- **Rear Fog Lamps** - For vehicles so equipped, the left multi-function switch control knob provides detent switching for the optional rear fog lamps. Rear fog lamps are optional only for vehicles manufactured for certain markets, where they are required.
- **Turn Signal Control** - The left multi-function switch control stalk provides both momentary non-detent switching and detent switching with automatic cancellation for both the left and right turn signal lamps.

### RIGHT CONTROL STALK

The right (wiper) control stalk of the multi-function switch supports the following functions and features:

- **Continuous Front Wipe Modes** - The right multi-function switch control knob provides two continuous front wipe switch positions, low speed or high speed.
- **Continuous Rear Wipe Mode** - The right multi-function switch control ring provides one continuous rear wipe switch position.
- **Front Washer Mode** - The right multi-function switch control stalk provides front washer system operation.
- **Front Wipe-After-Wash Mode** - The right multi-function switch control stalk provides a wipe-after-wash mode.
- **Front Wiper Mist Mode** - The right multi-function switch control stalk provides a front wiper system mist mode.
- **Intermittent Front Wipe Mode** - The right multi-function switch control knob provides an intermittent front wipe mode with five delay interval positions.
- **Intermittent Rear Wipe Mode** - The right multi-function switch control ring provides one fixed interval intermittent rear wipe mode switch position.
- **Rear Washer Mode** - The right multi-function switch control ring provides rear washer system operation.

## OPERATION

The multi-function switch uses a combination of resistor multiplexed and conventionally switched outputs to control the many functions and features it provides. The switch receives battery voltage on a fused ignition switch output (run-acc) circuit from a fuse in the Junction Block (JB) whenever the ignition switch is in the On or Accessory positions. The switch receives a path to ground at all times through a ground stud on the driver side instrument panel end bracket near the Junction Block (JB).

The multi-function switch can be diagnosed using conventional diagnostic tools and methods. However, proper testing of the multiplexed inputs to the Body Control Module (BCM) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are brief descriptions of how each of the two multi-function switch control stalks operate to control the functions and features they provide.

### LEFT CONTROL STALK

The left (lighting) control stalk of the multi-function switch operates as follows:

- **Front Fog Lamps** - For vehicles so equipped, the control knob on the end of the multi-function switch left (lighting) control stalk is pulled outward to activate the optional front fog lamps. The control knob is mechanically keyed so that it cannot be pulled outward unless it is first rotated to turn On the exterior lighting. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a fog lamp switch sense circuit, and the BCM responds by energizing or de-energizing the front fog lamp relay in the Junction Block (JB).

- **Headlamps** - The control knob on the end of the multi-function switch left (lighting) control stalk is rotated forward to its second detent position to activate the headlamps. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a headlamp switch sense circuit, and the BCM responds by energizing or de-energizing the selected low or high beam relay (Daytime Running Lamp relay in Canadian vehicles) in the Junction Block (JB).
- **Headlamp Beam Selection** - The left (lighting) control stalk of the multi-function switch is pulled towards the steering wheel past a detent to actuate the integral beam select switch circuitry. Each time the control stalk is activated in this manner, the opposite headlamp beam from what is currently selected will be energized. The multi-function switch provides a ground output to the Body Control Module (BCM) on a high beam switch sense circuit, and the BCM responds by energizing or de-energizing the selected low or high beam relay (Daytime Running Lamp relay in Canadian vehicles) in the Junction Block (JB).
- **Headlamp Optical Horn** - The left (lighting) control stalk of the multi-function switch is pulled towards the steering wheel to just before a detent, to momentarily activate the headlamp optical horn feature. The high beams will remain illuminated until the control stalk is released. The multi-function switch provides a ground output on a high beam relay control circuit to energize the headlamp high beam relay (Daytime Running Lamp relay in Canadian vehicles) in the Junction Block (JB).
- **Interior Lamps Defeat** - The control ring on the multi-function switch left (lighting) control stalk is rotated to a full rearward (clockwise) detent to defeat the illumination of all interior courtesy lamps. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a panel lamps dimmer switch circuit, and the BCM responds by de-energizing its internal courtesy lamp driver circuit.
- **Interior Lamps On** - The control ring on the multi-function switch left (lighting) control stalk is rotated to a full forward detent to illuminate all interior courtesy lamps. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a panel lamps dimmer switch circuit, and the BCM responds by energizing its internal courtesy lamp driver circuit.
- **Panel Lamps Dimming** - The control ring on the multi-function switch left (lighting) control stalk is rotated to one of six minor intermediate detents to simultaneously select the desired illumination intensity of all adjustable instrument panel and instrument cluster lighting. The control ring is rotated rearward to dim, or forward to brighten. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a panel lamps dimmer switch circuit, and the BCM responds by sending an electronic panel lamps dimming level message to the ElectroMechanical Instrument Cluster (EMIC) over the Programmable Communications Interface (PCI) data bus. The EMIC electronic circuitry then provides the proper PWM output to the cluster illumination lamps and the Vacuum Florescent Display (VFD) on the EMIC circuit board, and provides a matching Pulse Width Modulation (PWM) output on the hard wired fused panel lamps dimmer switch signal circuit.
- **Parade Mode** - The control ring on the multi-function switch left (lighting) control stalk is rotated to an intermediate detent that is one detent rearward from the full forward detent to select the Parade mode. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a panel lamps dimmer switch circuit, and the BCM responds by sending an electronic panel lamps dimming level message to the ElectroMechanical Instrument Cluster (EMIC) over the Programmable Communications Interface (PCI) data bus. The EMIC electronic circuitry then provides the proper PWM output to the cluster illumination lamps and the VFD on the EMIC circuit board, and provides a matching PWM output on the hard wired fused panel lamps dimmer switch signal circuit to illuminate all lamps at full (daylight) intensity with the exterior lamps turned On.
- **Park Lamps** - The control knob on the end of the multi-function switch left (lighting) control stalk is rotated forward to its first detent from the Off position to activate the park lamps. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a headlamp switch sense circuit, and the BCM responds by energizing or de-energizing the park lamp relay in the Junction Block (JB).
- **Rear Fog Lamps** - For vehicles so equipped, the control knob on the end of the multi-function switch left (lighting) control stalk is rotated forward to its third detent position to activate the rear fog lamps. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a headlamp switch sense circuit, and the BCM responds by energizing or de-energizing the rear fog lamp relay in the Junction Block (JB). Rear fog lamps are optional only for vehicles manufactured for markets, where they are required.
- **Turn Signal Control** - The left (lighting) control stalk of the multi-function switch is moved upward to activate the right turn signal circuitry, and downward to activate the left turn signal circuitry. The turn signal switch has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that provides turn signals only until the left multi-function switch control stalk is released. When the control stalk is moved to a turn signal switch detent position, the cancel actuator extends toward the center of the steering column. A turn signal cancel cam is integral to the clockspring and rotates with the steering wheel. The cam lobe contacts the cancel actuator when it is extended from the multi-

function switch. When the steering wheel is rotated during a turning maneuver, the turn signal cancel cam lobe will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the left turn signal detent is selected, the lobe of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral Off position. When a turn signal is activated, the multi-function switch provides a ground output on a right or left turn switch sense circuit to the combination flasher circuitry within the hazard switch, and the combination flasher flashes the turn signal lamps.

## RIGHT CONTROL STALK

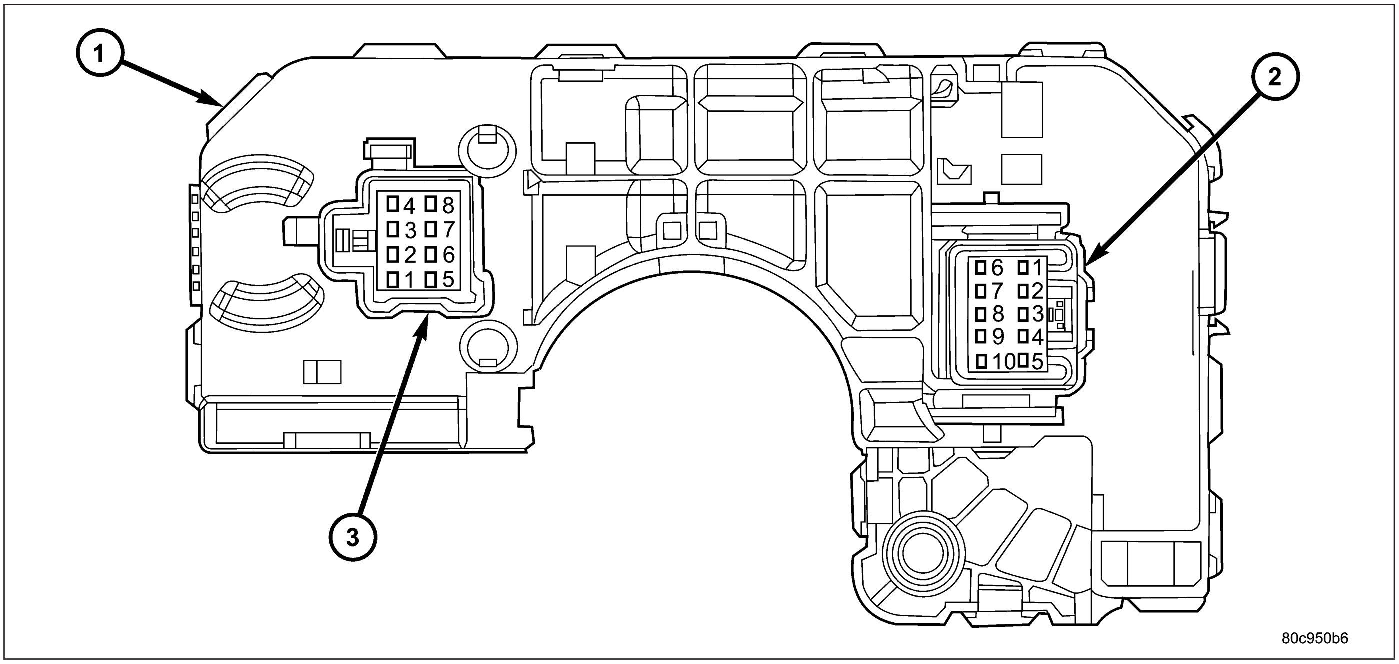
The right (wiper) control stalk of the multi-function switch operates as follows:

- **Continuous Front Wipe Modes** - The control knob on the end of the multi-function switch right (wiper) control stalk is rotated to an intermediate detent that is one detent rearward from the full forward detent to select the low speed continuous front wiper mode, or to its full forward detent to select the high speed continuous front wiper mode. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a front wiper switch circuit, and the BCM responds by energizing the wiper on/off relay in the Power Distribution Center (PDC) for the front low speed continuous wipe mode, or the wiper on/off relay and the wiper high/low relay in the PDC for the front high speed continuous wipe mode as required.
- **Continuous Rear Wipe Mode** - The control ring on the multi-function switch right (wiper) control stalk is rotated to the most forward detent to select the continuous rear wiper mode. The multi-function switch provides a battery voltage output to the rear wiper motor on a rear wiper on driver circuit to signal the rear wiper motor to operate in the continuous wipe mode.
- **Front Washer Mode** - The right (wiper) control stalk of the multi-function switch is pulled towards the steering wheel to momentarily activate the washer pump in the front washer mode. The washer pump will continue to operate in the front washer mode until the control stalk is released. The multi-function switch provides a ground output on a washer pump sense circuit, and battery voltage on a washer pump driver circuit to energize the washer pump in the front washer mode.
- **Front Wiper Mist Mode** - The right (wiper) control stalk of the multi-function switch is pushed towards the floor to momentarily activate the front wiper motor in the mist mode. The front wiper motor will continue to operate in the mist mode until the control stalk is released. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a front wiper switch circuit, and the BCM responds by energizing the wiper on/off relay in the Power Distribution Center (PDC) to operate the front wiper motor momentarily at low speed to provide the front wiper mist mode.
- **Intermittent Front Wipe Mode** - The control knob on the end of the multi-function switch right (wiper) control stalk is rotated to one of five minor intermediate detents to select the desired intermittent front wipe delay interval. The control knob is rotated rearward to increase the delay, or forward to decrease the delay. The multi-function switch provides a resistor multiplexed output to the Body Control Module (BCM) on a front wiper switch circuit, and the BCM responds by energizing the wiper on/off relay in the Power Distribution Center (PDC) to operate the front wiper motor at the selected delay intervals.
- **Intermittent Rear Wipe Mode** - The control ring on the multi-function switch right (wiper) control stalk is rotated to the center detent to select the intermittent rear wiper mode. The multi-function switch provides a battery voltage output to the rear wiper motor on a rear wiper intermittent driver circuit to signal the rear wiper motor to operate in the intermittent wipe mode.
- **Rear Washer Mode** - The control ring on the multi-function switch right (wiper) control stalk is rotated to either the full forward or full rearward momentary positions to activate the washer pump in the rear washer mode. The washer pump will continue to operate in the rear washer mode until the control ring is released. The multi-function switch provides a ground output on a washer pump driver circuit, and battery voltage on a washer pump sense circuit to energize the washer pump in the rear washer mode.

## DIAGNOSIS AND TESTING

## MULTI-FUNCTION SWITCH

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**



1. Remove the multi-function switch (1) from the steering column. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - REMOVAL).
2. Disconnect the lighting C-1 (2) or wiper C-2 (3) wire harness connector from the back of the multi-function switch.
3. Using an ohmmeter, perform the continuity and resistance tests at the terminals in the multi-function switch connector as shown in the Multi-Function Switch Tests table.

| MULTI-FUNCTION SWITCH TESTS | | |
|---|---|---|
| EXTERIOR LIGHTING FUNCTIONS | | |
| SWITCH POSITION | CONNECTOR C-1 PINS | RESISTANCE (OHMS) ±10% |
| Off | 4 and 5 | 3781 |
| Park Lamps On | 4 and 5 | 911 |
| Headlamp Low Beams On | 4 and 5 | 349 |
| Rear Fog Lamps On | 4 and 5 | 75 |
| Headlamp High Beams On | 8 and 9 | 0 - 1 |
| Front Fog Lamps On | 2 and 4 | 0 - 1 |
| Optical Horn (Flash-to-Pass) On | 7 and 8 | 0 - 1 |
| Turn Signal Neutral | 6 and 8, 8 and 10 | Infinite (Open) |
| Turn Signal Left | 6 and 8 | 0 - 1 |
| Turn Signal Right | 8 and 10 | 0 - 1 |
| INTERIOR LIGHTING FUNCTIONS | | |

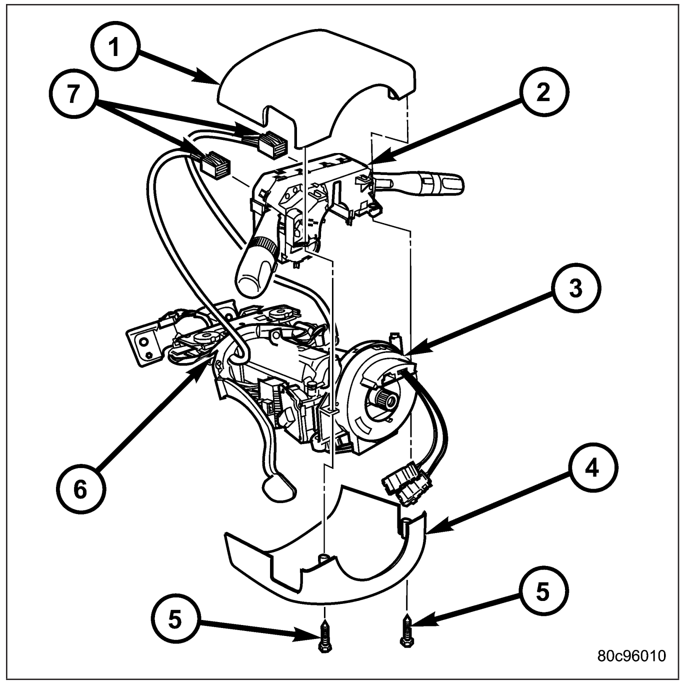
| MULTI-FUNCTION SWITCH TESTS | | |
|---|---|---|
| **SWITCH POSITION** | **CONNECTOR C-1 PINS** | **RESISTANCE (OHMS) ±10%** |
| Off (Courtesy Disable) | 1 and 4 | 63 |
| Dimming 1 | 1 and 4 | 200 |
| Dimming 2 | 1 and 4 | 557 |
| Dimming 3 | 1 and 4 | 914 |
| Dimming 4 | 1 and 4 | 1271 |
| Dimming 5 | 1 and 4 | 1628 |
| Dimming 6 | 1 and 4 | 1985 |
| Parade Mode On | 1 and 4 | 3565 |
| Courtesy On | 1 and 4 | 7885 |
| **FRONT WIPER FUNCTIONS** | | |
| **SWITCH POSITION** | **CONNECTOR C-1 AND C-2 PINS** | **RESISTANCE (OHMS) ±10%** |
| Front Wiper Off | C-1 Pin 4 and C-2 Pin 4 | 4587 |
| Delay 1 | C-1 Pin 4 and C-2 Pin 4 | 1267 |
| Delay 2 | C-1 Pin 4 and C-2 Pin 4 | 792 |
| Delay 3 | C-1 Pin 4 and C-2 Pin 4 | 531 |
| Delay 4 | C-1 Pin 4 and C-2 Pin 4 | 369 |
| Delay 5 | C-1 Pin 4 and C-2 Pin 4 | 262 |
| Front Wiper Low | C-1 Pin 4 and C-2 Pin 4 | 125 |
| Front Wiper High | C-1 Pin 4 and C-2 Pin 4 | 38 |
| Front Wiper Mist | C-1 Pin 4 and C-2 Pin 4 | 125 |
| Front Washer On | C-2 Pins 5 and 7 | 0 - 1 |
| **REAR WIPER FUNCTIONS** | | |
| **SWITCH POSITION** | **CONNECTOR C-2 PINS** | **RESISTANCE (OHMS) ±10%** |
| Rear Wiper Off | 1 and 5, 2 and 5 | Infinite (Open) |
| Rear Wiper Intermittent | 2 and 5 | 0 - 1 |
| Rear Wiper On | 1 and 5 | 0 - 1 |
| Rear Washer On | 2 and 5, 3 and 5 | 0 - 1 |

4. If the switch fails any of the tests, replace the ineffective multi-function switch as required.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the battery negative cable.
2. If the vehicle is equipped with the optional tilt steering column, move the tilt steering column to the fully lowered position and leave the tilt release lever in the released (down) position.
3. From below the steering column (6), remove the two screws (5) that secure the lower column shroud (4) to the upper shroud (1).
4. Using hand pressure, press inward on both sides of the upper shroud above the parting line of the lower shroud to release the snap features that secure the two shroud halves to each other.
5. Remove both shroud halves from the steering column.
6. Disconnect the two wire harness connectors (7) from the back of the multi-function switch housing (2).
7. Remove the multi-function switch from the steering column lock housing by carefully rocking the switch and pulling the switch housing upward far enough to disengage its alignment posts and locator tabs from the lock housing.

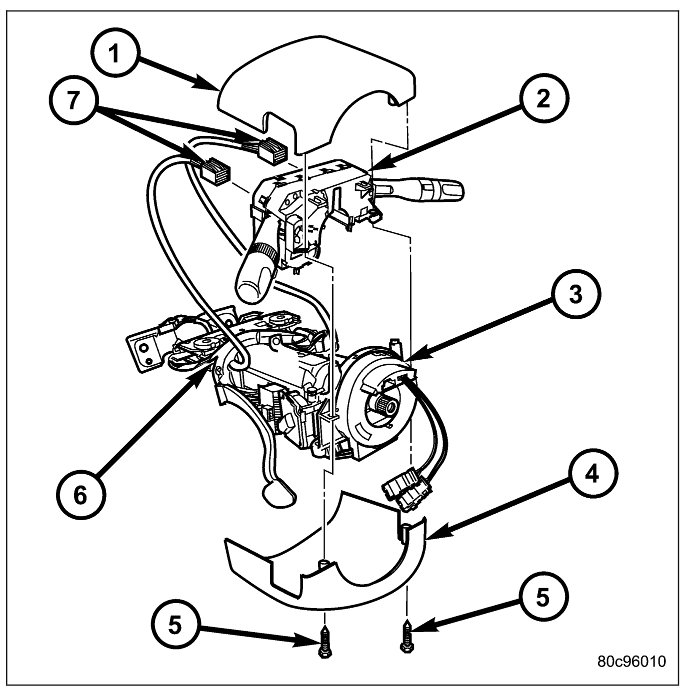


## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Before attempting to install the multi-function switch, be certain that the left control stalk is in the neutral turn signal position and the turn signal cancel actuator is in the retracted (neutral) position.**

1. Position the multi-function switch (2) to the steering column (6).
2. Reconnect the two wire harness connectors (7) to the connector receptacles on the back of the switch housing.
3. Position the multi-function switch onto the steering column lock housing. Be certain that the switch alignment posts and locator tabs are fully seated on the lock housing.
4. Position the upper (1) and lower shroud halves (4) onto the steering column.
5. Align the snap features on the lower shroud with the receptacles in the upper shroud and apply hand pressure to snap them together.
6. Install and tighten the two screws (5) that secure the lower shroud to the upper shroud. Tighten the screws to 2 N·m (20 in. lbs.).
7. If the vehicle is equipped with the optional tilt steering column, move the tilt steering column back to



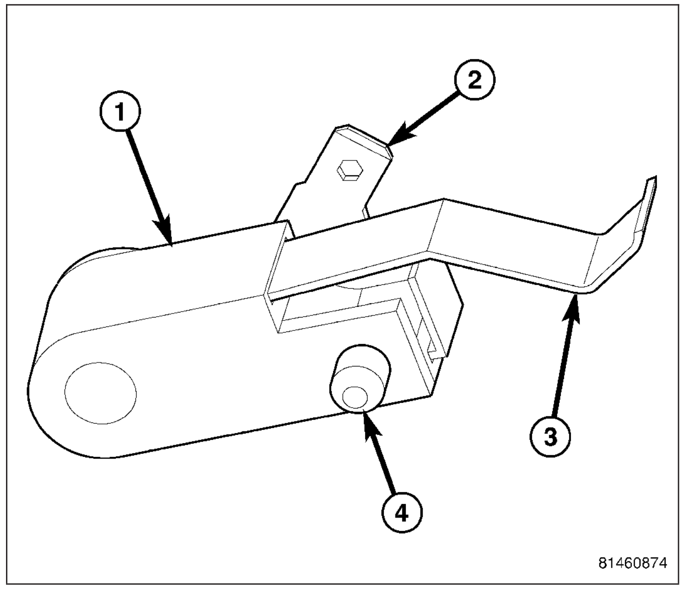
the fully raised position and move the tilt release lever into the locked (up) position.

8. Reconnect the battery negative cable.

# PARK BRAKE SWITCH

## DESCRIPTION

The park brake switch (1) is located on the park brake lever mechanism on the floor panel transmission tunnel below the center floor console. This switch includes a spade-type output terminal (2) that connects the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness. The output terminal is integral to the stationary contact within a molded plastic insulator. A locating tab (4) on the insulator engages a slot in the park brake lever mechanism for positive switch location. External to the insulator is a movable leaf contact (3) with an integral grounding lug on one end and an integral actuating lever and follower on the opposite end. The switch is secured to and grounded by a single screw to the park brake lever mechanism.



The park brake switch cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

## OPERATION

The park brake switch is a normally closed, mechanically actuated leaf contact switch that is operated by the park brake lever mechanism. The switch is grounded through its mounting to the park brake lever mechanism and provides a ground input to the ElectroMechanical Instrument Cluster (EMIC) on a park brake switch sense circuit whenever the park brake is applied, and opens this circuit whenever the park brake is released. The park brake switch sense input to the EMIC is used for control of the brake indicator and may also be used as a logic input for other electronic features in the vehicle.

The park brake switch can be diagnosed using conventional diagnostic tools and methods. However, proper testing of the EMIC processing of the park brake switch sense input requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## DIAGNOSIS AND TESTING

## PARK BRAKE SWITCH

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: If the brake indicator stays on with the ignition switch in the On position and the park brake released, or comes on while driving, the brake system must be diagnosed and repaired prior to performing the following tests. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING). If no brake system problem is found, the following procedures will help to locate a shorted or open park brake switch sense circuit, or an ineffective park brake switch.**

#### INDICATOR ILLUMINATES DURING BULB TEST, BUT DOES NOT WHEN PARK BRAKE APPLIED

1. Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the park brake switch from the switch terminal. Apply the parking brake. Check for continuity between the park brake switch terminal and a good ground. There should be continuity. If OK, go to Step 2. If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector for the instrument cluster from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavities of the body wire harness connector for the park brake switch and the instrument panel wire harness connector for the instrument cluster. There should be continuity. If not OK, repair the open park brake switch sense circuit between the park brake switch and the instrument cluster as required.

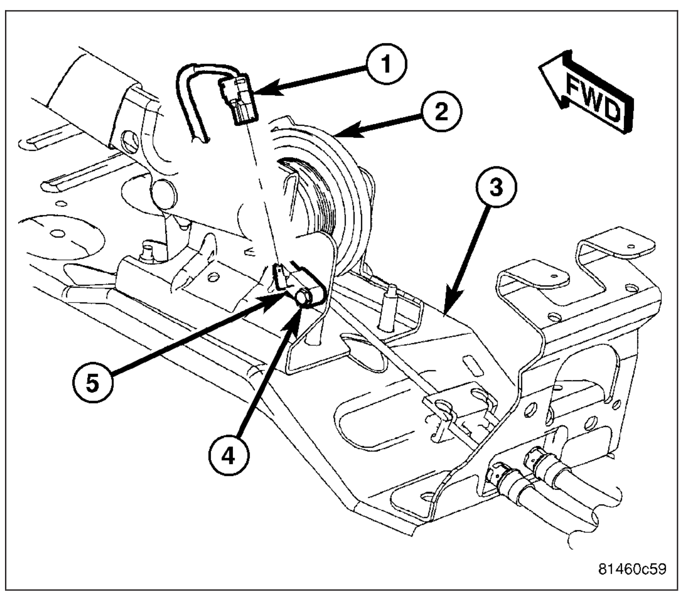
#### INDICATOR REMAINS ILLUMINATED - BRAKE SYSTEM CHECKS OK

1. Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the park brake switch from the switch terminal. Check for continuity between the terminal of the park brake switch and a good ground. There should be no continuity with the park brake released, and continuity with the park brake applied. If OK, go to Step 2. If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector for the instrument cluster from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavity of the body wire harness connector for the park brake switch and a good ground. There should be no continuity. If not OK, repair the shorted park brake switch sense circuit between the park brake switch and the instrument cluster as required.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

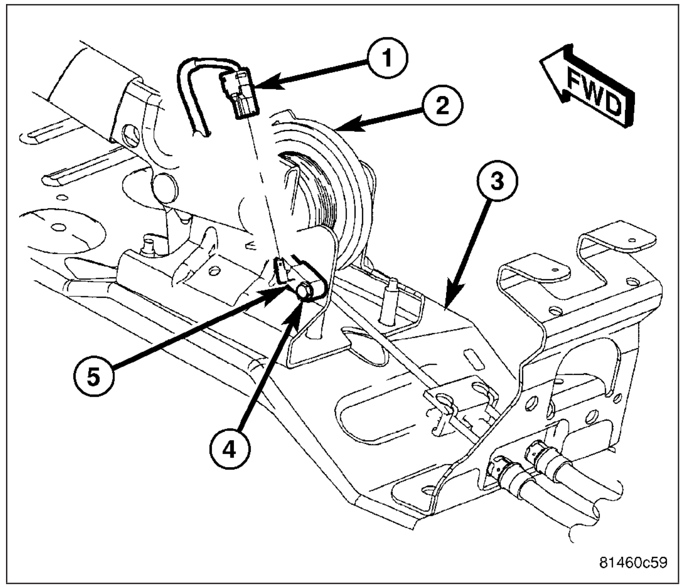
1. Disconnect and isolate the battery negative cable.
2. Remove the console from the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
3. Apply the parking brake lever mechanism (2).
4. Disconnect the body wire harness connector (1) from the terminal of the park brake switch (5) located on the left side of the park brake lever mechanism.
5. Remove the screw (4) that secures the park brake switch to the park brake lever mechanism.
6. Remove the switch from the park brake lever mechanism.



## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

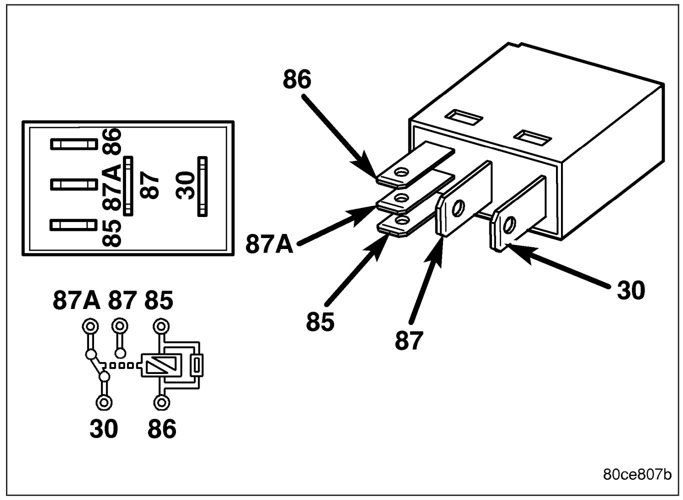
1. Position park brake switch (5) onto the left side of the park brake lever mechanism (2). Be certain to engage the locating pin on the back of the switch insulator into the locating slot in the lever mechanism bracket.
2. Install and tighten the screw (4) that secures the park brake switch to the park brake lever mechanism. Tighten the screw to 3 N·m (24 in. lbs.).
3. Reconnect the body wire harness connector (1) to the terminal of the park brake switch.
4. Reinstall the console onto the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).
5. Reconnect the battery negative cable.
6. Turn the ignition switch to the On position and check for proper brake indicator operation with the parking brake applied, then release the parking brake and check that the brake indicator extinguishes.



# PARK LAMP RELAY

## DESCRIPTION

The park lamp relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male spade-type terminals that extend from the relay base plate.



The park lamp relay is located in the Junction Block (JB) on the driver side outboard end bracket of the instrument panel. Refer to Junction Block in the wiring section of this service information for specific relay cavity assignment information. The park lamp relay cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

## OPERATION

The park lamp relay is an electromechanical switch that uses a low current input from the Body Control Module (BCM) to control a high current output to the park lamps. Within the relay are an electromagnetic coil, a movable contact and two fixed contact points. A resistor is connected in parallel with the coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the field of the relay coil collapses.

The movable common supply contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This field draws the movable contact away from the normally closed contact, and holds it against the normally open contact. When the relay coil is de-energized, spring pressure returns the movable contact back against the normally closed contact.

The inputs and outputs of the park lamp relay include:

- **Common Supply Terminal (30)** - The common feed terminal is connected to the park lamps through the park lamp relay output circuit. This terminal provides ground to the park lamps when the relay is de-energized, and battery voltage to the park lamps whenever the relay is energized.
- **Coil Ground Terminal (85)** - The coil ground terminal is connected to a control output of the BCM through a park lamp relay control circuit. The BCM controls park lamp operation by controlling a ground path through this circuit.
- **Coil Battery Terminal (86)** - The coil battery terminal is connected to a fused B(+) circuit at all times.
- **Normally Open Terminal (87)** - The normally open terminal is connected to a fused B(+) circuit at all times.
- **Normally Closed Terminal (87A)** - The normally closed terminal is connected to ground at all times through a ground stud on the driver side instrument panel end bracket near the Junction Block (JB).

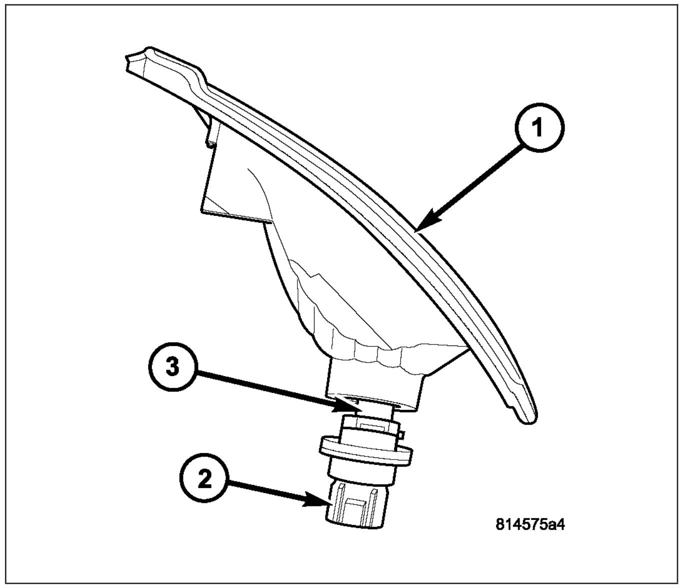
The park lamp relay can be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

# PARK/TURN SIGNAL LAMP

## REMOVAL

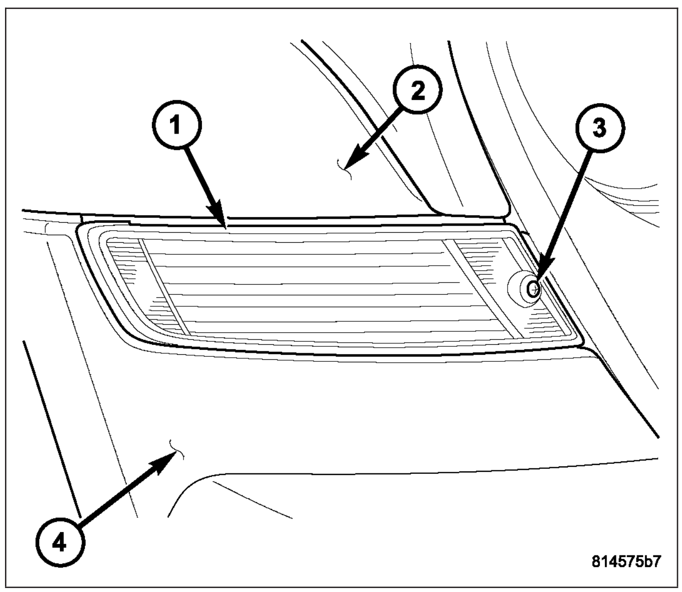
### BULB

1. Disconnect and isolate the battery negative cable.
2. Remove the front park/turn signal lamp unit (1) from the front fascia. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/PARK/TURN SIGNAL LAMP UNIT - REMOVAL).
3. Firmly grasp the park/turn signal bulb socket (2) on the back of the lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb (3) straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

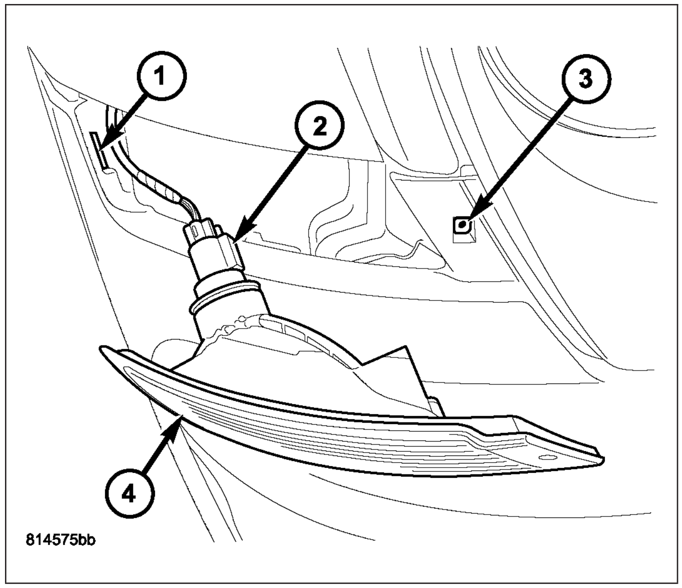


### LAMP

1. Disconnect and isolate the battery negative cable.
2. Remove the screw (3) that secures the inboard side of the front park/turn signal lamp unit (1) to the front bumper fascia (4).



3. Pull the inboard side of the lamp (4) away from the fascia far enough to disengage the tab that secures the outboard side of the lamp from the slot (1) in the front bumper fascia.
4. Disengage the lock feature and disconnect the wire harness connector (2) from the lamp socket.
5. Remove the front park/turn signal lamp unit from the vehicle.

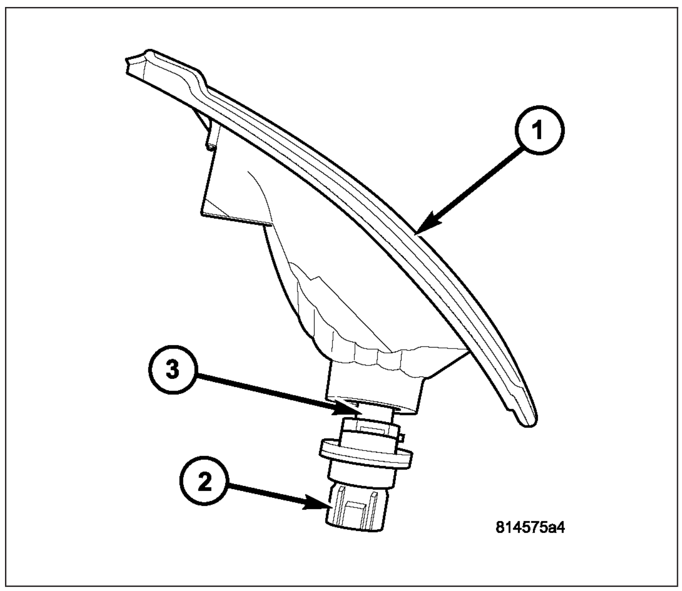


## INSTALLATION

## BULB

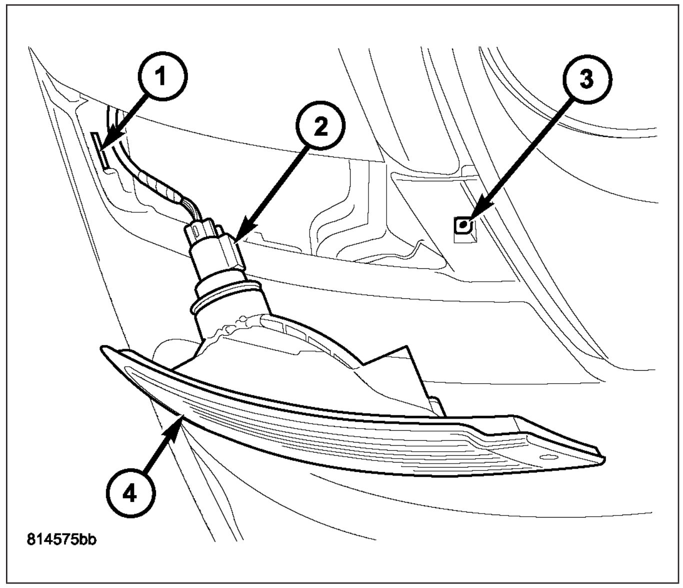
**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

1. Align the base of the bulb (3) with the park/turn signal bulb socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the front park/turn signal lamp unit housing (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the front park/turn signal lamp unit onto the front fascia. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/PARK/TURN SIGNAL LAMP UNIT - INSTALLATION).
7. Reconnect the battery negative cable.

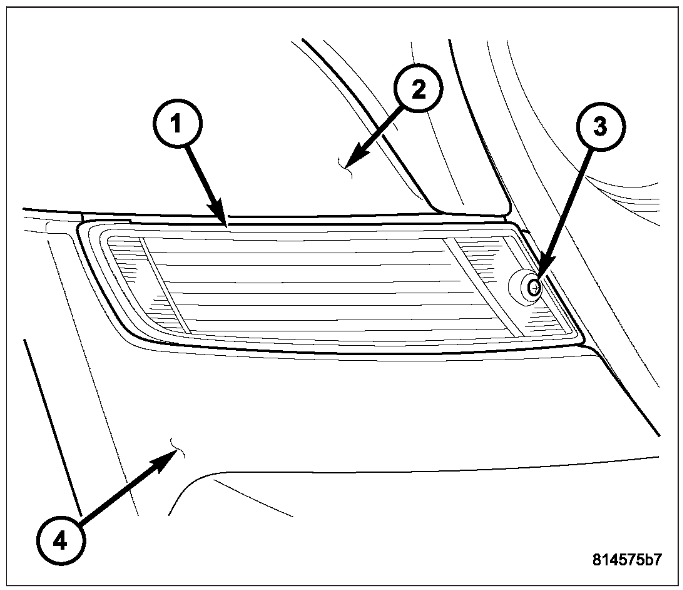


## LAMP

1. Check to be certain that the plastic nut (3) is in good condition and properly installed in the inboard side of the front park/turn signal lamp mounting hole in the front bumper fascia.
2. Position the lamp unit (4) near the mounting hole in the fascia.
3. Reconnect the wire harness connector (2) to the lamp socket and engage the lock feature.
4. Align and engage the tab on the outboard side of the lamp housing with the slot (1) in the fascia mounting hole.



5. Position the inboard side of the lamp (1) into the fascia (4) mounting hole.
6. Install and tighten the screw (3) that secures the inboard side of the lamp to the fascia. Tighten the screw to 2 N·m (20 in. lbs.).
7. Reconnect the battery negative cable.



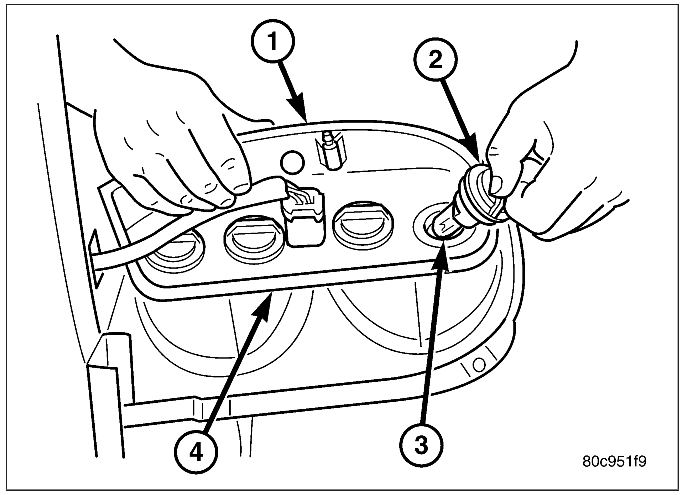
# REAR LAMP UNIT

## REMOVAL

### BULB

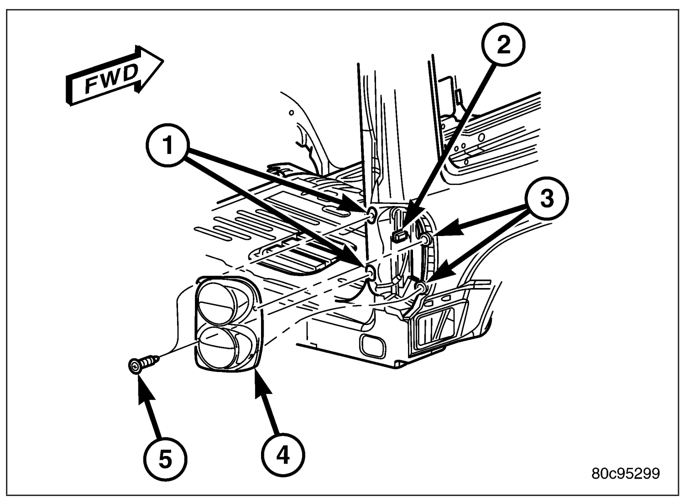
**NOTE: The rear lamp unit may contain up to four bulbs, depending upon the market for which the vehicle was manufactured. The service procedures for each bulb are the same, only the bulb sizes and types may differ.**

1. Disconnect and isolate the battery negative cable.
2. Remove the rear lamp unit (1) from the end of the quarter panel. (Refer to 8 - ELECTRICAL/LAMPS/ LIGHTING - EXTERIOR/REAR LAMP UNIT - REMOVAL).
3. Firmly grasp the socket (2) on the socket plate (4) on the back of the rear lamp unit housing for the bulb that is being removed and rotate it counter-clockwise about 30 degrees to unlock it.
4. Pull the socket and bulb (3) straight out of the keyed opening in the socket plate.
5. Pull the base of the bulb straight out of the rear lamp socket.



### LAMP

1. Disconnect and isolate the battery negative cable.
2. Open the tailgate to access and remove the two screws (5) that secure the rear lamp unit (4) to the two plastic nuts (1) in the side jamb of the tailgate opening.
3. Pull the outboard side of the rear lamp unit rearward far enough to unsnap the two ball studs on the outboard side of the lamp housing from the two plastic grommets (3) in the quarter panel.
4. Disconnect the wire harness connector (2) from the lamp socket plate connector.
5. Remove the lamp from the quarter panel.
6. Remove the two plastic grommets from the quarter panel and discard.



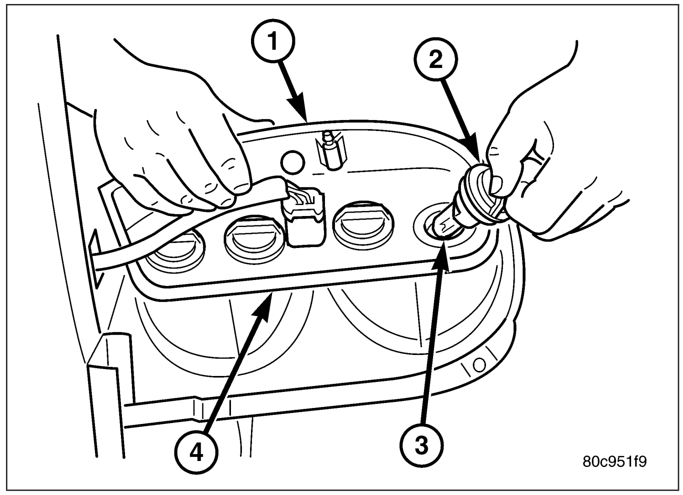
## INSTALLATION

### BULB

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

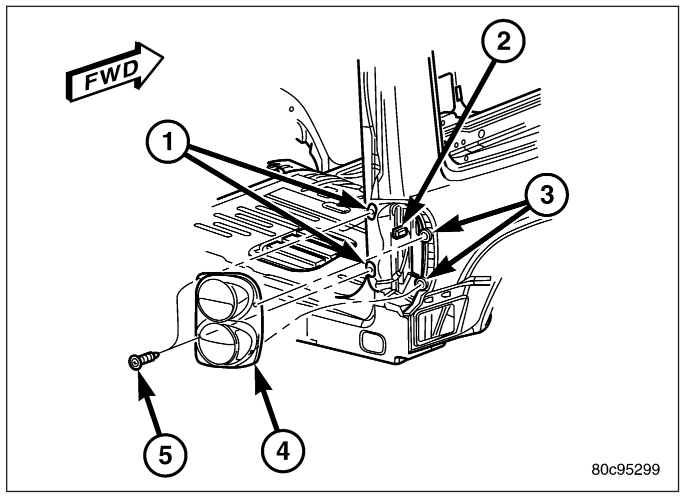
**NOTE: The rear lamp unit may contain up to four bulbs, depending upon the market for which the vehicle was manufactured. The service procedures for each bulb are the same, only the bulb sizes and types may differ.**

1. Align the base of the bulb (3) with the rear lamp socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening in the socket plate (4) on the back of the rear lamp unit housing (1).
4. Insert the socket and bulb straight into the socket plate until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the rear lamp unit onto the end of the quarter panel. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/REAR LAMP UNIT - INSTALLATION).
7. Reconnect the battery negative cable.



## LAMP

1. Install two new plastic grommets (3) into the quarter panel.
2. Position the rear lamp unit (4) to the quarter panel.
3. Reconnect the wire harness connector (2) to the lamp socket plate connector.
4. Align the two ball studs on the outboard side of the rear lamp housing with the two plastic grommets in the quarter panel.
5. Using hand pressure, push firmly and evenly on the outboard side of the lamp until the two ball studs snap into the plastic grommets.
6. Install and tighten the two screws (5) that secure the inboard side of the lamp housing to the plastic nuts (1) in the side jamb of the tailgate opening. Tighten the screws to 2 N·m (20 in. lbs.).
7. Reconnect the battery negative cable.



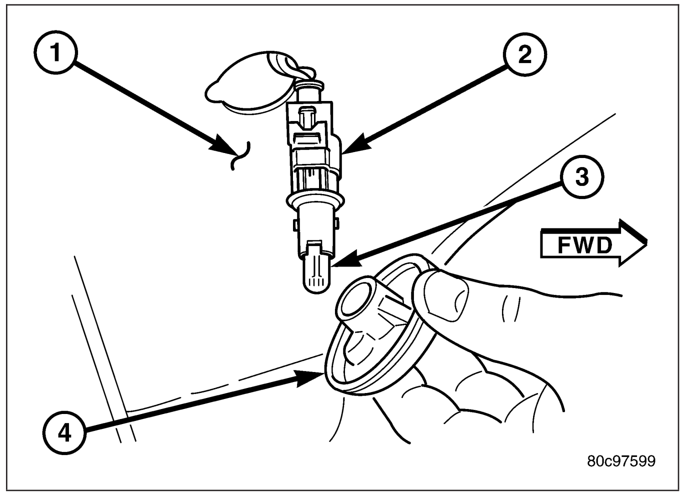
# REPEATER LAMP

## REMOVAL

## BULB

**NOTE: Side repeater lamps are used only on vehicles manufactured for certain markets where these lamps are required.**

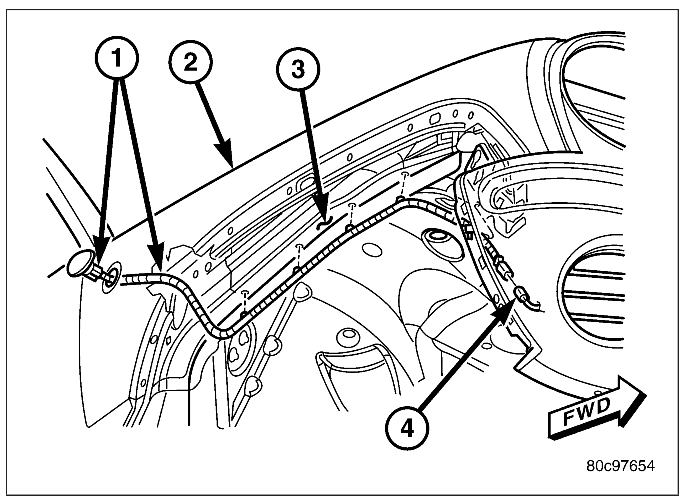
1. Disconnect and isolate the battery negative cable.
2. Remove the repeater lamp unit from the front fender panel (1). (Refer to 8 - ELECTRICAL/ LAMPS/LIGHTING - EXTERIOR/REPEATER LAMP UNIT - REMOVAL).
3. Rotate the repeater lamp socket (2) in the lamp lens (4) counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb (3) straight out of the keyed opening in the lamp lens.
5. Pull the base of the bulb straight out of the lamp socket.



## LAMP

**NOTE: Side repeater lamps are used only on vehicles manufactured for certain markets where these lamps are required.**

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable wide flat-bladed tool, carefully pry at the clearance notch in the lower edge of the repeater lamp lens (1) to disengage the snap features of the lens from the mounting hole in the front fender panel (2).
3. Pull the lamp unit out from the front fender panel far enough to access and disconnect the wire harness connector from the lamp socket.
4. Remove the lamp unit from the front fender panel.

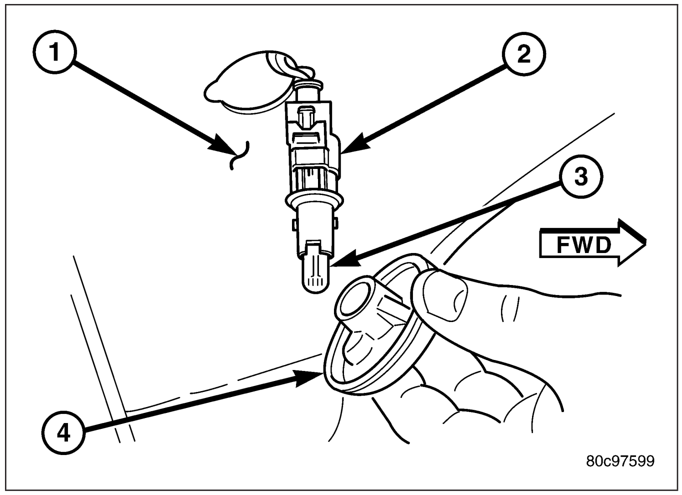


## INSTALLATION

## BULB

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

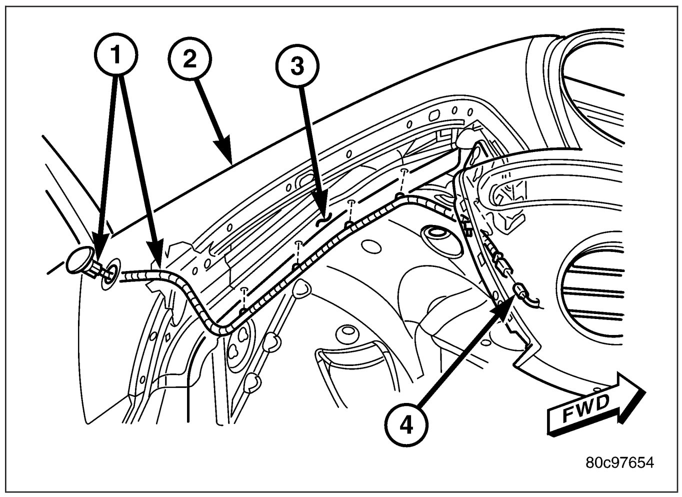
**NOTE: Side repeater lamps are used only on vehicles manufactured for certain markets where these lamps are required.**



1. Align the base of the bulb (3) with the repeater lamp socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the repeater lamp lens (4).
4. Insert the socket and bulb straight into the lens until the socket is firmly seated
5. Rotate the socket clockwise in the lens about 30 degrees to lock it into place.
6. Reinstall the repeater lamp unit onto the front fender panel (1). (Refer to 8 - ELECTRICAL/ LAMPS/LIGHTING - EXTERIOR/REPEATER LAMP UNIT - INSTALLATION).
7. Reconnect the battery negative cable.

## LAMP

**NOTE: Side repeater lamps are used only on vehicles manufactured for certain markets where these lamps are required.**

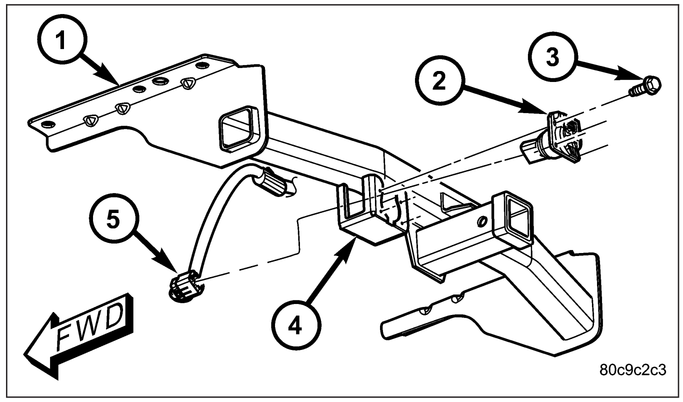


1. Position the repeater lamp unit (1) to the front fender panel (2).
2. Reconnect the wire harness connector to the lamp socket.
3. Position the lamp unit into the mounting hole in the front fender panel. Be certain that the clearance notch on the edge of the lamp lens is oriented towards the bottom.
4. Using hand pressure, press on the lamp lens firmly and evenly until the snap features of the lamp are fully engaged in the mounting hole of the front fender panel.
5. Reconnect the battery negative cable.

# TRAILER TOW CONNECTOR

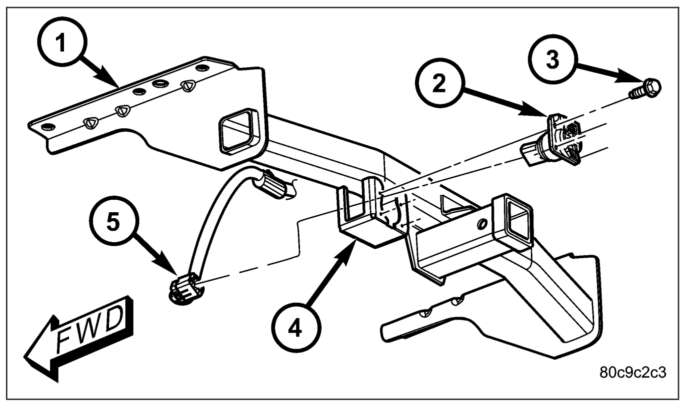
## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the four screws (3) that secure the trailer tow connector (2) to the bracket (4) on the trailer hitch receiver (1).
3. Pull the trailer tow connector rearward from the hitch receiver bracket far enough to access and disconnect the rear body wire harness connector (5).
4. Remove the trailer tow connector from the trailer hitch receiver.



## INSTALLATION

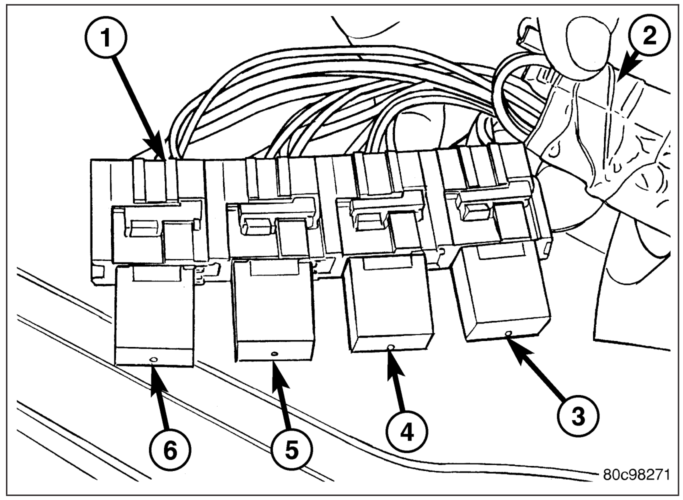
1. Position the trailer tow connector (2) to the trailer hitch receiver (1).
2. Reconnect the rear body wire harness connector (5) to the trailer tow connector.
3. Position the trailer tow connector into the bracket (4) on the trailer hitch receiver.
4. Install and tighten the four screws (3) that secure the trailer tow connector to the hitch receiver bracket. Tighten the screws to 4 N·m (35 in. lbs.).
5. Reconnect the battery negative cable.



# TRAILER TOW RELAY

## DESCRIPTION

Vehicles equipped with an optional factory-installed trailer towing package have four trailer tow relays. The trailer tow relays are conventional International Standards Organization (ISO) micro relays. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. Each relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male spade-type terminals that extend from the relay base plate.



The trailer tow relays include one each for brake lamps (5), right turn lamps (4), left turn lamps (3) and a fused ignition switch output (run) circuit (6) which are provided for the trailer through the rear body wiring (2) and connectors. The relays are located in a connector bank (1) above the right rear wheelhouse and behind the quarter trim panel. The connector bank and relays are wrapped within a foam rubber isolator envelope for sound deadening and anti-rattle protection.

Refer to Trailer Tow in the wiring information for specific relay cavity assignment information. A trailer tow relay cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

## OPERATION

The trailer tow relays are electromechanical switches that each use a low current input from the circuit that they isolate to control a high current output to the trailer brake and turn signal lamps, and a trailer accessory circuit. Within each relay are an electromagnetic coil, a movable contact and two fixed contact points. A resistor is connected in parallel with the coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the field of the relay coil collapses.

The movable common supply contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This field draws the movable contact away from the normally closed contact, and holds it against the normally open contact. When the relay coil is de-energized, spring pressure returns the movable contact back against the normally closed contact.

The inputs and outputs of the trailer tow relays include:

- **Common Supply Terminal (30)** - The common feed terminal is connected to the circuit connected to the normally open terminal (87) when the relay is energized, or to the circuit connected to the normally closed terminal (87A) when the relay is de-energized.
- **Coil Ground Terminal (85)** - The coil ground terminal is connected to a ground circuit at all times.
- **Coil Battery Terminal (86)** - The coil battery terminal is connected to the circuit that controls the relay output. When battery voltage is applied to this terminal, the relay is energized.
- **Normally Open Terminal (87)** - The normally open terminal is connected to the circuit connected to the common supply terminal (30) whenever the relay is energized.
- **Normally Closed Terminal (87A)** - The normally closed terminal is connected to the circuit connected to the common supply terminal (30) whenever the relay is de-energized.

The trailer tow relays can be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

## REMOVAL

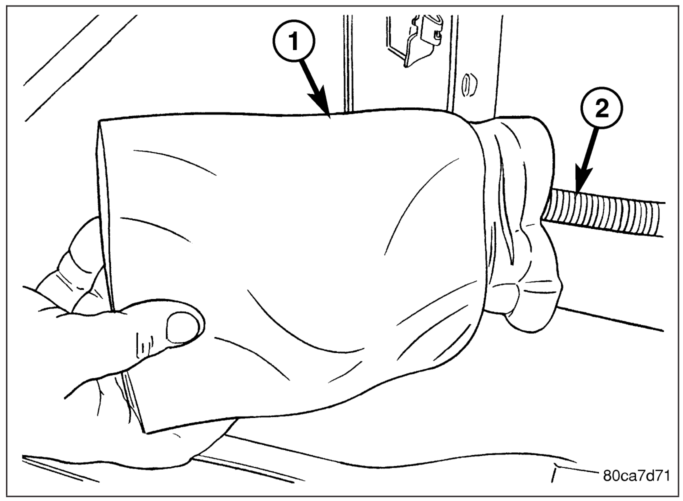
**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Use proper precautions to protect your skin and the rear body wire harness from cuts or scrapes caused by contact with the sharp edges of the quarter inner panel sheet metal while servicing the trailer tow relay connector bank.**

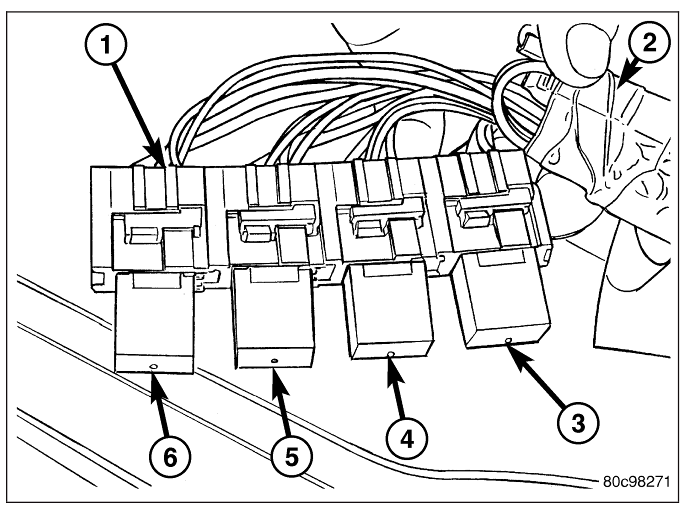
**CAUTION: Be certain any removed trailer tow relay is replaced with the same relay size and type that was removed.**

**NOTE: The trailer tow relay bank contains four relays. The service procedures for each relay are the same.**

1. Disconnect and isolate the battery negative cable.
2. Remove the trim from the right side quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).
3. Reach through the access hole in the quarter inner panel behind the right rear wheelhouse to locate and retrieve the trailer tow relay connector bank at the end of a take out of the rear body wire harness (2), which is wrapped within a foam rubber envelope (1) and placed on the top of the right rear wheelhouse between the quarter inner and outer panels.
4. Pull the trailer tow relay connector bank envelope into the cargo area far enough to access the relays for service.



5. Carefully remove the trailer tow relay connector bank (1) from the foam wrap.
6. Remove the appropriate relay (3, 4, 5 or 6) by grasping it firmly and pulling it straight out from the connector bank.



## INSTALLATION

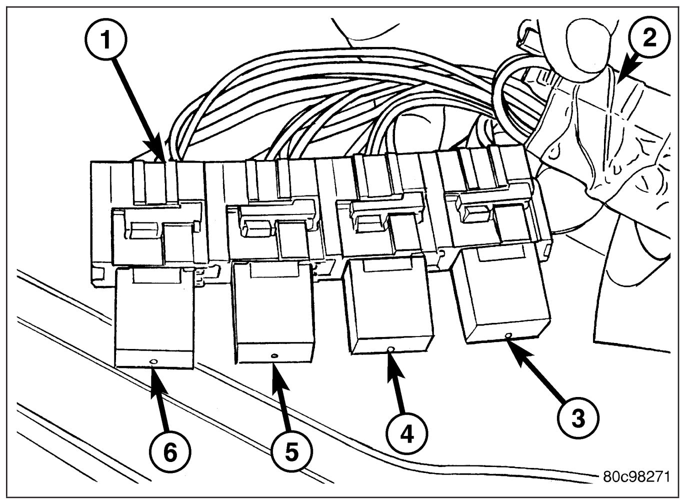
**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Use proper precautions to protect your skin and the rear body wire harness from cuts or scrapes caused by contact with the sharp edges of the quarter inner panel sheet metal while servicing the trailer tow relay connector bank.**

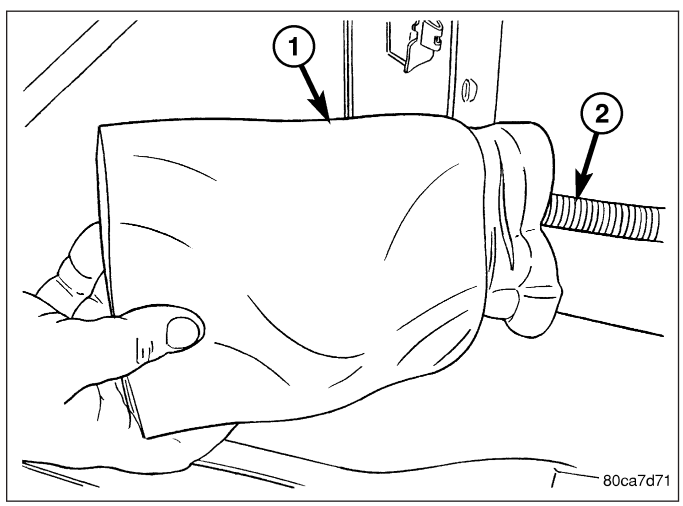
**CAUTION: Be certain any removed trailer tow relay is replaced with the same relay size and type that was removed.**

**NOTE: The trailer tow relay bank contains four relays. The service procedures for each relay are the same.**

1. Position the trailer tow relay (3, 4, 5 or 6) to the appropriate connector in the connector bank (1).
2. Align the relay terminals with the receptacles in the connector.
3. Push firmly and evenly on the top of the relay until the terminals are fully seated in the connector.



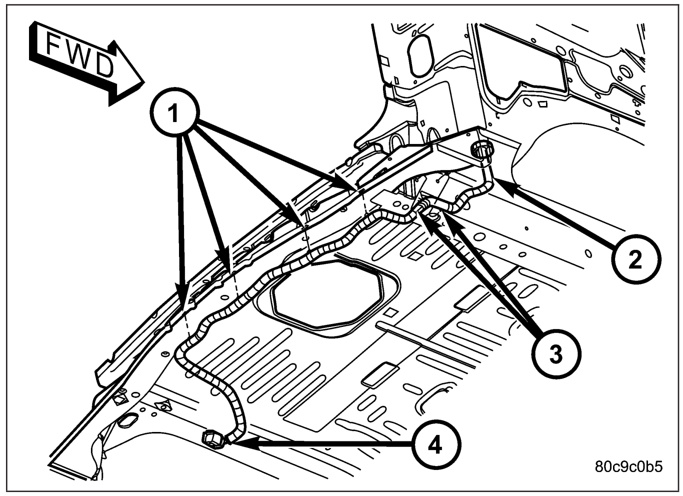
4. Carefully restore the foam wrap (1) around the trailer tow relay connector bank on the rear body wire harness take out (2).
5. Reach through the access hole in the quarter inner panel behind the right rear wheelhouse to place the relay connector bank on the top of the right rear wheelhouse between the quarter inner and outer panels.
6. Reinstall the trim onto the right side quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).
7. Reconnect the battery negative cable.



# TRAILER TOW WIRING

## DESCRIPTION

Vehicles equipped with an optional factory-installed trailer towing package have a rear body wire harness that includes a trailer tow wiring take out (2) secured beneath the rear underbody with retainer clips (1 and 3). A molded connector (4) at the end of the take out is connected to a heavy duty, sealed, 7-pin trailer tow connector located on a bracket on the trailer hitch receiver. The rear body harness includes a second take out with a trailer tow relay connector bank and the four trailer tow relays that isolate the right turn signal, left turn signal, and brake lamp circuits of the vehicle from the electrical system of the trailer. The fourth relay in the connector bank provides a fused ignition switch output (run) source of battery voltage to the trailer tow connector through a trailer tow relay output circuit.

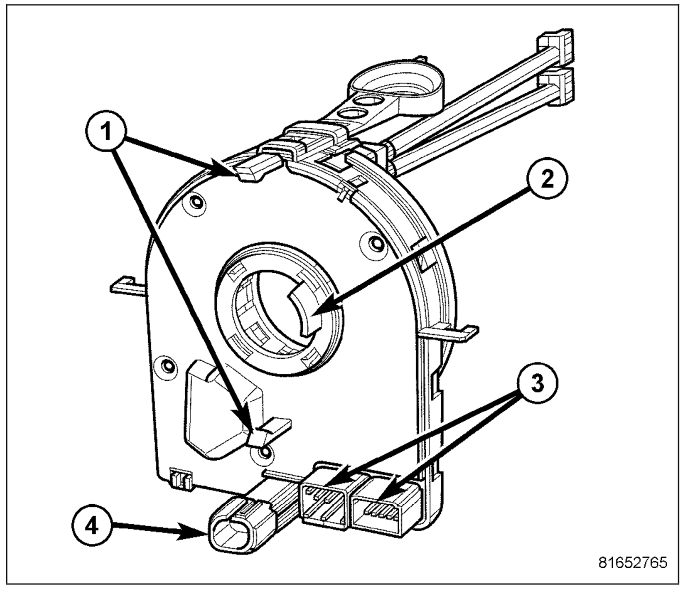


The package also includes an adapter harness (stored beneath the left rear seat cushion of the vehicle when it is shipped from the factory) that adapts the 7-pin trailer tow connector to a standard, light-duty, 4-pin trailer tow connector. Refer to the appropriate wiring information.

# TURN SIGNAL CANCEL CAM

## DESCRIPTION

The turn signal cancel cam (2) is concealed within the steering column. The cancel cam consists of a single lobe that is integral to the lower hub of the clockspring rotor. The clockspring mechanism provides turn signal cancellation as well as a constant electrical connection between the horn switch, driver airbag, speed control switches, and remote radio switches on the steering wheel and the instrument panel wire harness on the steering column. The housing of the clockspring is secured to the lock housing near the top of the steering column and remains stationary. The rotor of the clockspring, including the turn signal cancel cam lobe rotates with the steering wheel.



The turn signal cancel cam is serviced as a unit with the clockspring and cannot be repaired. If ineffective or damaged, the entire clockspring unit must be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

## OPERATION

When the multi-function switch left (lighting) control stalk is moved to a latched turn signal position, a turn signal cancel actuator is extended from the left inside surface of the switch housing toward the turn signal cancel cam. As the steering wheel is rotated to complete the turn, the cam lobe will contact the actuator, automatically cancelling the turn signal event and releasing the latched multi-function switch left control stalk to the neutral position.

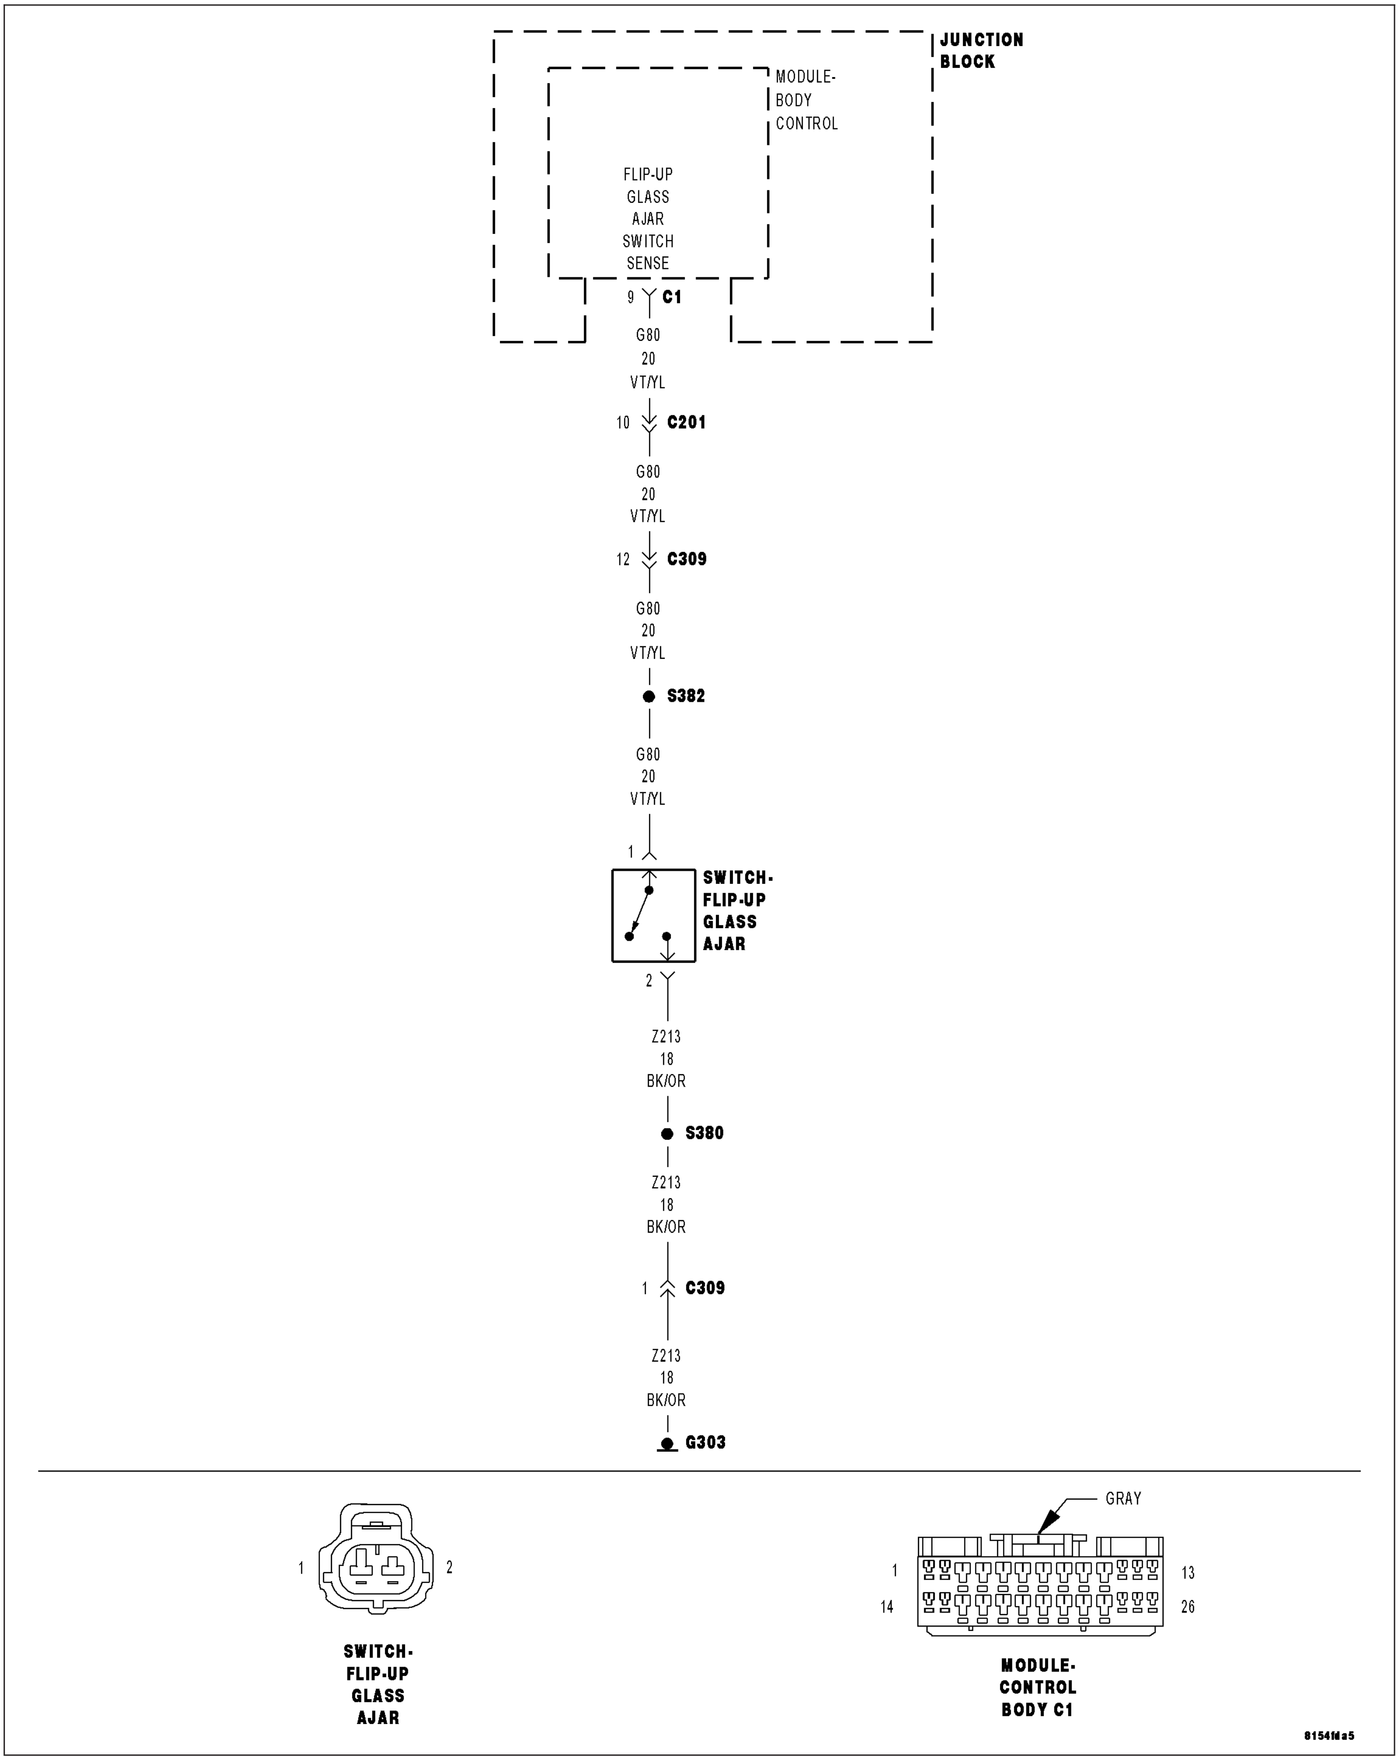
# LAMPS/LIGHTING - INTERIOR - ELECTRICAL DIAGNOSTICS

## TABLE OF CONTENTS

# LAMPS/LIGHTING - INTERIOR - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## *FLIP-UP GLASS AJAR CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| FLIP-UP GLASS AJAR SWITCH GROUND CIRCUIT OPEN |
| (G80) FLIP-UP GLASS AJAR SWITCH SENSE CIRCUIT OPEN |
| FLIP-UP GLASS AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. FLIP-UP GLASS AJAR FUNCTIONAL TEST

Open the Flip-up Glass.

With the scan tool in Data Display, read the FLIP-UP AJAR SW state.

**Does the scan tool display TRUE?**

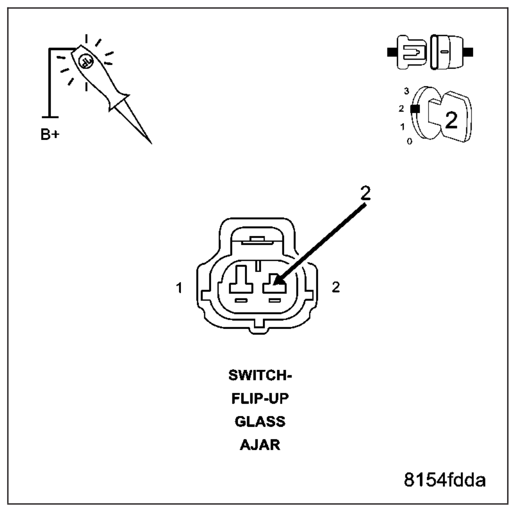
**Yes** >> The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires.

**No** >> Go To 2

### 2. OPEN FLIP-UP GLASS AJAR SWITCH GROUND CIRCUIT

Disconnect the Tailgate Flip-up Glass Ajar switch connector.

Using a 12-volt Test Light connected to 12-volts, test the Ground circuit.



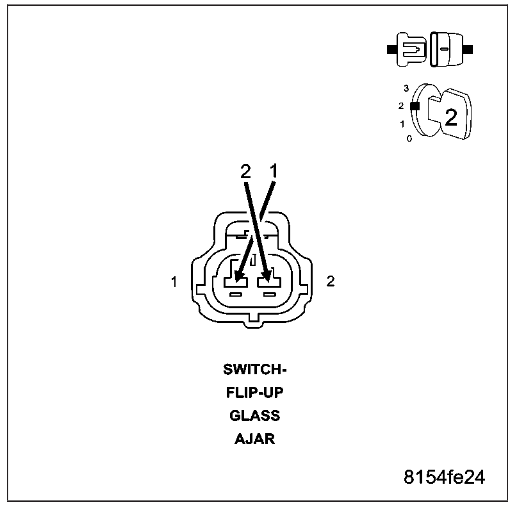
**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 3. CHECK FOR OPEN FLIP-UP GLASS AJAR SWITCH



With the scan tool in Data Display, read the FLIP-UP AJAR SW state.

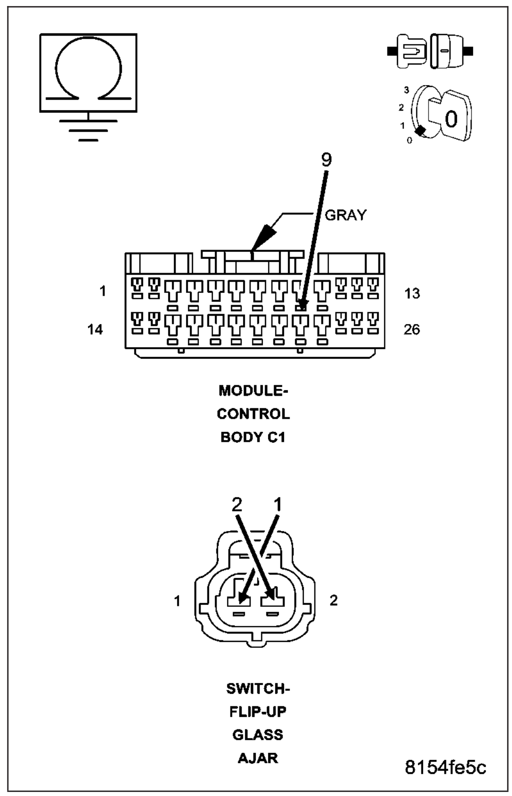
Connect a jumper wire between Sense circuit and the Ground circuit in the Tailgate Flip-Up Glass Ajar Switch connector.

**Does the scan tool display FLIP-UP AJAR SW: TRUE?**

**Yes** >> Replace the Flip-up Glass Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK FOR OPEN (G80) FLIP-UP GLASS AJAR SWITCH SENSE CIRCUIT



Turn the ignition off.

Leave the jumper wire from the previous step connected.

Disconnect the Body Control Module C1 harness connector.

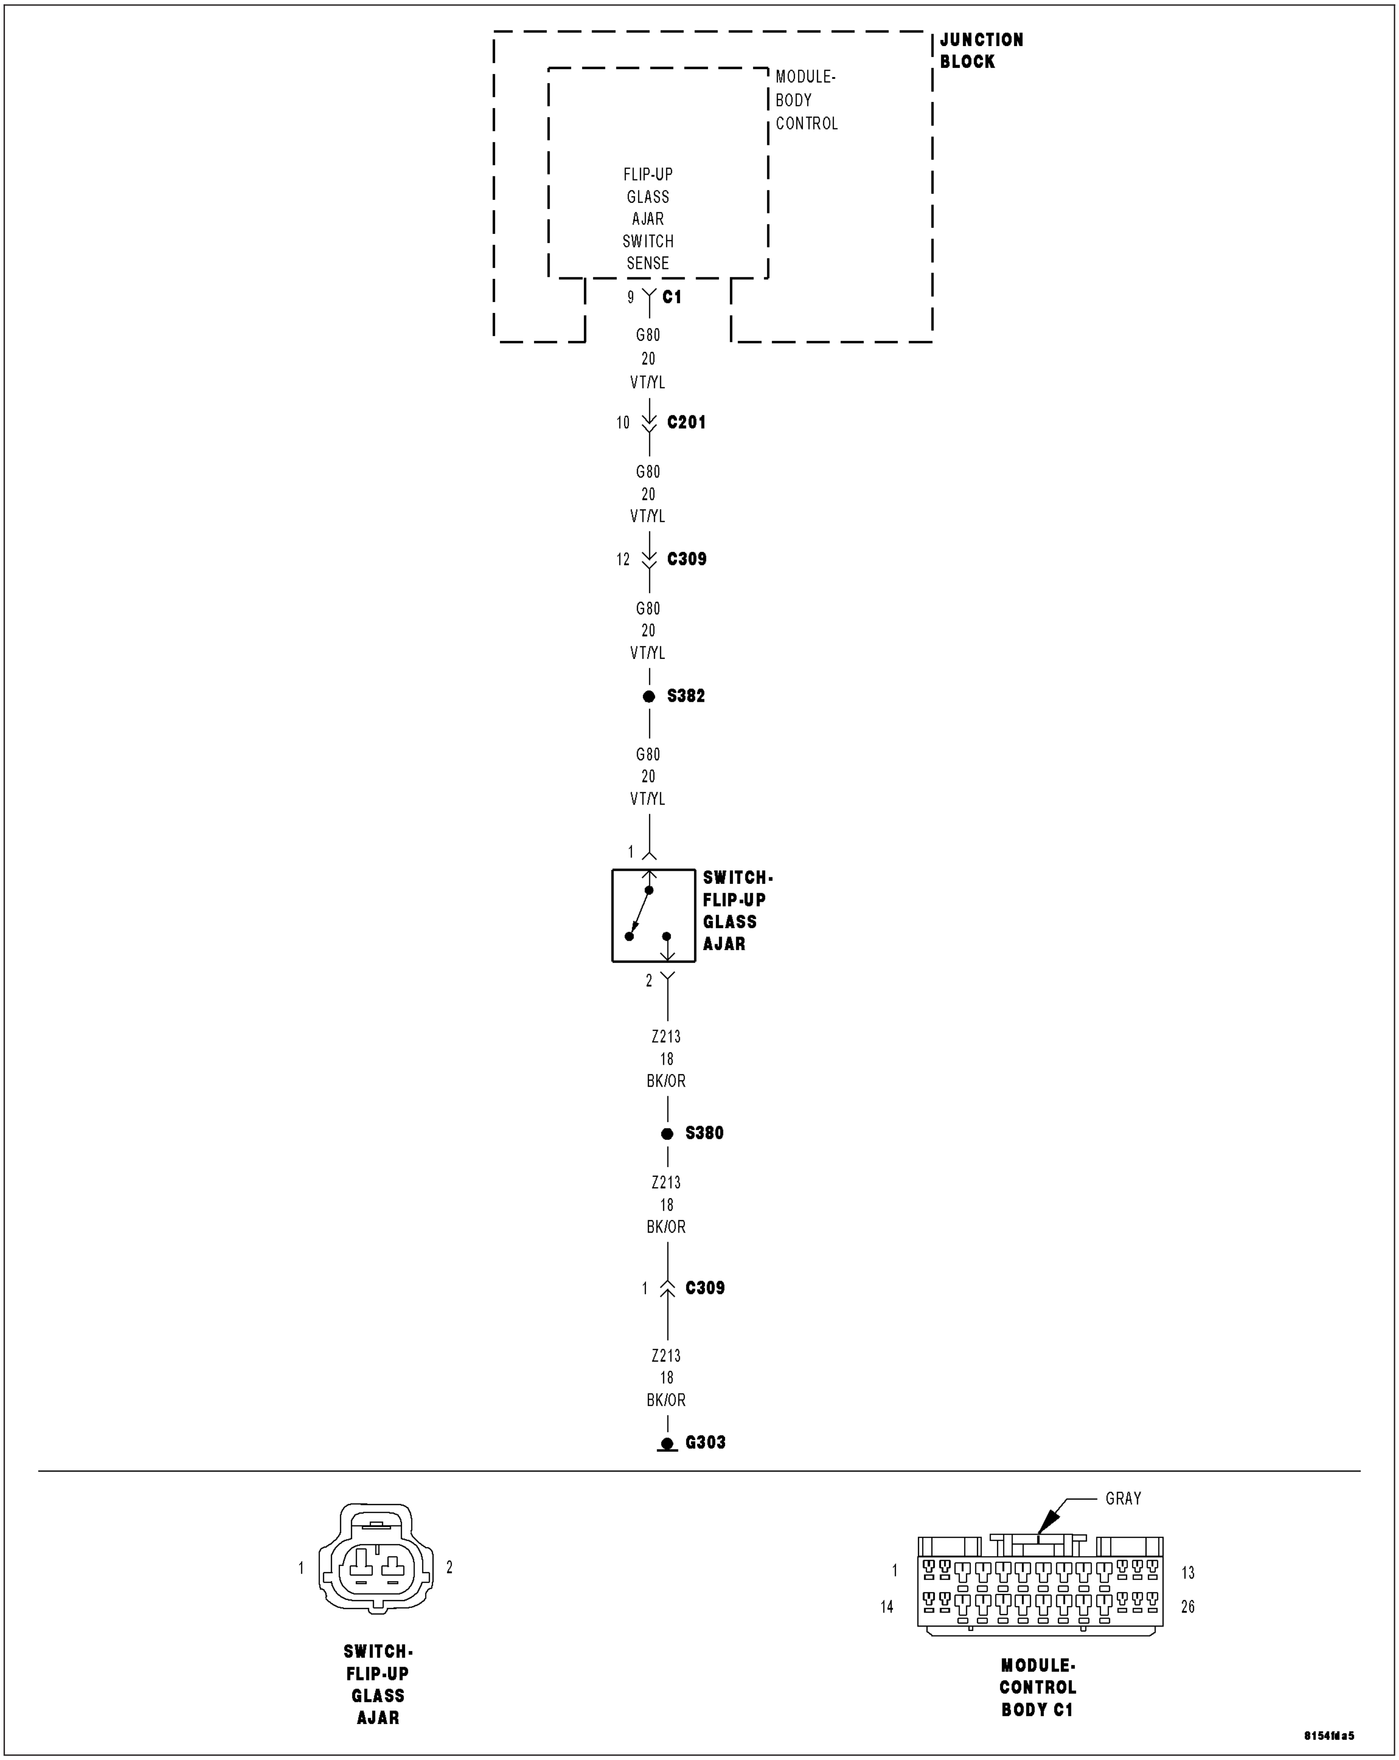
Measure the resistance between ground and the (G80) Flip-Up Glass Ajar Switch Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (G80) Flip-up Glass Ajar Switch Sense circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *FLIP-UP GLASS AJAR CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

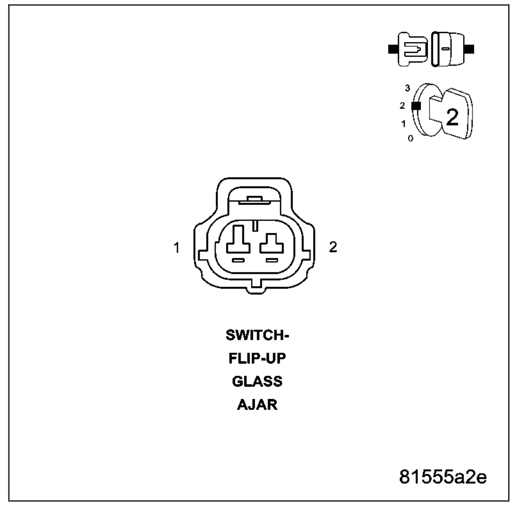
The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| (G80) FLIP-UP GLASS AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND |
| FLIP-UP GLASS AJAR SWITCH |
| BODY CONTROL MODULE |

## 1. CHECK FOR SHORTED FLIP-UP GLASS AJAR SWITCH

With the scan tool in Data Display, read the FLIP-UP AJAR SW state.

Disconnect the Tailgate Flip-Up Glass Ajar Switch connector.



**Does the scan tool display FLIP-UP AJAR SW: FALSE?**

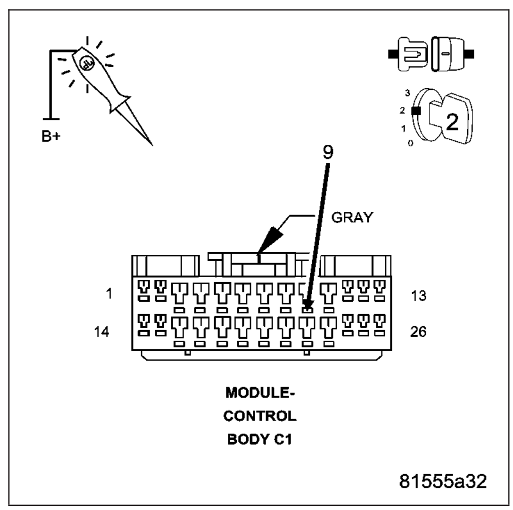
**Yes** >> Replace the Flip-up Glass Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

## 2. CHECK FOR (G80) FLIP-UP GLASS AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND

Disconnect the Body Control Module C1 harness connector.

Using a 12–volt test light connected to 12–volts, test the (G80) Flip-Up Glass Ajar Switch Sense circuit for a short to ground.

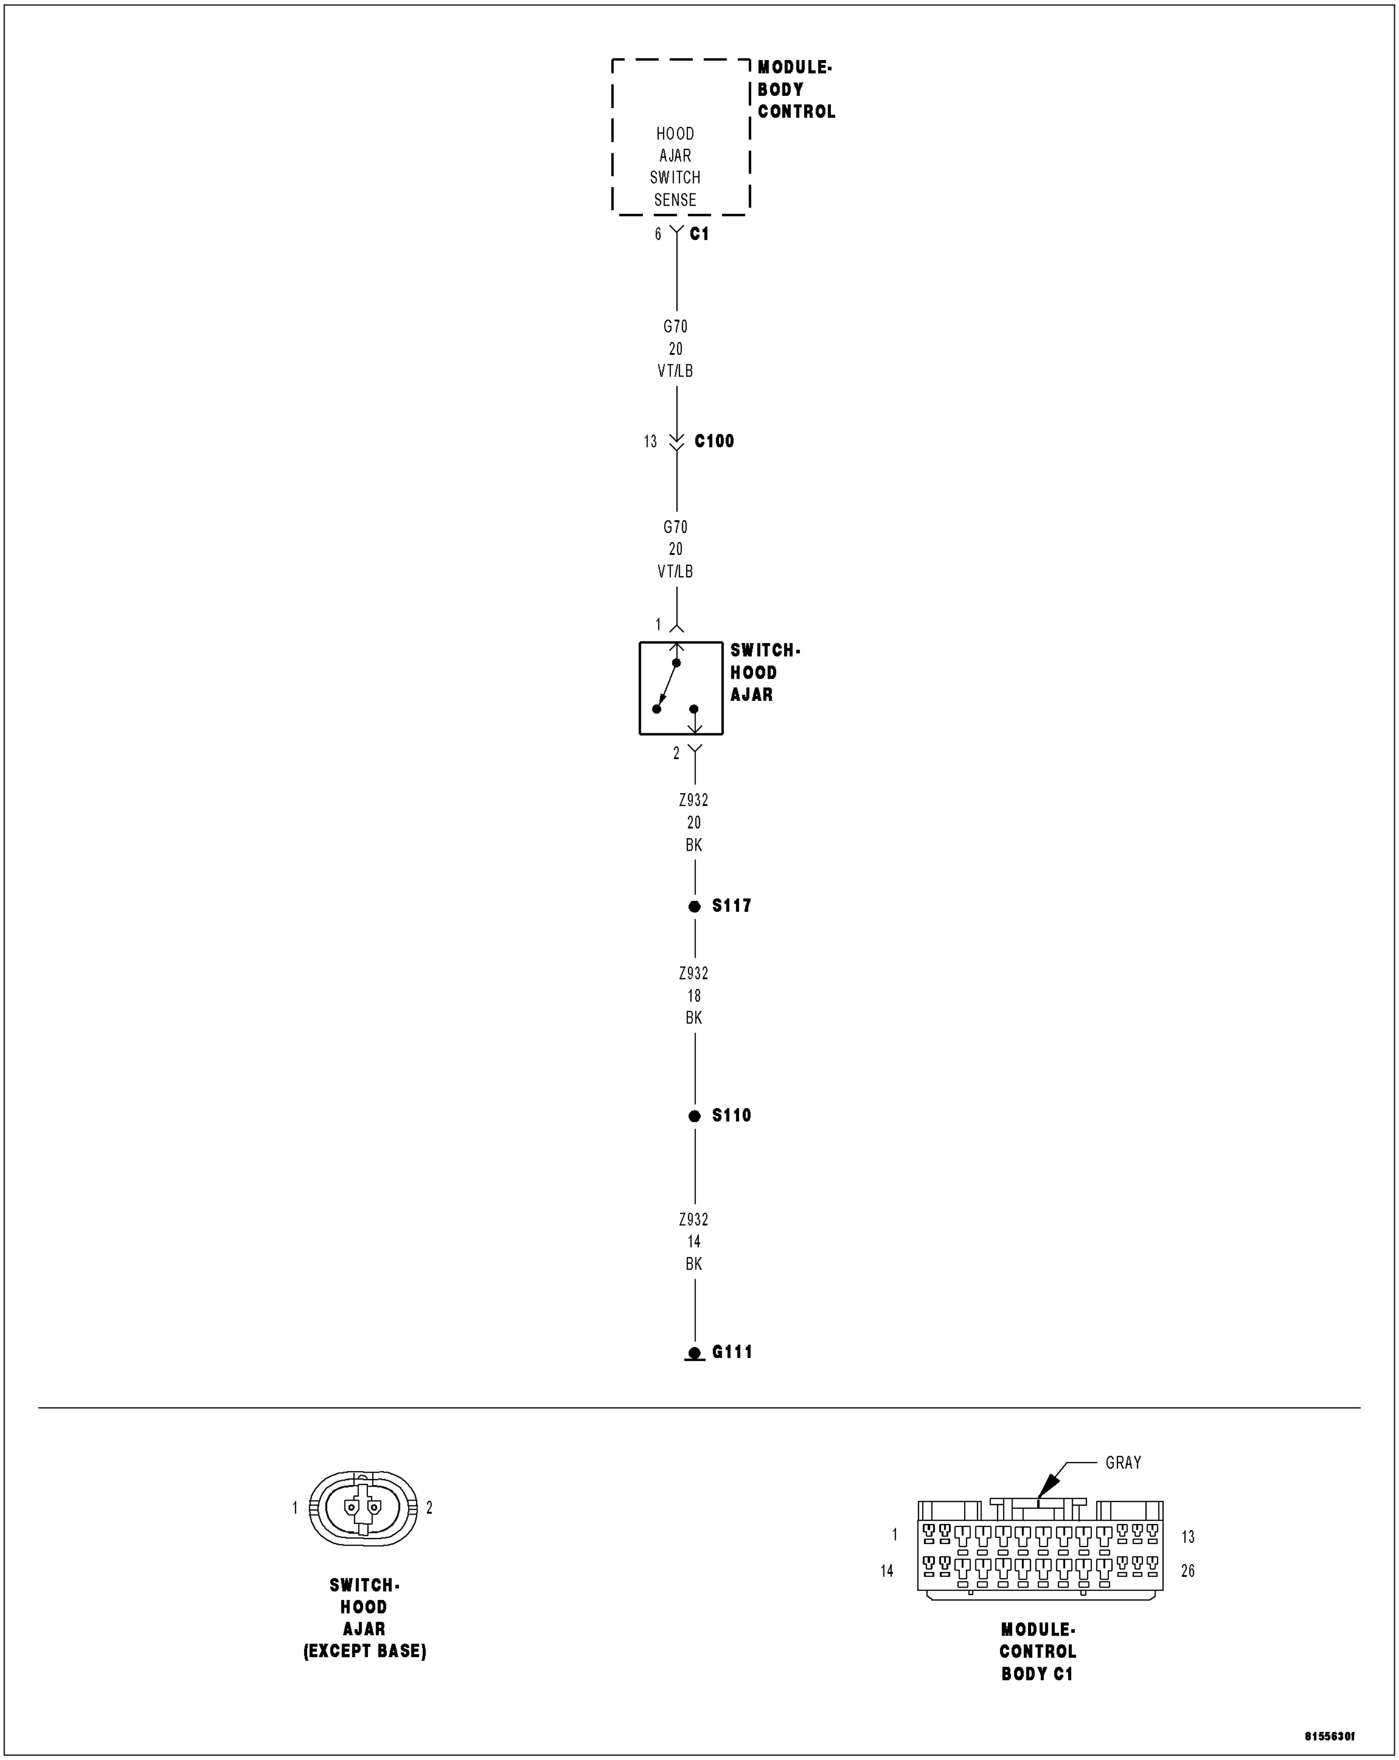


**Does the test light illuminate brightly?**

**No** >> Replace the Body Control Module in accordance with service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**Yes** >> Repair the (G80) Flip-up Glass Ajar Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *HOOD AJAR CIRCUIT OPEN – EXPORT ONLY



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| HOOD AJAR SWITCH GROUND CIRCUIT OPEN |
| (G70) HOOD AJAR SWITCH SENSE CIRCUIT OPEN |
| FLIP-UP GLASS AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. FLIP-UP GLASS AJAR FUNCTIONAL TEST

Open the Hood.

With the scan tool in Data Display, read the FLIP-UP AJAR SW state.

**Does the scan tool display TRUE?**

**Yes** >> The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires.

**No** >> Go To 2

### 2. OPEN HOOD AJAR SWITCH GROUND CIRCUIT

Disconnect the Hood Ajar switch connector.

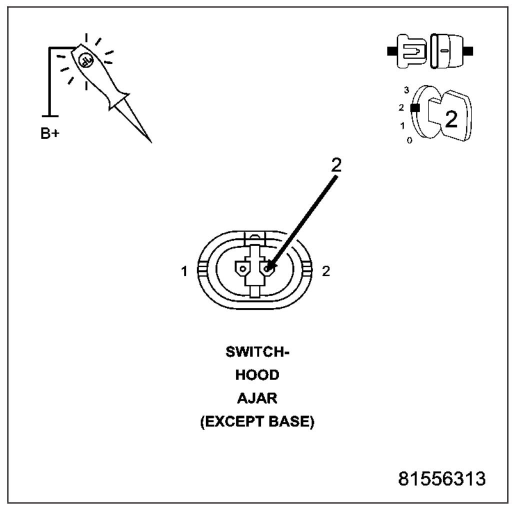
Using a 12-volt Test Light connected to 12-volts, test the Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the Ground circuit for an open.

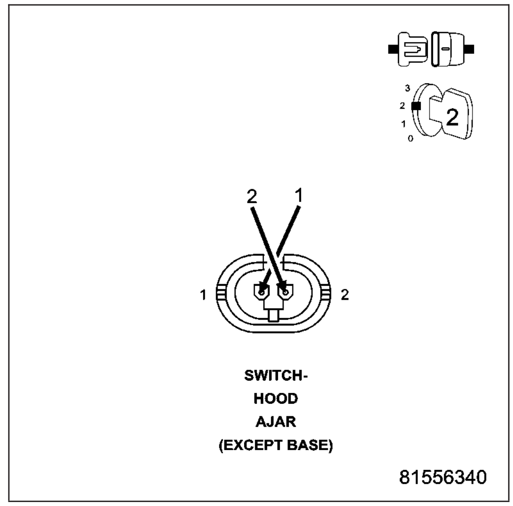
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 3. CHECK FOR OPEN HOOD AJAR SWITCH

With the scan tool in Data Display, read the HOOD AJAR SW state.

Connect a jumper wire between the Sense circuit and the Ground circuit in the Hood Ajar Switch connector.



**Does the scan tool display HOOD AJAR SW: TRUE?**

**Yes** >> Replace the Hood Ajar Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

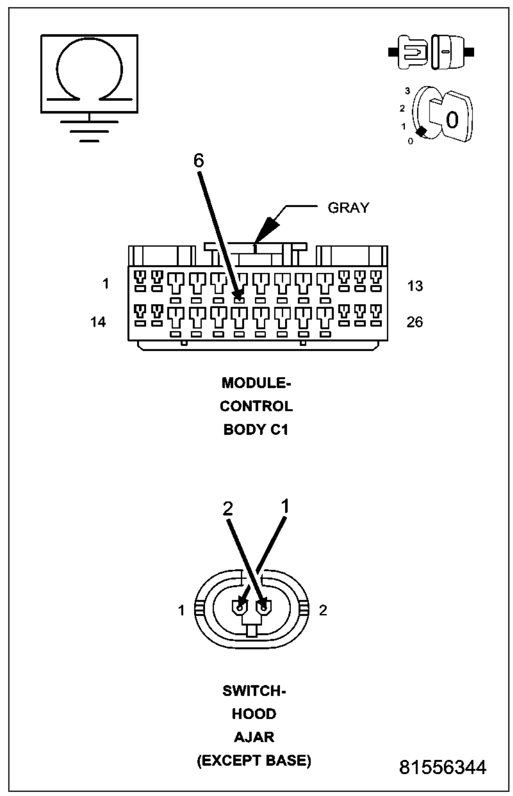
## 4. CHECK FOR OPEN (G70) HOOD AJAR SWITCH SENSE CIRCUIT

Turn the ignition off.

Leave the jumper wire from the previous step connected.

Disconnect the Body Control Module C1 harness connector.

Measure the resistance between ground and the (G70) Hood Ajar Switch Sense circuit in the BCM C1 connector.



**Is the resistance below 5.0 ohms?**

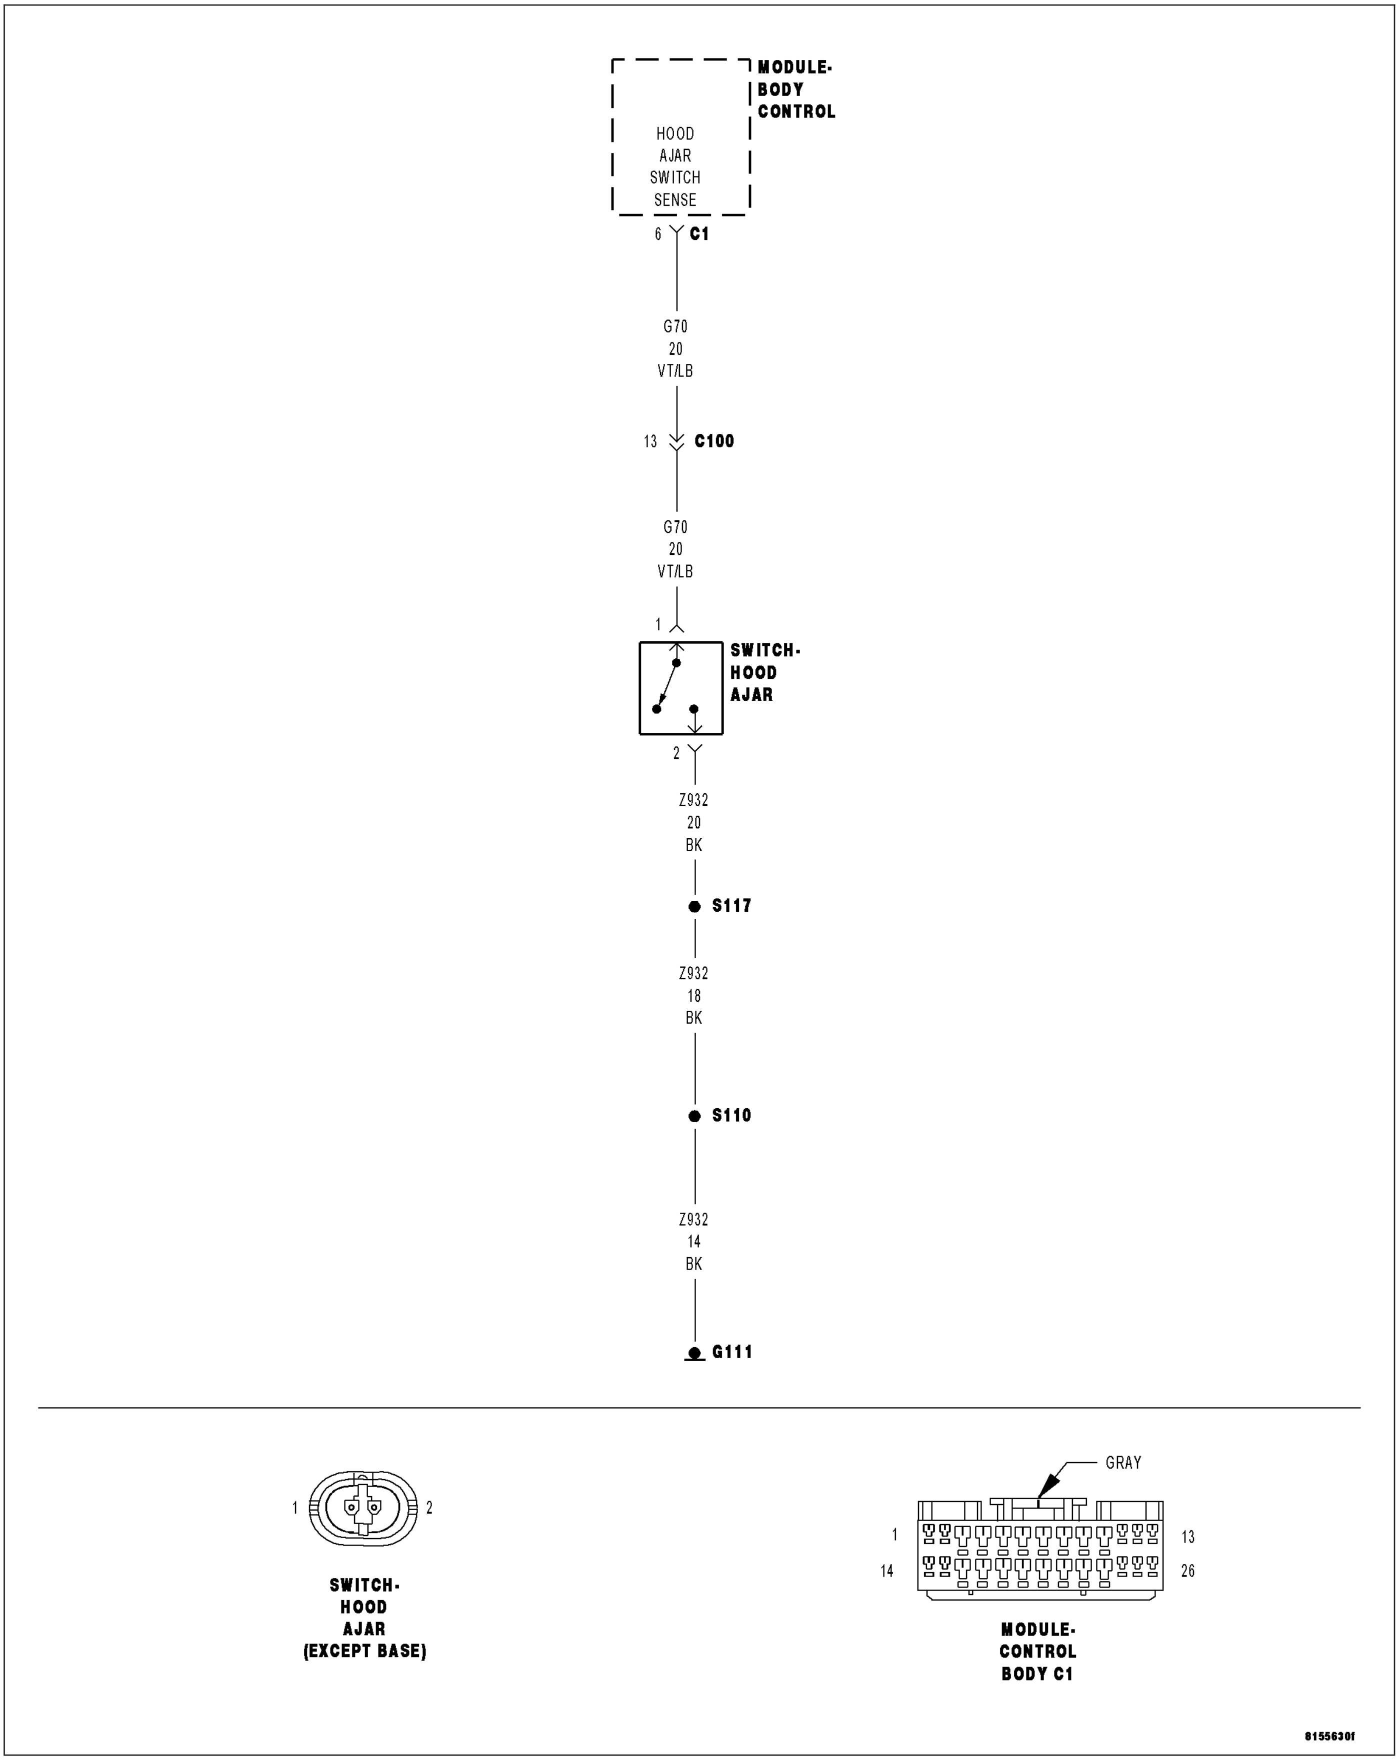
**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (G70) Hood Ajar Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *HOOD AJAR CIRCUIT SHORT TO GROUND – EXPORT ONLY



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| (G70) HOOD AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND |
| HOOD AJAR SWITCH |
| BODY CONTROL MODULE |

### 1. CHECK FOR SHORTED HOOD AJAR SWITCH

With the scan tool in Data Display, read the HOOD AJAR SW state.

Disconnect the Hood Ajar Switch connector.

**Does the scan tool display HOOD AJAR SW: FALSE?**

**Yes** >> Replace the Hood Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK FOR (G70) HOOD AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

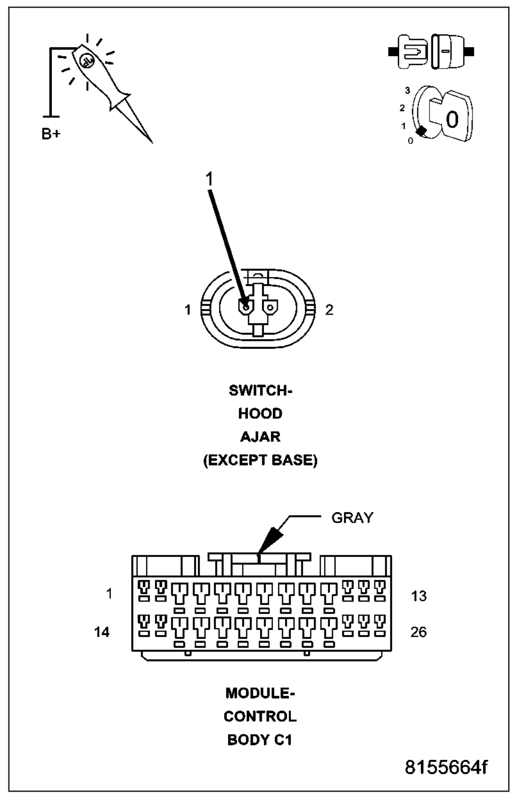
Disconnect the Body Control Module C1 harness connector.

Using a 12–volt test light connected to 12–volts, test the (G70) Hood Ajar Switch Sense circuit for a short to ground.

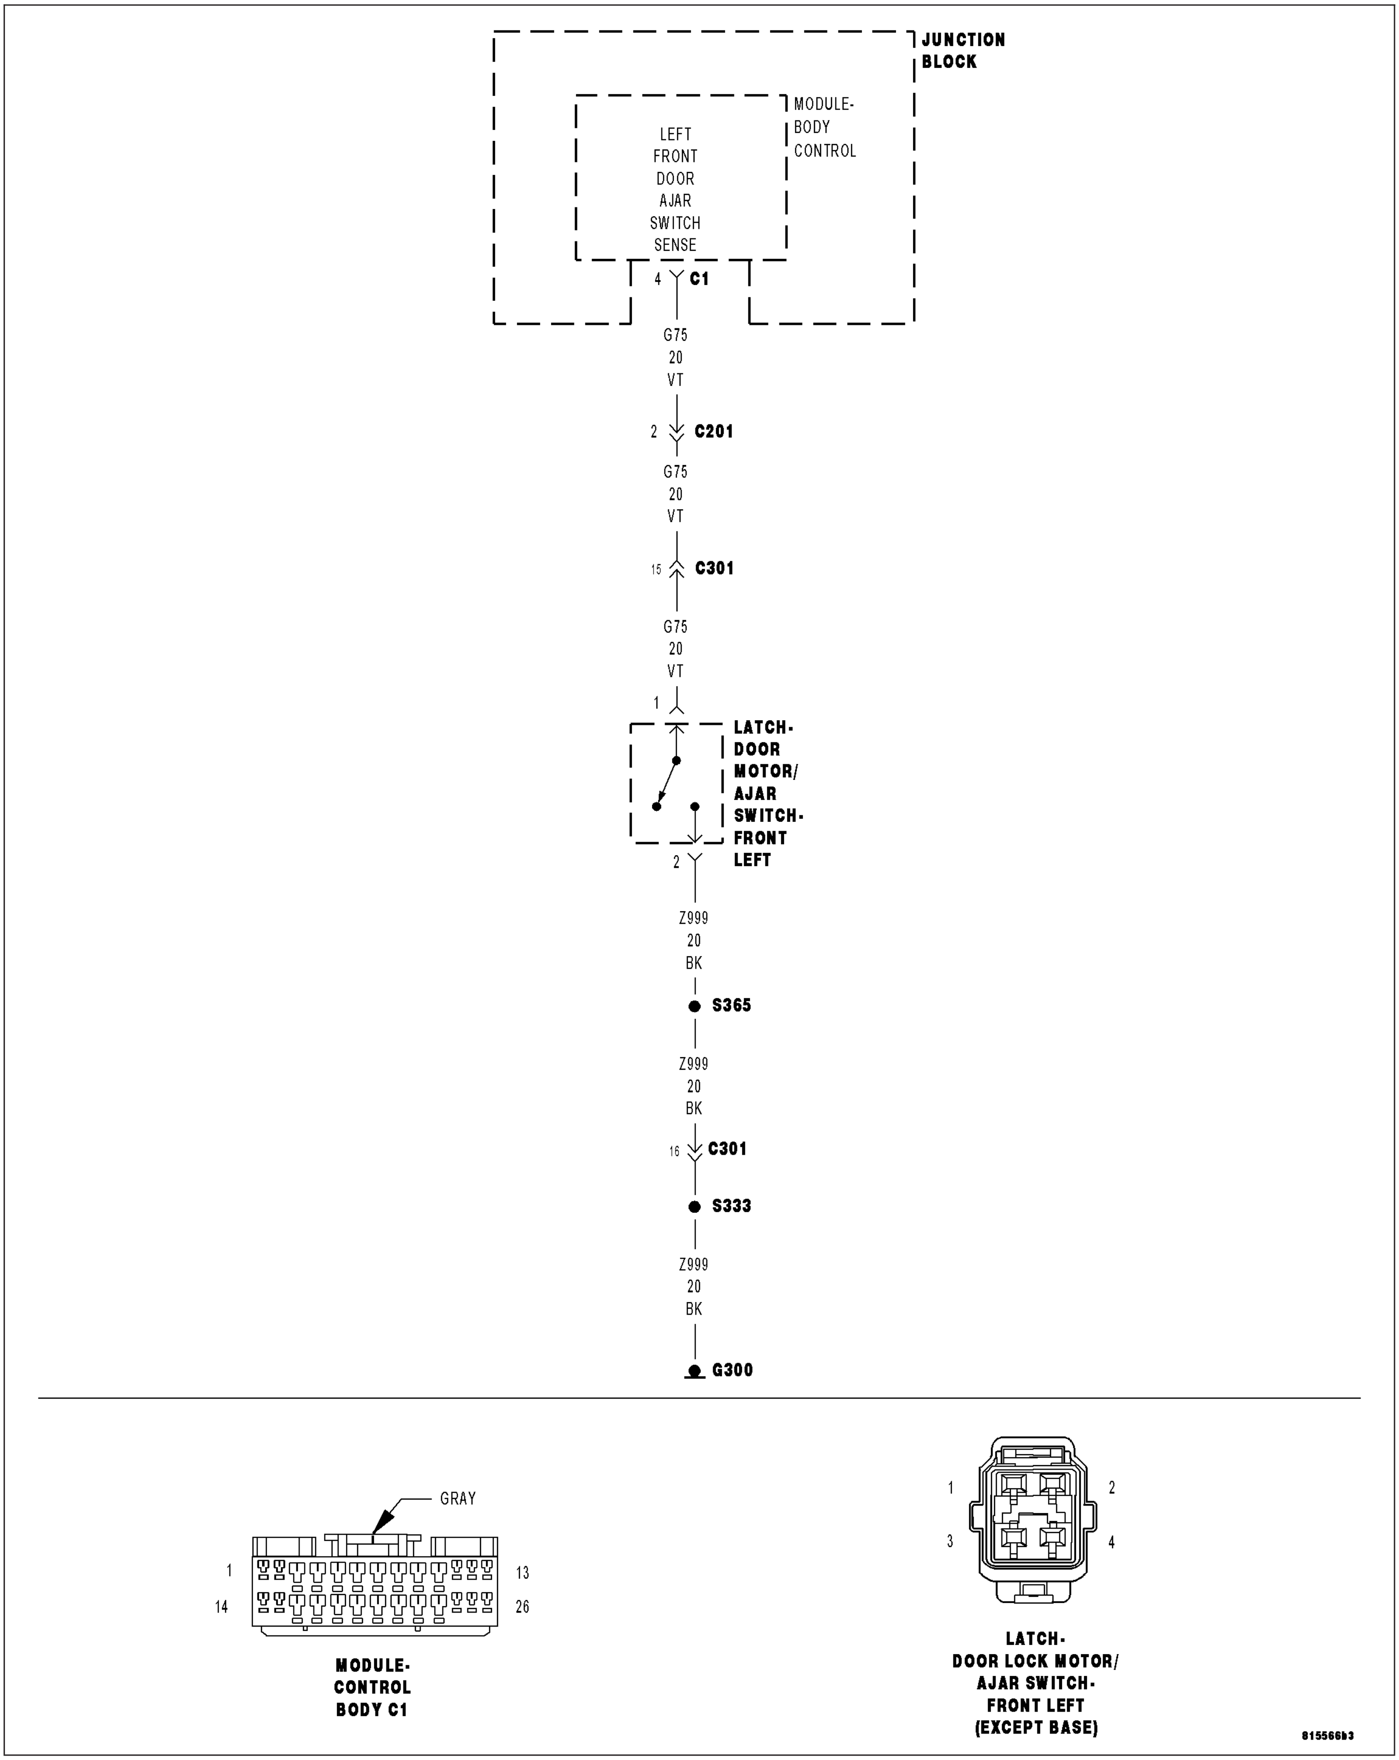
**Does the test light illuminate brightly?**

**No** >> Replace the Body Control Module in accordance with service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**Yes** >> Repair the (G70) Hood Ajar Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



# *LEFT FRONT DOOR AJAR CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| LEFT FRONT DOOR AJAR SWITCH GROUND CIRCUIT OPEN |
| (G75) LEFT FRONT DOOR AJAR SWITCH SENSE CIRCUIT OPEN |
| DOOR LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. OPEN LEFT FRONT DOOR AJAR SWITCH GROUND CIRCUIT

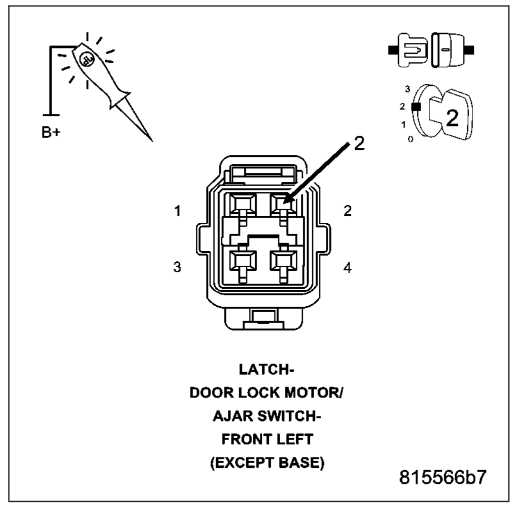
Disconnect the Left Front Door Lock Motor/Ajar switch connector.

Using a 12-volt Test Light connected to 12-volts, test the Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 2

**No** >> Repair the Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



### 2. CHECK FOR OPEN LEFT FRONT DOOR AJAR SWITCH

Connect a jumper wire between the Sense circuit and the Ground circuit.

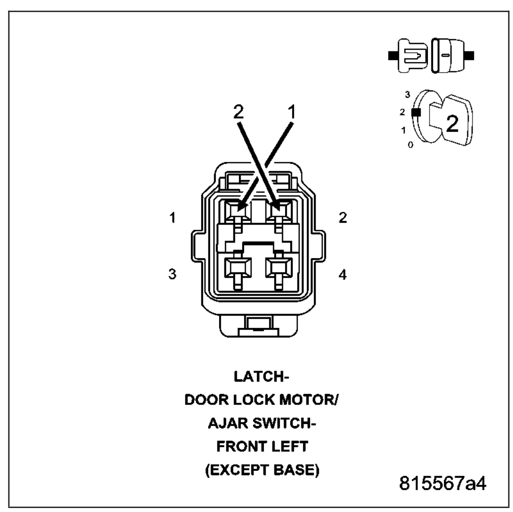
With the scan tool in Data Display, read the LEFT FRONT DOOR AJAR SW state.

**NOTE: For the Left Front Door Ajar state the scan tool will read “PASS” for RHD.**

**Does the scan tool display LEFT FRONT DOOR AJAR SW: TRUE?**

**Yes** >> Replace the Door Lock Motor/Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



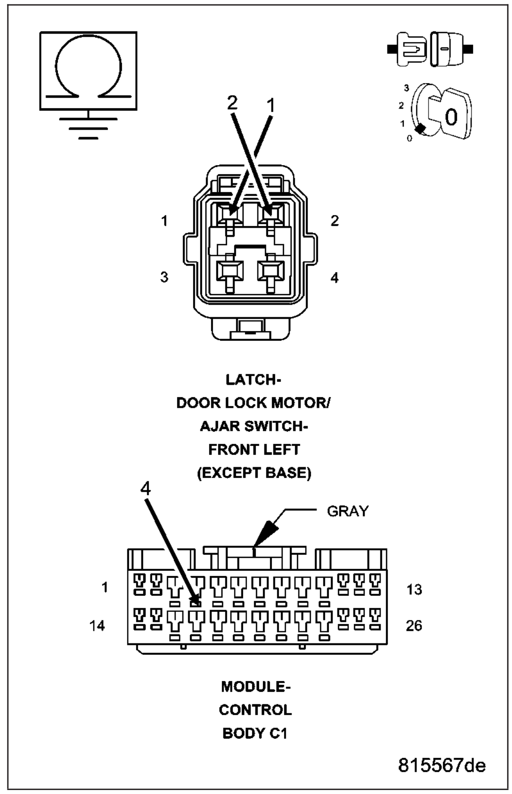
## 3. CHECK FOR OPEN (G75) LEFT FRONT DOOR AJAR SWITCH SENSE CIRCUIT

Turn the ignition off.

Leave the jumper wire from the previous step connected.

Disconnect the Body Control Module C1 harness connector.

Measure the resistance of the (G75) Left Front Door Ajar Switch Sense circuit in the BCM C1 connector.



**Is the resistance below 5.0 ohms?**

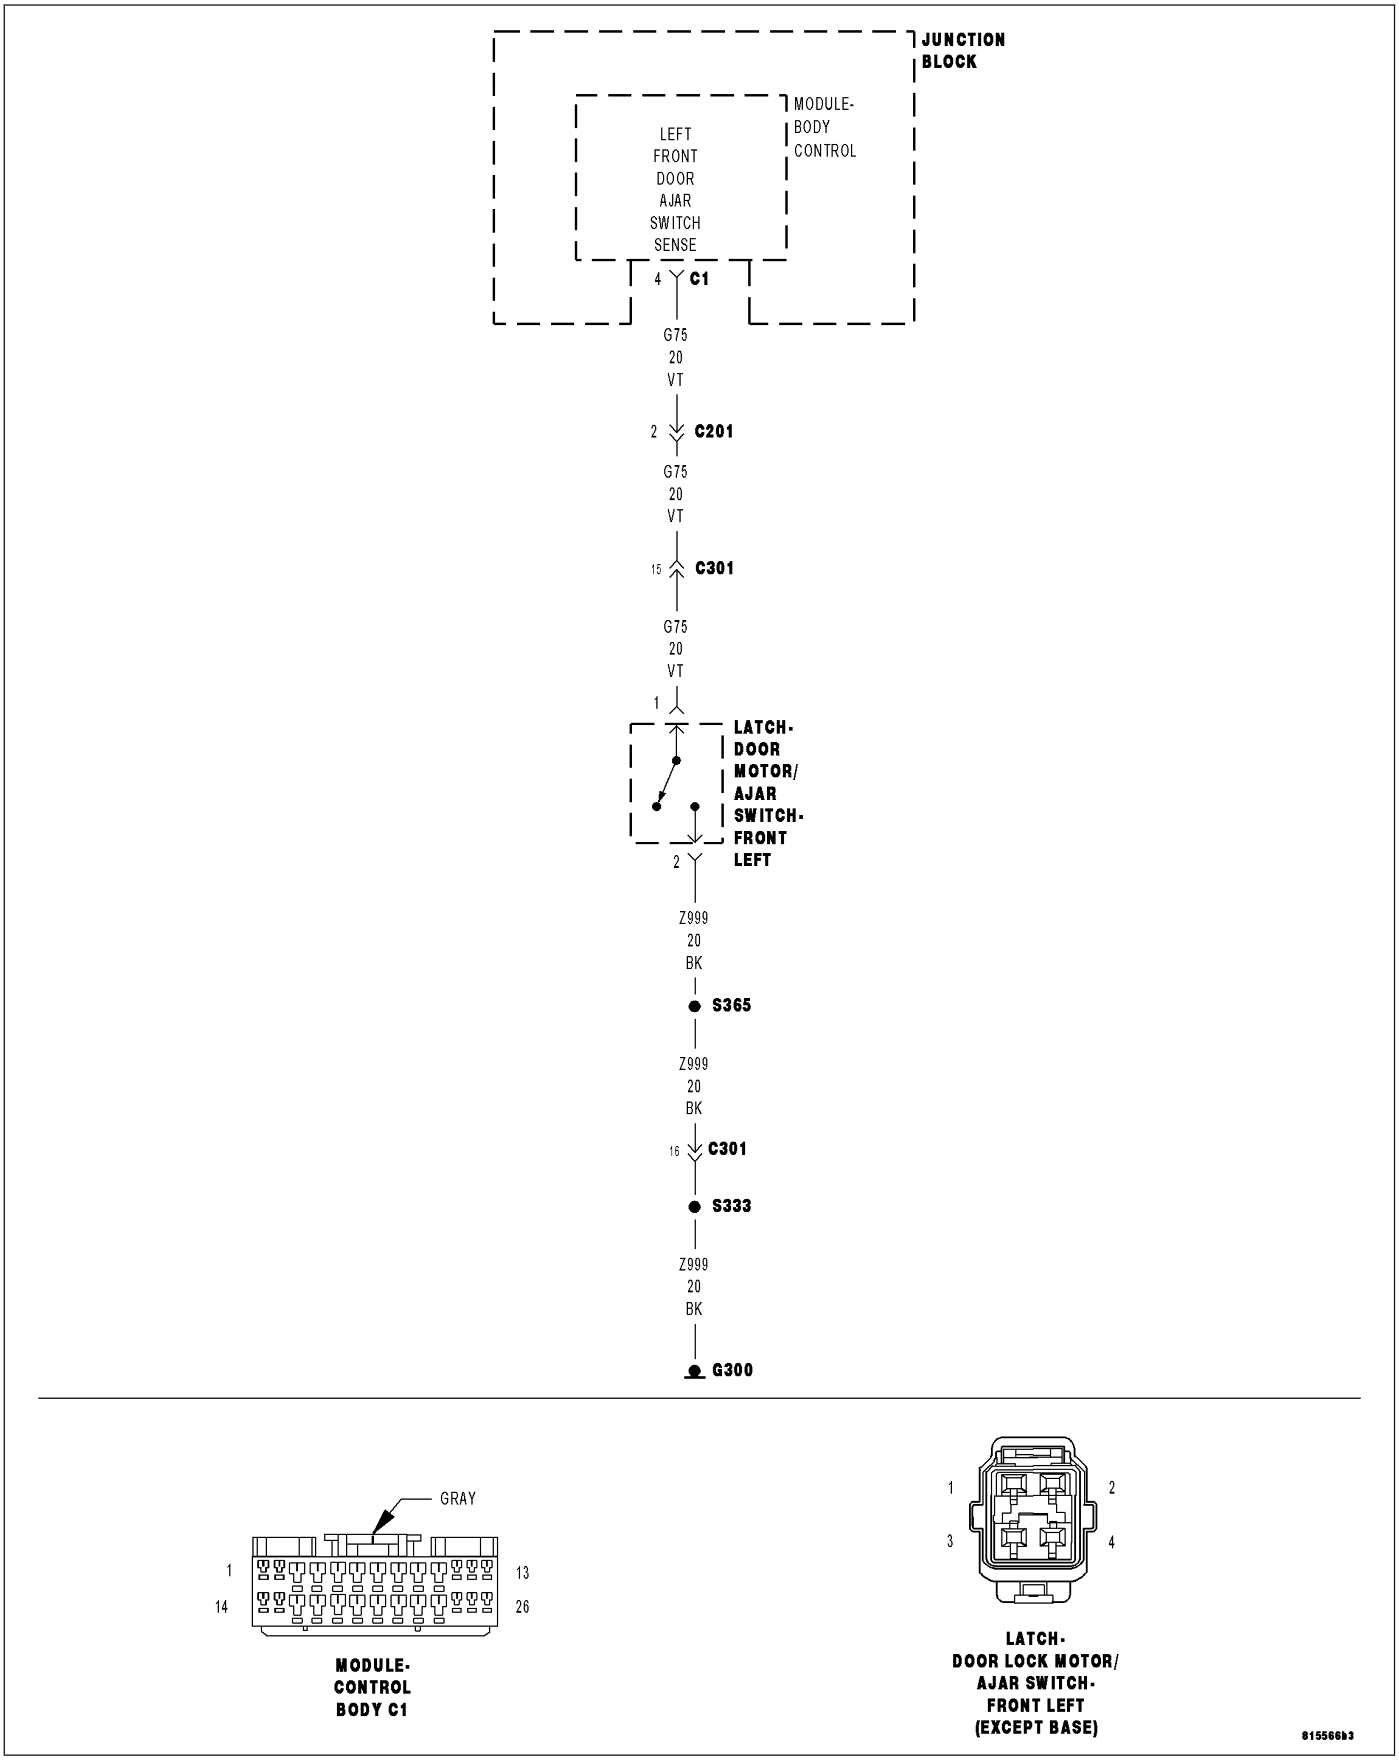
**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (G75) Left Front Door Ajar Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *LEFT FRONT DOOR AJAR CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
| --- |
| (G75) LEFT FRONT DOOR AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND |
| DOOR LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR SHORTED DOOR AJAR SWITCH

**NOTE: For the Left Front Door Ajar state the scan tool will read “PASS” for RHD.**

With the scan tool in Data Display, read the LEFT FRONT DOOR AJAR SW state.

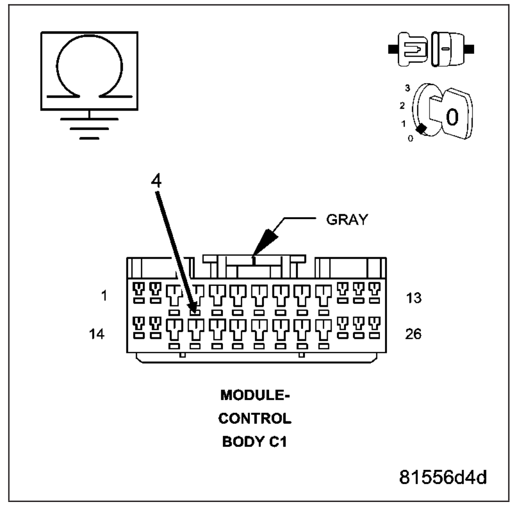
Disconnect the Door Lock Motor/Ajar Switch connector.

**Does the scan tool display LEFT FRONT DOOR AJAR SW: FALSE?**

**Yes** >> Replace the Door Lock Motor/Ajar Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2



### 2. CHECK FOR (G75) LEFT FRONT DOOR AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Body Control Module C1 harness connector.

Measure the resistance between ground and the (G75) Left Front Door Ajar Switch Sense circuit in the BCM C1 connector.

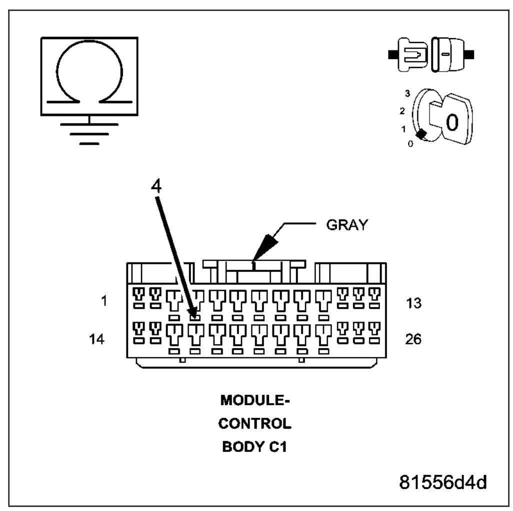
**Is the resistance below 1000.0 ohms?**

**No** >> Replace the Body Control Module in accordance with service information.

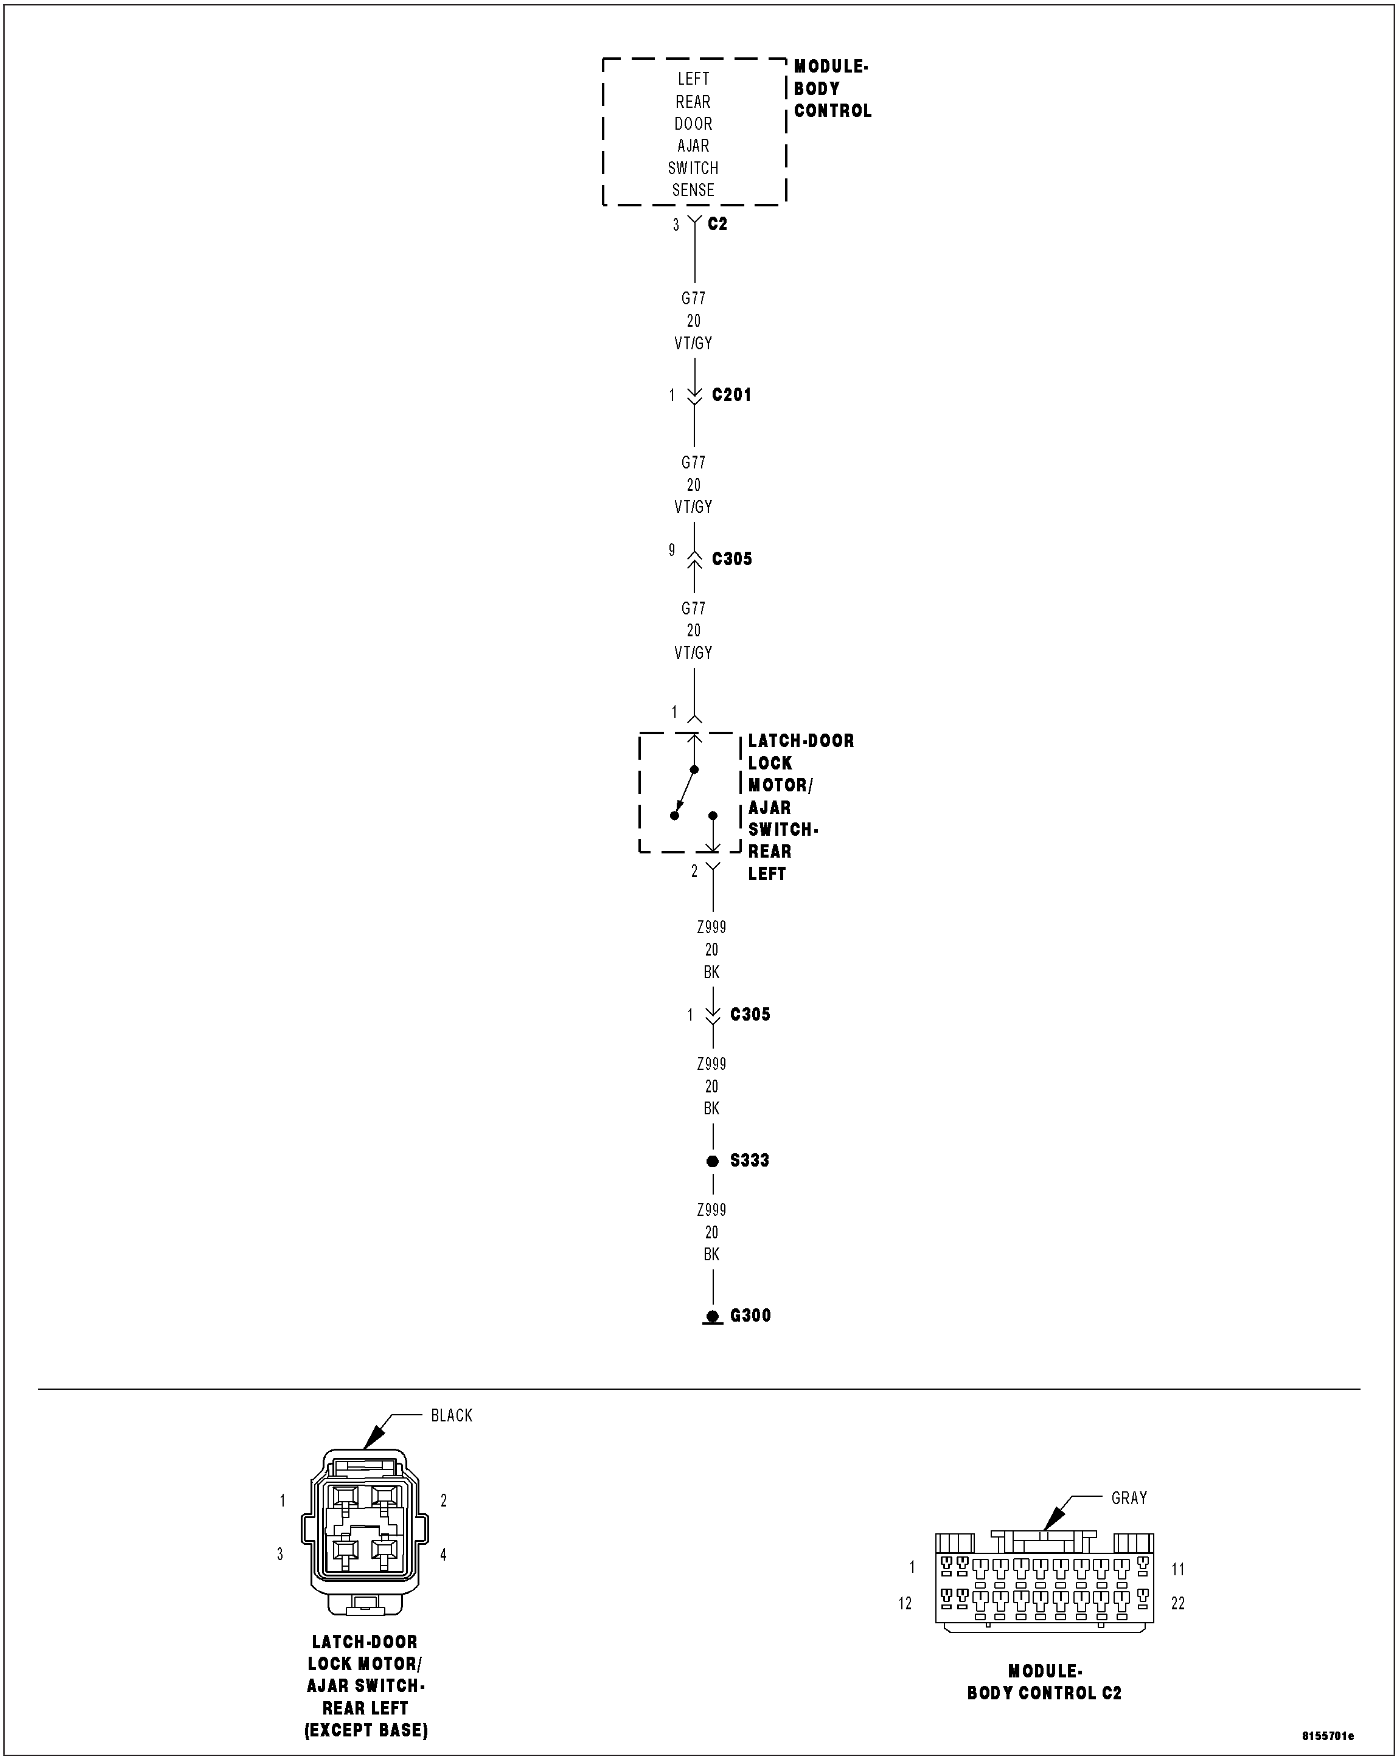
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**Yes** >> Repair the (G75) Left Front Door Ajar Switch Sense circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## *LEFT REAR DOOR AJAR CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
| --- |
| LEFT REAR DOOR AJAR SWITCH GROUND CIRCUIT OPEN |
| (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT OPEN |
| DOOR LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. OPEN LEFT REAR DOOR AJAR SWITCH GROUND CIRCUIT

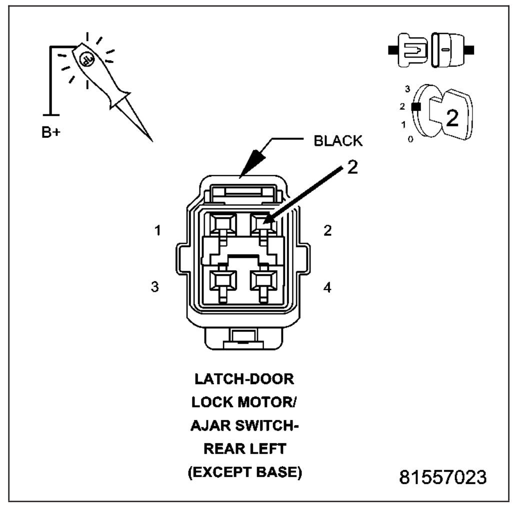
Disconnect the Left Rear Door Lock Motor/Ajar switch connector.

Using a 12-volt Test Light connected to 12-volts, test the Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 2

**No** >> Repair the Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



### 2. CHECK FOR OPEN LEFT FRONT DOOR AJAR SWITCH

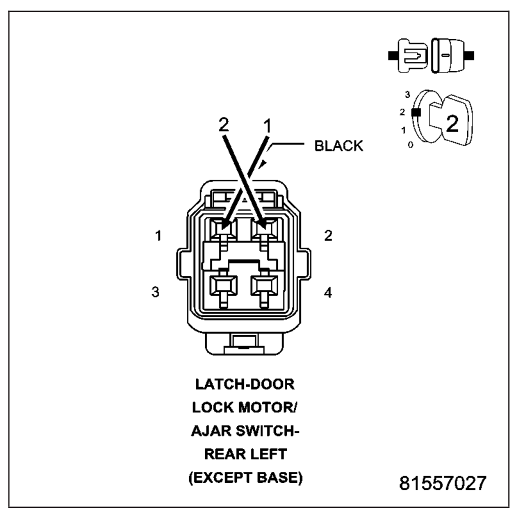
With the scan tool in Data Display, read the LEFT REAR DOOR AJAR SW state.

Connect a jumper wire between the Sense circuit and the Ground circuit.

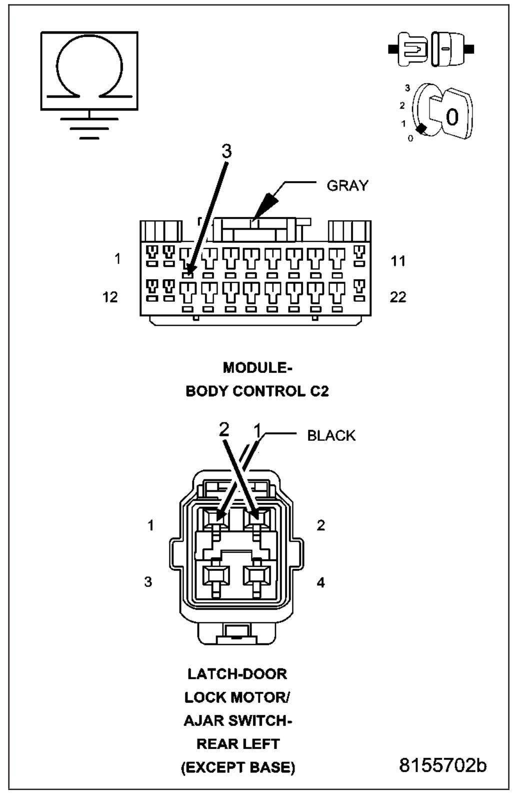
**Does the scan tool display LEFT REAR DOOR AJAR SW: TRUE?**

**Yes** >> Replace the Door Lock Motor/Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



## 3. CHECK FOR OPEN (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT



Turn the ignition off.

Leave the jumper wire from the previous step connected.

Disconnect the Body Control Module C2 harness connector.

Measure the resistance between ground and the (G77) Left Rear Door Ajar Switch Sense circuit in the BCM C2 connector.

**Is the resistance below 1000.0 ohms?**

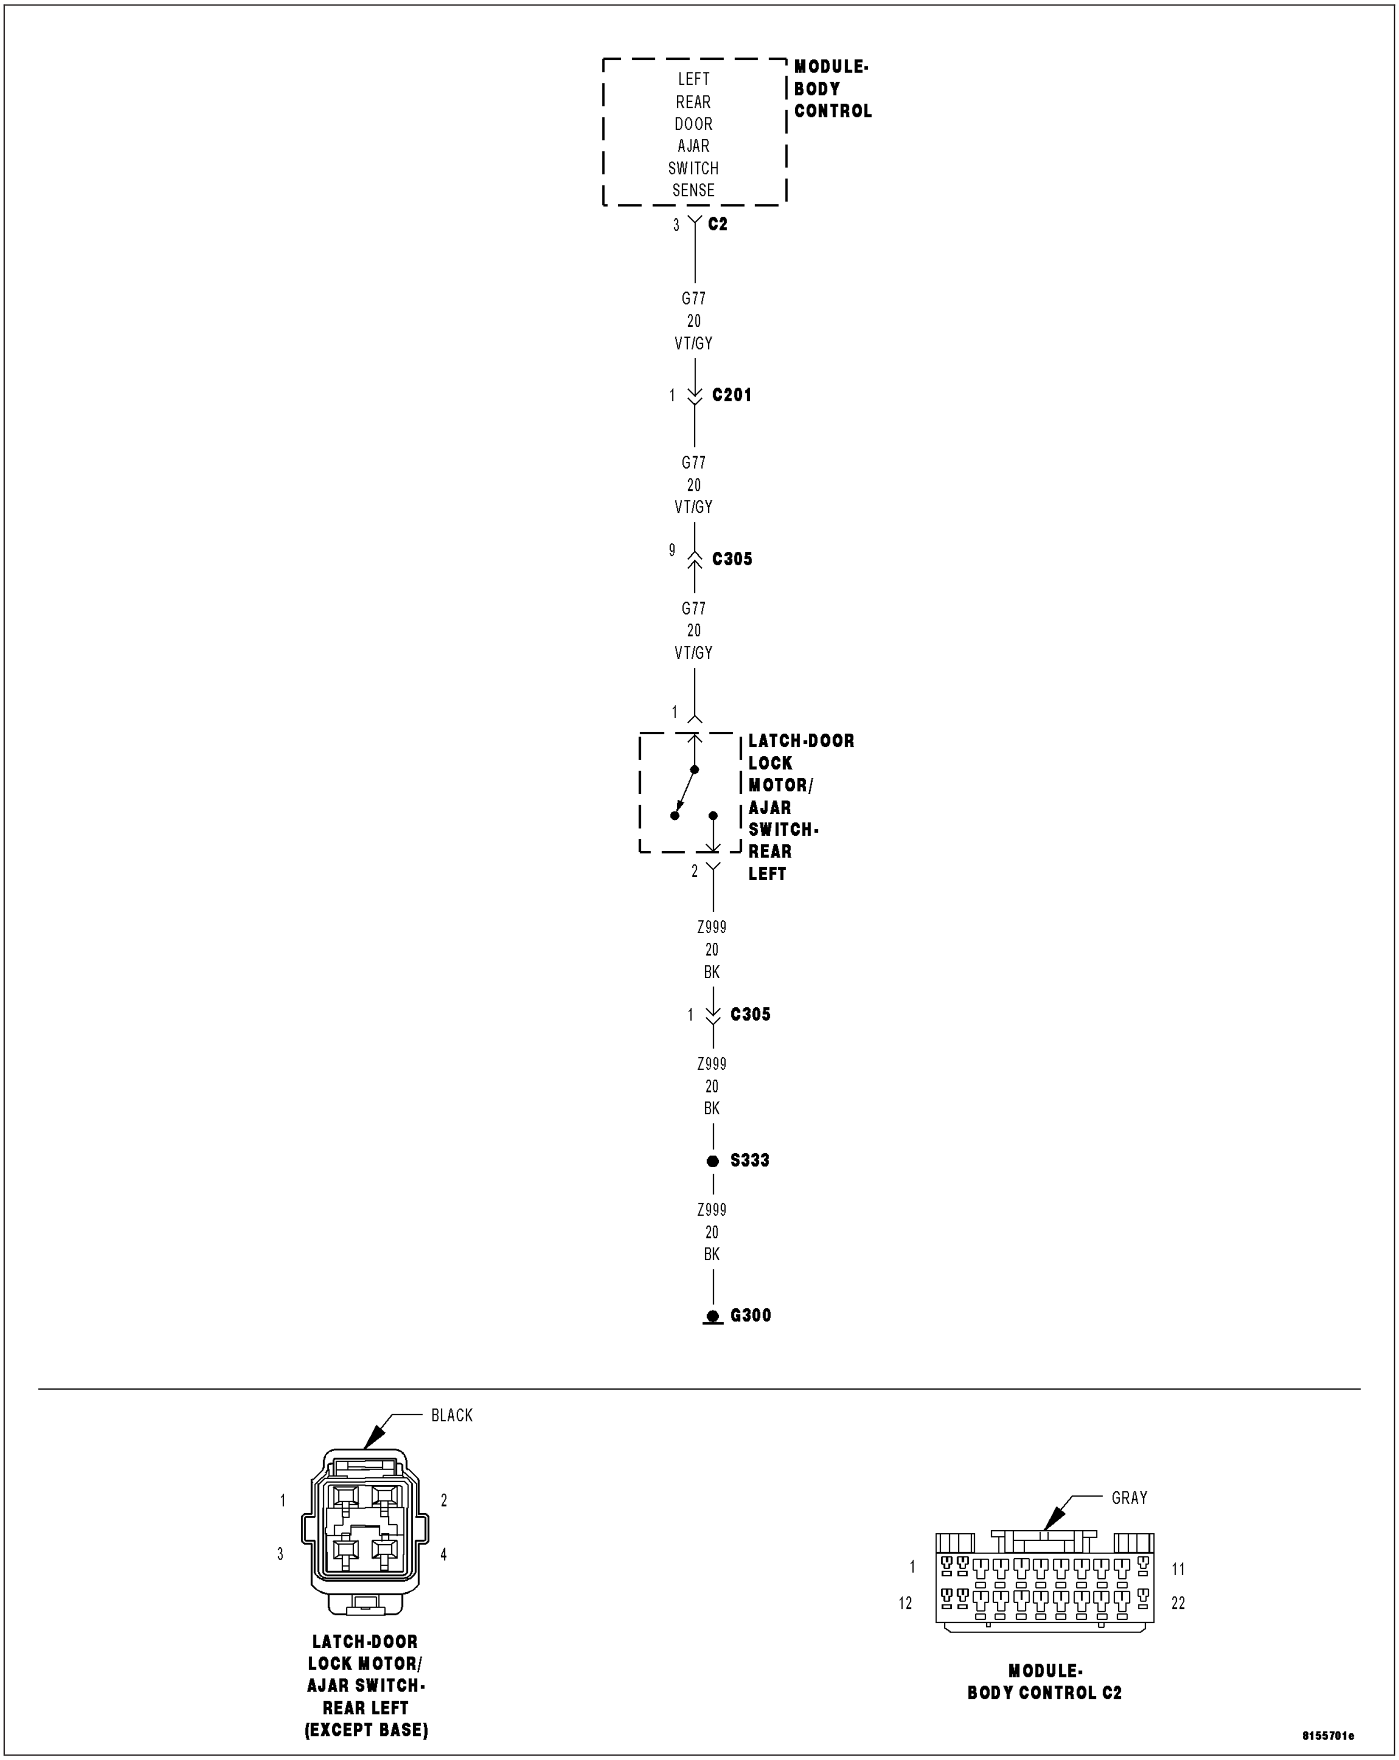
**No** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**Yes** >> Repair the (G75) Left Front Door Ajar Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *LEFT REAR DOOR AJAR CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND |
| DOOR LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR SHORTED DOOR AJAR SWITCH

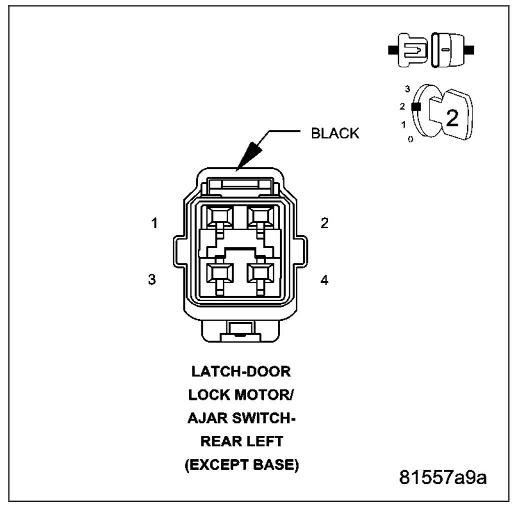
With the scan tool in Data Display, read the LEFT REAR DOOR AJAR SW state.

Disconnect the Door Lock Motor/Ajar Switch connector.

**Does the scan tool display LEFT REAR DOOR AJAR SW: FALSE?**

**Yes** >> Replace the Door Lock Motor/Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2



### 2. CHECK FOR (G77) LEFT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

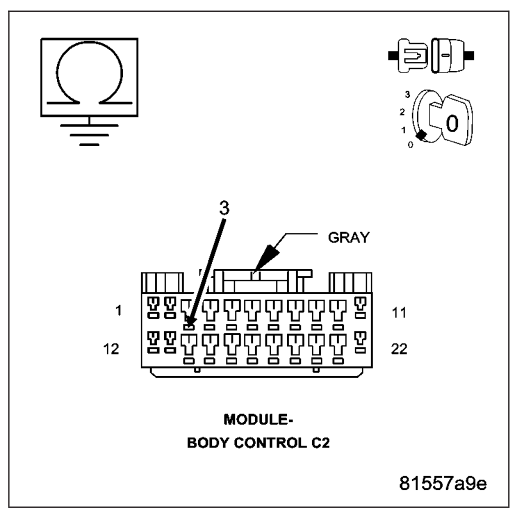
Disconnect the Body Control Module C2 harness connector.

Measure the resistance between ground and the (G77) Left Rear Door Ajar Switch Sense circuit in the BCM C2 connector.

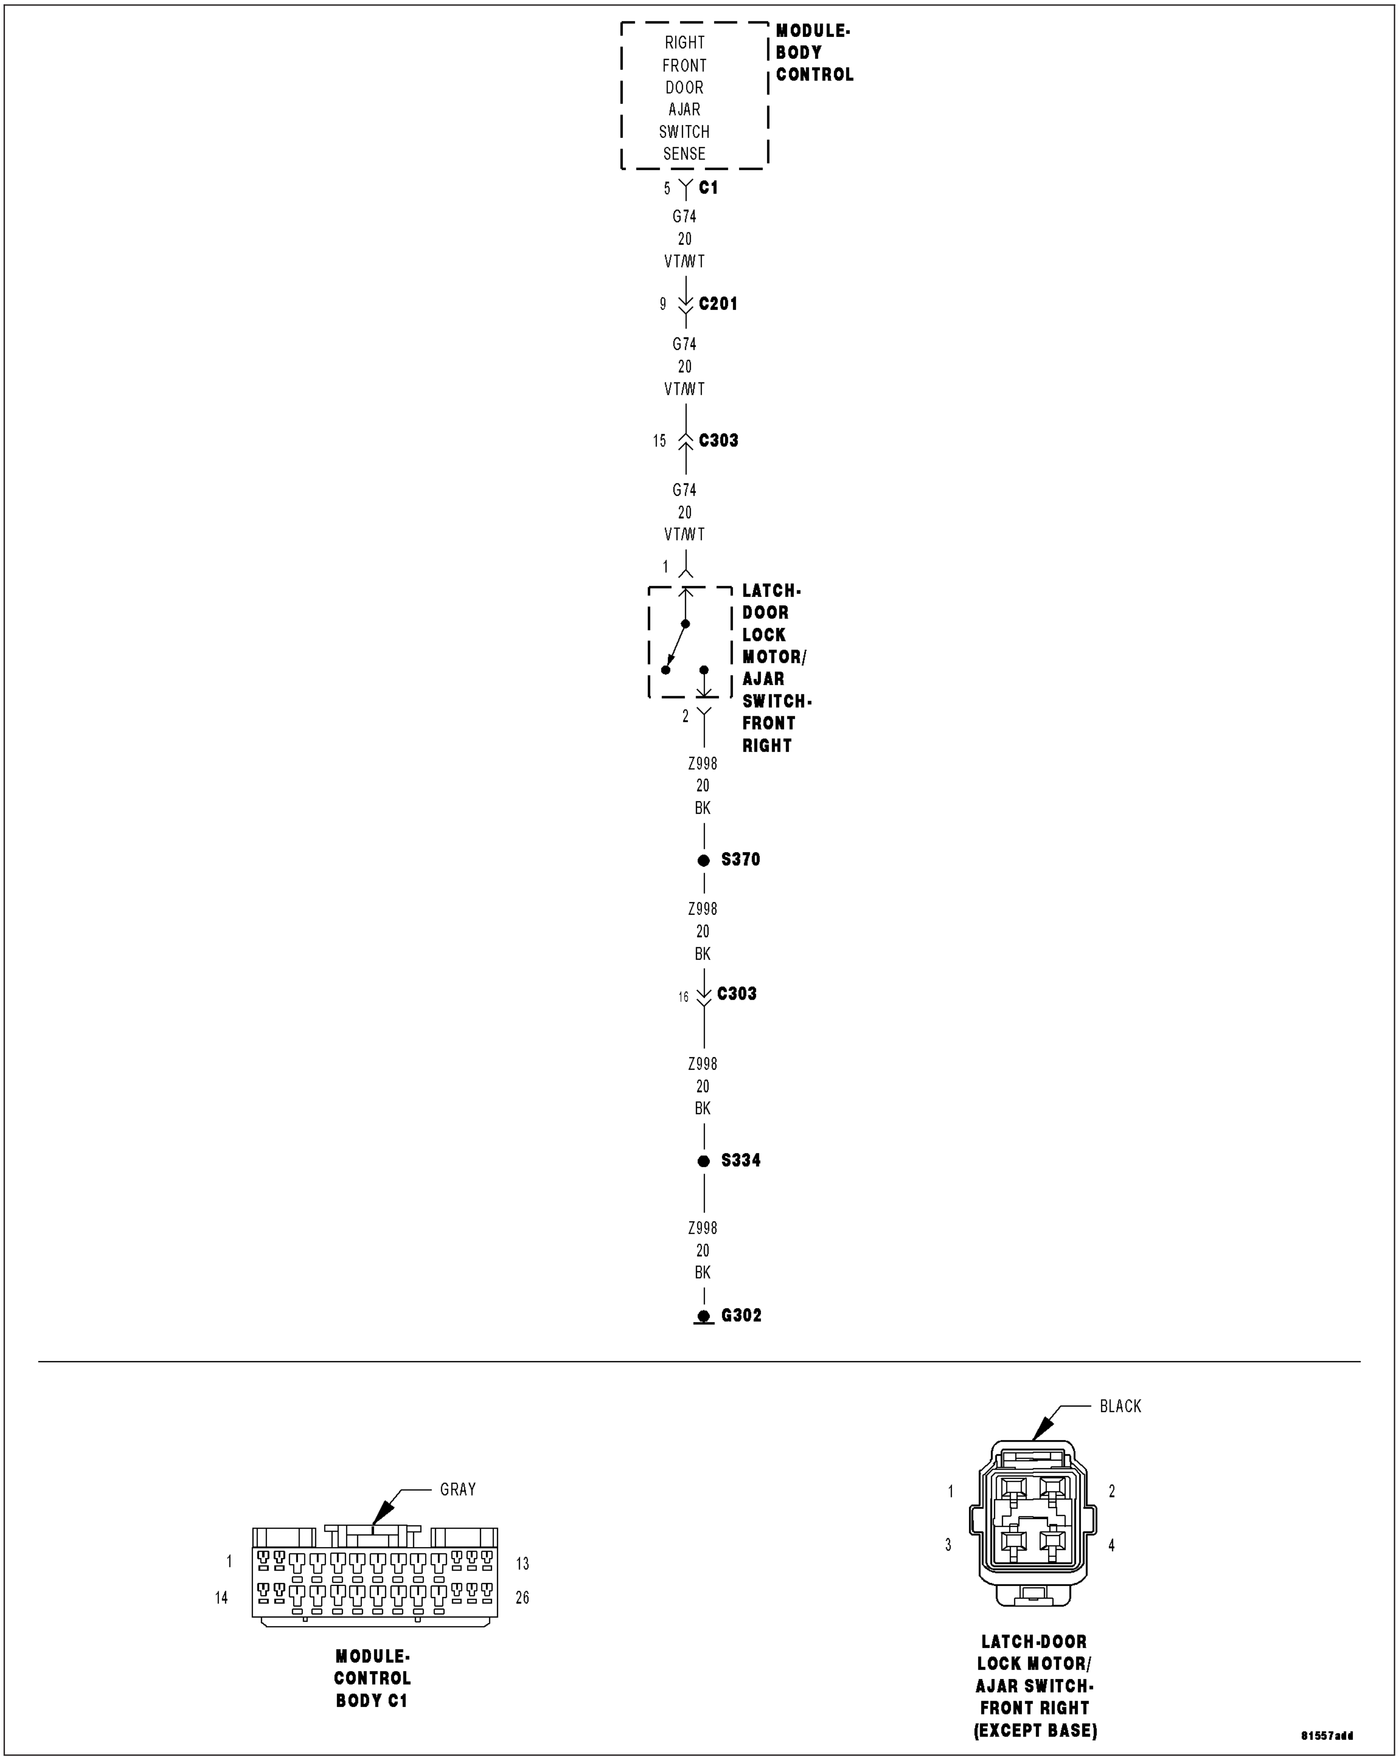
**Is the resistance below 1000.0 ohms?**

**No** >> Replace the Body Control Module in accordance with service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**Yes** >> Repair the (G77) Left Rear Door Ajar Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## *RIGHT FRONT DOOR AJAR CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| RIGHT FRONT DOOR AJAR SWITCH GROUND CIRCUIT OPEN |
| (G74) RIGHT FRONT DOOR AJAR SWITCH SENSE CIRCUIT OPEN |
| DOOR LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. OPEN RIGHT FRONT DOOR AJAR SWITCH GROUND CIRCUIT

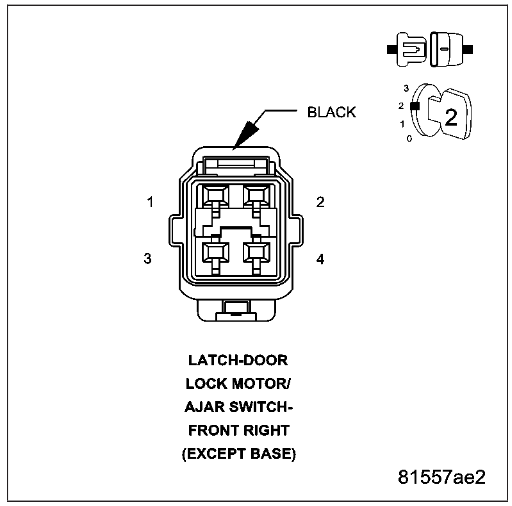
Disconnect the Right Front Door Lock Motor/Ajar switch connector.

Using a 12-volt Test Light connected to 12-volts, test the Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 2

**No** >> Repair the Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



### 2. CHECK FOR OPEN RIGHT FRONT DOOR AJAR SWITCH

With the scan tool in Data Display, read the LEFT FRONT DOOR AJAR SW state.

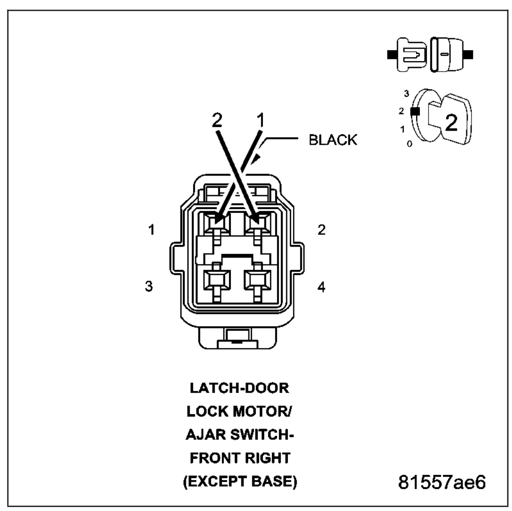
**NOTE: For the Right Front Door Ajar state the scan tool will read "DRIVER" for RHD.**

Connect a jumper wire between Sense circuit and the Ground circuit.

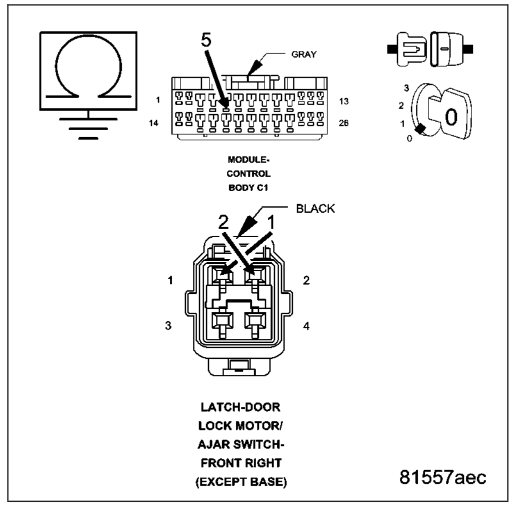
**Does the scan tool display LEFT FRONT DOOR AJAR SW: TRUE?**

**Yes** >> Replace the Door Lock Motor/Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



## 3. CHECK FOR OPEN (G74) RIGHT FRONT DOOR AJAR SWITCH SENSE CIRCUIT



Turn the ignition off.

Leave the jumper wire from the previous step connected.

Disconnect the Body Control Module C1 harness connector.

Measure the resistance between ground and the (G74) Right Front Door Ajar Switch Sense circuit in the BCM C1 connector.

**Is the resistance below 5.0 ohms?**

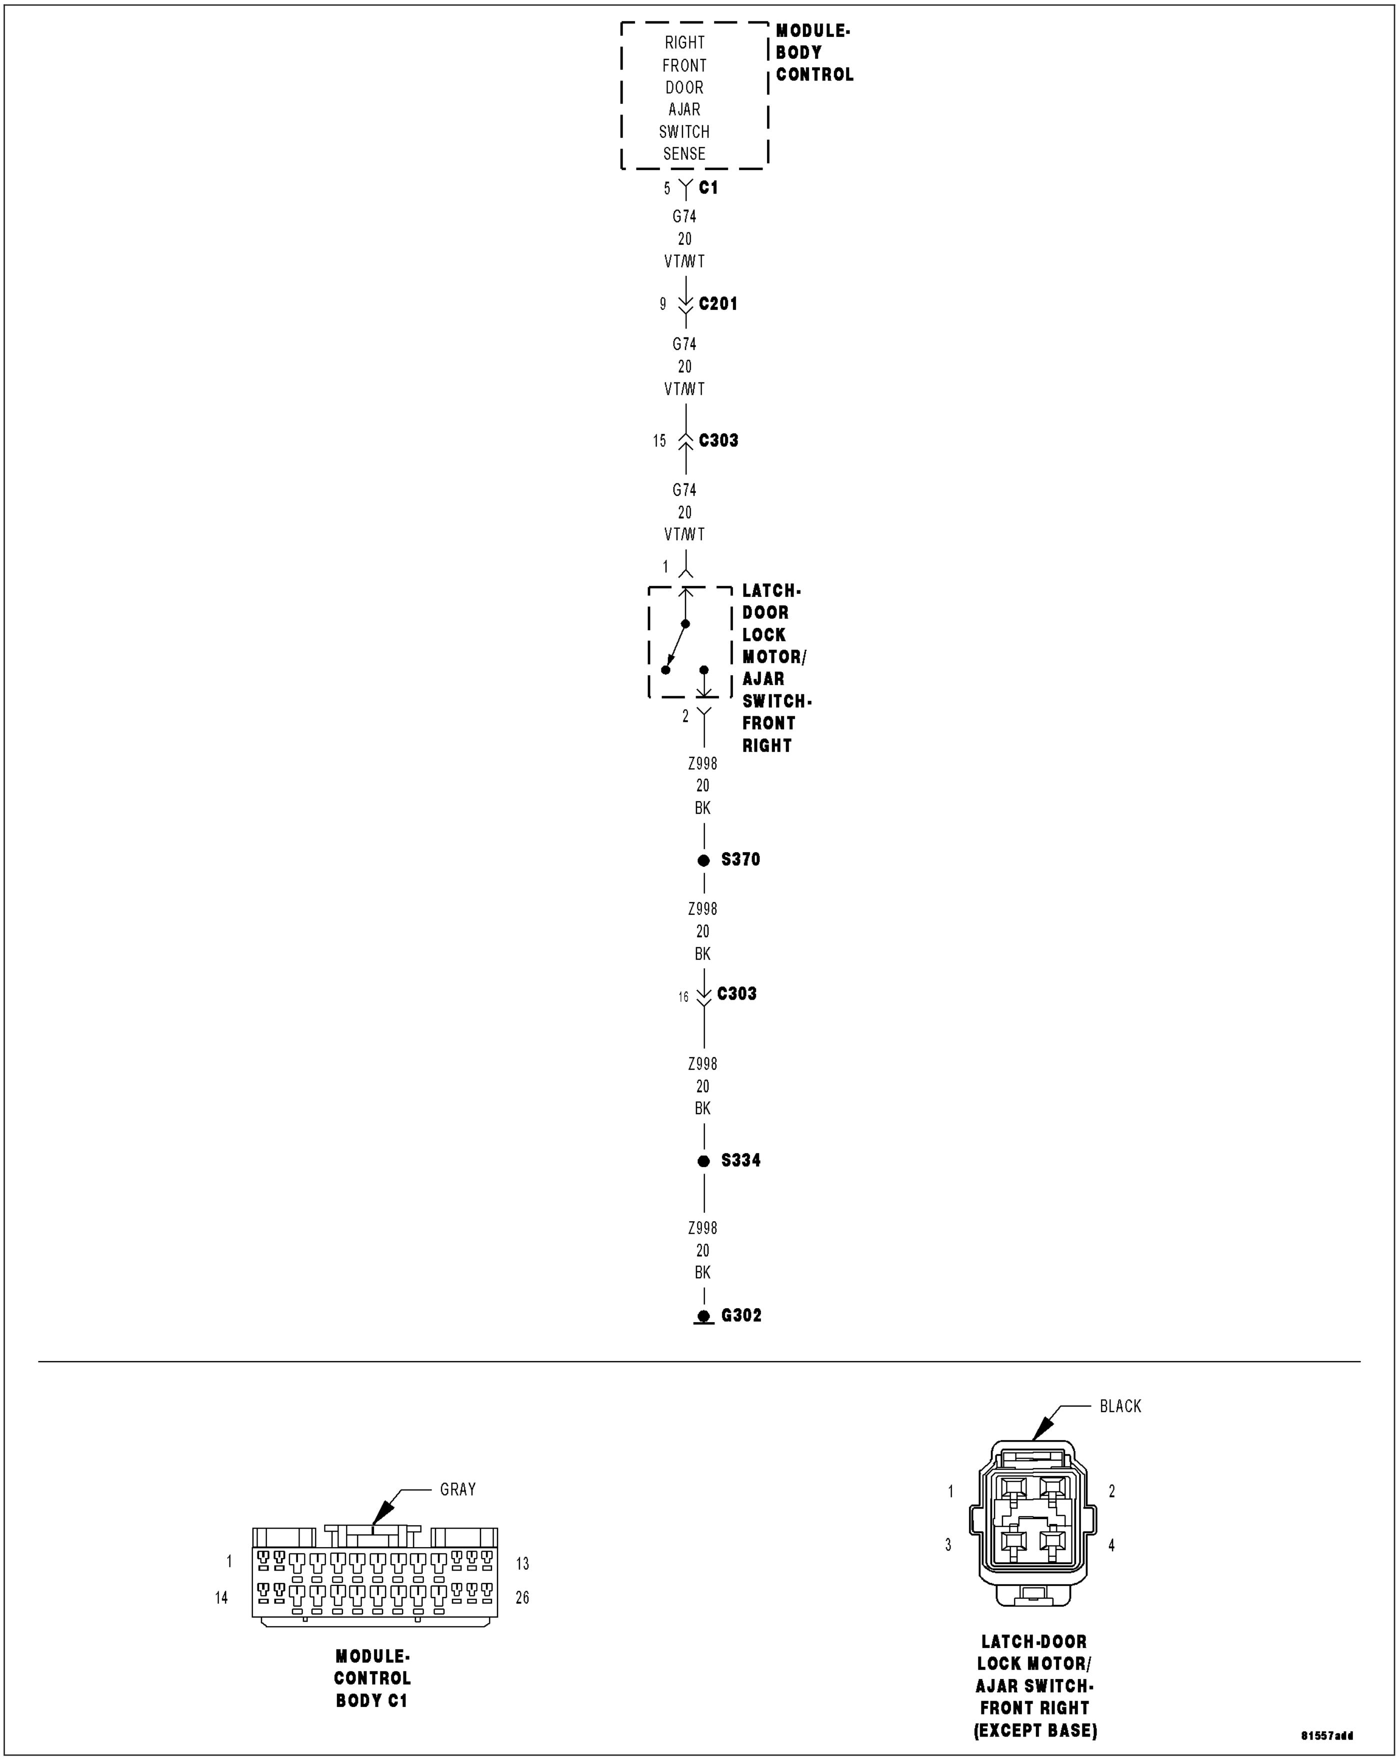
**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (G74) Right Front Door Ajar Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *RIGHT FRONT DOOR AJAR CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| (G74) RIGHT FRONT DOOR AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND |
| DOOR LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR SHORTED DOOR AJAR SWITCH

**NOTE: For the Right Front Door Ajar state the scan tool will read "PASS" for RHD.**

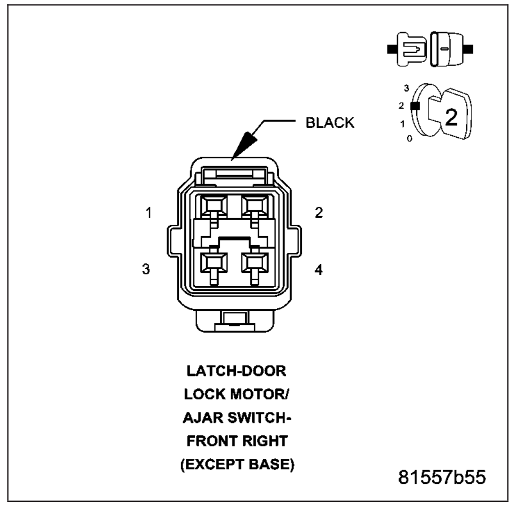
With the scan tool in Data Display, read the RIGHT FRONT DOOR AJAR SW state.

Disconnect the Door Lock Motor/Ajar Switch connector.

**Does the scan tool display RIGHT FRONT DOOR AJAR SW: FALSE?**

**Yes** >> Replace the Door Lock Motor/Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2



### 2. CHECK FOR (G74) RIGHT FRONT DOOR AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

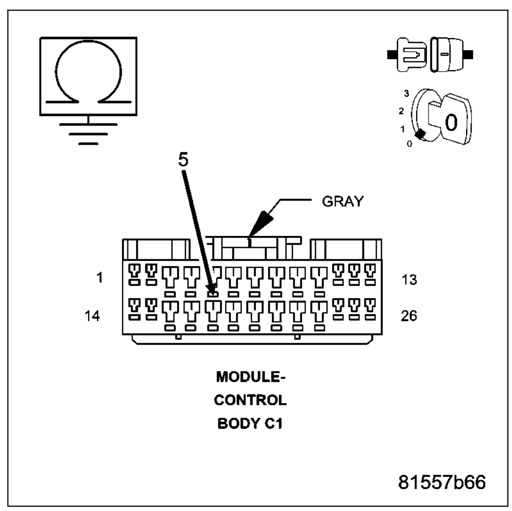
Disconnect the Body Control Module C1 harness connector.

Measure the resistance between ground and the (G74) Right Front Door Ajar Switch Sense circuit in the BCM C1 connector.

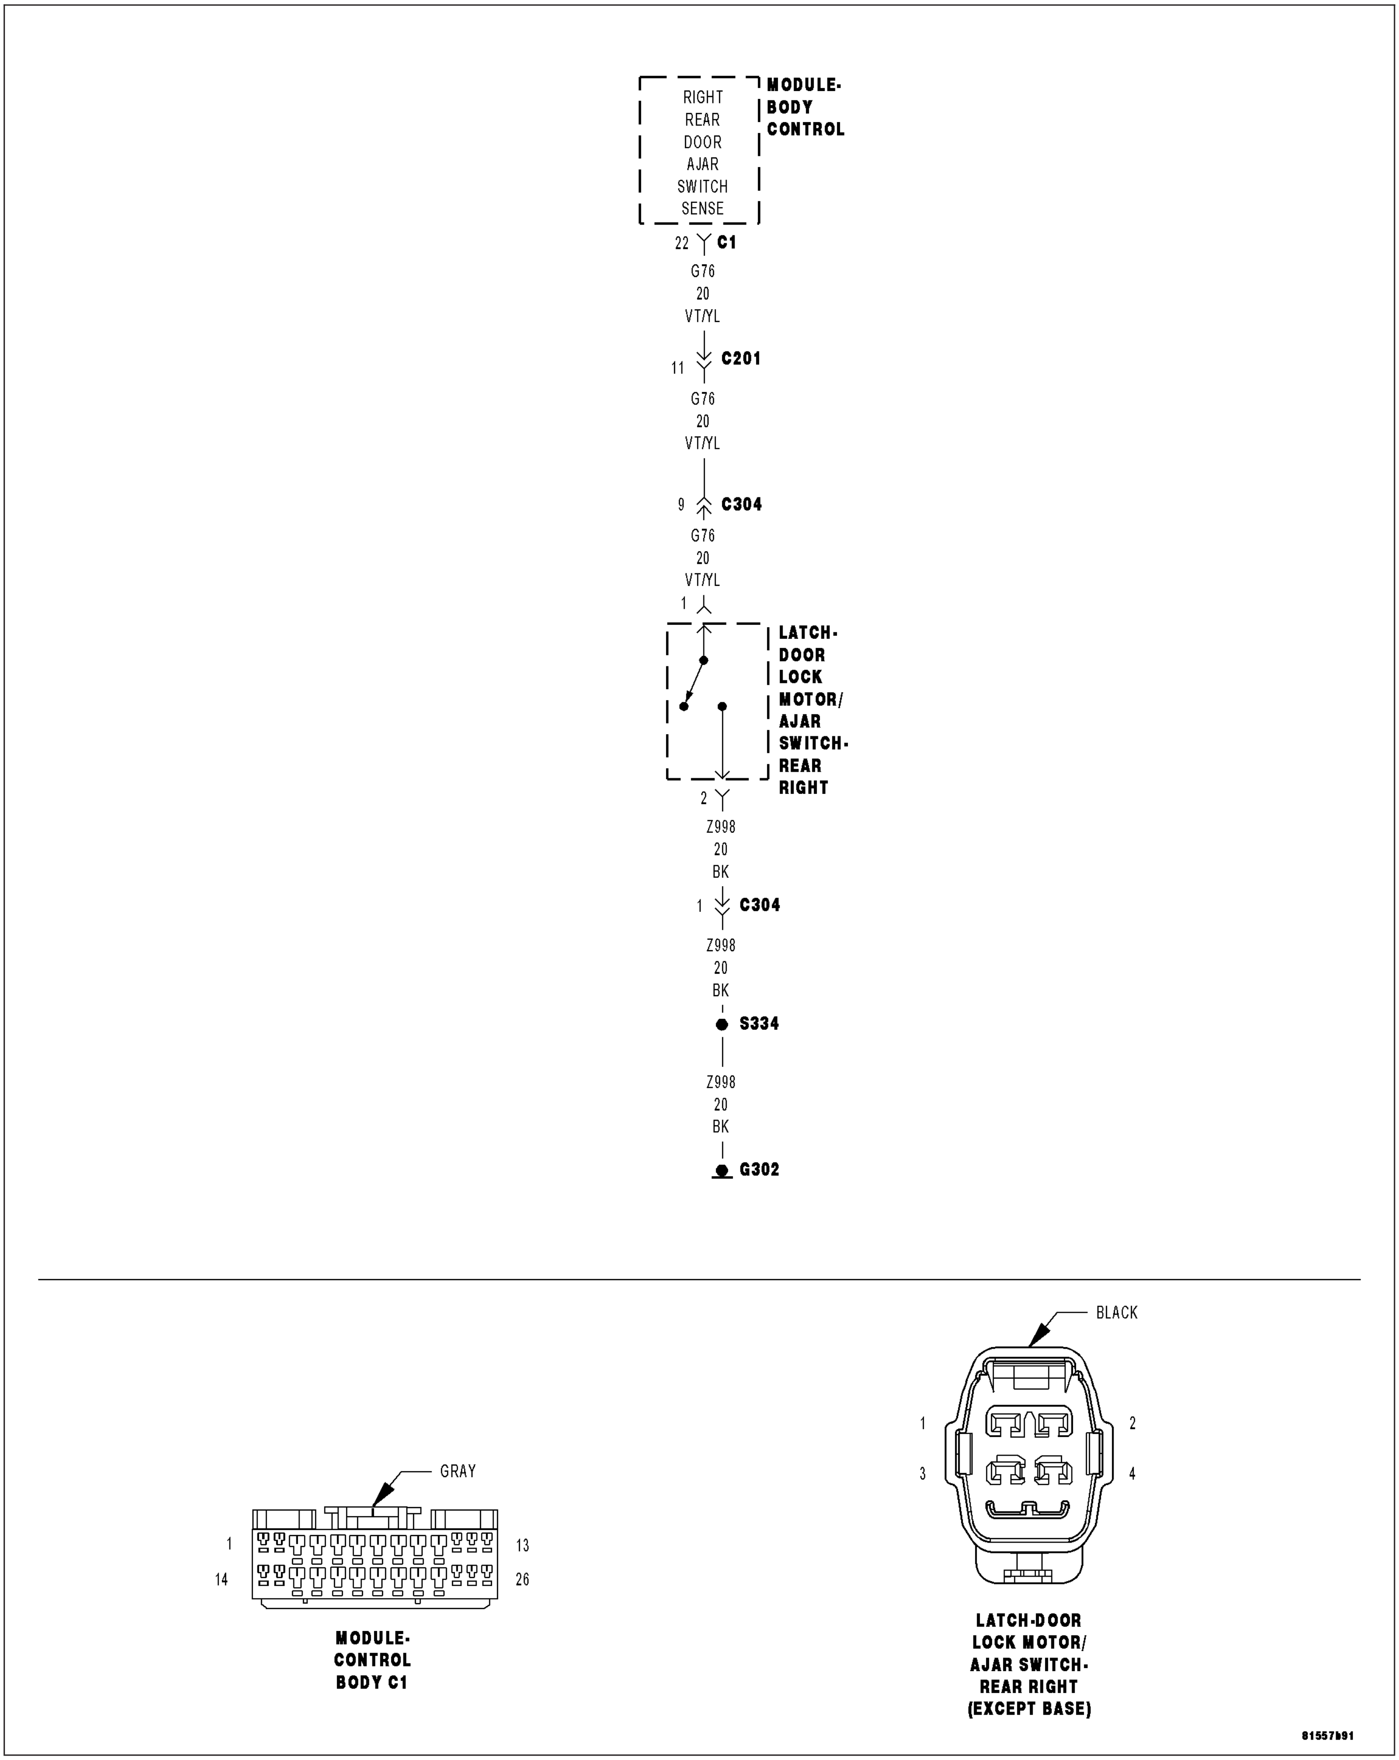
**Is the resistance below 1000.0 ohms?**

**Yes** >> Replace the Body Control Module in accordance with service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (G74) Right Front Door Ajar Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## *RIGHT REAR DOOR AJAR CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| RIGHT REAR DOOR AJAR SWITCH GROUND CIRCUIT OPEN |
| (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT OPEN |
| DOOR LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. OPEN RIGHT REAR DOOR AJAR SWITCH GROUND CIRCUIT

Disconnect the Right Rear Door Lock Motor/Ajar switch connector.

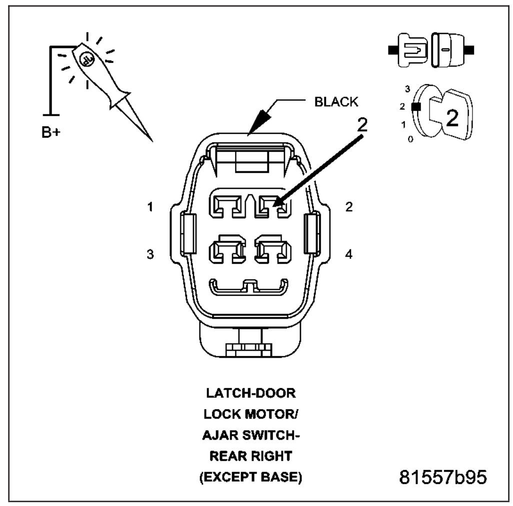
Using a 12-volt Test Light connected to 12-volts, test the Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 2

**No** >> Repair the Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



### 2. CHECK FOR OPEN RIGHT FRONT DOOR AJAR SWITCH

With the scan tool in Data Display, read the RIGHT REAR DOOR AJAR SW state.

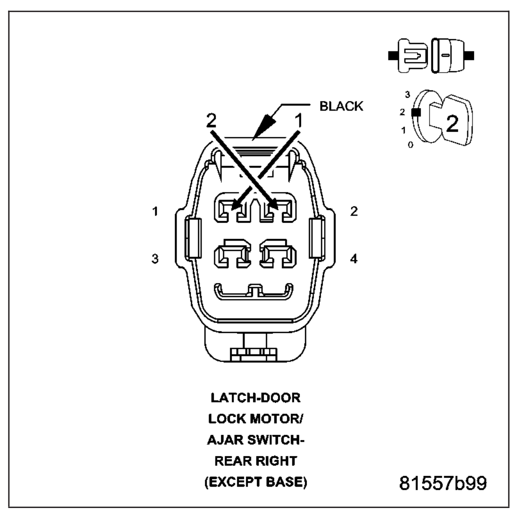
Connect a jumper wire between the Sense circuit and the Ground circuit.

**Does the scan tool display RIGHT REAR DOOR AJAR SW: TRUE?**

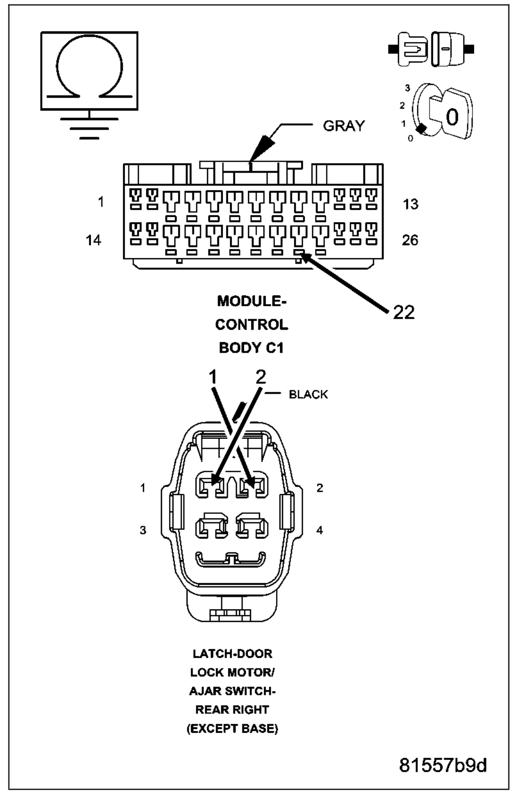
**Yes** >> Replace the Door Lock Motor/Ajar Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



## 3. CHECK FOR OPEN (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT



Turn the ignition off.

Leave the jumper wire from the previous step connected.

Disconnect the Body Control Module C1 harness connector.

Measure the resistance between ground and the (G76) Right Rear Door Ajar Switch Sense circuit in the BCM C1 connector.

**Is the resistance below 5.0 ohms?**

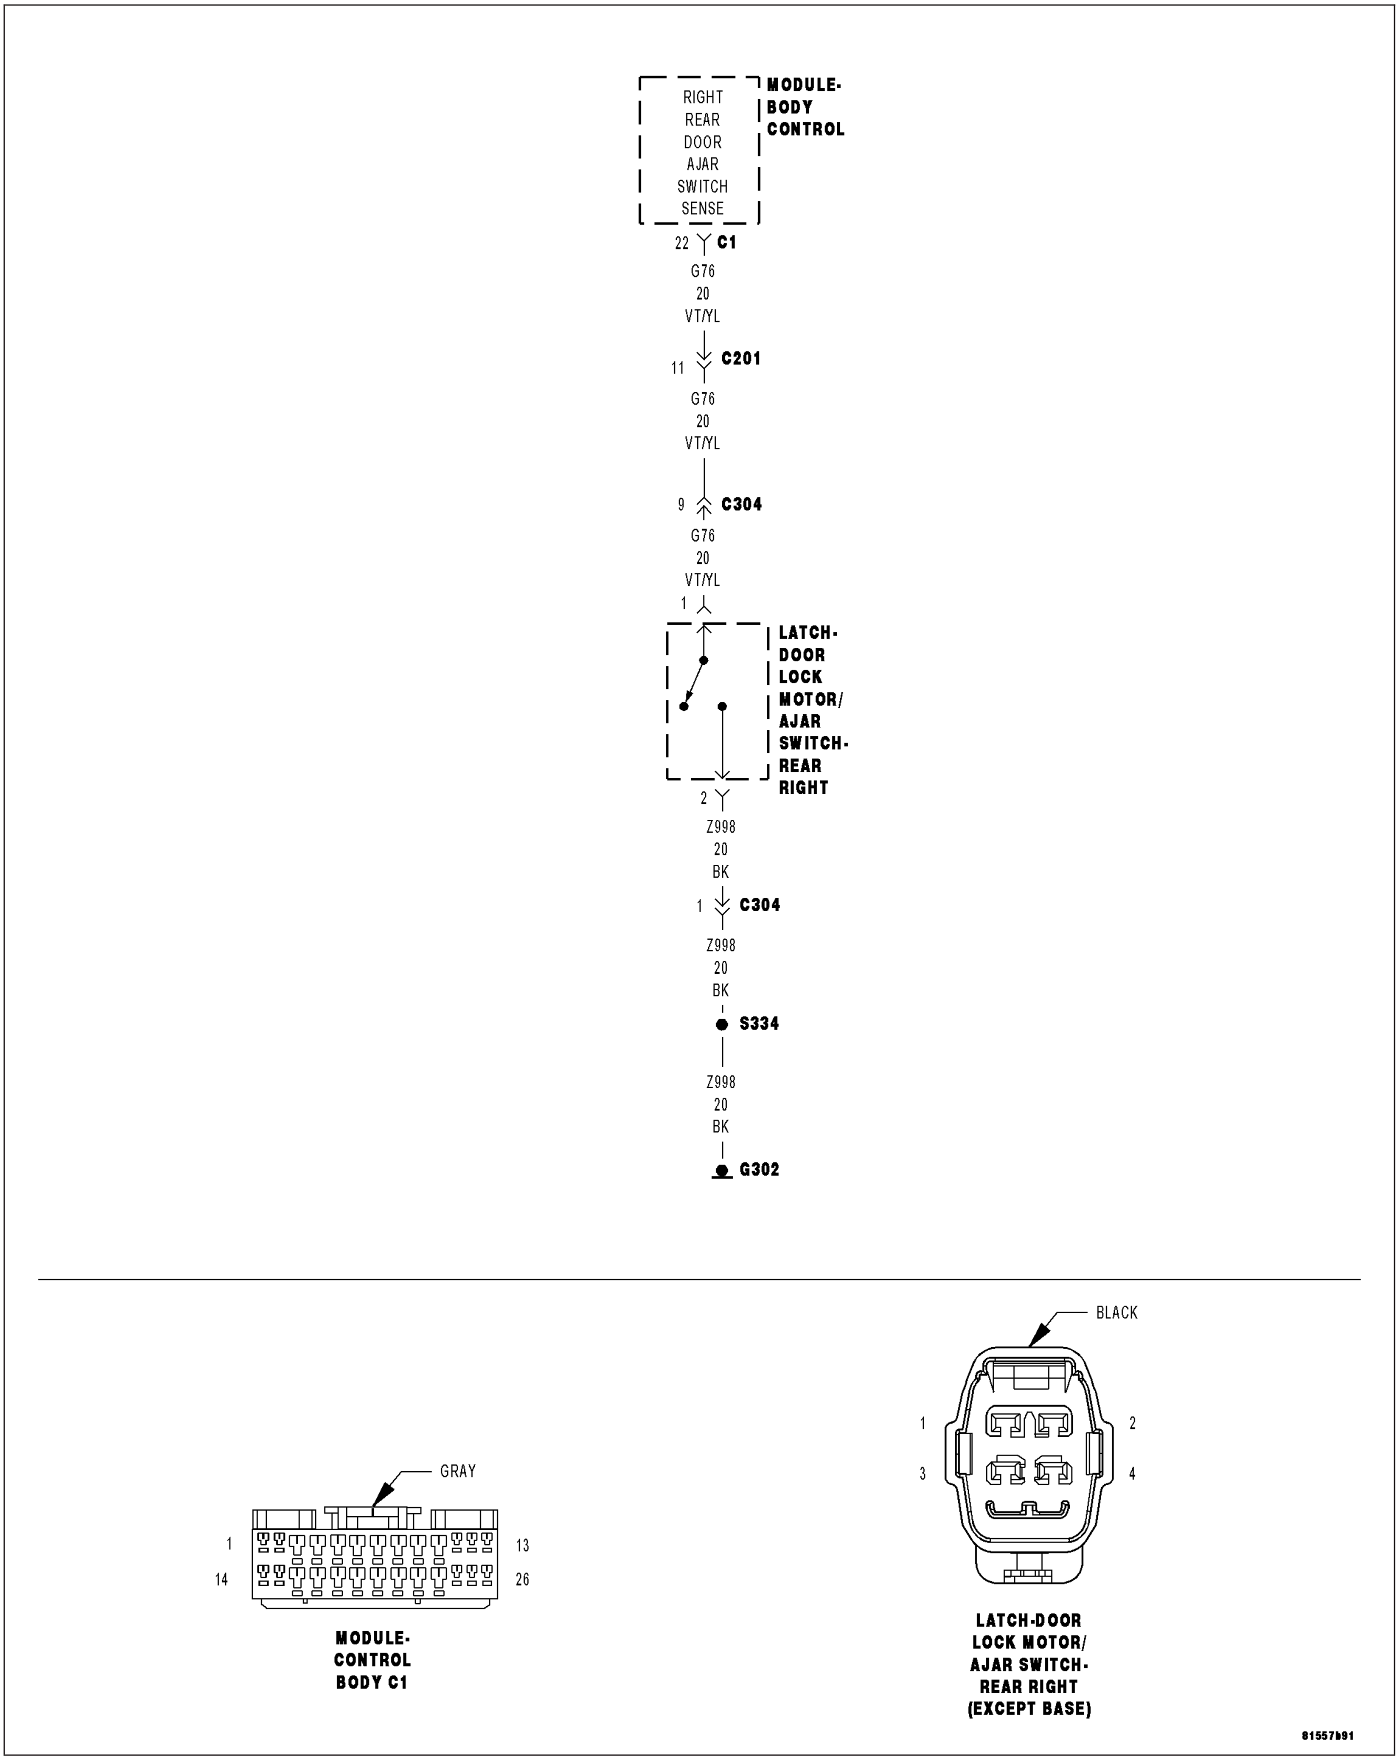
**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (G76) Right Front Door Ajar Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

# *RIGHT REAR DOOR AJAR CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

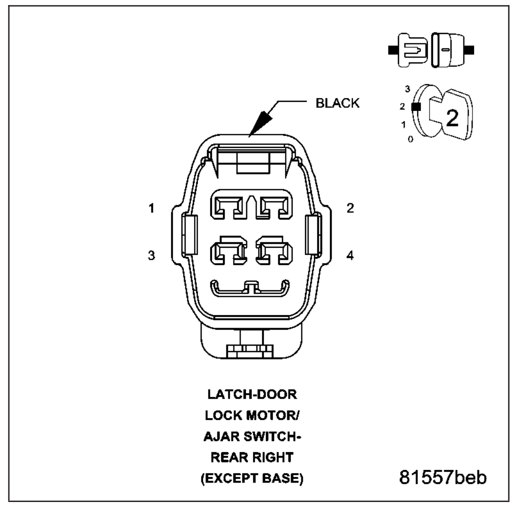
| Possible Causes |
|---|
| (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND |
| DOOR LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR SHORTED DOOR AJAR SWITCH

With the scan tool in Data Display, read the RIGHT REAR DOOR AJAR SW state.

Disconnect the Door Lock Motor/Ajar Switch connector.



**Does the scan tool display RIGHT REAR DOOR AJAR SW: FALSE?**

**Yes** >> Replace the Door Lock Motor/Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

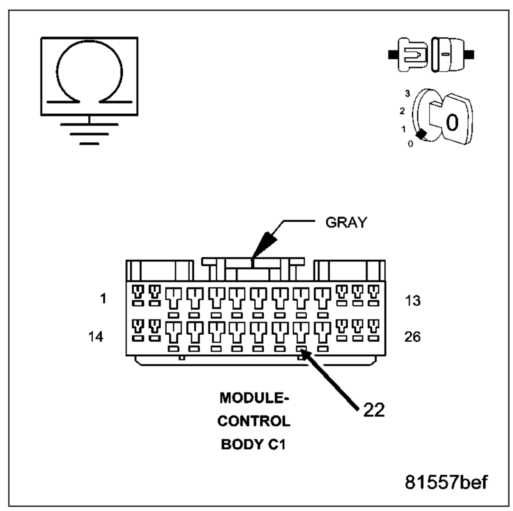
**No** >> Go To 2

### 2. CHECK FOR (G76) RIGHT REAR DOOR AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Body Control Module C1 harness connector.

Using a 12–volt test light connected to 12–volts, check the (G76) Right Rear Door Ajar Switch Sense circuit for a short to ground.

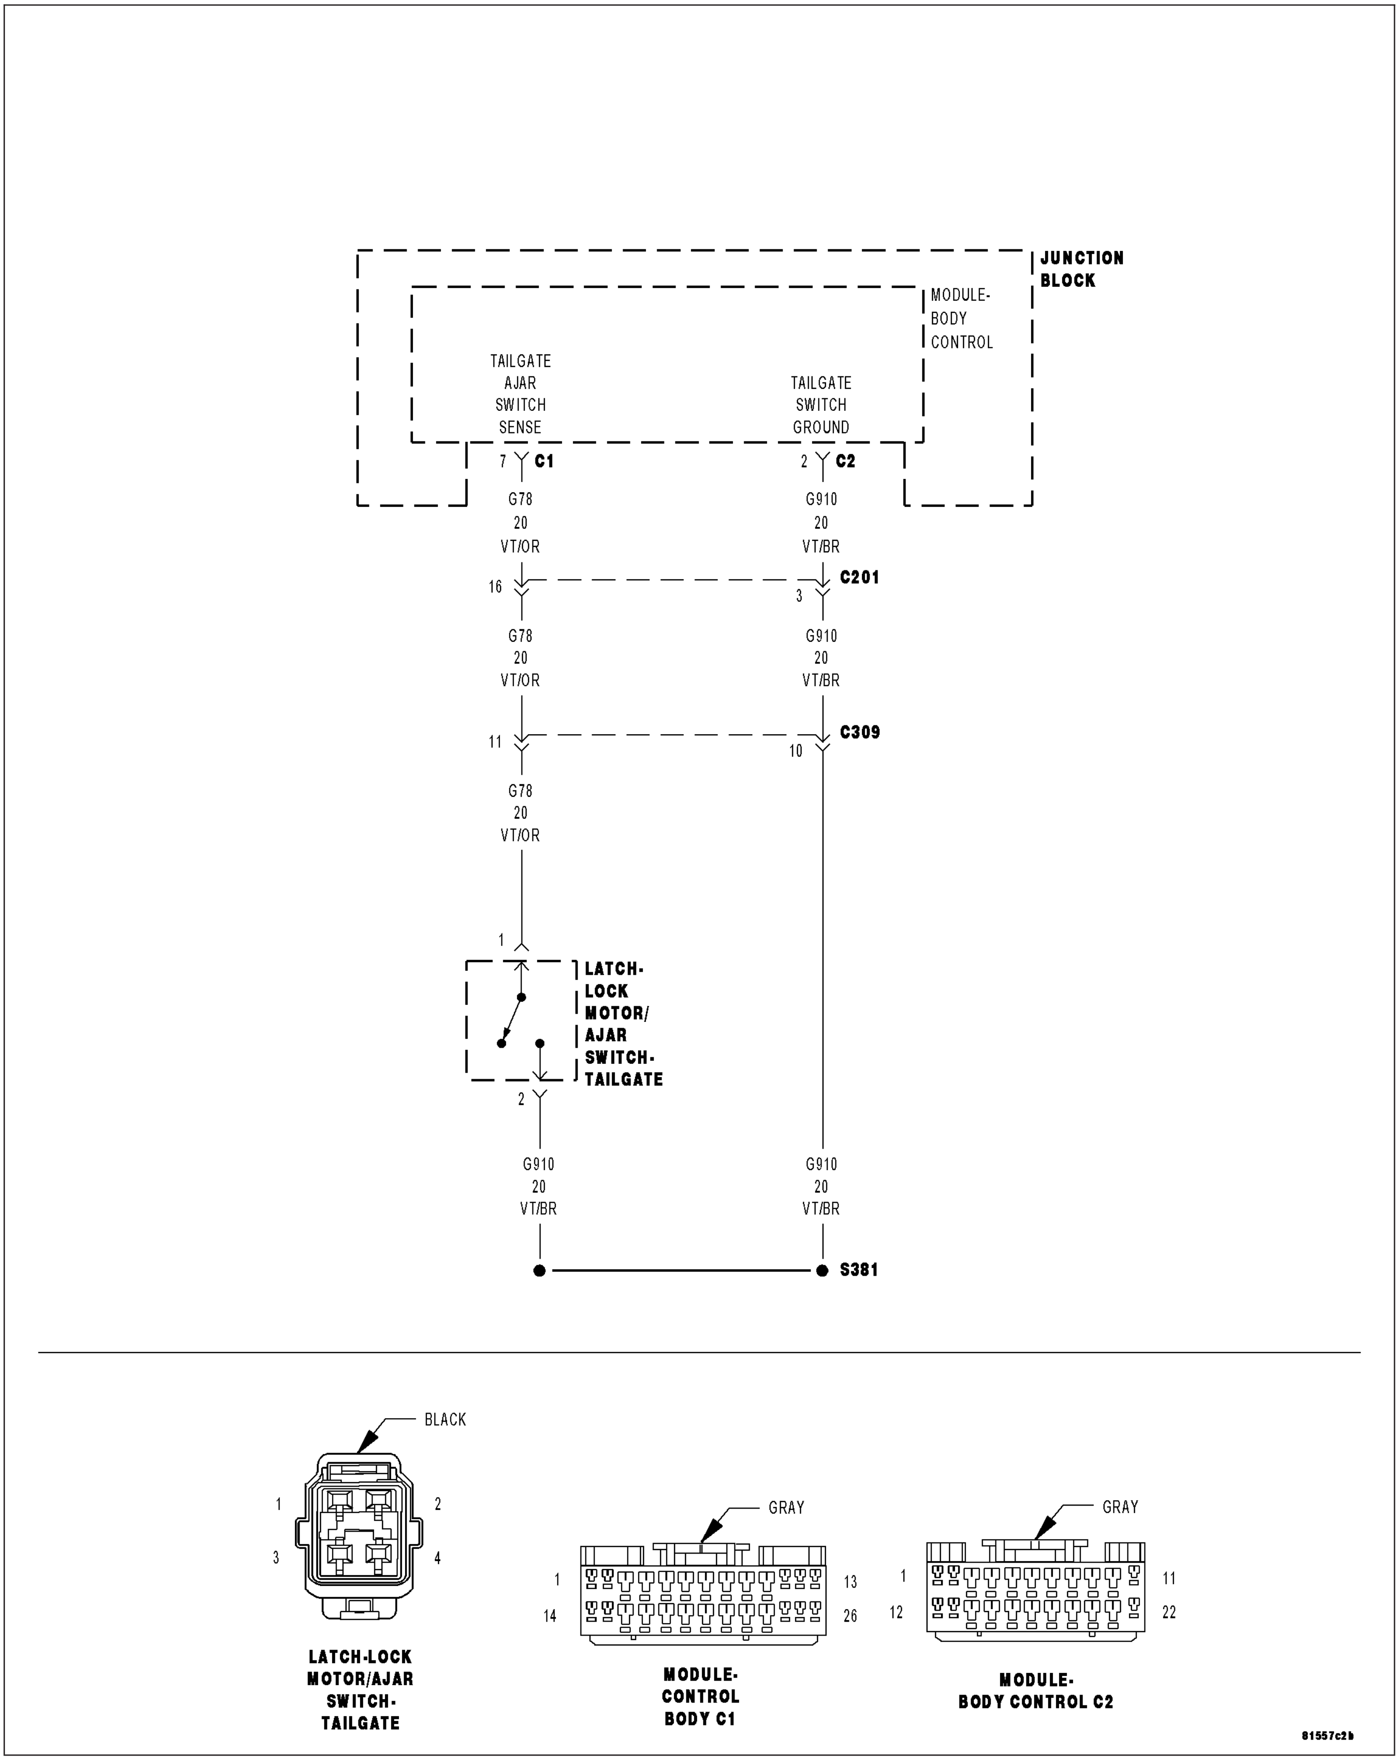


**Does the test light illuminate brightly?**

**No** >> Replace the Body Control Module in accordance with service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**Yes** >> Repair the (G76) Right Rear Door Ajar Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *TAILGATE AJAR CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| TAILGATE AJAR SWITCH GROUND CIRCUIT OPEN |
| (G78) TAILGATE AJAR SWITCH SENSE CIRCUIT OPEN |
| TAILGATE LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. OPEN TAILGATE SWITCH GROUND CIRCUIT

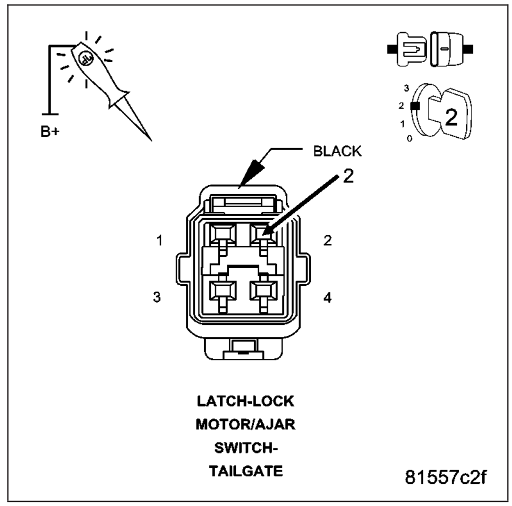
Disconnect the Tailgate Lock Motor/Ajar switch connector.

Using a 12-volt Test Light connected to 12-volts, test the Tailgate Switch Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 2

**No** >> Repair the Tailgate Switch Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



### 2. CHECK FOR OPEN TAILGATE AJAR SWITCH

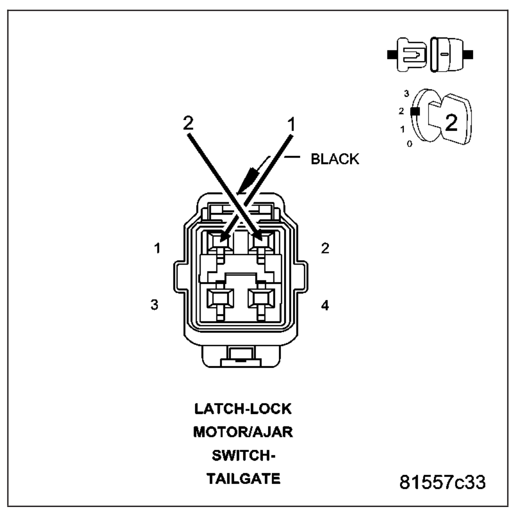
With the scan tool in Data Display, read the TAILGATE AJAR SW state.

Connect a jumper wire between the Sense circuit and the Ground circuit.

**Does the scan tool display TAILGATE AJAR SW: TRUE?**

**Yes** >> Replace the Tailgate Lock Motor/Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



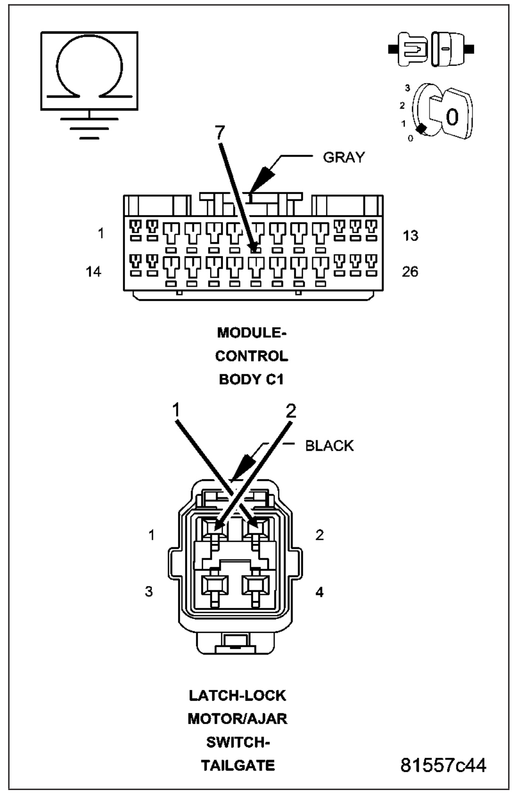
### 3. CHECK FOR OPEN (G78) TAILGATE AJAR SWITCH SENSE CIRCUIT

Turn the ignition off.

Leave the jumper wire from the previous step connected.

Disconnect the Body Control Module C1 harness connector.

Measure the resistance between ground and the (G78) Tailgate Ajar Switch Sense circuit in the BCM C1 connector.



**Is the resistance below 5.0 ohms?**

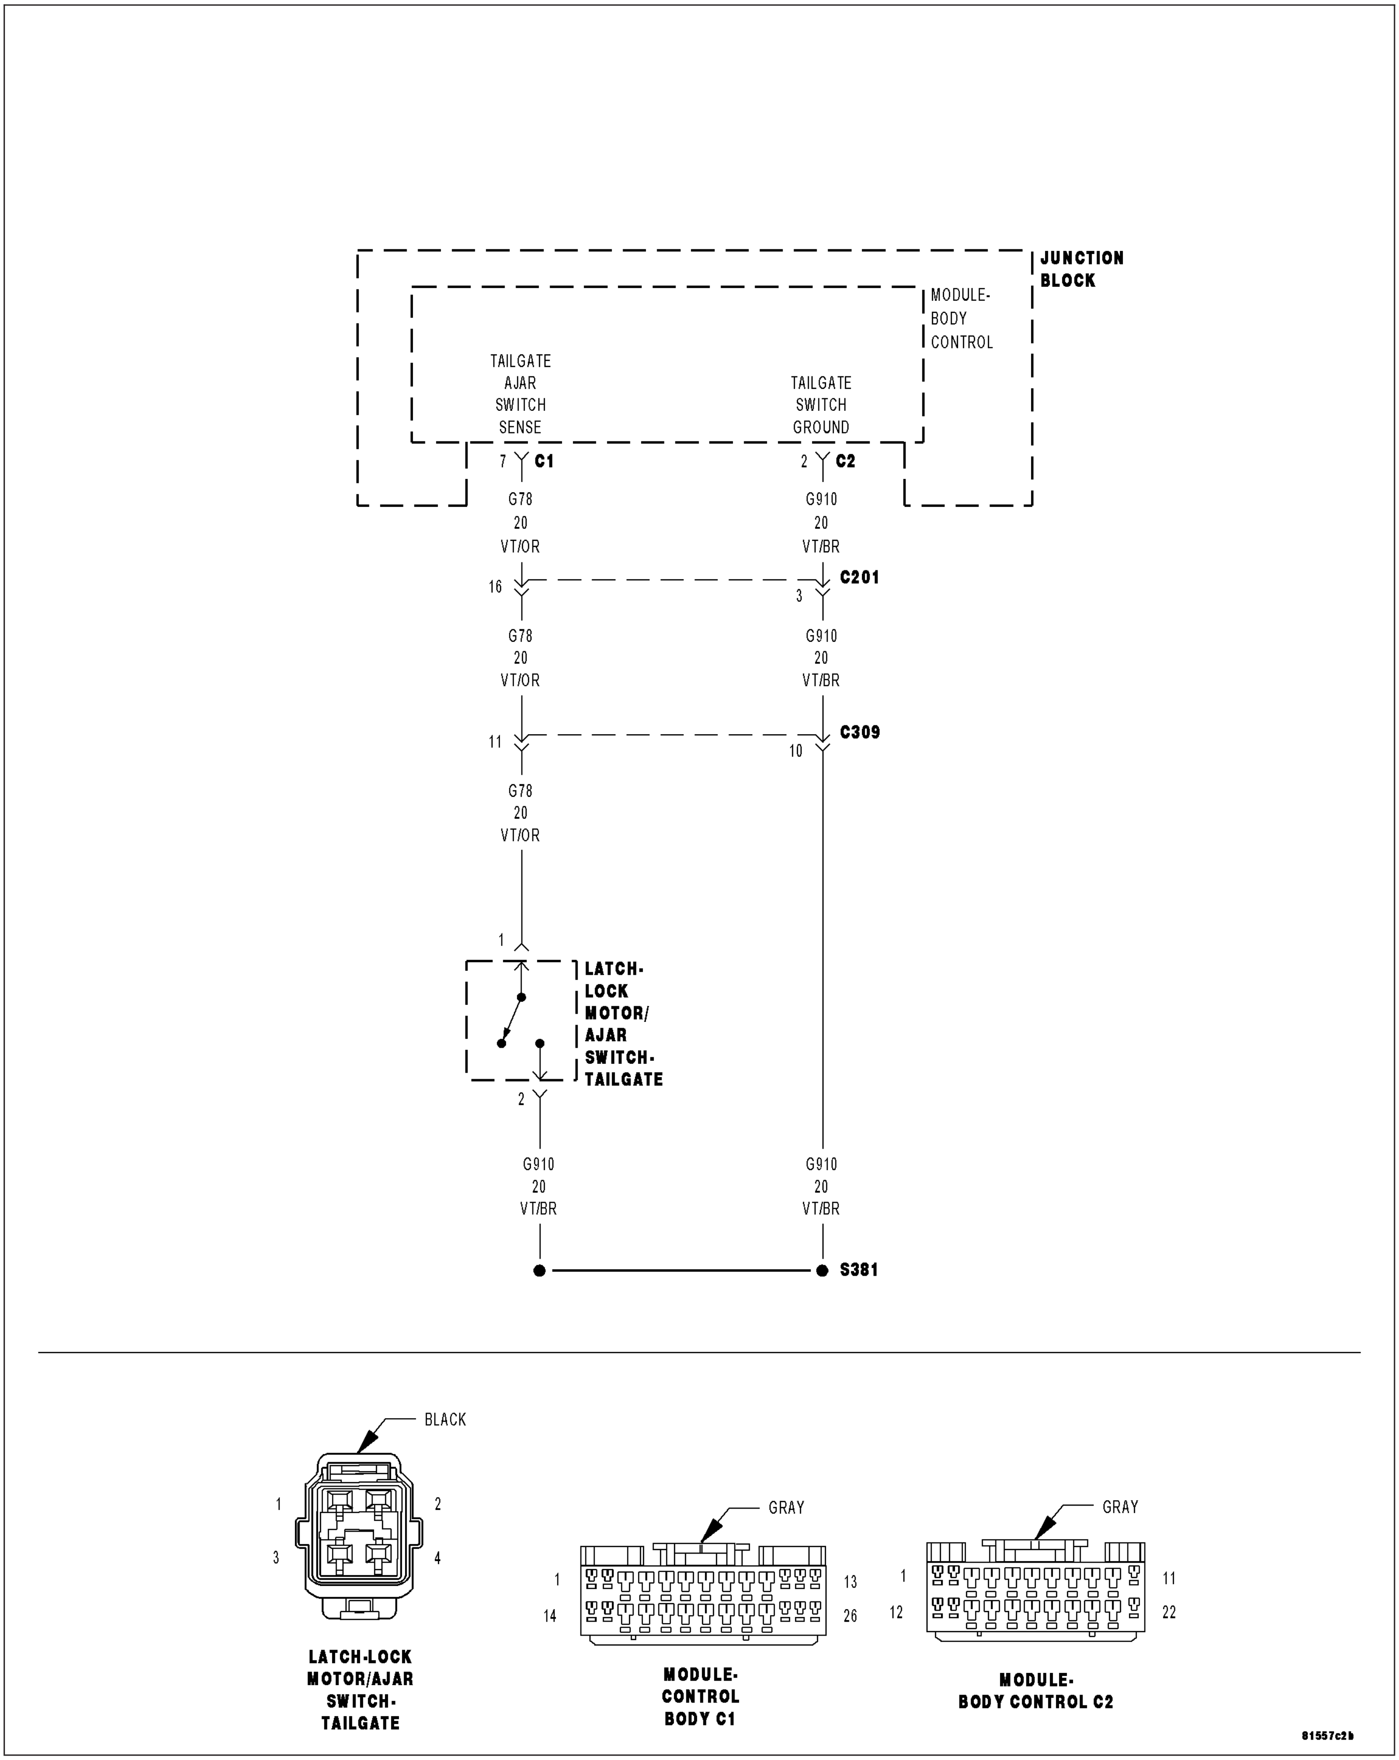
**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (G78) Tailgate Ajar Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *TAILGATE AJAR CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

The scan tool will display the door state NOT the switch state. It will display as True/False. True states that the door is ajar (open). False states that the door is NOT ajar (closed).

| Possible Causes |
|---|
| (G78) TAILGATE AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND |
| TAILGATE LOCK MOTOR/AJAR SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK FOR SHORTED TAILGATE AJAR SWITCH

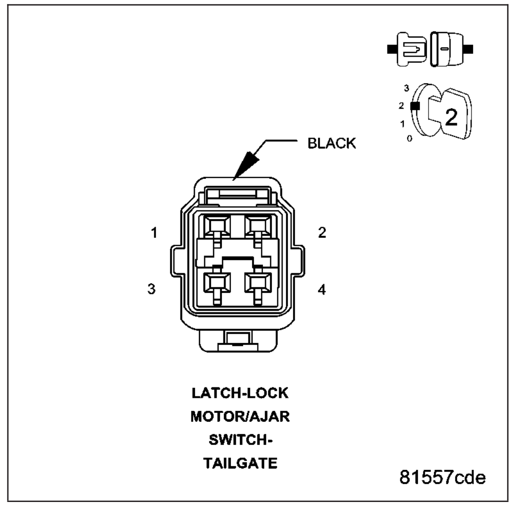
With the scan tool in Data Display, read the TAILGATE AJAR SW state.

Disconnect the Tailgate Lock Motor/Ajar Switch connector.

**Does the scan tool display TAILGATE AJAR SW: FALSE?**

**Yes** >> Replace the Tailgate Lock Motor/Ajar Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2



### 2. CHECK FOR (G78) TAILGATE AJAR SWITCH SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Body Control Module C1 harness connector.

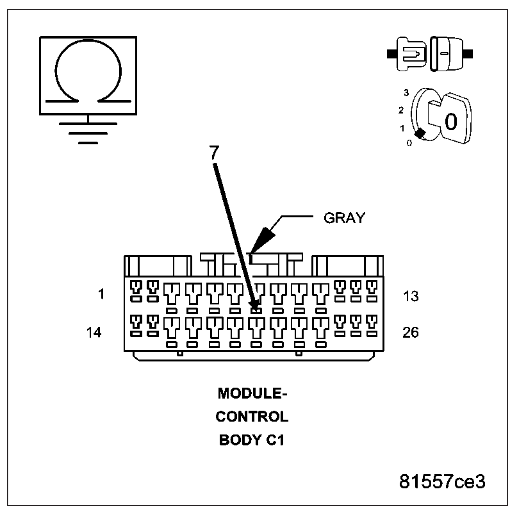
Turn the ignition on.

Using a 12–volt test light connected to 12–volts, test the (G78) Tailgate Ajar Switch Sense circuit for a short to ground.

**Does the test light illuminate brightly?**

**No** >> Replace the Body Control Module in accordance with service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**Yes** >> Repair the (G78) Tailgate Ajar Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## *COURTESY LAMPS INOPERATIVE-ALL LAMPS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| JUNCTION BLOCK |
| COURTESY LAMPS DRIVER CIRCUIT OPEN |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. JUNCTION BLOCK

Gain access to the junction block C24 Harness connector.
While back probing, measure the voltage of the Courtesy Lamp Driver circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Go To 2

**No** >> Replace the Junction Block.
Perform BODY VERIFICATION TEST - VER 1.

### 2. COURTESY LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE

Using a jumper wire, test the Courtesy Lamps Driver circuit to the Junction Block C24 connector and ground.

**Do the courtesy lamps come on?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Courtesy Lamp Driver circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

# *COURTESY LAMPS INOPERATIVE-OVERHEAD LAMPS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| JUNCTION BLOCK |
| OPEN BULB |
| COURTESY LAMP DRIVER CIRCUIT OPEN |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.
Turn the Courtesy Lamps on.
Verify that the Courtesy Lamps are inoperative.

**Do the Courtesy Lamps operate normally?**

**Yes** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 2

### 2. OPEN BULB

Remove and inspect any inoperative courtesy lamp bulbs.

**Are any of the inspected bulbs open or shorted?**

**Yes** >> Replace the applicable open bulb.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. COURTESY LAMP DRIVER CIRCUIT OPEN

Turn the ignition on.
Measure the voltage of the Courtesy Lamp Driver circuit to ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the Courtesy Lamps Driver circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Junction Block.
Perform BODY VERIFICATION TEST - VER 1.

## *COURTESY LAMPS STAY ON AT ALL TIMES

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| COURTESY LAMPS DRIVER HEADLINER CIRCUIT SHORT TO GROUND |
| COURTESY LAMPS DRIVER CIRCUIT BODY HARNESS SHORT TO GROUND |
| PANEL LAMPS DIMMER SWITCH MUX SHORT TO GROUND |
| MULTIFUNCTION SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. COURTESY LAMPS DRIVER (HEADLINER) CIRCUIT SHORTED TO GROUND

Ensure the Dimmer Switch is off.
Close all the passenger doors.
Disconnect the Junction Block C24 connector from the front of the junction block.
Observe the Courtesy Lamps.

**Did the Courtesy Lamps turn off?**

**Yes** >> Repair the Courtesy Lamps Driver circuit in the headliner harness for a short to ground. Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 2

### 2. COURTESY LAMPS DRIVER CIRCUIT (BODY HARNESS) SHORTED TO GROUND

Ensure the Dimmer Switch is off.
Close all the passenger doors.
Disconnect the Junction Block C24 harness connector from the Junction Block.
Observe the Courtesy Lamps.

**Did Courtesy Lamps turn off?**

**Yes** >> Repair the Courtesy Lamps Driver circuit in the Body Harness for a short to ground. Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. PANEL LAMPS DIMMER SWITCH MUX SHORT TO GROUND

Disconnect the Body Control Module C2 connector.
Disconnect the Multifunction Switch harness connector.
Measure the resistance of the Panel Lamps Dimmer Switch MUX circuit to ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Panel Lamps Dimmer Switch MUX circuit for a short to ground condition. Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. MULTIFUNCTION SWITCH

Turn the ignition off.
Disconnect the Body Control Module C2 connector.
Disconnect the Multifunction Switch harness connector.
Turn the ignition on.
Measure the resistance of the Multifunction Switch Ground circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Multifunction Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## DIMMING LEVEL SWITCH INPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  BCM detects a voltage greater than 4.75 volts on the dimming level switch input for more than 5 seconds.

| Possible Causes |
|---|
| PANEL LAMPS DIMMER SWITCH MUX OPEN |
| SHORT TO BATTERY |
| MULTIFUNCTION SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Actuate the Dimming Level Switch.

With the scan tool, read the DTC information.

**Does the scan tool read: Dimming Level Switch Input CKT High?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. PANEL LAMPS DIMMER SWITCH MUX OPEN

Turn the ignition off.

Disconnect the BCM C2 harness connector.

Turn the ignition on to check the Courtesy Lamp operation.

**Did the Courtesy Lamps come on?**

**Yes** >> Go To 3

**No** >> Repair the Panel Lamps Dimmer Switch MUX circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

### 3. SHORT TO BATTERY

Ensure the Junction Block C24 harness connector on the front of the junction block is connected.

Turn on all overhead, map and rear rearing lamps by their own individual switches.

This will disconnect each lamp from the Courtesy Lamp Driver Circuit.

**Did any lamp fail to light when it was turned on by it's own switch?**

**Yes** >> Repair the short to battery condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. MULTIFUNCTION SWITCH

Turn the ignition off.

Disconnect the Junction Block C24 harness connector from the front of the junction block.

Remove the Body Control Module from the junction block.

Measure the voltage of the Courtesy Lamps Driver circuit.

**Is there any voltage on the Courtesy Lamps Driver Circuit?**

**Yes** >> Replace the Multifunction Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## DIMMING LEVEL SWITCH INPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Ignition ON.
- **Set Condition:**
  BCM detects a voltage less than 0.25 volts on the dimming level switch input for more than 5 seconds.

| Possible Causes |
|---|
| COURTESY LAMPS DRIVER HEADLINER CIRCUIT SHORT TO GROUND |
| COURTESY LAMPS DRIVER CIRCUIT BODY HARNESS SHORT TO GROUND |
| PANEL LAMPS DIMMER SWITCH MUX SHORT TO GROUND |
| MULTIFUNCTION SWITCH |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Actuate the Dimming Level Switch.

With the scan tool, read the DTC information.

**Does the scan tool read: Dimming Level Switch Input CKT Low?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. PANEL LAMPS DIMMER SWITCH MUX OPEN

Turn the ignition off.

Disconnect the BCM C2 harness connector.

Cycle the ignition switch off than back on.

**Did any of the Courtesy Lamps come on?**

**Yes** >> Go To 3

**No** >> Repair the Panel Lamps Dimmer Switch MUX for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

### 3. PANEL LAMPS DIMMER SWITCH MUX SHORT TO GROUND

Ensure the Junction Block C24 harness connector on the front of the junction block is connected.

Turn on all overhead, map and rear rearing lamps by their own individual switches.

This will disconnect each lamp from the Courtesy Lamp Driver Circuit.

**Did any lamp fail to light when it was turned on by it's own switch?**

**Yes** >> Repair the Panel Lamps Dimmer Switch MUX circuit for a short to ground condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. MULTIFUNCTION SWITCH

Turn the ignition off.

Disconnect the Junction Block C24 harness connector from the front of the junction block.

Remove the Body Control Module from the junction block.

Measure the voltage of the Courtesy Lamps Driver circuit.

**Is voltage present on the Courtesy Lamps Driver Circuit?**

**Yes** >> Replace the Multifunction Switch.
Perform BODY VERIFICATION TEST - VER 1.

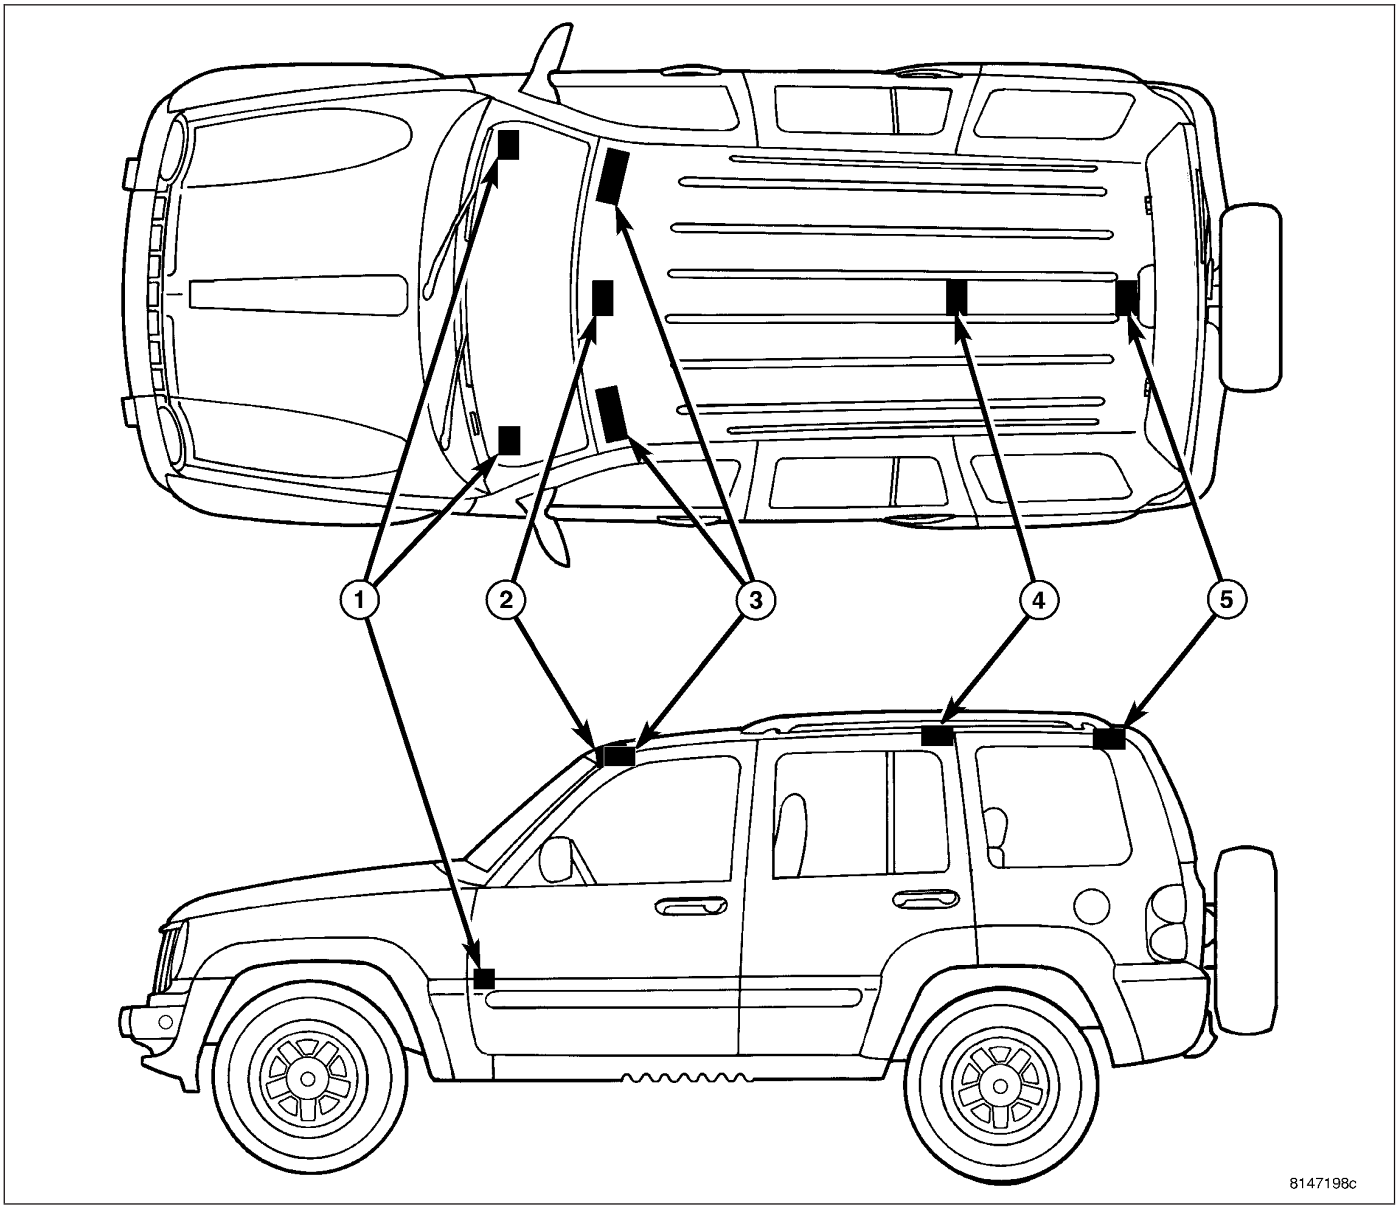
**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

# LAMPS/LIGHTING - INTERIOR

## TABLE OF CONTENTS

# LAMPS/LIGHTING - INTERIOR

## DESCRIPTION



The interior lighting system for this vehicle includes incandescent lighting on two separate circuits: the dome/courtesy lamp circuit and the panel lamps dimmer circuit. The lamps on the dome/courtesy circuit include:

- **Cargo Lamp (5) -** An available cargo lamp with an integral lens-actuated courtesy disable switch is located in the headliner near the rear roof header and is activated automatically whenever the rear flip-up glass is opened to illuminate the rear cargo area of the vehicle.
- **Courtesy Lamps (1) -** Available courtesy lamps are located below both the right and left side of the instrument panel and are illuminated whenever the dome/courtesy lamp circuit is energized.
- **Front Dome Lamp (2)** - A standard front dome lamp that does not include an on-off switch is located in the headliner near the windshield header, and is illuminated whenever the dome/courtesy lamp circuit is energized.
- **Reading Lamps (2)** - Available front seat driver side and passenger side reading lamps located in the headliner near the windshield header are controlled by both the dome/courtesy lamp circuit and independent lens-actuated switches.
- **Rear Dome Lamp (4)** - An available rear dome lamp is located in the center of the headliner above the rear seat is controlled by both the dome/courtesy lamp circuit and an independent lens-actuated switch.

- **Vanity Lamps (3)** - Available single intensity vanity lamps are located on each side of a covered mirror on both the right and left sun visors, and are controlled by an integral vanity mirror cover-actuated switch.

Most controls on the instrument panel and other controls located elsewhere on the interior of the vehicle are illuminated for night visibility. Some have miniature incandescent bulbs or Light-Emitting Diode (LED) units that are soldered to internal circuit boards and are not serviceable. The replaceable incandescent bulbs or bulb/bulb holder units in this vehicle include:

- **Ash Receiver Lamp** - An available ash receiver lamp is located above the ash receiver housing behind the instrument panel center bezel.
- **Compass Mini-Trip Control Illumination Lamps** - The optional Compass Mini-Trip Computer (CMTC) has three replaceable control illumination bulb/bulb holder units on its circuit board that are controlled by the panel lamps dimmer circuit.
- **Heater-Air Conditioner Control Illumination Lamps** - The heater-air conditioner control has two replaceable control illumination bulb/bulb holder units on its circuit board that are controlled by the panel lamps dimmer circuit.
- **Instrument Cluster Illumination Lamps** - The ElectroMechanical Instrument Cluster (EMIC) has nine replaceable general illumination bulb/bulb holder units on its circuit board that are controlled by the panel lamps dimmer circuit. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DESCRIPTION).
- **Transmission Range Indicator Illumination Lamp** - Vehicles equipped with an automatic transmission have an illuminated transmission range indicator integral to the console mounted gearshift mechanism. Illumination is provided by a replaceable incandescent bulb that is controlled by the panel lamps dimmer circuit.

Other components of the interior lighting system for this vehicle include:

- **Body Control Module** - The Body Control Module (BCM) is located on the Junction Block (JB) under the driver side outboard end of the instrument panel. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL MODULE - DESCRIPTION).
- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each front and rear door.
- **Flip-Up Glass Ajar Switch** - A flip-up glass ajar switch is integral to the flip-up glass latch mechanism on the top of the tailgate inner panel.
- **Multi-Function Switch** - The multi-function switch is located on the top of the steering column, just below the steering wheel. The multi-function switch includes a left and right control stalk. The left control stalk is dedicated to providing almost all of the driver controls for both the exterior and interior lighting systems. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DESCRIPTION).
- **Tailgate Ajar Switch** - A tailgate ajar switch is integral to the latch mechanism of the tailgate.

Hard wired circuitry connects the interior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the interior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

## OPERATION

The interior lighting systems can be divided into two general classifications based upon the circuit that controls their operation: The courtesy lamp circuit, or the panel lamps dimmer circuit. The hard wired circuits and components of the interior lighting systems may be diagnosed and tested using conventional diagnostic tools and procedures.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the Body Control Module (BCM), the ElectroMechanical Instrument Cluster (EMIC), or the Programmable Communications Interface (PCI) data bus network. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the PCI data bus, or the electronic bus message inputs and outputs related to the various interior lighting systems requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

### COURTESY LAMP CIRCUIT

Depending upon the selected vehicle options the courtesy lamp circuit may include the courtesy lamps located below the instrument panel, the dome or map/reading lamps located in the headliner near the windshield and over the rear seat, the cargo lamp located in the headliner near the rear roof header, and the vanity lamps located in the sun visors. The lamps in the courtesy lamp circuit are provided with battery voltage at all times from a fuse in the Junction Block (JB). The Body Control Module (BCM) controls the ground path for these lamps based upon hard wired inputs from the door ajar switches, the flip-up glass ajar switch, the tailgate ajar switch the multi-function switch and the ignition switch.

After all of the ajar switch inputs to the BCM transition to open, the BCM will keep the lamps illuminated for about 27 seconds, then fade the lamps to off (theater dimming) over about three seconds. The BCM also provides courtesy lamp operation based upon a resistor multiplexed input from the interior lighting control ring on the left control stalk of the multi-function switch through the headlamp switch circuit, and provides an illuminated entry feature in response to certain electronic message inputs received from the optional Remote Keyless Entry (RKE) system.

A resistor multiplexed courtesy lamp defeat input from the control ring on the left control stalk of the multi-function switch will cause the BCM to override normal courtesy lamp operation based upon inputs from all of the ajar switches. A hard wired input from the courtesy lamp defeat switch in the optional cargo lamp will cause the BCM to override normal courtesy lamp operation based upon inputs from only the flip-up glass and tailgate ajar switches.

For those lamps on the courtesy lamp circuit with independent switching such as the optional reading lamps and vanity lamps, the BCM provides a ground path to the switches using another internal driver through the courtesy lamp load shed circuit. The BCM provides a battery saver (load shedding) feature for all courtesy lamps, which will automatically turn these lamps off if they are left on for more than about eight minutes with the ignition switch in the Off position.

### PANEL LAMPS DIMMER CIRCUIT

The panel lamps dimmer circuit includes the ElectroMechanical Instrument Cluster (EMIC), the heater-air conditioner control, the hazard switch and depending upon the selected vehicle options, the ash receiver and/or the automatic transmission range indicator illumination lamps. All lamps in the panel lamps dimmer circuit are provided a path to ground at all times through a hard wired ground circuit. These lamps illuminate based upon inputs to the Body Control Module (BCM) from the exterior lighting control knob and the interior lighting control ring on the left control stalk of the multi-function switch. The left control knob of the multi-function switch selects the exterior lights, while the left control ring selects the panel lamps intensity (dimming) level.

When the exterior lighting is turned On, the BCM energizes the park lamp relay and provides an electronic dimming level message to the ElectroMechanical Instrument Cluster (EMIC), the radio, and the Compass Mini-Trip Computer (CMTC) over the Programmable Communications Interface (PCI) data bus. The energized park lamp relay provides a hard wired battery voltage signal input to the EMIC on the park lamp relay output circuit. The EMIC responds to these inputs by supplying a 12-volt Pulse Width Modulated (PWM) output to all of the incandescent lamps in the panel lamps dimmer circuit over the fused panel lamps dimmer switch signal circuit. This shared PWM output synchronizes the selected illumination intensity level of all of the incandescent lamps in the panel lamps dimmer circuit.

The EMIC and the radio each use the electronic dimming level message from the BCM to control and synchronize the illumination intensity of their own Vacuum Fluorescent Display (VFD) units, while the CMTC uses the dimming level message to control the illumination intensity of both its VFD unit and its incandescent lighting. In addition, when the left control ring of the multi-function switch is moved to the Parade Mode detent position, all of the VFD units are illuminated at their full intensity levels for increased visibility when the vehicle is driven during daylight hours with the exterior lights turned On.

## WARNING

## WARNINGS - LAMPS/LIGHTING - INTERIOR

**WARNING:: To avoid personal injury or death, eye protection should be used when servicing any glass components.**

**CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - SPECIFICATIONS). In addition, do not use fuses, circuit breakers or relays having a greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.**

## DIAGNOSIS AND TESTING

## LAMPS/LIGHTING - INTERIOR

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: When diagnosing the interior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.**

**NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.**

The hard wired interior lamp and lighting circuits may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the Body Control Module (BCM), the ElectroMechanical Instrument Cluster (EMIC), the Programmable Communications Interface (PCI) data bus, or the electronic message inputs used to provide interior lamp and lighting service or many of the electronic features of the interior lamp and lighting systems. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the PCI data bus, and the electronic message inputs for the interior lamps and lighting system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## COURTESY LAMP CIRCUIT

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| A SINGLE LAMP IN THE COURTESY LAMP CIRCUIT DOES NOT ILLUMINATE | 1. Ineffective or missing bulb. | 1. Test and replace the courtesy lamp bulb as required. |
| | 2. Ineffective lamp switch. | 2. Test and replace a faulty map/reading lamp switch, cargo lamp switch, or sunvisor (vanity lamp switch) as required. |
| | 3. Ineffective ground circuit. | 3. Test and repair the open courtesy lamp driver circuit as required. |
| | 4. Ineffective ground circuit (independently switched lamps only). | 4. Test and repair the open courtesy lamp load shed circuit as required. |
| | 5. Ineffective feed circuit. | 5. Test and repair the open feed circuit as required. |

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| ALL LAMPS IN THE COURTESY LAMP CIRCUIT DO NOT ILLUMINATE | 1. Ineffective or missing fuse. | 1. Test and replace the fuse as required. |

# AJAR SWITCH

## DESCRIPTION

### DOOR

This vehicle has four door ajar switches, one for each door. Each switch is concealed within and integral to its respective door latch unit. The switches are momentary leaf contact-type units that are actuated by the mechanisms internal to the door latch. A short pigtail wire and connector on each door latch connects the door ajar switch to the vehicle electrical system through its respective door wire harness. The door ajar switches cannot be adjusted or repaired and, if ineffective or damaged, the door latch unit must be replaced. (Refer to 23 - BODY/DOOR - FRONT/LATCH - REMOVAL) or (Refer to 23 - BODY/DOOR - REAR/LATCH - REMOVAL).

### FLIP-UP GLASS

A flip-up glass ajar switch is standard equipment in this vehicle. This switch is concealed within and integral to the flip-up glass latch. The switch is a momentary leaf contact-type unit that is actuated by the flip-up glass latch mechanism. An integral dedicated connector receptacle on the flip-up glass latch connects the flip-up glass ajar switch to the vehicle electrical system through the tailgate wire harness. The flip-up glass ajar switch cannot be adjusted or repaired and, if ineffective or damaged, the latch unit must be replaced. (Refer to 23 - BODY/SWING GATE/FLIP-UP GLASS LATCH - REMOVAL).

### TAILGATE

A tailgate ajar switch is standard equipment in this vehicle. This switch is concealed within and integral to the tailgate latch unit. The switch is a momentary leaf contact-type unit that is actuated by the mechanism internal to the tailgate latch. A pigtail wire harness and connector on the tailgate latch connects the tailgate ajar switch to the vehicle electrical system through the tailgate wire harness. The tailgate ajar switch cannot be adjusted or repaired and, if ineffective or damaged, the latch unit must be replaced. (Refer to 23 - BODY/SWING GATE/LATCH - REMOVAL).

## OPERATION

### DOOR

The door ajar switches are actuated by the mechanisms internal to the door latch. When a door is closed and properly latched, its door ajar switch is an open circuit. When a door is open or only partially latched, the door ajar switch is a closed circuit.

The door ajar switches are hard wired between a body ground and the Body Control Module (BCM). The front door ajar switches are connected to the BCM through a driver or passenger door ajar switch sense circuit, while the rear door ajar switches are connected to the BCM through a left or right rear door ajar switch sense circuit. The BCM reads the door ajar switch status through an internal pull-up, then sends electronic door ajar switch status messages to the ElectroMechanical Instrument Cluster (EMIC) over the Programmable Communications Interface (PCI) data bus and uses these inputs to control many electronic functions and features of the vehicle.

The door ajar switches can be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the BCM, the EMIC, the PCI data bus, or the electronic messaging used to convey door ajar switch status to other modules in the vehicle. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the PCI data bus, and both the hard wired and electronic message inputs and outputs affected by the door ajar switch inputs requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

### FLIP-UP GLASS

The flip-up glass ajar switch is actuated by the flip-up glass latch mechanism. When the flip-up glass is closed and properly latched, the flip-up glass ajar switch is an open circuit. When the flip-up glass is open or only partially latched, the flip-up glass ajar switch is a closed circuit. The flip-up glass ajar switch is hard wired between a body ground and both the Body Control Module (BCM) and the rear wiper motor.

The output of the switch is connected to the BCM and rear wiper motor through a flip-up glass ajar switch sense circuit. The BCM reads the flip-up glass ajar switch status through an internal pull-up, then sends electronic flip-up glass ajar switch status messages to the ElectroMechanical Instrument Cluster (EMIC) over the Programmable Communications Interface (PCI) data bus and uses this input to control many electronic functions and features of the vehicle. The rear wiper motor uses this input to restrict rear wiper operation when the flip-up glass is ajar.

The flip-up glass ajar switch can be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the BCM, the EMIC, the PCI data bus, or the electronic messaging used to convey flip-up glass ajar switch status to other modules in the vehicle. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the PCI data bus, and both the hard wired and electronic message inputs and outputs affected by the flip-up glass ajar switch inputs requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## TAILGATE

The tailgate switch is actuated by the mechanism internal to the tailgate latch. When the tailgate is closed and properly latched, the tailgate ajar switch is an open circuit. When the tailgate is open or only partially latched, the tailgate ajar switch is a closed circuit.

The tailgate ajar switch is hard wired between a body ground and the Body Control Module (BCM). The output of the switch is connected to the BCM through a tailgate ajar switch sense circuit. The BCM reads the tailgate ajar switch status through an internal pull-up, then sends electronic tailgate ajar switch status messages to the ElectroMechanical Instrument Cluster (EMIC) over the Programmable Communications Interface (PCI) data bus and uses this input to control many electronic functions and features of the vehicle.

The tailgate ajar switch can be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the BCM, the EMIC, the PCI data bus, or the electronic messaging used to convey tailgate ajar switch status to other modules in the vehicle. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the PCI data bus, and both the hard wired and electronic message inputs and outputs affected by the tailgate ajar switch input requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

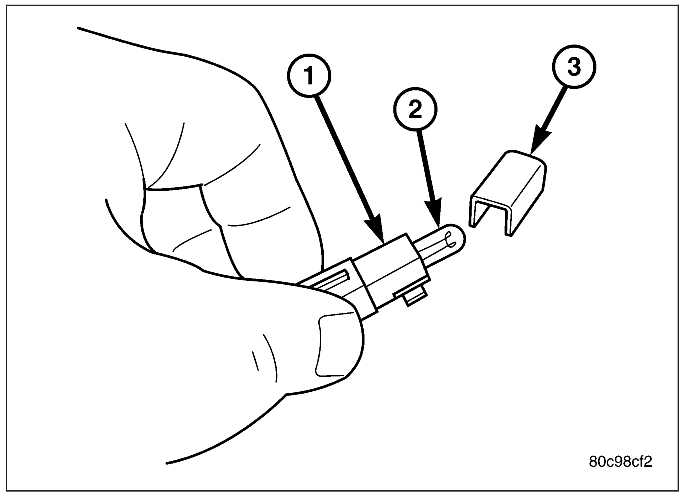
# ASH RECEIVER LAMP

## REMOVAL

### BULB

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

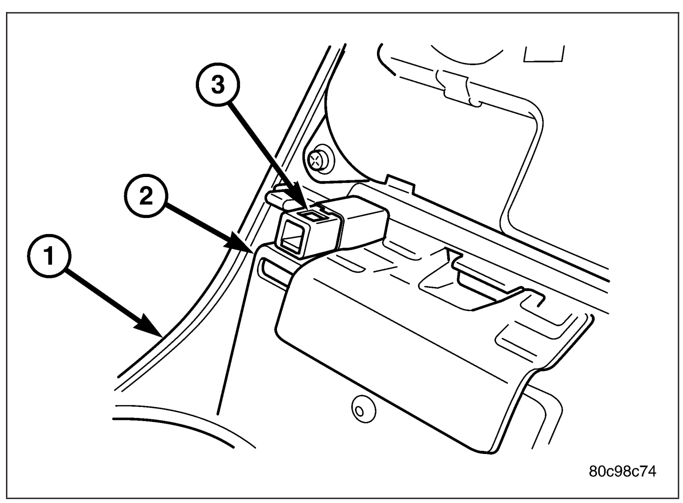
1. Disconnect and isolate the battery negative cable.
2. Remove the ash receiver lamp unit from the top of the ash receiver housing (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/ASH RECEIVER LAMP UNIT - REMOVAL).
3. Carefully disengage the ash receiver lamp hood (3) from the integral snap features on each side of the lamp socket (1) and remove the hood.
4. Pull the bulb (2) straight out of the socket.



### LAMP

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel (1) from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. While pulling the lamp unit (3) away from the top of the ash receiver housing (2), carefully release the four integral latches that secure the lamp to the mounting hole in the top of the housing.
4. Remove the lamp from the top of the ash receiver housing.



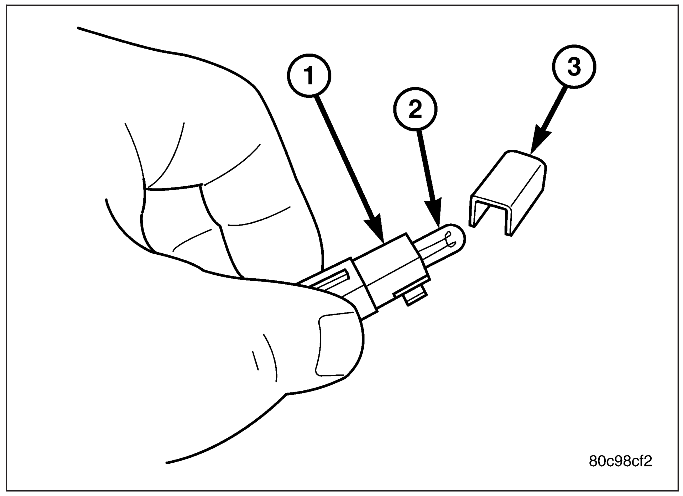
# INSTALLATION

## BULB

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

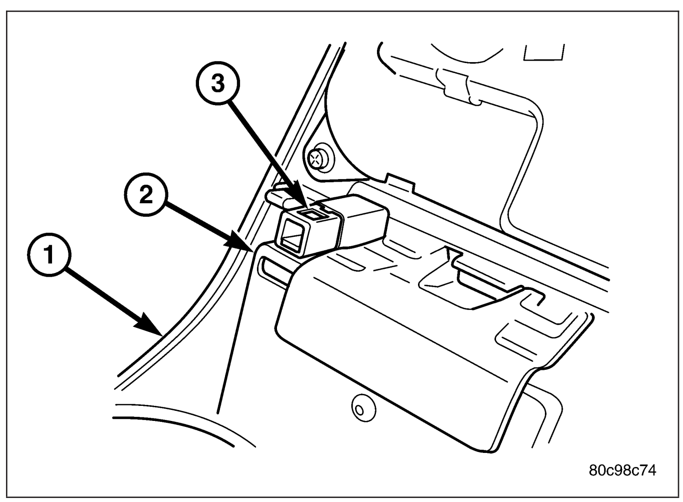
1. Align the base of the ash receiver lamp bulb (2) with the lamp socket (1).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Carefully slide the hood (3) onto the lamp socket until it is fully engaged with the integral snap features on each side of the socket.
4. Reinstall the lamp onto the top of the ash receiver housing (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/ASH RECEIVER LAMP UNIT - INSTALLATION).
5. Reconnect the battery negative cable.



## LAMP

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Align the four integral latches of the lamp unit (3) to the lamp mounting hole on the top of the ash receiver housing (2).
2. Using hand pressure, press firmly and evenly on the lamp until each of the four integral latches snap into place in the lamp mounting hole.
3. Reinstall the center bezel (1) onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Reconnect the battery negative cable.

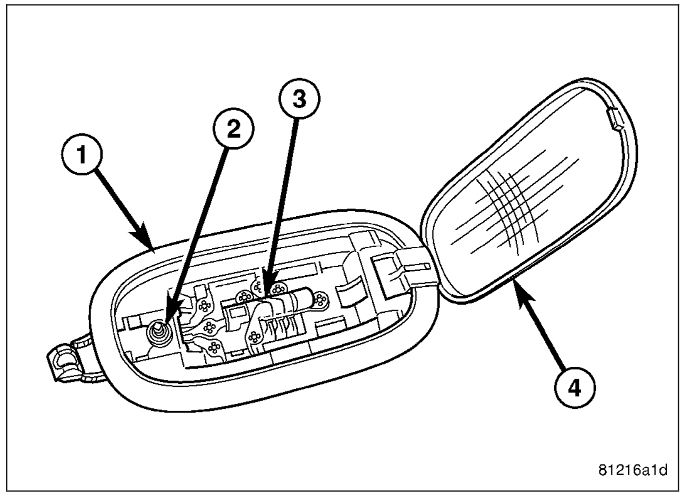


# CARGO LAMP

## REMOVAL

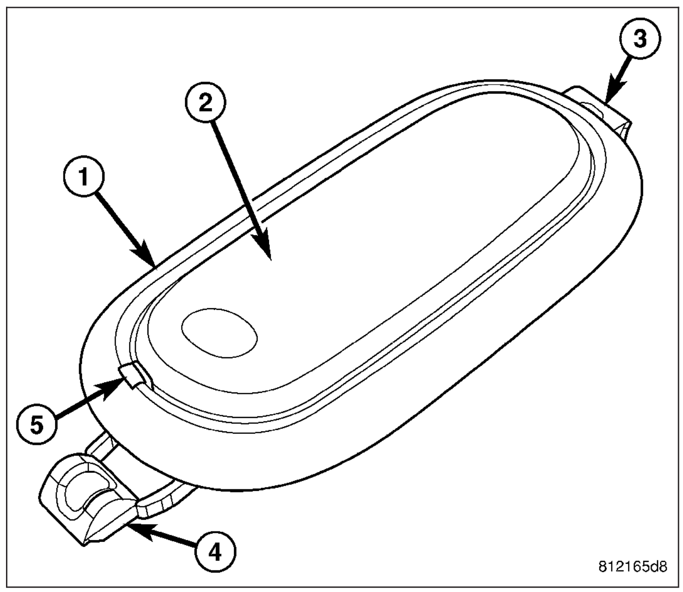
### BULB

1. Disconnect and isolate the battery negative cable.
2. Insert the tip of a small flat-bladed screwdriver into the notch on one side of the cargo lamp between the lens (4) and the lamp housing (1).
3. Gently pry the notched edge of the lens downward until it unsnaps from the housing.
4. Swing the notched end of the lens downward far enough to access the bulb (3).
5. Carefully unsnap the bulb from the two bulb holders within the cargo lamp housing.



### LAMP

1. Disconnect and isolate the battery negative cable.
2. Insert the tip of a small flat bladed screwdriver into the notch (5) between the lens (2) and the housing (1) on one side of the cargo lamp unit.
3. Gently pry the end of the lens outward until it unsnaps from the housing.
4. Swing the lens outward until it is perpendicular to the housing.
5. Pull the lens hinge/retainer (3) end of the housing outward slightly from the headliner, then slide the exposed end of the housing away from the mounting hole far enough to disengage the fixed retainer (4) on the notched end from the headliner.
6. Pull the lamp away from the headliner mounting hole far enough to access and disconnect the wire harness connector from the back of the lamp.
7. Remove the lamp from the vehicle.

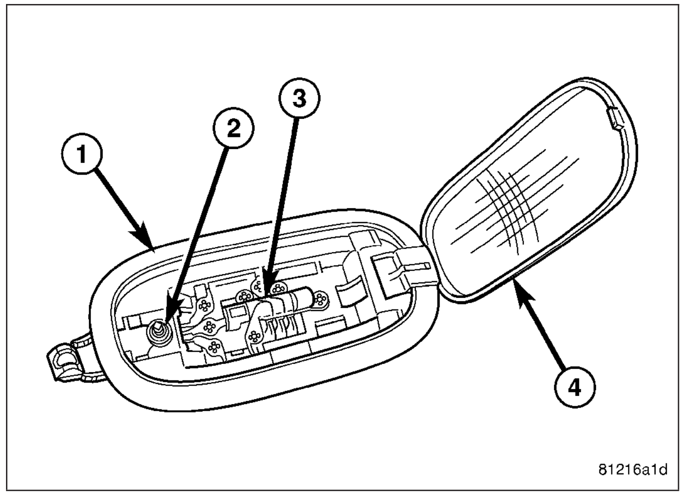


## INSTALLATION

### BULB

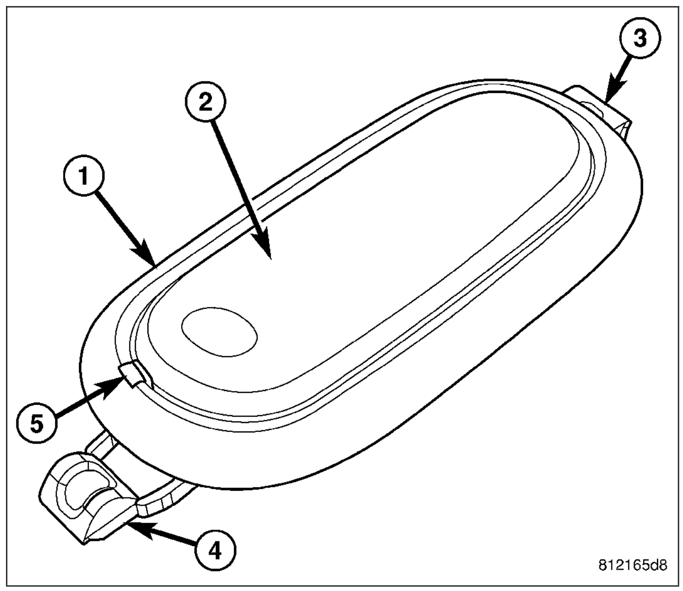
**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

1. Align the ends of the bulb (3) with the two bulb holders within the cargo lamp housing (1).
2. Carefully press the bulb firmly and evenly into the bulb holders until it snaps into place.
3. Swing the notched end of the lens (4) up into position against the housing, then press upward on the lens firmly and evenly until it snaps into the housing.
4. Reconnect the battery negative cable.



## LAMP

1. Position the dome lamp unit (1) to the mounting hole in the headliner.
2. Reconnect the wire harness connector to the connector on the back of the lamp.
3. Insert the fixed retainer (4) on the notched end of the lamp housing up into one side of the mounting hole in the headliner.
4. Slide the notched end of the housing into the mounting hole far enough to engage the lens hinge/retainer (3) into the opposite side of the hole in the headliner.
5. Gently and evenly press the lens hinge/retainer end of the lamp into the mounting hole until the bezel of the lamp housing is flush with the headliner.
6. Swing the notched end of the lamp lens (2) into position against the lamp housing, then press on the lens firmly and evenly until it snaps into the housing.
7. Reconnect the battery negative cable.



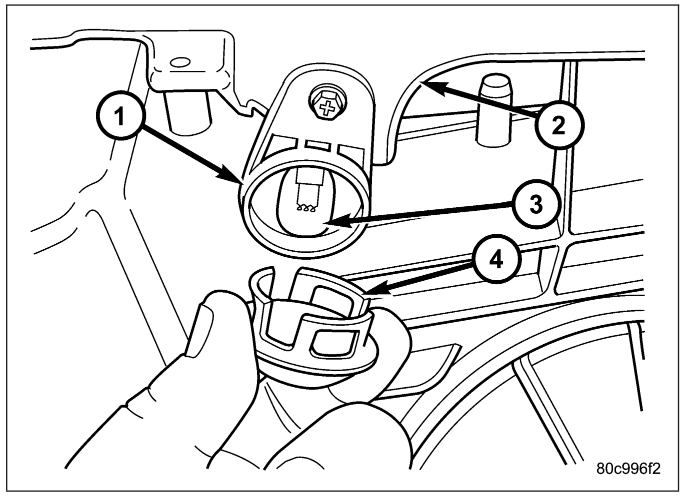
# COURTESY LAMP

## REMOVAL

### BULB

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

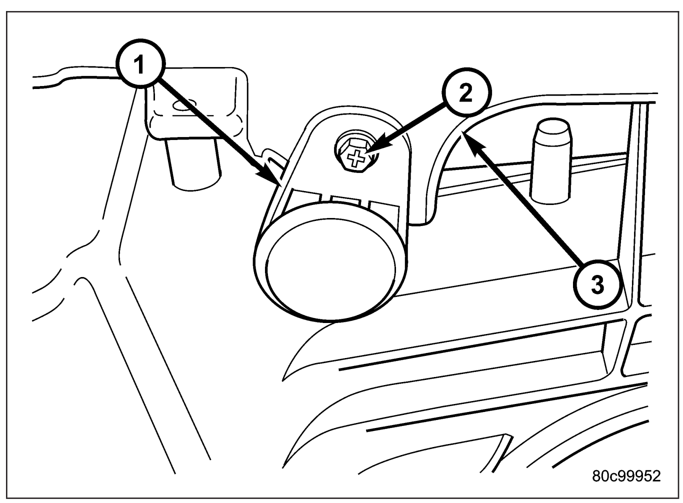
1. Disconnect and isolate the battery negative cable.
2. Support the courtesy lamp unit housing (1) with one hand while firmly grasping the flange on the outer circumference of the lens (4) with the other hand, then pull the lens straight down to unsnap it from the housing.
3. Pull the bulb (3) straight out of the courtesy lamp socket.



### LAMP

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the battery negative cable.
2. Remove the screw (2) that secures the integral mounting tab of the courtesy lamp unit (1) to the lower instrument panel (3).
3. Pull the courtesy lamp down from the lower instrument panel far enough to access and disconnect the instrument panel wire harness connector from the back of the courtesy lamp.
4. Remove the courtesy lamp from under the instrument panel.



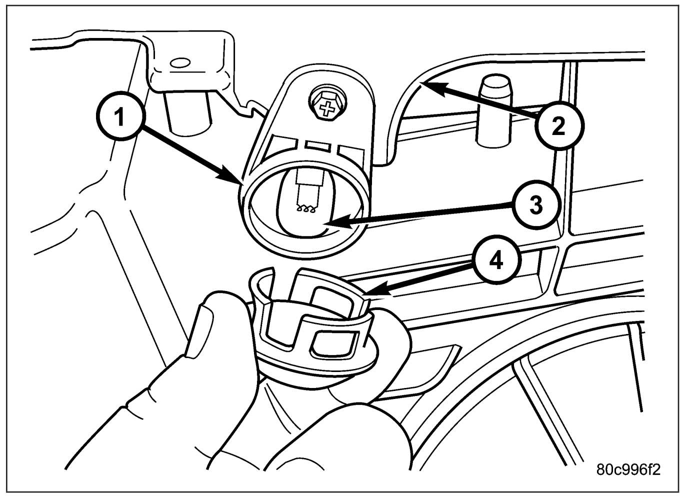
## INSTALLATION

## BULB

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

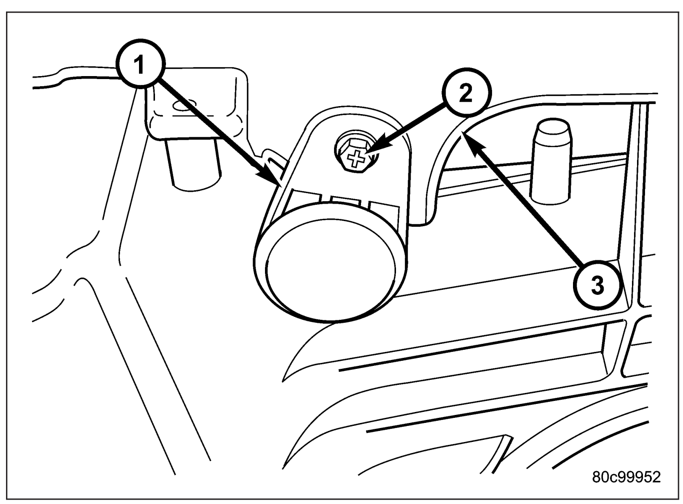
1. Align the base of the bulb (3) with the courtesy lamp socket.
2. Push the bulb straight into the lamp socket until the base is firmly seated.
3. Align the lens (4) with the courtesy lamp unit housing (1).
4. Support the lamp housing with one hand while firmly and evenly pushing the lens into the housing with the other hand, until the lens snaps into place.
5. Reconnect the battery negative cable.



## LAMP

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Position the courtesy lamp unit (1) under the instrument panel.
2. Reconnect the instrument panel wire harness connector to the back of the courtesy lamp.
3. Position the courtesy lamp to the lower instrument panel (3).
4. Install and tighten the screw (2) that secures the integral mounting tab of the courtesy lamp to the lower instrument panel. Tighten the screw to 2 N·m (17 in. lbs.).
5. Reconnect the negative battery cable.



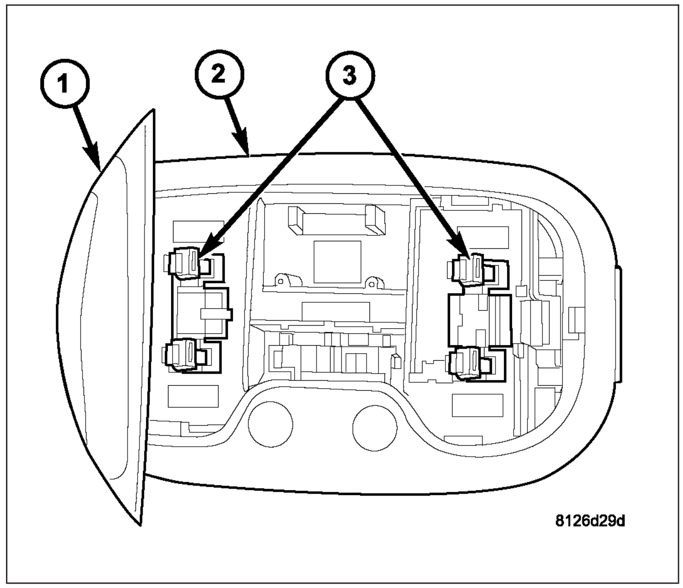
# DOME LAMP

## REMOVAL

### BULB - FRONT

**NOTE: Two different front dome lamps are available, one for vehicles without a sunroof and a second for vehicles with a sunroof. The only differences between these lamps are that the one for sunroof applications has a mount for a power sunroof switch within the lamp housing, an opening in the center of the lamp lens through which the sunroof switch rocker protrudes, and an opening on the back of the lamp housing through which the sunroof switch connector receptacle protrudes. The lamp and bulb service procedures are the same for either lamp.**

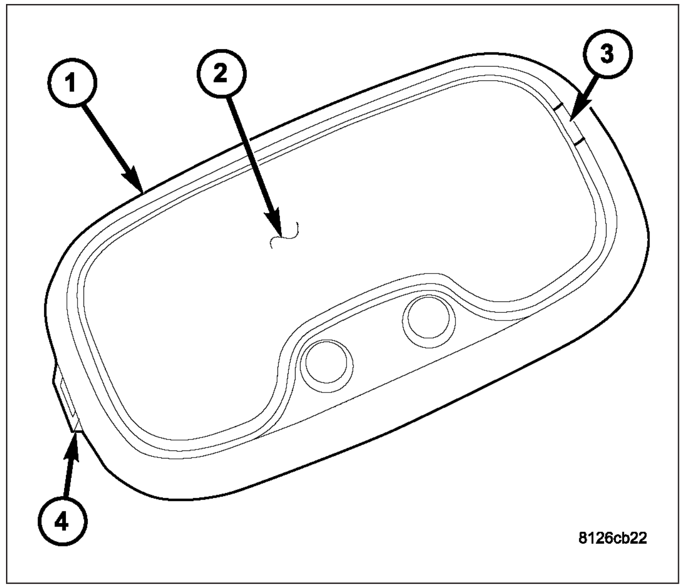
1. Disconnect and isolate the battery negative cable.
2. Remove the front dome lamp from the headliner. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - REMOVAL/FRONT DOME LAMP).
3. With the lamp lens (1) in the open position, carefully unsnap the bulb (3) from the two bulb holders within the front dome lamp housing (2).



### LAMP - FRONT

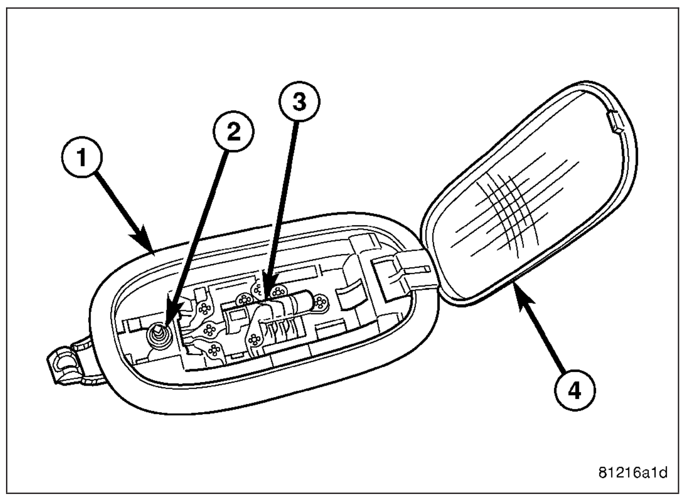
**NOTE: Two different front dome lamps are available, one for vehicles without a sunroof and a second for vehicles with a sunroof. The only differences between these lamps are that the one for sunroof applications has a mount for a power sunroof switch within the lamp housing, an opening in the center of the lamp lens through which the sunroof switch rocker protrudes, and an opening on the back of the lamp housing through which the sunroof switch connector receptacle protrudes. The lamp and bulb service procedures are the same for either lamp.**

1. Disconnect and isolate the battery negative cable.
2. Insert the tip of a small flat bladed screwdriver into the notch (3) between the lens (2) and the housing (1) on one side of the dome lamp unit.
3. Gently pry the end of the lens downward until it unsnaps from the housing.
4. Swing the lens downward until it is perpendicular to the housing.
5. Pull the lens hinge/retainer (4) end of the housing downward slightly from the headliner, then slide the lowered end of the housing away from the mounting hole far enough to disengage the fixed retainer on the notched end from the headliner.
6. Pull the lamp away from the headliner mounting hole far enough to disconnect the wire harness connector from the back of the lamp.
7. If the vehicle is equipped with an optional power sunroof, disconnect the wire harness connector from the sunroof switch connector receptacle on the back of the lamp.
8. Remove the lamp from the vehicle.



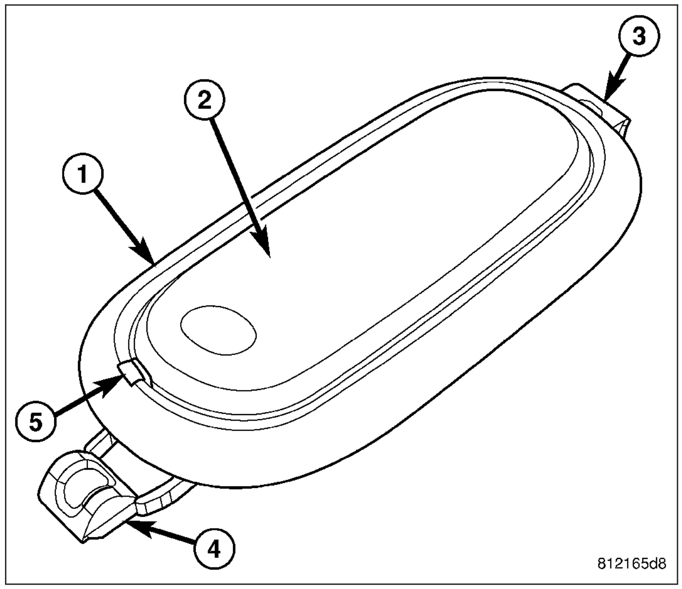
## BULB - REAR

1. Disconnect and isolate the battery negative cable.
2. Insert the tip of a small flat-bladed screwdriver into the notch on one side of the rear dome lamp between the lens (4) and the lamp housing (1).
3. Gently pry the notched edge of the lens downward until it unsnaps from the housing.
4. Swing the notched end of the lens downward far enough to access the bulb (3).
5. Carefully unsnap the bulb from the two bulb holders within the rear dome lamp housing.



## LAMP - REAR

1. Disconnect and isolate the battery negative cable.
2. Insert the tip of a small flat bladed screwdriver into the notch (5) between the lens (2) and the housing (1) on one side of the rear dome lamp unit.
3. Gently pry the end of the lens downward until it unsnaps from the housing.
4. Swing the lens downward until it is perpendicular to the housing.
5. Pull the lens hinge/retainer (3) end of the housing downward slightly from the headliner, then slide the exposed end of the housing away from the mounting hole far enough to disengage the fixed retainer (4) on the notched end from the headliner.
6. Pull the lamp away from the headliner mounting hole far enough to access and disconnect the wire harness connector from the back of the lamp.
7. Remove the lamp from the vehicle.



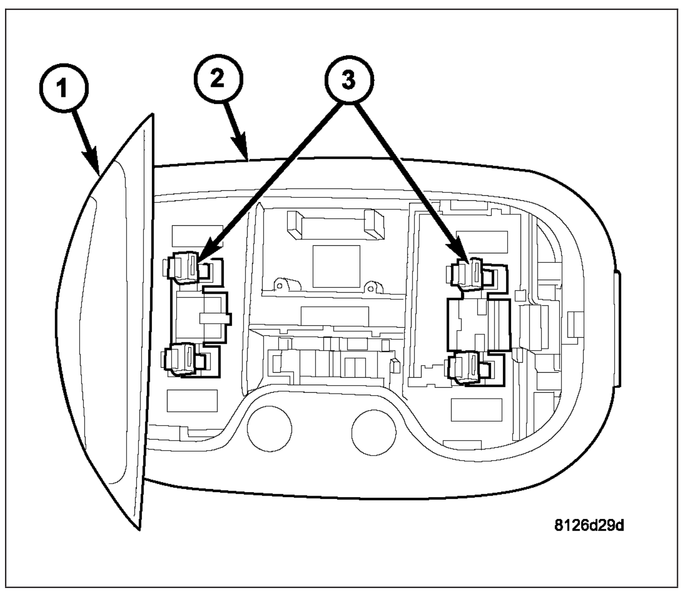
## INSTALLATION

## BULB - FRONT

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**NOTE: Two different front dome lamps are available, one for vehicles without a sunroof and a second for vehicles with a sunroof. The only differences between these lamps are that the one for sunroof applications has a mount for a power sunroof switch within the lamp housing, an opening in the center of the lamp lens through which the sunroof switch rocker protrudes, and an opening on the back of the lamp housing through which the sunroof switch connector receptacle protrudes. The lamp and bulb service procedures are the same for either lamp.**

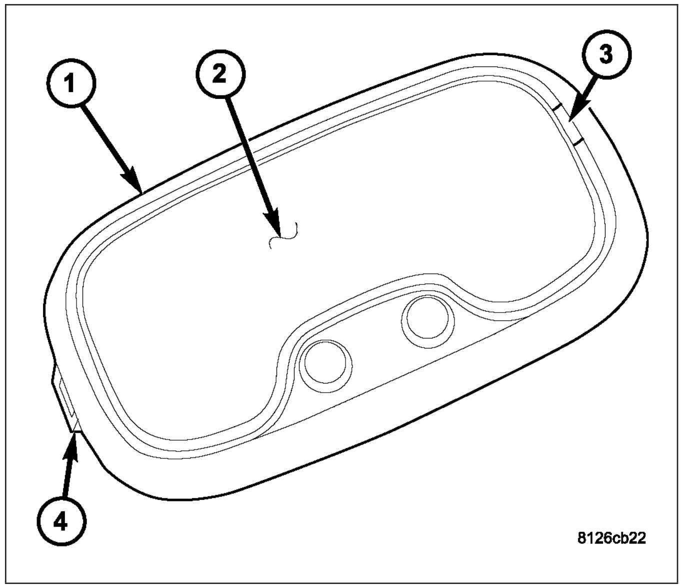
1. With the dome lamp lens (1) in the open position, align the ends of the bulb (3) with the two bulb holders within the front dome lamp housing (2).
2. Carefully press the bulb firmly and evenly into the bulb holders until it snaps into place.
3. Reinstall the lamp into the headliner. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/ DOME LAMP - INSTALLATION/FRONT DOME LAMP).
4. Reconnect the battery negative cable.



## LAMP - FRONT

**NOTE: Two different front dome lamps are available, one for vehicles without a sunroof and a second for vehicles with a sunroof. The only differences between these lamps are that the one for sunroof applications has a mount for a power sunroof switch within the lamp housing, an opening in the center of the lamp lens through which the sunroof switch rocker protrudes, and an opening on the back of the lamp housing through which the sunroof switch connector receptacle protrudes. The lamp and bulb service procedures are the same for either lamp.**

1. Position the dome lamp unit (1) to the mounting hole in the headliner.
2. Reconnect the wire harness connector to the connector on the back of the lamp.
3. If the vehicle is equipped with an optional power sunroof, reconnect the wire harness connector to the sunroof switch connector receptacle on the back of the lamp.
4. Insert the fixed retainer on the notched end of the lamp housing up into one side of the mounting hole in the headliner.
5. Slide the notched end of the housing into the mounting hole far enough to engage the lens hinge/retainer (4) into the opposite side of the hole in the headliner.
6. Gently and evenly press the lens hinge/retainer end of the lamp upward into the mounting hole until the bezel of the lamp housing is flush with the headliner.

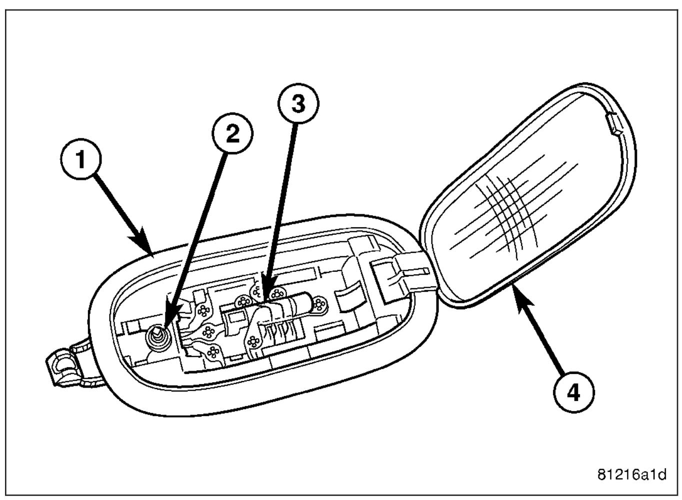


7. Swing the notched end of the lamp lens (2) up into position against the lamp housing, then press upward on the lens firmly and evenly until it snaps into the housing.
8. Reconnect the battery negative cable.

## BULB - REAR

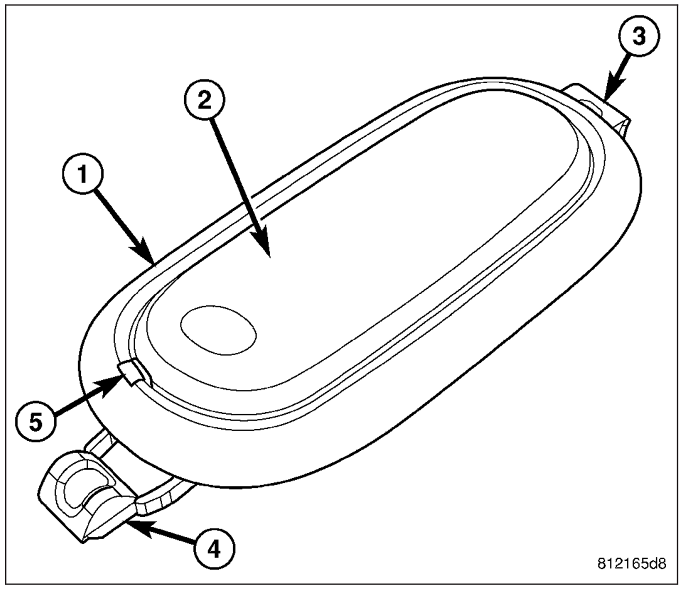
**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

1. Align the ends of the bulb (3) with the two bulb holders within the rear dome lamp housing (1).
2. Carefully press the bulb firmly and evenly into the bulb holders until it snaps into place.
3. Swing the notched end of the lens (4) up into position against the housing, then press upward on the lens firmly and evenly until it snaps into the housing.
4. Reconnect the battery negative cable.



## LAMP - REAR

1. Position the rear dome lamp unit (1) to the mounting hole in the headliner.
2. Reconnect the wire harness connector to the connector on the back of the lamp.
3. Insert the fixed retainer (4) on the notched end of the lamp housing up into one side of the mounting hole in the headliner.
4. Slide the notched end of the housing into the mounting hole far enough to engage the lens hinge/retainer (3) into the opposite side of the hole in the headliner.
5. Gently and evenly press the lens hinge/retainer end of the lamp into the mounting hole until the bezel of the lamp housing is flush with the headliner.
6. Swing the notched end of the lamp lens (2) into position against the lamp housing, then press on the lens firmly and evenly until it snaps into the housing.
7. Reconnect the battery negative cable.



# ILLUMINATION LAMP

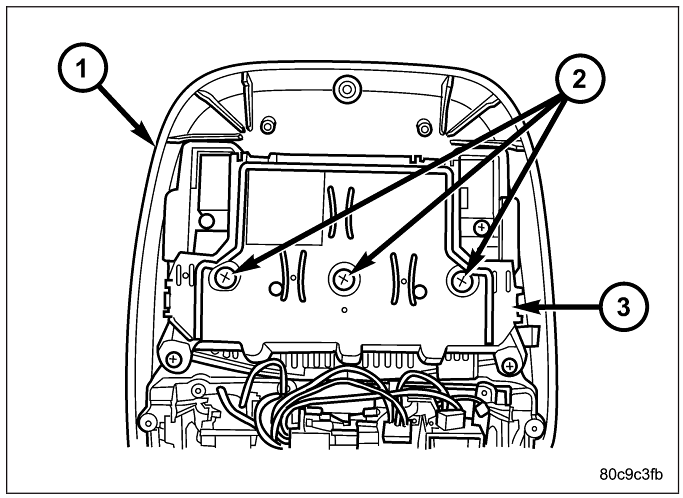
## REMOVAL

## BULB - CMTC CONTROL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The Compass Mini-Trip Computer (CMTC) in the overhead console includes either two or three incandescent illumination bulb and bulb holder units. Three bulbs are used only on vehicles that also feature the optional Universal Garage Door Opener (UGDO).**

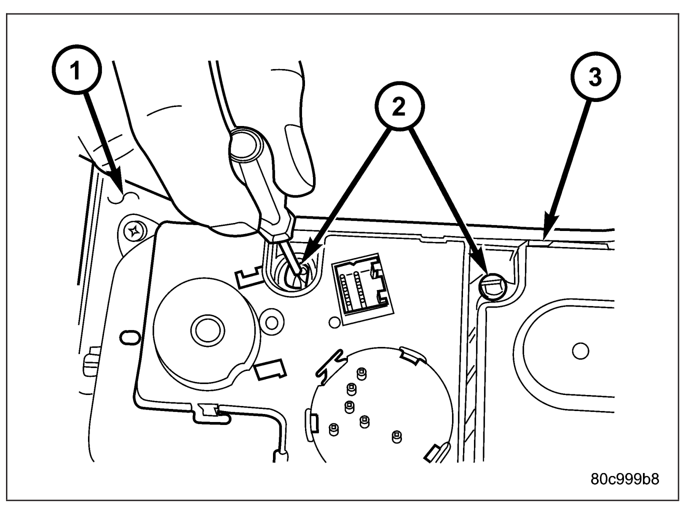
1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console (1) from the headliner. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
3. Use a small thin-bladed screwdriver to rotate the bulb holder (2) counterclockwise about 30 degrees to unlock it from the keyed opening in the Compass Mini-Trip Computer (CMTC) unit (3) circuit board.
4. Pull the bulb holder and bulb straight out of the circuit board.



## BULB - A/C-HEAT CONTROL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

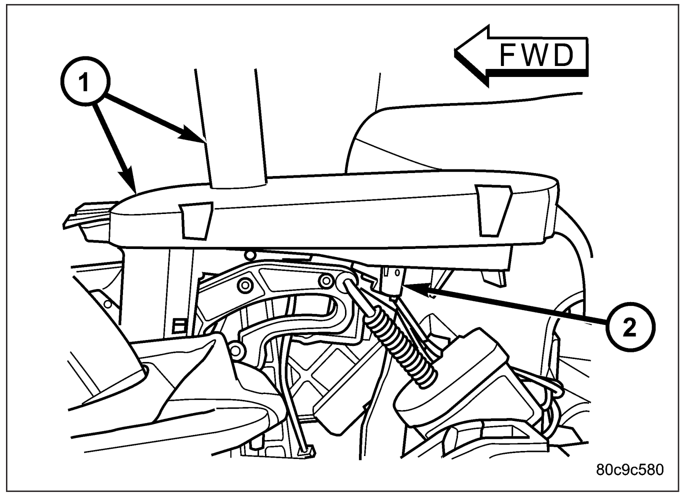
1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel (1) from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Use a small thin-bladed screwdriver to rotate the bulb holder (2) counterclockwise about 30 degrees to unlock it from the keyed opening on the A/C-heater control (3) circuit board.
4. Pull the bulb holder and bulb straight out of the circuit board.



## BULB - TRANSMISSION RANGE INDICATOR

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the battery negative cable.
2. Remove the center console from the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
3. From the left side of the vehicle, reach between the transmission range indicator (1) and the floor panel transmission tunnel to access the illumination lamp socket (2).
4. Rotate the socket counterclockwise about 30 degrees to unlock it from the bottom of the range indicator.
5. Pull the socket and bulb straight out of the keyed opening in the range indicator.
6. Pull the bulb straight out of the socket.



## INSTALLATION

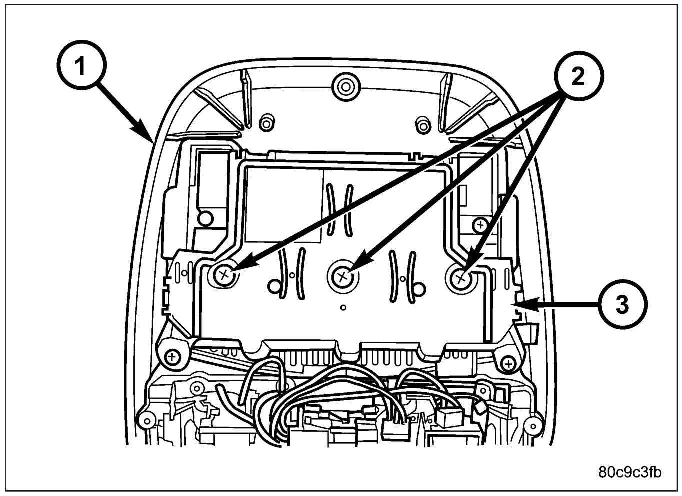
## BULB - CMTC CONTROL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**NOTE: The Compass Mini-Trip Computer (CMTC) in the overhead console includes either two or three incandescent illumination bulb and bulb holder units. Three bulbs are used only on vehicles that also feature the optional Universal Garage Door Opener (UGDO).**

1. Align the bulb holder and bulb (2) with the keyed opening in the circuit board of the Compass Mini-Trip Computer (CMTC) (3).
2. Insert the bulb holder and bulb straight into the circuit board until the bulb holder is firmly seated.
3. Using a small thin-bladed screwdriver, rotate the bulb holder clockwise about 30 degrees on the circuit board to lock it into place.
4. Reinstall the overhead console (1) onto the headliner. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
5. Reconnect the battery negative cable.

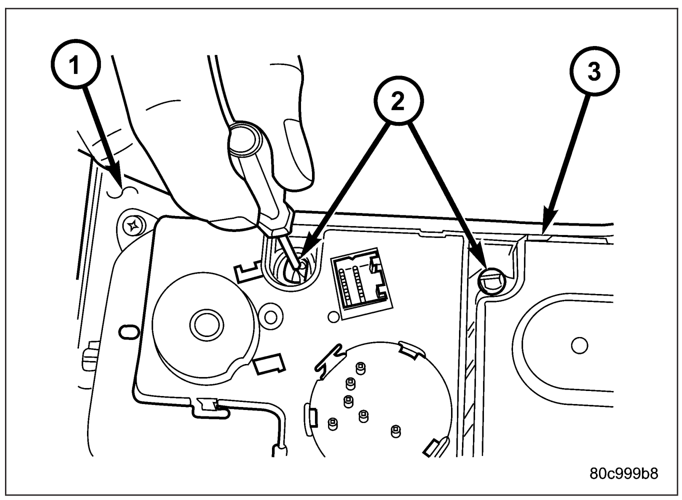


## BULB - A/C-HEAT CONTROL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

1. Align the bulb holder and bulb (2) with the keyed opening in the circuit board of the heater-A/C control (3).
2. Insert the bulb holder and bulb straight into the circuit board until the bulb holder is firmly seated.
3. Using a small thin-bladed screwdriver, rotate the bulb holder clockwise about 30 degrees on the circuit board to lock it into place.
4. Reinstall the center bezel (1) onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
5. Reconnect the battery negative cable.

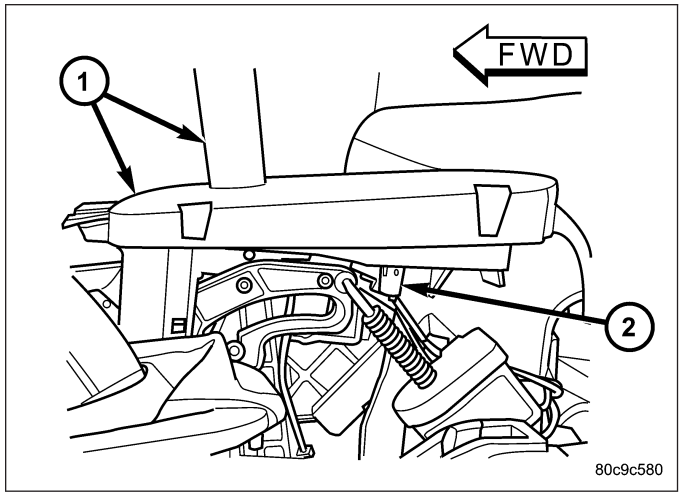


## BULB - TRANSMISSION RANGE INDICATOR

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

1. Align the base of the bulb with the transmission range indicator illumination lamp socket (2).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the lamp socket and bulb with the keyed opening on the bottom of the indicator (1).
4. Insert the socket and bulb straight into the bottom of the indicator until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the center console onto the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).
7. Reconnect the battery negative cable.

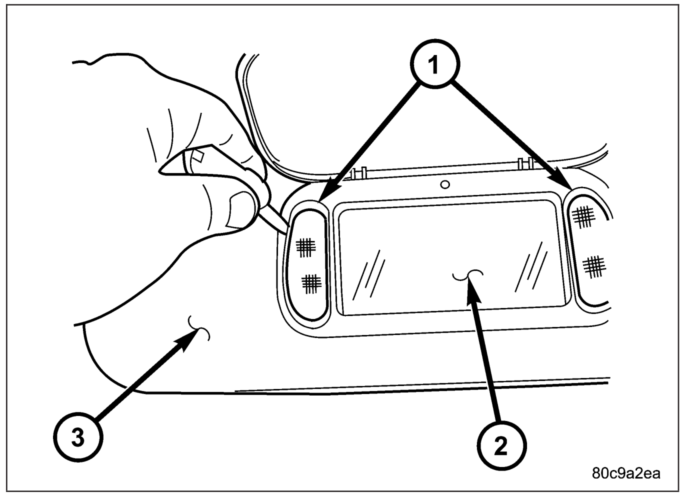


# VANITY LAMP

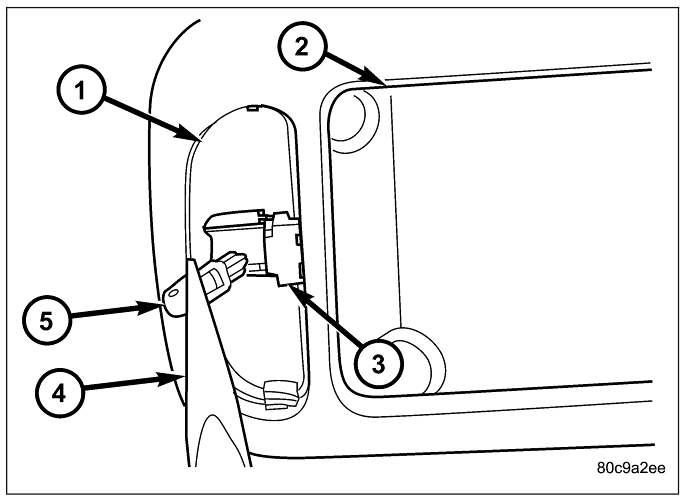
## REMOVAL - BULB

**NOTE: Vehicles equipped with optional vanity lamps have a mirror with a lamp that is integral to each sun visor. Each lamp is independently controlled by an integral switch that is automatically actuated by the mirror cover. The bulb types and service procedures are identical for both of these lamps.**

1. Disconnect and isolate the battery negative cable.
2. Insert a small thin-bladed tool on either side of the mirror (2) near the top or the bottom between the vanity lamp lens (1) and the sun visor (3) vanity lamp housing.
3. Carefully pry the lens outward until it unsnaps from the lamp housing.



4. Using small needle-nose pliers (4), carefully grasp the bulb (5) and pull the base out of the lamp socket (3).

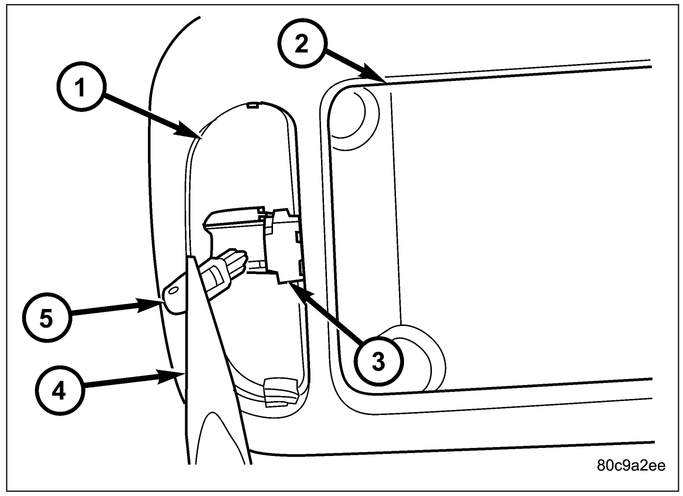


## INSTALLATION - BULB

**CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket and/or the lamp wiring.**

**NOTE: Vehicles equipped with optional vanity lamps have a mirror with a lamp that is integral to each sun visor. Each lamp is independently controlled by an integral switch that is automatically actuated by the mirror cover. The bulb types and service procedures are identical for both of these lamps.**

1. Using small needle-nose pliers (4), carefully grasp the vanity lamp bulb (5) and align the base of the bulb with the socket (3) in the lamp housing of the sun visor.
2. Push the bulb base straight into the socket until the base is fully seated.
3. Insert one tab on the top or the bottom of the lens into the appropriate slot at the top or the bottom of the lamp housing.
4. Flex the lens far enough to engage the loose tab into its slot in the lamp housing.
5. Reconnect the battery negative cable.



# MESSAGE SYSTEMS

## TABLE OF CONTENTS

## OVERHEAD CONSOLE - ELECTICAL DIAGNOSTICS

### TABLE OF CONTENTS

# OVERHEAD CONSOLE - ELECTICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## BUS MESSAGES MISSING

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| NO RESPONSE FROM EVIC |
| INTERMITTENT CONDITION |
| NO RESPONSE - PCI BUS - PCM |
| NO RESPONSE - PCI BUS - BCM |
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. EVIC SELF TEST RESULT

**NOTE: The EVIC self test can performed manually or by using the scan tool.**

Turn the ignition off.

Perform the EVIC self test.

Depress and hold the RESET and C/T (EVIC) buttons while turning the ignition on.

**Does the EVIC display ″PASSED SELF TEST″?**

**Yes** >> Go To 2

**No** >> Go To 4

### 2. NO RESPONSE - PCI BUS - PCM

Turn the ignition on.

With the scan tool, select Body Computer, System Tests, then PCM Monitor.

