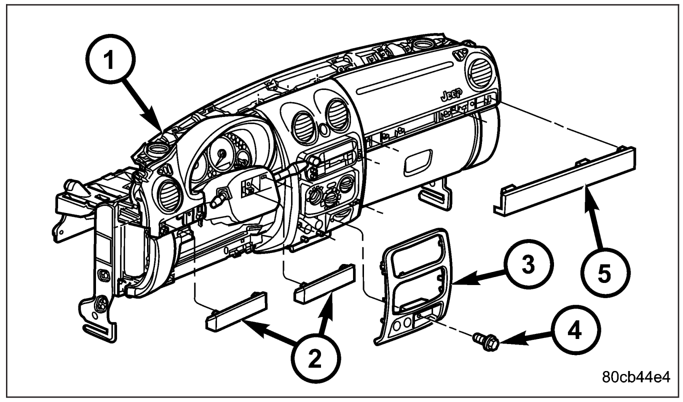
**WARNING: To avoid personal injury or death, the fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Daimlerchrysler Mopar® parts catalog.**

**WARNING: To avoid personal injury or death, when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.**

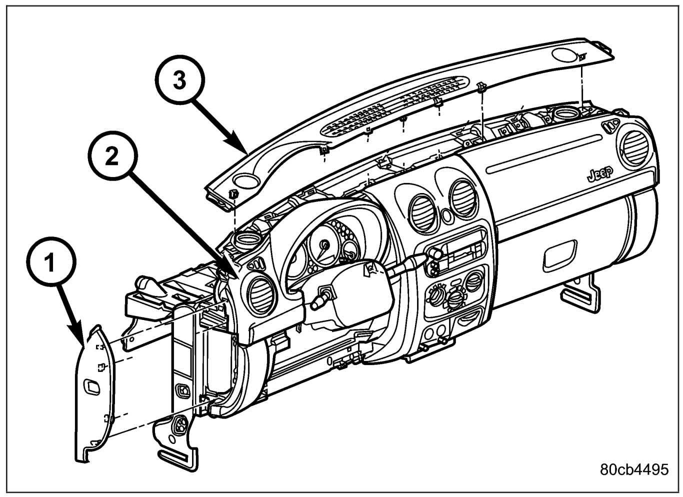
# CLUSTER BEZEL

## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Remove the driver side trim bezels (2). (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DRIVER SIDE BEZEL - REMOVAL)

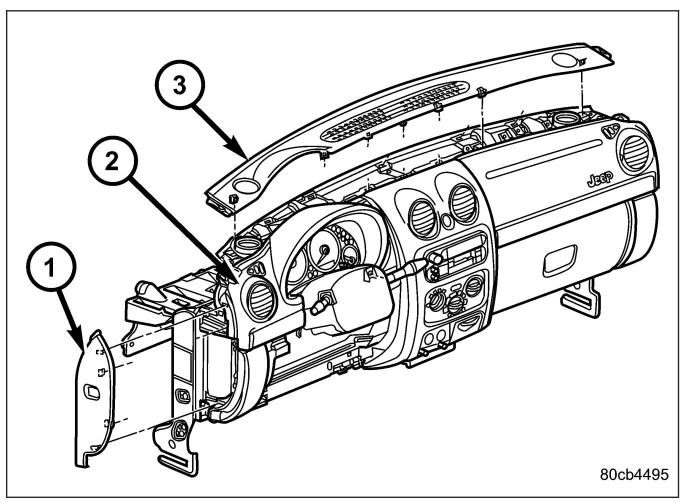


3. Remove the instrument panel top cover (3). (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)
4. Remove the seven screws and remove the cluster bezel.

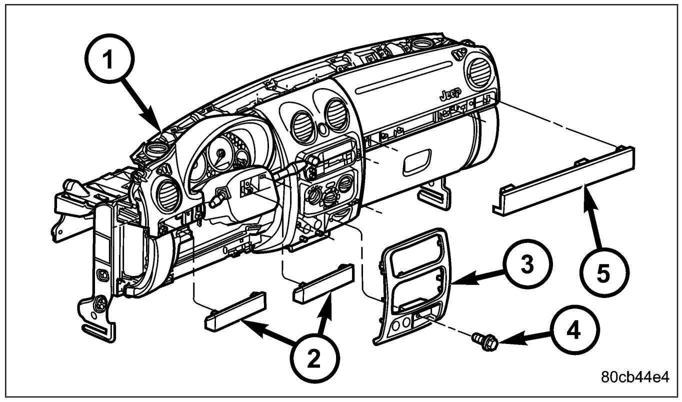


## INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Install the cluster bezel and the seven screws.
3. Install the instrument panel top cover (3). (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION)



4. Install the driver side trim bezels (2). (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DRIVER SIDE BEZEL - INSTALLATION)



# GLOVE BOX

## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Open the glove box.
3. Squeeze the stop tabs located on the sides of the box and allow the box to open fully.
4. With box in the full down position slide the box to the right off of the hinges and remove.

## INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Position the box on and slide the box to the left to engage the hinges.
3. Close the glove box.

# GLOVE BOX LATCH

## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Remove the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)
3. Remove the nine screws and remove the glove box skin.
4. Remove the latch from the locators.

## INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Position the latch onto the locators.
3. Install the glove box skin onto the glove box and install the nine screws.
4. Install the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION)

# GLOVE BOX LATCH STRIKER

## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ INSTRUMENT PANEL - WARNING)
2. Open the glove box.
3. Remove the two striker screws and remove the latch striker.

## INSTALLATION

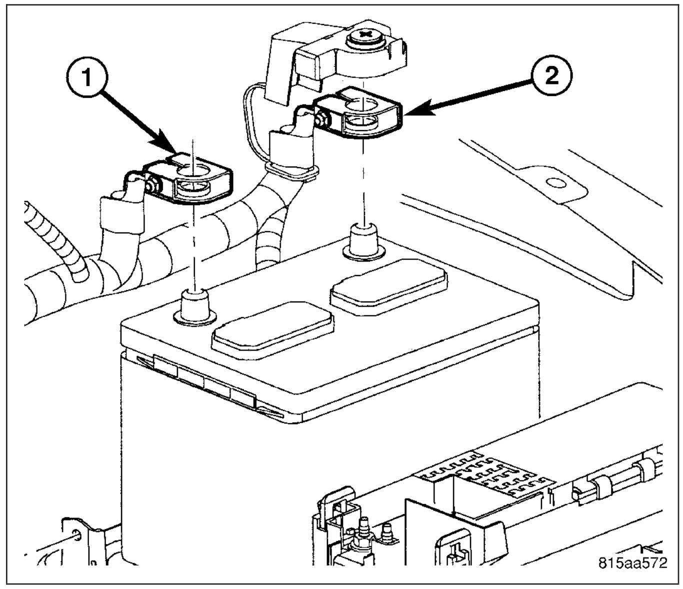
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ INSTRUMENT PANEL - WARNING)
2. Install the striker and install the two screws.
3. Loosen the screws to adjust if necessary.

# INSTRUMENT PANEL ASSEMBLY

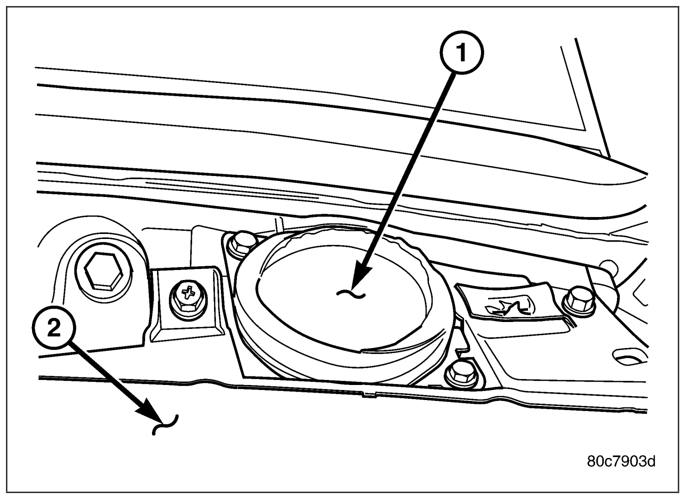
## REMOVAL

**NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.**

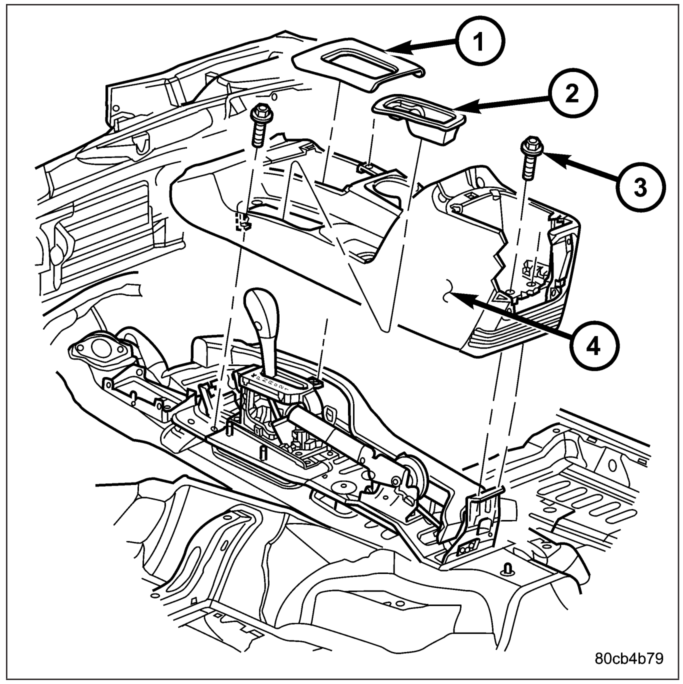
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Disconnect and isolate the battery negative cable.



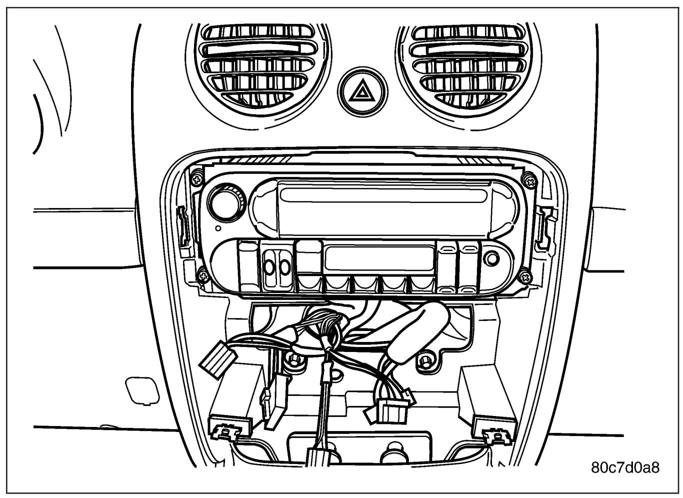
3. Remove the instrument panel speakers. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)

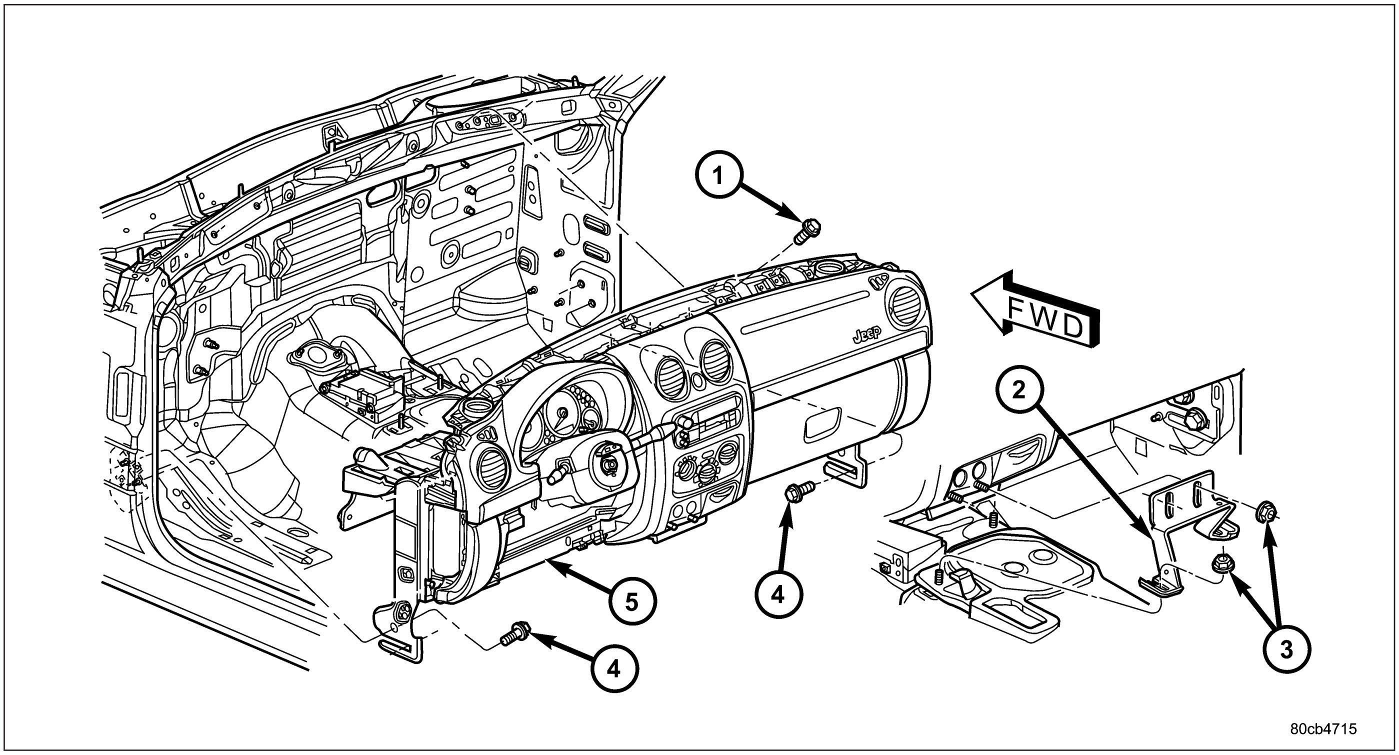


4. Remove the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)



5. Remove the radio. (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL)

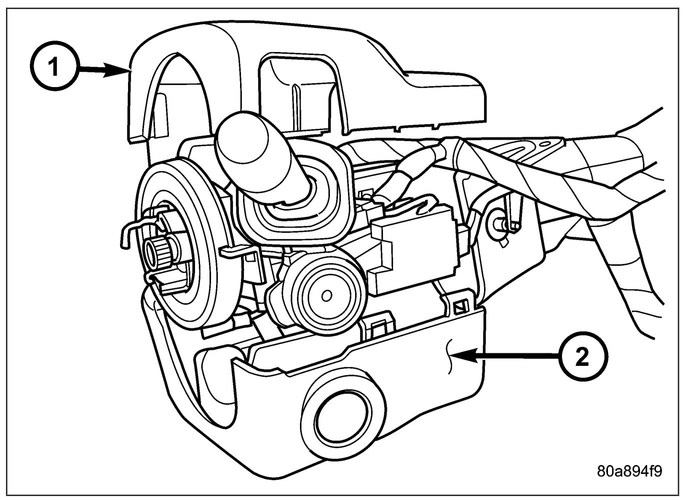


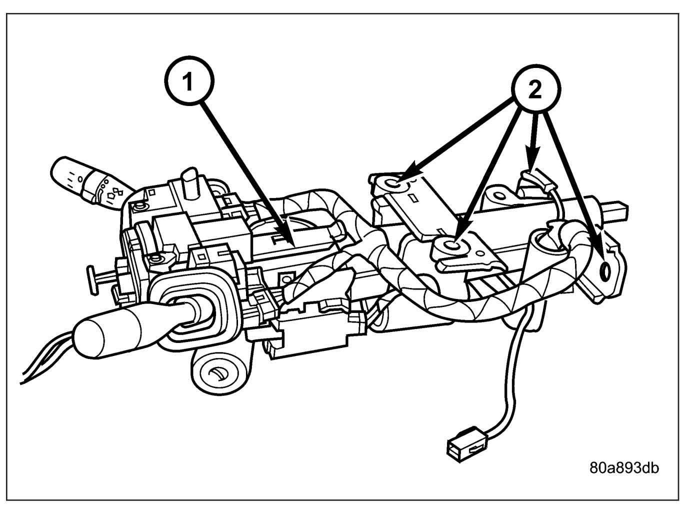


6. Remove the four nuts (3) and remove the center support bracket (2).
7. Remove the ground strap bolt and disconnect the restraint module electrical connector.
8. Position front wheels **straight ahead.**
9. Remove knee blocker cover and knee blocker. (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - REMOVAL)
10. Remove screws from the lower column shroud and remove both the upper (1) and lower (2) shrouds.
11. Turn ignition key to the on position.
12. Disconnect the automatic transmission shifter interlock cable from the column, if equipped.

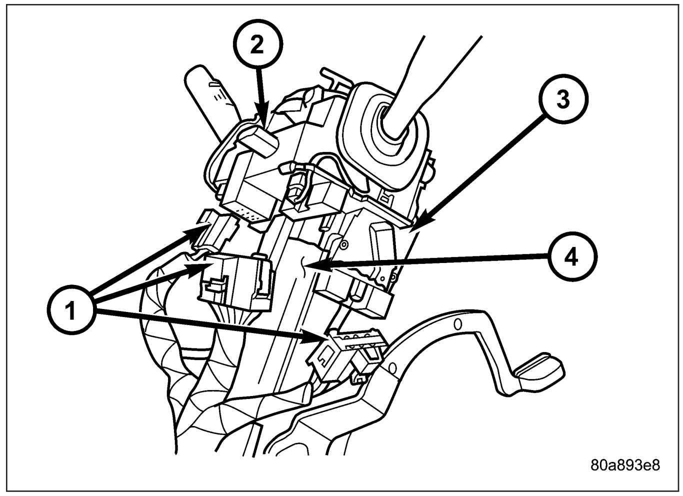
**CAUTION: Do not turn the clockspring more than 90° or damage to the clockspring may occur.**

13. Using a grease pencil or equivalent, mark the position of the steering wheel.
14. Remove the steering coupler bolt and column mounting nuts and bolts then lower column off the mounting studs.



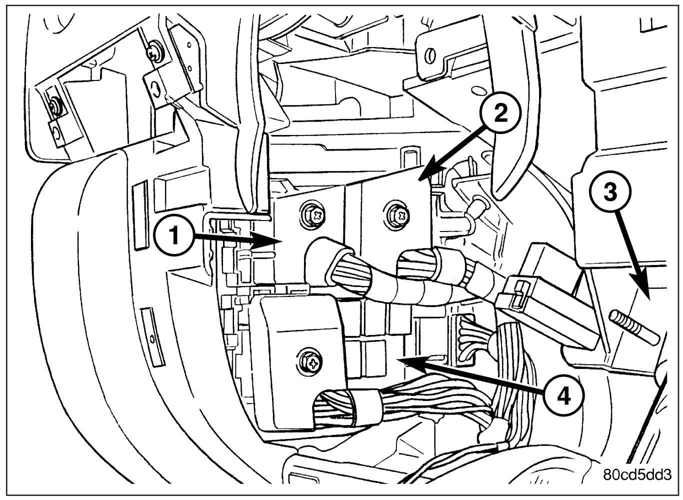


15. Disconnect and remove the wiring harness from the column.
16. Slide the shifter interlock cable from the tie straps.
17. Remove the steering column.

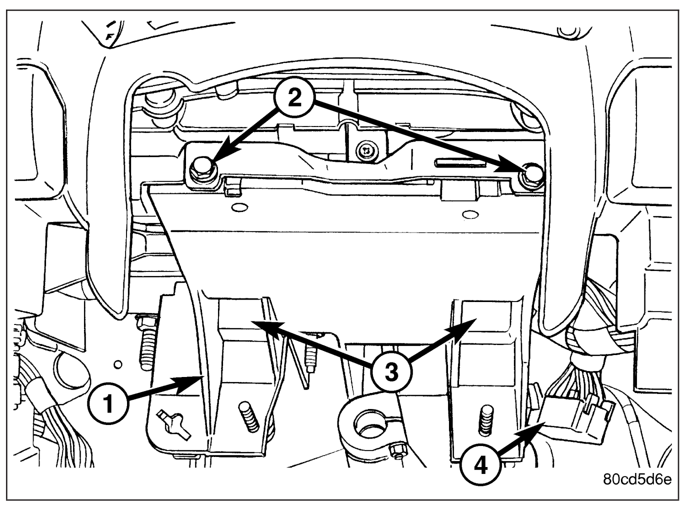


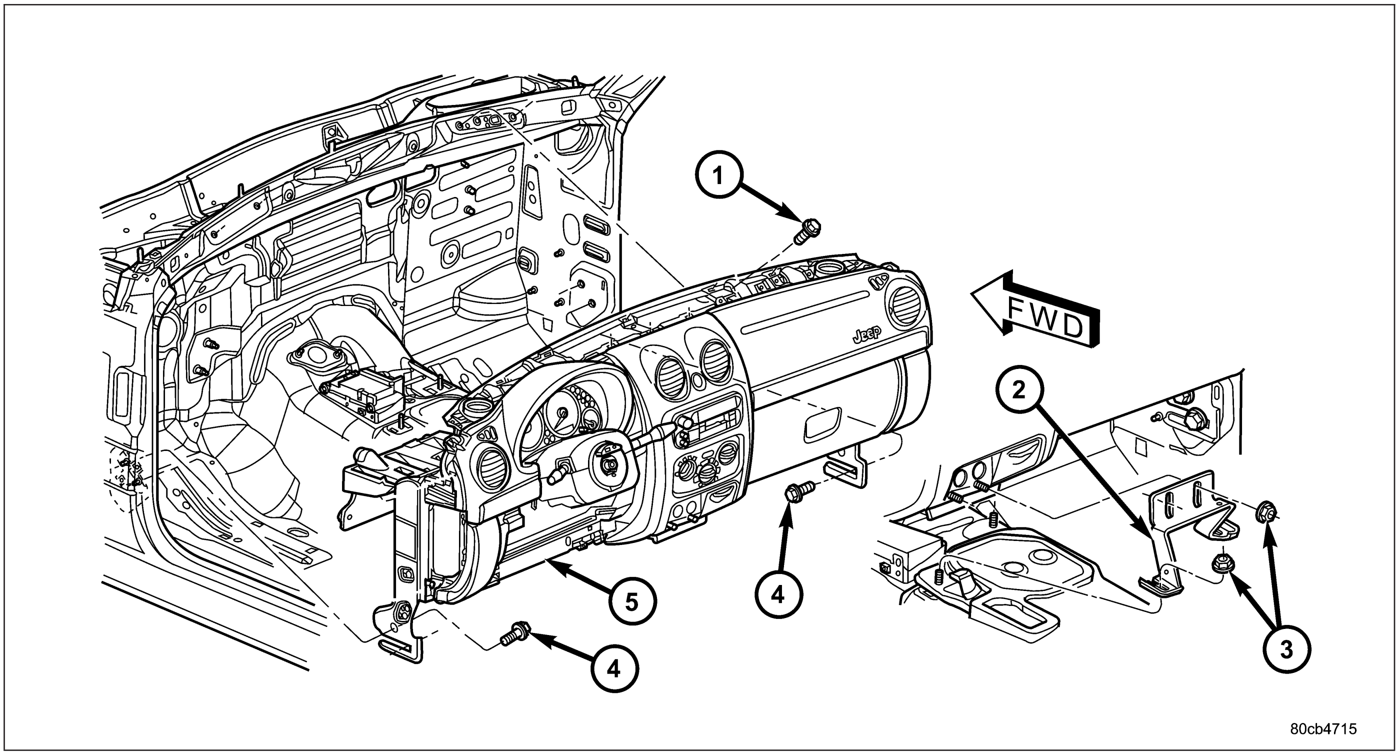
**CAUTION: Do not remove the brake lamp switch. This is a one time component and is not intended for reinstallation. If the brake lamp switch is removed it must be discarded and replaced with a new switch.**

18. Disconnect the brake lamp switch electrical connector.
19. Remove the drivers side cowl trim cover. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL)
20. Disconnect the wire harness connector behind the drivers side cowl trim cover.
21. Disconnect the green and light blue wire harness bulk connectors at the junction block.

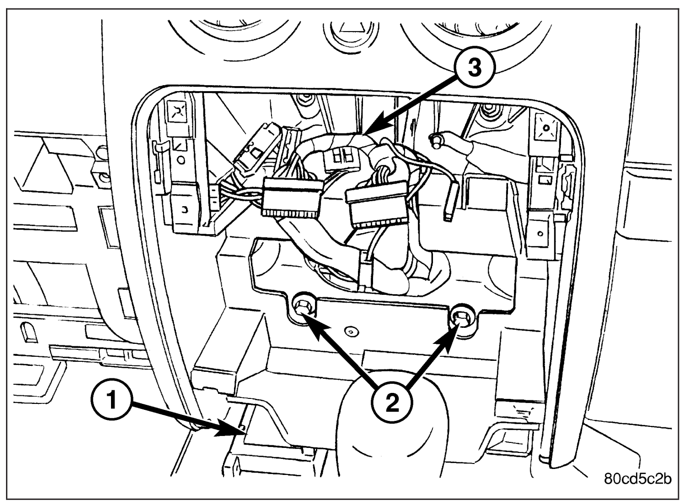


22. Disconnect the electrical connector at the inner side of the pedal support bracket.
23. Remove the two bolts at the front of the pedal support bracket.
24. Remove the two bolts from the bottom side of the pedal support bracket.

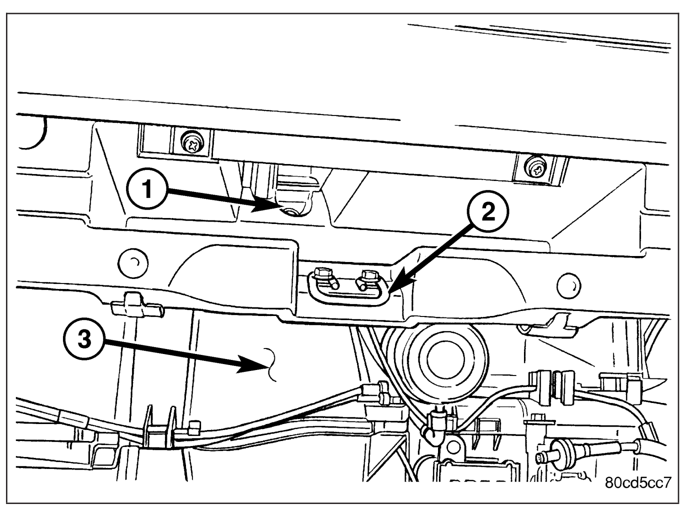




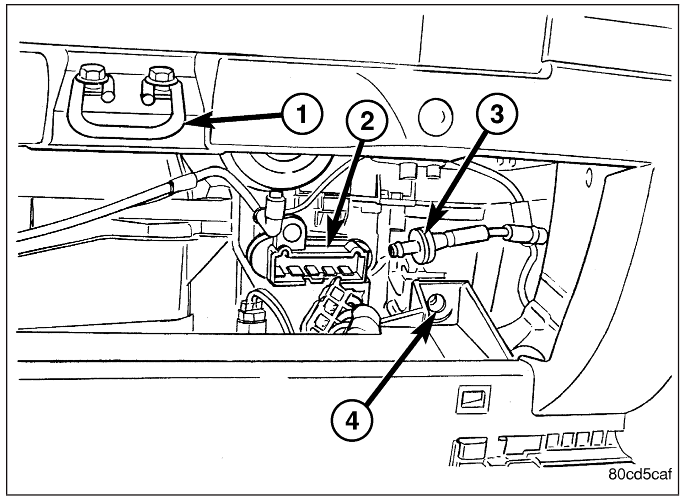
25. Remove the two roll down bracket bolts at the drivers cowl side panel.
26. Remove the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)
27. Remove the two HVAC mounting bolts behind the center trim.
28. Remove the passenger side trim bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL PASSENGER SIDE BEZEL - REMOVAL)



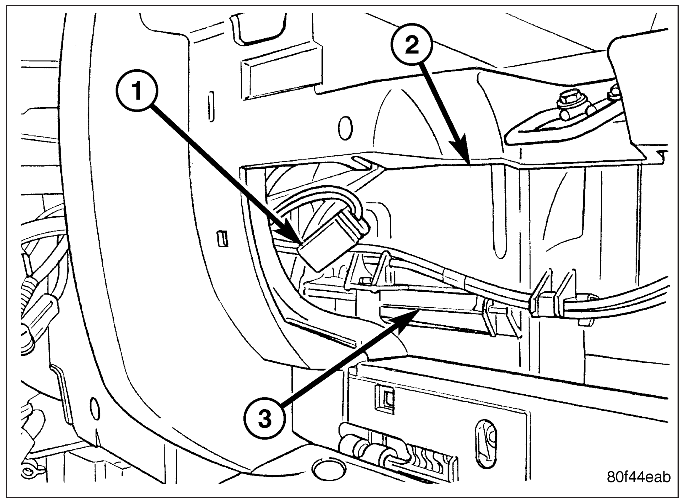
29. Remove the HVAC mounting bolt above the glove box striker.

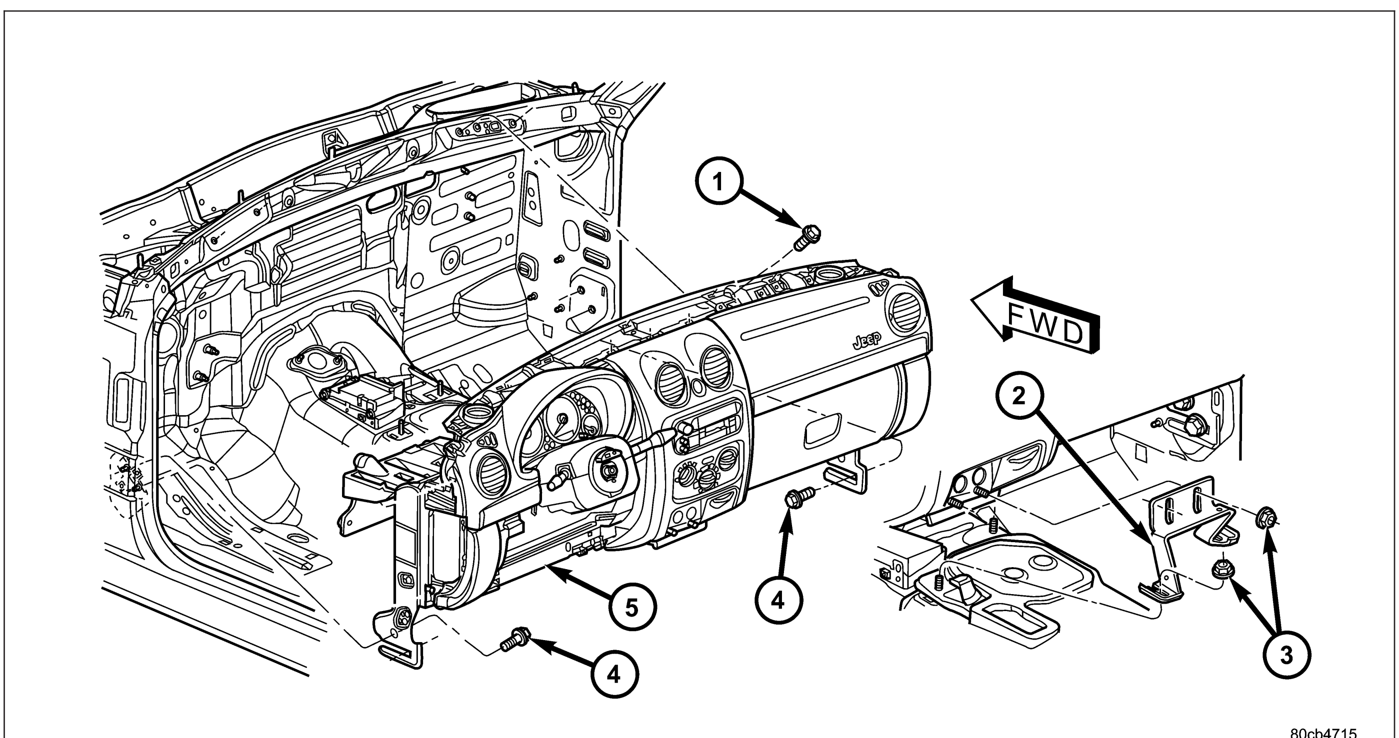


30. Remove the HVAC bolt at the lower outside corner of the glove box opening.
31. Remove the passenger side cowl trim cover. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL)
32. Disconnect the blower resistor electrical connector.
33. Remove the two roll down bracket bolts at the passenger cowl side panel.
34. Disconnect the vacuum check valve and the vacuum reservoir.



35. Disconnect the blower motor electrical connector.
36. Disconnect the blend door connector.

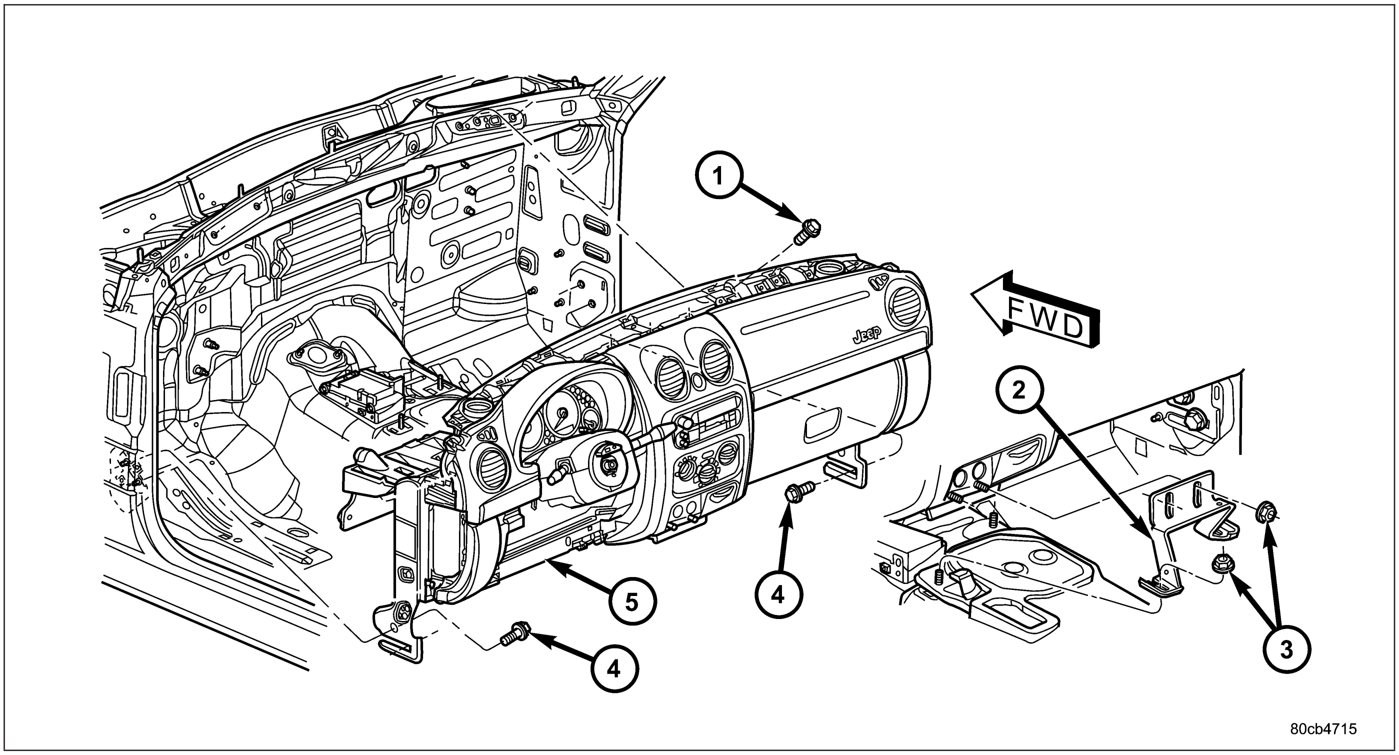




37. Remove the four bolts at the top of the instrument panel connecting to the cowl front panel.

38. Roll the instrument panel rearward and remove the wire harness from routing channel in the rear.
39. Disconnect the push pin fastener and position aside the radio wire harness. Note the location of the harness for installation.
40. Remove the instrument panel.

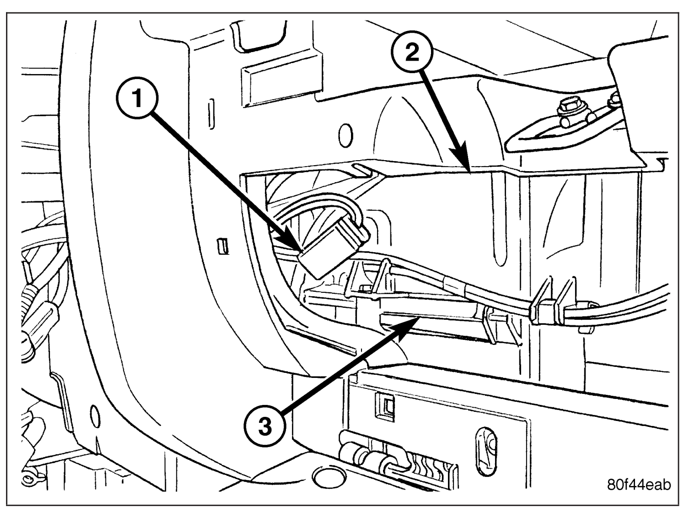
## INSTALLATION



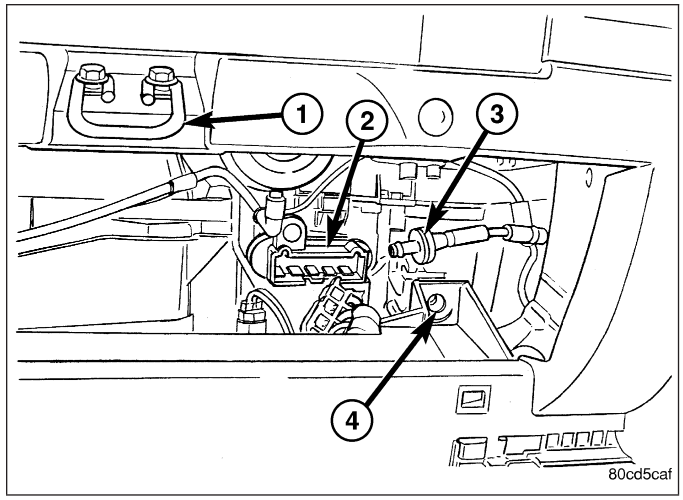
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ INSTRUMENT PANEL - WARNING)
2. Position the instrument panel into the vehicle.
3. Position the wire harness into the rear routing channel and roll the instrument panel back against the cowl.
4. Position the radio wire harness and seat the push pin fastener.

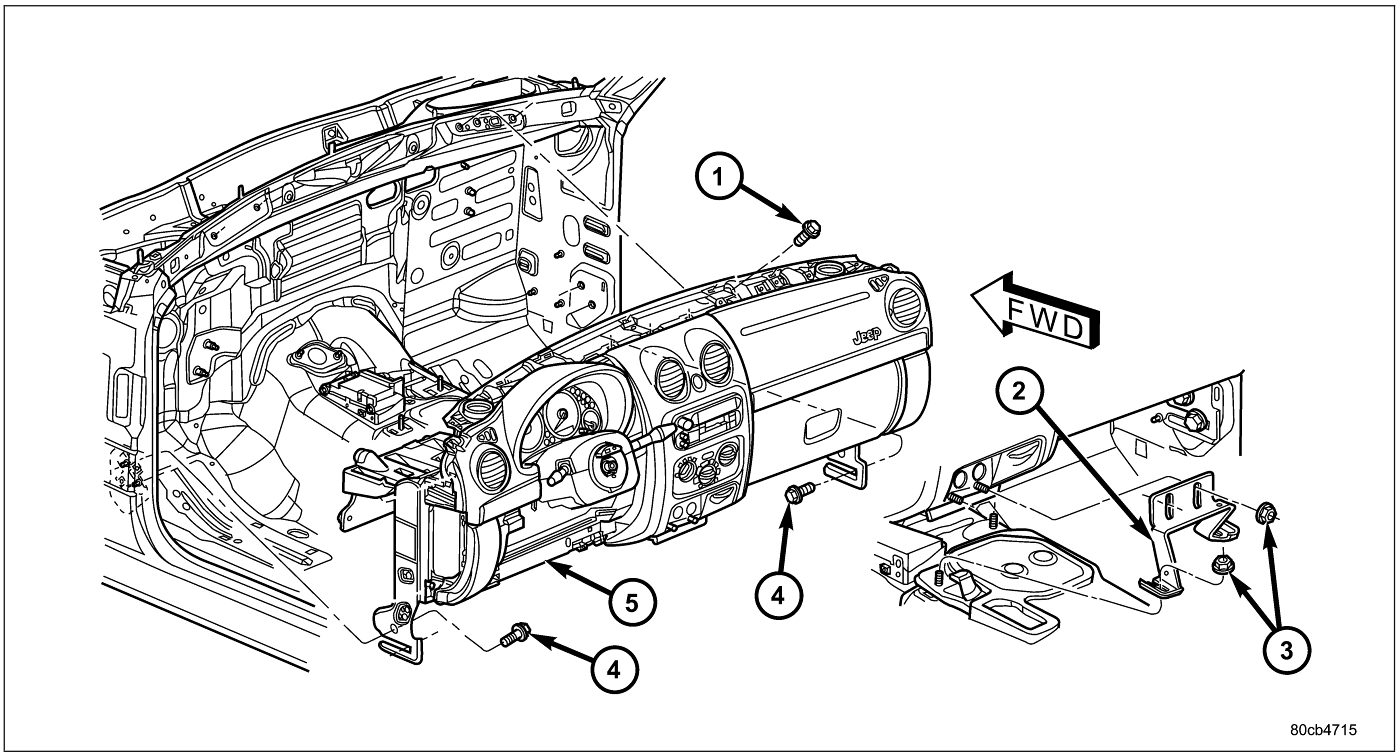
**NOTE: Position the speaker wires through the speaker openings.**

5. Install the four bolts at the top of the instrument panel connecting to the cowl front panel and tighten to 28 N·m (21 ft. lbs.).
6. Connect the blend door electrical connector.
7. Connect the blower motor electrical connector.



8. Connect the vacuum check valve and the vacuum reservoir.
9. Connect the blower resister electrical connector.

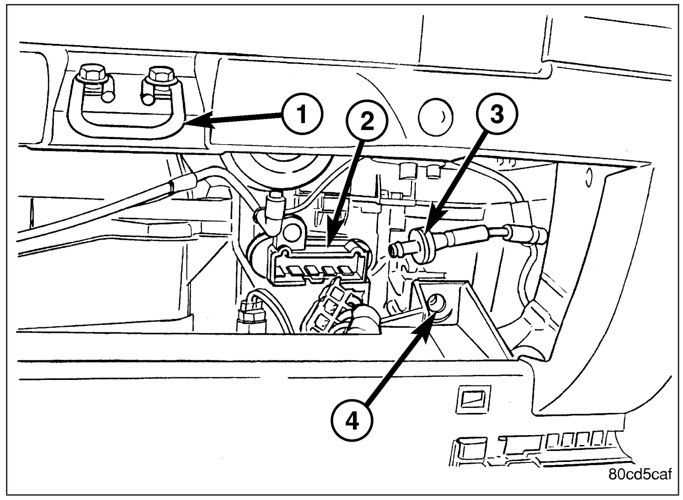




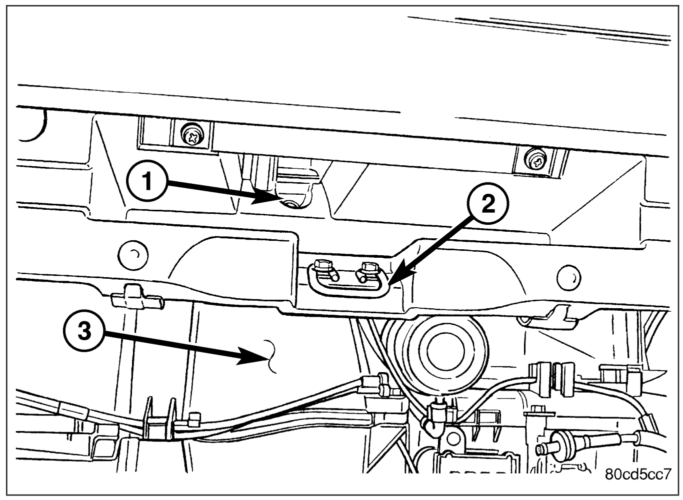
**NOTE: Do not push or pull bracket. Tighten at the rest position.**

10. Install the two roll down bracket bolts at the passenger cowl side panel and tighten to 54 N·m (40 ft. lbs.).

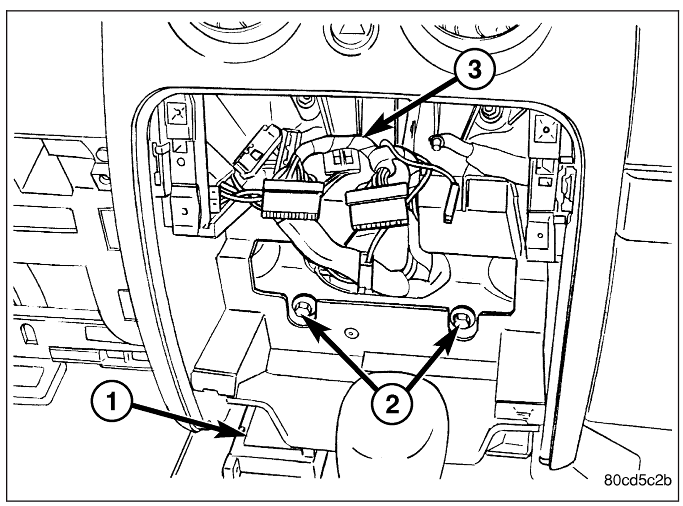
11. Install the HVAC mounting bolt at the lower outside corner of the glove box opening and tighten to 6 N·m (55 in. lbs.).

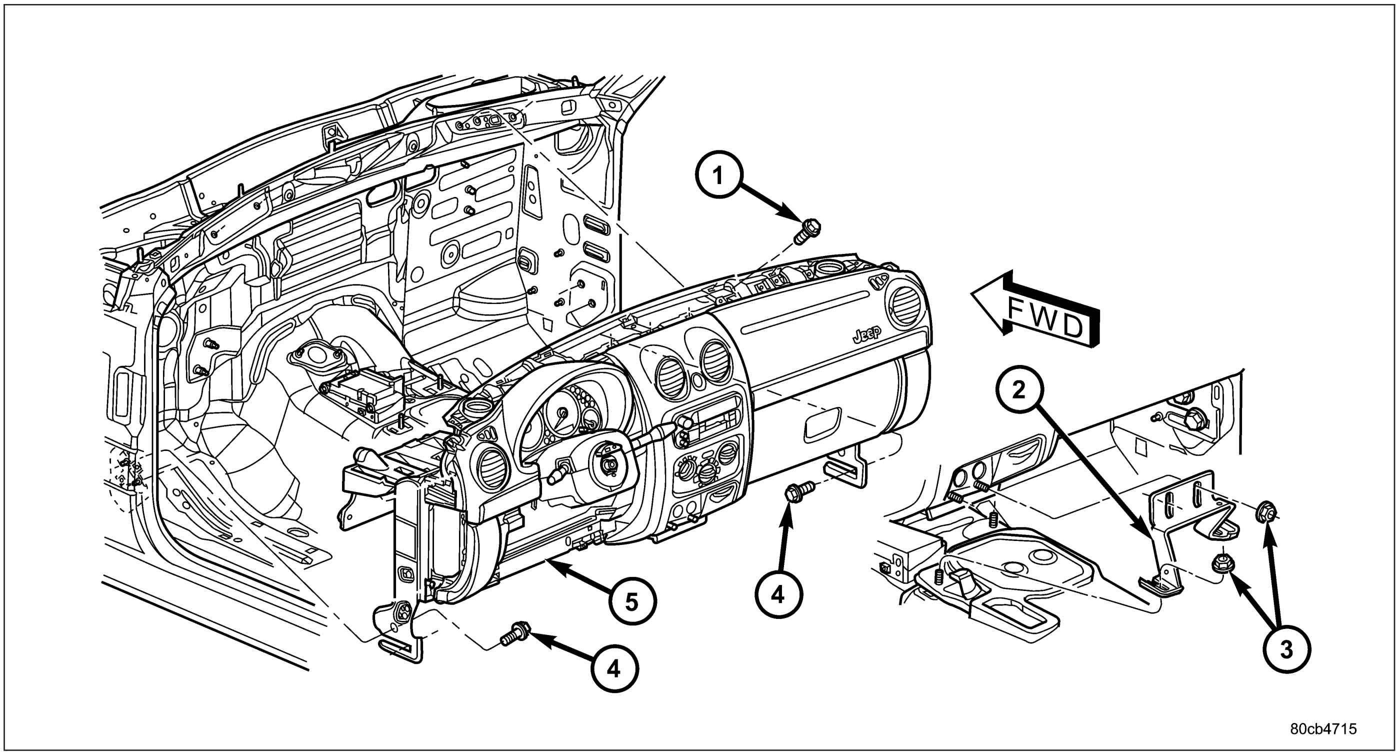


12. Install the HVAC mounting bolt above the glove box striker.



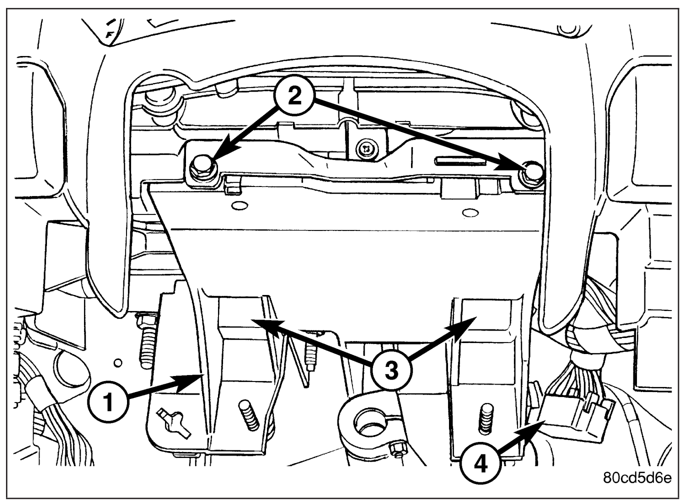
13. Install the passenger side trim bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL PASSENGER SIDE BEZEL - INSTALLATION)
14. Install the passenger side cowl trim cover. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION)
15. Install the two HVAC mounting bolts behind the center trim.
16. Install the glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION)



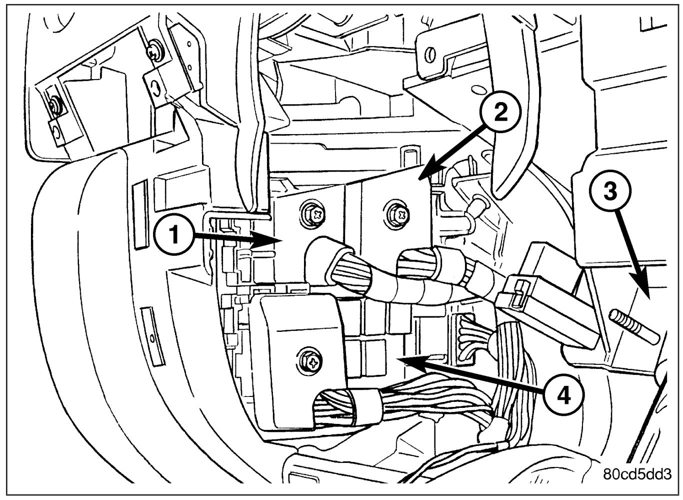


**NOTE: Do not push or pull bracket. Tighten at the rest position.**

17. Install the two roll down bracket bolts at the driver's cowl side panel and tighten to 54 N·m (40 ft. lbs.).
18. Install the two bolts at the bottom side of the pedal support bracket (3).
19. Install the two bolts (2) at the front of the pedal support bracket.
20. Connect the electrical connector at the inner side of the pedal support bracket.

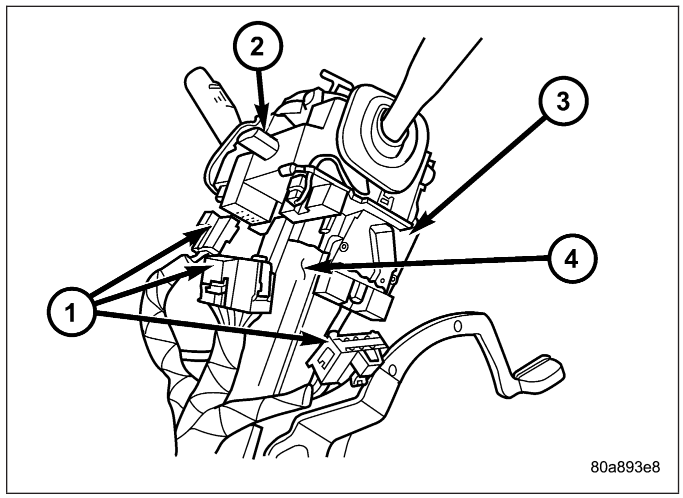


21. Connect the wiring harness electrical connectors at the junction block.
22. Connect the wire harness electrical connector behind the driver's side cowl trim cover.
23. Install the driver's side cowl trim cover. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION)



**CAUTION: Do not remove the brake lamp switch. This is a one time component and is not intended for reinstallation. If the brake lamp switch is removed it must be discarded and replaced with a new switch.**

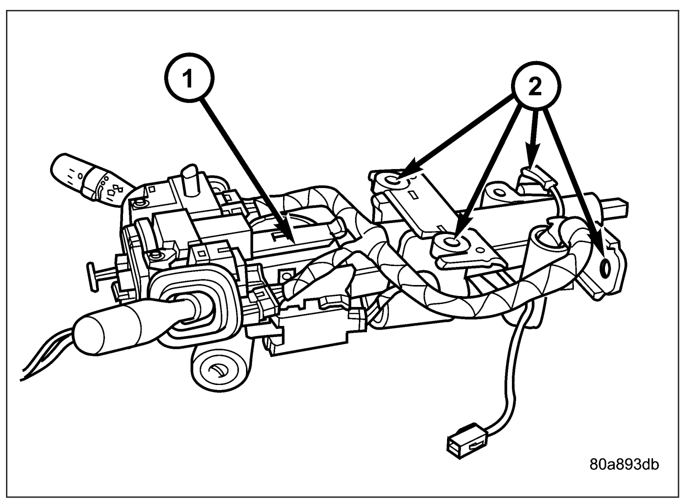
24. Connect the brake lamp switch electrical connector.
25. Install the steering column into the vehicle.
26. Slide the shifter interlock cable into the tie straps.
27. Install and connect the wire harness for the column.

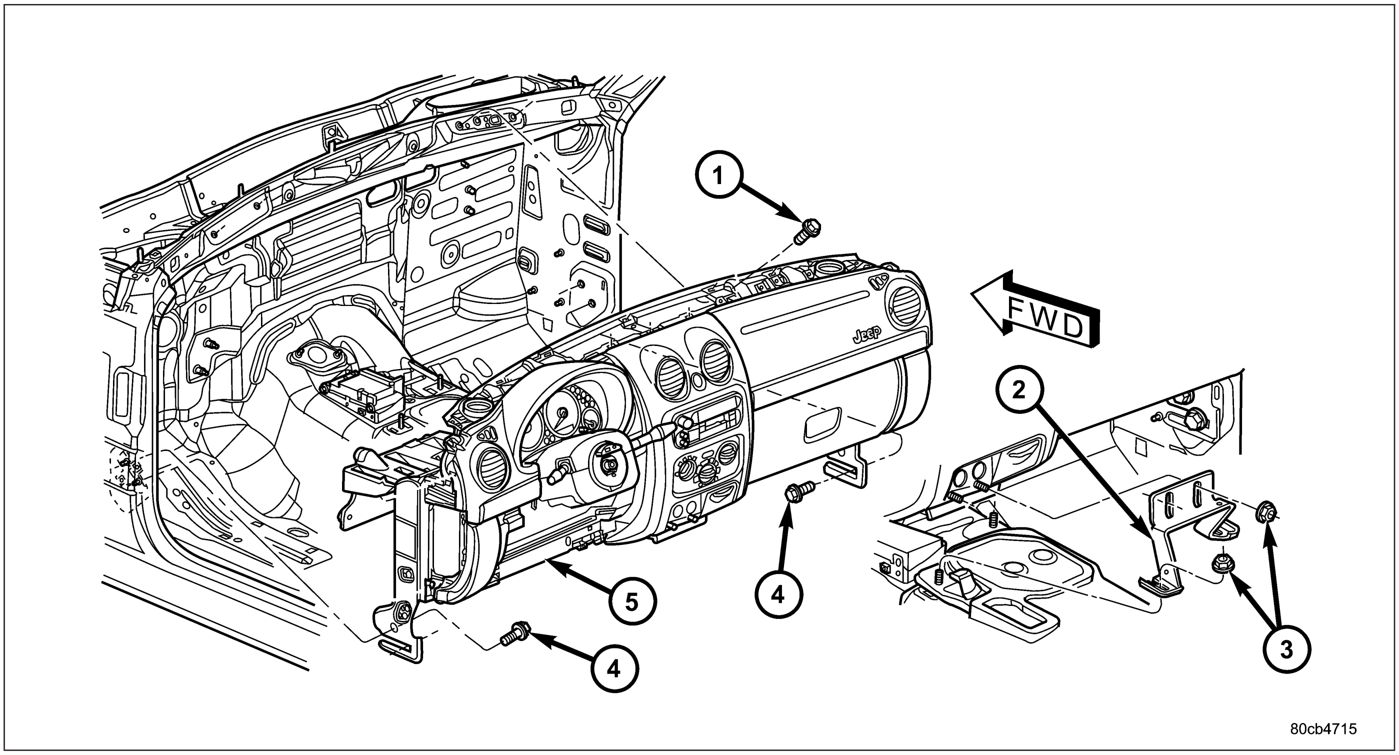


28. Install the two mounting nuts and the two mounting bolts all finger tight.

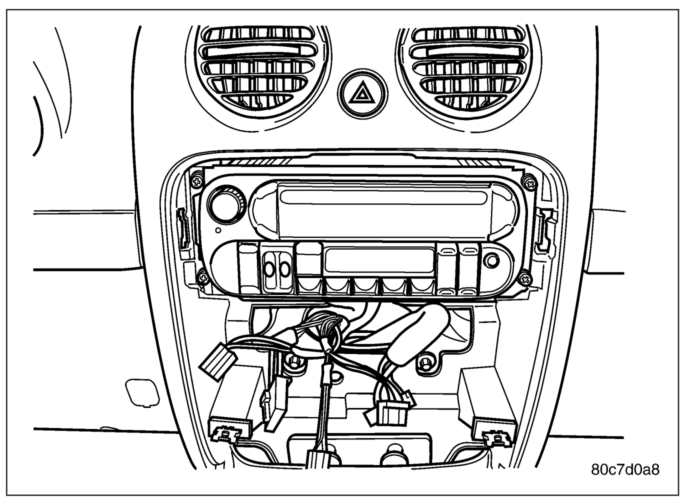
**CAUTION: Lower nuts must be installed and tightened first then the upper nuts in order to prevent damage to the capsules.**

29. Tighten the lower mounting nuts to 17 N·m (13 ft. lbs.).
30. Tighten the upper mounting nuts to 17 N·m (13 ft. lbs.).
31. Install the steering column coupler bolt and tighten to 49 N·m (36 ft. lbs.).
32. Install the upper and lower shrouds and install the screws.
33. Install the knee blocker cover and knee blocker. (Refer to 23 - BODY/INSTRUMENT PANEL/KNEE BLOCKER - INSTALLATION)

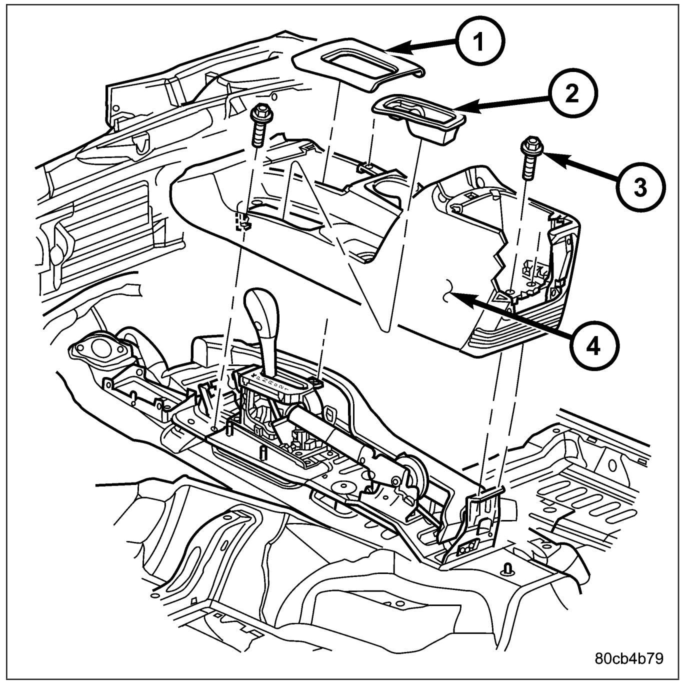




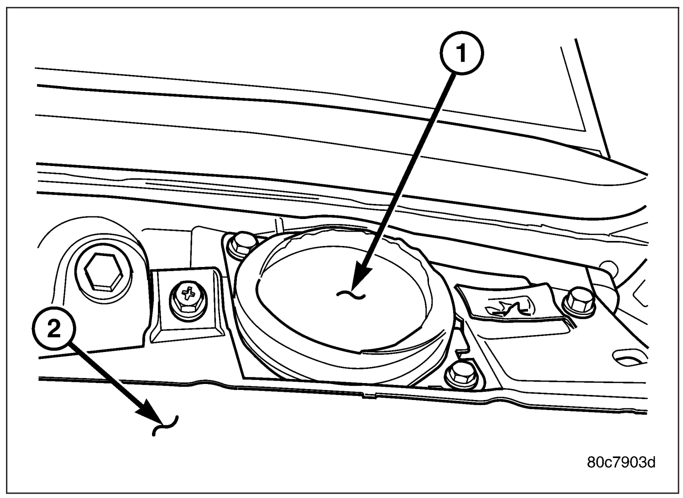
34. Install the ground strap and bolt and connect the restraint module electrical connector.
35. Install the center support bracket (2) and hold it tight against the instrument panel.
36. Tighten the lower nuts to 23 N·m (17 ft. lbs.).
37. Tighten the upper bracket nuts to 23 N·m (17 ft. lbs.).
38. Install the radio. (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION)



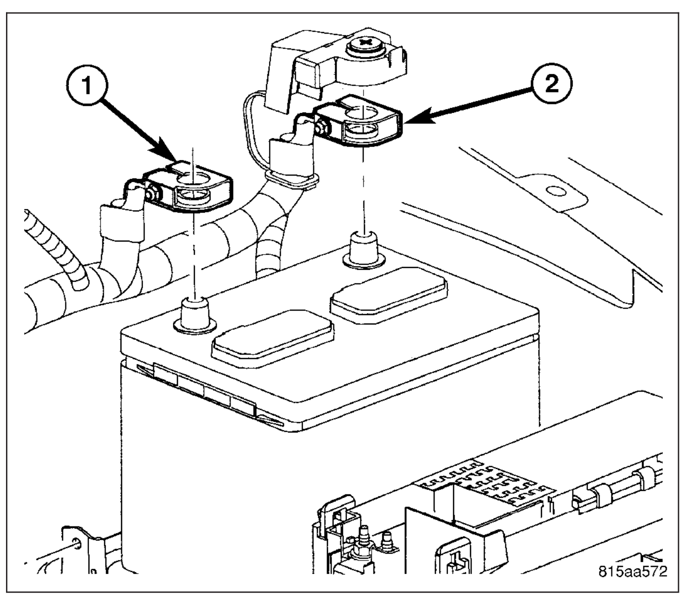
39. Install the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)



40. Install the speakers. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)



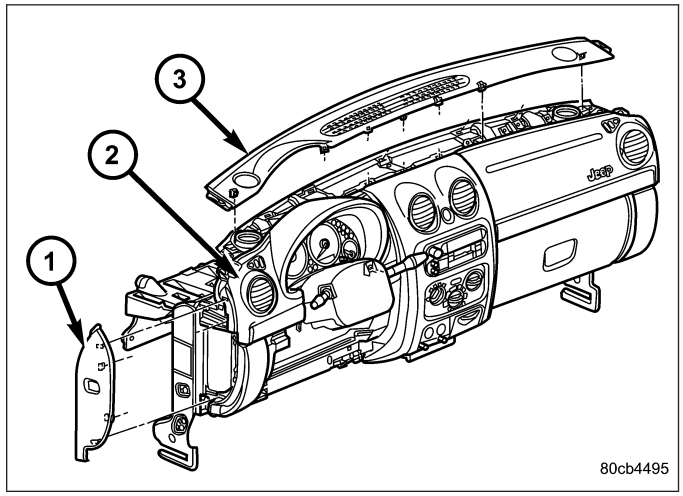
41. Reconnect the battery ground cable.



# INSTRUMENT PANEL TOP COVER

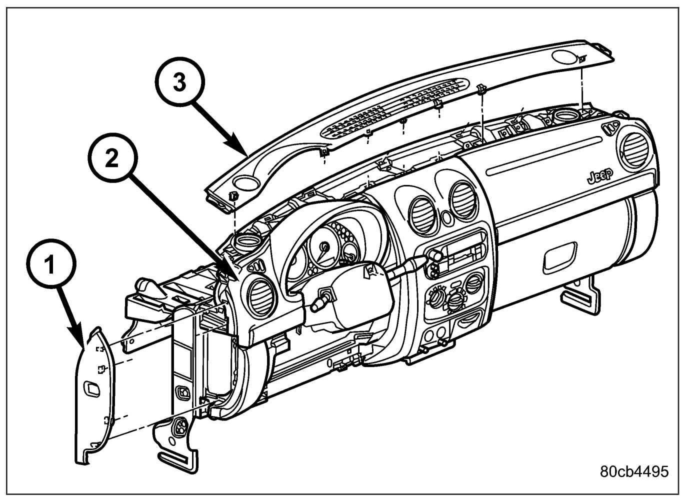
## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Remove the A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM AND GRAB HANDLE - REMOVAL)
3. Using a trim stick C-4755 or equivalent, release the attachment clips and remove the top cover (3).



## INSTALLATION

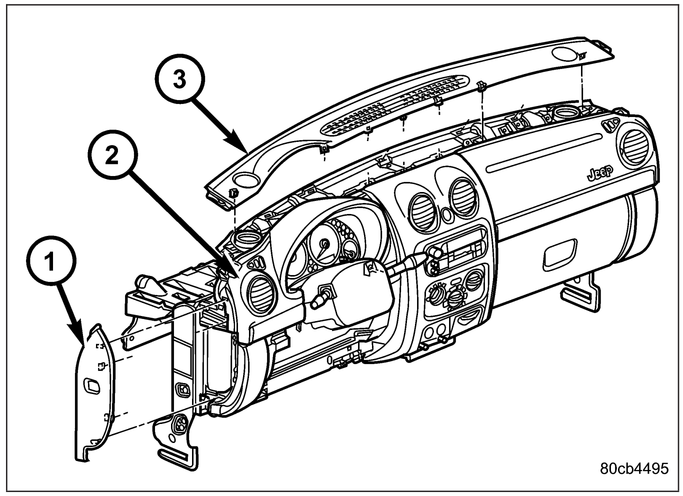
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Position the top cover (3) and seat the clips fully.
3. Install the A-pillar trim panels. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM AND GRAB HANDLE - INSTALLATION)



# INSTRUMENT PANEL END CAP

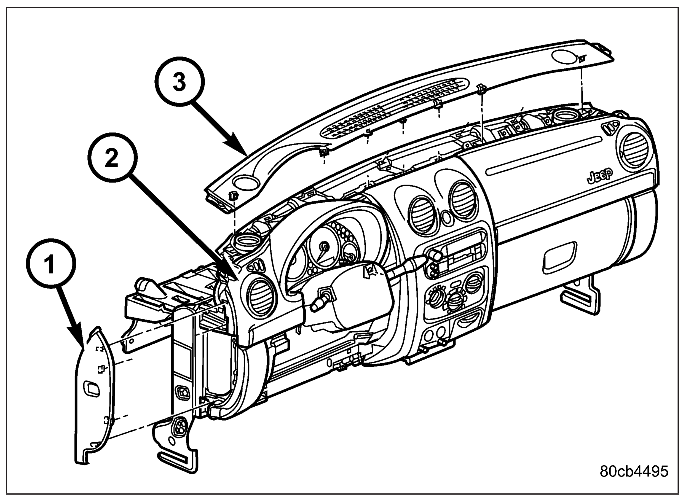
## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Open the door.
3. Using the finger indent, grasp and remove the side cover (1).



## INSTALLATION

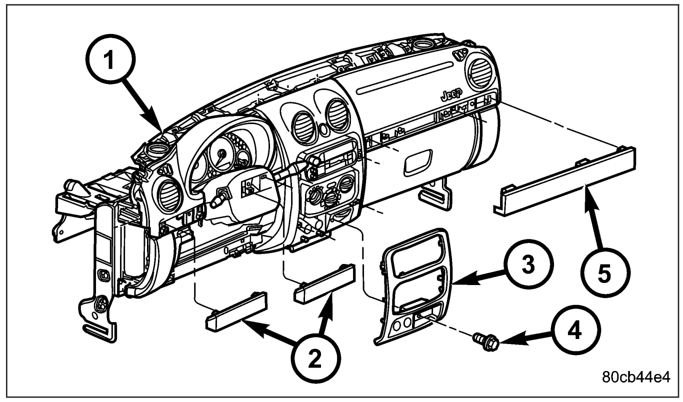
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Position the side panels (1) and seat the clips fully.



# INSTRUMENT PANEL DRIVER SIDE BEZELS

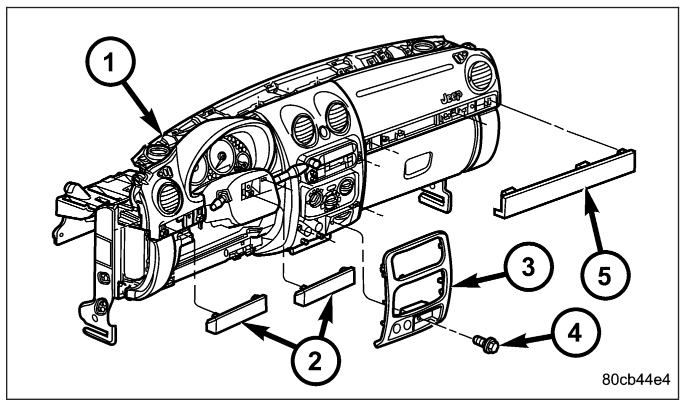
## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Using a trim stick C-4755 or equivalent, disengage the bezels (2) on either side of the steering column.



## INSTALLATION

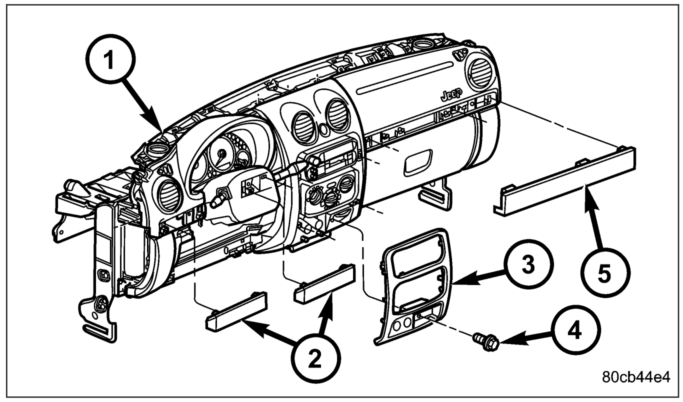
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Position the appropriate divers side bezels (2) on either side of the steering column and seat the attachment clips.



# INSTRUMENT PANEL CENTER BEZEL

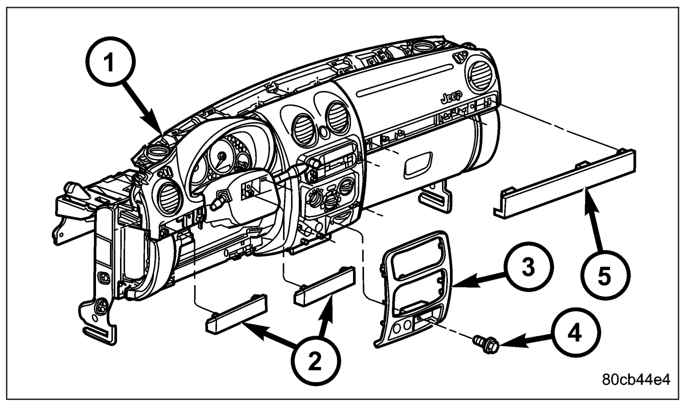
## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Remove the screw from inside the cubby bin next to the power outlet.
3. Using a trim stick C-4755 or equivalent, remove the center bezel (3) from the instrument panel assembly.
4. Disconnect the electrical and vacuum connectors.



## INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Connect the electrical and vacuum connectors.
3. Position the center bezel (3) and seat the retaining clips starting with the lower clips first.
4. Install the screw in the cubby bin next to the power outlet.



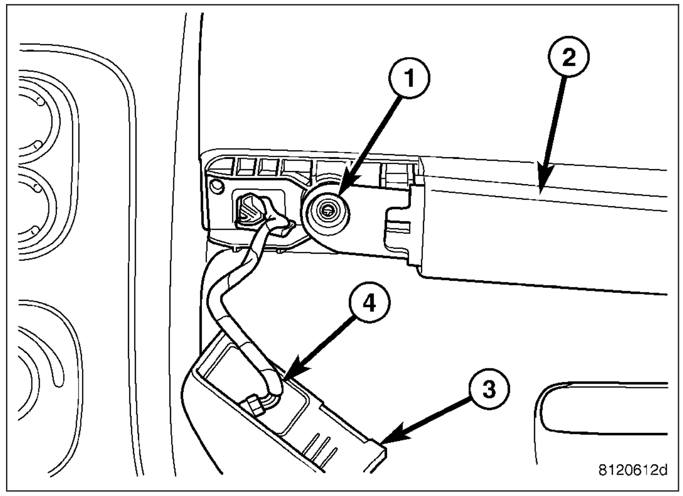
# INSTRUMENT PANEL PASSENGER SIDE BEZEL

## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ INSTRUMENT PANEL - WARNING)

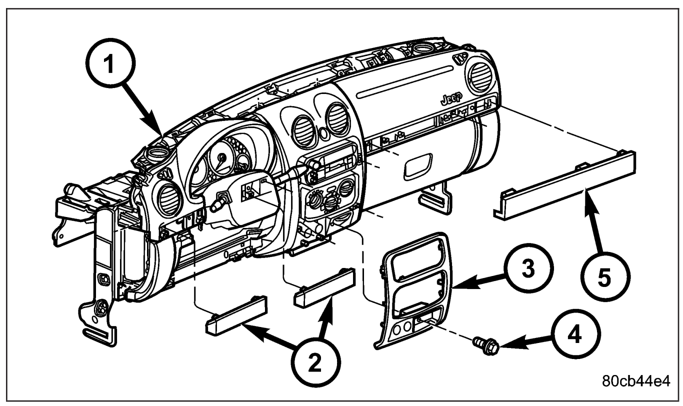
### On vehicles equipped with a grab handle:

1. Using a trim stick C-4755 or equivalent, remove the grab handle end caps.
2. Disconnect the electrical connector, if equipped.
3. Remove the grab handle screws.
4. Remove the grab handle and bezel assembly.



### On vehicles without a grab handle:

1. Using a trim stick C-4755 or equivalent, release the retaining clips and remove the passenger side bezel (5).

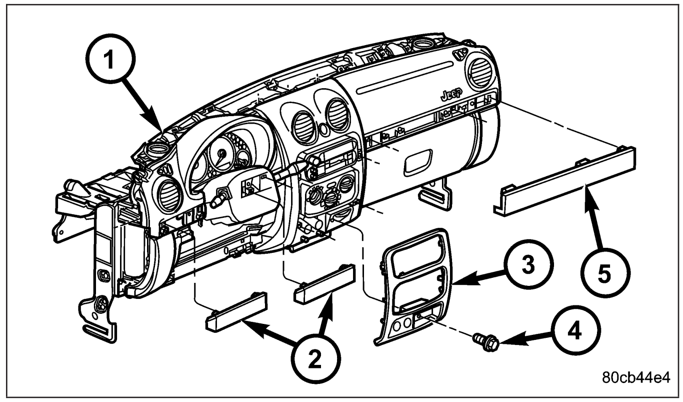


## INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ INSTRUMENT PANEL - WARNING)

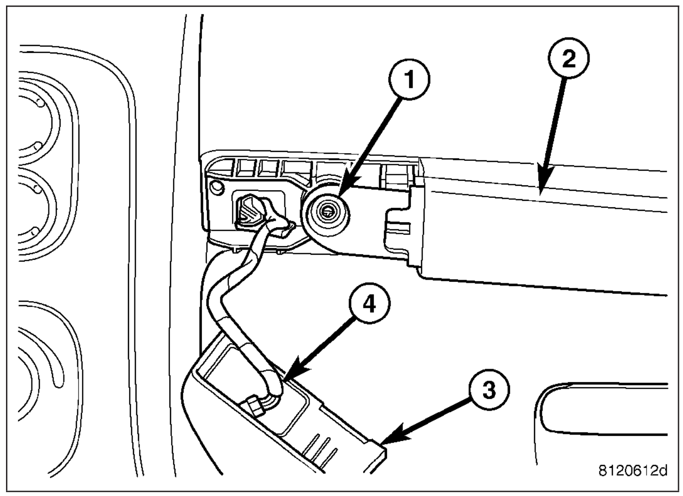
## On vehicles without a grab handle:

1. Position the passenger side bezel (5) and seat the retaining clips.



## On vehicles equipped with a grab handle:

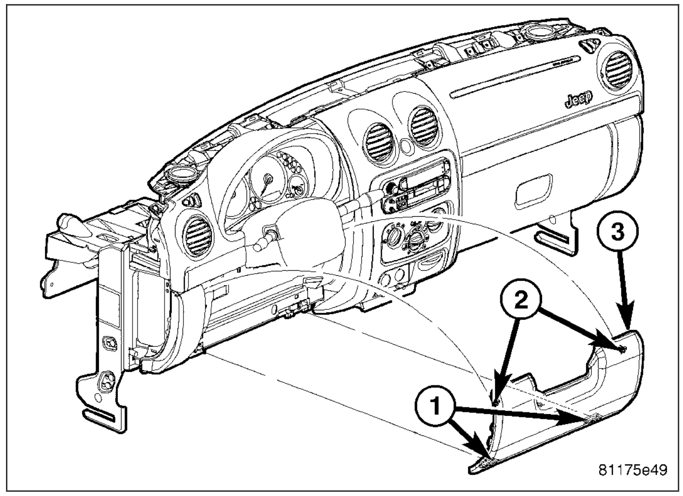
1. Install the grab handle (2) and bezel assembly and install the screws (1).
2. Connect the electrical connector (4), if equipped.
3. Position the end caps (3) in place and seat fully.



# KNEE BLOCKER

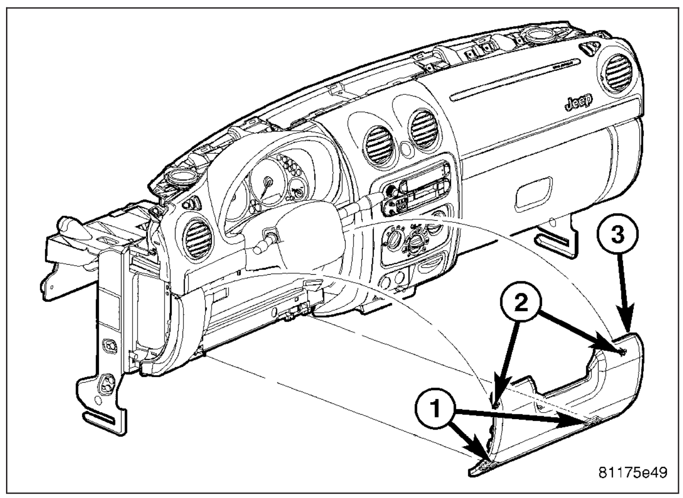
## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Reach into the steering column opening at the top of the knee blocker and pull the top rearward to disengage upper knee blocker clips (2).
3. Gently swing the knee blocker open.
4. Slide the knee blocker toward the driver side door and disengage the hinges (1) from the molded in hinge pins in the instrument panel.



## INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. With the knee blocker close to a horizontal position, align both knee blocker hinges (1) to the tabs at the bottom edge of the instrument panel.
3. engage the hinges by sliding them toward the center of the vehicle as far as they can go.
4. Gently swing the knee blocker upward until the clips (2) touch the corresponding slots in the instrument panel and engage fully.



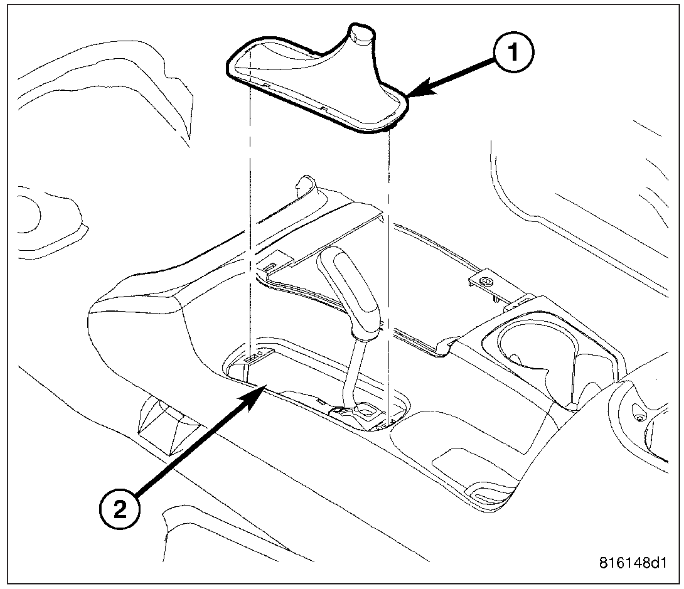
# INTERIOR

## TABLE OF CONTENTS

# 4WD FLOOR SHIFT BOOT

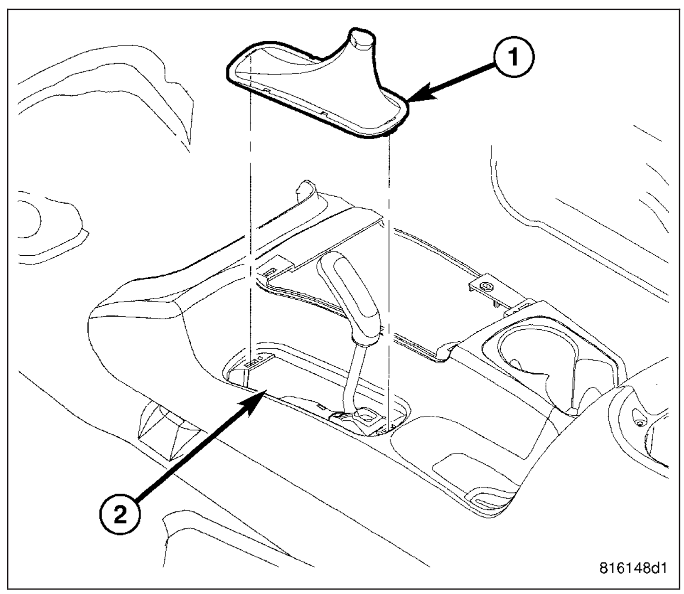
## REMOVAL

1. Separate the boot bezel from the console (2).
2. Release the upper snap and remove the boot (1) from the shifter.



## INSTALLATION

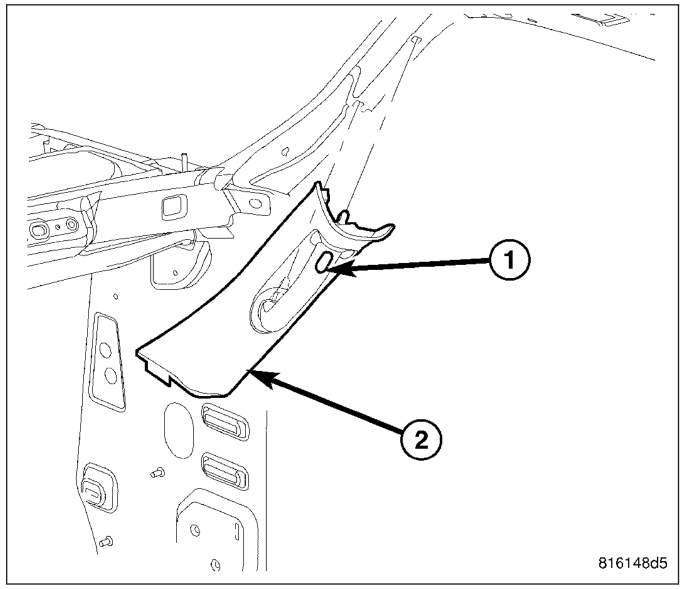
1. Position the boot (1) over the top of the transfer case shifter lever with the snap facing toward the front of the vehicle.
2. Seat the bezel into the console (2) aperture fully.
3. Fasten the snap on the top of the boot above the ring on the bottom of the knob.



# A-PILLAR TRIM AND GRAB HANDLE

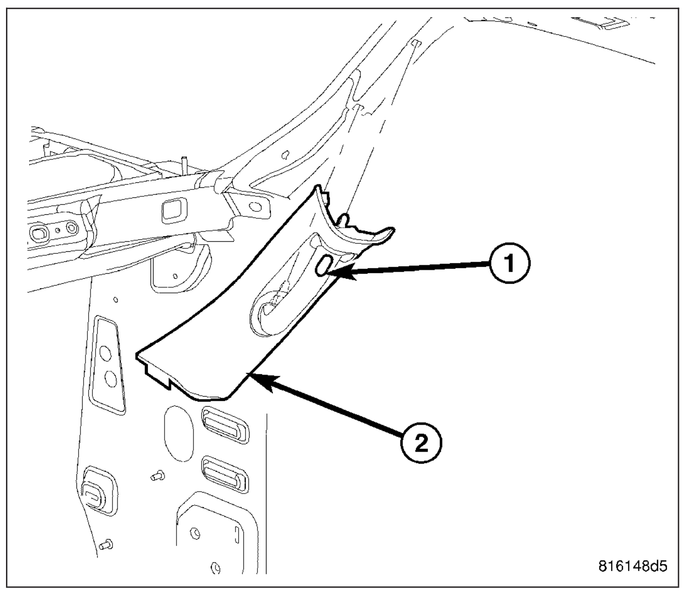
## REMOVAL

1. Using a small pry tool or equivalent, remove the grab handle trim plugs (1).
2. Remove the two grab handle screws.
3. Remove the grab handle and A-pillar trim (2) from the A-pillar.