**Does the scan tool display ″PCM Active on the Bus″?**

**Yes** >> Go To 3

**No** >> Refer to COMMUNICATION for the related symptom(s).

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 3. NO RESPONSE - PCI BUS - BCM

Turn the ignition on.

With the scan tool, attempt to I/D or communicate with the BCM.

**Was the scan tool able to I/D or communicate with the BCM?**

**Yes** >> Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to COMMUNICATION for the related symptom(s).

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 4. NO RESPONSE - PCI BUS - EVIC

Turn the ignition off.

Perform the EVIC self test.

Press and hold the RESET and C/T buttons.

Turn the ignition on.

**Does the EVIC display ″BUS″?**

**Yes** >> Refer to symptom *NO RESPONSE FROM COMPASS in the Communication category.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## COMPASS TEST FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Compass inoperative.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

Turn the ignition off.

Depress and hold the RESET and C/T buttons while turning the ignition on.

**NOTE: This test may also be performed using the scan tool.**

**Does the EVIC or scan tool display ″FAIL″?**

**Yes** >> Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## EVIC INTERNAL FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The EVIC detects an internal failure.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

Turn the ignition off.

Depress and hold the RESET and C/T buttons while turning the ignition on.

**NOTE: This test may also be performed using the scan tool.**

**Does the EVIC or scan tool display ″FAIL″?**

**Yes** >> Replace the EVIC in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test Complete.

## NO BCM MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the ignition is turned on.
- **Set Condition:**
  No PCI Bus message received for 5 seconds after the ignition is turned on. No PCI Bus message is indicated by dashes in the VF display. When valid data is received, the data will replace the dashes.

| Possible Causes |
| --- |
| DTC PRESENT |
| NO RESPONSE - PCI BUS - BCM |
| ELECTRONIC VEHICLE INFORMATION CENTER |

### Diagnostic Test

#### 1. DTC PRESENT

With the scan tool, erase DTCs.

Cycle the ignition and wait approximately 1 minute.

With the scan tool, read DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

#### 2. ELECTRONIC VEHICLE INFORMATION CENTER

Turn the ignition on.

With the scan tool, attempt to I/D or communicate with the BCM.

**Was the scan tool able to communicate with the BCM?**

**Yes** >> Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to the COMMUNICATION category and perform the appropriate symptom.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## NO PCM MESSAGES RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the ignition is turned on.
- **Set Condition:**
  No PCI Bus message received for 5 seconds after the ignition is turned on. No PCI Bus message is indicated by dashes in the VF display. When valid data is received, the data will replace the dashes.

| Possible Causes |
|---|
| DTC PRESENT |
| NO RESPONSE - PCI BUS - PCM |
| ELECTRONIC VEHICLE INFORMATION CENTER |

### Diagnostic Test

#### 1. DTC PRESENT

With the scan tool, erase DTCs.

Cycle the ignition and wait approximately 1 minute.

With the scan tool, read DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins (TSB) that may apply. Visually inspect the related wiring harness and connector terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

#### 2. ELECTRONIC VEHICLE INFORMATION CENTER

Turn the ignition on.

With the scan tool, enter Body Computer, System Tests, then PCM Monitor.

**Does the scan tool display PCM Active on the Bus?**

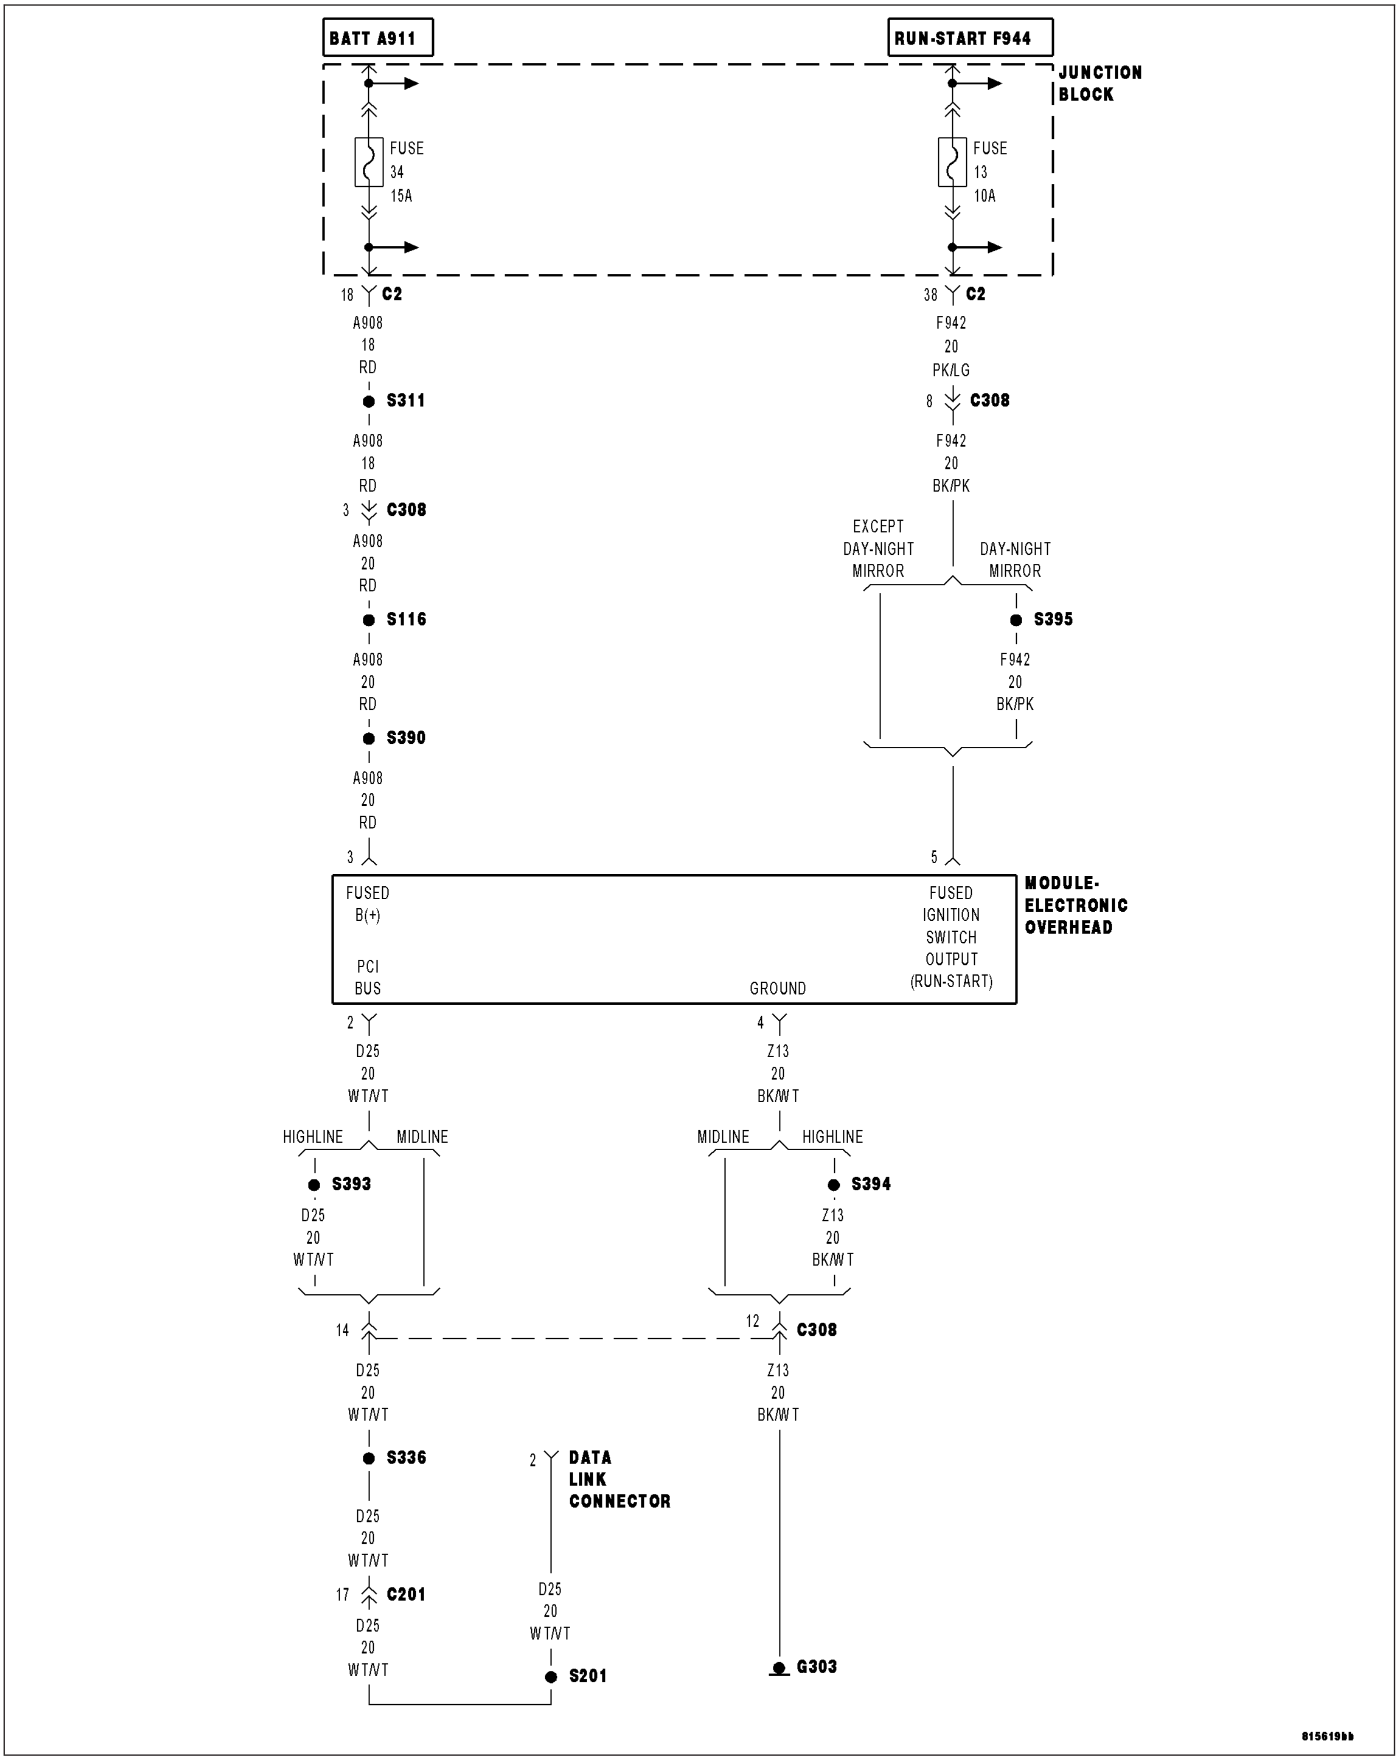
**Yes** >> Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Refer to the COMMUNICATION category and perform the appropriate symptom.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *EVIC INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (A908) FUSED B+ CIRCUIT OPEN |
| (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| (Z13) GROUND CIRCUIT OPEN |
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

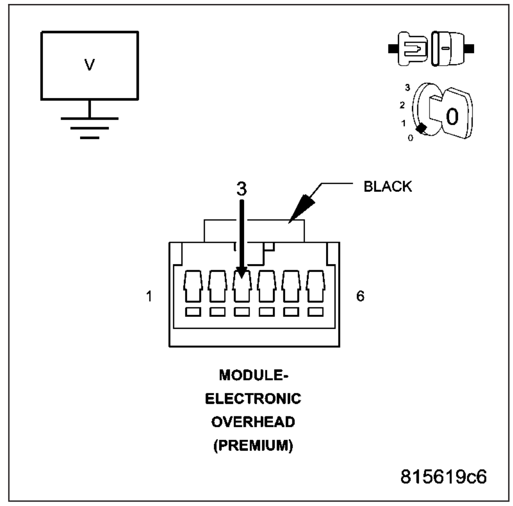
### 1. (A908) FUSED B+ CIRCUIT OPEN

**NOTE: Diagnose and repair any BCM, MIC, PCM, or COMMUNICATION DTCs before proceeding.**

Turn the ignition off.

Disconnect the Overhead Console harness connector.

Measure the voltage between the (A908) Fused B+ circuit and ground.



**Is the voltage above 10.5 volts?**

**Yes** >> Go To 2

**No** >> Repair the (A908) Fused B(+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

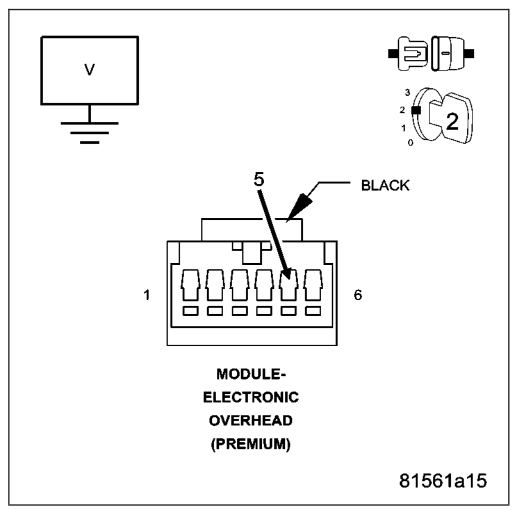
### 2. (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Overhead Console harness connector.

Turn the ignition on.

Measure the voltage between the (F942) Fused Ignition Switch Output circuit and ground.

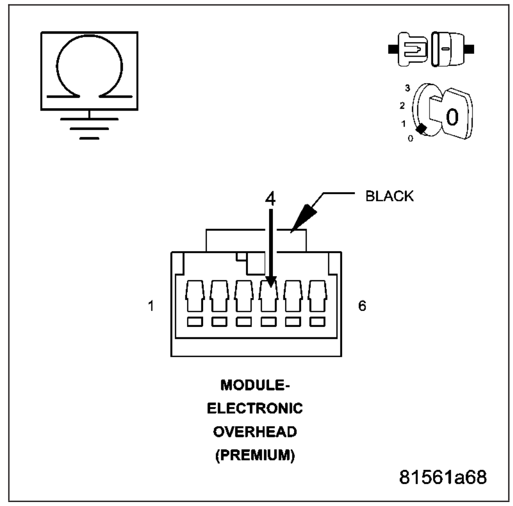


**Is the voltage below 10.5 volts?**

**Yes** >> Repair the (F942) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. (Z13) GROUND CIRCUIT OPEN



Turn the ignition off.

Disconnect the Overhead Console harness connector.

Measure the resistance between ground and the (Z13) EVIC ground circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (Z13) Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *ANY SWITCH ON EVIC INOPERATIVE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *AVERAGE MILES/GAL INOPERATIVE OR WRONG

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**NOTE: Average Miles/Gal is calculated in the BCM. The EVIC only displays this information.**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *BLANK SCREEN INOPERATIVE OR WRONG

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *EVIC FAILS TO RESPOND TO INSTRUMENT PANEL DIMMING

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *MILES TO EMPTY INOPERATIVE OR WRONG

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**NOTE: The Miles to Empty calculation is performed by the BCM. The EVIC only displays this information.**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *MILES TO SERVICE INOPERATIVE OR WRONG

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
| --- |
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *TIME ELAPSED INOPERATIVE OR WRONG

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *TIRE PSI SCREEN INOPERATIVE OR WRONG

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *TRIP MILES INOPERATIVE OR WRONG

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *UNIVERSAL GARAGE DOOR OPENER (UGDO) INOPERATIVE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ELECTRONIC VEHICLE INFORMATION CENTER |

## Diagnostic Test

### 1. ELECTRONIC VEHICLE INFORMATION CENTER

**NOTE: Diagnose and repair any BCM, MIC, WCM, PCM, or COMMUNICATION DTCs before proceeding**

**If all the possible causes above are operating correctly, view repair.**

**Repair**

Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *TEMP DISPLAY INOPERATIVE OR WRONG

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| AMBIENT TEMPERATURE SENSOR |
| EVIC INOPERATIVE |

## Diagnostic Test

### 1. AMBIENT TEMPERATURE SENSOR

**NOTE: Diagnose and repair any PCM, EVIC, or Communication DTCs before proceeding with this test.**

**NOTE: The Ambient Temperature Sensor is hardwired to the PCM. Ambient temperature information is transmitted to the EVIC via the PCI Bus.**

Turn the ignition off.

Disconnect the Ambient Temperature Sensor harness connector.

Measure the resistance of the Ambient Temperature Sensor using the following temperature/resistance values:

10°C (50°F) Sensor Resistance = 17.99 - 21.81 Kilohms

20°C (68°F) Sensor Resistance = 11.37 - 13.61 Kilohms

25°C (77°F) Sensor Resistance = 9.12 - 10.88 Kilohms

30°C (86°F) Sensor Resistance = 7.37 - 8.75 Kilohms

40°C (104°F) Sensor Resistance = 4.90 - 5.75 Kilohms

50°C (122°F) Sensor Resistance = 3.33 - 3.88 Kilohms

**Is the Ambient Temperature Sensor resistance measurement between the min/max specifications?**

**Yes** >> Go To 2

**No** >> Replace the Ambient Temperature Sensor. NOTE: After any repair for an Ambient Temperature Sensor problem, the vehicle must be driven over 5 kilometers (3 miles) above 40 km/h (25 MPH) to update the EVIC display.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. EVIC INOPERATIVE

Perform the EVIC self test.

Turn the ignition off.

Press and hold the C/T and Reset buttons.

Turn the ignition on.

**NOTE: The self test can also be performed using the scan tool.**

Observe the EVIC display at the conclusion of the self test.

**Does the EVIC display ″PASSED SELF TEST″?**

**Yes** >> Test Complete.

**No** >> Replace the EVIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

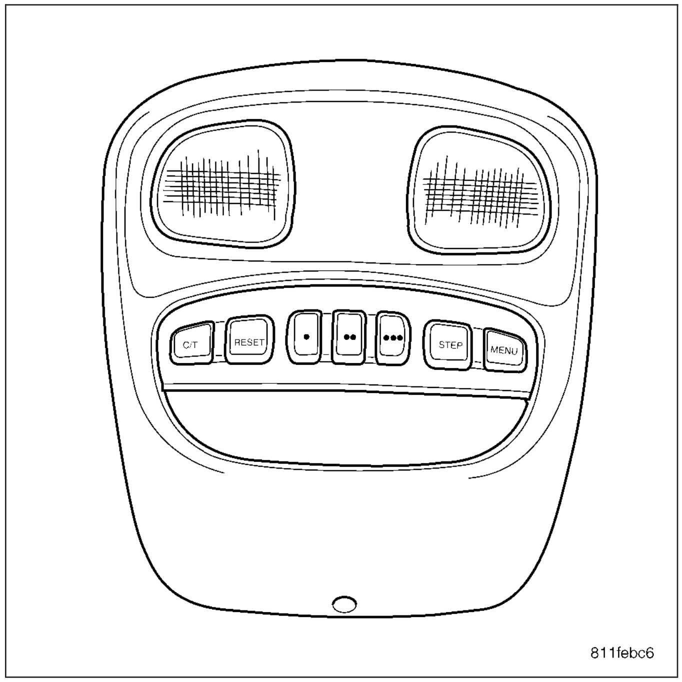
# OVERHEAD CONSOLE-SERVICE INFO

## TABLE OF CONTENTS

# OVERHEAD CONSOLE-SERVICE INFO

## DESCRIPTION

An overhead console is standard factory-installed equipment on this model. The overhead console includes an Electronic Vehicle Information Center Module. Some overhead consoles also contain a universal garage door transmitter. All overhead consoles are equipped with two reading and courtesy lamps. On vehicles equipped with a power sunroof, the sunroof switch is located between the two reading and courtesy lamps. The overhead console is mounted with one screw in the front and two snap clips in the rear. A molded plastic retainer bracket located above the headliner is used to provide secure overhead console attachment.



If any of the EVIC functions are faulty or damaged, the complete Electronic Overhead Module (EOM) must be replaced. Replaceable overhead console components include:

- The incandescent bulbs used for push button back-lighting
- Courtesy lamps
- Courtesy lamp lens
- EOM
- The overhead console housing

## OPERATION

Refer to the vehicle Owner's Manual for specific operation of overhead console and its systems.

## DIAGNOSIS AND TESTING - OVERHEAD CONSOLE

The most reliable, efficient, and accurate means to diagnose the overhead console or related system requires the use of a scan tool and the Service and Body Diagnostic Procedures Manuals. The scan tool can provide vital information to the technician trying to find a problem with a overhead console component. Diagnostic logic is built into the overhead console mounted module to help the person trying to locate the problem by the most efficient means possible. Anytime a problem is suspected, a scan tool must be obtained and used to retrieve any stored fault codes in the module. If diagnostic fault codes are present in the module, record them on a piece of paper immediately before proceeding any further. Then, use these fault codes to identify the problem by verifying the fault code. Example, If the module records "**TIRE PRESSURE N/A**" fault, locate the diagnostic procedure for this code in the appropriate Body Diagnostic Procedures Manual and follow the flow chart until the specific problem is located and resolved. Once the problem is thought to be corrected, erase the stored fault code using the scan tool and verify correct system operation. If the tire pressure monitoring system is functioning correctly, verify that there are no other stored codes in the module and return the vehicle to service.

If the fault code could not be verified, such as not finding anything wrong when following the diagnostic flow chart in the Body Diagnostic Procedures Manual. This is a good indication that an INTERMITTENT problem may be present. You must than attempt to find the intermittent problem, such as running a tire pressure monitoring system self test. Refer to the Tires/Wheels section for more information. Always, eliminate all other potential problems before attempting to replace the module.

### TESTING VOLTAGE AND GROUND SUPPLY TO OVERHEAD CONSOLE

1. Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL) Disconnect the overhead console electrical connector. Check the fused B(+) circuit in the overhead console electrical connector. If OK, go to Step 2. If not OK, repair the open circuit or component as required. Refer to the Wiring section for detailed schematics.

2. Check the IGN RUN B(+) circuit in the overhead console electrical connector. If OK, go to Step 3. If not OK, repair the open IGN RUN B(+) circuit as required.
3. Check the Ground circuit in the overhead console electrical connector. If OK, go to Step 4. If not OK, repair the open ground circuit as required.
4. If the tire pressure monitoring system is not operating properly, refer to the Tires/Wheels section for more information on the tire pressure monitoring system.

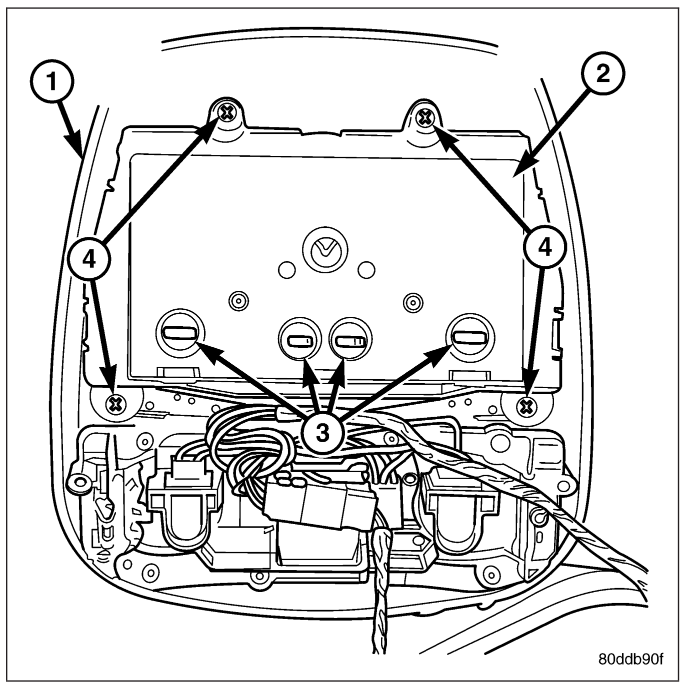
**NOTE: If the compass functions, but accuracy is suspect, it may be necessary to perform a variation adjustment. This procedure allows the compass unit to accommodate variations in the earth's magnetic field strength, based on geographic location. Refer to Compass Variation Adjustment in the Standard Procedures section of this group.**

**NOTE: If the compass reading displays dashes, and only "CAL" appears in the display, demagnetizing may be necessary to remove excessive residual magnetic fields from the vehicle. Refer to Compass Demagnetizing in the Standard Procedures section of this group.**

## STANDARD PROCEDURE

## STANDARD PROCEDURE - MODULE LAMP REPLACEMENT

1. Remove the overhead console (1), (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
2. Using a flat blade screwdriver twist out socket/lamp (3).
3. Replace lamp(s) as necessary.



## STANDARD PROCEDURE - COURTESY LAMP REPLACEMENT

1. Open hood, disconnect and isolate the negative battery cable.
2. Remove the overhead console from the headliner.
3. Remove the lamp and socket assembly from the overhead console.
4. Remove the lamp bulb by pulling it straight out of its socket.

## STANDARD PROCEDURE - COMPASS CALIBRATION

**CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not use magnetic tools when servicing the overhead console.**

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or out of calibration, perform the following calibration procedure. Also, new replacement Electronic Vehicle Information Center (EVIC) modules must have their compass calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

Calibrate the compass manually as follows:

1. Turn the ignition switch to the On position. If the compass/thermometer data is not currently being displayed, momentarily depress and release the C/T push button to reach the compass/thermometer display.
2. Depress the Reset push button and hold the button down until “CAL” appears in the display. This takes about ten seconds, and appears about five seconds after “VARIANCE = XX” is displayed.
3. Release the Reset push button.
4. Drive the vehicle on a level surface, away from large metal objects and power lines, through three or more complete circles at between five and eight kilometers-per-hour (three and five miles-per-hour) in not less than 48 seconds. The “CAL” message will disappear from the display to indicate that the compass is now calibrated.

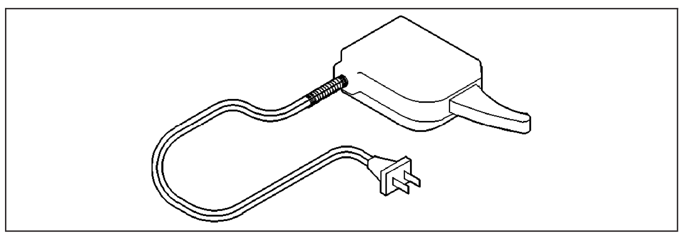
**NOTE: If the “CAL” message remains in the display, either there is excessive magnetism near the compass, or the unit is faulty. Repeat the calibration procedure one more time.**

**NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the calibration procedure in another location.**

## STANDARD PROCEDURE - COMPASS DEMAGNETIZING

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the overhead console forward mounting screw and the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

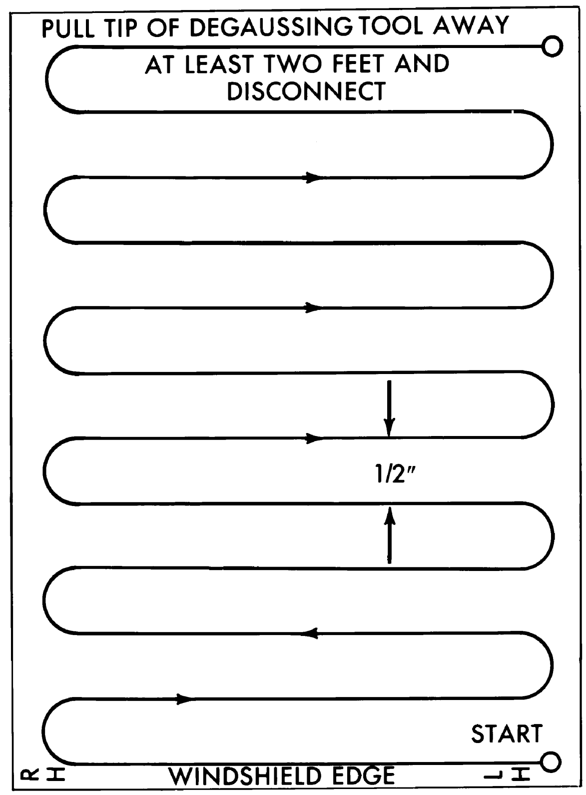
To demagnetize the roof panel and the overhead console forward mounting screw, proceed as follows:



***Degaussing Tool 6029***

1. Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.
2. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.
3. Slowly approach the head of the overhead console forward mounting screw with the degaussing tool connected.
4. Contact the head of the screw with the plastic coated tip of the degaussing tool for about two seconds.
5. With the degaussing tool still energized, slowly back it away from the screw. When the tip of the tool is at least 61 centimeters (2 feet) from the screw head, disconnect the tool.

6. Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header. The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.
7. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.
8. Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.
9. Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) back from the windshield header.
10. With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.
11. Calibrate the compass, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - STANDARD PROCEDURE - COMPASS CALIBRATION). Adjust the compass variance, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - STANDARD PROCEDURE - COMPASS VARIATION ADJUSTMENT).



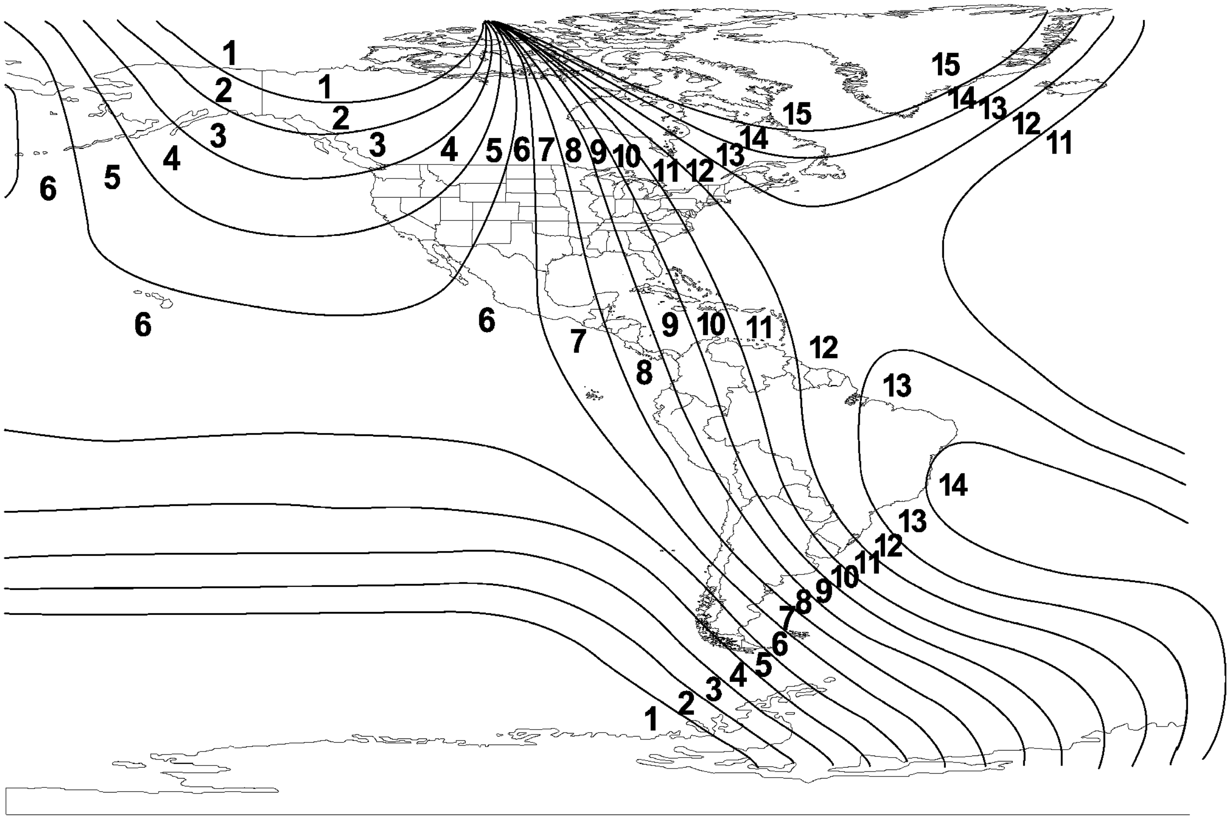
J908E-27

## STANDARD PROCEDURE - COMPASS VARIATION ADJUSTMENT

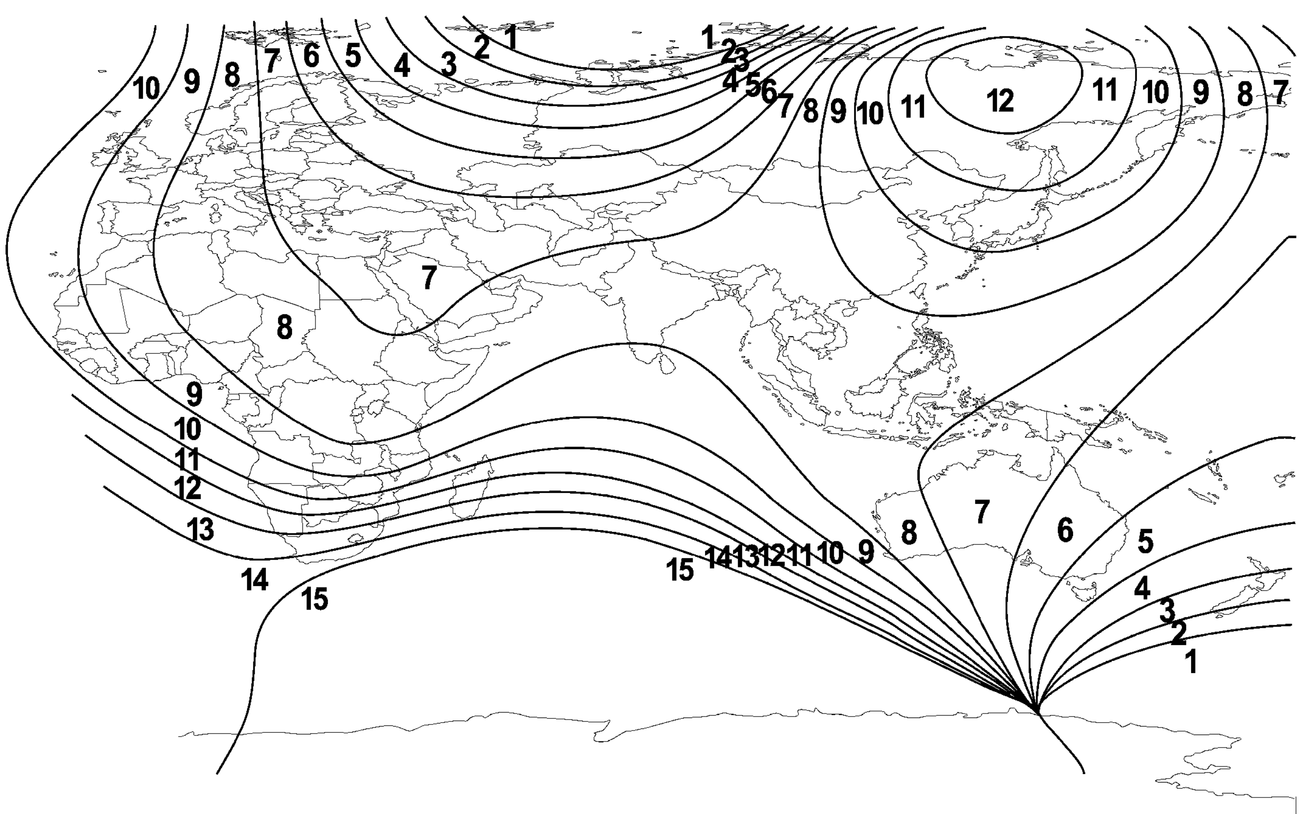
Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance setting may need to be changed.

To set the compass variance:

1. Using the Variance Settings map, find your geographic location and note the zone number.



811994c8



8119948e

2. Turn the ignition switch to the On position. If the compass/thermometer data is not currently being displayed, momentarily depress and release the C/T push button to reach the compass/thermometer display.
3. Depress the Reset push button and hold the button down until “VARIANCE = XX” appears in the display. This takes about five seconds.
4. Release the Reset push button. “VARIANCE =XX ” will remain in the display. “XX” equals the current variance zone setting.
5. Momentarily depress and release the Step push button to step through the zone numbers, until the zone number for your geographic location appears in the display.
6. Momentarily depress and release the Reset push button to enter the displayed zone number into the Electronic Overhead Module memory.
7. Confirm that the correct directions are now indicated by the compass.

## STANDARD PROCEDURE - ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING

### EVIC PROGRAMMING MODE

The Electronic Vehicle Information Center (EVIC) provides the vehicle operator with a user interface, which allows the selection of several optional customer programmable electronic features to suit individual preferences. The EVIC must be placed into its programming mode in order to view or change the programmable features. To enter the EVIC programming mode and to view or change the selected programmable features options, proceed as follows:

1. Turn the ignition switch to the On position.
2. Depress and release the Menu push button. The first item in the programmable features menu list will appear in the EVIC display.
3. Momentarily depress and release the Menu push button to step through the programmable features list. Each programmable feature and its currently selected option will appear on the EVIC display in the sequence shown in the Programmable Features list that follows.
4. Momentarily depress and release the Step push button to step through the available options for the programmable feature being displayed.
5. The option that last appears in the display with a programmable feature before exiting the programming mode, becomes the newly selected programmable feature option.
6. The EVIC exits the programming mode and returns to its normal operating mode when the C/T push button is depressed or when the end of the programmable features menu list is reached, whichever occurs first.

### PROGRAMMABLE FEATURES

- **LANGUAGE? -** The options include English, Francais, Deutsch, Italiana, or Espanol. The default is English. All EVIC display nomenclature, including the trip computer functions, warning messages and the programmable features appear in the selected language.
- **DISPLAY U.S. OR METRIC? -** The options include U.S. and M. The default is U.S. This feature toggles the trip computer temperature, fuel economy and odometer display readings between U.S. and metric units of measure. It also changes the odometer display in the instrument cluster.
- **AUTO DOOR LOCKS? -** The options include Yes and No. The default is Yes. When Yes is selected, all doors lock automatically when vehicle speed reaches 25 km/h (15 mp/h). If YES is selected, a second programmable feature appears, **AUTO UNLOCK ON EXIT? -** The options again include Yes and No. The default is No. When Yes is selected, following each Auto Door Lock event all doors will automatically unlock when the driver door is opened, if the vehicle is stopped and the transmission gear selector is in Park or Neutral. The Auto Door Unlock event will only occur once following each Auto Door Lock event.
- **REMOTE UNLOCK -** The options include Driver Door 1st and All Doors. The default is Driver Door 1st. When Diver Door 1st is selected, only the driver door unlocks when the Unlock button of the Remote Keyless Entry (RKE) transmitter is depressed once. The Unlock button of the RKE transmitter must be depressed twice to unlock all doors. When All Doors is selected, all doors unlock when the Unlock button of the RKE transmitter is depressed once.
- **SOUND HORN ON LOCK? -** The options include Yes and No. The default is No. When Yes is selected, a short horn chirp will provide an audible confirmation when the RKE receiver recognizes a valid Lock signal

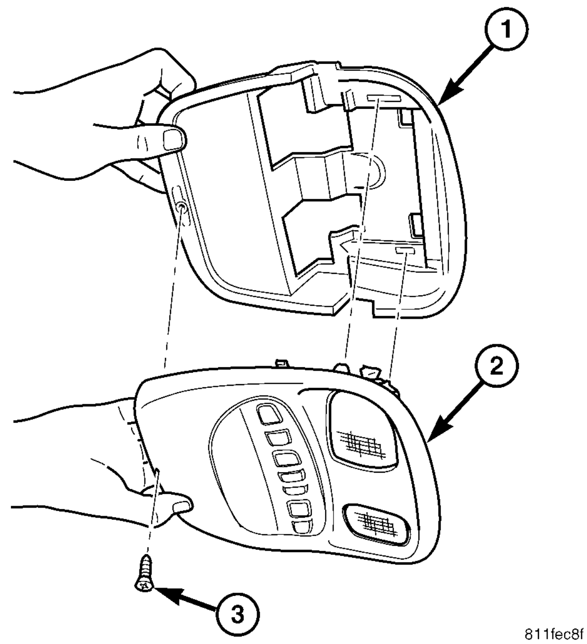
from an RKE transmitter. When No is selected, no horn chirp will occur with the RKE Lock event. This feature may be selected independent of the **FLASH LIGHTS WITH LOCKS?** programmable feature.

- **FLASH LIGHTS WITH LOCKS?** - The options include Yes and No. The default is Yes. When Yes is selected, a single flash of the hazard warning lamps will provide an optical confirmation when the RKE receiver recognizes a valid Lock signal from an RKE transmitter, and two flashes of the same lamps will occur when the RKE receiver recognizes a valid Unlock signal from an RKE transmitter. When No is selected, no lamp flash will occur with the RKE Lock or Unlock event. This feature may be selected independent of the **SOUND HORN ON LOCK?** programmable feature.
- **HEADLAMP DELAY =** - The options include Off, 30 Sec, 60 Sec, and 90 Sec. The default is 90 Sec. When a time interval is selected, the headlamps will remain on for that length of time when the headlamps are turned off after the ignition is turned off, or if the Auto mode is selected on vehicles with the Auto Headlamps option. When Off is selected, the headlamp delay feature is disabled.
- **SERVICE INTERVAL =** - The options will vary depending on the market and engine: **US/GAS engine** - the options include from 2000 to 6000 miles in 500 mile increments (3200 to 9600 kilometers in 800 kilometer increments). The default is 6000 miles (9600 kilometers). The selected distance becomes the interval at which the Perform Service warning message will be displayed by the EVIC. **EXPORT/GAS engine** - the options include from 2000 to 7500 miles in 500 mile increments (3200 to 12000 kilometers in 800 kilometer increments). The default is 7500 miles (12000 kilometers). The selected distance becomes the interval at which the Perform Service warning message will be displayed by the EVIC. **EXPORT/DIESEL engine** - the options include 3125, 6250, 9375, 12500 miles ( 5, 10, 15, 20 kilometers). The default is 12500 miles (20 kilometers). The selected distance becomes the interval at which the Perform Service warning message will be displayed by the EVIC. If a new distance is selected, a second programmable feature appears, **RESET SERVICE DISTANCE?** - The options include No and Yes. The default is Yes. When Yes is selected, the accumulated distance since the last previous Perform Service warning message will be reset to zero because the service interval has been changed. When No is selected, the distance until the next Perform Service warning message is reduced by the accumulated distance since the last previous message.
- **TRAIN REMOTE -** When this feature is selected the driver can choose to train up to four remote keyless entry transmitters. The options include Yes and No. The default is No. When Yes is selected and the MENU button is pressed the EVIC will display “PRESS A VALID FOB KEY”. Follow the directions displayed in the EVIC, you have approximately 30 seconds to train each transmitter, after each transmitter is trained the EVIC will display “FOB #? TRAINED”.
- **RETRAIN TIRE SENSORS** - This programmable feature only applies to vehicles equipped with the optional Tire Pressure Monitoring System. The options include Yes and No. The default is No. When Yes is selected, and the MENU button is depressed, the EVIC will enter the training mode starting with the left front tire. Refer to the tires and wheels section for additional information.

## REMOVAL

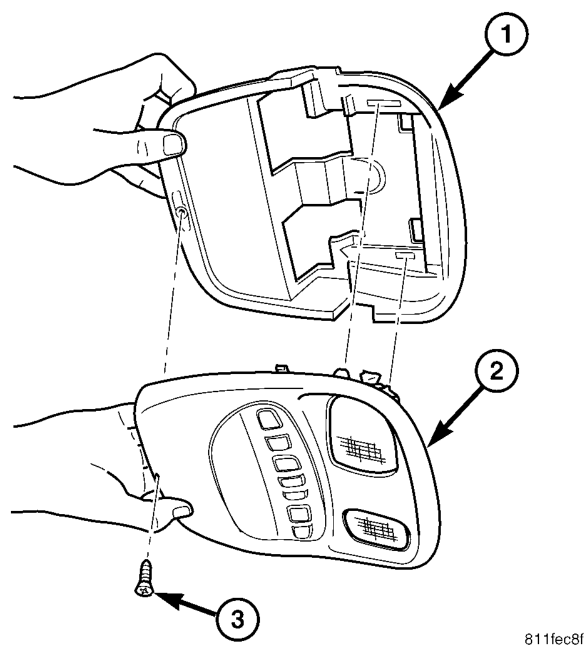
### OVERHEAD CONSOLE - REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console retaining screw (3) , located in the front of console (2) near the windshield.
3. Using your fingertips, grasp the sides of the overhead console (2) and pull straight down evenly to disengage the two snap clips at the rear of the unit.
4. Lower the overhead console far enough to access the wire harness connectors.
5. Disconnect the Electronic Overhead Module (EOM), courtesy lamps and power sunroof switch electrical connectors, if equipped.
6. Remove the overhead console (2) assembly from the vehicle.

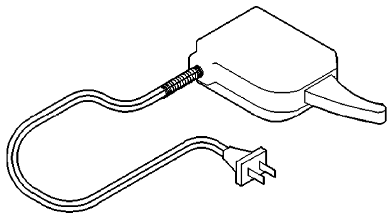


## INSTALLATION

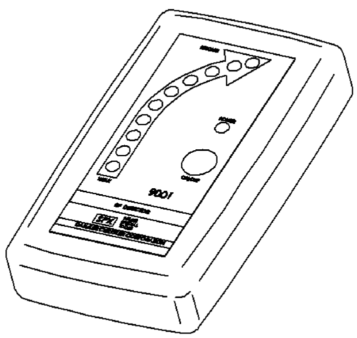
1. Position the overhead console (2) in the vehicle and connect the wire harness connectors.
2. Connect the Electronic Overhead Module (EOM), courtesy lamps and power sunroof switch electrical connectors, if equipped.
3. Grasp the sides of the overhead console (2) and push straight up evenly to engage the two snap clips at the rear of the unit.
4. Install the overhead console retaining screw (3), located in the front of console near the windshield. Torque the screw to 1 N·m (10 in. lbs.).
5. Connect the battery negative cable.



## SPECIAL TOOLS



*Degaussing Tool 6029*



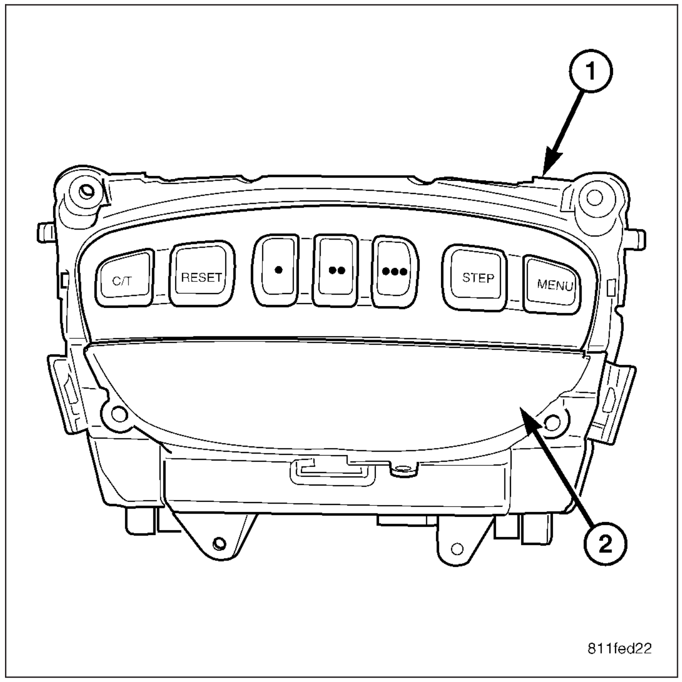
*Radio Frequency Detector 9001*

# ELECTRONIC VEHICLE INFO CENTER

## DESCRIPTION

The Electronic Overhead Module (EOM)(1) is located in the overhead console on some models. The EOM features a large Vacuum Fluorescent Display (VFD) screen (2) for displaying information, and back-lit push button function switches labeled C/T (compass/temperature), RESET, STEP, and MENU.

The EOM contains a central processing unit and interfaces with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) data bus network. The PCI data bus network allows the sharing of sensor information. This helps to reduce wire harness complexity, reduce internal controller hardware, and reduce component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities.



The Electronic Vehicle Information Center (EVIC) includes the following display options:

- **Average Fuel Economy** - provides the average fuel economy the vehicle is achieving.
- **Distance To Empty** - provides the approximate distance the vehicle can be driven on the current fuel level.
- **Trip Odometer** - shows the accumulated miles since the last trip computer reset.
- **Elapsed time** - shows the accumulated ignition-on time since the last trip computer reset.
- **Service Mileage** - shows the distance remaining until the next scheduled service interval.
- **Individual Tire Pressure** - shows the current individual tire air pressures.
- **Blank** - the EVIC computer VF display is turned off.

The EVIC “Menu” push button provides the vehicle operator with a user interface, which allows the selection of several optional customer programmable electronic features to suit individual preferences.

If the vehicle is equipped with the optional Universal Transmitter, the EVIC will also display messages and an icon indicating when the Universal Transmitter is being trained, which of the three transmitter buttons is transmitting, and when the transceiver is cleared.

Data input for all EVIC functions, including VFD dimming level, is received through PCI data bus messages. The EOM uses its internal programming and all of its data inputs to calculate and display the requested data. If the data displayed is incorrect, perform the self-diagnostic tests as described in this group. If these tests prove inconclusive, the use of a scan tool and the proper Diagnostic Procedures manual are recommended for further testing of the EOM and the PCI data bus.

The EOM cannot be repaired, and is available for service only as a unit. This unit includes the push button switches and the plastic module. If any of these components is faulty or damaged, the complete EOM must be replaced. The incandescent bulbs used for EVIC push button back-lighting and the lens are available for service replacement.

## DESCRIPTION - COMPASS

While in the compass/temperature mode, the compass will display the direction in which the vehicle is pointed using the eight major compass headings (Examples: north is N, northeast is NE). The self-calibrating compass unit requires no adjusting in normal use. The only calibration that may prove necessary is to drive the vehicle in three complete circles at 5 to 8 km/h (3 to 5 mp/h), on level ground, in not less than forty-eight seconds. This will reorient the compass unit to its vehicle.

The compass unit also will compensate for magnetism the body of the vehicle may acquire during normal use. However, avoid placing anything magnetic directly on the roof of the vehicle. Magnetic mounts for an antenna, a repair order hat, or a funeral procession flag can exceed the compensating ability of the compass unit if placed on the roof panel. Magnetic bit drivers used on the fasteners that hold the overhead console assembly to the roof header can also affect compass operation. If the vehicle roof should become magnetized, the demagnetizing and calibration procedures found in this group may be required to restore proper compass operation.

### DESCRIPTION - TEMPERATURE

The temperature displays the outside ambient temperature in whole degrees. The temperature display can be toggled from Fahrenheit to Celsius by selecting the desired U.S./Metric option from the customer programmable features, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - STANDARD PROCEDURE - ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING). The displayed temperature is not an instant reading of conditions, but an average temperature. It may take the thermometer display several minutes to respond to a major temperature change, such as driving out of a heated garage into winter temperatures.

When the ignition switch is turned to the Off position, the last displayed temperature reading stays in the EOM unit memory. When the ignition switch is turned to the On position again, the EOM will display the memory temperature for one minute; then update the display to the current average temperature reading within five minutes if temperature is less than memory.

The temperature function is supported by an ambient temperature sensor. The sensor is mounted outside the passenger compartment near the front and center of the vehicle, and is hard wired to the Powertrain Control Module (PCM). The PCM sends temperature status messages to the EOM over the PCI data bus network. The ambient temperature sensor is available as a separate service item.

## OPERATION

The EVIC has access to both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the On position. When the ignition switch is turned to the On position, the EVIC module VFD will return to the last function being displayed before the ignition was turned to the Off position.

The compass/temperature display is the normal EVIC display. With the ignition switch in the On position, momentarily depressing and releasing the C/T (compass/temperature) push button switch will cause the EVIC to return to the compass/temperature display mode from any other mode. While in the compass/temperature display mode, momentarily depressing and releasing the Step push button will step through the available trip computer display options.

The EVIC trip computer features several functions that can be reset. The functions that can be reset are: average fuel economy, trip odometer and elapsed time. With the ignition switch in the On position and with one of the functions of the trip computer that can be reset currently displayed, depressing the Reset push button twice within three seconds will perform a global reset, and all of the trip computer information that can be reset will be reset. With the ignition switch in the On position and the function that is to be reset currently displayed, momentarily depressing and releasing the Reset push button once will perform a local reset, and only the value of the displayed function will be reset to zero. A global or local reset will only occur if the function currently displayed is a function that can be reset. The distance to service function can also be reset by pressing and holding the RESET button for 1 second. Refer to **ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING** in the Standard Procedures section of this group for more information on setting the Service Interval.

For more information on the features, control functions and setting procedures for the EVIC module, see the owner's manual in the vehicle glove box.

## DIAGNOSIS AND TESTING - ELECTRONIC VEHICLE INFORMATION CENTER

If the problem with the EVIC is an inaccurate or scrambled display, refer to **Self-Diagnostic Test** later in this section. If the problem with the EVIC is incorrect Vacuum Fluorescent Display (VFD) dimming levels, use a DRB scan tool and the proper Diagnostic Procedures manual to test for the correct dimming message inputs being received from the Body Control Module (BCM) over the Programmable Communications Interface (PCI) data bus. If the problem is a no-display condition, use the following procedures. For complete circuit diagrams, refer to **Overhead Console** in Wiring Diagrams.

1. Press the C/T button.

2. Check the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
3. Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the fused B(+) fuse in the PDC as required.
4. Check the fused ignition switch output (run/start) fuse in the junction block. If OK, go to Step 5. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
5. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) fuse in the junction block. If OK, go to Step 6. If not OK, repair the open fused ignition switch output (run/start) circuit to the ignition switch as required.
6. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the overhead console. Check for continuity between the ground circuit cavity of the roof wire harness connector for the EVIC module and a good ground. There should be continuity. If OK, go to Step 7. If not OK, repair the open ground circuit to ground as required.
7. Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the roof wire harness connector for the EVIC module. If OK, go to Step 8. If not OK, repair the open fused B(+) circuit to the fused B(+) fuse in the junction block as required.
8. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the roof wire harness connector for the EVIC module. If OK, refer to **Self-Diagnostic Test** in the Diagnosis and Testing section of this group for further diagnosis of the EVIC module and the PCI data bus. If not OK, repair the open fused ignition switch output (run/start) circuit to the fuse in the junction block as required.

## SELF-DIAGNOSTIC TEST

A self-diagnostic test is used to determine that the EVIC module is operating properly, and that all PCI data bus messages are being received for initial operation. Initiate the self-diagnostic test as follows:

1. With the ignition switch in the Off position, simultaneously depress and hold the **C/T button** and the **Reset button**.
2. Turn the ignition switch to the On position.
3. Continue to hold both buttons depressed until the EVIC software version information is displayed, then release both buttons.
4. Following completion of these tests, the EVIC module will display one of the following messages:

a. **PASS SELF TEST** - Momentarily depress and release the Reset button to return to the compass/temperature/trip computer display mode. The EVIC module is working properly.

b. **FAILED SELF TEST** - The EVIC module has an internal failure. The EVIC module is faulty and must be replaced.

c. **NOT RECEIVING J1850 MESSAGE** - The EVIC module is not receiving proper message input through the PCI data bus. This can result from one or more faulty electronic modules in the vehicle, or from a faulty PCI data bus. The use of a DRB scan tool and the proper Diagnostic Procedures manual are required for further diagnosis.

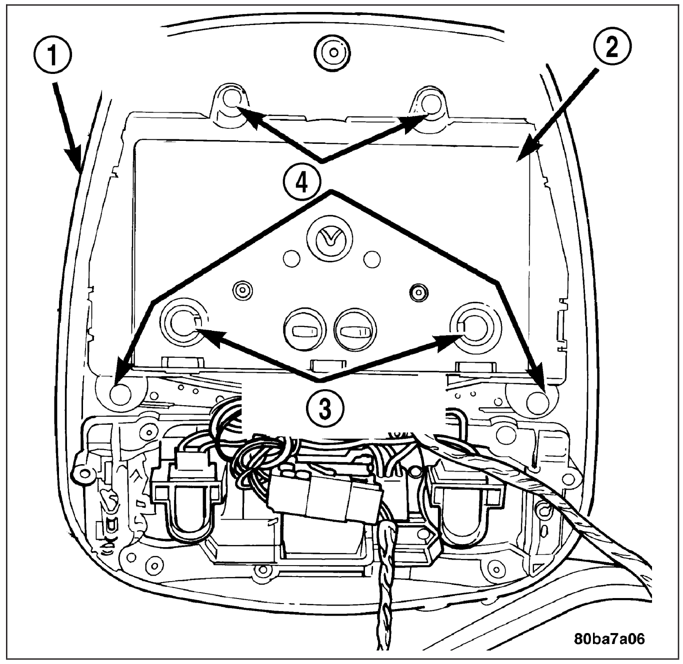
**NOTE: If the compass functions, but accuracy is suspect, it may be necessary to perform a variation adjustment. This procedure allows the compass unit to accommodate variations in the earth's magnetic field strength, based on geographic location. Refer to Compass Variation Adjustment in the Service Procedures section of this group.**

**NOTE: If the compass reading displays a blank, and only "CAL" appears in the display, demagnetizing may be necessary to remove excessive residual magnetic fields from the vehicle. Refer to Compass Demagnetizing in the Service Procedures section of this group.**

## REMOVAL

**NOTE: If the evic module is being replaced, the tire pressure monitoring system must be programmed. Refer to the tires/wheels section of this manual for detailed instructions.**

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
3. Remove the four screws (4) that secure the Electronic Overhead Module (EOM) (2) to the overhead console housing (1).
4. Remove the EOM (2) from the overhead console housing (1).

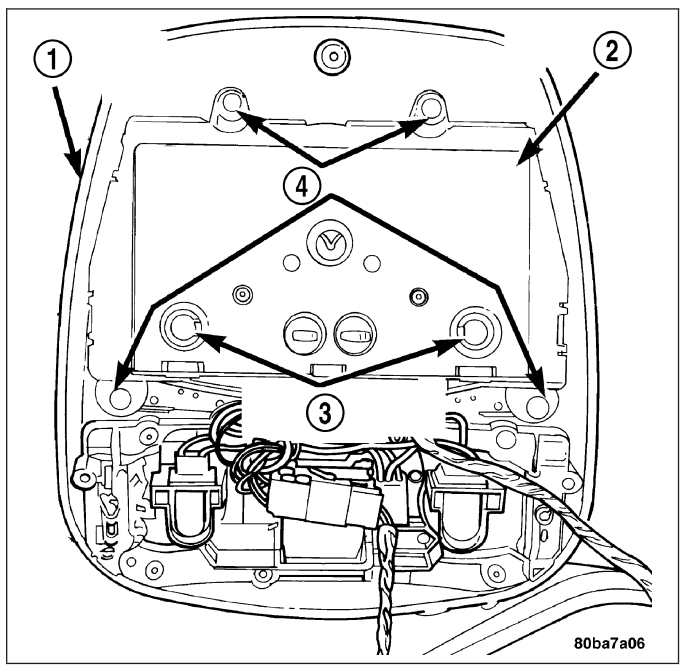


## INSTALLATION

**NOTE: If a new Electronic Overhead Module (EOM) has been installed, the compass will have to be calibrated and the variance set. Refer to compass variation adjustment and compass calibration in the standard procedures section of this group for detailed instructions.**

**NOTE: If a new Electronic Overhead Module (EOM) has been installed, the tire pressure sensors will have to be reprogrammed. Refer to the tires/wheels section of this manual for detailed instructions.**

1. Position the Electronic Overhead Module (EOM) (2) onto the overhead console housing (1).
2. Install the four screws (4) that secure the EOM (2) to the overhead console housing (1). Tighten the screws to 1 N·m (8 in. lbs.).
3. Install the overhead console (1) onto the headliner, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
4. Reconnect the battery negative cable.



# UNIVERSAL TRANSMITTER

## DESCRIPTION

On some KJ models a Universal Transmitter transceiver is standard factory-installed equipment. The universal transmitter transceiver is integral to the Electronic Vehicle Information Center Computer (EVIC), which is located in the overhead console. The only visible component of the universal transmitter are the three center transmitter push buttons centered between the four EVIC push buttons located just rearward of the EVIC display screen in the overhead console. The three universal transmitter push buttons are identified with one, two or three light indicators so that they be easily identified by sight.

Each of the three universal transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 286 to 399 MegaHertz (MHz) frequency range for remote operation. The universal transmitter is capable of operating systems using either rolling code or non-rolling code technology.

The EVIC module displays messages and a small house-shaped icon with one, two or three dots corresponding to the three transmitter buttons to indicate the status of the Universal Transmitter.

The Universal Transmitter cannot be repaired, and is available for service only as a unit with the EVIC module. This unit includes the push button switches and the plastic module and display lens. If any of these components is faulty or damaged, the complete EVIC module must be replaced.

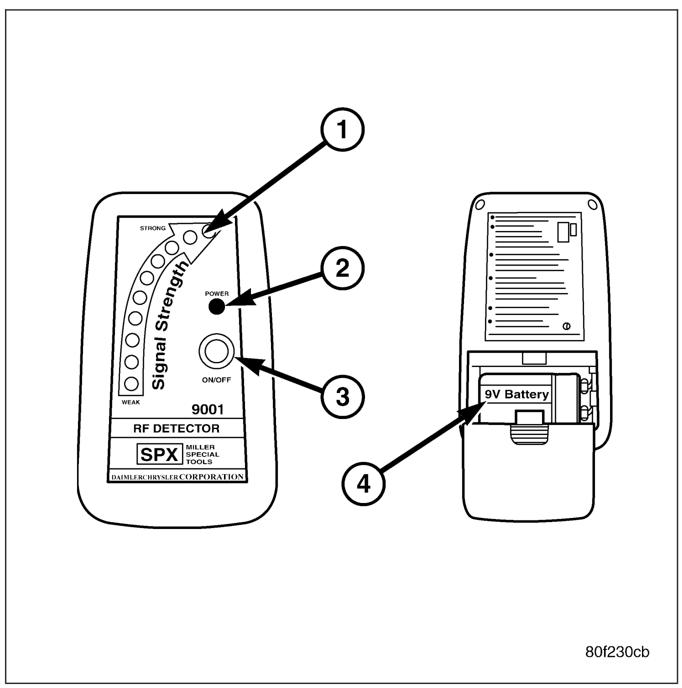
## OPERATION

The universal transmitter operates on a non-switched source of battery current so the unit will remain functional, regardless of the ignition switch position. For more information on the features, programming procedures and operation of the universal transmitter, see the owner's manual in the vehicle glove box.

## DIAGNOSIS AND TESTING - UNIVERSAL TRANSMITTER

If the Universal Transmitter is inoperative, but the Electronic Vehicle Information Center Computer (EVIC) is operating normally, see the owner's manual in the vehicle glove box for instructions on training the universal transmitter. Retrain the universal transmitter with a known good transmitter as instructed in the owner's manual and test the universal transmitter operation again. If the unit is still inoperative, test the universal transmitter with Radio Frequency Detector special tool as described below:

1. Turn the Radio Frequency (RF) Detector ON (3). A “chirp” will sound and the green power LED (2) will light. If the green LED does not light, replace the battery (4).
2. Hold the RF detector within one inch of the TRAINED universal transmitter and press any of the transmitters buttons.
3. The red signal detection LEDs (1) will light and the tool will beep if a radio signal is detected. Repeat this test three times.



If both the universal transmitter and the Electronic Overhead Module (EOM) are inoperative, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - DIAGNOSIS AND TESTING) for further diagnosis. For complete circuit diagrams, refer to **Wiring Diagrams**.

# STANDARD PROCEDURE

## STANDARD PROCEDURE - ERASING TRANSMITTER CODES

To erase **all** universal transmitter codes, simply hold down buttons 1 and 3 until the two green dots below the house symbol begin to flash and “CHANNELS CLEARED” is displayed.

**NOTE: Individual channels cannot be erased. Erasing the transmitter codes will erase ALL programmed codes.**

## STANDARD PROCEDURE - PROGRAMMING TRANSMITTER CODES

**WARNING: Before programming the universal transmitter to a garage door opener or gate operator, make sure that people and objects are out of the way of the device to prevent potential harm or damage. When programming a garage door opener, it is advised to park outside of the garage. Do not use universal transmitter with any garage door opener that lacks safety stop and reverse features as required by U.S. federal safety standards (this includes any garage door opener model manufactured before April 1, 1982). A garage door that cannot detect an object - signaling the door to stop and reverse - does not meet current U.S. federal safety standards.**

**WARNING: Your motorized door or gate will open and close while you are programming. Do not program the universal transmitter if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.**

**NOTE: It is recommended that a new battery be placed in the hand-held transmitter of the device being programmed to the universal transmitter for quicker training and accurate transmission of the radio frequency signal.**

1. Turn off the engine.
2. Erase the factory test codes by pressing buttons 1 and 3. Release the buttons when the two green lights begin to flash (about 20 seconds).
3. Choose one of the three buttons to train. Position the end of your hand-held transmitter 1-3 inches (5-14 cm) away from the lower left corner of the EVIC display while keeping the display in view.
4. Simultaneously press and hold both the desired Transmitter button and the hand-held transmitter button. After a short time, the message TRAINING will show on Transmitter display. **Do not release the buttons until the message TRAINED appears on the display (this may take as long as 60 seconds), release both the Transmitter and hand-held transmitter buttons.**
5. Press and hold the just-trained Transmitter button. TRANSMIT should appear on the display. If your device activates when the Transmitter button is depressed and released, programming is complete. To train the other buttons, repeat the process. Be sure to keep your hand-held transmitter in case you need to retrain the universal transmitter.

**NOTE: If the message TRANSMIT appears on the Transmitter display but your device does not activate, the device may be equipped with a ″rolling code″ system. Continue with steps six through eight below to complete the programming of a rolling code equipped device (most commonly a garage door opener).**

6. At the garage door opener receiver (motor-head unit) in the garage, locate the ″learn″ or ″smart″ button. This can usually be found where the hanging antenna wire is attached to the motor-head unit. Firmly press and release the ″learn″ or ″smart″ button. (The name and color of the button may vary by manufacturer.)

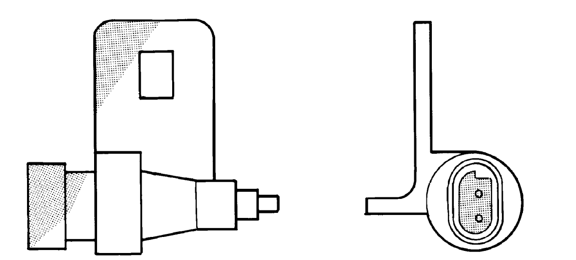
**NOTE: There are 30 seconds in which to initiate the next step.**

7. Return to the vehicle and firmly press, hold for two seconds and release the programmed Transmitter button. Repeat the ″press/hold/release″ sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming process.
8. Transmitter should now activate your rolling code equipped device. To program the remaining two buttons, simply repeat the process.

# AMBIENT TEMP SENSOR

## DESCRIPTION

Ambient air temperature is monitored by the Electronic Overhead Module (EOM) through ambient temperature sensor messages received from the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus network. The PCM receives a hard wired input from the ambient temperature sensor. The ambient temperature sensor is a variable resistor mounted in front the radiator, behind the grille, near the center of the vehicle.



938C-10

Refer to **Powertrain Control Module (PCM)** in Electronic Control Modules for more information. For complete circuit diagrams, refer to the Wiring information. The ambient temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference sent to it by the Powertrain Control Module (PCM). The resistance in the sensor changes as temperature changes. This changes the temperature sensor return signal circuit voltage to the PCM. Based upon the resistance in the sensor, the PCM is programmed to correspond to a specific temperature. The PCM then sends the proper ambient temperature messages to the EVIC over the PCI data bus.

The thermometer function is supported by the ambient temperature sensor, a wiring circuit, the Powertrain Control Module (PCM), the Programmable Communications Interface (PCI) data bus, and a portion of the Electronic Vehicle Information Center (EVIC) Computer module.

The ambient temperature sensor circuit can also be diagnosed by referring to **Diagnosis and Testing - Ambient Temperature Sensor, and Diagnosis and Testing - Ambient Temperature Sensor Circuit**. If the temperature sensor and circuit are confirmed to be OK, but the temperature display is inoperative or incorrect, refer to **Diagnosis and Testing - Electronic Vehicle Information Center Computer** in this section. For complete circuit diagrams, refer to the Wiring information.

## DIAGNOSIS AND TESTING

## DIAGNOSIS AND TESTING - AMBIENT TEMPERATURE SENSOR

1. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor wire harness connector.
2. Measure the resistance of the ambient temperature sensor. At room temperature (approx. 68°F), the sensor resistance should be between 10-13 Kilohms (10000-13000 ohms). The sensor resistance should be between these two values at 68°F. If OK, the sensor is OK at this time. If not OK, replace the faulty ambient temperature sensor.

## DIAGNOSIS AND TESTING - AMBIENT TEMPERATURE SENSOR CIRCUIT

1. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor wire harness connector and the Powertrain Control Module (PCM) wire harness connector.
2. Connect a jumper wire between the two terminals in the body half of the ambient temperature sensor wire harness connector.
3. Check for continuity between the sensor return circuit and the ambient temperature sensor signal circuit cavities of the PCM wire harness connector. There should be continuity. If OK, go to Step 4. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.
4. Remove the jumper wire from the body half of the ambient temperature sensor wire harness connector. Check for continuity between the sensor return circuit cavity of the PCM wire harness connector and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted sensor return circuit as required.

5. Check for continuity between the ambient temperature sensor signal circuit cavity of the PCM wire harness connector and a good ground. There should be no continuity. If OK, refer to **Diagnosis and Testing - Electronic Vehicle Information Center Computer** in this group. If not OK, repair the shorted ambient temperature sensor signal circuit as required.

## REMOVAL

1. Open hood, disconnect and isolate the negative battery cable.
2. Remove the grille from the vehicle.
3. Disconnect the ambient temperature sensor electrical connector.
4. Remove the ambient temperature sensor retaining screw and remove the sensor from the vehicle.

## INSTALLATION

1. Position the ambient temperature sensor and install the retaining screw.
2. Connect the ambient temperature sensor electrical connector.
3. Install the grille on the vehicle.
4. Connect the negative battery cable.

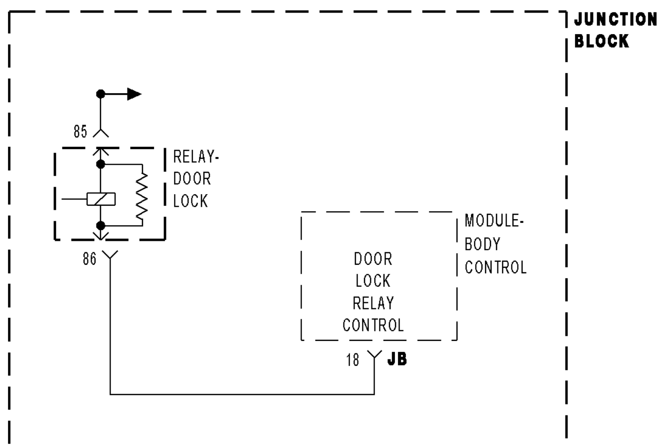
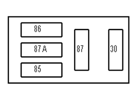
# POWER LOCKS - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## DOOR LOCK RELAY CONTROL CIRCUIT OPEN OR SHORT TO GROUND





RELAY-
DOOR LOCK
(IN JUNCTION BLOCK)

8153c267

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The BCM detects a low circuit on the Door Lock Relay Control circuit even though it is not attempting to lock the doors for more than 5 seconds. If the BCM is not grounding its side of the relay coil, the output should be high.

| Possible Causes |
| --- |
| RELAY OPEN OR SHORTED |
| JUNCTION BLOCK - DOOR LOCK RELAY CONTROL SHORT TO GROUND |
| JUNCTION BLOCK - DOOR LOCK RELAY CONTROL OPEN |
| BODY CONTROL MODULE - OPEN OR SHORTED |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

**NOTE: If the door locks are totally inoperative, check fuse No. 6 before proceeding.**

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the door locks several times.

With the scan tool, read DTCs.

**Does the scan tool display DOOR LOCK RELAY CONTROL CIRCUIT OPEN OR SHORT TO GROUND?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary. Ensure the relay is completely plugged in.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK FOR RELAY OPEN OR SHORTED

Turn the ignition off.

Remove the Door Lock Relay from the Junction Block.

Install a substitute relay in place of the Door Lock Relay.

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the Door Locks several times.

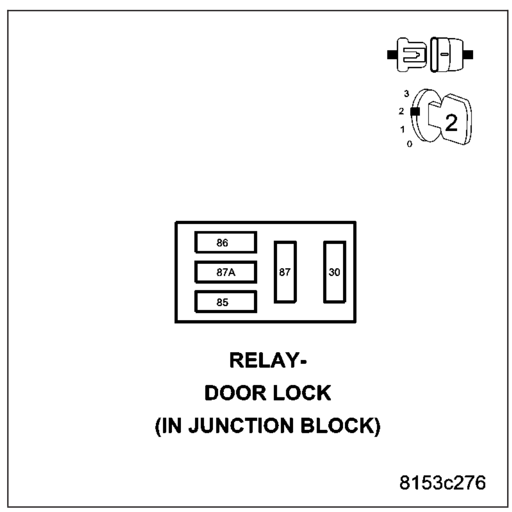
With the scan tool, read DTCs.

**Does the scan tool display DOOR LOCK RELAY CONTROL CIRCUIT OPEN/SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the original relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 3. CHECK THE JUNCTION BLOCK FOR THE DOOR LOCK RELAY CONTROL CIRCUIT SHORT TO GROUND

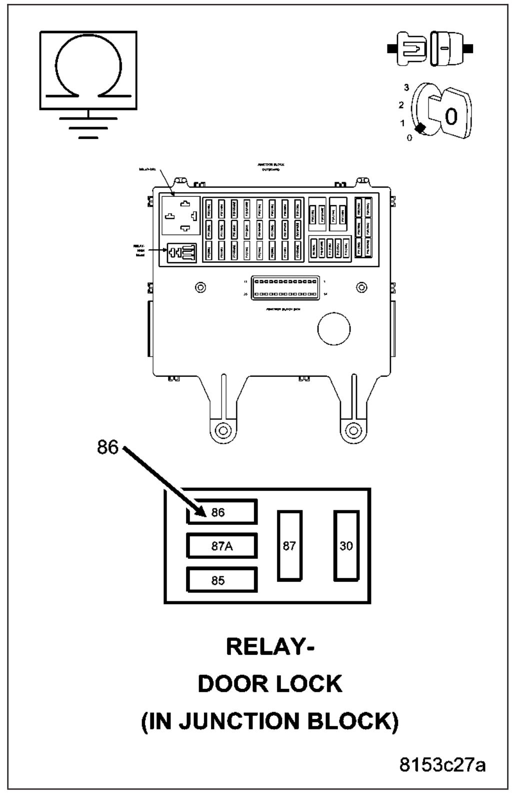
Turn the ignition off.

Remove the Door Lock Relay from the Junction Block.

Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block connectors are reconnected at this time.**

Measure the resistance between ground and the (P333) Door Lock Relay Control circuit in the relay connector of the Junction Block.



**Is the resistance below 100.0 ohms?**

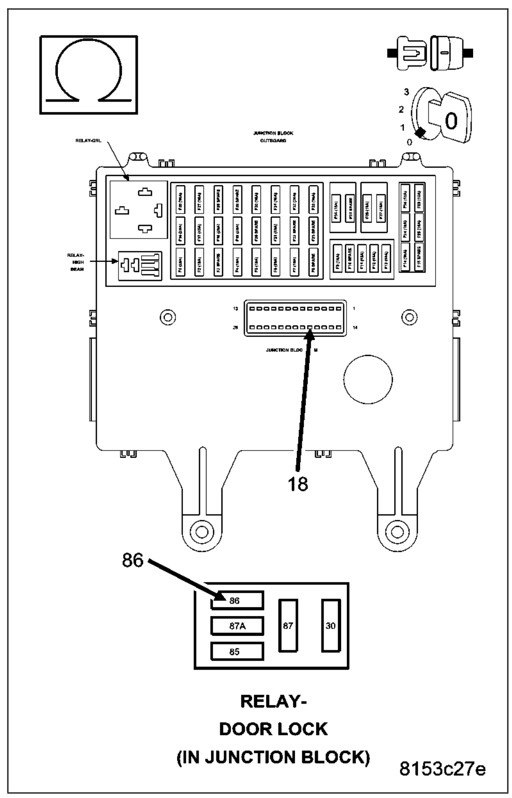
**Yes** >> Replace the Junction Block in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE JUNCTION BLOCK FOR THE DOOR LOCK RELAY CONTROL CIRCUIT OPEN

Measure the resistance of the (P333) Door Lock Relay Control circuit between the Relay connector and the Junction Block - BCM connector.



**Is the resistance below 2.0 ohms?**

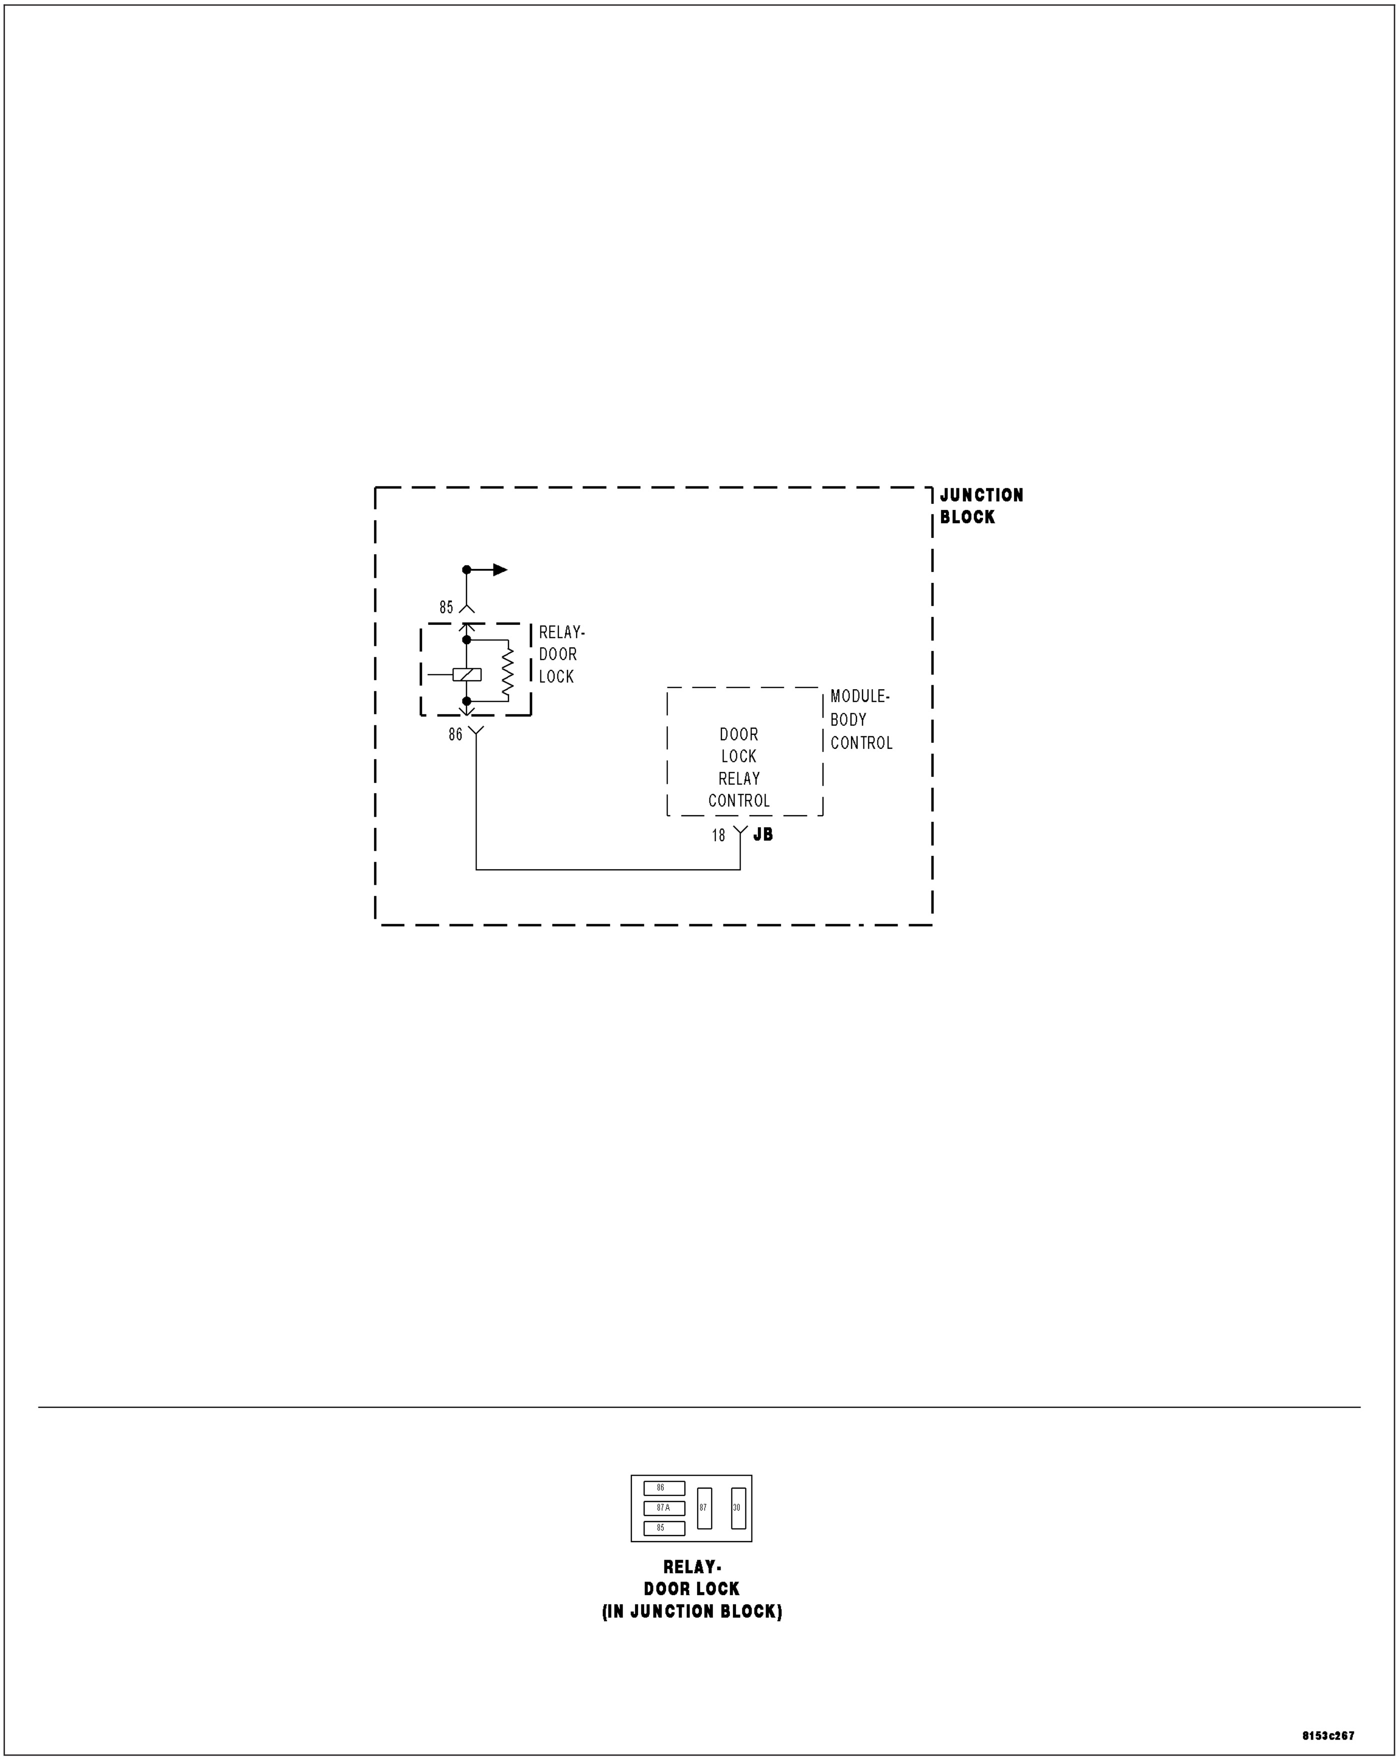
**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## DOOR LOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The BCM detects a high circuit on the Door Lock Relay Control circuit when it is attempting to lock the doors for more than 5 seconds. If the BCM is not able to ground its side of the relay coil, the control circuit remains high.

| Possible Causes |
| --- |
| RELAY SHORTED |
| JUNCTION BLOCK - DOOR LOCK RELAY CONTROL SHORT TO VOLTAGE |
| BODY CONTROL MODULE - SHORTED |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

**NOTE: If the door locks are totally inoperative, check fuse No. 6 before proceeding.**

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the door locks several times.

With the scan tool, read DTCs.

**Does the scan tool display DOOR LOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK FOR SHORTED RELAY

Turn the ignition off.

Remove the Door Lock Relay from the Junction Block.

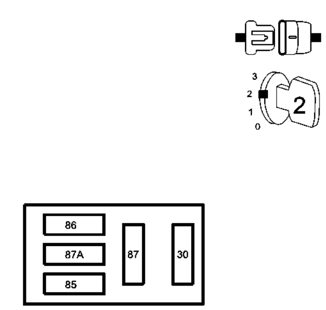
Install a substitute relay in place of the Door Lock Relay.

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the Door Locks several times.

With the scan tool, read DTCs.



RELAY-
DOOR LOCK
(IN JUNCTION BLOCK)
8153c276

**Does the scan tool display DOOR LOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE?**

**Yes** >> Go To 3

**No** >> Replace the original relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 3. CHECK THE JUNCTION BLOCK FOR THE DOOR LOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

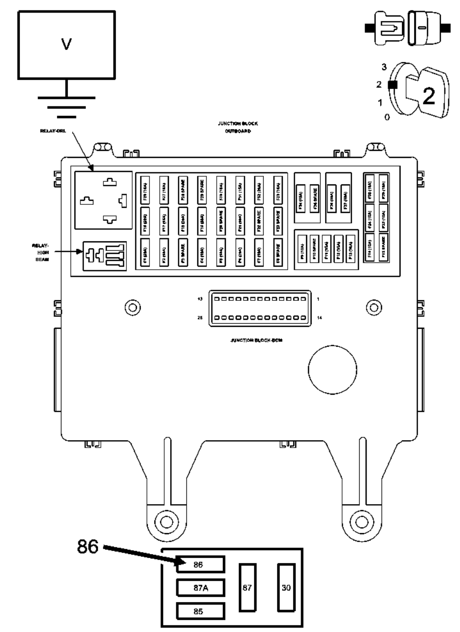
Remove the Door Lock Relay from the Junction Block.

Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block connectors are reconnected at this time.**

Turn the ignition on.

Measure the voltage between ground and the (P333) Door Lock Relay Control circuit in the relay connector of the Junction Block.



RELAY-
DOOR LOCK
(IN JUNCTION BLOCK)
81540dbe

**Is there any voltage present?**

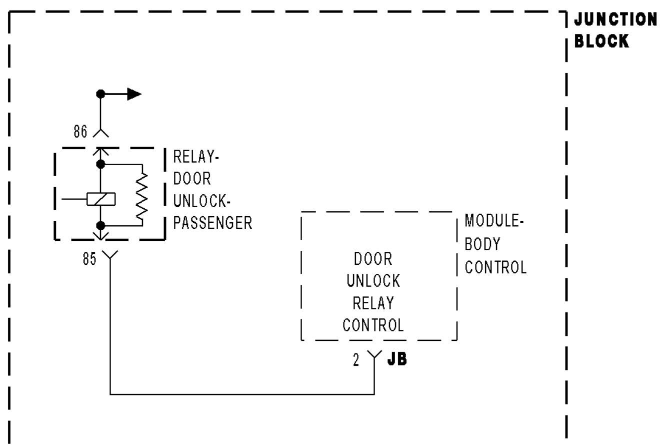
**Yes** >> Replace the Junction Block in accordance with service information.

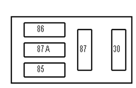
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## DOOR UNLOCK RELAY CONTROL CIRCUIT OPEN OR SHORT TO GROUND





RELAY-
DOOR UNLOCK-PASSENGER
(IN JUNCTION BLOCK)

81541111

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The BCM detects a low circuit on the Door Unlock Relay Control circuit even though it is not attempting to unlock the doors for more than 5 seconds. If the BCM is not grounding its side of the relay coil, the output should be high.

| Possible Causes |
| --- |
| RELAY OPEN OR SHORTED |
| JUNCTION BLOCK - DOOR UNLOCK RELAY CONTROL SHORT TO GROUND |
| JUNCTION BLOCK - DOOR UNLOCK RELAY CONTROL OPEN |
| BODY CONTROL MODULE - OPEN OR SHORTED |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

**NOTE: If the door locks are totally inoperative, check fuse No. 6 before proceeding.**

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the door locks several times.

With the scan tool, read DTCs.

**Does the scan tool display DOOR UNLOCK RELAY CONTROL CIRCUIT OPEN OR SHORT TO GROUND?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary. Ensure the relay is completely plugged in.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK FOR RELAY OPEN OR SHORTED

Turn the ignition off.

Remove the Door Unlock Relay from the Junction Block.

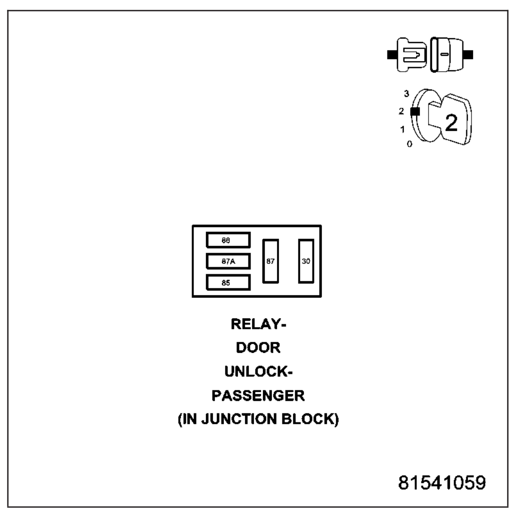
Install a substitute relay in place of the Door Unlock Relay.

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the Door Locks several times.

With the scan tool, read DTCs.



**Does the scan tool display DOOR UNLOCK RELAY CONTROL CIRCUIT OPEN/SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the original relay.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 3. CHECK THE JUNCTION BLOCK FOR THE DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Remove the Door Unlock Relay from the Junction Block.

Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block connectors are reconnected at this time.**

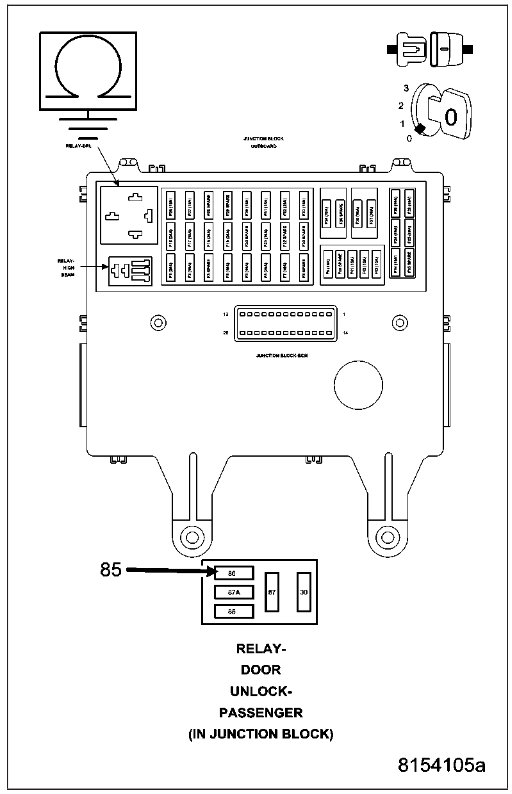
Measure the resistance between ground and the (P334) Door Unlock Relay Control circuit in the relay connector of the Junction Block.

**Is the resistance below 100.0 ohms?**

**Yes** >> Replace the Junction Block in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4



## 4. CHECK THE JUNCTION BLOCK FOR THE DOOR UNLOCK RELAY CONTROL CIRCUIT OPEN

Measure the resistance of the (P334) Door Unlock Relay Control circuit between the Relay connector and the Junction Block - BCM connector.

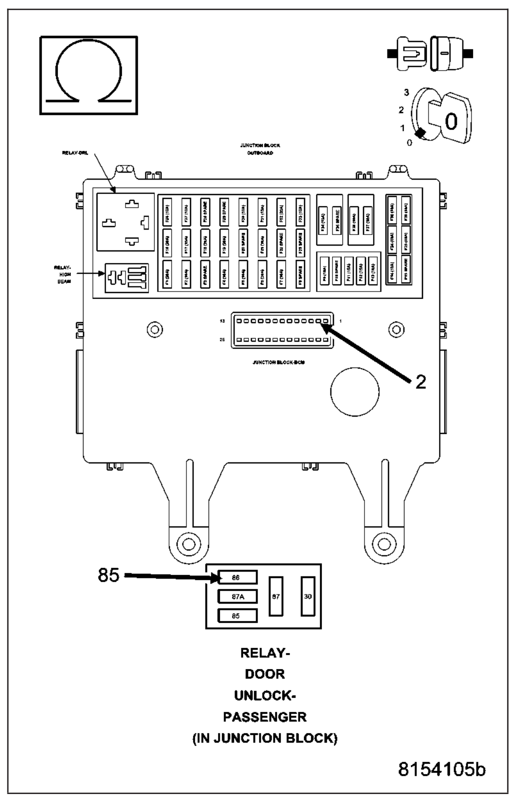
**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the Body Control Module in accordance with service information.

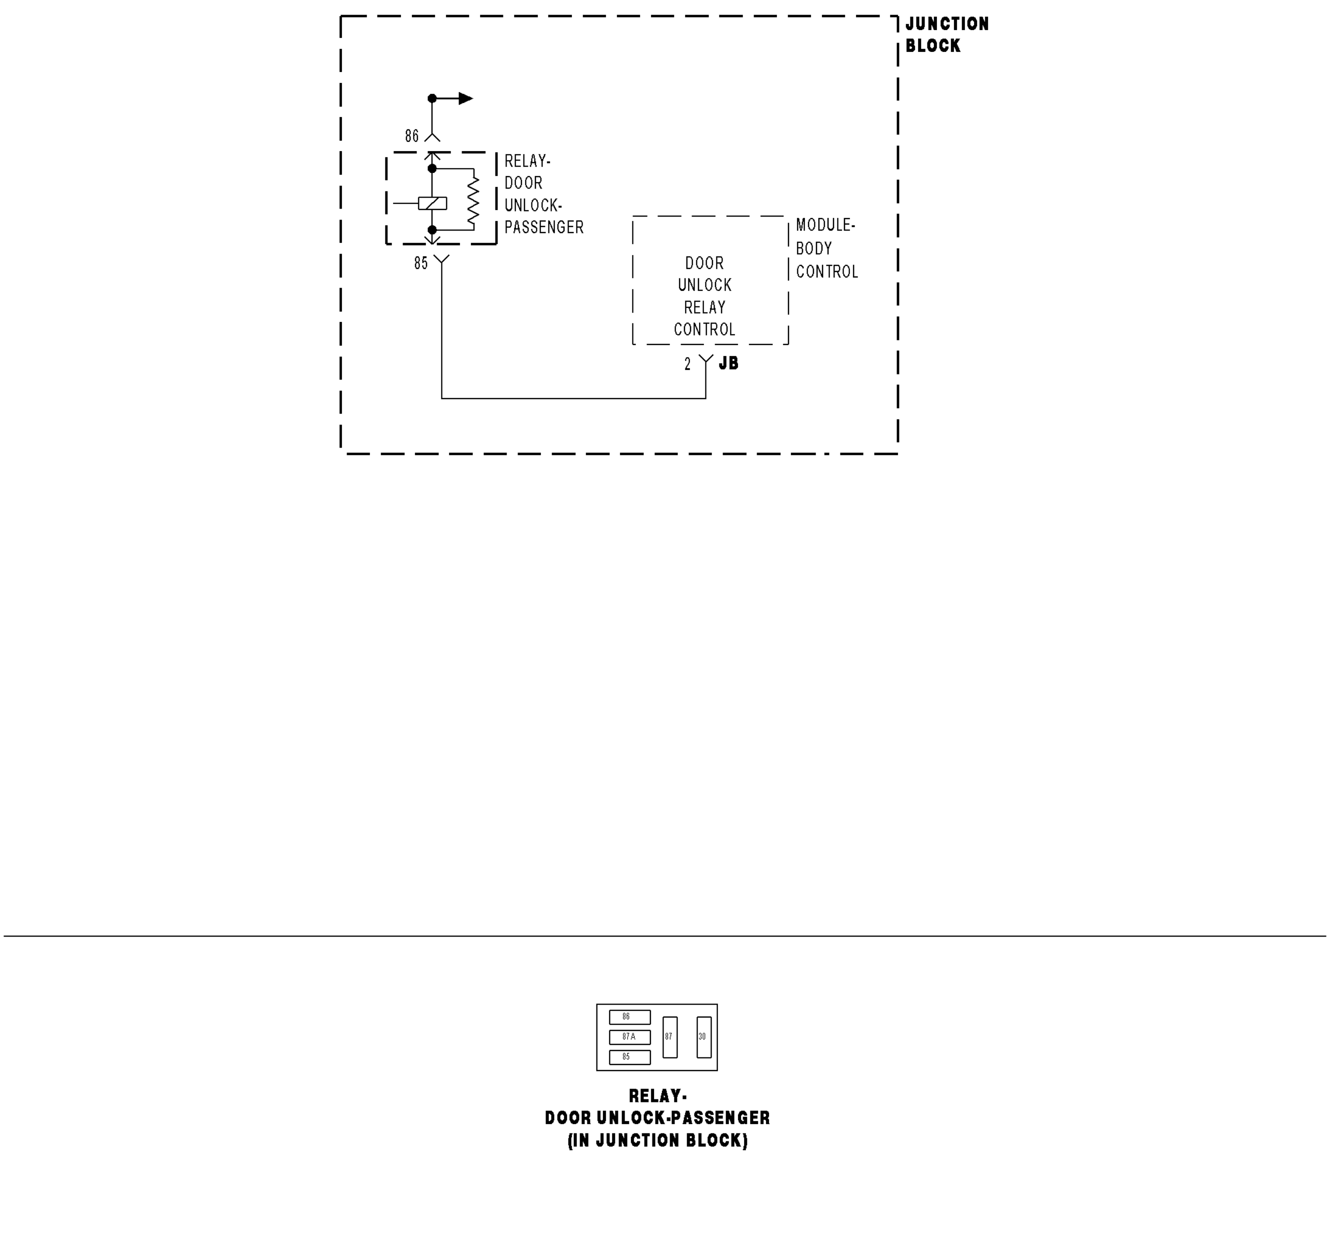
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The BCM detects a high circuit on the Door Lock Relay Control circuit when it is attempting to lock the doors for more than 5 seconds. If the BCM is not able to ground its side of the relay coil, the control circuit remains high.

| Possible Causes |
|---|
| RELAY SHORTED |
| JUNCTION BLOCK - DOOR UNLOCK RELAY CONTROL SHORT TO VOLTAGE |
| BODY CONTROL MODULE - SHORTED |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

**NOTE: If the door locks are totally inoperative, check fuse No. 6 before proceeding.**

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the door locks several times.

With the scan tool, read DTCs.

**Does the scan tool display DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK FOR SHORTED RELAY

Turn the ignition off.

Remove the Door Unlock Relay from the Junction Block.

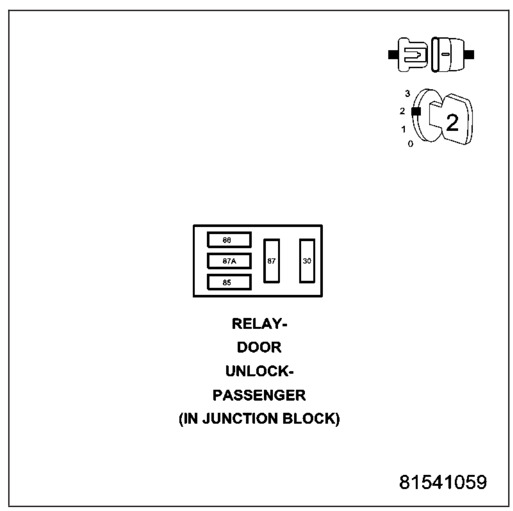
Install a substitute relay in place of the Door Unlock Relay.

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the Door Locks several times.

With the scan tool, read DTCs.



**Does the scan tool display DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE?**

**Yes** >> Go To 3

**No** >> Replace the original relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 3. CHECK THE JUNCTION BLOCK FOR THE DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

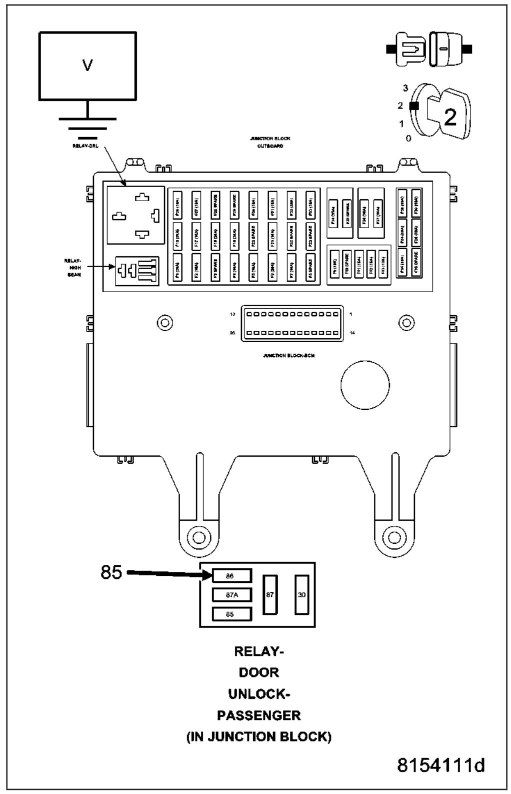
Remove the Door Unlock Relay from the Junction Block.

Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block connectors are reconnected at this time.**

Turn the ignition on.

Measure the voltage between ground and the (P334) Door Unlock Relay Control circuit in the relay connector of the Junction Block.



**Is there any voltage present?**

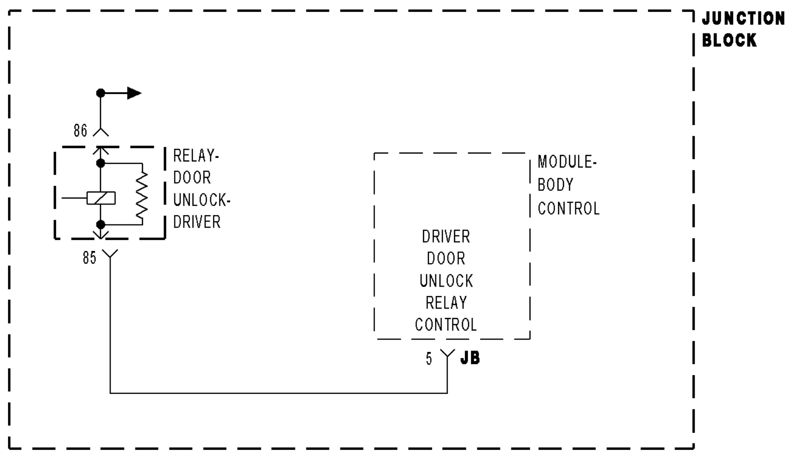
**Yes** >> Replace the Junction Block in accordance with service information.

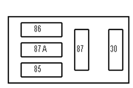
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## DRIVER DOOR UNLOCK RELAY CONTROL CIRCUIT OPEN OR SHORT TO GROUND





RELAY-
DOOR UNLOCK-DRIVER
(IN JUNCTION BLOCK)

81541144

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The BCM detects a low circuit on the Driver Door Unlock Relay Control circuit even though it is not attempting to unlock the doors for more than 5 seconds. If the BCM is not grounding its side of the relay coil, the output should be high.

| Possible Causes |
|---|
| RELAY OPEN OR SHORTED |
| JUNCTION BLOCK - DOOR UNLOCK RELAY CONTROL SHORT TO GROUND |
| JUNCTION BLOCK - DOOR UNLOCK RELAY CONTROL OPEN |
| BODY CONTROL MODULE - OPEN OR SHORTED |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

**NOTE: If the door locks are totally inoperative, check fuse No. 6 before proceeding.**

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the door locks several times.

With the scan tool, read DTCs.

**Does the scan tool display DRIVER DOOR UNLOCK RELAY CONTROL CIRCUIT OPEN OR SHORT TO GROUND?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary. Ensure the relay is completely plugged in.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK FOR RELAY OPEN OR SHORTED

Turn the ignition off.

Remove the Door Unlock Relay from the Junction Block.

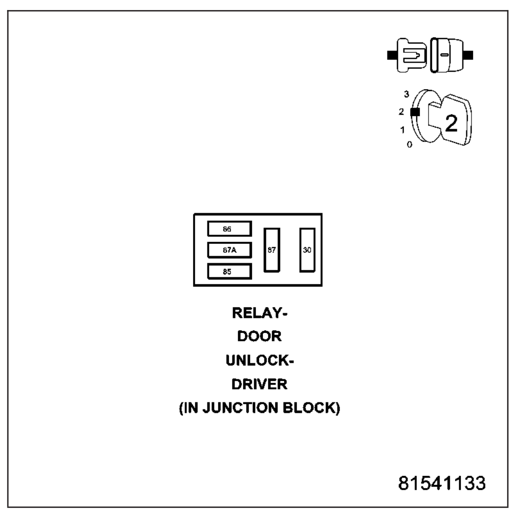
Install a substitute relay in place of the Door Unlock Relay.

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the Door Locks several times.

With the scan tool, read DTCs.



**Does the scan tool display DOOR UNLOCK RELAY CONTROL CIRCUIT OPEN/SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the original relay.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 3. CHECK THE JUNCTION BLOCK FOR THE (P109) DRIVER DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO GROUND

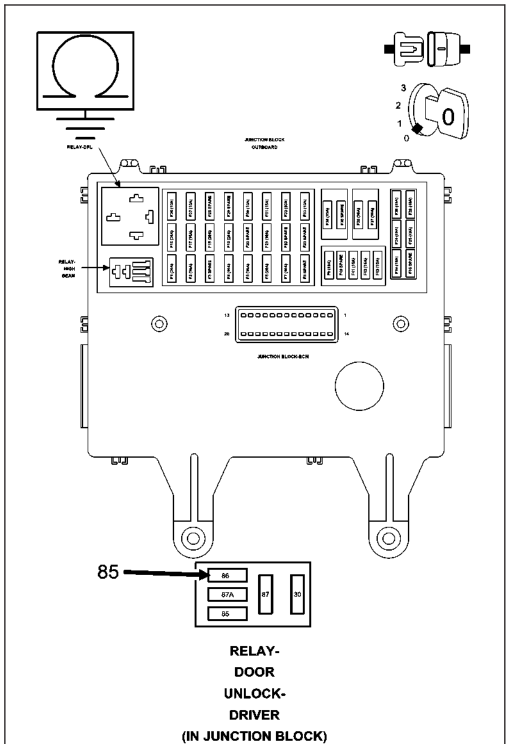
Turn the ignition off.

Remove the Door Unlock Relay from the Junction Block.

Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block connectors are reconnected at this time.**

Measure the resistance between ground and the (P109) Driver Door Unlock Relay Control circuit in the relay connector of the Junction Block.



81541134

**Is the resistance below 100.0 ohms?**

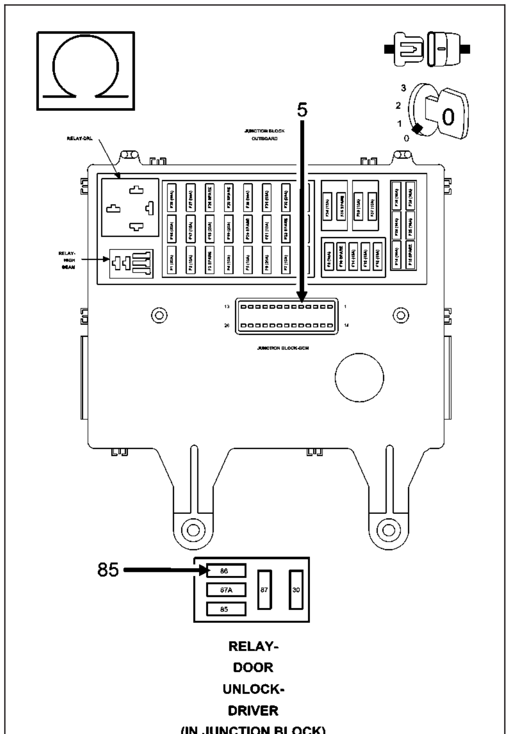
**Yes** >> Replace the Junction Block in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. CHECK THE JUNCTION BLOCK FOR THE (P109) DRIVER DOOR UNLOCK RELAY CONTROL CIRCUIT OPEN

Measure the resistance of the (P109) Driver Door Unlock Relay Control circuit between the Relay connector and the Junction Block - BCM connector.



81541135

**Is the resistance below 2.0 ohms?**

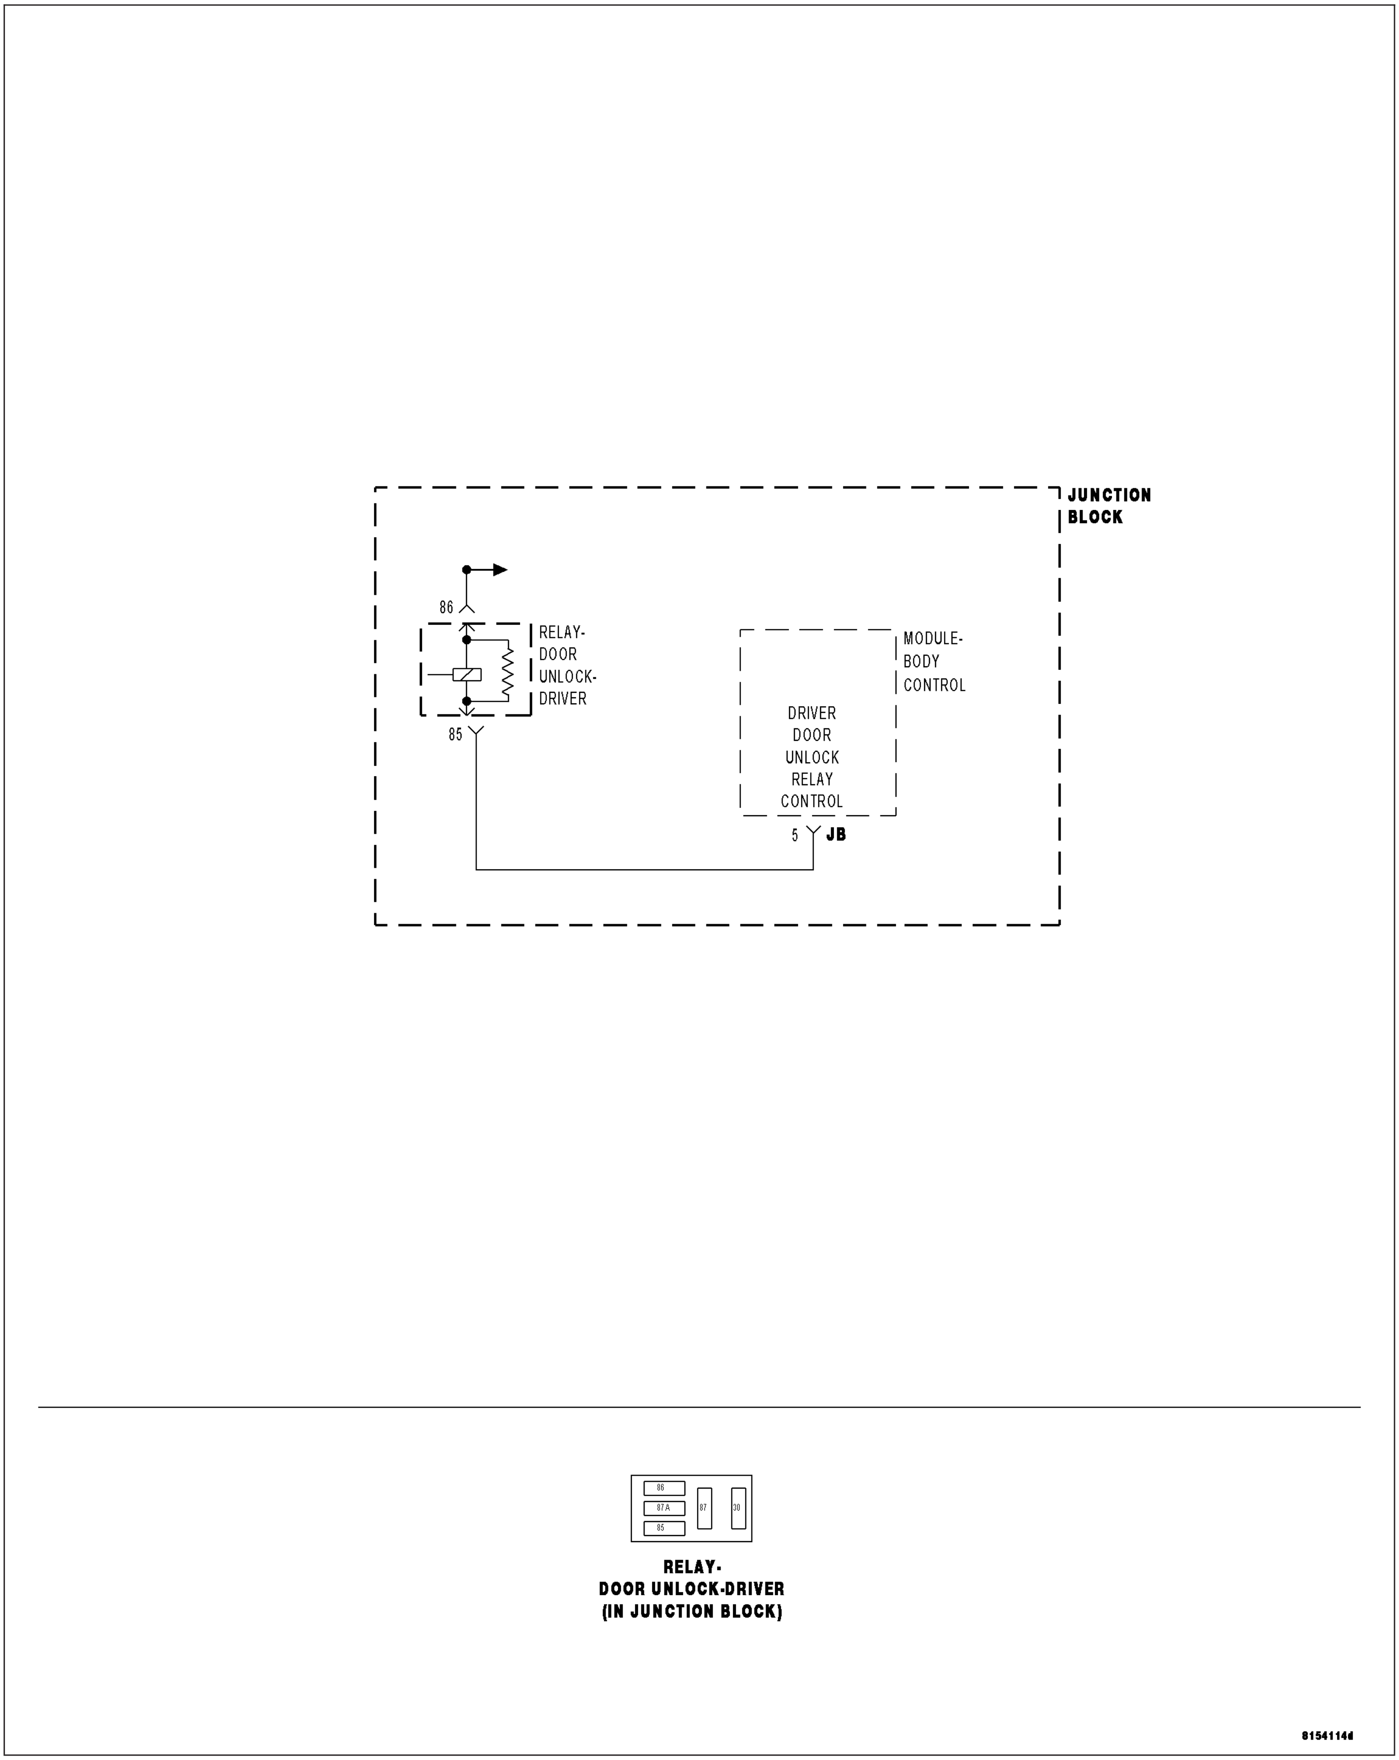
**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## DRIVER DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The BCM detects a high circuit on the Driver Door Unlock Relay Control circuit when it is attempting to Unlock the doors for more than 5 seconds. If the BCM is not able to ground its side of the relay coil, the control circuit remains high.

| Possible Causes |
| --- |
| RELAY SHORTED |
| JUNCTION BLOCK - DRIVER DOOR UNLOCK RELAY CONTROL SHORT TO VOLTAGE |
| BODY CONTROL MODULE - SHORTED |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

**NOTE: If the door locks are totally inoperative, check fuse No. 6 before proceeding.**

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the door locks several times.

With the scan tool, read DTCs.

**Does the scan tool display DRIVER DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK FOR SHORTED RELAY

Turn the ignition off.

Remove the Driver Door Unlock Relay from the Junction Block.

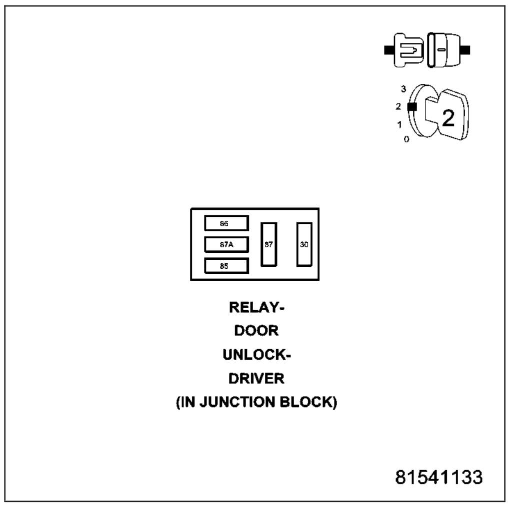
Install a substitute relay in place of the Driver Door Unlock Relay.

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the Door Locks several times.

With the scan tool, read DTCs.



**Does the scan tool display DRIVER DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE?**

**Yes** >> Go To 3

**No** >> Replace the original relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 3. CHECK THE JUNCTION BLOCK FOR THE (P109) DRIVER DOOR UNLOCK RELAY CONTROL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

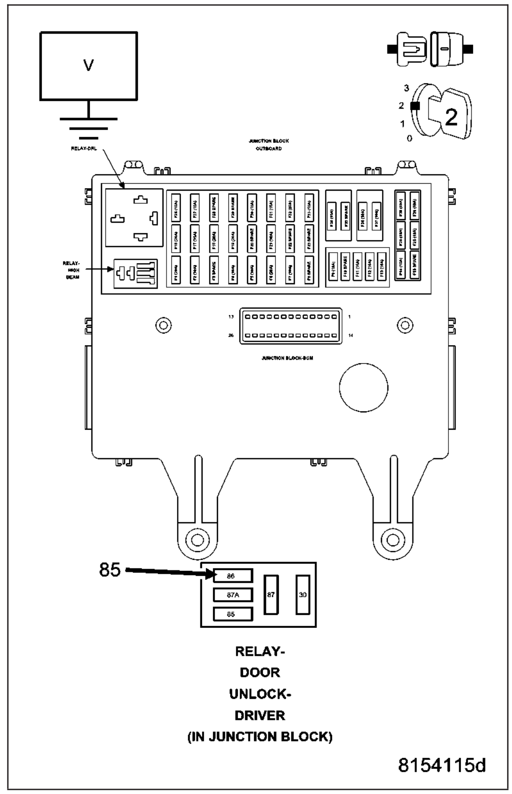
Remove the Driver Door Unlock Relay from the Junction Block.

Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block connectors are reconnected at this time.**

Turn the ignition on.

Measure the voltage between ground and the (P109) Driver Door Unlock Relay Control circuit in the relay connector of the Junction Block.



**Is there any voltage present?**

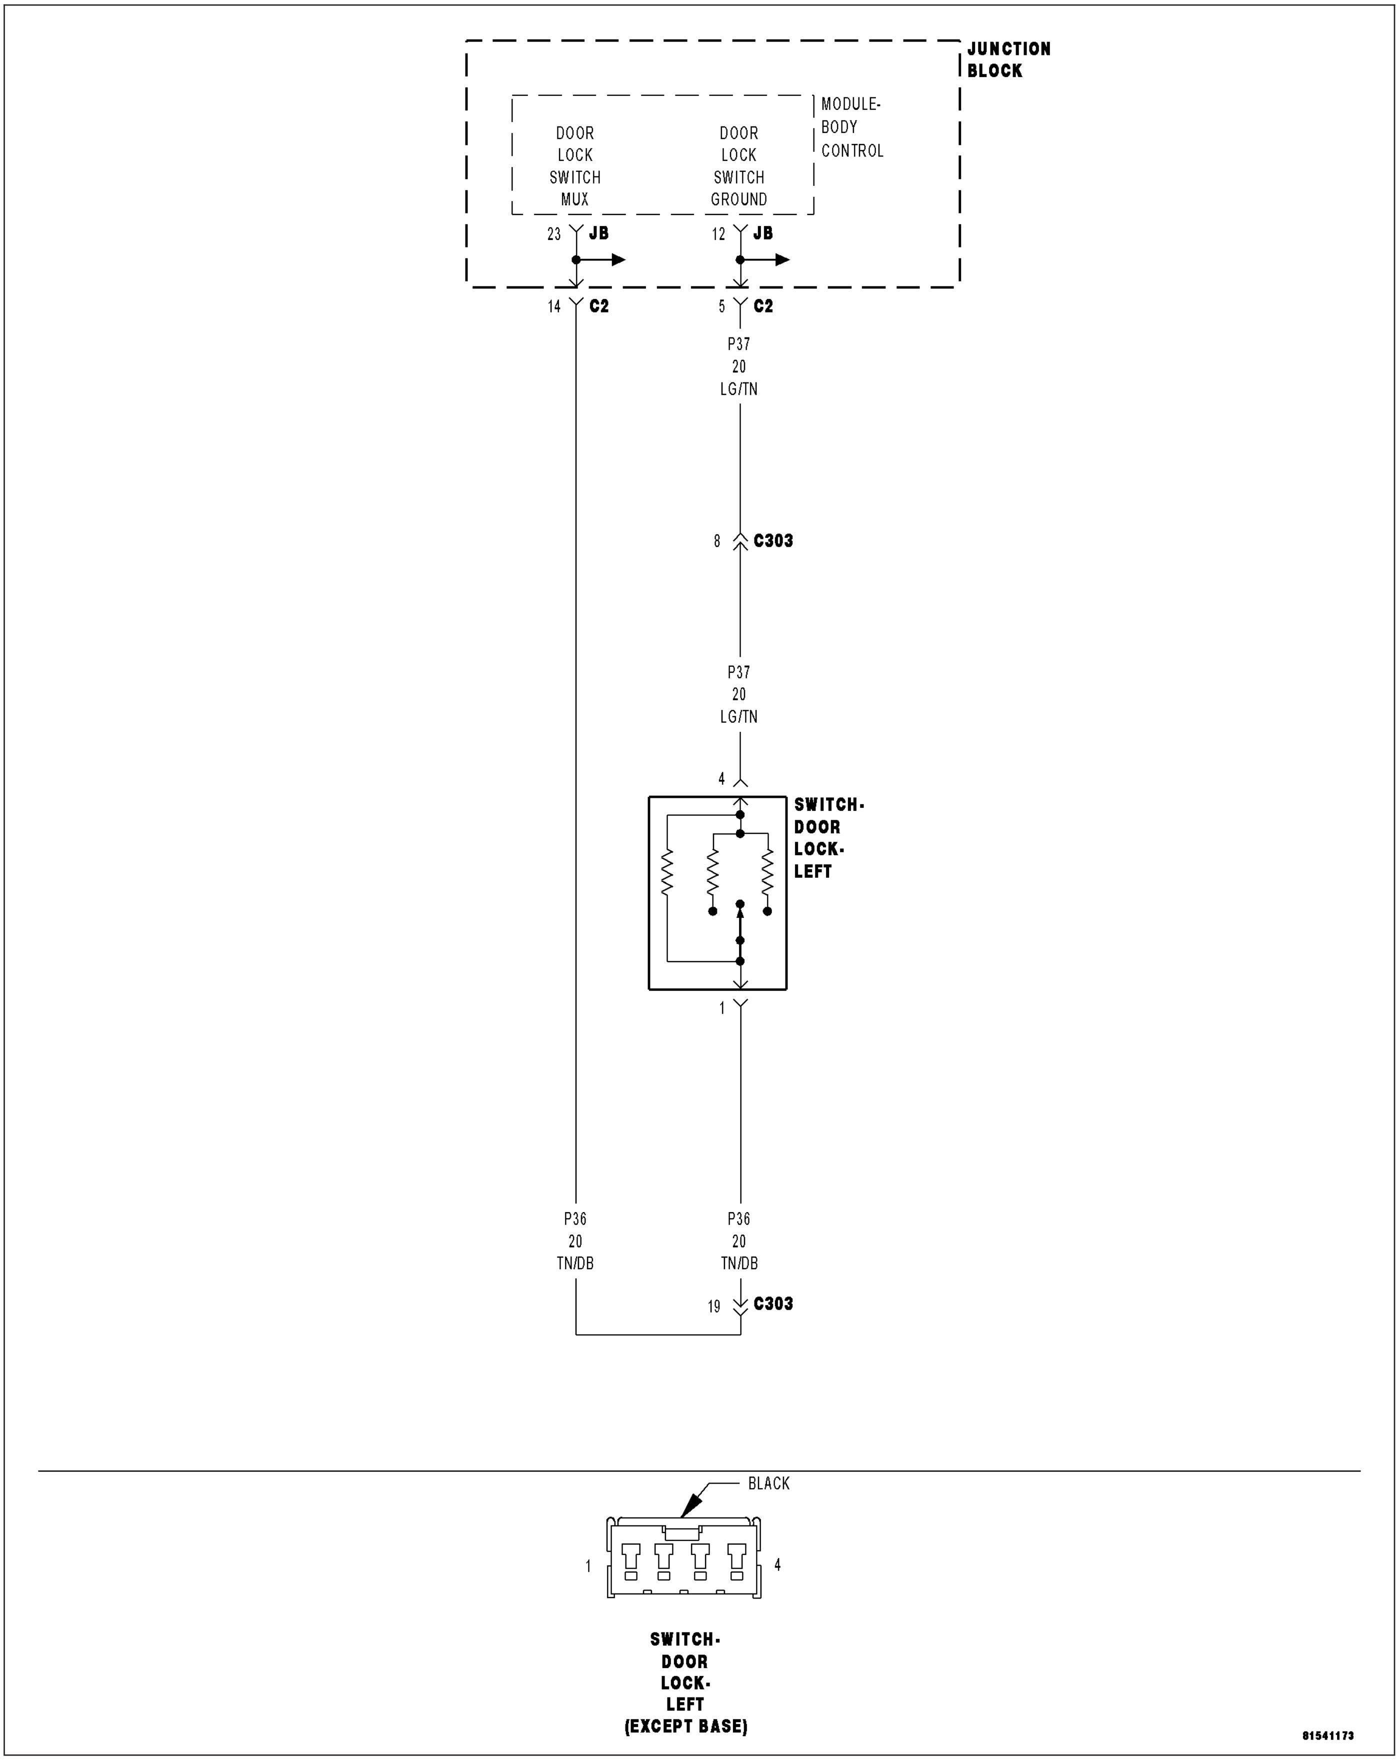
**Yes** >> Replace the Junction Block in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## DOOR LOCK SWITCH OPEN OR SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the ignition is on.
- **Set Condition:**
  When the BCM detects a voltage of greater than 4.75 volts on the door lock switch mux input for over 5 seconds, this code will set. The normal voltage on the circuit is between 0.25 and 4.75 volts depending on switch positions. NOTE: Left and right switches are in parallel.

| Possible Causes |
|---|
| (P37) LEFT DOOR LOCK SWITCH GND WIRE OPEN |
| (P36) LEFT DOOR LOCK SWITCH MUX WIRE OPEN |
| (P36) LEFT DOOR LOCK SWITCH MUX WIRE SHORT TO VOLTAGE |
| (P37) RIGHT DOOR LOCK SWITCH GND WIRE OPEN |
| (P36) RIGHT DOOR LOCK SWITCH MUX WIRE OPEN |
| (P36) RIGHT DOOR LOCK SWITCH MUX WIRE SHORT TO VOLTAGE |
| LEFT DOOR LOCK SWITCH - OPEN |
| LEFT DOOR LOCK SWITCH - SHORTED |
| RIGHT DOOR LOCK SWITCH - OPEN |
| RIGHT DOOR LOCK SWITCH - SHORTED |
| JUNCTION BLOCK OPEN |
| BODY CONTROL MODULE - DOOR LOCK SWITCH MUX OPEN |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the door locks several times from both door lock switches

With the scan tool read DTCs.

**Does the scan tool display DOOR LOCK SWITCH OPEN OR SHORT TO VOLTAGE?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary.

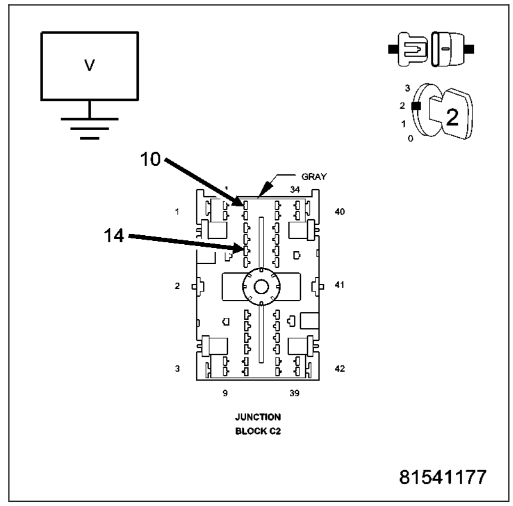
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 2. CHECK DOOR LOCK SWITCH MUX CIRCUIT FOR A SHORT TO VOLTAGE

Disconnect the Junction Block C2 connector.

Measure the voltage between ground and the (P36) Door Lock Switch Mux circuit cavity 14 in the C2 connector.

Measure the voltage between ground and the (P36) Door Lock Switch Mux circuit cavity 10 in the C2 connector.



**Which cavity had greater than 0.5 volts?**

**Cavity 14 - Left Door**
Go To 3

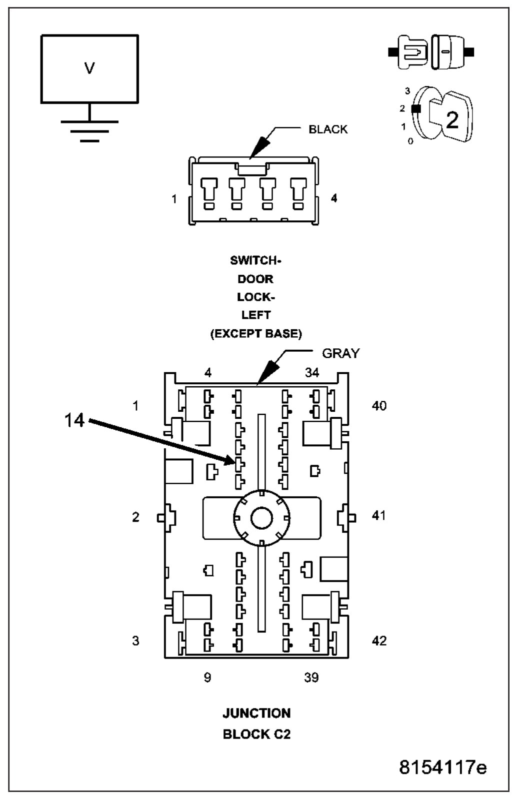
**Cavity 10 - Right Door**
Go To 4

**Neither circuit over 0.5 volts.**
Go To 5

## 3. CHECK LEFT DOOR LOCK SWITCH MUX WIRE FOR A SHORT TO VOLTAGE

Disconnect the Left Door Lock Switch connector.

Measure the voltage between ground and the (P36) Door Lock Switch Mux circuit cavity 14 in the JB-C2 connector.



**Is there any voltage present?**

**Yes** >> Repair the (P36) Door Lock Switch Mux wire for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

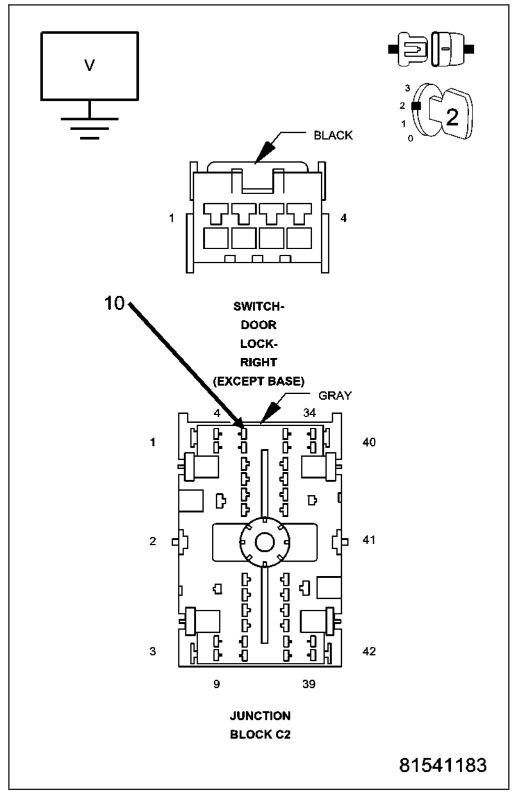
**No** >> Replace the Left Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 4. CHECK RIGHT DOOR LOCK SWITCH MUX WIRE FOR A SHORT TO VOLTAGE

Disconnect the Right Door Lock Switch connector.

Measure the voltage between ground and the (P36) Door Lock Switch Mux circuit cavity 10 in the JB-C2 connector.



**Is there any voltage present?**

**Yes** >> Repair the (P36) Door Lock Switch Mux wire for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Right Door Lock Switch.

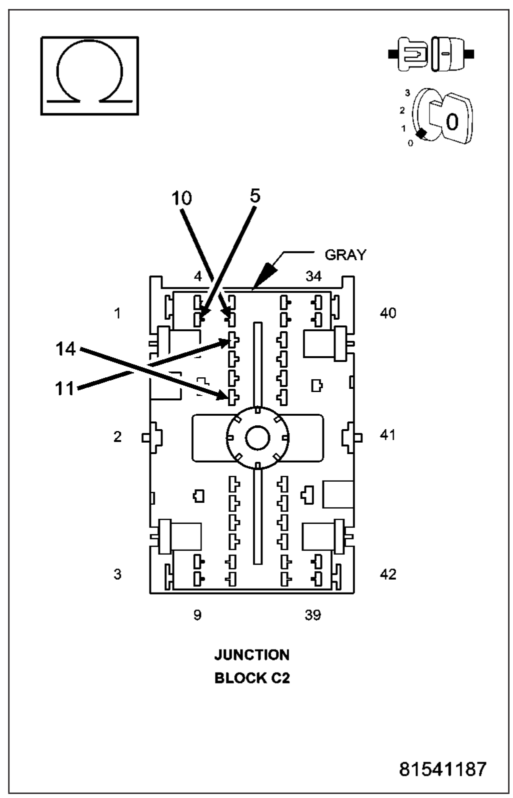
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 5. CHECK DOOR LOCK SWITCH MUX CIRCUIT FOR AN OPEN

Turn the ignition off.

Measure the resistance between the (P37) Door Lock Switch Ground cavity 5 and the (P36) Door Lock Switch Mux circuit cavity 10 in the JB-C2 connector.

Measure the resistance between the (P37) Door Lock Switch Ground cavity 11 and the (P36) Door Lock Switch Mux circuit cavity 14 in the JB-C2 connector.



**Which circuit was NOT between 4500 and 5500 ohms?**

**Cavities 5 & 10 - Right Door**
Go To 6

**Cavities 11 & 14 - Left Door**
Go To 8

**Both were approximately 5000 ohms.**
Go To 10

## 6. CHECK RIGHT DOOR LOCK SWITCH MUX WIRE FOR AN OPEN

Disconnect the Right Door Lock Switch connector.

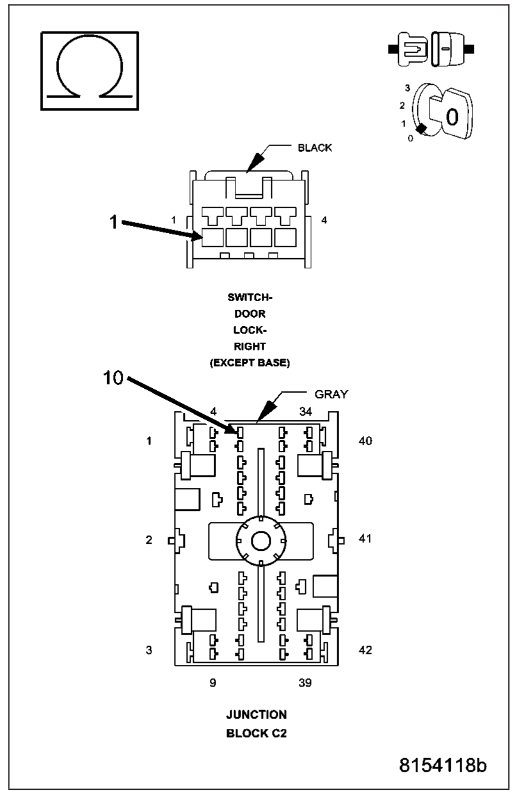
Measure the resistance of the (P36) Door Lock Switch Mux circuit between cavity 10 in the JB-C2 connector and the Right Door Lock Switch connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (P36) Door Lock Switch Mux wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 7. CHECK RIGHT DOOR LOCK SWITCH GROUND WIRE FOR AN OPEN

Measure the resistance of the (P37) Door Lock Switch Ground circuit between cavity 5 in the JB-C2 connector and the Right Door Lock Switch connector.

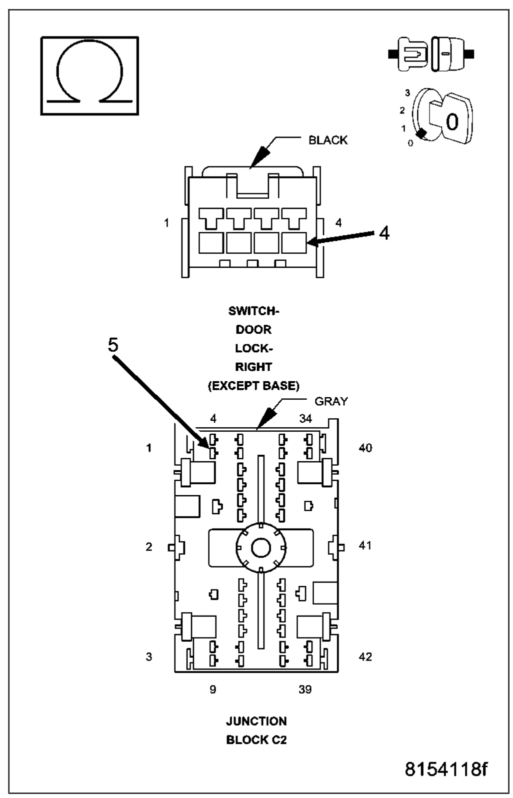
**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Right Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (P37) Door Lock Switch Ground wire for an open.

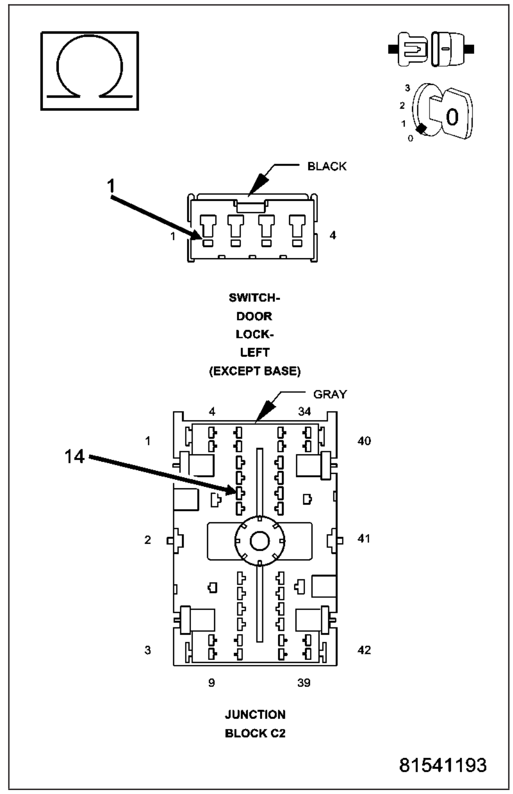
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 8. CHECK LEFT DOOR LOCK SWITCH MUX WIRE FOR AN OPEN

Disconnect the Left Door Lock Switch connector.

Measure the resistance of the (P36) Door Lock Switch Mux circuit between cavity 14 in the JB-C2 connector and the Left Door Lock Switch connector.



**Is the resistance below 5.0 ohms?**

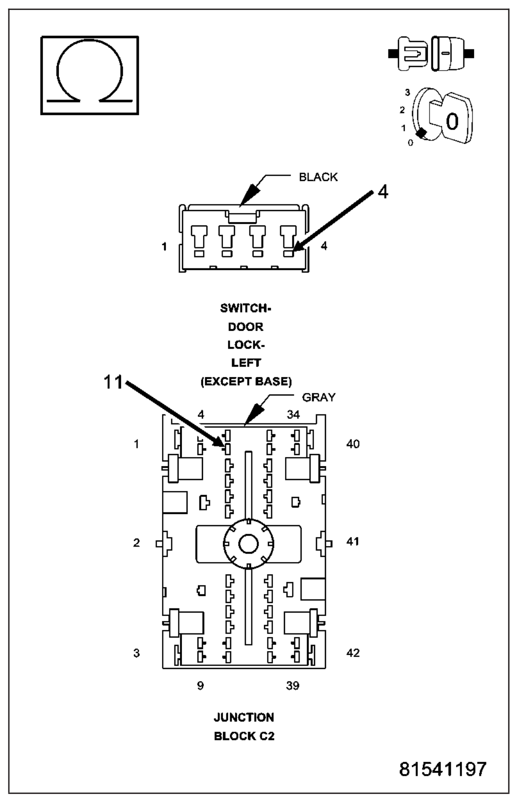
**Yes** >> Go To 9

**No** >> Repair the (P36) Door Lock Switch Mux wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 9. CHECK LEFT DOOR LOCK SWITCH GROUND WIRE FOR AN OPEN

Measure the resistance of the (P37) Door Lock Switch Ground circuit between cavity 11 in the JB-C2 connector and the Left Door Lock Switch connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Left Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (P37) Door Lock Switch Ground wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 10. CHECK THE JUNCTION BLOCK FOR AN OPEN

Disconnect the battery ground cable.

Disconnect all the Junction Block connectors and remove the Junction Block.

Remove the Body Control Module from the Junction Block.

**NOTE: Make all measurements in the Junction Block – NOT the harness connector.**

Measure the resistance of the (P36) Door Lock Switch Mux circuit between cavity 23 in the Junction Block - Body Control Module connector and cavity 10 in the Junction Block C2.

Measure the resistance of the (P36) Door Lock Switch Mux circuit between cavity 23 in the Junction Block - Body Control Module connector and cavity 14 in the Junction Block C2.

Measure the resistance of the (P37) Door Lock Switch Ground circuit between cavity 12 in the Junction Block - Body Control Module connector and cavity 5 in the Junction Block C2.

Measure the resistance of the (P37) Door Lock Switch Ground circuit between cavity 12 in the Junction Block - Body Control Module connector and cavity 11 in the Junction Block C2.

**Is the resistance below 1.0 ohm for each circuit?**

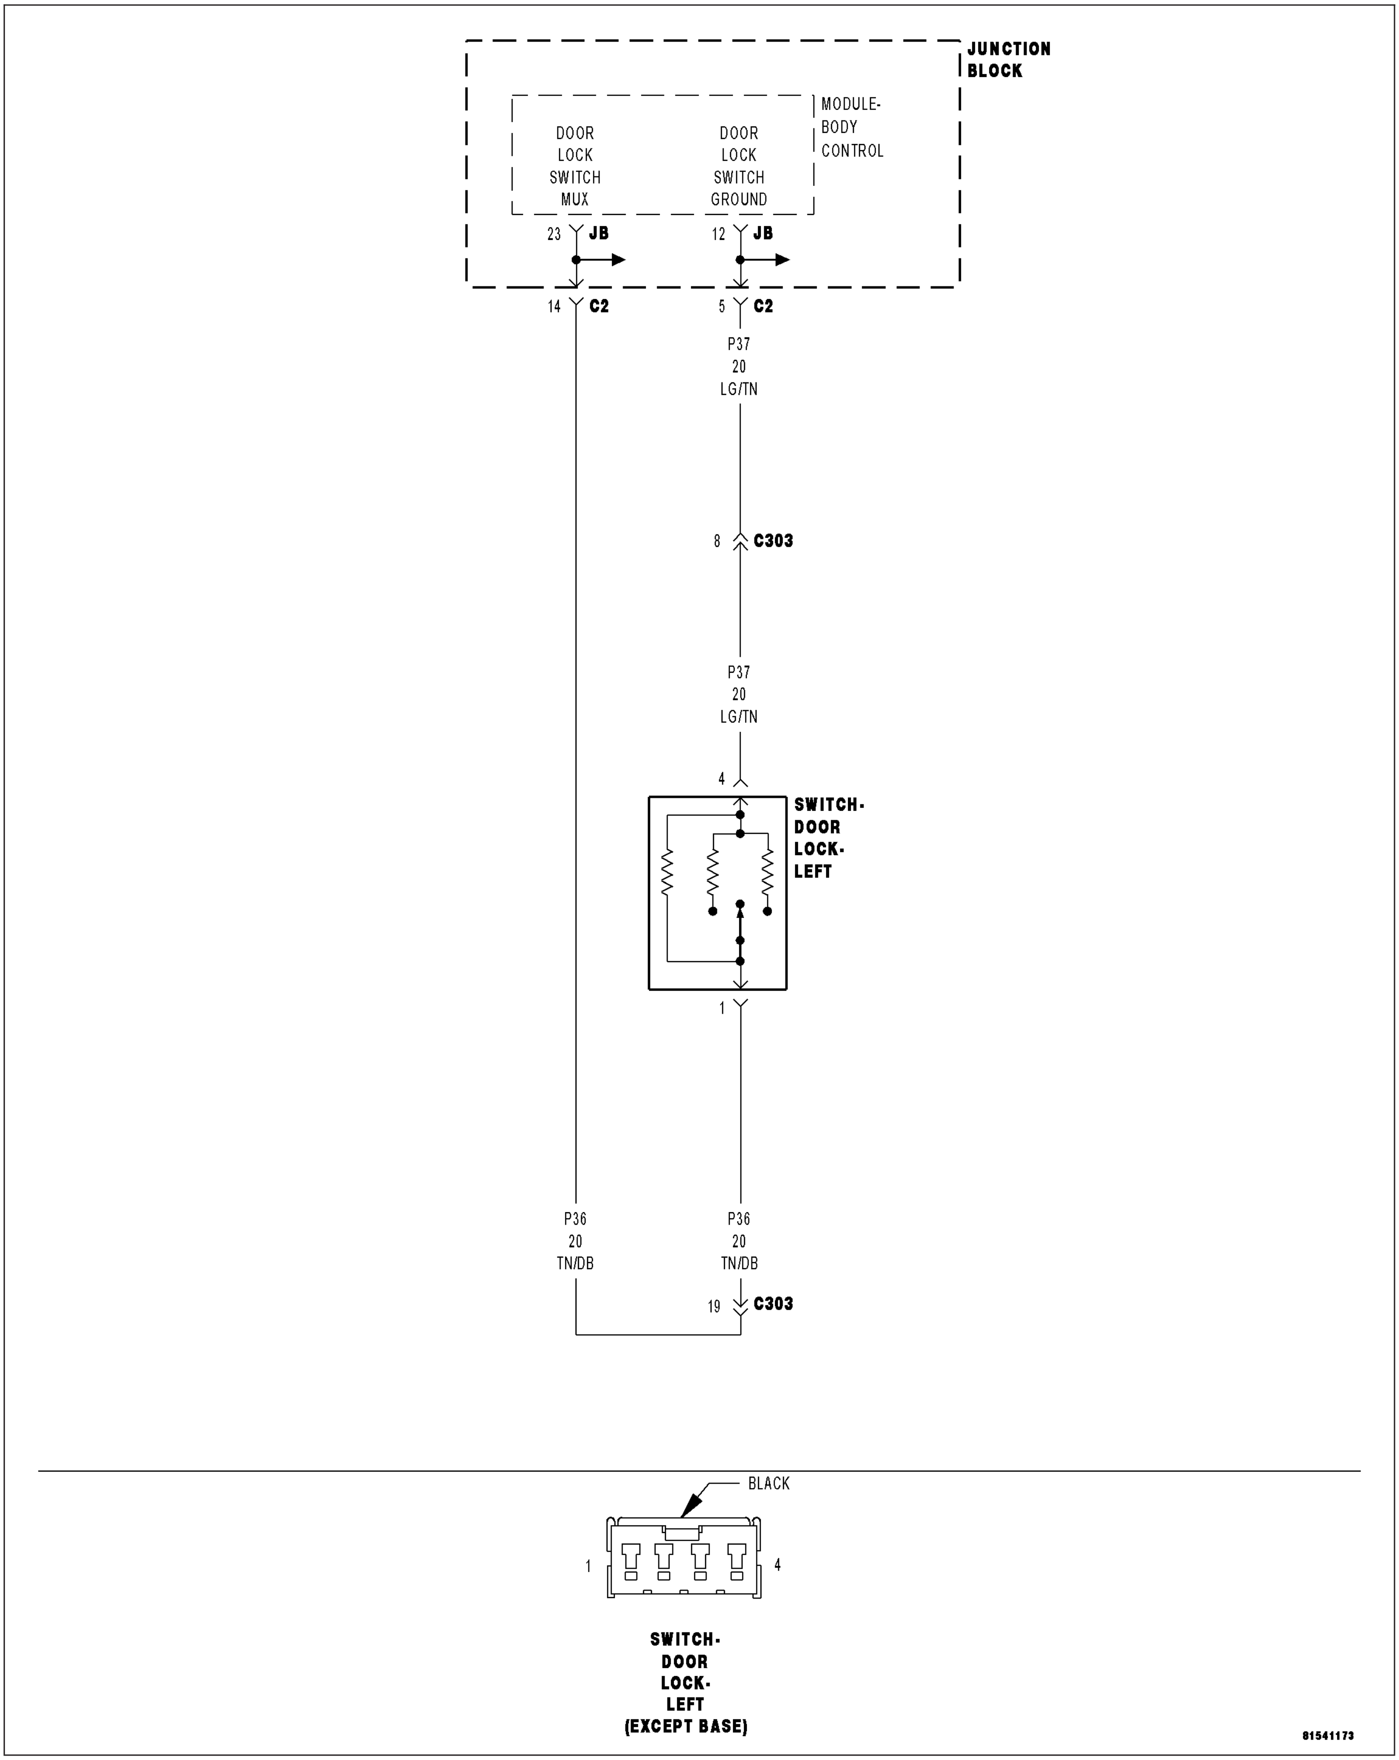
**Yes** >> Replace the Body Control Module.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## DOOR LOCK SWITCH SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the ignition is on.
- **Set Condition:**
  When the BCM detects a voltage of less than 0.25 volts on the door lock switch mux input for over 5 seconds, this code will set. The normal voltage on the circuit is between 0.25 and 4.75 volts depending on switch positions. NOTE: Left and right switches are in parallel.

| Possible Causes |
|---|
| (P36) LEFT DOOR LOCK SWITCH MUX WIRE SHORT TO GROUND |
| (P36) RIGHT DOOR LOCK SWITCH MUX WIRE SHORT TO GROUND |
| LEFT DOOR LOCK SWITCH - SHORTED |
| RIGHT DOOR LOCK SWITCH - SHORTED |
| JUNCTION BLOCK SHORT TO GROUND |
| BODY CONTROL MODULE - DOOR LOCK SWITCH MUX SHORT TO GROUND |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

Turn the ignition on.

With the scan tool, erase DTCs.

Operate the door locks several times from both door lock switches

With the scan tool read DTCs.

**Does the scan tool display DOOR LOCK SWITCH SHORT TO GROUND?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK THE LEFT DOOR LOCK SWITCH MUX CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

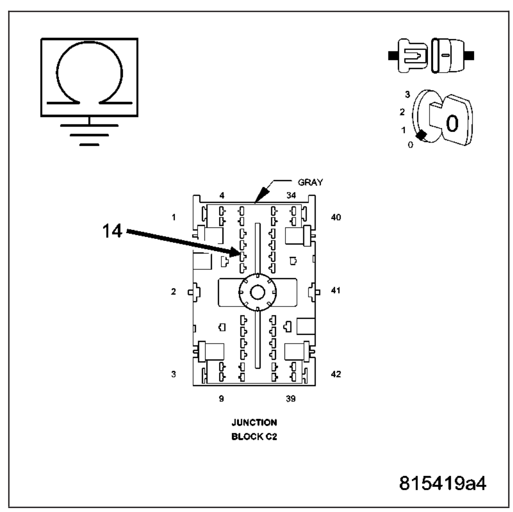
Disconnect the Junction Block C2 connector.

Measure the resistance between ground and the (P36) Door Lock Switch Mux circuit cavity 14 in the JB-C2 connector.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Go To 3

**No** >> Go To 4



## 3. CHECK LEFT DOOR LOCK SWITCH MUX WIRE FOR A SHORT TO GROUND

Disconnect the Left Door Lock Switch connector.

Measure the resistance between ground and the (P36) Door Lock Switch Mux circuit cavity 14 in the JB-C2 connector.

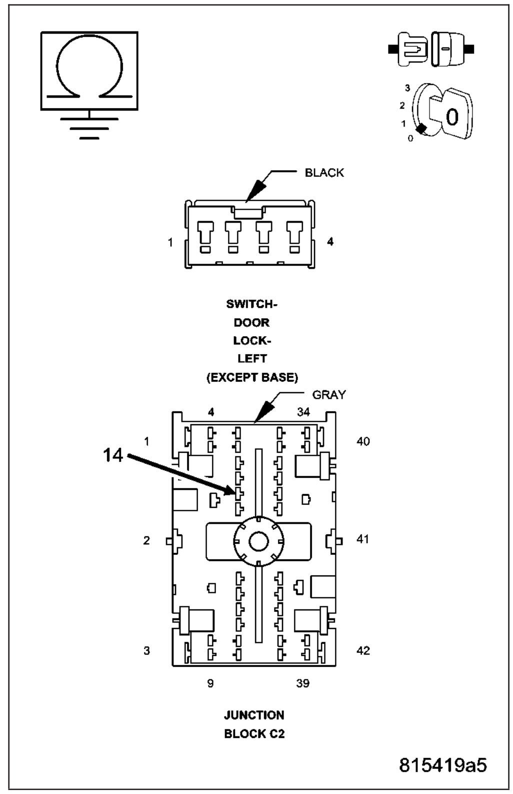
**Is the resistance below 1000.0?**

**Yes** >> Repair the (P36) Door Lock Switch Mux wire for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Left Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



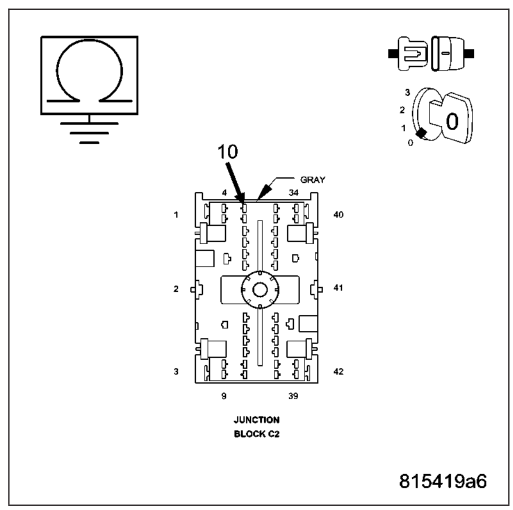
## 4. CHECK THE RIGHT DOOR LOCK SWITCH MUX CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (P36) Door Lock Switch Mux circuit cavity 10 in the JB-C2 connector.

**Is the resistance below 1000.0 ohms?**

**No** >> Go To 6

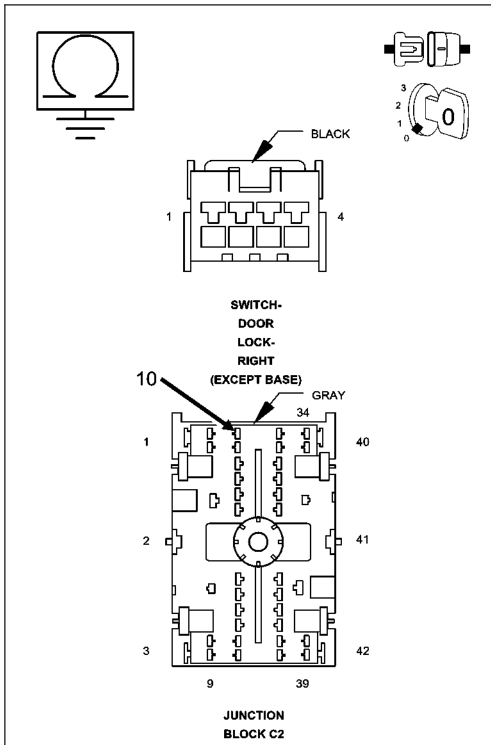
**Yes** >> Go To 5



## 5. CHECK RIGHT DOOR LOCK SWITCH MUX WIRE FOR A SHORT TO GROUND

Disconnect the Right Door Lock Switch connector.

Measure the resistance between ground and the (P36) Door Lock Switch Mux circuit cavity 10 in the JB-C2 connector.



815419a7

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (P36) Door Lock Switch Mux wire for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Right Door Lock Switch.

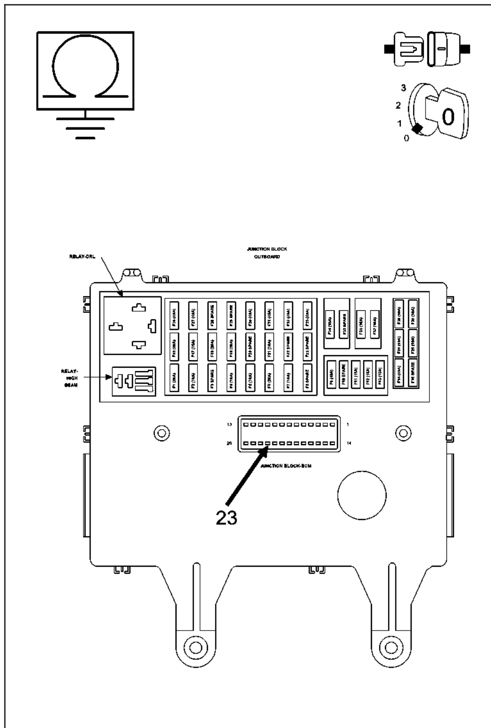
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 6. CHECK THE JUNCTION BLOCK FOR A SHORT TO GROUND

Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block C1, C2 and C3 connectors are connected before proceeding.**

Measure the resistance between ground and the (P36) Door Lock Switch Mux circuit cavity 23 in the Junction Block - Body Control Module connector.



815419a8

**Is the resistance below 2000.0 ohms?**

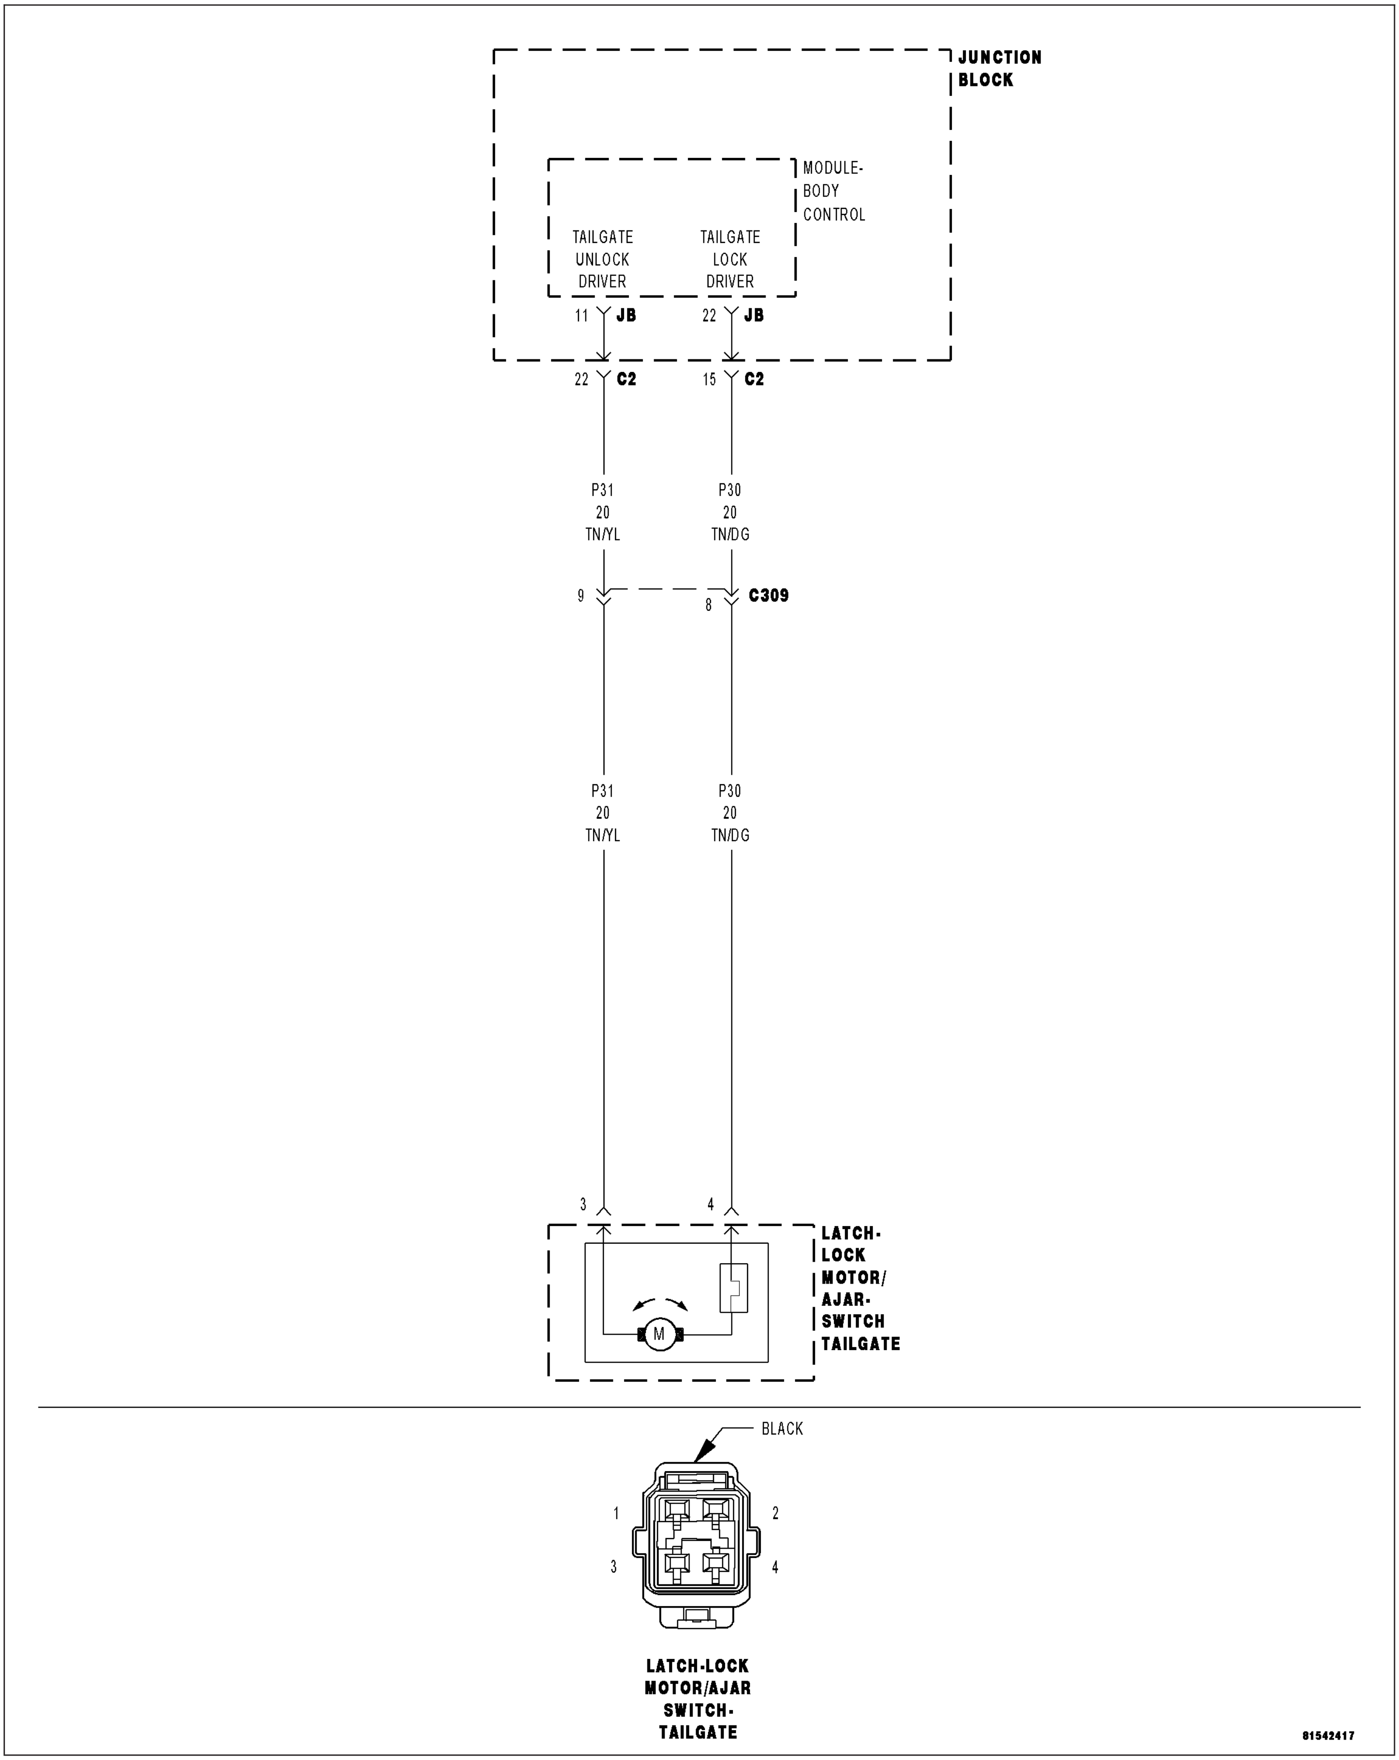
**Yes** >> Replace the Junction Block in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## TAILGATE LOCK MOTOR SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Whenever the ignition is on.
- **Set Condition:**
  When the BCM detects voltage on either the Tailgate Lock Driver or Unlock Driver circuit for longer than 5 seconds when the Tailgate is not being actuated. If there is, the BCM will disable the lock functions to protect the BCM.

| Possible Causes |
|---|
| TAILGATE (P30) LOCK OR (P31) UNLOCK CIRCUIT SHORT TO VOLTAGE |
| JUNCTION BLOCK - SHORT TO VOLTAGE |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. CHECK TROUBLE CODE

Turn the ignition on.

With the scan tool, erase DTCs.

Cycle the ignition switch from Off to On and wait 10 seconds.

With the scan tool , read DTCs.

**Does the scan tool display TAILGATE LOCK MOTOR SHORT TO VOLTAGE?**

**Yes** >> Go To 2

**No** >> Problem is intermittent and not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK TAILGATE LOCK OR UNLOCK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Junction Block C2 connector.

Turn the ignition on.

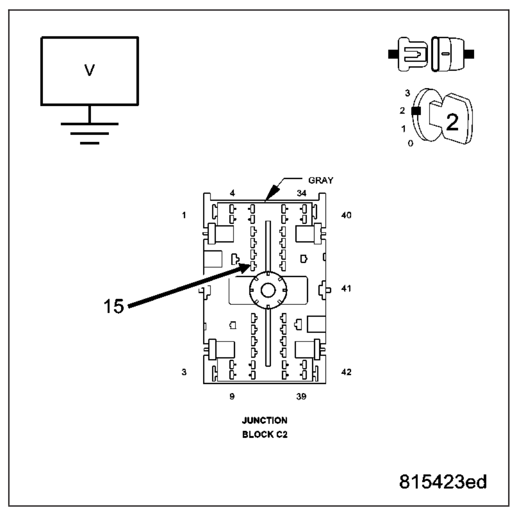
Measure the voltage between (P30) Tailgate Lock Driver circuit and ground.

**Is there any voltage present?**

**Yes** >> Repair the Tailgate (P30) Lock or (P31) Unlock Driver for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



## 3. CHECK JUNCTION BLOCK FOR A SHORT TO VOLTAGE

Turn the ignition off.

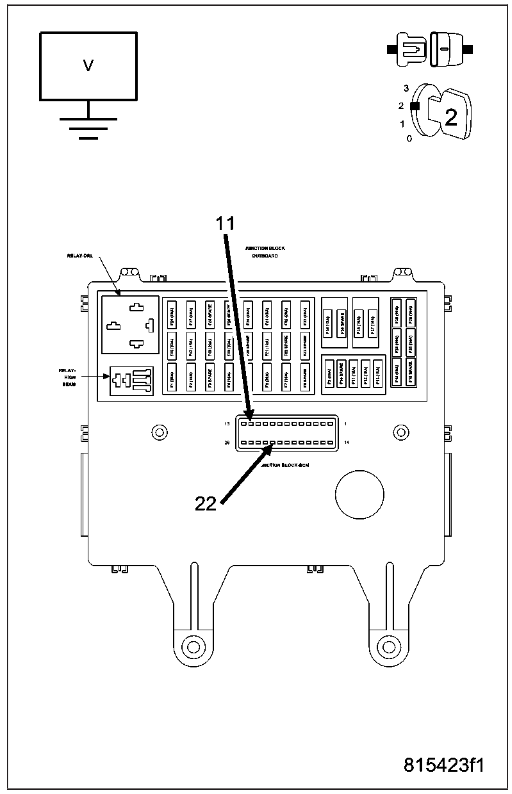
Remove the Body Control Module from the Junction Block.

**NOTE: Ensure the Junction Block C1, C2 and C3 connectors are connected at this time.**

Turn the ignition on.

Measure the voltage between the (P30) Tailgate Lock Driver circuit in the Junction Block - BCM connector and ground.

Measure the voltage between the (P31) Tailgate Unlock Driver circuit in the Junction Block - BCM connector and ground.



**Is there any voltage present on either circuit?**

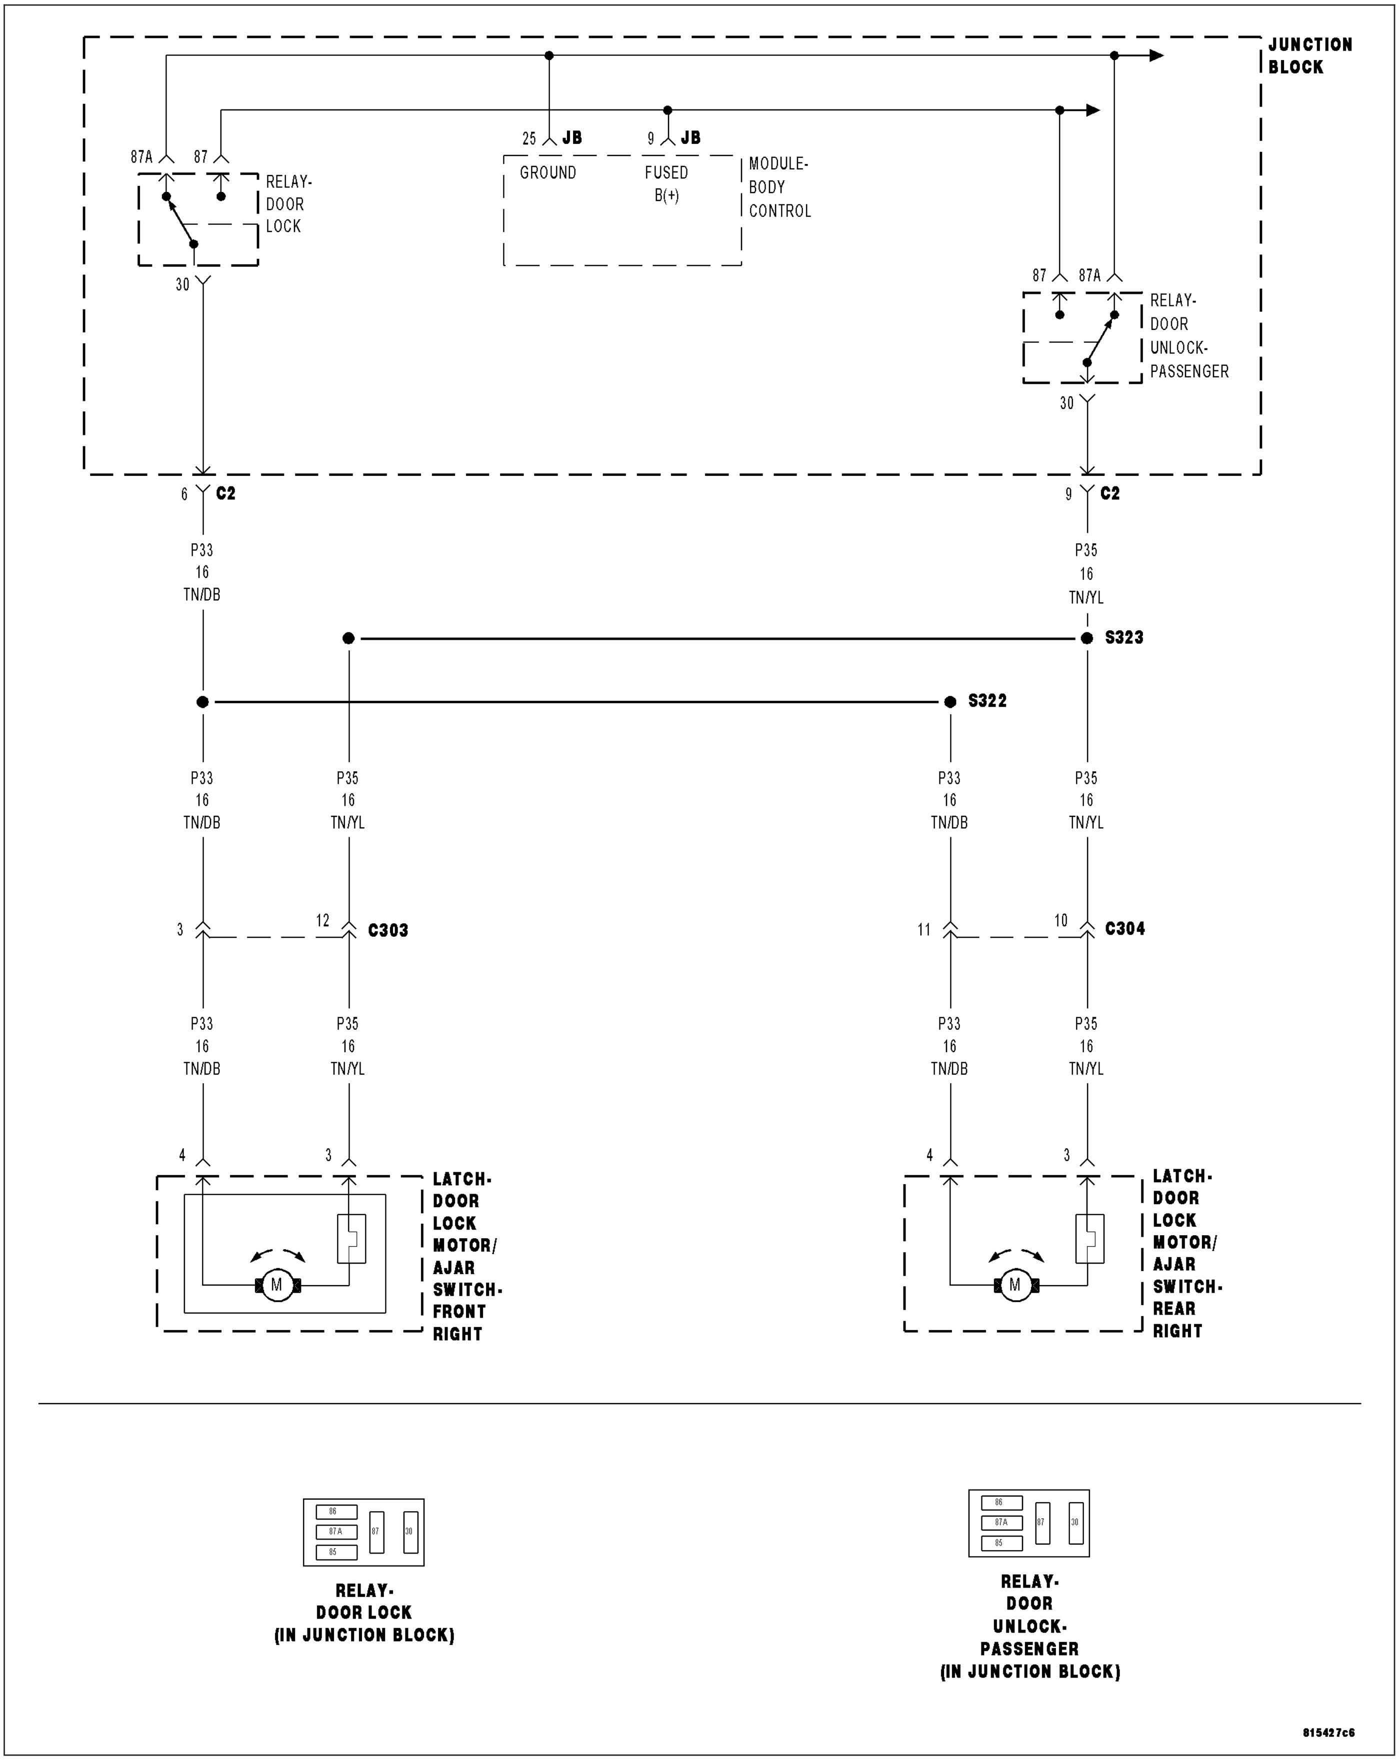
**Yes** >> Replace the Junction Block in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *ALL DOORS FAIL TO LOCK



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| KEY-IN IGNITION SWITCH SHORTED |
| (P33) DOOR LOCK RELAY OUTPUT CIRCUIT SHORT TO GROUND |
| DOOR LOCK RELAY |

## Diagnostic Test

### 1. DTC'S PRESENT

With the scan tool, read DTCs.

**Are there any Power Door Lock related codes present?**

**Yes** >> Refer to symptom list for problems related to POWER DOOR LOCKS/RKE.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK KEY-IN IGNITION SWITCH – SHORTED

Close both front doors.

Insert the key in the ignition switch but do not turn the switch on.

**Does the Chime continue to sound?**

**Yes** >> Refer to symptom list for problems related to CHIME.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

### 3. CHECK DOOR LOCK RELAY OUTPUT CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

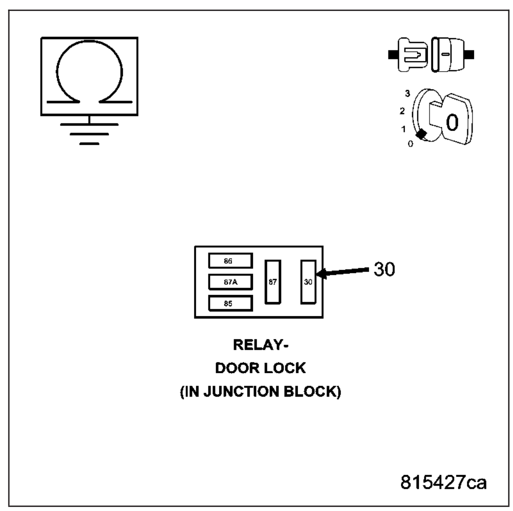
Remove the Door Lock, the Door Unlock and the Driver Door Unlock relays from the Junction Block.

Measure the resistance between ground and the (P33) Door Lock Relay Output circuit in the Door Lock relay connector.

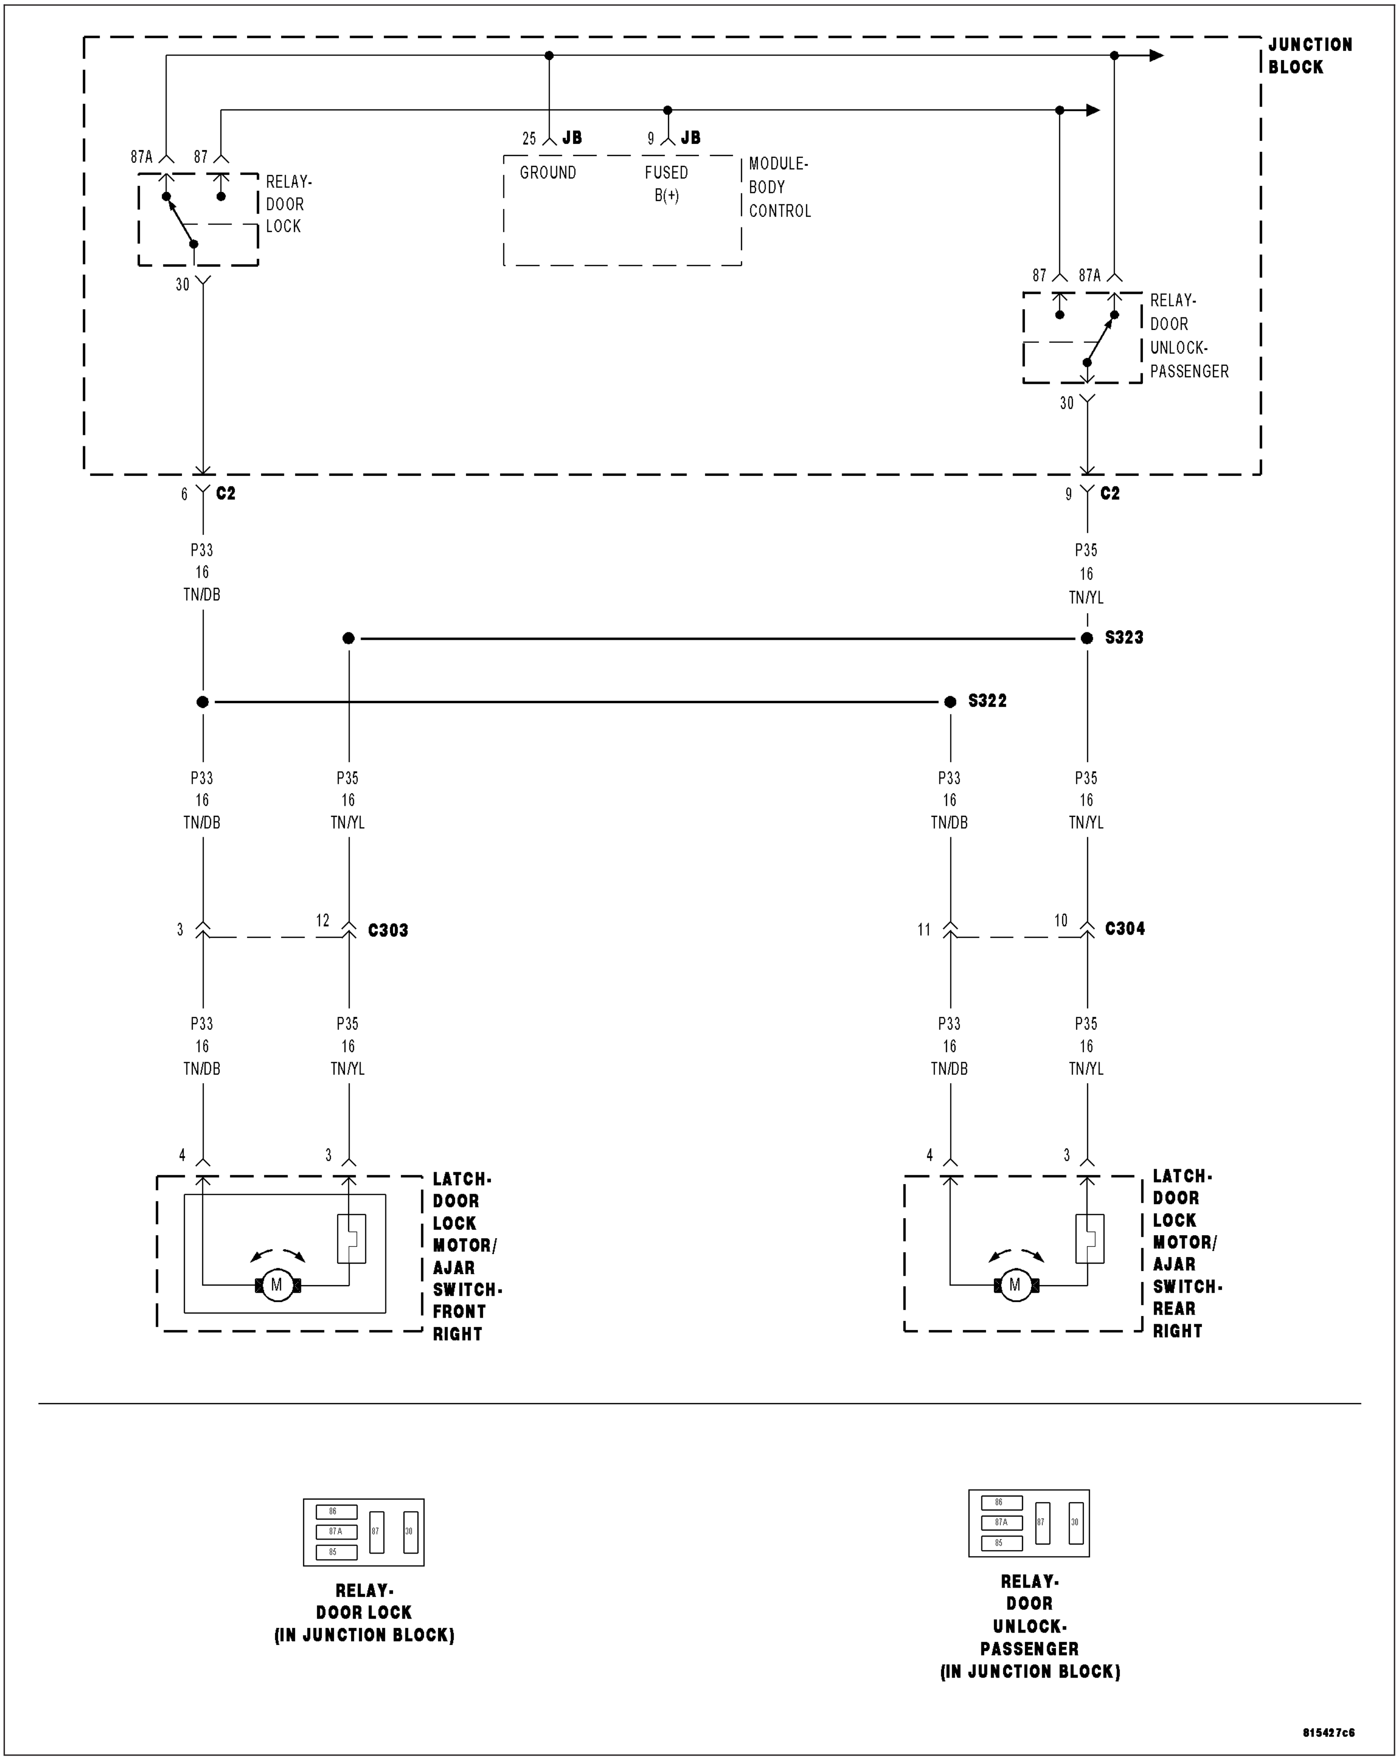
**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (P33) Door Lock Relay Output circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Door Lock Relay.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



# *ALL PASSENGER DOORS FAIL TO LOCK AND UNLOCK



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (P35) DOOR UNLOCK RELAY OUTPUT CIRCUIT OPEN |
| DOOR UNLOCK RELAY |

## Diagnostic Test

### 1. DTC'S PRESENT

With the scan tool, read DTCs.

**Are there any Power Door Lock related codes present?**

**Yes** >> Refer to symptom list for problems related to POWER DOOR LOCKS/RKE.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK (P35) DOOR UNLOCK RELAY OUTPUT CIRCUIT OPEN

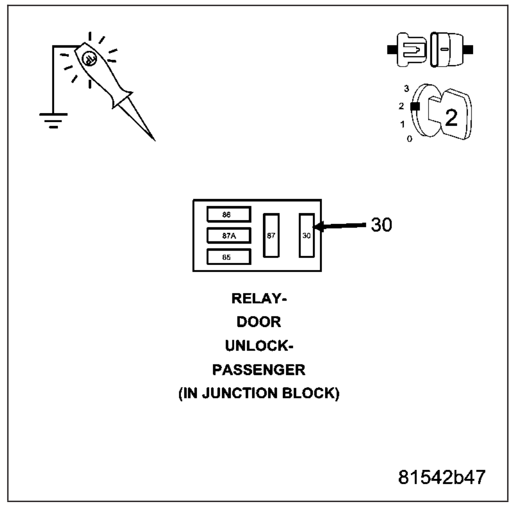
Turn the ignition off.

Remove the Door Unlock Relay from the Junction Block.

Using a 12-volt test light connected to ground, check the (P35) Door Unlock Relay Output circuit (cavity 30) in the relay connector.

Turn the ignition on.

With the scan tool, actuate the Door Locks (relay).



**Does the test light illuminate brightly when the relay is actuated?**

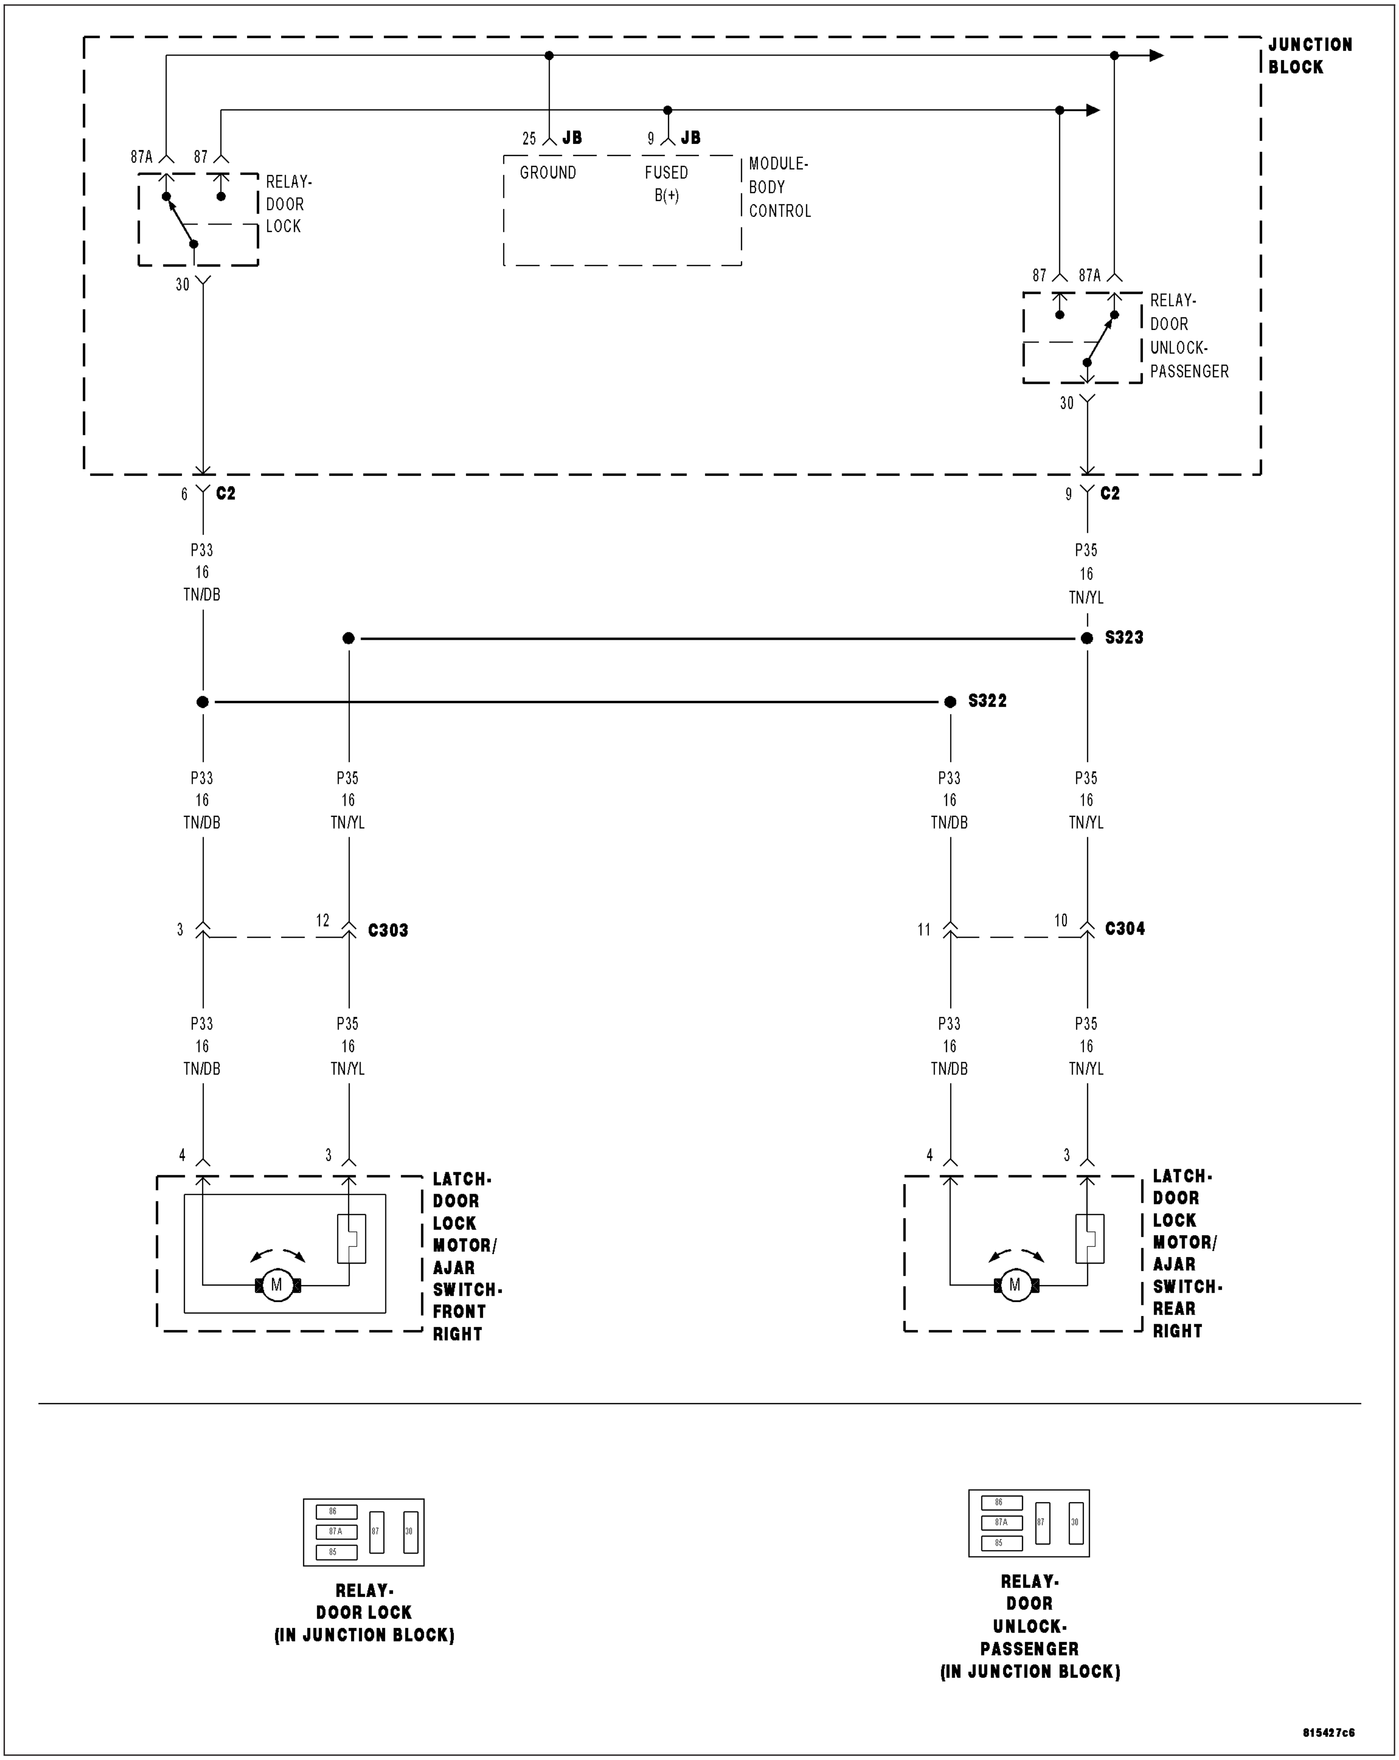
**Yes** >> Replace the Door Unlock Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (P35) Door Unlock Relay Output circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *ALL PASSENGER DOORS FAIL TO UNLOCK



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (P35) DOOR UNLOCK RELAY OUTPUT CIRCUIT SHORT TO GROUND |
| DOOR UNLOCK RELAY |

## Diagnostic Test

### 1. DTC'S PRESENT

With the scan tool, read DTCs.

**Are there any Power Door Lock related codes present?**

**Yes** >> Refer to symptom list for problems related to POWER DOOR LOCKS/RKE.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK (P35) DOOR UNLOCK RELAY OUTPUT FOR SHORT TO GROUND

Turn the ignition off.

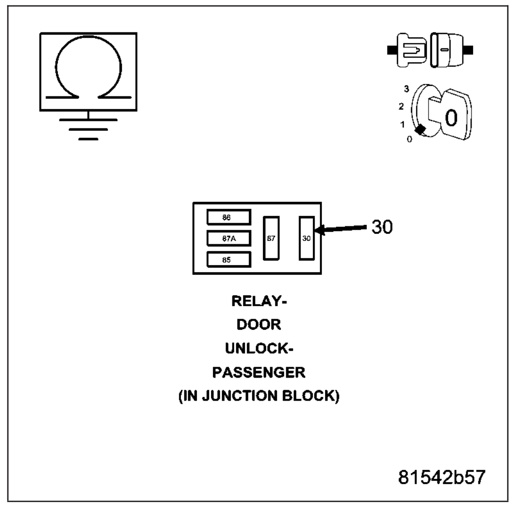
Remove the Door Lock, the Door Unlock and the Driver Door Unlock Relays from the Junction Block.

Measure the resistance between ground and the (P35) Door Unlock Relay Output circuit (cavity 30) in the Door Unlock Relay connector.

**Is the resistance below 1000.0 ohms?**

**No** >> Replace the Door Unlock Relay.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**Yes** >> Repair the (P35) Door Unlock Relay Output circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



# *AUTO DOOR LOCKS INOPERATIVE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| AUTO (ROLLING) DOOR LOCKS NOT ENABLED |
| DOOR AJAR STATUS |
| PCM DTC'S PRESENT |
| BODY CONTROL MODULE - AUTO LOCKS INOPERATIVE |

## Diagnostic Test

### 1. READ AUTO DOOR LOCK STATUS ON SCAN TOOL

With the scan tool select: ″Body Controller″, ″Miscellaneous″, ″Auto Door Locks″

**Does the scan tool show ″Auto Door Locks: ENABLED″?**

**Yes** >> Go To 2

**No** >> With the scan tool, enable the Auto (Rolling) Door Locks, open and close the driver door at least once and retest the System.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

### 2. CHECK DOOR AJAR STATES

Ensure all doors are closed.

With the scan tool read all DOOR AJAR states

**Do any door ajar states show CLOSED?**

**Yes** >> Refer to symptom list for problems related to DOOR AJAR.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3

### 3. CHECK FOR PCM DTC's

With the scan tool read ″Engine″ DTC's.

**Are there any TPS DTC's present?**

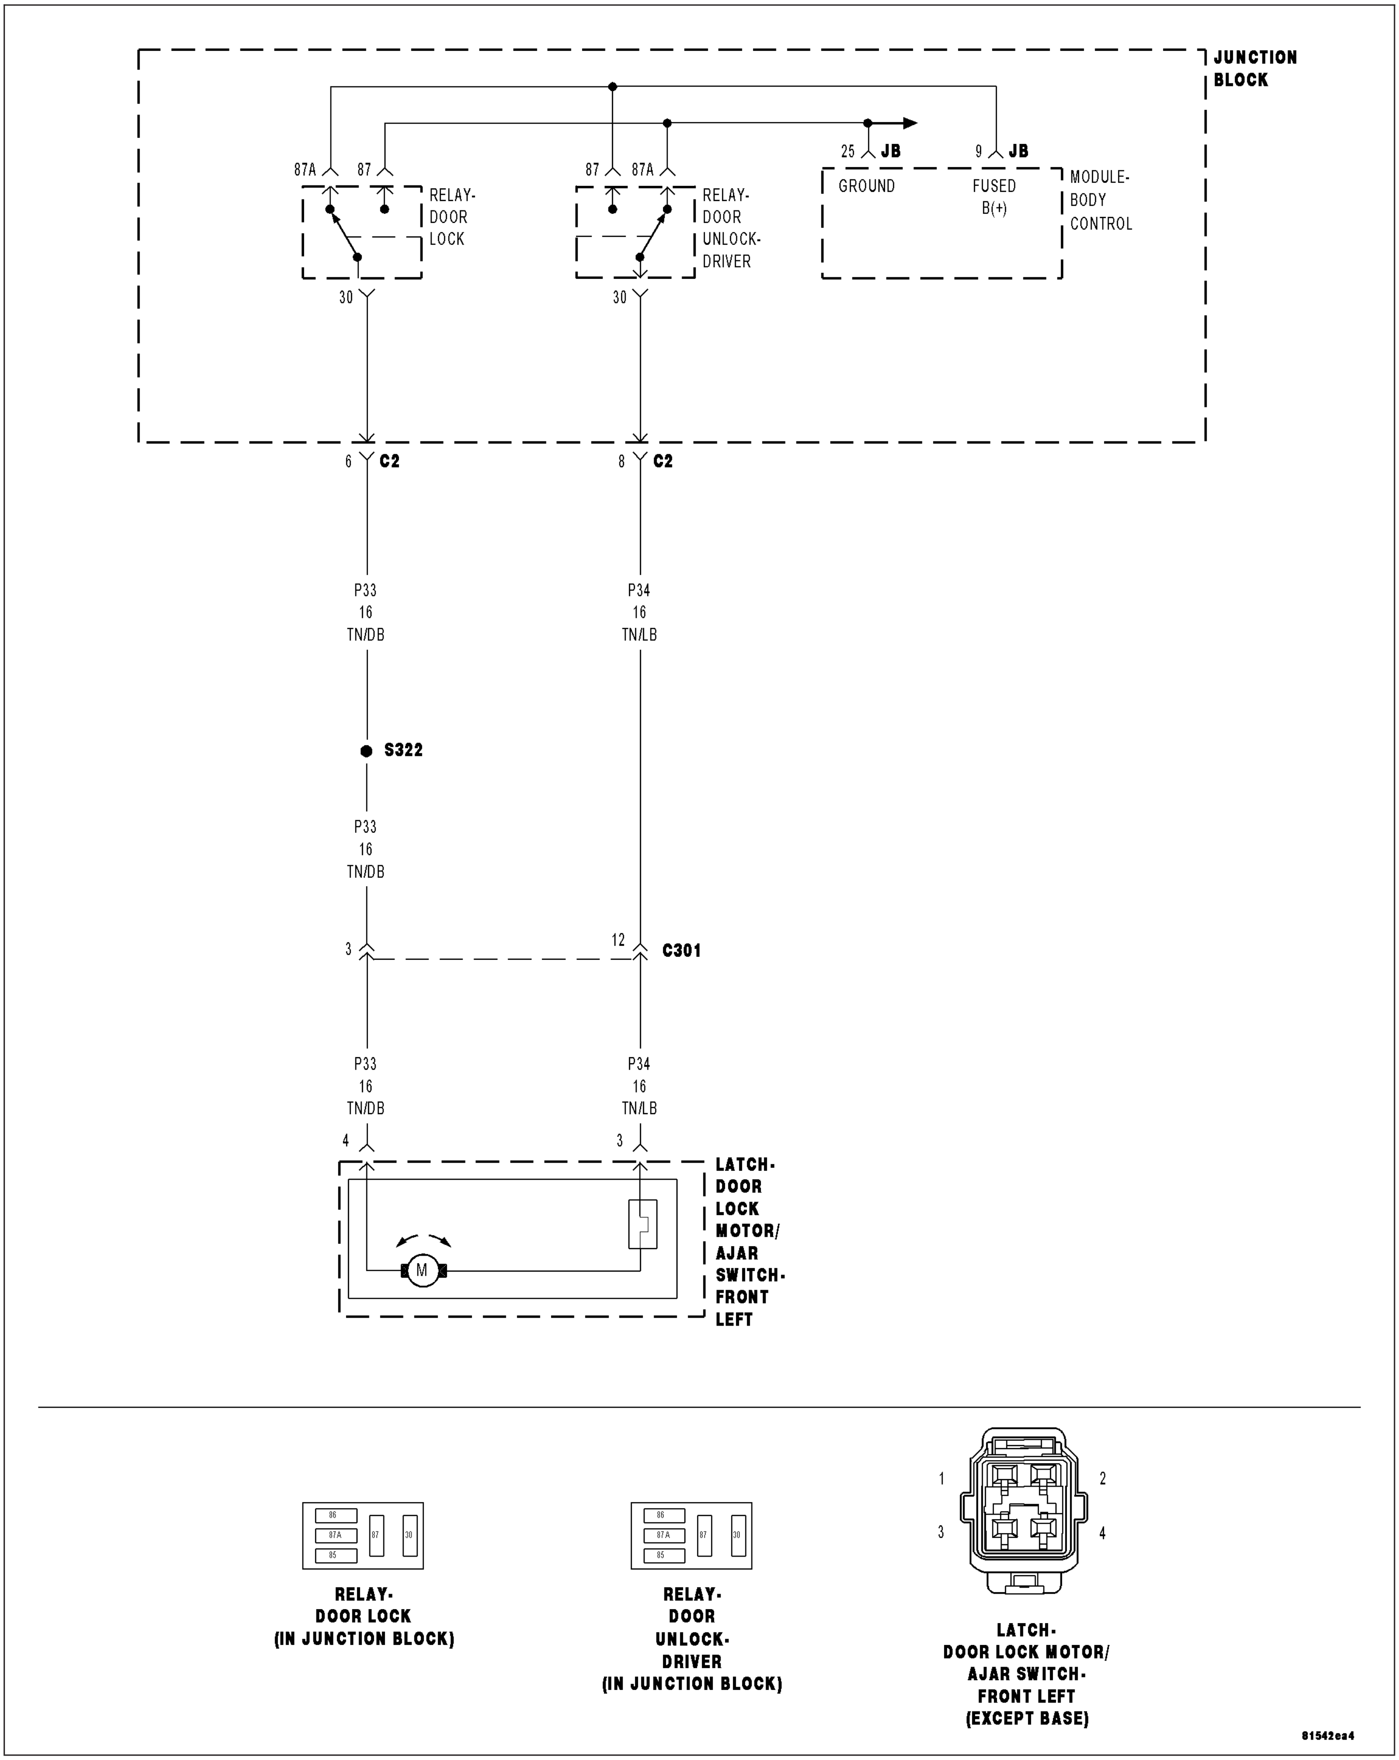
**Yes** >> Refer to symptom list for problems related to DRIVEABILITY..

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *DRIVER DOOR FAILS TO LOCK AND UNLOCK



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| DOOR LOCK MOTOR - OPEN |
| (P34) DRIVER DOOR UNLOCK RELAY OUTPUT WIRE OPEN |
| (P33) DOOR LOCK RELAY OUTPUT WIRE OPEN |
| DRIVER DOOR UNLOCK RELAY GROUND OPEN |

## Diagnostic Test

### 1. CHECK DOOR LOCK MOTOR

Turn the ignition off.

Remove the inner door trim panel to gain access to the Door Lock Motor connector.

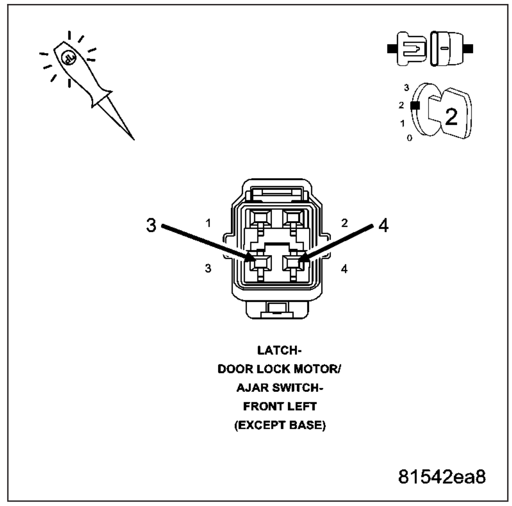
Disconnect the Driver Door Lock Motor connector.

Remove the key from the ignition switch.

Connect a test light between the Door Lock Relay Output and the Driver Door Unlock Relay Output circuits in the door lock motor connector.

Turn the ignition on.

Press the door lock switch to the Lock and Unlock positions.



**Did the test light illuminate brightly when the lock switch was pressed in both directions?**

**Yes** >> Replace the Door Lock Motor.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

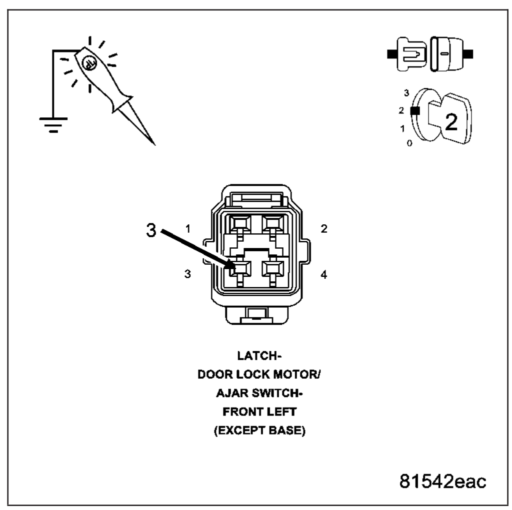
**No** >> Go To 2

### 2. CHECK (P34) DRIVER DOOR UNLOCK RELAY OUTPUT WIRE FOR AN OPEN

Using a 12-volt test light connected to ground, check the (P34) Driver Door Unlock Relay Output circuit in the door latch connector.

Close the driver door or trip the latch to the door closed position

With the scan tool actuate the DRIVER DOOR UNLOCK RELAY.



**Does the test light illuminate brightly when the relay is actuated?**

**Yes** >> Go To 3

**No** >> Repair the (P34) Driver Door Unlock Relay Output wire for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 3. CHECK (P33) DOOR LOCK RELAY OUTPUT WIRE FOR AN OPEN

Using a 12-volt test light connected to ground, check the (P33) Door Lock Relay Output circuit.

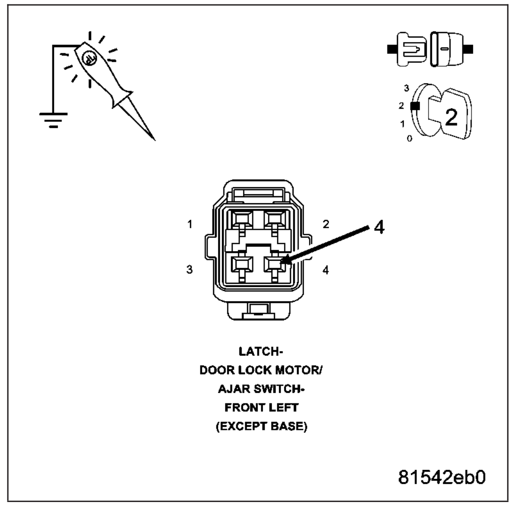
With the scan tool actuate the Door Lock Relay.

**Does the test light illuminate brightly when the relay is actuated?**

**Yes** >> Go To 4

**No** >> Repair the (P33) Door Lock Relay Output wire for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



## 4. CHECK DRIVER DOOR UNLOCK RELAY GROUND

Remove the Driver Door Unlock Relay.

Using a 12-volt test light connected to 12-volts, check the Driver Door Unlock Relay Ground circuit (cavity 87a) in the relay connector.

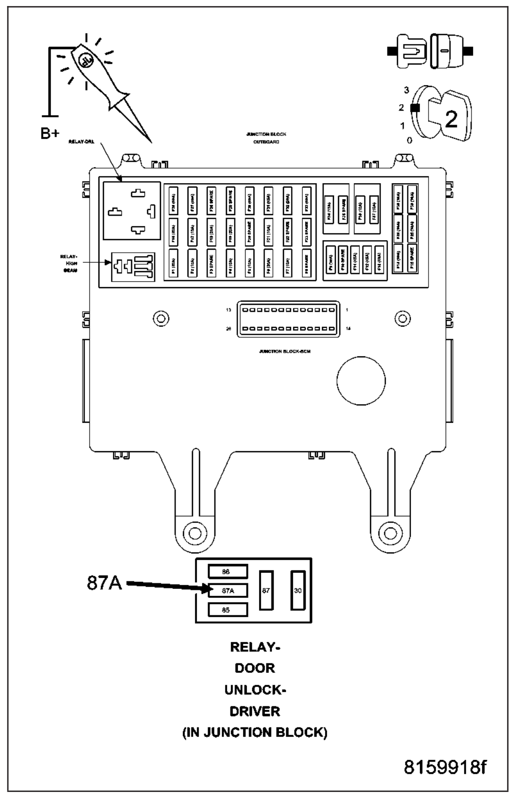
**Does the test light illuminate brightly?**

**Yes** >> Replace the Driver Door Unlock Relay.

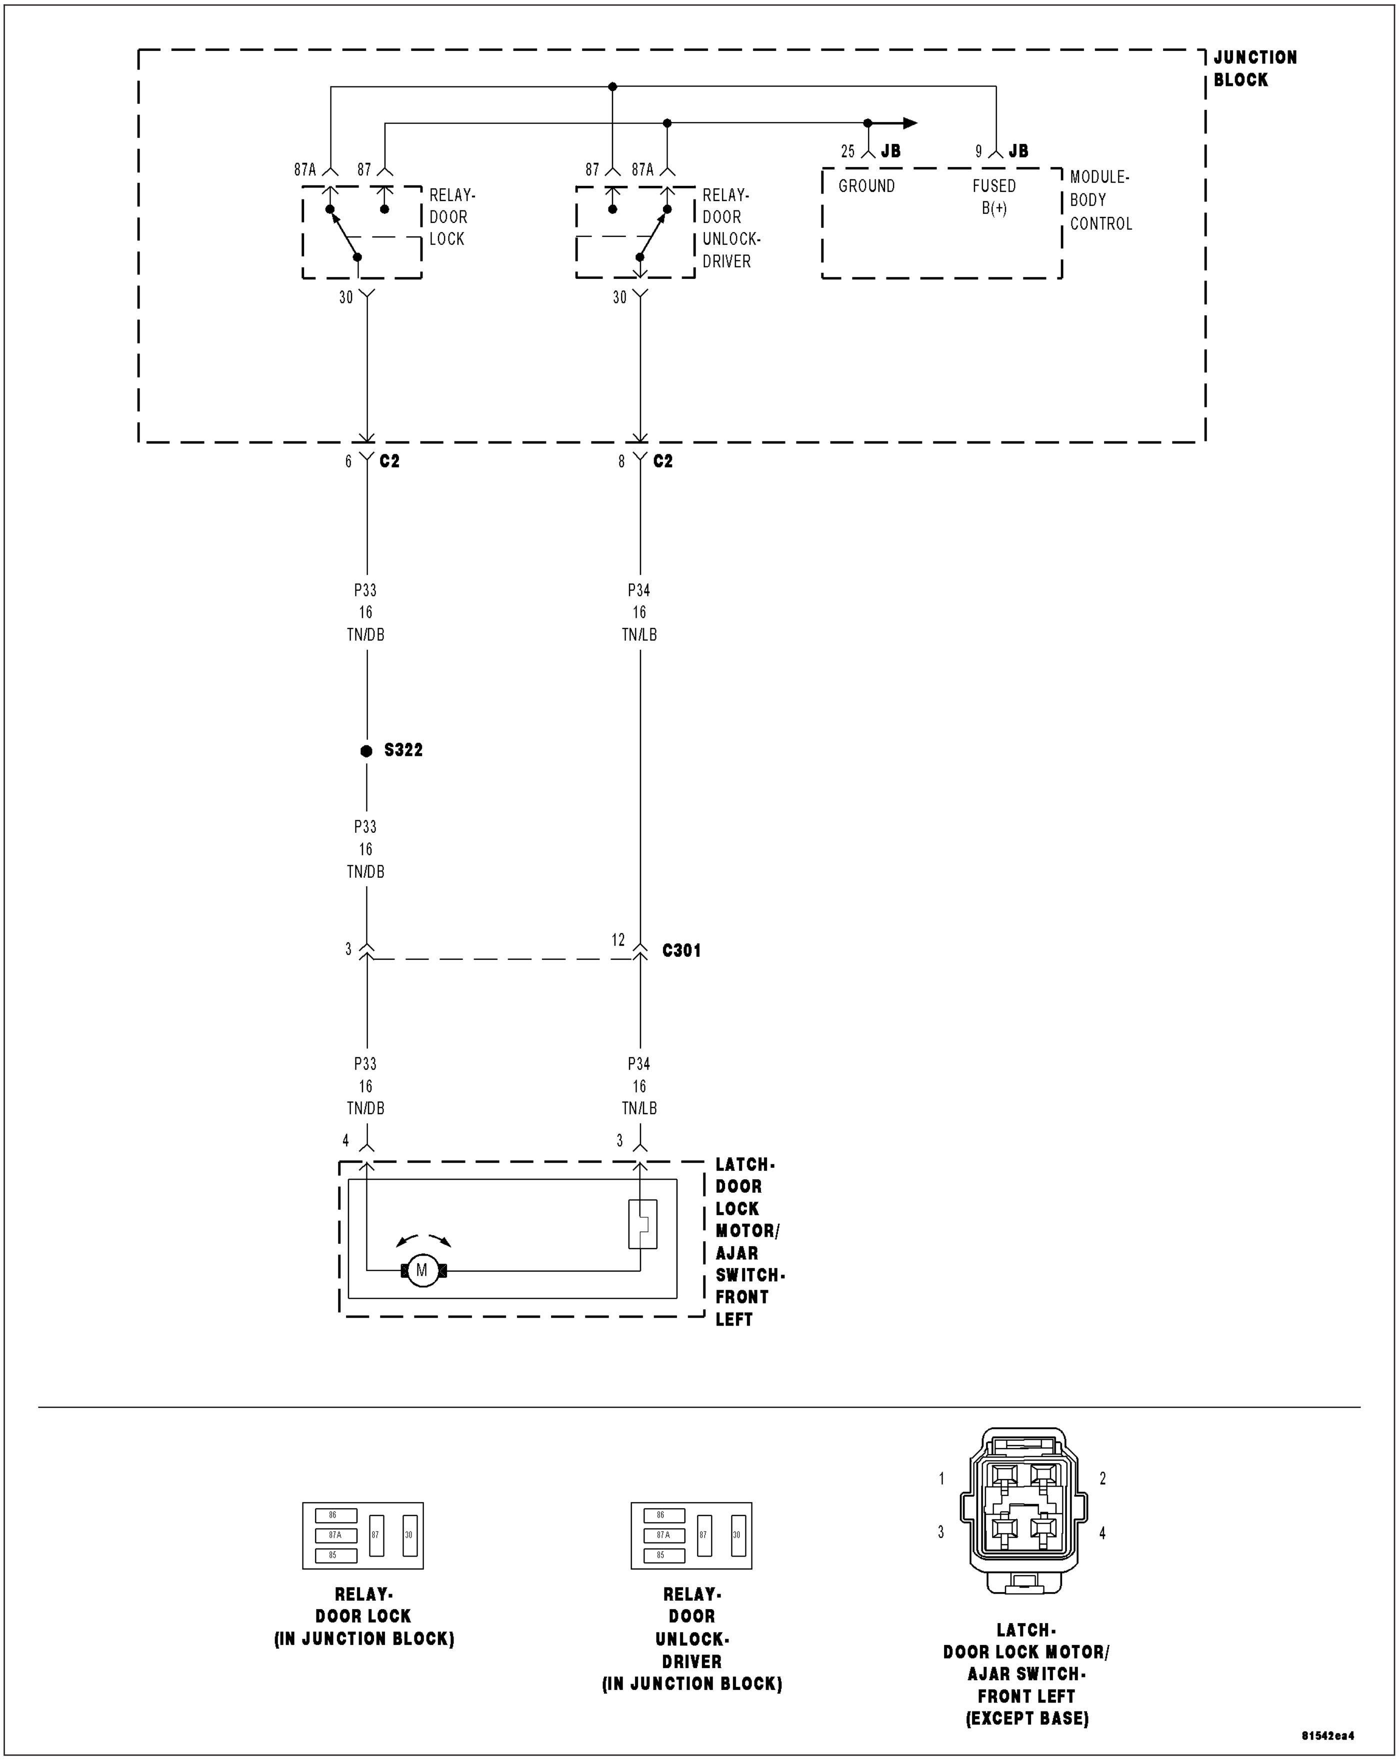
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the Driver Door Unlock Relay Ground circuit for an open or replace the Junction Block.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



# *DRIVER DOOR FAILS TO UNLOCK



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (P34) DRIVER DOOR UNLOCK RELAY OUTPUT CIRCUIT SHORT TO GROUND |
| DRIVER DOOR UNLOCK RELAY |

## Diagnostic Test

### 1. DTC'S PRESENT

With the scan tool, read DTCs.

**Are there any Power Door Lock related codes present?**

**Yes** >> Refer to symptom list for problems related to POWER DOOR LOCKS/RKE.

**No** >> Go To 2

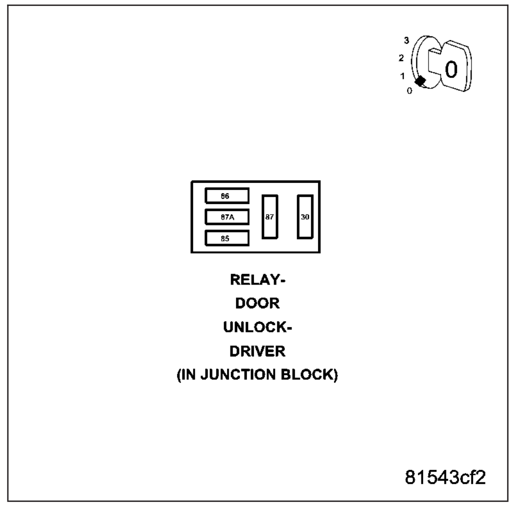
### 2. CHECK DRIVER DOOR UNLOCK RELAY

Install a substitute relay in place of the Driver Door Unlock relay in the Junction Block.

Lower the driver window.

Remove the key from the ignition switch.

Operate the door lock switch to lock and unlock positions several times.



**Did the Driver Door Lock and Unlock?**

**Yes** >> Replace the Driver Door Unlock Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

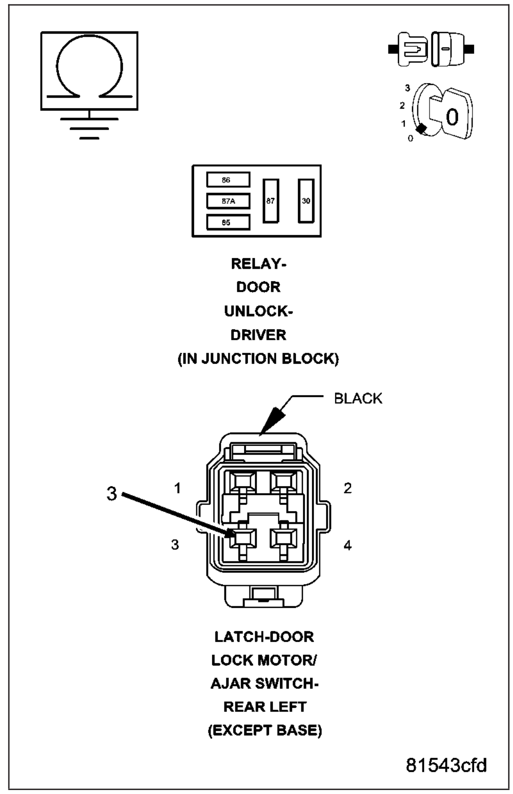
**Yes** >> Go To 3

## 3. CHECK (P34) DRIVER DOOR UNLOCK RELAY OUTPUT FOR A SHORT TO GROUND

Remove the Driver Door Unlock relay from the Junction Block.

Remove the Driver Door inner trim panel and disconnect the Driver Door Lock Motor connector.

Measure the resistance between ground and the (P34) Driver Door Unlock Relay Output circuit in the Door Lock Motor connector.



**Is the resistance below 1000.0 ohms?**

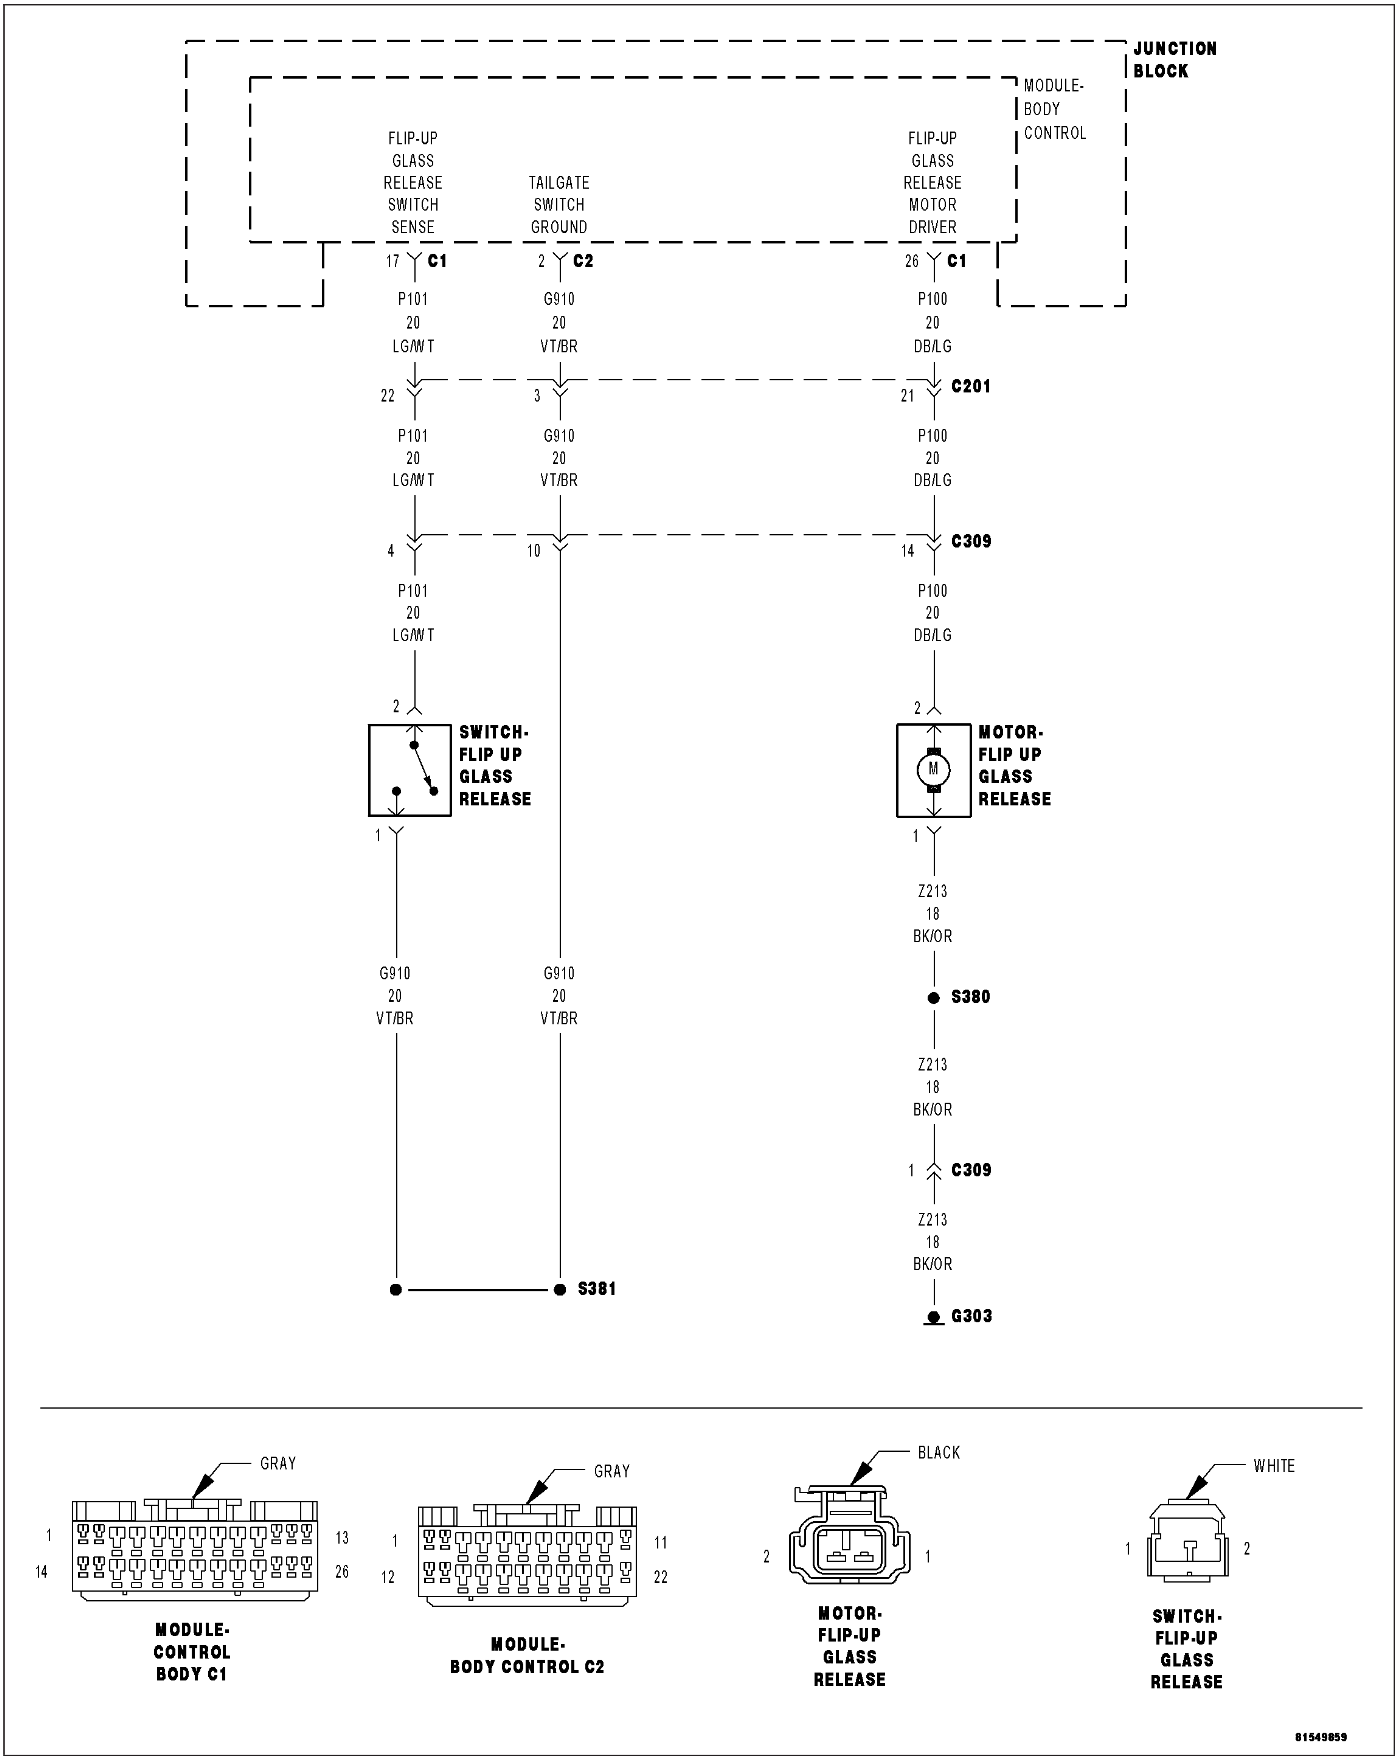
**Yes** >> Repair the (P34) Driver Door Unlock Relay Output circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Test complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *FLIP-UP GLASS RELEASE INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| G910 TAILGATE SWITCH GROUND OPEN |
| RELEASE MOTOR GROUND CIRCUIT OPEN |
| P100 FLIP-UP GLASS RELEASE MOTOR DRIVER WIRE OPEN |
| P101 FLIP-UP GLASS RELEASE SWITCH SENSE OPEN |
| FLIP-UP GLASS RELEASE MOTOR |
| FLIP-UP GLASS RELEASE SWITCH |
| BODY CONTROL MODULE - FLIP-UP GLASS RELEASE MOTOR DRIVER OPEN |
| BODY CONTROL MODULE - FLIP-UP GLASS RELEASE SWITCH SENSE OPEN |

## Diagnostic Test

### 1.

**WARNING: TEST RELEASE SWITCH**

With the scan tool in Inputs/Outputs, read the FLIP-UP GLASS REL SW state.

Observe the scan tool and move the tailgate handle from open to closed positions.

**Does the scan tool display OPEN then CLOSED as the handle is moved?**

**Yes** >> Go to 2

**No** >> Go to 5

### 2. CHECK FLIP-UP GLASS RELEASE MOTOR

Disconnect the Flip-Up Glass Release Motor connector.

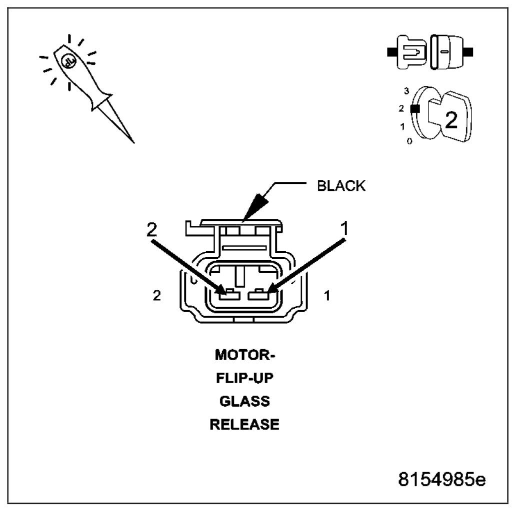
Connect a 12-volt test light between the (P100) Flip-Up Glass Release Motor Driver circuit and the (Z213) Ground circuit in the motor connector.

With the scan tool actuate the RELEASE FLIP-UP GLASS.

**Does the test light illuminate brightly when the motor is actuated?**

**Yes** >> Replace the Flip-Up Glass Release Motor.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

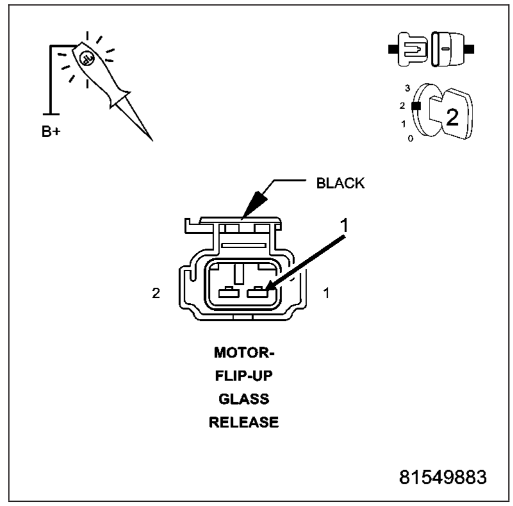
**No** >> Go To 3



## 3. CHECK FOR OPEN GROUND CIRCUIT

Using a 12-volt test light connected to 12-volts, check the (Z213) Ground circuit in the motor connector.

**Does the test light illuminate brightly?**



**Yes** >> Go To 4

**No** >> Repair the (Z213) Ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 4. TEST FOR OPEN (P100) FLIP-UP GLASS RELEASE MOTOR DRIVER WIRE

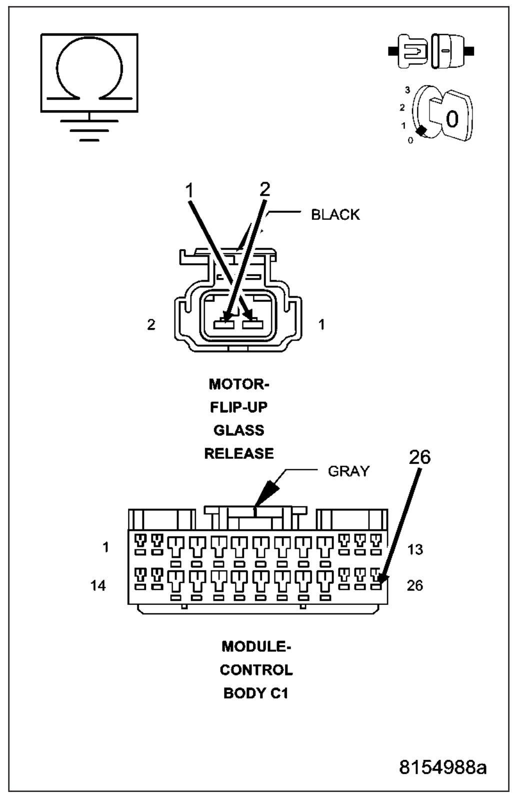
Turn the ignition off.

Connect a jumper wire between the (P100) Flip-Up Glass Release Motor Driver circuit and (Z213) Ground in the motor connector.

Disconnect the Body Control Module C1 connector.

Measure the resistance between ground and the (P100) Flip-Up Glass Release Motor Driver circuit.

**Is the resistance below 5.0 ohms?**



**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Repair the (P100) Flip-Up Glass Release Motor Driver circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

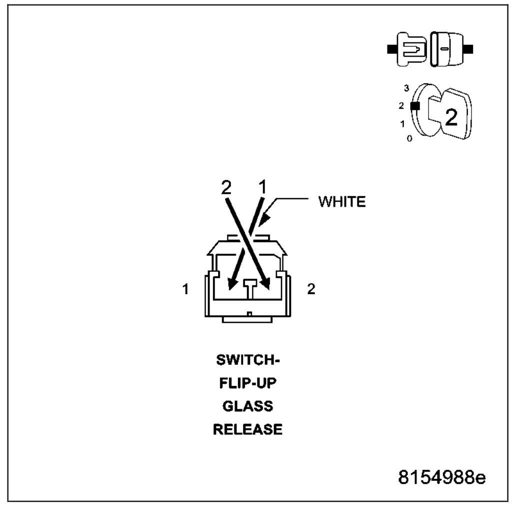
## 5. CHECK FLIP-UP GLASS RELEASE SWITCH

Remove the tailgate trim panel.

Disconnect the Flip-Up Glass Release Switch. connector.

Connect a jumper wire between the (P101) Flip-Up Glass Release Switch circuit and the (G910) Tailgate Switch Ground circuit in the switch connector.

With the scan tool in Data Display, read the Flip-Up Glass Rel Sw state.



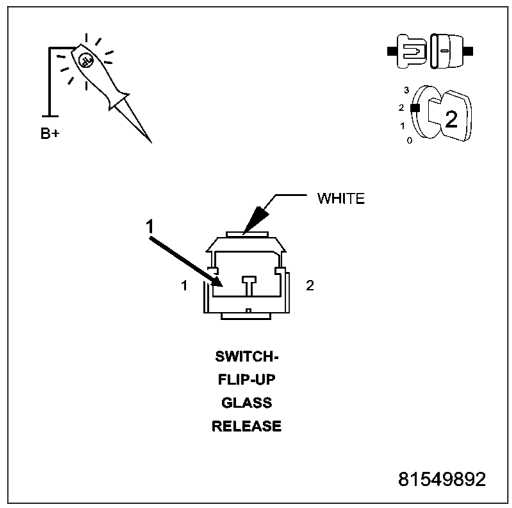
**Does the scan tool display CLOSED?**

**Yes** >> Replace the Flip-Up Glass Release Switch.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK (G910) TAILGATE SWITCH GROUND FOR AN OPEN

Using a 12-volt test light connected to 12-volts, check the (G910) Tailgate Switch Ground circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 7

**No** >> Repair the (G910) Tailgate Switch Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

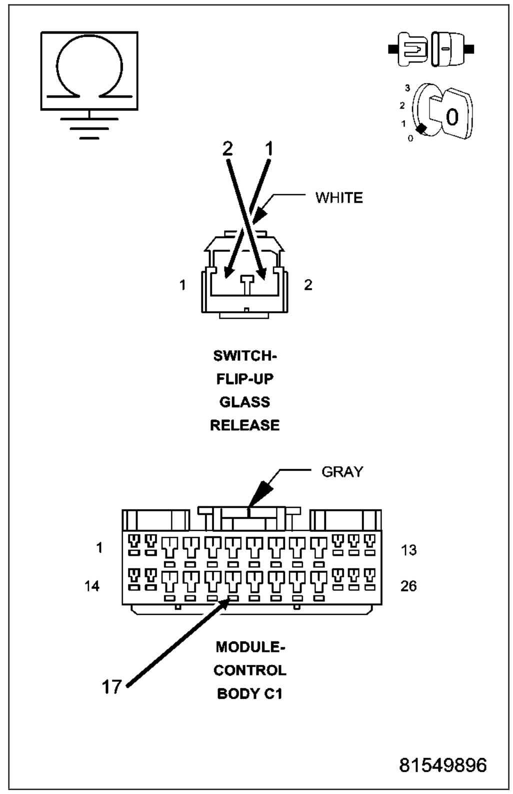
## 7. CHECK (P101) FLIP-UP GLASS RELEASE SWITCH SENSE WIRE FOR AN OPENl

Turn the ignition off.

Connect a jumper wire between the (P101) Flip-Up Glass Release Switch Sense circuit and (G910) Ground circuit in the Flip-Up Glass Release Switch connector.

Disconnect the Body Control Module C1 connector.

Measure the resistance between ground and the (P101) Flip-Up Glass Release Switch Sense circuit.



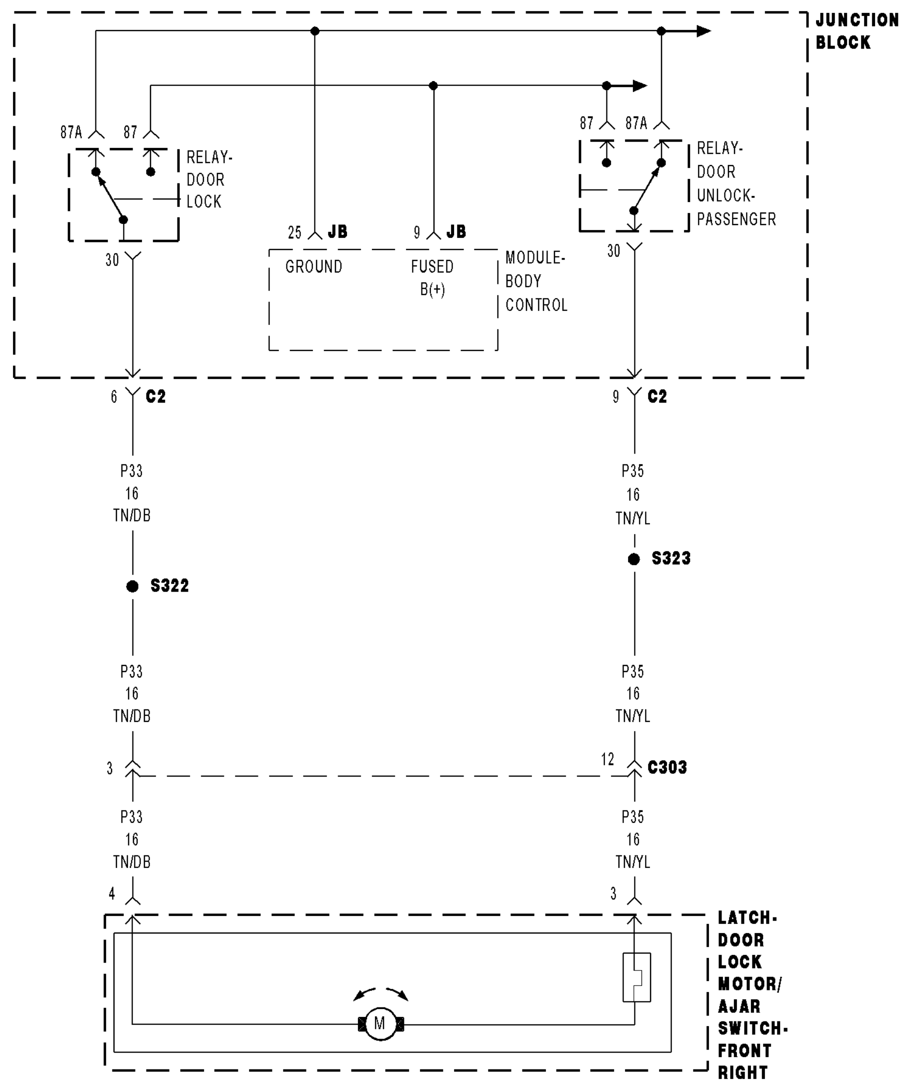
**Is the resistance below 5.0 ohms?**

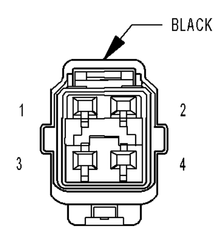
**Yes** >> Replace the Body Control Module in accordance with service information.

**No** >> Repair the (P101) Flip-Up Glass Release Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *ONE PASSENGER DOOR FAILS TO LOCK AND UNLOCK





For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| (P33) DOOR LOCK RELAY OUTPUT WIRE OPEN |
| (P35) DOOR UNLOCK RELAY OUTPUT WIRE OPEN |
| DOOR LOCK MOTOR - OPEN |

## Diagnostic Test

### 1. CHECK DOOR LOCK MOTOR

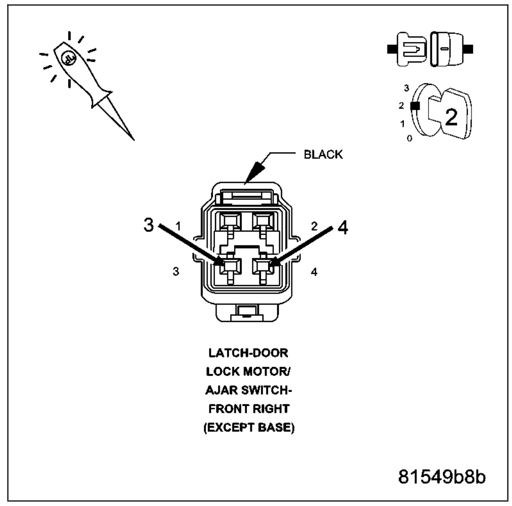
Remove the inner door trim panel to gain access to the Door Lock Motor connector.

Disconnect the appropriate Door Lock Motor connector.

Turn ignition on.

Connect a test light between the (P33) Lock Relay Output and the (P35) Unlock Relay Output circuits in the door lock motor connector.

Press the door lock switch to the Lock and Unlock positions.



**Did the test light illuminate when the lock switch was pressed in both directions?**

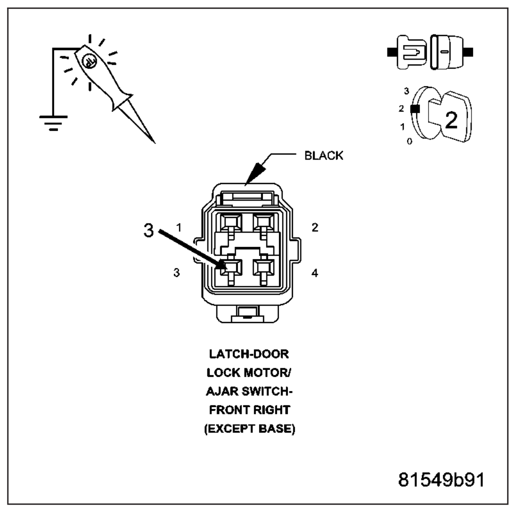
**Yes** >> Replace the Door Lock Motor.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 2

### 2. CHECK (P35) DOOR UNLOCK RELAY OUTPUT WIRE FOR AN OPEN

Using a 12-volt test light connected to ground, check the (P35) Door Unlock Relay Output circuit.

With the scan tool, actuate the Door Unlock Relay.



**Does the test light illuminate brightly when the relay is actuated?**

**Yes** >> Go To 3

**No** >> Repair the (P35) Door Unlock Relay Output wire for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

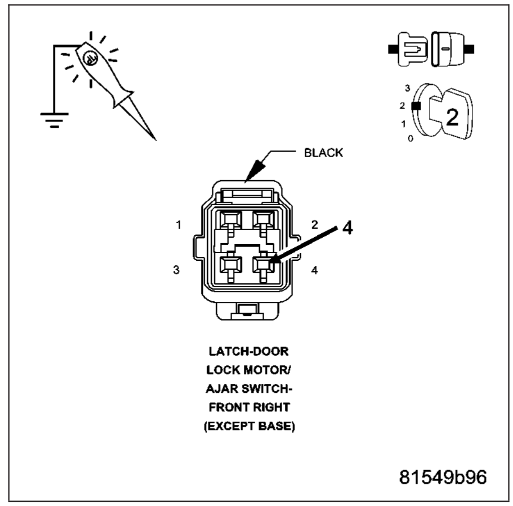
## 3. CHECK(P33) DOOR LOCK RELAY OUTPUT WIRE FOR AN OPEN

Turn ignition off.

Using a 12-volt test light connected to ground, check the (P33) Door Lock Relay Output circuit.

With the scan tool, actuate the Door Lock Relay.

**Does the test light illuminate brightly when the relay is actuated?**



**Yes** >> Test Complete.

**No** >> Repair the (P33) Door Lock Relay Output wire for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

# *REMOTE KEYLESS ENTRY INOPERATIVE

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| DOOR LOCK SYSTEM PROBLEM |
| RKE TRANSMITTER BATTERY VOLTAGE LOW |
| RKE TRANSMITTER NOT PROGRAMMED |
| RKE TRANSMITTER DEFECTIVE |
| BODY CONTROL MODULE |
| SKREEM MODULE - RKE INOPERATIVE |

## 1. DOOR LOCKS SYSTEM CHECK

Operate the door locks from both of the door lock switches.

**Did the door locks respond properly to both of the door lock switches?**

**Yes** >> Go To 2

**No** >> Refer to Power Door Locks/RKE in the Symptom List for the appropriate symptom.

## 2. 9001 TESTER AVAILABLE

**NOTE: NOTE: Ensure there is communication between the SKREEM and the BODY CONTROL MODULE before proceeding.**

**Do you have access to the Miller Special Tool ″9001 RF DETECTOR″?**

**No** >> Go To 3

**Yes** >> Go To 8

## 3. TEST BATTERIES WITH VOLTMETER

Using a voltmeter, test the Batteries in the RKE Transmitter.

**Is the voltage above 3.0 volts in each battery?**

**Yes** >> Go To 4

**No** >> Replace the Batteries.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 4. CHECK BODY CONTROL MODULE

With the scan tool actuate the door LOCK and then door UNLOCK relays.

**Do the door locks operate using the scan tool?**

**Yes** >> Go To 5

**No** >> Replace the Body Control Module in accordance with Service Information..
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 5. RKE TRANSMITTER NOT RESPONDING

With the scan tool select THEFT ALARM, SKIM, MONITORS and observe the “FOB No.” and ″FOB Button″.

Press the LOCK button and then the UNLOCK button on the Transmitter.

**Does the scan tool display:″ UNLOCK″, ″LOCK″ and the ″FOB Number″?**

**Yes** >> Replace the Body Control Module in accordance with Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. PROGRAM RKE TRANSMITTER WITH THE SCAN TOOL

With the scan tool select THEFT ALARM, SKIM, then PROGRAM NEW KEY. Follow instructions on the screen.

Exit PROGRAM NEW KEY. Try the Door Locks using the Transmitter.

**Did the Door Locks respond properly to the Transmitter commands ?**

**Yes** >> Repair complete. Using the scan tool, program other Transmitters used with this Vehicle.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. USE KNOWN GOOD TRANSMITTER

Secure a known good Transmitter.

Using the scan tool select THEFT ALARM, SKIM then PROGRAM NEW KEY and follow the instructions on the scan tool screen.

Exit PROGRAM new key. Try the Door Locks using the Transmitter.

**NOTE: When repairs are complete ensure all transmitters used with this vehicle are programmed.**

**Did the Door Locks respond properly to the Transmitter commands ?**

**Yes** >> Replace the Transmitter. Program all Transmitters that will be used with this Vehicle.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Sentry Key RemotE Entry Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 8. TEST TRANSMITTER WITH TESTER

Using the 9001 RF Detector, follow the instructions on the back of the tester and test the transmitter several times.

**Does the signal strength measure ″STRONG″?**

**Yes** >> Go To 9

**No** >> Check and replace the batteries if they are under 3.0 volts each and retest the transmitter. If the batteries are okay, replace the transmitter.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 9. PROGRAM RKE TRANSMITTER WITH THE SCAN TOOL

With the scan tool, select THEFT ALARM, SKIM then PROGRAM NEW KEY and follow the instructions on the screen.

Exit PROGRAM NEW KEY.

Activate the Door Locks using the RKE Transmitter.

**Did the door locks respond properly to the RKE transmitter commands?**

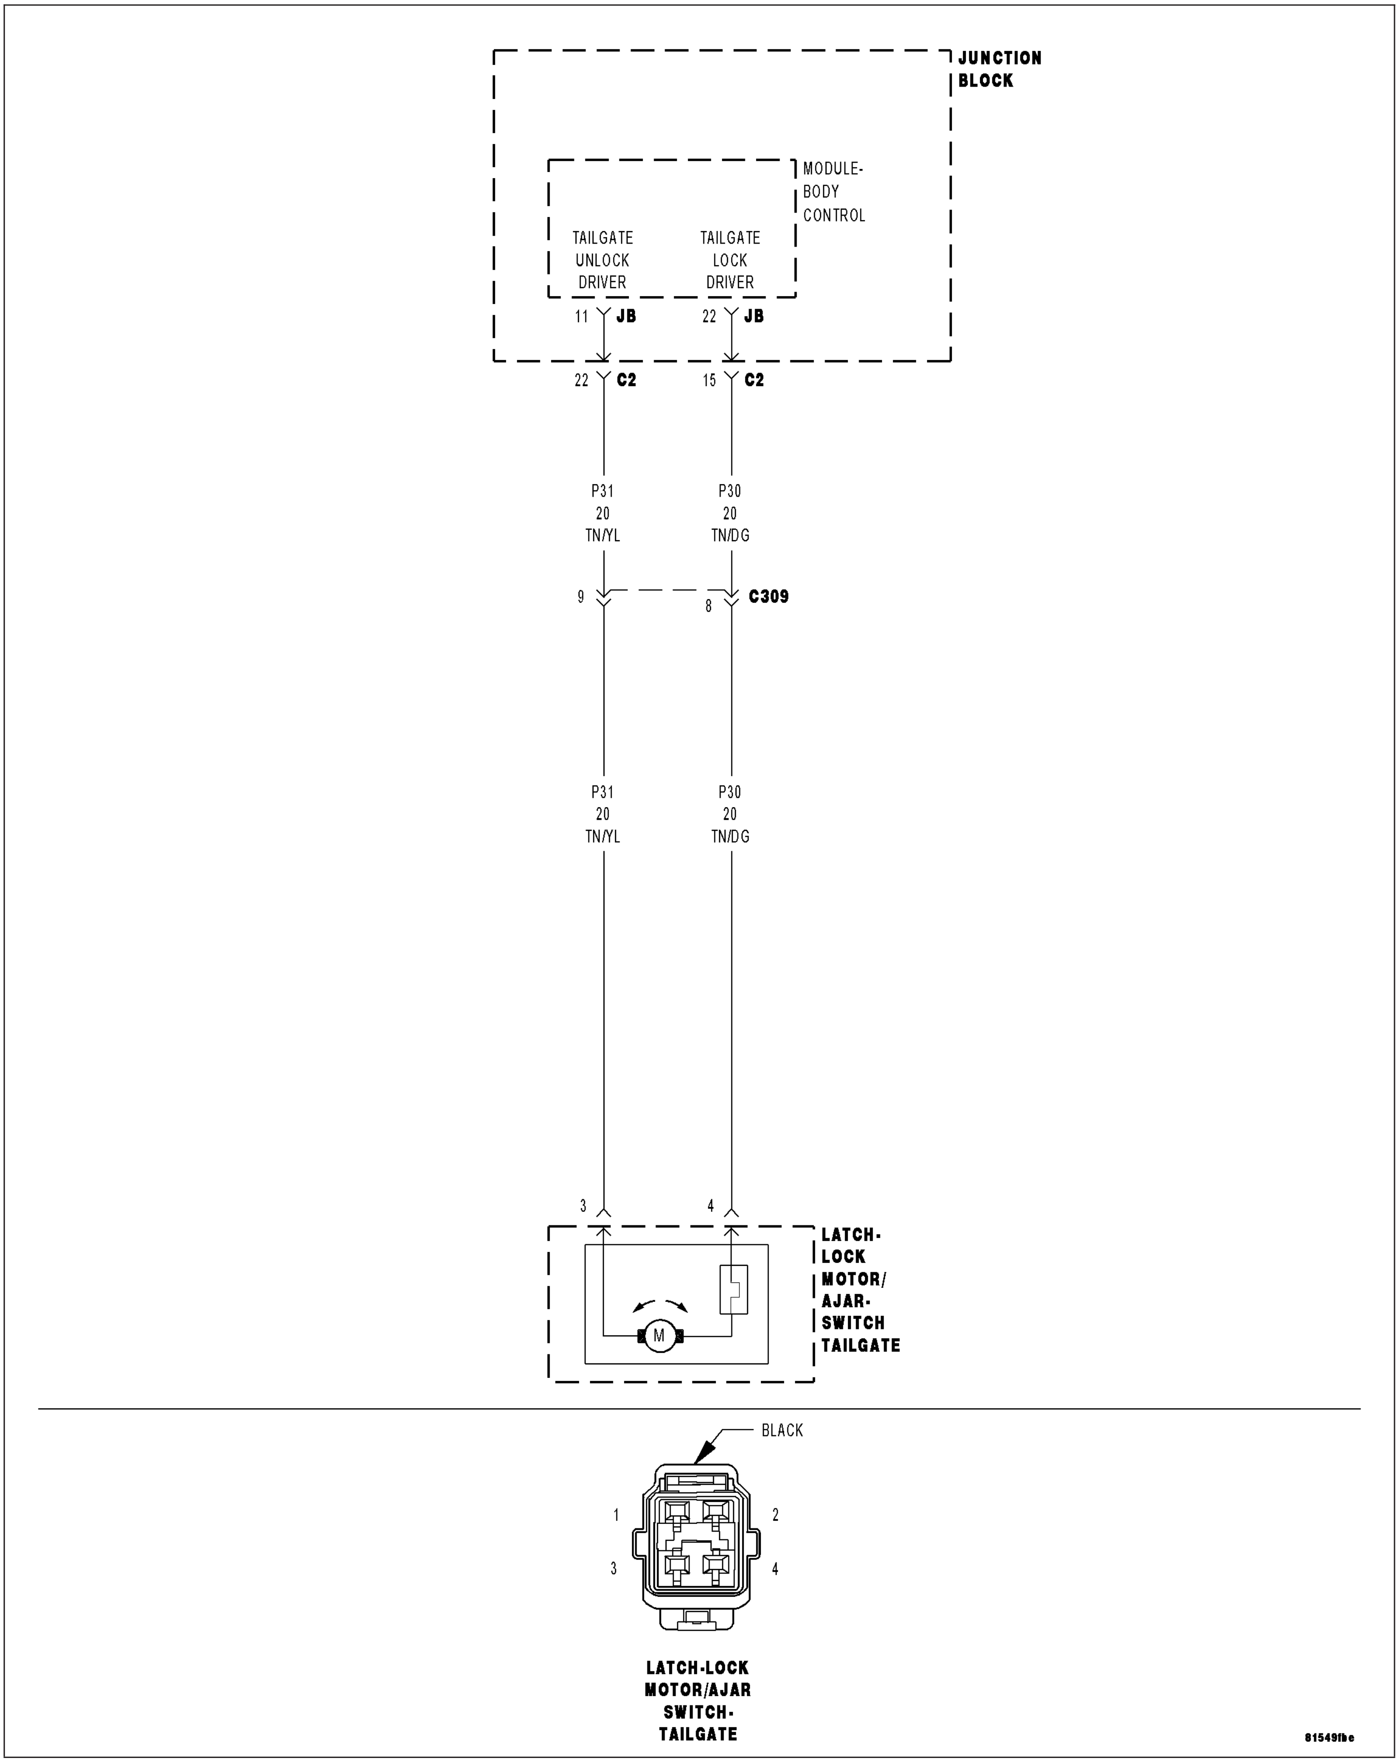
**Yes** >> Repair complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Sentry Key RemotE Entry Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## *TAILGATE LOCK INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| DTC'S PRESENT |
| (P30) TAILGATE LOCK DRIVER OPEN |
| (P30) TAILGATE LOCK DRIVER SHORT TO GROUND |
| (P31) TAILGATE UNLOCK DRIVER OPEN |
| (P31) TAILGATE UNLOCK DRIVER SHORT TO GROUND |
| TAILGATE LOCK MOTOR OPEN |
| JUNCTION BLOCK OPEN |
| BODY CONTROL MODULE - TAILGATE DRIVER OPEN |

## 1. CHECK DTC'S PRESENT

With the scan tool, read DTCs.

**Are there any Tailgate related codes present?**

**Yes** >> Refer to symptom list for problems related to POWER DOOR LOCKS/RKE.

**No** >> Go To 2

## 2. CHECK TAILGATE LOCK MOTOR

Disconnect the Tailgate Lock Motor connector.

Connect a test light between the Tailgate Lock Driver circuit and the Tailgate Unlock Driver circuit in the Lock Motor connector.

With the scan tool actuate the UNLOCK TAILGATE.

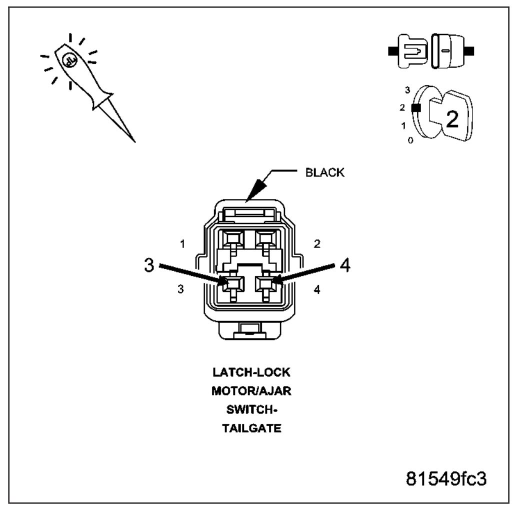
With the scan tool actuate the LOCK TAILGATE.

**Did the test light illuminate when the motor was actuated in both directions?**

**Yes** >> Replace the Tailgate Lock Motor.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 3



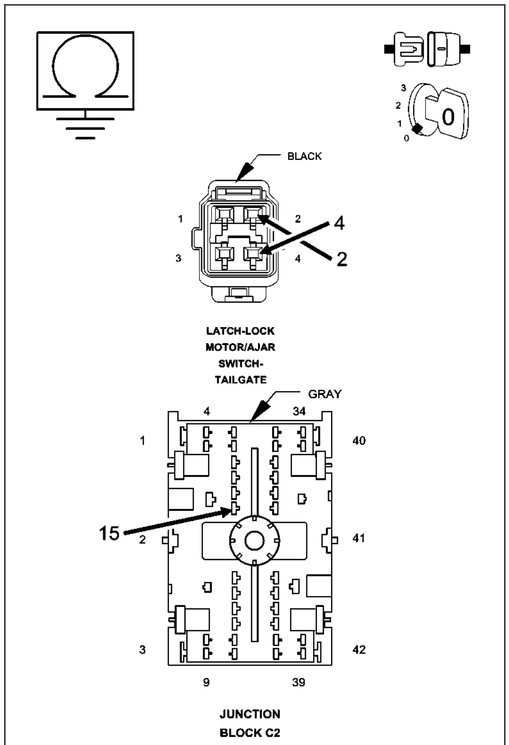
## 3. CHECK (P30) TAILGATE LOCK DRIVER CIRCUIT FOR AN OPEN

Turn the ignition off.

Connect a jumper wire between (P30) Tailgate Lock Driver circuit and the (G910) Tailgate Switch Ground in the Tailgate Lock Motor connector.

Disconnect the Junction Block C2 connector.

Measure the resistance between ground and the (P30) Tailgate Lock Driver circuit in the Junction Block C2 connector.



81549fc7

**Is the resistance below 5.0 ohms?**

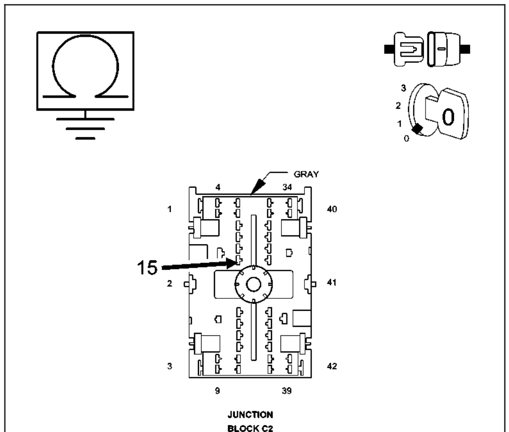
**Yes** >> Go To 4

**No** >> Repair the (P30) Tailgate Lock Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 4. CHECK (P31) TAILGATE UNLOCK DRIVER CIRCUIT FOR AN OPEN

Connect a jumper wire between (P31) Tailgate Unlock Driver circuit and the (G910) Tailgate Switch Ground in the Tailgate Lock Motor connector.

Measure the resistance between ground and the (P31) Tailgate Unlock Driver circuit in the Junction Block C2 connector.



81549fcf

**Is the resistance below 5.0 ohms?**

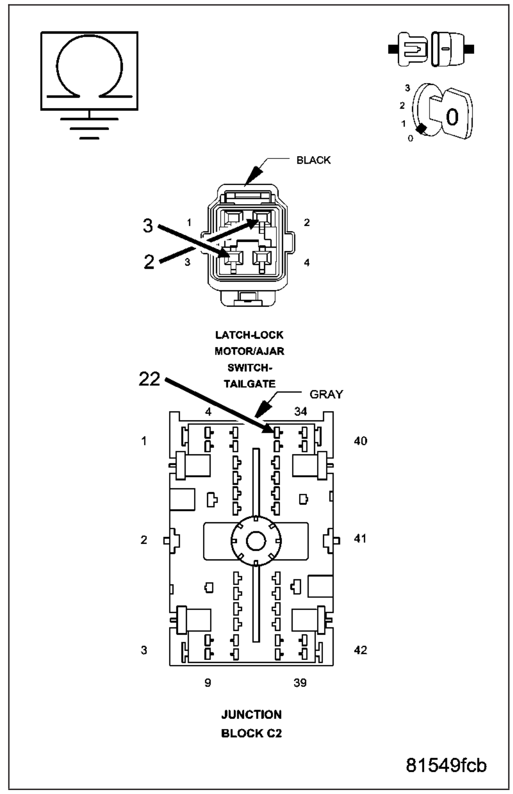
**Yes** >> Go To 5

**No** >> Repair the (P31) Tailgate Unlock Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 5. CHECK (P30) TAILGATE LOCK DRIVER CIRCUIT FOR A SHORT TO GROUND

Disconnect the Jumper wire installed in the previous step.

Measure the resistance between ground and the (P30) Tailgate Lock Driver circuit in the Junction Block C2 connector.



**Is the resistance below 1000.0 ohms?**

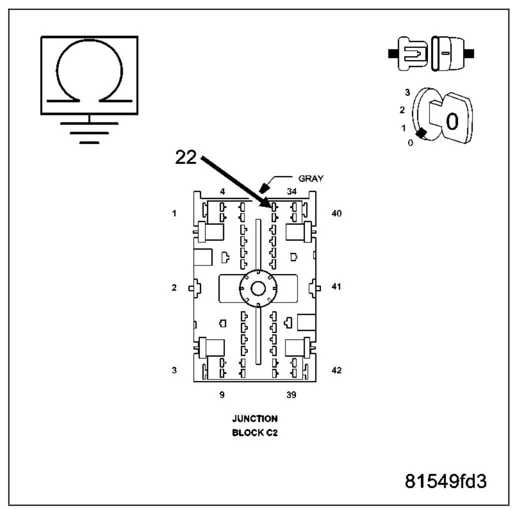
**Yes** >> Repair the (P30) Tailgate Lock Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. CHECK (P31) TAILGATE UNLOCK DRIVER CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (P31) Tailgate Unlock Driver circuit in the Junction Block C2 connector.



**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (P31) Tailgate Unlock Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

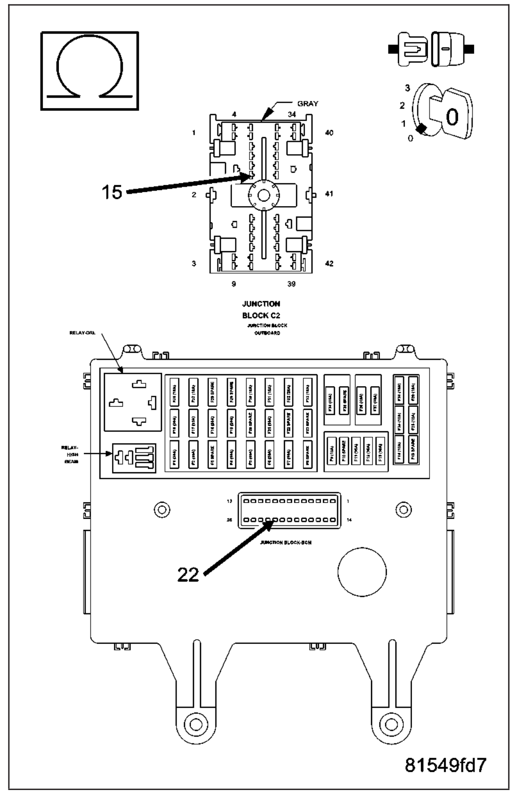
**No** >> Go To 7

## 7. CHECK JUNCTION BLOCK (P30) TAILGATE LOCK DRIVER CIRCUIT FOR AN OPEN

Remove the Junction Block.

Remove the Body Control Module from the Junction Block.

Measure the resistance of the (P30) Tailgate Lock Driver circuit between Junction Block C2 connector and the Junction Block - BCM connector.



**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 8

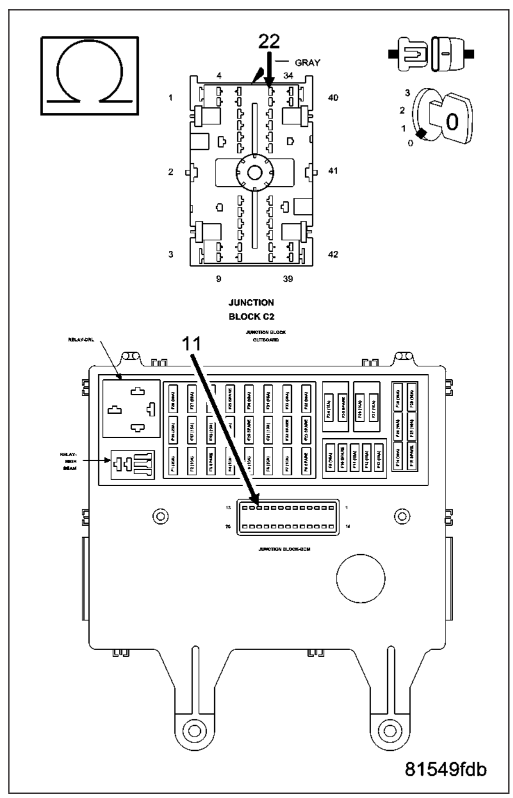
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## 8. CHECK JUNCTION BLOCK (P31) TAILGATE UNLOCK DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (P31) Tailgate Unlock Driver circuit between Junction Block C2 connector and the Junction Block - BCM connector.



**Is the resistance below 1.0 ohm?**

**Yes** >> Replace the Body Control Module in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Junction Block in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

# POWER LOCKS

## TABLE OF CONTENTS

# POWER LOCKS

## DESCRIPTION

### POWER LOCKS

The power lock system allows all of the doors and the tailgate to be locked or unlocked electrically by operating a switch on either front door trim panel. The power lock system receives non-switched battery current through a fuse in the Junction Block (JB), so that the power locks remain operational, regardless of the ignition switch position.

The Body Control Module (BCM) locks the doors and tailgate automatically when the vehicle is driven beyond the speed of 25.7 Km/h (15 mph), all doors are closed and the accelerator pedal is depressed. The rolling door lock feature can be disabled if desired.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences.

The power lock system for this vehicle can also be operated remotely using the available Remote Keyless Entry (RKE) system radio frequency transmitters, if equipped.

Certain functions and features of the power lock system rely upon resources shared with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) data bus network. For proper diagnosis of these electronic modules or of the PCI data bus network, the use of a scan tool and the appropriate diagnostic information are required.

### REMOTE KEYLESS ENTRY

The RKE system allows the use of a remote battery-powered radio transmitter to signal the Body Control Module (BCM) to actuate the power lock system. The RKE receiver operates on non-switched battery current through a fuse in the Junction Block (JB), so that the system remains operational, regardless of the ignition switch position.

Certain RKE transmitters are also equipped with a Panic button. If the Panic button on the RKE transmitter is depressed, the horn will sound and the exterior lights will flash on the vehicle for about three minutes, or until the Panic button is depressed a second time. A vehicle speed of about 25.7 Km/h (15 mph) will also cancel the panic event.

The RKE system can also perform other functions on this vehicle. If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), the RKE transmitter will arm the VTSS when the Lock button is depressed, and disarm the VTSS when the Unlock button is depressed.

The RKE system includes two transmitters when the vehicle is shipped from the factory, but the system can retain the vehicle access codes of up to four transmitters. The transmitter codes are retained in the RKE receiver memory, even if the battery is disconnected. If an RKE transmitter is faulty or lost, new transmitter vehicle access codes can be programmed into the system using a scan tool.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences. Customer programmable feature options affecting the RKE system include:

- **Remote Unlock Sequence** - Allows the option of having only the driver side front door unlock when the RKE transmitter Unlock button is depressed the first time. The remaining doors and the tailgate unlock when the button is depressed a second time within 5 seconds of the first unlock press. Another option is having all doors and the tailgate unlock upon the first depression of the RKE transmitter Unlock button.
- **Sound Horn on Lock** - Allows the option of having the horn sound a short chirp as an audible verification that the RKE system received a valid Lock request from the RKE transmitter, or having no audible verification. This feature is not available on export vehicles.
- **Flash Lights with Lock and Unlock** - Allows the option of having the lights flash as an optical verification that the RKE system received a valid Lock request or Unlock request from the RKE transmitter, or having no optical verification.
- **Flip-up Glass Release** - Allows the operation of a one half second press or a one second press of the rear release button to open flip-up glass.
- **Programming Additional Transmitters** - Allows up to four transmitter vehicle access codes to be stored in the receiver memory. This feature is not available on export vehicles.

Certain functions and features of the RKE system rely upon resources shared with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) data bus network. For diagnosis of these electronic modules or of the PCI data bus network, the use of a scan tool and the appropriate diagnostic information are required.

### TAILGATE / FLIP-UP GLASS POWER RELEASE SYSTEM

The entire system is controlled by the Body Control Module (BCM). The tailgate / flip-up glass power release system allows the flip-up glass latch to be released electrically by actuating a switch located integral to the outside tailgate handle. By pulling the handle to the first detent or turning the key cylinder to unlock, the flip-up glass will open. Pulling the handle to the second detent will allow the tailgate to open.

The tailgate / flip-up glass release system operates on non-switched battery current supplied through a fuse in the junction block so that the system remains functional, regardless of the ignition switch position. However, the BCM prevents the flip-up glass latch from being actuated when the tailgate latch is locked.

The tailgate will lock and can not be unlocked if the rear wiper switch is activated. The tailgate will also lock if battery power is lost and then restored.

The tailgate/flip-up glass will not function with the battery discharged or disconnected.

### COMBINATION FLASHER

This flasher can be energized by the BCM to flash all of the park/turn signal lamps as a optical alert for the RKE panic function and, if the Flash Lights with Lock/Unlock programmable feature is enabled, as an optical verification for the RKE lock/unlock event.

### HORN RELAY

This relay can be energized by the BCM to sound the horns as an audible alert for the RKE panic function and, if the Sound Horn on Lock programmable feature is enabled, as an audible verification for the RKE lock event.

### LOW BEAM HEADLAMP RELAY

This relay can be energized by the BCM to flash the headlamp low beams as an optical alert for the RKE panic function.

## OPERATION

### POWER LOCKS

The Body Control Module (BCM) locks or unlocks the doors when an actuation input signal from a door lock switch or Remote Keyless Entry Module (RKE) is received. The BCM turns on the output drivers and provides a voltage level to the door lock motor for a specified time. All passenger doors can be locked or unlocked using a mechanical button mounted on the door trim panel. The front passenger doors and tailgate can be locked or unlocked by using the key cylinder (tailgate cylinder does not lock/unlock vehicle. It only unlocks the tailgate). The tailgate will lock and can not be unlocked if the rear wiper switch is activated (this prevents the wiper from operating when the tailgate is ajar). The tailgate will also lock if battery power is lost and then restored.

### AUTOMATIC DOOR LOCKS

When the automatic door locks are ENABLED the door locks will lock when the vehicle is moving at about 25.7 Km/h (15 mph), all doors are closed and the accelerator pedal is depressed. This feature can be switched ON or OFF as desired. When the system is DISABLED the door locks will operate normally, but will not lock automatically when the vehicle is rolling. Once the automatic door locks have been actuated, they will not try to lock the doors again until a door is opened.

### DOOR LOCK INHIBIT

If the key is in the ignition, in any position, and either front door is ajar, the doors can not be locked, but the unlock function still operates. Pressing the RKE lock/unlock button under these conditions will result in a normal lock/unlock activation.

After the key is removed from the Ignition Switch, or the doors are closed, the power door locks will operate normally.

## DOOR LOCK CIRCUIT PROTECTION

The BCM controls the door lock relays. If the door lock switch is actuated continuously for more than five seconds the BCM will turn the output driver OFF (the BCM would consider the switch stuck). Each lock motor is protected with a Positive Temperature Coefficient device that prevents motor burn out.

## REMOTE KEYLESS ENTRY

- **LOCK**: Pressing the LOCK button locks all doors, sounds horn (chirp) if enabled, and arms the Vehicle Theft Security System, if enabled. The chirp verifies that the RKE receiver has sent a message to the BCM for door lock operation. If a door has not been closed before pressing the LOCK button, the vehicle may not be secured and the VTSS (if equipped) will not arm until the door is closed.
- **UNLOCK**: Pressing the UNLOCK button once will unlock the driver's door and activate the illuminated entry system and disarm Vehicle Theft Security System, if equipped. Pressing the UNLOCK button twice within five seconds will unlock all doors.
- **TAILGATE**: Pressing the TAILGATE BUTTON unlocks the tailgate remotely and opens the flip-up glass.
- **PANIC**: If equipped, pressing the PANIC button sounds the horns at half second intervals, flashes the exterior lamps, and turns ON the interior lamps. The panic alarm will remain on for three minutes, or until the PANIC button is actuated again or the ignition switch is turned to the RUN position.

The Remote Keyless Entry Module is capable of retaining the transmitter Vehicle Access Code(s) in its memory even after vehicle power has been interrupted.

## DIAGNOSIS AND TESTING - POWER LOCKS

**The Body Control Module (BCM) enters a reduced power mode after the key is turned OFF. All diagnosis and testing of the power lock system must be done with the key in the ON position unless otherwise stated.**

**The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a scan tool and the proper Diagnostic Procedures manual. The scan tool can provide confirmation that the PCI data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the PCI data bus, and that the power lock motors are being sent the proper hard wired outputs by the relays for them to perform their power lock system functions.**

Following are tests that will help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the Programmable Communications Interface (PCI) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the power lock system components must be checked.

The Body Control Module (BCM) will set Diagnostic Trouble Codes (DTC) for the power lock system.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

## PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while you actuate both the Lock and Unlock functions with the power lock switches and with the Remote Keyless Entry (RKE) transmitter. Then, proceed as follows:

- If the entire power lock system fails to function with either the power lock switches or the RKE transmitter, check the fused B(+) fuse in the junction Block (JB).
- If the power lock system functions with both power lock switches, but not with the RKE transmitter, proceed to diagnosis of the Remote Keyless Entry (RKE) system. (Refer to 8 - ELECTRICAL/POWER LOCKS/KEYLESS ENTRY TRANSMITTER - DIAGNOSIS AND TESTING) or (Refer to 8 - ELECTRICAL/POWER LOCKS/REMOTE KEYLESS ENTRY MODULE - DIAGNOSIS AND TESTING).
- If the power lock system functions with the RKE transmitter, but not with one or both power lock switches, proceed to diagnosis of the door lock switches. (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK SWITCH - DIAGNOSIS AND TESTING).
- If the driver side power lock switch operates only the driver side front door power lock motor, but all other power lock motors operate with the passenger side power lock switch or the RKE transmitter, use a scan tool and the appropriate diagnostic information to diagnose the Programmable Communications Interface (PCI) data bus.

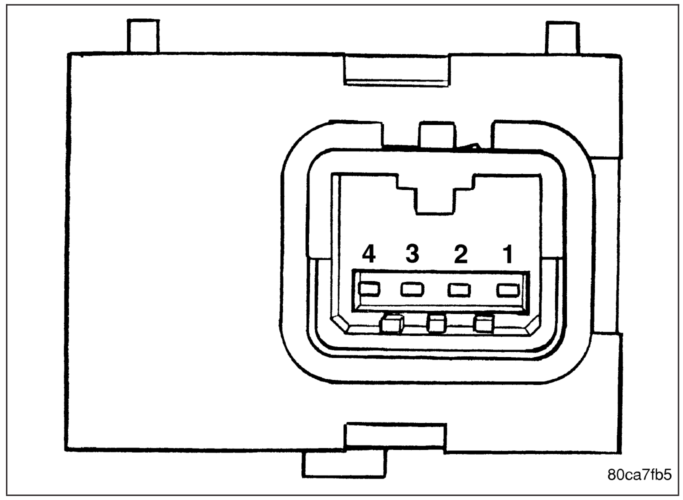
- If only one power lock motor fails to operate with both power lock switches and the RKE transmitter, proceed to diagnosis of the power lock motor. (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK MOTOR - DIAGNOSIS AND TESTING).

# DOOR LOCK / UNLOCK SWITCH

## DIAGNOSIS AND TESTING - DOOR LOCK/UNLOCK SWITCH

1. Remove the switch to be tested (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK SWITCH - REMOVAL).
2. Using an ohmmeter, Test switch for resistance values.

**DOOR LOCK SWITCH TEST**

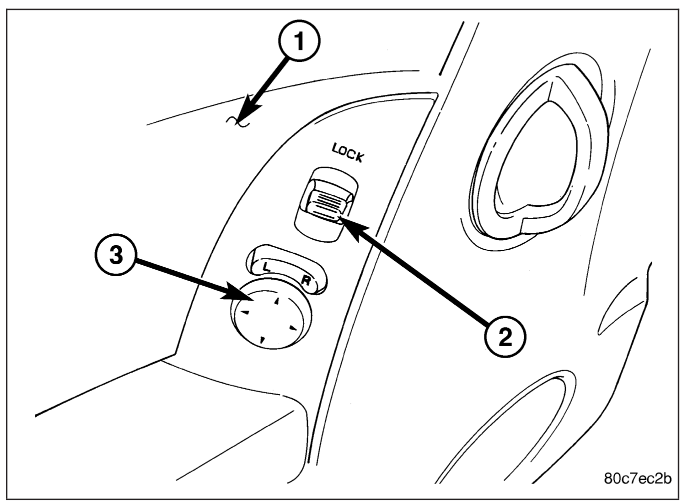


| SWITCH POSITION | PINS | RESISTANCE VALUE |
|---|---|---|
| UNACTUATED | 1 AND 4 | 5.0K OHM ± 10 % |
| LOCK | 1 AND 4 | 1.4K OHM ±10 % |
| UNLOCK | 1 AND 4 | 426 OHM ± 10 % |

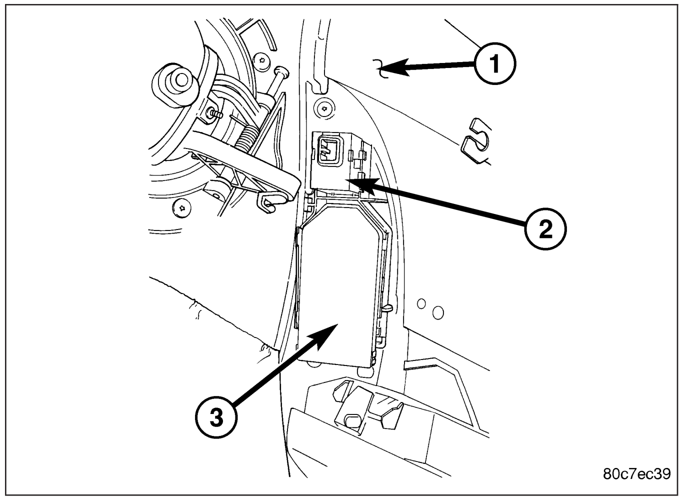
3. If test results are not obtained as shown in the test table, replace the switch.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the door trim panel (1) (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Disconnect electrical harness connector from switch (2).

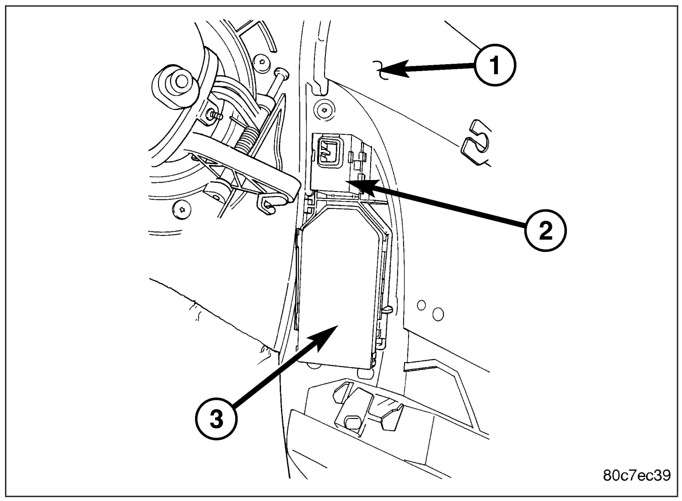


4. From behind the door trim panel (1), gently pry the switch (2) from the door trim panel.



## INSTALLATION

1. Press the switch (2) into place.
2. Connect the electrical harness connector to the switch.
3. Install the door trim panel (1) (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - INSTALLATION).
4. Connect the battery negative cable.



# DOOR LOCK MOTOR

## DESCRIPTION

The lock mechanisms are actuated by a reversible electric motor mounted within each door and tailgate. The power lock motors are integral to the door latch units.

The power lock motors cannot be adjusted or repaired and, if faulty or damaged, the door latch unit must be replaced.

## OPERATION

The door lock motors are controlled by relays. A positive and negative battery connection to the two motor terminals will cause the motor to move in one direction. Reversing the current will cause the motor to move in the opposite direction.

## DIAGNOSIS AND TESTING - DOOR LOCK MOTOR

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a scan tool and the proper Diagnostic Procedures manual. Refer to the appropriate wiring information.

# FLIP-UP GLASS RELEASE SWITCH

## DIAGNOSIS AND TESTING - FLIP-UP GLASS RELEASE SWITCH

1. Disconnect and isolate the battery negative cable.
2. Remove the tailgate trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
3. Disconnect the wire harness connector.
4. Using an ohmmeter, check for continuity between the pins of the wire harness connector while pulling on the tailgate handle.
5. If no continuity is found, replace the tailgate handle assembly (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/EXTERIOR HANDLE - REMOVAL).

# DOOR LOCK RELAY

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Reach up under instrument panel and remove the relay from Junction Block (JB).

## INSTALLATION

1. Position the horn relay in the proper receptacle in the Junction Block (JB).
2. Push down firmly on the relay until the terminals are fully seated.
3. Connect the battery negative cable.

# REMOTE KEYLESS ENTRY MODULE

## DESCRIPTION

When an RKE lock message is sent to the Body Control Module (BCM), the BCM actuates the doors and the tailgate lock, the interior lighting is turned off, the horn chirps (if this feature is enabled), the exterior lamps flash (if this feature is enabled) and, if the vehicle is so equipped, the Vehicle Theft Security System (VTSS) is armed. When an RKE unlock message is sent to the BCM, the BCM actuates the driver side front door (or all doors and the tailgate if this feature is enabled) unlock, the interior lighting is turned on and, if the vehicle is so equipped, the VTSS is disarmed. The exterior lamps flash if this feature is enabled

When an RKE panic message is sent to the BCM, the BCM actuates the driver side front door (or all doors and the tailgate if this feature is enabled) unlock, the interior lighting is turned on and, if the vehicle is so equipped, the VTSS is disarmed. The panic message will also cause the exterior lamps (including the headlights) to flash, and the horn to pulse for about three minutes, or until a second panic message is sent to the BCM. A vehicle speed of about 25.7 Km/h (15 mph) will also cancel the panic event.

## OPERATION

Whenever the vehicle battery power is interrupted, the Remote Keyless Module (RKE) Module will retain all vehicle access codes in its memory. When replacing or adding a key fob transmitter (maximum of 4) a scan tool is required to program the RKE Module to accept the new Vehicle Access Code if a customer owned transmitter is not available.

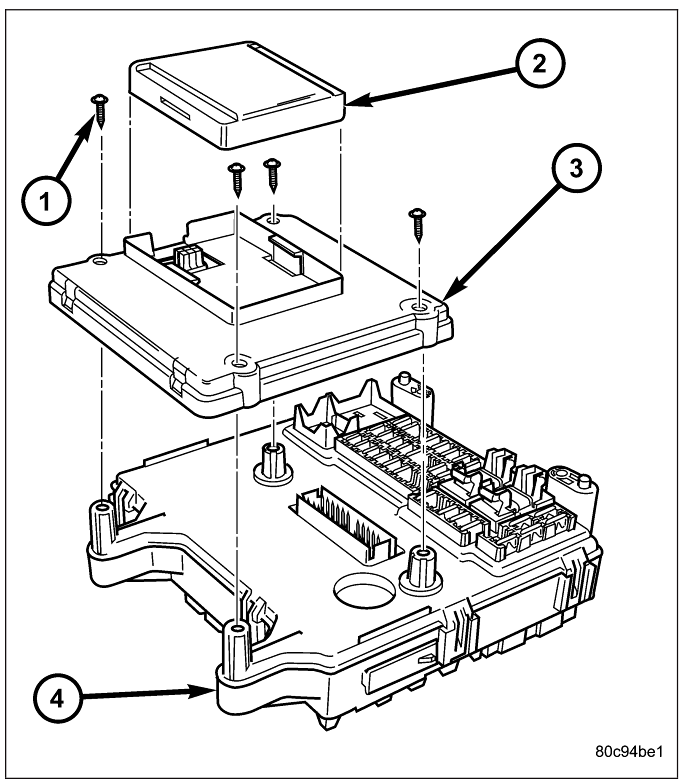
If a functioning transmitter is available, (Refer to 8 - ELECTRICAL/POWER LOCKS/KEYLESS ENTRY TRANSMITTER - STANDARD PROCEDURE)

## DIAGNOSIS AND TESTING - REMOTE KEYLESS ENTRY MODULE

Refer to the proper Body Diagnostic Procedures Manual for testing the Remote Keyless Entry system using a scan tool.

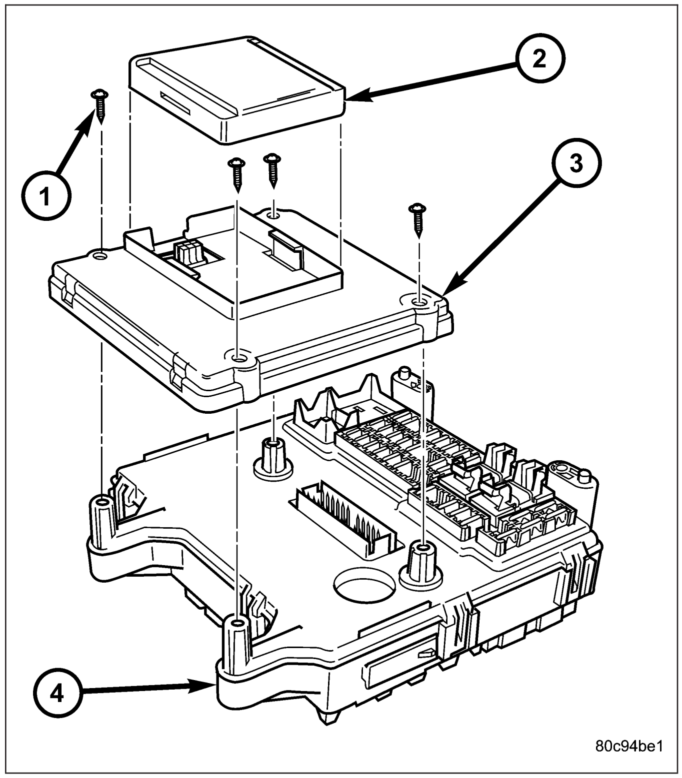
## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the Junction Block (JB) (4) (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - REMOVAL).
3. Remove Remote Keyless Entry module (2) from Body Control Module (3).



## INSTALLATION

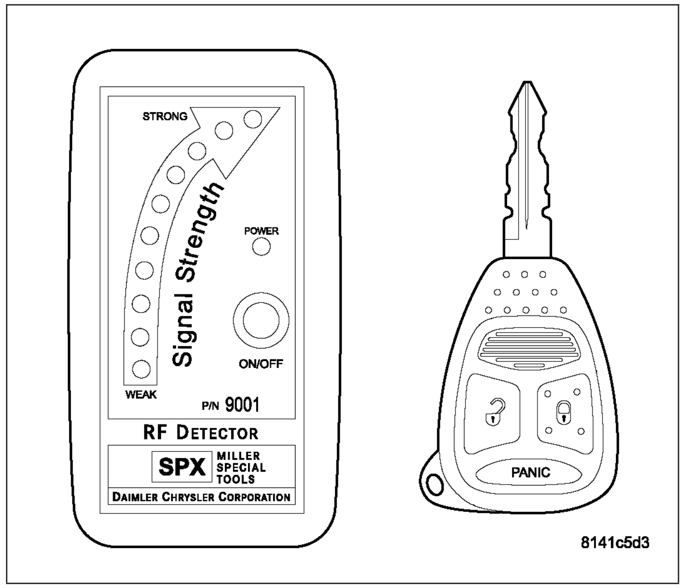
1. Install Remote Keyless Entry module (2) to Body Control Module (3).
2. Install Junction Block (JB) (4) (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - INSTALLATION).
3. Connect the battery negative cable.



# REMOTE KEYLESS ENTRY TRANSMITTER

## DIAGNOSIS AND TESTING - REMOTE KEYLESS ENTRY TRANSMITTER

Using special tool 9001, first test to ensure that the transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for Asian transmitters and 30.5 centimeters (12 inches) for all others. To test, position the transmitter as shown. Press any transmitter button, then test each button individually. The tool will beep if a radio signal strength that lights five or more LED’s is detected. Repeat this test three times. If transmitter fails any of the test refer to the Diagnostic Procedures manual.



## STANDARD PROCEDURE

## STANDARD PROCEDURE - RKE TRANSMITTER CUSTOMER PREFERENCES

### AUTOMATIC (ROLLING) LOCKS

The rolling locks feature can be toggled ON/OFF by using the scan tool only.

### HORN CHIRP DISABLING / ENABLING

The horn chirp can be toggled using the scan tool or by using the Remote Keyless Entry (RKE) transmitter.

To DISABLE (cancel) the horn chirp feature, press and hold the transmitter LOCK button for four to ten seconds. While pressing the LOCK button in, press the UNLOCK button. Release both buttons.

To ENABLE the horn chirp feature, repeat the above procedure.

### OPTICAL CHIRP (FLASH) DISABLING / ENABLING

The optical chirp can be toggled using the scan tool or by using the Remote Keyless Entry (RKE) transmitter.

To DISABLE (cancel) the optical chirp feature, press and hold the transmitter LOCK button for four to ten seconds. While pressing the LOCK button in, press the TAILGATE RELEASE button. Release both buttons.

To ENABLE the optical chirp feature, repeat the above procedure.

### TAIL GATE RELEASE DELAY

Press the UNLOCK button for four to ten seconds. While pressing the UNLOCK button, press the TAIL GATE RELEASE button. Release both buttons.

This will toggle between PRESS AND HOLD and PRESS (no delay).

### UNLOCK SEQUENCE

The unlock sequence can be toggled using the scan tool or by using the Remote Keyless Entry (RKE) transmitter.

Press and hold the transmitter UNLOCK button for four to ten seconds. While pressing the UNLOCK button in, press the LOCK button. Release both buttons.

This will toggle between Driver door first and Unlock all doors function.

## STANDARD PROCEDURE - RKE TRANSMITTER PROGRAMING

New Remote Keyless Entry (RKE) transmitters can be programed using the scan tool and the proper Diagnostic Procedures manual, if no functioning transmitter is available. The scan tool can provide confirmation that the PCI data bus is functional, and that all of the electronic modules are sending and receiving the proper messages on the PCI data bus.

The following procedure can be used as long as one functioning transmitter is available:

1. Turn ignition to the RUN position (allow ignition chimes to stop).
2. Using any original (working) transmitter, press the UNLOCK button for 4 to 10 seconds.
3. Within the specified 4 to 10 seconds, continue pressing the UNLOCK button and press the PANIC button for 1 second, and release both buttons (a chime will sound to indicate that the transmitter programming mode has been entered - allow 3 seconds for chime to sound).
4. Press LOCK and UNLOCK buttons simultaneously for 1 second and release.
5. Press and release any button on the same transmitter and a chime will sound after successfully programming the transmitter.
6. Repeat steps 4 to 6 to program additional transmitters.
7. Turn ignition to the OFF position. Transmitter programming mode will discontinue after 60 seconds. All transmitter programming must be completed within time specified.

## STANDARD PROCEDURE - RKE TRANSMITTER BATTERIES

The Remote Keyless Entry (RKE) transmitter case snaps open and shut for battery access. To replace the RKE transmitter batteries:

1. Using a thin coin, gently pry at the notch in the center seam of the RKE transmitter case halves near the key ring until the two halves unsnap.
2. Lift the back half of the transmitter case off of the RKE transmitter.
3. Remove the two batteries from the RKE transmitter.
4. Replace the two batteries with new Panasonic 2016 (if equipped with one battery, use 2032), or equivalent. Be certain that the batteries are installed with their polarity correctly oriented.
5. Align the two RKE transmitter case halves with each other, and squeeze them firmly and evenly together until they snap back into place.

## SPECIFICATIONS - REMOTE KEYLESS ENTRY TRANSMITTER

### RANGE

Normal operation range is up to a distance of 3 to 7 meters (10 to 23 ft.) of the vehicle. Range may be better or worse depending on the environment around the vehicle.

# TAILGATE CYLINDER LOCK SWITCH

## DESCRIPTION

The tailgate cylinder lock switch is integral to the key lock cylinder inside the tailgate. The tailgate cylinder lock switch is a normally-open momentary switch that is hard wired directly to the Body Control Module (BCM), and closes a path to ground through an internal resistor when the lock cylinder is rotated to the unlock or lock position.

The tailgate cylinder lock switch cannot be adjusted or repaired.

## OPERATION

The tailgate cylinder lock switch is actuated when the key is inserted in the lock cylinder and turned to the unlock or lock position. The tailgate cylinder lock switch closes a path to ground through an internal resistor for the Body Control Module (BCM) when the tailgate key lock cylinder is in the lock or unlock position, and opens the ground path when the lock cylinder is in the neutral position. The BCM reads the switch status, then sends the proper switch status messages to other electronic modules over the Programmable Communications Interface (PCI) data bus network. The tailgate cylinder lock switch unlock status message is used by the BCM as an input for Vehicle Theft Security System (VTSS) operation and to tell the BCM to lock or unlock the tailgate. There is no mechanical linkage between the tailgate key cylinder and the latches.

## DIAGNOSIS AND TESTING - TAILGATE CYLINDER LOCK SWITCH

1. Disconnect and isolate the battery negative cable.
2. Remove tailgate trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
3. Disconnect tailgate cylinder lock switch harness connector.
4. Using a ohmmeter, test for resistances as shown in the Tailgate Cylinder Lock Switch Table.

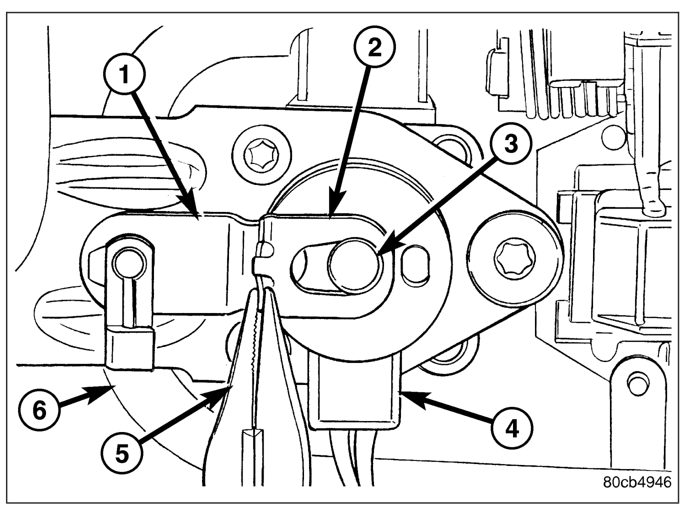
**TAILGATE CYLINDER LOCK SWITCH TABLE**

| SWITCH POSITION | RESISTANCE |
|---|---|
| NEUTRAL | 0 OHMS |
| LOCK (CLOCKWISE) | 2 K OHMS ± 10 % |
| UNLOCK (COUNTER-CLOCKWISE) | 470 OHMS ± 10 % |

5. If switch resistance is not correct, replace switch.

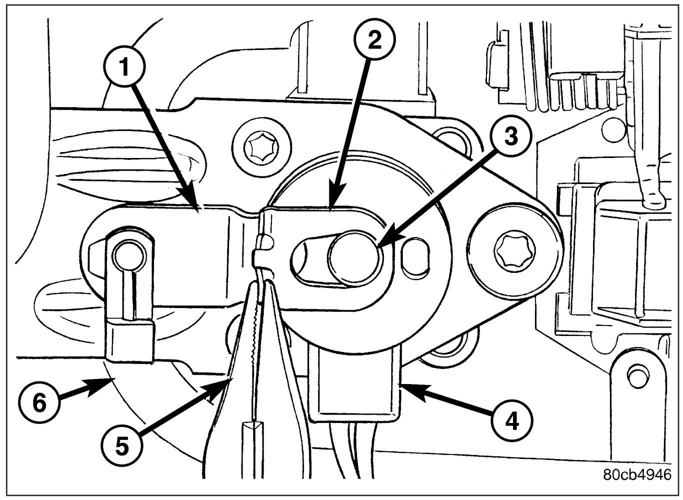
## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the tailgate trim panel. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
3. Remove the retainer clip from the pin on the back of the door lock cylinder (3).
4. Remove the washer from the pin on the back of the door lock cylinder.
5. Remove the door cylinder lock switch (4) from the back of the lock cylinder.



## INSTALLATION

1. Position the tailgate cylinder lock switch (4) onto the back of the lock cylinder (3) with the wire harness oriented toward the bottom.
2. Position the washer over the switch.
3. Install the retainer (2) clip onto the pin on the back of the tailgate lock cylinder. Be certain that the center tab of the retainer is engaged in the retention hole on the lock lever.
4. Install the trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).
5. Connect the battery negative cable.



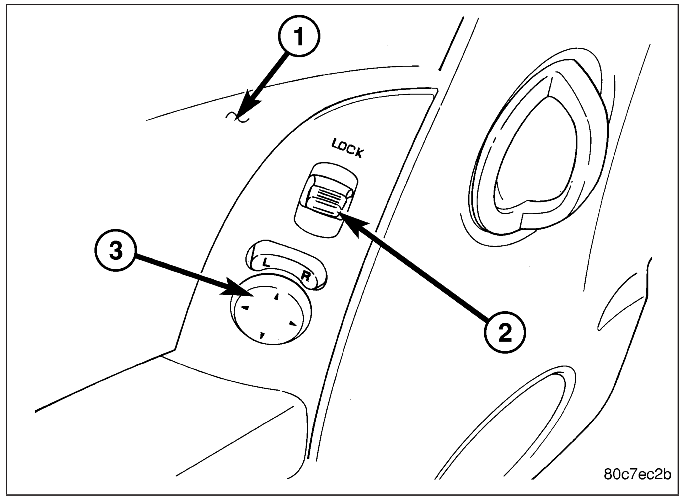
# POWER MIRRORS

## TABLE OF CONTENTS

# POWER MIRRORS

## DESCRIPTION

The power operated sideview mirrors allow the driver to adjust both outside mirrors electrically from the drivers seat by operating a switch (3) on the driver side front door trim panel (1).



## OPERATION

The power mirrors receive ignition current through a fuse in the junction block, and will only operate when the ignition switch is in the Run position.

## DIAGNOSIS AND TESTING - POWER MIRRORS

### WIRING VOLTAGE TEST

The following wiring test determines whether or not voltage is continuous through the body harness to switch.

1. Remove the power mirror switch (Refer to 8 - ELECTRICAL/POWER MIRRORS/POWER MIRROR SWITCH - REMOVAL).
2. Disconnect wire connector from back of power mirror switch.
3. Switch ignition to the RUN position.
4. Connect the clip end of a 12 volt test light to Pin 5 in the harness connector at the mirror switch. Touch the test light probe to Pin 3.

If the test light illuminates, the wiring circuit between the battery and switch is OK.

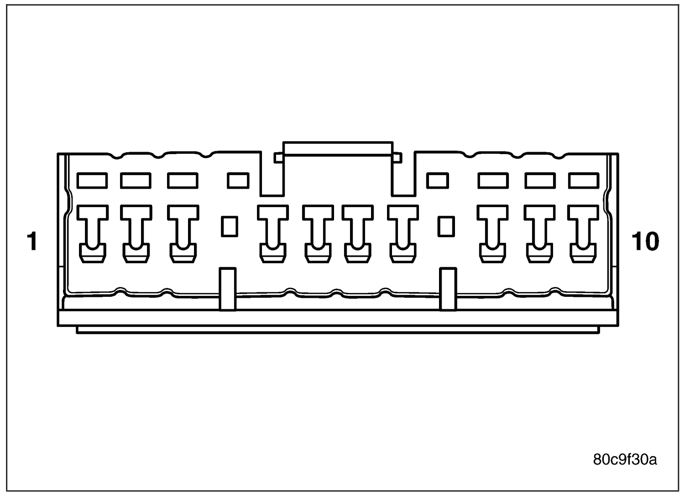
If the lamp does not illuminate, first check fuse 25 in the Junction Block (JB). If fuse 25 is OK, then check for a broken wire.

Refer to the appropriate wiring information.

## POWER MIRROR MOTOR TEST

If the power mirror switch is receiving proper current and ground and mirrors do not operate, proceed with power mirror motor test. Refer to the appropriate wiring information.

1. Remove front door trim panel to gain access to power mirror wire connector (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Disconnect wire harness connector to power mirror switch.
3. Using two jumper wires:
   - Connect one to a 12 volt source
   - Connect the other to a good body ground
   - Refer to the Mirror Motor Test Chart for proper wire connections at the switch connector



### MIRROR MOTOR TEST CHART

| 12 VOLTS | GROUND | MIRROR REACTION | |
|---|---|---|---|
| SWITCH CONNECTOR | | RIGHT | LEFT |
| PIN 2 | PIN 6 | - | UP |
| PIN 6 | PIN 1 | - | LEFT |
| PIN 6 | PIN 2 | - | DOWN |
| PIN 1 | PIN 6 | - | RIGHT |
| PIN 9 | PIN 6 | UP | - |
| PIN 6 | PIN 10 | LEFT | - |
| PIN 6 | PIN 9 | DOWN | - |
| PIN 10 | PIN 6 | RIGHT | - |

4. If results shown in table are not obtained, check for open or shorted circuit. Replace mirror assembly as necessary.

# AUTOMATIC DAY / NIGHT MIRROR

## DESCRIPTION - REAR VIEW MIRROR

The automatic dimming inside day/night rear view mirror system is a completely self-contained unit that replaces the standard equipment inside rear view mirror. This system will automatically change the reflectance of the inside rear view mirror to protect the driver from the unwanted headlight glare of trailing vehicles while driving at night. The automatic day/night inside mirror receives ignition switched battery current through a fuse in the junction block, and will only operate when the ignition switch is in the On position.

The automatic day/night mirror sensitivity cannot be repaired or adjusted. If any component of this unit is inoperative or damaged, the entire automatic day/night inside rear view mirror unit must be replaced.

## OPERATION - REAR VIEW MIRROR

The automatic day/night mirror switch allows the driver a manual control of whether the automatic dimming feature is operational. This switch is a momentary rocker-type switch located on the lower rear-facing surface of the mirror housing. When Auto is selected, a Light-Emitting Diode (LED) on the mirror housing just to the right of the switch illuminates to indicate that automatic day/night mirror is turned on. When Off is selected, the LED is turned off. The mirror also senses the backup lamp circuit, and will automatically disable its self-dimming feature whenever the transmission gear selector is in the Reverse position.

A thin layer of electrochromatic material between two pieces of conductive glass make up the face of the mirror. Two photocell sensors are used to monitor light levels and adjust the reflectance of the mirror. The ambient photocell sensor faces forward, to detect the outside light levels. The headlamp sensor is located on the mirror housing just to the left of the switch and facing rearward, to detect the light level received at the rear window side of the mirror. When the difference between the two light levels becomes too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), the mirror begins to darken.

## DIAGNOSIS AND TESTING - AUTOMATIC DAY / NIGHT MIRROR

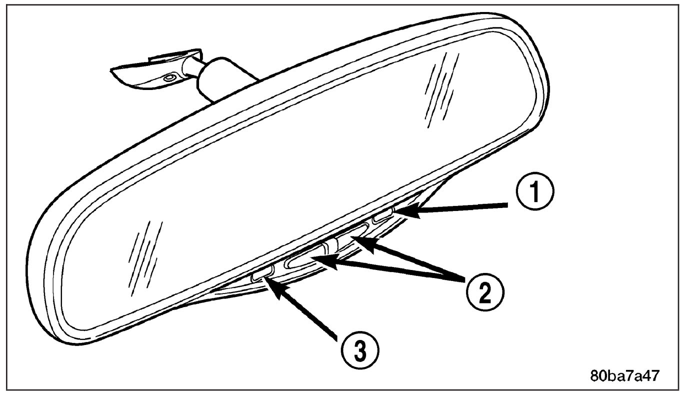
For complete circuit diagrams, refer to the appropriate wiring information.

1. Check the fused ignition switch output (run/start) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused ignition switch output (run/start) circuit to the ignition switch as required.
3. Disconnect the overhead wire harness connector from the automatic day/night mirror connector receptacle. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the overhead wire harness connector for the automatic day/night mirror. If OK, go to Step 4. If not OK, repair the open fused ignition switch output (run/start) circuit to the fuse in the junction block as required.
4. Turn the ignition switch to the Off position. Check for continuity between the ground circuit cavity of the overhead wire harness connector for the automatic day/night mirror and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open ground circuit to ground as required.
5. Turn the ignition switch to the On position. Set the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the overhead wire harness connector for the automatic day/night mirror. If OK, reconnect the overhead wire harness connector

to the automatic day/night mirror connector receptacle and go to Step 6. If not OK, repair the open backup lamp switch output circuit as required.

6. Place the transmission gear selector lever in the Neutral position. Place the automatic day/night mirror switch (2) in the Auto (LED (1) next to the switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

**NOTE: The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.**



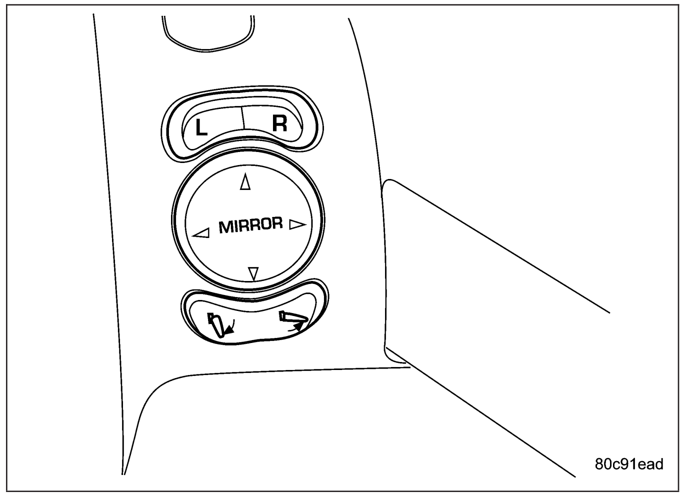
7. Shine a light into the rearward facing headlamp photocell sensor (3). The automatic day/night mirror should darken. If OK, go to Step 8. If not OK, replace the faulty automatic day/night mirror unit.
8. With the mirror darkened, place the transmission gear selector lever in the Reverse position. The automatic day/night mirror should return to its normal reflectance. If not OK, replace the faulty automatic day/night mirror unit.

# POWER FOLDAWAY MIRROR SWITCH - EXPORT

## DESCRIPTION

These vehicles may be equipped with Power Foldaway Mirrors. This feature allows both the driver and passenger side view mirrors to fold inward (retract) on demand. The vehicle has an additional switch located below the power mirror switch that controls the folding function of the mirror assembly.

The fold-away side view mirror is attached to the vehicle's door in the same manner as mirrors without the fold-away option. The fold-away mirrors unique option is the internal motor which allows the mirrors to fold inward. The fold-away mirror motor is not serviceable separately and if a motor is found to be faulty, the entire side view mirror must be replaced.



## OPERATION

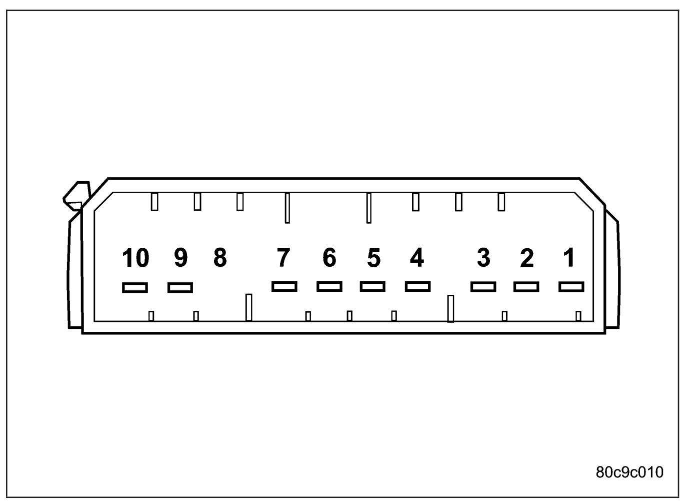
When the mirror retract switch is depressed, both of the side view mirrors will fold inward, Thus making the overall width of the vehicle the smallest possible. This can be helpful were parking space is a absolute minimum.

The power fold away mirrors will operate only when the ignition is in the On position.

The power fold away mirror system consists of the following components: mirror switch, side view mirror, relay, wires and fuse. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

## DIAGNOSIS AND TESTING - POWER FOLDAWAY MIRROR SWITCH - EXPORT

1. Disconnect and isolate the battery negative cable.
2. Remove power foldaway mirror switch (Refer to 8 - ELECTRICAL/POWER MIRRORS/POWER MIRROR SWITCH - REMOVAL).
3. Disconnect wire harness connector.
4. Using a ohmmeter, test for continuity between the terminals of the switch.
5. If results shown in the table are not obtained, replace the switch.



**POWER FOLDAWAY MIRROR SWITCH TEST**

| SWITCH POSITION | CONTINUITY BETWEEN |
|---|---|
| RETRACT | 5 AND 4 |
| | 3 AND 7 |
| EXTEND | 5 AND 7 |
| | 3 AND 4 |
| MIRROR SELECT SWITCH IN ″LEFT″ POSITION | |
| UP | 5 AND 2 |
| | 3 AND 6 |
| DOWN | 5 AND 6 |
| | 3 AND 2 |
| LEFT | 5 AND 6 |
| | 3 AND 1 |
| RIGHT | 5 AND 1 |
| | 3 AND 6 |
| MIRROR SELECT SWITCH IN ″RIGHT″ POSITION | |
| UP | 5 AND 9 |
| | 3 AND 6 |
| DOWN | 5 AND 6 |
| | 3 AND 9 |
| LEFT | 5 AND 6 |
| | 3 AND 10 |
| RIGHT | 5 AND 10 |
| | 3 AND 6 |

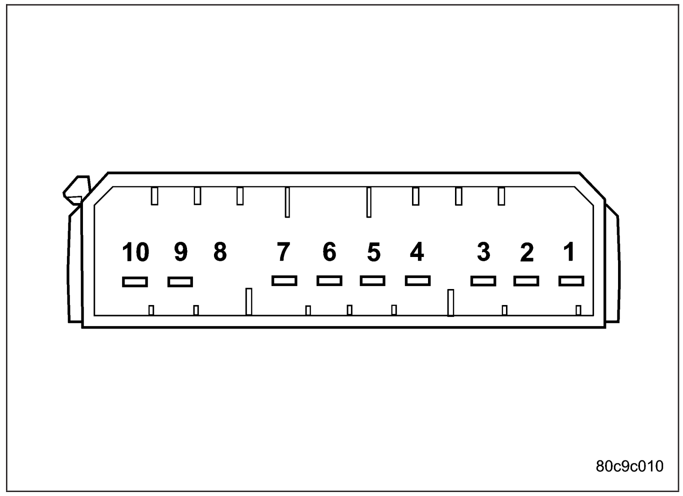
## REMOVAL

For removal procedures (Refer to 8 - ELECTRICAL/POWER MIRRORS/POWER MIRROR SWITCH - REMOVAL).

# POWER MIRROR SWITCH

## DIAGNOSIS AND TESTING - POWER MIRROR SWITCH

1. Remove power mirror switch (Refer to 8 - ELECTRICAL/POWER MIRRORS/POWER MIRROR SWITCH - REMOVAL).
2. Disconnect wiring harness connector from switch.
3. Using a ohmmeter, test for continuity between the terminals of the switch.
4. If results shown in the table are not obtained, replace the switch.

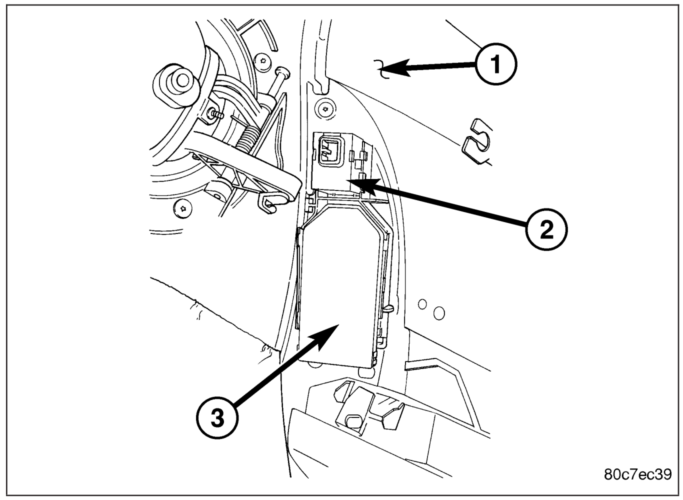


**POWER MIRROR SWITCH TEST**

| SWITCH POSITION | CONTINUITY BETWEEN |
|---|---|
| MIRROR SELECT SWITCH IN ″LEFT″ POSITION | |
| UP | 5 AND 2 |
| | 3 AND 6 |
| DOWN | 5 AND 6 |
| | 3 AND 2 |
| LEFT | 5 AND 6 |
| | 3 AND 1 |
| RIGHT | 5 AND 1 |
| | 3 AND 6 |
| MIRROR SELECT SWITCH IN ″RIGHT″ POSITION | |
| UP | 5 AND 9 |
| | 3 AND 6 |
| DOWN | 5 AND 6 |
| | 3 AND 9 |
| LEFT | 5 AND 6 |
| | 3 AND 10 |
| RIGHT | 5 AND 10 |
| | 3 AND 6 |

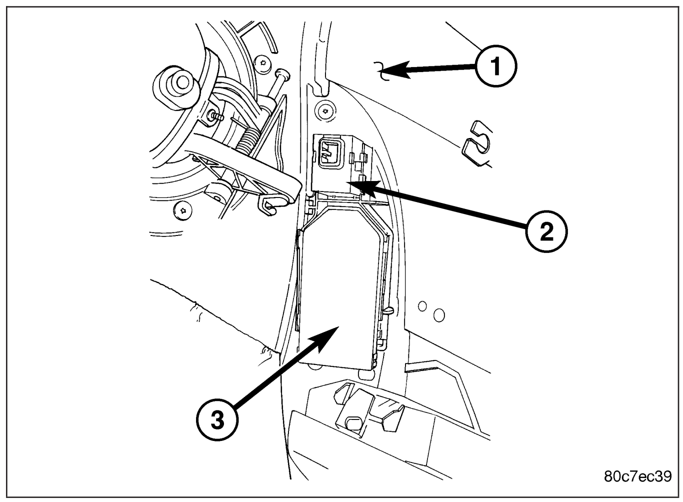
## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove door trim panel (1) (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Disconnect wire harness connector from switch (3).
4. Remove switch from door trim panel.



## INSTALLATION

1. Install switch to door trim panel (1).
2. Connect wire harness connector to switch (3).
3. Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
4. Connect battery negative cable.



# SIDEVIEW MIRROR

## REMOVAL

1. For removal procedures, (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - REMOVAL).

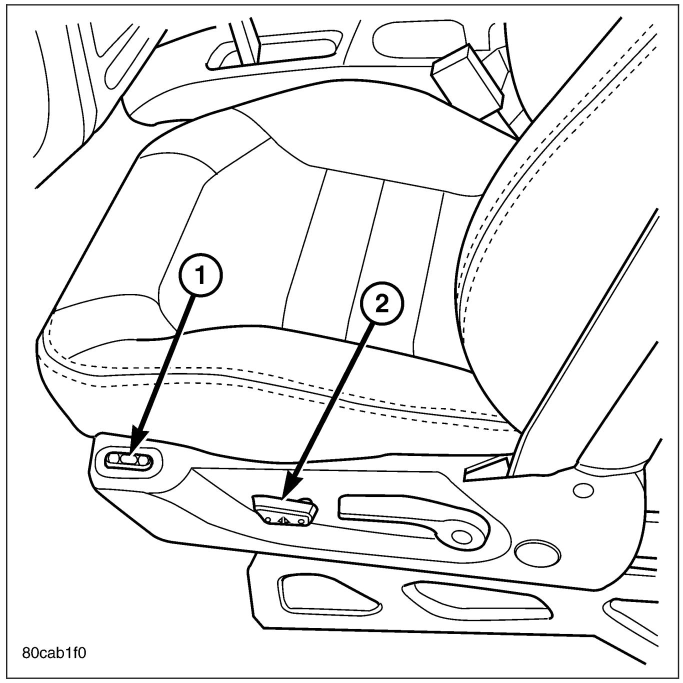
# POWER SEATS-SERVICE INFO

## TABLE OF CONTENTS

# POWER SEATS-SERVICE INFO

## DESCRIPTION

Individually controlled, electrically powered front seats are available as factory-installed equipment on this model. Vehicles with this option can be visually identified by the power seat switches (2), mounted on each of the front seat cushion side shields. The power seat system option allows the front seating positions to be electrically adjusted for optimum vehicle control and comfort. The power seat cushion can be adjusted forward, rearward, front up, front down, rear up, or rear down. The power seat system for this vehicle includes the following major components:



- **Power Seat Switches** - Two power seat switches are used per vehicle, one for the driver and one for the front seat passenger. Refer to the left and right power seat switch information later in this section.
- **Power Seat Tracks** - Two power seat tracks are used per vehicle, one for the driver and one for the front seat passenger seats. Refer to the power seat track information later in this section.
- **Circuit Breaker** - An automatic resetting circuit breaker is located in the Junction Block and is used to protect the power seat system from current overload.

Hard wired circuitry connects the power seat system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power seat system components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the **Wiring** section of this manual for more information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

## OPERATION

The power seat system receives battery current through a fuse in the Power Distribution Center (PDC) and a circuit breaker in the Junction Block, regardless of the ignition switch position.

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the appropriate power seat track adjuster motor. The selected adjuster motor operates to move the seat track through its drive unit in the selected direction until the switch is released, or until the travel limit of the seat track is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

Refer to the owner’s manual in the vehicle glove box for more information on the features, use and operation of the power seat system.

## DIAGNOSIS AND TESTING - POWER SEATS

Before any testing of the power seat system is attempted, the battery should be fully-charged and all wire harness connections and pins cleaned and tightened to ensure proper continuity and grounds. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and joint connector location views for the various wire harness connectors, splices and grounds.

1. If all power seats are inoperative, check the automatic resetting circuit breaker in the Junction Block. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/CIRCUIT BREAKER - DIAGNOSIS AND TESTING).

2. With the dome lamp on, apply the power seat switch in the direction of the failure.
3. If the dome lamp dims, the seat or the power seat track may be jammed. Check under and behind the seat for binding or obstructions.
4. If the dome lamp does not dim, proceed with testing of the individual power seat system components and circuits.

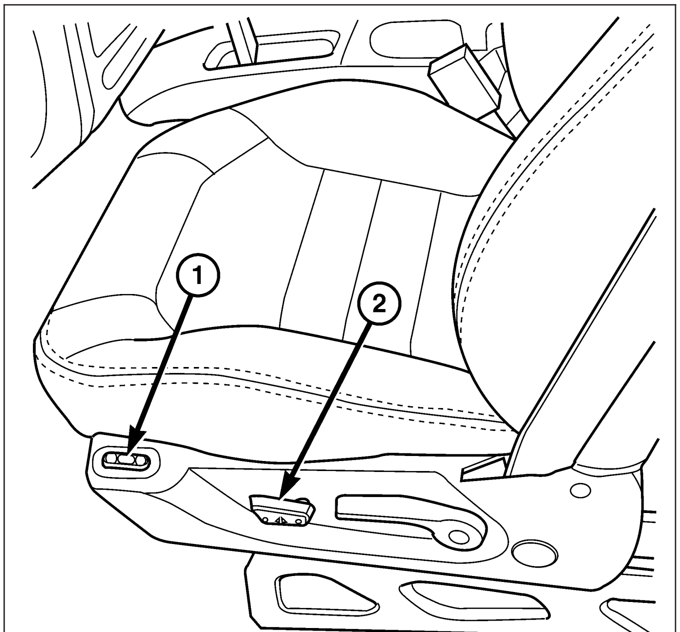
# POWER SEAT SWITCH

## DESCRIPTION

Vehicles equipped with the power seat option utilize a six-way power seat switch (2). This six-way power seat switch features one seat cushion shaped knob, visible on the outboard seat cushion side shield.

The switch is secured to the back of the seat cushion side shield with two screws. However, the control knob must be removed before the seat switch can be removed from the side shield.

The individual switches internal to the power seat switch assembly cannot be repaired. If one switch is damaged or faulty, the entire power seat switch assembly must be replaced.



80cab1f0

## OPERATION

The power seat tracks can be adjusted in six different ways using the power seat switches. See the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track adjuster motor. The selected adjuster motor operates to move the seat track through its drive unit in the selected direction until the switch is released, or until the travel limit of the seat track is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the seat track has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged.

## DIAGNOSIS AND TESTING

## POWER SEAT SWITCH

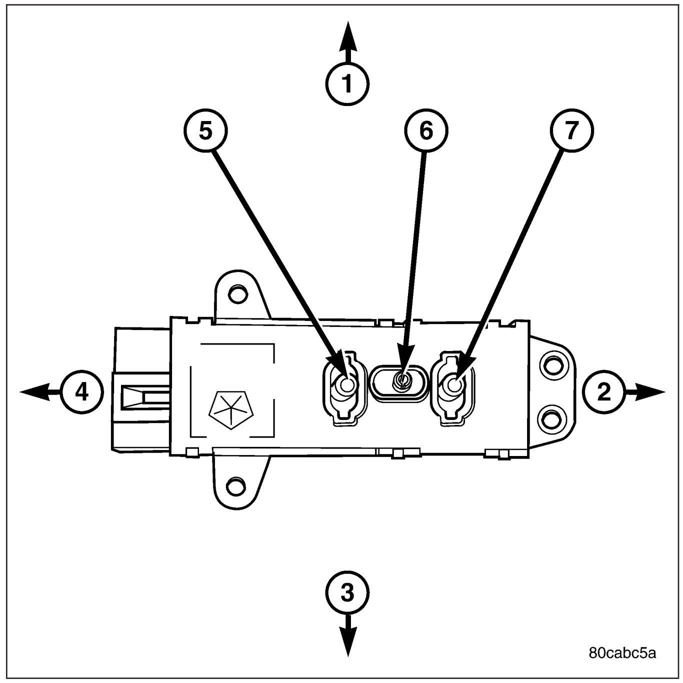
**For complete circuit diagrams, refer to the appropriate wiring information.** The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch, (Refer to 8 - ELECTRICAL/POWER SEATS/DRIVER SEAT SWITCH - REMOVAL).
3. Use an ohmmeter to test the continuity of the power seat switch in each switch position, refer to the switch illustration and the Power Seat Switch Direction Chart . See the Power Seat Switch Continuity Chart for test

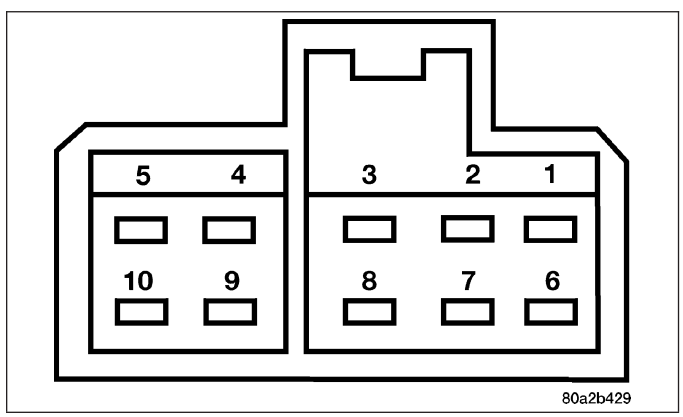
results. If OK, (Refer to 8 - ELECTRICAL/POWER SEATS/POWER SEAT TRACK - DIAGNOSIS AND TESTING) for further power seat system diagnosis. If not OK, replace the faulty power seat switch assembly.

**NOTE: The left power seat switch is shown, the right power seat switch is similar.**

**Power Seat Switch Direction Chart**



| ILLUSTRATION CALL-OUT NUMBER | POWER SEAT SWITCH DIRECTION |
|---|---|
| 1 | UP |
| 2 | REARWARD |
| 3 | DOWN |
| 4 | FORWARD |
| 5 | FRONT RISER SWITCH |
| 6 | CENTER SEAT SWITCH |
| 7 | REAR RISER SWITCH |



**Power Seat Switch Continuity Chart**

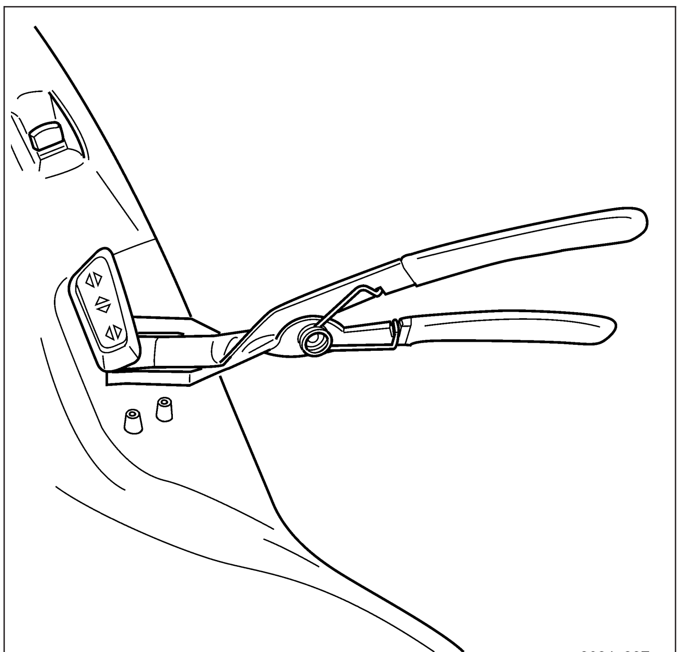
| REAR RISER DOWN | PIN 1 to 10<br>PIN 5 to 7 | PIN 1 to 10<br>PIN 5 to 10 |

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Using a push pin remover or another suitable wide flat-bladed tool, gently pry the power seat switch knob off of the switch control levers.
3. Remove the two forward-most screws that secure the outboard seat cushion side shield to the seat cushion frame.
4. Remove the recliner handle retaining screw and remove the recliner handle.
5. Pull the outboard seat cushion side shield away from the seat cushion frame far enough to access the power seat switch wire harness tie-strap and connector. Cut the tie-strap, if equipped.
6. Disconnect the power seat wire harness connector from the power seat switch connector receptacle. Depress the connector retaining tab and pull straight apart.
7. Using a very short phillips-headed screwdriver, remove the two screws that secure the power seat switch to the inside of the outboard seat cushion side shield.



8094e937

8. Remove the power seat switch from the outboard seat cushion side shield.

## INSTALLATION

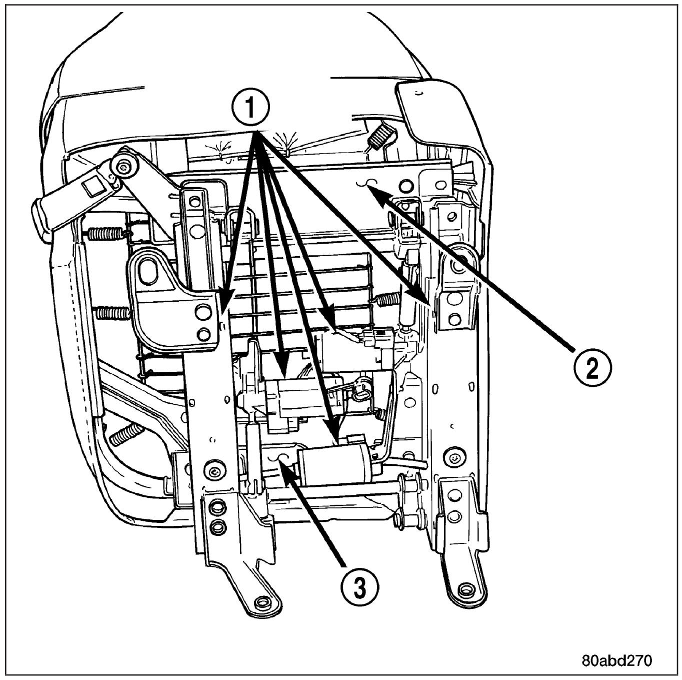
1. Reconnect the power seat wire harness connector to the power seat switch connector receptacle.
2. Position the power seat switch onto the outboard seat cushion side shield. Make certain the alignment dowel is inserted into the corresponding hole in the power seat switch.
3. Install and tighten the two screws that secure the power seat switch to the inside of the outboard seat cushion side shield. Tighten the screws to 1.5 N·m (14 in. lbs.).
4. Position the outboard seat cushion side shield onto the seat cushion frame
5. Install and tighten the two screws that secure the outboard seat cushion side shield to the seat cushion frame. Tighten the screws to 1.5 N·m (14 in. lbs.).
6. Install the recliner handle and retaining screw. Tighten the screws to 1.5 N·m (14 in. lbs.).
7. Position the power seat switch knob onto the switch control levers and push firmly and evenly until it snaps into place.
8. Reconnect the battery negative cable.

# POWER SEAT TRACK

## DESCRIPTION

The six-way power seat option includes a power seat track assembly (3) located under each front seat cushion frame (2). The power seat track assembly replaces the standard manually operated seat tracks. The lower half of the power seat track is secured at the front with two bolts to the floor panel seat cross member, and at the rear with one bolt and one nut to the floor panel. Four bolts secure the bottom of the seat cushion frame to the upper half of the power seat track unit.

The power seat track assembly cannot be repaired, and is serviced only as a complete assembly. If any component in this assembly is faulty or damaged, the entire power seat track must be replaced.



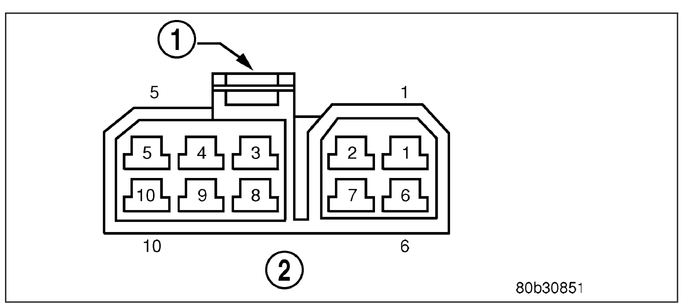
## OPERATION

The power seat track unit includes three reversible electric motors that are secured to the upper half of the track unit. Each motor moves the seat adjuster through a combination of worm-drive gearboxes and screw-type drive units. Each of the three driver side power seat track motors also has a position potentiometer integral to the motor assembly, which electronically monitors the motor position.

The front and rear of the seat are operated by two separate vertical adjustment motors. These motors can be operated independently of each other, tilting the entire seat assembly forward or rearward; or, they can be operated in unison by selecting the proper power seat switch functions, which will raise or lower the entire seat assembly. The third motor is the horizontal adjustment motor, which moves the seat track in the forward and rearward directions.

## DIAGNOSIS AND TESTING - POWER SEAT TRACK

1. Remove the power seat switch from the seat (Refer to 8 - ELECTRICAL/POWER SEATS/DRIVER SEAT SWITCH - REMOVAL).
2. Checking the body harness side of the power seat switch electrical connector, check Pin 1 for ground and Pin 5 for battery voltage. If either of these two are not present repair the body harness as required.
3. To test the seat motors and verify proper seat responses, refer to the SEAT TRACK MOTOR TEST TABLE . Using two jumper wires, connect one to a battery supply and the second to a ground. Connect the other ends to the seat wire harness connector as described in the SEAT TRACK MOTOR TEST TABLE .



**SEAT TRACK MOTOR TEST TABLE**

| SEAT SWITCH CONNECTOR | | | |
|---|---|---|---|
| CONNECT JUMPER | | SEAT ACTION | |
| B(+) | B(–) | LEFT SIDE | RIGHT SIDE |
| PIN 9 | PIN 8 | FRONT RISER UP | FRONT RISER DOWN |
| PIN 8 | PIN 9 | FRONT RISER DOWN | FRONT RISER UP |
| PIN 3 | PIN 6 | FORWARD | FORWARD |
| PIN 6 | PIN 3 | REARWARD | REARWARD |
| PIN 10 | PIN 7 | REAR RISER UP | REAR RISER DOWN |
| PIN 7 | PIN 10 | REAR RISER DOWN | REAR RISER UP |

## REMOVAL

1. Remove the appropriate seat from the vehicle. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
2. Remove the seat cushion side shield from the seat (Refer to 23 - BODY/SEATS/SEAT CUSHION SIDE COVERS - REMOVAL).
3. Remove four seat track mounting bolts from cushion pan.
4. Disconnect the power seat electrical and remove the seat track from the seat cushion.

## INSTALLATION

1. Position the seat track and install the retaining bolts in the seat cushion pan. Torque the bolts to 45-60 N·m.
2. Route and connect the power seat electrical on the seat track and cushion pan.
3. Install the seat cushion side shield on the seat. Refer to the Body section for the procedure.
4. Install the seat in the vehicle (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).
5. Connect the negative battery cable.

# POWER TOP - SUNROOF

## TABLE OF CONTENTS

# POWER TOP - SUNROOF

## DESCRIPTION

**WARNING: Keep fingers and other body parts out of sunroof opening at all times.**

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch located in the overhead console in between the two reading lamps. The sunroof system receives battery feed through a 30 amp circuit breaker in the junction block. The sunroof system power is supplied when the ignition switch is in the RUN and ACCESSORY positions. The sunroof will continue to operate normally with the key in the OFF position or with the key removed while the Accessory Delay System is active.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

The sunroof is electrically operated from a combination push-button/rocker style switch located in the overhead console in between the two reading lamps. The “VENT” switch is a push button type switch and opens the sunroof to the vent position only. The other switch “OPEN/CLOSED” is a rocker type switch for opening and closing the sunroof. Pressing and releasing the open button once, the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position.

## OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open feature. The sunroof system receives battery feed through the “sunroof” relay and a 20 amp mini fuse located in the junction block. The sunroof system power is supplied when the ignition switch is in the RUN and ACCESSORY positions. The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The sunroof is electrically operated from two switches located in the overhead console in between the two reading lamps. The “VENT” switch is a push button type switch and opens the sunroof to the vent position only. The other switch “OPEN/CLOSED” is a rocker type switch for opening and closing the sunroof. Pressing and releasing the open button once, the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position.

## DIAGNOSIS AND TESTING

## SUNROOF

Refer to SUNROOF DIAGNOSIS CHART for possible causes. Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist.

Check the condition of the circuit protection and inspect all wiring connector pins for proper engagement and continuity. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**SUNROOF DIAGNOSIS CHART**

| SYMPTOM | POSSIBLE CAUSE | CORRECTION |
|---|---|---|
| Sunroof completely inoperative. | Inoperative control switch. | Perform sunroof switch diagnostics, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - DIAGNOSIS AND TESTING). |
| | Inoperative circuit ground between sunroof motor/module, control switch, and body harness. | Inspect ground connections and wiring. Repair as necessary. |
| | Inoperative power circuit between sunroof motor/module, control switch, and body harness. | Check the condition of the circuit protection and inspect all wiring. Repair as necessary. |
| | Inoperative sunroof motor/module. | Replace the sunroof motor/module, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - REMOVAL). |
| Audible whine when switch is depressed, sunroof does not operate. | Inoperative sunroof motor/module. | Replace the sunroof motor/module, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - REMOVAL). |
| | Binding cable. | Repair or replace binding cable as necessary. |
| Audible clicking or ratcheting when switch is pressed, sunroof does not operate. | Broken or worn drive cable. | Repair or replace binding cable as necessary. |
| | Worn drive motor gear. | Replace the sunroof motor/module, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - REMOVAL). |
| | Mechanisms not synchronized. | Synchronize mechanisms, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF MOTOR/MODULE CALIBRATION). |
| Sunroof vents and opens, but does not close. | Broken or disengaged trough guide. | Repair trough guide as necessary. |
| | Binding cable. | Repair or replace binding cable as necessary. |
| | Inoperative sunroof ″CLOSE″ circuit. | Check the condition of the circuit, connections and wiring. Repair as necessary. |
| | Inoperative control switch. | Perform sunroof switch diagnostics, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - DIAGNOSIS AND TESTING). |
| | Inoperative sunroof motor/module. | Replace the sunroof motor/module, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - REMOVAL). |

| SYMPTOM | POSSIBLE CAUSE | CORRECTION |
|---|---|---|
| Sunroof vents, but does not open. | Binding cable or mechanism. | Repair or replace binding cable as necessary. |
| | Inoperative sunroof ″OPEN″ circuit. | Check the condition of the circuit, connections and wiring. Repair as necessary. |
| | Inoperative control switch. | Perform sunroof switch diagnostics, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - DIAGNOSIS AND TESTING). |
| | Inoperative sunroof motor/module. | Replace the sunroof motor/module, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - REMOVAL). |
| Sunroof does not vent | Binding cable or mechanism. | Repair or replace binding cable as necessary. |
| | Inoperative sunroof ″VENT″ circuit. | Check the condition of the circuit, connections and wiring. Repair as necessary. |
| | Inoperative control switch. | Perform sunroof switch diagnostics, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - DIAGNOSIS AND TESTING). |
| | Inoperative sunroof motor/module. | Replace the sunroof motor/module, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - REMOVAL). |
| Glass movement not consistant or glass does not operate smoothly | Glass and Track timing.<br>Glass and Track alignment.<br>Cables and Guide alignment. | Perform the necessary adjustments, (Refer to 23 - BODY/SUNROOF/ GLASS PANEL - ADJUSTMENTS). |

# MOTOR/MODULE - SUNROOF

## DIAGNOSIS AND TESTING -

**For complete circuit diagrams, refer to the appropriate wiring information.** The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If the power top is completely inoperative perform the following diagnostic steps.

1. Check the Accessory delay 30 amp Circuit breaker in the Junction Block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the inoperative circuit breaker.
2. Partially remove the headliner to access the sunroof motor/module.
3. Disconnect the motor/module electrical connector. With the ignition switch in the “RUN” position check for Battery voltage at the Accessory Relay Output terminal of the harness connector. If OK, go to Step 4. If not OK repair the Accessory Relay Output circuit as necessary.
4. Using an ohmmeter test for continuity between the harness connector ground circuit and a known good ground. Continuity should be present. If OK, go to Step 5. If not OK, repair the open ground circuit as necessary.
5. Turn the ignition switch to the “OFF” position. Reconnect the motor/module electrical connector. With the ignition switch in the “RUN” position check for 5 volts on the “VENT”, “CLOSE” and “OPEN” control circuits at the back side of the motor/module connector. If OK, go to Step 6. If not OK, replace the motor/module assembly, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - REMOVAL).
6. Turn the ignition switch to the “OFF” position. Disconnect the motor/module and sunroof switch electrical connectors. Using an ohmmeter check for continuity on the “VENT”, “CLOSE” and “OPEN” circuits between the motor/module and sunroof switch. Continuity should be present. If OK, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - DIAGNOSIS AND TESTING) for diagnosis of the sunroof switch. If not OK, repair the control circuits as necessary.

## STANDARD PROCEDURE

## STANDARD PROCEDURE - POWER SUNROOF TIMING

**NOTE: Perform the timing procedures if any of the following conditions exist:**

- Glass skewed in the channel
- One side of the glass dropping before the other while moving from “VENT” to “CLOSE”
- Glass reversing direction when closing the sunroof
- Glass will not close or may stop at the wrong location
- The glass may over travel the “OPEN” position and stall the motor
- The glass may over travel the “CLOSE” position and stall the motor

**NOTE: The timing of the motor/module and the sunroof assembly play a critical role in the proper function of the sunroof. If the motor/module is removed and the sunroof glass or cables are moved the sunroof module will have to be timed. REFER to the following procedure for the necessary steps.**

1. Perform the motor/module re-initialization procedure, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE).
2. Remove the motor/module, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - REMOVAL).
3. Remove sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL).
4. Now place both right and left arms in the closed position. Using a screwdriver, push the plastic cable all the way forward in the track until the glass mounting arm drops into the closed position.
5. Repeat this on the other side.
6. To verify correct timing, there is an 1/8 inch hole in the cable ramp that must be aligned with the front glass mounting screw hole.
7. Using an awl, verify alignment of both right and left timing holes. The tracks will now be timed to the fully closed position.
8. Install the motor/module (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - INSTALLATION).

9. Install the sunroof glass panel, (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).
10. Perform the motor/module re-initialization procedure, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE).

## STANDARD PROCEDURE - RE-INITIALIZATION

**NOTE: If for some reason the sunroof is not operating normally it may be necessary to re-initialize the sunroof assembly. This procedure should be attempted prior to any diagnosis of the sunroof system.**

**NOTE: The re-initialization procedure is not complete if any one of the following conditions occurs before the re-initialization procedure is completed:**

- The sunroof switch is not held in the CLOSE position.
- The ignition or battery power is lost.
- The glass panel has not reached its closed position.

**NOTE: If the re-initialization procedure is not carried out completely, it must be started over.**

1. Cycle the sunroof to full “OPEN” position.
2. Once the sunroof is in the full “OPEN” position, press and continuously hold the “OPEN” button on the sunroof switch.
3. After a delay of 10 seconds the sunroof will begin to move past the normal “OPEN” position to the **hard stop** position. It will then reverse to the normal “OPEN” position also known as the **soft stop**. Once the sunroof has reversed to the **soft stop**, immediately (within 5 seconds of stopping travel) release the “OPEN” button and continuously press it again.
4. After a delay of three seconds the sunroof will begin moving to the “VENT” and then “CLOSED” position. When the roof reaches the fully “CLOSED” position and stops the “OPEN” button can be released.

The re-initialization procedure is now complete. Operate the sunroof in all directions to verify proper operation.

## STANDARD PROCEDURE - INITIALIZATION

**NOTE: This procedure should be attempted any time a new motor/module is installed in the sunroof assembly. It must be performed on initial vehicle power up to be successful.**

**NOTE: The initialization procedure is not complete if any one of the following conditions occurs before the initialization procedure is completed:**

- The sunroof switch is not held in the CLOSE position.
- The ignition or battery power is lost.
- The glass panel has not reached its closed position.

**NOTE: if the initialization procedure is not carried out completely, it must be started over.**

1. Turn the ignition key to the “RUN” position.
2. Move the sunroof to the full open position.
3. Continuously press the “OPEN” button on the sunroof switch.
4. The sunroof will begin to move past the normal “OPEN” position to the **hard stop** position. It will then reverse to the normal “OPEN” position also known as the **soft stop**. Once the sunroof has reversed to the **soft stop**, immediately (within 5 seconds of stopping travel) release the “OPEN” button and continuously press it again.
5. After a delay of three seconds the sunroof will begin moving to the “VENT” and then “CLOSED” position. When the roof reaches the fully “CLOSED” position and stops the “OPEN” button can be released.

The initialization procedure is now complete. Operate the sunroof in all directions to verify proper operation.

## REMOVAL

**NOTE: The sunroof system is timed from the factory so that the motor/module shuts off automatically when the sunroof window reaches a certain position. Extreme care must be taken when removing the motor/module from the sunroof assembly or this timing may be thrown off causing damage to the sunroof system. Anytime the motor/module needs to be removed from the sunroof assembly the sunroof window must be in the FULLY CLOSED POSITION if possible.**
**If glass panel is not in the fully closed position and the motor/module is removed or inoperative, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE).**

1. Disconnect and isolate the negative battery cable.
2. Remove A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
3. Remove sun visors (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).
4. Remove map lamps/mini console, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/READING LAMP - REMOVAL).
5. Remove the sunroof switch, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - REMOVAL).
6. Remove sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).
7. Remove headliner as necessary to gain access to sunroof motor/module. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
8. Disconnect the motor/module wire harness connectors.
9. Remove the motor/module attaching screws.
10. Remove motor/module from the sunroof housing assembly.

## INSTALLATION

**NOTE: Before installing a new motor/module or the original motor/module ensure that the sunroof glass panel is in the FULLY CLOSED POSITION. If sunroof glass panel is not in the FULLY CLOSED POSITION, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE).**

1. Ensure that sunroof assembly is in the FULLY CLOSED position before mounting the motor/module. If not in the fully closed position (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE).
2. Place motor/module into position on the sunroof housing and install attaching screws. Tighten the screws to 3.5 N·m (31 in. lbs.) torque.
3. Connect the motor/module, and sunroof switch wire connectors.
4. Install sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).
5. Connect the battery negative cable.
6. Perform the motor/module initialization procedure, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - MOTOR/MODULE INITIALIZATION).
7. Verify sunroof operation and alignment, and adjust as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).
8. Disconnect and isolate battery negative cable.
9. Installing the headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
10. Install sunroof opening trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).
11. Install the sunroof switch, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - INSTALLATION).
12. Install the map lamps/mini console, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/READING LAMP - INSTALLATION).
13. Install sun visors (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).
14. Install A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).
15. Connect the battery negative cable.

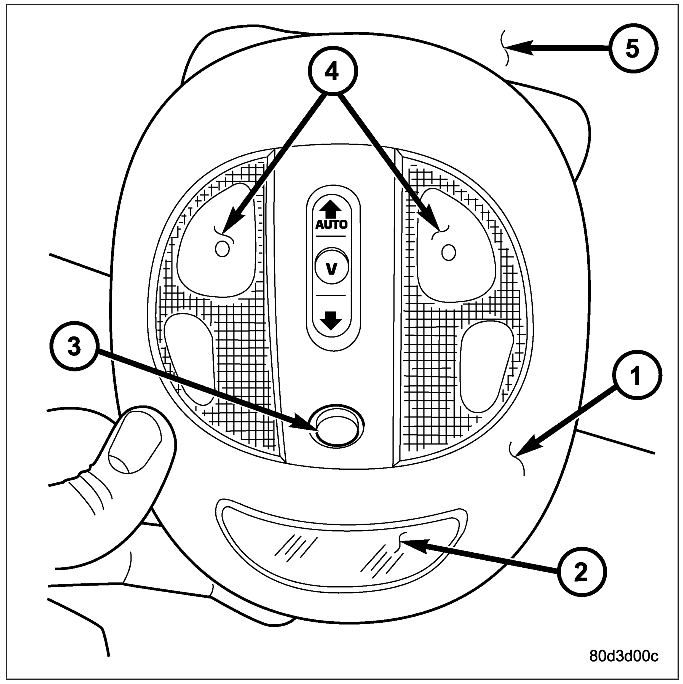
# SWITCH - SUNROOF

## DESCRIPTION

The power sunroof switch is a combination push-button and rocker switch located in the overhead console (1) positioned between the two reading lamps (4). The switch is mounted in the overhead console with four plastic retaining tabs, molded into the switch housing. The sunroof switch is a direct contact unit that is directly wired to the sunroof motor/module assembly. The sunroof switch performs the following functions:

- Power sunroof open
- Power sunroof auto open
- Power sunroof closed
- Power sunroof vent

The power sunroof switch cannot be repaired. If the individual components are damaged or inoperative the switch assembly must be replaced, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - REMOVAL).



## OPERATION

The sunroof is electrically operated from two switches located on the windshield header, rearward of the map lamp. The “VENT” switch is a push button type switch and opens the sunroof to the vent position only. The other switch “OPEN/CLOSED” is a rocker type switch for opening and closing the sunroof. Pressing and releasing the open button once, the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position.

The switch is grounded at on terminal and receives a 5 volt signal from the sunroof motor/module on the remaining three terminals. The switch pulls down the 5 volt reference voltage from the module signaling it to perform the desired function.

**For complete circuit diagrams, refer to the appropriate wiring information.** The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

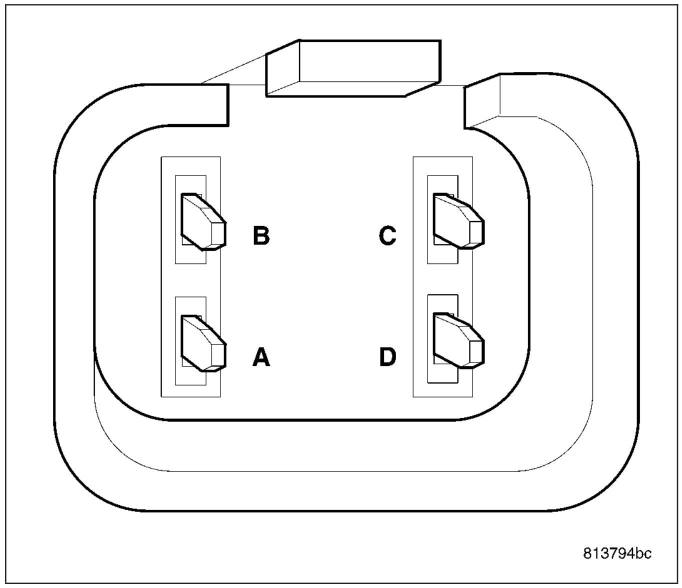
## DIAGNOSIS AND TESTING

## SUNROOF SWITCH

**For complete circuit diagrams, refer to the appropriate wiring information.** The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Remove the power sunroof switch, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - REMOVAL).
2. Disconnect the power sunroof switch wire harness connector.
3. With the ignition key in the “RUN” position check for 5 volts on the “OPEN”, “CLOSE” and “VENT” circuits of the sunroof switch harness connector. If OK, go to Step 4. If not OK, inspect the wiring harness and connectors between the motor/module and switch for damage and repair as necessary.

4. With the ignition key in the “OFF” position check for continuity between the ground circuit of the sunroof switch harness connector and a known good ground. Continuity should be present. If OK, go to Step 5. If not OK, inspect the wiring harness and connector and repair the ground circuit as necessary.
5. Using an ohmmeter, test the continuity of the power sunroof switch in each switch position. Refer to the POWER SUNROOF SWITCH CONTINUITY TABLE . If OK, inspect the wiring harness and connectors for damage and repair as necessary. If not OK, replace the power sunroof switch, (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - REMOVAL).



**POWER SUNROOF SWITCH CONTINUITY TABLE**

| SWITCH POSITION | CONTINUITY BETWEEN PINS |
|---|---|
| OFF | NO CONTINUITY |
| SUNROOF OPEN | B & C |
| SUNROOF CLOSED | B & D |
| SUNROOF VENT | B & A |

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
3. Disconnect the switch electrical connector.
4. To remove the switch from the overhead console, push on the back of the switch until it comes free from the overhead console.

## INSTALLATION

1. Install the switch in the overhead console assembly. Be certain the switch is securely snapped in place.
2. Connect the sunroof control switch electrical connector. Be certain the switch connector is securely snapped in place.
3. Install the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
4. Connect the battery negative cable.
5. Confirm proper sunroof system operation.

# POWER WINDOWS

## TABLE OF CONTENTS

# POWER WINDOWS

## DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the center console. A master switch on the front of the center console allows the driver to raise or lower each of the passenger door windows and to lock out the individual switches on the rear of the center console from operation. The power window system receives battery feed through fuse 13 in the Power Distribution Center (PDC), only when the ignition switch is in the RUN or ACCESSORY position.

## OPERATION

### WINDOW SWITCH

The power window switches control the battery and ground feeds to the power window motors. Both of the rear door power window switches receive their battery and ground feeds through the circuitry of the front window switch. When the power window lockout switch is in the Lock position, the battery feed for the rear door window switches is interrupted.

### WINDOW MOTOR

Front door window lift motors use permanent type magnets. The B+ and ground applied at the motor terminal pins will cause the motor to rotate in one direction. Reversing current through the motor terminals will cause the motor to rotate in the opposite direction.

Refer to the appropriate wiring information.

## DIAGNOSIS AND TESTING - POWER WINDOWS

### WIRING VOLTAGE TEST

The following wiring test determines whether or not voltage is continuous through the body harness to the front switch.

1. Remove the power window switch and bezel (Refer to 8 - ELECTRICAL/POWER WINDOWS/POWER WINDOW SWITCH - REMOVAL).
2. Disconnect wire connector from back of power window switch.
3. Switch ignition to the ON position.
4. Connect the clip end of a 12 volt test light to Pin 14 of the window switch harness connector. Touch the test light probe to Pin 10.
   - If the test light illuminates, the wiring circuit between the battery and switch is OK.
   - If the lamp does not illuminate, first check fuse 13 in the Power Distribution Center (PDC). If fuse 13 is OK, then check for a broken wire.

Refer to the appropriate wiring information.

### POWER WINDOW MOTOR TEST

If the power window motor is receiving proper current and ground and does not operate, proceed with motor test. Refer to the appropriate wiring information.

1. Remove front door trim panel as necessary to gain access to power window motor wire connector (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Disconnect power window motor wire connector from door harness.
3. Using two jumper wires, connect one to a battery (+) source and the other to a good ground (-).
4. Connect the Negative (-) jumper probe to one of the motor connector terminals.
5. Momentarily touch the Positive (+) jumper probe to the other motor connector terminal.

When positive probe is connected the motor should rotate in one direction to either move window up or down. If window is all the way up or down the motor will grunt and the inner door panel will flex when actuated in that one direction.

6. Reverse jumper probes at the motor connector terminals and window should now move in opposite direction. If window does not move or grunt, replace the motor.

If window moved completely up or down, reverse the jumper probes and cycle window to the opposite position to verify full operation.

If motor grunts and does not move, verify that regulator is not binding.

# WINDOW MOTOR

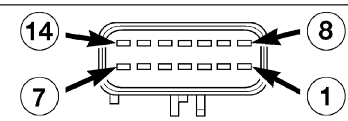
## REMOVAL

The window motor is incorporated into the window regulator assembly. If the window motor requires replacement, the window regulator must be replaced. (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL) or (Refer to 23 - BODY/DOORS - REAR/WINDOW REGULATOR - REMOVAL).

# WINDOW SWITCH

## DIAGNOSIS AND TESTING - WINDOW SWITCH

1. Remove the switch to be tested (Refer to 8 - ELECTRICAL/POWER WINDOWS/POWER WINDOW SWITCH - REMOVAL).
2. Using an ohmmeter, Test front switch for continuity.

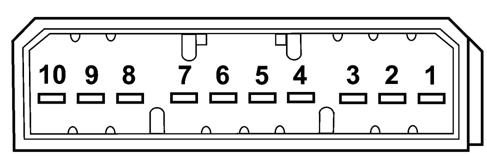


80a7e2ba

**POWER WINDOW FRONT SWITCH TEST**

| SWITCH POSITION | CONTINUITY BETWEEN |
|---|---|
| OFF | 14 AND 4 |
| | 14 AND 5 |
| | 14 AND 6 |
| | 14 AND 7 |
| | 14 AND 9 |
| | 14 AND 11 |
| | 14 AND 12 |
| | 14 AND 13 |
| LEFT FRONT UP | 10 AND 11 |
| LEFT FRONT DOWN | 10 AND 9 |
| RIGHT FRONT UP | 10 AND 12 |
| RIGHT FRONT DOWN | 10 AND 13 |
| LEFT REAR UP | 10 AND 5 |
| LEFT REAR DOWN | 10 AND 4 |
| RIGHT REAR UP | 10 AND 7 |
| RIGHT REAR DOWN | 10 AND 6 |
| LOCKOUT (LOCKED) | NO CONTINUITY BETWEEN 10 AND 2 |
| LOCKOUT (UNLOCKED) | 10 AND 2 |

3. If the proper results are not obtained, replace the front window switch.
4. Test rear switch for continuity.



80c9b8cf

**POWER WINDOW REAR SWITCH TEST**

| SWITCH POSITION | CONTINUITY BETWEEN |
|---|---|
| OFF | 1 AND 3 |
| | 4 AND 2 |
| | 7 AND 10 |
| | 8 AND 9 |
| LEFT UP | 10 AND 6 |
| LEFT DOWN | 6 AND 8 |
| RIGHT UP | 5 AND 2 |
| RIGHT DOWN | 5 AND 3 |

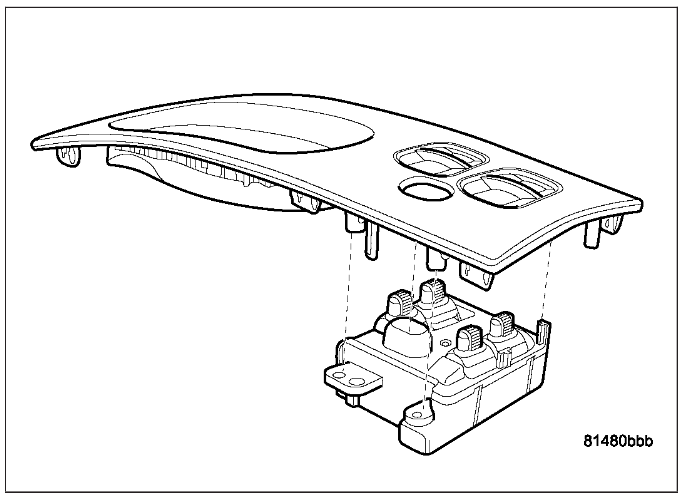
5. If the proper results are not obtained, replace the rear window switch.

The power window master switch has a Auto-Down feature on both front windows. The switch is equipped with two detent positions when actuating the power window OPEN. The first detent position allows the window to roll down and stop when the switch is released. The second detent position actuates an integral express roll down relay that rolls the window down after the switch is released. When the express down circuit senses stall current (window has reached end of down travel), the switch will turn current off to the motor. The AUTO feature can be cancelled by actuating the switch UP or DOWN while window is in motion. If the electronic circuit in the switch fails to detect a stall current, the auto down circuit will time out within 9 to 14 seconds.

## REMOVAL

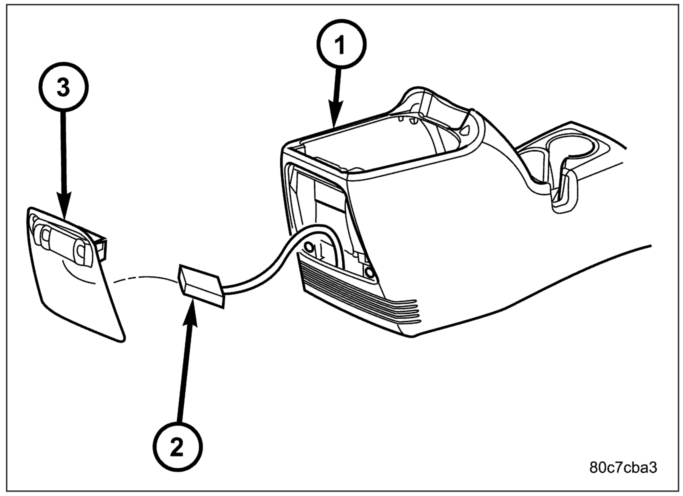
### FRONT

1. Disconnect and isolate the battery negative cable.
2. Remove the shift bezel.
3. Remove the mounting fasteners and switch.
4. Disconnect electrical harness connector.



### REAR

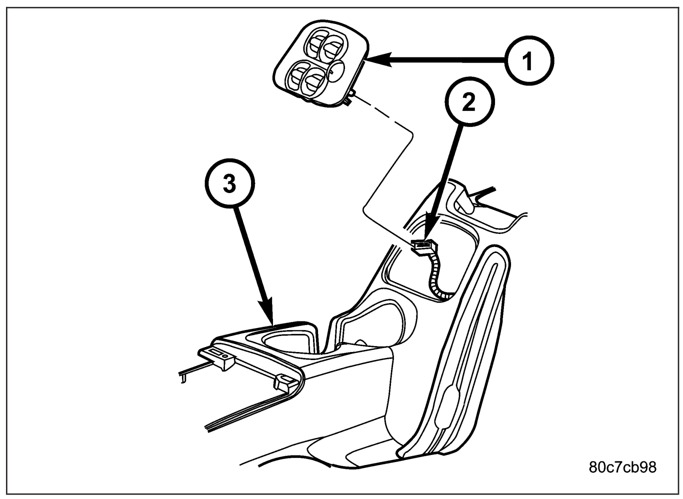
1. Disconnect and isolate the battery negative cable.
2. Using a trim stick, gently pry the switch (3) from the console (1).
3. Disconnect electrical harness connector (2).



## INSTALLATION

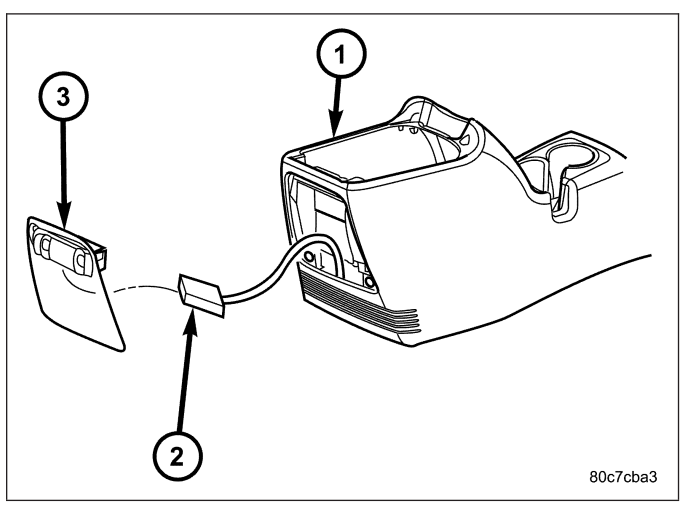
### FRONT

1. Connect electrical harness connector (2) to switch (1).
2. Install switch to shifter bezel. Install and tighten mounting fasteners.
3. Install shifter bezel.
4. Connect battery negative cable.



### REAR

1. Connect electrical harness connector (2) to switch (3).
2. Install switch into opening in console (1) and press into place.
3. Connect battery negative cable.



# RESTRAINTS

## TABLE OF CONTENTS

# RESTRAINTS - ELECTRICAL DIAGNOSTICS

## TABLE OF CONTENTS

# RESTRAINTS - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## AIRBAG WARNING INDICATOR OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The Instrument Cluster (IC) broadcasts the airbag warning indicator status on the Bus. The Occupant Restraint Controller (ORC) expects this status message once every second. The ORC will set this DTC immediately if the status is OPEN.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER (IC) |
| OCCUPANT RESTRAINT CONTROLLER (ORC) |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**WARNING: When disconnecting or connecting airbag system components, the ignition must be turned off and the battery must be disconnected.**

Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. VERIFYING IC INDICATOR STATUS

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, select the MONITORS and read the AIRBAG INDICATOR STATUS (Short, Open, OK).

Turn the ignition off, wait 15 seconds, then turn the ignition on.

Observe the AIRBAG INDICATOR STATUS during the IC bulb check and for 10 seconds afterwards.

**Does the scan tool display AIRBAG INDICATOR STATUS: OPEN?**

**Yes** >> Replace the IC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all DTCs Airbag System Modules and IC.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC and IC.

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in the applicable section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## AIRBAG WARNING INDICATOR SHORT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  The Instrument Cluster (IC) broadcasts the airbag warning indicator status on the Bus. The Occupant Restraint Controller (ORC) expects this status message once every second. The ORC will set this DTC immediately if the status is SHORT.

| Possible Causes |
|---|
| INSTRUMENT CLUSTER (IC) |
| OCCUPANT RESTRAINT CONTROLLER (ORC) |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**WARNING: When disconnecting or connecting airbag system components, the ignition must be turned off and the battery must be disconnected.**

Turn the ignition on.

**Select ACTIVE or STORED DTC**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. VERIFYING IC INDICATOR STATUS

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, select the MONITORS and read the AIRBAG INDICATOR STATUS (Short, Open, OK).

Turn the ignition off, wait 15 seconds, then turn the ignition on.

Observe the AIRBAG INDICATOR STATUS during the IC bulb check and for 10 seconds afterwards.

**Does the scan tool display AIRBAG INDICATOR STATUS: SHORT?**

**Yes** >> Replace the IC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all DTCs in Airbag System Modules and IC.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC and IC.

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in the applicable section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## CALIBRATION MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the Ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) will set this DTC if the VIN stored in the Powertrain Control Module (PCM) does not match the VIN stored in the ORC.

| Possible Causes |
|---|
| INCORRECT PCM |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: When disconnecting or connecting airbag system components, the ignition must be turned off and the battery must be disconnected.**

Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. VERIFY THAT THE CURRENT VIN AND THE ACTUAL VIN MATCH

With the scan tool, select System Tests and select VIN Verification.

Compare the current VIN displayed by the scan tool and the VIN on the vehicle VIN plate.

**Does the current VIN match the VIN on the vehicle VIN plate?**

**Yes** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

Replace the ORC in accordance with the service information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Replace and program the PCM in accordance with the service information. Ensure that the PCM is replaced with the correct vehicle line PCM.

Perform POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase DTCs in all Airbag System Modules.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC.

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## CLUSTER MESSAGE MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on following the instrument cluster (MIC) bulb check.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) broadcasts the Airbag Lamp On/Off request message on the Bus one time each second. In turn, the MIC broadcasts the Airbag Lamp On/Off status message on the Bus one time each second. The ORC compares the request message and the status message and will set this DTC if they do not match.

| Possible Causes |
| --- |
| INSTRUMENT CLUSTER (IC) |
| OCCUPANT RESTRAINT CONTROLLER (ORC) |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: When disconnecting or connecting airbag system components, the ignition must be turned off and the battery must be disconnected.**
Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR ACTIVE MIC DTCs

With the scan tool, read active IC DTCs.

**Does the scan tool display any DTCs?**

**Yes** >> (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING) for the diagnostic test procedures.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. VERIFY THAT THE AIRBAG LAMP REQUEST AND STATUS MESSAGE MATCH

Turn the ignition off, wait 5 seconds, then turn the ignition on. Allow the IC bulb check to complete before proceeding.

With the scan tool in ORC, select Monitor Display and select Warning Lamp Status ORC.

Compare the ABAG IND REQ BY ACM status and the ABAG IND ON BY MIC status which display as either ON or OFF.

**Does the ABAG IND REQ BY ACM status match the ABAG IND ON BY MIC status?**

**Yes** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Replace the MIC in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all DTCs in Airbag System Modules and IC.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

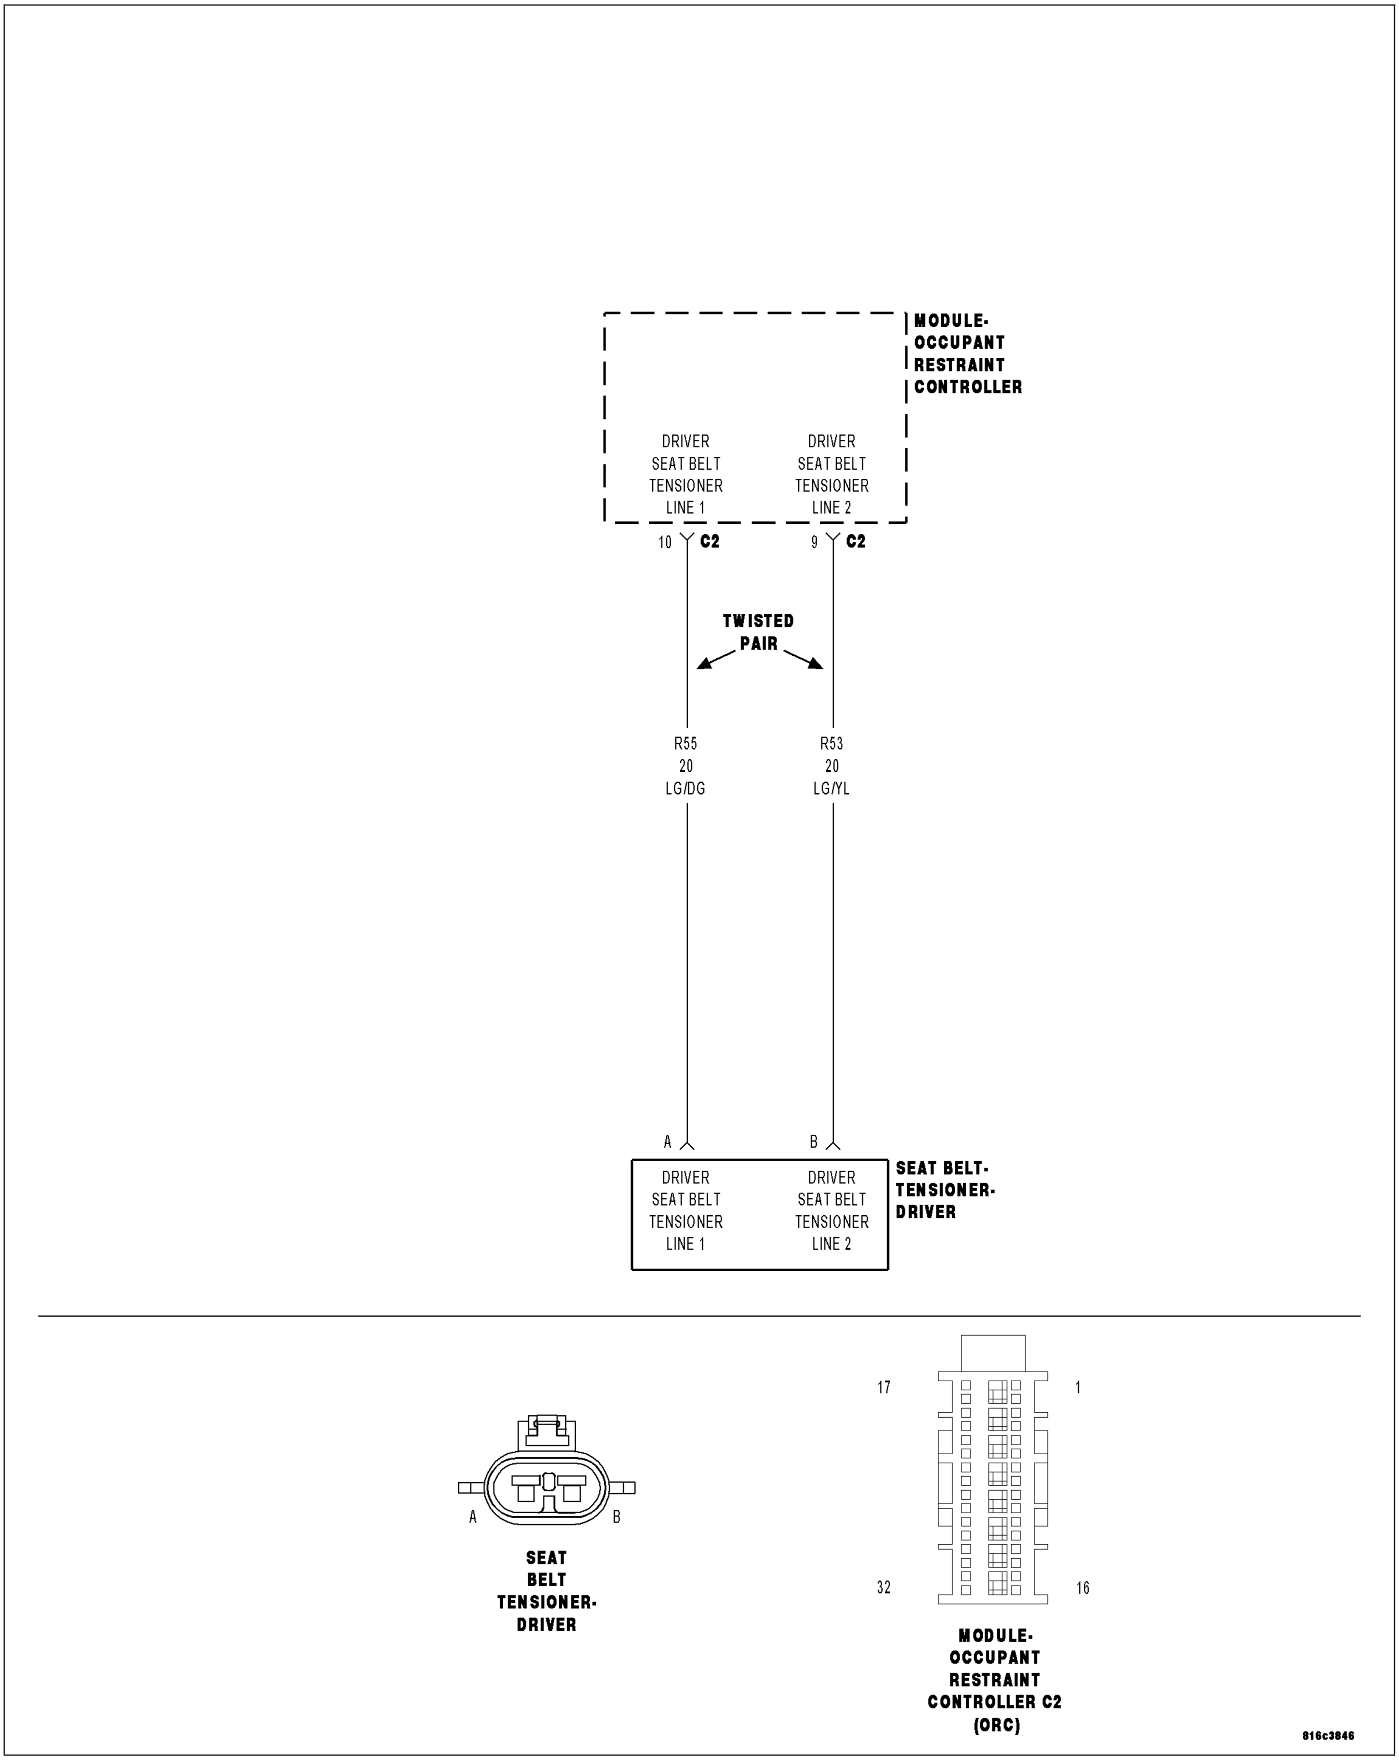
With the scan tool, check for active DTCs in the ORC and the IC.

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in the applicable section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## DRIVER SEAT BELT TENSIONER CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Tensioner circuits. The ORC will set this DTC if it detects an open or high resistance on the Driver Seat Belt Tensioner circuits.

| Possible Causes |
|---|
| (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT OPEN |
| DRIVER SEAT BELT PRETENSIONER |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR OPEN DRIVER SEAT BELT PRETENSIONER

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Driver Seat Belt Pretensioner connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Seat Belt Pretensioner connector.

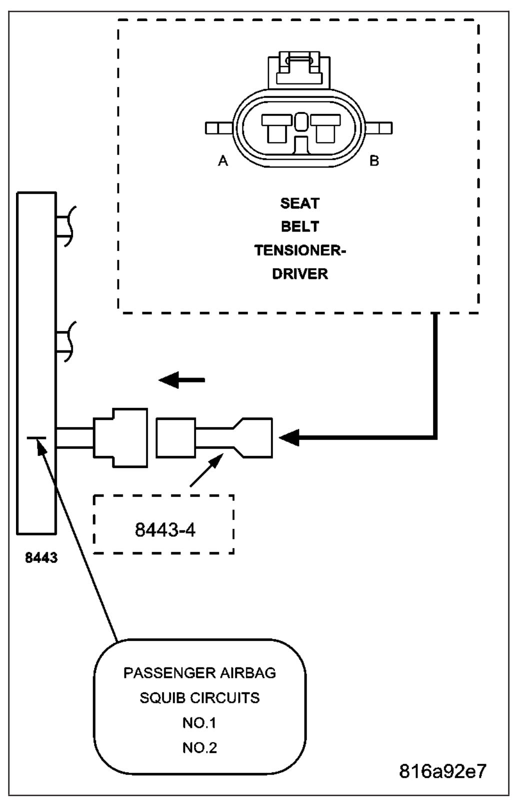
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

**Does the scan tool display: DRIVER SEAT BELT TENSIONER CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Driver Seat Belt Pretensioner in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

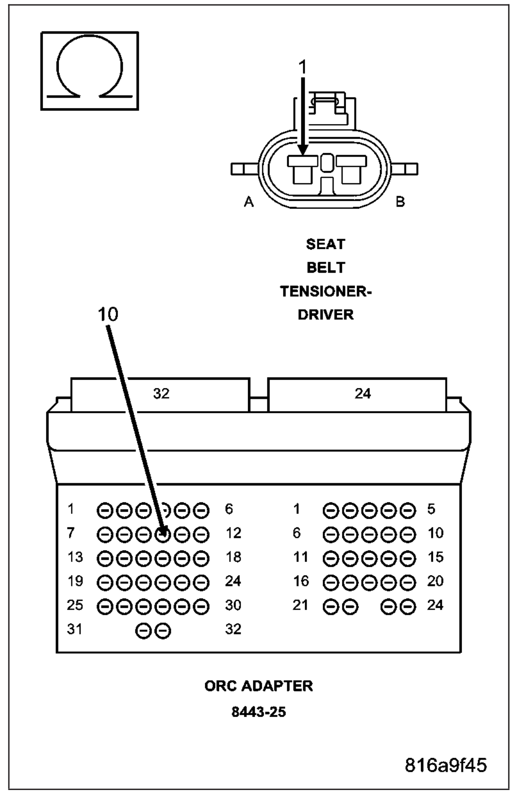
Measure the resistance of the (R55) Driver Seat Belt Tensioner Line 1 circuit between the Driver Seat Belt Pretensioner connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 4

**No** >> Repair the (R55) Driver Seat Belt Tensioner Line 1 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 4. CHECK (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR AN OPEN

Measure the resistance of the (R53) Driver Seat Belt Tensioner Line 2 circuit between the Driver Seat Belt Pretensioner connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

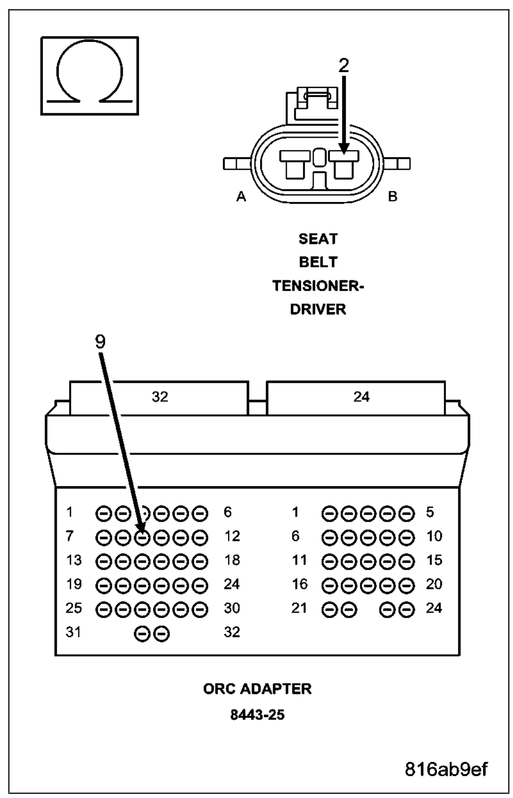
**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (R53) Driver Seat Belt Tensioner Line 2 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

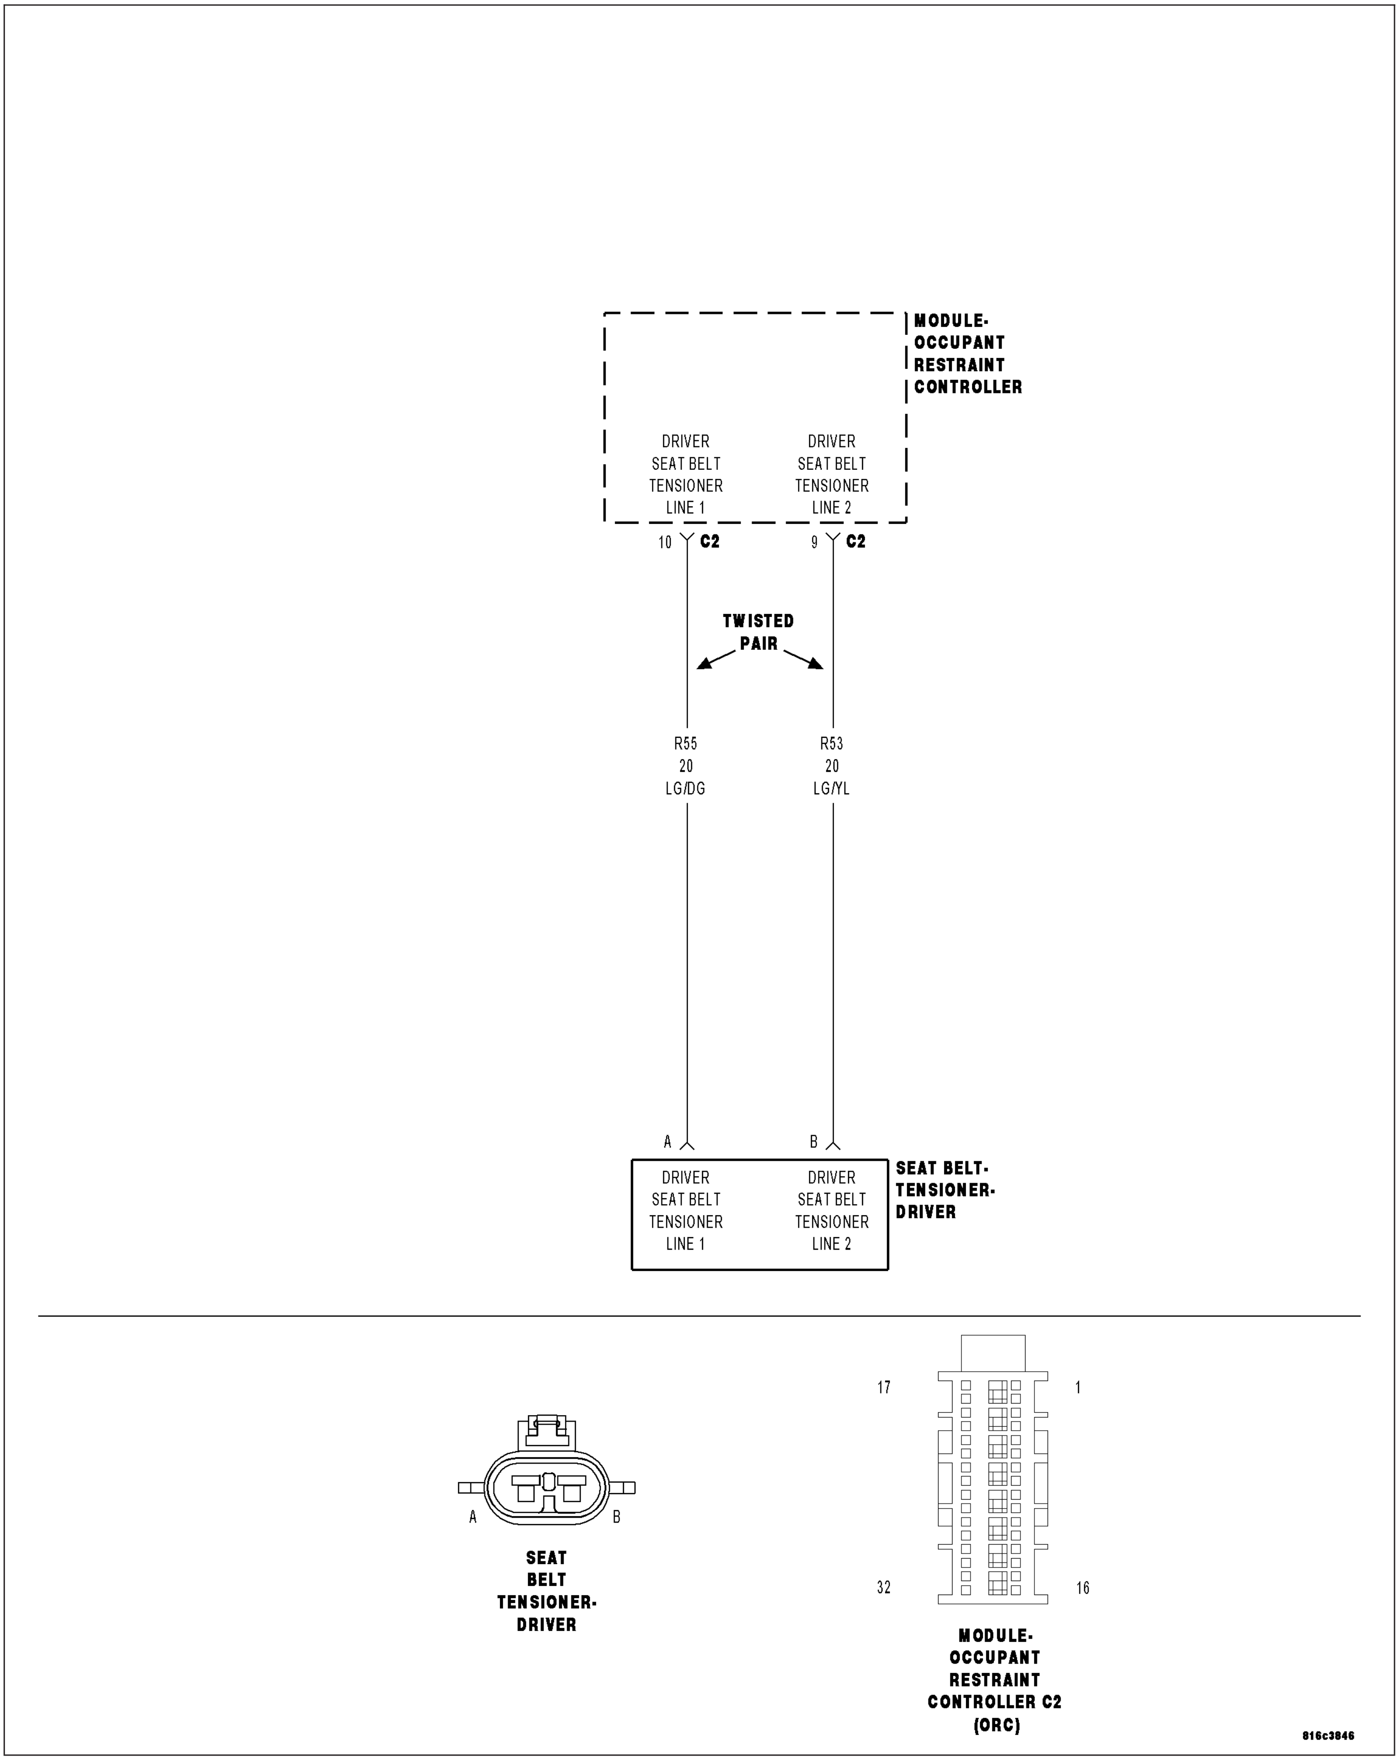
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SEAT BELT TENSIONER CIRCUIT SHORT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Tensioner circuits. The ORC will set this DTC if it detects low resistance between the Driver Seat Belt Tensioner circuits.

| Possible Causes |
| --- |
| (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT SHORTED TO (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT |
| DRIVER SEAT BELT PRETENSIONER |
| ORC |

## Diagnostic Test

### 1. SELECT ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED DRIVER SEAT BELT PRETENSIONER

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Driver Seatbelt Pretensioner connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Seat Belt Pretensioner connector.

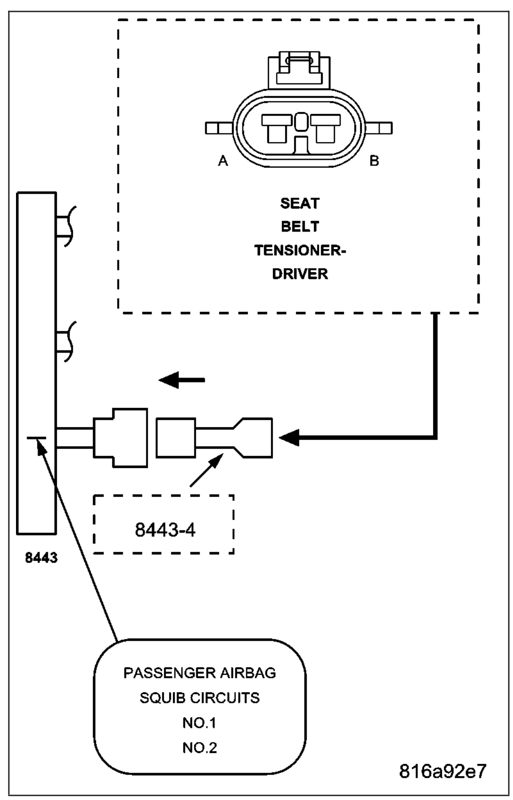
**WARNING: To avoid personal injury or death, turn the ignition on then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

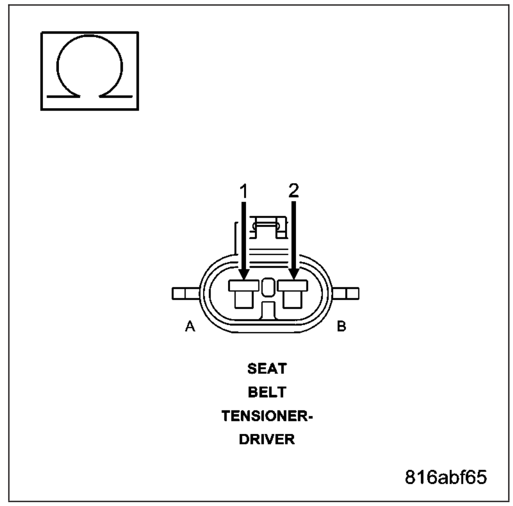
**Does the scan tool display: DRIVER SEAT BELT TENSIONER CIRCUIT SHORT?**

**Yes** >> Go To 3

**No** >> Replace the Driver Seat Belt Pretensioner in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT FOR A SHORT TO (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance between the (R55) Driver Seat Belt Tensioner Line 1 circuit and the (R53) Driver Seat Belt Tensioner Line 2 circuit at the Driver Seat Belt Pretensioner connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R55) Driver Seat Belt Tensioner Line 1 circuit for a short to the (R53) Driver Seat Belt Tensioner Line 2 circuit.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

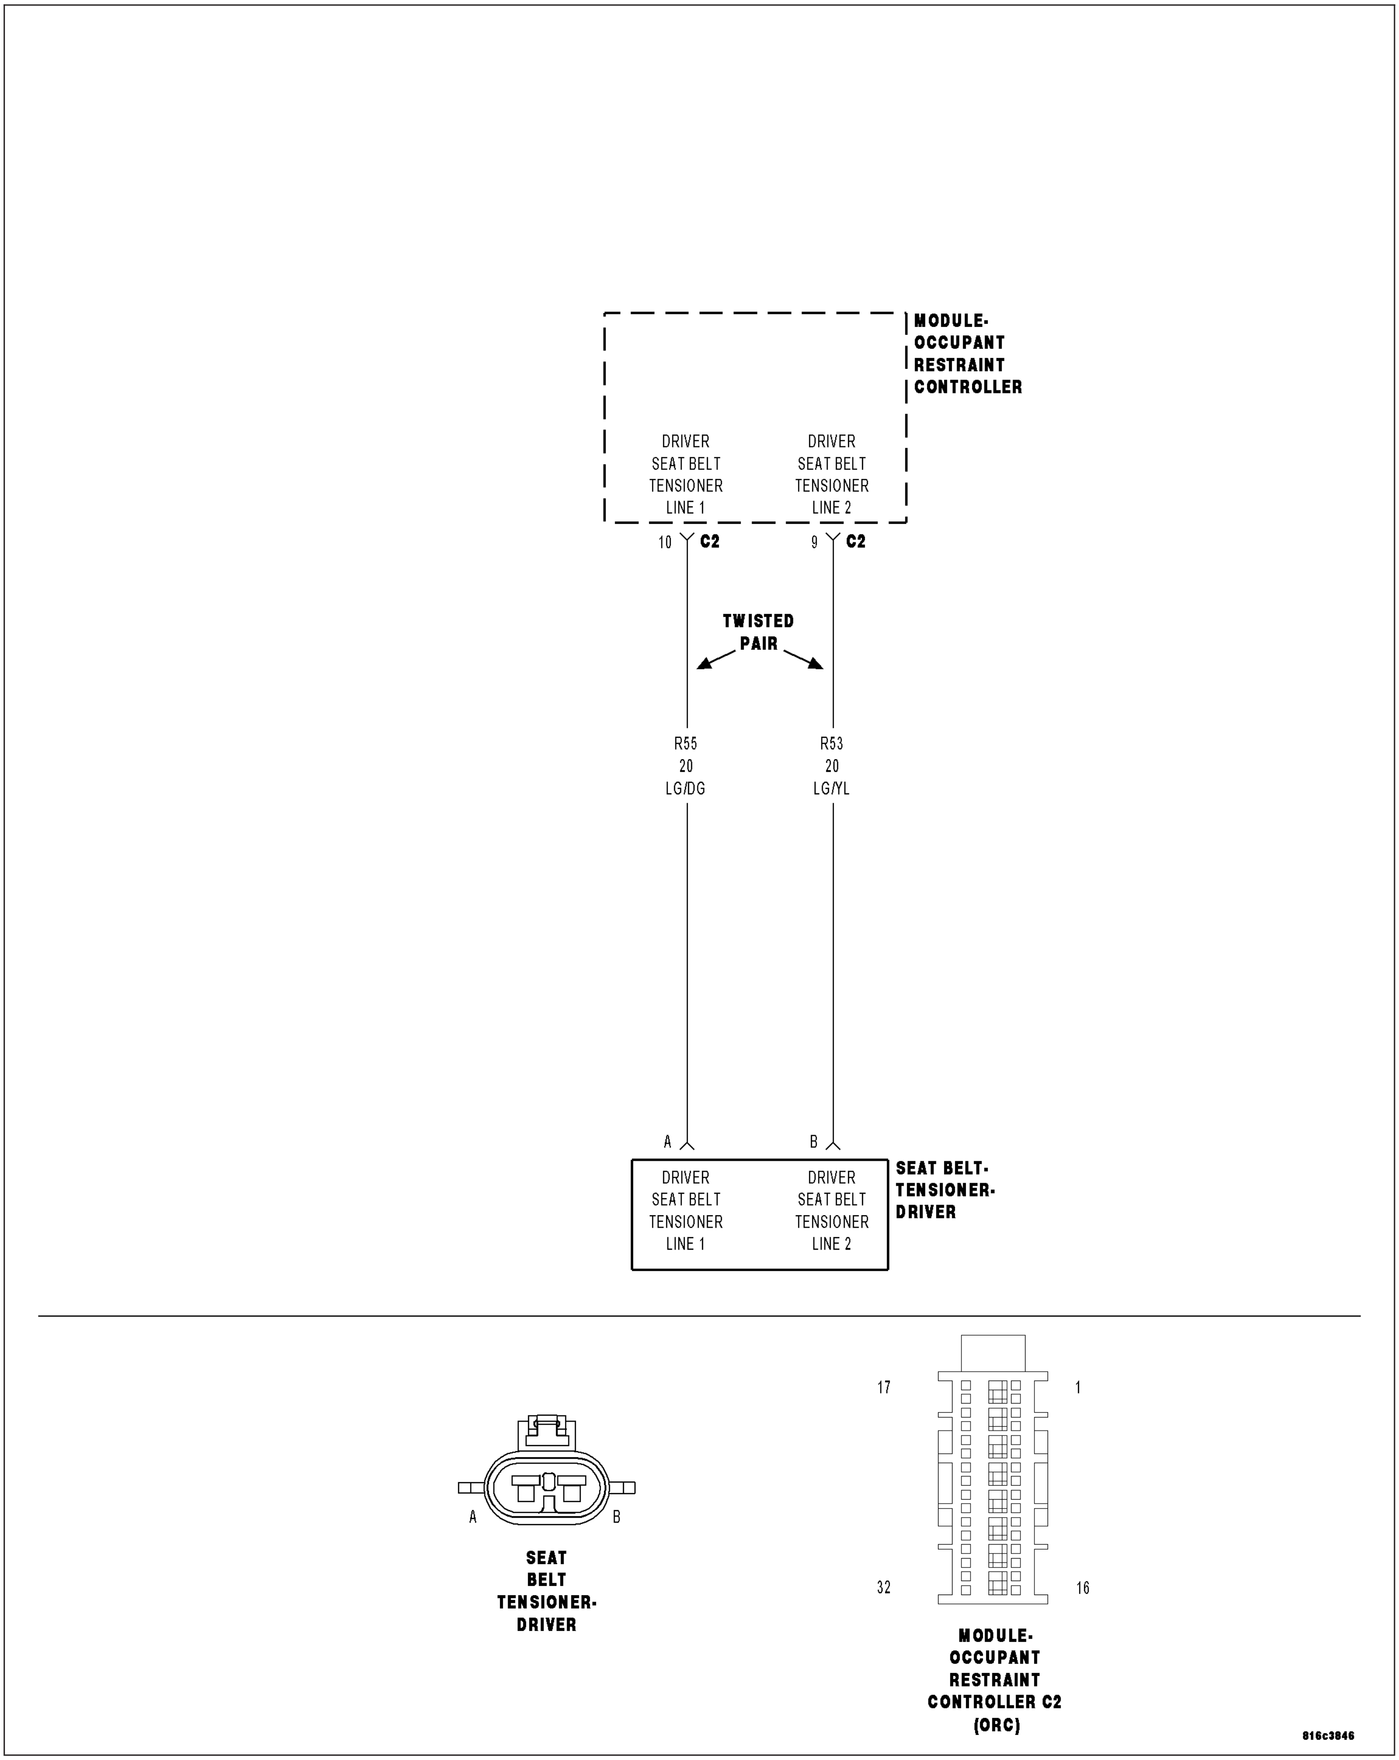
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SEAT BELT TENSIONER SHORT TO BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage on the Driver Seat Belt Tensioner circuits. The ORC will set this DTC if it detects voltage on the Driver Seat Belt Tensioner circuits.

| Possible Causes |
|---|
| (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT SHORTED TO BATTERY |
| DRIVER SEAT BELT PRETENSIONER |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED DRIVER SEAT BELT PRETENSIONER

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Driver Seat Belt Pretensioner connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Seat Belt Pretensioner connector.

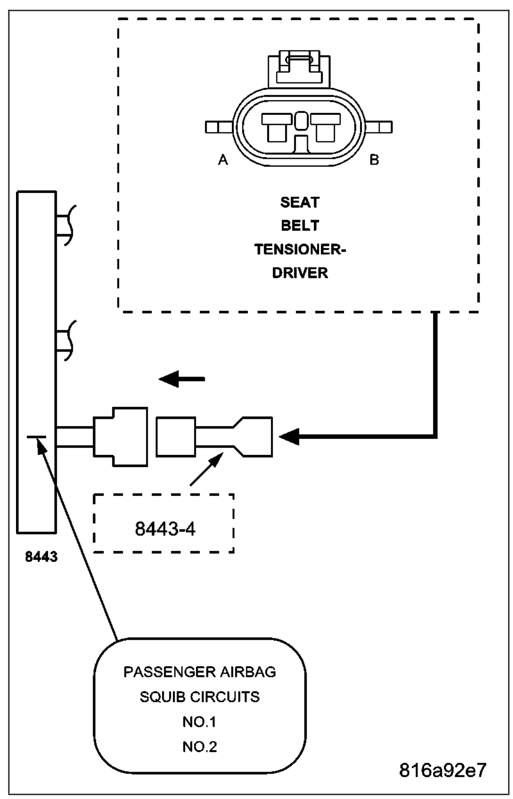
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

**Does the scan tool display: DRIVER SEAT BELT TENSIONER SHORT TO BATTERY?**

**Yes** >> Go To 3

**No** >> Replace the Driver Seat Belt Pretensioner in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT AND (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY

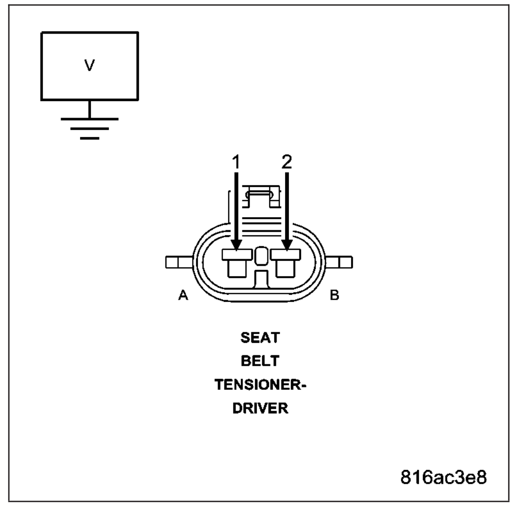
**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the voltage of the (R55) Driver Seat Belt Tensioner Line 1 circuit between the Driver Seat Belt Pretensioner connector and ground.

Measure the voltage of the (R53) Driver Seat Belt Tensioner Line 2 circuit between the Driver Seat Belt Pretensioner connector and ground.



**Is there any voltage present on either circuit?**

**Yes** >> Repair the Driver Seat Belt Tensioner circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

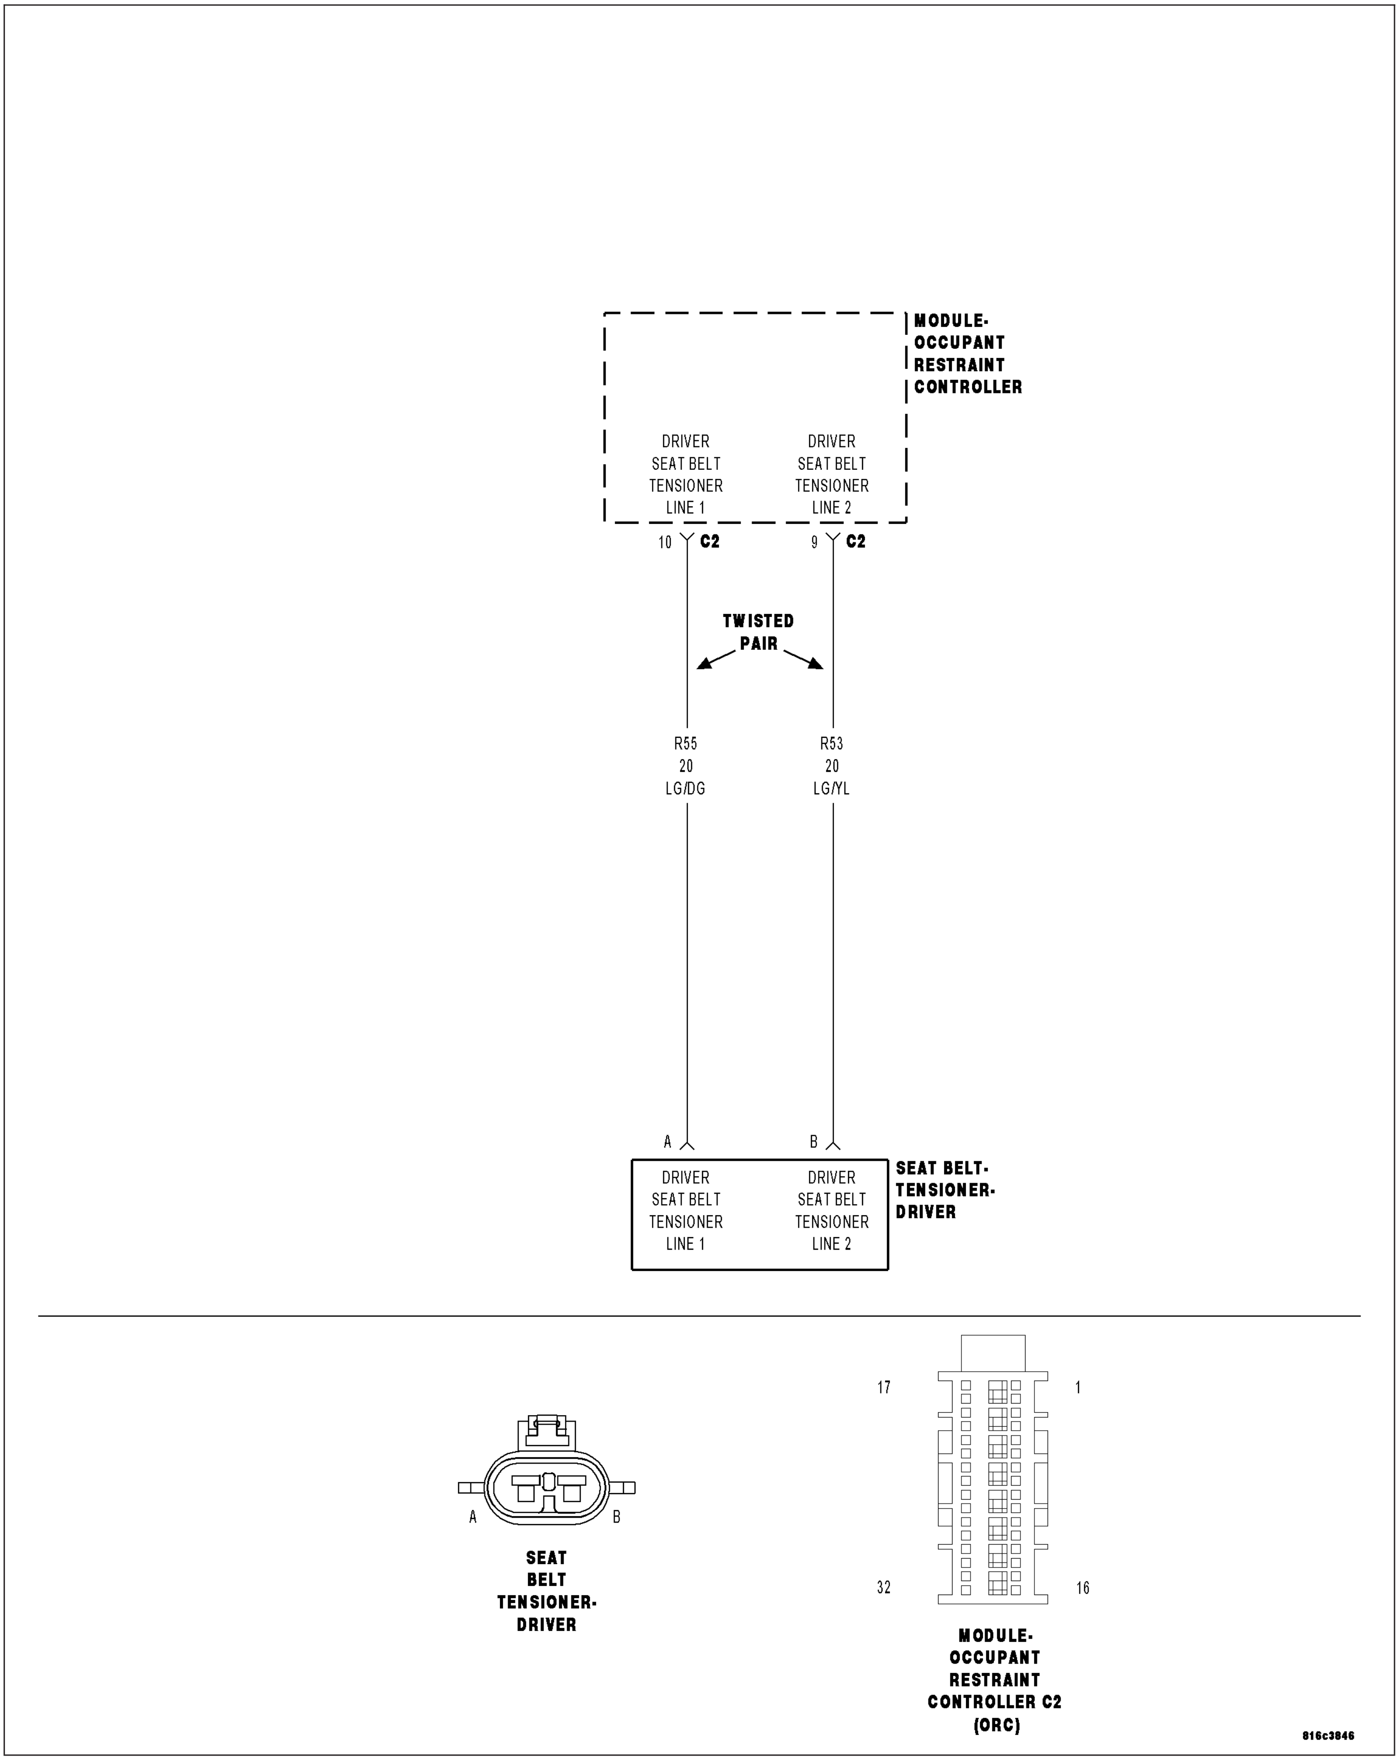
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SEAT BELT TENSIONER SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Tensioner circuits. The ORC will set this DTC if it detects low resistance on the Driver Seat Belt Tensioner circuits.

| Possible Causes |
|---|
| (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND |
| DRIVER SEAT BELT PRETENSIONER |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED DRIVER SEAT BELT PRETENSIONER

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Driver Seat Belt Pretensioner connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Seat Belt Pretensioner connector.

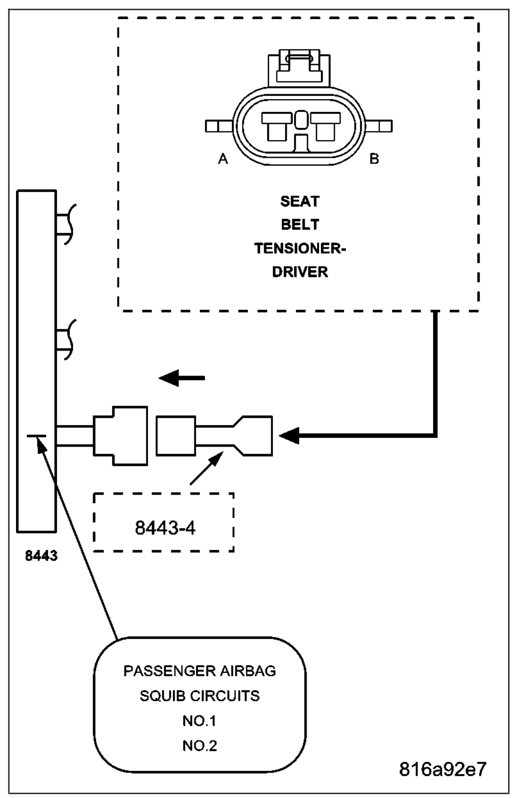
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

**Does the scan tool display: DRIVER SEAT BELT TENSIONER SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the Driver Seat Belt Pretensioner in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT AND (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND

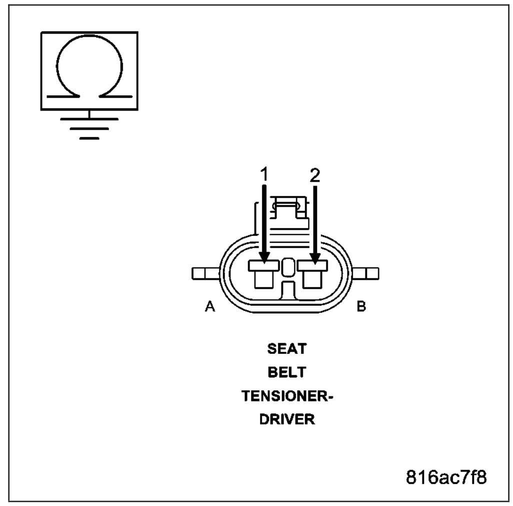
**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R55) Driver Seat Belt Tensioner Line 1 circuit between ground and the Driver Seat Belt Pretensioner connector.

Measure the resistance of the (R53) Driver Seat Belt Tensioner Line 2 circuit between ground and the Driver Seat Belt Pretensioner connector.



**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Driver Seat Belt Tensioner circuits with a resistance below 10K ohms for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

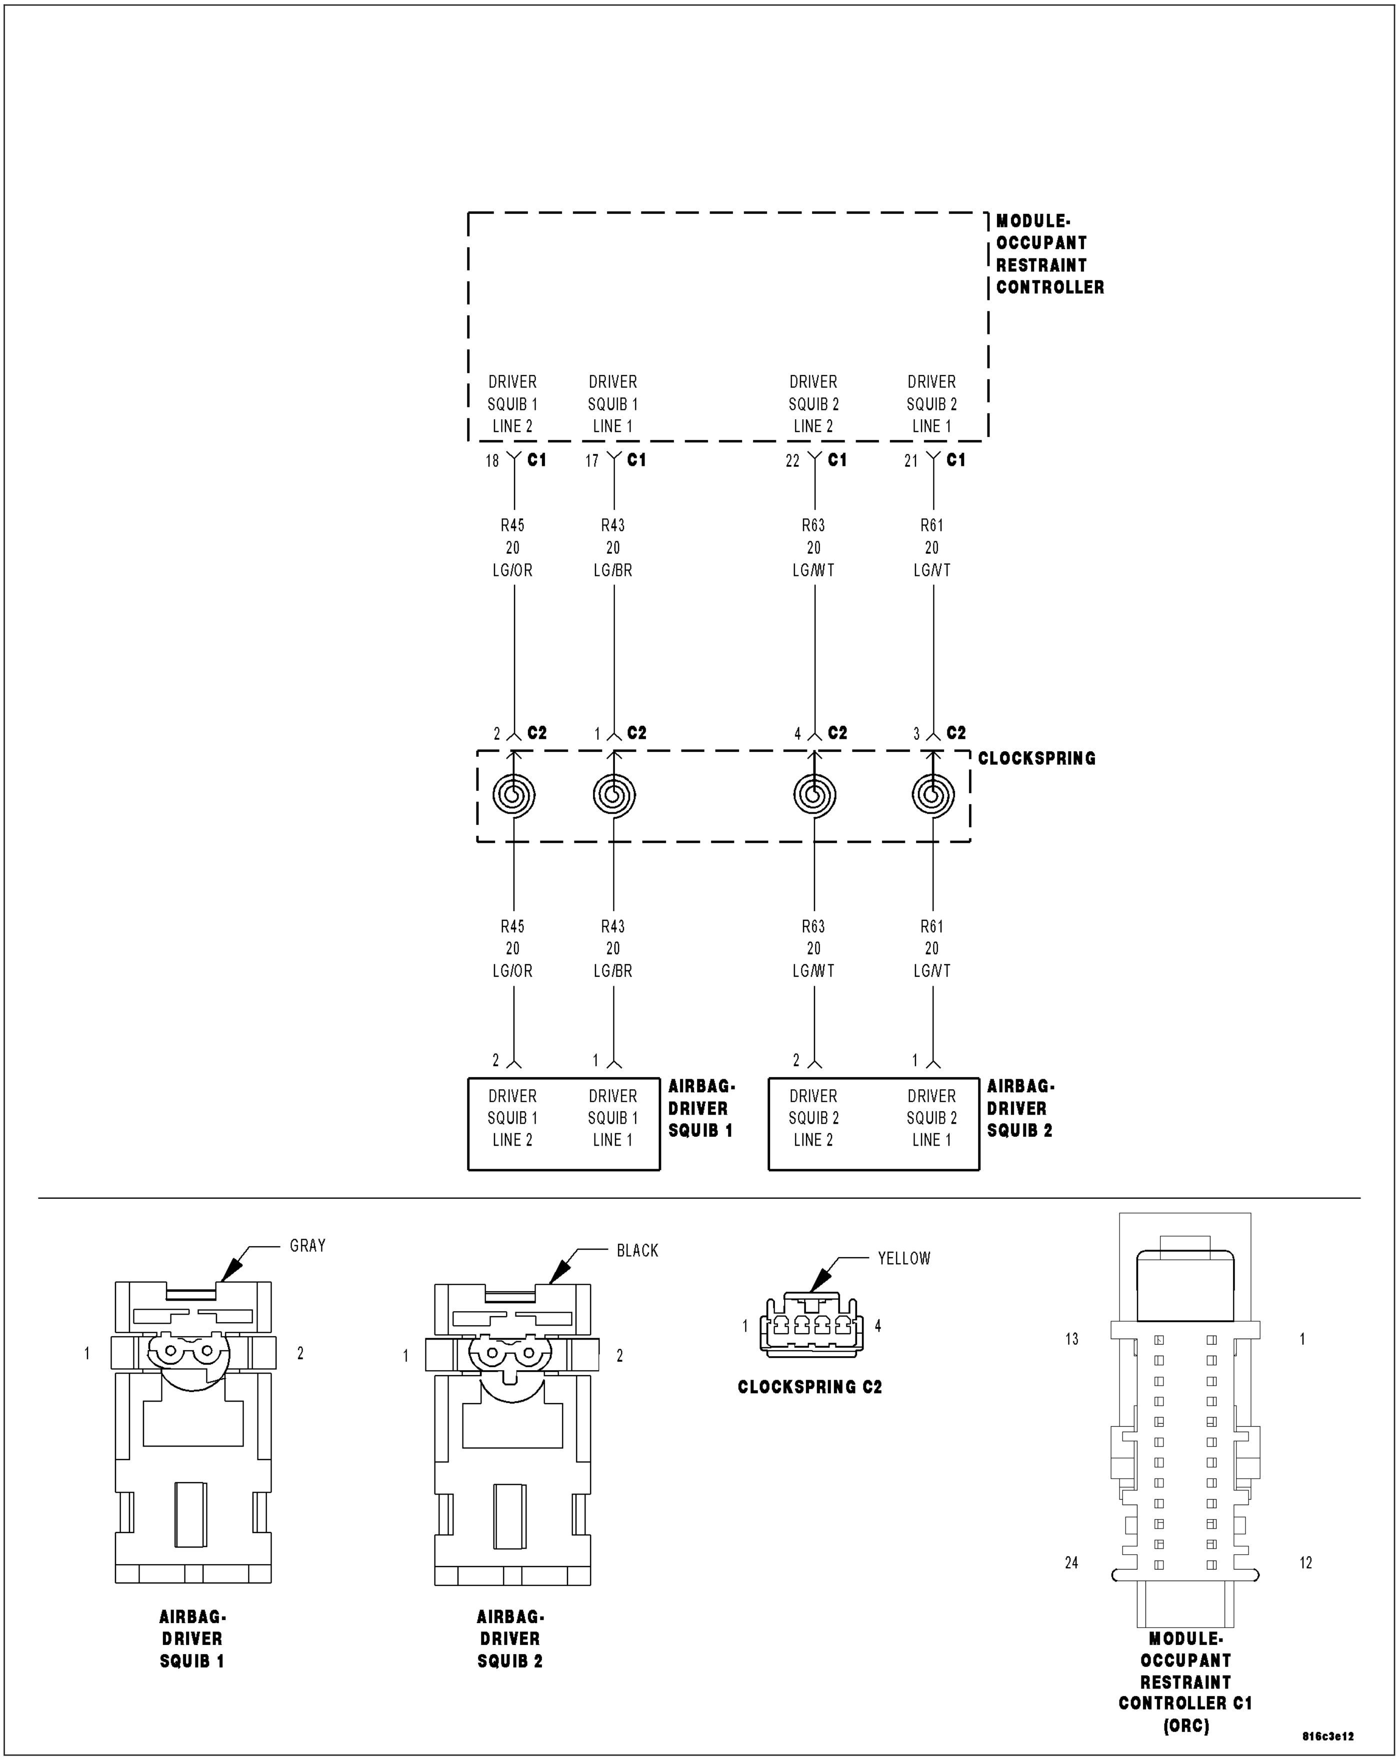
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SQUIB 1 CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits. The ORC will set this DTC if it detects an open or high resistance on the Driver Squib 1 circuits.

| Possible Causes |
|---|
| DRIVER SQUIB 1 LINE 2 CIRCUIT OPEN |
| DRIVER SQUIB 1 LINE 1 CIRCUIT OPEN |
| CLOCKSPRING |
| DRIVER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 6

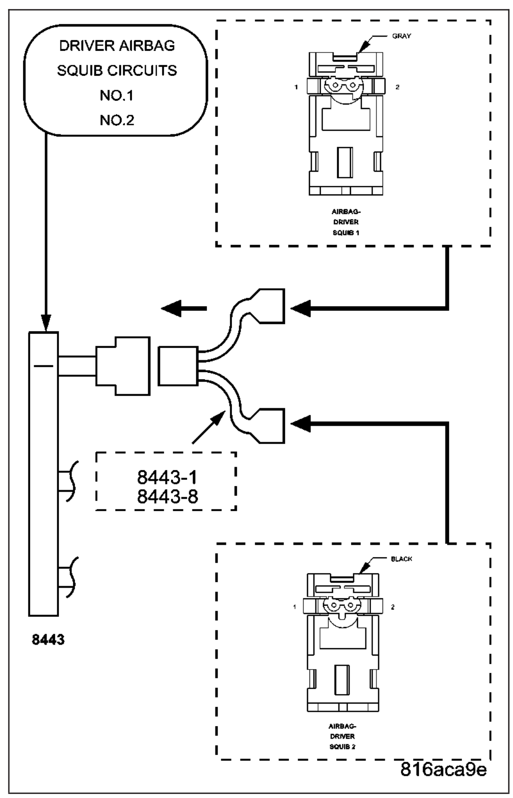
### 2. CHECK FOR OPEN SQUIB CIRCUITS IN DRIVER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.



**Does the scan tool display: DRIVER SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

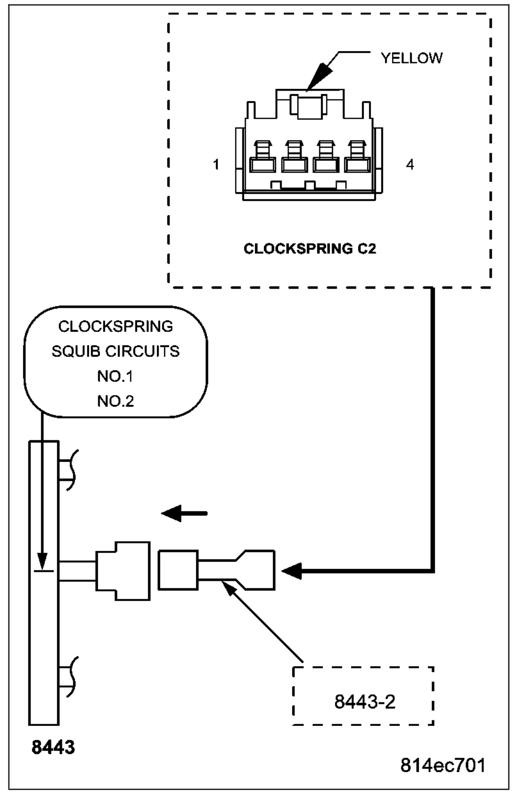
## 3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Clockspring connector.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Clockspring connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.



**Does the scan tool display: DRIVER SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

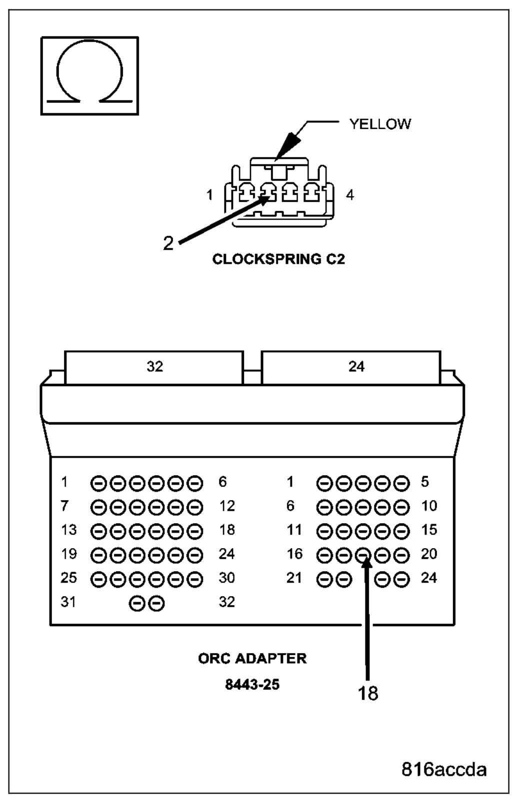
## 4. CHECK DRIVER SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Clockspring connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the Driver Squib 1 Line 2 circuit between the Clockspring connector and the ORC Load Tool Adaptor.



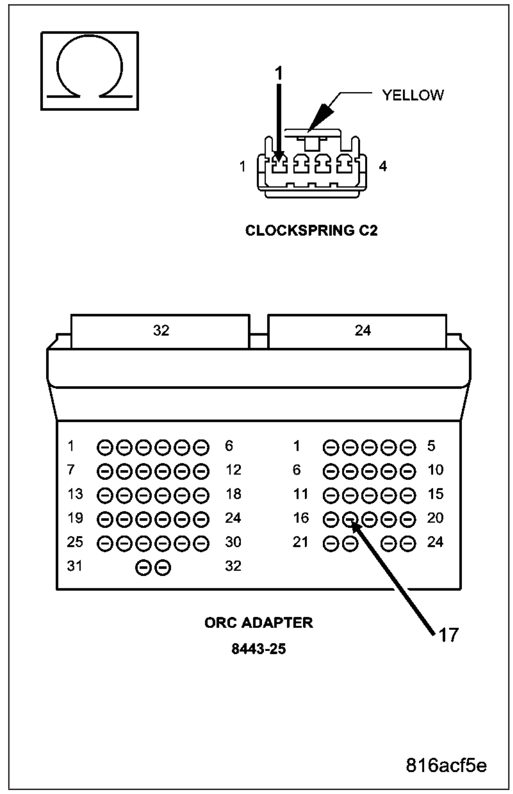
**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the Driver Squib 1 Line 2 circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECK DRIVER SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN

Measure the resistance of the Driver Squib 1 Line 1 circuit between the Clockspring connector and the ORC Load Tool Adaptor.



**Is the resistance below 1.0 ohm?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the Driver Squib 1 Line 1 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 6. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

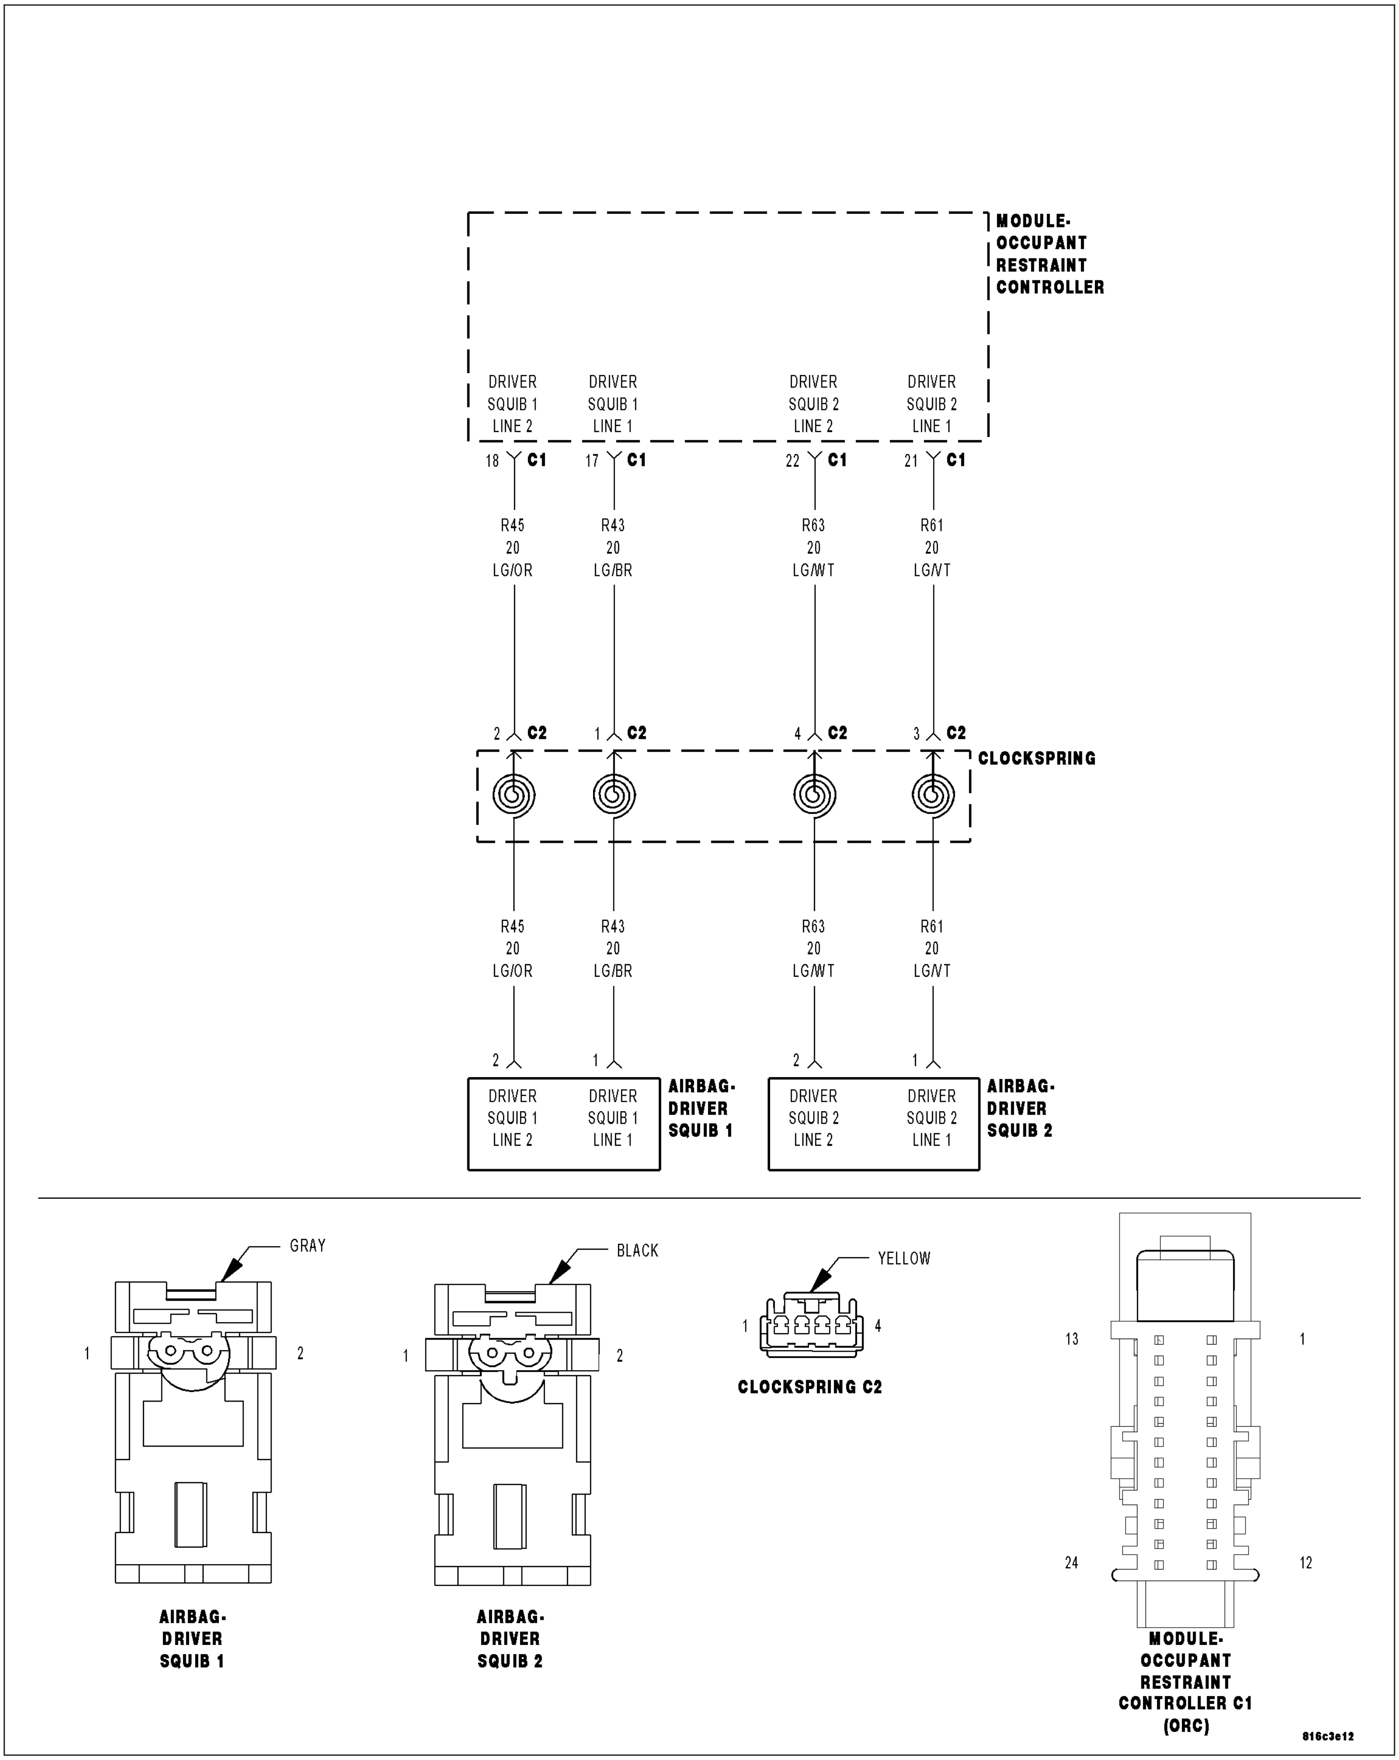
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SQUIB 1 CIRCUIT SHORT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits. The ORC will set this DTC if it detects low resistance between the Driver Squib 1 circuits.

| Possible Causes |
| --- |
| DRIVER SQUIB 1 LINE 2 CIRCUIT SHORTED TO DRIVER SQUIB 1 LINE 1 CIRCUIT |
| CLOCKSPRING |
| DRIVER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

Disconnect the Driver Airbag Squib connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

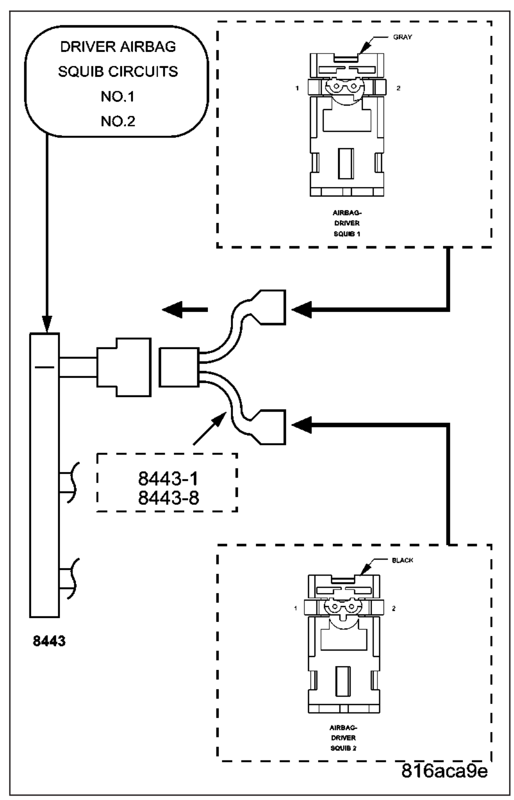
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

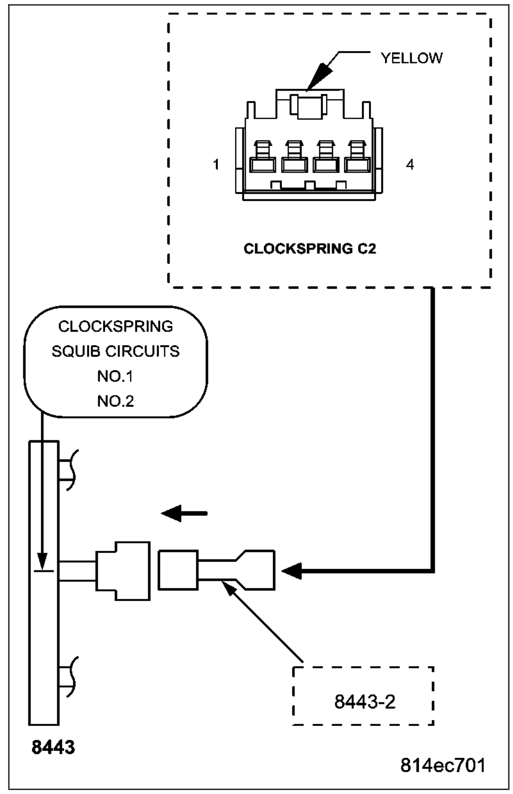
**Does the scan tool display: DRIVER SQUIB 1 CIRCUIT SHORT?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TOGETHER



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool ORC from the Driver Airbag Squib connectors.

Disconnect the Clockspring connector.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Clockspring connector.

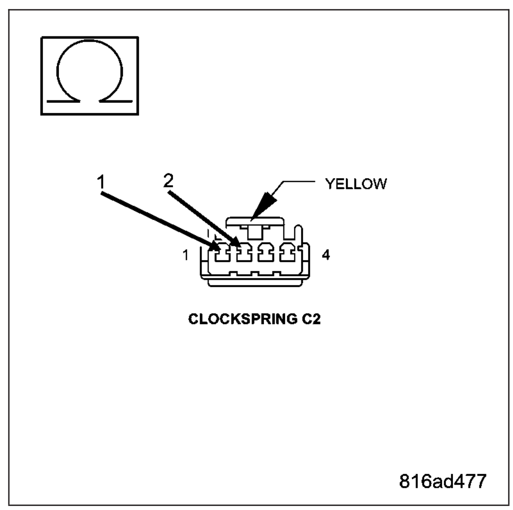
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.

**Does the scan tool display: DRIVER SQUIB 1 CIRCUIT SHORT?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK DRIVER SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO DRIVER SQUIB 1 LINE 1 CIRCUIT



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Clockspring connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance between the Driver Squib 1 Line 2 circuit and the Driver Squib 1 Line 1 circuit at the Clockspring connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the Driver Squib 1 Line 2 circuit for a short to the Driver Squib 1 Line 1 circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

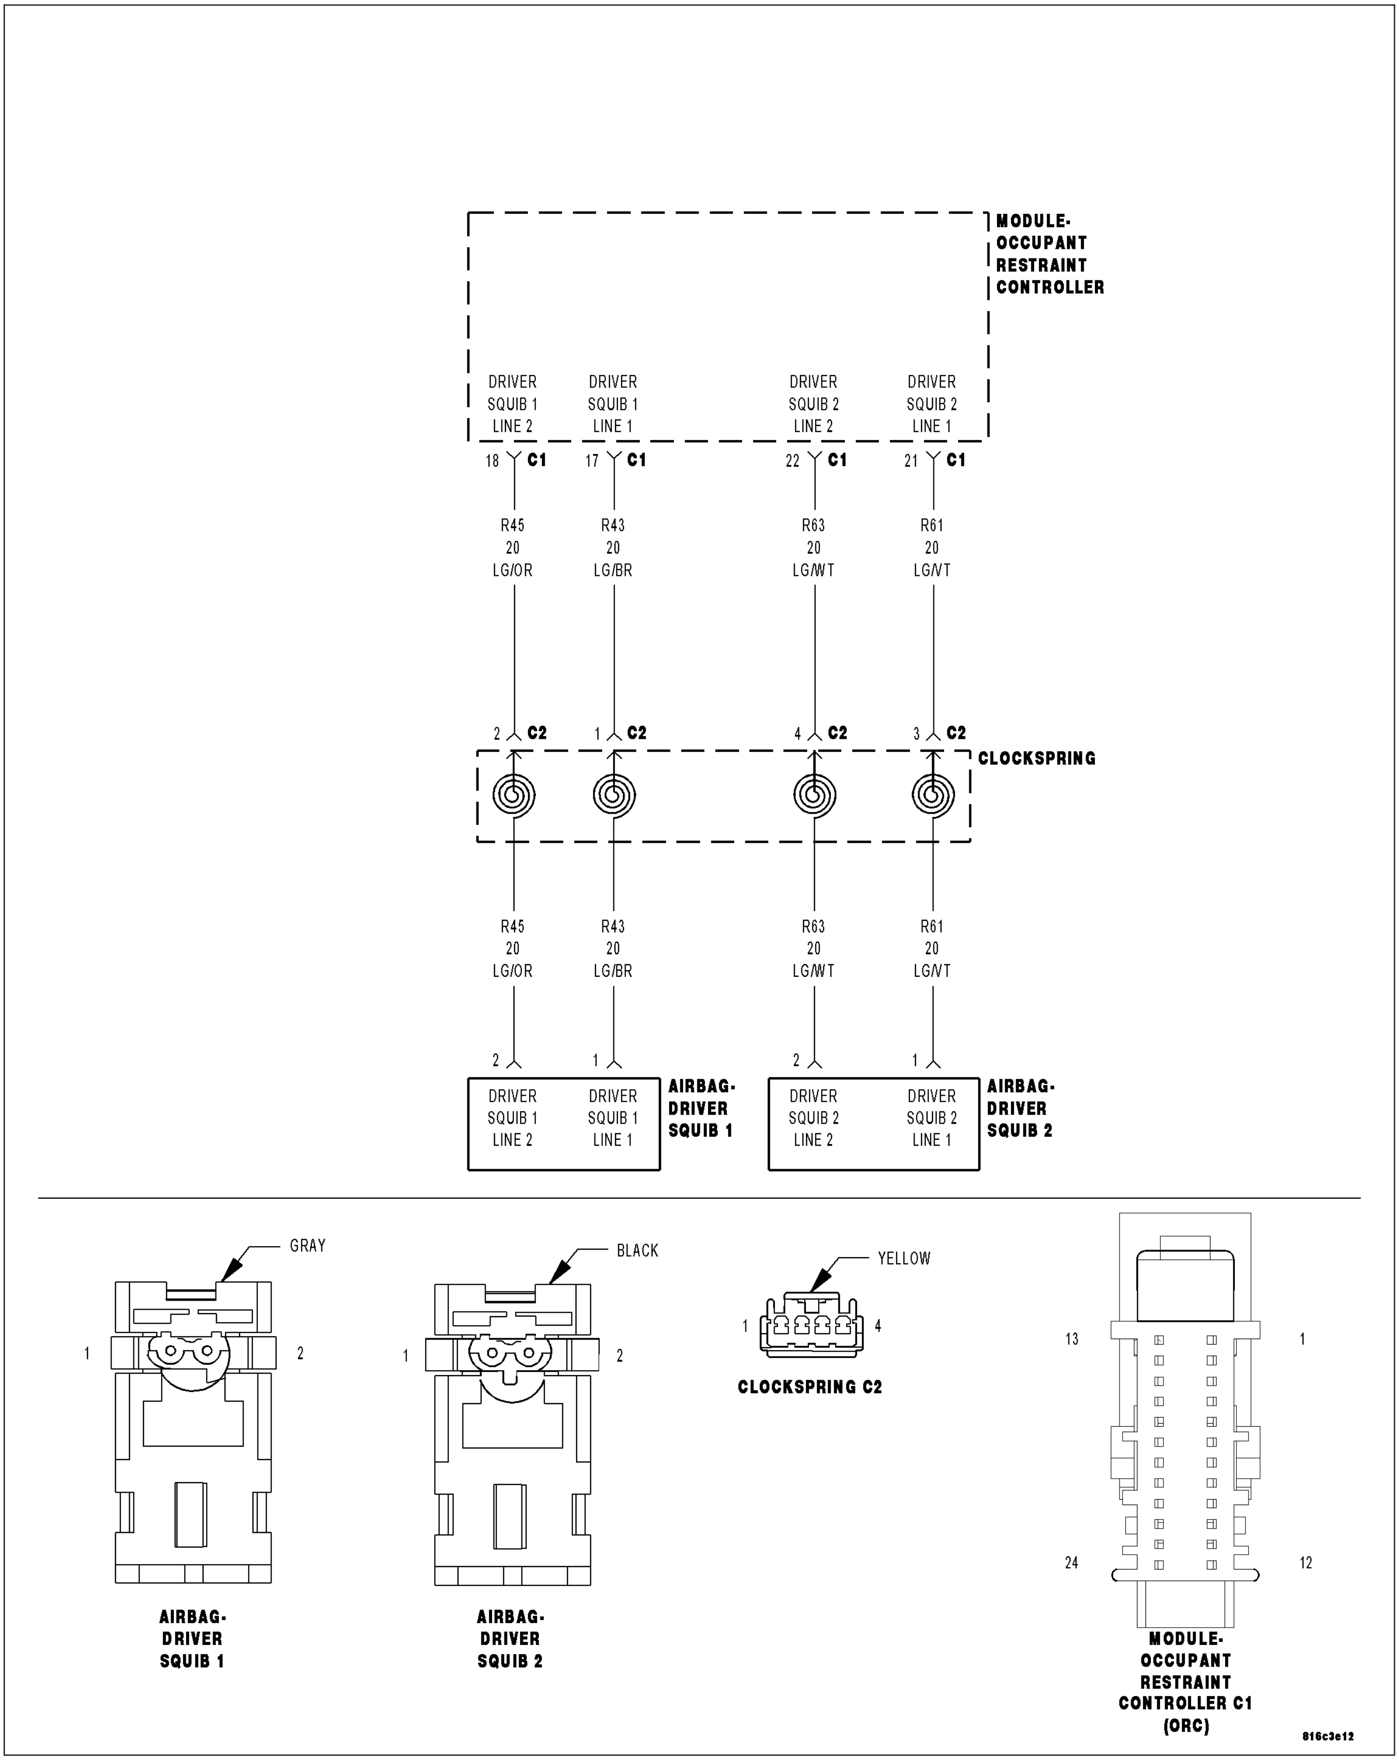
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SQUIB 1 SHORT TO BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage on the Driver Squib 1 circuits. The ORC will set this DTC if it detects voltage on the Driver Squib 1 circuits.

| Possible Causes |
| --- |
| DRIVER SQUIB 1 LINE 2 CIRCUIT OR DRIVER SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY |
| CLOCKSPRING |
| DRIVER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

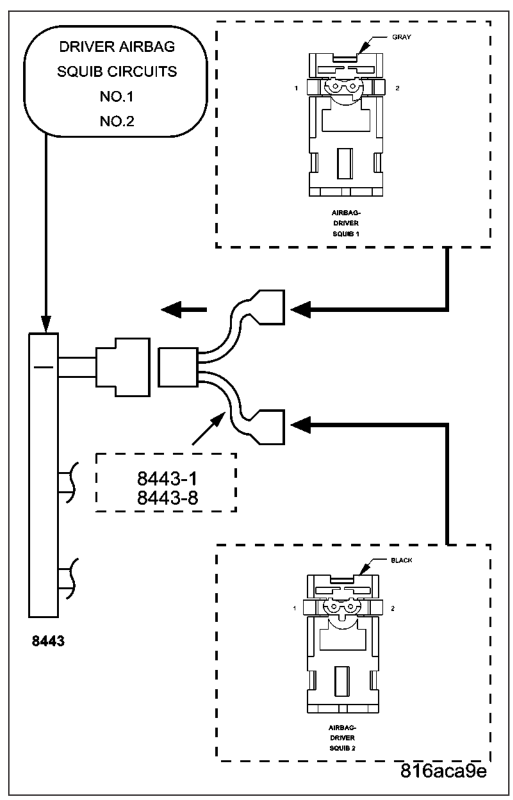
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

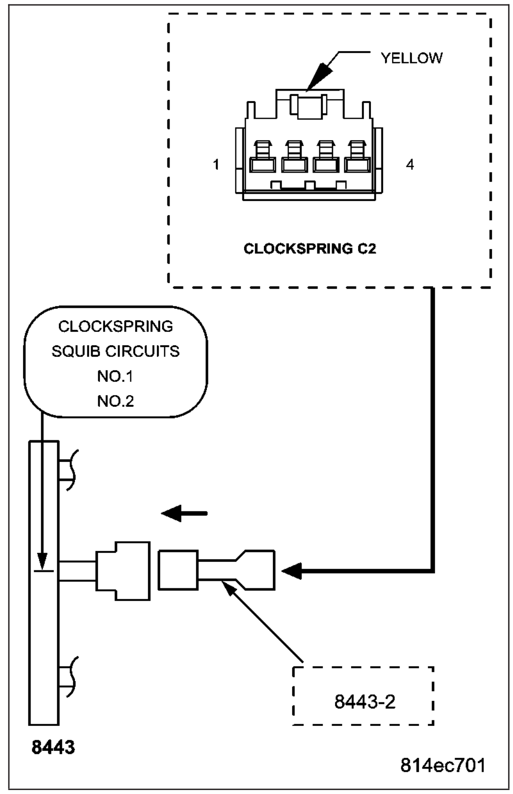
**Does the scan tool display: DRIVER SQUIB 1 SHORT TO BATTERY?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO BATTERY



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Clockspring connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Clockspring connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

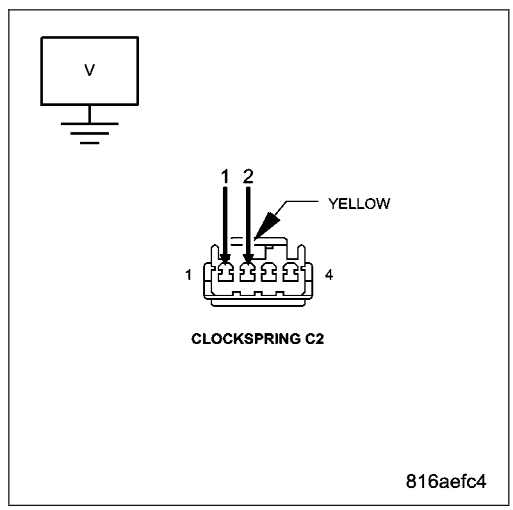
**Does the scan tool display: DRIVER SQUIB 1 SHORT TO BATTERY?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK DRIVER SQUIB 1 LINE 2 CIRCUIT AND DRIVER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO BATTERY



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the 8443 Load Tool and Jumper from the Clockspring connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Measure the voltage of the Driver Squib 1 Line 2 circuit between the Clockspring connector and ground.

Measure the voltage of the Driver Squib 1 Line 1 circuit between the Clockspring connector and ground.

**Is there any voltage present for either measurement?**

**Yes** >> Repair the Driver Squib 1 circuits with voltage present for a short to Battery.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

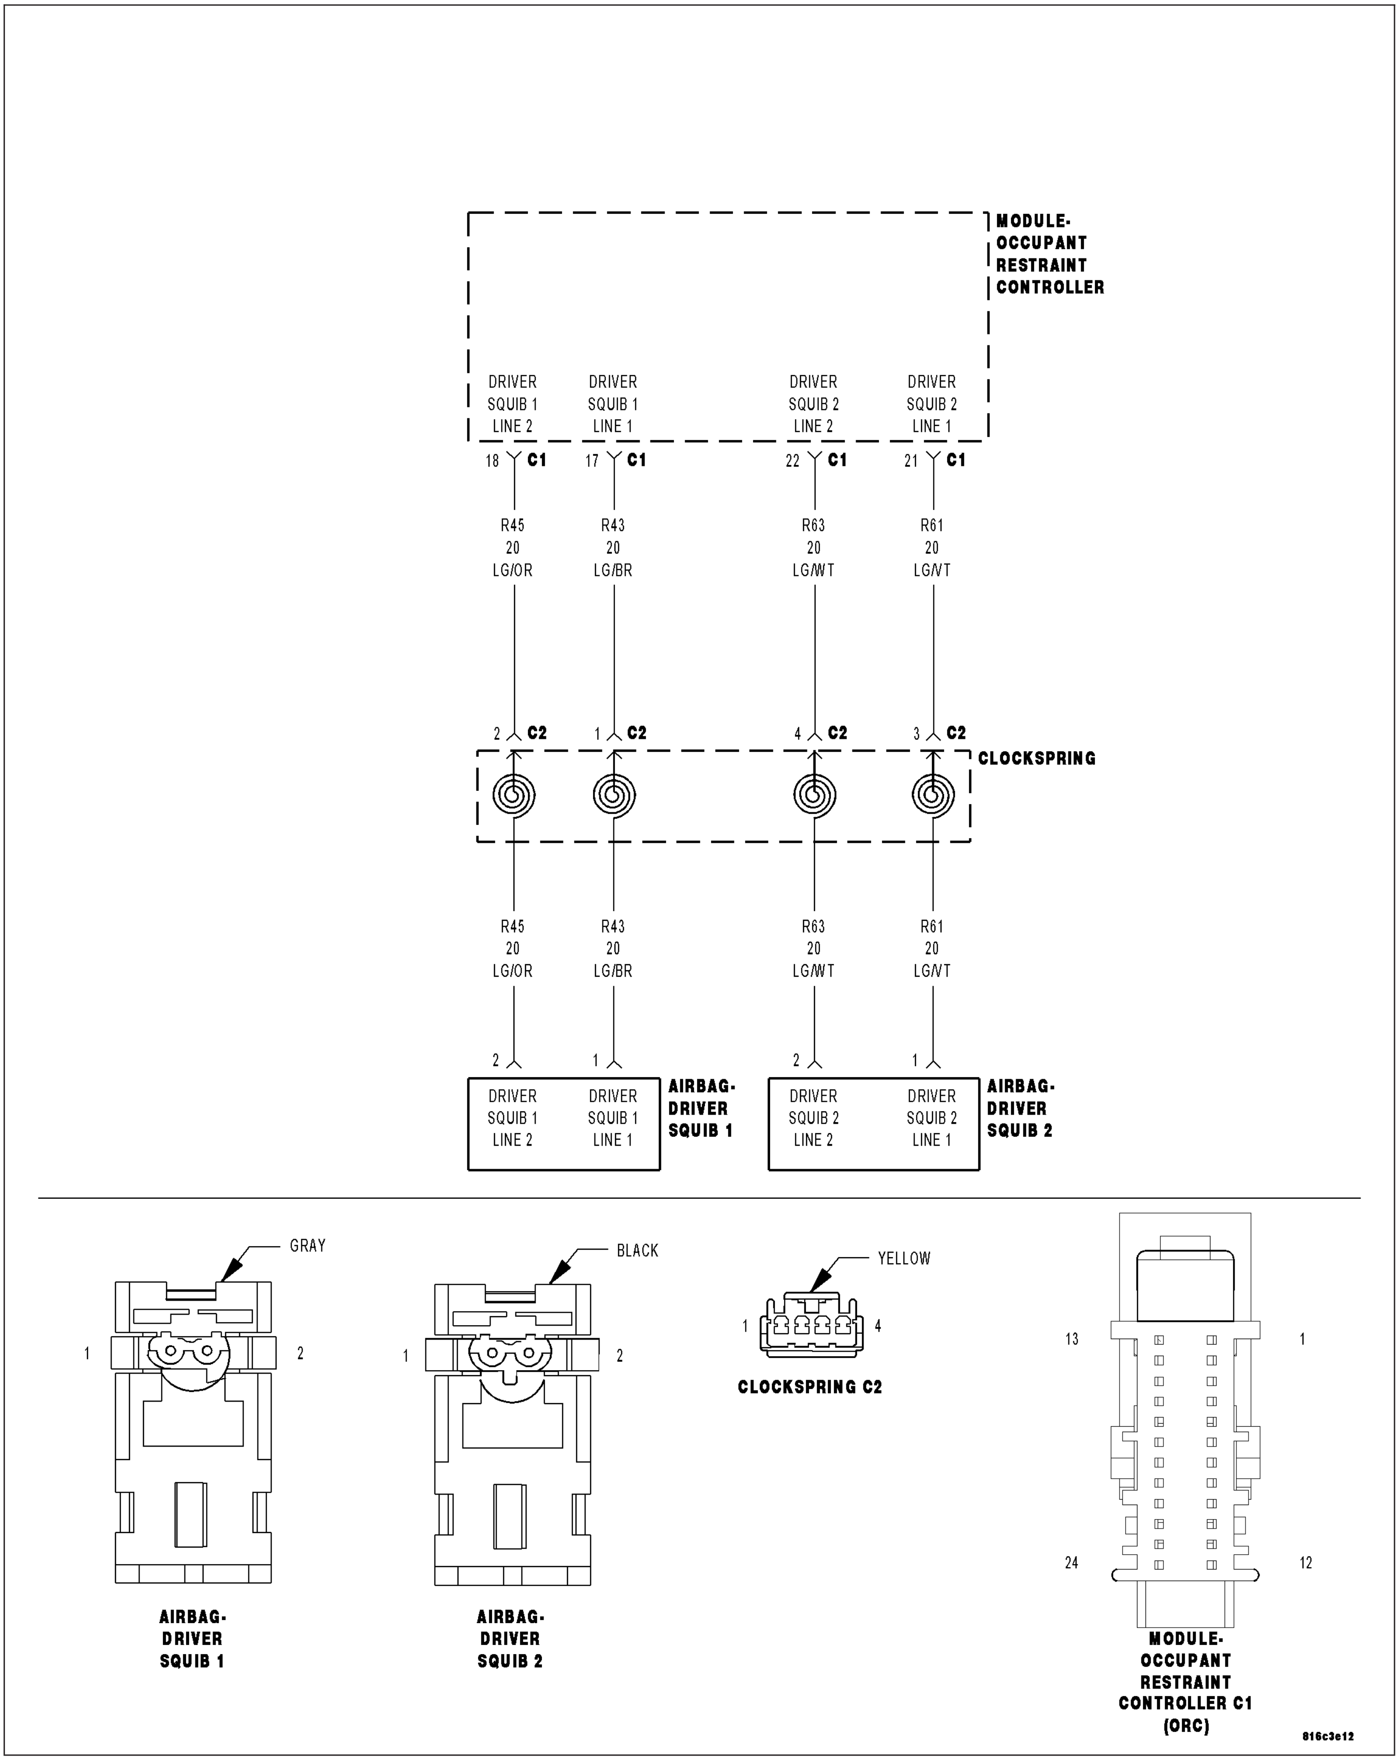
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SQUIB 1 SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits. The ORC will set this DTC if it detects low resistance on the Driver Squib 1 circuits.

| Possible Causes |
| --- |
| DRIVER SQUIB 1 LINE 2 CIRCUIT OR DRIVER SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND |
| CLOCKSPRING |
| DRIVER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

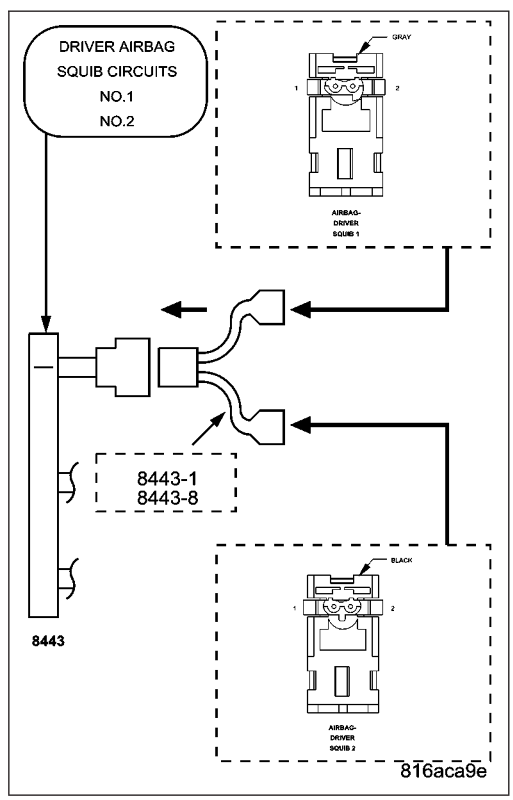
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

**Does the scan tool display: DRIVER SQUIB 1 SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

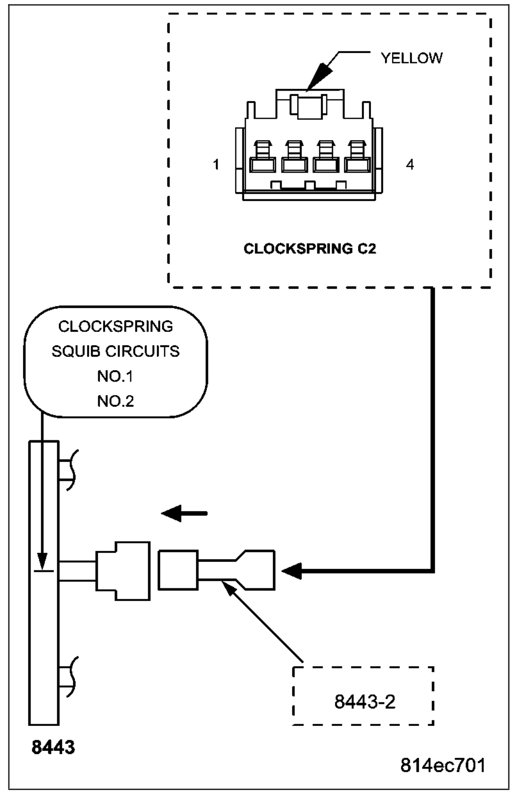
## 3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool Jumper from the Driver Airbag Squib connectors.

Disconnect the Clockspring connector.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Clockspring connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.



**Does the scan tool display: DRIVER SQUIB 1 SHORT TO GROUND?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK DRIVER SQUIB 1 LINE 2 CIRCUIT AND DRIVER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO GROUND

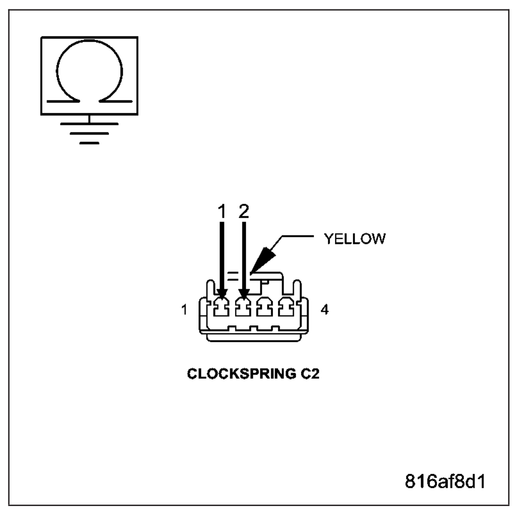
**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Clockspring connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the Driver Squib 1 Line 2 circuit between ground and the Clockspring connector.

Measure the resistance of the Driver Squib 1 Line 1 circuit between ground and the Clockspring connector.



**Is the resistance below 10K ohms for either measurement?**

**Yes** >> Repair the Driver Squib 1 circuits with a resistance below 10K ohms for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

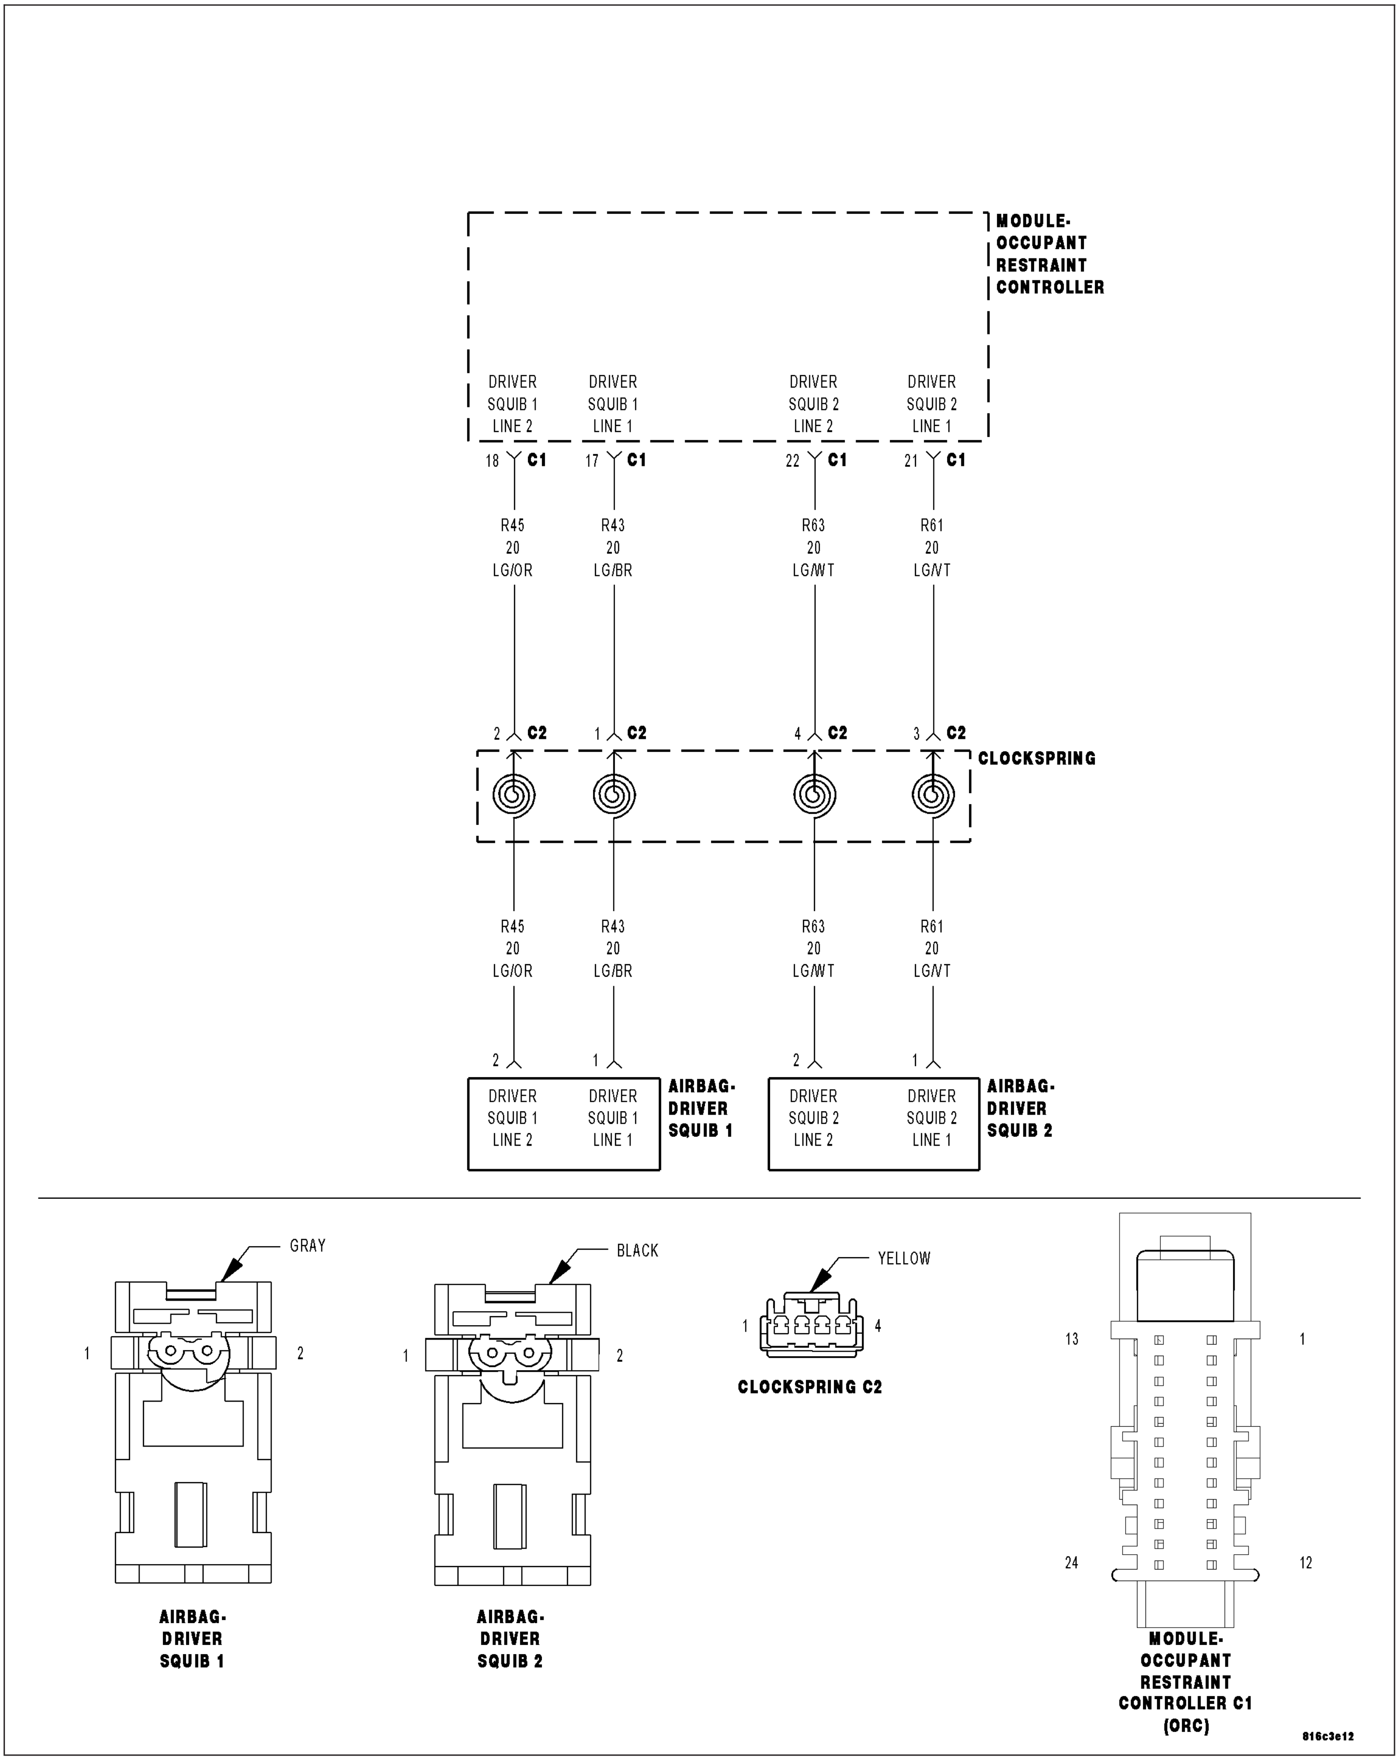
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SQUIB 2 CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 2 circuits. The ORC will set this DTC if it detects an open or high resistance on the Driver Squib 2 circuits.

| Possible Causes |
|---|
| DRIVER SQUIB 2 LINE 1 CIRCUIT OPEN |
| DRIVER SQUIB 2 LINE 2 CIRCUIT OPEN |
| CLOCKSPRING |
| DRIVER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 6

### 2. CHECK FOR OPEN SQUIB CIRCUITS IN DRIVER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

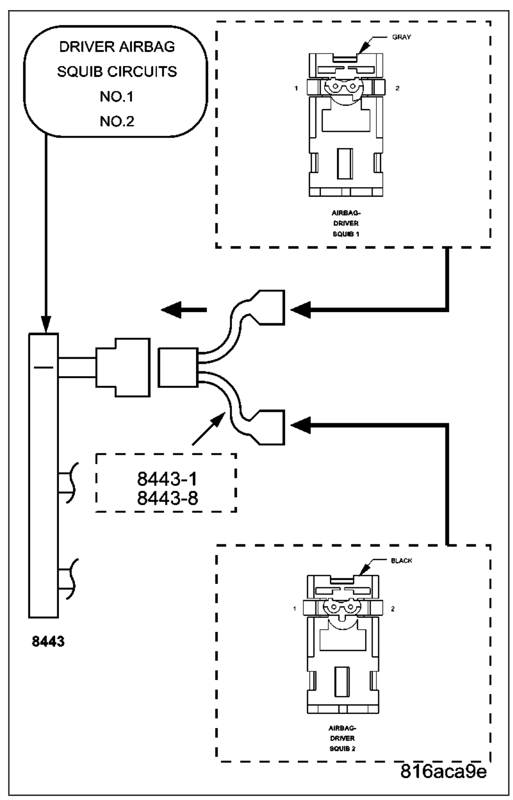
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

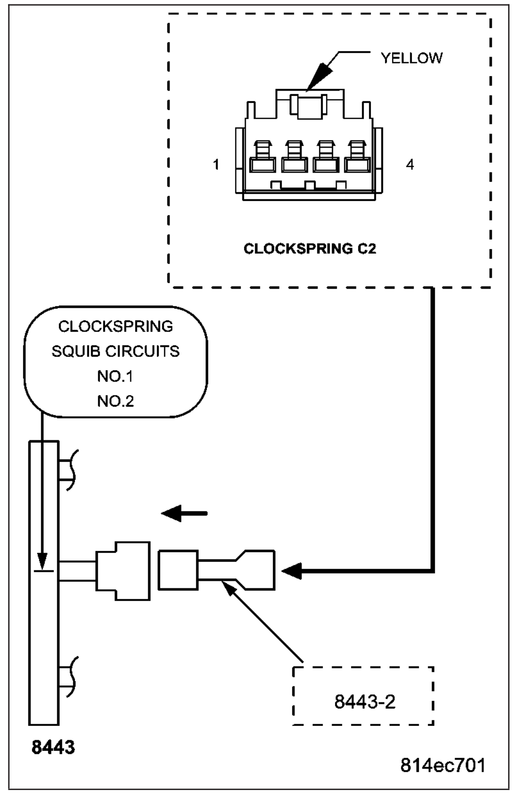
**Does the scan tool display: DRIVER SQUIB 2 CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR AN OPEN



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Clockspring connector.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Clockspring connector.

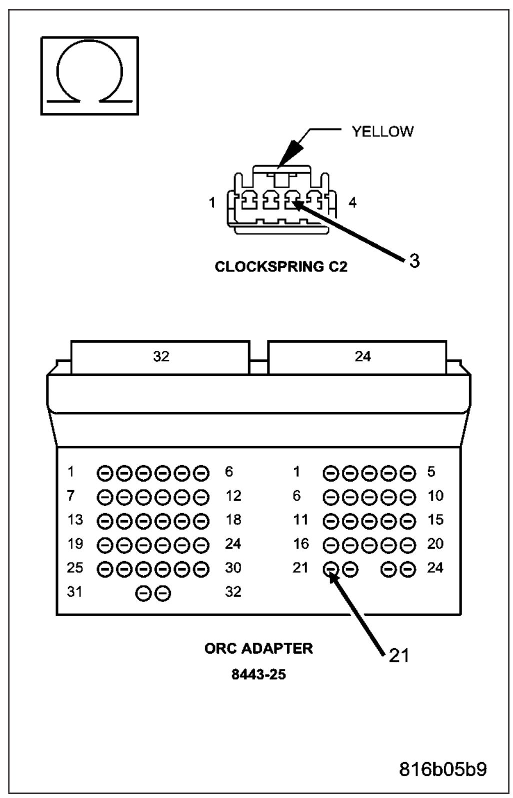
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.

**Does the scan tool display: DRIVER SQUIB 2 CIRCUIT OPEN?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK DRIVER SQUIB 2 LINE 1 CIRCUIT FOR AN OPEN



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Clockspring connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the Driver Squib 2 Line 1 circuit between the Clockspring connector and the ORC Load Tool Adaptor.

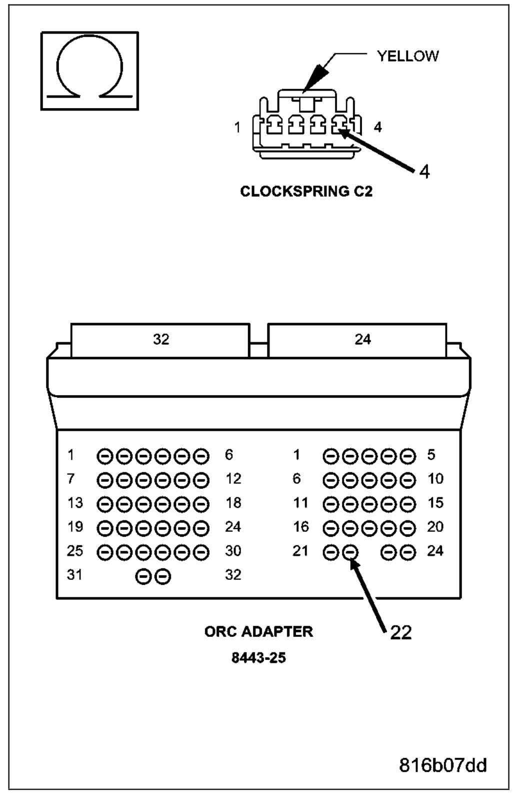
**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the Driver Squib 2 Line 1 circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECK DRIVER SQUIB 2 LINE 2 CIRCUIT FOR AN OPEN

Measure the resistance of the Driver Squib 2 Line 2 circuit between the Clockspring connector and the ORC Load Tool Adaptor.



**Is the resistance below 1.0 ohm?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the Driver Squib 2 Line 2 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 6. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

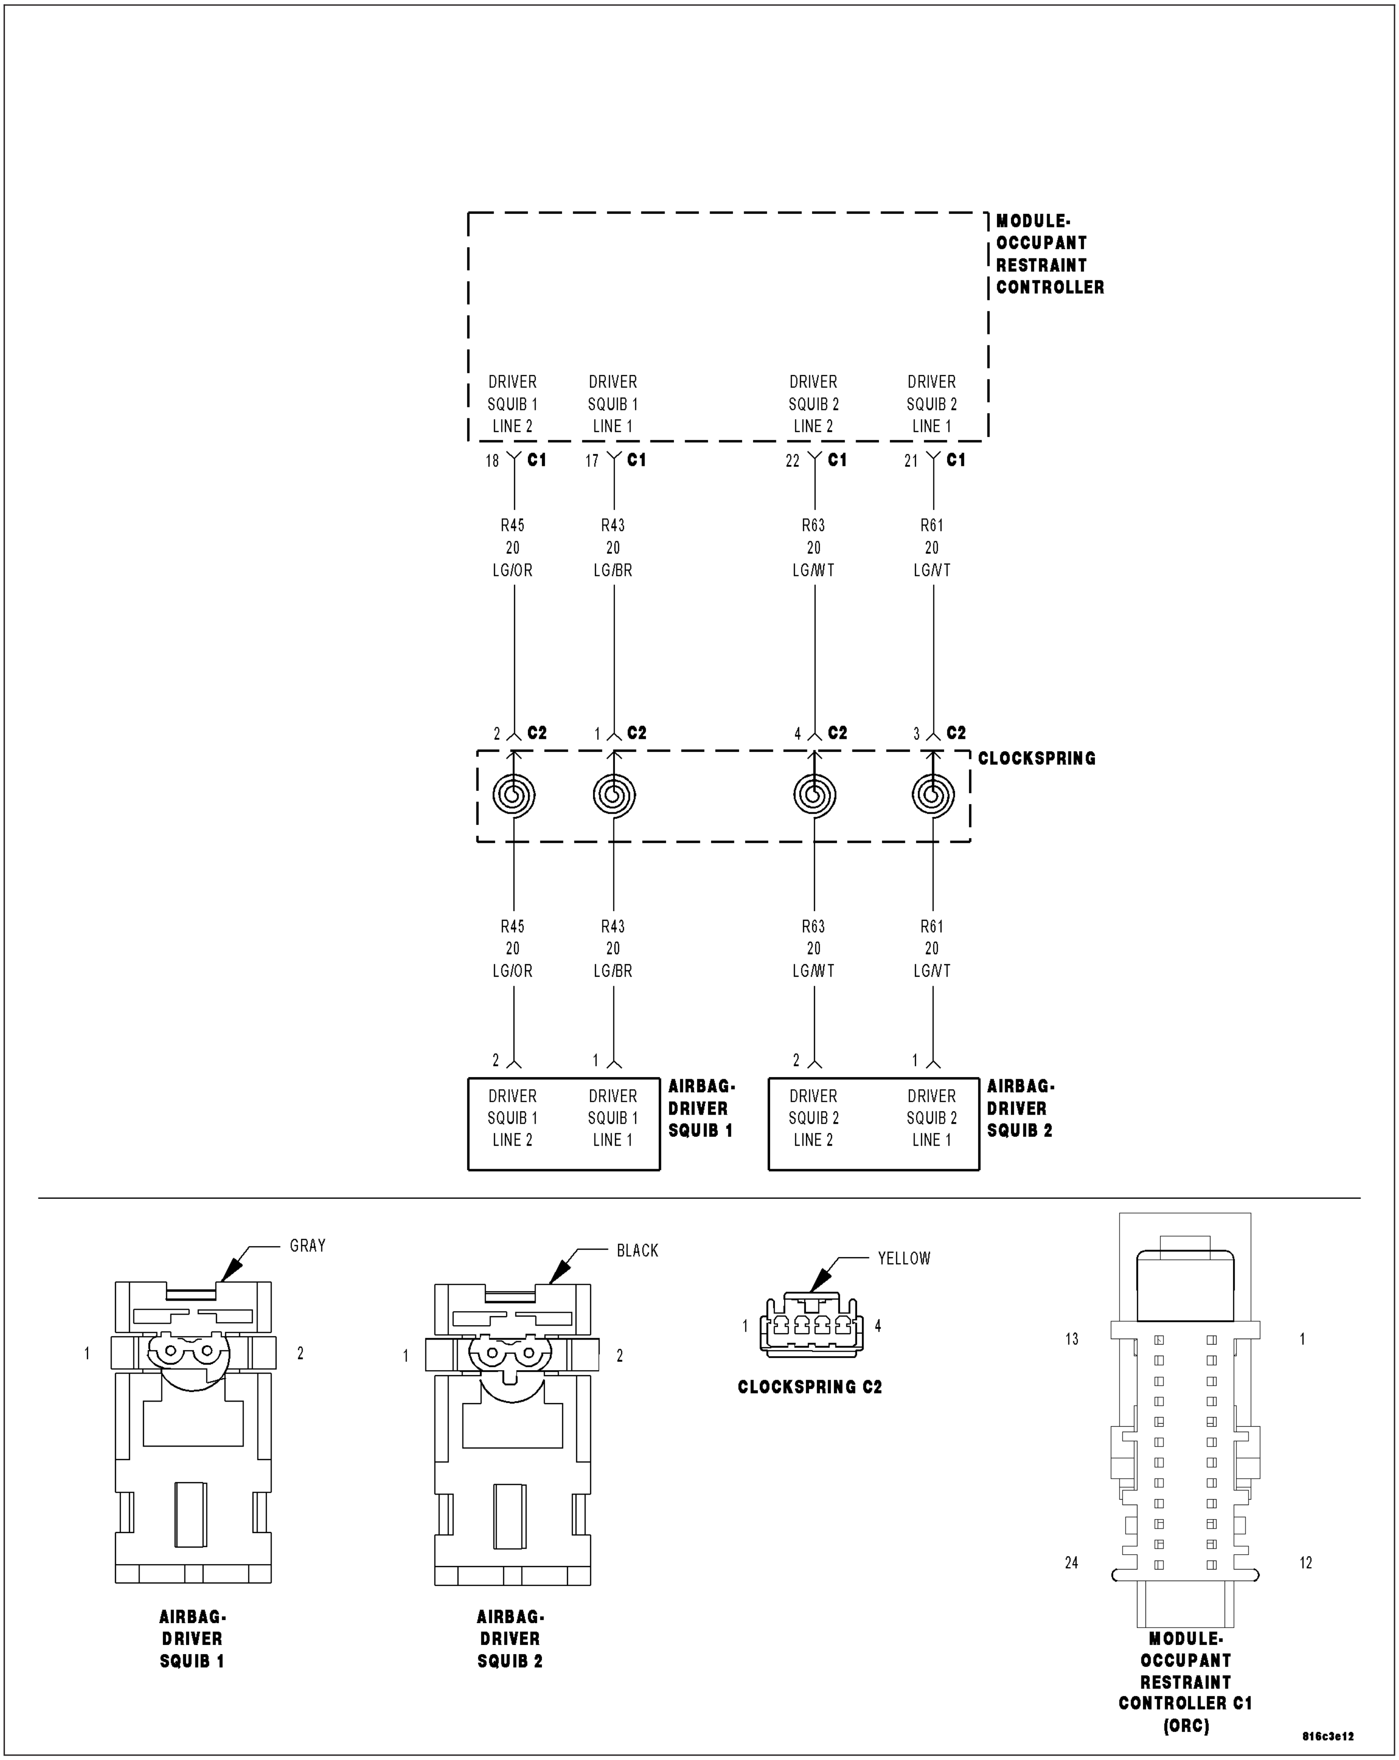
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SQUIB 2 CIRCUIT SHORT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 2 circuits. The ORC will set this DTC if it detects low resistance between the Driver Squib 2 circuits.

| Possible Causes |
|---|
| DRIVER SQUIB 2 LINE 1 CIRCUIT SHORTED TO DRIVER SQUIB 2 LINE 2 CIRCUIT |
| CLOCKSPRING |
| DRIVER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The Scan Tool, SRS Airbag Load Tool MRL 8443 and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

Disconnect the Driver Airbag Squib connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

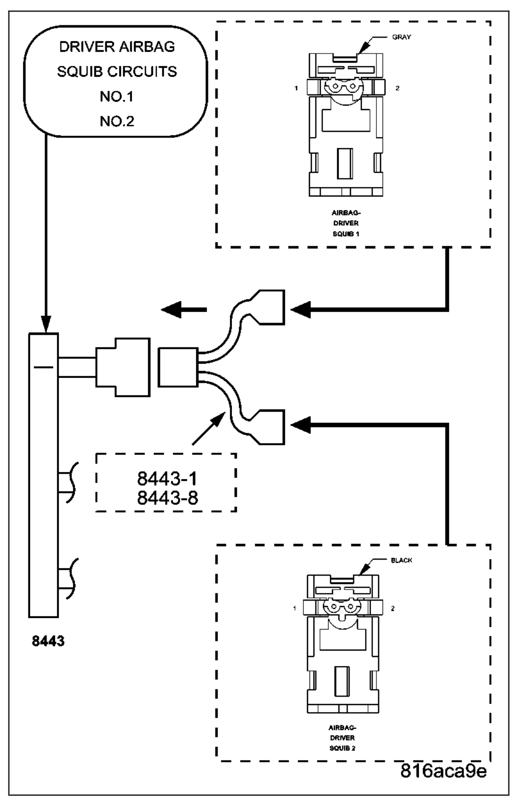
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

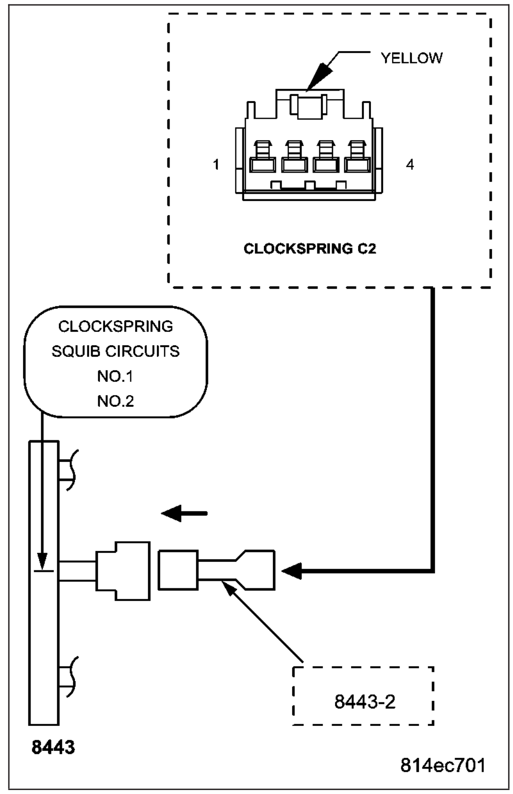
**Does the scan tool display: DRIVER SQUIB 2 CIRCUIT SHORT?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TOGETHER



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool ORC from the Driver Airbag Squib connectors.

Disconnect the Clockspring connector.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Clockspring connector.

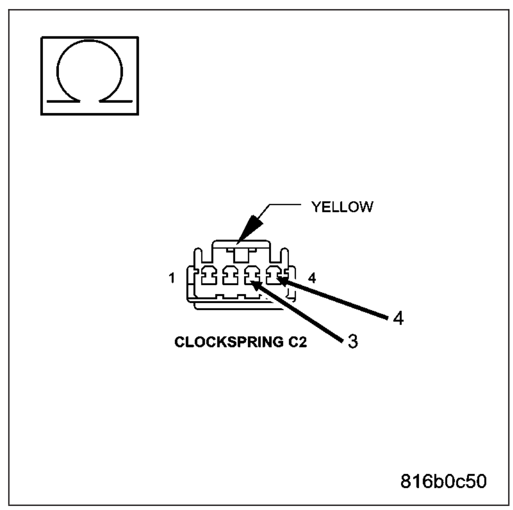
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.

**Does the scan tool display: DRIVER SQUIB 2 CIRCUIT SHORT?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK DRIVER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO DRIVER SQUIB 2 LINE 2 CIRCUIT



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Clockspring connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance between the Driver Squib 2 Line 1 circuit and the Driver Squib 2 Line 2 circuit at the Clockspring connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the Driver Squib 2 Line 1 circuit for a short to the Driver Squib 2 Line 2 circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

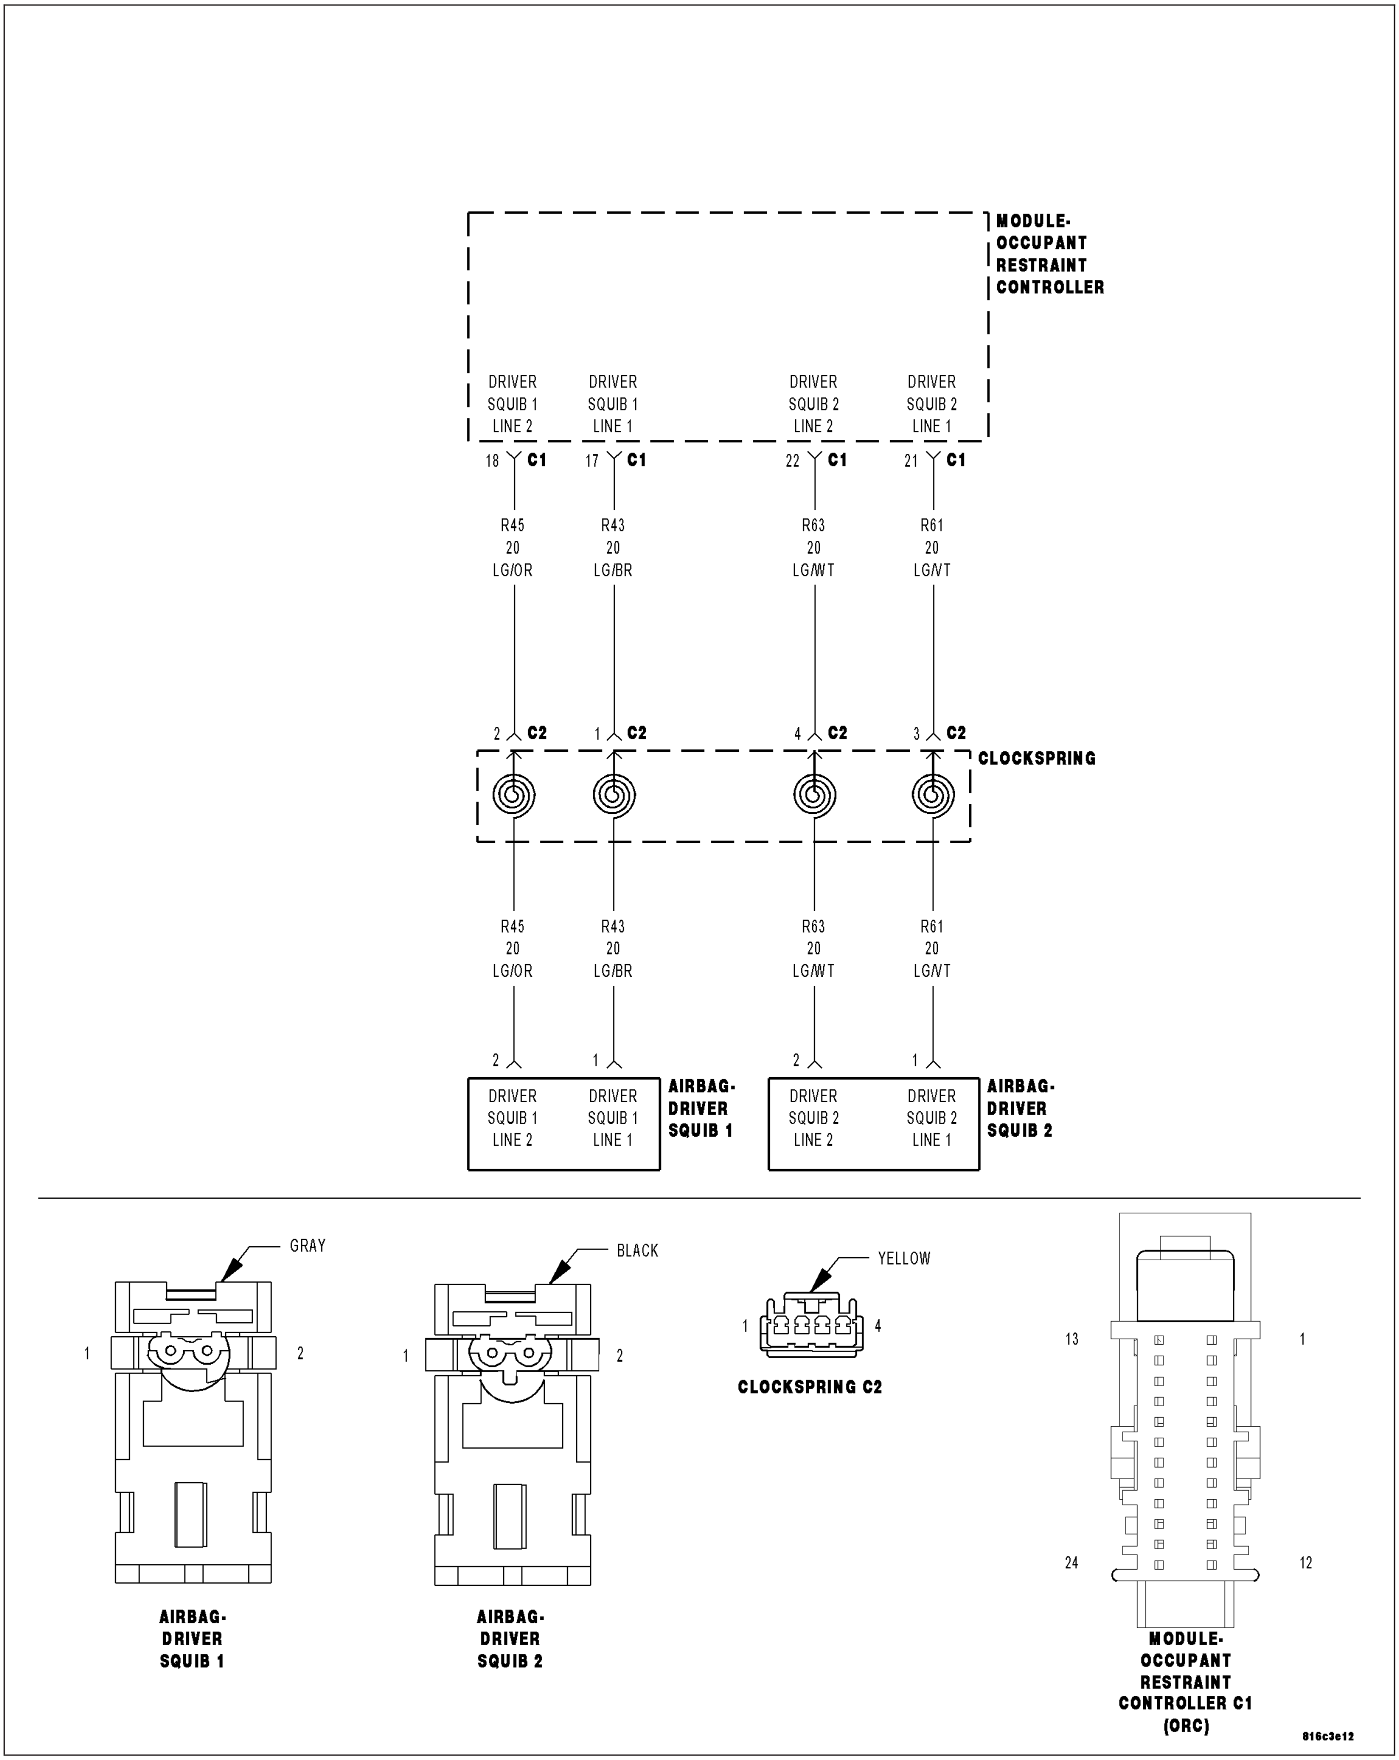
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SQUIB 2 SHORT TO BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage on the Driver Squib 2 circuits. The ORC will set this DTC if it detects voltage on the Driver Squib 2 circuits.

| Possible Causes |
|---|
| DRIVER SQUIB 2 LINE 1 CIRCUIT OR DRIVER SQUIB 2 LINE 2 CIRCUIT SHORTED TO BATTERY |
| CLOCKSPRING |
| DRIVER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443 and DVOM are required to perform the following test.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

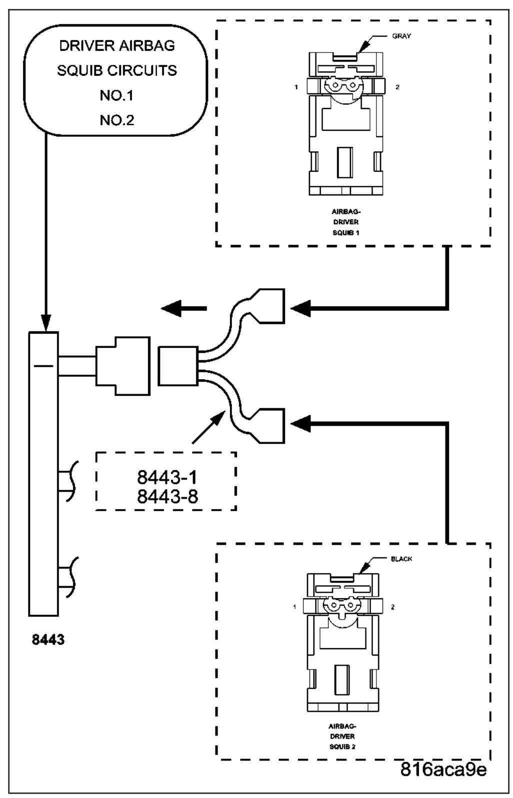
### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.



**Does the scan tool display: DRIVER SQUIB 2 SHORT TO BATTERY?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO BATTERY

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Disconnect the Clockspring connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Clockspring connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

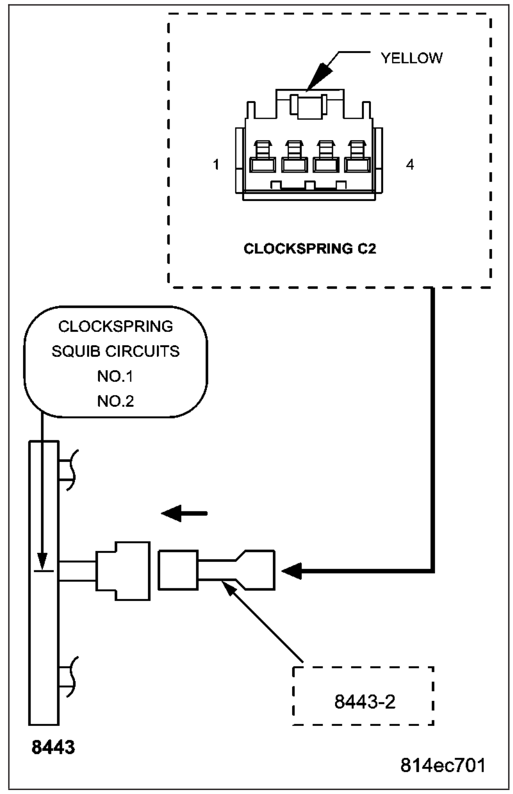
With the scan tool, read the active ORC DTCs.

**Does the scan tool display: DRIVER SQUIB 2 SHORT TO BATTERY?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 4. CHECK DRIVER SQUIB 2 LINE 1 CIRCUIT AND DRIVER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO BATTERY

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the 8443 Load Tool and Jumper from the Clockspring connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Measure the voltage of the Driver Squib 2 Line 1 circuit between the Clockspring connector and ground.

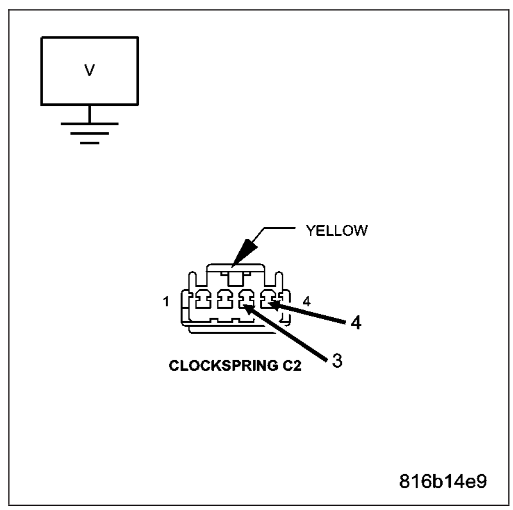
Measure the voltage of the Driver Squib 2 Line 2 circuit between the Clockspring connector and ground.

**Is there any voltage present for either measurement?**

**Yes** >> Repair the Driver Squib 2 circuits with voltage present for a short to Battery.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>



**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

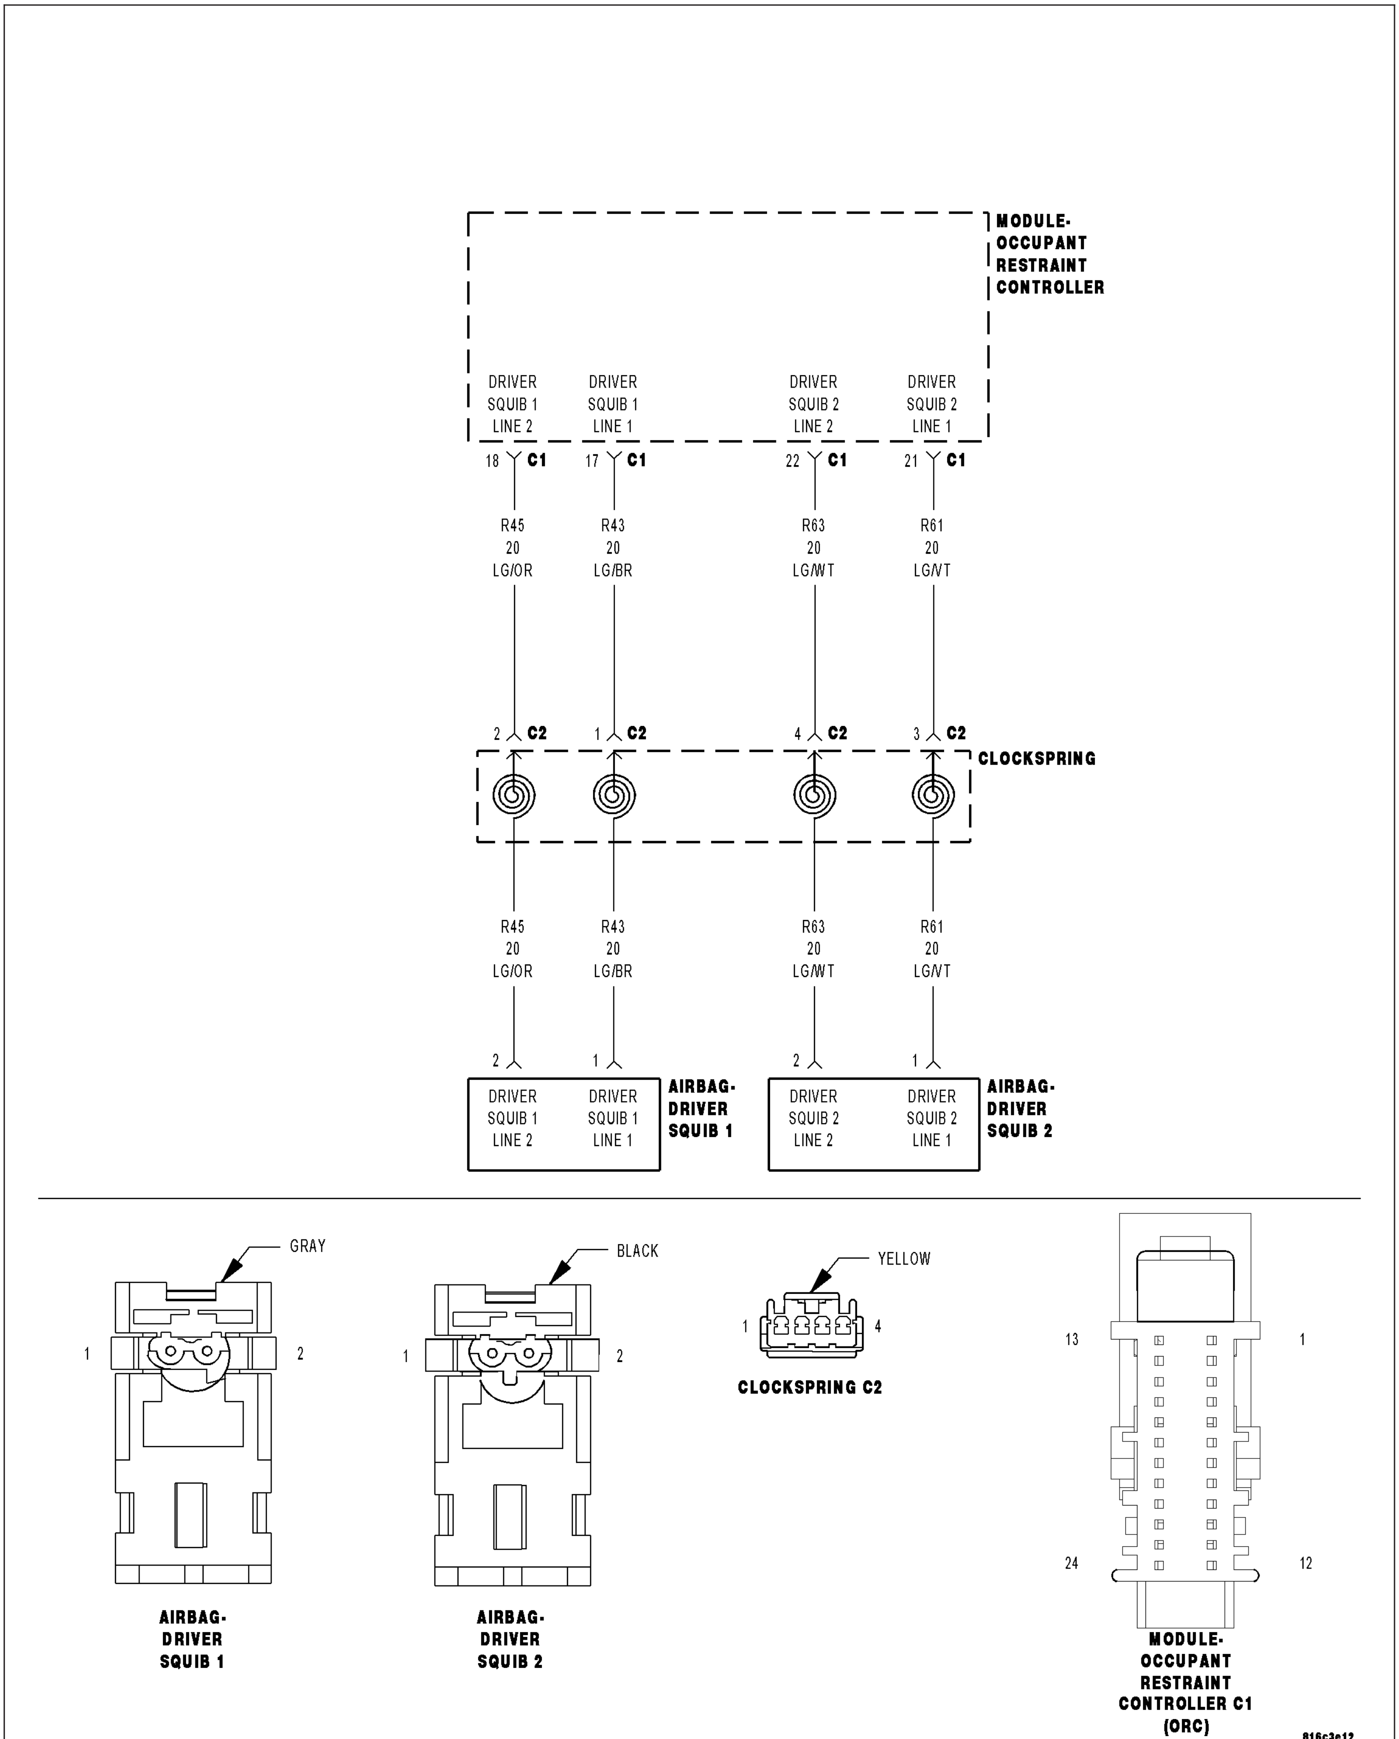
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DRIVER SQUIB 2 SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 2 circuits. The ORC will set this DTC if it detects low resistance on the Driver Squib 2 circuits.

| Possible Causes |
|---|
| DRIVER SQUIB 2 LINE 1 CIRCUIT OR DRIVER SQUIB 2 LINE 2 CIRCUIT SHORTED TO GROUND |
| CLOCKSPRING |
| DRIVER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Driver Airbag Squib connectors.

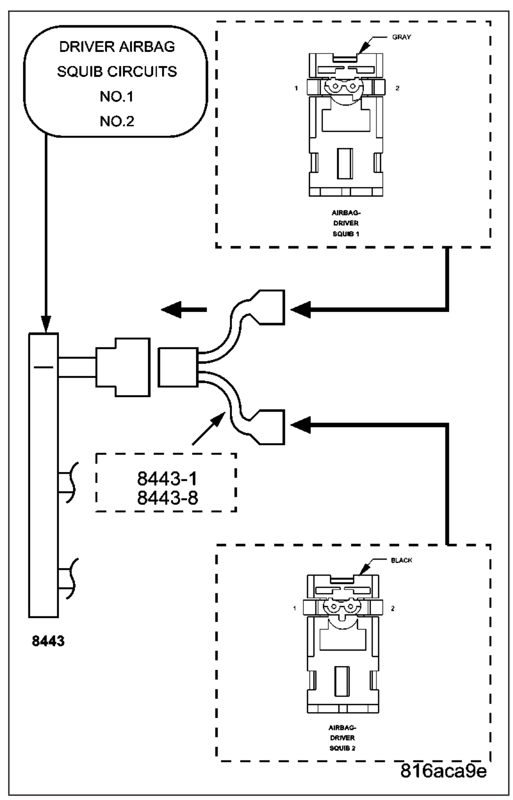
**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

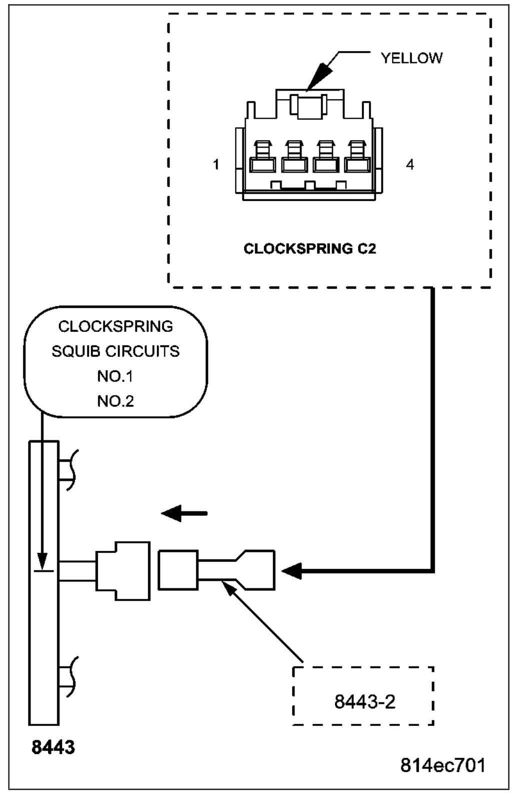


**Does the scan tool display: DRIVER SQUIB 2 SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO GROUND



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool Jumper from the Driver Airbag Squib connectors.

Disconnect the Clockspring connector.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Clockspring connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.

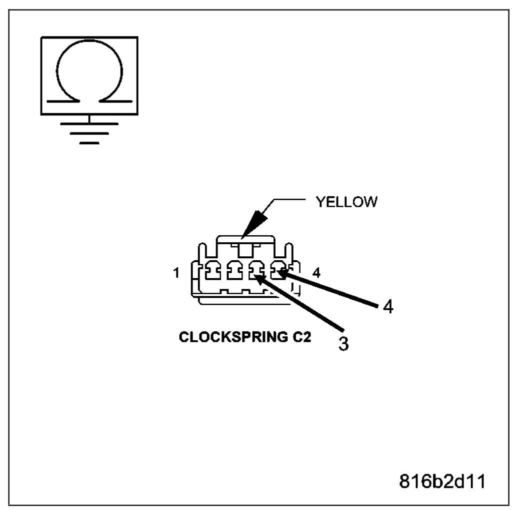
**Does the scan tool display: DRIVER SQUIB 2 SHORT TO GROUND?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK DRIVER SQUIB 2 LINE 1 CIRCUIT AND DRIVER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO GROUND



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Clockspring connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the Driver Squib 2 Line 1 circuit between ground and the Clockspring connector.

Measure the resistance of the Driver Squib 2 Line 2 circuit between ground and the Clockspring connector.

**Is the resistance below 10K ohms for either measurement?**

**Yes** >> Repair the Driver Squib 2 circuits with a resistance below 10K ohms for a short to ground.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## DEPLOYMENT DATA RECORD FULL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controllers (ORC) on board diagnostics monitors the airbag deployment counter. The Airbag Deployment Counter increments each time the vehicle is in an impact that deploys a front or side airbag. The ORC will set this DTC when the Airbag Deployment Counter reaches 3.

| Possible Causes |
| --- |
| ORC |

### Diagnostic Test

#### 1. REPLACE THE ORC

**Repair**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## INTERROGATE OCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Classification Module (OCM) broadcasts a status message on the Bus that provides classification and system fault data to the Occupant Restraint Controller (ORC). The ORC will set this DTC if the message indicates that there is an active fault in the occupant classification system.

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**CAUTION: Repair all other active ORC DTCs before proceeding with this test. Refer to the Table Of Contents in this Section for a complete list of airbag system diagnostic procedures.**

**NOTE: Ensure that the battery is fully charged.**

**WARNING: When disconnecting or connecting airbag system components, the ignition must be turned off and the battery must be disconnected.**

Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. CHECK FOR ACTIVE DTCs IN THE OCM

With the scan tool, read active OCM DTCs.

**Does the scan tool display any DTCs?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table Of Contents in this Section for a complete list of airbag system diagnostic procedures.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

### 3. TEST FOR AN INTERMITTENT CONDITION

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

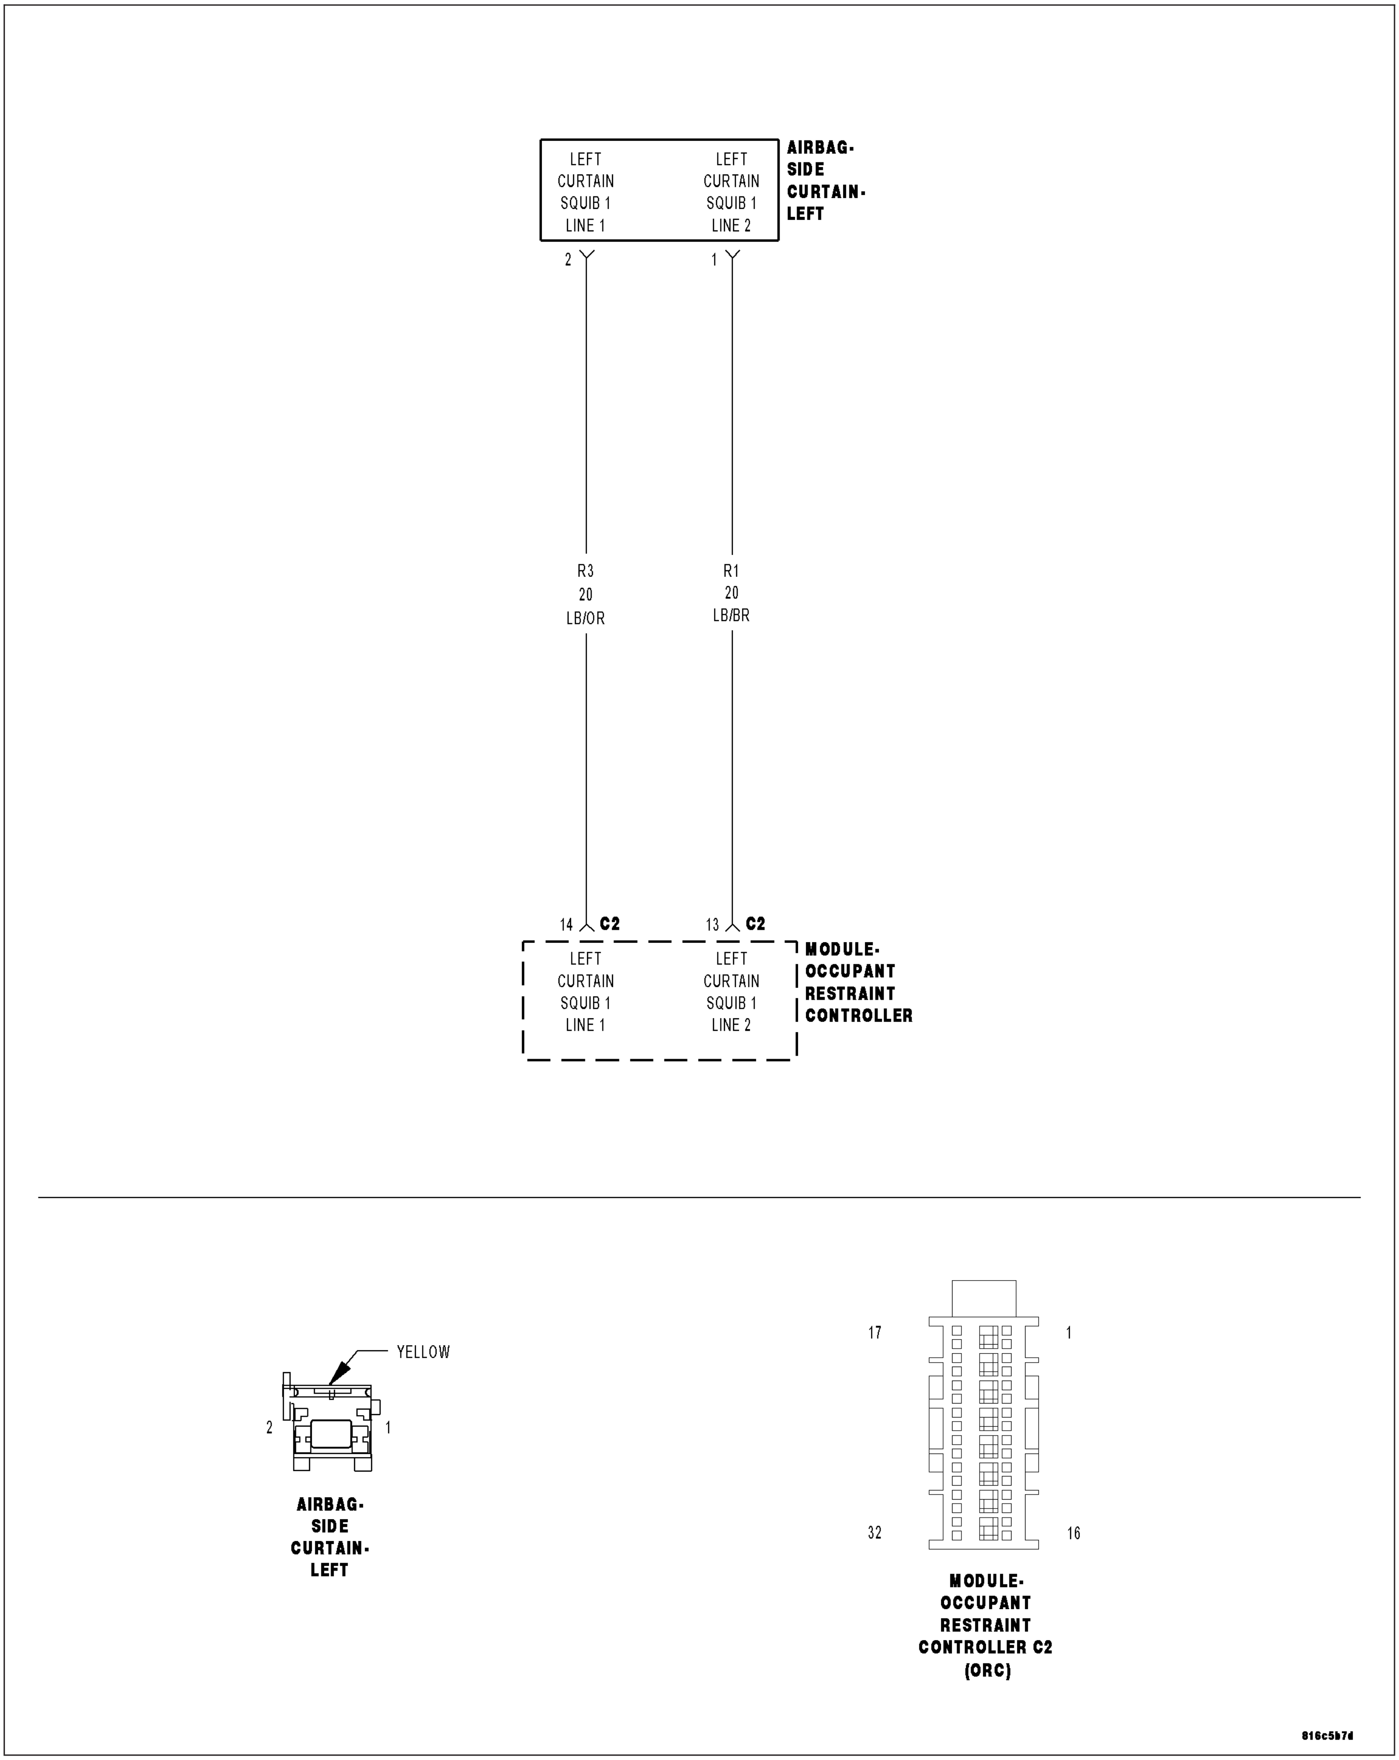
With the scan tool, read the active ORC DTCs.

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## LEFT CURTAIN SQUIB 1 CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits. The ORC will set this DTC if it detects an open or high resistance on the Left Curtain Squib 1 circuits.

| Possible Causes |
|---|
| (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT OPEN |
| (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT OPEN |
| LEFT SIDE CURTAIN AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR OPEN SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Left Side Curtain Airbag connector.

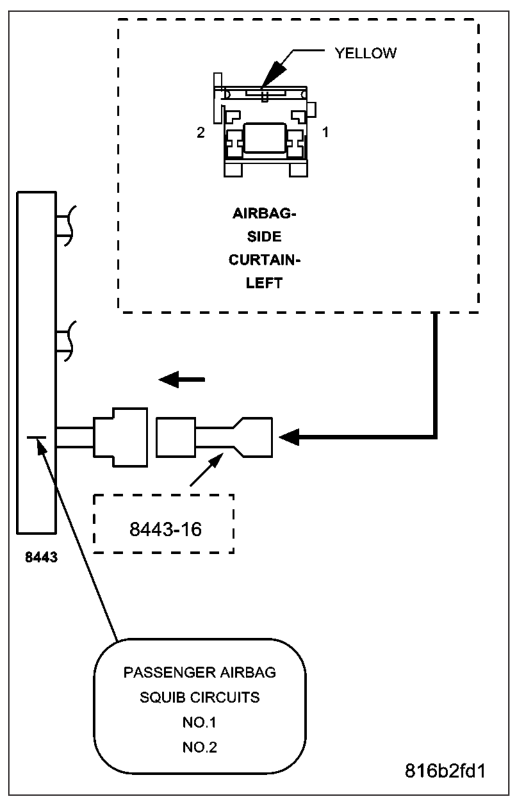
**WARNING: To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Left Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.



**Does the scan tool display: LEFT CURTAIN SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Left Side Curtain Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

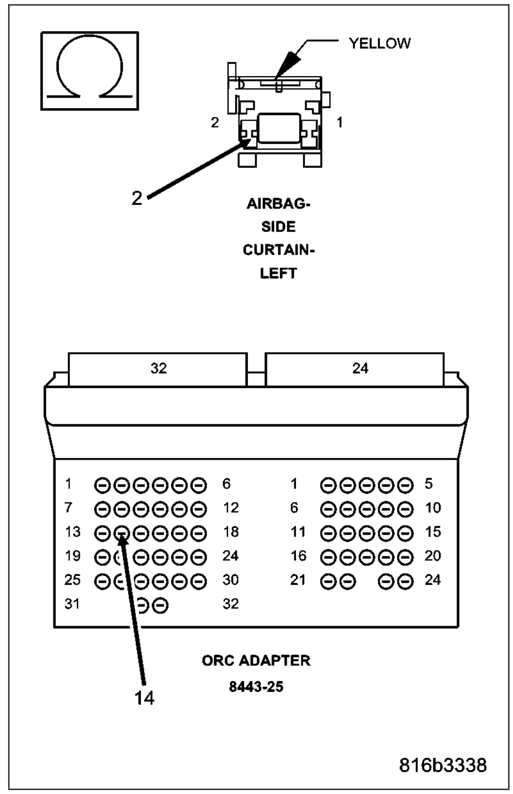
Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag connector and the Load Tool ORC Adaptor.



**Is the resistance below 1.0 ohm?**

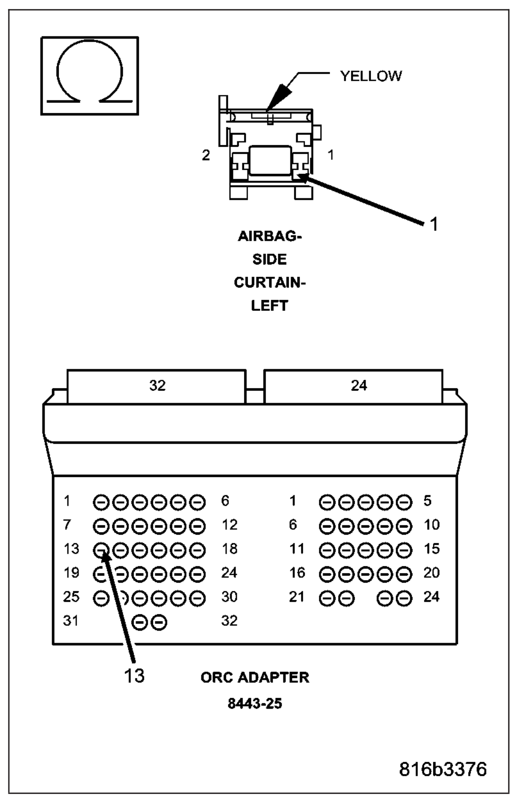
**Yes** >> Go To 4

**No** >> Repair the (R3) Left Curtain Squib 1 Line 1 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN

Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag connector and the Load Tool ORC Adaptor.



**Is the resistance below 1.0 ohm?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (R1) Left Curtain Squib 1 Line 2 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

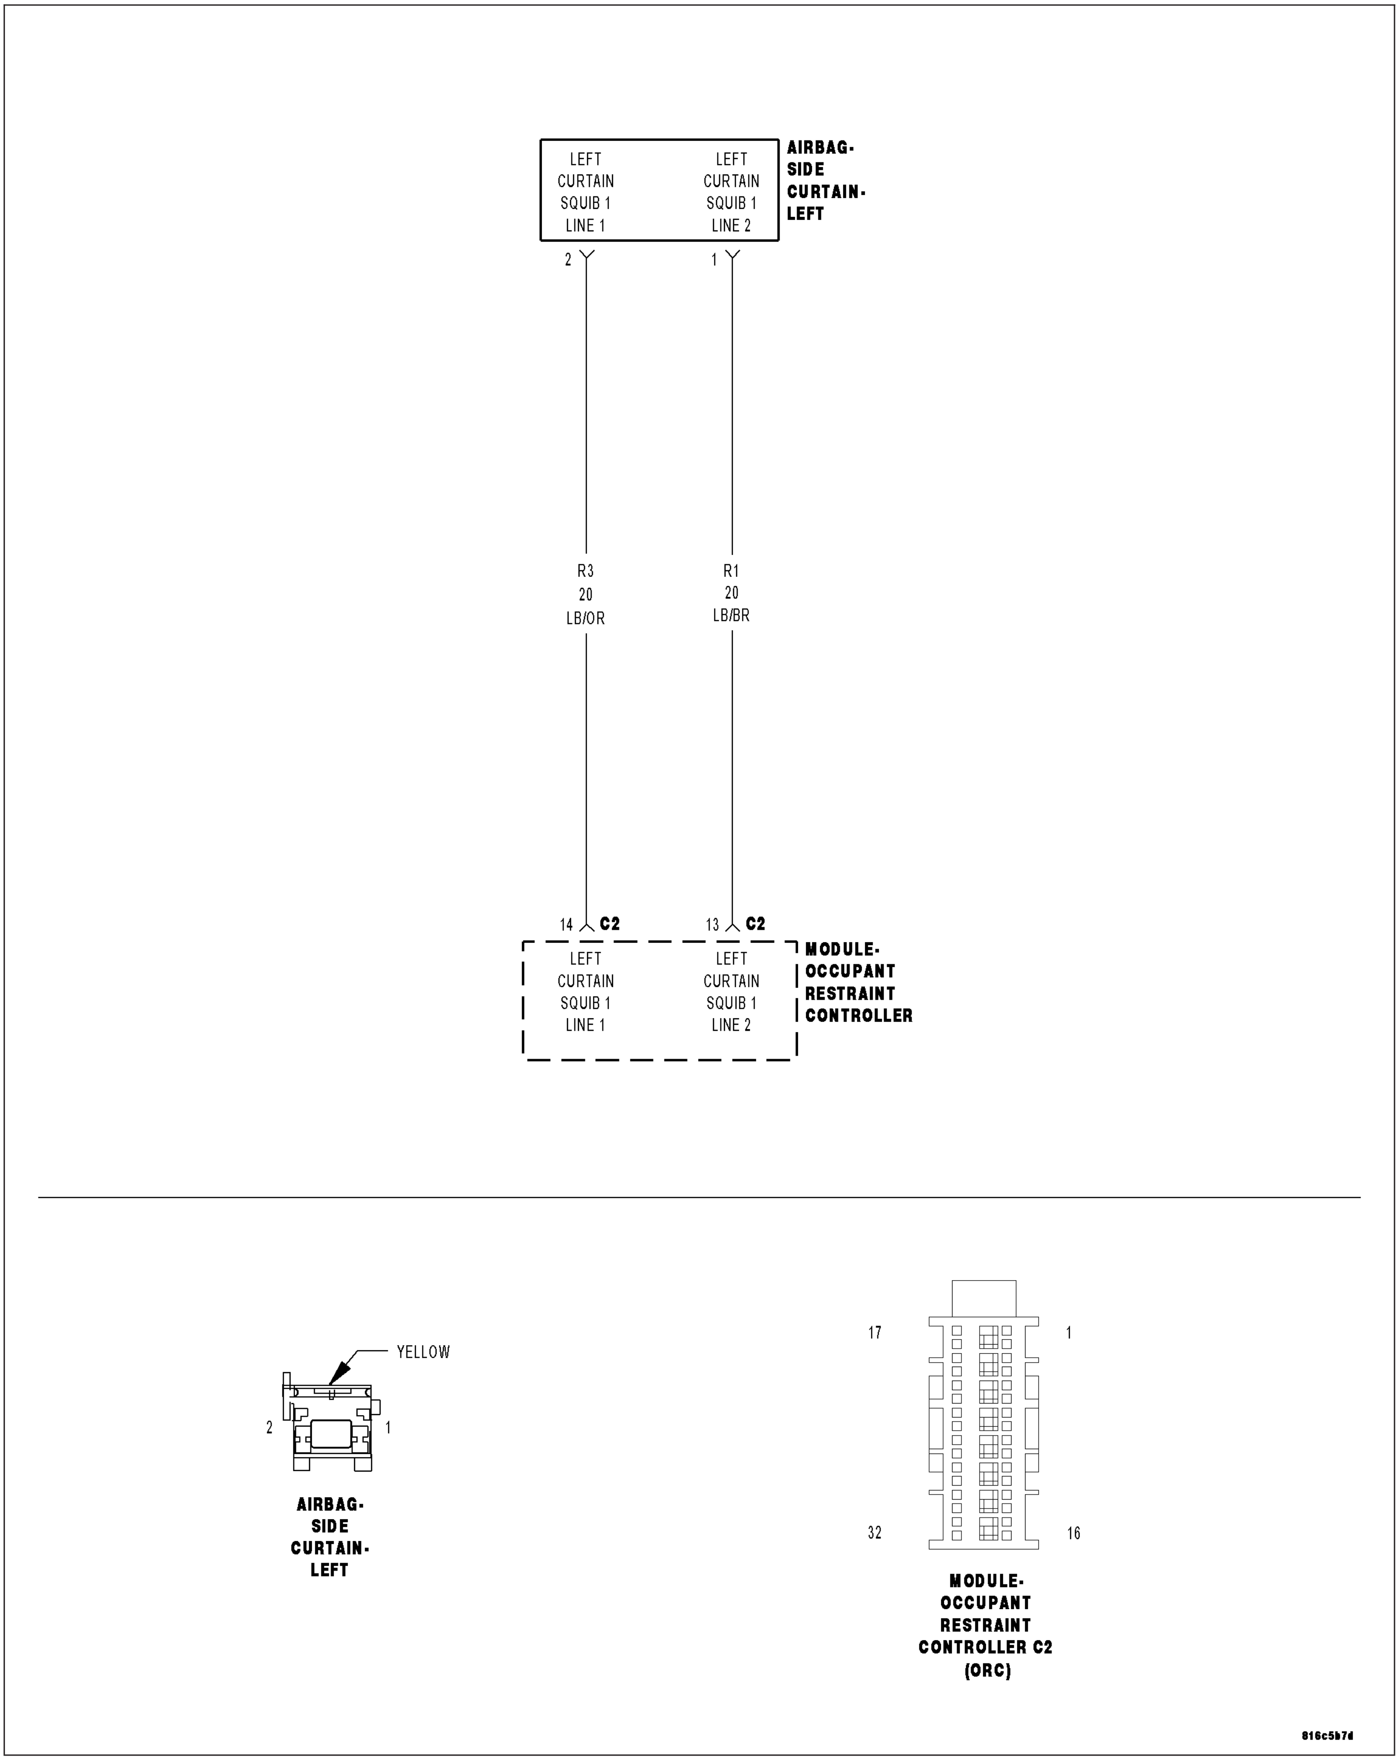
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## LEFT CURTAIN SQUIB 1 CIRCUIT SHORT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits. The ORC will set this DTC if it detects low resistance between the Left Curtain Squib 1 circuits.

| Possible Causes |
|---|
| (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT |
| LEFT SIDE CURTAIN AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Left Side Curtain Airbag connector.

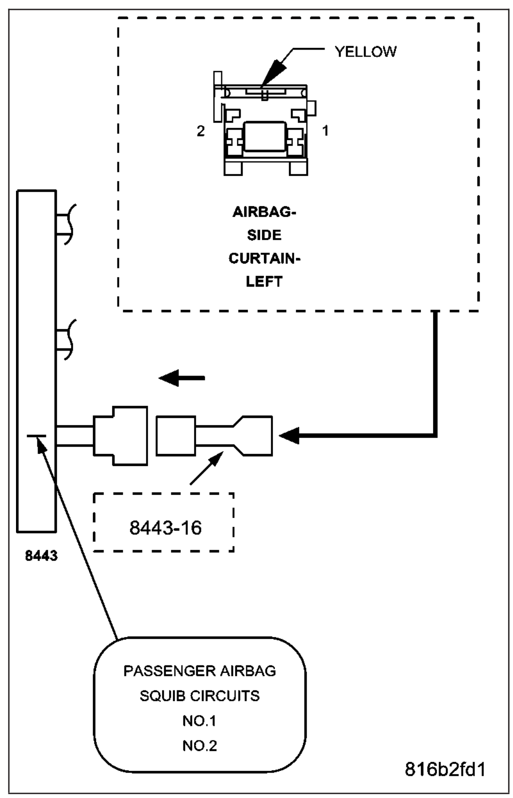
**WARNING: To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Left Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

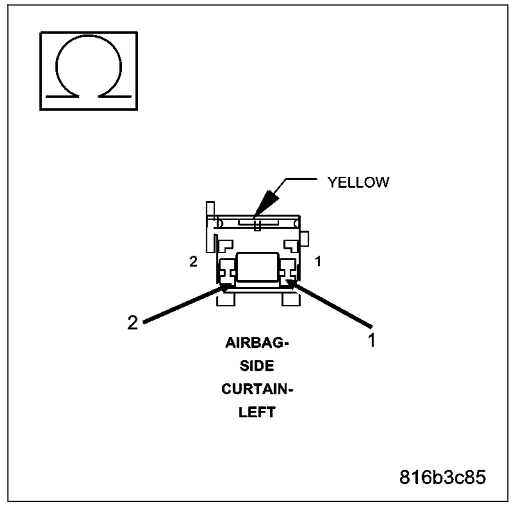


**Does the scan tool display: LEFT CURTAIN SQUIB 1 CIRCUIT SHORT?**

**Yes** >> Go To 3

**No** >> Replace the Left Side Curtain Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance between the (R3) Left Curtain Squib 1 Line 1 circuit and the (R1) Left Curtain Squib 1 Line 2 circuit at the Left Side Curtain Airbag connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R3) Left Curtain Squib 1 Line 1 circuit for a short to the (R1) Left Curtain Squib 1 Line 2 circuit.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

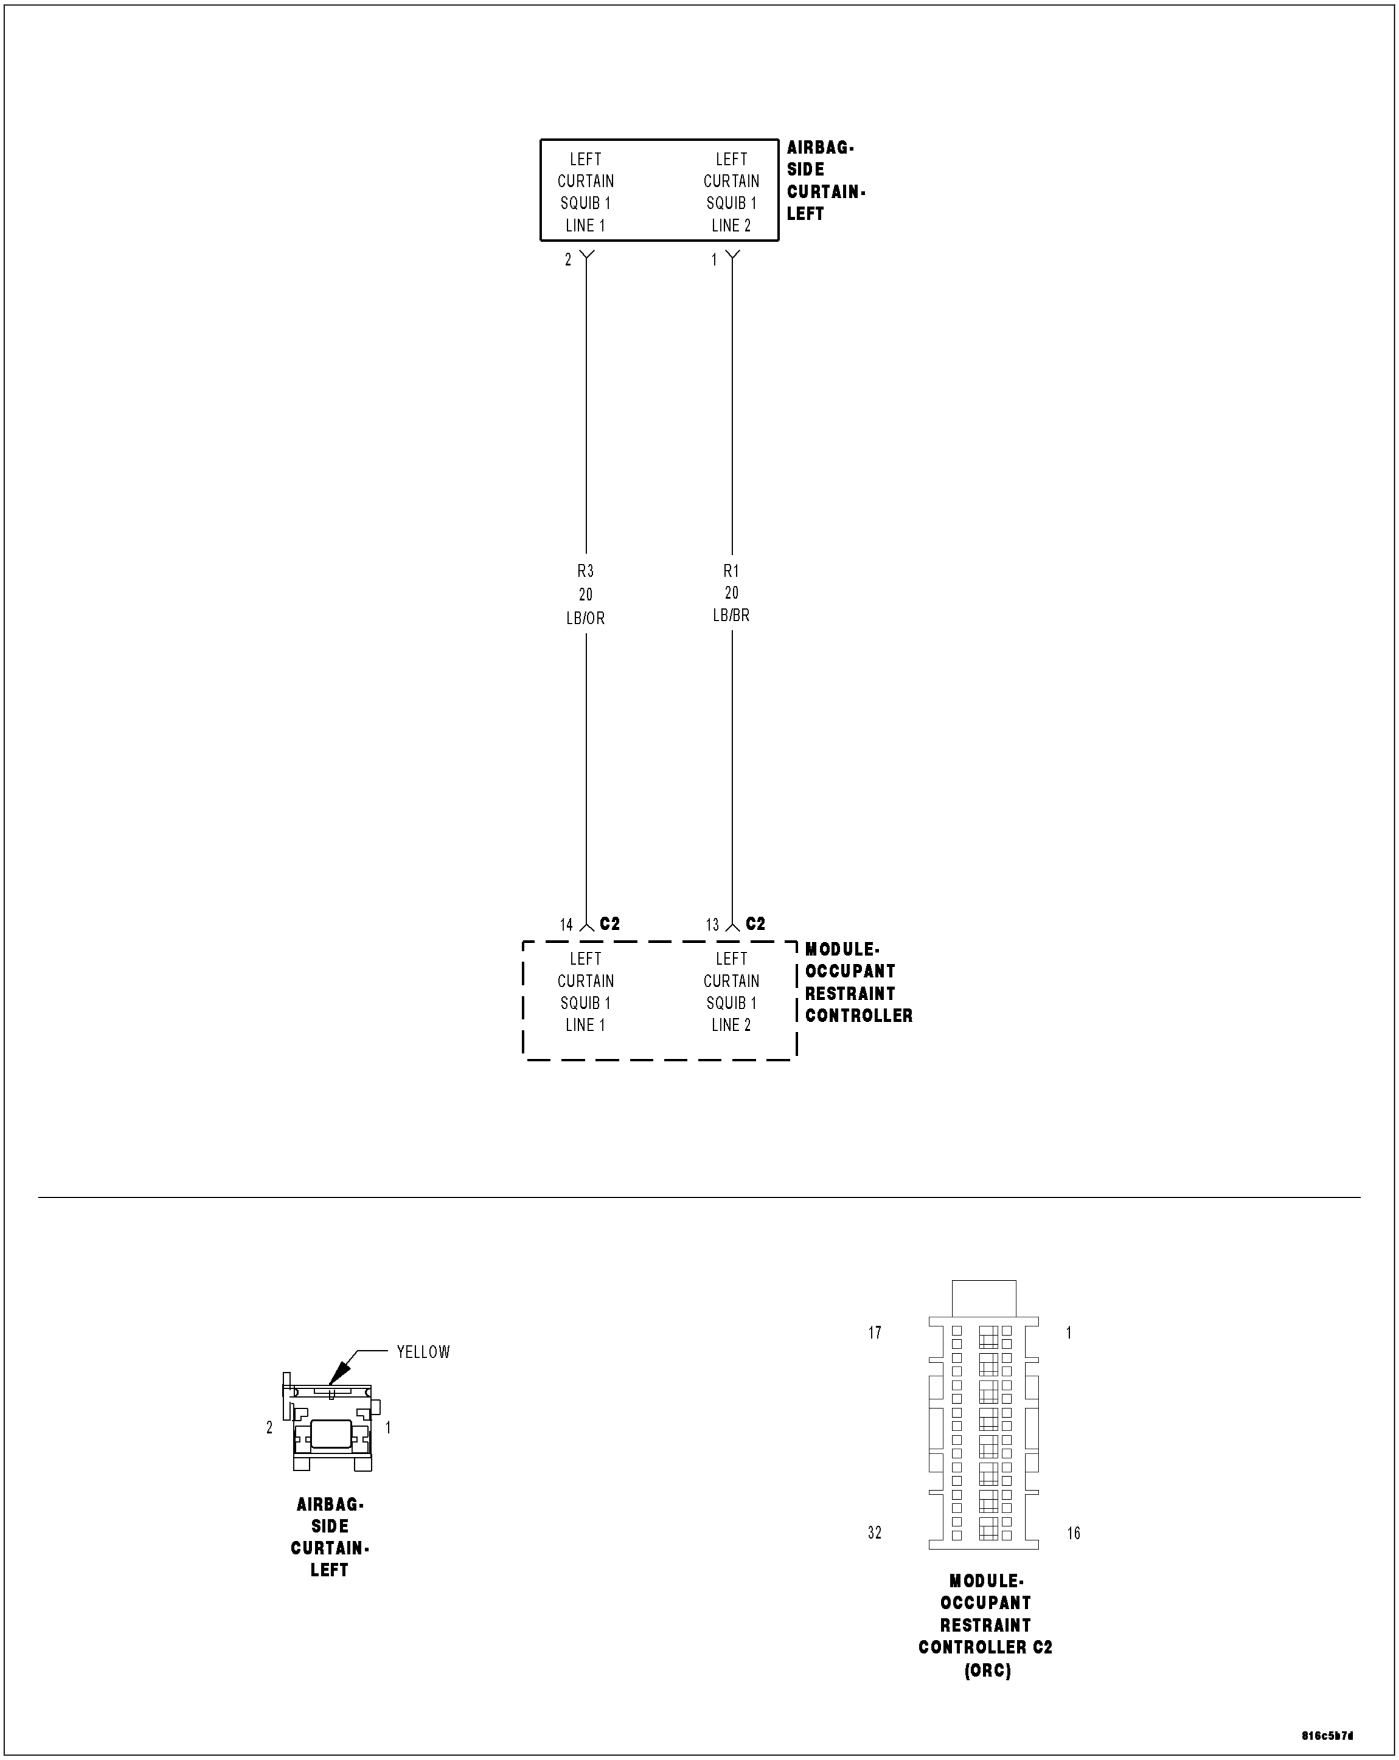
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## LEFT CURTAIN SQUIB 1 SHORT TO BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage on the Left Curtain Squib 1 circuits. The ORC will set this DTC if it detects voltage on the Left Curtain Squib 1 circuits.

| Possible Causes |
| --- |
| (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT OR (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY |
| LEFT SIDE CURTAIN AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Left Side Curtain Airbag connector.

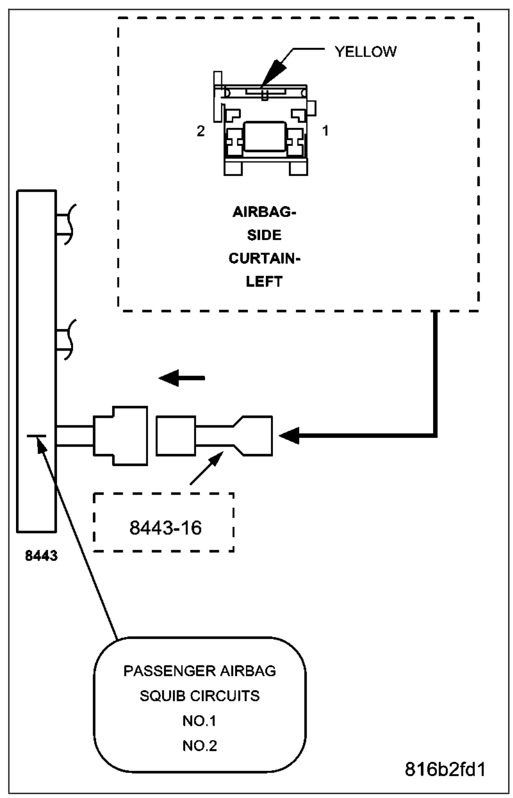
**WARNING: To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Left Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

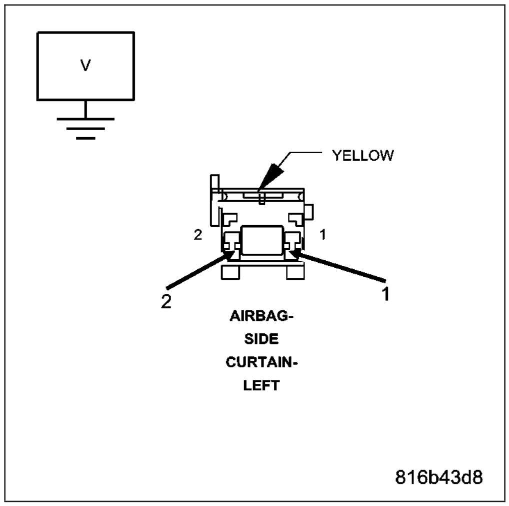


**Does the scan tool display: LEFT CURTAIN SQUIB 1 SHORT TO BATTERY?**

**Yes** >> Go To 3

**No** >> Replace the Left Side Curtain Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO BATTERY



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the voltage of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag connector and ground.

Measure the voltage of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Left Curtain Squib 1 circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

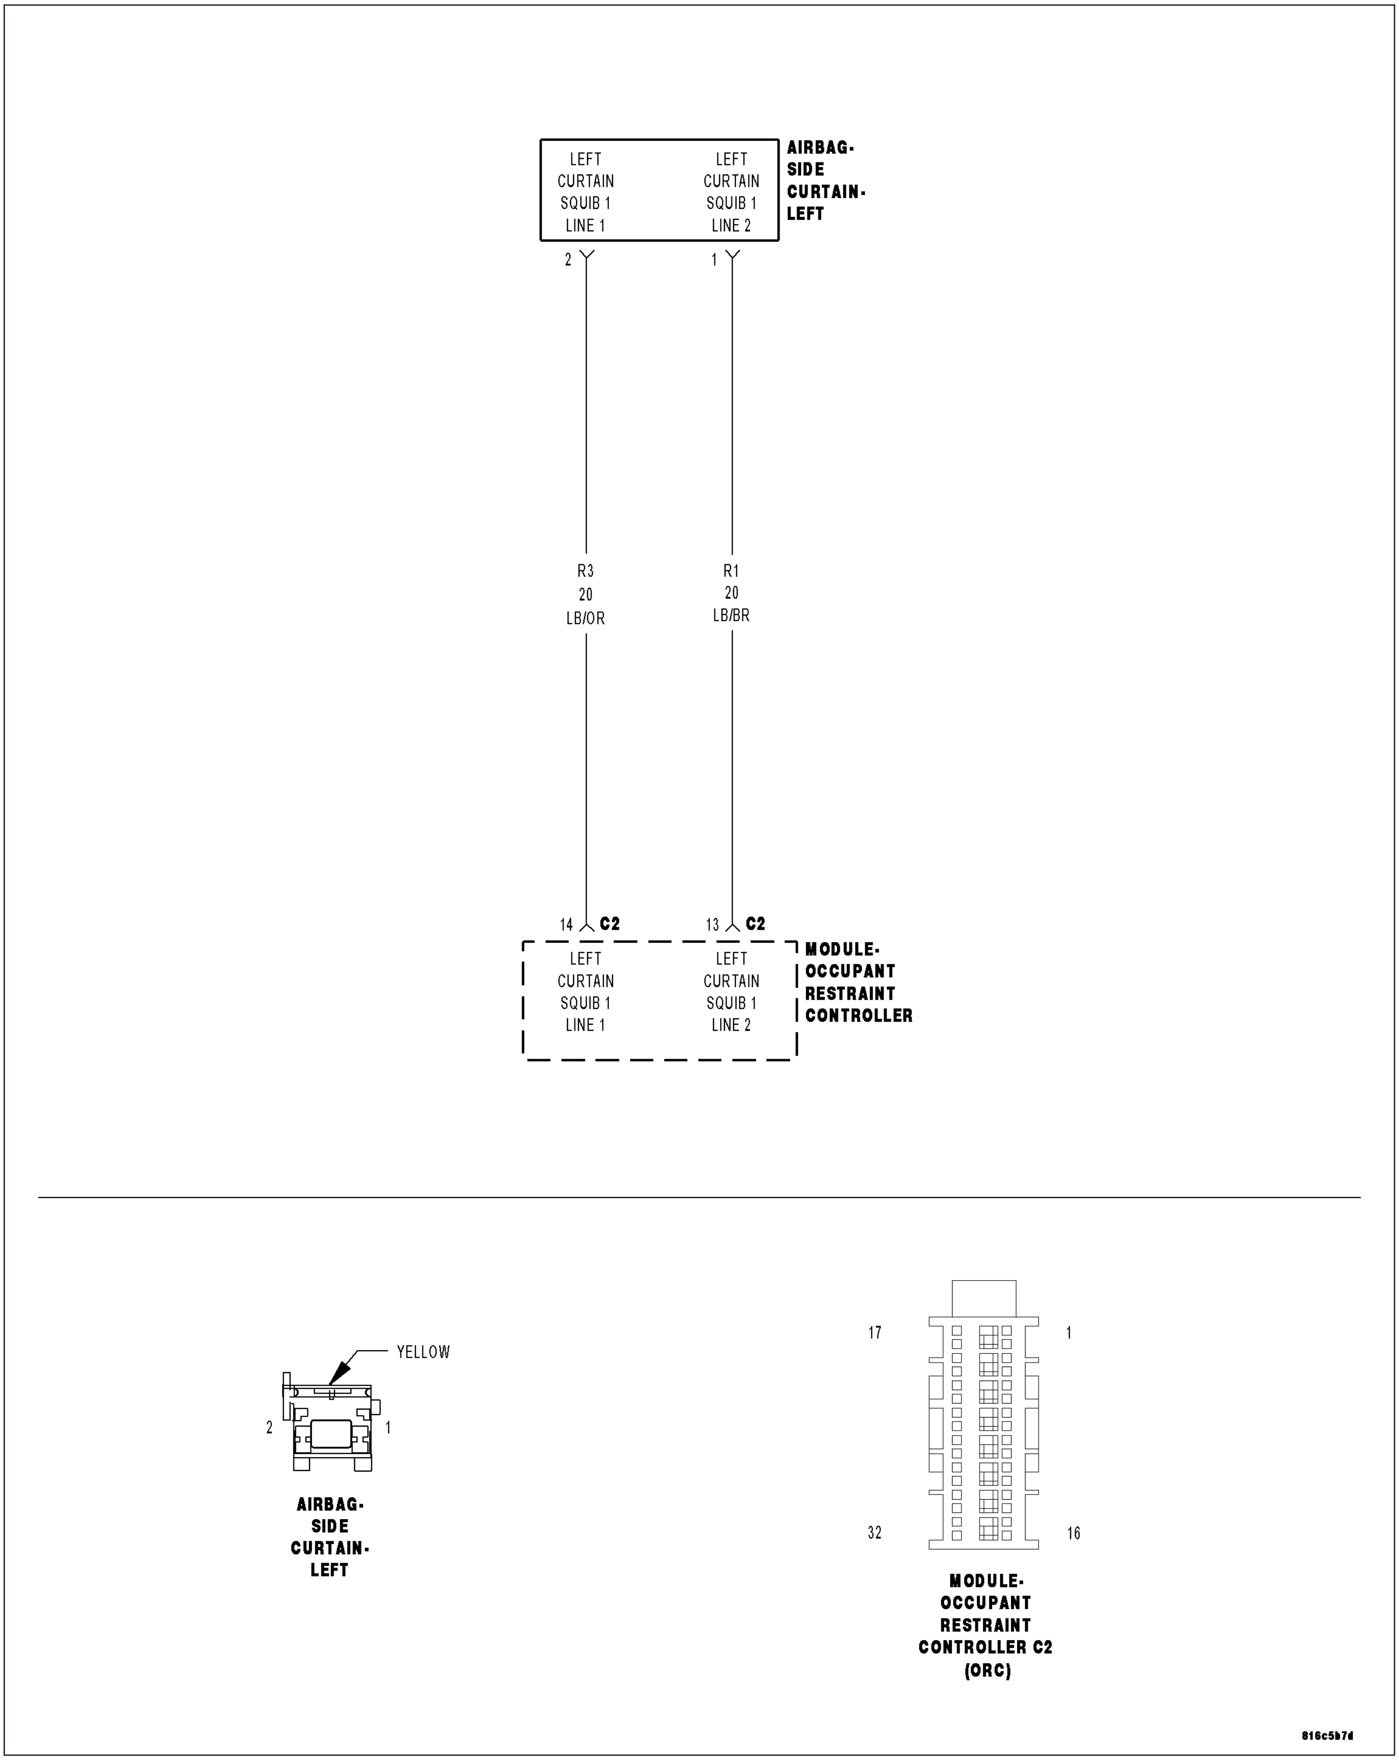
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## LEFT CURTAIN SQUIB 1 SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits. The ORC will set this DTC if it detects low resistance on the Left Curtain Squib 1 circuits.

| Possible Causes |
| --- |
| (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT OR (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND |
| LEFT SIDE CURTAIN AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Left Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

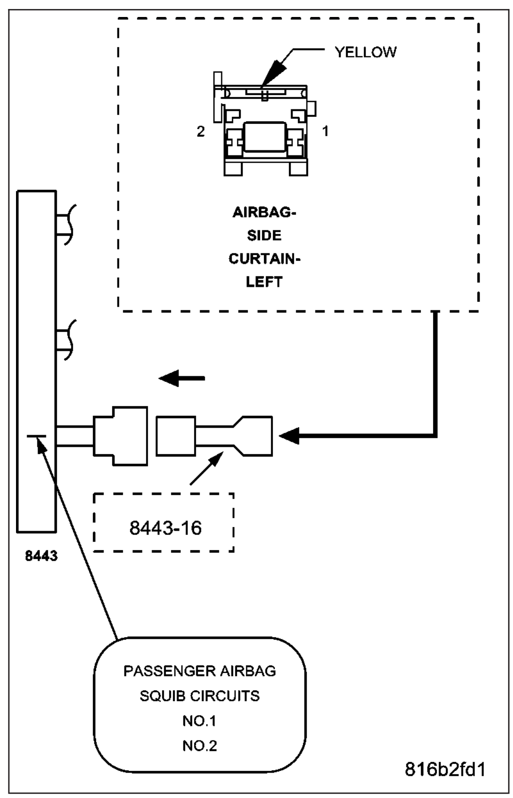
**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Left Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.

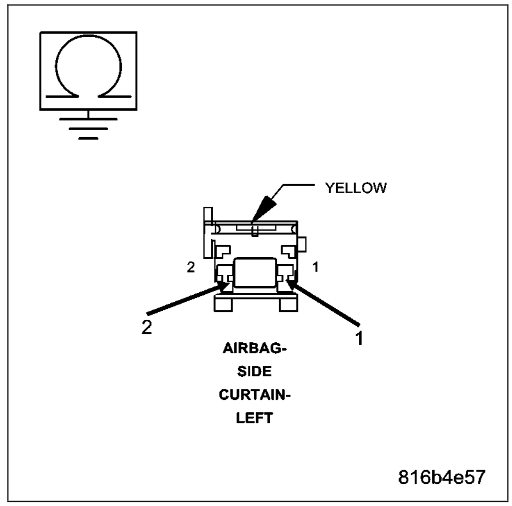
**Does the scan tool display: LEFT CURTAIN SQUIB 1 SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the Left Side Curtain Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO GROUND



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between ground and the Left Side Curtain Airbag connector.

Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between ground and the Left Side Curtain Airbag connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Left Curtain Squib 1 circuits with a resistance below 10K ohms for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## LEFT FRONT IMPACT SENSOR INTERNAL 1

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) supplies power to and communicates continuously with each impact sensor via each sensor's signal circuit. The power supply also enables each sensor's self-diagnostic capabilities. If an impact sensor detects an internal fault, it sends the applicable Impact Sensor Internal 1 message to the ORC. The ORC will set this DTC if it receives the Left Front Impact Sensor internal 1 message.

| Possible Causes |
|---|
| LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE |
| LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND |
| LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO LEFT FRONT IMPACT SENSOR GROUND CIRCUIT |
| LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT OPEN |
| LEFT FRONT IMPACT SENSOR GROUND CIRCUIT OPEN |
| LEFT FRONT IMPACT SENSOR |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: When disconnecting or connecting airbag system components, the ignition must be turned off and the battery must be disconnected.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 8

### 2. CHECK THE LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Occupant Restraint Controller (ORC) connector(s).

Disconnect the Left Front Impact Sensor connector.

**NOTE: Check connectors - Clean and repair as necessary.**

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the Left Front Impact Sensor Signal circuit between the Left Front Impact Sensor connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the Left Front Impact Sensor Signal circuit for a short to voltage.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the Left Front Impact Sensor Signal circuit between ground and the Left Front Impact Sensor connector.

**Is the resistance below 100k ohms?**

**Yes** >> Repair the Left Front Impact Sensor Signal circuit for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. CHECK THE LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE LEFT FRONT IMPACT SENSOR GROUND CIRCUIT

Measure the resistance between the Left Front Impact Sensor Signal circuit and the Left Front Impact Sensor Ground circuit at the Left Front Impact Sensor connector.

**Is the resistance below 100k ohms?**

**Yes** >> Repair the Left Front Impact Sensor Signal circuit for a short to the Left Front Impact Sensor Ground circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. CHECK THE LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN

Connect the appropriate Load Tool Adaptor to the ORC connector.

Measure the resistance of the Left Front Impact Sensor Signal circuit between the Left Front Impact Sensor connector and the Airbag Load Tool adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the Left Front Impact Sensor Signal circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 6. CHECK THE LEFT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the Left Front Impact Sensor Ground circuit between the Left Front Impact Sensor connector and the Airbag Load Tool adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 7

**No** >> Repair the Left Front Impact Sensor Ground circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 7. REPLACE THE LEFT FRONT IMPACT SENSOR AND THEN CHECK FOR ACTIVE DTCs

Replace the Left Front Impact Sensor in accordance with the Service Information.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, erase all DTCs in all Restraint System Modules.

Turn the Ignition off, wait 15 seconds, then turn the Ignition on.

Wait one minute before proceeding.

With the scan tool, read active ORC DTCs.

**Does the scan tool display: LEFT FRONT IMPACT SENSOR INTERNAL 1?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. TEST FOR AN INTERMITTENT CONDITION

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

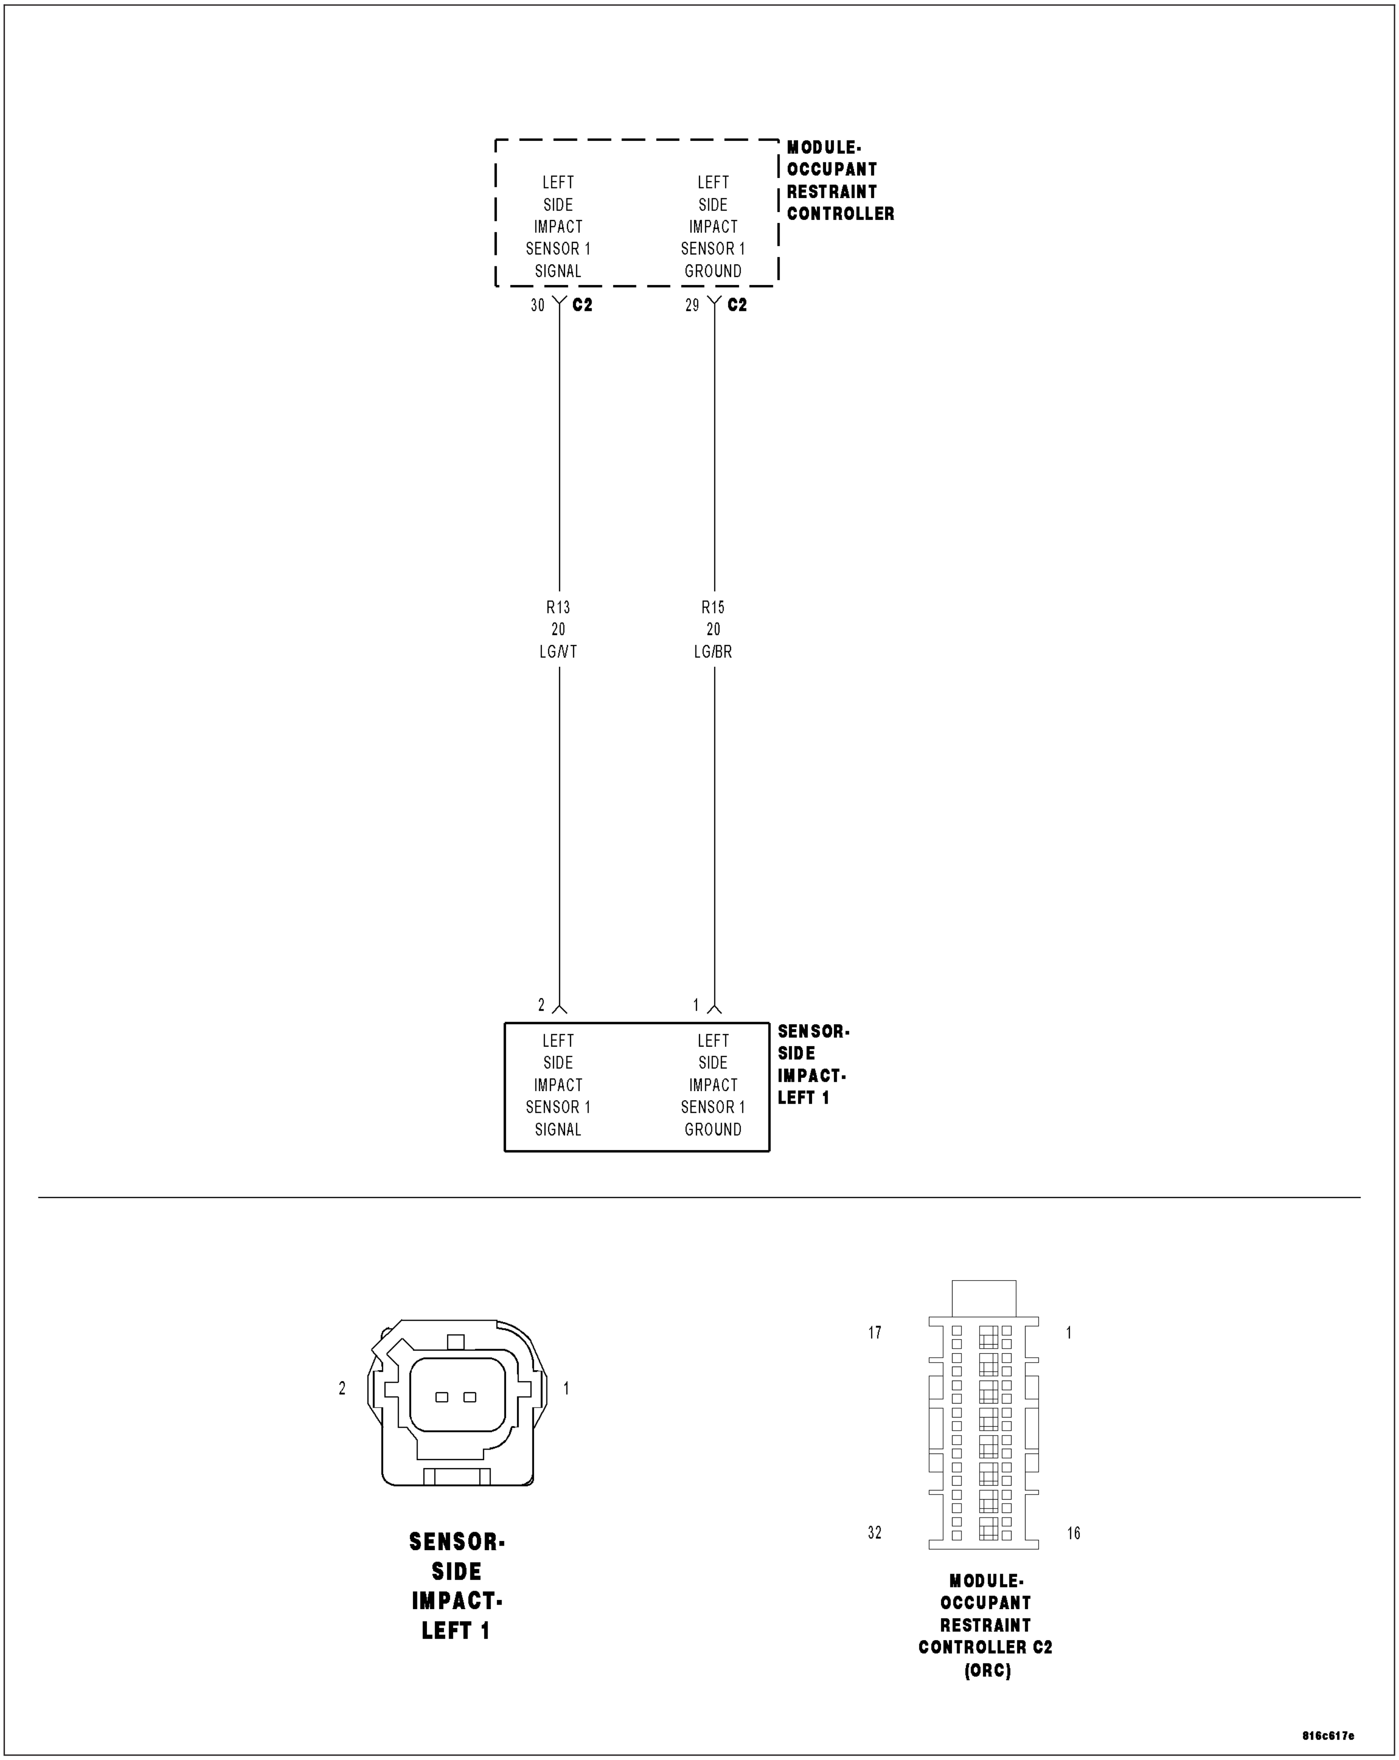
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## LEFT SIDE IMPACT SENSOR 1 INTERNAL 1



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) supplies power to and communicates continuously with each impact sensor via each sensor's signal circuit. The power supply also enables each sensor's self-diagnostic capabilities. If an impact sensor detects an internal fault, it sends the applicable Impact Sensor Internal 1 message to the ORC. The ORC will set this DTC if it receives the Left Side Impact Sensor internal 1 message.

| Possible Causes |
| --- |
| (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO BATTERY |
| (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND |
| (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT |
| (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN |
| (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN |
| LEFT SIDE IMPACT SENSOR 1 |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 8

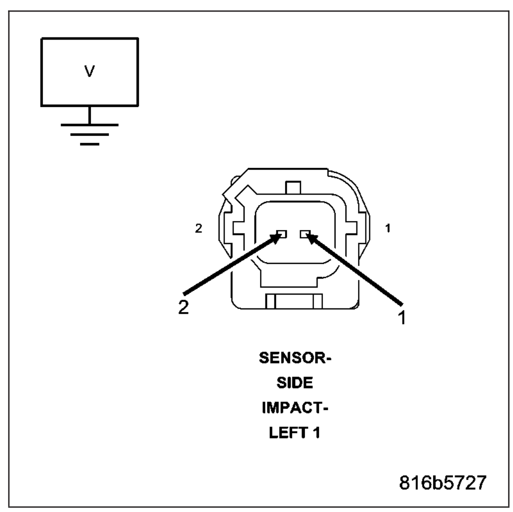
### 2. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT AND THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR A SHORT TO BATTERY

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Left side Impact Sensor 1 connector.

Disconnect the ORC connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 connector and ground.

Measure the voltage of the (R15) Left Side Impact Sensor 1 Ground circuit between the Left Side Impact Sensor 1 connector and ground.



**Is there any voltage present on either circuit?**

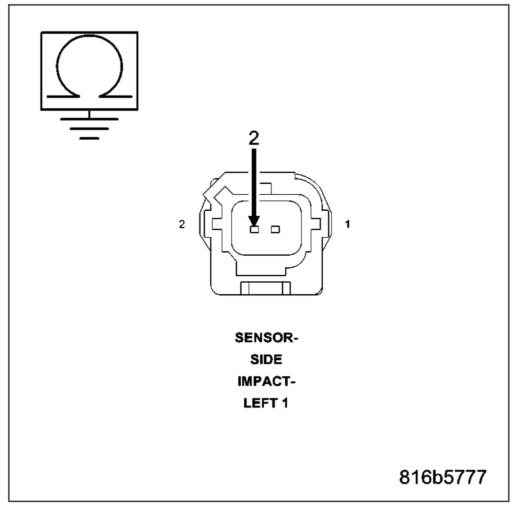
**Yes** >> Repair the circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between ground and the Left Side Impact Sensor 1 connector.



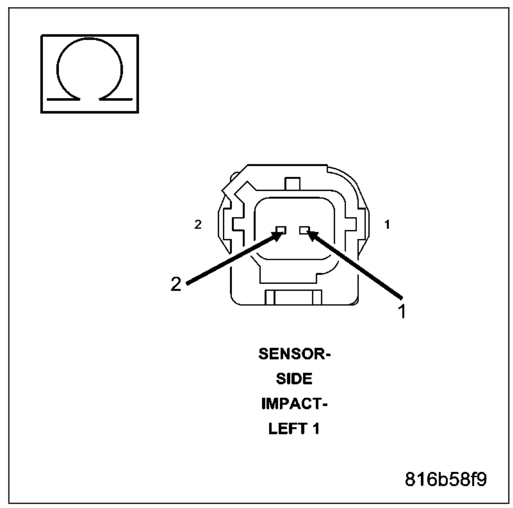
**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R13) Left Side Impact Sensor 1 Signal circuit for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT

Measure the resistance between the (R13) Left Side Impact Sensor 1 Signal circuit and the (R15) Left Side Impact Sensor 1 Ground circuit at the Left Side Impact Sensor 1 connector.



**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R13) Left Side Impact Sensor 1 Signal circuit for the (R15) Left Side Impact Sensor 1 Ground circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. CHECK THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

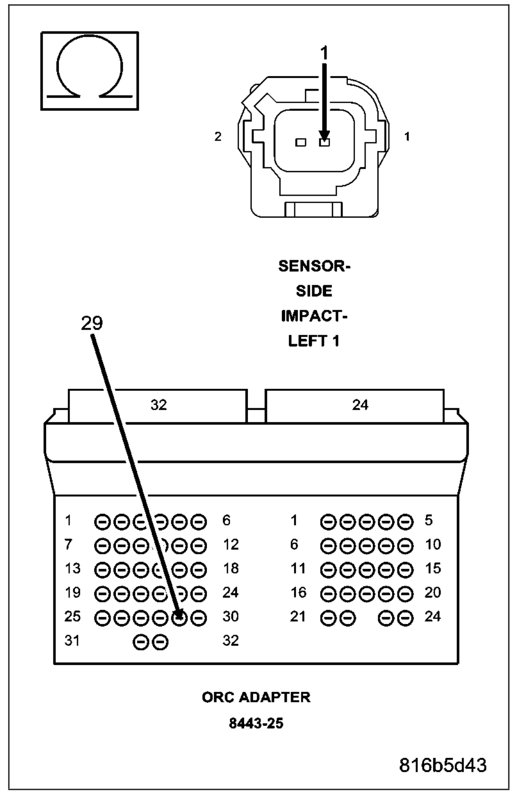
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R15) Left Side Impact Sensor 1 Ground circuit between the Left Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R15) Left Side Impact Sensor 1 Ground circuit for an open or high resistance.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



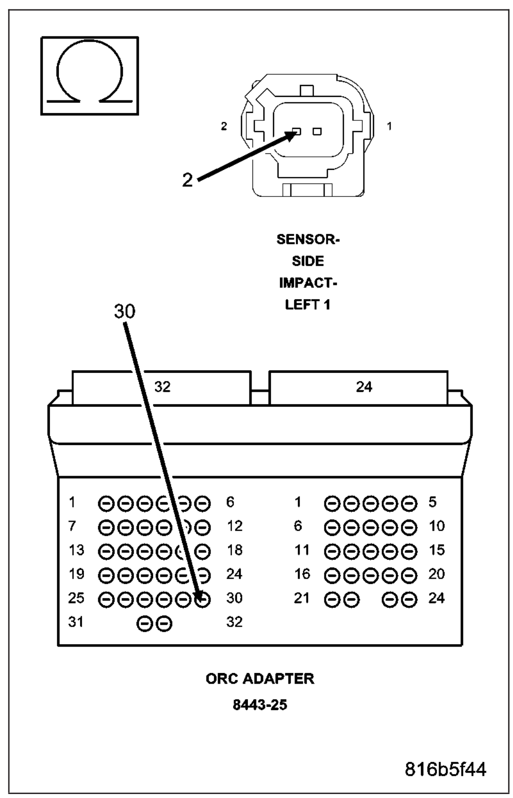
## 6. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R13) Left Side Impact Sensor 1 Signal circuit for an open or high resistance.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 7. CHECK THE LEFT SIDE IMPACT SENSOR 1 OPERATION

Replace the Left Side Impact Sensor 1 in accordance with the Service Information.

Remove any special tools or jumper wires and reconnect all previously disconnected components, except the battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, erase all Airbag System Module DTCs.

Turn the Ignition Off, wait 15 seconds, then turn the Ignition On. Wait one minute before proceeding.

With the scan tool, read active ORC DTCs.

**Does the scan tool display: LEFT SIDE IMPACT SENSOR 1 INTERNAL 1?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with Service Instructions.

Perform AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

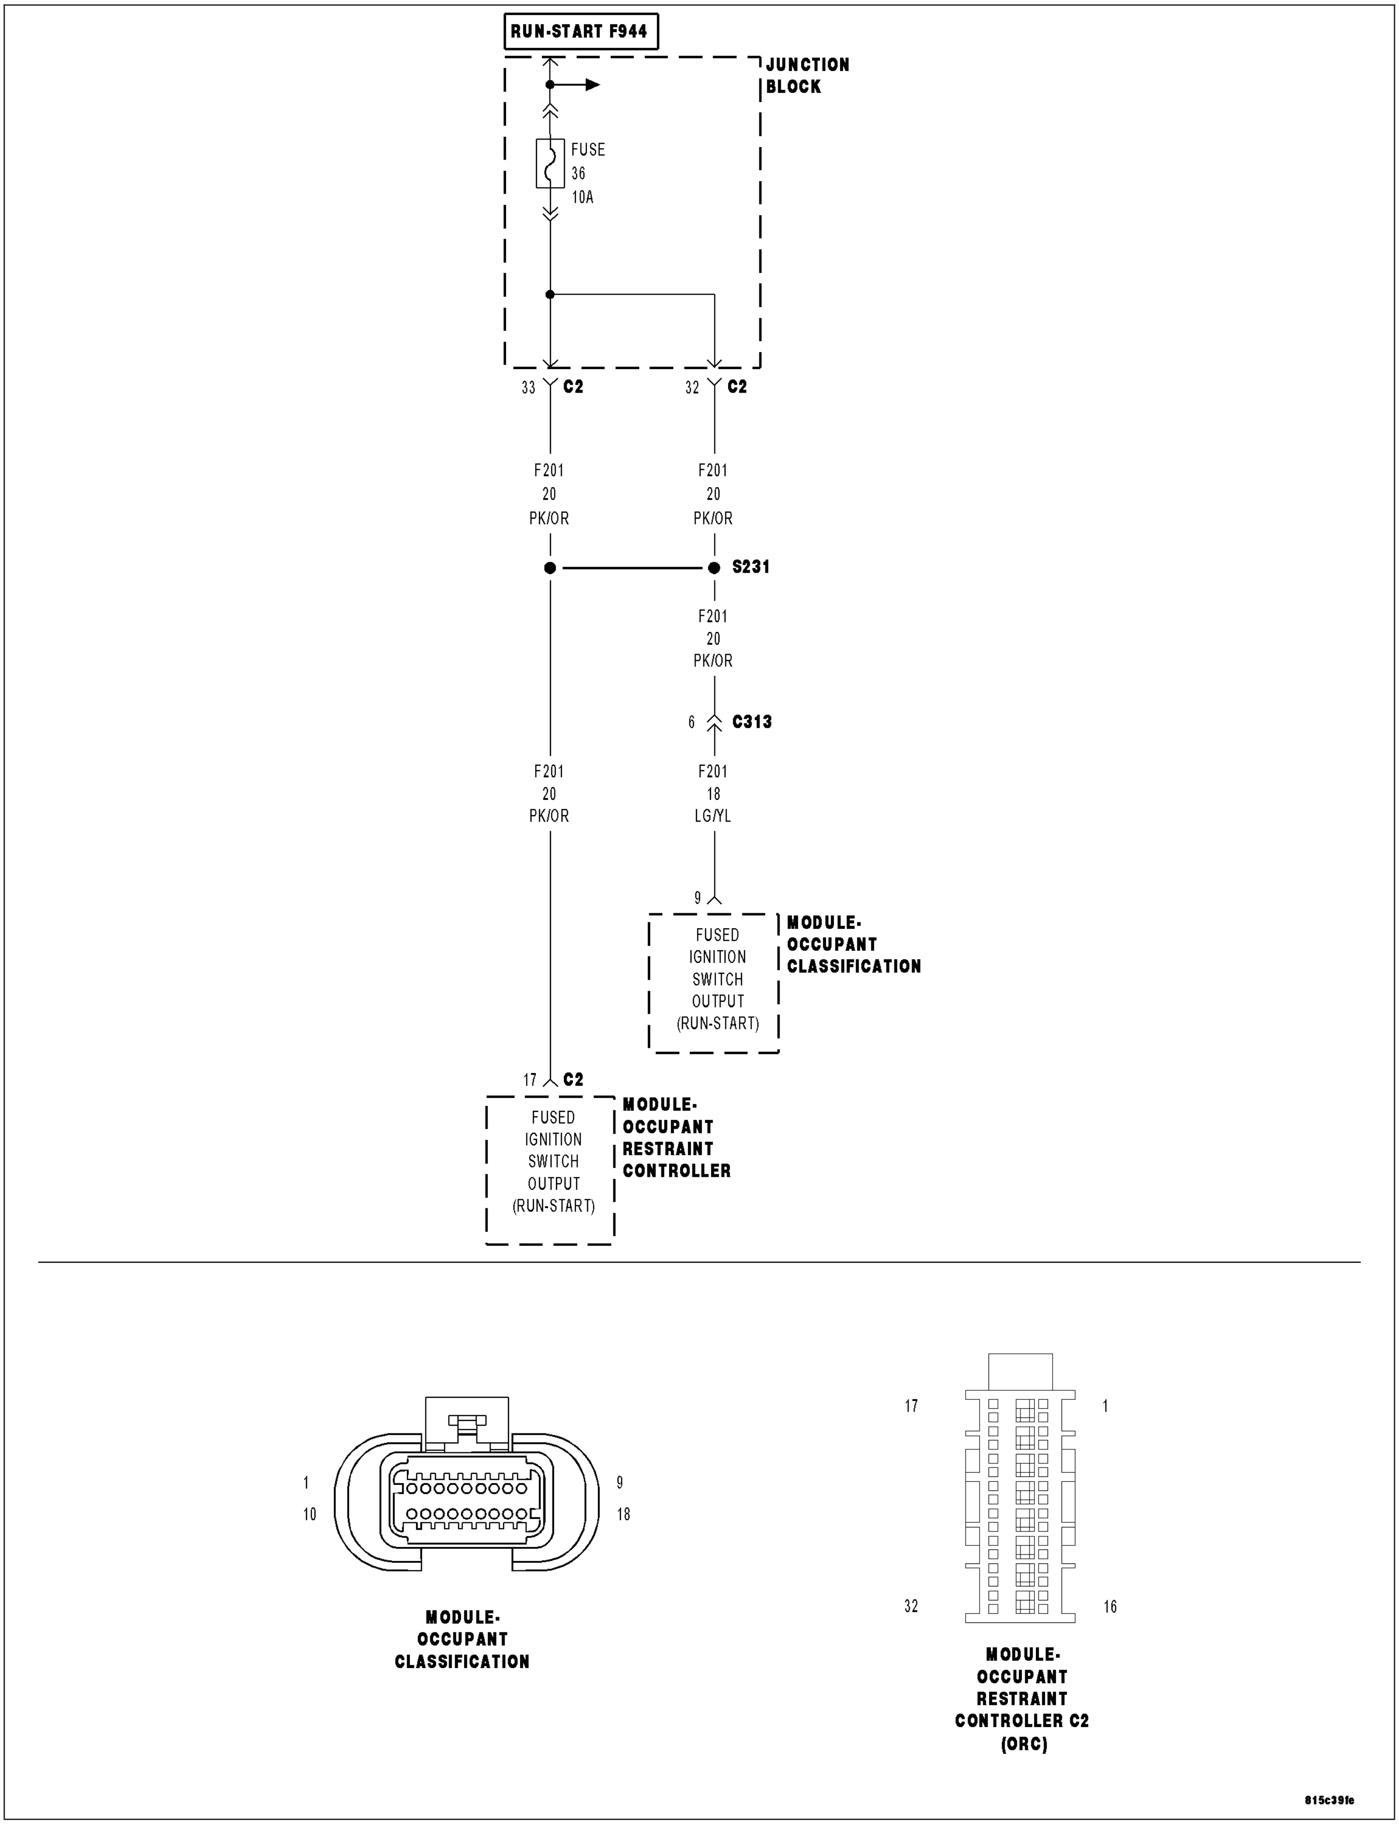
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## LOSS OF IGNITION RUN - START



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run-Start position.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage of the (F201) Fused Ignition Switch Output (Run-Start) circuit and will set this DTC if it drops below approximately 4.5 volts. Note: this condition will also cause a No Response from the Occupant Classification module (OCM).

| Possible Causes |
|---|
| (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) SHORTED TO GROUND |
| (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN |
| (F944) IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| JUNCTION BLOCK 36 AIRBAG RUN-START CIRCUIT FUSE OPEN |
| OCCUPANT CLASSIFICATION MODULE (OCM) |
| OCCUPANT RESTRAINT CONTROLLER (ORC) |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE ORC DTC**
Go To 2

**STORED ORC DTC**
Go To 10

### 2. CHECK THE AIRBAG RUN-START CIRCUIT FUSE

Turn the ignition off.

Remove and inspect the Airbag Run-Start circuit fuse.

**NOTE: Check connectors - Clean and repair as necessary.**

**Is the fuse open?**

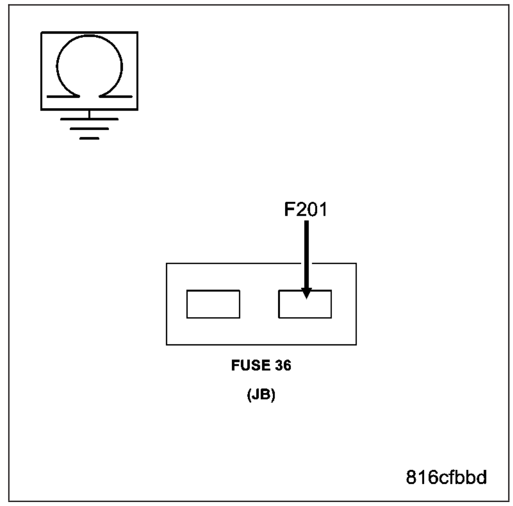
**Yes** >> Go To 3

**No** >> Go To 8

## 3. CHECK FOR A SHORTED (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit between ground and the Airbag Run-Start fuse terminal (output side).



**Is the resistance below 100.0 ohms?**

**Yes** >> Go To 4

**No** >> Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Replace the Airbag Run-Start circuit fuse.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING EQUIPMENT

**Is the vehicle equipped with an Occupant Classification System?**

**Yes** >> Go To 5

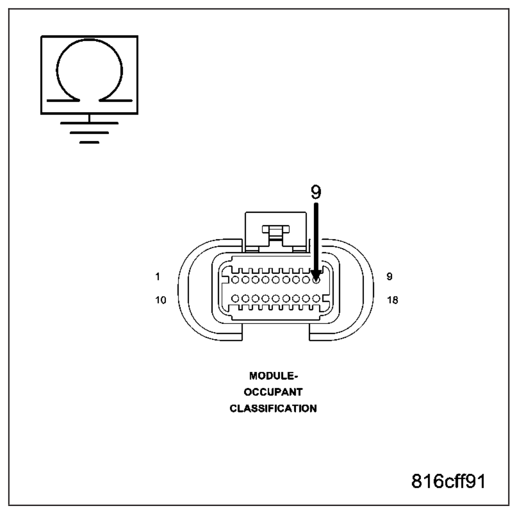
**No** >> Go To 6

## 5. CHECK THE OCCUPANT CLASSIFICATION MODULE (OCM) FOR A SHORT TO GROUND

Disconnect the OCM harness connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit between ground and the Airbag Run-Start fuse terminal (output side).



**Is the resistance below 100.0 ohms?**

**Yes** >> Go To 6

**No** >> Go To 7

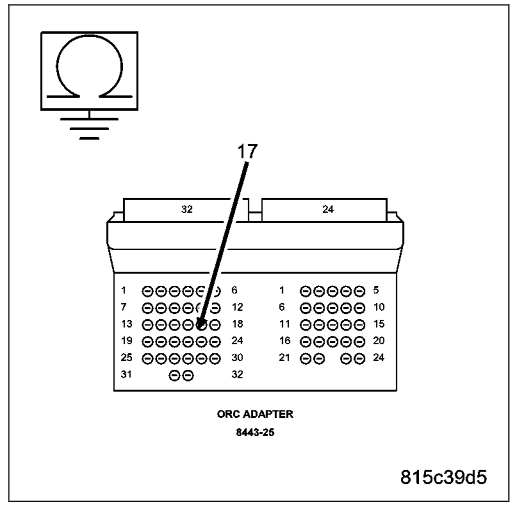
## 6. CHECK THE OCCUPANT RESTRAINT CONTROLLER (ORC) FOR A SHORT TO GROUND

Disconnect the ORC C1 and C2 connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the Load Tool ORC 8443–25 Adaptor to the ORC C2 connector.

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit.



***JB F201 OHM OUTPUT R ST***

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (F201) Fused Ignition Switch Output (Run-Start) circuit for a short to ground. Replace the Airbag Run-Start circuit fuse.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information. Replace the Airbag Run-Start circuit fuse.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 7. DETERMINE THE CORRECT REPAIR

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Determine the correct repair by verifying if the front passenger seat has a Bladder and Cushion Service Kit as follows:

- If possible, check the vehicle's repair history.
- The Service Kit wiring harness uses tamper resistant material on the harness connector. Inspect for the tamper resistant material on the harness connector.

**Does the seat have a Bladder and Cushion Service Kit?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

**Replace OCS Bladder and Cushion Kit in accordance with the Service information.**

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the OCM in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. CHECK THE (F944) IGNITION SWITCH OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition on.

Measure the voltage of the (F944) Ignition Switch Output circuit at the Airbag Run-Start circuit fuse terminal (input side).

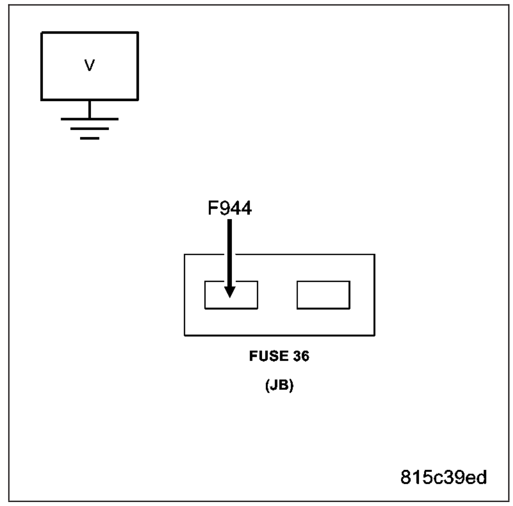
**NOTE: Reinstall the fuse after performing this test.**

**Is the voltage above 4.5 volts?**

**Yes** >> Go To 9

**No** >> Repair the (F944) Ignition Switch Output circuit for an open. Reinstall the Airbag Run-Start circuit fuse.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



***JB F944 VOLTS INPUT R ST***

## 9. CHECK THE (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the ORC C1 and C2 connector.

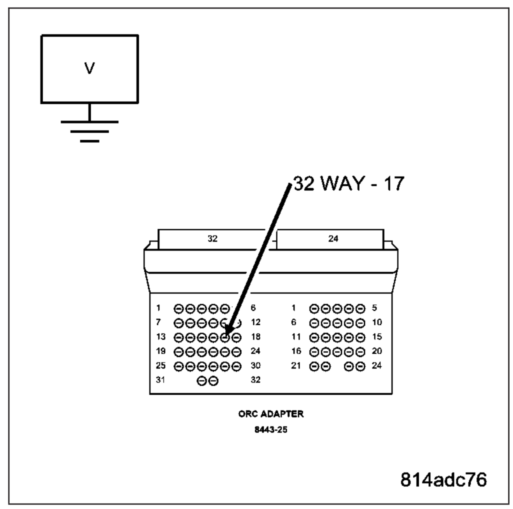
**NOTE: Check connectors - Clean and repair as necessary.**

**NOTE: If not done so previously, reinstall the Airbag Run-Start circuit fuse.**

Connect the appropriate Load Tool Adaptor to the ORC C2 connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Measure the voltage of the (F201) Fused Ignition Switch Output (Run-Start) Circuit.



**Is the voltage above 4.5 volts?**

**Yes** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: When reconnecting Airbag System components the Ignition must be turned off and the Battery must be disconnected.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair (F201) Fused Ignition Switch Output (Run-Start) circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 10. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

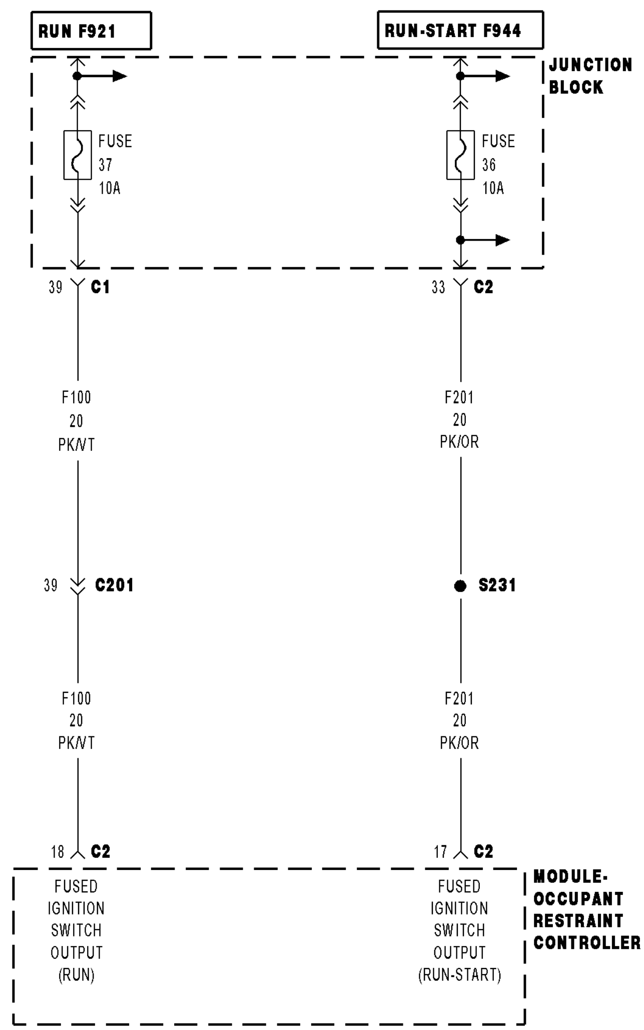
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

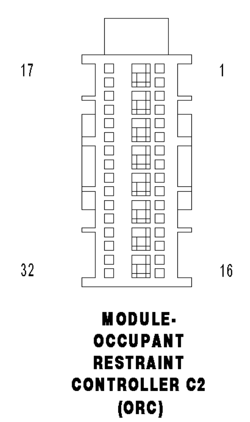
**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## LOSS OF IGNITION RUN ONLY





For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Run position.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage of the (F100) Fused Ignition Switch Output (Run) circuit and will set this DTC if it drops below approximately 6.0 volts.

| Possible Causes |
| --- |
| (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT SHORTED TO GROUND |
| IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN |
| (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN |
| AIRBAG RUN ONLY CIRCUIT FUSE OPEN |
| ORC, FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT SHORTED TO GROUND |
| ORC, FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 7

### 2. CHECK THE AIRBAG RUN ONLY CIRCUIT FUSE

Turn the ignition off.

Remove and inspect the Airbag Run Only circuit fuse.

**NOTE: Check connectors - Clean and repair as necessary.**

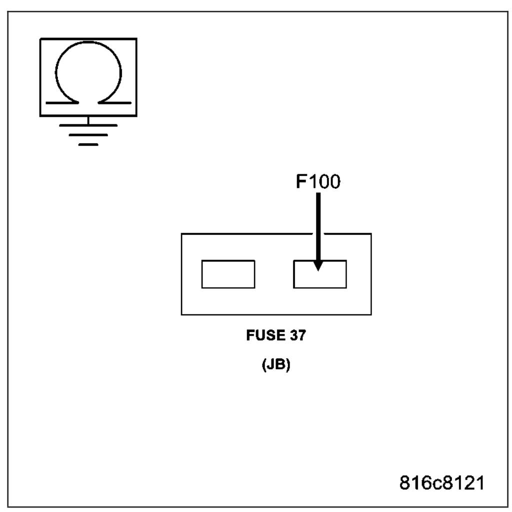
**Is the fuse open?**

**Yes** >> Go To 3

**No** >> Go To 5

### 3. CHECK THE (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT RESISTANCE

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Measure the resistance of the (F100) Fused Ignition Switch Output (Run) circuit between ground and the Airbag Run Only circuit fuse terminal (output side).

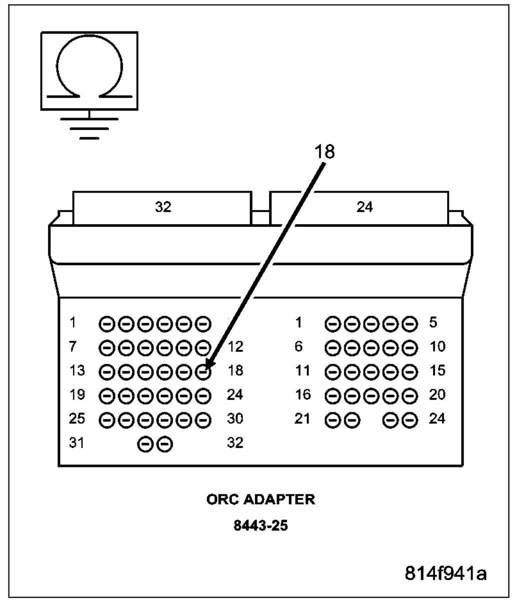


**Is the resistance below 100.0 ohms?**

**Yes** >> Go To 4

**No** >> Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Replace the Airbag Run Only circuit fuse.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK THE (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR A SHORT TO GROUND



Disconnect the ORC C2 connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the appropriate Load Tool Adaptor to the ORC C2 connector.