## INSTALLATION

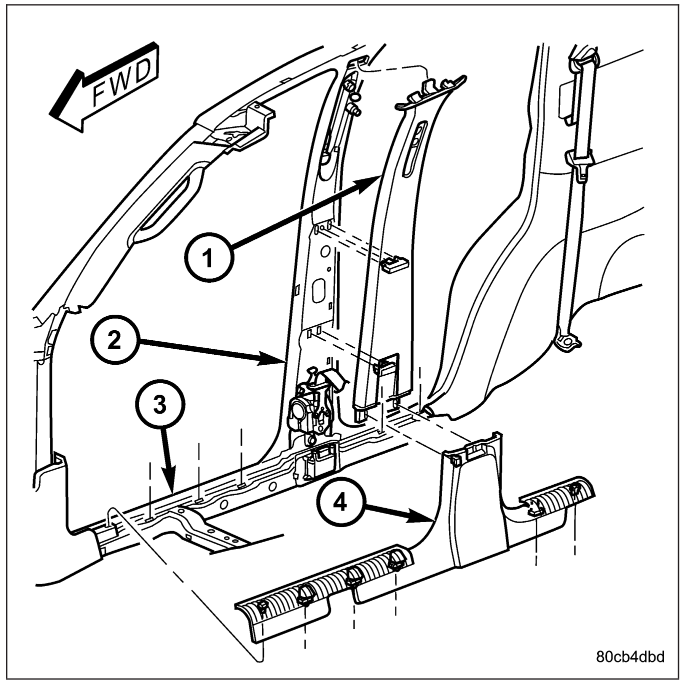
1. Snap A-pillar trim (2) and grab handle into the A-pillar.
2. Install the two screws and install the grab handle trim plugs (1).



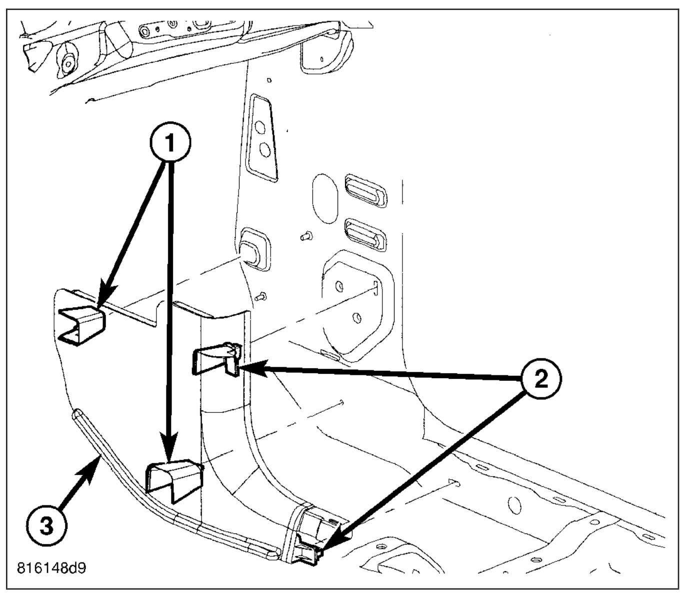
# COWL TRIM COVER

## REMOVAL

1. Using a trim stick C-4755 or equivalent, lift up the front edge of the lower B-pillar trim (4) and position aside. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)

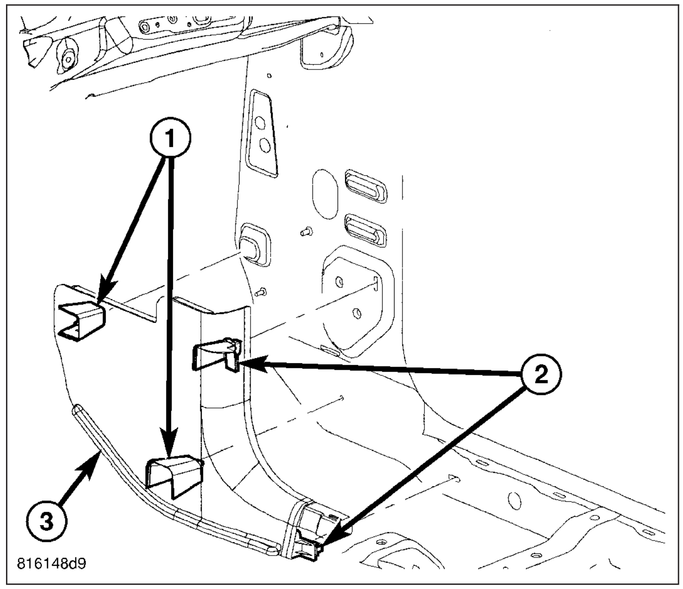


2. Remove the cowl trim cover (3) by pulling it away from the A-pillar and releasing the clips (1 and 2).

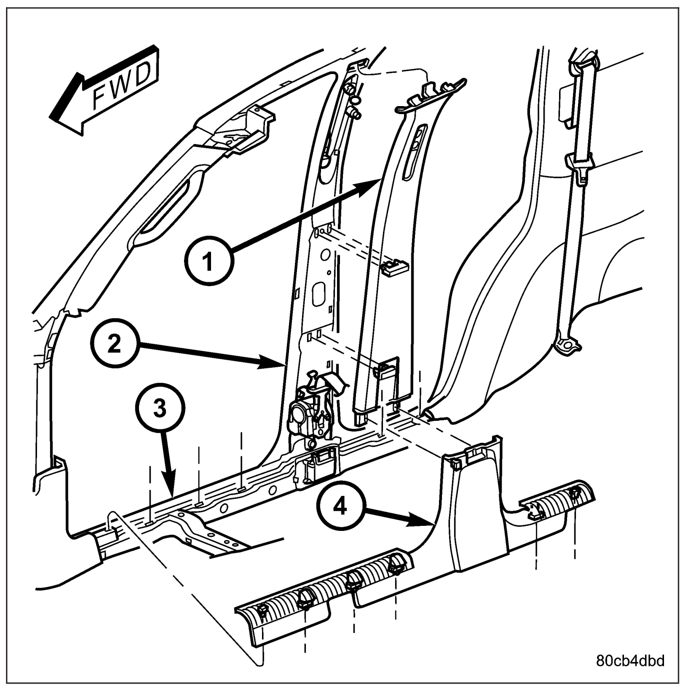


## INSTALLATION

1. Install the cowl trim cover (3) and seat the retaining clips (1 and 2).



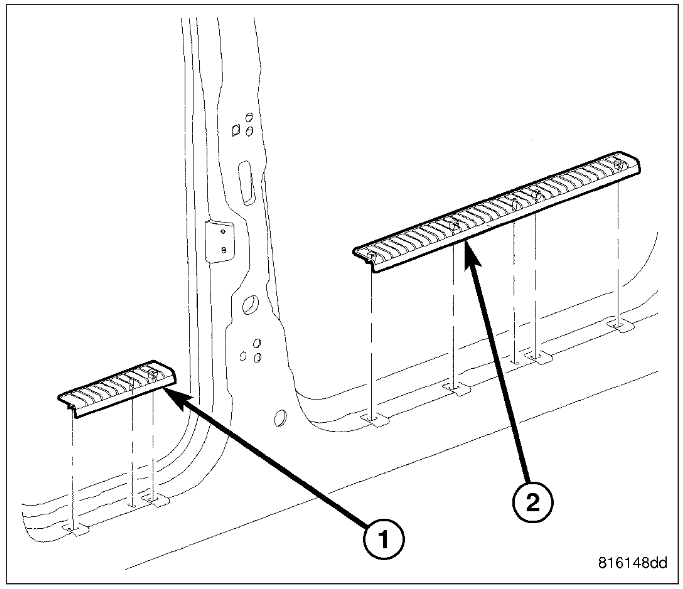
2. Position the B-pillar trim panel (4) and seat the retaining clips.



# DOOR SILL SCUFF PLATE

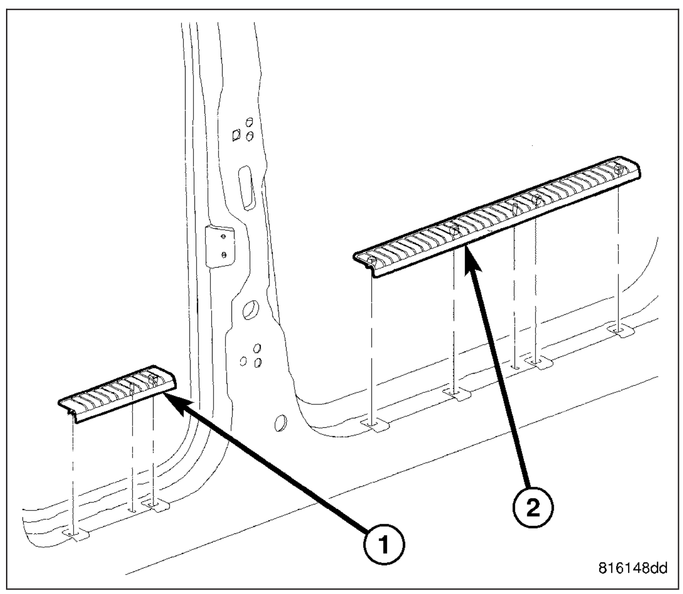
## REMOVAL

1. Using a trim stick C-4755 or equivalent, pry up the scuff plate releasing the retaining clips.



## INSTALLATION

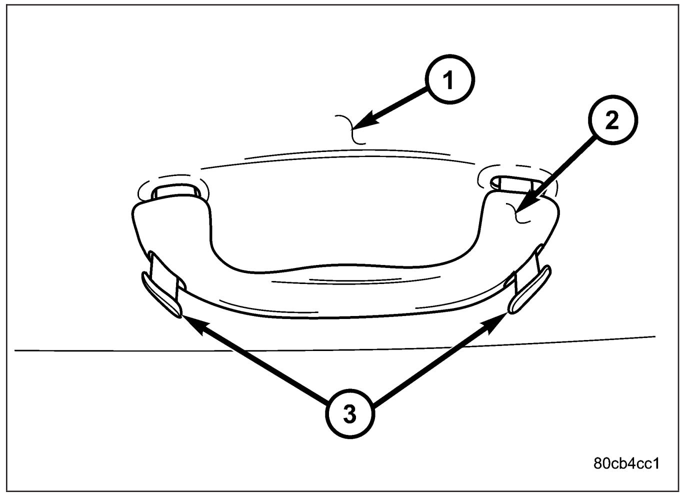
1. Position the scuff plate and seat the retaining clips.



# ASSIST HANDLE

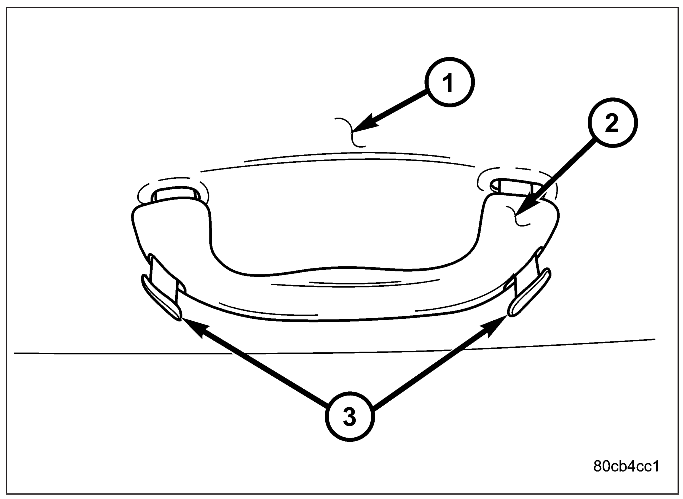
## REMOVAL

1. Using a small pry tool or equivalent, release the assist handle by prying out the clips (3) at either end.



## INSTALLATION

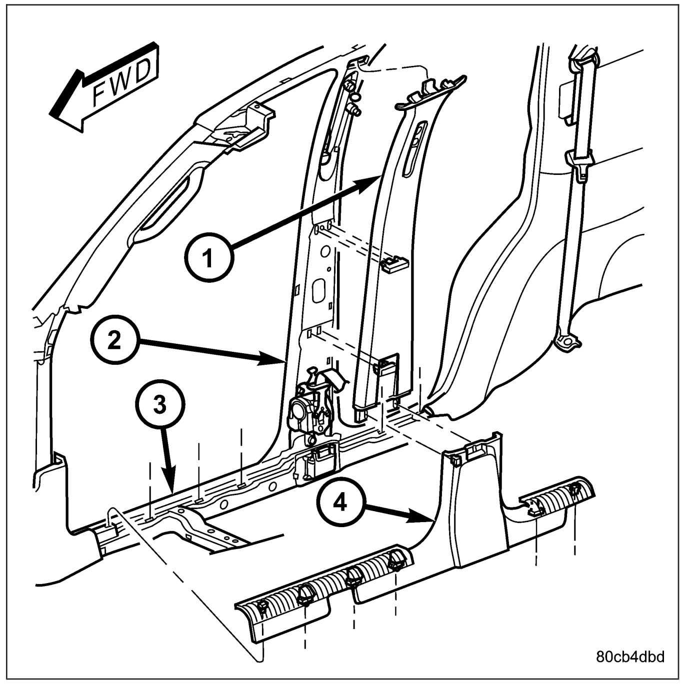
1. Position the assist handle and seat the retaining clips (3).



# B-PILLAR LOWER TRIM

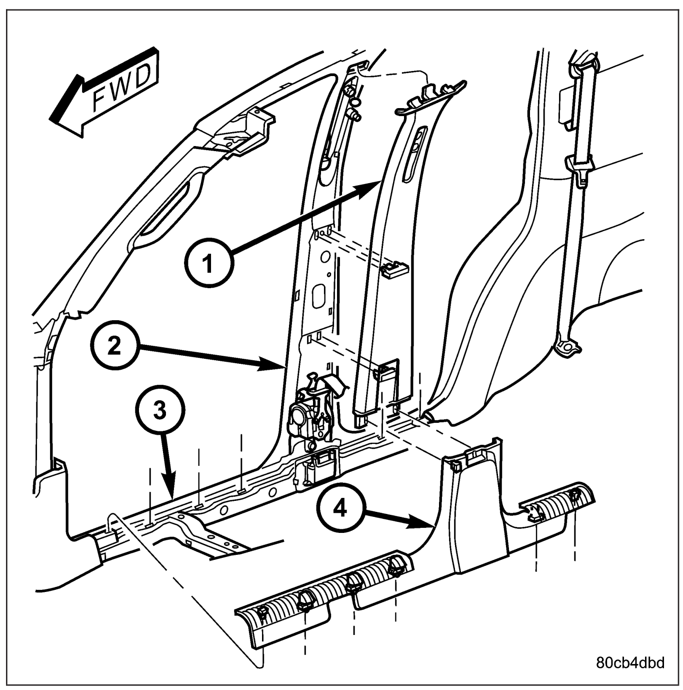
## REMOVAL

1. Using a trim stick C-4755 or equivalent, pry up the trim panel (4), releasing the retaining clips.



## INSTALLATION

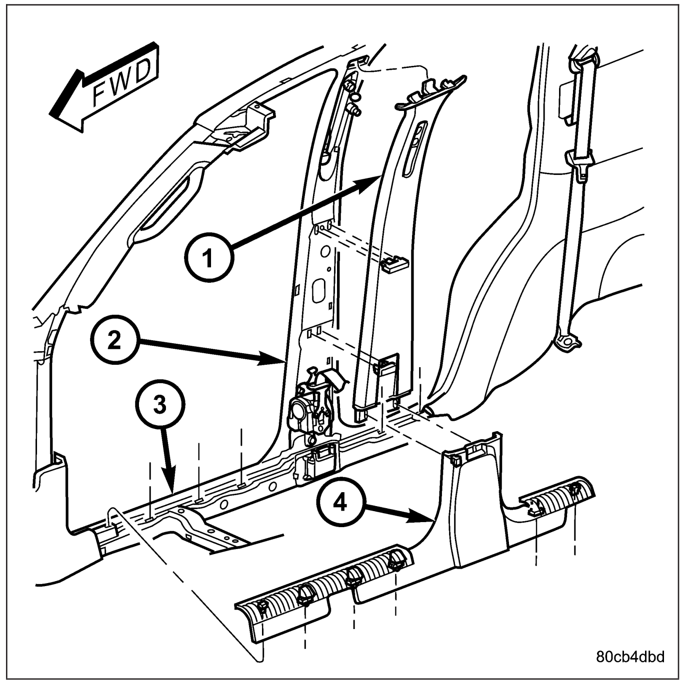
1. Position the trim panel (4) and seat the retaining clips fully.



# B-PILLAR UPPER TRIM

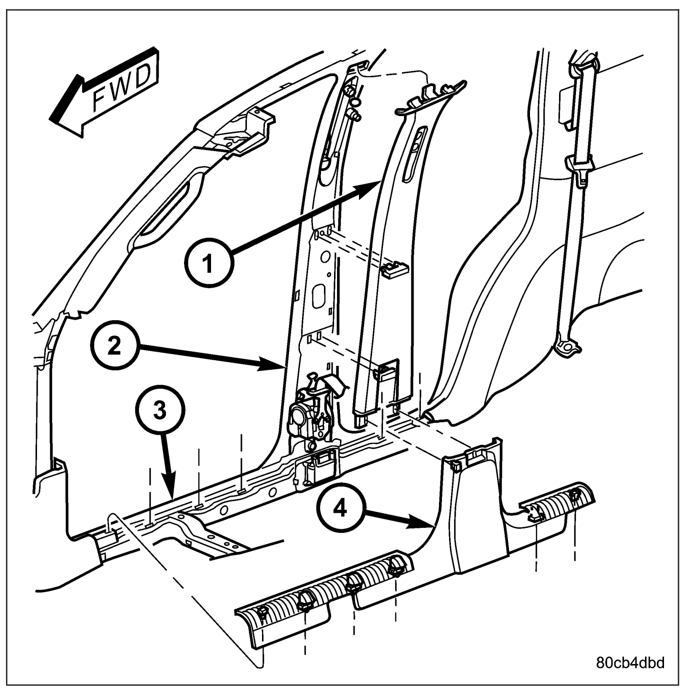
## REMOVAL

1. Remove the lower B-pillar trim panel (4). (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
2. Remove the shoulder belt turning loop. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
3. Using a trim stick C-4755 or equivalent, release the trim retaining clips and remove the upper trim (1).



## INSTALLATION

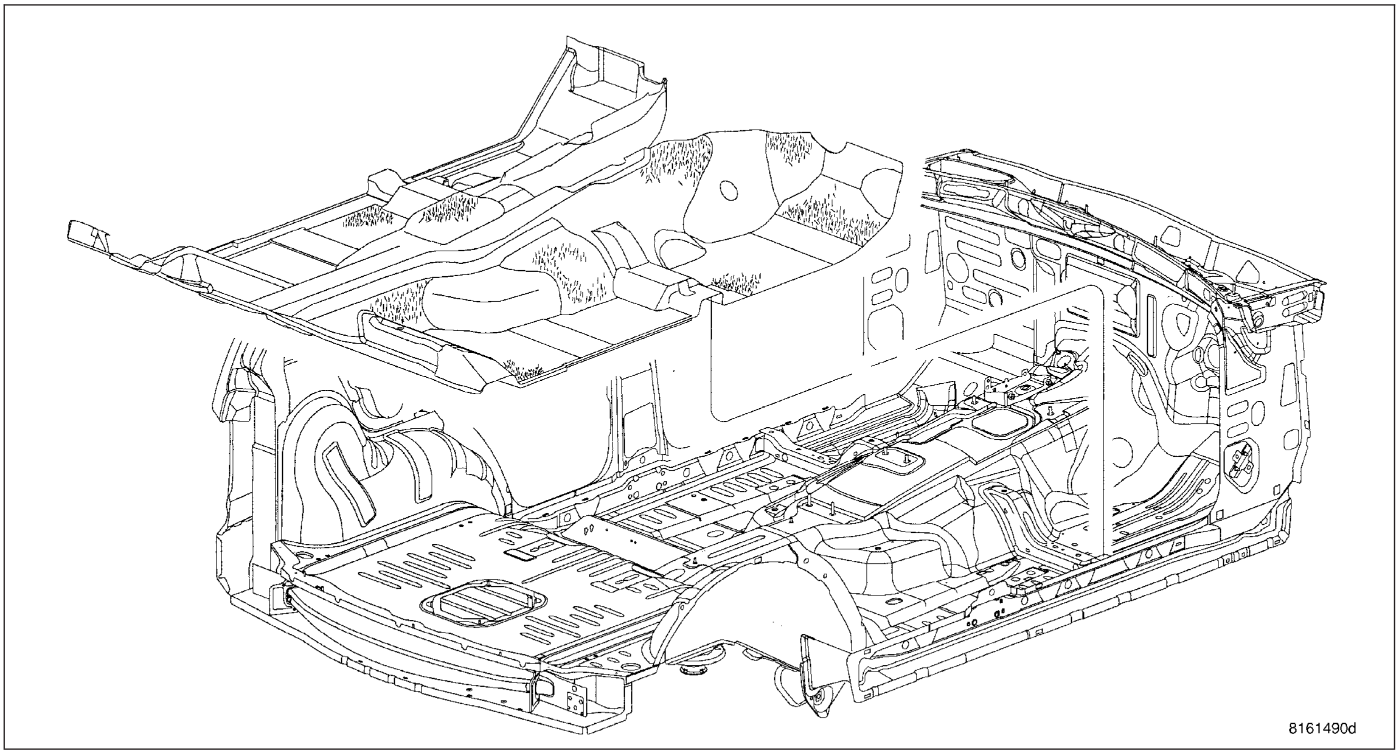
1. Position the upper trim panel (1) and seat the retaining clips.
2. Install the seat belt turning loop. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)
3. Install the B-pillar lower trim panel (4). (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)



# CARPETS AND FLOOR MATS

## REMOVAL

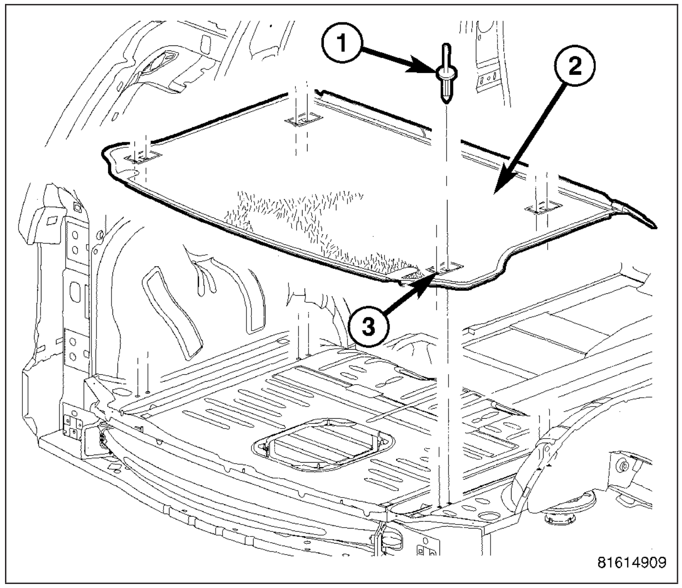
### Front Carpet



1. Remove front seats. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
2. Remove the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
3. Remove the rear seats. (Refer to 23 - BODY/SEATS/SEAT - REAR - REMOVAL)
4. Remove the cowl trim panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL)
5. Remove the B-pillar lower trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
6. Remove the jack assembly.
7. Remove the carpet.

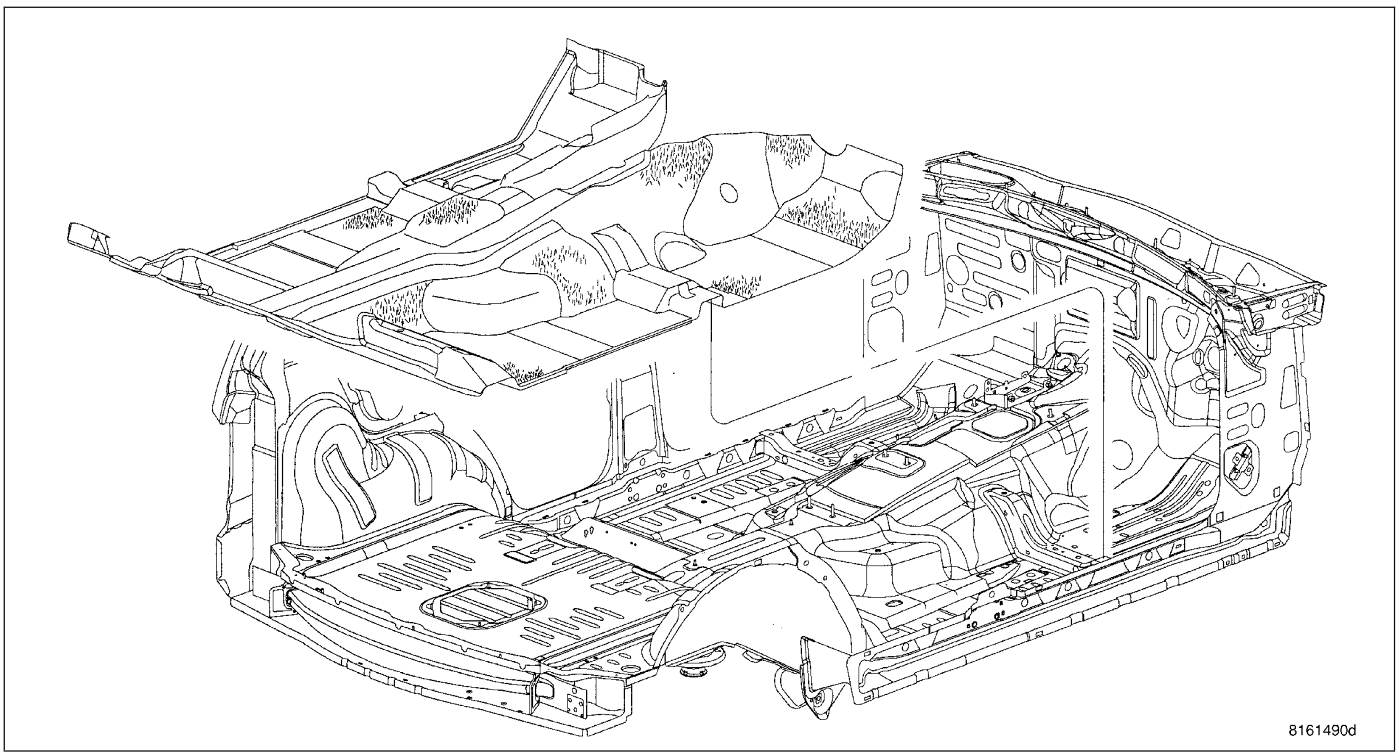
### Rear Cargo Carpet

1. Remove the rivets (1) attaching the cargo hooks (3) to the floor.
2. Remove the carpet (2).



## INSTALLATION

### Front Carpet

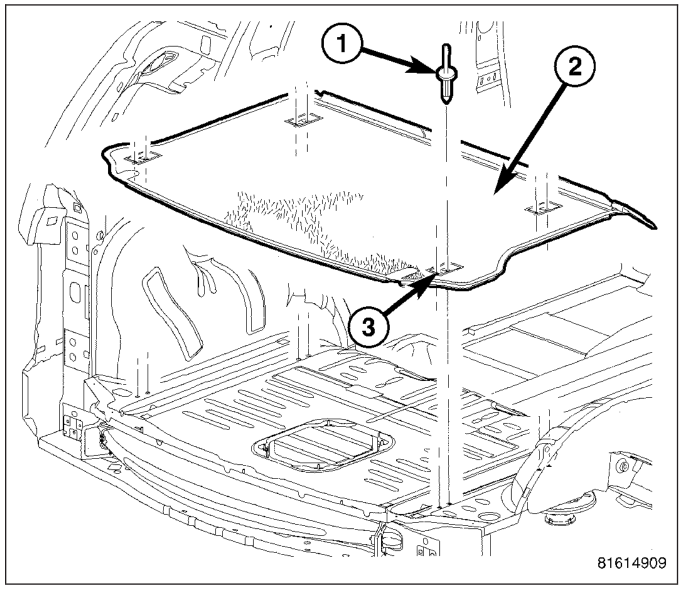


1. Install the carpet.
2. Install the jack assembly.
3. Install the B-pillar lower trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)
4. Install the cowl trim panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION)
5. Install the rear seats. (Refer to 23 - BODY/SEATS/SEAT - REAR - INSTALLATION)
6. Install the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

7. Install the front seats. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)

## Rear Cargo Carpet

1. Install the carpet and slide under the trim panels.
2. Install new rivets securing the carpet and cargo hooks to the floor.



# SHIFT BEZEL

## REMOVAL

1. Using a trim stick C-4755 or equivalent, pry shift bezel out of the floor console.

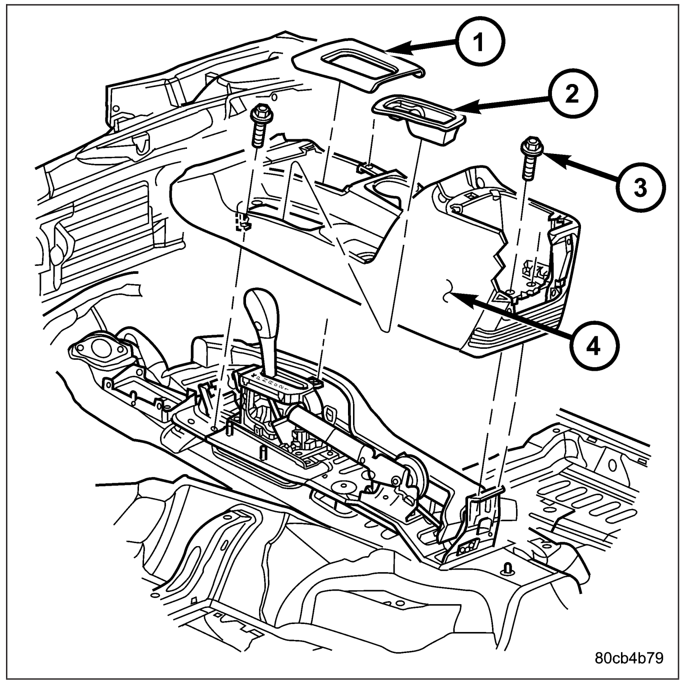
## INSTALLATION

1. Position the shift bezel and seat the retaining clips into the floor console.

# FLOOR CONSOLE

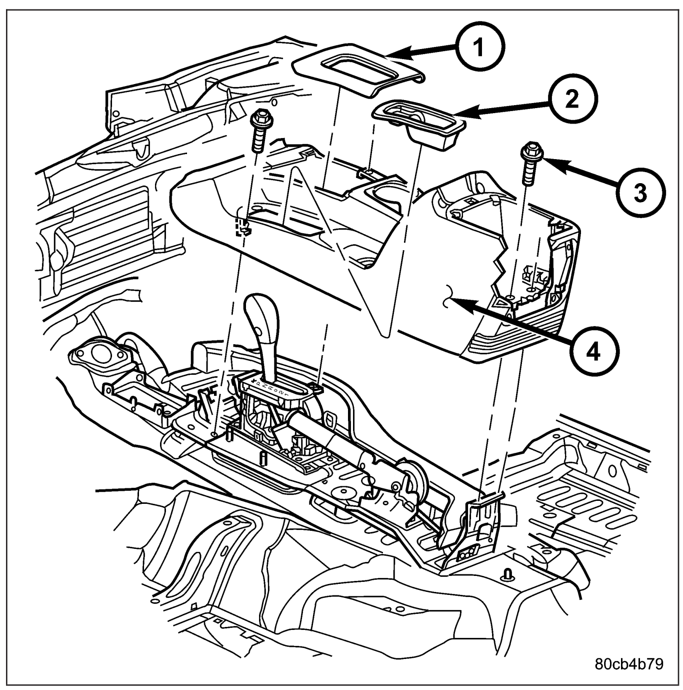
## REMOVAL

1. Remove the shift bezel, if equipped. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - REMOVAL)
2. Set park brake lever in the up position.
3. Using a trim stick C-4755 or equivalent, disconnect the manual trans shifter boot, if equipped.
4. Using a trim stick C-4755 or equivalent, disconnect the transfer case shifter boot, if equipped.
5. Remove the four bolts.
6. Lift the console at the back and remove.



## INSTALLATION

1. Position the front of the console and lower the rear over the shifter and brake levers.
2. Install the bolts.
3. Install the shift boots and seat the retainer clips.
4. Install the shift bezel. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - INSTALLATION)



# FLOOR CONSOLE LID LATCH

## REMOVAL

1. Remove the screws and remove the lid.
2. Remove the screws attaching the lid cover and remove the latch.

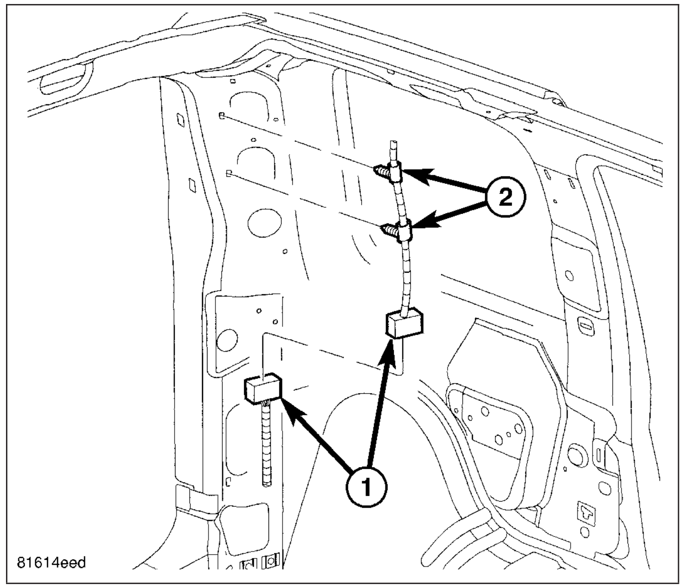
## INSTALLATION

1. Install the latch and the lid cover.
2. Install the screws attaching the lid cover.
3. Install the console lid onto the console and install the screws.

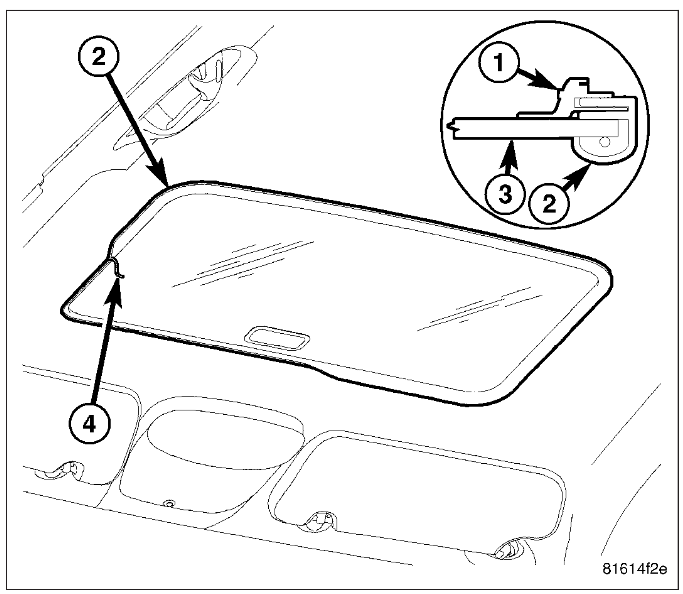
# HEADLINER

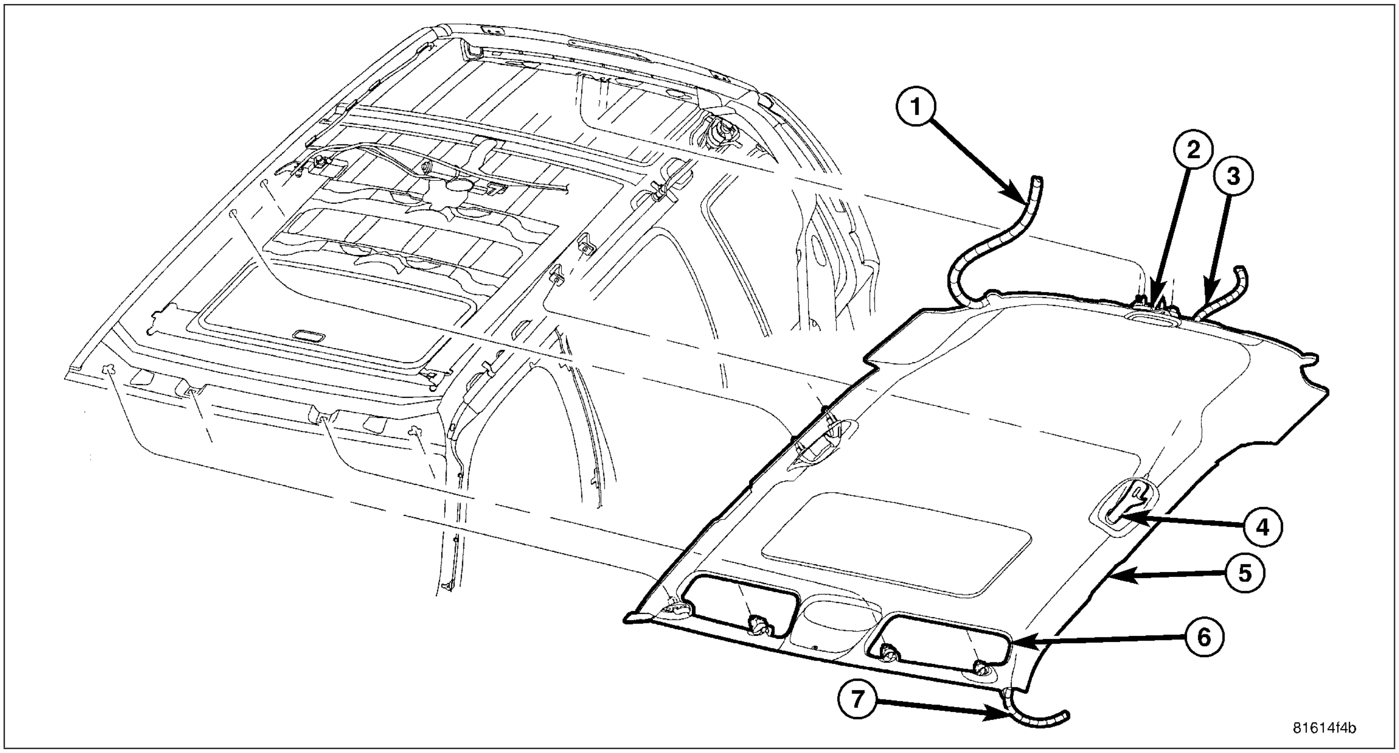
## REMOVAL

1. Remove the A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM AND GRAB HANDLE - REMOVAL)
2. Remove the visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL)
3. Remove the sun visor support. (Refer to 23 - BODY/INTERIOR/SUN VISOR SUPPORT - REMOVAL)
4. Remove the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL)
5. Cut rear washer hose at the mark about halfway up the A-pillar.
6. Remove the upper B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL)
7. Remove the assist handles. (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL)
8. Remove the quarter trim. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)
9. Disconnect the electrical connector along the left D-pillar and remove the ground wire.



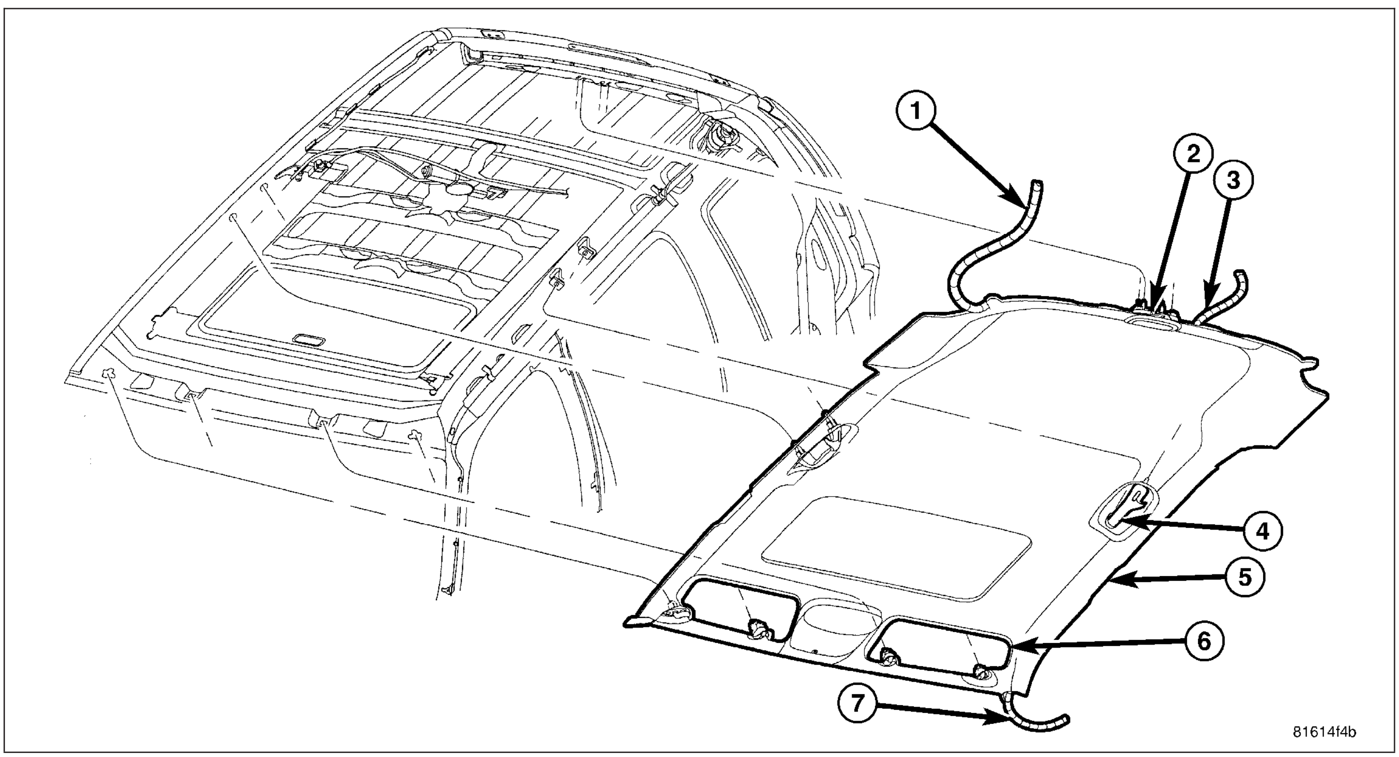
10. Remove the sunroof opening trim lace (2), if equipped. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL)





11. Remove the dome light in the rear.
12. Remove the rear washer nozzle.
13. Remove the headliner.

## INSTALLATION



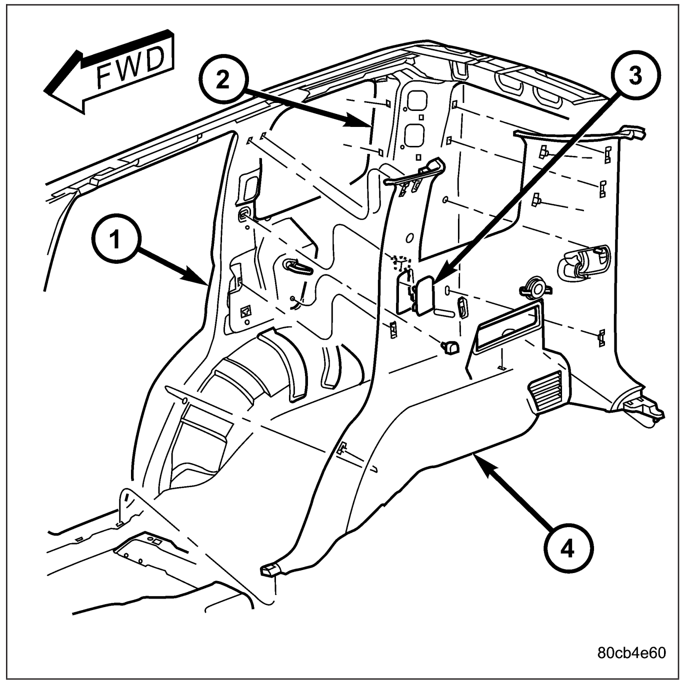
1. Install the headliner.
2. Install the assist handles (4). (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - INSTALLATION)
3. Install the visors (6). (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION)
4. Install the visor supports. (Refer to 23 - BODY/INTERIOR/SUN VISOR SUPPORT - INSTALLATION)

5. Install the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION)
6. Connect the rear washer hose, previously cut, with a hose junction.
7. Install the A-pillar trim and grab handles. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)
8. Install the upper B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION)
9. Install the rear washer nozzle.
10. Connect the electrical connector and ground wire at the left D-pillar.
11. Install the quarter trim panels. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)
12. Install the rear dome light.
13. Install the sunroof opening trim lace, if equipped. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION)

# QUARTER TRIM PANEL

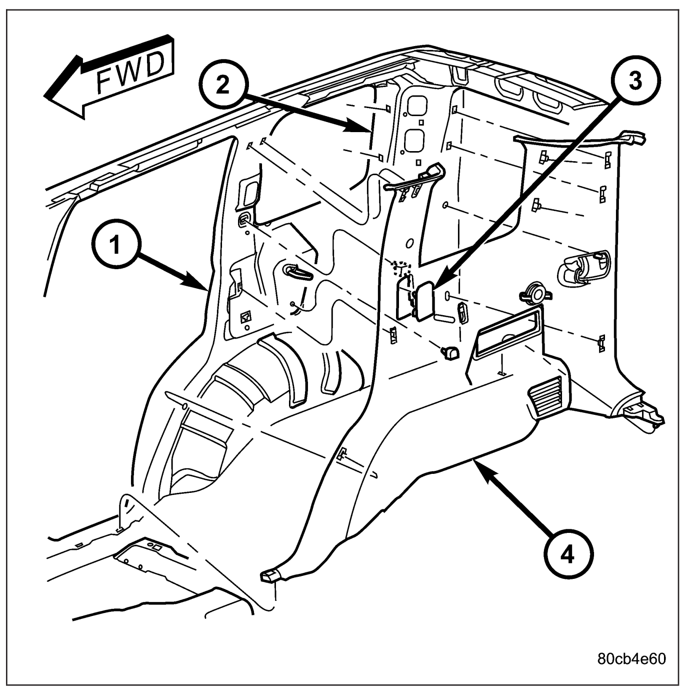
## REMOVAL

1. Using a trim stick C-4755 or equivalent, remove the rear header trim.
2. Using a trim stick C-4755 or equivalent, remove the rear sill plate.
3. Remove the hook pin type connector.
4. Fold down the rear seat.
5. Remove the seat belt anchor and pivot. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
6. Remove the belt access panel.
7. Remove the storage cover.
8. Disconnect the 12v power supply electrical connector, if equipped.



## INSTALLATION

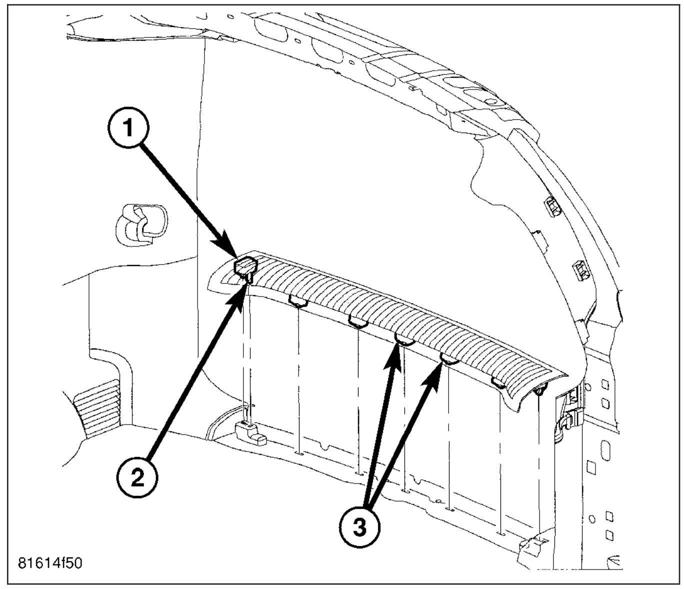
1. Position the 12v power supply electrical connector, if equipped.
2. Install the storage cover.
3. Install the belt access panel.
4. Install the seat belt anchor and pivot. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)
5. Install the hook pin type connector.
6. Position the rear sill plate and seat the retaining clips.
7. Position the rear header trim and seat the retaining clips.



# REAR DOOR SCUFF PLATE

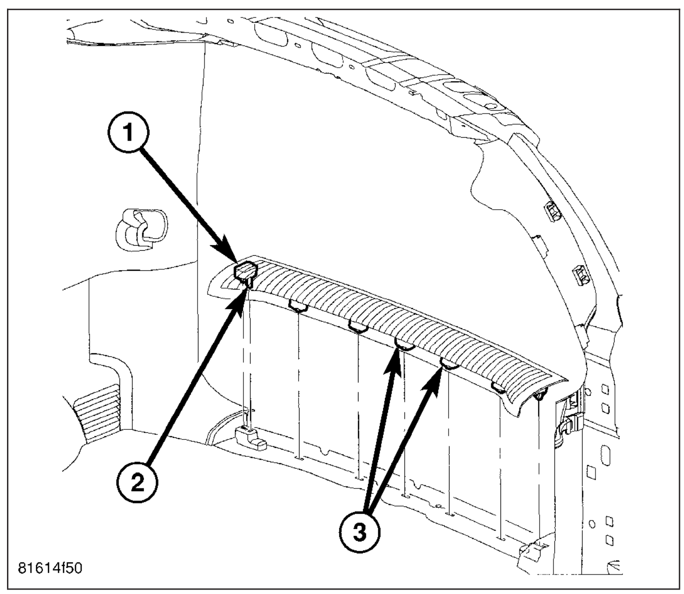
## REMOVAL

1. Using a trim stick C-4755 or equivalent, release the retaining clips and remove the scuff plate.



## INSTALLATION

1. Position the scuff plate and seat the retaining clips.



# SUN VISOR

## REMOVAL

1. Remove the screws at the visor pivot.
2. Disconnect the electrical connector and remove the visor.

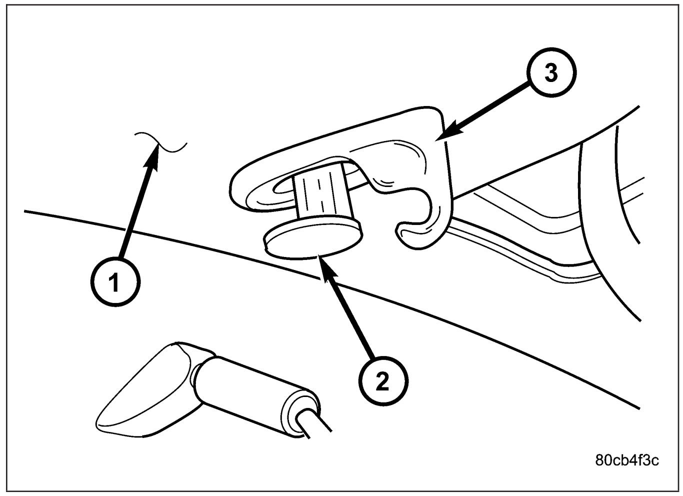
## INSTALLATION

1. Connect the electrical connector and install the visor.
2. Install the screws at the visor pivots.

# SUN VISOR SUPPORT

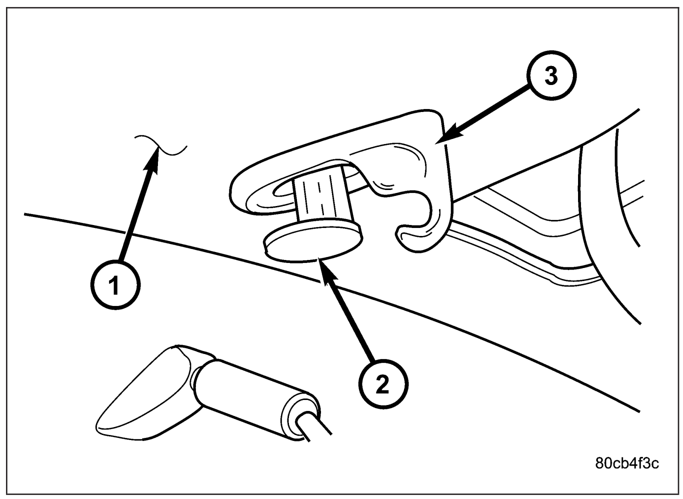
## REMOVAL

1. Using a small pry tool or equivalent, release the support retaining clip by prying out and remove the support.



## INSTALLATION

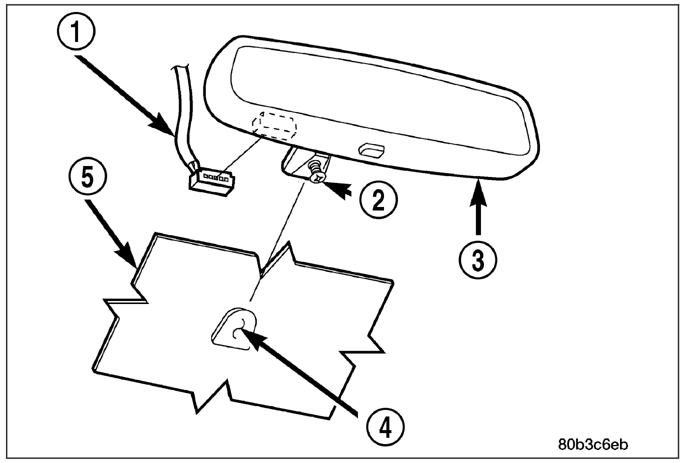
1. Position the visor support and seat the retaining clip.



# REAR VIEW MIRROR

## REMOVAL

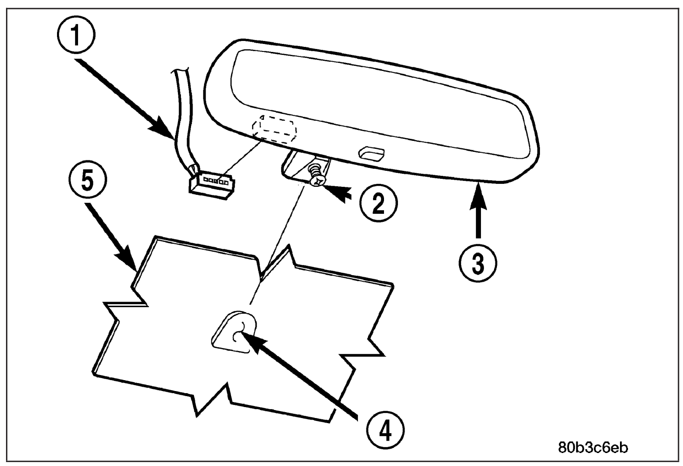
1. If equipped, disconnect mirror harness connector.
2. Loosen the mirror base setscrew.
3. Slide the mirror base upward and off the bracket.



## INSTALLATION

## INSTALLATION

1. Position the mirror base at the bracket and slide it downward onto the support bracket.
2. Tighten the setscrew 1 N·m (15 in. lbs.) torque.
3. If equipped, connect mirror harness connector.



## INSTALLATION - REAR VIEW MIRROR SUPPORT BRACKET

1. Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
2. Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerator to the surface on the bracket according to the following instructions:
   a. Crush the vial to saturate the felt applicator.
   b. Remove the paper sleeve.
   c. Apply accelerator to the contact surface on the bracket.
   d. Allow the accelerator to dry for five minutes.
   e. Do not touch the bracket contact surface after the accelerator has been applied.
5. Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.

6. Install the bracket according to the following instructions:
   a. Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
   b. Apply an even coat of adhesive to the contact surface on the bracket.
   c. Align the bracket with the marked position on the windshield glass.
   d. Press and hold the bracket in place for at least one minute.

**NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.**

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

# PAINT CODE

## DESCRIPTION

Exterior vehicle body colors are identified on the Vehicle Certification Label (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE CERTIFICATION LABEL - DESCRIPTION) or the Body Code Plate (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION). The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers. (Refer to 23 - BODY/PAINT - SPECIFICATIONS)

# BASE COAT/CLEAR COAT FINISH

## DESCRIPTION

The original equipment finish is a multi step process that involves cleaning, applying electro de-position (E-coat), anti-chip primer, basecoat, and clearcoat steps.

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clear coat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

**CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result. Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.**

# PAINT TOUCH-UP

## DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch-Up Paints and Clear Topcoat. Refer to Introduction group of this manual for Body Code Plate information.

**WARNING: Use an OSHA approved respirator and safety glasses when spraying paint or solvents in a confined area. Personal injury can result.**

## OPERATION

1. Scrape loose paint and corrosion from inside scratch or chip.
2. Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.
5. On vehicles without clearcoat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
6. On vehicles with clearcoat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear topcoat to dry hard. If desired, Step 5 can be performed on clear topcoat.

**WARNING: Avoid prolonged skin contact with petroleum or alcohol – based cleaning solvents. Personal injury can result.**
**Avoid prolonged skin contact with petroleum or alcohol – based cleaning solvents. Personal injury can result.**

# FINESSE SANDING/BUFFING & POLISHING

## DESCRIPTION

**CAUTION: Do not remove more than .5 mils of clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.**
**Use a Paint Thickness Gauge #PR-ETG-2X or equivalent to determine film thickness before and after the repair.**

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

# SEATS

## TABLE OF CONTENTS

# SEATS

## WARNING

## WARNINGS - RESTRAINT SYSTEM

**WARNING:**

- **To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**
- **To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**
- **To avoid personal injury or death on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Airbag Control Module (ACM). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components.**
- **To avoid personal injury or death, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 2500 psi.**
- **To avoid personal injury or death, when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.**
- **To avoid personal injury or death, replace all restraint system components only with parts specified in the DaimlerChrysler Mopar Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.**
- **To avoid personal injury or death, the fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar® Parts Catalog.**
- **To avoid personal injury or death, when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.**

**NOTE: A non-calibrated Occupant Classification Module (OCM) is the only component of the Occupant Classification System (OCS) that is available for separate service replacement, as outlined in the procedures that follow. The OCS components of the passenger side front seat cushion including the cushion frame, springs, pad, occupant detection bladder, pressure sensor, seat cushion foam and the OCM are a factory-calibrated and assembled unit. Once this unit is connected to a vehicle electrically, the calibration settings are uploaded from the OCM and stored in the memory of the Airbag Control Module (ACM). If only the OCM is subsequently replaced, the new, non-calibrated OCM learns the proper calibration settings from the ACM after it is connected to the vehicle electrically.**

**If any of the remaining OCS components of the passenger side front seat cushion require replacement, they are serviced only as a factory-calibrated, assembled, and tamper-evident service replacement package. This package includes the assembled frame, springs, pad, bladder, sensor, foam, wiring and a calibrated OCM. When installing this package, always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components contained in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle.**

**Once any of the original factory-installed components except the OCM have been replaced with the service replacement package components, the OCM can only be serviced by replacing the entire passenger side front seat cushion unit with another complete service replacement package. (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - REMOVAL).**

# HEADREST

## REMOVAL

1. Depress head restraint release button and lift head restraint to full up position.
2. Using a small flat blade, depress tab on right side head restraint release button and using your hand, simultaneously press tab on left side head restraint release button and pull head restraint up to separate from seat back.

## INSTALLATION

1. Position head restraint in seat back, press tab on left side head restraint release button and push down head restraint to secure.

# HEADREST SLEEVE

## REMOVAL

1. Remove the headrest. (Refer to 23 - BODY/SEATS/HEADREST - REMOVAL)
2. Remove the headrest sleeve cover.
3. Rotate head restraint sleeve 1/4 turn counter-clockwise to release retaining tab.
4. Pull sleeve from seat back frame.

## INSTALLATION

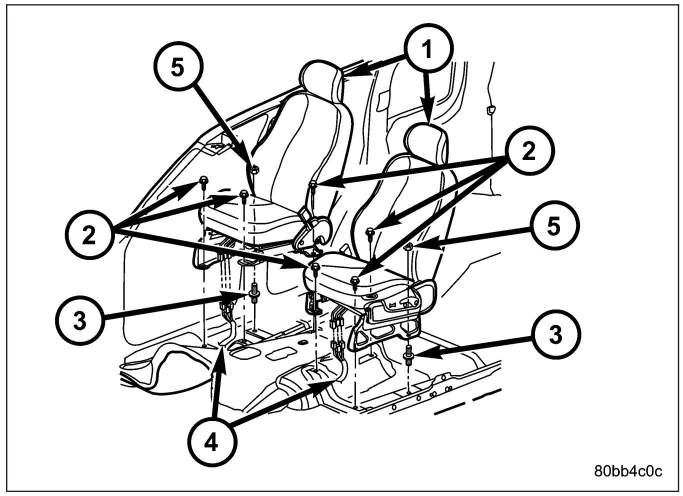
1. Position sleeve in seat back frame.
2. Rotate head restraint sleeve 1/4 turn clockwise to engage retaining tab.
3. Install the headrest sleeve cover.
4. Install the headrest. (Refer to 23 - BODY/SEATS/HEADREST - INSTALLATION)

# SEAT - FRONT

## REMOVAL

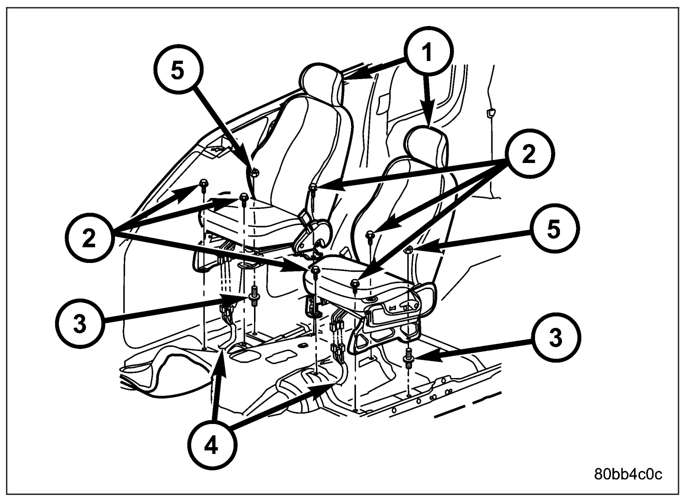
**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Remove the seat belt anchor bolt. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
2. Slide seat back and remove the front bolts.
3. Slide seat to forward position and remove the rear bolt/nut.
4. Disconnect the electrical connectors and remove the seat.



## INSTALLATION

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**



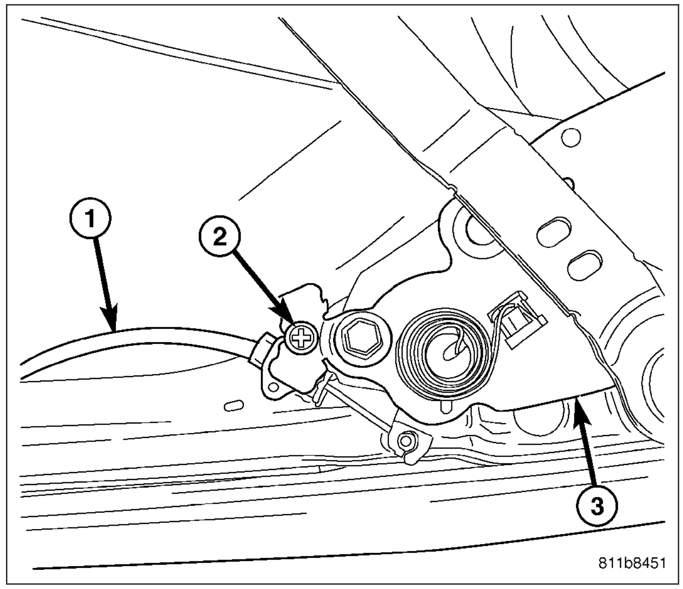
1. Install the seats and connect the electrical connectors.
2. Slide the seat to the rearward position and install the bolts.
3. Tighten the outboard bolt to 43 N·m (32 ft. lbs.) and then tighten the inboard bolt to 43 N·m (32 ft. lbs.).
4. Slide the seat to the forward position and install the rear bolt and nut.
5. Tighten the fasteners to 43 N·m (32 ft. lbs.).
6. Install the seat belt anchor and bolt. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)
7. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).
8. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a DRBIII® scan tool. Refer to the appropriate diagnostic procedures.

# SEAT BACK - FRONT

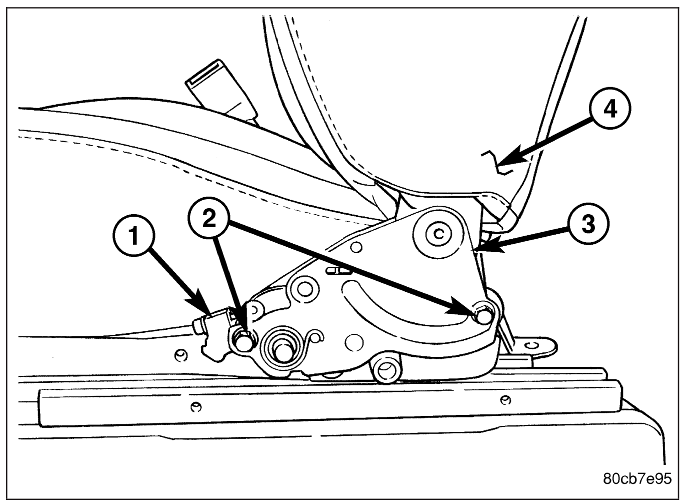
## REMOVAL

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Remove the seat. (Refer to 23 - BODY/SEATS/ SEAT - FRONT - REMOVAL)
2. Remove the seat cushion side shields.
3. Remove the screw and disconnect the lock out cable from both recliners.



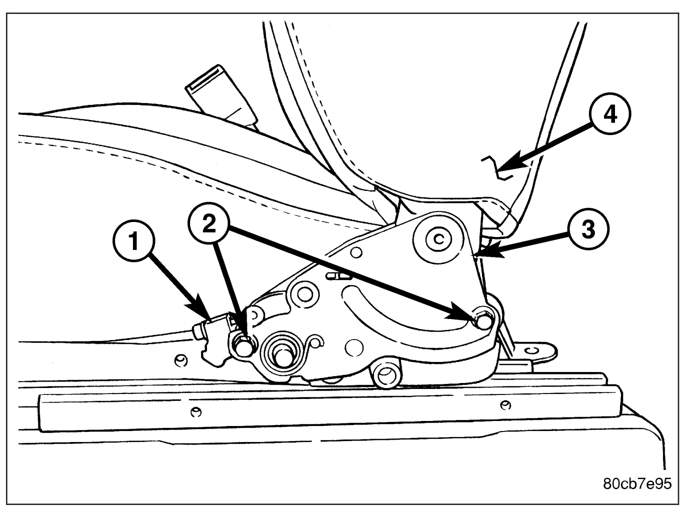
4. Remove the bolts and remove the seat back.



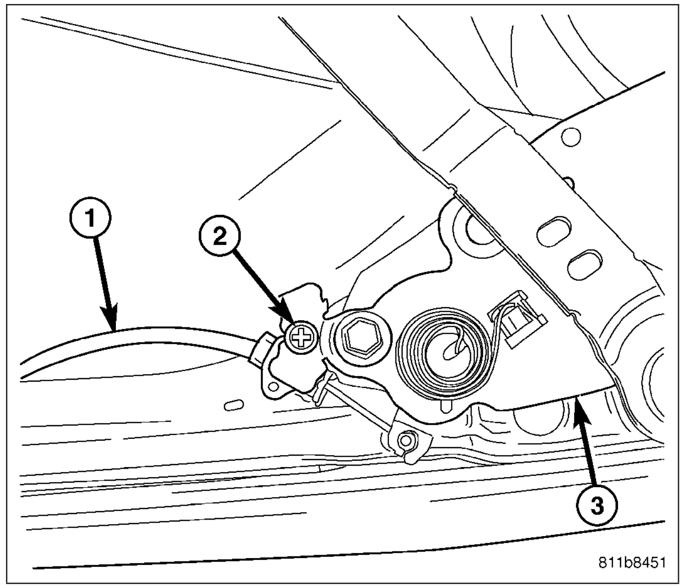
## INSTALLATION

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Install the seat back and install the bolts.
2. Tighten the bolts to 28 N·m (21 ft. lbs.).



3. Connect the lock out cable to both recliners and install the screws.
4. Install the belt buckle. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - INSTALLATION)
5. Install the side shields.
6. Install the seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)

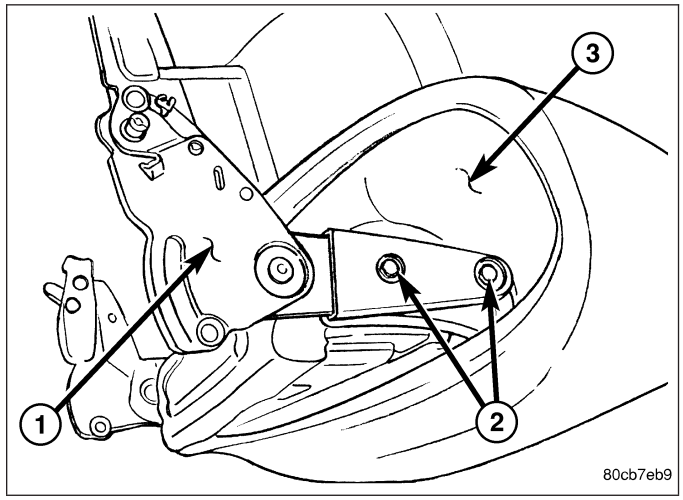


# SEAT BACK RECLINER - FRONT

## REMOVAL

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

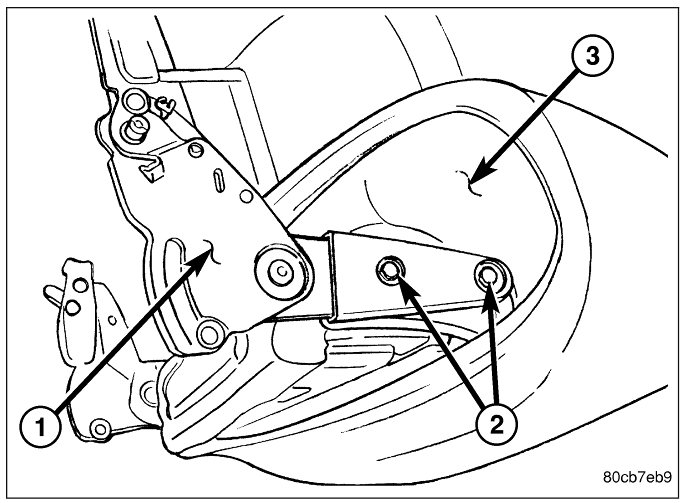
1. Remove the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - FRONT - REMOVAL)
2. Position the seat back cover out of the way and remove the bolts.
3. Remove the recliners from the seat back frame.



## INSTALLATION

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Install the recliners onto the seat back.
2. Position the seat back cover aside and install the recliner bolts.
3. Tighten the bolts to 28 N·m (21 ft. lbs.).
4. Install the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - FRONT - INSTALLATION)



# SEAT BACK COVER - FRONT

## REMOVAL

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Remove the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - FRONT - REMOVAL)
2. Remove the head rest and remove the trim caps. (Refer to 23 - BODY/SEATS/HEADREST - REMOVAL)
3. Disconnect the J-straps.
4. Remove the two lower hog rings.
5. Partially remove the seat back cover and remove the two upper hog rings.
6. Remove the seat back cover.

## INSTALLATION

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Partially install the seat back cover and replace the two top hog rings.
2. Pull cover down and replace the two lower hog rings.
3. Connect the J-straps.
4. Install trim caps and the head rest. (Refer to 23 - BODY/SEATS/HEADREST - INSTALLATION)
5. Install the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - FRONT - INSTALLATION)

# SEAT BACK CUSHION - FRONT

## REMOVAL

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Remove the seat back cover. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - FRONT - REMOVAL)
2. Separate the cushion from the seat back frame.

## INSTALLATION

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

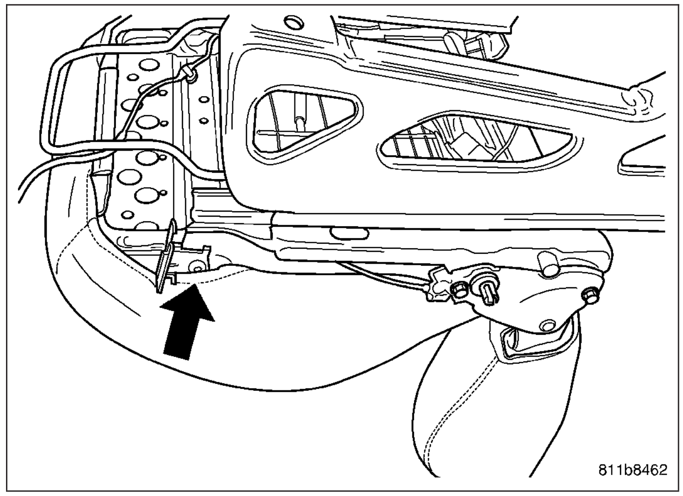
1. Position the cushion onto the seat back frame.
2. Install the seat back cover. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - FRONT - INSTALLATION)

# SEAT CUSHION - FRONT

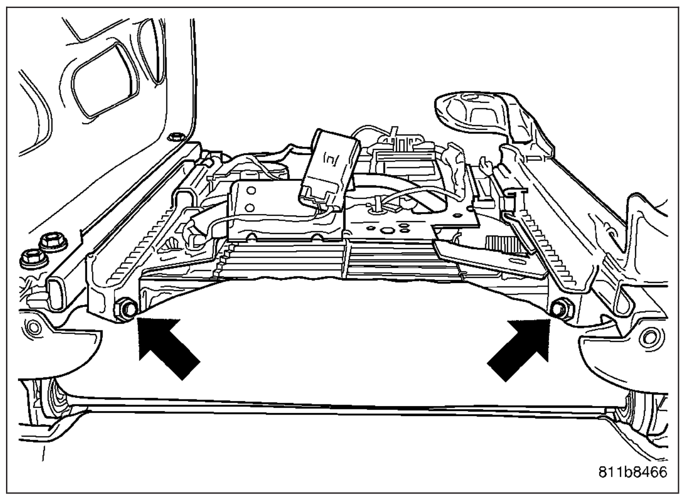
## REMOVAL

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

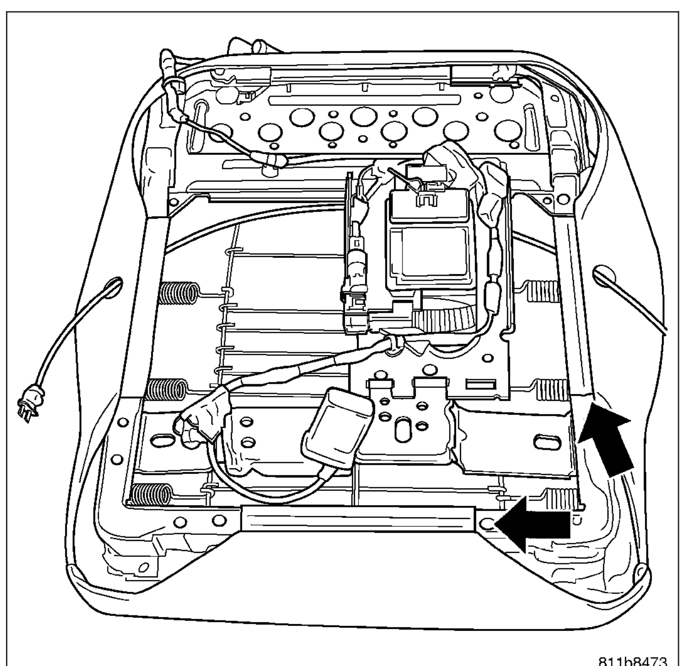
1. Remove the seat. (Refer to 23 - BODY/SEATS/ SEAT - FRONT - REMOVAL)
2. Remove the trim covers from each side.
3. Remove the screws and disconnect the recliner cable to the seat back hinges.
4. Remove the two bolts attaching the front of the cushion frame to the seat frame.



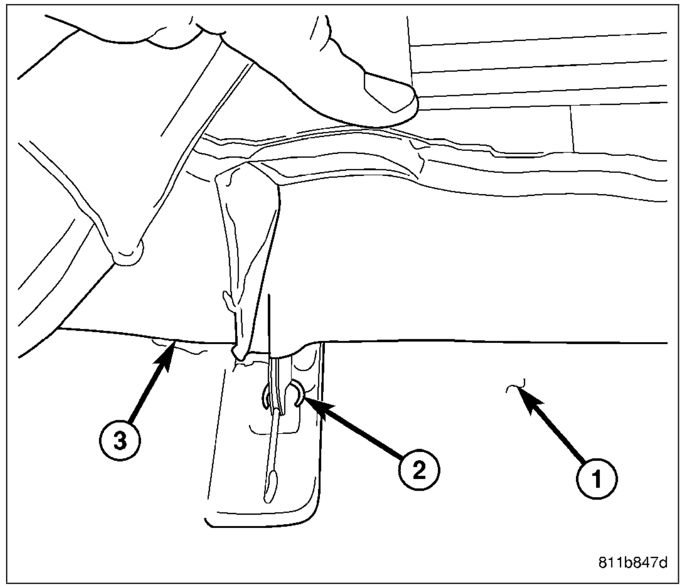
5. Remove the two bolts attaching the rear of the cushion frame to the seat frame.



6. Separate the seat cushion assembly from the seat assembly.
7. Separate the J-straps and remove the seat cushion and cover from the frame.



8. Remove the hog rings and remove the seat cushion cover.



## INSTALLATION

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

**NOTE: After replacing passenger front seat cushion and/or Occupant Classification Module (OCM) there may be a wire connector not used from the seat weight sensor. Secure wire connector to the seat cushion frame with wire ties.**

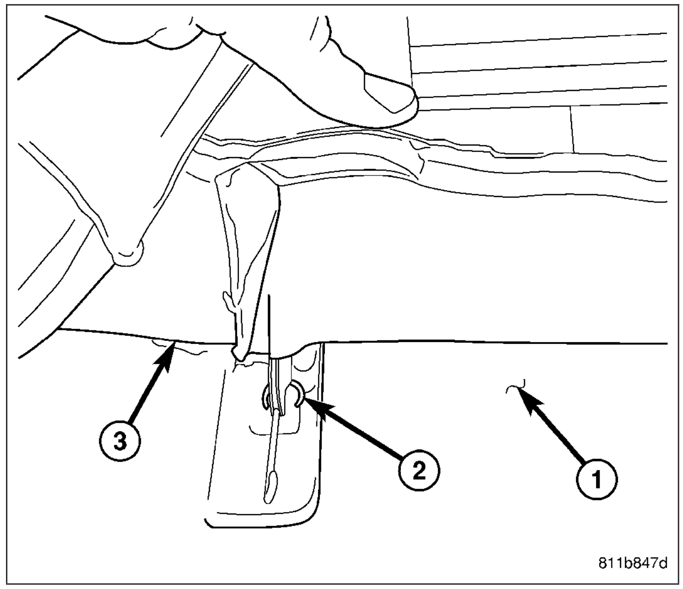
1. Position the seat cushion cover over the seat foam cushion and install new hog rings.
2. Position the seat cushion onto the seat cushion frame and attach the J-straps.
3. Install the seat cushion onto the seat assembly and install the rear two bolts.
4. Install the front two bolts and tighten the bolts to 28 N·m (21 ft. lbs.).
5. Connect the recliner cables to the seat back hinges and install the screws.
6. Install the trim covers.
7. Install the seat. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

# SEAT CUSHION COVER - FRONT

## REMOVAL

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

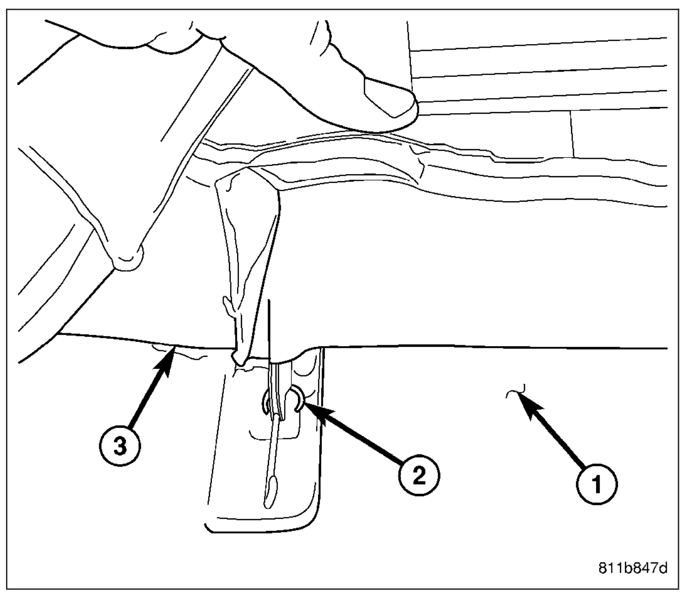
1. Remove the seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - REMOVAL)
2. Disconnect the J-straps.
3. Remove the hog rings and remove the cushion cover.



## INSTALLATION

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Position the seat cushion cover and install new hog rings.
2. Connect the J-straps.
3. Install the seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - INSTALLATION)

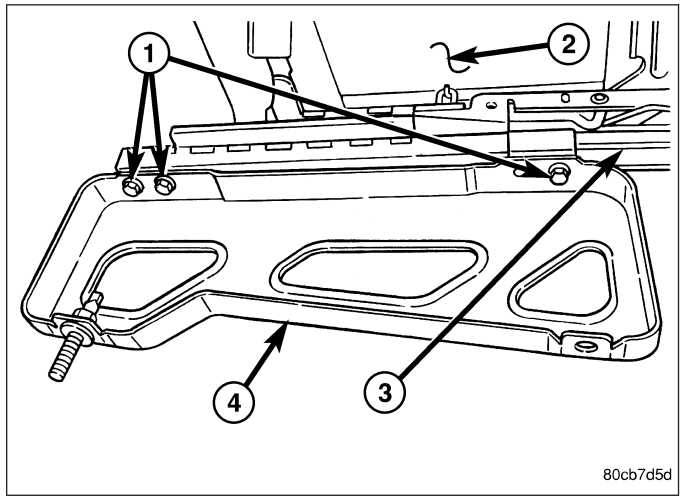


# MANUAL SEAT RISER

## REMOVAL

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

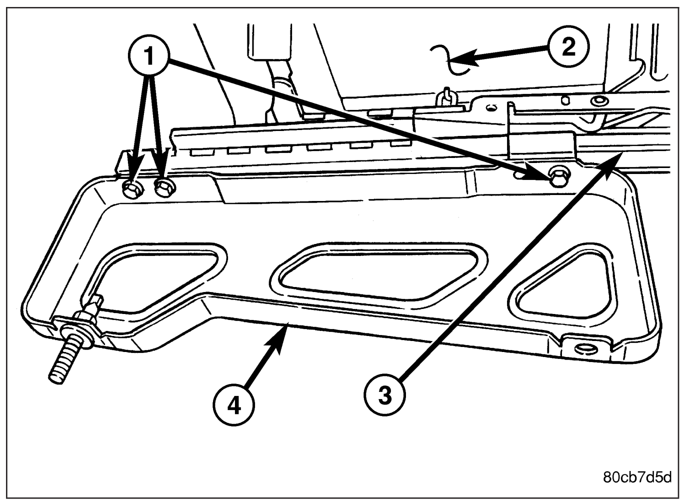
1. Remove the seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
2. Remove the bolts and remove the rivet from the release handle.
3. Remove the riser.



## INSTALLATION

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Install the seat riser and install the bolts.
2. Tighten the bolts to 28 N·m (21 ft. lbs.).
3. Install a new release handle rivet.
4. Install the seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)



# SEAT TRACK

## REMOVAL

**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Remove the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - FRONT - REMOVAL)
2. Remove the outer riser. (Refer to 23 - BODY/SEATS/SEAT RISER - REMOVAL)
3. Remove the front outer bolts and remove the tracks.

## INSTALLATION

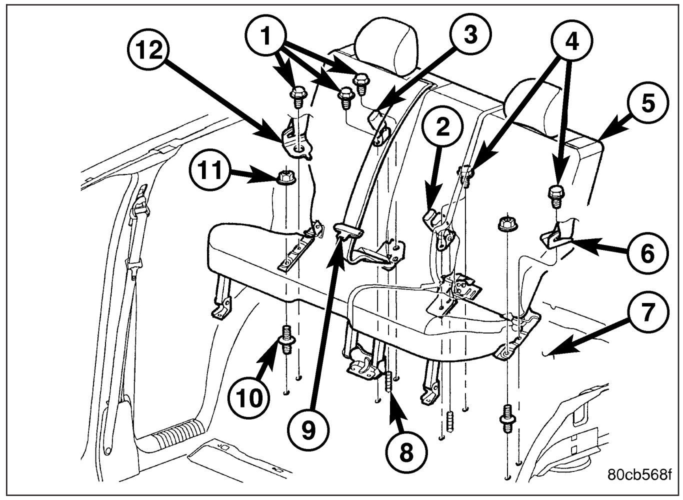
**WARNING: Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)**

1. Install the seat track onto the seat cushion and install the front outer bolts.
2. Tighten the bolts to 28 N·m (21 ft. lbs.).
3. Install the seat riser. (Refer to 23 - BODY/SEATS/SEAT RISER - INSTALLATION)
4. Install the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - FRONT - INSTALLATION)

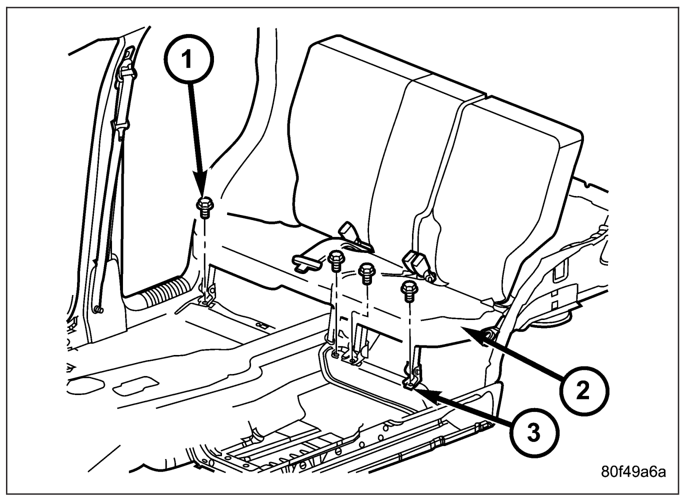
# SEAT - REAR

## REMOVAL

1. Remove the outer seat belt anchors. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
2. Remove the inner seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - REMOVAL)
3. Remove the center seat belt anchor. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
4. Remove the remaining rear seat fasteners.

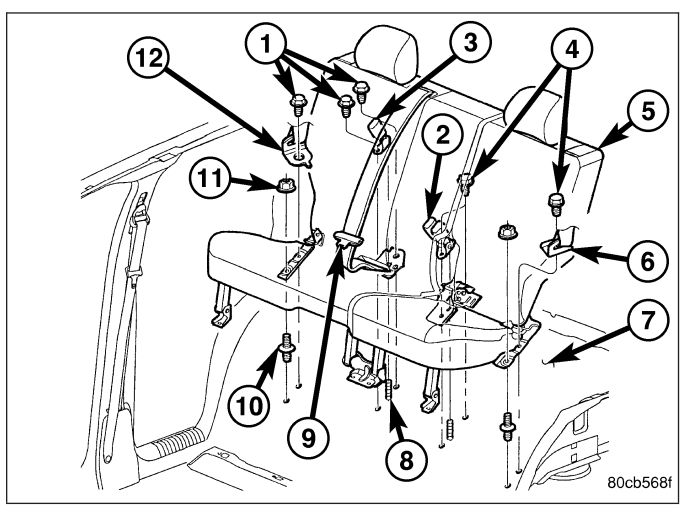


5. Remove the front bolts.
6. Fold down the seat backs and remove the seat assembly through the rear door.

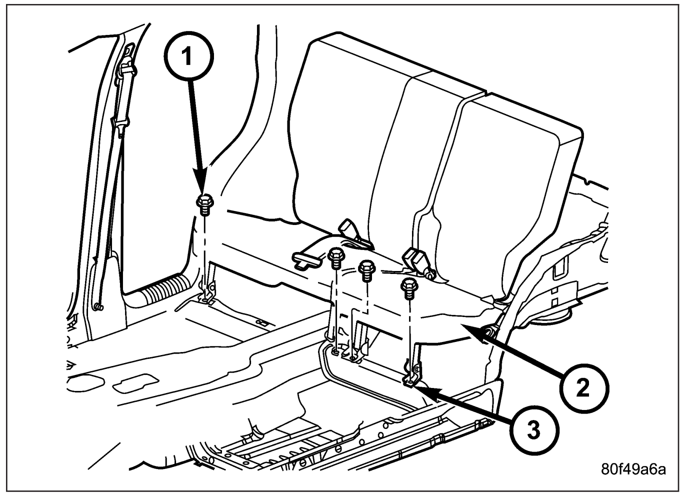


## INSTALLATION

1. Install the seat assembly and position over the studs.
2. Open the seat back and engage the latches onto the latch strikers.
3. Install the rear outboard nuts and tighten to 43 N·m (32 ft. lbs.).
4. Install the outer seat belt anchors. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)
5. Install the inner seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - INSTALLATION)
6. Install the center seat belt anchor. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)



7. Install the front outer seat cushion leg bolts and tighten to 35 N·m (26 ft. lbs.)

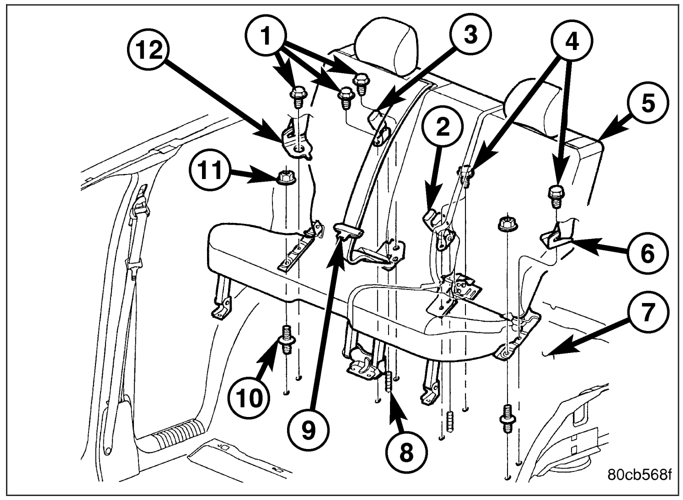


# SEAT BACK - REAR

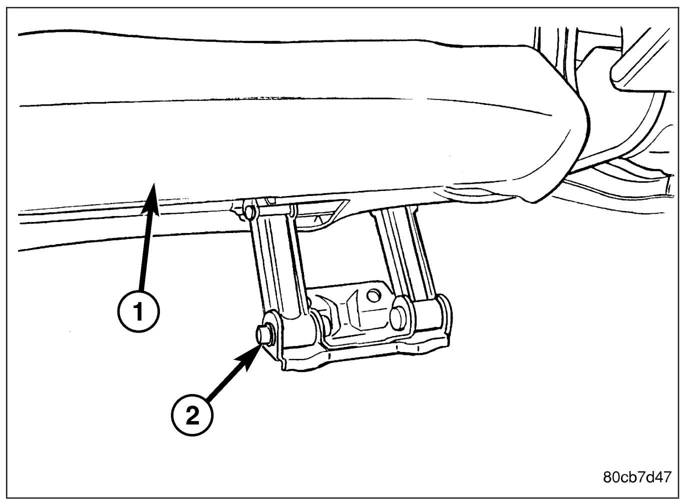
## REMOVAL

### 60/40 Split Seat - Left

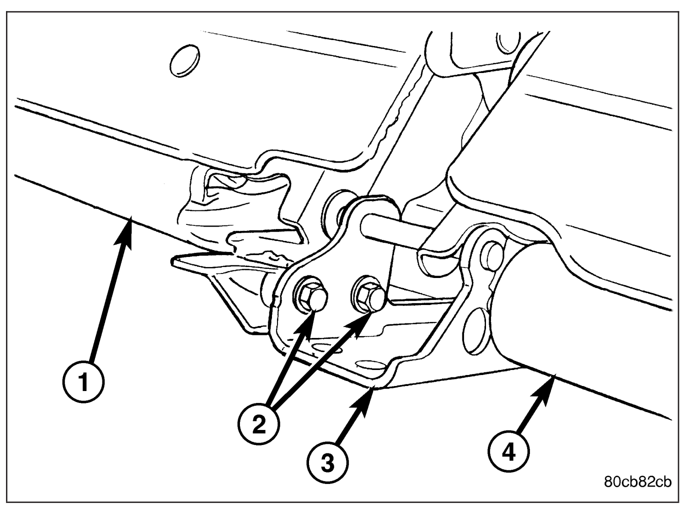
1. Remove the outer seat belt anchors. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
2. Remove the outer seat anchor nut.



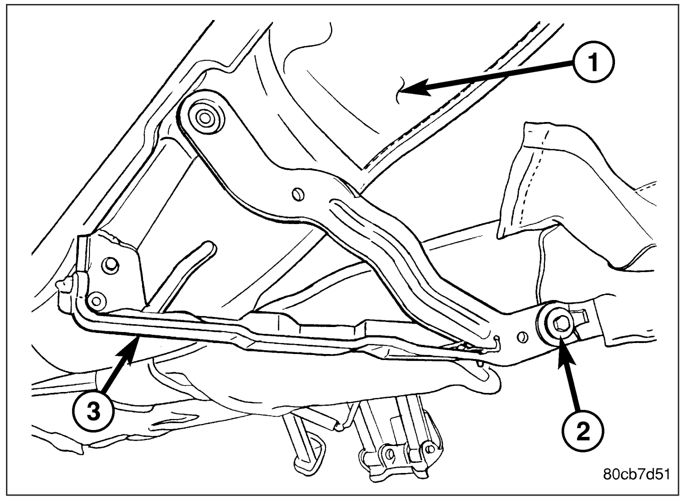
3. Remove the front seat cushion hinge bolt.



4. Remove the center seat back hinge bolts and separate the rear seat assembly.

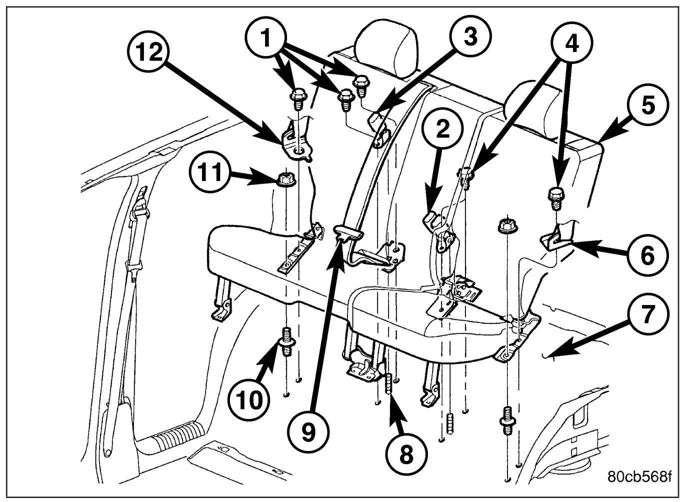


5. Release the clips and remove the seat back hinge covers.
6. Lift the seat cushion cover and remove the hinge bolts.
7. Remove the seat back.

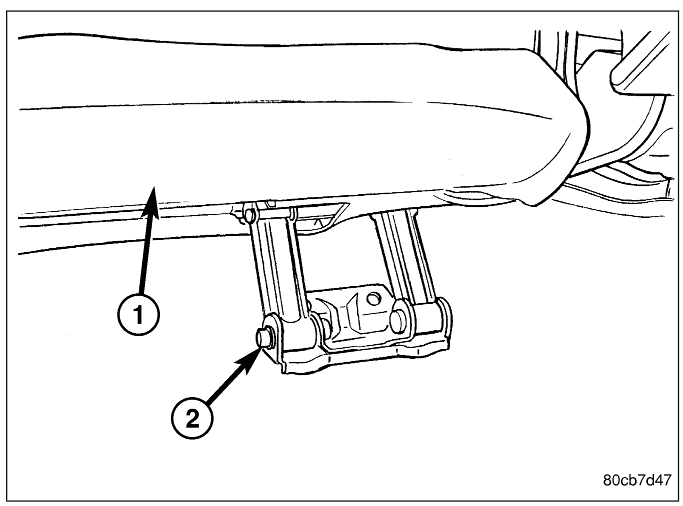


## 60/40 Split Seat - Right

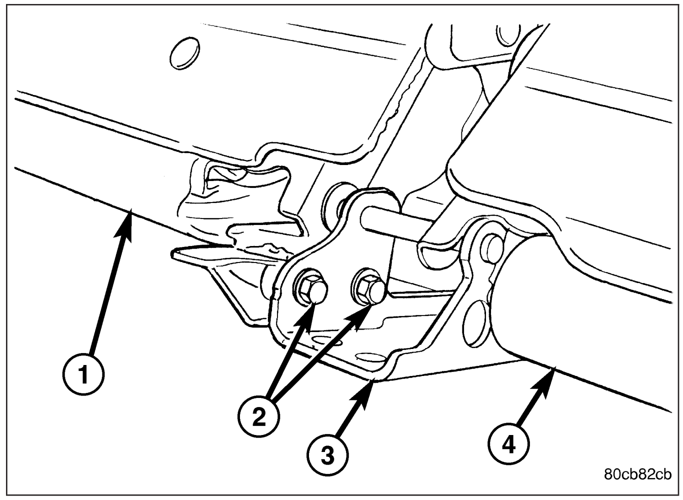
1. Remove the outer seat belt anchors. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
2. Remove the outer seat anchor nut.



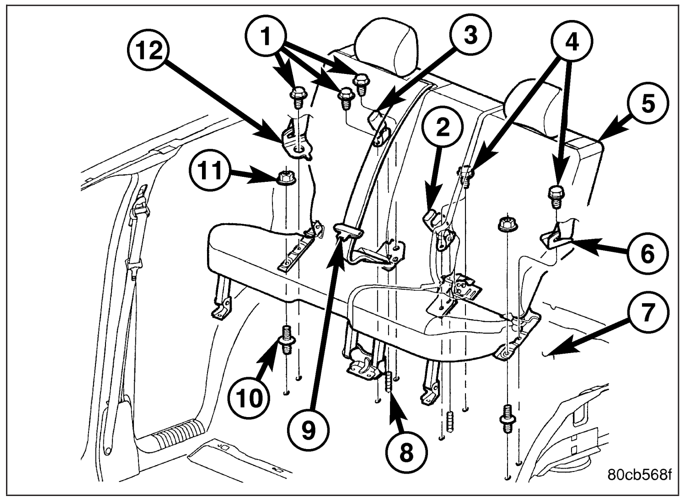
3. Remove the inner seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - REMOVAL)
4. Remove the front seat cushion hinge bolt.



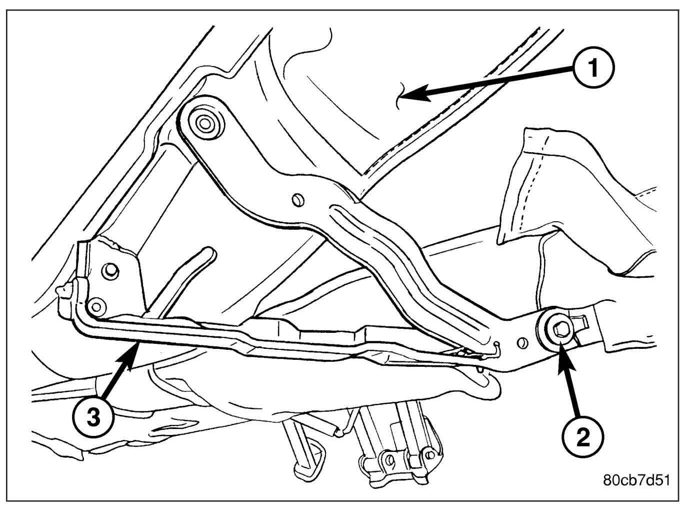
5. Remove the center seat back hinge bolts and separate the rear seat assembly.



6. Remove the center seat belt anchor. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
7. Remove the remaining outer and inner seat anchor bolts.



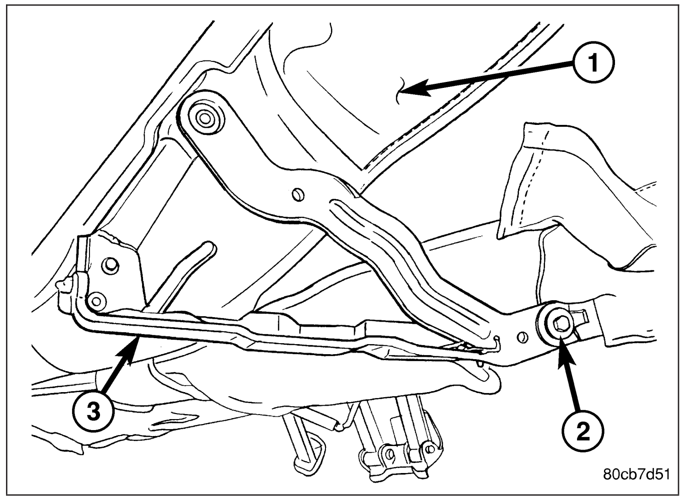
8. Release the clips and remove the seat back hinge covers.
9. Lift the seat cushion cover and remove the hinge bolts.
10. Remove the seat back.



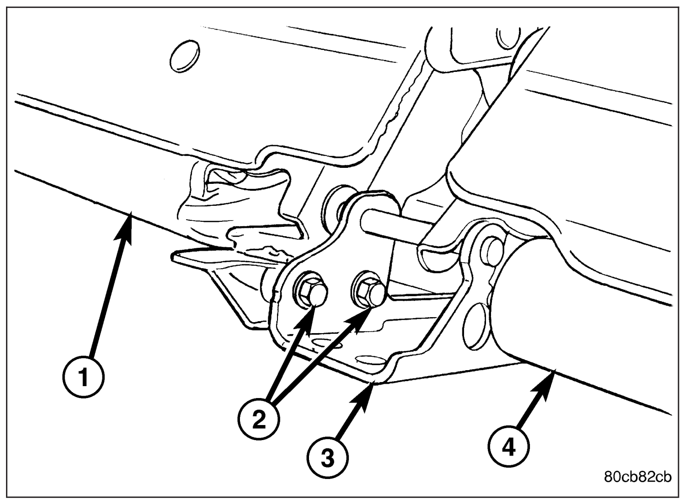
# INSTALLATION

## 60/40 Split Seat - Left

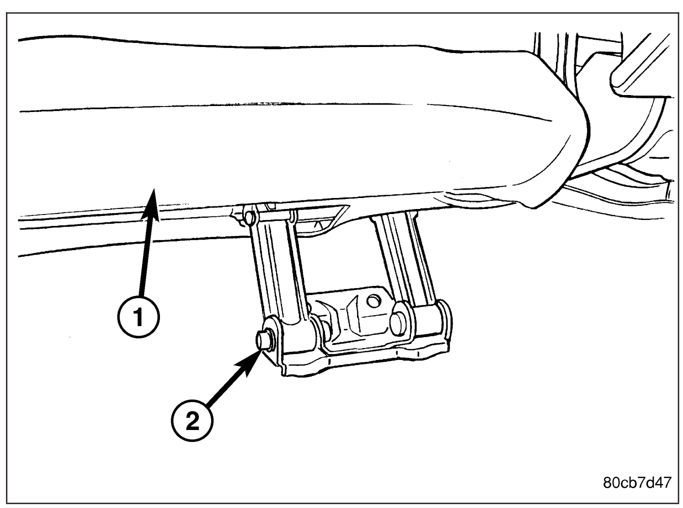
1. Install the seat back.
2. Install the seat back hinge bolt and tighten to 8 N·m (71 in. lbs.).



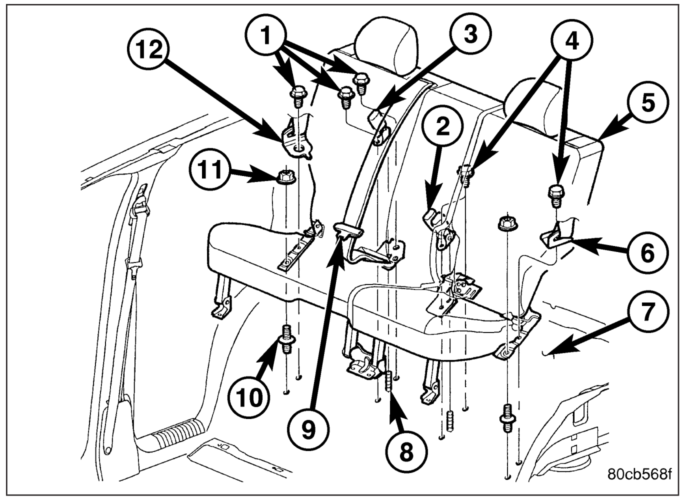
3. Position the seat back hinge covers and fully seat the clips.
4. Connect the seat halves and install the center seat back hinge bolts.
5. Tighten the bolts to 28 N·m (21 ft. lbs.).



6. Install the front seat cushion hinge bolt and tighten to 28 N·m (21 ft. lbs.).

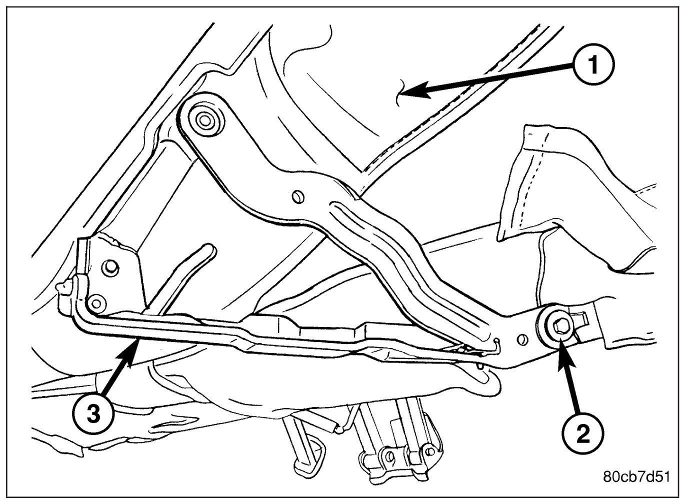


7. Install the outer seat anchor nut and tighten to 35 N·m (26 ft. lbs.).
8. Install the outer seat belt anchors. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)

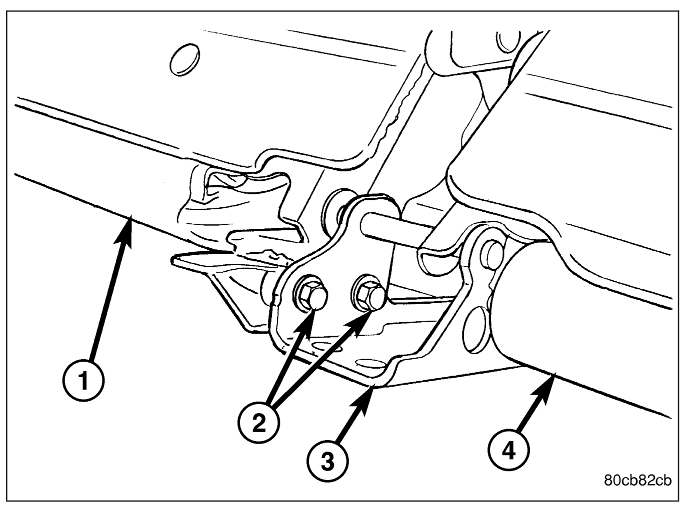


### 60/40 Split Seat - Right

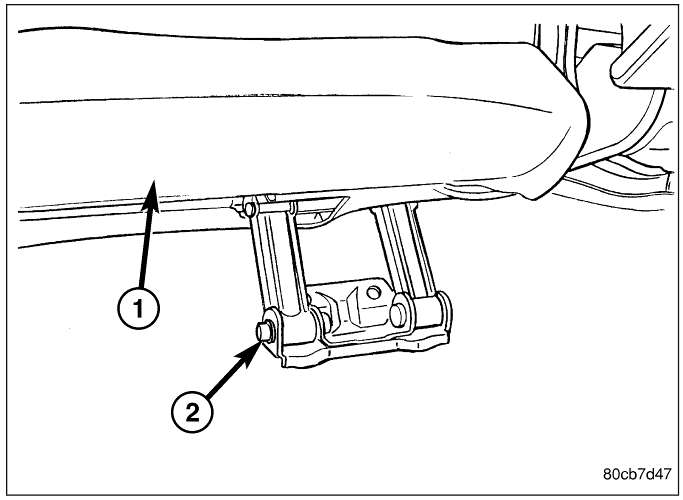
1. Install the seat back.
2. Install the seat back hinge bolt and tighten to 8 N·m (71 in. lbs.).



3. Position the seat back hinge covers and fully seat the clips.
4. Connect the seat halves and install the center seat back hinge bolts.
5. Tighten the bolts to 28 N·m (21 ft. lbs.).

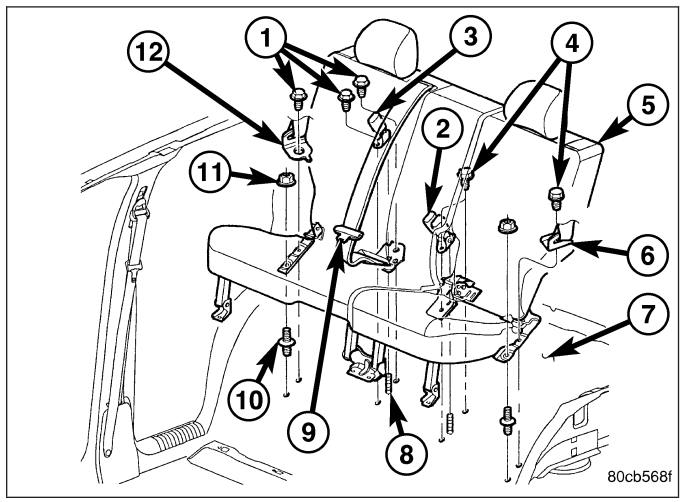


6. Install the front seat cushion hinge bolt and tighten to 28 N·m (21 ft. lbs.).



## Seat Installation

1. Install the outer and inner seat anchor nuts and tighten to 62.5 N·m (46 ft. lbs.).
2. Install the inner seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - INSTALLATION)
3. Install the center seat belt anchor. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)
4. Install the outer seat belt anchors. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)



# SEAT BACK COVER - REAR

## REMOVAL

1. Remove the rear seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - REAR - REMOVAL)
2. Remove the screws and remove the center seat belt guide.
3. Remove the screws and push pin fasteners and remove the latch handle bezel.
4. Remove the head rest and remove the guide covers. (Refer to 23 - BODY/SEATS/HEADREST - REMOVAL)
5. Remove the screws and remove the grocery hooks.
6. Remove the push pin fasteners and remove the seat back panel.
7. Disconnect the J-straps.
8. Remove the seat back cover.

## INSTALLATION

1. Install the seat back cover and connect the J-straps.
2. Install the seat back panel and install the push pin fasteners.
3. Install the grocery hooks and install the screws.
4. Install the head rest guide covers and install the head rest. (Refer to 23 - BODY/SEATS/HEADREST - INSTALLATION)
5. Install the latch handle bezel and install the screws and push pin fasteners.
6. Install the center seat belt guide and screws.
7. Install the rear seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - REAR - INSTALLATION)

# SEAT BACK CUSHION - REAR

## REMOVAL

1. Remove the seat back cover. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - REAR - REMOVAL)
2. Separate the cushion from the seat back frame.

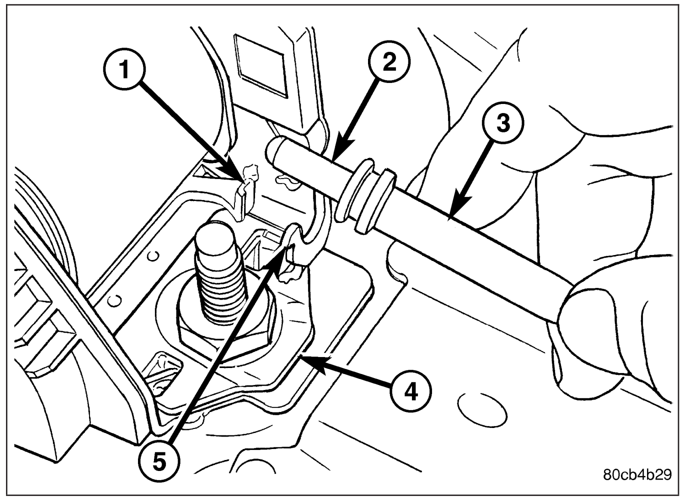
## INSTALLATION

1. Position the seat back cushion onto the seat back frame.
2. Install the seat back cover. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - REAR - INSTALLATION)

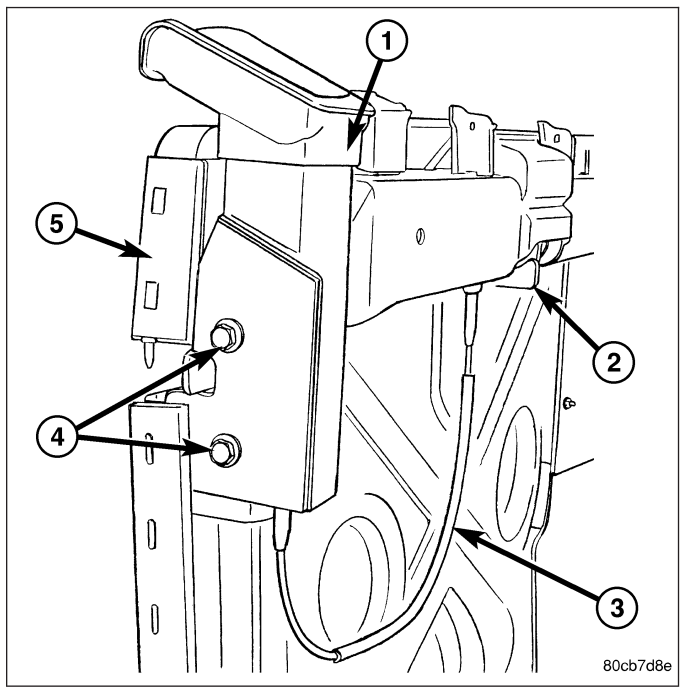
# FOLDING REAR SEAT BACK LATCH / LOCK

## REMOVAL

1. Remove the rear seat back cushion. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - REAR - REMOVAL)
2. Disconnect the shoulder belt release cable.

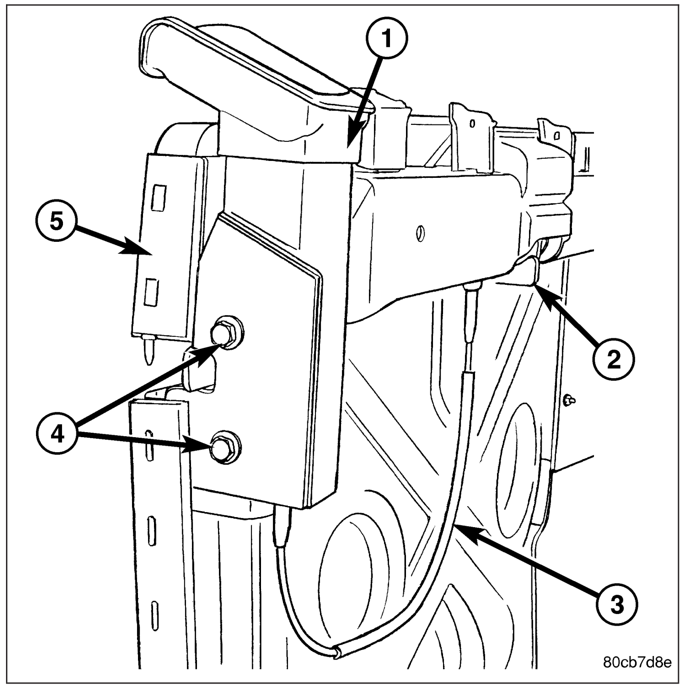


3. Remove the bolts and remove the latch/lock assembly.

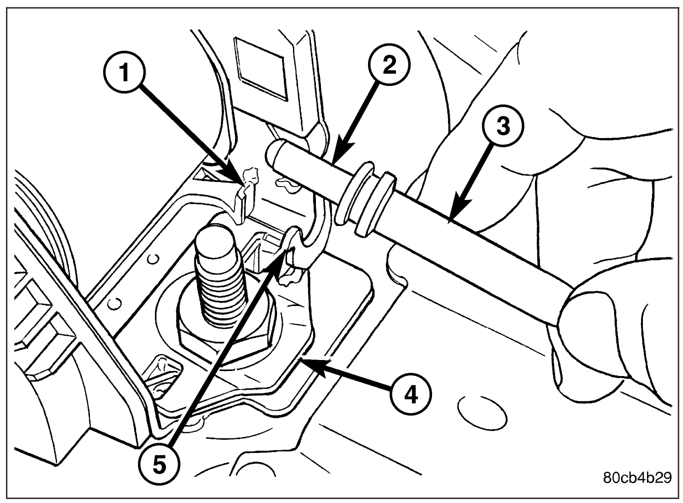


## INSTALLATION

1. Install the latch/lock assembly and install the bolts.
2. Tighten the bolts to 28 N·m (21 ft. lbs.).



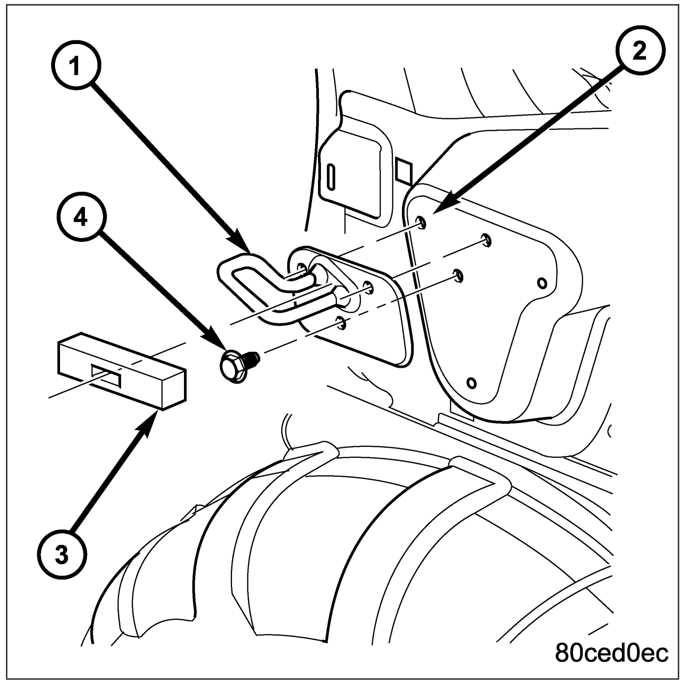
3. Connect the shoulder belt release cable.
4. Install the rear seat back cushion. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - REAR - INSTALLATION)



# REAR SEAT BACK LATCH STRIKER

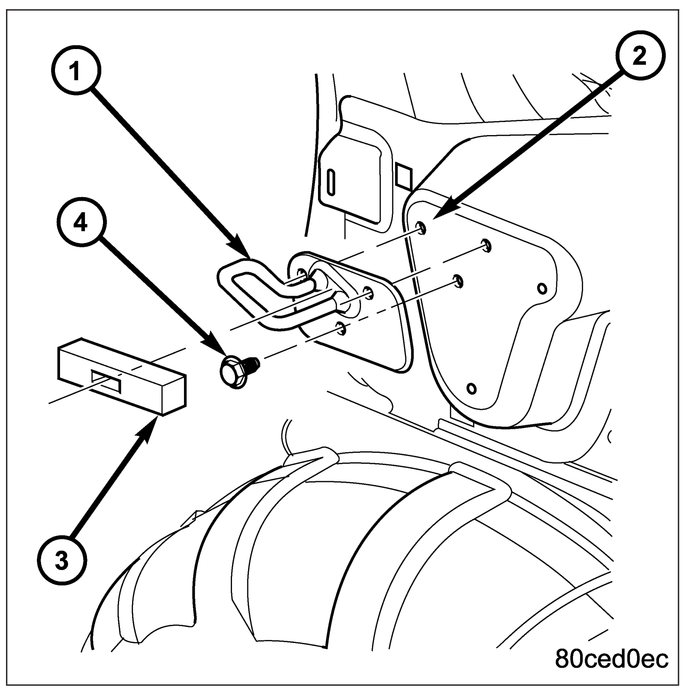
## REMOVAL

1. Remove the quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)
2. Remove the bolts and remove the striker.



## INSTALLATION

1. Position the striker and install the bolts.
2. Tighten the bolts to 35 N·m (26 ft. lbs.).
3. Install the quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)



# SEAT BACK FRAME - REAR

## REMOVAL

1. Remove the center seat belt retractor, if equipped. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - REMOVAL)
2. Remove the seat back latch/lock assembly. (Refer to 23 - BODY/SEATS/FOLDING REAR SEAT BACK LATCH / LOCK - REMOVAL)

## INSTALLATION

1. Install the seat back latch/lock assembly. (Refer to 23 - BODY/SEATS/FOLDING REAR SEAT BACK LATCH / LOCK - INSTALLATION)
2. Install the center seat belt retractor, if equipped. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT & RETRACTOR - INSTALLATION)

# SEAT CUSHION - REAR

## REMOVAL

1. Remove the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - REAR - REMOVAL)
2. Disconnect the J-straps and remove the seat cushion and cover.

## INSTALLATION

1. Position the seat cushion and cushion cover onto the seat frame.
2. Connect the J-straps.
3. Install the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - REAR - INSTALLATION)

# STATIONARY GLASS

## TABLE OF CONTENTS

# DOOR GLASS

## REMOVAL

1. Remove the rear door glass run channel. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - REMOVAL)

## INSTALLATION

1. Install the rear door glass run channel. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - INSTALLATION)

# QUARTER WINDOW

## REMOVAL

1. Remove the headliner as necessary to gain access to the glass seal from the inside. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
2. Cut urethane bonding from around quarter window glass using a suitable sharp cold knife. A pneumatic cutting device can be used if available.
3. Separate glass from vehicle.

## INSTALLATION

**CAUTION: Open a window before installing glass. This will avoid pressurizing the passenger compartment. If a door or swing gate flip-up glass is slammed before urethane is cured, water leaks can result.**

The window opening fence should be cleaned of old urethane bonding material.

1. Install the headliner as necessary. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
2. Clean inside of glass with Mopar® Glass Cleaner and lint-free cloth.
3. Apply PVC (vinyl) primer 25 mm (1 in.) wide around edge of glass. Wipe with clean/dry lint-free cloth.
4. Apply fence primer around edge of fence. Allow at least eighteen minutes drying time.
5. Apply a 10 mm (0.4 in.) bead of urethane around window vinyl border location.
6. Position glass into window opening and lock clips into place.

# WINDSHIELD

## WARNING

## WINDSHIELD SAFETY PRECAUTIONS

**WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.**
- **Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, pvc (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.**
- **DaimlerChrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.**
- **Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.**
- **Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.**
- **Skin contact with urethane adhesive should be avoided. Personal injury may result.**
- **Always wear eye and hand protection when working with glass.**

**CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.**

## REMOVAL

1. Remove inside rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL)
2. Remove cowl cover. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL)
3. Remove screws attaching windshield side molding to A-pillar.
4. Cut urethane bonding from around windshield using a suitable sharp cold knife. A pneumatic cutting device can be used if available.
5. Separate windshield from vehicle.

## INSTALLATION

**WARNING: Review all warnings and cautions in this group before preceding with installation.**

**CAUTION: Open a window before installing windshield. This will avoid pressurizing the passenger compartment. If a door or swing gate flip-up glass is slammed before urethane is cured, water leaks can result.**

The windshield fence should be cleaned of old urethane bonding material. Support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

1. Place replacement windshield into windshield opening. Position glass in the center of the opening against the support spacers. Mark the glass at the support spacers with a grease pencil or masking tape and ink pen to use as a reference for installation. Remove replacement windshield from windshield opening.
2. Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart.
3. Clean inside of windshield with Mopar® Glass Cleaner and lint-free cloth.
4. Apply clear glass primer 25 mm (1 in.) wide around edge of windshield. Wipe with clean/dry lint-free cloth.
5. Apply black-out primer 15 mm (.75 in.) wide on top and sides of windshield and 25 mm (1 in.) on bottom of windshield. Allow at least three minutes drying time.
6. Position windshield spacers on lower fence above support spacers at the edge of the windshield opening.

7. Align the dot on the upper molding to the tick mark in the center of the glass and install upper molding onto windshield.
8. Apply a 10 mm (0.4 in.) bead of urethane around perimeter of windshield along the inside of the moldings. Apply two beads along the bottom edge.
9. Apply fence primer around the perimeter of the windshield opening fence. Allow at least 18 minutes drying time.
10. With aid of a helper, position windshield over windshield opening. Align reference marks at bottom of windshield to support spacers.
11. Slowly lower windshield glass to windshield opening fence. Guide top molding into proper position if necessary. Push windshield inward to fence spacers at bottom and until top molding is flush to roof line.
12. Clean excess urethane from exterior with Mopar® Super Clean or equivalent.
13. Install windshield side moldings. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/WINDSHIELD A-PILLAR WEATHERSTRIP - INSTALLATION)
14. Install cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION)
15. Install inside rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION)
16. After urethane has cured, water test windshield to verify repair.

# SUNROOF

## TABLE OF CONTENTS

# SUNROOF

## DESCRIPTION

**WARNING: Keep fingers and other body parts out of sunroof opening at all times.**

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from two switches located on the windshield header, rearward of the map lamp. To operate the sunroof the ignition switch must be in either the Accessory or On/Run position. One switch (vent) is a push button type and opens the sunroof to the vent position only. The other switch (open/close) is a rocker type for opening and closing the sunroof. Pressing and releasing the open button once the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position.

### SUNROOF OPERATION INSTRUCTIONS

| SWITCH INPUTS | | | |
|---|---|---|---|
| | OPEN | CLOSE | VENT |
| FULL VENT | Push and hold switch until glass stops in flush closed position glass will then express open | Push and hold switch until glass stops in flush closed position. | No action |
| VENT RANGE | Push and hold switch until glass passes through flush closed position. Glass will then open | Push and hold switch until glass stops in flush closed position. | Push and hold switch until glass stops in full vent position. |
| FLUSH | 1. Press switch for less than 0.65 seconds for express to full open.<br>2. Press switch for more than 0.65 seconds and glass will stop when switch is released | No action | Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released or when fully vented. |
| FULL OPEN | No action | Press and hold switch until glass stops in flush closed position or anywhere in between. | Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released. |

## DIAGNOSIS AND TESTING

## WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a piece of paper between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. Refer to Sunroof Glass Panel Adjustment for proper procedures.

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

1. Remove A-pillar trim, sun visors, and map lamps/mini console.
2. Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL)
3. Lower headliner as necessary to gain access to sunroof housing drain tubes. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
4. Repair as necessary.
5. Install headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
6. Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION)

## DIAGNOSTIC PROCEDURES

Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. Refer to Sunroof Diagnostic Chart for possible causes. If not, a common electrical problem may exist. Refer to Wiring Diagrams, in this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in cavity 19 of the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof drive motor, refer to Wiring Diagrams, for circuit information. If battery voltage of more than 9 volts is detected at the drive motor, proceed with the following tests (the drive motor will not operate at less than 9 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

**SUNROOF DIAGNOSIS CHART**

| SYMPTOM | POSSIBLE CAUSE |
|---|---|
| Sunroof motor inoperative. | Faulty control switch.<br>Faulty circuit ground between sunroof drive motor, control switch, and body harness.<br>Faulty power circuit between sunroof drive motor, control switch, and body harness.<br>Faulty drive motor.<br>Faulty drive motor electrical connector. |
| Audible whine when switch is depressed, sunroof does not operate. | Faulty drive motor.<br>Binding cable. |
| Audible clicking or ratcheting when switch is pressed, sunroof does not operate. | Broken or worn drive cable.<br>Worn drive motor gear.<br>Mechanisms not synchronized. |
| Sunroof vents and opens, but does not close. | Binding cable.<br>Faulty circuit.<br>Faulty control switch.<br>Faulty drive motor. |
| Sunroof vents, but does not open. | Binding cable or mechanism.<br>Faulty circuit.<br>Faulty switch.<br>Faulty drive motor. |

| SYMPTOM | POSSIBLE CAUSE |
|---|---|
| Sunroof does not vent. | Binding cable or mechanism.<br>Faulty circuit.<br>Faulty control switch.<br>Faulty drive motor. |
| Sunroof water leak. | Drain tubes clogged or kinked or disconnected from the sunroof.<br>Glass panel improperly adjusted.<br>Faulty glass panel seal. |
| Gurgling sound from sunroof. | Low spot in drain hose routing, allowing water to stand. |
| Wind noise from sunroof. | Front of glass panel too high or rear too low.<br>Wind deflector not deploying.<br>Glass not centered in opening.<br>Faulty glass panel seal. |
| Rattles from open sunroof while driving. | Loose or broken attaching hardware.<br>Worn or broken mechanism. |
| Sunroof does not stop in the fully closed position. | Drive motor has lost position of glass, teach procedure required to reprogram drive motor. Refer to sunroof drive motor teach procedure. |

# CONTROL SWITCH

## DESCRIPTION

Vehicles equipped with a power sunroof utilize an sunroof control switch. On this model, the sunroof control switch is located in the overhead console, in between the two reading lamps. The switch is mounted in the overhead console with four plastic retaining tabs, molded into the switch housing.

This switch incorporates four selections of operation open, auto open, close and vent. The individual switches in the sunroof control switch unit cannot be repaired. If one switch is damaged or faulty, the entire sunroof control switch unit must be replaced.

## OPERATION

With the operation of the sunroof control switch, voltage is directed to the sunroof motor, through the switch contacts or control module. If the control switch is depressed and held depressed the voltage signal is controlled manually through the switch contacts, so when the switch is released the sunroof stops.

Refer to the Owner's Manual for more information on the operation of the sunroof switch and system.

## DIAGNOSIS AND TESTING - CONTROL SWITCH

The following test will determine if the sunroof control switch is operating properly.

1. Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
2. Remove the sunroof control switch from the overhead console (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH - REMOVAL).
3. Using an ohmmeter, test the switch terminals for proper continuity using the table below. If any of the terminals do not show proper continuity, replace the sunroof control switch.

| SWITCH POSITION (DEPRESSED) | CONTINUITY BETWEEN TERMINALS |
|---|---|
| VENT (V) | 3, 4 |
| OPEN (AUTO) | 1, 4 |
| CLOSE | 2, 4 |

## REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
3. Disconnect the sunroof control switch electrical connector. Depress the connector retaining tab and pull the connector straight out.
4. To remove the switch from the overhead console, push on the back of the switch until it comes free from the overhead console.

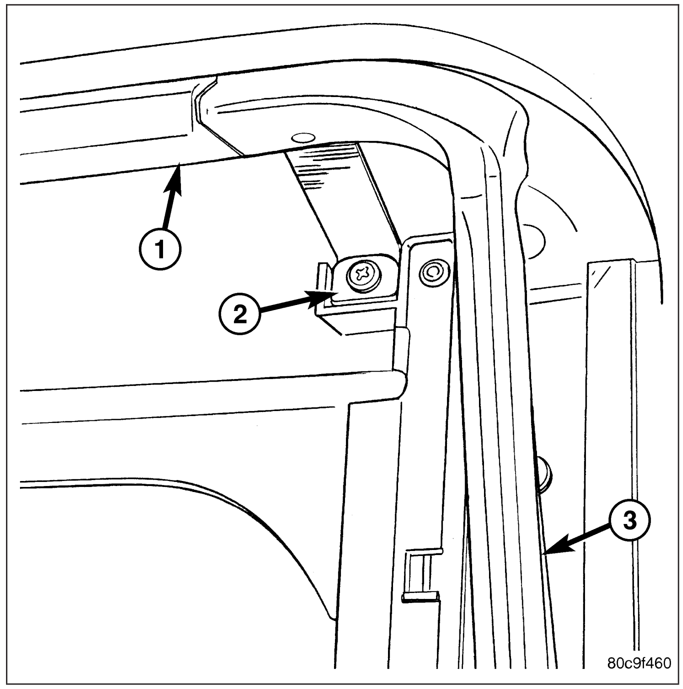
## INSTALLATION

1. Install the switch in the overhead console assembly. Be certain the switch is securely snapped in place.
2. Connect the sunroof control switch electrical connector. Be certain the switch connector is securely snapped in place.
3. Install the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
4. Connect the negative battery cable.

# DEFLECTOR-WIND

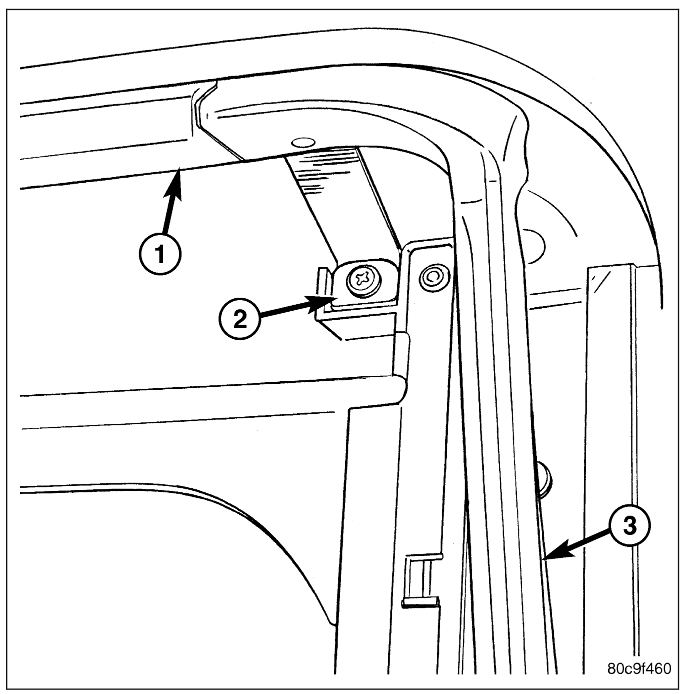
## REMOVAL

1. Open sunroof glass panel to the full open position.
2. Remove screws (2) attaching wind deflector straps to front crossmember.
3. Rotate wind deflector back about 110° and slide backwards to disengage from the spring hook.



## INSTALLATION

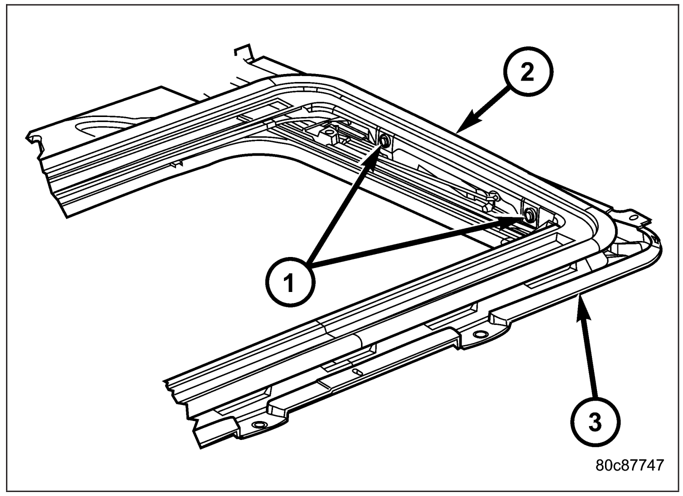
1. Place wind deflector (1) in position 110° to roof.
2. Push arms (3) down and forward to engage spring hooks.
3. Rotate wind deflector forward into correct position. Depress wind deflector down onto front crossmember to check spring function.
4. Install fasteners attaching wind deflector straps (2) to front crossmember.
5. Test sunroof operation.



# GLASS

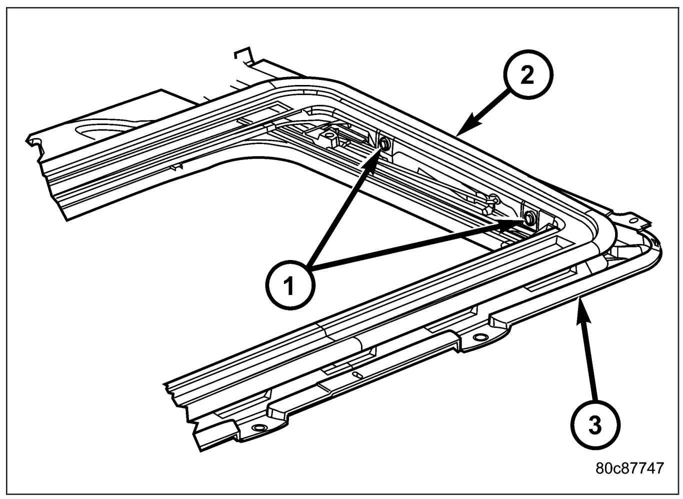
## REMOVAL

1. Slide sunshade rearward to the open position.
2. Move the glass panel (2) to the closed position.
3. Remove the four glass panel screws (1).
4. Lift off glass panel and remove from vehicle.



## INSTALLATION

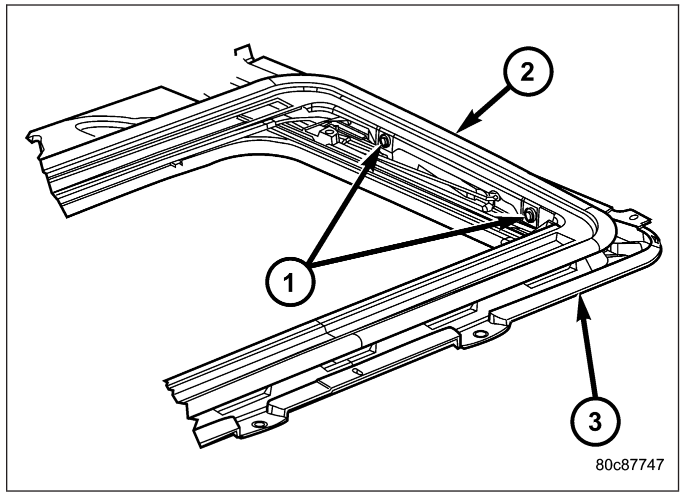
1. Position glass panel (2) on to mechanism lift arm.
2. Start the four attaching screws (1).
3. Center glass in opening by running a business card around the glass.
4. Adjust glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)



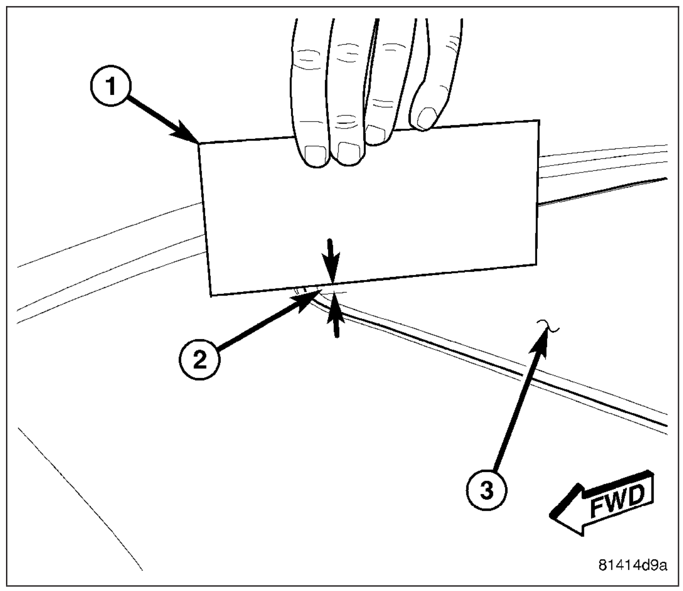
## ADJUSTMENTS

### SUNROOF GLASS PANEL ADJUSTMENT

1. Move the sunshade rearward to the open position.
2. Move the sunroof glass panel to the fully closed position.
3. Adjust the glass one corner at a time.
   a. Loosen four glass screws (1).
   b. Lift glass assembly and align the top of the glass panel to the top of the roof panel.
   c. Tighten screw to 3.5 N·m (31 in. lbs.).
   d. Repeat steps a. and b. for each corner of the glass panel.
   e. When properly adjusted, the front of the glass panel is 1.75 mm (0.07 in.) to 2.75 mm (0.11 in.) lower than the roof surface and the rear edge of the glass panel is 1.75mm (0.07 in.) to .75 mm (0.03 in.) lower than the roof surface.



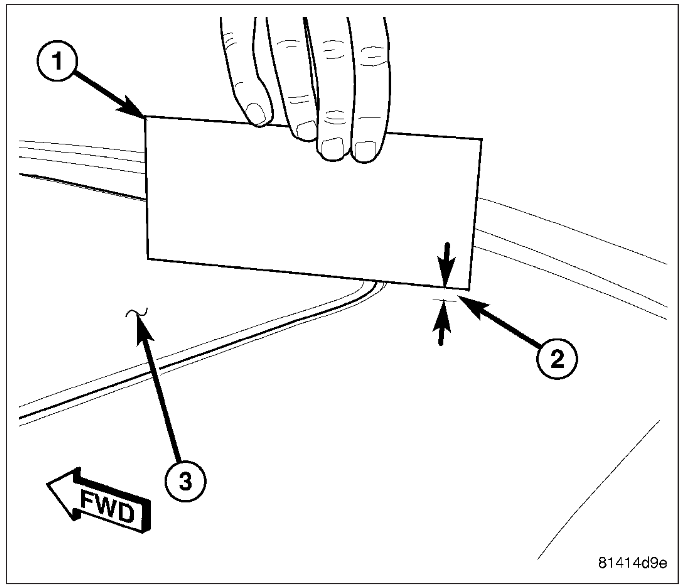
**NOTE: When properly adjusted, the front of the glass panel(3) is 1.75 mm (0.07 in.) to 2.75 mm (0.11 in.) lower than the roof surface (2).**



**NOTE: When properly adjusted, the rear edge of the glass panel (3) is 1.75mm (0.07 in.) to .75 mm (0.03 in.) lower than the roof surface (2).**

**NOTE: Glass assembly seal is 2.5mm (0.1 in) higher than the glass panel. Measure at 300mm (11.8 in) outboard of the centerline of the vehicle.**

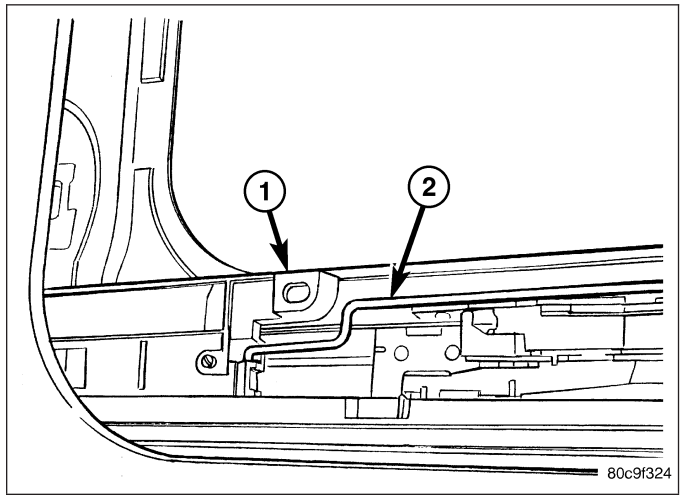
4. Verify sunroof operation and alignment. Check fit and re-adjust as necessary.



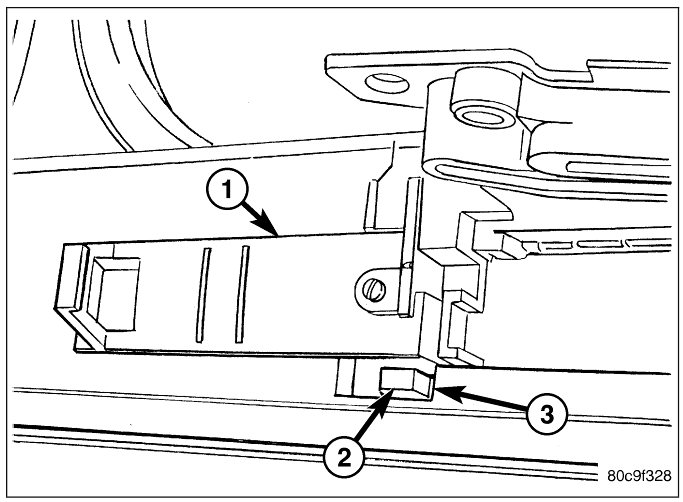
# GUIDE-TROUGH ASSEMBLY

## REMOVAL

1. Remove trough. (Refer to 23 - BODY/SUNROOF/ TROUGH - REMOVAL)
2. Disconnect the guide link (2).

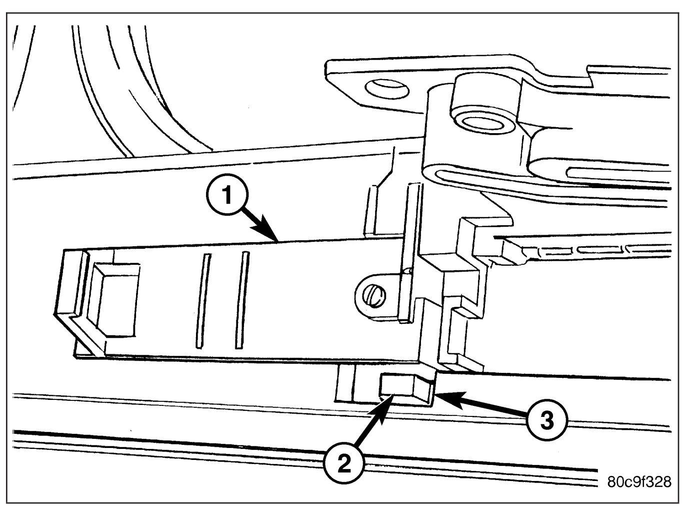


3. Slide trough guide (1) forward and disengage the sliders (2) through the notches (3) in the guide channels.

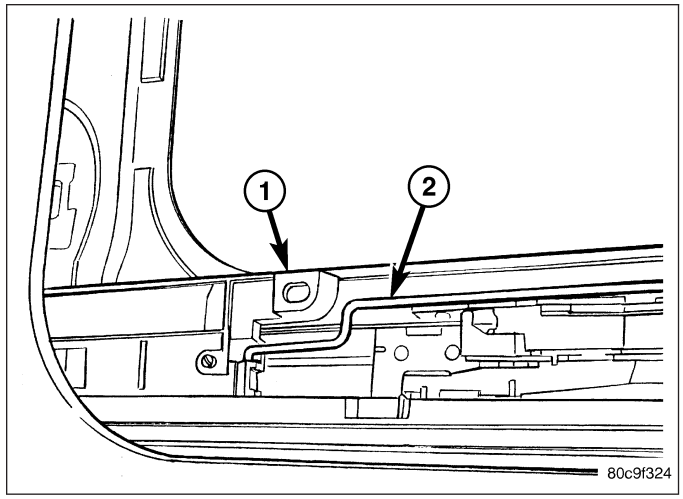


## INSTALLATION

1. Install the trough guide (1) and engage the sliders (2) into the guide channels through the small notch (3) in track.



2. Connect the guide link (2).
3. Install the trough. (Refer to 23 - BODY/SUNROOF/ TROUGH - INSTALLATION)

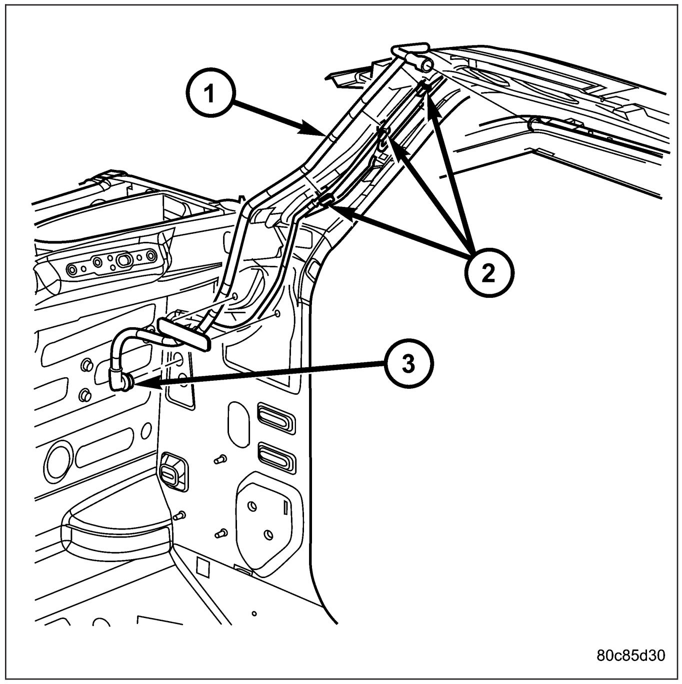


# HOSE-DRAIN

## REMOVAL

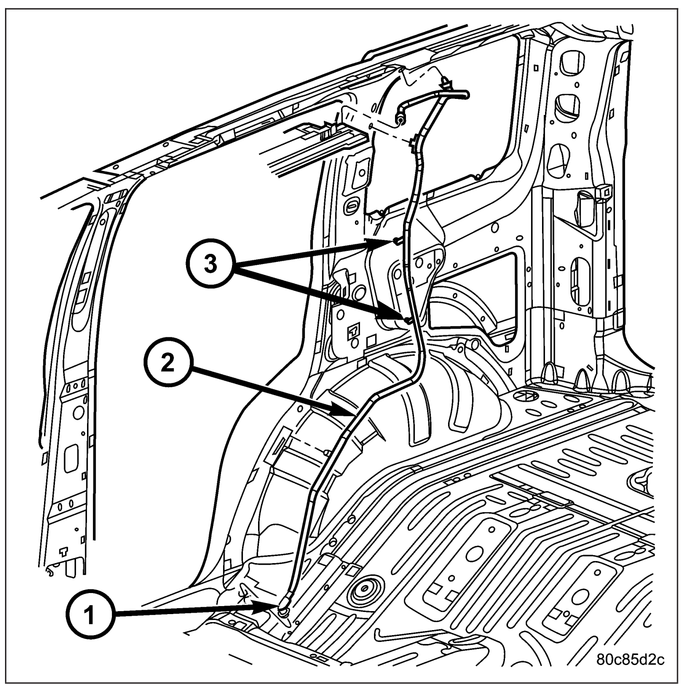
### FRONT DRAIN TUBES

1. Move glass panel to the fully closed position.
2. Remove sunroof opening trim lace.
3. Remove the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
4. Disconnect the drain hose from the sunroof housing.
5. Drain any liquid from hose connection, if necessary.
6. Remove the instrument panel top panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)
7. Disconnect the grommet, attachment clips and remove the drain tube.



### REAR DRAIN TUBES

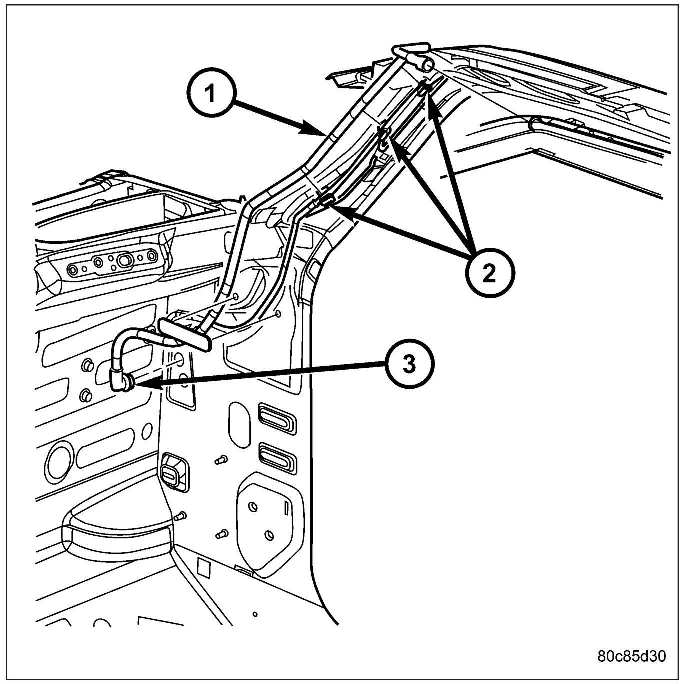
1. Move glass panel to the fully closed position.
2. Remove sunroof opening trim lace.
3. Remove headliner.
4. Disconnect the drain hose from the sunroof housing.
5. Drain any liquid from hose connection, if necessary.
6. Disconnect the grommet, attachment clips and remove the drain tube.



# INSTALLATION

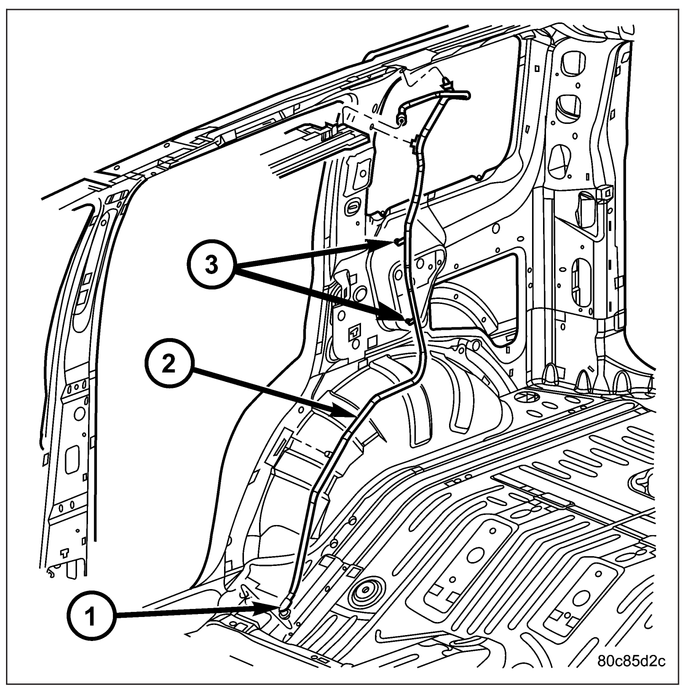
## FRONT DRAIN TUBES

1. Connect the drain hose to the sunroof housing and test drainage.
2. Connect the body grommet and attachment clips.
3. Install the instrument panel top panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION)
4. Install the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
5. Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION)



## REAR DRAIN TUBES

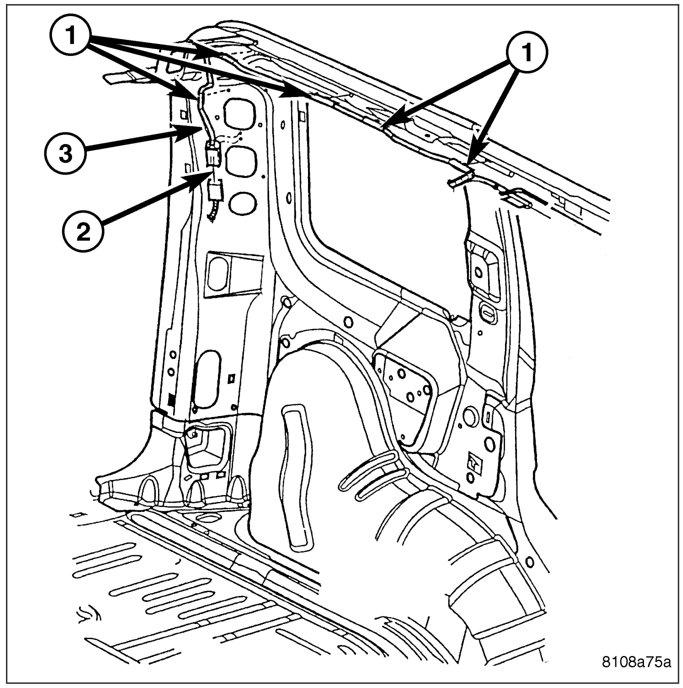
1. Connect the drain hose to the sunroof housing and test drainage.
2. Connect the body grommet and attachment clips.
3. Install the headliner.
4. Install sunroof opening trim lace.



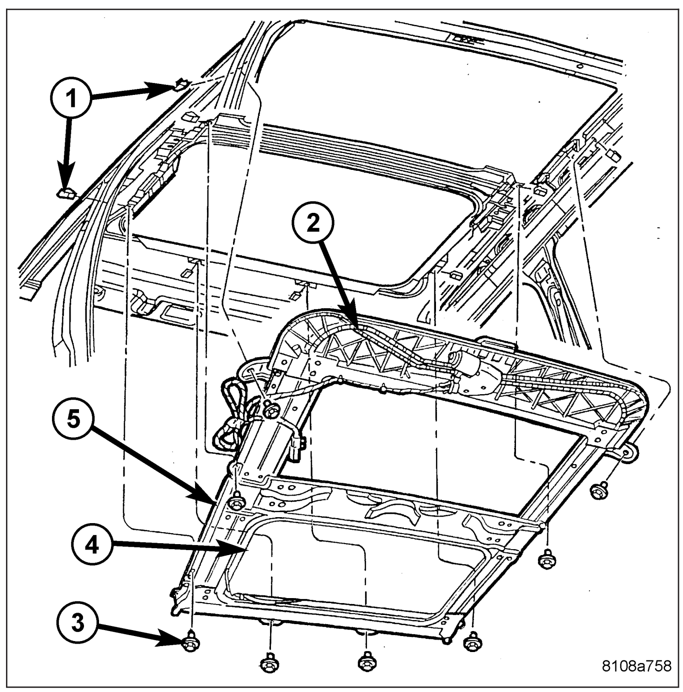
# MODULE/FRAME ASSEMBLY

## REMOVAL

1. Move glass panel to fully closed position.
2. Disconnect and isolate negative battery cable.
3. Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL)
4. Remove control switch. (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH - REMOVAL)
5. Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
6. Disconnect wire harness push in fasteners (1) and electrical connector (2) from vehicle harness (3).
7. Disconnect drain tubes from sunroof housing.
8. Cut foam support pad at rear of module if necessary.

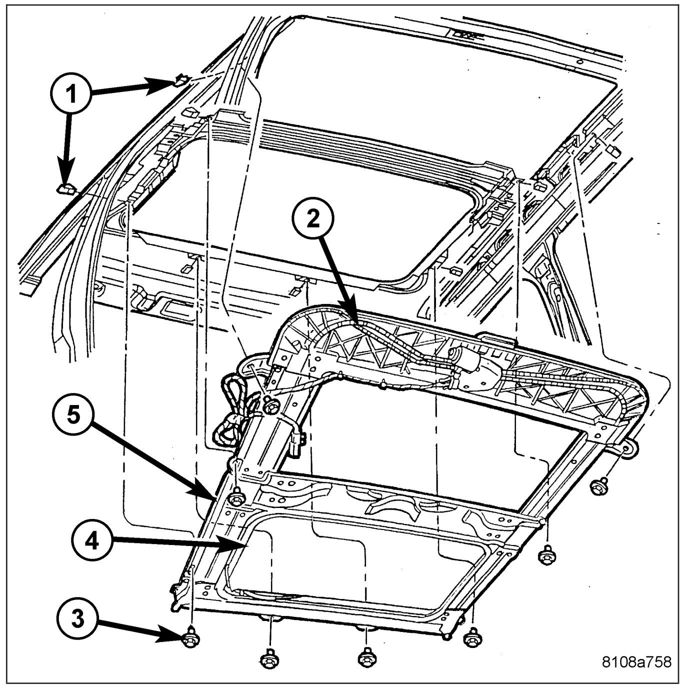


9. Remove two module bracket bolts and loosen the remaining fasteners.
10. With the aid of a helper, remove fasteners attaching sunroof module assembly to roof panel.
11. Remove the sunshade. (Refer to 23 - BODY/SUNROOF/SUNSHADE - REMOVAL)
12. Remove the drive motor. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - REMOVAL)
13. Remove the wire harness.
14. Remove the trough guides. (Refer to 23 - BODY/SUNROOF/GUIDE ASSEMBLY - REMOVAL)

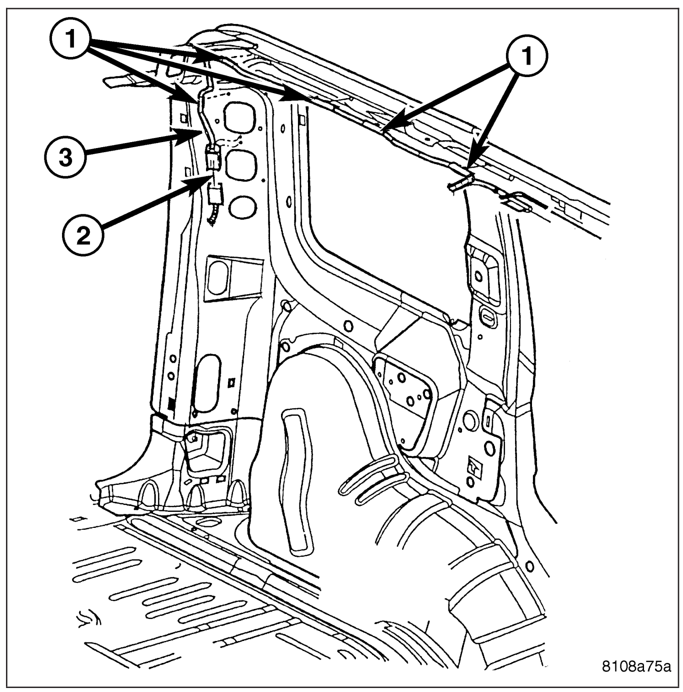


## INSTALLATION

1. Install the trough guides. (Refer to 23 - BODY/SUNROOF/TROUGH GUIDE ASSEMBLY - INSTALLATION)
2. Install the drive motor. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - INSTALLATION - VEHICLES BUILT ON 9/10/02 AND LATER)
3. Install the sunshade. (Refer to 23 - BODY/SUNROOF/SUNSHADE - INSTALLATION)
4. Remove the backing tape from the foam support pad, if necessary.
5. Raise rear end of sunroof module assembly and guide into position and start fasteners.
6. Tighten the fasteners to 9 N·m (80 in. lbs.).
7. Connect the drain tubes.



8. Install the wire harness. (Refer to 23 - BODY/SUNROOF/WIRE HARNESS - INSTALLATION)
9. Connect battery negative cable.
10. Temporarily install sunroof switch and perform the sunroof motor teach procedure. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - STANDARD PROCEDURE - TEACH PROCEDURE)
11. Test sunroof operation, adjust glass as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)
12. Install the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
13. Install the opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION)



# MOTOR-SUNROOF - W/CONTROL UNIT

## STANDARD PROCEDURE

## DRIVE MOTOR TEACH PROCEDURE

### REPLACEMENT DRIVE MOTOR

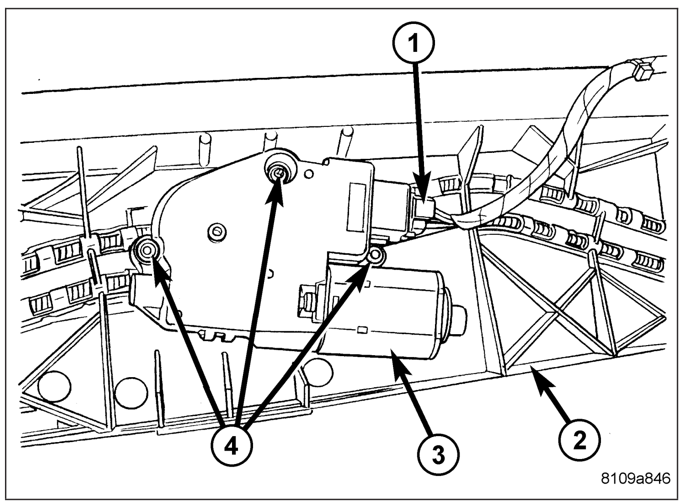
1. Press and hold the sunroof switch open until the sunroof glass fully opens, automatically reverses direction, and stops at a position just forward of the full open position.
2. Release sunroof switch.
3. Within five seconds of releasing sunroof switch, press and hold the sunroof switch open again until the sunroof glass closes, goes into vent position, and then finally stops in the closed position.
4. Release sunroof switch. Sunroof will now operate normally.

### ORIGINAL DRIVE MOTOR

1. Press and hold sunroof switch open until the sunroof glass opens and stops.
2. Release sunroof switch.
3. Press and hold sunroof switch open once again for at least 10 seconds. After 10 seconds of pressing the switch open, the sunroof glass will automatically move and stop at a new location.
4. Release sunroof switch.
5. Within five seconds of releasing the sunroof switch, press and hold the switch open again until the sunroof glass closes, goes into vent position, and then finally stops in the closed position.
6. Release sunroof switch. The sunroof will now operate normally.

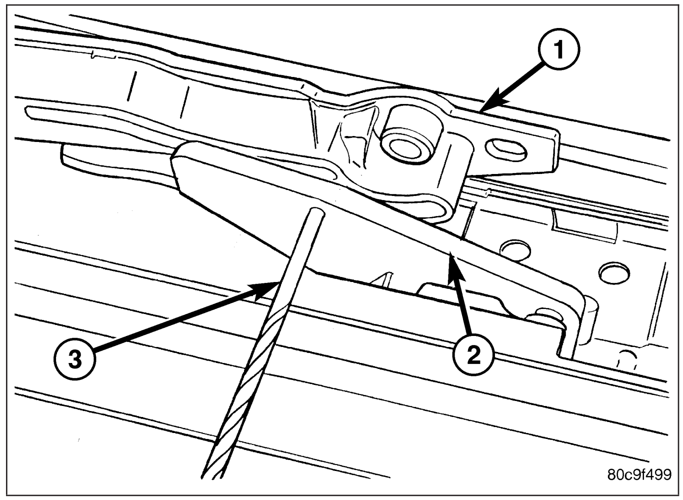
## REMOVAL

1. Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
2. Disconnect the electrical connector (1).
3. Remove three motor assembly attaching screws (4) from bottom side of motor assembly (3) and remove motor assembly from the motor bracket.

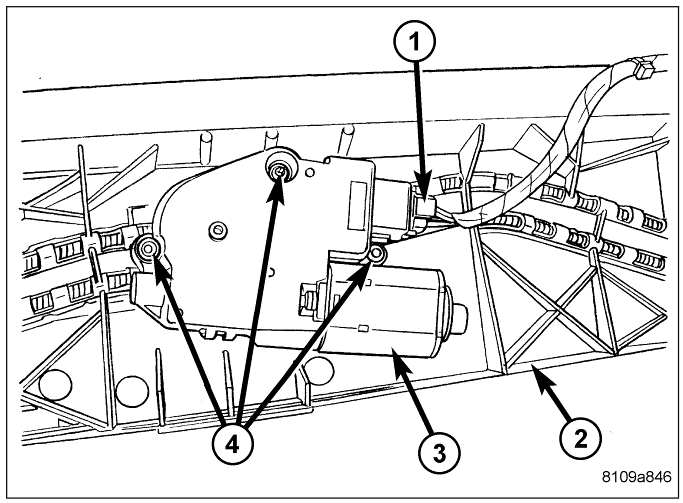


## INSTALLATION

1. If sunroof was open when drive motor was removed, carefully move glass panel into closed position and remove glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)
2. Set lifter arm timing by manually sliding the mechanisms (1) in the track until timing holes in the trollies are aligned with the timing holes in the lifter arm cams (2) and insert pins (3) into the mechanisms to hold mechanisms in closed position.



3. Place motor (3) into position and install screws (4) attaching motor to bracket (2).
4. Tighten the screws (4) to 3 N·m (26 in. lbs.).
5. If sunroof glass panel was removed previously, remove the timing pins and install the sunroof glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION)
6. Temporarily install sunroof switch and perform the sunroof motor teach procedure. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - STANDARD PROCEDURE - TEACH PROCEDURE)
7. Test sunroof operation, adjust glass as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)
8. Install headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)



# SEAL-SUNROOF GLASS

## REMOVAL

1. Remove sunroof glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)
2. Place glass panel on clean work area with the top side up. Support the glass assembly from underside to avoid bending or otherwise damaging the mounting tabs.
3. Grasp the seal and pull seal away from the glass panel. The seal is a one piece seal.

## INSTALLATION

**NOTE: Always position seal seam on center of the passenger side of glass panel.**

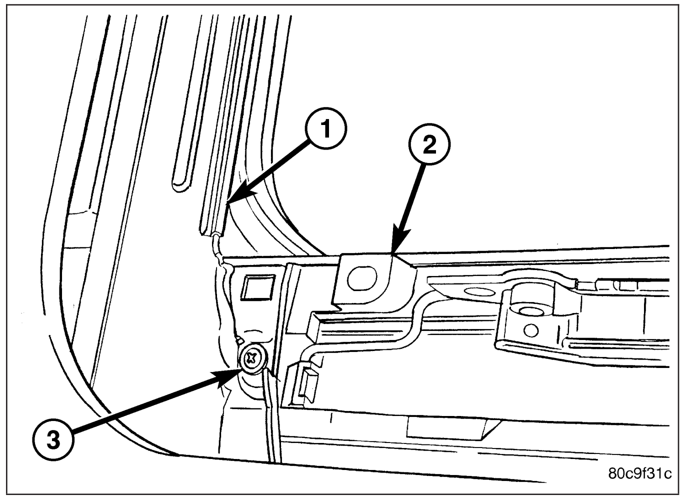
1. Place seal into position.
2. Install seal on glass. Using care working the seal around the glass, being careful not to over stretch the seal while installing.
3. Install the glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION)

# SUNSHADE

## REMOVAL

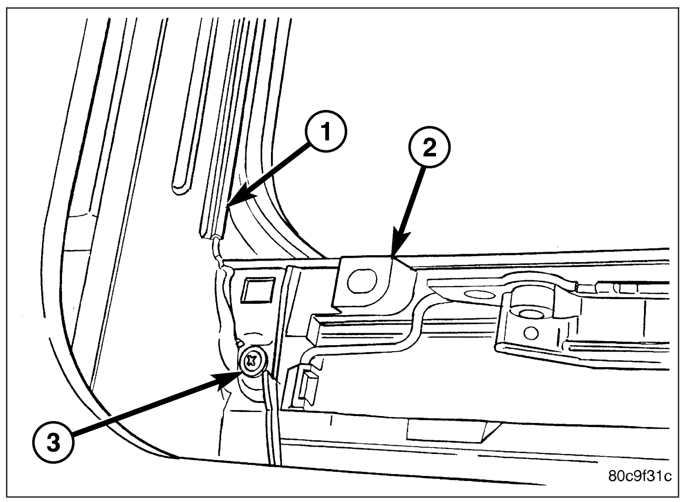
1. Remove glass assembly from the sunroof assembly. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)
2. Remove two screws (3) from trough assembly (1).
3. Remove trough assembly (1).
4. Slide the sunshade forward to disengage the guide feet from the tracks through the cutouts at the front of the tracks.

**CAUTION: Use care not to crease the sunshade when removing or installing.**



## INSTALLATION

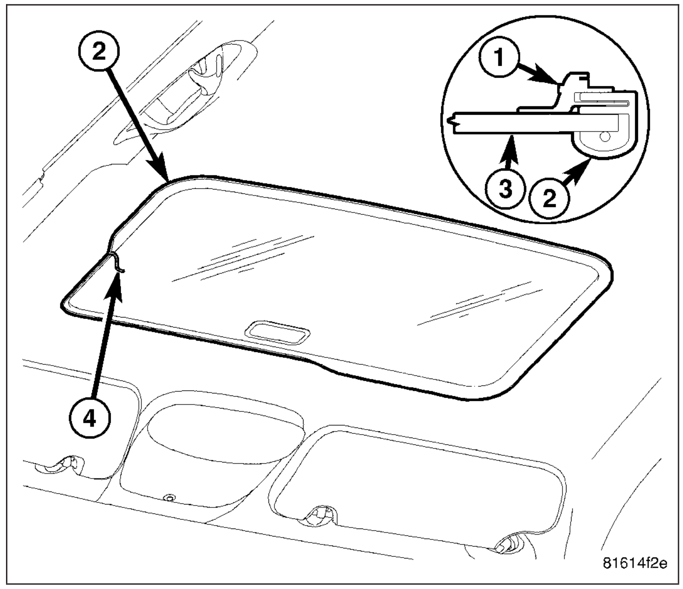
1. Place sunshade into position, through the cutouts at the front of the tracks and slide the sunshade back.
2. Place trough (1) assembly into position on sunroof module and install the screws (3).
3. Install the glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION)



# TRIM LACE

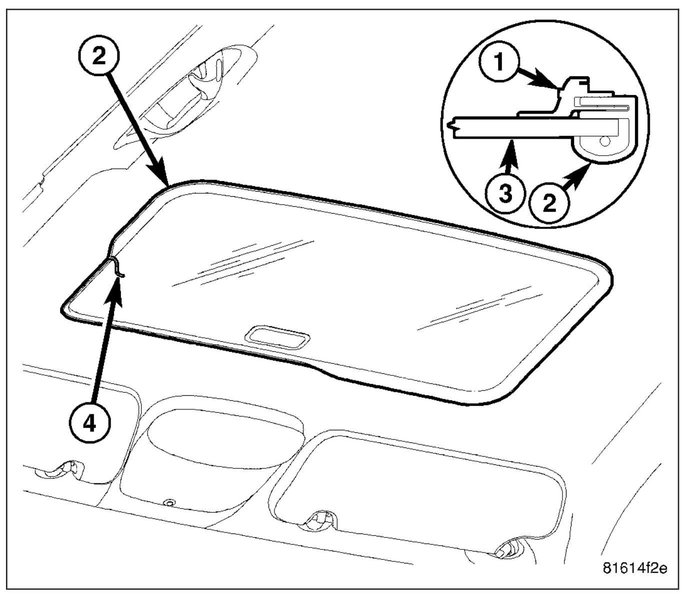
## REMOVAL

1. Remove lace by starting at the joint center of the opening on driver's side.
2. Pull one end of the lace away from the headliner until the entire lace is removed.



## INSTALLATION

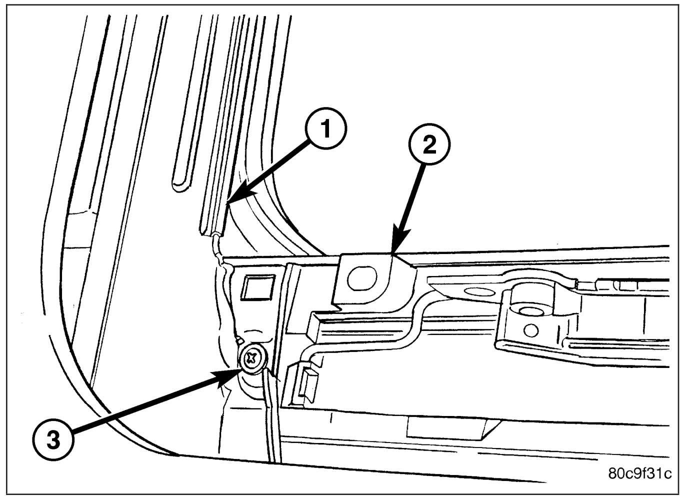
1. Place end of trim lace into position starting at center of the opening on driver's side.
2. Push lace into position.
3. Ensure that the corner radii is fully engage.
4. Once trim lace is attached to sunroof module begin tucking the headline under the lip on the trim lace working all the way around the opening.



# TROUGH

## REMOVAL

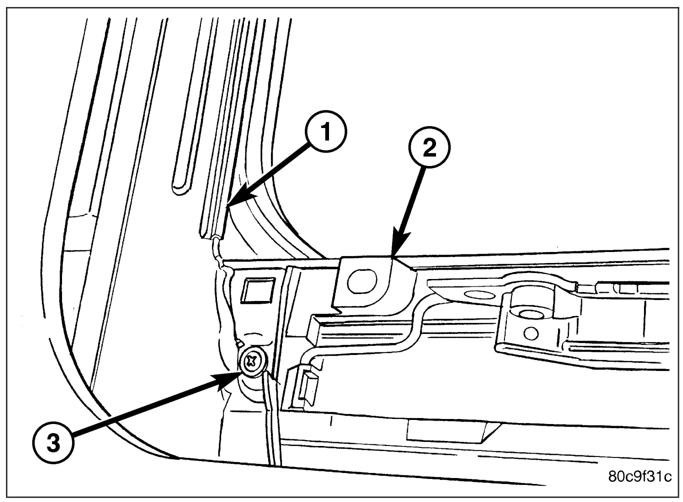
1. Remove the glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)
2. Through the top of the roof opening remove two screws (3) from trough assembly (1).
3. Remove trough assembly (1).