Measure the resistance of the (F100) Fused Ignition Switch Output (Run) circuit between ground and the ORC Adapter.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (F100) Fused Ignition Switch Output (Run) circuit for a short to ground. Replace the Airbag Run Only circuit fuse.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

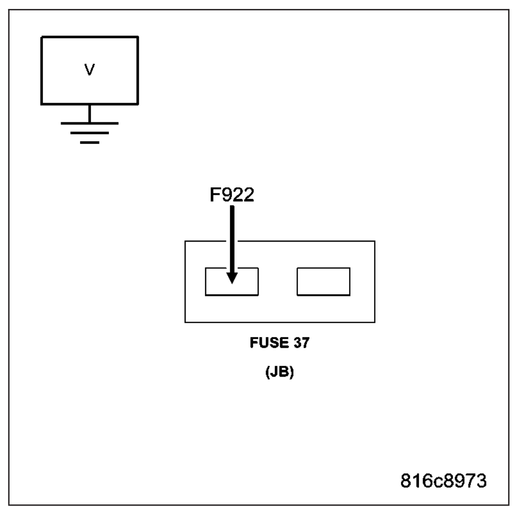
**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information. Replace the Airbag Run Only circuit fuse.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECK THE IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR AN OPEN



Turn the ignition on.

Measure the voltage of the Ignition Switch Output (Run) circuit at the Airbag Run Only circuit fuse terminal (input side).

**NOTE: Reinstall the fuse after performing this test.**

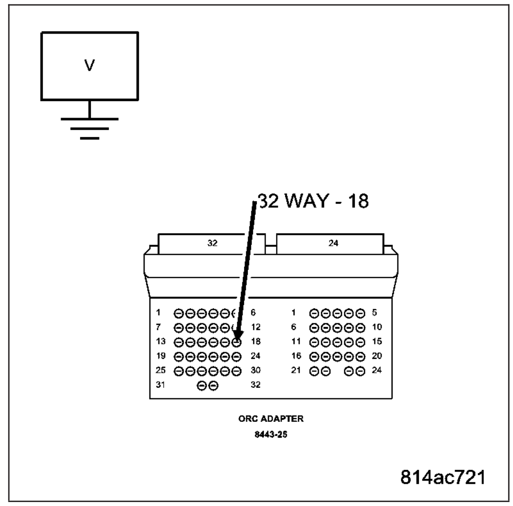
**Is the voltage above 6.0 volts?**

**Yes** >> Go To 6

**No** >> Repair the Ignition Switch Output Run circuit for an open. Reinstall the Airbag Run Only circuit fuse.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 6. CHECK THE (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR AN OPEN



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the ORC C2 connector.

**NOTE: Check connectors - Clean and repair as necessary.**

**NOTE: If not done so previously, reinstall the Airbag Run-Start circuit fuse.**
Connect the appropriate Load Tool Adapter to the ORC C2 connector.

**NOTE: If not done so previously, reinstall the Airbag Run Only circuit fuse.**

**WARNING: To avoid personal injury or death, turn the ignition on, then, reconnect the battery.**
Measure the voltage of the (F100) Fused Ignition Switch Output (Run) Only circuit.

**Is the voltage above 6.0 volts?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

Replace the ORC in accordance with the Service Information. Replace the Airbag Run Only circuit fuse.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (F23 Fused Ignition Switch Output (Run) circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 7. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

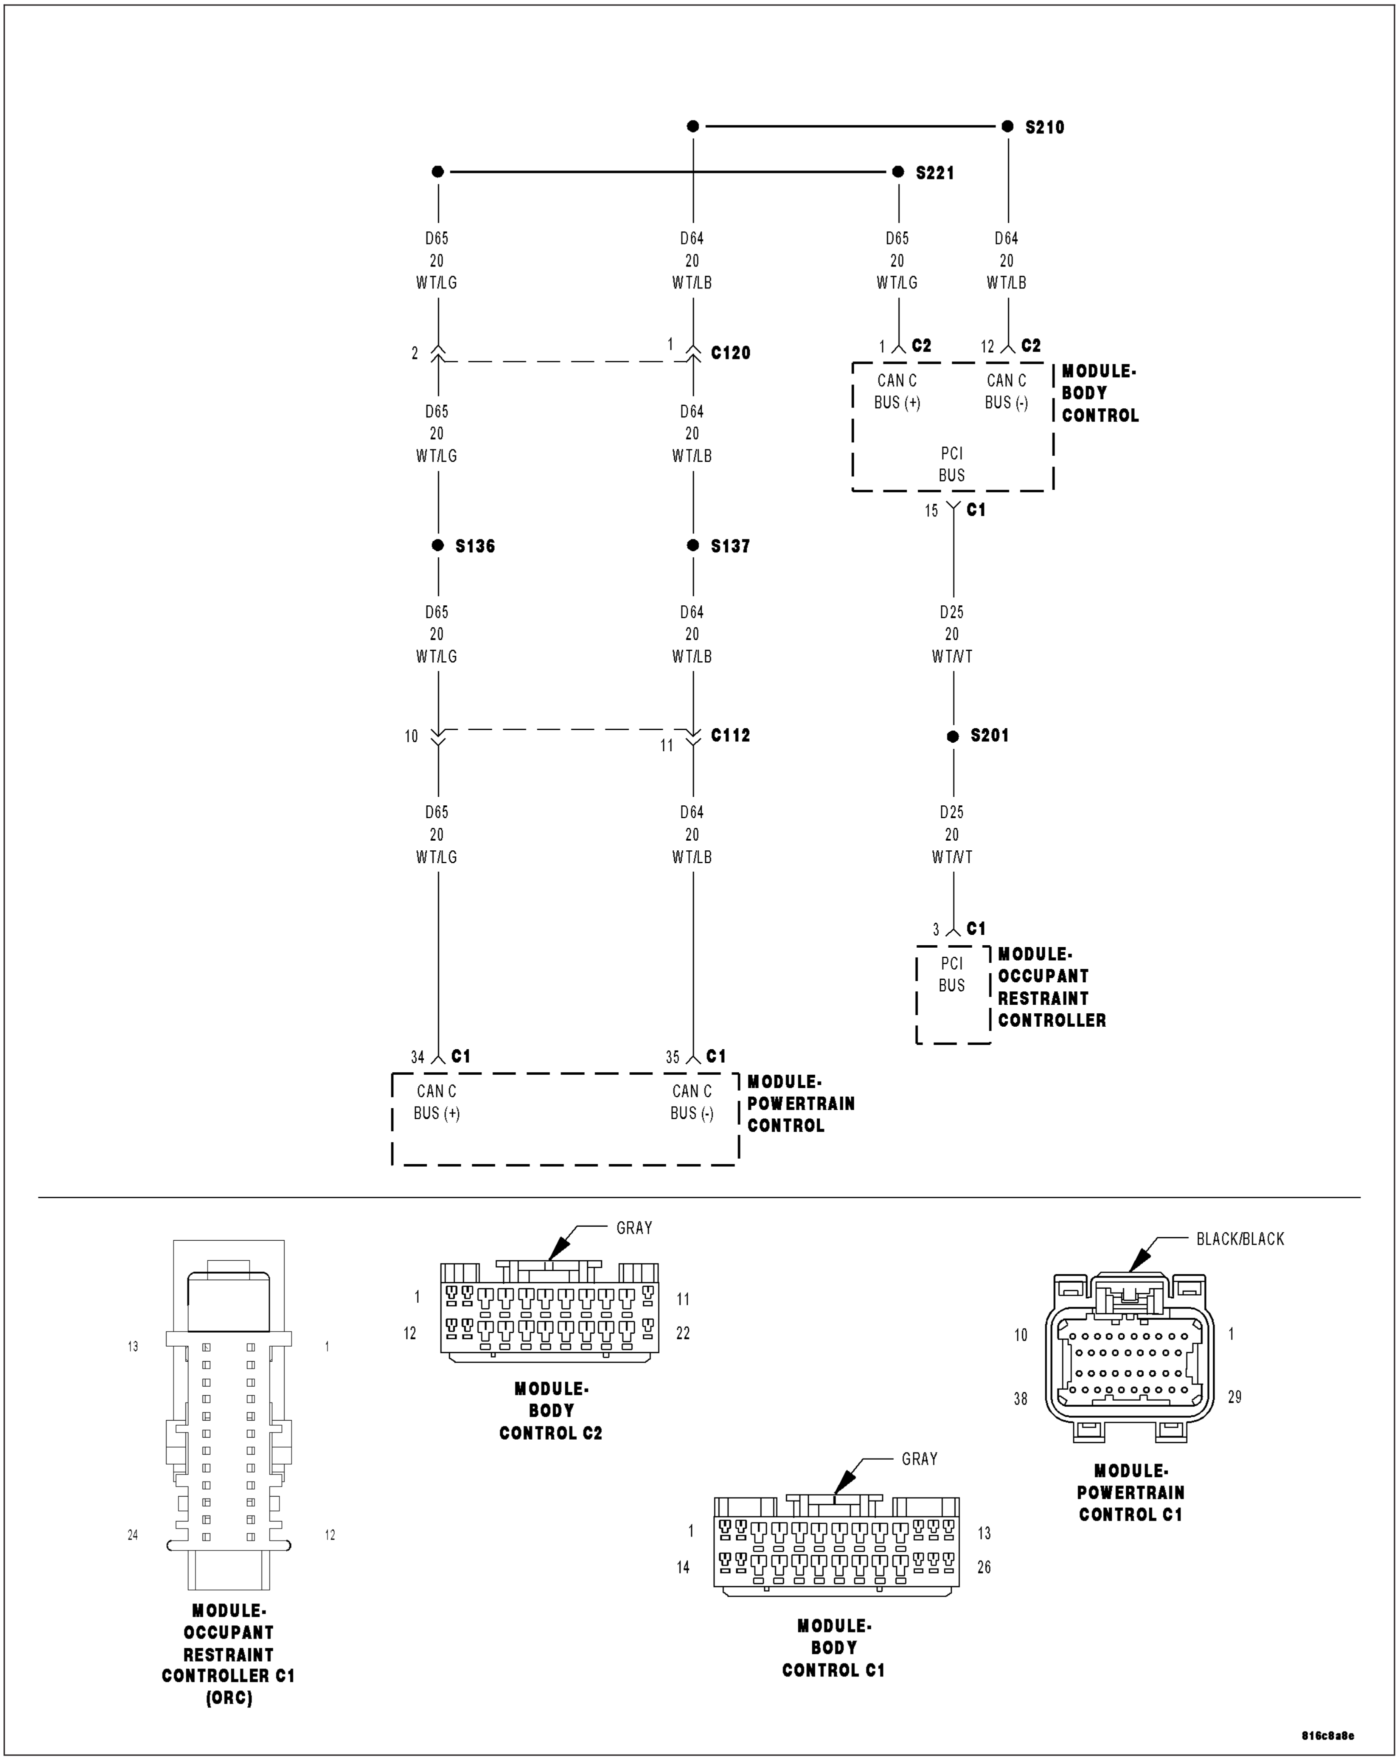
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## MISSING CURRENT VIN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During power-up.
- **Set Condition:**
  The Powertrain Control Module (PCM) broadcasts the current VIN on the Bus. The Occupant Restraint Controller (ORC) will set this DTC if the VIN stored in the ORC does not match the current VIN.

| Possible Causes |
|---|
| PCM COMMUNICATION FAILURE |
| PCM |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure the battery is fully charged.**
Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. VERIFY THAT THE PCM IS PROGRAMMED WITH THE CORRECT VIN

With the scan tool, select System Tests and select VIN Verification.

Compare the VIN displayed by the Scan Tool and the VIN on the Vehicle VIN plate.

**Does the current VIN match the VIN on the vehicle VIN plate?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Replace and program the PCM in accordance with the Service Information.
Perform POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

### 3. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC.

**Does the scan tool display any DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in the applicable section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## MODULE NOT CONFIGURED FOR OCS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Restraint Controller (ORC) is not configured for an Occupant Classification System (OCS) and it detects OCS messages on the Bus.

| Possible Causes |
|---|
| ORC |

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**STORED DTC**

Go To 2

#### 2. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC.

**Does the scan tool display any DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in the applicable section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## NO CLUSTER MESSAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Instrument Cluster (IC) broadcasts the airbag warning indicator status on the Bus. The Occupant Restraint Controller (ORC) expects this status message once every second. The ORC will set this DTC if it fails to receive this status message for 10 consecutive seconds.

| Possible Causes |
|---|
| MIC COMMUNICATION FAILURE |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. VERIFY THAT THE IC IS ACTIVE ON THE BUS

With the scan tool, attempt to communicate with the IC.

**Will the scan tool communicate with the IC?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the service information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic test procedures.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

### 3. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC.

**Does the scan tool display any DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in the applicable section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## NO LEFT FRONT IMPACT SENSOR COMMUNICATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Occupant Restraint Controller (ORC) supplies power to and communicates continuously with each impact sensor via each sensor’s signal circuit.
- **Set Condition:**
  The ORC will set this DTC if it is unable to either establish or maintain communication with the Left Front Impact Sensor.

| Possible Causes |
|---|
| LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE |
| LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND |
| LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO LEFT FRONT IMPACT SENSOR GROUND CIRCUIT |
| LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT OPEN |
| LEFT FRONT IMPACT SENSOR GROUND CIRCUIT OPEN |
| LEFT FRONT IMPACT SENSOR |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 8

### 2. CHECK THE LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Occupant Restraint Controller (ORC) connector(s).

Disconnect the Left Front Impact Sensor connector.

**NOTE: Check connectors - Clean and repair as necessary.**

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Measure the voltage of the Left Front Impact Sensor Signal circuit between the Left Front Impact Sensor connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the Left Front Impact Sensor Signal circuit for a short to voltage.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the Left Front Impact Sensor Signal circuit between ground and the Left Front Impact Sensor connector.

**Is the resistance below 100k ohms?**

**Yes** >> Repair the Left Front Impact Sensor Signal circuit for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. CHECK THE LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE LEFT FRONT IMPACT SENSOR GROUND CIRCUIT

Measure the resistance between the Left Front Impact Sensor Signal circuit and the Left Front Impact Sensor Ground circuit at the Left Front Impact Sensor connector.

**Is the resistance below 100k ohms?**

**Yes** >> Repair the Left Front Impact Sensor Signal circuit for a short to the Left Front Impact Sensor Ground circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. CHECK THE LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN

Connect the appropriate Load Tool Adaptor to the ORC connector.

Measure the resistance of the Left Front Impact Sensor Signal circuit between the Left Front Impact Sensor connector and the Airbag Load Tool adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the Left Front Impact Sensor Signal circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 6. CHECK THE LEFT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the Left Front Impact Sensor Ground circuit between the Left Front Impact Sensor connector and the Airbag Load Tool adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 7

**No** >> Repair the Left Front Impact Sensor Ground circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 7. REPLACE THE LEFT FRONT IMPACT SENSOR AND THEN CHECK FOR ACTIVE DTCs

Replace the Left Front Impact Sensor in accordance with the Service Information.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, erase all DTCs in all Restraint System Modules.

Turn the Ignition off, wait 15 seconds, then turn the Ignition on.

Wait one minute before proceeding.

With the scan tool, read active ORC DTCs.

**Does the scan tool display: NO LEFT FRONT IMPACT SENSOR COMMUNICATION?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service information.

Perform AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. TEST FOR AN INTERMITTENT CONDITION

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

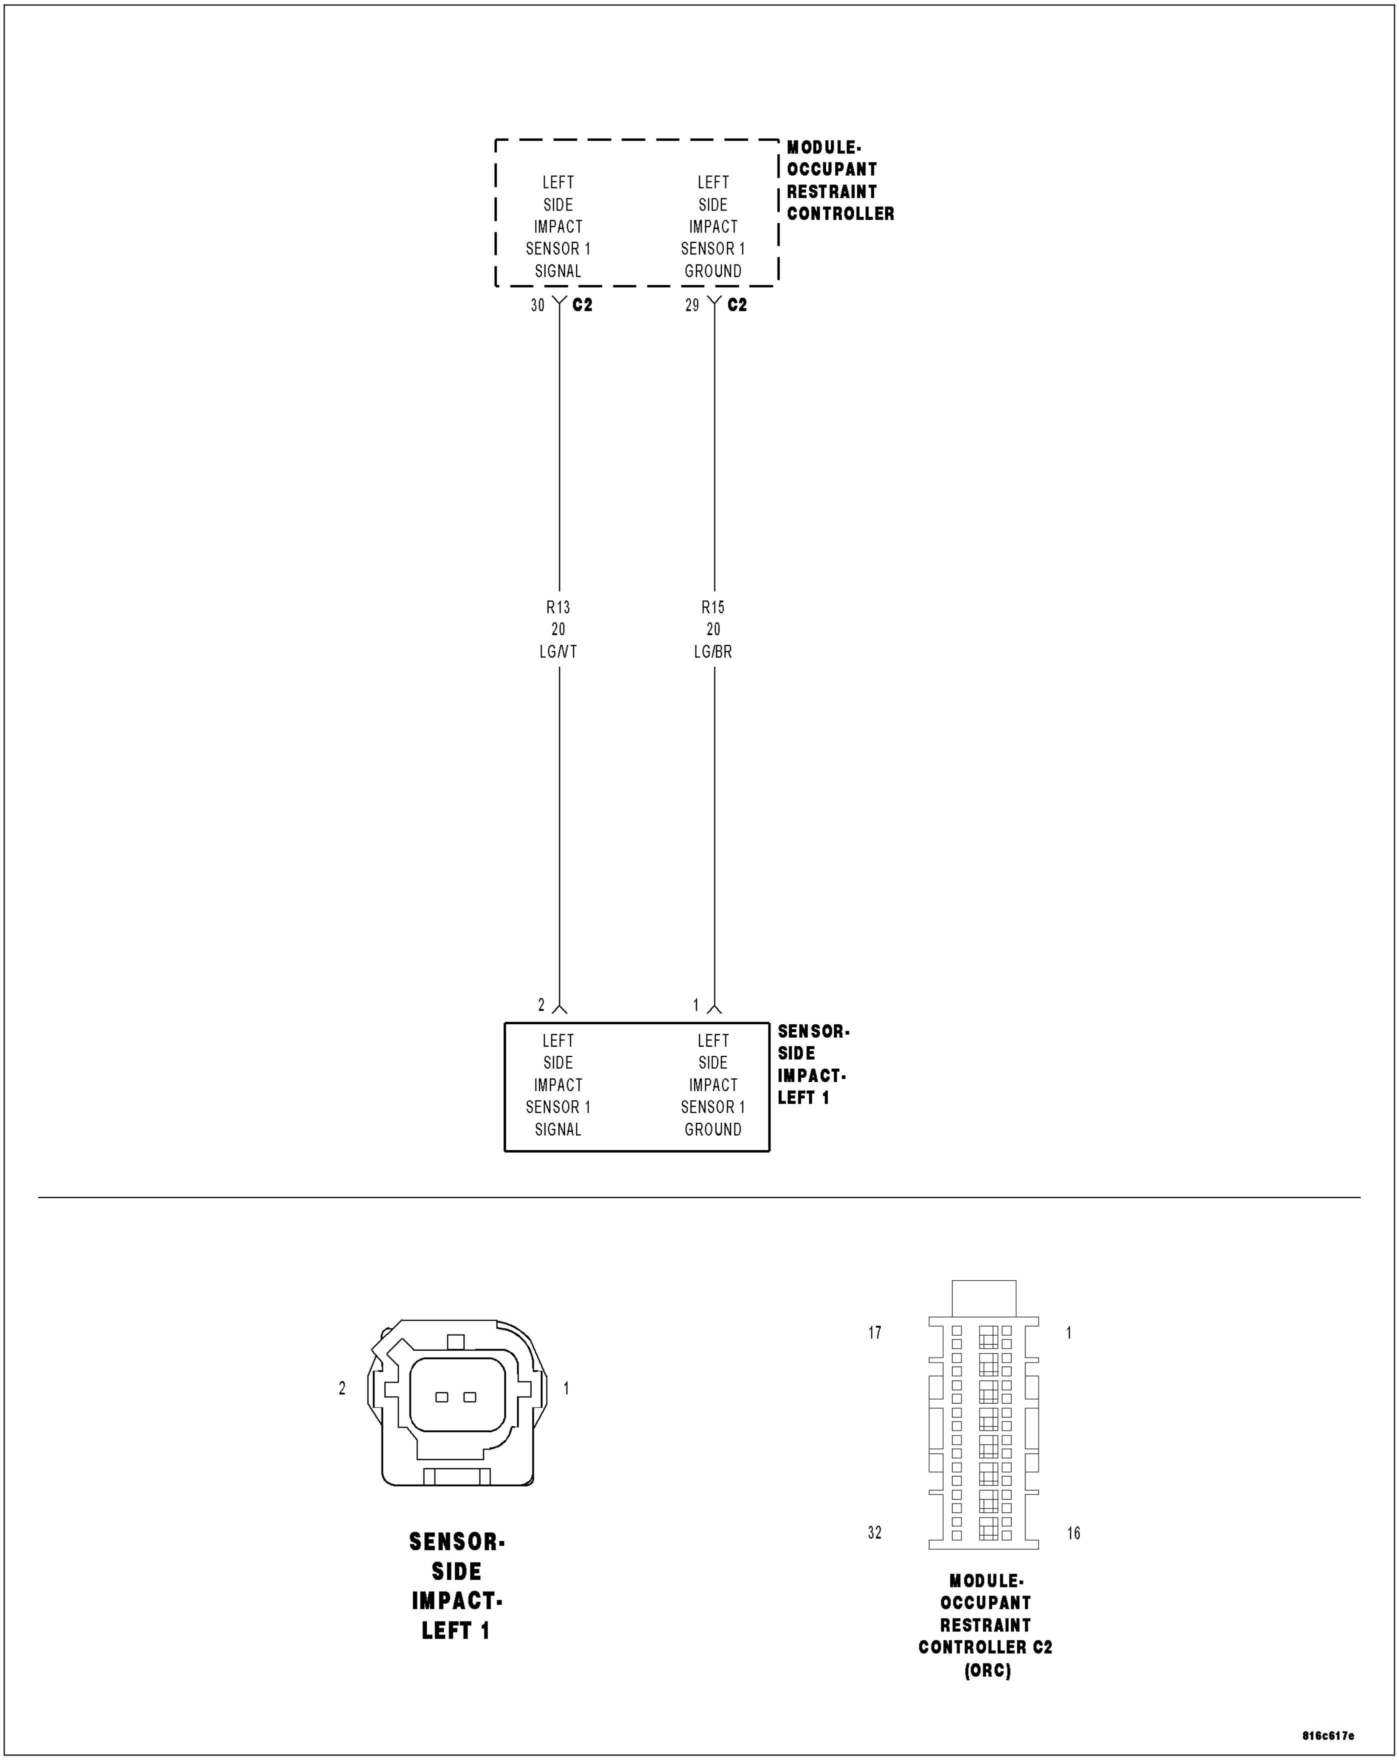
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## NO LEFT SIDE IMPACT SENSOR 1 COMMUNICATION



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Occupant Restraint Controller (ORC) supplies power to and communicates continuously with each impact sensor via each sensor's signal circuit.
- **Set Condition:**
  The ORC will set this DTC if it is unable to either establish or maintain communication with the Left Side Impact Sensor.

| Possible Causes |
|---|
| (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO BATTERY |
| (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND |
| (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT |
| (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN |
| (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN |
| LEFT SIDE IMPACT SENSOR 1 |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 8

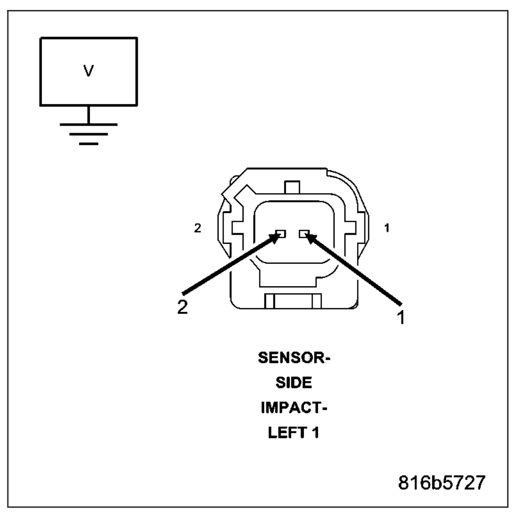
### 2. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT AND THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR A SHORT TO BATTERY

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Left side Impact Sensor 1 connector.

Disconnect the ORC connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 connector and ground.

Measure the voltage of the (R15) Left Side Impact Sensor 1 Ground circuit between the Left Side Impact Sensor 1 connector and ground.



**Is there any voltage present on either circuit?**

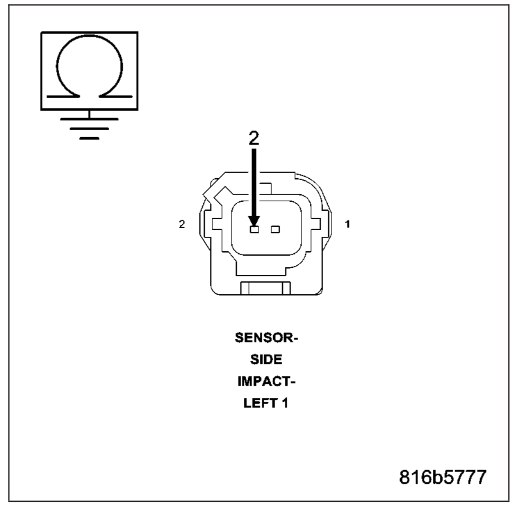
**Yes** >> Repair the circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between ground and the Left Side Impact Sensor 1 connector.



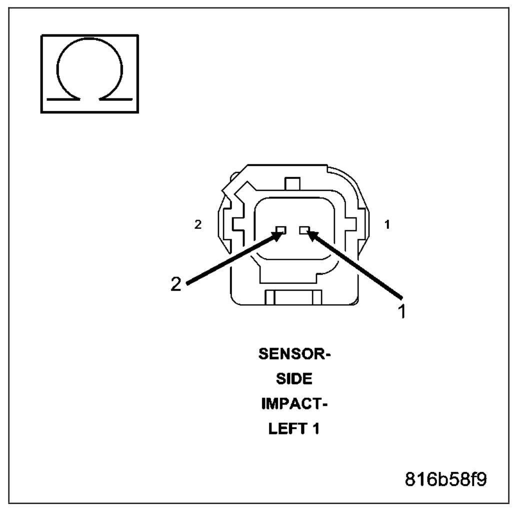
**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R13) Left Side Impact Sensor 1 Signal circuit for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT

Measure the resistance between the (R13) Left Side Impact Sensor 1 Signal circuit and the (R15) Left Side Impact Sensor 1 Ground circuit at the Left Side Impact Sensor 1 connector.



**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R13) Left Side Impact Sensor 1 Signal circuit for the (R15) Left Side Impact Sensor 1 Ground circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. CHECK THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

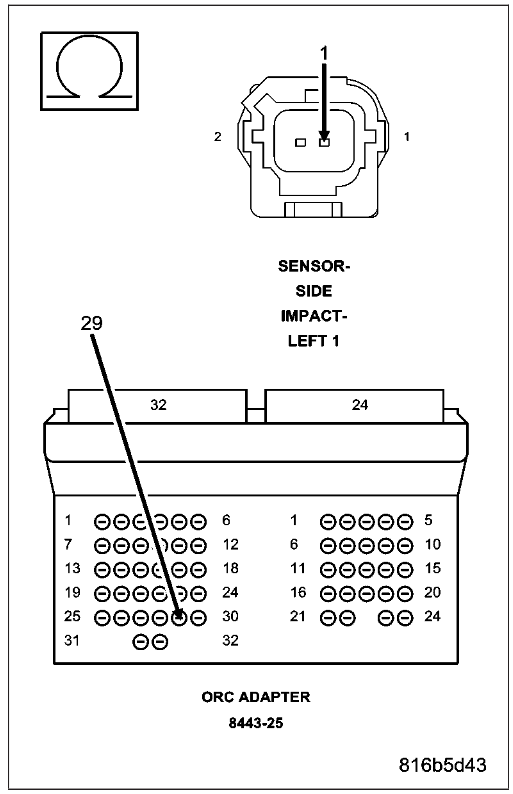
Connect the 8443 Load Tool ORC Adaptor to the Occupant Controller Module connector.

Measure the resistance of the (R15) Left Side Impact Sensor 1 Ground circuit between the Left Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R15) Left Side Impact Sensor 1 Ground circuit for an open or high resistance.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



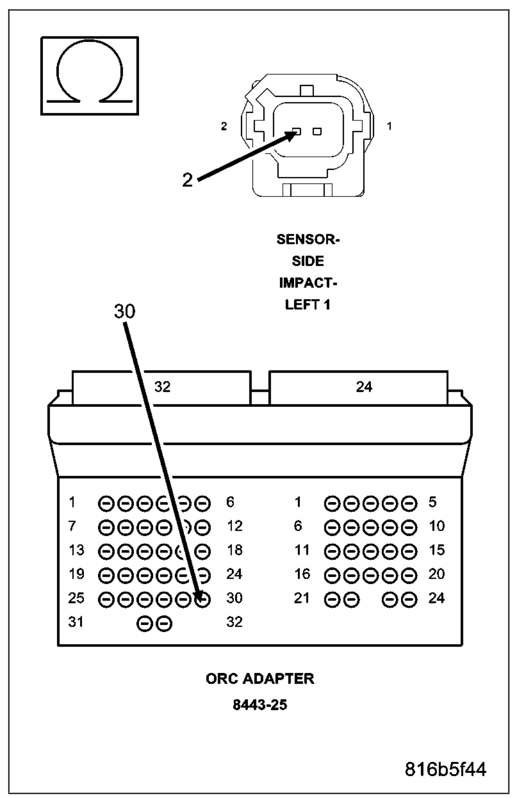
## 6. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R13) Left Side Impact Sensor 1 Signal circuit for an open or high resistance.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 7. CHECK THE LEFT SIDE IMPACT SENSOR 1 OPERATION

Replace the Left Side Impact Sensor 1 in accordance with the Service Information.

Remove any special tools or jumper wires and reconnect all previously disconnected components, except the battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, erase all Airbag System Module DTCs.

Turn the Ignition Off, wait 15 seconds, then turn the Ignition On. Wait one minute before proceeding.

With the scan tool, read active ORC DTCs.

**Does the scan tool display: NO LEFT SIDE IMPACT SENSOR 1 COMMUNICATION?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with Service Instructions.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## NO ORC MESSAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) broadcasts messages on the Bus that provide data to the Occupant Classification Module (OCM). The OCM will set this DTC if it does not receive a valid message from the ORC within 3 consecutive seconds.

| Possible Causes |
|---|
| ORC COMMUNICATION FAILURE |
| OCM |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. VERIFY THAT THE ORC IS ACTIVE ON THE BUS

With the scan tool, attempt communications with the ORC.

**Will the scan tool communicate with the ORC?**

**Yes** >> Go To 3

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the No Response From ORC diagnostic test procedure.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

### 3. DETERMINE THE CORRECT REPAIR

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**
Determine the correct repair by verifying if the front passenger seat has a Bladder and Cushion Service Kit as follows:

- If possible, check the vehicle's repair history.
- The Service Kit wiring harness uses tamper resistant material on the harness connector. Inspect for the tamper resistant material on the harness connector.

**Does the seat have a Bladder and Cushion Service Kit?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the OCM in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: When disconnecting or connecting airbag system components, the ignition must be turned off and the battery must be disconnected.**

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. INSPECT THE OCCUPANT RESTRAINT AND BODY SYSTEM WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

**Are any of these conditions present?**

**Yes** >> Repair as necessary in accordance with the Service Information.

**No** >> Go To 6

## 6. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question.

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## NO PCI LOOPBACK

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) broadcasts messages on the Bus. The ORC on-board diagnostic monitors the Bus for valid ORC messages. The ORC will set this DTC immediately if it fails to detect valid ORC messages on the Bus. NOTE: Any Bus Failure may cause a stored code to set.

| Possible Causes |
| --- |
| OCCUPANT RESTRAINT CONTROLLER (ORC) |

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**STORED DTC**

Go To 2

#### 2. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of Airbag System diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC.

**Does the scan tool display any DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## NO PCI TRANSMISSION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) broadcasts messages on the Bus. The ORC on-board diagnostic monitors the Bus for valid ORC messages. The ORC will set this DTC immediately if it fails to detect valid ORC messages on the Bus. NOTE: Any Bus Failure may cause a stored code to set.

| Possible Causes |
| --- |
| OCCUPANT RESTRAINT CONTROLLER (ORC) |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**STORED DTC**

Go To 2

### 2. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of Airbag System diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC.

**Does the scan tool display any DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## NO RIGHT FRONT IMPACT SENSOR COMMUNICATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Occupant Restraint Controller (ORC) supplies power to and communicates continuously with each impact sensor via each sensor's signal circuit.
- **Set Condition:**
  The ORC will set this DTC if it is unable to either establish or maintain communication with the Right Front Impact Sensor.

| Possible Causes |
|---|
| RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE |
| RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND |
| RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT |
| RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT OPEN |
| RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT OPEN |
| RIGHT FRONT IMPACT SENSOR |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 8

### 2. CHECK THE RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Occupant Restraint Controller (ORC) connector(s).

Disconnect the Right Front Impact Sensor connector.

**NOTE: Check connectors - Clean and repair as necessary.**

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the Right Front Impact Sensor Signal circuit between the Right Front Impact Sensor connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the Right Front Impact Sensor Signal circuit for a short to voltage.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the Right Front Impact Sensor Signal circuit between ground and the Right Front Impact Sensor connector.

**Is the resistance below 100k ohms?**

**Yes** >> Repair the Right Front Impact Sensor Signal circuit for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. CHECK THE RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT

Measure the resistance between the Right Front Impact Sensor Signal circuit and the Right Front Impact Sensor Ground circuit at the Right Front Impact Sensor connector.

**Is the resistance below 100k ohms?**

**Yes** >> Repair the Right Front Impact Sensor Signal circuit for a short to the Right Front Impact Sensor Ground circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. CHECK THE RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN

Connect the appropriate Load Tool Adaptor to the ORC connector.

Measure the resistance of the Right Front Impact Sensor Signal circuit between the Right Front Impact Sensor connector and the Airbag Load Tool adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the Right Front Impact Sensor Signal circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 6. CHECK THE RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the Right Front Impact Sensor Ground circuit between the Right Front Impact Sensor connector and the Airbag Load Tool adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 7

**No** >> Repair the Right Front Impact Sensor Ground circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 7. REPLACE THE RIGHT FRONT IMPACT SENSOR AND THEN CHECK FOR ACTIVE DTCs

Replace the Right Front Impact Sensor in accordance with the Service Information.

Remove any special tools or jumper wires and reconnect all previously disconnected components, except the battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, erase all DTCs in all Airbag System Modules.

Turn the Ignition off, wait 15 seconds, then turn the Ignition on.

Wait one minute before proceeding.

With the scan tool, read active ORC DTCs.

**Does the scan tool display: NO RIGHT FRONT IMPACT SENSOR COMMUNICATION?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. TEST FOR AN INTERMITTENT CONDITION

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

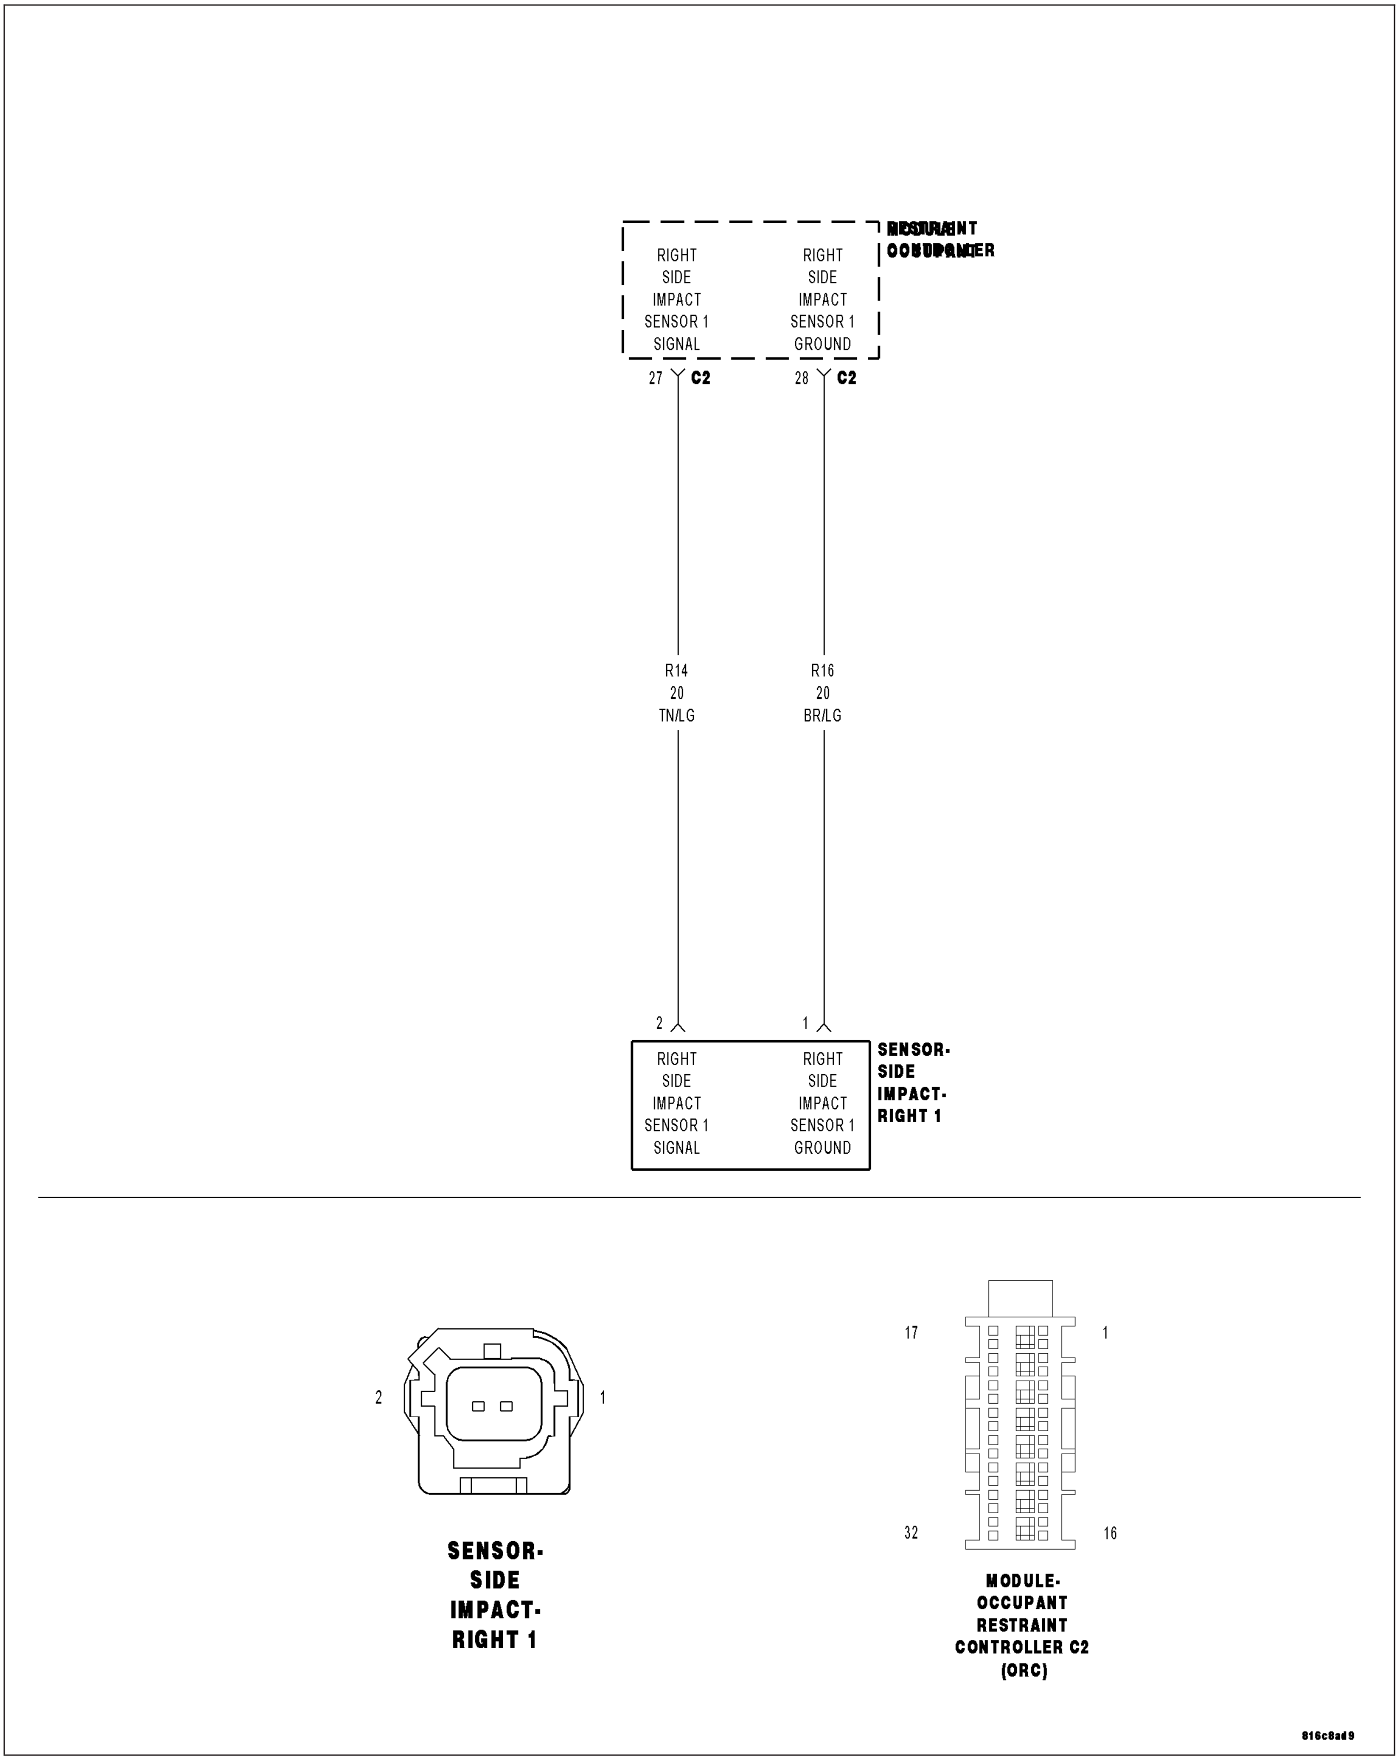
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## NO RIGHT SIDE IMPACT SENSOR 1 COMMUNICATION



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Occupant Restraint Controller (ORC) supplies power to and communicates continuously with each impact sensor via each sensor's signal circuit.
- **Set Condition:**
  The ORC will set this DTC if it is unable to either establish or maintain communication with the Right Side Impact Sensor.

| Possible Causes |
| --- |
| (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO BATTERY |
| (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND |
| (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT |
| (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN |
| (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN |
| RIGHT SIDE IMPACT SENSOR 1 |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 8

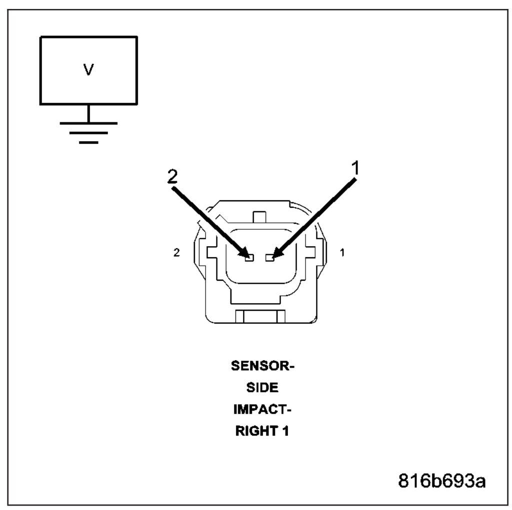
### 2. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT AND THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR A SHORT TO BATTERY

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Right side Impact Sensor 1 connector.

Disconnect the ORC connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the (R14) Right Side Impact Sensor 1 Signal circuit between the Right Side Impact Sensor 1 connector and ground.

Measure the voltage of the (R16) Right Side Impact Sensor 1 Ground circuit between the Right Side Impact Sensor 1 connector and ground.



**Is there any voltage present on either circuit?**

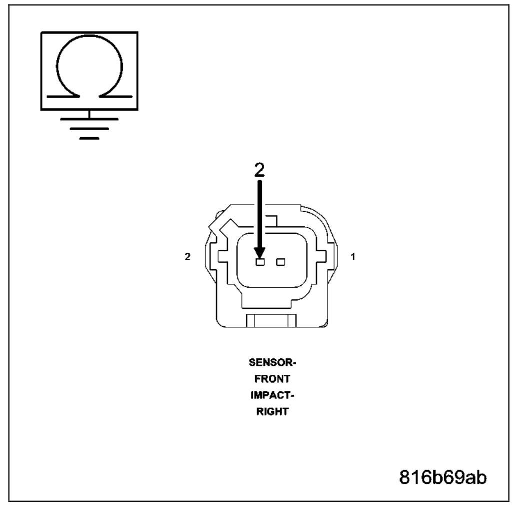
**Yes** >> Repair the circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between ground and the Right Side Impact Sensor 1 connector.



**Is the resistance below 100K ohms?**

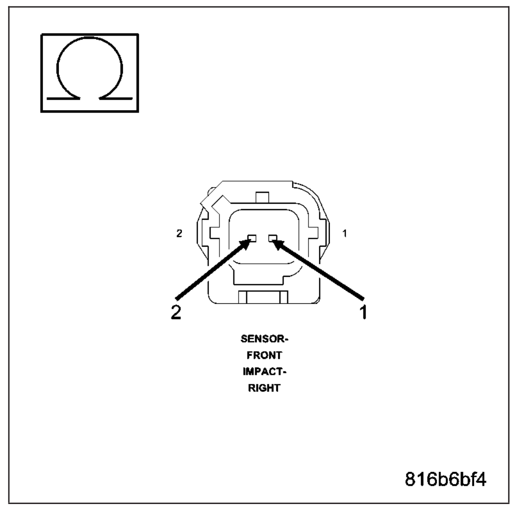
**Yes** >> Repair the (R14) Right Side Impact Sensor 1 Signal circuit for a short to ground.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT

Measure the resistance between the (R14) Right Side Impact Sensor 1 Signal circuit and the (R16) Right Side Impact Sensor 1 Ground circuit at the Right Side Impact Sensor 1 connector.



**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R14) Right Side Impact Sensor 1 Signal circuit for a short to the (R16) Right Side Impact Sensor 1 Ground circuit.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. CHECK THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

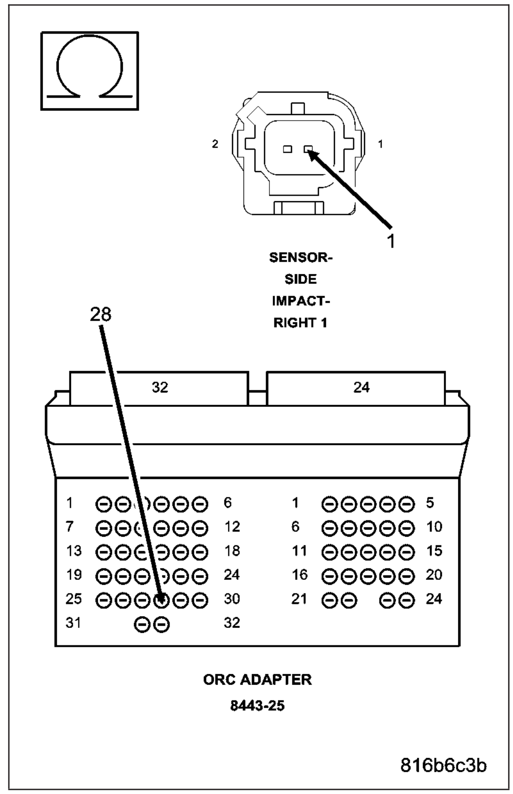
Connect the 8443 Load Tool ORC Adaptor to the Occupant Control Module connector.

Measure the resistance of the (R16) Right Side Impact Sensor 1 Ground circuit between the Right Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R16) Right Side Impact Sensor 1 Ground circuit for an open or high resistance.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



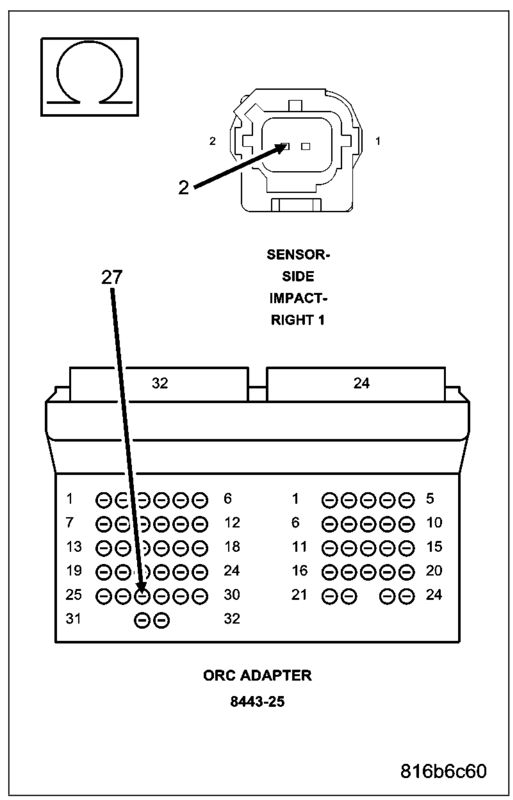
## 6. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the Right Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R14) Right Side Impact Sensor 1 Signal circuit for an open or high resistance.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 7. CHECK THE RIGHT SIDE IMPACT SENSOR 1 OPERATION

Replace the Right Side Impact Sensor 1 in accordance with the Service Information.

Remove any special tools or jumper wires and reconnect all previously disconnected components, except the battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, erase all Airbag System Module DTCs.

Turn the Ignition Off, wait 15 seconds, then turn the Ignition On. Wait one minute before proceeding.

With the scan tool, read active ORC DTCs.

**Does the scan tool display: NO RIGHT SIDE IMPACT SENSOR 1 COMMUNICATION?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with Service Instructions.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

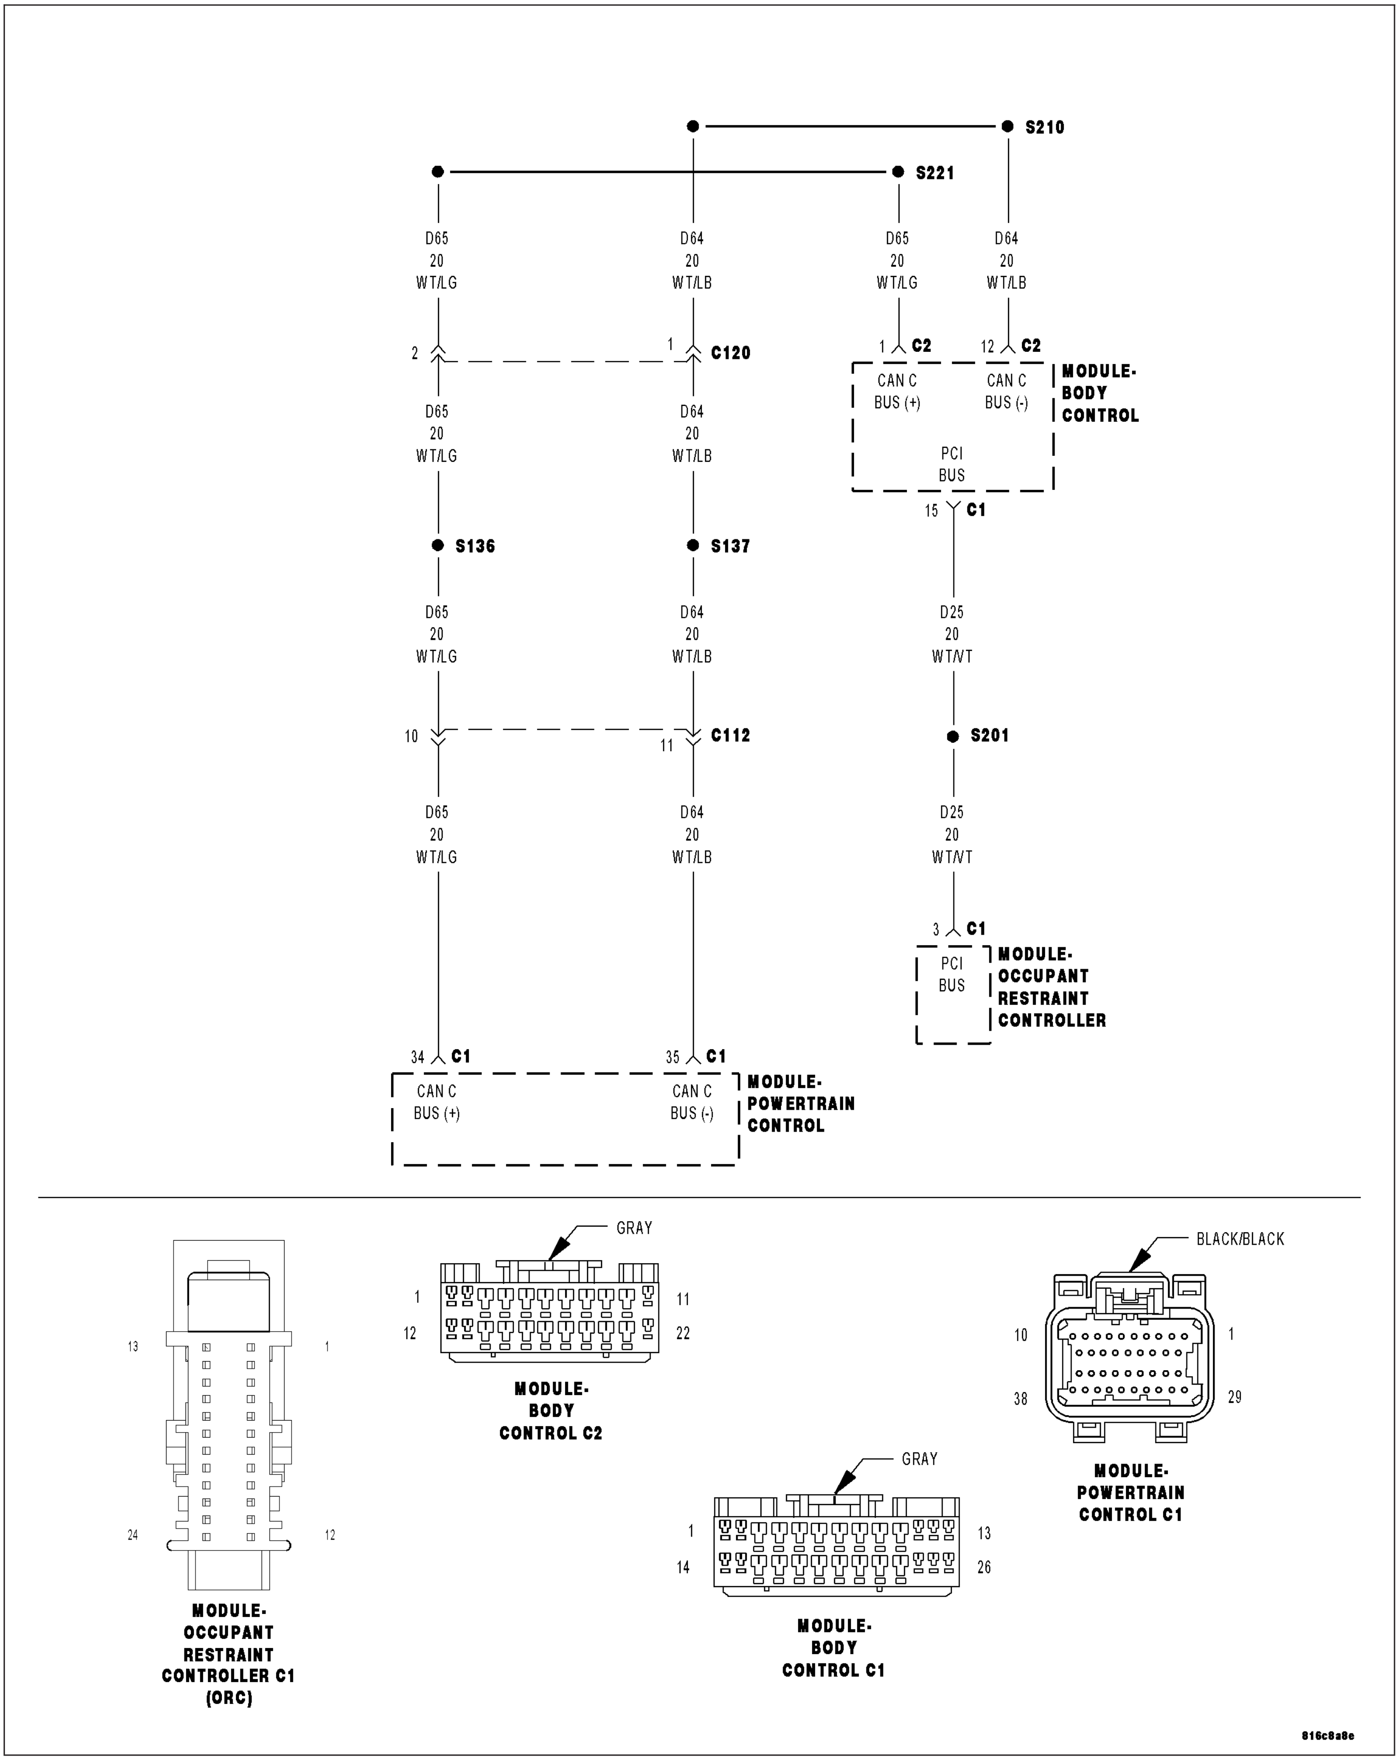
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## OCM CONFIGURATION MISMATCH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the Bus for the Occupant Classification Module (OCM) messages and then compares the messages to the known configuration. The ORC will set this DTC if it is not configured for Passenger Only OCM and OCM messages are broadcast on the Bus.

| Possible Causes |
|---|
| PCM |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. VERIFY THAT THE PCM IS PROGRAMMED WITH THE CORRECT VIN

With the scan tool, select System Tests and select VIN Verification.

Compare the VIN displayed by the scan tool and the VIN on the Vehicle VIN plate.

**Does the current VIN match the VIN on the vehicle VIN plate?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Replace and program the PCM in accordance with the Service Information.
Perform POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

### 3. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC.

**Does the scan tool display any DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## OCCUPANT CLASSIFICATION MODULE DATA TRANSFER ERROR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Upon validating the VIN, the Occupant Classification Module (OCM) sends seat calibration data to the Occupant Restraint Controller (ORC). In turn, the ORC transmits this data back to the OCM. This provides a means for the OCM to verify that the ORC received the calibration data correctly. The OCM will set this DTC if it fails to receive the data back correctly from the ORC.

| Possible Causes |
|---|
| ORC COMMUNICATION FAILURE |
| OCM |

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**CAUTION: Repair all other active OCM and ORC DTCs before proceeding with this test. Refer to the Table Of Contents in this Section for a complete list of airbag system diagnostic procedures.**

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

#### 2. VERIFY THAT THE ORC IS ACTIVE ON THE BUS

With the scan tool, attempt to communication with the ORC.

**Will the scan tool communicate with the ORC?**

**Yes** >> Go To 3

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the No Response From ORC diagnostic test procedure.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

#### 3. DETERMINE THE CORRECT REPAIR

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Determine the correct repair by verifying if the front passenger seat has a Bladder and Cushion Service Kit as follows:

- If possible, check the vehicle's repair history.
- The Service Kit wiring harness uses tamper resistant material on the harness connector. Inspect for the tamper resistant material on the harness connector.

**Does the seat have a Bladder and Cushion Service Kit?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the OCM in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase the ORC and OCM DTCs.

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. INSPECT THE OCCUPANT RESTRAINT AND BODY SYSTEM WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

**Are any of these conditions present?**

**Yes** >> Repair as necessary in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. TEST FOR AN INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, read and erase the OCM and ORC DTCs.
Turn the ignition off, wait 15 seconds, then turn the ignition on.
With the scan tool, read the active OCM and ORC DTCs.

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## OCM INTERNAL 1

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Classification Module (OCM) will set this DTC if it detects an out of range internal circuit or low voltage on the (F201) Fused Ignition Switch Output (Run-Start) circuit.

| Possible Causes |
|---|
| BATTERY VOLTAGE LOW |
| (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT VOLTAGE LOW |
| OCM |

### 1. CHECK FOR ACTIVE DTCs IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

With the scan tool, read active Occupant Restraint Controller (ORC) DTCs.

**NOTE: Some DTCs require up to one minute to mature.**

**Does the scan tool display: Loss Of Ignition Run - Start?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.

**No** >> Go To 2

### 2. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

With the scan tool, record and erase OCM DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT AND GROUND CIRCUIT FUNCTION AT THE OCM HARNESS CONNECTOR

If disconnected, reconnect the Seat harness connector to the (C313) Vehicle Body in-line harness connector.

If not done so previously, disconnect the OCM harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage between the Fused Ignition Switch Output (Run-Start) circuit and the Ground circuit.

**Is the voltage below 11.0 volts?**

**Yes** >> Go To 4

**No** >> Go To 5

## 4. CHECK THE (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT VOLTAGE AT THE (C313) VEHICLE BODY IN-LINE HARNESS CONNECTOR

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Seat harness connector from the (C313) Vehicle Body in-line harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the Fused Ignition Switch Output (Run-Start) circuit at the (C313) Vehicle Body harness in-line harness connector.

**Is the voltage below 11.0 volts?**

**Yes** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Repair as necessary to fix the low voltage condition to the Seat harness connector.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. DETERMINE ACTIVE OR STORE DTC

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Reconnect all disconnected OCS harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read active OCM DTCs.

**NOTE: Some DTCs require up to one minute to mature.**

**Does the scan tool display: OCM Internal 1?**

**Yes** >> Go To 6

**No** >> Go To 7

## 6. DETERMINE THE CORRECT REPAIR

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Determine the correct repair by verifying if the front passenger seat has a Bladder and Cushion Service Kit as follows:

- If possible, check the vehicle's repair history.
- The Service Kit wiring harness uses tamper resistant material on the harness connector. Inspect for the tamper resistant material on the harness connector.

**Does the seat have a Bladder and Cushion Service Kit?**

**Yes** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace the OCM in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 7. TEST FOR AN INTERMITTENT CONDITION

With the scan tool, monitor for active codes while performing the following:

**NOTE: The Passenger Airbag On-Off Indicator will illuminate within one second of a fault becoming active.**

- Verify that all connectors are completely seated and locked.
- Wiggle the wiring harness and connectors of the related circuit.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question.

**NOTE: Some DTCs require up to one minute to mature.**

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## OCCUPANT CLASSIFICATION UNDETERMINED STATUS

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Classification Module (OCM) broadcasts a status message on the Bus that provides classification and system fault data to the Occupant Restraint Controller (ORC). Both the OCM and the ORC will set this DTC if an active fault in the Occupant Classification System (OCS) affects occupant classification determination.

**NOTE: Diagnose and repair all other active OCM DTCs except INTERROGATE OCM before diagnosing this DTC. Refer to the Table of Contents in this section for a complete list of airbag system diagnostic procedures.**

Perform SYSTEM VERIFICATION REQUIRED test.

## ORC ACCELEROMETER 1

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) on board diagnostics continuously performs internal circuit tests. The ORC will set this DTC if it identifies an out of range internal circuit.

| Possible Causes |
|---|
| ORC |

## Diagnostic Test

### 1. REPLACE THE ORC

**NOTE: Ensure that the battery is fully charged.**

**Repair**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## ORC ACCELEROMETER 2

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) on board diagnostics continuously performs internal circuit tests. The ORC will set this DTC if it identifies an out of range internal circuit.

| Possible Causes |
|---|
| ORC |

## Diagnostic Test

### 1. REPLACE THE ORC

**NOTE: Ensure that the battery is fully charged.**

**Repair**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## ORC INTERNAL 1

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) on board diagnostics continuously performs internal circuit tests. The ORC will set this DTC if it identifies an out of range internal circuit.

| Possible Causes |
|---|
| ORC |

## Diagnostic Test

### 1. REPLACE THE ORC

**NOTE: Ensure that the battery is fully charged.**

**Repair**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## ORC INTERNAL 2

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) on board diagnostics continuously performs internal circuit tests. The ORC will set this DTC if it identifies an out of range internal circuit.

| Possible Causes |
|---|
| ORC |

## Diagnostic Test

### 1. REPLACE THE ORC

**NOTE: Ensure that the battery is fully charged.**

**Repair**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## ORC STORED ENERGY FIRING 1

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) on board diagnostics continuously performs internal circuit tests. The ORC will set this DTC if it identifies an out of range internal circuit.

| Possible Causes |
|---|
| ORC |

## Diagnostic Test

### 1. REPLACE THE ORC

**NOTE: Ensure that the battery is fully charged.**

**Repair**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## B2255-OCCUPANT RESTRAINT CONTROLLER ROLL OVER FEATURE DISABLE

- **When Monitored:**
  With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**
  This DTC will set if the ORC Roll Over Feature has been disabled via the scan tool.

| Possible Causes |
|---|
| OCCUPANT RESTRAINT CONTROLLER |

## Diagnostic Test

### 1. OCCUPANT RESTRAINT CONTROLLER ROLL OVER FEATURE DISABLED

Turn the ignition on.

With the scan tool read the ORC Roll Over Feature status Enabled or Disabled.

**Does the scan tool show Roll Over Feature Disabled?**

**Repair**

Perform the *ORC VERIFICATION TEST-VER. 1.

## ORC OUTPUT DRIVER 1

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) on board diagnostics continuously performs internal circuit tests. The ORC will set this DTC if it identifies an out of range internal circuit.

| Possible Causes |
| --- |
| ORC |

## Diagnostic Test

### 1. REPLACE THE ORC

**NOTE: Ensure that the battery is fully charged.**

**Repair**

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## PASSENGER BTS OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects voltage above the high threshold on the Seat Belt Tension Sensor Signal circuit.

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Refer to ***Belt Tension Sensor / Pressure Sensor Faults** for the diagnostic procedure.

**STORED DTC**
Go To 2

### 2. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH NO LOAD APPLIED TO THE SENSOR

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
Verify that the passenger seat belt is unbuckled and that there is no load on the passenger seat belt and retractor assembly.

With the scan tool in OCM, select Sensor Display and select Passenger Belt Tension Sensor Output.

Read the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 39 and 69?**

**Yes** >> Go To 3

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.
Perform BELT TENSION SENSOR VERIFICATION TEST.

### 3. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH A LOAD APPLIED TO THE SENSOR

Apply 11 kg (24 lbs) to 12 kg (26 lbs) of pressure to the Passenger Belt Tension Sensor using the spring scale Miller special tool 8828 as follows:

- Connect the hook at the bottom of the spring scale through the Passenger Belt Tension Sensor webbing loop so that the end of the hook faces the passenger seat.
- Place the maximum reading indicator at the bottom of the spring scale.
- Grab the horizontal bar at the top of the spring scale. Pull the spring scale straight upward keeping the horizontal bar level with the door sill and the spring scale in-line with the Passenger Belt Tension Sensor.
- Apply and hold 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the sensor while an assistant monitors the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 153 and 204 with 11 kg (24 lbs) to 12 kg (26 lbs) of pressure applied to the sensor?**

**Yes** >> Maintain the 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the Passenger Belt Tension Sensor and Go To 4

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.
Perform BELT TENSION SENSOR VERIFICATION TEST.

## 4. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH THE LOAD RELEASED

Release the pressure applied with the spring scale while monitoring the Passenger Belt Tension Sensor Output on the scan tool display. Make sure that there is no load applied to the sensor. The output must return to between 39 and 69 within 20 seconds of releasing the load.

**Does the Passenger BTS Output return to between 39 and 69 within 20 seconds of releasing the load?**

**Yes** >> Go To 5

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.

Perform BELT TENSION SENSOR VERIFICATION TEST.

## 5. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER BTS SHORT TO BATTERY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects Belt Tension Sensor A/D counts are greater than 233.

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Refer to ***Belt Tension Sensor / Pressure Sensor Faults** for the diagnostic procedure.

**STORED DTC**
Go To 2

#### 2. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH NO LOAD APPLIED TO THE SENSOR

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

Verify that the passenger seat belt is unbuckled and that there is no load on the passenger seat belt and retractor assembly.

With the scan tool in OCM, select Sensor Display and select Passenger Belt Tension Sensor Output.

Read the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 39 and 69?**

**Yes** >> Go To 3

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.
Perform BELT TENSION SENSOR VERIFICATION TEST.

#### 3. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH A LOAD APPLIED TO THE SENSOR

Apply 11 kg (24 lbs) to 12 kg (26 lbs) of pressure to the Passenger Belt Tension Sensor using the spring scale Miller special tool 8828 as follows:

- Connect the hook at the bottom of the spring scale through the Passenger Belt Tension Sensor webbing loop so that the end of the hook faces the passenger seat.
- Place the maximum reading indicator at the bottom of the spring scale.
- Grab the horizontal bar at the top of the spring scale. Pull the spring scale straight upward keeping the horizontal bar level with the door sill and the spring scale in-line with the Passenger Belt Tension Sensor.
- Apply and hold 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the sensor while an assistant monitors the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 153 and 204 with 11 kg (24 lbs) to 12 kg (26 lbs) of pressure applied to the sensor?**

**Yes** >> Maintain the 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the Passenger Belt Tension Sensor and Go To 4

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.
Perform BELT TENSION SENSOR VERIFICATION TEST.

## 4. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH THE LOAD RELEASED

Release the pressure applied with the spring scale while monitoring the Passenger Belt Tension Sensor Output on the scan tool display. Make sure that there is no load applied to the sensor. The output must return to between 39 and 69 within 20 seconds of releasing the load.

**Does the Passenger BTS Output return to between 39 and 69 within 20 seconds of releasing the load?**

**Yes** >> Go To 5

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.

Perform BELT TENSION SENSOR VERIFICATION TEST.

## 5. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER BTS SHORT TO GROUND

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects Belt Tension Sensor A/D counts are less than 13.

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Refer to ***Belt Tension Sensor / Pressure Sensor Faults** for the diagnostic procedure.

**STORED DTC**
Go To 2

#### 2. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH NO LOAD APPLIED TO THE SENSOR

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
Verify that the passenger seat belt is unbuckled and that there is no load on the passenger seat belt and retractor assembly.

With the scan tool in OCM, select Sensor Display and select Passenger Belt Tension Sensor Output.

Read the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 39 and 69?**

**Yes** >> Go To 3

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.
Perform BELT TENSION SENSOR VERIFICATION TEST.

#### 3. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH A LOAD APPLIED TO THE SENSOR

Apply 11 kg (24 lbs) to 12 kg (26 lbs) of pressure to the Passenger Belt Tension Sensor using the spring scale Miller special tool 8828 as follows:

- Connect the hook at the bottom of the spring scale through the Passenger Belt Tension Sensor webbing loop so that the end of the hook faces the passenger seat.
- Place the maximum reading indicator at the bottom of the spring scale.
- Grab the horizontal bar at the top of the spring scale. Pull the spring scale straight upward keeping the horizontal bar level with the door sill and the spring scale in-line with the Passenger Belt Tension Sensor.
- Apply and hold 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the sensor while an assistant monitors the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 153 and 204 with 11 kg (24 lbs) to 12 kg (26 lbs) of pressure applied to the sensor?**

**Yes** >> Maintain the 24 to 26 lbs of pressure on the Passenger Belt Tension Sensor and Go To 4

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.
Perform BELT TENSION SENSOR VERIFICATION TEST.

## 4. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH THE LOAD RELEASED

Release the pressure applied with the spring scale while monitoring the Passenger Belt Tension Sensor Output on the scan tool display. Make sure that there is no load applied to the sensor. The output must return to between 39 and 69 within 20 seconds of releasing the load.

**Does the Passenger BTS Output return to between 39 and 69 within 20 seconds of releasing the load?**

**Yes** >> Go To 5

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.

Perform BELT TENSION SENSOR VERIFICATION TEST.

## 5. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER BTS SHORT TOGETHER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects the same value on two Seat Belt Tension Sensor circuits.

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Refer to ***Belt Tension Sensor / Pressure Sensor Faults** for the diagnostic procedure.

**STORED DTC**
Go To 2

### 2. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH NO LOAD APPLIED TO THE SENSOR

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
Verify that the passenger seat belt is unbuckled and that there is no load on the passenger seat belt and retractor assembly.

With the scan tool in OCM, select Sensor Display and select Passenger Belt Tension Sensor Output.

Read the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 39 and 69?**

**Yes** >> Go To 3

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.
Perform BELT TENSION SENSOR VERIFICATION TEST.

### 3. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH A LOAD APPLIED TO THE SENSOR

Apply 11 kg (24 lbs) to 12 kg (26 lbs) of pressure to the Passenger Belt Tension Sensor using the spring scale Miller special tool 8828 as follows:

- Connect the hook at the bottom of the spring scale through the Passenger Belt Tension Sensor webbing loop so that the end of the hook faces the passenger seat.
- Place the maximum reading indicator at the bottom of the spring scale.
- Grab the horizontal bar at the top of the spring scale. Pull the spring scale straight upward keeping the horizontal bar level with the door sill and the spring scale in-line with the Passenger Belt Tension Sensor.
- Apply and hold 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the sensor while an assistant monitors the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 153 and 204 with 11 kg (24 lbs) to 12 kg (26 lbs) of pressure applied to the sensor?**

**Yes** >> Maintain the 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the Passenger Belt Tension Sensor and Go To 4

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.
Perform BELT TENSION SENSOR VERIFICATION TEST.

## 4. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH THE LOAD RELEASED

Release the pressure applied with the spring scale while monitoring the Passenger Belt Tension Sensor Output on the scan tool display. Make sure that there is no load applied to the sensor. The output must return to between 39 and 69 within 20 seconds of releasing the load.

**Does the Passenger BTS Output return to between 39 and 69 within 20 seconds of releasing the load?**

**Yes** >> Go To 5

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.

Perform BELT TENSION SENSOR VERIFICATION TEST.

## 5. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING & CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

**Replace the OCS Bladder and Cushion Kit in accordance with the Service information.**

Perform SYSTEM VERIFICATION REQUIRED test.

Perform AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER FLUID LEVEL TOO LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Classification Module (OCM) will set this DTC if the Passenger Bladder Pressure Sensor input value is less than 25 A/D counts for more than 20 seconds.

| Possible Causes |
|---|
| PASSENGER BLADDER PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE |
| SEAT BELT TENSION SENSOR POWER CIRCUIT SHORTED TO PASSENGER BLADDER PRESSURE SENSOR SIGNAL CIRCUIT |
| SEAT WEIGHT BLADDER AND PRESSURE SENSOR |
| OCM |

## Diagnostic Test

### 1. REPLACE THE OCS BLADDER AND CUSHION KIT

**NOTE: Ensure that the battery is fully charged.**

**Repair**

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## PASSENGER PRESSURE SENSOR OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects voltage above the high threshold on the Passenger Bladder Pressure Sensor Signal circuit.

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Refer to ***Belt Tension Sensor / Pressure Sensor Faults** for the diagnostic procedure.

**STORED DTC**
Go To 2

#### 2. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform System Verification Required test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

#### 3. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER PRESSURE SENSOR SHORT TO BATTERY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects Passenger Seat Weight Sensor A/D counts are greater than 233.

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Refer to ***Belt Tension Sensor / Pressure Sensor Faults** for the diagnostic procedure.

**STORED DTC**
Go To 2

#### 2. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.
Perform SYSTEM VERIFICATION REQUIRED test.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

#### 3. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER PRESSURE SENSOR SHORT TO GROUND

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects Passenger Seat Weight Sensor A/D counts are less than 13.

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Refer to ***Belt Tension Sensor / Pressure Sensor Faults** for the diagnostic procedure.

**STORED DTC**
Go To 2

### 2. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER PRESSURE SENSOR SHORT TOGETHER

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects the same value on two Passenger Bladder Pressure Sensor circuits.

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Refer to ***Belt Tension Sensor / Pressure Sensor Faults** for the diagnostic procedure.

**STORED DTC**
Go To 2

### 2. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

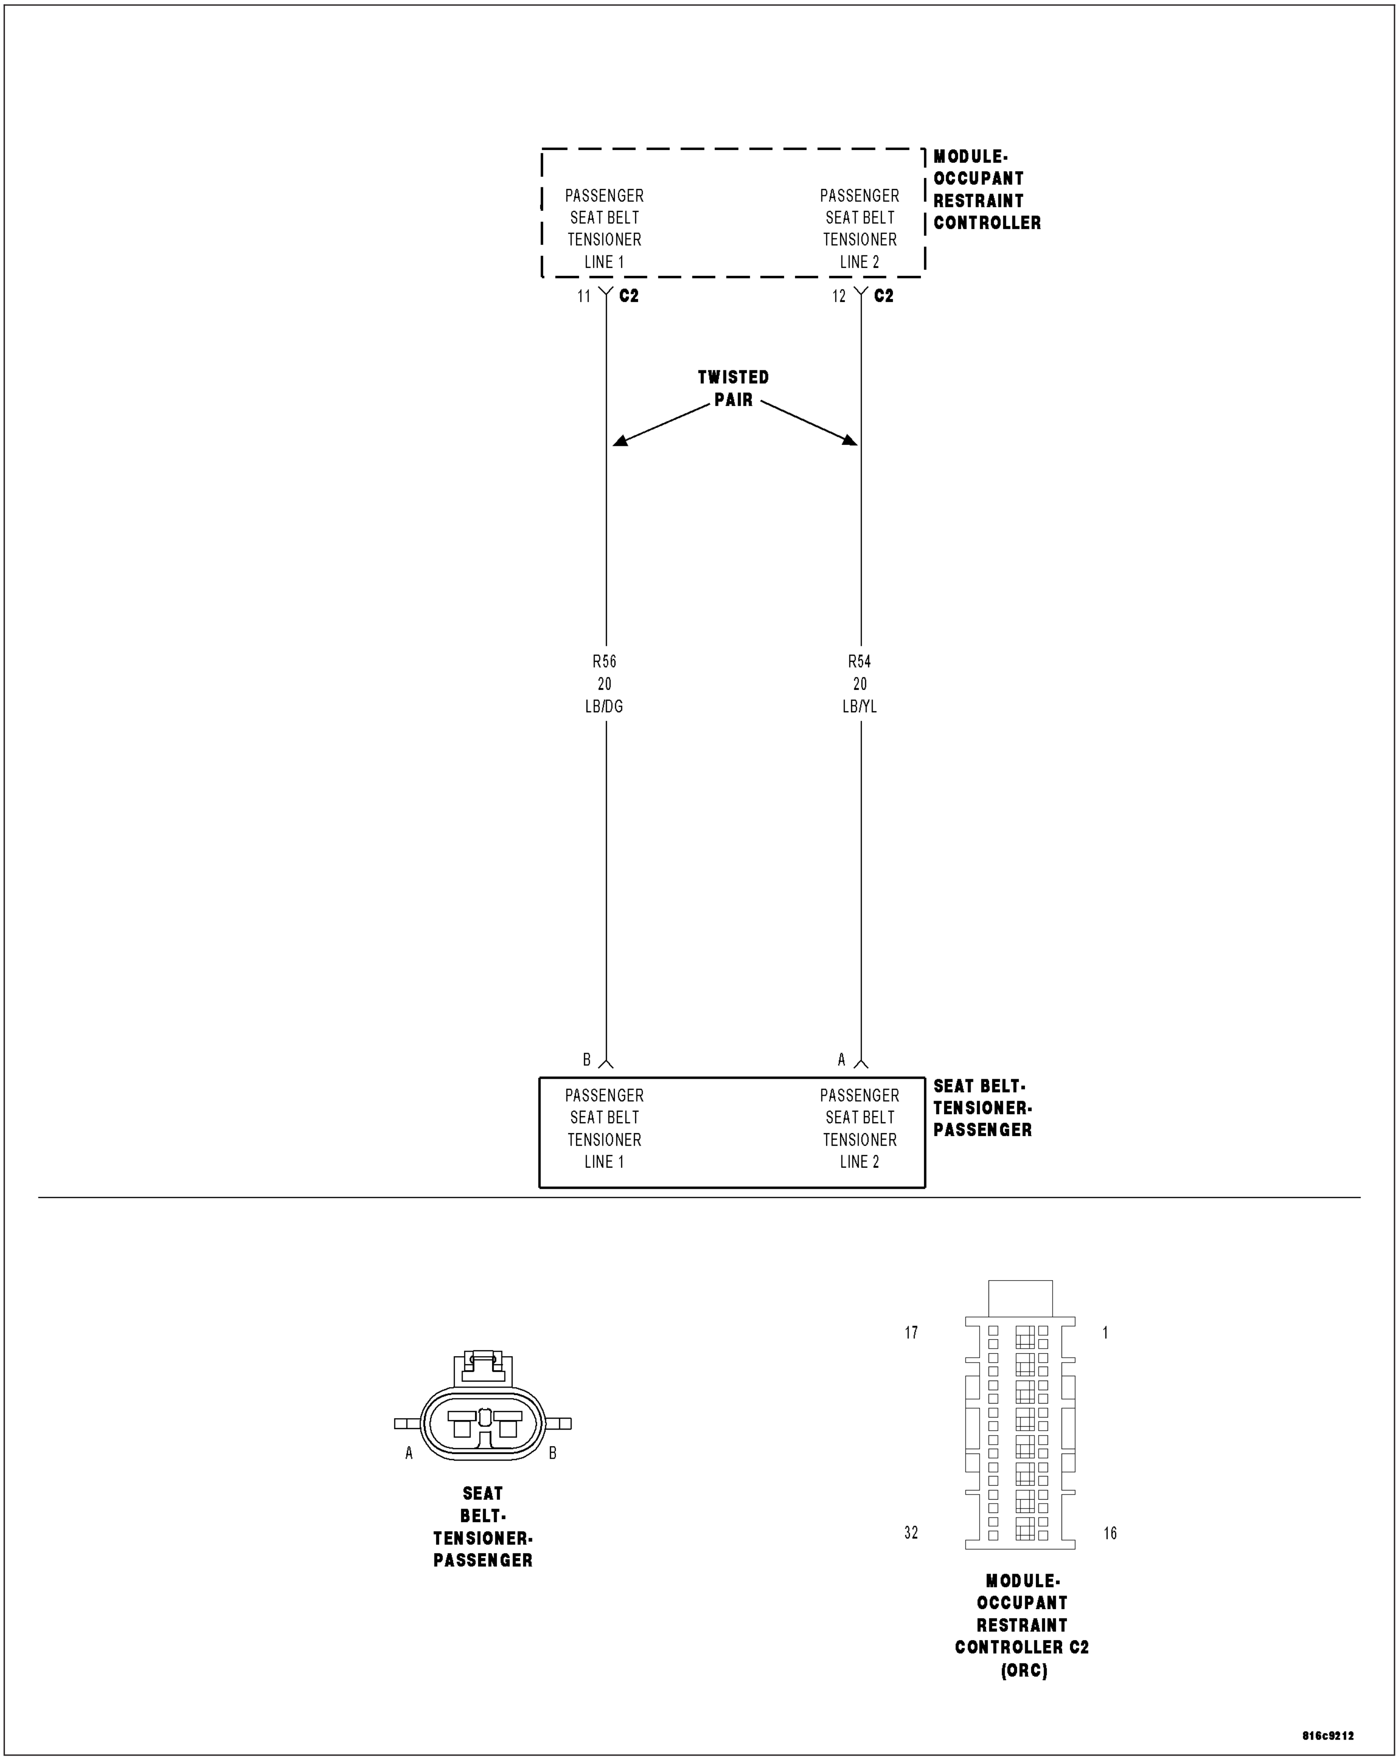
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SEAT BELT TENSIONER CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Tensioner circuits. The ORC will set this DTC if it detects an open or high resistance on the Passenger Seat Belt Tensioner circuits.

| Possible Causes |
|---|
| (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT OPEN |
| PASSENGER SEAT BELT PRETENSIONER |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR OPEN PASSENGER SEAT BELT PRETENSIONER

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Seat Belt Pretensioner connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Passenger Seat Belt Pretensioner connector.

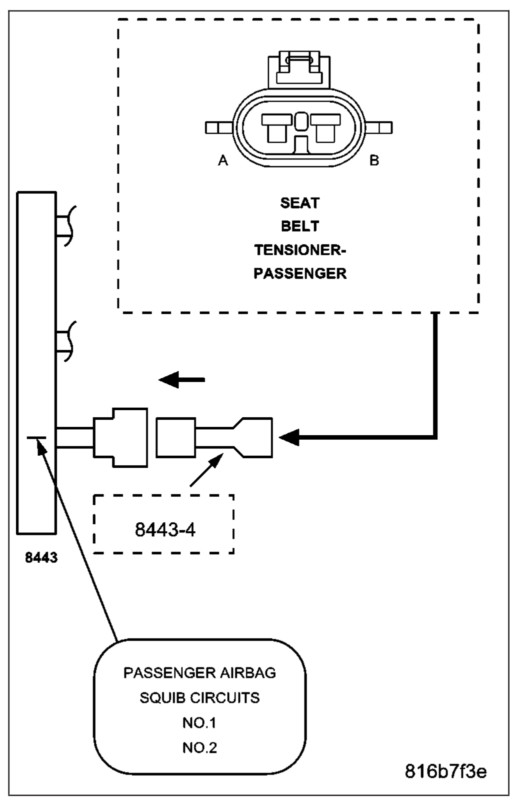
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

**Does the scan tool display: PASSENGER SEAT BELT TENSIONER CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Seat Belt Pretensioner in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

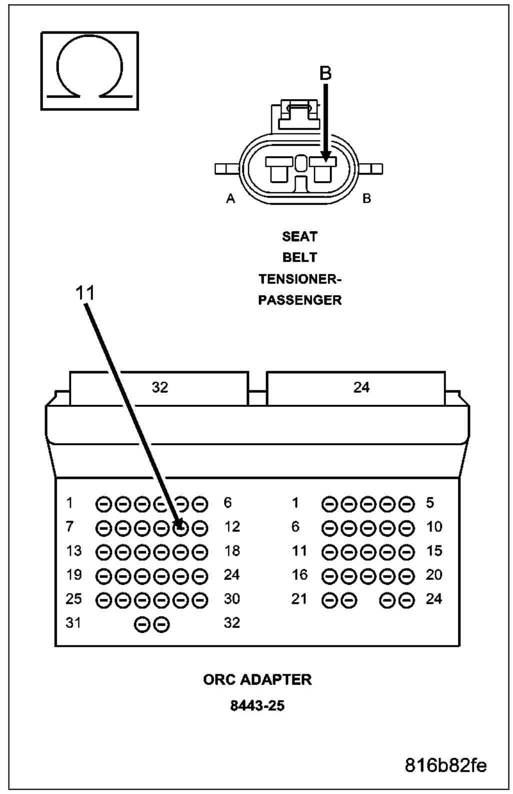
Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector.

Measure the resistance of the (R56) Passenger Seat Belt Tensioner Line 1 circuit between the Passenger Seat Belt Pretensioner connector and the 8443 ORC Adaptor.



**Is the resistance below 1.0 ohm?**

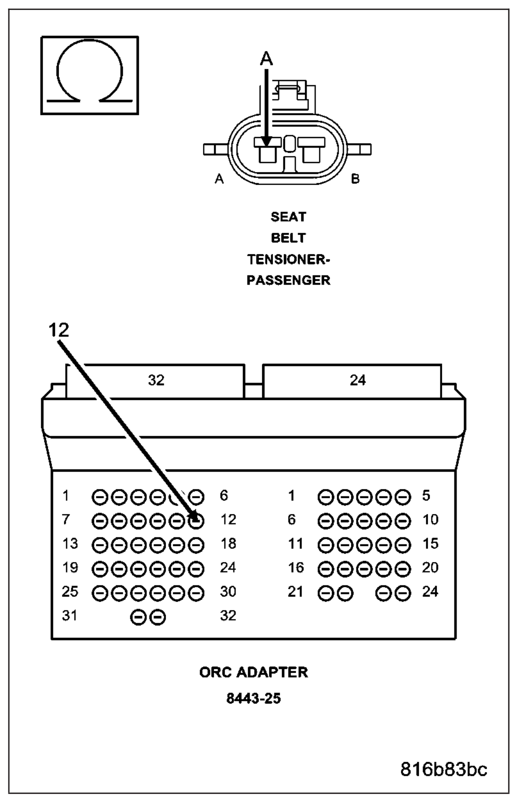
**Yes** >> Go To 4

**No** >> Repair the (R56) Passenger Seat Belt Tensioner Line 1 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR AN OPEN

Measure the resistance of the (R54) Passenger Seat Belt Tensioner Line 2 circuit between the Passenger Seat Belt Pretensioner connector and the 8443 ORC Adaptor.



**Is the resistance below 1.0 ohm?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (R54) Passenger Seat Belt Tensioner Line 2 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

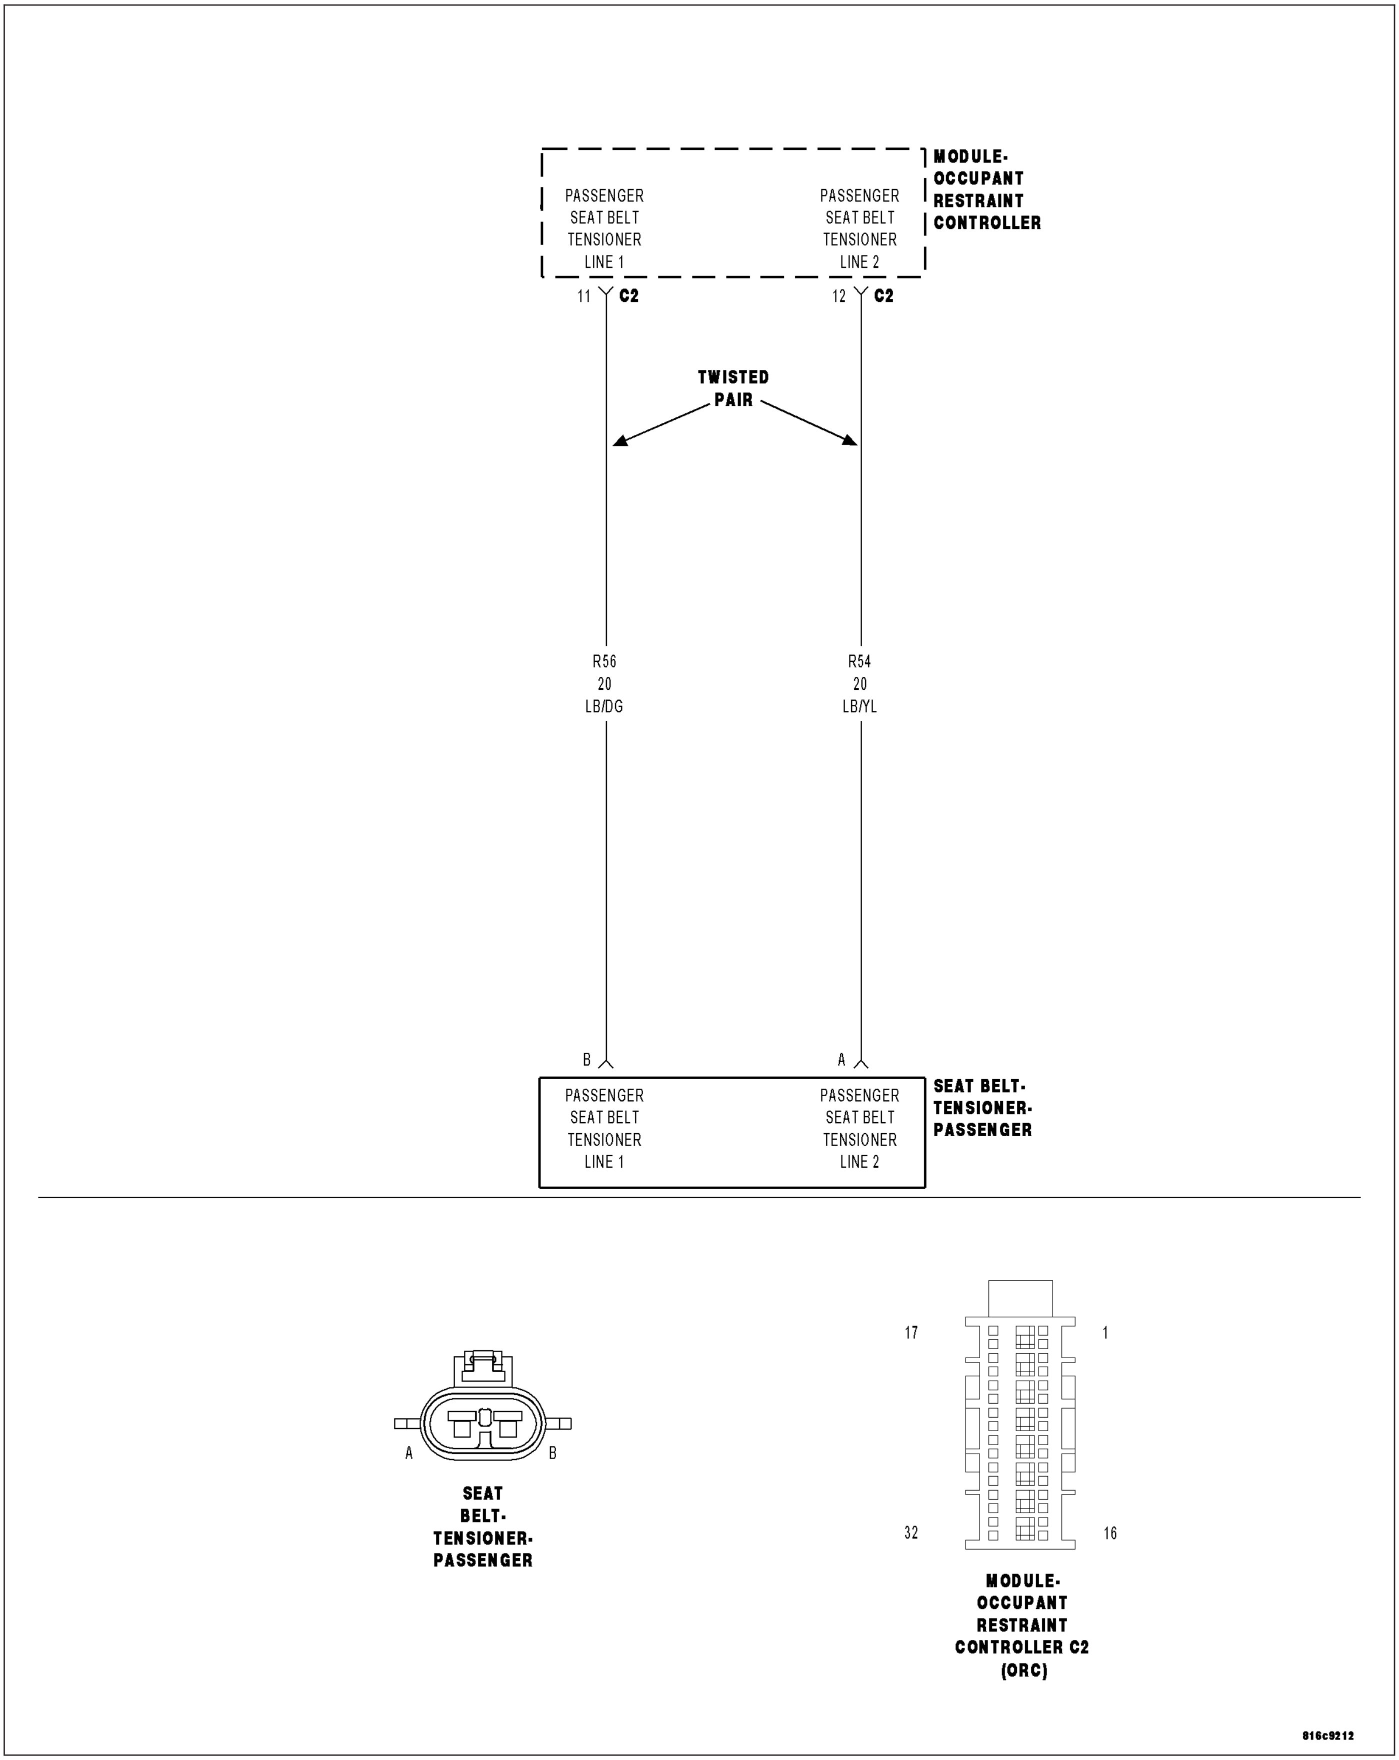
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SEAT BELT TENSIONER CIRCUIT SHORT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Tensioner circuits. The ORC will set this DTC if it detects low resistance between the Passenger Seat Belt Tensioner circuits.

| Possible Causes |
| --- |
| (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT SHORTED TO (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT |
| PASSENGER SEAT BELT PRETENSIONER |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED PASSENGER SEAT BELT PRETENSIONER

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

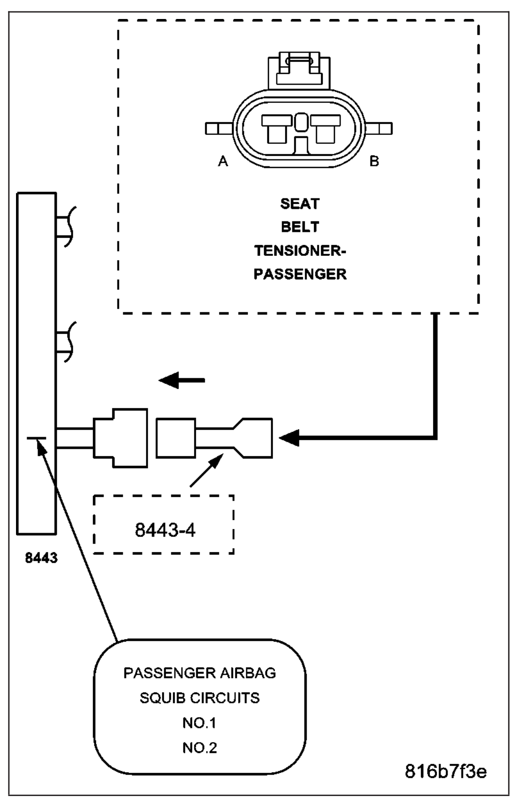
Disconnect the Passenger Seat Belt Pretensioner connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Passenger Seat Belt Pretensioner connector.

**WARNING: To avoid personal injury or death, turn the ignition on then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

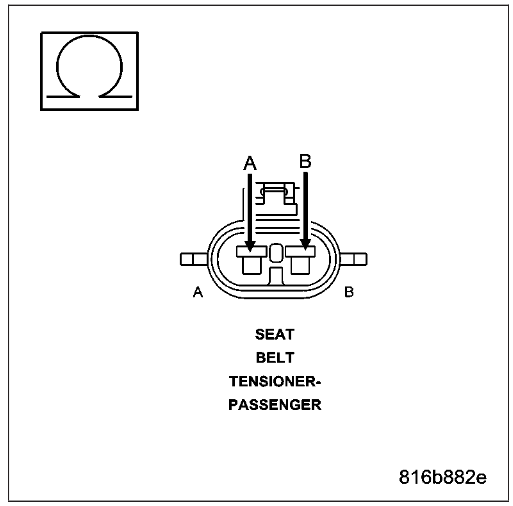


**Does the scan tool display: PASSENGER SEAT BELT TENSIONER CIRCUIT SHORT?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Seat Belt Pretensioner in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT FOR A SHORT TO THE (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance between the (R56) Passenger Seat Belt Tensioner Line 1 circuit and the (R54) Passenger Seat Belt Tensioner Line 2 circuit at the Passenger Seat Belt Pretensioner connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R56) Passenger Seat Belt Tensioner Line 1 circuit for a short to the (R54) Passenger Seat Belt Tensioner Line 2 circuit.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

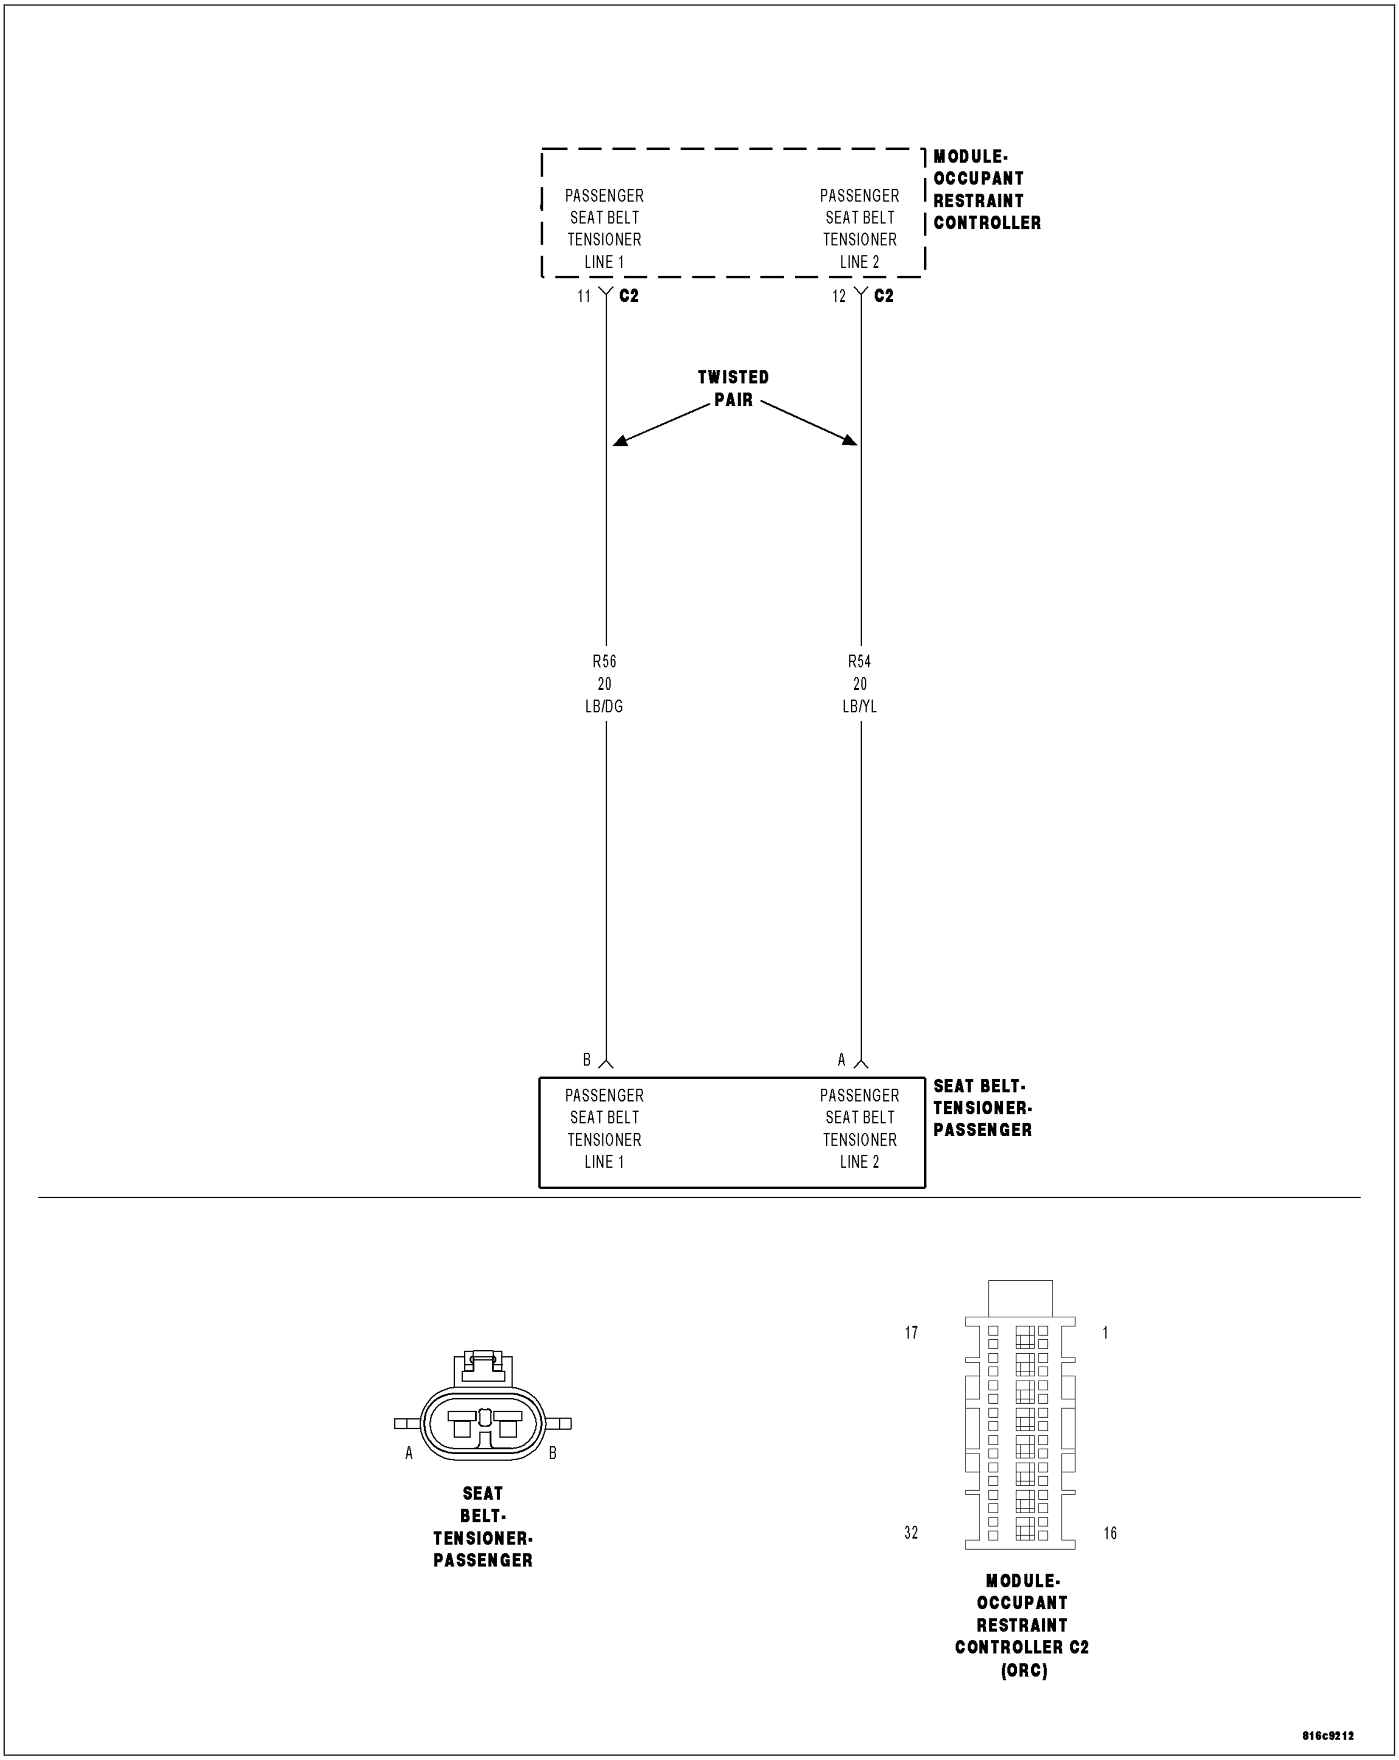
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SEAT BELT TENSIONER SHORT TO BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage on the Passenger Seat Belt Tensioner circuits. The ORC will set this DTC if it detects voltage on the Passenger Seat Belt Tensioner circuits.

| Possible Causes |
|---|
| (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT SHORTED TO BATTERY |
| PASSENGER SEAT BELT PRETENSIONER |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED PASSENGER SEAT BELT PRETENSIONER

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Seat Belt Pretensioner connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Passenger Seat Belt Pretensioner connector.

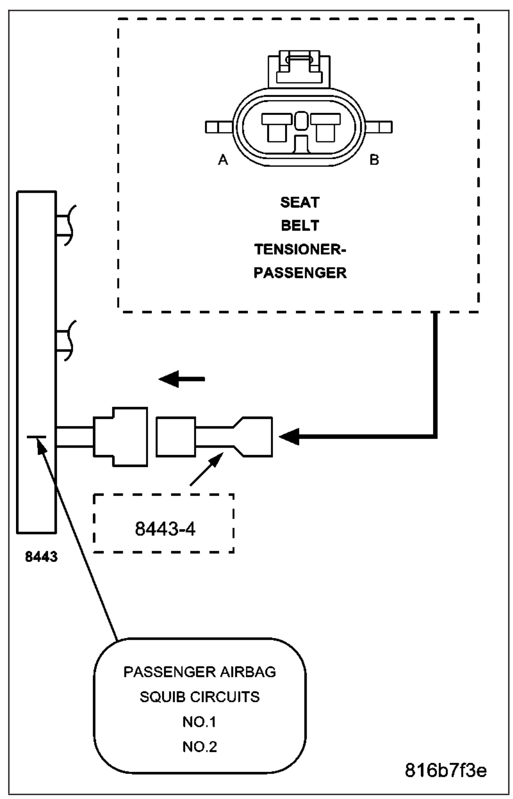
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

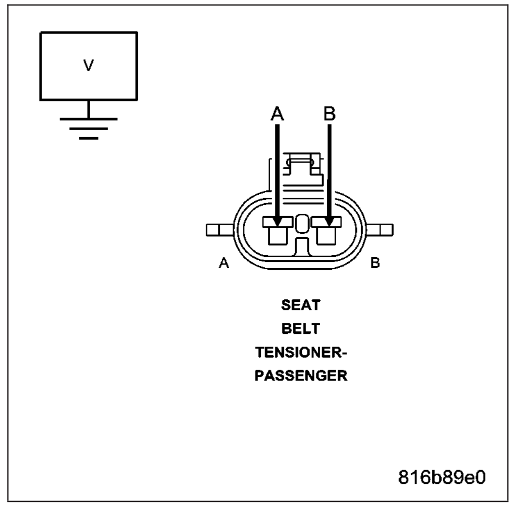
**Does the scan tool display: PASSENGER SEAT BELT TENSIONER SHORT TO BATTERY?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Seat Belt Pretensioner in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT AND (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the (R56) Passenger Seat Belt Tensioner Line 1 circuit between the Passenger Seat Belt Pretensioner connector and ground.

Measure the voltage of the (R54) Passenger Seat Belt Tensioner Line 2 circuit between the Passenger Seat Belt Pretensioner connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Passenger Seat Belt Tensioner circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

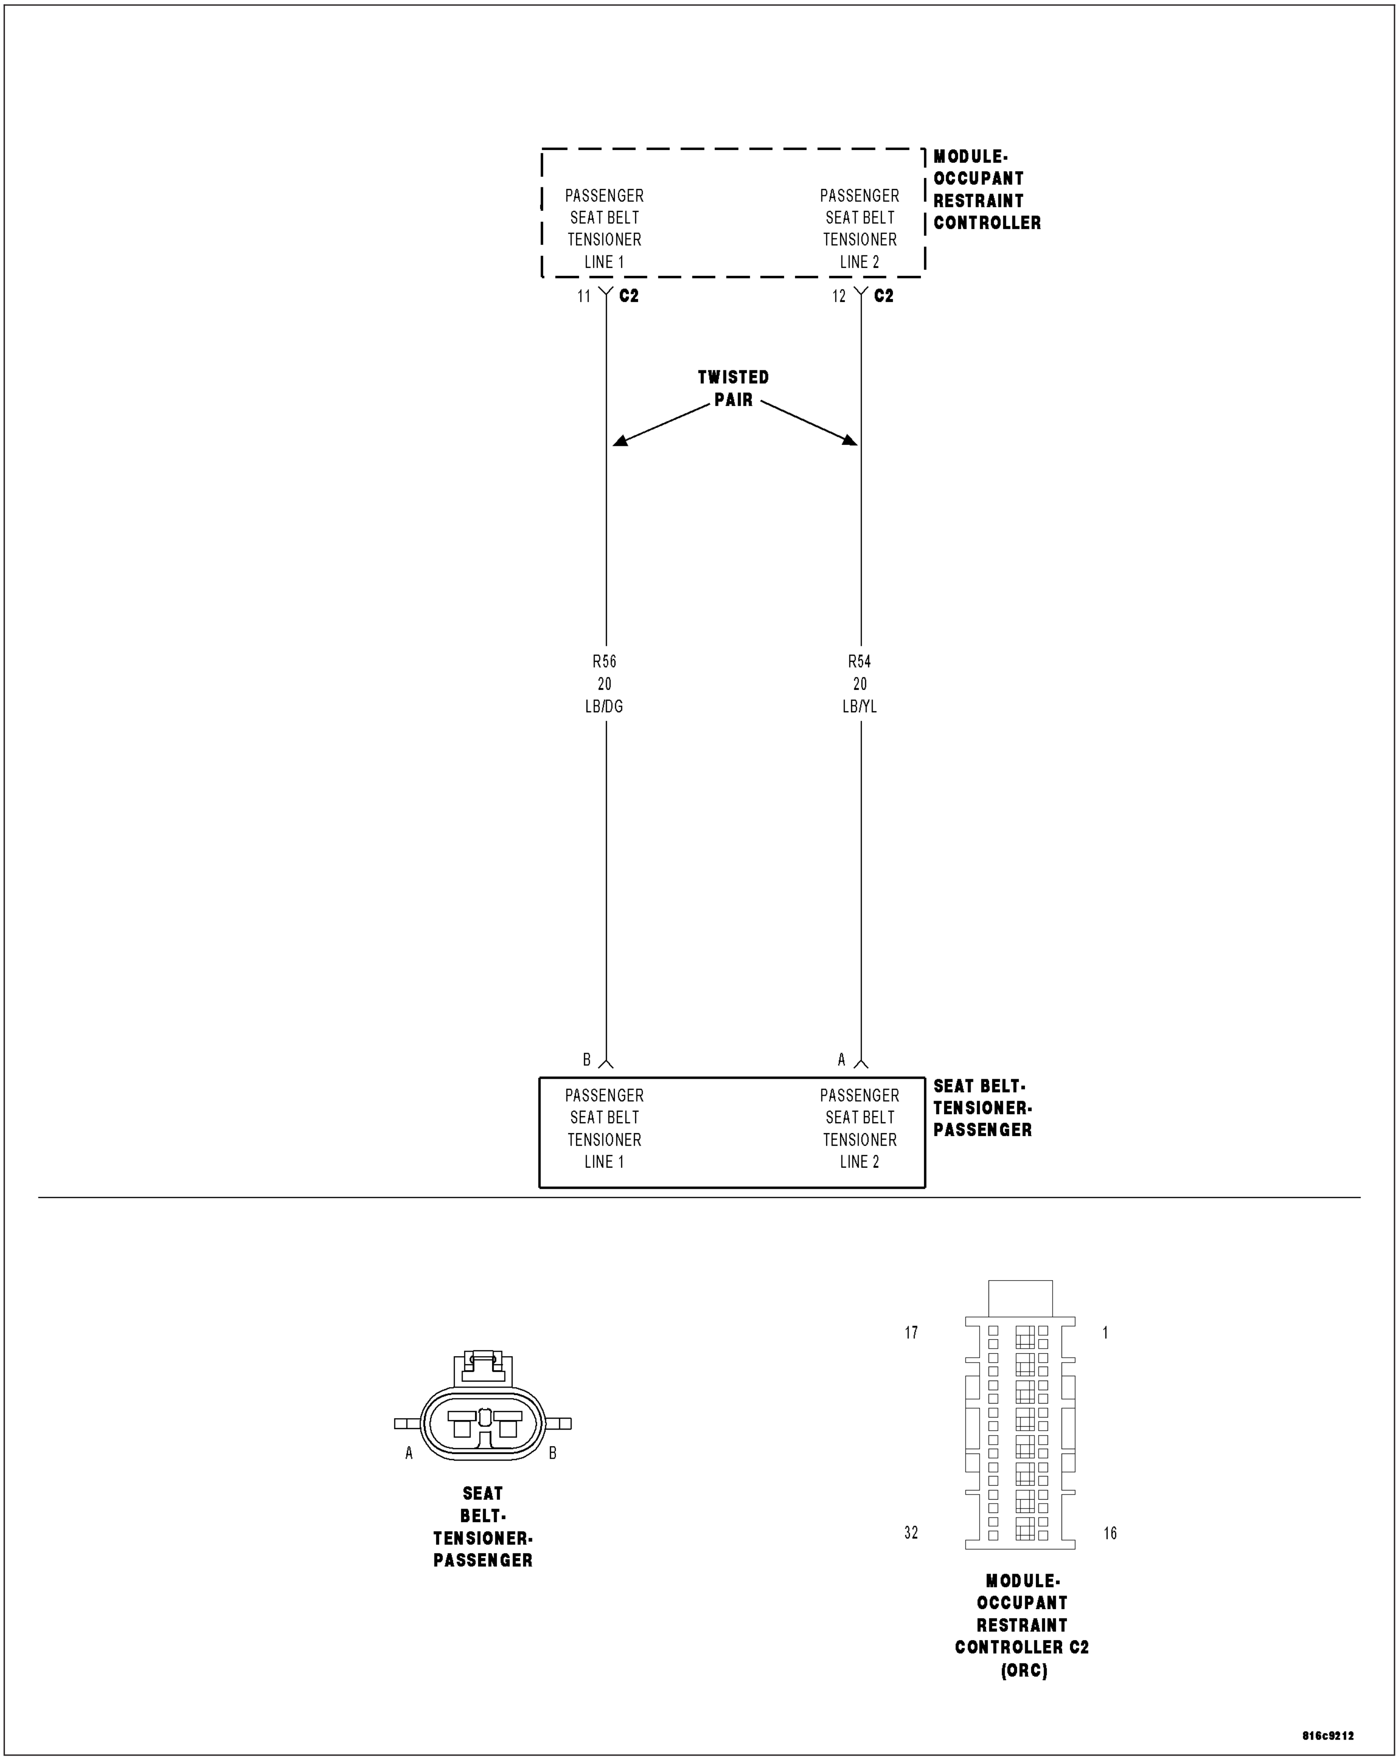
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SEAT BELT TENSIONER SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Tensioner circuits. The ORC will set this DTC if it detects low resistance on the Passenger Seat Belt Tensioner circuits.

| Possible Causes |
|---|
| (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND |
| PASSENGER SEAT BELT PRETENSIONER |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED PASSENGER SEAT BELT PRETENSIONER

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Passenger Seat Belt Pretensioner connector.

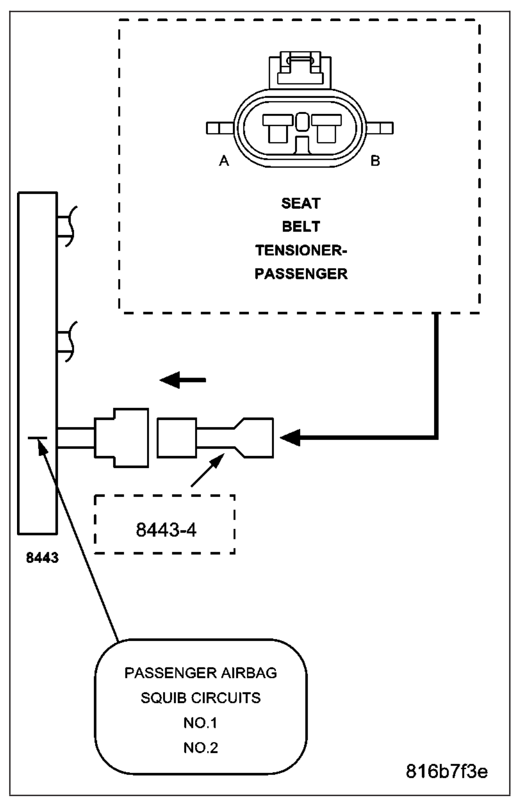
**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Passenger Seat Belt Pretensioner connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.

**Does the scan tool display: PASSENGER SEAT BELT TENSIONER SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Seat Belt Pretensioner in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT AND (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Pretensioner connector.

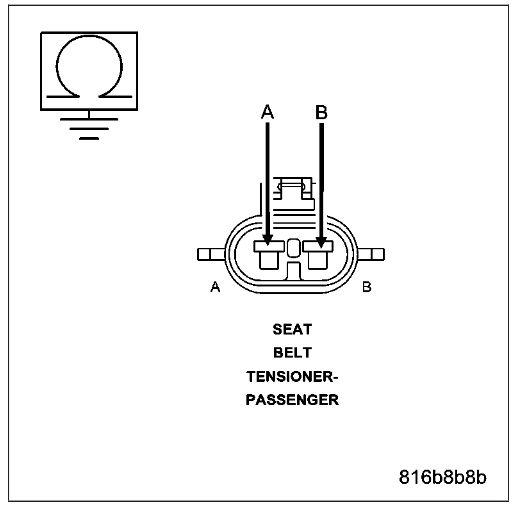
Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R56) Passenger Seat Belt Tensioner Line 1 circuit between ground and the Passenger Seat Belt Pretensioner connector.

Measure the resistance of the (R54) Passenger Seat Belt Tensioner Line 2 circuit between ground and the Passenger Seat Belt Pretensioner connector.



**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Passenger Seat Belt Tensioner circuits with a resistance below 10k ohms for a short to ground.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

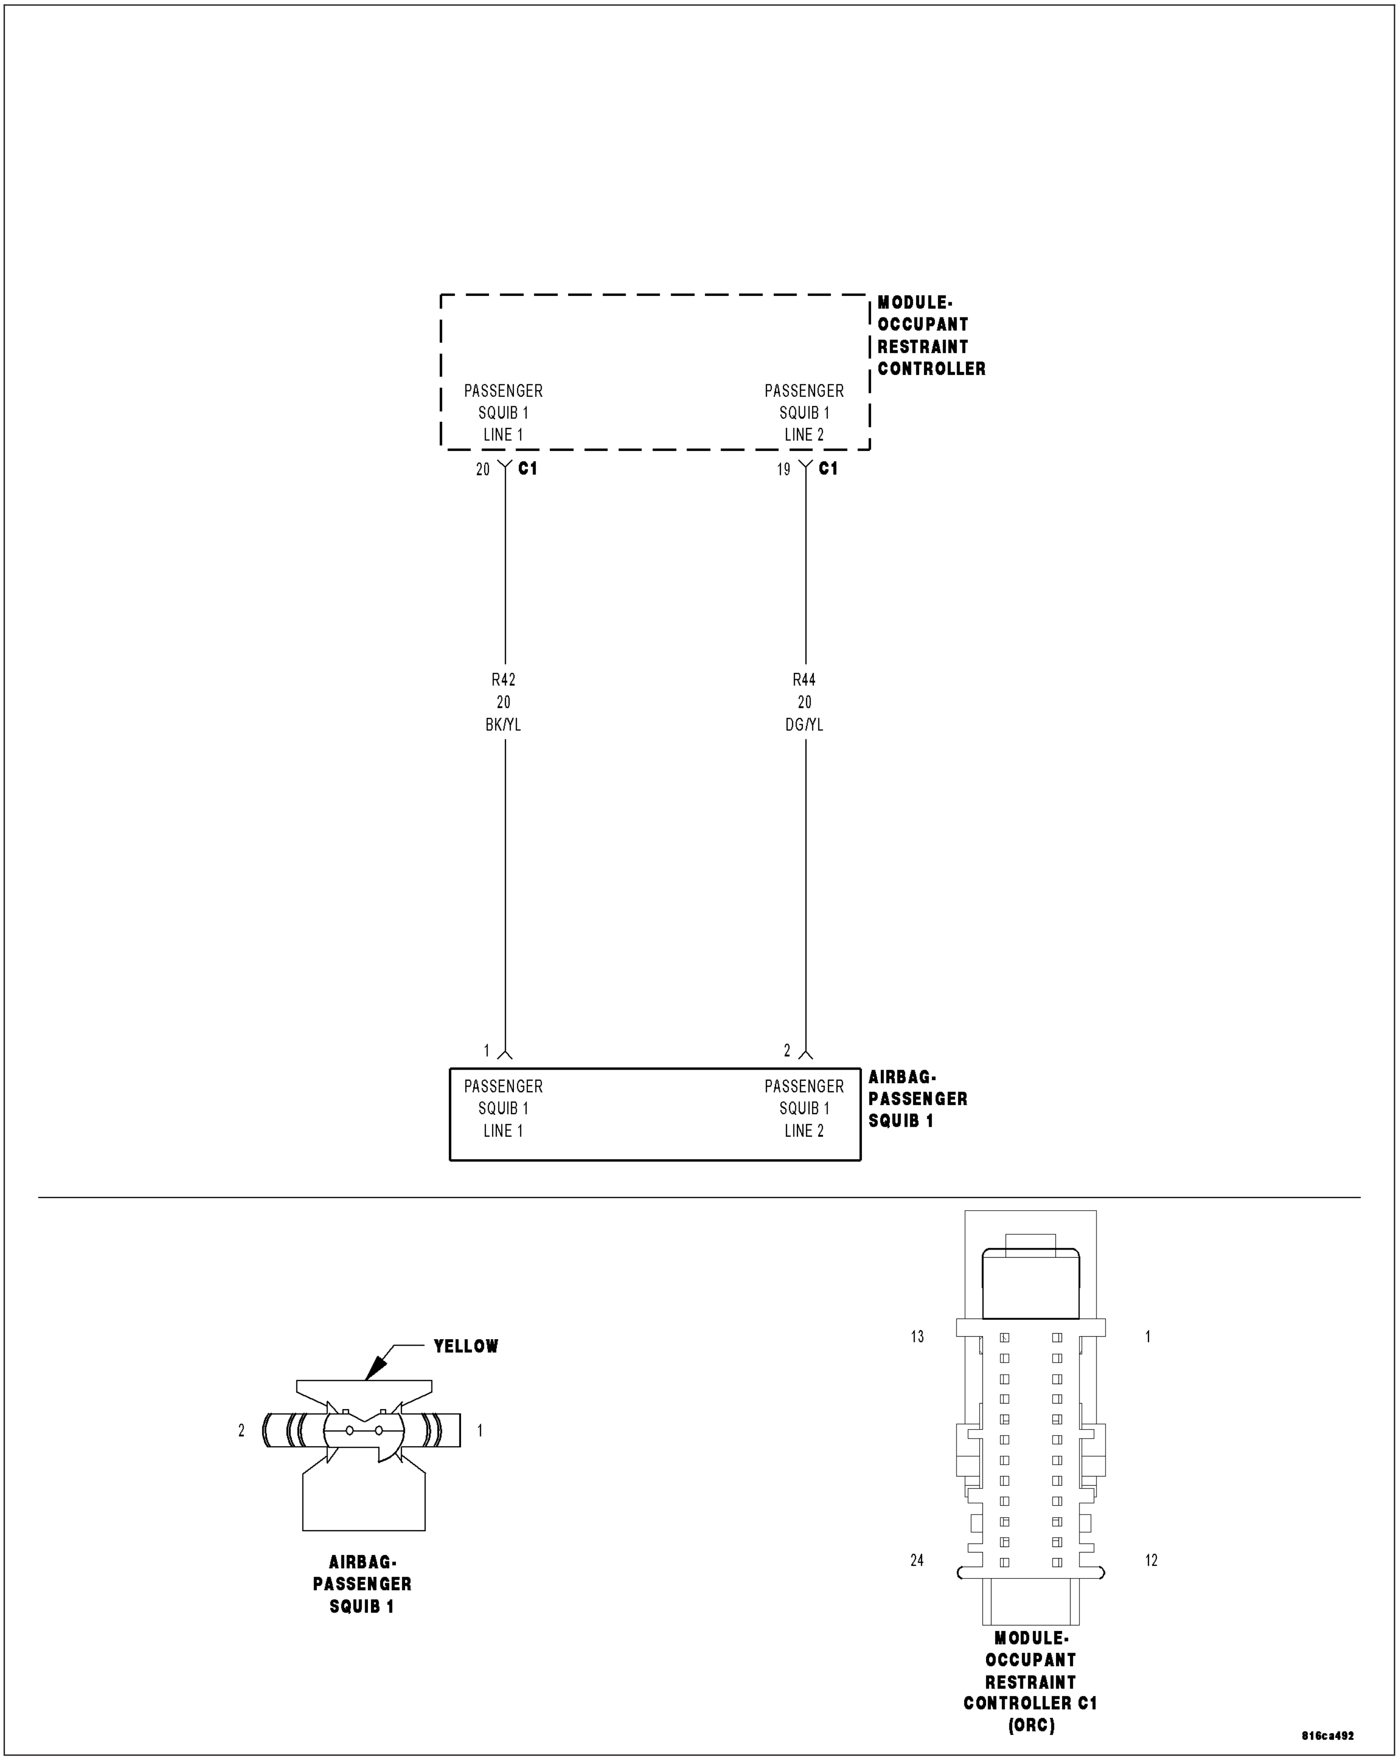
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SQUIB 1 CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 1 circuits. The ORC will set this DTC if it detects an open or high resistance on the Passenger Squib 1 circuits.

| Possible Causes |
|---|
| PASSENGER SQUIB 1 LINE 2 CIRCUIT OPEN |
| PASSENGER SQUIB 1 LINE 1 CIRCUIT OPEN |
| PASSENGER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR OPEN SQUIB CIRCUITS IN PASSENGER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Airbag Squib connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

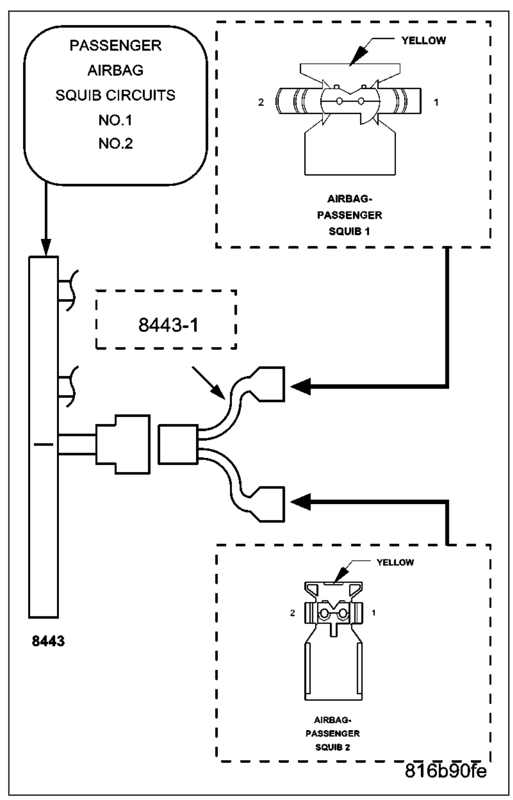
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

**Does the scan tool display: PASSENGER SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK PASSENGER SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

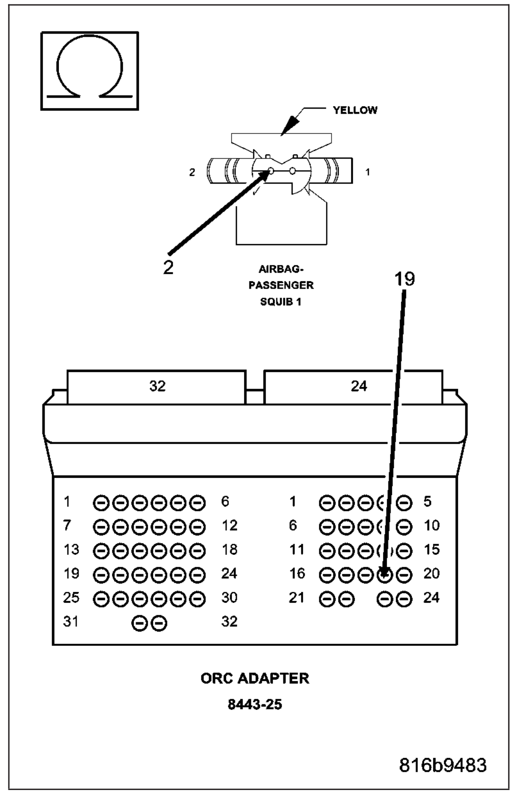
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the Passenger Squib 1 Line 2 circuit between the Passenger Airbag Squib connector and the 8443 ORC Adaptor.



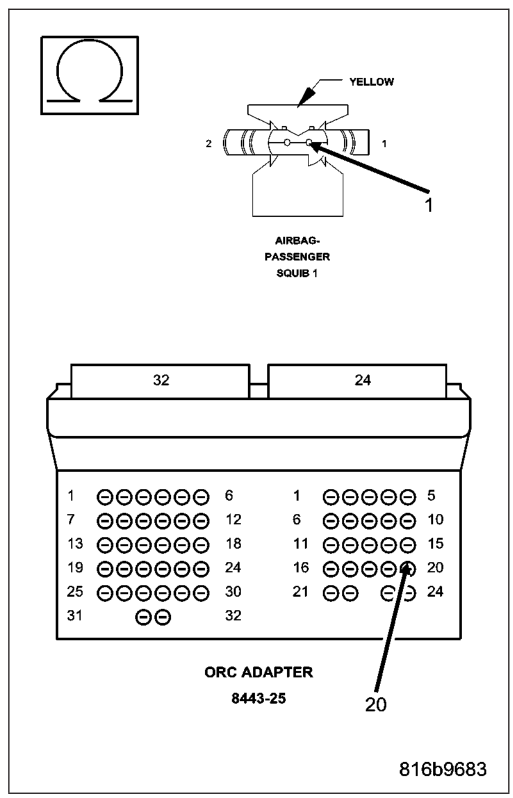
**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 4

**No** >> Repair the Passenger Squib 1 Line 2 circuit for and open. Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN

Measure the resistance of the Passenger Squib 1 Line 1 circuit between the Passenger Airbag Squib connector and the 8443 ORC Adaptor.



**Is the resistance below 1.0 ohm?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the Passenger Squib 1 Line 1 circuit for an open. Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

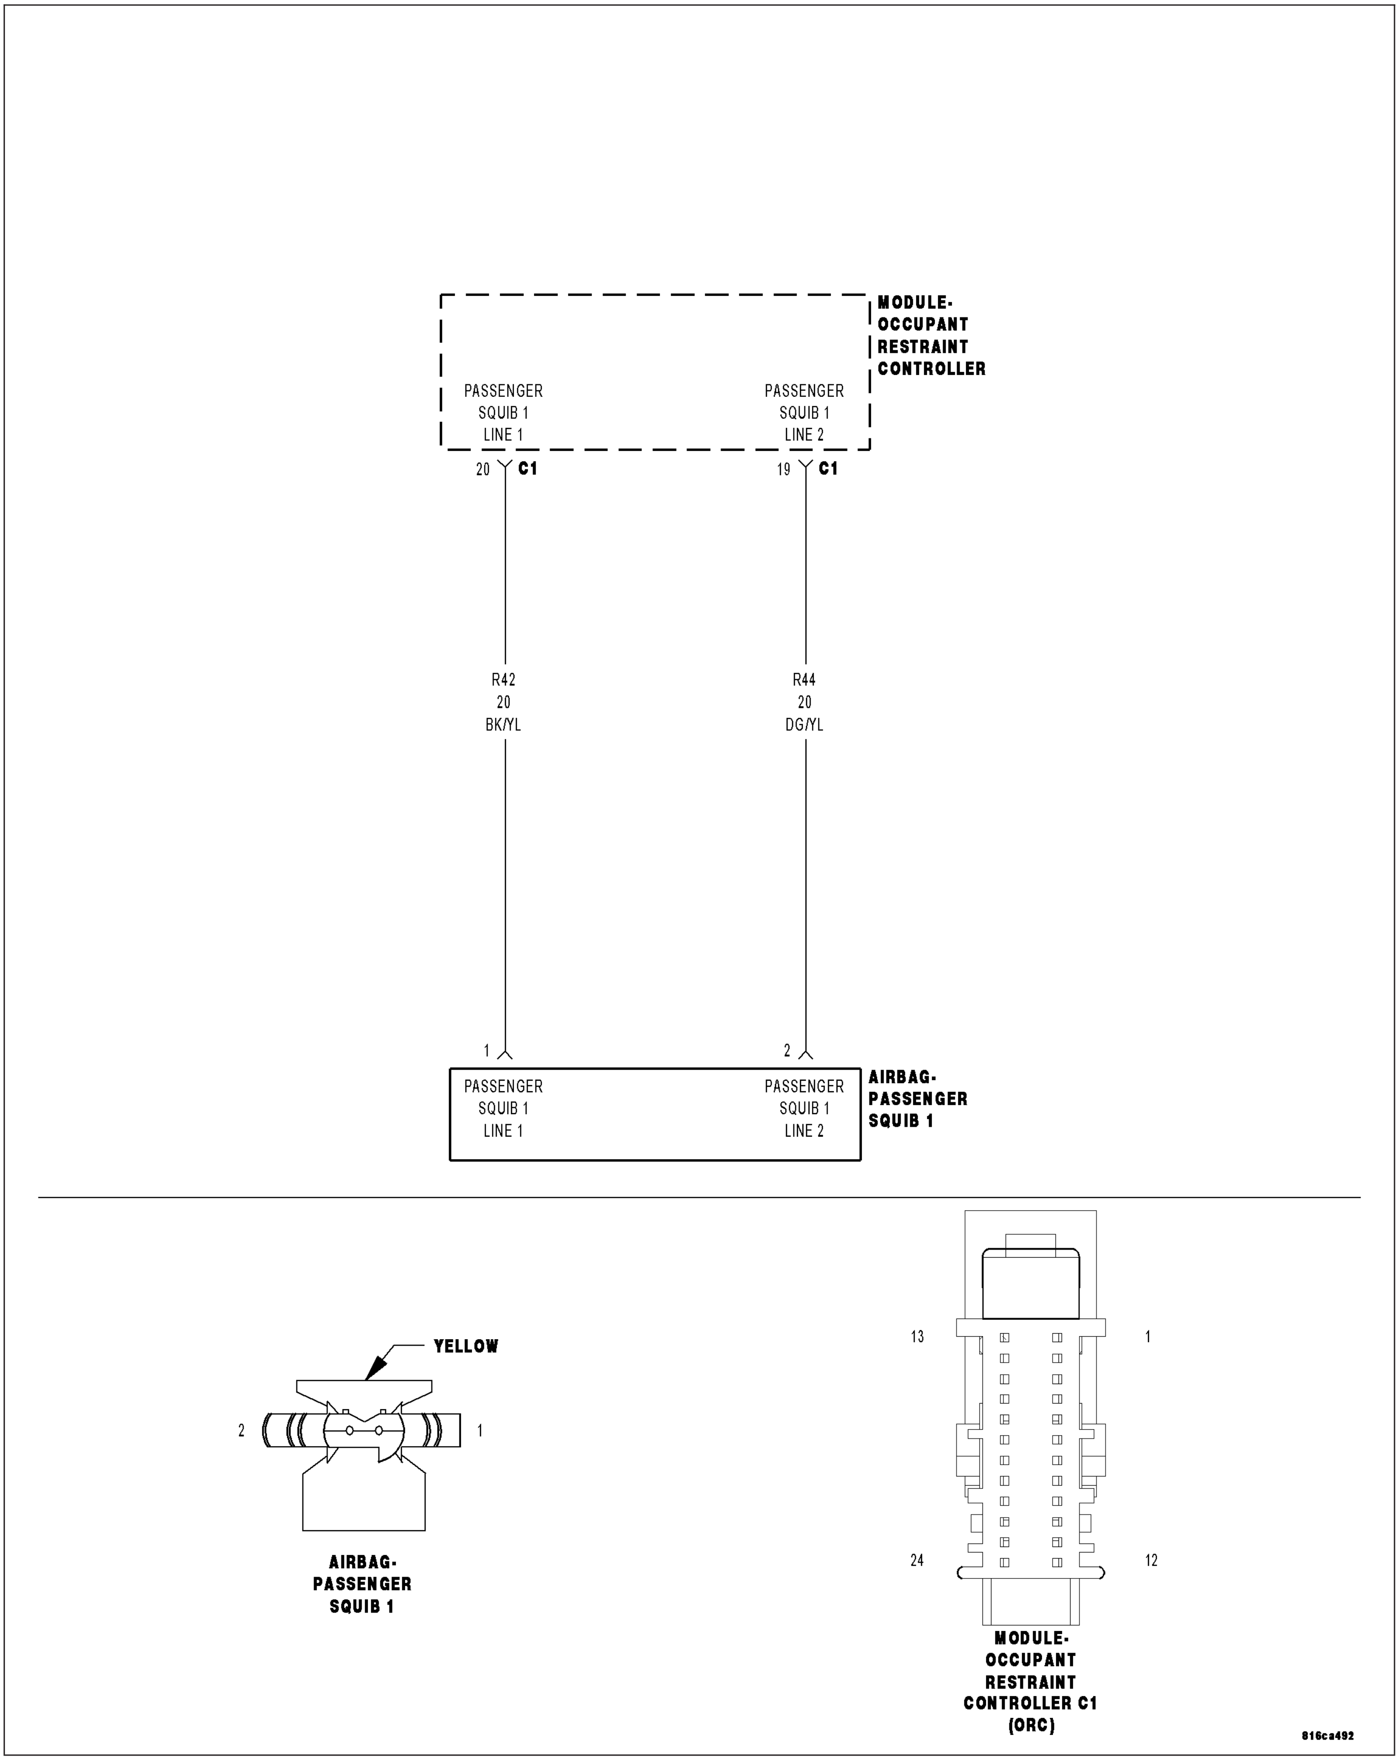
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SQUIB 1 CIRCUIT SHORT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 1 circuits. The ORC will set this DTC if it detects low resistance between the Passenger Squib 1 circuits.

| Possible Causes |
|---|
| PASSENGER SQUIB 1 LINE 2 CIRCUIT SHORTED TO PASSENGER SQUIB 1 LINE 1 CIRCUIT |
| PASSENGER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

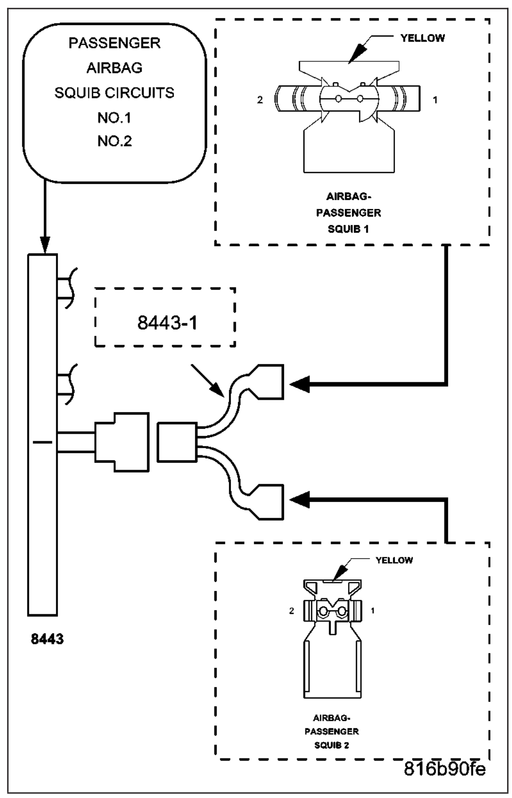
Disconnect the Passenger Airbag Squib connector.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.



**Does the scan tool display: PASSENGER SQUIB 1 CIRCUIT SHORT?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK PASSENGER SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO PASSENGER SQUIB 1 LINE 1 CIRCUIT

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

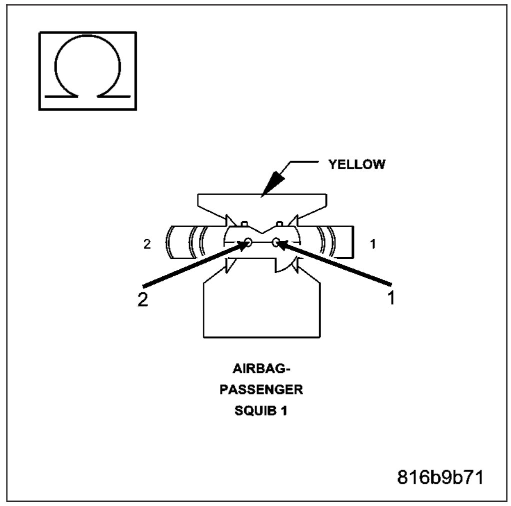
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance between the Passenger Squib 1 Line 2 circuit and the Passenger Squib 1 Line 1 circuit at the Passenger Airbag Squib connector.



**Is the resistance below 10K ohms?**

**Yes** >> Repair the Passenger Squib 1 Line 2 circuit for a short to the Passenger Squib 1 Line 1 circuit.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

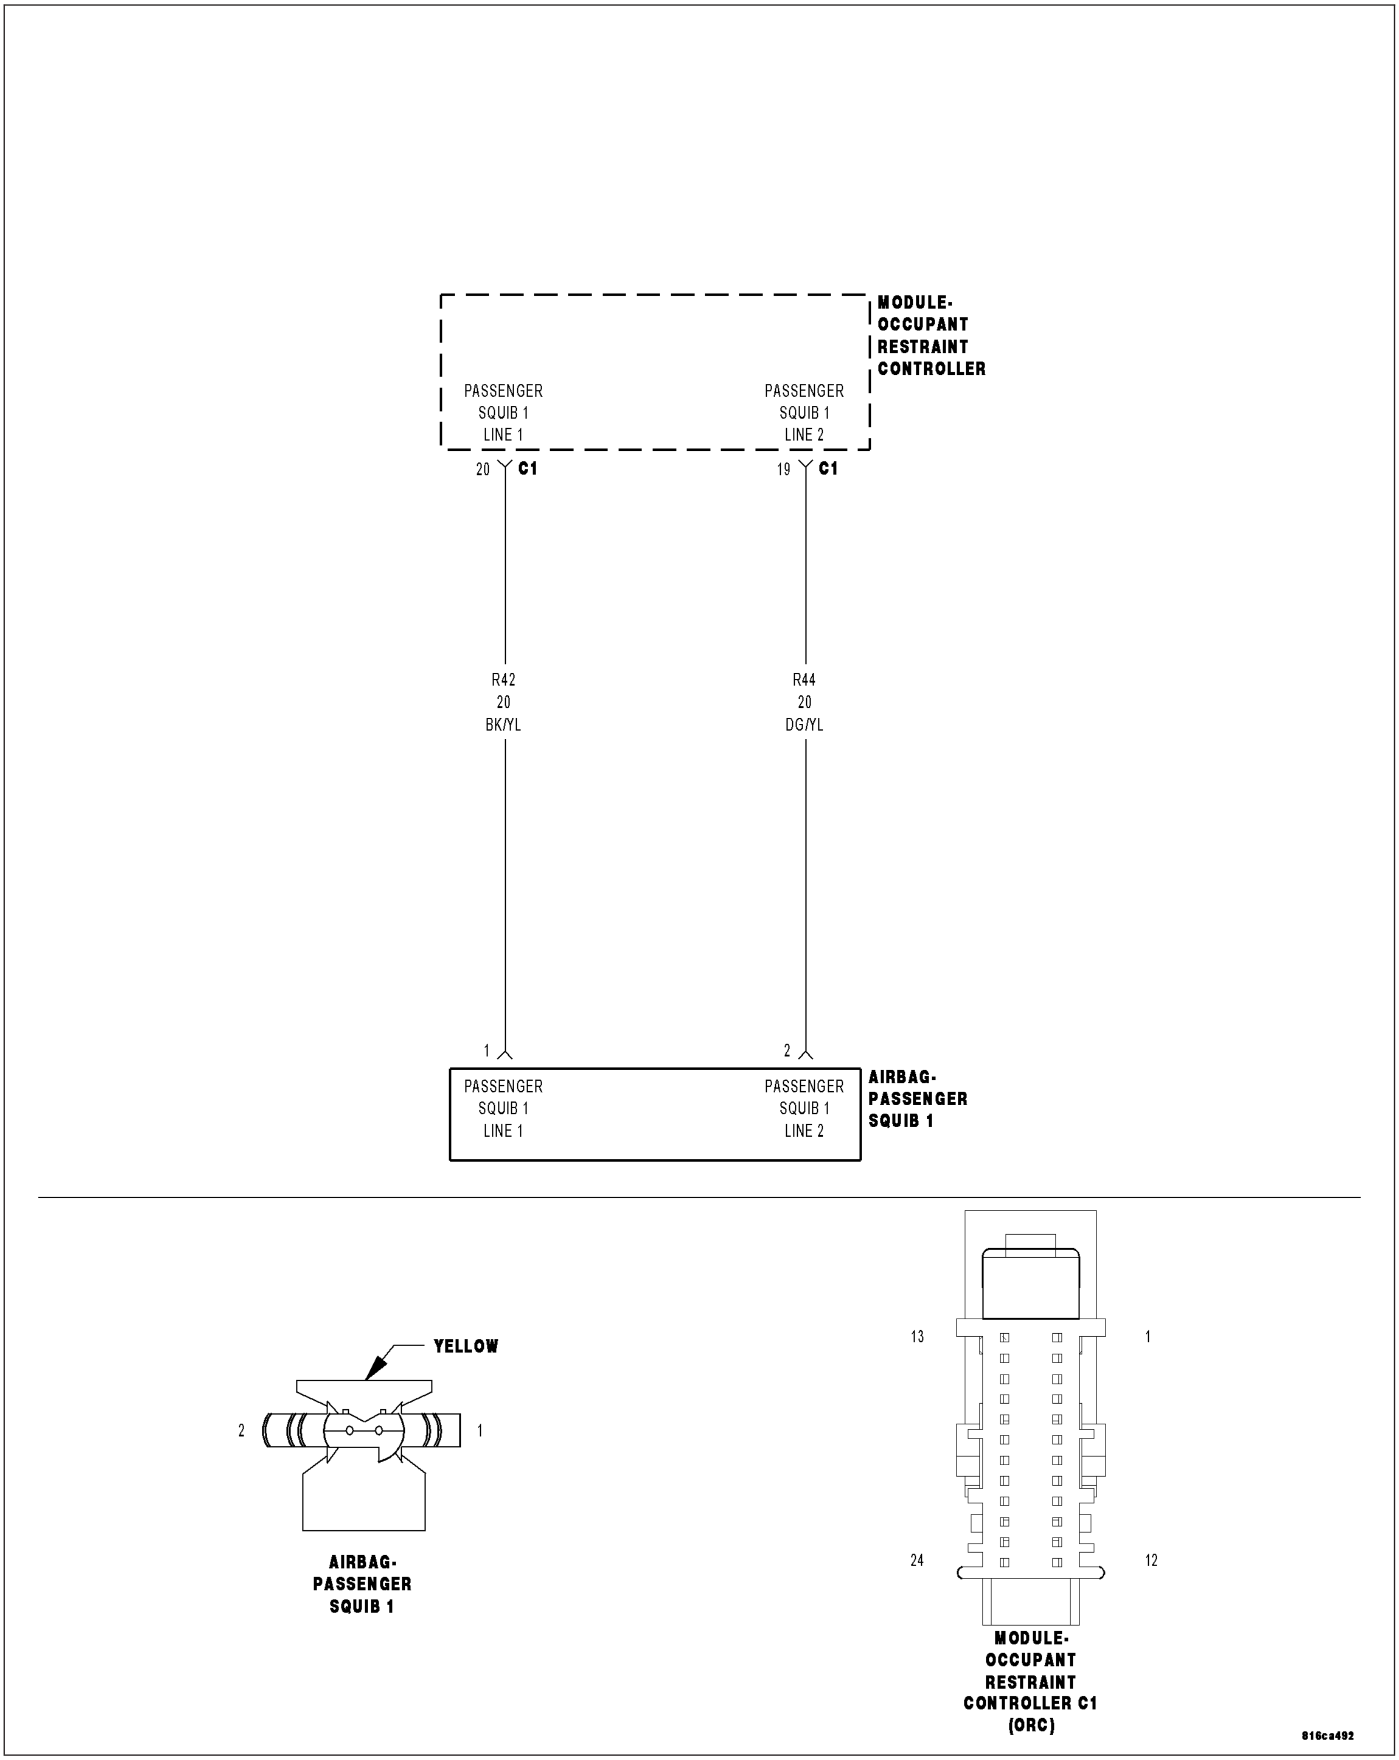
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SQUIB 1 SHORT TO BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage on the Passenger Squib 1 circuits. The ORC will set this DTC if it detects voltage on the Passenger Squib 1 circuits.

| Possible Causes |
|---|
| PASSENGER SQUIB 1 LINE 2 CIRCUIT OR PASSENGER SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY |
| PASSENGER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

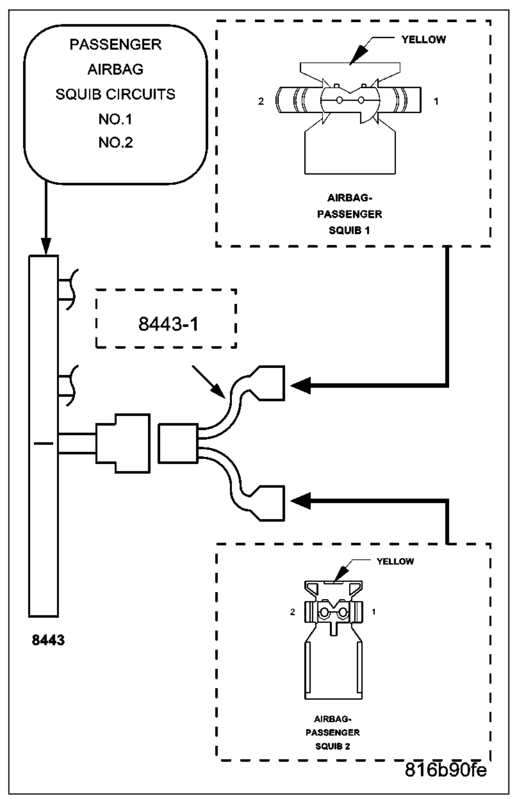
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Airbag Squib connector.

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

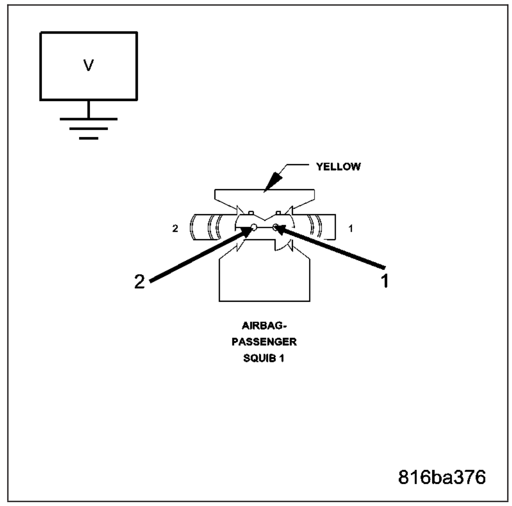
With the scan tool, read the active ORC DTCs.

**Does the scan tool display: PASSENGER SQUIB 1 SHORT TO BATTERY?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK PASSENGER SQUIB 1 LINE 2 CIRCUIT AND PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO BATTERY



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the voltage of the Passenger Squib 1 Line 2 circuit between the Passenger Airbag Squib connector and ground.

Measure the voltage of the Passenger Squib 1 Line 1 circuit between the Passenger Airbag Squib connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Passenger Squib 1 circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

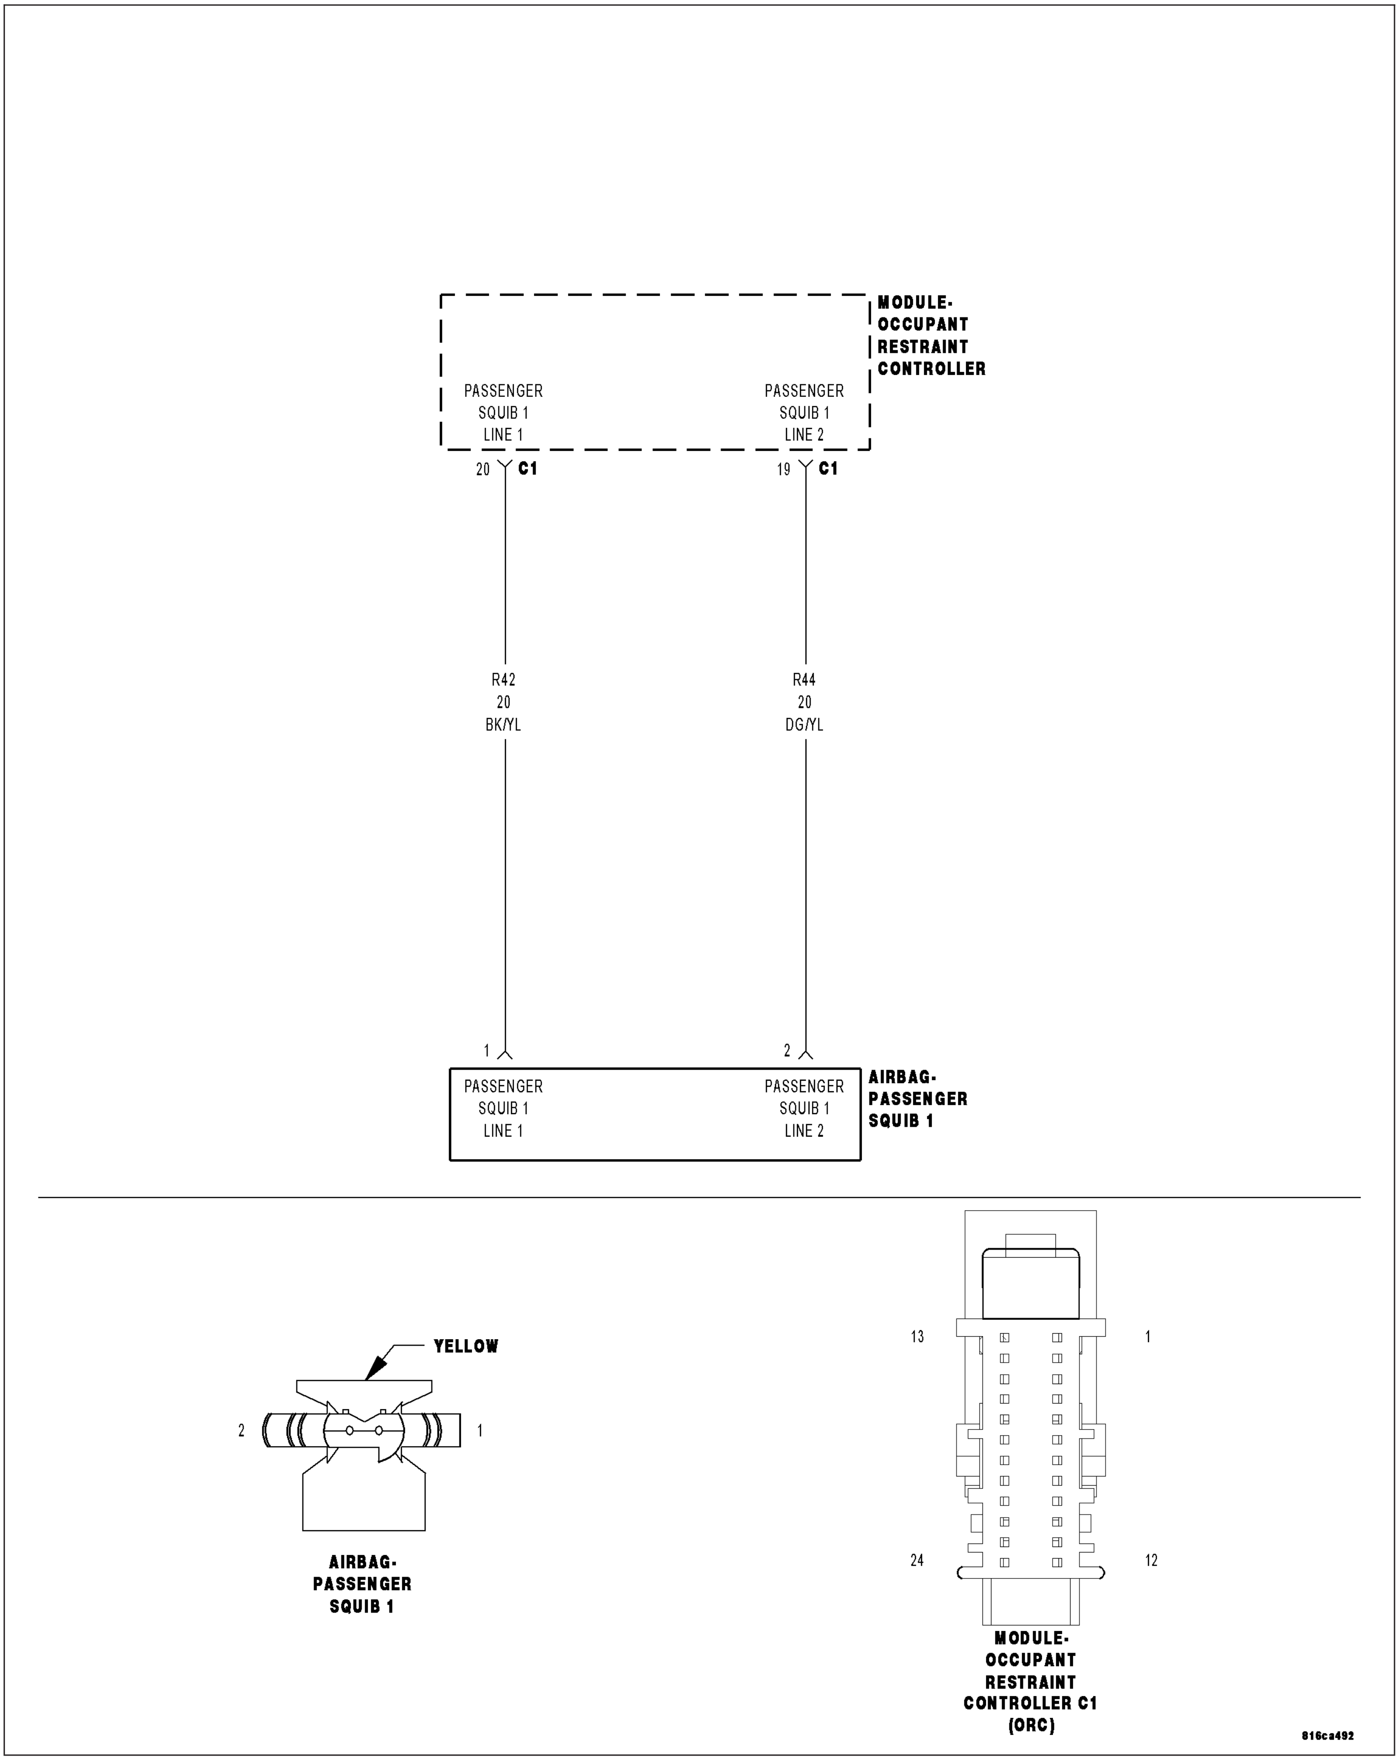
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SQUIB 1 SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 1 circuits. The ORC will set this DTC if it detects low resistance on the Passenger Squib 1 circuits.

| Possible Causes |
|---|
| PASSENGER SQUIB 1 LINE 2 CIRCUIT OR PASSENGER SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND |
| PASSENGER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Airbag Squib connector.

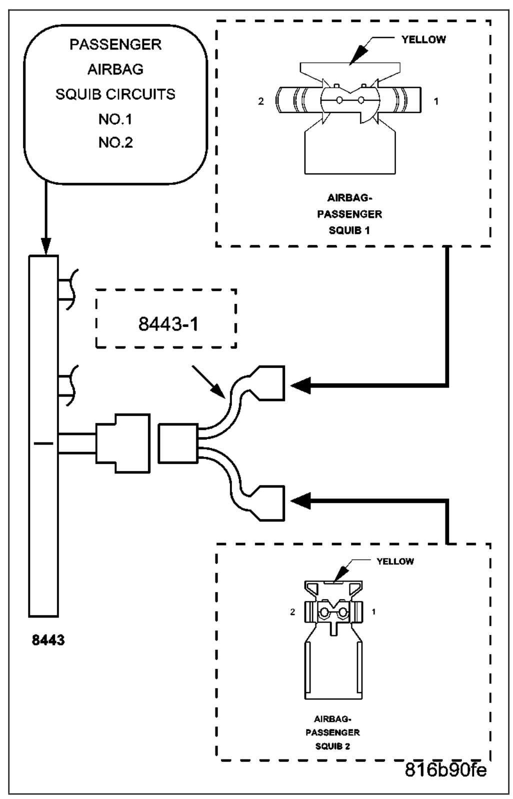
**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

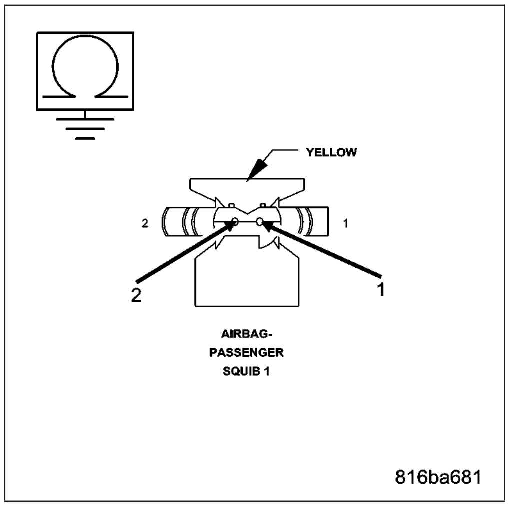


**Does the scan tool display: PASSENGER SQUIB 1 SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK PASSENGER SQUIB 1 LINE 2 CIRCUIT AND PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO GROUND



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the Passenger Squib 1 Line 2 circuit between ground and the Passenger Airbag Squib connector.

Measure the resistance of the Passenger Squib 1 Line 1 circuit between ground and the Passenger Airbag Squib connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Passenger Squib 1 circuits with a resistance below 10K ohms for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

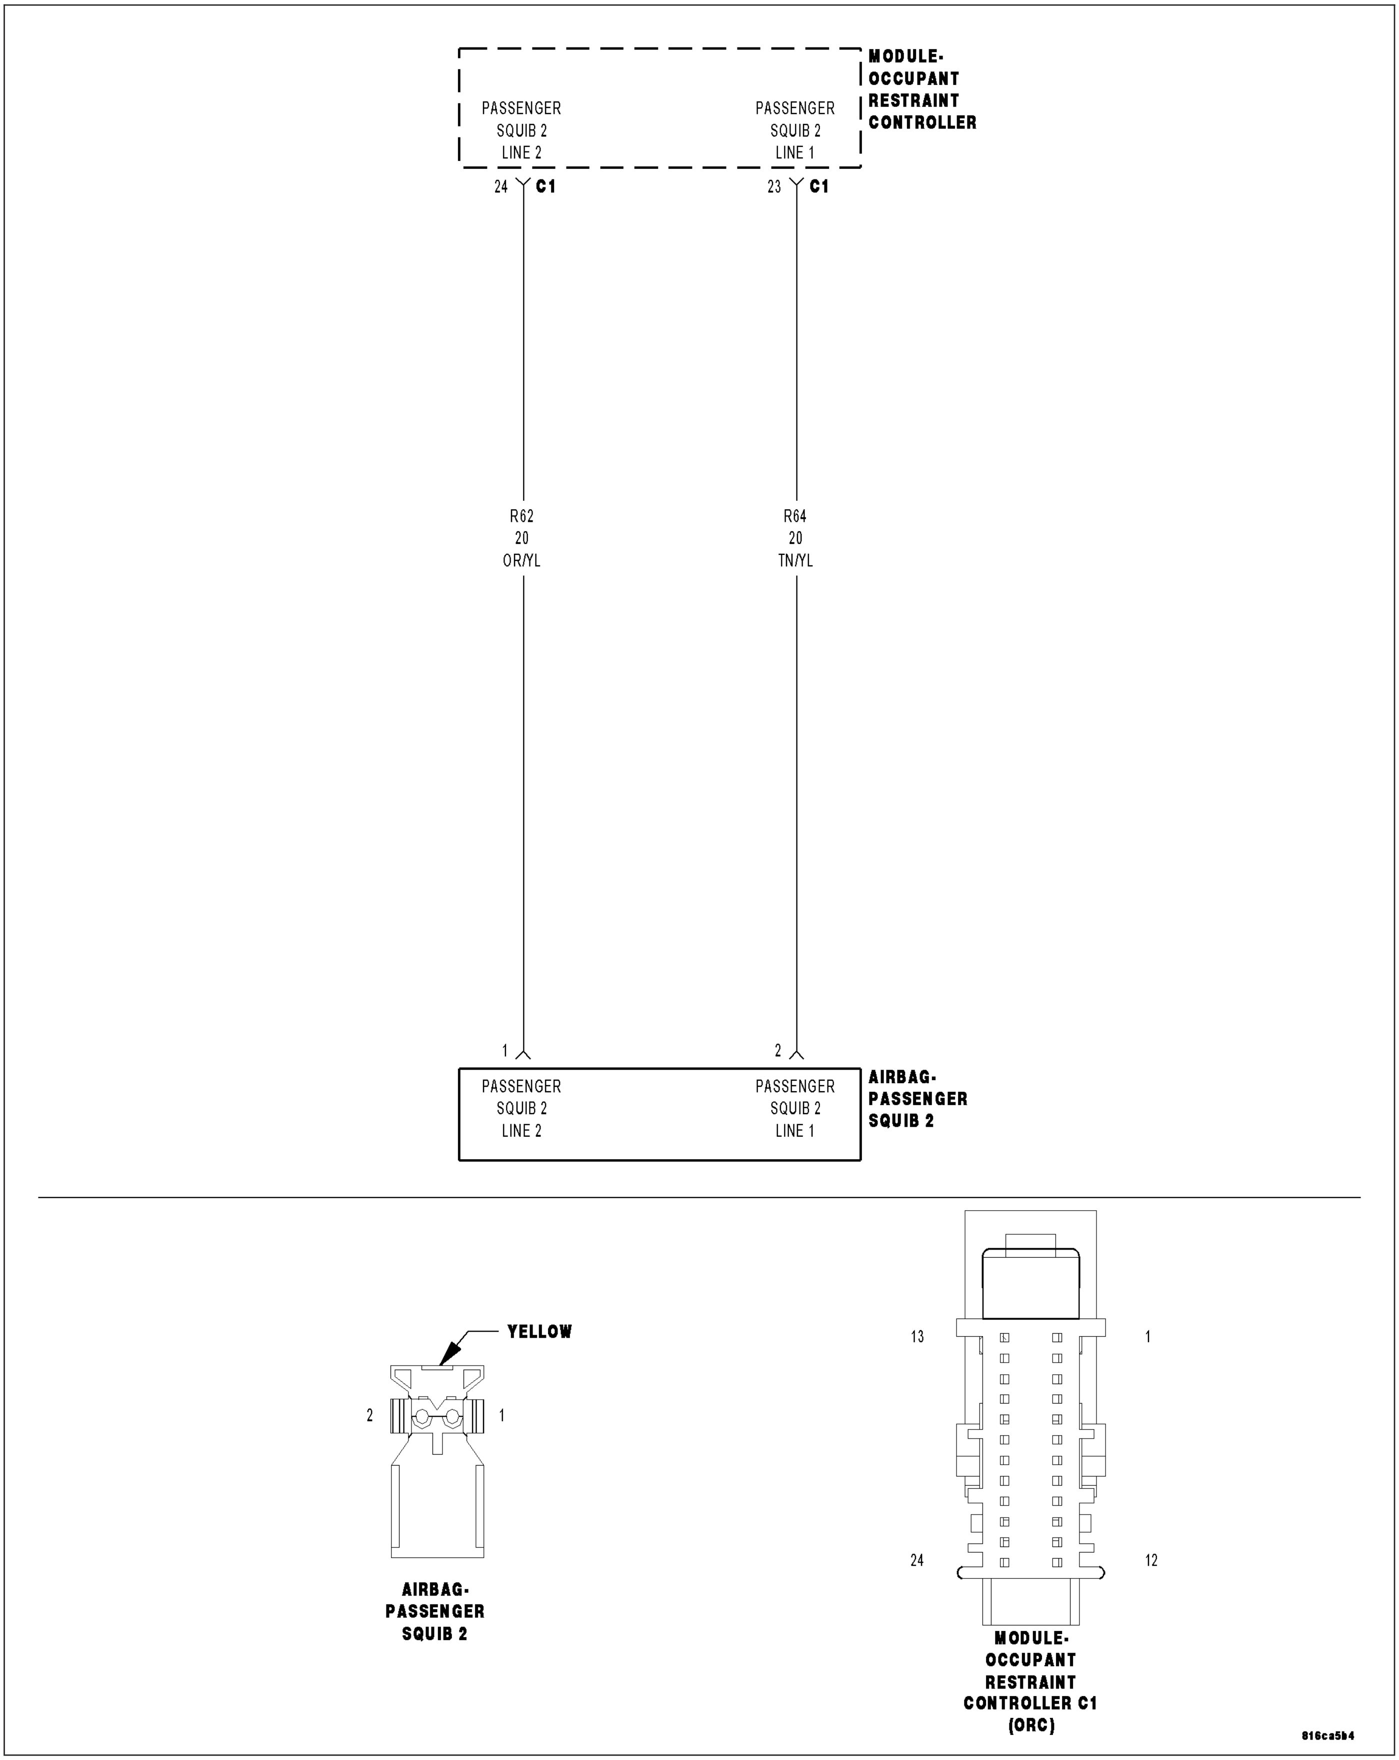
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SQUIB 2 CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits. The ORC will set this DTC if it detects an open or high resistance on the Passenger Squib 2 circuits.

| Possible Causes |
|---|
| (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OPEN |
| (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT OPEN |
| PASSENGER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR OPEN SQUIB CIRCUITS IN PASSENGER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Airbag Squib connector.

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

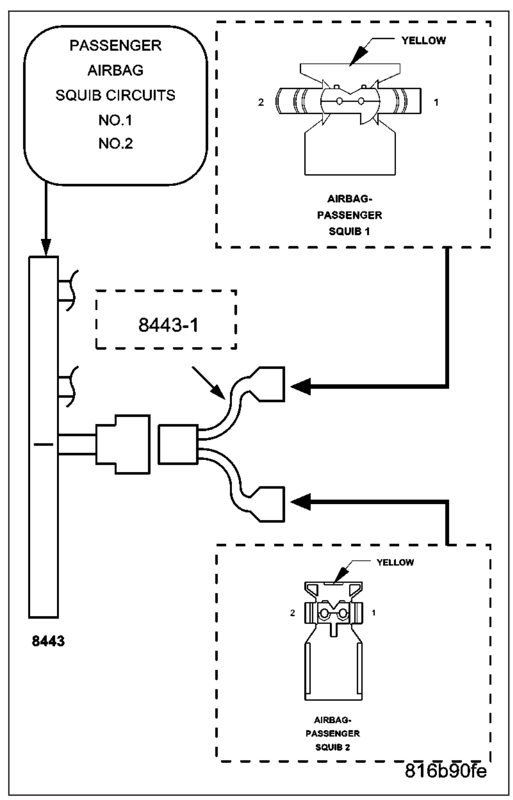
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

**Does the scan tool display: PASSENGER SQUIB 2 CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

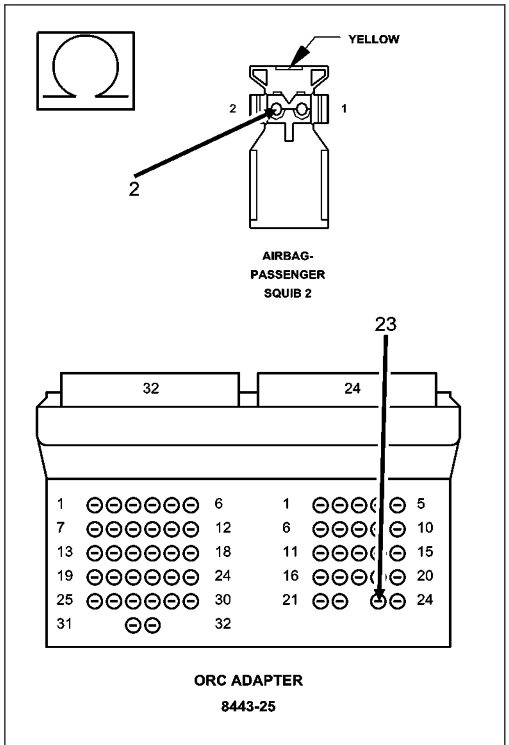
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between the Passenger Airbag Squib connector and the 8443 Load Tool ORC Adaptor.



816ba88e

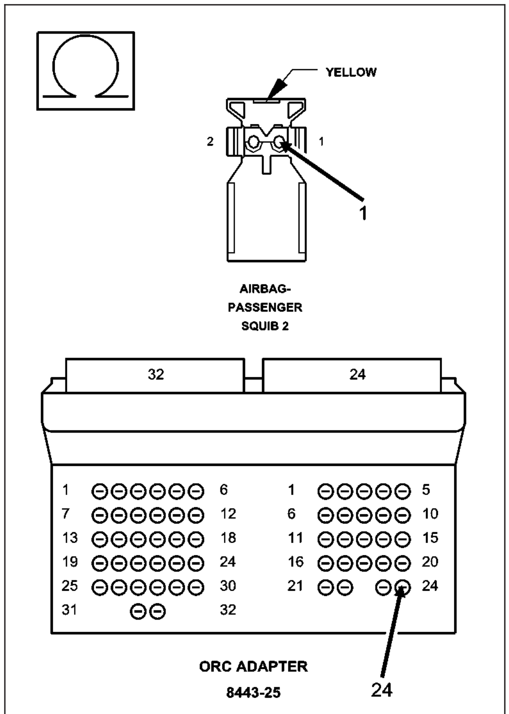
**Is the resistance below 1.0 ohm?**

**Yes** >> Go to 4

**No** >> Repair the (R64) Passenger Squib 2 Line 1 circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR AN OPEN

Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib connector and the 8443 Load Tool ORC Adaptor.



816bab49

**Is the resistance below 1.0 ohm?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (R62) Passenger Squib 2 Line 2 circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

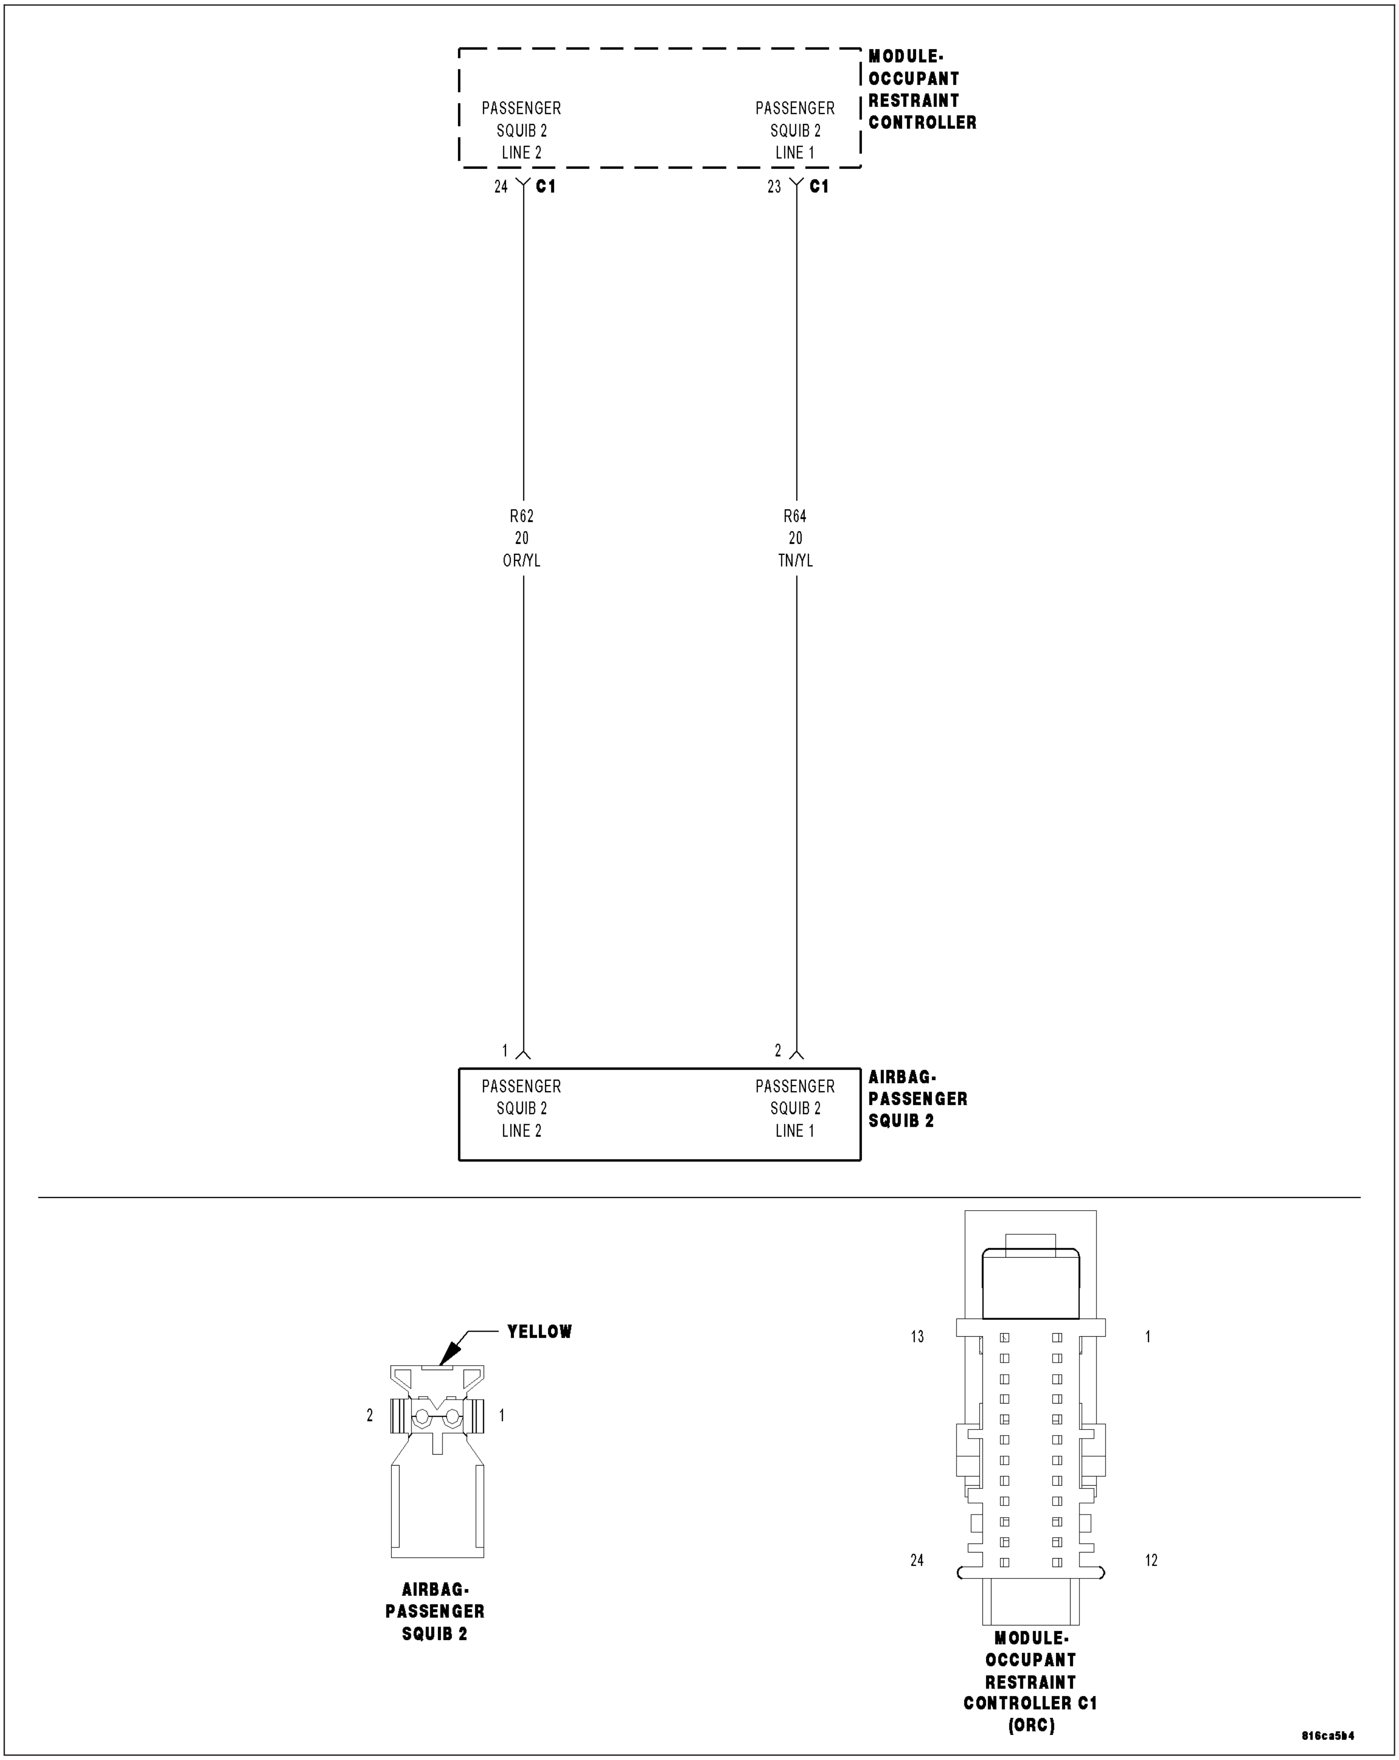
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SQUIB 2 CIRCUIT SHORT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits. The ORC will set this DTC if it detects low resistance between the Passenger Squib 2 circuits.

| Possible Causes |
|---|
| (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT |
| PASSENGER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Airbag Squib connector.

**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

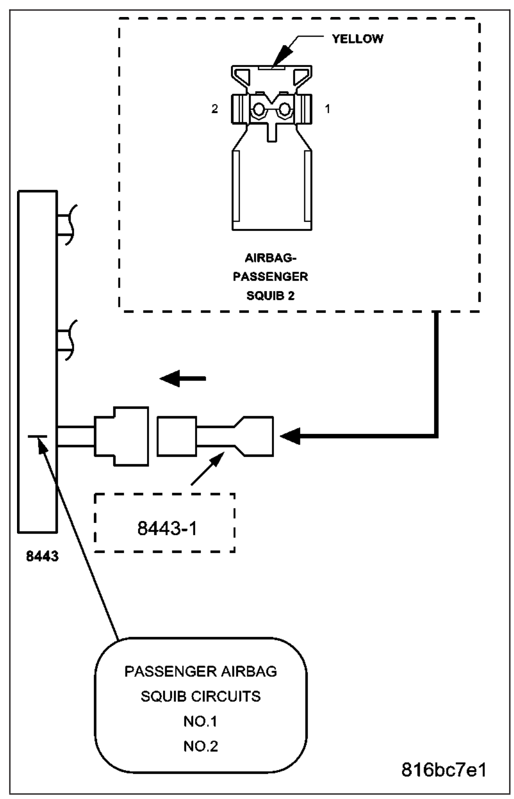
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery**

With the scan tool, read the active ORC DTCs.

**Does the scan tool display: PASSENGER SQUIB 2 CIRCUIT SHORT?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

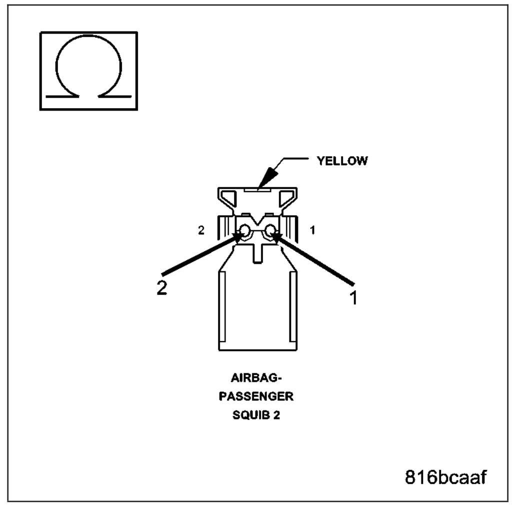
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance between the (R64) Passenger Squib 2 Line 1 circuit and the (R62) Passenger Squib 2 Line 2 circuit at the Passenger Airbag Squib connector.



**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R64) Passenger Squib 2 Line 1 circuit for a short to the (R62) Passenger Squib 2 Line 2 circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

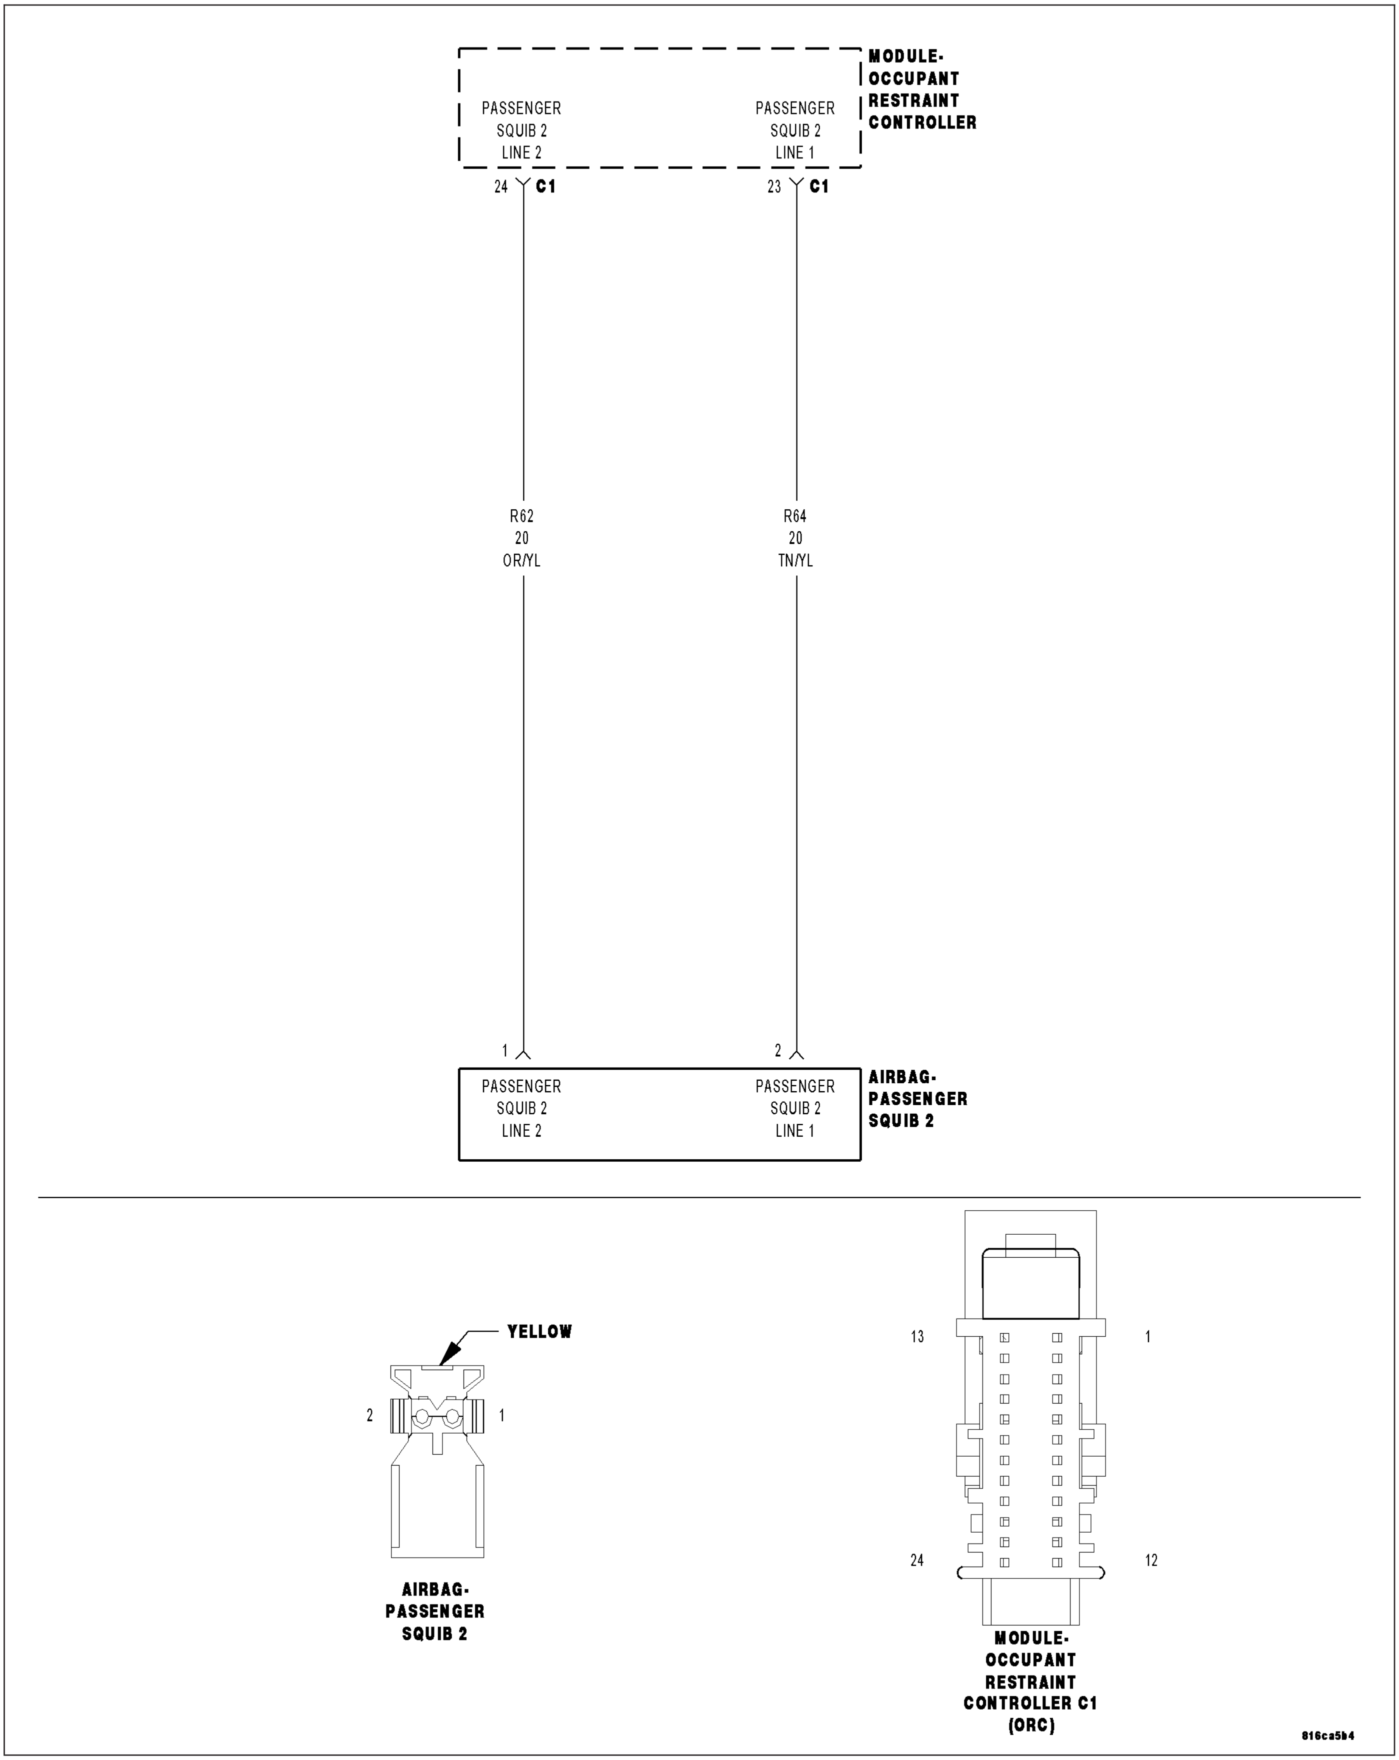
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SQUIB 2 SHORT TO BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage of the Passenger Squib 2 circuits. The ORC will set this DTC if it detects voltage on the Passenger Squib 2 circuits.

| Possible Causes |
|---|
| (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OR (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO BATTERY |
| PASSENGER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Airbag Squib connector.

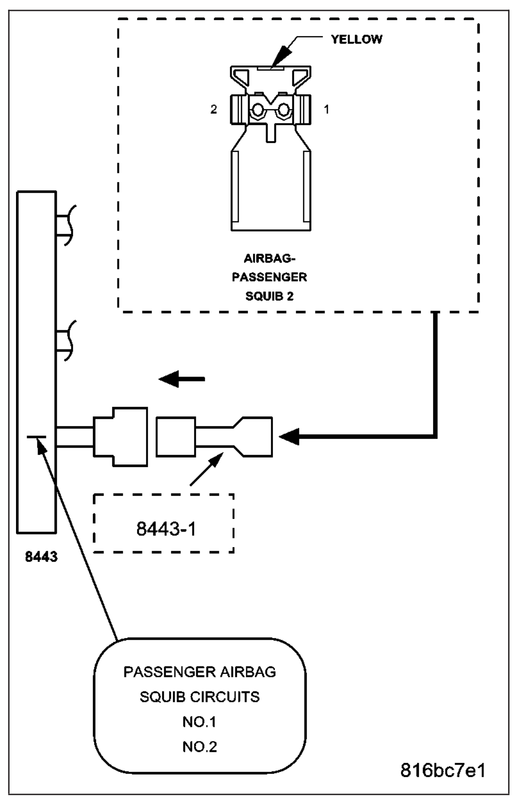
**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

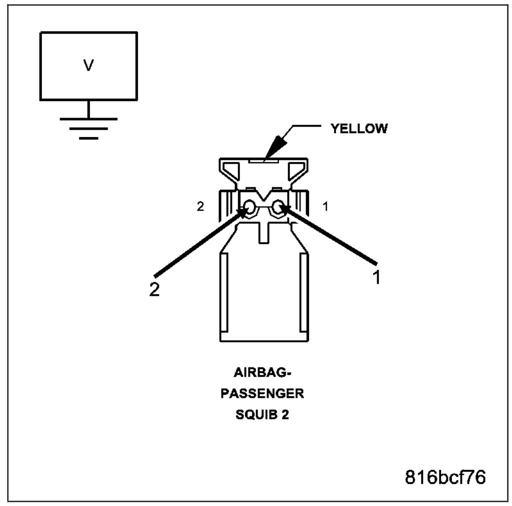


**Does the scan tool display: PASSENGER SQUIB 2 SHORT TO BATTERY?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO BATTERY



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the voltage of the (R64) Passenger Squib 2 Line 1 circuit between the Passenger Airbag Squib connector and ground.

Measure the voltage of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Passenger Squib 2 circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

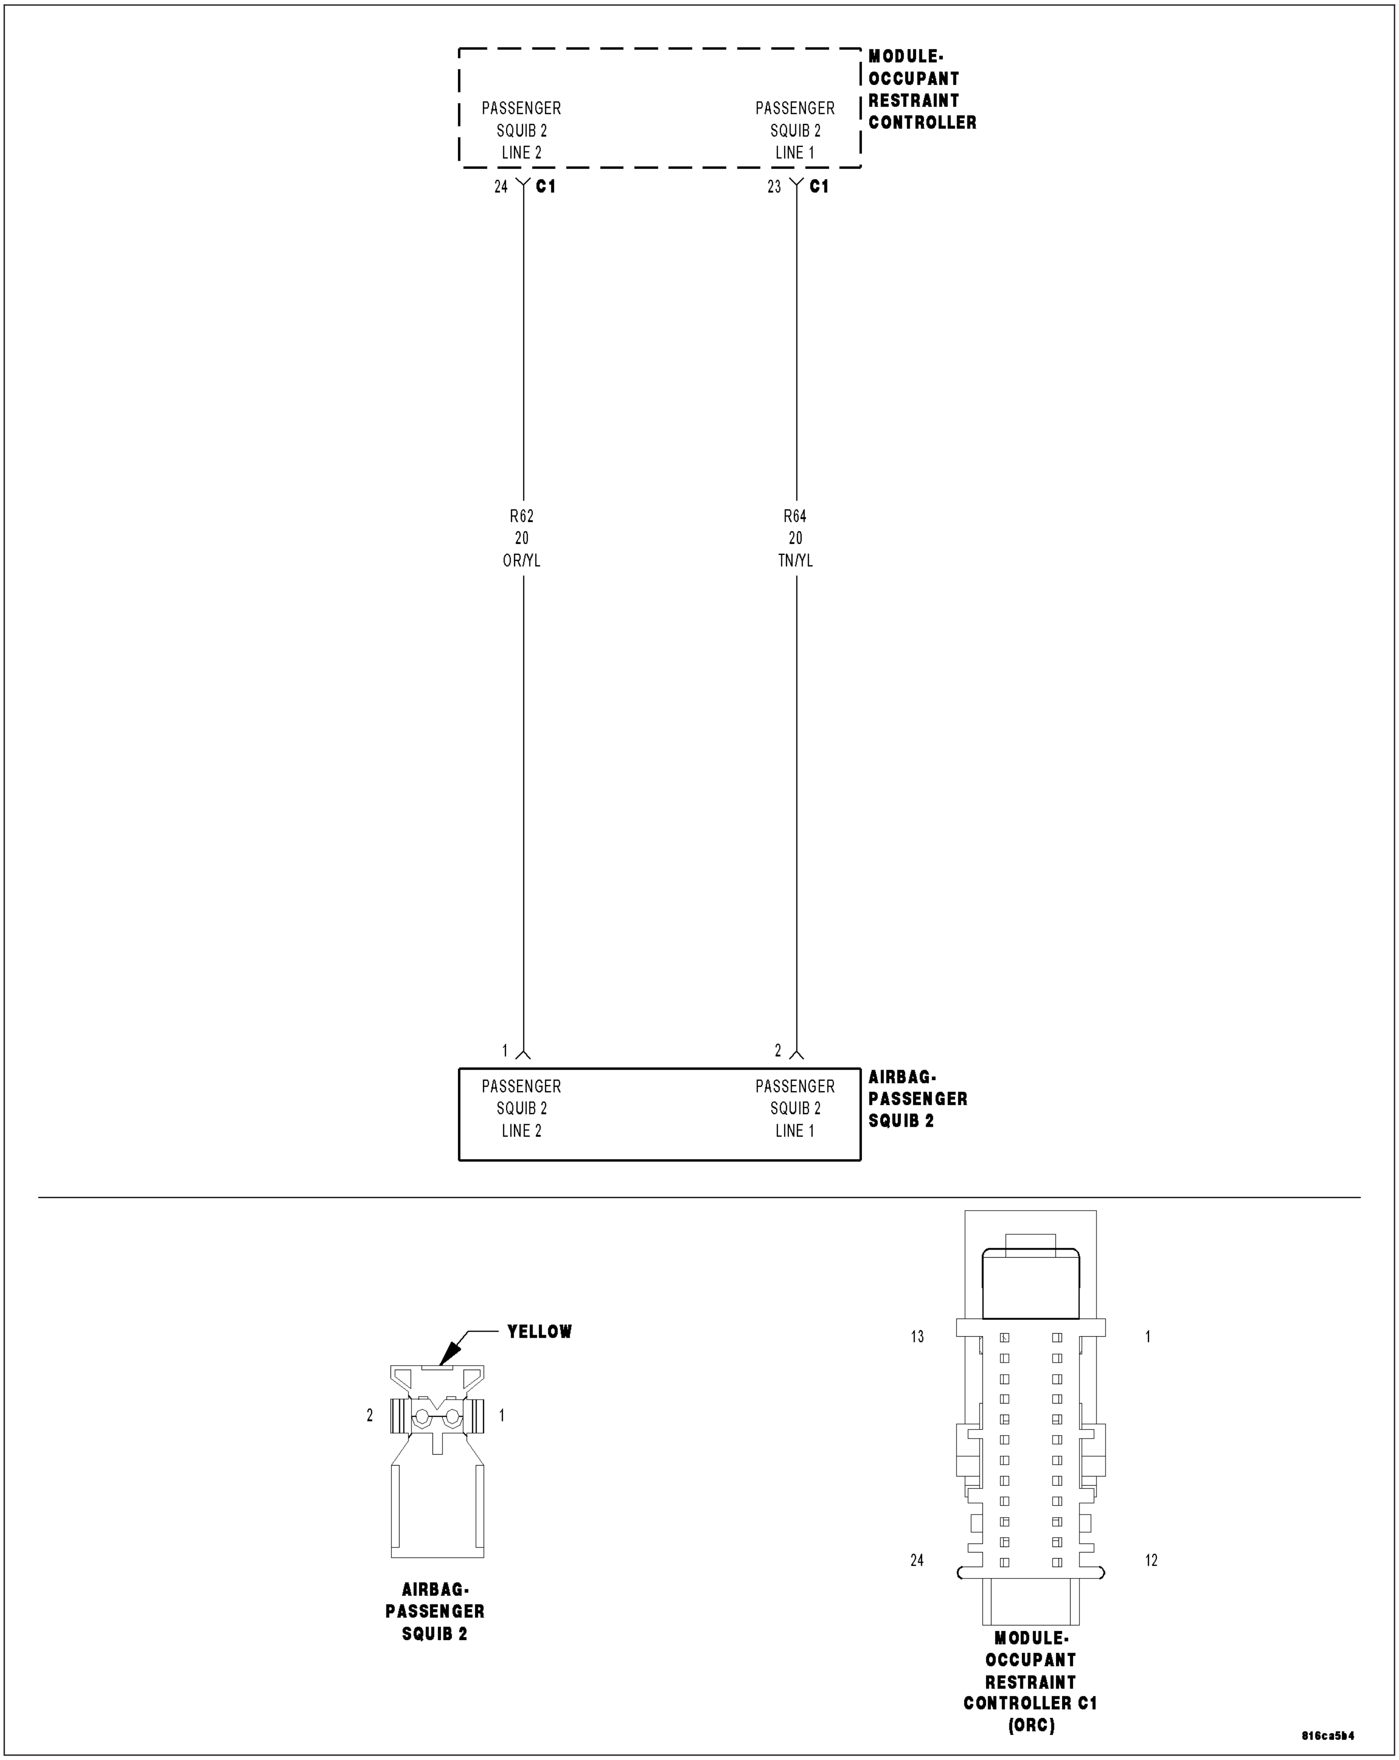
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PASSENGER SQUIB 2 SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits. The ORC will set this DTC if it detects low resistance on the Passenger Squib 2 circuits.

| Possible Causes |
| --- |
| (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OR (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO GROUND |
| PASSENGER AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Passenger Airbag Squib connector.

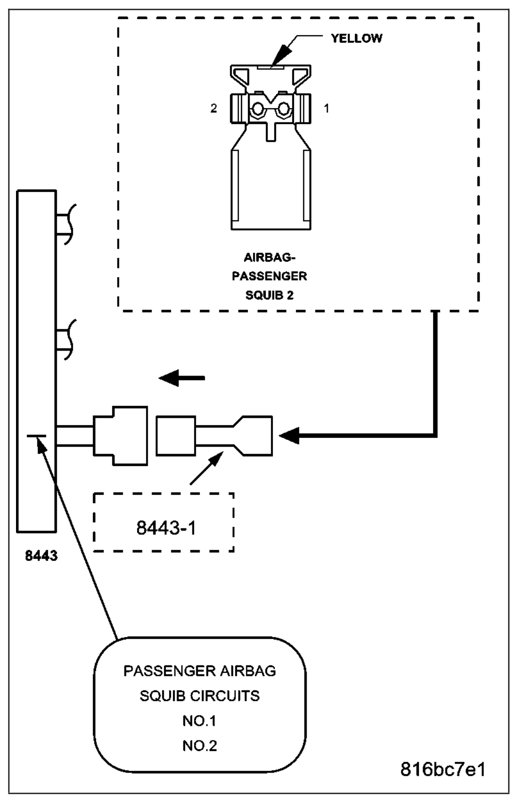
**WARNING: To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

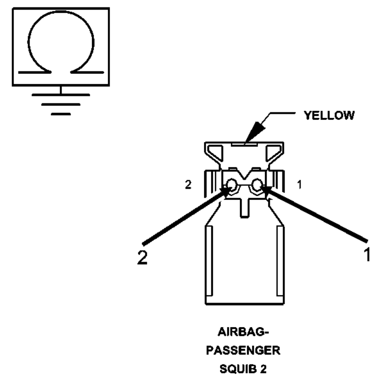


**Does the scan tool display: PASSENGER SQUIB 2 SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO GROUND



816bd885

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between ground and the Passenger Airbag Squib connector.

Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between ground and the Passenger Airbag Squib connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Passenger Squib 2 circuits with a resistance below 10K ohms for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

Wiggle the wiring harness and connectors of the related airbag circuit.

Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PCI BUS SHORT TO BATTERY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects a short to voltage on the PCI Bus circuit.

| Possible Causes |
|---|
| PCI BUS CIRCUIT SHORTED TO VOLTAGE |
| OCM |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

Turn the ignition on.

**NOTE: Ensure the battery is fully charged.**

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. DETERMINE THE CORRECT REPAIR

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Determine the correct repair by verifying if the front passenger seat has a Bladder and Cushion Service Kit as follows:

- If possible, check the vehicle's repair history.
- The Service Kit wiring harness uses tamper resistant material on the harness connector. Inspect for the tamper resistant material on the harness connector.

**Does the seat have a Bladder and Cushion Service Kit?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace the OCM in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. INSPECT THE RELATED BODY WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

Using the wiring diagram/schematic as a guide, inspect the related body wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

**Are any of these conditions present?**

**Yes** >> Repair as necessary in accordance with the Service Information.

**No** >> Go To 5

## 5. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## PCI BUS SHORT TO GROUND

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition.
- **Set Condition:**
  If the Occupant Classification Module (OCM) detects a short to ground on the PCI Bus circuit.

| Possible Causes |
|---|
| PCI BUS CIRCUIT SHORTED TO GROUND |
| OCM |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure the battery is fully charged.**
Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 3

### 2. DETERMINE THE CORRECT REPAIR

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**
Determine the correct repair by verifying if the front passenger seat has a Bladder and Cushion Service Kit as follows:

- If possible, check the vehicle's repair history.
- The Service Kit wiring harness uses tamper resistant material on the harness connector. Inspect for the tamper resistant material on the harness connector.

**Does the seat have a Bladder and Cushion Service Kit?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace the OCM in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. INSPECT THE RELATED BODY WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

Using the wiring diagram/schematic as a guide, inspect the related body wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

**Are any of these conditions present?**

**Yes** >> Repair as necessary in accordance with the Service Information.

**No** >> Go To 5

## 5. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit.
- If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

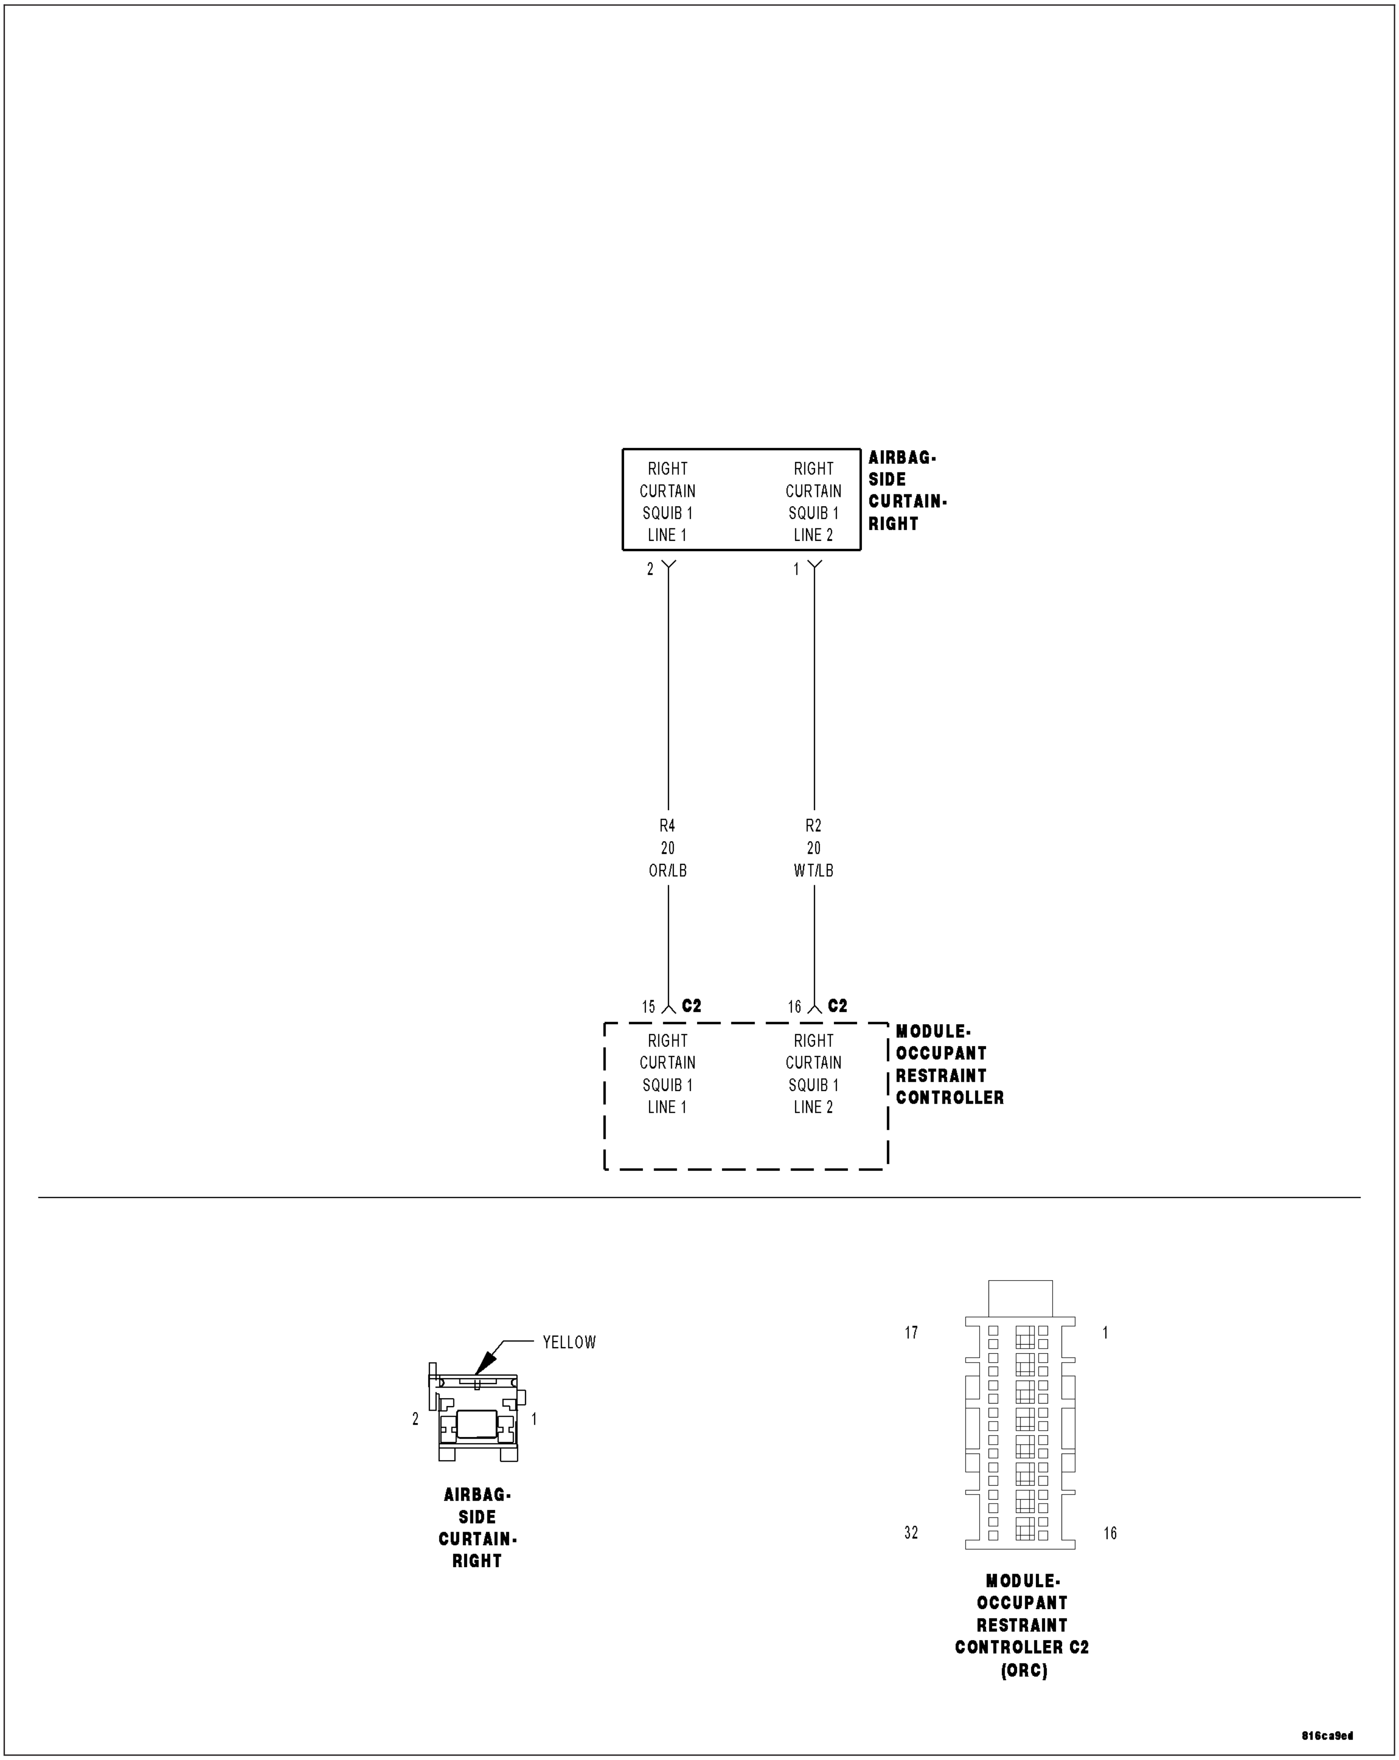
**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## RE-ZERO INCOMPLETE

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the OCS Verification system test is not run to completion after initiating the test.

Refer to **System Verification Required** for the diagnostic procedure.

## RIGHT CURTAIN SQUIB 1 CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits. The ORC will set this DTC if it detects an open or high resistance on the Right Curtain Squib 1 circuits.

| Possible Causes |
|---|
| (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT OPEN |
| (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT OPEN |
| RIGHT SIDE CURTAIN AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. CHECK FOR OPEN SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Right Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Right Side Curtain Airbag connector.

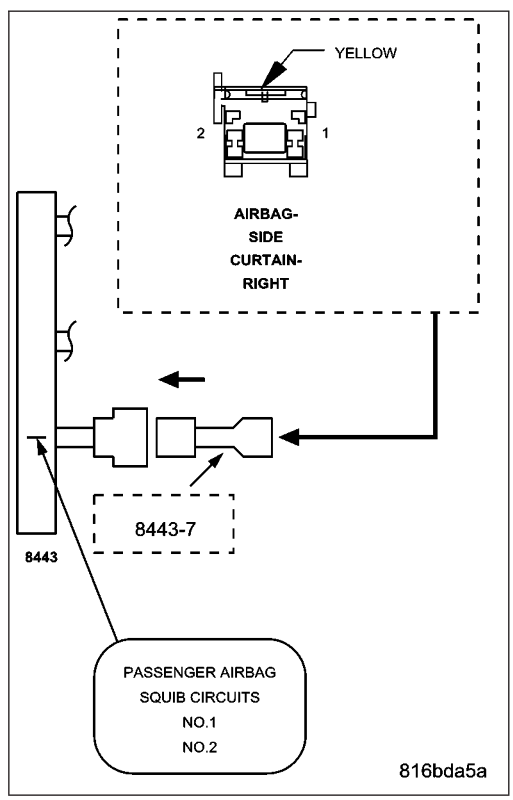
**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.

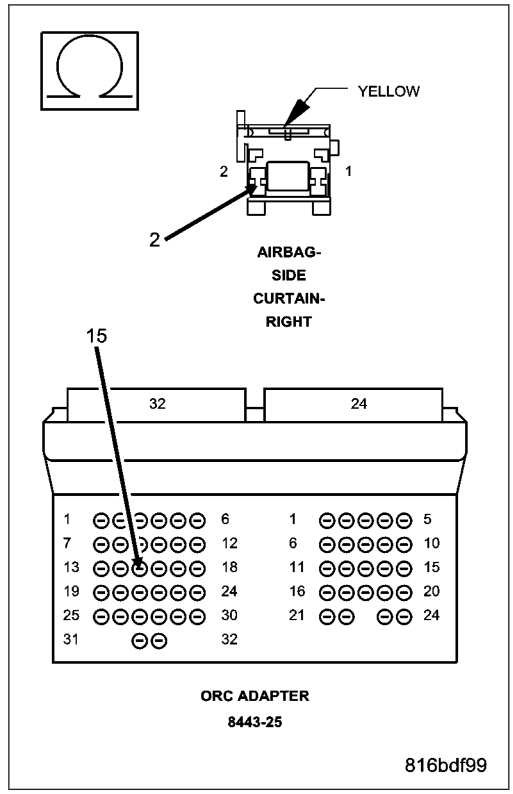
**Does the scan tool display: RIGHT CURTAIN SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go to 3

**No** >> Replace the Right Side Curtain Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R4) Right Curtain Squib 1 Line 1 circuit between the Right Side Curtain Airbag connector and the 8443 ORC Adaptor.

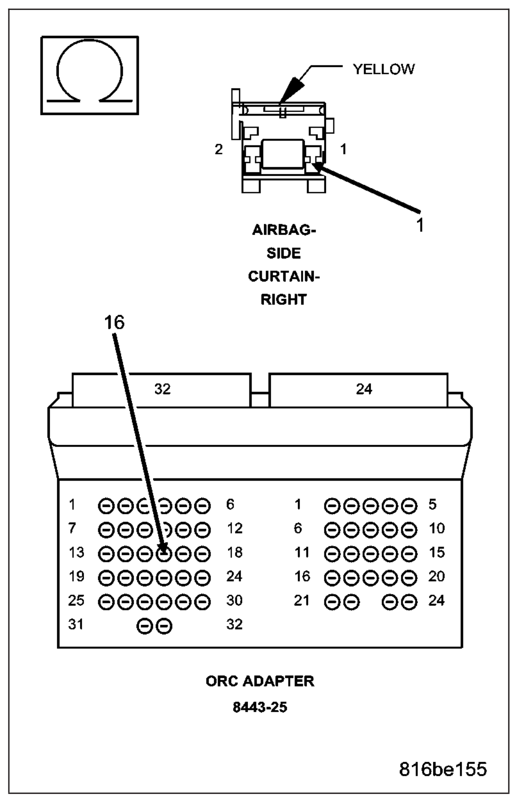
**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 4

**No** >> Repair the (R4) Right Curtain Squib 1 Line 1 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECK (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN



Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between the Right Side Curtain Airbag connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (R2) Right Curtain Squib 1 Line 2 circuit for an open.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

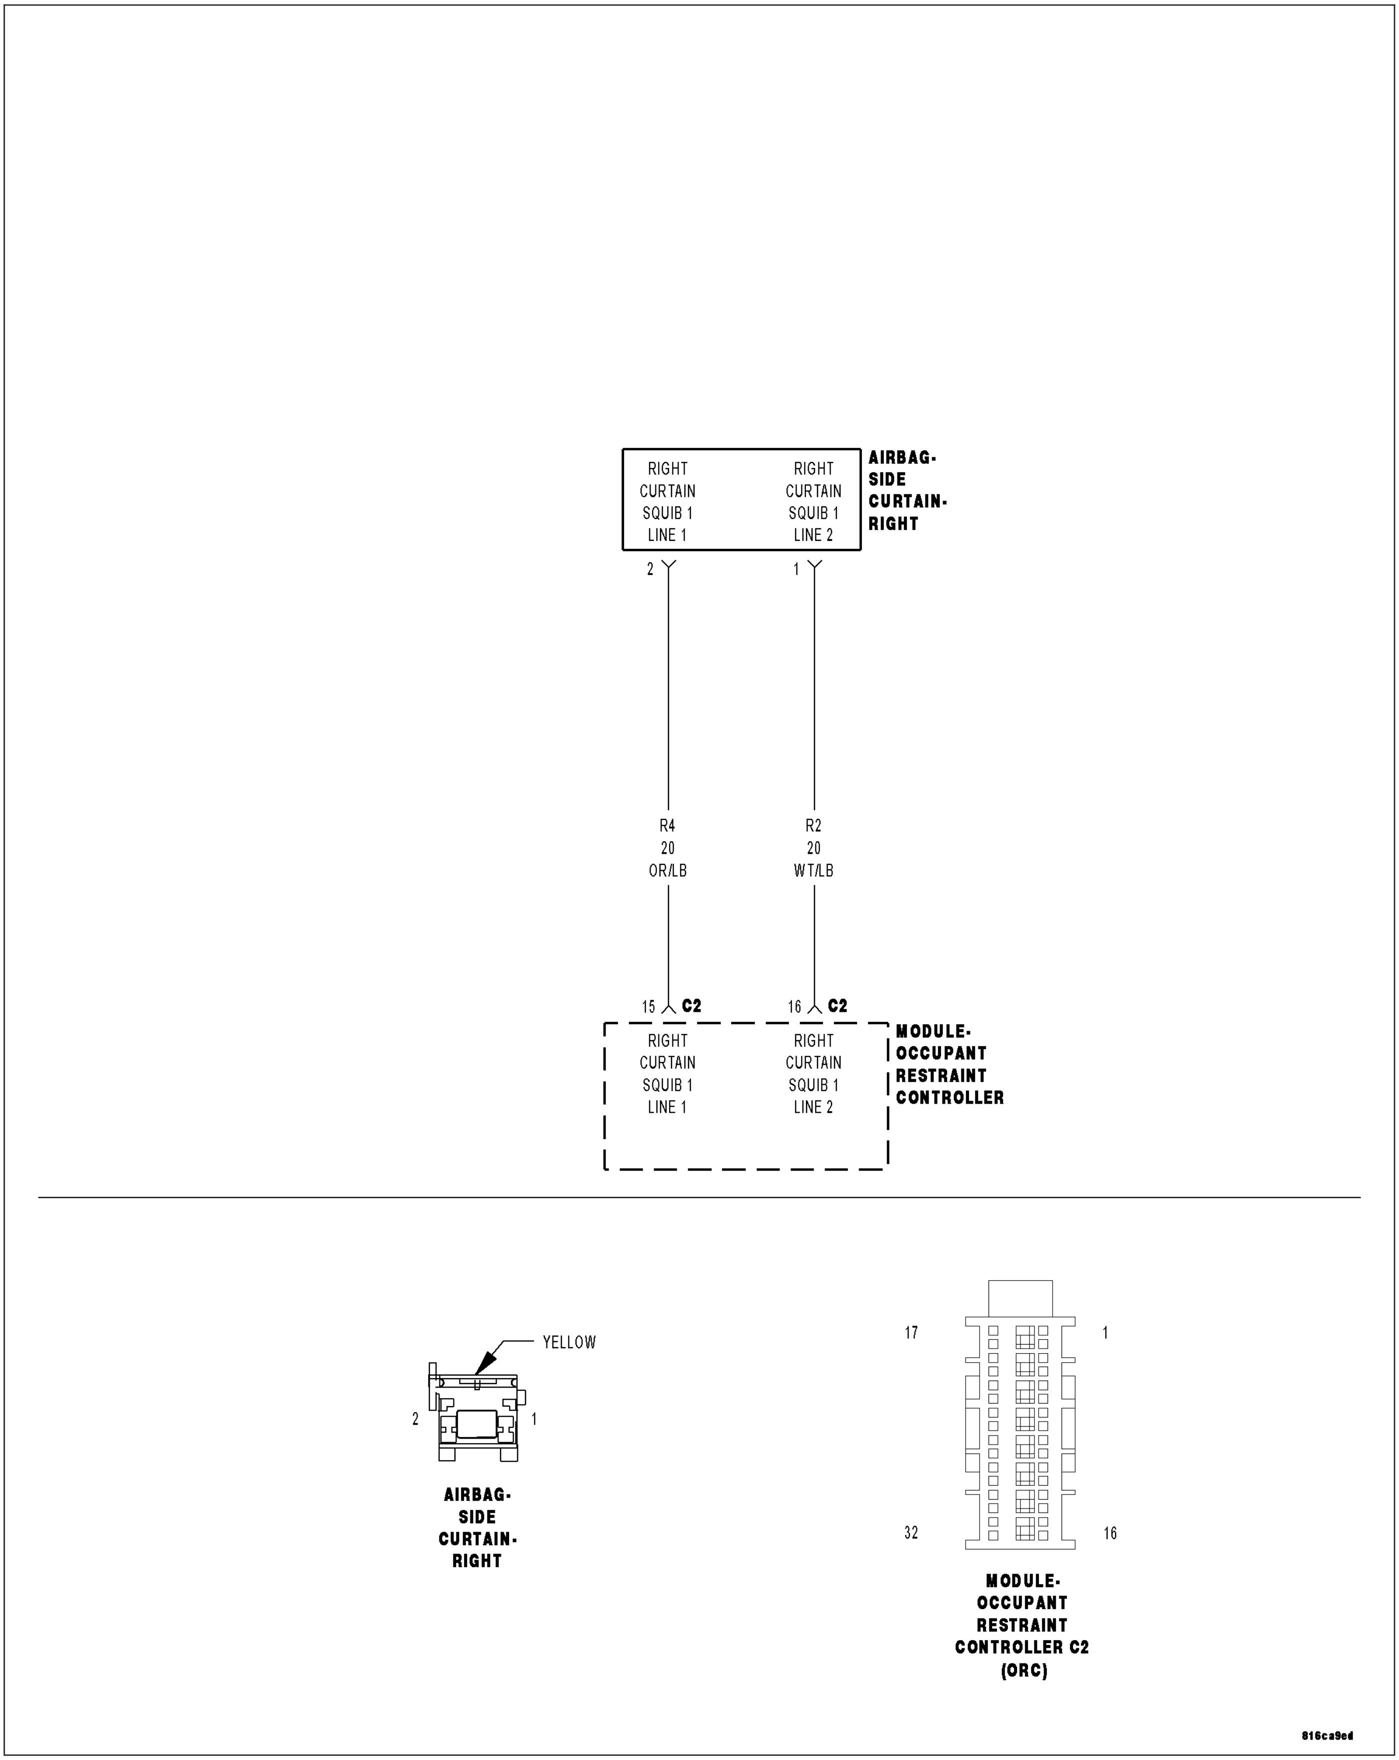
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## RIGHT CURTAIN SQUIB 1 CIRCUIT SHORT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits. The ORC will set this DTC if it detects low resistance between the Right Curtain Squib 1 circuits.

| Possible Causes |
|---|
| (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT |
| RIGHT SIDE CURTAIN AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Right Side Curtain Airbag connector.

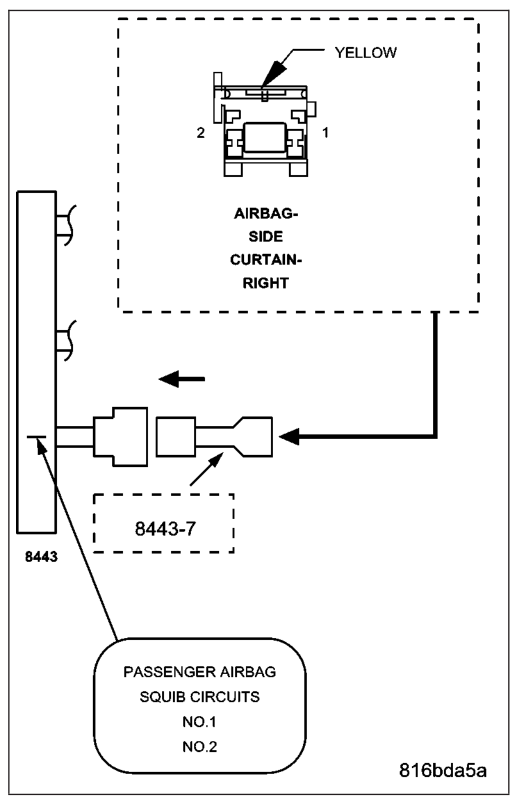
**WARNING: To avoid personal injury or death, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Right Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, read the active ORC DTCs.



**Does the scan tool display: RIGHT CURTAIN SQUIB 1 CIRCUIT SHORT?**

**Yes** >> Go to 3

**No** >> Replace the Right Side Curtain Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

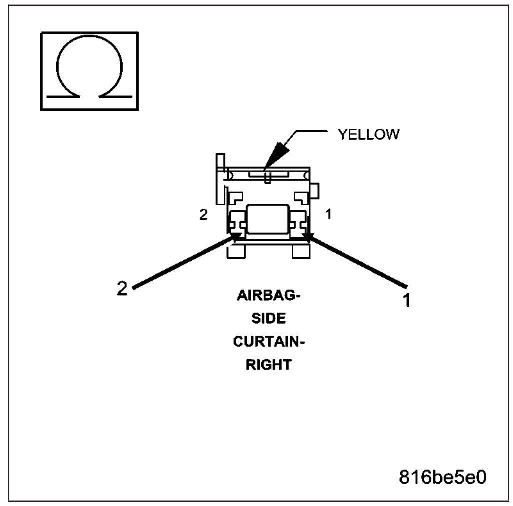
Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance between the (R4) Right Curtain Squib 1 Line 1 circuit and the (R2) Right Curtain Squib 1 Line 2 circuit at the Right Side Curtain Airbag connector.



**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R4) Right Curtain Squib 1 Line 1 circuit for a short to the (R2) Right Curtain Squib 1 Line 2 circuit.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

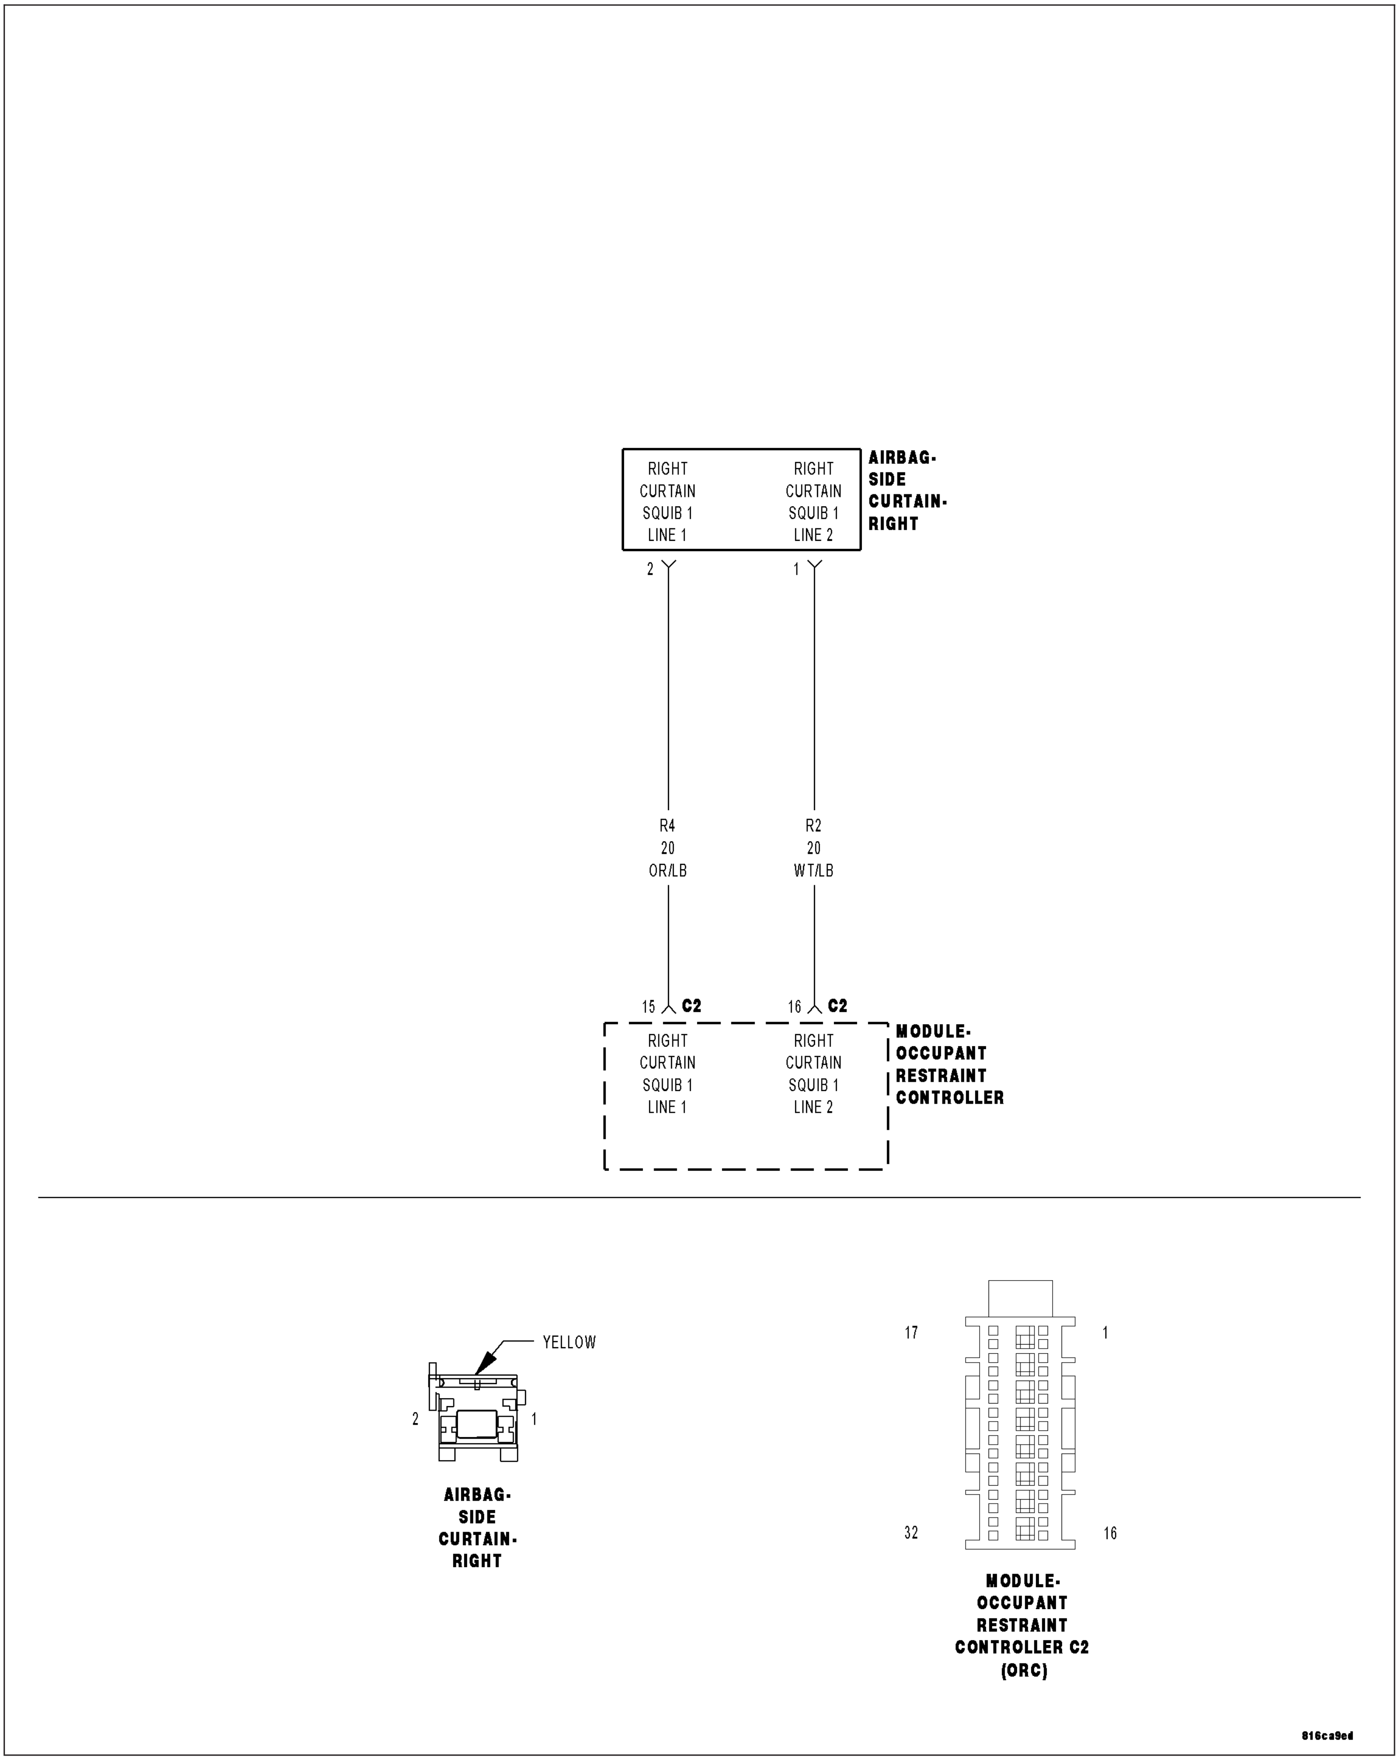
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## RIGHT CURTAIN SQUIB 1 SHORT TO BATTERY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the voltage on the Right Curtain Squib 1 circuits. The ORC will set this DTC if it detects voltage on the Right Curtain Squib 1 circuits.

| Possible Causes |
|---|
| (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT OR (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY |
| RIGHT SIDE CURTAIN AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**

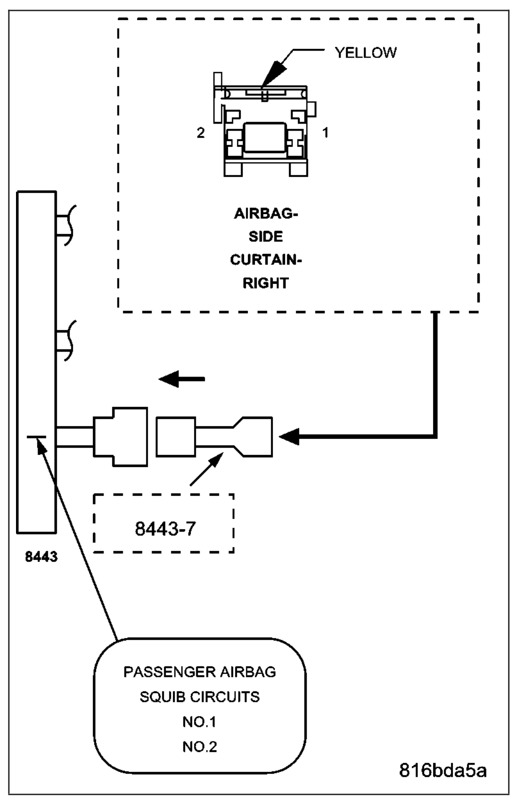
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the Right Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Right Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

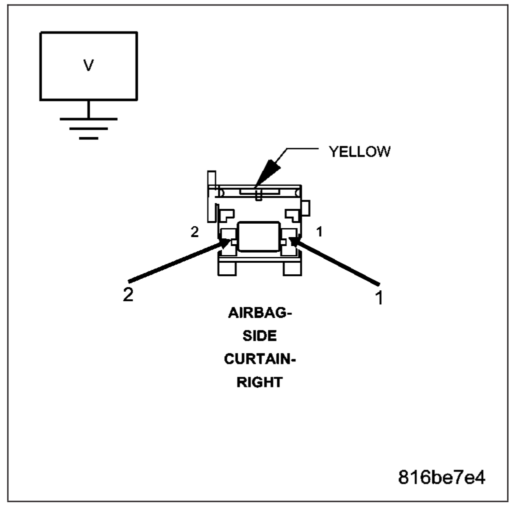
With the scan tool, read the active ORC DTCs.

**Does the scan tool display: RIGHT CURTAIN SQUIB 1 SHORT TO BATTERY?**

**Yes** >> Go To 3

**No** >> Replace the Right Side Curtain Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO BATTERY



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the voltage of the (R4) Right Curtain Squib 1 Line 1 circuit between the Right Side Curtain Airbag connector and ground.

Measure the voltage of the (R2) Right Curtain Squib 1 Line 2 circuit between the Right Side Curtain Airbag connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Right Curtain Squib 1 circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

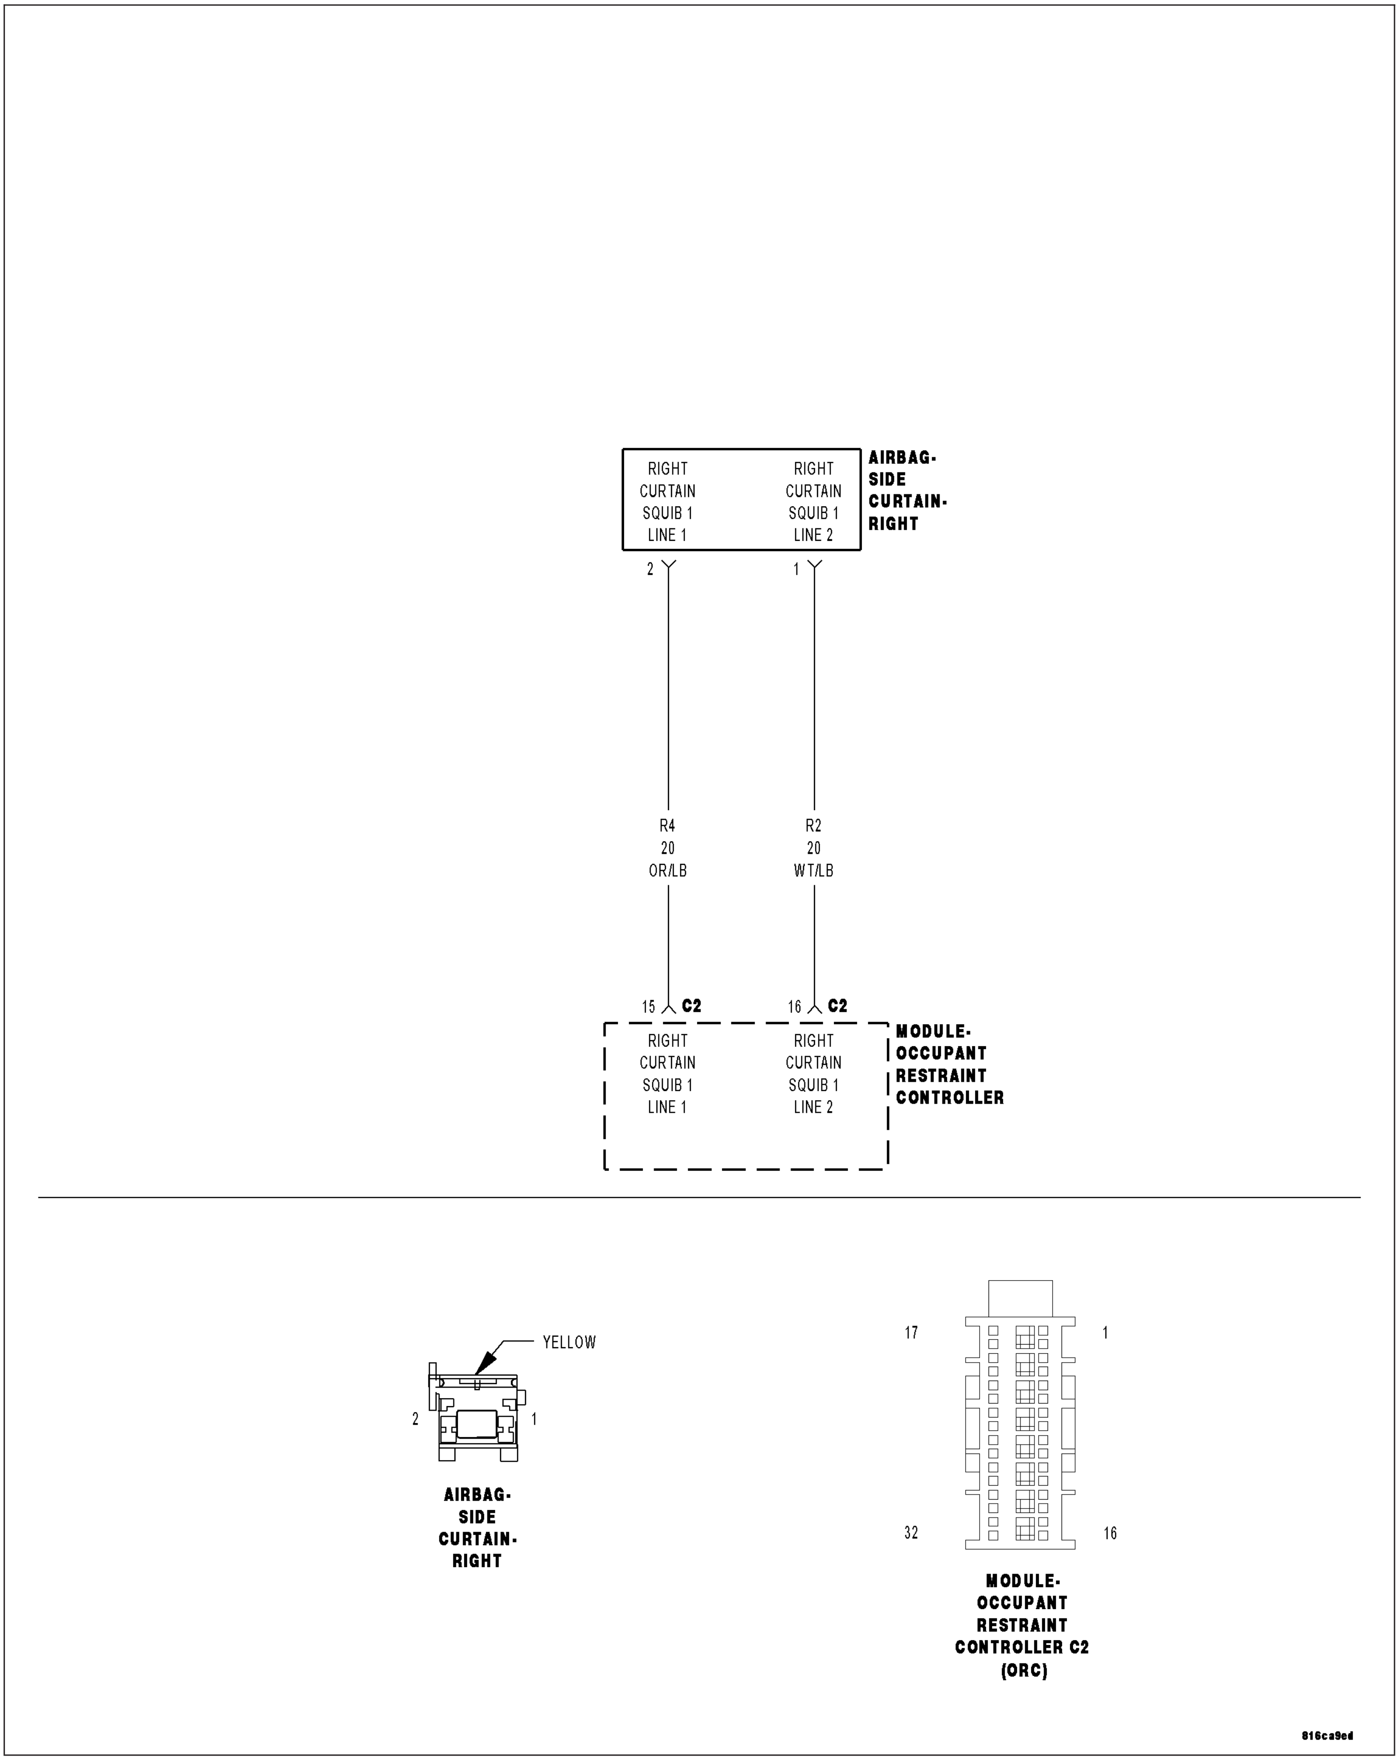
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## RIGHT CURTAIN SQUIB 1 SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits. The ORC will set this DTC if it detects low resistance on the Right Curtain Squib 1 circuits.

| Possible Causes |
|---|
| (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT OR (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND |
| RIGHT SIDE CURTAIN AIRBAG |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**

**NOTE: The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 4

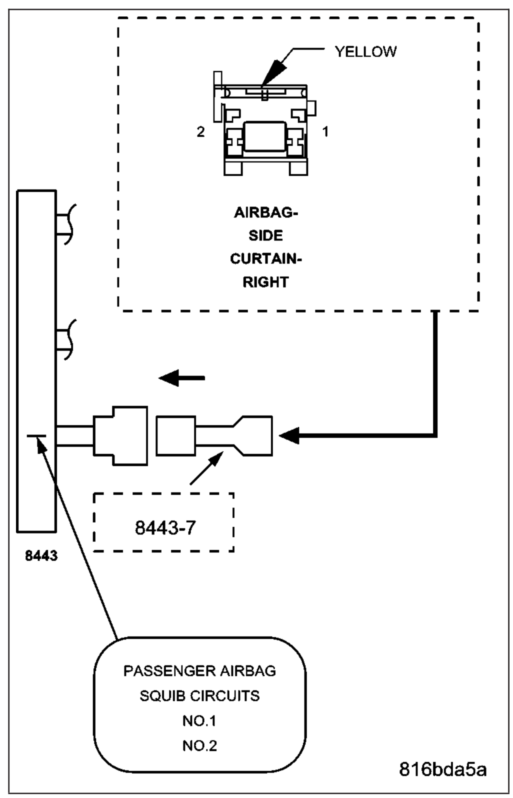
### 2. CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Right Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool and appropriate Jumper to the Right Side Curtain Airbag connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, read the active ORC DTCs.

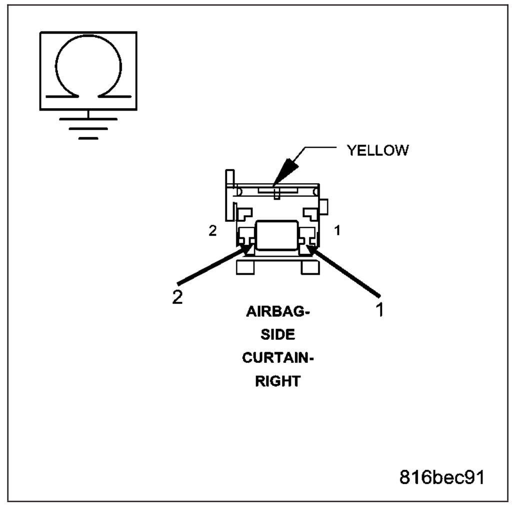


**Does the scan tool display: RIGHT CURTAIN SQUIB 1 SHORT TO GROUND?**

**Yes** >> Go To 3

**No** >> Replace the Right Side Curtain Airbag in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO GROUND



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

**NOTE: Check connectors - Clean and repair as necessary.**
Connect the 8443 Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (R4) Right Curtain Squib 1 Line 1 circuit between ground and the Right Side Curtain Airbag connector.

Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between ground and the Right Side Curtain Airbag connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Right Curtain Squib 1 circuits with a resistance below 10K ohms for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 4. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## RIGHT FRONT IMPACT SENSOR INTERNAL 1

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) supplies power to and communicates continuously with each impact sensor via each sensor's signal circuit. The power supply also enables each sensor's self-diagnostic capabilities. If an impact sensor detects an internal fault, it sends the applicable Impact Sensor Internal 1 message to the ORC. The ORC will set this DTC if it receives the Right Front Impact Sensor internal 1 message.

| Possible Causes |
|---|
| RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE |
| RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND |
| RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT |
| RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT OPEN |
| RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT OPEN |
| RIGHT FRONT IMPACT SENSOR |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 8

### 2. CHECK THE RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Occupant Restraint Controller (ORC) connector(s).

Disconnect the Right Front Impact Sensor connector.

**NOTE: Check connectors - Clean and repair as necessary.**

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the Right Front Impact Sensor Signal circuit between the Right Front Impact Sensor connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the Right Front Impact Sensor Signal circuit for a short to voltage.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the Right Front Impact Sensor Signal circuit between ground and the Right Front Impact Sensor connector.

**Is the resistance below 100k ohms?**

**Yes** >> Repair the Right Front Impact Sensor Signal circuit for a short to ground.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. CHECK THE RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT

Measure the resistance between the Right Front Impact Sensor Signal circuit and the Right Front Impact Sensor Ground circuit at the Right Front Impact Sensor connector.

**Is the resistance below 100k ohms?**

**Yes** >> Repair the Right Front Impact Sensor Signal circuit for a short to the Right Front Impact Sensor Ground circuit.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. CHECK THE RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN

Connect the appropriate Load Tool Adaptor to the ORC connector.

Measure the resistance of the Right Front Impact Sensor Signal circuit between the Right Front Impact Sensor connector and the Airbag Load Tool adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the Right Front Impact Sensor Signal circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 6. CHECK THE RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the Right Front Impact Sensor Ground circuit between the Right Front Impact Sensor connector and the Airbag Load Tool adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 7

**No** >> Repair the Right Front Impact Sensor Ground circuit for an open.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 7. REPLACE THE RIGHT FRONT IMPACT SENSOR AND THEN CHECK FOR ACTIVE DTCs

Replace the Right Front Impact Sensor in accordance with the Service Information.

Remove any special tools or jumper wires and reconnect all previously disconnected components, except the battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, erase all DTCs in all Airbag System Modules.

Turn the Ignition off, wait 15 seconds, then turn the Ignition on.

Wait one minute before proceeding.

With the scan tool, read active ORC DTCs.

**Does the scan tool display: RIGHT FRONT IMPACT SENSOR INTERNAL 1?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. TEST FOR AN INTERMITTENT CONDITION

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
- Continue the test until either a code becomes active or the problem area is isolated.

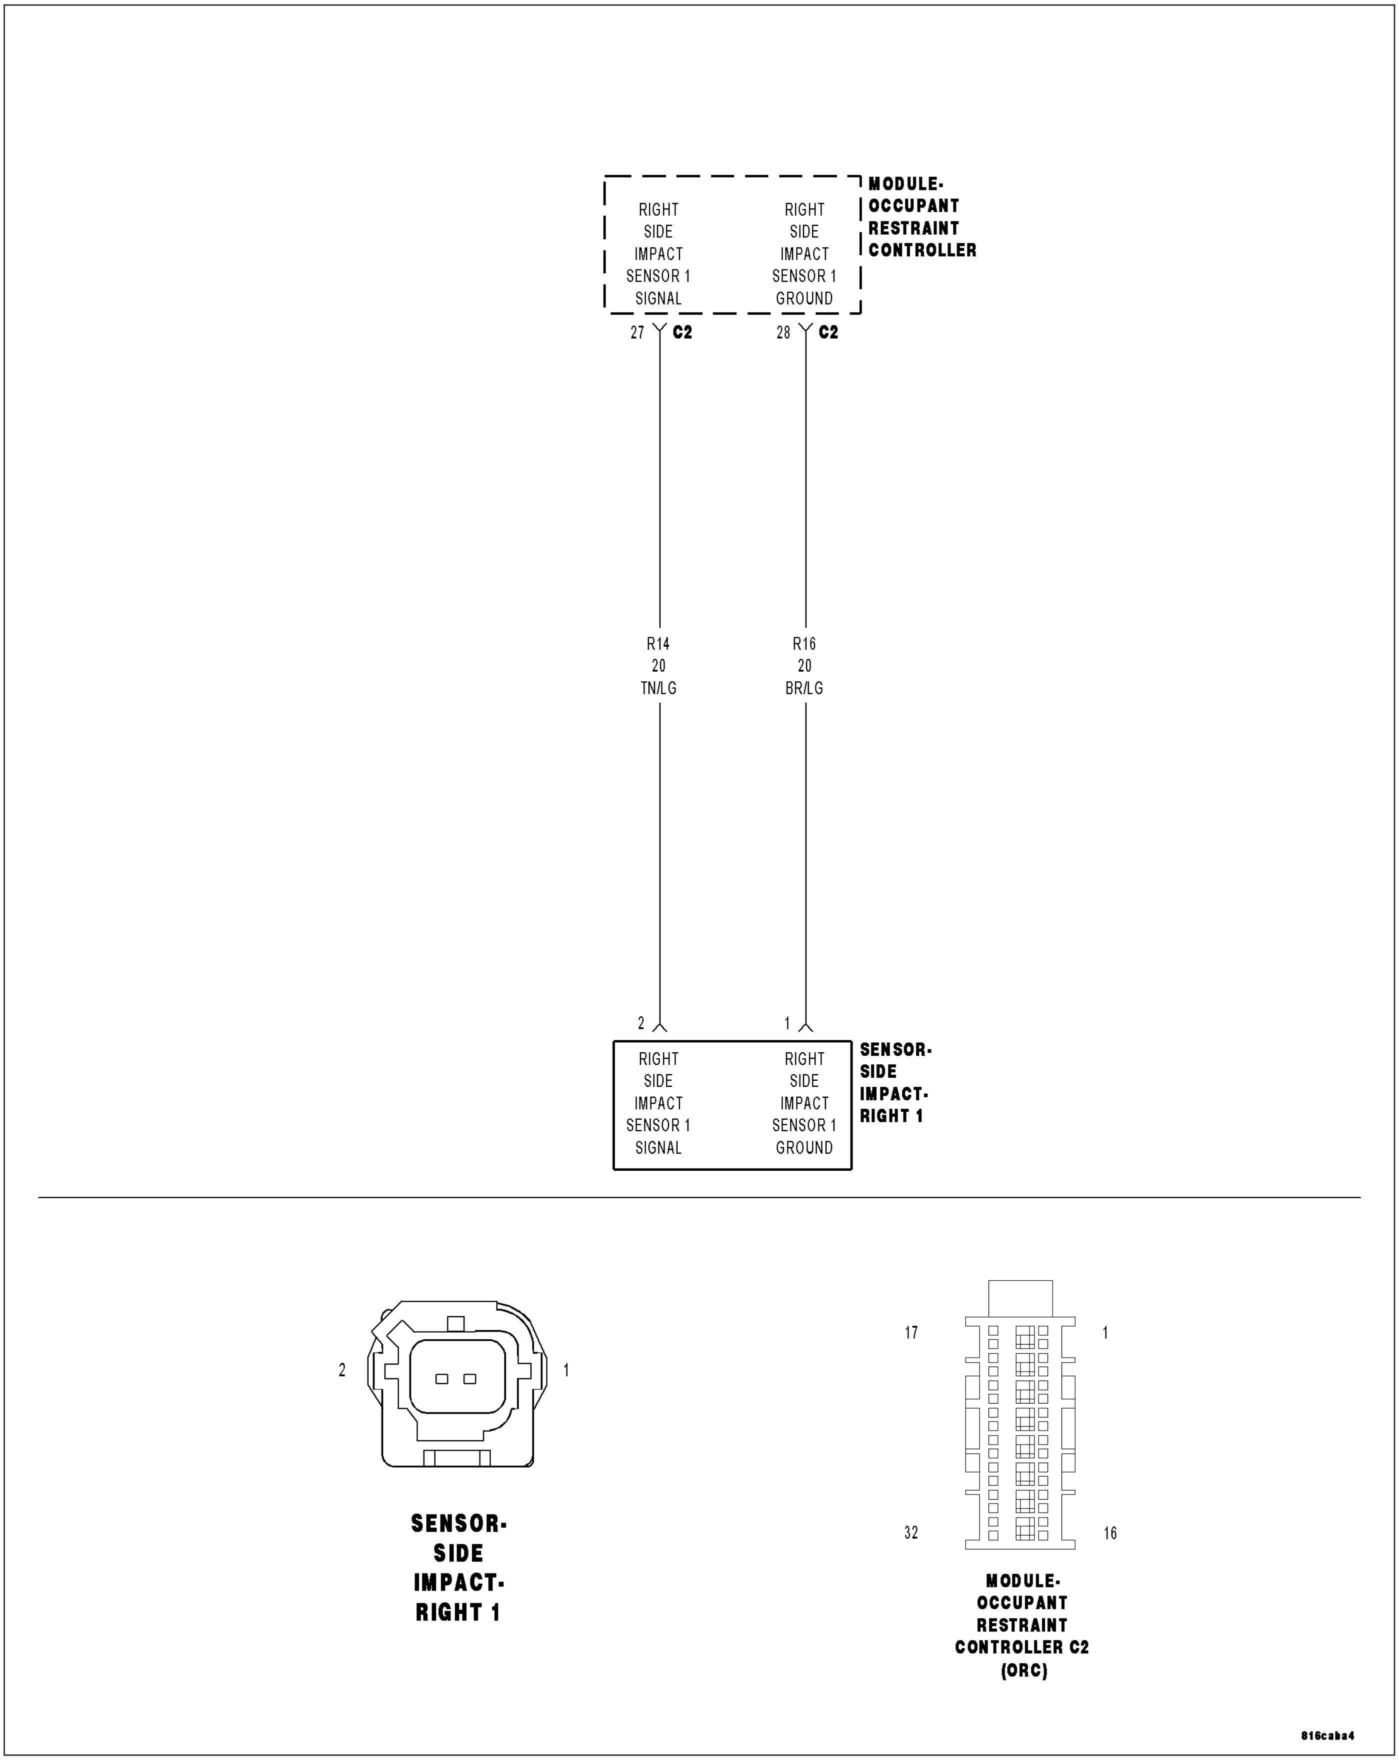
In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## RIGHT SIDE IMPACT SENSOR 1 INTERNAL 1



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) supplies power to and communicates continuously with each impact sensor via each sensor's signal circuit. The power supply also enables each sensor's self-diagnostic capabilities. If an impact sensor detects an internal fault, it sends the applicable Impact Sensor Internal 1 message to the ORC. The ORC will set this DTC if it receives the Right Side Impact Sensor internal 1 message.

| Possible Causes |
|---|
| (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO BATTERY |
| (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND |
| (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT |
| (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN |
| (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN |
| RIGHT SIDE IMPACT SENSOR 1 |
| ORC |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

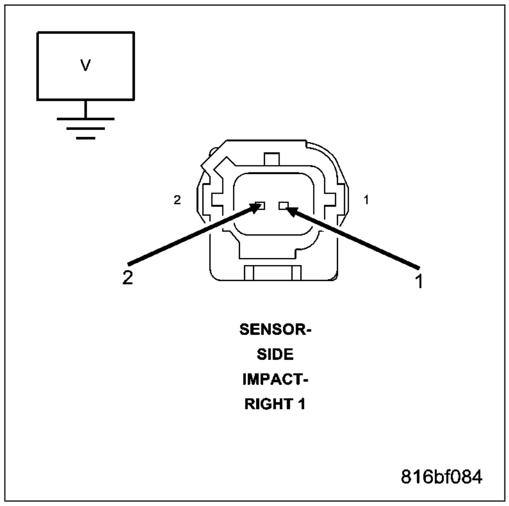
**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 8

### 2. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT AND THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR A SHORT TO BATTERY



**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Right side Impact Sensor 1 connector.

Disconnect the ORC connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the (R14) Right Side Impact Sensor 1 Signal circuit between the Right Side Impact Sensor 1 connector and ground.

Measure the voltage of the (R16) Right Side Impact Sensor 1 Ground circuit between the Right Side Impact Sensor 1 connector and ground.

**Is there any voltage present on either circuit?**

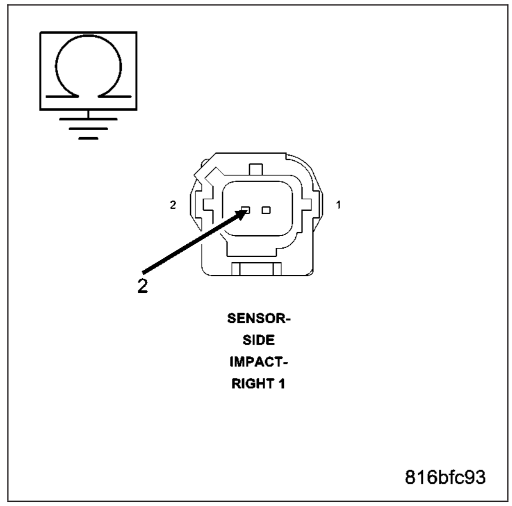
**Yes** >> Repair the circuits with voltage present for a short to battery.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between ground and the Right Side Impact Sensor 1 connector.



**Is the resistance below 100K ohms?**

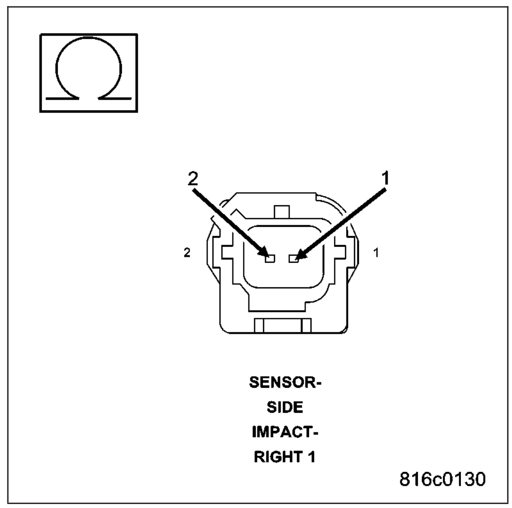
**Yes** >> Repair the (R14) Right Side Impact Sensor 1 Signal circuit for a short to ground.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT

Measure the resistance between the (R14) Right Side Impact Sensor 1 Signal circuit and the (R16) Right Side Impact Sensor 1 Ground circuit at the Right Side Impact Sensor 1 connector.



**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R14) Right Side Impact Sensor 1 Signal circuit for a short to the (R16) Right Side Impact Sensor 1 Ground circuit.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. CHECK THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

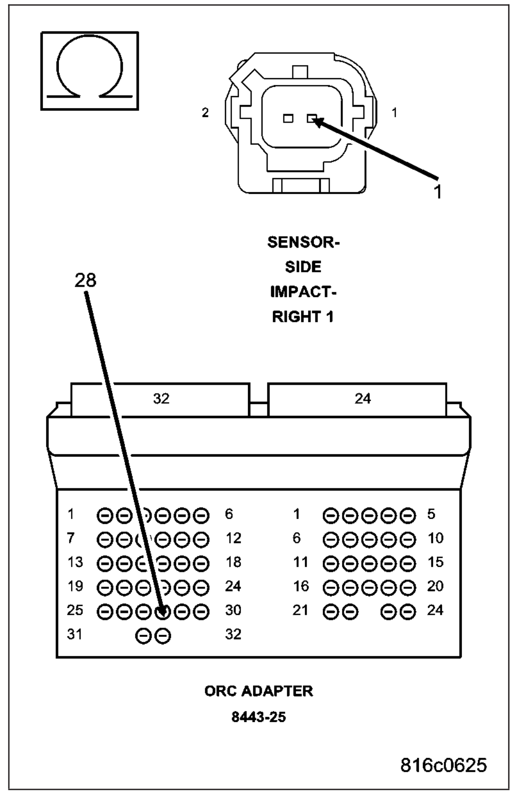
Connect the 8443 Load Tool ORC Adaptor to the Occupant Control Module connector.

Measure the resistance of the (R16) Right Side Impact Sensor 1 Ground circuit between the Right Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R16) Right Side Impact Sensor 1 Ground circuit for an open or high resistance.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



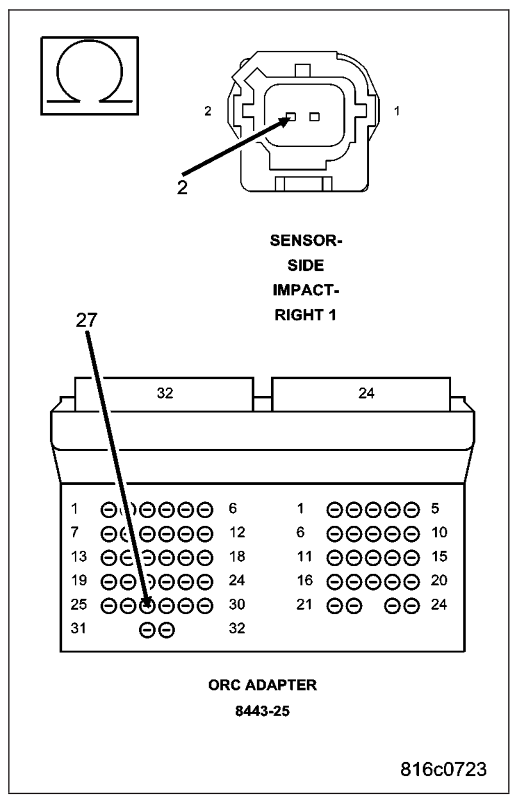
## 6. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the Right Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R14) Right Side Impact Sensor 1 Signal circuit for an open or high resistance.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.



## 7. CHECK THE RIGHT SIDE IMPACT SENSOR 1 OPERATION

Replace the Right Side Impact Sensor 1 in accordance with the Service Information.

Remove any special tools or jumper wires and reconnect all previously disconnected components, except the battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, erase all Airbag System Module DTCs.

Turn the Ignition Off, wait 15 seconds, then turn the Ignition On. Wait one minute before proceeding.

With the scan tool, read active ORC DTCs.

**Does the scan tool display: NO RIGHT SIDE IMPACT SENSOR 1 COMMUNICATION?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with Service Instructions.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related airbag circuit.
- Continue the test until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## SEAT NOT CALIBRATED

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If either the SYSTEM VERIFICATION REQUIRED test failed or if the Occupant Classification Module (OCM) is not calibrated.

Refer to **System Verification Required** for the diagnostic procedure.

## SQUIB CONFIGURATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Restraint Controller (ORC) monitors the resistance across its side airbag squib terminals to detect for side airbag squibs in the airbag system. The ORC will set this DTC if it is not configured for side airbags and it detects valid squib circuit resistance across these terminals.

| Possible Causes |
|---|
| POWERTRAIN CONTROL MODULE (PCM) |
| ORC |

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC.**

**Active DTC**
Go To 2

**Stored DTC**
Go To 3

#### 2. CHECK ORC CONFIGURATION

With the scan tool, read the VIN and the ORC part number. Verify that the VIN and the ORC part number match the vehicle.

**Is the correct ORC installed in the vehicle?**

**Yes** >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform NGC POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

**No** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

#### 3. TEST FOR AN INTERMITTENT CONDITION

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**
With the scan tool, record and erase all Airbag System Module DTCs.

**NOTE: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, monitor for active codes while performing the following:

Wiggle the wiring harness and connectors of the related airbag circuit.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question.

**Does the scan tool display any active DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## SYSTEM VERIFICATION REQUIRED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Occupant Classification Module (OCM) will set this DTC if either the Occupant Restraint Controller (ORC) broadcasts the airbag deployment message on the Bus, or following a complete seat replacement, or following an OCS Bladder and Cushion Kit installation.

| Possible Causes |
| --- |
| AIRBAG, CURTAIN, OR SEAT BELT TENSIONER DEPLOYED |
| SEAT REPLACED |
| OCS BLADDER AND CUSHION KIT INSTALLED |
| OCM |

### Diagnostic Test

#### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Verify that the scan tool has the latest software update before proceeding with this test.**

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 7

#### 2. VERIFY IF AN AIRBAG, CURTAIN, OR SEAT BELT TENSIONER DEPLOYED

Turn the ignition off.

Verify if an airbag, curtain, or seat belt tensioner deployed.

**Has an airbag, curtain, or seat belt tensioner deployed?**

**Yes** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Refer to the Service Information for a list of components that require inspection and replacement following an airbag, curtain, or tensioner deployment. Replace all required (per the Service Information), deployed, and damaged airbag system components in accordance with the service information.

Perform BELT TENSION SENSOR VERIFICATION test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. VERIFY IF OTHER OCS DTCs ARE ACTIVE

Verify if any of the following OCS DTCs are active:

- Passenger Fluid Level Too Low
- OCM Internal 1
- OCM Data Transfer Error
- Passenger Pressure Sensor Open
- Passenger Pressure Sensor Short To Ground
- Passenger Pressure Sensor Short To Battery
- Passenger Pressure Sensor Short Together
- Vehicle Body Style Mismatch
- VIN Mismatch

**Are any of these DTCs active?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this section for a complete list of Airbag System DTCs. When the repair is complete, Go To 4

**No** >> Go To 4

## 4. PERFORM THE OCS VERIFICATION SYSTEM TEST

**CAUTION: Do not perform this test step unless directed here by the previous test steps.**

**NOTE: The OCS Verification system test requires the use of special tool OCS Seat Weights MRL 9077.**

**NOTE: Verify that the vehicle's interior temperature and the passenger seat temperature are between 12.77°C (55°F) and 35°C (95°F) for at least 30 minutes before proceeding with this test.**

**NOTE: Active DTCs will set in the OCM until the scan tool displays the words The OCS has been Verified.**

Verify that the front passenger seat is empty and the seat belt is retracted.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool in OCM, select System Test and then select Verify OCS.

- Follow the directions displayed on the scan tool.
- Allow 30 seconds for the seat to stabilize after adding or removing weight from the seat before continuing with the test.
- Proceed as follows when the test is complete.

**Select the result:**

**The OCS has been Verified**
The OCS has passed the test and the repair is complete.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**Test Failed - No EOL Calibration**
Go To 5

**Test Failed - K Allow is FF**
Go To 5

**Test Failed - K Empty Count is 0**
Go To 5

**Test Failed - Active DTCs Present**
Correct the condition that caused the failure. Then Go To 6.

**Test Failed - Temperature Out of Range**
Correct the condition that caused the failure. Then, Go To 6.

**Test Failed - Seat Pressure Too High**
Correct the condition that caused the failure. Then, Go To 6.

**Test Failed - Seat Pressure Too Low**
Correct the condition that caused the failure. Then, Go To 6.

**Test Failed - Power Up Time Too Short**

Correct the condition that caused the failure. Then, Go To 6.

**Test Failed - Power Up Time Too Long**

Correct the condition that caused the failure. Then, Go To 6.

**Test Failed - Seat Pressure Not Stable**

Correct the condition that caused the failure. Then, Go To 6.

**Test Failed - Seat is Empty**

Correct the condition that caused the failure. Then, Go To 6.

**Test Failed - Weight Above Threshold**

Correct the condition that caused the failure. Then, Go To 6.

**Test Failed - Weight Below Threshold**

Correct the condition that caused the failure. Then Go To 6.

**Test Failed - Seat Occupied**

Correct the condition that caused the failure. Then, Go To 6.

## 5. REPLACE THE OCS BLADDER AND CUSHION KIT

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

**Repair**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information. Then, perform the System Verification Required test again to remove the DTC that set from making this repair.

## 6. PERFORM THE OCS VERIFICATION SYSTEM TEST AGAIN

With the scan tool in OCS, select System Test and then select OCS Verification.

- Follow the directions displayed on the scan tool.
- Allow 30 seconds for the seat to stabilize after adding or removing weight from the seat before continuing with the test.
- Active DTCs will set in the OCM until the scan tool displays the words “The OCS has been Verified.”
- Proceed as follows when the test is complete.

**Select the result:**

**The OCS has been Verified**

The OCS has passed the test and the repair is complete.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**Test Failed**

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information. Then, perform the System Verification Required test again to remove the DTC that set from making this repair.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 7. ERASE THE STORED DTC AND THEN CHECK IF DTC SETS ACTIVE

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase OCM DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

Wait one minute before proceeding.

With the scan tool, read active DTCs.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning the vehicle to the customer.

## VEHICLE BODY STYLE MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the ignition is on.
- **Set Condition:**
  The Powertrain Control Module (PCM) broadcasts the vehicle Body Style message on the Bus. The Occupant Restraint Controller (ORC) monitors the Bus for this message and will set this DTC if it does not receive this message.
  The Occupant Classification Module (OCM) is programmed for a specific body style. Installing a module intended for a different body style (incorrect part number) will set this DTC.

| Possible Causes |
|---|
| POWERTRAIN CONTROL MODULE (PCM) |
| OCCUPANT RESTRAINT CONTROLLER (ORC) |
| OCCUPANT CLASSIFICATION MODULE (OCM) |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**Select ACTIVE or STORED DTC:**

**ACTIVE ORC DTC**
Go To 2

**STORED ORC DTC**
Go To 5

### 2. VERIFY THAT THE PCM IS PROGRAMMED WITH THE CORRECT VIN

With the scan tool, select System Tests and select VIN Verification.

Compare the VIN displayed by the Scan Tool and the VIN on the Vehicle VIN plate.

**Does the current VIN match the VIN on the vehicle VIN plate?**

**Yes** >> Go To 3

**No** >> Replace and program the PCM in accordance with the Service Information.
Perform NGC POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

### 3. VERIFY THAT THE PCM IS BROADCASTING THE CORRECT BODY STYLE

With the scan tool, check for active DTCs in the ORC.

**Does the scan tool display VEHICLE BODY STYLE MISMATCH active DTC?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> 4

## 4. VERIFYING OCM REPLACEMENT PART

With the scan tool, check for active DTCs in the OCM.

**Does the scan tool display VEHICLE BODY STYLE MISMATCH active DTC?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the OCM in accordance with the Service Information.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. CHECKING STORED OR INTERMITTENT CODES

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

Turn the ignition off, wait 15 seconds, then turn the ignition on.

With the scan tool, check for active DTCs in the ORC and OCM.

**Does the scan tool display any DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in the applicable section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## VIN MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Powertrain Control Module (PCM) broadcasts the current VIN on the Bus. The Occupant Classification Module (OCM) will set this DTC if the VIN stored in the OCM does not match the current VIN.

| Possible Causes |
|---|
| PCM COMMUNICATION FAILURE |
| SEAT OR OCS COMPONENTS SERVICED WITH PARTS FROM ANOTHER VEHICLE |
| PCM |
| OCM |

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**NOTE: Ensure that the battery is fully charged.**
Turn the ignition on.

**SELECT ACTIVE or STORED DTC:**

**ACTIVE DTC**
Go To 2

**STORED DTC**
Go To 5

### 2. VERIFY THAT THE PCM IS PROGRAMMED WITH THE CORRECT VIN

With the scan tool, select System Tests and select VIN Verification.

Compare the current VIN displayed by the Scan Tool and the VIN on the Vehicle VIN plate.

**Does the current VIN match the VIN on the vehicle VIN plate?**

**Yes** >> Go To 3

**No** >> Replace and program the PCM in accordance with the Service Information.
Perform NGC POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

### 3. VERIFY IF EITHER THE FRONT PASSENGER SEAT OR ANY OCS COMPONENTS WERE SWAPPED FROM ANOTHER VEHICLE

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**
Verify if either the front passenger seat or any Occupant Classification System (OCS) components were swapped from another vehicle.

**Were either the front passenger seat or any OCS components swapped from another vehicle?**

**Yes,** >> Installed OCS Components From Another Vehicle

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Either reinstall the original OCS equipment or replace the OCS Bladder and Cushion Kit in accordance with the Service information. Then, perform the System Verification Required test in this section to remove the DTC that set from making this repair.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**Yes,** >> Installed Complete Seat From Another Vehicle

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Perform the Clear VIN Mismatch procedure using the scan tool. Then, perform the System Verification Required test in this section to remove the DTC that set from making this repair.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. DETERMINE THE CORRECT REPAIR

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Determine the correct repair by verifying if the front passenger seat has a Bladder and Cushion Service Kit as follows:

- If possible, check the vehicle's repair history.
- The Service Kit wiring harness uses tamper resistant material on the harness connector. Inspect for the tamper resistant material on the harness connector.

**Does the seat have a Bladder and Cushion Service Kit?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace the OCM in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 5. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

**NOTE: Diagnose and repair all active codes before diagnosing stored codes. Refer to the Table of Contents in this Section for a complete list of airbag system diagnostic procedures.**

With the scan tool, record and erase all Airbag System Module DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors for chaffed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 6

## 6. INSPECT THE RELATED BODY WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC TO SET

Using the wiring diagram/schematic as a guide, inspect the related body wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals. Repair as necessary.

**Are any of these conditions present?**

**Yes** >> Repair as necessary in accordance with the Service Information.

**No** >> Go To 7

## 7. TEST FOR AN INTERMITTENT CONDITION

Reconnect all disconnected components and harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor for active codes while performing the following:

- Wiggle the wiring harness and connectors of the related circuit until either a code becomes active or the problem area is isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the DTC in question / causing the intermittent condition.

**Are any ACTIVE DTCs present?**

**Yes - ACTIVE**

Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No - STORED**

No problem found at this time. Erase all codes before returning the vehicle to the customer.

## *AIRBAG INDICATOR ON WITHOUT ACTIVE TROUBLE CODES

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| ACTIVE INSTRUMENT CLUSTER (MIC) FAULTS |
| OCCUPANT RESTRAINT CONTROLLER (ORC) |

### Diagnostic Test

#### 1. VERIFY IF THE AIRBAG INDICATOR REQUEST STATUS IS ON OR OFF

**CAUTION: Diagnose and repair all active DTCs before performing this procedure.**

**NOTE: Ensure that the battery is fully charged.**

Turn the ignition on.

With the scan tool in ORC, select Monitor Display and select Warning Lamp Status ORC.

Read the AIRBAG IND REQ BY ACM status.

**Is the status ON?**

**Yes** >>

**WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the ORC in accordance with the Service Information.

Perform the *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING) for problems related to Instrument Cluster.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

# *AIRBAG SYSTEM VERIFICATION TEST - VER 1

For a complete wiring diagram **Refer to Section 8W**.

## 1. *AIRBAG SYSTEM VERIFICATION TEST - VER 1

1. Remove all special tools and jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

1. If repairs were made to the Occupant Classification System (OCS), perform the Belt Tension Sensor Verification Test in this Section before proceeding.
2. Connect the scan tool to the Data Link Connector - use the most current software available.
3. With the scan tool, erase stored DTCs in all Airbag System Modules.
4. Turn the ignition off, and wait 15 seconds, then turn the ignition on.
5. Wait one minute, and read active DTCs in all Airbag System Modules.
6. Read the stored DTCs in all Airbag System Modules.

**Are any DTCs present or if the original condition still present?**

**Yes** >> Repair is not complete. Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> Repair is complete.

## *BELT TENSION SENSOR / PRESSURE SENSOR FAULTS

For a complete wiring diagram **Refer to Section 8W**.

| Possible Causes |
|---|
| OCS WIRING CHAFED, PIERCED, PINCHED, OR BROKEN |
| OCS WIRING CONNECTOR TERMINAL(S) BROKEN, BENT, PUSHED OUT, CORRODED, OR CONTAMINATED |
| PASSENGER BLADDER PRESSURE SENSOR POWER, SIGNAL, OR GROUND CIRCUIT OPEN |
| PASSENGER BLADDER PRESSURE SENSOR POWER, SIGNAL, OR GROUND CIRCUIT SHORTED TO VOLTAGE |
| PASSENGER BLADDER PRESSURE SENSOR POWER, SIGNAL, OR GROUND CIRCUIT SHORTED TO GROUND |
| SEAT BELT TENSION SENSOR POWER, SIGNAL, OR GROUND CIRCUIT OPEN |
| SEAT BELT TENSION SENSOR POWER, SIGNAL, OR GROUND CIRCUIT SHORTED TO VOLTAGE |
| SEAT BELT TENSION SENSOR POWER, SIGNAL, OR GROUND CIRCUIT SHORTED TO GROUND |
| BELT TENSION SENSOR |
| PASSENGER SEAT WEIGHT SENSOR |
| OCM |

## Diagnostic Test

### 1. INSPECT THE OCCUPANT CLASSIFICATION SYSTEM (OCS) WIRING AND CONNECTORS FOR CONDITIONS THAT CAUSED THE DTC(s) TO SET

Turn the ignition on.

With the scan tool, record and erase Occupant Classification Module (OCM) DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect Occupant Classification System (OCS) wiring and connectors for chafed, pierced, pinched, and partially broken wires, and for broken, bent, pushed out, corroded, and contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

If the condition is present in the OCM / OCM connector terminals / OCM wiring harness / Passenger Seat Weight Sensor, replace the OCS Bladder and Cushion Kit in accordance with the Service information. If the condition is present in the Passenger Belt Tension Sensor / sensor wiring, replace the Front Passenger Seat Belt and Retractor Assembly and the Belt Tension Sensor in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 2

## 2. CHECK FOR ACTIVE OCM DTCs

Reconnect all disconnected OCS harness connectors.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
With the scan tool, select OCM. Wait two minutes before proceeding.

With the scan tool, read active OCM DTCs.

**Does the scan tool display any active Belt Tension Sensor or Pressure Sensor Related DTCs?**

**Yes** >> Record the DTCs displayed by the scan tool for reference in a later step. Then, Go To 3.

**No, But Other DTCs Active**
Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No DTCs Active**
Perform SYSTEM VERIFICATION REQUIRED test.
Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 3. CHECK THE VOLTAGE OF THE PASSENGER BLADDER PRESSURE SENSOR POWER, SIGNAL, AND GROUND CIRCUIT

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Passenger Seat Weight Sensor.

Disconnect the Belt Tension Sensor.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the Passenger Bladder Pressure Sensor Power circuit. The voltage should be approximately 4.9 volts.

Measure the voltage of the Passenger Bladder Pressure Sensor Signal circuit. The voltage should be approximately 2.5 volts.

Measure the voltage of the Passenger Bladder Pressure Sensor Ground circuit. The voltage should be 0.0 volts.

**Is the voltage correct on all three circuits?**

**Yes** >> Go To 4

**No** >> Go To 13

## 4. CHECK THE VOLTAGE BETWEEN THE PASSENGER BLADDER PRESSURE SENSOR POWER AND GROUND CIRCUIT

Measure the voltage between the Passenger Bladder Pressure Sensor Power circuit and the Passenger Bladder Pressure Sensor Ground circuit. The voltage should be approximately 4.9 volts.

**Is the voltage correct?**

**Yes** >> Go To 5

**No** >> Go To 24

## 5. CHECK THE VOLTAGE OF THE SEAT BELT TENSION SENSOR POWER, SIGNAL, AND GROUND CIRCUIT

Measure the voltage of the Seat Belt Tension Sensor Power circuit. The voltage should be approximately 4.9 volts.

Measure the voltage of the Seat Belt Tension Sensor Signal circuit. The voltage should be approximately 2.5 volts.

Measure the voltage of the Seat Belt Tension Sensor Ground circuit. The voltage should be 0.0 volts.

**Is the voltage correct on all three circuits?**

**Yes** >> Go To 6

**No** >> Go To 13

## 6. CHECK THE VOLTAGE BETWEEN THE SEAT BELT TENSION SENSOR POWER AND GROUND CIRCUIT

Measure the voltage between the Seat Belt Tension Sensor Power circuit and the Seat Belt Tension Sensor Ground circuit. The voltage should be approximately 4.9 volts.

**Is the voltage correct?**

**Yes** >> Go To 7

**No** >> Go To 25

## 7. CHECK THE VOLTAGE OF THE PASSENGER BLADDER PRESSURE SENSOR POWER, SIGNAL, AND GROUND CIRCUIT WITH THE BELT TENSION SENSOR CONNECTED

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Connect the Belt Tension Sensor.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the Passenger Bladder Pressure Sensor Power circuit. The voltage should be approximately 4.9 volts.

Measure the voltage of the Passenger Bladder Pressure Sensor Signal circuit. The voltage should be approximately 2.5 volts.

Measure the voltage of the Passenger Bladder Pressure Sensor Ground circuit. The voltage should be 0.0 volts.

**Is the voltage correct on all three circuits?**

**Yes** >> Go To 8

**No** >>

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Replace the Front Passenger Seat Belt and Retractor Assembly and the Belt Tension Sensor in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 8. CHECK THE VOLTAGE OF THE SEAT BELT TENSION SENSOR POWER, SIGNAL, AND GROUND CIRCUIT WITH THE PASSENGER SEAT WEIGHT SENSOR CONNECTED

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**
Disconnect the Belt Tension Sensor.

Connect the Passenger Seat Weight Sensor.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**
Measure the voltage of the Seat Belt Tension Sensor Power circuit. The voltage should be approximately 4.9 volts.

Measure the voltage of the Seat Belt Tension Sensor Signal circuit. The voltage should be approximately 2.5 volts.

Measure the voltage of the Seat Belt Tension Sensor Ground circuit. The voltage should be 0.0 volts.

**Is the voltage correct on all three circuits?**

**Yes** >> Go To 9

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 9. CHECK FOR AN OPEN PASSENGER SEAT WEIGHT SENSOR

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the OCM harness connector.

Measure the resistance between the Passenger Bladder Pressure Sensor Power circuit and the Passenger Bladder Pressure Sensor Ground circuit in the OCM harness connector.

**NOTE: Verify that the DVOM is connected with the positive lead to the Power circuit and the negative lead to the Ground circuit.**

**Is the resistance approximately 3.25k ohms?**

**Yes** >> Go To 10

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 10. CHECK FOR AN OPEN PASSENGER SEAT WEIGHT SENSOR

Measure the resistance between the Passenger Bladder Pressure Sensor Signal circuit and the Passenger Bladder Pressure Sensor Ground circuit in the OCM harness connector.

**NOTE: Verify that the DVOM is connected with the positive lead to the Signal circuit and the negative lead to the Ground circuit.**

**Is the resistance approximately 106k ohms?**

**Yes** >> Go To 11

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 11. CHECK FOR AN OPEN SEAT BELT TENSION SENSOR

Connect the Belt Tension Sensor.

Measure the resistance between the Seat Belt Tension Sensor Power circuit and the Seat Belt Tension Sensor Ground circuit in the OCM harness connector.

**NOTE: Verify that the DVOM is connected with the positive lead to the Power circuit and the negative lead to the Ground circuit.**

**Is the resistance approximately 7.5k ohms?**

**Yes** >> Go To 12

**No** >> Replace the Front Passenger Seat Belt and Retractor Assembly and the Belt Tension Sensor in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 12. CHECK FOR AN OPEN SEAT BELT TENSION SENSOR

Measure the resistance between the Seat Belt Tension Sensor Signal circuit and the Seat Belt Tension Sensor Ground circuit in the OCM harness connector.

**NOTE: Verify that the DVOM is connected with the positive lead to the Signal circuit and the negative lead to the Ground circuit.**

**Is the resistance approximately 19.5m ohms?**

**Yes** >> Go To 26

**No** >> Replace the Front Passenger Seat Belt and Retractor Assembly and the Belt Tension Sensor in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 13. CHECK THE PASSENGER BLADDER PRESSURE SENSOR AND THE SEAT BELT TENSION SENSOR POWER, SIGNAL, AND GROUND CIRCUIT FOR A SHORT TO VOLTAGE

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the OCM harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Measure the voltage of the Passenger Bladder Pressure Sensor Power circuit.

Measure the voltage of the Passenger Bladder Pressure Sensor Signal circuit.

Measure the voltage of the Passenger Bladder Pressure Sensor Ground circuit.

Measure the voltage of the Seat Belt Tension Sensor Power circuit.

Measure the voltage of the Seat Belt Tension Sensor Signal circuit.

Measure the voltage of the Seat Belt Tension Sensor Ground circuit.

**Is there any voltage present on any of the circuits?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 14

## 14. CHECK THE PASSENGER BLADDER PRESSURE SENSOR POWER CIRCUIT FOR AN OPEN

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Measure the resistance of the Passenger Bladder Pressure Sensor Power circuit between the OCM connector and the Passenger Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 15

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 15. CHECK THE PASSENGER BLADDER PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Measure the resistance of the Passenger Bladder Pressure Sensor Signal circuit between the OCM connector and the Passenger Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 16

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 16. CHECK THE SEAT BELT TENSION SENSOR POWER CIRCUIT FOR AN OPEN

Measure the resistance of the Seat Belt Tension Sensor Power circuit between the OCM connector and the Belt Tension Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 17

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 17. CHECK THE SEAT BELT TENSION SENSOR SIGNAL CIRCUIT FOR AN OPEN

Measure the resistance of the Seat Belt Tension Sensor Signal circuit between the OCM connector and the Belt Tension Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 18

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 18. CHECK THE PASSENGER BLADDER PRESSURE SENSOR AND THE SEAT BELT TENSION SENSOR POWER, SIGNAL, AND GROUND CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the Passenger Bladder Pressure Sensor Power circuit.

Measure the resistance between ground and the Passenger Bladder Pressure Sensor Signal circuit.

Measure the resistance between ground and the Passenger Bladder Pressure Sensor Ground circuit.

Measure the resistance between ground and the Seat Belt Tension Sensor Power circuit.

Measure the resistance between ground and the Seat Belt Tension Sensor Signal circuit.

Measure the resistance between ground and the Seat Belt Tension Sensor Ground circuit.

**Is the resistance below 10k ohms on any of the circuits?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 19

## 19. CHECK THE PASSENGER BLADDER PRESSURE SENSOR POWER CIRCUIT FOR A SHORT TO THE OTHER SENSOR CIRCUITS

Measure the resistance between the Passenger Bladder Pressure Sensor Power circuit and the Passenger Bladder Pressure Sensor Signal circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Power circuit and the Passenger Bladder Pressure Sensor Ground circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Power circuit and the Seat Belt Tension Sensor Power circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Power circuit and the Seat Belt Tension Sensor Signal circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Power circuit and the Seat Belt Tension Sensor Ground circuit.

**Is the resistance below 10k ohms on any of the circuits?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 20

## 20. CHECK THE PASSENGER BLADDER PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE OTHER SENSOR CIRCUITS

Measure the resistance between the Passenger Bladder Pressure Sensor Signal circuit and the Passenger Bladder Pressure Sensor Ground circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Signal circuit and the Seat Belt Tension Sensor Power circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Signal circuit and the Seat Belt Tension Sensor Signal circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Signal circuit and the Seat Belt Tension Sensor Ground circuit.

**Is the resistance below 10k ohms on any of the circuits?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 21

## 21. CHECK THE PASSENGER BLADDER PRESSURE SENSOR GROUND CIRCUIT FOR A SHORT TO THE OTHER SENSOR CIRCUITS

Measure the resistance between the Passenger Bladder Pressure Sensor Ground circuit and the Seat Belt Tension Sensor Power circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Ground circuit and the Seat Belt Tension Sensor Signal circuit.

Measure the resistance between the Passenger Bladder Pressure Sensor Ground circuit and the Seat Belt Tension Sensor Ground circuit.

**Is the resistance below 10k ohms on any of the circuits?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 22

## 22. CHECK THE SEAT BELT TENSION SENSOR POWER CIRCUIT FOR A SHORT TO THE OTHER SENSOR CIRCUITS

Measure the resistance between the Seat Belt Tension Sensor Power circuit and the Seat Belt Tension Sensor Signal circuit.

Measure the resistance between the Seat Belt Tension Sensor Power circuit and the Seat Belt Tension Sensor Ground circuit.

**Is the resistance below 10k ohms on any of the circuits?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 23

## 23. CHECK THE SEAT BELT TENSION SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE SEAT BELT TENSION SENSOR GROUND CIRCUIT

Measure the resistance between the Seat Belt Tension Sensor Signal circuit and the Seat Belt Tension Sensor Ground circuit.

**Is the resistance below 10k ohms?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Go To 26

## 24. CHECK FOR AN OPEN PASSENGER BLADDER PRESSURE SENSOR GROUND CIRCUIT

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the OCM harness connector.

Measure the resistance of the Passenger Bladder Pressure Sensor Ground circuit between the Passenger Seat Weight Sensor harness connector and the OCM harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 26

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 25. CHECK FOR AN OPEN SEAT BELT TENSION SENSOR GROUND CIRCUIT

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Disconnect the OCM harness connector.

Measure the resistance of the Seat Belt Tension Sensor Ground circuit between the Belt Tension Sensor harness connector and the OCM harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 26

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Replace the OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

## 26. DETERMINE THE CORRECT REPAIR

**NOTE: The Occupant Classification Module (OCM) and the Passenger Seat Bladder and Cushion Kit are the only serviceable OCS components.**

Determine the correct repair by verifying if the front passenger seat has a Bladder and Cushion Service Kit as follows:

- If possible, check the vehicle's repair history.
- The Service Kit wiring harness uses tamper resistant material on the harness connector. Inspect for the tamper resistant material on the harness connector.

**Does the seat have a Bladder and Cushion Service Kit?**

**Yes** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace OCS Bladder and Cushion Kit in accordance with the Service information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >>

**WARNING: If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

**NOTE: The Bladder and Cushion Kit are calibrated as an assembly. Do not disconnect the Bladder from the Cushion Kit. Service only as an assembly.**

Replace the OCM in accordance with the Service Information.

Perform SYSTEM VERIFICATION REQUIRED test.

Perform *AIRBAG SYSTEM VERIFICATION TEST - VER 1.

# *BELT TENSION SENSOR VERIFICATION TEST

For a complete wiring diagram **Refer to Section 8W**.

## Diagnostic Test

### 1. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH NO LOAD APPLIED TO THE SENSOR

**NOTE: Ensure that the battery is fully charged.**

Remove any special tools or jumper wires and reconnect all previously disconnected components.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Verify that the passenger seat belt is unbuckled and that there is no load on the passenger seat belt and retractor assembly.

With the scan tool in OCM, select Sensor Display and select Passenger Belt Tension Sensor Output.

Read the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 39 and 69?**

**Yes** >> Go To 2

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.

Perform BELT TENSION SENSOR VERIFICATION TEST.

### 2. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH A LOAD APPLIED TO THE SENSOR

Apply 11 kg (24 lbs) to 12 kg (26 lbs) of pressure to the Passenger Belt Tension Sensor using the spring scale Miller special tool 8828 as follows:

- Connect the hook at the bottom of the spring scale through the Passenger Belt Tension Sensor webbing loop so that the end of the hook faces the passenger seat.
- Place the maximum reading indicator at the bottom of the spring scale.
- Grab the horizontal bar at the top of the spring scale. Pull the spring scale straight upward keeping the horizontal bar level with the door sill and the spring scale in-line with the Passenger Belt Tension Sensor.
- Apply and hold 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the sensor while an assistant monitors the Passenger Belt Tension Sensor Output on the scan tool display.

**Is the Passenger BTS Output between 153 and 204 with 11 kg (24 lbs) to 12 kg (26 lbs) of pressure applied to the sensor?**

**Yes** >> Maintain the 11 kg (24 lbs) to 12 kg (26 lbs) of pressure on the Passenger Belt Tension Sensor and Go To 3

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.

Perform BELT TENSION SENSOR VERIFICATION TEST.

### 3. CHECK THE PASSENGER BELT TENSION SENSOR OUTPUT WITH THE LOAD RELEASED

Release the pressure applied with the spring scale while monitoring the Passenger Belt Tension Sensor Output on the scan tool display. Make sure that there is no load applied to the sensor. The output must return to between 39 and 69 within 20 seconds of releasing the load.

**Does the Passenger BTS Output return to between 39 and 69 within 20 seconds of releasing the load?**

**Yes** >> Perform AIRBAG SYSTEM VERIFICATION TEST - VER 1.

**No** >> Replace the Front Passenger Seat Belt Retractor and Passenger Belt Tension Sensor Assembly in accordance with the Service Information.

Perform BELT TENSION SENSOR VERIFICATION TEST.