## INSTALLATION

**NOTE: When installing the trough be sure the trough crosses over the top of the sunshade.**

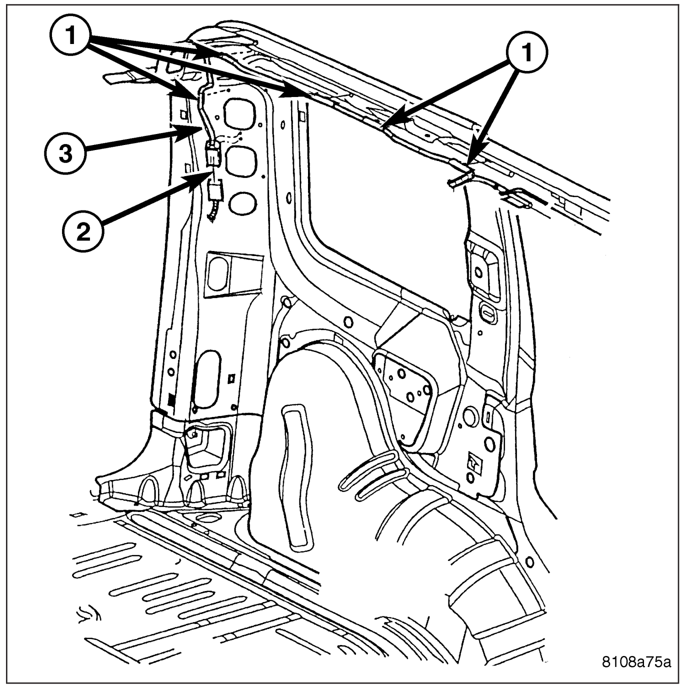
1. Install the trough (1) and install the two screws (3).
2. Install the glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION)



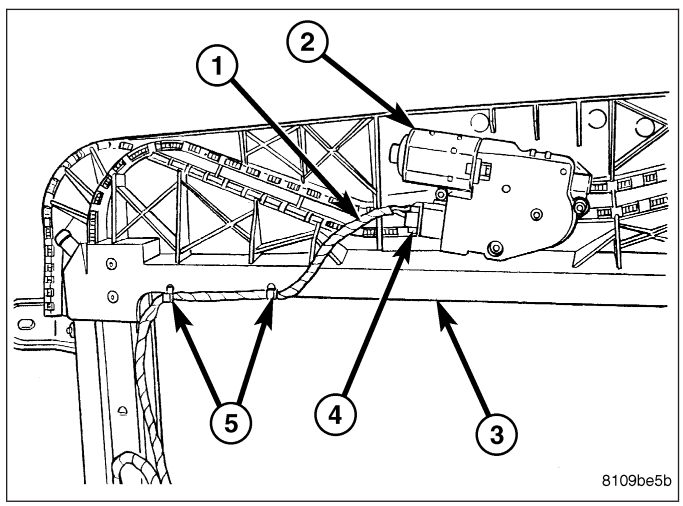
# WIRING

## REMOVAL

1. Remove the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
2. Disconnect wire harness from vehicle harness (2).

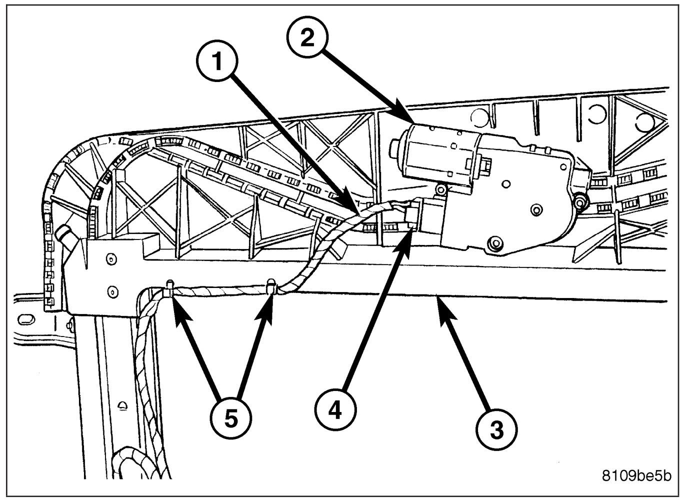


3. Disconnect drive motor electrical connector (4) and cut tie straps (5).
4. Remove harness (1).

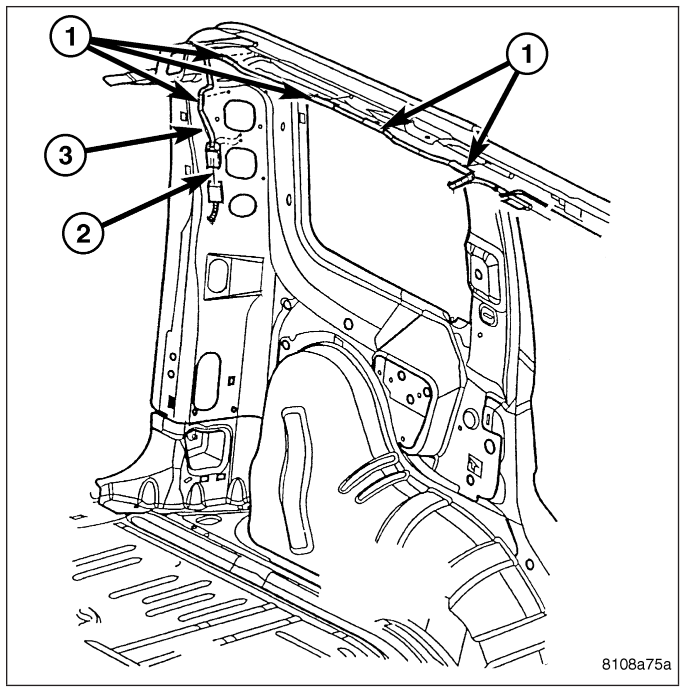


## INSTALLATION

1. Connect drive motor (4) electrical connectors.
2. Replace the two tie straps (5) on the module assembly (3).



3. Connect vehicle harness electrical connectors (2).
4. Install the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)



# WEATHERSTRIP/SEALS

## TABLE OF CONTENTS

# A-PILLAR SEAL

## REMOVAL

1. Open the doors and peel the seal away from the A-pillar/windshield and the side rail weather strip flanges.

## INSTALLATION

1. Position the no-notch end of the seal to the rear end of the rail retainer above the C-pillar. Seat the seal fully onto the retainer starting at the rear and working forward along the retainer. Make sure the seal covers the retainer all the way to the C-pillar end and the seal is oriented with the lip down and the bulbs up.

# COWL WEATHERSTRIP

## REMOVAL

1. Open the hood and peel the cowl seal from the cowl panel and cowl flange.

## INSTALLATION

1. Position the weatherstrip over the cowl flange and the cowl grille and seat fully.

# DOOR PRIMARY WEATHERSTRIP

## REMOVAL

1. Remove the lower B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
2. Peal seal off of the door opening flange.

## INSTALLATION

1. Position the seal to the bottom of the door opening, with bulb facing outboard, starting the installation at the center of the lower flange. Press the seal onto the sill flange and work around the perimeter of the door opening until fully seated. Work ½ the way around and then start at the other end of the seal working back, making sure the splice joint has no gap and smoothing the seal to avoid puckers or wrinkles.
2. Install the lower B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)
3. When installing a new weatherstrip on the front door opening, remove the tear strip starting at the splice and moving around the front of the door to the back of the opening.
4. When installing a new weatherstrip on the rear door opening, remove the tear strip starting at the splice and moving around the back of the door to the front of the opening.

# DOOR LOWER WEATHERSTRIP

## REMOVAL

1. Carefully disengage the push pin fasteners and remove the seal.

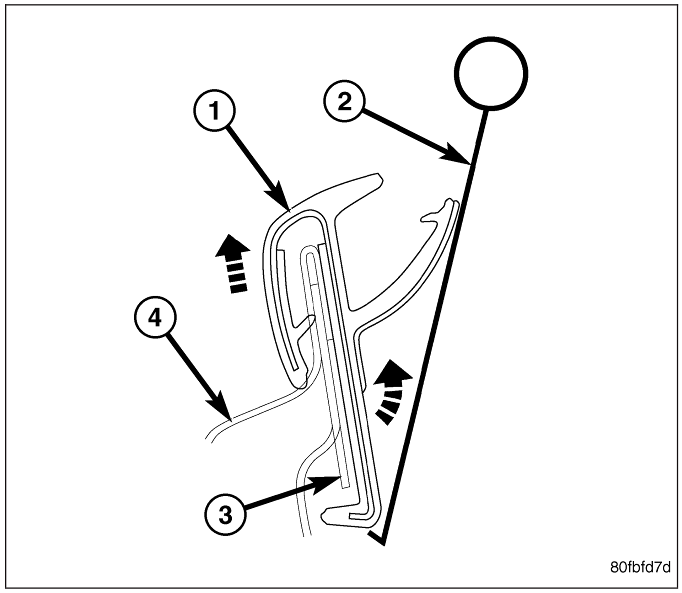
## INSTALLATION

1. Position the seal so that the flat side of the lip faces inboard, and seat the push pin fasteners.

# FRONT DOOR OUTER BELT MOLDING

## REMOVAL

1. Lower window completely.
2. Remove trim panel as necessary. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
3. Insert special tool #9093 between belt molding and glass at rear and then slide tool forward approximately 14 cm (5.5 in.).
4. Push down on outer belt molding and rotate upper part of tool outward from vehicle approximately 6 – 8 cm (2.5 - 3 in.) then lift up on molding to disengage from locking tab.
5. Repeat step 3 and 4 at 28 cm (11 in.), 43 cm (17 in.), and 57 cm (22.5 in.) from rear of door.
6. Remove belt molding.



## INSTALLATION

1. Press the belt molding onto the outer door window flange starting at the rear and working forward.
2. Install trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

# SWING GATE BELTLINE WEATHERSTRIP

## REMOVAL

1. Remove the swing gate trim panel. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - REMOVAL)
2. Pull seal away from the corner tabs and remove from the swing gate flange.

## INSTALLATION

1. Install the seal over the swing gate flange and seat the corner tabs.
2. Install the swing gate trim panel. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - INSTALLATION)

# SWING GATE OPENING WEATHERSTRIP

## REMOVAL

1. Open the swing gate and using a trim stick C-4755 or equivalent, remove the swing gate lower sill plate.
2. Peel seal off of the gate opening flange.

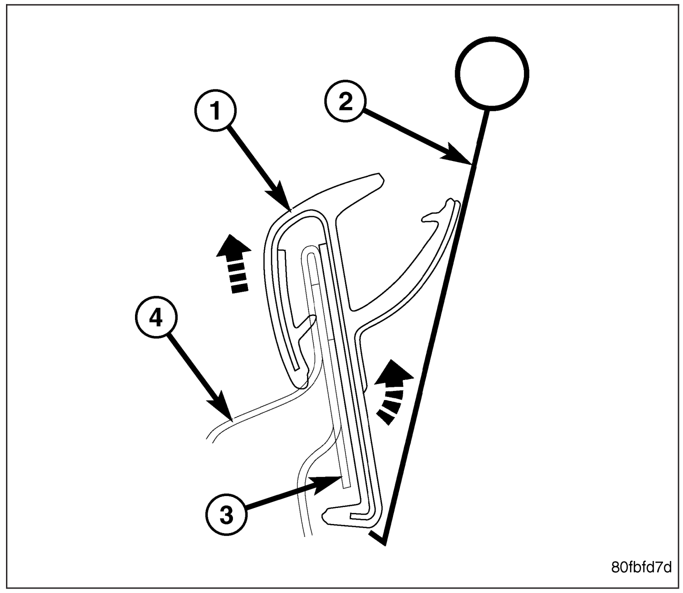
## INSTALLATION

1. Position the seal to the bottom of the gate opening starting the installation 10 to 13 cm (4 to 5 in.) from the hinge side of the flange with the trim lip facing inboard. Press the seal onto the sill flange and work around the perimeter of the door opening until fully seated. Work in one direction, smoothing the seal to avoid puckers or wrinkles. Pull trim lip cord so that the lip covers the trim edge all around.
2. Position the lower sill plate and seat the attachment clips fully.

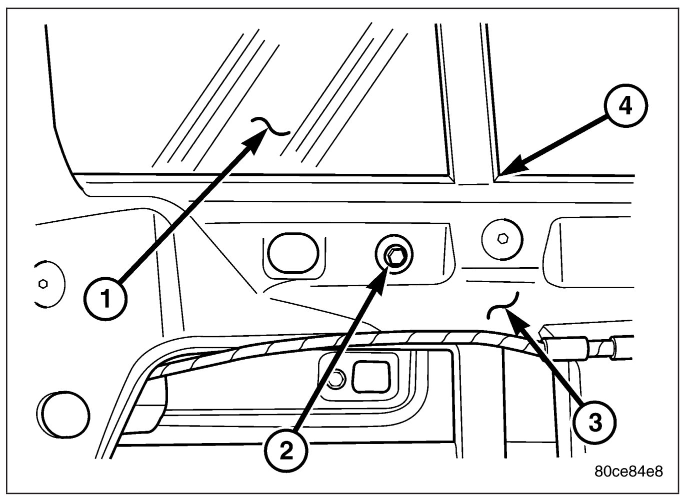
# REAR DOOR OUTER BELT MOLDING

## REMOVAL

1. Lower window completely.
2. Remove trim panel as necessary. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
3. Insert special tool #9093 between belt molding and glass at front and then slide tool back approximately 4.5 cm (1.75 in.).

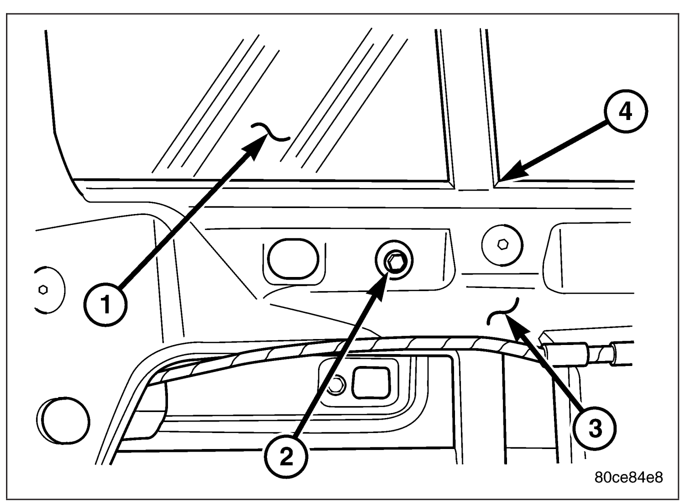


4. Push down on outer belt molding and rotate upper part of tool outward from vehicle approximately 6 – 8 cm (2.5 - 3 in.) then lift up on molding to disengage from locking tab.
5. Repeat step 3 and 4 at 23 cm (9 in.) and 41 cm (16 in.).
6. Loosen division bar bolt and slide tool 57 cm (23 in.) from front of door and disengage the last locking tab.
7. Remove belt molding.



## INSTALLATION

1. Press the belt molding onto the outer door window flange starting at the back and working towards the front.
2. Tighten the division bar bolt to 9 N·m (80 in. lbs.).
3. Install the trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)



# SIDE RAIL WEATHERSTRIP/RETAINER

## REMOVAL

1. Remove the windshield weatherstrip retainer. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/WINDSHIELD A-PILLAR WEATHERSTRIP/RETAINER - REMOVAL)
2. Remove the two screws.
3. Using a trim stick C-4755 or equivalent, release the push in fasteners and remove the weatherstrip.

## INSTALLATION

1. Position the weatherstrip and seat the push in fasteners.
2. Install the two screws.
3. Install the windshield weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/WINDSHIELD A-PILLAR WEATHERSTRIP/RETAINER - INSTALLATION)

# WINDSHIELD A-PILLAR WEATHERSTRIP/RETAINER

## REMOVAL

1. Open the doors and peel the A-pillar seal away from the A-pillar/windshield and the side rail weather strip flanges.
2. Remove the seven screws and remove the weatherstrip.

## INSTALLATION

1. Position the weatherstrip and install the seven screws.
2. Position the A-pillar seal over the windshield/A-pillar and the side rail weatherstrip flanges and seat fully.

# COWL/PLENUM SEAL

## REMOVAL

1. Remove the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL)
2. Remove the seal from the plenum flange above the air inlet duct.

## INSTALLATION

**NOTE: Seal should not be touching the plenum baffle flange seal.**

1. Position the seal on the plenum flange and seat fully.
2. Install the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION)

# COWL/PLENUM WINDOW BAFFLE SEAL

## REMOVAL

1. Remove the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL)
2. Remove the seal from the window below the cowl/plenum seal.

## INSTALLATION

1. Position the seal against the upper flange of the inner plenum window below the cowl/plenum seal and seat fully.
2. Install the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION)

# AIR INLET SEAL

## REMOVAL

1. Open the hood and carefully disengage the push pin fasteners and remove the seal.

## INSTALLATION

1. Position the seal and seat the push pin fasteners fully.

# FRONT DOOR INNER BELT WEATHERSTRIP

## REMOVAL

1. Remove the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
2. Rotate the outer belt molding outboard while pulling up to disengage the retention tabs.

## INSTALLATION

1. Press the belt molding onto the trim panel flange starting at the rear and working forward.
2. Install the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

# REAR DOOR INNER BELT WEATHERSTRIP

## REMOVAL

1. Remove the door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
2. Rotate the outer belt molding outboard while pulling up to disengage the retention tabs.

## INSTALLATION

1. Press the belt molding onto the trim panel flange starting at the rear and working forward.
2. Install the door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

# HEATING & AIR CONDITIONING

## TABLE OF CONTENTS

# HVAC - SERVICE INFORMATION

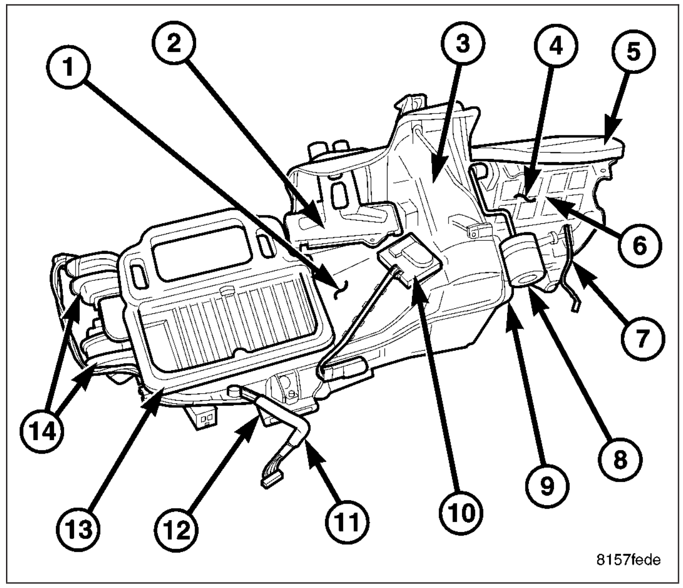
## DESCRIPTION

A manual temperature control (MTC) single zone type heating-A/C system is standard equipment on this vehicle.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to 7 - Cooling for more information before opening or attempting any service to the engine cooling system.

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing (1). The heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing mounted within the passenger compartment behind the instrument panel. The HVAC housing includes:



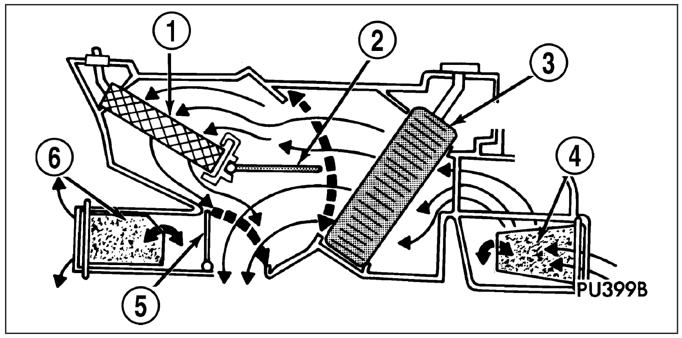
- Heater core (2)
- A/C evaporator (3)
- Air inlet housing (4) and foam seal (5)
- Recirculation-air door (6)
- Blower motor (7)
- Recirculation door actuator (8)
- Blower motor resistor (9)
- Blend-air doors and actuator (10)
- HVAC vacuum harness (11)
- Floor distribution duct (12)
- Mode-air doors (13)
- Mode door actuators (14)

Based upon the mode selected, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the housing and the floor outlet is located on the bottom of the housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlet** - Dual defroster outlets are located in the center of the instrument panel top cover, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each outboard end of the instrument panel top cover, near the belt line at the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located near the top of the instrument panel center bezel.
- **Front Floor Outlets** - There are two front floor outlets, one located above each side of the center of the floor panel near the dash panel.
- **Rear Floor Outlets** - There are four rear floor outlets, two located on each side of the floor console near the rear of each front seat.

## OPERATION

The heating-A/C system used in this vehicle is a single zone, blend-air type system. In this blend-air heating-A/C system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core. The temperature control adjusts discharge air temperature by operating an electric actuator, which operates the blend-air door. This allows an almost immediate control of the output air temperature of the system. The A/C system is designed for the use of non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air.



The heating-A/C system pulls outside (ambient) air through the cowl opening at the base of the windshield, then into the air inlet housing and through the A/C evaporator (3). Air flow can be directed either through or around the heater core (1). This is done by adjusting the position of the blend-air door (2) by an electric actuator using the temperature control on the A/C-heater control. The air flow can then be directed from the panel, floor and defrost outlets in various combinations using the mode control located on the A/C-heater control. Air flow velocity can be adjusted with the blower speed control located on the A/C-heater control.

The outside (fresh) air intake can be shut off by selecting the Recirculation Mode with the mode control. This will operate a vacuum actuated recirculation-air door (4) that closes off the fresh air intake and recirculates the air that is already inside the vehicle.

The A/C compressor is engaged by placing the mode control in any A/C mode and mix to defrost positions. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control on the A/C-heater control is used to also direct the conditioned air to the selected system outlets. The mode control uses vacuum actuators to control the mode-air doors (5 and 6).

The defroster outlet receives airflow from the HVAC housing through the molded plastic defroster duct, which is connected to the HVAC housing defroster outlet. The airflow from the defroster outlet is directed by fixed vanes in the defroster outlet grille and cannot be adjusted.

The side window demister outlets receive airflow from the HVAC housing through the molded plastic defroster duct and molded plastic demister ducts. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The demisters direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The demisters operate when the mode control is positioned in the floor-defrost and defrost-only settings. Some air may be noticeable from the demister outlets when the mode control is in the bi-level to floor positions.

The panel outlets receive airflow from the HVAC housing through a molded plastic main panel duct, center panel duct and two end panel ducts. The two end panel ducts direct airflow to the left and right instrument panel outlets, while the center panel duct directs airflow to the two center panel outlets. Each of these outlets can be individually adjusted to direct the flow of air.

The floor outlets receive airflow from the HVAC housing through the floor distribution duct. The front floor outlets are integral to the molded plastic floor distribution duct, which is secured to the bottom of the HVAC housing. The floor outlets cannot be adjusted.

**NOTE: It is important to keep the air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.**

This A/C system uses an A/C fixed orifice tube located in the liquid line to meter the flow of refrigerant to the A/C evaporator. The A/C evaporator cools and dehumidifies the incoming air prior to blending it with the heated air. To maintain minimum evaporator temperature and prevent evaporator freezing, the A/C clutch is cycled on and off by the A/C low pressure switch mounted on the A/C accumulator.

## DIAGNOSIS AND TESTING

## A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test.

## A/C PERFORMANCE TEST

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.**

1. Check for diagnostic trouble codes using a scan tool. If no DTCs are found in the powertrain control module (PCM) or engine control module (ECM), depending on engine application, go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2.
2. Connect a tachometer and a manifold gauge set or an A/C recycling/charging station.
3. Operate the heating-A/C system under the following conditions.
   - Engine at 1,000 rpm at operating temperature
   - Door or windows open
   - Transmission in Park or Neutral with parking brake set (depending on application)
   - A/C-heater controls set to Recirculation mode (max-A/C), full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the A/C System Diagnosis chart.
4. Insert a thermometer in the driver side center panel air outlet and operate the A/C system until the thermometer temperature stabilizes.
5. With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the A/C compressor discharge pressure (high side) to the A/C Performance Temperature and Pressure chart. The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

**A/C PERFORMANCE TEMPERATURE AND PRESSURE**

| **Ambient Air Temperature** | 21° C (70° F) | 27° C (80° F) | 32° C (90° F) | 38° C (100° F) | 43° C (110° F) |
|---|---|---|---|---|---|
| **Air Temperature at Center Panel Outlet** | 7° C (45° F) | 7° C (45° F) | 13° C (55° F) | 13° C (55° F) | 18° C (64° F) |
| **Compressor Inlet Pressure at Service Port (Low Side)** | 138 to 207 kPa (20 to 30 psi) | 172 to 241 kPa (25 to 35 psi) | 207 to 276 kPa (30 to 40 psi) | 241 to 310 kPa (35 to 45 psi) | 276 to 345 kPa (40 to 50 psi) |

| **Ambient Air Temperature** | 21° C (70° F) | 27° C (80° F) | 32° C (90° F) | 38° C (100° F) | 43° C (110° F) |
|---|---|---|---|---|---|
| **Condensor Outlet Pressure at Service Port (High Side)** | 1034 to 1724 kPa (150 to 250 psi) | 1379 to 2068 kPa (200 to 300 psi) | 1724 to 2413 kPa (250 to 350 psi) | 1999 to 2689 kPa (290 to 390 psi) | 2413 to 2965 kPa (350 to 430 psi) |

6. If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the A/C compressor discharge pressure is high, refer to the A/C System Diagnosis chart.

**A/C SYSTEM DIAGNOSIS**

| Condition | Possible Causes | Correction |
|---|---|---|
| Rapid A/C clutch cycling (ten or more cycles per minute). | 1. Low refrigerant system charge. | 1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. |
| Equal pressures, but the A/C clutch does not engage. | 1. No refrigerant in the refrigerant system. | 1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. |
| | 2. Faulty fuse. | 2. Check the fuses in the power distribution center and the junction block. Repair the shorted circuit or component and replace the fuses, if required. Refer to Group 8. |
| | 3. Faulty A/C clutch field coil. | 3. See A/C Compressor Clutch in this group. Test the A/C clutch field coil and replace, if required. |
| | 4. Faulty A/C clutch relay. | 4. See A/C Clutch Relay in this group. Test the A/C clutch relay and relay circuits. Repair the circuits or replace the relay, if required. |
| | 5. Improperly installed or faulty A/C low pressure switch. | 5. See A/C Low Pressure Switch in this group. Test the A/C low pressure switch and tighten or replace, if required. |
| | 6. Faulty A/C high pressure switch (diesel engine application). | 6. See A/C High Pressure Switch in this group. Test the A/C high pressure switch and replace, if required. |
| | 7. Faulty A/C pressure transducer (gasoline engine application). | 7. See A/C Pressure Transducer in this group. Test the A/C pressure transducer and replace, if required. |
| | 8. Faulty powertrain control module (PCM) or engine control module (ECM), depending on engine application. | 8. Refer to the proper Diagnostic Procedures manual for testing of the PCM or ECM. Test the PCM or ECM and replace, if required. |
| Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high. | 1. Excessive refrigerant oil in system. | 1. See Refrigerant Oil Level in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required. |
| | 2. Blend door actuator improperly installed or faulty. | 2. See Blend Door Actuator in this group. Inspect the actuator for proper operation and replace, if required. |
| | 3. Blend-air door inoperative or sealing improperly. | 3. See HVAC Housing in this group. Inspect the blend-air door for proper operation and sealing and correct, if required. |

| Condition | Possible Causes | Correction |
| --- | --- | --- |
| The low side pressure is normal or slightly low, and the high side pressure is too low. | 1. Low refrigerant system charge. | 1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. |
| | 2. Refrigerant flow through the A/C accumulator is restricted. | 2. See A/C Accumulator in this group. Replace the restricted accumulator, if required. |
| | 3. Refrigerant flow through the A/C evaporator is restricted. | 3. See A/C Evaporator in this group. Replace the restricted A/C evaporator, if required. |
| | 4. Faulty A/C compressor. | 4. See A/C Compressor in this group. Replace the A/C compressor, if required. |
| The low side pressure is normal or slightly high, and the high side pressure is too high. | 1. A/C Condenser air flow restricted. | 1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required. |
| | 2. Inoperative radiator cooling fan. | 2. Test the radiator cooling fan and replace, if required. Refer to Group 7. |
| | 3. Refrigerant system overcharged. | 3. See Refrigerant System Charge Level in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required. |
| | 4. Air in the refrigerant system. | 4. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. |
| | 5. Engine overheating. | 5. Test the engine cooling system and repair, if required. Refer to Group 7. |
| The low side pressure is too high, and the high side pressure is too low. | 1. Accessory drive belt slipping. | 1. Inspect the accessory drive belt condition and tension. Tighten or replace the accessory drive belt, if required. Refer to Group 7. |
| | 2. Faulty A/C orifice tube. | 2. See A/C Orifice Tube in this group. Replace the liquid line, if required. |
| | 3. Faulty A/C compressor. | 3. See A/C Compressor in this group. Replace the A/C compressor, if required. |
| The low side pressure is too low, and the high side pressure is too high. | 1. Restricted refrigerant flow through the refrigerant lines. | 1. See Liquid Line, Suction Line and A/C Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required. |
| | 2. Restricted refrigerant flow through the A/C orifice tube. | 2. See A/C Orifice Tube in this group. Replace the liquid line, if required. |
| | 3. Restricted refrigerant flow through the A/C condenser. | 3. See A/C Condenser in this group. Replace the restricted condenser, if required. |

## HEATER PERFORMANCE

Before performing the following tests, refer to Group 7 - Cooling for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation.

**WARNING: Do not remove radiator cap when engine is hot, personal injury can result.**

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure stabilizes, remove the cap completely.

## MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

### HEATER TEMPERATURE REFERENCE

| | | | | |
|---|---|---|---|---|
| **Ambient Air Temperature** | 16° C<br>(60° F) | 21° C<br>(70° F) | 26° C<br>(80° F) | 32° C<br>(90° F) |
| **Minimum Air Temperature at Floor Outlet** | 52° C<br>(125° F) | 56° C<br>(133° F) | 59° C<br>(139° F) | 62° C<br>(144° F) |

If the heater outlet air temperature is below the minimum specification, refer to Group 7 - Cooling. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling for more information.

### OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Faulty water pump.
- Faulty thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- Plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

### MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Faulty engine thermostat.
- Faulty blower motor system.
- Faulty A/C-heater control.
- Faulty blend door actuator.
- Faulty, obstructed or improperly installed blend-air door.

### TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Faulty A/C-heater control.
- Faulty blend door actuator.
- Faulty, obstructed or improperly installed blend-air door.
- Faulty related wiring harness or connectors.
- Improper engine coolant temperature.

## SPECIFICATIONS

## A/C SYSTEM

| Item | Description | Notes |
|---|---|---|
| A/C Compressor | Denso 10S17 (2.8L diesel engine) | ND-8 PAG oil |
| | Visteon HS-18 (3.7L engine) | VC-46 PAG oil |
| Freeze–up Control | A/C low pressure switch | Input to PCM, accumulator mounted - cycles clutch off below -1° C (30° F), cycles back on above 7.2° C (45° F) |
| Low psi Control | A/C low pressure switch | Opens below 141 kPa (20.5 psi), resets above 234 - 262 kPa (34 - 38 psi) |
| High psi Control | A/C high pressure switch (diesel engine) | A/C discharge line mounted - opens at discharge pressure above 3100 - 3375 kPa (450 - 490 psi), resets at 1860 - 2275 kPa (270 - 330 psi) |
| | A/C pressure transducer (gasoline engines) | A/C discharge line mounted - opens at discharge pressure above 2971 kPa (431 psi) and below 206 kPa (30 psi) |
| Refrigerant Charge Capacity | Refer to the A/C Underhood Specification Label located in the engine compartment. | R-134a refrigerant |
| A/C Clutch Coil Draw | 2.2 - 2.3 amps @ 12V ± 0.5V @ 21° C (70° F) | 2.8L diesel engine. A/C Clutch Field Coil Resistance when measured across coil lead connector is 3.6 ± 0.2 ohms. |
| | 3.1 - 4 amps @ 12V ± 0.5V @ 21° C (70° F) | 3.7L engine |
| A/C Clutch Air Gap | 0.35 - 0.60 mm (0.014 - 0.024 in.) | 2.8L diesel engine |
| | 0.35 - 0.65 mm (0.014 - 0.025 in.) | 3.7L engine |

# CONTROLS

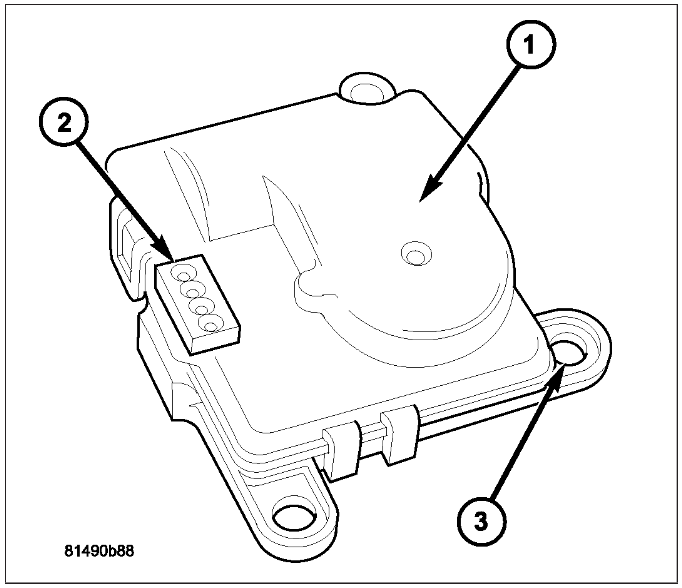
## TABLE OF CONTENTS

# ACTUATOR-BLEND DOOR

## DESCRIPTION

The heating-A/C system uses a reversible, 12-volt direct current (DC) servo motor which mechanically positions the blend-air door. The blend door actuator (1) is located on the top of the HVAC housing.

The blend door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2) and three integral mounting tabs (3) that allow the actuator to be secured to the HVAC housing. The blend door actuator also has an output shaft with splines that connects it to the linkage that drives the blend-air door. The blend door actuator requires mechanical indexing to the blend door linkage.



## OPERATION

The blend door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated three-wire lead and connector of the instrument panel wire harness. The blend door actuator can move the blend-air door in two directions. A potentiometer within the actuator allows the A/C-heater control to know the exact position of the blend-air door at all times.

The blend door actuator can be diagnosed using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

The blend door actuator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.**

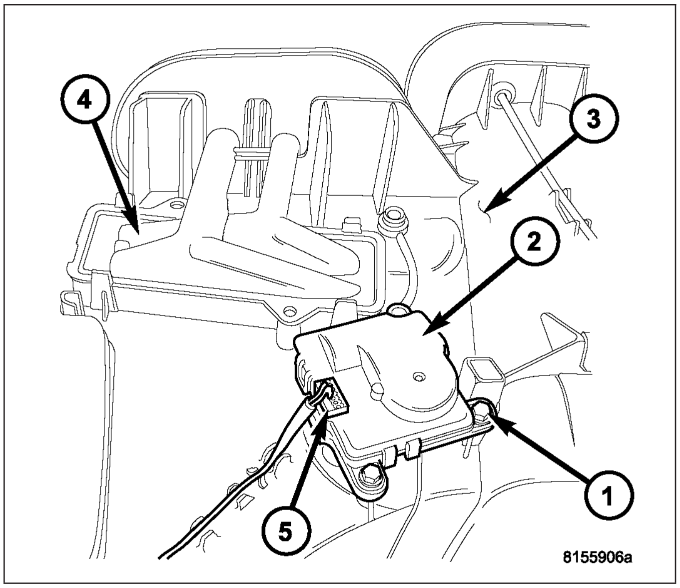
**NOTE: Prior to performing this procedure, turn the ignition key to the On position and set the A/C-heater control in the mid-temperature position and wait 10 seconds.**

**NOTE: LHD model shown in illustration. RHD models similar.**

1. Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).
2. Remove the three screws (1) that secure the blend door actuator (2) to the top of the HVAC housing (3) near the heater core (4).

**NOTE: Note the actuator shaft position for installation reference.**

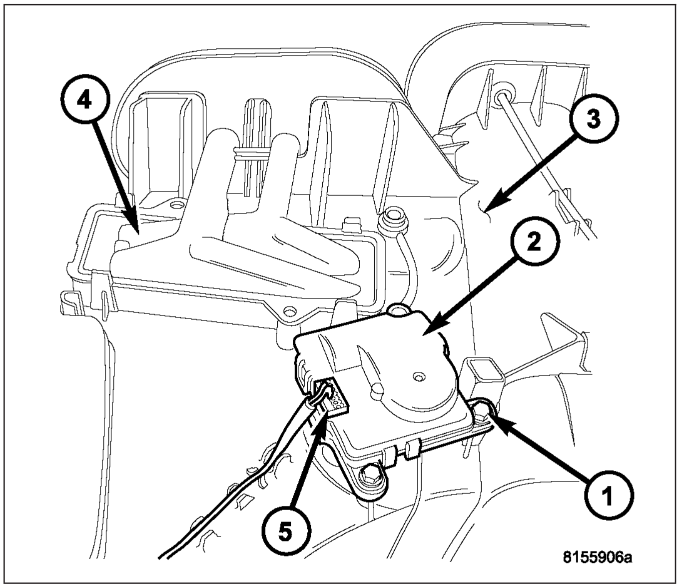
3. Remove the blend door actuator from the HVAC housing and disconnect the wire harness connector (5) from the actuator.
4. Remove the blend door actuator from the vehicle.



## INSTALLATION

**NOTE: LHD model shown in illustration. RHD models similar.**

1. Position the blend door actuator (2) onto the top of the HVAC housing (3) near the heater core (4), making sure the actuator spline is positioned properly with the door spline. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend door pivot.
2. Install the three screws (1) that secure the blend door actuator to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the wire harness connector (5) to the blend door actuator.
4. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).



# ACTUATOR-MODE DOOR

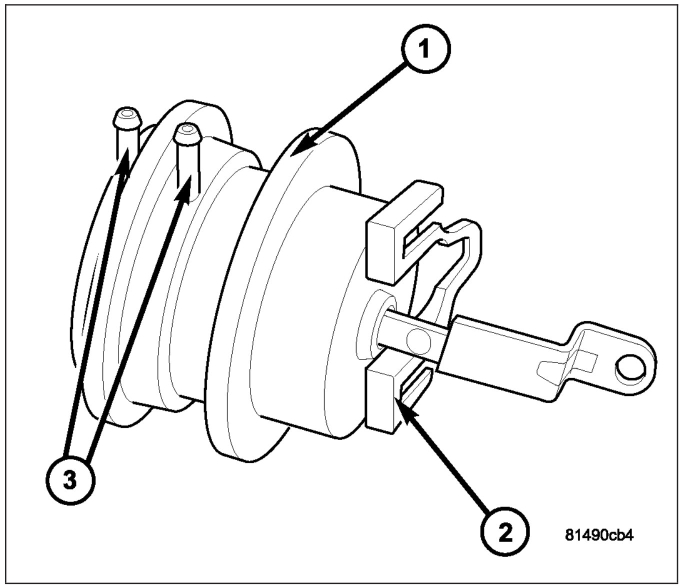
## DESCRIPTION

The heating-A/C system uses two vacuum operated mode door actuators (1) to control the movement of the mode-air doors within the HVAC housing.

When vacuum is supplied by the A/C-heater control to the vacuum connector (3) on one side of the defrost/floor actuator or the panel door actuator, the actuator rod is pulled into the actuator, which moves the mode door lever and mode-air door in one direction. When vacuum is supplied by the A/C-heater control to the other side of the actuator, the rod moves the mode-air door in the other direction.

The mode door actuators are retained to the HVAC housing by an integral mounting provision (2) and can be accessed for service from under the driver side of the instrument panel.

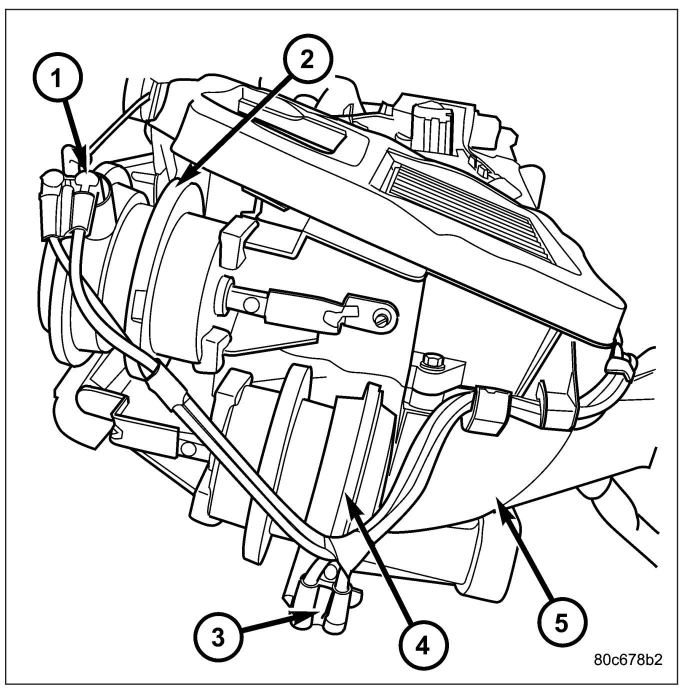
The mode door actuators cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.



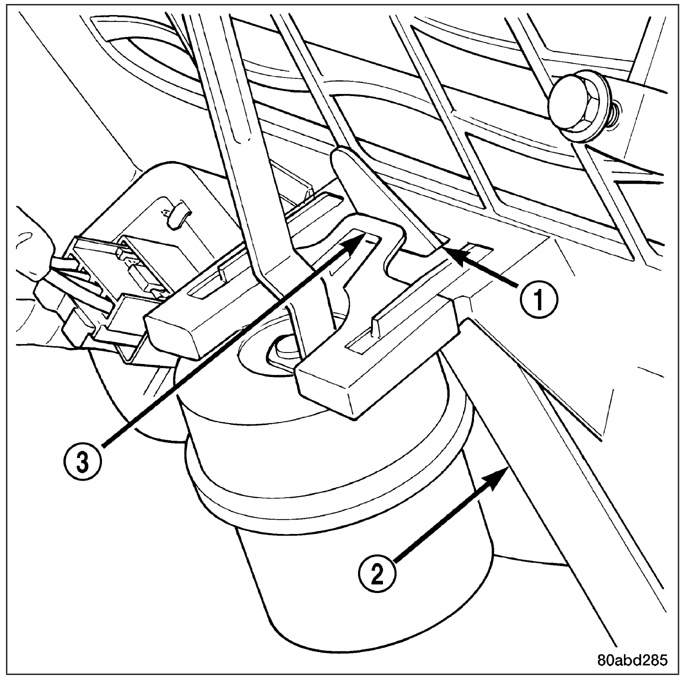
## REMOVAL

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.**

1. Disconnect and isolate the negative battery cable.
2. Remove the knee blocker from the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/BLOCKER-KNEE - REMOVAL).
3. Disconnect the vacuum harness connectors (1 and 3) from the panel door actuator (2) or the floor/defrost door actuator (4) located on the driver side of the HVAC housing (5) as required.

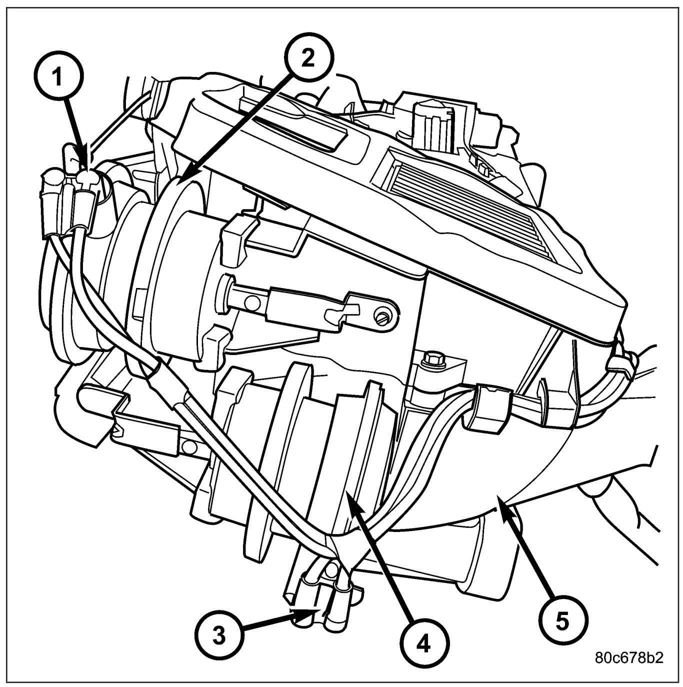


4. Insert a trim stick C-4755 or equivalent (2) into the latch hole of the HVAC housing actuator mount(s) (1). Gently pry the actuator latch (3) away from the HVAC housing mount while pulling firmly outward on the actuator and disconnect the actuator from the HVAC housing.
5. Rotate and tilt the actuator(s) as required to disengage the actuator link from the mode door lever and remove the actuator from the vehicle.



## INSTALLATION

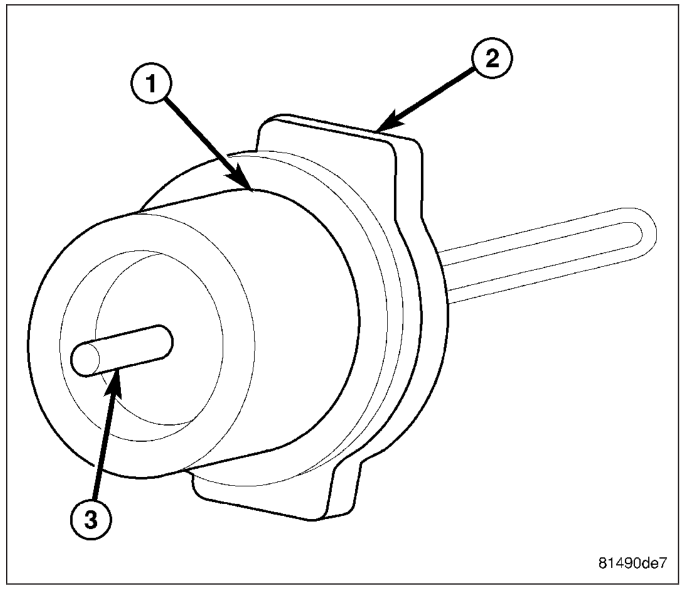
1. Install the panel door actuator (2) or the floor/defrost door actuator (4) as required, by engaging the hole in the end of the actuator link to the hooked pin on the end of the door lever located on the driver side of the HVAC housing (5).
2. Install the actuator(s) onto the actuator mount(s).
3. Connect the vacuum harness connectors (1 and 3) to the actuators as required.
4. Install the knee blocker (Refer to 23 - BODY/INSTRUMENT PANEL/BLOCKER-KNEE - INSTALLATION).
5. Reconnect the negative battery cable.



# ACTUATOR-RECIRCULATION DOOR

## DESCRIPTION

The heating-A/C system uses a vacuum operated recirculation door actuator (1) to control the movement of the recirculation-air door within the HVAC air inlet housing.



When vacuum is supplied by the A/C-heater control to the vacuum connector (3) of the recirculation door actuator, the actuator linkage is pulled into the actuator, which moves the recirculation door lever and recirculation-air door to the Recirculation position. The recirculation door actuator is spring loaded, so when vacuum is released from the actuator, the linkage moves the recirculation-air door back to its static position (fresh air).

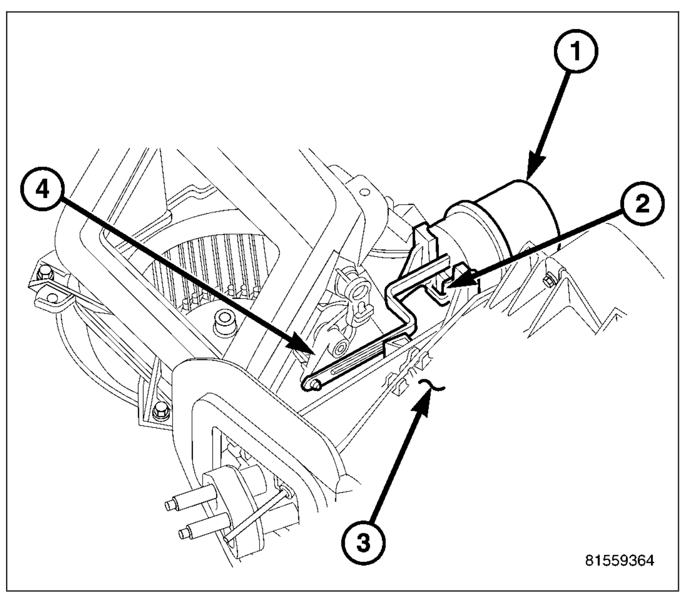
The recirculation door actuator is retained to the HVAC air inlet housing by an integral mounting provision (2) and can be accessed for service by removing the instrument panel.

The recirculation door actuator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

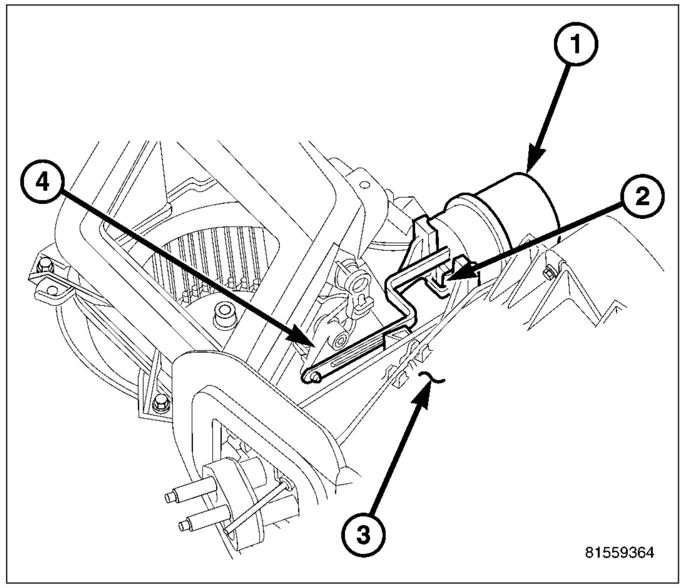
**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.**

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
3. Disconnect the vacuum line harness connector from the recirculation door actuator (1).
4. Release the latch that secures the recirculation door actuator mount (2) to the top of the HVAC housing (3) and disengage the actuator from the housing.
5. Disconnect the recirculation door actuator from the recirculation door lever (4) and remove the actuator from the vehicle.



## INSTALLATION

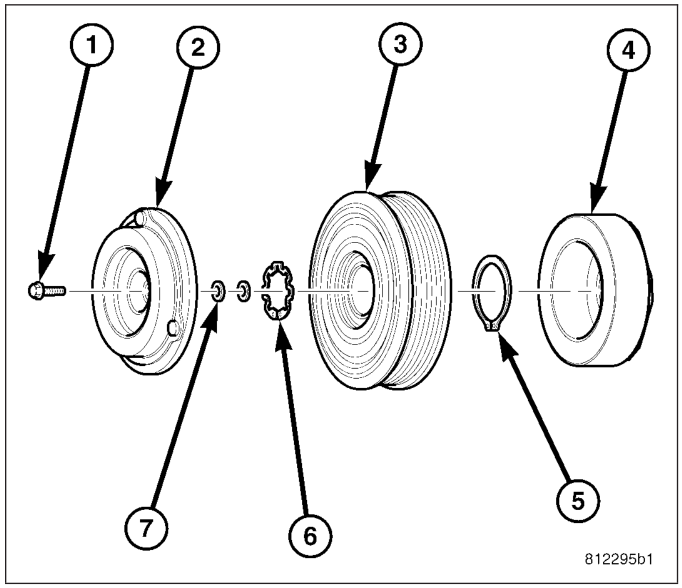
1. Connect the recirculation door actuator (1) to the recirculation door lever (4).
2. Align the recirculation door actuator mount (2) to the stanchion on the HVAC housing (3), and press the actuator onto the stanchion firmly to fully engage the latch.
3. Connect the vacuum harness connector to the recirculation door actuator.
4. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
5. Reconnect the battery negative cable.



# CLUTCH-A/C COMPRESSOR

## DESCRIPTION

**NOTE: Denso 10S17 A/C clutch assembly shown. Visteon HS-18 compressor similar.**



The A/C compressor clutch assembly consists of a stationary electromagnetic field coil (4), bearing and pulley assembly (3), shims (7) and a clutch plate (2) that is splined to the compressor shaft and secured by a bolt (1). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch bearing and pulley assembly on both A/C compressors are retained to the front of the compressor with a snap ring (6). The A/C clutch field coil on the Denso 10S17 A/C compressor is also retained to the front of the compressor using a snap ring (5). The field coil on the Visteon HS-!8 compressor is pressed onto the front of the compressor.

## OPERATION

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C clutch engagement is controlled by the following:

- A/C-heater mode control
- A/C clutch relay
- A/C pressure transducer (gasoline engines)
- A/C high pressure switch (diesel engine)
- A/C low pressure switch
- Powertrain control module (PCM) or engine control module (ECM) (depending on application)

The A/C compressor clutch components cannot be repaired and, if faulty or damaged, they must be replaced.

## DIAGNOSIS AND TESTING

## A/C COMPRESSOR CLUTCH COIL

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) through the A/C clutch relay. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

### PRELIMINARY CHECKS

1. If no diagnostic trouble codes (DTCs) are found in the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application), go to Step 2. If any DTCs are found, repair as required.
2. If the A/C compressor clutch still will not engage, verify the refrigerant charge level (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS). If the refrigerant charge level is OK, go to Step 3. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.
3. On models equipped with the 3.7L gasoline engine, if the A/C compressor clutch still will not engage, disconnect the wire harness connector from the A/C pressure transducer and check for battery current at the connector with the engine running and the A/C-heater control set to the A/C mode. If OK, go to TESTS . If not OK, refer to the

Body Diagnostic Procedures to perform further diagnosis. On models equipped with the 2.8L diesel engine, go to TESTS .

**TESTS**

1. Verify the battery state of charge (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - DIAGNOSIS AND TESTING).
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch coil feed terminal. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the A/C-heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C compressor clutch should engage immediately, and the clutch coil supply voltage should be within two volts of the battery voltage. If the coil supply voltage is OK, go to Step 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary. If there is no voltage reading at the clutch coil, use a DRB III ® scan tool and refer to appropriate diagnostic information for testing of the compressor clutch circuit and PCM control. The following components must be checked and repaired as required before you can complete testing of the clutch coil:
   - Fuses in the junction block (JB) and the power distribution center (PDC)
   - A/C heater mode control
   - A/C clutch relay
   - A/C high pressure switch (diesel engine)
   - A/C low pressure switch
   - Powertrain control module (PCM) or the engine control module (ECM) (depending on engine application)
5. Specifications apply for a work area temperature of 21° C (70° F) (Refer to 24 - HEATING & AIR CONDITIONING - SPECIFICATIONS). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
   a. If the A/C clutch coil current reading is zero, the coil is open and must be replaced.
   b. If the A/C clutch coil current reading is above specifications, the coil is shorted and must be replaced.

## STANDARD PROCEDURE

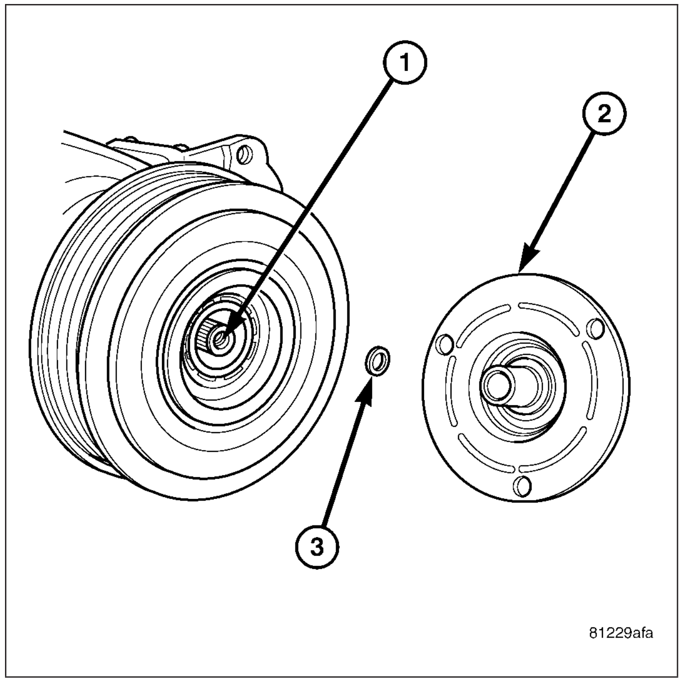
## A/C CLUTCH PLATE INSPECTION

**NOTE: The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.**

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.



## A/C CLUTCH BREAK-IN

After a new A/C compressor clutch has been installed, cycle the compressor clutch approximately 20 times (5 seconds on, then 5 seconds off). During this procedure, set the A/C-heater controls to the A/C Recirculation Mode, the blower motor in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

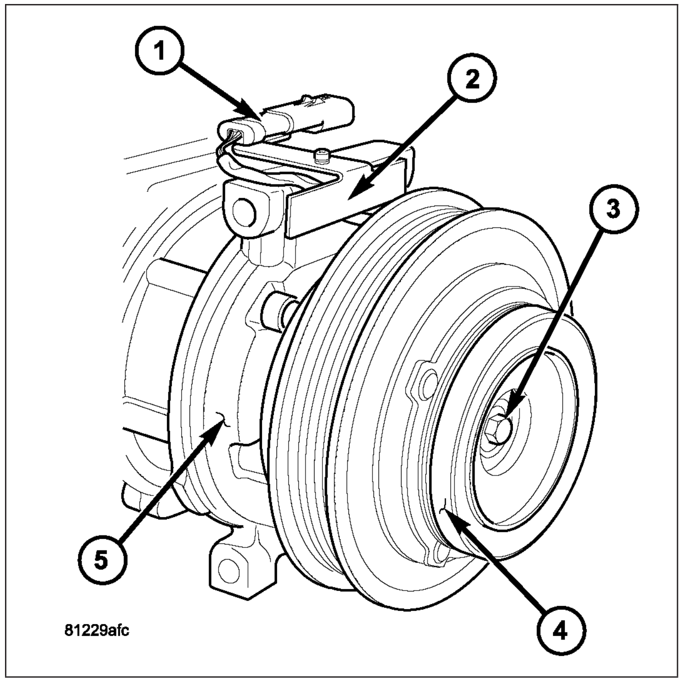
## REMOVAL

## DENSO A/C COMPRESSOR

**NOTE: The compressor clutch assembly can be serviced with the refrigerant system fully-charged and the A/C compressor installed on the engine.**

**NOTE: Typical A/C compressor shown in illustrations.**

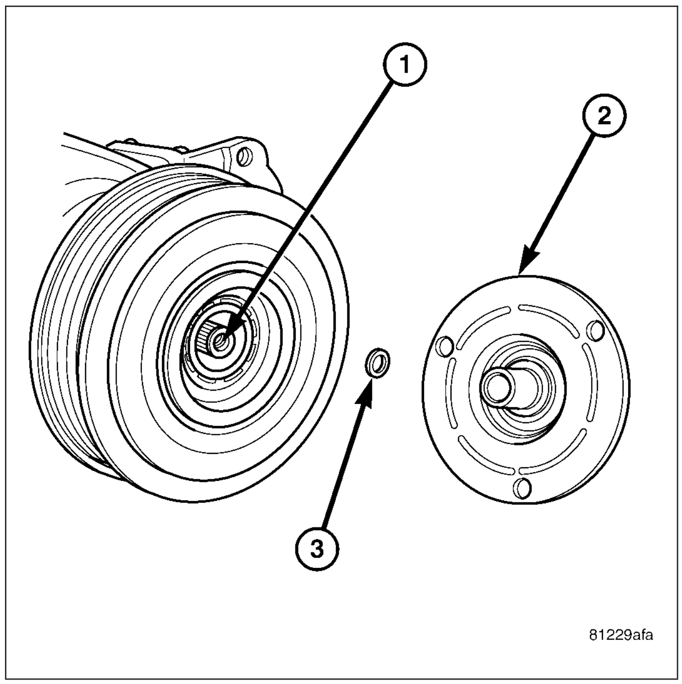
1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Raise and support the vehicle.
4. Remove the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL).
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1) located on the top of the A/C compressor (5).
6. Carefully remove the compressor clutch field coil connector and wire lead from the connector bracket (2).
7. Remove the compressor shaft bolt (3). A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate (4) from rotating during bolt removal.



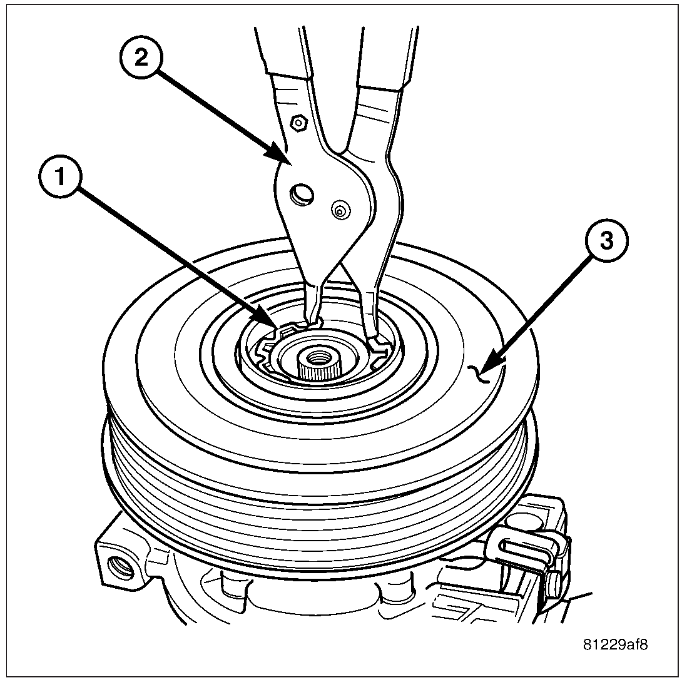
**CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.**

**NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.**

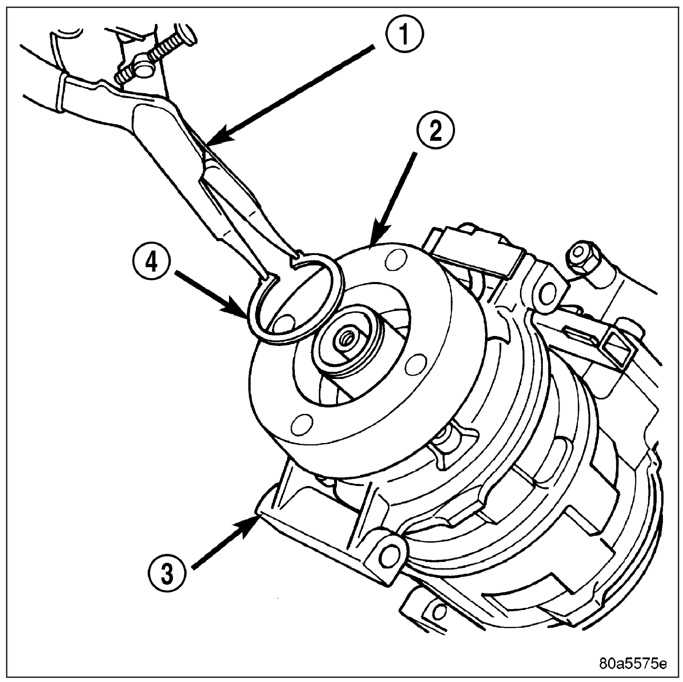
8. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).



9. Using snap ring pliers (2), remove the snap ring (1) that secures the pulley and bearing assembly (3) to the front of the A/C compressor and remove the pulley and bearing assembly.



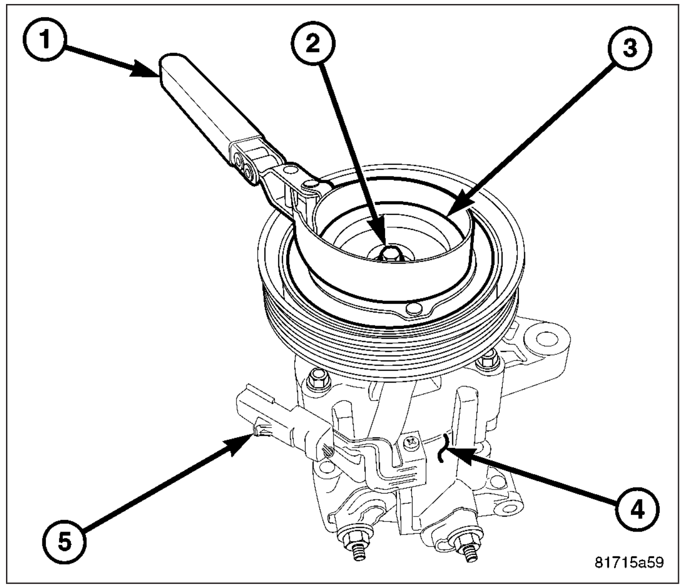
10. Using snap ring pliers (1), remove the snap ring (4) that secures the compressor clutch field coil (2) to the front of the A/C compressor (3) and remove the field coil.



## VISTEON A/C COMPRESSOR

**NOTE: The A/C compressor clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly or field coil replacement.**

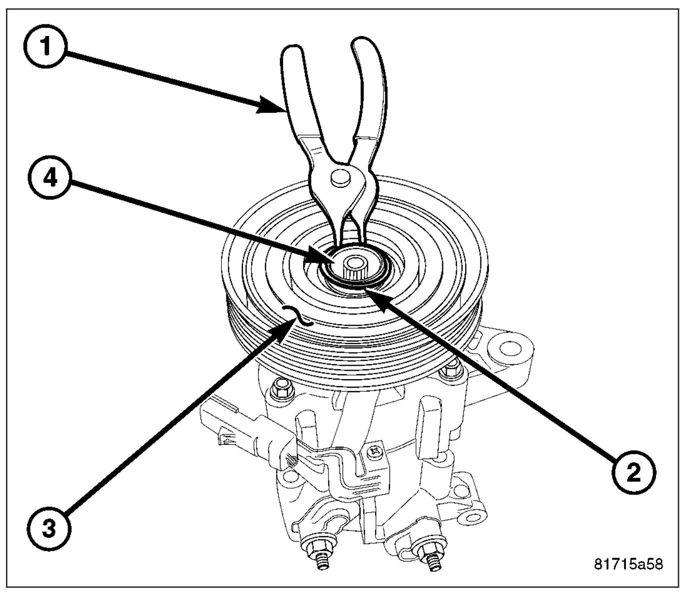
1. Disconnect and isolate negative battery cable.
2. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
3. Disconnect the engine wire harness from the clutch field coil connector (4).
4. Remove the bolts that secure the A/C compressor (4) to the mounting bracket (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - 3.7L ENGINE - REMOVAL).
5. Remove the A/C compressor from the mounting bracket and support the compressor while servicing the clutch.
6. Using a strap wrench (1), remove the bolt (2) that secures the clutch plate (3) to the compressor shaft.



**NOTE: The clutch plate can be removed from the compressor shaft by hand or, if required, pressed off with an 8 x 1.25 mm bolt.**

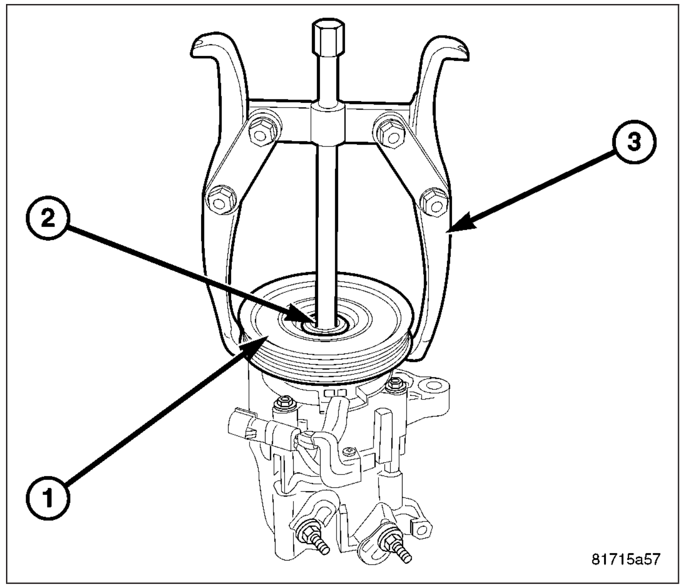
**NOTE: Clutch plate shim(s) may remain inside the hub of the clutch plate. Be sure to remove all of the shims from inside the hub or from the end of the compressor shaft.**

7. Remove the clutch plate and shim(s) from the A/C compressor. If required, install a 8 x 1.25 mm bolt into the center of the clutch plate and turn the bolt clockwise until the clutch plate is completely removed from the A/C compressor.
8. Using snap ring pliers (1), remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4).

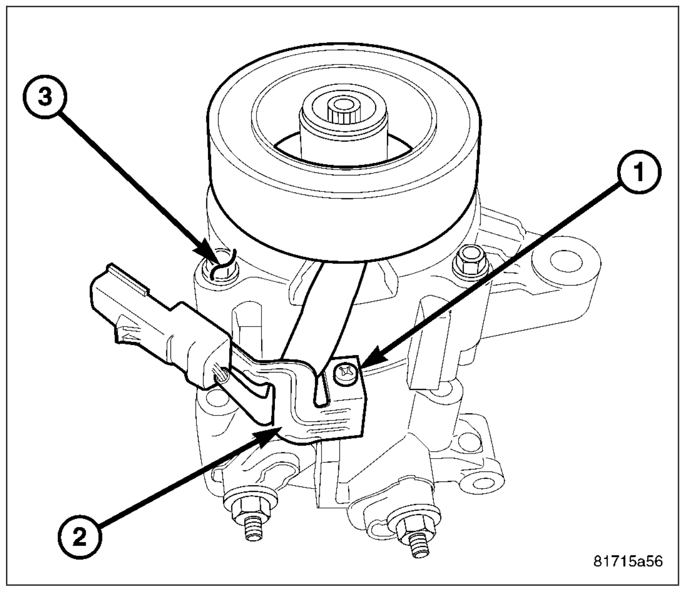


**NOTE: The pulley and bearing assembly can be removed from the compressor by hand or, if required, with a two jaw puller.**

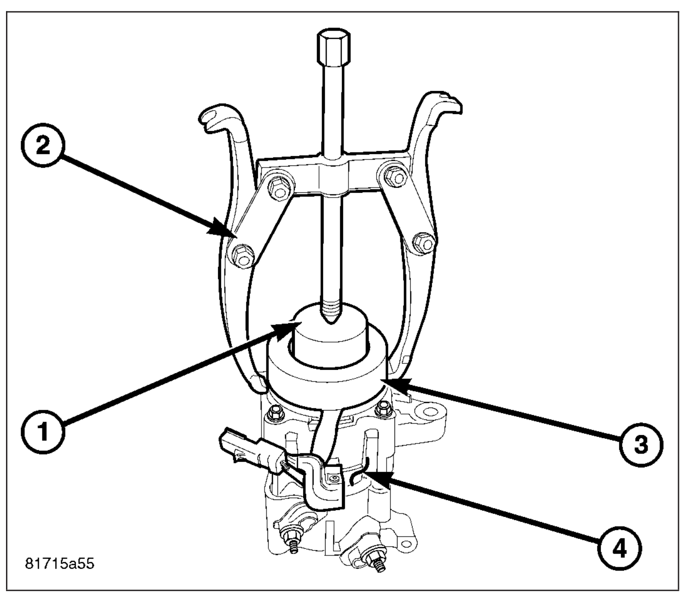
9. Remove the pulley and bearing assembly (1) from the front of the A/C compressor (2). If required, install a two jaw puller (3) and turn the puller center-bolt clockwise until the pulley and bearing assembly is completely removed.



10. Remove the screw (1) that secures the clutch field coil wire lead bracket (2) to the A/C compressor (3).



11. Using compressor field coil remover (Special Tool 9354 in Kit 9349) (1) and a two jaw puller (2), remove the clutch field coil (3) from the front of the A/C compressor (4).

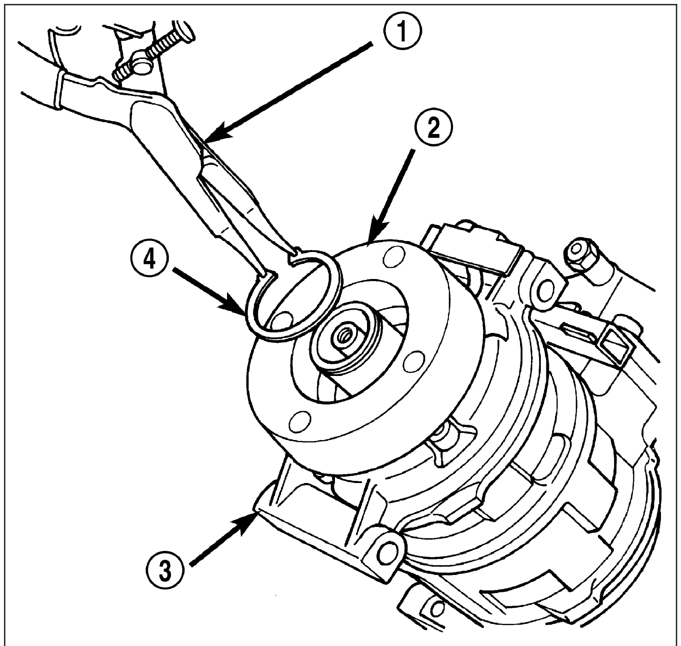


## INSTALLATION

## DENSO A/C COMPRESSOR

**NOTE: Typical A/C compressor shown in illustrations.**

1. Align the dowel pin on the back of the compressor clutch field coil (2) with the hole in the front of the A/C compressor (3) and position the field coil onto the compressor. Be certain that the compressor clutch field coil wire lead is properly routed so that it is not pinched between the A/C compressor and the field coil.



80a5575e

**CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.**

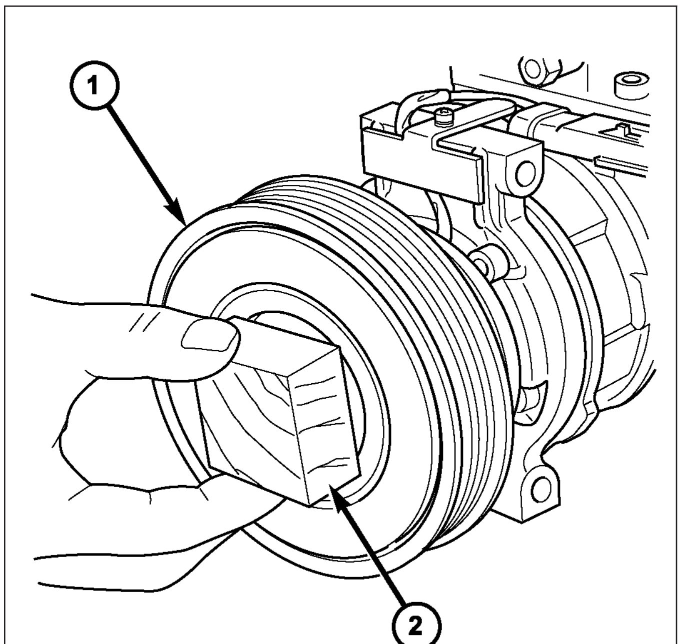
**NOTE: A new snap ring must be used to secure the compressor clutch field coil to the A/C compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or to the left of the field coil dowel pin location on the A/C compressor.**

2. Using snap ring pliers (1), install the snap ring (4) that secures the compressor clutch field coil to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove and oriented correctly.

**CAUTION: Be certain to position the compressor clutch field coil wire lead so that it is not damaged during A/C compressor pulley and bearing installation.**

**CAUTION: When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the clutch will result.**

3. Install the pulley and bearing assembly (1) onto the front of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

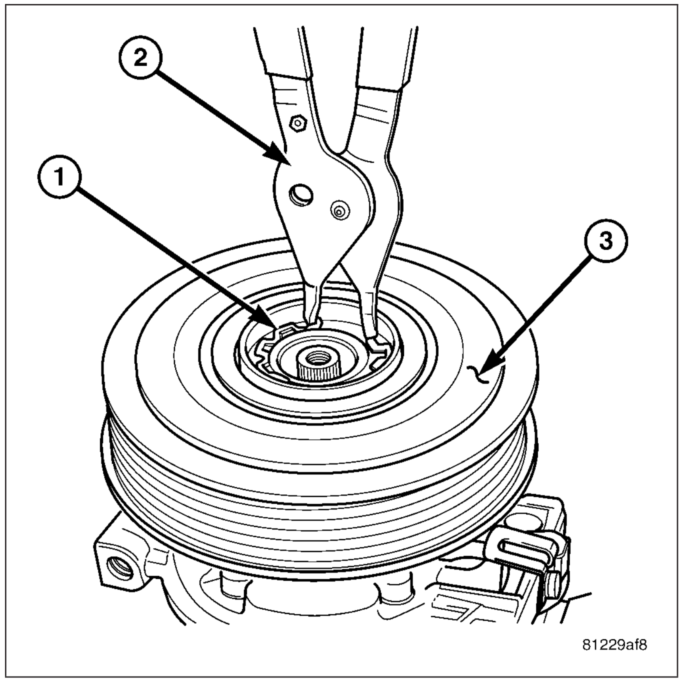


81229b4a

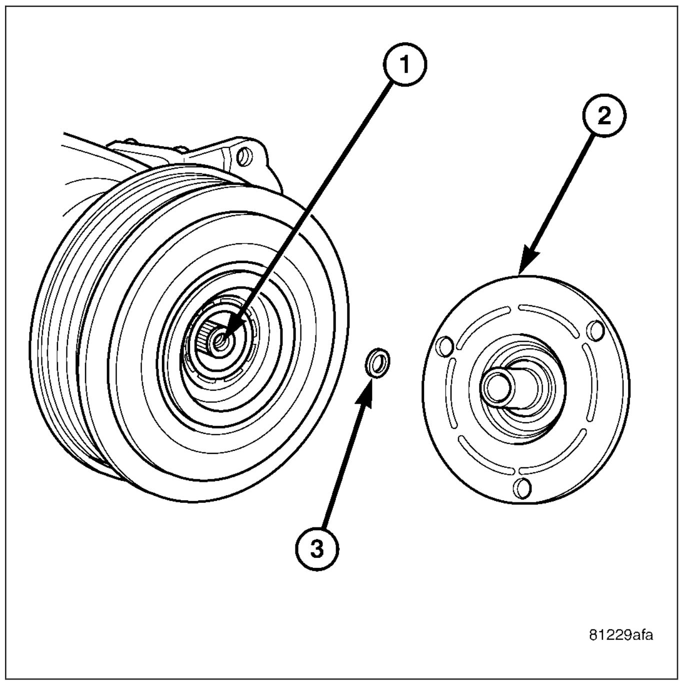
**CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.**

**NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.**

4. Using snap ring pliers (2), install the snap ring (1) that secures the pulley and bearing assembly (3) to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.



5. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim(s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick onto the compressor shaft.

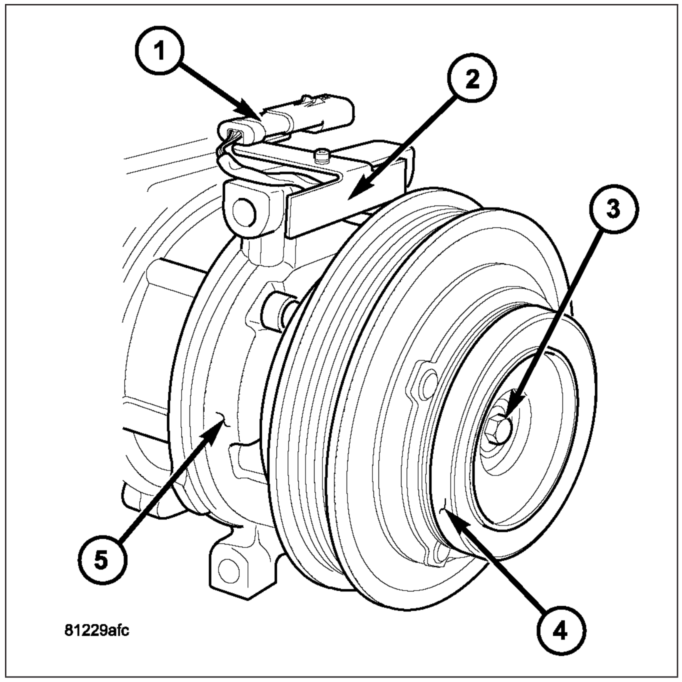


6. Install the clutch plate (4) onto the front of the A/C compressor (5).
7. Install the compressor shaft bolt (3). Tighten the bolt to 19 N·m (168 in. lbs.).

**NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.**

**NOTE: On models with the clutch plate recessed into the pulley, use a 90° wire gap gauge to measure the clutch air gap. On other models, use a blade type feeler gauge to measure the air gap.**

8. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. The air gap should be between 0.35 - 0.60 mm (0.014 - 0.024 in.). If the air gap is not between specifications, add or subtract shims as needed until the correct air gap is obtained.



**CAUTION: Be certain that the compressor clutch field coil wire lead is routed so that it is not pinched between the A/C compressor and the field coil connector bracket.**

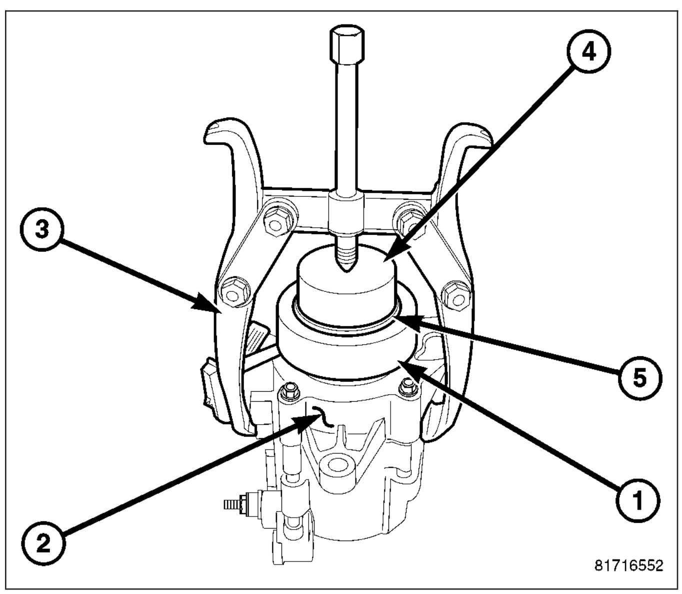
9. Carefully route the compressor clutch field coil wire lead behind the connector bracket (2).
10. Install the compressor clutch field coil connector (1) onto the connector bracket and connect the engine wire harness to the field coil connector.
11. Install the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).
12. Lower the vehicle.
13. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).
14. Reconnect the negative battery cable.

## VISTEON A/C COMPRESSOR

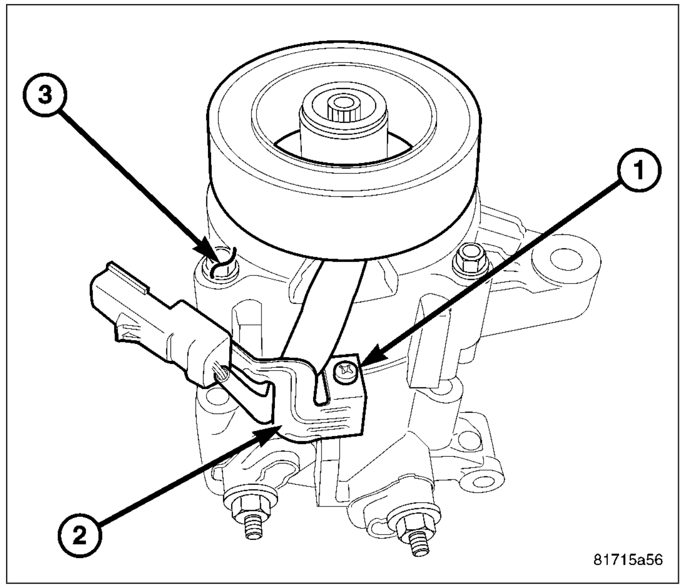
1. Position the A/C clutch field coil (1) squarely onto the front of the A/C compressor (2).

**CAUTION: Position the A/C clutch field coil so that the coil positioning tabs and the wire harness lead are oriented in the correct direction. Failure to correctly position the field coil on the A/C compressor will result in field coil damage.**

2. Align the field coil positioning tabs to the recessed area at the front of the A/C compressor and install the clutch field coil onto the compressor using a two jaw puller (3), compressor field coil installer (Special Tool 9352 in Kit 9349) (4) and the compressor field coil installer spacer (Special Tool 9353 in Kit 9349) (5).



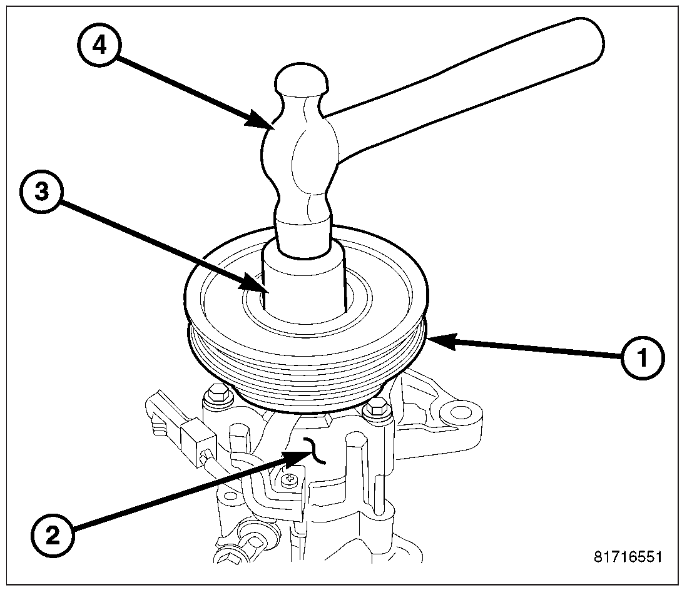
3. Position the clutch field coil wire lead and bracket (2) to the A/C compressor (3) and install the screw (1) that secures the bracket to the compressor. Tighten the screw to 4 N·m (35 in. lbs.).



4. Align the pulley and bearing assembly (1) squarely onto the front of the A/C compressor (2).

**NOTE: A distinct change of sound during the clutch pulley tapping process indicates that the pulley and bearing assembly has bottomed out against the compressor housing.**

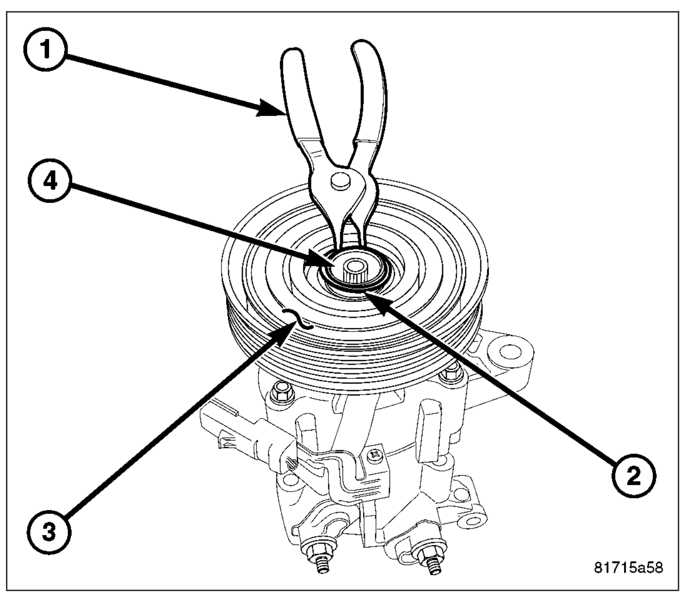
5. Using clutch pulley installer (Special Tool 9355 in Kit 9349) (3) and a hammer (4), install the pulley and bearing assembly onto the front of the A/C compressor. Tap the installer with a hammer until the pulley and bearing assembly has bottomed against the compressor housing.



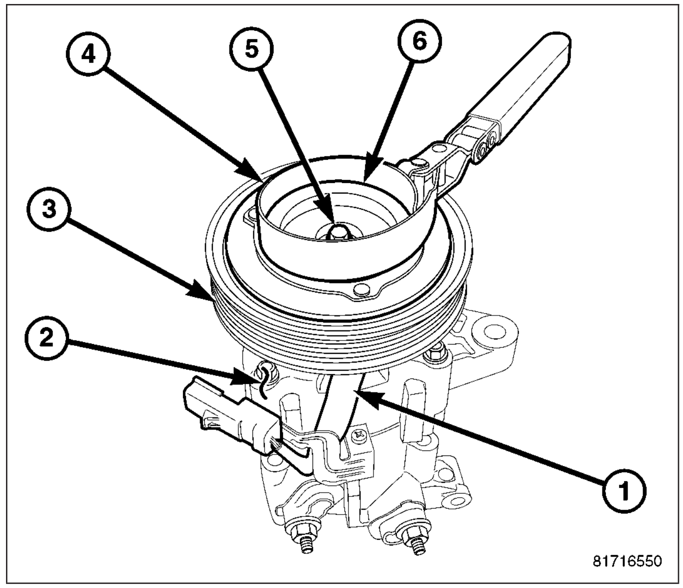
**CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in clutch failure and severe damage to the A/C compressor.**

**NOTE: Install the snap ring with the beveled side of the snap ring facing outward.**

6. Using snap ring pliers (1), install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor (4). Make sure the snap ring is properly seated in the groove.

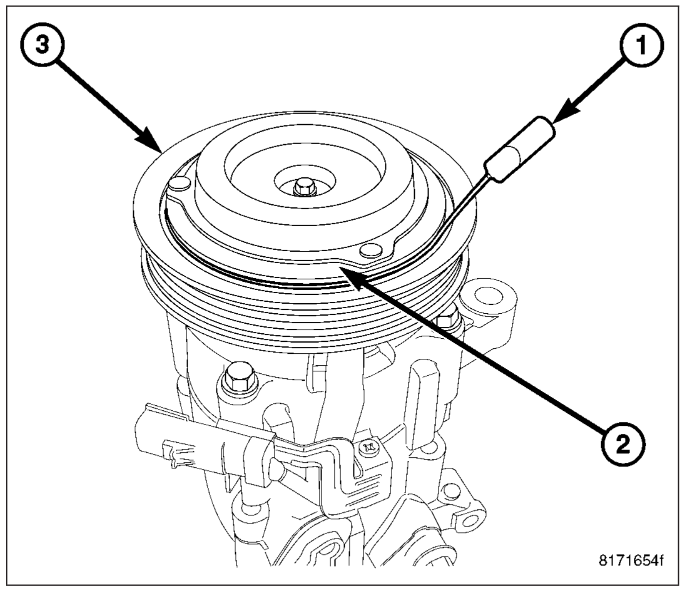


7. Verify that there is adequate clearance for the clutch field coil wire lead (1) between the housing of the A/C compressor (2) and the pulley and bearing assembly (3).



**NOTE: When installing an original or a new clutch assembly, try the original shims first. When installing a clutch onto a compressor that previously did not have a clutch, use the 1.0, 0.50 and 0.13 millimeter (0.040, 0.020 and 0.005 inch) shims from the clutch hardware package which is provided with the new clutch.**

8. Install the clutch shims onto the compressor shaft.
9. Using a strap wrench (4), install the bolt (5) that secures the clutch plate (6) to the A/C compressor. Hold the clutch plate stationary with the strap wrench and tighten the bolt to 15 N·m (133 in. lbs.).
10. Using 90° wire gauges (1), check the air gap between the clutch plate (2) and the pulley and bearing assembly (3). If the air gap is not between 0.35 to 0.65 millimeter (0.014 to 0.025 inch), add or subtract shims as required.



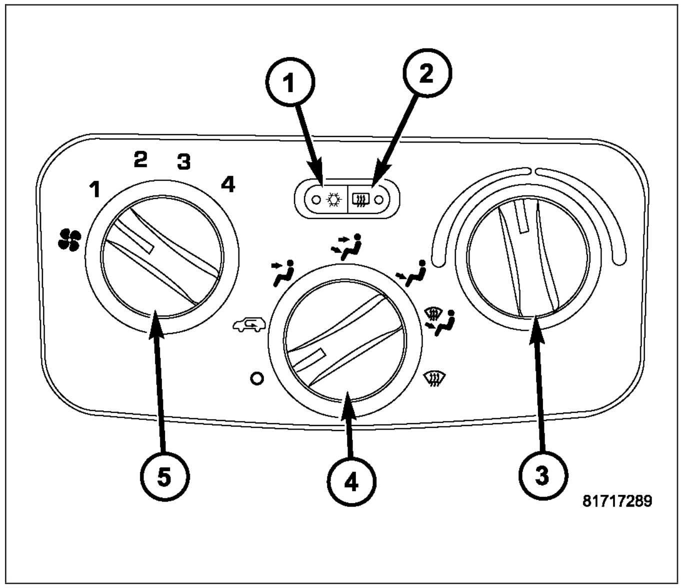
11. Position the A/C compressor onto the mounting bracket.
12. Install the bolts that secure the A/C compressor to the mounting bracket (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - 3.7L ENGINE - INSTALLATION).
13. Connect the engine wire harness to the compressor clutch field coil connector.
14. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
15. Reconnect the negative battery cable.
16. Perform the Clutch Break-in Procedure (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH - STANDARD PROCEDURE).

# CONTROL-A/C HEATER

## DESCRIPTION

The A/C-heater control for the manual temperature control (MTC) single zone heating-A/C system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The heating-A/C system uses a combination of, electrical and vacuum controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle.



The A/C-heater control is located in the instrument panel and contains:

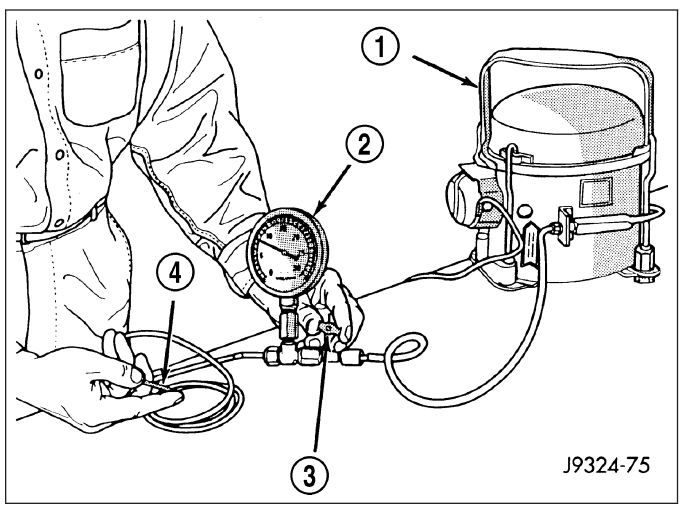
- a push button A/C on/off control (1). The snowflake button contains an LED that illuminates when the A/C system is in operation.
- a push button rear window defogger on/off control (2). The defogger button contains an LED that illuminates when the rear window defogger system is in operation.
- a rotary control for temperature control of the discharged air (3)
- a rotary control for turning the heating-A/C system on and off and for recirculation and mode control of the discharged air (4).
- a rotary control for fan speed selection (5).

The A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced. The control knobs and illumination lamps are available for service replacement.

## DIAGNOSIS AND TESTING

## VACUUM CONTROL SYSTEM

Use an adjustable Vacuum Test Set (Special Tool C-3707-B or equivalent) (2) and a suitable vacuum pump (1) to test the heater-A/C vacuum control system.



Place a finger over the end of the Vacuum Test Probe (4) and adjust the bleed valve (3) on the Vacuum Test Gauge to obtain a vacuum of exactly -27 kPa (-8 in. Hg.). Release and block the end of the Vacuum Test Probe several times to verify that the vacuum reading returns to the exact -27 kPa (-8 in. Hg.) setting. Otherwise, a false reading will be obtained during testing.

### VACUUM CHECK VALVE

1. Remove the vacuum check valve. The valve is located in the vacuum supply line (black) at the HVAC system vacuum tee.
2. Connect the Vacuum Test Probe from the Vacuum Test Set to the heater side of the vacuum check valve. When connected to this side of the check valve, no vacuum should pass and the Vacuum Test Gauge should return to the -27 kPa (-8 in. Hg.) setting. If OK, go to step Step 3. If not OK, replace the faulty vacuum check valve.

3. Connect the Vacuum Test Probe from the Vacuum Test Set to the engine side of the vacuum check valve. When connected to this side of the check valve, vacuum should flow through the valve without restriction. If not OK, replace the faulty vacuum check valve.

## A/C HEATER CONTROLS

**NOTE: The operation of the recirculation-air door can be viewed by removing the blower motor and looking up into the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/MOTOR-BLOWER - REMOVAL).**

1. Connect the Vacuum Test Probe to the vehicle vacuum supply (black) line. Position the Vacuum Test Gauge so it can be viewed from the passenger compartment.
2. Place the A/C-heater mode control in each mode position, one position at a time, and pause after each selection. The Vacuum Test Gauge should return to the calibrated setting of -27 kPa (-8 in. Hg.) setting shortly after each selection is made. If the Vacuum Test Gauge cannot achieve the calibrated setting, the vacuum circuit or a component has a vacuum leak. See the procedure in Locating Vacuum Leaks.

## LOCATING VACUUM LEAKS

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.**

**CAUTION: Do not use lubricant on the switch ports or in the holes of the connector, as lubricant will ruin the vacuum valve in the switch. A drop of clean water in the connector holes will help the connector slide onto the switch ports.**

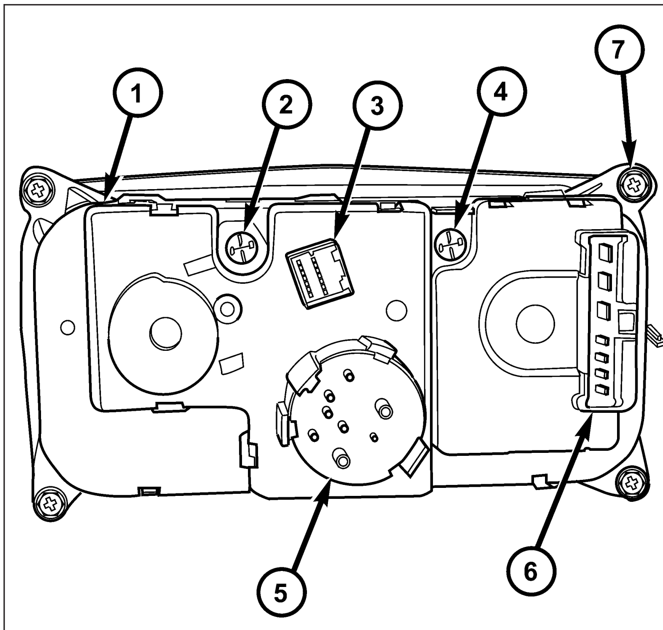
8171400d

1. Disconnect the vacuum harness connector from the back of the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).
2. Connect the Vacuum Test Probe to each port in the HVAC housing half of the vacuum harness connector, one port at a time, and pause after each connection. The test set gauge should return to the -27 kPa (-8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty A/C-heater control. If not OK, go to Step 3.
3. Determine the vacuum line color of the vacuum circuit that is leaking. To determine the vacuum line colors, refer to the Vacuum Circuits Chart.
4. Disconnect and plug the vacuum line from the component (fitting, actuator, valve, switch, or reservoir) on the other end of the leaking circuit. Instrument panel disassembly or removal may be necessary to gain access to some components. See the appropriate service procedures.
5. Connect the test set hose or probe to the open end of the leaking circuit. The test set gauge should return to the -27 kPa (-8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty disconnected component. If not OK, go to Step 6.
6. To locate a leak in a vacuum line, leave one end of the line plugged and connect the test set hose or probe to the other end of the line. Run your fingers slowly along the line while watching the test set gauge. The vacuum reading will fluctuate when your fingers contact the source of the leak. To repair the vacuum line, cut out the leaking section of the line. Then, insert the loose ends of the line into a suitable length of 3 millimeter (0.125 inch) inside diameter rubber hose.

## REMOVAL

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.**

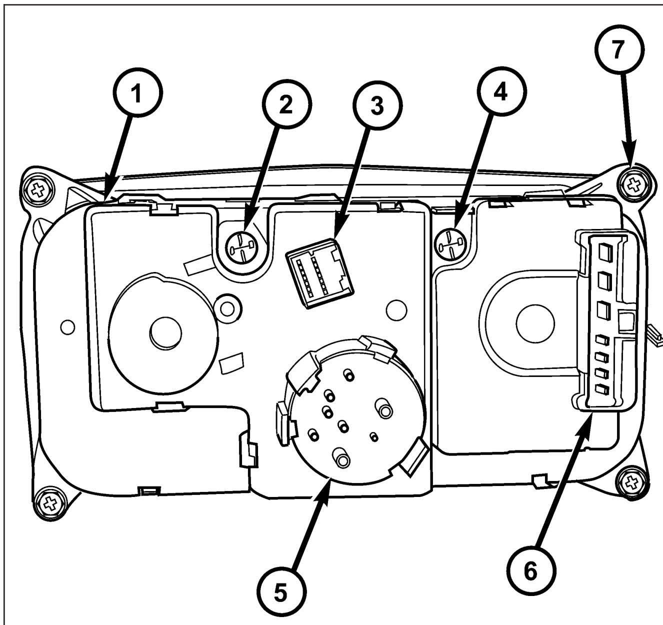
1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove the four screws that secure the A/C-heater control (1) to the instrument panel at the mounting screw locations shown (7).
4. Remove the A/C-heater control from the instrument panel to gain access to the wire harness connections (3 and 6) and the vacuum harness connector (5) at the rear of the A/C-heater control.
5. Disconnect the vacuum harness and wire harness connectors from the A/C-heater control and remove the control from the vehicle.
6. If required, remove the illumination lamps (2 and 4) from the A/C-heater control.



80c62f2c

## INSTALLATION

1. If removed, install the illumination lamps (2 and 4) into the rear of the A/C-heater control (1).
2. Connect the wire harness and vacuum connectors to the connections (3, 5 and 6) at the rear of the A/C-heater control.
3. Position the A/C-heater control into the instrument panel and install the four retaining screws at the locations shown (7). Tighten the screws to 2 N·m (17 in. lbs.).
4. Install the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
5. Reconnect the negative battery cable.



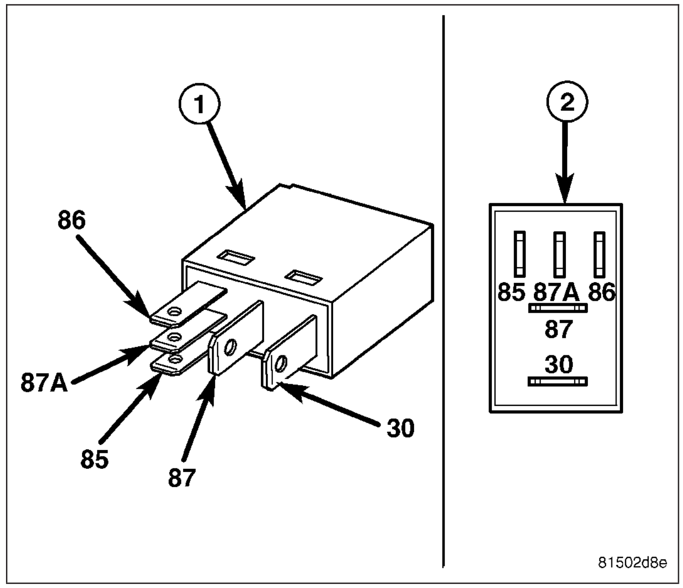
80c62f2c

# RELAY-A/C CLUTCH

## DESCRIPTION

The A/C clutch relay (1) is an International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay.

The A/C clutch relay is located in the power distribution center (PDC) in the engine compartment.



## OPERATION

The A/C clutch relay is an electromechanical switch that uses a low current input controlled by the powertrain control module (PCM) or engine contol module (ECM), depending on engine application, to control the high current output to the A/C clutch field coil. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the A/C clutch field coil.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The A/C clutch relay terminals are connected to the vehicle electrical system through a receptacle in the power distribution center (PDC). The inputs and outputs of the A/C clutch relay include:

- The common feed terminal (30) receives battery current through a fuse in the PDC at all times.
- The coil ground terminal (85) receives a ground through the A/C compressor clutch relay control circuit only when the PCM or ECM electronically pulls the circuit to ground.
- On gasoline engine applications, the coil battery terminal (86) receives battery current through a fuse in the junction block only when the ignition switch is in the Run or Start position.
- On diesel engine applications, the coil battery terminal (86) receives battery current through a fuse in the PDC at all times.
- The normally open terminal (87) provides battery current to the A/C clutch coil through the A/C clutch relay only when the A/C clutch relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the A/C clutch relay coil is de-energized.

The A/C clutch relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard micro-relay and for complete HVAC wiring diagrams.

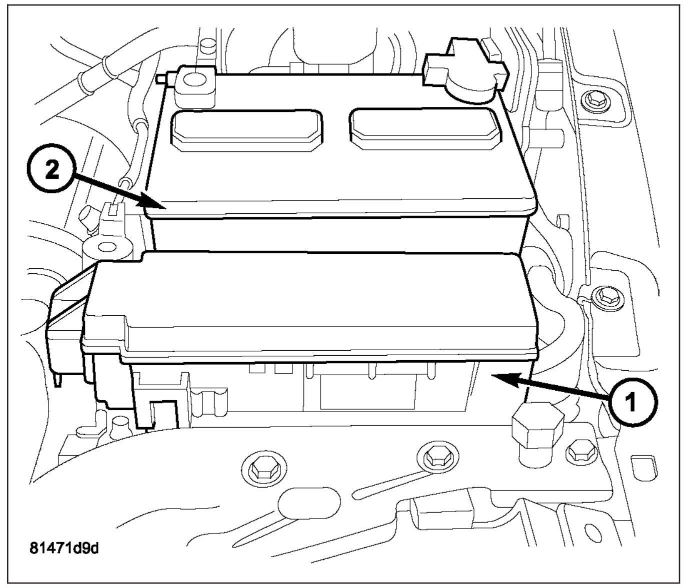
## REMOVAL

**NOTE: LHD model shown in illustration. RHD models similar.**

1. Disconnect and isolate the negative battery cable.
2. Open the cover of the power distribution center (PDC) (1) located near the battery (2) in the engine compartment.

**NOTE: Refer to the fuse and relay layout map on the inside of the PDC cover for A/C clutch relay location.**

3. Remove the A/C clutch relay from the PDC.

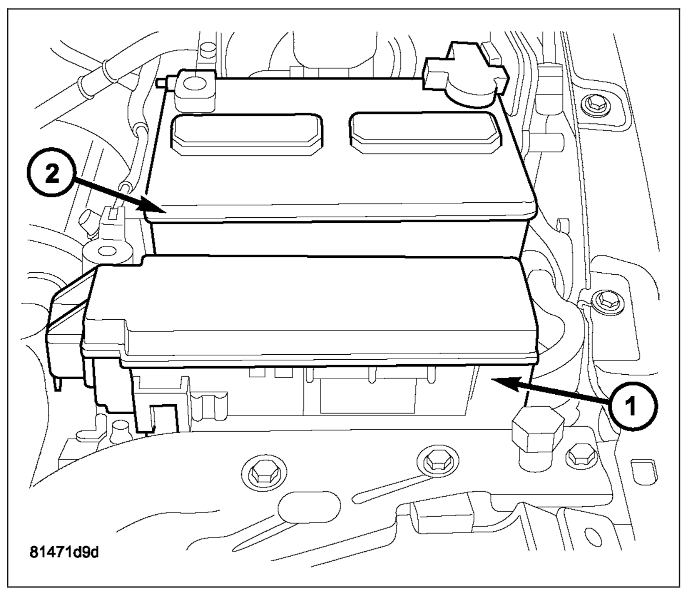


## INSTALLATION

**NOTE: LHD model shown in illustration. RHD models similar.**

**NOTE: Refer to the fuse and relay layout map on the inside of the power distribution center (PDC) cover for A/C clutch relay location.**

1. Position the A/C clutch relay into the proper receptacle of the PDC (1) located near the battery (2) in the engine compartment.
2. Align the A/C clutch relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the PDC.
4. Reconnect the negative battery cable.

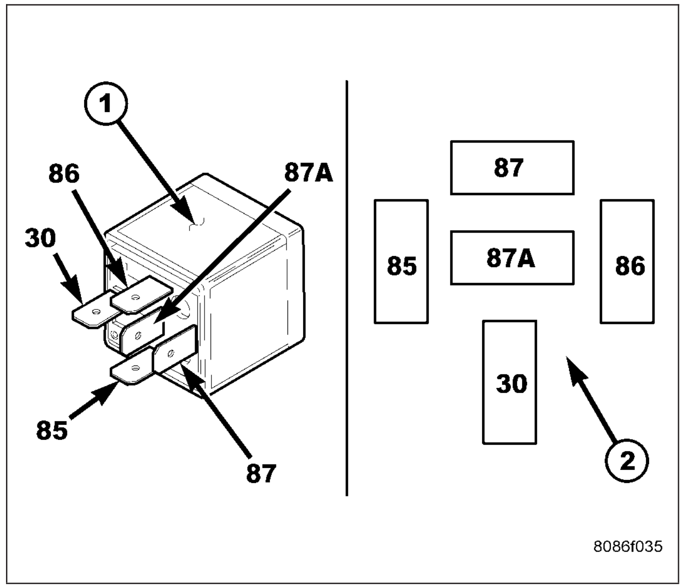


# RELAY-BLOWER MOTOR

## DESCRIPTION

The blower motor relay (1) for the heating-A/C system is an International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The blower motor relay is a electromechanical device that switches battery current from a fuse in the power distribution center (PDC) directly to the blower motor. The blower motor relay is energized when the relay coil is provided a voltage signal by the ignition switch.

The blower motor relay is located in the PDC in the engine compartment.



## OPERATION

The ISO-standard blower motor relay is an electromechanical switch that uses a low current input from the ignition switch to control the high current output to the blower motor. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the blower motor.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

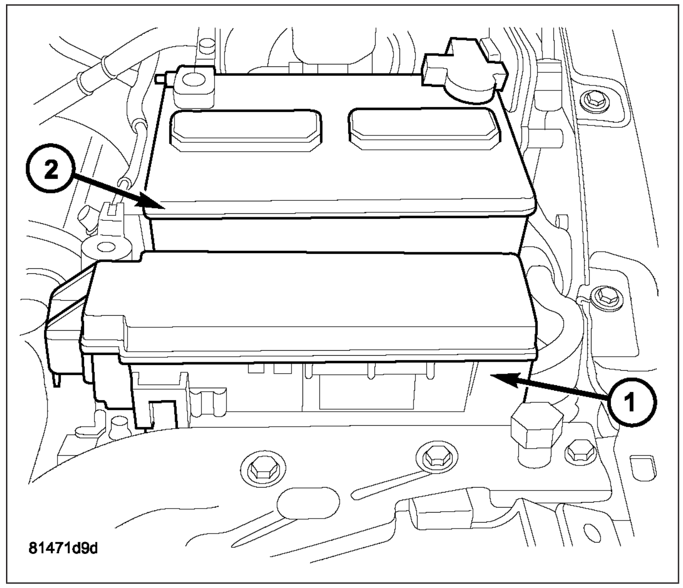
The blower motor relay terminals are connected to the vehicle electrical system through a receptacle in the power distribution center (PDC). The inputs and outputs of the blower motor relay include:

- The common feed terminal (30) receives a battery current input from a fuse in the PDC through a fused B(+) circuit at all times.
- The coil ground terminal (85) is connected to a ground at all times.
- The coil battery terminal (86) receives a battery current input from a fuse in the junction block (JB) through a fused ignition switch output (run) circuit only when the ignition switch is in the On position.
- The normally open terminal (87) provides a battery current output to the blower motor through the blower motor relay output circuit only when the blower motor relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the blower motor relay coil is de-energized.

The blower motor relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relay and for complete HVAC wiring diagrams.

## REMOVAL

**NOTE: LHD model shown in illustration. RHD models similar.**



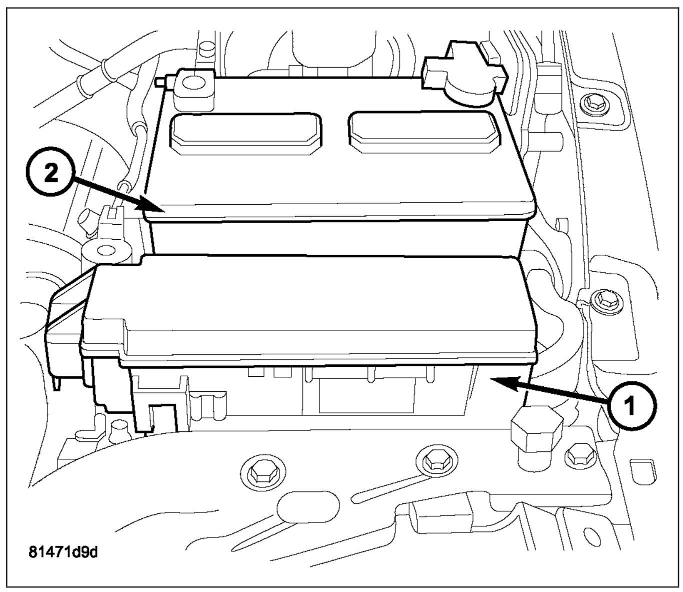
1. Disconnect and isolate the negative battery cable.
2. Open the cover of the power distribution center (PDC) (1) located near the battery (2) in the engine compartment.

**NOTE: Refer to the fuse and relay layout map on the PDC cover for blower motor relay location.**

3. Remove the blower motor relay from the PDC.

## INSTALLATION

**NOTE: LHD model shown in illustration. RHD models similar.**



**NOTE: Refer to the fuse and relay map on the cover of the power distribution center (PDC) for blower motor relay location.**

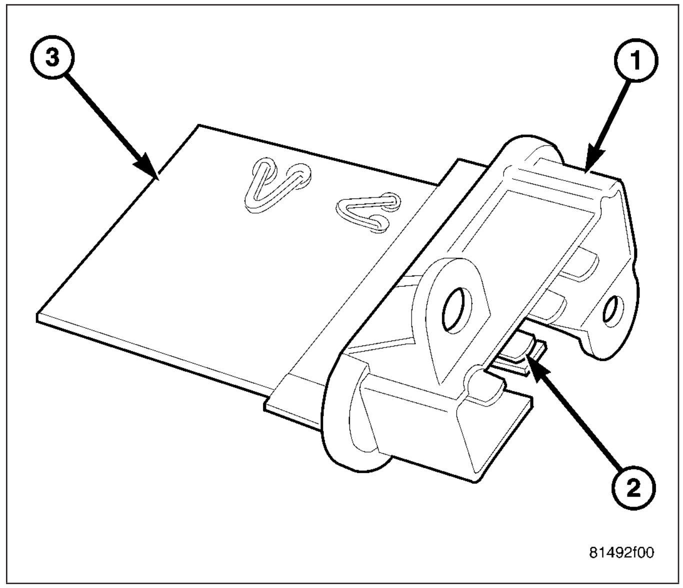
1. Position the blower motor relay into the proper receptacle of the PDC (1) located near the battery (2) in the engine compartment.
2. Align the blower motor relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the PDC.
4. Reconnect the negative battery cable.

# RESISTOR-BLOWER MOTOR

## DESCRIPTION

The blower motor resistor is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate is the resistor circuit board (3).

The blower motor resistor is accessed for service by opening the glove box.



## OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated wire lead and connector of the HVAC wire harness. The blower motor resistor has multiple resistor circuits, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor control in the MTC heating-A/C system directs the ground path for the blower motor through the correct resistor circuit to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistor circuits. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistor circuits, increasing the blower motor speed. When the blower motor control is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING

## BLOWER MOTOR RESISTOR

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.**

**NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.**

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - REMOVAL).

3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor speed control and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

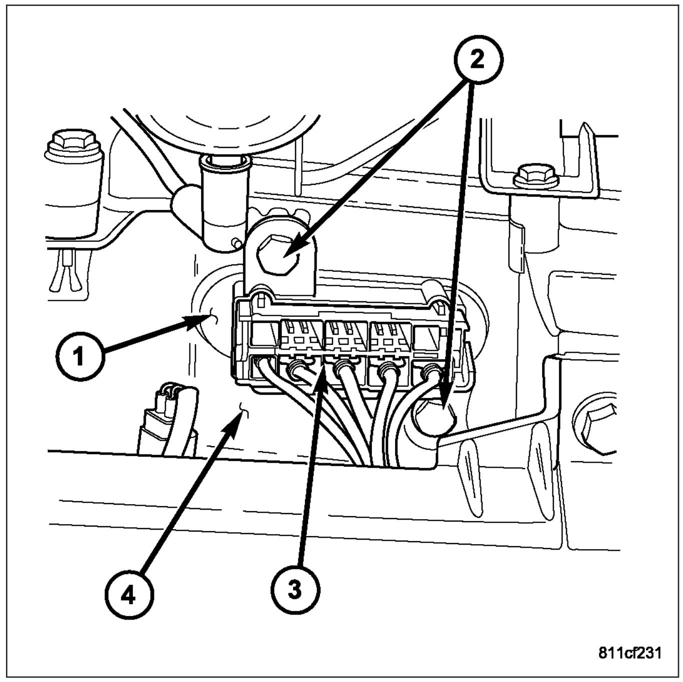
## REMOVAL

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.**

**WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.**

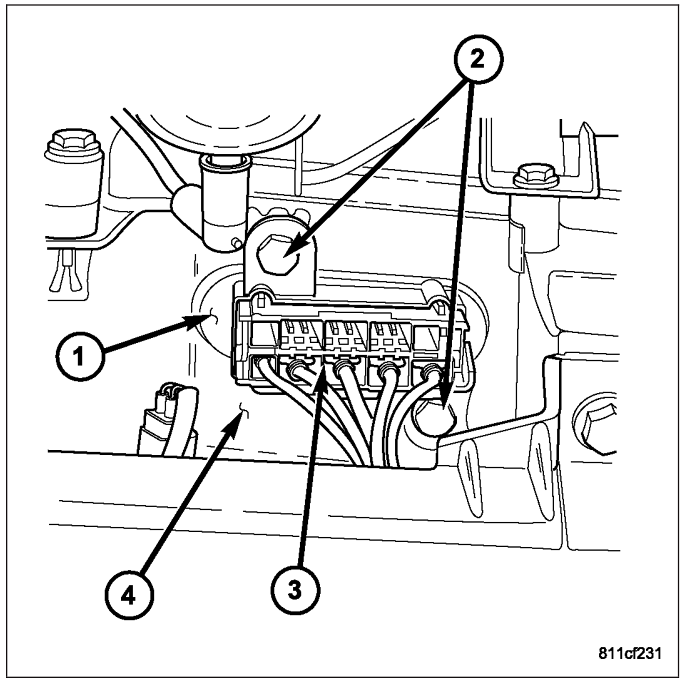
**NOTE: LHD model shown in illustration. RHD models similar.**

1. Disconnect and isolate the negative battery cable.
2. Open the glove box door to gain access to the blower motor resistor (1).
3. Pull out the lock on the blower motor resistor wire harness connector (3) to unlock the connector latch.
4. Depress the latch on the blower motor resistor wire harness connector and disconnect the wire harness from the resistor.
5. Remove the two screws (2) that secure the blower motor resistor to the HVAC housing (4) and remove the resistor.



## INSTALLATION

**NOTE: LHD model shown in illustration. RHD models similar.**



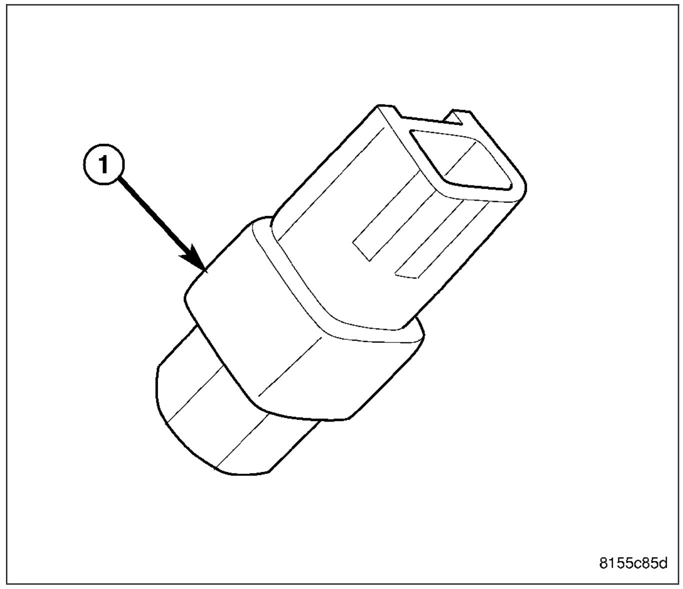
1. Position the blower motor resistor (1) into the HVAC housing (4).
2. Install the two screws (2) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the wire harness connector (3) to the blower motor resistor.
4. Push in the lock on the blower motor resistor wire harness connector.
5. Close the glove box door.
6. Reconnect the negative battery cable.

# SWITCH-A/C HIGH PRESSURE

## DESCRIPTION

The A/C high pressure switch (1) sends a signal to the engine control module (ECM) to control A/C compressor clutch engagement/disengagement and, controls electric cooling fan operation when equipped with the 2.8L diesel engine. The A/C high pressure switch is mounted on a fitting located on the A/C discharge line near the A/C compressor. The ECM will disengage the A/C compressor clutch if the refrigerant system pressure exceeds 3100 - 3375 kPa (450 - 490 psi).

The fitting for the A/C high pressure switch on the A/C discharge line is equipped with an O-ring seal and contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system.



## OPERATION

The contacts in the A/C high pressure switch open and close causing the engine control module (ECM) to turn the A/C compressor clutch on and off. This prevents A/C compressor operation when the discharge pressure approaches high levels, and also reduces electrical surging from A/C clutch engagement.

The A/C high pressure switch controls the electric cooling fan operation by monitoring refrigerant line pressures. When the A/C discharge line pressure rises above 1900 to 2200 kPa (280 to 320 psi) the fan will turn on. The cooling fan will turn off when the A/C discharge line pressure drops to 1600 kPa (235 psi).

The A/C high pressure switch contacts open when the A/C discharge line pressure rises above 3100 to 3375 kPa (450 to 490 psi). The A/C high pressure switch contacts close when the A/C discharge line pressure drops to 1860 to 2275 kPa (270 to 330 psi).

The A/C high pressure switch is factory-calibrated and cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING

## A/C HIGH PRESSURE SWITCH

**NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.**

Before performing diagnosis of the A/C high pressure switch, verify that the refrigerant system has the correct refrigerant charge (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

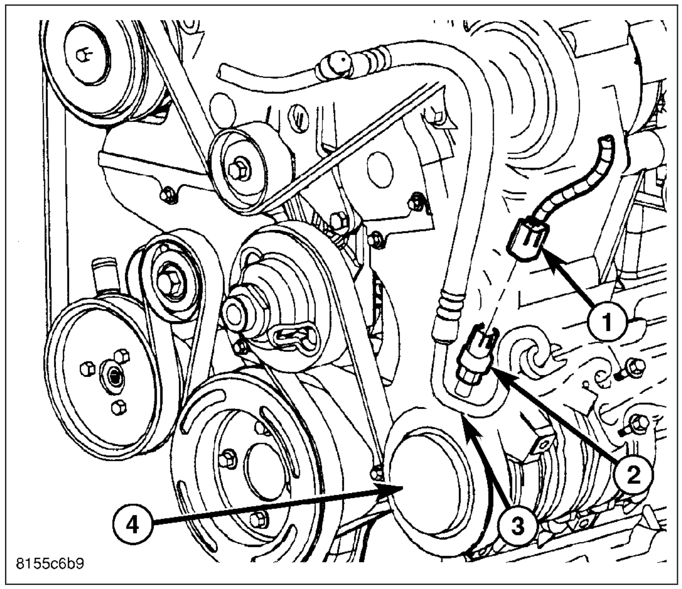
1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C high pressure switch.
3. Using an ohmmeter, check for continuity between both terminals of the A/C high pressure switch. There should be continuity. If there is not continuity, replace the faulty A/C high pressure switch. If there is continuity, test the A/C high pressure switch sense circuit and repair as required (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING).

## REMOVAL

**NOTE: It is not necessary to discharge the refrigerant system to replace the A/C high pressure switch.**

**NOTE: LHD model shown in illustration. RHD models similar.**

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C high pressure switch (2) located on the A/C discharge line (3) near the A/C compressor (4).
3. Remove the A/C high pressure switch from the A/C discharge line and remove and discard the O-ring seal.

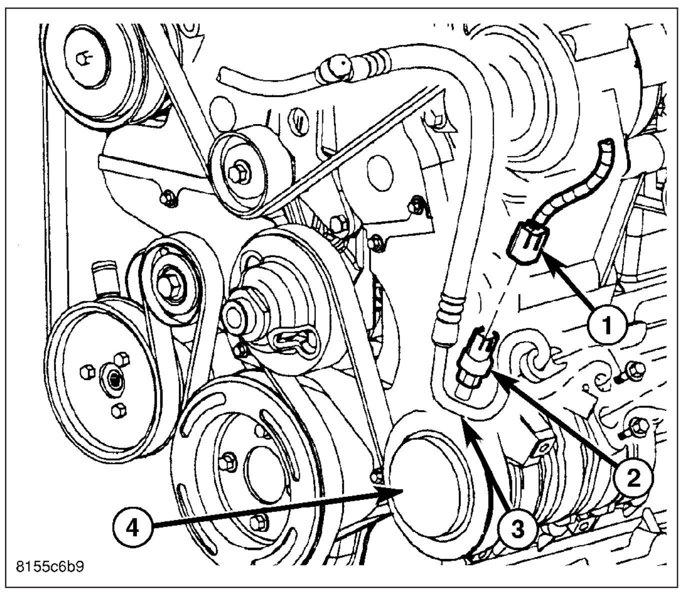


## INSTALLATION

**NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.**

**NOTE: LHD model shown in illustration. RHD models similar.**

1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the A/C high pressure switch fitting.
2. Install the A/C high pressure switch (2) onto the A/C discharge line (3) near the A/C compressor (4). Hand-tightened the switch securely.
3. Connect the wire harness connector (1) to the A/C high pressure switch.
4. Reconnect the negative battery cable.

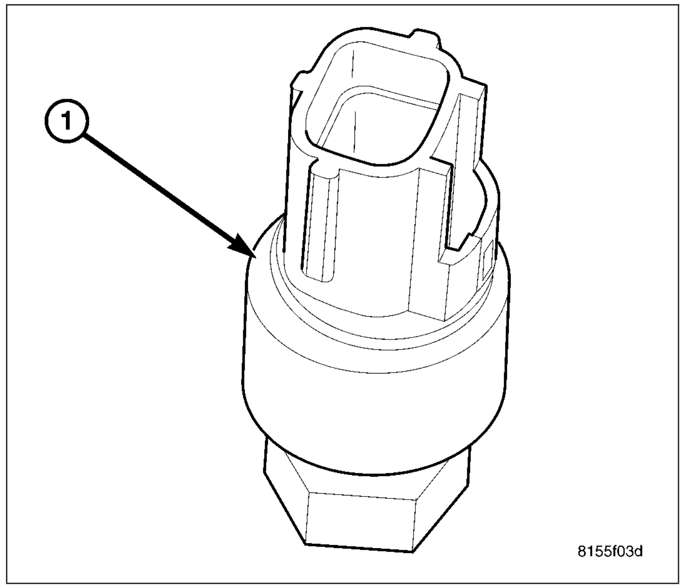


# SWITCH-A/C-LOW PRESSURE

## DESCRIPTION

The A/C low pressure switch (1) sends a signal to the powertrain control module (PCM) or the engine control module (ECM), depending on engine application, to regulate the refrigerant system pressure and control A/C evaporator temperature. The A/C low pressure switch is mounted on a fitting located on the top of the A/C accumulator. The PCM/ECM will disengage the A/C compressor clutch if the refrigerant system suction line pressure falls to approximately 141 kPa (20.5 psi) or lower.

The fitting for the A/C low pressure switch on the A/C accumulator is equipped with an O-ring seal and contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system.



## OPERATION

The A/C low pressure switch monitors the pressure of the refrigerant leaving the accumulator to the A/C compressor. When equipped with a diesel engine, the A/C low pressure switch is electrically connected in series with the A/C high pressure switch, between ground and the engine control module (ECM).

The contacts in the A/C low pressure switch open or close the path to ground, signaling the powertrain control module (PCM) or the ECM (depending on engine application) to turn the A/C compressor clutch on and off. This regulates the refrigerant system pressure and controls A/C evaporator temperature. Controlling the evaporator temperature prevents condensate water on the evaporator fins from freezing and obstructing A/C system air flow.

The A/C low pressure switch contacts are open when the A/C suction line pressure is approximately 141 kPa (20.5 psi) or lower. The A/C low pressure switch contacts will close when the A/C suction line pressure rises to approximately 234 to 262 kPa (34 to 38 psi) or above. Lower ambient temperatures, below approximately -1° C (30° F), will also cause the A/C low pressure switch contacts to open. This is due to the pressure/temperature relationship of the refrigerant in the system.

The A/C low pressure switch is factory-calibrated and cannot be adjusted or repaired. If the A/C low pressure switch is faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING

## A/C LOW PRESSURE SWITCH

**NOTE: Lower ambient temperatures, below about -1° C (30° F), during cold weather will open the A/C low pressure switch contacts and prevent A/C compressor operation due to the pressure/temperature relationship of the refrigerant.**

Before performing diagnosis of the A/C low pressure switch, verify that the refrigerant system has the correct refrigerant charge (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) and that the A/C low pressure switch is properly installed on the accumulator fitting. If the A/C low pressure switch is not properly installed, it may not open the Schrader-type valve in the accumulator fitting, which will prevent the switch from correctly monitoring the refrigerant system pressure.

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

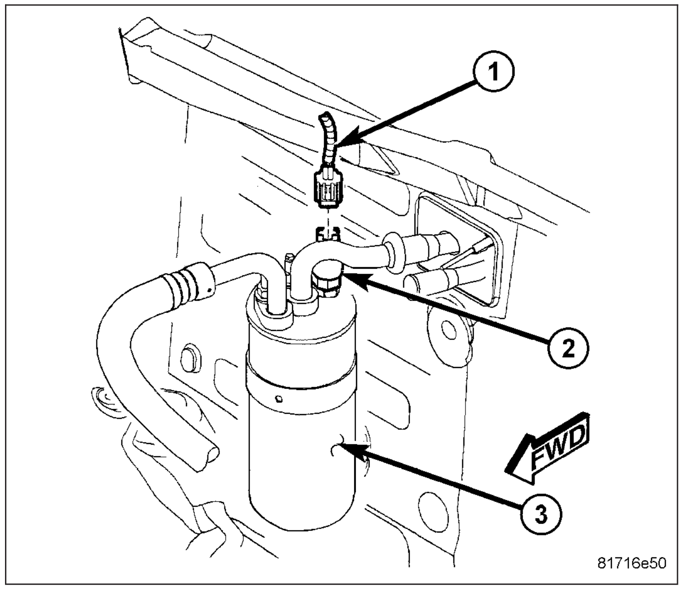
1. With gear selector in Park or Neutral and with park brake set, start the engine and allow it to idle.
2. Place the A/C-heater mode control in any A/C position.
3. Disconnect the wire harness connector from the A/C low pressure switch.
4. Using a suitable jumper wire, install the jumper wire between the two terminals of the wire harness connector for the A/C low pressure switch. The A/C compressor clutch should engage. If the A/C clutch does engage, replace the faulty A/C low pressure switch. If the A/C clutch does not engage, the A/C clutch, A/C clutch relay, A/C-heater control, A/C high pressure switch (diesel engine application), A/C pressure transducer (gasoline engine application), PCM or ECM (depending on engine application), fuses or related wiring circuits may be defective (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING). Repair as required.

## REMOVAL

**NOTE: It is not necessary to discharge the refrigerant system to replace the A/C low pressure switch.**

**NOTE: LHD model shown. RHD model similar.**

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector (1) from the A/C low pressure switch (2) located on the top of the A/C accumulator (3).
3. Remove the A/C low pressure switch from the A/C accumulator and remove and discard the O-ring seal.

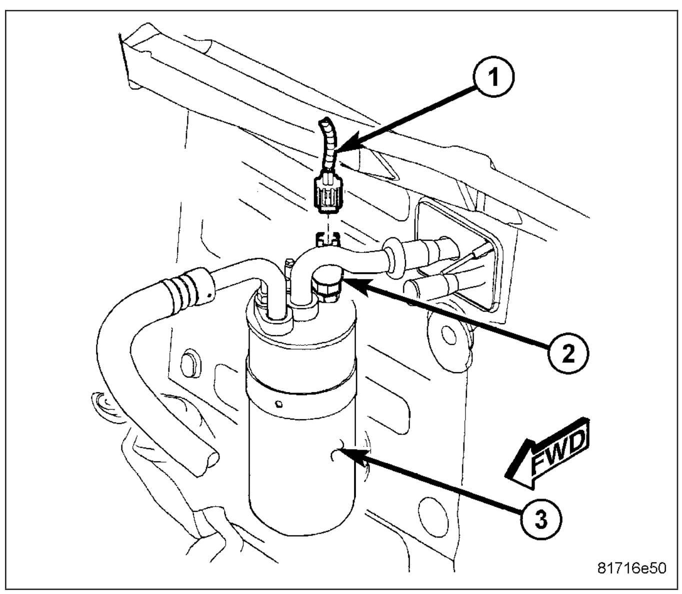


## INSTALLATION

**NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.**

**NOTE: LHD model shown. RHD model similar.**

1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the A/C low pressure switch fitting.
2. Install the A/C low pressure switch (2) onto the top of the A/C accumulator (3). Hand-tightened the switch securely.
3. Connect the wire harness connector (1) to the A/C low pressure switch.
4. Reconnect the negative battery cable.

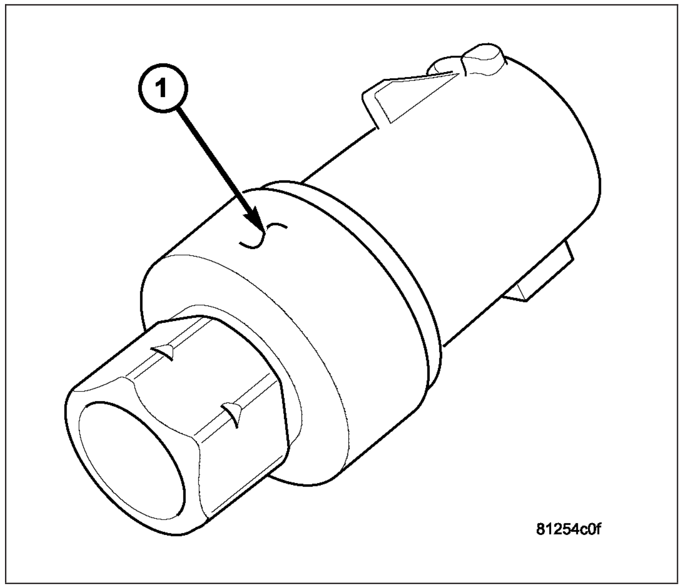


# TRANSDUCER-A/C PRESSURE

## DESCRIPTION

The A/C pressure transducer (1) sends a signal to the powertrain control module (PCM) which controls both A/C compressor clutch engagement/disengagement and electric cooling fan operation when equipped with the 3.7L gasoline engine. The A/C pressure transducer is mounted on a fitting located on the A/C discharge line near the A/C compressor. The PCM will disengage the A/C compressor clutch when high side pressure rises above 2971 kPa (431 psi) or fall below 206 kPa (30 psi).

The fitting for the A/C pressure transducer on the A/C discharge line is equipped with an O-ring seal and contains a Schrader-type valve, which allows the transducer to be serviced without discharging the refrigerant system.



## OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C discharge line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. A Schrader-type valve in the discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The powertrain control module (PCM) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the A/C pressure transducer on a sensor return circuit to determine refrigerant pressure. The PCM is programmed to respond to the A/C pressure transducer and other sensor inputs by controlling the operation of the A/C compressor clutch and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage PCM will disengage the A/C compressor clutch when high side pressure rises above 2971 kPa (431 psi) or fall below 206 kPa (30 psi). The A/C pressure transducer input to the PCM will also prevent the A/C compressor clutch from engaging when ambient temperatures are below about 1.0° C (50° F) due to the pressure/temperature relationship of the refrigerant.

The A/C pressure transducer is diagnosed using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

The A/C pressure transducer cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING

## A/C PRESSURE TRANSDUCER

The A/C pressure transducer is tested using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information. Before testing the A/C pressure transducer, be certain that the transducer wire harness connection is clean of corrosion and properly connected. For the A/C to operate, an A/C pressure transducer voltage reading between 0.451 and 4.519 volts is required. Voltages outside this range indicate a low or high refrigerant system pressure condition to the powertrain control module (PCM). The PCM is programmed to respond to a low or high refrigerant system pressure by suppressing operation of the A/C compressor. Refer to the A/C Pressure Transducer Voltage chart for the possible conditions indicated by the transducer voltage reading.

**A/C PRESSURE TRANSDUCER VOLTAGE**

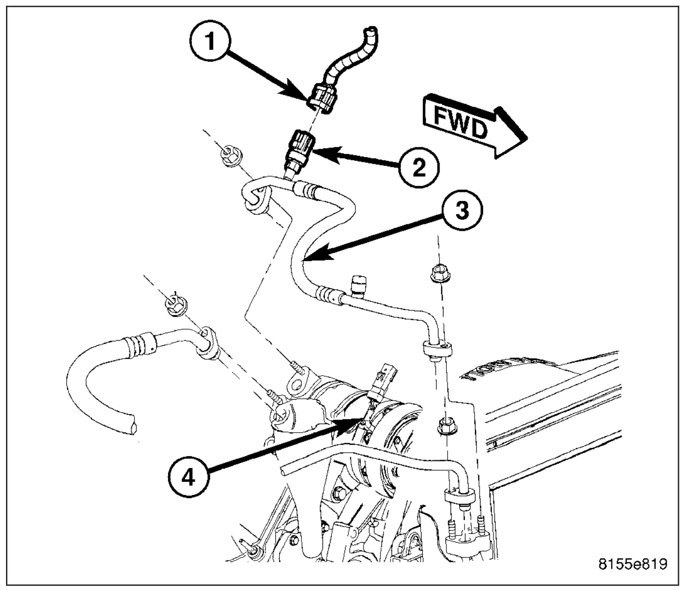
| Voltage | Possible Indication |
|---|---|
| 0.0 | 1. No sensor supply voltage from PCM.<br>2. Shorted sensor circuit.<br>3. Faulty transducer. |
| 0.150 TO 0.450 | 1. Ambient temperature below 10° C (50° F).<br>2. Low refrigerant system pressure. |
| 0.451 TO 4.519 | 1. Normal refrigerant system pressure. |
| 4.520 TO 4.850 | 1. High refrigerant system pressure. |
| 5.0 | 1. Open sensor circuit.<br>2. Faulty transducer. |

## REMOVAL

**NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.**

**NOTE: LHD model shown in illustration. RHD models similar.**

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2) located on the A/C discharge line (3) near the A/C compressor (4).
3. Remove the A/C pressure transducer from the A/C discharge line and remove and discard the O-ring seal.

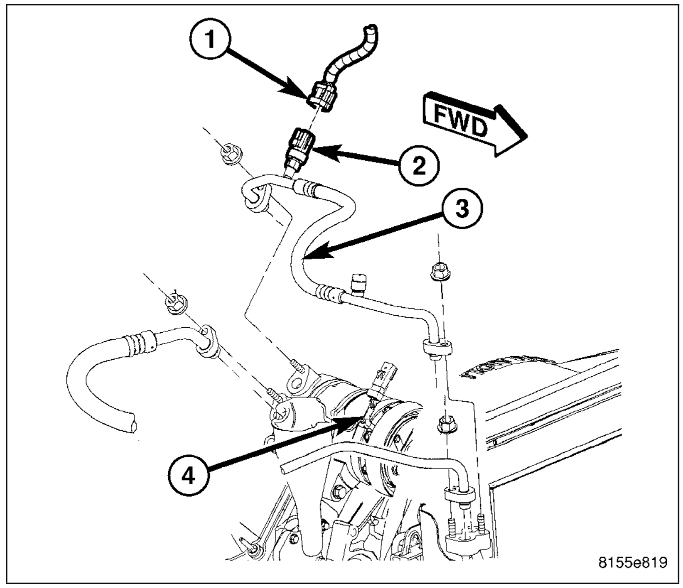


## INSTALLATION

**NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.**

**NOTE: LHD model shown in illustration. RHD models similar.**

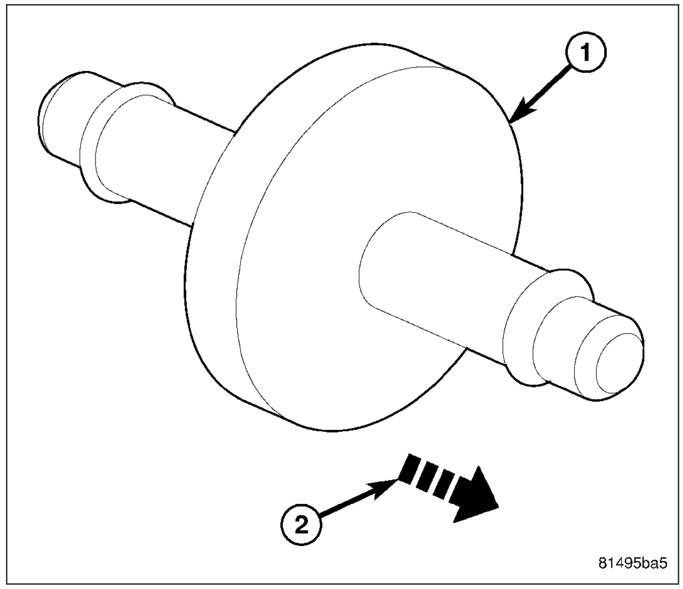
1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the A/C pressure transducer fitting.
2. Install the A/C pressure transducer (2) onto the A/C discharge line (3) near the A/C compressor (4). Hand-tightened the transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.



# VALVE-VACUUM CHECK

## DESCRIPTION

Both the heating-A/C system and the heater-only system use two vacuum check valves. One vacuum check valve (1) is installed in the accessory vacuum supply line located on the dash panel in the engine compartment, near the brake booster and, the other check valve is located on the passenger side of the HVAC housing, behind the glove box. The vacuum check valves are used to stabilize the vacuum within the HVAC vacuum circuits whenever the vehicle is accelerating or when engine vacuum varies due to operating conditions. The vacuum check valves are designed to allow vacuum to flow in only one direction (2) through the vacuum supply circuits.



## OPERATION

The use of two vacuum check valves help to maintain the vacuum required to retain the heating and the A/C systems in the selected operating mode. The vacuum check valves will prevent the engine from bleeding down system vacuum through the intake manifold during extended heavy engine load (low engine vacuum) operation.

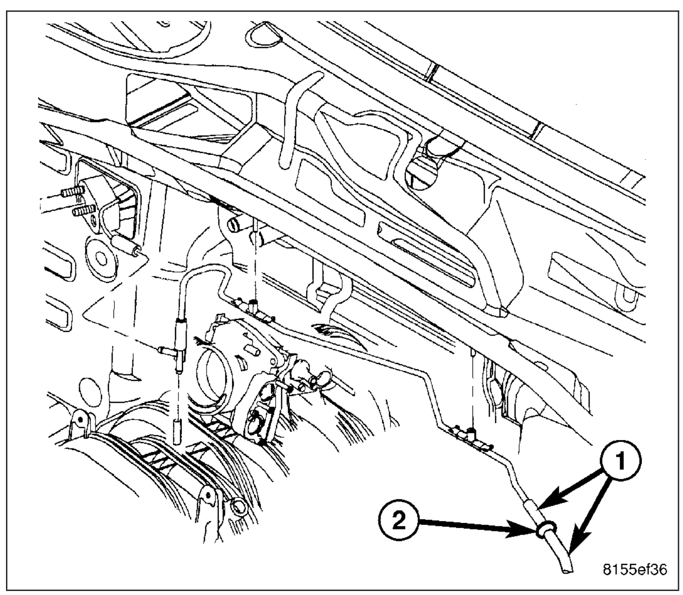
The vacuum check valves cannot be repaired and, if faulty or damaged, they must be replaced.

## REMOVAL

**NOTE: Make note the orientation of the vacuum check valves in the vacuum supply circuit for correct installation position.**

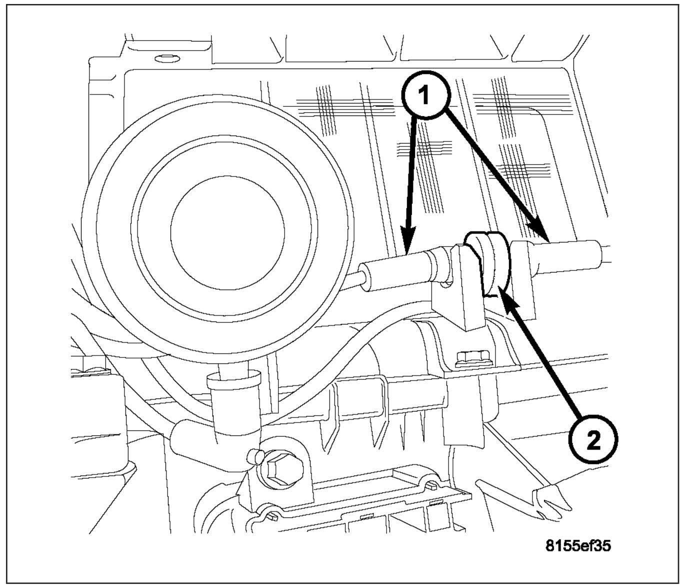
**NOTE: LHD 3.7L engine shown in illustration. Diesel and RHD models similar.**

1. Disconnect the vacuum supply line connectors (1) from the vacuum check valve (2) located in the engine compartment near the dash panel and remove the valve.



**NOTE: LHD heating-A/C system shown in illustration. RHD similar.**

2. Disconnect the vacuum supply line connectors from the vacuum check valve located in the passenger compartment, behind the glove box and remove the valve.

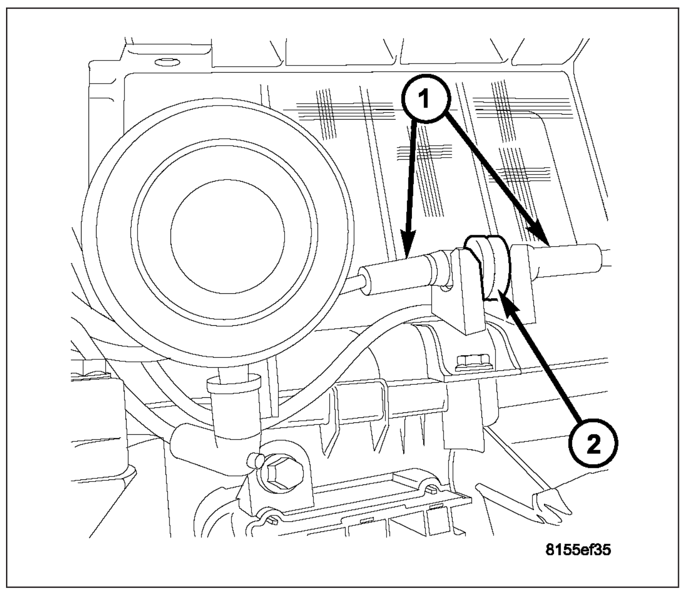


## INSTALLATION

**NOTE: Be sure to install the vacuum check valves into the vacuum supply circuit in the correct orientation as noted during removal.**

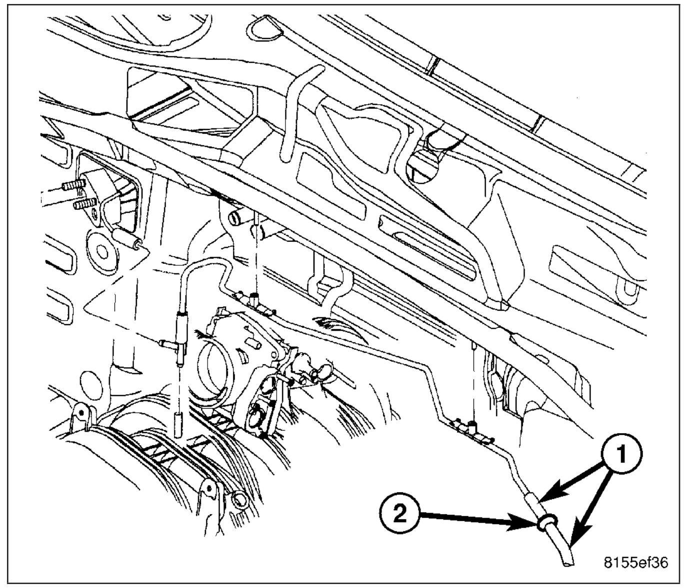
**NOTE: LHD heating-A/C system shown in illustration. RHD similar.**

1. Position the vacuum check valve (2) into the passenger compartment behind the glove box and connect the vacuum supply line connectors (1) to the check valve.



**NOTE: LHD 3.7L engine shown in illustration. Diesel and RHD models similar.**

2. Position the vacuum check valve (2) into the engine compartment near the dash panel and connect the vacuum supply line connectors (1) to the check valve.



# DISTRIBUTION

## TABLE OF CONTENTS

# DUCT-DEFROSTER

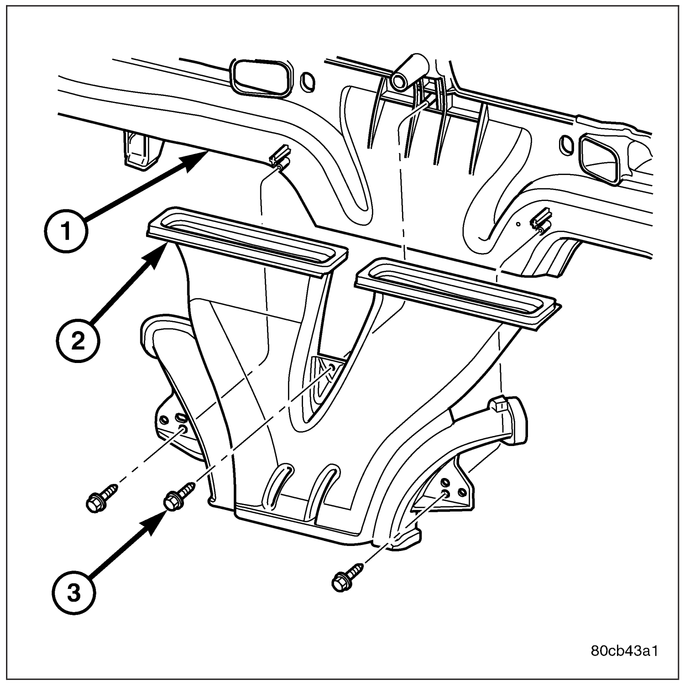
## REMOVAL

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.**

**NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage during this service procedure.**

**NOTE: LHD model shown in illustration. RHD model similar.**

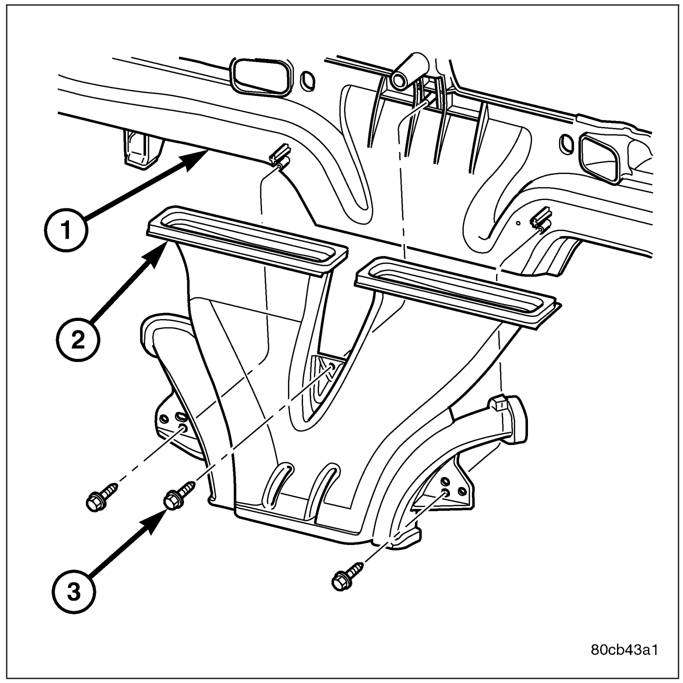
1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the three screws (3) that secure the defroster duct (2) to the instrument panel (1) and remove the duct.



## INSTALLATION

**NOTE: LHD model shown in illustration. RHD model similar.**

1. Position the defroster duct (2) into the instrument panel (1).
2. Install the three screws (3) that secure the defroster duct to the instrument panel. Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).



# DUCT-FLOOR DISTRIBUTION

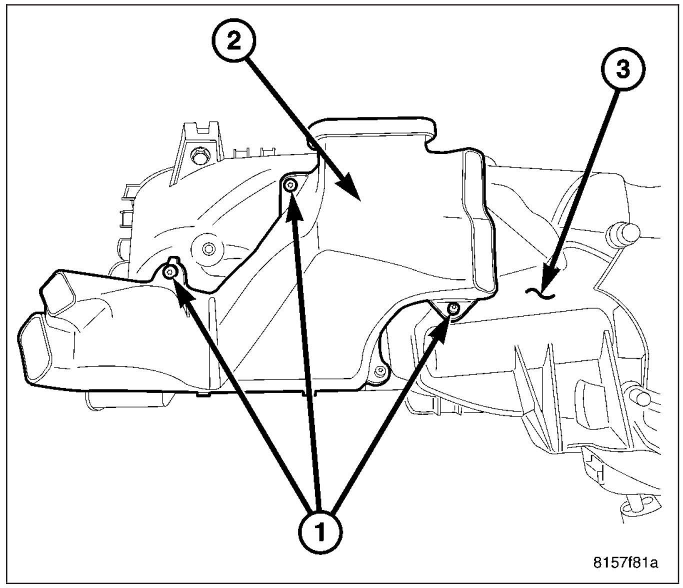
## REMOVAL

**NOTE: LHD model shown in illustration. RHD model similar.**

1. Remove the HVAC Housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - REMOVAL).
2. Remove the three screws (1) that secure the floor distribution duct (2) to the bottom of the HVAC housing (3).

**NOTE: If the foam seal on the floor distribution duct is deformed or damaged, the foam seal must be replaced.**

3. Remove the floor distribution duct from the HVAC housing. If the foam seal on the floor distribution duct is deformed or damaged, the seal must be replaced.

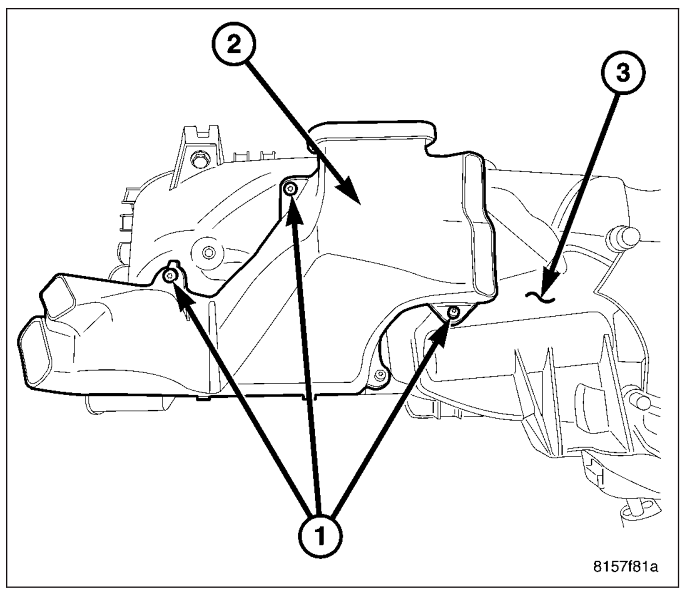


## INSTALLATION

**NOTE: LHD model shown in illustration. RHD model similar.**

**NOTE: If the foam seal on the floor distribution duct is deformed or damaged, the foam seal must be replaced.**

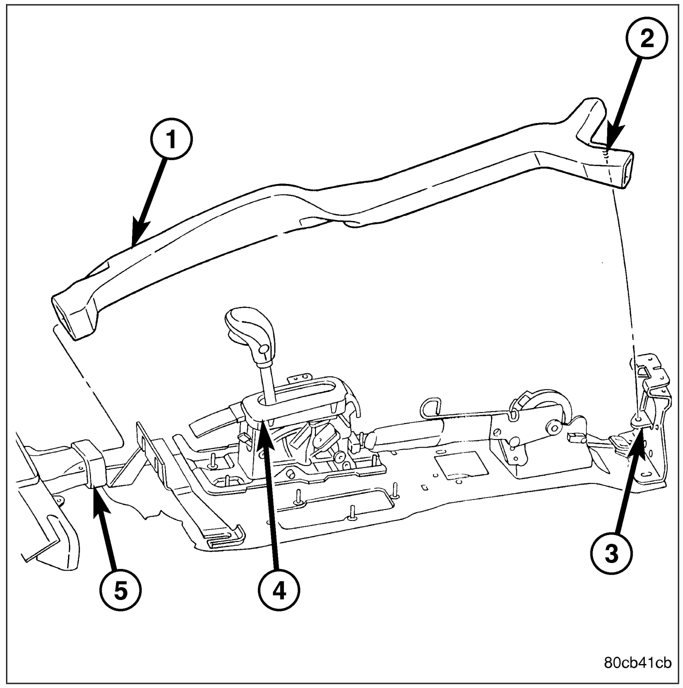
1. Position the floor distribution duct (2) onto the bottom of the HVAC housing (3).
2. Install the three screws (1) that secure the floor distribution duct to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).



# DUCT-REAR FLOOR HEAT

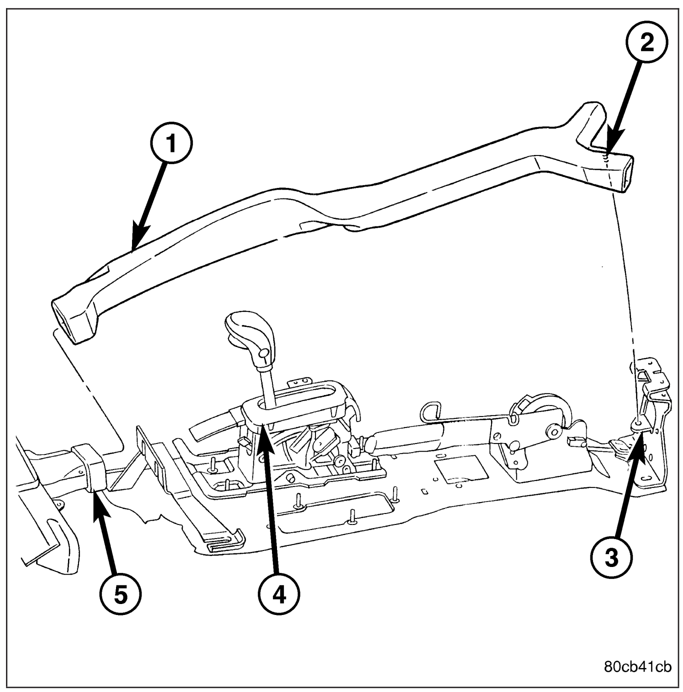
## REMOVAL

1. Remove the floor console (Refer to 23 - BODY/INTERIOR/CONSOLE-FLOOR - REMOVAL).
2. Remove the push-pin retainer (2) that secures the rear floor heat duct (1) to the floor console bracket (3) located behind the gear shift lever assembly (4).
3. Disconnect the rear floor heat duct from the floor distribution duct (5).
4. Remove the rear floor heat duct from the vehicle.



## INSTALLATION

1. Position the rear floor heat duct (1) into the vehicle.
2. Connect the rear floor heat duct to the floor distribution duct (5) located in front of the gear shift lever assembly (4).
3. Install the push-pin retainer (2) that secures the rear floor heat duct to the floor console bracket (3).
4. Install the floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

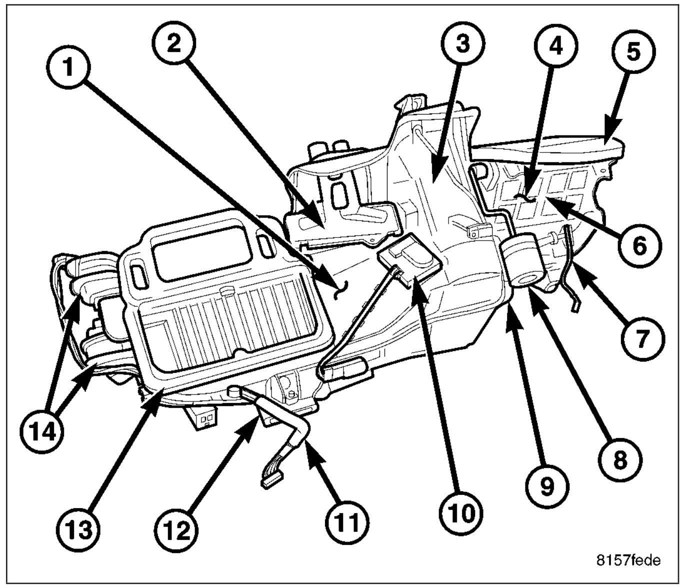


# HOUSING-HVAC

## DESCRIPTION

All models are equipped with a common HVAC housing assembly (1) that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The HVAC housing consists of the following:

- **HVAC housing** — The HVAC housing consists of an upper housing and a lower housing that are attached together by screws and are mounted to the dash panel behind the instrument panel. The HVAC housing contains the heater core (2), A/C evaporator (3), blower motor (7), blower motor resistor (9), blend-air doors and actuator (10), HVAC vacuum harness (11), floor distribution duct (12), foam seals (13 ) and the mode-air doors and actuators (14).
- **Air inlet housing** — The air inlet housing (4) is mounted to the right end of the HVAC housing and contains the foam seal (5), recirculation-air door (6) and the recirculation door actuator (8).



The heating-A/C system is a blend-air type system. The two blend-air doors control the amount of conditioned air that is allowed to flow through, or around, the heater core. This single zone heating-A/C system uses only one blend door actuator.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the blend door actuator, which moves the blend-air doors. This allows an almost immediate control of the output air temperature of the system. The two mode door actuators operate the mode-air doors which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. The recirculation door actuator operates the recirculation-air door which closes off the fresh air intake and recirculates the air already inside the vehicle. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housings at the selected speed by use of the blower motor resistor.

The HVAC housing must be removed from the vehicle for service of the heater core and the air inlet housing, and disassembled for service of the A/C evaporator, blend-air and mode-air doors. The air inlet housing must be removed and disassembled for service of the recirculation-air door.

## REMOVAL

## HVAC HOUSING

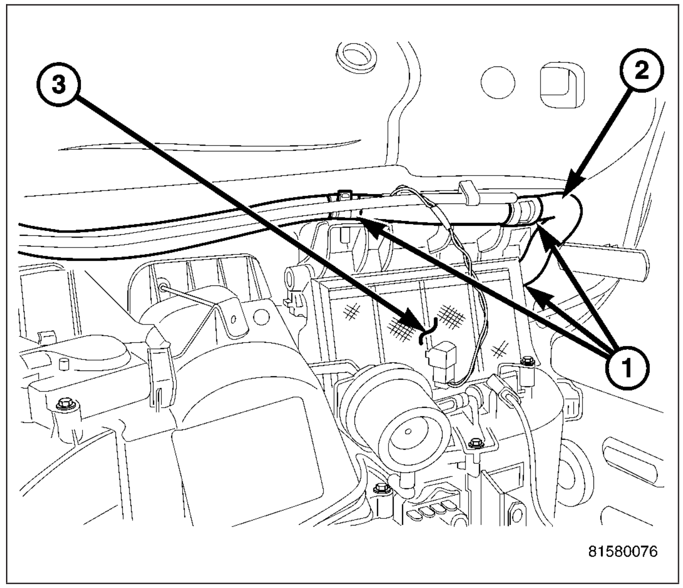
**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.**

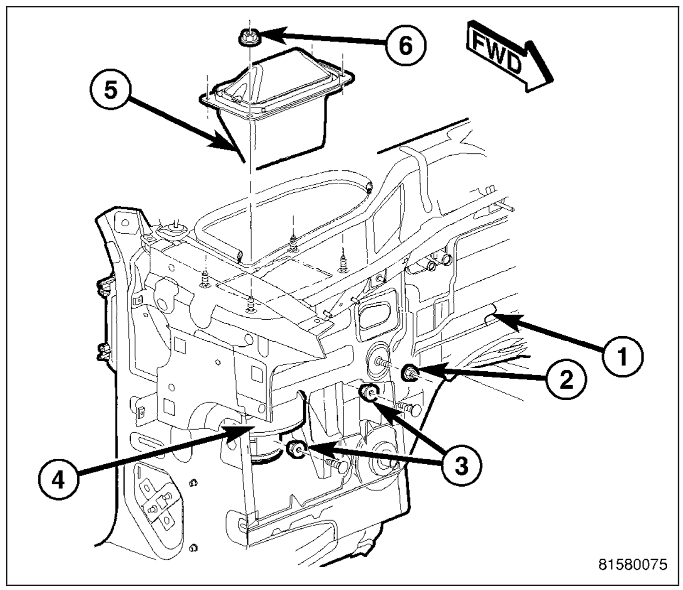
**NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator and the mode-air and blend-air doors.**

**NOTE: LHD model shown in illustrations. RHD model similar.**

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
4. Remove the instrument panel from the passenger compartment (Refer to 23 - BODY/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
5. Disengage the three retaining straps (1) that secure the dash panel wire harness (2) to the top of the HVAC air inlet housing (3) and position the wire harness out of the way.



6. Remove the two nuts that secure the A/C accumulator to the dash panel and disconnect the refrigerant lines from the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR-A/C - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - REMOVAL).
7. Install plugs into or caps over the opened refrigerant line fittings and evaporator ports
8. Disconnect the heater hoses from the heater core tubes and install plugs into or caps over the heater core tubes.
9. Disconnect the HVAC system vacuum supply line from the engine vacuum harness at the connector located near the evaporator tapping block.
10. Remove the condensation drain tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/TUBE-CONDENSATION DRAIN - REMOVAL).



11. Remove the one nut (2) that secures the HVAC housing (4) to the engine compartment side of the dash panel (1).
12. Remove the two nuts (3) that secure the HVAC housing to the passenger compartment side of the dash panel.
13. Pull the HVAC housing assembly rearward so that the mounting studs and condensate drain clear the dash panel and remove the HVAC housing from the passenger compartment.
14. If required, remove the four retaining nuts (6) and the fresh air inlet screen (5) from the top of the dash panel.

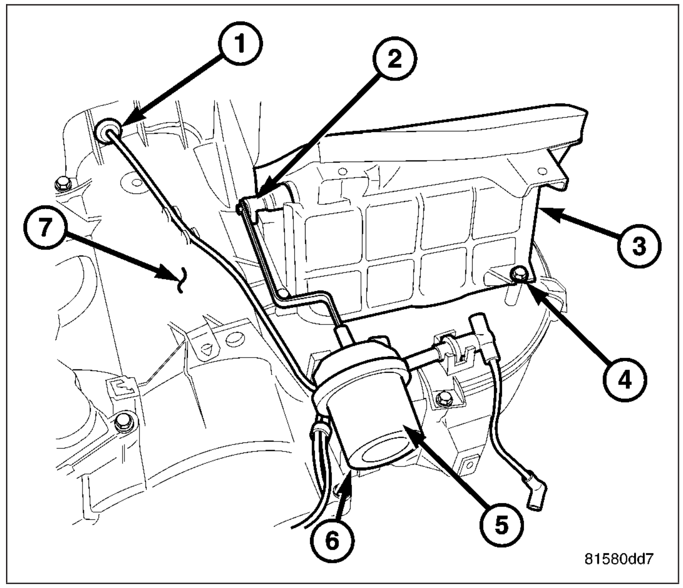
## AIR INLET HOUSING

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.**

**NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.**

1. Disconnect and isolate the negative battery cable.
2. Remove the HVAC housing (7) and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - REMOVAL).
3. Disconnect the HVAC vacuum harness connector (6) from the recirculation door actuator (5) and if required, position the vacuum harness (1) out of the way.
4. Carefully disconnect the recirculation door actuator from the recirculation door lever (2) and if required, remove the actuator from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-RECIRCULATION DOOR - REMOVAL).
5. Remove the four screws (4) that secure the air inlet housing (3) to the top of the HVAC housing and remove the air inlet housing.



**NOTE: If the foam seal on the air inlet housing is deformed or damaged, it must be replaced.**

6. If required, disassemble the air inlet housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - DISASSEMBLY).

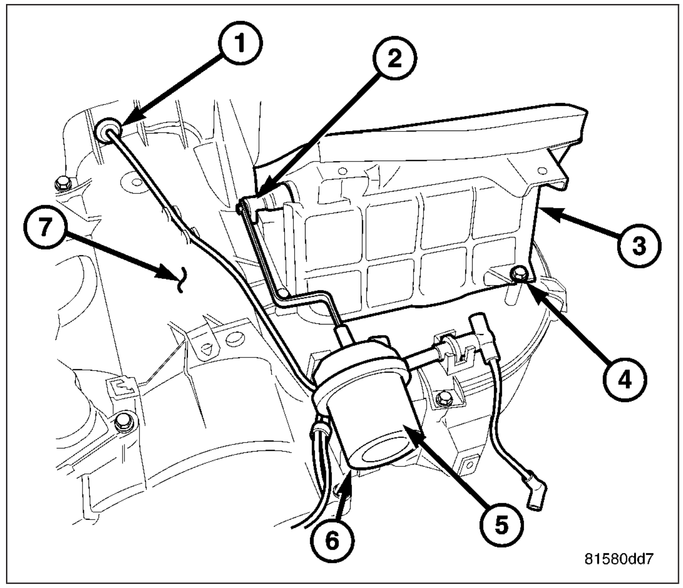
## DISASSEMBLY

## HVAC HOUSING

**NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator and the mode-air and blend-air doors.**

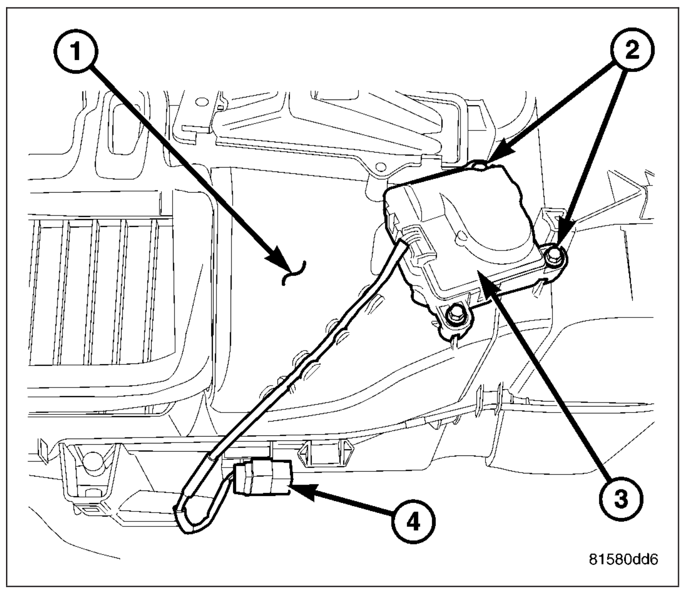
**NOTE: LHD model shown in illustrations. RHD model similar.**

1. Remove the HVAC housing from the vehicle and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - REMOVAL).
2. Remove the vacuum harness and grommet (1) from the top of the HVAC housing (7).
3. Disconnect the vacuum harness connector (6) from the recirculation door actuator (5).
4. Carefully disconnect the recirculation door actuator from the recirculation door lever (2) and remove the actuator from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-RECIRCULATION DOOR - REMOVAL).
5. Remove the four screws (4) that secure the air inlet housing (3) to the top of the HVAC housing and remove the air inlet housing.

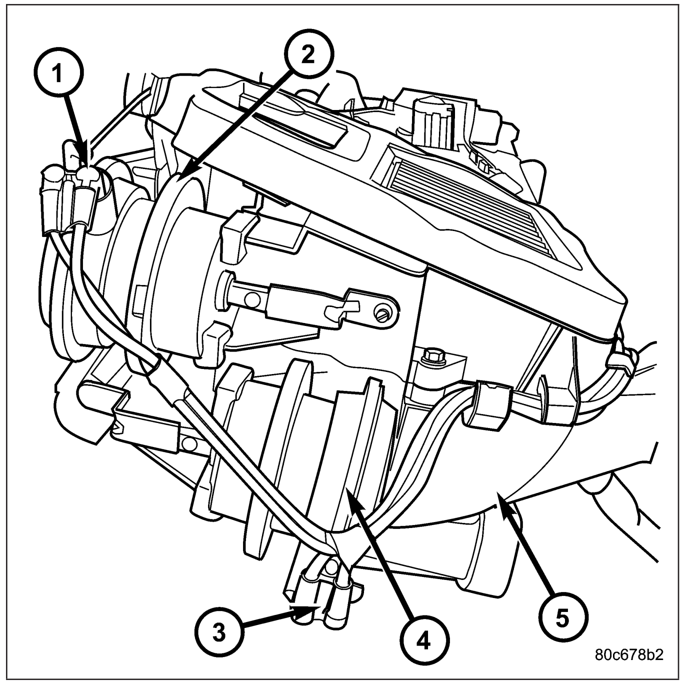


**NOTE: If the foam seal on the air inlet housing is deformed or damaged, the seal must be replaced.**

6. If required, disassemble the air inlet housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - DISASSEMBLY).
7. Disengage the wire harness lead and connector (4) for the blend door actuator (3) from the retainers located on the top and on the rear of the HVAC housing (1).
8. Remove the three screws (2) that secure the blend door actuator to the top of the HVAC housing and remove the actuator and wire harness lead and connector from the housing.



9. Disconnect the vacuum harness connectors (1 and 3) from the two mode door actuators (2 and 4) located on the driver side end of the HVAC housing (5).
10. Carefully disconnect the mode door actuators from the mode-air door levers and remove the actuators from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ ACTUATOR-MODE DOOR - REMOVAL).
11. Disengage the HVAC vacuum harness from the routing clips located on the HVAC housing and remove the vacuum harness from the housing.

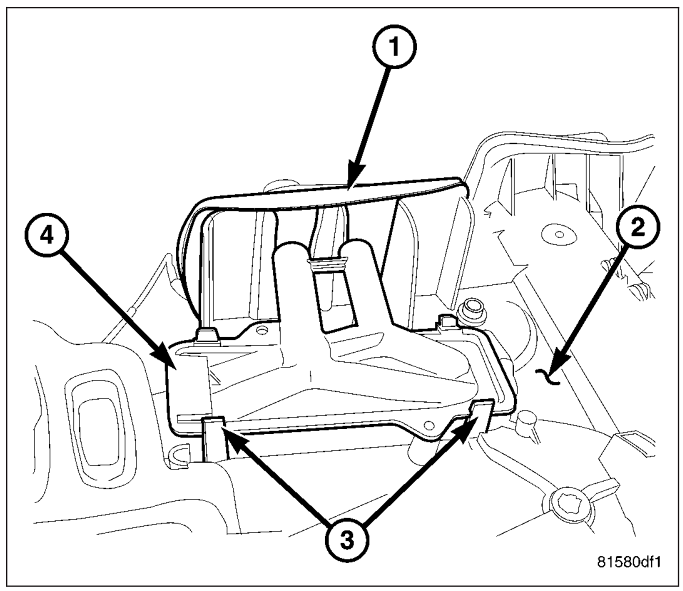


**NOTE: If the foam seal around the heater core tubes is deformed or damaged, the seal must be replaced.**

12. Carefully remove the foam seal (1) from the heater core (4) and the front of the HVAC housing (2). If the seal is deformed or damaged, it must be replaced.