# RESTRAINTS - SERVICE INFORMATION

## TABLE OF CONTENTS

# RESTRAINTS - SERVICE INFORMATION

## DESCRIPTION

An occupant restraint system is standard factory-installed safety equipment on this model. Available occupant restraints for this model include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening a seat belt; while passive restraints require no action by the vehicle occupants to be employed.

### ACTIVE RESTRAINTS

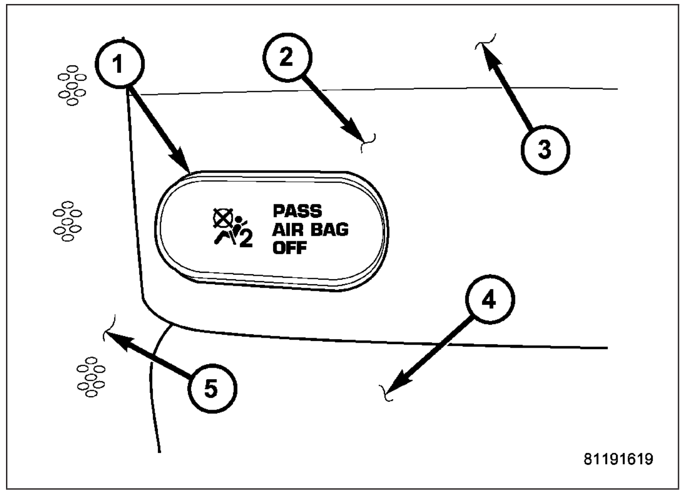
The active restraints for this model include:

- **Front Seat Belts** - Both front seating positions are equipped with three-point seat belt systems employing lower B-pillar mounted inertia latch-type emergency locking retractors, height-adjustable upper B-pillar mounted turning loops, a traveling lower seat belt anchor secured to the outboard side of the seat frame, and a traveling end-release seat belt buckle secured to the inboard side of the seat frame. The driver side front seat belt buckle includes an integral Hall-effect seat belt switch that detects whether the driver side front seat belt has been fastened.
- **Rear Seat Belts** - All three rear seating positions are equipped with three-point seat belt systems. The outboard seating position belts employ lower C-pillar mounted inertia latch-type emergency locking retractors, fixed position upper C-pillar mounted turning loops, self-cinching latch plates for compatibility with child seats, and fixed lower seat belt anchors secured to the floor panel. The rear seat center seating position belt has an inertia latch-type emergency locking retractor that is integral to the rear seat back panel, and a cable from the seat back latch locks the center belt retractor spool unless the seat back is fully latched. The rear seat center seating position belt lower anchor is secured to the floor panel. All three rear seat belts have fixed end-release seat belt buckles secured to the floor panel, a single buckle unit on the right side and a double buckle unit on the left side.
- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position, child seat upper tether anchors for the rear seat. Two anchors are integral to the back of the right rear seat back panel, and one is integral to the left rear seat back panel. Two lower anchors are also provided for each outboard rear seating position. These lower anchors are accessed from the front of the rear seat where the seat back meets the seat cushion. Two lower anchors are integral to the right rear seat back panel, and two are integral to the left rear seat back panel.

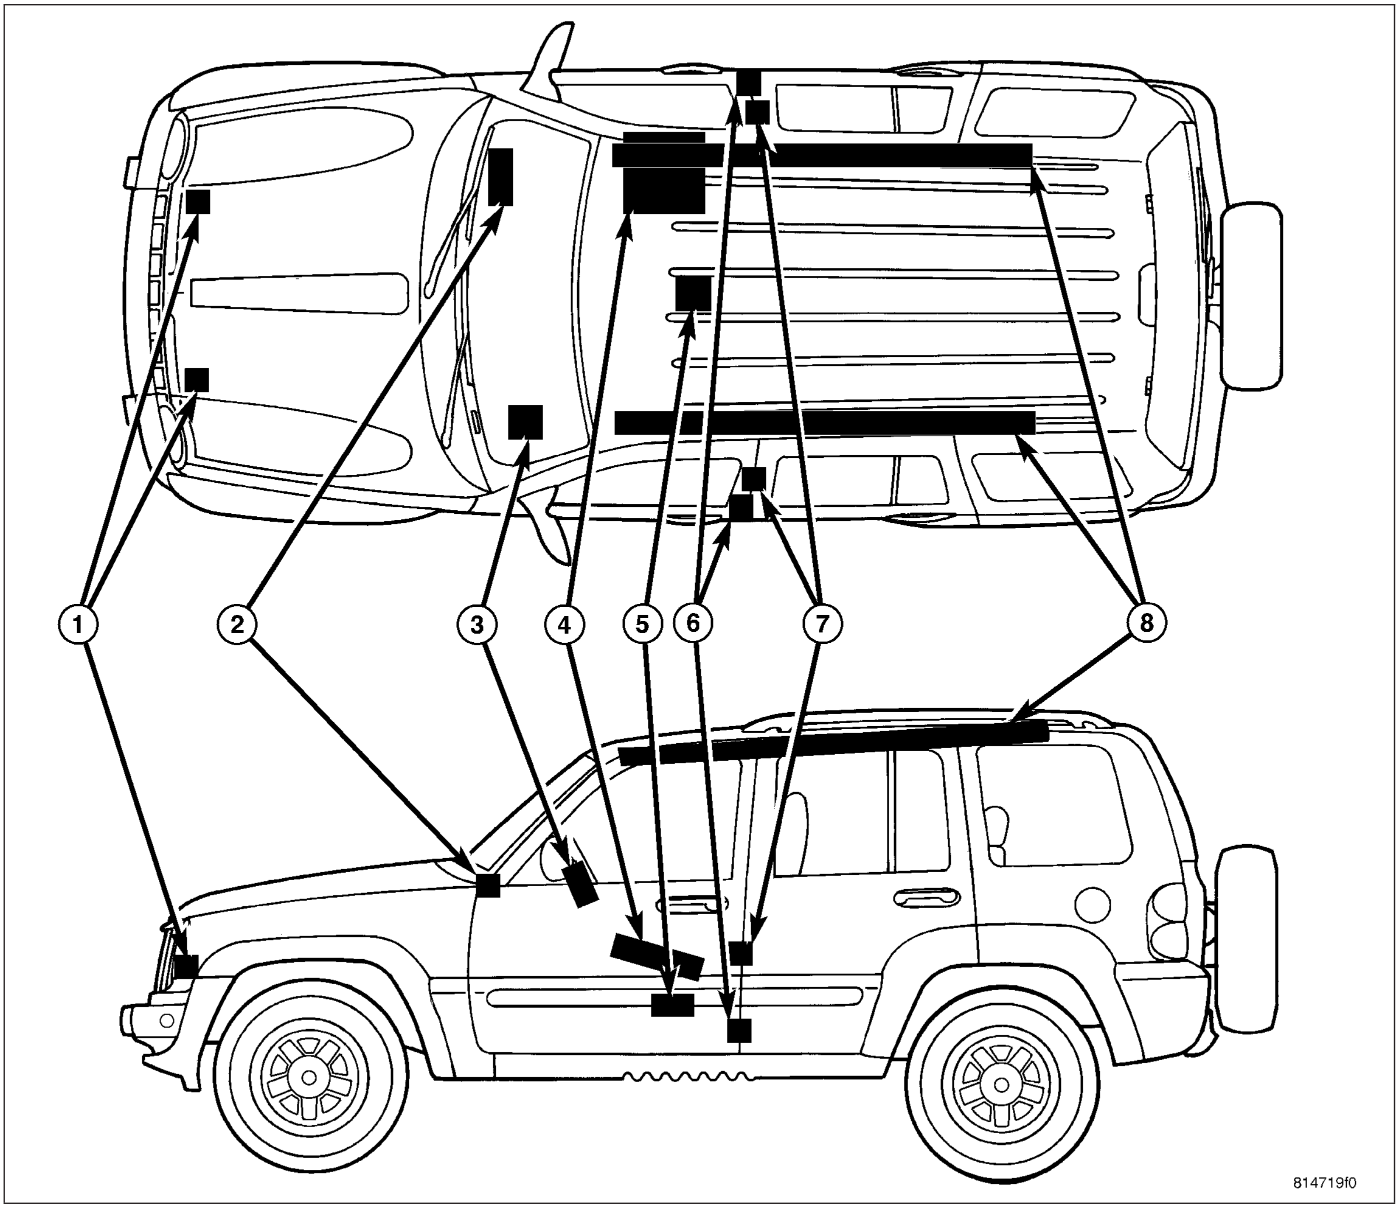
### PASSIVE RESTRAINTS

The passive restraints available for this model include the following:

8098029e



- **Dual Front Airbags** - Multistage driver and front passenger airbags are available for this model. This airbag system is a passive, inflatable, Supplemental Restraint System (SRS) and vehicles with this equipment can be readily identified by the “SRS - AIRBAG” logo molded into the driver airbag trim cover in the center of the steering wheel and also into the passenger airbag door on the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the ElectroMechanical Instrument Cluster (EMIC) for about seven seconds as a bulb test each time the ignition switch is turned to the On position. A pyrotechnic-type seat belt tensioner is also integral to the driver and passenger front seat belt retractors of all airbag equipped models to work in conjunction with the dual front airbags.
- **Occupant Classification System** - Vehicles manufactured for sale in North America also include an Occupant Classification System (OCS) with components that are located on the passenger side front seat cushion. These components include an Occupant Classification Module (OCM) and a seat weight bladder and pressure sensor assembly. In addition, this system includes a belt tension sensor integral to the lower anchor of the passenger side front seat belt. Vehicles equipped with the OCS components can be readily identified by a passenger airbag on/off indicator (1) located in the inboard end cap of the grab handle (2) on the instrument panel above the glove box door (4).
- **Side Curtain Airbags** - Optional side curtain airbags are available for this model when it is also equipped with dual front airbags. This airbag system is a passive, inflatable, Supplemental Restraint System (SRS) and vehicles with this equipment can be readily identified by a molded identification trim button with the “SRS - AIRBAG” logo located on the headliner above each B-pillar.



The supplemental restraint system includes the following major components, which are described in further detail elsewhere in this service information:

- **Airbag Control Module (5)** - The Airbag Control Module (ACM) is also sometimes referred to as the Occupant Restraint Controller (ORC). The ACM is located on a mount on the floor panel transmission tunnel behind the transmission gear selector, and is concealed below the center floor console.
- **Airbag Indicator** - The airbag indicator is integral to the ElectroMechanical Instrument Cluster (EMIC), which is located on the instrument panel in front of the driver.
- **Belt Tension Sensor (4)** - Vehicles equipped with the Occupant Classification System (OCS) include a belt tension sensor. This sensor is integral to the passenger side front seat belt lower anchor which is secured to the outboard side of the passenger side front seat cushion frame.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel. On vehicles equipped with an optional Electronic Stability Program (ESP) the clockspring includes an integral Steering Angle Sensor (SAS).
- **Driver Airbag (3)** - The driver airbag is located in the center of the steering wheel, beneath the driver airbag trim cover.
- **Driver Knee Blocker** - The driver knee blocker is a structural unit secured to the back side of and integral to the instrument panel steering column opening cover.
- **Front Impact Sensor (1)** - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the back side of each vertical member of the radiator support.

- **Occupant Classification Module (4)** - Vehicles equipped with the Occupant Classification System (OCS) include an Occupant Classification Module (OCM) which is secured to a stamped steel mounting bracket on the underside of the passenger side front seat cushion frame.
- **Passenger Airbag (2)** - The passenger airbag is located on the instrument panel, beneath the passenger airbag door and above the glove box on the passenger side of the vehicle.
- **Passenger Airbag On/Off Indicator** - The Occupant Classification System (OCS) includes a passenger airbag on/off indicator which is located in the inboard grab handle end cap on the instrument panel between the passenger airbag door and the glove box. Vehicles without the OCS have only a trim bezel above the glove box, instead of a grab handle.
- **Passenger Knee Blocker** - The passenger knee blocker is a structural reinforcement that is integral to and concealed within the glove box door.
- **Seat Belt Tensioner (6)** - A seat belt tensioner is integral to both front seat belt retractor units on vehicles equipped with dual front airbags. The seat belt retractor and tensioner units are secured to the right and left inner B-pillars and concealed beneath the lower B-pillar trim.
- **Seat Weight Sensor (4)** - Vehicles equipped with the Occupant Classification System (OCS) include a seat weight sensor, which includes a liquid-filled bladder, a pressure sensor, and a short hose that connects the bladder to the sensor. The bladder is sandwiched between an insulator pad on the top of the passenger side front seat cushion spring and the seat cushion foam padding, while the pressure sensor is secured to the Occupant Classification Module (OCM) mounting bracket on the underside of the passenger side front seat cushion frame.
- **Side Curtain Airbag (8)** - In vehicles equipped with this option, a side curtain airbag is secured to each inside roof side rail, and extends from the A-pillar to just beyond the C-pillar. The side curtain airbags are concealed above the headliner trim.
- **Side Impact Sensor (7)** - Two side impact sensors are used on vehicles equipped with the optional side curtain airbags, one left side and one right side. One sensor is located behind the lower B-pillar trim above the front seat belt retractor on each inner B-pillar.

The ACM, the OCM, and the EMIC each contain a microprocessor and programming that allow them to communicate with each other using the Programmable Communications Interface (PCI) data bus network. This method of communication is used by the ACM for control of the airbag indicator in the EMIC on all models equipped with dual front airbags. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION).

Hard wired circuitry connects the supplemental restraint system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the supplemental restraint system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

## OPERATION

### ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them. See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the factory-installed active restraints.

### PASSIVE RESTRAINTS

The passive restraints are referred to as a supplemental restraint system because they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed supplemental restraint system.

The supplemental restraint system electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Airbag Control Module (ACM). An airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) illuminates for about seven seconds as a bulb test each time the ignition switch is turned to the On or Start positions. Following the bulb test, the airbag indicator is turned on or off by the ACM to indicate the status of the supplemental restraint system. If the airbag indicator comes on at any time other than during the bulb test, it indicates that there is a problem in the supplemental restraint system electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the supplemental restraints depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the impact sensors. When an impact is severe enough, the microprocessor in the ACM signals the inflator of the appropriate airbag units to deploy their airbag cushions. The front seat belt tensioners are provided with a deployment signal by the ACM in conjunction with the front airbags.

During a frontal vehicle impact, the knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance that the driver and front seat passenger are properly positioned and restrained for an airbag deployment.

Typically, the vehicle occupants recall more about the events preceding and following a collision than they do of an airbag deployment itself. This is because the airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ACM monitors a problem in any of the dual front airbag system circuits or components, including the seat belt tensioners, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the EMIC to turn on the airbag indicator. Proper testing of the supplemental restraint system components, the Programmable Communications Interface (PCI) data bus, the electronic message inputs to and outputs from the EMIC or the ACM, as well as the retrieval or erasure of a DTC from the ACM or the EMIC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the factory-installed passive restraints.

## OCCUPANT CLASSIFICATION SYSTEM

Vehicles manufactured for the North American market are equipped with the Occupant Classification System (OCS). The OCS automatically suppresses or enables passenger airbag and seat belt tensioner operation based upon whether or not the passenger side front seat is occupied and, if the seat is occupied, classifies the size of the occupant and whether the seat is occupied by a child seat.

The OCS has an Occupant Classification Module (OCM) that monitors inputs from the seat weight bladder pressure sensor under the passenger side front seat cushion and from the belt tension sensor on the passenger side front seat belt lower anchor. Based upon those inputs the microprocessor within the OCM classifies the occupant of the passenger side front seat. The OCM then sends electronic occupant classification messages to the Airbag Control Module (ACM). The microprocessor and programming of the ACM determines whether to enable or disable the deployment circuits for the passenger airbag and seat belt tensioner; and, if enabled, what force level should be used to deploy each front airbag.

The OCS electrical circuits and components are continuously monitored by the OCM, and the OCM is continuously monitored by the ACM. A passenger airbag on/off indicator is located in the inboard end cap of the instrument panel grab handle. This indicator receives battery current whenever the ignition switch is in the On or Start positions, and illuminates only when the ACM pulls the indicator control circuit to ground. The indicator illuminates for about seven seconds as a bulb test each time the ignition switch is turned to the On or Start positions. Following the bulb test, the indicator is turned on or off by the ACM based upon the electronic occupant classification messages received from the OCM. This indicator is illuminated whenever the passenger airbag and seat belt tensioner operation has been suppressed, and is turned off whenever the seat is empty or when the seat is occupied and the passenger airbag and seat belt tensioner are enabled.

When the OCM monitors a problem in any of the OCS circuits or components, it stores a fault code or DTC in its memory circuit and sends an electronic message to the ACM. The ACM then sends an electronic message to the

EMIC to turn on the airbag indicator. If for any reason the OCM is unable to classify the occupant it sends an electronic message to the ACM, and the ACM suppresses passenger airbag and seat belt tensioner operation. Proper testing of the OCS components, the Programmable Communications Interface (PCI) data bus, the electronic message inputs to and outputs from the OCM, the EMIC or the ACM, as well as the retrieval or erasure of a DTC from the OCM, the ACM or the EMIC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the OCS.

## WARNING

## WARNINGS - RESTRAINT SYSTEM

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Airbag Control Module (ACM). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components.**

**WARNING: To avoid personal injury or death, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 2500 psi.**

**WARNING: To avoid personal injury or death, when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.**

**WARNING: To avoid personal injury or death, replace all restraint system components only with parts specified in the DaimlerChrysler Mopar Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.**

**WARNING: To avoid personal injury or death, the fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar Parts Catalog.**

**WARNING: To avoid personal injury or death, when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.**

## DIAGNOSIS AND TESTING

## SUPPLEMENTAL RESTRAINT SYSTEM

Proper diagnosis and testing of the supplemental restraint system components, the Programmable Communications Interface (PCI) data bus, the data bus electronic message inputs to and outputs from the ElectroMechanical Instrument Cluster (EMIC), the Airbag Control Module (ACM), or the Occupant Classification Module (OCM) as well as the retrieval or erasure of a Diagnostic Trouble Code (DTC) from the ACM or OCM requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

## STANDARD PROCEDURE

## HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt tensioner, take proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. In addition, the supplemental restraint system should be disarmed whenever any steering wheel, steering column, seat belt tensioner, driver airbag, passenger airbag, Occupant Classification System (OCS), front impact sensor, side impact sensor, side curtain airbag, or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, faulty or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is faulty or damaged and non-deployed, refer to the Hazardous Substance Control System for proper disposal. Dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

### SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment; away from sources of extreme heat, sparks, and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

## SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT

Any vehicle which is to be returned to use following a supplemental restraint deployment, must have the deployed restraints replaced. In addition, if the driver airbag has been deployed, the clockspring must be replaced. If the passenger airbag is deployed, the passenger airbag door and both passenger airbag mounting brackets must be replaced. The seat belt tensioners are deployed by the same signal that deploys the driver and passenger airbags and must also be replaced if either front airbag has been deployed. If a side curtain airbag has been deployed, the complete airbag unit, the headliner, as well as the upper A, B, C and D-pillar trim must be replaced. These components are not intended for reuse and will be damaged or weakened as a result of a supplemental restraint deployment, which may or may not be obvious during a visual inspection.

On vehicles with an optional sunroof, the sunroof drain tubes and hoses must be closely inspected following a side curtain airbag deployment. It is also critical that the mounting surfaces and/or mounting brackets for the Airbag Control Module (ACM), side impact sensors, and front impact sensors be closely inspected and restored to their original conditions following any vehicle impact damage. Because the ACM and each front and side impact sensor are used by the supplemental restraint system to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.

All other vehicle components should be closely inspected following any supplemental restraint deployment, but are to be replaced only as required by the extent of the visible damage incurred.

## AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used during the deployment event. The driver and passenger airbags in this model are deployed by electrical signals generated by the Airbag Control Module (ACM) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used due to an airbag system fault; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

**CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are sure of complete deployment. Refer to the Hazardous Substance Control System for proper disposal procedures. Dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local, and federal regulations.**

1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, inboard of the steering column.
2. Turn the ignition switch to the On position.
3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **Airbag Squib Status** table to determine the status of both driver and/or passenger airbag squibs.

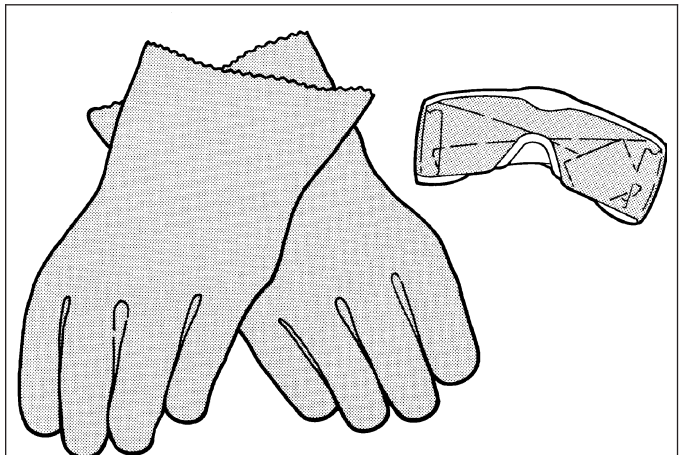
<table>
<tr><th colspan="3">AIRBAG SQUIB STATUS</th></tr>
<tr><th>IF the Active DTC is:</th><th>Conditions</th><th>Squib Status</th></tr>
<tr><td>Driver or Passenger Squib 1 open</td><td rowspan="2">AND the stored DTC minutes for both Driver or Passenger squibs are within 15 minutes of each other</td><td rowspan="2">Both Squib 1 and 2 were used.</td></tr>
<tr><td>Driver or Passenger Squib 2 open</td></tr>
<tr><td>Driver or Passenger Squib 1 open</td><td rowspan="2">AND the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more</td><td rowspan="2">Squib 1 was used; Squib 2 is live.</td></tr>
<tr><td>Driver or Passenger Squib 2 open</td></tr>
</table>

| AIRBAG SQUIB STATUS | | |
|---|---|---|
| **IF the Active DTC is:** | **Conditions** | **Squib Status** |
| Driver or Passenger Squib 1 open | **AND** the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more | Squib 1 is live; Squib 2 was used. |
| Driver or Passenger Squib 2 open | | |
| Driver or Passenger Squib 1 open | **AND** Driver or Passenger Squib 2 open is NOT an active code | Squib 1 was used; Squib 2 is live. |
| Driver or Passenger Squib 2 open | **AND** Driver or Passenger Squib 1 open is NOT an active code | Squib 1 is live; Squib 2 was used. |

**If** none of the Driver or Passenger Squib 1 or 2 open are active codes, the status of the airbag squibs is unknown. In this case the airbag should be handled and disposed of as if the squibs were both live.

## CLEANUP PROCEDURE

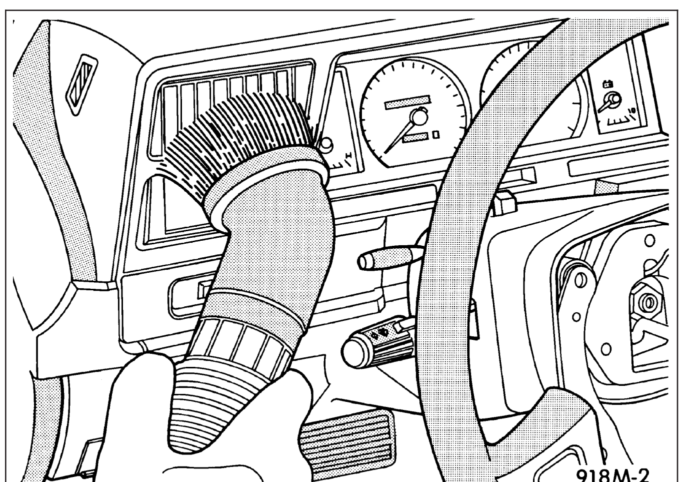
Following a supplemental restraint deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a supplemental restraint. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.



918M-4

**WARNING: To avoid personal injury or death, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.**

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.
2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.



918M-2

**CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are sure of complete deployment. Refer to AIRBAG SQUIB STATUS . All damaged, faulty, or non-deployed supplemental restraints which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is faulty or damaged and non-deployed, refer to the Hazardous Substance Control System for proper disposal. Be certain to dispose of all non-deployed and deployed supplemental restraints in a manner consistent with state, provincial, local and federal regulations.**

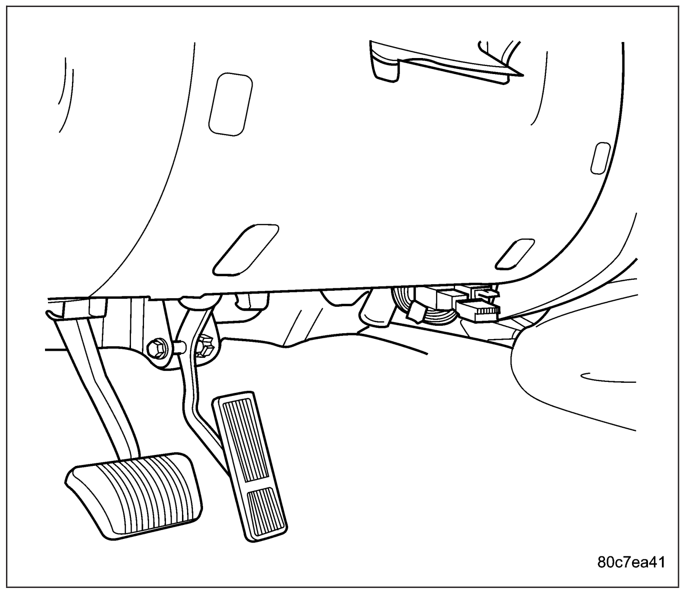
3. Next, remove the deployed supplemental restraints from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

## SUPPLEMENTAL RESTRAINTS VERIFICATION TEST

The following procedure should be performed using a diagnostic scan tool to verify proper supplemental restraint system operation following the service or replacement of any supplemental restraint system component. In addition, if the vehicle is equipped with the Occupant Classification System and one of the passenger front seat supplemental restraint components has been replaced, following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a diagnostic scan tool. Refer to the appropriate diagnostic procedures.

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Airbag Control Module (ACM) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace the OCM first. Then perform the supplemental restraint verification test including an ignition-On time of at least one minute before replacing the ACM. Both the ACM and the OCM store OCS calibration data, which they transfer to one another during the first minute of ignition-On time after one of them is replaced. If both modules are replaced at the same time, an irreversible fault will be set in both modules. If the data transfer is not allowed sufficient time to complete between modules (at least one minute of ignition-On), an irreversible fault will be set in the module requiring the data.**



1. During the following test, the battery negative cable remains disconnected and isolated, as it was during the supplemental restraint system component removal and installation procedures.
2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, inboard of the steering column.
3. Turn the ignition switch to the On position and exit the vehicle with the scan tool.

**CAUTION: On vehicles equipped with the Occupant Classification System (OCS), if the Airbag Control Module (ACM) or the Occupant Classification Module (OCM) have been replaced, leave the ignition switch in the On position with the battery connected for at least one minute to allow the data transfer between the ACM and the OCM to complete. If the data transfer is not allowed sufficient time to complete between modules (at least one minute of ignition-On), an irreversible fault will be set in the module requiring the data.**

4. Check to be certain that nobody is in the vehicle, then reconnect the battery negative cable.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is found in Step 5 or Step 6, refer to the appropriate diagnostic information.

8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to Step 9.
9. Turn the ignition switch to the Off position for about fifteen seconds, and then back to the On position. Observe the airbag indicator in the instrument cluster. It should illuminate for six to eight seconds, and then go out. This indicates that the supplemental restraint system is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays on, there is still an active supplemental restraint system fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

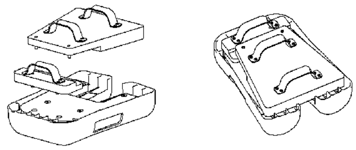
## SPECIAL TOOLS

## RESTRAINT SYSTEMS

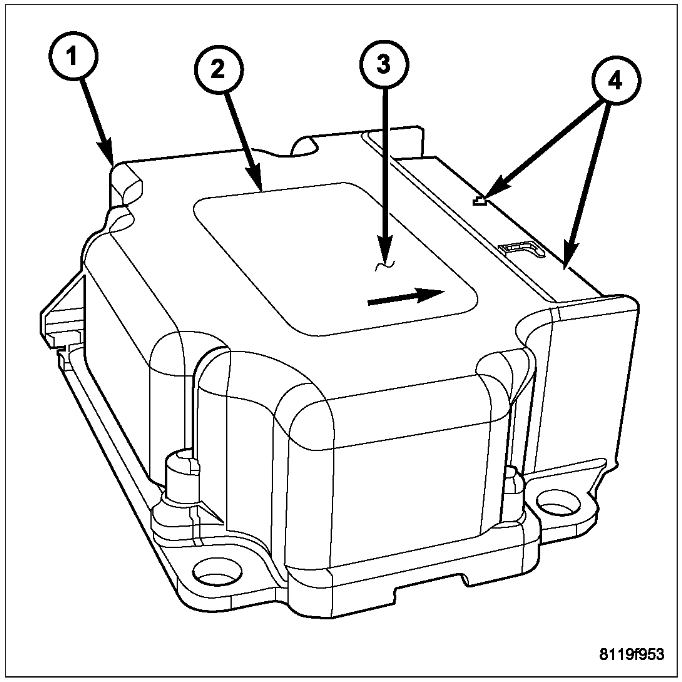


*OCS Seat Weight Tool #9077*

# AIRBAG CONTROL MODULE

## DESCRIPTION

The Airbag Control Module (ACM) (1) is also sometimes referred to as the Occupant Restraint Controller (ORC). The ACM is secured with three screws to a stamped steel mounting bracket welded onto the top of the floor panel transmission tunnel just forward of the park brake mechanism and beneath the center floor console in the passenger compartment of the vehicle. Concealed within a hollow in the center of the die cast aluminum ACM housing is the electronic circuitry of the ACM which includes a microprocessor, an electronic impact sensor, an electronic safing sensor, and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ACM housing with four screws to enclose and protect the internal electronic circuitry and components.



An arrow (3) printed on the label (2) on the top of the ACM housing provides a visual verification of the proper orientation of the unit, and should always be pointed toward the front of the vehicle. The ACM housing has integral mounting flanges on three corners. The mounting flange to the right of the connector receptacle has an integral locating pin on its lower surface. Both right side flanges have round mounting holes, while the flange on the left side has a slotted mounting hole. A molded plastic electrical connector (4) with two receptacles, one containing twenty-four terminal pins and the other containing thirty-two terminal pins, exits the forward facing side of the ACM housing. These terminal pins connect the ACM to the vehicle electrical system through two dedicated take outs and connectors, one from the instrument panel wire harness and the other from the body wire harness.

A molded plastic protective cover is installed over the ACM to protect the unit from condensation or water intrusion. Integral latch tabs on each side of the cover engage slots on each side at the base of the ACM housing to secure the cover in place over the ACM.

The impact sensor and safing sensor internal to the ACM are calibrated for the specific vehicle, and are only serviced as a unit with the ACM. In addition, there are unique versions of the ACM for vehicles with or without the optional side curtain airbags. The ACM cannot be repaired or adjusted and, if damaged or faulty, it must be replaced. The ACM cover is available for individual service replacement.

## OPERATION

The microprocessor in the Airbag Control Module (ACM) contains the supplemental restraint system logic circuits and controls all of the supplemental restraint system components. The ACM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Programmable Communications Interface (PCI) data bus. This method of communication is used for control of the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) and for supplemental restraint system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/AIRBAG INDICATOR - OPERATION).

The ACM microprocessor continuously monitors all of the supplemental restraint system electrical circuits to determine the system readiness. If the ACM detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the EMIC over the PCI data bus to turn on the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the ACM. For some DTCs, if a fault does not recur for a number of ignition cycles, the ACM will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The ACM also monitors a Hall effect-type seat belt switch located in the buckle of the driver side front seat belt to determine whether that seat belt is buckled, and provides an input to the EMIC over the PCI data bus to control the seatbelt indicator operation based upon the status of the driver side front seat belt switch.

On models equipped with the Occupant Classification System (OCS), the ACM communicates with the Occupant Classification Module (OCM) over the PCI data bus. The ACM stores OCS calibration data for retrieval when the OCM must be replaced with a new unit. The ACM will internally disable the passenger airbag and seat belt tensioner deployment circuits if the OCM detects that the passenger side front seat is unoccupied or that it is occupied by a load that is inappropriate for an airbag deployment. The ACM also provides a control output to the passenger airbag on/off indicator through the passenger airbag on/off indicator driver circuit. The OCM notifies the ACM when it has detected a monitored system fault and stored a DTC in its memory for any faulty OCS component or circuit, then the ACM sets a DTC and controls the airbag indicator operation accordingly.

The ACM receives battery current through two circuits; a fused ignition switch output (run) circuit through a fuse in the Junction Block (JB), and a fused ignition switch output (run-start) circuit through a second fuse in the JB. The ACM receives ground through a ground circuit and take out of the body wire harness. This take out has a single eyelet terminal connector that is secured by a ground screw to the top of the right front seat riser on the floor panel beneath the right front seat. These connections allow the ACM to be operational whenever the ignition switch is in the Start or On positions.

The ACM also contains an energy-storage capacitor. When the ignition switch is in the Start or On positions, this capacitor is continually being charged with enough electrical energy to deploy the supplemental restraint components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup supplemental restraint system protection in case there is a loss of battery current supply to the ACM during an impact.

Two sensors are contained within the ACM, an electronic impact sensor and a safing sensor. The ACM also monitors inputs from two remote front impact sensors located on the back of the right and left vertical members of the radiator support near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. On vehicles equipped with optional side curtain airbags the ACM also monitors inputs from two additional remote impact sensors located on the left and right inner B-pillars to control deployment of the side curtain airbag units.

The safing sensor is an electronic accelerometer sensor within the ACM that provides an additional logic input to the ACM microprocessor. The safing sensor is used to verify the need for a supplemental restraint deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the airbags to deploy. Vehicles equipped with optional side curtain airbags, feature a second safing sensor within the ACM to provide confirmation to the ACM microprocessor of side impact forces. This second safing sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

Pre-programmed decision algorithms in the ACM microprocessor determine when the deceleration rate as signaled by the impact sensors and the safing sensors indicate an impact that is severe enough to require supplemental restraint system protection and, based upon the severity of the monitored impact, determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ACM sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the front seat belt tensioners and, if the vehicle is so equipped, either side curtain airbag unit. For vehicles equipped with the OCS, the passenger front airbag and seat belt tensioner will be deployed by the ACM only if enabled by the OCM (passenger airbag on/off indicator Off) at the time of the impact.

The hard wired inputs and outputs for the ACM may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ACM, the PCI data bus network, or the electronic message inputs to and outputs from the ACM. The most reliable, efficient, and accurate means to diagnose the ACM, the PCI data bus, and the electronic message inputs to and outputs from the ACM requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

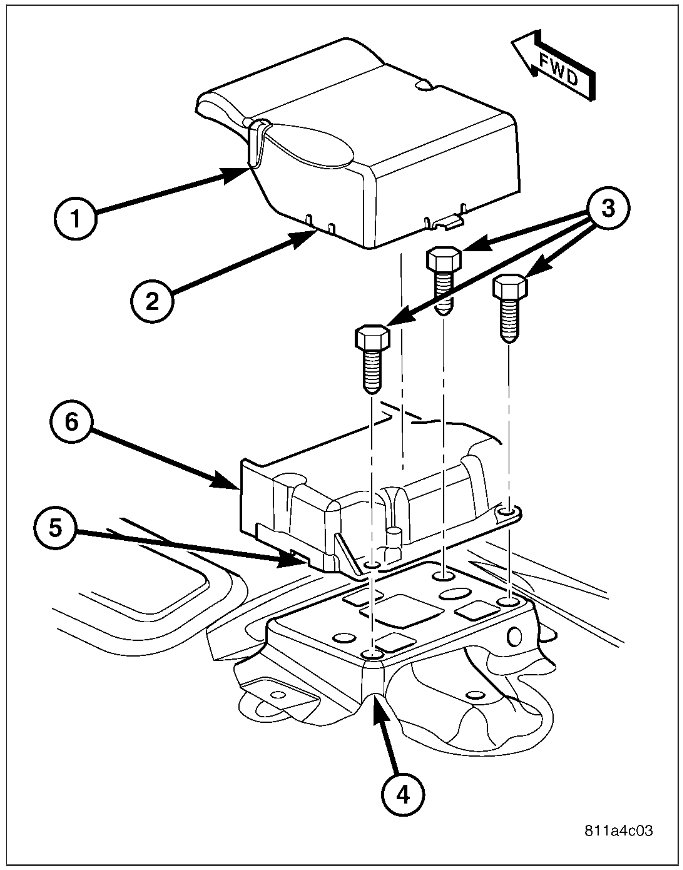
**WARNING: To avoid personal injury or death, never strike or drop the airbag control module, as it can damage the impact sensor or affect its calibration. The airbag control module contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment.**

**CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Airbag Control Module (ACM) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace the OCM first. Then perform the supplemental restraint verification test including an ignition-On time of at least one minute before replacing the ACM. Both the ACM and the OCM store OCS calibration data, which they transfer to one another during the first minute of ignition-On time after one of them is replaced. If both modules are replaced at the same time, an irreversible fault will be set in both modules. If the data transfer is not allowed sufficient time to complete between modules (at least one minute of ignition-On), an irreversible fault will be set in the module requiring the data.**

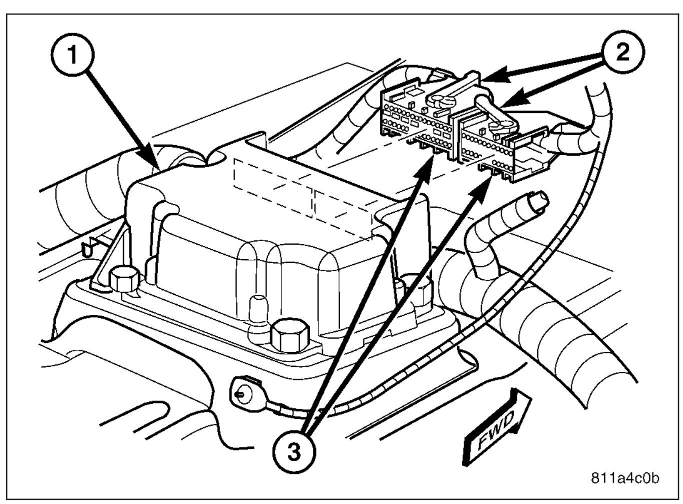
1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the center console from the top of the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

**CAUTION: Use care when disengaging the Airbag Control Module (ACM) cover latches from the ACM or the cover may be damaged.**

3. The ACM cover (1) is secured to the ACM by a latch tab (2) located on each side of the cover. Gently pry both latch tabs away from the ACM far enough to disengage the latches from the slots (5) in the base of the ACM housing, then lift the cover off of the ACM.



4. Disconnect the two wire harness connectors (3) (one each from the instrument panel and the body wire harnesses) for the ACM (1) from the ACM connector receptacles located on the forward facing side of the module. To disconnect the wire harness connectors from the ACM, depress the release tab and lift the lever arm (2) on each connector.
5. Remove the three screws that secure the ACM to the ACM bracket that is welded onto the top of the floor panel transmission tunnel.
6. Remove the ACM from the floor panel transmission tunnel.



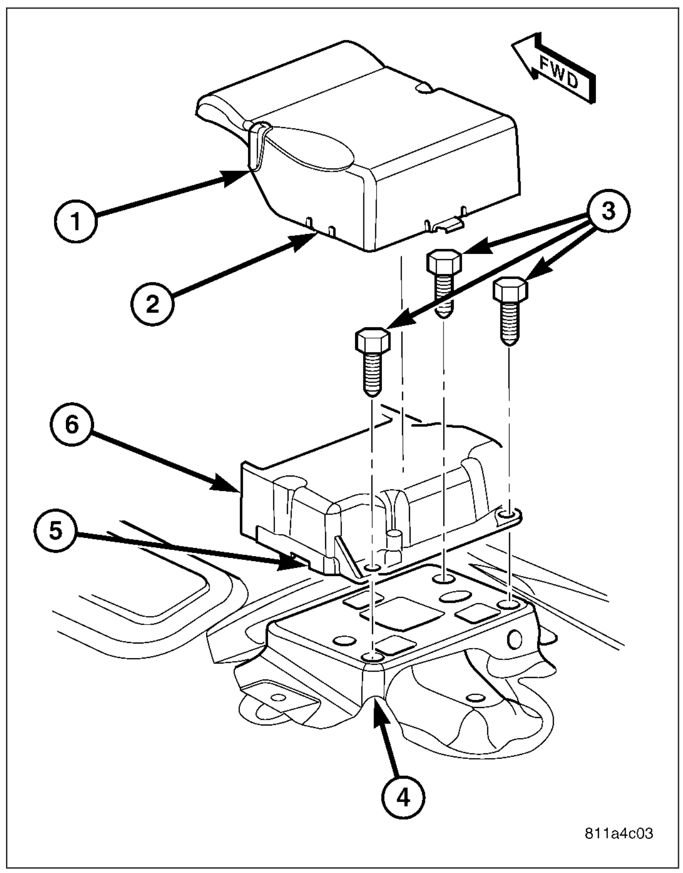
## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

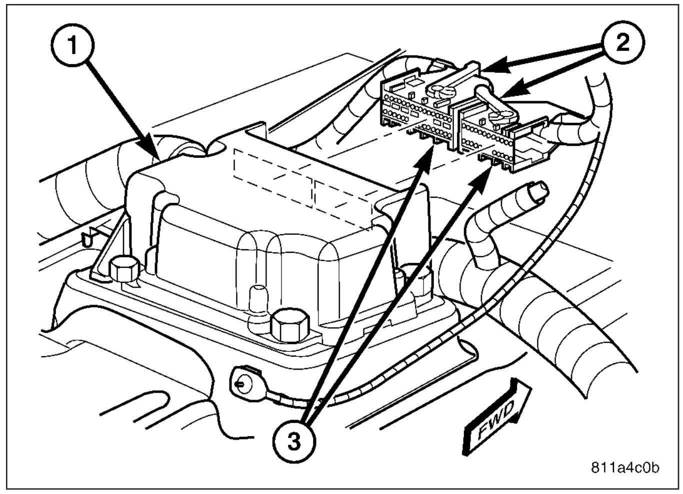
**WARNING: To avoid personal injury or death, never strike or drop the airbag control module, as it can damage the impact sensor or affect its calibration. The airbag control module contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment.**

**CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Airbag Control Module (ACM) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace the OCM first. Then perform the supplemental restraint verification test including an ignition-On time of at least one minute before replacing the ACM. Both the ACM and the OCM store OCS calibration data, which they transfer to one another during the first minute of ignition-On time after one of them is replaced. If both modules are replaced at the same time, an irreversible fault will be set in both modules. If the data transfer is not allowed sufficient time to complete between modules (at least one minute of ignition-On), an irreversible fault will be set in the module requiring the data.**

1. Carefully position the Airbag Control Module (ACM) (6) to the ACM bracket (4) on the floor panel transmission tunnel. When the ACM is correctly positioned, the arrow on the ACM label will be pointed forward in the vehicle and the locating pin on the bottom of the right ACM mounting flange will be engaged into the locating hole in the ACM bracket.
2. Install and tighten the three screws (3) that secure the ACM to the ACM bracket that is welded onto the floor panel transmission tunnel. Tighten the screws to 11 N·m (8 ft. lbs.).



**CAUTION: The lever arms (2) of the wire harness connectors for the ACM MUST be in the unlatched position before they are inserted into their connector receptacles on the ACM or they may become damaged.**

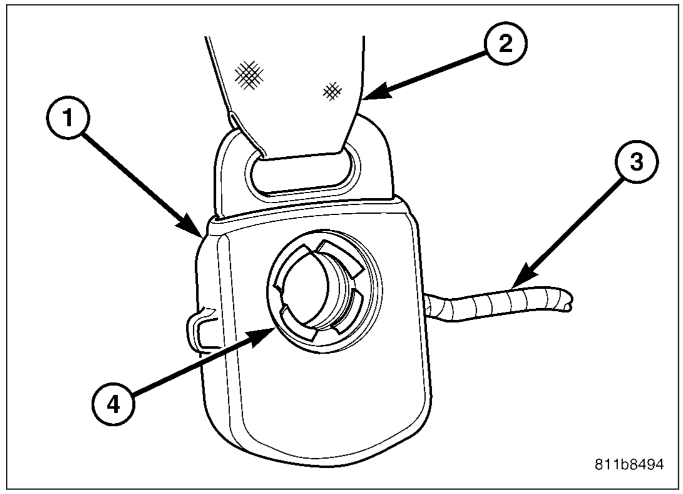


3. Reconnect the two wire harness connectors (3) (one each from the instrument panel and the body wire harnesses) for the ACM (1) to the ACM connector receptacles located on the forward facing side of the module. Be certain that the latches on both connectors are each fully engaged.
4. Carefully position the ACM cover back over the top of the ACM. Be certain both cover latches are engaged in the slots in the base of the ACM housing.
5. Reinstall the center console onto the top of the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).
6. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

# BELT TENSION SENSOR

## DESCRIPTION

Vehicles equipped with the Occupant Classification System (OCS) include a belt tension sensor (1). This sensor is integral to the passenger side front seat belt (2) lower anchor which is secured to the outboard side of the passenger side front seat cushion frame. The lower anchor and belt tension sensor are concealed beneath an access cover on the outboard seat cushion side shield on the passenger side front seat. The belt tension sensor consists of a molded plastic housing with a central mounting hole (4), a metal seat belt anchor loop, and a short pigtail wire. The electronic circuitry of the belt tension sensor is concealed and protected within the molded plastic housing. The sensor is connected to the vehicle electrical system through its pigtail wire (3) to a dedicated take out of the passenger side front seat wire harness with a keyed and latching molded plastic connector insulator to ensure a proper and secure connection.



The belt tension sensor cannot be repaired and, if faulty or damaged, the entire passenger side front seat belt and retractor unit must be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/FRONT SEAT BELT & RETRACTOR - REMOVAL).

## OPERATION

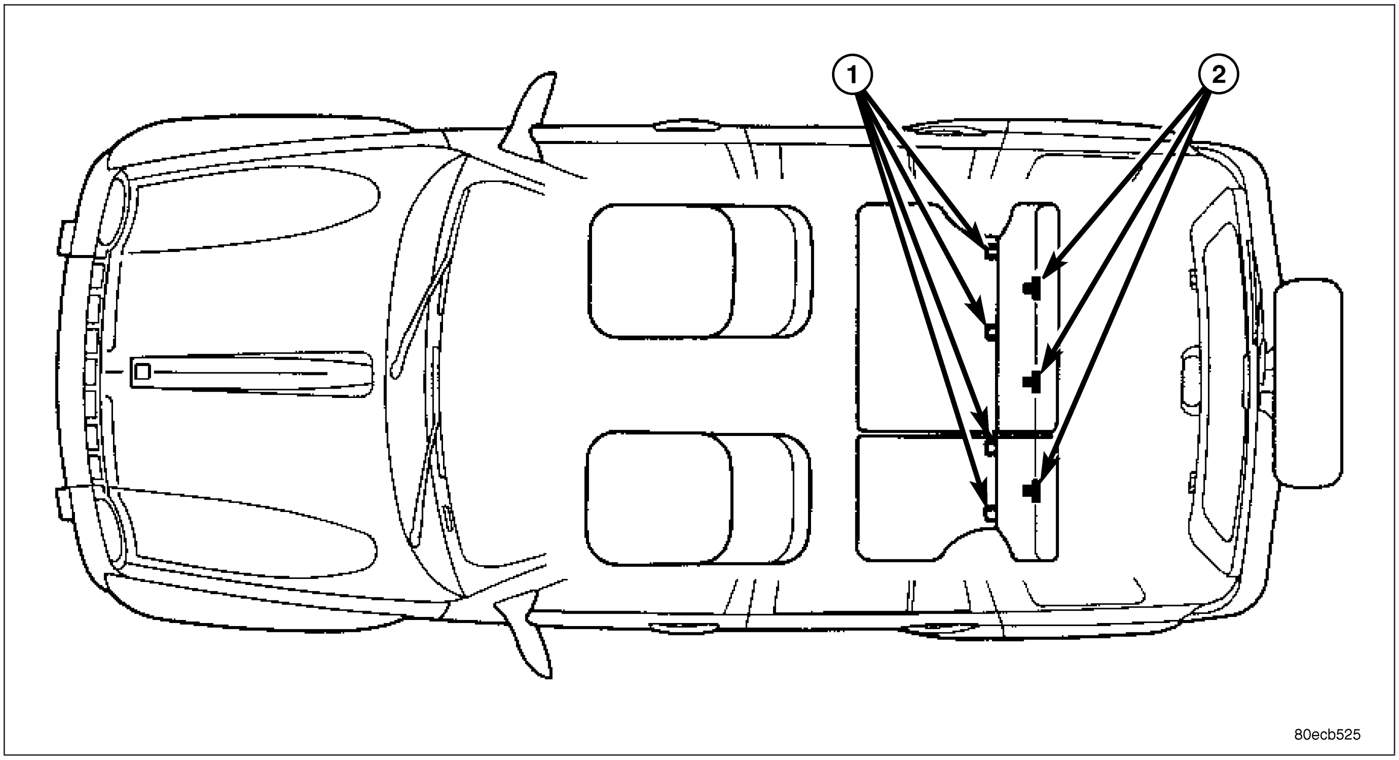
The belt tension sensor unit is designed to sense the relative cinch load applied to the passenger side front seat belt, which provides a logic input to the microprocessor of the Occupant Classification Module (OCM). When a load is applied to the seat belt, the changes in the load are measured by the belt tension sensor through the seat belt lower anchor. As the load changes, the circuitry of the belt tension sensor changes the output voltage of the sensor.

The belt tension sensor receives a nominal five volts and a ground through dedicated hard wired circuits from the OCM. The OCM then monitors the belt tension sensor output voltage on a dedicated hard wired data communication circuit. The hard wired circuits between the belt tension sensor and the OCM may be diagnosed and tested using conventional diagnostic tools and procedures. However, the most reliable, efficient, and accurate means to diagnose the belt tension sensor input to the OCM, and the electronic message communication between the OCM and the Airbag Control Module (ACM) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

# CHILD RESTRAINT ANCHOR

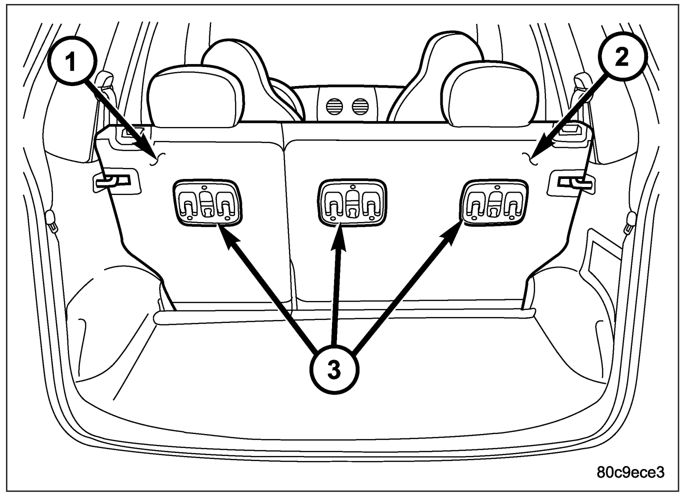
## DESCRIPTION

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

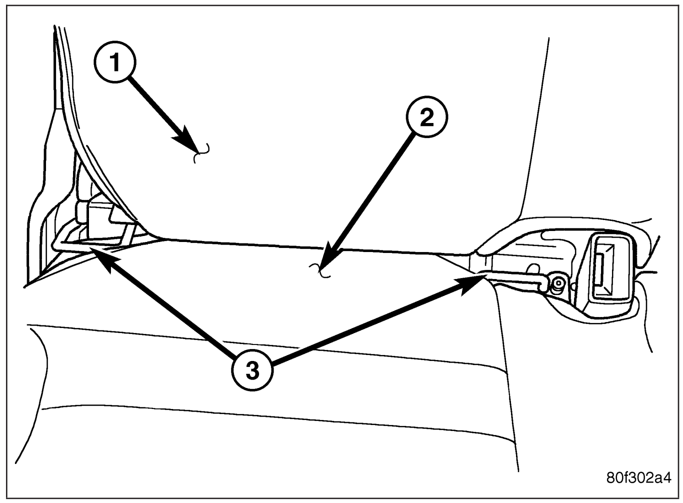


This model is equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system. The LATCH system provides for the installation of suitable child restraints in certain seating positions without using the standard equipment seat belt provided for that seating position. The rear seats in this model are equipped with a fixed-position child restraint upper tether anchor (2) for both the center and the two outboard seating positions, and child restraint lower anchors (1) for the two outboard seating positions only.

The three upper tether anchors are integral to the rear seat back panels. Two anchors are integral to the back of the right rear seat back panel (2), and one is integral to the left rear seat back panel (1). These anchors are each constructed from a short piece of heavy-gauge steel wire stock that is securely welded into a stamped cup integral to the seat back panel. There is a separate molded plastic trim bezel (3) located around each of the three anchors. The child restraint upper tether anchors cannot be adjusted or repaired and, if faulty or damaged, they must be replaced as a unit with their respective rear seat back panels.



The lower anchors (3) for this model are also integral to their respective rear seat back panels. These anchors are also constructed from heavy-gauge steel wire stock that is formed into a U-shape, then securely welded to the lower edge of the seat back panel. They are each accessed from the front of their respective seats, at each side where the seat back (1) meets the seat cushion (2). These lower anchors cannot be adjusted or repaired and, if faulty or damaged, they must be replaced as a unit with the seat back panel.



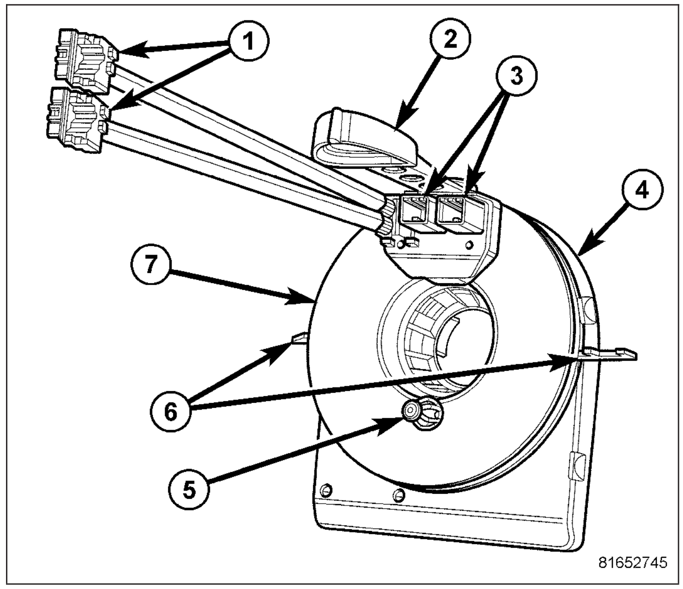
## OPERATION

See the owner's manual in the vehicle glove box for more information on the proper use of all of the factory-installed child restraint anchors.

# CLOCKSPRING

## DESCRIPTION

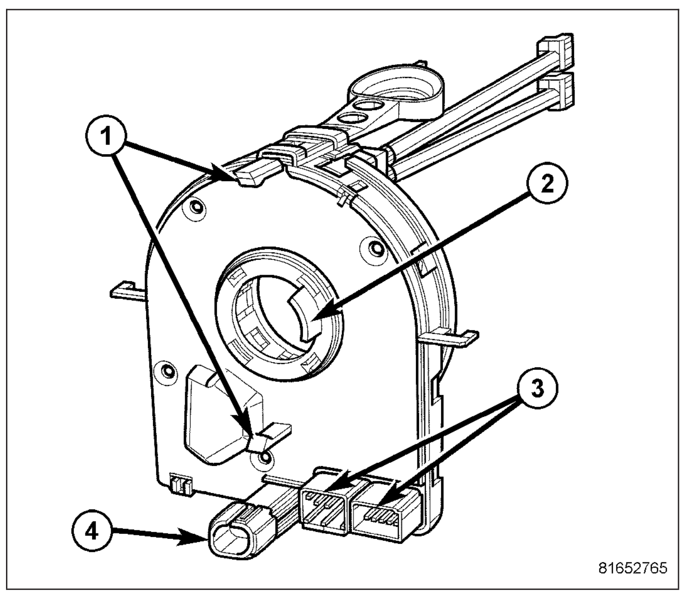
The clockspring assembly is secured with two plastic latches integral to the back of the case onto the upper steering column housing near the top of the steering column behind the steering wheel. Two additional mounting tabs (6) with slotted holes integral to the sides of the case are secured by two screws that secure the upper and lower steering column shrouds to the column housing and to each other. On models equipped with an optional Electronic Stability Program (ESP), the clockspring also includes an integral, internal Steering Angle Sensor (SAS) that is serviced as a unit with the clockspring.



The clockspring consists of a flat, round molded plastic case (4) with a stubby tail that hangs below the steering column. Within the plastic case is a spool-like molded plastic rotor with a large exposed hub. The upper surface of the rotor hub has a large center hole, an engagement dowel (5), two short pigtail wires with connectors (1), and two connector receptacles (3) that face toward the steering wheel.

Service replacement clocksprings are shipped pre-centered and with a molded plastic locking pin (2) that snaps into a receptacle on the rotor and is engaged with tabs on the upper surface of the clockspring case. The locking pin secures the centered clockspring rotor to the clockspring case during shipment and handling, but must be removed from the clockspring after it is installed on the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

Besides the two latch features (1), the lower surface of the case facing toward the instrument panel includes two integral connector receptacles (3). On units with the SAS there is an additional applied connector (4) with a short pigtail wire on the lower surface of the case, inboard of the two integral connectors. The lower surface of the rotor hub has a molded plastic turn signal cancel cam with a single lobe (2) that is integral to the rotor.



Within the plastic case and wound around the rotor spool is a long ribbon-like tape that consists of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tape terminates at the connector receptacles that face the instrument panel, while the inner end of the tape terminates at the pigtail wires and connector receptacles that face the steering wheel.

The clockspring cannot be repaired. If the clockspring is faulty, damaged, or if the driver airbag has been deployed, the clockspring must be replaced.

## OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and the electrical components mounted on or in the rotating steering wheel. On this model the rotating electrical components include the driver airbag, the horn switch, the speed control switches, and the remote radio switches, if the vehicle is so equipped. The clockspring case is positioned and secured to the upper steering column housing near the top of the steering column. The connector receptacles on the tail of the fixed clockspring case connect the clockspring to the vehicle electrical system through two take outs with connectors from the instrument panel wire harness.

The clockspring rotor is movable and is keyed by the engagement dowel that is molded onto the upper surface of the rotor hub to an opening that is cast into the steering wheel armature. The lobe of the turn signal cancel cam on the lower surface of the clockspring rotor hub contacts a turn signal cancel actuator of the multi-function switch to provide automatic turn signal cancellation. On units with an integral, internal Steering Angle Sensor (SAS), a connector and pigtail wire on the lower clockspring case connects the sensor to the vehicle electrical system through a third dedicated take out and connector of the instrument panel wire harness.

The yellow-sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the multistage driver airbag, while a steering wheel wire harness connects the connector receptacle on the upper surface of the clockspring rotor to the horn switch and, if the vehicle is so equipped, to the optional speed control switches and remote radio switches on the steering wheel.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the clockspring is removed from the steering column or if the steering shaft is disconnected from the steering gear, the clockspring spool can change position relative to the other steering components. The clockspring must be re-centered following completion of this service or the tape may be damaged.

Service replacement clocksprings are shipped pre-centered and with a locking pin installed. This locking pin should not be removed until the clockspring has been installed on the steering column. If the locking pin is removed before the clockspring is installed on a steering column, the clockspring centering procedure must be performed. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

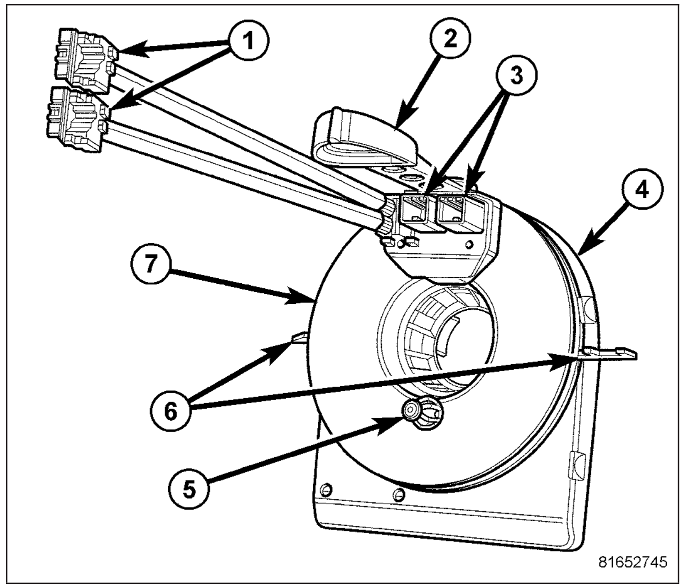
## STANDARD PROCEDURE

## CLOCKSPRING CENTERING

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.**

1. Place the front wheels in the straight-ahead position.
2. Remove the clockspring from the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).
3. Rotate the clockspring rotor (7) clockwise to the end of its travel. **Do not apply excessive torque.**
4. From the end of the clockwise travel, rotate the rotor about two and one-half turns counterclockwise. The engagement dowel (5) should end up at the bottom, and the airbag pigtail wires (1) and connector receptacles (3) should be at the top. Turn the rotor slightly clockwise or counterclockwise as necessary so that the slots for the clockspring locking pin (2) are in alignment.
5. The clockspring is now centered. Secure the clockspring rotor to the clockspring case to maintain clockspring centering until it is reinstalled on the steering column.



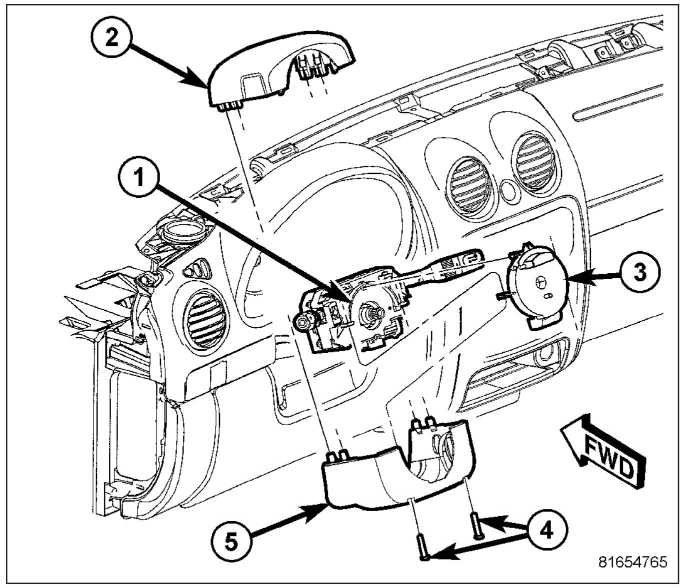
6. The front wheels should still be in the straight-ahead position. Reinstall the clockspring onto the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: A service replacement clockspring is shipped with the clockspring pre-centered and with a molded plastic locking pin installed. This locking pin should not be removed until the clockspring has been installed on the steering column. If the locking pin is removed before the clockspring is installed on a steering column, the clockspring centering procedure must be performed. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).**

**NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.**



1. Place the front wheels in the straight ahead position.
2. Disconnect and isolate the battery negative cable.
3. Remove the driver airbag from the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
4. Disconnect the steering wheel wire harness connectors from the upper clockspring connector receptacles.

**CAUTION: Be certain that the screws that secure the steering wheel puller to the steering wheel are fully engaged in the steering wheel armature without passing through the steering wheel and damaging the clockspring.**

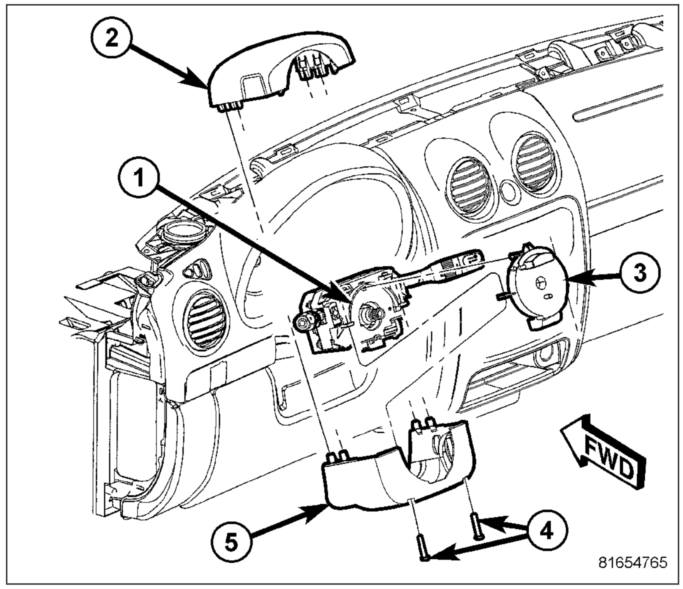
5. Remove the steering wheel from the steering column (8). (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).
6. If the vehicle is equipped with the optional tilt steering column, move the column to the fully lowered position and leave the tilt release lever in the released (down) position.
7. From below the steering column, remove the two screws (4) that secure the lower shroud (5) to the upper shroud (2).
8. Using hand pressure, push gently inward on both sides of the upper shroud above the parting line between the upper and lower shrouds to release the snap features that secure the two shroud halves to each other.
9. Remove both the upper and lower shrouds from the steering column.
10. Disconnect the two instrument panel wire harness connectors for the clockspring from the two connector receptacles located below the steering column on the back of the clockspring (3) case.
11. If the vehicle is equipped with the optional Electronic Stability Program (ESP) there will be an applied pigtail wire connector located below the steering column on the back of the clockspring case for the Steering Angle Sensor (SAS) that is internal to the clockspring. Disconnect the instrument panel wire harness connector for the SAS from the pigtail connector.
12. Using a small thin-bladed screwdriver, release the two integral plastic latches that secure the back of the clockspring case to the steering column lock housing (1).
13. Remove the clockspring from the steering column lock housing. The clockspring cannot be repaired. It must be replaced if faulty or damaged, or if the driver airbag has been deployed.
14. If the removed clockspring is to be reused, be certain to secure the clockspring rotor to the clockspring case to maintain clockspring centering until it is reinstalled on the steering column. If clockspring centering is not maintained, the clockspring must be centered again before it is reinstalled. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**CAUTION: A service replacement clockspring is shipped with the clockspring pre-centered and with a molded plastic locking pin installed. This locking pin should not be removed until the clockspring has been installed on the steering column. If the locking pin is removed before the clockspring is installed on a steering column, the clockspring centering procedure must be performed. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).**

**NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.**



1. Carefully slide the centered clockspring (3) down over the steering column upper shaft until the two integral plastic latches on the back of the clockspring case are fully engaged through their openings in the steering column lock housing (1).
2. If the vehicle is equipped with the optional Electronic Stability Program (ESP) there will be an applied pigtail wire connector located below the steering column on the back of the clockspring case for the Steering Angle Sensor (SAS) that is internal to the clockspring. Reconnect the instrument panel wire harness connector for the SAS to the pigtail connector.
3. Reconnect the two instrument panel wire harness connectors for the clockspring to the two connector receptacles located below the steering column on the back of the clockspring case.
4. Position the upper (2) and lower (5) shrouds onto the steering column.
5. Align the snap features on the lower shroud with the receptacles in the upper shroud and apply hand pressure to snap them together.
6. From below the steering column, install and tighten the two screws (4) that secure the lower shroud to the upper shroud. Tighten the screws to 2 N·m (18 in. lbs.).
7. If the vehicle is equipped with the optional tilt steering column, move the column back to the fully raised position and move the tilt release lever back to the locked (up) position.
8. If a new clockspring has been installed, remove the plastic locking pin that secures the clockspring rotor to the clockspring case to maintain clockspring centering.
9. Reinstall the steering wheel onto the steering column. (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).

**NOTE: Be certain that the steering wheel mounting screw is tightened to the proper torque specification to ensure proper clockspring operation.**

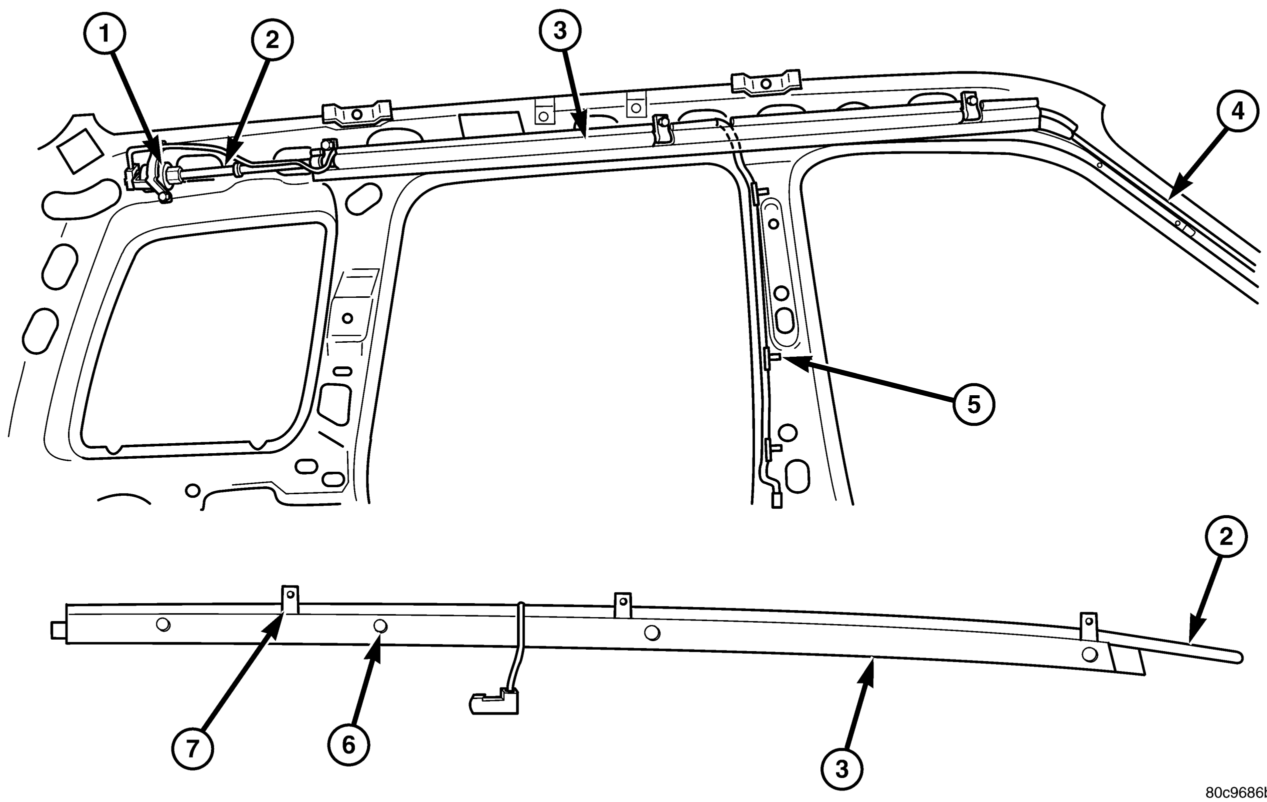
10. Reconnect the steering wheel wire harness connector to the upper clockspring connector receptacle.
11. Reinstall the driver airbag onto the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
12. Reconnect the battery negative cable.

# CURTAIN AIRBAG

## DESCRIPTION

Optional side curtain airbags are available for this model when it is also equipped with dual front airbags. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components, and vehicles with this equipment can be readily identified by a molded identification trim button with the “SRS - AIRBAG” logo located on the headliner above each B-pillar. This system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision.

8098029e



80c9686b

Vehicles equipped with side curtain airbags have two individually controlled curtain airbag units. These airbag units are concealed and mounted above the headliner where they are each secured to one of the roof side rails. Each folded airbag cushion is contained within a long extruded plastic channel (3) that extends along the roof rail from the A-pillar at the front of the vehicle to just behind the C-pillar at the rear of the vehicle. The channel is secured with plastic push-in fasteners to the roof rail (6).

A tether (4) extends down the A-pillar from the front of the airbag cushion, where it is retained to the pillar with a plastic push-in routing clip and is secured to the base of the A-pillar near the belt line with a screw. The hybrid-type inflator (1) for each airbag is secured to the roof rail at the rear of the airbag unit between the C-pillar and the D-pillar, and is connected to the airbag cushion by a long tubular manifold (2). The bracket holding the inflator and three other brackets (7) holding the manifold are secured to the roof rail with screws.

A two-wire pigtail harness is routed forward from the airbag inflator through a trough along the top of the plastic airbag channel on the roof rail and down the B-pillar, where it is retained by three routing clips (5). The pigtail harness is connected to a take out and connector of the body wire harness on the B-pillar, which connects the airbag unit to the Airbag Control Module (ACM).

The side curtain airbag unit cannot be adjusted or repaired and must be replaced if deployed, faulty, or in any way damaged. Once a side curtain airbag has been deployed, the complete airbag unit, the headliner, the upper A, B, and C-pillar trim, and all other visibly damaged components must be replaced.

## OPERATION

Each side curtain airbag is deployed individually by an electrical signal generated by the Airbag Control Module (ACM) to which it is connected through left or right curtain airbag line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ACM sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded curtain airbag cushion, causing the cushion to inflate. As the airbag cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision.

The front tether keeps the front portion of the bag taut to the side of the vehicle, thus ensuring that the bag will deploy in the proper position. Following the airbag deployment, the airbag cushion quickly deflates by venting the inert gas through the loose weave of the cushion fabric, and the deflated cushion hangs down loosely from the roof rail.

## REMOVAL

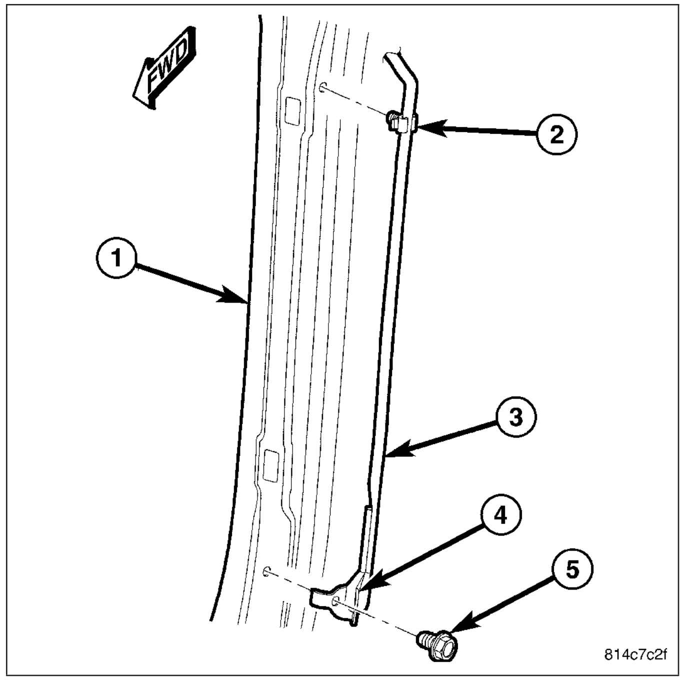
The following procedure is for replacement of a faulty or damaged side curtain airbag. If the airbag is faulty or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS). If the side curtain airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

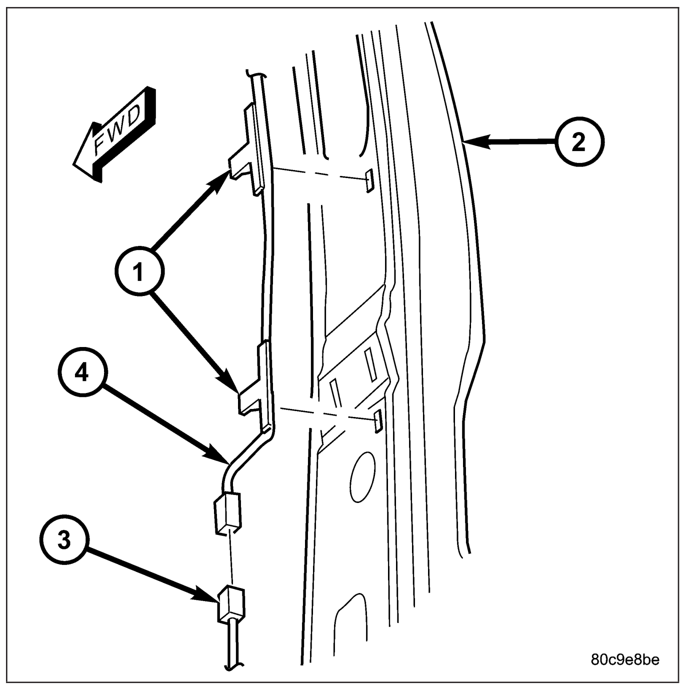
**WARNING: To avoid personal injury or death, when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

**WARNING: To avoid personal injury or death, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

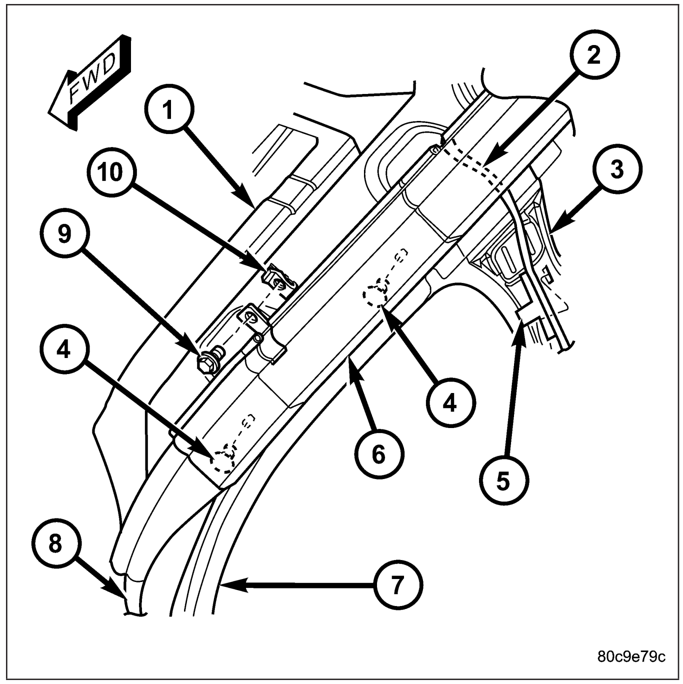
1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the lower trim from the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).
3. Remove the headliner from the vehicle. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
4. Remove the screw (5) that secures the side curtain airbag tether retainer (4) to the base of the A-pillar (1) near the belt line.
5. Disengage the side curtain airbag tether (3) plastic retainer clip (2) from the A-pillar.

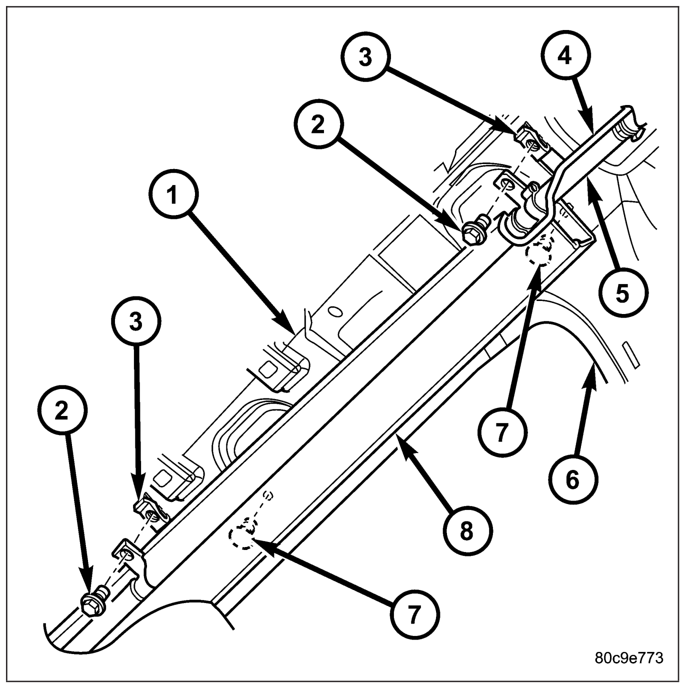


6. Disconnect the side curtain airbag pigtail wire connector (4) from the body wire harness connector (3) near the base of the B-pillar (2).
7. Disengage the three side curtain airbag pigtail wire retainer clips (1) from the B-pillar.

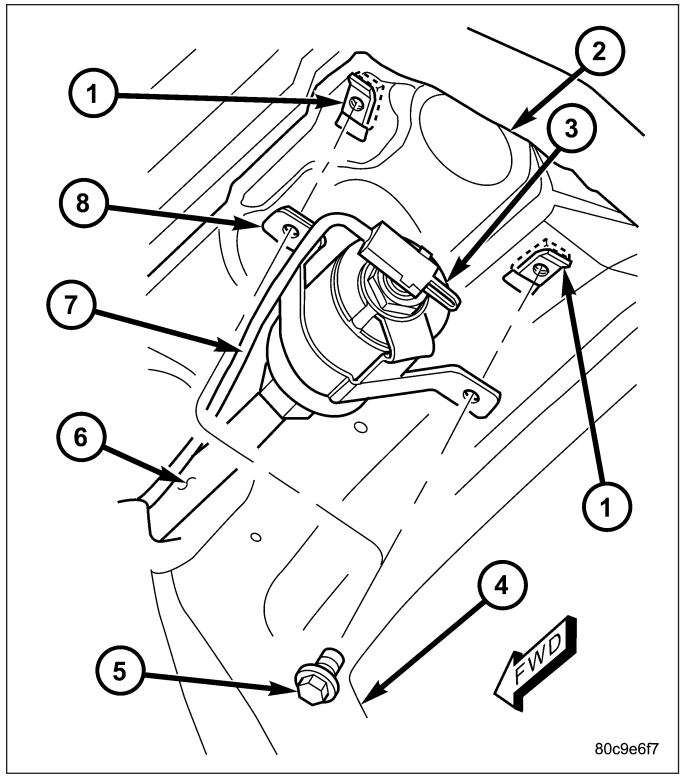


8. Remove the three screws (9 or 2) that secure the side curtain airbag manifold tube (5) brackets to the U-nuts (10 or 3) in the roof rail (1).





9. Remove the two screws (5) that secure the side curtain airbag inflator (3) bracket (8) to the U-nuts (1) in the roof rail (2).
10. Grasp the extruded plastic side curtain airbag channel firmly and pull it straight away from the roof rail far enough to disengage all four plastic push-in fasteners that secure it.
11. Remove the side curtain airbag from the vehicle as a unit.



## INSTALLATION

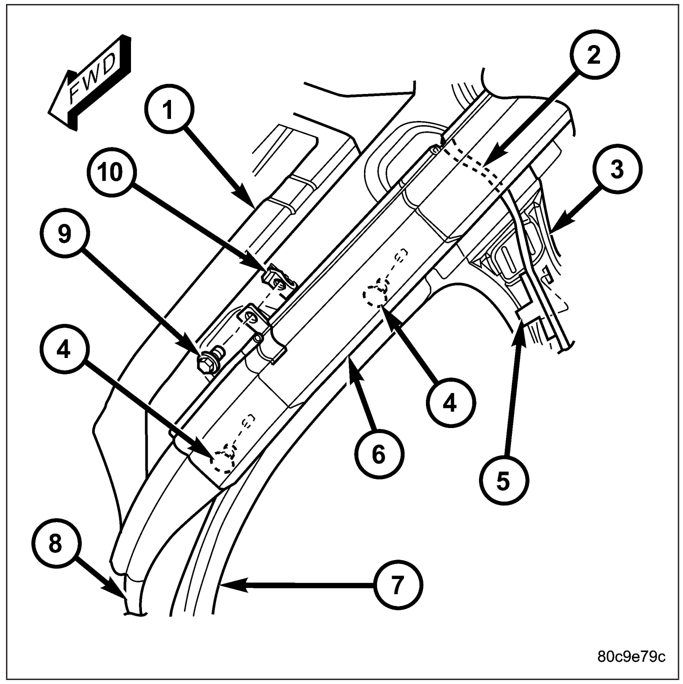
The following procedure is for replacement of a faulty or damaged side curtain airbag. If the airbag is faulty or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS). If the side curtain airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).

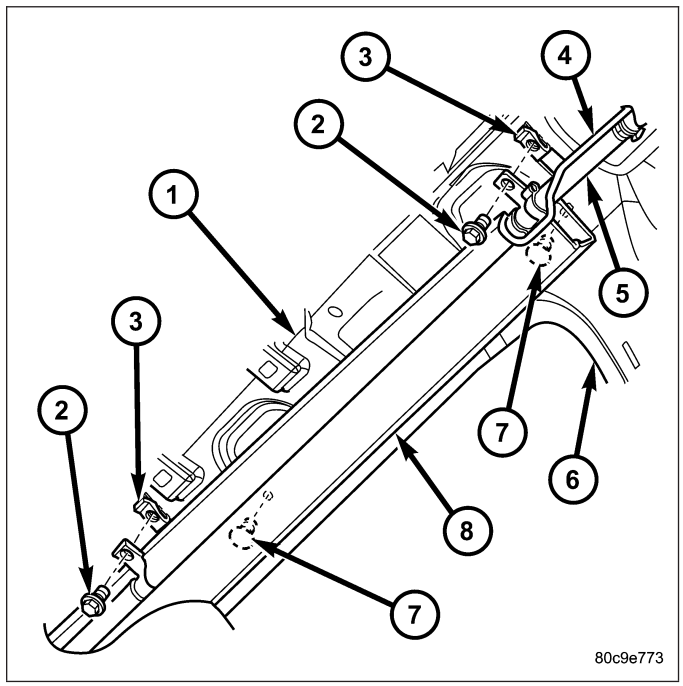
**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

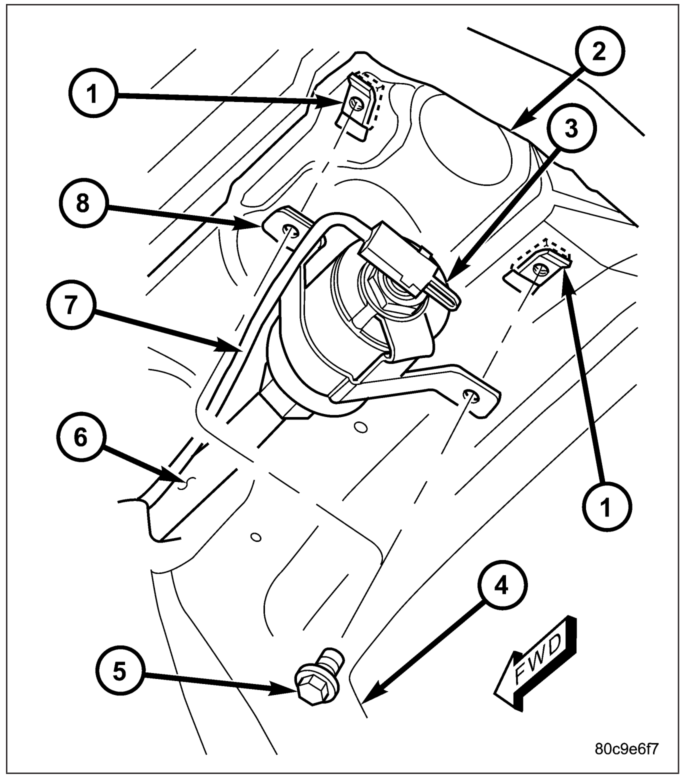
**WARNING: To avoid personal injury or death, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

1. Position the side curtain airbag into the vehicle as a unit.
2. Align all four plastic push-in fasteners (4 or 7) that secure the extruded plastic side curtain airbag channel (6 or 8) with their holes in the roof side rail (1) and push them straight into the roof rail until they are fully seated.





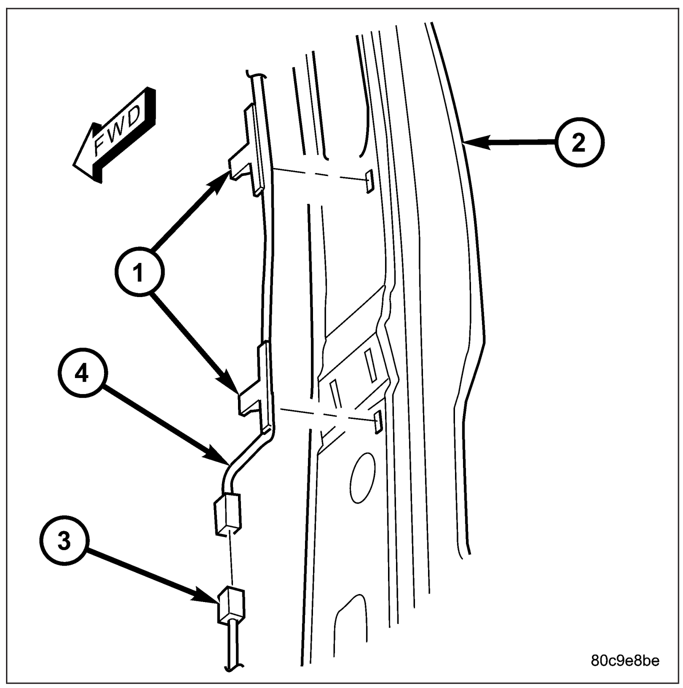
3. Install and tighten the upper screw (5) that secures the side curtain airbag inflator bracket (8) to the U-nut (1) in the roof rail, followed by the lower screw. Tighten the screws to 12 N·m (105 in. lbs.).
4. Working from the rear of the vehicle to the front, install and tighten each of the three screws that secure the side curtain airbag manifold tube brackets to the U-nuts in the roof rail. Tighten the screws to 12 N·m (105 in. lbs.).



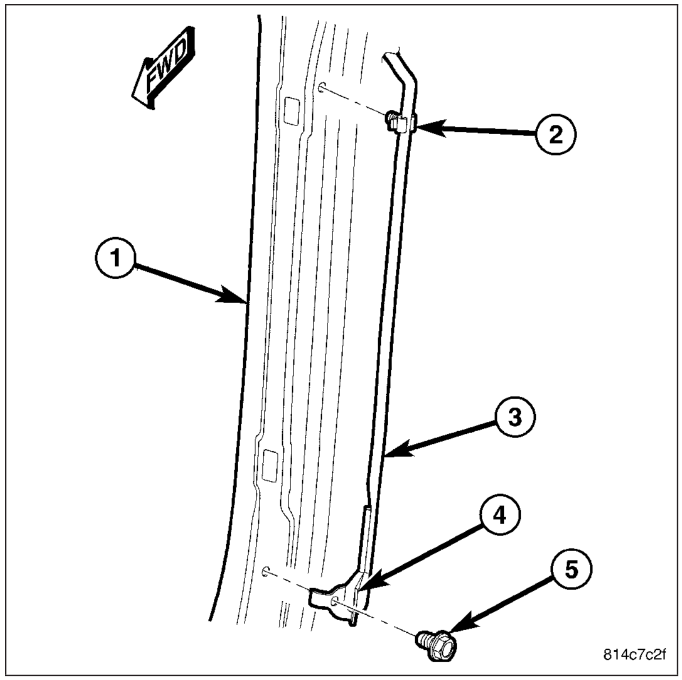
5. Route the side curtain airbag pigtail wire (4) through the trough along the top of the extruded plastic airbag channel on the roof side rail, then between the channel and the body down the B-pillar (2).

**NOTE: Be certain that the side curtain airbag pigtail wire is routed behind the airbag channel, between the channel and the body above the B-pillar.**

6. Engage the three side curtain airbag pigtail wire retainer clips (1) into the B-pillar.
7. Reconnect the side curtain airbag pigtail wire connector to the body wire harness connector (3) near the base of the B-pillar.



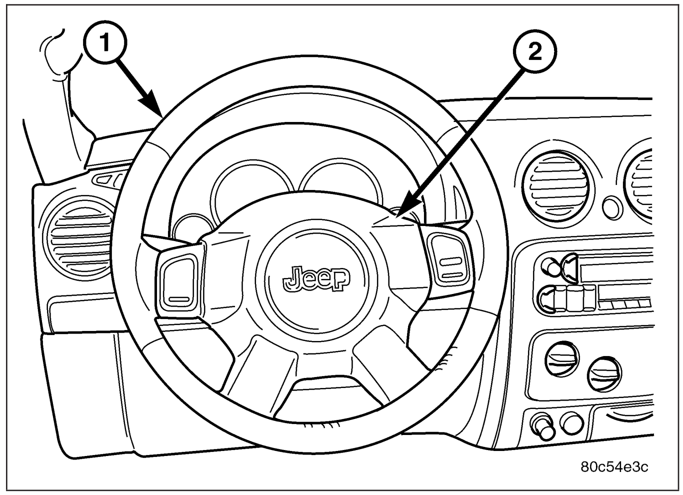
8. Engage the side curtain airbag tether (3) plastic retainer clip (2) into the A-pillar (1).
9. Install and tighten the screw (5) that secures the side curtain airbag tether retainer (4) to the base of the A-pillar near the belt line. Tighten the screw to 14 N·m (120 in. lbs.).
10. Reinstall the headliner into the vehicle. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
11. Reinstall the lower trim onto the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).
12. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).



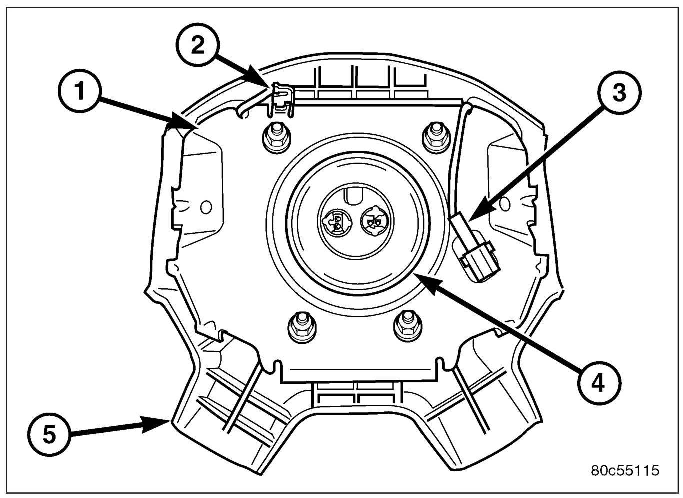
# DRIVER AIRBAG

## DESCRIPTION

The black, injection molded, thermoplastic driver airbag protective trim cover (2) is the most visible part of the driver airbag. The driver airbag is located in the center of the steering wheel (1), where it is secured with two screws to the two horizontal spokes of the four-spoke steering wheel armature. All models have a bright silver Jeep® logo applied to the center of the trim cover. Concealed beneath the driver airbag trim cover are the horn switch, the folded airbag cushion, the airbag cushion retainer, the airbag housing, the airbag inflator, and the retainers that secure the inflator to the airbag housing. The airbag cushion, housing, and inflator are secured within an integral receptacle molded into the back of the trim cover.



The resistive membrane-type horn switch is secured with heat stakes to the inside surface of the driver airbag trim cover (5), between the trim cover and the folded airbag cushion. The horn switch ground pigtail wire (2) has a female spade terminal connector that receives a path to ground through a male spade terminal that is integral to the driver airbag housing stamping (1) and is located near the upper right corner on the back of the housing. The horn switch feed pigtail wire (3) has a white, molded plastic insulator that is secured by an integral retainer to a mounting hole located near the lower left corner on the back of the housing, and is connected to the vehicle electrical system through a take out and connector of the steering wheel wire harness.



The airbag used in this model is a multistage unit that complies with revised federal airbag standards to deploy with less force than those used in some prior models. A 71 centimeter (28.0 inch) diameter, radial deploying fabric cushion with internal tethers is used. The airbag inflator (4) is a dual-initiator, non-azide, pyrotechnic-type unit with four mounting studs and is secured to the stamped metal airbag housing using four hex nuts with washers. Two keyed and color-coded connector receptacles on the driver airbag inflator connect the two inflator initiators to the vehicle electrical system through two yellow or black-jacketed, two-wire pigtail harnesses of the clockspring.

The driver airbag unit cannot be repaired, and must be replaced if deployed or in any way damaged.

## OPERATION

The multistage driver airbag is deployed by electrical signals generated by the Airbag Control Module (ACM) through the driver airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ACM to suit the monitored impact conditions by providing one of three delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ACM sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the airbag housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the driver airbag trim cover will split at predetermined breakout lines, then fold back out of the way along with the horn switch unit. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through vent holes within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic or hazardous materials. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).

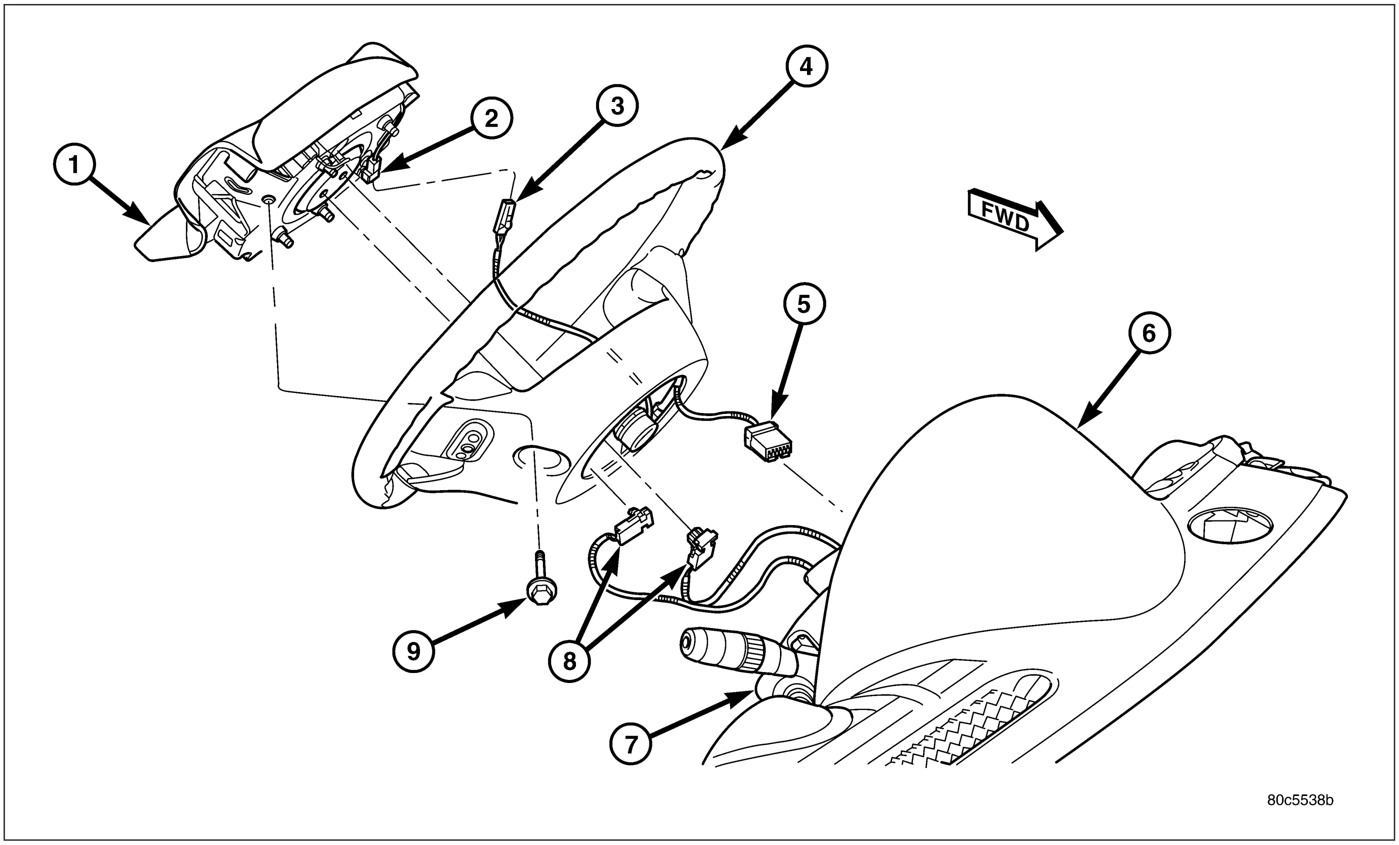
The inert gas that is produced when the chemicals are burned is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

**NOTE: The following procedure is for replacement of a faulty or damaged driver airbag. If the airbag is faulty or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS). If the driver airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).**



1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. From the underside of the steering wheel, remove the two screws (9) that secure the driver airbag (1) to the steering wheel armature.
3. Pull the driver airbag away from the steering wheel (4) far enough to access the three electrical connections on the back of the airbag housing.
4. Disconnect the steering wheel wire harness connector (3) for the horn switch from the horn switch feed pigtail wire connector (2), which is located on the back of the driver airbag housing.

**CAUTION: Do not pull on the clockspring pigtail wires or pry on the connector insulator to disengage the connector from the driver airbag inflator connector receptacle. Improper removal of these pigtail wires and their connector insulators can result in damage to the airbag circuits or connector insulators.**

5. The clockspring driver airbag pigtail wire connectors (8) are secured by integral latches to the airbag inflator connector receptacles, which are located on the back of the driver airbag housing. Depress the latches on each side of each connector insulator and pull the insulators straight out from the airbag inflator to disconnect them from the connector receptacles.
6. Remove the driver airbag from the steering wheel.
7. If the driver airbag has been deployed, the clockspring must be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

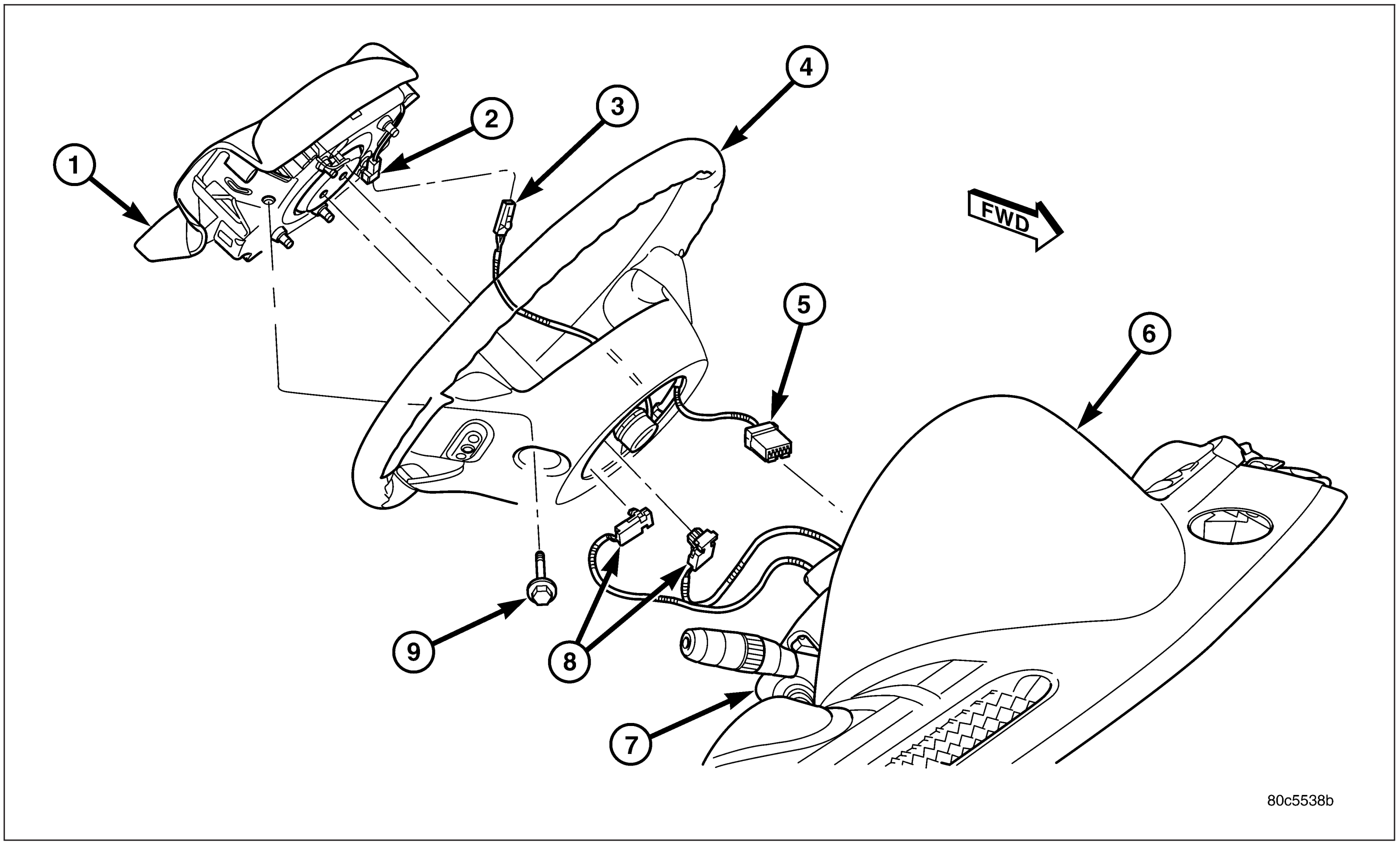
## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, use extreme care to prevent any foreign material from entering the driver airbag, or becoming entrapped between the driver airbag cushion and the driver airbag trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

**WARNING: To avoid personal injury or death, the driver airbag trim cover must never be painted. Replacement airbags are serviced with trim covers in the original colors. Paint may change the way in which the material of the trim cover responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

**NOTE: The following procedure is for replacement of a faulty or damaged driver airbag. If the airbag is faulty or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS). If the driver airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).**



1. Position the driver airbag (1) close enough to the steering wheel (4) to reconnect the three electrical connections on the back of the airbag housing.
2. When installing the driver airbag, reconnect the two clockspring driver airbag pigtail wire connectors (8) to the airbag inflator connector receptacles by pressing straight in on the connectors. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. You can be certain that each connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
3. Reconnect the steering wheel wire harness connector (3) for the horn switch to the horn switch feed pigtail wire connector (2), which is located at the back of the driver airbag housing.
4. Carefully position the driver airbag in the steering wheel. Be certain that the clockspring pigtail wires and steering wheel wire harness in the steering wheel hub area are not pinched between the driver airbag and the steering wheel armature.

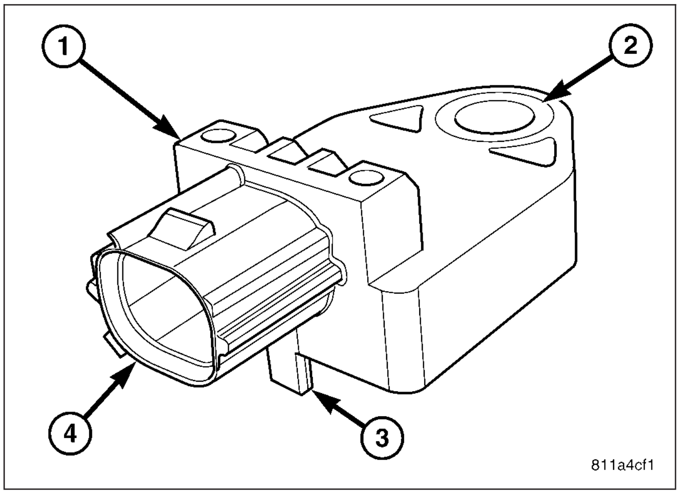
5. From the underside of the steering wheel, install and tighten the two screws (9) that secure the driver airbag to the steering wheel armature. Tighten the screws to 10 N·m (90 in. lbs.).
6. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

# IMPACT SENSOR

## DESCRIPTION

### FRONT

Two front impact sensors (1) are used on this model, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Airbag Control Module (ACM). Each front sensor is secured with a screw to the backs of the right and left vertical members of the radiator support within the engine compartment. The sensor housing has an integral connector receptacle (4), an integral anti-rotation pin (3), and an integral mounting hole (2) with a metal sleeve to provide crush protection.

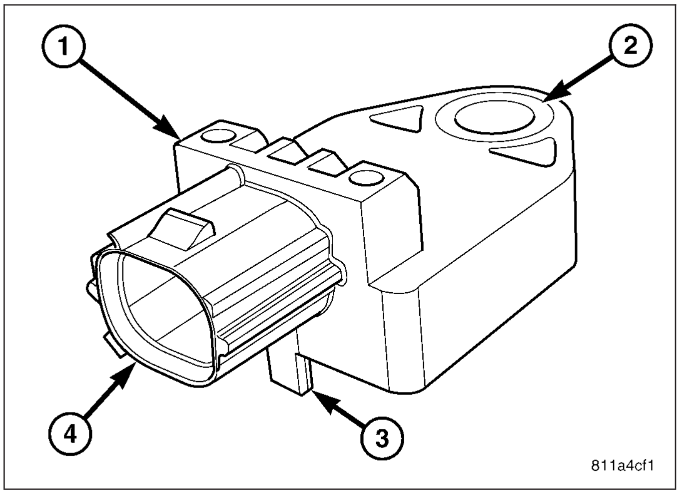


The right and left front impact sensors are identical in construction and calibration. A cavity in the center of the molded black plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic impact sensor. Potting material fills the cavity to seal and protect the internal electronic circuitry and components. The front impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The impact sensors cannot be repaired or adjusted and, if damaged or faulty, they must be replaced.

### SIDE

Two side impact sensors (1) are used on this model when it is equipped with the optional side curtain airbags, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Airbag Control Module (ACM). Each side sensor is secured with a screw to the inner right or left B-pillar above the front seat belt retractor within the passenger compartment. The sensor housing has an integral connector receptacle (4), an integral anti-rotation pin (3), and an integral mounting hole (2) with a metal sleeve to provide crush protection.



The right and left side impact sensors are identical in construction and calibration. A cavity in the center of the molded black plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic impact sensor. Potting material fills the cavity to seal and protect the internal electronic circuitry and components. The side impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness.

The impact sensors cannot be repaired or adjusted and, if damaged or faulty, they must be replaced.

## OPERATION

## FRONT

The front impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Airbag Control Module (ACM).

The ACM microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ACM detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ACM. The impact sensors and the ACM communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the front impact sensors and the ACM may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ACM, the impact sensors, or the electronic message inputs to or outputs from the impact sensors. The most reliable, efficient, and accurate means to diagnose the impact sensors, the ACM, and the electronic message communication between the sensors and the ACM requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## SIDE

The side impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Airbag Control Module (ACM).

The ACM microprocessor continuously monitors all of the side passive restraint system electrical circuits to determine the system readiness. If the ACM detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ACM. The impact sensors and the ACM communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the side impact sensors and the ACM may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ACM, the impact sensors, or the electronic message inputs to or outputs from the impact sensors. The most reliable, efficient, and accurate means to diagnose the impact sensors, the ACM, and the electronic message communication between the sensors and the ACM requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

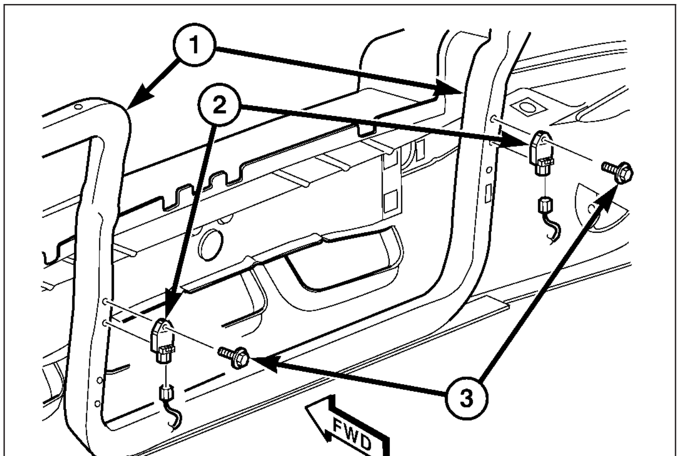
## REMOVAL

## FRONT

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front supplemental restraints. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front supplemental restraint deployment.**

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the screw (3) that secures the right or left front impact sensor (2) to the back of the right or left radiator support vertical member (1).
3. Disconnect the headlamp and dash wire harness connector for the front impact sensor from the sensor connector receptacle.
4. Remove the right or left front impact sensor from the engine compartment.



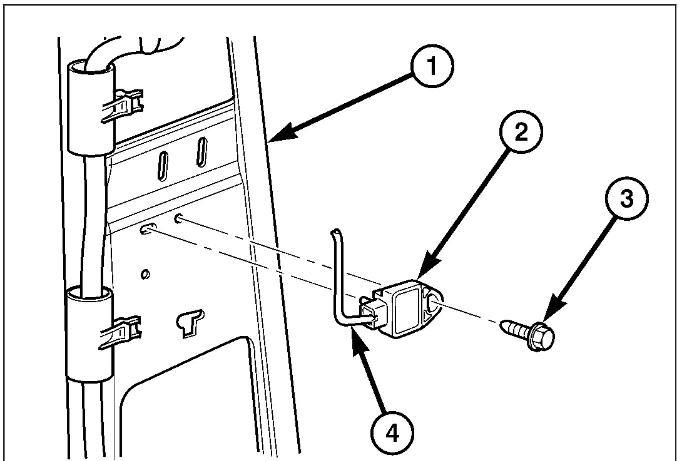
811a5c8a

## SIDE

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side curtain supplemental restraints. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side supplemental restraint deployment.**

1. Adjust the driver or passenger side front seat to its most forward position for easiest access to the B-pillar trim.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the lower trim from the inside of the right or left B-pillar (1). (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).
4. Remove the screw (3) that secures the right or left side impact sensor (2) to the lower B-pillar.
5. Disconnect the body wire harness connector (4) for the side impact sensor from the sensor connector receptacle.
6. Remove the right or left side impact sensor from the passenger compartment.



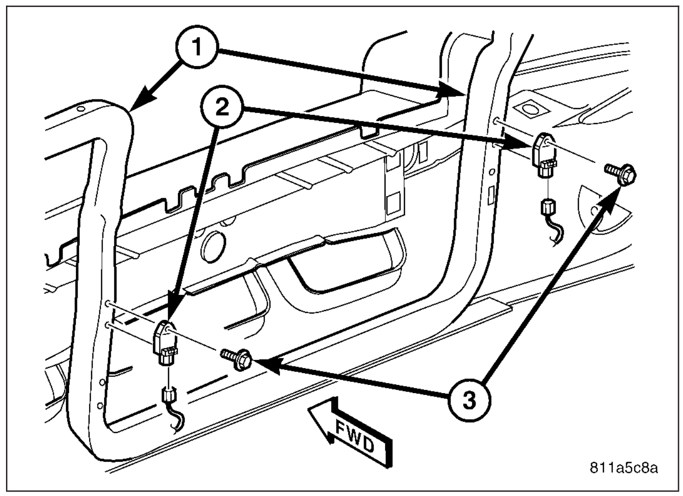
811b8d1c

# INSTALLATION

## FRONT

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front supplemental restraints. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front supplemental restraint deployment.**

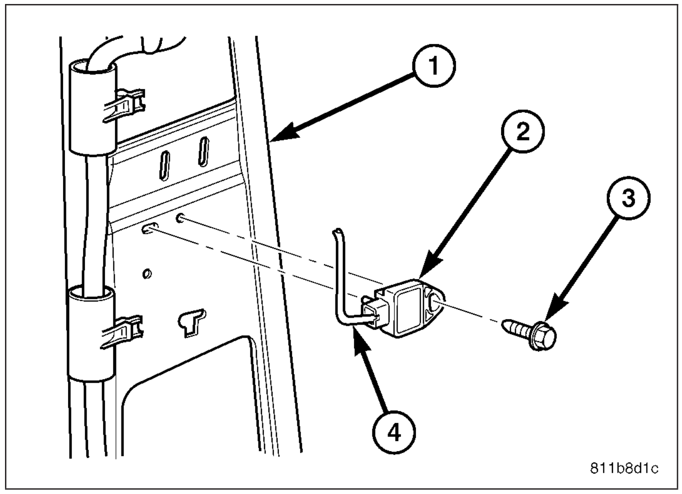


1. Position the right or left front impact sensor (2) into the engine compartment.
2. Reconnect the headlamp and dash wire harness connector for the front impact sensor to the sensor connector receptacle.
3. Position the sensor onto the back of the right or left radiator support vertical member (1). Be certain that the anti-rotation pin on the back of the sensor is engaged in the lower clearance hole of the radiator support.
4. Install and tighten the screw (3) that secures the sensor to the back of the support vertical member. Tighten the screw to 7 N·m (65 in. lbs.).
5. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

## SIDE

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side curtain supplemental restraints. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side supplemental restraint deployment.**

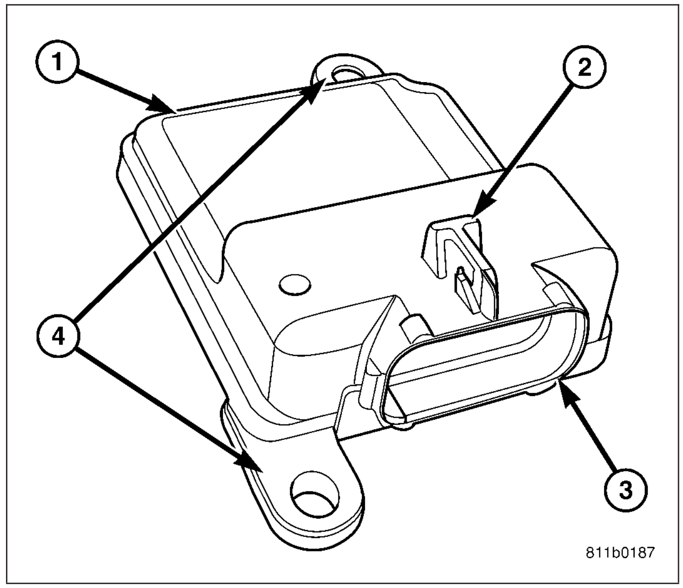


1. Position the right or left side impact sensor (2) near the lower B-pillar (1) in the passenger compartment.
2. Reconnect the body wire harness connector (4) for the side impact sensor to the sensor connector receptacle.
3. Position the right or left side impact sensor onto the inner B-pillar. Be certain that the anti-rotation pin on the back of the sensor is engaged in the clearance hole of the B-pillar.
4. Install and tighten the screw (3) that secures the right or left side impact sensor to the inner B-pillar. Tighten the screw to 11 N·m (100 in. lbs.).
5. Reinstall the lower trim onto the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).
6. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

# OCCUPANT CLASSIFICATION MODULE

## DESCRIPTION

The Occupant Classification Module (OCM) (1) is secured with two screws to a stamped steel mounting bracket welded onto the underside of the passenger side front seat cushion frame near the inboard front corner. Concealed within a hollow in the center of the molded plastic OCM housing is a microprocessor and the other electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry. The OCM software is flash programmable.



Two mounting tabs (4), a connector lock tower (2), and a connector receptacle (3) are integral to the OCM housing. The connector receptacle contains terminal pins that connect the OCM to the vehicle electrical system through a dedicated take out and connector of the passenger side front seat wire harness. A molded plastic lock pin is integral to one end of a long tether, while the other end of the tether is secured to the seat wire harness. After the wire harness has been connected to the module, the lock pin is engaged through the lock tower on the module housing preventing the connector latches from becoming disengaged and ensuring that a secure electrical connection is maintained at all times.

A non-calibrated OCM is the only component of the Occupant Classification System (OCS) that is available for separate service replacement. The OCS components of the passenger side front seat cushion including the cushion frame, springs, insulator pad, seat weight bladder and pressure sensor, seat cushion foam, wiring harness and the OCM are a factory-calibrated and assembled unit. Once this unit is connected to a vehicle electrically, the calibration settings are uploaded from the calibrated OCM and stored in the memory of the ACM. If only the OCM is subsequently replaced, the new, non-calibrated OCM learns the proper calibration settings from the ACM after it is connected to the vehicle electrically.

The OCM cannot be adjusted or repaired and, if damaged or faulty, it must be replaced. The components of the passenger side front seat cushion including the cushion frame, springs, insulator pad, seat weight bladder and pressure sensor, seat cushion foam, wire harness and the OCM are serviced only as a factory-calibrated, assembled and tamper-evident unit. Only the OCM and the seat cushion trim are available for separate service replacement. Once a service replacement package has been installed in a vehicle, the OCM can thereafter be serviced only by replacing the entire passenger side front seat cushion unit with another complete service replacement package.

## OPERATION

The microprocessor in the Occupant Classification Module (OCM) contains the Occupant Classification System (OCS) logic circuits. The OCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Programmable Communications Interface (PCI) data bus. This method of communication is also used for OCS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The OCM provides a nominal five volts to both the pressure sensor of the seat weight bladder beneath the passenger side front seat cushion and to the belt tension sensor on the passenger side front seat belt lower anchor through dedicated hard wired sensor voltage and sensor ground circuits. The OCM then monitors the return voltage from each of the sensors on dedicated hard wired data communication circuits. The bladder pressure sensor input allows the OCM to determine whether the passenger side front seat is occupied and the relative size of the occupant by providing a weight-sensing reference to the load on the seat cushion. The belt tension sensor provides an additional logic input to the OCM microprocessor that allows it to distinguish between the lower seat belt cinch loads of a belted occupant and the higher loads associated with a belted child seat.

Pre-programmed decision algorithms and OCS calibration allow the OCM microprocessor to determine when passenger airbag protection is appropriate based upon the seat cushion load as signaled by the bladder pressure sensor and the seat belt cinch load as signaled by the belt tension sensor. When the programmed conditions are met, the OCM sends the proper electronic occupant classification messages over the PCI data bus to the Airbag Control Module (ACM), and the ACM enables or disables the deployment circuits for the passenger front supplemental restraints. The ACM also provides a control output for the passenger airbag on/off indicator in the instrument panel grab handle based upon the electronic occupant classification messages it receives from the OCM.

The OCM microprocessor continuously monitors all of the OCS electrical circuits and components to determine the system readiness. If the OCM detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the ACM over the PCI data bus. Then the ACM sets a DTC and sends messages to control the airbag indicator operation accordingly. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the OCM and the ACM. For some DTCs, if a fault does not recur for a number of ignition cycles, the OCM will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The OCM receives battery current on a fused ignition switch output (run-start) circuit through a fuse in the Junction Block (JB). The OCM receives ground through a ground circuit and take out of the body wire harness, which it shares with the ACM. This take out has a single eyelet terminal connector that is secured by a ground screw to the top of the right front seat riser on the floor panel beneath the right front seat. These connections allow the OCM to be operational whenever the ignition switch is in the Start or On positions.

The hard wired inputs and outputs for the OCM may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the OCM, the PCI data bus network, or the electronic message inputs to and outputs from the OCM. The most reliable, efficient, and accurate means to diagnose the OCM, the PCI data bus network, and the electronic message inputs to and outputs from the OCM requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

A non-calibrated Occupant Classification Module (OCM) is the only component of the Occupant Classification System (OCS) that is available for separate service replacement, as outlined in the procedures that follow. The OCS components of the passenger side front seat cushion including the cushion frame, springs, pad, seat weight bladder and pressure sensor, seat cushion foam and the OCM are a factory-calibrated and assembled unit. Once this unit is connected to a vehicle electrically, the calibration settings are uploaded from the OCM and stored in the memory of the Airbag Control Module (ACM). If only the OCM is subsequently replaced, the new, non-calibrated OCM learns the proper calibration settings from the ACM after it is connected to the vehicle electrically.

If any of the remaining OCS components of the passenger side front seat cushion require replacement, they are serviced only as a factory-calibrated, assembled, and tamper-evident service replacement package. This package includes the assembled frame, springs, pad, seat weight bladder and pressure sensor, foam, wiring and a calibrated OCM. When installing this package, always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components contained in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle.

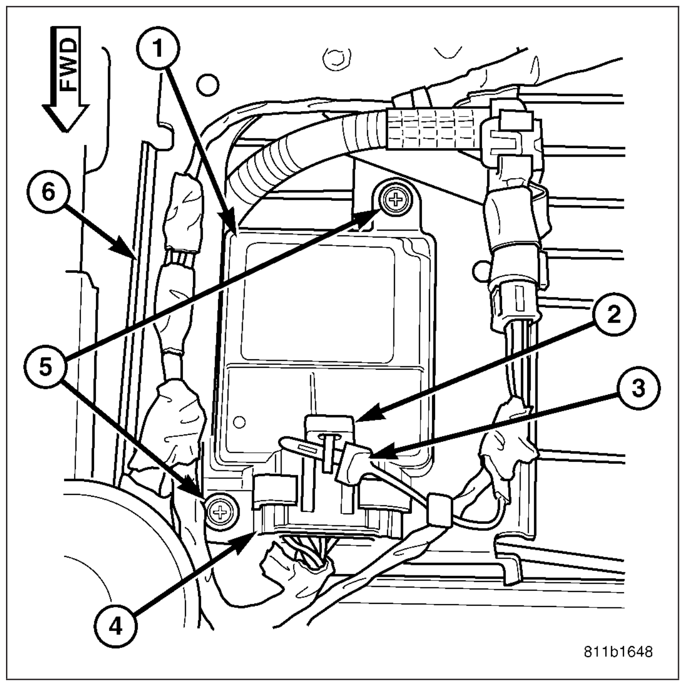
Once any of the original factory-installed components except the OCM have been replaced with the service replacement package components, the OCM can only be serviced by replacing the entire passenger side front seat cushion unit with another complete service replacement package. Any time any one of these components is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death on vehicles equipped with the Occupant Classification System (OCS), only the Occupant Classification Module (OCM) and the seat cushion trim may be serviced separately. All other components of the passenger side front seat cushion assembly must be serviced only as a complete factory-calibrated, assembled and tamper-evident service replacement package. This package includes the frame, springs, pad, bladder and pressure sensor, foam, wiring and a calibrated OCM. When installing this package always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle. Failure to take the proper precautions could result in failure of the passenger airbag to deploy when required, or in passenger airbag deployment when not required.**

**CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Airbag Control Module (ACM) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace the OCM first. Then perform the supplemental restraint verification test including an ignition-On time of at least one minute before replacing the ACM. Both the ACM and the OCM store OCS calibration data, which they transfer to one another during the first minute of ignition-On time after one of them is replaced. If both modules are replaced at the same time, an irreversible fault will be set in both modules. If the data transfer is not allowed sufficient time to complete between modules (at least one minute of ignition-On), an irreversible fault will be set in the module requiring the data.**

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Reach under the front edge of the passenger side front seat cushion to access and remove the lock pin (3) from the connector lock tower (2) on the Occupant Classification Module (OCM) (1).
3. Disconnect the passenger side front seat wire harness connector (4) for the OCM from the OCM connector receptacle located on the forward facing side of the module.
4. Remove the two screws (5) that secure the OCM to the OCM bracket (6) that is welded onto the underside of the passenger side front seat cushion frame.
5. Remove the OCM from under the passenger side front seat.



## INSTALLATION

A non-calibrated Occupant Classification Module (OCM) is the only component of the Occupant Classification System (OCS) that is available for separate service replacement, as outlined in the procedures that follow. The OCS components of the passenger side front seat cushion including the cushion frame, springs, pad, seat weight bladder and pressure sensor, seat cushion foam and the OCM are a factory-calibrated and assembled unit. Once this unit is connected to a vehicle electrically, the calibration settings are uploaded from the OCM and stored in the memory of the Airbag Control Module (ACM). If only the OCM is subsequently replaced, the new, non-calibrated OCM learns the proper calibration settings from the ACM after it is connected to the vehicle electrically.

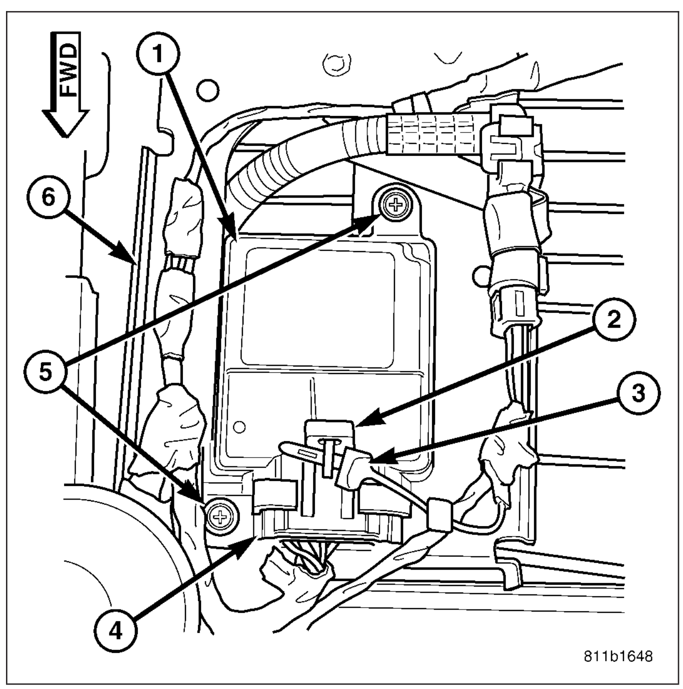
If any of the remaining OCS components of the passenger side front seat cushion require replacement, they are serviced only as a factory-calibrated, assembled, and tamper-evident service replacement package. This package includes the assembled frame, springs, pad, seat weight bladder and pressure sensor, foam, wiring and a calibrated OCM. When installing this package, always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components contained in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle.

Once any of the original factory-installed components except the OCM have been replaced with the service replacement package components, the OCM can only be serviced by replacing the entire passenger side front seat cushion unit with another complete service replacement package. Any time any one of these components is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death on vehicles equipped with the Occupant Classification System (OCS), only the Occupant Classification Module (OCM) and the seat cushion trim may be serviced separately. All other components of the passenger side front seat cushion assembly must be serviced only as a complete factory-calibrated, assembled and tamper-evident service replacement package. This package includes the frame, springs, pad, bladder and pressure sensor, foam, wiring and a calibrated OCM. When installing this package always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle. Failure to take the proper precautions could result in failure of the passenger airbag to deploy when required, or in passenger airbag deployment when not required.**

**CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Airbag Control Module (ACM) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace the OCM first. Then perform the supplemental restraint verification test including an ignition-On time of at least one minute before replacing the ACM. Both the ACM and the OCM store OCS calibration data, which they transfer to one another during the first minute of ignition-On time after one of them is replaced. If both modules are replaced at the same time, an irreversible fault will be set in both modules. If the data transfer is not allowed sufficient time to complete between modules (at least one minute of ignition-On), an irreversible fault will be set in the module requiring the data.**



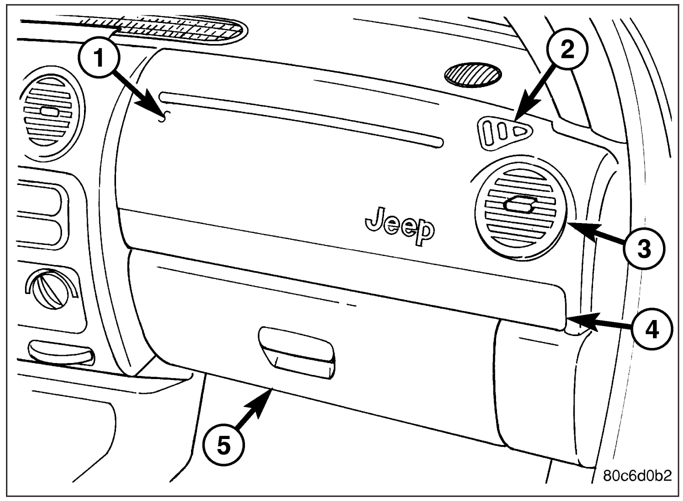
1. Carefully position the Occupant Classification Module (OCM) (1) to the OCM bracket (6) that is welded onto the underside of the passenger side front seat cushion frame. When the OCM is correctly positioned, the connector receptacle on the module will be pointed forward in the vehicle.
2. Install and tighten the two screws (5) that secure the OCM to the OCM bracket that is welded onto the underside of the passenger side front seat cushion frame. Tighten the screws to 2 N·m (20 in. lbs.).
3. Reconnect the passenger side front seat wire harness connector (4) for the OCM to the OCM connector receptacle located on the forward facing side of the module. Be certain that the latches on the connector are each fully engaged.
4. Reinstall the lock pin (3) into the connector lock tower (2) on the OCM.
5. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

6. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a diagnostic scan tool and the Occupant Classification Seat Weight special tool. Refer to the appropriate diagnostic procedures.

# PASSENGER AIRBAG

## DESCRIPTION

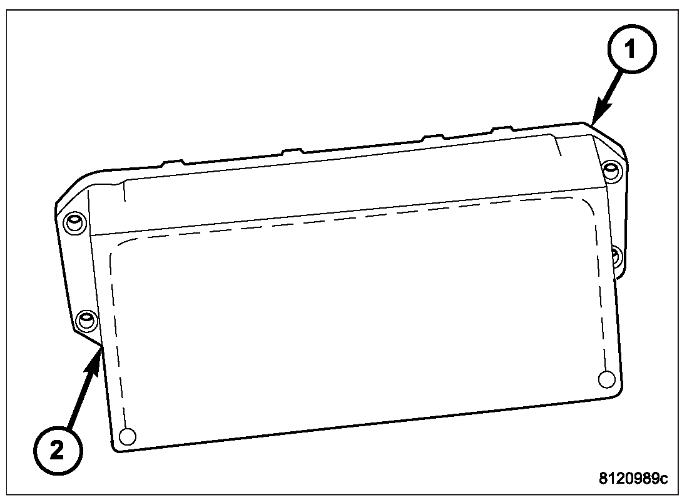
The rearward facing surface of the injection molded, thermoplastic passenger airbag door (1) is the most visible part of the passenger airbag. The passenger airbag door is located above the glove box (5) opening on the instrument panel in front of the front seat passenger seating position. The integral upper mounting flange of the airbag door is secured with five screws and the lower mounting flange with six screws to the instrument panel structural support.



The passenger airbag door includes an integral air conditioning panel outlet (3) housing and an integral side window demister outlet (2). An integral stamped metal bracket that reinforces the upper airbag door mounting flange is secured to the back of the door unit with heat stakes. The upper airbag door fasteners and mounting flange are concealed beneath the instrument panel top cover, while the lower fasteners and mounting flange are concealed beneath a bezel (4) on the instrument panel above the glove box opening.

Located behind the passenger airbag door within the instrument panel is the passenger airbag unit. The passenger airbag unit is secured by two screws on each side to two stamped metal mounting brackets that are fastened with screws to the instrument panel structural support.

The passenger airbag unit used in this model is a multistage unit that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The passenger airbag unit consists of a molded, glass-filled nylon plastic housing (1), a molded plastic inner airbag cushion cover (2), the airbag cushion, the airbag inflator and a heat shield. The airbag housing contains the airbag inflator and the heat shield, while the inner cover contains the folded airbag cushion. The inner cover completely encloses the airbag cushion and is permanently retained to the housing. The airbag cushion is constructed of a coated nylon fabric.



The airbag inflator is a dual-initiator, pyrotechnic-type unit that is secured to and sealed within the airbag housing. The passenger airbag is connected to the vehicle electrical system through two dedicated take outs of the instrument panel wire harness with connector insulators that connect directly to the two inflator initiators. The connector insulators are uniquely keyed and color-coded to ensure they can only be connected to the correct initiator.

The passenger airbag cannot be repaired, and must be replaced if deployed, faulty, or in any way damaged. If the passenger airbag is deployed, the passenger airbag door and both passenger airbag mounting brackets must also be replaced. The passenger airbag door and the passenger airbag mounting brackets are available for individual service replacement.

## OPERATION

The multistage passenger airbag is deployed by electrical signals generated by the Airbag Control Module (ACM) through the passenger airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ACM to suit the monitored impact conditions by providing one of three delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

The pyrotechnic-type inflator assembly includes two separate internal chambers filled with solid propellant. When the ACM sends the proper electrical signal to the airbag initiator, the initiator converts the electrical energy into chemical energy. This chemical energy ignites the solid propellant. As the solid propellant burns it produces a large quantity of inert gas. The inflator is sealed to the airbag cushion so that the inert gas is directed into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the passenger airbag door will split at predetermined tear seam lines on the inside surface of the door and the door will pivot out of the way. Following a passenger airbag deployment, the airbag cushion quickly deflates by venting the inert gas through vent holes within the fabric used to construct the sides of the airbag cushion.

Typically, both initiators are used during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic materials. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).

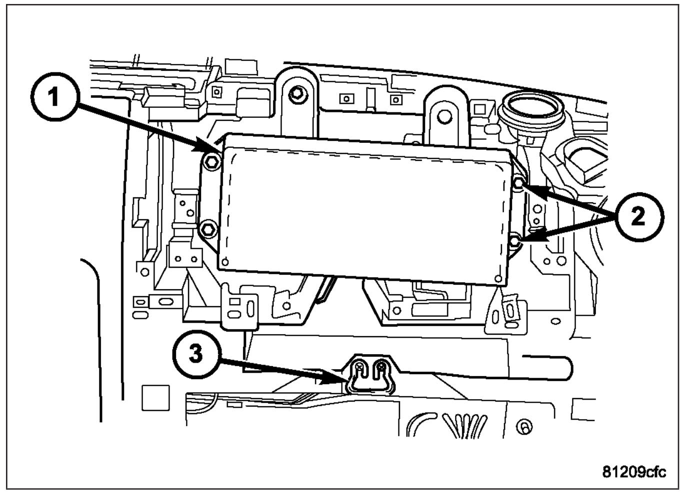
## REMOVAL

## AIRBAG

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

**NOTE: The following procedure is for replacement of a faulty or damaged passenger airbag. If the airbag is faulty or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS). If the passenger airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).**



1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the passenger airbag door from the instrument panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG DOOR - REMOVAL).
3. Remove the two screws (2) on each side of the passenger airbag housing (1) that secure the passenger airbag to the metal brackets on the instrument panel support structure.
4. Disengage the passenger airbag wire harness connector from the retainer securing the connector to the metal bracket on the instrument panel support structure above the airbag by sliding both halves of the connector to the left.
5. Pull the passenger airbag away from the instrument panel far enough to access the two wire harness connectors for the airbag.

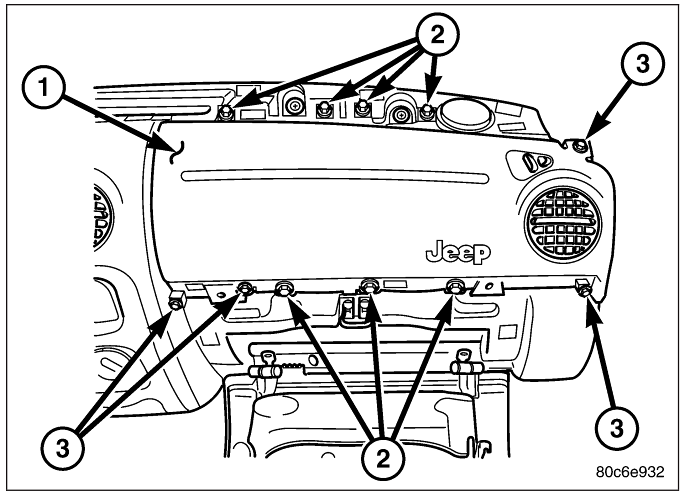
**CAUTION: Do not pull on the instrument panel wire harness passenger airbag take outs or pry on the connector insulators to disengage the connectors from the passenger airbag inflator connector receptacles. Improper removal of these wires and their connector insulators can result in damage to the airbag circuits or connector insulators.**

6. The instrument panel passenger airbag wire harness connectors are secured by integral latches to the airbag inflator connector receptacles, which are located on the sides of the passenger airbag housing. Depress the latches on each side of each connector insulator and pull the insulators straight out from the airbag inflator to disconnect them from the connector receptacles.
7. Remove the passenger airbag from the instrument panel as a unit.
8. If the passenger airbag has been deployed, both passenger airbag mounting brackets on the instrument panel must be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG MOUNTING BRACKET - REMOVAL).

## DOOR

**WARNING: To avoid personal injury or death on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, driver airbag, passenger airbag, occupant classification system, seat belt tensioner, front impact sensor, side impact sensor, side curtain airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death on vehicles equipped with airbags, when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

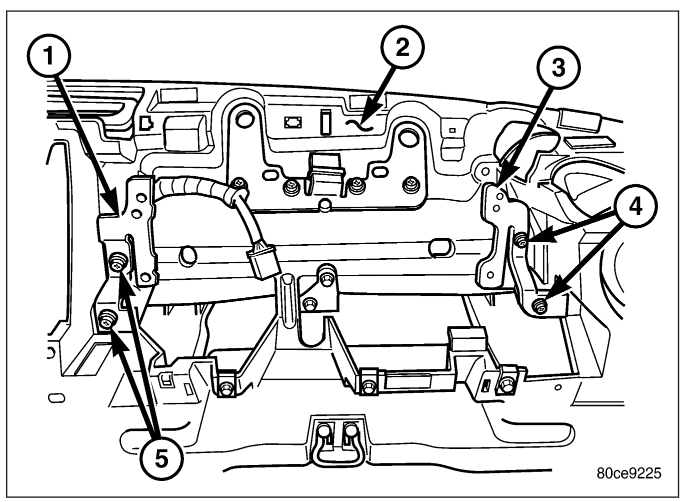


1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the top cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
3. Remove the passenger side bezel from the upper glove box opening of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP PASSENGER SIDE BEZEL - REMOVAL).
4. Remove the three small screws that secure the passenger airbag door to the glove box opening upper reinforcement.
5. Remove the three large screws (3) that secure the passenger airbag door (1) to the glove box opening upper reinforcement.
6. Remove the one small screw (3) that secures the passenger airbag door to the top of the instrument panel.
7. Remove the four large screws (2) that secure the passenger airbag door to the top of the instrument panel.
8. Remove the passenger airbag door from the instrument panel.

## BRACKETS

**WARNING: To avoid personal injury or death on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, driver airbag, passenger airbag, occupant classification system, seat belt tensioner, front impact sensor, side impact sensor, side curtain airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The passenger airbag mounting brackets cannot be repaired. They must be replaced if faulty or damaged, or if the passenger airbag has been deployed.**



1. Remove the passenger airbag from the instrument panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL).
2. Remove the two screws (4 or 5) that secure the inboard (1) and/or outboard passenger airbag mounting bracket (3) to the instrument panel support structure (2).
3. Remove the inboard and/or outboard passenger airbag mounting bracket(s) from the instrument panel support structure.

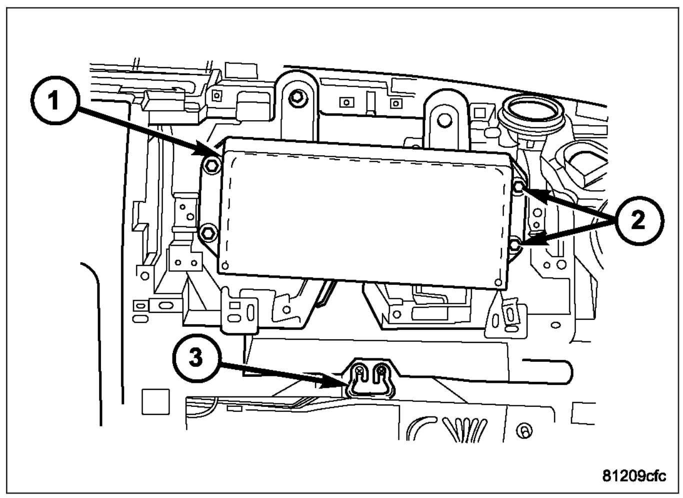
## INSTALLATION

## AIRBAG

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the passenger airbag door. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

**NOTE: The following procedure is for replacement of a faulty or damaged passenger airbag. If the airbag is faulty or damaged, but not deployed, review the recommended procedures for handling non-deployed supplemental restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS). If the passenger airbag has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the airbag from the vehicle. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).**

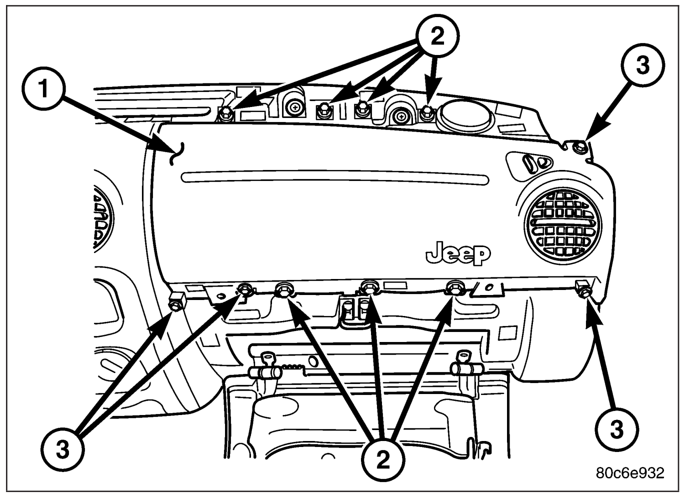


1. Position the passenger airbag unit (1) close enough to the instrument panel to reconnect the electrical connections on each side of the airbag housing.
2. When installing the passenger airbag, reconnect the two instrument panel wire harness connectors to the airbag inflator connector receptacles by pressing straight in on the connectors. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. You can be certain that each connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector latches snap into place.
3. Carefully position the passenger airbag unit onto the two metal brackets on the instrument panel support structure. Be certain that the alignment pin features on each side of the airbag are engaged in the alignment holes in the metal brackets.
4. Install and tighten the two screws (2) on each side of the passenger airbag housing that secure the passenger airbag to the metal brackets on the instrument panel support structure. Tighten the screws to 6 N·m (55 in. lbs.).
5. Reinstall the passenger airbag door onto the instrument panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG DOOR - INSTALLATION).
6. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

## DOOR

**WARNING: To avoid personal injury or death on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, driver airbag, passenger airbag, occupant classification system, seat belt tensioner, front impact sensor, side impact sensor, side curtain airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death on vehicles equipped with airbags, the passenger airbag door must never be painted. Replacement passenger airbag doors are serviced in the original colors. Paint may change the way in which the material of the airbag door responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.**



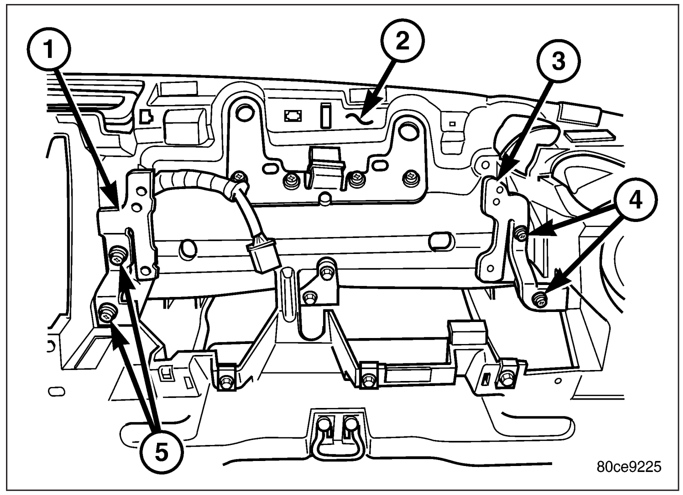
1. Position the passenger airbag door (1) onto the instrument panel.
2. Install and tighten the four large screws (2) that secure the passenger airbag door to the top of the instrument panel. Tighten the screws to 4 N·m (35 in. lbs.).
3. Install and tighten the one small screw (3) that secures the passenger airbag door to the top of the instrument panel. Tighten the screw to 2 N·m (20 in. lbs.).
4. Install and tighten the three large screws (2) that secure the passenger airbag door to the glove box opening upper reinforcement. Tighten the screws to 4 N·m (35 in. lbs.).
5. Install and tighten the three small screws (3) that secure the passenger airbag door to the glove box opening upper reinforcement. Tighten the screws to 2 N·m (20 in. lbs.).
6. Reinstall the passenger side bezel onto the upper glove box opening of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP PASSENGER SIDE BEZEL - INSTALLATION).
7. Reinstall the top cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).
8. Reconnect the battery negative cable.

## BRACKETS

**WARNING: To avoid personal injury or death on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, driver airbag, passenger airbag, occupant classification system, seat belt tensioner, front impact sensor, side impact sensor, side curtain airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The passenger airbag mounting brackets cannot be repaired. They must be replaced if faulty or damaged, or if the passenger airbag has been deployed.**

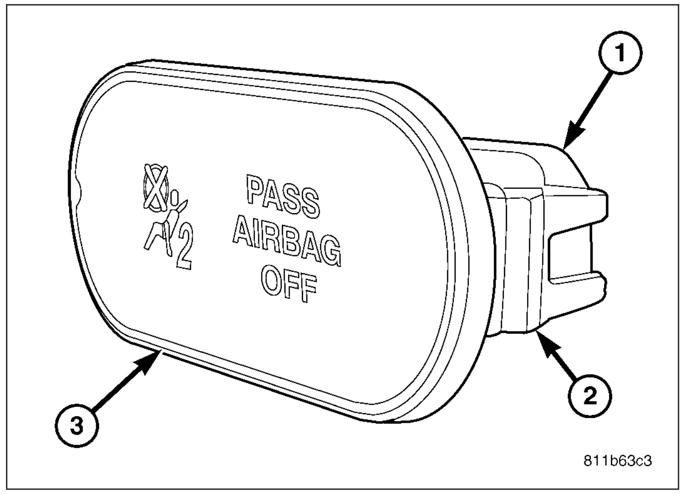
1. Position the inboard (1) and/or outboard passenger airbag mounting bracket (3) to the instrument panel support structure (2).
2. Install and tighten the two screws (4 or 5) that secure the inboard and/or outboard passenger airbag mounting bracket(s) to the instrument panel support structure. Tighten the screws to 2 N·m (20 in. lbs.).
3. Reinstall the passenger airbag to the instrument panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - INSTALLATION).



# PASSENGER AIRBAG ON/OFF INDICATOR

## DESCRIPTION

Vehicles equipped with the Occupant Classification System (OCS) include a passenger airbag on/off indicator (3), which is located in the inboard grab handle end cap located on the instrument panel between the passenger airbag door and the glove box. The passenger airbag on/off indicator and the grab handle are present only in vehicles equipped with the OCS. Vehicles without the OCS have only a trim bezel on the instrument panel, instead of a grab handle.



The passenger airbag on/off indicator consists of a molded plastic housing with an integral connector receptacle (1) at the back, an integral latch tab (2) on each side, and an oblong dark translucent outer lens. The opaque words “PASS AIRBAG OFF” and an opaque International Control and Display Symbol icon for “Passenger Airbag Off or Not Available” are imprinted on the back of the lens within the indicator. The dark outer lens prevents the indicator text and icon from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the lens causes the “PASS AIRBAG OFF” text and icon to appear silhouetted against an amber field through the translucent lens when the indicator is illuminated from behind by the LED.

The passenger airbag on/off indicator cannot be repaired or adjusted and, if faulty or damaged, the indicator unit must be replaced.

## OPERATION

In vehicles equipped with the Occupant Classification System (OCS), the passenger airbag on/off indicator gives an indication when the passenger airbag and seat belt tensioner deployment circuits are disabled by the Airbag Control Module (ACM). This indicator is controlled by a transistor within the ACM through a hard wired output based upon ACM programming and electronic occupant classification messages received by the ACM over the Programmable Communications Interface (PCI) data bus from the Occupant Classification Module (OCM).

The passenger airbag on/off indicator Light Emitting Diode (LED) is completely controlled by the ACM. The LED receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the ACM transistor. The ACM will turn on the passenger airbag on/off indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the passenger airbag on/off indicator is illuminated for about six seconds.
- **Child Seat Detected (or Load Less Than Fifth Percentile Female) Occupant Classification Message** - Each time the ACM receives a message from the OCM indicating a child seat has been detected in the passenger side front seat (or that the seat load is less than that of a fifth percentile female) the passenger airbag and seat belt tensioner deployment circuits are deactivated and the passenger airbag on/off indicator will be illuminated. The indicator remains illuminated until the ACM receives an occupant classification message indicating that the passenger side front seat is empty, that the seat is occupied by a load equal to or greater than a fifth percentile female, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Load Undetermined Occupant Classification Message** - Each time the ACM receives a message from the OCM indicating that a load cannot be determined in the passenger side front seat, the passenger airbag and seat belt tensioner deployment circuits are deactivated and the passenger airbag on/off indicator will be illuminated. The indicator remains illuminated until the ACM receives an occupant classification message indicating that the passenger side front seat is empty, that the seat is occupied by a load equal to or greater than a fifth percentile female, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Communication Error** - If the ACM receives invalid occupant classification messages or no messages from the OCM, the passenger airbag on/off indicator is illuminated. The indicator remains illuminated until the ACM receives a valid message from the OCM indicating that the passenger side front seat is empty, that the seat is occupied by a load equal to or greater than a fifth percentile female, or until the ignition switch is turned to the Off position, whichever occurs first.

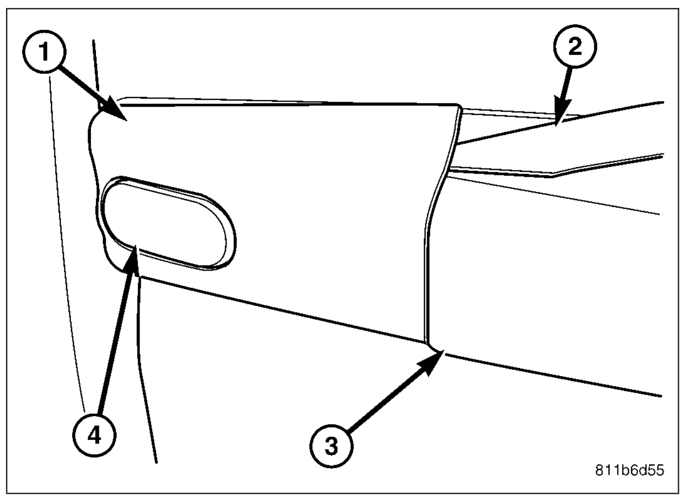
The ACM continually monitors the occupant classification messages from the OCM to decide whether the passenger airbag and seat belt tensioner deployment circuits should be activated or deactivated. Note that there may be several seconds of delay between changes in the detected occupant status and passenger airbag on/off indications. This is a programmed feature of the OCM used to prevent a flashing indicator condition resulting from the normal shifting of occupant weight on the passenger seat cushion. The ACM then provides the proper control output to turn the passenger airbag on/off indicator on or off.

The ACM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. For proper diagnosis of the OCM, the ACM, the PCI data bus, or the electronic message inputs to the ACM that control the passenger airbag on/off indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

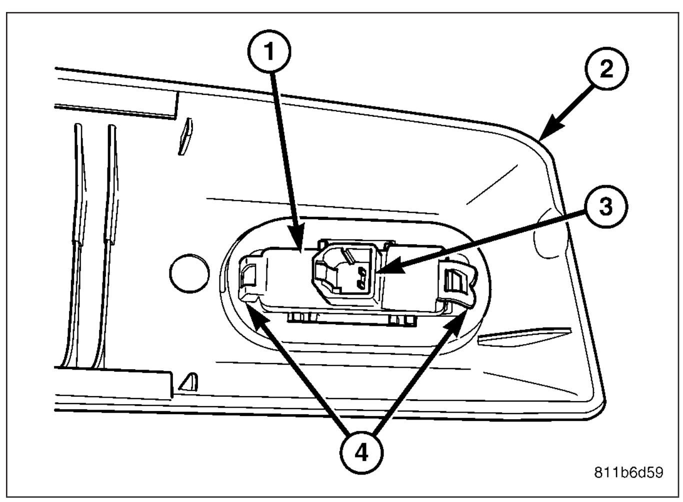
## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Using a trim stick (2) or another suitable wide flat-bladed tool, gently pry the inboard grab handle end cap (1) upwards at the parting line between the cap and the grab handle (3) far enough to disengage the cap from the handle.

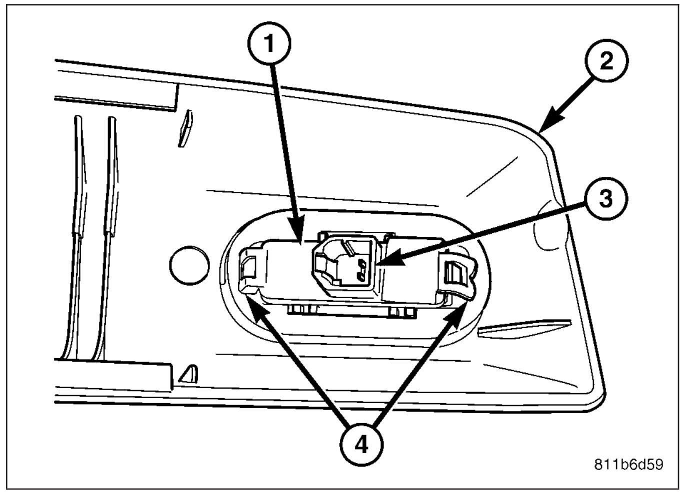


3. Pull the end cap (2) away from the instrument panel far enough to access and disconnect the wire harness connector for the passenger airbag on/off indicator from the connector receptacle (3) on the back of the indicator housing (1).
4. From the back of the inboard end cap, depress the two latches (4) toward the indicator housing and push the indicator out through the face of the end cap.



## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**



1. From the face of the inboard end cap (2), align the passenger airbag on/off indicator housing (1) with the mounting hole.
2. Using hand pressure, push the indicator firmly and evenly into inboard end cap until the two latches (4) are fully engaged on the back of the cap.
3. Position the indicator and end cap unit close enough to the instrument panel to reconnect the wire harness connector for the indicator to the indicator connector receptacle (3). Be certain that the connector is fully engaged in the receptacle.
4. Align the indicator and end cap unit with the inboard end of the grab handle, and engage the lower snap feature of the end cap to the bottom of the grab handle.
5. Using hand pressure, push the upper edge of the end cap firmly and evenly over the top of the grab handle until the cap snaps into place.
6. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).
7. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a diagnostic scan tool. Refer to the appropriate diagnostic procedures.

# SEAT BELT BUCKLE

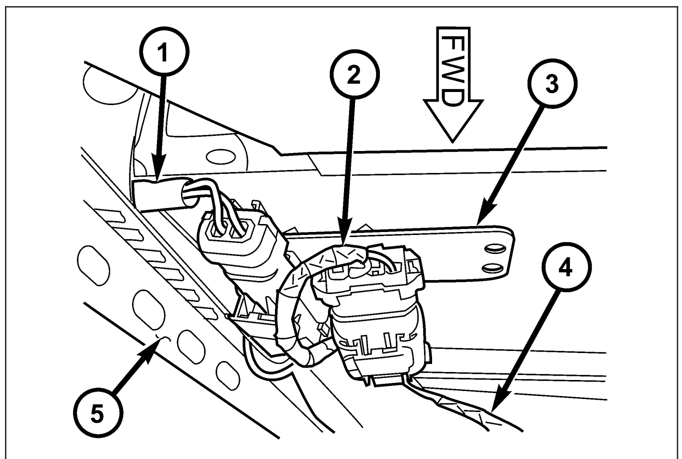
## REMOVAL

## FRONT

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

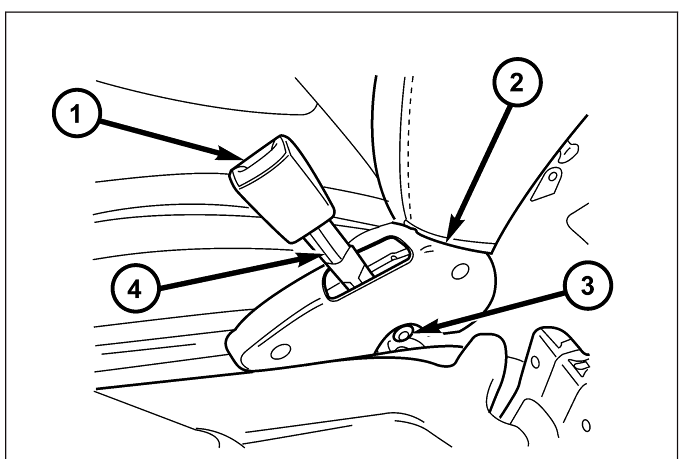
**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

1. On the driver side only, disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. On the driver side only, remove the front seat and seat track from the floor panel as a unit. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL).
3. On the driver side only, disconnect the seat belt switch pigtail wire (1) connector from the seat wire harness connector (2) on the seat cushion frame bracket (3) located under the rear edge of the seat cushion near the inboard side of the seat.



80c733d8

4. Remove the screw (3) that secures the front seat belt buckle (1) anchor to the bracket near the rear of the inboard seat track.
5. On the driver side only, remove the two screws that secure the inboard seat cushion side shield (2) to the seat cushion frame.
6. On the driver side only, remove the two screws that secure the inboard seat track to the rear inboard corner of the seat cushion frame.
7. On the driver side only, disconnect the seat belt switch pigtail wire routing clip from the locating hole in the seat cushion frame.
8. On the driver side only, remove the seat belt switch pigtail wire from between the seat cushion frame and the seat track by gently prying the inboard seat track away from the inboard rear corner of the seat cushion frame far enough to slide the pigtail wire from between them.



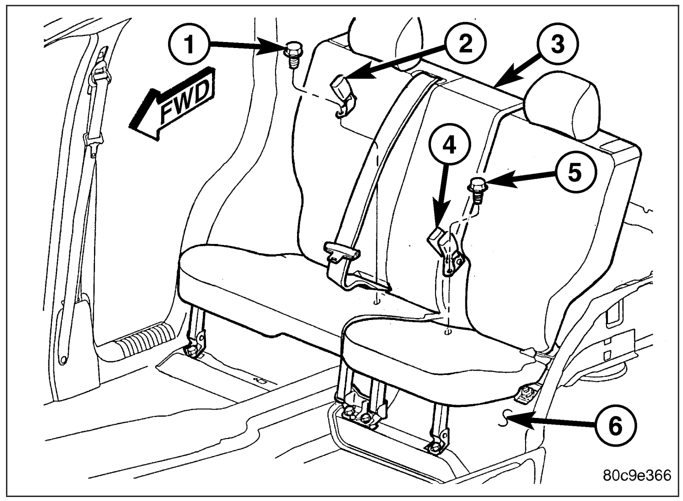
80c733dc

9. Remove the buckle from the seat.

## REAR

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

1. Unlatch the rear seat back (3) and fold it forward far enough to access the screw (1 or 5) that secures the rear seat belt buckle (2 or 4) anchor to the rear floor panel (6) between the rear seat back and the rear seat cushion.
2. Remove the screw that secures the rear seat belt buckle anchor to the rear floor panel.
3. Lift the rear seat belt buckle anchor off of the stud on the rear floor panel.
4. Remove the rear seat belt buckle and anchor from between the rear seat back and the rear seat cushion as a unit.



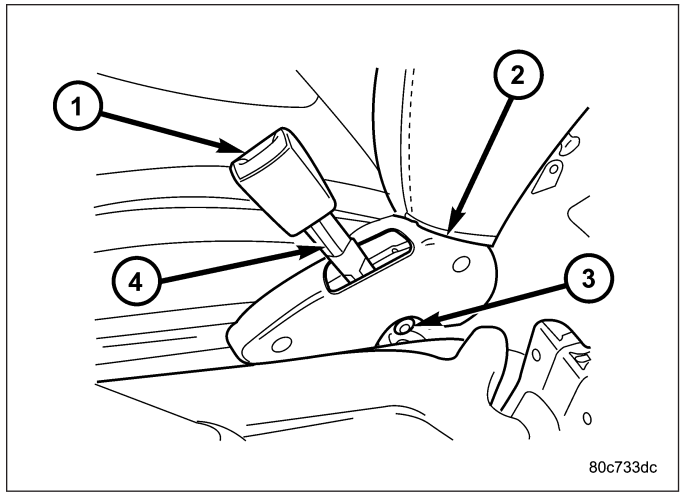
## INSTALLATION

## FRONT

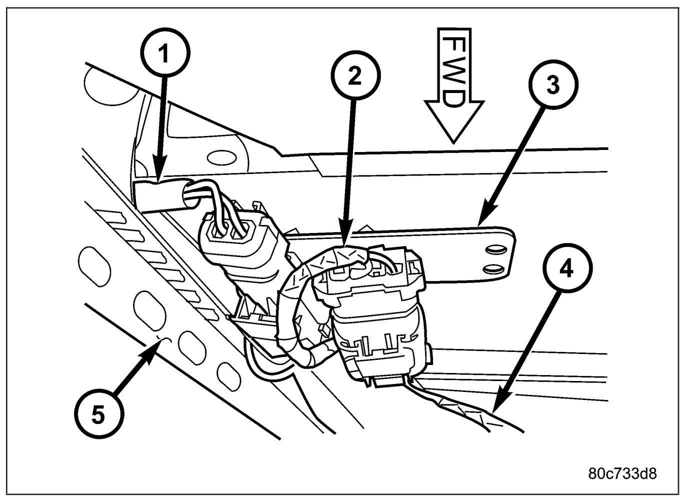
**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

1. Position the front seat belt buckle (1) lower anchor through the inboard seat cushion side shield (2).
2. On the driver side only, position the seat belt switch pigtail wire (4) between the seat cushion frame and the seat track by gently prying the inboard seat track away from the inboard rear corner of the seat cushion frame far enough to slide the pigtail wire into position between them.
3. On the driver side only, engage the seat belt switch pigtail wire routing clip into the locating hole in the seat cushion frame.
4. On the driver side only, install and tighten the two screws that secure the inboard seat track to the rear inboard corner of the seat cushion frame. Tighten the screws to 28 N·m (21 ft. lbs.).



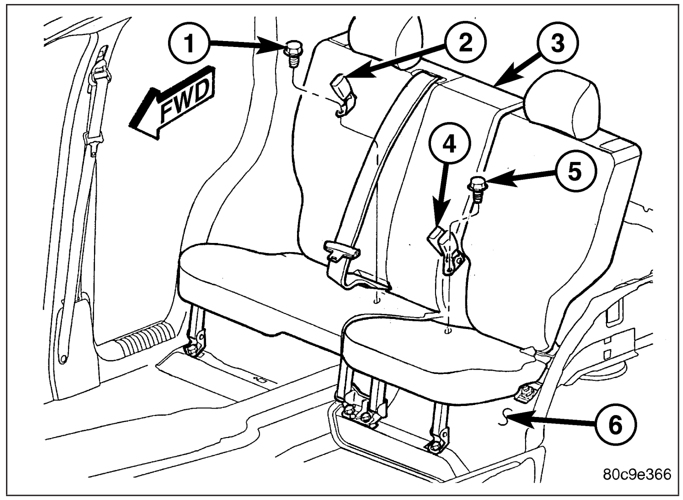
5. On the driver side only, position the inboard seat cushion side shield to the seat cushion frame.
6. On the driver side only, install and tighten the two screws that secure the inboard seat cushion side shield to the seat cushion frame. Tighten the screws to 1 N·m (9 in. lbs.).
7. Position the front seat belt buckle lower anchor to the bracket on the inboard side of the seat track.
8. Install and tighten the screw (3) that secures the front seat belt buckle anchor to the bracket on the inboard side of the seat track. Tighten the screw to 43 N·m (32 ft. lbs.).
9. On the driver side only, reconnect the seat belt switch pigtail wire (1) connector to the seat wire harness (2) connector on the seat cushion frame bracket (3) located under the rear edge of the seat cushion near the inboard side of the seat.
10. On the driver side only, reinstall the front seat and seat track to the floor panel as a unit. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION).
11. For the driver side only, do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).



## REAR

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

1. Unlatch the rear seat back (3) and fold it forward far enough to access the mounting location for the rear seat belt buckle (2 or 4) anchor to the rear floor panel (6) between the rear seat back and the rear seat cushion.
2. Position the rear seat belt buckle and anchor between the rear seat back and the rear seat cushion as a unit.
3. Lower the rear seat belt buckle anchor over the stud on the rear floor panel.
4. Install and tighten the screw (1 or 5) that secures the rear seat belt buckle anchor to the rear floor panel. Tighten the screw to 43 N·m (32 ft. lbs.).



# SEAT BELT & RETRACTOR

## REMOVAL

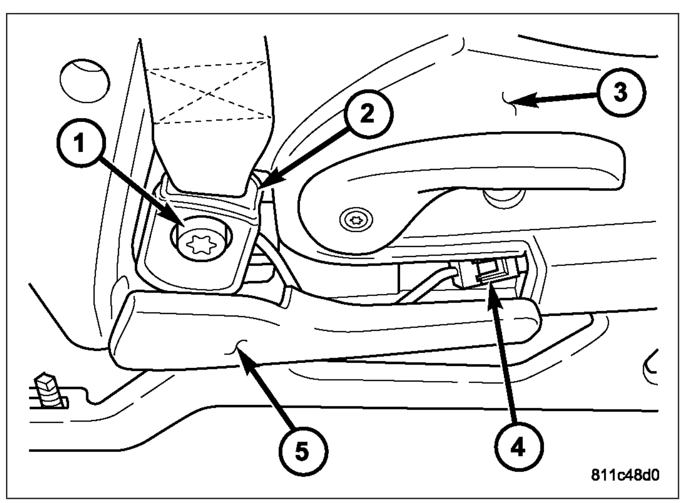
## FRONT

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

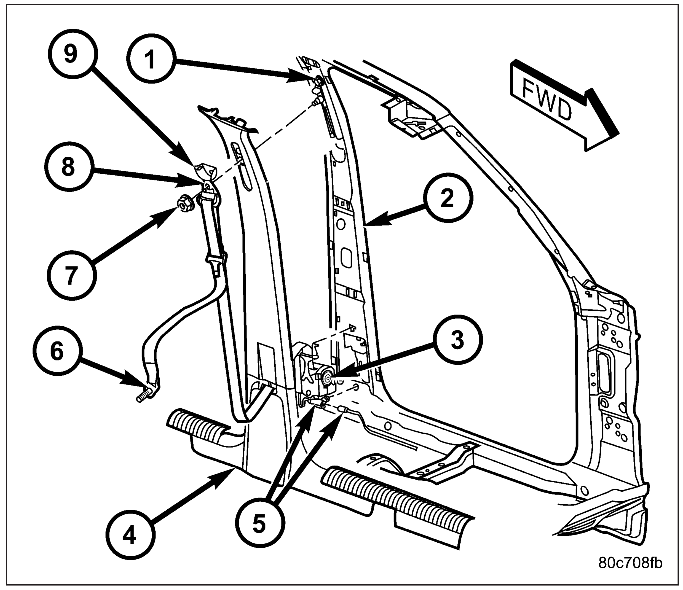
**NOTE: On vehicles equipped with the Occupant Classification System (OCS), the passenger side front seat belt and retractor unit includes a belt tension sensor that is integral to the lower seat belt anchor, which is secured to the outboard side of the passenger side front seat cushion frame. Any time any OCS component is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.**

**NOTE: The following procedure is for replacement of a faulty or damaged seat belt and retractor unit. The front retractor also includes a seat belt tensioner. If the front seat belt or retractor is faulty or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for handling non-deployed supplemental restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS). If the seat belt tensioner has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the unit from the vehicle. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).**



1. Adjust the front seat to its most forward position for easiest access to the front seat belt lower anchor (2) and the B-pillar trim.
2. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
3. Using a trim stick or another suitable wide flat-bladed tool, gently pry the seat belt anchor cover to remove it from the rear of the outboard seat side shield (3).
4. On the passenger side only if the vehicle is equipped with the Occupant Classification System, disconnect the belt tension sensor pigtail wire connector (4) from the seat wire harness connector.
5. Remove the screw (1) that secures the lower anchor/belt tension sensor to the bracket on the outboard side of the front seat cushion frame.

6. Unsnap and lift the trim cover (9) to access the nut (7) that secures the front seat belt turning loop (6) to the height adjuster (1) on the upper B-pillar (2).
7. Remove the nut that secures the seat belt turning loop to the height adjuster stud on the upper B-pillar.
8. Remove the seat belt turning loop from the height adjuster stud.
9. Remove the upper trim (4) from the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).
10. Remove the lower trim (4) from the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).
11. Disconnect the body wire harness connector from the seat belt tensioner pigtail wire connector (5).
12. Remove the screw that secures the lower retractor (3) bracket to the B-pillar.

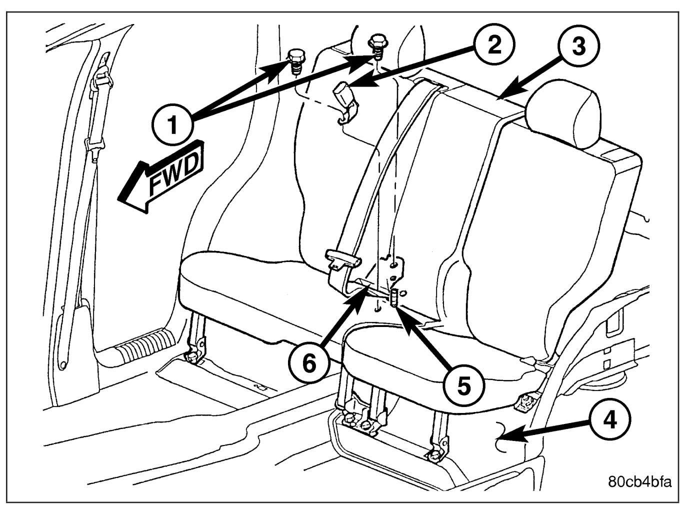


13. Disengage the engagement tab on the upper retractor bracket/seat belt web guide from the engagement slot in the B-pillar.
14. Remove the front seat belt and retractor from the B-pillar as a unit.

## REAR CENTER

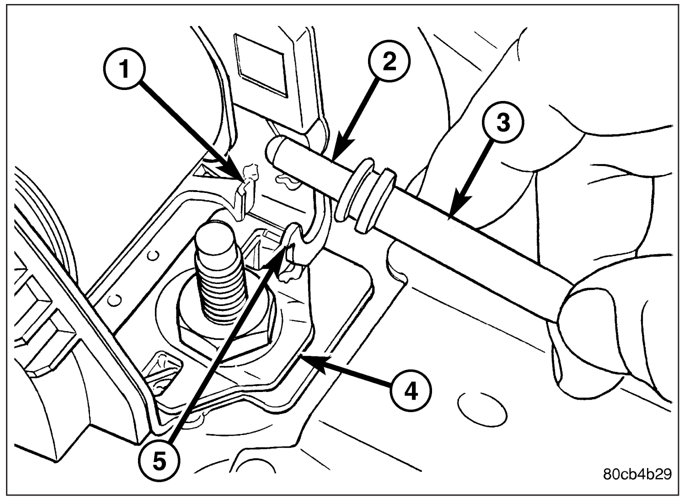
**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

1. Remove the right center seat belt buckle unit (2) from the floor panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/REAR SEAT BELT BUCKLE - REMOVAL).
2. Unlatch and fold the right rear seat back (3) forward and separate the cargo area carpet from the base of the seat back panel.
3. Reach between the base of the right rear seat back and the forward edge of the rear cargo floor to access and remove the screw (1) that secures the rear center seat belt lower anchor to the floor panel.
4. Lift the rear center seat belt lower anchor off of the stud on the rear floor panel.
5. Remove the right rear seat back panel from the vehicle. (Refer to 23 - BODY/SEATS/SEAT BACK - REAR - REMOVAL).

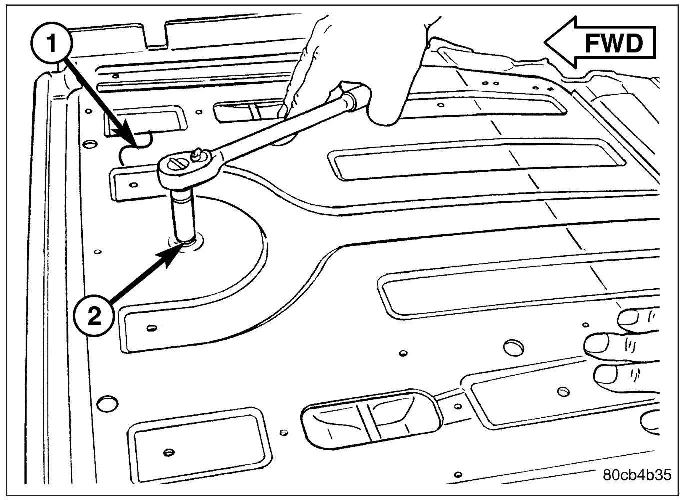


6. Remove the two screws that secure the belt web guide to the top of the right rear seat back panel.
7. Remove the trim from the right rear seat back. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - REAR - REMOVAL).
8. Route the rear seat belt lower anchor and belt web guide through the top of the seat back panel.

9. Disengage the seat back latch cable fitting (3) from the cable support (5) on the retractor (4), which is a light snap fit.

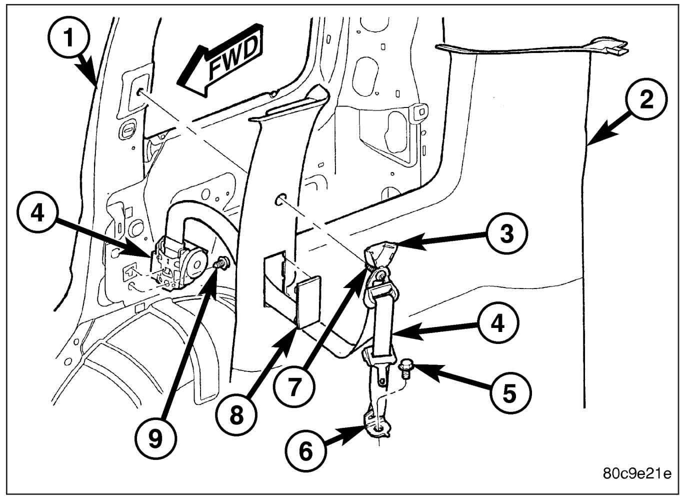


10. Remove the screw (2) that secures the retractor to the rear seat back panel (1).
11. Remove the rear center seat belt and retractor unit from the seat back panel.



## REAR OUTBOARD

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**



1. Unsnap and lift the trim cover (3) to access the screw (7) that secures the rear outboard seat belt turning loop to the upper C-pillar (1).
2. Remove the screw that secures the seat belt turning loop to the upper C-pillar.
3. Remove the screw (5) that secures the lower seat belt anchor (6) to the bracket on the outboard side of the rear seat cushion frame.
4. Remove the quarter trim panel (2) from the C-pillar. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).
5. Route the seat belt lower anchor and turning loop through the access hole in the quarter trim panel.
6. Remove the screw (9) that secures the retractor (4) bracket to the lower C-pillar.
7. Lift the retractor upward far enough to disengage the retractor tab from the engagement hole in the lower C-pillar.
8. Remove the rear outboard seat belt and retractor from the C-pillar as a unit.

## INSTALLATION

## FRONT

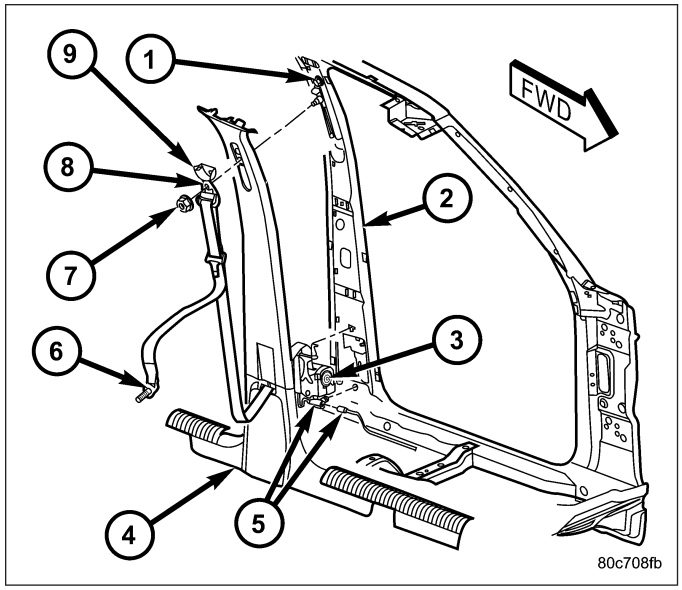
**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

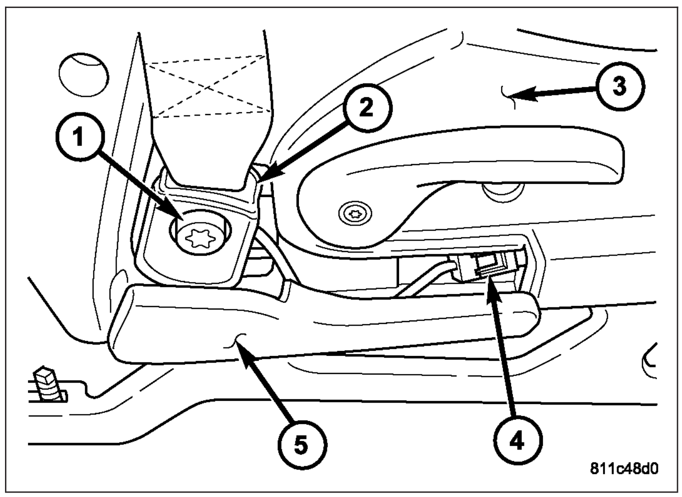
**NOTE: On vehicles equipped with the Occupant Classification System (OCS), the passenger side front seat belt and retractor unit includes a belt tension sensor that is integral to the lower seat belt anchor, which is secured to the outboard side of the passenger side front seat cushion frame. Any time any OCS component is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.**

**NOTE: The following procedure is for replacement of a faulty or damaged seat belt and retractor unit. The front retractor also includes a seat belt tensioner. If the front seat belt or retractor is faulty or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for handling non-deployed supplemental restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS). If the seat belt tensioner has been deployed, review the recommended procedures for service after a supplemental restraint deployment before removing the unit from the vehicle. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT).**

1. Position the front seat belt and retractor (3) to the B-pillar (2) as a unit. Be certain to engage the engagement tab on the upper retractor bracket/seat belt web guide into the engagement slot in the lower B-pillar.
2. Install and tighten the screw that secures the lower retractor bracket to the B-pillar. Tighten the screw to 43 N·m (32 ft. lbs.).
3. Reconnect the body wire harness connector to the seat belt tensioner pigtail wire connector (5).
4. Reinstall the lower trim (4) onto the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).
5. Reinstall the upper trim (4) onto the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).
6. Position the seat belt turning loop (8) onto the height adjuster (1) stud on the upper B-pillar.



7. Install and tighten the nut (7) that secures the seat belt turning loop to the height adjuster stud. Tighten the nut to 34 N·m (25 ft. lbs.).
8. Fold and snap the trim cover (9) back into place to conceal the nut that secures the turning loop to the height adjuster.
9. Position the front seat belt lower anchor/belt tension sensor (2) to the bracket on the outboard side of the front seat cushion frame.
10. Install and tighten the screw (1) that secures the lower anchor/belt tension sensor to the bracket on the outboard side of the front seat cushion frame. Tighten the screw to 47 N·m (35 ft. lbs.).
11. On the passenger side only if the vehicle is equipped with the Occupant Classification System, reconnect the belt tension sensor pigtail wire connector (4) to the seat wire harness connector for the sensor.
12. Align the seat belt anchor cover to the opening near the rear of the outboard seat side shield (5). Using hand pressure, press firmly and evenly on the cover until it snaps into place.

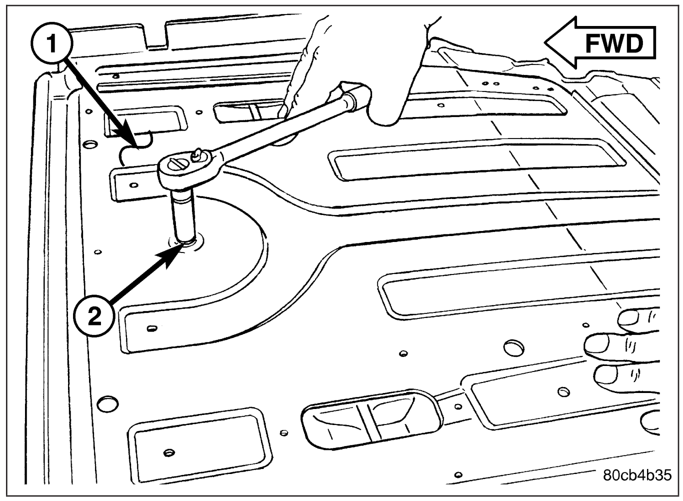


13. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).
14. For the passenger side front seat belt and retractor only if the vehicle is equipped with the Occupant Classification System, following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a diagnostic scan tool and the Occupant Classification Seat Weight special tool. Refer to the appropriate diagnostic procedures.

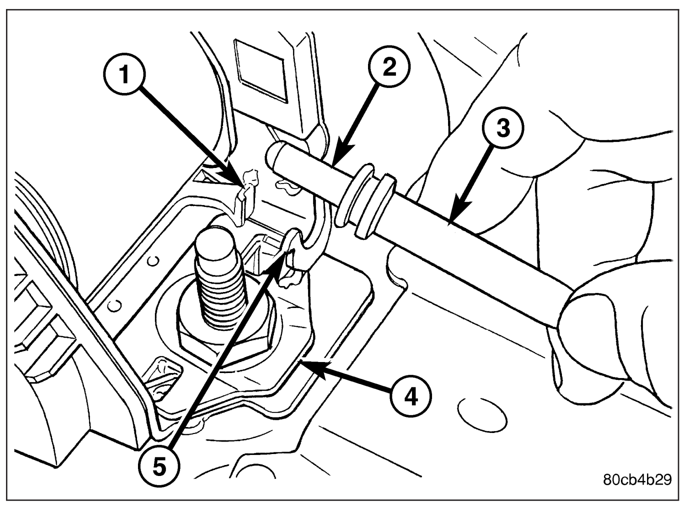
## REAR CENTER

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

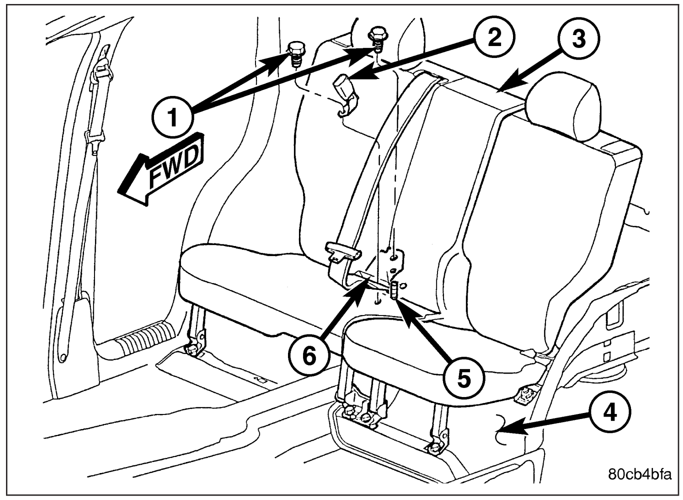
1. Position the rear center seat belt and retractor unit onto the seat back panel (1).
2. Install and tighten the screw (2) that secures the retractor to the rear seat back panel. Tighten the screw to 27 N·m (20 ft. lbs.).



3. Position the seat back latch cable plunger (2) against the retractor latch lever (1), then engage the cable fitting (3) into the cable support (5) on the retractor (4), which is a light snap fit.
4. Route the rear seat belt lower anchor and belt web guide through the top of the seat back panel.
5. Reinstall the trim onto the right rear seat back. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - REAR - INSTALLATION).
6. Install and tighten the two screws that secure the belt web guide to the top of the right rear seat back panel. Tighten the screws to 2 N·m (20 in. lbs.).
7. Reinstall the right rear seat back panel into the vehicle. (Refer to 23 - BODY/SEATS/SEAT BACK - REAR - INSTALLATION).



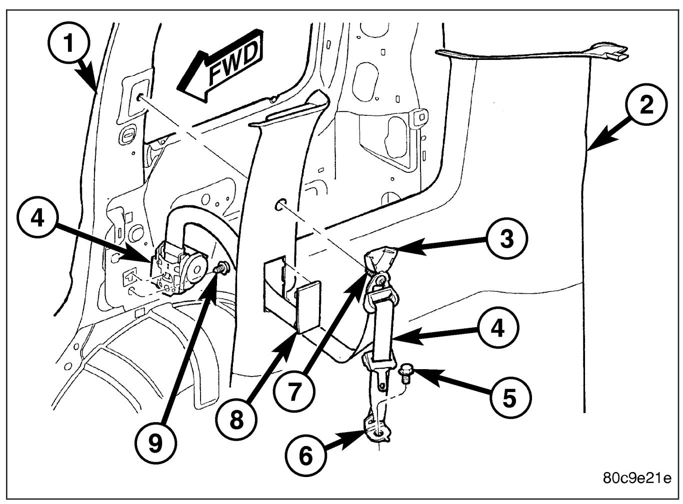
8. Position the rear center seat belt lower anchor (6) onto the stud (5) on the rear floor panel.
9. Reach between the base of the right rear seat back (3) and the forward edge of the rear cargo floor to install and tighten the screw (1) that secures the rear center seat belt lower anchor to the floor panel. Tighten the screw to 43 N·m (32 ft. lbs.).
10. Restore the cargo area carpet to the base of the seat back panel and unfold the right rear seat back to its upright position.
11. Reinstall the right center seat belt buckle unit (2) onto the floor panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - INSTALLATION).



## REAR OUTBOARD

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

1. Position the rear outboard seat belt and retractor (4) to the C-pillar (1) as a unit.
2. Engage the retractor tab into the engagement hole in the lower C-pillar.
3. Install and tighten the screw (9) that secures the retractor bracket to the lower C-pillar. Tighten the screw to 43 N·m (32 ft. lbs.).
4. Route the seat belt lower anchor (6) and turning loop through the access hole in the quarter trim panel (2).
5. Reinstall the quarter trim panel onto the C-pillar. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

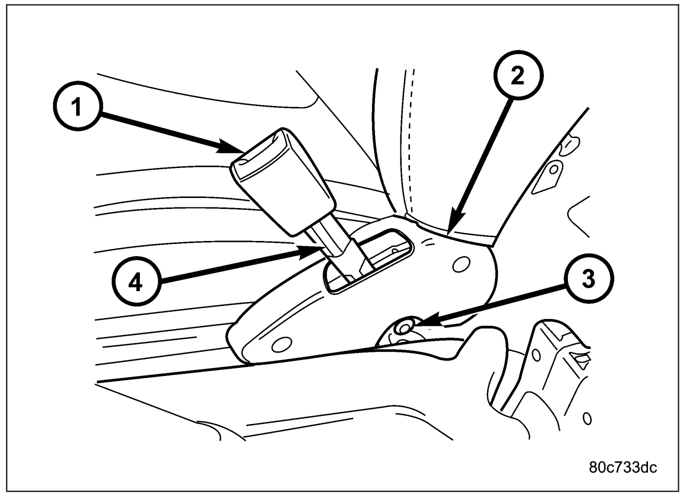


6. Position the lower seat belt anchor to the bracket on the outboard side of the rear seat cushion frame. Be certain that the anti-rotation tab on the anchor is engaged in the slot in the seat bracket.
7. Install and tighten the screw (5) that secures the lower seat belt anchor to the bracket on the outboard side of the rear seat cushion frame. Tighten the screw to 43 N·m (32 ft. lbs.).
8. Position the seat belt turning loop to the upper C-pillar.
9. Install and tighten the screw (7) that secures the seat belt turning loop to the upper C-pillar. Tighten the screw to 43 N·m (32 ft. lbs.).
10. Fold and snap the trim cover (3) back into place to conceal the screw that secures the rear outboard seat belt turning loop to the upper C-pillar.

# SEAT BELT SWITCH

## DESCRIPTION

The seat belt switches for this model are actually Hall Effect-type sensors. This sensor consists of a fixed-position, Hall Effect Integrated Circuit (IC) chip and a small permanent magnet that are integral to the driver side and passenger side front seat belt buckle (1). The front seat belt buckles are located on stamped steel stanchions and secured with a screw (3) to the inboard side of each front seat cushion frame between the seat and the floor panel transmission tunnel.



The seat belt switches are connected to the vehicle electrical system through a two-lead pigtail wire (4) and connector on the front seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness beneath the rear edge of each front seat cushion frame. A radio noise suppression capacitor is connected in parallel with the IC where the two pigtail wire leads connect to the IC pins.

The seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced.

## OPERATION

The seat belt switches are designed to provide a status signal to the seat belt switch sense inputs of the Electro-Mechanical Instrument Cluster (EMIC) indicating whether the driver side and passenger side front seat belts are fastened. The EMIC uses these inputs to control the seat belt indicator based upon the status of the driver side and passenger side front seat belt switches.

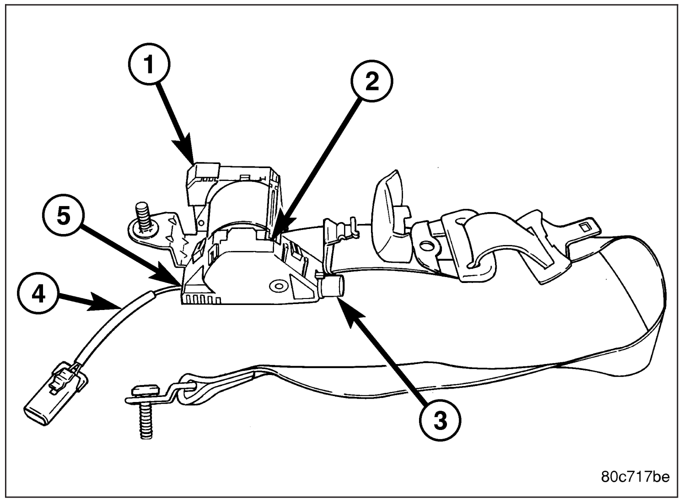
A spring-loaded plastic slide with a small, enclosed permanent magnet is integral to the buckle latch mechanism. When a seat belt tip-half is inserted and latched into the seat belt buckle, the slide is pushed downward and into close proximity of the Hall Effect Integrated Circuit (IC) chip within the buckle. The field of the permanent magnet induces a current within the chip. The chip provides this induced current as an output to the EMIC, which monitors the current to determine the status of the front seat belts. When the seat belt is unbuckled, the spring-loaded slide and permanent magnet move upward and away from the IC, causing the output current from the seat belt switch to be reduced.

The seat belt switch receives a supply of current from the EMIC, and the EMIC senses the status of the front seat belt through its pigtail wire connection to the seat wire harness. The EMIC also monitors the condition of the seat belt switch circuit and will store a Diagnostic Trouble Code (DTC) for any fault that is detected in the seat belt switch circuit. For proper diagnosis of the seat belt switch, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# SEAT BELT TENSIONER

## DESCRIPTION

Seat belt tensioners supplement the dual front airbag system for all versions of this model. The seat belt tensioners are integral to the front seat belt and retractor units (1), which are secured to the B-pillars on the right and left sides of the vehicle. The retractors are concealed beneath the molded plastic B-pillar trim. The seat belt tensioner consists primarily of a molded plastic tensioner housing (2), a tubular metal piston housing (3), a piston, a short rack gear, a set of pinion gears, a pyrotechnically activated gas generator (5), and a short pigtail wire (4).



All of these components are located on one side of the retractor spool on the outside of the retractor housing. The seat belt tensioners are controlled by the Airbag Control Module (ACM) and are connected to the vehicle electrical system through dedicated take outs of the body wire harness by keyed and latching molded plastic connector insulators to ensure a secure connection.

The seat belt tensioners cannot be repaired and, if faulty or damaged, the entire front seat belt and retractor unit must be replaced. The seat belt tensioners are not intended for reuse and must be replaced following any front airbag deployment. A locked retractor that will not allow the seat belt webbing to be retracted or extracted is a sure indication that the seat belt tensioner has been deployed and requires replacement. (Refer to 8 - ELECTRICAL/ RESTRAINTS/FRONT SEAT BELT & RETRACTOR - REMOVAL).

## OPERATION

The seat belt tensioners are deployed by a signal generated by the Airbag Control Module (ACM) through the driver or passenger seat belt tensioner line 1 and line 2 (or squib) circuits. When the ACM sends the proper electrical signal to the tensioners, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator. The gas generator is installed in one end of the tubular metal piston housing, which contains a piston and a small rack gear. As the gas expands, it pushes the piston and the rack gear through the tube. The rack gear engages a pinion gear that drives a gear set in the tensioner housing, which rotates the seat belt retractor spool causing the slack to be removed from the front seat belts.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupants of the front seat might experience in these situations as a result of a harmful contact with the steering wheel, steering column, instrument panel and/or windshield. Also, the seat belt retractor has a torsion bar mechanism that is designed to deform in order to control the loading being applied to the occupants by the seat belts during a frontal impact, further reducing the potential for occupant injuries.

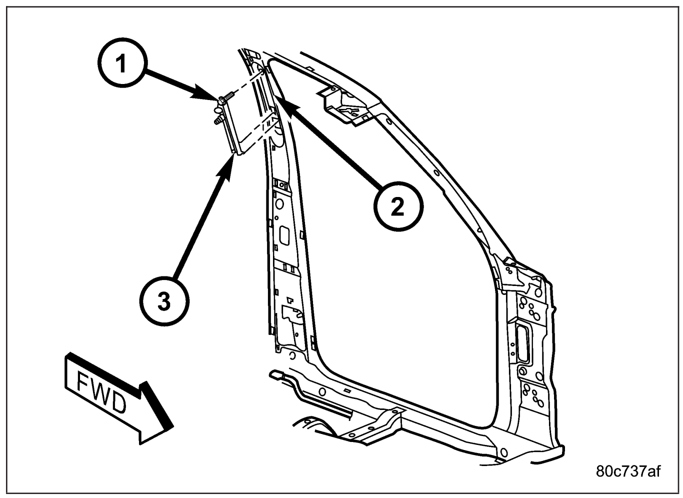
The ACM monitors the condition of the seat belt tensioners through circuit resistance, and will illuminate the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. For proper diagnosis of the seat belt tensioners, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

# SEAT BELT TURNING LOOP ADJUSTER

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

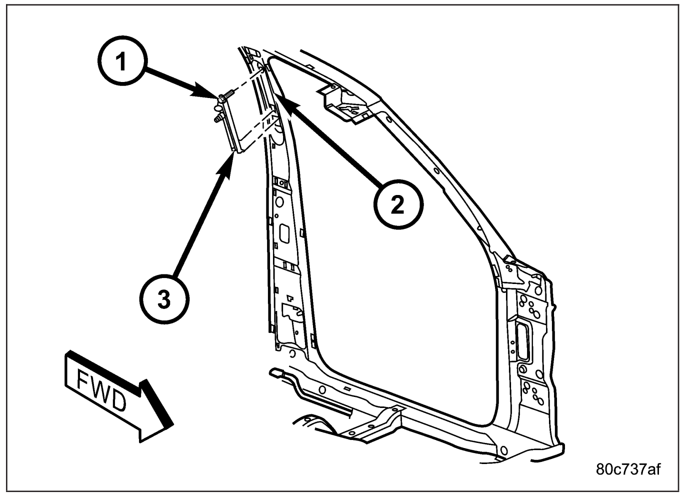


1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Unsnap and lift the trim cover to access the nut that secures the front seat belt turning loop to the height adjuster on the upper B-pillar.
3. Remove the nut that secures the seat belt turning loop to the height adjuster stud on the upper B-pillar.
4. Remove the seat belt turning loop from the height adjuster stud.
5. Remove the upper trim from the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).
6. Remove the screw (1) that secures the seat belt turning loop adjuster (3) to the upper B-pillar (2).
7. Pull the upper end of the turning loop adjuster away from the B-pillar far enough to disengage the hooks on the lower end of the adjuster from the slots in the B-pillar.
8. Remove the seat belt turning loop adjuster from the B-pillar.

## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar Parts Catalog.**

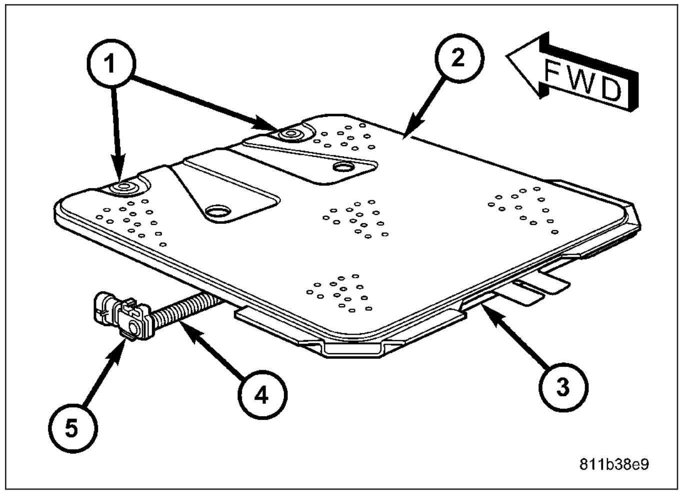


1. Position the seat belt turning loop adjuster (3) to the B-pillar (2).
2. Engage the hooks on the lower end of the adjuster into the slots in the B-pillar.
3. Tilt the upper end of the turning loop adjuster up into position against the B-pillar.
4. Install and tighten the screw (1) that secures the seat belt turning loop adjuster to the upper B-pillar. Tighten the screw to 34 N·m (25 ft. lbs.).
5. Reinstall the upper trim onto the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).
6. Position the seat belt turning loop onto the height adjuster stud on the upper B-pillar.
7. Install and tighten the nut that secures the seat belt turning loop to the height adjuster stud. Tighten the nut to 34 N·m (25 ft. lbs.).
8. Fold and snap the trim cover back into place to conceal the nut that secures the front seat belt turning loop to the height adjuster on the upper B-pillar.
9. Reconnect the battery negative cable.

# SEAT WEIGHT SENSOR

## DESCRIPTION

Vehicles equipped with the Occupant Classification System (OCS) have a seat weight bladder (2) and pressure sensor (5) unit that is integral to the passenger side front seat cushion. The bladder is sandwiched between the seat cushion springs and seat cushion foam. A heavy jute-like insulator pad (3) is installed between the lower surface of the bladder and the seat cushion springs. The pad is secured to the underside of the bladder by diagonal straps that form pockets at each of the two rear corners of the bladder, while two plastic push-in fasteners (1) locate and secure the forward edge of the bladder and the pad to the front edge of the seat cushion frame. The seat cushion foam is installed loosely over the top of the bladder, then secured by the installation of the trim cover to the seat cushion.



The bladder consists of two rectangular sheets of an elastomeric material and a molded plastic elbow fitting. The two sheets of material are sealed together around their perimeter and heat staked to each other at numerous regular points within their field. The elbow fitting is sealed to a small round hole in the lower surface of the bladder and is pointed downward where it passes through a clearance hole in the insulator pad and extends to just below the seat cushion springs. Then the bladder is filled with a silicone fluid to become a pliable, quilted membrane.

Under the seat cushion a short tube (4) is securely clamped at one end to the bladder nipple, and at the other end to a nipple on the electronic pressure sensor. The pressure sensor is contained within a molded plastic housing with an integral nipple formation near one end and an integral electrical connector receptacle at the opposite end. The sensor housing also features an integral mount that snaps over a tab integral to the stamped steel Occupant Classification Module (OCM) mounting bracket welded to the underside of the passenger side front seat cushion frame. The pressure sensor connector receptacle contains terminal pins that connect the sensor to the vehicle electrical system and the OCM through a dedicated take out and connector of the passenger side front seat wire harness.

The seat weight bladder and pressure sensor cannot be adjusted or repaired. The components of the passenger side front seat cushion of a vehicle equipped with the OCS including the cushion frame, springs, insulator pad, seat weight bladder and pressure sensor, seat cushion foam, wire harness and the OCM are serviced only as a factory-calibrated, assembled and tamper-evident unit. Only the OCM and the seat cushion trim are available for separate service replacement. Once a service replacement package has been installed in a vehicle, the OCM can thereafter be serviced only by replacing the entire passenger side front seat cushion unit with another complete service replacement package.

## OPERATION

The seat weight bladder and pressure sensor unit is designed to sense the relative weight of a load applied to the passenger side front seat cushion, which provides a logic input to the microprocessor of the Occupant Classification Module (OCM). When a load is applied to the seat cushion, fluid within the bladder becomes pressurized. These changes in bladder fluid pressure are measured by the pressure sensor under the seat cushion through the bladder tube. As the pressure within the bladder changes, the circuitry of the pressure sensor changes the output voltage of the sensor.

The pressure sensor receives a nominal five volts and a ground through dedicated hard wired circuits from the OCM. The OCM then monitors the pressure sensor output voltage on a dedicated hard wired data communication circuit. The hard wired circuits between the pressure sensor and the OCM may be diagnosed and tested using conventional diagnostic tools and procedures. However, the most reliable, efficient, and accurate means to diagnose the bladder and pressure sensor input to the OCM, and the electronic message communication between the OCM and the Airbag Control Module (ACM) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

If any of the Occupant Classification System (OCS) components of the passenger side front seat cushion require replacement, they are serviced only as a factory-calibrated, assembled, and tamper-evident service replacement package. This package includes the assembled frame, springs, pad, seat weight bladder and pressure sensor, foam, wiring and a calibrated Occupant Classification Module (OCM). When installing this package, always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components contained in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle.

Once any of the original factory-installed components except the OCM have been replaced with the service replacement package components, the OCM can only be serviced by replacing the entire passenger side front seat cushion unit with another complete service replacement package. Any time any one of these components is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death on vehicles equipped with the Occupant Classification System (OCS), only the Occupant Classification Module (OCM) and the seat cushion trim may be serviced separately. All other components of the passenger side front seat cushion assembly must be serviced only as a complete factory-calibrated, assembled and tamper-evident service replacement package. This package includes the frame, springs, pad, bladder and pressure sensor, foam, wiring and a calibrated OCM. When installing this package always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle. Failure to take the proper precautions could result in failure of the passenger airbag to deploy when required, or in passenger airbag deployment when not required.**

**WARNING: To avoid personal injury or death on vehicles equipped with the Occupant Classification System (OCS), do not modify the front passenger seat assembly or center floor console in any way. Do not use any prior year, subsequent year, secondary or aftermarket seat trim covers. At no time should any Supplemental Restraint System (SRS) or OCS component be modified or replaced with any part except those which are specified for the particular vehicle application in the DaimlerChrysler Mopar Parts Catalog. Failure to observe these precautions could cause an OCS miscalibration condition, which may result in the passenger airbag failing to deploy when required or deploying when not required.**

**CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Airbag Control Module (ACM) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ACM and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.**

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the passenger side front seat from the vehicle. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL).
3. Remove the seat cushion assembly from the passenger side front seat. (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - REMOVAL).
4. Remove the trim cover from the passenger side front seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - FRONT - REMOVAL).

5. Discard the entire passenger side front seat cushion frame, springs, pad, bladder and pressure sensor, foam, wiring and Occupant Classification Module (OCM) and replace with the entire contents of the factory-calibrated, assembled and tamper-evident service replacement package.

## INSTALLATION

If any of the Occupant Classification System (OCS) components of the passenger side front seat cushion require replacement, they are serviced only as a factory-calibrated, assembled, and tamper-evident service replacement package. This package includes the assembled frame, springs, pad, seat weight bladder and pressure sensor, foam, wiring and a calibrated Occupant Classification Module (OCM). When installing this package, always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components contained in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle.

Once any of the original factory-installed components except the OCM have been replaced with the service replacement package components, the OCM can only be serviced by replacing the entire passenger side front seat cushion unit with another complete service replacement package. Any time any one of these components is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**WARNING: To avoid personal injury or death on vehicles equipped with the Occupant Classification System (OCS), only the Occupant Classification Module (OCM) and the seat cushion trim may be serviced separately. All other components of the passenger side front seat cushion assembly must be serviced only as a complete factory-calibrated, assembled and tamper-evident service replacement package. This package includes the frame, springs, pad, bladder and pressure sensor, foam, wiring and a calibrated OCM. When installing this package always replace all of the existing components with the new components as a unit. Do not attempt to separate or disconnect any of the new OCS components in the service replacement package from each other, and do not attempt to reuse any of the replaced components in this or any other vehicle. Failure to take the proper precautions could result in failure of the passenger airbag to deploy when required, or in passenger airbag deployment when not required.**

**WARNING: To avoid personal injury or death on vehicles equipped with the Occupant Classification System (OCS), do not modify the front passenger seat assembly or center floor console in any way. Do not use any prior year, subsequent year, secondary or aftermarket seat trim covers. At no time should any Supplemental Restraint System (SRS) or OCS component be modified or replaced with any part except those which are specified for the particular vehicle application in the DaimlerChrysler Mopar Parts Catalog. Failure to observe these precautions could cause an OCS miscalibration condition, which may result in the passenger airbag failing to deploy when required or deploying when not required.**

**CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Airbag Control Module (ACM) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ACM and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.**

1. Discard the entire passenger side front seat cushion frame, springs, pad, bladder and pressure sensor, foam, wiring and Occupant Classification Module (OCM) and replace with the entire contents of the factory-calibrated, assembled and tamper-evident service replacement package.
2. Reinstall the trim cover onto the passenger side front seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - FRONT - INSTALLATION).

3. Reinstall the seat cushion assembly onto the passenger side front seat. (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - INSTALLATION).
4. Reinstall the passenger side front seat into the vehicle. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION).
5. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).
6. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a diagnostic scan tool and the Occupant Classification Seat Weight special tool. Refer to the appropriate diagnostic procedures.

# SPEED CONTROL

## TABLE OF CONTENTS

# SPEED CONTROL

## DESCRIPTION

The speed control system is electronically controlled and vacuum operated. Electronic control of the speed control system is integrated into the Powertrain Control Module (PCM). The controls consist of two steering wheel mounted switches. The switches are labeled: ON/OFF, RES/ACCEL, SET, COAST, and CANCEL.

The system is designed to operate at speeds above 30 mph (50 km/h).

**WARNING: The use of speed control is not recommended when driving conditions do not permit maintaining a constant speed, such as in heavy traffic or on roads that are winding, icy, snow covered, or slippery.**

## OPERATION

When speed control is selected by depressing the ON switch, the PCM allows a set speed to be stored in PCM RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral.

The speed control can be disengaged manually by:

- Stepping on the brake pedal
- Depressing the OFF switch
- Depressing the CANCEL switch.
- Depressing the clutch pedal (if equipped).

**NOTE: Depressing the OFF switch or turning off the ignition switch will erase the set speed stored in the PCM.**

For added safety, the speed control system is programmed to disengage for any of the following conditions:

- An indication of Park or Neutral
- A rapid increase rpm (indicates that the clutch has been disengaged)
- Excessive engine rpm (indicates that the transmission may be in a low gear)
- The speed signal increases at a rate of 10 mph per second (indicates that the coefficient of friction between the road surface and tires is extremely low)
- The speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate)

Once the speed control has been disengaged, depressing the RES/ACCEL switch (when speed is greater than 30 mph) restores the vehicle to the target speed that was stored in the PCM.

While the speed control is engaged, the driver can increase the vehicle speed by depressing the RES/ACCEL switch. The new target speed is stored in the PCM when the RES/ACCEL is released. The PCM also has a ″tap-up″ feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the RES/ACCEL switch.

A “tap down” feature is used to decelerate without disengaging the speed control system. To decelerate from an existing recorded target speed, momentarily depress the COAST switch. For each switch activation, speed will be lowered approximately 1 mph.

### OVERSHOOT/UNDERSHOOT

If the vehicle operator repeatedly presses and releases the SET button with their foot off of the accelerator (referred to as a “lift foot set”), the vehicle may accelerate and exceed the desired set speed by up to 5 mph (8 km/h). It may also decelerate to less than the desired set speed, before finally achieving the desired set speed.

The Speed Control System has an adaptive strategy that compensates for vehicle-to-vehicle variations in speed control cable lengths. When the speed control is set with the vehicle operators foot off of the accelerator pedal, the speed control thinks there is excessive speed control cable slack and adapts accordingly. If the “lift foot sets” are continually used, a speed control overshoot/undershoot condition will develop.

To “unlearn” the overshoot/undershoot condition, the vehicle operator has to press and release the set button while maintaining the desired set speed using the accelerator pedal (not decelerating or accelerating), and then turning the cruise control switch to the OFF position (or press the CANCEL button if equipped) after waiting 10 seconds. This procedure must be performed approximately 10–15 times to completely unlearn the overshoot/undershoot condition.

## DIAGNOSIS AND TESTING - ROAD TEST

Perform a vehicle road test to verify reports of speed control system malfunction. The road test should include attention to the speedometer. Speedometer operation should be smooth and without flutter at all speeds.

Flutter in the speedometer indicates a problem which might cause surging in the speed control system. The cause of any speedometer problems should be corrected before proceeding. Refer to Group 8J, Instrument Cluster for speedometer diagnosis.

If a road test verifies a system problem and the speedometer operates properly, check for:

- A Diagnostic Trouble Code (DTC). If a DTC exists, conduct tests per the Powertrain Diagnostic Procedures service manual.
- A misadjusted brake (stop) lamp switch. This could also cause an intermittent problem.
- Loose, damaged or corroded electrical connections at the servo. Corrosion should be removed from electrical terminals and a light coating of Mopar MultiPurpose Grease, or equivalent, applied.
- Leaking vacuum reservoir.
- Loose or leaking vacuum hoses or connections.
- Defective one-way vacuum check valve.
- Secure attachment of both ends of the speed control servo cable.
- Smooth operation of throttle linkage and throttle body air valve.
- Failed speed control servo. Do the servo vacuum test.

**CAUTION: When test probing for voltage or continuity at electrical connectors, care must be taken not to damage connector, terminals or seals. If these components are damaged, intermittent or complete system failure may occur.**

## SPECIFICATIONS

## TORQUE

| DESCRIPTION | N-m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Servo Mounting Bracket-to-Servo Nuts | 9 | - | 75 |
| Servo Mounting Bracket-to-Body Bolts | 12 | - | 105 |
| Speed Control Switch Mounting Screws | 1.5 | - | 14 |
| Vacuum Reservoir Mounting Screws | 3 | - | 20 |

# CABLE - SPEED CONTROL

## DESCRIPTION

The speed control servo cable is connected between the speed control vacuum servo diaphragm and the throttle body control linkage.

## OPERATION

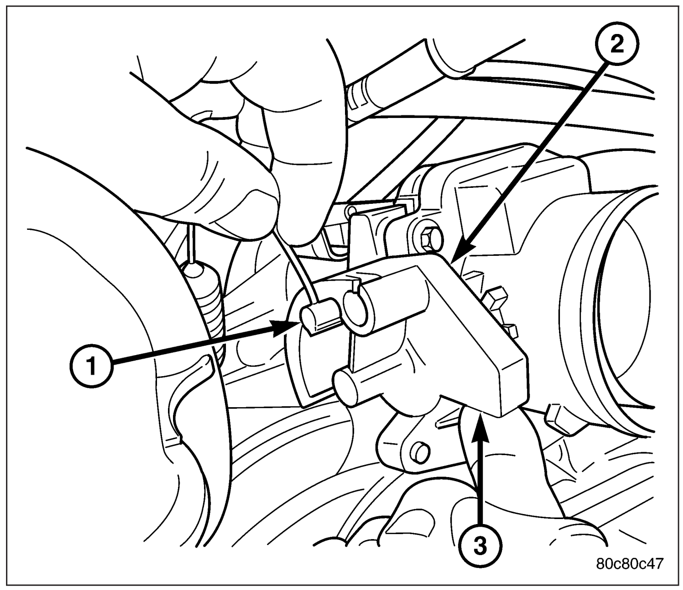
This cable causes the throttle control linkage to open or close the throttle valve in response to movement of the vacuum servo diaphragm.

## REMOVAL - 3.7L

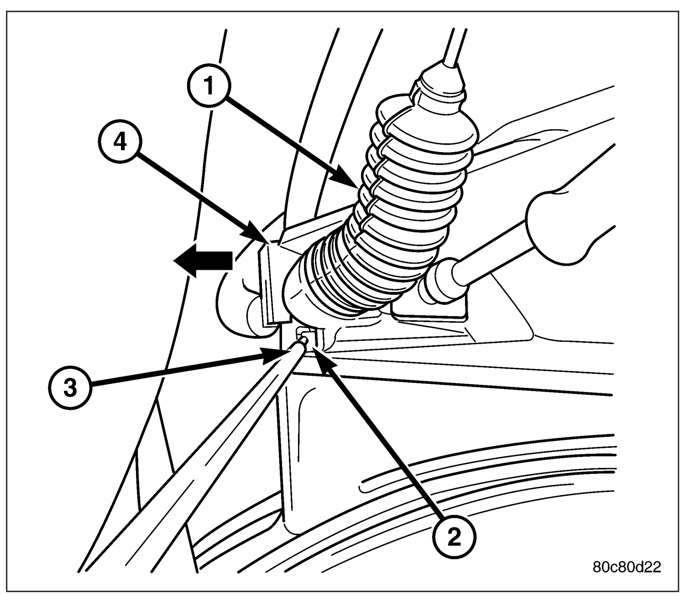
1. Disconnect negative battery cable at battery.
2. Remove air filter resonator at throttle body.

The accelerator cable must be partially removed to gain access to speed control cable.

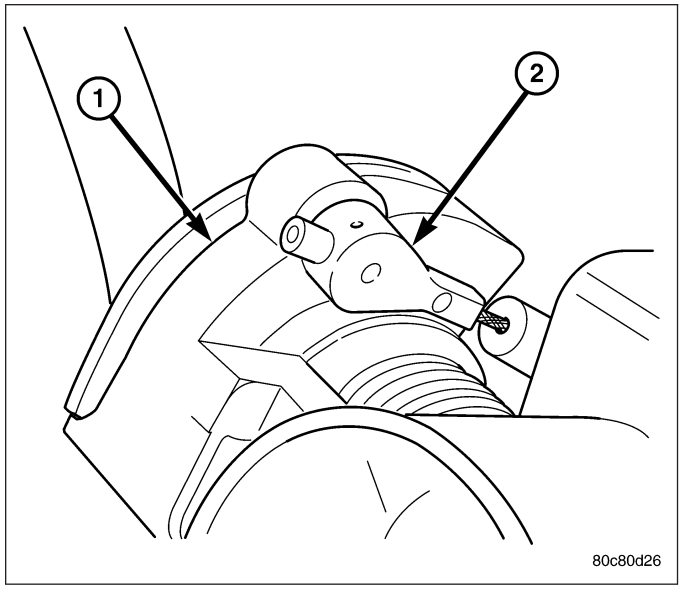
3. Hold throttle in wide open position. While held in this position, slide throttle cable pin (1) from throttle body bellcrank (2).



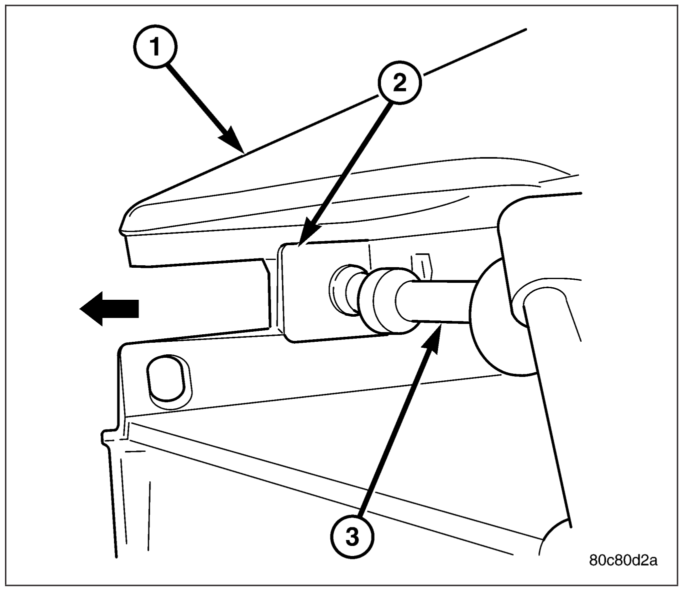
4. Using a pick or small screwdriver, press release tab (2) to release plastic cable mount from bracket. **Press on tab only enough to release cable from bracket. If tab is pressed too much, it will be broken.** Slide plastic mount (4) towards right side of vehicle to remove throttle cable from throttle body bracket.



5. Using finger pressure only, disconnect servo cable connector (2) at throttle body bellcrank pin by pushing connector off bellcrank pin towards front of vehicle. **DO NOT try to pull connector off perpendicular to the bellcrank pin. Connector will be broken.**



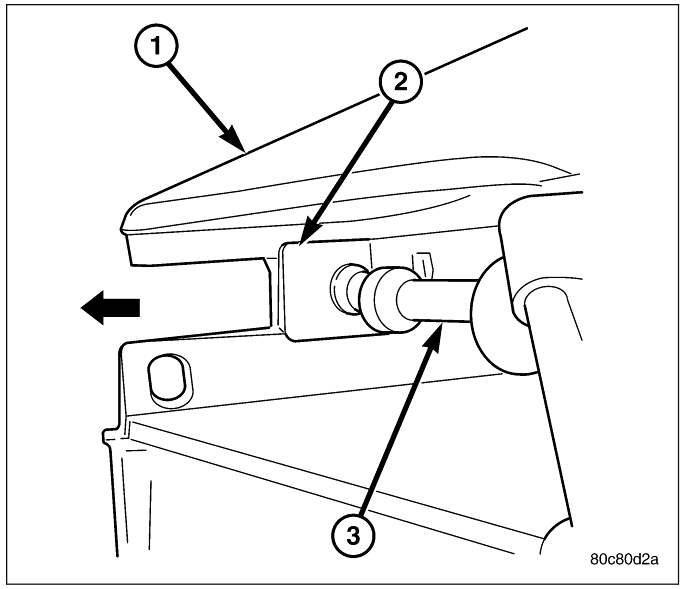
6. Slide speed control cable plastic mount (2) towards right of vehicle to remove cable from throttle body bracket.
7. Remove servo cable from servo. Refer to Servo Removal/Installation.



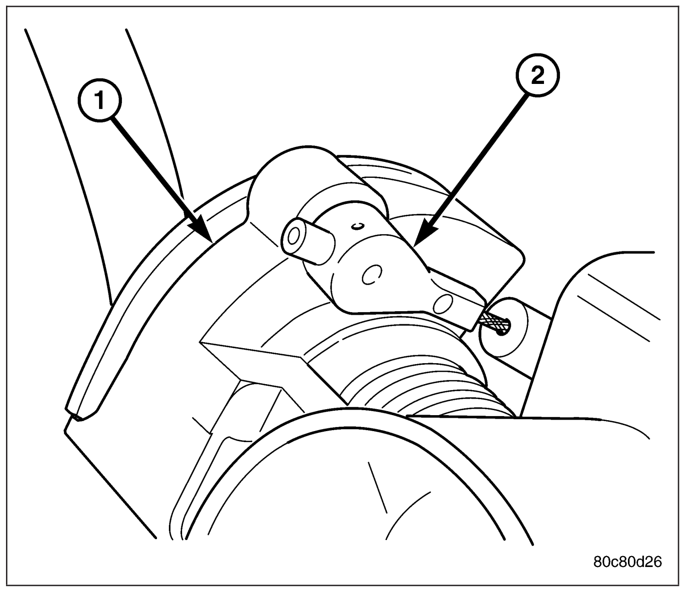
## INSTALLATION - 3.7L

1. Install end of cable to speed control servo. Refer to Servo Removal/Installation.

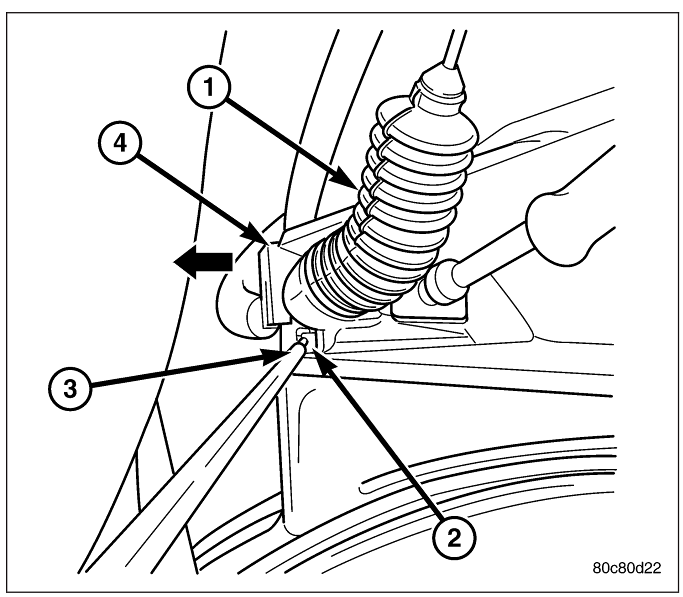
2. Slide speed control cable plastic mount (2) into throttle body bracket.



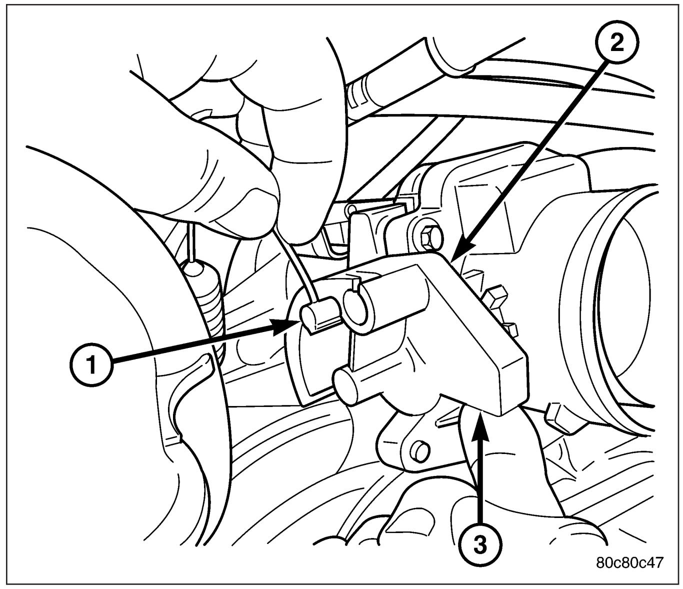
3. Install speed control cable connector (2) onto throttle body bellcrank pin (push rearward to snap into location).



4. Slide throttle (accelerator) cable plastic mount (4) into throttle body bracket. Continue sliding until cable release tab (2) is aligned to hole in throttle body mounting bracket.



5. While holding throttle to wide open position, place throttle cable pin (1) into throttle body bellcrank (2).
6. Install air filter resonator box to throttle body.
7. Connect negative battery cable at battery.
8. Before starting engine, operate accelerator pedal to check for any binding.



# SERVO - SPEED CONTROL

## DESCRIPTION

The servo unit consists of a solenoid valve body, and a vacuum chamber. The solenoid valve body contains three solenoids:

- Vacuum
- Vent
- Dump

The vacuum chamber contains a diaphragm with a cable attached to control the throttle linkage.

## OPERATION

The Powertrain Control Module (PCM) controls the solenoid valve body. The solenoid valve body controls the application and release of vacuum to the diaphragm of the vacuum servo. The servo unit cannot be repaired and is serviced only as a complete assembly.

Power is supplied to the servo's by the PCM through the brake switch. The PCM controls the ground path for the vacuum and vent solenoids.

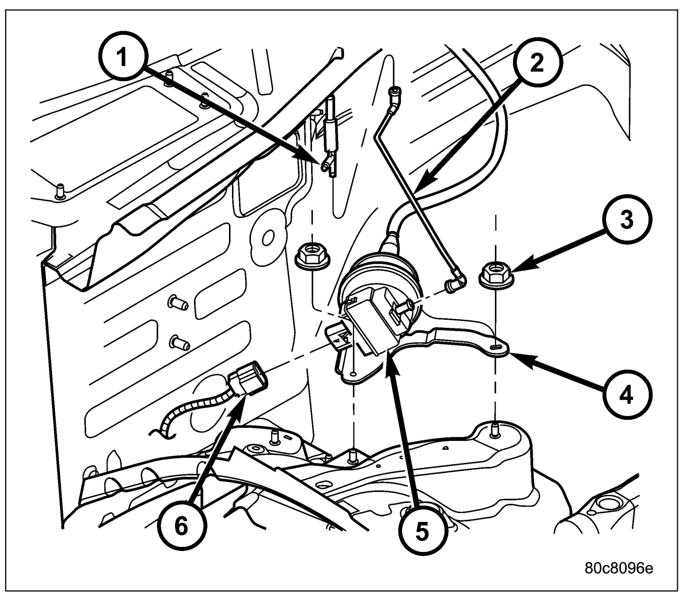
The dump solenoid is energized anytime it receives power. If power to the dump solenoid is interrupted, the solenoid dumps vacuum in the servo. This provides a safety backup to the vent and vacuum solenoids.

The vacuum and vent solenoids must be grounded at the PCM to operate. When the PCM grounds the vacuum servo solenoid, the solenoid allows vacuum to enter the servo and pull open the throttle plate using the cable. When the PCM breaks the ground, the solenoid closes and no more vacuum is allowed to enter the servo. The PCM also operates the vent solenoid via ground. The vent solenoid opens and closes a passage to bleed or hold vacuum in the servo as required.

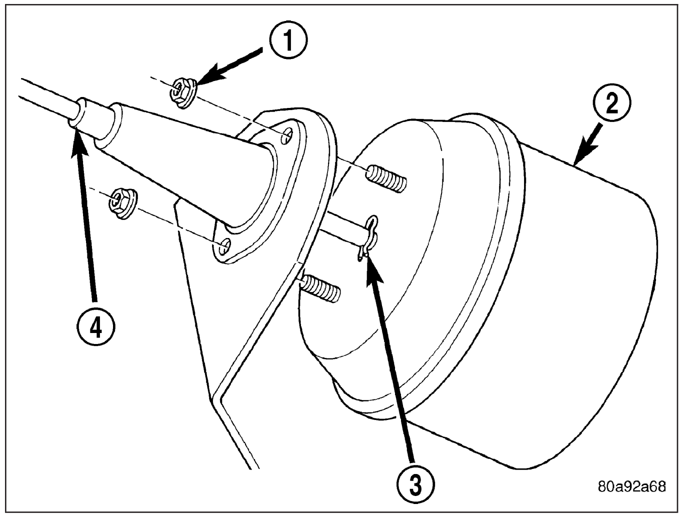
The PCM duty cycles the vacuum and vent solenoids to maintain the set speed, or to accelerate and decelerate the vehicle. To increase throttle opening, the PCM grounds the vacuum and vent solenoids. To decrease throttle opening, the PCM removes the grounds from the vacuum and vent solenoids. When the brake is released, if vehicle speed exceeds 30 mph to resume, 35 mph to set, and the RES/ACCEL switch has been depressed, ground for the vent and vacuum circuits is restored.

## REMOVAL

1. Disconnect negative battery cable at battery.
2. Disconnect vacuum line (2) at servo.
3. Disconnect electrical connector (6) at servo.
4. Remove coolant bottle nuts/bolts. Position bottle forward a few inches.
5. Disconnect servo cable at throttle body. Refer to servo Cable Removal/Installation.
6. Remove servo bracket mounting nuts (3).

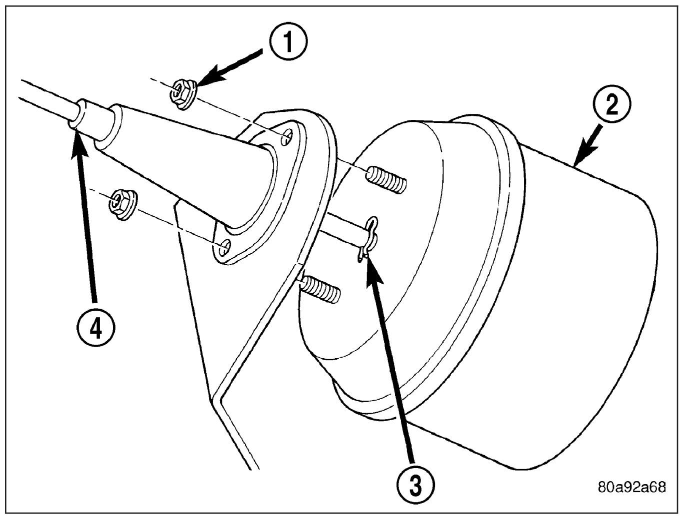


7. Remove two mounting nuts (1) holding servo cable sleeve to bracket.
8. Pull speed control cable sleeve and servo away from servo mounting bracket to expose cable retaining clip (3) and remove clip. Note: The servo mounting bracket displayed in graphic is a typical bracket and may/may not be applicable to this model vehicle.
9. Remove servo from mounting bracket. While removing, note orientation of servo to bracket.

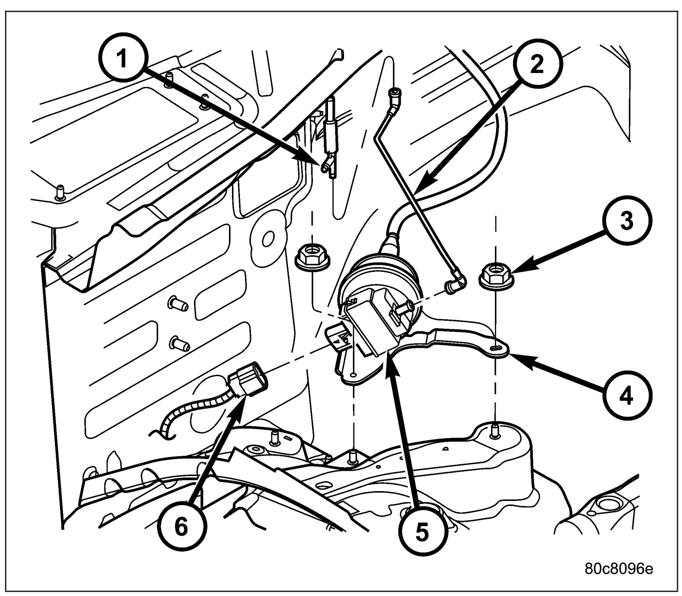


## INSTALLATION

1. Position servo to mounting bracket.
2. Align hole in cable connector with hole in servo pin. Install cable-to-servo retaining clip (3).
3. Insert servo mounting studs through holes in servo mounting bracket.
4. Install servo-to-mounting bracket nuts (1) and tighten. Refer to torque specifications.



5. Install servo mounting bracket-to-body nuts (3) and tighten. Refer to torque specifications.
6. Connect vacuum line (2) at servo.
7. Connect electrical connector (6) at servo.
8. Connect servo cable to throttle body. Refer to servo Cable Removal/Installation.
9. Install coolant bottle.
10. Connect negative battery cable to battery.
11. Before starting engine, operate accelerator pedal to check for any binding.



# SWITCH - SPEED CONTROL

## DESCRIPTION

There are two separate switch pods that operate the speed control system. The steering-wheel-mounted switches use multiplexed circuits to provide inputs to the PCM for ON, OFF, RESUME, ACCELERATE, SET, DECEL and CANCEL modes. Refer to the Owner's Manual for more information on speed control switch functions and setting procedures.

The individual switches cannot be repaired. If one switch fails, the entire switch module must be replaced.

## OPERATION

When speed control is selected by depressing the ON, OFF switch, the PCM allows a set speed to be stored in its RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between approximately 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral.

The speed control can be disengaged manually by:

- Stepping on the brake pedal
- Depressing the OFF switch
- Depressing the CANCEL switch.

The speed control can be disengaged also by any of the following conditions:

- An indication of Park or Neutral
- The VSS signal increases at a rate of 10 mph per second (indicates that the co-efficient of friction between the road surface and tires is extremely low)
- Depressing the clutch pedal.
- Excessive engine rpm (indicates that the transmission may be in a low gear)
- The VSS signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate)
- If the actual speed is not within 20 mph of the set speed

The previous disengagement conditions are programmed for added safety.

Once the speed control has been disengaged, depressing the ACCEL switch restores the vehicle to the target speed that was stored in the PCM's RAM.

**NOTE: Depressing the OFF switch will erase the set speed stored in the PCM's RAM.**

If, while the speed control is engaged, the driver wishes to increase vehicle speed, the PCM is programmed for an acceleration feature. With the ACCEL switch held closed, the vehicle accelerates slowly to the desired speed. The new target speed is stored in the PCM's RAM when the ACCEL switch is released. The PCM also has a ″tap-up″ feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the ACCEL switch.

The PCM also provides a means to decelerate without disengaging speed control. To decelerate from an existing recorded target speed, depress and hold the COAST switch until the desired speed is reached. Then release the switch. The ON, OFF switch operates two components: the PCM's ON, OFF input, and the battery voltage to the brake switch, which powers the speed control servo.

### Multiplexing

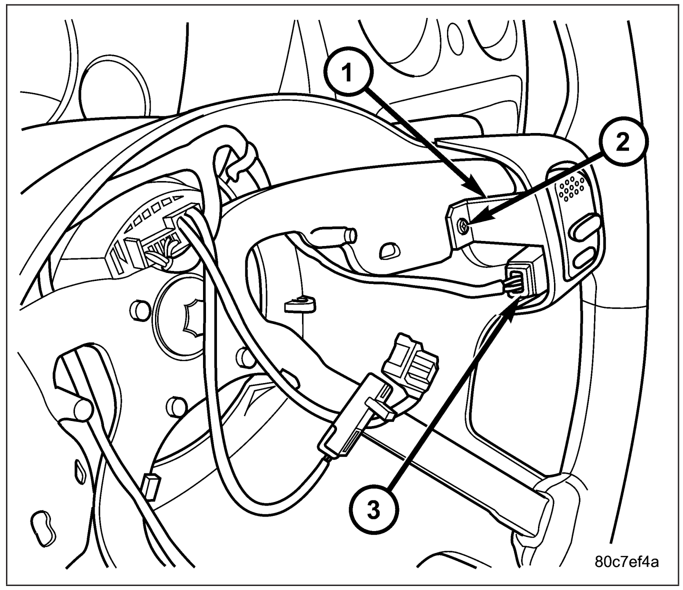
The PCM sends out 5 volts through a fixed resistor and monitors the voltage change between the fixed resistor and the switches. If none of the switches are depressed, the PCM will measure 5 volts at the sensor point (open circuit). If a switch with no resistor is closed, the PCM will measure 0 volts (grounded circuit). Now, if a resistor is added to a switch, then the PCM will measure some voltage proportional to the size of the resistor. By adding a different resistor to each switch, the PCM will see a different voltage depending on which switch is pushed.

Another resistor has been added to the 'at rest circuit' causing the PCM to never see 5 volts. This was done for diagnostic purposes. If the switch circuit should open (bad connection), then the PCM will see the 5 volts and know the circuit is bad. The PCM will then set an open circuit fault.

## REMOVAL

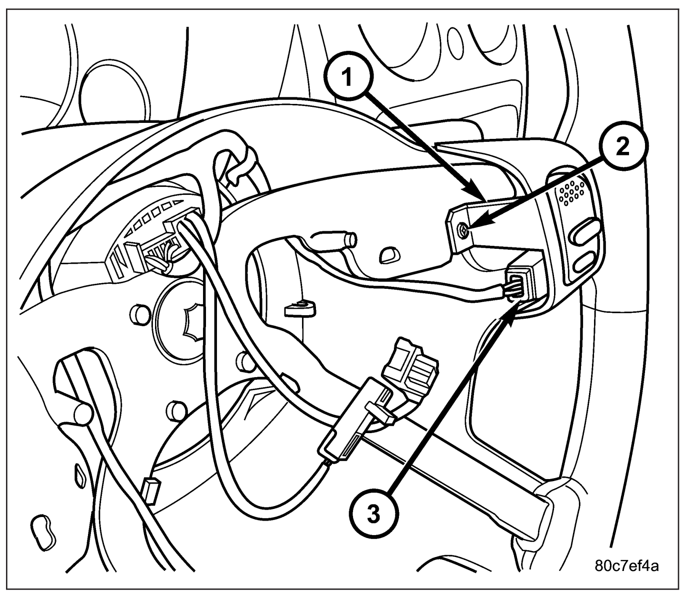
**WARNING: Before attempting to diagnose, remove or install any airbag system or related steering wheel and steering column components you must first disconnect and isolate the negative (ground) battery cable. Wait 2 minutes for system capacitor to discharge before further system service. Failure to do so could result in accidental deployment and possible personal injury.**

1. Disconnect and isolate negative battery cable from battery.
2. Remove airbag module. Refer to Restraint Systems.
3. Unplug electrical connector (3).
4. Remove speed control switch mounting screw (2) and remove switch (1) from steering wheel.



## INSTALLATION

1. Position switch to steering wheel.
2. Install switch mounting screw (2) and tighten to 1.5 N·m (14 in. lbs.).
3. Plug electrical connector into switch.
4. Install airbag module. Refer to Restraint Systems.
5. Connect negative battery cable to battery.

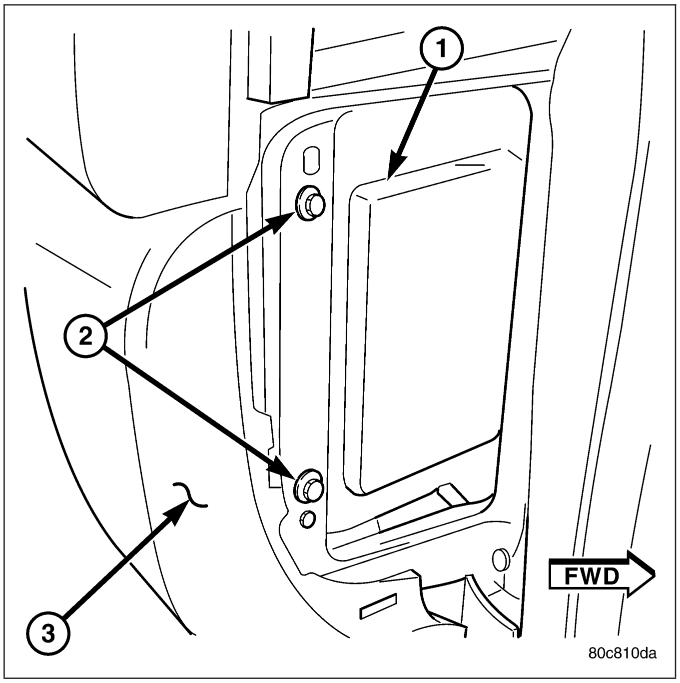


# RESERVOIR - VACUUM

## DESCRIPTION

The vacuum reservoir (1) is a plastic storage tank connected to an engine vacuum source by vacuum lines.

The reservoir (1) is located behind, and at the outer end of the instrument panel. To gain access for testing or removal, remove glovebox assembly. Also remove fuse box access cover panel at end of instrument panel. On vehicles equipped with LHD (Left Hand Drive), this fuse access panel is located at right end of instrument panel. On vehicles equipped with RHD (Right Hand Drive), this access panel is located at left end of instrument panel.



## OPERATION

The vacuum reservoir is used to supply the vacuum needed to maintain proper speed control operation when engine vacuum drops, such as in climbing a grade while driving. A one-way check valve is used in the vacuum line between the reservoir and the vacuum source. This check valve is used to trap engine vacuum in the reservoir. On certain vehicle applications, this reservoir is shared with the heating/air-conditioning system. The vacuum reservoir cannot be repaired and must be replaced if faulty.

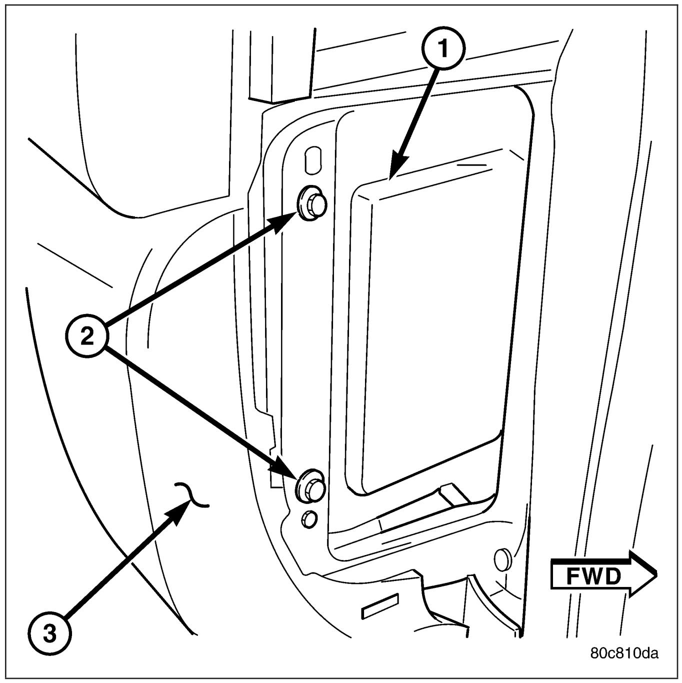
## DIAGNOSIS AND TESTING - VACUUM RESERVOIR

1. Disconnect vacuum hose at speed control servo and install a vacuum gauge into the disconnected hose.
2. Start engine and observe gauge at idle. Vacuum gauge should read at least ten inches of mercury.
3. If vacuum is less than ten inches of mercury, determine source of leak. Check vacuum line to engine for leaks. Also check actual engine intake manifold vacuum. If manifold vacuum does not meet this requirement, check for poor engine performance and repair as necessary.
4. If vacuum line to engine is not leaking, check for leak at vacuum reservoir. To locate and gain access to reservoir, refer to Vacuum Reservoir Removal/Installation in this group. Disconnect vacuum line at reservoir and connect a hand-operated vacuum pump to reservoir fitting. Apply vacuum. Reservoir vacuum should not bleed off. If vacuum is being lost, replace reservoir.
5. Verify operation of one-way check valve and check it for leaks. **Certain models may be equipped with 2 check-valves.**
   a. Locate one-way check valve. The valve is located in vacuum line between vacuum reservoir and engine vacuum source. Disconnect vacuum hoses (lines) at each end of valve.
   b. Connect a hand-operated vacuum pump to reservoir end of check valve. Apply vacuum. Vacuum should not bleed off. If vacuum is being lost, replace one-way check valve.
   c. Connect a hand-operated vacuum pump to vacuum source end of check valve. Apply vacuum. Vacuum should flow through valve. If vacuum is not flowing, replace one-way check valve. Seal the fitting at opposite end of valve with a finger and apply vacuum. If vacuum will not hold, diaphragm within check valve has ruptured. Replace valve.

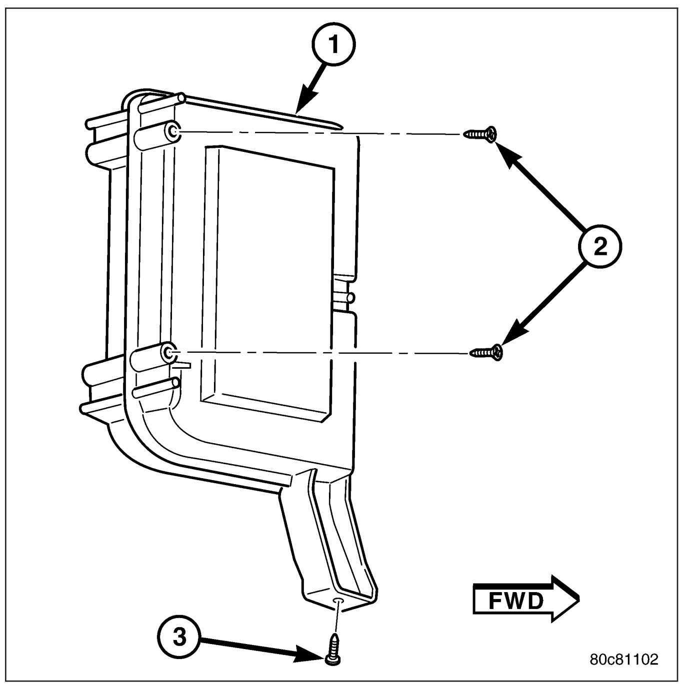
## REMOVAL

The vacuum reservoir (1) is located behind, and at the outer end of the instrument panel. To gain access for testing or removal, remove glovebox assembly. Also remove fuse box access cover panel at end of instrument panel. On vehicles equipped with LHD (Left Hand Drive), this fuse access panel is located at right end of instrument panel. On vehicles equipped with RHD (Right Hand Drive), this access panel is located at left end of instrument panel.

1. Remove glovebox assembly. Access to reservoir vacuum line and fitting can now be made.
2. Remove vacuum line at reservoir.
3. Remove fuse access cover panel at end of instrument panel.
4. Through fuse access opening, remove two horizontally mounted screws (2).

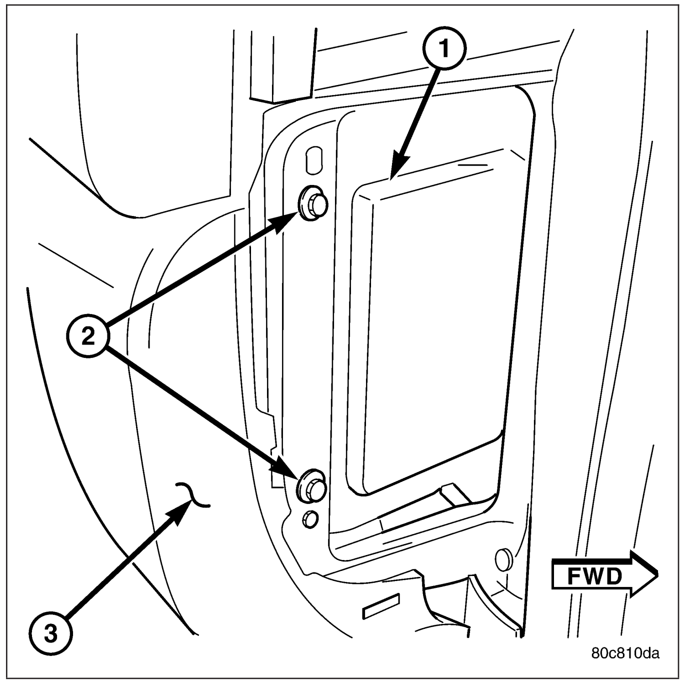


5. From bottom of instrument panel, remove one vertically mounted screw (3).
6. Remove reservoir from instrument panel.

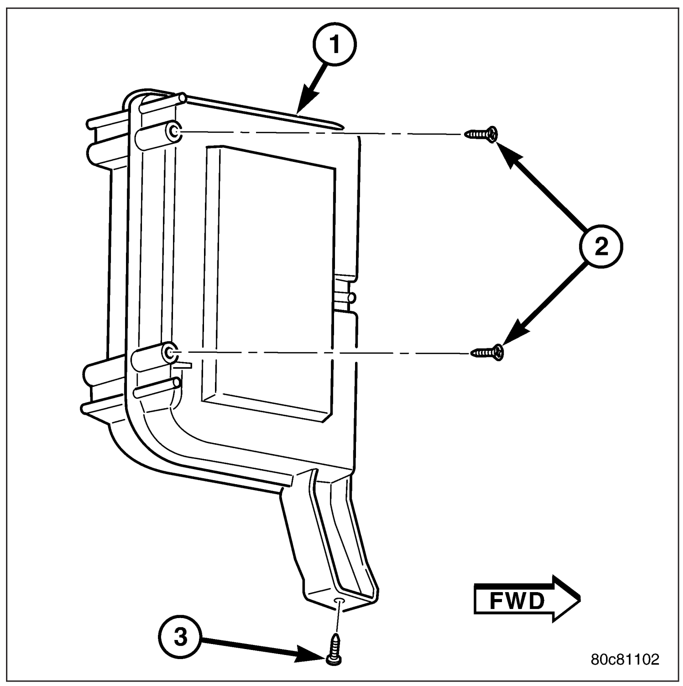


## INSTALLATION

1. Position reservoir (1) to instrument panel.
2. Install two horizontal mounting screws (2) but do not tighten.



3. Install one vertically mounted screw (3). Tighten all three mounting screws to 3 N·m (20 in. lbs.).
4. Connect vacuum line to reservoir fitting.
5. Install glovebox assembly.
6. Install fuse box access cover panel.



# VEHICLE THEFT SECURITY

## TABLE OF CONTENTS

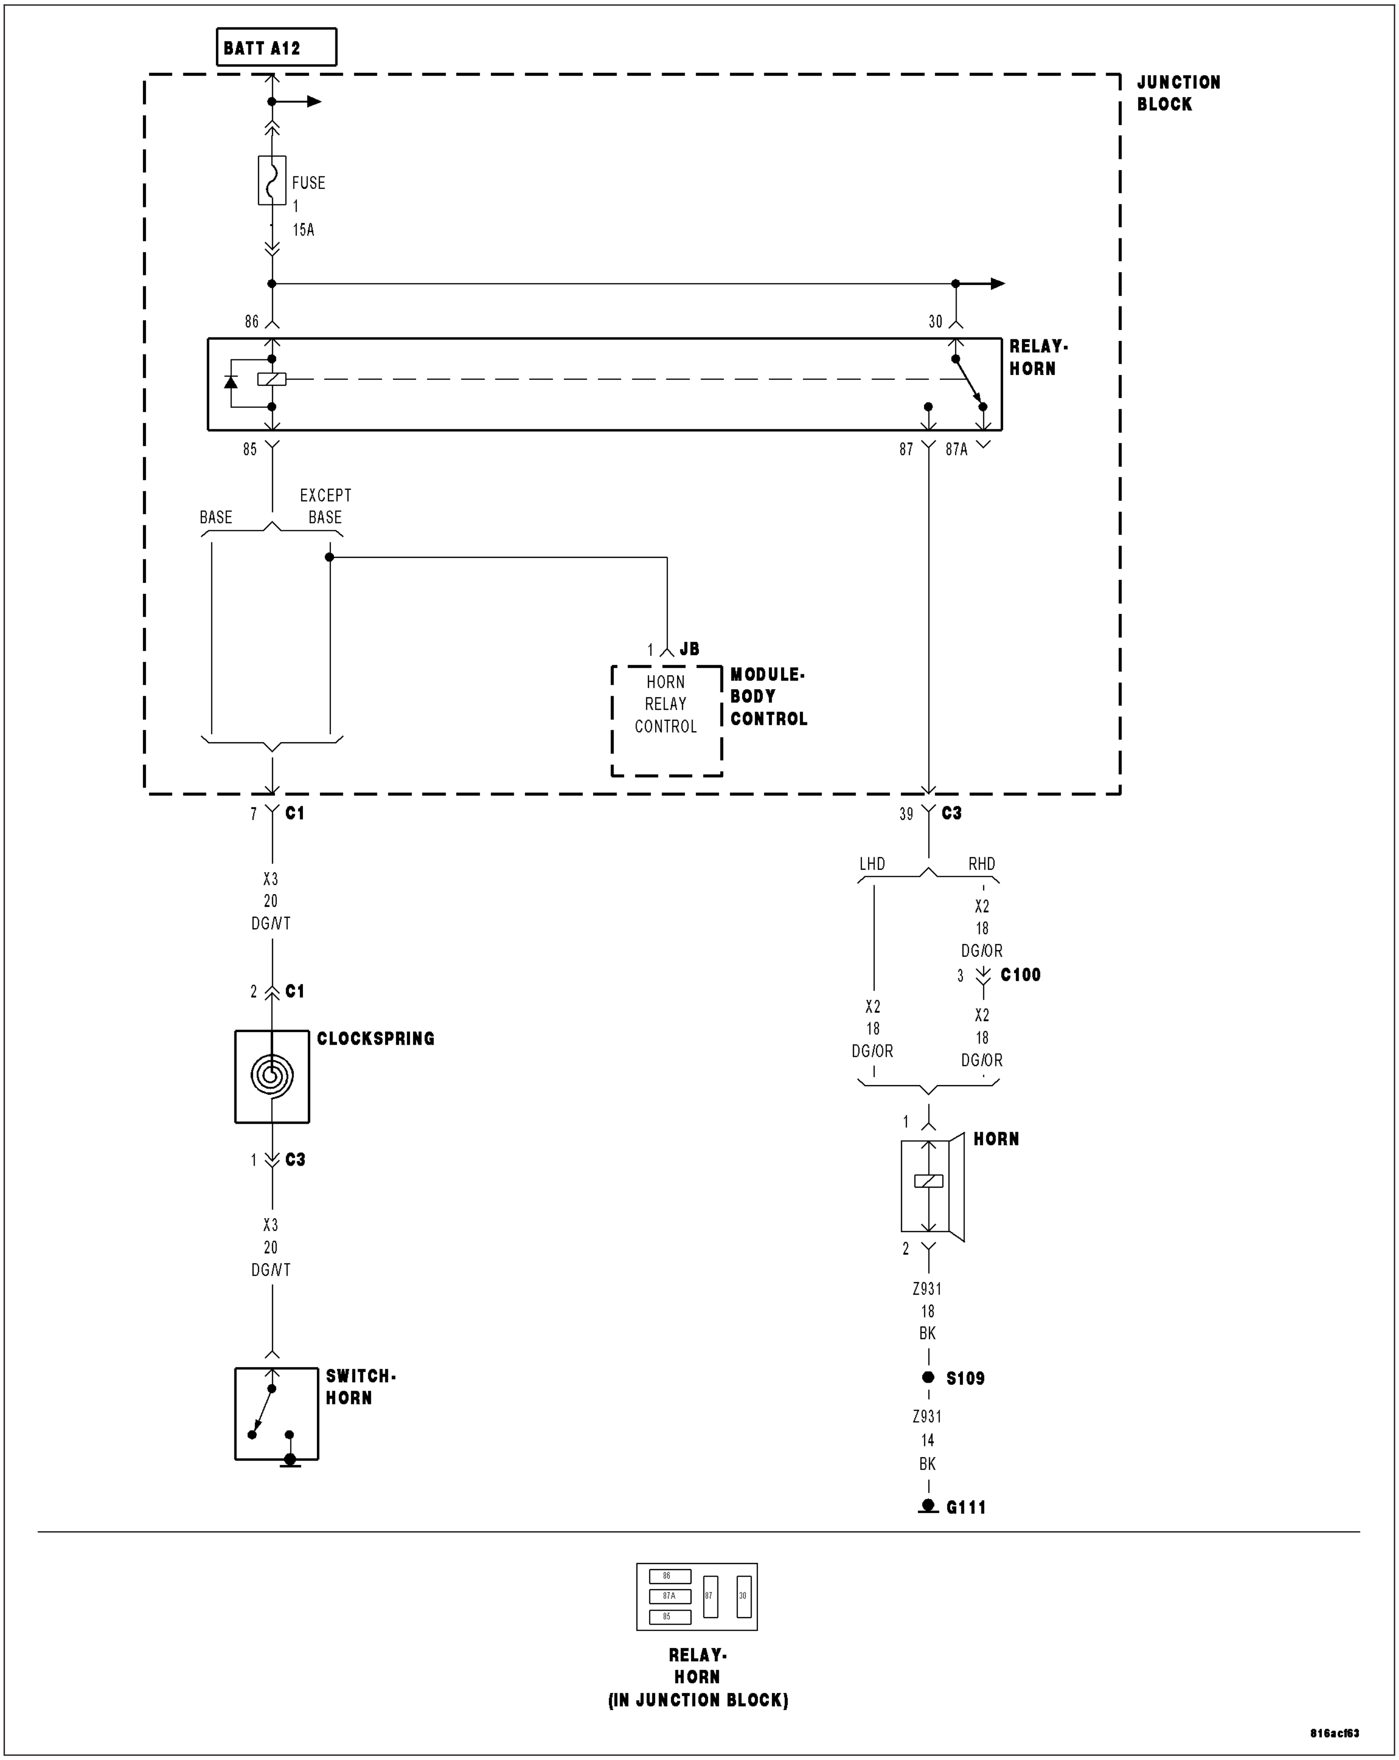
## VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS

### TABLE OF CONTENTS

# VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## HORN RELAY OUTPUT HIGH



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Body Control Module (BCM) detects unwanted voltage on the (X3) Horn Relay Control circuit.

| Possible Causes |
|---|
| HORN RELAY SHORTED |
| (X3) HORN RELAY CONTROL CIRCUIT SHORTED |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.
With the scan tool, erase BCM DTCs.
With the scan tool, actuate the Horn Relay.
With the scan tool, read BCM DTCs.

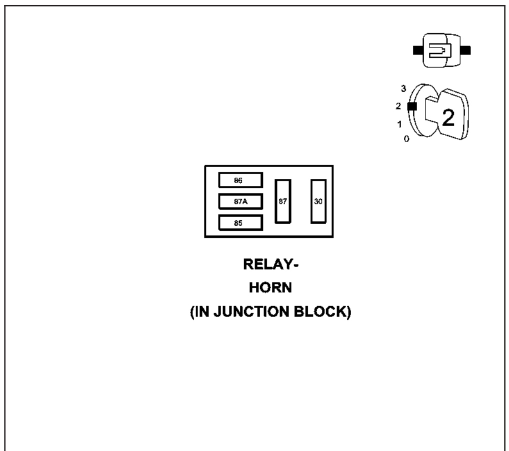
**Does the scan tool display: HORN RELAY OUTPUT HIGH?**

**Yes** >> Go To 2

**No** >> The condition that caused this symptom is not currently present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 2. CHECK FOR A SHORTED HORN RELAY

Turn the ignition off.
Install a substitute Horn Relay in place of the existing relay.
Turn the ignition on.
With the scan tool, erase BCM DTCs.
With the scan tool, actuate the Horn Relay.
With the scan tool, read BCM DTCs.



816acf67

**Does the scan tool display: HORN RELAY OUTPUT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the original Horn Relay in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. CHECK FOR A SHORTED (X3) HORN RELAY CONTROL CIRCUIT

Turn the ignition off.

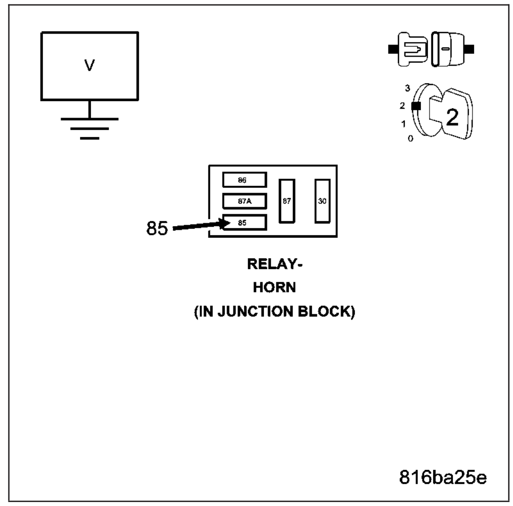
Remove the substitute Horn Relay from the Junction Block.

Remove the BCM from the Junction Block.

**NOTE: Ensure that the Junction Block connectors are reconnected at this time.**

Turn the ignition on.

Measure the voltage of the (X3) Horn Relay Control circuit in the Horn Relay connector in the Junction Block.



**Is there any voltage present?**

**Yes** >> Replace the Junction Block in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–BCM MESSAGE NOT RECEIVED (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  When the Intrusion Transceiver Module (ITM) transmits bus messages.
- **Set Condition:**
  If the ITM fails to receive status messages from the Body Control Module (BCM).

| Possible Causes |
|---|
| BUS COMMUNICATION FAILURE |
| INTRUSION TRANSCEIVER MODULE (ITM) |

### Diagnostic Test

#### 1. VERIFY THAT THE BCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, verify that the BCM is active on the bus.

**Is the BCM active on the bus?**

**Yes** >> Go To 2

**No** >> Refer to (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

#### 2. VERIFY THAT THE DTC IS ACTIVE

With the scan tool, erase ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the ITM in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced or partially broken wires.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–EEPROM FAILURE (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the VTSS is armed and during change of the VTSS state.
- **Set Condition:**
  If the EEPROM erase/write does not correctly complete the operation.

| Possible Causes |
|---|
| INTRUSION TRANSCEIVER MODULE (ITM) |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase the ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the ITM in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Test complete.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–LOOPBACK FAILURE (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the VTSS is armed, pre-armed, or reset.
- **Set Condition:**
  If the Intrusion Transceiver Module (ITM) fails an internal bus test.

| Possible Causes |
|---|
| INTRUSION TRANSCEIVER MODULE (ITM) |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase the ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

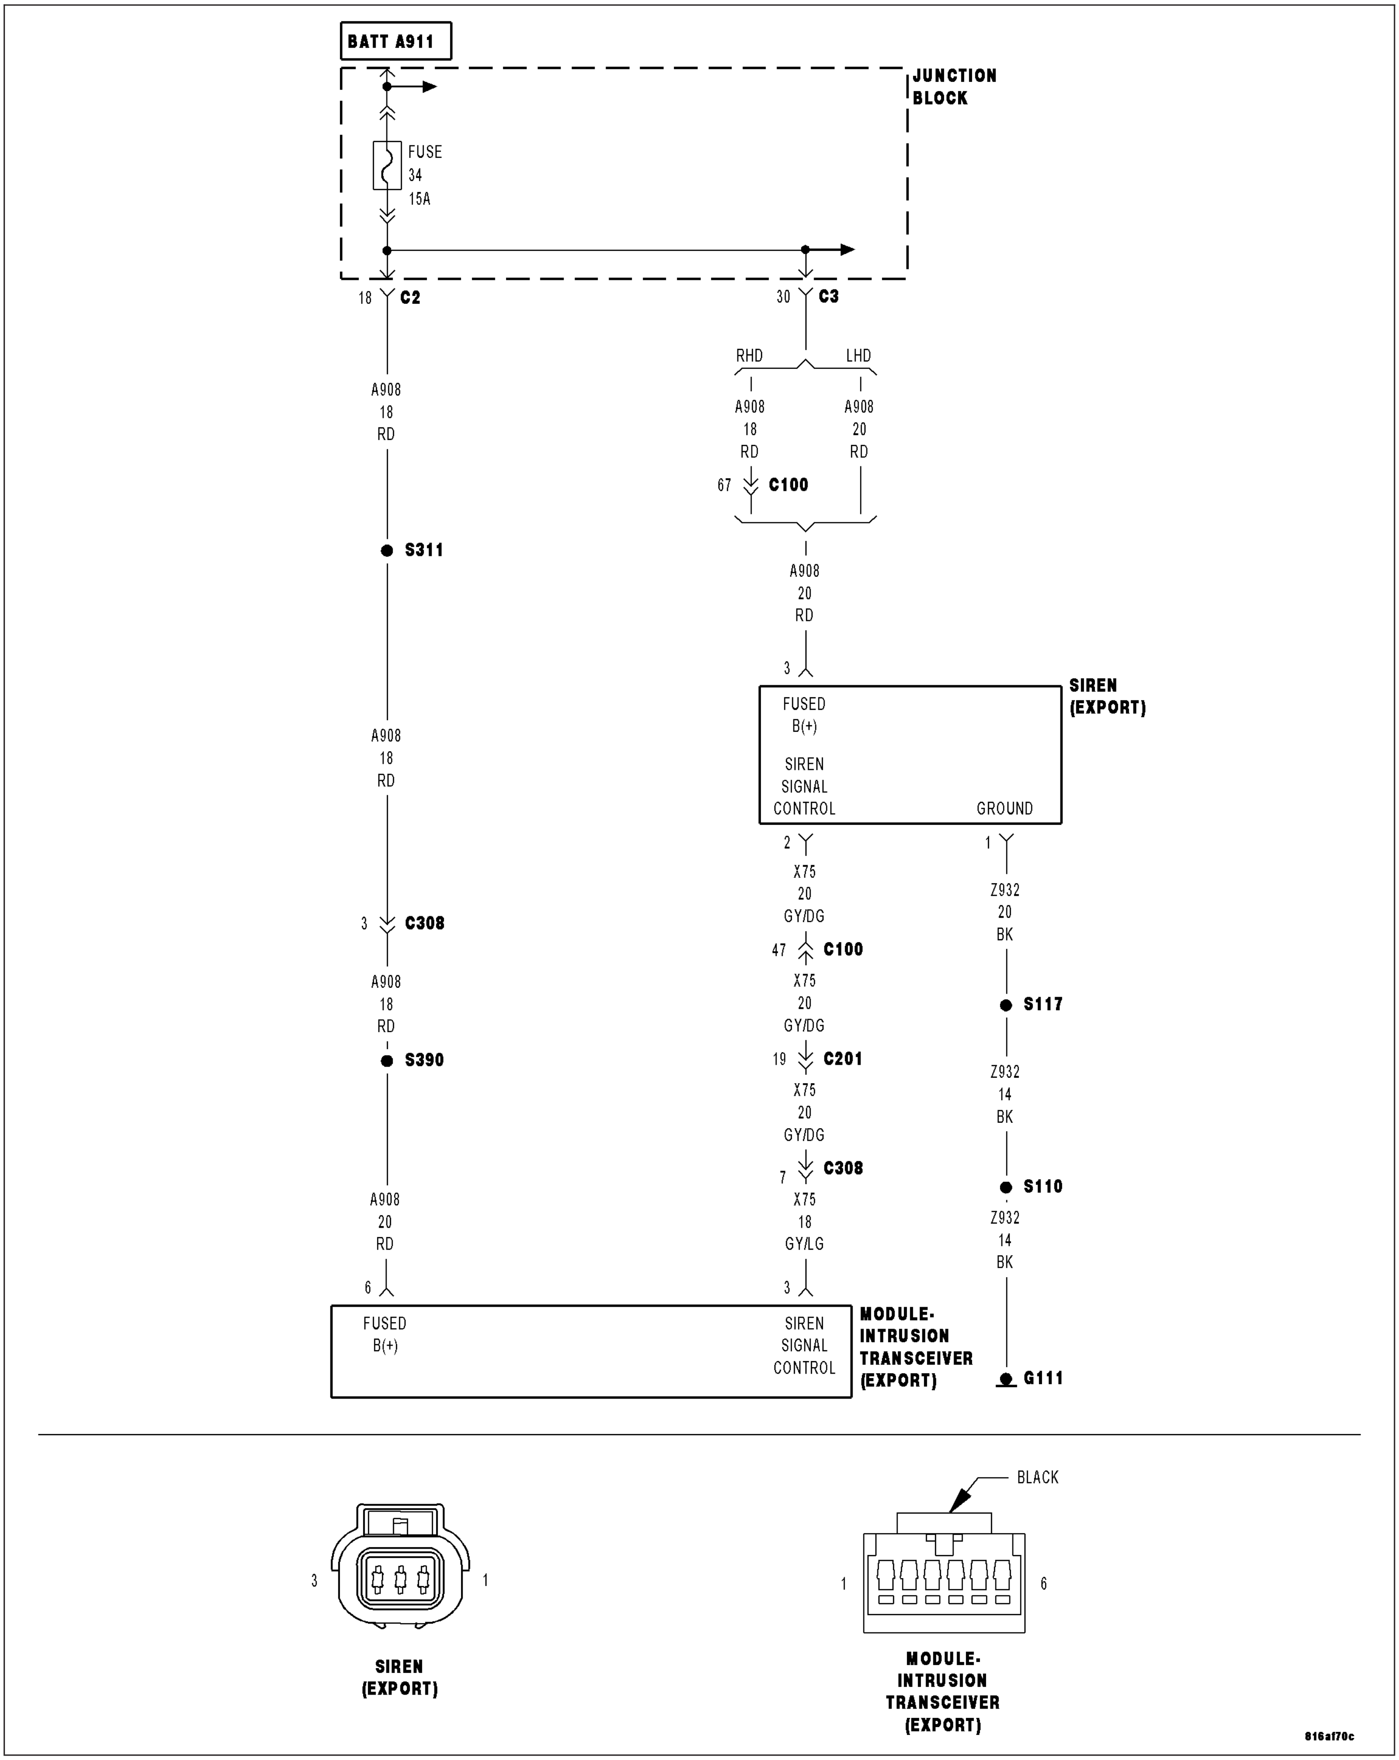
With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the ITM in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Test complete.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–NO SERIAL COMMUNICATION (EXPORT ONLY)



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the VTSS is armed.
- **Set Condition:**
  If the Intrusion Transceiver Module (ITM) fails to receive messages from the Siren.

| Possible Causes |
|---|
| (A908) FUSED B+ CIRCUIT OPEN |
| (Z932) GROUND CIRCUIT OPEN |
| (X75) SIREN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND |
| (X75) SIREN SIGNAL CONTROL CIRCUIT OPEN |
| VTSS SIREN |
| INTRUSION TRANSCEIVER MODULE (ITM) |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase the ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

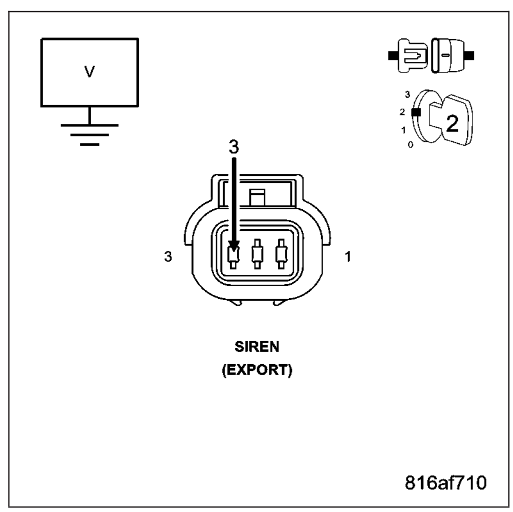
**No** >> The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced or partially broken wires.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 2. CHECK THE (A908) FUSED B+ CIRCUIT FOR AN OPEN

Disconnect the Siren harness connector.

Measure the voltage of the (A908) Fused B(+) circuit in the Siren harness connector.



**Is the voltage above 10.0 volts?**

**Yes** >> Go To 3

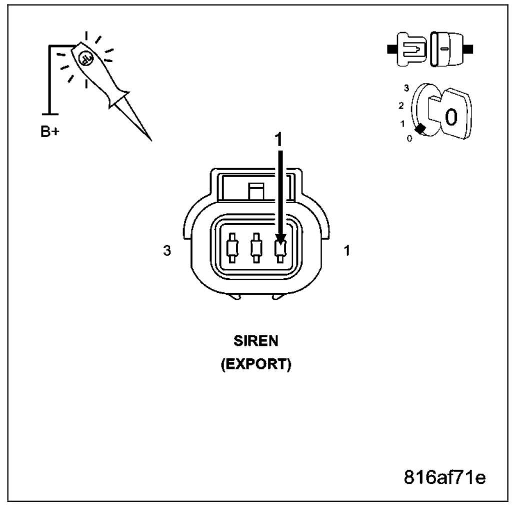
**No** >> Repair the (A908) Fused B+ circuit for an open.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

## 3. CHECK THE (Z932) GROUND CIRCUIT FOR AN OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12 volts, check the (Z932) Ground circuit in the Siren harness connector.



**Does the test light illuminate brightly?**

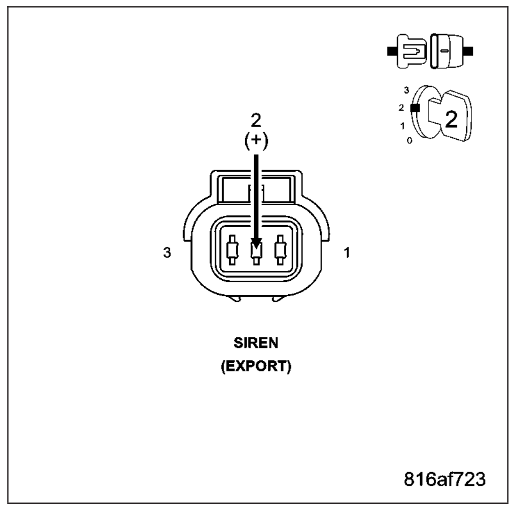
**Yes** >> Go To 4

**No** >> Repair the (Z932) Ground circuit for an open.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

## 4. CHECK THE (X75) SIREN SIGNAL CONTROL CIRCUIT FUNCTION

Using the DRBIII®, set up the lab scope as follows:



- Turn the ignition on.
- Use the Scope input cable CH7058, Cable to Probe adapter CH7062 and the red and black test probes.
- Connect the scope input cable to the channel one connector on the DRBIII®.
- Attach the red and black leads and the cable to probe adapter to the scope input cable.
- Select DRBIII® Standalone.
- Select lab scope.
- Select Live.
- Select 12 volt square wave.
- Press F2 for Scope.
- Press F2 and use the down arrow to set voltage range to 20 volts. Press F2 again when complete.

Connect the black lead to the chassis ground.

Connect the red lead to the (X75) Siren Signal Control circuit in the Siren harness connector.

Start the engine and hold the engine RPM's above 600.

Observe the voltage displayed on the DRBIII® Lab Scope.

**Is there a voltage square wave present for one to two seconds?**

**Yes** >> Replace the VTSS Siren in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK THE (X75) SIREN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the ITM harness connector.

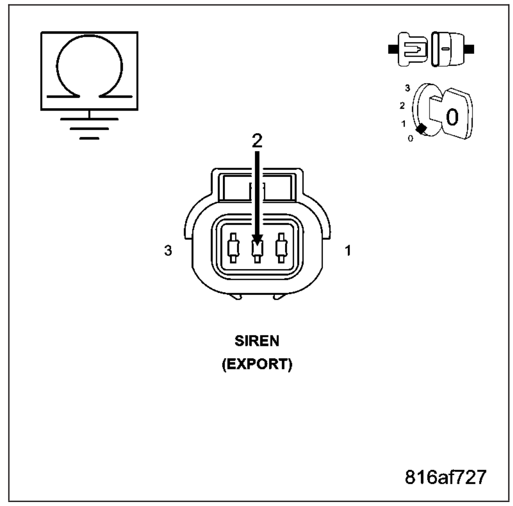
Measure the resistance between ground and the (X75) Siren Signal Control circuit in the Siren harness connector.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (X75) Siren Signal Control circuit for a short to ground.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 6



## 6. CHECK THE (X75) SIREN SIGNAL CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (X75) Siren Signal Control circuit between the ITM harness connector and the Siren harness connector.

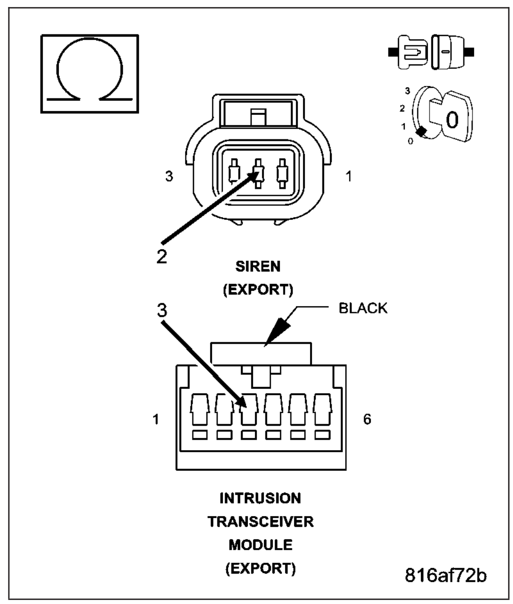
**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the ITM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (X75) Siren Signal Control circuit for an open.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.



## ITM–PCM MESSAGE NOT RECEIVED (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Intrusion Transceiver Module (ITM) fails to receive bus messages from the Powertrain Control Module (PCM).

| Possible Causes |
|---|
| BUS COMMUNICATION FAILURE |
| INTRUSION TRANSCEIVER MODULE (ITM) |

### Diagnostic Test

#### 1. VERIFY THAT THE PCM AND BCM ARE ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, verify that the PCM and BCM are active on the bus.

**Are both modules active on the bus?**

**Yes** >> Go To 2

**No** >> Refer to (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response related diagnostic procedures.

#### 2. VERIFY THAT THE DTC IS ACTIVE

With the scan tool, erase ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the ITM in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced or partially broken wires.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–PRE-ARM TIMEOUT FAILURE (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  During the VTSS pre-arm process.
- **Set Condition:**
  If the Intrusion Transceiver Module (ITM) fails to receive the arm message from the Body Control Module (BCM) after sixty seconds.

| Possible Causes |
|---|
| BUS COMMUNICATION FAILURE |
| INTRUSION TRANSCEIVER MODULE (ITM) |

### Diagnostic Test

#### 1. VERIFY THAT THE BCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, verify that the BCM is active on the bus.

**Is the BCM active on the bus?**

**Yes** >> Go To 2

**No** >> Refer to (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for no response related diagnostic procedures.

#### 2. VERIFY THAT THE DTC IS ACTIVE

With the scan tool, erase ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the ITM in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced or partially broken wires.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–SIREN BATTERY HAS BEEN TAMPERED (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the VTSS is armed.
- **Set Condition:**
  If the siren detects the loss of vehicle battery voltage.

| Possible Causes |
|---|
| SIREN WIRE HARNESS TAMPERED WITH OR DAMAGED |
| INTRUSION TRANSCEIVER MODULE (ITM) |

## Diagnostic Test

### 1. INSPECT THE SIREN WIRE HARNESS SIGNS OF TAMPERING AND DAMAGE

Turn the ignition off.

Inspect the wiring harness to the siren for signs of tampering and damage.

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 2

### 2. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the Siren in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced or partially broken wires.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–SIREN COMMUNICATION FAILURE (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the VTSS is armed.
- **Set Condition:**
  If the Siren fails to receive messages from the Intrusion Transceiver Module (ITM).

Refer to **ITM–No Serial Communication (Export Only)** in this Section for the diagnostic test procedure.

## ITM–SIREN EEPROM FAILURE (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the VTSS is armed.
- **Set Condition:**
  If the checksum of the EEPROM does not calculate to the correct value.

| Possible Causes |
|---|
| SIREN |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase the ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the Siren in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Test complete.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–SIREN INTERNAL BATTERY (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously with engine speed over 600 rpm.
- **Set Condition:**
  The Intrusion Transceiver Module (ITM) will set this DTC if the internal battery within the siren does not charge as expected.

| Possible Causes |
|---|
| SIREN |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase the ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the Siren in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Test complete.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–SIREN ROM FAILURE (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the VTSS is armed.
- **Set Condition:**
  If the checksum of the ROM does not calculate to the correct value.

| Possible Causes |
|---|
| SIREN |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase the ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the Siren in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Test complete.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–TRANSDUCER FAILURE (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously during VTSS pre-arm mode.
- **Set Condition:**
  The Intrusion Transceiver Module (ITM) sends a test ultrasonic signal during the pre-arm process. If the test signal is not correctly received this code will set.

| Possible Causes |
|---|
| INTRUSION TRANSCEIVER MODULE SENSORS BLOCKED / DIRTY |
| INTRUSION TRANSCEIVER MODULE (ITM) |

### Diagnostic Test

#### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase the ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that caused this symptom is currently not present. Test complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

#### 2. INSPECT ITM SENSORS FOR BLOCKAGE FROM DUST / DEBRIS

Inspect the louvers of the Intrusion Transceiver Module for blockage from dust / debris.

**Were any problems found?**

**Yes** >> Clean as necessary.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Replace the ITM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ITM–VIN MISMATCH (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  While the Intrusion Transceiver Module (ITM) is being disarmed.
- **Set Condition:**
  If the VIN stored in the ITM fails to match the VIN in the Body Control Module (BCM).

| Possible Causes |
|---|
| MODULE PROGRAMMED WITH INCORRECT VIN |

## Diagnostic Test

### 1. VERIFY THAT THE ITM, BCM, AND PCM ARE PROGRAMMED WITH THE CORRECT VIN

**NOTE: Never install an ITM or Siren which was removed from another vehicle.**

Turn the ignition on.

Display and record the VIN programmed in the ITM, BCM, and PCM as follows:

- With the scan tool, select ECU View, select the applicable module, select More Options, and select ECU Details.

**Are the ITM, BCM, and PCM programmed with the correct VIN?**

**Yes** >> Go To 2

**No** >> Replace and program all modules that are programmed with the incorrect VIN.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 2. VERIFY THAT THE DTC IS ACTIVE

With the scan tool, erase the ITM DTCs.

Turn the ignition off.

Arm the VTSS and wait one minute.

Disarm the VTSS and turn the ignition on.

With the scan tool, read ITM DTCs.

**Did this DTC reset?**

**Yes** >> Replace the ITM in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that caused this symptom is currently not present. Test complete.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## SKREEM/SKIM–ANTENNA FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Every 250 milliseconds with the ignition on.
- **Set Condition:**
  The SKREEM/SKIM micro-controller determines that an antenna circuit fault has occurred for 2.0 consecutive seconds.

| Possible Causes |
| --- |
| SKREEM/SKIM INTERNAL FAILURE |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: This trouble code indicates an internal module fault.**

Turn the ignition on.

With the scan tool, record and erase SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–COP FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The COP timer is not reset by the micro-controller every 65.5 milliseconds.

| Possible Causes |
|---|
| SKREEM/SKIM INTERNAL DTC FAILURE |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: This trouble code indicates an internal module fault.**

Turn the ignition on.

With the scan tool, record and erase the SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–EEPROM FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the value written to EEPROM memory does not equal the value read back after the write operation.

| Possible Causes |
|---|
| SKREEM/SKIM INTERNAL DTC FAILURE |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: This trouble code indicates an internal module fault.**

Turn the ignition on.

With the scan tool, record and erase the SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–INTERNAL FAULT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The SKREEM/SKIM has detected a fault during an internal self test.

| Possible Causes |
|---|
| SKREEM/SKIM INTERNAL DTC FAILURE |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: This trouble code indicates an internal module fault.**

Turn the ignition on.

With the scan tool, record and erase the SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–PCM STATUS FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the SKREEM/SKIM fails to receive the PCM STATUS message from the PCM for at least 20.0 consecutive seconds.

| Possible Causes |
| --- |
| WIRE HARNESS FAILURE |
| SKREEM/SKIM |
| PCM |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: Verify that the PCM has good power and ground connections before continuing.**

Turn the ignition on.

With the scan tool, record and erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 2 minutes.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the Intermittent Condition diagnostic procedure in this Section.

### 2. INSPECT RELATED WIRING FOR CONDITION CAUSING THE FAULT

Turn the ignition off.

**NOTE: Visually inspect the related wiring harness and PCI Bus circuits for any chafed, pierced, pinched, and partially broken wires.**

**NOTE: Visually inspect the related wiring harness connectors for broken, bent, pushed out, and corroded terminals.**

**NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.**

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. VERIFY THAT THE DTC IS STILL ACTIVE

**NOTE: Obtain the SKIM PIN before proceeding.**

Turn the ignition on.

With the scan tool, erase all PCM and SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the PCM in accordance with the Service Information.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–RAM FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The RAM fails a test that checks the RAM's ability to retain memory.

| Possible Causes |
|---|
| SKREEM/SKIM INTERNAL DTC FAILURE |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: This trouble code indicates an internal module fault.**

Turn the ignition on.

With the scan tool, record and erase the SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–ROLLING CODE FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKREEM/SKIM or PCM reset.
- **Set Condition:**
  When a PCM STATUS message with a Valid Key status is not received by the SKREEM/SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

| Possible Causes |
|---|
| PCM NOT PROGRAMMED OR PROGRAMMED WITH INCORRECT VIN |
| SKREEM/SKIM |
| PCM |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on and wait 2 minutes.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the Intermittent Condition diagnostic procedure is this section.

### 2. VERIFY THAT THE PCM IS PROGRAMMED WITH THE CORRECT VIN

Display and record the VIN programmed in the PCM as follows:

- With the scan tool, select ECU View, select PCM, select More Options, and select ECU Details.

**NOTE: Make sure that a VIN is programmed in the PCM. If the VIN does not display, attempt to program the PCM with the correct VIN before continuing.**

**Is the PCM programmed with the correct VIN?**

**Yes** >> Go To 3

**No** >> Using the scan tool, perform PCM Replaced to update the VIN in the PCM.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## 3. VERIFY THAT THE DTC IS STILL ACTIVE

Turn the ignition off.

Replace and program the SKREEM/SKIM in accordance with the Service Information.

Turn the ignition on.

With the scan tool, erase all PCM and SKREEM/SKIM DTCs.

Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle.

With the scan tool, check for SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the PCM in accordance with the Service Information.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> The repair is complete.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## SKREEM/SKIM–SERIAL LINK EXTERNAL FAULT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKREEM/SKIM reset, or during SECRET KEY transfers to the PCM.
- **Set Condition:**
  If the SKREEM/SKIM fails to receive the PCI BUS message transmission acknowledgement from the PCM after 3 transmit attempts.

| Possible Causes |
|---|
| WIRE HARNESS FAILURE |
| SKREEM/SKIM |
| PCM |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: Verify that the PCM has good power and ground connections before continuing.**

Turn the ignition on.

With the scan tool, record and erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 2 minutes.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> Perform the Intermittent Condition diagnostic procedure in this Section.

### 2. INSPECT RELATED WIRING FOR CONDITION CAUSING THE FAULT

Turn the ignition off.

**NOTE: Visually inspect the related wiring harness and PCI Bus circuits for chafed, pierced, pinched, and partially broken wires.**

**NOTE: Visually inspect the related wiring harness connectors for broken, bent, pushed out, and corroded terminals.**

**NOTE: Refer to any Technical Service Bulletins (TSB) that may apply.**

**Were any problems found?**

**Yes** >> Repair as necessary.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Go To 3

## 3. VERIFY THAT THE DTC IS STILL ACTIVE

**NOTE: Obtain the SKIM PIN before proceeding.**

Turn the ignition on.

With the scan tool, erase all PCM and SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the PCM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–SERIAL LINK INTERNAL FAULT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The SKREEM/SKIM fails an internal J1850 communication self test.

| Possible Causes |
|---|
| SKREEM/SKIM INTERNAL DTC FAILURE |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: This trouble code indicates an internal module fault.**

Turn the ignition on.

With the scan tool, record and erase the SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–STOCK OVERFLOW FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The micro-controller has exceeded its stack space limit.

| Possible Causes |
|---|
| SKREEM/SKIM INTERNAL DTC FAILURE |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

**NOTE: This trouble code indicates an internal module fault.**

Turn the ignition on.

With the scan tool, record and erase the SKREEM/SKIM DTCs.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test complete, the conditions that set this DTC are not present at this time.

## SKREEM/SKIM–TRANSPONDER COMMUNICATION FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At ignition on and during Key Programming Mode.
- **Set Condition:**
  When SKREEM/SKIM fails to receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

| Possible Causes |
|---|
| IGNITION KEY PROGRAMMING |
| IGNITION KEY |
| SKREEM/SKIM |

### Diagnostic Test

#### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, record and erase SKREEM/SKIM DTCs.

**NOTE: Perform the following test several times to make sure the DTC is current.**

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Intermittent Condition diagnostic procedure in this Section.

#### 2. VERIFY IF MULTIPLE IGNITION KEYS EXIST

**Are there multiple vehicle ignition keys available?**

**Yes** >> Go To 3

**No** >> Go To 4

#### 3. CHECK KEY OPERATION

**NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each remaining key, one at a time.**

With the scan tool, erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Is the DTC present for all ignition keys?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Replace all ignition keys that cause the DTC to set.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## 4. REPROGRAM THE IGNITION KEYS

With the scan tool, attempt to reprogram the ignition keys to the SKREEM/SKIM.

With the scan tool, erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 5

**No** >> Test Complete.

## 5. PROGRAM A NEW IGNITION KEY

Replace the existing ignition key with a new key.

With the scan tool, program the new ignition key to the SKREEM/SKIM.

With the scan tool, erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test Complete.

## SKREEM/SKIM–TRANSPONDER CYCLIC REDUNDANCY CHECK (CRC) FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At ignition on and during Key Programming Mode.
- **Set Condition:**
  When 5 consecutive transponder signal transmissions are sent to the SKREEM/SKIM with the correct message format but with invalid data.

| Possible Causes |
|---|
| IGNITION KEY PROGRAMMING |
| IGNITION KEY |
| SKREEM/SKIM |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, record and erase SKREEM/SKIM DTCs.

**NOTE: Perform the following test several times to make sure the DTC is current.**

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Intermittent Condition diagnostic procedure in this Section.

### 2. VERIFY IF MULTIPLE IGNITION KEYS EXIST

**Are there multiple vehicle ignition keys available?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. CHECK KEY OPERATION

**NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each remaining key, one at a time.**

With the scan tool, erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Is the DTC present for all ignition keys?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Replace all ignition keys that cause the DTC to set.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## 4. REPROGRAM THE IGNITION KEYS

With the scan tool, attempt to reprogram the ignition keys to the SKREEM/SKIM.
With the scan tool, erase the SKREEM/SKIM DTCs.
Turn the ignition off.
Wait 10 seconds.
Turn the ignition on.
With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 5

**No** >> Test Complete.

## 5. PROGRAM A NEW IGNITION KEY

Replace the existing ignition key with a new key.
With the scan tool, program the new ignition key to the SKREEM/SKIM.
With the scan tool, erase the SKREEM/SKIM DTCs.
Turn the ignition off.
Wait 10 seconds.
Turn the ignition on.
With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test Complete.

## SKREEM/SKIM–TRANSPONDER ID MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At ignition on and during Key Programming Mode.
- **Set Condition:**
  When the transponder ID read by the SKREEM/SKIM does not match any of the transponder IDs stored in the SKREEM/SKIM's memory.

| Possible Causes |
|---|
| IGNITION KEY PROGRAMMING |
| IGNITION KEY |
| SKREEM/SKIM |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, record and erase SKREEM/SKIM DTCs.

**NOTE: Perform the following test several times to make sure the DTC is current.**

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Intermittent Condition diagnostic procedure in this Section.

### 2. VERIFY IF MULTIPLE IGNITION KEYS EXIST

**Are there multiple vehicle ignition keys available?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. CHECK KEY OPERATION

**NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each remaining key, one at a time.**

With the scan tool, erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Is the DTC present for all ignition keys?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Replace all ignition keys that cause the DTC to set.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## 4. REPROGRAM THE IGNITION KEYS

With the scan tool, attempt to reprogram the ignition keys to the SKREEM/SKIM.
With the scan tool, erase the SKREEM/SKIM DTCs.
Turn the ignition off.
Wait 10 seconds.
Turn the ignition on.
With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 5

**No** >> Test Complete.

## 5. PROGRAM A NEW IGNITION KEY

Replace the existing ignition key with a new key.
With the scan tool, program the new ignition key to the SKREEM/SKIM.
With the scan tool, erase the SKREEM/SKIM DTCs.
Turn the ignition off.
Wait 10 seconds.
Turn the ignition on.
With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test Complete.

## SKREEM/SKIM–TRANSPONDER RESPONSE MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At ignition on and during Key Programming Mode.
- **Set Condition:**
  When transponder's crypt algorithm results fail to match the SKREEM/SKIM result.

| Possible Causes |
|---|
| IGNITION KEY PROGRAMMING |
| IGNITION KEY |
| SKREEM/SKIM |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, record and erase SKREEM/SKIM DTCs.

**NOTE: Perform the following test several times to make sure the DTC is current.**

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Intermittent Condition diagnostic procedure in this Section.

### 2. VERIFY IF MULTIPLE IGNITION KEYS EXIST

**Are there multiple vehicle ignition keys available?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. CHECK KEY OPERATION

**NOTE: Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each remaining key, one at a time.**

With the scan tool, erase the SKREEM/SKIM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM/SKIM DTCs.

**Is the DTC present for all ignition keys?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Replace all ignition keys that cause the DTC to set.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## 4. REPROGRAM THE IGNITION KEYS

With the scan tool, attempt to reprogram the ignition keys to the SKREEM/SKIM.
With the scan tool, erase the SKREEM/SKIM DTCs.
Turn the ignition off.
Wait 10 seconds.
Turn the ignition on.
With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 5

**No** >> Test Complete.

## 5. PROGRAM A NEW IGNITION KEY

Replace the existing ignition key with a new key.
With the scan tool, program the new ignition key to the SKREEM/SKIM.
With the scan tool, erase the SKREEM/SKIM DTCs.
Turn the ignition off.
Wait 10 seconds.
Turn the ignition on.
With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the SKREEM/SKIM in accordance with the Service Information.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> Test Complete.

## SKREEM/SKIM–VIN MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the VIN received from the PCM does not match the VIN stored in the SKREEM/SKIM's EEPROM.

| Possible Causes |
|---|
| PCM NOT PROGRAMMED OR PROGRAMMED WITH INCORRECT VIN |
| SKREEM/SKIM |
| PCM |

## Diagnostic Test

### 1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.
With the scan tool, record and erase the SKREEM/SKIM DTCs.
Turn the ignition off.
Wait 10 seconds.
Turn the ignition on and wait 2 minutes.
With the scan tool, read the SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> Refer to the Intermittent Condition diagnostic procedure in this Section.

### 2. VERIFY THAT THE PCM IS PROGRAMMED WITH THE CORRECT VIN

Display and record the VIN programmed in the PCM as follows:

- With the scan tool, select ECU View, select PCM, select More Options, and select ECU Details.

**NOTE: Make sure that a VIN is programmed in the PCM. If the VIN does not display, attempt to program the PCM with the correct VIN before continuing.**

**Is the PCM programmed with the correct VIN?**

**Yes** >> Go To 3

**No** >> Using the scan tool, perform PCM Replaced to update the VIN in the PCM.
Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## 3. VERIFY THAT THE DTC IS STILL ACTIVE

Turn the ignition off.

Replace and program the SKREEM/SKIM in accordance with the Service Information.

Turn the ignition on.

With the scan tool, erase all PCM and SKREEM/SKIM DTCs.

Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle.

With the scan tool, check for SKREEM/SKIM DTCs.

**Did this DTC reset?**

**Yes** >> Replace and program the PCM in accordance with the Service Information.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

**No** >> The repair is complete.

Perform SKIS VERIFICATION TEST. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## *ALARM TRIPS ON ITS OWN

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| VTSS RELATED WIRING |
| IGNITION RUN RUN/START |
| DOOR |
| HOOD SECURITY SWITCH |
| FLIPPER GLASS |
| LIFTGATE/SWINGATE |
| INTRUSION TRANSCEIVER MODULE (ITM) |

## Diagnostic Test

### 1. CHECK THE LAST ALARM CAUSED BY STATE WITH THE SCAN TOOL

Turn the ignition on.

With the scan tool in BCM, select Data Display and look for any of the following VTA Triggers indicated as causing the symptom:

- Ignition Run Run/Start
- Front driver door
- Hood Security Switch
- Flipper Glass
- Liftgate/Swingate Ajar
- All other door
- ITM

**Does the scan tool indicate that any of the above triggered the VTA?**

**Yes** >> Check for a possible intermittent condition caused by the trigger displayed on scan tool.
Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 2

### 2. INSPECT FOR A HOOD AJAR

**Is this an export vehicle equipped with a hood ajar switch?**

**Yes** >> Go To 3

**No** >> Go To 4

### 3. ATTEMPT TO TRIP THE ALARM VIA THE HOOD AJAR SWITCH

Remove the ignition key (but keep in hand).

Lock the vehicle and close all doors, the liftgate, and the hood.

Allow the VTSS to arm.

Lightly tap on hood near ajar switch to simulate wind and noise vibration.

**Did the VTSS trip to the alarming state?**

**Yes** >> Replace the hood ajar switch in accordance with the Service Information.
Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 4

## 4. TEST FOR AN INTERMITTENT CONDITION

**NOTE: The condition that caused the alarm is not present at this time. The following list may help you in identifying the cause of the intermittent condition.**

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect related wiring harnesses. Look for chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for loose connections, broken, bent, pushed out, or corroded terminals.

**Were any of the above conditions present?**

**Yes** >> Repair as necessary.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Test Complete.

## *DRIVER DOOR DOES NOT TRIP VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| DRIVER DOOR AJAR CIRCUIT |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. CHECK DRIVER DOOR AJAR SWITCH FUNCTION

Verify that the lighting control on the multi-function switch is not in the Interior Lamps Defeat position.

Open the driver door while observing the interior lamps.

Close the driver door while observing the interior lamps.

**Do the interior lamps function correctly with regard to the door position?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

### 2. CHECK DRIVER DOOR AJAR SWITCH STATUS WITH THE SCAN TOOL

**NOTE: The VTSS must arm properly for the result of this test to be valid.**

Turn the ignition on.

Open the driver door.

With the scan tool in BCM, select Data Display and read the Door Ajar Switch status for the driver door.

**Does the scan tool display: CLOSED?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

## *FLIP-UP GLASS DOES NOT TRIP VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| FLIP-UP GLASS AJAR CIRCUIT |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. CHECK FLIP-UP GLASS AJAR SWITCH FUNCTION

Verify that the lighting control on the multi-function switch is not in the Interior Lamps Defeat position.

Open the flip-up glass while observing the interior lamps.

Close the flip-up glass while observing the interior lamps.

**Do the interior lamps function correctly with regard to the flip-up glass position?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

### 2. CHECK FLIP-UP GLASS AJAR SWITCH STATUS WITH THE SCAN TOOL

**NOTE: The VTSS must arm properly for the result of this test to be valid.**

Turn the ignition on.

Open the flip-up glass.

With the scan tool in BCM, select Data Display and read the Flip-Up Glass Ajar Switch status for the driver door.

**Does the scan tool display: CLOSED?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

## *FRONT PASSENGER DOOR DOES NOT TRIP VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
| --- |
| FRONT PASSENGER DOOR AJAR CIRCUIT |
| BODY CONTROL MODULE (BCM) |

### 1. CHECK FRONT PASSENGER DOOR AJAR SWITCH FUNCTION

Verify that the lighting control on the multi-function switch is not in the Interior Lamps Defeat position.

Open the front passenger door while observing the interior lamps.

Close the front passenger door while observing the interior lamps.

**Do the interior lamps function correctly with regard to the door position?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

### 2. CHECK FRONT PASSENGER DOOR AJAR SWITCH STATUS WITH THE SCAN TOOL

**NOTE: The VTSS must arm properly for the result of this test to be valid.**

Turn the ignition on.

Open the front passenger door.

With the scan tool in BCM, select Data Display and read the Door Ajar Switch status for the front passenger door.

**Does the scan tool display: CLOSED?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

## *HAZARD LAMPS INOPERATIVE WITH VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| BODY CONTROL MODULE (BCM) DTCS PRESENT |
| HAZARD LAMPS / RELATED CIRCUITS |
| (L91) HAZARD LAMP CONTROL CIRCUIT OPEN |
| HAZARD LAMP SWITCH |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. CHECK FOR DTCs IN THE BCM

Turn the ignition on.

With the scan tool, read BCM DTCs.

**Does the scan tool display any DTCs?**

**Yes** >> Diagnose and repair the DTC(s) Refer to the Table of Contents in the applicable Section for the diagnostic procedure(s).
Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 2

### 2. CHECK HAZARD LAMP OPERATION USING THE HAZARD SWITCH

Operate the Hazard Lamps with the Hazard Switch.

**Do the hazard lamps operate?**

**Yes** >> Go To 3

**No** >> Diagnose and repair the hazard lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - DIAGNOSIS AND TESTING).
Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

### 3. ACTUATE THE HAZARD LAMPS WITH THE SCAN TOOL

Turn the Hazard Switch off.

With the scan tool in BCM, actuate the Hazard Lamps.

**Do the Hazard Lamps operate?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. CHECK (L91) HAZARD LAMP CONTROL CIRCUIT FUNCTION

Using the scan tool, turn the Hazard Lamp actuator off.

Turn the ignition off.

Disconnect the BCM C1 harness connector.

Connect a jumper wire between the (L91) Hazard Lamp Control circuit and ground.