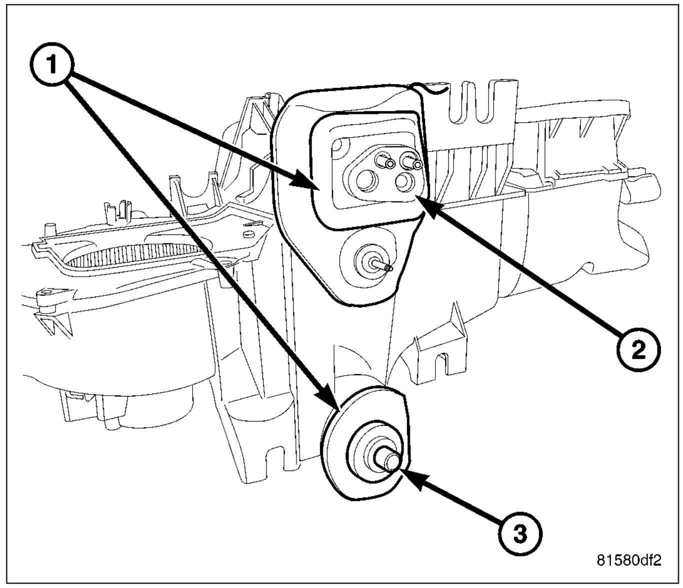
**NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.**

13. Disengage the four retaining tabs (3) that secure the heater core to the top of the HVAC housing and carefully remove the heater core from the housing.

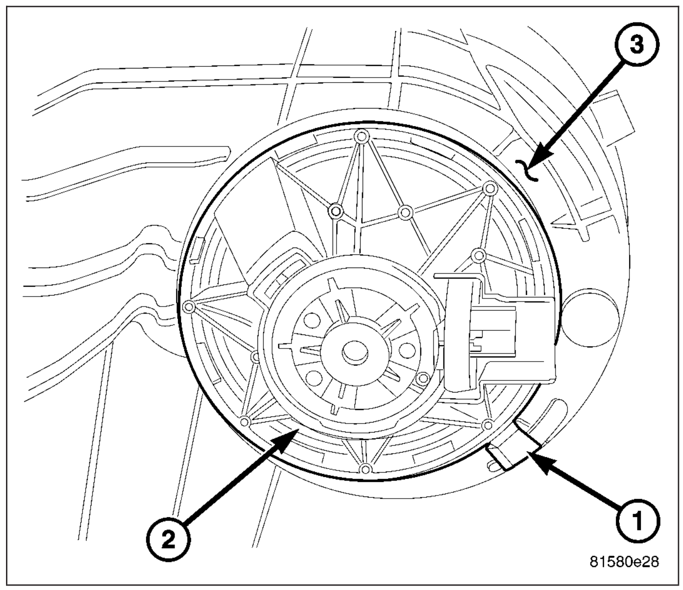


**NOTE: If any foam or rubber seal is deformed or damaged, the seal must be replaced.**

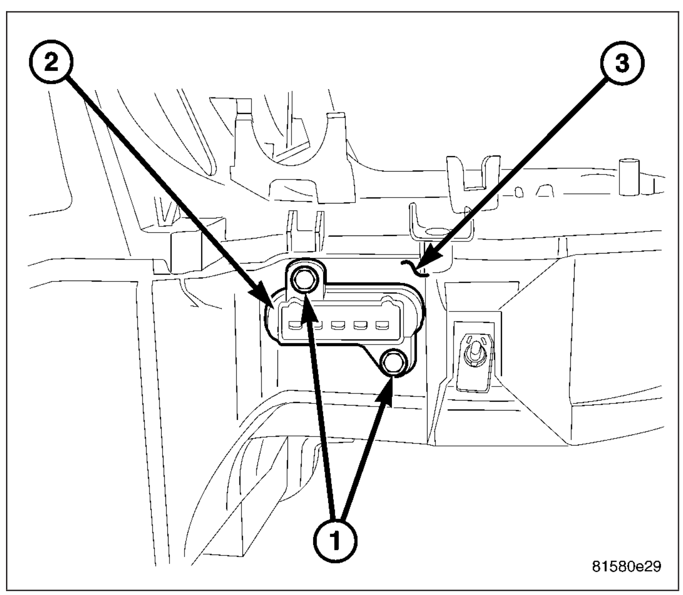
14. Carefully remove the foam and rubber seals (1) from around the evaporator tapping block (2) and the condensate drain (3). If any seal is deformed or damaged, it must be replaced.



15. Release the locking tab (1) that secures the blower motor (2) to the HVAC housing (3) and rotate blower motor counterclockwise.
16. Rotate the blower motor counterclockwise as needed to remove the blower motor and wheel from the HVAC housing.

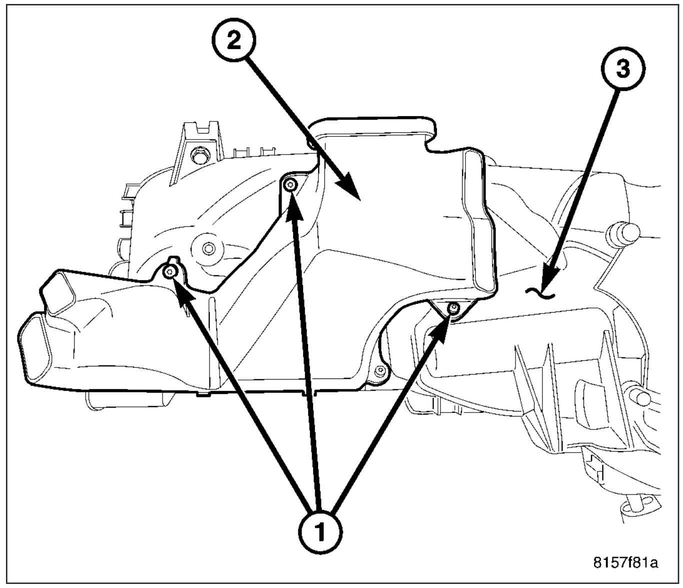


17. Remove the two screws (1) that secure the blower motor resistor (2) to the rear of the HVAC housing (3) and remove the resistor.



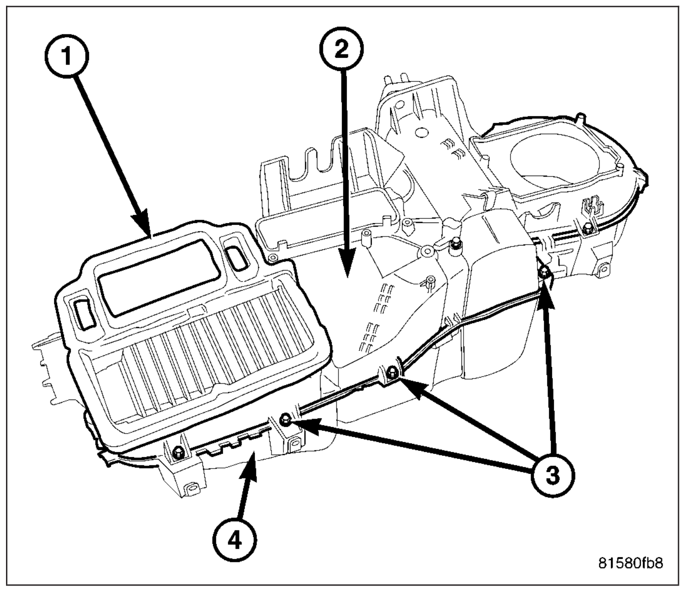
**NOTE: If the foam seal on the floor distribution duct is deformed or damaged, the seal must be replaced.**

18. Remove the three screws (1) that secure the floor distribution duct (2) to the bottom of the HVAC housing (3) and remove the duct.



**NOTE: If the foam seal on the panel/defrost outlet is deformed or damaged, the seal must be replaced.**

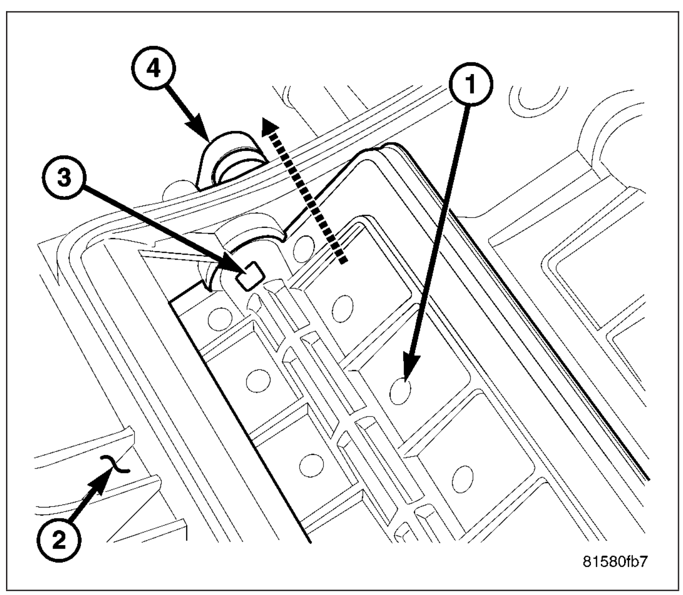
19. If required, remove the foam seal (1) from the panel/defrost outlet located on the upper half of the HVAC housing (2).
20. Remove the screws (3) that secure the upper half of the HVAC housing to the lower half of the HVAC housing (4).
21. Carefully separate the two halves of the HVAC housing.



22. To remove the panel-air door (1) from the inside of the upper half of the HVAC housing (2), first carefully release the retaining tab (3) of the panel door lever (4) from the pivot shaft of the panel-air door, using a small pick-type tool.
23. Pull the panel door lever out of the pivot shaft of the panel-air door.

**NOTE: If the seal on the air door is deformed or damaged, the air door must be replaced.**

24. Remove the panel-air door from the upper half of the HVAC housing.

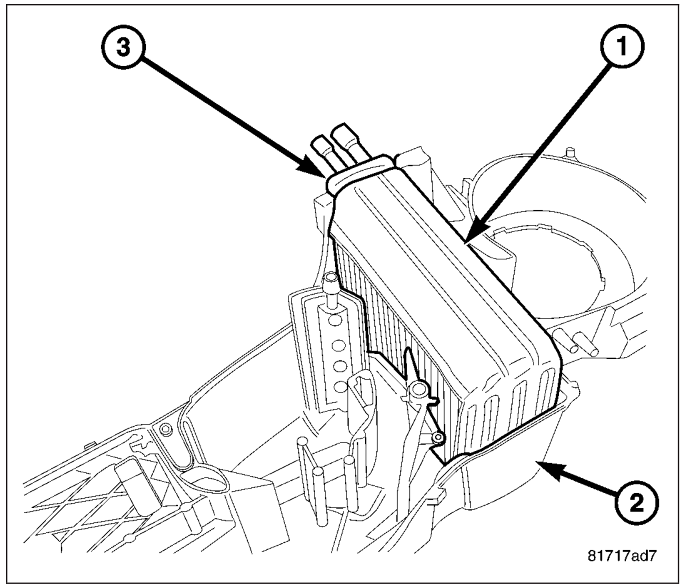


**NOTE: If the foam insulator around the A/C evaporator is deformed or damaged, the insulator must be replaced.**

25. Carefully lift the A/C evaporator (1) and the foam insulator out of the lower half of the HVAC housing (2).

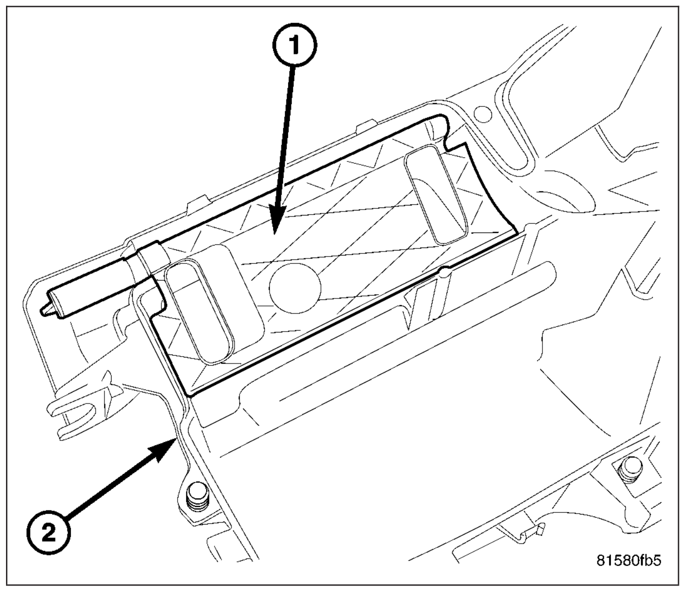
**NOTE: If the rubber seal around the evaporator tubes is deformed or damaged, the seal must be replaced.**

26. If required, remove the rubber seal (3) from around the evaporator tubes.



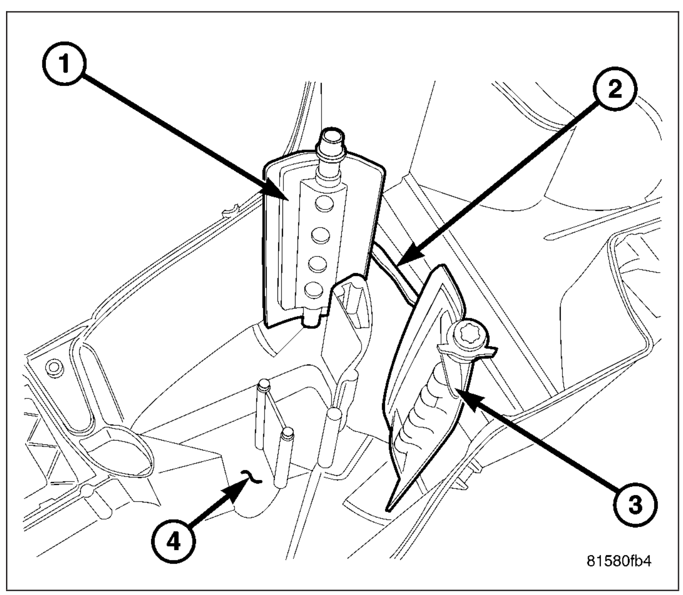
**NOTE: If the seal on the air door is deformed or damaged, the air door must be replaced.**

27. Remove the floor/defrost-air door (1) from the lower half of the HVAC housing (2).



**NOTE: If the seal on any air door is deformed or damaged, the air door must be replaced.**

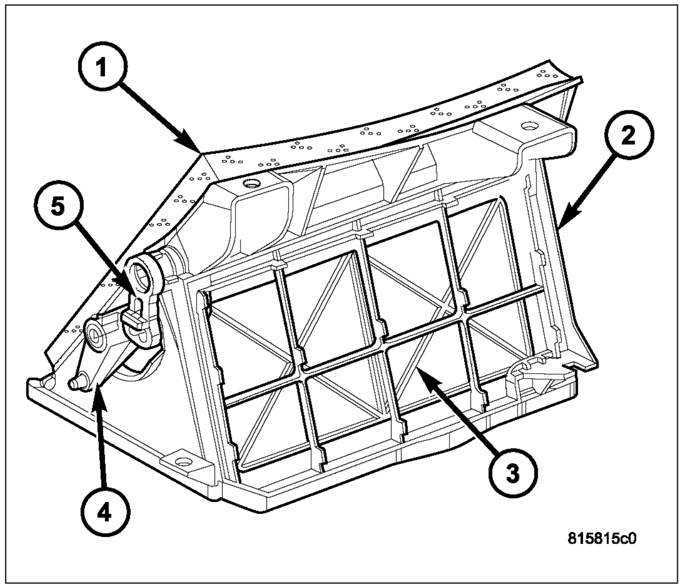
28. Remove both blend-air doors (1 and 3) from the lower half of the HVAC housing (4).
29. If required, disengage the blend door arm (2) from both blend-air doors.



## AIR INLET HOUSING

**NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.**

1. Remove the air inlet housing from the HVAC housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - REMOVAL)



**NOTE: If the foam seal on the air inlet housing is deformed or damaged, the seal must be replaced.**

2. If required, remove the foam seal (1) from the top of the air inlet housing (2).
3. To remove the recirculation-air door (3) from the inside of the air inlet housing, first carefully pull the recirculation door lever (5) out from the end of the pivot shaft of the recirculation-air door, using pliers.
4. Remove the pivot lever (4) from the side of the air inlet housing.

**NOTE: If the seal on the air door is deformed or damaged, the air door must be replaced.**

5. Remove the recirculation-air door from the air inlet housing.

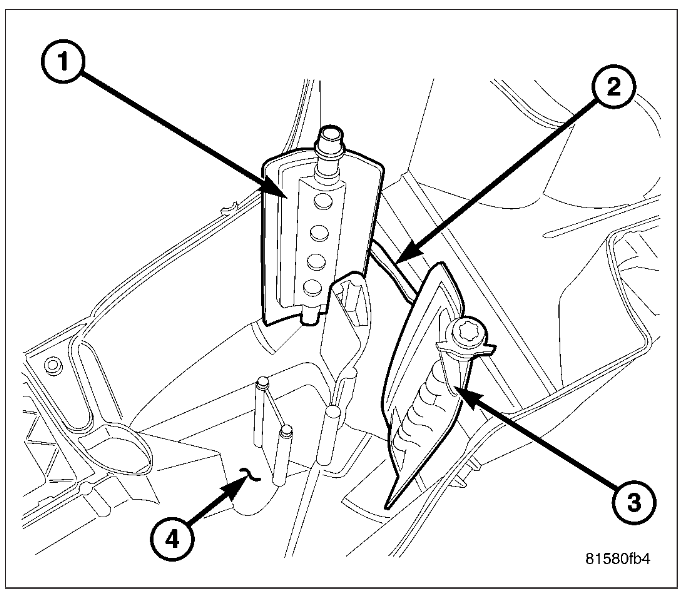
## ASSEMBLY

## HVAC HOUSING

**NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator and the mode-air and blend-air doors.**

**NOTE: LHD model shown in illustrations. RHD model similar.**

1. If removed, install the blend door arm (2) onto both blend-air doors (1 and 3).

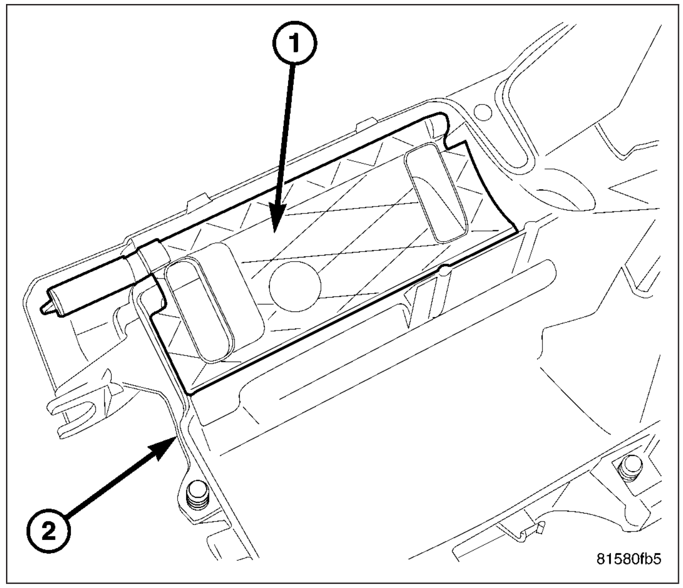


**NOTE: If the seal on any air door is deformed or damaged, the air door must be replaced.**

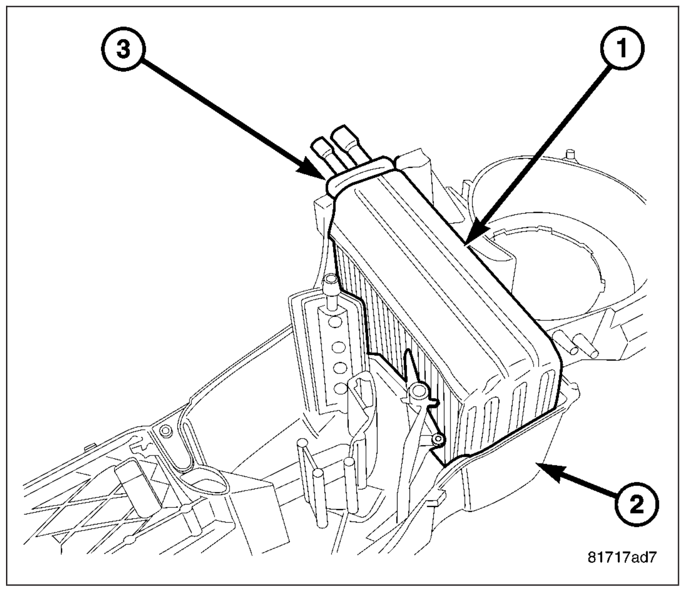
2. Position both blend-air doors into the pivot holes in the lower half of the HVAC housing.

**NOTE: If the seal on any air door is deformed or damaged, the air door must be replaced.**

3. Position the floor/defrost-air door (1) into the pivot grooves in the lower half of the HVAC housing (2).



4. If removed, install the rubber seal (3) around the tubes of the A/C evaporator (1).



**NOTE: Make sure that the evaporator drain is clean and unrestricted and that the rubber seal around the evaporator tubes is properly positioned in the HVAC housing.**

**NOTE: If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

**NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.**

**NOTE: Make sure that the foam insulator is properly positioned in the HVAC housing.**

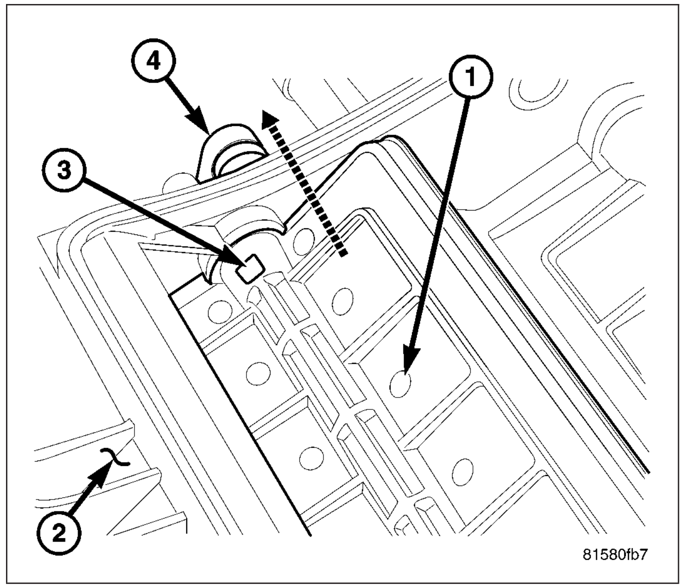
5. Install the A/C evaporator and its foam insulator into the lower half of the HVAC housing (2).

**NOTE: If the seal on the air door is deformed or damaged, the air door must be replaced.**

6. Position the panel-air door (1) into the upper half of the HVAC housing (2).

**CAUTION: Make sure that the panel-air door pivot shaft is properly seated in the pivot holes located in the upper half of the HVAC housing.**

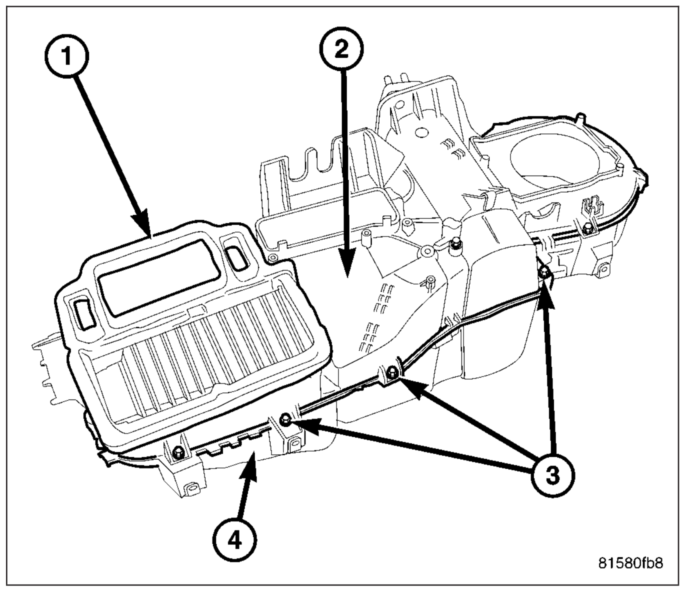
7. Align the panel door lever (4) with the pivot shaft of the panel-air door and install the lever into the pivot shaft. Make sure the retaining tab (3) is fully engaged.



8. Align the blend-air door pivot shafts with the pivot holes in the upper half of the HVAC housing (2) and install it onto the lower half of the HVAC housing (4).
9. Install the screws (3) that secure the two halves of the HVAC housing together. Tighten the screws to 2 N·m (17 in. lbs.).

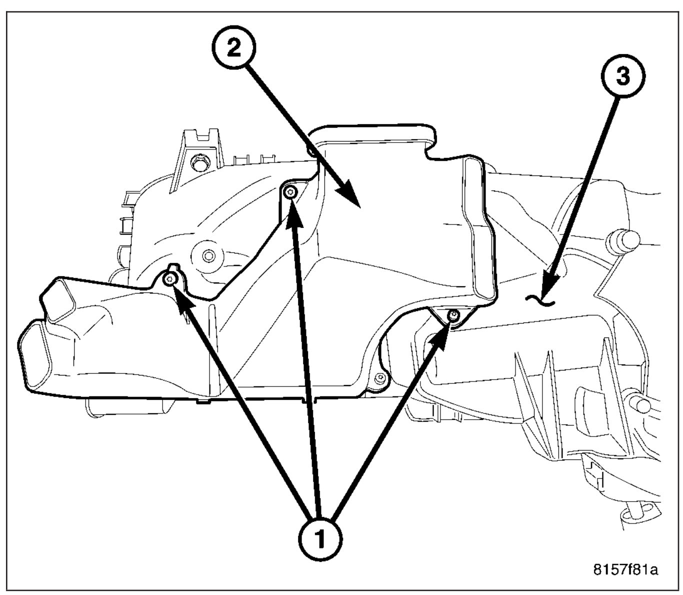
**NOTE: If the foam seal on the panel/defrost outlet is deformed or damaged, the seal must be replaced.**

10. If removed, install a new foam seal (1) onto the panel/defrost outlet located on the upper half of the HVAC housing.

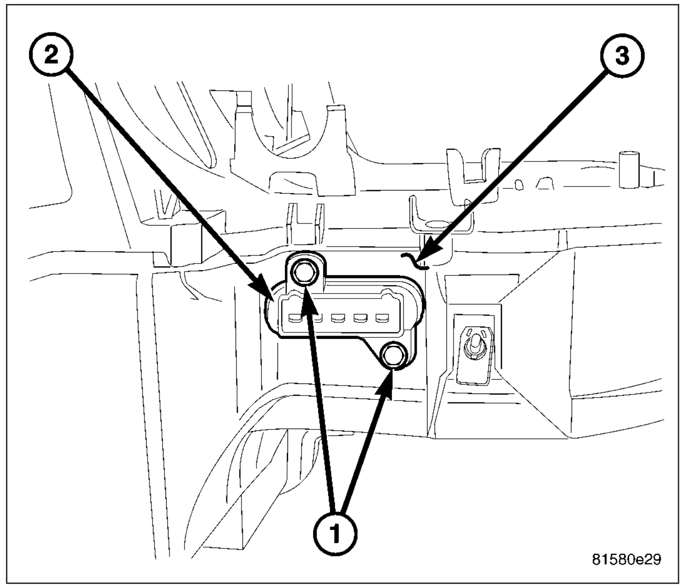


**NOTE: If the foam seal on the floor distribution duct is deformed or damaged, the seal must be replaced.**

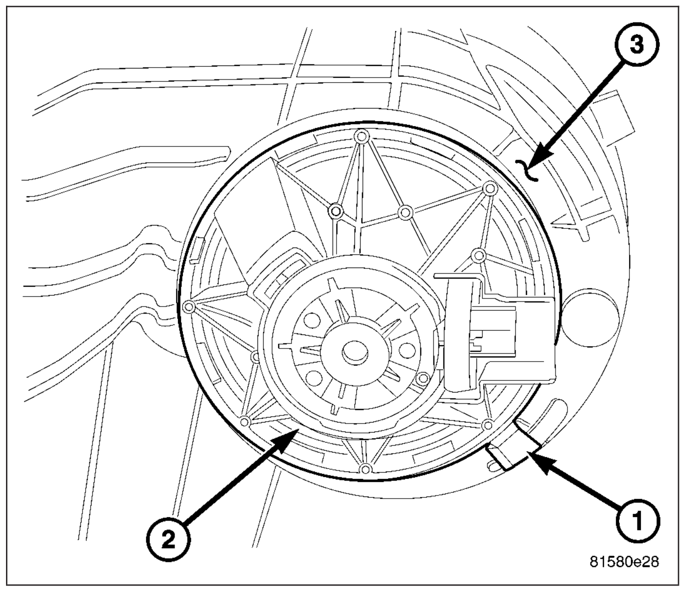
11. Position the floor distribution duct (2) onto the bottom of the HVAC housing (3).
12. Install the three screws (1) that secure the floor distribution duct to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).



13. Position the blower motor resistor (2) into the rear of the HVAC housing (3).
14. Install the two screws (1) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).

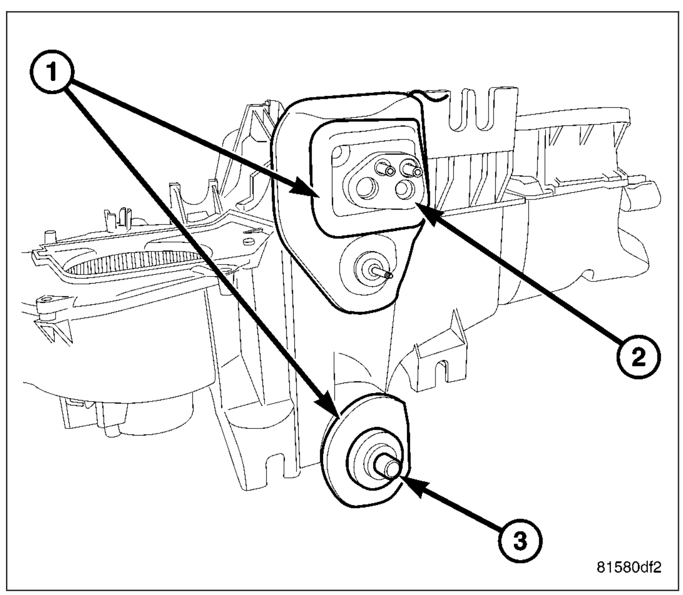


15. Align and install the blower motor (2) into the HVAC housing (3).
16. Rotate the blower motor until the locking tab (1) secures the blower motor to the HVAC housing.



**NOTE: If any foam or rubber seal is deformed or damaged, the seal must be replaced.**

17. Install the foam and rubber seals (1) around the evaporator tapping block (2) and the condensate drain (3).



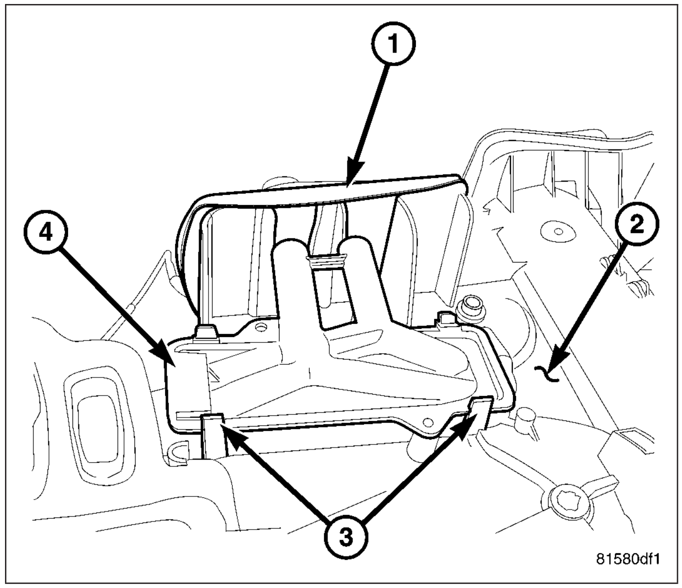
**NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.**

**NOTE: Make sure that the foam insulator is properly positioned in the HVAC housing.**

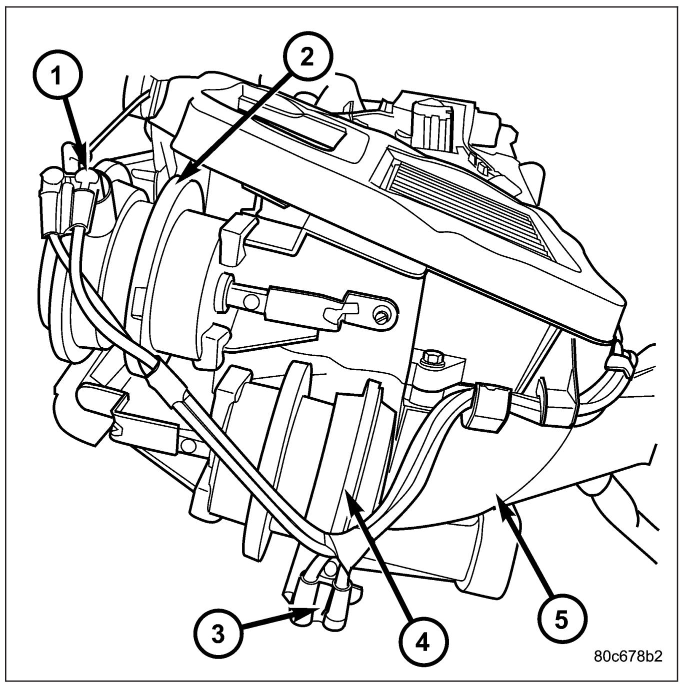
18. Carefully install the heater core (4) into the top of the HVAC housing (2).
19. Engage the four retaining tabs (3) that secure the heater core to the HVAC housing.

**NOTE: If the foam seal around the heater core tubes is deformed or damaged, the seal must be replaced.**

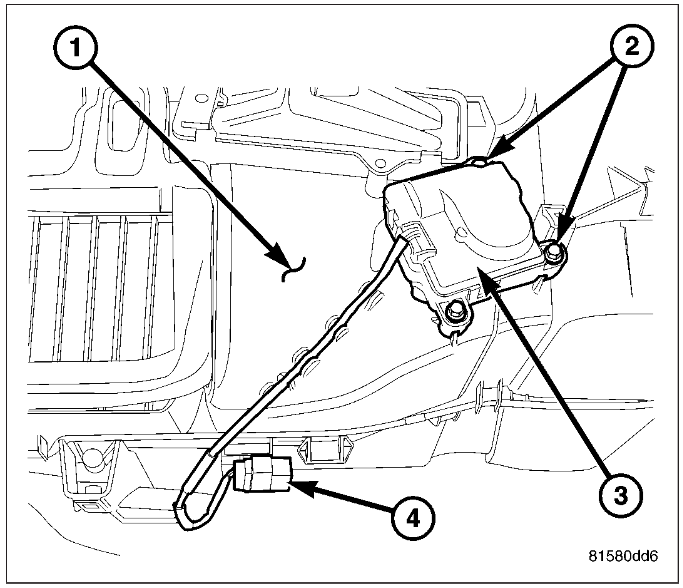
20. Install the foam seal (1) onto the front of the HVAC housing and around the heater core tubes.



21. Position the HVAC vacuum harness and connectors (1 and 3) to the HVAC housing (5) and install the vacuum harness into the routing clips.
22. Install the panel door actuator (2) and the floor/defrost door actuator (4) on to the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-MODE DOOR - INSTALLATION).
23. Connect the mode door actuators to the mode-air door levers.
24. Connect the vacuum harness connectors to the mode door actuators.

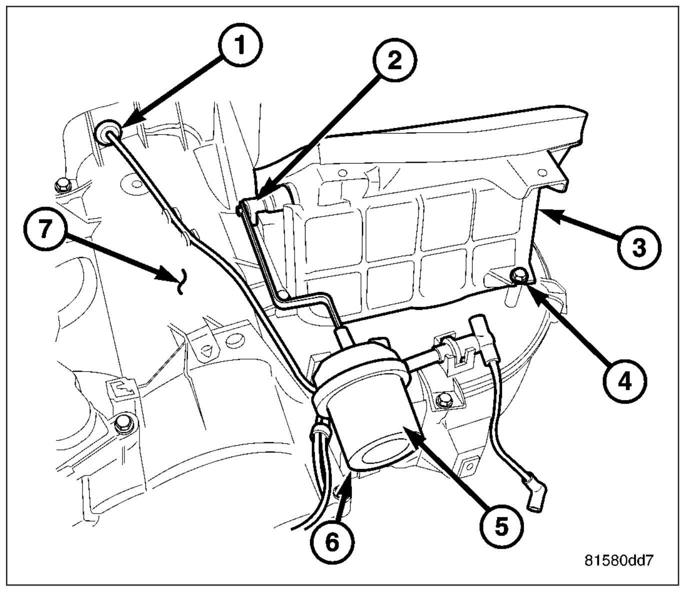


25. Position the blend door actuator (3) onto the top of the HVAC housing (1), making sure the actuator spline is positioned properly with the door spline. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend door pivot.
26. Install the three screws (2) that secure the blend door actuator to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
27. Engage the wire harness lead and connector (4) to the retainers located on the top and on the rear of the HVAC housing.



**NOTE: If the foam seal on the air inlet housing is deformed or damaged, the seal must be replaced.**

28. Position the air inlet housing (3) onto the top of the HVAC housing (7).
29. Install the four screws (4) that secure the air inlet housing to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
30. Install the recirculation door actuator (5) onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-RECIRCULATION DOOR - INSTALLATION).
31. Connect the recirculation door actuator to the recirculation door lever (2).
32. Connect the HVAC vacuum harness connector (6) to the recirculation door actuator.
33. Install the HVAC vacuum harness and grommet (1) onto the top of HVAC housing.



34. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).

## AIR INLET HOUSING

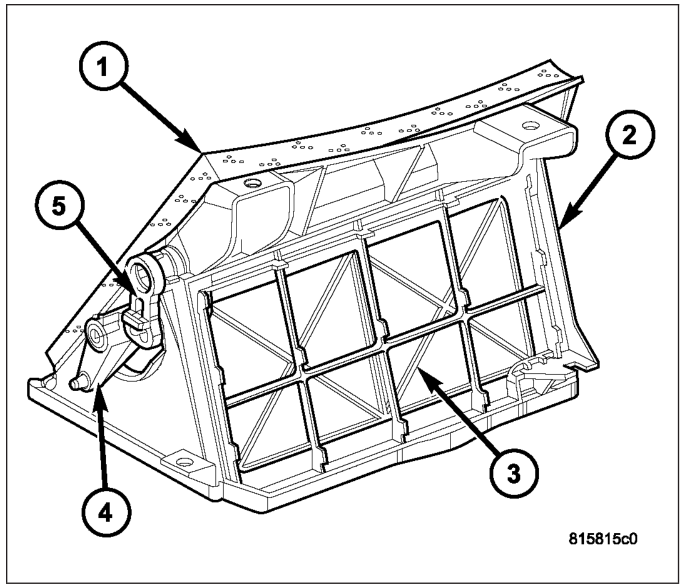
**NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.**

**NOTE: If the seal on the air door is deformed or damaged, the air door must be replaced.**

1. Position the recirculation-air door (3) into the air inlet housing (2).
2. Install the pivot lever (4) onto the side of the air inlet housing.

**CAUTION: Make sure that the recirculation-air door pivot shaft is properly seated in the pivot holes located in the air inlet housing.**

3. Align the recirculation door lever (5) with the pivot lever and install the recirculation door lever into the end of the pivot shaft of the recirculation-air door. Make sure the recirculation door lever is fully engaged to the pivot shaft and the pivot lever.



**NOTE: If the foam seal on the air inlet housing is deformed or damaged, the seal must be replaced.**

4. If removed, install a new foam seal (1) onto the top of the air inlet housing.
5. Install the air inlet housing onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - INSTALLATION).

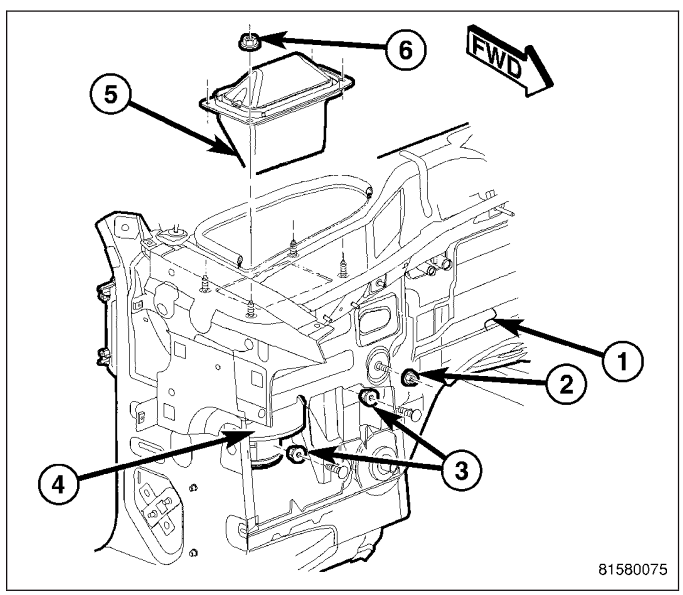
## INSTALLATION

## HVAC HOUSING

**NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator and the mode-air and blend-air doors.**

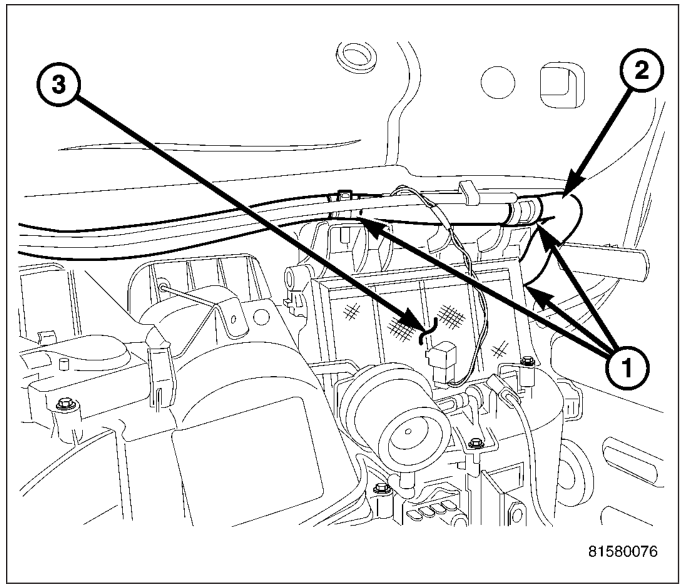
**NOTE: LHD model shown in illustrations. RHD model similar.**

1. If removed, install the fresh air inlet screen (5) and the four retaining nuts (6) onto the top of the dash panel (1).
2. Position the HVAC housing to the dash panel (4). Be certain that the condensate drain and the housing mounting studs are inserted into their correct locations.
3. Loosely install the two nuts (3) that secure the HVAC housing to the passenger compartment side of the dash panel.
4. Install the one nut (2) that secures the HVAC housing to the engine compartment side of the dash panel. Tighten the nut to 6 N·m (53 in. lbs.).
5. Install the condensation drain tube (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/TUBE-CONDENSATION DRAIN - INSTALLATION).
6. Connect the HVAC system vacuum supply line to the engine vacuum harness at the connector located near the evaporator tapping block.



7. Remove the previously installed plugs or caps and connect the heater hoses to the heater core tubes.
8. Remove the previously installed plugs or caps from the opened refrigerant line filltings and evaporator ports.

9. Connect the refrigerant lines to the A/C evaporator using new O-ring seals and install the two nuts that secure the A/C accumulator to the dash panel (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING /LINE-A/C LIQUID - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR-A/C - INSTALLATION).
10. Tighten the two nuts that secure the HVAC housing to the passenger compartment side of the dash panel to 6 N·m (53 in. lbs.).
11. Position the dash panel wire harness (2) to the top of the HVAC air inlet housing (3) and engage the three retaining straps (1) that secure the wire harness to the housing.
12. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
13. Reconnect the negative battery cable.
14. If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).
15. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

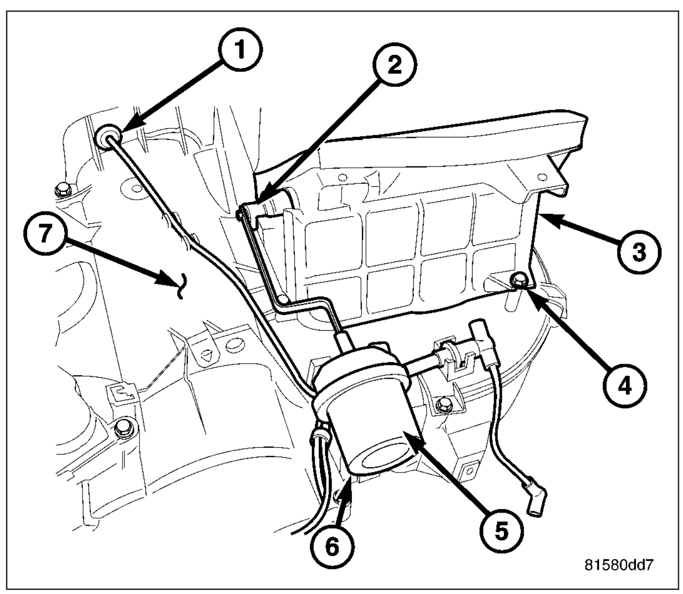


16. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
17. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## AIR INLET HOUSING

**NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.**

1. Position the air inlet housing (3) onto the top of the HVAC housing (7).
2. Install the four screws (4) that secure the air inlet housing to the top of the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. If removed, install the recirculation door actuator (5) onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-RECIRCULATION DOOR - INSTALLATION).
4. Connect the recirculation door actuator to the recirculation door lever (2).
5. If removed, install the HVAC vacuum harness (1) into the routing retainers located on the HVAC housing.
6. Connect the HVAC vacuum harness connector (6) to the recirculation door actuator.



**NOTE: If the foam seal on the air inlet housing is deformed or damaged, the seal must be replaced.**

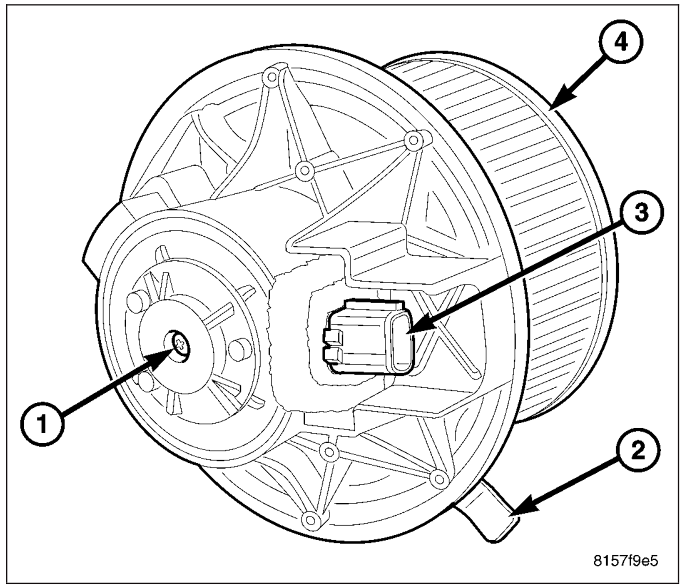
7. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).
8. Reconnect the negative battery cable.

# MOTOR-BLOWER

## DESCRIPTION

The blower motor (1) is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral retaining tab (2), an integral wire harness connector (3) and a squirrel cage-type blower wheel (4) that is secured to the blower motor shaft. The blower motor wheel is positioned within the HVAC air inlet housing, which is mounted to the passenger side end of the HVAC housing.

The blower motor can be accessed for service from underneath the instrument panel.



## OPERATION

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

The blower motor will operate whenever the ignition switch is in the On position and the A/C-heater controls in any position except Off. The blower motor receives fused battery circuit through a fuse and a relay located in the power distribution center (PDC) whenever the ignition switch is in the On position.

Blower motor speed is controlled by regulating the ground path through or around the blower motor resistor and through the blower motor control located within the A/C-heater control.

The blower motor and blower motor wheel are factory balanced and cannot be adjusted or repaired. If faulty or damaged, the blower motor and blower wheel must be replaced as an assembly.

## DIAGNOSIS AND TESTING

## BLOWER MOTOR

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.**

**NOTE: For circuit descriptions and diagrams, refer to Air Conditioning/Heater in Group 8W - Wiring Diagrams.**

### OPERATION

Possible causes of an inoperative blower motor include:

- Faulty fuse
- Faulty blower motor resistor
- Faulty blower motor switch
- Faulty blower motor relay

- Faulty blower motor
- Faulty mode control switch
- Faulty blower motor circuit wiring or wire harness connectors

**VIBRATION**

Possible causes of a blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Deformed blower wheel
- Out of balance blower wheel due to foreign material in the wheel
- Faulty blower motor

**NOISE**

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material in the HVAC housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Faulty blower motor

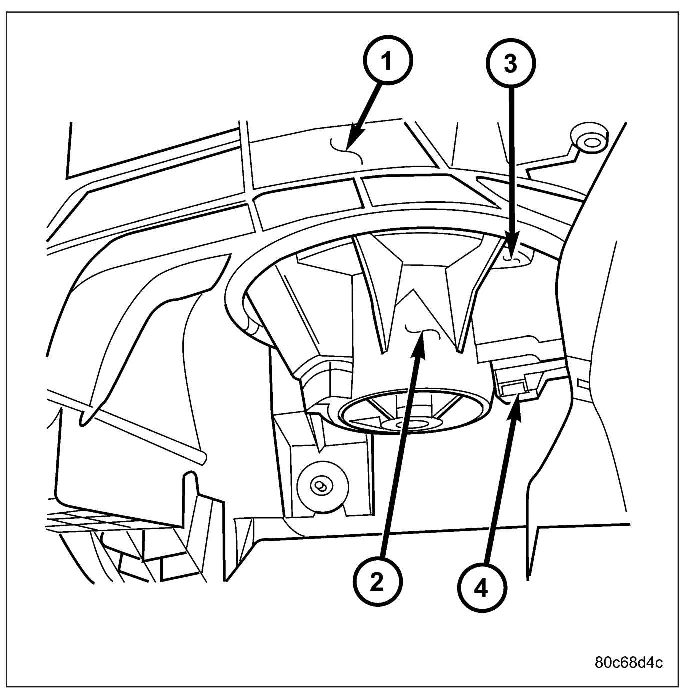
## REMOVAL

**WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.**

**NOTE: The blower motor is located on the passenger side of the vehicle under the instrument panel. The blower motor can be removed without having to remove the instrument panel or the HVAC housing.**

**NOTE: LHD model shown in illustration. RHD model similar.**

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness lead from the blower motor connector (4).
3. Release the locking tab (3) that secures the blower motor (2) to the HVAC housing (1) and rotate blower motor counterclockwise.
4. Rotate and tilt the blower motor as needed for clearance to remove the blower motor and wheel from the HVAC housing.

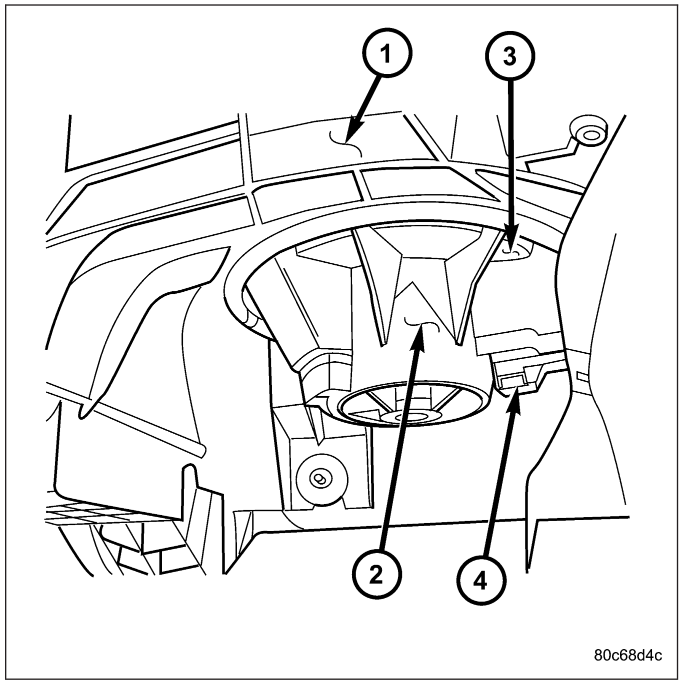


## INSTALLATION

**NOTE: Failure to install the blower motor correctly could result in an air leak or the blower motor becoming completely disengaged from the HVAC housing.**

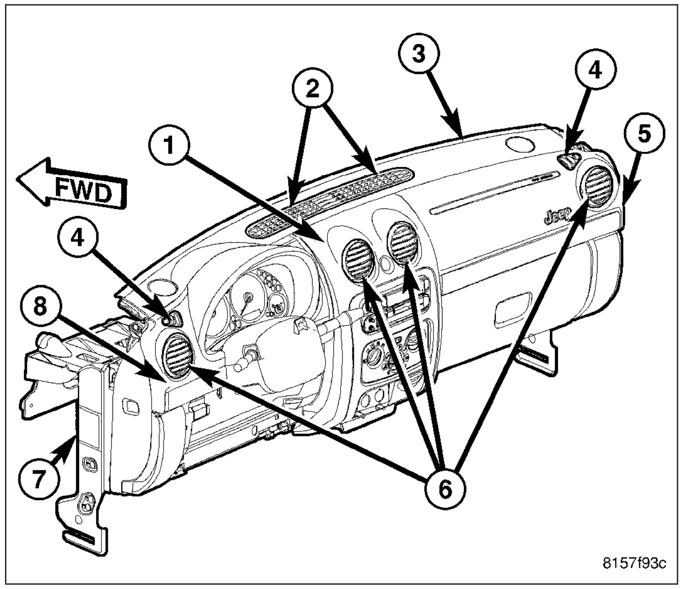
**NOTE: LHD model shown in illustration. LHD model similar.**

1. Align and install the blower motor (2) into the HVAC housing (1).
2. Rotate the blower motor until the locking tab (3) secures the blower motor to the HVAC housing.
3. Connect the wire harness lead to the blower motor connector (4).
4. Reconnect the negative battery cable.
5. Test the blower motor for proper installation by operating the blower motor at its fastest speed while checking around the outer edges of the blower motor and HVAC housing for air leaks. If any are found, remove and reinstall the blower motor.



# OUTLET-AIR

## DESCRIPTION



There are two defroster air outlets (2) in the defroster grille (3) located on the top of the instrument panel (7). The airflow from the defroster outlets is directed by fixed vanes in the defroster grille and cannot be adjusted. The defroster air outlets are not serviceable from the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).

There are two side window demister air outlets (4). One located at each end of the instrument panel near the A-pillars. The airflow from the side window demister air outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister air outlet located at the right end of the instrument panel is integral to the passenger side air bag door (5) and cannot be serviced separately (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL). The other side window demister air outlet is integral to the instrument cluster bezel (8) and cannot be serviced separately (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

There are four instrument panel air outlets. One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and the other two outlets are located near the top of the instrument panel center bezel. The air outlet located at the right end of the instrument panel is integral to the passenger side air bag door and cannot be serviced separately (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL). The air outlets located at the center of the instrument panel are integral to the instrument panel and cannot be serviced separately (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL). The other instrument panel air outlet is integral to the instrument cluster bezel (1) and cannot be serviced separately (Refer to 23 - BODY/INSTRUMENT PANEL/IP PASSENGER SIDE BEZEL - REMOVAL).

Each of the instrument panel air outlets contain an air outlet barrel (6) that is used to direct or shut off the flow of the conditioned air leaving the instrument panel.

**CAUTION: The instrument panel air outlet barrels can only be installed in one direction. If the outlet barrel is not properly oriented prior to installation, damage to the outlet barrel will occur.**

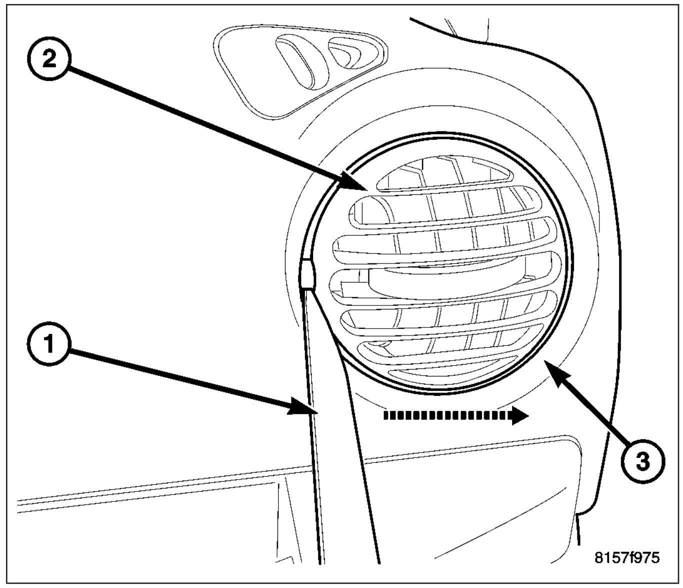
**NOTE: Each air outlet barrel is retained into the air outlet housing by two pivot shafts. One pivot shaft is larger than the other. The air outlet barrel must be first installed onto the larger pivot shaft, then snapped into place over the smaller pivot shaft.**

All of the instrument panel air outlets barrels can be serviced individually.

## REMOVAL

**NOTE: The instrument panel air outlet barrels are retained onto the pivots located in the outlet housing by a light snap fit.**

1. Using a trim stick C-4755 or equivalent (1), gently pry the panel air outlet barrel(s) (2) out of the instrument panel air outlet(s) (3) as required.

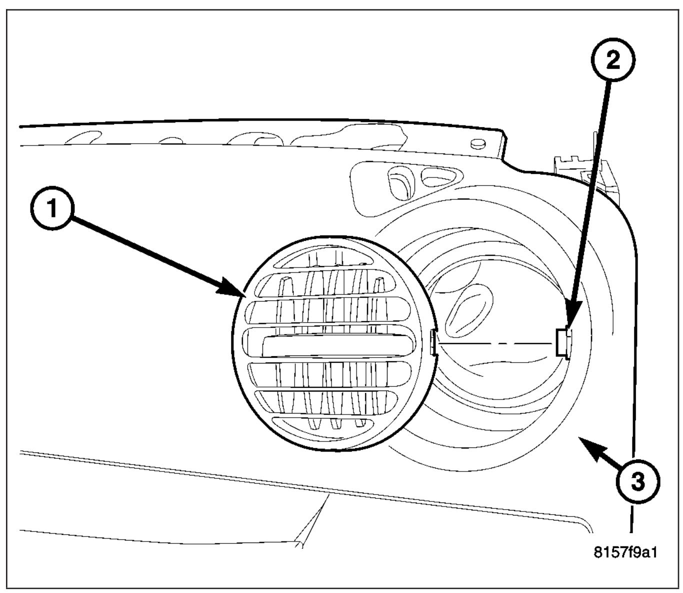


## INSTALLATION

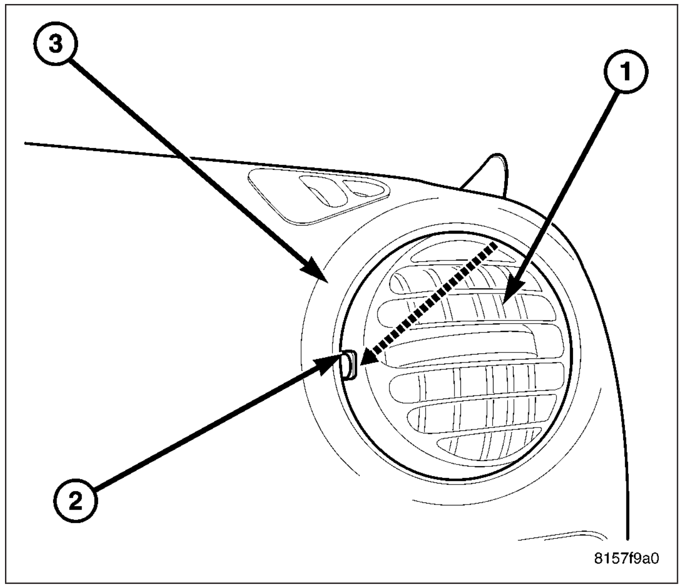
**CAUTION: The instrument panel air outlet barrels can only be installed in one direction. If the air outlet barrel is not properly oriented prior to installation, damage to the air outlet barrel will occur.**

**NOTE: Each air outlet barrel is retained into the air outlet housing by two pivot shafts. One pivot shaft is larger than the other. The air outlet barrel must be first installed onto the larger pivot shaft, then snapped into place over the smaller pivot shaft.**

1. Install the air outlet barrel (1) onto the larger pivot shaft (2) located in the instrument panel air outlet housing (3).



2. Gently push the air outlet barrel (1) onto the smaller pivot shaft (2) of the instrument panel air outlet housing (3) until it snaps into position.



# PLUMBING

## TABLE OF CONTENTS

# PLUMBING

## DESCRIPTION

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a system on this vehicle consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant lines are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and can reduce the flow of refrigerant in the system. The radius of all bends in the flexible hose refrigerant lines should be at least ten times the diameter of the hose and the refrigerant lines should be routed so they are at least 80 millimeters (3 inches) away from the exhaust manifold(s) and exhaust pipe(s).

## OPERATION

High pressures are produced in the refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

Depending on vehicle, model and market application, refrigerant lines are connected to each other or other A/C system components with block-type or quick-connect type fittings. To ensure the integrity of the refrigerant system, flat gaskets and O-rings are used to seal the refrigerant system connections.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

## WARNING

**WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Severe personal injury or death may result from improper service procedures.**

**WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.**

**WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Severe personal injury or death may result from improper service procedures.**

**WARNING: If accidental system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and death.**

**WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.**

**WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage, personal injury or death.**

**WARNING: The engine cooling system is designed to develop internal pressures up to 145 kilopascals (21 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.**

## CAUTION

**CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.**

**CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.**

**CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.**

**CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.**

**CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.**

**CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.**

**CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.**

**CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.**

## DIAGNOSIS AND TESTING

## REFRIGERANT SYSTEM LEAKS

**WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage, personal injury or death.**
**Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge an R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.**

**NOTE: If the A/C refrigerant system charge is empty or low, a leak in the A/C system is likely. Visually inspect all A/C lines, fittings and components for an oily residue. Oil residue can be an indicator of an A/C system leak location.**

**NOTE: The only way to correctly determine if the refrigerant system is fully charged with R-134a is to completely evacuate and recharge the A/C system.**

Connect a suitable manifold gauge set and determine if the static A/C system pressure is above or below 345 kPa (50 psi) (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT). If less than 345 kPa (50 psi), proceed to SYSTEM EMPTY . If greater than 345 kPa (50 psi), go to SYSTEM LOW .

### SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater vacuum) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE). Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed to Step 2.
2. Prepare and dispense 0.284 kilograms (10 ounces) of R-134a refrigerant into the evacuated refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) and proceed to Step 1 of the System Low procedure.

### SYSTEM LOW

1. Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
2. Operate the heating-A/C system with the engine at idle under the following conditions for at least 5 minutes.
   - Doors or windows open
   - Transmission in Park or Neutral with the parking brake set (depending on application)
   - A/C-heater controls set to outside air, full cool, panel mode, high blower and with A/C compressor engaged

**CAUTION: A leak detector only designed for R-12 refrigerant will not detect leaks in an R-134a refrigerant system.**

3. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the drain tube opening or an air outlet. A dye for R-134a is available to aid in leak detection. Use only DaimlerChrysler approved refrigerant dye.

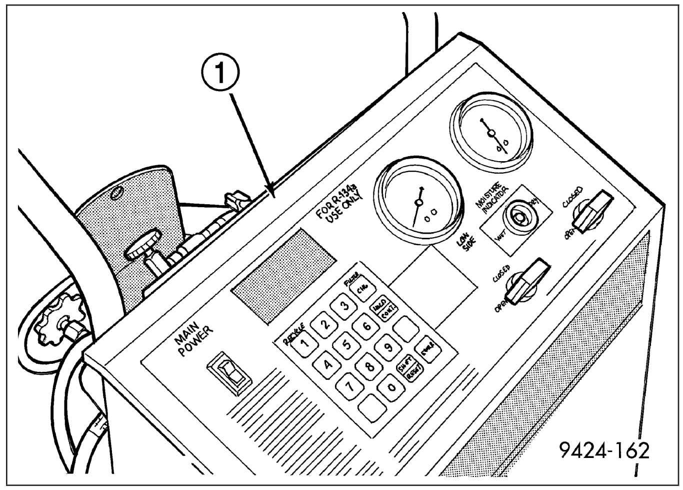
## STANDARD PROCEDURE

## REFRIGERANT SYSTEM SERVICE EQUIPMENT

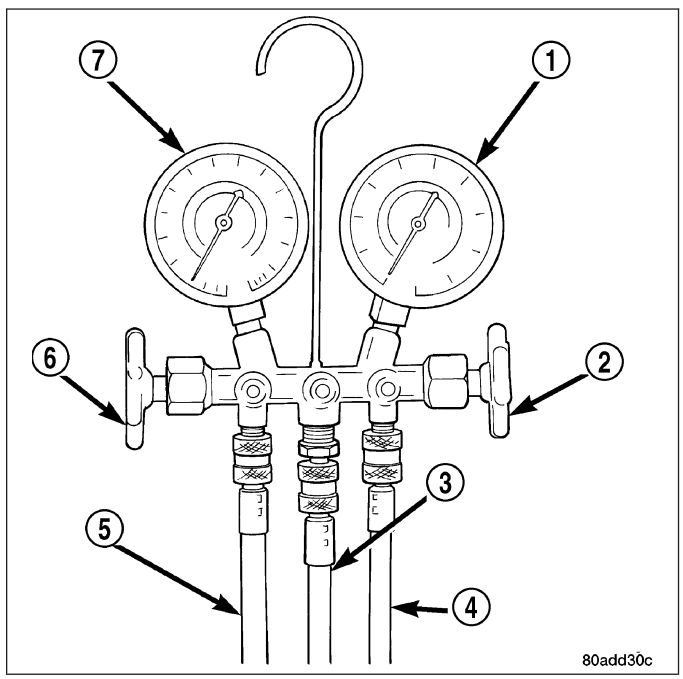
**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**WARNING: Eye protection must be worn when servicing an air conditioning refrigerant system. Turn off (rotate clockwise) all valves on the equipment being used, before connecting to or disconnecting from the refrigerant system. Failure to observe these warnings may result in personal injury or death.**

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 must be used (1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.



A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.



## MANIFOLD GAUGE SET CONNECTIONS

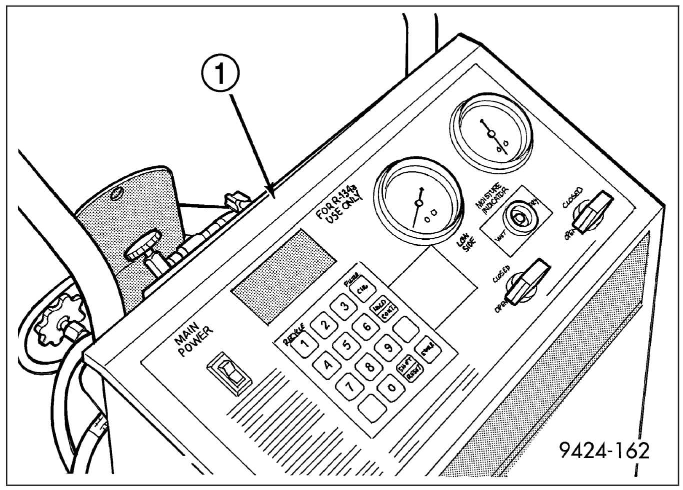
**CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.**

- **LOW PRESSURE GAUGE HOSE** - The low pressure hose (Blue with Black stripe) attaches to the low-side service port. This port is located on the A/C liquid line near the front of the engine compartment.
- **HIGH PRESSURE GAUGE HOSE** - The high pressure hose (Red with Black stripe) attaches to the high-side service port. This port is located on the A/C discharge line near the A/C condenser.
- **RECOVERY, RECYCLING, EVACUATION AND CHARGING HOSE** - The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

## REFRIGERANT SYSTEM RECOVERY

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

An R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2210 must be used to recover the refrigerant from the R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.



## REFRIGERANT SYSTEM EVACUATE

**NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.**

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

**NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.**

1. Recover the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT).
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that

must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.

4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## REFRIGERANT SYSTEM CHARGE

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: Always refer to the Underhood HVAC Specification Label for the refrigerant fill specification of the vehicle being serviced.**

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. For the proper amount of the refrigerant charge, refer to the Underhood HVAC Specification Label.

An R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

### CHARGING PROCEDURE

**CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.**

1. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
2. A manifold gauge set and an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 should be connected to the refrigerant system.
3. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
4. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
5. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
6. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the A/C compressor does not engage, test the compressor clutch control circuit and repair as required.
7. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.

**WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning could result in possible personal injury or death.**

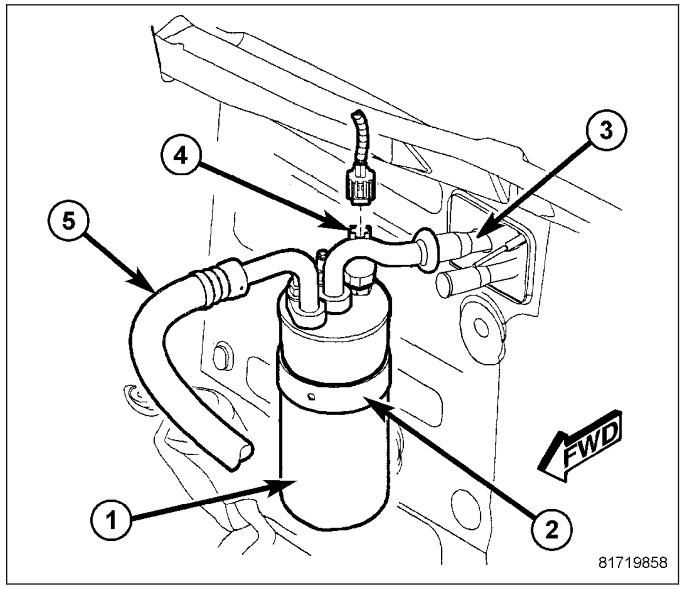
8. Disconnect the charging station and manifold gauge set from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

# ACCUMULATOR-A/C

## DESCRIPTION

The A/C accumulator (1) is mounted in a bracket (2) in the engine compartment between the A/C evaporator (3) and the A/C suction line (5) and includes a fitting for the A/C low pressure switch (4).

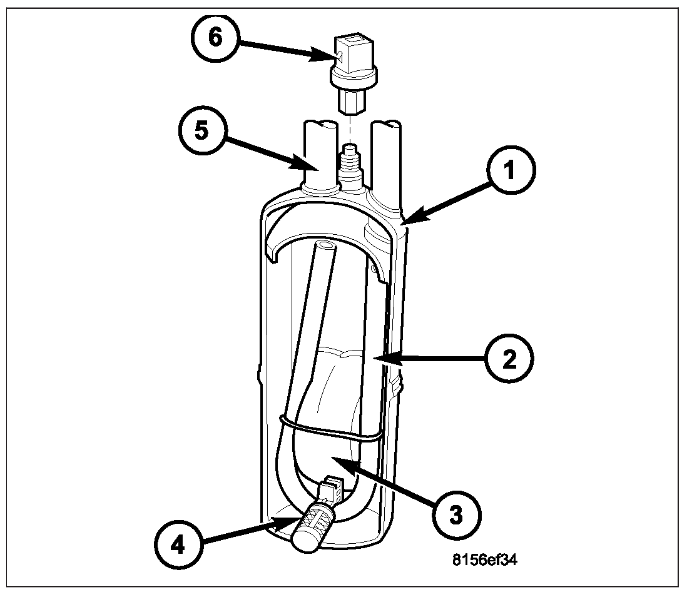
The A/C accumulator has no serviceable parts except for the rubber O-ring seals and the A/C low pressure switch. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C accumulator is removed and installed.



## OPERATION

Refrigerant enters the A/C accumulator (1) mostly as a low pressure vapor through the inlet tube (2). Any liquid, oil-laden refrigerant falls to the bottom of the canister, which acts as a separator. A desiccant bag (3) is mounted inside the accumulator canister to absorb any moisture which may have entered and become trapped within the refrigerant system. A filter (4) is also mounted inside the canister to trap any foreign material that may have entered the refrigerant system during assembly. The low pressure vapor exits the A/C accumulator through the outlet tube (5). On this model, the A/C low pressure switch (6) is mounted to the top of the A/C accumulator.

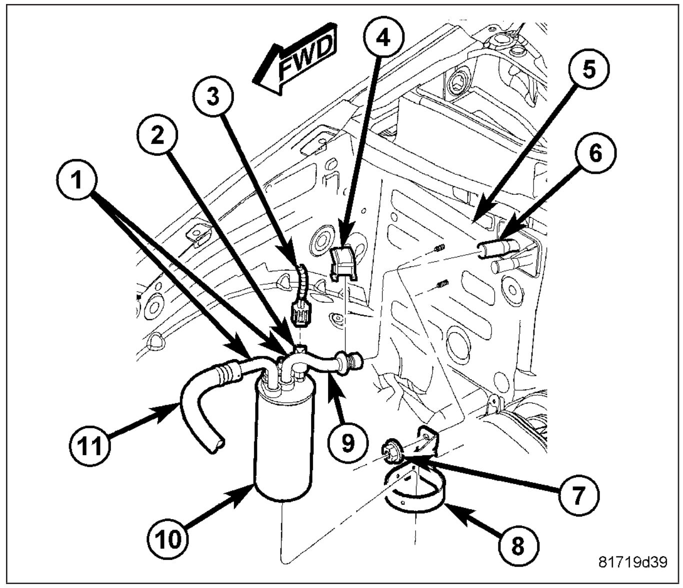
The A/C accumulator cannot be repaired. If the A/C accumulator is faulty or damaged, or if an internal failure of the A/C compressor has occurred, the A/C accumulator must be replaced.



## REMOVAL

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: LHD model shown. RHD model similar.**



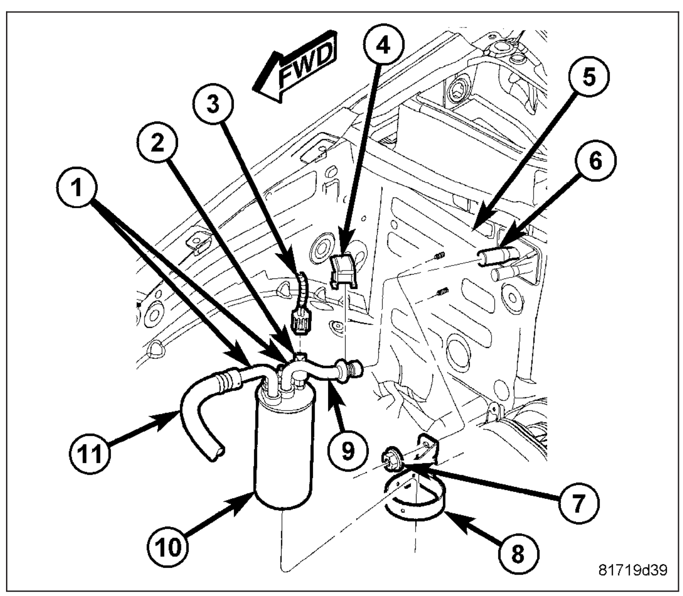
1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Disconnect the wire lead and connector (3) from the A/C low pressure switch (2) and remove the switch from the A/C accumulator (10).
4. Remove the two nuts (7) that secure the accumulator bracket (8) to the dash panel (5).
5. On LHD models, remove the secondary retaining clip (4) from the suction line spring-lock coupler and using the proper A/C line disconnect tool, disconnect the rear section of the A/C suction line (9) from the evaporator outlet tube (6) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ COUPLER-REFRIGERANT LINE - REMOVAL).
6. On RHD models, remove the nut that secures the rear section of the A/C suction line to the A/C evaporator and disconnect the line from the evaporator.
7. Remove the nuts (1) that secure the rear section of the A/C suction line and the front section of the A/C suction line (11) to the A/C accumulator and disconnect the lines from the accumulator.
8. Remove the A/C accumulator and the bracket from the engine compartment as an assembly and, if necessary, remove the bracket from the accumulator.
9. Remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the accumulator and evaporator ports.

## INSTALLATION

**NOTE: If the A/C accumulator is being replaced, add 120 milliliters (4 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

**NOTE: LHD model shown. RHD model similar.**



1. If removed, install the A/C accumulator (10) into the accumulator bracket (8) and position the accumulator and bracket into the engine compartment as an assembly.
2. Remove the tape or plugs from all of the opened refrigerant line fittings and the accumulator and evaporator ports.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C suction lines (9 and 11) to the A/C accumulator and install the retaining nuts (1). Tighten the nuts to 12.5 N·m (110 in. lbs.).

5. On LHD models, connect the spring-lock coupler that secures the rear section of the A/C suction line to the A/C evaporator (6) and install the secondary retaining clip (4) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COUPLER-REFRIGERANT LINE - INSTALLATION).
6. On RHD models, connect the rear section of the A/C suction line to the A/C evaporator and install the retaining nut. Tighten the nut to 12.5 N·m (110 in. lbs.).
7. Install the two nuts (7) that secure the accumulator bracket to the dash panel (5). Tighten the nuts to 4.5 N·m (40 in. lbs.).
8. If removed, install the A/C low pressure switch (2) onto the A/C accumulator using a new O-ring seal. Hand-tighten the switch securely.
9. Connect the wire lead and connector (3) to the A/C low pressure switch.
10. Reconnect the negative battery cable.
11. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
12. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

# COMPRESSOR-A/C

## DESCRIPTION

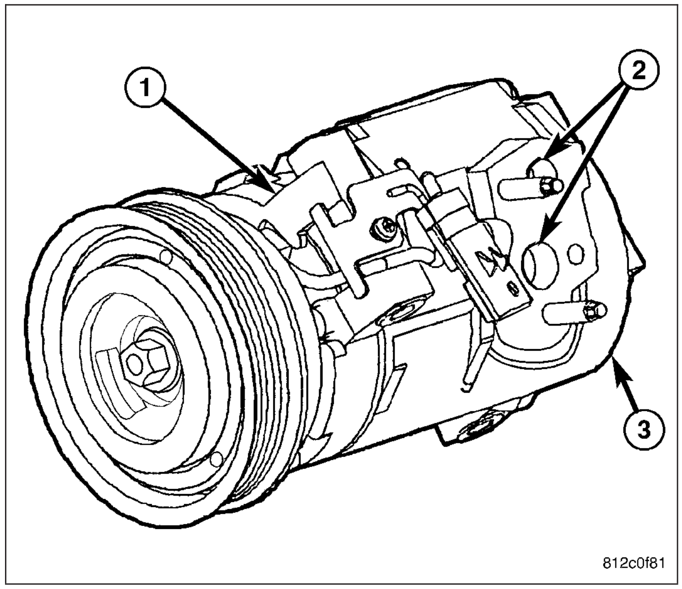
## A/C COMPRESSOR

**NOTE: Denso 10S17 A/C compressor shown. Visteon HS-18 compressor similar.**

The A/C system on vehicles equipped with the 2.8L diesel engine use a Denso 10S17 ten cylinder, double-acting swash plate-type A/C compressor (1). This A/C compressor has a fixed displacement of 170 cubic centimeters (10.374 cubic inches).

The A/C system on models equipped with the 3.7L engine use a Visteon HS-18 A/C compressor. This A/C compressor is a 10 cylinder reciprocating swash plate-type compressor with a fixed displacement of 180 cubic centimeters (10.9 cubic inches).

Both A/C compressors have the suction and discharge ports (2) located on the compressor cylinder head (3) at the rear of the compressor and have a label identifying the use of R-134a refrigerant.



## HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the A/C compressor. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components, caused by condenser air flow restriction or an overcharge of refrigerant.

## OPERATION

## A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

The A/C compressor cannot be repaired and, if faulty or damaged, it must be replaced. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service. If an internal failure of the A/C compressor has occurred, the A/C accumulator must also be replaced.

## HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

## DIAGNOSIS AND TESTING

## A/C COMPRESSOR

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CLUTCH-A/C COMPRESSOR - INSTALLATION).
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DESCRIPTION - REFRIGERANT LINES).
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE). If the high pressure relief valve still does not seat properly, replace the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - REMOVAL).
6. If the noise is from liquid refrigerant slugging in the A/C suction line, replace the A/C accumulator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR-A/C - REMOVAL) and check the refrigerant oil level and the refrigerant system charge (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING- STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
7. If a slugging condition still exists after replacing the A/C accumulator, then replace the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - REMOVAL) and repeat Step 1.

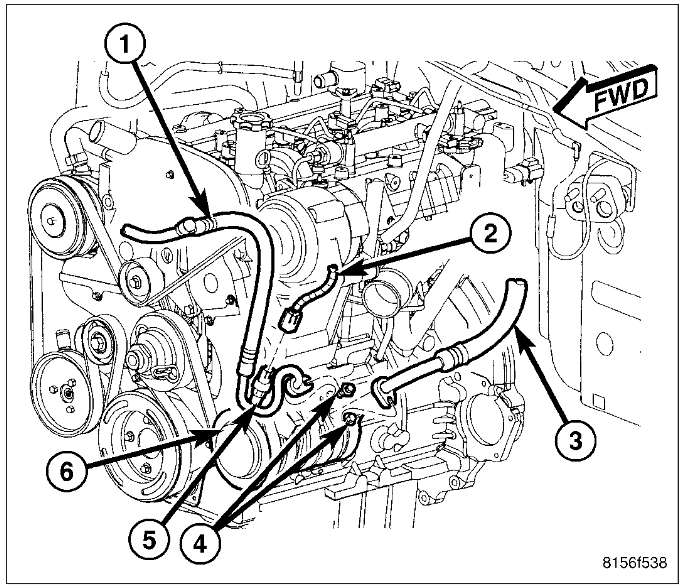
## REMOVAL

## 2.8L DIESEL ENGINE

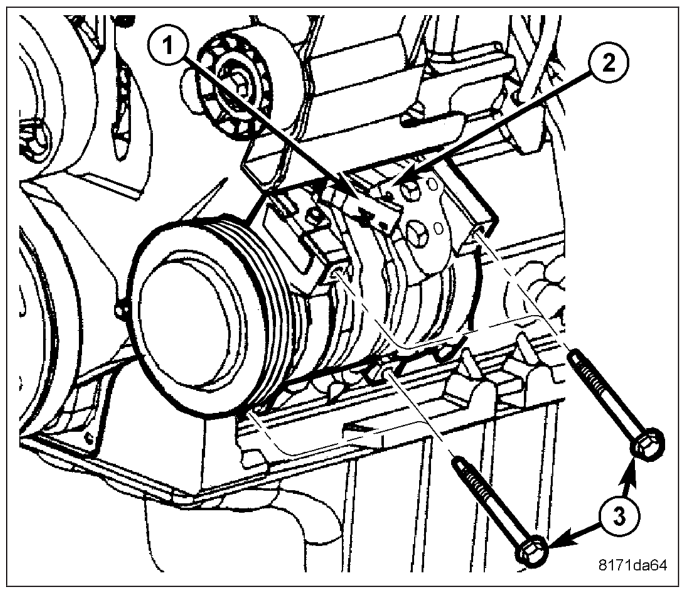
**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch field coil or the engine.**

**NOTE: RHD model shown. LHD model similar.**



1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).
3. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Raise and support the vehicle.
5. Remove the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL).
6. If necessary, disconnect the engine wire harness (2) from the A/C high pressure switch (5).
7. Remove the bolts (4) that secure the A/C suction line (3) and the A/C discharge line (1) to the A/C compressor (6) and disconnect the lines from the compressor.
8. Remove and discard the O-ring seals from the refrigerant line fittings and install plugs in, or tape over the opened fittings and the compressor ports.
9. Disconnect the engine wire harness from the A/C clutch field coil connector (1).
10. Support the A/C compressor (2) and remove the four bolts (3) that secure the compressor to the engine.
11. Remove the A/C compressor from the engine compartment.

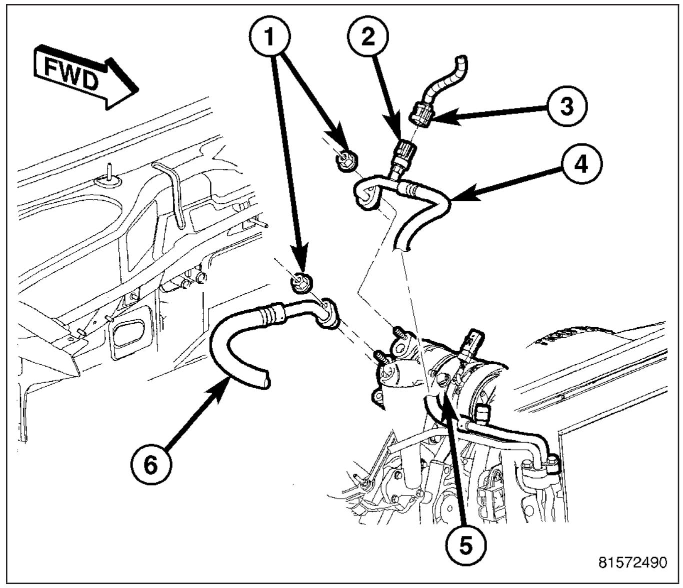


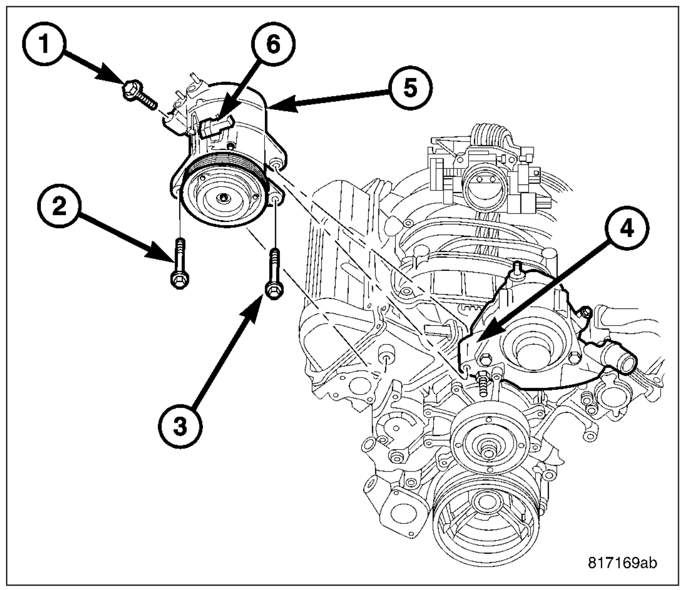
## 3.7L ENGINE

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch field coil or the engine.**

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).
3. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
4. Disconnect the wire harness connector (3) from the A/C pressure transducer (2).
5. Remove the nuts (1) that secure the A/C discharge line (4) and the A/C suction line (6) to the A/C compressor (5).
6. Disconnect the A/C discharge line and the A/C suction line from the A/C compressor and remove and discard the O-ring seals.
7. Install plugs in, or tape over the opened refrigerant line fittings and compressor ports.
8. Disconnect the engine wire harness from the clutch field coil connector (6).
9. Remove the three bolts (1, 2 and 3) that secure the A/C compressor (5) to the engine and mounting bracket (4) and remove the compressor.





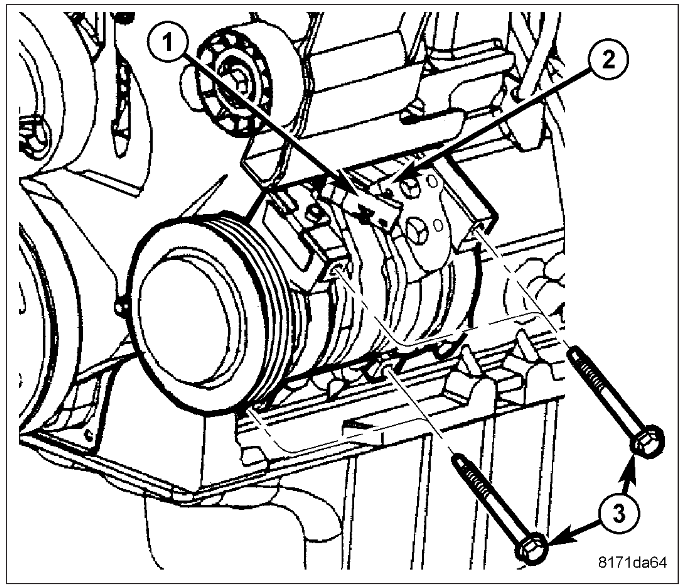
## INSTALLATION

## 2.8L DIESEL ENGINE

**NOTE: If the A/C compressor is being replaced, be certain to check the refrigerant oil level (refer to Refrigerant Oil in this group). Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

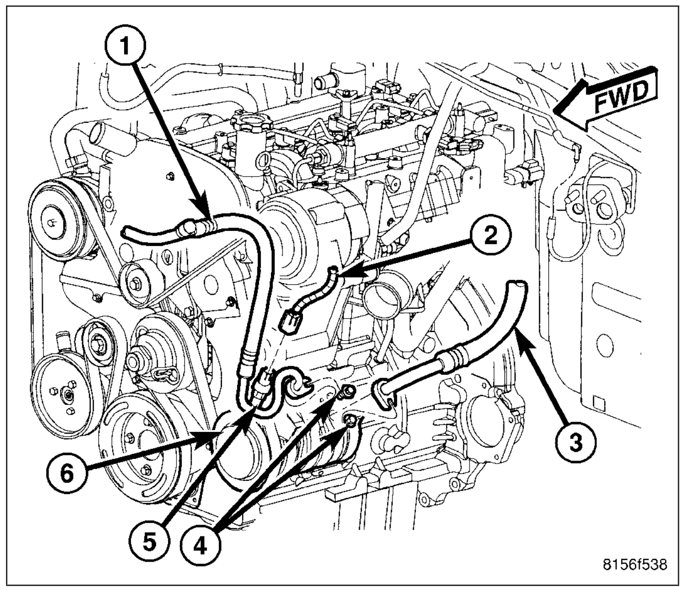
**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

1. Position the A/C compressor (2) onto the engine.
2. Install the four bolts (3) that secure the A/C compressor to the engine. Tighten the bolts to 24.5 N·m (18 ft. lbs.).
3. Connect the engine wire harness to the A/C clutch field coil connector (1).



**NOTE: RHD model shown. LHD model similar.**

4. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
5. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Connect the A/C discharge line (1) and the A/C suction line (3) to the A/C compressor (6) and install the retaining bolts (4). Tighten the bolts to 12 N·m (106 in. lbs.).
7. If disconnected, connect the engine wire harness (2) to the A/C high pressure switch (5).
8. Install the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).
9. Lower the vehicle.
10. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

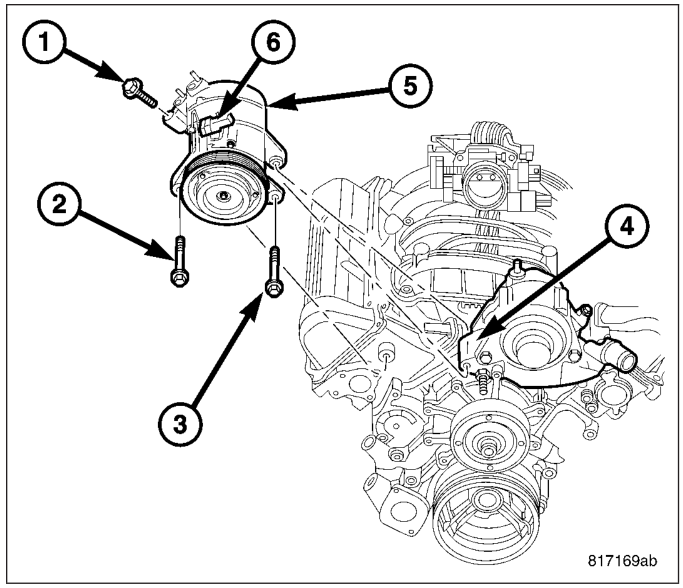


## 3.7L ENGINE

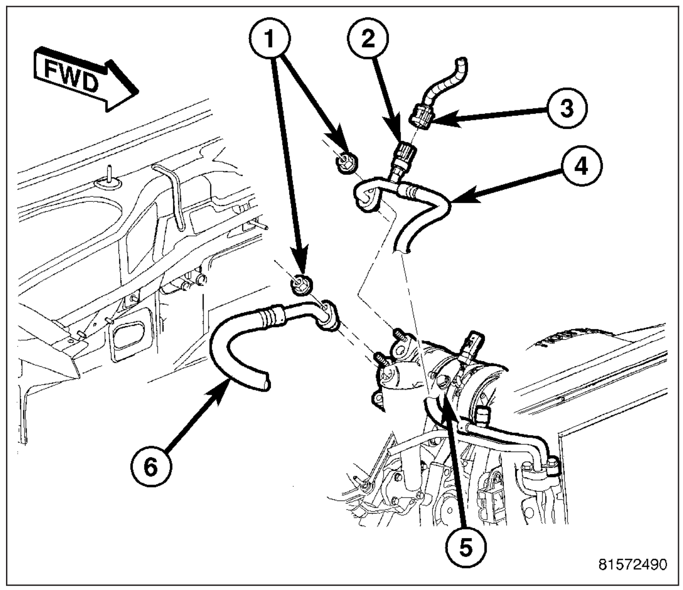
**NOTE: If the A/C compressor is being replaced, be certain to check the refrigerant oil level (refer to Refrigerant Oil in this group). Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

1. Position the A/C compressor (5) onto the engine and mounting bracket (4).
2. Install and hand tighten the three bolts that secure the A/C compressor to the engine and mounting bracket.
3. Tighten the mounting bolts in the following sequence:
   - The rear bolt (1) to 55 N·m (41 ft. lbs.).
   - The front inboard bolt (3) to 40 N·m (30 ft. lbs.).
   - The front outboard bolt (2) to 55 N·m (41 ft. lbs.).
4. Connect the wire harness connector to the A/C clutch field coil (6).



5. Remove the tape or plugs from the opened refrigerant line fittings and compressor ports.
6. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Connect the A/C discharge line (4) and the A/C suction line (6) to the A/C compressor (5).
8. Install the nuts (1) that secure the A/C suction and discharge lines to the A/C compressor. Tighten the nuts to 12 N·m (105 in. lbs.).
9. Connect the wire harness connector (3) to the A/C pressure transducer (2).
10. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).



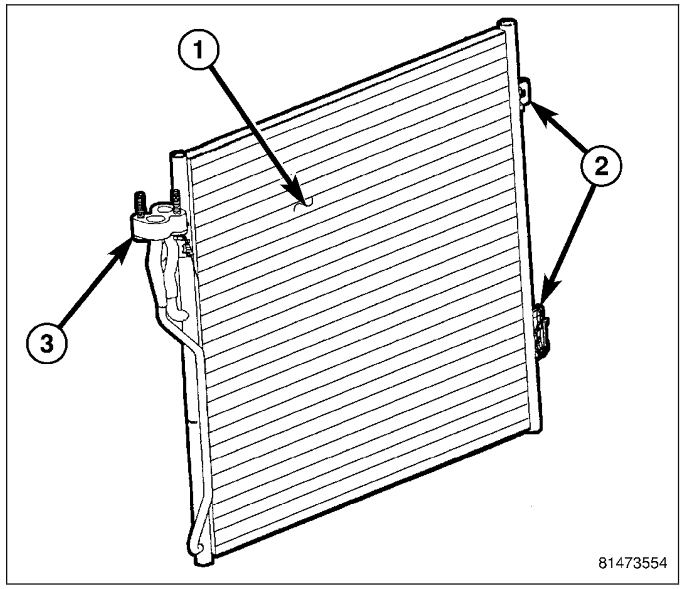
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

# CONDENSER-A/C

## DESCRIPTION

The A/C condenser (1) is located in the front of the engine compartment behind the grille. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with mounting provisions (2) and a tapping block (3) for the A/C refrigerant lines.



## OPERATION

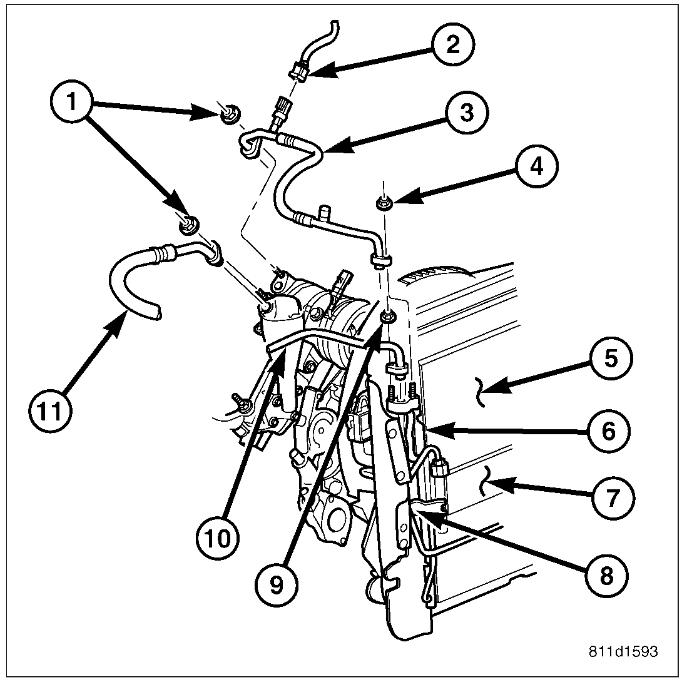
When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

The A/C condenser cannot be repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**CAUTION: Before removing the A/C condenser, note the location of each of the radiator/condenser air seals. These air seals are used to direct air through the A/C condenser and radiator. The air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.**

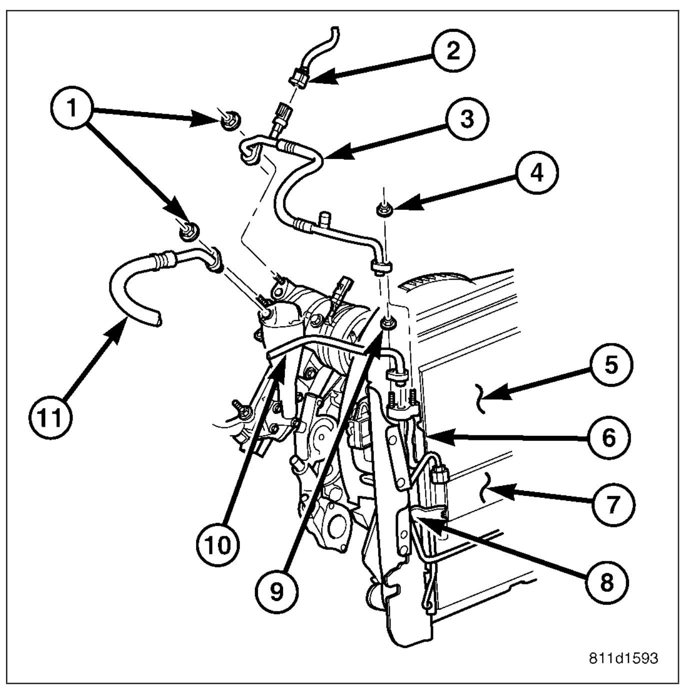


1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Remove the nuts (4 and 9) that secure the A/C discharge line (3) and the A/C liquid line (10) to the A/C condenser (5).
4. Disconnect the A/C discharge line and the A/C liquid line from the A/C condenser and remove and discard the O-ring seals.
5. Install plugs in, or tape over all of the opened refrigerant line fittings and condenser ports.
6. Remove the upper radiator crossmember (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - REMOVAL).
7. If equipped, remove the two bolts (8) that secure the automatic transmission cooler (7) to the radiator and position the transmission cooler aside.
8. Remove the two bolts (6) that secure the upper A/C condenser brackets to the radiator.
9. Carefully lift the A/C condenser straight up to disconnect the lower brackets from the radiator and remove the A/C condenser from the engine compartment.

## INSTALLATION

**NOTE: If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**



1. Carefully position the A/C condenser (5) into the engine compartment and engage the lower condenser brackets to the radiator.
2. Install the two bolts (6) that secure the upper condenser brackets to the radiator. Tighten the bolts to 5 N·m (44 in. lbs.).
3. If equipped, position the automatic transmission cooler (7) to the radiator and install the two retaining bolts (8). Tighten the bolts to 5 N·m (44 in. lbs.).
4. Install the upper radiator crossmember (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - INSTALLATION).
5. Remove the tape or plugs from the refrigerant line fittings and condenser ports.
6. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Connect the A/C liquid line (10) and the A/C discharge line (3) to the A/C condenser and install the retaining nuts (4 and 9). Tighten the nuts to 22.5 N·m (200 in. lbs.).

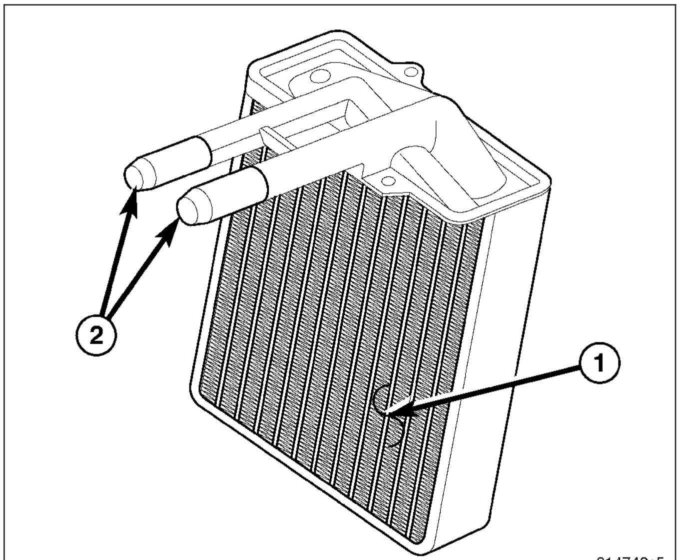
8. Reconnect the negative battery cable.
9. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
10. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

# CORE-HEATER

## DESCRIPTION

The heater core is mounted in the HVAC housing, located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes and fins (1). The heater core inlet and outlet tubes (2) are integral to the heater core and cannot be serviced separately.

The heater core is serviced by removing the HVAC housing from the vehicle.



814742c5

## OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door(s) allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

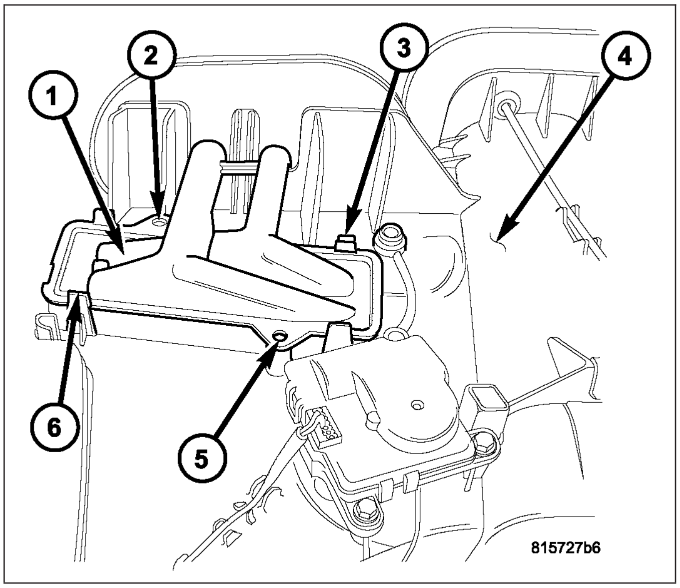
**NOTE: LHD model shown in illustration. RHD models similar.**

1. Remove the HVAC housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - REMOVAL).

**NOTE: If the rubber flange around the heater core tubes is deformed or damaged, the flange must be replaced.**

2. If equipped, remove the two screws (2 and 5) that secure the heater core (1) into the top of the HVAC housing (4).

**NOTE: If the foam insulator around the heater core is deformed or damaged, the insulator must be replaced.**



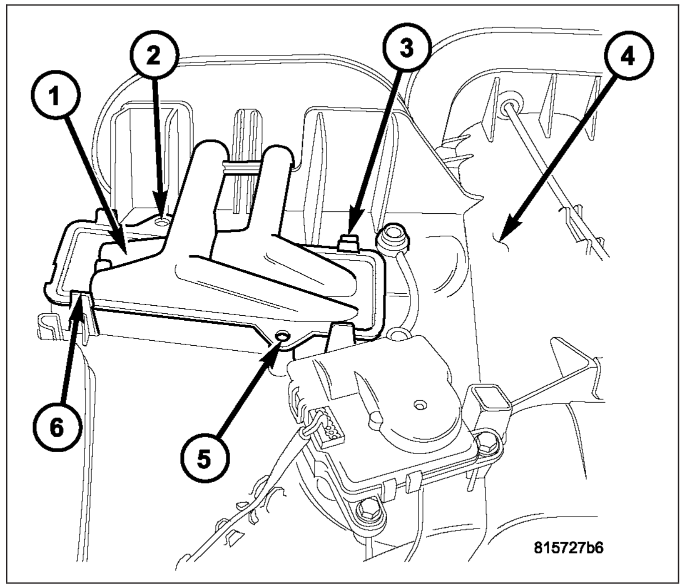
815727b6

3. Disengage the four retaining tabs (3 and 6) that secure the heater core to the HVAC housing and carefully remove the heater core from the housing.

## INSTALLATION

**NOTE: Make sure that the foam insulator is properly positioned in the HVAC housing.**

1. Carefully install the heater core (1) into the top of the HVAC housing (4).
2. Engage the four retaining tabs (3 and 6) that secure the heater core to the HVAC housing.
3. If equipped, install the two screws (2 and 5) that secure the heater core to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).



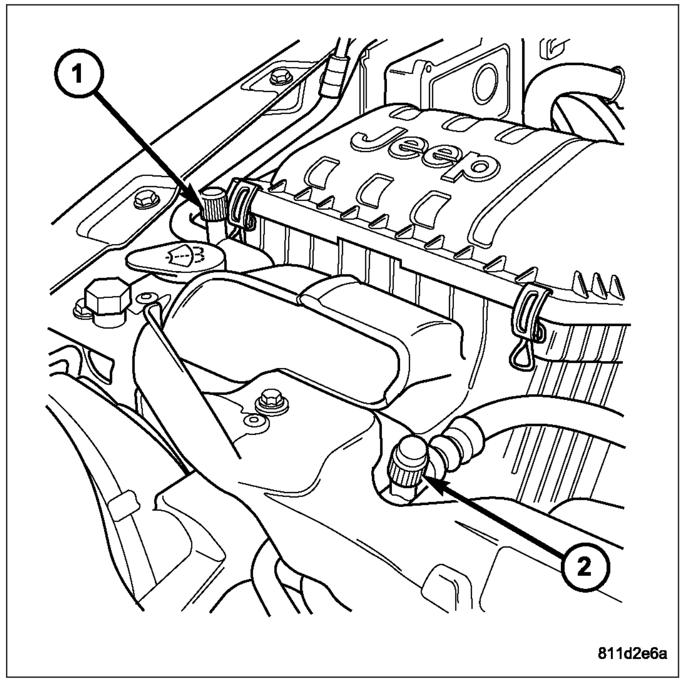
**NOTE: If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).**

4. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).

# CORE-VALVE-SERVICE PORT

## DESCRIPTION

**NOTE: 3.7L engine shown in illustration. 2.8L engine similar.**



Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

The low-side service port (1) is located on the A/C liquid line near the air filter housing. The high-side service port (2) is located on the A/C discharge line near the A/C condenser. Both the high-side and low-side A/C service port valve cores are serviceable.

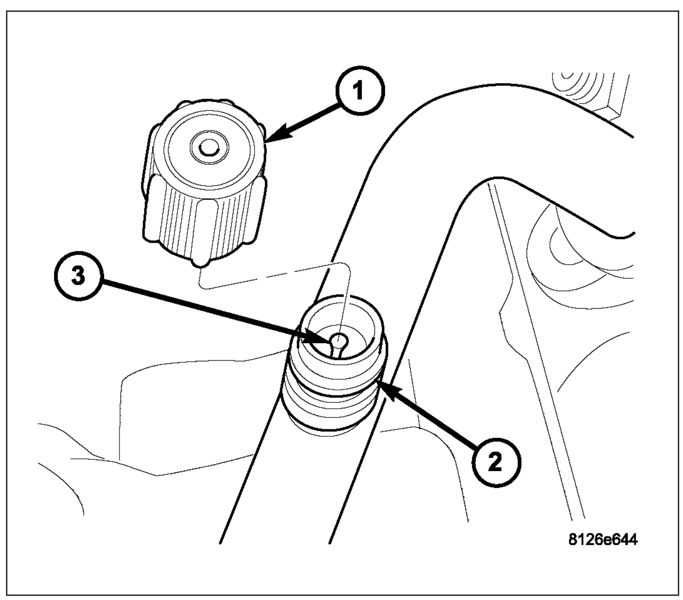
**NOTE: The protective cap aids in service port sealing and helps protects the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.**

Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

## REMOVAL

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

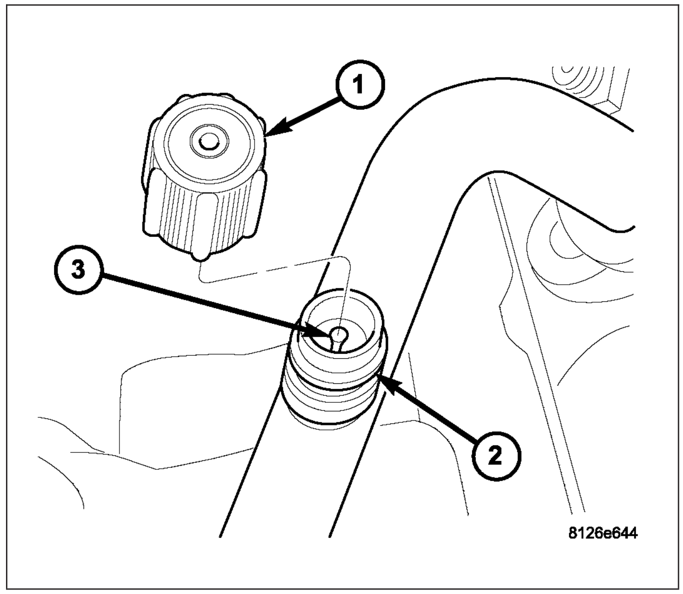
**NOTE: Typical A/C service port shown.**



1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in or tape over the opened service port(s).

## INSTALLATION

**NOTE: Typical A/C service port shown.**



1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

**CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.**

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).
4. Evacuate the refrigerant system (r to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
5. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

**NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.**

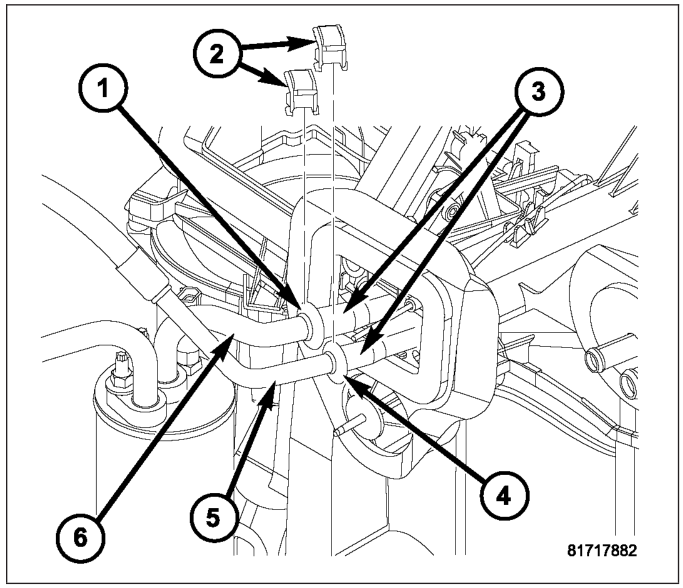
6. Install the protective cap (1) onto the service port.

# COUPLER-REFRIGERANT LINE

## DESCRIPTION

Spring-lock type refrigerant line couplers (1 and 4) are used to connect the A/C liquid and suction lines (5 and 6) to the A/C evaporator tubes (3) on LHD models. Secondary retaining clips (2) are installed over the connected couplers for added protection.

The spring-lock refrigerant line couplers require special disconnect tools for disengaging the two coupler halves.

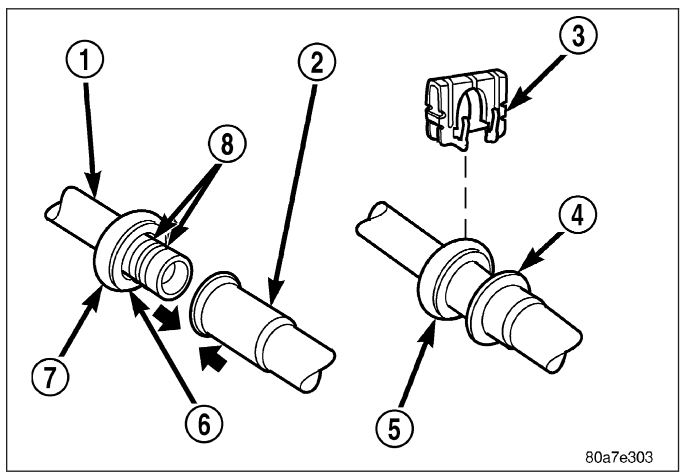


## OPERATION

The spring-lock type refrigerant line coupler is held together by a garter spring (6) inside a circular cage (7) on the male half of the fitting (1). When the two coupler halves are connected, the flared end of the female fitting (2) slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage. Some applications use a connection indicator ring (4) to help indicate when the two coupler halves are fully connected.

Two O-rings (8) are used to seal the coupler connections. These O-rings are compatible with R-134a refrigerant and must be replaced with O-rings made of the same material.

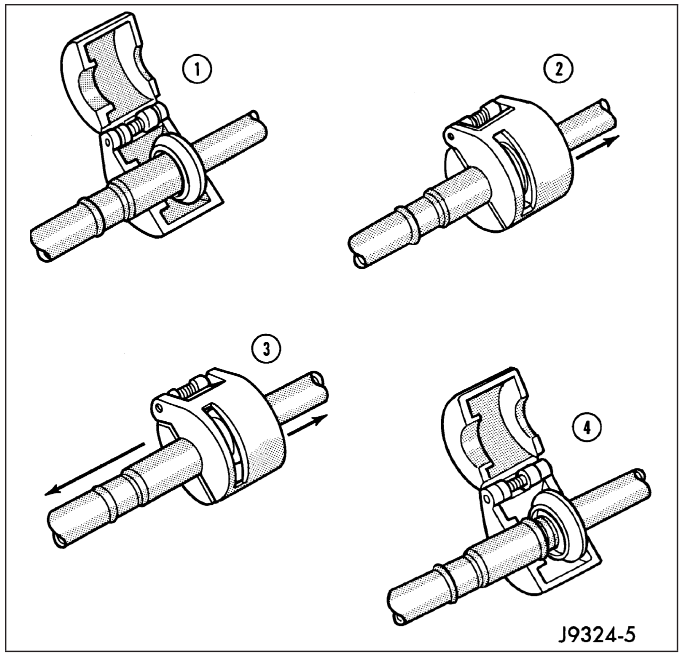
A secondary retaining clip (3) is installed over the connected coupler (5) for added protection.



## REMOVAL

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Remove the secondary retaining clip from the spring-lock type refrigerant line coupler.
3. Fit the proper size A/C line disconnect tool (Special Tool Kit 7193 or equivalent) over the coupler cage (1).
4. Close the two halves of the A/C line disconnect tool around the coupler (2).

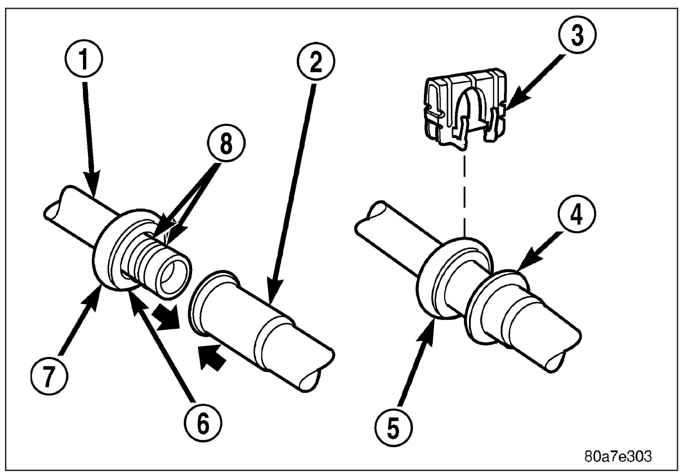


**NOTE: The garter spring may not release if the A/C line disconnect tool is cocked while pushing it into the coupler cage opening.**

5. Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring (3). Once the garter spring is expanded, pull on the refrigerant line attached to the female half of the coupler until the flange on the female fitting is separated from the garter spring and cage on the male fitting.
6. Open and remove the A/C line disconnect tool from the refrigerant line coupler (4).

## INSTALLATION

1. Clean any dirt or foreign material from the spring-lock type refrigerant line coupler.
2. Check to make sure that the garter spring (6) is located within the cage (7) of the male half of the refrigerant line coupler (1), and that the garter spring is not damaged.
   a. If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.
   b. If the garter spring is damaged, remove it from the coupler cage with a small hook (DO NOT use a screwdriver) and install a new garter spring.



**CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the connection to leak.**

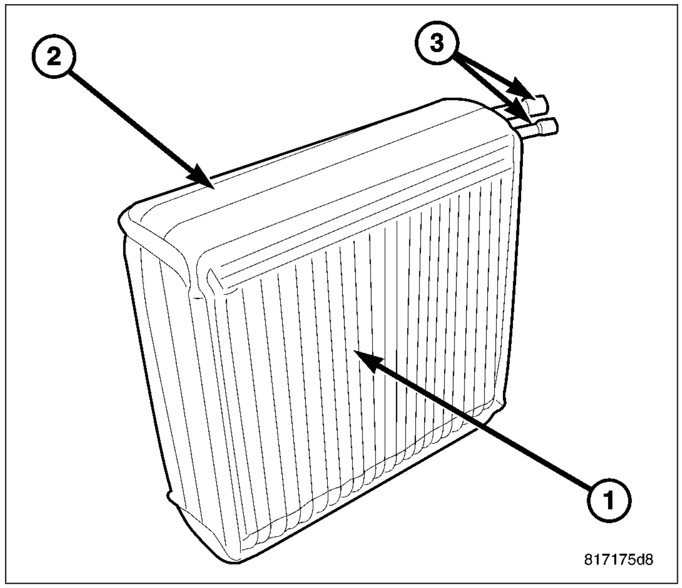
3. Install new O-rings (8) on the male half of the refrigerant line coupler.
4. Lubricate the O-rings, and the inside of the female half of the refrigerant line coupler (2) with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Position the female half of the coupler over the male half of the coupler.
6. Push together firmly on the two halves of the refrigerant line coupler until the garter spring in the cage on the male half of the coupler snaps over the flanged end on the female half of the coupler.
7. Make sure that the refrigerant line coupler is fully engaged by firmly pulling the refrigerant lines away from each other on both sides of the coupler.
8. Install the secondary retaining clip (3) over connected coupler cage (5).
9. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

10. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

# EVAPORATOR-A/C

## DESCRIPTION

**NOTE: LHD model shown. RHD model similar.**



The A/C evaporator (1) and its insulator (2) for the heating-A/C system is located within the HVAC housing, behind the instrument panel. The A/C evaporator is positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

On LHD models, the A/C liquid and suction lines are connected to the evaporator tubes (3) by use of rubber O-rings and quick-connect fittings (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COUPLER-REFRIGERANT LINE - DESCRIPTION for more information). The refrigerant lines on RHD models are connected to the A/C evaporator by use of rubber O-rings, tapping blocks and retaining nuts.

The A/C evaporator can be serviced by removing and disassembling the HVAC housing assembly.

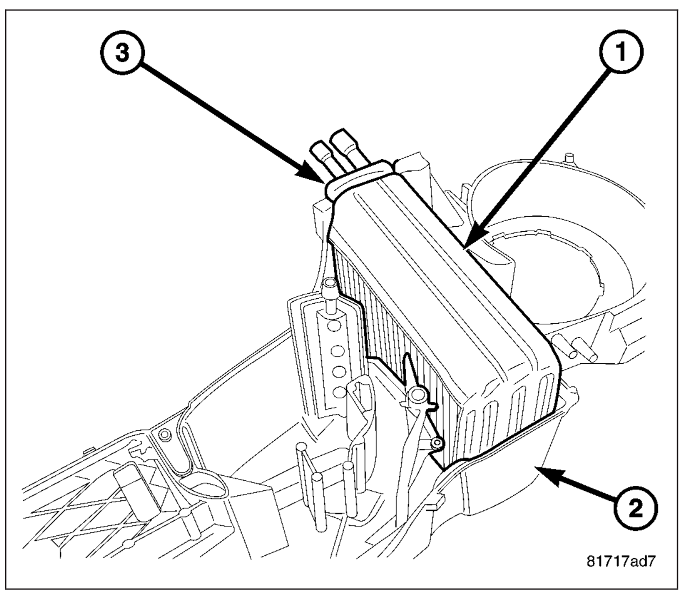
## OPERATION

Refrigerant enters the A/C evaporator through the A/C orifice tube as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

The A/C evaporator cannot be repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

**NOTE: LHD model shown. RHD model similar.**



1. Remove the HVAC housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - REMOVAL).
2. Disassemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - DISASSEMBLY).

**NOTE: If the foam insulator around the A/C evaporator is deformed or damaged, the insulator must be replaced.**

3. Carefully lift the A/C evaporator (1) and the foam insulator out of the lower half of the HVAC housing (2).

**NOTE: If the rubber seal around the evaporator tubes is deformed or damaged, the seal must be replaced.**

4. If required, remove the rubber seal (3) from around the evaporator tubes.

## INSTALLATION

**NOTE: If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system.**

**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

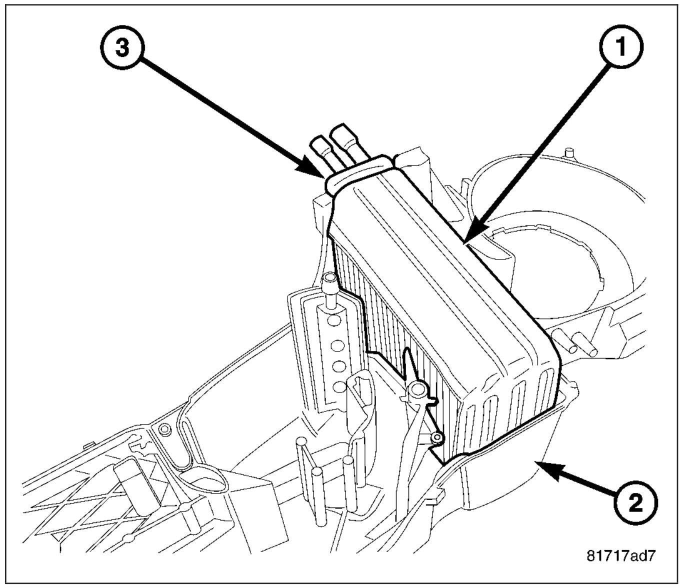
**NOTE: LHD model shown. RHD model similar.**

**NOTE: Make sure that the rubber seal is properly positioned in the HVAC housing.**

1. If removed, install the rubber seal (3) around the tubes of the A/C evaporator (1).

**NOTE: Make sure that the foam insulator is properly positioned in the HVAC housing.**

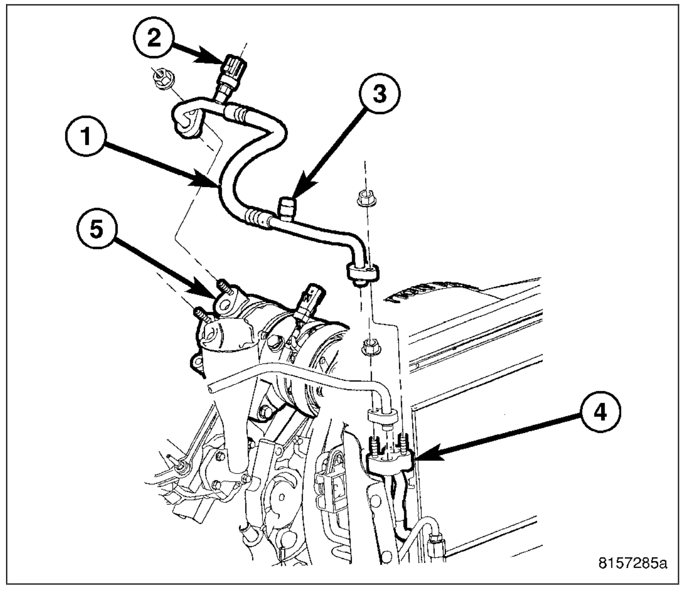
2. Install the A/C evaporator and its foam insulator into the lower half of the HVAC housing (2).
3. Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - ASSEMBLY).
4. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).



# LINE-A/C DISCHARGE

## DESCRIPTION

**NOTE: 3.7L engine shown in illustration. 2.8L engine similar.**



The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor (5) to the A/C condenser (4). The A/C discharge line includes the high side service port (3) and a fitting for the A/C pressure transducer (2) (or the A/C high pressure switch, depending on engine application).

**CAUTION: Use only the O-ring seals specified for the vehicle. Failure to use the correct O-ring seals will cause the refrigerant system connections to leak.**

The A/C discharge line has no serviceable parts except for the rubber O-ring seals and the high service port valve core. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C discharge line is removed and installed.

The A/C discharge line cannot be repaired and, if leaking or damaged, it must be replaced.

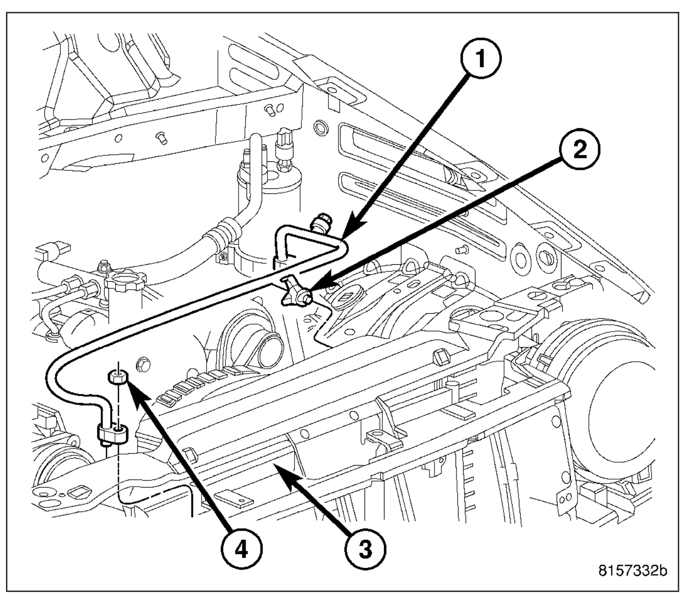
## REMOVAL

## 2.8L DIESEL ENGINE

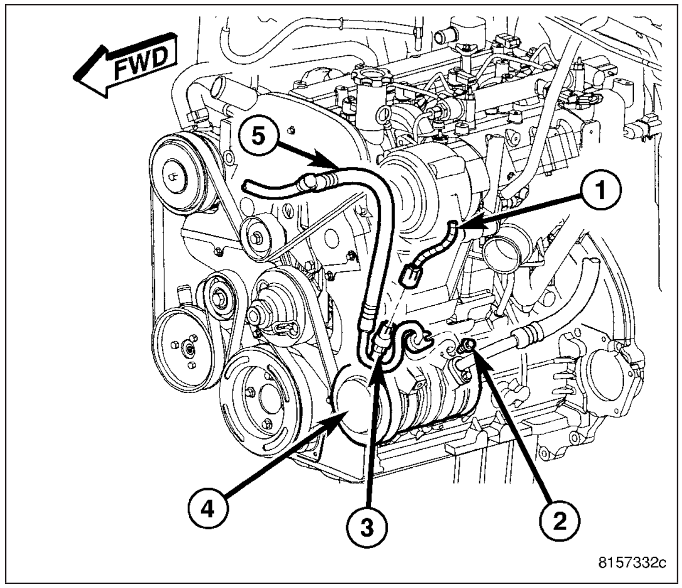
**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: RHD model shown in illustrations. LHD model similar.**

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY).
3. Remove the nut (4) that secures the A/C discharge line (1) to the A/C condenser (3) and disconnect the line from the condenser.
4. Remove and discard the O-ring seal from the refrigerant line fitting and install plugs in, or tape over the opened fitting and condenser port.
5. Disengage the A/C discharge line from the retaining clip (2).



6. Raise and support the vehicle.
7. Remove the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL).
8. Disconnect the engine wire harness (1) from the A/C high pressure switch (3) and if required, remove the switch from the A/C discharge line (5).
9. Remove the bolt (2) that secures the A/C discharge line to the A/C compressor (4) and disconnect the line from the compressor.
10. Remove and discard the O-ring seal from the refrigerant line fitting and install plugs in, or tape over the opened fitting and compressor port.
11. Remove the A/C discharge line from the engine compartment.

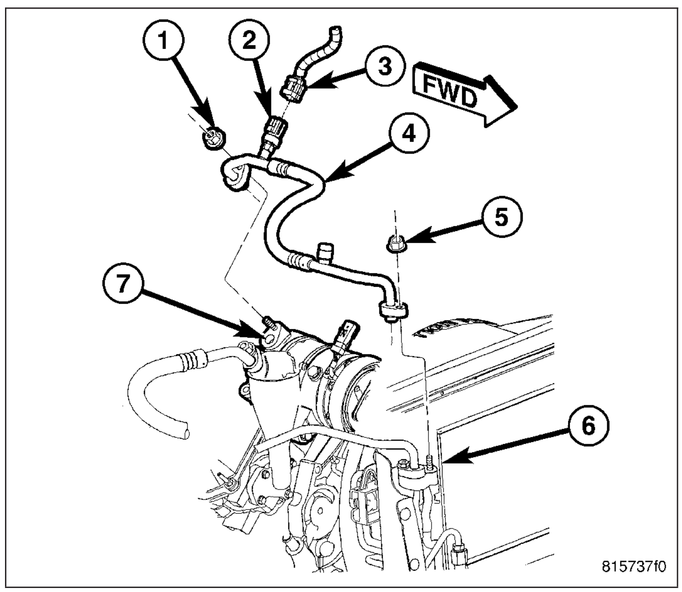


## 3.7L ENGINE

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: LHD model shown. RHD model similar.**

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Disconnect the wire harness connector (3) from the A/C pressure transducer (2) and, if required, remove the transducer from the A/C discharge line (4).
4. Remove the nuts (1 and 5) that secure the A/C discharge line to the A/C condenser (6) and the A/C compressor (7).
5. Disconnect the A/C discharge line from the A/C condenser and the A/C compressor and remove and discard the O-ring seals.
6. Install plug in, or tape over the opened discharge line fittings and the compressor and condenser ports.



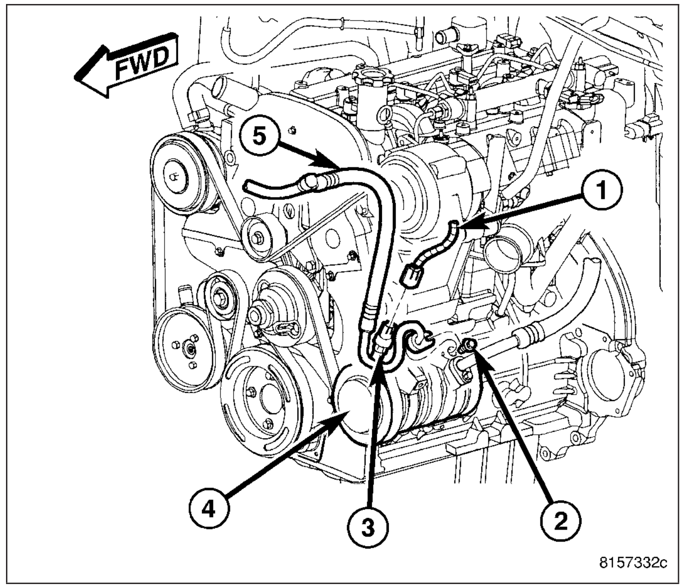
# INSTALLATION

## 2.8L DIESEL ENGINE

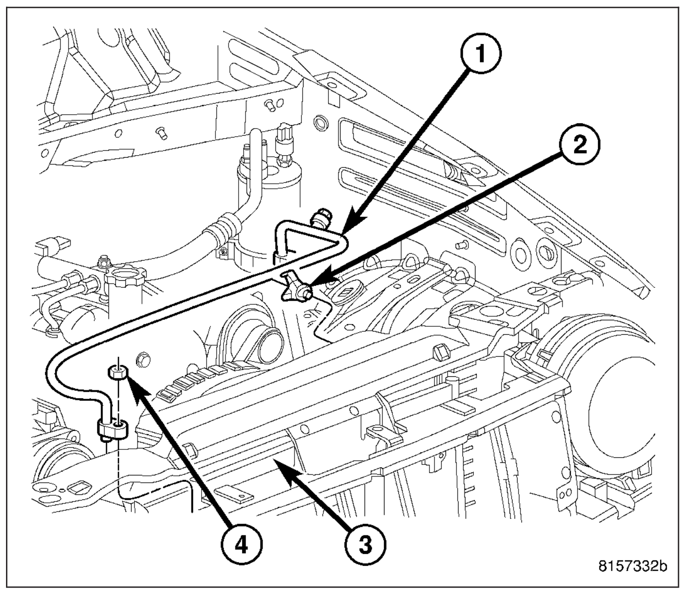
**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

**NOTE: RHD model shown in illustrations. LHD model similar.**

1. Position the A/C discharge line (5) into the engine compartment.
2. Remove the tape or plugs from the discharge line fitting and compressor port.
3. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C discharge line to the A/C compressor (4) and install the retaining bolt (2). Tighten the bolt to 12 N·m (106 ft. lbs.).
5. If removed, install the A/C high pressure switch (3) onto the A/C discharge line. Hand-tightened the switch securely.
6. Connect the engine wire harness (1) to the A/C high pressure switch.



7. Install the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).
8. Lower the vehicle.
9. Engage the A/C discharge line (1) into the retaining clip (2).
10. Remove the tape or plugs from the discharge line fitting and condenser port.
11. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
12. Connect the A/C discharge line to the A/C condenser (3).
13. Install the nut (4) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 22.5 N·m (200 in. lbs.).
14. Reconnect the negative battery cable.
15. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

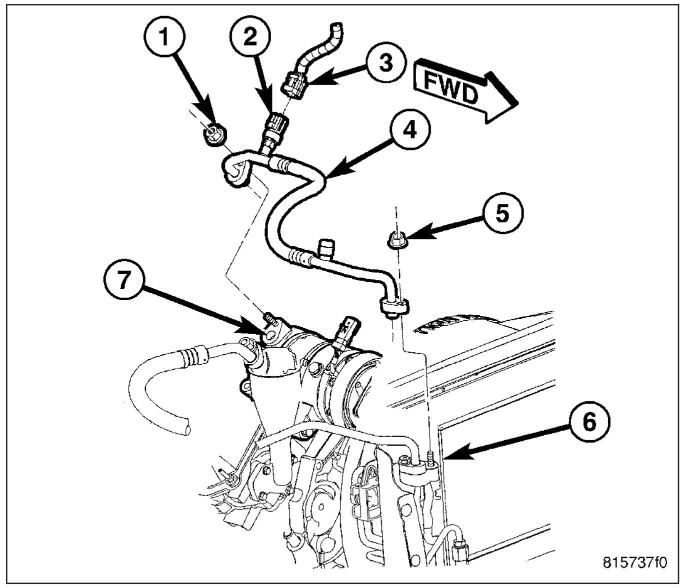


16. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## 3.7L ENGINE

**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

**NOTE: LHD model shown. RHD model similar.**

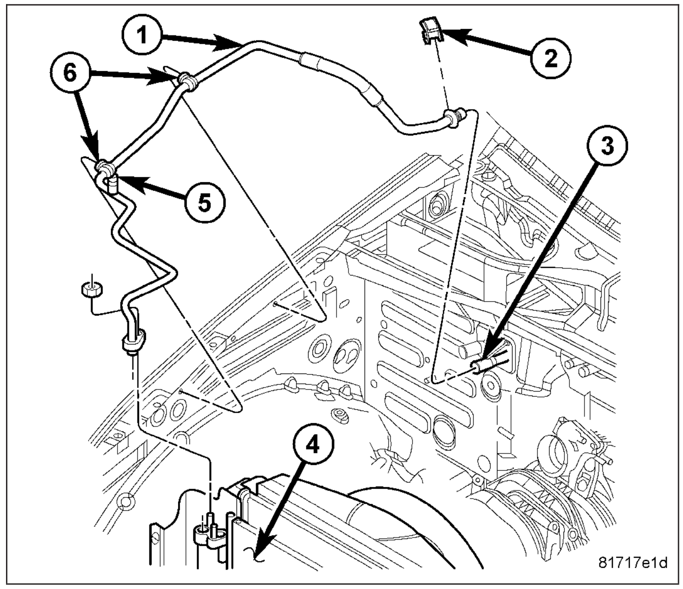


1. Position the A/C discharge line (4) into the engine compartment.
2. Remove the tape or plugs from the discharge line fittings and the compressor and condenser ports.
3. Lubricate a new rubber O-ring seals with clean refrigerant oil and install them on the discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C discharge line to the A/C compressor (7) and install the retaining nut (1). Tighten the nut to 27 N·m (20 ft. lbs.).
5. Connect the A/C discharge line to the A/C condenser (6) and install the retaining nut (5). Tighten the nut to 22.5 N·m (200 in. lbs.).
6. If removed, install the A/C pressure transducer (2) onto the A/C discharge line. Hand-tightened the transducer securely.
7. Connect the wire harness connector (3) to the A/C pressure transducer.
8. Reconnect the negative battery cable.
9. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
10. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

# LINE-A/C LIQUID

## DESCRIPTION

**NOTE: LHD model shown. RHD model similar.**



The A/C liquid line (1) is the refrigerant line that carries refrigerant from the A/C condenser (4) to the A/C evaporator (3). The A/C liquid line contains the fixed A/C orifice tube and the low-side service port (5). On LHD models, the A/C liquid line is serviced only as an assembly and uses a secondary retaining clip (2) installed over the connected spring lock coupler for added protection. On RHD models, the A/C liquid line is serviced in two sections.

**CAUTION: Use only the O-ring seals specified for the vehicle. Failure to use the correct O-ring seals will cause the refrigerant system connections to leak.**

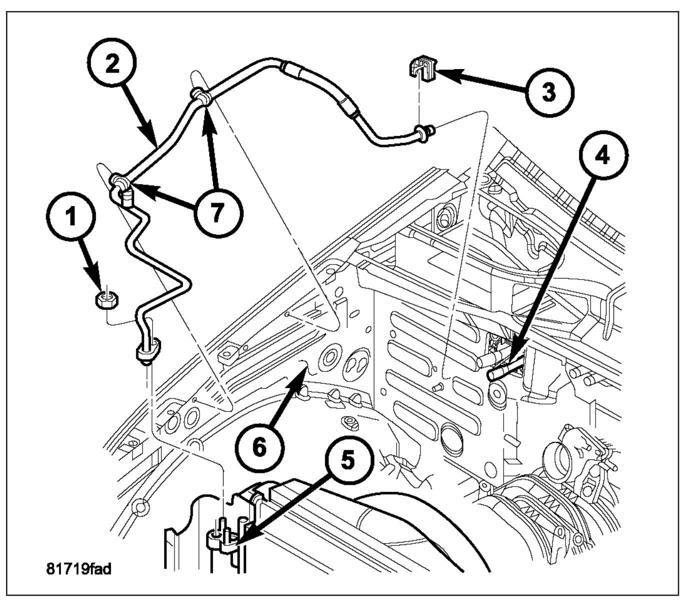
The A/C liquid line has no serviceable parts except for the rubber O-ring seals, plastic retainer clips (6) and the low-side service port valve and its protective cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C liquid line is removed and installed.

If the A/C liquid line is found to be leaking or damaged, it must be replaced.

## REMOVAL

## LHD MODEL

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

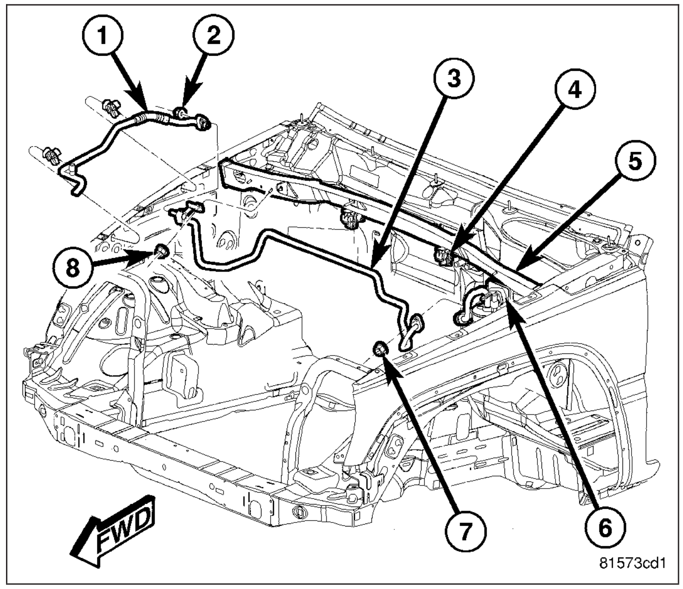


1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Remove the engine air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
4. Remove the nut (1) that secures the A/C liquid line (2) to the A/C condenser (5) and disconnect the line from the condenser.
5. Disengage the A/C liquid line from the retaining clips (7) located on the inner fender (6).
6. Remove the secondary retaining clip (3) from the liquid line spring-lock coupler and using the proper A/C line disconnect tool, disconnect the A/C liquid line from the evaporator inlet tube (4) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COUPLER-REFRIGERANT LINE - REMOVAL).

7. Remove the A/C liquid line from the engine compartment and remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the condenser and evaporator ports.

## RHD MODEL

**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

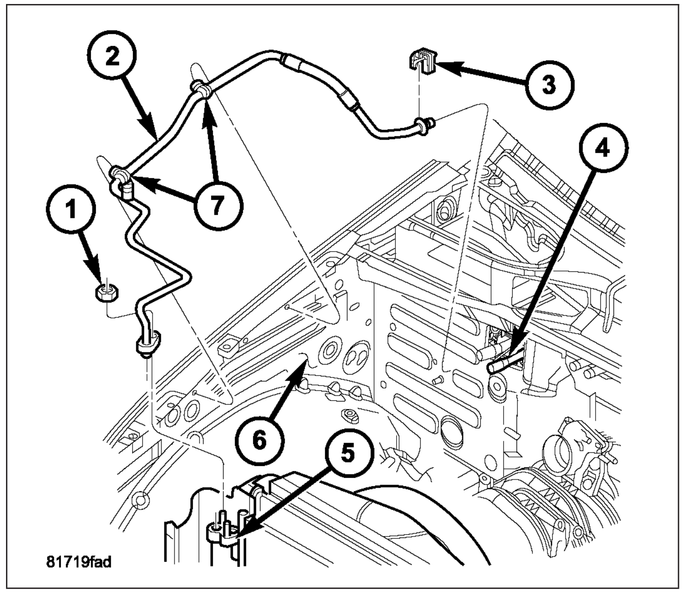


1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Remove the engine air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
4. Remove the front section of the A/C liquid line (1) from the A/C condenser and remove and discard the O-ring seal (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/CONDENSER-A/C - REMOVAL).
5. Disengage the A/C liquid line from the retaining clips located on the inner fender.
6. Remove the nut (2) that secures the front section of the A/C liquid line to rear section of the A/C liquid line (3) and disconnect the lines from each other.
7. Remove the nut (8) that secures the rear section of the A/C liquid line to the stud located on the dash panel (5).
8. Disengage the rear section of the A/C liquid line from the retaining clips (4) located on the dash panel.
9. Remove the nut (7) that secures the rear section of the A/C liquid line to the A/C evaporator (6) and disconnect the line from the evaporator.
10. Remove the A/C liquid lines from the engine compartment and remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the condenser and evaporator ports.

## INSTALLATION

## LHD MODEL

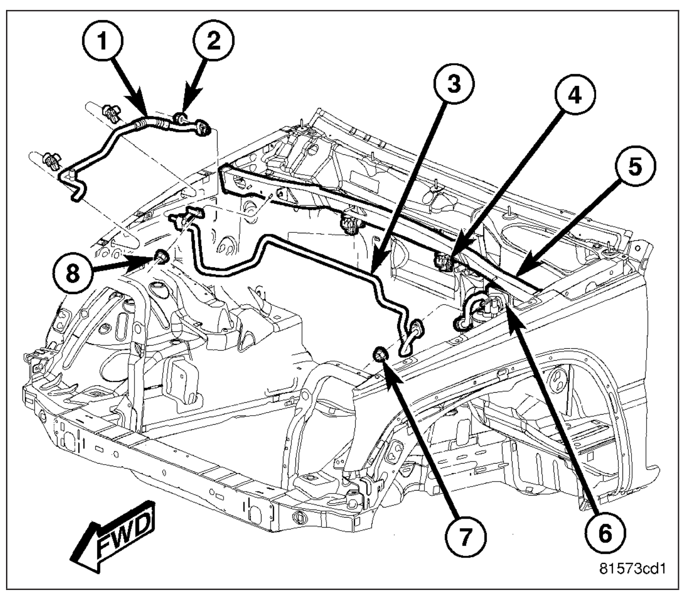
**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**



1. Position the A/C liquid line (2) into the engine compartment.
2. Remove the tape or plugs from the liquid line fittings and the condenser and evaporator ports.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the liquid line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C liquid line to the evaporator inlet tube (4) and install the secondary retaining clip (3) (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING/COUPLER-REFRIGERANT LINE - INSTALLATION).
5. Install the A/C liquid line into the retaining clips (7) located on the inner fender (6).
6. Connect the A/C liquid line to the A/C condenser (5) and install the retaining nut (1). Tighten the nut to 22.5 N·m (200 in. lbs.).
7. Install the engine air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).
8. Reconnect the negative battery cable.
9. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
10. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## RHD MODEL

**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**



1. Position the two sections of the A/C liquid line (1 and 3) into the engine compartment.
2. Remove the tape or plugs from the liquid line fittings and the condenser and evaporator ports.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the liquid line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the rear section of the A/C liquid line to the A/C evaporator (6) and install the retaining nut (7). Tighten the nut to 12.5 N·m (110 in. lbs.).
5. Engage the rear section of the A/C liquid line into the retaining clips (4) located on the dash panel (5).
6. Position the rear section of the A/C liquid line onto the stud located on the dash panel and install the retaining nut (8). Tighten the nut to 5 N·m (44 in. lbs.).
7. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line and install the retaining nut (2). Tighten the nut to 22.5 N·m (200 in. lbs.).
8. Engage the front section of the A/C liquid line into the retaining clips located on the inner fender.

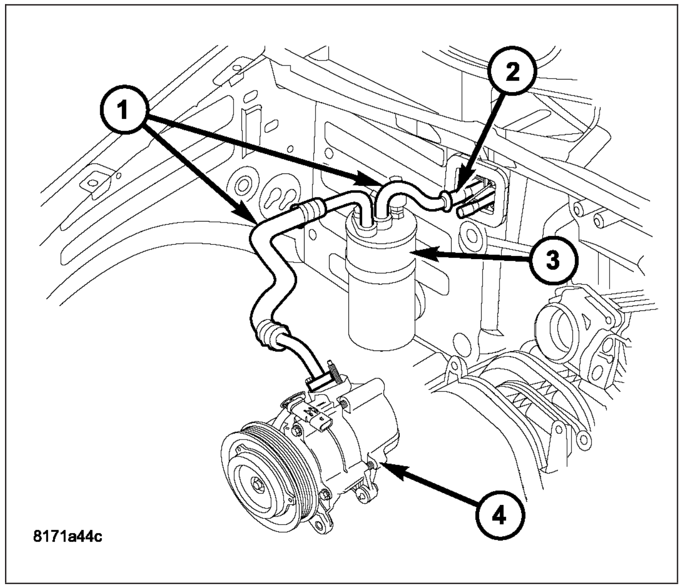
9. Install the front section of the A/C liquid line onto the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/CONDENSER-A/C - INSTALLATION).
10. Install the engine air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

# LINE-A/C SUCTION

## DESCRIPTION

**NOTE: 3.7L LHD shown. 2.8L and RHD similar.**

The A/C suction line (1) is the refrigerant line that carries refrigerant from the A/C evaporator (2) to the A/C accumulator (3), and then, to the A/C compressor (4). The A/C suction line is serviced in two sections.



**CAUTION: Use only the O-ring seals specified for the vehicle. Failure to use the correct O-ring seals will cause the refrigerant system connections to leak.**

The A/C suction lines have no serviceable parts except for the rubber O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever an A/C suction line is removed and installed.

If an A/C suction line is found to be leaking or is damaged, it must be replaced.

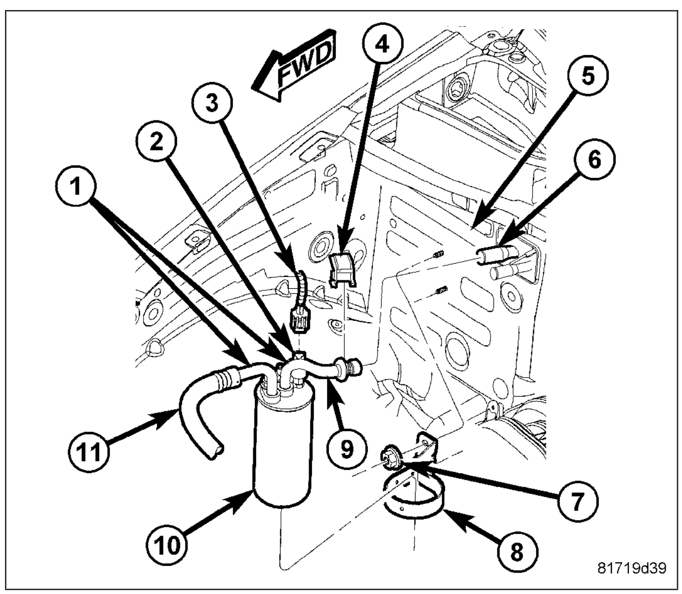
## REMOVAL

## 2.8L DIESEL ENGINE

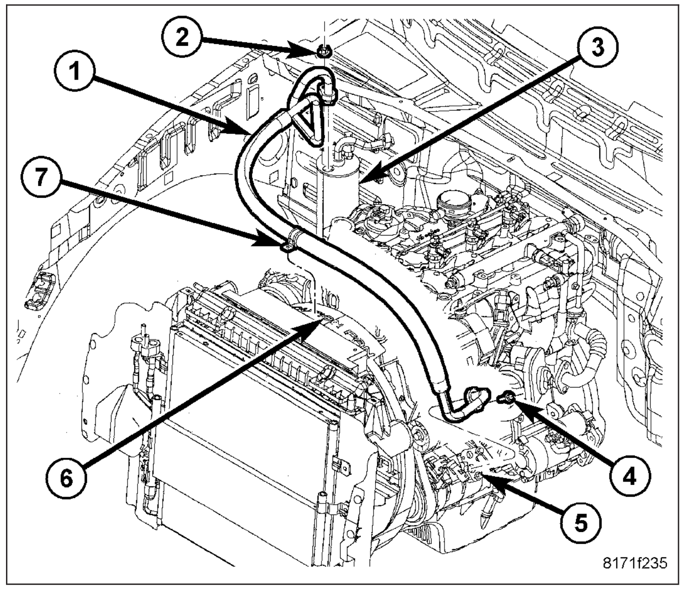
**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: LHD model shown in illustrations. RHD model similar.**

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. If servicing the rear section of the A/C suction line (9), proceed to Step 4. If servicing only the front section of the A/C suction line (11), go to Step 10.
4. Disconnect the wire lead and connector (3) from the A/C low pressure switch (2) and remove the switch from the A/C accumulator (10).
5. Remove the two nuts (7) that secure the accumulator bracket (8) to the dash panel (5).
6. On LHD models, remove the secondary retaining clip (4) from the suction line spring-lock coupler and using the proper A/C line disconnect tool, disconnect the rear section of the A/C suction line (9) from the evaporator outlet tube (6) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COUPLER-REFRIGERANT LINE - REMOVAL).



7. On RHD models, remove the nut that secures the rear section of the A/C suction line to the A/C evaporator and disconnect the line from the evaporator.
8. Remove the nut (1) that secures the rear section of the A/C suction line to the A/C accumulator and disconnect the line from the accumulator.
9. Remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the accumulator and evaporator ports.
10. Remove the nut (2) that secures the front section of the A/C suction line (1) to the A/C accumulator (3) and disconnect the line from the accumulator.
11. Remove and discard the O-ring seal from the refrigerant line fitting and install plugs in, or tape over the opened refrigerant line fitting and the accumulator port.
12. Disengage the retaining clip (7) that secures the A/C suction line to the top of the fan shroud (6).
13. Raise and support the vehicle.
14. Remove the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - REMOVAL).
15. Remove the bolt (4) that secures the A/C suction line to the A/C compressor (5) and disconnect the line from the compressor.
16. Remove and discard the O-ring seal from the refrigerant line fitting and install plugs in, or tape over the opened fitting and compressor port.



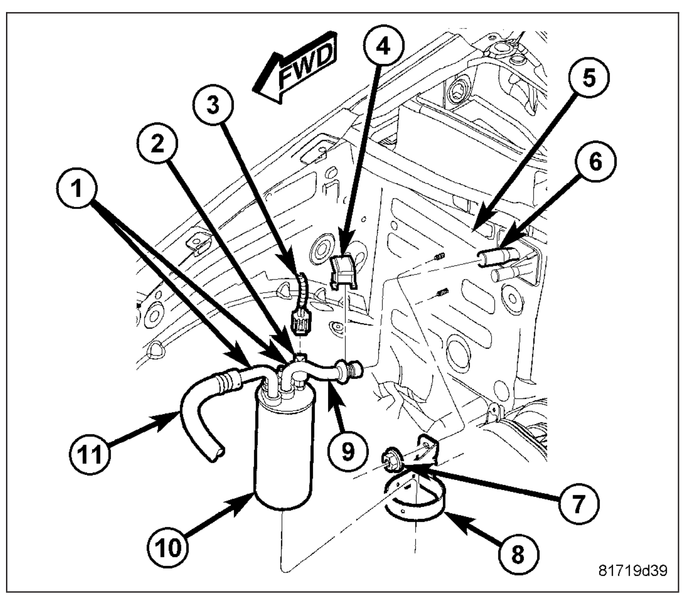
17. Remove the A/C suction line from the engine compartment.

## 3.7L ENGINE

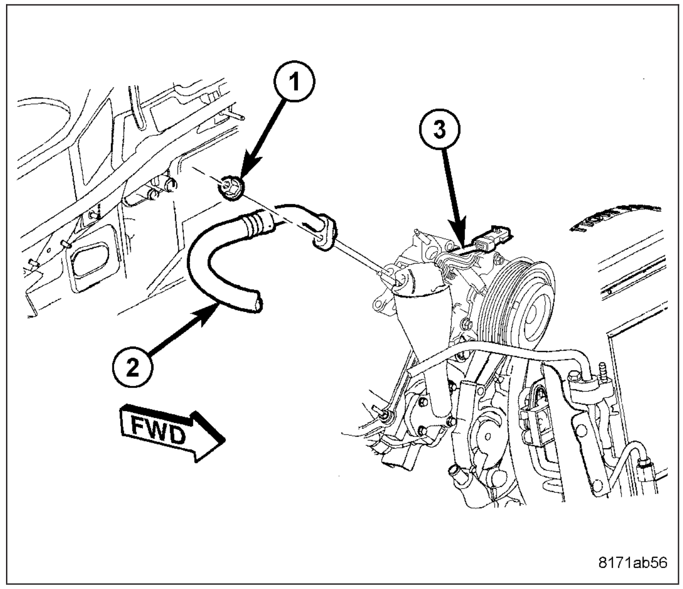
**WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.**

**NOTE: LHD model shown in illustrations. RHD model similar.**

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. If servicing the rear section of the A/C suction line (9), proceed to Step 4. If servicing only the front section of the A/C suction line (11), go to Step 10.
4. Disconnect the wire lead and connector (3) from the A/C low pressure switch (2) and remove the switch from the A/C accumulator (10).
5. Remove the two nuts (7) that secure the accumulator bracket (8) to the dash panel (5).
6. On LHD models, remove the secondary retaining clip (4) from the suction line spring-lock coupler and using the proper A/C line disconnect tool, disconnect the rear section of the A/C suction line (9) from the evaporator outlet tube (6) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COUPLER-REFRIGERANT LINE - REMOVAL).



7. On RHD models, remove the nut that secures the rear section of the A/C suction line to the A/C evaporator and disconnect the line from the evaporator.
8. Remove the nut (1) that secures the rear section of the A/C suction line to the A/C accumulator and disconnect the line from the accumulator.
9. Remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the accumulator and evaporator ports.
10. Remove the nut (1) that secures the front section of the A/C suction line (11) to the A/C accumulator (10) and disconnect the line from the accumulator and remove and discard the O-ring seal.
11. Remove the nut (1) that secures the front section of the A/C suction line (2) to the A/C compressor (3) and disconnect the line from the compressor.
12. Remove and discard the O-ring seals and install plugs in, or tape over the opened refrigerant line fittings and the accumulator and compressor ports.



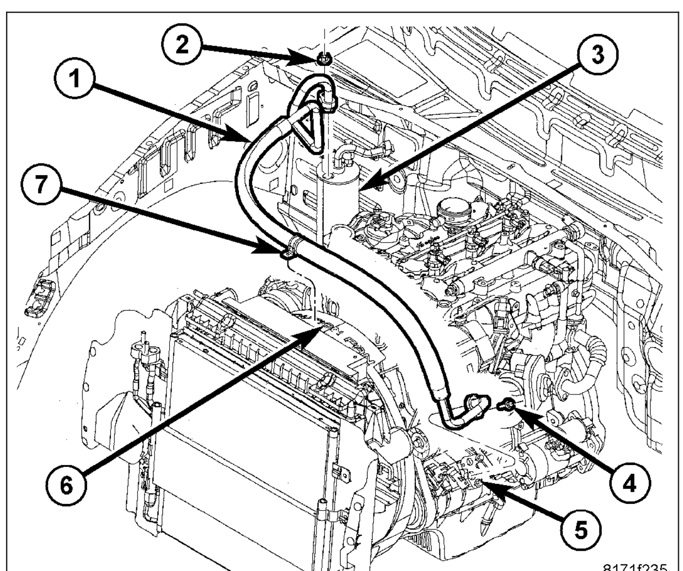
## INSTALLATION

## 2.8L DIESEL ENGINE

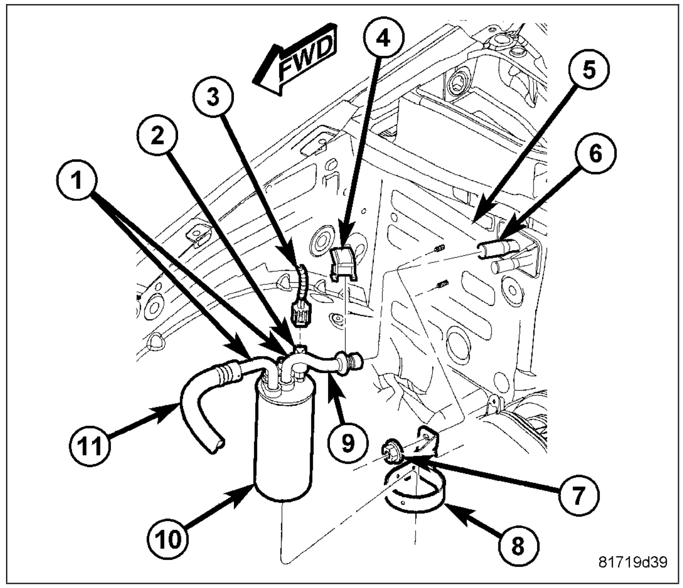
**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

**NOTE: LHD model shown in illustrations. RHD model similar.**

1. If servicing only the rear section of the A/C suction line, go to Step 13.
2. Position the front section of the A/C suction line (3) into the engine compartment.
3. Remove the tape or plugs from the discharge line fitting and compressor port.
4. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the A/C discharge line to the A/C compressor (4) and install the retaining bolt (2). Tighten the bolt to 12 N·m (106 ft. lbs.).
6. Install the front skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FRONT SKID PLATE - INSTALLATION).



7. Lower the vehicle.
8. Engage the retaining clip (7) to the top of the fan shroud (6).
9. Remove the tape or plugs from the discharge line fitting and accumulator port.
10. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
11. Connect the front section of the A/C suction line to the A/C accumulator (3) and install the retaining nut (2). Tighten the nut to 12.5 N·m (110 in. lbs.).
12. If servicing only the front section of the A/C suction line, go to Step 20.
13. Remove the tape or plugs from the opened refrigerant line fittings and the accumulator and evaporator ports.
14. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the refrigerant line fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Connect the rear section of the A/C suction line (9) to the A/C accumulator (10) and install the retaining nut (1). Tighten the nut to 12 N·m (110 in. lbs.).
16. On LHD models, connect the spring-lock coupler that secures the rear section of the A/C suction line to the evaporator outlet tube (6) and install the secondary retaining clip (4) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ COUPLER-REFRIGERANT LINE - INSTALLATION).



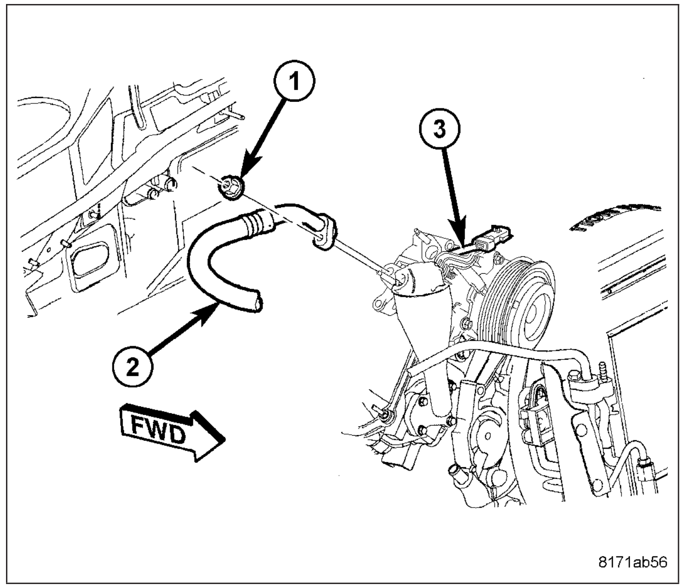
17. On RHD models, connect the rear section of the A/C suction line to the A/C evaporator and install the retaining nut. Tighten the nut to 12 N·m (110 in. lbs.).
18. Install the two nuts (7) that secure the accumulator bracket (8) to the dash panel (5). Tighten the nuts to 4.5 N·m (40 in. lbs.).
19. Connect the wire lead and connector (3) to the A/C low pressure switch (2).
20. Reconnect the negative battery cable.
21. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
22. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## 3.7L ENGINE

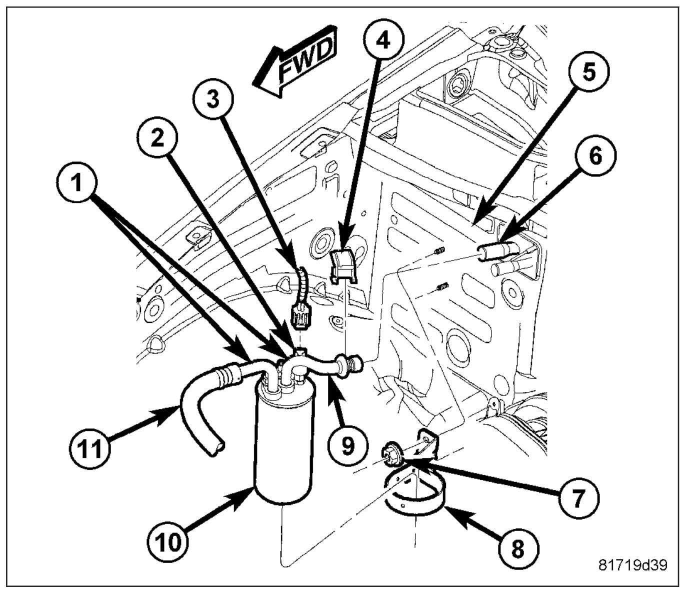
**NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

**NOTE: LHD model shown in illustrations. RHD model similar.**

1. Position the front section of the A/C suction line (2) into the engine compartment.
2. Remove the tape or plugs from the opened refrigerant line fittings and the accumulator and compressor ports.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the refrigerant line fittings. Use only the specified O-ring seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the front section of the A/C suction line to the A/C compressor (3) and install the retaining nut (1). Tighten the nut to 12 N·m (105 in. lbs.).



5. Connect the front section of the A/C suction line (11) to the A/C accumulator (10) and install the retaining nut (1). Tighten the nut to 12 N·m (110 in. lbs.).
6. If servicing the front section of the A/C suction line only, go to Step 14.
7. Remove the tape or plugs from all of the opened refrigerant line fittings and the accumulator and evaporator ports.
8. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the rear section of the A/C suction line (9) to the A/C accumulator and install the retaining nut. Tighten the nut to 12 N·m (110 in. lbs.).



10. On LHD models, connect the spring-lock coupler that secures the rear section of the A/C suction line to the evaporator outlet tube (6) and install the secondary retaining clip (4) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COUPLER-REFRIGERANT LINE - INSTALLATION).
11. On RHD models, connect the rear section of the A/C suction line to the A/C evaporator and install the retaining nut. Tighten the nut to 12 N·m (110 in. lbs.).
12. Install the two nuts (7) that secure the accumulator bracket to the dash panel (5). Tighten the nuts to 4.5 N·m (40 in. lbs.).
13. Connect the wire lead and connector (3) to the A/C low pressure switch (2).
14. Reconnect the negative battery cable.
15. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
16. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

# OIL-A/C REFRIGERANT

## DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. Use **only** refrigerant oil of the same type as recommended to service the refrigerant system (**always refer to the specification tag** included with the replacement A/C compressor or the A/C Underhood Specification Label located in the engine compartment).

The Denso 10S17 A/C compressor used in this vehicle when equipped with the 2.8L diesel engine is designed to use ND-8 PAG refrigerant oil. Use only this type of refrigerant oil when servicing this A/C compressor.

The Visteon HS-18 A/C compressor used in this vehicle when equipped with 3.7L engine is designed to use VC-46 PAG refrigerant oil. Use only this type of refrigerant oil when servicing this A/C compressor.

## OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

## STANDARD PROCEDURE

## REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The A/C accumulator, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

**CAUTION: The refrigerant oil in the R-134a A/C system is unique depending on the A/C compressor used. Use only PAG oils that are designed to work with R-134a refrigerant and the A/C compressor in the vehicle. Always refer to the A/C Underhood Specification Label for the correct oil designation. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.**

**NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.**

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to component replacement, or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C accumulator, A/C evaporator or A/C condenser is replaced. See the Refrigerant Oil Capacities chart. When an A/C compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new A/C compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

## REFRIGERANT OIL CAPACITIES

| Component | ml | oz |
|---|---|---|
| Total System Fill | 240 | 8 |
| A/C Accumulator | 120 | 4 |
| A/C Condenser | 30 | 1 |
| A/C Evaporator | 60 | 2 |
| A/C Compressor | Drain and measure the oil from the old compressor as noted | |

# REFRIGERANT-A/C

## DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

## OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

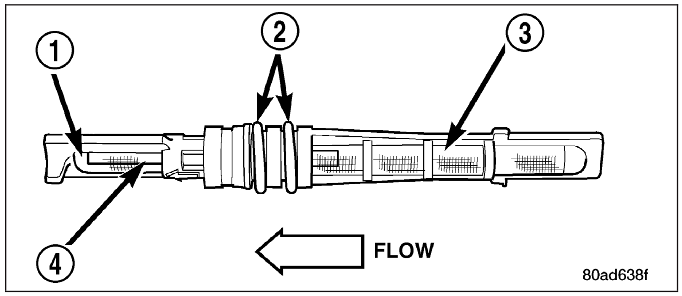
R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

# TUBE-A/C ORIFICE

## DESCRIPTION

The fixed A/C orifice tube is installed in the A/C liquid line and provides a restriction in the liquid refrigerant line between the A/C condenser and the A/C evaporator. This restriction established the pressure differential between the high and low-pressure sides of the A/C system.

The A/C orifice tube includes a diffuser screen (1), O-ring seals (2) to seal it to the inner wall of the A/C liquid line, an inlet filter screen (3) and the fixed orifice (4).



## OPERATION

The fixed A/C orifice tube is used to meter the flow of liquid refrigerant into the A/C evaporator. The high-pressure liquid refrigerant from the A/C condenser expands into a low-pressure liquid as it passes through the metering orifice and diffuser screen of the A/C orifice tube.

The A/C orifice tube is not serviceable and cannot be repaired and, if faulty or plugged, the A/C liquid line must be replaced (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - DESCRIPTION).

## DIAGNOSIS AND TESTING

## A/C ORIFICE TUBE

**WARNING: The A/C liquid line between the A/C condenser and the A/C orifice tube can become hot enough to burn the skin. Use extreme caution when performing the following test to prevent possible personal injury.**

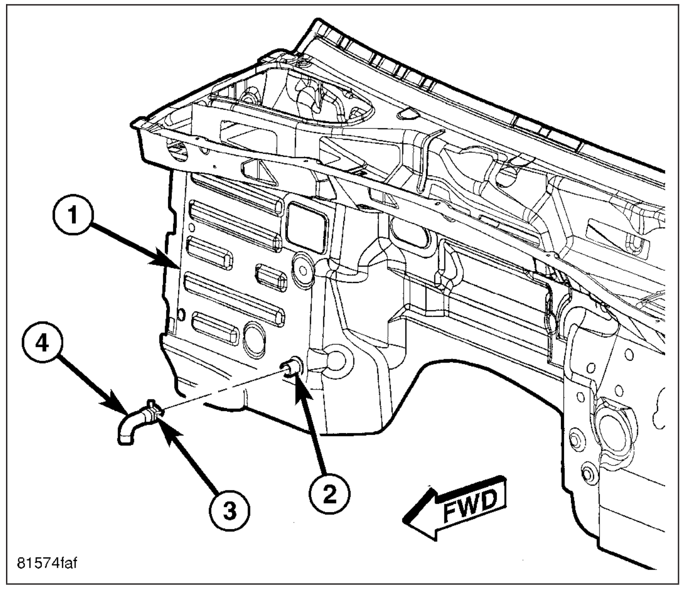
**NOTE: The A/C orifice tube can be checked for proper operation using the following procedure. However, the A/C orifice tube is only serviced as a part of the A/C liquid line. If the results of this test indicate that the A/C orifice tube is obstructed or missing, the A/C liquid line must be replaced.**

1. Confirm that the refrigerant system is properly charged (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE).
2. Start the engine. Turn on the A/C system and confirm that the compressor clutch is engaged.
3. Allow the A/C system to operate for five minutes.
4. Lightly and cautiously touch the A/C liquid line near the condenser outlet at the front of the engine compartment. The A/C liquid line should be hot to the touch.
5. Touch the A/C liquid line near the evaporator inlet at the rear of the engine compartment. The A/C liquid line should be cold to the touch.
6. If there is a distinct temperature differential between the two ends of the A/C liquid line, the A/C orifice tube is in good condition. If there is little or no detectable temperature differential between the two ends of the A/C liquid line, the A/C orifice tube is obstructed or missing and the A/C liquid line must be replaced (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - REMOVAL).

# TUBE-CONDENSATION DRAIN

## DESCRIPTION

**NOTE: LHD model shown in illustration. RHD model similar.**



Condensation that accumulates within the HVAC housing is drained through a port (2) that protrudes through the dash panel (1). A rubber condensation drain tube (4) is installed onto the drain port with a retaining clamp (3) to ensure that any condensation completely drains to the ground.

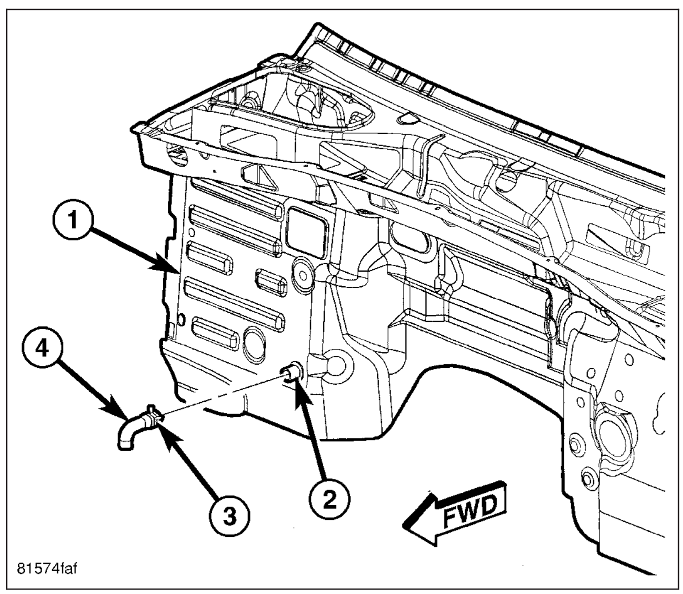
**NOTE: The condensation drain tube must be kept open to prevent condensate water from collecting in the bottom of the HVAC housing.**

The tapered end of the condensation drain tube is designed to keep contaminants from entering the HVAC housing. If the tube is pinched or blocked, condensate cannot drain, causing water to back up and spill into the passenger compartment. It is normal to see condensate drainage below the vehicle in warm weather.

If the condensation drain tube is damaged or missing, it must be replaced.

## REMOVAL

**NOTE: LHD model shown in illustration. RHD model similar.**

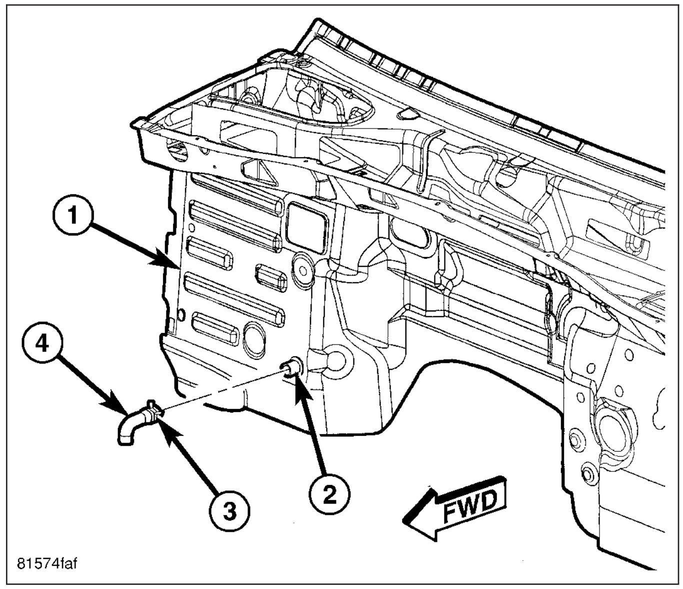


1. Raise and support the vehicle.
2. Disengage the retaining clamp (3) that secures the condensate drain tube (4) to the HVAC housing drain (2) located at the passenger side of the dash panel (1) in the engine compartment.
3. Remove the condensate drain tube.