**Do the Hazard Lamps operate?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 5

## 5. CHECK (L91) HAZARD LAMP CONTROL CIRCUIT FOR AN OPEN

Disconnect the Hazard Switch harness connector.

Measure the resistance of the (L91) Hazard Lamp Control circuit between the BCM C1 harness connector and the Hazard Switch harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Hazard Switch in accordance with the Service Information.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Repair the (L91) Hazard Lamp Control circuit for an open.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

# *HEADLAMPS FAIL TO FLASH WITH VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| BODY CONTROL MODULE (BCM) DTCS PRESENT |
| HEADLAMP / RELATED CIRCUITS |
| INCORRECT COUNTRY CODE SETTING PROGRAMMED IN BCM |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. CHECK FOR DTCs IN THE BCM

Turn the ignition on.

With the scan tool, read BCM DTCs.

**Does the scan tool display any DTCs?**

**Yes** >> Diagnose and repair the DTC(s) Refer to the Table of Contents in the applicable Section for the diagnostic procedure(s).

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 2

### 2. CHECK LOW BEAM HEADLAMP OPERATION

Turn the Low Beam Headlamps on.

**Do the Low Beam Headlamps operate properly?**

**Yes** >> Go To 3

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - DIAGNOSIS AND TESTING) for Headlamp related diagnostic procedures.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

### 3. VERIFY THE BCM IS PROGRAMMED WITH THE CORRECT COUNTRY CODE SETTING

With the scan tool in BCM, check the country code setting.

**Is the BCM programmed with the correct country code setting?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Program the BCM with the correct country code setting.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

## *HOOD DOES NOT TRIP VTSS (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

Refer to **(ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING)** for Ajar Switch related diagnostic procedures.

## *HORN FAILS TO SOUND WITH VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| BODY CONTROL MODULE (BCM) DTCS PRESENT |
| HORN / RELATED CIRCUITS |
| INCORRECT COUNTRY CODE SETTING PROGRAMMED IN BCM |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. CHECK FOR DTCs IN THE BCM

Turn the ignition on.

With the scan tool, read BCM DTCs.

**Does the scan tool display any DTCs?**

**Yes** >> Diagnose and repair the DTC(s) Refer to the Table of Contents in the applicable Section for the diagnostic procedure(s).

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 2

### 2. VERIFY VTSS OPERATION

**NOTE: The Horn must be operational from the horn button for the results of this test to be valid.**

Open the driver door window.

Remove the key from the ignition switch.

Lock the doors with the RKE transmitter or power door lock switch.

Close all of the doors and the tailgate.

Wait approximately 15 seconds for the VTSS indicator to flash at a slower rate indicating that the Vehicle Theft Security System is armed.

Manually unlock the driver door lock.

Trip the VTSS by opening the driver door.

**Did the Horn sound when the VTSS was tripped?**

**Yes** >> The condition that caused this symptom is not currently present. Inspect the related wiring harness for a possible intermittent condition. Look for any chafed, pierced, pinched or partially broken wires.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 3

### 3. VERIFY THE BCM IS PROGRAMMED WITH THE CORRECT COUNTRY CODE SETTING

With the scan tool in BCM, check the country code setting.

**Is the BCM programmed with the correct country code setting?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Program the BCM with the correct country code setting.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

## *INTRUSION TRANSCEIVER MODULE SENSITIVITY (EXPORT ONLY)

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| INTRUSION TRANSCEIVER MODULE (ITM) PROGRAMMED WITH INCORRECT INTERIOR TYPE |

## Diagnostic Test

### 1. VERIFY THE ITM IS PROGRAMMED WITH THE CORRECT INTERIOR TYPE

With the scan tool, verify that the ITM is programmed with the correct interior type.

**Is the ITM programmed with the correct Interior Type?**

**Yes** >> Test Complete.

**No** >> Program the ITM with the correct interior type.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## *LEFT REAR DOOR DOES NOT TRIP VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| LEFT REAR DOOR AJAR CIRCUIT |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. CHECK LEFT REAR DOOR AJAR SWITCH FUNCTION

Verify that the lighting control on the multi-function switch is not in the Interior Lamps Defeat position.

Open the left rear door while observing the interior lamps.

Close the left rear door while observing the interior lamps.

**Do the interior lamps function correctly with regard to the door position?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

### 2. CHECK DRIVER DOOR AJAR SWITCH STATUS WITH THE SCAN TOOL

**NOTE: The VTSS must arm properly for the result of this test to be valid.**

Turn the ignition on.

Open the driver door.

With the scan tool in BCM, select Data Display and read the Door Ajar Switch status for the left rear door.

**Does the scan tool display: CLOSED?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

## *RIGHT REAR DOOR DOES NOT TRIP VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| RIGHT REAR DOOR AJAR CIRCUIT MALFUNCTION |
| BODY CONTROL MODULE (BCM) |

### Diagnostic Test

#### 1. CHECK RIGHT REAR DOOR AJAR SWITCH FUNCTION

Verify that the lighting control on the multi-function switch is not in the Interior Lamps Defeat position.

Open the right rear door while observing the interior lamps.

Close the right rear door while observing the interior lamps.

**Do the interior lamps function correctly with regard to the door position?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

#### 2. CHECK RIGHT REAR DOOR AJAR SWITCH STATUS WITH THE SCAN TOOL

**NOTE: The VTSS must arm properly for the result of this test to be valid.**

Turn the ignition on.

Open the right rear door.

With the scan tool in BCM, select Data Display and read the Door Ajar Switch status for the right rear door.

**Does the scan tool display: CLOSED?**

**Yes** >> Replace and program the BCM in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

## *TAILGATE DOES NOT TRIP VTSS

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| TAILGATE AJAR SWITCH CIRCUIT |
| BODY CONTROL MODULE (BCM) |

Refer to **(ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING)** for Ajar Switch related diagnostic procedures.

## *VTSS WILL NOT ARM

For a complete wiring diagram **Refer to Section 8W**

| Possible Causes |
|---|
| VEHICLE THEFT SECURITY SYSTEM (VTSS) DISABLED IN BODY CONTROL MODULE (BCM) |
| BODY CONTROL MODULE (BCM) DTCS PRESENT |
| AJAR SWITCH CIRCUITS |
| BODY CONTROL MODULE (BCM) |

## Diagnostic Test

### 1. VERIFY THAT VTSS IS ENABLED IN THE BCM

Turn the ignition on.

With the scan tool in BCM, check that the VTSS is enabled.

**Is the VTSS enabled?**

**Yes** >> Go To 2

**No** >> With the scan tool, enable the VTSS.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

### 2. CHECK FOR DTCs IN THE BCM

With the scan tool, read BCM DTCs.

**Does the scan tool display any DTCs?**

**Yes** >> Diagnose and repair the DTC(s) Refer to the Table of Contents in the applicable Section for the diagnostic procedure(s).

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Go To 3

### 3. CHECK AJAR SWITCH STATES WITH THE SCAN TOOL

Verify that the tailgate, flip-up glass, and all doors are closed.

With the scan tool in BCM, select Data Display and read the Ajar Switch states.

**Do any Ajar Switch states display: Closed?**

**Yes** >> Diagnose and repair all Ajar Switch circuits that display as Closed on the scan tool. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - DIAGNOSIS AND TESTING) for Ajar Switch related diagnostic procedures.

Perform VTSS VERIFICATION TEST - 1A. (Refer to VTSS VERIFICATION TEST - 1A - STANDARD PROCEDURE) in this Section.

**No** >> Replace and program the BCM in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## INTERMITTENT CONDITION

| POSSIBLE CAUSES |
|---|
| INTERMITTENT CONDITION |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

**NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.**

**WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.**

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Freeze Frame information. If possible, try to duplicate the conditions under which the DTC set.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wire harness. Look for parameter values to change and/or a DTC to set.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Perform a voltage drop test on the related circuits between the suspected inoperative component and the PCM.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Inspect and clean all PCM, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits.

For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.

For intermittent Evaporative Emission trouble codes perform a visual and physical inspection of the related parts including hoses and the Fuel Filler cap.

For intermittent Misfire DTCs check for restrictions in the Intake and Exhaust system, proper installation of Sensors, vacuum leaks, and binding components that are run by the accessory drive belt.

Use the scan tool to perform a System Test if one applies to failing component.

A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

**Were any problems found during the above inspections?**

**Yes** >> Perform the necessary repairs.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Test Complete.

## STANDARD PROCEDURE

## SKREEM/SKIM VERIFICATION

For a complete wiring diagram **Refer to Section 8W**.

### Diagnostic Test

### 1. SKREEM/SKIM VERIFICATION

**NOTE: When entering the PIN, care should be taken because the SKREEM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKREEM will Lock Out the scan tool. To exit Lock Mode, the ignition key must remain the Run position for I hour. All accessories must be off. A battery charger connected to the battery during this time period is recommended.**

**NOTE: On vehicles equipped with a premium Tire Pressure Monitoring (TPM) system, when the SKREEM and/or the spare tire pressure sensor is replaced with a new unit, a diagnostic scan tool MUST be used to run a routine that allows the SKREEM to be programmed with the ID number and location of the spare tire pressure sensor mounted in the wheel of the spare tire. Follow the programming steps outlined in the diagnostic scan tool for "Learn Spare Tire Sensor ID" under "Miscellaneous Functions" for the "WCM/Wireless Control Module" menu item as appropriate. In addition, if the SKREEM is replaced, the spare tire must be dismounted from its wheel to access and note the ID number on the spare tire pressure sensor so that the ID code for that sensor can be programmed into the new SKREEM.**

1. Reconnect the previously disconnected components and connectors.
2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKREEM. This number can be obtained from the vehicle invoice or from the DaimlerChrysler Customer Center (Phone 1-800-992-1997).
3. With the scan tool, select Miscellaneous Functions, WCM/Wireless Control Module. Then select the desired procedure and follow the display on the scan tool.
4. If the vehicle is equipped with Tire Pressure Monitoring System program the Palcard Pressure Values into the WCM/SKREEM.
5. Ensure all the customer's key have been programmed into the new module if necessary.
6. With the scan tool, ease all DTCs. Perform 5 ignition key cycles, leaving the key on for at least 90 seconds per cycle.
7. With the scan tool, read SKREEM DTC(s).
8.

**NOTE: If this vehicle is equipped with a Steering Column Lock Module, it must be replaced along with the SKREEM.**

**Are there any SKREEM DTC(s) present?**

**Yes** >> Repair not complete, refer to the appropriate symptom.

**No** >> Repair is complete.

# VTSS VERIFICATION TEST - 1A

## Diagnostic Test

### 1. Perform VTSS Verification Test

1. Open the driver door and roll down the window.
2. Remove the ignition key (but keep in hand).
3. Lock the doors with RKE transmitter or power door lock switch.
4. Ensure all doors, tailgate, and tailgate flip-up glass are closed.
5. If the VTSS Indicator Lamp flashes rapidly and after approximately 16 seconds changes to a slower flash, the system is operational. However, If the indicator fails to flash as described, there is a problem with the system.

**Does the VTSS Indicator Lamp flash as specified?**

**Yes** >> The repair is complete.

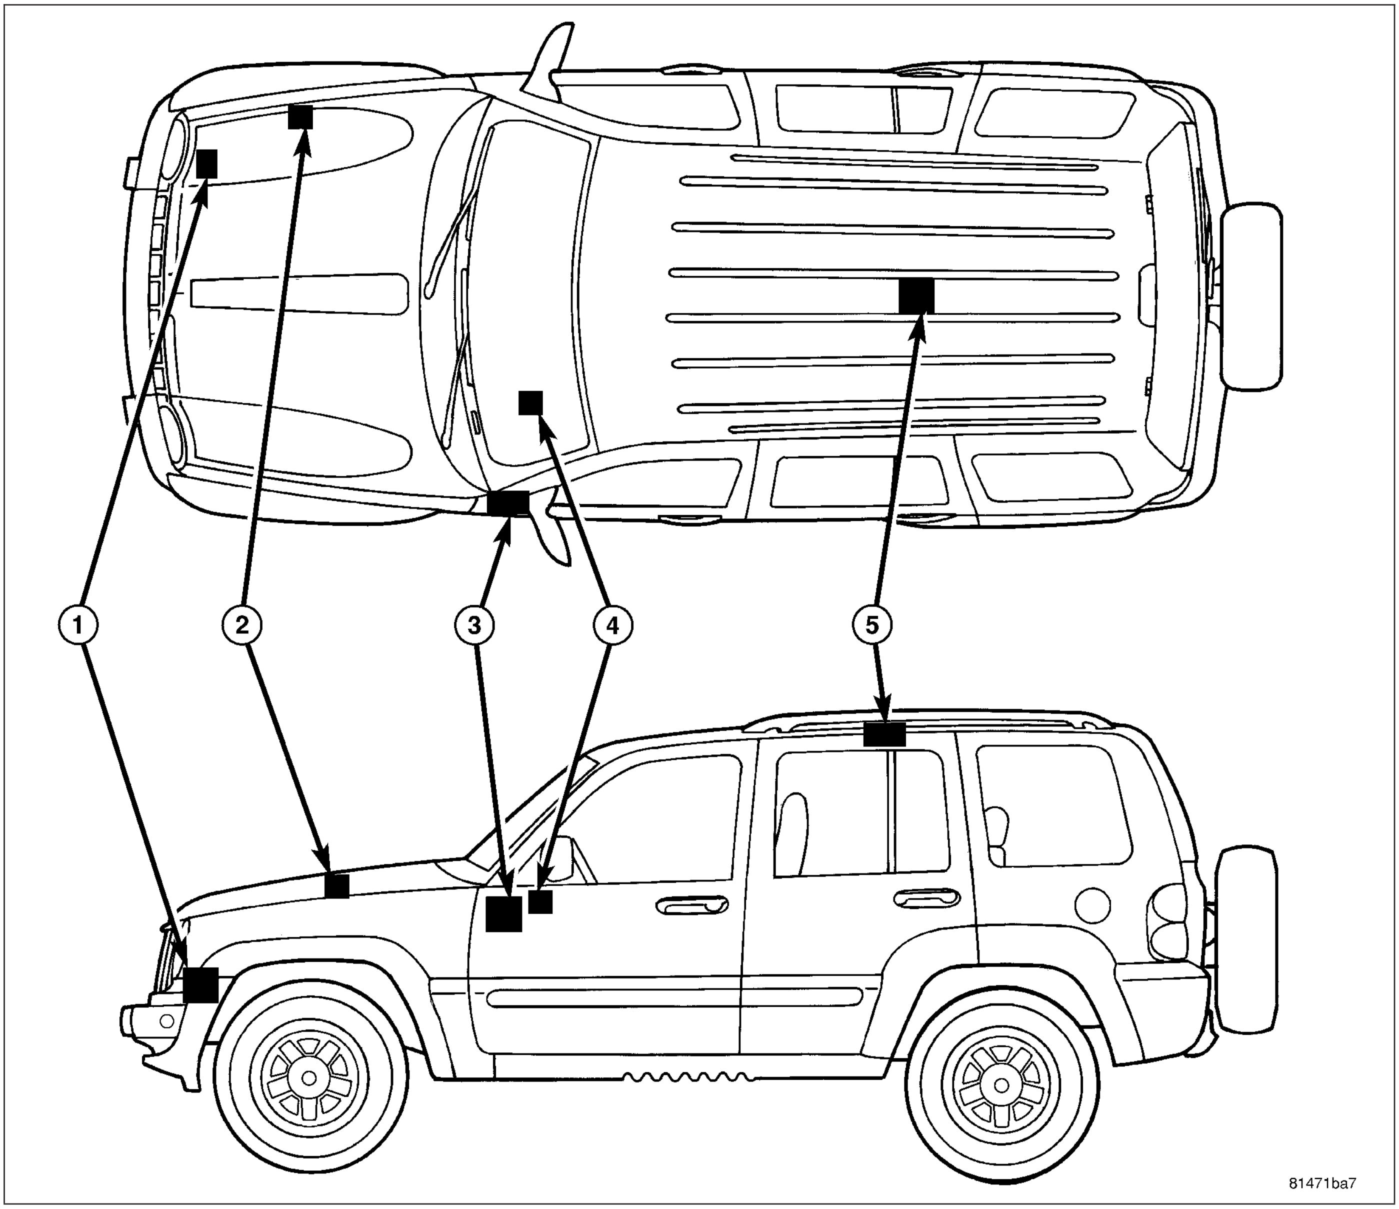
**No** >> Diagnose and repair the DTC or symptom that is still present. Refer to the Table of Contents in this Section for a complete list of VTSS symptoms.

# VEHICLE THEFT SECURITY - SERVICE INFORMATION

## TABLE OF CONTENTS

# VEHICLE THEFT SECURITY - SERVICE INFORMATION

## DESCRIPTION



The Vehicle Theft Security System (VTSS) is an available factory-installed option on this vehicle. The VTSS is comprised of two primary subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS).

The VTA is an active system that provides visual and audible responses as deterrents to and warnings of unauthorized vehicle tampering. The SKIS is a passive system that effectively immobilizes the vehicle against unauthorized operation. Following are paragraphs which describe the various components that are included in each of these subsystems of the VTSS.

Except for the Sentry Key transponders, which rely upon Radio Frequency (RF) communication, hard wired circuitry connects the VTA and SKIS components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the SKIS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

### VEHICLE THEFT ALARM

The VTA is available in two different configurations for this vehicle: One configuration is designed for vehicles manufactured for sale in North America; while, the other configuration is designed for vehicles manufactured for sale in markets outside of North America, also referred to as Rest-Of-World (ROW) or export. In addition, the VTA for export is available in two versions: base and premium. All vehicles equipped with VTA are also equipped with the Remote Keyless Entry (RKE) system and the Sentry Key Immobilizer System (SKIS), regardless of their market destination.

The North American and export base version of the VTA provides perimeter vehicle protection by monitoring the vehicle doors, the tailgate, the rear flip-up glass and, for vehicles built for certain markets where it is required equipment, the hood. If unauthorized vehicle use or tampering is detected, these systems respond by pulsing the horn and flashing certain exterior lamps.

The export premium version of the VTA is only available in vehicles manufactured for sale in certain markets where it is required equipment. The export premium version of the VTA provides the same perimeter protection features as the base version, but adds interior vehicle intrusion protection. The export premium VTA also replaces the pulsing horn feature of the base version with an alarm siren as the audible deterrent, while retaining the flashing exterior lamps visual deterrent.

The VTA includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module (3)** - The Body Control Module (BCM) is located on the Junction Block (JB) behind the driver side end of the instrument panel. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ BODY CONTROL MODULE - DESCRIPTION).
- **Combination Flasher** - An electronic combination flasher is integral to the hazard switch located in the center of the instrument panel above the radio. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/COMBINATION FLASHER - DESCRIPTION).
- **Door Ajar Switches** - A door ajar switch is integral to the latch of each door in the vehicle. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOOR AJAR SWITCH - DESCRIPTION).
- **Flip-Up Glass Ajar Switch** - A flip-up glass ajar switch is integral to the rear flip-up glass latch, located on the top of the tailgate near the center. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/FLIP-UP GLASS AJAR SWITCH - DESCRIPTION).
- **Hood Ajar Switch (2)** - A hood ajar switch is located on the right inner fender side shield of Export vehicles built for sale in markets where it is required equipment. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/HOOD AJAR SWITCH - DESCRIPTION).
- **Horn Relay** - The horn relay is located on the Junction Block (JB) behind the driver side end of the instrument panel. (Refer to 8 - ELECTRICAL/HORN/HORN RELAY - DESCRIPTION).
- **Intrusion Transceiver Module (5)** - An Intrusion Transceiver Module (ITM) is located near the center of the headliner in the passenger compartment of Export vehicles built for sale in markets where it is required equipment. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/UK SECURITY SYSTEM MODULE - DESCRIPTION).
- **Security Indicator** - A security indicator is integral to the ElectroMechanical Instrument Cluster (EMIC). (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/SECURITY INDICATOR - DESCRIPTION).
- **Siren (1)** - An alarm siren is located on the front of the right front wheel house panel in the engine compartment of Export vehicles built for sale in markets where it is required equipment. (Refer to 8 - ELECTRICAL/ VEHICLE THEFT SECURITY/SIREN - DESCRIPTION).
- **Tailgate Ajar Switch** - A tailgate ajar switch is integral to the latch for the tailgate in the vehicle. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/TAILGATE AJAR SWITCH - DESCRIPTION).

### SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is available as a factory-installed option on this vehicle. Vehicles equipped with the Vehicle Theft Alarm (VTA) are also equipped with SKIS. The SKIS provides passive vehicle protection by preventing the engine from operating unless a valid electronically encoded key is detected in the ignition lock cylinder.

The SKIS includes the following major components, which are described in further detail elsewhere in this service information:

- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located on the left inner fender shield in the engine compartment. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION).
- **Sentry Key Remote Entry Module (4)** - The Sentry Key REmote Entry Module (SKREEM) is sometimes referred to as the Wireless Control Module (WCM). The SKREEM is located on the right side of the steering column near the ignition lock cylinder housing and an integral molded plastic antenna ring circles the ignition lock cylinder like a halo. The SKREEM and its antenna are concealed beneath the steering column shrouds. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/SENTRY KEY REMOTE ENTRY MODULE - DESCRIPTION).
- **Sentry Key Transponder** - The Sentry Key transponder is contained within the Remote Keyless Entry (RKE) transmitter on the ignition key. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/TRANSPONDER KEY - DESCRIPTION).
- **Security Indicator** - A security indicator is integral to the ElectroMechanical Instrument Cluster (EMIC). (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/SECURITY INDICATOR - DESCRIPTION).

## OPERATION

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). Following are paragraphs that briefly describe the operation of each of these two subsystems.

## VEHICLE THEFT ALARM

The Body Control Module (BCM) is used on this vehicle to control and integrate many of the electronic functions and features included in the Vehicle Theft Alarm (VTA). In the VTA system, the BCM receives inputs indicating the status of the door ajar switches, the ignition switch, the tailgate ajar switch, the flip-up glass ajar switch, the power lock switches and, in vehicles built for certain markets where it is required, the hood ajar switch.

The BCM will process the information from all of these inputs and send control outputs to energize or de-energize the combination flasher, the horn relay (except vehicles with the export premium version of the VTA), and the security indicator as appropriate. In addition, in vehicles built for certain markets where the export premium version of the VTA is required, the BCM also exchanges electronic messages with the Intrusion Transceiver Module (ITM) over the Programmable Communications Interface (PCI) data bus to provide the features found in this version of the VTA.

The hard wired circuits and components of the VTA may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the BCM, the EMIC, the ITM, the PCI data bus or the electronic message inputs used to provide the electronic features of the VTA. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the ITM, the PCI data bus, and the electronic message inputs for the VTA requires the use of a diagnostic scan tool. See the “Vehicle Theft Security System” menu item on the scan tool. Refer to the appropriate diagnostic information.

Following are paragraphs that briefly describe the operation of each of the VTA features. See the owner’s manual in the vehicle glove box for more information on the features, use and operation of the VTA.

### ENABLING

The BCM must have the VTA function electronically enabled in order for the VTA to perform as designed. The logic in the BCM keeps its VTA function dormant until it is enabled using a diagnostic scan tool. The VTA function of the BCM is enabled on vehicles equipped with the VTA option at the factory, but a service replacement BCM must be VTA-enabled by the dealer using a diagnostic scan tool. Refer to the appropriate diagnostic information.

### PRE-ARMING

The VTA has a pre-arming sequence. Pre-arming is initiated when a door, the tailgate, or the flip-up glass is open when the vehicle is locked using a power door lock switch, or when the Remote Keyless Entry (RKE) transmitter “Lock” button is depressed. Pre-arming will not occur if the key is in the ignition switch or the headlamps are turned on with the driver side front door open. When the VTA is pre-armed, the arming sequence is delayed until all of the doors, the tailgate and the flip-up glass have been closed. The VTA will remain in “Pre-Armed” mode for up to sixteen seconds after all doors, the tailgate and the flip-up glass have been closed.

### ARMING

Passive arming of the VTA occurs when the vehicle is exited with the key removed from the ignition switch, the headlamps are turned off, and the doors are locked while they are open using the power lock switch. Active arming occurs when the LOCK button on the RKE transmitter is depressed to lock the vehicle after all of the doors, the tailgate and the flip-up glass are closed. For active arming to occur, the doors, the tailgate and the flip-up glass must be closed and the ignition switch must be in the OFF position when the RKE transmitter LOCK button is depressed. The power lock switch will not function if the key is in the ignition switch or the headlamps are turned on with the driver side front door open.

Once the VTA begins the passive or active arming sequence, the security indicator in the instrument cluster will flash rapidly for about sixteen seconds. This indicates that VTA arming is in progress. If the ignition switch is turned to the ON position, if a door or the tailgate is unlocked and opened by any means, or the RKE PANIC button (if equipped) is depressed during the sixteen second arming process, the security indicator will stop flashing and the arming process will abort.

On vehicles equipped with the hood ajar switch, the VTA arming sequence will occur regardless of whether the hood is open or closed, but the underhood area will not be protected unless the hood is closed when the VTA arming sequence begins. Also, if the status of the hood ajar switch changes from open to closed during the sixteen second arming process, the security indicator will stop flashing and the VTA arming sequence will abort. Once the sixteen second arming process is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

### DISARMING

For vehicles built for the North American market, passive disarming of the VTA occurs by turning the ignition switch to the ON position using a valid Sentry Key Immobilizer System (SKIS) key. Active disarming of the VTA for any market occurs when the vehicle is unlocked by depressing the UNLOCK button of the RKE transmitter. Once the alarm has been activated, either disarming method will also deactivate the alarm. Depressing the PANIC button (if equipped) on the RKE transmitter will **not** disarm the VTA.

### POWER-UP MODE

When the armed VTA senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode the alarm system remains armed following a battery failure or disconnect. If the VTA was armed prior to a battery disconnect or failure, the technician or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed, and battery jump-starting is attempted. The VTA will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTA is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

### ALARM

The VTA alarm output varies by the version of the VTA with which the vehicle is equipped. In all cases, the alarm provides both visual and audible outputs; however, the time intervals of these outputs vary by the requirements of the market for which the vehicle is manufactured. In all cases, the visual output will be a flashing on and off of the exterior lamps. For vehicles equipped with the North American or the export base version of the VTA, the audible output will be a pulsing of the horn. For vehicles with the export premium version of the VTA, the audible output will be a cycling of the alarm siren. See the owner's manual in the vehicle glove box for details of the alarm output requirements of the specific market for which the vehicle was manufactured. The inputs that will trigger the alarm include the door ajar switches, the tailgate ajar switch, the flip-up glass ajar switch, and in vehicles built for certain markets where they are required, the hood ajar switch and the Intrusion Transceiver Module (ITM).

### TAMPER ALERT

The VTA tamper alert feature will pulse the horn (or the alarm siren for the export premium version of the VTA) three times upon VTA disarming, if the alarm was triggered and has since timed-out, or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator that the VTA alarm was activated while the vehicle was unattended.

#### INTRUSION ALARM

The intrusion alarm is an exclusive feature of the export premium version of the VTA, which is only available in certain markets where it is required. When the VTA is armed, a motion sensor in the Intrusion Transceiver Module (ITM) monitors the interior of the vehicle for movement. If motion is detected, the ITM sends an electronic message to the BCM over the PCI data bus to invoke the visual alarm feature, and sends an electronic message to the alarm siren in the engine compartment over a dedicated serial bus to invoke the audible alarm feature. The motion detect feature of the ITM can be disabled by depressing the “Lock” button on the RKE transmitter three times within fifteen seconds during VTA arming, while the security indicator is still flashing rapidly. The VTA provides a single short siren “chirp” as an audible confirmation that the motion detect disable request has been received.

The ITM must be electronically enabled in order for the intrusion alarm to perform as designed. The logic in the ITM keeps its intrusion alarm function dormant until it is enabled using a diagnostic scan tool. The intrusion alarm function of the ITM is enabled on vehicles equipped with this option at the factory, but a service replacement ITM must be configured and enabled by the dealer using a diagnostic scan tool. Refer to the appropriate diagnostic information.

### SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by disabling the engine after about two seconds of running, whenever any method other than a valid Sentry Key is used to start the vehicle. The SKIS is considered a passive protection system because it is always active when the ignition system is energized and does not require any customer intervention. The SKIS uses Radio Frequency (RF) communication to obtain confirmation that the key in the ignition switch is a valid key for operating the vehicle. The microprocessor-based SKIS hardware and software also uses electronic messages to communicate with other electronic modules in the vehicle over the Programmable Communications Interface (PCI) data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

Pre-programmed Sentry Key transponders are provided with the vehicle from the factory. Each Sentry REmote Entry Module (SKREEM) will recognize a maximum of eight Sentry Keys. If the customer would like additional keys other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional keys must be programmed to the SKREEM in the vehicle in order for the system to recognize them as valid keys. This can be done by the dealer using a diagnostic scan tool or, if Customer Learn programming is an available SKIS feature in the market where the vehicle was purchased, the customer can program the additional keys, as long as at least two valid Sentry Keys are already available. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE - TRANSPONDER PROGRAMMING).

The SKREEM performs a self-test of the SKIS each time the ignition switch is turned to the ON position, and will store fault information in the form of a Diagnostic Trouble Code (DTC) if a system malfunction is detected. The SKIS can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic information.

## DIAGNOSIS AND TESTING

### VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Vehicle Theft Alarm (VTA) and Sentry Key Immobilizer System (SKIS). Following are the recommended procedures for diagnosis and testing of each of these two subsystems.

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

### VEHICLE THEFT ALARM

Models equipped with the export premium version of the Vehicle Theft Alarm (VTA) provide some preliminary diagnostic feedback by illuminating the security indicator located in the ElectroMechanical Instrument Cluster (EMIC). If the security indicator illuminates with the ignition switch in the On position, it indicates that there is a communication problem between the Intrusion Transceiver Module (ITM) and the Body Control Module (BCM), or between the ITM and the siren module. The BCM will also turn on the security indicator if it receives a message from the ITM indicating that the ITM has stored a Diagnostic Trouble Code (DTC) for a siren module fault.

The hard wired VTA circuits and components may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the Body Control Module (BCM), the ElectroMechanical Instrument Cluster (EMIC), the Intrusion Transceiver Module (ITM), the Programmable Communications Interface (PCI) data bus, or the electronic message inputs used to provide the electronic features of the VTA. The most reliable, efficient, and accurate means to diagnose the BCM, the EMIC, the ITM, the PCI data bus, and the electronic message inputs for the VTA requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## SENTRY KEY IMMOBILIZER SYSTEM

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired Sentry Key Immobilizer System (SKIS) components and circuits may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the Sentry Key REmote Entry Module (SKREEM), the ElectroMechanical Instrument Cluster (EMIC), the Powertrain Control Module (PCM), the Programmable Communications Interface (PCI) data bus, or the electronic message inputs used to provide the electronic features of the SKIS. The most reliable, efficient, and accurate means to diagnose the SKREEM, the EMIC, the PCM, the CAN data bus, and the electronic message inputs for the SKIS requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

**SENTRY KEY IMMOBILIZER SYSTEM DIAGNOSIS**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SECURITY INDICATOR FAILS TO LIGHT DURING BULB TEST | 1. Light-Emitting Diode (LED) inoperative. | 1. Perform the instrument cluster actuator test. (Refer to 8 - ELECTRICAL/ INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING - ACTUATOR TEST). |
| | 2. Fuse inoperative. | 2. Check the SKREEM fused B(+) fuse and the fused ignition switch output (run-start) fuse in the Junction Block (JB). Replace fuses, if required. |
| | 3. Ground path inoperative. | 3. Check for continuity to ground at the connector for the SKREEM. Repair wiring, if required. |
| | 4. Battery feed inoperative. | 4. Check for battery voltage at the connector for the SKREEM. Repair wiring, if required. |
| | 5. Ignition feed inoperative. | 5. Check for battery voltage at the connector for the SKREEM with the ignition switch in the ON position. Repair wiring, if required. |

| SENTRY KEY IMMOBILIZER SYSTEM DIAGNOSIS | | |
|---|---|---|
| **CONDITION** | **POSSIBLE CAUSES** | **CORRECTION** |
| SECURITY INDICATOR FLASHES FOLLOWING BULB TEST | 1. Invalid key in ignition switch lock cylinder. | 1. Replace the key with a known valid key. |
| | 2. Key-related fault. | 2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis. |
| SECURITY INDICATOR LIGHTS SOLID FOLLOWING BULB TEST | 1. SKIS system malfunction/ fault detected. | 1. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis. |
| | 2. SKIS system inoperative. | 2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis. |

## STANDARD PROCEDURE

## SKIS INITIALIZATION

The Sentry Key Immobilizer System (SKIS) must be initialized following a Sentry Key REmote Entry Module (SKREEM) replacement. SKIS initialization requires the use of a diagnostic scan tool. Initialization will also require that you have access to the unique four-digit PIN code that was assigned to the original SKREEM. The PIN code **must** be used to enter the Secured Access Mode in the SKREEM. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice, or from the DaimlerChrysler Customer Center. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE - PCM/SKREEM PROGRAMMING).

**NOTE: If a Powertrain Control Module (PCM) is replaced on a vehicle equipped with the Sentry Key Immobilizer System (SKIS), the unique Secret Key data must be transferred from the Sentry Key REmote Entry Module (SKREEM) to the new PCM using the PCM replacement procedure. This procedure also requires the use of a diagnostic scan tool and the unique four-digit PIN code to enter the Secured Access Mode in the SKREEM. Refer to the appropriate diagnostic information for the proper PCM replacement procedures.**

## SENTRY KEY TRANSPONDER PROGRAMMING

All Sentry Keys included with the vehicle are pre-programmed to work with the Sentry Key Immobilizer System (SKIS) when it is shipped from the factory. The Sentry Key REmote Entry Module (SKREEM) can be programmed to recognize up to a total of eight Sentry Keys. When programming a blank Sentry Key transponder, the key must first be cut to match the ignition switch lock cylinder in the vehicle for which it will be used. Once the additional or new key has been cut, the SKREEM must be programmed to recognize it as a valid key. There are two possible methods to program the SKREEM to recognize a new or additional valid key, the Secured Access Method and the Customer Learn Method. Following are the details of these two programming methods.

### SECURED ACCESS METHOD

The Secured Access method applies to all vehicles. This method requires the use of a diagnostic scan tool. This method will also require that you have access to the unique four-digit PIN code that was assigned to the original SKREEM. The PIN code **must** be used to enter the Secured Access Mode in the SKREEM. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice, or from the DaimlerChrysler Customer Center. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE - PCM/SKREEM PROGRAMMING).

### CUSTOMER LEARN METHOD

The Customer Learn feature is only available on domestic vehicles, or those vehicles which have a U.S. country code designator. This programming method also requires access to at least two valid Sentry Keys. If two valid Sentry Keys are not available, or if the vehicle does not have a U.S. country code designator, the Secured Access Method **must** be used to program new or additional valid keys to the SKREEM. The Customer Learn programming method procedures are as follows:

1. Obtain the blank Sentry Key(s) that are to be programmed as valid keys for the vehicle. Cut the blank key(s) to match the ignition switch lock cylinder mechanical key codes.
2. Insert one of the two valid Sentry Keys into the ignition switch and turn the ignition switch to the ON position.
3. After the ignition switch has been in the ON position for longer than three seconds, but no more than fifteen seconds, cycle the ignition switch back to the OFF position. Replace the first valid Sentry Key in the ignition switch lock cylinder with the second valid Sentry Key and turn the ignition switch back to the ON position. The second valid Sentry Key must be inserted in the lock cylinder within fifteen seconds of removing the first valid key.
4. About ten seconds after the completion of Step 3, the security indicator in the instrument cluster will start to flash and a single audible chime will sound to indicate that the system has entered the Customer Learn programming mode.
5. Within sixty seconds of entering the Customer Learn programming mode, turn the ignition switch to the OFF position, replace the valid Sentry Key with a blank Sentry Key transponder, and turn the ignition switch back to the ON position.
6. About ten seconds after the completion of Step 5, a single audible chime will sound and the security indicator will stop flashing, stay on solid for three seconds, then turn off to indicate that the blank Sentry Key has been successfully programmed. The SKIS will immediately exit the Customer Learn programming mode. After the ignition is cycled the vehicle may be started using the newly programmed valid Sentry Key.

Each of these steps must be repeated and completed in their entirety for each additional Sentry Key that is to be programmed. If the above steps are not completed in the given sequence, or within the allotted time, the SKIS will exit the Customer Learn programming mode and the programming will be unsuccessful. The SKREEM will also automatically exit the Customer Learn programming mode if it sees a non-blank Sentry Key transponder when it should see a blank, if it has already programmed eight (8) valid Sentry Keys, or if the ignition switch is turned to the OFF position for more than about fifty seconds.

**NOTE: If an attempt is made to start the vehicle while in the Customer Learn mode (security indicator flashing), the SKIS will respond as though the vehicle were being started with an invalid key. In other words, the engine will stall after about two seconds of operation. No faults will be set.**

**NOTE: Once a Sentry Key has been programmed as a valid key to a vehicle, it cannot be programmed as a valid key for use on any other vehicle.**

## SPECIFICATIONS

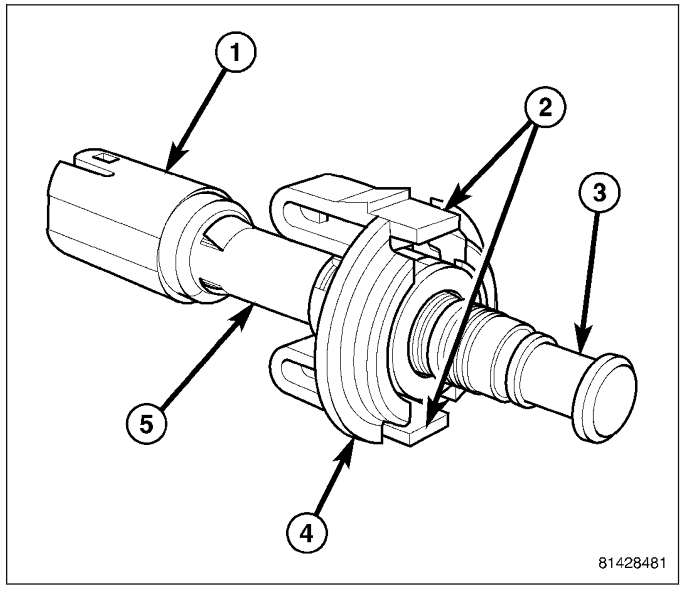
# HOOD AJAR SWITCH

## DESCRIPTION

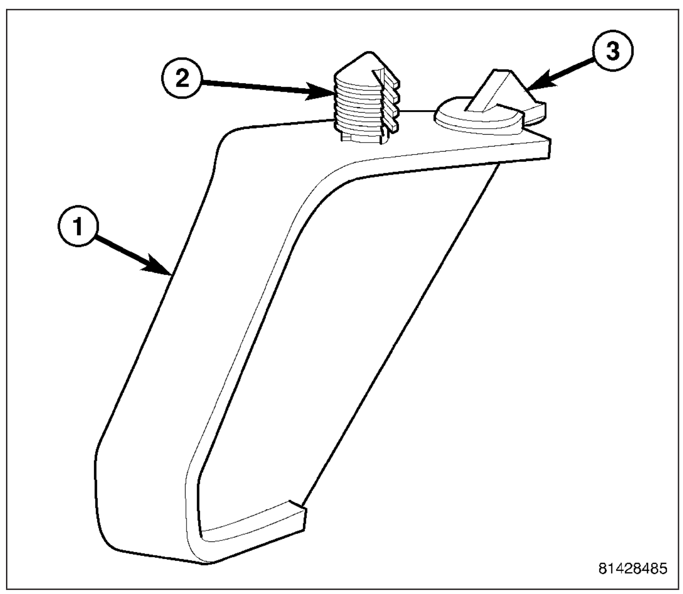
The hood ajar switch is a normally closed, single pole, spring-loaded plunger actuated switch that is used only on vehicles equipped with the Vehicle Theft Security System (VTSS) for sale in certain export markets where it is required equipment. The molded plastic switch body (5) has an integral molded connector receptacle (1) on the lower end containing two terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the headlamp and dash wire harness.



The switch plunger (3) extends through a mounting collar (4) and sleeve on the upper end of the switch body. The sleeve has a one-time, self-adjustment feature that is activated after the switch is installed by closing the hood. Two integral latches (2) lock the switch into a keyed mounting hole in the stamped steel switch mounting bracket. The mounting bracket is secured with screws to the right inner fender shield near the fender ledge in the engine compartment.

A molded plastic striker (1) with an integral retainer (2) and mounting tab (3) is secured to the underside of the hood panel inner reinforcement to actuate the switch plunger as the hood panel is closed.

An installed hood ajar switch cannot be readjusted or repaired. If the switch is damaged, inoperative, or requires readjustment, it must be replaced with a new unit. The hood ajar switch striker is not intended for reuse. If the striker is removed from the hood inner reinforcement for any reason, it must be replaced with a new unit.



## OPERATION

The hood ajar switch is a normally closed switch that is held open as the spring-loaded switch plunger is depressed by the striker on the hood panel when the hood panel is closed and latched. When the hood is opened, the spring-loaded switch plunger extends from the switch body and the switch contacts are closed. The switch is connected in series between ground and the hood ajar switch sense input of the Body Control Module (BCM). The BCM uses an internal resistor pull up to monitor the state of the hood ajar switch contacts.

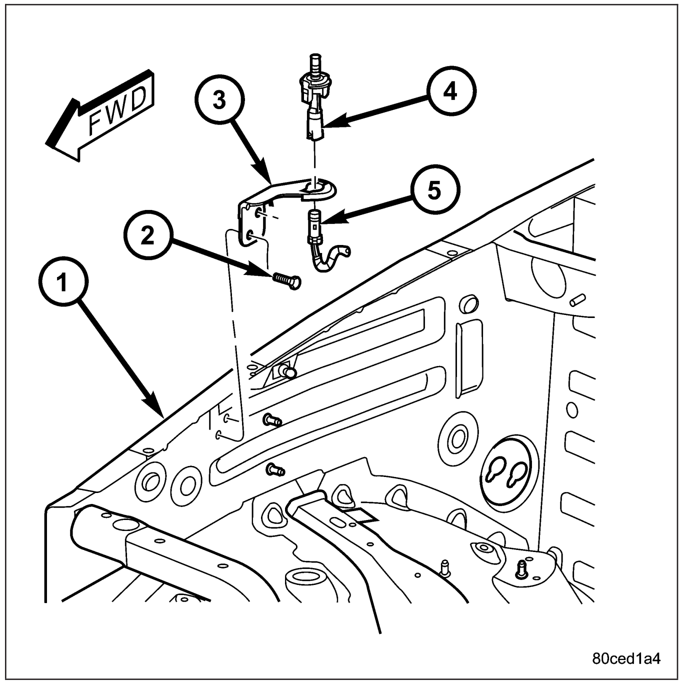
The components of the switch self-adjustment feature include an integral stop on the shaft of the plunger and a ribbed, ratcheting sleeve at the top of the switch body from which the plunger extends. With the switch mounting collar secured in its mounting bracket, the plunger is depressed by the striker on the hood inner reinforcement as the hood is closed. As the plunger is depressed, the plunger stop contacts the top of the sleeve and the sleeve is driven downward, ratcheting through the switch mounting collar until the hood is fully closed and latched. The ribs on the sleeve are engaged within the mounting collar to maintain this adjusted position.

The hood ajar switch and circuits may be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the BCM or its responses to the hood ajar switch input. The most reliable, efficient, and accurate means to diagnose the hood ajar switch, the BCM, and both the hard wired and electronic message inputs and outputs affected by the hood ajar switch input requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

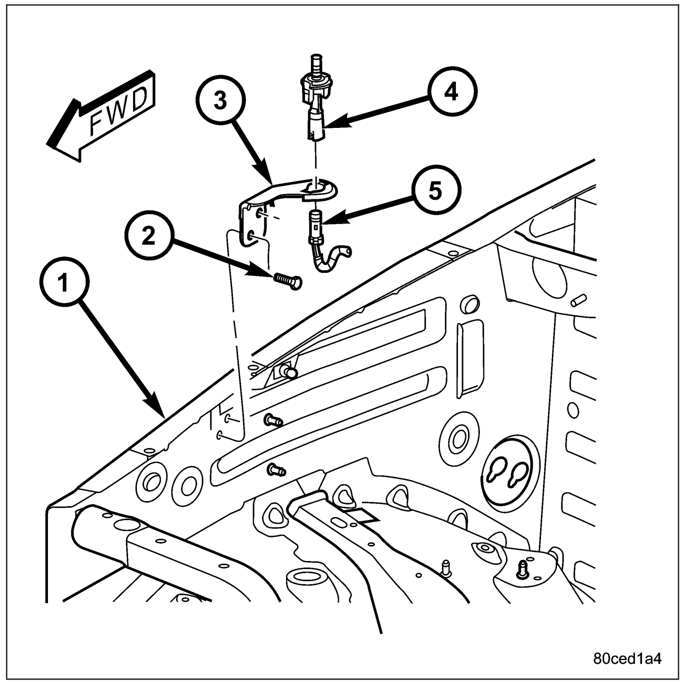
## SWITCH

1. Unlatch and open the hood.
2. Disconnect and isolate the battery negative cable.
3. From the top of the mounting bracket (3) on the right front fender inner shield (1), squeeze the two hood ajar switch (4) latch tabs together and pull the switch upward.
4. Pull the hood ajar switch up through the hole in the mounting bracket far enough to access and disconnect the wire harness connector (5) from the switch connector receptacle.
5. Remove the hood ajar switch from the mounting bracket.



## BRACKET

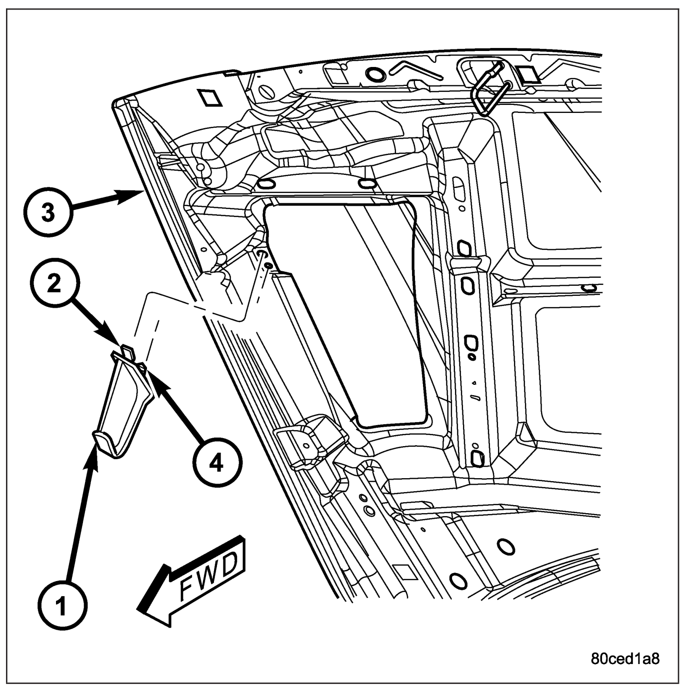
1. Remove the hood ajar switch (4) from the mounting bracket (3). (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/HOOD AJAR SWITCH - REMOVAL).
2. If necessary, remove and set aside the engine air cleaner housing for access to the hood ajar switch mounting bracket screws (2).
3. Remove the two screws that secure the hood ajar switch bracket to the right fender inner shield (1).
4. Remove the hood ajar switch bracket from the right fender inner shield.



## STRIKER

**NOTE: The hood ajar switch striker is not intended for reuse. If the striker is removed from the hood inner reinforcement for any reason, it must be replaced.**

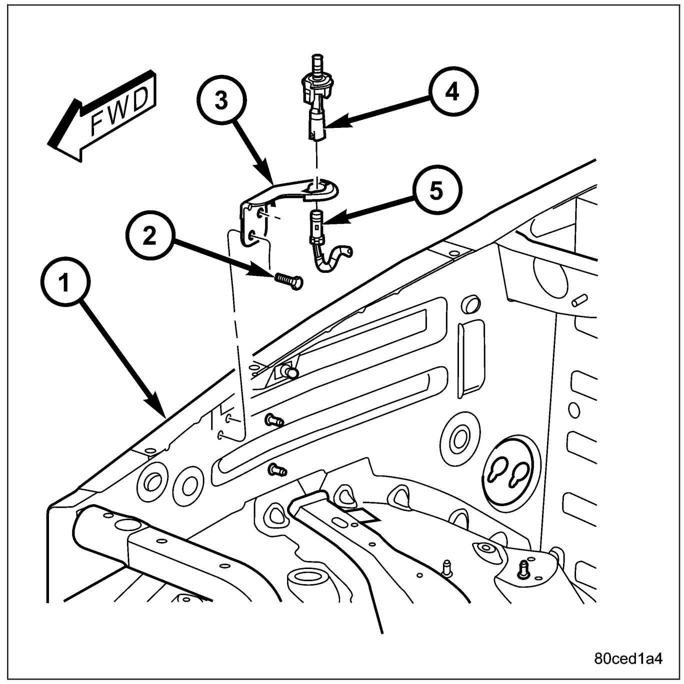
1. Unlatch and open the hood (3).
2. Using a trim stick or another suitable wide flat-bladed tool, pry the rearward end of the hood ajar switch striker (1) away from the inner hood panel reinforcement far enough to disengage the integral retainer (4) from its mounting hole.
3. Move the hood ajar switch striker slightly rearward to disengage the integral mounting tab (2) from the forward mounting hole.
4. Remove the hood ajar switch striker from the inner hood panel reinforcement and discard.



## INSTALLATION

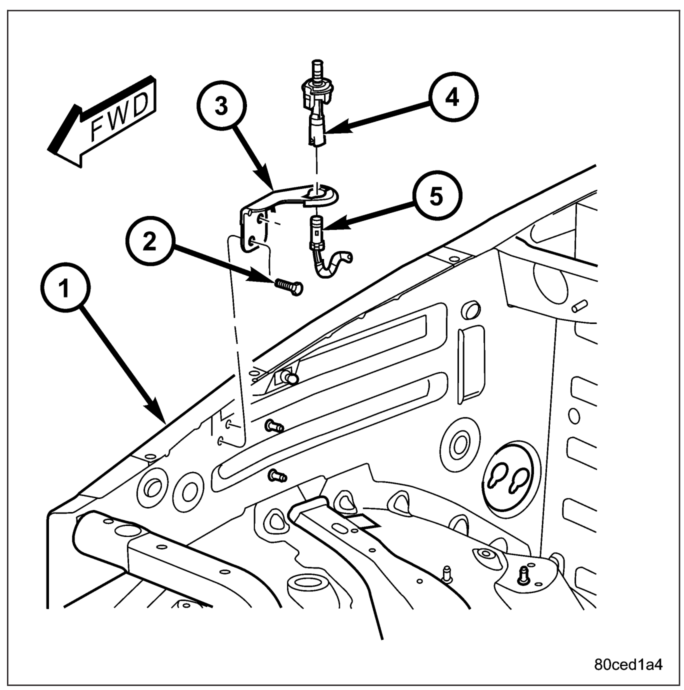
## SWITCH

1. Position the hood ajar switch (4) near the hole in the mounting bracket (3) on the right inner fender side shield (1).
2. Pull the wire harness connector (5) through the switch mounting bracket and reconnect it to the switch connector receptacle.
3. From the top of the mounting bracket, press the switch downward into the mounting hole until the integral switch latch tabs lock it into place.
4. Reconnect the battery negative cable.
5. Close and latch the hood.



## BRACKET

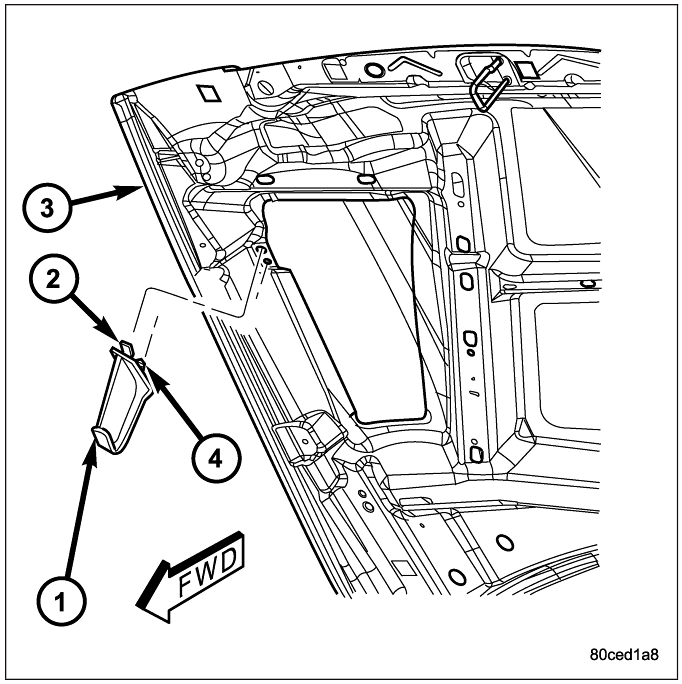
1. Position the hood ajar switch bracket (3) onto the right fender inner shield (1).
2. Install and tighten the two screws (2) that secure the hood ajar switch bracket to the right fender inner shield. Tighten the screws to 7 N·m (60 in. lbs.).
3. If removed, reinstall the engine air cleaner housing.
4. Reinstall the hood ajar switch (4) into the mounting bracket. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/HOOD AJAR SWITCH - INSTALLATION).



## STRIKER

**NOTE: The hood ajar switch striker is not intended for reuse. If the striker is removed from the hood inner reinforcement for any reason, it must be replaced.**

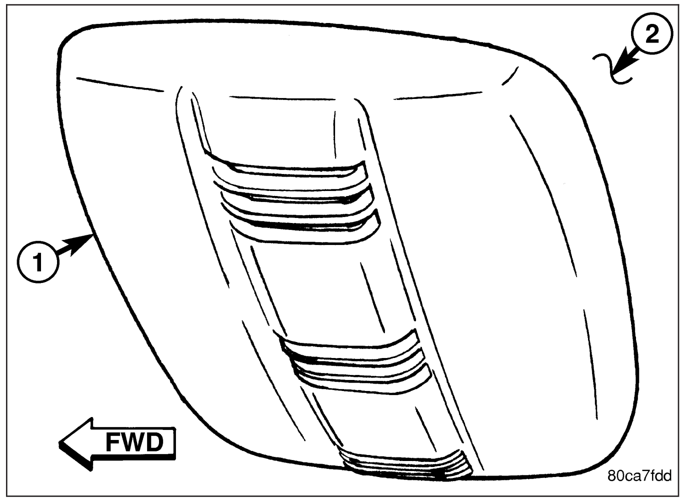
1. Position the new hood ajar switch striker (1) to the inner hood panel reinforcement (3).
2. Insert the mounting tab (2) on the front of the hood ajar switch striker into the forward mounting hole.
3. Align the retainer (4) on the rear of the hood ajar switch striker with the rearward mounting hole.
4. Using hand pressure, press the hood ajar switch striker rearward and upward against the inner hood panel reinforcement until the retainer is fully engaged in the rearward mounting hole.
5. Close and latch the hood.



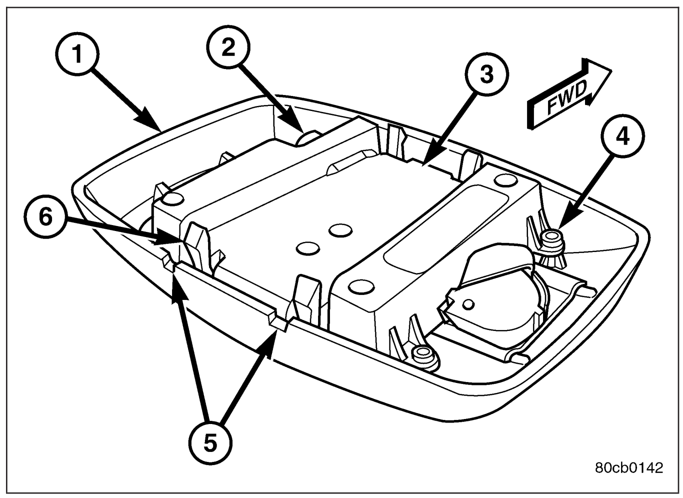
# UK SECURITY SYSTEM MODULE

## DESCRIPTION

An Intrusion Transceiver Module (ITM) (1) is part of the export premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The export premium version of the VTA is only available in vehicles built for certain export markets, where the additional features offered by this system are required. The ITM is located in the passenger compartment, on the lower surface of the headliner (2) near the center of the vehicle. This component is designed to provide interior motion detection, and serve as an interface between the Body Control Module (BCM) and the alarm siren module.



The ITM is concealed beneath a molded plastic trim cover (1) that approximates the size and shape of a typical dome lamp housing. Rather than a lens, the trim cover features three sets of louvered openings. Each of the louvered openings is covered on the inside by a single molded black plastic sight shield that extends the length of the center rib for appearance. The entire module is secured to a molded plastic mounting bracket above the headliner. Besides the ITM, the trim cover also conceals two plastic pins integral to the mounting bracket that are used to secure the bracket to the headliner with two stamped nuts that are installed from below. An adhesive-backed foam pad is installed above the ITM bracket between the headliner and the roof panel to provide additional headliner stabilization and support for the ITM mounting. Two small notch-like service holes (5) on the rear edge of the trim cover afford access to the two integral rear latches (6) of the ITM housing (3) for service removal.



Concealed within the housing is the electronic circuitry of the ITM which includes a microprocessor, and an ultrasonic receive transducer. A molded plastic connector receptacle (2) containing six terminal pins that is soldered to a small circuit board and extends through a clearance hole in the left front corner of the ITM housing, and an ultrasonic transmit transducer housing extends from the center of the right side of the ITM housing. Both the transmit transducer on the right side of the module and the receive transducer on the ITM circuit board are aimed through two small round holes in the sight shield of the trim cover. The ITM is connected to the vehicle electrical system by a wire harness that is integral to the headliner.

The ITM unit cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

## OPERATION

The microprocessor in the Intrusion Transceiver Module (ITM) contains the motion sensor logic circuits and controls all of the features of the export premium version of the Vehicle Theft Alarm (VTA). The ITM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with a diagnostic scan tool using the Programmable Communications Interface (PCI) data bus network. This method of communication is used by the ITM to communicate with the Body Control Module (BCM) and for diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel. The ITM also communicates with the alarm siren module over a dedicated serial bus circuit.

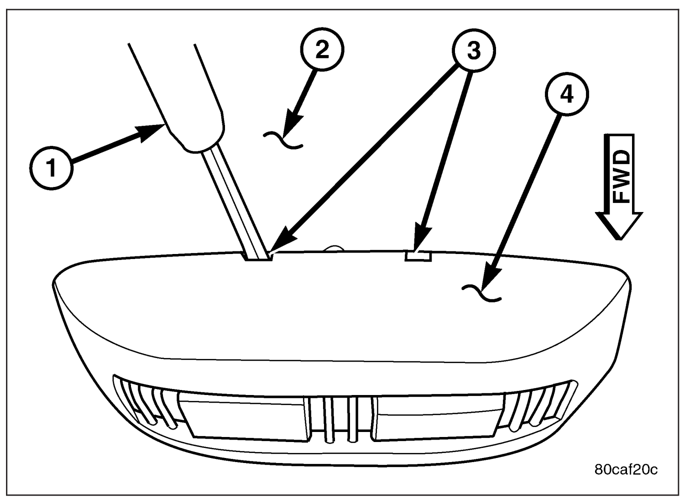
The ITM microprocessor continuously monitors inputs from its on-board motion sensor circuitry as well as inputs from the BCM and the alarm siren module. The on-board ITM motion sensor circuitry transmits ultrasonic signals into the vehicle cabin through a transmit transducer, then listens to the returning signals as they bounce off of objects in the vehicle interior. If an object is moving in the interior, a detection circuit in the ITM senses this movement through the modulation of the returning ultrasonic signals that occurs due to the Doppler effect. The motion detect function of the ITM can be disabled by depressing the “Lock” button on the Remote Keyless Entry (RKE) transmitter three times within fifteen seconds, while the VTA is arming (security indicator is still flashing rapidly). The ITM will signal the alarm siren module to provide a single siren “chirp” as an audible confirmation that the motion sensor function has been disabled.

If movement is detected, the ITM sends an electronic message to the BCM over the PCI data bus to flash the exterior lighting and sends an electronic message to the alarm siren module over a dedicated serial bus line to sound the siren. When the BCM detects a breach in the perimeter protection through a door, tailgate, flip-up glass, or hood ajar switch input, it sends an electronic message to the ITM and the ITM sends an electronic message to the BCM over the PCI data bus to flash the exterior lighting and sends an electronic message to the alarm siren module over a dedicated serial bus line to sound the siren. The ITM also monitors inputs from the alarm siren module for siren battery or siren input/output circuit tamper alerts, and for siren battery condition alerts, then sets an active or stored Diagnostic Trouble Code (DTC) for any monitored system faults it detects. An active fault only remains for the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the ITM. If a fault does not recur for fifty ignition cycles, the ITM will automatically erase the stored DTC.

The ITM is connected to the vehicle electrical system through the overhead wire harness. The ITM receives battery current through a fuse in the Junction Block (JB), and receives ground through the body wire harness from a ground screw located at the base of the left D-pillar behind the quarter trim panel. These connections allow the ITM to remain operational, regardless of the ignition switch position. The hard wired inputs and outputs for the ITM may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ITM, the PCI data bus, or the electronic message inputs to and outputs from the ITM. The most reliable, efficient, and accurate means to diagnose the ITM, the PCI data bus, and the electronic message inputs to and outputs from the ITM requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

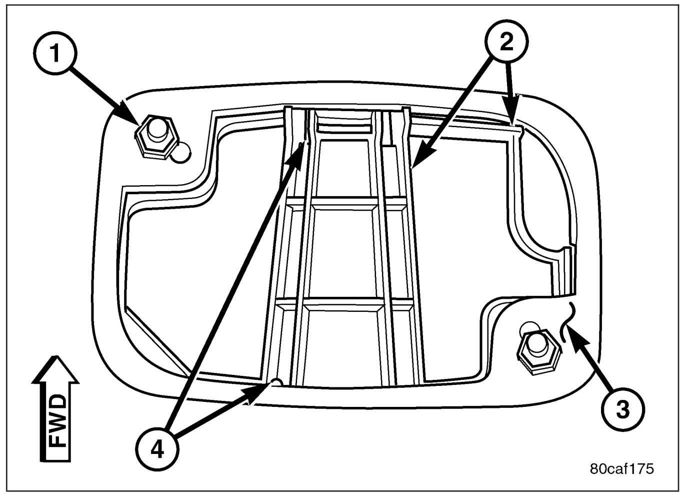
## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. While lightly pulling downward on either rear corner of the Intrusion Transceiver Module (ITM) trim cover (4), insert a small thin-bladed screwdriver (1) through each of the service holes (3) on the rear edge of the trim cover to depress and release the two integral rear latch features of the module from the mounting bracket above the headliner (2).
3. Pull the ITM trim cover rearward far enough to disengage the two integral front latch features of the module from the mounting bracket above the headliner.
4. Pull the ITM and trim cover down from the headliner far enough to access and disconnect the overhead wire harness connector for the ITM from the module connector receptacle.
5. Remove the ITM from the headliner.



## INSTALLATION

1. Position the Intrusion Transceiver Module (ITM) to the headliner (3).
2. Reconnect the overhead wire harness connector for the ITM to the module connector receptacle.
3. Align the two front latch features of the ITM with the mounting bracket (2) above the headliner.
4. Push the ITM trim cover forward far enough to insert the two integral rear latch features of the module into the two rear latch receptacles (4) of the mounting bracket above the headliner.
5. Push upward firmly and evenly on the rear edge of the ITM trim cover until the two rear latch features of the module are engaged in the mounting bracket above the headliner.
6. Reconnect the battery negative cable.

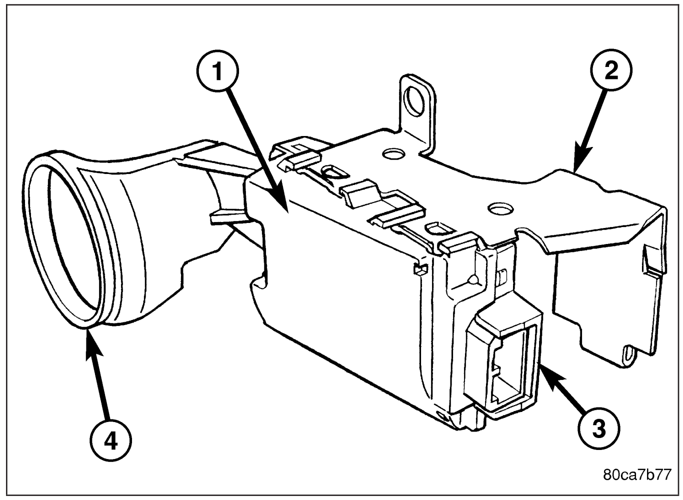


**NOTE: If the Intrusion Transceiver Module (ITM) has been replaced with a new unit, the new ITM MUST be initialized before the Vehicle Theft Security System can operate as designed. The use of a diagnostic scan tool is required to initialize the ITM. Refer to the appropriate diagnostic information.**

# SENTRY KEY REMOTE ENTRY MODULE

## DESCRIPTION

The Sentry Key REmote Entry Module (SKREEM) (1) is sometimes referred to as the Wireless Control Module (WCM). The SKREEM is the primary component of the Sentry Key Immobilizer System (SKIS) and is also the receiver for the Remote Keyless Entry (RKE) system and the Tire Pressure Monitor (TPM) system. The SKREEM is located on the right side of the steering column, near the ignition lock cylinder housing and is concealed beneath the steering column shrouds. The molded black plastic housing for the SKREEM has an integral molded plastic halo-like antenna ring (4) that extends from one end. When the SKREEM is properly installed on the steering column, the antenna ring is oriented around the circumference of the ignition lock cylinder housing.



A single integral connector receptacle (3) is located on the opposite end of the SKREEM housing from the antenna ring. A stamped metal mounting bracket (2) secured to the SKREEM housing is used to secure the component to the right lower flange of the steering column jacket. The SKREEM is connected to the vehicle electrical system through a single take out and connector of the instrument panel wire harness.

Several SKREEM modules are used, specific to optional vehicle equipment and the market in which the vehicle is sold. The SKREEM cannot be adjusted or repaired. If inoperative or damaged, the entire SKREEM unit must be replaced.

## OPERATION

The Sentry Key REmote Entry Module (SKREEM) contains a Radio Frequency (RF) transceiver and a microprocessor. The SKIM transmits RF signals to, and receives RF signals from the Sentry Key transponder through a tuned antenna enclosed within the molded plastic antenna ring integral to the SKREEM housing. If this antenna ring is not mounted properly around the ignition lock cylinder housing, communication problems between the SKREEM and the transponder may arise. These communication problems will result in Sentry Key transponder-related faults.

The SKREEM also serves as the Remote Keyless Entry (RKE) and the Tire Pressure Monitor (TPM) RF receiver. (Refer to 8 - ELECTRICAL/POWER LOCKS - DESCRIPTION) or (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - DESCRIPTION). The SKREEM communicates over the Programmable Communications Interface (PCI) data bus with the Body Control Module (BCM), the Electronic Vehicle Information Center (EVIC), the Powertrain Control Module (PCM) or the diagnostic scan tool.

The SKREEM retains in memory the ID numbers of any Sentry Key transponder that is programmed into it. A maximum of eight Sentry Key transponders can be programmed into the SKREEM. For added system security, each SKREEM is programmed with a unique Secret Key code. This code is stored in memory, sent over the PCI data bus to the PCM, and is encoded to the transponder of every Sentry Key that is programmed into the SKREEM. Therefore, the Secret Key code is a common element that is found in every component of the Sentry Key Immobilizer System (SKIS). Another security code, called a PIN, is used to gain access to the SKREEM Secured Access Mode. The Secured Access Mode is required during service to perform the SKIS initialization and Sentry Key transponder programming procedures. The SKREEM also stores the Vehicle Identification Number (VIN) in its memory, which it learns through a PCI data bus message from the PCM during SKIS initialization.

In the event that a SKREEM replacement is required, the Secret Key code can be transferred to the new SKREEM from the PCM using the diagnostic scan tool and the SKIS initialization procedure. Proper completion of the SKIS initialization will allow the existing Sentry Keys to be programmed into the new SKREEM so that new keys will not be required. In the event that the original Secret Key code cannot be recovered, SKREEM replacement will also require new Sentry Keys. The diagnostic scan tool will alert the technician during the SKIS initialization procedure if new Sentry Keys are required.

When the ignition switch is turned to the ON position, the SKREEM transmits an RF signal to the transponder in the ignition key. The SKREEM then waits for an RF signal response from the transponder. If the response received identifies the key as valid, the SKREEM sends a valid key message to the PCM over the PCI data bus. If the response received identifies the key as invalid, or if no response is received from the key transponder, the SKREEM sends an invalid key message to the PCM. The PCM will enable or disable engine operation based upon the status of the SKREEM messages. It is important to note that the default condition in the PCM is an invalid key; therefore, if no message is received from the SKREEM by the PCM, the engine will be disabled and the vehicle immobilized after two seconds of running.

The SKREEM also sends SKIS indicator status messages to the BCM over the PCI data bus to tell the BCM how to operate the security indicator in the ElectroMechanical Instrument Cluster (EMIC). This indicator status message tells the BCM to turn the indicator on for about three seconds each time the ignition switch is turned to the ON position as a bulb test. After completion of the bulb test, the SKREEM sends indicator status messages to the BCM to turn the indicator off, turn the indicator on, or to flash the indicator on and off. If the security indicator flashes upon ignition ON or stays on solid after the bulb test, it signifies a SKIS fault.

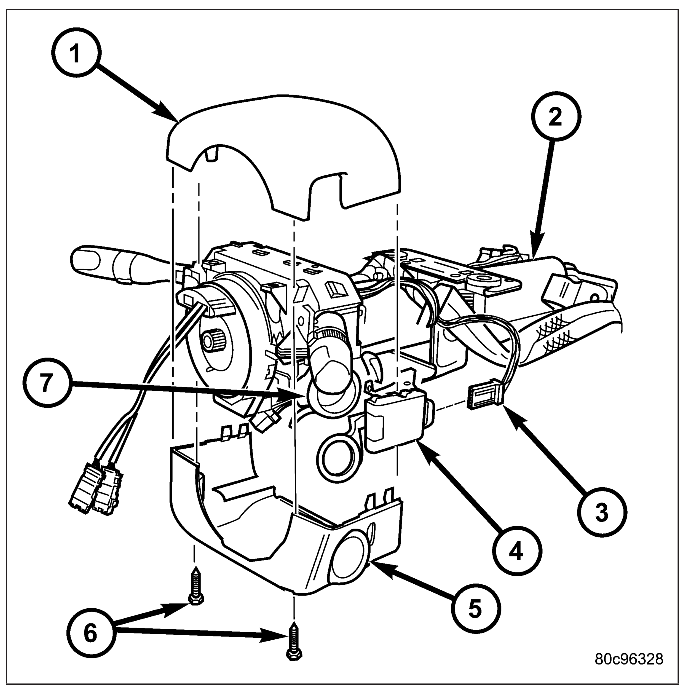
If the SKREEM detects a system malfunction or if the SKIS has become inoperative, the security indicator will stay on solid. If the SKREEM detects an invalid key or if a key transponder-related fault exists, the security indicator will flash. If the vehicle is equipped with the Customer Learn transponder programming feature, the SKREEM will also send messages to the BCM to flash the security indicator and to generate a single audible chime whenever the Customer Learn programming mode is being utilized. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE - SENTRY KEY TRANSPONDER PROGRAMMING).

The SKIS performs a self-test each time the ignition switch is turned to the On position, and will store fault information in the form of a Diagnostic Trouble Code (DTC) in SKREEM memory if a system malfunction is detected. The SKREEM can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the negative battery cable.
2. If the vehicle is equipped with a tilt steering column, move the tilt steering column to the fully lowered position and leave the tilt release lever in the released (down) position.
3. From below the steering column (2), remove the two screws (6) that secure the lower shroud (5) to the upper shroud (1).
4. Using hand pressure, push gently inward on both sides of the upper shroud near the parting line of the lower shroud to release the snap features that secure the two shroud halves to each other.
5. Remove both the upper and lower shrouds from the steering column.
6. Disconnect the wire harness connector (3) from the Sentry Key REmote Entry Module (SKREEM) (4).
7. The SKREEM mounting bracket features a clip that secures the module to the right lower flange of the steering column jacket. Pull downward on the connector end of the SKREEM mounting bracket to release this clip from the steering column.

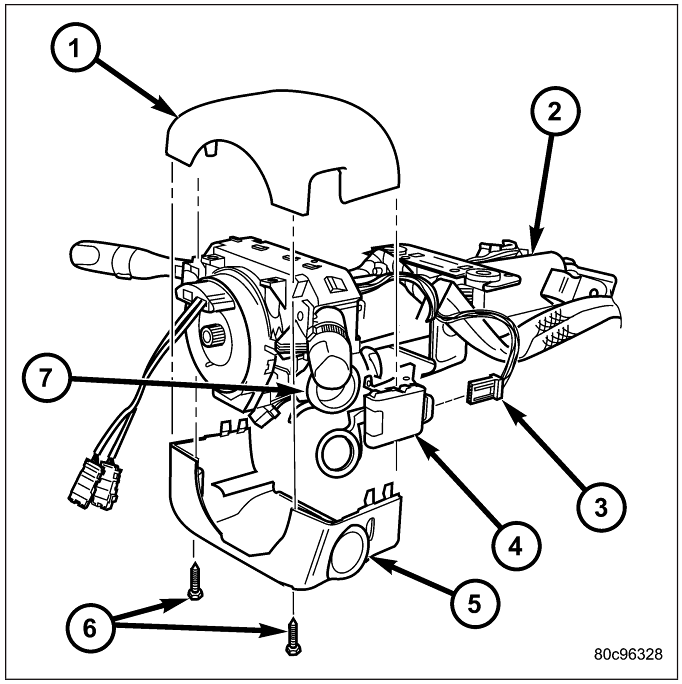


8. Rotate the SKREEM and its mounting bracket downwards and then to the side away from the steering column to disengage the antenna ring from around the ignition lock cylinder housing (7).

9. Lift the multi-function switch upward off of the upper steering column housing far enough to remove the SKREEM antenna ring formation from between the ignition key release button and the multi-function switch housing.
10. Remove the SKREEM from the steering column.

## INSTALLATION

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**



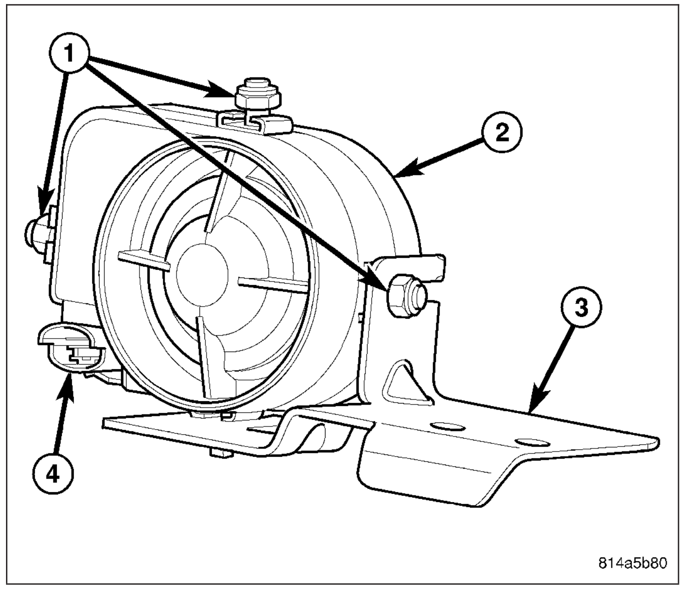
1. Position the SKREEM (4) to the right side of the steering column (2).
2. Lift the multi-function switch upward off of the upper steering column housing far enough to insert the SKREEM antenna ring formation between the ignition key release button and the multi-function switch housing.
3. Slide the SKREEM antenna ring around the ignition switch lock cylinder housing (7), then rotate the SKREEM and its mounting bracket upwards and toward the steering column.
4. Align the SKREEM mounting bracket clip with the right lower flange of the steering column jacket and, push upward firmly and evenly on the connector end of the module mounting bracket to engage this clip with the steering column.
5. Reconnect the wire harness connector (3) to the SKREEM.
6. Position both the upper (1) and lower shrouds (5) onto the steering column.
7. Align the snap features on the lower shroud with the receptacles in the upper shroud and apply hand pressure to snap them together.
8. From below the steering column, install and tighten the two screws (6) that secure the lower shroud to the upper shroud. Tighten the screws to 2 N·m (18 in. lbs.).
9. If the vehicle is equipped with a tilt steering column, move the column to the fully raised position and secure it in place by moving the tilt release lever back to the locked (up) position.
10. Reconnect the negative battery cable.

**NOTE: If the Sentry Key REmote Entry Module (SKREEM) is replaced with a new unit, a diagnostic scan tool MUST be used to initialize the new SKREEM and to program at least two Sentry Key transponders before the vehicle can be operated. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE - SKIS INITIALIZATION).**

# SIREN

## DESCRIPTION

An alarm siren module (2) is part of the export premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The export premium version of the VTA is only available in vehicles built for certain markets where the additional features offered by this system are required. The alarm siren module is located in the engine compartment, on the front extension of the right front wheel house panel below and behind the right headlamp. This assembly is designed to provide the audible alert requirements for the export premium VTA.



The alarm siren module consists of microprocessor-based electronic control circuitry, the siren, and a nickel metal hydride backup battery. All of the alarm module components are protected and sealed within a molded plastic housing. A stamped steel mounting bracket (3) is secured to the module with three stud plates and nuts (1) that fit into slotted holes at the top and each side of the bracket. Two mounting holes in the horizontal surface of the bracket are used to secure the alarm siren module to the wheel house extension with screws. A connector receptacle (4) extends forward from the alarm siren housing, and connects the module to the vehicle electrical system through a dedicated take out of the headlamp and dash wire harness.

The alarm siren module cannot be repaired or adjusted and, if inoperative or damaged, it must be replaced.

## OPERATION

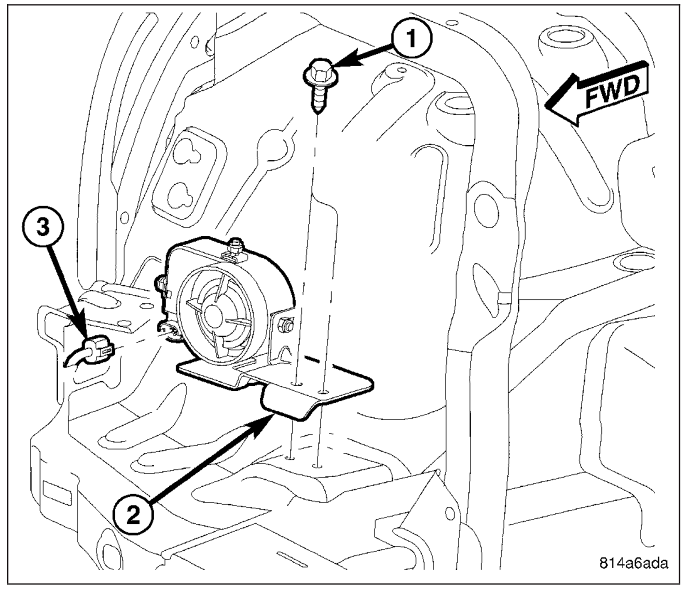
The microprocessor within the alarm siren module performs the tasks required to provide the siren features and functions based upon internal programming and electronic arm and disarm message inputs received from the Intrusion Transceiver Module (ITM) over a dedicated serial bus communication circuit. Upon receiving a request from the ITM, the alarm siren module will self-detect problems with its internal and external power supply and communication circuits, then send electronic messages indicating the problem to the ITM. The ITM will store a Diagnostic Trouble Code (DTC) for a detected alarm siren module fault that can be retrieved with a diagnostic scan tool over the Programmable Communications Interface (PCI) data bus through the 16-way data link connector located on the driver side lower edge of the instrument panel.

When the export premium version of the Vehicle Theft Alarm (VTA) is armed, the alarm siren module microprocessor continuously monitors inputs from the ITM for messages to sound its internal siren and to enter its auto-detect mode. While in the auto-detect mode, if the alarm siren module detects that its power supply or communication circuits are being tampered with or have been sabotaged, it will sound an alarm and continue to operate through its on-board backup battery. If the alarm siren module is in its disarmed mode when its power supply or communication circuits are interrupted, the siren will not sound. The alarm module will also notify the ITM when the backup battery requires charging, and the ITM will send a message that will allow the backup battery to be charged through the battery voltage and ground circuits to the alarm module only when the ignition switch is in the ON position and the engine is running. This will prevent the recharging of the alarm backup battery from depleting the charge in the main vehicle battery while the vehicle is not being operated.

The alarm siren module receives battery voltage through a fuse in the Power Distribution Center (PDC), and receives ground through a ground location on the left inner fender shield in the engine compartment. These connections allow the alarm siren module to remain operational, regardless of the ignition switch position. The hard wired inputs and outputs for the alarm siren module may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the internal circuitry or the backup battery of the alarm siren module, the ITM, the serial bus communication line, or the electronic message inputs to and outputs from the alarm siren module. The most reliable, efficient, and accurate means to diagnose the alarm siren module, the ITM, the serial bus communication line, and the electronic message inputs to and outputs from the alarm siren module requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

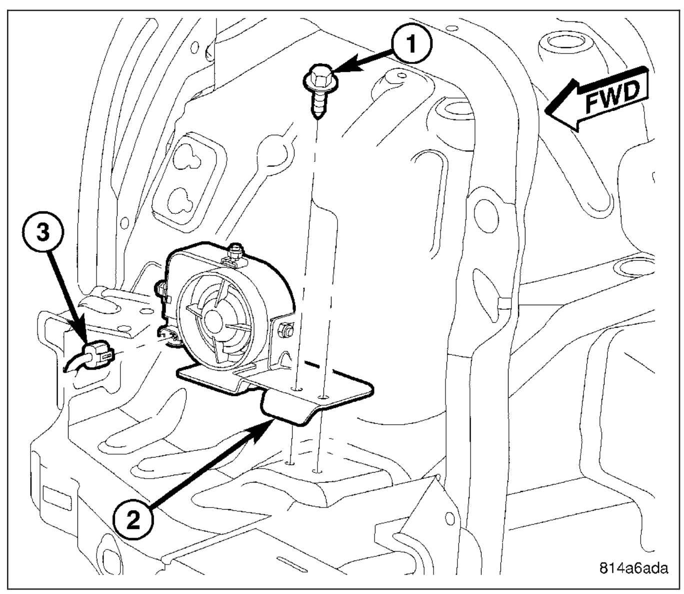
1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector (3) from the connector receptacle of the alarm siren module (2).
3. Remove the two screws (1) that secure the alarm siren module to the front extension of the right front wheel house panel.
4. Remove the alarm siren module from the front extension of the right front wheel house panel.



## INSTALLATION

1. Position the alarm siren module (2) onto the front extension of the right front wheel house panel.
2. Install and tighten the two screws (1) that secure the alarm siren module to the front extension of the right front wheel house panel. Tighten the screws to 6 N·m (50 in. lbs.).
3. Reconnect the wire harness connector (3) for the alarm siren module.
4. Reconnect the battery negative cable.

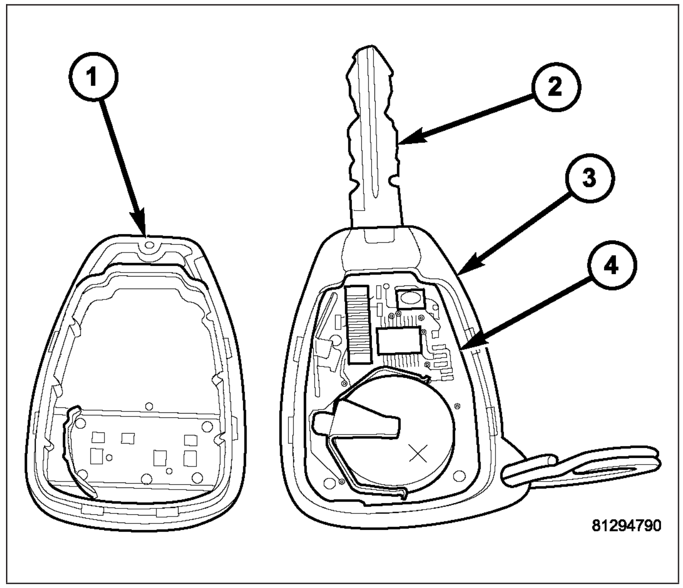
**NOTE: If the alarm siren module has been replaced with a new unit, the new unit MUST be configured in the Intrusion Transceiver Module (ITM) before the Vehicle Theft Security System can operate as designed. The use of a diagnostic scan tool is required to configure the alarm siren module settings in the ITM. Refer to the appropriate diagnostic information.**



# TRANSPONDER KEY

## DESCRIPTION

Each ignition key (2) used in the Sentry Key Immobilizer System (SKIS) has an integral transponder chip included on the circuit board (4) beneath the cover (1) of the integral Remote Keyless Entry (RKE) transmitter (3). In addition to having to be cut to match the mechanical coding of the ignition lock cylinder and programmed for operation of the RKE system, each new Sentry Key has a unique transponder identification code that is permanently programmed into it by the manufacturer, and which must be programmed into the Sentry Key REmote Entry Module (SKREEM) to be recognized by the SKIS as a valid key.



The Sentry Key transponder cannot be adjusted or repaired. If inoperative or damaged, the entire key and RKE transmitter unit must be replaced.

## OPERATION

When the ignition switch is turned to the ON position, the Sentry Key REmote Entry Module (SKREEM) communicates through its antenna with the Sentry Key transponder using a Radio Frequency (RF) signal. The SKREEM then listens for a RF response from the transponder through the same antenna. The Sentry Key transponder chip is within the range of the SKREEM transceiver antenna ring when it is inserted into the ignition lock cylinder. The SKREEM determines whether a valid key is present in the ignition lock cylinder based upon the response from the transponder. If a valid key is detected, that fact is communicated by the SKREEM to the Powertrain Control Module (PCM) over the Programmable Communications Interface (PCI) data bus, and the PCM allows the engine to continue running. If the PCM receives an invalid key message, or receives no message from the SKREEM over the PCI data bus, the engine will be disabled after about two seconds of operation. The Body Control Module (BCM) will also respond to the invalid key message on the PCI data bus by flashing the security indicator in the ElectroMechanical Instrument Cluster (EMIC) on and off.

Each Sentry Key has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the SKREEM has a unique Secret Key code programmed into it by the manufacturer. When a Sentry Key is programmed into the memory of the SKREEM, the SKREEM stores the transponder identification code from the Sentry Key, and the Sentry Key learns the Secret Key code from the SKREEM. Once the Sentry Key learns the Secret Key code of the SKREEM, it is permanently stored in the memory of the transponder. Therefore, once a Sentry Key has been programmed to a particular vehicle, it cannot be used on any other vehicle. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE - TRANSPONDER PROGRAMMING).

The Sentry Key Immobilizer System (SKIS) performs a self-test each time the ignition switch is turned to the ON position, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in SKREEM memory if a Sentry Key transponder problem is detected. The Sentry Key transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic information.

# WIPERS/WASHERS

## TABLE OF CONTENTS

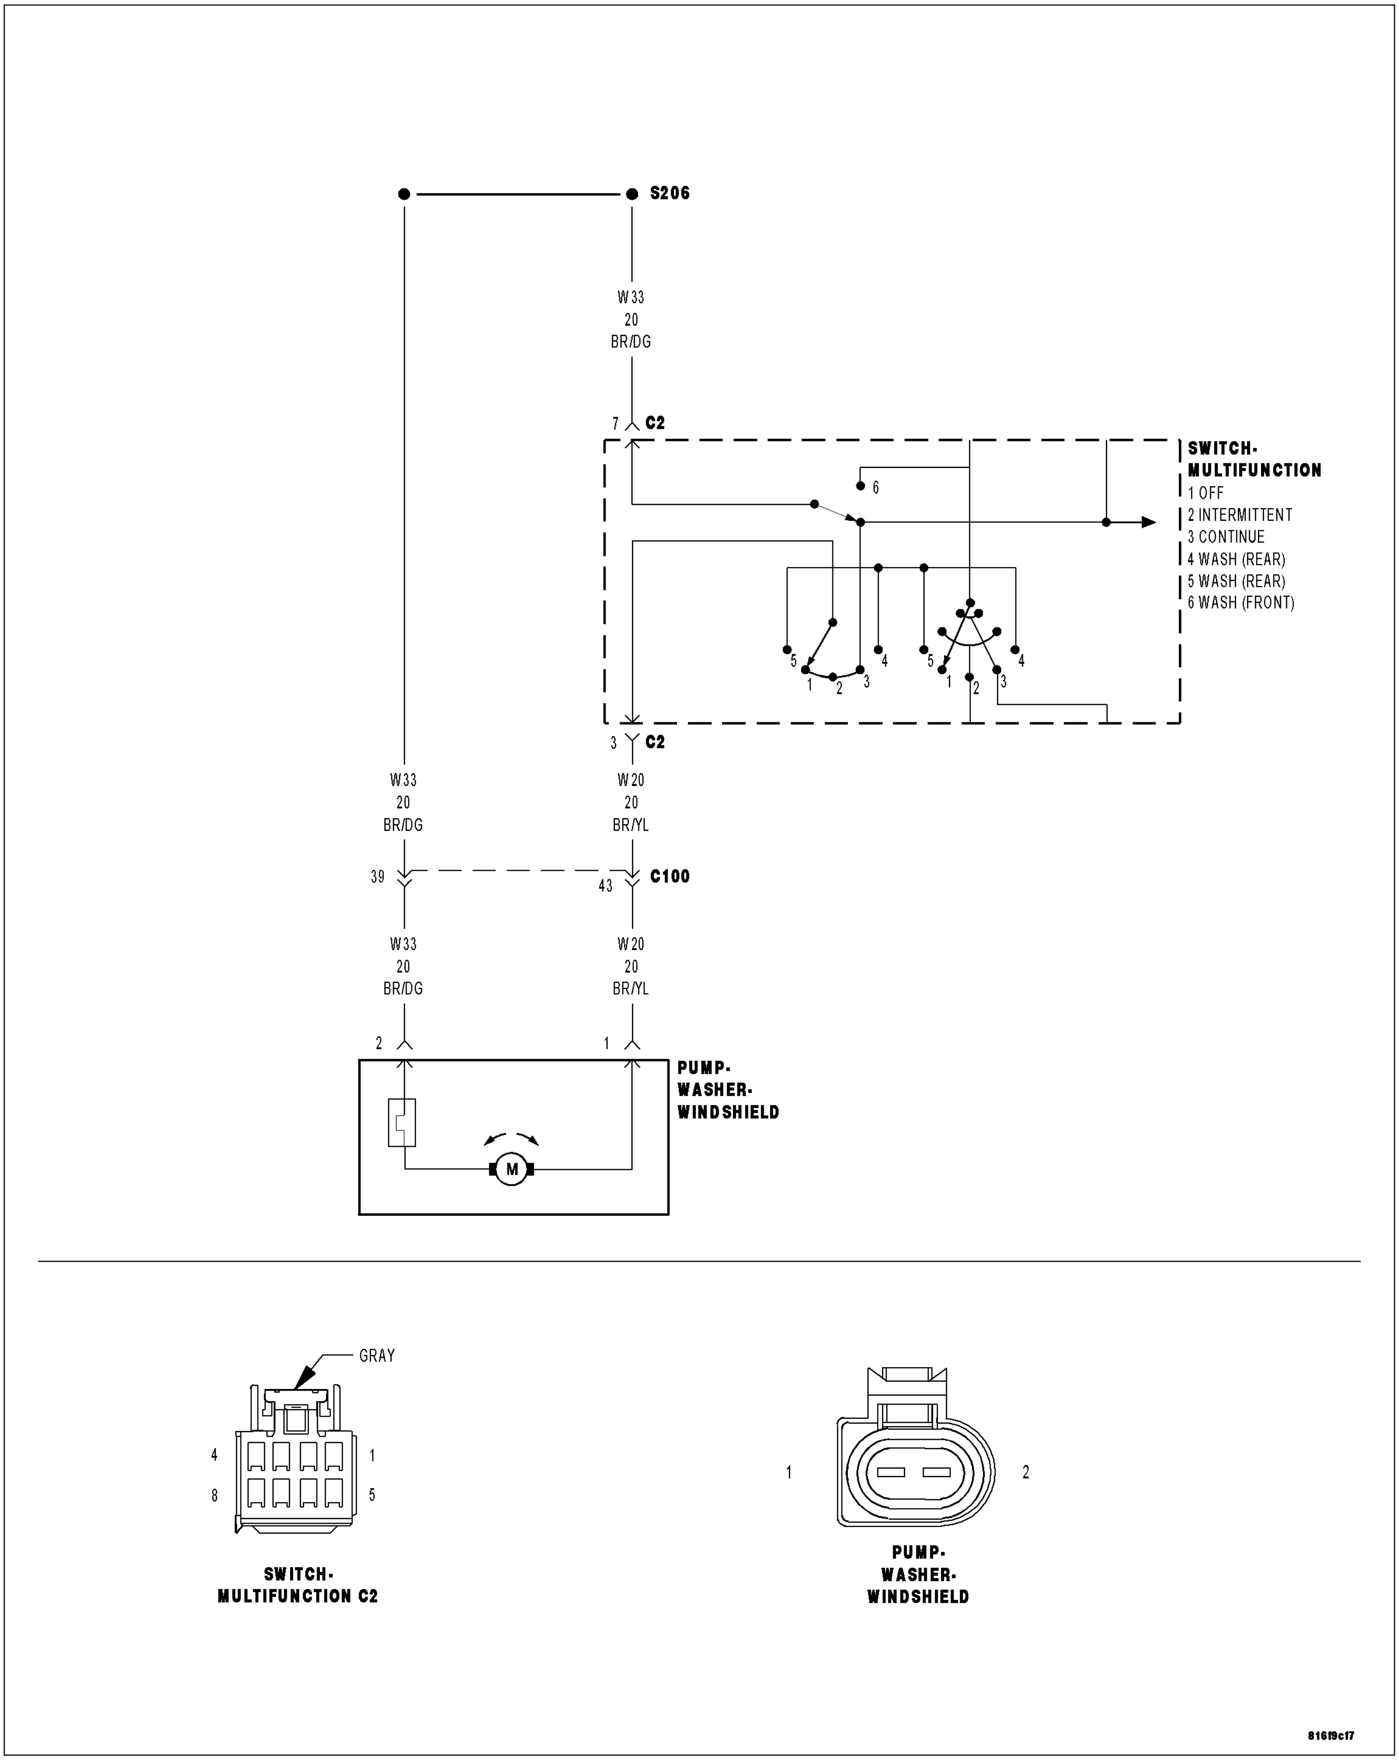
## WIPERS/WASHERS ELECTRICAL DIAGNOSTICS

### TABLE OF CONTENTS

# WIPERS/WASHERS ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## FRONT WASHER PUMP INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Possible Causes
- **Set Condition:**
  Possible Causes

| Possible Causes |
|---|
| FRONT WASHER PUMP |
| FRONT WASHER PUMP GROUND CIRCUIT OPEN |
| MULTIFUNCTION SWITCH |
| FRONT WASHER PUMP SENSE CIRCUIT OPEN |
| FRONT WASHER PUMP DRIVER CIRCUIT OPEN |
| FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. FRONT WASHER PUMP

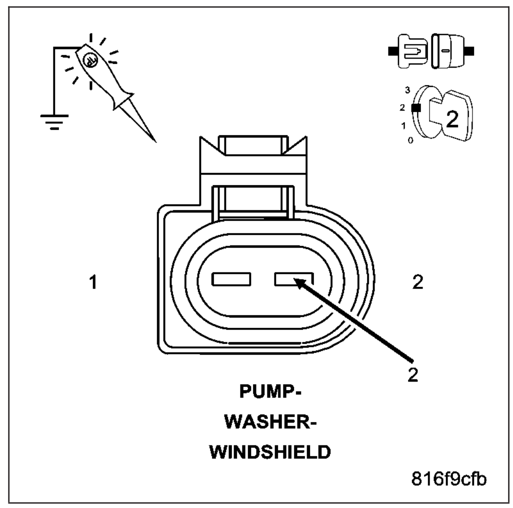
Turn the ignition off.

Disconnect the Front Washer Pump harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the Front Washer Pump Driver circuit.

Actuate the Front Washers.



**Does the test light illuminate brightly?**

**Yes** >> Replace the Front Washer Pump.
Perform BODY VERIFICATION TEST - VER 1.

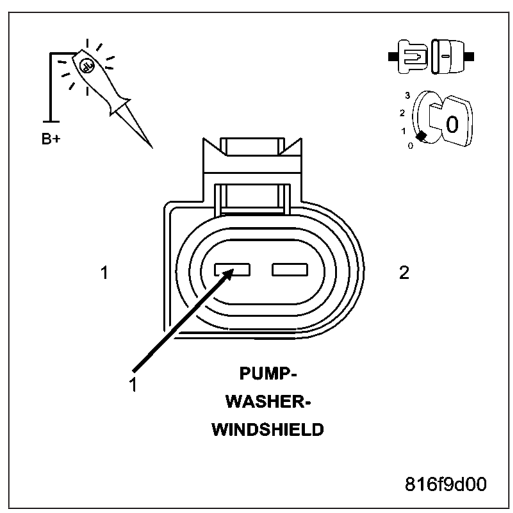
**No** >> Go To 2

### 2. FRONT WASHER PUMP GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Washer Pump.

Using a 12-volt test light connected to 12-volts, check the Front Washer Pump Ground circuit.



**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the Front Washer Pump Ground Circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

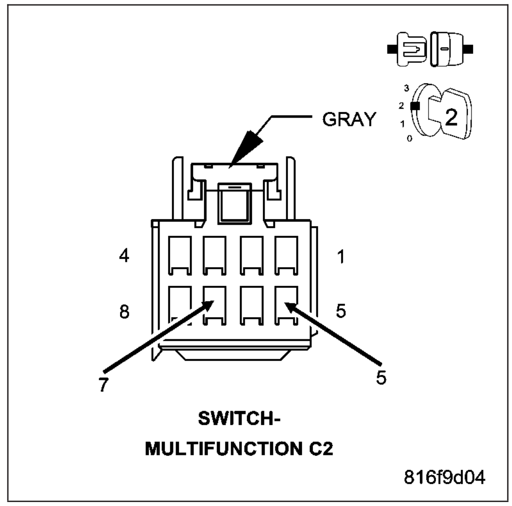
## 3. MULTIFUNCTION SWITCH

Turn the ignition off.

Disconnect the right side Multifunction Switch C2 harness connector.

Connect a jumper wire between the Fused Ignition Switch Output circuit and the Front Washer Pump Driver circuit in the Multifunction Switch harness connector.

Turn the ignition on.



**Does the Front Washer Pump operate?**

**Yes** >> Replace the Multifunction Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

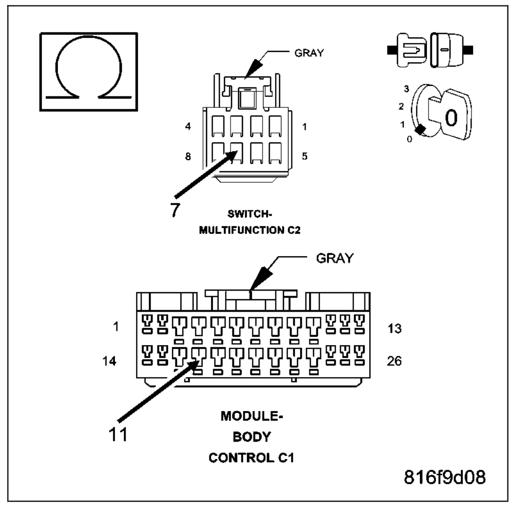
## 4. FRONT WASHER PUMP SENSE CIRCUIT OPEN

Turn the ignition off.

Disconnect the right side Multifunction Switch.

Disconnect the Body Control Module.

Measure the resistance of the Front Washer Pump Sense circuit.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Front Washer Pump Sense Circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

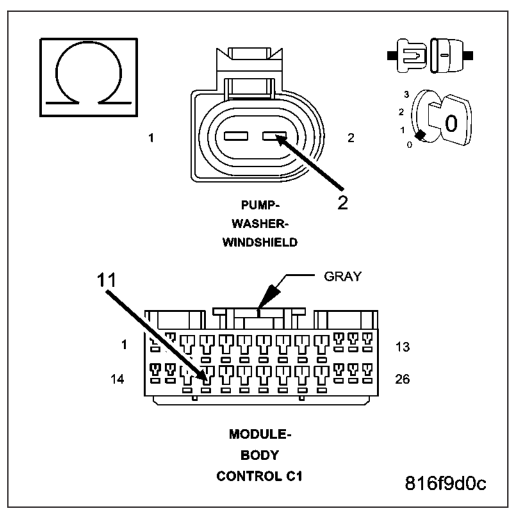
## 5. FRONT WASHER PUMP DRIVER CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Washer Pump.

Disconnect the Body Control Module from the Junction Block.

Measure the resistance of the Front Washer Pump Driver circuit.



**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Front Washer Pump Driver Circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

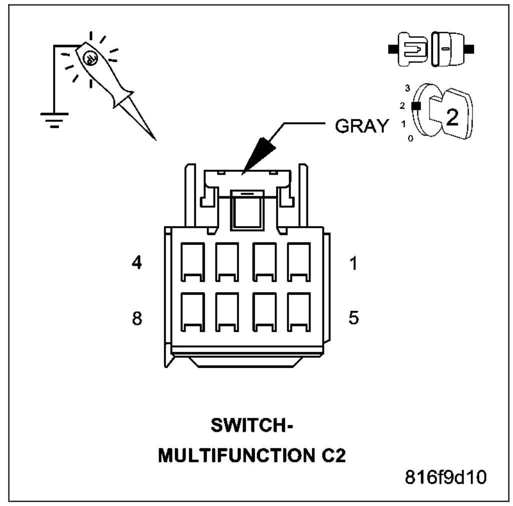
**No** >> Go To 6

## 6. FUSED IGNITION SWITCH OUTPUT OPEN

Turn the ignition off.

Disconnect the Multifunction Switch.

Using a 12-volt test light connected to ground, check the Fused Ignition Switch Output circuit.



**Does the test light illuminate brightly?**

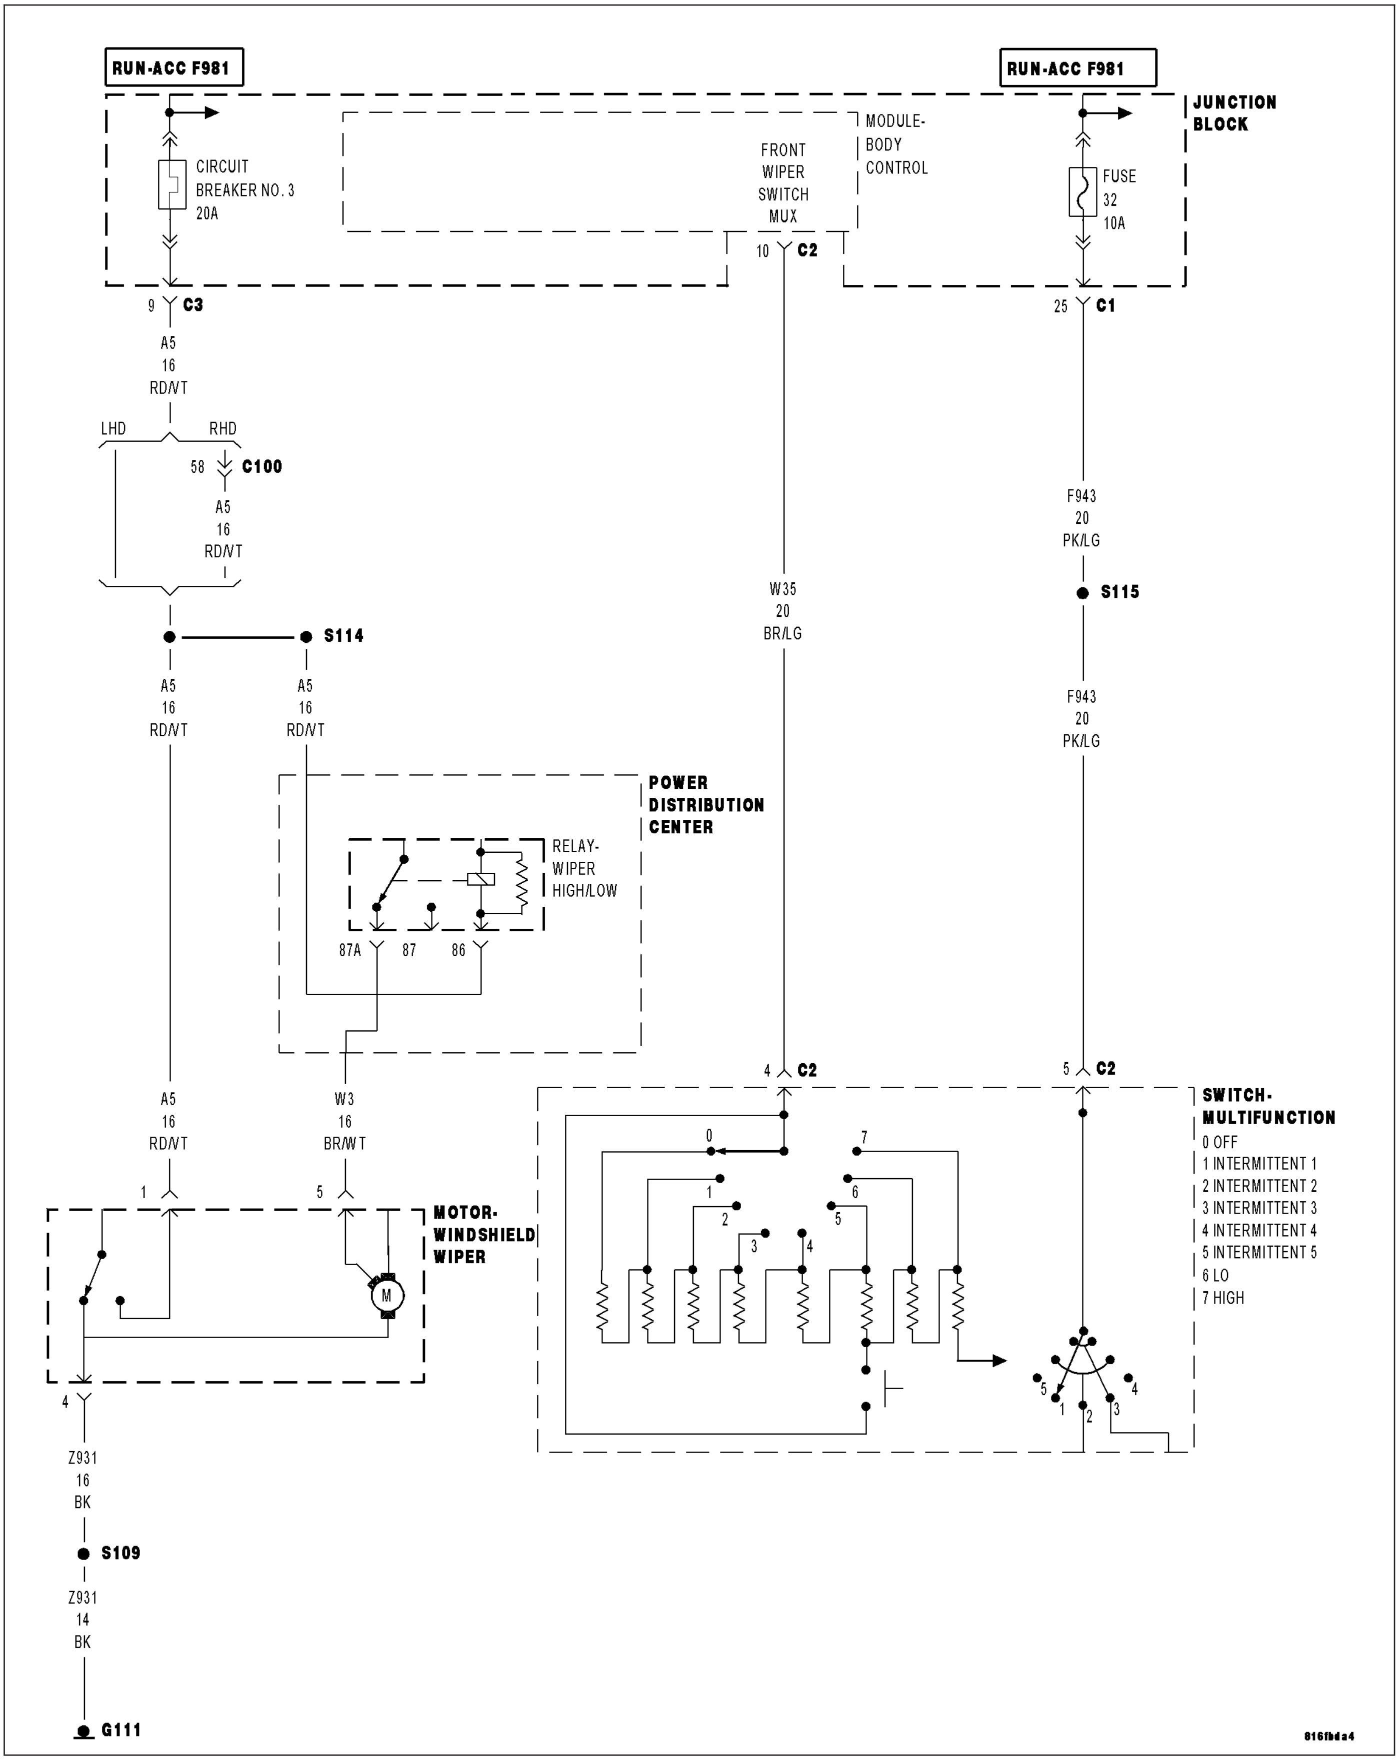
**Yes** >> Repair the Fused Ignition Switch Output circuit for an open. If the fuse is open make sure to check for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.

Perform BODY VERIFICATION TEST - VER 1.

## FRONT WIPER LOW SPEED INOPERATIVE



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Possible Causes
- **Set Condition:**
  Possible Causes

| Possible Causes |
|---|
| MULTIFUNCTION SWITCH |
| FRONT WIPER MOTOR GROUND CIRCUIT OPEN |
| FRONT WIPER MOTOR LOW DRIVER CIRCUIT OPEN |
| FRONT WIPER MOTOR |
| FUSED IGNITION SWITCH OUTPUT CIRCUIT |

## Diagnostic Test

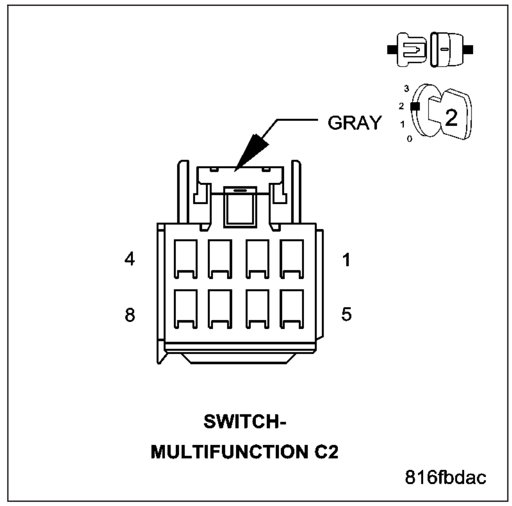
### 1. MULTIFUNCTION SWITCH

Turn the ignition off.

Disconnect the right side Multifunction Switch harness connector.

Connect a jumper wire between the Fused Ignition Switch Output circuit and the Front Wiper Motor Low Driver circuit in the Multifunction Switch harness connector.

Turn the ignition on.



**Does the Front Wiper Motor function normally?**

**Yes** >> Replace the Multifunction Switch.
Perform BODY VERIFICATION TEST - VER 1.

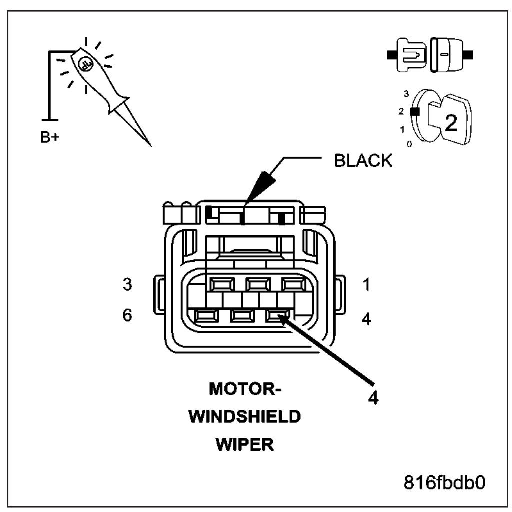
**No** >> Go To 2

### 2. FRONT WIPER MOTOR GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Wiper Motor.

Using a 12-volt test light connected to 12-volts, check the Front Wiper Motor Ground circuit.

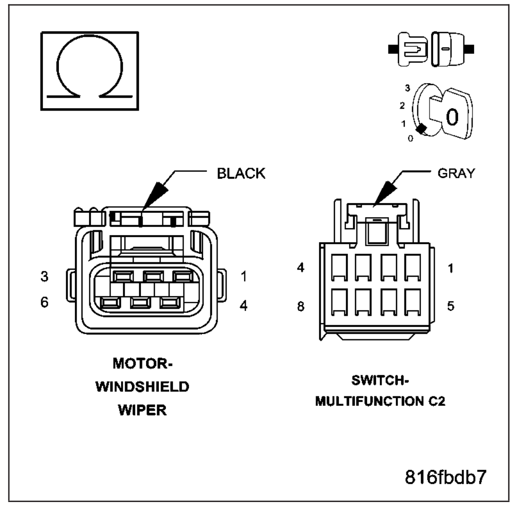


**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the Front Wiper Motor Ground Circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

## 3. FRONT WIPER MOTOR LOW DRIVER CIRCUIT OPEN



Turn the ignition off.

Disconnect the Front Wiper Motor.

Disconnect the right side Multifunction Switch.

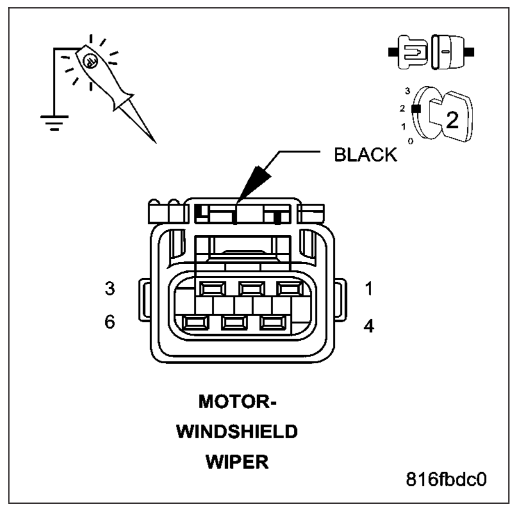
Measure the resistance of the Front Wiper Motor Low Driver circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Front Wiper Motor Low Driver Circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. FRONT WIPER MOTOR



Turn the ignition off.

Disconnect the Front Wiper Motor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the Front Wiper Motor Low Driver circuit.

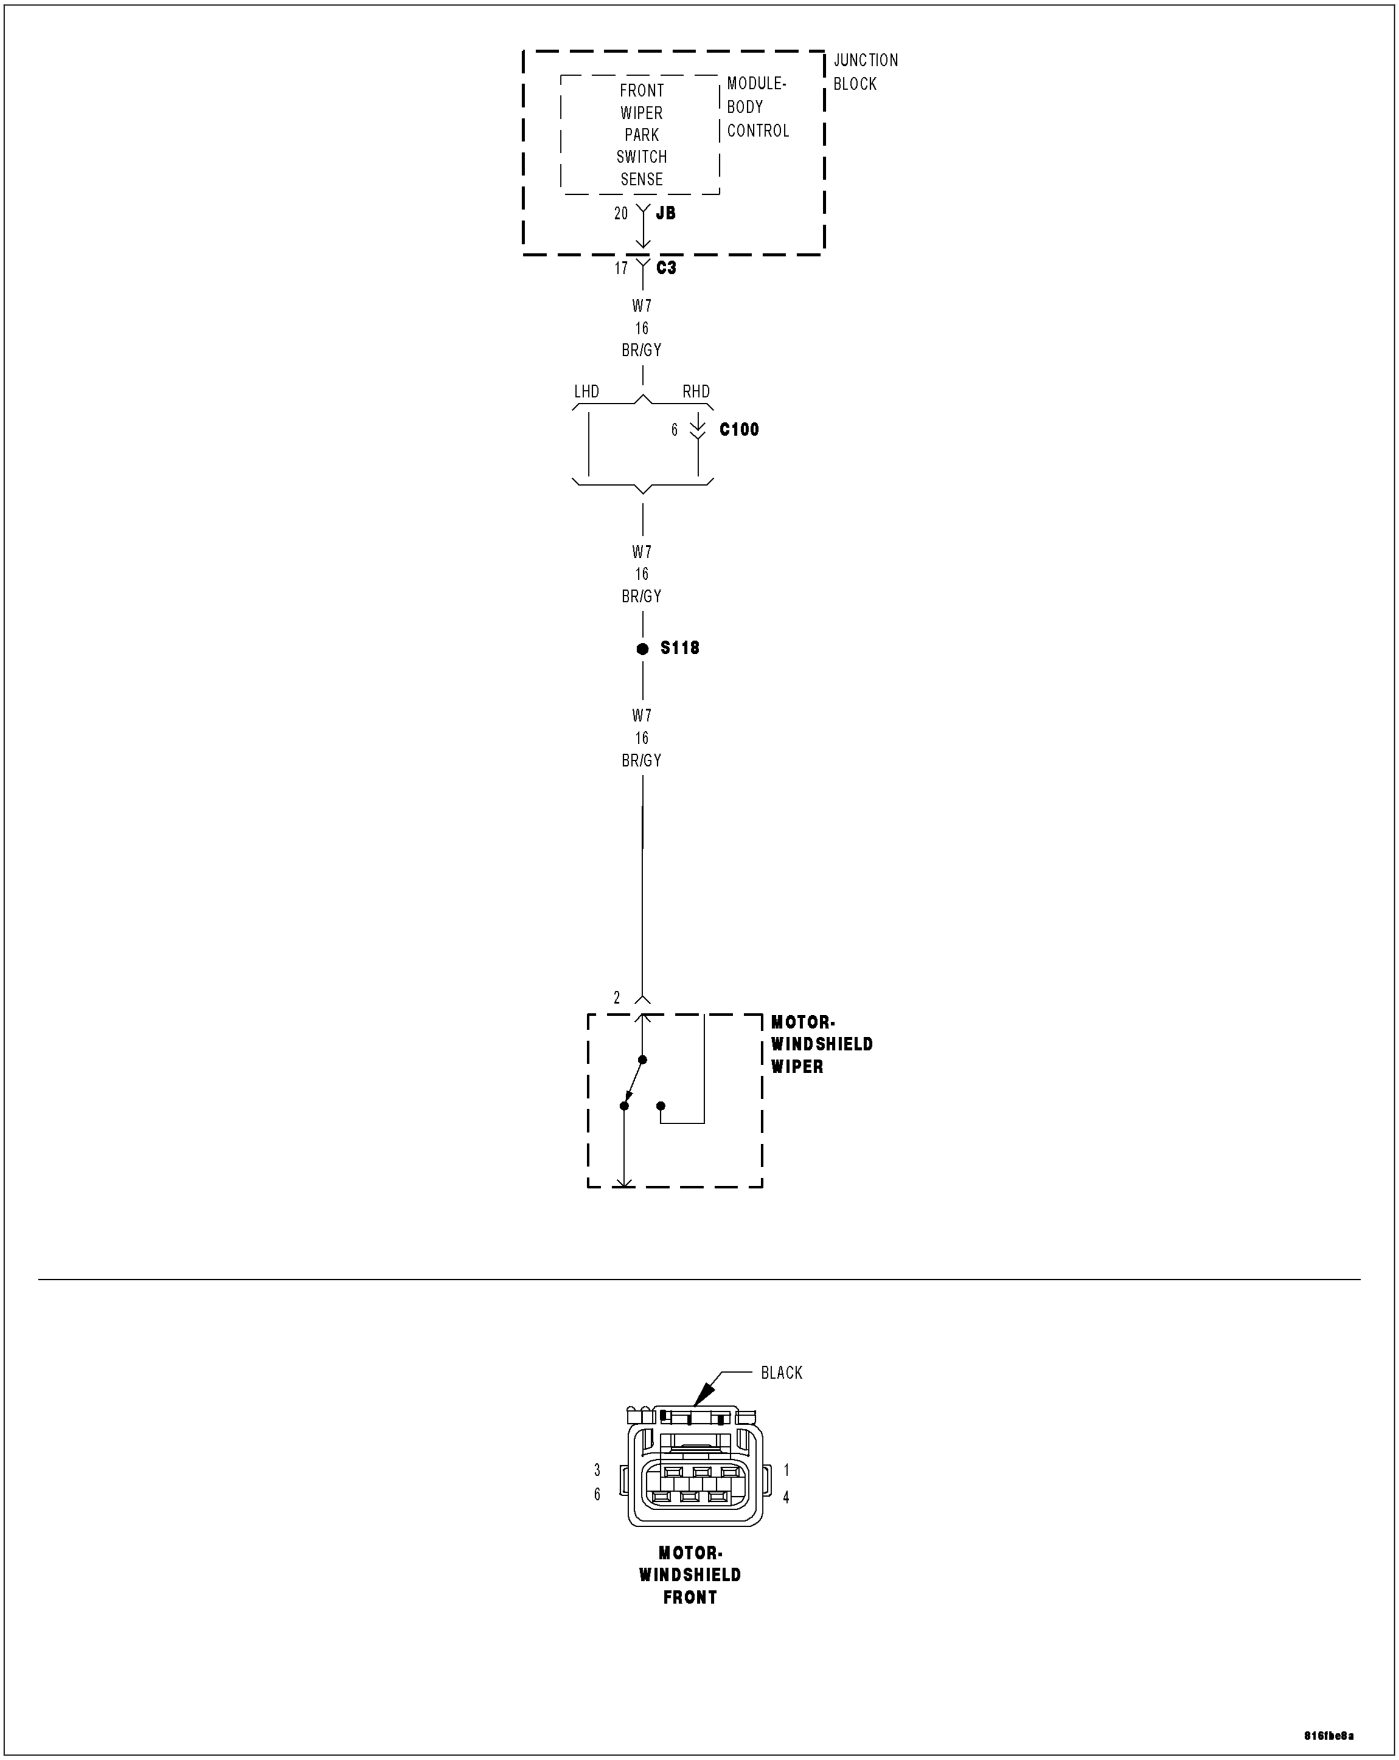
Turn the Front Wipers on to Low.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Front Wiper Motor.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Fused B+ Output circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

## WIPER HIGH/LOW RELAY OUTPUT CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  BCM detects a high level on the Wiper High/Low relay output when it is attempting to turn the wipers on for more than 5 seconds.

| Possible Causes |
|---|
| MISSING RELAY |
| OPEN CIRCUIT BREAKER |
| WIPER HIGH/LOW RELAY |
| BODY CONTROL MODULE |
| FRONT WIPER PARK SWITCH SENSE CIRCUIT OPEN |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Front Wipers on.

With the scan tool, read the DTC information.

**Does the scan tool read: WIPER HIGH/LOW RELAY CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MISSING RELAY

Turn the ignition off.

Check the PDC to make certain the Wiper High/Low Relay is present.

**Is the Wiper High/Low Relay present?**

**Yes** >> Go To 3

**No** >> Replace the missing Wiper High/Low Relay.
Perform BODY VERIFICATION TEST - VER 1.

### 3. OPEN CIRCUIT BREAKER

Turn the ignition off.

Check the Junction Block Circuit Breaker 3.

**Is the Circuit Breaker open?**

**Yes** >> Replace the open Circuit Breaker.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. WIPER HIGH/LOW RELAY

Turn the ignition off.

Install a known good relay in place of the Wiper High/Low Relay.

Turn the Wipers On.

**Do the Wipers operate normally?**

**Yes** >> Replace the Wiper High/Low Relay.
Perform BODY VERIFICATION TEST - VER 1.

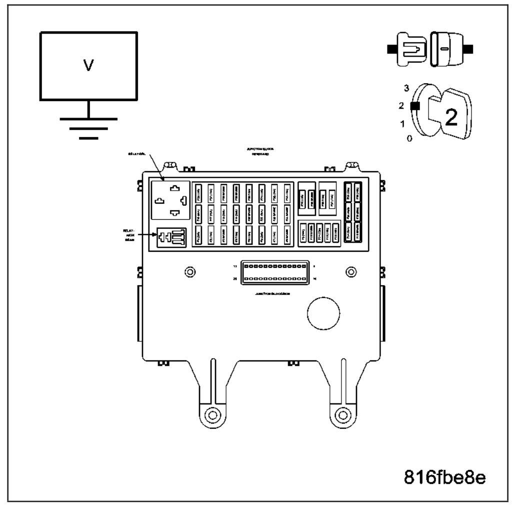
**No** >> Go To 5

## 5. BODY CONTROL MODULE

Turn the ignition off

Remove the Wiper High/Low Relay.

Measure the voltage of the Fused B+ circuit of the Wiper High/Low Relay.

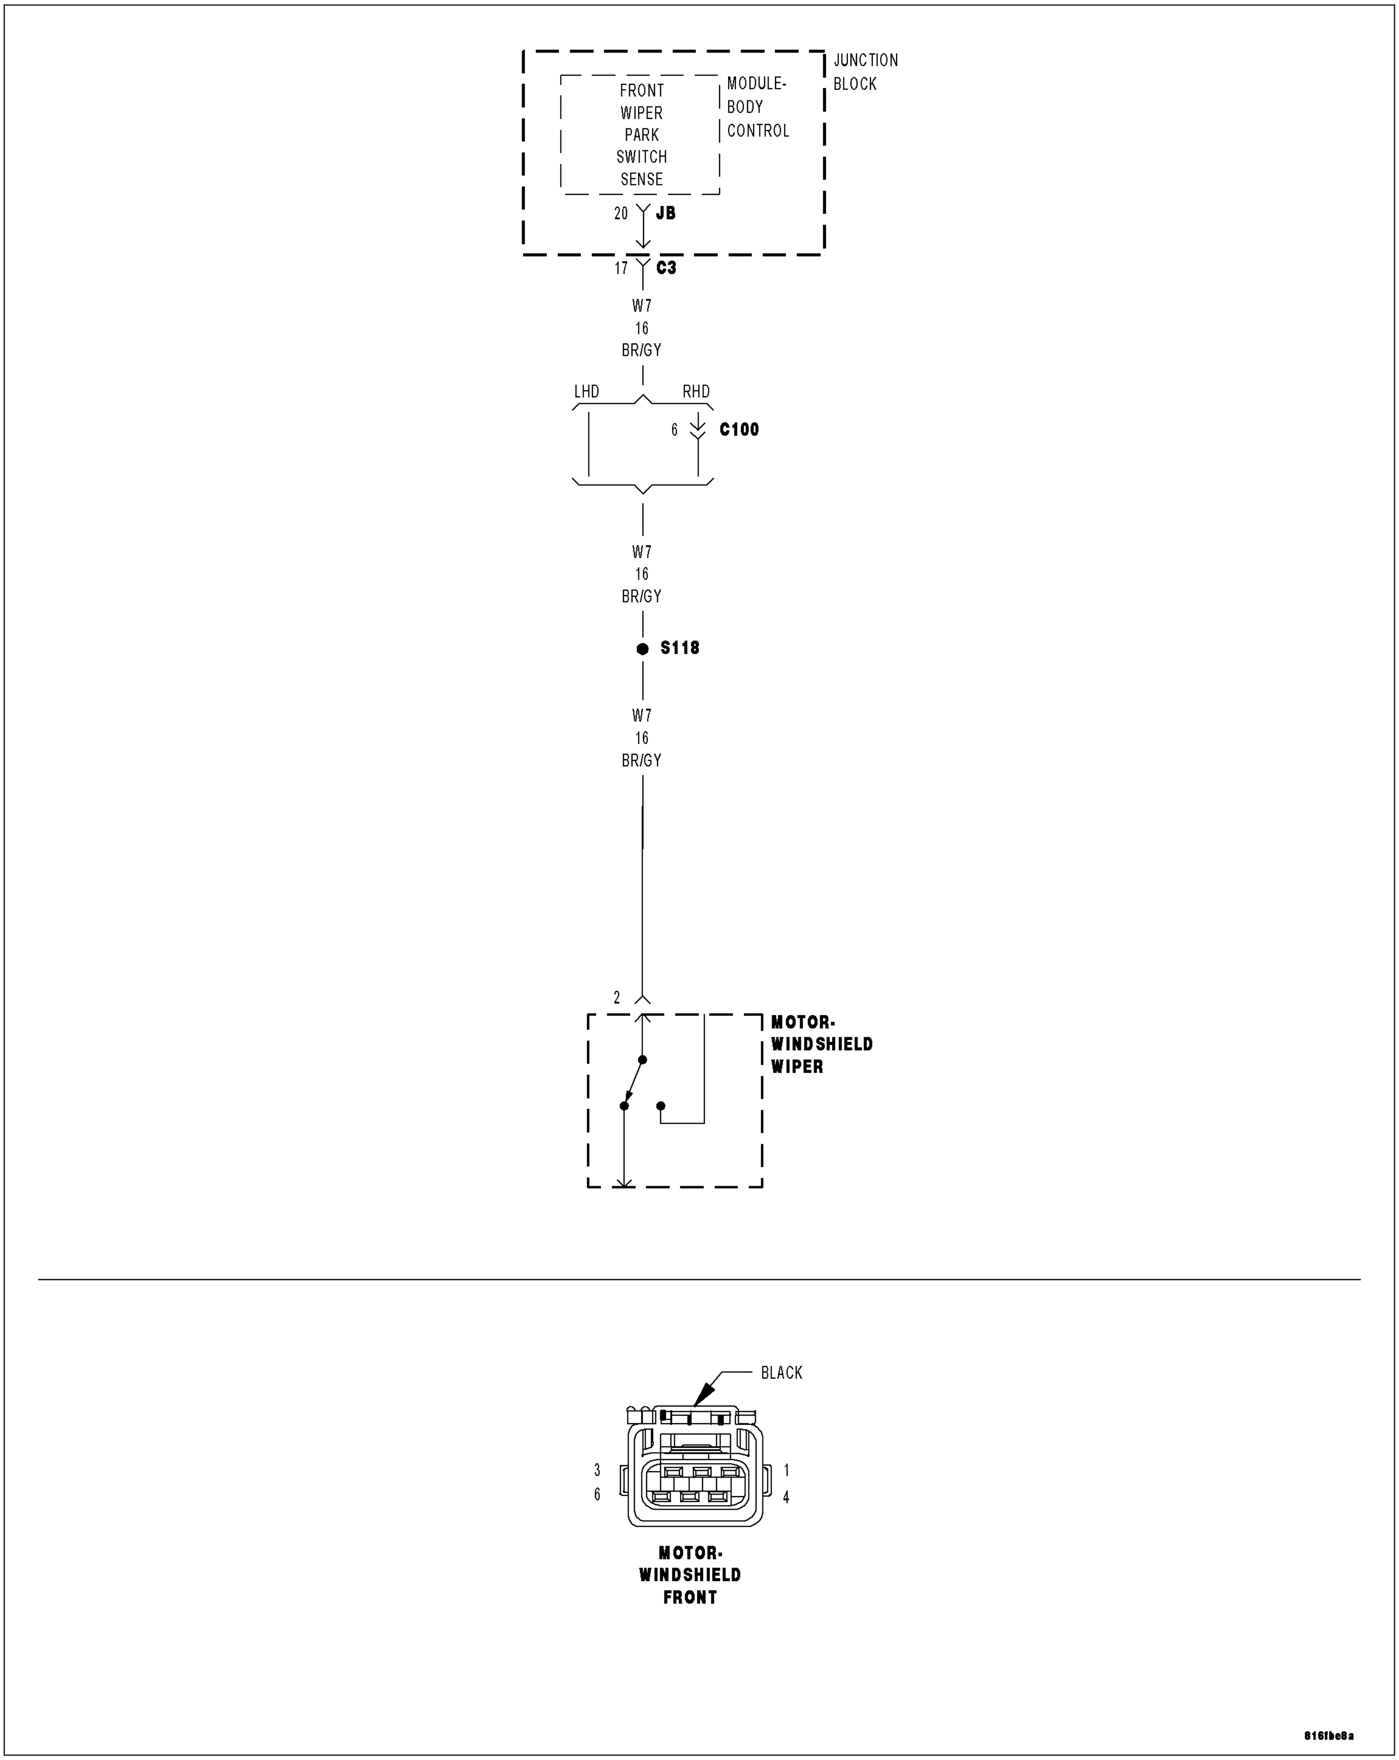


**Is the voltage above 10 volts?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Front Wiper Park Switch Sense circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

## WIPER HIGH/LOW RELAY OUTPUT CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With ignition on.
- **Set Condition:**
  BCM detects a low (ground) signal on the wiper on/off relay output even though it is not attempting to drive the output for more than 5 seconds.

| Possible Causes |
|---|
| WIPER HIGH/LOW RELAY SHORT TO GROUND |
| WIPER HIGH/LOW RELAY |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Wipers on.

With the scan tool, read the DTC information.

**Does the scan tool read: WIPER HIGH/LOW RELAY OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. WIPER HIGH/LOW RELAY SHORT TO GROUND

Turn the ignition off.

Disconnect the Wiper High/Low Relay.

Measure the resistance between ground and the Wiper High/Low Relay Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Wiper High/Low Relay Control circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. WIPER HIGH/LOW RELAY

Turn the ignition off.

Disconnect the Wiper High/Low Relay harness connector.

Measure the voltage of the Wiper High/Low Relay harness connector coil side feed circuit to ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Wiper High/Low Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## WIPER MODE SWITCH CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  BCM detects a voltage greater than 4.75 volts on the Wiper Mode Switch Input for more than 5 seconds.

| Possible Causes |
|---|
| MULTIFUNCTION SWITCH |
| FRONT WIPER SWITCH MUX CIRCUIT OPEN |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all BCM DTC's.

Turn the Wipers on.

With the scan tool, read DTCs.

**Does the scan tool display: WIPER MODE SWITCH CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MULTIFUNCTION SWITCH

Turn the ignition off.

Disconnect the Multifunction Switch harness connector.

Connect a jumper wire between the Front Wiper Switch MUX circuit to ground.

Turn the ignition on.

With the DRBIII®, select Body, Body Controller and read: Wiper Switch volts.

**Does the scan tool display: Multifunction Switch voltage below 0.5volts?**

**Yes** >> Replace the Multifunction Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. FRONT WIPER SWITCH MUX CIRCUIT OPEN

Turn the ignition off.

Disconnect the Body Control Module harness connector.

Disconnect the Multifunction Switch harness connector.

Measure resistance of the Front Wiper Switch MUX circuit from the Body Control Module connector to the Multifunction Switch harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Front Wiper Switch MUX circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## WIPER MODE SWITCH CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the igntion on.
- **Set Condition:**
  BCM detects a voltage less than 0.25 volts on the Wiper Mode Switch Input for more than 5 seconds.

| Possible Causes |
|---|
| MULTIFUNCTION SWITCH SHORTED |
| FRONT WIPER SWITCH MUX CIRCUIT SHORT TO GROUND |
| BODY CONTROL MODULE |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Wipers on.

With the scan tool, read DTCs.

**Does the scan tool display: WIPER MODE SWITCH CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MULTIFUNCTION SWITCH SHORTED

Turn the ignition off.

Disconnect the Multifunction Switch harness connector.

Turn the ignition on.

With the DRBIII®, select Body, Body Control Module and read: Multifunction Switch voltage..

**Does the scan tool display: Multifunction Switch voltage above 4.75 volts?**

**Yes** >> Replace the Multifunction Switch.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. FRONT WIPER SWITCH MUX CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Body Control Module harness connector.

Disconnect the Multifunction Switch harness connector.

Measure resistance between ground and the Front Wiper Switch MUX circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the Front Wiper Switch MUX Circuit for a short to ground condition.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## WIPER ON/OFF RELAY OUTPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  BCM detects a high level on the Wiper On/Off Relay output when it is attempting to turn the wipers on for more than 5 seconds.

| Possible Causes |
|---|
| MISSING RELAY |
| OPEN CIRCUIT BREAKER |
| WIPER ON/OFF RELAY |
| BODY CONTROL MODULE |
| FRONT WIPER PARK SWITCH SENSE CIRCUIT OPEN |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Front Wipers on.

With the scan tool, read the DTC information.

**Does the scan tool read: WIPER ON/OFF RELAY CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

### 2. MISSING RELAY

Turn the ignition off.

Check the PDC to make certain the Wiper On/Off Relay is present.

**Is the Wiper On/Off Relay present?**

**Yes** >> Go To 3

**No** >> Replace the missing Wiper On/Off Relay.
Perform BODY VERIFICATION TEST - VER 1.

### 3. OPEN CIRCUIT BREAKER

Turn the ignition off.

Check the Junction Block Circuit Breaker 3.

**Is the Circuit Breaker open?**

**Yes** >> Replace the open Circuit Breaker.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

## 4. WIPER ON/OFF RELAY

Turn the ignition off.
Install a known good relay in place of the Wiper On/Off Relay.
Turn the Wipers On.

**Do the Wipers operate normally?**

**Yes** >> Replace the Wiper On/Off Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. BODY CONTROL MODULE

Turn the ignition off
Remove the Wiper On/Off Relay.
Measure the voltage of the Fused B+ circuit of the Wiper On/Off Relay.

**Is the voltage above 10 volts?**

**Yes** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Front Wiper Park Switch Sense circuit for an open condition.
Perform BODY VERIFICATION TEST - VER 1.

## WIPER ON/OFF RELAY OUTPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  BCM detects a low (ground) signal on the Wiper On/Off Relay output even though it is not attempting to drive the output for more than 5 seconds.

| Possible Causes |
|---|
| WIPER ON/OFF RELAY SHORT TO GROUND |
| WIPER ON/OFF RELAY |
| BODY CONTROL MODULE |

### Diagnostic Test

#### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, clear all BCM DTC's.

Turn the Wipers on.

With the scan tool, read the DTC information.

**Does the scan tool read: WIPER ON/OFF RELAY OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

#### 2. WIPER ON/OFF RELAY SHORT TO GROUND

Turn the ignition off.

Disconnect the Wiper On/Off Relay.

Measure the resistance between ground and the Wiper On/Off Relay Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Wiper On/Off Relay Control circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

#### 3. WIPER ON/OFF RELAY

Turn the ignition off.

Disconnect the Wiper On/Off Relay harness connector.

Measure the voltage of the Wiper On/Off Relay harness connector coil side feed circuit to ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Wiper On/Off Relay.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

## WIPER PARK SWITCH FAILURE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the Wipers on (any speed).
- **Set Condition:**
  BCM fails to detect a park signal from the wiper motor for 8 consecutive seconds.

| Possible Causes |
|---|
| MULTIFUNCTION SWITCH |
| FRONT WIPER MOTOR GROUND CIRCUIT OPEN |
| FRONT WIPER MOTOR LOW DRIVER CIRCUIT OPEN |
| FRONT WIPER MOTOR |
| FUSED IGNITION SWITCH OUTPUT CIRCUIT |

### Diagnostic Test

#### 1. INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, erase all BCM DTC's.

Turn the Wipers on.

With the scan tool, read DTCs.

**Does the scan tool display: WIPER PARK SWITCH FAILURE?**

**Yes** >> Go To 2

**No** >> The condition is not present at this time. Monitor scan tool parameters while wiggling the related wire harness. Refer to any Technical Service Bulletins that may apply. Visually inspect the related wiring harness and connector terminals.
Perform BODY VERIFICATION TEST - VER 1.

#### 2. FRONT WIPER PARK SWITCH SENSE CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Front Wiper Motor harness connector.

Disconnect the Junction Block C3 harness connector.

Turn the ignition on.

Measure the voltage of the Wiper Park Switch Sense circuit in the Front Wiper Motor harness connector.

**Is there any voltage present?**

**Yes** >> Repair the Wiper Park Switch Sense circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

## 3. FRONT WIPER PARK SWITCH SENSE CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Wiper Motor harness connector.

Disconnect the Junction Block C3 harness connector.

Measure the resistance of the Wiper Park Switch Sense circuit between the Junction Block C3 harness connector and the Wiper Motor harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the Front Wiper Park Switch Sense circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

## 4. FRONT WIPER PARK SWITCH SENSE CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Front Wiper Motor harness connector.

Disconnect the Junction Block C3 harness connector.

Measure the resistance between ground and the Wiper Park Switch Sense circuit in the Junction Block C3 harness connector.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the Front Wiper Park Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

## 5. GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Wiper Motor harness connector.

Using a 12-volt test light connected to 12-volts, test the Ground circuit in the Front Wiper Motor harness connector.

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the Wiper Motor Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

## 6. WIPER MOTOR

Turn the ignition off.

Disconnect the Front Wiper Motor harness connector.

Turn the ignition on.

Connect a jumper wire from the Wiper Park Switch Sense circuit to ground.

With the scan tool in Inputs/Outputs read: Wiper Park Switch state.

**Did the Wiper Park Switch Input change state when connected to ground?**

**Yes** >> Replace the Wiper Motor.
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Body Control Module.
Perform BODY VERIFICATION TEST - VER 1.

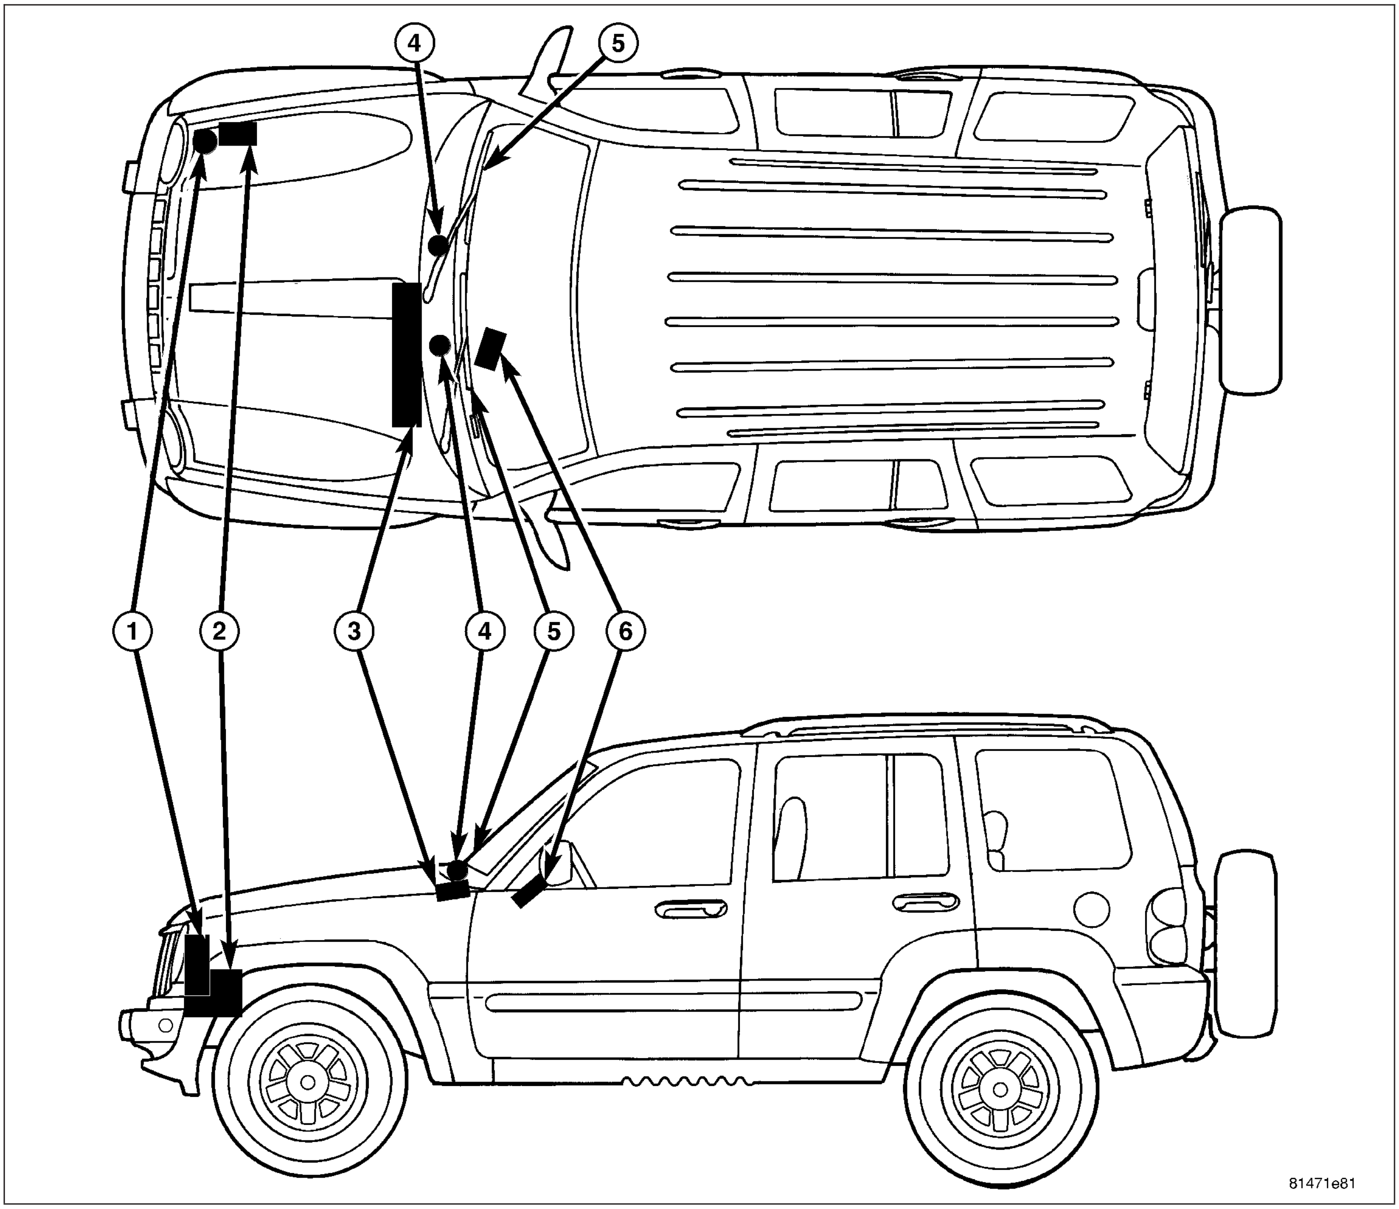
# WIPERS/WASHERS - SERVICE INFORMATION

## TABLE OF CONTENTS

# WIPERS/WASHERS - SERVICE INFORMATION

## DESCRIPTION

## FRONT



An electrically operated intermittent front wiper and washer system is standard factory-installed safety equipment on this vehicle. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

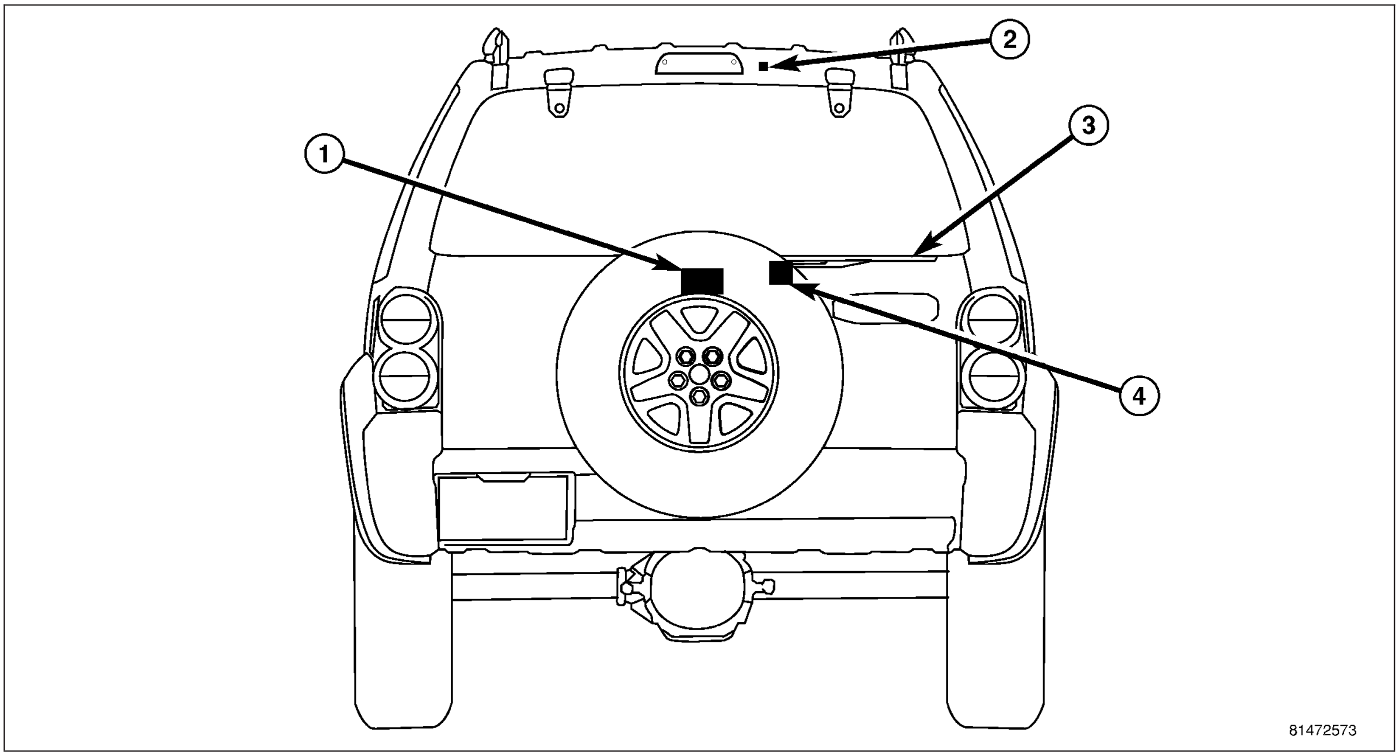
- **Body Control Module** - The Body Control Module (BCM) is located on the Junction Block (JB) under the driver side outboard end of the instrument panel. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL MODULE - DESCRIPTION).
- **Front Check Valve** - The front washer system check valve is integral to the wye fitting located in the washer plumbing between the cowl plenum washer hose and the front washer nozzles, and is concealed beneath the cowl plenum cover/grille panel at the base of the windshield.
- **Front Washer Nozzle (4)** - Two fluidic front washer nozzles are secured by integral latch features to dedicated openings in the cowl plenum cover/grille panel located near the base of the windshield.
- **Front Washer Plumbing** - The plumbing for the washer system consists of rubber hoses and molded plastic fittings. The plumbing is routed along the right side of the engine compartment from the washer reservoir, and

through the dash panel into the cowl plenum beneath the cowl plenum cover/grille panel to the washer nozzles.

- **Front Wiper Arms & Blades (5)** - The two front wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl plenum cover/grille panel located near the base of the windshield. The two front wiper blades are secured to the two wiper arms with an integral latch, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation.
- **Front Wiper Module (3)** - The wiper pivot shafts are the only visible components of the front wiper module. The remainder of the module is concealed within the cowl plenum area beneath the cowl plenum cover/grille panel. The wiper module includes the wiper module bracket, four rubber-isolated wiper module mounts, the wiper motor, the wiper motor crank arm, the two wiper drive links, and the two wiper pivots.
- **Multi-Function Switch (6)** - The multi-function switch is located on the top of the steering column, just below the steering wheel. The multi-function switch includes a left (lighting) control stalk and a right (wiper) control stalk. The right control stalk is dedicated to providing all of the driver controls for both the front and rear wiper systems. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DESCRIPTION).
- **Washer Fluid Level Switch** - The washer fluid level switch is located in a dedicated hole near the center of the rearward facing surface of the washer reservoir, behind the right front wheel house splash shield.
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole on the lower outboard side of the washer reservoir, behind the right front wheel house splash shield. This single reversible washer pump/motor provides washer fluid to either the front or rear washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir (1 & 2)** - The washer reservoir (2) is concealed behind the right front wheel house splash shield ahead of the right front wheel. The washer reservoir filler neck (1) is the only visible portion of the reservoir, and it is accessed from the right front corner of the engine compartment.
- **Wiper High/Low Relay** - The wiper high/low relay is an International Standards Organization (ISO) micro relay located in the Power Distribution Center (PDC) in the engine compartment near the battery.
- **Wiper On/Off Relay** - The wiper on/off relay is an International Standards Organization (ISO) micro relay located in the Power Distribution Center (PDC) in the engine compartment near the battery.

Hard wired circuitry connects the front wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the front wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

## REAR



An electrically operated fixed interval intermittent rear wiper and washer system is standard factory-installed equipment on this vehicle. The rear wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **Multi-Function Switch** - The multi-function switch is located on the top of the steering column, just below the steering wheel. The multi-function switch includes a left (lighting) control stalk and a right (wiper) control stalk. The right control stalk is dedicated to providing all of the driver controls for both the front and rear wiper systems. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DESCRIPTION).
- **Rear Check Valve** - The rear washer system check valve function is performed by the diaphragm integral to the valve body of the washer pump/motor unit in this vehicle. (Refer to 8 - ELECTRICAL/FRONT WIPERS/ WASHERS/WASHER PUMP/MOTOR - DESCRIPTION).
- **Rear Washer Nozzle (2)** - A fluidic rear washer nozzle is secured by a latch feature to a mounting hole in the roof outer panel above the rear flip-up glass opening.
- **Rear Washer Plumbing** - The plumbing for the rear washer system consists of rubber hoses and molded plastic fittings. The plumbing is routed along the right side of the engine compartment from the washer reservoir, through the dash into the passenger compartment, up the right cowl side and A-pillar to the headliner, and above the headliner to the rear washer nozzle on the rear roof header.
- **Rear Wiper Arm & Blade (3)** - The single rear wiper arm is secured by a nut directly to the rear wiper motor output shaft, which extends through the center of the tailgate outer panel near the base of the rear flip-up glass. The single rear wiper blade is secured to the rear wiper arm with an integral latch, and is parked off of the rear flip-up glass when the rear wiper system is not in operation.
- **Rear Wiper Arm Park Ramp (4)** - The molded rubber rear wiper arm park ramp is secured with a screw to the tailgate outer panel to the right of the rear wiper motor output shaft bezel. When the rear wiper system is not in operation, the rear wiper arm is parked off of the rear flip-up glass on this ramp so that it will not interfere with or be damaged by the flip-up glass operation.
- **Rear Wiper Module (1)** - The rear wiper motor output shaft is the only visible component of the rear wiper module. The remainder of the module is concealed within the tailgate below the rear flip-up glass opening. The rear wiper module includes the module bracket, the rear wiper motor, and the rear wiper electronic control circuitry.
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole on the lower outboard side of the washer reservoir, behind the right front wheel house splash shield. This single

reversible washer pump/motor provides washer fluid to either the front or rear washer system plumbing, depending upon the direction of the pump motor rotation. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS/WASHER PUMP MOTOR - DESCRIPTION).

- **Washer Reservoir** - The washer reservoir is concealed behind the right front wheel house splash shield ahead of the right front wheel. The washer reservoir filler neck is the only visible portion of the reservoir, and it is accessed from the right front corner of the engine compartment. This single washer reservoir is shared by both the front and rear washer systems. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS/WASHER RESERVOIR - DESCRIPTION).

Hard wired circuitry connects the rear wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the rear wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

## OPERATION

## FRONT

The front wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outside windshield glass surface that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all front wiper and washer system functions with the right (wiper) control stalk of the multi-function switch that extends from the right side of the steering column, just below the steering wheel. Rotating the control knob on the end of the control stalk, selects the Off, Delay, Low, or High front wiper system operating modes. In the Delay mode, the control knob also allows the vehicle operator to select from one of five intermittent wipe Delay intervals. Pulling the right control stalk downwards actuates the momentary front wiper system Mist mode switch, while pulling the right control stalk towards the steering wheel actuates the momentary front washer system switch. The multi-function switch provides hard wired resistor multiplexed inputs to the Body Control Module (BCM) for all of the front wiper system functions, as well as a separate hard wired sense input to the BCM for the front washer system function.

The front wiper and washer system will only operate when the ignition switch is in the Accessory or On positions. Battery current is directed from a B(+) fuse in the Power Distribution Center (PDC) to the wiper and washer system circuit breaker in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit. The automatic resetting circuit breaker then provides battery current through a fused ignition switch output (run-acc) circuit to the wiper high/low relay, the wiper on/off relay, and the park switch within the front wiper motor. A separate fuse in the JB provides battery current through another fused ignition switch output (run-acc) circuit to the multi-function switch. The multi-function switch circuitry uses this battery feed and a ground circuit input to directly control the operation and direction of the reversible electric washer pump/motor unit. The BCM uses low side drivers to control front wiper system operation by energizing or de-energizing the wiper high/low and wiper on/off relays.

The hard wired circuits and components of the front wiper and washer system may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the Body Control Module (BCM), or the inputs to or outputs from the BCM that control the front wiper and washer system operating modes. The most reliable, efficient, and accurate means to diagnose the BCM, or the BCM inputs and outputs related to the various front wiper and washer system operating modes requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

### OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the wiper and washer system operating modes.

### CONTINUOUS WIPE MODE

When the Low position of the control knob on the right (wiper) control stalk of the multi-function switch is selected, the Body Control Module (BCM) energizes the wiper on/off relay. This directs battery current through the normally open contacts of the energized wiper on/off relay and the normally closed contacts of the de-energized wiper high/low relay to the low speed brush of the front wiper motor, causing the front wipers to cycle at low speed. When the High position of the control knob is selected, the BCM energizes both the wiper on/off relay and the wiper high/low relay. This directs battery current through the normally open contacts of the energized wiper on/off relay and the normally open contacts of the energized wiper high/low relay to the high speed brush of the front wiper motor, causing the front wipers to cycle at high speed.

When the Off position of the control knob is selected, the BCM de-energizes both the wiper on/off and wiper high/low relays, then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob Off position is selected. If the wiper blades are in the down position on the windshield when the Off position is selected, the park switch that is integral to the front wiper motor is closed to ground and the wiper motor ceases to operate.

If the wiper blades are not in the down position on the windshield at the moment the Off position is selected, the park switch is closed to battery current from the fused ignition switch output (run-acc) circuit of the front wiper motor. The park switch directs this battery current to the low speed brush of the wiper motor through the wiper park switch sense circuit and the normally closed contacts of the de-energized wiper on/off and wiper high/low relays. This causes the wiper motor to continue running at low speed until the wiper blades are in the down position on the windshield and the park switch is again closed to ground.

### INTERMITTENT WIPE MODE

When the control knob on the right (wiper) control stalk of the multi-function switch is moved to one of the Delay interval positions, the BCM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input. The BCM monitors the changing state of the wiper motor park switch through a hard wired front wiper park switch sense circuit input. This input allows the BCM to determine the proper intervals at which to energize and de-energize the wiper on/off relay to operate the front wiper motor intermittently for one low speed cycle at a time.

The BCM logic is also programmed to provide an immediate wipe cycle and begin a new delay interval timing cycle each time a shorter delay interval is selected, and to add the remaining delay timing interval to the new delay interval timing before the next wipe cycle occurs each time a longer delay interval is selected.

### MIST WIPE MODE

When the right (wiper) control stalk of the multi-function switch is moved to the momentary Mist position, the BCM energizes the wiper on/off relay for as long as the Mist switch is held closed, then de-energizes the relay when the state of the Mist switch input changes to open. The BCM can operate the front wiper motor in this mode for only one low speed cycle at a time, or for an indefinite number of sequential low speed cycles, depending upon how long the Mist switch is held closed.

### WASH MODE

When the right (wiper) control stalk of the multi-function switch is moved to the momentary front Wash position while the control knob is in the Low or High positions, the circuitry within the switch directs battery current and ground to the washer pump/motor unit. This will cause the washer pump/motor unit to be energized for as long as the front Wash switch is held closed, and to de-energize when the front Wash switch is released.

When the right (wiper) control stalk of the multi-function switch is moved to the momentary front Wash position while the control knob is in one of the Delay interval positions, the front washer pump/motor operation is the same. However, the BCM energizes the wiper on/off relay to override the selected delay interval and operate the front wiper motor in a continuous low speed mode for as long as the front Wash switch is held closed, then de-energizes the relay and reverts to the selected delay mode interval several wipe cycles after the front Wash switch is released. The BCM detects the front Wash switch state through a hard wired washer pump driver circuit input from the multi-function switch.

#### WIPE-AFTER-WASH MODE

When the right (wiper) control stalk of the multi-function switch is moved to the momentary front Wash position while the control knob is in the Off position, the BCM detects that switch state through a hard wired washer pump driver circuit input from the multi-function switch. The BCM responds to this input by energizing the wiper on/off relay for as long as the Wash switch is held closed, then de-energizes the relay several wipe cycles after the front Wash switch is released. The BCM monitors the changing state of the wiper motor park switch through a hard wired front wiper park switch sense circuit input. This input allows the BCM to count the number of wipe cycles that occur after the front Wash switch state changes to open, and to determine the proper interval at which to de-energize the wiper on/off relay to complete the wipe-after-wash mode cycle.

## REAR

The rear wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the rear flip-up glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blade to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the rear flip-up glass surface that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all rear wiper and washer system functions with the right (wiper) control stalk of the multi-function switch that extends from the right side of the steering column, just below the steering wheel. Rotating the control ring on the control stalk to a detent position selects the Off, Delay, or On rear wiper system operating modes. Rotating the control ring on the control stalk to either of two Wash positions actuates the momentary rear washer system switch. The multi-function switch provides hard wired outputs to the rear wiper module and the washer pump/motor unit for all rear wiper and washer system functions.

The rear wiper and washer system will only operate when the ignition switch is in the Accessory or On positions, and the rear flip-up glass and tailgate ajar switches are closed. Battery current is directed from a fuse in the Junction Block (JB) to the multi-function switch through a fused ignition switch output (run-accessory) circuit. The internal circuitry of the right (wiper) control stalk of the multi-function switch then provides battery current signals through a rear wiper on driver circuit and a rear wiper intermittent driver circuit to the rear wiper module and to the Body Control Module (BCM). The BCM uses these rear wiper system inputs as a signal to lock the rear flip-up glass and the tailgate to prevent the rear flip-up glass or tailgate from being opened for as long as the rear wiper is operating. The multi-function switch circuitry also uses this battery current and a ground circuit input to directly control the operation and direction of the reversible electric washer pump/motor unit.

A separate fuse in the JB provides battery current to the electronic control circuitry of the rear wiper module through a fused B(+) circuit. The rear wiper module uses this fused B(+) input to park the rear wiper blade off of the rear flip-up glass if the ignition switch is turned to the Off position while the rear wiper is operating, or if the ignition switch is turned to the Off position before the rear wiper blade has parked. However, if the ignition switch is turned to the Off position while the rear wiper is operating, then turned back On, the rear wiper switch must be cycled to the Off position and back to the On or Delay position before the rear wiper will operate again. In addition, the rear wiper module receives an input from the rear flip-up glass ajar switch on a flip-up glass ajar switch sense circuit, which prevents the rear wiper from operating when the flip-up glass is not closed or fully latched.

The hard wired circuits and components of the rear wiper and washer system may be diagnosed and tested using conventional diagnostic tools and procedures.

### OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the rear wiper and washer system operating modes.

#### CONTINUOUS WIPE MODE

When the On position of the control ring on the right (wiper) control stalk of the multi-function switch is selected, the multi-function switch circuitry directs a battery current signal to the rear wiper module through the rear wiper on driver circuit, causing the rear wiper to cycle continuously at a fixed speed.

#### INTERMITTENT WIPE MODE

When the Delay position of the control ring on the right (wiper) control stalk of the multi-function switch is selected, the multi-function switch circuitry directs a battery current signal to the rear wiper module through the rear wiper intermittent driver circuit, causing the rear wiper to cycle intermittently at a fixed delay interval.

#### WASH MODE

When the momentary Wash (after On) position of the control ring on the right (wiper) control stalk of the multi-function switch is selected, the multi-function switch circuitry directs both battery current and ground to the washer pump/motor unit, and a battery current signal to be provided to the rear wiper module through the rear wiper on driver circuit. This will cause the washer pump/motor unit to be energized and the rear wiper to cycle continuously at a fixed speed for as long as the rear Wash switch is held closed.

#### WIPE-AFTER-WASH MODE

When the momentary Wash (before Off) position of the control ring on the right (wiper) control stalk of the multi-function switch is selected, the multi-function switch circuitry directs both battery current and ground to the washer pump/motor unit, and a battery current signal to be provided to the rear wiper module through the rear wiper on driver circuit. This will cause the washer pump/motor unit to be energized and the rear wiper to cycle continuously at a fixed speed for as long as the rear Wash switch is held closed. When the control ring is released to the Off position, the washer pump/motor is de-energized, but the circuitry within the rear wiper module will provide several additional wipe cycles to complete the wipe-after-wash mode cycle.

## DIAGNOSIS AND TESTING

## FRONT

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: If the front wiper motor operates, but the wipers do not move on the windshield, replace the inoperative front wiper module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the front wiper and washer system components as required. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS - CLEANING) and (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS - INSPECTION).**

The hard wired front wiper and washer system circuits and components of the may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the Body Control Module (BCM), or the inputs to or outputs from the BCM that provide front wiper and washer system service or many of the electronic features of the front wiper and washer systems. The most reliable, efficient, and accurate means to diagnose the BCM, or the BCM inputs and outputs for the front wiper and washer system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REAR

### WIPER SYSTEM

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The diagnosis found here addresses an electrically inoperative rear wiper system. If the rear wiper motor operates, but the wiper does not move on the rear flip-up glass, inspect the mechanical connection between the rear wiper arm and the rear wiper motor output shaft. If OK, replace the inoperative rear wiper module. If the wiper operates, but chatters, lifts, or does not clear the glass, clean and inspect the rear wiper system components as required. (Refer to 8 - ELECTRICAL/REAR WIPERS/WASHERS - CLEANING) and (Refer to 8 - ELECTRICAL/REAR WIPERS/WASHERS - INSPECTION).**

1. Check that the interior lighting switch on the left (lighting) control stalk of the multi-function switch is not in the dome lamp disable position. With all four doors and the tailgate closed, open the rear flip-up glass. The interior lamps should light. Close the rear flip-up glass. Note whether the interior lamps remain lighted. They should turn off after about thirty seconds. If OK, go to Step 2. If not OK, go to Step 9.
2. Check the fused B(+) fuse (Fuse 17 - 15 ampere) in the Junction Block (JB). If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the inoperative fuse.
3. Check for battery voltage at the fused B(+) fuse (Fuse 17 - 15 ampere) in the JB. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit between the JB and the Power Distribution Center (PDC) as required.
4. Check the fused ignition switch output (run-acc) fuse (Fuse 22 - 10 ampere) in the JB. If OK, go to Step 5. If not OK, repair the shorted circuit or component as required and replace the inoperative fuse.
5. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-acc) fuse (Fuse 22 - 10 ampere) in the JB. If OK, turn the ignition switch to the Off position and go to Step 6. If not OK, repair the open fused ignition switch output (run-acc) circuit between the JB and the ignition switch as required.
6. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector for the multi-function switch (Connector C-2) from the switch connector receptacle. Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-acc) circuit cavity of the instrument panel wire harness connector for the multi-function switch (Connector C-2). If OK, go to Step 7. If not OK, repair the open fused ignition switch output (run-acc) circuit between the multi-function switch and the JB as required.
7. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Test the multi-function switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING). If the multi-function switch tests OK, reconnect the instrument panel wire harness connectors for the multi-function switch to the switch connector receptacles and go to Step 8. If the multi-function switch does not test OK, replace the inoperative switch.
8. Remove the tailgate inner trim panel. Disconnect the tailgate wire harness connector for the rear wiper module from the module connector receptacle. Check for continuity between the ground circuit cavity of the tailgate wire harness connector for the rear wiper module and a good ground. There should be continuity. If OK, go to Step 9. If not OK, repair the open ground circuit to ground (G303) as required.
9. Check for continuity between the flip-up glass ajar switch sense circuit cavity of the tailgate wire harness connector for the rear wiper module and a good ground. There should be continuity with the rear flip-up glass open, and no continuity with the rear flip-up glass closed. If OK, go to Step 10. If not OK, repair the open flip-up glass ajar circuit between the rear wiper module and the flip-up glass ajar switch as required.
10. Reconnect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the tailgate wire harness connector for the rear wiper module. If OK, go to Step 11. If not OK, repair the open fused B(+) circuit between the rear wiper module and the JB as required.
11. Turn the ignition switch to the On position. Turn the control ring on the right (wiper) control stalk of the multi-function switch to the Delay position. Check for battery voltage at the rear wiper intermittent driver circuit cavity

of the tailgate wire harness connector for the rear wiper module. If OK, go to Step 12. If not OK, repair the open rear wiper intermittent driver circuit between the rear wiper module and the multi-function switch as required.

12. Turn the control ring on the right (wiper) control stalk of the multi-function switch to the On position. Check for battery voltage at the rear wiper on driver circuit cavity of the tailgate wire harness connector for the rear wiper module. If OK, replace the inoperative rear wiper module. If not OK, repair the open rear wiper on driver circuit between the rear wiper module and the multi-function switch as required.

### WASHER SYSTEM

**WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.**

**NOTE: The diagnosis found here addresses an electrically inoperative rear washer system. If the washer pump/motor operates, but no washer fluid is emitted from the rear washer nozzle, be certain to check the fluid level in the reservoir. Also inspect the rear washer system components as required. (Refer to 8 - ELECTRICAL/REAR WIPERS/WASHERS - INSPECTION).**

1. Turn the ignition switch to the On position. Turn the control ring on the right (wiper) control stalk of the multi-function switch to the On position. Check whether the rear wiper system is operating. If OK, go to Step 2. If not OK, test and repair the rear wiper system before continuing with these tests. Refer to WIPER SYSTEM .
2. Pull the right (wiper) control stalk of the multi-function switch toward the steering wheel. Check whether the front washer system is operating. If OK, test the multi-function switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING). If the multi-function switch tests OK, go to Step 3. If the multi-function switch does not test OK, replace the inoperative switch.
3. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the headlamp and dash wire harness connector for the washer pump/motor unit from the pump/motor unit connector receptacle. Check for continuity between the washer pump driver circuit cavity of the headlamp and dash wire harness connector for the washer pump/motor unit and a good ground. There should be no continuity. If OK, go to Step 4. If not OK, repair the shorted washer pump driver circuit between the washer pump/motor unit and the multi-function switch as required.
4. Check for continuity between the washer pump driver circuit cavities of the headlamp and dash wire harness connector for the washer pump/motor unit and the instrument panel wire harness connector for the multi-function switch (Connector C-2). There should be continuity. If OK, go to Step 5. If not OK, repair the open washer pump driver circuit between the washer pump/motor unit and the multi-function switch as required.
5. Check for continuity between the washer pump sense circuit cavity of the headlamp and dash wire harness connector for the washer pump/motor unit and a good ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted washer pump sense circuit between the washer pump/motor unit and the multi-function switch as required.
6. Check for continuity between the washer pump sense circuit cavities of the headlamp and dash wire harness connector for the washer pump/motor unit and the instrument panel wire harness connector for the multi-function switch (Connector C-2). There should be continuity. If OK, replace the inoperative washer pump/motor unit. If not OK, repair the open washer pump sense circuit between the washer pump/motor unit and the multi-function switch as required.

## CLEANING

## FRONT

### WIPER SYSTEM

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms, and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

**CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.**

### WASHER SYSTEM

If the washer system is contaminated with foreign material, drain the washer reservoir using a siphon. Remove the washer pump/motor from the reservoir. Clean foreign material from the inside of the washer pump/motor inlet grommet seal/filter screen and flush the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted washer nozzles should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

**CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.**

**CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.**

## REAR

### WIPER SYSTEM

The squeegee of a wiper blade exposed to the elements for a long time tends to lose its wiping effectiveness. Periodic cleaning of the squeegee is suggested to remove any deposits of salt or road film. The wiper blade, arm, and rear flip-up glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blade continues to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

**CAUTION: Protect the rubber squeegee of the wiper blade from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegee.**

### WASHER SYSTEM

**CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegee of the wiper blade.**

**CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.**

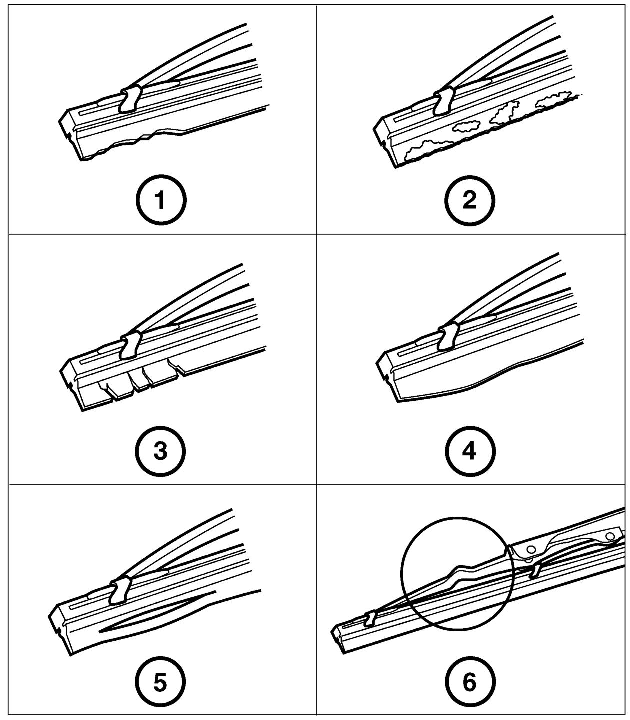
# INSPECTION

## FRONT

### WIPER SYSTEM

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blades for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arms for damage (6) or corrosion. If the wiper arms and blades are contaminated with any foreign material, clean them and the glass as required. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS - CLEANING). If a wiper blade or arm is damaged, or if corrosion is evident, replace the affected wiper arm or blade with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.



**CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.**

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. Compare the scale readings between the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.
4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

### WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

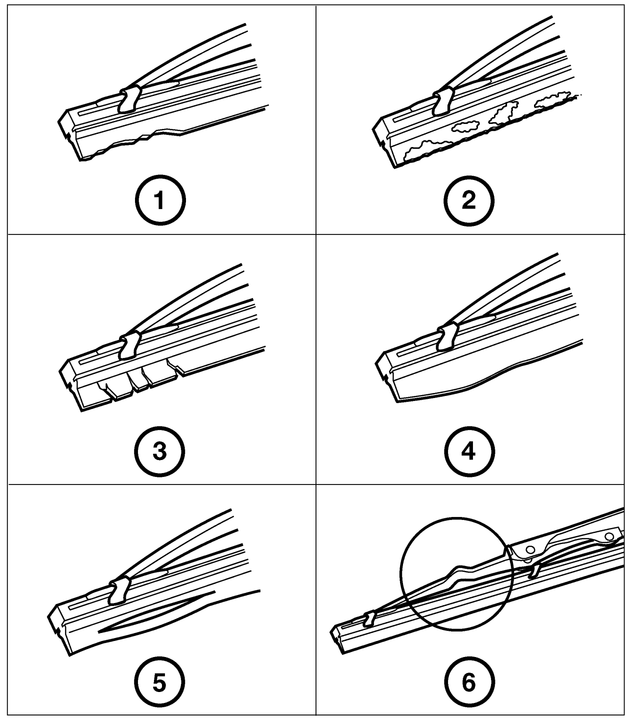
1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS - CLEANING).
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

## REAR

### WIPER SYSTEM

The rear wiper blade and wiper arm should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blade for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arm for damage (6). If the wiper arms and blades are contaminated with any foreign material, clean them and the glass as required. (Refer to 8 - ELECTRICAL/REAR WIPERS/WASHERS - CLEANING). If a wiper blade or arm is damaged, replace the affected wiper blade or arm with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.



809ac961

**CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.**

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. The spring tension of the wiper arm should be sufficient to cause the rubber squeegee to conform to the curvature of the glass. Replace a wiper arm if it has low or no spring tension.
4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

### WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. (Refer to 8 - ELECTRICAL/REAR WIPERS/WASHERS - CLEANING).
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

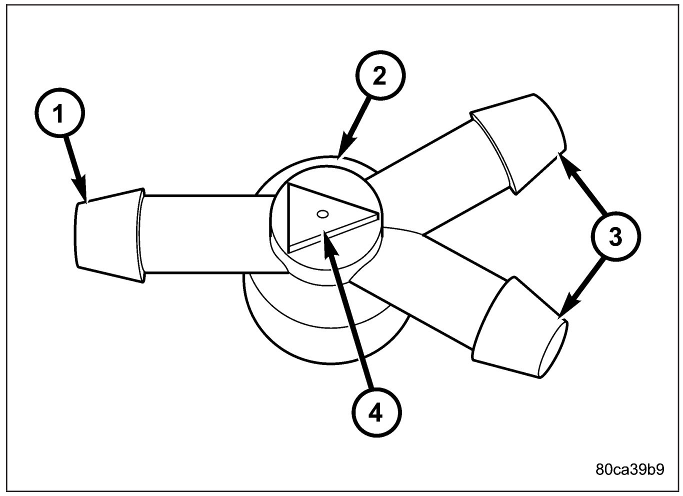
# CHECK VALVE

## DESCRIPTION

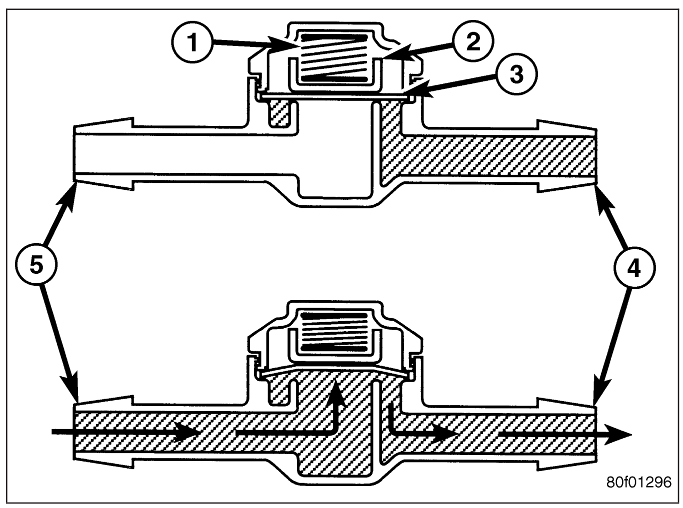
A single front washer system check valve (2) is standard equipment on this vehicle, and is installed in the front washer system plumbing. The front check valve is integral to the front washer nozzle plumbing wye fitting located in the cowl plenum area beneath the cowl plenum cover/grille panel near the base of the windshield. The check valve consists of a molded plastic body with a raised arrowhead (4) molded into its center section that indicates the direction of the flow through the valve, and three barbed hose nipples (1 & 3) formed in a wye configuration on the outside circumference of the center section of the valve body.



The front check valve cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

## OPERATION

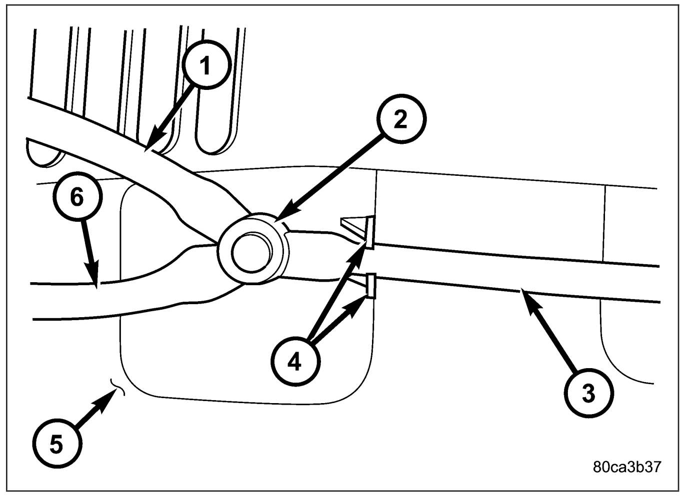
The front check valve provides more than one function in this application. It serves as a wye connector fitting between the cowl grille panel and washer nozzle sections of the front washer supply hose. It prevents washer fluid from draining out of the front washer supply hoses back to the washer reservoir. This drain-back would result in a lengthy delay when the front washer switch is actuated until washer fluid was dispensed through the front washer nozzles, because the washer pump would have to refill the front washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzles after the washer system is turned Off.



When the washer pump pressurizes and pumps washer fluid from the reservoir (5) through the washer plumbing, the fluid pressure unseats a diaphragm (3) from over a sump well within the valve by overriding the spring pressure (1) applied to it by a piston (2). With the diaphragm unseated, washer fluid is allowed to flow toward the two washer nozzles (4). When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the valve and fluid flow in either direction within the washer plumbing is prevented.

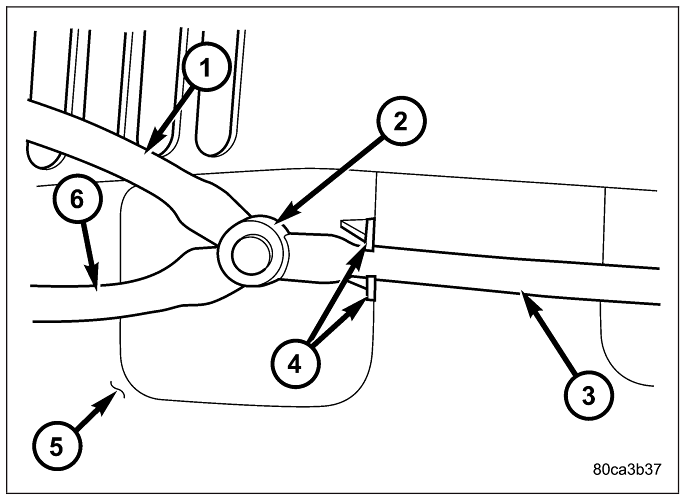
## REMOVAL

1. Unlatch and open the hood.
2. Remove both front wiper arms from the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - FRONT/FRONT WIPER ARM - REMOVAL).
3. Remove the cowl plenum cover/grille panel from over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).
4. From the underside of the cowl plenum cover/grille panel (5), disconnect the cowl plenum (3) and washer nozzle hoses (1 & 6) from the three barbed nipples of the front check valve (2).
5. Remove the front check valve from the underside of the cowl plenum cover/grille panel.



## INSTALLATION

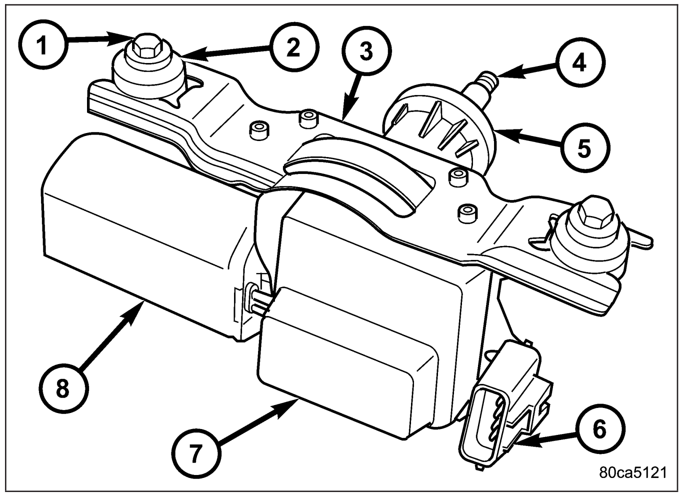
1. Position the front check valve (2) to the underside of the cowl plenum cover/grille panel (5). Be certain that the flow direction arrow molded into the front check valve body is oriented towards the front washer nozzles.
2. From the underside of the cowl plenum cover/grille panel, reconnect the cowl plenum (3) and washer nozzle hoses (1 & 6) to the three barbed nipples of the front check valve.
3. Reinstall the cowl plenum cover/grille panel over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).
4. Reinstall both front wiper arms onto the wiper pivots. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS/FRONT WIPER ARM - INSTALLATION).
5. Close and latch the hood.



# REAR WIPER MOTOR

## DESCRIPTION

The rear wiper motor is concealed within the tailgate, below the rear flip-up glass opening and behind the tailgate inner trim panel. The end of the motor output shaft (4) that protrudes through the tailgate outer panel to drive the rear wiper arm and blade is the only visible component of the rear wiper motor. A rubber gasket (5), a bezel, and a nut secure and seal the motor output shaft to the tailgate outer panel. A molded plastic nut cover snaps onto the bezel to conceal the nut and improve appearance. An integral connector receptacle (6) connects the rear wiper motor to the vehicle electrical system through a dedicated take out and connector of the tailgate wire harness. The rear wiper motor consists of the following major components:



- **Bracket (3)** - The rear wiper motor bracket consists of a stamped steel mounting plate for the wiper motor that is secured with screws through two rubber insulators to the tailgate inner panel.
- **Rear Wiper Module (7)** - The rear wiper motor electronic controls are concealed beneath a molded plastic cover and includes the rear wiper system electronic logic and rear wiper motor electronic controls.
- **Motor (8)** - The permanent magnet rear wiper motor is secured with screws to the rear wiper motor bracket. The wiper motor includes an integral transmission, and the motor output shaft.

The rear wiper motor cannot be adjusted or repaired. If any component of the motor is inoperative or damaged, the entire rear wiper motor unit must be replaced. The motor output shaft gasket, bezel, nut, and nut cover are available for individual service replacement.

## OPERATION

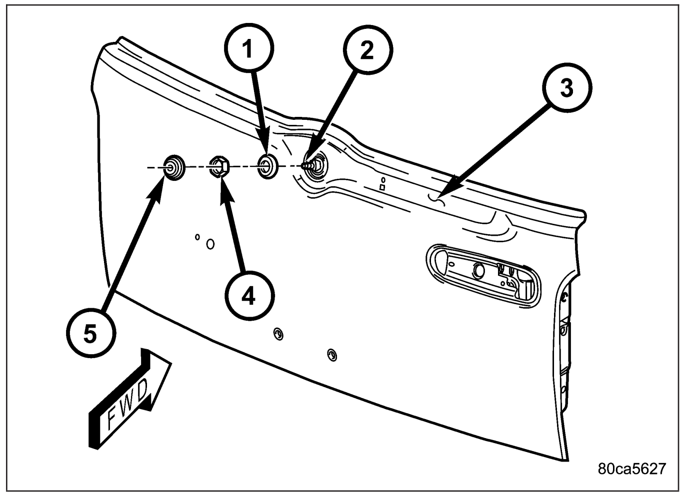
The rear wiper motor receives non-switched battery current through a fuse in the Junction Block (JB) on a fused B(+) circuit and is connected to ground at all times. The rear wiper motor operation is controlled by the vehicle operator through battery current signal inputs received by the rear wiper motor electronic control module from the rear wiper switch circuitry that is integral to the right (wiper) control stalk of the multi-function switch on the steering column. The module also receives an external control input from the flip-up glass ajar switch sense circuit. If the rear wiper module senses that the flip-up glass is ajar, it will not allow the rear wiper motor to operate.

The rear wiper module electronic control logic uses these inputs, its internal inputs, and its programming to provide a continuous wipe mode, an intermittent wipe mode, a wipe-after-wash mode, and off-the-glass wiper blade parking. The wiper blade cycling is controlled by the internal electronic controls of the module. The module controls current flow to the wiper motor brushes and provides an electronic speed control that speeds the wiper blade near the center of the glass, but slows the wiper blade during directional reversals at each end of the wipe pattern and during wiper blade off-the-glass parking for quieter operation.

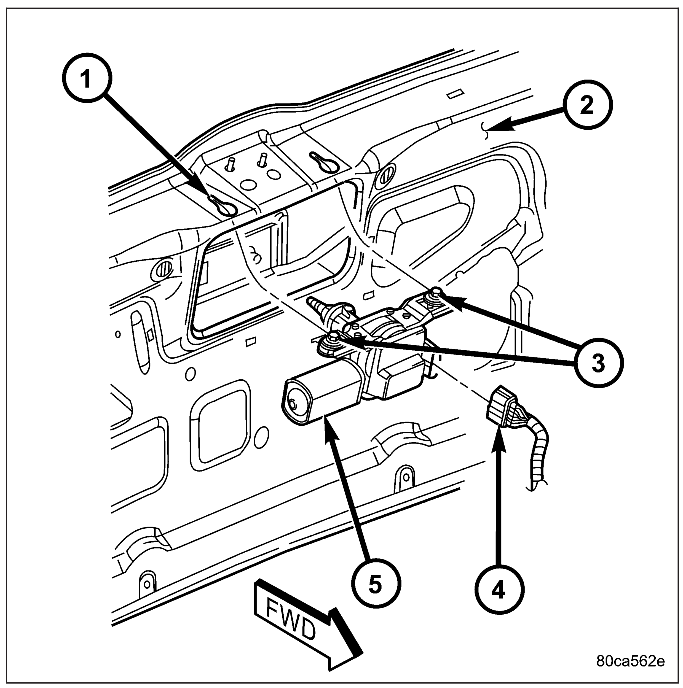
The wiper motor transmission converts the rotary output of the wiper motor to the back and forth wiping motion of the rear wiper arm and blade on the rear flip-up glass. The rear wiper motor may be diagnosed using conventional diagnostic tools and methods.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the rear wiper arm from the rear wiper motor output shaft. (Refer to 8 - ELECTRICAL/ REAR WIPERS/WASHERS/REAR WIPER ARM - REMOVAL).
3. Using a small thin-bladed tool, gently pry at the notch in the base of the rear wiper motor output shaft bezel (1) to unsnap the nut cover (5) from the bezel. **Be certain to take proper precautions to protect the outer tailgate panel and its paint finish from damage during this procedure.**
4. Remove the nut (4) that secures the rear wiper motor output shaft (2) to the outer tailgate panel (3).
5. Remove the bezel and gasket from the rear wiper motor output shaft.

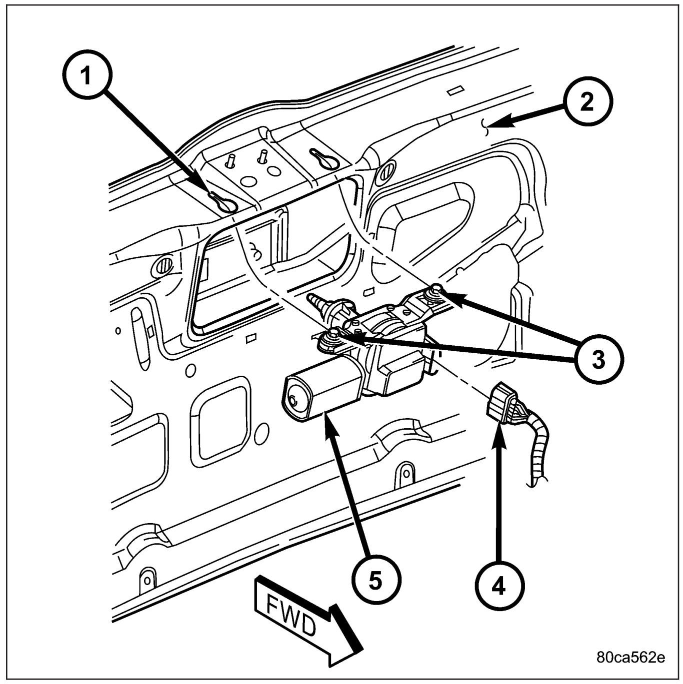


6. Remove the trim panel from the tailgate inner panel. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - REMOVAL).
7. Disconnect the tailgate wire harness connector for the flip-up glass ajar switch from the flip-up glass latch connector receptacle.
8. Disconnect the tailgate wire harness connector (4) for the rear wiper motor (5) from the motor connector receptacle.
9. Loosen the two screws (3) that secure the rear wiper motor mounting bracket to the top of the tailgate inner panel (2).
10. Slide the rear wiper motor and mounting bracket forward far enough to disengage the two mounting screws from the keyed slots (1) in the top of the tailgate inner panel.
11. Remove the rear wiper motor and mounting bracket from the tailgate as a unit.

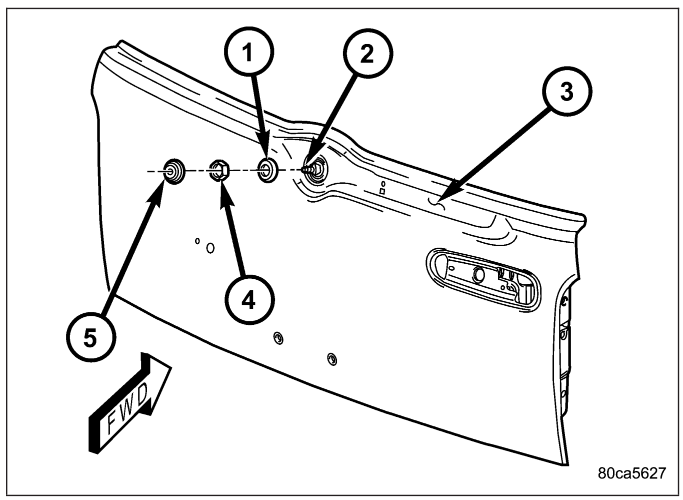


## INSTALLATION

1. Position the rear wiper motor (5) and bracket into the tailgate (2) as a unit.
2. Insert the rear wiper motor output shaft through the hole in the tailgate outer panel and engage the two mounting screws (3) into the keyed slots (1) in the top of tailgate inner panel.



3. From the outside of the tailgate (3), center the rear wiper motor output shaft (2) in the tailgate outer panel clearance hole and install the gasket and bezel (1) over the centered shaft.
4. Install and tighten the nut (4) that secures the rear wiper motor output shaft to the outer tailgate panel. Tighten the nut to 5 N·m (43 in. lbs.).
5. From the inside of the tailgate, tighten the two screws that secure the rear wiper motor mounting bracket to the top of the tailgate inner panel. Tighten the screws to 6 N·m (57 in. lbs.).
6. Reconnect the tailgate wire harness connector for the rear wiper motor to the motor connector receptacle.
7. Reconnect the tailgate wire harness connector for the flip-up glass ajar switch to the flip-up glass latch connector receptacle.

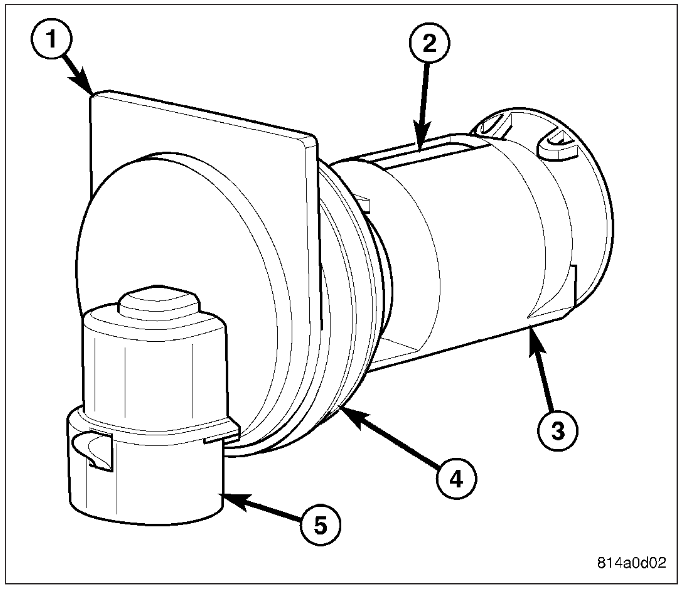


8. Reinstall the trim panel onto the tailgate inner panel. (Refer to 23 - BODY/SWING GATE/TRIM PANEL - INSTALLATION).
9. From the outside of the tailgate, press the nut cover (5) firmly and evenly over the rear wiper motor output shaft bezel using hand pressure until it snaps into place.
10. Reinstall the rear wiper arm onto the rear wiper motor output shaft. (Refer to 8 - ELECTRICAL/REAR WIPERS/WASHERS/REAR WIPER ARM - INSTALLATION).
11. Reconnect the battery negative cable.

# WASHER FLUID LEVEL SWITCH

## DESCRIPTION

The washer fluid level switch is a single pole, single throw reed-type switch mounted just above the sump area near the bottom of the washer reservoir. Only the molded plastic switch mounting flange (1) and the integral connector receptacle (5) are visible when the switch is installed in the reservoir. A short nipple formation (4) extends from the inner surface of the switch mounting flange, and a barb on the nipple near the switch mounting flange is pressed through a rubber grommet seal installed in the mounting hole of the reservoir.



A molded plastic float (3) rides saddle-like over a molded plastic beam that extends axially from the switch mounting flange. A small permanent magnet (2) is secured in a receptacle on the top of the float, and the reed switch is concealed within the beam. A diagnostic resistor is connected between the two switch terminals within the switch mounting flange. The washer fluid level switch cannot be adjusted or repaired. If inoperative or damaged, the switch must be replaced.

## OPERATION

The washer fluid level switch uses a float to monitor the level of the washer fluid in the washer reservoir. The float contains a small magnet. When the float moves, the proximity of this magnet to a stationary reed switch within the beam formation of the switch changes. When the fluid level in the washer reservoir is at or above the float level, the float rises and the influence of the float magnetic field is removed from the reed switch causing the normally open reed switch contacts to open. When the fluid level in the washer reservoir falls below the level of the float, the float falls and the influence of the float magnetic field is applied to the reed switch, causing the contacts of the normally open reed switch to close.

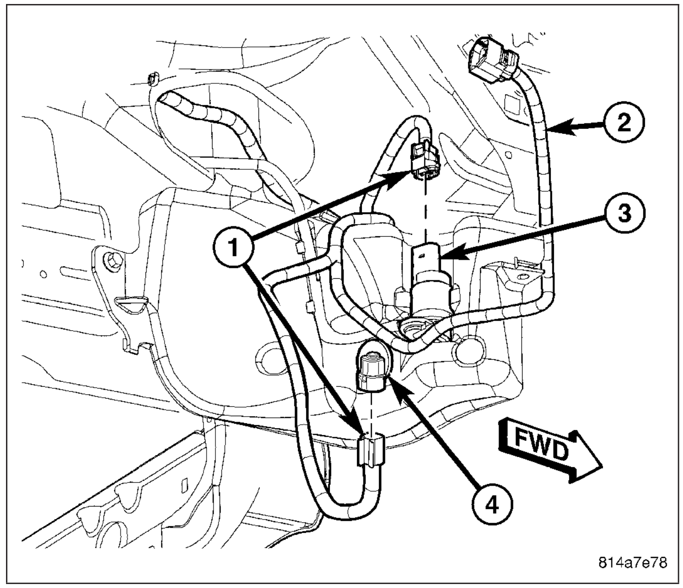
The washer fluid level switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness. The switch is connected in series between ground and the washer fluid switch sense input to the ElectroMechanical Instrument Cluster (EMIC). The switch receives a path to ground at all times through another take out of the headlamp and dash wire harness with a single eyelet terminal connector that is secured under a ground screw near the front of the left front fender inner shield in the engine compartment. When the switch closes, the EMIC senses the ground on the washer fluid switch sense circuit. The EMIC is programmed to respond to this input by illuminating the washer fluid indicator and by sounding an audible chime tone warning.

The washer fluid level switch input to the EMIC may be diagnosed using conventional diagnostic tools and methods. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/WASHER FLUID INDICATOR - DIAGNOSIS AND TESTING).

## REMOVAL

**NOTE: The washer fluid level switch can be removed from the washer reservoir without removing the reservoir from the vehicle.**

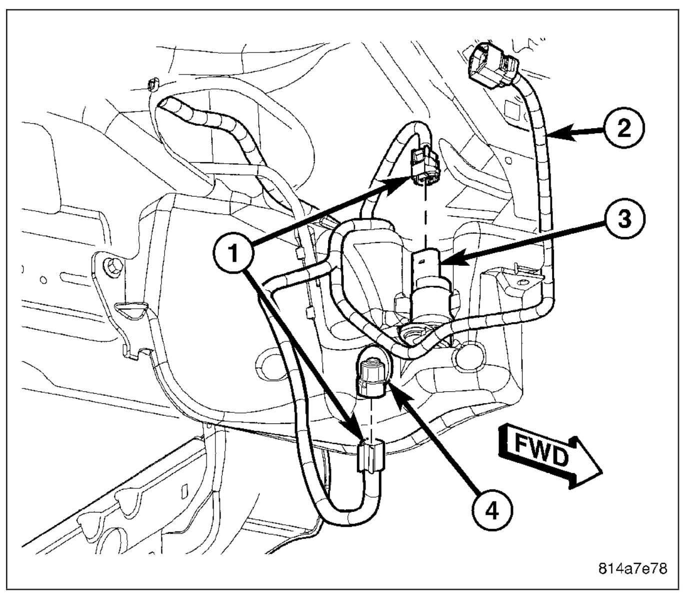
1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir into a clean container for reuse.
3. Turn the steering wheel to move the front wheels to the full right position.
4. Raise and support the vehicle.
5. Remove the plastic push-in fasteners that secure the forward end of the front wheelhouse splash shield to the inner fender panel and the front fascia. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL).
6. Pull the forward end of the front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the washer fluid level switch (4) for service.
7. Disconnect the headlamp and dash wire harness (2) connector (1) for the washer fluid level switch from the switch connector receptacle.



8. Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level switch out of the rubber grommet seal on the reservoir just above the sump. Care must be taken not to damage the reservoir.
9. Remove the washer fluid level switch from the washer reservoir.
10. Remove the rubber grommet seal from the washer fluid level switch mounting hole in the washer reservoir and discard.

## INSTALLATION

1. Install a new rubber grommet seal into the washer fluid level switch mounting hole in the washer reservoir. Always use a new rubber grommet seal on the reservoir.
2. Insert the float of the washer fluid level switch (4) through the rubber grommet seal and into the washer reservoir. The connector receptacle of the washer fluid level switch should be pointed downward.
3. Using hand pressure, press firmly and evenly on the washer fluid level switch mounting flange until the barbed nipple is fully seated in the rubber grommet seal in the washer reservoir mounting hole.
4. Reconnect the headlamp and dash wire harness (2) connector (1) for the washer fluid level switch to the switch connector receptacle.
5. Reposition the forward end of the front wheelhouse splash shield to the inner fender panel and the front fascia.



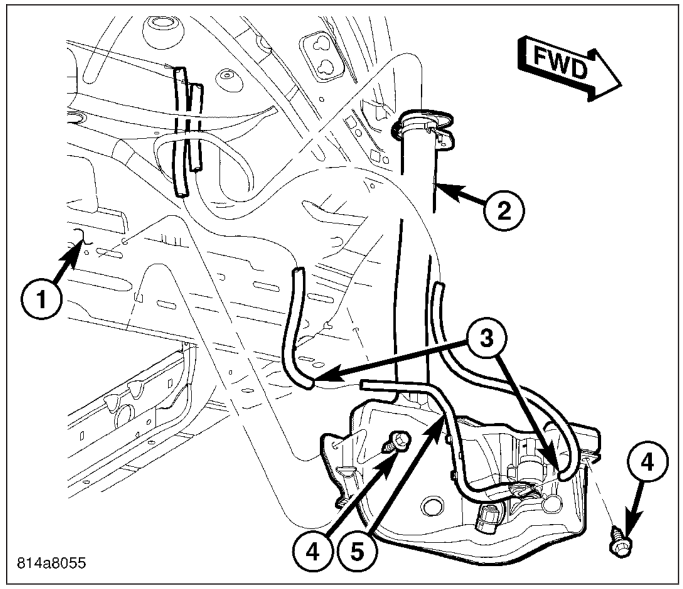
6. Reinstall the plastic push-in fasteners that secure the front wheelhouse splash shield to the inner fender panel and the front fascia. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - INSTALLATION).
7. Lower the vehicle.
8. Reconnect the battery negative cable.
9. Refill the washer reservoir with the washer fluid siphoned from the reservoir during the removal procedure.

# WASHER HOSES/TUBES

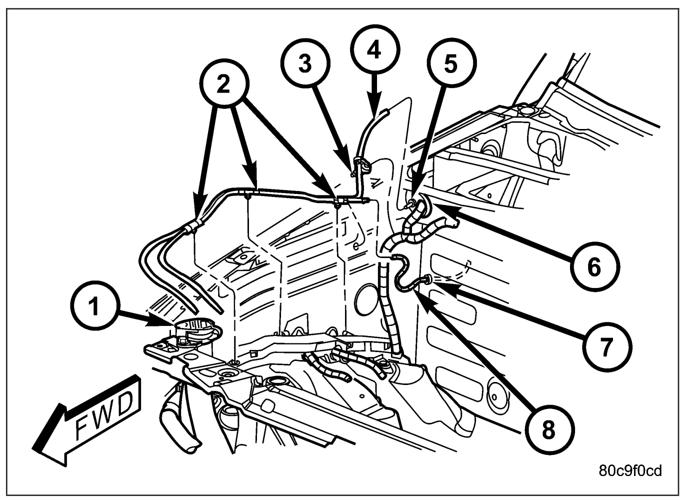
## DESCRIPTION

### FRONT

The front washer plumbing consists of a small diameter rubber hose (3) that is routed from the barbed outlet nipple of the reversible electric washer pump/motor unit on the washer reservoir (2) and along the reservoir filler neck into the engine compartment.



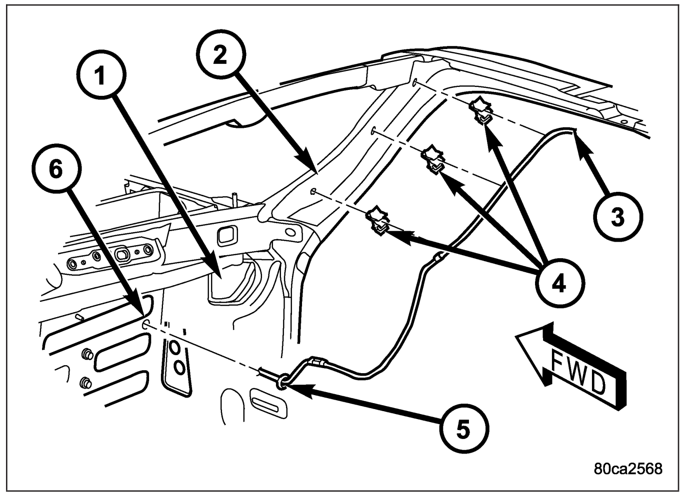
Within the engine compartment, the front washer hose (4) is routed side by side with the engine compartment rear washer hose along the top of the right front fender wheel house to the dash panel. Molded plastic routing clips (2) secure the hoses to the headlamp and dash wire harness in the engine compartment. The front washer hose is connected in the engine compartment to the barbed nipple of a molded plastic in-line fitting (5) installed through a rubber grommet (6) in a hole in the right side of the dash plenum panel. The barbed nipple of the in-line fitting protrudes through the other side of the rubber grommet into the cowl plenum area, where the cowl plenum washer hose joins the front washer hose to the front check valve/wye fitting.



The cowl plenum washer hose is routed through integral routing clips on the underside of the cowl plenum cover/grille panel to the molded plastic wye fitting. The cowl plenum washer hose is connected to one nipple on the wye fitting and the two washer nozzle hoses are connected to the other two wye fitting nipples. The washer nozzle hoses are then routed along the underside of the cowl plenum cover/grille panel to the two front washer nozzles.

Washer hose is available for service only as roll stock, which must then be cut to length. The molded plastic washer hose fittings cannot be repaired. If these fittings are inoperative or damaged, they must be replaced.

## REAR



The rear washer plumbing consists of small diameter rubber hose routed from the barbed outlet nipple of the reversible electric washer pump/motor unit on the washer reservoir through a trough molded into the reservoir rearward of the washer pump up to the top of the reservoir. Near the base of the reservoir filler neck an in-line plastic fitting connects the reservoir rear washer hose to the engine compartment rear washer hose, which is routed through the reservoir filler neck opening in the front extension of the right front fender wheel house panel in to the engine compartment. The engine compartment rear washer hose is routed side by side with the front washer hose along the top of the right front fender wheel house to the dash panel. Molded plastic routing clips secure the hoses to the headlamp and dash wire harness in the engine compartment.

The engine compartment rear washer hose is connected to the headliner washer hose (3) near the right side of the dash panel with a molded plastic in-line fitting. The headliner hose has a rubber grommet (5) that allows it to pass through the dash panel from the passenger compartment into the engine compartment. The headliner hose is routed below the instrument panel in the passenger compartment near the right cowl side inner panel (1). The hose is routed up the right A-pillar (2) to the headliner. Mounting clips (4) secure the hose to the A-pillar. The headliner hose is glued to top of the headliner and routed along the right roof side rail to the rear of the vehicle. At the rear of the vehicle, the headliner hose passes through a hole at the rear portion of the roof rear inner header panel and is connected to the rear washer nozzle.

Washer hose is available for service only as roll stock, which must then be cut to length. The headliner washer hose is integral to the headliner unit and, if inoperative or damaged, the headliner unit must be replaced. However, the headliner hose is marked with a white cut line on the A-pillar where the hose should be cut and spliced with a plastic in-line connector fitting to facilitate headliner removal without the need to remove the instrument panel. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL AND INSTALLATION). The molded plastic washer hose fittings cannot be repaired. If these fittings are inoperative or damaged, they must be replaced.

## OPERATION

## FRONT

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor through the front washer system plumbing and fittings to the two front washer nozzles. Whenever routing the washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

## REAR

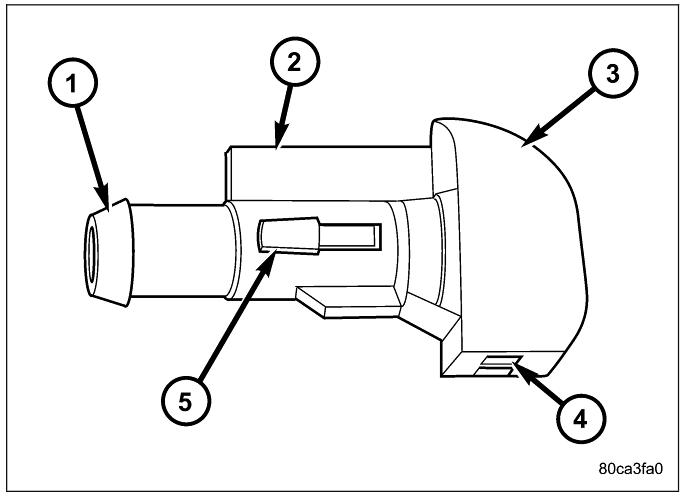
Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor through the rear washer system plumbing and fittings to the rear washer nozzle located on the roof panel above the rear flip-up glass opening. Whenever routing the washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

# WASHER NOZZLE

## DESCRIPTION

### FRONT

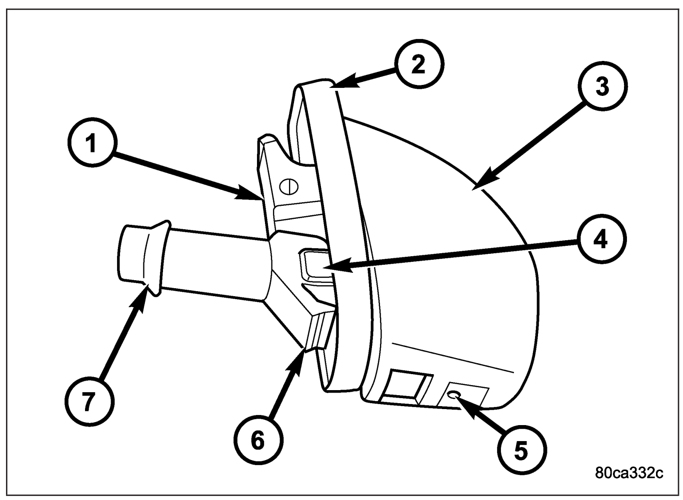
The two front washer nozzles (3) have integral latch features (5) and an anti-rotation tab (2) that secure them in dedicated holes in the cowl plenum cover/grille panel located near the base of the windshield. The domed upper surface of the washer nozzle is visible on the top of the plenum cover/grille panel, and the nozzle orifice (4) is oriented towards the windshield glass. The washer plumbing fittings (1) for the washer nozzles are concealed beneath the cowl plenum cover/grille panel. These fluidic washer nozzles are constructed of molded plastic.



The cowl plenum cover/grille panel must be removed from the vehicle to access the nozzles for service. The washer nozzles cannot be adjusted or repaired. If inoperative or damaged, they must be replaced.

### REAR

The rear washer nozzle (3) is a fluidic-type unit constructed of molded plastic. The nozzle is secured by a snap fit in a dedicated mounting hole located in the rear edge of the roof panel above the rear flip-up glass opening and to the right of the Center High Mounted Stop Lamp (CHMSL) unit. The nozzle orifice (5) is oriented downward toward the glass. A rubber gasket (2) on the back of the nozzle seals the nozzle to the roof panel opening. The back of the nozzle includes an integral alignment feature (4) on the left side, an integral engagement tab (1) on the top, an integral latch feature (6) on the bottom, and the washer plumbing nipple (7) which are all concealed between the outer roof panel and the rear roof inner header.



The rear washer nozzle latch feature is a one time component, and will be damaged if the nozzle is removed from its mounting hole for service. The rear washer nozzle cannot be adjusted or repaired. If inoperative or damaged, the entire nozzle unit must be replaced.

## OPERATION

### FRONT

The two front washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor unit through a single hose, which is attached to a barbed nipple on each front washer nozzle below the cowl plenum cover/grille panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

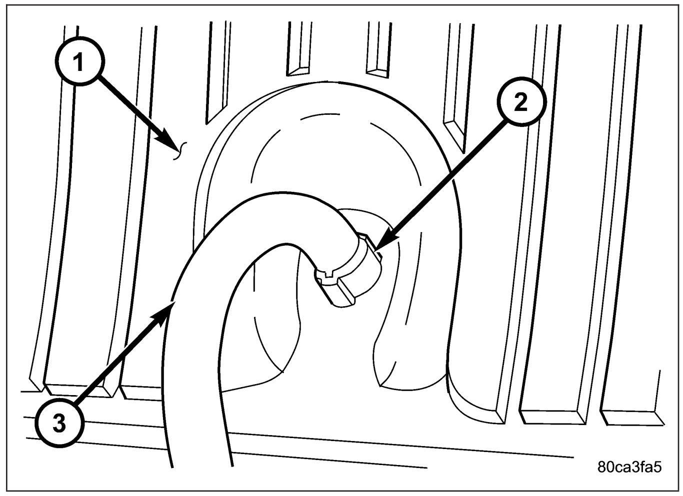
## REAR

The rear washer nozzle is designed to dispense washer fluid into the wiper pattern area on the outside of the rear flip-up glass. Pressurized washer fluid is fed to the nozzle from the washer reservoir by the washer pump/motor through a single hose, which is attached to a barbed nipple on the back of the rear washer nozzle. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

## REMOVAL

## FRONT

1. Unlatch and open the hood.
2. Remove both front wiper arms from the wiper pivots. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS/FRONT WIPER ARM - REMOVAL).
3. Remove the cowl plenum cover/grille panel from over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).
4. From the underside of the cowl plenum cover/grille panel (1), disconnect the washer nozzle hose (3) from the barbed nipple of the front washer nozzle (2).
5. From the underside of the cowl plenum cover/grille panel, release the integral latch features of the front washer nozzle and push the nozzle out through the mounting hole toward the top side of the cowl plenum cover/grille panel.

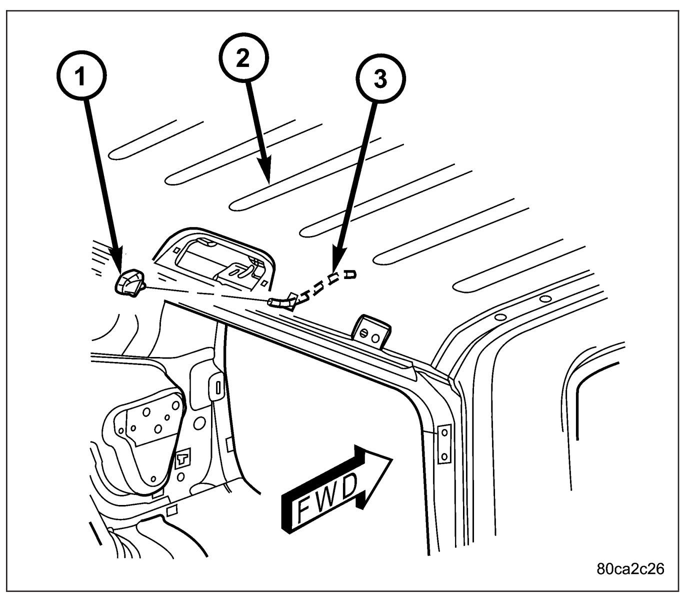


6. Remove the front washer nozzle from the top of the cowl plenum cover/grille panel.

## REAR

**NOTE: The rear washer nozzle latch feature is a one time component, and will be damaged if the nozzle is removed from its mounting hole for service. If removed from its mounting hole for any reason, the rear washer nozzle must be replaced with a new unit.**

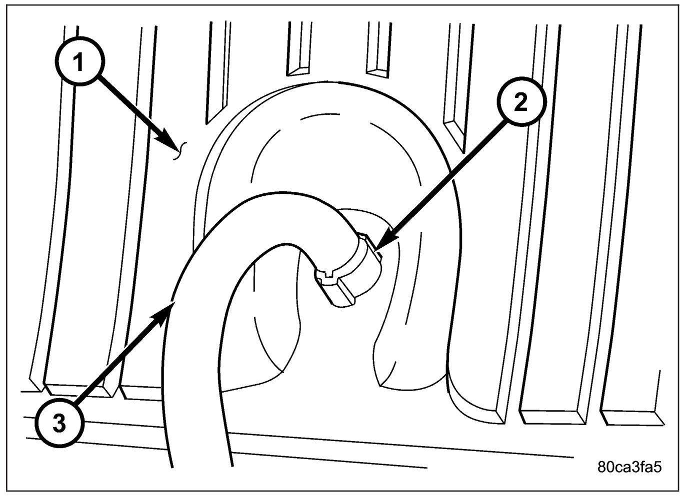
1. Using a trim stick or another suitable wide flat-bladed tool, gently pry the bottom of the rear washer nozzle (1) away from the roof panel (2) until the latch feature at the bottom of the nozzle that secures it in the mounting hole of the roof panel unsnaps.
2. Pull the rear washer nozzle out from the roof panel far enough to access the headliner washer hose (3).
3. Disconnect the washer hose from the barbed nipple on the back of the rear washer nozzle.
4. Discard the rear washer nozzle.



# INSTALLATION

## FRONT

1. From the top of the cowl plenum cover/grille panel, position the nipple end of the front washer nozzle (2) through the mounting hole and engage the anti-rotation tab of the nipple into the anti-rotation notch in the mounting hole.
2. Push firmly and evenly on the top of the front washer nozzle until the integral latch features lock into place on the underside of the cowl plenum cover/grille panel (1).
3. From the underside of the cowl grille cover, reconnect the washer hose (3) to the barbed nipple of the front washer nozzle.
4. Reinstall the washer hose for the front washer nozzle into its routing clips on the underside of the cowl plenum cover/grille panel.

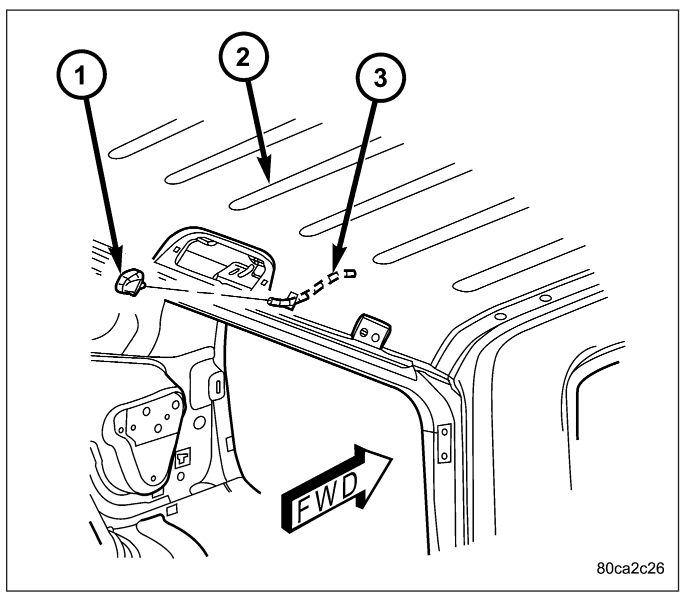


5. Reinstall the cowl plenum cover/grille panel over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).
6. Reinstall both front wiper arms onto the wiper pivots. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS/FRONT WIPER ARM - INSTALLATION).
7. Close and latch the hood.

## REAR

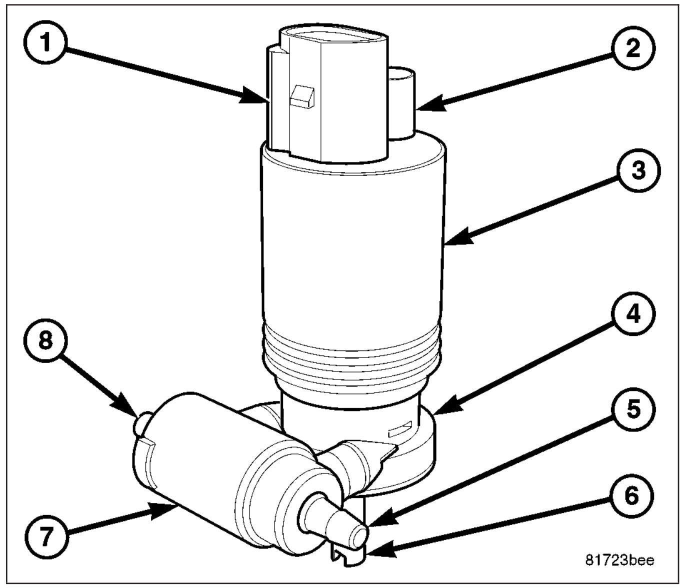
**NOTE: The rear washer nozzle latch feature is a one time component, and will be damaged if the nozzle is removed from its mounting hole for service. If removed from its mounting hole for any reason, the rear washer nozzle must be replaced with a new unit.**

1. Position the new rear washer nozzle (1) to the mounting hole in the roof panel (2). Be certain that a new rubber gasket is in position on the back of the nozzle.
2. Reconnect the headliner washer hose (3) to the barbed nipple on the back of the rear washer nozzle.
3. Insert the rear washer nozzle and hose into the mounting hole in the roof panel and align the nozzle with the hole.
4. Engage the tab at the top of the nozzle behind the sheet metal at the top of the roof panel mounting hole.
5. Using hand pressure, press firmly and evenly on the hood of the rear washer nozzle until the lower latch feature snaps into place behind the sheet metal at the bottom of the roof panel mounting hole.



# WASHER PUMP/MOTOR

## DESCRIPTION



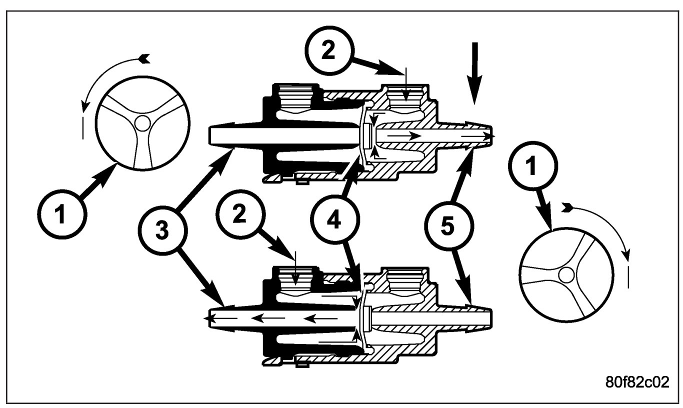
The washer pump/motor unit is located on the top of a sump area of the washer reservoir, on the outboard side of the right front frame rail ahead of the right front wheel house splash shield. A small permanently lubricated and sealed reversible electric motor (3) is coupled to the rotor-type washer pump (4). The use of an integral valve body (7) allows the washer pump/motor unit to provide washer fluid to either the front or the rear washer systems, depending upon the direction of the motor/pump impeller rotation.

An inlet nipple (6) on the pump housing passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole of the washer reservoir sump. The filter screen prevents most debris from entering the pump housing. When the pump is installed in the reservoir the front barbed outlet nipple (5) on the pump valve body housing connects the unit to the front washer hose, and the rear barbed outlet nipple (8) connects the unit to the rear washer hose. The letters “F” and “R” molded into the valve body housing adjacent to each nipple provide further clarification of the nipple assignments.

The washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by the use of a snap fit between the motor housing and a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle (1) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The washer pump/motor unit cannot be repaired. If inoperative or damaged, the entire washer pump/motor unit must be replaced.

## OPERATION



The washer pump/motor unit features a reversible electric motor. The direction of the motor is controlled by hard wired outputs from the momentary front and rear washer switch circuitry contained within the right (wiper) control stalk of the multi-function switch. When battery current and ground are applied to the two pump motor terminals, the motor rotates in one direction. When the polarity of these connections is reversed, the motor rotates in the opposite direction.

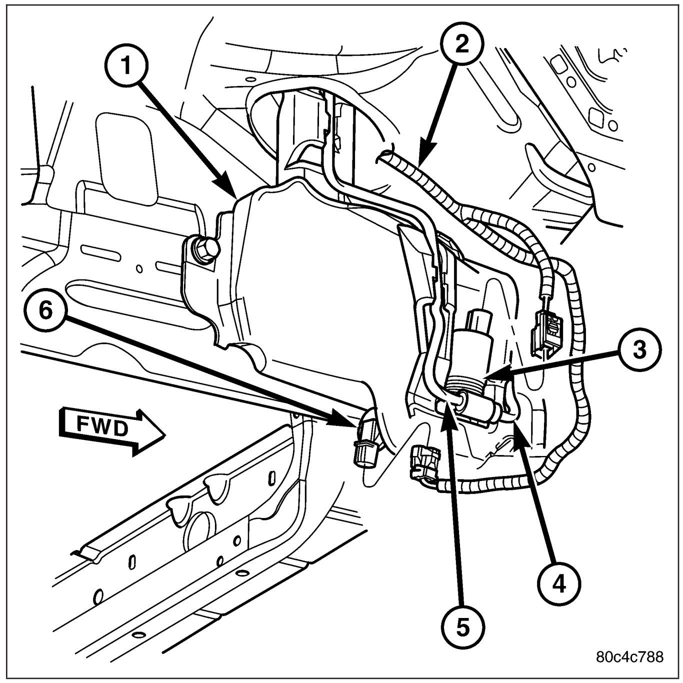
When the pump motor is energized, the rotor-type pump pressurizes the washer fluid and forces it through one of the two pump outlet nipples, and into the front or rear washer plumbing. Washer fluid is drawn through the pump inlet nipple from the washer reservoir to the inlet port of the washer pump housing. An integral valve body is located in a housing on the outlet port side (2) of the pump housing. A diaphragm (4) in this valve body controls which washer system plumbing receives the washer fluid being pressurized by the pump. When the pump is not operating the diaphragm is biased to close all washer fluid flow in the rear washer system and, in this way it also performs the function of the rear washer system check valve.

When the pump impeller (1) rotates in the counterclockwise direction (viewed from the bottom), the biased diaphragm is sealing off the rear washer system outlet and nipple so the pressurized washer fluid is pushed out through the pump front outlet port and the front washer outlet nipple (5). When the pump impeller rotates in the clockwise direction (viewed from the bottom), pressurized washer fluid is pushed out through the pump rear outlet port and moves the diaphragm to open the rear washer outlet nipple and seal off the front washer outlet nipple, then the pressurized washer fluid is pushed out through the rear washer outlet nipple (3).

The washer pump/motor unit may be diagnosed using conventional diagnostic tools and methods.

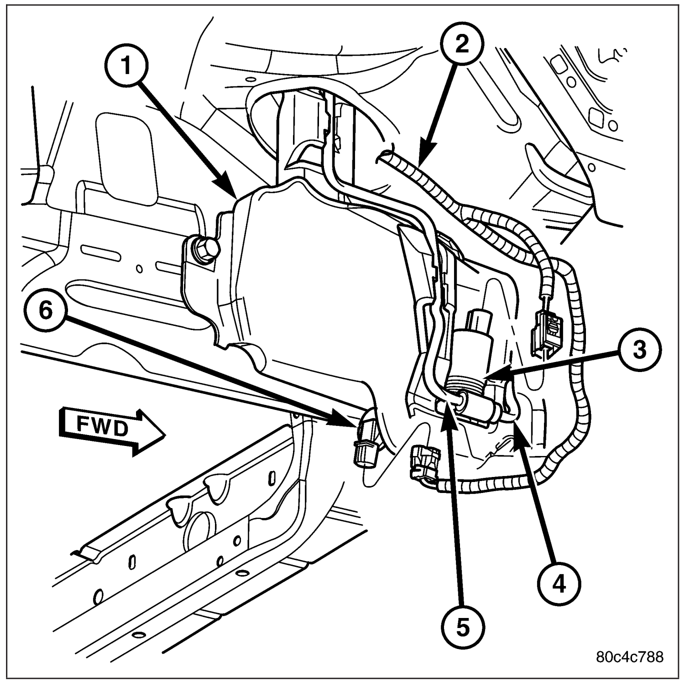
## REMOVAL

**NOTE: The washer pump/motor can be removed from the washer reservoir without removing the reservoir from the vehicle.**



1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir into a clean container for reuse.
3. Turn the steering wheel to move the front wheels to the full right position.
4. Raise and support the vehicle.
5. Remove the plastic push-in fasteners that secure the forward end of the front wheelhouse splash shield to the inner fender panel and the front fascia. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL).
6. Pull the forward end of the front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the washer pump/motor for service.
7. Disconnect the two washer hoses (4 and 5) from the two washer pump/motor unit (3) outlet nipples.
8. Disconnect the headlamp and dash wire harness (2) connector from the washer pump/motor unit connector receptacle on the top of the motor housing.
9. Firmly grasp the top of the washer pump/motor housing and pull it lightly outward from the washer reservoir far enough to disengage the top of the motor from the receptacle in the reservoir. Care must be taken not to damage the reservoir.
10. Pull the washer pump/motor unit straight up and out of the washer reservoir far enough to disengage the inlet nipple from the rubber grommet seal/filter screen in the reservoir.
11. Remove the rubber grommet seal/filter screen for the washer pump from the pump mounting hole in the washer reservoir and discard.

## INSTALLATION

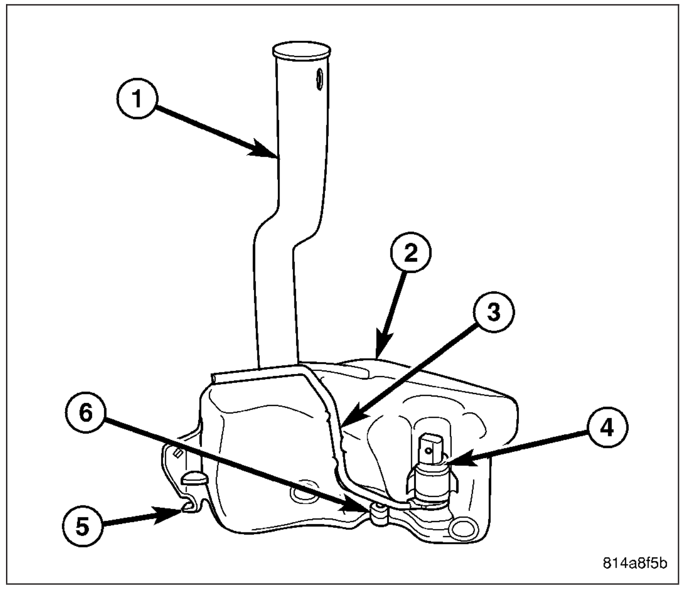


1. Install a new rubber grommet seal/filter screen unit into the washer pump mounting hole in the washer reservoir. Always use a new rubber grommet seal/filter screen on the reservoir.
2. Position the inlet nipple of the washer pump (3) to the rubber grommet seal/filter screen in the washer reservoir (1).
3. Using hand pressure, press firmly and evenly downward on the washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the reservoir.
4. Align the top of the washer pump/motor housing with the receptacle in the washer reservoir.
5. Using hand pressure, press firmly and evenly on the top of washer pump/motor unit until the motor housing snaps into the reservoir receptacle.
6. Reconnect the headlamp and dash wire harness (2) connector for the washer pump/motor unit to the connector receptacle on the top of the motor housing.
7. Reconnect the front and rear washer hoses to the two barbed pump outlet nipples. Be certain that the hose in the trough on the reservoir located behind the pump is connected to the rear (black) nipple, and the hose in front of the pump is connected to the front (blue) nipple.
8. Reposition the forward end of the front wheelhouse splash shield to the inner fender panel and the front fascia.
9. Reinstall the plastic push-in fasteners that secure the front wheelhouse splash shield to the inner fender panel and the front fascia. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - INSTALLATION).
10. Lower the vehicle.
11. Reconnect the battery negative cable.
12. Refill the washer reservoir with the washer fluid siphoned from the reservoir during the removal procedure.

# WASHER RESERVOIR

## DESCRIPTION

A single washer fluid reservoir (2) is used for both the front and rear washer systems. The molded plastic washer fluid reservoir is mounted on the outboard side of the right front frame rail in front of the right front wheel, where it is concealed by the right front wheel house splash shield. The only visible component of the washer reservoir is the filler neck (1) and cap unit, which extends through a hole in the right front wheel house extension panel into the engine compartment. A bright yellow plastic filler cap with an integral bail strap and filler neck mounting bracket is labeled with an International Control and Display Symbol icon for “Windshield Washer.” The cap snaps over the open end of the filler neck.



There is a dedicated hole in the top of a ledge-like sump area of the reservoir provided for the mounting of the washer pump/motor unit (4), and another dedicated hole inboard of the pump for the washer fluid level switch (6). A receptacle molded into the reservoir allows for mounting of the washer pump without the use of fasteners. The reservoir also features an integral rear hose routing trough (3) on its outboard side. The washer reservoir is secured to the outboard side of the right front frame rail by two screws and an integral molded hook tab (5) that engages in a slot in the right front frame rail. A blind rivet secures the reservoir filler neck bracket to the upper radiator cross-member in the front of the engine compartment. The forward end of the right front fender wheel house splash shield must be removed to access the washer reservoir for service.

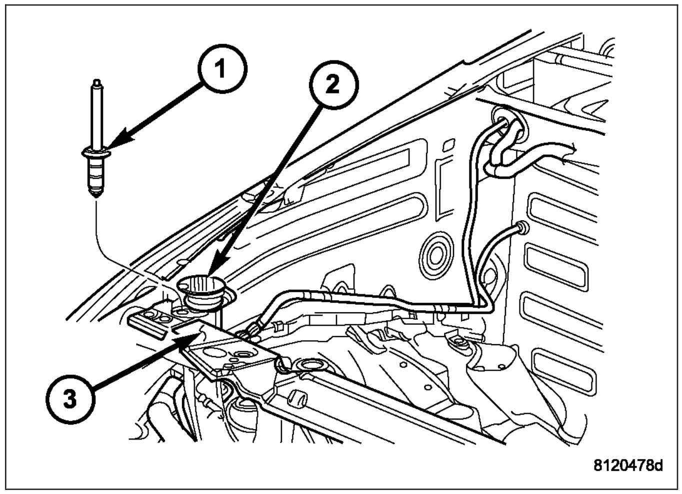
The washer reservoir cannot be repaired and, if inoperative or damaged, it must be replaced. The washer reservoir, the grommet seal/filter screen for the washer pump/motor unit, the grommet seal for washer fluid level switch, and the filler cap are each available for individual service replacement.

## OPERATION

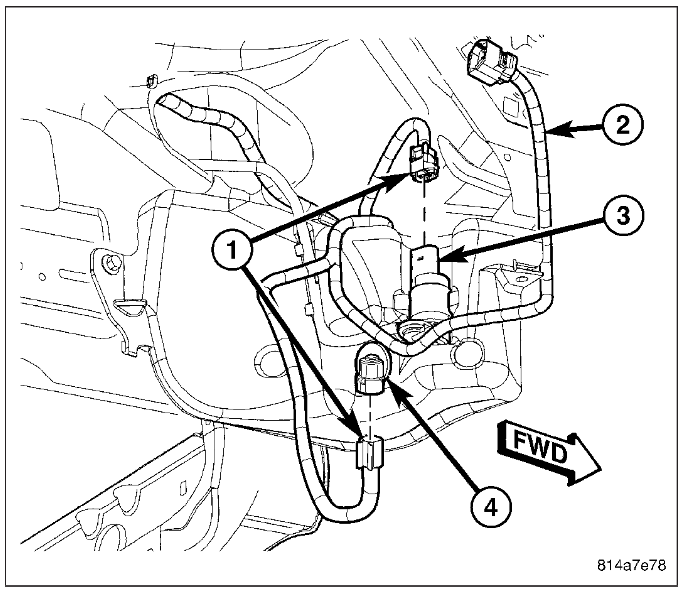
The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the front and rear washer systems. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir. The washer/pump motor unit is located in a sump area near the front of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer pump/motor unit is mounted above the lowest position in the sump. The washer fluid level switch is mounted just above the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, before the washer system will no longer operate.

## REMOVAL

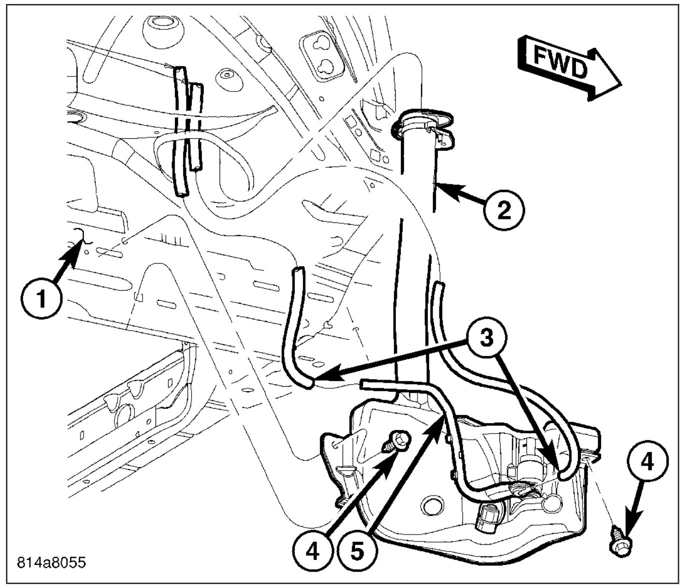
1. Disconnect and isolate the battery negative cable.
2. Siphon the washer fluid from the washer reservoir into a clean container for reuse.
3. Turn the steering wheel to move the front wheels to the full right position.
4. Remove the air cleaner housing from the top of the right front fender wheel house. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
5. Remove the blind rivet (1) that secures the washer reservoir filler neck support bracket (2) to the upper radiator crossmember (3).



6. Raise and support the vehicle.
7. Remove the plastic push-in fasteners that secure the forward end of the front wheelhouse splash shield to the inner fender panel and the front fascia. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - REMOVAL).
8. Pull the forward end of the front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the washer reservoir for service.
9. Disconnect the headlamp and dash wire harness (2) connector (1) for the washer pump/motor unit from the connector receptacle on the top of the motor housing (3).
10. Disconnect the headlamp and dash wire harness connector for the washer fluid level switch from the switch connector receptacle (4).

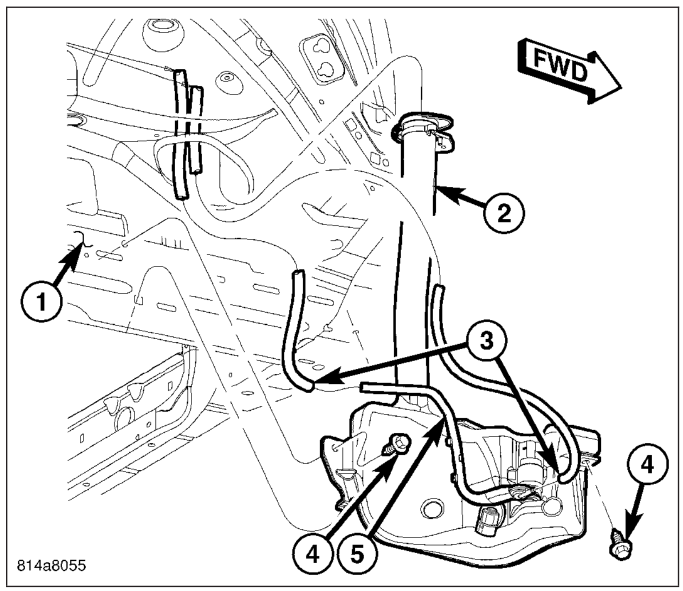


11. Disconnect the two washer hoses (3 & 5) from the two washer pump/motor unit outlet nipples.
12. Disengage the rear washer hose from the integral washer reservoir trough.
13. Remove the two screws (4) that secure the washer reservoir to the right front frame rail (1).
14. Disengage the hook tab at the back of the washer reservoir from the slot in the right front frame rail.
15. Lower the washer reservoir far enough for the filler neck (2) to be removed from the clearance hole in the right front fender wheel house panel extension.
16. Remove the washer reservoir from the right front fender wheel house.



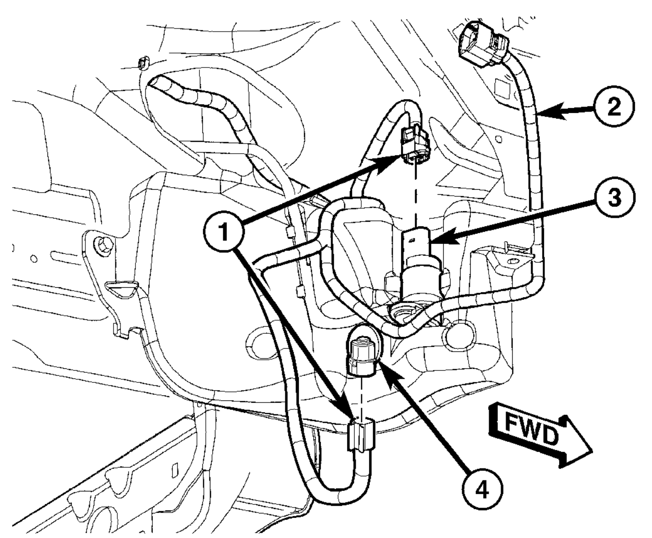
## INSTALLATION

1. Position the washer reservoir into the right front fender wheel house.
2. Insert the washer reservoir filler neck (2) through the clearance hole in the right front fender wheel house panel extension.
3. Raise the washer reservoir far enough to engage the hook tab at the back of the reservoir into the slot in the right front frame rail (1).
4. Install and tighten the two screws (4) that secure the reservoir to the right front frame rail. Tighten the screws to 7 N·m (65 in. lbs.).
5. Engage the rear washer hose (5) into the integral washer reservoir trough. Be certain that the rear washer hose is routed rearward of the washer pump/motor unit, and the front washer hose is routed forward of the washer pump/motor unit. The rear washer hose can be identified by an in line hose connector that joins the reservoir hose to the engine compartment hose located near the top of main body of the reservoir.



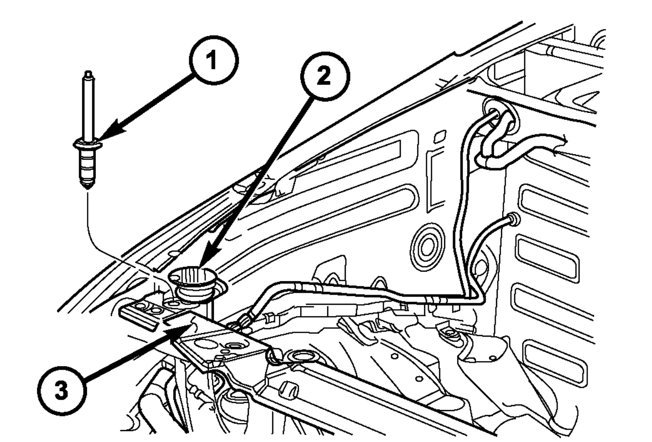
6. Reconnect the front and rear washer hoses (3) to the washer pump/motor outlet nipples. Be certain that the rear washer hose in the trough rearward of the washer pump/motor unit is connected to the rear (black) nipple, and the hose forward of the washer pump/motor is connected to the front (blue) nipple.

7. Reconnect the headlamp and dash wire harness (2) connector (1) for the washer fluid level switch to the switch connector receptacle (4).
8. Reconnect the headlamp and dash wire harness connector for the washer pump/motor to the connector receptacle (3) on the top of the motor housing.
9. Reposition the forward end of the front wheelhouse splash shield to the inner fender panel and the front fascia.
10. Reinstall the plastic push-in fasteners that secure the front wheelhouse splash shield to the inner fender panel and the front fascia. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - INSTALLATION).
11. Lower the vehicle.



814a7e78

12. Install a new blind rivet (1) to secure the washer reservoir filler neck support bracket (2) to the upper radiator crossmember (3).
13. Reinstall the air cleaner housing onto the top of the right front fender wheel house. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).
14. Reconnect the battery negative cable.
15. Refill the washer reservoir with the washer fluid siphoned from the reservoir during the removal procedure.



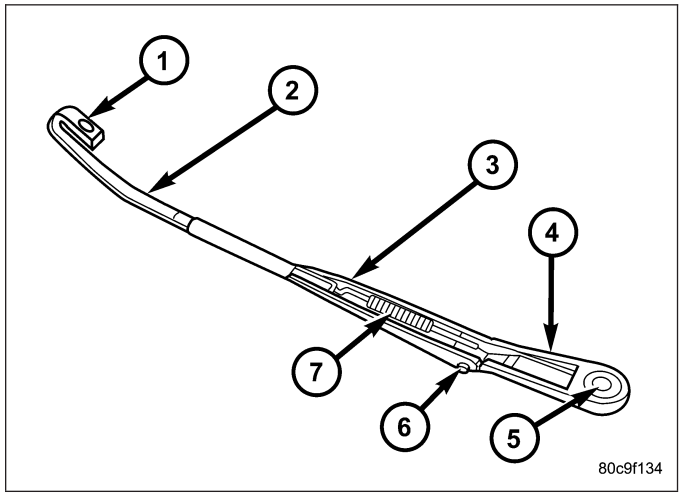
8120478d

# WIPER ARM

## DESCRIPTION

### FRONT

The front wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. These wiper arms feature an over-center hinge that allows easy access to the windshield glass for cleaning. The wiper arm has a die cast metal pivot end (4) with a large tapered mounting hole (5) at one end. A molded black plastic cap fits over the wiper arm retaining nut to conceal the nut and this mounting hole following wiper arm installation.

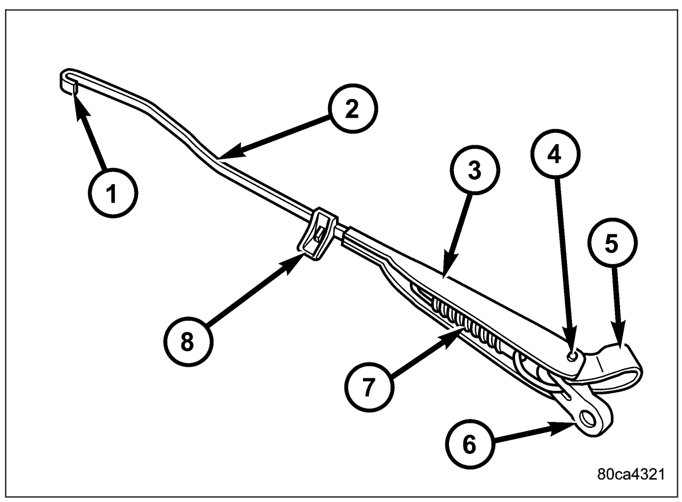


The wide end of a tapered, stamped steel channel (3) hinges on and is secured with a hinge pin (6) to the blade end of the wiper arm pivot end. One end of a long, rigid, stamped steel strap (2) with a small hole near its pivot end is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook (1). Concealed within the stamped steel channel, one end of a long tension spring (7) is engaged with a wire hook on the underside of the die cast pivot end, while the other end of the spring is hooked through the small hole in the steel strap. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

A wiper arm cannot be adjusted or repaired. If damaged or inoperative, the entire wiper arm unit must be replaced.

### REAR

The rear wiper arm is the rigid member located between the rear wiper motor output shaft that protrudes from the outer tailgate panel near the base of the rear flip-up glass opening and the rear wiper blade. This wiper arm features an over-center hinge that allows easy access to the tailgate and rear flip-up glass for cleaning, after the spare tire is removed. The wiper arm has a die cast metal pivot end (6) with a large tapered mounting hole at one end. A molded plastic pivot cover (5) is secured loosely to and pivots on the wiper arm hinge pin (4) to conceal the wiper arm retaining nut.



The wide end of a tapered, stamped steel channel (3) is secured with a hinge pin to the pivot end of the wiper arm. One end of a long, rigid, stamped steel strap (2) with a small hole near its pivot end is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook (1). Concealed within the stamped steel channel, one end of a long tension spring (7) is engaged with a wire hook on the underside of the die cast pivot end, while the other end of the spring is hooked through the small hole in the steel strap. A molded plastic wiper arm support (8) is snapped onto the wiper arm strap where it exits the channel. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

A wiper arm cannot be adjusted or repaired. If damaged or inoperative, the entire wiper arm unit must be replaced.

## OPERATION

### FRONT

The front wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The tapered mounting hole in the wiper arm pivot end interlocks with the serrations on the tapered outer circumference of the wiper pivot shaft, allowing positive engagement and finite adjustment of this connection. The mounting nut locks the wiper arm to the threaded stud of the wiper pivot shaft. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

### REAR

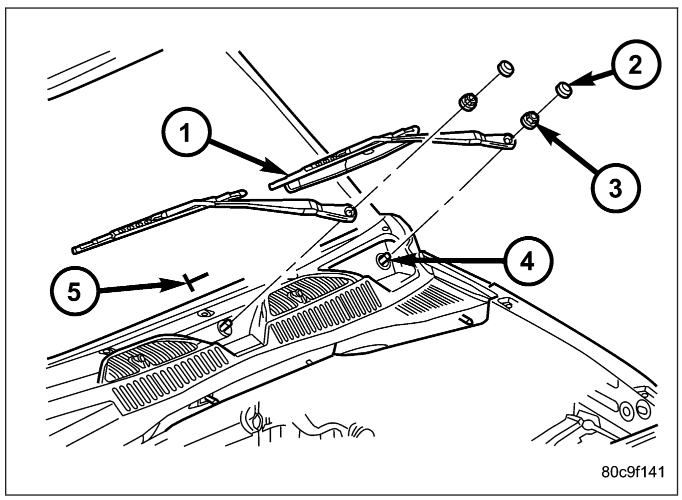
The rear wiper arm is designed to mechanically transmit the motion from the rear wiper motor output shaft to the rear wiper blade. The wiper arm must be properly indexed to the motor output shaft in order to maintain the proper wiper blade travel on the glass. The wiper arm support is designed to lift and support the rear wiper arm and blade off of the glass when the rear wiper blade is parked. This support and the park ramp on the tailgate outer panel below the glass also provide an alignment reference to ensure accurate rear wiper arm and blade installation.

The tapered hole in the wiper arm pivot end interlocks with the serrations on the outer circumference of the tapered motor output shaft, allowing positive engagement and finite adjustment of this connection. A hex nut secures the wiper arm pivot end to the threads on the rear wiper motor output shaft and the pivot cover hinges and snaps over this connection for a neat appearance. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

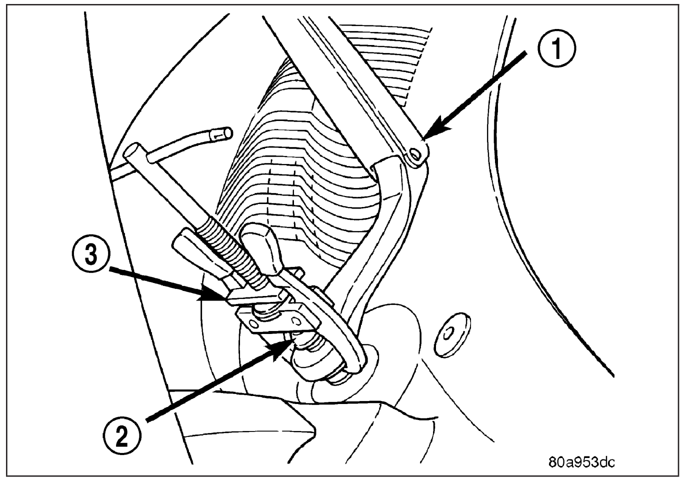
## REMOVAL

### FRONT

1. Lift the front wiper arm (1) to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to wiper pivot shaft connection.
2. Carefully pry the plastic nut cap (2) off of the pivot end of the wiper arm.
3. Remove the nut (3) that secures the wiper arm to the wiper pivot shaft (4).

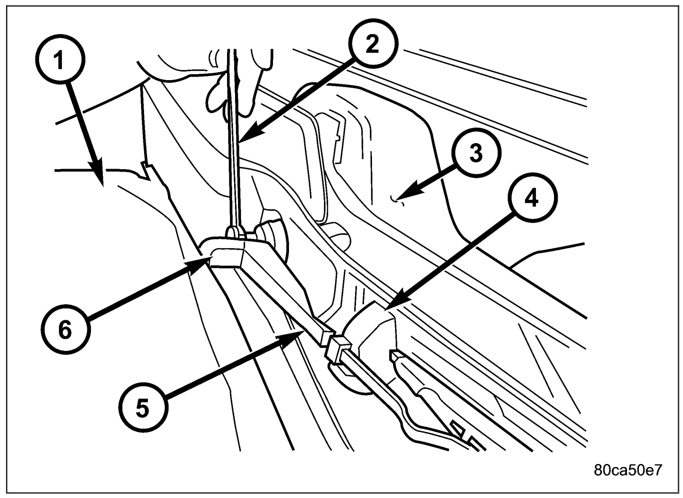


4. If necessary, use a suitable battery terminal puller (3) to disengage the wiper arm (1) from the wiper pivot shaft (2).
5. Remove the front wiper arm pivot end from the wiper pivot shaft.



## REAR

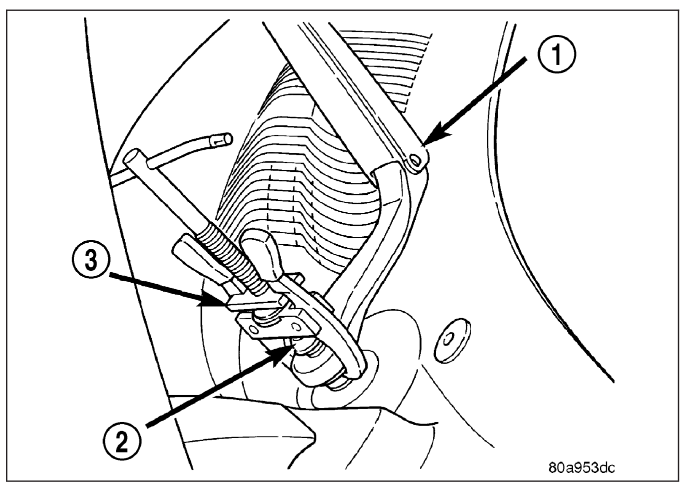
1. Lift the rear wiper arm pivot cover (6) by lifting it at the rear wiper motor output shaft end of the arm (5).
2. Remove the nut that secures the rear wiper arm to the rear wiper motor output shaft.



3. If necessary, use a battery terminal puller (3) to disengage the wiper arm (1) from the rear wiper motor output shaft splines (2).

**NOTE: Depending upon the size and type of puller used, it may be necessary to remove the spare tire from the tailgate. Refer to the owner's manual in the vehicle glove box for information on removing the spare tire from the tailgate.**

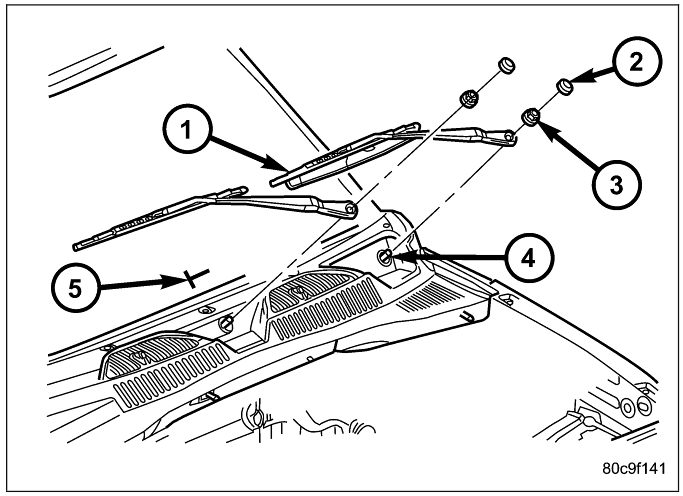
4. Remove the rear wiper arm pivot end from the motor output shaft.



## INSTALLATION

### FRONT

**NOTE: Be certain that the wiper motor is in the park position before attempting to install the front wiper arms. Turn the ignition switch to the On position and move the control knob on the right (wiper) control stalk of the multi-function switch to its Off position. If the wiper pivots move, wait until they stop moving, then turn the ignition switch back to the Off position. The wiper motor is now in its park position.**

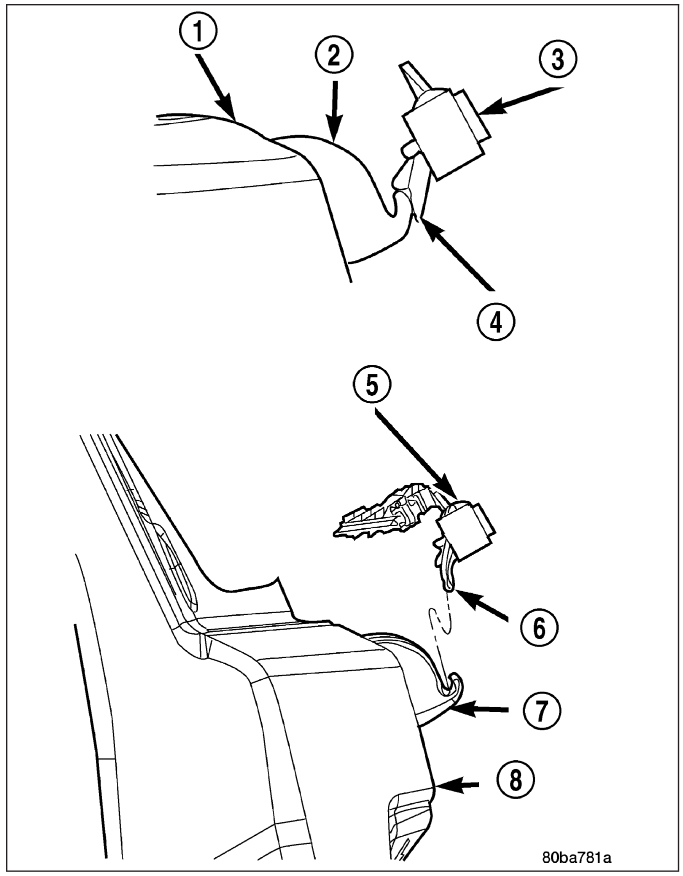


1. The front wiper arms must be indexed to the wiper pivot shafts with the wiper motor in the park position to be properly installed. Position the front wiper arm pivot ends onto the wiper pivot shafts (4) so that the tip of the wiper blade (1) is aligned with the T-shaped wiper alignment lines (5) located in the lower edge of the windshield glass.
2. Once the wiper blade is aligned, lift the wiper arm away from the windshield slightly to relieve the spring tension on the pivot end and push the pivot hole on the end of the wiper arm down firmly and evenly over the wiper pivot shaft.
3. Install and tighten the nut (3) that secures the wiper arm to the wiper pivot shaft. Tighten the nut to 24 N·m (18 ft. lbs.).
4. Wet the windshield glass, then operate the front wipers. Turn the front wipers Off, then check for the correct wiper arm position and readjust as required.
5. Reinstall the plastic nut cap (2) onto the wiper arm pivot nut.

### REAR

**NOTE: Always install the wiper arm and blade with the wiper motor in the Park position.**

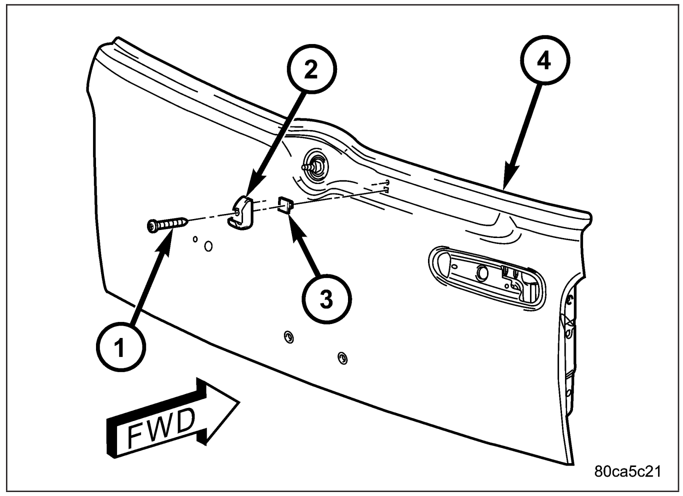
1. The rear wiper arm (3) must be indexed to the motor output shaft with the rear wiper motor in the park position to be properly installed. Place the wiper arm onto the tailgate (1) with the wiper arm support positioned on the park ramp (2) and the tapered mounting hole on the pivot end of the arm positioned over the rear wiper motor output shaft.
2. Position the tab on the back of the rear wiper arm support on the tailgate park ramp in the Installation Position (4).
3. With the wiper arm in the Installation Position, push the tapered mounting hole on the pivot end of the wiper arm down over the rear wiper motor output shaft.
4. Install and tighten the nut that secures the rear wiper arm to the rear wiper motor output shaft. Tighten the nut to 18 N·m (13 ft. lbs.).
5. Close the rear wiper arm pivot cover.
6. Lift the rear wiper arm (5) support away from the park ramp (7), then place the wiper arm support in the park ramp on the tailgate (8) in the Park Position (6).



# WIPER ARM PARK RAMP

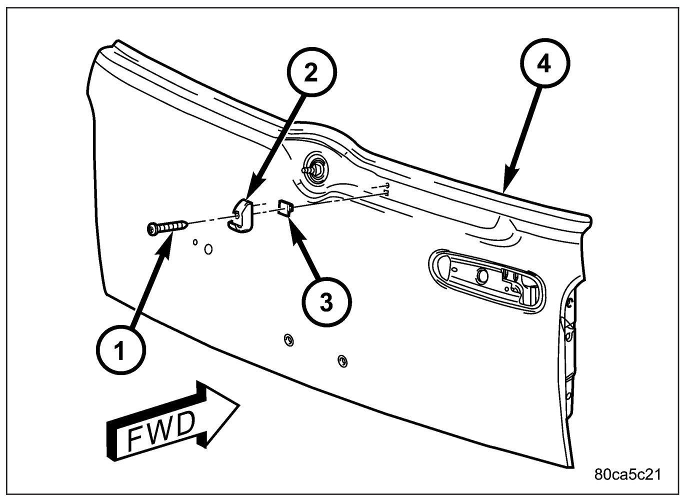
## REMOVAL

1. Disengage the rear wiper arm support from the wiper arm park ramp on the right side of the tailgate just below the rear flip-up glass.
2. Lift the wiper arm and blade away from the tailgate until the wiper arm hinge is in its over-center position.
3. Remove the screw (1) that secures the wiper arm park ramp (2) to the tailgate outer panel (4).
4. Remove the wiper arm park ramp from the tailgate outer panel.



## INSTALLATION

1. Check to be certain that the rivet nut (3) is properly installed and in good condition in the tailgate outer panel (4).
2. Position the wiper arm park ramp (2) onto the tailgate outer panel.
3. Install and tighten the screw (1) that secures the wiper arm park ramp to the tailgate outer panel. Tighten the screw to 5 N·m (45 in. lbs.).
4. Lower the rear wiper arm and blade and place the wiper arm support onto the wiper arm park ramp.

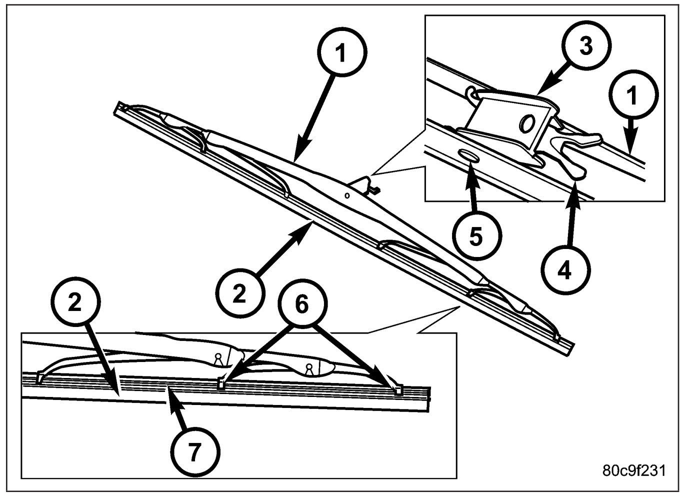


# WIPER BLADE

## DESCRIPTION

### FRONT

Each front wiper blade is secured by an integral latching pivot block (3) to the hook formation on the tip of the front wiper arms, and rests on the glass near the base of the windshield when the wipers are not in operation. The wiper blade consists of the following components:

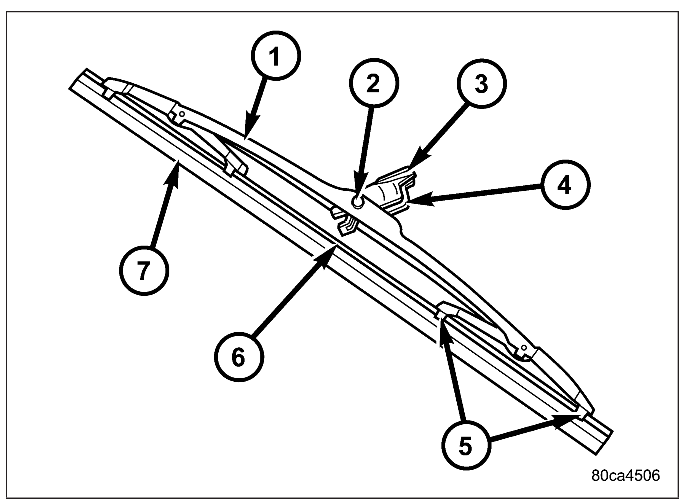


- **Superstructure (1)** - The superstructure includes several stamped steel bridges and links with claw formations (6) that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. On vehicles manufactured for certain markets where it is required, the driver side front wiper blade has an additional molded black plastic airfoil secured to the superstructure, which is oriented toward the base of the windshield when the front wipers are in their parked position. All of the metal components of the wiper blade have a satin black finish applied.
- **Element (2)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor (7)** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

All vehicles have two 47.50 centimeter (18.70 inch) long front wiper blades with non-replaceable rubber elements (squeegees). The wiper blades cannot be adjusted or repaired. If inoperative, worn, or damaged the entire wiper blade unit must be replaced.

### REAR

The rear wiper blade is secured by an integral latching pivot block to the hook formation on the tip of the rear wiper arm, and rests off the glass on a park ramp on the tailgate near the base of the rear flip-up glass opening when the wiper is not in operation. The rear wiper blade consists of the following components:



- **Superstructure (1)** - The superstructure includes a stamped steel bridge and plastic links with claw formations (5) that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block (4) that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.

- **Element (7)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor (6)** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

All vehicles have a single 28.00 centimeter (11.00 inch) rear wiper blade with a non-replaceable rubber element (squeegee). The wiper blade cannot be adjusted or repaired. If inoperative, worn, or damaged the entire wiper blade unit must be replaced.

## OPERATION

## FRONT

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, yet resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions. The airfoil used on the driver side wiper blade of vehicles manufactured for certain markets is designed to reduce the lifting effect caused by air moving over the vehicle at higher highway speeds.

## REAR

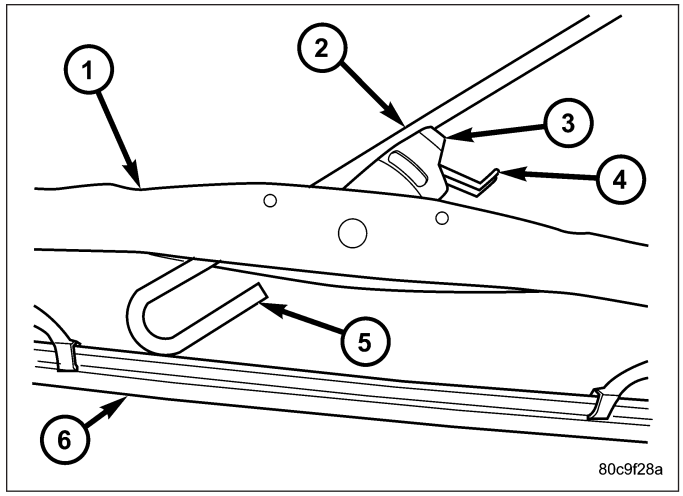
The rear wiper blade is moved back and forth across the glass by the wiper arm when the rear wiper system is in operation. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature found across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, but resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

## REMOVAL

## FRONT

**NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.**



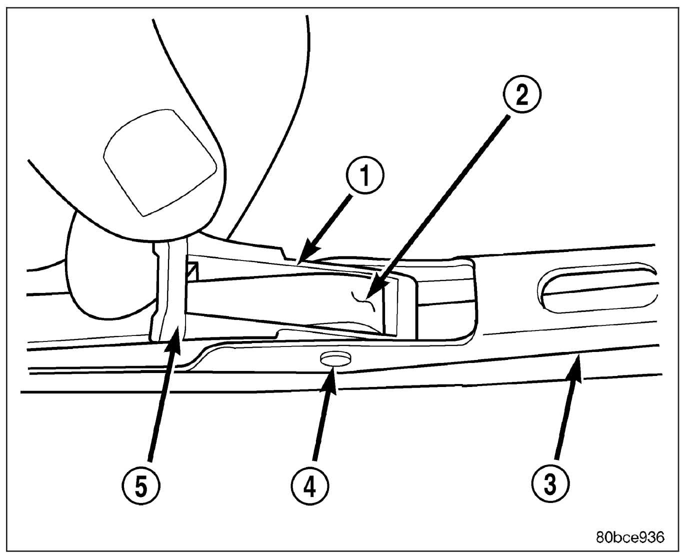
1. Lift the front wiper arm (2) to raise the wiper blade and element off of the glass, until the wiper arm hinge is in its over-center position.
2. To remove the wiper blade from the wiper arm, depress the pivot block latch release tab (4) under the tip of the arm and slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block (3) from the hook formation (5) on the end of the arm.
3. Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure (1) just ahead of the wiper blade pivot block/latch unit.

**CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.**

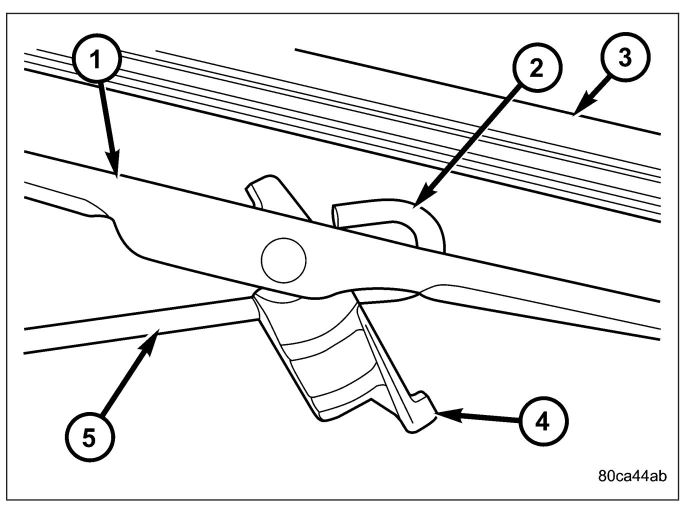
4. Gently lower the tip of the wiper arm onto the glass.

## REAR

**NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the rear wiper motor output shaft.**



1. Disengage the rear wiper arm support from the rear wiper arm park ramp on the right side of the tailgate just below the rear flip-up glass.
2. Lift the rear wiper arm to raise the wiper blade and element off of the tailgate and the rear flip-up glass.
3. To remove the wiper blade from the wiper arm, carefully lift up the pivot block latch release tab (5) on the top of the wiper arm to unlatch it from the arm (2).



4. Raise the pivot block latch release tab (4) until it is perpendicular to the rear wiper blade superstructure (1).
5. Slide the rear wiper blade away from the tip of the arm towards the pivot end of the arm far enough to disengage the pivot block from the hook formation (2) on the end of the arm (5).
6. Extract the hook formation on the tip of the wiper arm from the window in the wiper blade pivot block/latch unit.

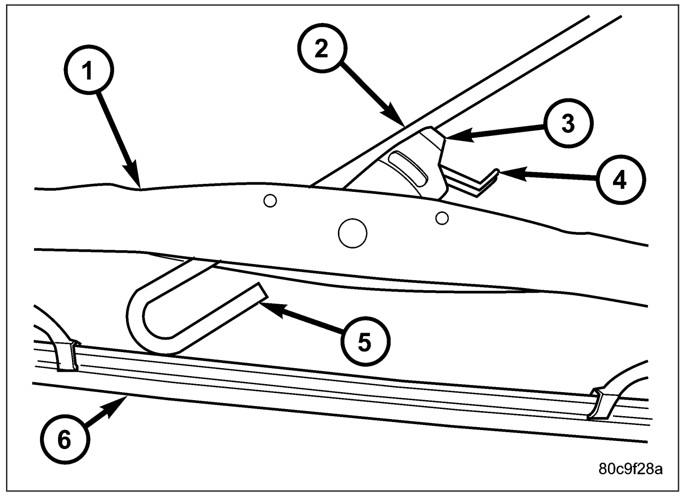
**CAUTION: Do not allow the wiper arm to spring back against the tailgate or the flip-up glass without the wiper blade in place or they may be damaged.**

7. Gently lower the wiper arm and place the arm support in the park ramp.

## INSTALLATION

## FRONT

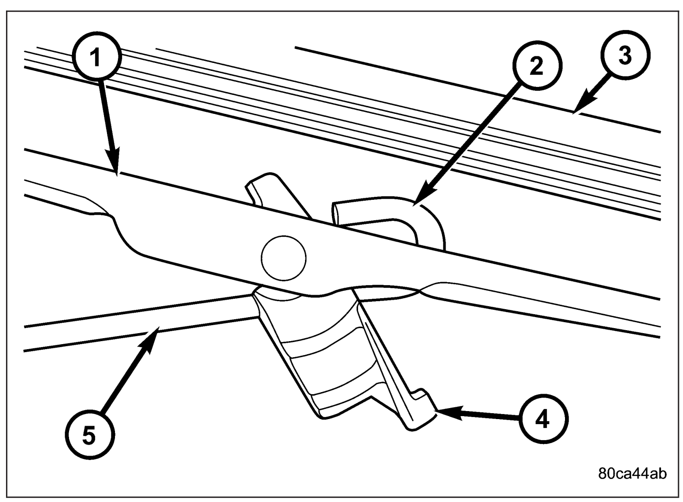
**NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.**



1. Lift the front wiper arm (2) off of the windshield glass, until the wiper arm hinge is in its over-center position.
2. Position the front wiper blade near the hook formation (5) on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.
3. Insert the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure (1) ahead of the wiper blade pivot block/latch unit far enough to engage the pivot block (3) into the hook.
4. Slide the wiper blade pivot block/latch up into the hook formation on the tip of the wiper arm until the latch release tab (4) snaps into its locked position. Latch engagement will be accompanied by an audible click.
5. Gently lower the wiper blade onto the glass.

## REAR

**NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the rear wiper motor output shaft.**

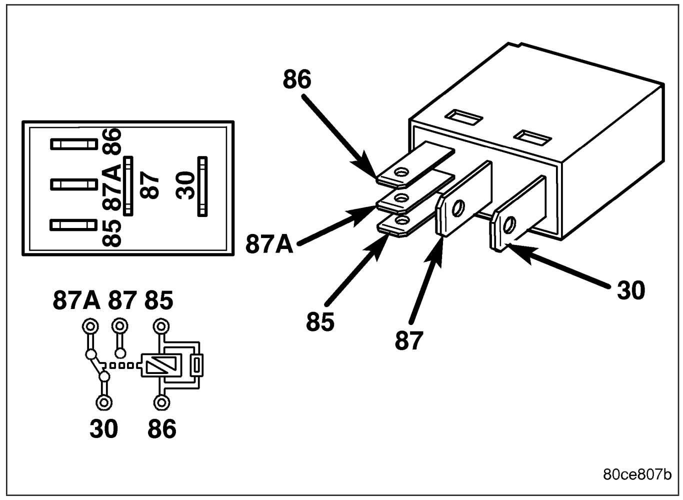


1. Lift the rear wiper arm support out of the tail gate park ramp.
2. Position the rear wiper blade (1) near the hook formation (2) on the tip of the arm (5) with the notched end of the wiper element (3) flexor oriented towards the end of the wiper arm that is nearest to the rear wiper motor output shaft.
3. Raise the pivot block latch release tab (4) until it is perpendicular to the rear wiper blade superstructure.
4. Insert the hook formation on the tip of the wiper arm through the window in the wiper blade pivot block/latch unit.
5. Slide the wiper blade pivot block/latch up into the hook formation on the tip of the wiper arm until the hook is firmly seated against the pivot block.
6. Press the pivot block latch release tab downward until it snaps into its locked position over the top of the wiper arm.
7. Gently lower the wiper arm and place the arm support in the tailgate park ramp.

# WIPER HIGH/LOW RELAY

## DESCRIPTION

The wiper high/low relay is located in the Power Distribution Center (PDC) in the engine compartment near the battery. The wiper high/low relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs by five integral male spade-type terminals that extend from the bottom of the relay base.



The wiper high/low relay cannot be adjusted or repaired and, if inoperative or damaged, the unit must be replaced.

## OPERATION

The wiper high/low relay is an electromechanical switch that uses a low current input from the Body Control Module (BCM) to control a high current output to the front wiper motor. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The wiper high/low relay terminals are connected to the vehicle electrical system through a connector receptacle in the Power Distribution Center (PDC). The inputs and outputs of the wiper high/low relay include:

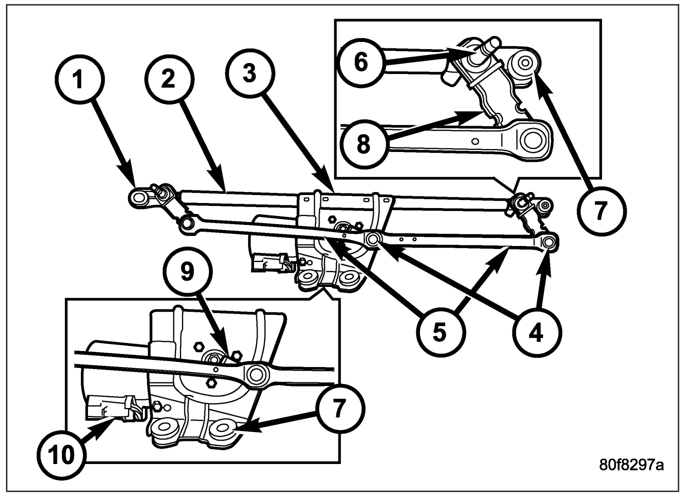
- **Common Feed Terminal** - The common feed terminal (30) is connected to the common feed terminal (30) of the wiper on/off relay at all times through the wiper on/off relay output circuit. Therefore, the wiper high/low relay common feed terminal is only powered when the wiper on/off relay is energized.
- **Coil Ground Terminal** - The coil ground terminal (85) is connected to a control output of the Body Control Module (BCM) through the front wiper high/low relay control circuit. The BCM controls front wiper motor operation by controlling a ground path through this circuit.
- **Coil Battery Terminal** - The coil battery terminal (86) receives battery current at all times from a circuit breaker in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit.
- **Normally Open Terminal** - The normally open terminal (87) is connected to the high speed brush of the front wiper motor through the front wiper high/low relay high speed output circuit. Therefore, when the wiper high/low relay is energized, the wiper motor high speed brush is powered.
- **Normally Closed Terminal** - The normally closed terminal (87A) is connected to the low speed brush of the front wiper motor through the front wiper high/low relay low speed output circuit. Therefore, the wiper motor low speed brush can only be powered when the wiper high/low relay is de-energized.

The wiper high/low relay can be diagnosed using conventional diagnostic tools and methods.

# WIPER MODULE

## DESCRIPTION

The front wiper module bracket is secured with two nuts below the wiper motor through rubber insulators (7) to two weld studs on the bottom of the cowl plenum panel beneath the cowl plenum cover/grille panel. Two screws secure the top of the module bracket to the cowl plenum panel through rubber insulators located on the outboard end of each pivot bracket. The ends of the wiper pivot shafts that protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades are the only visible components of the front wiper module. The front wiper module consists of the following major components:



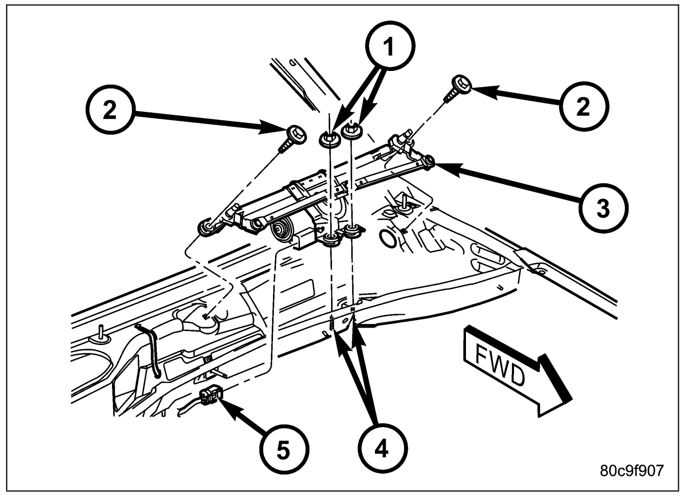
- **Bracket** - The front wiper module bracket consists of a long tubular steel main member (2) that has a die cast pivot bracket (1) formation near each end where the two wiper pivots are secured. A stamped steel mounting plate (3) for the wiper motor is secured with welds near the center of the main member. A short stamped steel tab that extends laterally from one side of the mounting plate provides a mounting location for the wiper motor pigtail wire connector (10).
- **Crank Arm (9)** - The front wiper motor crank arm is a stamped steel unit with a slotted hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a ball stud secured to the drive end.
- **Linkage (5)** - Two stamped steel drive links connect the wiper motor crank arm to the wiper pivot lever arms. The right side drive link has a plastic socket-type bushing (4) on each end. The left side drive link has a plastic socket-type bushing on one end, and a plastic sleeve-type bushing on the other end. The socket-type bushing on one end of each drive link is snap-fit over the ball stud on the lever arm of its respective pivot. The left side drive link sleeve-type bushing end is then fit over the motor crank arm ball stud, and the other socket-type bushing of the right side drive link is snap-fit over the exposed end of the wiper motor crank arm ball stud.
- **Motor** - The front wiper motor is secured with three screws to the motor mounting plate near the center of the wiper module bracket. The wiper motor output shaft passes through a hole in the module bracket, where a nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal automatic resetting circuit breaker.
- **Pivots** - The two front wiper pivots are secured within the die cast pivot brackets on the outboard ends of the wiper module main member. The lever arms (8) that extend from the center of the pivot shafts (6) each have a ball stud on their end. The upper end of each pivot shaft where the wiper arms will be fastened each is tapered and serrated with a threaded stud formation at the tip. The lower ends of the pivot shafts are installed through lubricated bushings in the pivot brackets and are secured with snap rings.

The front wiper module cannot be adjusted or repaired. If any component of the module is inoperative or damaged, the entire front wiper module unit must be replaced.

## OPERATION

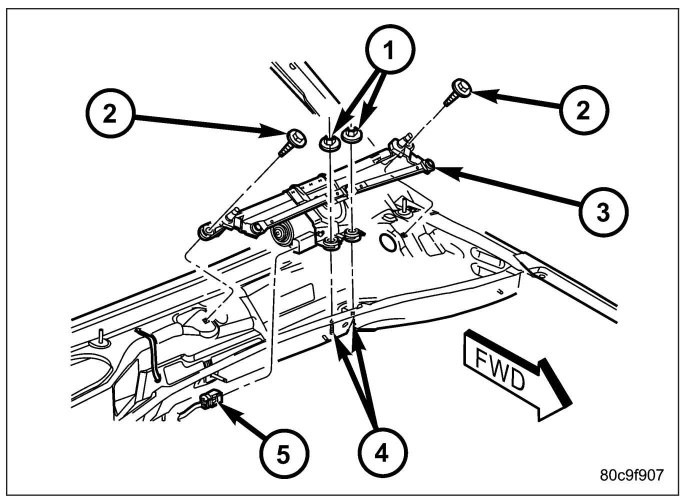
The front wiper module operation is controlled by the battery current inputs received by the wiper motor from the wiper on/off and wiper high/low relays. The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes the wiper park switch sense circuit to ground or to battery current, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned Off, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads. The wiper motor crank arm, the two wiper linkage members, and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

## REMOVAL



1. Unlatch and open the hood.
2. Disconnect and isolate the battery negative cable.
3. Remove both front wiper arms from the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - FRONT/FRONT WIPER ARM - REMOVAL).
4. Remove the cowl plenum cover/grille panel from over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).
5. Disconnect the headlamp and dash wire harness connector (5) for the front wiper motor from the motor pigtail wire connector.
6. Remove the two screws (2) that secure the front wiper module (3) to the top of the cowl plenum panel at the pivot brackets.
7. Remove the two nuts (1) that secure the front wiper module to the two weld studs (4) on the bottom of the cowl plenum panel.
8. Lift the front wiper module up from the cowl plenum panel far enough to disengage the two lower insulators from the weld studs on the bottom of the plenum panel.
9. Remove the front wiper module from the cowl plenum panel as a unit.

## INSTALLATION

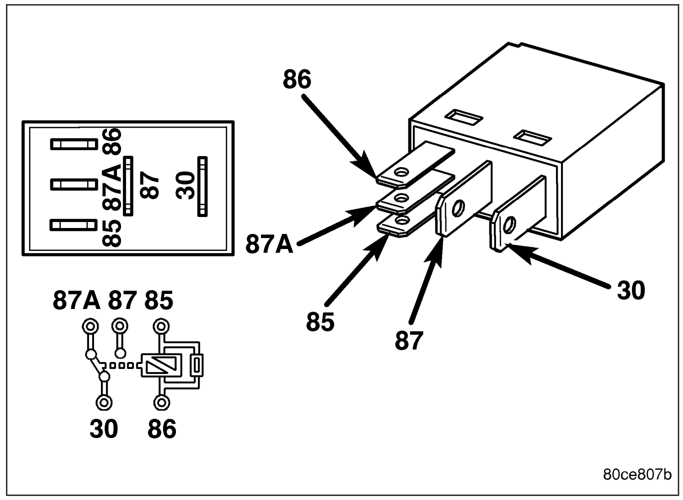


1. Position the front wiper module (3) to the cowl plenum as a unit.
2. Lower the front wiper module lower mounting insulators over the two weld studs (4) on the bottom of the cowl plenum panel.
3. Install the two screws (2) that secure the front wiper module to the top of the cowl plenum panel at the pivot brackets. Tighten the screw on the driver side, followed by the screw on the passenger side. Tighten the screws to 8 N·m (72 in. lbs.).
4. Install and tighten the two nuts (1) that secure the front wiper module to the two weld studs on the bottom of the cowl plenum panel. Tighten the nuts to 8 N·m (72 in. lbs.).
5. Reconnect the headlamp and dash wire harness connector (5) for the front wiper motor to the motor pigtail wire connector.
6. Reinstall the cowl plenum cover/grille panel over the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).
7. Close and latch the hood.
8. Reinstall both front wiper arms onto the wiper pivots. (Refer to 8 - ELECTRICAL/FRONT WIPERS/WASHERS/FRONT WIPER ARM - INSTALLATION).
9. Reconnect the battery negative cable.

# WIPER ON/OFF RELAY

## DESCRIPTION

The wiper on/off relay is located in the Power Distribution Center (PDC) in the engine compartment near the battery. The wiper on/off relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs by five integral male spade-type terminals that extend from the bottom of the relay base.



The wiper on/off relay cannot be adjusted or repaired and, if inoperative or damaged, the unit must be replaced.

## OPERATION

The wiper on/off relay is an electromechanical switch that uses a low current input from the Body Control Module (BCM) to control a high current output to the front wiper motor. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The wiper on/off relay terminals are connected to the vehicle electrical system through a connector receptacle in the Power Distribution Center (PDC). The inputs and outputs of the wiper on/off relay include:

- **Common Feed Terminal** - The common feed terminal (30) is connected to the common feed terminal of the wiper high/low relay at all times through the wiper on/off relay output circuit. Therefore, the wiper high/low relay is able to control the wiper motor speed only when the wiper on/off relay is energized.
- **Coil Ground Terminal** - The coil ground terminal (85) is connected to a control output of the Body Control Module (BCM) through the front wiper on/off relay control circuit. The BCM controls front wiper motor operation by controlling a ground path through this circuit.
- **Coil Battery Terminal** - The coil battery terminal (86) receives battery current at all times from a circuit breaker in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit.
- **Normally Open Terminal** - The normally open terminal (87) receives battery current from a circuit breaker in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit. When the front wiper on/off relay is energized, the wiper high/low relay is able to control the wiper motor speed.
- **Normally Closed Terminal** - The normally closed terminal (87A) is connected to the wiper park switch in the front wiper motor through the front wiper park switch sense circuit, and is connected to the wiper park switch whenever the relay is de-energized.

The wiper on/off relay can be diagnosed using conventional diagnostic tools and methods.

# NAVIGATION/TELECOMMUNICATION

## TABLE OF CONTENTS

## NAVIGATION/TELECOMMUNICATION - ELECTRICAL DIAGNOSTICS

### TABLE OF CONTENTS

# NAVIGATION/TELECOMMUNICATION - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

## AMP MESSAGE NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module does not receive the PCI Bus message from the Amplifier.

| Possible Causes |
|---|
| LOST COMMUNICATION WITH AMPLIFIER |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE AMPLIFIER

Turn the ignition on.

With the scan tool, attempt to communicate with the Amplifier.

**Was the scan tool able to communicate with the Amplifier?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

### 2. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC's.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## AUDIO HARDWARE MESSAGE NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module does not receive the PCI Bus message from the radio indicating what kind of radio the vehicle is equipped with.

| Possible Causes |
|---|
| LOST COMMUNICATION WITH RADIO |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE RADIO

Turn the ignition on.

Turn the radio on.

With the scan tool, attempt to communicate with the radio.

**Was the scan tool able to communicate with the radio?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

### 2. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC’s.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC’s.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## BLUETOOTH ERROR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a fault during an internal diagnostic check.

| Possible Causes |
|---|
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ERASE DTC AND ATTEMPT TO RESET

Turn the ignition on.

With the scan tool, read and record the HFM DTC's and then erase the DTC's.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## BODY STYLE MESSAGE NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module does not receive the body style message from the PCM.

| Possible Causes |
|---|
| LOST COMMUNICATION WITH PCM |
| PCM NOT ACTIVE ON THE BUS NETWORK |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE PCM

Turn the ignition on.

With the scan tool, attempt to communicate with the PCM.

**Was the scan tool able to communicate with the PCM?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

### 2. CHECK PCM ACTIVITY ON THE BUS NETWORK

With the scan tool, select System Monitors then J1850 Module Scan.

**Does the scan tool indicate that the PCM is present or active on the bus network?**

**Yes** >> Go To 3

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

### 3. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC’s.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC’s.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## FLASH CHECKSUM ERROR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a fault during an internal diagnostic check.

| Possible Causes |
|---|
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ERASE DTC AND ATTEMPT TO RESET

Turn the ignition on.

With the scan tool, read and record the HFM DTC's and then erase the DTC's.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## FLASH WRITE ERROR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a fault during an internal diagnostic check.

| Possible Causes |
|---|
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ERASE DTC AND ATTEMPT TO RESET

Turn the ignition on.

With the scan tool, read and record the HFM DTC's and then erase the DTC's.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the HFM DTC's.

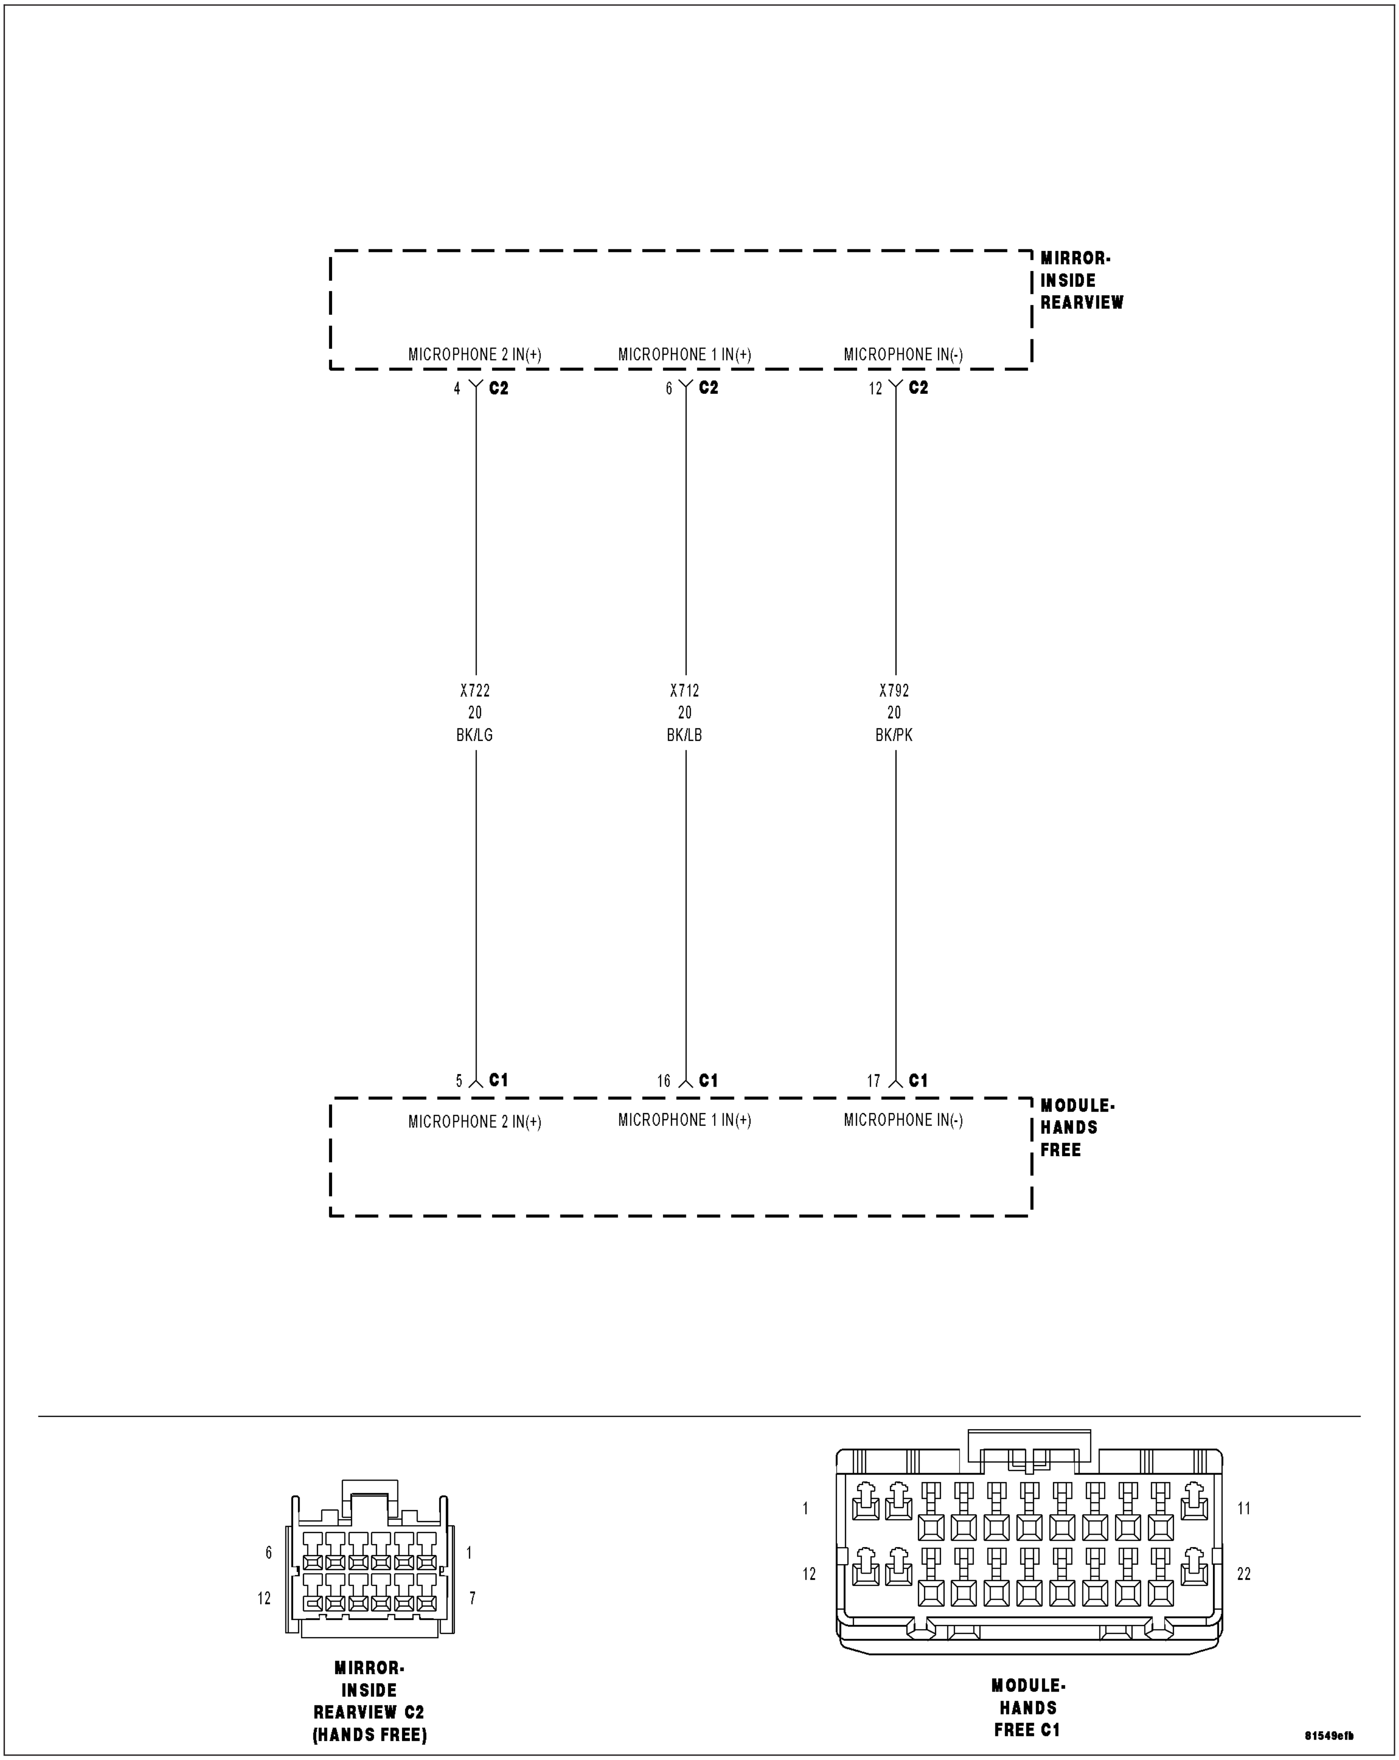
**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## GENERAL MICROPHONE FAULT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a fault in any of the microphone circuits.

| Possible Causes |
|---|
| (X712) MICROPHONE 1 IN (+) CIRCUIT OPEN |
| (X722) MICROPHONE 2 IN (+) CIRCUIT OPEN |
| (X792) MICROPHONE IN (-) CIRCUIT OPEN |
| (X712) (X722) (X792) MICROPHONE CIRCUITS SHORTED TO GROUND |
| (X712) (X722) (X792) MICROPHONE CIRCUITS SHORTED TO VOLTAGE |
| (X712) (X722) (X792) MICROPHONE CIRCUITS SHORTED TOGETHER |
| AUTOMATIC DAY/NIGHT MIRROR |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, read and record the HFM DTC's and then erase the DTC's.

Attempt to make a phone call with the system.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (X712) MICROPHONE 1 IN (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module C1 harness connector.

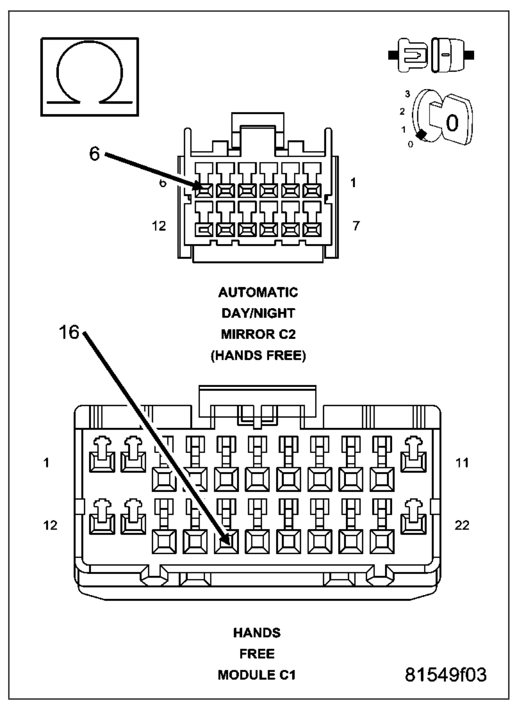
Disconnect the Automatic Day/Night Mirror C2 harness connector.