## INSTALLATION

**NOTE: LHD model shown in illustration. RHD model similar.**

1. Position the condensate drain tube (4) onto the HVAC housing drain (2) located on the passenger side of the dash panel (1) in the engine compartment.
2. Engage the retaining clamp (3) that secures the condensate drain tube onto the HVAC housing drain.
3. Lower the vehicle.



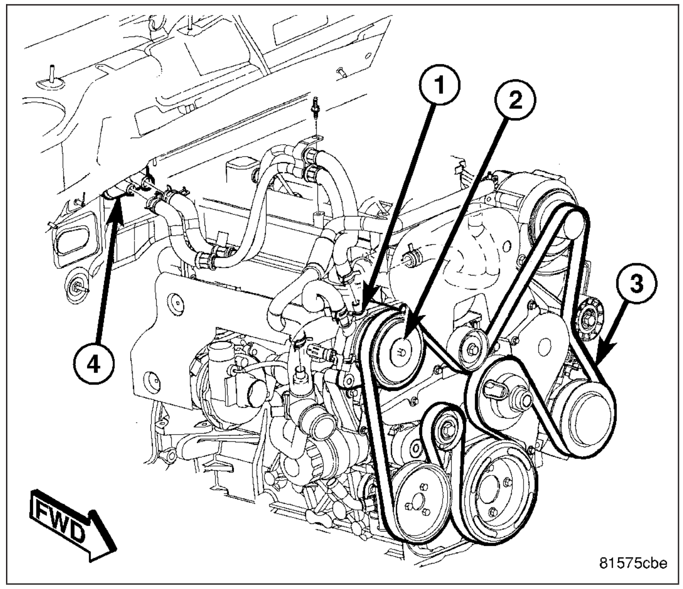
# HEATER-DIESEL ENGINE COOLANT

## TABLE OF CONTENTS

# HEATER-DIESEL ENGINE COOLANT

## DESCRIPTION

The 2.8L diesel engine uses a supplemental engine coolant heater (1) to help heat the engine coolant prior to it entering the heater core (4). This mechanical device is commonly called a viscous heater. The supplemental engine coolant heater is driven by the engine accessory drive belt (3) and has an electro-mechanical clutch (2) which is controlled by the engine control module (ECM).



## OPERATION

The supplemental diesel engine coolant heater (viscous heater) uses an electro-mechanical clutch that receives a signal from the diesel engine control module (ECM) via the A/C-heater control and the viscous heater controller, to energize and engage the clutch. Once engaged, the clutch allows the viscous heater to increase the temperature of the engine coolant flowing to the heater core to provide heat to the passenger compartment quicker than diesel engines without the viscous heater.

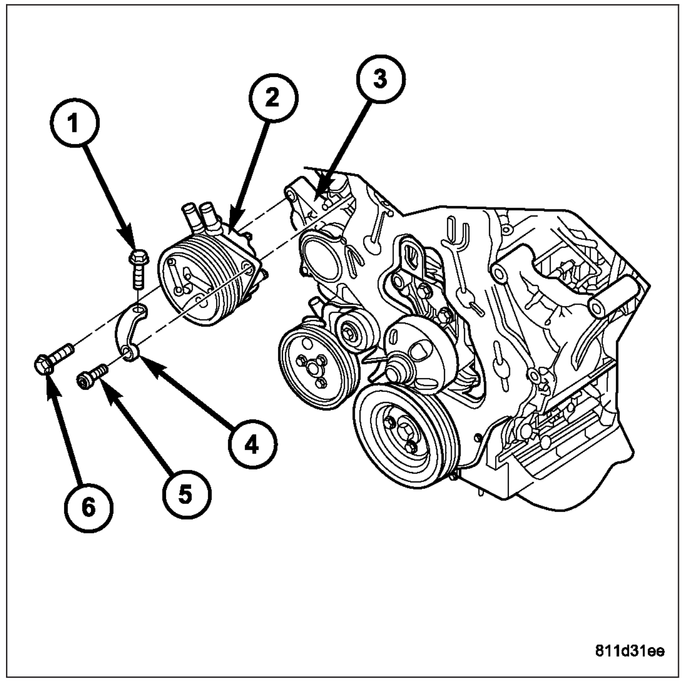
The viscous heater uses friction to heat a special silicon oil within its housing. The generated heat is then transferred to the engine coolant when the coolant passes over the fins within the housing. When demand for passenger compartment heat decreases the viscous heater receives an input from the heater controller to disengage the clutch.

The supplemental diesel engine coolant heater cannot be repaired and, if faulty or damaged, the entire heater assembly must be replaced.

# HEATER UNIT

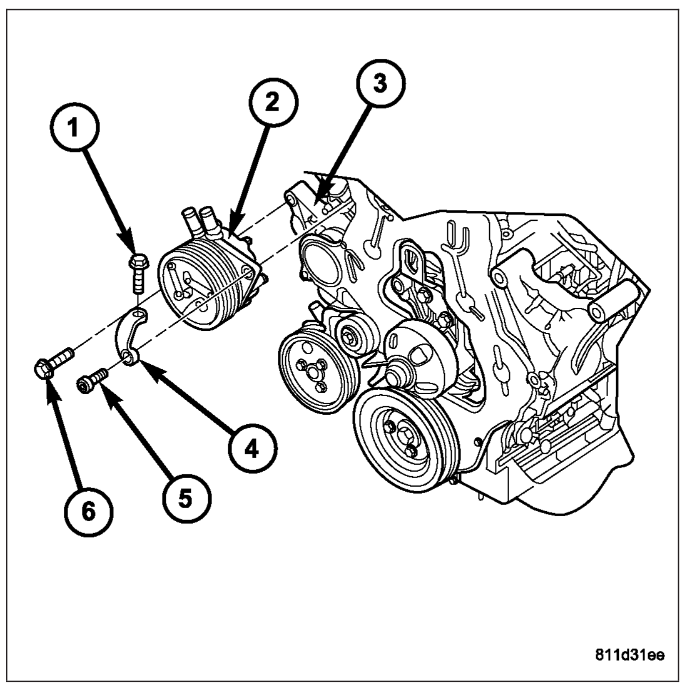
## REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Drain the engine coolant (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).
3. Remove the engine accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Loosen the hose clamps and disconnect the heater hoses from the supplemental diesel engine coolant heater (2).
5. Disconnect the wire harness connector from the engine coolant heater clutch.
6. Remove the three bolts (1, 5 and 6) and the support bracket (4) that secure the diesel engine coolant heater to the mounting bracket (3).
7. Remove the diesel engine coolant heater from the engine compartment.



## INSTALLATION

1. Position the supplemental diesel engine coolant heater onto the mounting bracket.
2. Install the support bracket (4) and the three bolts (1, 5 and 6) that secure the engine coolant heater to the mounting bracket. Tighten the bolts to 33 N·m (25 ft. lbs.).
3. Connect the wiring harness connector to the engine coolant heater clutch.
4. Install the heater hoses to the engine coolant heater and tighten the hose clamps securely.
5. Install the engine accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
6. Refill the engine cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
7. Reconnect the negative battery cable.



# EMISSIONS CONTROL

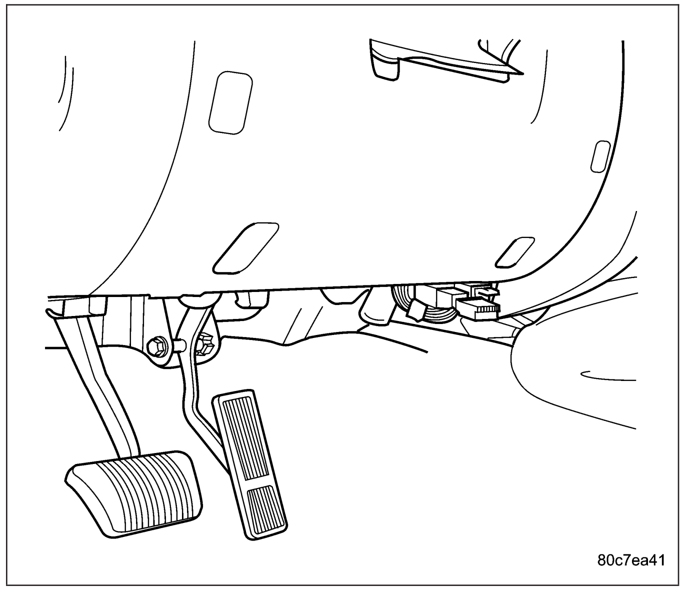
## TABLE OF CONTENTS

# EMISSIONS CONTROL

## DESCRIPTION

## GAS ENGINES

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warm-up cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). The MIL is displayed as an engine icon on the instrument panel. Refer to Malfunction Indicator Lamp (MIL) in this section.



Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16–way data link connector.

**NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, connect the DRB scan tool to the 16–way data link connector to erase all DTC's and extinguish the MIL.**

## STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

## CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect the DRB scan tool to the data link connector and access the Actuators screen.

## DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

**Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.**

### BULB CHECK

Each time the ignition key is turned to the ON position, the malfunction indicator (check engine) lamp on the instrument panel should illuminate for approximately 2 seconds then go out. This is done for a bulb check.

### OBTAINING DTC'S

1. Obtain the applicable Powertrain Diagnostic Information.
2. Obtain the appropriate scan tool.
3. Connect the appropriate scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.
4. Turn the ignition switch on and access the "Read Fault" screen.
5. Record all the DTC's and "freeze frame" information shown on the appropriate scan tool.
6. To erase DTC's, use the "Erase Trouble Code" data screen on the appropriate scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

## TASK MANAGER

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is referred to as the 'Task Manager'.

## MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator Lamp (MIL) will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the MIL or a scan tool.

The following is a list of the system monitors:

- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Leak Detection Pump Monitor (if equipped)

All these system monitors require two consecutive trips with the malfunction present to set a fault.

**Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.**

The following is an operation and description of each system monitor:

## OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the Catalyst and Fuel Monitors.

The O2S can fail in any or all of the following manners:

- slow response rate
- reduced output voltage
- dynamic shift
- shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

## OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) shorted to voltage DTC, as well as a O2S heater DTC, the O2S fault MUST be repaired first. Before checking the O2S fault, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S sensor are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S sensor is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S sensor must be tested to ensure that it is heating the sensor properly.

The O2S sensor circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S sensor output voltage from the other effects.

## LEAK DETECTION PUMP MONITOR (IF EQUIPPED)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves and a spring/diaphragm, a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

**Pump Mode:** The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

**Test Mode:** The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5” water. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .040” orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

After passing the leak detection phase of the test, system pressure is maintained by turning on the LDP’s solenoid until the purge system is activated. Purge activation in effect creates a leak. The cycle rate is again interrogated and when it increases due to the flow through the purge system, the leak check portion of the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the 02 control system. If fuel vapor, indicated by a shift in the 02 control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

## MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

## FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the Air Fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio of 14.7 to 1. This is done by making short term corrections in the fuel injector pulse width based on the O2S sensor output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual fuel-air ratio with the O2S sensor (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

## CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S’s) to monitor the efficiency of the converter. The dual O2S’s sensor strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S’s.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S’s is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL will be illuminated.

## TRIP DEFINITION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the "Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Contiuous OBDII Monitor fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor, is considered to be a Good Trip. These will include the following:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

## COMPONENT MONITORS

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks or any component that has an associated limp in will set a fault after 1 trip with the malfunction present. Components without an associated limp in will take two trips to illuminate the MIL.

## NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code

## FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

### SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

### CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

### EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

### FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

### EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

### THROTTLE BODY AIRFLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

### VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

### PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

### PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

## HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

## LOAD VALUE

| ENGINE | IDLE/NEUTRAL | 2500 RPM/NEUTRAL |
|---|---|---|
| All Engines | 2% to 8% of Maximum Load | 9% to 17% of Maximum Load |

## OPERATION - TASK MANAGER

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence

- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

## Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are know as ’two trip monitors.’ Other tests that turn the MIL lamp on after a single failure are known as ’one trip monitors.’ A trip is defined as ’start the vehicle and operate it to meet the criteria necessary to run the given monitor.’

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending
  Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.
  For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.
- Conflict - There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.
  For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.
- Suspend - Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precis diagnosis.
  For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

## MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

## Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

### *Priorities*

- Priority 0 - Non-emissions related trouble codes
- Priority 1 - One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 - One trip failure of a two trip fault for fuel system (rich/lean) or misfire.

- Priority 3 - Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 - Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

## DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ±375 RPM and load is within ±10% of when the fault occurred.

**NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.**

DTCs can be erased anytime with a DRB III. Erasing the DTC with the DRB III erases all OBD II information. The DRB III automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

## Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

### Good Trip

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRB III)
  - Comprehensive Components
  - Major Monitor
- Warm-Up Cycles

### Specific Good Trip

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.
- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

### Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

**Misfire Good Trip**

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

**Warm-Up Cycles**

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F (71 °C)
- Engine coolant temperature must rise by 40° F (4.5 °C).
- No further faults occur

## Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

**CAUTION: Erasing DTCs, either with the DRB III or by disconnecting the battery, also clears all Freeze Frame data.**

## Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

**FUEL SYSTEM**

- **Fuel System Similar Conditions Window -** An indicator that ’Absolute MAP When Fuel System Fail’ and ’RPM When Fuel System Failed’ are all in the same range when the failure occurred. Indicated by switching from ’NO’ to ’YES’.
- **Absolute MAP When Fuel System Fail -** The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP -** A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel System Fail** - The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** - A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** - The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** - A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** - A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.

- **Fuel System Good Trip Counter -** A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip -** Indicates that the monitor has already been run and completed during the current trip.

**MISFIRE**

- **Same Misfire Warm-Up State -** Indicates if the misfire occurred when the engine was warmed up (above 160° F (71 °C)).
- **In Similar Misfire Window -** An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred -** The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP -** A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred -** The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM -** A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor -** The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter -** Counts 0–100 720° cycles.
- **SCW Cat 200 Rev Counter -** Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter -** Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter -** Counts up to three to turn OFF the MIL.
- **Misfire Data -** Data collected during test.
- **Test Done This Trip -** Indicates YES when the test is done.

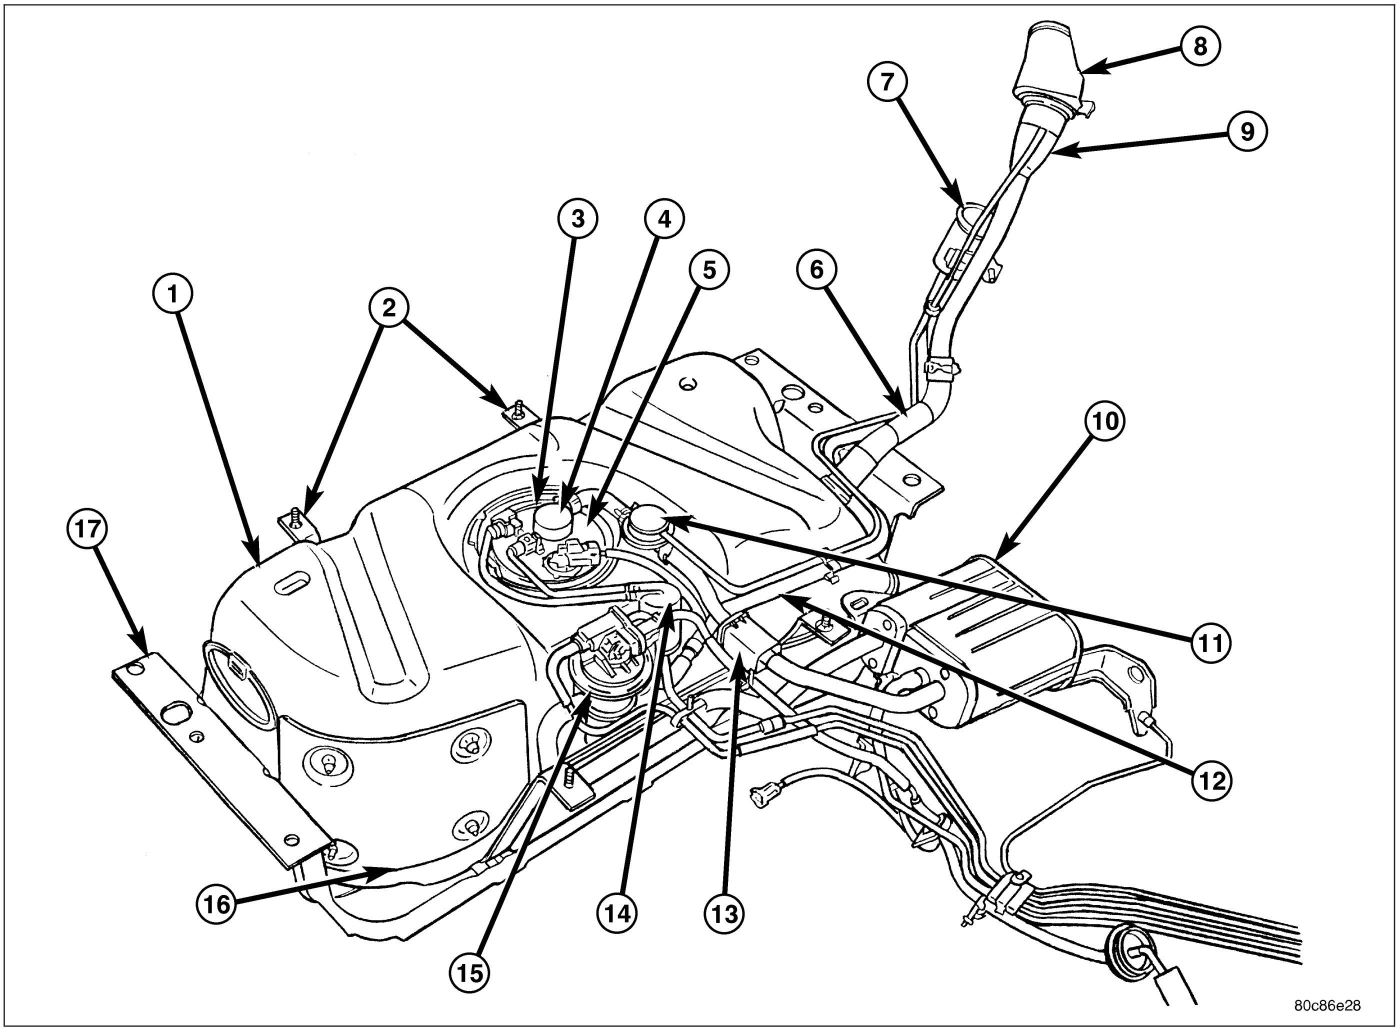
# EVAPORATIVE EMISSIONS

## TABLE OF CONTENTS

# EVAPORATIVE EMISSIONS

## DESCRIPTION

## EVAPORATION CONTROL SYSTEM



**NOTE: The evaporative system uses specially manufactured lines/hoses. If replacement becomes necessary, only use fuel resistant, low permeation hose.**

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through the control valve located in the top section of the fuel pump module, through the fuel management valve, and through vent hoses and tubes to a charcoal filled evaporative canister. The canister temporarily holds the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions.

Gas powered engines use a duty cycle purge system. The PCM controls vapor flow by operating the duty cycle EVAP purge solenoid. Refer to Duty Cycle EVAP Canister Purge Solenoid.

When equipped with certain emissions packages, a Leak Detection Pump (LDP) will be used as part of the evaporative system for OBD II requirements. Also refer to Leak Detection Pump.

Vehicles powered with gasoline engines are also equipped with ORVR (On-Board Refueling Vapor Recovery). Refer to ORVR for additional information.

## 2.8L TURBODIESEL

The 2.8L diesel Engine Control Module (ECM) controls many different circuits in the fuel injection pump and engine systems. If the ECM senses a problem with a monitored circuit that indicates an actual problem, a Diagnostic Trouble Code (DTC) will be stored in the ECM's memory, and eventually may illuminate the MIL (Malfunction Indicator Lamp) constantly while the key is on. If the problem is repaired, or is intermittent, the ECM will erase the DTC after 40 warm-up cycles without the fault detected. A warm-up cycle consists of starting the vehicle when the engine is cold, then the engine is warmed up to a certain temperature, and finally, the engine temperature falls to a normal operating temperature, then the key is turned off.

Certain criteria must be met for a DTC to be entered into ECM memory. The criteria may be a specific range of engine rpm, engine or fuel temperature and/or input voltage to the ECM. A DTC indicates that the ECM has identified an abnormal signal in a circuit or the system.

There are several operating conditions that the ECM does not monitor and set a DTC for. Refer to the following Monitored Circuits and Non-Monitored Circuits in this section.

### ECM MONITORED SYSTEMS

The ECM can detect certain problems in the electrical system.

**Open or Shorted Circuit** – The ECM will not distinguish between an open or a short to ground, however the ECM can determine if there is excessive current on a circuit, such as a short to voltage or a decrease in component resistance.

**Output Device Current Flow** – The ECM senses whether the output devices are electrically connected.

If there is a problem with the circuit, the ECM senses whether the circuit is open, shorted to ground (–), or shorted to (+) voltage.

**Fuel Pressure:** High fuel pressure is controlled by the fuel injection pump, fuel pressure solenoid, and fuel rail pressure sensor. The ECM uses inputs from the sensor and solenoid to calculate and determine if a high fuel pressure problem exists.

**Fuel Injector Malfunctions:** The ECM can determine if a fuel injector has an electrical problem. The fuel injectors on the diesel engine are **controlled** by the ECM.

### ECM NON-MONITORED SYSTEMS

The ECM does not monitor the following circuits, systems or conditions that could have malfunctions that result in driveability problems. A DTC will not be displayed for these conditions.

**Cylinder Compression:** The ECM cannot detect uneven, low, or high engine cylinder compression.

**Exhaust System:** The ECM cannot detect a plugged, restricted or leaking exhaust system.

**Vacuum Assist:** Leaks or restrictions in the vacuum circuits of the Exhaust Gas Recirculation System (EGR) are not monitored by the ECM.

**ECM System Ground:** The ECM cannot determine a poor system ground. However, a DTC may be generated as a result of this condition.

**ECM/PCM Connector Engagement:** The ECM cannot determine spread or damaged connector pins. However, a DTC may be generated as a result of this condition.

### HIGH AND LOW LIMITS

The ECM compares input signals from each input device. There are high and low limits that are programmed into the ECM for that device. If the inputs are not within specifications and other DTC criteria are met, a DTC will be stored in memory. Other DTC criteria might include engine rpm limits or input voltages from other sensors or switches. The other inputs might have to be sensed by the ECM when it senses a high or low input voltage from the control system device in question.

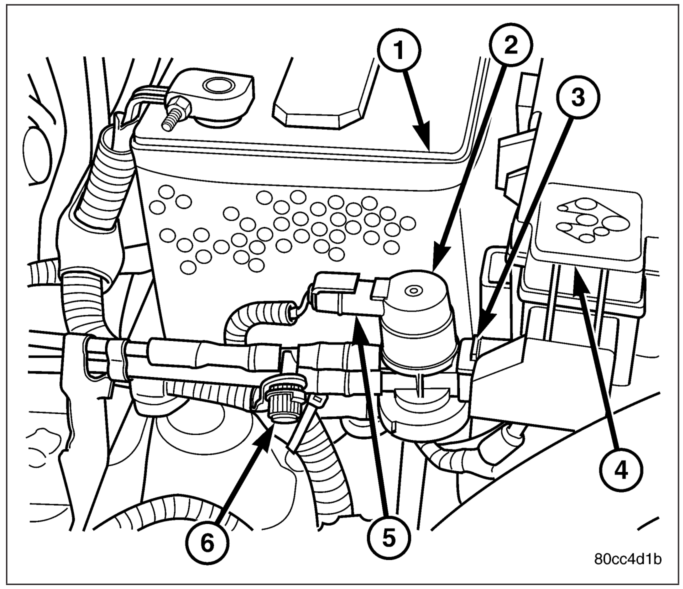
# SOLENOID-EVAP/PURGE

## DESCRIPTION

The duty cycle EVAP canister purge solenoid (DCP) (2) is located in the engine compartment. It is attached to a bracket located between the battery and the Power Distribution Center (PDC). The EVAP system test port is located near the solenoid.



## OPERATION

The duty cycle EVAP canister purge solenoid (DCP) regulates the rate of vapor flow from the EVAP canister to the intake manifold. The Powertrain Control Module (PCM) operates the solenoid.

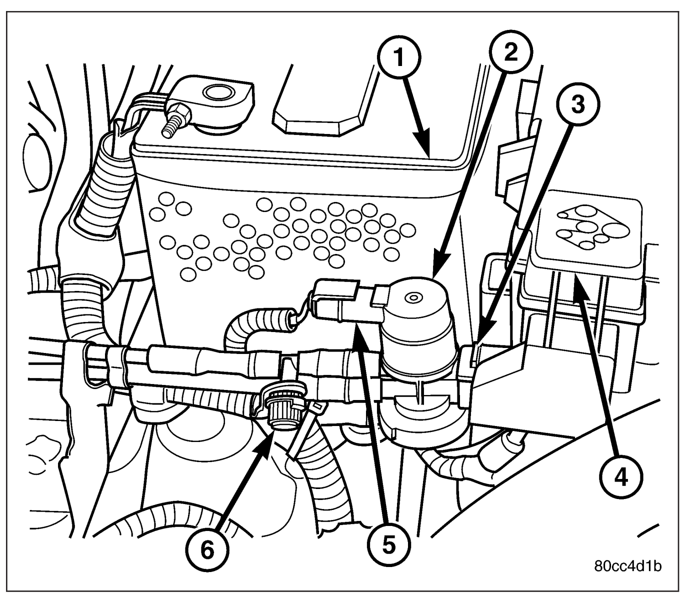
During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM cycles (energizes and de-energizes) the solenoid 5 or 10 times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time that the solenoid is energized. The PCM adjusts solenoid pulse width based on engine operating condition.

## REMOVAL

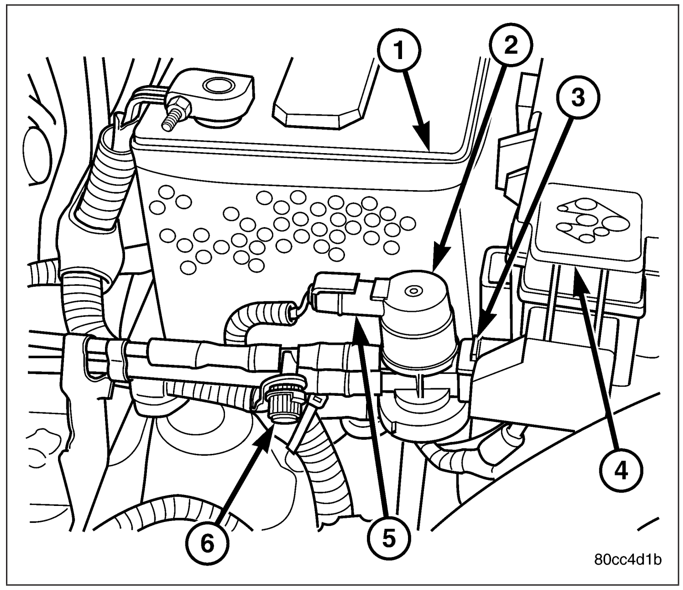
The duty cycle EVAP canister purge solenoid (DCP) (2) is located in the engine compartment. It is attached to a bracket located between the battery and the Power Distribution Center (PDC). The EVAP system test port is located near the solenoid.

1. Disconnect electrical wiring connector (5) at solenoid.
2. Disconnect vacuum harness at solenoid.
3. Remove solenoid and its support bracket (pull straight up).



## INSTALLATION

1. Slip EVAP canister purge solenoid (2) onto its mounting bracket (3).
2. Connect vacuum harness to solenoid.
3. Connect electrical connector (5) to solenoid.



# CAP-FUEL FILLER

## DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. All models are equipped with a 1/4 turn cap.

## OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

**CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with an ORVR system and a Leak Detection Pump (LDP), the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.**

# ORVR

## DESCRIPTION

The ORVR (On-Board Refueling Vapor Recovery) system consists of a unique fuel tank, flow management valve, fluid control valve, one-way check valve and vapor canister.

## OPERATION

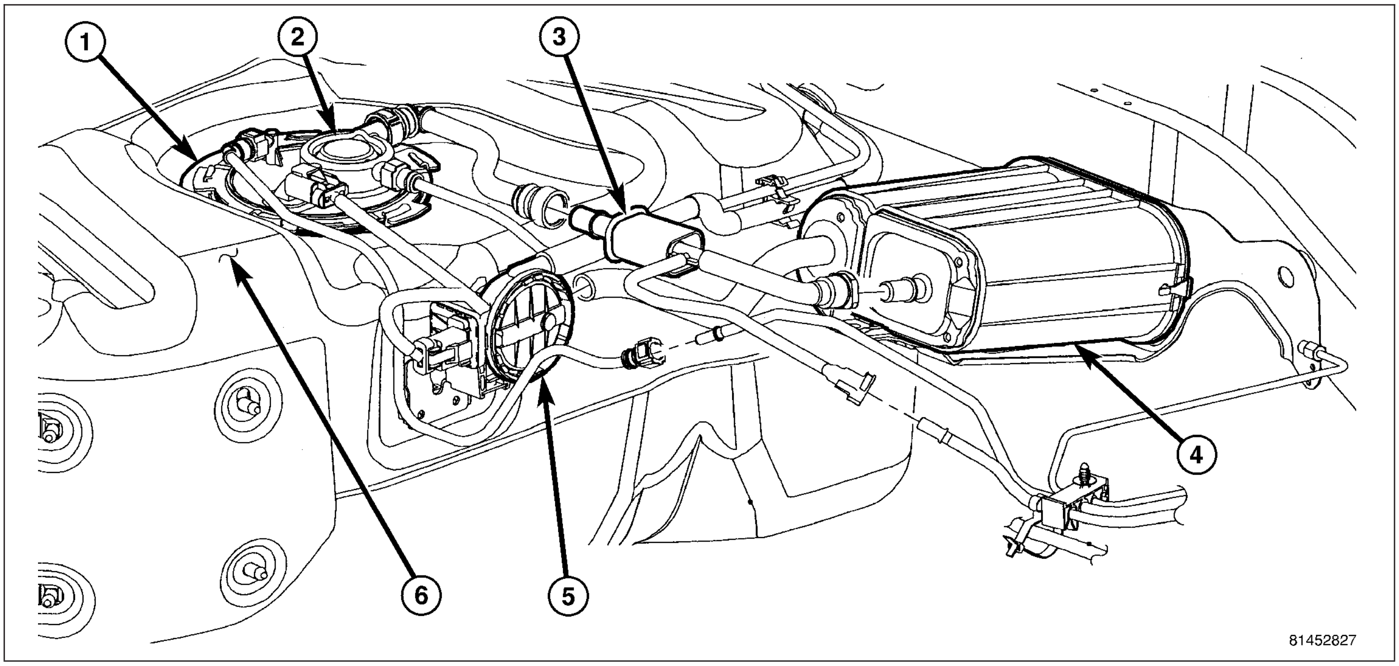
The ORVR (On-Board Refueling Vapor Recovery) system is used to remove excess fuel tank vapors. This is done while the vehicle is being refueled..

Fuel flowing into the fuel filler tube (approx. 1” I.D.) creates an aspiration effect drawing air into the fuel fill tube. During refueling, the fuel tank is vented to the EVAP canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the EVAP canister, the vehicle’s computer controlled purge system draws vapor out of the canister for the engine to burn. The vapor flow is metered by the purge solenoid so that there is no, or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fuel fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve and on to the vapor canister. Vapor is absorbed in the EVAP canister until vapor flow in the lines stops. This stoppage occurs following fuel shut-off, or by having the fuel level in the tank rise high enough to close the control valve. This control valve contains a float that rises to seal the large diameter vent path to the EVAP canister. At this point in the refueling process, fuel tank pressure increases, the check valve closes (preventing liquid fuel from spiting back at the operator), and fuel then rises up the fuel filler tube to shut off the dispensing nozzle.

# PUMP-NATURAL VAC LEAK DETECTION

## DESCRIPTION



The NVLD pump (5) is located at the front of the fuel tank.

## OPERATION

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020″ (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the ″Gas Law″. This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

A vent valve seals the canister vent during engine off conditions. If the vapor system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1″ H2O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies, utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1″ H2O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

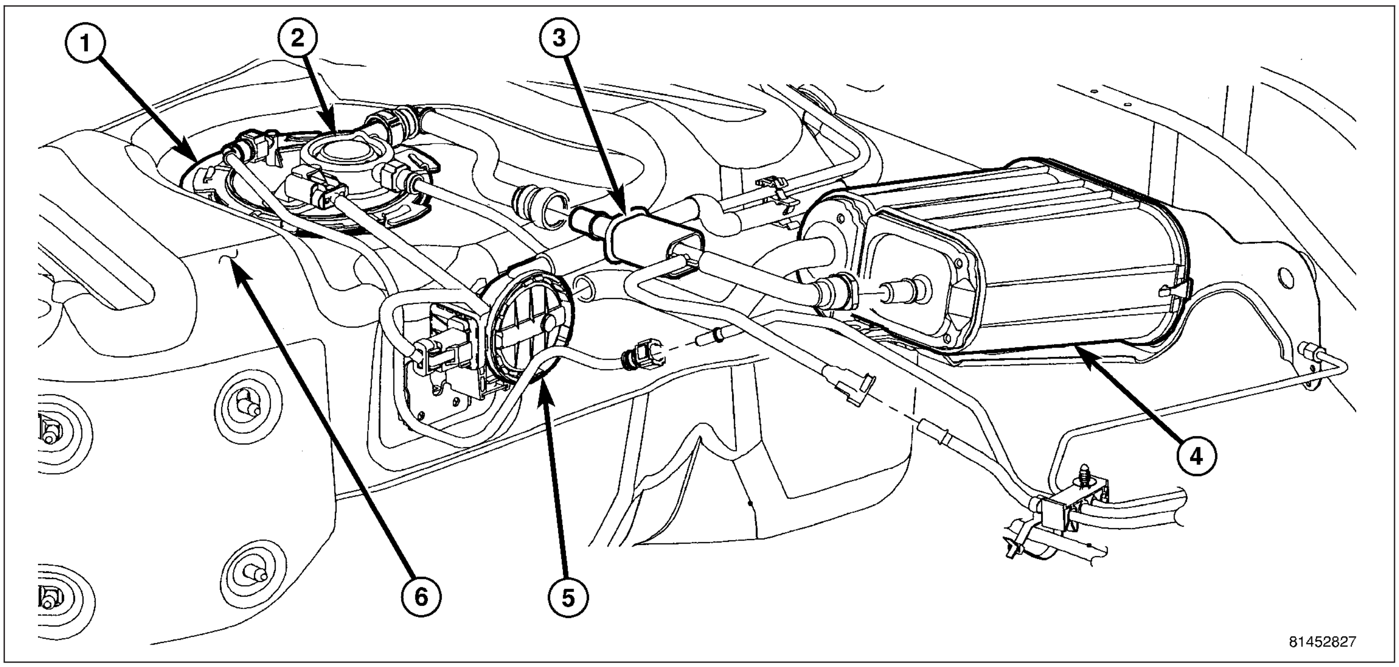
The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3″ to 6″ H2O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires an initial 1.5 amps of current to pull the valve open, but after 100 mili-seconds, will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will ″blow off″ at about 0.5″ $H_2O$ (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to ″breathe″ during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

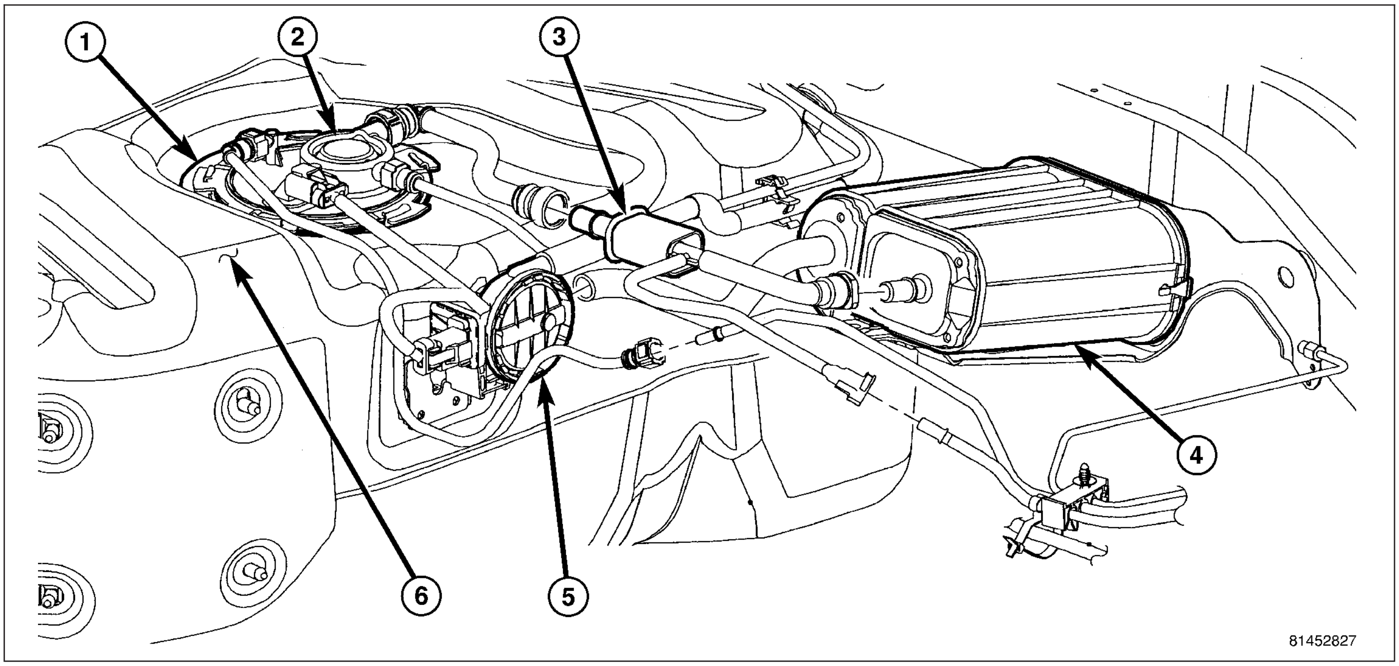
## REMOVAL



The NVLD pump (5) is located at the front of the fuel tank.

1. Raise and support vehicle.
2. If equipped, remove fuel tank skid plate.
3. Disconnect electrical connector at pump.
4. Carefully remove vapor/vacuum hoses at pump.
5. The NVLD pump snaps on to a mounting bracket. Press on release tab while sliding pump from bracket.

## INSTALLATION



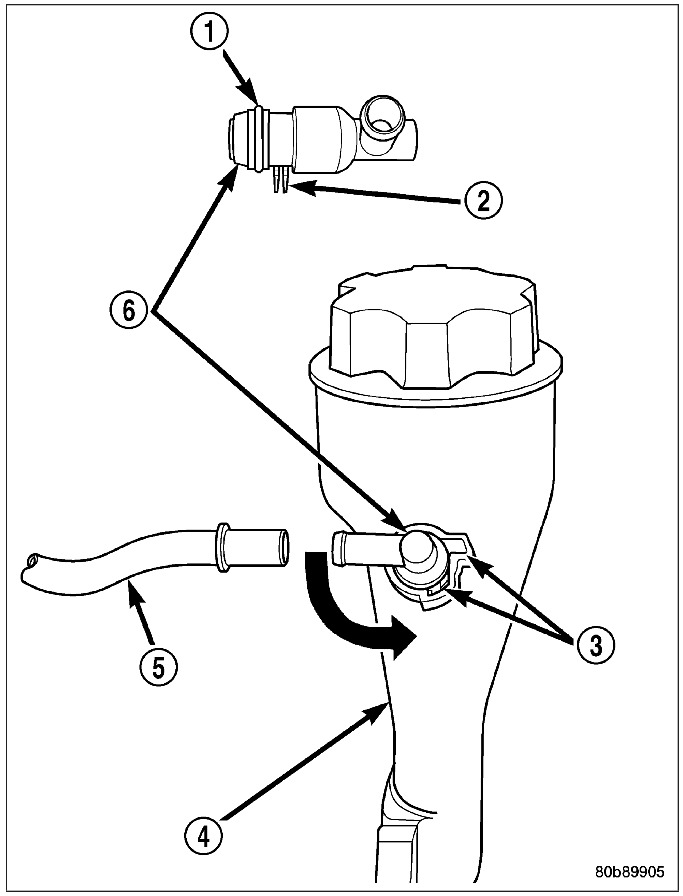
1. Install NVLD pump (5) to mounting bracket (snaps on).
2. Carefully install vapor/vacuum lines to NVLD pump. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the NVLD pump, filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
3. Connect electrical connector to pump.
4. If equipped, install fuel tank skid plate.

# VALVE-PCV

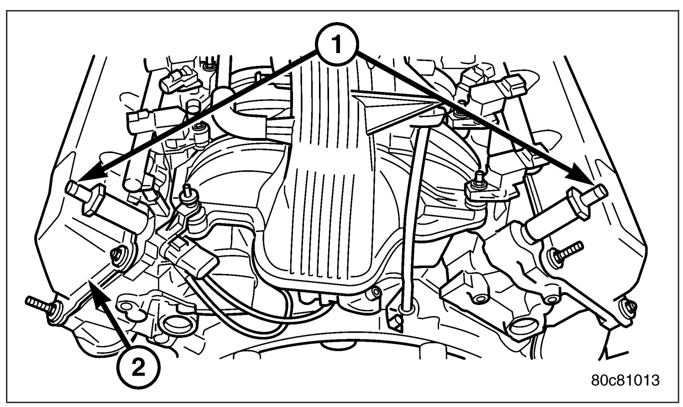
## DESCRIPTION

The 3.7L is equipped with a closed crankcase ventilation system and a Positive Crankcase Ventilation (PCV) valve.

This system consists of the air cleaner housing and the tubes and hoses used to connect the various system components. A PCV valve (6) is mounted to the oil filler housing. The PCV valve (6) is sealed to the oil filler housing with an O-ring (1).

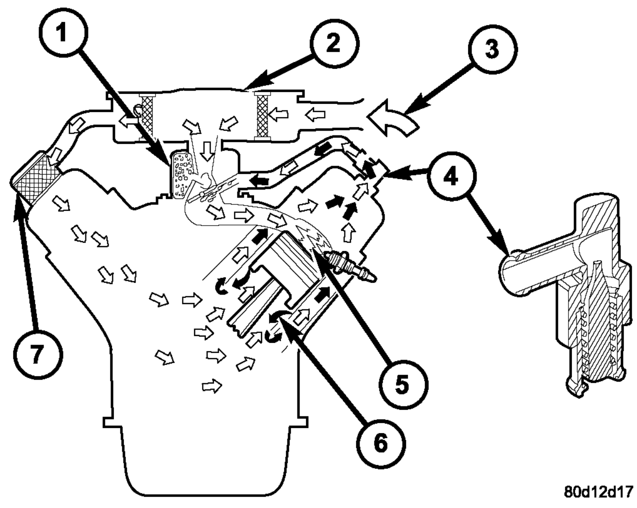


Two interconnected breathers (1) are threaded into the rear of each cylinder head.



## OPERATION

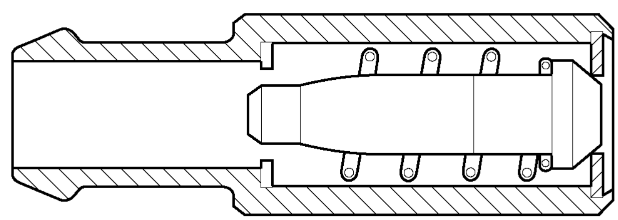
A typical enclosed crankcase ventilation system is shown in the graphic.



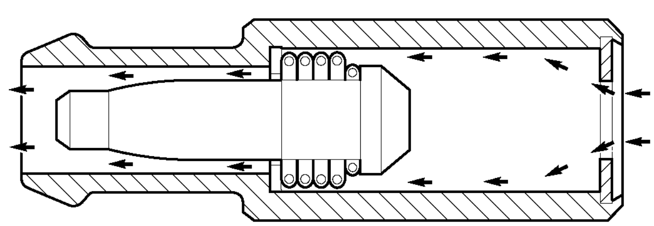
The PCV system operates by engine intake manifold vacuum. Filtered air is routed into the crankcase through the air cleaner hose. The metered air, along with crankcase vapors, are drawn through the PCV valve (4) and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow by gases to the intake system, reducing engine sludge formation.

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

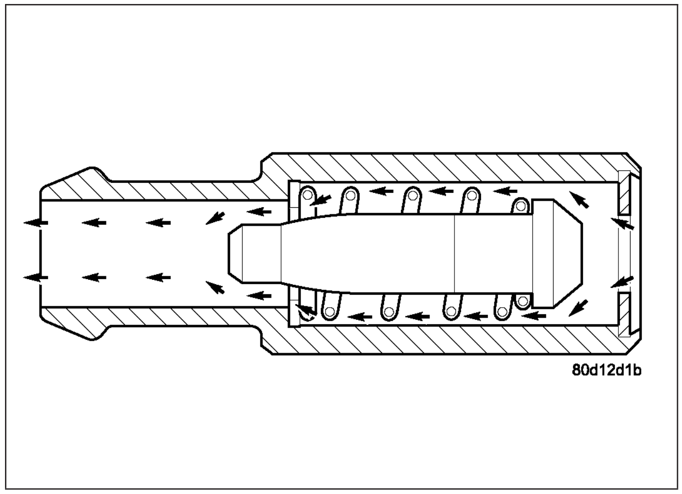
When the engine is not operating or during an engine pop-back, the spring forces the plunger back against the seat. This will prevent vapors from flowing through the valve.



During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve. In this position there is minimal vapor flow through the valve.



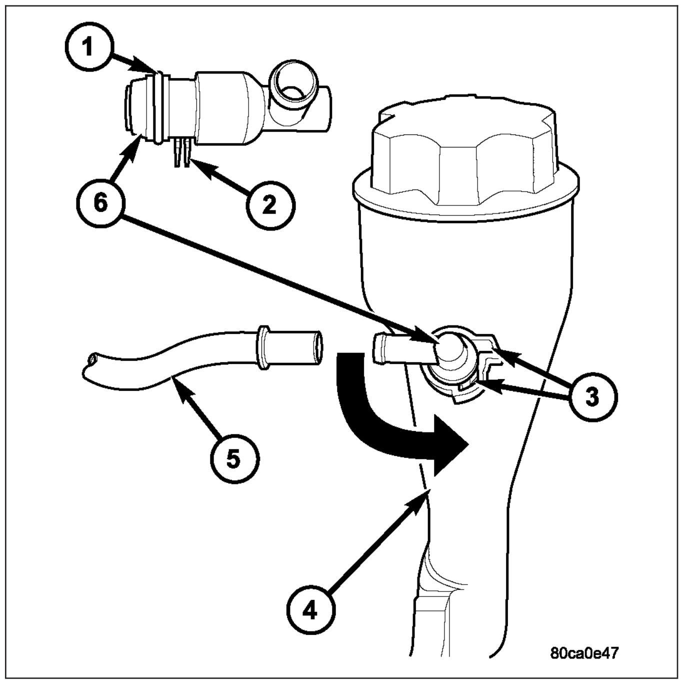
During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve.



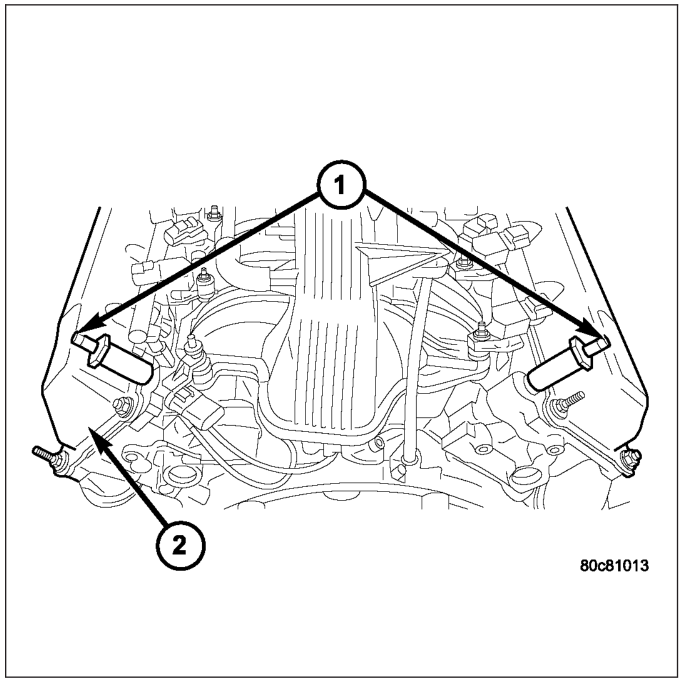
## DIAGNOSIS AND TESTING

### PCV VALVE

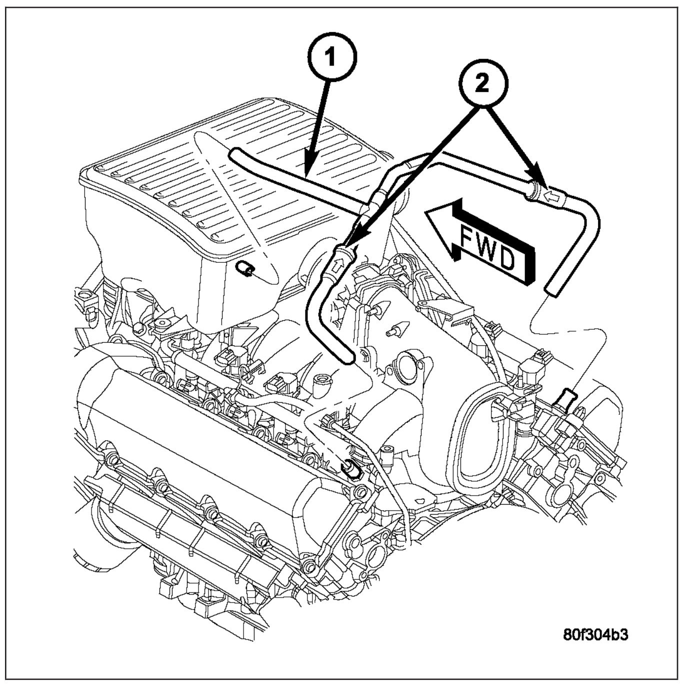
1. Disconnect PCV line/hose (5) by disconnecting rubber connecting hose at PCV valve fitting.
2. Remove PCV valve at oil filler tube by rotating PCV valve downward until locating tabs (2) have been freed at cam lock (3). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**
3. After valve is removed, check condition of valve O-ring (1). Also, PCV valve should rattle when shaken.
4. Reconnect PCV valve to its connecting line/hose.
5. Start engine and bring to idle speed.
6. If valve is not plugged, a hissing noise will be heard as air passes through valve. Also, a strong vacuum should be felt with a finger placed at valve inlet.
7. If vacuum is not felt at valve inlet, check line/hose for kinks or for obstruction. If necessary, clean out intake manifold fitting at rear of manifold. Do this by turning a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.
8. **Do not attempt to clean the old PCV valve.**
9. Return PCV valve back to oil filler tube by placing valve locating tabs (2) into cam lock (3). Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.
10. Connect PCV line/hose (5) and connecting rubber hose to PCV valve.
11. Disconnect rubber hose from fresh air fitting at air cleaner resonator box. Start engine and bring to idle speed. Hold a piece of stiff paper (such as a parts tag) loosely over the opening of the disconnected rubber hose.



12. The paper should be drawn against the hose opening with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.
13. If vacuum is not present, disconnect each PCV system hose at top of each crankcase breather (1). Check for obstructions or restrictions.
14. If vacuum is still not present, remove each PCV system crankcase breather (1) from each cylinder head. Check for obstructions or restrictions. If plugged, replace breather. Tighten breather to 12 N·m (106 in. lbs.) torque. Do not attempt to clean breather.



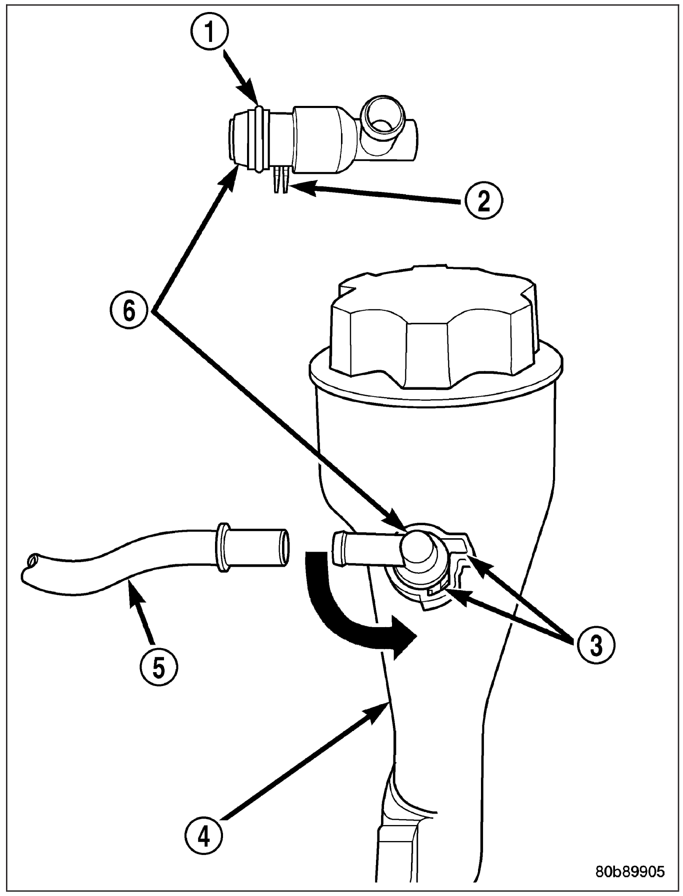
15. If vacuum is still not present, disconnect each PCV system hose (1) at each fitting, and at each check valve (2). Check for obstructions or restrictions.



## REMOVAL

The PCV valve (6) is located on the oil filler tube (4). Two locating tabs (2) are located on the side of the valve. These 2 tabs fit into a cam lock in the oil filler tube. An O-ring seals the valve to the filler tube.

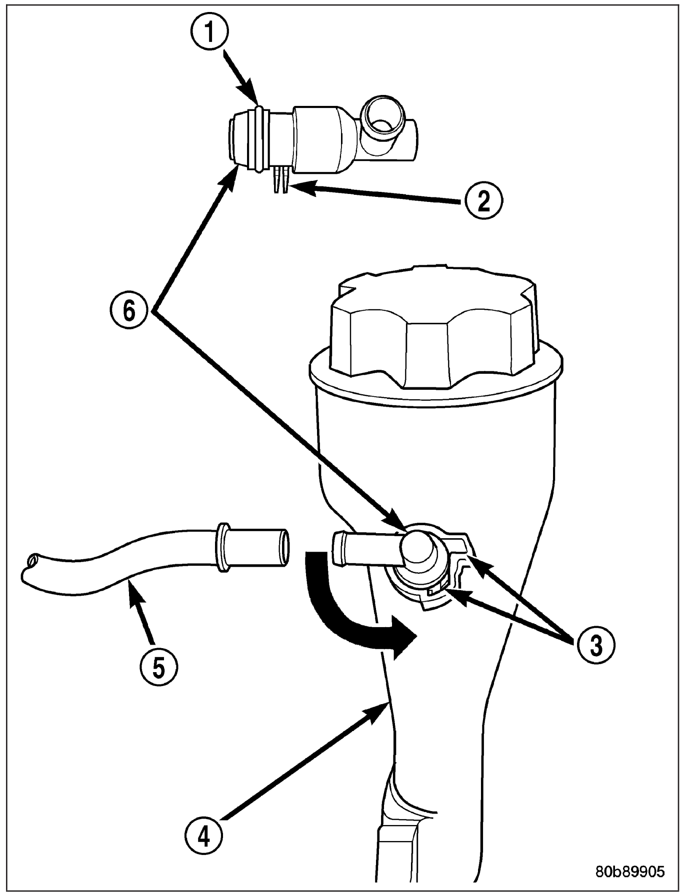
1. Disconnect PCV line/hose (5) by disconnecting rubber hose at PCV valve fitting.
2. Remove PCV valve at oil filler tube by rotating PCV valve downward (counterclockwise) until locating tabs have been freed at cam lock. After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**
3. After valve is removed, check condition of valve O-ring (1).



## INSTALLATION

The PCV valve (6) is located on the oil filler tube (4). Two locating tabs (2) are located on the side of the valve. These 2 tabs fit into a cam lock (3) in the oil filler tube. An O-ring seals the valve to the filler tube.

1. Return PCV valve back to oil filler tube by placing valve locating tabs into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.
2. Connect PCV line/hose and rubber hose to PCV valve.



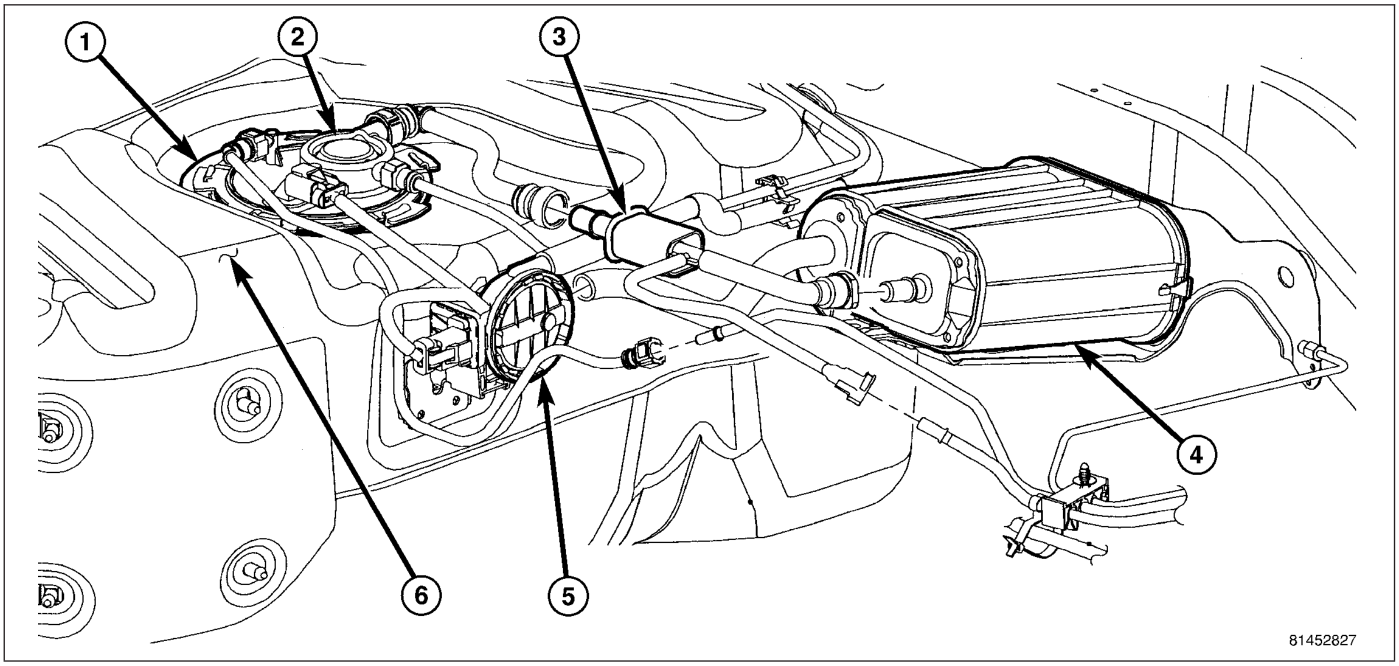
# LINES-VACUUM

## DESCRIPTION

A vacuum schematic for emission related items can be found on the VECI label. Refer to Vehicle Emission Control Information (VECI) Label for label location.

# CANISTER-VAPOR

## DESCRIPTION



A maintenance free, EVAP canister is used on all gasoline powered models. The EVAP canister (4) is located near the left/front corner of the fuel tank.

## OPERATION

The EVAP canister is filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canister are absorbed by the charcoal granules.

The canister serves two functions: as a temporary fuel vapor storage point while refueling the vehicle for the ORVR system, as a temporary vapor storage point while the engine is running.

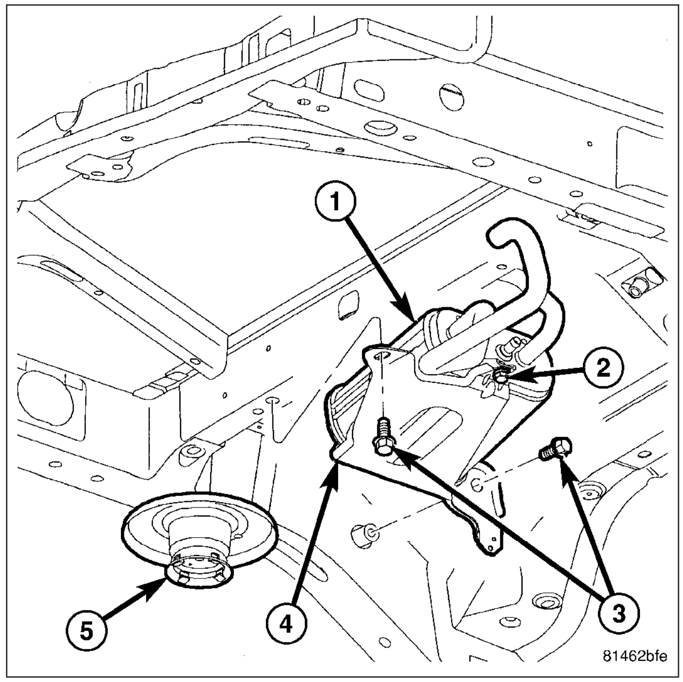
Fuel tank pressure vents into the EVAP canister. Fuel vapors are temporarily held in the canister until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canister to be purged at predetermined times and at certain engine operating conditions.

(Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/ORVR - OPERATION)

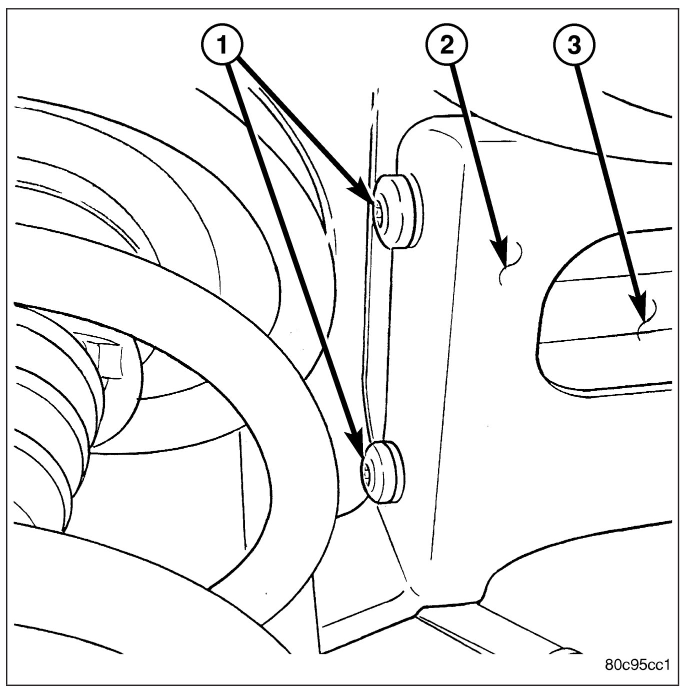
## REMOVAL

The EVAP canister (1) is located near front of fuel tank and next to the left/rear spring perch (5).

1. Raise vehicle.
2. Disconnect vacuum hoses/lines at EVAP canister. Note location of lines before removal.
3. Remove EVAP canister (1) and mounting bracket assembly (4) from body (2 bolts).
4. Remove canister-to-mounting bracket bolt (2).

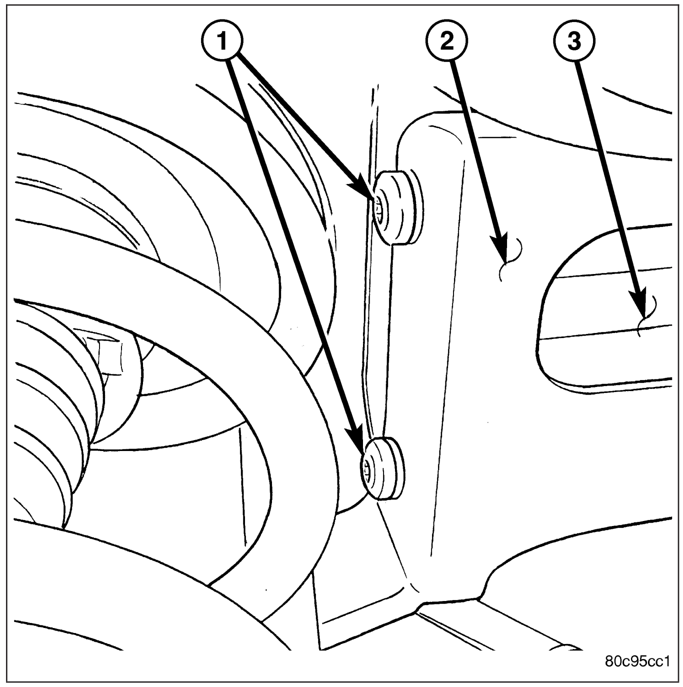


5. Slide two canister mounting pins (1) from mounting bracket (2).

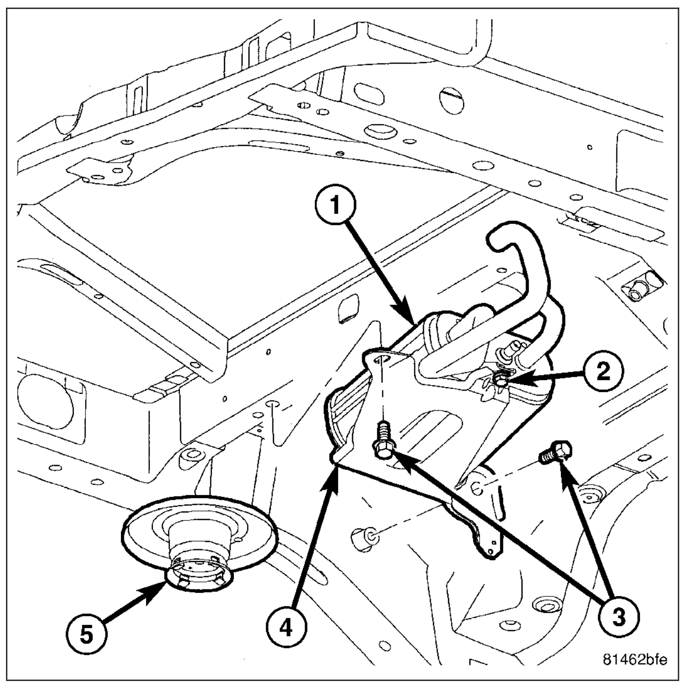


## INSTALLATION

1. Slide two canister mounting pins (1) into mounting bracket (2).



2. Install canister-to-mounting bracket bolt (2).
3. Position canister and bracket assembly to body.
4. Install two mounting bracket bolts (3). Tighten to 48 N·m (35 ft. lbs.) torque.
5. Carefully install vapor/vacuum lines to EVAP canister. **The vapor/vacuum lines and hoses must be firmly connected. Also check the vapor/vacuum lines at the NVLD pump, filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
6. Lower vehicle.



# EXHAUST GAS RECIRCULATION

## TABLE OF CONTENTS

# EXHAUST GAS RECIRCULATION

## DESCRIPTION

The task of the Exhaust Gas Recirculation (EGR) is to regulate the fresh air supply to the engine by means of the exhaust gas recirculation system, in favor of clean combustion. The EGR system reduces oxides of nitrogen (NOx) in the engine exhaust. This is accomplished by allowing a predetermined amount of hot exhaust gas to recirculate and dilute the incoming charge air.

A malfunctioning EGR system can cause engine stumble, sags, or hesitation, rough idle, engine stalling and poor driveability.

## OPERATION

The system consists of:

- A EGR valve assembly. The valve is located on the left side of the engine below the intake manifold.
- A EGR Cooler. The cooler is located on the left side of the engine below the intake manifold.
- A EGR air flow control valve. The EGR air flow control valve is located in the air inlet between the charge air inlet and the intake manifold. The air control valve is used to increase the EGR flow rate at low engine speeds.
- The ECM operates and monitors the EGR valve and air flow control valve. The ECM is located in the left-rear side of the engine compartment.

The ECM will monitor and determine the positioning of the EGR valve and air control valve by internal programming defined during engine development. This will depend on inputs from the engine coolant temperature, engine load, fuel quantity, throttle position and engine speed sensors. The air control valve blends the incoming charge air and the cooled and recirculated EGR gasses, to be used again in the combustion chamber.

Exhaust gas recirculation will begin in this order when:

- The ECM determines that EGR system operation is necessary.
- The inlet seat (poppet valve) at the bottom of the EGR valve opens to dilute and recirculate exhaust gas back into the intake manifold.
- The EGR Cooler further cools the hot exhaust gasses before recirculation

The EGR system will be shut down by the ECM after 60 seconds of continuous engine idling to improve idle quality and the air flow control valve will close completely when the vehicle is shut off to assist with engine shake on shut down.

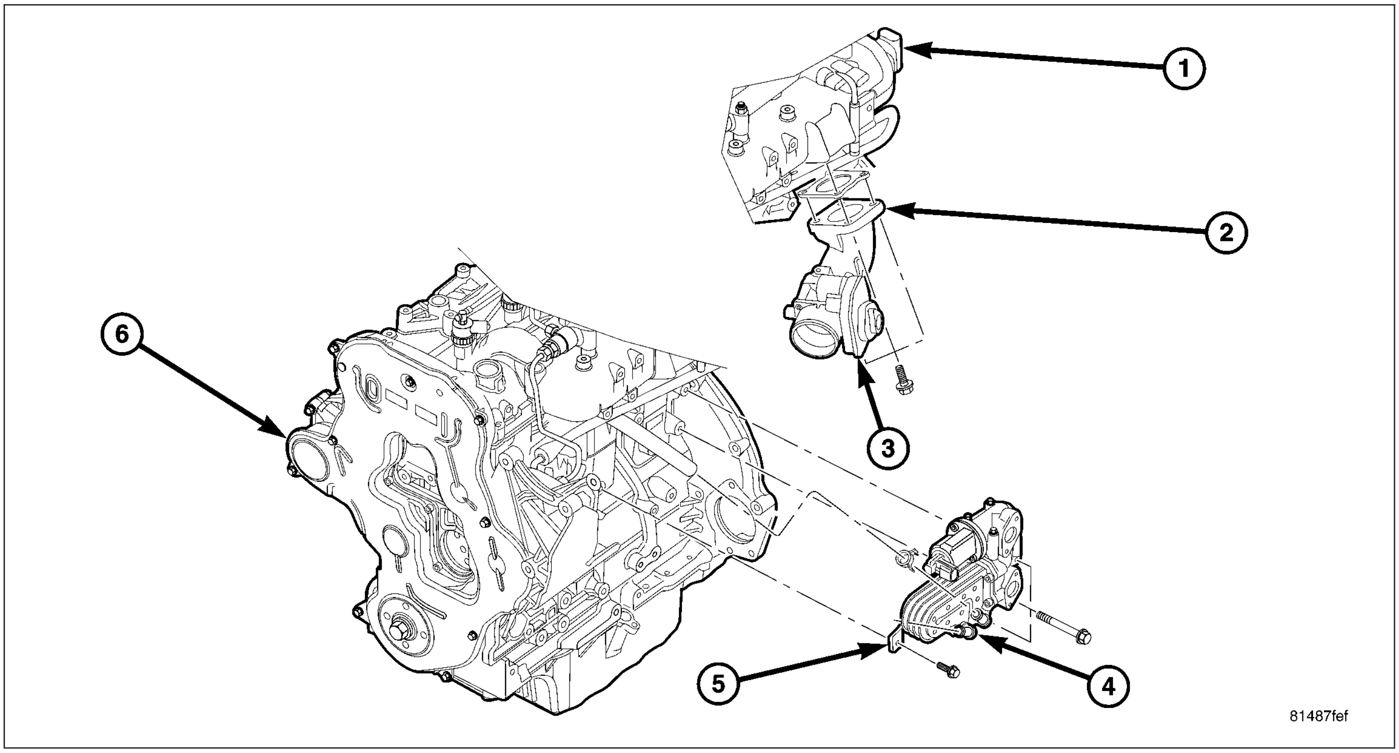
## SPECIFICATIONS

## TORQUE - 2.8L DIESEL

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| EGR tube to EGR Valve Bolts | 32. | 24 | - |
| EGR valve to Cooler Bolts | 11 | - | 95 |
| EGR tube Clamps | 7 | - | 62 |
| EGR Valve to Head Bolts | 24.5 | - | 216 |
| PCV Breather | 12 | - | 106 |

# VALVE

## DESCRIPTION



***EGR AND AIR CONTROL VALVE***

1 - REAR OF INTAKE MANIFOLD
2 - AIR INLET ELBOW
3 - EGR AIR CONTROL VALVE
4 - EGR VALVE COOLER
5 - EGR VALVE
6 - ENGINE

The EGR system consists of:

- EGR valve
- Air Control Valve
- EGR cooler

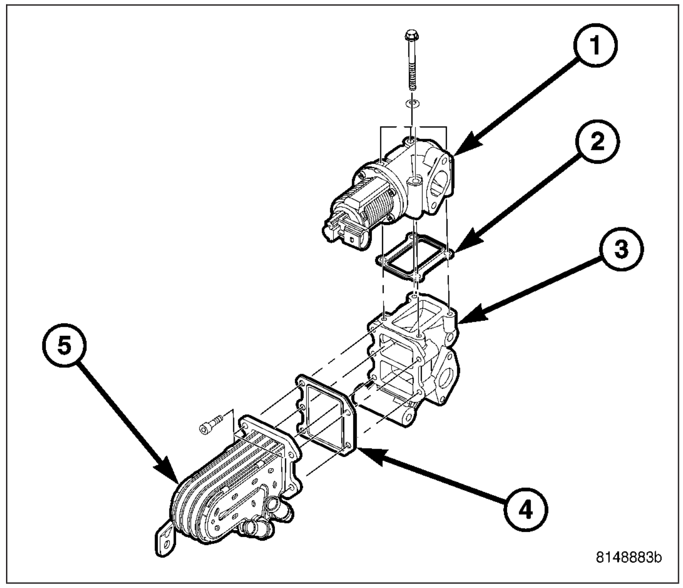
The EGR valve and cooler are located under the intake manifold toward the left rear of the engine. The air control valve is located in the charge air inlet before the intake manifold.

## OPERATION

The EGR system reduces oxides of nitrogen (NOx) in engine exhaust. Formation of NOx increases proportionally with combustion temperature. To reduce the emission of these oxides, the cylinder temperature must be lowered. The system allows a predetermined amount of hot exhaust gas to recirculate and dilute the incoming charge air. The diluted air mixture reduces peak flame temperature during combustion. The EGR cooler further reduces these temperatures.

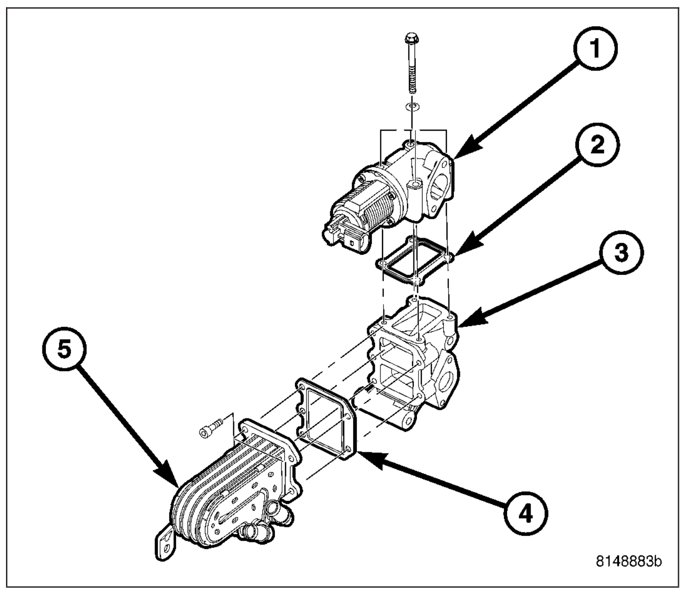
## REMOVAL

1. Disconnect the negative battery cable.
2. Remove engine cover.
3. Drain cooling system.
4. Disconnect the electrical connector at EGR valve.
5. Disconnect coolant hoses at EGR valve (1) and cooler (5).
6. Disconnect tube at the EGR valve housing.
7. Remove EGR valve housing to engine block fastener.
8. Remove EGR valve and cooler assembly from vehicle.
9. Remove EGR valve to cooler retaining bolts and separate EGR valve from cooler.



## INSTALLATION

1. Clean all gasket mating surfaces.
2. Assemble EGR valve (1) and cooler (5) to housing (3). A new gasket should only be required if the cooler has been replaced. Torque bolts to 11 N·m (95 in.lbs.).
3. Install EGR valve/cooler assembly to head and tighten bolts to 24.5 N·m (216 in. lbs.).
4. Install EGR tube to EGR assembly and tighten bolts to 32 N·m (24 ft.lbs).
5. Tighten EGR tube clamps to 7 N·m (62 in. lbs.).
6. Connect the EGR cooler hoses.
7. Refill cooling system.
8. Install engine cover.
9. Connect negative battery cable.



# EGR VALVE COOLER

## DESCRIPTION

Refer to the EGR valve operation for EGR cooler description (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION - OPERATION)

## REMOVAL

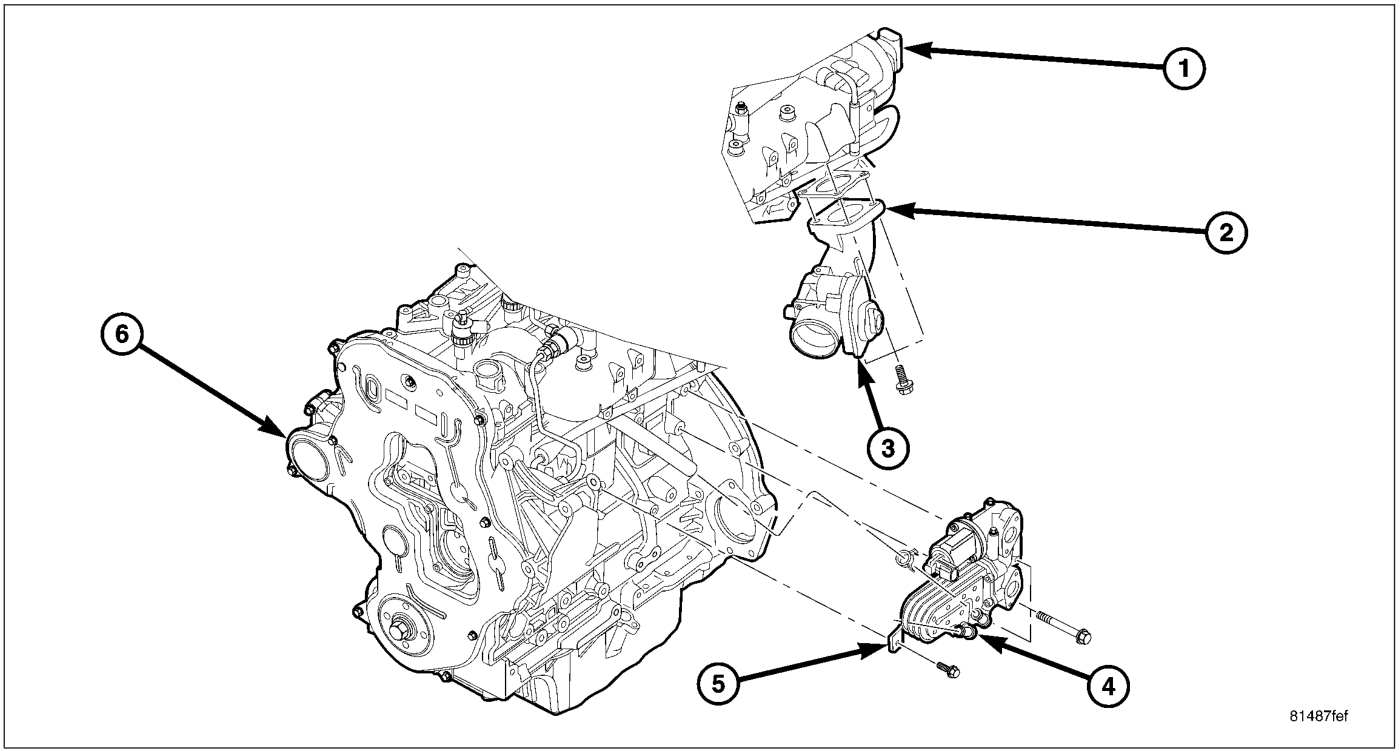
1. (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - REMOVAL)

## INSTALLATION

1. (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - INSTALLATION)

# EGR AIR FLOW CONTROL VALVE

## DESCRIPTION

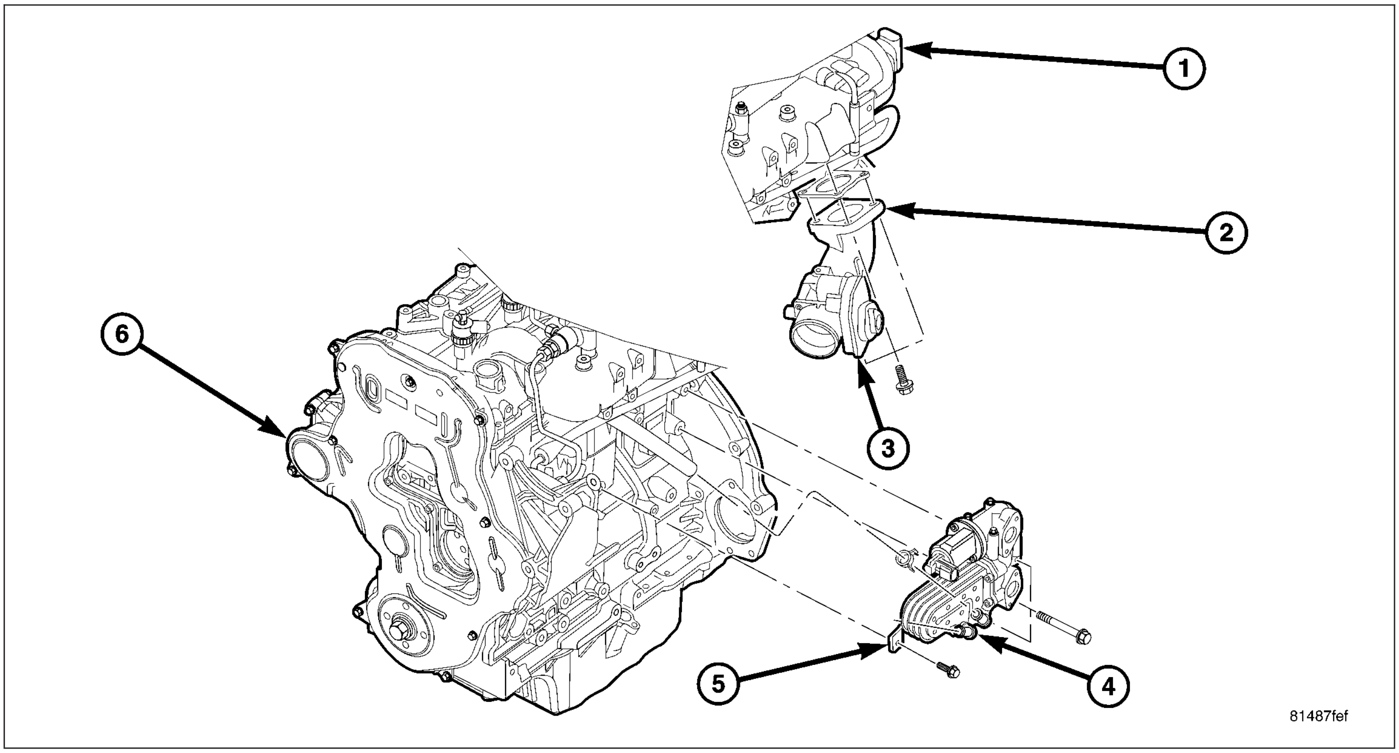


***EGR AND AIR CONTROL VALVE***

1 - REAR OF INTAKE MANIFOLD
2 - AIR INLET ELBOW
3 - EGR AIR CONTROL VALVE
4 - EGR VALVE COOLER
5 - EGR VALVE
6 - ENGINE

The EGR air flow control valve is located between the incoming charge air and the intake manifold. It is used to increase the EGR flow rate at low engine loads. The valve is never totally closed, but the valve position depends on the exhaust gas quantity that needs to be recirculated with in the emission target.

## OPERATION



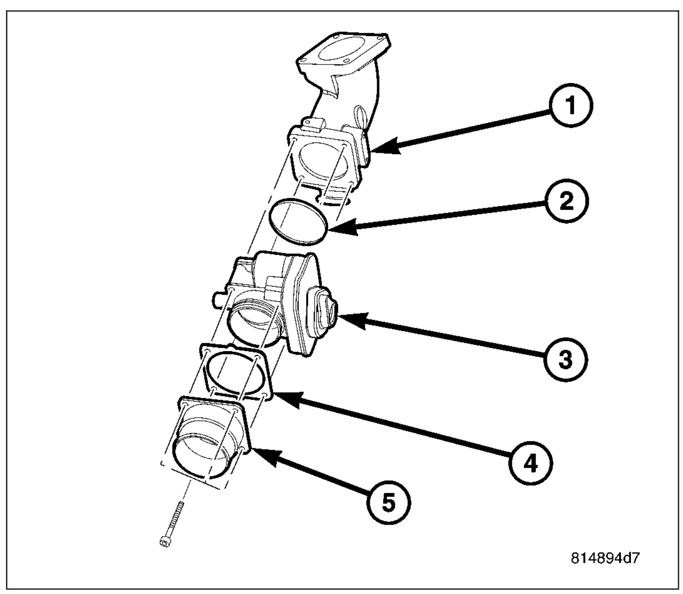
**_EGR AND AIR CONTROL VALVE_**

1 - REAR OF INTAKE MANIFOLD
2 - AIR INLET ELBOW
3 - EGR AIR CONTROL VALVE
4 - EGR VALVE COOLER
5 - EGR VALVE
6 - ENGINE

The EGR air flow control valve is a pluse width modulated control valve that is operated by the ECM in line with the EGR flow quantity required to remain inside the emissions target.

## REMOVAL

1. Disconnect the negative battery cable.
2. Disconnect the EGR air control valve (3) wiring harness connector.
3. Disconnect the charge air inlet hose.
4. Remove the generator to intake manifold support bracket.
5. Separate the oil level indicator tube and the vacuum pipe from the air control valve.
6. Disconnect the EGR tube connected to the back of the air control valve.
7. Remove the air control valve fasteners and the control valve assembly.



## INSTALLATION

1. Clean all gasket mating surfaces.
2. Install the gasket (4), seal (2) and the air control valve (3). Tighten the air control valve fasteners to 10.8 N·m (95 in. lbs.).
3. Install the EGR tube to the back of the air control valve.
4. Connect the vacuum pipe and oil level indicator tube to the air control valve.
5. Install the generator to intake support bracket. Tighten fasteners to 32.4 N·m (24 ft. lbs.).
6. Install the charge air hose. Tighten clamp to 7 N·m (61 in. lbs.).
7. Connect the wiring harness connector.
8. Connect the negative battery cable.