Measure the resistance of the (X712) Microphone 1 IN (+) circuit between the HFM connector and the Automatic Day/Night Mirror connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (X712) Microphone 1 IN (+) circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



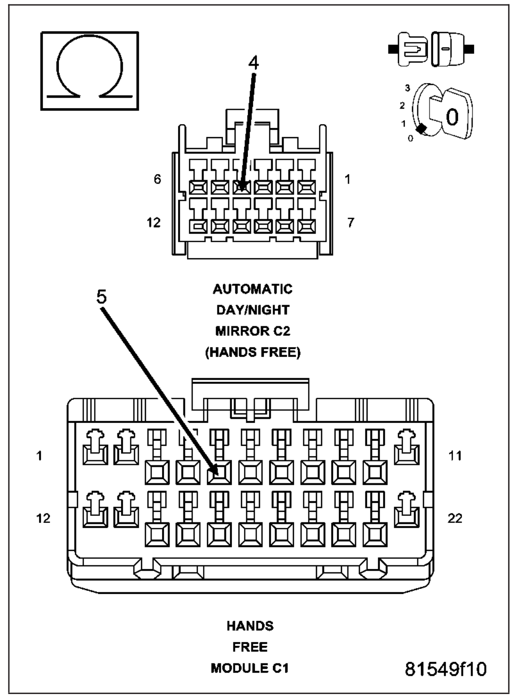
## 3. (X722) MICROPHONE 2 IN (+) CIRCUIT OPEN

Measure the resistance of the (X722) Microphone 2 IN (+) circuit between the HFM connector and the Automatic Day/Night Mirror connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X722) Microphone 2 IN (+) circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



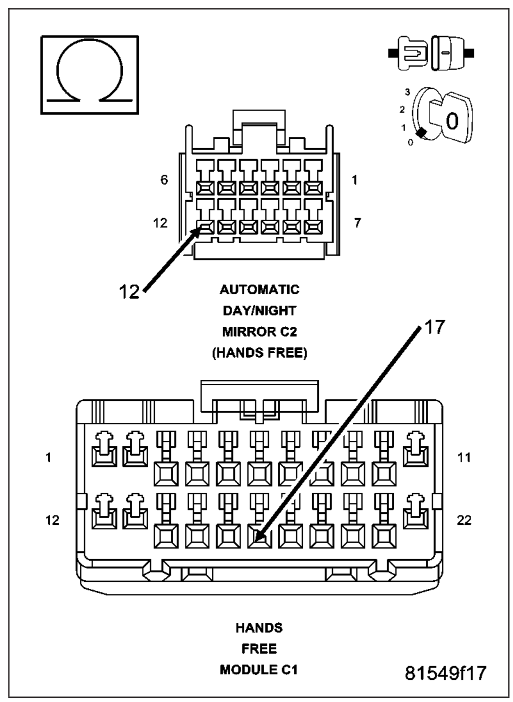
## 4. (X792) MICROPHONE IN (-) CIRCUIT OPEN

Measure the resistance of the (X792) Microphone IN (-) circuit between the HFM connector and the Automatic Day/Night Mirror connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (X792) Microphone IN (-) circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 5. (X712) (X722) (X792) MICROPHONE CIRCUITS SHORTED TO GROUND

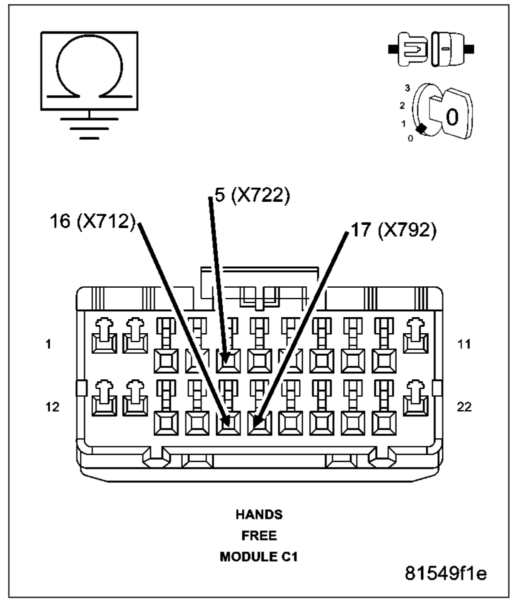
Measure the resistance between ground and each (X712) (X722) (X792) Microphone circuit.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the Microphone circuit that measured below 100.0 ohms for short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 6



## 6. (X712) (X722) (X792) MICROPHONE CIRCUITS SHORTED TO VOLTAGE

Turn the ignition on.

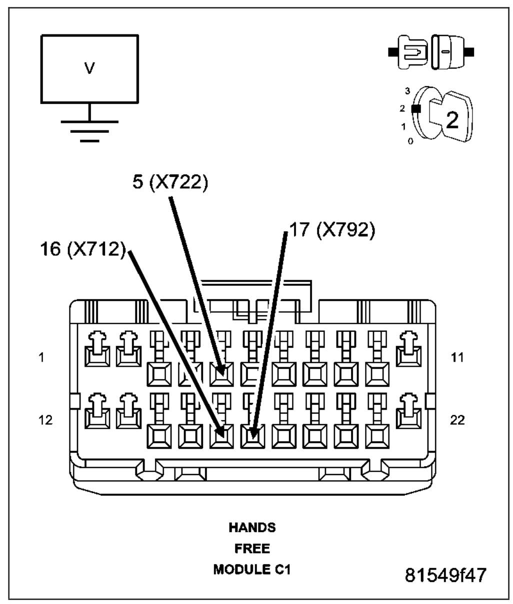
Measure the voltage of each (X712) (X722) (X792) Microphone circuit.

**Is the voltage above 1.0 volt?**

**Yes** >> Repair the Microphone circuit that measured above 1.0 volt for short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

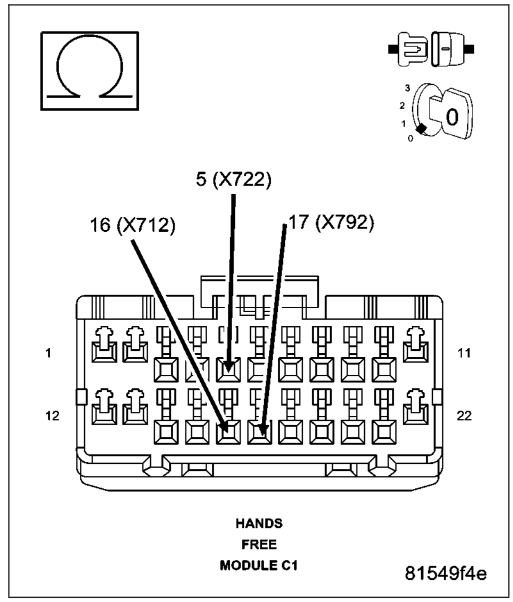
**No** >> Go To 7



## 7. (X712) (X722) (X792) MICROPHONE CIRCUITS SHORTED TOGETHER

Turn the ignition off.

Measure the resistance between each (X712) (X722) (X792) Microphone circuit.



**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the Microphone circuit that measured below 100.0 ohms for a short together.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 8

## 8. AUTOMATIC DAY/NIGHT MIRROR

Replace the Automatic Day/Night Mirror in accordance with the service information.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Attempt to make a phone call with the system.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair is complete.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## IGNITION POWER MESSAGE NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module does not receive an ignition power status message from the Body Control Module (BCM).

| Possible Causes |
| --- |
| LOST COMMUNICATION WITH BODY CONTROL MODULE (BCM) |
| HANDS FREE MODULE |

### Diagnostic Test

#### 1. ATTEMPT TO COMMUNICATE WITH THE BODY CONTROL MODULE (BCM)

Turn the ignition on.

With the scan tool, attempt to communicate with the BCM.

**Was the scan tool able to communicate with the BCM?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

#### 2. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC's.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## INVALID BODY STYLE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module receives an invalid body style message from the PCM.

| Possible Causes |
| --- |
| LOST COMMUNICATION WITH PCM |
| PCM NOT ACTIVE ON THE BUS NETWORK |
| HANDS FREE MODULE |

### Diagnostic Test

#### 1. ATTEMPT TO COMMUNICATE WITH THE PCM

Turn the ignition on.

With the scan tool, attempt to communicate with the PCM.

**Was the scan tool able to communicate with the PCM?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

#### 2. CHECK PCM ACTIVITY ON THE BUS NETWORK

With the scan tool, select System Monitors then J1850 Module Scan.

**Does the scan tool indicated that the PCM is present or active on the bus network?**

**Yes** >> Go To 3

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

#### 3. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC's.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC's.

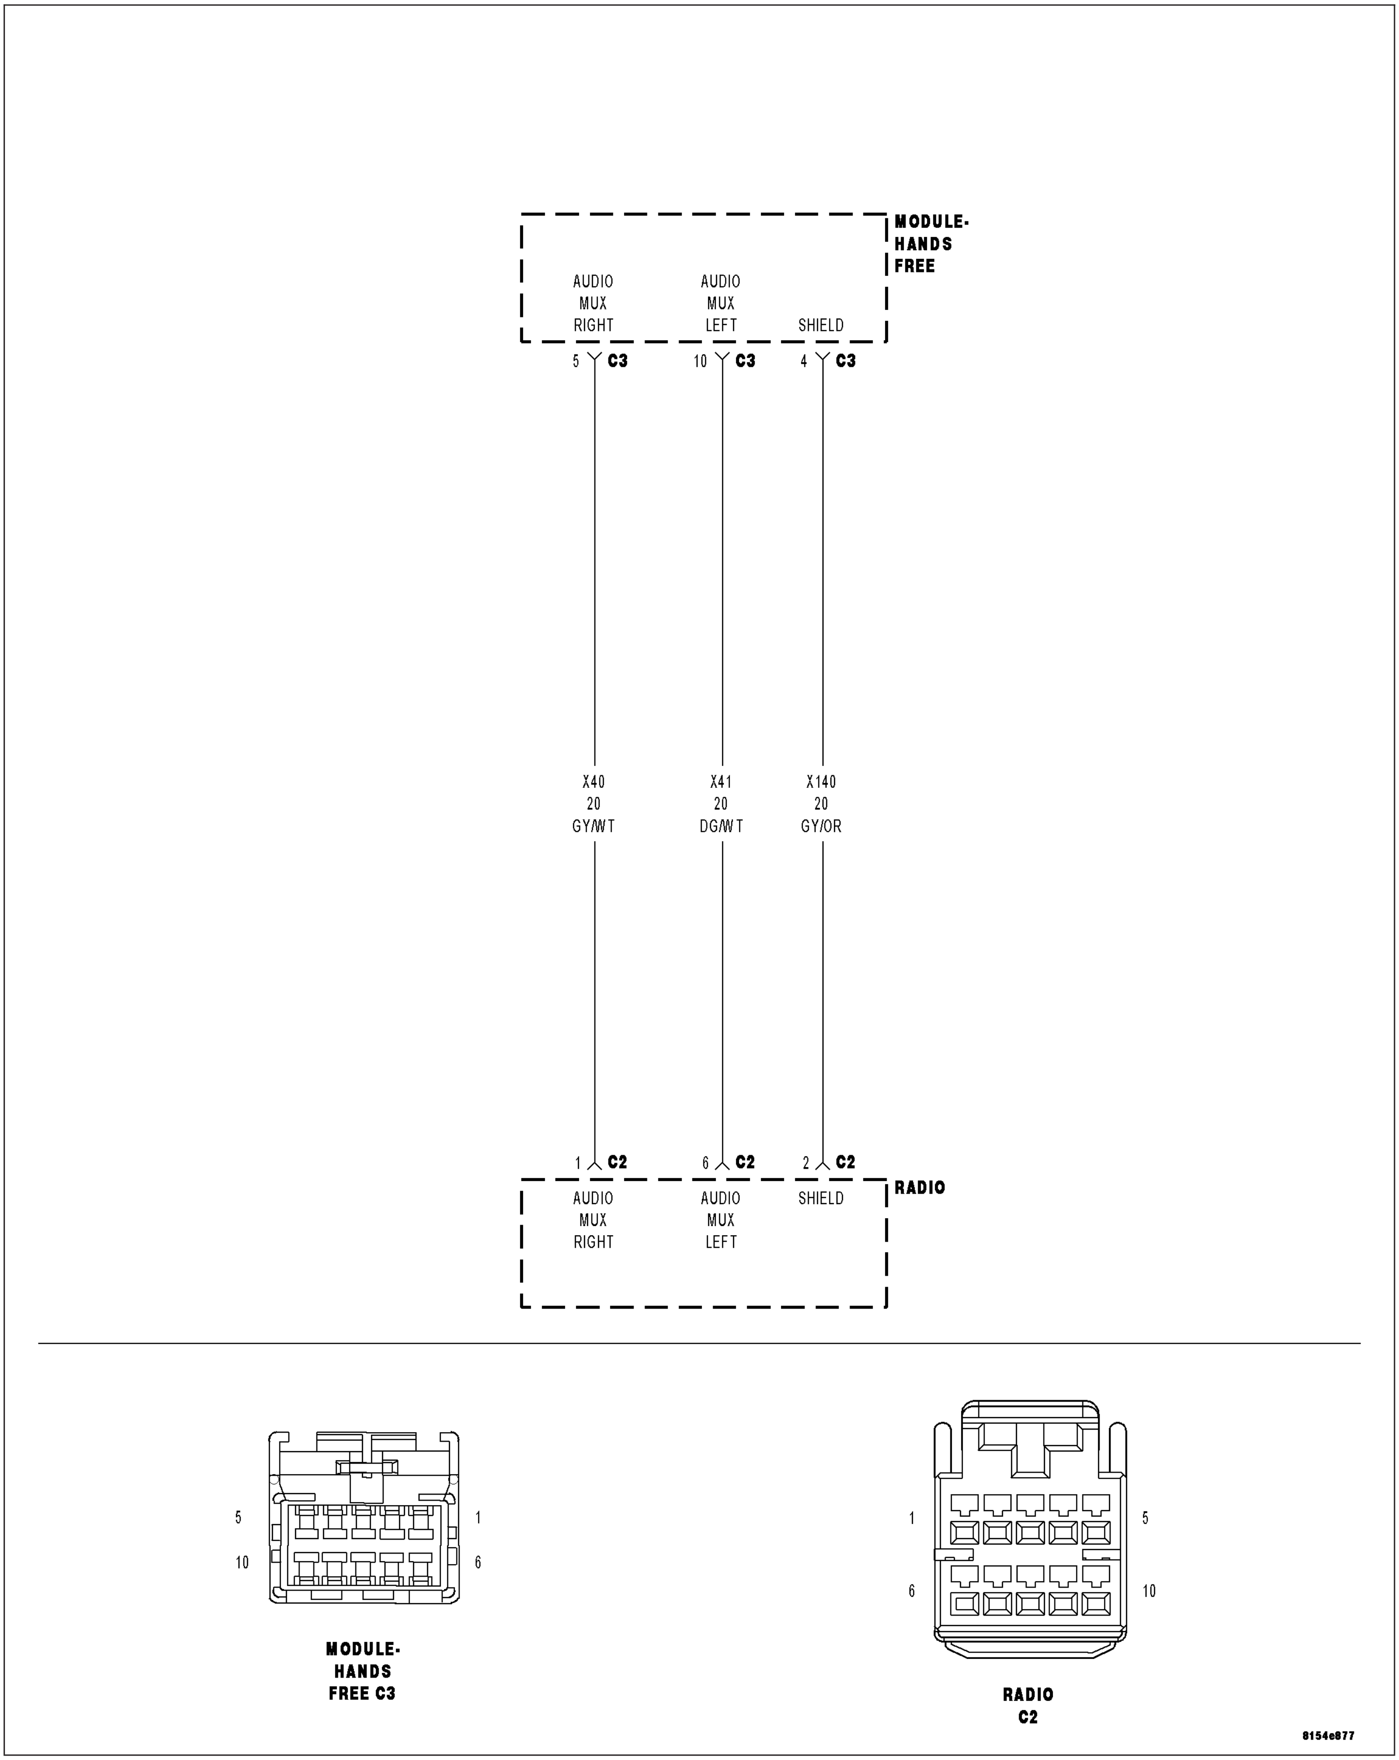
**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## LEFT AUDIO INPUT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects low voltage on the (X41) Audio MUX Left circuit.

| Possible Causes |
|---|
| (X41) AUDIO MUX LEFT CIRCUIT OPEN |
| (X41) AUDIO MUX LEFT CIRCUIT SHORT TO GROUND |
| (X140) AUDIO RETURN CIRCUIT OPEN |
| (X41) AUDIO MUX LEFT CIRCUIT SHORT TO (X140) AUDIO RETURN CIRCUIT |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

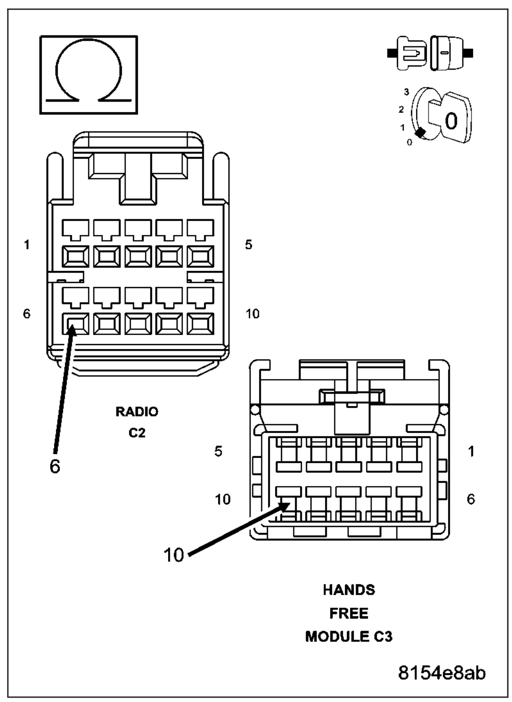
### 2. (X41) AUDIO MUX LEFT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C2 harness connector.

Measure the resistance of the (X41) Audio MUX Left circuit between the HFM connector and the radio connector.



**Is the resistance below 5.0 ohms?**

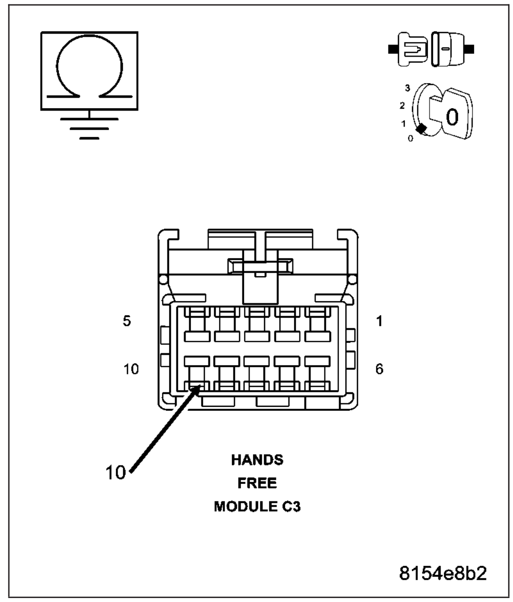
**Yes** >> Go To 3

**No** >> Repair the (X41) Audio MUX Left circuit for an open

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (X41) AUDIO MUX LEFT CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (X41) Audio MUX Left circuit.



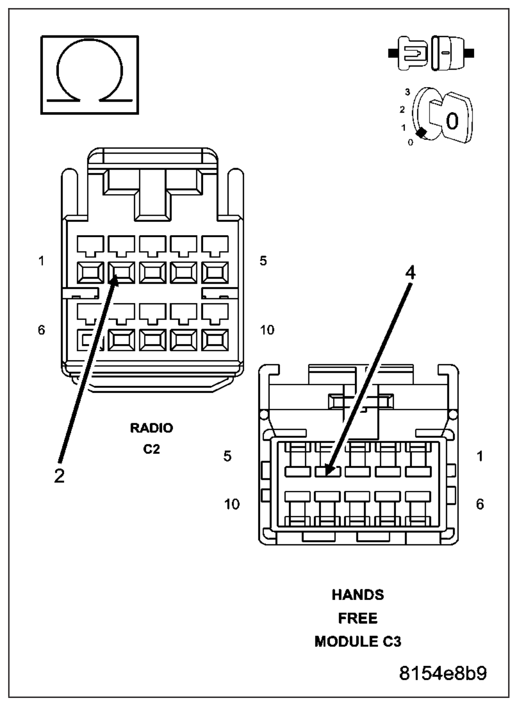
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (X41) Audio MUX Left circuit for short to ground. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. (X140) AUDIO RETURN CIRCUIT OPEN

Measure the resistance of the (X140) Audio Return circuit between the HFM connector and the radio connector.



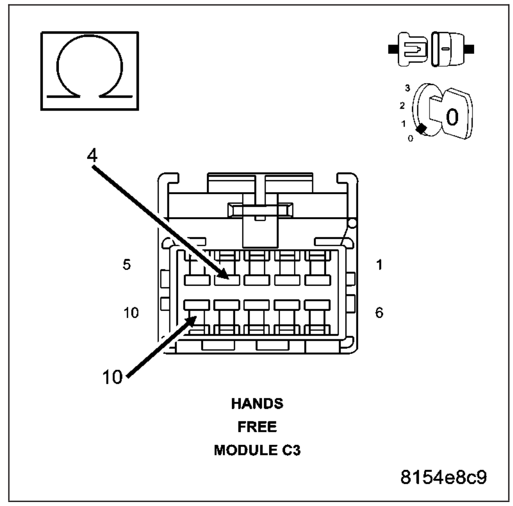
**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (X140) Audio Return circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. (X41) AUDIO MUX LEFT CIRCUIT SHORT TO (X140) AUDIO RETURN CIRCUIT

Measure the resistance between the (X41) Audio MUX Left circuit and the (X140) Audio Return circuit.



**Is the resistance below 5.0 ohms?**

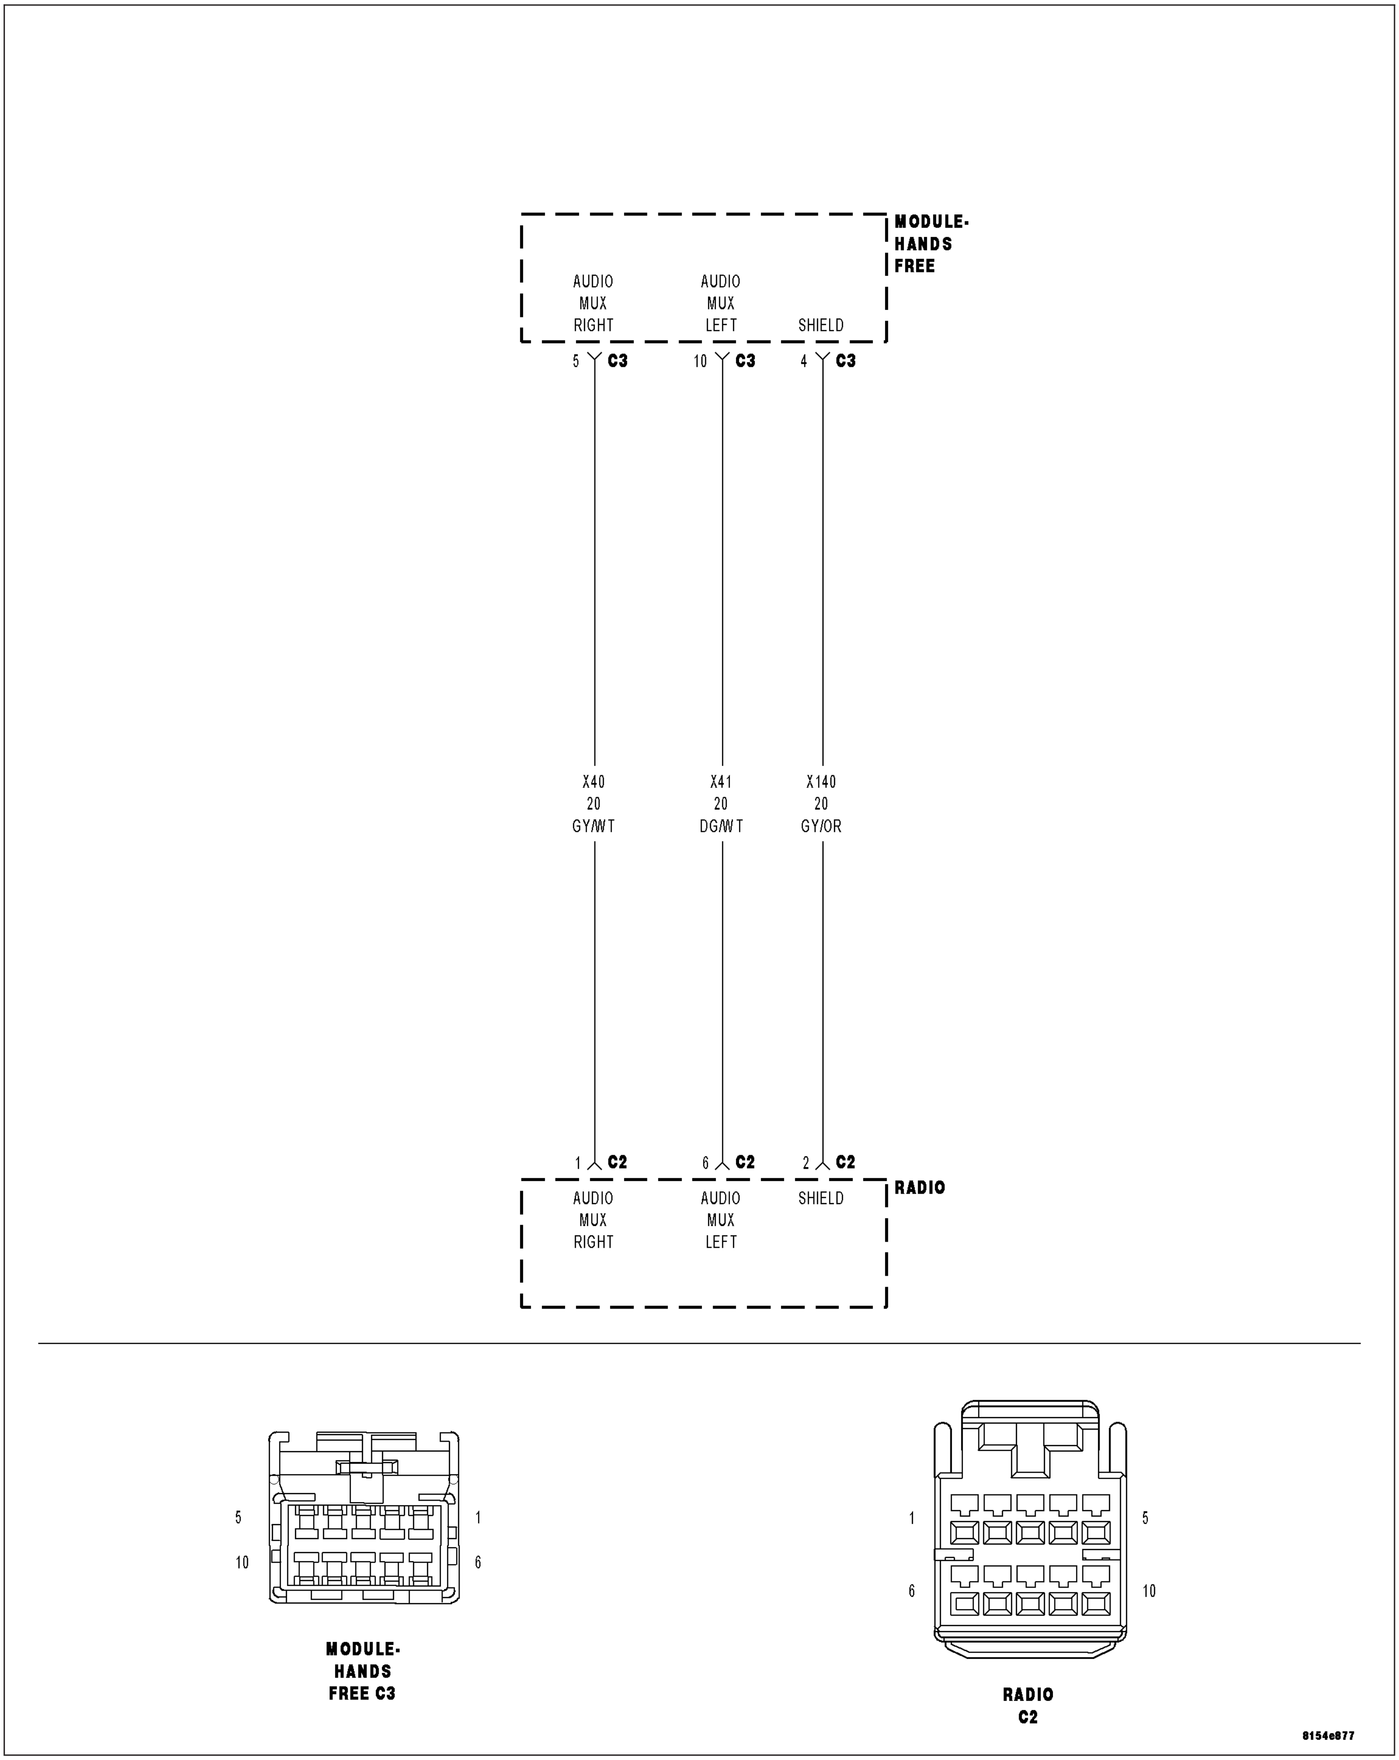
**Yes** >> Repair the (X41) Audio MUX Left circuit for a short to the (X140) Audio Return circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## LEFT AUDIO INPUT SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects high voltage on the (X41) Audio MUX Left circuit.

| Possible Causes |
|---|
| (X41) AUDIO MUX LEFT CIRCUIT OPEN |
| (X140) AUDIO RETURN CIRCUIT OPEN |
| (X41) AUDIO MUX LEFT CIRCUIT SHORT TO VOLTAGE |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

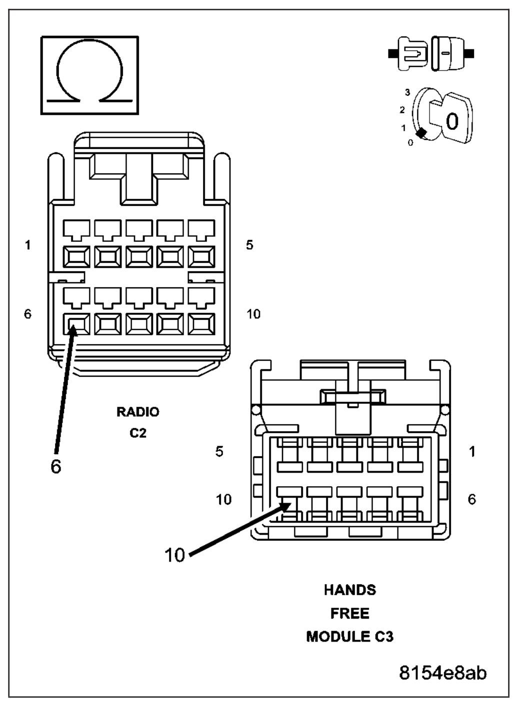
### 2. (X41) AUDIO MUX LEFT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C2 harness connector.

Measure the resistance of the (X41) Audio MUX Left circuit between the HFM connector and the radio connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (X41) Audio MUX Left circuit for an open

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (X140) AUDIO RETURN CIRCUIT OPEN

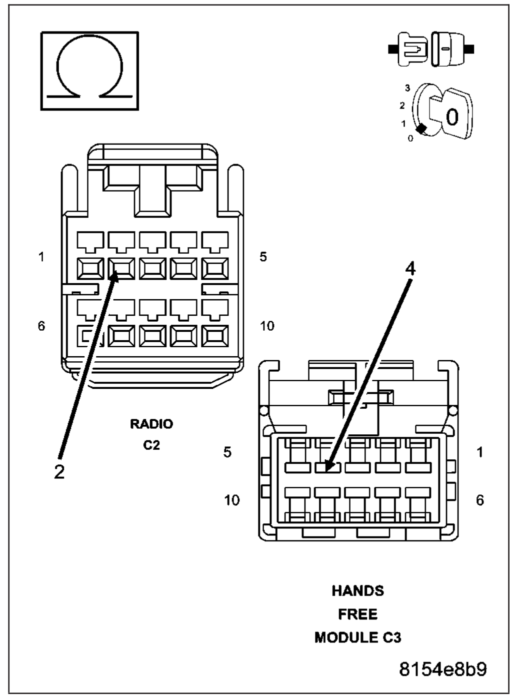
Measure the resistance of the (X140) Audio Return circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X140) Audio Return circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 4. (X41) AUDIO MUX LEFT CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (X41) Audio MUX Left circuit.

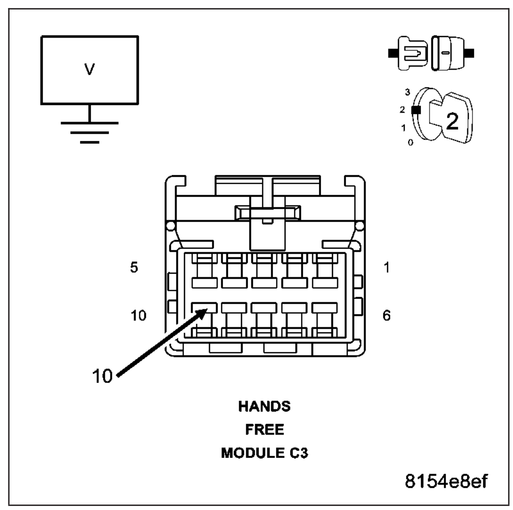
**Is the voltage above 1.0 volts?**

**Yes** >> Repair the (X41) Audio MUX Left circuit for a short to voltage.

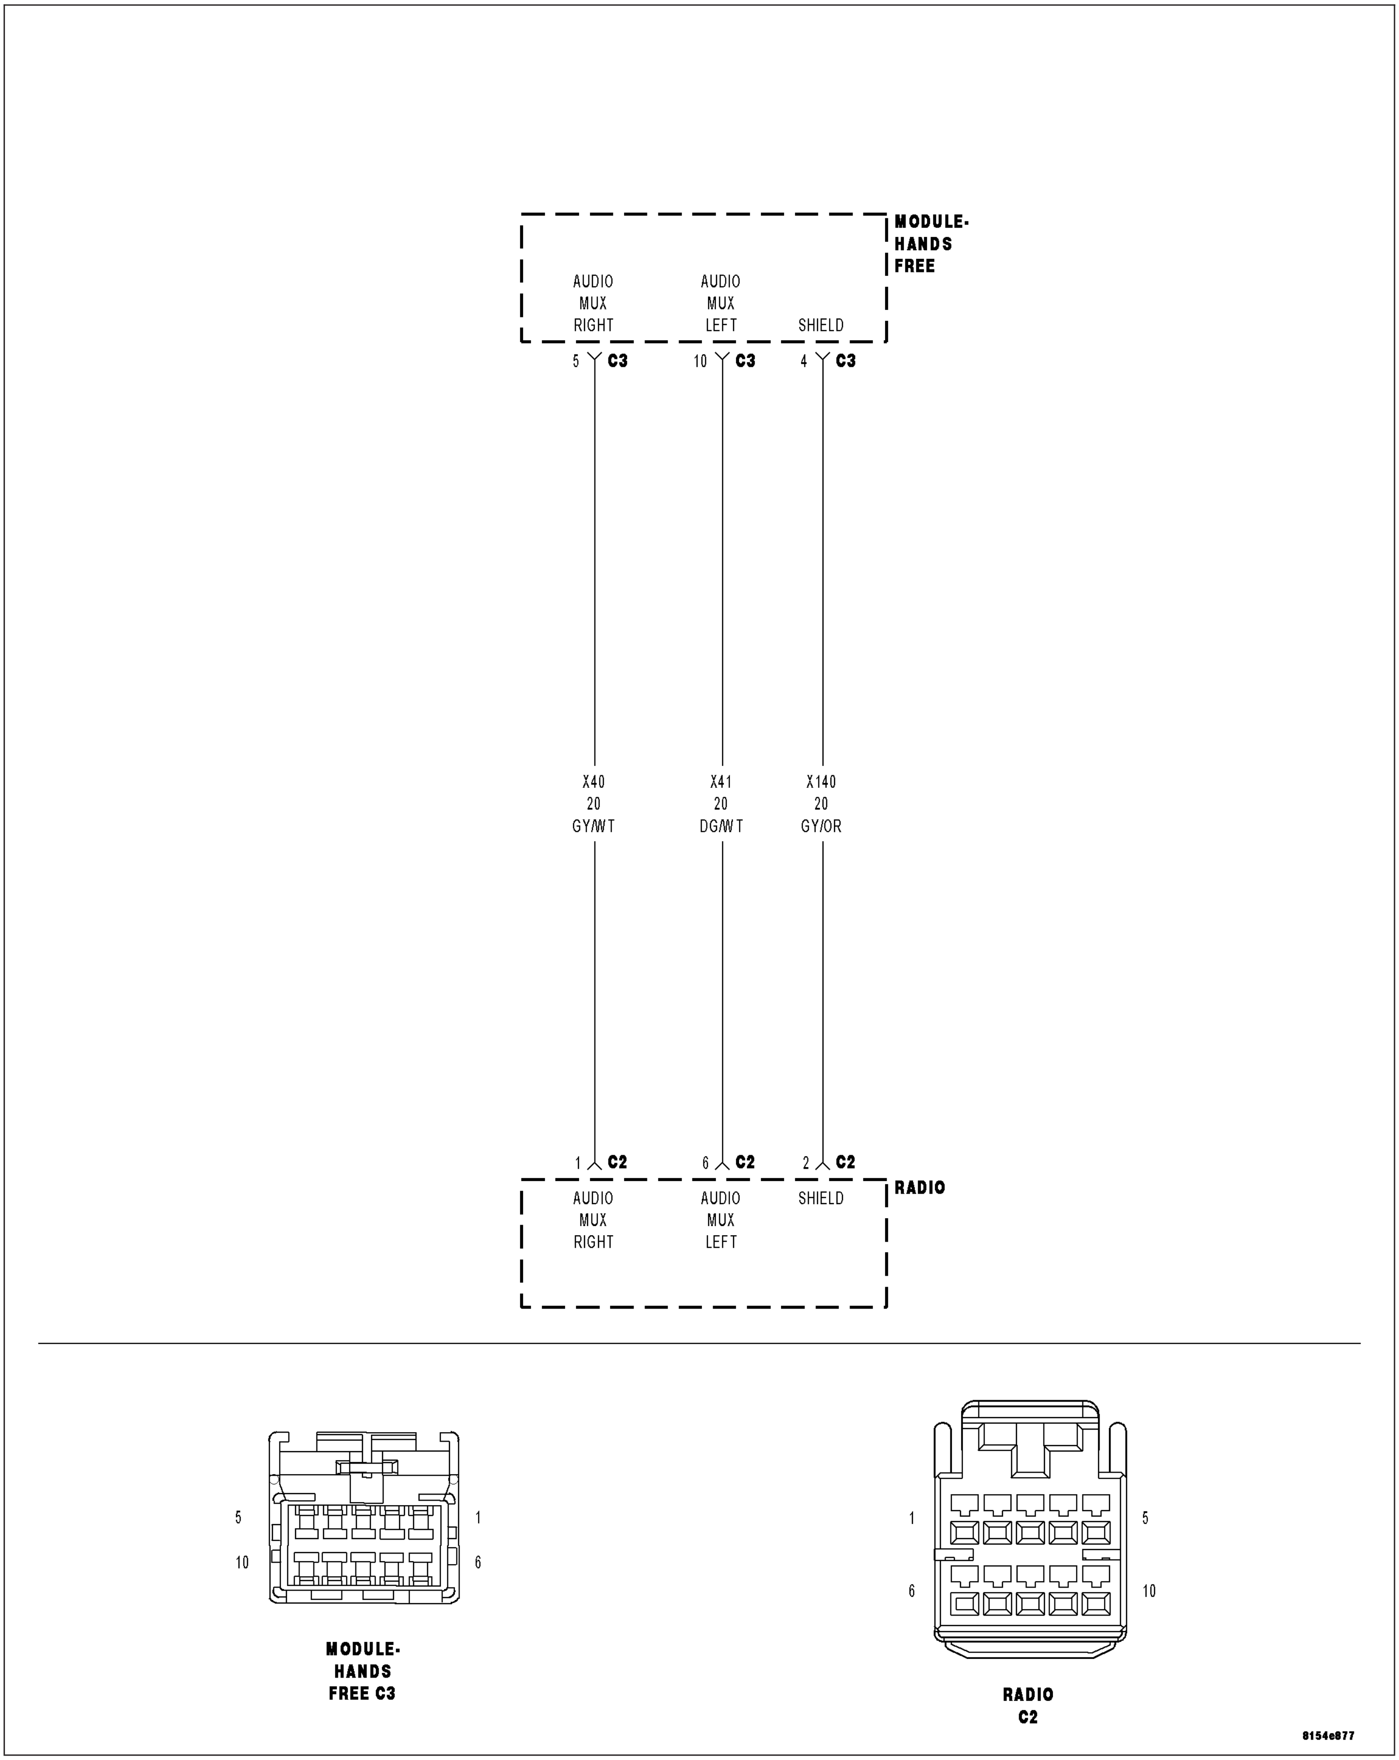
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## LEFT AUDIO OUTPUT 1 SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a short to ground on the (X41) Audio MUX Left circuit.

| Possible Causes |
| --- |
| (X41) AUDIO MUX LEFT CIRCUIT OPEN |
| (X41) AUDIO MUX LEFT CIRCUIT SHORT TO GROUND |
| (X140) AUDIO RETURN CIRCUIT OPEN |
| (X41) AUDIO MUX LEFT CIRCUIT SHORT TO (X140) AUDIO RETURN CIRCUIT |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (X41) AUDIO MUX LEFT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C2 harness connector.

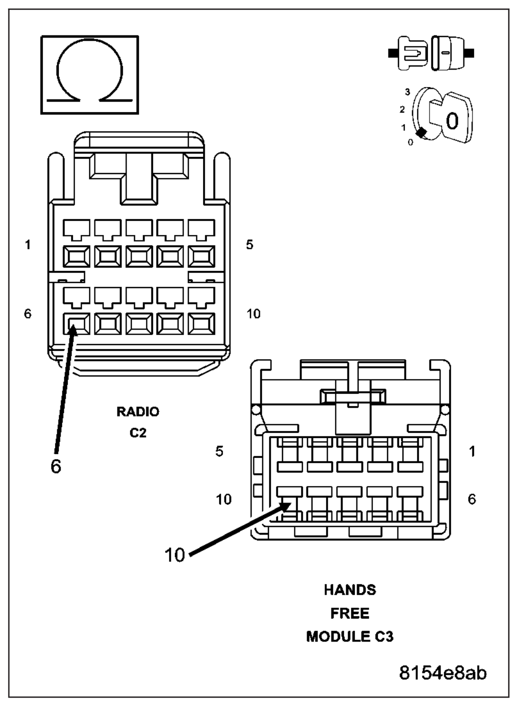
Measure the resistance of the (X41) Audio MUX Left circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

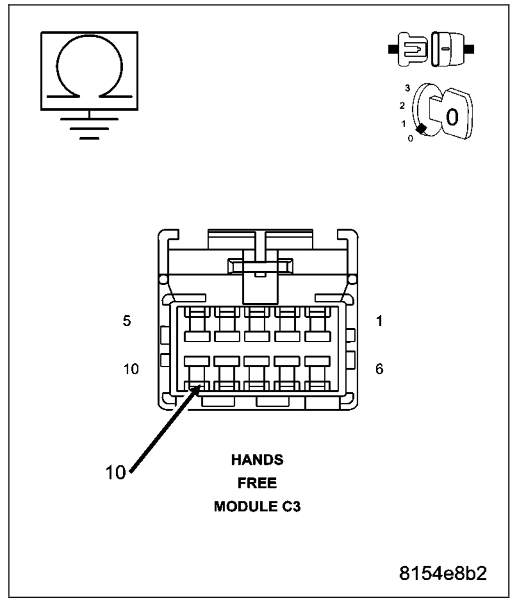
**No** >> Repair the (X41) Audio MUX Left circuit for an open

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 3. (X41) AUDIO MUX LEFT CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (X41) Audio MUX Left circuit.



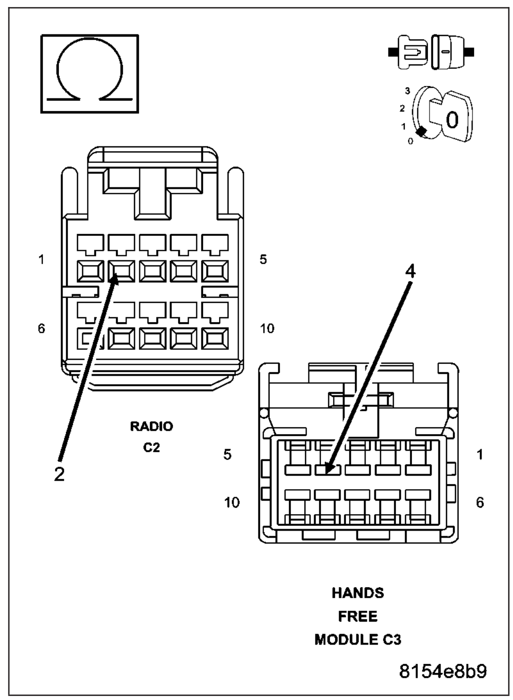
**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (X41) Audio MUX Left circuit for short to ground. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. (X140) AUDIO RETURN CIRCUIT OPEN

Measure the resistance of the (X140) Audio Return circuit between the HFM connector and the radio connector.



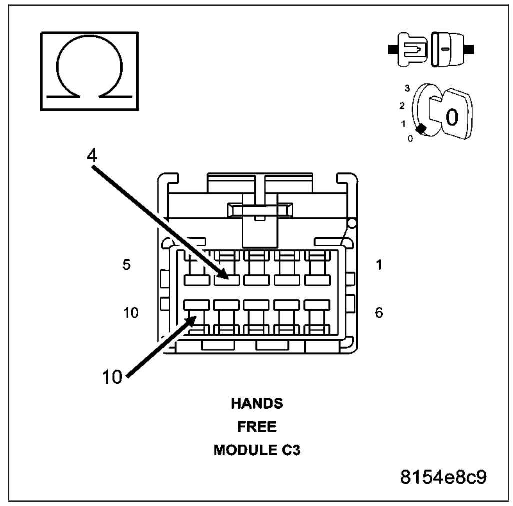
**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (X140) Audio Return circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. (X41) AUDIO MUX LEFT CIRCUIT SHORT TO (X140) AUDIO RETURN CIRCUIT

Measure the resistance between the (X41) Audio MUX Left circuit and the (X140) Audio Return circuit.



**Is the resistance below 5.0 ohms?**

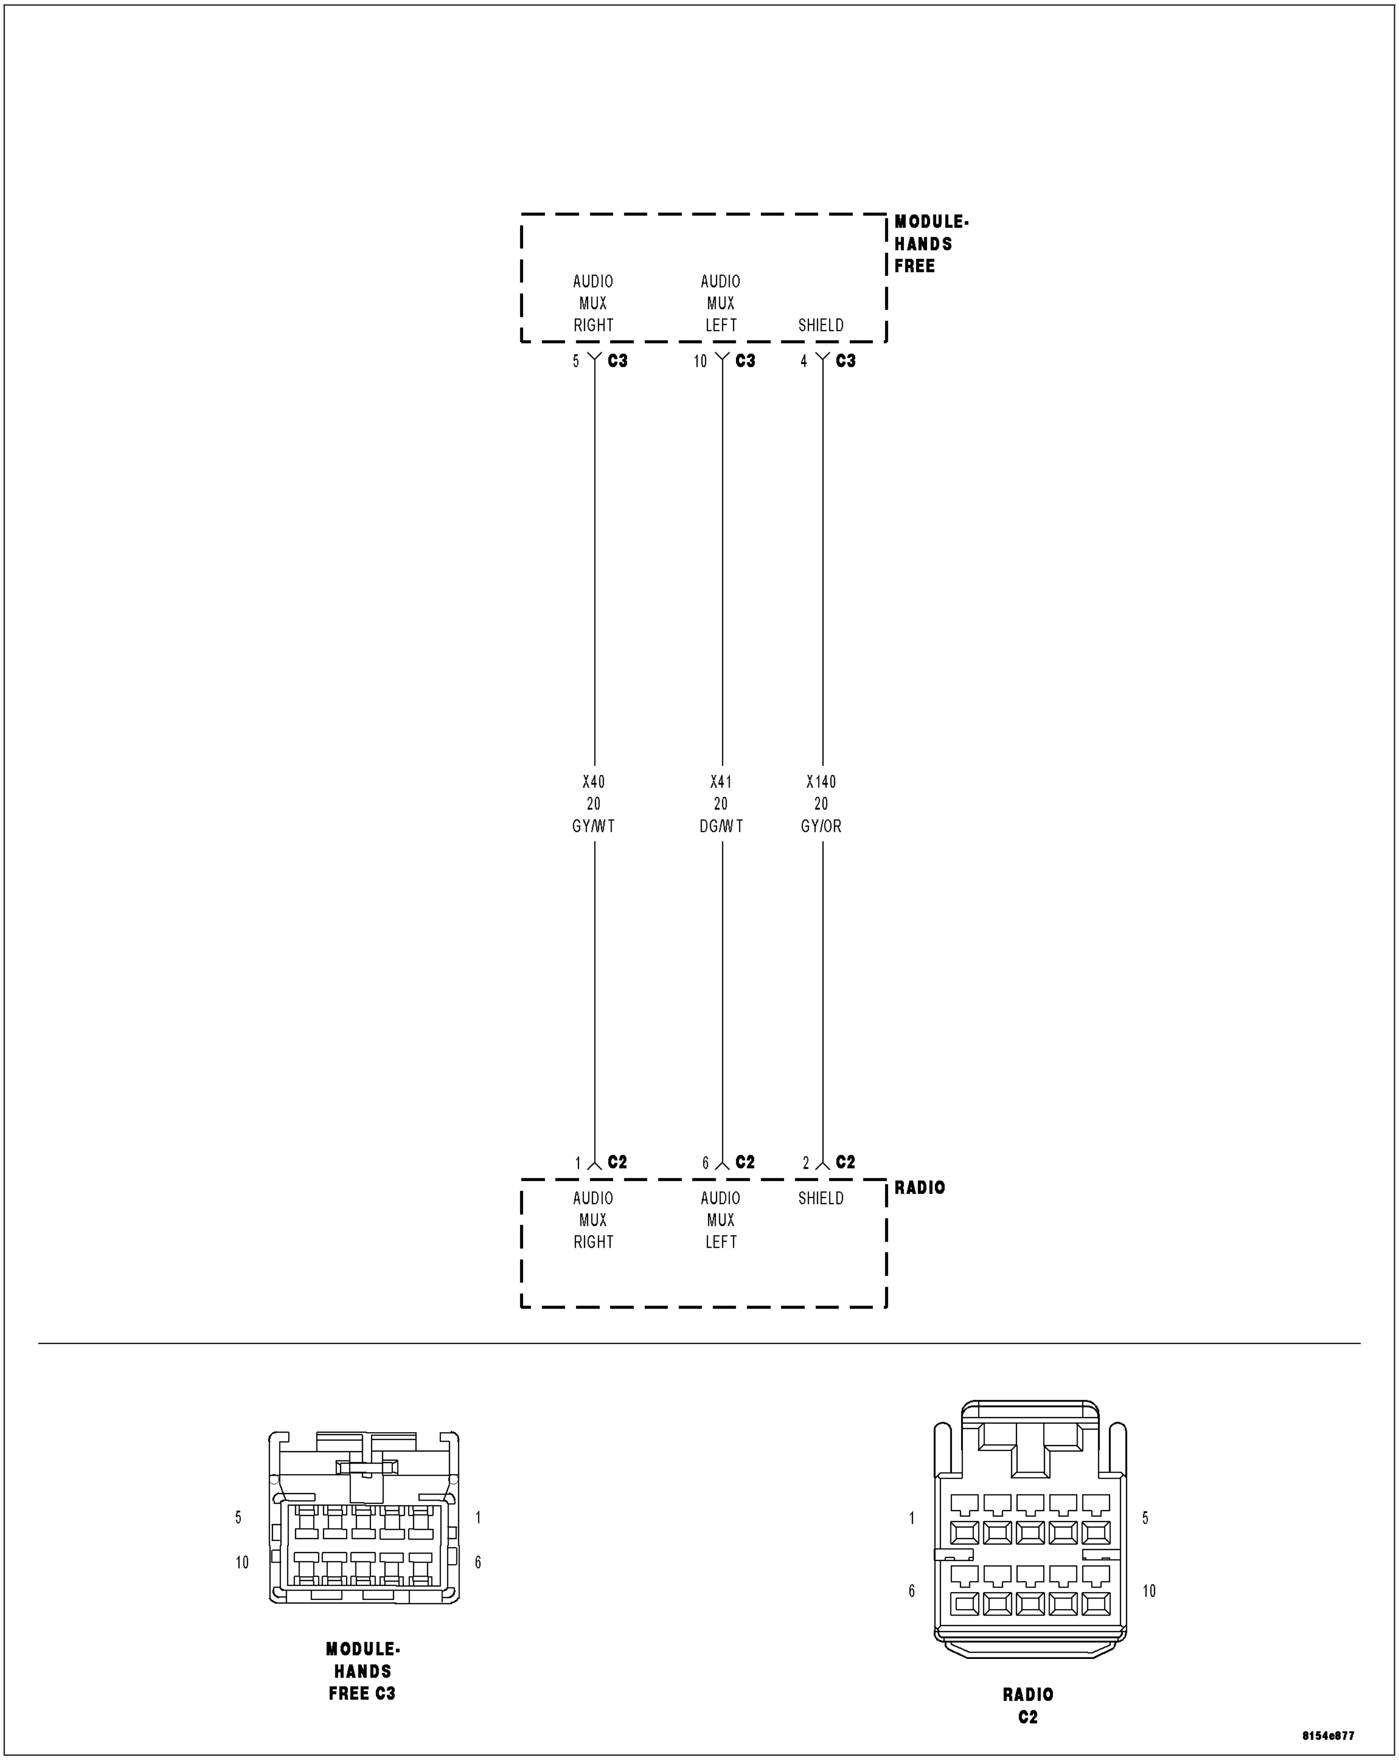
**Yes** >> Repair the (X41) Audio MUX Left circuit for a short to the (X140) Audio Return circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## LEFT AUDIO OUTPUT 1 SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a short voltage on the (X41) Audio MUX Left circuit.

| Possible Causes |
|---|
| (X41) AUDIO MUX LEFT CIRCUIT OPEN |
| (X140) AUDIO RETURN CIRCUIT OPEN |
| (X41) AUDIO MUX LEFT CIRCUIT SHORT TO VOLTAGE |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

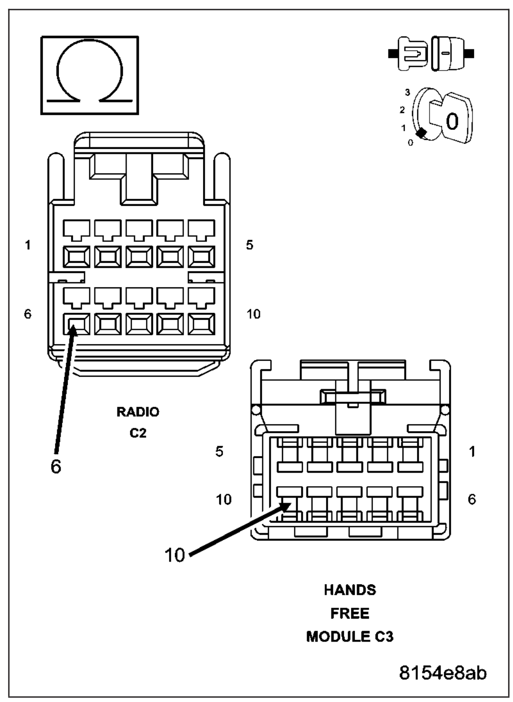
### 2. (X41) AUDIO MUX LEFT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C2 harness connector.

Measure the resistance of the (X41) Audio MUX Left circuit between the HFM connector and the radio connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (X41) Audio MUX Left circuit for an open

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (X140) AUDIO RETURN CIRCUIT OPEN

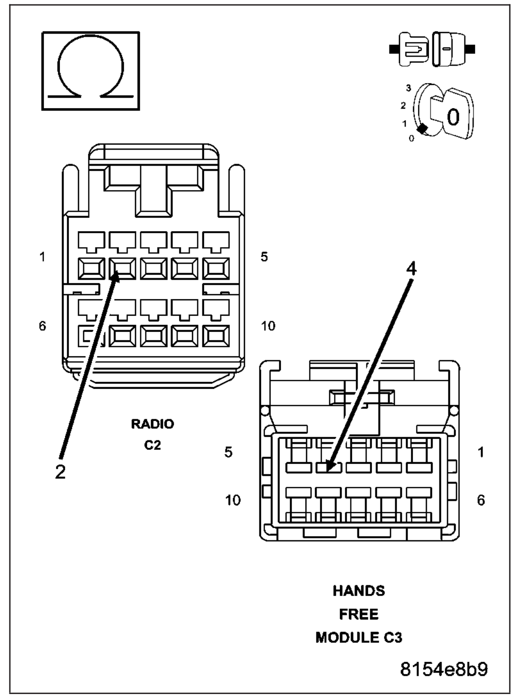
Measure the resistance of the (X140) Audio Return circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X140) Audio Return circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 4. (X41) AUDIO MUX LEFT CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (X41) Audio MUX Left circuit.

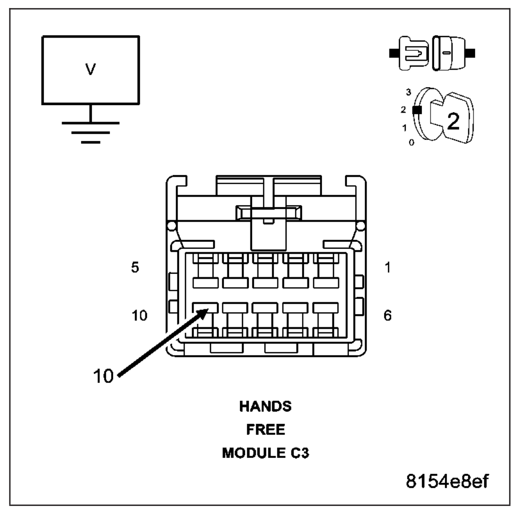
**Is the voltage above 1.0 volts?**

**Yes** >> Repair the (X41) Audio MUX Left circuit for a short to voltage.

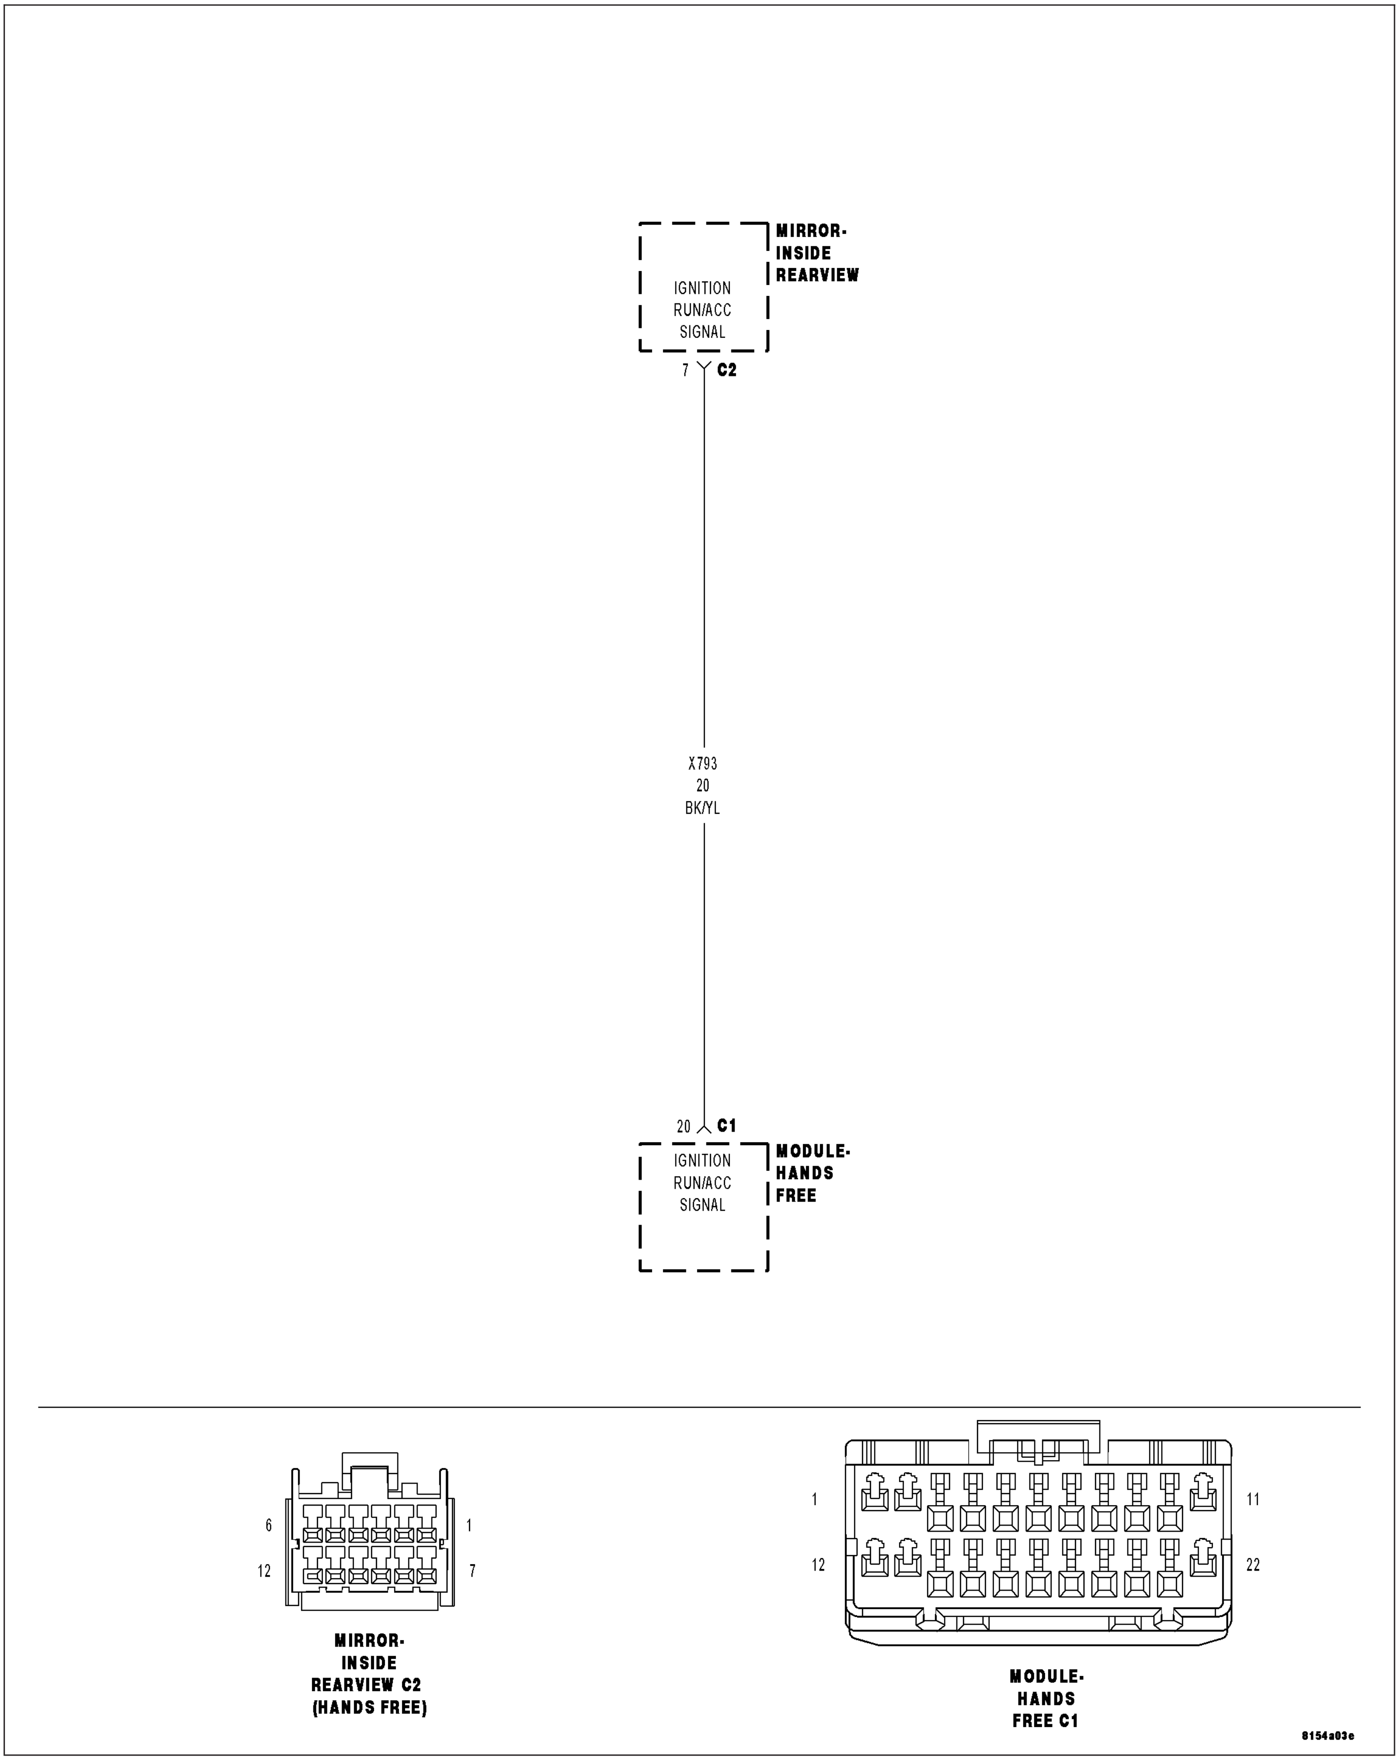
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## MIRROR POWER CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects low voltage on the (X793) Microphone Feed circuit.

| Possible Causes |
|---|
| (X793) MICROPHONE FEED CIRCUIT OPEN |
| (X793) MICROPHONE FEED CIRCUIT SHORT TO GROUND |
| AUTOMATIC DAY/NIGHT MIRROR |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

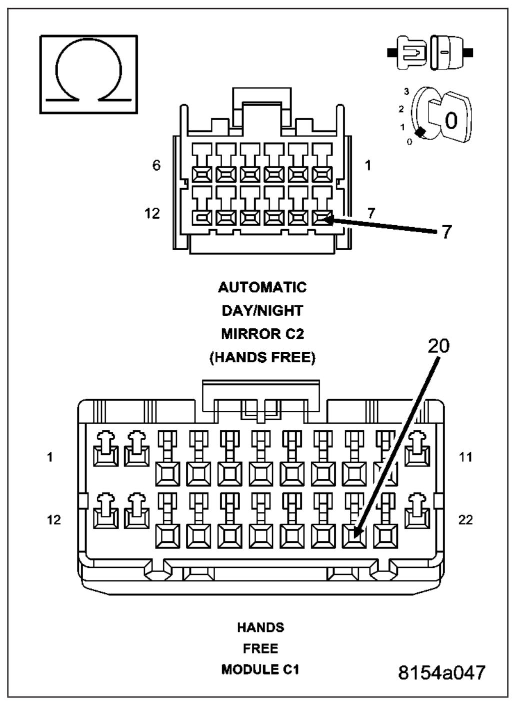
### 2. (X793) MICROPHONE FEED CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module C1 harness connector.

Disconnect the Automatic Day/Night Mirror C2 harness connector.

Measure the resistance of the (X793) Microphone Feed circuit between the HFM connector and the Automatic Day/Night Mirror connector.



**Is the resistance below 5.0 ohms?**

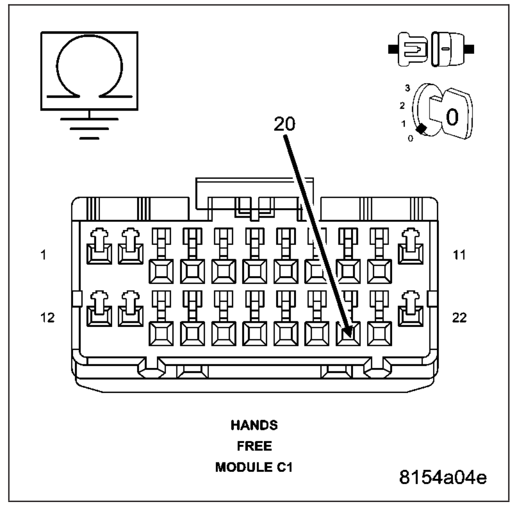
**Yes** >> Go To 3

**No** >> Repair the (X793) Microphone Feed circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (X793) MICROPHONE FEED CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (X793) Microphone Feed circuit



**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (X793) Microphone Feed circuit for short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. AUTOMATIC DAY/NIGHT MIRROR

Replace the Inside Automatic Day/Night Mirror in accordance with the service information.

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

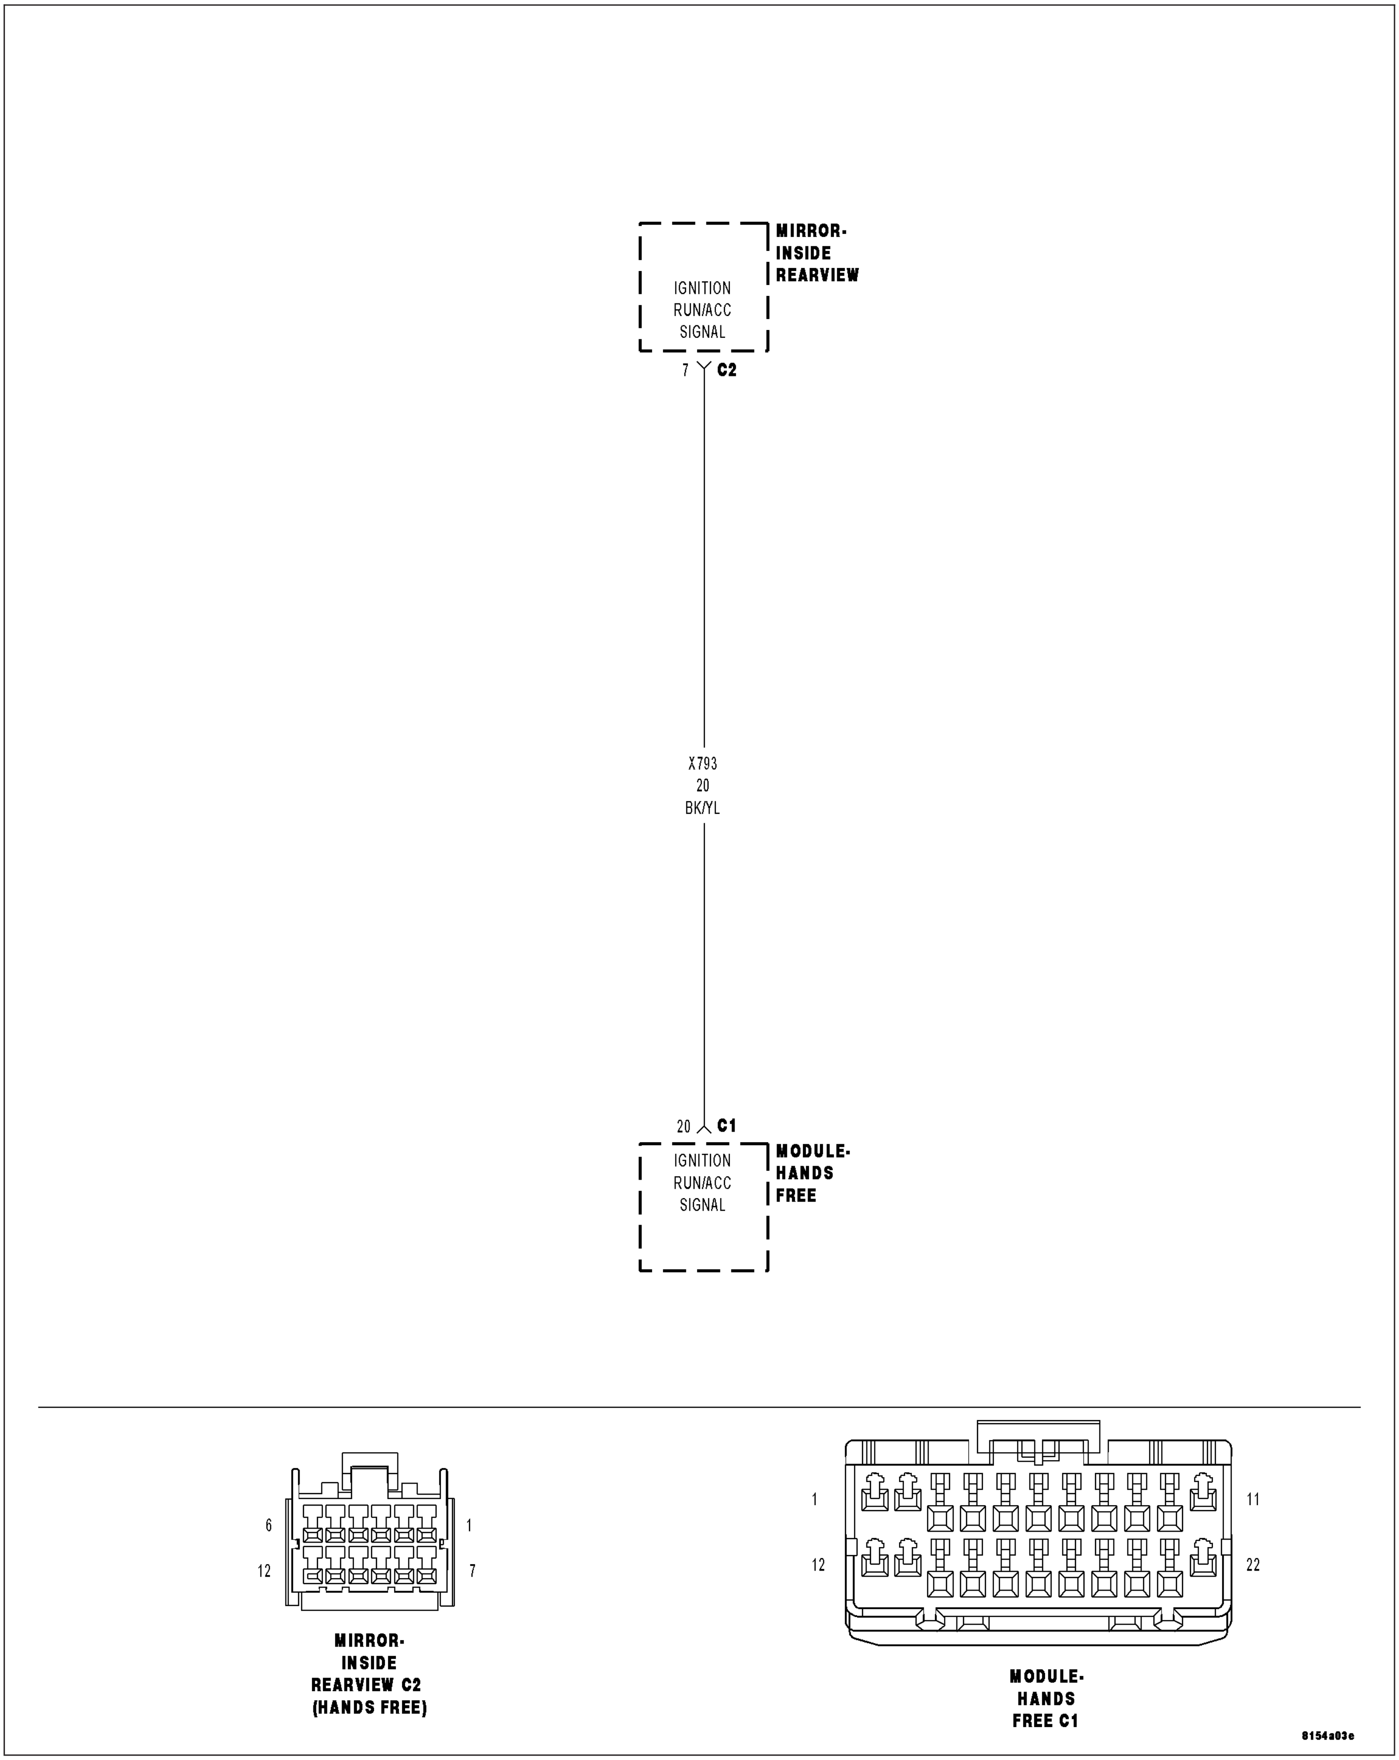
**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair is complete.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## MIRROR POWER CIRCUIT SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects high voltage on the (X793) Microphone Feed circuit.

| Possible Causes |
|---|
| (X793) MICROPHONE FEED CIRCUIT OPEN |
| (X793) MICROPHONE FEED CIRCUIT SHORT TO VOLTAGE |
| AUTOMATIC DAY/NIGHT MIRROR |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

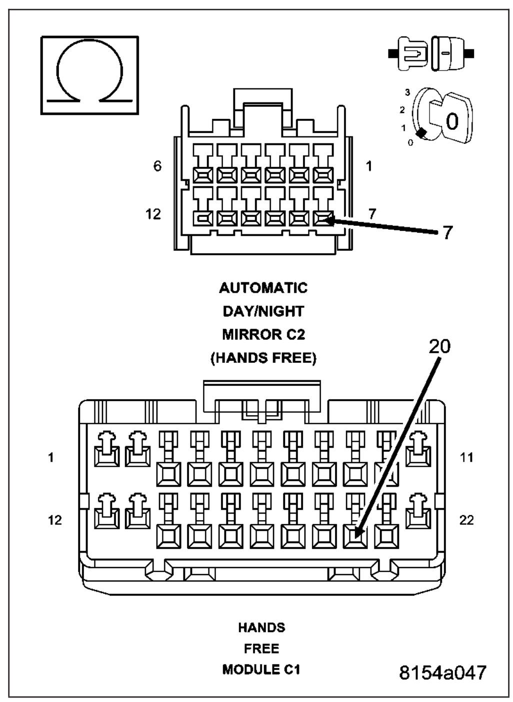
### 2. (X793) MICROPHONE FEED CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module C1 harness connector.

Disconnect the Automatic Day/Night Mirror C2 harness connector.

Measure the resistance of the (X793) Microphone Feed circuit between the HFM connector and the Automatic Day/Night Mirror connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

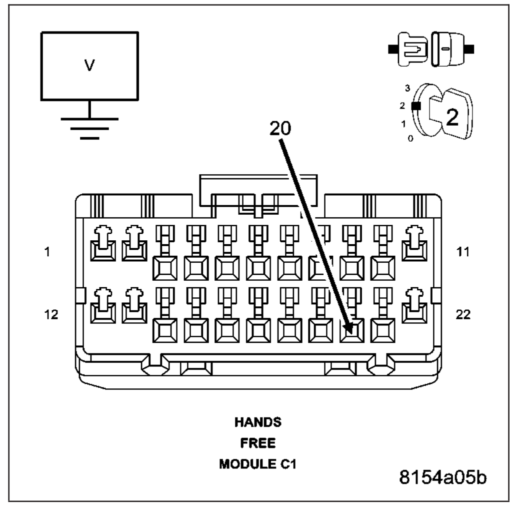
**No** >> Repair the (X793) Microphone Feed circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (X793) MICROPHONE FEED CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (X793) Microphone Feed circuit.



**Is the voltage above 1.0 volt?**

**Yes** >> Repair the (X793) Microphone Feed circuit for short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. AUTOMATIC DAY/NIGHT MIRROR

Replace the Automatic Day/Night Mirror in accordance with the service information.

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

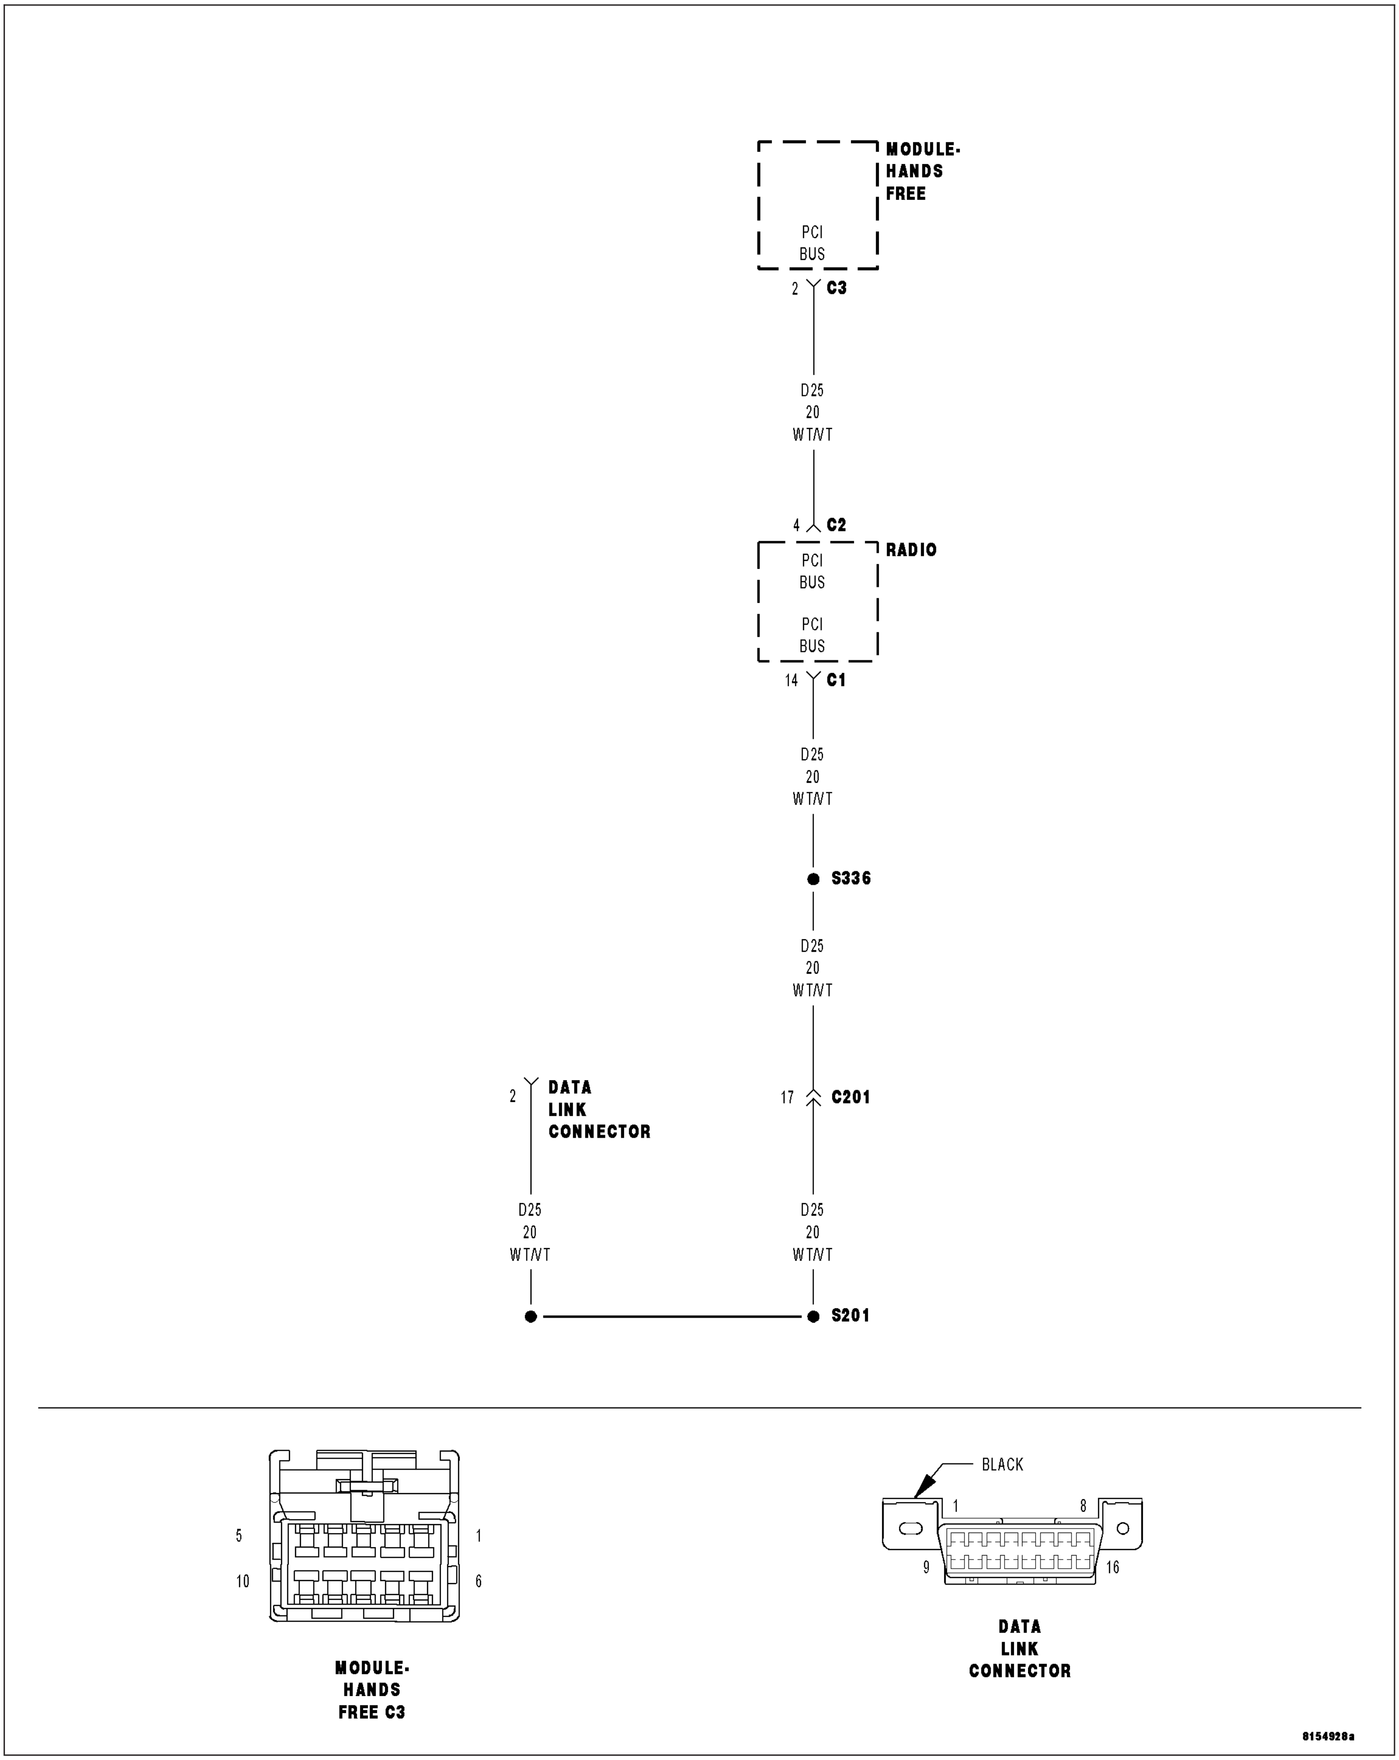
**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair is complete.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## PCI BUS BUSY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detected a fault on the (D25) PCI Bus circuit.

| Possible Causes |
|---|
| (D25) PCI BUS CIRCUIT FAULT |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR AN INTERMITTENT CONDITION

**NOTE: For this code to be active, the scan tool will not be able to communicate with any modules on the vehicle (except any CAN Bus module).**

**NOTE: Clear the DTC. If this DTC continues to set and the scan tool can still communicate with the module, it will be necessary to replace the module.**

**NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.**

With the engine running at normal operating temperature, wiggle the wiring harnesses. This is to try and duplicate the complete bus failure condition.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

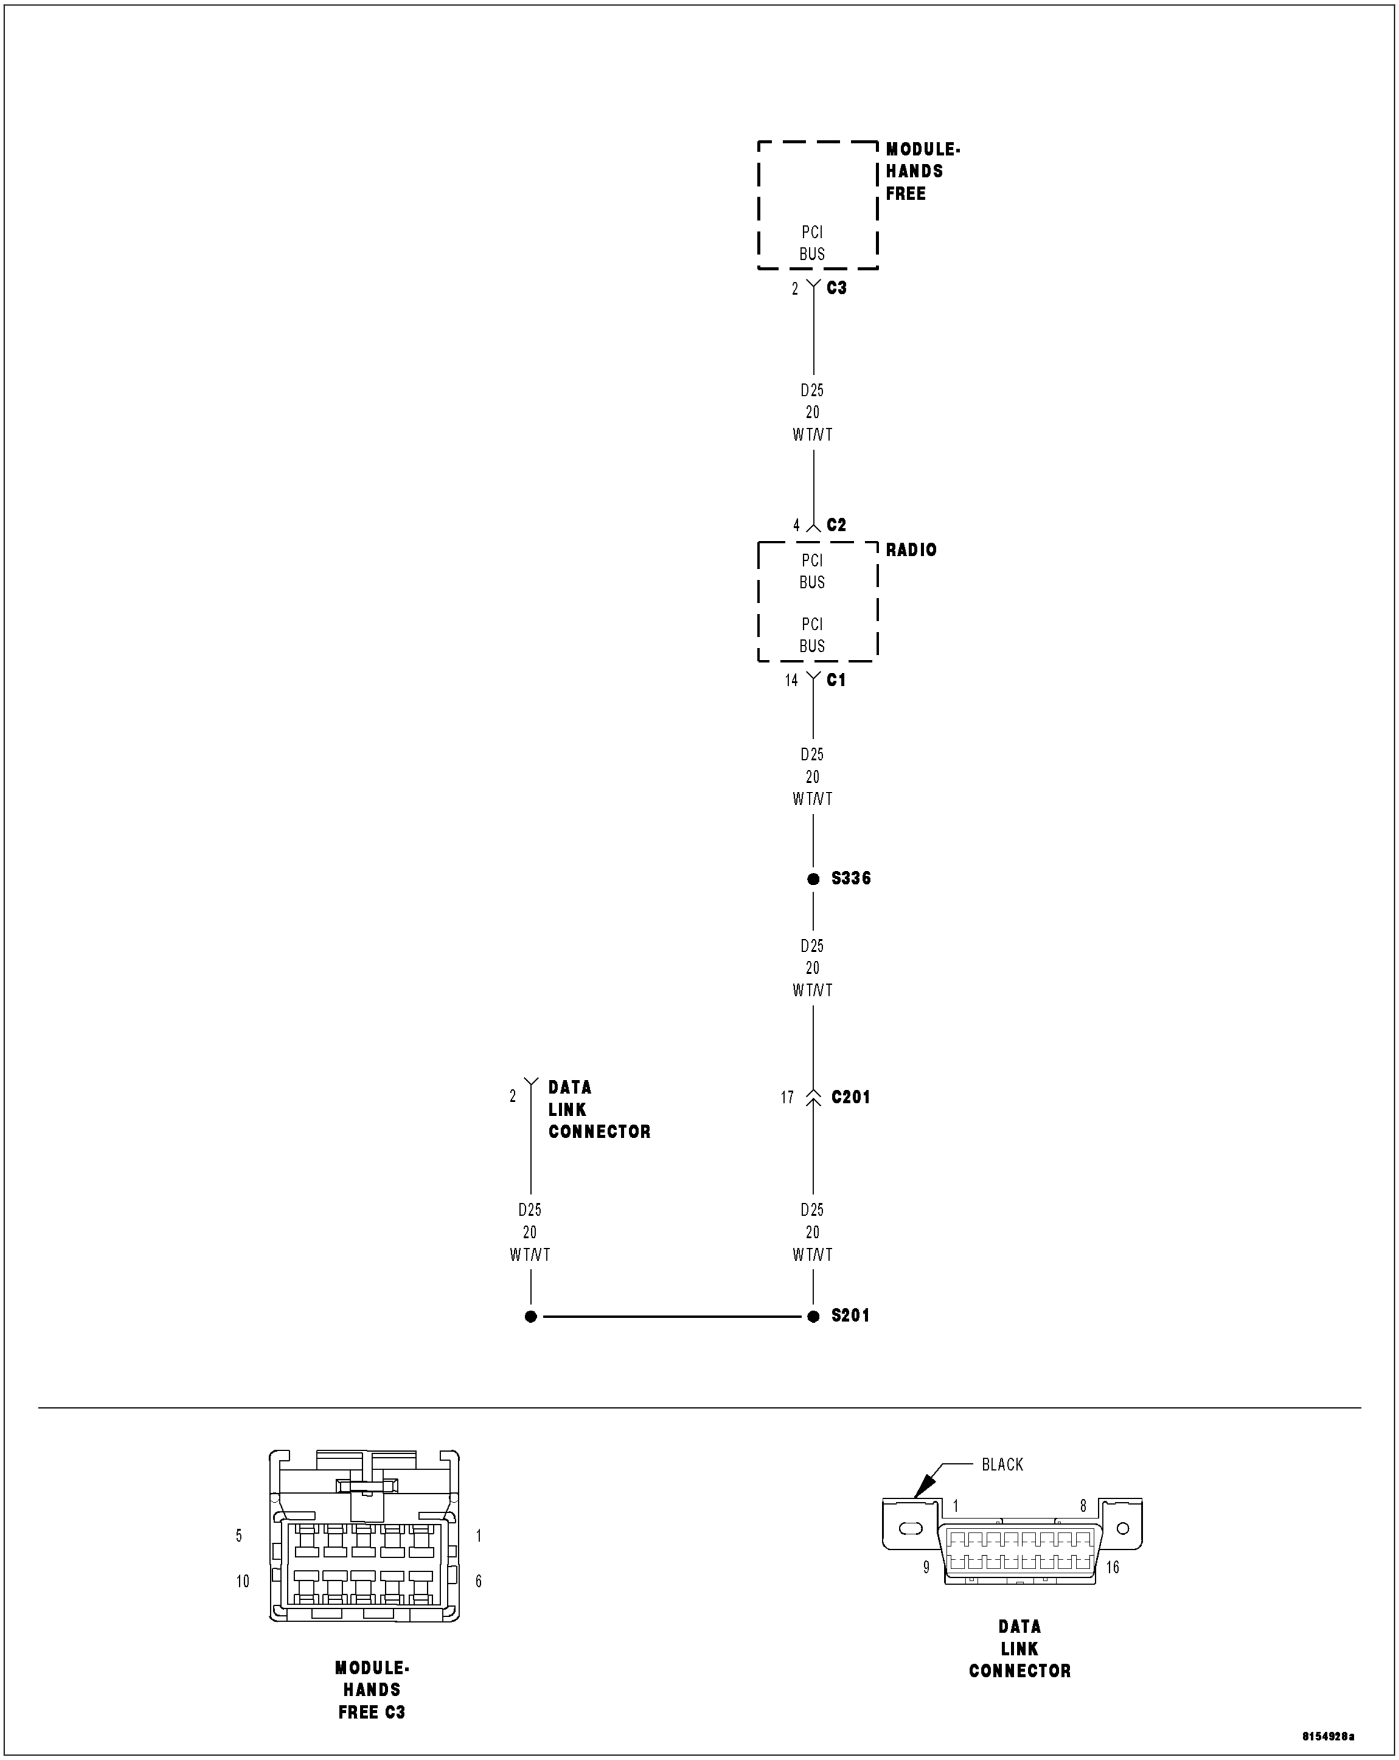
Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any of the above conditions present?**

**Yes** >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test complete.

## PCI BUS CIRCUIT OPEN



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detected an open on the (D25) PCI Bus circuit.

| Possible Causes |
|---|
| (D25) PCI BUS CIRCUIT OPEN |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR AN INTERMITTENT CONDITION

**NOTE: For this code to be active, the scan tool will not be able to communicate with any modules on the vehicle (except any CAN Bus module).**

**NOTE: Clear the DTC. If this DTC continues to set and the scan tool can still communicate with the module, it will be necessary to replace the module.**

**NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.**

With the engine running at normal operating temperature, wiggle the wiring harnesses. This is to try and duplicate the complete bus failure condition.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

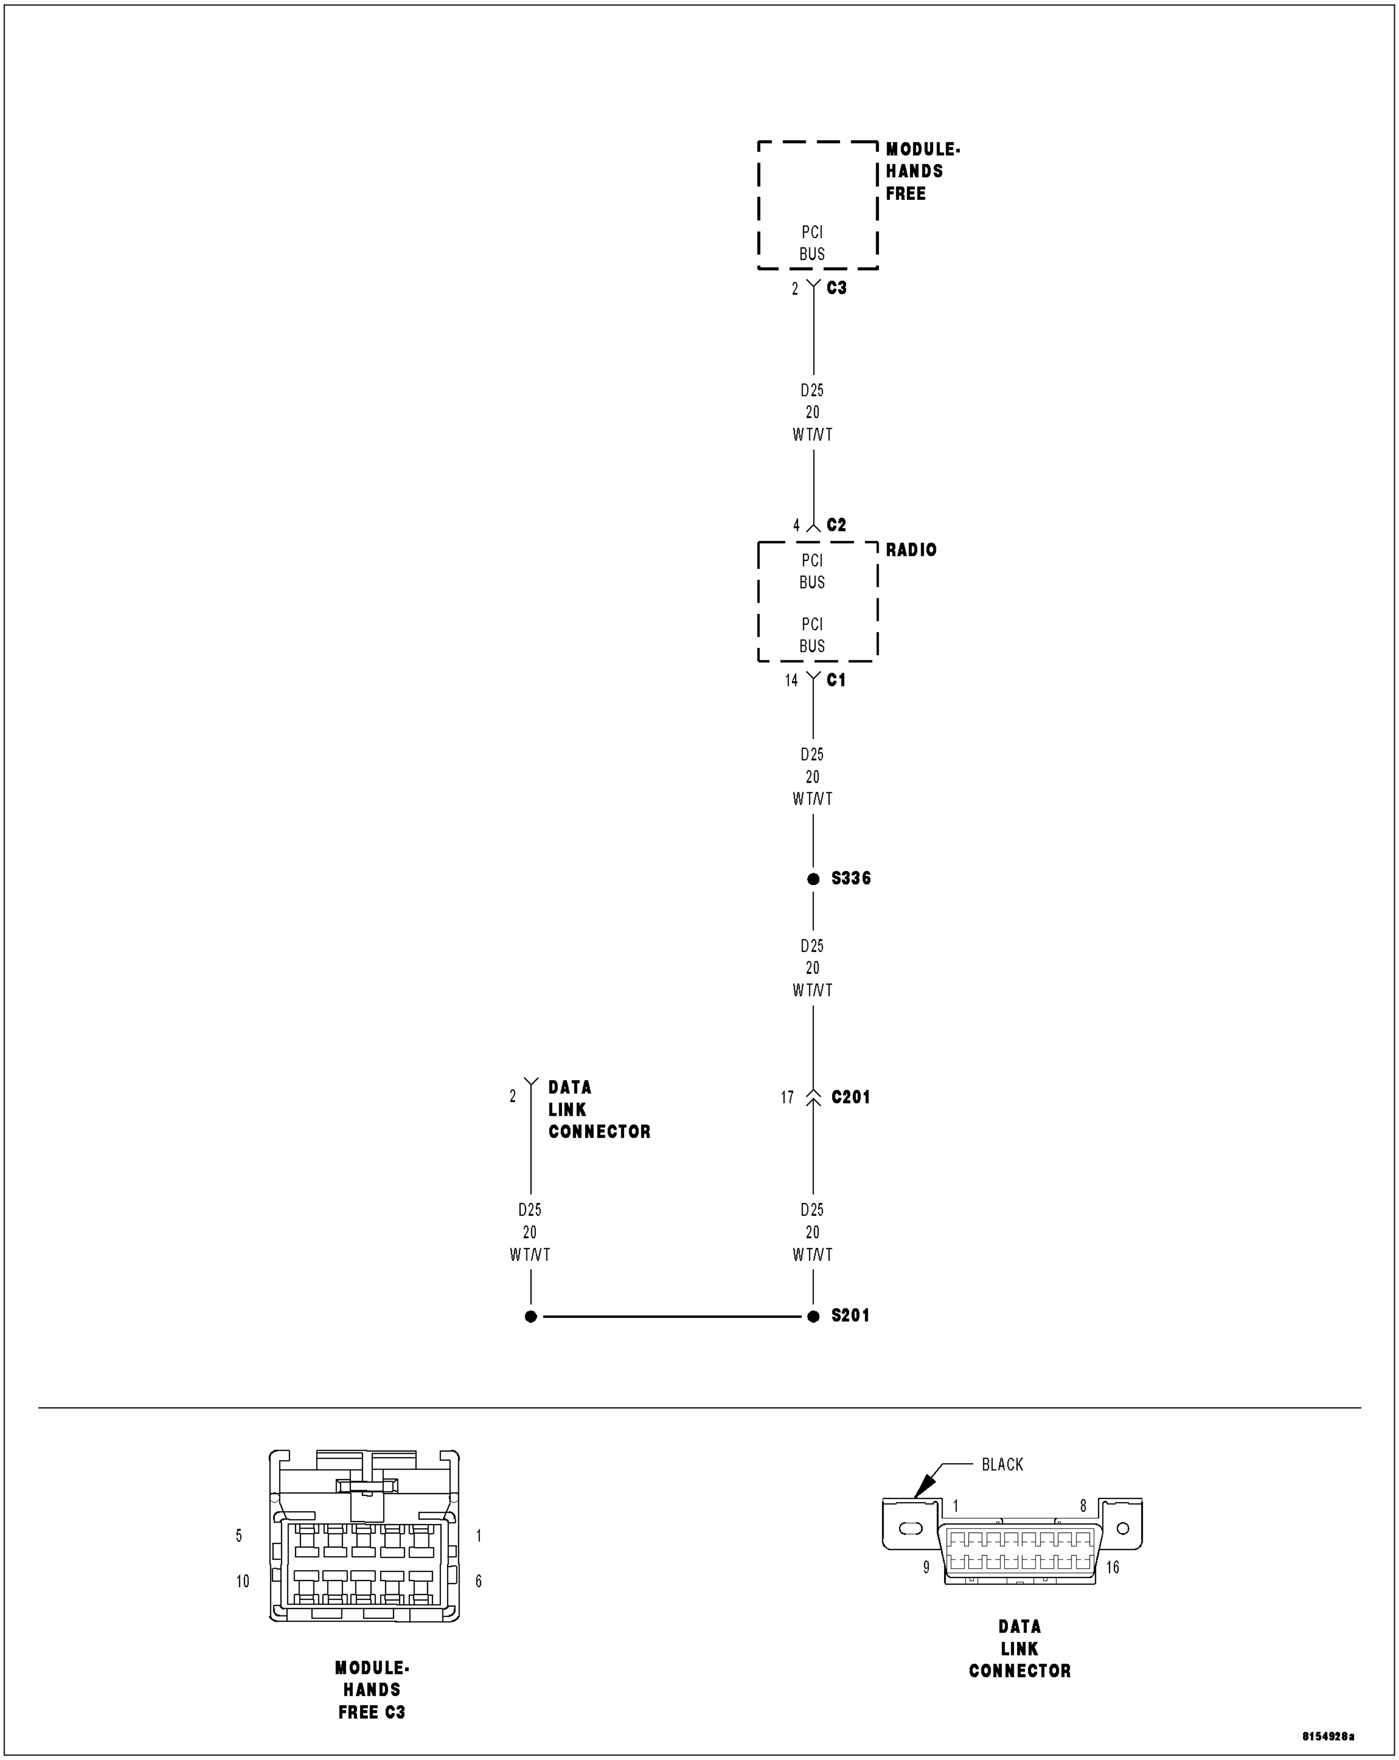
Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any of the above conditions present?**

**Yes** >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test complete.

## PCI BUS CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detected a short to ground on the (D25) PCI Bus circuit.

| Possible Causes |
|---|
| (D25) PCI BUS CIRCUIT SHORTED TO GROUND |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR AN INTERMITTENT CONDITION

**NOTE: For this code to be active, the scan tool will not be able to communicate with any modules on the vehicle (except any CAN Bus module).**

**NOTE: Clear the DTC. If this DTC continues to set and the scan tool can still communicate with the module, it will be necessary to replace the module.**

**NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.**

With the engine running at normal operating temperature, wiggle the wiring harnesses. This is to try and duplicate the complete bus failure condition.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

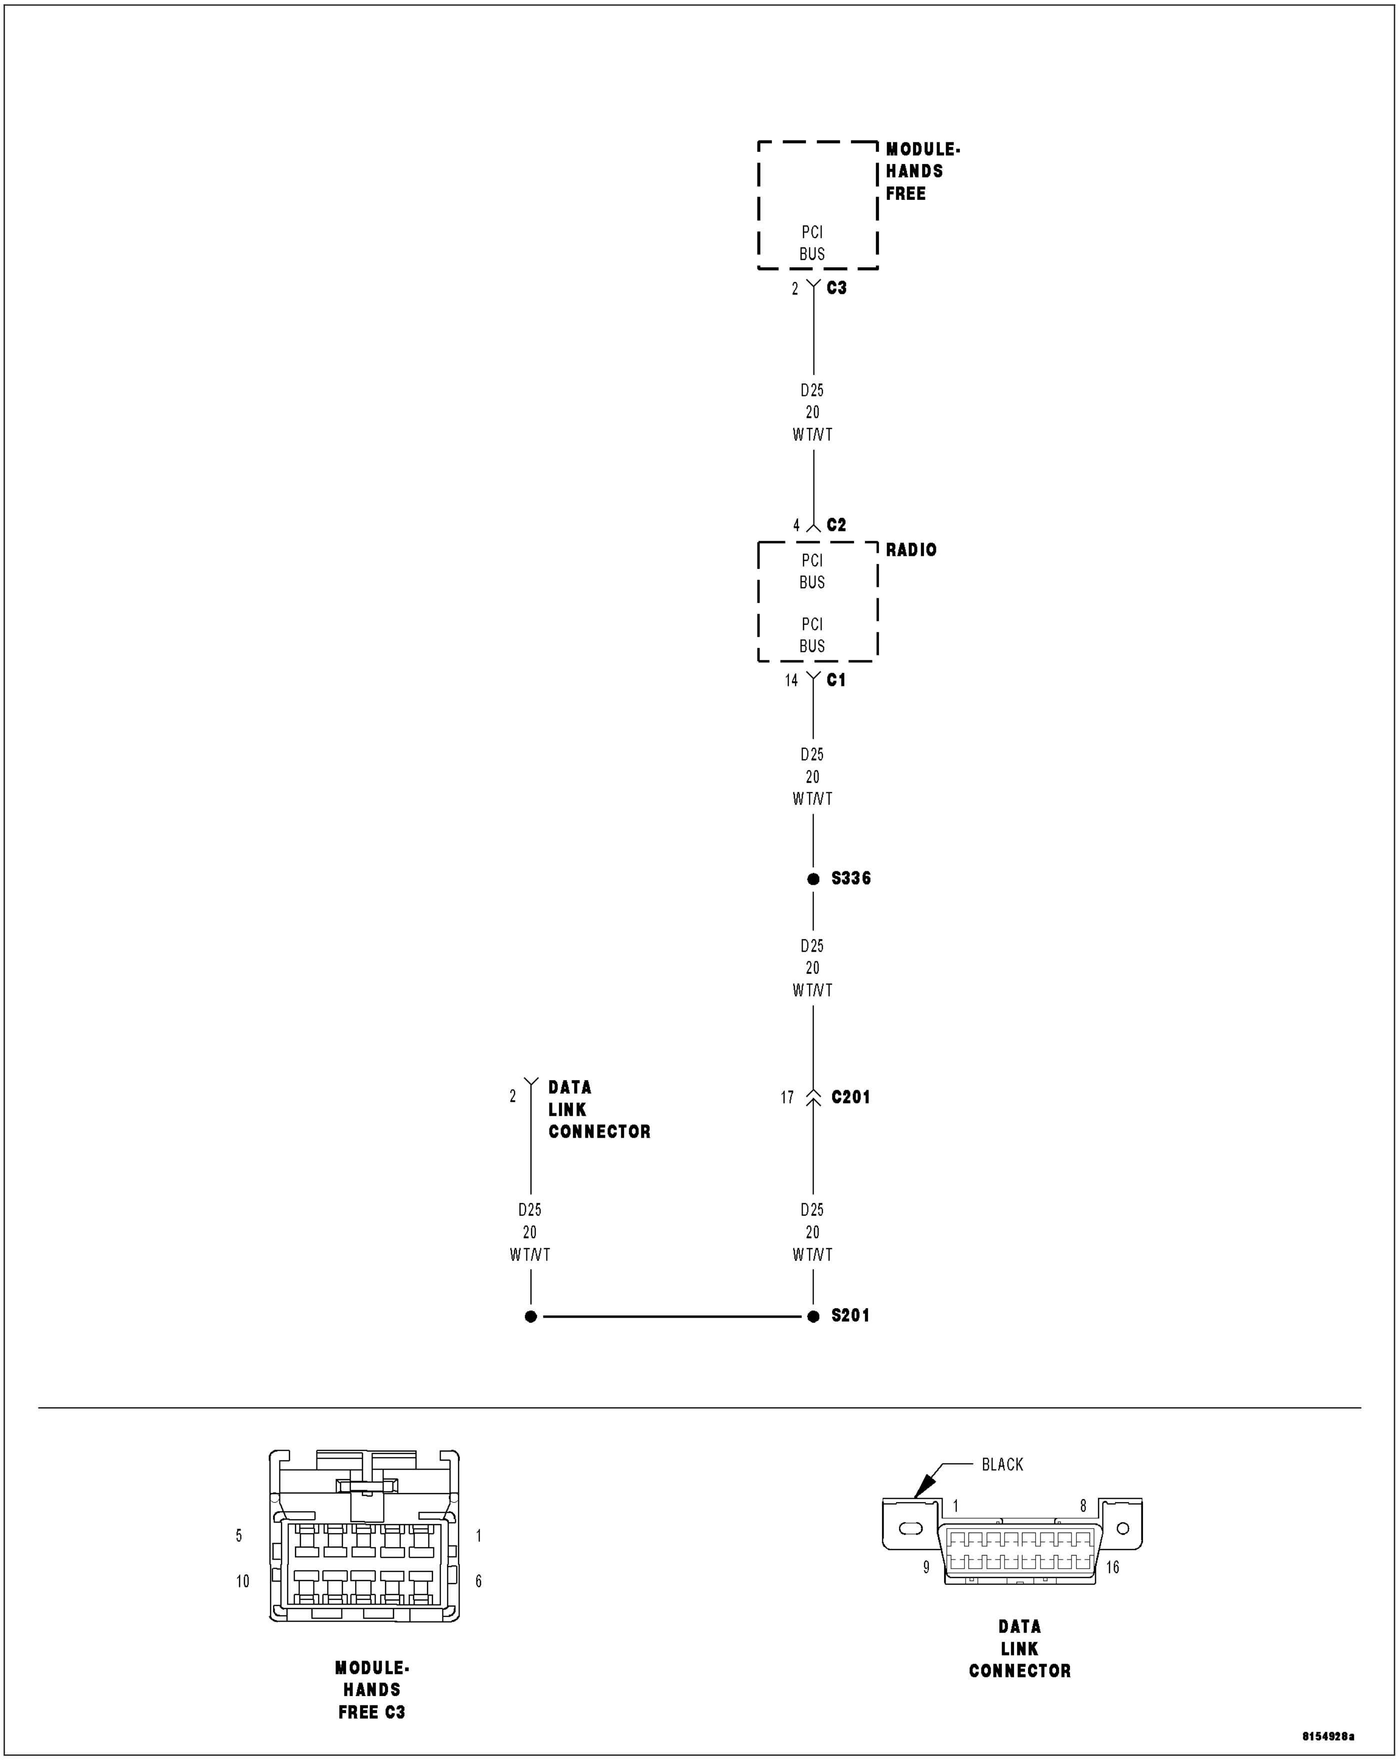
**Were any of the above conditions present?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test complete.

## PCI BUS CIRCUIT SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detected a short to voltage on the (D25) PCI Bus circuit.

| Possible Causes |
| --- |
| (D25) PCI BUS CIRCUIT SHORTED TO VOLTAGE |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR AN INTERMITTENT CONDITION

**NOTE: For this code to be active, the scan tool will not be able to communicate with any modules on the vehicle (except any CAN Bus module).**

**NOTE: Clear the DTC. If this DTC continues to set and the scan tool can still communicate with the module, it will be necessary to replace the module.**

**NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.**

With the engine running at normal operating temperature, wiggle the wiring harnesses. This is to try and duplicate the complete bus failure condition.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any of the above conditions present?**

**Yes** >> Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Test complete.

## PCI BUS INTERNAL ERROR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a fault during an internal diagnostic check.

| Possible Causes |
| --- |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ERASE DTC AND ATTEMPT TO RESET

Turn the ignition on.

With the scan tool, read and record the HFM DTC's and then erase the DTC's.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the HFM DTC's.

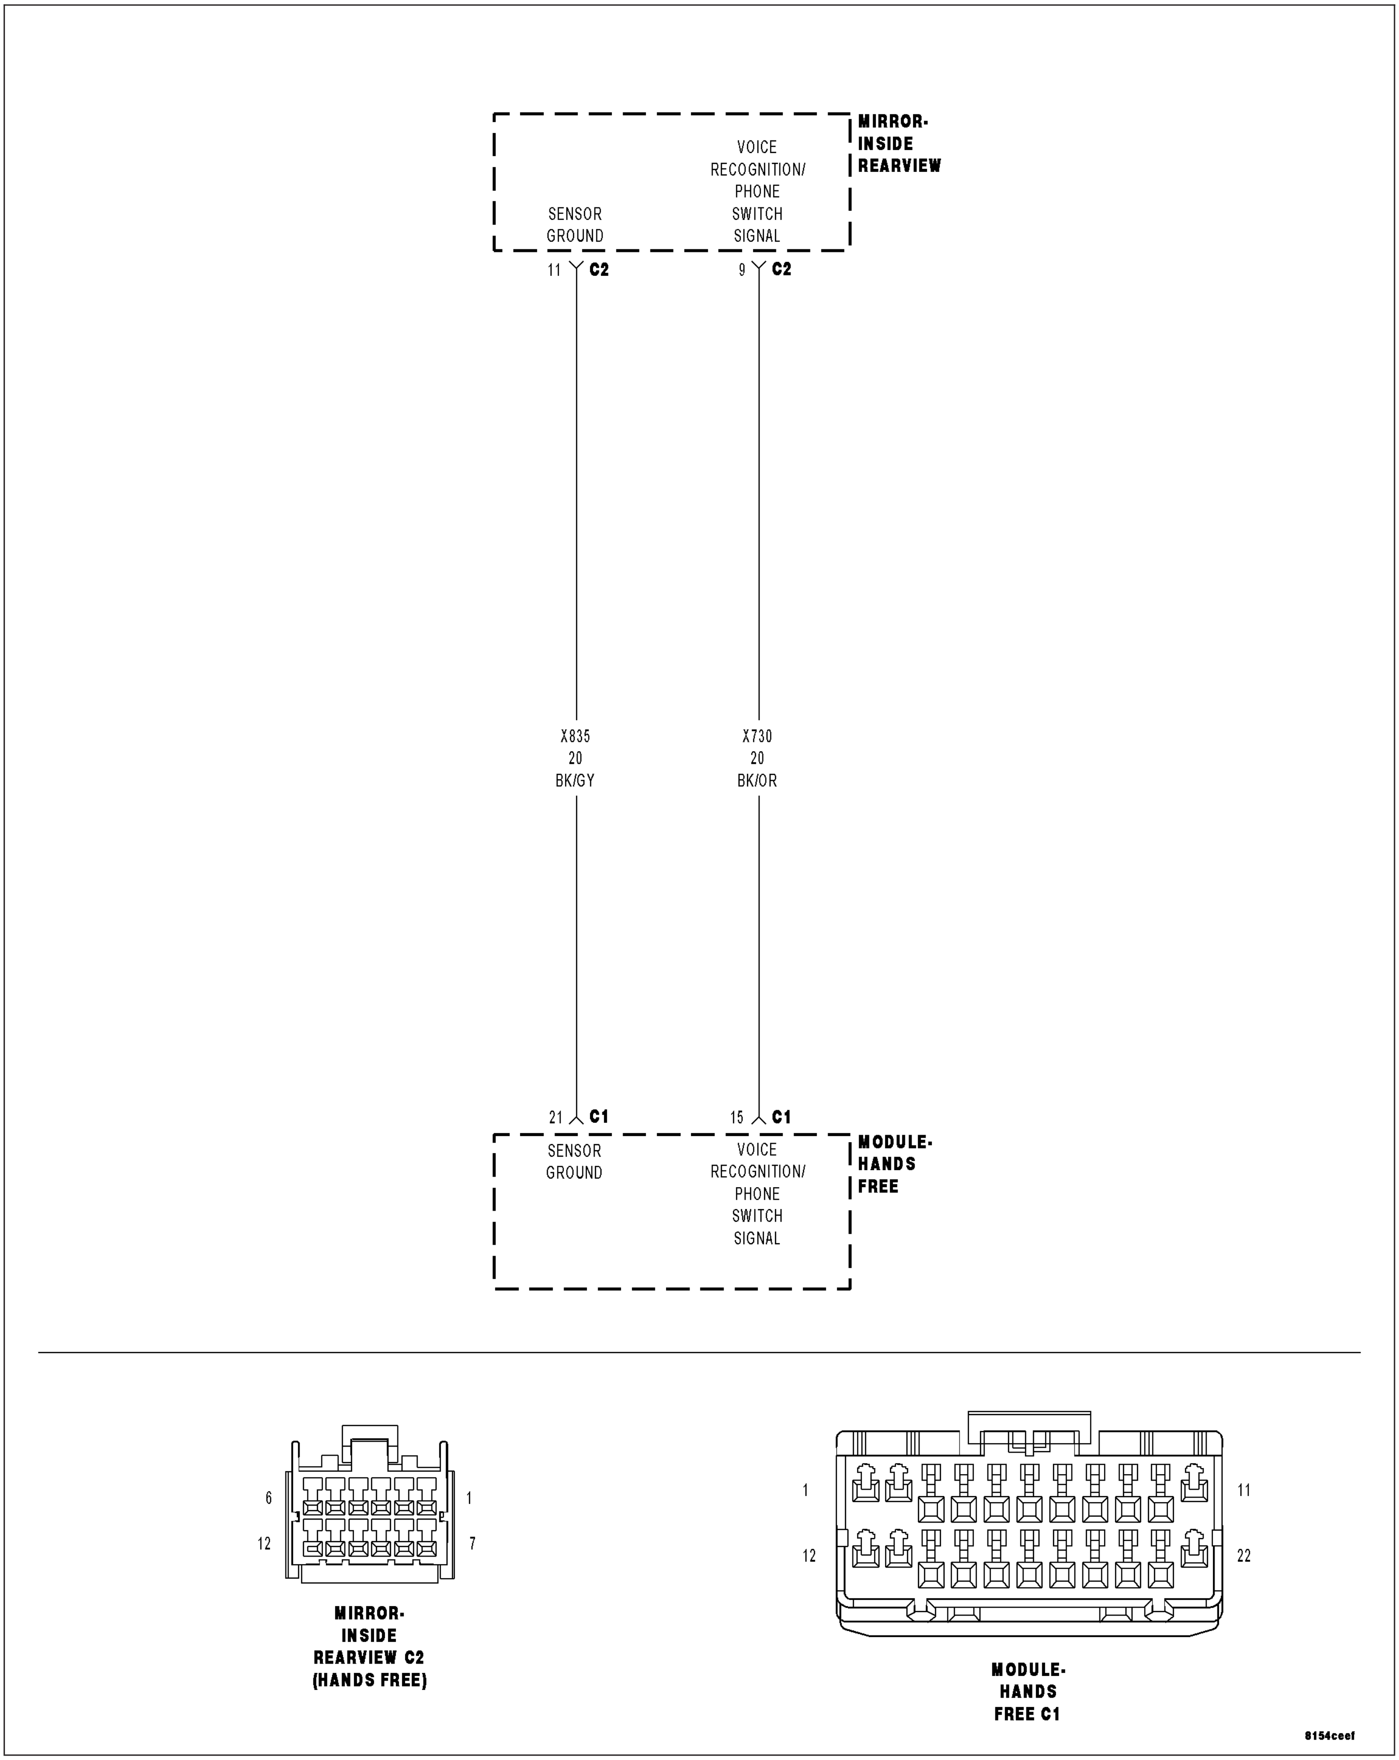
**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## PHONE SWITCH STUCK



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects voltage between 2.8 volts and 3.3 volts on the (X730) Voice Recognition/ Phone Switch Signal circuit for more than 30 seconds.

| Possible Causes |
|---|
| AUTOMATIC DAY/NIGHT MIRROR |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTCS

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. CHECK THE VOLTAGE OF THE (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL

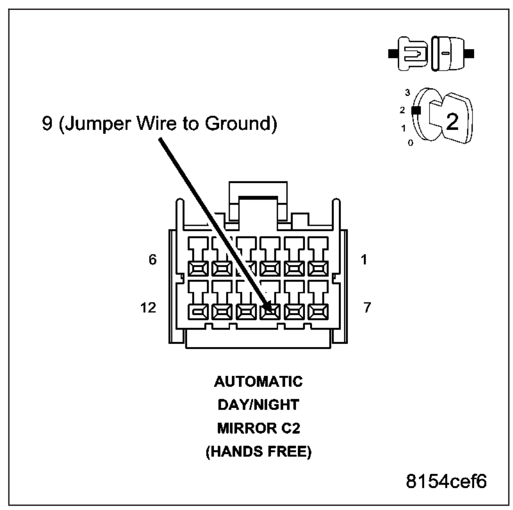
Turn the ignition off.

Disconnect the Automatic Day/Night Mirror C2 harness connector.

Turn the ignition on.

With the scan tool, monitor the VR Phone Switch voltage.

While monitoring the VR Phone Switch voltage, momentarily connect a jumper wire between (X730) Voice Recognition/Phone Switch Signal circuit and ground.



**NOTE: The sensor voltage should switch from above 4.7 volts when the jumper is not connected to below 0.6 volts when the jumper is connected.**

**Does the sensor voltage switch from above 4.7 volts to below 0.6 volt as described?**

**Yes** >> Replace the Automatic Day/Night Mirror in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## PRNDL MESSAGE NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module does not receive a gear selector message from the TCM.

| Possible Causes |
|---|
| LOST COMMUNICATION WITH TCM |
| HANDS FREE MODULE |

### Diagnostic Test

#### 1. ATTEMPT TO COMMUNICATE WITH THE TCM

Turn the ignition on.

Turn the radio on.

With the scan tool, attempt to communicate with the TCM.

**Was the scan tool able to communicate with the TCM?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

#### 2. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC's.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## RADIO MESSAGE NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module does not receive a message from the radio.

| Possible Causes |
|---|
| LOST COMMUNICATION WITH RADIO |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE RADIO

Turn the ignition on.

Turn the radio on.

With the scan tool, attempt to communicate with the radio.

**Was the scan tool able to communicate with the radio?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

### 2. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC's.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## RAM WRITE ERROR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a fault during an internal diagnostic check.

| Possible Causes |
| --- |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ERASE DTC AND ATTEMPT TO RESET

Turn the ignition on.

With the scan tool, read and record the HFM DTC's and then erase the DTC's.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the HFM DTC's.

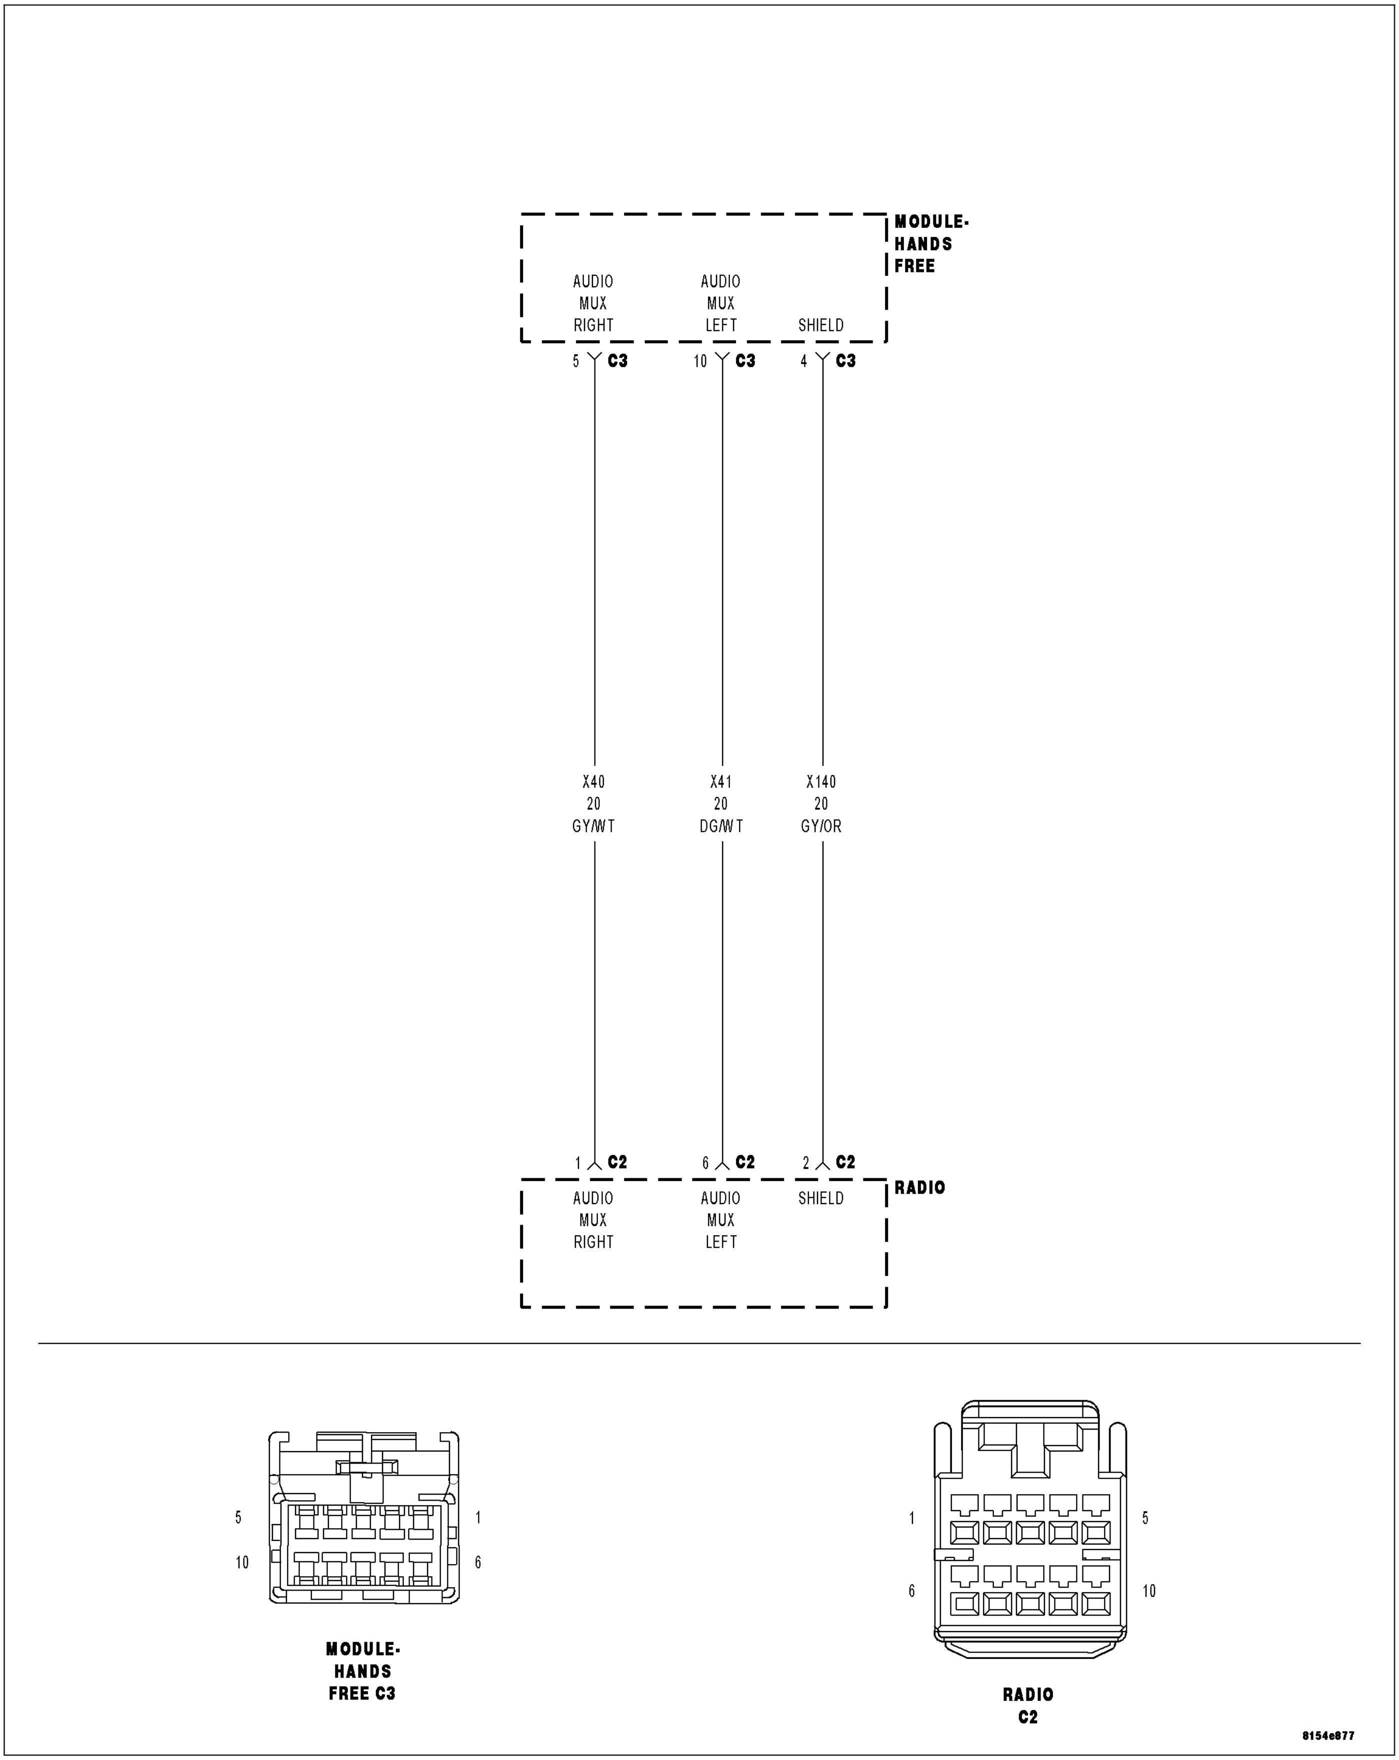
**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## RIGHT AUDIO INPUT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects low voltage on the (X40) Audio MUX Right circuit.

| Possible Causes |
| --- |
| (X40) AUDIO MUX RIGHT CIRCUIT OPEN |
| (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO GROUND |
| (X140) AUDIO RETURN CIRCUIT OPEN |
| (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO (X140) AUDIO RETURN CIRCUIT |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (X40) AUDIO MUX RIGHT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C2 harness connector.

Measure the resistance of the (X40) Audio MUX Right circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (X40) Audio MUX Right circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 3. (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (X40) Audio MUX Right circuit.

**Is the resistance below 5.0 ohms?**

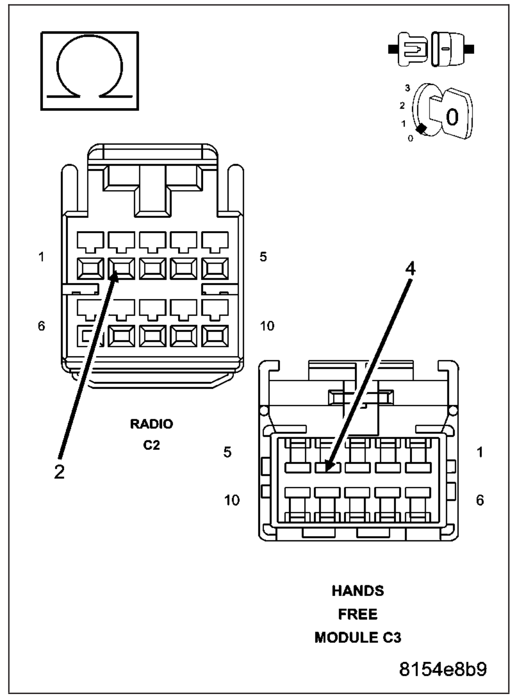
**Yes** >> Repair the (X40) Audio MUX Right circuit for short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. (X140) AUDIO RETURN CIRCUIT OPEN

Measure the resistance of the (X140) Audio Return circuit between the HFM connector and the radio connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (X140) Audio Return circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 5. (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO (X140) AUDIO RETURN CIRCUIT

Measure the resistance between the (X40) Audio MUX Right circuit and the (X140) Audio Return circuit.

**Is the resistance below 5.0 ohms?**

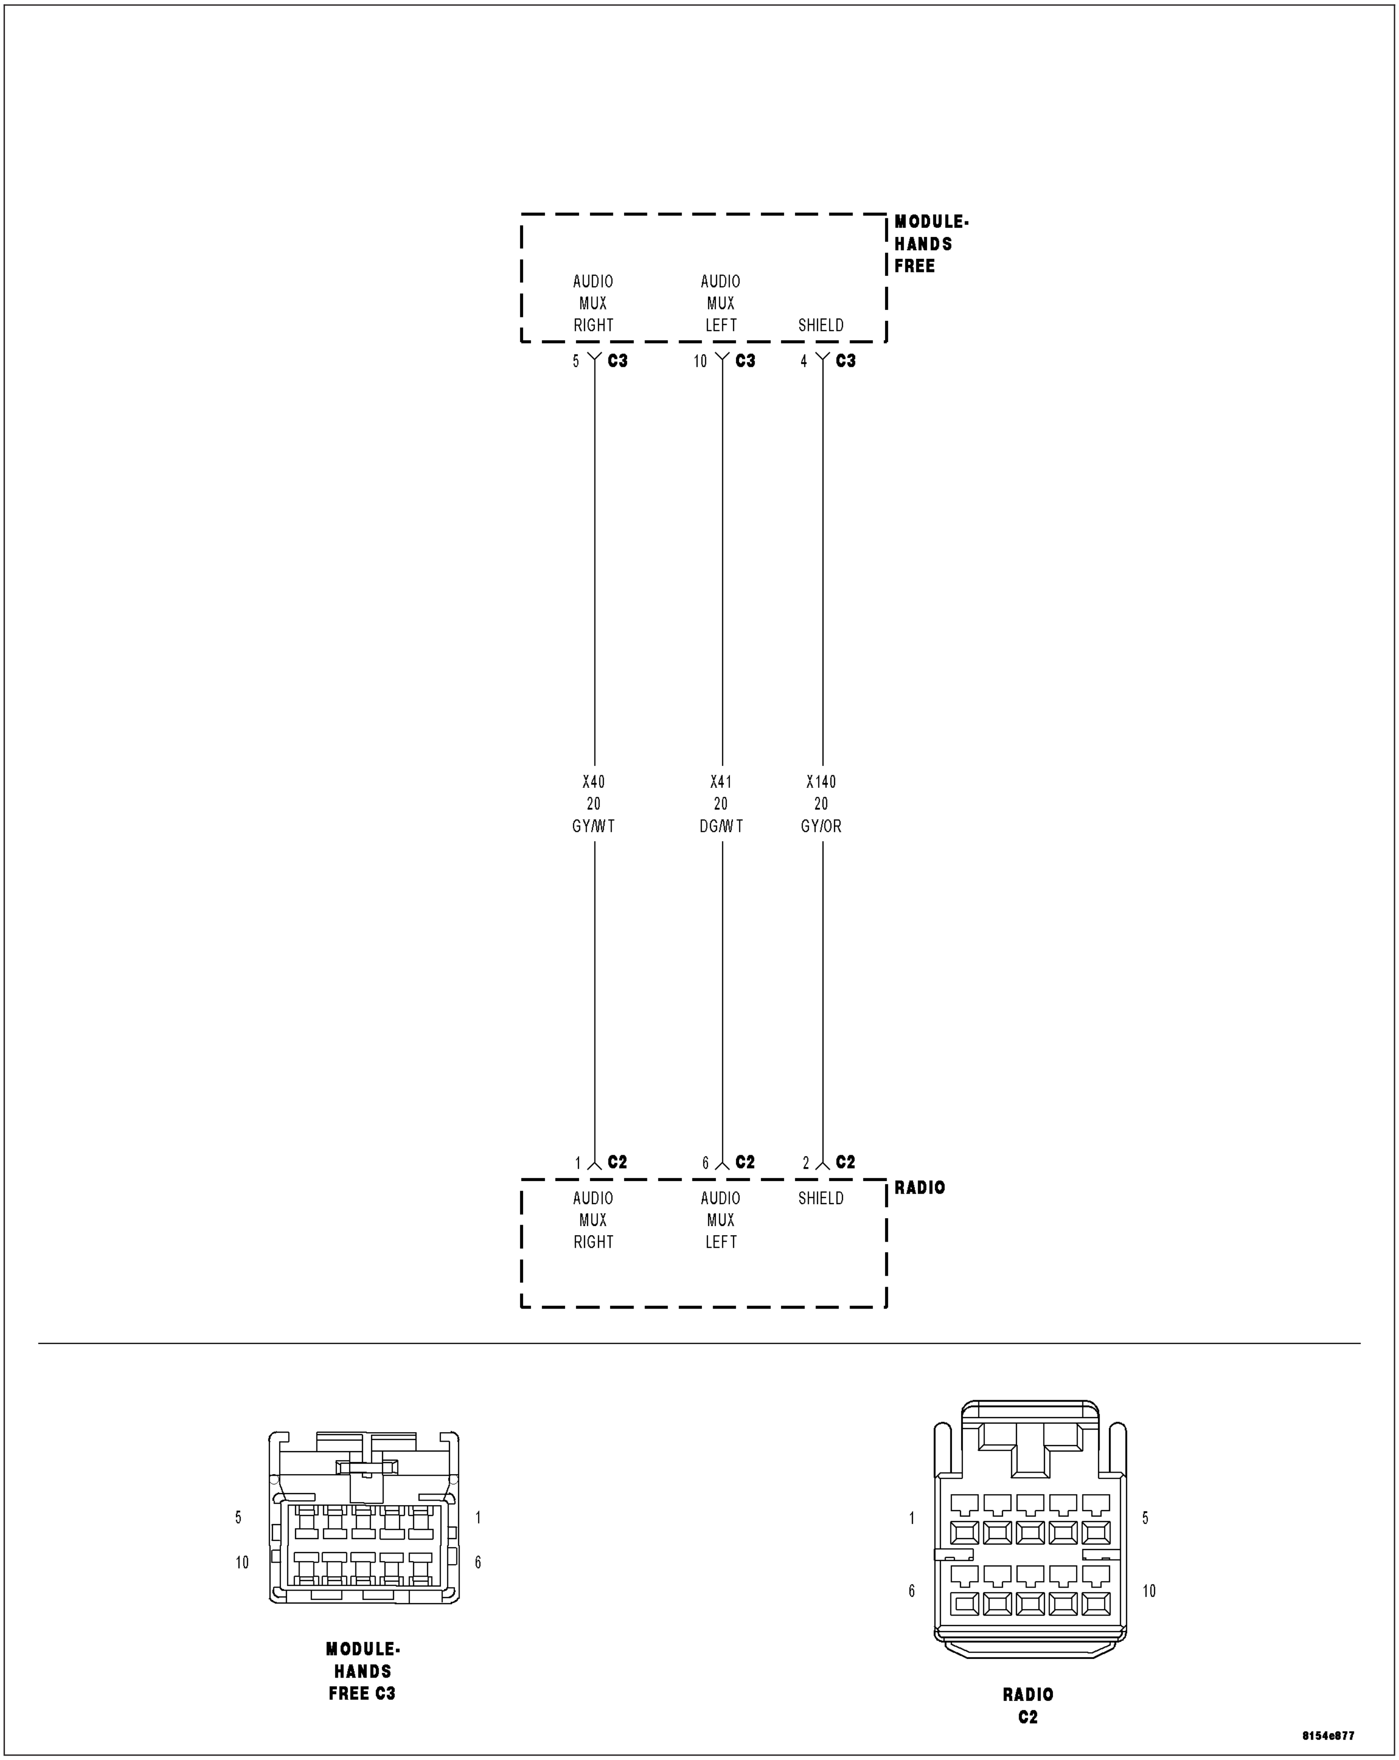
**Yes** >> Repair the (X40) Audio MUX Right circuit for a short to the (X140) Audio Return circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## RIGHT AUDIO INPUT SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects high voltage on the (X40) Audio MUX Right circuit.

| Possible Causes |
|---|
| (X40) AUDIO MUX RIGHT CIRCUIT OPEN |
| (X140) AUDIO RETURN CIRCUIT OPEN |
| (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO VOLTAGE |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (X40) AUDIO MUX RIGHT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C2 harness connector.

Measure the resistance of the (X40) Audio MUX Right circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

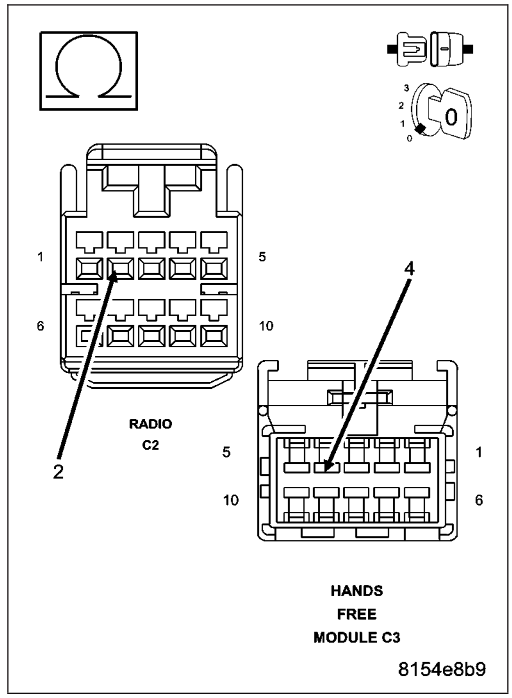
**Yes** >> Go To 3

**No** >> Repair the (X40) Audio MUX Right circuit for an open

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (X140) AUDIO RETURN CIRCUIT OPEN

Measure the resistance of the (X140) Audio Return circuit between the HFM connector and the radio connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X140) Audio Return circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (X40) Audio MUX Right circuit.

**Is the voltage above 1.0 volts?**

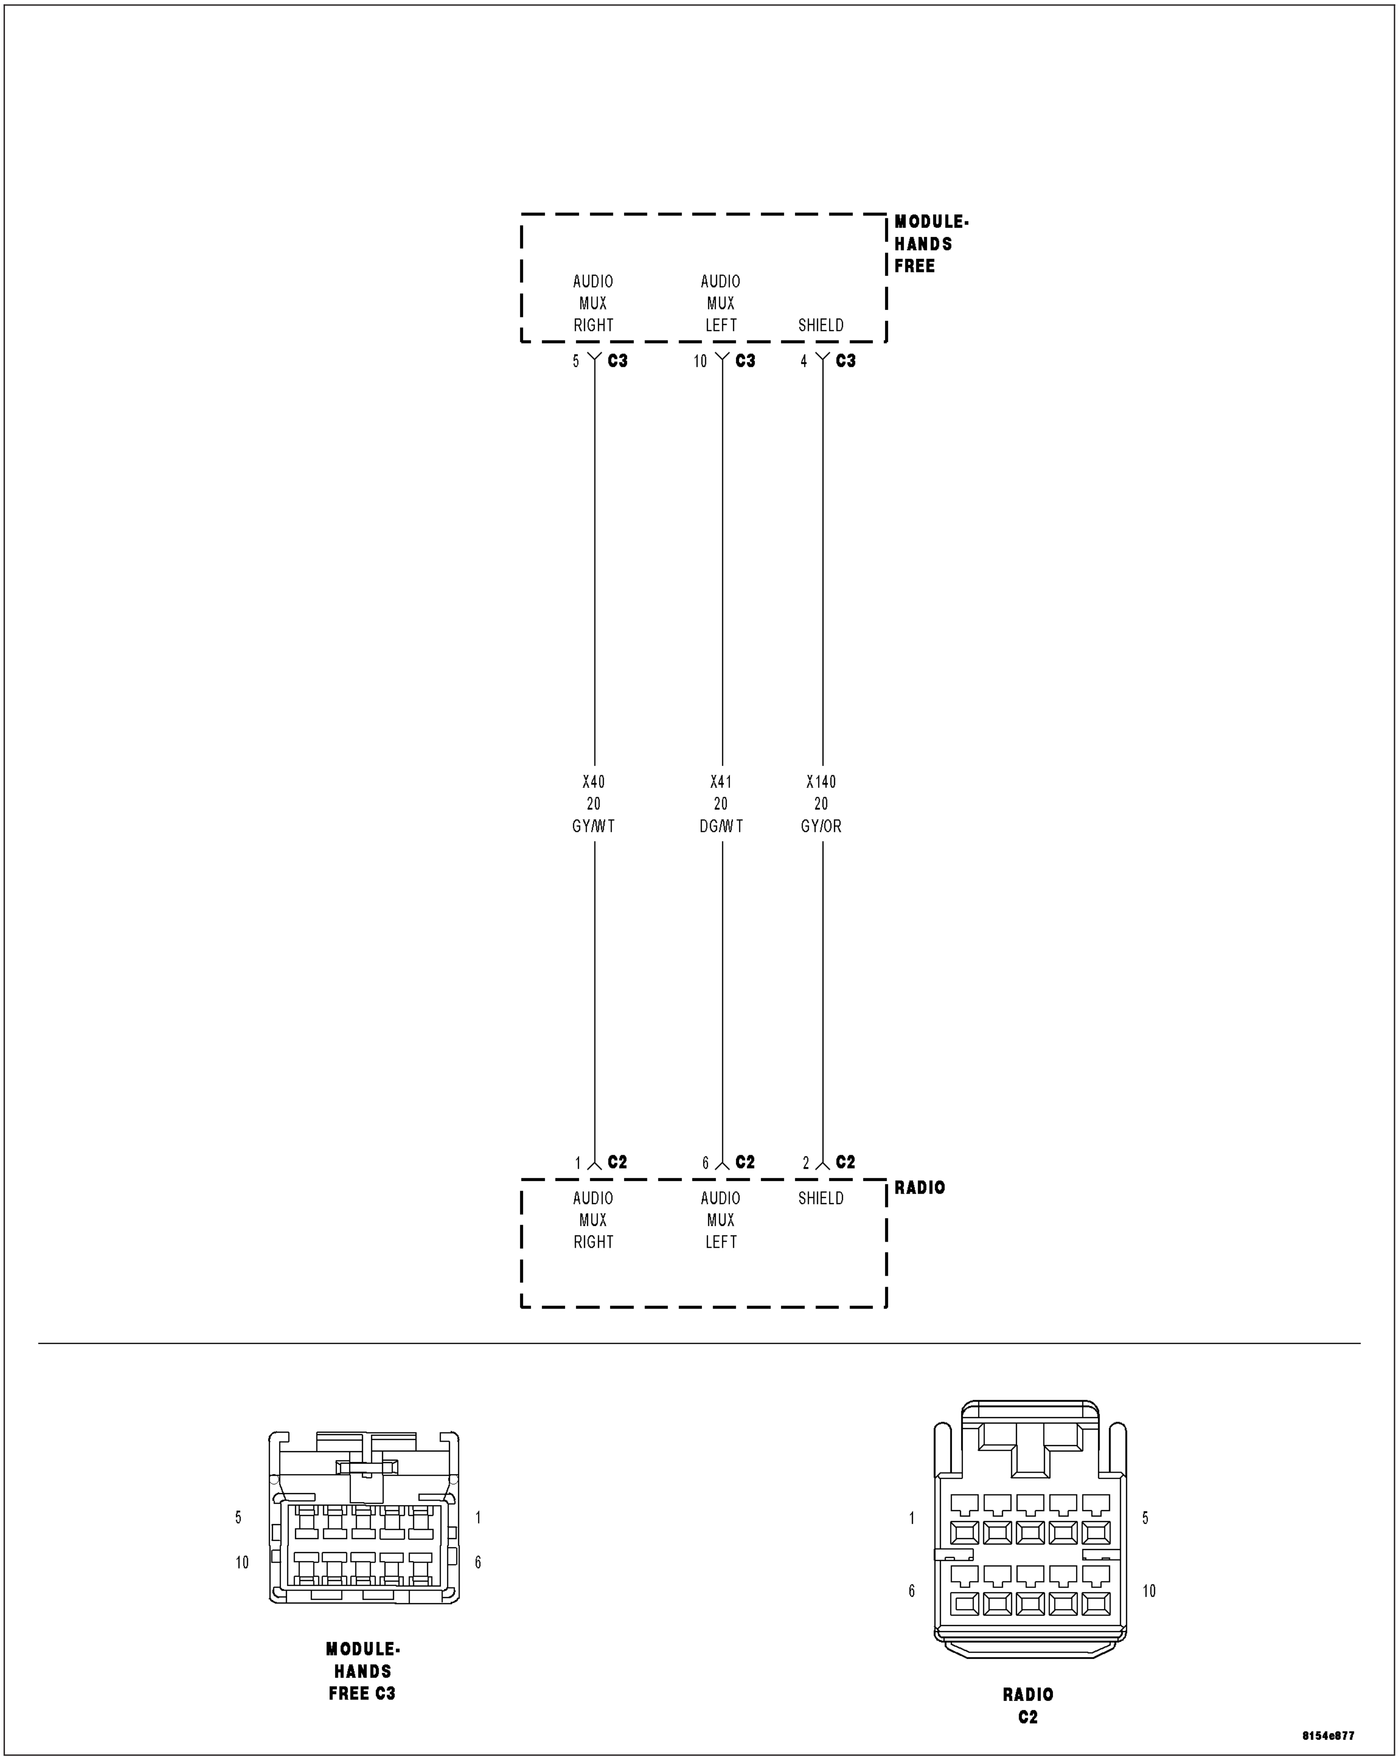
**Yes** >> Repair the (X40) Audio MUX Right circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## RIGHT AUDIO OUTPUT 1 SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects low voltage on the (X40) Audio MUX Right circuit.

| Possible Causes |
| --- |
| (X40) AUDIO MUX RIGHT CIRCUIT OPEN |
| (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO GROUND |
| (X140) AUDIO RETURN CIRCUIT OPEN |
| (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO (X140) AUDIO RETURN CIRCUIT |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (X40) AUDIO MUX RIGHT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C2 harness connector.

Measure the resistance of the (X40) Audio MUX Right circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (X40) Audio MUX Right circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

### 3. (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (X40) Audio MUX Right circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (X40) Audio MUX Right circuit for short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. (X140) AUDIO RETURN CIRCUIT OPEN

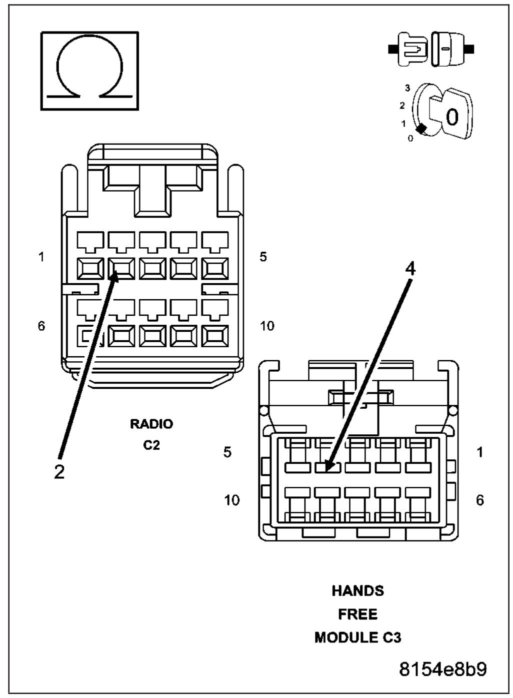
Measure the resistance of the (X140) Audio Return circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (X140) Audio Return circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 5. (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO (X140) AUDIO RETURN CIRCUIT

Measure the resistance between the (X40) Audio MUX Right circuit and the (X140) Audio Return circuit.

**Is the resistance below 5.0 ohms?**

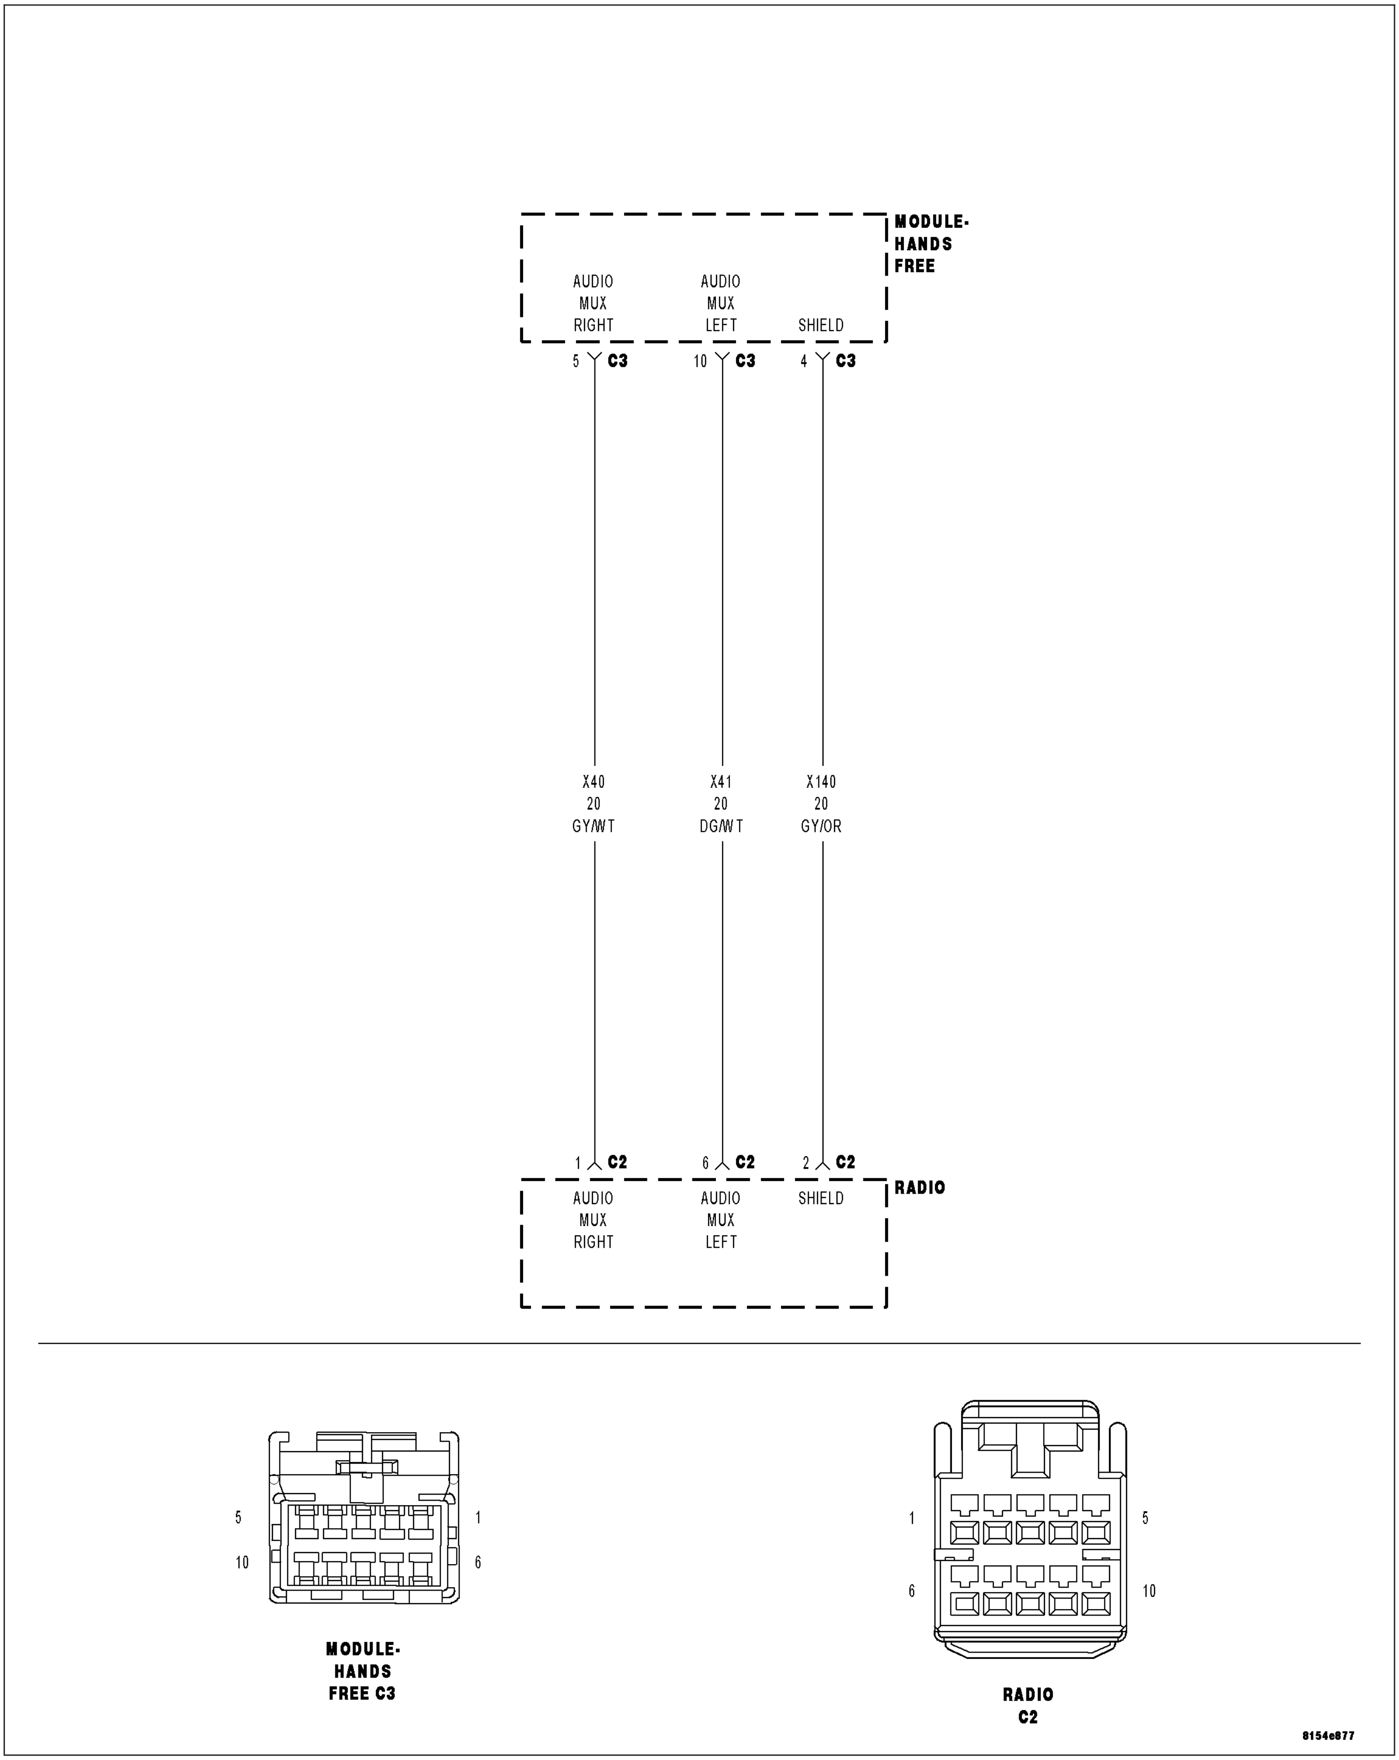
**Yes** >> Repair the (X40) Audio MUX Right circuit for a short to the (X140) Audio Return circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## RIGHT AUDIO OUTPUT 1 SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects high voltage on the (X40) Audio MUX Right circuit.

| Possible Causes |
|---|
| (X40) AUDIO MUX RIGHT CIRCUIT OPEN |
| (X140) AUDIO RETURN CIRCUIT OPEN |
| (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO VOLTAGE |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. (X40) AUDIO MUX RIGHT CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C2 harness connector.

Measure the resistance of the (X40) Audio MUX Right circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

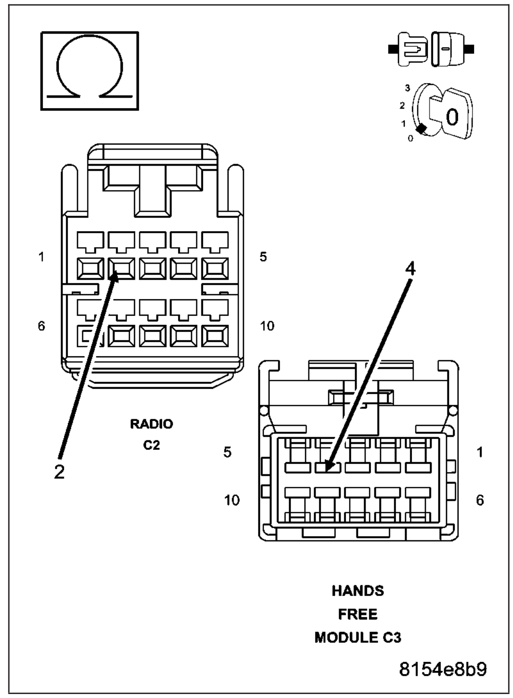
**Yes** >> Go To 3

**No** >> Repair the (X40) Audio MUX Right circuit for an open

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 3. (X140) AUDIO RETURN CIRCUIT OPEN

Measure the resistance of the (X140) Audio Return circuit between the HFM connector and the radio connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X140) Audio Return circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## 4. (X40) AUDIO MUX RIGHT CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (X40) Audio MUX Right circuit.

**Is the voltage above 1.0 volts?**

**Yes** >> Repair the (X40) Audio MUX Right circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## ROM CHECKSUM ERROR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects a fault during an internal diagnostic check.

| Possible Causes |
| --- |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ERASE DTC AND ATTEMPT TO RESET

Turn the ignition on.

With the scan tool, read and record the HFM DTC's and then erase the DTC's.

Perform 5 ignition key cycles, leaving the ignition key on for a minimum of 90 seconds per cycle.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## RPM MESSAGE NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module does not detect a Bus message indicating current engine RPM.

| Possible Causes |
|---|
| LOST COMMUNICATION WITH PCM |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE PCM

Start and idle the engine.

With the scan tool, select Engine and read the Engine RPM.

**Was the scan tool able to communicate with the PCM and read engine RPM?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

### 2. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC's.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC's.

**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## VIN MESSAGE NOT RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module does not receive the VIN message from the PCM.

| Possible Causes |
|---|
| LOST COMMUNICATION WITH PCM |
| PCM NOT ACTIVE ON THE BUS NETWORK |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. ATTEMPT TO COMMUNICATE WITH THE PCM

Turn the ignition on.

With the scan tool, attempt to communicate with the PCM.

**Was the scan tool able to communicate with the PCM?**

**Yes** >> Go To 2

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

### 2. CHECK PCM ACTIVITY ON THE BUS NETWORK

With the scan tool, select System Monitors then J1850 Module Scan.

**Does the scan tool indicate that the PCM is present or active on the bus network?**

**Yes** >> Go To 3

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) and perform the related symptom.

### 3. ERASE DTC AND ATTEMPT TO RESET

With the scan tool, erase the HFM DTC's.

Cycle the ignition switch from off to on and wait approximately 1 minute.

With the scan tool, read the HFM DTC's.

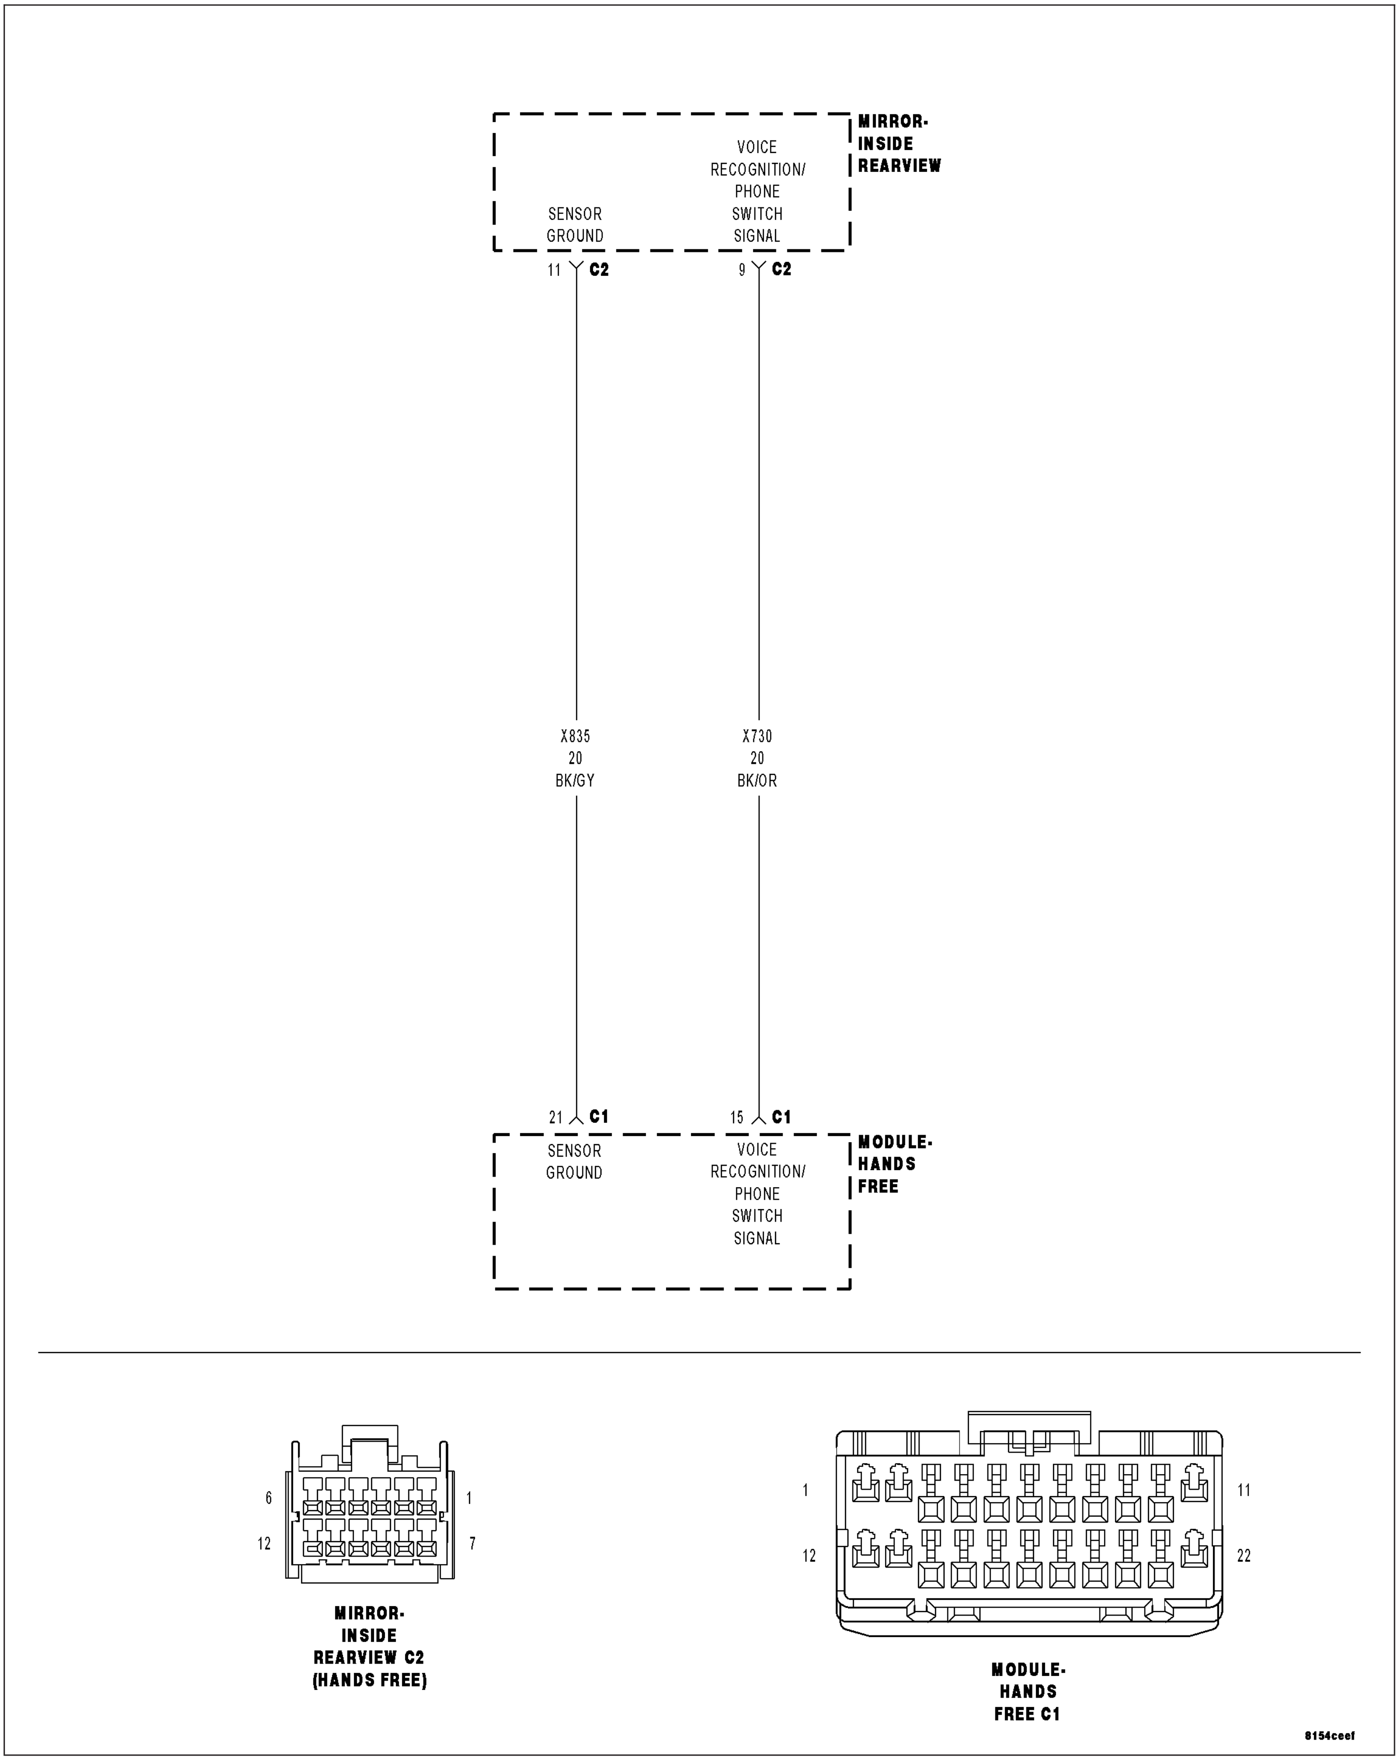
**Did this DTC reset?**

**Yes** >> Replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

## VOICE RECOGNITION SWITCH STUCK



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects voltage between 3.5 volts and 4.0 volts on the (X730) Voice Recognition/ Phone Switch Signal circuit for more than 30 seconds.

| Possible Causes |
|---|
| AUTOMATIC DAY/NIGHT MIRROR |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTCS

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. CHECK THE VOLTAGE OF THE (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL

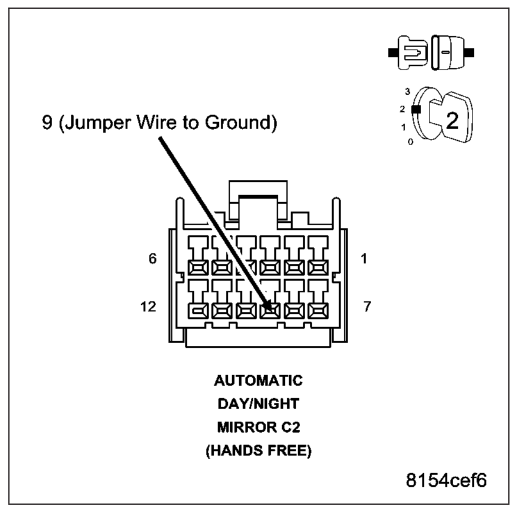
Turn the ignition off.

Disconnect the Automatic Day/Night Mirror C2 harness connector.

Turn the ignition on.

With the scan tool, monitor the VR Phone Switch voltage.

While monitoring the VR Phone Switch voltage, momentarily connect a jumper wire between (X730) Voice Recognition/Phone Switch Signal circuit and ground.



**NOTE: The sensor voltage should switch from above 4.7 volts when the jumper is not connected to below 0.6 volts when the jumper is connected.**

**Does the sensor voltage switch from above 4.7 volts to below 0.6 volt as described?**

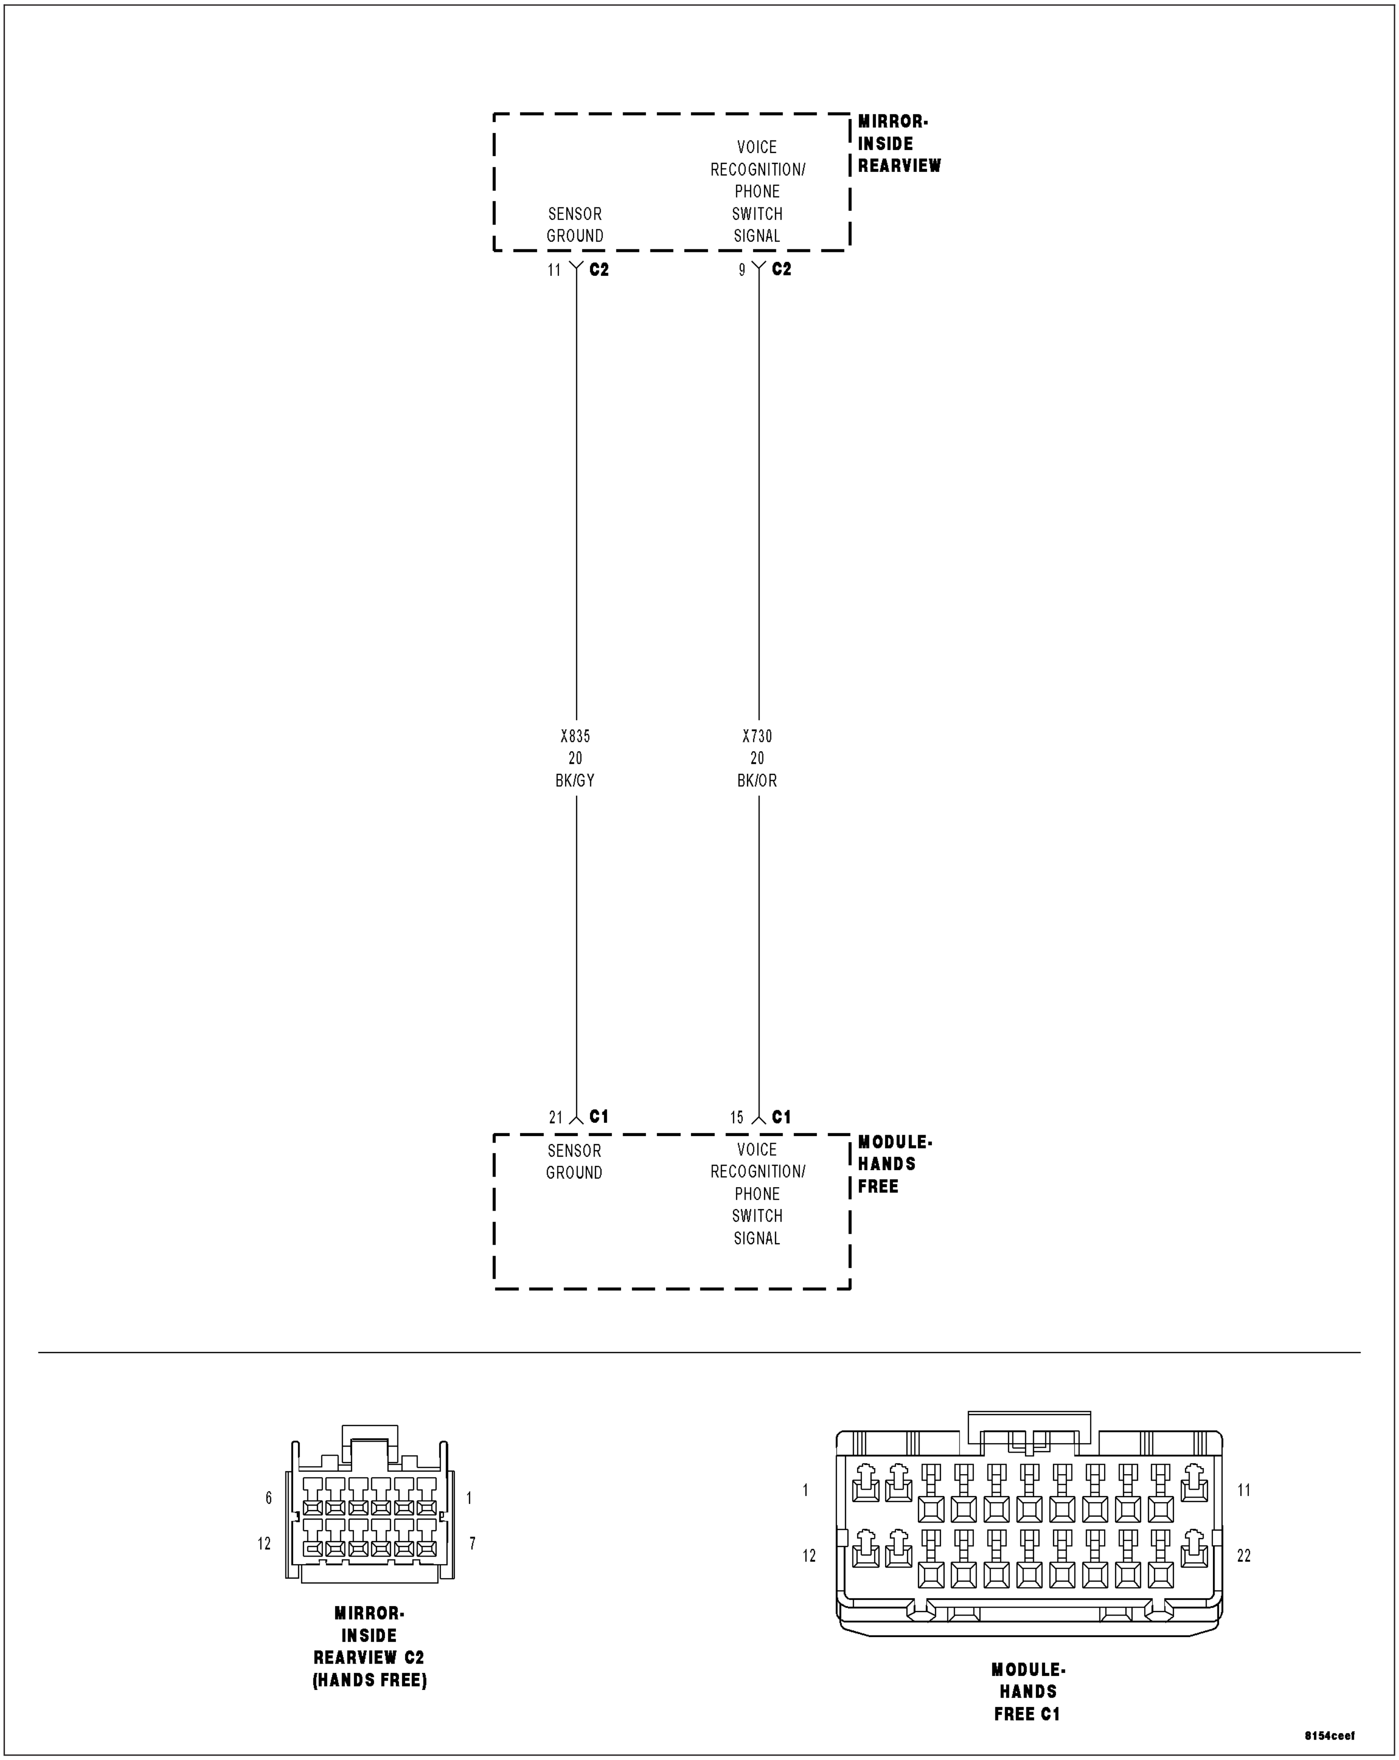
**Yes** >> Replace the Automatic Day/Night Mirror in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## VOICE RECOGNITION/PHONE SWITCH CIRCUIT RATIONALITY



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects an invalid voltage signal on the (X730) Voice Recognition/Phone Switch Signal circuit.

| Possible Causes |
|---|
| AUTOMATIC DAY/NIGHT MIRROR |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. CHECK THE VOLTAGE OF THE (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL

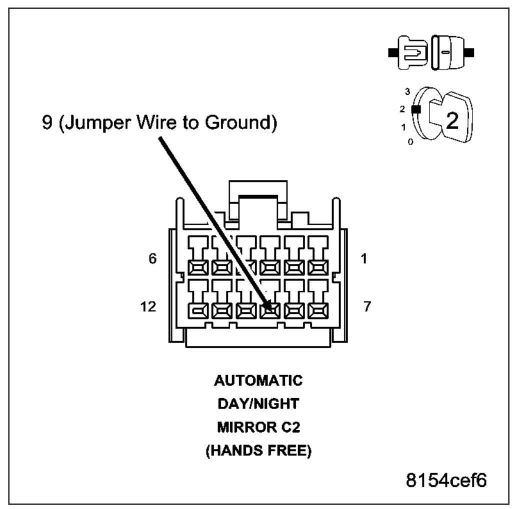
Turn the ignition off.

Disconnect the Automatic Day/Night Mirror C2 harness connector.

Turn the ignition on.

With the scan tool, monitor the VR Phone Switch voltage.

While monitoring the VR Phone Switch voltage, momentarily connect a jumper wire between the (X730) Voice Recognition/Phone Switch Signal circuit and ground.



**NOTE: The sensor voltage should switch from above 4.7 volts when the jumper is not connected to below 0.6 volts when the jumper is connected.**

**Does the sensor voltage switch from above 4.7 volts to below 0.6 volt as described?**

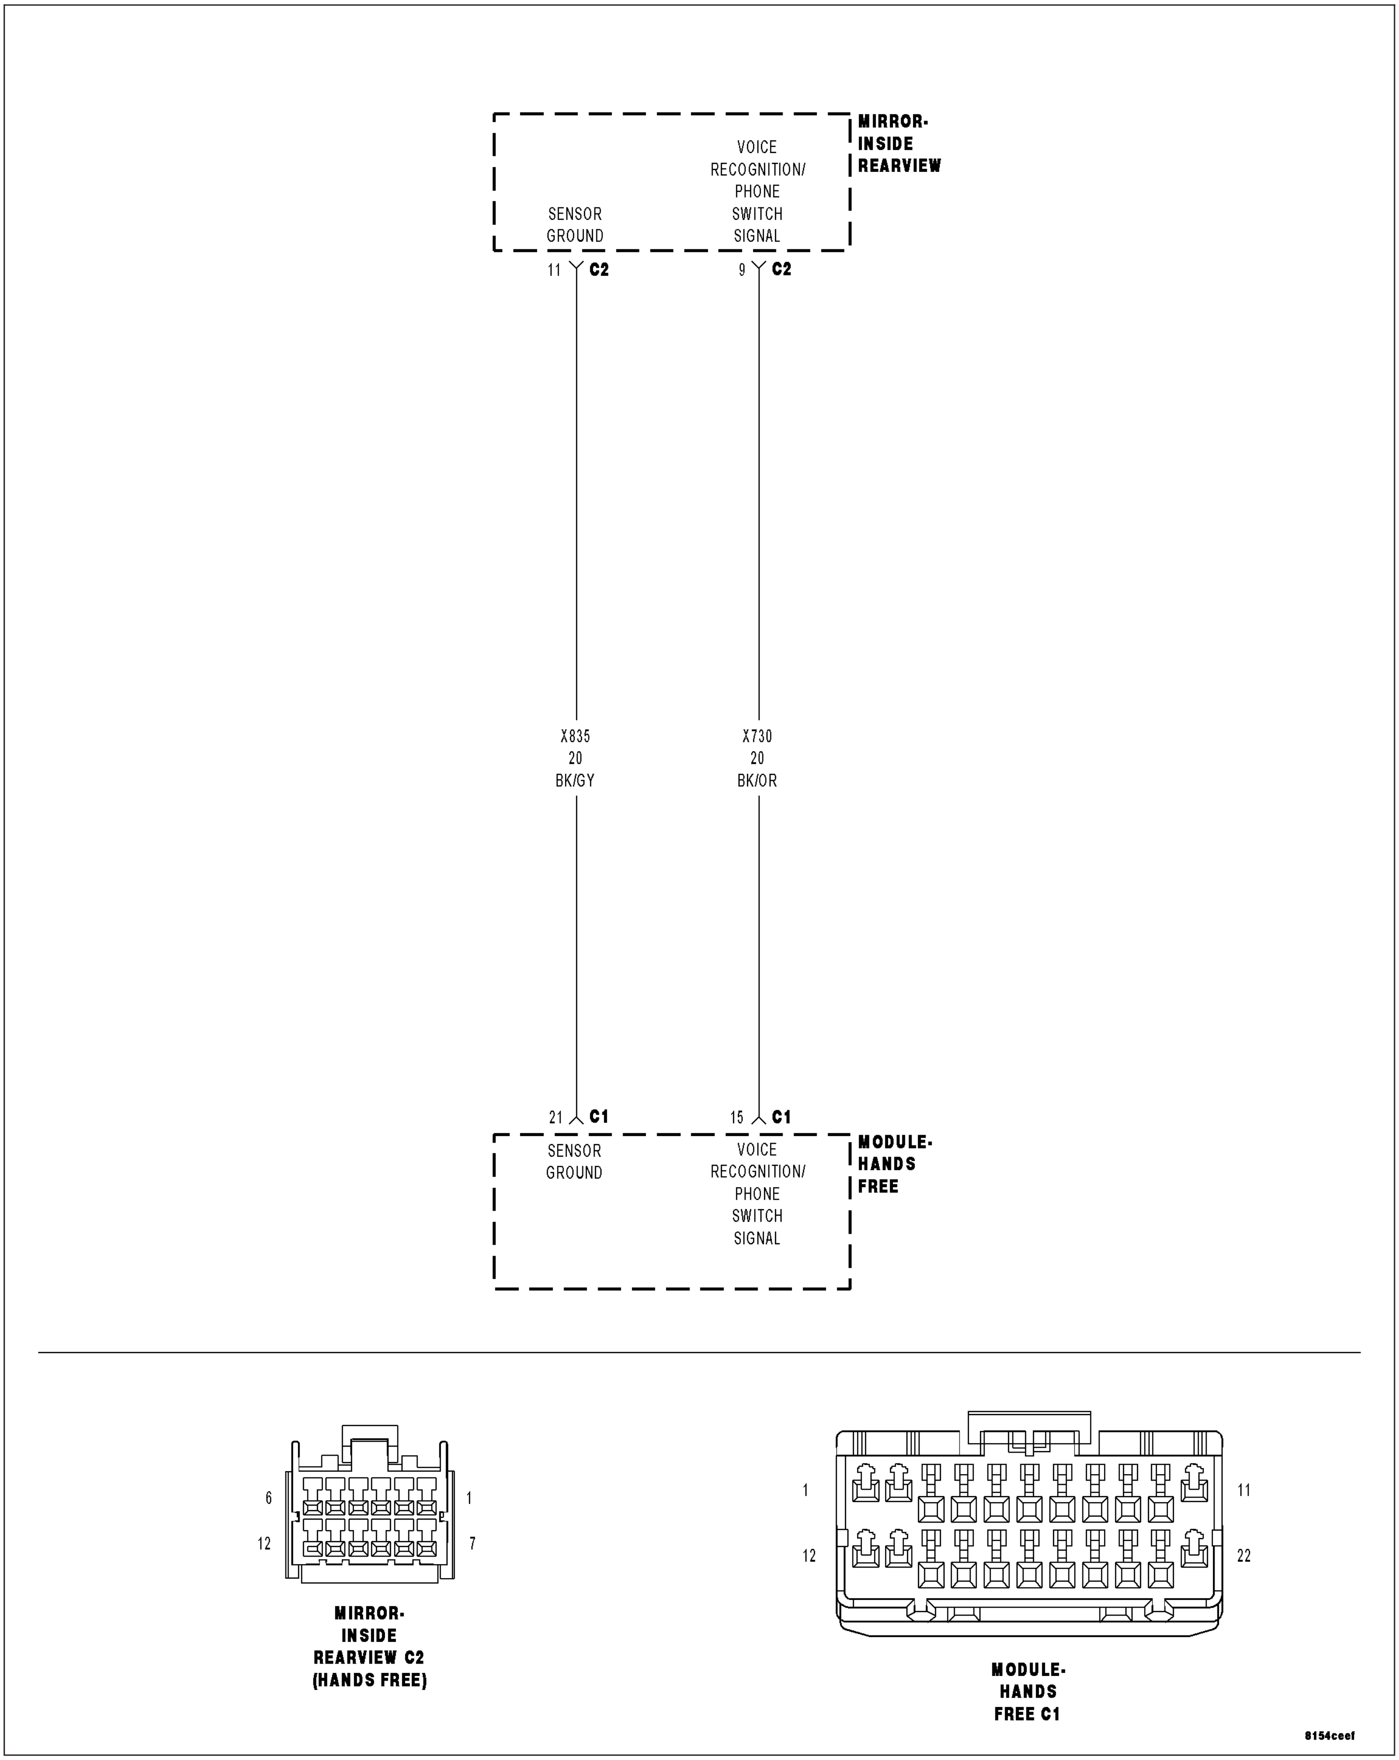
**Yes** >> Replace the Automatic Day/Night Mirror in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## VOICE RECOGNITION/PHONE SWITCH CIRCUIT SHORT TO GROUND



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects voltage below 0.6 volts on the (X730) Voice Recognition/Phone Switch Signal circuit.

| Possible Causes |
| --- |
| (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL CIRCUIT SHORT TO (X835) SENSOR GROUND CIRCUIT |
| (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL CIRCUIT SHORT TO GROUND |
| AUTOMATIC DAY/NIGHT MIRROR |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. CHECK THE VOLTAGE OF THE (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL

Turn the ignition off.

Disconnect the Automatic Day/Night Mirror C2 harness connector.

Turn the ignition on.

With the scan tool, monitor the VR Phone Switch voltage.

**Is the voltage above 4.7 volts?**

**Yes** >> Replace the Automatic Day/Night Mirror in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

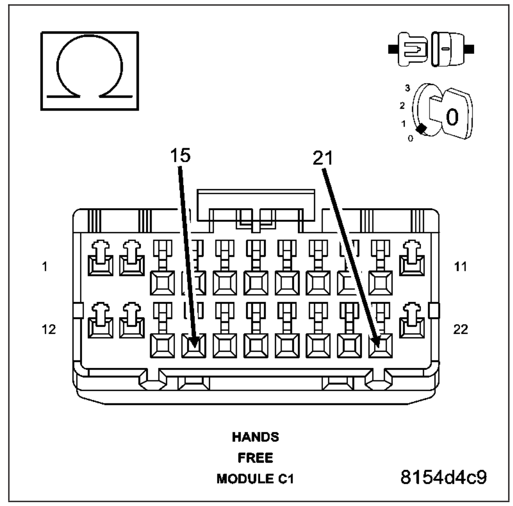
**No** >> Go To 3

## 3. (X730) VOICE/RECOGNITION/PHONE SWITCH SIGNAL CIRCUIT SHORTED TO THE (X835) SENSOR GROUND CIRCUIT

Turn the ignition off.

Disconnect the Hands Free Module C1 harness connector.

Measure the resistance between the (X730) Voice Recognition/Phone Switch Signal circuit and the (X835) Sensor Ground circuit.



**Is the resistance below 100.0 ohms?**

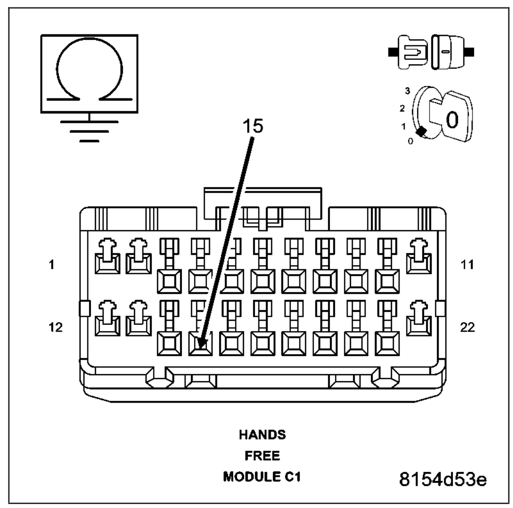
**Yes** >> Repair the (X730) Voice Recognition/Phone Switch Signal circuit for a short to the (X835) Sensor Ground circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4

## 4. (X730) VOICE/RECOGNITION/PHONE SWITCH SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (X730) Voice Recognition/Phone Switch Signal circuit.



**Is the resistance below 100.0 ohms?**

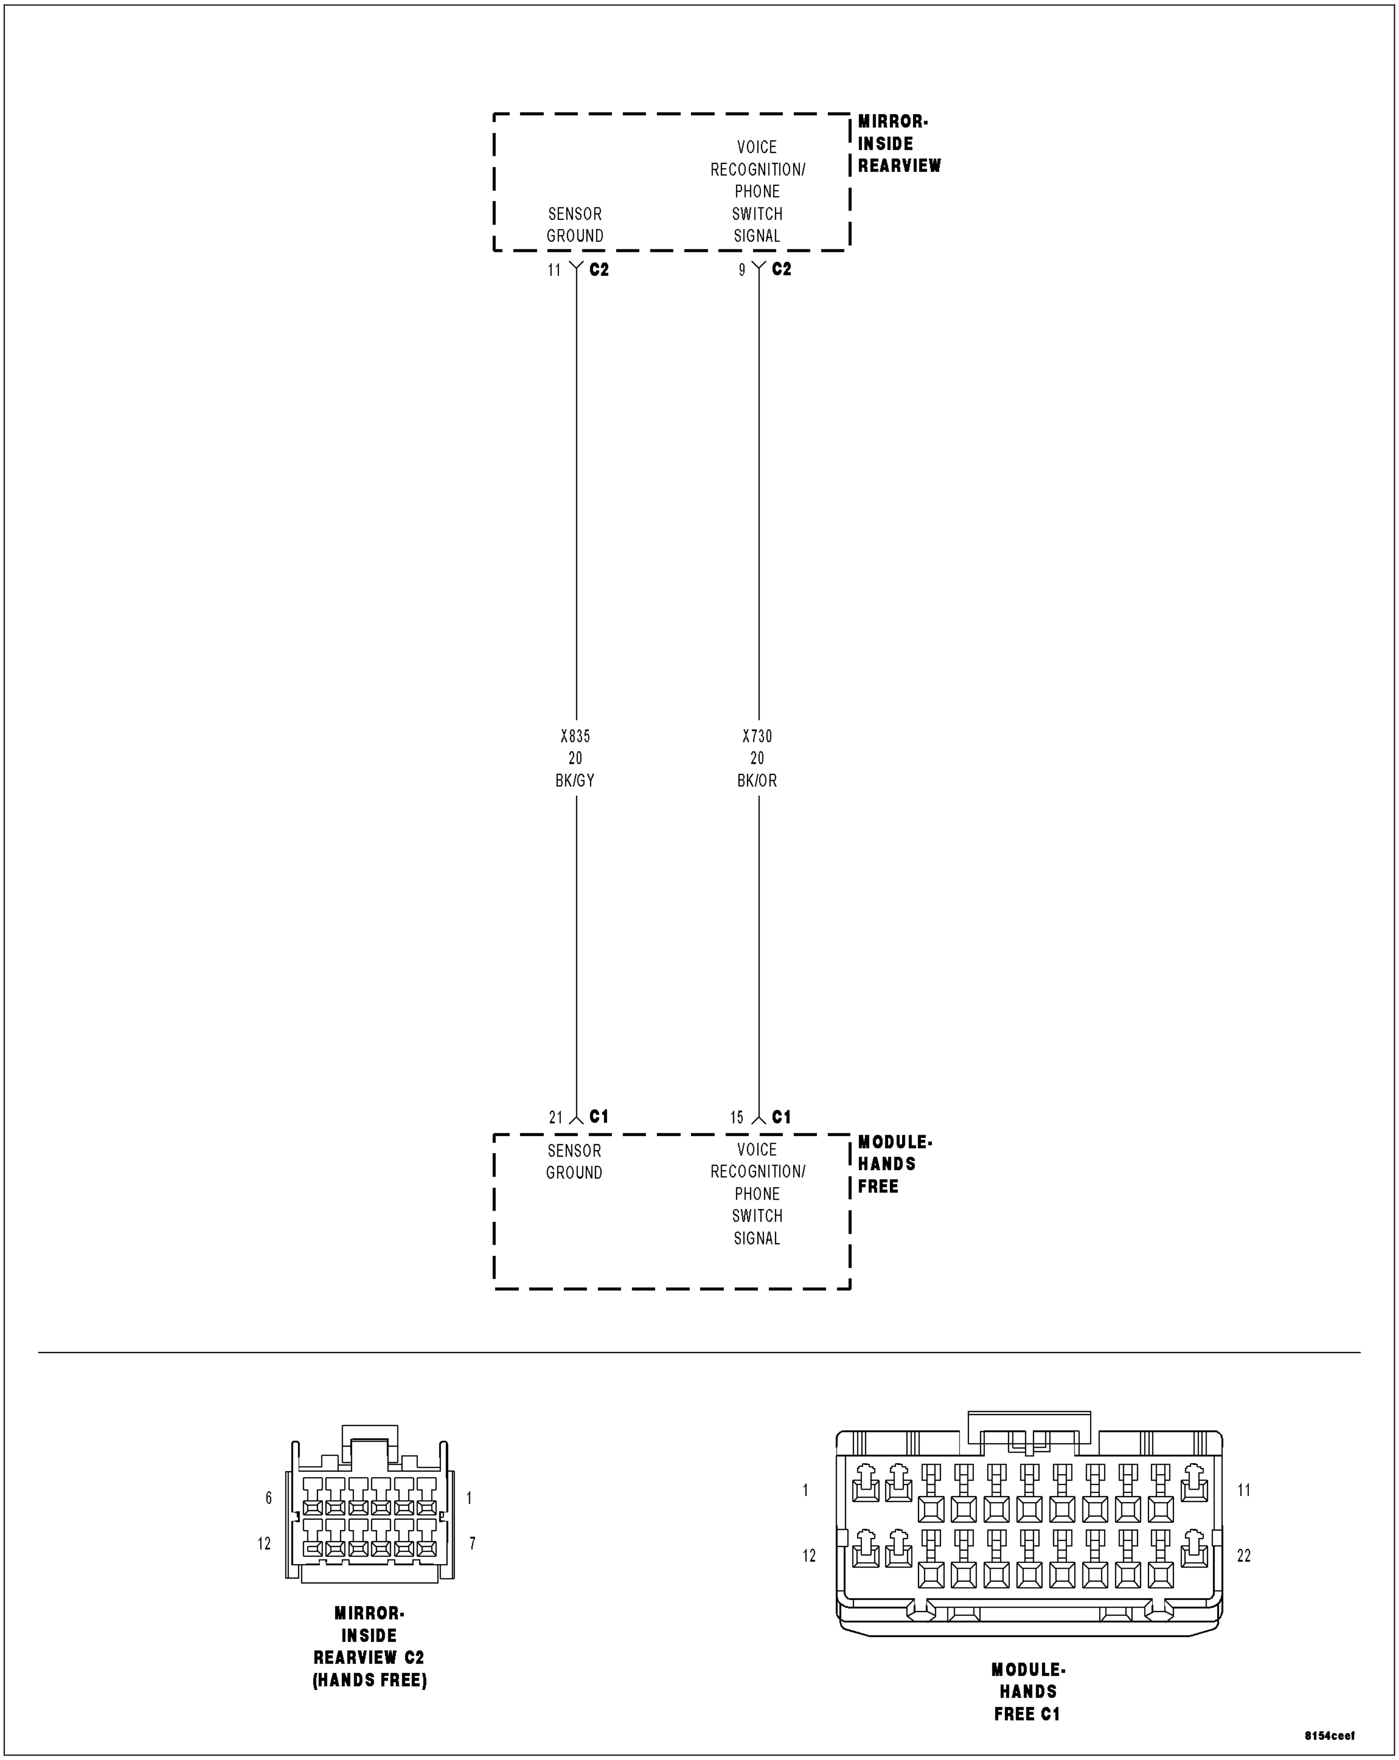
**Yes** >> Repair the (X730) Voice Recognition/Phone Switch Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

## VOICE RECOGNITION/PHONE SWITCH CIRCUIT SHORT TO VOLTAGE



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Hands Free Module detects voltage above 4.7 volts on the (X730) Voice Recognition/Phone Switch Signal circuit.

| Possible Causes |
|---|
| (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL CIRCUIT SHORT TO VOLTAGE |
| (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL CIRCUIT OPEN |
| (X835) SENSOR GROUND CIRCUIT OPEN |
| AUTOMATIC DAY/NIGHT MIRROR |
| HANDS FREE MODULE |

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase the HFM DTCs.

Attempt to make a phone call using the system.

With the scan tool, read the HFM DTCs.

**Did this DTC reset?**

**Yes** >> Go To 2

**No** >> The condition that set this DTC is no longer present. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

### 2. CHECK THE VOLTAGE OF THE (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL

Turn the ignition off.

Disconnect the Automatic Day/Night Mirror C2 harness connector.

Turn the ignition on.

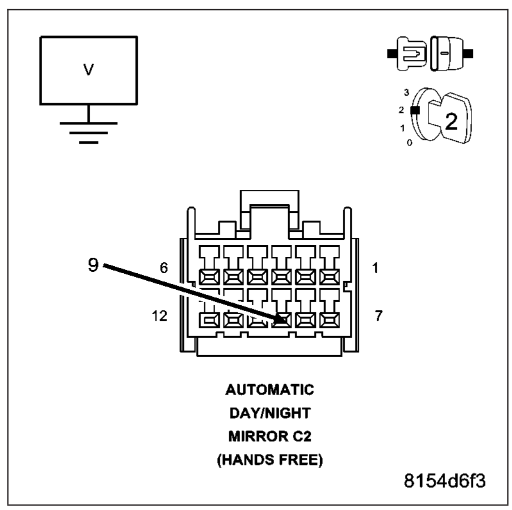
Measure the voltage of the (X730) Voice Recognition/Phone Switch Signal circuit.

**Is the voltage above 5.3 volts?**

**Yes** >> Repair the (X730) Voice Recognition/Phone Switch Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 3



## 3. AUTOMATIC DAY/NIGHT MIRROR

Turn the ignition off.

Connect a jumper wire between (X730) Voice Recognition/Phone Switch Signal circuit and the (X835) Sensor Ground circuit.

Turn the ignition on.

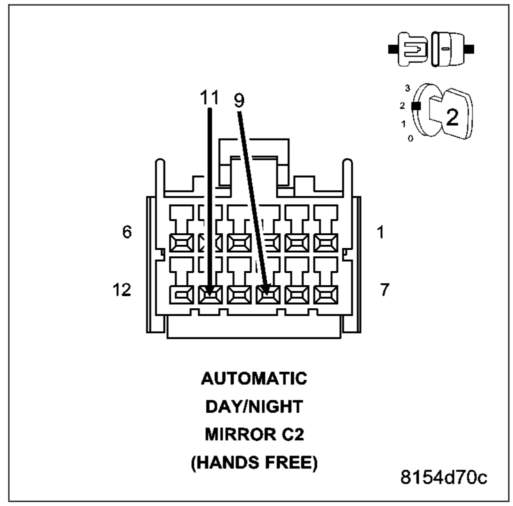
With the scan tool, monitor the VR Phone Switch Voltage.

**Is the voltage approximately 0 volts?**

**Yes** >> Replace the Automatic Day/Night Mirror in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Go To 4



## 4. (X730) VOICE RECOGNITION/PHONE SWITCH SIGNAL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Hands Free Module C1 harness connector.

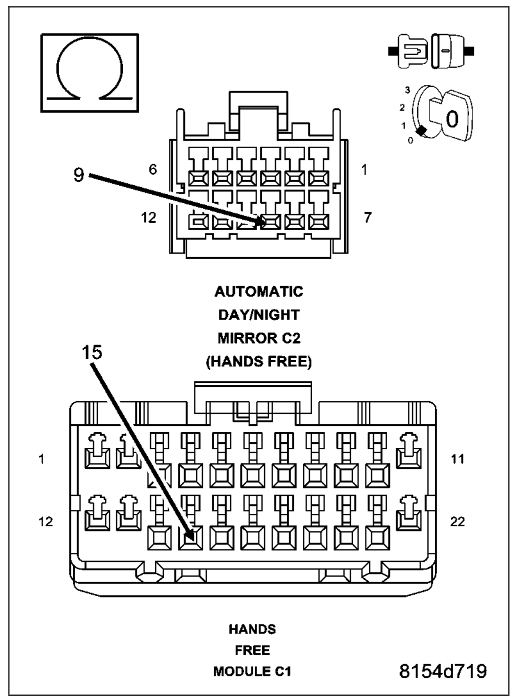
Measure the resistance of the (X730) Voice Recognition/Phone Switch Signal circuit between the HFM connector and the Automatic Day/Night Mirror connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

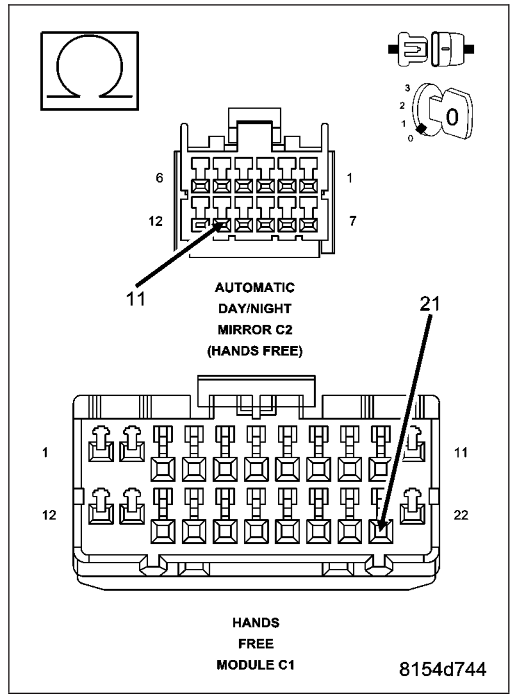
**No** >> Repair the (X730) Voice Recognition/Phone Switch Signal circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



## 5. (X835) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (X835) Sensor Ground circuit between the HFM connector and the Automatic Day/Night Mirror connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**No** >> Repair the (X835) Sensor Ground circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

# NAVIGATION/TELECOMMUNICATION

## TABLE OF CONTENTS

# NAVIGATION/TELECOMMUNICATION

## DESCRIPTION

### TELECOMMUNICATIONS

The hands-free cellular system on this vehicle uses Bluetooth™ technology to provide wireless communication between the operator's compatible cellular telephone and the vehicle's on-board receiver.

The system uses voice recognition technology to control operation. The incoming voice is broadcast through the vehicle's radio speakers, automatically overriding any other audio signals on the front speakers when the hands-free system is in use. A microphone in the rearview mirror picks up vehicle occupant's voices. If a call is in progress when the ignition is switched off, the call will be transferred to the hand-held telephone.

The system will communicate with a telephone that is anywhere within the vehicle. However, covering the hand held phone or the hands-free phone module with a metal object may block the signal. The system will recognize up to seven telephones, each of which is given a spoken identification by the user during the setup process. The system includes Spanish and French voice recognition in addition to English.

## OPERATION

### TELECOMMUNICATION

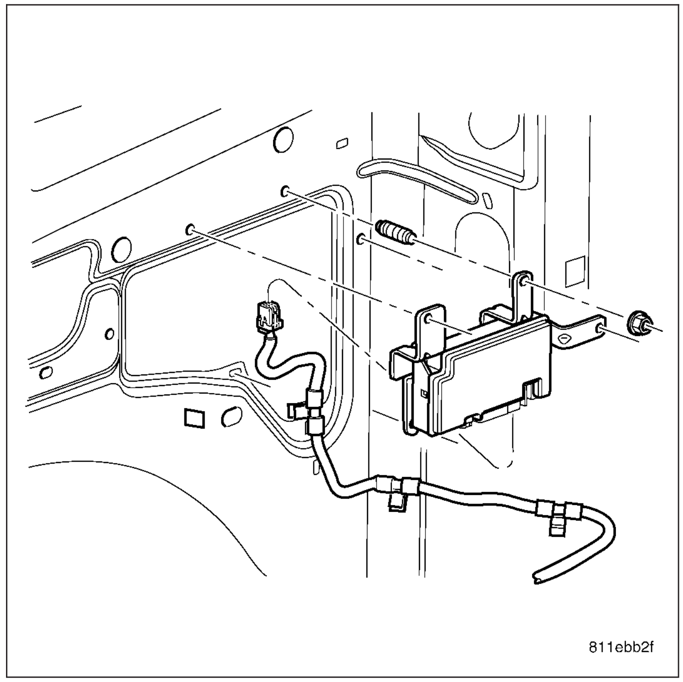
Two buttons on the rearview mirror, identified with ISO icons, control the system: A ″phone″ button turns the system on and off; a ″voice recognition″ (or voice command) button prompts the hands-free system to listen for a voice command. The system includes the following features:

- Phone book - Stores telephone numbers for later recall by name or other verbal identification, called a voice tag, and memory location.
- Four memory locations - Home, Work, Mobile, and Pager. A maximum of 32 unique names or voice tags may be stored at the same time, with a different number in each of the four memory locations.
- Voice tag dialing - Dials the number associated with a voice tag and memory location.
- Digit dialing - Dials the telephone number by recognizing the names of the digits as they are spoken.
- Receiving calls - A voice prompt notifies the user of an incoming call. Pressing the UConnect button accepts or rejects the call.
- Privacy Mode - Switches the call to the handheld telephone and the hands-free system and back again using the “voice recognition” (or “voice command”) button and a voice command, if desired.

# HANDS FREE MODULE

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the right quarter trim panel (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).
3. Remove mounting fasteners.
4. Disconnect electrical harness connector.



## INSTALLATION

1. Connect electrical harness connector.
2. Position module, and install mounting fasteners.
3. Install quarter trim panel (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).
4. Connect battery negative cable.

## TABLE OF CONTENTS

# 8W-01 WIRING DIAGRAM INFORMATION

## TABLE OF CONTENTS

# WIRING DIAGRAM INFORMATION

## DESCRIPTION

## DESCRIPTION - HOW TO USE WIRING DIAGRAMS

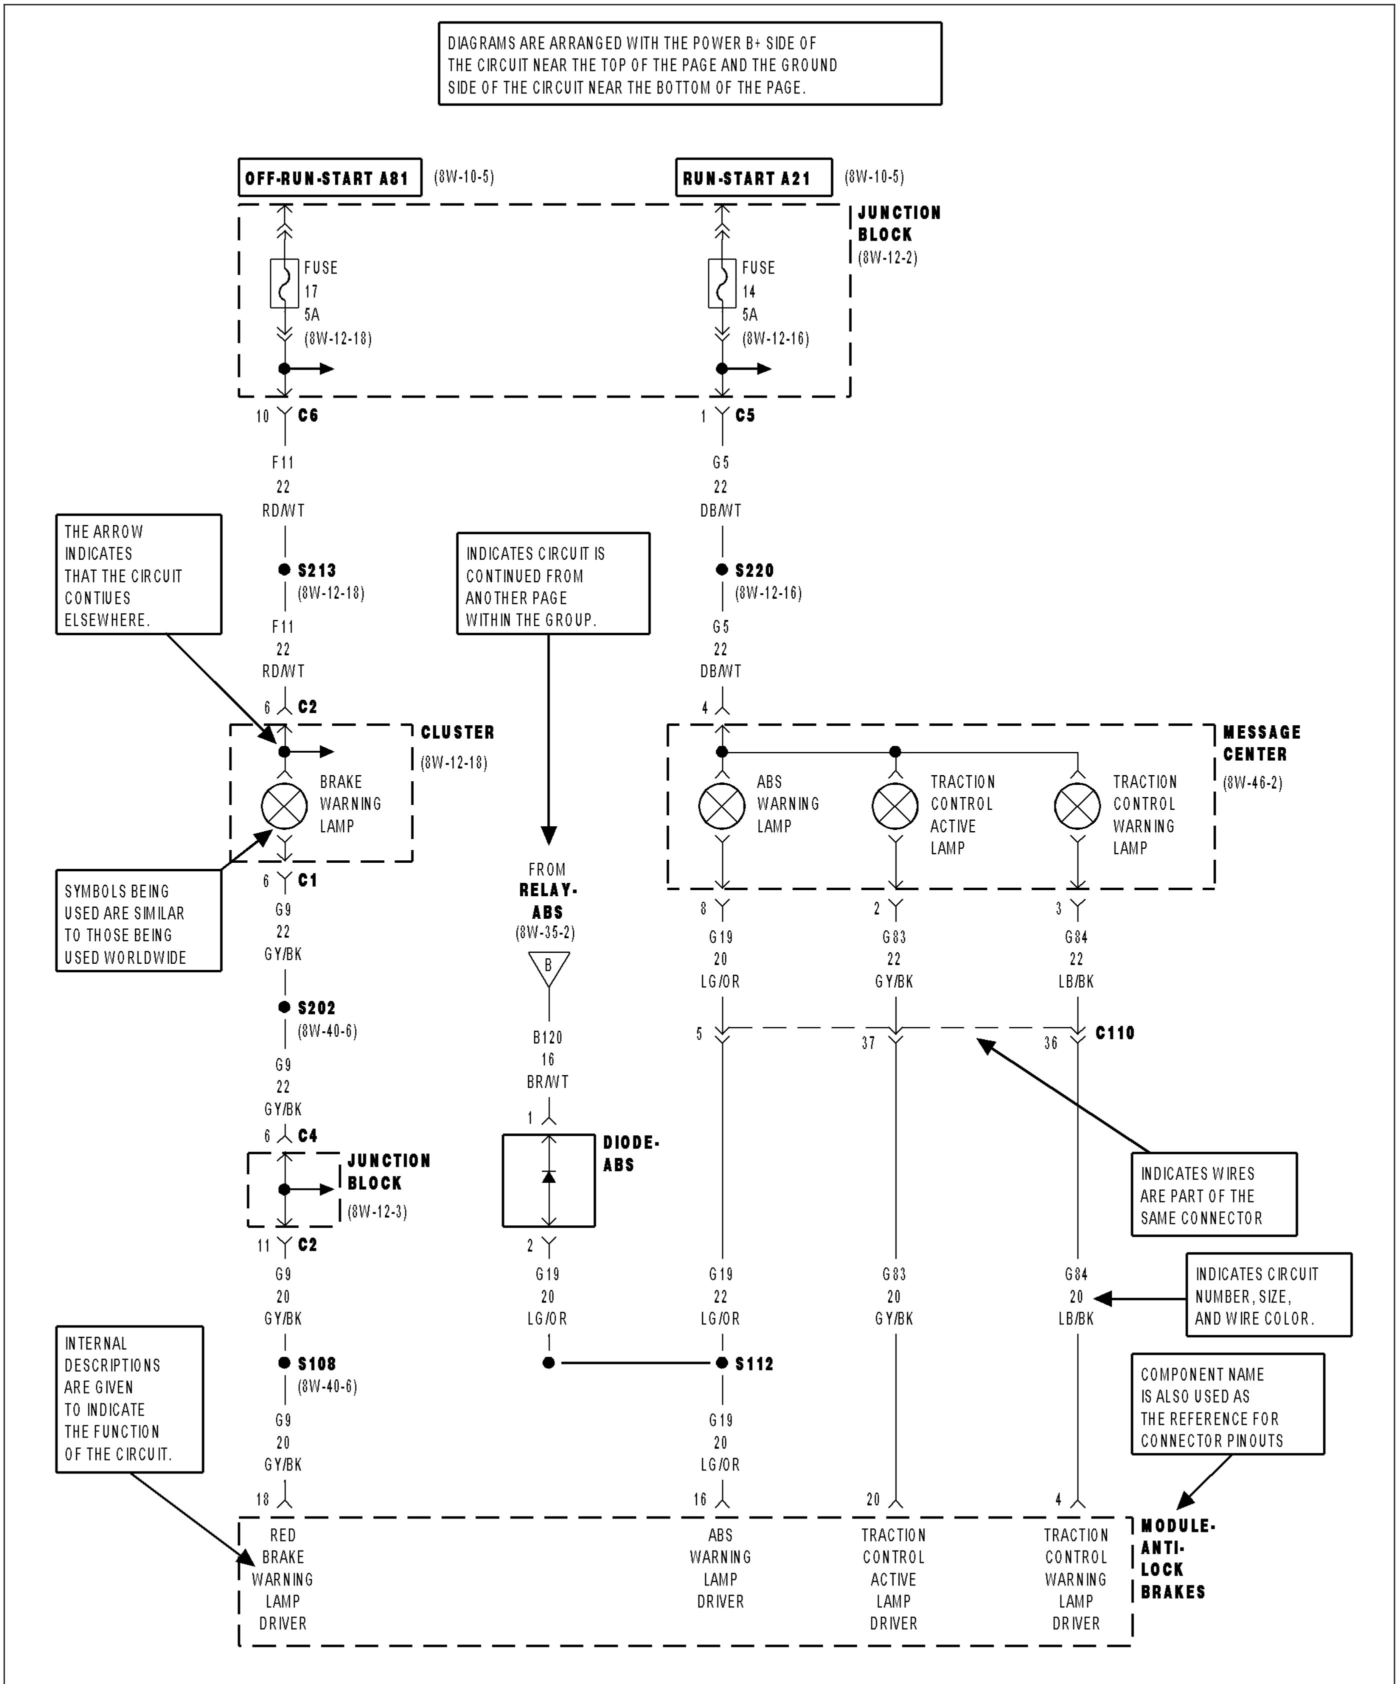
DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicles wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page.

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition.

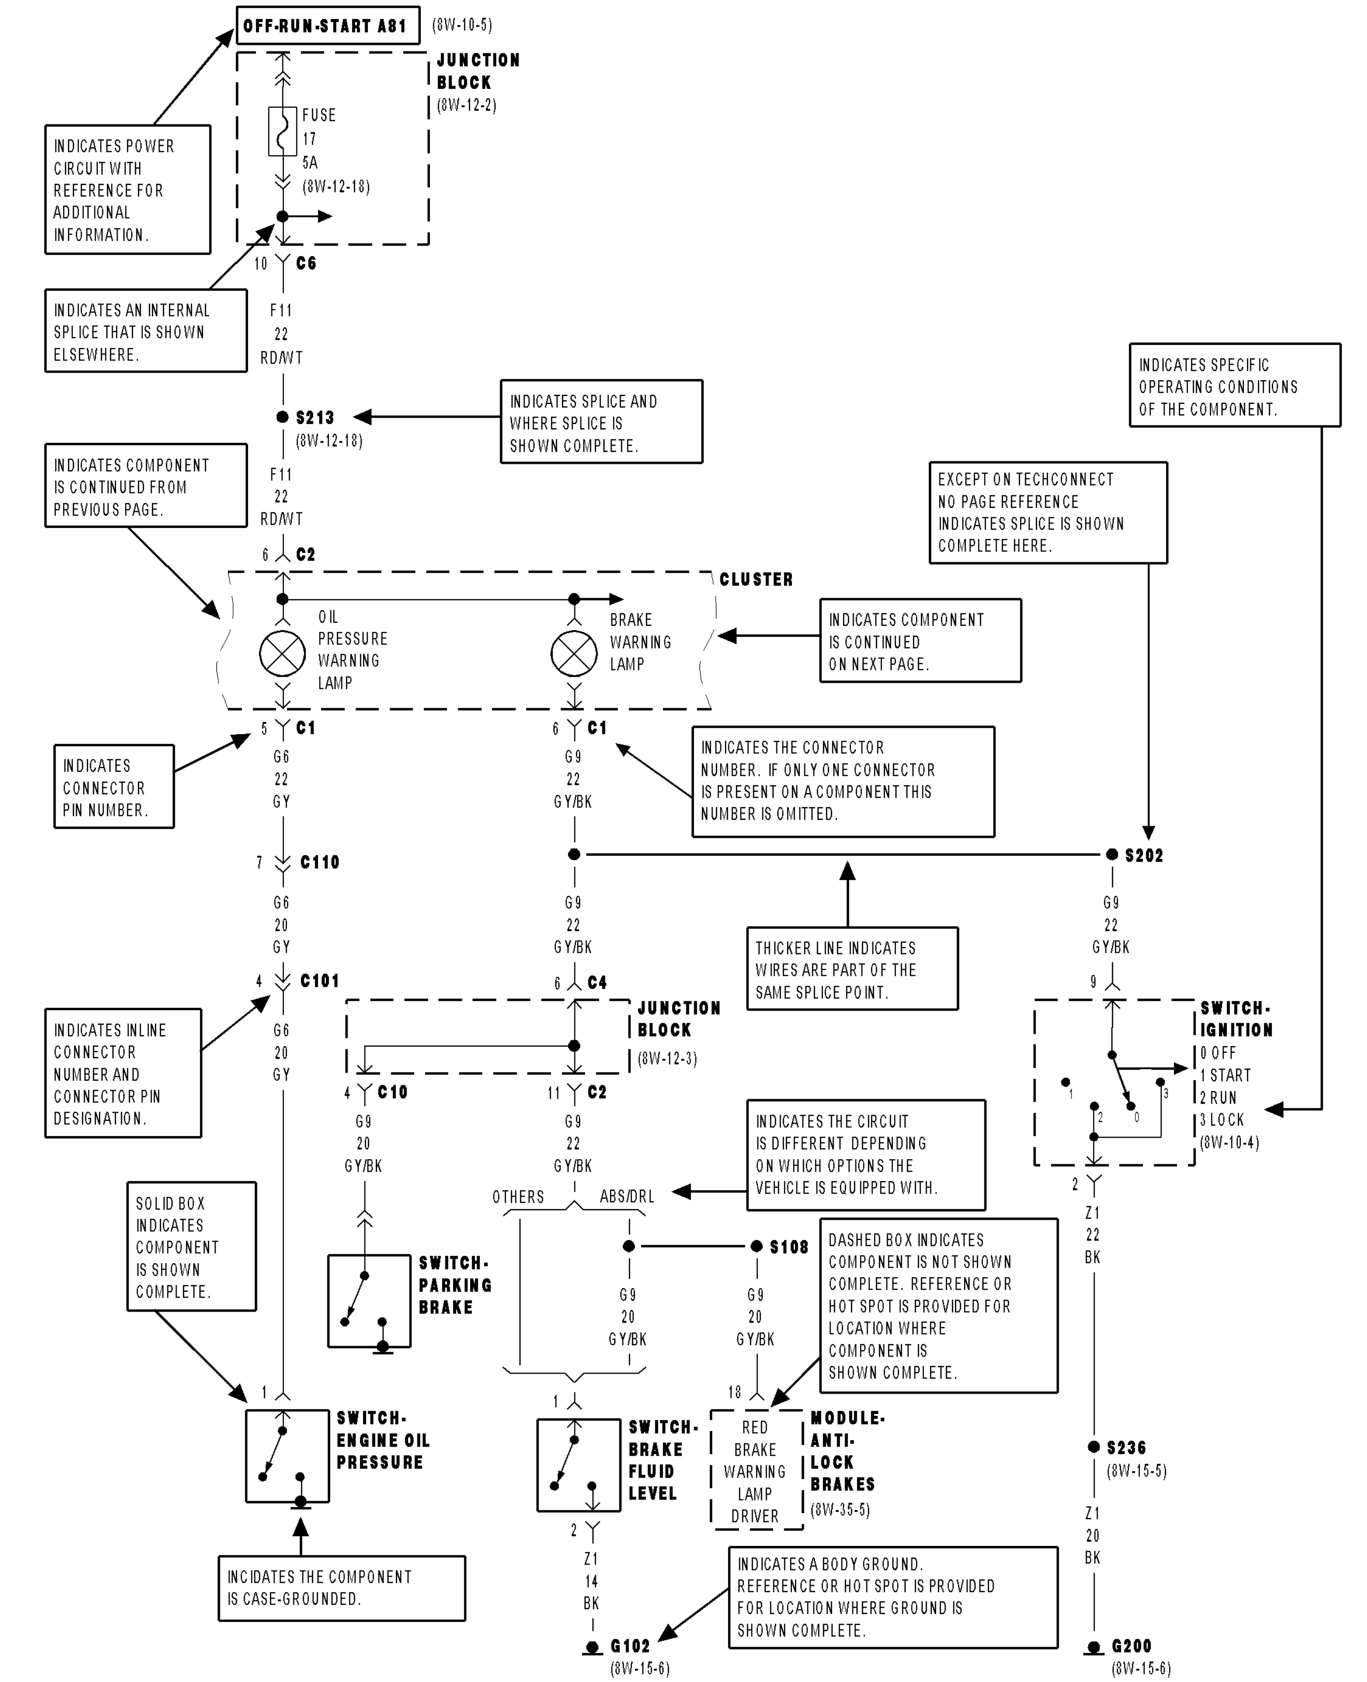
Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.



The System shown here is an EXAMPLE ONLY. It does not represent the actual circuit shown in the WIRING DIAGRAM SECTION.

8153c2c5



The System shown here is an EXAMPLE ONLY. It does not represent the actual circuit shown in the WIRING DIAGRAM SECTION.

8153c2c9

## SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world.

## DESCRIPTION - CIRCUIT INFORMATION

Each wire shown in the diagrams contains a code which identifies the main circuit, a specific part of the main circuit, gage of wire, and color. An example would be **A 2 18 LB/YL**. This is a Battery Feed circuit, level two, eighteen gauge, light blue with a yellow tracer.

### WIRE COLOR CODE CHART

| COLOR CODE | COLOR |
|---|---|
| BL | BLUE |
| BK | BLACK |
| BR | BROWN |
| DB | DARK BLUE |
| DG | DARK GREEN |
| GY | GRAY |
| LB | LIGHT BLUE |
| LG | LIGHT GREEN |
| OR | ORANGE |
| PK | PINK |
| RD | RED |
| TN | TAN |
| VT | VIOLET |
| WT | WHITE |
| YL | YELLOW |
| * | WITH TRACER |

## DESCRIPTION - CIRCUIT FUNCTIONS

All circuits in the diagrams use an alpha/numeric code to identify the wire and it's function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

**CIRCUIT IDENTIFICATION CODE CHART**

| CIRCUIT | FUNCTION |
|---|---|
| A | BATTERY FEED |
| B | BRAKE CONTROLS |
| C | CLIMATE CONTROLS |
| D | DIAGNOSTIC CIRCUITS |
| E | DIMMING ILLUMINATION CIRCUITS |
| F | FUSED CIRCUITS |
| G | MONITORING CIRCUITS (GAUGES) |
| H | MULTIPLE |
| I | NOT USED |
| J | OPEN |
| K | POWERTRAIN CONTROL MODULE |
| L | EXTERIOR LIGHTING |
| M | INTERIOR LIGHTING |
| N | MULTIPLE |
| O | NOT USED |
| P | POWER OPTION (BATTERY FEED) |
| Q | POWER OPTIONS (IGNITION FEED) |
| R | PASSIVE RESTRAINT |
| S | SUSPENSION/STEERING |
| T | TRANSMISSION/TRANSAXLE/ TRANSFER CASE |
| U | OPEN |
| V | SPEED CONTROL, WIPER/ WASHER |
| W | WIPERS |
| X | AUDIO SYSTEMS |
| Y | TEMPORARY |
| Z | GROUNDS |

## DESCRIPTION - SECTION IDENTIFICATION AND INFORMATION

The wiring diagrams are grouped into individual sections. If a component is most likely found in a particular group, it will be shown complete (all wires, connectors, and pins) within that group. For example, the Auto Shutdown Relay is most likely to be found in Group 30, so it is shown there complete. It can, however, be shown partially in another group if it contains some associated wiring.

Splice diagrams in Section 8W-70 show the entire splice and provide references to other sections the splices serves. Section 8W-70 only contains splice diagrams that are not shown in their entirety somewhere else in the wiring diagrams.

Section 8W-80 shows each connector and the circuits involved with that connector. The connectors are identified using the name/number on the diagram pages.

## DESCRIPTION - CONNECTOR, GROUND AND SPLICE INFORMATION

**CAUTION: Not all connectors are serviced. Some connectors are serviced only with a harness. A typical example might be the Supplemental Restraint System connectors. Always check parts availability before attempting a repair.**

### IDENTIFICATION

In-line connectors are identified by a number, as follows:

- In-line connectors located in the engine compartment are C100 series numbers.
- In-line connectors located in the instrument panel area are C200 series numbers.
- In-line connectors located in the body are C300 series numbers.
- Jumper harness connectors are C400 series numbers.
- Grounds and ground connectors are identified with a “G” and follow the same series numbering as the in-line connectors.
- Splices are identified with an “S” and follow the same series numbering as the in-line connectors. In addition, S001–S099 numbers are located in the engine compartment.
- Component connectors are identified by the component name instead of a number. Multiple connectors on a component use a C1, C2, etc. identifier.

### LOCATIONS

Section 8W-91 contains connector/ground/splice location illustrations. The illustrations contain the connector name (or number)/ground number/splice number and component identification. Connector/ground/splice location charts in section 8W-91 reference the figure numbers of the illustrations.

The abbreviation T/O is used in the component location section to indicate a point in which the wiring harness branches out to a component. The abbreviation N/S means Not Shown in the illustrations

## WARNING

## WARNINGS - GENERAL

**WARNINGS** provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

**WARNING: Always wear safety glasses for eye protection.**

**WARNING: Use safety stands anytime a procedure requires being under a vehicle.**

**WARNING: Be sure that the ignition switch always is in the off position, unless the procedure requires it to be on.**

**WARNING: Set the parking brake when working on any vehicle. An automatic transmission should be in park. A manual transmission should be in neutral.**

**WARNING: Operate the engine only in a well-ventilated area.**

**WARNING: Keep away from moving parts when the engine is running, especially the fan and belts.**

**WARNING: To prevent serious burns, avoid contact with hot parts such as the radiator, exhaust manifold(s), tail pipe, catalytic converter and muffler.**

**WARNING: Do not allow flame or sparks near the battery. Gases are always present in and around the battery.**

**WARNING: Always remove rings, watches, loose hanging jewelry and avoid loose clothing.**

## DIAGNOSIS AND TESTING - WIRING HARNESS

### TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

**WARNING: Never use a jumper wire across a load, such as a motor, connected between a battery feed and ground.**

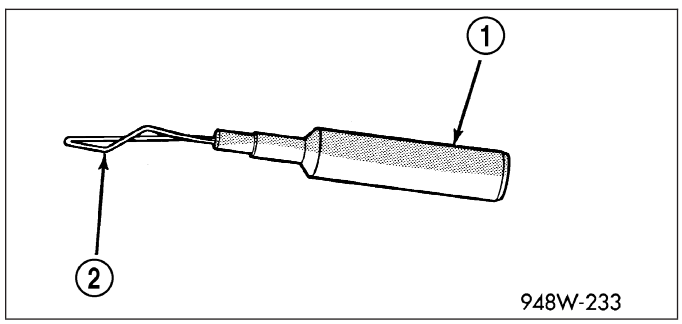
- Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

**CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.**

- Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

**CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.**

- Probing Tools - These tools are used for probing terminals in connectors. Select the proper size tool from Special Tool Package 6807, and insert the probing end (2) into the terminal being tested. Use the other end of the tool (1) to insert the meter probe.



### INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

## TROUBLESHOOTING WIRING PROBLEMS

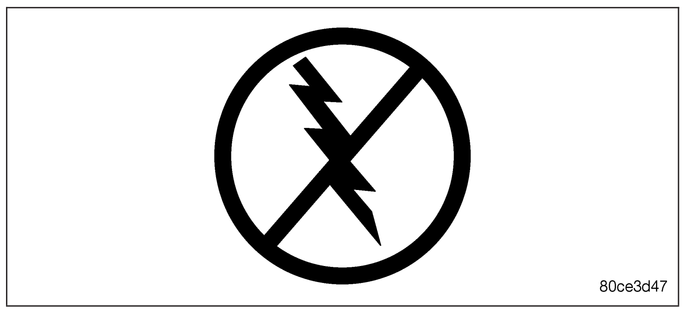
When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

1. Verify the problem.
2. Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.
3. Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
4. Isolate the problem area.
5. Repair the problem area.
6. Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

## STANDARD PROCEDURE

## STANDARD PROCEDURE - ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

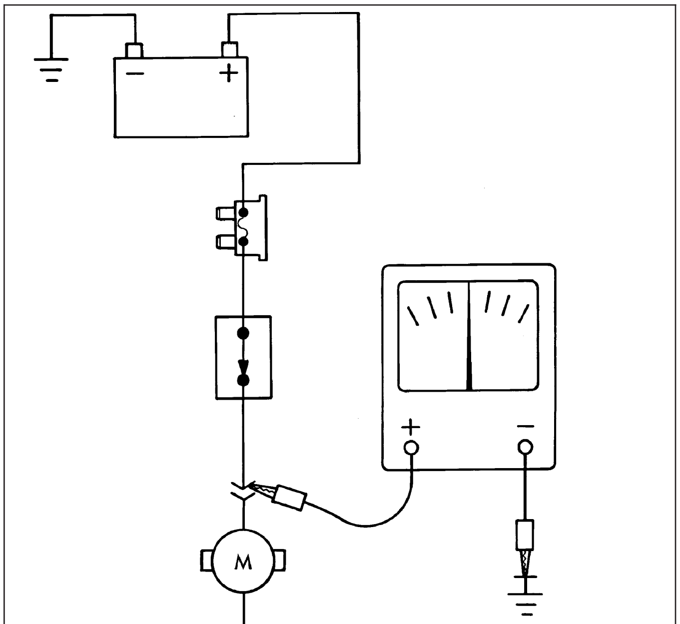
All ESD sensitive components are solid state and a symbol is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.



1. Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
2. Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.
3. When using a voltmeter, be sure to connect the ground lead first.
4. Do not remove the part from it’s protective packing until it is time to install the part.
5. Before removing the part from it’s package, ground the package to a known good ground on the vehicle.

## STANDARD PROCEDURE - TESTING OF VOLTAGE POTENTIAL

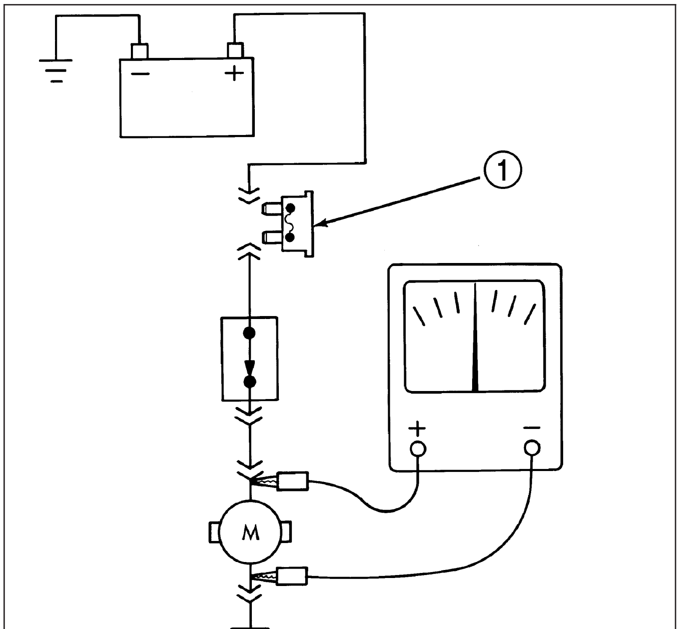
1. Connect the ground lead of a voltmeter to a known good ground.
2. Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.



948W-194

## STANDARD PROCEDURE - TESTING FOR CONTINUITY

1. Remove the fuse (1) for the circuit being checked or, disconnect the battery.
2. Connect one lead of the ohmmeter to one side of the circuit being tested
3. Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.



948W-195

## STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND

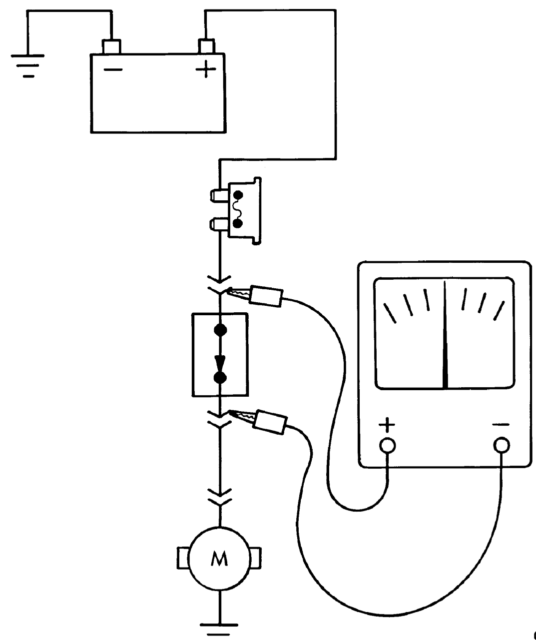
1. Remove the fuse and disconnect all items involved with the fuse.
2. Connect a test light or a voltmeter across the terminals of the fuse.
3. Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.
4. If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

## STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

1. Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
2. Replace the blown fuse.
3. Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
4. Start connecting or energizing the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

## STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP

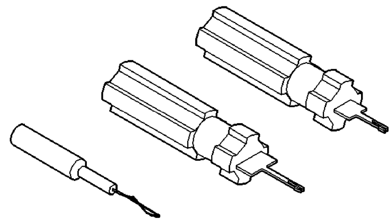
1. Connect the positive lead of the voltmeter to the side of the circuit closest to the battery.
2. Connect the other lead of the voltmeter to the other side of the switch, component or circuit.
3. Operate the item.
4. The voltmeter will show the difference in voltage between the two points.



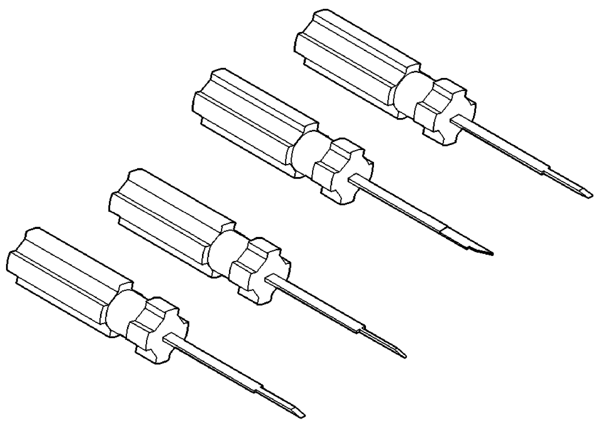
948W-196

## SPECIAL TOOLS

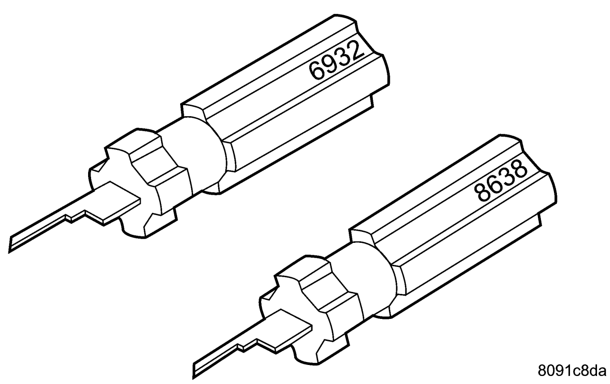
## WIRING/TERMINAL



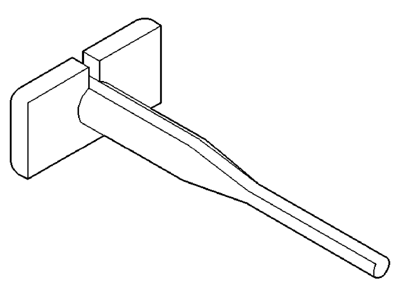
*PROBING TOOL PACKAGE 6807*



*TERMINAL PICK TOOL SET 6680*



*TERMINAL REMOVING TOOLS 6932 AND 8638*

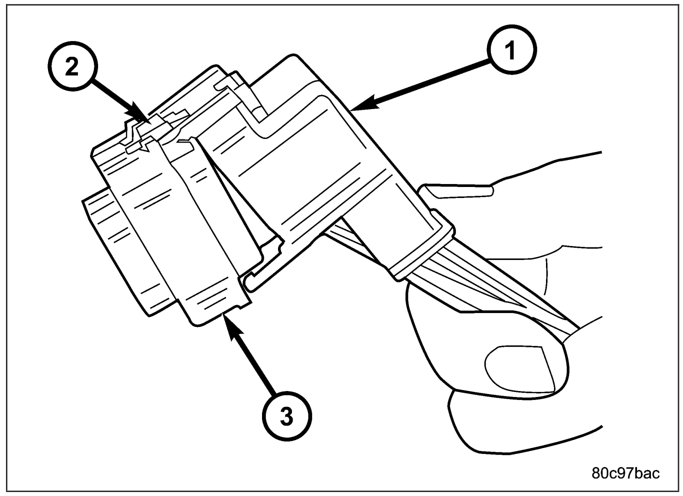


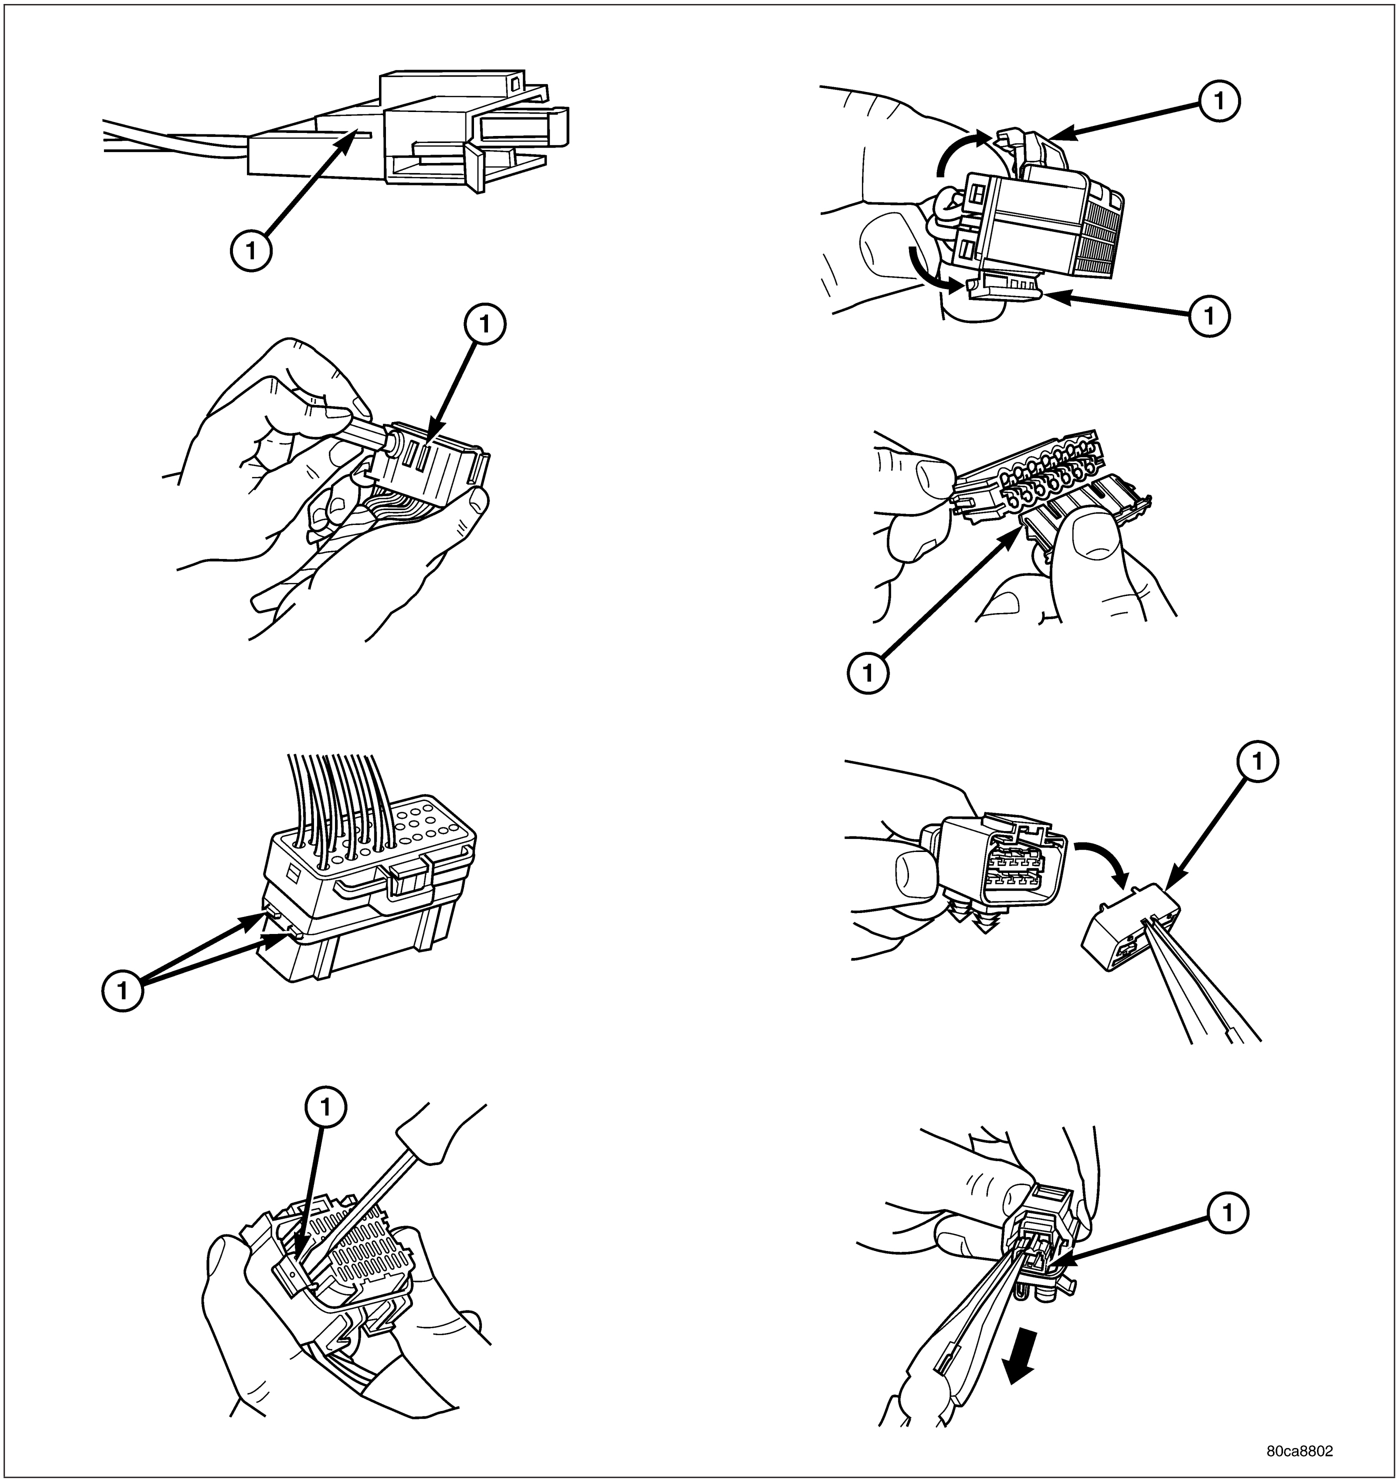
*TERMINAL REMOVING TOOL 6934*

# CONNECTOR

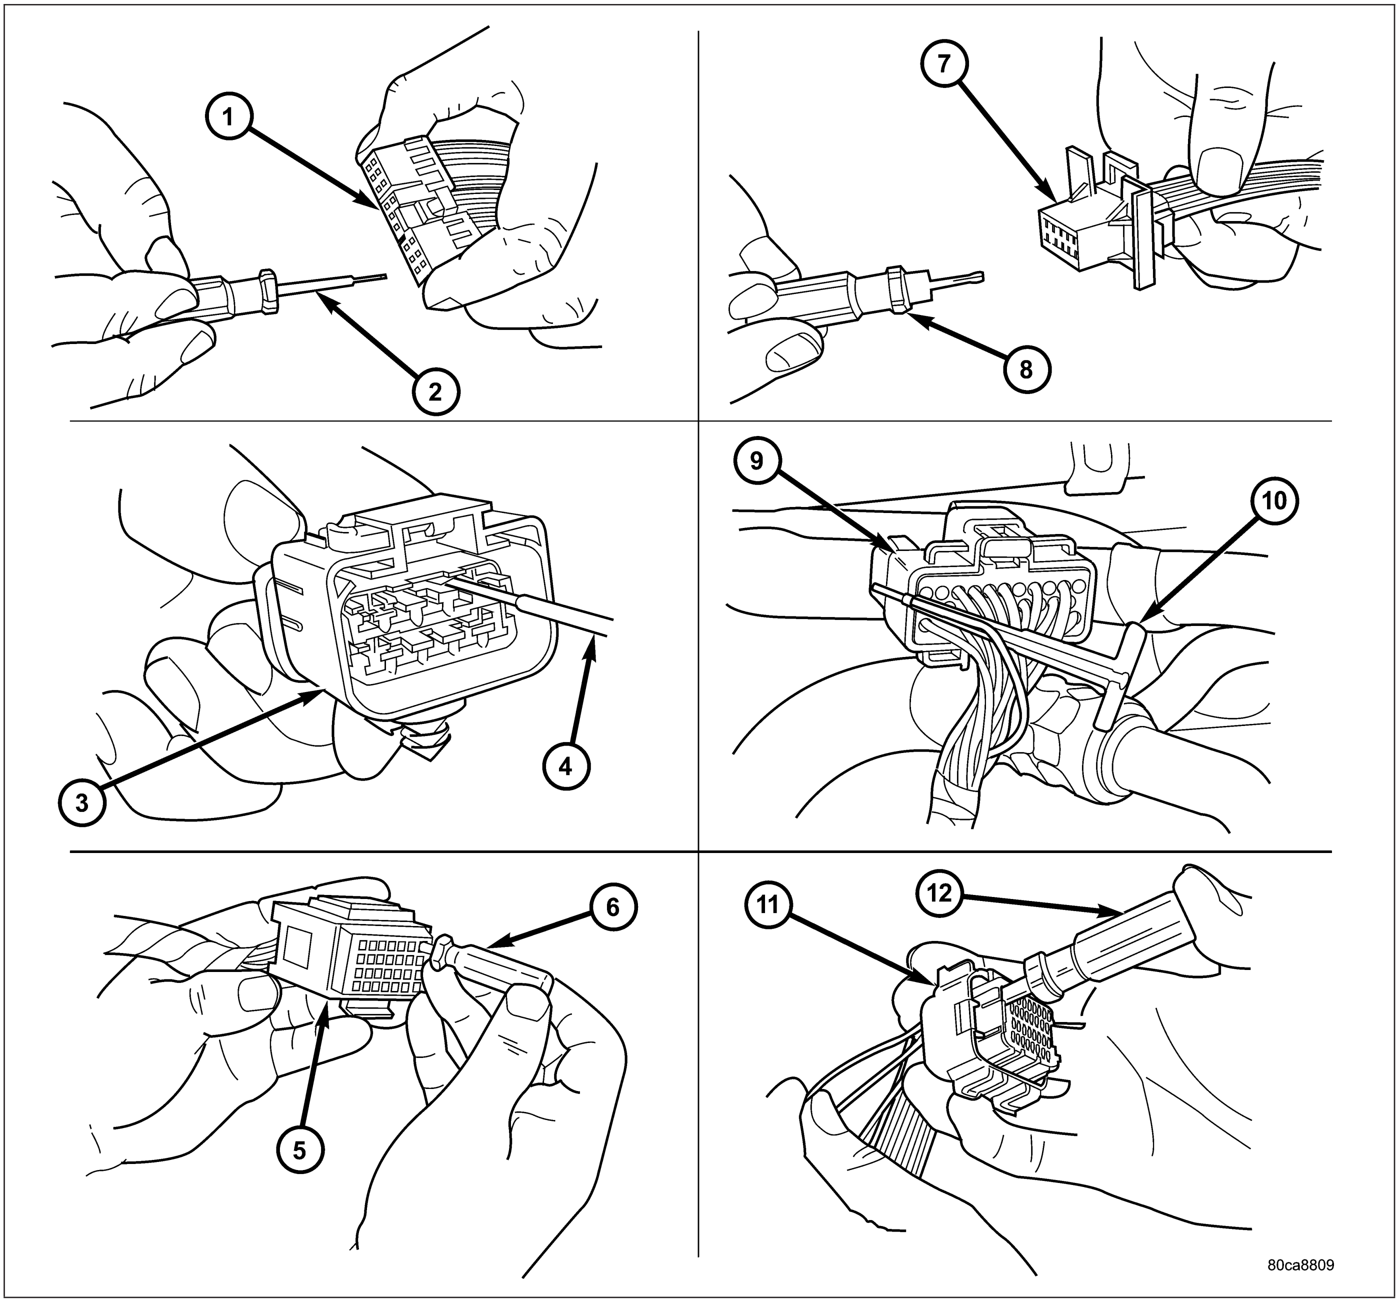
## REMOVAL

1. Disconnect battery.
2. Release Connector Lock (2).
3. Disconnect the connector (3) being repaired from its mating half/component.
4. Remove the dress cover (if applicable) (1).





5. Release the Secondary Terminal Lock, if required (1).



1 - TYPICAL CONNECTOR
2 - PICK FROM SPECIAL TOOL KIT 6680
3 - APEX CONNECTOR
4 - PICK FROM SPECIAL TOOL KIT 6680
5 - AUGAT CONNECTOR
6 - SPECIAL TOOL 6932
7 - MOLEX CONNECTOR
8 - SPECIAL TOOL 6742
9 - THOMAS AND BETTS CONNECTOR
10 - SPECIAL TOOL 6934
11 - TYCO CONNECTOR
12 - SPECIAL TOOL 8638

6. Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector.

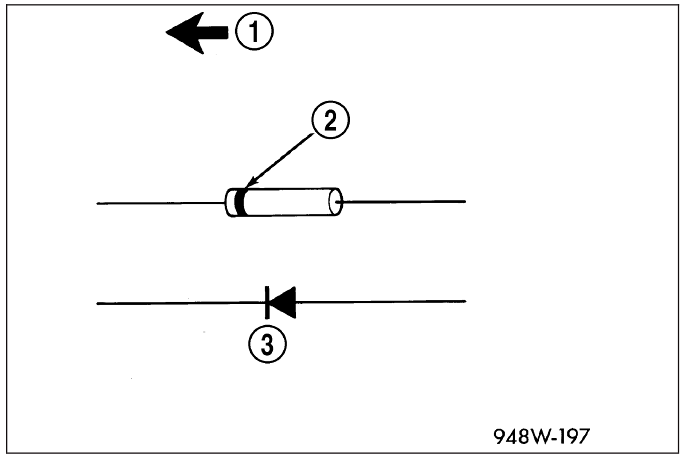
## INSTALLATION

1. Insert the removed terminal in the same cavity on the repair connector.
2. Repeat steps for each terminal in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.
3. When the connector is re-assembled, the secondary terminal lock must be placed in the locked position to prevent terminal push out.
4. Replace dress cover (if applicable).
5. Connect connector to its mating half/component.
6. Connect battery and test all affected systems.

# DIODE

## REMOVAL

1. Disconnect the battery.
2. Locate the diode in the harness, and remove the protective covering.
3. Remove the diode from the harness, pay attention to the current flow direction (1) (2) (3).



## INSTALLATION

1. Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.
2. Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow.
3. Solder the connection together using rosin core type solder only. **Do not use acid core solder.**
4. Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.
5. Re-connect the battery and test affected systems.

# TERMINAL

## REMOVAL

1. Follow steps for removing terminals described in the connector removal section.
2. Cut the wire 6 inches from the back of the connector.

## INSTALLATION

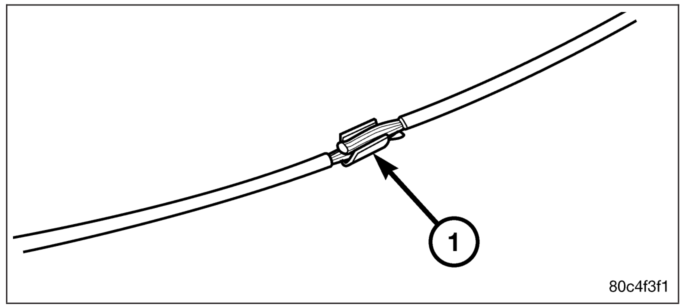
1. Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.
2. Cut the repair wire to the proper length and remove one–half (1/2) inch of insulation.
3. Splice the repair wire to the wire harness (see wire splicing procedure) (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION/WIRE - STANDARD PROCEDURE).
4. Insert the repaired wire into the connector.
5. Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
6. Re-tape the wire harness starting at 1–1/2 inches behind the connector and 2 inches past the repair.
7. Connect battery and test all affected systems.

# WIRE

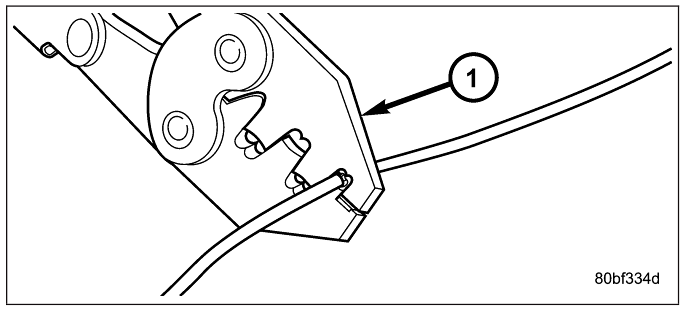
## STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

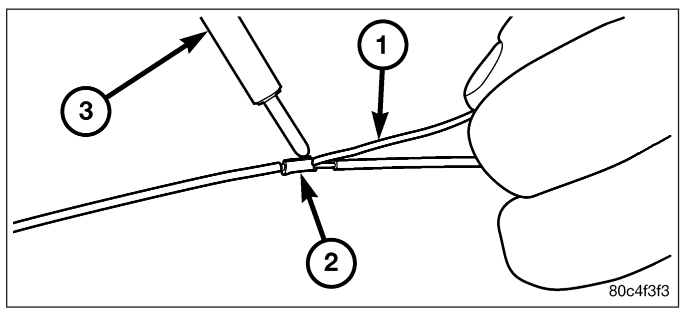
1. Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.
3. Place the strands of wire overlapping each other inside of the splice clip (1).



4. Using crimping tool (1), Mopar p/n 05019912AA, crimp the splice clip and wires together.



5. Solder (3) the connection (2) together using rosin core type solder (1) only.



**CAUTION: DO NOT USE ACID CORE SOLDER.**

6. Center the heat shrink tubing (2) over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) comes out of both ends of the tubing.

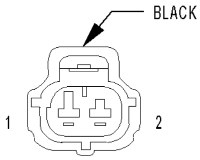
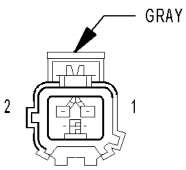
| 3 | K668 20BR | INLET PRESSURE SENSOR 5 VOLT SUPPLY |



SENSOR-
INPUT
SPEED
(A/T)

SENSOR-INPUT SPEED (A/T) - BLACK 2 WAY

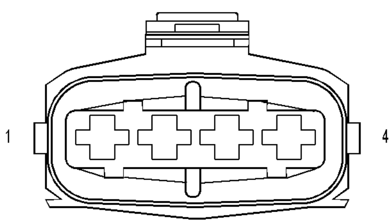
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | T52 20DG/WT | INPUT SPEED SENSOR SIGNAL |
| 2 | T13 20DG/VT | SPEED SENSOR GROUND |



SENSOR-
INTAKE AIR
TEMPERATURE
(GAS)

SENSOR-INTAKE AIR TEMPERATURE (GAS) - GRAY 2 WAY

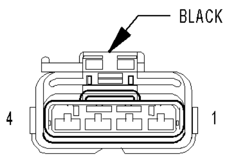
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K21 20BR/WT | IAT SIGNAL |
| 2 | K900 20DB/DG | SENSOR GROUND |



SENSOR-
INTAKE AIR
TEMPERATURE/
INTAKE
PRESSURE
(DIESEL)

SENSOR-INTAKE AIR TEMPERATURE/INTAKE PRESSURE (DIESEL) - 4 WAY

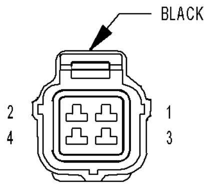
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K656 20GY/BR | SENSOR GROUND |
| 2 | K21 20BR/WT | IAT SENSOR SIGNAL |
| 3 | K856 20BR/YL | INTAKE PRESSURE SENSOR 5 VOLT SUPPLY |
| 4 | K37 20BR/OR | INTAKE PRESSURE SENSOR SIGNAL |



SENSOR-KNOCK (3.7L)

SENSOR-KNOCK (3.7L) - BLACK 4 WAY

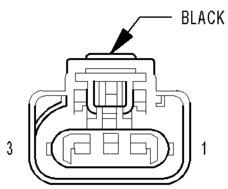
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K942 20BR/LG | KNOCK SENSOR NO. 1 RETURN |
| 2 | K42 20DB/OR | KNOCK SENSOR NO. 1 SIGNAL |
| 3 | K924 20PK/RD | KNOCK SENSOR NO. 2 RETURN |
| 4 | K242 20BR/WT | KNOCK SENSOR NO. 2 SIGNAL |



SENSOR-LINE PRESSURE (2.8L 45RFE)

SENSOR-LINE PRESSURE (2.8L 45RFE) - BLACK 4 WAY

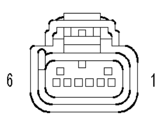
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | Z133 20BK/LG | GROUND |
| 2 | T39 20BR/YL | 5 VOLT SUPPLY |
| 3 | T38 20YL/BR | LINE PRESSURE SENSOR SIGNAL |
| 4 | - | - |



SENSOR-MAP (GAS)

SENSOR-MAP (GAS) - BLACK 3 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K1 20VT/BR | MAP SIGNAL |
| 2 | K900 20DB/DG | SENSOR GROUND |
| 3 | F856 20YL/PK | 5 VOLT SUPPLY |



SENSOR-MASS AIR FLOW (DIESEL)

SENSOR-MASS AIR FLOW (DIESEL) - 6 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | - | - |
| 2 | K811 20BK/OR | MAF SENSOR 5 VOLT SUPPLY |
| 3 | F1 20PK/WT | FUSED IGNITION SWITCH OUTPUT (RUN-START) |
| 4 | - | - |
| 5 | K957 20BR/OR | MAF SENSOR GROUND |

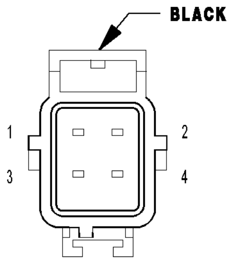
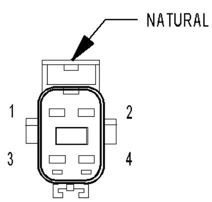
SENSOR-OUTPUT SPEED (A/T) - BLACK 2 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | T14 20DG/BR | OUTPUT SPEED SENSOR SIGNAL |
| 2 | T13 20DG/VT | SPEED SENSOR GROUND |



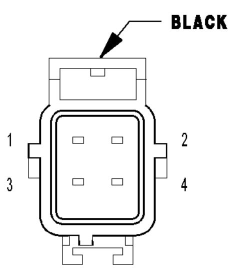
SENSOR-OXYGEN-LEFT FRONT (3.7L) - BLACK 4 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K99 18BR/TN | O2 1/1 HEATER CONTROL |
| 2 | Z42 18BK/LG | GROUND |
| 3 | K902 20BR/DG | O2 UPSTREAM RETURN |
| 4 | K41 20DB/LB | O2 1/1 SIGNAL |



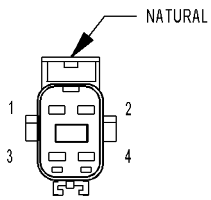
SENSOR-OXYGEN-LEFT REAR - NATURAL 4 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K299 18BR/OR | O2 1/2 HEATER CONTROL |
| 2 | Z42 18BK/LG | GROUND |
| 3 | K904 20DB/DG | O2 DOWNSTREAM RETURN |
| 4 | K141 20DB/YL | O2 1/2 SIGNAL |



SENSOR-OXYGEN-RIGHT FRONT (3.7L) - BLACK 4 WAY

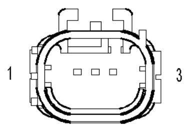
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K199 18BR/BK | O2 2/1 HEATER CONTROL |
| 2 | Z42 18BK/LG | GROUND |
| 3 | K902 20BR/DG | O2 UPSTREAM RETURN |
| 4 | K43 20DB/LG | O2 2/1 SIGNAL |



SENSOR-OXYGEN-RIGHT REAR (3.7L)

SENSOR-OXYGEN-RIGHT REAR (3.7L) - NATURAL 4 WAY

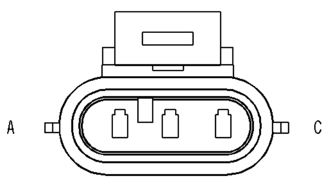
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K399 18BR/GY | O2 2/2 HEATER CONTROL |
| 2 | Z42 18BK/LG | GROUND |
| 3 | K904 20DB/DG | O2 DOWNSTREAM RETURN |
| 4 | K243 20BR | O2 2/2 SIGNAL |



SENSOR-SEAT BELT TENSION

SENSOR-SEAT BELT TENSION - 3 WAY

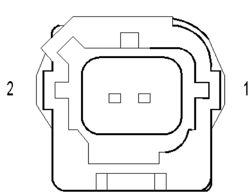
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | R86 20LG/LB | SEAT BELT TENSION SENSOR POWER |
| 2 | R986 20LG/BR | SEAT BELT TENSION SENSOR GROUND |
| 3 | D105 20WT/OR | SEAT BELT TENSION SENSOR SIGNAL |



SENSOR-SEAT WEIGHT-PASSENGER

SENSOR-SEAT WEIGHT-PASSENGER - 3 WAY

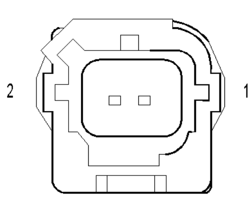
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| A | R941 20LG/DG | PASSENGER BLADDER PRESSURE SENSOR GROUND |
| B | R741 20LG/VT | PASSENGER BLADDER PRESSURE SENSOR SIGNAL |
| C | R740 20LG/OR | PASSENGER BLADDER PRESSURE SENSOR POWER |



SENSOR-SIDE IMPACT-LEFT 1

SENSOR-SIDE IMPACT-LEFT 1 - 2 WAY

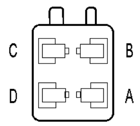
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | R15 20LG/BR | LEFT SIDE IMPACT SENSOR 1 GROUND |
| 2 | R13 20LG/VT | LEFT SIDE IMPACT SENSOR 1 SIGNAL |



SENSOR-SIDE IMPACT-RIGHT 1

SENSOR-SIDE IMPACT-RIGHT 1 - 2 WAY

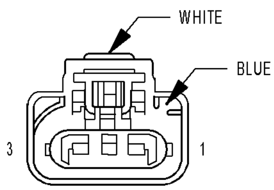
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | R16 20BR/LG | RIGHT SIDE IMPACT SENSOR 1 GROUND |
| 2 | R14 20TN/LG | RIGHT SIDE IMPACT SENSOR 1 SIGNAL |



SENSOR-STEERING ANGLE

SENSOR-STEERING ANGLE - 4 WAY

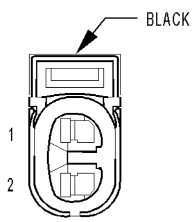
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| A | D65 20WT/LG | CAN C BUS (+) |
| B | Z385 20BK | GROUND |
| C | D64 20WT/LB | CAN C BUS (-) |
| D | F943 20PK/LG | FUSED IGNITION SWITCH OUTPUT (RUN-ACC) |



SENSOR-THROTTLE POSITION (GAS)

SENSOR-THROTTLE POSITION (GAS) - WHITE/BLUE 3 WAY

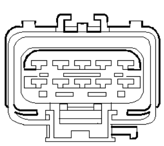
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | F855 20PK/YL | 5 VOLT SUPPLY |
| 2 | K900 20DB/DG | SENSOR GROUND |
| 3 | K22 20BR/OR | TP SIGNAL |



SENSOR-TRANSFER CASE POSITION

SENSOR-TRANSFER CASE POSITION - BLACK 2 WAY

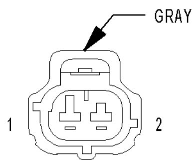
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K77 20BR/WT | TRANSFER CASE POSITION SENSOR INPUT |
| 2 | K300 20BR | SENSOR GROUND |



SENSOR-TRANSMISSION RANGE (42RLE)

SENSOR-TRANSMISSION RANGE (42RLE) - 10 WAY

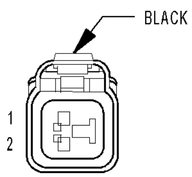
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | C115 20DB | FUSED IGNITION SWITCH OUTPUT (RUN) |
| 2 | - | - |
| 3 | T13 20DG/VT | SPEED SENSOR GROUND |
| 4 | T54 20DG/OR | TRANSMISSION TEMPERATURE SENSOR SIGNAL |
| 5 | - | - |
| 6 | L10 20WT/GY | BACK-UP LAMP FEED |
| 7 | T1 20DG/LB | TRS T1 SENSE |
| 8 | T3 20DG/DB | TRS T3 SENSE |
| 9 | T42 20DG/YL | TRS T42 SENSE |
| 10 | T41 20YL/DB | TRS T41 SENSE (P/N) |



**SENSOR-WATER IN FUEL (DIESEL)**

SENSOR-WATER IN FUEL (DIESEL) - GRAY 2 WAY

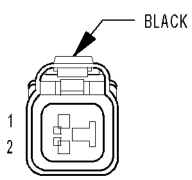
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K303 20BR/OR | WATER IN FUEL SENSOR SIGNAL |
| 2 | K300 20BR | SENSOR GROUND |



**SENSOR-WHEEL SPEED-ABS-LEFT FRONT (ABS)**

SENSOR-WHEEL SPEED-ABS-LEFT FRONT (ABS) - BLACK 2 WAY

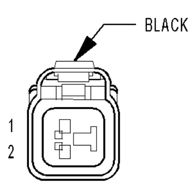
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | B9 18DG/LG | LEFT FRONT WHEEL SPEED SENSOR 12 VOLT SUPPLY |
| 2 | B8 18DG/WT | LEFT FRONT WHEEL SPEED SENSOR SIGNAL |



**SENSOR-WHEEL SPEED-ABS-LEFT REAR (ABS)**

SENSOR-WHEEL SPEED-ABS-LEFT REAR (ABS) - BLACK

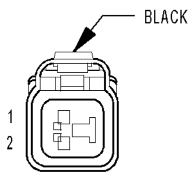
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | B4 18DG/GY | LEFT REAR WHEEL SPEED SENSOR 12 VOLT SUPPLY |
| 2 | B3 18DG/YL | LEFT REAR WHEEL SPEED SENSOR SIGNAL |



**SENSOR-WHEEL SPEED-ABS-RIGHT FRONT (ABS)**

SENSOR-WHEEL SPEED-ABS-RIGHT FRONT (ABS) - BLACK 2 WAY

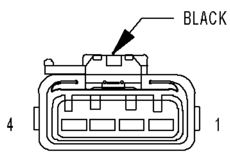
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | B7 18DG/VT | RIGHT FRONT WHEEL SPEED SENSOR 12 VOLT SUPPLY |
| 2 | B6 18DG/WT | RIGHT FRONT WHEEL SPEED SENSOR SIGNAL |



SENSOR-WHEEL SPEED-ABS-RIGHT REAR (ABS)

SENSOR-WHEEL SPEED-ABS-RIGHT REAR (ABS) - BLACK

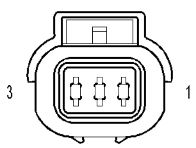
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | B2 18DG/LB | RIGHT REAR WHEEL SPEED SENSOR 12 VOLT SUPPLY |
| 2 | B1 18DG/OR | RIGHT REAR WHEEL SPEED SIGNAL |



SERVO-SPEED CONTROL

SERVO-SPEED CONTROL - BLACK 4 WAY

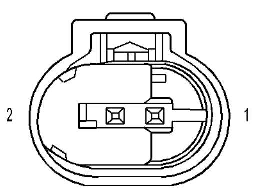
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | V36 20VT/TN | S/C VACUUM CONTROL |
| 2 | V35 20VT/OR | S/C VENT CONTROL |
| 3 | V30 20VT/WT | S/C BRAKE SWITCH OUTPUT |
| 4 | Z937 20BK | GROUND |



SIREN (EXPORT)

SIREN (EXPORT) - 3 WAY

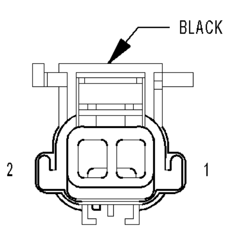
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | Z932 20BK | GROUND |
| 2 | X75 18GY/DG | SIREN SIGNAL CONTROL |
| 3 | A908 20RD | FUSED B(+) |



SOLENOID-BOOST PRESSURE (DIESEL)

SOLENOID-BOOST PRESSURE (DIESEL) - 2 WAY

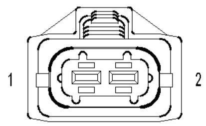
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K347 20BR/PK | FUSED ASD RELAY OUTPUT |
| 2 | X635 20BR/WT | BOOST PRESSURE SOLENOID CONTROL |



SOLENOID-EVAP/PURGE (GAS)

SOLENOID-EVAP/PURGE (GAS) - BLACK 2 WAY

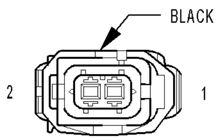
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K70 20DB/BR | EVAP PURGE SOL CONTROL |
| 2 | K52 20DB/WT | EVAP PURGE SOL SIGNAL |



SOLENOID-FUEL PRESSURE (DIESEL)

SOLENOID-FUEL PRESSURE (DIESEL) - 2 WAY

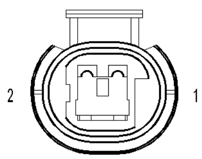
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K370 16BR | FUEL PRESSURE SOLENOID CONTROL |
| 2 | K369 16BR/OR | FUEL PRESSURE SOLENOID SUPPLY |



SOLENOID-FUEL QUANTITY (DIESEL)

SOLENOID-FUEL QUANTITY (DIESEL) - BLACK 2 WAY

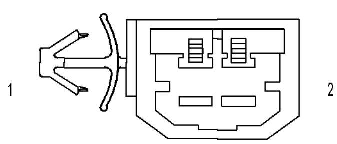
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K366 16BR/LG | FUEL QUANTITY SOLENOID SUPPLY |
| 2 | K646 16BR/YL | FUEL QUANTITY SOLENOID CONTROL |



SOLENOID-VACUUM RESERVOIR (DIESEL)

SOLENOID-VACUUM RESERVOIR (DIESEL) - 2 WAY

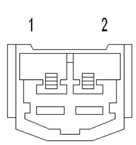
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K347 20BR/PK | FUSED ASD RELAY OUTPUT |
| 2 | N117 20DB/WT | VACUUM RESERVOIR SOLENOID CONTROL |



SPEAKER-INSTRUMENT PANEL-LEFT (BASE)

SPEAKER-INSTRUMENT PANEL-LEFT (BASE) - WHITE 2 WAY

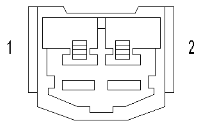
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X53 18DG | LEFT FRONT SPEAKER (+) |
| 2 | X55 18DG/BR | LEFT FRONT SPEAKER (-) |



SPEAKER-INSTRUMENT PANEL-LEFT (PREMIUM)

SPEAKER-INSTRUMENT PANEL-LEFT (PREMIUM) - 2 WAY

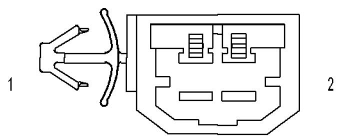
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X209 18GY/OR | AMPLIFIED HIGH LEFT FRONT SPEAKER (+) |
| 2 | X299 18GY/YL | AMPLIFIED HIGH LEFT FRONT SPEAKER (-) |



SPEAKER-INSTRUMENT PANEL-RIGHT (PREMIUM)

SPEAKER-INSTRUMENT PANEL-RIGHT (PREMIUM) - 2 WAY

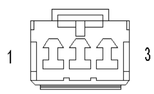
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X298 18GY/LG | AMPLIFIED HIGH RIGHT FRONT SPEAKER (+) |
| 2 | X208 18GY/DG | AMPLIFIED HIGH RIGHT FRONT SPEAKER (-) |



SPEAKER-INSTRUMENT PANEL-RIGHT (BASE)

SPEAKER-INSTRUMENT PANEL-RIGHT (BASE) - WHITE 2 WAY

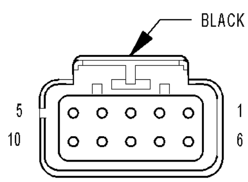
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X54 18GY | RIGHT FRONT SPEAKER (+) |
| 2 | X56 18GY/BR | RIGHT FRONT SPEAKER (-) |



SPEAKER-LEFT FRONT DOOR (BASE)

SPEAKER-LEFT FRONT DOOR (BASE) - 3 WAY

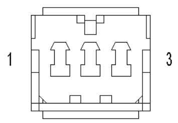
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X53 18DG | LEFT FRONT SPEAKER (+) |
| 2 | - | - |
| 3 | X55 18DG/BR | LEFT FRONT SPEAKER (-) |



SPEAKER-LEFT FRONT DOOR (PREMIUM)

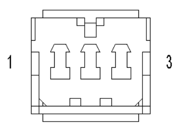
SPEAKER-LEFT FRONT DOOR (PREMIUM) - 10 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X53 18DG | LEFT FRONT SPEAKER (+) |
| 2 | X55 18DG/BR | LEFT FRONT SPEAKER (-) |
| 3 | Z514 16BK/LG | GROUND |
| 4 | X299 18GY/YL | AMPLIFIED HIGH LEFT FRONT SPEAKER (-) |
| 5 | X295 18GY/DG | AMPLIFIED LOW LEFT REAR SPEAKER (-) |
| 6 | X57 18DG/OR | LEFT REAR DOOR SPEAKER (-) |
| 7 | X51 18DG/DB | LEFT REAR DOOR SPEAKER (+) |
| 8 | X13 16LG/GY | RADIO CHOKE OUTPUT |
| 9 | X209 18GY/OR | AMPLIFIED HIGH LEFT FRONT SPEAKER (+) |
| 10 | X206 18DG/LG | AMPLIFIED LOW LEFT REAR SPEAKER (+) |



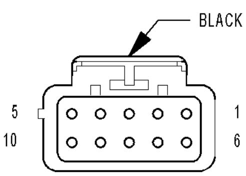
SPEAKER-LEFT REAR DOOR (PREMIUM) - 3 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X206 18DG/LG | AMPLIFIED LOW LEFT REAR SPEAKER (+) |
| 2 | - | - |
| 3 | X295 18GY/DG | AMPLIFIED LOW LEFT REAR SPEAKER (-) |



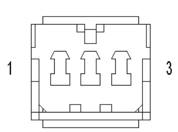
SPEAKER-RIGHT FRONT DOOR (BASE) - 3 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X54 18GY | RIGHT FRONT SPEAKER (+) |
| 2 | - | - |
| 3 | X56 18GY/BR | RIGHT FRONT SPEAKER (-) |



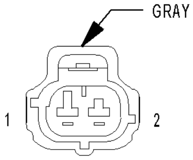
SPEAKER-RIGHT FRONT DOOR (PREMIUM) - BLACK 10 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X54 18GY | RIGHT FRONT SPEAKER (+) |
| 2 | X56 18GY/BR | RIGHT FRONT SPEAKER (-) |
| 3 | Z514 16BK/LG | GROUND |
| 4 | X208 18GY/DG | AMPLIFIED HIGH RIGHT FRONT SPEAKER (-) |
| 5 | X296 18LG/GY | AMPLIFIED LOW RIGHT REAR SPEAKER (-) |
| 6 | X58 18GY/OR | RIGHT REAR DOOR SPEAKER (-) |
| 7 | X52 18GY/DB | RIGHT REAR DOOR SPEAKER (+) |
| 8 | X13 16LG/GY | RADIO CHOKE OUTPUT |
| 9 | X298 18GY/LG | AMPLIFIED HIGH RIGHT FRONT SPEAKER (+) |
| 10 | X205 18GY/LG | AMPLIFIED LOW RIGHT REAR SPEAKER (+) |



SPEAKER-RIGHT REAR DOOR (PREMIUM) - 3 WAY

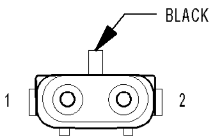
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X205 18GY/LG | AMPLIFIED LOW RIGHT REAR SPEAKER (+) |
| 2 | - | - |
| 3 | X296 18LG/GY | AMPLIFIED LOW RIGHT REAR SPEAKER (-) |



SWITCH-A/C-
LOW PRESSURE

SWITCH-A/C-LOW PRESSURE - GRAY 2 WAY

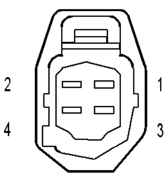
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | C20 20DB/YL | A/C SWITCH SENSE |
| 2 | Z937 20BK (LHD) | GROUND |
| 2 | Z932 18BK (RHD) | GROUND |



SWITCH-
BACKUP
LAMP
(M/T)

SWITCH-BACK UP LAMP (M/T) - BLACK 2 WAY

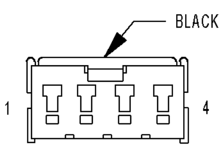
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | C115 20DB | FUSED IGNITION SWITCH OUTPUT (RUN) |
| 2 | L10 20WT/GY | BACK-UP LAMP FEED |



SWITCH-
CLUTCH
INTERLOCK
(A/T)

SWITCH-CLUTCH INTERLOCK (M/T) - 4 WAY

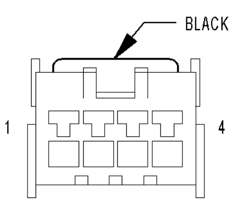
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | T141 20YL/OR | CLUTCH INTERLOCK SWITCH SIGNAL |
| 2 | T26 20DG/OR | CLUTCH UPSTOP SWITCH SIGNAL |
| 3 | Z945 18BK | GROUND |
| 4 | Z945 18BK | GROUND |



SWITCH-
DOOR
LOCK-
LEFT
(EXCEPT BASE)

SWITCH-DOOR LOCK-LEFT (EXCEPT BASE) - BLACK 4 WAY

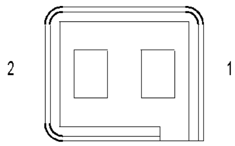
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | P36 20TN/DB | DOOR LOCK SWITCH MUX |
| 2 | - | - |
| 3 | - | - |
| 4 | P37 20LG/TN | DOOR LOCK SWITCH GROUND |



SWITCH-
DOOR
LOCK-
RIGHT
(EXCEPT BASE)

SWITCH-DOOR LOCK-RIGHT (EXCEPT BASE) - BLACK 4 WAY

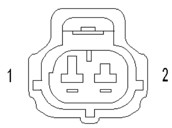
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | P36 20TN/DB | DOOR LOCK SWITCH MUX |
| 2 | - | - |
| 3 | - | - |
| 4 | P37 20LG/TN | DOOR LOCK SWITCH GROUND |



SWITCH-ESP

SWITCH-ESP - 2 WAY

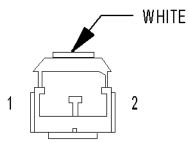
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | B46 20DG/WT | ESP/TCS ON/OFF SWITCH |
| 2 | Z385 20BK | GROUND |



SWITCH-FLIP-UP GLASS AJAR

SWITCH-FLIP-UP GLASS AJAR - 2 WAY

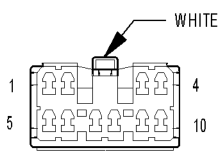
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | G80 20VT/YL | FLIP-UP GLASS AJAR SWITCH SENSE |
| 2 | Z213 18BK/OR | GROUND |



SWITCH-FLIP-UP GLASS RELEASE

SWITCH-FLIP-UP GLASS RELEASE - WHITE 2 WAY

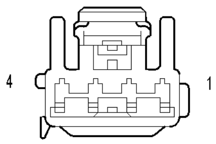
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | G910 20VT/BR | TAILGATE SWITCH GROUND |
| 2 | P101 20LG/WT | FLIP-UP GLASS RELEASE SWITCH SENSE |



SWITCH-HAZARD/COMBINATION FLASHER

SWITCH-HAZARD/COMBINATION FLASHER - WHITE 10 WAY

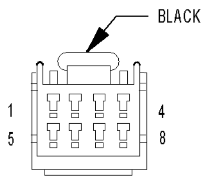
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | A701 18BR/RD | FUSED B(+) |
| 2 | Z940 16BK | GROUND |
| 3 | L62 18WT/OR | RIGHT TURN SIGNAL |
| 4 | L91 18WT/DB | HAZARD LAMP CONTROL |
| 5 | L305 20WT/LB | LEFT TURN SWITCH SENSE |
| 6 | - | - |
| 7 | L63 18WT/DG | LEFT TURN SIGNAL |
| 8 | C115 20DB | FUSED IGNITION SWITCH OUTPUT (RUN) |
| 9 | L306 20LB/WT | RIGHT TURN SWITCH SENSE |
| 10 | E2 20OR/BR | PANEL LAMPS DRIVER |



SWITCH-HEADLAMP LEVELING (EXPORT)

SWITCH-HEADLAMP LEVELING (EXPORT) - 4 WAY

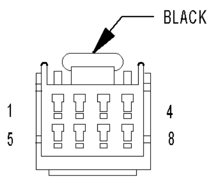
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | L13 18WT/YL | HEADLAMP ADJUST SIGNAL |
| 2 | L78 18WT/OR | FUSED PARK LAMP RELAY OUTPUT |
| 3 | Z945 18BK | GROUND |
| 4 | - | - |



SWITCH-HEATED SEAT-DRIVER (HIGHLINE)

SWITCH-HEATED SEAT-DRIVER (HIGHLINE) - BLACK 8 WAY

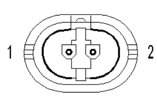
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | P137 20VT/DG | LEFT SEAT LOW HEAT LED DRIVER |
| 2 | P133 20TN/DG | LEFT SEAT HEATER SWITCH MUX |
| 3 | P139 20VT/WT | LEFT SEAT HIGH HEAT LED DRIVER |
| 4 | F302 20BR/PK | FUSED IGNITION SWITCH OUTPUT (RUN) |
| 5 | - | - |
| 6 | - | - |
| 7 | - | - |
| 8 | Z849 20BK/WT | GROUND |



SWITCH-HEATED SEAT-PASSENGER (HIGHLINE)

SWITCH-HEATED SEAT-PASSENGER (HIGHLINE) - BLACK 8 WAY

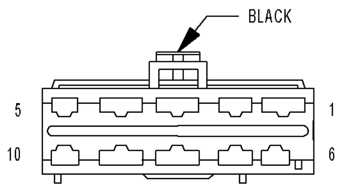
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | P82 20VT/LG | RIGHT SEAT LOW HEAT LED DRIVER |
| 2 | P134 20TN/LG | RIGHT SEAT HEATER SWITCH MUX |
| 3 | P84 20VT/BK | RIGHT SEAT HIGH HEAT LED DRIVER |
| 4 | F302 20BR/PK | FUSED IGNITION SWITCH OUTPUT (RUN) |
| 5 | - | - |
| 6 | - | - |
| 7 | - | - |
| 8 | Z849 20BK/TN | GROUND |



SWITCH-HOOD AJAR (EXCEPT BASE)

SWITCH-HOOD AJAR (EXCEPT BASE) - 2 WAY

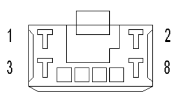
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | G70 20VT/LB | HOOD AJAR SWITCH SENSE |
| 2 | Z932 20BK | GROUND |



SWITCH-IGNITION

SWITCH-IGNITION - BLACK 10 WAY

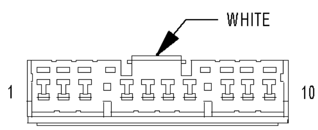
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | A1 12RD | FUSED B(+) |
| 2 | F944 12PK/LG | IGNITION SWITCH OUTPUT (RUN-START) |
| 3 | - | - |
| 4 | - | - |
| 5 | G15 20VT/TN | KEY-IN IGNITION SWITCH SENSE |
| 6 | A106 12LB/RD | IGNITION SWITCH OUTPUT (START) |
| 7 | F981 12PK/YL | IGNITION SWITCH OUTPUT (RUN-ACC) |
| 8 | F921 12PK/YL | IGNITION SWITCH OUTPUT (RUN) |
| 9 | A916 12RD | FUSED B(+) |
| 10 | Z938 20BK | GROUND |



SWITCH-LIGHTBAR (RENEGADE)

SWITCH-LIGHTBAR (RENEGADE) - 8 WAY

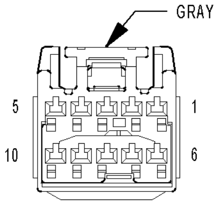
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | - | - |
| 2 | A904 14RD | FUSED B(+) |
| 3 | L8 14WT/DG | LIGHTBAR SWITCHED OUTPUT |
| 4 | Z940 20BK | GROUND |
| 5 | F942 20PK/LG (EXCEPT EXPORT) | FUSED IGNITION SWITCH OUTPUT (RUN-START) |
| 5 | L78 18WT/OR (EXPORT) | FUSED PARK LAMP RELAY OUTPUT |
| 6 | E2 20OR/BR | PANEL LAMPS DRIVER |
| 7 | L43 18WT/DB (EXPORT) | FUSED LEFT LOW BEAM OUTPUT |
| 8 | L18 20WT/LG | LIGHTBAR SWITCH SENSE |



SWITCH-MIRROR (EXCEPT BASE)

SWITCH-MIRROR (EXCEPT BASE) - WHITE 10 WAY

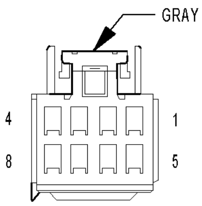
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | P75 20TN/LG | LEFT MIRROR LEFT DRIVER |
| 2 | P71 20TN/LG | LEFT MIRROR UP DRIVER |
| 3 | Z999 20BK (LHD) | GROUND |
| 3 | Z998 20BK (RHD) | GROUND |
| 4 | P110 20LG/WT (RHD) | FOLDING MIRROR RETURN |
| 5 | F302 20GY/PK | FUSED IGNITION SWITCH OUTPUT (RUN) |
| 6 | P76 20TN/LB | MIRROR COMMON DRIVER |
| 7 | P99 20LG/LB (RHD) | FOLDING MIRROR FEED |
| 8 | - | - |
| 9 | P72 20TN/GY | RIGHT MIRROR UP DRIVER |
| 10 | P74 20TN/OR | RIGHT MIRROR LEFT DRIVER |



SWITCH-MULTIFUNCTION C1

SWITCH-MULTIFUNCTION C1 - GRAY 10 WAY

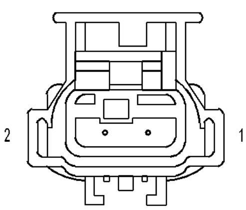
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | E3 20OR/YL | PANEL LAMPS DIMMER SWITCH MUX |
| 2 | L87 20WT/OR | FRONT FOG LAMP SWITCH SENSE |
| 3 | - | - |
| 4 | L900 20WT/YL | HEADLAMP SWITCH RETURN |
| 5 | L307 20PK/RD | HEADLAMP SWITCH MUX |
| 6 | L305 20WT/LB | LEFT TURN SWITCH SENSE |
| 7 | L309 20WT/OR | HIGH BEAM RELAY CONTROL |
| 8 | Z945 18BK | GROUND |
| 9 | L115 20WT/YL | HIGH BEAM SWITCH SENSE |
| 10 | L306 20LB/WT | RIGHT TURN SWITCH SENSE |



SWITCH-MULTIFUNCTION C2

SWITCH-MULTIFUNCTION C2 - GRAY 8 WAY

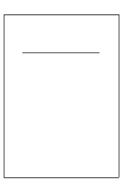
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | W13 20BR/LG | REAR WIPER ON DRIVER |
| 2 | W27 20DB/BR | REAR WIPER INTERMITTENT DRIVER |
| 3 | W20 20BR/YL | WASHER MOTOR SENSE |
| 4 | W35 20BR/LG | FRONT WIPER SWITCH MUX |
| 5 | F943 20PK/LG | FUSED IGNITION SWITCH OUTPUT (RUN-ACC) |
| 6 | - | - |
| 7 | W33 20BR/DG | WASHER PUMP DRIVER |
| 8 | - | - |



SWITCH-OIL PRESSURE (GAS)

SWITCH-OIL PRESSURE (GAS) - 2 WAY

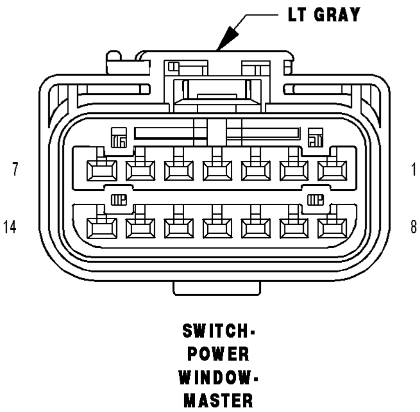
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | G6 20VT/GY | ENGINE OIL PRESSURE SIGNAL |
| 2 | - | - |



SWITCH-PARK BRAKE

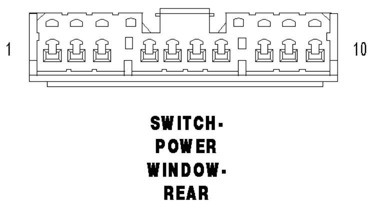
SWITCH-PARK BRAKE

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | B25 20DG/WT | PARK BRAKE SWITCH SENSE |



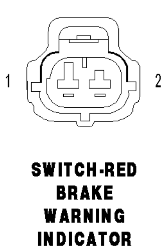
SWITCH-POWER WINDOW-MASTER - LT GRAY 14 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | - | - |
| 2 | Q1 14YL/OR | POWER WINDOW SWITCH FEED |
| 3 | - | - |
| 4 | Q411 14WT/OR | LEFT REAR WINDOW DRIVER (UP) |
| 5 | Q611 14GY/OR | LEFT REAR WINDOW DRIVER (DOWN) |
| 6 | Q412 14LG/OR | MASTER WINDOW SWITCH RIGHT REAR (UP) |
| 7 | Q612 14DB/OR | RIGHT REAR WINDOW DRIVER (DOWN) |
| 8 | - | - |
| 9 | Q21 14OR/WT | LEFT FRONT WINDOW DRIVER DOWN |
| 10 | F30 14PK/YL | FUSED IGNITION SWITCH OUTPUT (RUN-ACC) |
| 11 | Q11 14OR/LG | LEFT FRONT WINDOW DRIVER UP |
| 12 | Q12 14OR/BR | RIGHT FRONT WINDOW DRIVER UP |
| 13 | Z849 16BK/OR | GROUND |
| 14 | Q22 14OR/VT | RIGHT FRONT WINDOW DRIVER DOWN |



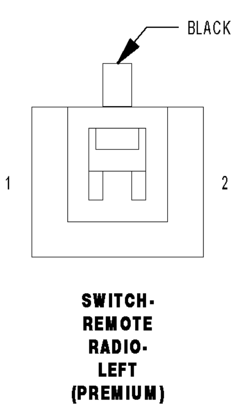
SWITCH-POWER WINDOW-REAR - 10 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | Q12 14DB/OR | RIGHT FRONT WINDOW DRIVER UP |
| 2 | Q112 14OR/BR | RIGHT REAR WINDOW DRIVER UP |
| 3 | Q212 14OR/VT | RIGHT REAR WINDOW DRIVER DOWN |
| 4 | Q412 14LG/OR | MASTER WINDOW SWITCH RIGHT REAR (UP) |
| 5 | Q1 14YL/OR | POWER WINDOW SWITCH FEED |
| 6 | Q1 14YL/OR | POWER WINDOW SWITCH FEED |
| 7 | Q411 14WT/OR | LEFT REAR WINDOW DRIVER (UP) |
| 8 | Q211 14TN/LB | LEFT REAR WINDOW DRIVER DOWN |
| 9 | Q611 14GY/OR | LEFT REAR WINDOW DRIVER (DOWN) |
| 10 | Q111 14TN/YL | LEFT REAR WINDOW DRIVER UP |



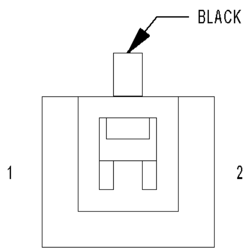
SWITCH-RED BRAKE WARNING INDICATOR - 2 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | B20 20DG/OR | RED BRAKE WARNING INDICATOR DRIVER |
| 2 | Z932 20BK | GROUND |



SWITCH-REMOTE RADIO-LEFT (PREMIUM) - BLACK 2 WAY

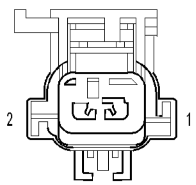
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X920 20GY/OR | RADIO CONTROL MUX RETURN |
| 2 | X20 20GY/WT | RADIO CONTROL MUX |



**SWITCH-REMOTE RADIO-RIGHT (PREMIUM)**

SWITCH-REMOTE RADIO-RIGHT (PREMIUM) - BLACK 2 WAY

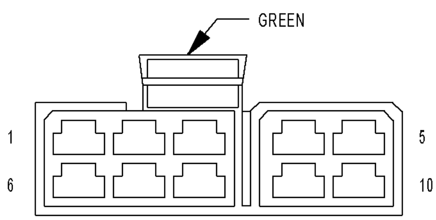
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | X920 20GY/OR | RADIO CONTROL MUX RETURN |
| 2 | X20 20GY/WT | RADIO CONTROL MUX |



**SWITCH-SEAT BELT-DRIVER**

SWITCH-SEAT BELT-DRIVER

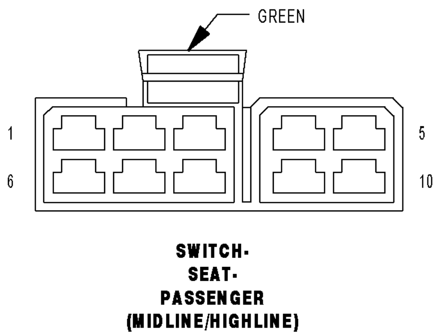
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | R57 20DG (EXCEPT HEATED SEATS) | DRIVER SEAT BELT SWITCH SENSE |
| 1 | R57 18DG (HEATED SEATS) | DRIVER SEAT BELT SWITCH SENSE |
| 2 | R59 20LB (EXCEPT HEATED SEATS) | DRIVER SEAT BELT SWITCH GROUND |
| 2 | R59 18LB (HEATED SEATS) | DRIVER SEAT BELT SWITCH GROUND |



**SWITCH-SEAT-DRIVER (MIDLINE/HIGHLINE)**

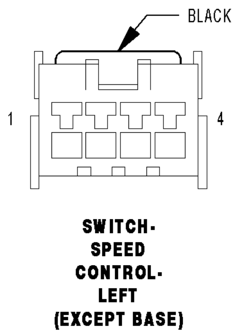
SWITCH-SEAT-DRIVER (MIDLINE/HIGHLINE) - GREEN 10 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | Z849 14BK/WT | GROUND |
| 2 | - | - |
| 3 | P15 14YL/LB | DRIVER SEAT HORIZONTAL FORWARD DRIVER |
| 4 | - | - |
| 5 | F37 14RD/LB | FUSED B(+) |
| 6 | P17 14RD/LB | DRIVER SEAT HORIZONTAL REARWARD DRIVER |
| 7 | P13 14RD/WT | DRIVER SEAT REAR DOWN DRIVER |
| 8 | P21 14RD/LG | DRIVER SEAT FRONT DOWN DRIVER |
| 9 | P19 14YL/LG | DRIVER SEAT FRONT UP DRIVER |
| 10 | P11 14YL/WT | DRIVER SEAT REAR UP DRIVER |



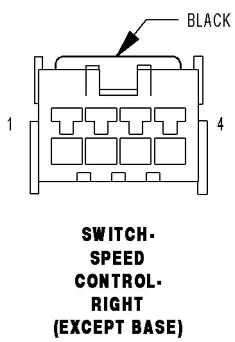
SWITCH-SEAT-PASSENGER (MIDLINE/HIGHLINE) - GREEN 10 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | Z849 16BK/OR | GROUND |
| 2 | - | - |
| 3 | P14 14YL/LB | PASSENGER SEAT HORIZONTAL FORWARD DRIVER |
| 4 | - | - |
| 5 | F37 14RD/LB | FUSED B(+) |
| 6 | P16 14RD/LB | PASSENGER SEAT HORIZONTAL REARWARD DRIVER |
| 7 | P10 14YL/WT | PASSENGER SEAT REAR UP DRIVER |
| 8 | P18 14YL/LG | PASSENGER SEAT FRONT UP DRIVER |
| 9 | P20 14RD/LG | PASSENGER SEAT FRONT DOWN DRIVER |
| 10 | P12 14RD/WT | PASSENGER SEAT REAR DOWN DRIVER |



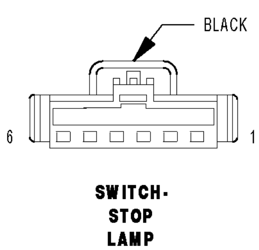
SWITCH-SPEED CONTROL-LEFT (EXCEPT BASE) - BLACK 4 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | V38 20VT/OR | S/C SWITCH SIGNAL NO. 2 |
| 2 | K900 20DB/DG | SENSOR GROUND |
| 3 | V37 20VT | S/C SWITCH SIGNAL NO. 1 |
| 4 | - | - |



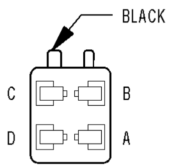
SWITCH-SPEED CONTROL-RIGHT (EXCEPT BASE) - BLACK 4 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | V38 20VT/OR | S/C SWITCH SIGNAL NO. 2 |
| 2 | K900 20DB/DG | SENSOR GROUND |
| 3 | V37 20VT | S/C SWITCH SIGNAL NO. 1 |
| 4 | - | - |



SWITCH-STOP LAMP - BLACK 6 WAY

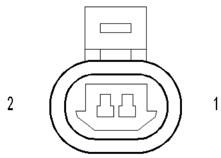
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | A103 18GY/RD | FUSED B(+) |
| 2 | L50 18WT/TN (DIESEL) | PRIMARY BRAKE SWITCH SIGNAL |
| 2 | L50 18WT/TN (GAS) | BRAKE LAMP SWITCH OUTPUT |
| 3 | V30 20VT/WT | S/C BRAKE SWITCH OUTPUT |
| 4 | V32 20VT/YL | S/C POWER SUPPLY |
| 5 | Z940 20BK | GROUND |
| 6 | B15 20DG/WT (DIESEL) | SECONDARY BRAKE SWITCH SIGNAL |
| 6 | B15 20DG/WT (GAS) | BRAKE SWITCH NO. 1 SIGNAL |



SWITCH-SUNROOF

SWITCH-SUNROOF - BLACK 4 WAY

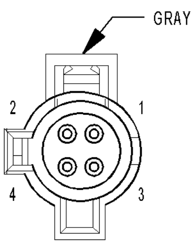
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | Q43 20OR/LB | SUNROOF VENT |
| 2 | Q644 20OR/YL | SUNROOF SWITCH GROUND |
| 3 | Q3 20OR/TN | SUNROOF OPEN |
| 4 | Q5 20OR/LB | SUNROOF CLOSE |



SWITCH-WASHER FLUID LEVEL

SWITCH-WASHER FLUID LEVEL - 2 WAY

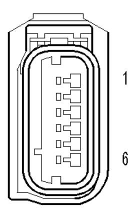
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | W1 20BR/TN | LOW WASHER FLUID SENSE |
| 2 | Z931 20BK | GROUND |



TRANSDUCER-A/C PRESSURE

TRANSDUCER-A/C PRESSURE - BLACK 4 WAY

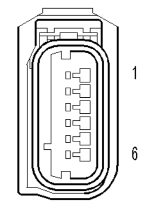
| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | K310 20BR/DG | SENSOR GROUND |
| 2 | K301 20BR/LG | 5 VOLT SUPPLY |
| 3 | C18 20LB/BR | A/C PRESSURE SIGNAL |



TRANSPONDER-TIRE PRESSURE-LEFT FRONT

TRANSPONDER-TIRE PRESSURE-LEFT FRONT - 6 WAY

| CAV | CIRCUIT | FUNCTION |
|---|---|---|
| 1 | F22 20PK/TN | FUSED IGNITION SWITCH OUTPUT (RUN) |
| 2 | D508 20WT/GY | COM-LIN TIRE PRESSURE MONITOR LAN |
| 3 | Z384 20BK | GROUND |
| 4 | Z384 20BK | GROUND |
| 5 | - | |
| 6 | - | |



TRANSPONDER-TIRE PRESSURE-RIGHT FRONT

TRANSPONDER-TIRE PRESSURE-RIGHT FRONT - 6 WAY

# 8W-91 CONNECTOR/GROUND/SPLICE LOCATION

TABLE OF CONTENTS

page

## CONNECTOR/GROUND/SPLICE LOCATION

### DESCRIPTION

This section provides illustrations identifying connector, ground, and splice locations in the vehicle. Connector, ground, and splice indexes are provided. Use the wiring diagrams in each section for connector, ground, and splice identification. Refer to the appropriate index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

**CONNECTORS**

| CONNECTOR NAME/NUMBER | COLOR | LOCATION | FIG. |
|---|---|---|---|
| Actuator-Blend Door | BK | Behind Right Side of Instrument Panel | N/S |
| Airbag-Driver Squib 1 | GY | In Steering Wheel | 31 |
| Airbag-Driver Squib 2 | BK | In Steering Wheel | 31 |
| Airbag-Passenger Squib 1 | YL | Passenger Side Instrument Panel | N/S |
| Airbag-Passenger Squib 2 | YL | Passenger Side Instrument Panel | N/S |
| Airbag-Side Curtain-Left | YL | Left Mid B-Pillar | 36, 39 |
| Airbag-Side Curtain-Right | YL | Right Mid B-Pillar | 35, 40 |
| Antenna Cable-Radio (Export) | | Right Side Instrument Panel | 45 |
| Antenna-Radio (Except Export) | | Center Instrument Panel | 34 |
| Antenna-Radio (Export) | | Center Instrument Panel | 45 |
| Assembly-Exhaust Gas Recirculation Valve | | Right Rear Side of Engine Compartment | 22 |
| Assembly-Heated Seat-Left | LG | At Left Seat | N/S |
| Assembly-Heated Seat-Right | LG | At Right Seat | N/S |
| Assembly-Line Pressure Sensor/ Variable Force Solenoid | | Left Side Transmission | 5 |
| Assembly-Natural Vacuum Leak Detection | BK | Near Fuel Tank | 54 |
| Assembly-Power Seat Motors-Left | BK | At Left Seat | N/S |
| Assembly-Power Seat Motors-Right | BK | At Right Seat | N/S |
| Assembly-Shift Lever | WT | Center Console | 37 |

| CONNECTOR NAME/NUMBER | COLOR | LOCATION | FIG. |
|---|---|---|---|
| Assembly-Transmission Solenoid/ Pressure Switch (42RLE) | | Right Side of Transmission | 6 |
| Assembly-Transmission Solenoid/ Trs (2,8L 45RFE) | GY | Left Side of Transmission | 18 |
| Backlite-Electric Heated | BK | At Rear Window | 51 |
| Battery (-) | | Left Front Engine Compartment | 25, 26, 27 |
| Battery (+) | | Left Front Engine Compartment | 25, 26, 27 |
| C100 | GY | Left Kick Panel | 30, 33 |
| C102 (RHD) | | Left Kick Panel | 30, 39 |
| C104 | BK | Right Rear Side of Engine Compartment | 8, 10, 13 |
| C105 | GY | Right Rear Side of Engine Compartment | 8, 10, 13 |
| C106 | BK | Left Front Side of Engine Compartment | 24 |
| C107 | BK | Left Front Side of Engine Compartment | 24 |
| C108 (Gas) | GY | Left Front Side of Engine | 25, 28, 29 |
| C109 | | Right Front Engine Compartment | N/S |
| C111 (Diesel) | LG | Right Rear Side of Engine Compartment | 13 |
| C112 (Gas) | BK | Right Side of Engine Compartment | 8, 9, 29 |
| C113 (Diesel) | LG | Left Rear Side of Engine Compartment | 27 |
| C114 | | Left Front Engine Compartment | 27, 28 |
| C117 (Diesel)-(Injector Side) | | Right Rear Engine Compartment | 13 |
| C120 | | Left Kick Panel | 30 |
| C201 | BK | Behind Center of Instrument Panel | 33, 38 |
| C203 | | Left A-Pillar | 32 |
| C300 (LHD) | OR | Left A-Pillar | 36, 42 |
| C300 (RHD) | OR | Right A-Pillar | 40, 42 |
| C301 (LHD) | OR | Left A-Pillar | 36, 42 |
| C301 (RHD) | OR | Right A-Pillar | 40, 42 |
| C302 (LHD) | OR | Right A-Pillar | 35, 42 |
| C302 (RHD) | OR | Left A-Pillar | 39, 42 |
| C303 (LHD) | OR | Right A-Pillar | 35, 42 |
| C303 (RHD) | OR | Left A-Pillar | 39, 42 |
| C304 | DB | Right Mid B-Pillar | 35, 40, 43 |
| C305 | DB | Left Mid B-Pillar | 36, 39, 43 |
| C306 (LHD) | WT | Left Lower B-Pillar | N/S |
| C307 | LG | Left Lower B-Pillar | 36, 39, 44, 54 |
| C308 | LG | Left Rear Quarter Panel | 44 |
| C309 | DB | Left Rear Quarter Panel | 44, 51 |
| C310 | LG | Right Rear Quarter Panel | 49, 50 |
| C311 | LG | Left Front Seat | 36, 39 |

| CONNECTOR NAME/NUMBER | COLOR | LOCATION | FIG. |
|---|---|---|---|
| C312 (Highline) | LG | Left Front Seat | 36, 39 |
| C313 | LG | Right Front Seat | 37, 40, 41 |
| C314 | LG | Right Front Seat | 37, 40, 41 |
| C315 (Midline/Highline) (LHD) | LG | Right Front Seat | 35, 37 |
| C315 (Midline/Highline) (RHD) | LG | Left Front Seat | 39 |
| C318 | | Front of Roof in Light Bar Harness | 32, 53 |
| C328 (Overhead Side) | | Left Rear Headliner | 44 |
| C330 | | Right Rear Body | 49 |
| Changer CD | GN | Right Rear Body | N/S |
| Choke-Radio | GY | Center of Instrument Panel | N/S |
| Clockspring C1 | WT | Behind Steering Wheel | N/S |
| Clockspring C2 | YL | Behind Steering Wheel | N/S |
| Clockspring C3 | BK | At Steering Wheel | N/S |
| Clockspring C4 (Except Base) | | Steering Wheel Side of Clockspring | 31 |
| Cluster | BK | Rear of Cluster | N/S |
| Clutch-A/C Compressor | BK | At A/C Compressor | 2, 15 |
| Coil-Ignition-No. 1 | BK | Left Side of Engine Near Fuel Injector No.1 | 1 |
| Coil-Ignition-No. 2 | BK | Right Side of Engine Near Fuel Injector No.2 | 2 |
| Coil-Ignition-No. 3 | BK | Left Side of Engine Near Fuel Injector No.3 | 1 |
| Coil-Ignition-No. 4 | BK | Right Side of Engine Near Fuel Injector No.4 | 2 |
| Coil-Ignition-No. 5 | BK | Left Side of Engine Near Fuel Injector No.5 | 1 |
| Coil-Ignition-No. 6 | BK | Right Side of Engine Near Fuel Injector No.6 | 2 |
| Control-A/C Heater C1 | BK | Center of Dash, Behind A/C-Heater Controls | N/S |
| Control-A/C Heater C1 | WT | Center of Dash, Behind A/C-Heater Controls | N/S |
| Data Link Connector | BK | Under Center of Instrument Panel | N/S |
| Generator | BK | Left Front Side of Engine | 15, 25, 27 |
| Glow Plug No. 1 | | Top of Engine | N/S |
| Glow Plug No. 2 | | Top of Engine | N/S |
| Glow Plug No. 3 | | Top of Engine | N/S |
| Glow Plug No. 4 | | Top of Engine | N/S |
| Heater-Cabin (Diesel) | BK | Right Front Side of Engine | 16 |
| Heater-Fuel (Diesel) | BK | Left Rear Side of Engine Compartment | 14 |
| Horn | BK | Left Front Side of Engine Compartment | 24 |
| Injector-Fuel-No. 1 (Diesel) | BK | At Fuel Injector | 19 |
| Injector-Fuel-No. 1 (Gas) | BK | At Fuel Injector | 1 |

| CONNECTOR NAME/NUMBER | COLOR | LOCATION | FIG. |
|---|---|---|---|
| Injector-Fuel-No. 2 (Diesel) | BK | At Fuel Injector | 19 |
| Injector-Fuel-No. 2 (Gas) | BK | At Fuel Injector | 2 |
| Injector-Fuel-No. 3 (Diesel) | BK | At Fuel Injector | 19 |
| Injector-Fuel-No. 3 (Gas) | BK | At Fuel Injector | 1 |
| Injector-Fuel-No. 4 (Diesel) | BK | At Fuel Injector | 17 |
| Injector-Fuel-No. 4 (Gas) | BK | At Fuel Injector | N/S |
| Injector-Fuel-No. 5 (Gas) | BK | At Fuel Injector | 1 |
| Injector-Fuel-No. 6 (Gas) | BK | At Fuel Injector | 2 |
| Junction Block C1 | GY | Under Left Side of Instrument Panel | N/S |
| Junction Block C2 | GN | Under Left Side of Instrument Panel | N/S |
| Junction Block C3 | LB | Under Left Side of Instrument Panel | N/S |
| Junction Block-BCM | | Under Left Side of Instrument Panel | N/S |
| Lamp-Cargo (Except Base) | BK | Center Rear Headliner | N/S |
| Lamp-Courtesy-Left | BK | Left Side of Instrument Panel | N/S |
| Lamp-Courtesy-Right | BK | Right Side of Instrument Panel | N/S |
| Lamp-Dome (Base) | | Front Center Headliner | N/S |
| Lamp-Fog Left Front | BK | Left Side of Front Bumper | N/S |
| Lamp-Fog Right Front | BK | Right Side of Front Bumper | N/S |
| Lamp-Headlamp-Left (Except Export) | DB | Behind Left Headlamp | N/S |
| Lamp-Headlamp-Left (Export) | | Behind Left Headlamp | N/S |
| Lamp-Headlamp-Right (Except Export) | DB | Behind Right Headlamp | N/S |
| Lamp-Headlamp-Right (Export) | | Behind Right Headlamp | N/S |
| Lamp-High Mounted Stop | WT | At Lamp | 51 |
| Lamp-License Plate (Except Export) | LG | On Bumper | 51 |
| Lamp-License Plate (Except Export) | LG | In Tailgate | 49 |
| Lamp-Lightbar-No. 1 | | Front of Roof in Light Bar Harness | 53 |
| Lamp-Lightbar-No. 2 | | Front of Roof in Light Bar Harness | 53 |
| Lamp-Lightbar-No. 3 | | Front of Roof in Light Bar Harness | 53 |
| Lamp-Lightbar-No. 4 | | Front of Roof in Light Bar Harness | 53 |
| Lamp-Park/Turn-Left Front | BK | At Lamp | N/S |
| Lamp-Park/Turn-Right Front | BK | At Lamp | N/S |
| Lamp-Passenger Airbag On/Off Indicator | | Near Passenger Airbag | N/S |
| Lamp-Reading-Front | | At Overhead Console | N/S |
| Lamp-Side Marker-Left Front | BK | Left Front Fender | N/S |
| Lamp-Side Marker-Right Front | BK | Right Front Fender | N/S |
| Lamp-Tail Stop Turn-Left | BK | Left Rear Quarter Panel | 49 |
| Lamp-Tail Stop Turn-Right | BK | Right Rear Quarter Panel | 49 |
| Lamp-Vanity-Left | WT | Left Front of Headliner | N/S |
| Lamp-Vanity-Right | WT | On Visor | N/S |
| Latch-Door Lock Motor/Ajar Switch-Front Left (Except Base) | BK | In Driver Door | 42 |

| CONNECTOR NAME/NUMBER | COLOR | LOCATION | FIG. |
|---|---|---|---|
| Latch-Door Lock Motor/Ajar Switch-Front Right (Except Base) | BK | In Passenger Door | 42 |
| Latch-Door Lock Motor/Ajar Switch-Rear Left (Except Base) | BK | In Left Rear Door | 43 |
| Latch-Door Lock Motor/Ajar Switch-Rear Right (Except Base) | BK | In Right Rear Door | 43 |
| Latch-Lock Motor/Ajar Switch-Tailgate | BK | In Tailgate | 51 |
| Mirror-Inside Rearview C1 | | Top Center Windshield | N/S |
| Mirror-Inside Rearview C2 (Hands Free) | | Top Center Windshield | N/S |
| Mirror-Outside Rearview-Driver (Except Base) | WT | In Left Front Door | 42 |
| Mirror-Outside Rearview-Passenger (Except Base) | WT | In Right Front Door | 42 |
| Module-Antenna C1 (Export) | | Above Right Quarter Window | 45 |
| Module-Antenna C2 (Export) | | Above Right Quarter Window | 45 |

# 8W-97 POWER DISTRIBUTION

## TABLE OF CONTENTS

# POWER DISTRIBUTION

## DESCRIPTION

This group covers the various standard and optional power distribution components used on this model. The power distribution system for this vehicle consists of the following components:

- Power Distribution Center (PDC)
- Junction Block (JB)
- Cigar Lighter Outlet
- Power Outlets

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Bus bars
- Cartridge fuses
- Circuit splice blocks
- Fusible link
- ISO Standard and Micro-Relays

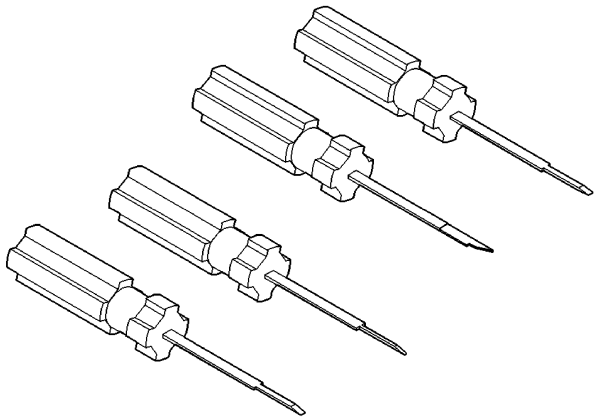
Following are general descriptions of the major components in the power distribution system. See the owner's manual in the vehicle glove box for more information on the features and use of all of the power distribution system components. Refer to Wiring Diagrams for complete circuit diagrams.

## OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized distribution points for the electrical current required to operate all of the standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the vehicle technician to use when conducting diagnosis and repair of faulty circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate accessories that the vehicle owner may choose to have installed in the aftermarket.

## SPECIAL TOOLS

## TERMINAL PICK KIT 6680



*Terminal Pick Kit 6680*

# CIGAR LIGHTER OUTLET

## DESCRIPTION

Some models are equipped with a cigar lighter outlet installed in the instrument panel. The cigar lighter outlet is located near the bottom of the instrument panel center stack area, below the heater and air conditioner controls. The cigar lighter outlet is secured by a snap fit within the center lower bezel.

The cigar lighter outlet, plastic cap and the knob and heating element unit are available for service replacement. These components cannot be repaired and, if faulty or damaged, they must be replaced.

## OPERATION

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar lighter base or outlet shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The cigar lighter receives battery voltage from a fuse in the junction block when the ignition switch is in the Accessory or Run positions.

The cigar lighter knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the outlet shell, the heating element resistor coil is grounded through its housing to the outlet shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the outlet shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the outlet shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the outlet shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

## DIAGNOSIS AND TESTING - CIGAR LIGHTER OUTLET

For complete circuit diagrams, refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams.

1. Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the Run position. Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open or short as required.
3. Remove the cigar lighter knob and element from the cigar lighter outlet shell. Check for continuity between the inside circumference of the cigar lighter outlet shell and a good ground. there should be continuity. If OK, go to Step 4. If not OK, go to Step 5.
4. Turn the ignition switch to the Run position. Check for battery voltage at the insulated contact located at the back of the cigar lighter outlet shell. If OK, replace the faulty cigar lighter knob and element. If not OK, go to Step 5.
5. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument panel center lower bezel. Check for continuity between the ground circuit cavity of the cigar lighter wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.
6. Connect the battery negative cable. Turn the ignition switch to the Accessory or Run positions. Check for battery voltage at the fused B(+) circuit cavity of the cigar lighter wire harness connector. If OK, replace the faulty cigar lighter outlet. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

# IOD FUSE

## DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Junction Block when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the junction block as part of the preparation procedures performed just prior to new vehicle delivery.

On left hand drive vehicles, the left end of the instrument panel cover has a snap-fit fuse access panel that can be removed to provide service access to the fuses in the junction block. On right hand drive vehicles the junction block is mounted on the right hand side of the instrument panel. A finger recess is molded into the access panel for easy removal. An adhesive-backed fuse layout map is secured to the instrument panel side of the access panel to ensure proper fuse identification. The IOD fuse is a 15 ampere mini blade-type fuse, located in fuse cavity # 34. The fuse is secured within a White molded plastic fuse holder and puller unit that serves both as a tool for disconnecting and reconnecting the fuse in its junction block cavity, and as a fuse holder that conveniently stores the fuse in the same junction block cavity after it has been disconnected.

### CIRCUITS INCLUDED WITH IOD FUSE

- Cluster
- Body Control Module
- Diagnostic Connector
- Map Lamps
- Glove Box Lamp
- Courtesy Lamps
- Compass Mini-Trip Computer
- Radio

## OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is disconnected from JB fuse cavity # 34 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged.

## REMOVAL

The Ignition-Off Draw (IOD) fuse is disconnected from Junction Block fuse cavity # 34 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation.

1. Turn the ignition switch to the Off position.
2. Remove the fuse access panel by unsnapping it from the outboard end of the instrument panel.
3. Grasp the outer tabs of the IOD fuse holder unit in fuse cavity # 34 of the Junction Block between the thumb and forefinger and pull the unit firmly outward.
4. Install the fuse access panel by snapping it onto the outboard end of the instrument panel.

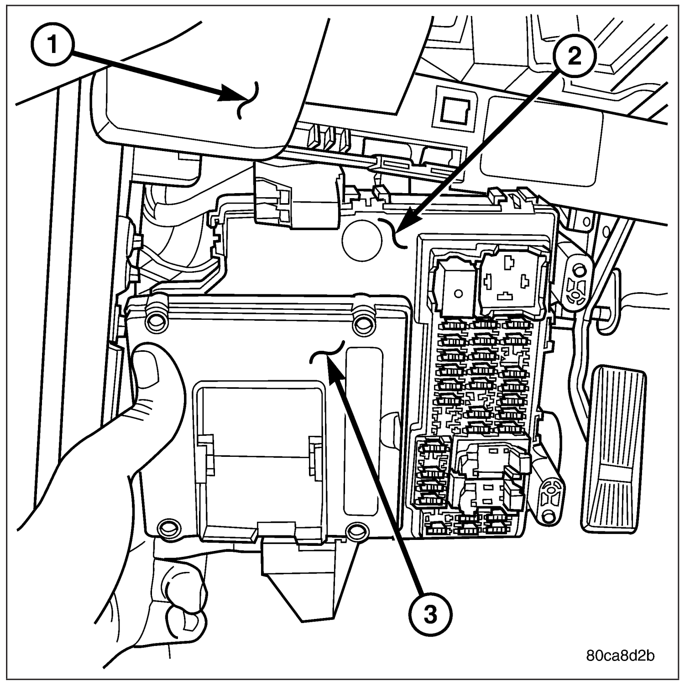
## INSTALLATION

1. Turn the ignition switch to the Off position.
2. To install the IOD fuse, use a thumb to press the IOD fuse holder unit in fuse cavity # 34 firmly into the junction block.
3. Install the fuse access panel by snapping it onto the left outboard end of the instrument panel.

# JUNCTION BLOCK

## DESCRIPTION

**NOTE: Left hand drive shown, right hand drive similar.**



An electrical Junction Block (2) is concealed behind the left outboard end of the instrument panel (1) on left hand drive vehicles. On right hand drive vehicles the Junction Block is concealed behind the right outboard end of the instrument panel. The junction block simplifies and centralizes numerous electrical components and distributes electrical current to many of the accessory systems throughout the vehicle. It also eliminates the need for numerous splice connections and serves in place of a bulkhead connector between many of the engine compartment, instrument panel, and body wire harnesses. The junction block houses up to thirty-nine mini blade-type fuses, up to three blade-type automatic resetting circuit breakers, up to three International Standards Organization (ISO) relays and up to eleven International Standards Organization (ISO) micro-relays.

The junction block (2) also provides the mounting location for the Body Control Module (BCM) (3) and Remote Keyless Entry (RKE) Module. Refer to the Electronic Control Modules section of the manual for more information on these two modules. The BCM is secured to the junction block assembly with four screws and multiple electrical connectors. The RKE module is mounted on the BCM via a single built-in electrical connector. With the junction block in its normal mounting location the BCM and RKE module are not accessible.

The molded plastic junction block housing has two integral mounting bosses that are secured with two screws to the left instrument panel end bracket on left hand drive. Additionally, upper and lower mounting brackets are attached to the junction block. These brackets are also secured to the instrument panel with two screws. On right hand drive vehicles, the junction block is secured to the right instrument panel end bracket on right hand drive. The left or right instrument panel end caps have snap-fit fuse access panels that can be removed for service of the junction block mounted fuses, daytime running lamp or high beam headlamp relays. A fuse puller and spare fuse holders are located on the back of the fuse access cover, as well as an adhesive-backed fuse layout map to ensure proper fuse identification. Refer to the owners manual or Wiring section of this manual for detailed component location and/or identification.

The junction block unit cannot be repaired and is only serviced as an assembly. If any internal circuit or the junction block housing is faulty or damaged, the entire junction block unit must be replaced.

## OPERATION

All of the circuits entering and exiting the junction block do so through wire harness connectors or the body control module which is mounted directly to the junction block underneath the instrument panel. These components are connected to the junction block through integral connector receptacles molded into the junction block housing. Internal connection of all of the junction block circuits is accomplished by an intricate combination of hard wiring and bus bars. Refer to **Wiring Diagrams** for the location of complete junction block circuit diagrams.

## DIAGNOSIS AND TESTING - JUNCTION BLOCK

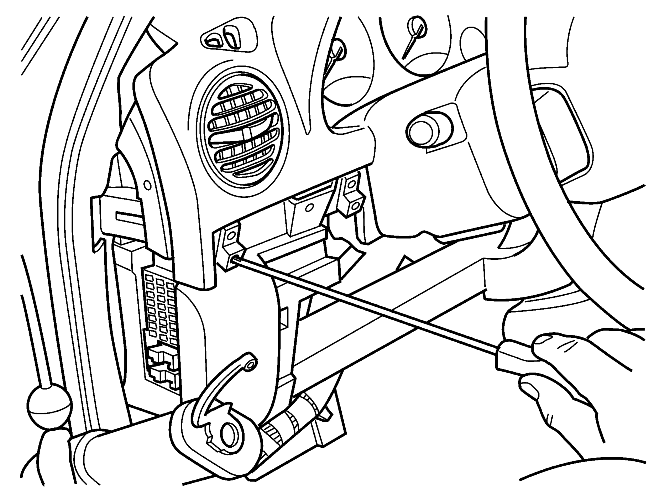
The junction block does not incorporate any self diagnostic capability. Most of the electrical circuits incorporated into the vehicle must pass through the junction block at one point or another. The most efficient means of diagnosing a suspected junction block problem involves a simple continuity tester or ohm meter. Using the Wiring Diagrams as a guide trace the problem circuit to the proper junction block cavity and test all circuits in the effected circuit for proper continuity. A open or high resistance circuit is a sign of a problem. Some other possible junction block problems to look for are:

- Loose fuse receptacle terminals.
- Loose relay / circuit breaker receptacle terminals.
- Bent or distorted electrical circuit pins.
- Incorrect size fuse installed in junction block fuse cavity.
- Dark areas identifying a source of excess heat.
- Defective fuse, relay or circuit breaker installed in junction block cavity.

## REMOVAL

## REMOVAL - LHD

**NOTE: On models equipped with a manual transmission, depress the clutch pedal to remove the Junction Block from under the instrument panel.**



80c9c623

The following junction block removal procedure is for Left Hand Drive (LHD) vehicles only.

1. Disconnect and isolate the negative battery cable.
2. Remove the left end cap from the instrument panel.
3. Unsnap and remove the left outboard trim bezel from the instrument panel. Located just to the left of the steering column.
4. Remove the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
5. Remove the left cowl trim panel from the vehicle (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
6. Remove the courtesy lamp from under the left side of the instrument panel. This will allow sufficient room to remove the junction block from under the instrument panel.
7. Working through the steering column opening cover, remove the three bulkhead and two body controller electrical connectors from the junction block assembly.
8. Detach instrument panel wire harness from the lower channel on the instrument panel. This will allow sufficient room to remove the junction block from under the instrument panel.
9. Remove the four junction block retaining screws and remove the junction block from under the instrument panel.

## REMOVAL - RHD

The following junction block removal procedure applies to Right Hand Drive (RHD) vehicles only.

1. Disconnect and isolate the negative battery cable.
2. Remove the right end cap from the instrument panel.
3. Unsnap and remove the right outboard trim bezel from the instrument panel. Located just to the right of the steering column.
4. Remove the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

5. Remove the right cowl trim panel from the vehicle (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
6. Remove the courtesy lamp from under the right side of the instrument panel. This will allow sufficient room to remove the junction block from under the instrument panel.
7. Working through the steering column opening cover, remove the three bulkhead and two body controller electrical connectors from the junction block assembly.
8. Remove the two ground wires from the right lower kick panel area. Located directly behind the kick trim panel. This will allow sufficient room to remove the junction block from under the instrument panel.
9. Remove the upper and forward most (in relation to the vehicle) group of relays from the junction block. This will allow sufficient room to remove the junction block from under the instrument panel.
10. Remove the four junction block retaining screws and remove the junction block from under the instrument panel. It will be necessary to position the under instrument panel wire harness out of the way to remove the junction block.

## INSTALLATION

## INSTALLATION - LHD

**NOTE: On vehicles equipped with a manual transmission, it will be helpful to depress the clutch pedal when installing the Junction Block under the instrument panel.**

1. Position the junction block and install the four junction block retaining screws.
2. Install instrument panel wire harness on the lower channel of the instrument panel.
3. Working through the steering column opening cover, install the three bulkhead and two body controller electrical connectors on the junction block assembly.
4. Install the courtesy lamp under the left side of the instrument panel.
5. Install the left cowl trim panel on the vehicle (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
6. Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
7. Install the left outboard trim bezel on the instrument panel.
8. Install the left end cap on the instrument panel.
9. Connect the negative battery cable.

## INSTALLATION - RHD

1. Position the junction block and install the four junction block retaining screws.
2. Install the upper and forward most group of relays in the junction block.
3. Install the two ground wires on the right lower kick panel area.
4. Working through the steering column opening cover, install the three bulkhead and two body controller electrical connectors on the junction block assembly.
5. Install the courtesy lamp under the right side of the instrument panel.
6. Install the right cowl trim panel on the vehicle (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).
7. Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).
8. Install the right outboard trim bezel on the instrument panel.
9. Install the right end cap on the instrument panel.
10. Connect the negative battery cable.

# POWER DISTRIBUTION CENTER

## DESCRIPTION

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Power Distribution Center (PDC). The molded plastic PDC housing is located in the left front corner of the engine compartment, between the battery and the grille. The PDC houses up to fifteen maxi-type cartridge fuses, which replace all in-line fusible links, except for the fusible link between the PDC and alternator. The PDC also houses up to thirteen blade-type mini fuses, and up to twelve International Standards Organization (ISO) relays (four standard-type and eight micro-type).

The PDC housing is secured in the engine compartment at three points. Integral mounts on both sides of the PDC housing engage and latch to stanchions that are integral to the molded plastic battery tray. The PDC is integral to the headlamp and dash wire harness, which exits from the bottom of the PDC housing. The PDC housing has a molded plastic cover that includes an integral latch at the front and pivot hooks at the back that snap over a hinge pin on the rear of the PDC housing. The PDC cover is easily opened or removed for service access and has a convenient fuse and relay layout map integral to the inside surface of the cover to ensure proper component identification. A fuse puller is also stored on the inside of the PDC cover.

The PDC cover, the PDC housing lower cover, the PDC relay wedges, the PDC mini fuse wedge, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC main housing unit, the cartridge fuse wedges and the bus bars cannot be repaired and are only serviced as a unit with the headlamp and dash wire harness. If the PDC main housing unit, cartridge fuse wedge or the bus bars are faulty or damaged, the headlamp and dash wire harness unit must be replaced.

## OPERATION

All of the current from the battery and the alternator output enters the PDC through two cables and a single two-holed eyelet that is secured with nuts to the two PDC B(+) terminal studs just inside the inboard end of the PDC housing. The PDC cover is unlatched and opened to access the battery and alternator output connection B(+) terminal studs, the fuses or the relays. Internal connection of all of the PDC circuits is accomplished by an intricate combination of hard wiring and bus bars. Refer to **Power Distribution** in Wiring Diagrams for the location of complete PDC circuit diagrams.

## REMOVAL

The Power Distribution Center (PDC) main housing unit, the PDC cartridge fuse wedge and the PDC bus bars cannot be repaired and are only serviced as a unit with the headlamp and dash wire harness. If the PDC main housing unit, the cartridge fuse wedges or the bus bars are faulty or damaged, the entire PDC and headlamp and dash wire harness unit must be replaced.

1. Disconnect and isolate the battery negative cable.
2. Disconnect each of the headlamp and dash wire harness connectors. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness connector locations.
3. Remove all of the fasteners that secure each of the headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the ground eyelet locations.
4. Disengage each of the retainers that secure the headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the headlamp and dash wire harness retainer locations.
5. Unlatch and open the PDC cover.
6. Remove the two nuts that secure the two-holed eyelet of the battery wire harness PDC take outs to the PDC B(+) terminal studs.
7. Remove the battery wire harness PDC take out eyelet from the B(+) terminal studs.
8. Disengage the latches on the PDC housing mounts from the tabs on the PDC mounting stanchions of the battery tray, and pull the PDC housing upward to disengage the mounts from the stanchions.
9. Remove the PDC and the headlamp and dash wire harness from the engine compartment as a unit.

# DISASSEMBLY

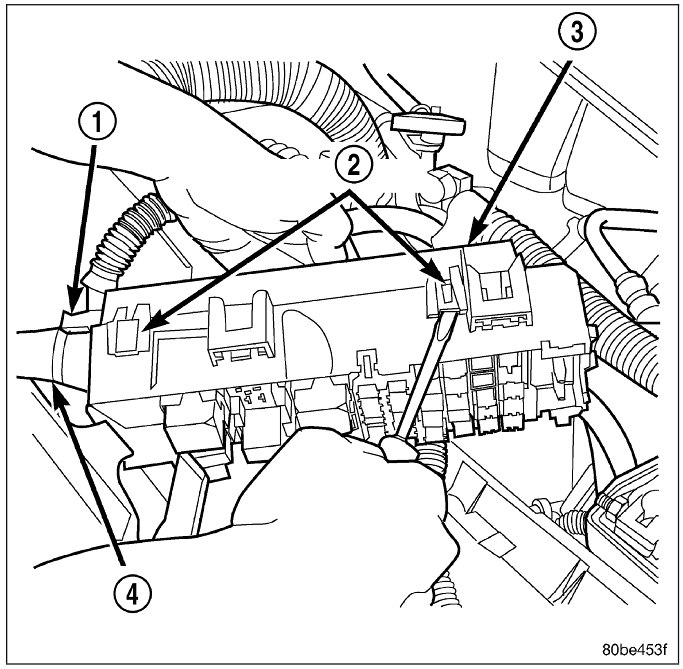
## POWER DISTRIBUTION CENTER DISASSEMBLY

### PDC HOUSING LOWER COVER

#### REMOVAL

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC mini fuse wedge, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC cover can be simply unlatched and removed from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

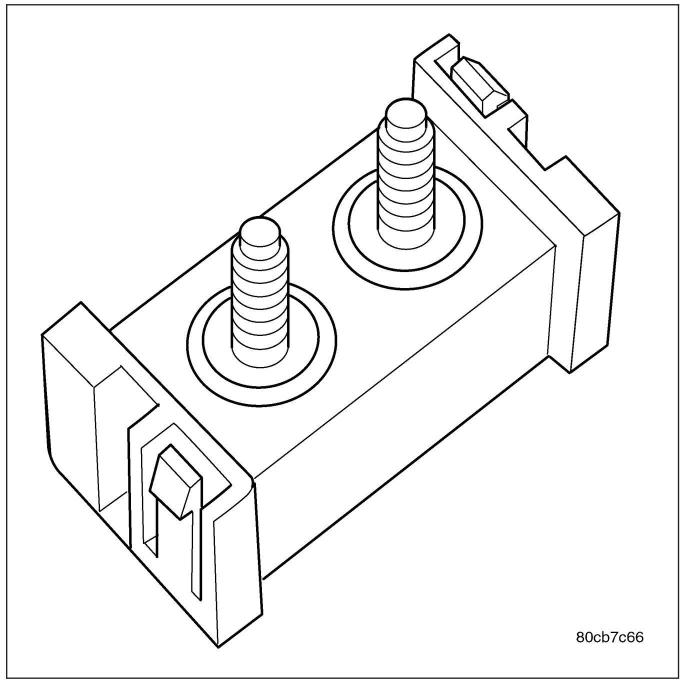
1. Unlatch and remove the cover from the PDC.
2. Remove the two nuts that secure the two-holed eyelet of the battery wire harness PDC take out to the B(+) terminal studs near the inboard end of the PDC.
3. Remove the battery wire harness PDC take out eyelet from the two PDC B(+) terminal studs.
4. Disengage the latches on the PDC housing mounts from the tabs on the PDC mounting stanchions on the battery tray, and pull the PDC housing upward to disengage the mounts from the stanchions.
5. Where the headlamp and dash wire harness exits the PDC, remove the tape that secures the wire harness to the trough formation on the PDC housing lower cover.
6. Using a trim stick or another suitable wide flat-bladed tool, gently pry the latches (2) on each side of the PDC housing that secure the housing lower cover (3) to the PDC and remove the housing lower cover.



## PDC B+ TERMINAL MODULE

### REMOVAL

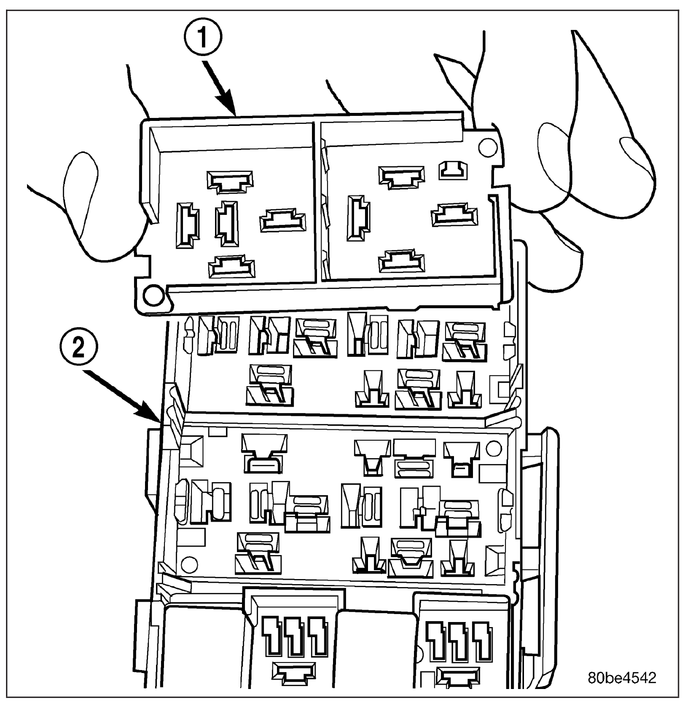
1. Remove the PDC housing lower cover.
2. From the top of the PDC housing, use a small screwdriver or a terminal pick tool (Special Tool Kit 6680) to release the two latches that secure the B(+) terminal module in the PDC.
3. Gently and evenly press the two B(+) terminal studs down through the bus bar in the PDC.
4. From the bottom of the PDC housing, remove the B(+) terminal module from the PDC.



## PDC RELAY WEDGE

### REMOVAL

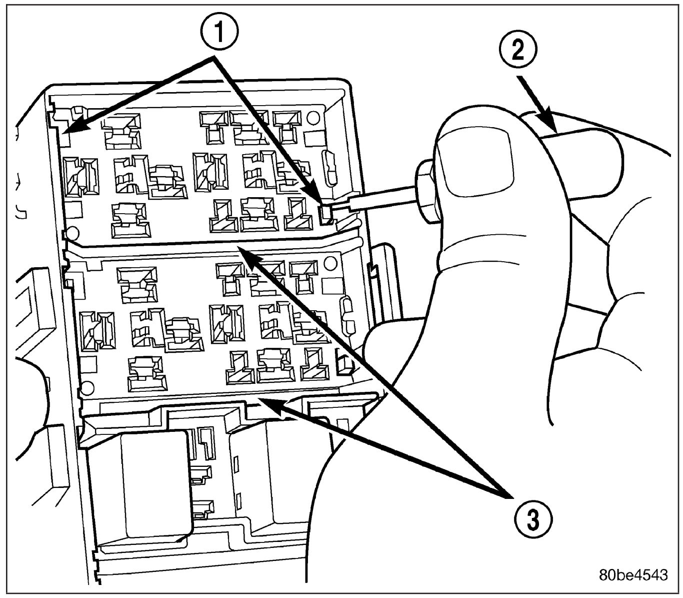
1. Remove the PDC housing lower cover.
2. Remove each of the relays from the PDC relay wedge (1) to be removed.
3. From the bottom of the PDC housing, use a small screwdriver or a terminal pick tool (Special Tool Kit 6680) to release the two latches (yellow) that secure the relay wedge (1) to the PDC relay cassette (2).
4. From the top of the PDC housing, remove the relay wedge (1) from the PDC relay cassette (2).



## PDC RELAY CASSETTE

### REMOVAL

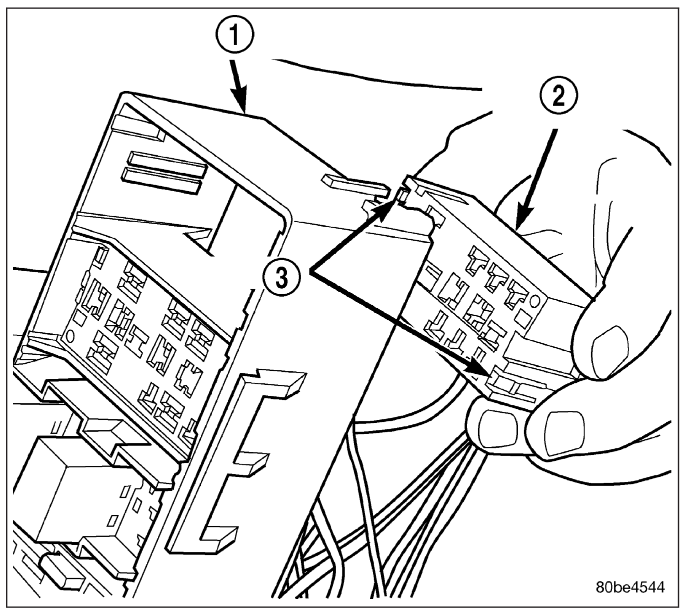
**CAUTION: Do not remove the wiring and terminals from the terminal cavities of the faulty PDC relay cassette at this time. Refer to the Assembly procedure that follows for the proper procedures for transferring the wiring and terminals to the replacement PDC relay cassette.**



1. Remove the relay wedge from the PDC relay cassette to be removed.

**NOTE: It may be necessary to remove relay cassettes that are not being serviced from the PDC housing in order to obtain sufficient clearance to access the faulty relay cassette. The same service procedure is repeated as necessary to remove each of the interfering relay wedges and relay cassettes from the PDC housing.**

2. From the top of the PDC housing, use a small screwdriver or a terminal pick tool (2) (Special Tool Kit 6680) to release the two latches (1) that secure the relay cassette (3) in the PDC.
3. Gently and evenly press the relay cassette (3) down through the PDC housing.
4. From the bottom of the PDC housing (1), remove the relay cassette (2) from the PDC.



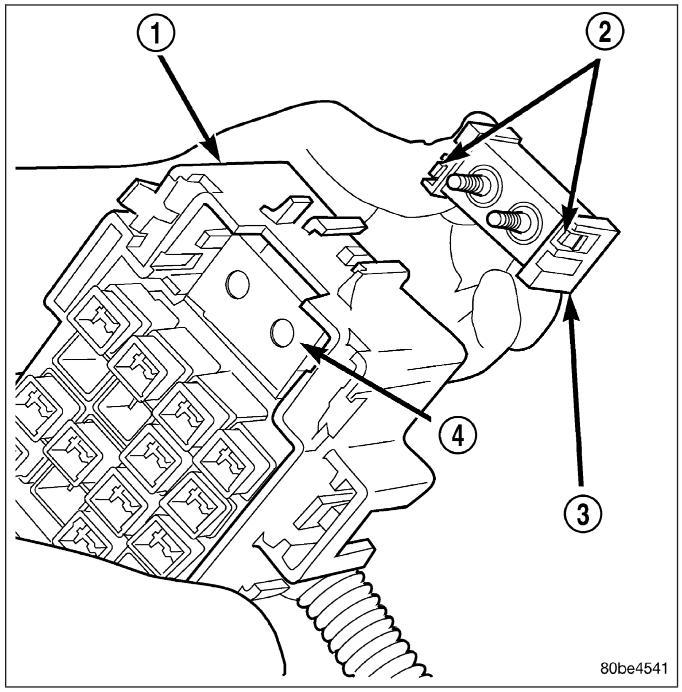
# ASSEMBLY

## POWER DISTRIBUTION CENTER ASSEMBLY

### PDC B(+) TERMINAL MODULE

#### INSTALLATION

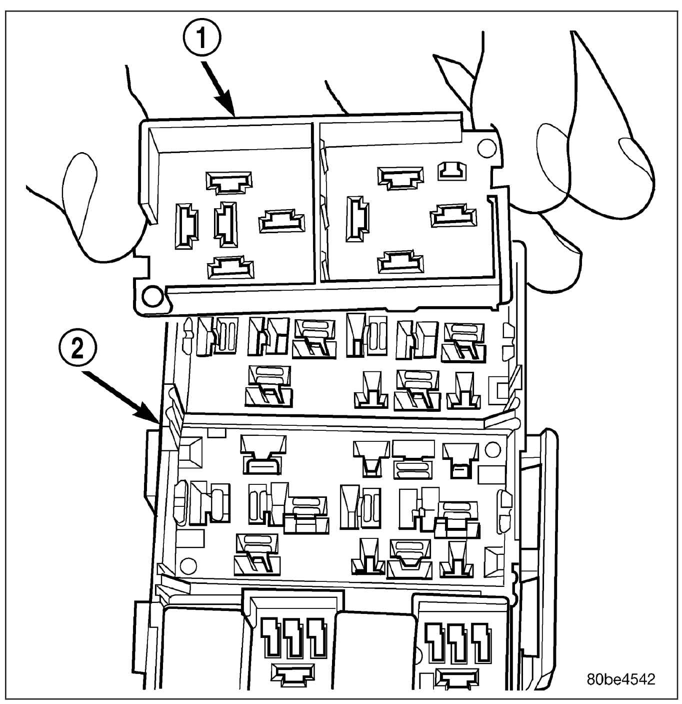
1. From the bottom of the PDC housing (1) , align and insert the B(+) terminal module (3) into the PDC.
2. From the bottom of the PDC housing (1) , align and insert the two studs of the PDC B(+) terminal module (3) through the bus bar (4) in the PDC.
3. From the bottom of the PDC housing (1) , press the B(+) terminal module (3) gently and evenly into the PDC until both of the latches (2) are fully engaged.
4. Install the PDC housing lower cover.



### RELAY WEDGE

#### INSTALLATION

1. From the top of the PDC housing (2), align and insert the PDC relay wedge (1) latch arms into the correct cavities in the relay cassette.
2. Gently and evenly press the PDC relay wedge (1) down into the relay cassette until both of the latches are fully engaged.
3. Install each of the removed relays into the proper cavities of the PDC relay wedge (1).
4. Install the PDC housing lower cover.

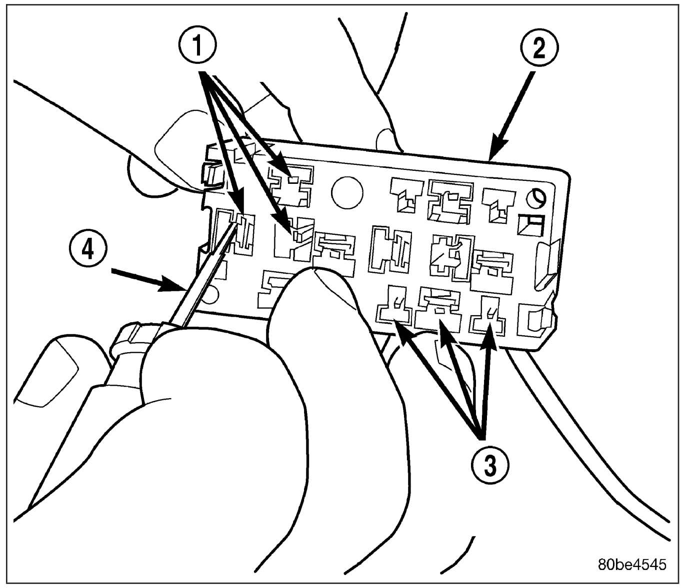


## RELAY CASSETTE

### INSTALLATION

1. Move the faulty PDC relay cassette with its wiring away from the bottom of the PDC housing far enough to allow the replacement relay cassette to be installed into the PDC.
2. Using the faulty relay cassette as a guide, be certain that the replacement relay cassette is correctly oriented before installing it into the PDC housing.
3. From the bottom of the PDC housing, align and insert the replacement relay cassette into the PDC. Press the relay cassette up into the PDC until both of the latches are fully engaged.

**CAUTION: Proper care must be taken to be certain that the wiring and terminals from the faulty PDC relay cassette are installed in the correct terminal cavities of the replacement relay cassette. To prevent mistakes it is recommended that the wiring and terminals be removed from the faulty relay cassette one cavity at a time, repaired or spliced as necessary, then installed securely into the correct cavity of the replacement relay cassette. If you are not absolutely certain into which cavity a terminal should be installed, refer to Power Distribution in the index of this service manual for the location of complete circuit diagrams covering the PDC.**



4. While pulling gently on the wire from the bottom of the faulty PDC relay cassette (2), use a terminal pick tool (4)(Special Tool Kit 6680) from the top of the relay cassette to release the latch (3) that secures the terminal in the relay cassette terminal cavity (1).
5. From the bottom of the faulty PDC relay cassette (2), remove the wire and terminal from the relay cassette terminal cavity (1).
6. Make all necessary repairs and splices to the wire for the removed terminal. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.
7. From the bottom of the PDC housing, align and insert the removed wire and terminal into the correct terminal cavity of the replacement relay cassette. Push the wire and terminal up into the relay cassette terminal cavity until it is fully engaged by the latch.
8. Repeat Step 4, Step 5, Step 6 and Step 7 one wire and terminal at a time until each of the wires and terminals have been transferred from the faulty PDC relay cassette into the replacement relay cassette.
9. Install the PDC relay wedge into the replacement PDC relay cassette.

## PDC LOWER COVER

### INSTALLATION

1. Align the PDC housing lower cover on the bottom of the PDC.
2. Evenly press the lower cover into place until latches are fully engaged.
3. Where the headlamp and dash harness enters the PDC, tape the harness securely to the trough formation on the PDC lower cover.
4. Install the PDC in its mounting location on the battery support.
5. Install the battery wire harness over the two PDC B+ terminal studs. Torque the nuts to 11.3 N·m (100 in. lbs.).
6. Install the battery. Refer to the Battery section for the procedure.
7. Install the PDC cover.

## INSTALLATION

The Power Distribution Center (PDC) main housing unit, the PDC fuse wedges, the PDC mini fuse wedge and the PDC bus bars cannot be repaired and are only serviced as a unit with the right headlamp and dash wire harness. If the PDC main housing unit, the fuse wedges or the bus bars are faulty or damaged, the entire PDC and right headlamp and dash wire harness unit must be replaced.

1. Position the PDC and the headlamp and dash wire harness unit in the engine compartment.
2. Engage the PDC housing mounts with the stanchions of the battery tray and push the unit downward until the mount latches fully engage the mounting tabs on the stanchions.
3. Install the two-holed eyelet of the battery wire harness PDC take outs onto the two PDC B(+) terminal studs.
4. Install and tighten the nuts that secure the eyelet of the battery wire harness PDC take outs to the B(+) terminal studs. Tighten the nuts to 11.3 N·m (100 in. lbs.).
5. Engage each of the retainers that secure the headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the headlamp and dash wire harness retainer locations.
6. Install all of the fasteners that secure each of the headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the ground eyelet locations.
7. Reconnect each of the headlamp and dash wire harness connectors. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the headlamp and dash wire harness connector locations. For connectors secured with bolts, tighten the screws to 4.3 N·m (38 in. lbs.).
8. Reconnect the battery negative cable.

# POWER OUTLET

## DESCRIPTION

One power outlet is installed in the vehicle. It is located in the right rear quarter trim panel. The power outlet base is secured by a snap fit within the trim panel. A plastic protective cap snaps into the power outlet base when the power outlet is not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use.

The power outlet receptacle unit and the accessory power outlet protective cap are available for service. The power outlet receptacle cannot be repaired and, if faulty or damaged, it must be replaced.

## OPERATION

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the Junction Block at all times.

While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

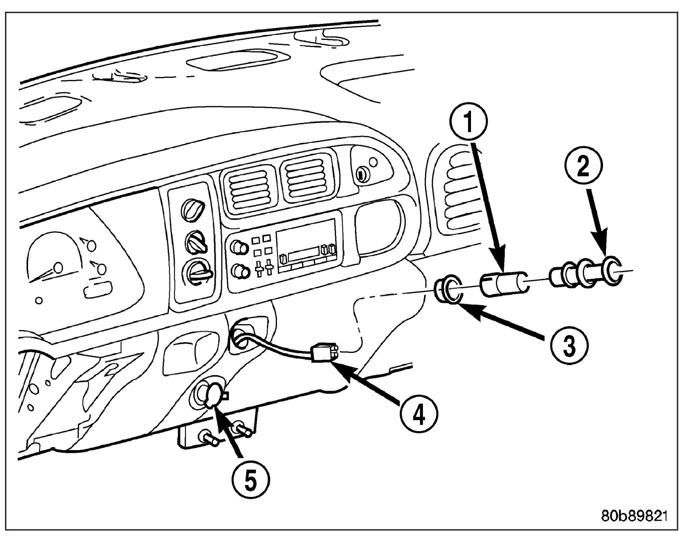
## DIAGNOSIS AND TESTING - POWER OUTLET

For complete circuit diagrams, refer to **Power Outlet** in Wiring Diagrams.

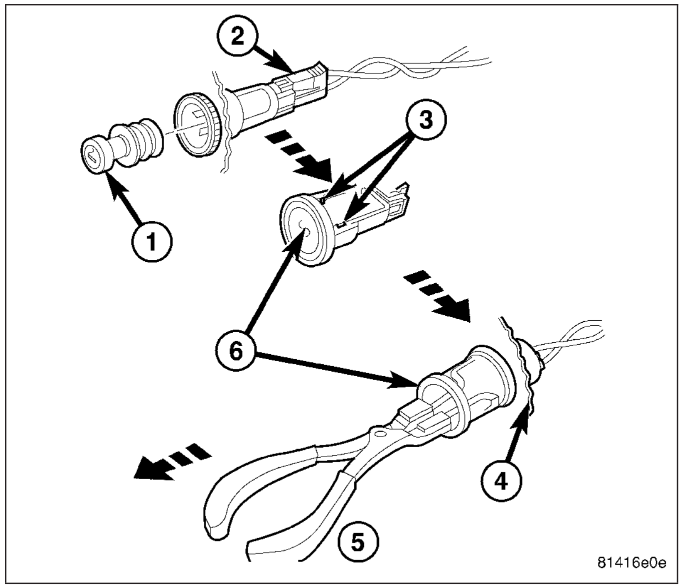
1. Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the battery as required.
3. Remove the plastic protective cap from the power outlet receptacle. Check for continuity between the inside circumference of the power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.
4. Check for battery voltage at the insulated contact located at the back of the power outlet receptacle. If not OK, go to Step 5.
5. Disconnect and isolate the battery negative cable. Remove the power outlet receptacle from the instrument panel. Disconnect the wire harness connector from the power outlet receptacle. Check for continuity between the ground circuit cavity of the power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.
6. Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the power outlet wire harness connector. If OK, replace the faulty power outlet receptacle. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Pull the cigar lighter knob and element (2) out of the cigar lighter receptacle base (1), or unsnap the protective cap from the power outlet receptacle base (5).
3. Look inside the cigar lighter or power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the instrument panel.



4. Insert a pair of external snap ring pliers (5) into the cigar lighter or power outlet receptacle base (6) and engage the tips of the pliers with the retaining bosses (3) of the mount.
5. Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.
6. Pull the receptacle base away from the instrument panel (4) far enough to access the instrument panel wire harness connector (2).
7. Disconnect the instrument panel wire harness connector (2) from the cigar lighter or power outlet receptacle base (6).
8. Remove the cigar lighter or power outlet mount from the instrument panel.



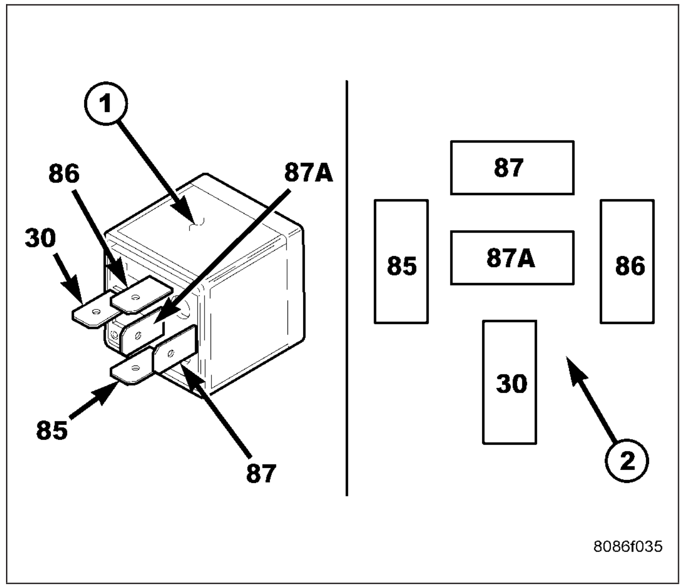
## INSTALLATION

1. Reconnect the instrument panel wire harness connector to the cigar lighter or power outlet receptacle base connector receptacle.
2. Install the cigar lighter or power outlet mount into the instrument panel.
3. Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.
4. Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.
5. Install the cigar lighter knob and element into the cigar lighter receptacle base, or the protective cap into the power outlet receptacle base.
6. Reconnect the battery negative cable.

# RELAY

## DESCRIPTION

A relay is an electromechanical device that switches fused battery current to a electrical component when the ignition switch is turned to the Accessory or Run positions, or when controlled by a electronic module. The relays are located in the junction block or power distribution center.



The relay is a International Standards Organization (ISO) relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

A relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

## OPERATION

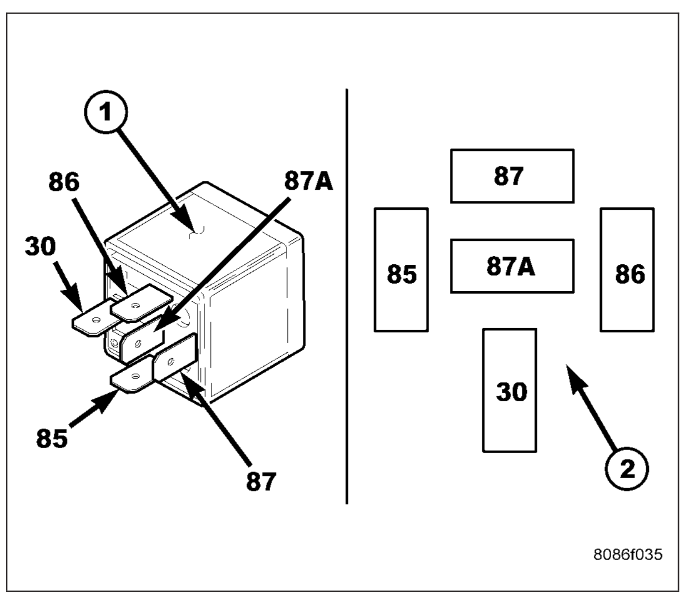
The ISO relay consists of an electromagnetic coil, a resistor and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

## DIAGNOSIS AND TESTING - RELAY

The relays are located in the junction block or power distribution center. For complete circuit diagrams, refer to **Wiring Diagrams**.

1. Remove the relay from its mounting location.
2. A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.
3. Resistance between terminals 85 and 86 (electromagnet) should be 60.7 - 80.3 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.
4. Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, perform the Relay Circuit Test that follows. If not OK, replace the faulty relay.



## DIAGNOSIS & TESTING - RELAY CIRCUIT TEST

1. The relay common feed terminal cavity (30) of the junction block or power distribution center is connected to battery voltage and should be hot at all times. Check for battery voltage at the fused B(+) circuit cavity in the junction block receptacle for the relay. If OK, go to Step 2. If not OK, repair the fused B(+) circuit to the Power Distribution Center (PDC) fuse as required.
2. The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.
3. The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the fused B(+) fuse in the junction block that feeds the accessory when the relay is energized by the ignition switch. There should be continuity between the junction block cavity for relay terminal 87 and the fused B(+) fuse in the junction block at all times. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.
4. The coil ground terminal (85) is connected to the electromagnet in the relay. It receives battery feed to energize the relay when the ignition switch is in the Accessory or Run positions. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (acc/run) circuit cavity for relay terminal 85 in the junction block receptacle for the relay. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (acc/run) circuit to the ignition switch as required.
5. The coil battery terminal (86) is connected to the electromagnet in the relay. The junction block cavity for this terminal should have continuity to ground at all times. If not OK, repair the open ground circuit to ground as required.

## REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the relay by grasping it firmly and pulling it straight out from its receptacle. A slight back and fourth rocking motion may help the removal process.

## INSTALLATION

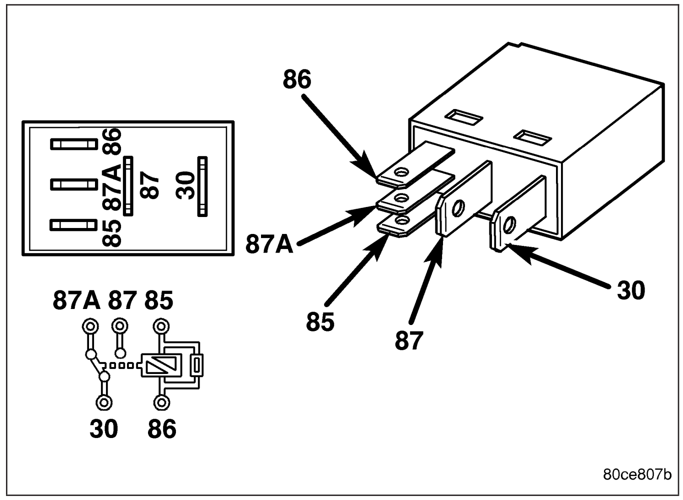
1. Position the relay to the proper receptacle.
2. Align the relay terminals with the terminal cavities in the receptacle.
3. Push firmly and evenly on the top of the relay until the terminals are fully seated in the terminal cavities in the receptacle.
4. Connect the negative battery cable.

# MICRO-RELAY

## DESCRIPTION

A micro-relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs by five integral male spade-type terminals that extend from the bottom of the relay base.

Relays cannot be adjusted or repaired and, if faulty or damaged, the unit must be replaced.



## OPERATION

A micro-relay is an electromechanical switch that uses a low current input from one source to control a high current output to another device. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

## DIAGNOSIS AND TESTING - MICRO-RELAY

1. Remove the relay from its mounting location.
2. A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.
3. Resistance between terminals 85 and 86 (electromagnet) should be 67.5 - 82.5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.
4. Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, reinstall the relay and use a DRBIII® scan tool to perform further testing. Refer to the appropriate diagnostic information.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

## REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the relay by grasping it firmly and pulling it straight out from its receptacle. A slight back and fourth rocking motion may help the removal process.

## INSTALLATION

1. Align the micro-relay terminals with the terminal cavities in the receptacle.
2. Push firmly and evenly on the top of the relay until the terminals are fully seated in the terminal cavities in the receptacle.
3. Connect the battery negative cable.

# ENGINE

## TABLE OF CONTENTS

## ENGINE ELECTRICAL DIAGNOSTICS

### TABLE OF CONTENTS

# ENGINE ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

# PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

## Diagnostic Test

### 1. NO RESPONSE

Make sure the scan tool will communicate with the appropriate modules.

**Are you currently experiencing a NO RESPONSE condition?**

**Yes** >> The NO RESPONSE condition must be properly diagnosed before continuing.
Refer to the appropriate BUS Communication test in Section 8 ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS.

**No** >> Go To 2

### 2. NO START

**Is the customer complaint a NO START condition?**

**Yes** >> Check the vehicle for any NO START related PCM DTCs or Vehicle Theft Security related DTCs.
If no Theft related DTCs are present, refer to the Non DTC Diagnostic Procedures that relate to Fuel and Starting.

**No** >> Go To 3

### 3. VEHICLE HISTORY AND TSB(s)

Continue by reading PCM DTCs and record the related Freeze Frame data if any DTCs are present.

Whether or not any DTCs are present you will want to check the following items which may assist in repairing the customers complaint successfully.

Check the vehicles repair history.

If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any TSBs related to the customer's complaint or DTCs.

If a TSB applies, follow the instructions per the TSB.

**Choose the following scenario that best applies.**

**The TSB repaired the customers complaint.**
Testing complete.

**A DTC is present, no TSB applies, or the TSB didn't repair the customers complaint.**
Go To 4

**No DTCs are present.**
Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

### 4. WIRE HARNESS INSPECTION

Clear the DTCs.

Attempt to duplicate the customer complaint.

Whether the customer complaint can be duplicated or not, make a quick wire harness inspection related to the DTCs that were previously cleared.

Check the Powertrain Control Module connectors, the suspected component connection, in-line connectors, wire harness splices, PCM power and ground circuits, and any related fuses.

If the DTCs are fuel or air related, check the fuel level and quality.

**Were any repairs made that fixed the customer's complaint?**

**Yes** >> Testing complete.

**No** >> Refer to the diagnostic test procedure related to the DTC.

## INTERMITTENT CONDITION

| POSSIBLE CAUSES |
|---|
| INTERMITTENT CONDITION |

## Diagnostic Test

### 1. INTERMITTENT CONDITION

**NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.**

**WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.**

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Freeze Frame information. If possible, try to duplicate the conditions under which the DTC set.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wire harness. Look for parameter values to change and/or a DTC to set.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Perform a voltage drop test on the related circuits between the suspected inoperative component and the PCM.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Inspect and clean all PCM, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits.

For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.

For intermittent Evaporative Emission trouble codes perform a visual and physical inspection of the related parts including hoses and the Fuel Filler cap.

For intermittent Misfire DTCs check for restrictions in the Intake and Exhaust system, proper installation of Sensors, vacuum leaks, and binding components that are run by the accessory drive belt.

Use the scan tool to perform a System Test if one applies to failing component.

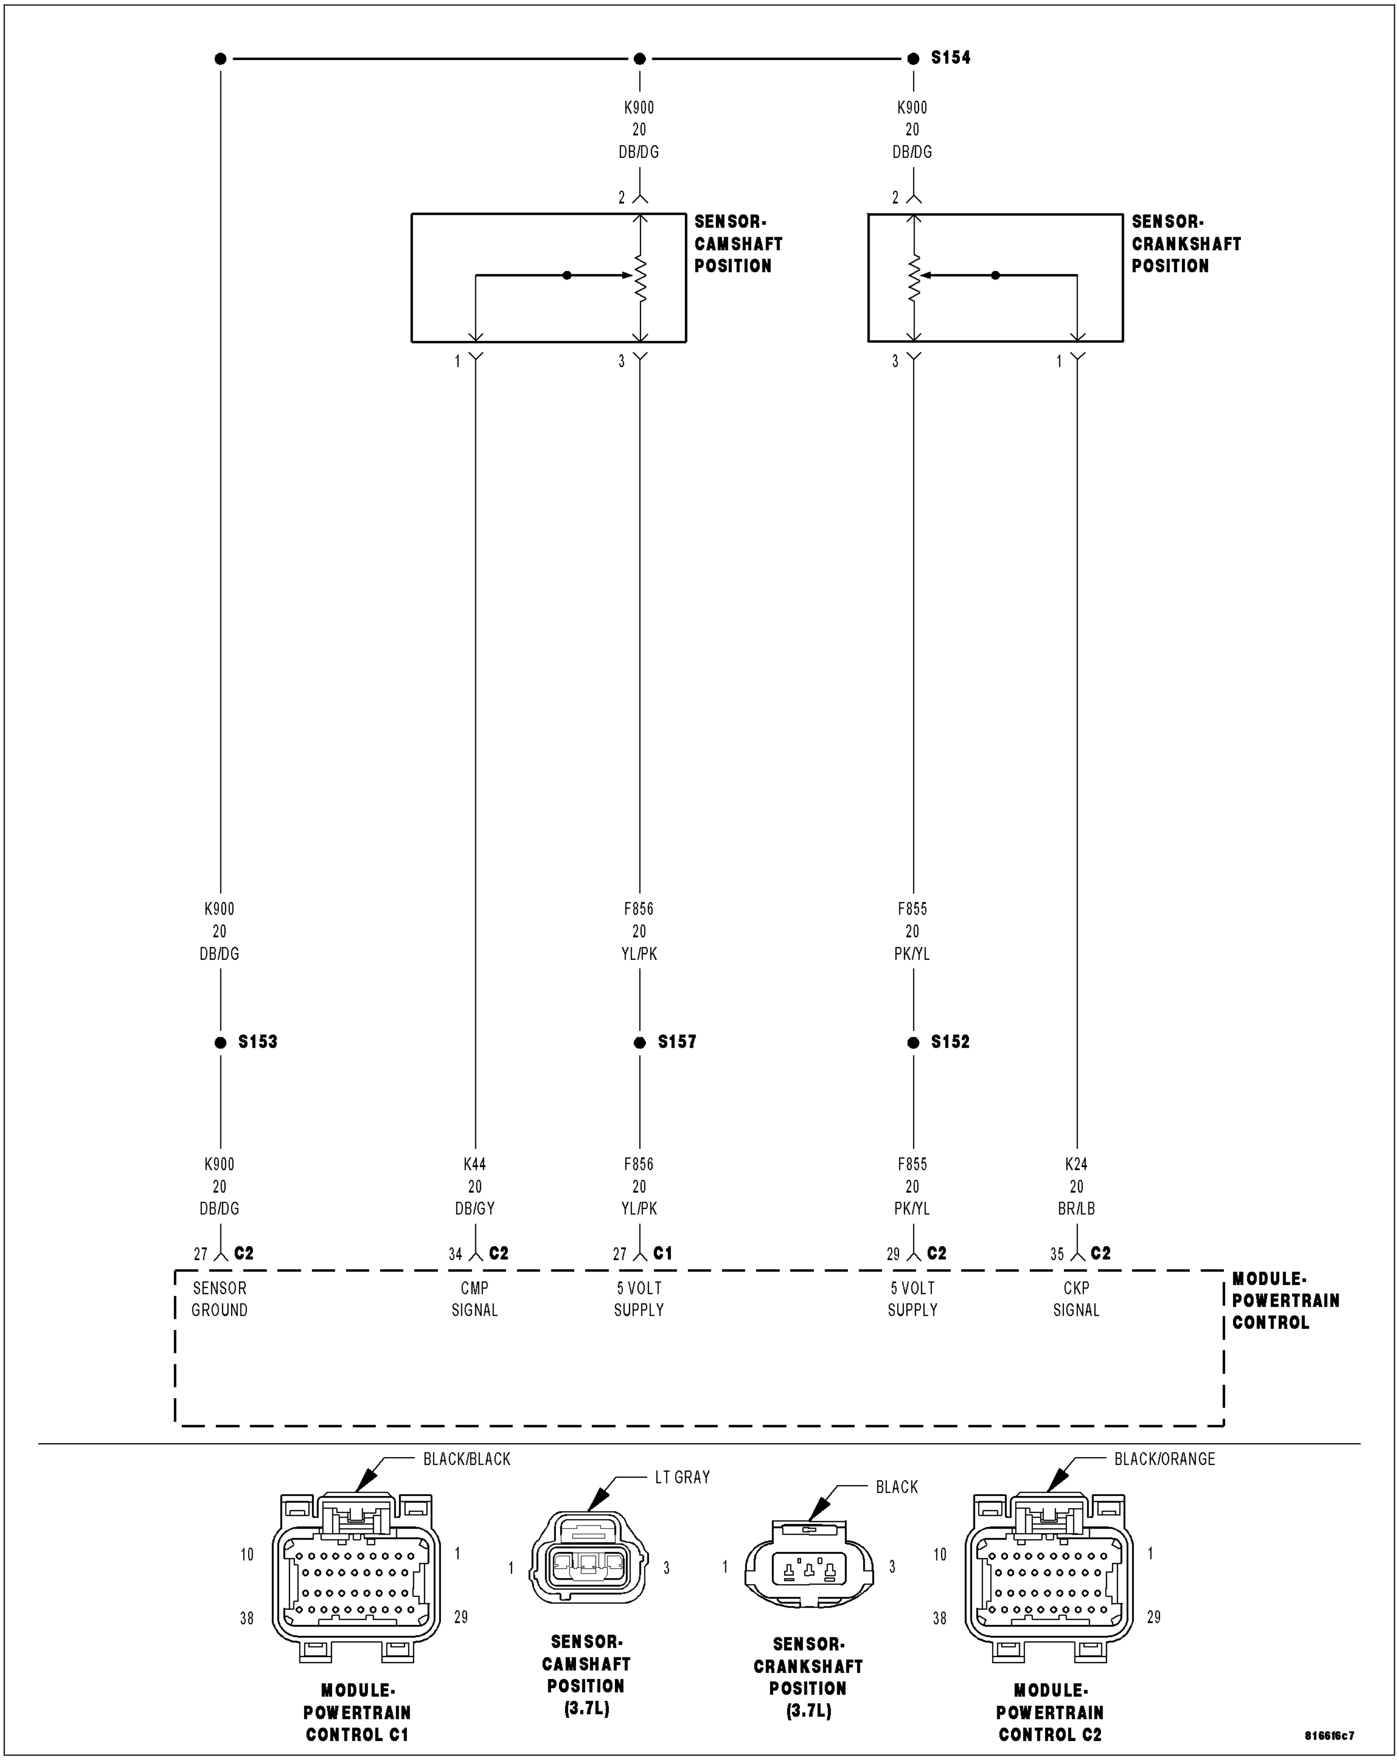
A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

**Were any problems found during the above inspections?**

**Yes** >> Perform the necessary repairs.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0016–CRANKSHAFT / CAMSHAFT TIMING MISALIGNMENT



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Engine cranking and Engine running
- **Set Condition:**
  Powertrain Control Module detects an error when the camshaft position is out of phase with the crankshaft position. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
| --- |
| ERRATIC CAM POSITION SENSOR SIGNAL |
| CAMSHAFT POSITION SENSOR TONE WHEEL/PULSE RING |
| ERRATIC CRANKSHAFT POSITION SENSOR SIGNAL |
| CRANKSHAFT POSITION SENSOR TONE WHEEL/PULSE RING |
| CAMSHAFT POSITION SENSOR |
| CRANKSHAFT POSITION SENSOR |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. ACTIVE DTC

**WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.**

With the scan tool clear the DTC(s).

Start the engine and run until operating temp is reached. (Closed Loop)

If the DTC does not reset it may be necessary to test drive the vehicle.

**Does the P0016 return?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. CHECKING THE CMP SIGNAL WITH A LAB SCOPE

With a lab scope, backprobe the (K44) CMP Signal circuit at the CMP Sensor harness connector.

**WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.**

Start the engine.

Observe the lab scope screen.

**Are there any irregular or missing signals?**

**Yes** >> Go To 3

**No** >> Go To 6

## 3. CMP WIRE HARNESS INSPECTION

Turn the ignition off.

Visually inspect the related wire harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Make sure the Crankshaft Position Sensor and the Camshaft Position Sensor are properly installed and the mounting bolt(s) are torqued to their proper specification.

Refer to any TSBs that may apply.

**Were any of the above conditions present?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. TONE WHEEL/PULSE RING INSPECTION

Remove the Camshaft Position Sensor.

Inspect the Tone Wheel/Pulse Ring for damage, foreign material, or excessive movement.

**Were any problems found?**

**Yes** >> Repair or replace the Tone Wheel/Pulse Ring as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. CAMSHAFT POSITION SENSOR

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Camshaft Position Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 6. ERRATIC CMP SIGNAL

Turn the ignition off.

Remove the lab scope probe.

**WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.**

Ignition on, engine not running.

With scan tool, erase DTCs.

Start the engine.

Gently tap on and wiggle the Cam Position Sensor.

Ignition on, engine not running.

Inspect the Sensor connector and harness connector, and inspect the PCM connector and harness connector for loose, bent, corroded, or pushed out pins/terminals.

Inspect the related wire harness and the splices in the CMP circuit.

**Does the P0016 return?**

**Yes** >> Repair the wiring/connector concerns as needed or replace the Camshaft Position Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 7

## 7. CHECKING THE CKP SIGNAL WITH A LAB SCOPE

Turn the ignition off.

With a lab scope, backprobe the (K24) CKP Signal circuit at the CKP harness connector.

**WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.**

Start the engine.

Observe the lab scope screen.

**Are there any irregular or missing signals?**

**Yes** >> Go To 8

**No** >> Go To 11

## 8. CKP WIRE HARNESS INSPECTION

Turn the ignition off.

Visually inspect the related wire harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Make sure the Crankshaft Position Sensor and the Camshaft Position Sensor are properly installed and the mounting bolt(s) are torqued to their proper specification.

Refer to any TSBs that may apply.

**Were any of the above conditions present?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. TONE WHEEL/FLEX PLATE INSPECTION

Remove the Crankshaft Position Sensor.

Inspect the Tone Wheel/Flex Plate slots for damage, foreign material, or excessive movement.

**Were any problems found?**

**Yes** >> Repair or replace the Tone Wheel/Flex Plate as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 10

## 10. CRANKSHAFT POSITION SENSOR

Remove the Crankshaft Position Sensor.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Crankshaft Position Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

## 11. ERRATIC CKP SIGNAL

**NOTE: The conditions that set this DTC are not present at this time. The following test may help in identifying the intermittent condition.**

**WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.**

Start the engine.

Gently tap on and wiggle the Crank Position Sensor.

Turn the ignition off.

Inspect the Sensor connector and harness connector, and inspect the PCM connector and harness connector for loose, bent, corroded, or pushed out pins/terminals.

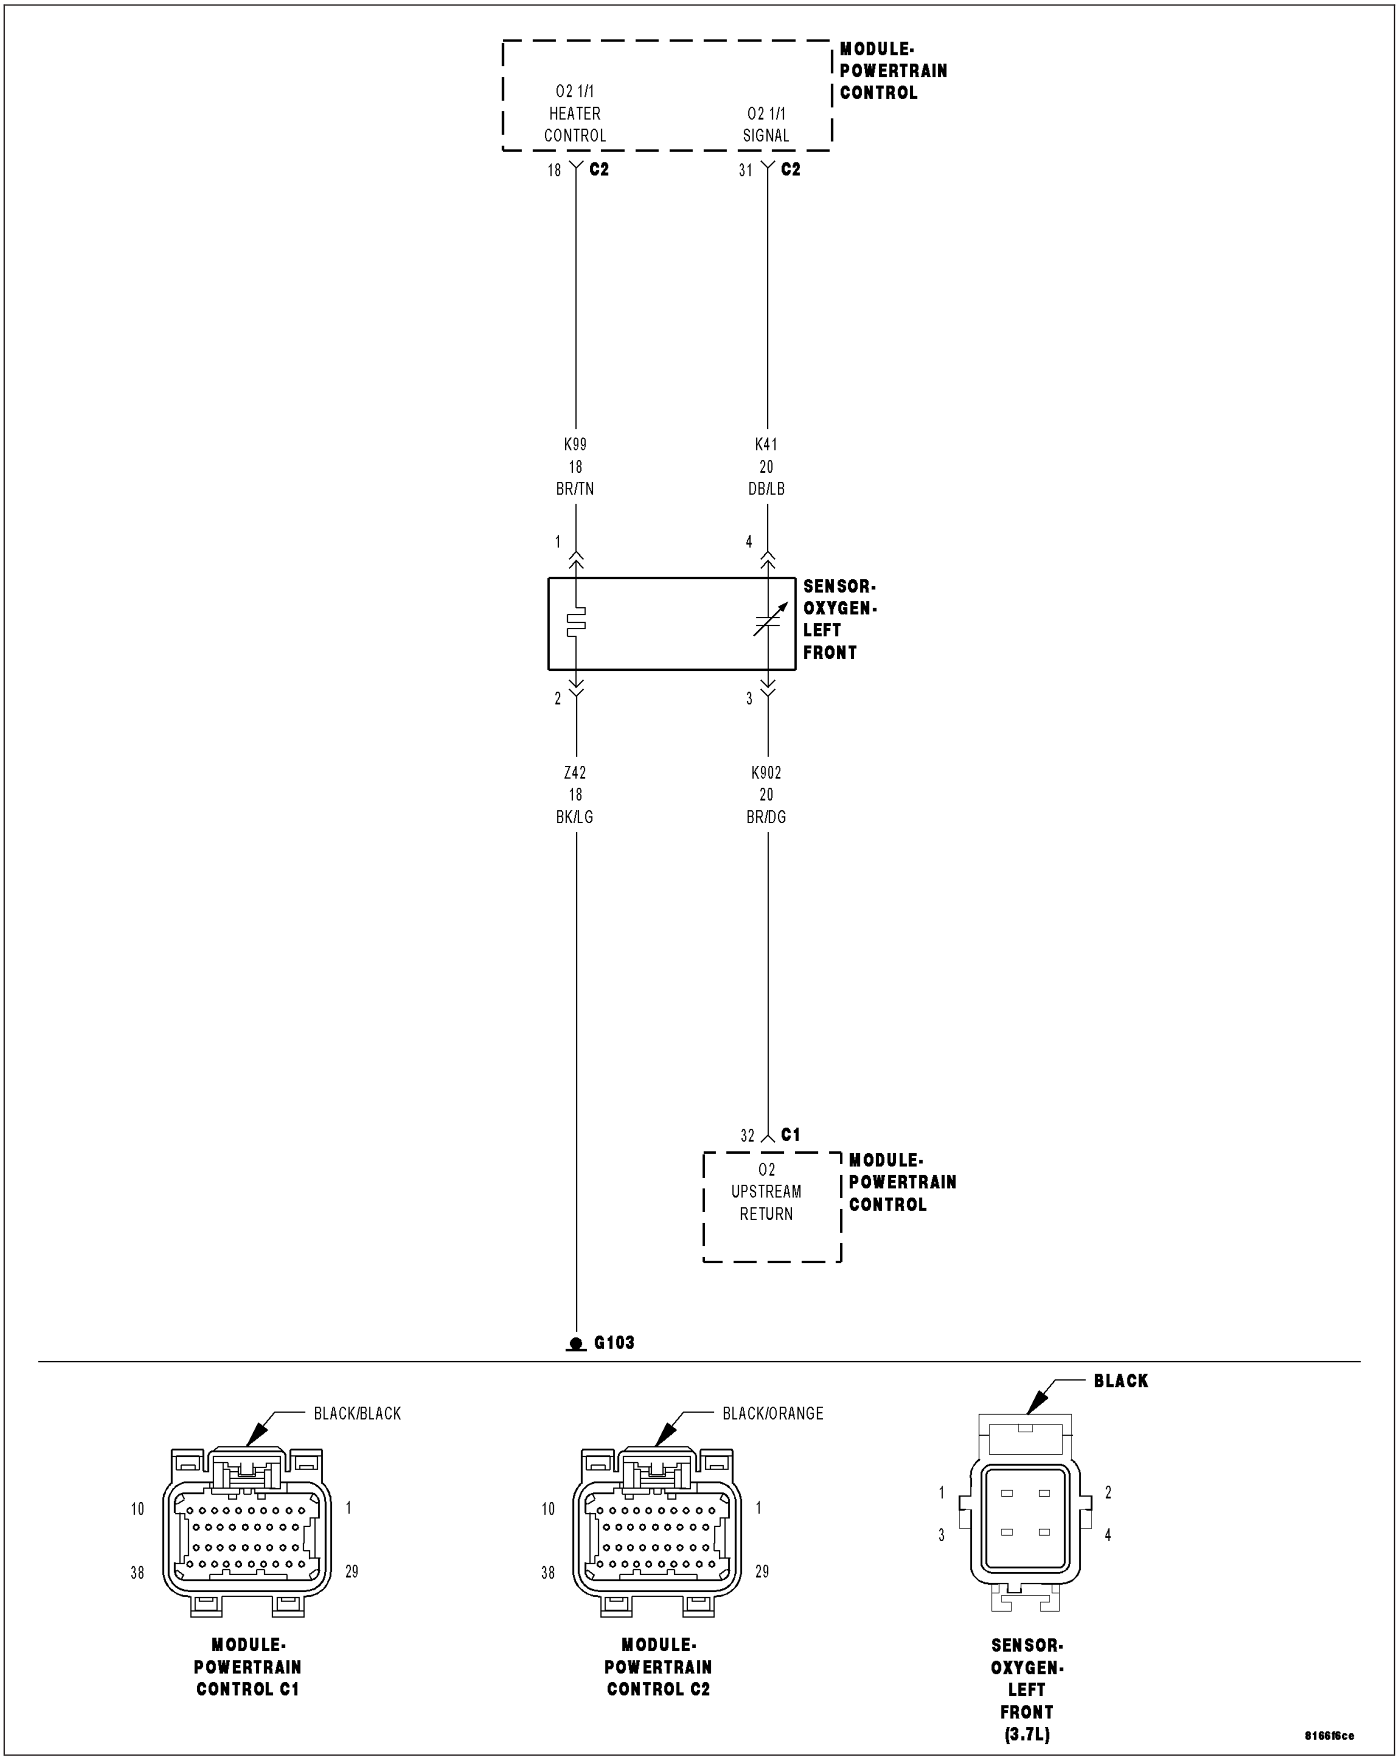
Inspect the related wire harness and the splices in the CKP circuits.

**Were any problems found?**

**Yes** >> Repair the wiring/connector concerns as needed or replace the Crankshaft Position Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Test Complete.

## P0031-O2 SENSOR 1/1 HEATER CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Battery voltage above 10.6 volts, ASD is powered up, and O2 heater is powered.
- **Set Condition:**
  Desired state does not match Actual state. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K99) O2 SENSOR 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND |
| O2 SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. O2 SENSOR HEATER OPERATION

Turn the ignition off.

**NOTE: Wait a minimum of 8 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.**

Ignition on, engine not running.

With a scan tool, actuate the O2 Heater Test.

With the scan tool, monitor 1/1 O2 Sensor voltage for at least 2 minutes.

**Does the O2 Sensor voltage stay above 4.5 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. O2 HEATER ELEMENT

Turn the ignition off.

**NOTE: Allow the O2 Sensor to cool down to room temperature.**

Disconnect the 1/1 O2 Sensor harness connector.

Measure the resistance across the O2 Sensor Heater element, between the Heater Control terminal and the Heater ground terminal at the component.

**NOTE: O2 Heater Element resistance values should be measured at 70°F (21.1°C). The resistance value will vary with different temperature values.**

**Is the O2 Sensor Heater Element resistance between 2.0 and 30.0 ohms?**

**Yes** >> Go To 3

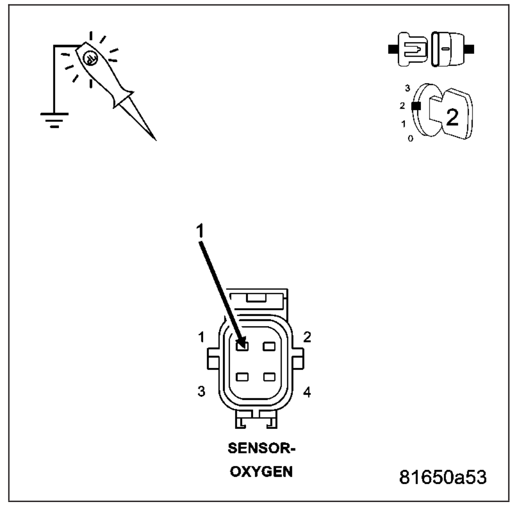
**No** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 3. O2 SENSOR

Ignition on, engine not running.

With a scan tool, actuate the O2 1/1 Heater Test with the O2 Sensor harness connector still disconnected.

Using a 12-volt test light connected to ground, probe the (K99) O2 1/1 Heater Control circuit in the O2 Sensor harness connector.



**Does the test light illuminate brightly and flash on and off during the actuation?**

**Yes** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

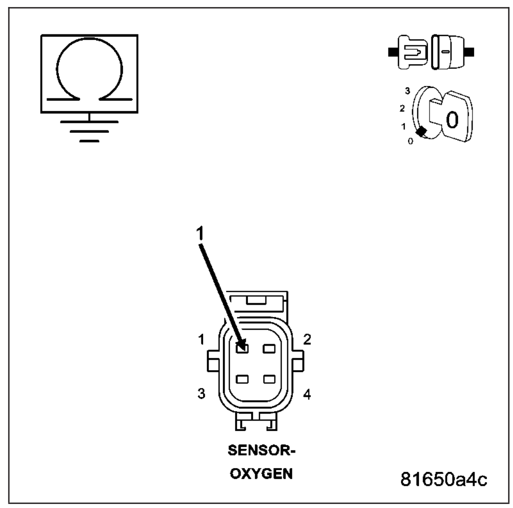
**No** >> Go To 4

## 4. (K99) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Measure the resistance between ground and the (K99) O2 1/1 Heater Control circuit in the O2 Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short to ground in the (K99) O2 1/1 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

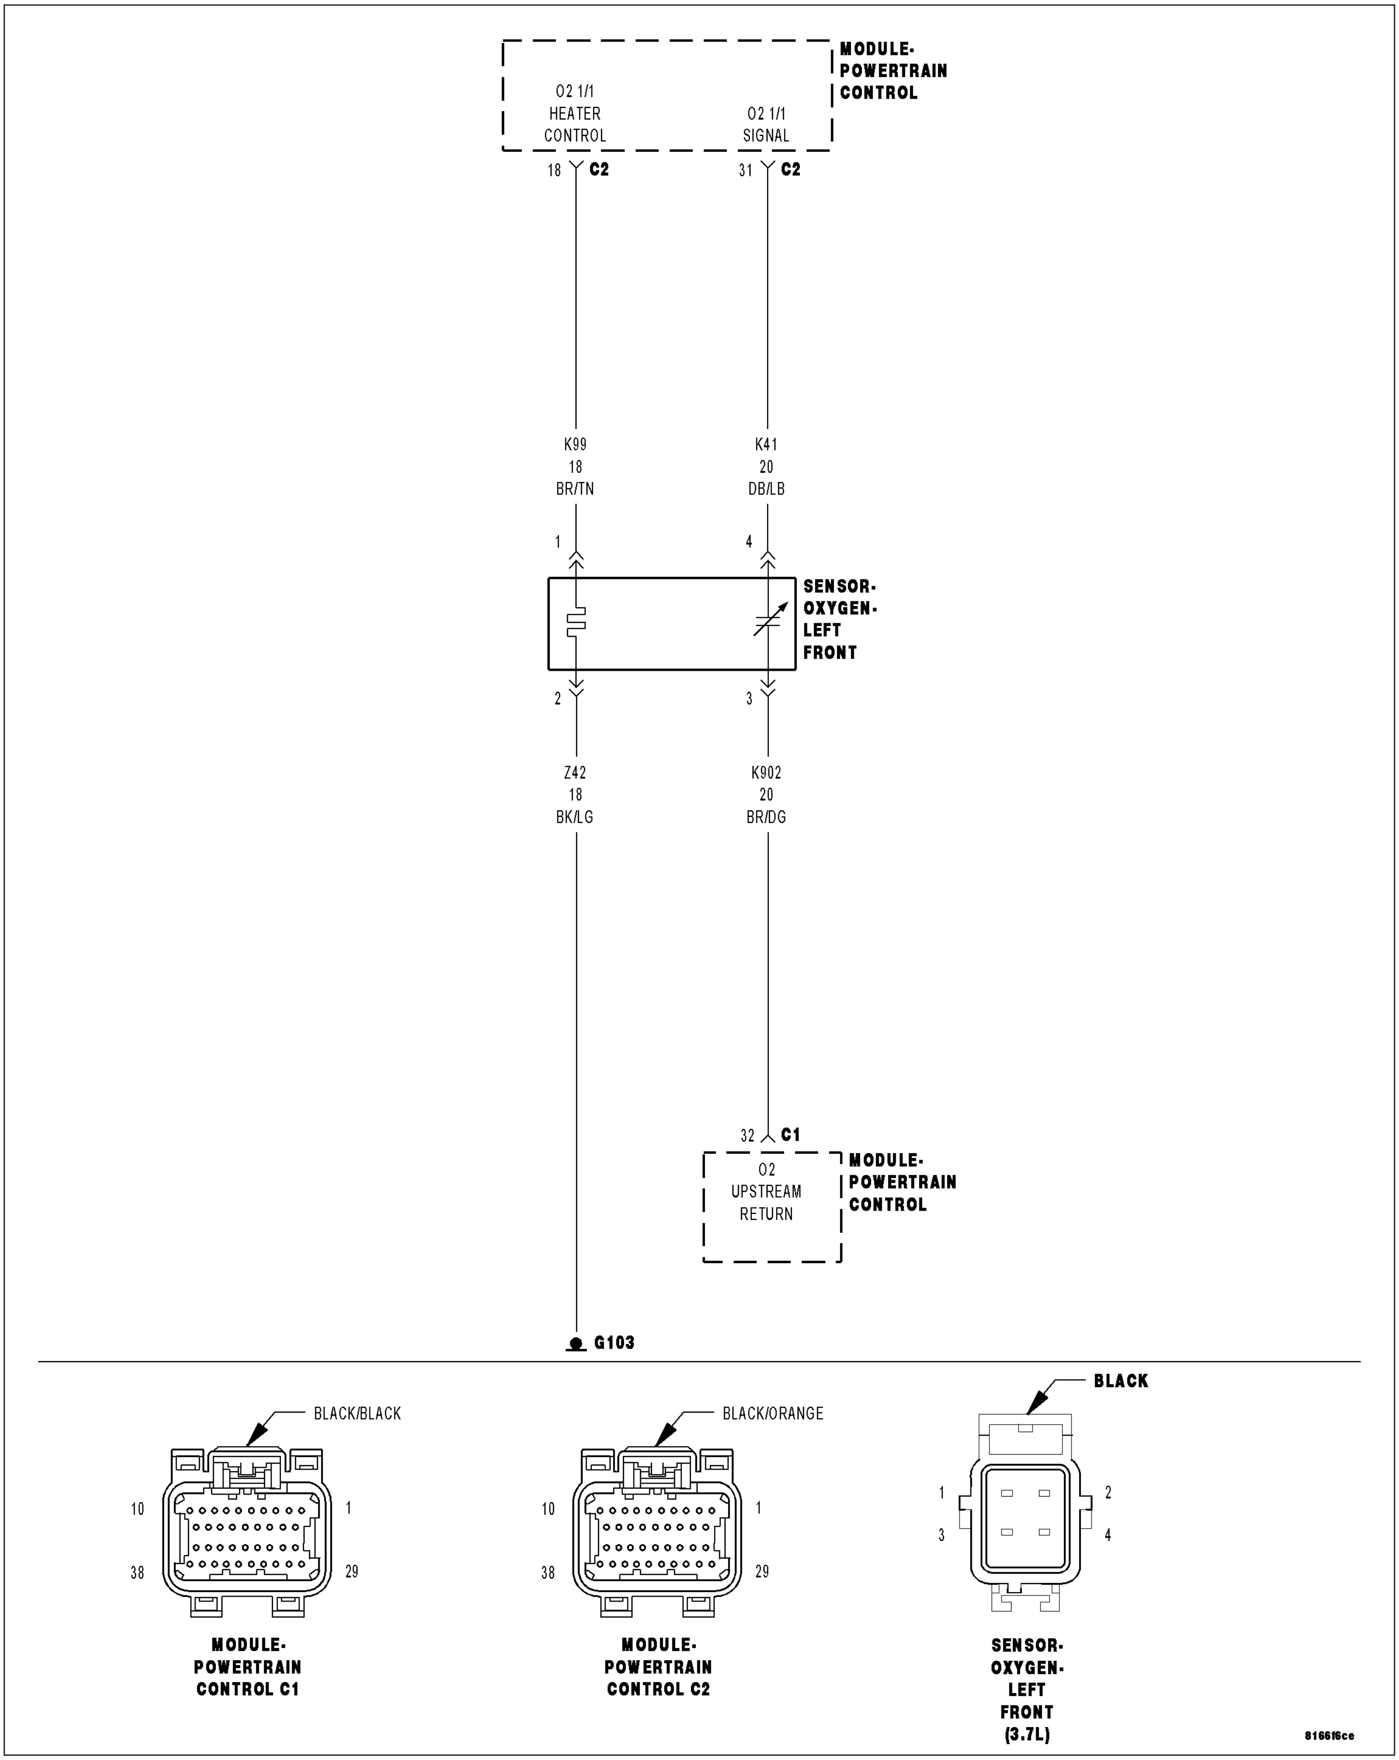
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

# P0032-O2 SENSOR 1/1 HEATER CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Battery voltage above 10.6 volts, ASD is powered up, and O2 heater is off.
- **Set Condition:**
  Desired state does not equal Actual state. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K99) O2 1/1 HEATER CONTROL CIRCUIT OPEN |
| (Z42) O2 1/1 HEATER GROUND CIRCUIT OPEN |
| (K99) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| O2 SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, check DTC's

**Is the DTC active at this time?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. O2 HEATER ELEMENT

Turn the ignition off.

**NOTE: Allow the O2 Sensor to cool down to room temperature.**

Disconnect the 1/1 O2 Sensor harness connector.

Measure the resistance across the O2 Sensor Heater element between the O2 Heater Control terminal and the O2 Heater ground terminal at the component.

**NOTE: O2 Heater Element resistance values should be measured at 70°F (21.1°C). The resistance value will vary with different temperature values.**

**Is the O2 Sensor Heater Element resistance between 2.0 and 30.0 ohms?**

**Yes** >> Go To 3

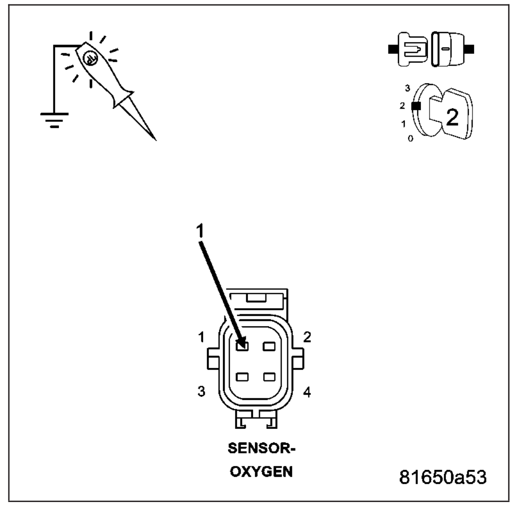
**No** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 3. (K99) O2 1/1 HEATER CONTROL CIRCUIT

Ignition on, engine not running.

With a scan tool, actuate the O2 1/1 Heater Test with the Sensor harness connector still disconnected.

Using a 12-volt test light connected to ground, probe the (K99) O2 1/1 Heater Control circuit in the O2 Sensor harness connector.



**Does the test light illuminate brightly and flash on and off during the actuation?**

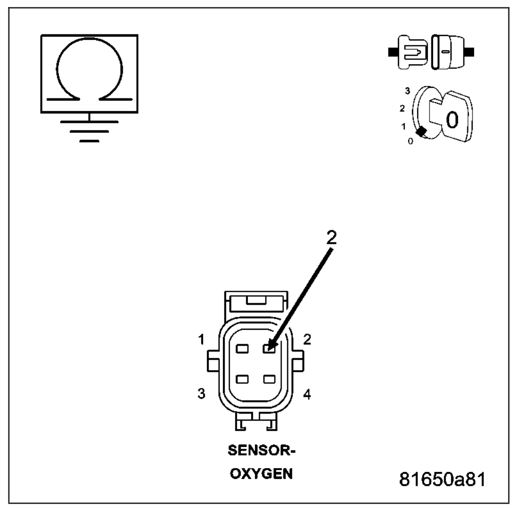
**Yes** >> Go To 4

**No** >> Go To 5

## 4. (Z42) O2 HEATER GROUND CIRCUIT OPEN

Turn the ignition off.

Measure the resistance between an engine ground and the (Z42) O2 1/1 Heater ground circuit in the O2 Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Repair the open in the (Z42) O2 1/1 Heater ground circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

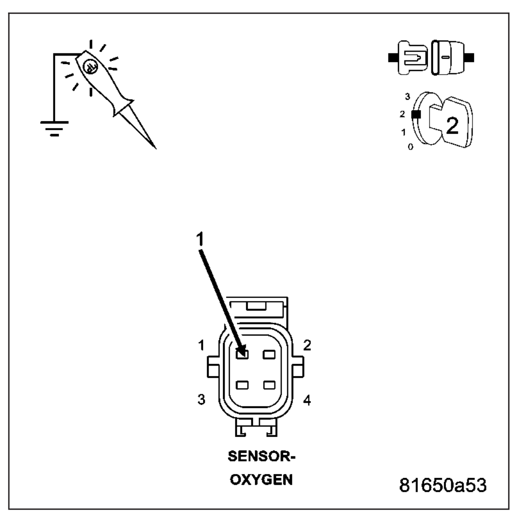
## 5. (K99) O2 1/1 HEATER CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, probe the (K99) O2 1/1 Heater Control circuit in the O2 Sensor harness connector.



**Does the test light illuminate brightly?**

**Yes** >> Repair the short to battery voltage in the (K99) O2 1/1 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

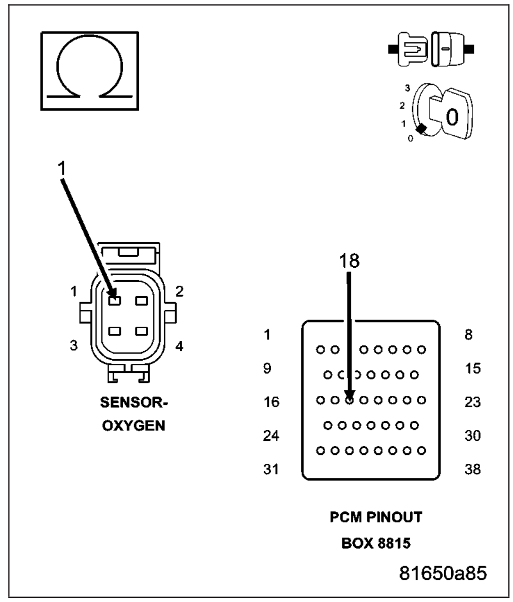
**No** >> Go To 6

## 6. (K99) O2 1/1 HEATER CONTROL CIRCUIT OPEN

Turn the ignition off.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K99) O2 1/1 Heater Control circuit from the O2 Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the open in the (K99) O2 1/1 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 7. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

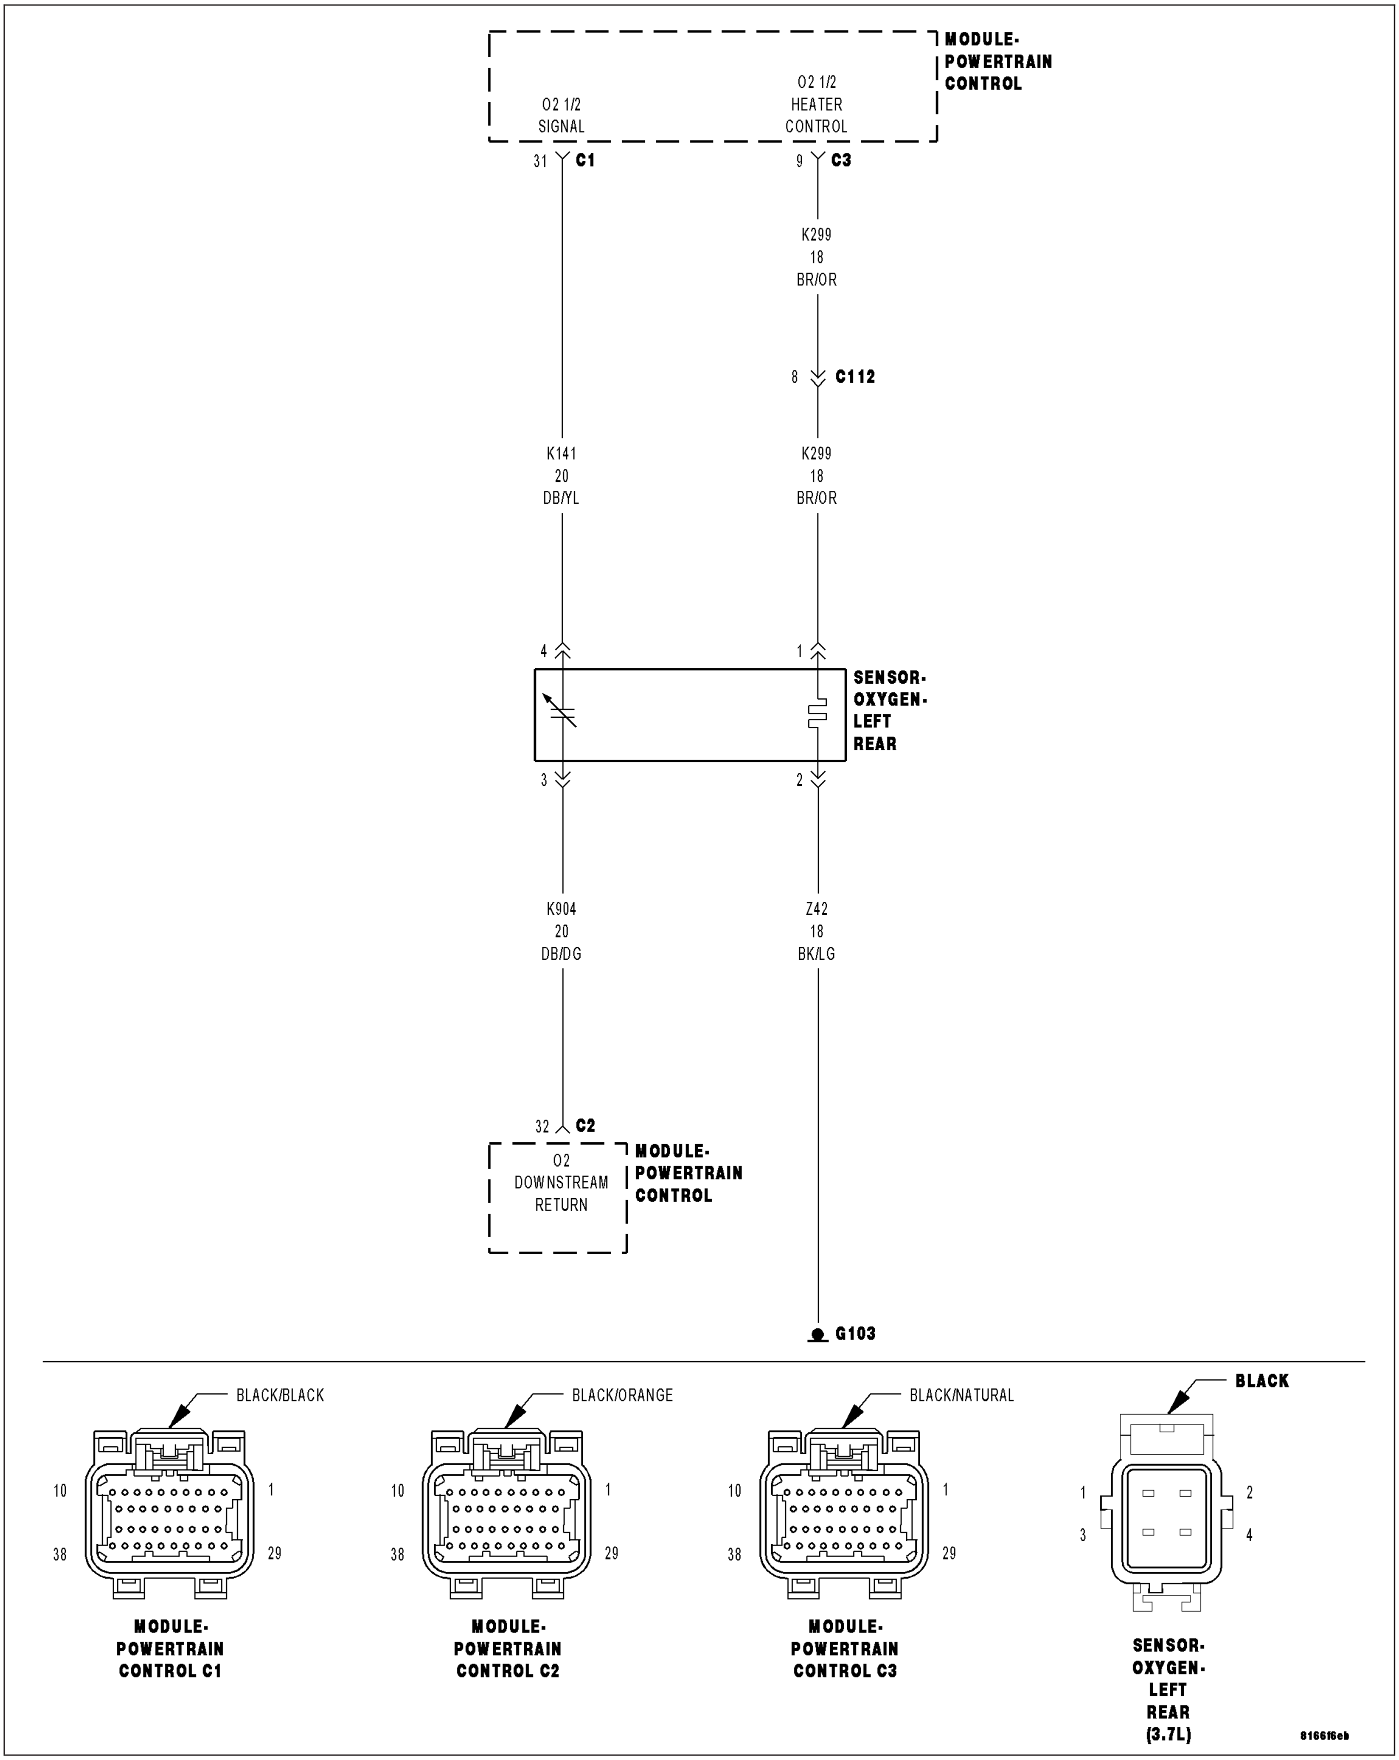
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0037-O2 SENSOR 1/2 HEATER CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Battery voltage above 10.6 volts, ASD is powered up, and O2 heater is on.
- **Set Condition:**
  Desired state does not match Actual state. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K299) O2 1/2 HEATER CONTROL CIRCUIT SHORTED TO GROUND |
| O2 SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. O2 SENSOR HEATER OPERATION

Turn the ignition off.

**NOTE: Wait a minimum of 8 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.**

Ignition on, engine not running.

With a scan tool, actuate the O2 1/2 Heater Test.

With the scan tool, monitor 1/2 O2 Sensor voltage for at least 2 minutes.

**Does the O2 Sensor voltage stay above 4.5 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. O2 HEATER ELEMENT

Turn the ignition off.

**NOTE: Allow the O2 Sensor to cool down to room temperature.**

Disconnect the 1/2 O2 Sensor harness connector.

Measure the resistance across the O2 Sensor Heater element, between the O2 Heater Control terminal and the O2 Heater ground terminal at the component.

**NOTE: O2 Heater Element resistance values should be measured at 70°F (21.1°C). The resistance value will vary with different temperature values.**

**Is the O2 Sensor Heater Element resistance between 2.0 and 30.0 ohms?**

**Yes** >> Go To 3

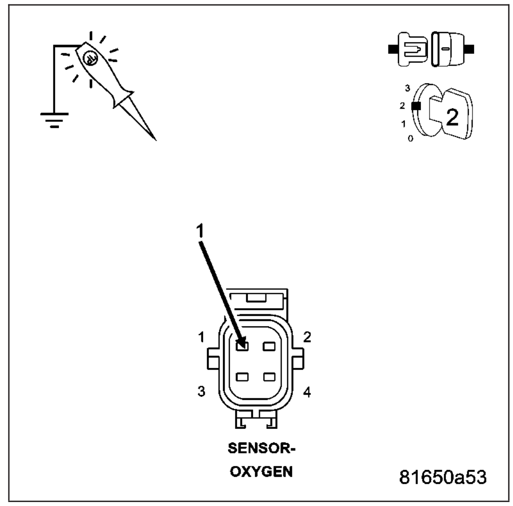
**No** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 3. O2 SENSOR

Ignition on, engine not running.

With a scan tool, actuate the O2 Heater Test with the 1/2 O2 Sensor harness connector still disconnected.

Using a 12-volt test light connected to ground, probe the (K299) O2 1/2 Heater Control circuit in the O2 Sensor harness connector.



**Does the test light illuminate brightly and flash on and off during the actuation?**

**Yes** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

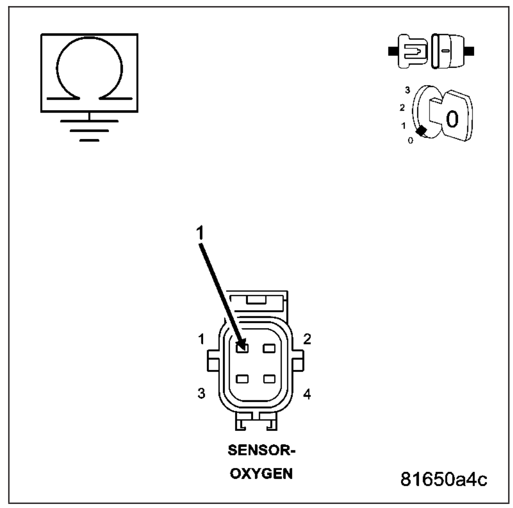
**No** >> Go To 4

## 4. (K299) O2 1/2 HEATER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C3 PCM harness connector.

Measure the resistance between ground and the (K299) O2 1/2 Heater Control circuit in the O2 Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short to ground in the (K299) O2 1/2 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

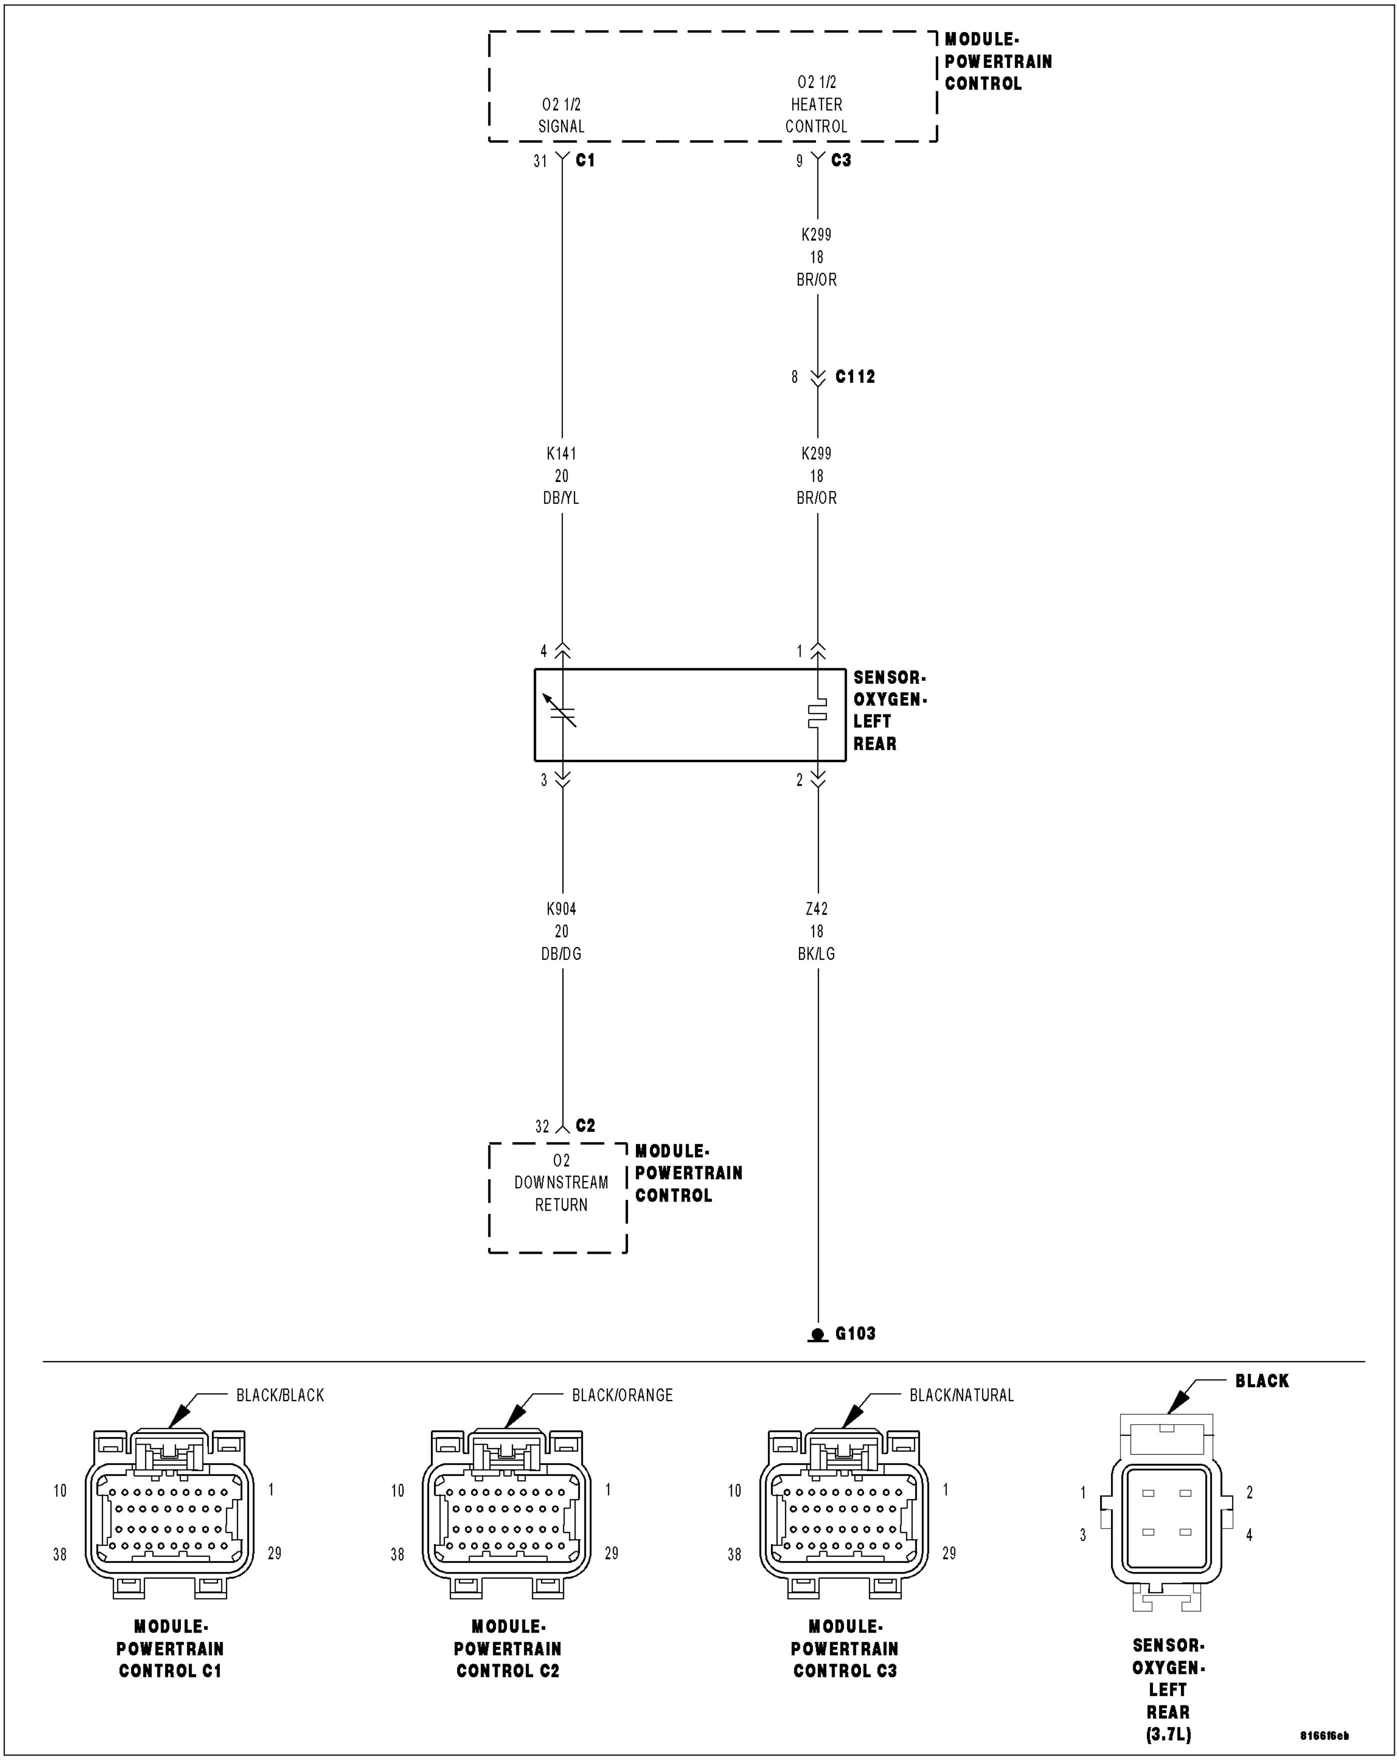
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0038-O2 SENSOR 1/2 HEATER CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Battery voltage above 10.6 volts, ASD is powered up, and O2 heater is off.
- **Set Condition:**
  Desired state does not equal Actual state. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K299) O2 1/2 HEATER CONTROL CIRCUIT OPEN |
| (Z42) O2 1/2 HEATER GROUND CIRCUIT OPEN |
| (K299) O2 SENSOR 1/2 HEATER CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| O2 SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, read DTC's.

**Is the DTC active at this time?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. O2 HEATER ELEMENT

Turn the ignition off.

**NOTE: Allow the O2 Sensor to cool down to room temperature.**
Disconnect the 1/2 O2 Sensor harness connector.

Measure the resistance across the O2 Sensor Heater element, between the Heater Control terminal and the Heater ground terminal at the component.

**NOTE: O2 Heater Element resistance values should be measured at 70°F (21.1°C). The resistance value will vary with different temperature values.**

**Is the O2 Sensor Heater Element resistance between 2.0 and 30.0 ohms?**

**Yes** >> Go To 3

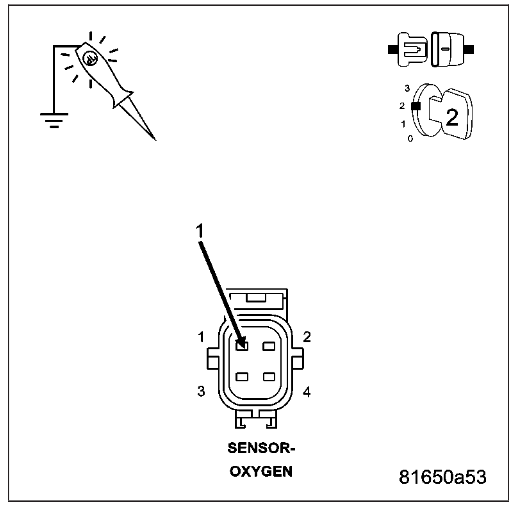
**No** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 3. (K299) O2 1/2 HEATER CONTROL CIRCUIT

Ignition on, engine not running.

With a scan tool, actuate the O2 1/2 Heater Test with the O2 Sensor harness connector still disconnected.

Using a 12-volt test light connected to ground, probe the (K299) O2 1/2 Heater Control circuit in the O2 Sensor harness connector.



**Does the test light illuminate brightly and flash on and off during the actuation?**

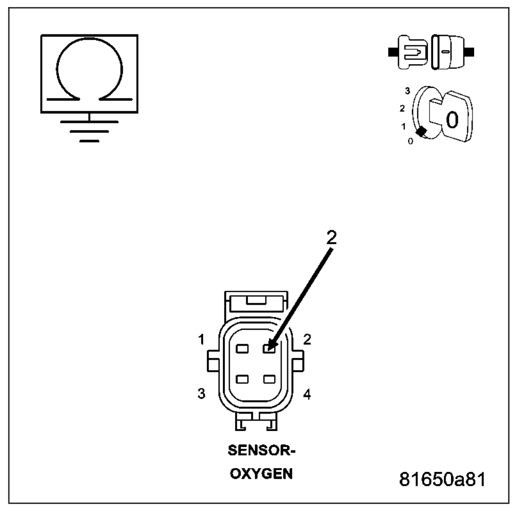
**Yes** >> Go To 4

**No** >> Go To 5

## 4. (Z42) O2 HEATER GROUND CIRCUIT OPEN

Turn the ignition off.

Measure the resistance between an engine ground and the (Z42) O2 1/2 Heater ground circuit in the O2 Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the O2 Sensor.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Repair the open in the (Z42) O2 1/2 Heater ground circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

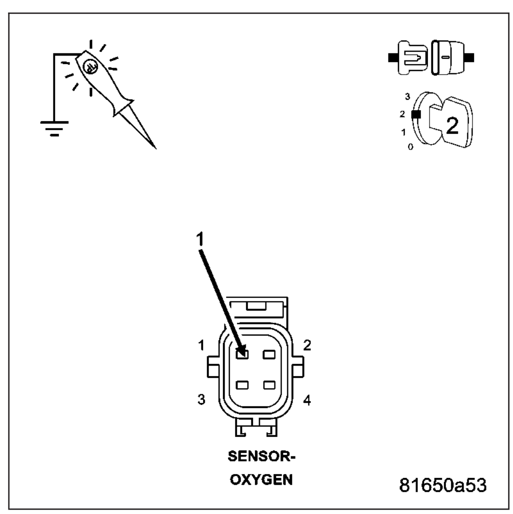
## 5. (K299) O2 1/2 HEATER CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.

Disconnect the C3 PCM harness connector.

Ignition on, engine not running.

Using a 12-volt test light connect to ground, probe the (K299) O2 1/2 Heater Control circuit in the O2 Sensor harness connector.



**Does the test light illuminate brightly?**

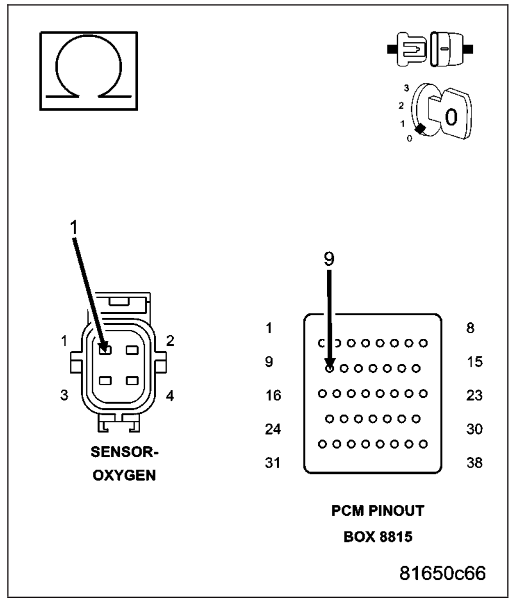
**Yes** >> Repair the short to battery voltage in the (K299) O2 1/2 Heater Control circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (K299) O2 1/2 HEATER CONTROL CIRCUIT OPEN

Turn the ignition off.



**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K299) O2 1/2 Heater Control circuit from the O2 Sensor harness connector to the appropriate terminal of special tool #8815.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the open in the (K299) O2 1/2 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 7. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

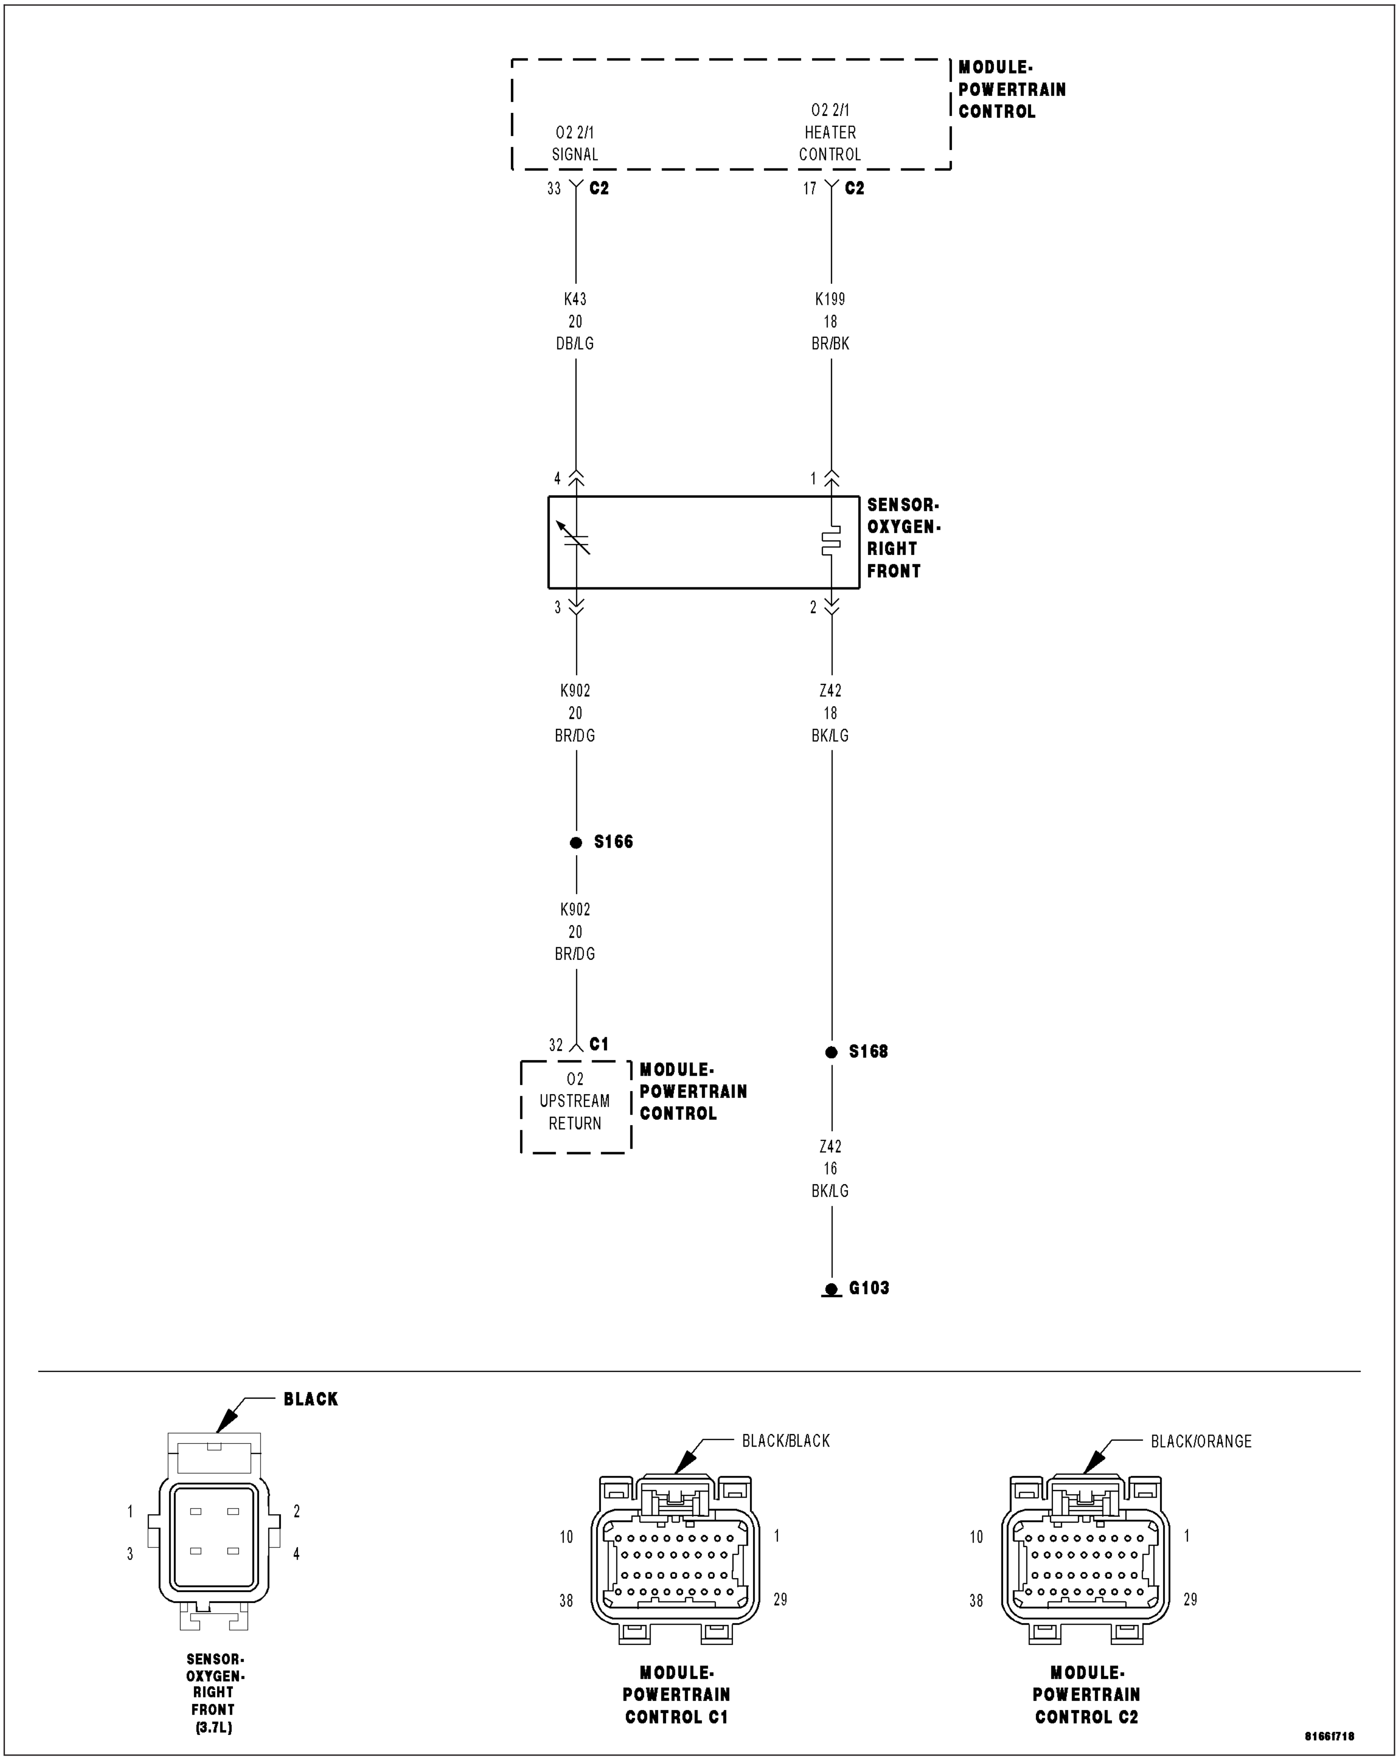
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0051-O2 SENSOR 2/1 HEATER CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Battery voltage above 10.6 volts, ASD is powered up, and O2 heater is on.
- **Set Condition:**
  Desired state does not match Actual state. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K199) O2 2/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND |
| O2 SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. O2 SENSOR HEATER OPERATION

Turn the ignition off.

**NOTE: Wait a minimum of 8 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.**

Ignition on, engine not running.

With a scan tool, actuate the O2 Heater Test.

With a scan tool, monitor 2/1 O2 Sensor voltage for at least 2 minutes.

**Does the O2 Sensor voltage stay above 4.5 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. O2 HEATER ELEMENT

Turn the ignition off.

**NOTE: Allow the O2 Sensor to cool down to room temperature.**

Disconnect the 2/1 O2 Sensor harness connector.

Measure the resistance across the O2 Sensor Heater element, between the Heater Control terminal and the Heater ground terminal at the component.

**NOTE: O2 Heater Element resistance values should be measured at 70°F (21.1°C). The resistance value will vary with different temperature values.**

**Is the O2 Sensor Heater Element resistance between 2.0 and 30.0 ohms?**

**Yes** >> Go To 3

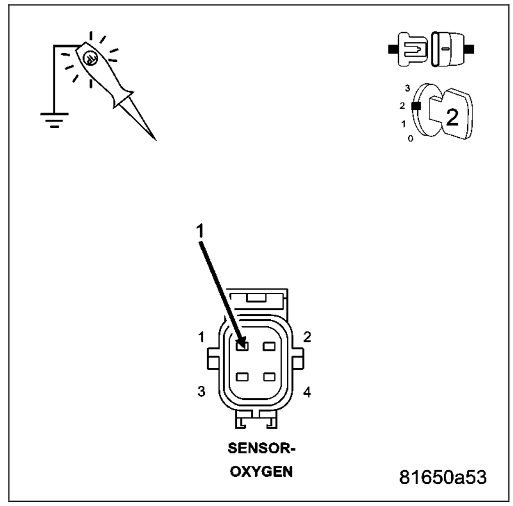
**No** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 3. O2 SENSOR

Ignition on, engine not running.

With a scan tool, actuate the O2 Heater Test with the O2 Sensor harness connector still disconnected.

Using a 12-volt test light connected to ground, probe the (K199) O2 2/1 Heater Control circuit in the O2 Sensor harness connector.



**Does the test light illuminate brightly and flash on and off during the actuation?**

**Yes** >> Replace the O2 Sensor.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

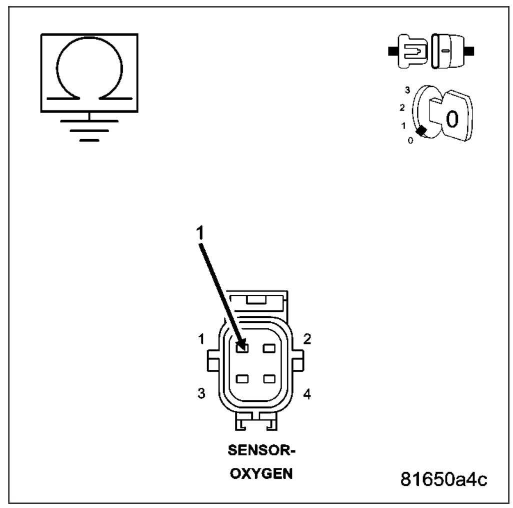
**No** >> Go To 4

## 4. (K199) O2 2/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Measure the resistance between ground and the (K199) O2 2/1 Heater Control circuit in the O2 Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short to ground in the (K199) O2 2/1 Sensor Heater Control circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

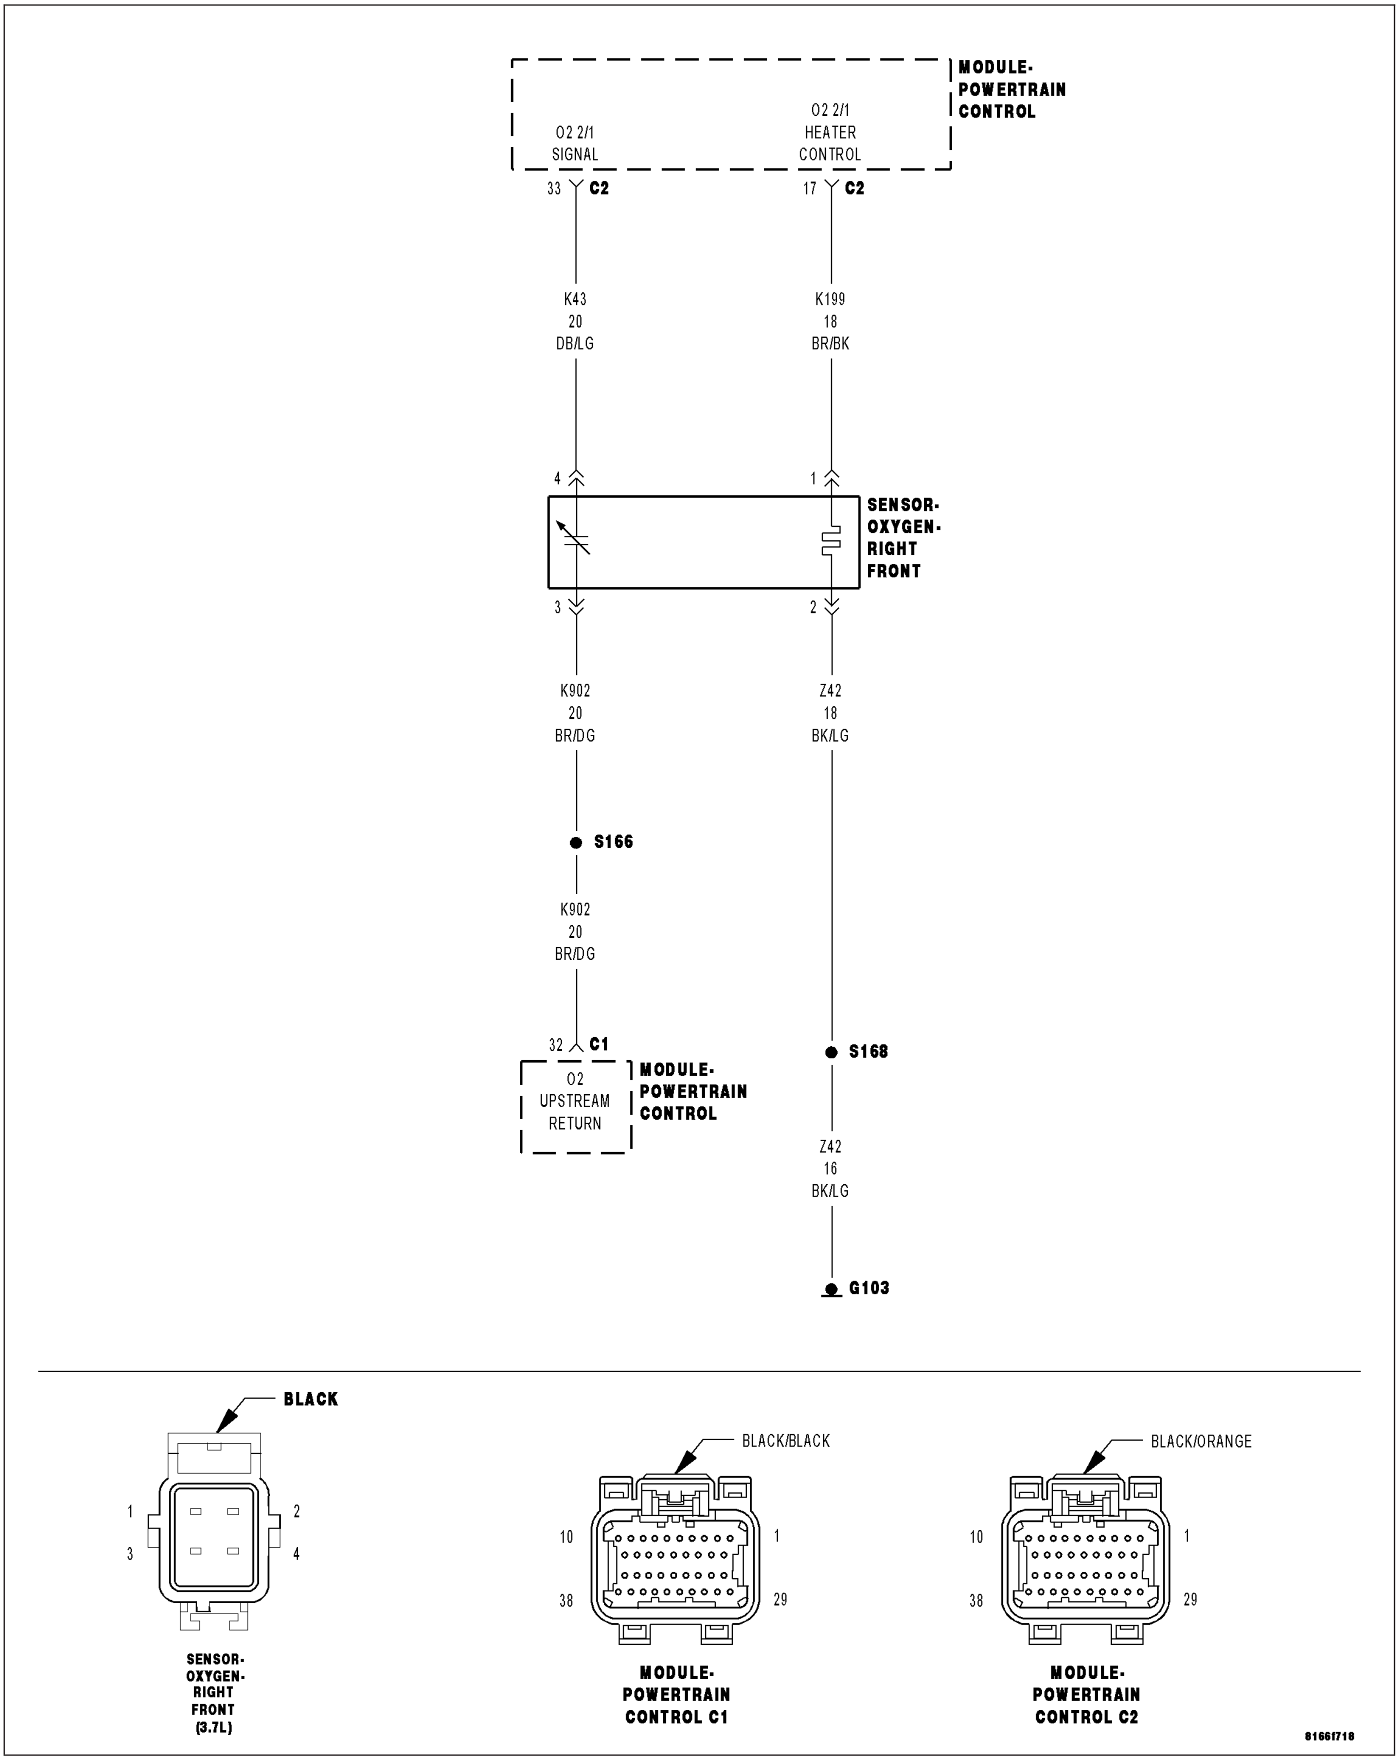
**Yes** >> Repair as necessary.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0052-O2 SENSOR 2/1 HEATER CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Battery voltage above 10.6 volts, ASD is powered up, and O2 heater is off.
- **Set Condition:**
  Desired state does not equal Actual state. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K199) O2 2/1 HEATER CONTROL CIRCUIT OPEN |
| (Z42) O2 2/1 HEATER GROUND CIRCUIT OPEN |
| (K199) O2 2/1 HEATER CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| O2 SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, read DTC's.

**Is the DTC active at this time?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. O2 HEATER ELEMENT

Turn the ignition off.

**NOTE: Allow the O2 Sensor to cool down to room temperature.**

Disconnect the 2/1 O2 Sensor harness connector.

Measure the resistance across the O2 Sensor Heater element, between the O2 Heater Control terminal and the Heater ground terminal at the component connector.

**NOTE: O2 Heater Element resistance values should be measured at 70°F (21.1°C). The resistance value will vary with different temperature values.**

**Is the O2 Sensor Heater Element resistance between 2.0 and 30.0 ohms?**

**Yes** >> Go To 3

**No** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 3. (K199) O2 2/1 HEATER CONTROL CIRCUIT

Ignition on, engine not running.

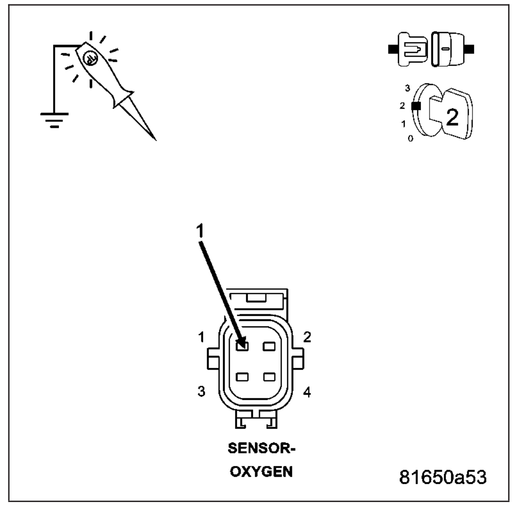
With the scan tool, actuate the O2 Heater Test with the Sensor harness connector still disconnected.

Using a 12-volt test light connected to ground, probe the (K199) O2 2/1 Heater Control circuit in the O2 Sensor harness connector.

**Does the test light illuminate brightly and flash on and off during the actuation?**

**Yes** >> Go To 4

**No** >> Go To 5



## 4. (Z42) O2 2/1 HEATER GROUND CIRCUIT OPEN

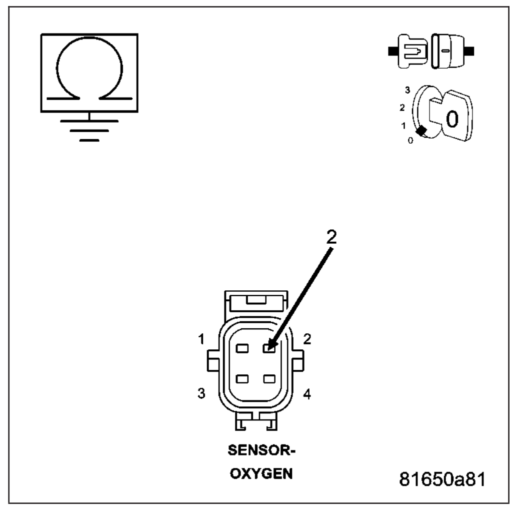
Turn the ignition off.

Measure the resistance between an engine ground and the (Z42) O2 2/1 Heater ground circuit in the O2 Sensor harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Repair the open in the (Z42) O2 2/1 Heater ground circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



## 5. (K199) O2 2/1 HEATER CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.

Disconnect the C2 PCM harness connector.

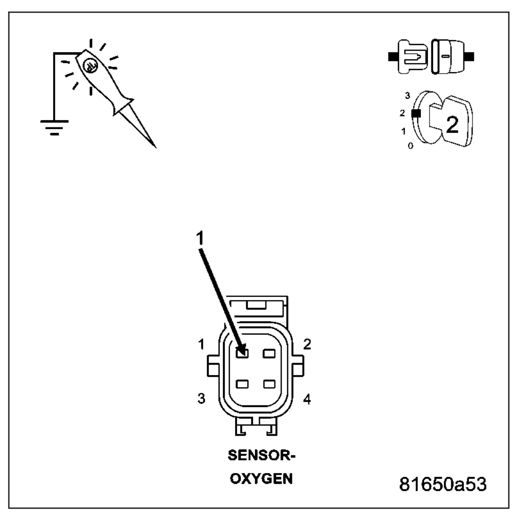
Ignition on, engine not running.

Using a 12-volt test light connected to ground, probe the (K199) O2 2/1 Heater Control circuit in the O2 Sensor harness connector.

**Does the test light illuminate?**

**Yes** >> Repair the short to battery voltage in the (K199) O2 2/1 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 6

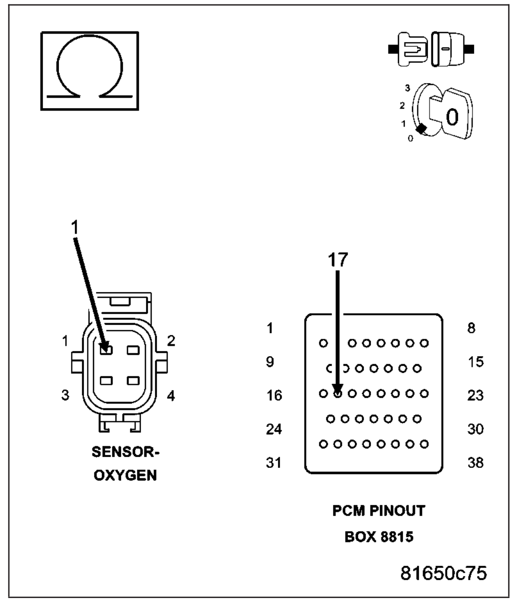


## 6. (K199) O2 2/1 HEATER CONTROL CIRCUIT OPEN

Turn the ignition off.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K199) O2 2/1 Heater Control circuit from the O2 Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the open in the (K199) O2 2/1 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 7. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

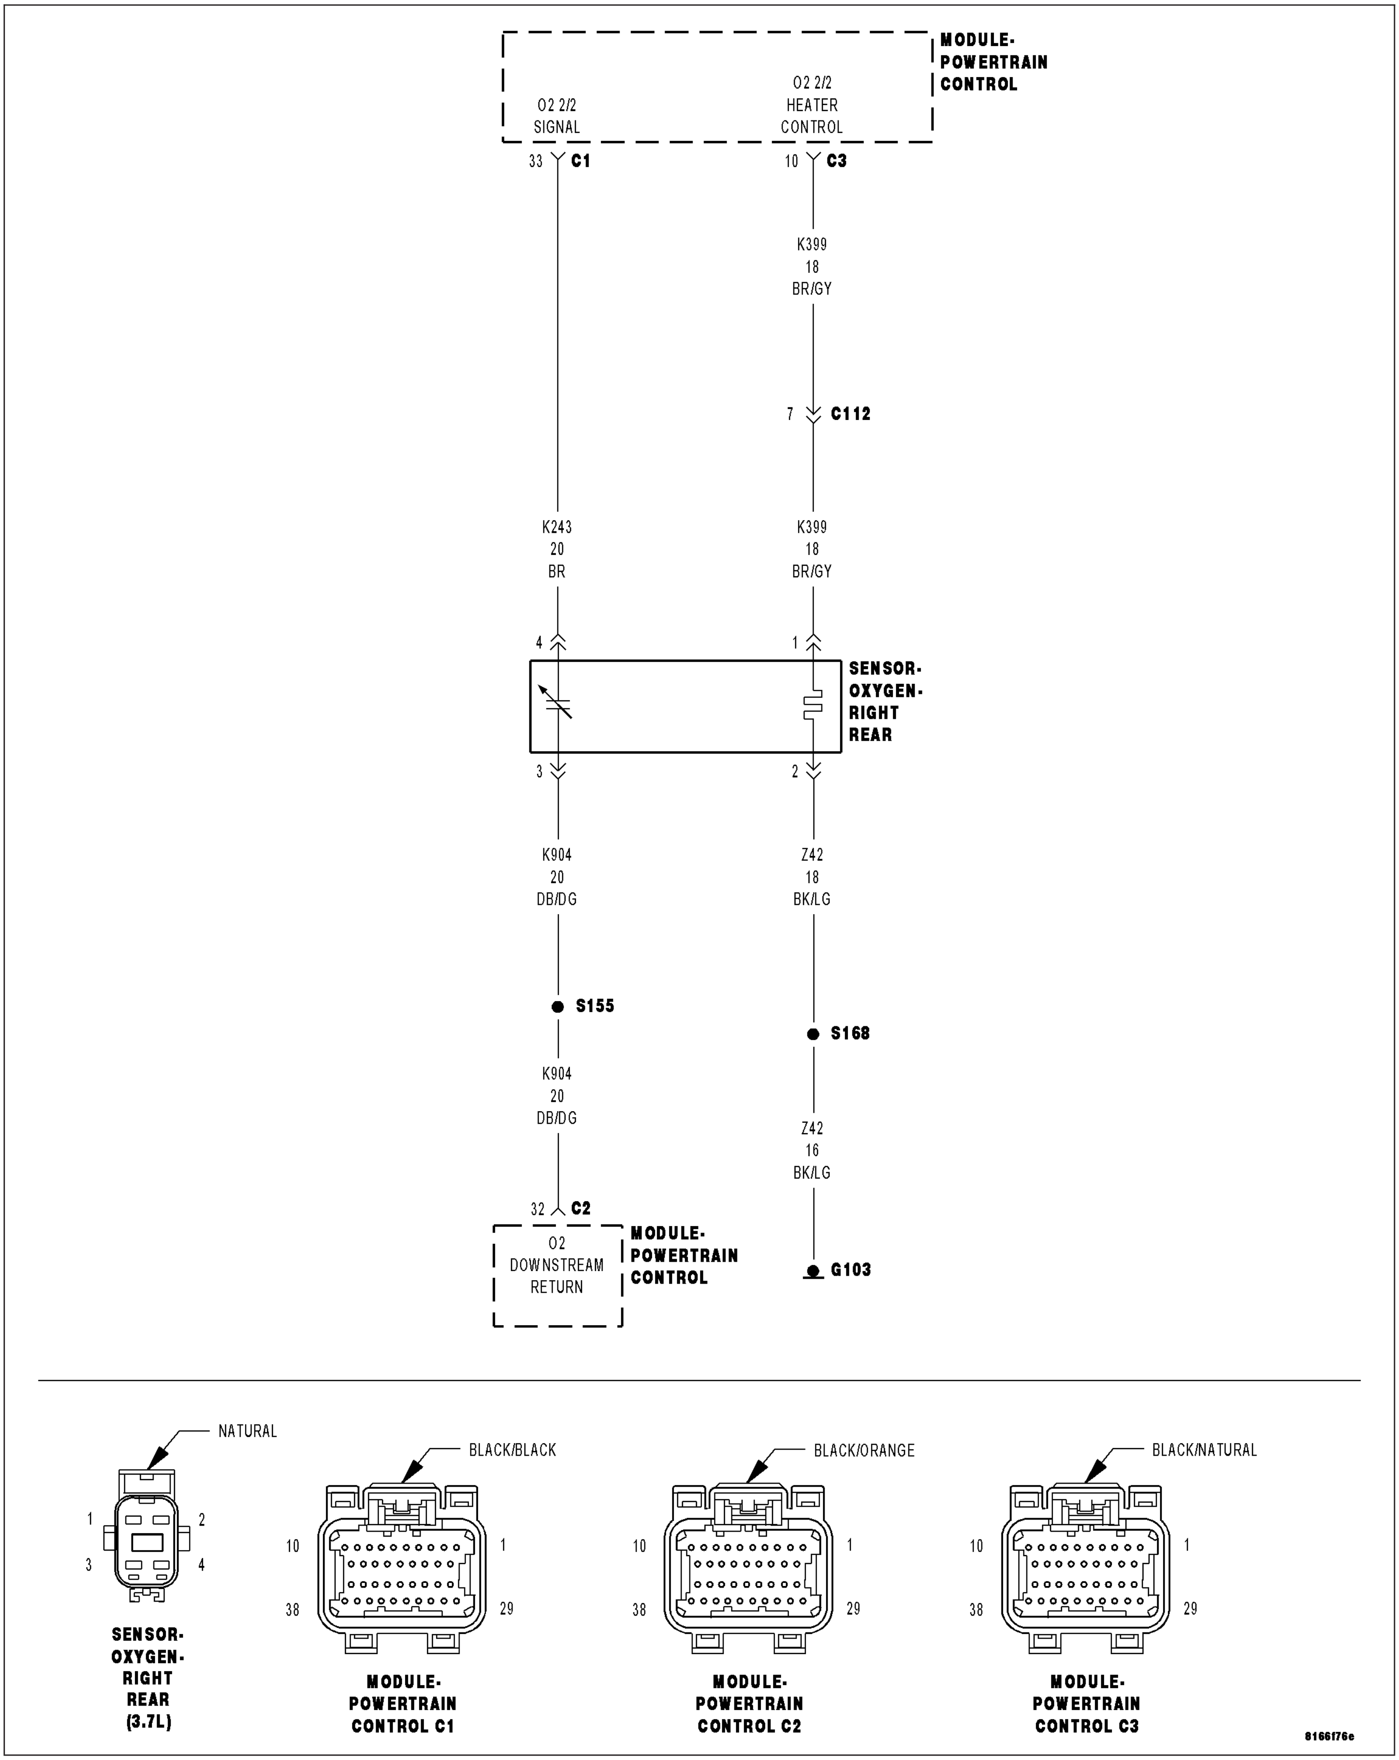
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0057-O2 SENSOR 2/2 HEATER CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Battery voltage above 10.6 volts, ASD is powered up, and O2 heater is on.
- **Set Condition:**
  Desired state does not match Actual state. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
| --- |
| (K399) O2 SENSOR 2/2 HEATER CONTROL CIRCUIT SHORTED TO GROUND |
| O2 SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. O2 SENSOR HEATER OPERATION

Turn the ignition off.

**NOTE: Wait a minimum of 8 minutes to allow the O2 Sensor to cool down before continuing the test. Allow the O2 Sensor voltage to stabilize at 5.0 volts.**

Ignition on, engine not running.

With a scan tool, actuate the O2 Heater Test.

With the scan tool, monitor 2/2 O2 Sensor voltage for at least 2 minutes.

**Does the O2 Sensor voltage stay above 4.5 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. O2 HEATER ELEMENT

Turn the ignition off.

**NOTE: Allow the O2 Sensor to cool down to room temperature.**

Disconnect the 2/2 O2 Sensor harness connector.

Measure the resistance across the O2 Sensor Heater element, between the O2 Heater Control terminal and the O2 Heater ground terminal in the component connector.

**NOTE: O2 Heater Element resistance values should be measured at 70°F (21.1°C). The resistance value will vary with different temperature values.**

**Is the O2 Sensor Heater Element resistance between 2.0 and 30.0 ohms?**

**Yes** >> Go To 3

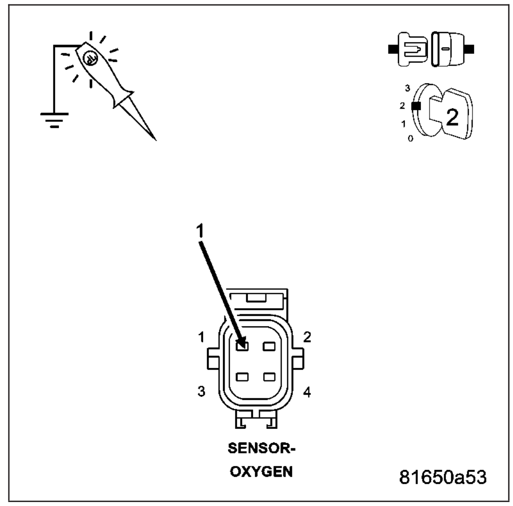
**No** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 3. O2 SENSOR

Ignition on, engine not running.

With a scan tool, actuate the O2 Heater Test with the O2 Sensor harness connector still disconnected.

Using a 12-volt test light connected to ground, probe the (K399) O2 2/2 Heater Control circuit in the O2 Sensor harness connector.



**Does the test light illuminate brightly and flash on and off during the actuation?**

**Yes** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

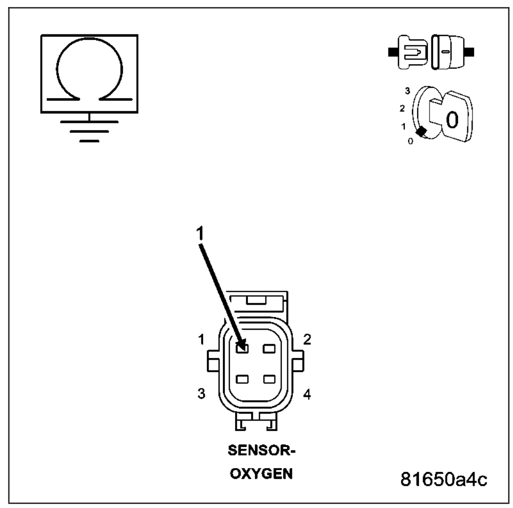
**No** >> Go To 4

## 4. (K399) O2 2/2 HEATER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C3 PCM harness connector.

Measure the resistance between ground and the (K399) O2 2/2 Heater Control circuit in the O2 Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short to ground in the (K399) O2 2/2 Sensor Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

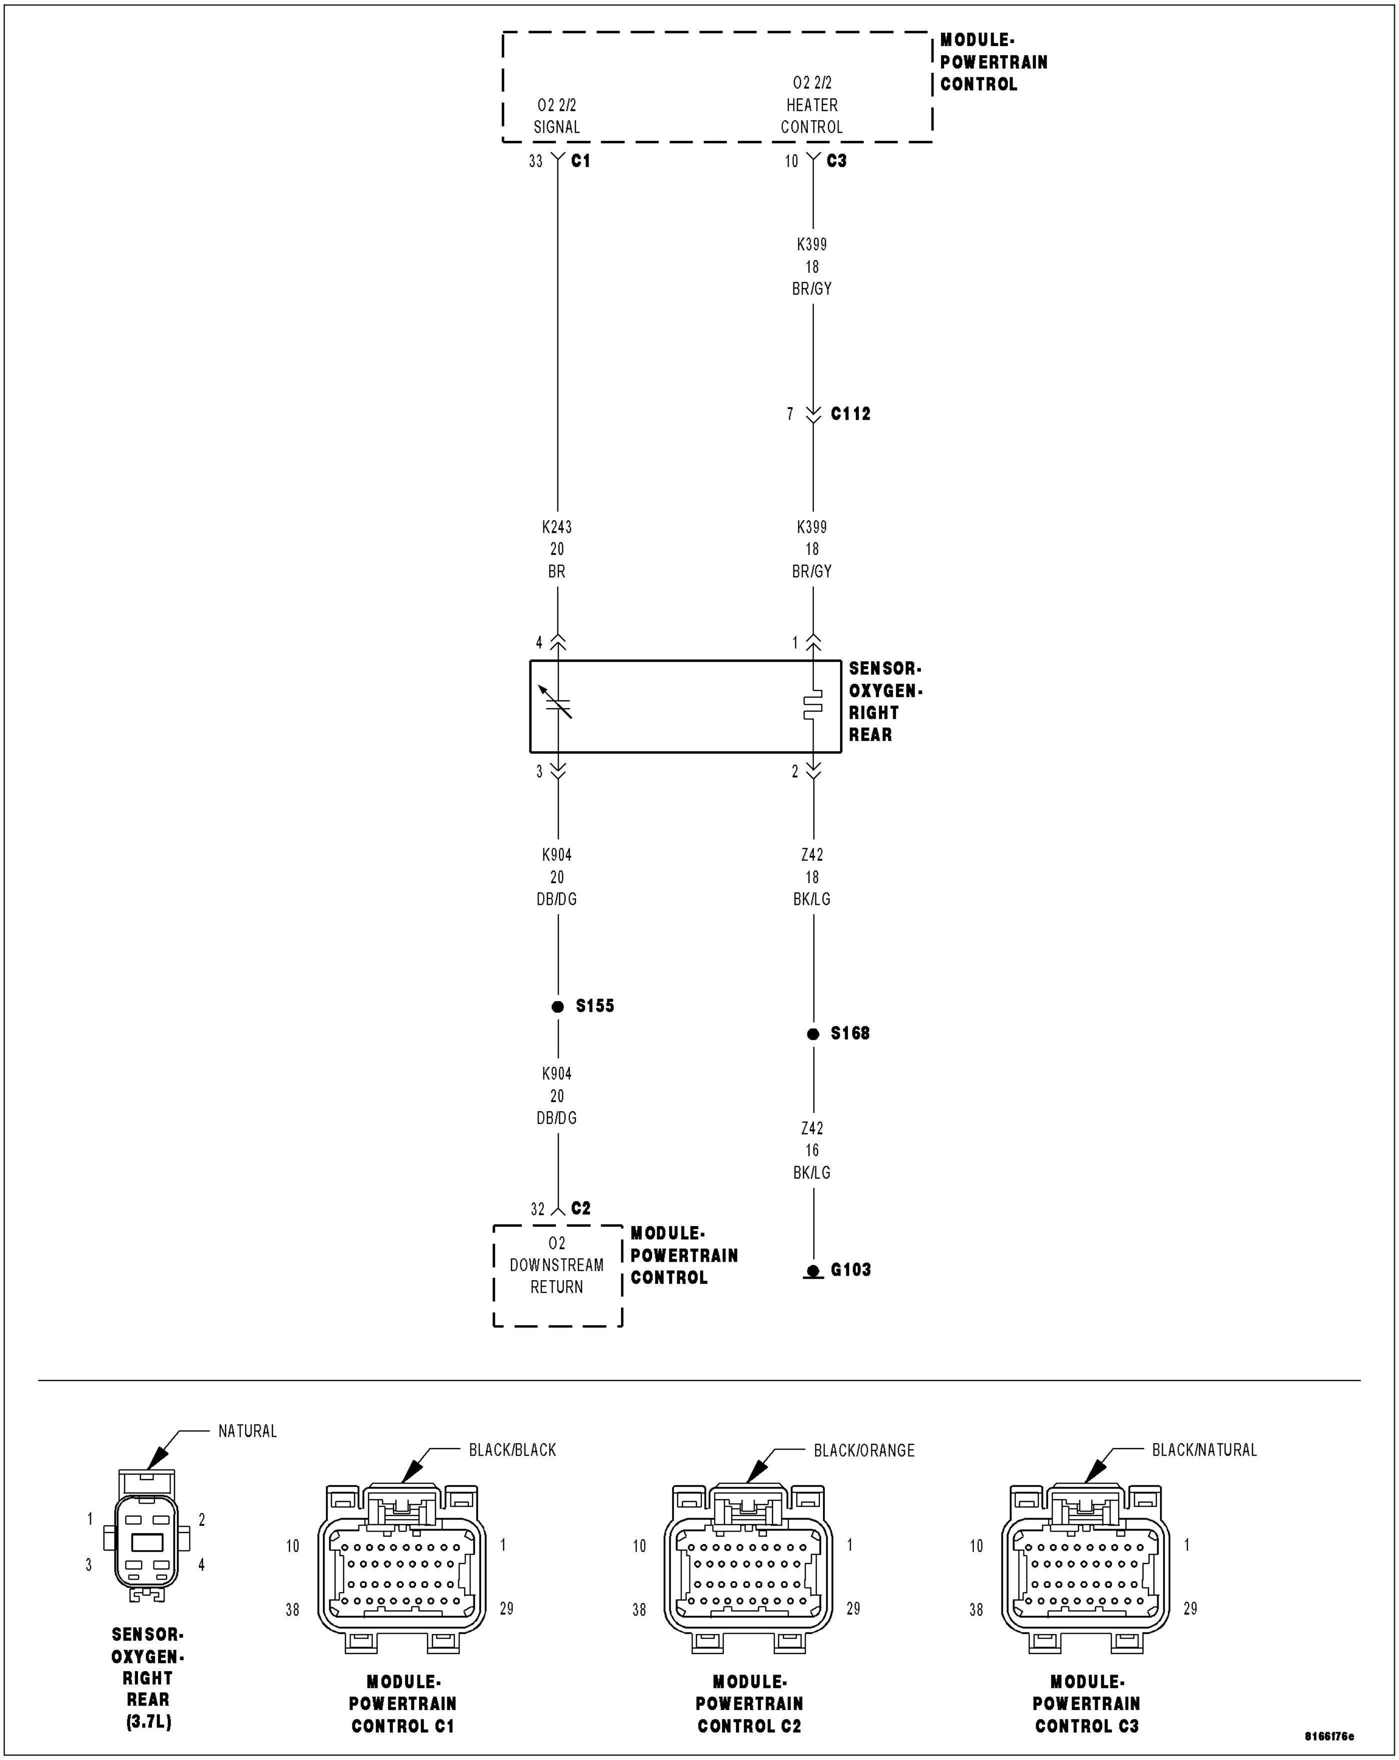
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0058-O2 SENSOR 2/2 HEATER CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Battery voltage above 10.6 volts, ASD is powered up, and O2 heater is off.
- **Set Condition:**
  Desired state does not equal Actual state. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
| --- |
| (K399) O2 2/2 HEATER CONTROL CIRCUIT OPEN |
| (Z42) O2 2/2 HEATER GROUND CIRCUIT OPEN |
| (K399) O2 2/2 HEATER CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| O2 SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, read DTC's.

**Is the DTC active at this time?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. O2 HEATER ELEMENT

Turn the ignition off.

**NOTE: Allow the O2 Sensor to cool down to room temperature.**

Disconnect the 2/2 O2 Sensor harness connector.

Measure the resistance across the O2 Sensor Heater element, between the O2 Heater Control terminal and the O2 Heater ground terminal in the component connector.

**NOTE: O2 Heater Element resistance values should be measured at 70°F (21.1°C). The resistance value will vary with different temperature values.**

**Is the O2 Sensor Heater Element resistance between 2.0 and 30.0 ohms?**

**Yes** >> Go To 3

**No** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 3. (K399) O2 2/2 HEATER CONTROL CIRCUIT

Ignition on, engine not running.

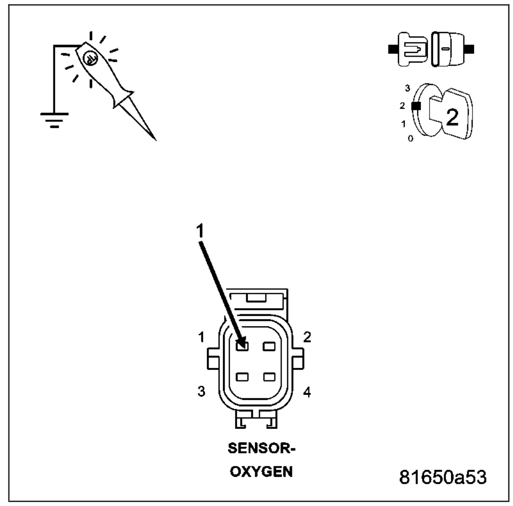
With a scan tool, actuate the O2 2/2 Heater Test with the Sensor harness connector still disconnected.

Using a 12-volt test light connected to ground, probe the (K399) O2 2/2 Heater Control circuit in the O2 Sensor harness connector.

**Does the test light illuminate brightly and flash on and off during the actuation?**

**Yes** >> Go To 4

**No** >> Go To 5



## 4. (Z42) O2 HEATER GROUND CIRCUIT OPEN

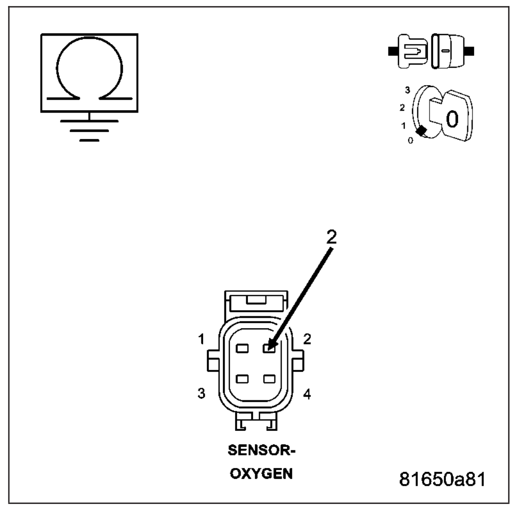
Turn the ignition off.

Measure the resistance between an engine ground and the (Z42) O2 2/2 Heater ground circuit in the O2 Sensor harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the O2 Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Repair the open in the (Z42) O2 2/2 Heater ground circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



## 5. (K399) O2 2/2 HEATER CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.

Disconnect the C3 PCM harness connector.

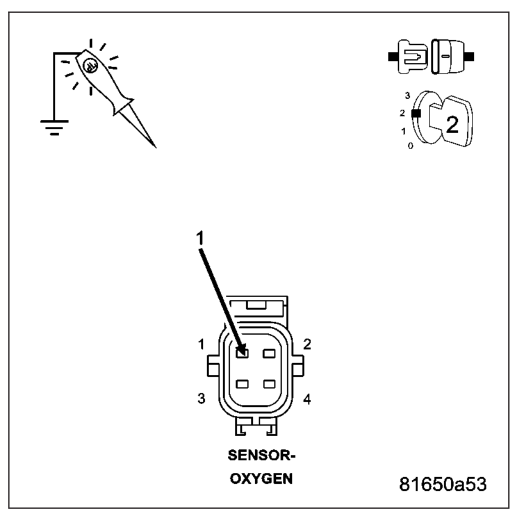
Ignition on, engine not running.

Using a 12-volt test light connected to ground, probe the (K399) O2 Heater 2/2 Control circuit in the O2 Sensor harness connector.

**Does the test light illuminate?**

**Yes** >> Repair the short to battery voltage in the (K399) O2 2/2 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 6

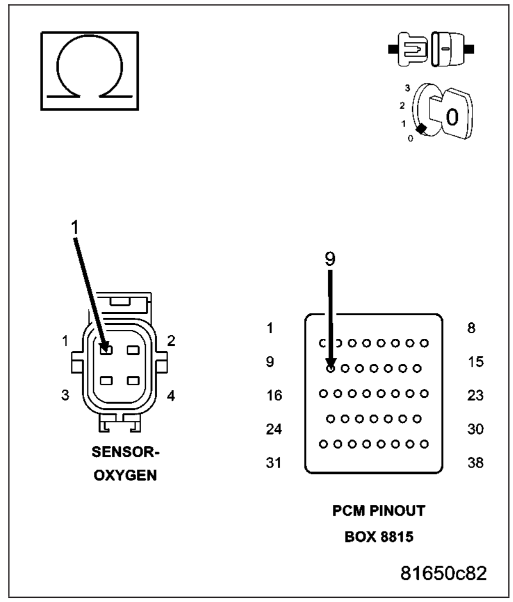


## 6. (K399) O2 2/2 HEATER CONTROL CIRCUIT OPEN

Turn the ignition off.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K399) O2 2/2 Heater Control circuit from the O2 Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the open in the (K399) O2 2/2 Heater Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ POWERTRAIN CONTROL MODULE - DIAGNOSIS AND TESTING)

## 7. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0068-MANIFOLD PRESSURE/THROTTLE POSITION CORRELATION

For a complete wiring diagram **Refer to Section 8W**.

### Theory of Operation

This DTC sets when an unexpected high intake manifold air flow condition exists that can lead to increased engine speed and puts the NGC into a High Air flow Protection limiting mode. The High Air flow Protection feature includes RPM limits for when a Throttle and/or MAP sensor limp-in fault is present.

- **When Monitored:**
  During all drive modes.
- **Set Condition:**
  If vacuum drops below 1.5″Hg with engine RPM greater than 2000 RPM and closed throttle. This fault can set due to a TPS/MAP sensor failure. It will set much faster than the TPS/MAP fault can mature. If there is not an obvious large intake leak, suspect a TPS/MAP fault. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| VACUUM LEAK |
| RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT |
| (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND |
| RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT |
| (K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND |
| RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT |
| (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND |
| RESISTANCE IN THE (K22) TP SENSOR NO.1 SIGNAL CIRCUIT |
| (K22) TP SENSOR NO.1 SIGNAL CIRCUIT SHORTED TO GROUND |
| RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT |
| MAP SENSOR |
| THROTTLE POSITION SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

### Diagnostic Test

#### 1. ACTIVE DTC

**NOTE: Diagnose any TP Sensor or MAP Sensor component DTCs before continuing.**

**NOTE: If the P0501 - No Vehicle Speed Signal is set long with this DTC, refer to the P0501 diagnostics before continuing.**

**NOTE: The throttle plate and linkage should be free from binding and carbon build up.**

**NOTE: Make sure the throttle plate is at the idle position.**

Ignition on, engine not running.

With a scan tool, read DTCs.

**Is the DTC active at this time?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 2. VACUUM LEAK

**NOTE: This code is enabled on engines with a plastic intake manifold and is intended to shut down the engine if a large crack occurs.**

**NOTE: A large vacuum leak is most likely the cause of this DTC.**

Inspect the Intake Manifold for leaks and cracks.

Inspect the Power Brake Booster for any vacuum leaks.

Inspect the PCV system for proper operation and vacuum leaks.

Inspect the throttle plate to see if it is bent and will close entirely, if it is bent it may need to be replaced.

Inspect the MAP Sensor for proper installation.

Verify the engine is free from any mechanical failures.

**Were any vacuum leaks found?**

**Yes** >> Repair the vacuum leak as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE) x

**No** >> Go To 3

## 3. MAP SENSOR OPERATION

Start the engine.

With a scan tool, monitor the MAP Sensor voltage.

Snap the throttle.

**Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?**

**Yes** >> Go To 4

**No** >> Go To 11

## 4. TP SENSOR OPERATION

Ignition on, engine not running.

With a scan tool, monitor the TP Sensor voltage while slowly pressing the throttle pedal from closed to wide open throttle.

**Does voltage start at approximately 0.8 of a volt and go above 3.5 volts with a smooth transition?**

**Yes** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. EXCESSIVE RESISTANCE IN THE (F855) 5-VOLT SUPPLY CIRCUIT

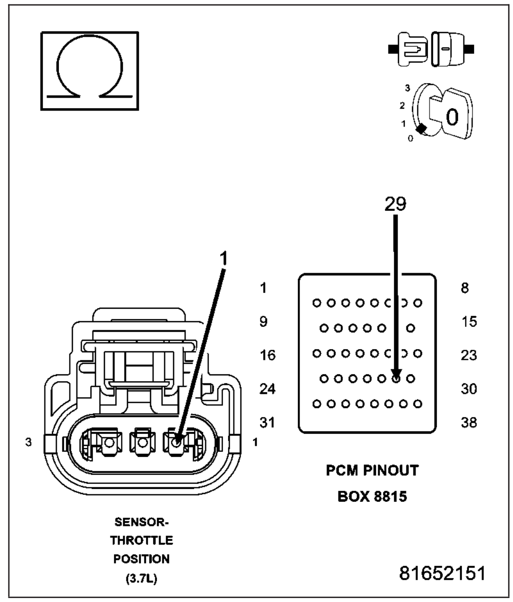
Turn the ignition off.

Disconnect the TP Sensor harness connector.

Disconnect the C2 PCM harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (F855) 5-volt Supply circuit from the TP Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

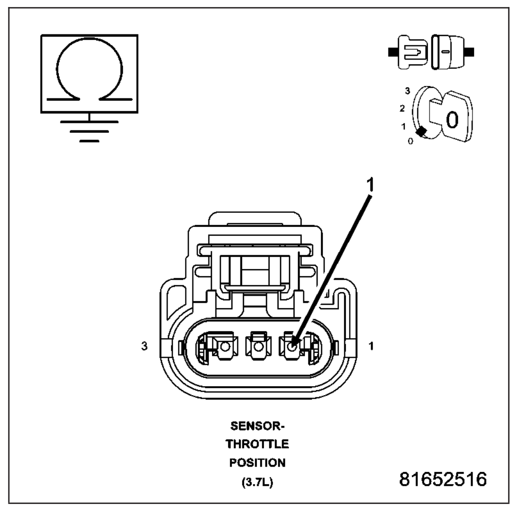
**Yes** >> Go To 6

**No** >> Repair the excessive resistance in the (F855) 5-volt Supply circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 6. (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and (F855) 5-volt Supply circuit in the TP Sensor harness connector.



**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (F855) 5-volt Supply circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 7

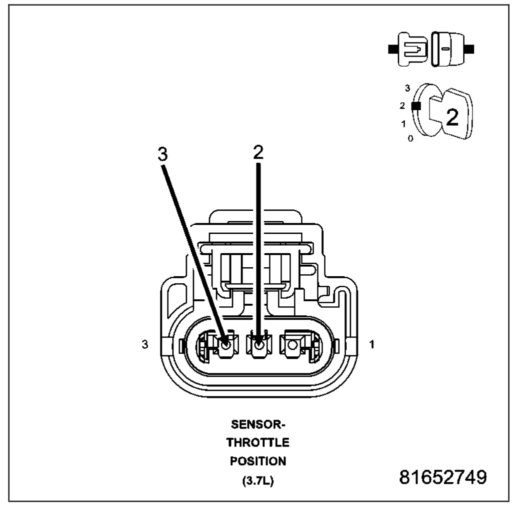
## 7. THROTTLE POSITION SENSOR

Connect the PCM harness connector.

Ignition on, engine not running.

With a scan tool, monitor the TP Sensor voltage.

Connect a jumper wire between the (K22) TP Sensor No.1 Signal circuit and the (K900) Sensor ground circuit in the Sensor harness connector.



**Does the TP Sensor voltage change from approximately 4.9 volts to below 0.5 of a volt with the jumper wire installed?**

**Yes** >> Replace the Throttle Position Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 8

**NOTE: Remove the jumper wire before continuing.**

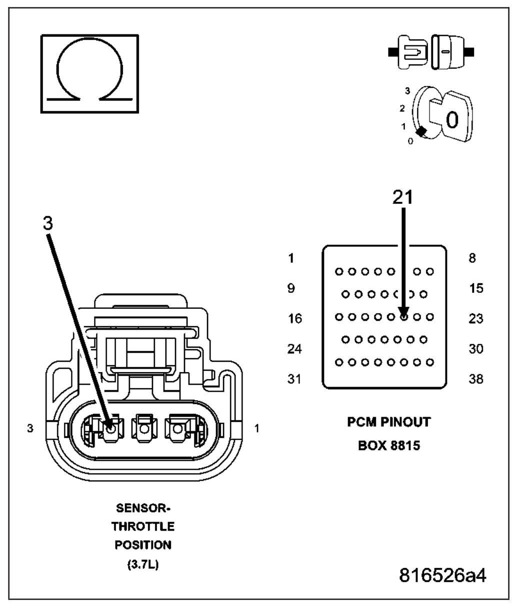
## 8. EXCESSIVE RESISTANCE IN THE (K22) TP NO.1 SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the C2 PCM harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K22) TP Sensor No.1 Signal circuit from the TP Sensor harness connector to the appropriate terminal of special tool #8815.



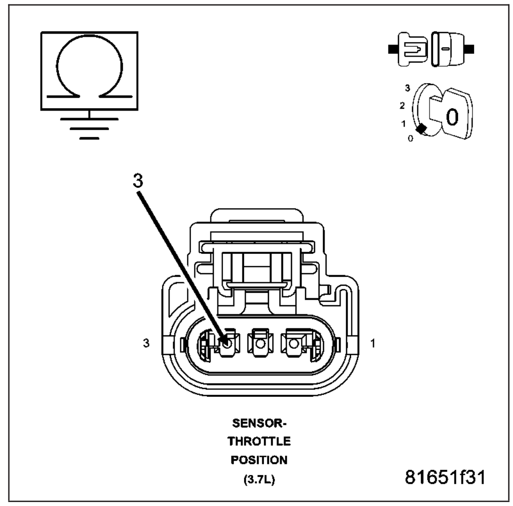
**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 9

**No** >> Repair the excessive resistance in the (K22) TP Sensor No.1 Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 9. (K22) TP SENSOR NO.1 SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K22) TP Sensor No.1 Signal circuit in the TP Sensor harness connector.



**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (K22) TP Sensor No.1 Signal circuit.

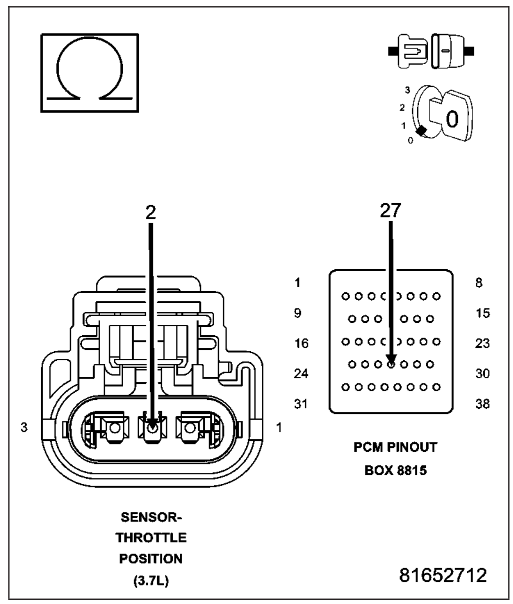
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 10

## 10. EXCESSIVE RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K900) Sensor ground circuit from the TP Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 17

**No** >> Repair the excessive resistance in the (K900) Sensor ground circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 11. EXCESSIVE RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT

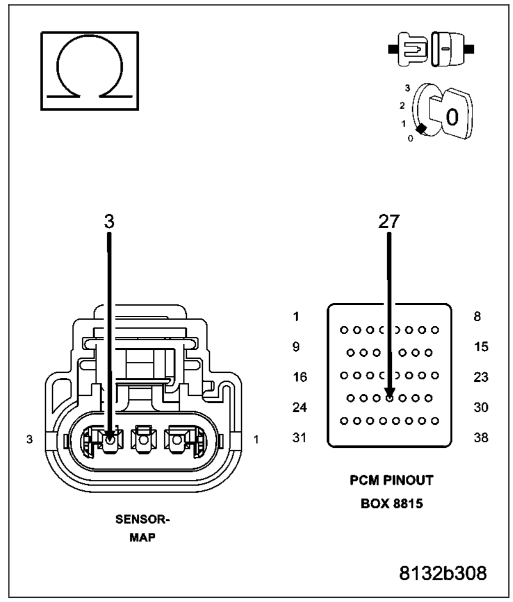
Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Disconnect the C1 PCM harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (F856) 5-volt Supply circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

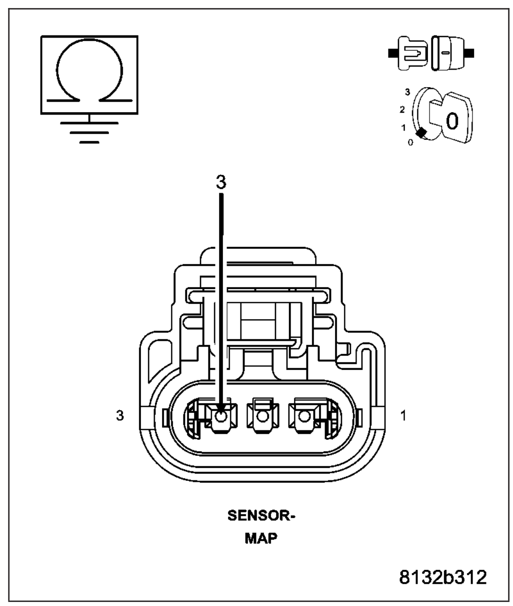
**Yes** >> Go To 12

**No** >> Repair the excessive resistance in the (F856) 5-volt Supply circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 12. (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit in the MAP Sensor harness connector.



**Is the resistance above 100k ohms?**

**Yes** >> Go To 13

**No** >> Repair the short to ground in the (F856) 5-volt Supply circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 13. MAP SENSOR

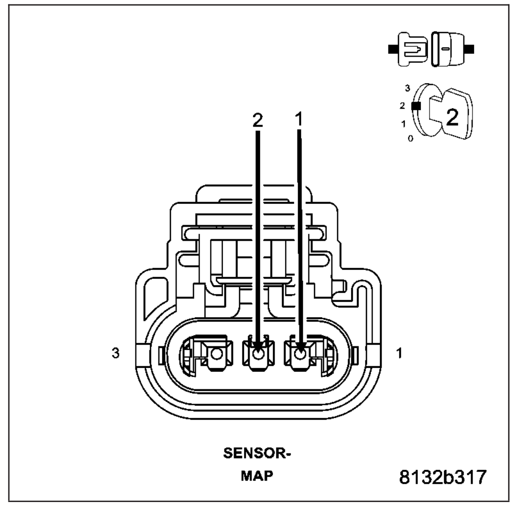
Turn the ignition off.

Connect the C1 PCM harness connector.

Ignition on, engine not running.

With a scan tool, monitor the MAP Sensor voltage.

Connect a jumper wire between the (K1) MAP Signal circuit and the (K900) Sensor ground circuit.



**Does the scan tool display MAP voltage from approximately 4.9 volts to below 0.5 of a volt with the jumper wire installed?**

**Yes** >> Replace the MAP Sensor.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

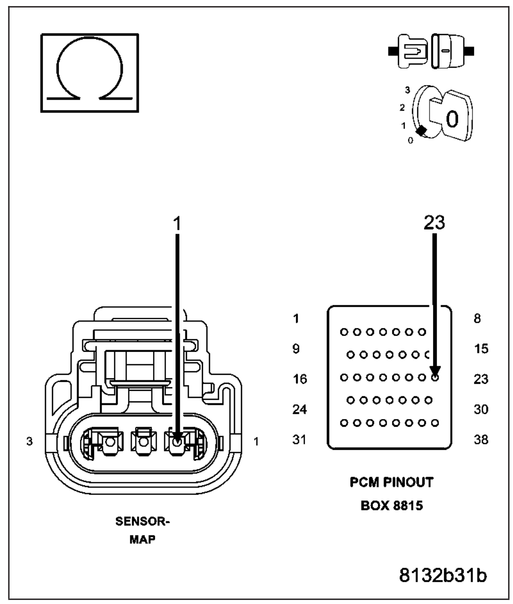
**No** >> Go To 14

**NOTE: Remove the jumper wire before continuing.**

## 14. EXCESSIVE RESISTANCE IN THE (K1) MAP SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the C2 PCM harness connector.



**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K1) MAP Signal circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.

**Is the resistance below 5.0 ohms?**

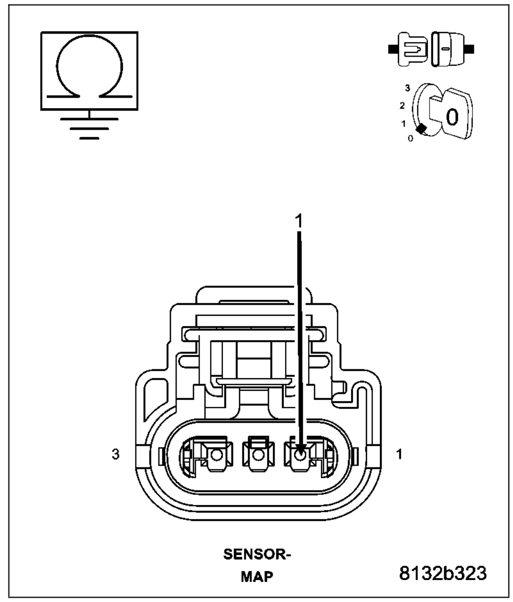
**Yes** >> Go To 15

**No** >> Repair the excessive resistance in the (K1) MAP Signal circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 15. (K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K1) MAP Signal circuit in the MAP Sensor harness connector.



**Is the resistance below 100 ohms?**

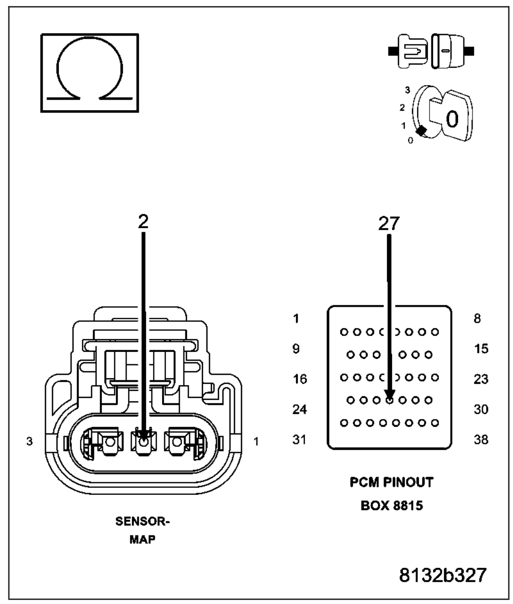
**Yes** >> Repair the short to ground in the (K1) MAP Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 16

## 16. EXCESSIVE RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K900) Sensor ground circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 17

**No** >> Repair the excessive resistance in the (K900) Sensor ground circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 17. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

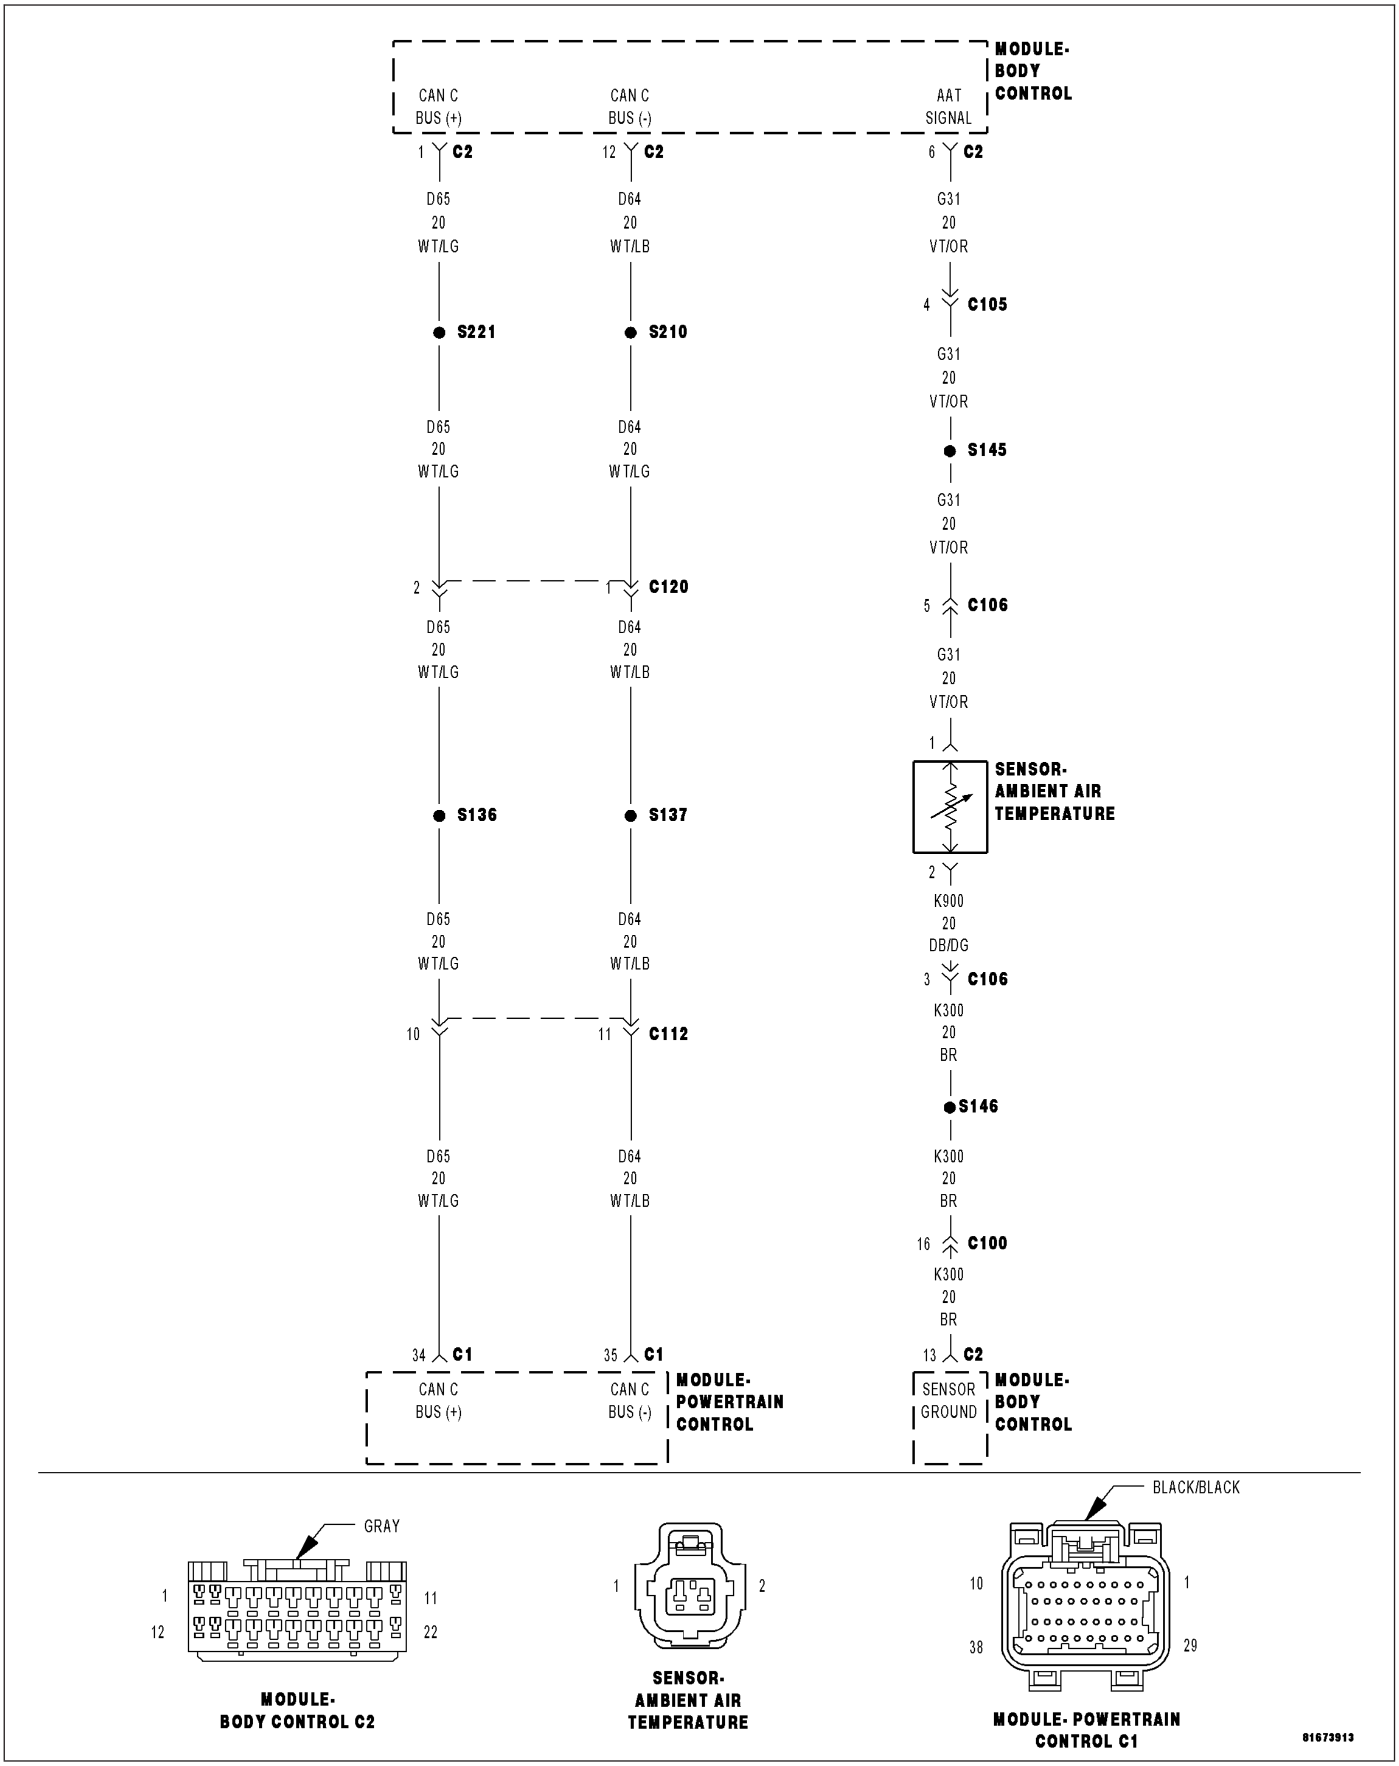
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

# P0071-AMBIENT AIR TEMPERATURE SENSOR PERFORMANCE



## Theory of Operation

Ambient Air Temperature Sensor performance looks at the outputs of three temperature sensors and compare them under cold start conditions. Following a start to run delay time, the outputs of the ambient, engine coolant, and intake air temperature sensors will be compared. If the engine coolant and intake air temperature sensors agree and the ambient air temperature does not agree, the ambient air temperature sensor is declared as irrational.

- **When Monitored:**
  Engine off time is greater than 480 minutes. Ambient temperature is greater than 4 deg C (38 deg F).
- **Set Condition:**
  After a calibrated amount of cool down time the BCM compares the ECT Sensor, IAT Sensor, and the Ambient Air Temp Sensor values. If the IAT Sensor value is not within –10 deg C (18 deg F) of the other two temperature sensors. Two Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (G31) AAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| (G31) AAT SIGNAL CIRCUIT OPEN |
| (K300) SENSOR GROUND CIRCUIT OPEN |
| (G31) AAT SIGNAL CIRCUIT SHORTED TO GROUND |
| (G31) AAT SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT |
| AMBIENT AIR TEMPERATURE SENSOR |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| BCM |
| BCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. ACTIVE DTC

**NOTE: Diagnose any CAN C Bus communication DTC's before continuing.**

Ignition on, engine not running.

With a scan tool, read DTCs.

**Is the DTC active at this time?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 2. (G31) AAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.

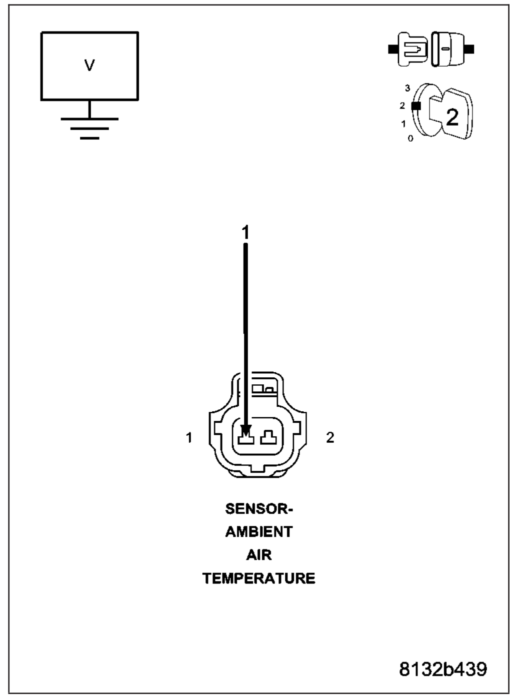
Disconnect the C2 BCM harness connector.

Disconnect the AAT Sensor harness connector.

**NOTE: Visually inspect both the component and the BCM connectors. Look for damaged, partially broken wires, and backed out or corroded terminals.**

Ignition on, engine not running.

Measure the voltage on the (G31) AAT Signal circuit in the AAT Sensor harness connector.



**Is the voltage above 5.2 volts?**

**Yes** >> Repair the short to voltage in the (G31) AAT Signal circuit. Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. AAT SENSOR VOLTAGE ABOVE 4.6 VOLTS

Turn the ignition off.

Connect the C2 BCM harness connector.

Ignition on, engine not running.

With a scan tool, read the AAT voltage.

**Is the voltage above 4.6 volts?**

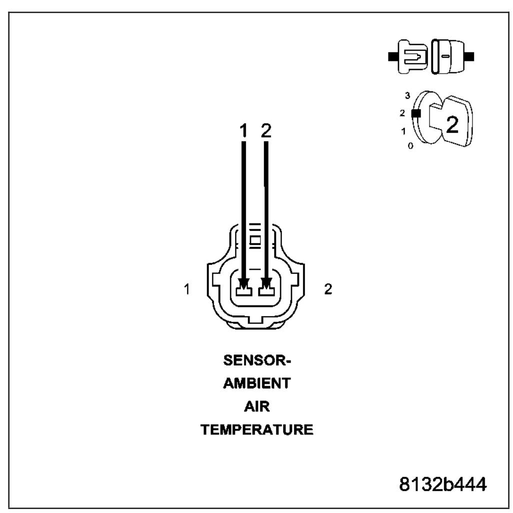
**Yes** >> Go To 4

**No** >> Go To 7

## 4. AAT SENSOR

Connect a jumper wire between the (G31) AAT Signal circuit and the (K300) Sensor ground circuit in the AAT Sensor harness connector.

With a scan tool, read the AAT voltage.



**Is the voltage below 1.0 volt with the jumper wire installed?**

**Yes** >> Replace the AAT Sensor. Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

**NOTE: Remove the jumper wire before continuing.**

## 5. (G31) AAT SIGNAL CIRCUIT OPEN

Turn the ignition off.

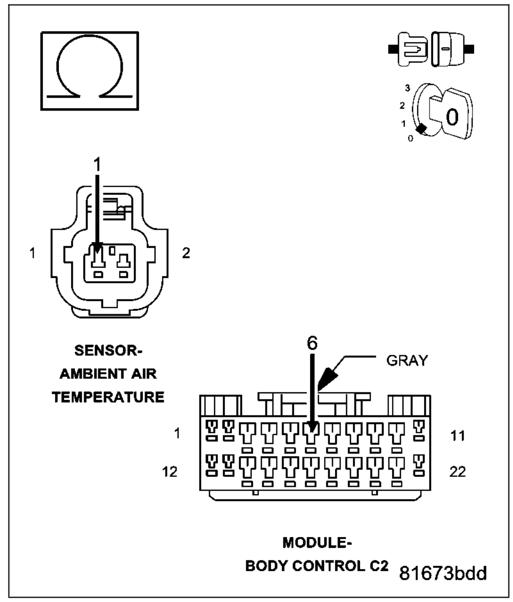
Disconnect the C2 BCM harness connector.

Measure the resistance of the (G31) AAT Signal circuit from the AAT Sensor harness connector to the C2 BCM harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the open in the (G31) AAT Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



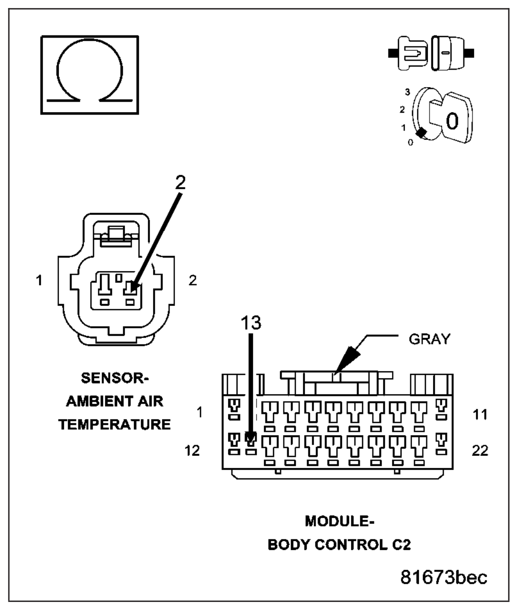
## 6. (K300) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (K300) Sensor ground circuit from the AAT Sensor harness connector to the C2 BCM harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 9

**No** >> Repair the open in the (K300) Sensor ground circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

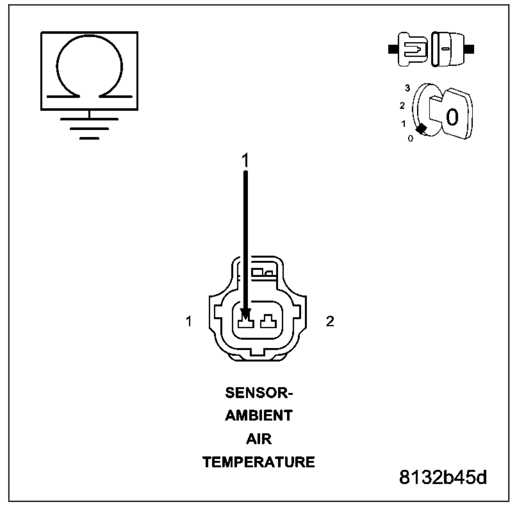


## 7. (G31) AAT SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 BCM harness connector.

Measure the resistance between ground and the (G31) AAT Signal circuit in the AAT Sensor harness connector.



**Is the resistance below 100 ohms?**

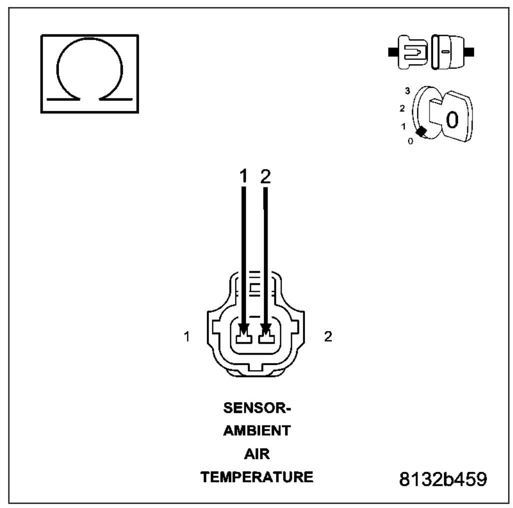
**Yes** >> Repair the short to ground in the (G31) AAT Signal circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. (G31) AAT SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT

Measure the resistance between the (G31) AAT Signal circuit and the (K300) Sensor ground circuit in the AAT Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short between the (K300) Sensor ground circuit and the (G31) AAT Signal circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

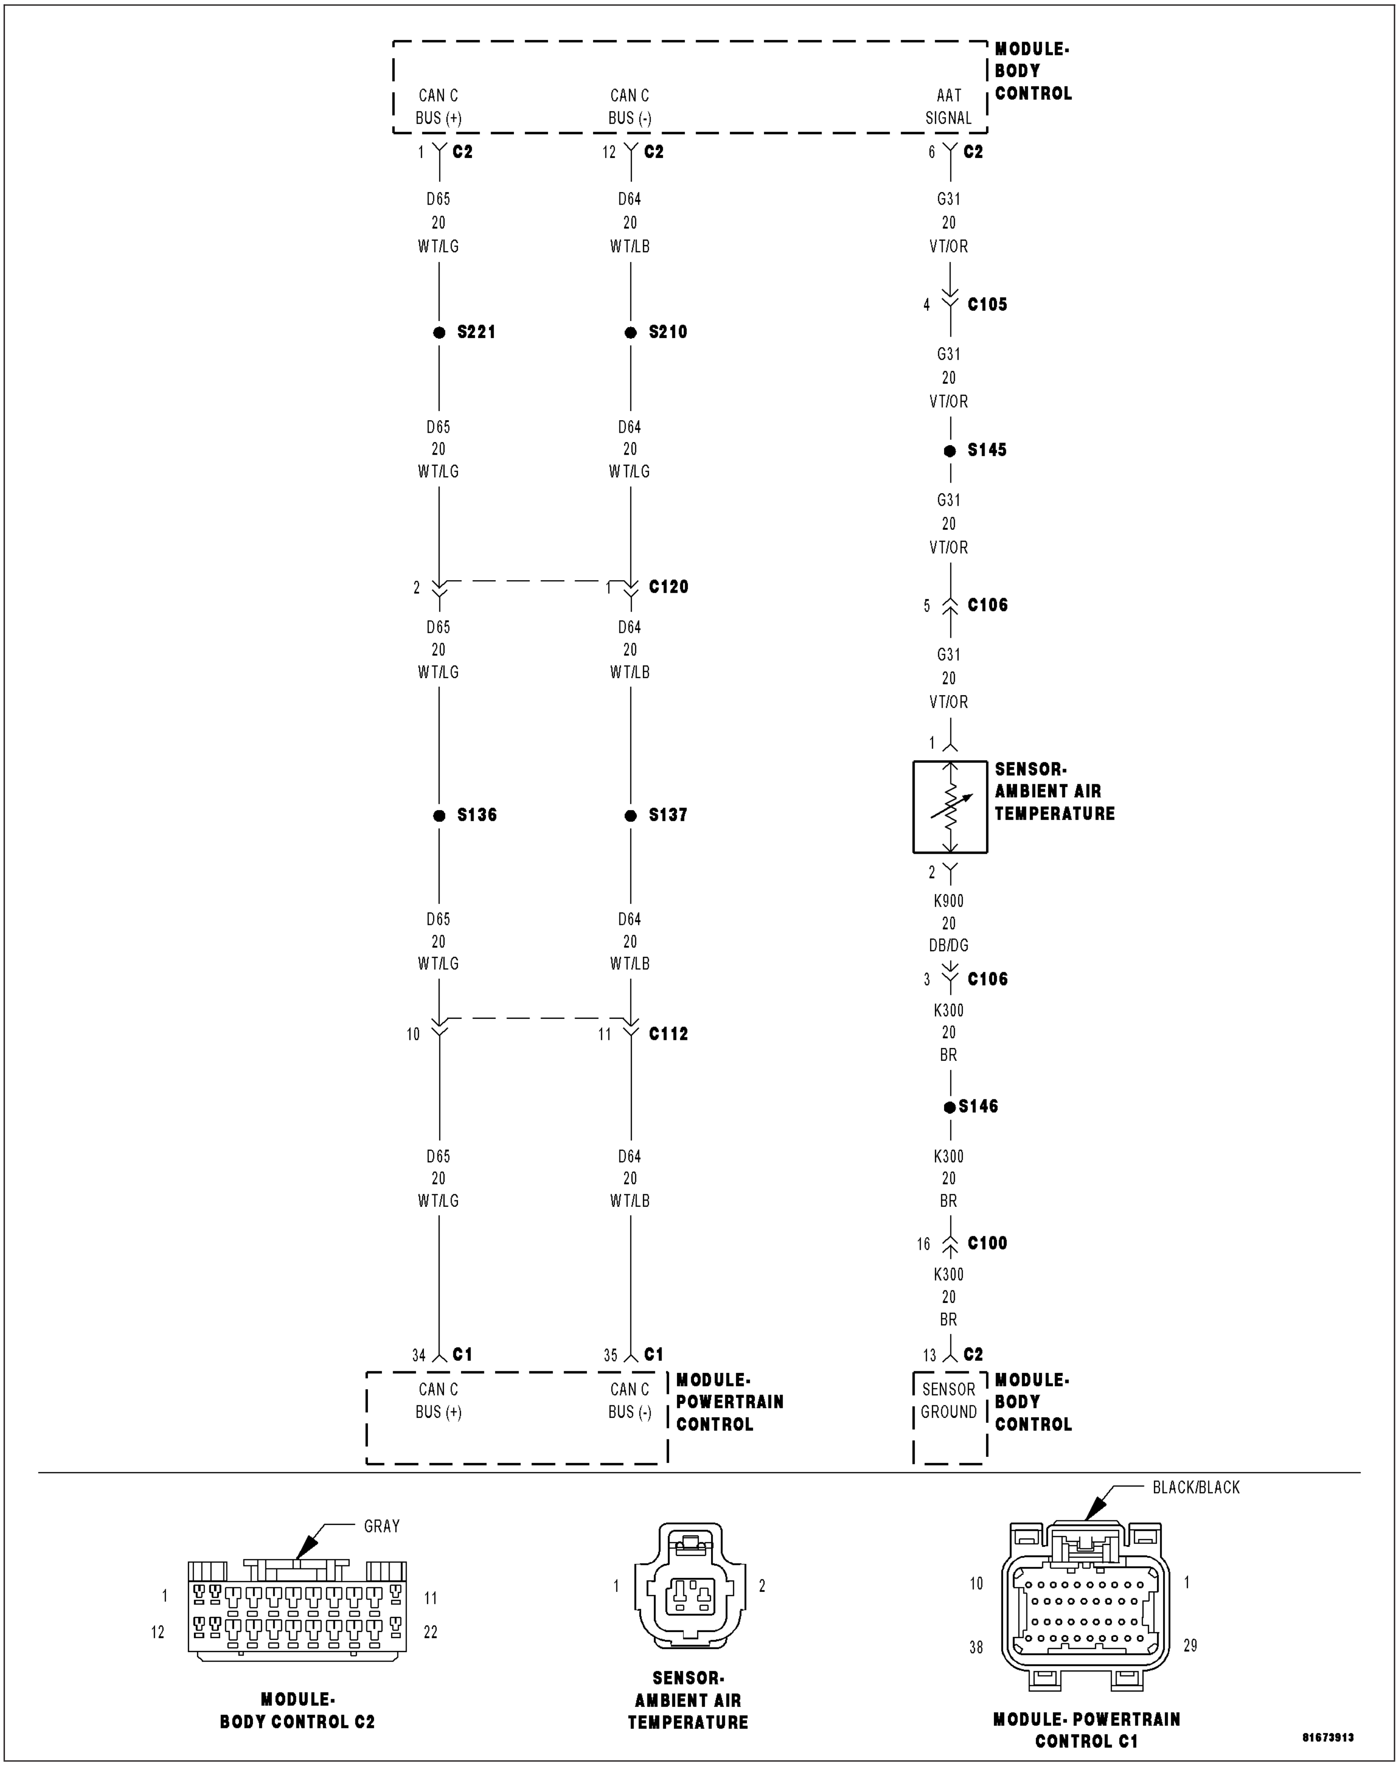
**Yes** >> Repair as necessary.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Body Control Module per Service Information.

Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## P0072-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The ignition key on.
- **Set Condition:**
  Ambient Temperature Sensor is less than 0.078 of a volt at the BCM for 4.8 seconds. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (G31) AAT SIGNAL CIRCUIT SHORTED TO GROUND |
| (G31) ATT SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT |
| AMBIENT AIR TEMPERATURE SENSOR |
| CAN C BUS CIRCUITS OPEN OR SHORTED |
| BCM |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. AAT SENSOR VOLTAGE BELOW 0.078 OF A VOLT

**NOTE: Diagnose any CAN C Bus Communication DTCs before continuing.**
Ignition on, engine not running.
With a scan tool, read the Ambient Air Temperature Sensor voltage.

**Is the voltage below 0.078 of a volt?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. CHECKING AAT SENSOR

Turn the ignition off.
Disconnect the Ambient Air Temperature Sensor harness connector.
Ignition on, engine not running.
With a scan tool, read the AAT Sensor voltage.

**Is the voltage above 4.6 volts?**

**Yes** >> Replace the Ambient Temperature Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

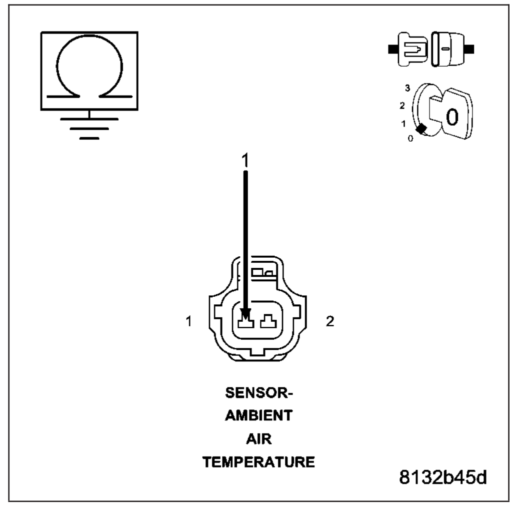
**No** >> Go To 3

## 3. (G31) AAT SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 BCM harness connector.

Measure the resistance between ground and the (G31) AAT Signal circuit in the AAT Sensor harness connector.



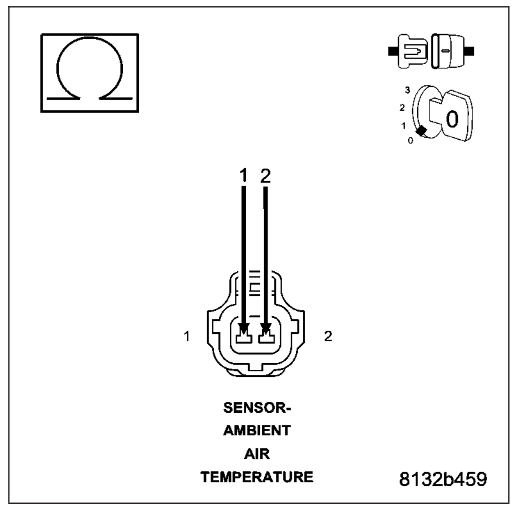
**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (G31) AAT Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 4

## 4. (G31) AAT SIGNAL CIRCUIT SHORTED TO THE (K300) SENSOR GROUND CIRCUIT

Measure the resistance between the (K300) Sensor ground circuit and the (G31) AAT Signal circuit in the AAT Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short between the (K300) Sensor ground circuit and the (G31) AAT Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

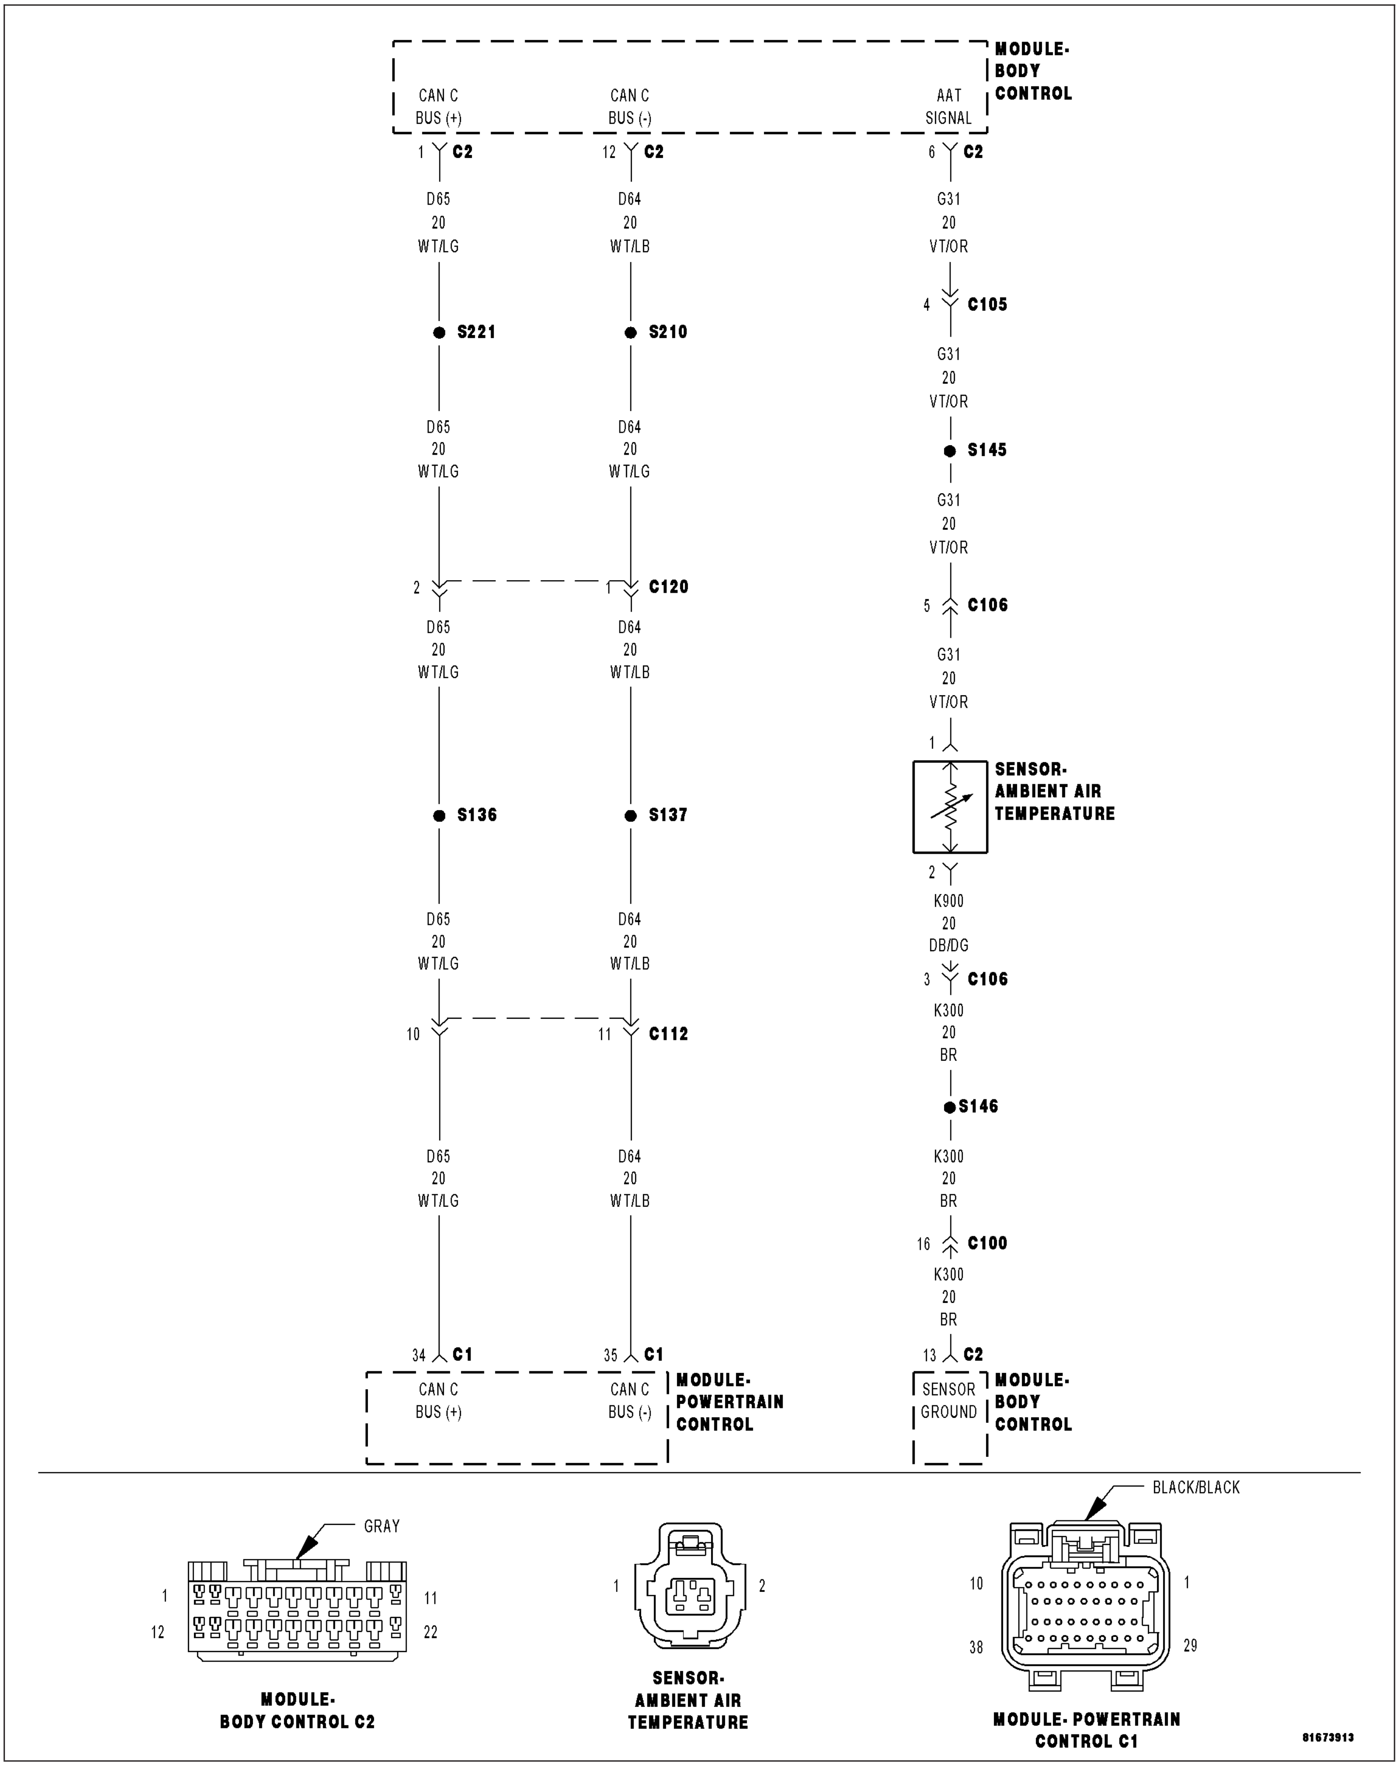
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace and program the Body Control Module per Service Information.
Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## P0073–AMBIENT AIR TEMPERATURE SENSOR CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  The Ambient Temperature Sensor voltage is greater than 4.94 volts at the PCM for 4.8 seconds. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (G31) AAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| (G31) AAT SIGNAL CIRCUIT OPEN |
| (K300) SENSOR GROUND CIRCUIT OPEN |
| AMBIENT AIR TEMPERATURE SENSOR |
| CAN C BUS CIRCUIT OPEN OR SHORTED |
| BCM |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. AAT SENSOR VOLTAGE ABOVE 4.94 VOLTS

**NOTE: Diagnose any CAN C Bus Communication DTCs before continuing.**

Ignition on, engine not running.

With a scan tool, read the Ambient Air Temperature Sensor voltage.

**Is the voltage above 4.94 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. AAT SENSOR

Turn the ignition off.

Disconnect the Ambient Air Temperature Sensor harness connector.

Connect a jumper wire between the (G31) AAT Signal circuit and the (K300) Sensor ground circuit in the AAT Sensor harness connector.

Ignition on, engine not running.

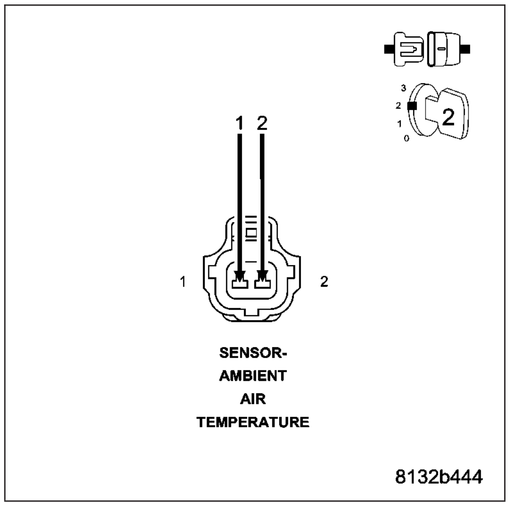
With a scan tool, read AAT Sensor voltage.

**Is the voltage below 1.0 volt with the jumper wire installed?**

**Yes** >> Replace the Ambient Air Temperature Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

**NOTE: Remove the jumper wire before continuing.**



## 3. (G31) AAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.

Disconnect the C2 BCM harness connector.

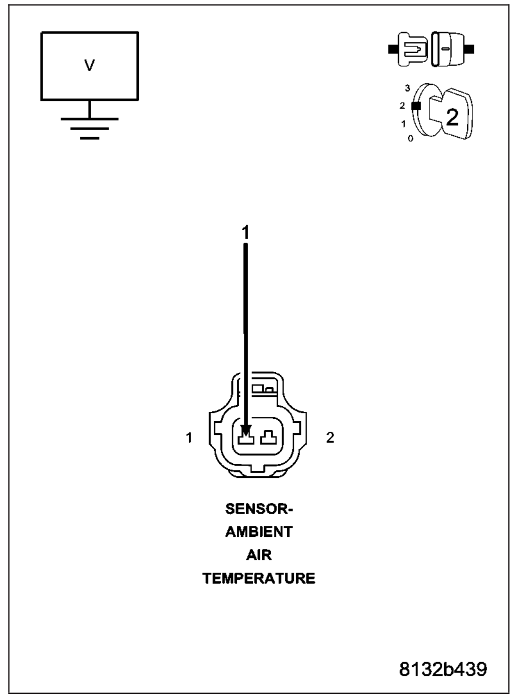
Ignition on, engine not running.

Measure the voltage on the (G31) AAT Signal circuit in the AAT Sensor harness connector.

**Is the voltage above 5.2 volts?**

**Yes** >> Repair the short to battery voltage in the (G31) AAT Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 4



## 4. (G31) AAT SIGNAL CIRCUIT OPEN

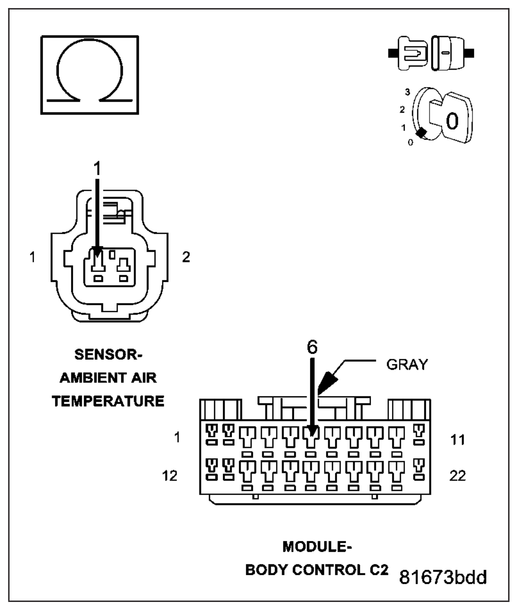
Turn the ignition off.

Measure the resistance of the (G31) AAT Signal circuit from the AAT Sensor harness connector to the C2 BCM harness connector.

**Is the resistance below 5.0 ohms?**

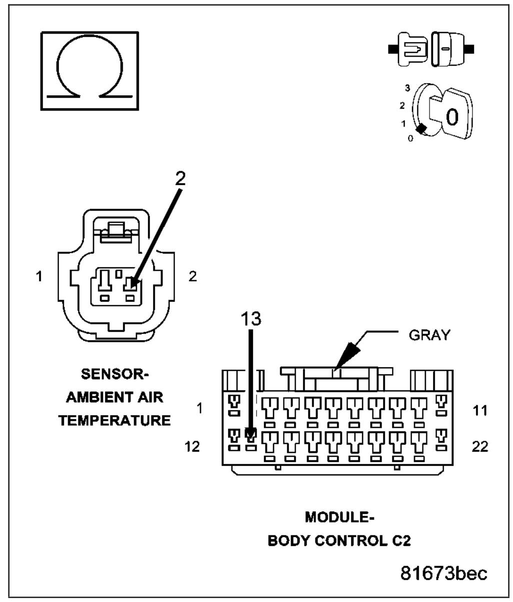
**Yes** >> Go To 5

**No** >> Repair the open in the (G31) AAT Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



## 5. (K300) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (K300) Sensor ground circuit from the AAT Sensor harness connector to the C2 BCM harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the open in the (K300) Sensor ground circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 6. BCM

**NOTE: Before continuing, check the BCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

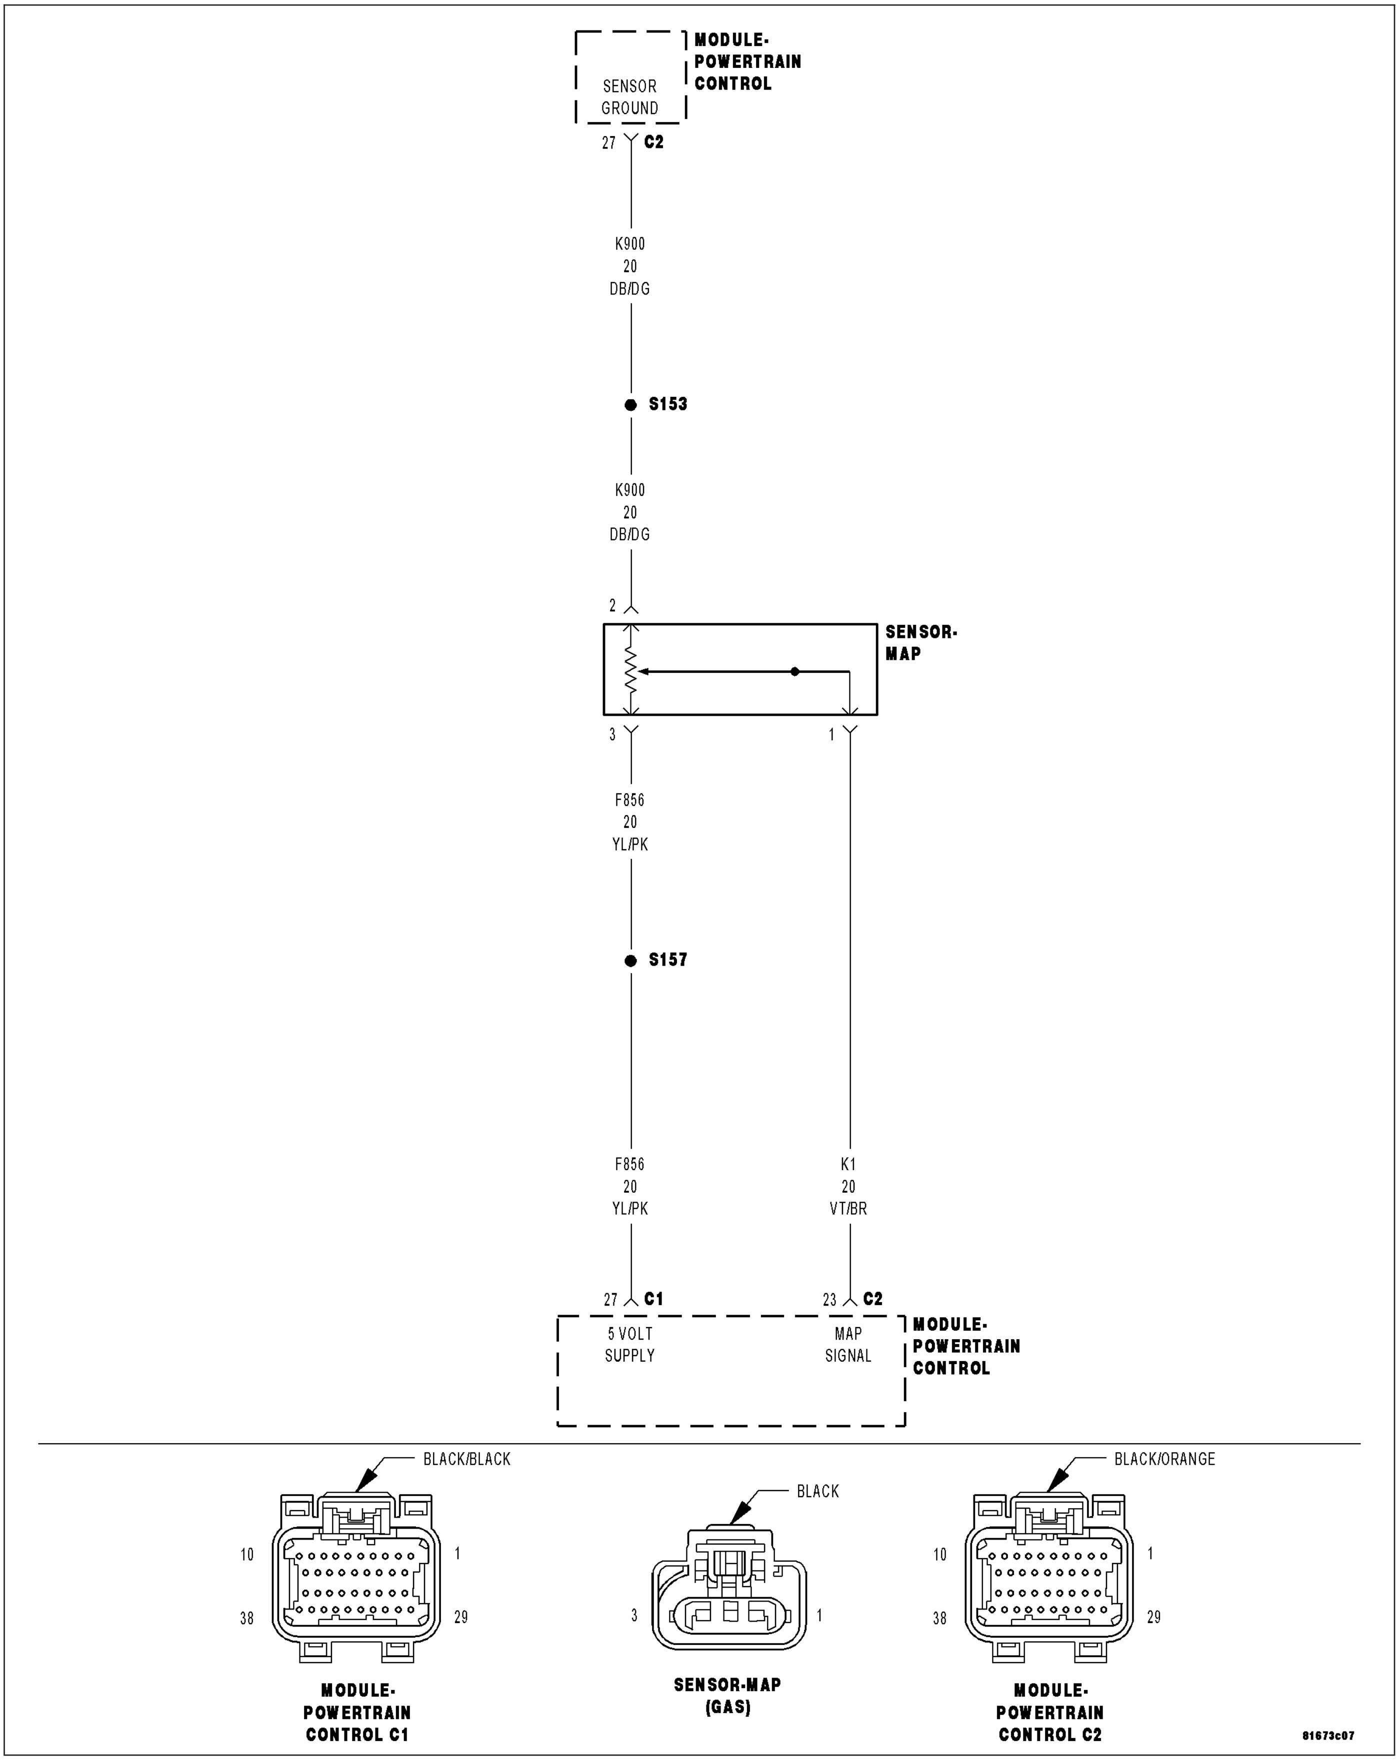
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**No** >> Replace the Body Control Module per Service Information.
Perform the BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

## P0107-MANIFOLD ABSOLUTE PRESSURE SENSOR CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Engine speed between 600 and 3500 RPM. Battery voltage greater than 10.37 volts.
- **Set Condition:**
  The MAP sensor signal voltage is below 0.08 of a volt for 3.0 seconds. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (F856) 5-VOLT SUPPLY CIRCUIT OPEN |
| (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND |
| (K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND |
| (K1) MAP SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT |
| MAP SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. MAP SENSOR VOLTAGE BELOW 0.08 OF A VOLT

Ignition on, engine not running.

With a scan tool, read the MAP Sensor voltage.

**Is the voltage below 0.08 of a volt?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

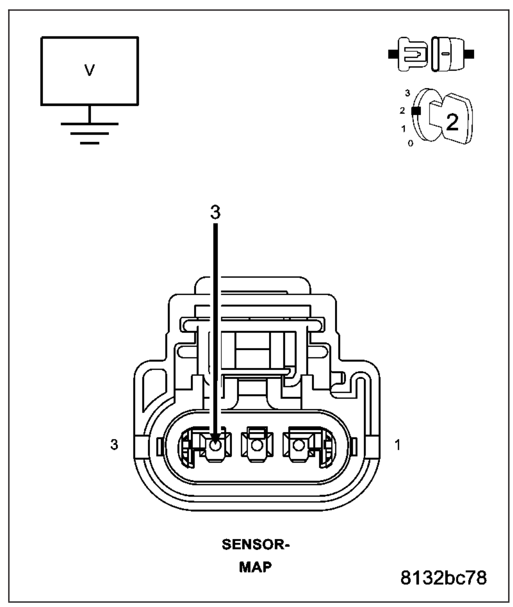
### 2. (F856) 5-VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Ignition on, engine not running.

Measure the voltage on the (F856) 5-volt Supply circuit in the MAP Sensor harness connector.



**Is the voltage between 4.5 to 5.2 volts?**

**Yes** >> Go To 3

**No** >> Go To 6

## 3. MAP SENSOR

With a scan tool, monitor the MAP Sensor voltage with the Sensor harness connector disconnected.

**Is the voltage above 4.5 volts?**

**Yes** >> Replace the MAP Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

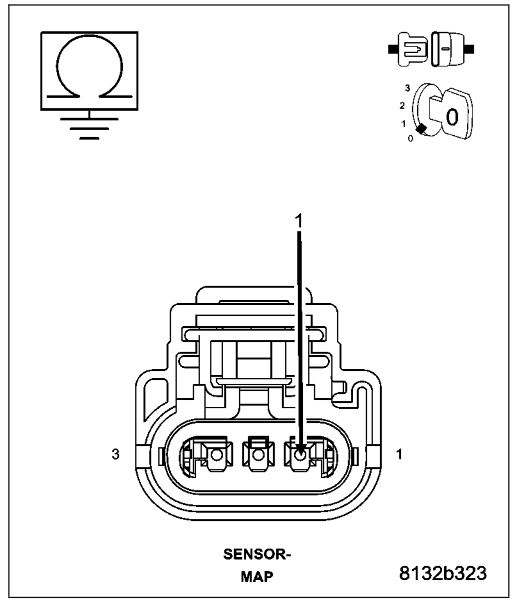
**No** >> Go To 4

## 4. (K1) MAP SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Measure the resistance between ground and the (K1) MAP Signal circuit in the MAP Sensor harness connector.



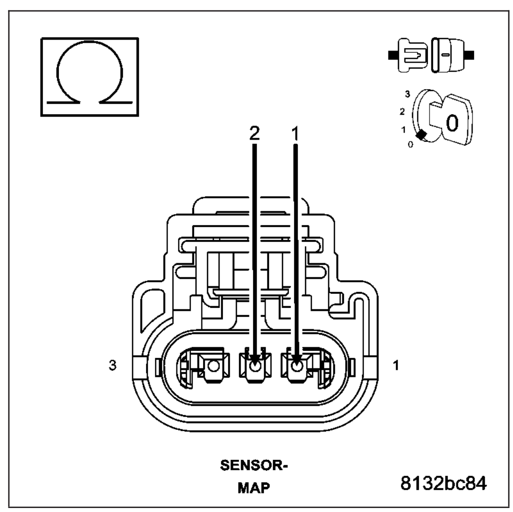
**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (K1) MAP Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

## 5. (K1) MAP SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K1) MAP Signal circuit and the (K900) Sensor ground circuit in the MAP Sensor harness connector.



**Is the resistance below 100 ohms?**

**Yes** >> Repair the short between the (K900) Sensor ground and the (K1) MAP Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 8

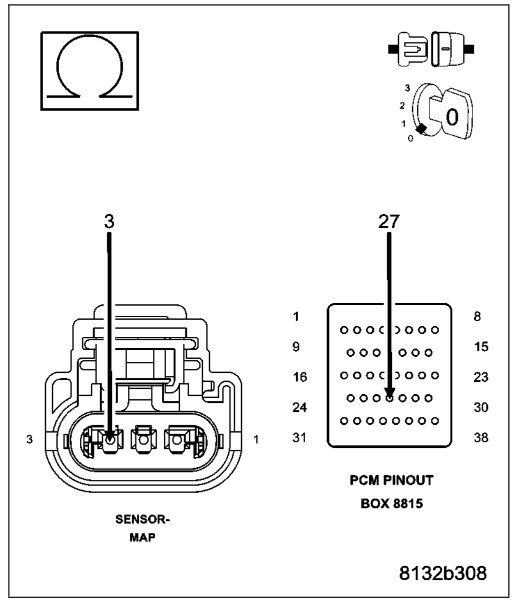
## 6. (F856) 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.

Disconnect the C1 PCM harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (F856) 5-volt Supply circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

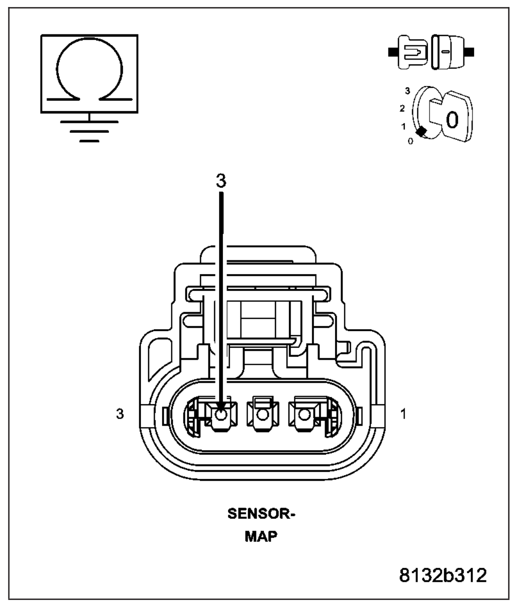
**Yes** >> Go To 7

**No** >> Repair the open in the (F856) 5-volt Supply circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 7. (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (F856) 5-volt Supply circuit in the MAP Sensor harness connector.



**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (F856) 5-volt Supply circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

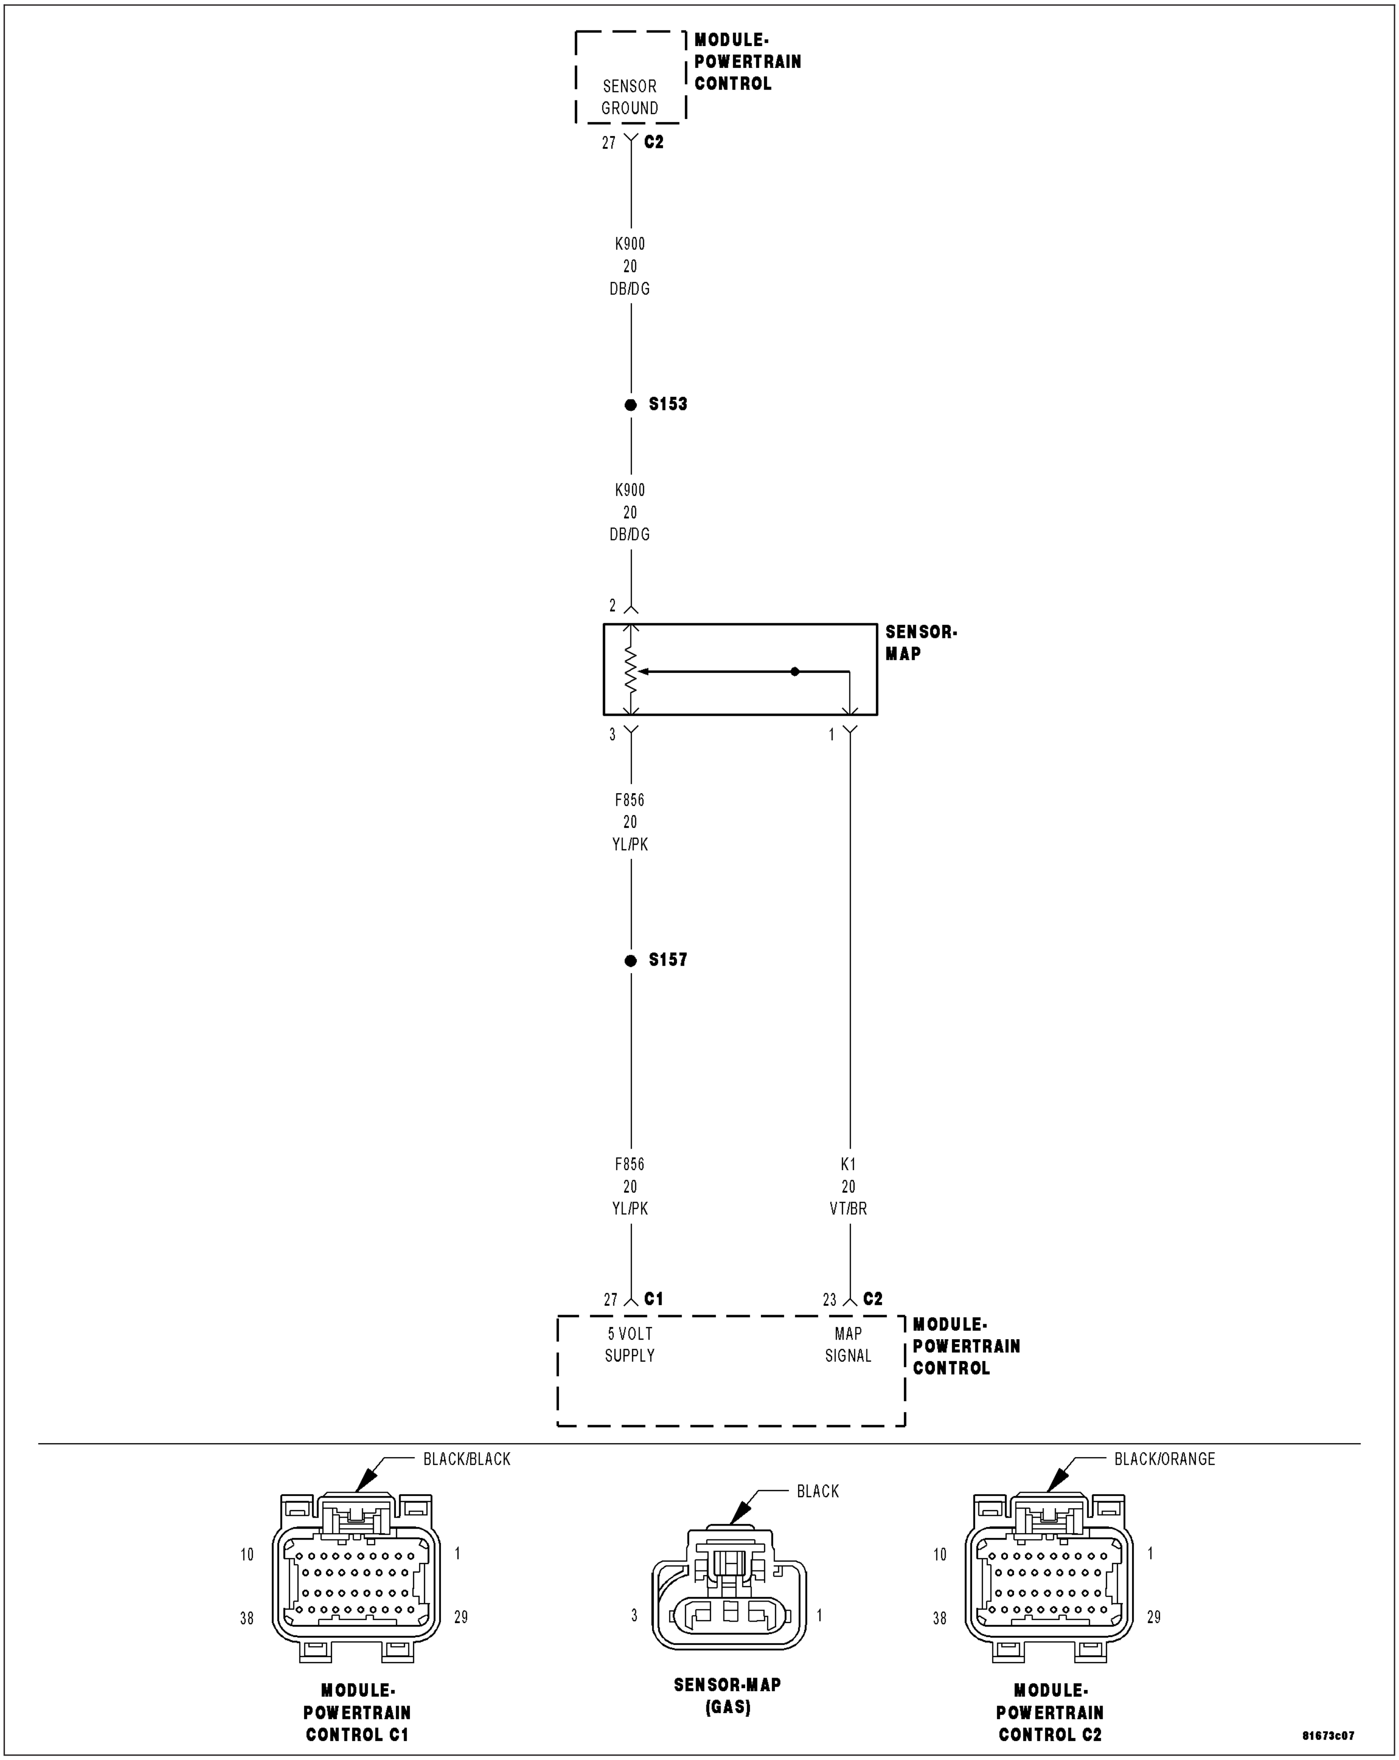
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

# P0108-MANIFOLD ABSOLUTE PRESSURE SENSOR CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Engine speed between 600 to 3500 RPM. Battery voltage greater than 10.37 volts.
- **Set Condition:**
  The MAP sensor signal voltage is greater than 4.92 volts for 3.0 seconds. One trip fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K1) MAP SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| (K1) MAP SIGNAL CIRCUIT OPEN |
| (K1) MAP SIGNAL CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT |
| (K900) SENSOR GROUND CIRCUIT OPEN |
| MAP SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. MAP SENSOR VOLTAGE ABOVE 4.92 VOLTS

Start the engine.

With a scan tool, read the MAP Sensor voltage.

**Is the voltage above 4.92 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. MAP SENSOR

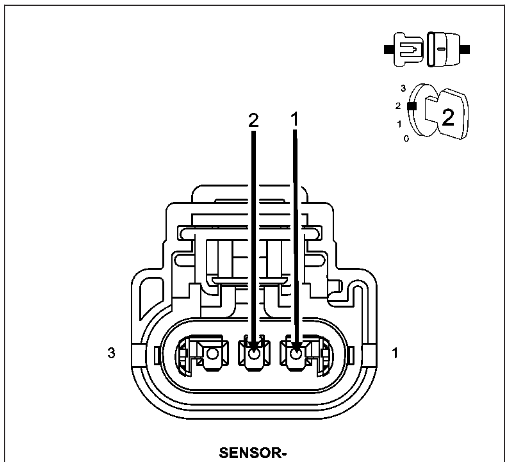
Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Connect a jumper wire between the (K1) MAP Signal circuit and the (K900) Sensor ground circuit in the Sensor harness connector.

Ignition on, engine not running.

With a scan tool, monitor the MAP Sensor voltage.



8132b317

**Is the voltage below 1.0 volt with the jumper wire installed?**

**Yes** >> Replace the MAP Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

**NOTE: Remove the jumper wire before continuing.**

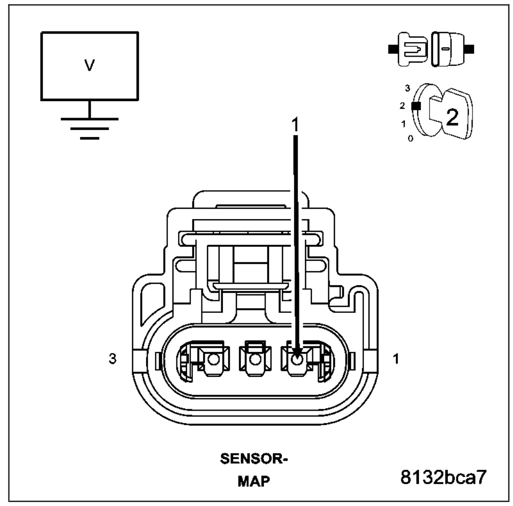
## 3. (K1) MAP SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Ignition on, engine not running.

Measure the voltage on the (K1) MAP Signal circuit in the MAP Sensor harness connector.



**Is the voltage above 5.2 volts?**

**Yes** >> Repair the short to battery voltage in the (K1) MAP Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

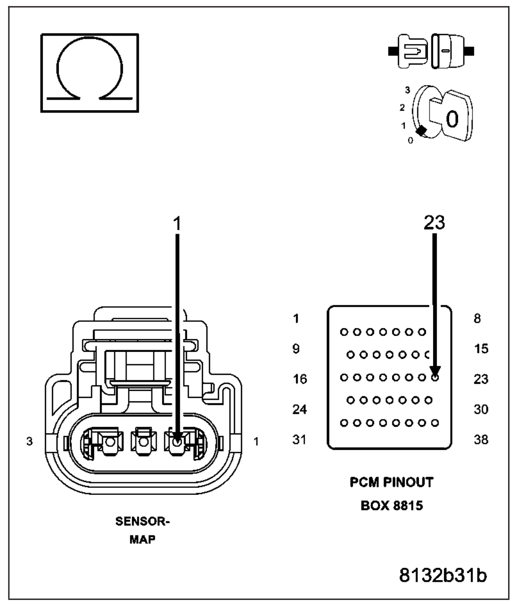
**No** >> Go To 4

## 4. (K1) MAP SIGNAL CIRCUIT OPEN

Turn the ignition off.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K1) MAP Signal circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

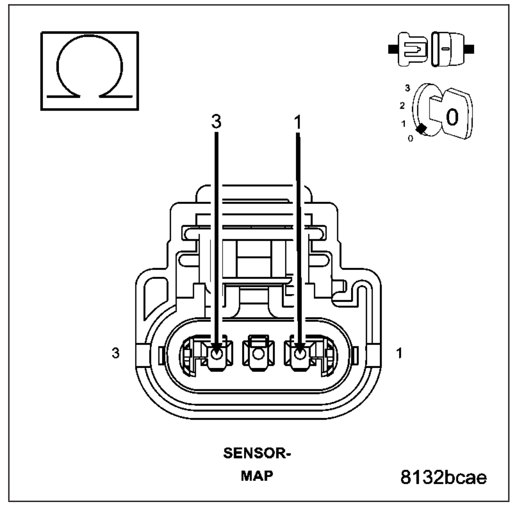
**Yes** >> Go To 5

**No** >> Repair the open in the (K1) MAP Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 5. (K1) MAP SIGNAL CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT

Disconnect the C1 PCM harness connector.

Measure the resistance between the (K1) MAP Signal circuit and the (F856) 5-volt Supply circuit in the MAP Sensor harness connector.



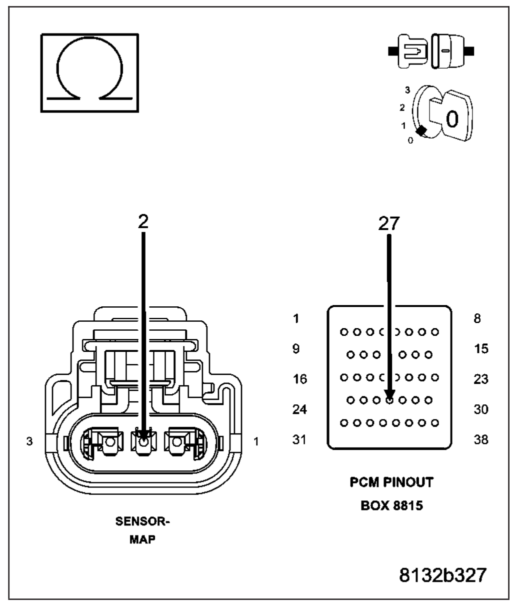
**Is the resistance below 100 ohms?**

**Yes** >> Repair the short between the (F856) 5-volt Supply circuit and the (K1) MAP Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 6

## 6. (K900) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (K900) Sensor ground circuit from the MAP Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the open in the (K900) Sensor ground circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 7. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

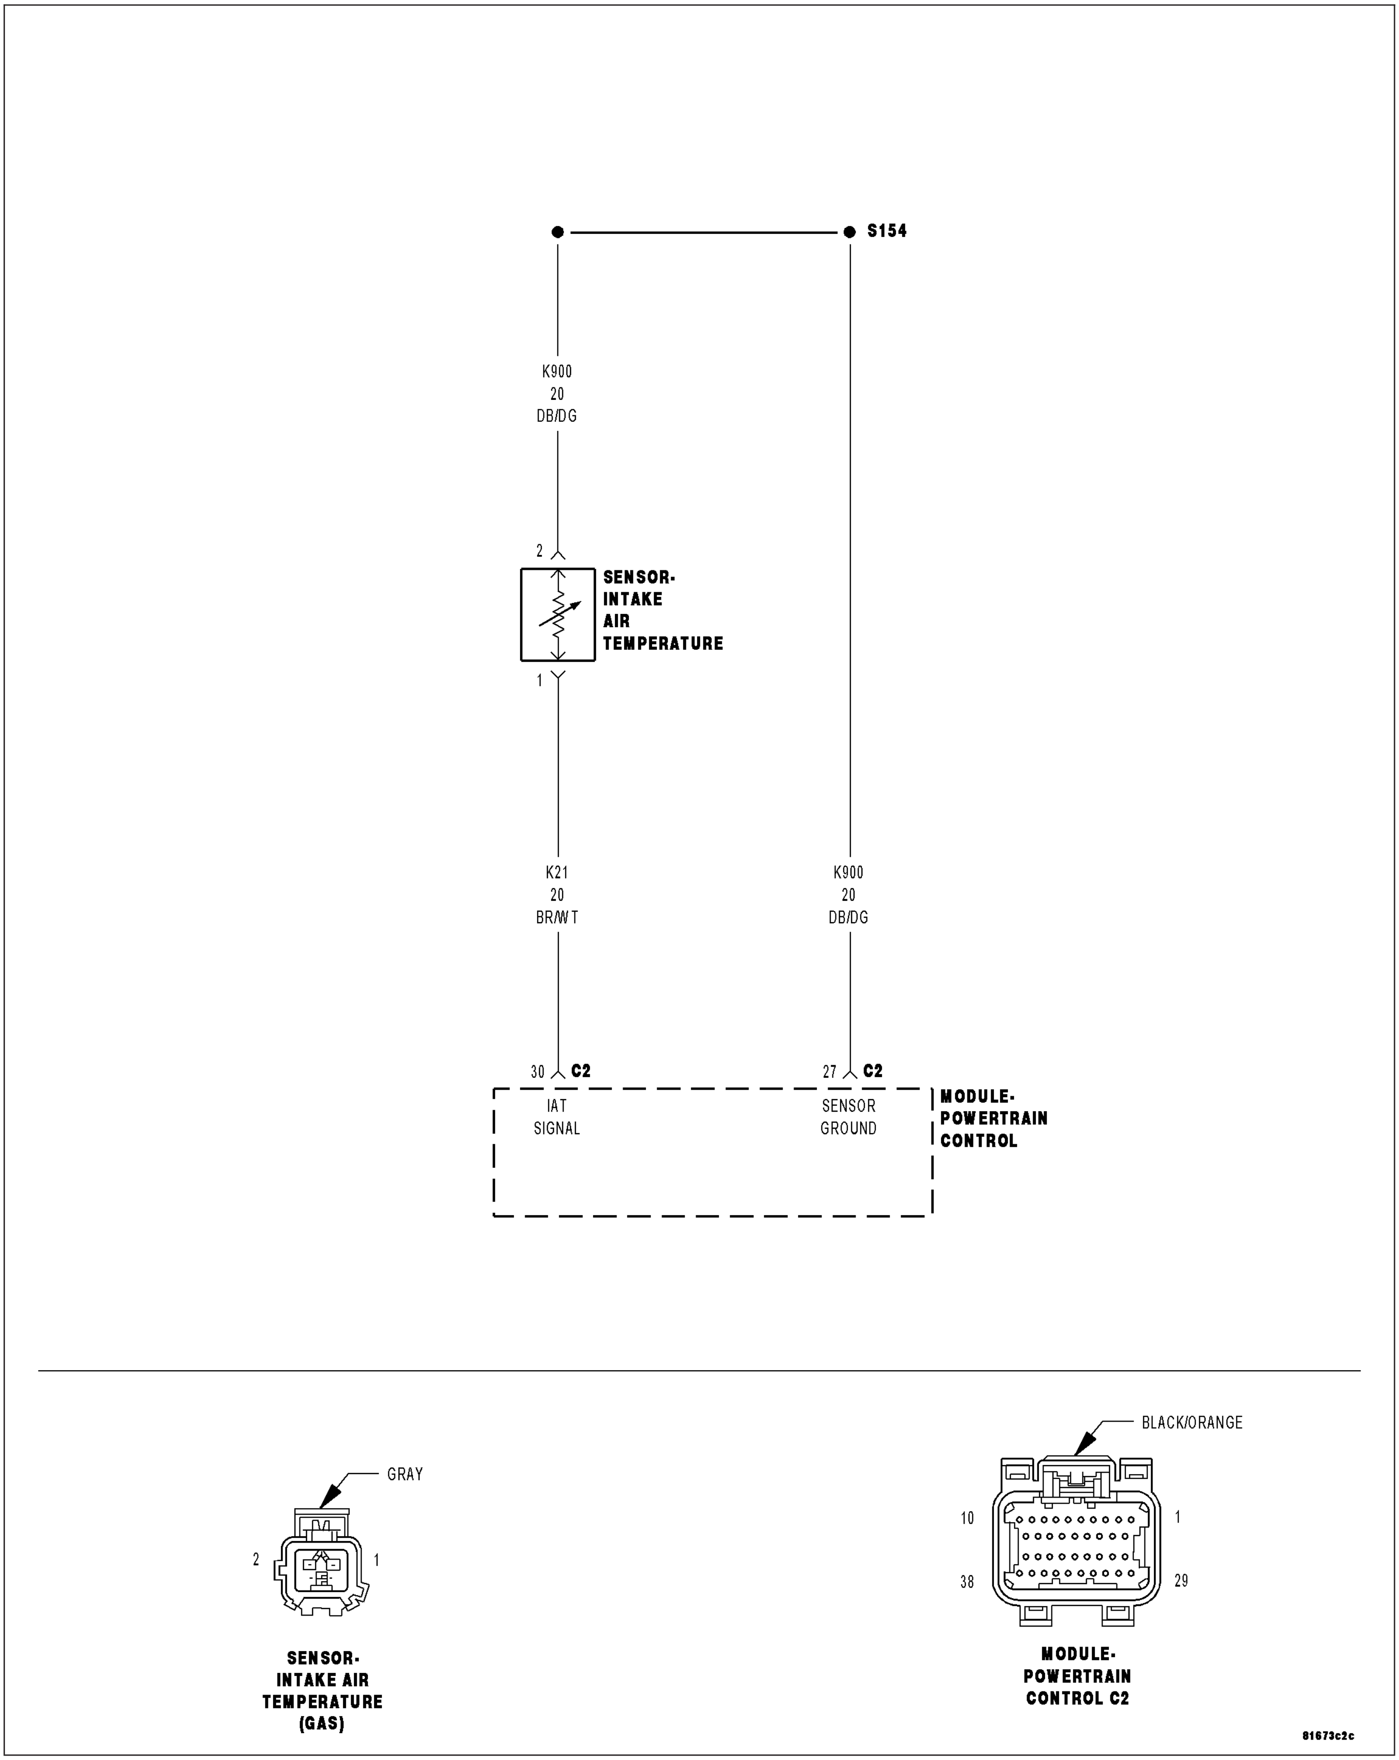
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0111-INTAKE AIR TEMPERATURE SENSOR RATIONALITY



For a complete wiring diagram **Refer to Section 8W**.

## Theory of Operation

Intake Air Temperature Sensor performance looks at the outputs of three temperature sensors and compare them under cold start conditions. Following a start to run delay time, the outputs of the ambient, engine coolant, and intake air temperature sensors will be compared. If the engine coolant and ambient air temperature sensors agree and the intake air temperature does not agree, the intake air temperature sensor is declared as irrational.

- **When Monitored:**
  The engine off time is greater than 480 minutes. Ambient Temperature if greater than 4 deg C (38 deg F).
- **Set Condition:**
  After a calibrated amount of cool down time the PCM compares the ECT Sensor, IAT Sensor, and the Ambient Air Temp Sensor values. If the IAT Sensor value is not within -10 deg C (18 deg F) of the other two temperature sensors. Two Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K21) IAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| (K21) IAT SIGNAL CIRCUIT OPEN |
| (K900) SENSOR GROUND CIRCUIT OPEN |
| (K21) IAT SIGNAL CIRCUIT SHORTED TO GROUND |
| (K21) IAT SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT |
| INTAKE AIR TEMPERATURE SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, read DTCs.

**Is the DTC active at this time?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. (K21) IAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

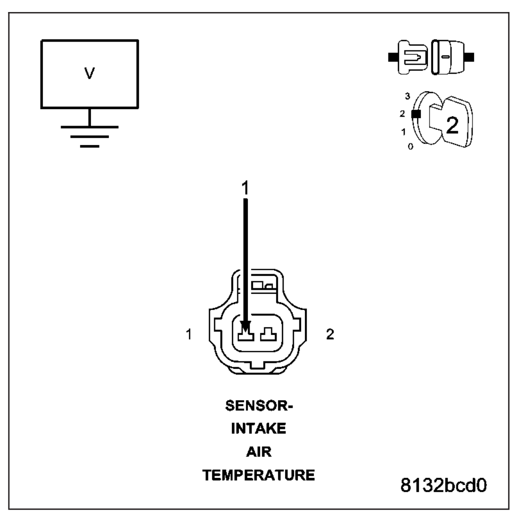
Turn the ignition off.

Disconnect the C2 PCM harness connector.

Disconnect the IAT Sensor harness connector.

**NOTE: Visually inspect both the component and the PCM connectors. Look for damaged, partially broken wires, and backed out or corroded terminals.**

Ignition on, engine not running.



Measure the voltage on the (K21) IAT Signal circuit in the IAT Sensor harness connector.

**Is the voltage above 5.2 volts?**

**Yes** >> Repair the short to battery voltage in the (K21) IAT Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. IAT SENSOR VOLTAGE ABOVE 4.6 VOLTS

Turn the ignition off.

Connect the C2 PCM harness connector.

Ignition on, engine not running.

With a scan tool, read the IAT voltage.

**Is the voltage above 4.6 volts?**

**Yes** >> Go To 4

**No** >> Go To 7

## 4. IAT SENSOR

Connect a jumper wire between the (K21) IAT Signal circuit and the (K900) Sensor ground circuit in the IAT Sensor harness connector.

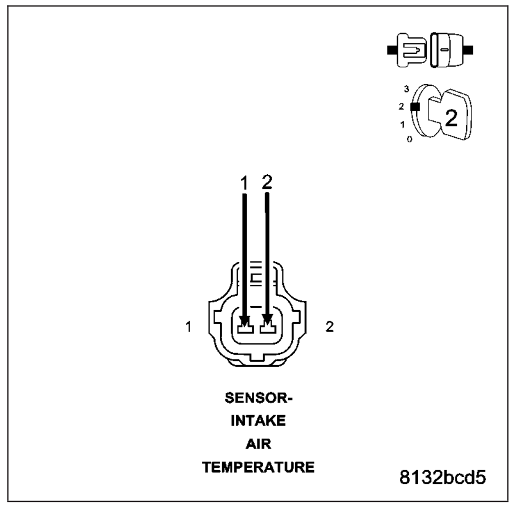
With a scan tool, read the IAT voltage.

**Is the voltage below 1.0 volt with the jumper wire installed?**

**Yes** >> Replace the IAT Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5

**NOTE: Remove the jumper wire before continuing.**



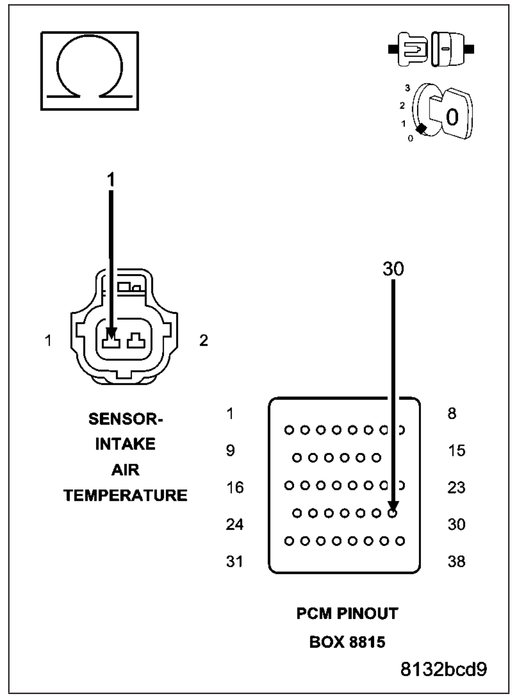
## 5. (K21) IAT SIGNAL CIRCUIT OPEN

Turn the ignition off.

Disconnect the C2 PCM harness connector.

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Measure the resistance of the (K21) IAT Signal circuit from the IAT Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

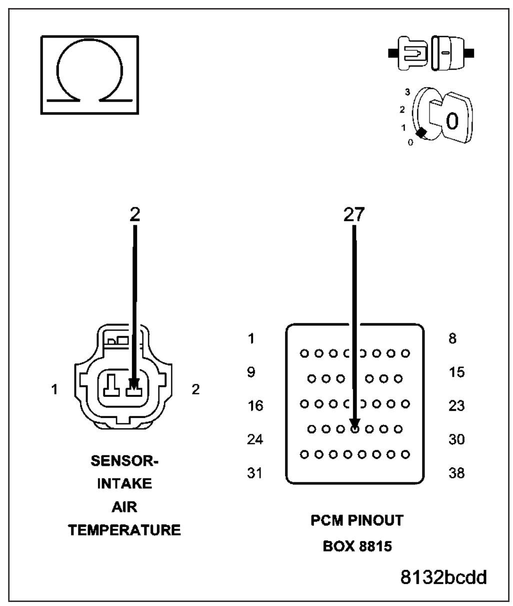
**Yes** >> Go To 6

**No** >> Repair the open in the (K21) IAT Signal circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ POWERTRAIN CONTROL MODULE - DIAGNOSIS AND TESTING)

## 6. (K900) SENSOR GROUND CIRCUIT OPEN

Measure the resistance of the (K900) Sensor ground circuit from the IAT Sensor harness connector to the appropriate terminal of special tool #8815.



**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 9

**No** >> Repair the open in the (K900) Sensor ground circuit.

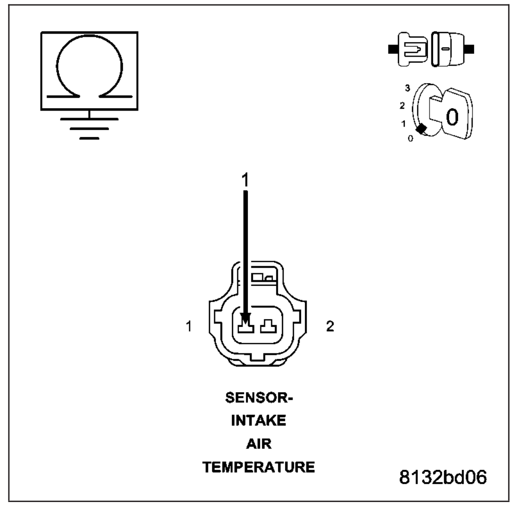
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## 7. (K21) IAT SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 PCM harness connector.

Measure the resistance between ground and the (K21) IAT Signal circuit in the IAT Sensor harness connector.



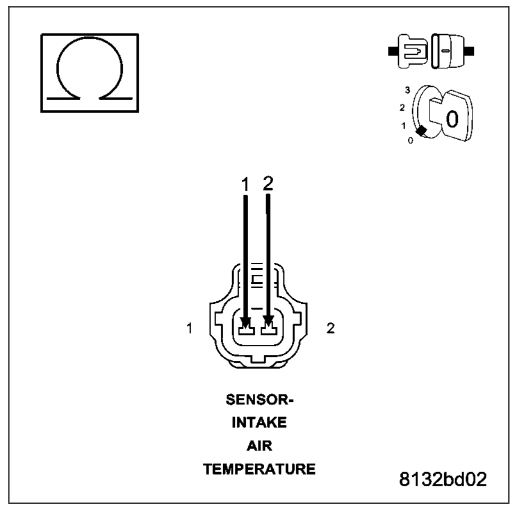
**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (K21) IAT Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 8

## 8. (K21) IAT SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K21) IAT Signal circuit and the (K900) Sensor ground circuit in the IAT Sensor harness connector.



**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the short between the (K900) Sensor ground circuit and the (K21) IAT Signal circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 9

## 9. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

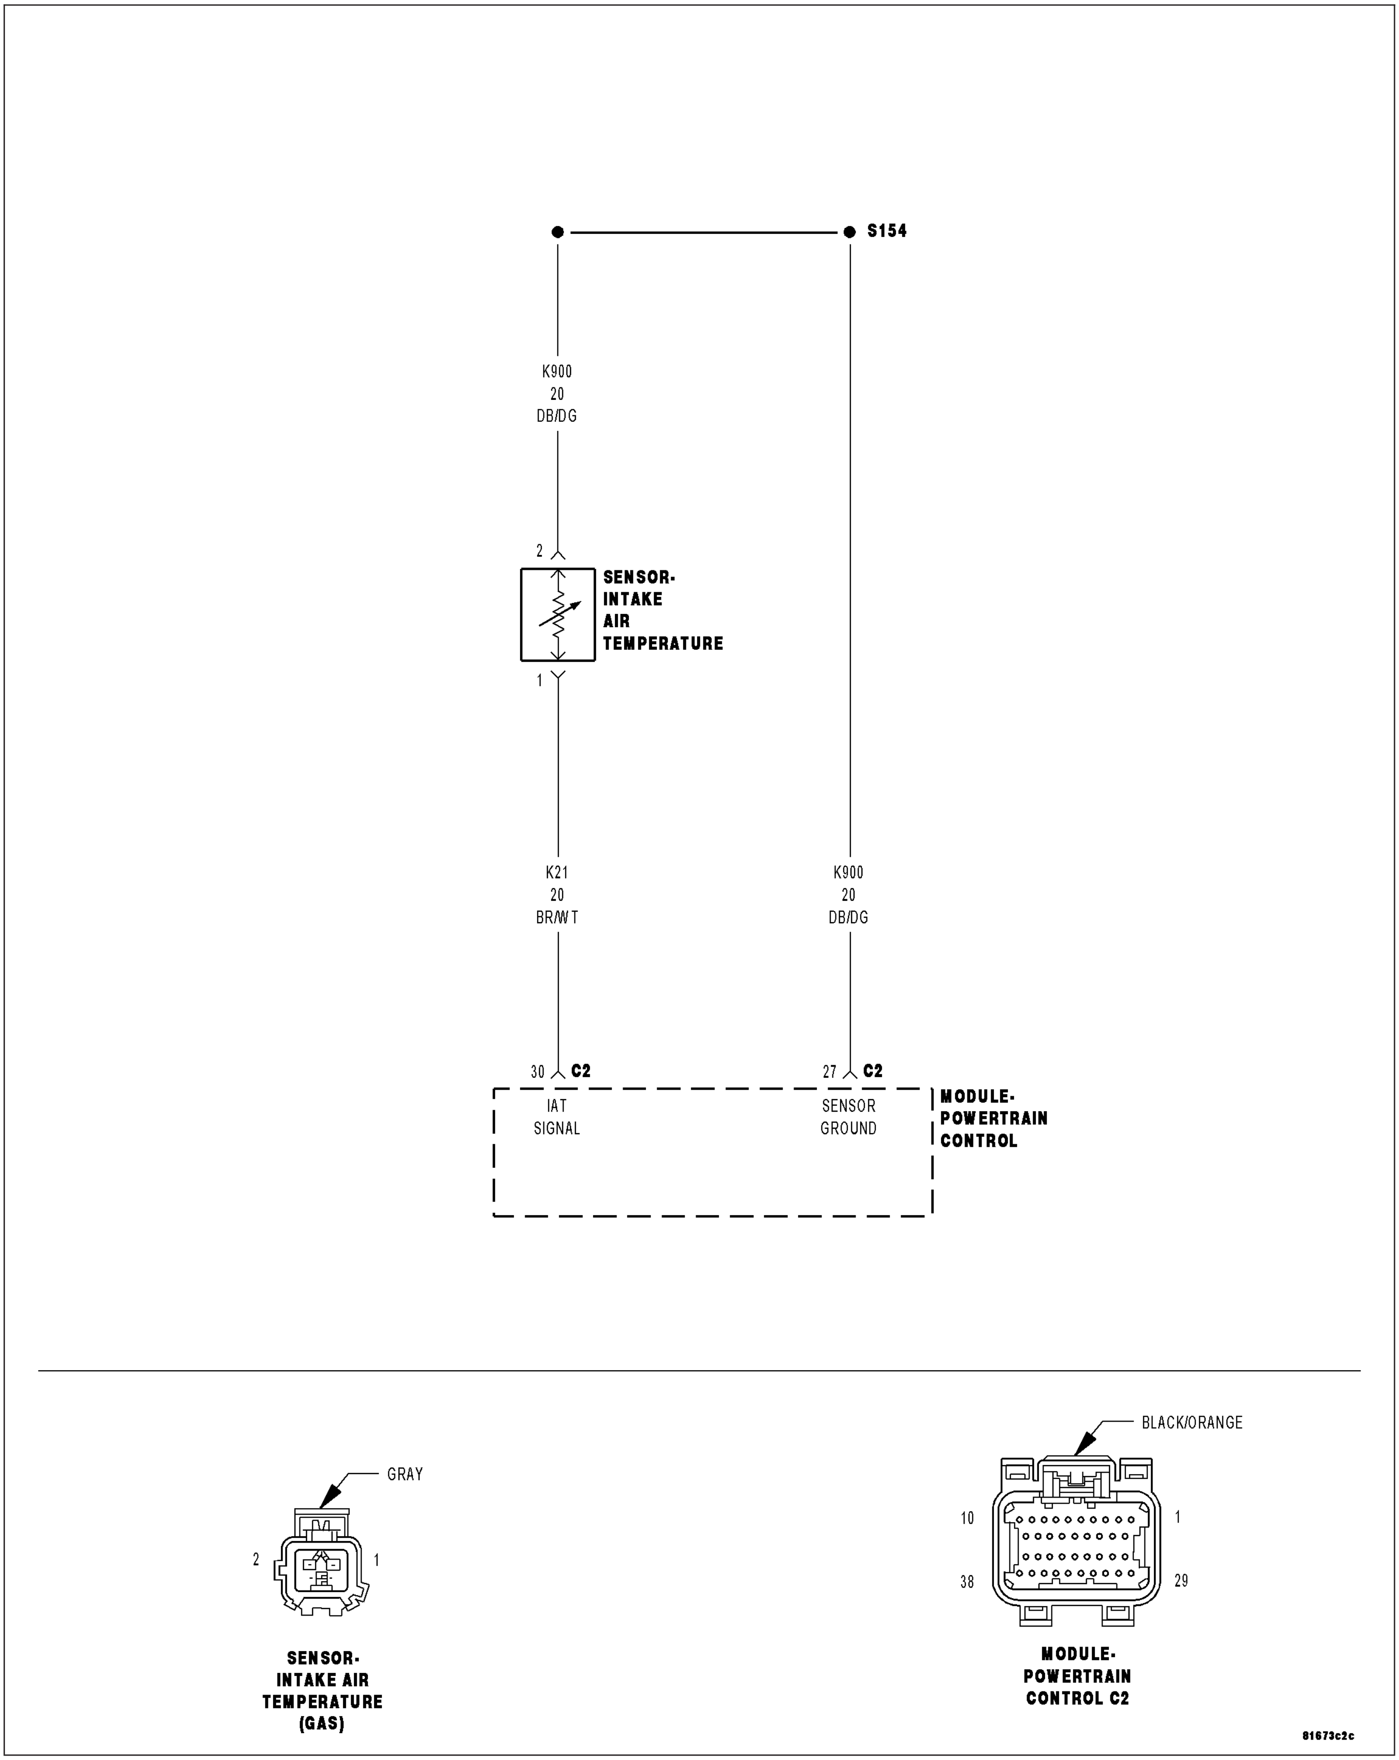
Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

**Yes** >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0112-INTAKE AIR TEMPERATURE SENSOR CIRCUIT LOW



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  When the Inlet Air Temp Sensor Signal circuit voltage is less than .078 volt for more than 2.8 seconds. One trip failure. Three good trips to clear the MIL.

| Possible Causes |
| --- |
| (K21) IAT SIGNAL CIRCUIT SHORTED TO GROUND |
| (K21) IAT SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT |
| INTAKE AIR TEMPERATURE SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. IAT SENSOR VOLTAGE BELOW 0.078 OF A VOLT

Ignition on, engine not running.
With a scan tool, read the IAT voltage.

**Is the voltage below 0.078 of a volt?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. IAT SENSOR

Turn the ignition off.
Disconnect the IAT Sensor harness connector.
Ignition on, engine not running.
With a scan tool, read IAT voltage.

**Is the voltage above 0.05 of a volt?**

**Yes** >> Replace the Intake Air Temperature Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

## 3. (K21) IAT SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the C2 PCM harness connector.

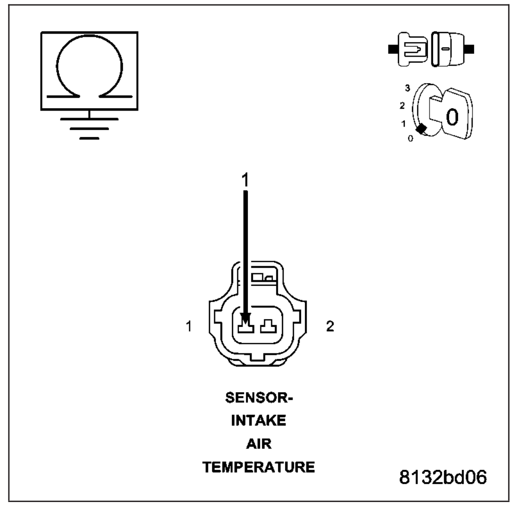
Measure the resistance between ground and the (K21) IAT Signal circuit in the IAT Sensor harness connector.

**Is the resistance below 100 ohms?**

**Yes** >> Repair the short to ground in the (K21) IAT Signal circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 4



## 4. (K21) IAT SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT

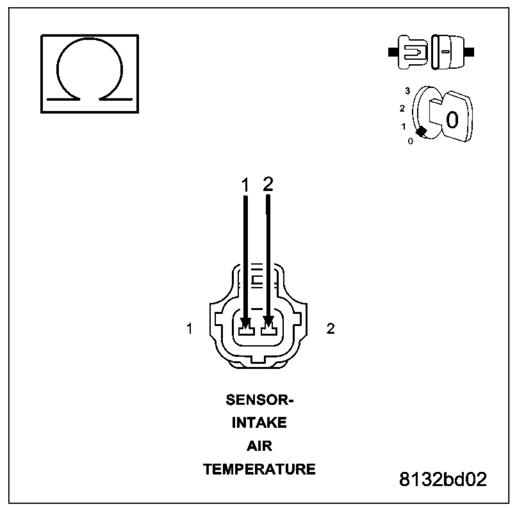
Measure the resistance between the (K21) IAT Signal circuit and the (K900) Sensor ground circuit in the IAT Sensor harness connector.

**Is the resistance below 100 ohms?**

**Yes** >> Repair the short between the (K900) Sensor ground circuit and the (K21) IAT Signal circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 5



## 5. PCM

**NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

**Were there any problems found?**

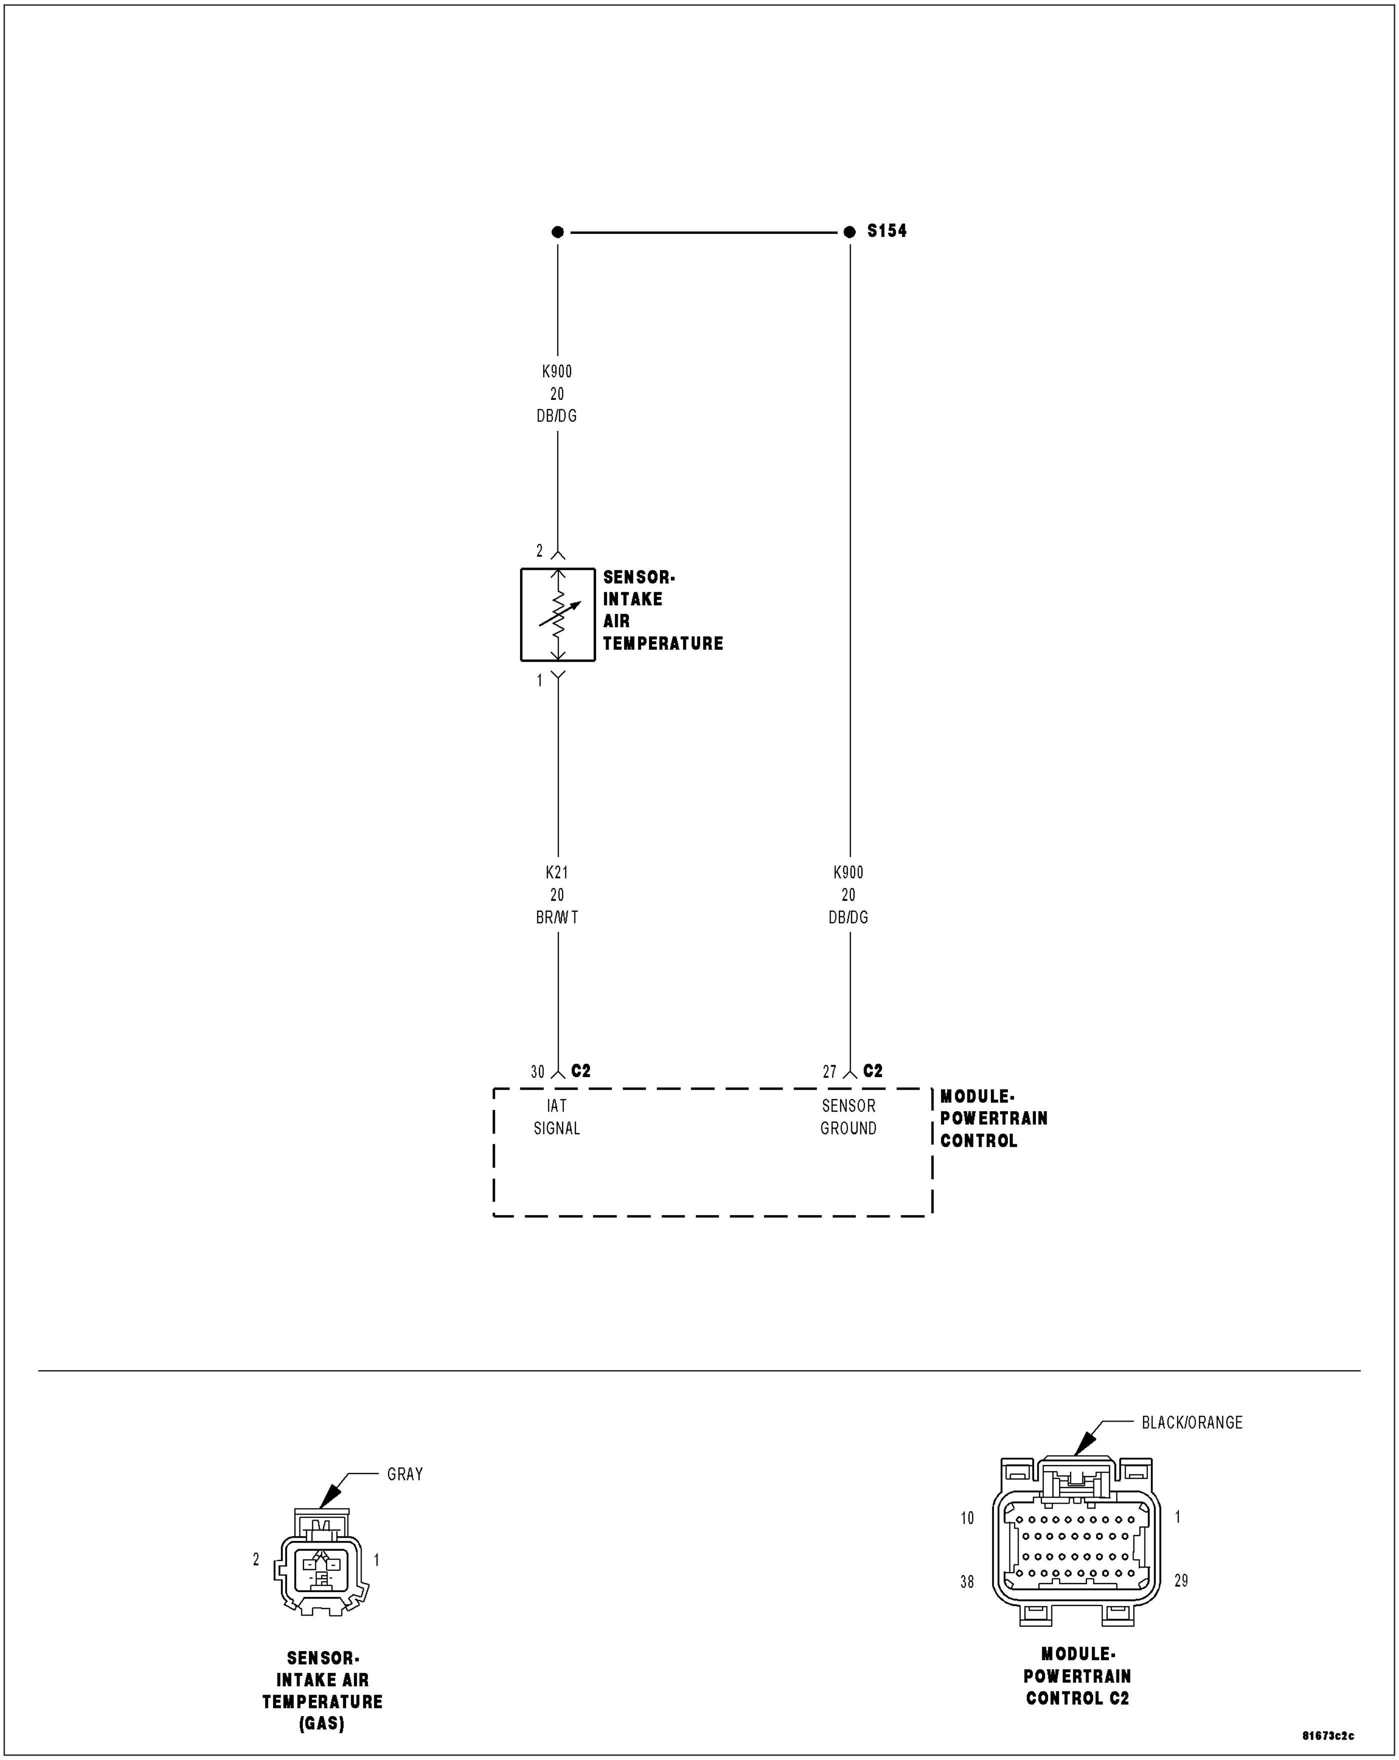
**Yes** >> Repair as necessary.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Replace and program the Powertrain Control Module per Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

## P0113-INTAKE AIR TEMPERATURE SENSOR CIRCUIT HIGH



For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  The Intake Air Temperature (IAT) sensor circuit voltage at the PCM goes above 4.98 volts for 2.8 seconds. One Trip Fault. Three good trips to turn off the MIL.

| Possible Causes |
|---|
| (K21) IAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE |
| (K21) IAT SIGNAL CIRCUIT OPEN |
| (K900) SENSOR GROUND CIRCUIT OPEN |
| IAT SENSOR |
| PCM |

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).**

## Diagnostic Test

### 1. IAT SENSOR VOLTAGE ABOVE 4.98 VOLTS

Ignition on, engine not running.

With a scan tool, read the Intake Air Temperature Sensor voltage.

**Is the voltage above 4.98 volts?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

### 2. IAT SENSOR

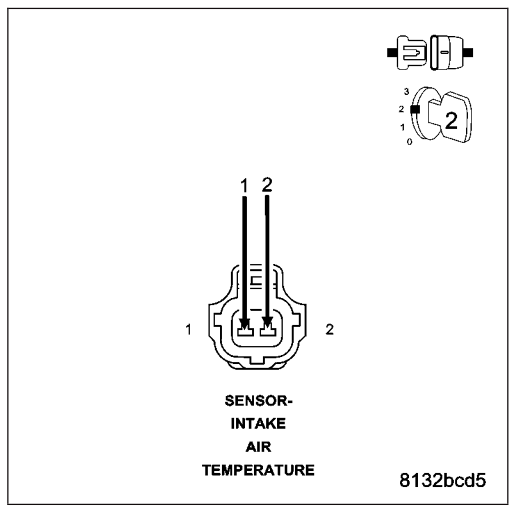
Turn the ignition off.

Disconnect the Intake Air Temperature Sensor harness connector.

Connect a jumper wire between the (K21) IAT Signal circuit and the (K900) Sensor ground circuit in the IAT Sensor harness connector.

Ignition on, engine not running.

With a scan tool, read the IAT Sensor voltage.



**Is the voltage below 1.0 volt with the jumper wire installed?**

**Yes** >> Replace the IAT Sensor.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

**No** >> Go To 3

**NOTE: Remove the jumper wire before continuing.**

## 3. (K21) IAT SIGNAL CIRCUIT SHORTED TO BATTERY VOLTAGE

Ignition on, engine not running.
